038 Y Example 32.10.7. Let $k=\mathbf{F}_{p}(t)$. It is quite easy to give an example of a regular variety $V$ over $k$ which is not geometrically reduced. For example we can take $\operatorname{Spec}\left(k[x] /\left(x^{p}-t\right)\right)$. In fact, there exists an example of a regular variety $V$ which is geometrically reduced, but not even geometrically normal. Namely, take for $p>2$ the scheme $V=\operatorname{Spec}\left(k[x, y] /\left(y^{2}-x^{p}+t\right)\right)$. This is a variety as the polynomial $y^{2}-x^{p}+t \in k[x, y]$ is irreducible. The morphism $V \rightarrow \operatorname{Spec}(k)$ is smooth at all points except at the point $v_{0} \in V$ corresponding to the maximal ideal $\left(y, x^{p}-t\right)$ (because $2 y$ is invertible). In particular we see that $V$ is (geometrically) regular at all points, except possibly $v_{0}$. The local ring

$$
\mathcal{O}_{V, v_{0}}=\left(k[x, y] /\left(y^{2}-x^{p}+t\right)\right)_{\left(y, x^{p}-t\right)}
$$

is a domain of dimension 1 . Its maximal ideal is generated by 1 element, namely $y$. Hence it is a discrete valuation ring and regular. Let $k^{\prime}=k\left[t^{1 / p}\right]$. Denote $t^{\prime}=t^{1 / p} \in k^{\prime}, V^{\prime}=V_{k^{\prime}}, v_{0}^{\prime} \in V^{\prime}$ the unique point lying over $v_{0}$. Over $k^{\prime}$ we can write $x^{p}-t=\left(x-t^{\prime}\right)^{p}$, but the polynomial $y^{2}-\left(x-t^{\prime}\right)^{p}$ is still irreducible and $V^{\prime}$ is still a variety. But the element

$$
\frac{y}{x-t^{\prime}} \in f \cdot f \cdot\left(\mathcal{O}_{V^{\prime}, v_{0}^{\prime}}\right)
$$

is integral over $\mathcal{O}_{V^{\prime}, v_{0}^{\prime}}$ (just compute its square) and not contained in it, so $V^{\prime}$ is not normal at $v_{0}^{\prime}$. This concludes the example.

### 32.11. Change of fields and the Cohen-Macaulay property

045 O The following lemma says that it does not make sense to define geometrically CohenMacaulay schemes, since these would be the same as Cohen-Macaulay schemes.
045P Lemma 32.11.1. Let $X$ be a locally Noetherian scheme over the field $k$. Let $k \subset k^{\prime}$ be a finitely generated field extension. Let $x \in X$ be a point, and let $x^{\prime} \in X_{k^{\prime}}$ be a point lying over $x$. Then we have

$$
\mathcal{O}_{X, x} \text { is Cohen-Macaulay } \Leftrightarrow \mathcal{O}_{X_{k^{\prime}}, x^{\prime}} \text { is Cohen-Macaulay }
$$

If $X$ is locally of finite type over $k$, the same holds for any field extension $k \subset k^{\prime}$.
Proof. The first case of the lemma follows from Algebra, Lemma 10.159.2. The second case of the lemma is equivalent to Algebra, Lemma 10.129.6

### 32.12. Change of fields and the Jacobson property

0477 A scheme locally of finite type over a field has plenty of closed points, namely it is Jacobson. Moreover, the residue fields are finite extensions of the ground field.

0478 Lemma 32.12.1. Let $X$ be a scheme which is locally of finite type over $k$. Then (1) for any closed point $x \in X$ the extension $k \subset \kappa(x)$ is algebraic, and
(2) $X$ is a Jacobson scheme (Properties, Definition 27.6.1).

Proof. A scheme is Jacobson if and only if it has an affine open covering by Jacobson schemes, see Properties, Lemma 27.6.3. The property on residue fields at closed points is also local on $X$. Hence we may assume that $X$ is affine. In this case the result is a consequence of the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1. It also follows from a combination of Morphisms, Lemmas 28.16.8, 28.16.9, and 28.16.10.

It turns out that if $X$ is not locally of finite type, then we can achieve the same result after making a suitably large base field extension.
0479 Lemma 32.12.2. Let $X$ be a scheme over a field $k$. For any field extension $k \subset K$ whose cardinality is large enough we have
(1) for any closed point $x \in X_{K}$ the extension $K \subset \kappa(x)$ is algebraic, and
(2) $X_{K}$ is a Jacobson scheme (Properties, Definition 27.6.1).

Proof. Choose an affine open covering $X=\bigcup U_{i}$. By Algebra, Lemma 10.34.12 and Properties, Lemma 27.6 .2 there exist cardinals $\kappa_{i}$ such that $U_{i, K}$ has the desired properties over $K$ if $\#(\bar{K}) \geq \kappa_{i}$. Set $\kappa=\max \left\{\kappa_{i}\right\}$. Then if the cardinality of $K$ is larger than $\kappa$ we see that each $U_{i, K}$ satisfies the conclusions of the lemma. Hence $X_{K}$ is Jacobson by Properties, Lemma 27.6.3. The statement on residue fields at closed points of $X_{K}$ follows from the corresponding statements for residue fields of closed points of the $U_{i, K}$.

### 32.13. Change of fields and ample invertible sheaves

0 BDB The following result is typical for the results in this section.
0BDC Lemma 32.13.1. Let $k$ be a field. Let $X$ be a scheme over $k$. If there exists an ample invertible sheaf on $X_{K}$ for some field extension $k \subset K$, then $X$ has an ample invertible sheaf.

Proof. Let $k \subset K$ be a field extension such that $X_{K}$ has an ample invertible sheaf $\mathcal{L}$. The morphism $X_{K} \rightarrow X$ is surjective. Hence $X$ is quasi-compact as the image of a quasi-compact scheme (Properties, Definition 27.26.1. Since $X_{K}$ is quasi-separated (by Properties, Lemma 27.26.7) we see that $X$ is quasi-separated: If $U, V \subset X$ are affine open, then $(U \cap V)_{K}=U_{K} \cap V_{K}$ is quasi-compact and $(U \cap V)_{K} \rightarrow U \cap V$ is surjective. Thus Schemes, Lemma 25.21.7 applies.

Write $K=\operatorname{colim} A_{i}$ as the colimit of the subalgebras of $K$ which are of finite type over $k$. Denote $X_{i}=X \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(A_{i}\right)$. Since $X_{K}=\lim X_{i}$ we find an $i$ and an invertible sheaf' $\mathcal{L}_{i}$ on $X_{i}$ whose pullback to $X_{K}$ is $\mathcal{L}$ (Limits, Lemma 31.9.3 here and below we use that $X$ is quasi-compact and quasi-separated as just shown). By Limits, Lemma 31.3 .12 we may assume $\mathcal{L}_{i}$ is ample after possibly increasing $i$. Fix such an $i$ and let $\mathfrak{m} \subset A_{i}$ be a maximal ideal. By the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1) the residue field $k^{\prime}=A_{i} / \mathfrak{m}$ is a finite extension of $k$. Hence $X_{k^{\prime}} \subset X_{i}$ is a closed subscheme hence has an ample invertible sheaf (Properties, Lemma 27.26.3). Since $X_{k^{\prime}} \rightarrow X$ is finite locally free we conclude that $X$ has an ample invertible sheaf by Divisors, Proposition 30.14.8.

0BDD Lemma 32.13.2. Let $k$ be a field. Let $X$ be a scheme over $k$. If $X_{K}$ is quasi-affine for some field extension $k \subset K$, then $X$ is quasi-affine.

Proof. Let $k \subset K$ be a field extension such that $X_{K}$ is quasi-affine. The morphism $X_{K} \rightarrow X$ is surjective. Hence $X$ is quasi-compact as the image of a quasi-compact scheme (Properties, Definition 27.18.1). Since $X_{K}$ is quasi-separated (as an open subscheme of an affine scheme) we see that $X$ is quasi-separated: If $U, V \subset X$ are affine open, then $(U \cap V)_{K}=U_{K} \cap V_{K}$ is quasi-compact and $(U \cap V)_{K} \rightarrow U \cap V$ is surjective. Thus Schemes, Lemma 25.21.7 applies.

Write $K=\operatorname{colim} A_{i}$ as the colimit of the subalgebras of $K$ which are of finite type over $k$. Denote $X_{i}=X \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(A_{i}\right)$. Since $X_{K}=\lim X_{i}$ we find an $i$ such that $X_{i}$ is quasi-affine (Limits, Lemma 31.3.9 here we use that $X$ is quasi-compact and quasi-separated as just shown). By the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1) the residue field $k^{\prime}=A_{i} / \mathfrak{m}$ is a finite extension of $k$. Hence $X_{k^{\prime}} \subset X_{i}$ is a closed subscheme hence is quasi-affine (Properties, Lemma 27.27.2). Since $X_{k^{\prime}} \rightarrow X$ is finite locally free we conclude by Divisors, Lemma 30.14.9.

0BDE Lemma 32.13.3. Let $k$ be a field. Let $X$ be a scheme over $k$. If $X_{K}$ is quasiprojective over $K$ for some field extension $k \subset K$, then $X$ is quasi-projective over $k$.

Proof. By definition a morphism of schemes $g: Y \rightarrow T$ is quasi-projective if it is locally of finite type, quasi-compact, and there exists a $g$-ample invertible sheaf on $Y$. Let $k \subset K$ be a field extension such that $X_{K}$ is quasi-projective over $K$. Let $\operatorname{Spec}(A) \subset X$ be an affine open. Then $U_{K}$ is an affine open subscheme of $X_{K}$, hence $A_{K}$ is a $K$-algebra of finite type. Then $A$ is a $k$-algebra of finite type by Algebra, Lemma 10.125.1. Hence $X \rightarrow \operatorname{Spec}(k)$ is locally of finite type. Since $X_{K} \rightarrow \operatorname{Spec}(K)$ is quasi-compact, we see that $X_{K}$ is quasi-compact, hence $X$ is quasi-compact, hence $X \rightarrow \operatorname{Spec}(k)$ is of finite type. By Morphisms, Lemma 28.39.4 we see that $X_{K}$ has an ample invertible sheaf. Then $X$ has an ample invertible sheaf by Lemma 32.13.1. Hence $X \rightarrow \operatorname{Spec}(k)$ is quasi-projective by Morphisms, Lemma 28.39.4.

The following lemma is a special case of Descent, Lemma 34.19.12.
0BDF Lemma 32.13.4. Let $k$ be a field. Let $X$ be a scheme over $k$. If $X_{K}$ is proper over $K$ for some field extension $k \subset K$, then $X$ is proper over $k$.

Proof. Let $k \subset K$ be a field extension such that $X_{K}$ is proper over $K$. Recall that this implies $X_{K}$ is separated and quasi-compact (Morphisms, Definition 28.41.1). The morphism $X_{K} \rightarrow X$ is surjective. Hence $X$ is quasi-compact as the image of a quasi-compact scheme (Properties, Definition 27.26.1). Since $X_{K}$ is separated we see that $X$ is quasi-separated: If $U, V \subset X$ are affine open, then $(U \cap V)_{K}=U_{K} \cap V_{K}$ is quasi-compact and $(U \cap V)_{K} \rightarrow U \cap V$ is surjective. Thus Schemes, Lemma 25.21.7 applies.

Write $K=$ colim $A_{i}$ as the colimit of the subalgebras of $K$ which are of finite type over $k$. Denote $X_{i}=X \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(A_{i}\right)$. By Limits, Lemma 31.12.4 there exists an $i$ such that $X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ is proper. Here we use that $X$ is quasi-compact and quasi-separated as just shown. Choose a maximal ideal $\mathfrak{m} \subset A_{i}$. By the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1) the residue field $k^{\prime}=A_{i} / \mathfrak{m}$ is a finite extension of $k$. The base change $X_{k^{\prime}} \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ is proper (Morphisms, Lemma 28.41.5). Since $k \subset k^{\prime}$ is finite both $X_{k^{\prime}} \rightarrow X$ and the composition $X_{k^{\prime}} \rightarrow$ $\operatorname{Spec}(k)$ are proper as well (Morphisms, Lemmas 28.43.10, 28.41.5, and 28.41.4. The first implies that $X$ is separated over $k$ as $X_{k^{\prime}}$ is separated (Morphisms, Lemma $28.41 .11)$. The second implies that $X \rightarrow \operatorname{Spec}(k)$ is proper by Morphisms, Lemma 28.41 .8

0BDG Lemma 32.13.5. Let $k$ be a field. Let $X$ be a scheme over $k$. If $X_{K}$ is projective over $K$ for some field extension $k \subset K$, then $X$ is projective over $k$.

Proof. A scheme over $k$ is projective over $k$ if and only if it is quasi-projective and proper over $k$. See Morphisms, Lemma 28.42.14. Thus the lemma follows from Lemmas 32.13.3 and 32.13.4.

### 32.14. Tangent spaces

0B28 In this section we define the tangent space of a morphism of schemes at a point of the source using points with values in dual numbers.

0B29 Definition 32.14.1. For any ring $R$ the dual numbers over $R$ is the $R$-algebra denoted $R[\epsilon]$. As an $R$-module it is free with basis $1, \epsilon$ and the $R$-algebra structure comes from setting $\epsilon^{2}=0$.
Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s=f(x)$ in $S$. Consider the solid commutative diagram

with the curved arrow being the canonical morphism of $\operatorname{Spec}(\kappa(x))$ into $X$.
0B2B Lemma 32.14.2. The set of dotted arrows making 32.14.1.1) commute has a canonical $\kappa(x)$-vector space structure.

Proof. Set $\kappa=\kappa(x)$. Observe that we have a pushout in the category of schemes

$$
\operatorname{Spec}(\kappa[\epsilon]) \amalg_{\operatorname{Spec}(\kappa)} \operatorname{Spec}(\kappa[\epsilon])=\operatorname{Spec}\left(\kappa\left[\epsilon_{1}, \epsilon_{2}\right]\right)
$$

where $\kappa\left[\epsilon_{1}, \epsilon_{2}\right]$ is the $\kappa$-algebra with basis $1, \epsilon_{1}, \epsilon_{2}$ and $\epsilon_{1}^{2}=\epsilon_{1} \epsilon_{2}=\epsilon_{2}^{2}=0$. This follows immediately from the corresponding result for rings and the description of morphisms from spectra of local rings to schemes in Schemes, Lemma 25.13.1, Given two arrows $\theta_{1}, \theta_{2}: \operatorname{Spec}(\kappa[\epsilon]) \rightarrow X$ we can consider the morphism

$$
\theta_{1}+\theta_{2}: \operatorname{Spec}(\kappa[\epsilon]) \rightarrow \operatorname{Spec}\left(\kappa\left[\epsilon_{1}, \epsilon_{2}\right]\right) \xrightarrow{\theta_{1}, \theta_{2}} X
$$

where the first arrow is given by $\epsilon_{i} \mapsto \epsilon$. On the other hand, given $\lambda \in \kappa$ there is a self map of $\operatorname{Spec}(\kappa[\epsilon])$ corresponding to the $\kappa$-algebra endomorphism of $\kappa[\epsilon]$ which sends $\epsilon$ to $\lambda \epsilon$. Precomposing $\theta: \operatorname{Spec}(\kappa[\epsilon]) \rightarrow X$ by this selfmap gives $\lambda \theta$. The reader can verify the axioms of a vector space by verifying the existence of suitable commutative diagrams of schemes. We omit the details. (An alternative proof would be to express everything in terms of local rings and then verify the vector space axioms on the level of ring maps.)

0B2C Definition 32.14.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. The set of dotted arrows making (32.14.1.1) commute with its canonical $\kappa(x)$-vector space structure is called the tangent space of $X$ over $S$ and we denote it $T_{X / S, x}$. An element of this space is called a tangent vector of $X / S$ at $x$.

Since tangent vectors at $x \in X$ live in the scheme theoretic fibre $X_{s}$ of $f: X \rightarrow S$ over $s=f(x)$, we get a canonical identification
0BEA

$$
\begin{equation*}
T_{X / S, x}=T_{X_{s} / s, x} \tag{32.14.3.1}
\end{equation*}
$$

This pleasing definition involving the functor of points has the following algebraic description, which suggests defining the cotangent space of $X$ over $S$ at $x$ as the $\kappa(x)$-vector space

$$
T_{X / S, x}^{*}=\Omega_{X / S, x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

simply because it is canonically $\kappa(x)$-dual to the tangent space of $X$ over $S$ at $x$.
0B2D Lemma 32.14.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. There is a canonical isomorphism

$$
T_{X / S, x}=\operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\Omega_{X / S, x}, \kappa(x)\right)
$$

of vector spaces over $\kappa(x)$.
Proof. Set $\kappa=\kappa(x)$. Given $\theta \in T_{X / S, x}$ we obtain a map

$$
\theta^{*} \Omega_{X / S} \rightarrow \Omega_{\operatorname{Spec}(\kappa[\epsilon]) / \operatorname{Spec}(\kappa(s))} \rightarrow \Omega_{\operatorname{Spec}(\kappa[\epsilon]) / \operatorname{Spec}(\kappa)}
$$

Taking sections we obtain an $\mathcal{O}_{X, x}$-linear map $\xi_{\theta}: \Omega_{X / S, x} \rightarrow \kappa \mathrm{~d} \epsilon$, i.e., an element of the right hand side of the formula of the lemma. To show that $\theta \mapsto \xi_{\theta}$ is an isomorphism we can replace $S$ by $s$ and $X$ by the scheme theoretic fibre $X_{s}$. Indeed, both sides of the formula only depend on the scheme theoretic fibre; this is clear for $T_{X / S, x}$ and for the RHS see Morphisms, Lemma 28.33.10. We may also replace $X$ by the spectrum of $\mathcal{O}_{X, x}$ as this does not change $T_{X / S, x}$ (Schemes, Lemma 25.13.1) nor $\Omega_{X / S, x}$ (Modules, Lemma 17.24.7.
Let $(A, \mathfrak{m}, \kappa)$ be a local ring over a field $k$. To finish the proof we have to show that any $A$-linear map $\xi: \Omega_{A / k} \rightarrow \kappa$ comes from a unique $k$-algebra map $\varphi: A \rightarrow \kappa[\epsilon]$ agreeing with the canonical map $c: A \rightarrow \kappa$ modulo $\epsilon$. Write $\varphi(a)=c(a)+D(a) \epsilon$
the reader sees that $a \mapsto D(a)$ is a $k$-derivation. Using the universal property of $\Omega_{A / k}$ we see that each $D$ corresponds to a unique $\xi$ and vice versa. This finishes the proof.

0B2E Lemma 32.14.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point and let $s=f(x) \in S$. Assume that $\kappa(x)=\kappa(s)$. Then there are canonical isomorphisms

$$
\mathfrak{m}_{x} /\left(\mathfrak{m}_{x}^{2}+\mathfrak{m}_{s} \mathcal{O}_{X, x}\right)=\Omega_{X / S, x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

and

$$
T_{X / S, x}=\operatorname{Hom}_{\kappa(x)}\left(\mathfrak{m}_{x} /\left(\mathfrak{m}_{x}^{2}+\mathfrak{m}_{s} \mathcal{O}_{X, x}\right), \kappa(x)\right)
$$

This works more generally if $\kappa(x) / \kappa(s)$ is a separable algebraic extension.
Proof. The second isomorphism follows from the first by Lemma 32.14.4 For the first, we can replace $S$ by $s$ and $X$ by $X_{s}$, see Morphisms, Lemma 28.33.10. We may also replace $X$ by the spectrum of $\mathcal{O}_{X, x}$, see Modules, Lemma 17.24.7. Thus we have to show the following algebra fact: let $(A, \mathfrak{m}, \kappa)$ be a local ring over a field $k$ such that $\kappa / k$ is separable algebraic. Then the canonical map

$$
\mathfrak{m} / \mathfrak{m}^{2} \longrightarrow \Omega_{A / k} \otimes \kappa
$$

is an isomorphism. Observe that $\mathfrak{m} / \mathfrak{m}^{2}=H_{1}\left(N L_{\kappa / A}\right)$. By Algebra, Lemma 10.132 .4 it suffices to show that $\Omega_{\kappa / k}=0$ and $H_{1}\left(N L_{\kappa / k}\right)=0$. Since $\kappa$ is the union of its finite separable extensions in $k$ it suffices to prove this when $\kappa$ is a finite separable extension of $k$ (Algebra, Lemma 10.132.9). In this case the ring map $k \rightarrow \kappa$ is étale and hence $N L_{\kappa / k}=0$ (more or less by definition, see Algebra, Section 10.141.

0B2F Lemma 32.14.6. Let $f: X \rightarrow Y$ be a morphism of schemes over a base scheme S. Let $x \in X$ be a point. Set $y=f(x)$. If $\kappa(y)=\kappa(x)$, then $f$ induces a natural linear map

$$
d f: T_{X / S, x} \longrightarrow T_{Y / S, y} .
$$

which is dual to the linear map $\Omega_{Y / S, y} \otimes \kappa(y) \rightarrow \Omega_{X / S, \kappa(x)}$ via the indentifications of Lemma 32.14.4.

Proof. Omitted.
0BEB Lemma 32.14.7. Let $X, Y$ be schemes over a base $S$. Let $x \in X$ and $y \in Y$ with the same image point $s \in S$ such that $\kappa(s)=\kappa(x)$ and $\kappa(s)=\kappa(y)$. There is a canonical isomorphism

$$
T_{X \times_{S} Y / S,(x, y)}=T_{X / S, x} \oplus T_{Y / S, y}
$$

The map from left to right is induced by the maps on tangent spaces coming from the projections $X \times_{S} Y \rightarrow X$ and $X \times_{S} Y \rightarrow Y$. The map from right to left is induced by the maps $1 \times y: X_{s} \rightarrow X_{s} \times_{s} Y_{s}$ and $x \times 1: Y_{s} \rightarrow X_{s} \times_{s} Y_{s}$ via the indentification 32.14.3.1) of tangent spaces with tangent spaces of fibres.
Proof. The direct sum decomposition follows from Morphisms, Lemma 28.33 .11 via Lemma 32.14.5. Compatibility with the maps comes from Lemma 32.14.6.

0B2G Lemma 32.14.8. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over a base scheme $S$. Let $x \in X$ be a point. Set $y=f(x)$ and assume that $\kappa(y)=\kappa(x)$. Then the following are equivalent
(1) $d f: T_{X / S, x} \longrightarrow T_{Y / S, y}$ is injective, and
(2) $f$ is unramified at $x$.

Proof. The morphism $f$ is locally of finite type by Morphisms, Lemma 28.15.8. The map $\mathrm{d} f$ is injective, if and only if $\Omega_{Y / S, y} \otimes \kappa(y) \rightarrow \Omega_{X / S, x} \otimes \kappa(x)$ is surjective (Lemma 32.14.6). The exact sequence $f^{*} \Omega_{Y / S} \rightarrow \Omega_{X / S} \rightarrow \Omega_{X / Y} \rightarrow 0$ (Morphisms, Lemma 28.33.9) then shows that this happens if and only if $\Omega_{X / Y, x} \otimes \kappa(x)=0$. Hence the result by Morphisms, Lemma 28.35.14.

### 32.15. Generically finite morphisms

0AB5 In this section we revisit the notion of a generically finite morphism of schemes as studied in Morphisms, Section 28.47 .
0AB6 Lemma 32.15.1. Let $f: X \rightarrow Y$ be locally of finite type. Let $y \in Y$ be a point such that $\mathcal{O}_{Y, y}$ is Noetherian of dimension $\leq 1$. Assume in addition one of the following conditions is satisfied
(1) for every generic point $\eta$ of an irreducible component of $X$ the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),
(2) for every generic point $\eta$ of an irreducible component of $X$ such that $f(\eta) \rightsquigarrow y$ the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),
(3) $f$ is quasi-finite at every generic point of an irreducible component of $X$,
(4) $Y$ is locally Noetherian and $f$ is quasi-finite at a dense set of points of $X$, (5) add more here.

Then $f$ is quasi-finite at every point of $X$ lying over $y$.
Proof. Condition (4) implies $X$ is locally Noetherian (Morphisms, Lemma 28.15.6). The set of points at which morphism is quasi-finite is open (Morphisms, Lemma 28.50 .2 . A dense open of a locally Noetherian scheme contains all generic point of irreducible components, hence (4) implies (3). Condition (3) implies condition (1) by Morphisms, Lemma 28.20.5. Condition (1) implies condition (2). Thus it suffices to prove the lemma in case (2) holds.

Assume (2) holds. Recall that $\operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ is the set of points of $Y$ specializing to $y$, see Schemes, Lemma 25.13.2. Combined with Morphisms, Lemma 28.20.13 this shows we may replace $Y$ by $\operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$. Thus we may assume $Y=\operatorname{Spec}(B)$ where $B$ is a Noetherian local ring of dimension $\leq 1$ and $y$ is the closed point.
Let $X=\bigcup X_{i}$ be the irreducible components of $X$ viewed as reduced closed subschemes. If we can show each fibre $X_{i, y}$ is a discrete space, then $X_{y}=\bigcup X_{i, y}$ is discrete as well and we conclude that $X \rightarrow Y$ is quasi-finite at all points of $X_{y}$ by Morphisms, Lemma 28.20.6. Thus we may assume $X$ is an integral scheme.
If $X \rightarrow Y$ maps the generic point $\eta$ of $X$ to $y$, then $X$ is the spectrum of a finite extension of $\kappa(y)$ and the result is true. Assume that $X$ maps $\eta$ to a point corresponding to a minimal prime $\mathfrak{q}$ of $B$ different from $\mathfrak{m}_{B}$. We obtain a factorization $X \rightarrow \operatorname{Spec}(B / \mathfrak{q}) \rightarrow \operatorname{Spec}(B)$. Let $x \in X$ be a point lying over $y$. By the dimension formula (Morphisms, Lemma 28.30.1) we have

$$
\operatorname{dim}\left(\mathcal{O}_{X, x}\right) \leq \operatorname{dim}(B / \mathfrak{q})+\operatorname{trdeg}_{\kappa(\mathfrak{q})}(R(X))-\operatorname{trdeg}_{\kappa(y)} \kappa(x)
$$

We know that $\operatorname{dim}(B / \mathfrak{q})=1$, that the generic point of $X$ is not equal to $x$ and specializes to $x$ and that $R(X)$ is algebraic over $\kappa(\mathfrak{q})$. Thus we get

$$
1 \leq 1-\operatorname{trdeg}_{\kappa(y)} \kappa(x)
$$

Hence every point $x$ of $X_{y}$ is closed in $X_{y}$ by Morphisms, Lemma 28.20.2 and hence $X \rightarrow Y$ is quasi-finite at every point $x$ of $X_{y}$ by Morphisms, Lemma 28.20.6 (which also implies that $X_{y}$ is a discrete topological space).

0AB7 Lemma 32.15.2. Let $f: X \rightarrow Y$ be a proper morphism. Let $y \in Y$ be a point such that $\mathcal{O}_{Y, y}$ is Noetherian of dimension $\leq 1$. Assume in addition one of the following conditions is satisfied
(1) for every generic point $\eta$ of an irreducible component of $X$ the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),
(2) for every generic point $\eta$ of an irreducible component of $X$ such that $f(\eta) \rightsquigarrow y$ the field extension $\kappa(\eta) \supset \kappa(f(\eta))$ is finite (or algebraic),
(3) $f$ is quasi-finite at every generic point of $X$,
(4) $Y$ is locally Noetherian and $f$ is quasi-finite at a dense set of points of $X$, (5) add more here.

Then there exists an open neighbourhood $V \subset Y$ of $y$ such that $f^{-1}(V) \rightarrow V$ is finite.

Proof. By Lemma 32.15 .1 the morphism $f$ is quasi-finite at every point of the fibre $X_{y}$. Hence $X_{y}$ is a discrete topological space (Morphisms, Lemma 28.20.6). As $f$ is proper the fibre $X_{y}$ is quasi-compact, i.e., finite. Thus we can apply Cohomology of Schemes, Lemma 29.20.2 to conclude.

0BFP Lemma 32.15.3. Let $X$ be a Noetherian scheme. Let $f: Y \rightarrow X$ be a birational proper morphism of algebraic spaces with $Y$ reduced. Let $U \subset X$ be the maximal open over which $f$ is an isomorphism. Then $U$ contains
(1) every point of codimension 0 in $X$,
(2) every $x \in X$ of codimension 1 on $X$ such that $\mathcal{O}_{X, x}$ is a discrete valuation ring, and
(3) every $x \in X$ such that the fibre of $Y \rightarrow X$ over $x$ is finite and such that $\mathcal{O}_{X, x}$ is normal.
Proof. Part (1) follows from Morphisms, Lemma 28.47.6. Part (2) follows from part (3) and Lemma 32.15 .2 (and the fact that finite morphisms have finite fibres). Let $x \in X$ be as in (3). By Cohomology of Schemes, Lemma 29.20 .2 we may assume $f$ is finite. We may assume $X$ affine. This reduces us to the case of a finite birational morphism of Noetherian affine schemes $Y \rightarrow X$ and $x \in X$ such that $\mathcal{O}_{X, x}$ is a normal domain. Since $\mathcal{O}_{X, x}$ is a domain and $X$ is Noetherian, we may replace $X$ by an affine open of $x$ which is integral. Then, since $Y \rightarrow X$ is birational and $Y$ is reduced we see that $Y$ is integral. Writing $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$ we see that $A \subset B$ is a finite inclusion of domains having the same field of fractions. If $\mathfrak{p} \subset A$ is the prime corresponding to $x$, then $A_{\mathfrak{p}}$ being normal implies that $A_{\mathfrak{p}} \subset B_{\mathfrak{p}}$ is an equality. Since $B$ is a finite $A$-module, we see there exists an $a \in A, a \notin \mathfrak{p}$ such that $A_{a} \rightarrow B_{a}$ is an isomorphism and the proof is complete.

### 32.16. Dimension of fibres

0B2H We have already seen that dimension of fibres of finite type morphisms typically jump up. In this section we discuss the phenomenon that in codimension 1 this does not happen. More generally, we discuss how much the dimension of a fibre can jump. Here is a list of related results:
(1) For a finite type morphism $X \rightarrow S$ the set of $x \in X$ with $\operatorname{dim}_{x}\left(X_{f(x)}\right) \leq d$ is open, see Algebra, Lemma 10.124 .6 and Morphisms, Lemma 28.28 .4 .
(2) We have the dimension formula, see Algebra, Lemma 10.112.1 and Morphisms, Lemma 28.30.1.
(3) Constant fibre dimension for an integral finite type scheme dominating a valuation ring, see Algebra, Lemma 10.124.9.
(4) If $X \rightarrow S$ is of finite type and is quasi-finite at every generic point of $X$, then $X \rightarrow S$ is quasi-finite in codimension 1, see Algebra, Lemma 10.112.2 and Lemma 32.15.1
The last result mentioned above generalizes as follows.
0B2I Lemma 32.16.1. Let $f: X \rightarrow Y$ be locally of finite type. Let $x \in X$ be a point with image $y \in Y$ such that $\mathcal{O}_{Y, y}$ is Noetherian of dimension $\leq 1$. Let $d \geq 0$ be an integer such that for every generic point $\eta$ of an irreducible component of $X$ which contains $x$, we have $\operatorname{dim}_{\eta}\left(X_{f(\eta)}\right)=d$. Then $\operatorname{dim}_{x}\left(X_{y}\right)=d$.
Proof. Recall that $\operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ is the set of points of $Y$ specializing to $y$, see Schemes, Lemma 25.13.2 Thus we may replace $Y$ by $\operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ and assume $Y=\operatorname{Spec}(B)$ where $B$ is a Noetherian local ring of dimension $\leq 1$ and $y$ is the closed point. We may also replace $X$ by an affine neighbourhood of $x$.
Let $X=\bigcup X_{i}$ be the irreducible components of $X$ viewed as reduced closed subschemes. If we can show each fibre $X_{i, y}$ has dimension $d$, then $X_{y}=\bigcup X_{i, y}$ has dimension $d$ as well. Thus we may assume $X$ is an integral scheme.
If $X \rightarrow Y$ maps the generic point $\eta$ of $X$ to $y$, then $X$ is a scheme over $\kappa(y)$ and the result is true by assumption. Assume that $X$ maps $\eta$ to a point $\xi \in Y$ corresponding to a minimal prime $\mathfrak{q}$ of $B$ different from $\mathfrak{m}_{B}$. We obtain a factorization $X \rightarrow$ $\operatorname{Spec}(B / \mathfrak{q}) \rightarrow \operatorname{Spec}(B)$. By the dimension formula (Morphisms, Lemma 28.30.1) we have

$$
\operatorname{dim}\left(\mathcal{O}_{X, x}\right)+\operatorname{trdeg}_{\kappa(y)} \kappa(x) \leq \operatorname{dim}(B / \mathfrak{q})+\operatorname{trdeg}_{\kappa(\mathfrak{q})}(R(X))
$$

We have $\operatorname{dim}(B / \mathfrak{q})=1$. We have $\operatorname{trdeg}_{\kappa(\mathfrak{q})}(R(X))=d$ by our assumption that $\operatorname{dim}_{\eta}\left(X_{\xi}\right)=d$, see Morphisms, Lemma 28.28.1. Since $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X_{s}, x}$ has a kernel (as $\eta \mapsto \xi \neq y$ ) and since $\mathcal{O}_{X, x}$ is a Noetherian domain we see that $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)>$ $\operatorname{dim}\left(\mathcal{O}_{X_{y}, x}\right)$. We conclude that

$$
\operatorname{dim}_{x}\left(X_{s}\right)=\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)+\operatorname{trdeg}_{\kappa(y)} \kappa(x) \leq d
$$

(Morphisms, Lemma 28.28.1). On the other hand, we have $\operatorname{dim}_{x}\left(X_{s}\right) \geq \operatorname{dim}_{\eta}\left(X_{f(\eta)}\right)=$ $d$ by Morphisms, Lemma 28.28.4

0B2J Lemma 32.16.2. Let $f: X \rightarrow \operatorname{Spec}(R)$ be a morphism from an integral scheme to the spectrum of a valuation ring. If $f$ is locally of finite type and surjective, then the special fibre is equidimensional of dimension equal to the dimension of the generic fibre.
Proof. This is a reformulation of Algebra, Lemma 10.124.9.
The following lemma generalizes Lemma 32.16.1.
0B2K Lemma 32.16.3. Let $f: X \rightarrow Y$ be locally of finite type. Let $x \in X$ be a point with image $y \in Y$ such that $\mathcal{O}_{Y, y}$ is Noetherian. Let $d \geq 0$ be an integer such that for every generic point $\eta$ of an irreducible component of $X$ which contains $x$, we have $f(\eta) \neq y$ and $\operatorname{dim}_{\eta}\left(X_{f(\eta)}\right)=d$. Then $\operatorname{dim}_{x}\left(X_{y}\right) \leq d+\operatorname{dim}\left(\mathcal{O}_{Y, y}\right)-1$.

Proof. Exactly as in the proof of Lemma 32.16.1 we reduce to the case $X=$ $\operatorname{Spec}(A)$ with $A$ a doman and $Y=\operatorname{Spec}(B)$ where $B$ is a Noetherian local ring whose maximal ideal corresponds to $y$. After replacing $B$ by $B / \operatorname{Ker}(B \rightarrow A)$ we may assume that $B$ is a domain and that $B \subset A$. Then we use the dimension formula (Morphisms, Lemma 28.30.1) to get

$$
\operatorname{dim}\left(\mathcal{O}_{X, x}\right)+\operatorname{trdeg}_{\kappa(y)} \kappa(x) \leq \operatorname{dim}(B)+\operatorname{trdeg}_{f . f .(B)} f . f .(A)
$$

We have $\operatorname{trdeg}_{f . f .(B)} f . f .(A)=d$ by our assumption that $\operatorname{dim}_{\eta}\left(X_{\xi}\right)=d$, see Morphisms, Lemma 28.28.1. Since $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X_{s}, x}$ has a kernel (as $f(\eta) \neq y$ ) and since $\mathcal{O}_{X, x}$ is a Noetherian domain we see that $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)>\operatorname{dim}\left(\mathcal{O}_{X_{y}, x}\right)$. We conclude that

$$
\operatorname{dim}_{x}\left(X_{s}\right)=\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)+\operatorname{trdeg}_{\kappa(y)} \kappa(x)<\operatorname{dim}(B)+d
$$

(equality by Morphisms, Lemma 28.28.1) which proves what we want.

### 32.17. Algebraic schemes

06LF The following definition is taken from [DG67, I Definition 6.4.1].
06LG Definition 32.17.1. Let $k$ be a field. An algebraic $k$-scheme is a scheme $X$ over $k$ such that the structure morphism $X \rightarrow \operatorname{Spec}(k)$ is of finite type. A locally algebraic $k$-scheme is a scheme $X$ over $k$ such that the structure morphism $X \rightarrow \operatorname{Spec}(k)$ is locally of finite type.

Note that every (locally) algebraic $k$-scheme is (locally) Noetherian, see Morphisms, Lemma 28.15.6. The category of algebraic $k$-schemes has all products and fibre products (unlike the category of varieties over $k$ ). Similarly for the category of locally algebraic $k$-schemes.

06LH Lemma 32.17.2. Let $k$ be a field. Let $X$ be a locally algebraic $k$-scheme of dimension 0. Then $X$ is a disjoint union of spectra of local Artinian $k$-algebras $A$ with $\operatorname{dim}_{k}(A)<\infty$. If $X$ is an algebraic $k$-scheme of dimension 0 , then in addition $X$ is affine and the morphism $X \rightarrow \operatorname{Spec}(k)$ is finite.

Proof. Let $X$ be a locally algebraic $k$-scheme of dimension 0 . Let $U=\operatorname{Spec}(A) \subset$ $X$ be an affine open subscheme. Since $\operatorname{dim}(X)=0$ we see that $\operatorname{dim}(A)=0$. By Noether normalization, see Algebra, Lemma 10.114 .4 we see that there exists a finite injection $k \rightarrow A$, i.e., $\operatorname{dim}_{k}(A)<\infty$. Hence $A$ is Artinian, see Algebra, Lemma 10.52.2. This implies that $A=A_{1} \times \ldots \times A_{r}$ is a product of finitely many Artinian local rings, see Algebra, Lemma 10.52.6. Of course $\operatorname{dim}_{k}\left(A_{i}\right)<\infty$ for each $i$ as the sum of these dimensions equals $\operatorname{dim}_{k}(A)$.
The arguments above show that $X$ has an open covering whose members are finite discrete topological spaces. Hence $X$ is a discrete topological space. It follows that $X$ is isomorphic to the disjoint union of its connected components each of which is a singleton. Since a singleton scheme is affine we conclude (by the results of the paragraph above) that each of these singletons is the spectrum of a local Artinian $k$-algebra $A$ with $\operatorname{dim}_{k}(A)<\infty$.

Finally, if $X$ is an algebraic $k$-scheme of dimension 0 , then $X$ is quasi-compact hence is a finite disjoint union $X=\operatorname{Spec}\left(A_{1}\right) \amalg \ldots \amalg \operatorname{Spec}\left(A_{r}\right)$ hence affine (see Schemes, Lemma 25.6.8) and we have seen the finiteness of $X \rightarrow \operatorname{Spec}(k)$ in the first paragraph of the proof.

The following lemma collects some statements on dimension theory for locally algebraic schemes.

0A21 Lemma 32.17.3. Let $k$ be a field. Let $X$ be a locally algebraic $k$-scheme.
(1) The topological space of $X$ is catenary (Topology, Definition 5.10.4).
(2) For $x \in X$ closed, we have $\operatorname{dim}_{x}(X)=\operatorname{dim}\left(\mathcal{O}_{X, x}\right)$.
(3) For $X$ irreducible we have $\operatorname{dim}(X)=\operatorname{dim}(U)$ for any nonempty open $U \subset X$ and $\operatorname{dim}(X)=\operatorname{dim}_{x}(X)$ for any $x \in X$
(4) For $X$ irreducible any chain of irreducible closed subsets can be extended to a maximal chain and all maximal chains of irreducible closed subsets have length equal to $\operatorname{dim}(X)$.
(5) For $x \in X$ we have $\operatorname{dim}_{x}(X)=\max \operatorname{dim}(Z)=\min \operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)$ where the maximum is over irreducible components $Z \subset X$ containing $x$ and the minimum is over specializations $x \rightsquigarrow x^{\prime}$ with $x^{\prime}$ closed in $X$.
(6) If $X$ is irreducible with generic point $x$, then $\operatorname{dim}(X)=\operatorname{trdeg}_{k}(\kappa(x))$.
(7) If $x \rightsquigarrow x^{\prime}$ is an immediate specialization of points of $X$, then we have $\operatorname{trdeg}_{k}(\kappa(x))=\operatorname{trdeg}_{k}\left(\kappa\left(x^{\prime}\right)\right)+1$.
(8) The dimension of $X$ is the supremum of the numbers $\operatorname{trdeg}_{k}(\kappa(x))$ where $x$ runs over the generic points of the irreducible components of $X$.
(9) If $x \rightsquigarrow x^{\prime}$ is a nontrivial specialization of points of $X$, then
(a) $\operatorname{dim}_{x}(X) \leq \operatorname{dim}_{x^{\prime}}(X)$,
(b) $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)<\operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)$,
(c) $\operatorname{trdeg}_{k}(\kappa(x))>\operatorname{trdeg}_{k}\left(\kappa\left(x^{\prime}\right)\right)$, and
(d) any maximal chain of nontrivial specializations $x=x_{0} \rightsquigarrow x_{1} \rightsquigarrow$ $\ldots \rightsquigarrow x_{n}=x$ has length $n=\operatorname{trdeg}_{k}(\kappa(x))-\operatorname{trdeg}_{k}\left(\kappa\left(x^{\prime}\right)\right)$.
(10) For $x \in X$ we have $\operatorname{dim}_{x}(X)=\operatorname{trdeg}_{k}(\kappa(x))+\operatorname{dim}\left(\mathcal{O}_{X, x}\right)$.
(11) If $x \rightsquigarrow x^{\prime}$ is an immediate specialization of points of $X$ and $X$ is irreducible or equidimensional, then $\operatorname{dim}\left(\mathcal{O}_{X, x^{\prime}}\right)=\operatorname{dim}\left(\mathcal{O}_{X, x}\right)+1$.

Proof. Instead on relying on the more general results proved earlier we will reduce the statements to the corresponding statements for finite type $k$-algebras and cite results from the chapter on commutative algebra.

Proof of (11). This is local on $X$ by Topology, Lemma 5.10.5. Thus we may assume $X=\operatorname{Spec}(A)$ where $A$ is a finite type $k$-algebra. We have to show that $A$ is catenary (Algebra, Lemma 10.104.2). We can reduce to $k\left[x_{1}, \ldots, x_{n}\right]$ using Algebra, Lemma 10.104.6 and then apply Algebra, Lemma 10.113 .3 . Alternatively, this holds because $k$ is Cohen-Macaulay (trivially) and Cohen-Macaulay rings are universally catenary (Algebra, Lemma 10.104.8).

Proof of (2). Choose an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$. Then $\operatorname{dim}_{x}(X)=$ $\operatorname{dim}_{x}(U)$. Hence we reduce to the affine case, which is Algebra, Lemma 10.113.6.

Proof of (3). It suffices to show that any two nonempty affine opens $U, U^{\prime} \subset X$ have the same dimension (any finite chain of irreducible subsets meets an affine open). Pick a closed point $x$ of $X$ with $x \in U \cap U^{\prime}$. This is possible because $X$ is irreducible, hence $U \cap U^{\prime}$ is nonempty, hence there is such a closed point because $X$ is Jacobson by Lemma 32.12.1. Then $\operatorname{dim}(U)=\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=\operatorname{dim}\left(U^{\prime}\right)$ by Algebra, Lemma 10.113 .4 (stricly speaking you have to replace $X$ by its reduction before applying the lemma).

Proof of (4). Given a chain of irreducible closed subsets we can find an affine open $U \subset X$ which meets the smallest one. Thus the statement follows from Algebra, Lemma 10.113.4 and $\operatorname{dim}(U)=\operatorname{dim}(X)$ which we have seen in (3).
Proof of (5). Choose an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$. Then $\operatorname{dim}_{x}(X)=$ $\operatorname{dim}_{x}(U)$. The rule $Z \mapsto Z \cap U$ is a bijection between irreducible components of $X$ passing through $x$ and irreducible components of $U$ passing through $x$. Also, $\operatorname{dim}(Z \cap U)=\operatorname{dim}(Z)$ for such $Z$ by (3). Hence the statement follows from Algebra, Lemma 10.113.5
Proof of (6). By (3) this reduces to the case where $X=\operatorname{Spec}(A)$ is affine. In this case it follows from Algebra, Lemma 10.115.1 applied to $A_{\text {red }}$.
Proof of (7). Let $Z=\overline{\{x\}} \supset Z^{\prime}=\overline{\left\{x^{\prime}\right\}}$. Then it follows from (4) that $Z \supset Z^{\prime}$ is the start of a maximal chain of irreducible closed subschemes in $Z$ and consequently $\operatorname{dim}(Z)=\operatorname{dim}\left(Z^{\prime}\right)+1$. We conclude by (6).
Proof of (8). A simple topological argument shows that $\operatorname{dim}(X)=\sup \operatorname{dim}(Z)$ where the supremum is over the irreducible components of $X$ (hint: use Topology, Lemma 5.7.3). Thus this follows from (6).
Proof of (9). Part (a) follows from the fact that any open $U \subset X$ containing $x^{\prime}$ also contains $x$. Part (b) follows because $\mathcal{O}_{X, x}$ is a localization of $\mathcal{O}_{X, x^{\prime}}$ hence any chain of primes in $\mathcal{O}_{X, x}$ corresponds to a chain of primes in $\mathcal{O}_{X, x^{\prime}}$ which can be extended by adding $\mathfrak{m}_{x^{\prime}}$ at the end. Both (c) and (d) follow formally from 77 .
Proof of (10). Choose an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$. Then $\operatorname{dim}_{x}(X)=$ $\operatorname{dim}_{x}(U)$. Hence we reduce to the affine case, which is Algebra, Lemma 10.115.3.
Proof of (11). If $X$ is equidimensional (Topology, Definition 5.9.5) then $\operatorname{dim}(X)$ is equal to the dimension of every irreducible component of $X$, whence $\operatorname{dim}_{x}(X)=$ $\operatorname{dim}(X)=\operatorname{dim}_{x^{\prime}}(X)$ by (5). Thus this follows from (7).
0B2L Lemma 32.17.4. Let $k$ be a field. Let $f: X \rightarrow Y$ be a morphism of locally algebraic $k$-schemes.
(1) For $y \in Y$, the fibre $X_{y}$ is a locally algebraic scheme over $\kappa(y)$ hence all the results of Lemma 32.17.3 apply.
(2) Assume $X$ is irreducible. Set $Z=\overline{f(X)}$ and $d=\operatorname{dim}(X)-\operatorname{dim}(Z)$. Then
(a) $\operatorname{dim}_{x}\left(X_{f(x)}\right) \geq d$ for all $x \in X$,
(b) the set of $x \in X$ with $\operatorname{dim}_{x}\left(X_{f(x)}\right)=d$ is dense open,
(c) if $\operatorname{dim}\left(\mathcal{O}_{Z, f(x)}\right) \geq 1$, then $\operatorname{dim}_{x}\left(X_{f(x)}\right) \leq d+\operatorname{dim}\left(\mathcal{O}_{Z, f(x)}\right)-1$,
(d) if $\operatorname{dim}\left(\mathcal{O}_{Z, f(x)}\right)=1$, then $\operatorname{dim}_{x}\left(X_{f(x)}\right)=d$,
(3) For $x \in X$ with $y=f(x)$ we have $\operatorname{dim}_{x}\left(X_{y}\right) \geq \operatorname{dim}_{x}(X)-\operatorname{dim}_{y}(Y)$.

Proof. The morphism $f$ is locally of finite type by Morphisms, Lemma 28.15.8. Hence the base change $X_{y} \rightarrow \operatorname{Spec}(\kappa(y))$ is locally of finite type. This proves (1). In the rest of the proof we will freely use the results of Lemma 32.17.3 for $X, Y$, and the fibres of $f$.
Proof of (2). Let $\eta \in X$ be the generic point and set $\xi=f(\eta)$. Then $Z=\overline{\{\xi\}}$. Hence

$$
d=\operatorname{dim}(X)-\operatorname{dim}(Z)=\operatorname{trdeg}_{k} \kappa(\eta)-\operatorname{trdeg}_{k} \kappa(\xi)=\operatorname{trdeg}_{\kappa(\xi)} \kappa(\eta)=\operatorname{dim}_{\eta}\left(X_{\xi}\right)
$$

Thus parts (2)(a) and (2)(b) follow from Morphisms, Lemma 28.28.4. Parts (2)(c) and $(2)(\mathrm{d})$ follow from Lemmas 32.16 .3 and 32.16 .1 .

Proof of (3). Let $x \in X$. Let $X^{\prime} \subset X$ be a irreducible component of $X$ passing through $x$ of dimension $\operatorname{dim}_{x}(X)$. Then (2) implies that $\operatorname{dim}_{x}\left(X_{y}\right) \geq \operatorname{dim}\left(X^{\prime}\right)-$ $\operatorname{dim}\left(Z^{\prime}\right)$ where $Z^{\prime} \subset Y$ is the closure of the image of $X^{\prime}$. This proves (3).

0B2M Lemma 32.17.5. Let $k$ be a field. Let $X, Y$ be locally algebraic $k$-schemes.
(1) For $z \in X \times Y$ lying over $(x, y)$ we have $\operatorname{dim}_{z}(X \times Y)=\operatorname{dim}_{x}(X)+$ $\operatorname{dim}_{y}(Y)$.
(2) We have $\operatorname{dim}(X \times Y)=\operatorname{dim}(X)+\operatorname{dim}(Y)$.

Proof. Proof of (1). Consider the factorization

$$
X \times Y \longrightarrow Y \longrightarrow \operatorname{Spec}(k)
$$

of the structure morphism. The first morphism $p: X \times Y \rightarrow Y$ is flat as a base change of the flat morphism $X \rightarrow \operatorname{Spec}(k)$ by Morphisms, Lemma 28.25.7. Moreover, we have $\operatorname{dim}_{z}\left(p^{-1}(y)\right)=\operatorname{dim}_{x}(X)$ by Morphisms, Lemma 28.28.3. Hence $\operatorname{dim}_{z}(X \times Y)=\operatorname{dim}_{x}(X)+\operatorname{dim}_{y}(Y)$ by Morphisms, Lemma 28.28.2. Part (2) is a direct consequence of (1).

### 32.18. Global generation

0B5W Some lemmas related to global generation of quasi-coherent modules.
0B57 Lemma 32.18.1. Let $X \rightarrow \operatorname{Spec}(A)$ be a morphism of schemes. Let $A \subset A^{\prime}$ be a faithfully flat ring map. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then $\mathcal{F}$ is globally generated if and only if the base change $\mathcal{F}_{A^{\prime}}$ is globally generated.

Proof. More precisely, set $X_{A^{\prime}}=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\prime}\right)$. Let $\mathcal{F}_{A^{\prime}}=p^{*} \mathcal{F}$ where $p: X_{A^{\prime}} \rightarrow X$ is the projection. By Cohomology of Schemes, Lemma 29.5.2 we have $H^{0}\left(X_{k^{\prime}}, \mathcal{F}_{A^{\prime}}\right)=H^{0}(X, \mathcal{F}) \otimes_{A} A^{\prime}$. Thus if $s_{i}, i \in I$ are generators for $H^{0}(X, \mathcal{F})$ as an $A$-module, then their images in $H^{0}\left(X_{A^{\prime}}, \mathcal{F}_{A^{\prime}}\right)$ are generators for $H^{0}\left(X_{A^{\prime}}, \mathcal{F}_{A^{\prime}}\right)$ as an $A^{\prime}$-module. Thus we have to show that the map $\alpha: \bigoplus_{i \in I} \mathcal{O}_{X} \rightarrow \mathcal{F},\left(f_{i}\right) \mapsto \sum f_{i} s_{i}$ is surjective if and only if $p^{*} \alpha$ is surjective. This we may check over an affine open $U=\operatorname{Spec}(B)$ of $X$. Then $\left.\mathcal{F}\right|_{U}$ corresponds to a $B$-module $M$ and $\left.s_{i}\right|_{U}$ to elements $x_{i} \in M$. Thus we have to show that $\bigoplus_{i \in I} B \rightarrow M$ is surjective if and only if the base change $\bigoplus_{i \in I} B \otimes_{A} A^{\prime} \rightarrow M \otimes_{A} A^{\prime}$ is surjective. This is true because $A \rightarrow A^{\prime}$ is faithfully flat.

0B58 Lemma 32.18.2. Let $k$ be an infinite field. Let $X$ be a scheme of finite type over $k$. Let $\mathcal{L}$ be a very ample invertible sheaf on $X$. Let $n \geq 0$ and $x, x_{1}, \ldots, x_{n} \in X$ be points with $x$ a $k$-rational point, i.e., $\kappa(x)=k$, and $x \neq x_{i}$ for $i=1, \ldots, n$. Then there exists an $s \in H^{0}(X, \mathcal{L})$ which vanishes at $x$ but not at $x_{i}$.

Proof. If $n=0$ the result is trivial, hence we assume $n>0$. By definition of a very ample invertible sheaf, the lemma immediately reduces to the case where $X=\mathbf{P}_{k}^{r}$ for some $r>0$ and $\mathcal{L}=\mathcal{O}_{X}(1)$. Write $\mathbf{P}_{k}^{r}=\operatorname{Proj}\left(k\left[T_{0}, \ldots, T_{r}\right]\right)$. Set $V=H^{0}(X, \mathcal{L})=k T_{0} \oplus \ldots \oplus k T_{r}$. Since $x$ is a $k$-rational point, we see that the set $s \in V$ which vanish at $x$ is a codimension 1 subspace $W \subset V$ and that $W$ generates the homogeneous prime ideal corresponding to $x$. Since $x_{i} \neq x$ the corresponding homogeneous prime $\mathfrak{p}_{i} \subset k\left[T_{0}, \ldots, T_{r}\right]$ does not contain $W$. Since $k$ is infinite, we then see that $W \neq \bigcup W \cap \mathfrak{q}_{i}$ and the proof is complete.

0B3Z Lemma 32.18.3. Let $k$ be an infinite field. Let $X$ be an algebraic $k$-scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $V \rightarrow \Gamma(X, \mathcal{L})$ be a linear map of $k$-vector spaces whose image generates $\mathcal{L}$. Then there exists a subspace $W \subset V$ with $\operatorname{dim}_{k}(W) \leq$ $\operatorname{dim}(X)+1$ which generates $\mathcal{L}$.

Proof. Throughout the proof we will use that for every $x \in X$ the linear map

$$
\psi_{x}: V \rightarrow \Gamma(X, \mathcal{L}) \rightarrow \mathcal{L}_{x} \rightarrow \mathcal{L}_{x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

is nonzero. The proof is by induction on $\operatorname{dim}(X)$.
The base case is $\operatorname{dim}(X)=0$. In this case $X$ has finitely many points $X=$ $\left\{x_{1}, \ldots, x_{n}\right\}$ (see for example Lemma 32.17.2). Since $k$ is infinite there exists a vector $v \in V$ such that $\psi_{x_{i}}(v) \neq 0$ for all $i$. Then $W=k \cdot v$ does the job.
Assume $\operatorname{dim}(X)>0$. Let $X_{i} \subset X$ be the irreducible components of dimension equal to $\operatorname{dim}(X)$. Since $X$ is Noetherian there are only finitely many of these. For each $i$ pick a point $x_{i} \in X_{i}$. As above choose $v \in V$ such that $\psi_{x_{i}}(v) \neq 0$ for all $i$. Let $Z \subset X$ be the zero scheme of the image of $v$ in $\Gamma(X, \mathcal{L})$, see Divisors, Definition 30.11.19. By construction $\operatorname{dim}(Z)<\operatorname{dim}(X)$. By induction we can find $W \subset V$ with $\operatorname{dim}(W) \leq \operatorname{dim}(X)$ such that $W$ generates $\left.\mathcal{L}\right|_{Z}$. Then $W+k \cdot v$ generates $\mathcal{L}$.

### 32.19. Closures of products

047A Some results on the relation between closure and products.
047B Lemma 32.19.1. Let $k$ be a field. Let $X, Y$ be schemes over $k$, and let $A \subset X$, $B \subset Y$ be subsets. Set

$$
A B=\left\{z \in X \times_{k} Y \mid p r_{X}(z) \in A, p r_{Y}(z) \in B\right\} \subset X \times_{k} Y
$$

Then set theoretically we have

$$
\bar{A} \times_{k} \bar{B}=\overline{A B}
$$

Proof. The inclusion $\overline{A B} \subset \bar{A} \times_{k} \bar{B}$ is immediate. We may replace $X$ and $Y$ by the reduced closed subschemes $\bar{A}$ and $\bar{B}$. Let $W \subset X \times_{k} Y$ be a nonempty open subset. By Morphisms, Lemma 28.23 .4 the subset $U=\operatorname{pr}_{X}(W)$ is nonempty open in $X$. Hence $A \cap U$ is nonempty. Pick $a \in A \cap U$. Denote $Y_{\kappa(a)}=\{a\} \times_{k} Y$ the fibre of $\operatorname{pr}_{X}: X \times_{k} Y \rightarrow X$ over $a$. By Morphisms, Lemma 28.23.4 again the morphism $Y_{a} \rightarrow Y$ is open as $\operatorname{Spec}(\kappa(a)) \rightarrow \operatorname{Spec}(k)$ is universally open. Hence the nonempty open subset $W_{a}=W \times_{X \times_{k} Y} Y_{a}$ maps to a nonempty open subset of $Y$. We conclude there exists a $b \in B$ in the image. Hence $A B \cap W \neq \emptyset$ as desired.

04Q0 Lemma 32.19.2. Let $k$ be a field. Let $f: A \rightarrow X, g: B \rightarrow Y$ be morphisms of schemes over $k$. Then set theoretically we have

$$
\overline{f(A)} \times_{k} \overline{g(B)}=\overline{(f \times g)\left(A \times_{k} B\right)}
$$

Proof. This follows from Lemma 32.19.1 as the image of $f \times g$ is $f(A) g(B)$ in the notation of that lemma.

04Q1 Lemma 32.19.3. Let $k$ be a field. Let $f: A \rightarrow X, g: B \rightarrow Y$ be quasi-compact morphisms of schemes over $k$. Let $Z \subset X$ be the scheme theoretic image of $f$, see Morphisms, Definition 28.6.2. Similarly, let $Z^{\prime} \subset Y$ be the scheme theoretic image of $g$. Then $Z \times_{k} Z^{\prime}$ is the scheme theoretic image of $f \times g$.

Proof. Recall that $Z$ is the smallest closed subscheme of $X$ through which $f$ factors. Similarly for $Z^{\prime}$. Let $W \subset X \times_{k} Y$ be the scheme theoretic image of $f \times g$. As $f \times g$ factors through $Z \times_{k} Z^{\prime}$ we see that $W \subset Z \times_{k} Z^{\prime}$.
To prove the other inclusion let $U \subset X$ and $V \subset Y$ be affine opens. By Morphisms, Lemma 28.6 .3 the scheme $Z \cap U$ is the scheme theoretic image of $\left.f\right|_{f^{-1}(U)}$ : $f^{-1}(U) \rightarrow U$, and similarly for $Z^{\prime} \cap V$ and $W \cap U \times_{k} V$. Hence we may assume $X$ and $Y$ affine. As $f$ and $g$ are quasi-compact this implies that $A=\bigcup U_{i}$ is a finite union of affines and $B=\bigcup V_{j}$ is a finite union of affines. Then we may replace $A$ by $\coprod U_{i}$ and $B$ by $\coprod V_{j}$, i.e., we may assume that $A$ and $B$ are affine as well. In this case $Z$ is cut out by $\operatorname{Ker}\left(\Gamma\left(X, \mathcal{O}_{X}\right) \rightarrow \Gamma\left(A, \mathcal{O}_{A}\right)\right)$ and similarly for $Z^{\prime}$ and $W$. Hence the result follows from the equality

$$
\Gamma\left(A \times_{k} B, \mathcal{O}_{A \times_{k} B}\right)=\Gamma\left(A, \mathcal{O}_{A}\right) \otimes_{k} \Gamma\left(B, \mathcal{O}_{B}\right)
$$

which holds as $A$ and $B$ are affine. Details omitted.

### 32.20. Schemes smooth over fields

04QM Here are two lemmas characterizing smooth schemes over fields.
04QN Lemma 32.20.1. Let $k$ be a field. Let $X$ be a scheme over $k$. Assume
(1) $X$ is locally of finite type over $k$,
(2) $\Omega_{X / k}$ is locally free, and
(3) $k$ has characteristic zero.

Then the structure morphism $X \rightarrow \operatorname{Spec}(k)$ is smooth.
Proof. This follows from Algebra, Lemma 10.138.7.
In positive characteristic there exist nonreduced schemes of finite type whose sheaf of differentials is free, for example $\operatorname{Spec}\left(\mathbf{F}_{p}[t] /\left(t^{p}\right)\right)$ over $\operatorname{Spec}\left(\mathbf{F}_{p}\right)$. If the ground field $k$ is nonperfect of characteristic $p$, there exist reduced schemes $X / k$ with free $\Omega_{X / k}$ which are nonsmooth, for example $\operatorname{Spec}\left(k[t] /\left(t^{p}-a\right)\right.$ where $a \in k$ is not a $p$ th power.

04QP Lemma 32.20.2. Let $k$ be a field. Let $X$ be a scheme over $k$. Assume
(1) $X$ is locally of finite type over $k$,
(2) $\Omega_{X / k}$ is locally free,
(3) $X$ is reduced, and
(4) $k$ is perfect.

Then the structure morphism $X \rightarrow \operatorname{Spec}(k)$ is smooth.
Proof. Let $x \in X$ be a point. As $X$ is locally Noetherian (see Morphisms, Lemma 28.15 .6 there are finitely many irreducible components $X_{1}, \ldots, X_{n}$ passing through $x$ (see Properties, Lemma 27.5.5 and Topology, Lemma 5.8.2). Let $\eta_{i} \in X_{i}$ be the generic point. As $X$ is reduced we have $\mathcal{O}_{X, \eta_{i}}=\kappa\left(\eta_{i}\right)$, see Algebra, Lemma 10.24.1. Moreover, $\kappa\left(\eta_{i}\right)$ is a finitely generated field extension of the perfect field $k$ hence separably generated over $k$ (see Algebra, Section 10.41). It follows that $\Omega_{X / k, \eta_{i}}=\Omega_{\kappa\left(\eta_{i}\right) / k}$ is free of rank the transcendence degree of $\kappa\left(\eta_{i}\right)$ over $k$. By Morphisms, Lemma 28.28.1 we conclude that $\operatorname{dim}_{\eta_{i}}\left(X_{i}\right)=\operatorname{rank}_{\eta_{i}}\left(\Omega_{X / k}\right)$. Since $x \in X_{1} \cap \ldots \cap X_{n}$ we see that

$$
\operatorname{rank}_{x}\left(\Omega_{X / k}\right)=\operatorname{rank}_{\eta_{i}}\left(\Omega_{X / k}\right)=\operatorname{dim}\left(X_{i}\right)
$$

Therefore $\operatorname{dim}_{x}(X)=\operatorname{rank}_{x}\left(\Omega_{X / k}\right)$, see Algebra, Lemma 10.113.5. It follows that $X \rightarrow \operatorname{Spec}(k)$ is smooth at $x$ for example by Algebra, Lemma 10.138.3.

056S Lemma 32.20.3. Let $X \rightarrow \operatorname{Spec}(k)$ be a smooth morphism where $k$ is a field. Then $X$ is a regular scheme.

Proof. (See also Lemma 32.10.6.) By Algebra, Lemma 10.138 .3 every local ring $\mathcal{O}_{X, x}$ is regular. And because $X$ is locally of finite type over $k$ it is locally Noetherian. Hence $X$ is regular by Properties, Lemma 27.9.2.

056 T Lemma 32.20.4. Let $X \rightarrow \operatorname{Spec}(k)$ be a smooth morphism where $k$ is a field. Then $X$ is geometrically regular, geometrically normal, and geometrically reduced over $k$.

Proof. (See also Lemma 32.10.6.) Let $k^{\prime}$ be a finite purely inseparable extension of $k$. It suffices to prove that $X_{k^{\prime}}$ is regular, normal, reduced, see Lemmas 32.10 .3 , 32.8.3, and 32.4.5 By Morphisms, Lemma 28.34.5 the morphism $X_{k^{\prime}} \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ is smooth too. Hence it suffices to show that a scheme $X$ smooth over a field is regular, normal, and reduced. We see that $X$ is regular by Lemma 32.20.3. Hence Properties, Lemma 27.9.4 guarantees that $X$ is normal.

055T Lemma 32.20.5. Let $k$ be a field. Let $d \geq 0$. Let $W \subset \mathbf{A}_{k}^{d}$ be nonempty open. Then there exists a closed point $w \in W$ such that $k \subset \kappa(w)$ is finite separable.

Proof. After possible shrinking $W$ we may assume that $W=\mathbf{A}_{k}^{d} \backslash V(f)$ for some $f \in k\left[x_{1}, \ldots, x_{n}\right]$. If the lemma is wrong then $f\left(a_{1}, \ldots, a_{n}\right)=0$ for all $\left(a_{1}, \ldots, a_{n}\right) \in$ $\left(k^{s e p}\right)^{n}$. This is absurd as $k^{\text {sep }}$ is an infinite field.

056U Lemma 32.20.6. Let $k$ be a field. If $X$ is smooth over $\operatorname{Spec}(k)$ then the set

$$
\{x \in X \text { closed such that } k \subset \kappa(x) \text { is finite separable }\}
$$

is dense in $X$.
Proof. It suffices to show that given a nonempty smooth $X$ over $k$ there exists at least one closed point whose residue field is finite separable over $k$. To see this, choose a diagram

$$
X \leftharpoonup \quad U \xrightarrow{\pi} \mathbf{A}_{k}^{d}
$$

with $\pi$ étale, see Morphisms, Lemma 28.36.20. The morphism $\pi: U \rightarrow \mathbf{A}_{k}^{d}$ is open, see Morphisms, Lemma 28.36.13. By Lemma 32.20 .5 we may choose a closed point $w \in \pi(U)$ whose residue field is finite separable over $k$. Pick any $x \in U$ with $\pi(x)=w$. By Morphisms, Lemma 28.36.7 the field extension $\kappa(w) \subset \kappa(x)$ is finite separable. Hence $k \subset \kappa(x)$ is finite separable. The point $x$ is a closed point of $X$ by Morphisms, Lemma 28.20.2.

056 V Lemma 32.20.7. Let $X$ be a scheme over a field $k$. If $X$ is locally of finite type and geometrically reduced over $k$ then $X$ contains a dense open which is smooth over $k$.

Proof. The problem is local on $X$, hence we may assume $X$ is quasi-compact. Let $X=X_{1} \cup \ldots \cup X_{n}$ be the irreducible components of $X$. Then $Z=\bigcup_{i \neq j} X_{i} \cap X_{j}$ is nowhere dense in $X$. Hence we may replace $X$ by $X \backslash Z$. As $X \backslash Z$ is a disjoint union of irreducible schemes, this reduces us to the case where $X$ is irreducible. As $X$ is irreducible and reduced, it is integral, see Properties, Lemma 27.3.4 Let $\eta \in X$ be
its generic point. Then the function field $K=k(X)=\kappa(\eta)$ is geometrically reduced over $k$, hence separable over $k$, see Algebra, Lemma 10.43.1. Let $U=\operatorname{Spec}(A) \subset X$ be any nonempty affine open so that $K=f . f .(A)=A_{(0)}$. Apply Algebra, Lemma 10.138.5 to conclude that $A$ is smooth at (0) over $k$. By definition this means that some principal localization of $A$ is smooth over $k$ and we win.

0B8X Lemma 32.20.8. Let $k$ be a perfect field. Let $X$ be a locally algebraic reduced $k$-scheme, for example a variety over $k$. Then we have

$$
\{x \in X \mid X \rightarrow \operatorname{Spec}(k) \text { is smooth at } x\}=\left\{x \in X \mid \mathcal{O}_{X, x} \text { is regular }\right\}
$$

and this is a dense open subscheme of $X$.
Proof. The equality of the two sets follows immediately from Algebra, Lemma 10.138 .5 and the definitions (see Algebra, Definition 10.44 .1 for the definition of a perfect field). The set is open because the set of points where a morphism of schemes is smooth is open, see Morphisms, Definition 28.34.1. Finally, we give two arguments to see that it is dense: (1) The generic points of $X$ are in the set as the local rings at generic points are fields (Algebra, Lemma 10.24.1) hence regular.
(2) We use that $X$ is geometrically reduced by Lemma 32.4.3 and hence Lemma 32.20 .7 applies.

05AX Lemma 32.20.9. Let $k$ be a field. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over $k$. Let $x \in X$ be a point and set $y=f(x)$. If $X \rightarrow \operatorname{Spec}(k)$ is smooth at $x$ and $f$ is flat at $x$ then $Y \rightarrow \operatorname{Spec}(k)$ is smooth at $y$. In particular, if $X$ is smooth over $k$ and $f$ is flat and surjective, then $Y$ is smooth over $k$.

Proof. It suffices to show that $Y$ is geometrically regular at $y$, see Lemma 32.10.6. This follows from Lemma 32.10 .5 (and Lemma 32.10.6 applied to $(X, x)$ ).

### 32.21. Types of varieties

04L0 Short section discussion some elementary global properties of varieties.
04L1 Definition 32.21.1. Let $k$ be a field. Let $X$ be a variety over $k$.
(1) We say $X$ is an affine variety if $X$ is an affine scheme. This is equivalent to requiring $X$ it be isomorphic to a closed subscheme of $\mathbf{A}_{k}^{n}$ for some $n$.
(2) We say $X$ is a projective variety if the structure morphism $X \rightarrow \operatorname{Spec}(k)$ is projective. By Morphisms, Lemma 28.42 .4 this is true if and only if $X$ is isomorphic to a closed subscheme of $\mathbf{P}_{k}^{n}$ for some $n$.
(3) We say $X$ is a quasi-projective variety if the structure morphism $X \rightarrow$ $\operatorname{Spec}(k)$ is quasi-projective. By Morphisms, Lemma 28.40.5 this is true if and only if $X$ is isomorphic to a locally closed subscheme of $\mathbf{P}_{k}^{n}$ for some $n$.
(4) A proper variety is a variety such that the morphism $X \rightarrow \operatorname{Spec}(k)$ is proper.

Note that a projective variety is a proper variety, see Morphisms, Lemma 28.42.5. Also, an affine variety is quasi-projective as $\mathbf{A}_{k}^{n}$ is isomorphic to an open subscheme of $\mathbf{P}_{k}^{n}$, see Constructions, Lemma 26.13.3.

04L2 Lemma 32.21.2. Let $X$ be a proper variety over $k$. Then $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a field which is a finite extension of the field $k$.

Proof. By Cohomology of Schemes, Proposition 29.18.1 we see that $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a finite dimensional $k$-vector space. It is also a $k$-algebra without zero-divisors. Hence it is a field, see Algebra, Lemma 10.35.17.

### 32.22. Groups of invertible functions

04L3 It is often (but not always) the case that $\mathcal{O}^{*}(X) / k^{*}$ is a finitely generated abelian group if $X$ is a variety over $k$. We show this by a series of lemmas. Everything rests on the following special case.

04L4 Lemma 32.22.1. Let $k$ be an algebraically closed field. Let $\bar{X}$ be a proper variety over $k$. Let $X \subset \bar{X}$ be an open subscheme. Assume $X$ is normal. Then $\mathcal{O}^{*}(X) / k^{*}$ is a finitely generated abelian group.

Proof. We will use without further mention that for any affine open $U$ of $\bar{X}$ the ring $\mathcal{O}(U)$ is a finitely generated $k$-algebra, which is Noetherian, a domain and normal, see Algebra, Lemma 10.30.1, Properties, Definition 27.3.1, Properties, Lemmas 27.5 .2 and 27.7.2. Morphisms, Lemma 28.15.2

Let $\xi_{1}, \ldots, \xi_{r}$ be the generic points of the complement of $X$ in $\bar{X}$. There are finitely many since $\bar{X}$ has a Noetherian underlying topological space (see Morphisms, Lemma 28.15.6, Properties, Lemma 27.5.5, and Topology, Lemma 5.8.2. For each $i$ the local ring $\mathcal{O}_{i}=\mathcal{O}_{X, \xi_{i}}$ is a normal Noetherian local domain (as a localization of a Noetherian normal domain). Let $J \subset\{1, \ldots, r\}$ be the set of indices $i$ such that $\operatorname{dim}\left(\mathcal{O}_{i}\right)=1$. For $j \in J$ the local ring $\mathcal{O}_{j}$ is a discrete valuation ring, see Algebra, Lemma 10.118.7. Hence we obtain a valuation

$$
v_{j}: k(\bar{X})^{*} \longrightarrow \mathbf{Z}
$$

with the property that $v_{j}(f) \geq 0 \Leftrightarrow f \in \mathcal{O}_{j}$.
Think of $\mathcal{O}(X)$ as a sub $k$-algebra of $k(X)=k(\bar{X})$. We claim that the kernel of the map

$$
\mathcal{O}(X)^{*} \longrightarrow \prod_{j \in J} \mathbf{Z}, \quad f \longmapsto \prod v_{j}(f)
$$

is $k^{*}$. It is clear that this claim proves the lemma. Namely, suppose that $f \in$ $\mathcal{O}(X)$ is an element of the kernel. Let $U=\operatorname{Spec}(B) \subset \bar{X}$ be any affine open. Then $B$ is a Noetherian normal domain. For every height one prime $\mathfrak{q} \subset B$ with corresponding point $\xi \in X$ we see that either $\xi=\xi_{j}$ for some $j \in J$ or that $\xi \in X$. The reason is that $\operatorname{codim}(\overline{\{\xi\}}, \bar{X})=1$ by Properties, Lemma 27.10 .3 and hence if $\xi \in \bar{X} \backslash X$ it must be a generic point of $\bar{X} \backslash X$, hence equal to some $\xi_{j}, j \in J$. We conclude that $f \in \mathcal{O}_{X, \xi}=B_{\mathfrak{q}}$ in either case as $f$ is in the kernel of the map. Thus $f \in \bigcap_{\mathrm{ht}(\mathfrak{q})=1} B_{\mathfrak{q}}=B$, see Algebra, Lemma 10.149.6. In other words, we see that $f \in \Gamma\left(\bar{X}, \mathcal{O}_{\bar{X}}\right)$. But since $k$ is algebraically closed we conclude that $f \in k$ by Lemma 32.21.2.

Next, we generalize the case above by some elementary arguments, still keeping the field algebraically closed.

04L5 Lemma 32.22.2. Let $k$ be an algebraically closed field. Let $X$ be an integral scheme locally of finite type over $k$. Then $\mathcal{O}^{*}(X) / k^{*}$ is a finitely generated abelian group.

Proof. As $X$ is integral the restriction mapping $\mathcal{O}(X) \rightarrow \mathcal{O}(U)$ is injective for any nonempty open subscheme $U \subset X$. Hence we may assume that $X$ is affine. Choose a closed immersion $X \rightarrow \mathbf{A}_{k}^{n}$ and denote $\bar{X}$ the closure of $X$ in $\mathbf{P}_{k}^{n}$ via the usual immersion $\mathbf{A}_{k}^{n} \rightarrow \mathbf{P}_{k}^{n}$. Thus we may assume that $X$ is an affine open of a projective variety $\bar{X}$.
Let $\nu: \bar{X}^{\nu} \rightarrow \bar{X}$ be the normalization morphism, see Morphisms, Definition 28.49.1. We know that $\nu$ is finite, dominant, and that $\bar{X}^{\nu}$ is a normal irreducible scheme, see Morphisms, Lemmas 28.49.4 28.49.6, and 28.18.2. It follows that $\bar{X}^{\nu}$ is a proper variety, because $\bar{X} \rightarrow \operatorname{Spec}(k)$ is proper as a composition of a finite and a proper morphism (see results in Morphisms, Sections 28.41 and 28.43 ). It also follows that $\nu$ is a surjective morphism, because the image of $\nu$ is closed and contains the generic point of $\bar{X}$. Hence setting $X^{\nu}=\nu^{-1}(X)$ we see that it suffices to prove the result for $X^{\nu}$. In other words, we may assume that $X$ is a nonempty open of a normal proper variety $\bar{X}$. This case is handled by Lemma 32.22.1.

The preceding lemma implies the following slight generalization.
04L6 Lemma 32.22.3. Let $k$ be an algebraically closed field. Let $X$ be a connected reduced scheme which is locally of finite type over $k$ with finitely many irreducible components. Then $\mathcal{O}^{*}(X) / k^{*}$ is a finitely generated abelian group.

Proof. Let $X=\bigcup X_{i}$ be the irreducible components. By Lemma 32.22 .2 we see that $\mathcal{O}\left(X_{i}\right)^{*} / k^{*}$ is a finitely generated abelian group. Let $f \in \mathcal{O}(X)^{*}$ be in the kernel of the map

$$
\mathcal{O}(X)^{*} \longrightarrow \prod \mathcal{O}\left(X_{i}\right)^{*} / k^{*}
$$

Then for each $i$ there exists an element $\lambda_{i} \in k$ such that $\left.f\right|_{X_{i}}=\lambda_{i}$. By restricting to $X_{i} \cap X_{j}$ we conclude that $\lambda_{i}=\lambda_{j}$ if $X_{i} \cap X_{j} \neq \emptyset$. Since $X$ is connected we conclude that all $\lambda_{i}$ agree and hence that $f \in k^{*}$. This proves that

$$
\mathcal{O}(X)^{*} / k^{*} \subset \prod \mathcal{O}\left(X_{i}\right)^{*} / k^{*}
$$

and the lemma follows as on the right we have a product of finitely many finitely generated abelian groups.
04MI Lemma 32.22.4. Let $k$ be a field. Let $X$ be a scheme over $k$ which is connected and reduced. Then the integral closure of $k$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a field.
Proof. Let $k^{\prime} \subset \Gamma\left(X, \mathcal{O}_{X}\right)$ be the integral closure of $k$. Then $X \rightarrow \operatorname{Spec}(k)$ factors through $\operatorname{Spec}\left(k^{\prime}\right)$, see Schemes, Lemma 25.6.4. As $X$ is reduced we see that $k^{\prime}$ has no nonzero nilpotent elements. As $k \rightarrow k^{\prime}$ is integral we see that every prime ideal of $k^{\prime}$ is both a maximal ideal and a minimal prime, and $\operatorname{Spec}\left(k^{\prime}\right)$ is totally disconnected, see Algebra, Lemmas 10.35 .18 and 10.25 .5 . As $X$ is connected the morphism $X \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ is constant, say with image the point corresponding to $\mathfrak{p} \subset k^{\prime}$. Then any $f \in k^{\prime}, f \notin \mathfrak{p}$ maps to an invertible element of $\mathcal{O}_{X}$. By definition of $k^{\prime}$ this then forces $f$ to be a unit of $k^{\prime}$. Hence we see that $k^{\prime}$ is local with maximal ideal $\mathfrak{p}$, see Algebra, Lemma 10.17 .2 . Since we've already seen that $k^{\prime}$ is reduced this implies that $k^{\prime}$ is a field, see Algebra, Lemma 10.24.1.
04L7 Proposition 32.22.5. Let $k$ be a field. Let $X$ be a scheme over $k$. Assume that $X$ is locally of finite type over $k$, connected, reduced, and has finitely many irreducible components. Then $\mathcal{O}(X)^{*} / k^{*}$ is a finitely generated abelian group if in addition to the conditions above at least one of the following conditions is satisfied:
(1) the integral closure of $k$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is $k$,
(2) $X$ has a $k$-rational point, or
(3) $X$ is geometrically integral.

Proof. Let $\bar{k}$ be an algebraic closure of $k$. Let $Y$ be a connected component of $\left(X_{\bar{k}}\right)_{\text {red }}$. Note that the canonical morphism $p: Y \rightarrow X$ is open (by Morphisms, Lemma 28.23.4 and closed (by Morphisms, Lemma 28.43.7). Hence $p(Y)=X$ as $X$ was assumed connected. In particular, as $X$ is reduced this implies $\mathcal{O}(X) \subset$ $\mathcal{O}(Y)$. By Lemma 32.6 .13 we see that $Y$ has finitely many irreducible components. Thus Lemma 32.22 .3 applies to $Y$. This implies that if $\mathcal{O}(X)^{*} / k^{*}$ is not a finitely generated abelian group, then there exist elements $f \in \mathcal{O}(X), f \notin k$ which map to an element of $\bar{k}$ via the map $\mathcal{O}(X) \rightarrow \mathcal{O}(Y)$. In this case $f$ is algebraic over $k$, hence integral over $k$. Thus, if condition (1) holds, then this cannot happen. To finish the proof we show that conditions (2) and (3) imply (1).

Let $k \subset k^{\prime} \subset \Gamma\left(X, \mathcal{O}_{X}\right)$ be the integral closure of $k$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$. By Lemma 32.22 .4 we see that $k^{\prime}$ is a field. If $e: \operatorname{Spec}(k) \rightarrow X$ is a $k$-rational point, then $e^{\sharp}: \Gamma\left(X, \mathcal{O}_{X}\right) \rightarrow k$ is a section to the inclusion map $k \rightarrow \Gamma\left(X, \mathcal{O}_{X}\right)$. In particular the restriction of $e^{\sharp}$ to $k^{\prime}$ is a field map $k^{\prime} \rightarrow k$ over $k$, which clearly shows that (2) implies (1).

If the integral closure $k^{\prime}$ of $k$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is not trivial, then we see that $X$ is either not geometrically connected (if $k \subset k^{\prime}$ is not purely inseparable) or that $X$ is not geometrically reduced (if $k \subset k^{\prime}$ is nontrivial purely inseparable). Details omitted. Hence (3) implies (1).

04L8 Lemma 32.22.6. Let $k$ be a field. Let $X$ be a variety over $k$. The group $\mathcal{O}(X)^{*} / k^{*}$ is a finitely generated abelian group provided at least one of the following conditions holds:
(1) $k$ is integrally closed in $\Gamma\left(X, \mathcal{O}_{X}\right)$,
(2) $k$ is algebraically closed in $k(X)$,
(3) $X$ is geometrically integral over $k$, or
(4) $k$ is the "intersection" of the field extensions $k \subset \kappa(x)$ where $x$ runs over the closed points of $x$.

Proof. We see that (1) is enough by Proposition 32.22.5. We omit the verification that each of (2), (3), (4) implies (1).

### 32.23. Künneth formula

0BEC There is a version over a general base too, but first we state and prove the version over a field.

0BED Lemma 32.23.1. Let $k$ be a field. Let $X$ and $Y$ be schemes over $k$ and let $\mathcal{F}$, resp. $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{X}$-module, resp. $\mathcal{O}_{Y}$-module. Then we have a canonical isomorphism

$$
H^{n}\left(X \times_{\operatorname{Spec}(k)} Y, p r_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times \operatorname{Spec}(k)}} p r_{2}^{*} \mathcal{G}\right)=\bigoplus_{p+q=n} H^{p}(X, \mathcal{F}) \otimes_{k} H^{q}(Y, \mathcal{G})
$$

provided $X$ and $Y$ are quasi-compact and have affine diagona (for example if $X$ and $Y$ are separated).

[^86]Proof. In this proof unadorned products and tensor products are over $k$. As maps

$$
H^{p}(X, \mathcal{F}) \otimes H^{q}(Y, \mathcal{G}) \longrightarrow H^{n}\left(X \times Y, \operatorname{pr}_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times Y}} \operatorname{pr}_{2}^{*} \mathcal{G}\right)
$$

we use functoriality of cohomology to get maps $H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X \times Y, \operatorname{pr}_{1}^{*} \mathcal{F}\right)$ and $H^{p}(Y, \mathcal{G}) \rightarrow H^{p}\left(X \times Y, \operatorname{pr}_{2}^{*} \mathcal{G}\right)$ and then we use the cup product

$$
\cup: H^{p}\left(X \times Y, \operatorname{pr}_{1}^{*} \mathcal{F}\right) \otimes H^{p}\left(X \times Y, \operatorname{pr}_{2}^{*} \mathcal{G}\right) \longrightarrow H^{n}\left(X \times Y, \operatorname{pr}_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times Y}} \operatorname{pr}_{2}^{*} \mathcal{G}\right)
$$

The result is true when $X$ and $Y$ are affine by the vanishing of higher cohomology groups on affines (Cohomology of Schemes, Lemma 29.2.2) and the definitions (of pullbacks of quasi-coherent modules and tensor products of quasi-coherent modules).

Choose finite affine open coverings $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ and $\mathcal{V}: Y=\bigcup_{j \in J} V_{j}$. This determines an affine open covering $\mathcal{W}: X \times Y=\bigcup_{(i, j) \in I \times J} U_{i} \times V_{j}$. Note that $\mathcal{W}$ is a refinement of $\mathrm{pr}_{1}^{-1} \mathcal{U}$ and of $\mathrm{pr}_{2}^{-1} \mathcal{V}$. Thus by Cohomology, Lemma 20.16.1 we obtain maps

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \rightarrow \check{\mathcal{C}} \bullet(\mathcal{W}, \mathcal{F}) \quad \text { and } \quad \check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{G}) \rightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{W}, \mathcal{G})
$$

compatible with pullback maps on cohomology. In Cohomology, Equation 20.26.1.2 we have constructed a map of complexes

$$
\operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}\left(\mathcal{W}, \operatorname{pr}_{1}^{*} \mathcal{F}\right) \otimes \check{\mathcal{C}}^{\bullet}\left(\mathcal{W}, \operatorname{pr}_{2}^{*} \mathcal{G}\right)\right) \longrightarrow \check{\mathcal{C}}^{\bullet}\left(\mathcal{W}, \operatorname{pr}_{1}^{*} \mathcal{F} \otimes \operatorname{pr}_{2}^{*} \mathcal{G}\right)
$$

defining the cup product on cohomology. Combining the above we obtain a map of complexes
$0 \operatorname{BEE} \quad(32.23 .1 .1) \quad \operatorname{Tot}\left(\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \otimes \check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{G})\right) \longrightarrow \check{\mathcal{C}}^{\bullet}\left(\mathcal{W}, \operatorname{pr}_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times Y}} \operatorname{pr}_{2}^{*} \mathcal{G}\right)$
We warn the reader that this map is not an isomorphism of complexes. Recall that we may compute the cohomologies of our quasi-coherent sheaves using our coverings (Cohomology of Schemes, Lemmas 29.2.5 and 29.2.6). Thus on cohomology 32.23.1.1) reproduces the map of the lemma.

Consider a short exact sequence $0 \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime \prime} \rightarrow 0$ of quasi-coherent modules. Since the construction of $\sqrt[32.23 .1 .1]{ })$ is functorial in $\mathcal{F}$ and since the formation of the relevant Čech complexes is exact in the variable $\mathcal{F}$ (because we are taking sections over affine opens) we find a map between short exact sequence of complexes

(we have dropped the outer zeros). Looking at long exact cohomology sequences we find that if the result of the lemma holds for 2 -out-of- 3 of $\mathcal{F}, \mathcal{F}^{\prime}, \mathcal{F}^{\prime \prime}$, then it holds for the third.

Observe that $X$ has finite cohomological dimension for quasi-coherent modules, see Cohomology of Schemes, Lemma 29.4.2. Using induction on $d(\mathcal{F})=\max \{d \mid$ $\left.H^{d}(X, \mathcal{F}) \neq 0\right\}$ we will reduce to the case $d(\mathcal{F})=0$. Assume $d(\mathcal{F})>0$. By Cohomology of Schemes, Lemma 29.4.3 we have seen that there exists an embedding $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ such that $H^{p}\left(X, \mathcal{F}^{\prime}\right)=0$ for all $p \geq 1$. Setting $\mathcal{F}^{\prime \prime}=\operatorname{Coker}\left(\mathcal{F} \rightarrow \mathcal{F}^{\prime}\right)$ we see that $d\left(\mathcal{F}^{\prime \prime}\right)<d(\mathcal{F})$. Then we can apply the result from the previous paragraph to
see that it suffices to prove the lemma for $\mathcal{F}^{\prime}$ and $\mathcal{F}^{\prime \prime}$ thereby proving the induction step.
Arguing in the same fashion for $\mathcal{G}$ we find that we may assume that both $\mathcal{F}$ and $\mathcal{G}$ have nonzero cohomology only in degree 0 . Let $V \subset Y$ be an affine open. Consider the affine open covering $\mathcal{U}_{V}: X \times V=\bigcup_{i \in I} U_{i} \times V$. It is immediate that

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F}) \otimes \mathcal{G}(V)=\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}_{V}, \operatorname{pr}_{1}^{*} \mathcal{F} \otimes \otimes_{\mathcal{O}_{X \times Y}} \operatorname{pr}_{2}^{*} \mathcal{G}\right)
$$

(equality of complexes). We conclude that

$$
R \operatorname{pr}_{2, *}\left(\operatorname{pr}_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times Y}} \operatorname{pr}_{2}^{*} \mathcal{G}\right) \cong \Gamma(X, \mathcal{F}) \otimes_{k} \mathcal{G} \cong \bigoplus_{\alpha \in A} \mathcal{G}
$$

on $Y$. Here $A$ is a basis for the $k$-vector space $\Gamma(X, \mathcal{F})$. Cohomology on $Y$ commutes with direct sums (Cohomology, Lemma 20.20.1). Using the Leray spectral sequence for $\mathrm{pr}_{2}$ (via Cohomology, Lemma 20.14.6) we conclude that $H^{n}\left(X \times Y, \operatorname{pr}_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times Y}}\right.$ $\left.\operatorname{pr}_{2}^{*} \mathcal{G}\right)$ is zero for $n>0$ and isomorphic to $H^{0}(X, \mathcal{F}) \otimes H^{0}(Y, \mathcal{G})$ for $n=0$. This finishes the proof (except that we should check that the isomorphism is indeed given by cup product in degree 0 ; we omit the verification).

0BEF Lemma 32.23.2. Let $k$ be a field. Let $X$ and $Y$ be schemes over $k$ and let $\mathcal{F}$, resp. $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{X}$-module, resp. $\mathcal{O}_{Y}$-module. Then we have a canonical isomorphism

$$
H^{n}\left(X \times_{\operatorname{Spec}(k)} Y, p r_{1}^{*} \mathcal{F} \otimes_{\mathcal{O}_{X \times \operatorname{Spec}(k)} Y} p r_{2}^{*} \mathcal{G}\right)=\bigoplus_{p+q=n} H^{p}(X, \mathcal{F}) \otimes_{k} H^{q}(Y, \mathcal{G})
$$

provided $X$ and $Y$ are quasi-compact and quasi-separated.
Proof. If $X$ and $Y$ are separated or more generally have affine diagonal, then please see Lemma 32.23 .1 for "better" proof (the feature it has over this proof is that it identifies the maps as pullbacks followed by cup products). Let $X^{\prime}$, resp. $Y^{\prime}$ be the infinitesimal thickening of $X$, resp. $Y$ whose structure sheaf is $\mathcal{O}_{X^{\prime}}=\mathcal{O}_{X} \oplus \mathcal{F}$, resp. $\mathcal{O}_{Y^{\prime}}=\mathcal{O}_{Y} \oplus \mathcal{G}$ where $\mathcal{F}$, resp. $\mathcal{G}$ is an ideal of square zero. Then

$$
\mathcal{O}_{X^{\prime} \times Y^{\prime}}=\mathcal{O}_{X \times Y} \oplus \operatorname{pr}_{1}^{*} \mathcal{F} \oplus \operatorname{pr}_{2}^{*} \mathcal{G} \oplus \operatorname{pr}_{1}^{*} \mathcal{F} \otimes \mathcal{O}_{X \times Y} \operatorname{pr}_{2}^{*} \mathcal{G}
$$

as sheaves on $X \times Y$. In this way we see that it suffices to prove that

$$
H^{n}\left(X \times Y, \mathcal{O}_{X \times Y}\right)=\bigoplus_{p+q=n} H^{p}\left(X, \mathcal{O}_{X}\right) \otimes_{k} H^{q}\left(Y, \mathcal{O}_{Y}\right)
$$

for any pair of quasi-compact and quasi-separated schemes over $k$. Some details omitted.

To prove this statement we use cohomology and base change in the form of Cohomology of Schemes, Lemma 29.7.3. This lemma tells us there exists a bounded below complex of $k$-vector spaces, i.e., a complex $\mathcal{K}^{\bullet}$ of quasi-coherent modules on $\operatorname{Spec}(k)$, which universally computes the cohomology of $Y$ over $\operatorname{Spec}(k)$. In particular, we see that

$$
R \operatorname{pr}_{1, *}\left(\mathcal{O}_{X \times Y}\right) \cong(X \rightarrow \operatorname{Spec}(k))^{*} \mathcal{K}^{\bullet}
$$

in $D\left(\mathcal{O}_{X}\right)$. Up to homotopy the complex $\mathcal{K}^{\bullet}$ is isomorphic to $\bigoplus_{q \geq 0} H^{q}\left(Y, \mathcal{O}_{Y}\right)[-q]$ because this is true for every complex of vector spaces over a field. We conclude that

$$
R \operatorname{pr}_{1, *}\left(\mathcal{O}_{X \times Y}\right) \cong \bigoplus_{q \geq 0} H^{q}\left(Y, \mathcal{O}_{Y}\right)[-q] \otimes_{k} \mathcal{O}_{X}
$$

in $D\left(\mathcal{O}_{X}\right)$. Then we have

$$
\begin{aligned}
R \Gamma\left(X \times Y, \mathcal{O}_{X \times Y}\right) & =R \Gamma\left(X, \operatorname{Rpr}_{1, *}\left(\mathcal{O}_{X \times Y}\right)\right) \\
& =R \Gamma\left(X, \bigoplus_{q \geq 0} H^{q}\left(Y, \mathcal{O}_{Y}\right)[-q] \otimes_{k} \mathcal{O}_{X}\right) \\
& =\bigoplus_{q \geq 0} R \Gamma\left(X, H^{q}\left(Y, \mathcal{O}_{Y}\right) \otimes \mathcal{O}_{X}\right)[-q] \\
& =\bigoplus_{q \geq 0} R \Gamma\left(X, \mathcal{O}_{X}\right) \otimes_{k} H^{q}\left(Y, \mathcal{O}_{Y}\right)[-q] \\
& =\bigoplus_{p, q \geq 0} H^{p}\left(X, \mathcal{O}_{X}\right)[-p] \otimes_{k} H^{q}\left(Y, \mathcal{O}_{Y}\right)[-q]
\end{aligned}
$$

as desired. The first equality by Leray for $\mathrm{pr}_{1}$ (Cohomology, Lemma 20.14.1). The second by our decomposition of the total direct image given above. The third because cohomology always commutes with finite direct sums (and cohomology of $Y$ vanishes in sufficiently large degree by Cohomology of Schemes, Lemma 29.4.4). The fourth because cohomology on $X$ commutes with infinite direct sums by Cohomology, Lemma 20.20.1. The final equality by our remark on the derived category of a field above.

### 32.24. Picard groups of varieties

0BEG In this section we collect some elementary results on Picard groups of algebraic varieties. The following lemma tells us that "rationally equivalence invertible modules" are isomorphic on normal varieties.

0BEH Lemma 32.24.1. Let $k$ be a field. Let $X$ be a normal variety over $k$. Let $U \subset \mathbf{A}_{k}^{n}$ be an open subscheme with $k$-rational points $p, q \in U(k)$. For every invertible module $\mathcal{L}$ on $X \times_{\operatorname{Spec}(k)} U$ the restrictions $\left.\mathcal{L}\right|_{X \times p}$ and $\left.\mathcal{L}\right|_{X \times q}$ are isomorphic.
Proof. Applying Divisors, Lemma 30.23 .1 we see that $\mathcal{L}$ is the pullback of an invertible module $\mathcal{N}$ on $X$.

### 32.25. Uniqueness of base field

04 MJ The phrase "let $X$ be a scheme over $k$ " means that $X$ is a scheme which comes equipped with a morphism $X \rightarrow \operatorname{Spec}(k)$. Now we can ask whether the field $k$ is uniquely determined by the scheme $X$. Of course this is not the case, since for example $\mathbf{A}_{\mathbf{C}}^{1}$ which we ordinarily consider as a scheme over the field $\mathbf{C}$ of complex numbers, could also be considered as a scheme over $\mathbf{Q}$. But what if we ask that the morphism $X \rightarrow \operatorname{Spec}(k)$ does not factor as $X \rightarrow \operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$ for any nontrivial field extension $k \subset k^{\prime}$ ? In other words we ask that $k$ is somehow maximal such that $X$ lives over $k$.
An example to show that this still does not guarantee uniqueness of $k$ is the scheme

$$
X=\operatorname{Spec}\left(\mathbf{Q}(x)[y]\left[\frac{1}{P(y)}, P \in \mathbf{Q}[y], P \neq 0\right]\right)
$$

At first sight this seems to be a scheme over $\mathbf{Q}(x)$, but on a second look it is clear that it is also a scheme over $\mathbf{Q}(y)$. Moreover, the fields $\mathbf{Q}(x)$ and $\mathbf{Q}(y)$ are subfields of $R=\Gamma\left(X, \mathcal{O}_{X}\right)$ which are maximal among the subfields of $R$ (details omitted). In particular, both $\mathbf{Q}(x)$ and $\mathbf{Q}(y)$ are maximal in the sense above. Note that both morphisms $X \rightarrow \operatorname{Spec}(\mathbf{Q}(x))$ and $X \rightarrow \operatorname{Spec}(\mathbf{Q}(y))$ are "essentially of finite
type" (i.e., the corresponding ring map is essentially of finite type). Hence $X$ is a Noetherian scheme of finite dimension, i.e., it is not completely pathological.
Another issue that can prevent uniqueness is that the scheme $X$ may be nonreduced. In that case there can be many different morphisms from $X$ to the spectrum of a given field. As an explicit example consider the dual numbers $D=\mathbf{C}[y] /\left(y^{2}\right)=$ $\mathbf{C} \oplus \epsilon \mathbf{C}$. Given any derivation $\theta: \mathbf{C} \rightarrow \mathbf{C}$ over $\mathbf{Q}$ we get a ring map

$$
\mathbf{C} \longrightarrow D, \quad c \longmapsto c+\epsilon \theta(c)
$$

The subfield of $\mathbf{C}$ on which all of these maps are the same is the algebraic closure of $\mathbf{Q}$. This means that taking the intersection of all the fields that $X$ can live over may end up being a very small field if $X$ is nonreduced.
One observation in this regard is the following: given a field $k$ and two subfields $k_{1}, k_{2}$ of $k$ such that $k$ is finite over $k_{1}$ and over $k_{2}$, then in general it is not the case that $k$ is finite over $k_{1} \cap k_{2}$. An example is the field $k=\mathbf{Q}(t)$ and its subfields $k_{1}=\mathbf{Q}\left(t^{2}\right)$ and $\mathbf{Q}\left((t+1)^{2}\right)$. Namely we have $k_{1} \cap k_{2}=\mathbf{Q}$ in this case. So in the following we have to be careful when taking intersections of fields.
Having said all of this we now show that if $X$ is locally of finite type over a field, then some uniqueness holds. Here is the precise result.

04MK Proposition 32.25.1. Let $X$ be a scheme. Let $a: X \rightarrow \operatorname{Spec}\left(k_{1}\right)$ and $b: X \rightarrow$ $\operatorname{Spec}\left(k_{2}\right)$ be morphisms from $X$ to spectra of fields. Assume $a, b$ are locally of finite type, and $X$ is reduced, and connected. Then we have $k_{1}^{\prime}=k_{2}^{\prime}$, where $k_{i}^{\prime} \subset \Gamma\left(X, \mathcal{O}_{X}\right)$ is the integral closure of $k_{i}$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$.

Proof. First, assume the lemma holds in case $X$ is quasi-compact (we will do the quasi-compact case below). As $X$ is locally of finite type over a field, it is locally Noetherian, see Morphisms, Lemma 28.15.6. In particular this means that it is locally connected, connected components of open subsets are open, and intersections of quasi-compact opens are quasi-compact, see Properties, Lemma 27.5.5. Topology, Lemma 5.6.10. Topology, Section 5.8, and Topology, Lemma 5.15.1. Pick an open covering $X=\bigcup_{i \in I} U_{i}$ such that each $U_{i}$ is quasi-compact and connected. For each $i$ let $K_{i} \subset \mathcal{O}_{X}\left(U_{i}\right)$ be the integral closure of $k_{1}$ and of $k_{2}$. For each pair $i, j \in I$ we decompose

$$
U_{i} \cap U_{j}=\coprod U_{i, j, l}
$$

into its finitely many connected components. Write $K_{i, j, l} \subset \mathcal{O}\left(U_{i, j, l}\right)$ for the integral closure of $k_{1}$ and of $k_{2}$. By Lemma 32.22 .4 the rings $K_{i}$ and $K_{i, j, l}$ are fields. Now we claim that $k_{1}^{\prime}$ and $k_{2}^{\prime}$ both equal the kernel of the map

$$
\prod K_{i} \longrightarrow \prod K_{i, j, l},\left.\quad\left(x_{i}\right)_{i} \longmapsto x_{i}\right|_{U_{i, j, l}}-\left.x_{j}\right|_{U_{i, j, l}}
$$

which proves what we want. Namely, it is clear that $k_{1}^{\prime}$ is contained in this kernel. On the other hand, suppose that $\left(x_{i}\right)_{i}$ is in the kernel. By the sheaf condition $\left(x_{i}\right)_{i}$ corresponds to $f \in \mathcal{O}(X)$. Pick some $i_{0} \in I$ and let $P(T) \in k_{1}[T]$ be a monic polynomial with $P\left(x_{i_{0}}\right)=0$. Then we claim that $P(f)=0$ which proves that $f \in k_{1}$. To prove this we have to show that $P\left(x_{i}\right)=0$ for all $i$. Pick $i \in I$. As $X$ is connected there exists a sequence $i_{0}, i_{1}, \ldots, i_{n}=i \in I$ such that $U_{i_{t}} \cap U_{i_{t+1}} \neq \emptyset$. Now this means that for each $t$ there exists an $l_{t}$ such that $x_{i_{t}}$ and $x_{i_{t+1}}$ map to the same element of the field $K_{i, j, l}$. Hence if $P\left(x_{i_{t}}\right)=0$, then $P\left(x_{i_{t+1}}\right)=0$. By induction, starting with $P\left(x_{i_{0}}\right)=0$ we deduce that $P\left(x_{i}\right)=0$ as desired.

To finish the proof of the lemma we prove the lemma under the additional hypothesis that $X$ is quasi-compact. By Lemma 32.22 .4 after replacing $k_{i}$ by $k_{i}^{\prime}$ we may assume that $k_{i}$ is integrally closed in $\Gamma\left(X, \mathcal{O}_{X}\right)$. This implies that $\mathcal{O}(X)^{*} / k_{i}^{*}$ is a finitely generated abelian group, see Proposition 32.22.5. Let $k_{12}=k_{1} \cap k_{2}$ as a subring of $\mathcal{O}(X)$. Note that $k_{12}$ is a field. Since

$$
k_{1}^{*} / k_{12}^{*} \longrightarrow \mathcal{O}(X)^{*} / k_{2}^{*}
$$

we see that $k_{1}^{*} / k_{12}^{*}$ is a finitely generated abelian group as well. Hence there exist $\alpha_{1}, \ldots, \alpha_{n} \in k_{1}^{*}$ such that every element $\lambda \in k_{1}$ has the form

$$
\lambda=c \alpha_{1}^{e_{1}} \ldots \alpha_{n}^{e_{n}}
$$

for some $e_{i} \in \mathbf{Z}$ and $c \in k_{12}$. In particular, the ring map

$$
k_{12}\left[x_{1}, \ldots, x_{n}, \frac{1}{x_{1} \ldots x_{n}}\right] \longrightarrow k_{1}, \quad x_{i} \longmapsto \alpha_{i}
$$

is surjective. By the Hilbert Nullstellensatz, Algebra, Theorem 10.33.1 we conclude that $k_{1}$ is a finite extension of $k_{12}$. In the same way we conclude that $k_{2}$ is a finite extension of $k_{12}$. In particular both $k_{1}$ and $k_{2}$ are contained in the integral closure $k_{12}^{\prime}$ of $k_{12}$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$. But since $k_{12}^{\prime}$ is a field by Lemma 32.22 .4 and since we chose $k_{i}$ to be integrally closed in $\Gamma\left(X, \mathcal{O}_{X}\right)$ we conclude that $k_{1}=k_{12}=k_{2}$ as desired.

### 32.26. Euler characteristics

OBEI In this section we prove some elementary properties of Euler characteristics of coherent sheaves on schemes proper over fields.

0BEJ Definition 32.26.1. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. In this situation the Euler characteristic of $\mathcal{F}$ is the integer

$$
\chi(X, \mathcal{F})=\sum_{i}(-1)^{i} \operatorname{dim}_{k} H^{i}(X, \mathcal{F})
$$

For justification of the formula see below.
In the situation of the definition only a finite number of the vector spaces $H^{i}(X, \mathcal{F})$ are nonzero (Cohomology of Schemes, Lemma 29.4.5) and that each of these spaces is finite dimensional (Cohomology of Schemes, Lemma 29.18.3). Thus $\chi(X, \mathcal{F}) \in \mathbf{Z}$ is well defined. Observe that this definition depends on the field $k$ and not just on the pair $(X, \mathcal{F})$.

08AA Lemma 32.26.2. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $0 \rightarrow$ $\mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ be a short exact sequence of coherent modules on $X$. Then

$$
\chi\left(X, \mathcal{F}_{2}\right)=\chi\left(X, \mathcal{F}_{1}\right)+\chi\left(X, \mathcal{F}_{3}\right)
$$

Proof. Consider the long exact sequence of cohomology

$$
0 \rightarrow H^{0}\left(X, \mathcal{F}_{1}\right) \rightarrow H^{0}\left(X, \mathcal{F}_{2}\right) \rightarrow H^{0}\left(X, \mathcal{F}_{3}\right) \rightarrow H^{1}\left(X, \mathcal{F}_{1}\right) \rightarrow \ldots
$$

associated to the short exact sequence of the lemma. The rank-nullity theorem in linear algebra shows that

$$
0=\operatorname{dim} H^{0}\left(X, \mathcal{F}_{1}\right)-\operatorname{dim} H^{0}\left(X, \mathcal{F}_{2}\right)+\operatorname{dim} H^{0}\left(X, \mathcal{F}_{3}\right)-\operatorname{dim} H^{1}\left(X, \mathcal{F}_{1}\right)+\ldots
$$

This immediately implies the lemma.

0AYT Lemma 32.26.3. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $\mathcal{F}$ be a coherent sheaf with $\operatorname{dim}(\operatorname{Supp}(\mathcal{F})) \leq 0$. Then $\mathcal{F}$ is generated by global sections and

$$
\chi(X, \mathcal{F})=\operatorname{dim}_{k} \Gamma(X, \mathcal{F}) \quad \text { and } \quad \chi(X, \mathcal{F} \otimes \mathcal{E})=n \chi(X, \mathcal{F})
$$

for every locally free module $\mathcal{E}$ of rank $n$.
Proof. By Cohomology of Schemes, Lemma 29.9.7 we see that $\mathcal{F}=i_{*} \mathcal{G}$ where $i: Z \rightarrow X$ is the inclusion of the scheme theoretic support of $\mathcal{F}$ and where $\mathcal{G}$ is a coherent $\mathcal{O}_{Z}$-module. Since the dimension of $Z$ is 0 , we see $Z$ is affine (Properties, Lemma 27.10 .5 . Hence $\mathcal{G}$ is globally generated and the higher cohomology groups of $\mathcal{G}$ are zero (Cohomology of Schemes, Lemma 29.2.2). Hence $\mathcal{F}=i_{*} \mathcal{G}$ is globally generated. Since the cohomologies of $\mathcal{F}$ and $\mathcal{G}$ agree (Cohomology of Schemes, Lemma 29.2.4 we conclude that the higher cohomology groups of $\mathcal{F}$ are zero which gives the first formula. By the projection formula (Cohomology, Lemma 20.43.2) we have

$$
i_{*}\left(\mathcal{G} \otimes i^{*} \mathcal{E}\right)=\mathcal{F} \otimes \mathcal{E}
$$

Since $Z$ has dimension 0 the locally free sheaf $i^{*} \mathcal{E}$ is isomorphic to $\mathcal{O}_{Z}^{\oplus n}$ and arguing as above we see that the second formula holds.

08AB Lemma 32.26.4. Let $k \subset k^{\prime}$ be an extension of fields. Let $X$ be a proper scheme over $k$. Let $\mathcal{F}$ be a coherent sheaf on $X$. Let $\mathcal{F}^{\prime}$ be the pullback of $\mathcal{F}$ to $X_{k^{\prime}}$. Then $\chi(X, \mathcal{F})=\chi\left(X^{\prime}, \mathcal{F}^{\prime}\right)$.

Proof. This is true because

$$
H^{i}\left(X_{k^{\prime}}, \mathcal{F}^{\prime}\right)=H^{i}(X, \mathcal{F}) \otimes_{k} k^{\prime}
$$

by flat base change, see Cohomology of Schemes, Lemma 29.5.2
0BEK Lemma 32.26.5. Let $k$ be a field. Let $f: Y \rightarrow X$ be a morphism of proper schemes over $k$. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{Y}$-module. Then

$$
\chi(Y, \mathcal{G})=\sum(-1)^{i} \chi\left(X, R^{i} f_{*} \mathcal{G}\right)
$$

Proof. The formula makes sense: the sheaves $R^{i} f_{*} \mathcal{G}$ are coherent and only a finite number of them are nonzero, see Cohomology of Schemes, Proposition 29.18.1 and Lemma 29.4.5. By Cohomology, Lemma 20.14.4 there is a spectral sequence with

$$
E_{2}^{p, q}=H^{p}\left(X, R^{q} f_{*} \mathcal{G}\right)
$$

converging to $H^{p+q}(Y, \mathcal{G})$. By finiteness of cohomology on $X$ we see that only a finite number of $E_{2}^{p, q}$ are nonzero and each $E_{2}^{p, q}$ is a finite dimensional vector space. It follows that the same is true for $E_{r}^{p, q}$ for $r \geq 2$ and that

$$
\sum(-1)^{p+q} \operatorname{dim}_{k} E_{r}^{p, q}
$$

is indepedent of $r$. Since for $r$ large enough we have $E_{r}^{p, q}=E_{\infty}^{p, q}$ and since convergence means there is a filtration on $H^{n}(Y, \mathcal{G})$ whose graded pieces are $E_{\infty}^{p, q}$ with $p+1=n$ (this is the meaning of covergence of the spectral sequence), we conclude.

### 32.27. Projective space

0B2N Some results on projective space over a field.
0B2P Lemma 32.27.1. Let $k$ be a field and $n \geq 0$. Then $\mathbf{P}_{k}^{n}$ is a smooth projective variety of dimension $n$ over $k$.

Proof. Omitted.
0B2Q Lemma 32.27.2. Let $k$ be a field and $n \geq 0$. Let $X, Y \subset \mathbf{A}_{k}^{n}$ be closed subsets. Assume that $X$ and $Y$ are equidimensional, $\operatorname{dim}(X)=r$ and $\operatorname{dim}(Y)=s$. Then every irreducible component of $X \cap Y$ has dimension $\geq r+s-n$.

Proof. Consider the closed subscheme $X \times Y \subset \mathbf{A}_{k}^{2 n}$ where we use coordinates $x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n}$. Then $X \cap Y=X \times Y \cap V\left(x_{1}-y_{1}, \ldots, x_{n}-y_{n}\right)$. Let $t \in$ $X \cap Y \subset X \times Y$ be a closed point. By Lemma 32.17 .5 we have $\operatorname{dim}_{t}(X \times Y)=$ $\operatorname{dim}(X)+\operatorname{dim}(Y)$. Thus $\operatorname{dim}\left(\mathcal{O}_{X \times Y, t}\right)=r+s$ by Lemma 32.17.3. By Algebra, Lemma 10.59.12 we conclude that

$$
\operatorname{dim}\left(\mathcal{O}_{X \cap Y, t}\right)=\operatorname{dim}\left(\mathcal{O}_{X \times Y, t} /\left(x_{1}-y_{1}, \ldots, x_{n}-y_{n}\right)\right) \geq r+s-n
$$

This implies the result by Lemma 32.17 .3 .
0B2R Lemma 32.27.3. Let $k$ be a field and $n \geq 0$. Let $X, Y \subset \mathbf{P}_{k}^{n}$ be nonempty closed subsets. If $\operatorname{dim}(X)=r$ and $\operatorname{dim}(Y)=s$ and $r+s \geq n$, then $X \cap Y$ is nonempty and $\operatorname{dim}(X \cap Y) \geq r+s-n$.

Proof. Write $\mathbf{A}^{n}=\operatorname{Spec}\left(k\left[x_{0}, \ldots, x_{n}\right]\right)$ and $\mathbf{P}^{n}=\operatorname{Proj}\left(k\left[T_{0}, \ldots, T_{n}\right]\right)$. Consider the morphism $\pi: \mathbf{A}^{n+1} \backslash\{0\} \rightarrow \mathbf{P}^{n}$ which sends $\left(x_{0}, \ldots, x_{n}\right)$ to the point $\left[x_{0}: \ldots\right.$ : $\left.x_{n}\right]$. More precisely, it is the morphism associated to the pair $\left(\mathcal{O}_{\mathbf{A}^{n+1} \backslash\{0\}},\left(x_{0}, \ldots, x_{n}\right)\right)$, see Constructions, Lemma 26.13.1. Over the standard affine open $D_{+}\left(T_{i}\right)$ we get the morphism associated to the ring map

$$
k\left[\frac{T_{0}}{T_{i}}, \ldots, \frac{T_{n}}{T_{i}}\right] \longrightarrow k\left[T_{0}, \ldots, T_{n}, \frac{1}{T_{i}}\right] \cong k\left[\frac{T_{0}}{T_{i}}, \ldots, \frac{T_{n}}{T_{i}}\right]\left[T_{i}, \frac{1}{T_{i}}\right]
$$

which is surjective and smooth of relative dimension 1 with irreducible fibres (details omitted). Hence $\pi^{-1}(X)$ and $\pi^{-1}(Y)$ are nonempty closed subsets of dimension $r+1$ and $s+1$. Choose an irreducible component $V \subset \pi^{-1}(X)$ of dimension $r+1$ and an irreducible component $W \subset \pi^{-1}(Y)$ of dimension $s+1$. Observe that this implies $V$ and $W$ contain every fibre of $\pi$ they meet (since $\pi$ has irreducible fibres of dimension 1 and since Lemma 32.17 .4 says the fibres of $V \rightarrow \pi(V)$ and $W \rightarrow \pi(W)$ have dimension $\geq 1$ ). Let $\bar{V}$ and $\bar{W}$ be the closure of $V$ and $W$ in $\mathbf{A}^{n+1}$. Since $0 \in \mathbf{A}^{n+1}$ is in the closure of every fibre of $\pi$ we see that $0 \in \bar{V} \cap \bar{W}$. By Lemma 32.27 .2 we have $\operatorname{dim}(\bar{V} \cap \bar{W}) \geq r+s-n+1$. Arguing as above using Lemma 32.17.4 again, we conclude that $\pi(V \cap W) \subset X \cap Y$ has dimension at least $r+s-n$ as desired.

### 32.28. Coherent sheaves on projective space

089X In this section we prove some results on the cohomology of coherent sheaves on $\mathbf{P}^{n}$ over a field which can be found in Mum66. These will be useful later when discussing Quot and Hilbert schemes.

089 Y 32.28.1. Preliminaries. Let $k$ be a field, $n \geq 1, d \geq 1$, and let $s \in \Gamma\left(\mathbf{P}_{k}^{n}, \mathcal{O}(d)\right)$ be a nonzero section. In this section we will write $\mathcal{O}(d)$ for the $d$ th twist of the structure sheaf on projective space (Constructions, Definitions 26.10.1 and 26.13.2. Since $\mathbf{P}_{k}^{n}$ is a variety this section is regular, hence $s$ is a regular section of $\mathcal{O}(d)$ and defines an effective Cartier divisor $H=Z(s) \subset \mathbf{P}_{k}^{n}$, see Divisors, Section 30.11 . Such a divisor $H$ is called a hypersurface and if $d=1$ it is called a hyperplane.

089Z Lemma 32.28.2. Let $k$ be a field. Let $n \geq 1$. Let $i: H \rightarrow \mathbf{P}_{k}^{n}$ be a hyperplane. Then there exists an isomorphism

$$
\varphi: \mathbf{P}_{k}^{n-1} \longrightarrow H
$$

such that $i^{*} \mathcal{O}(1)$ pulls back to $\mathcal{O}(1)$.
Proof. We have $\mathbf{P}_{k}^{n}=\operatorname{Proj}\left(k\left[T_{0}, \ldots, T_{n}\right]\right)$. The section $s$ corresponds to a homogeneous form in $T_{0}, \ldots, T_{n}$ of degree 1, see Cohomology of Schemes, Section 29.8. Say $s=\sum a_{i} T_{i}$. Constructions, Lemma 26.13.6 gives that $H=\operatorname{Proj}\left(k\left[T_{0}, \ldots, T_{n}\right] / I\right)$ for the graded ideal $I$ defined by setting $I_{d}$ equal to the kernel of the map $\Gamma\left(\mathbf{P}_{k}^{n}, \mathcal{O}(d)\right) \rightarrow$ $\Gamma\left(H, i^{*} \mathcal{O}(d)\right)$. By our construction of $Z(s)$ in Divisors, Definition 30.11.19 we see that on $D_{+}\left(T_{j}\right)$ the ideal of $H$ is generated by $\sum a_{i} T_{i} / T_{j}$ in the polynomial ring $k\left[T_{0} / T_{j}, \ldots, T_{n} / T_{j}\right]$. Thus it is clear that $I$ is the ideal generated by $\sum a_{i} T_{i}$. Note that

$$
k\left[T_{0}, \ldots, T_{n}\right] / I=k\left[T_{0}, \ldots, T_{n}\right] /\left(\sum a_{i} T_{i}\right) \cong k\left[S_{0}, \ldots, S_{n-1}\right]
$$

as graded rings. For example, if $a_{n} \neq 0$, then mapping $S_{i}$ equal to the class of $T_{i}$ works. We obtain the desired isomorphism by functoriality of Proj. Equality of twists of structure sheaves follows for example from Constructions, Lemma 26.11.5.

08A0 Lemma 32.28.3. Let $k$ be an infinite field. Let $n \geq 1$. Let $\mathcal{F}$ be a coherent module on $\mathbf{P}_{k}^{n}$. Then there exist a nonzero section $s \in \Gamma\left(\mathbf{P}_{k}^{n}, \mathcal{O}(1)\right)$ and a short exact sequence

$$
0 \rightarrow \mathcal{F}(-1) \rightarrow \mathcal{F} \rightarrow i_{*} \mathcal{G} \rightarrow 0
$$

where $i: H \rightarrow \mathbf{P}_{k}^{n}$ is the hyperplane $H$ associated to $s$ and $\mathcal{G}=i^{*} \mathcal{F}$.
Proof. The map $\mathcal{F}(-1) \rightarrow \mathcal{F}$ comes from Constructions, Equation 26.10.1.2 with $n=1, m=-1$ and the section $s$ of $\mathcal{O}(1)$. Let's work out what this map looks like if we restrict it to $D_{+}\left(T_{0}\right)$. Write $D_{+}\left(T_{0}\right)=\operatorname{Spec}\left(k\left[x_{1}, \ldots, x_{n}\right]\right)$ with $x_{i}=$ $T_{i} / T_{0}$. Identify $\left.\mathcal{O}(1)\right|_{D_{+}\left(T_{0}\right)}$ with $\mathcal{O}$ using the section $T_{0}$. Hence if $s=\sum a_{i} T_{i}$ then $\left.s\right|_{D_{+}\left(T_{0}\right)}=a_{0}+\sum a_{i} x_{i}$ with the identification chosen above. Furthermore, suppose $\left.\mathcal{F}\right|_{D_{+}\left(T_{0}\right)}$ corresponds to the finite $k\left[x_{1}, \ldots, x_{n}\right]$-module $M$. Via the identification $\mathcal{F}(-1)=\mathcal{F} \otimes \mathcal{O}(-1)$ and our chosen trivialization of $\mathcal{O}(1)$ we see that $\mathcal{F}(-1)$ corresponds to $M$ as well. Thus restricting $\mathcal{F}(-1) \rightarrow \mathcal{F}$ to $D_{+}\left(T_{0}\right)$ gives the map

$$
M \xrightarrow{a_{0}+\sum a_{i} x_{i}} M
$$

To see that the arrow is injective, it suffices to pick $a_{0}+\sum a_{i} x_{i}$ outside any of the associated primes of $M$, see Algebra, Lemma 10.62.9. By Algebra, Lemma 10.62 .5 the set $\operatorname{Ass}(M)$ of associated primes of $M$ is finite. Note that for $\mathfrak{p} \in \operatorname{Ass}(M)$ the intersection $\mathfrak{p} \cap\left\{a_{0}+\sum a_{i} x_{i}\right\}$ is a proper $k$-subvector space. We conclude that there is a finite family of proper sub vector spaces $V_{1}, \ldots, V_{m} \subset \Gamma\left(\mathbf{P}_{k}^{n}, \mathcal{O}(1)\right)$ such that if we take $s$ outside of $\bigcup V_{i}$, then multiplication by $s$ is injective over $D_{+}\left(T_{0}\right)$. Similarly for the restriction to $D_{+}\left(T_{j}\right)$ for $j=1, \ldots, n$. Since $k$ is infinite, a finite
union of proper sub vector spaces is never equal to the whole space, hence we may choose $s$ such that the map is injective. The cokernel of $\mathcal{F}(-1) \rightarrow \mathcal{F}$ is annihilated by $\operatorname{Im}(s: \mathcal{O}(-1) \rightarrow \mathcal{O})$ which is the ideal sheaf of $H$ by Divisors, Definition 30.11.19. Hence we obtain $\mathcal{G}$ on $H$ using Cohomology of Schemes, Lemma 29.9.8.
08A1 Remark 32.28.4. Let $k$ be an infinite field. Let $n \geq 1$. Given a finite number of coherent modules $\mathcal{F}_{i}$ on $\mathbf{P}_{k}^{n}$ we can choose a single $s \in \Gamma\left(\mathbf{P}_{k}^{n}, \mathcal{O}(1)\right)$ such that the statement of Lemma 32.28 .3 works for each of them. To prove this, just apply the lemma to $\bigoplus \mathcal{F}_{i}$.
08A2 32.28.5. Regularity. Here is the definition.
08A3 Definition 32.28.6. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. We say $\mathcal{F}$ is $m$-regular if

$$
H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m-i)\right)=0
$$

for $i=1, \ldots, n$.
Note that $\mathcal{F}=\mathcal{O}(d)$ is $m$-regular if and only if $d \geq m$. This follows from the computation of cohomology groups in Cohomology of Schemes, Equation 29.8.1.1). Namely, we see that $H^{n}\left(\mathbf{P}_{k}^{n}, \mathcal{O}(d)\right)=0$ if and only if $d \geq-n$.

08A4 Lemma 32.28.7. Let $k \subset k^{\prime}$ be an extension of fields. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. Let $\mathcal{F}^{\prime}$ be the pullback of $\mathcal{F}$ to $\mathbf{P}_{k^{\prime}}^{n}$. Then $\mathcal{F}$ is m-regular if and only if $\mathcal{F}^{\prime}$ is $m$-regular.
Proof. This is true because

$$
H^{i}\left(\mathbf{P}_{k^{\prime}}^{n}, \mathcal{F}^{\prime}\right)=H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{F}\right) \otimes_{k} k^{\prime}
$$

by flat base change, see Cohomology of Schemes, Lemma 29.5.2.
08A5 Lemma 32.28.8. In the situation of Lemma 32.28.3, if $\mathcal{F}$ is m-regular, then $\mathcal{G}$ is m-regular on $H \cong \mathbf{P}_{k}^{n-1}$.
Proof. Recall that $H^{i}\left(\mathbf{P}_{k}^{n}, i_{*} \mathcal{G}\right)=H^{i}(H, \mathcal{G})$ by Cohomology of Schemes, Lemma 29.2.4. Hence we see that for $i \geq 1$ we get

$$
H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m-i)\right) \rightarrow H^{i}(H, \mathcal{G}(m-i)) \rightarrow H^{i+1}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m-1-i)\right)
$$

as part of the long exact sequence associated to the short exact sequence $0 \rightarrow$ $\mathcal{F}(m-1-i) \rightarrow \mathcal{F}(m-i) \rightarrow i_{*} \mathcal{G}(m-i) \rightarrow 0$ we obtain from the exact sequence of Lemma 32.28 .3 by tensoring with the invertible sheaf $\mathcal{O}(m-i)$. The lemma follows.

08A6 Lemma 32.28.9. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. If $\mathcal{F}$ is $m$-regular, then $\mathcal{F}$ is $(m+1)$-regular.

Proof. We prove this by induction on $n$. If $n=0$ every sheaf is $m$-regular for all $m$ and there is nothing to prove. By Lemma 32.28 .7 we may replace $k$ by an infinite overfield and assume $k$ is infinite. Thus we may apply Lemma 32.28.3. By Lemma 32.28 .8 we know that $\mathcal{G}$ is $m$-regular. By induction on $n$ we see that $\mathcal{G}$ is $(m+1)$-regular. Considering the long exact cohomology sequence associated to the sequence

$$
0 \rightarrow \mathcal{F}(m-i) \rightarrow \mathcal{F}(m+1-i) \rightarrow i_{*} \mathcal{G}(m+1-i) \rightarrow 0
$$

the reader easily deduces for $i \geq 1$ the vanishing of $H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m+1-i)\right)$ from the (known) vanishing of $H^{i}\left(\mathbf{P}_{k}^{n}, \overline{\mathcal{F}}(m-i)\right)$ and $H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{G}(m+1-i)\right)$.

08A7 Lemma 32.28.10. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. If $\mathcal{F}$ is $m$-regular, then the multiplication map

$$
H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m)\right) \otimes_{k} H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{O}(1)\right) \longrightarrow H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m+1)\right)
$$

is surjective.
Proof. Let $k \subset k^{\prime}$ be an extension of fields. Let $\mathcal{F}^{\prime}$ be as in Lemma 32.28.7. By Cohomology of Schemes, Lemma 29.5.2 the base change of the linear map of the lemma to $k^{\prime}$ is the same linear map for the sheaf $\mathcal{F}^{\prime}$. Since $k \rightarrow k^{\prime}$ is faithfully flat it suffices to prove the lemma over $k^{\prime}$, i.e., we may assume $k$ is infinite.

Assume $k$ is infinite. We prove the lemma by induction on $n$. The case $n=0$ is trivial as $\mathcal{O}(1) \cong \mathcal{O}$ is generated by $T_{0}$. For $n>0$ apply Lemma 32.28 .3 and tensor the sequence by $\mathcal{O}(m+1)$ to get

$$
0 \rightarrow \mathcal{F}(m) \xrightarrow{s} \mathcal{F}(m+1) \rightarrow i_{*} \mathcal{G}(m+1) \rightarrow 0
$$

Let $t \in H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m+1)\right)$. By induction the image $\bar{t} \in H^{0}(H, \mathcal{G}(m+1))$ is the image of $\sum g_{i} \otimes \bar{s}_{i}$ with $\bar{s}_{i} \in \Gamma(H, \mathcal{O}(1))$ and $g_{i} \in H^{0}(H, \mathcal{G}(m))$. Since $\mathcal{F}$ is $m$-regular we have $H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m-1)\right)=0$, hence long exact cohomology sequence associated to the short exact sequence

$$
0 \rightarrow \mathcal{F}(m-1) \xrightarrow{s} \mathcal{F}(m) \rightarrow i_{*} \mathcal{G}(m) \rightarrow 0
$$

shows we can lift $g_{i}$ to $f_{i} \in H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m)\right)$. We can also lift $\bar{s}_{i}$ to $s_{i} \in H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{O}(1)\right)$ (see proof of Lemma 32.28 .2 for example). After substracting the image of $\sum f_{i} \otimes s_{i}$ from $t$ we see that we may assume $\bar{t}=0$. But this exactly means that $t$ is the image of $f \otimes s$ for some $f \in H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(m)\right)$ as desired.

08A8 Lemma 32.28.11. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. If $\mathcal{F}$ is $m$-regular, then $\mathcal{F}(m)$ is globally generated.

Proof. For all $d \gg 0$ the sheaf $\mathcal{F}(d)$ is globally generated. This follows for example from the first part of Cohomology of Schemes, Lemma 29.14.1. Pick $d \geq m$ such that $\mathcal{F}(d)$ is globally generated. Choose a basis $f_{1}, \ldots, f_{r} \in H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}\right)$. By Lemma 32.28 .10 every element $f \in H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(d)\right)$ can be written as $f=\sum P_{i} f_{i}$ for some $P_{i} \in k\left[T_{0}, \ldots, T_{n}\right]$ homogeneous of degree $d-m$. Since the sections $f$ generate $\mathcal{F}(d)$ it follows that the sections $f_{i}$ generate $\mathcal{F}(m)$.

08A9 32.28.12. Hilbert polynomials. The following lemma will be made obsolete by the more general Lemma 32.34.1.

08AC Lemma 32.28.13. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. The function

$$
d \longmapsto \chi\left(\mathbf{P}_{k}^{n}, \mathcal{F}(d)\right)
$$

is a polynomial.
Proof. We prove this by induction on $n$. If $n=0$, then $\mathbf{P}_{k}^{n}=\operatorname{Spec}(k)$ and $\mathcal{F}(d)=\mathcal{F}$. Hence in this case the function is constant, i.e., a polynomial of degree 0 . Assume $n>0$. By Lemma 32.26 .4 we may assume $k$ is infinite. Apply Lemma 32.28.3 Applying Lemma 32.26.2 to the twisted sequences $0 \rightarrow \mathcal{F}(d-1) \rightarrow \mathcal{F}(d) \rightarrow$ $i_{*} \mathcal{G}(d) \rightarrow 0$ we obtain

$$
\chi\left(\mathbf{P}_{k}^{n}, \mathcal{F}(d)\right)-\chi\left(\mathbf{P}_{k}^{n}, \mathcal{F}(d-1)\right)=\chi(H, \mathcal{G}(d))
$$

(this also uses the identification of the cohomology of $i_{*} \mathcal{G}$ with the cohomology of $\mathcal{G}$, see Cohomology of Schemes, Lemma 29.2.4. Since $H \cong \mathbf{P}_{k}^{n-1}$ (Lemma 32.28.2) by induction the right hand side is a polynomial. The lemma is finished by noting that any function $f: \mathbf{Z} \rightarrow \mathbf{Z}$ with the property that the map $d \mapsto f(d)-f(d-1)$ is a polynomial, is itself a polynomial. We omit the proof of this fact (hint: compare with Algebra, Lemma 10.57.5).

08AD Definition 32.28.14. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$. The function $d \mapsto \chi\left(\mathbf{P}_{k}^{n}, \mathcal{F}(d)\right)$ is called the Hilbert polynomial of $\mathcal{F}$.

The Hilbert polynomial has coefficients in $\mathbf{Q}$ and not in general in $\mathbf{Z}$. For example the Hilbert polynomial of $\mathcal{O}_{\mathbf{P}_{k}^{n}}$ is

$$
d \longmapsto\binom{d+n}{n}=\frac{d^{n}}{n!}+\ldots
$$

This follows from the following lemma and the fact that

$$
H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{O}_{\mathbf{P}_{k}^{n}}\right)=k\left[T_{0}, \ldots, T_{n}\right]_{d}
$$

(degree $d$ part) whose dimension over $k$ is $\binom{d+n}{n}$.
08AE Lemma 32.28.15. Let $k$ be a field. Let $n \geq 0$. Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{k}^{n}$ with Hilbert polynomial $P \in \mathbf{Q}[t]$. Then

$$
P(d)=\operatorname{dim}_{k} H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{F}(d)\right)
$$

for all $d \gg 0$.
Proof. This follows from the vanishing of cohomology of high enough twists of $\mathcal{F}$. See Cohomology of Schemes, Lemma 29.14.1.

08 AF 32.28.16. Boundedness of quotients. In this subsection we bound the regularity of quotients of a given coherent sheaf on $\mathbf{P}^{n}$ in terms of the Hilbert polynomial.

08AG Lemma 32.28.17. Let $k$ be a field. Let $n \geq 0$. Let $r \geq 1$. Let $P \in \mathbf{Q}[t]$. There exists an integer $m$ depending on $n$, $r$, and $P$ with the following property: if

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{O}^{\oplus r} \rightarrow \mathcal{F} \rightarrow 0
$$

is a short exact sequence of coherent sheaves on $\mathbf{P}_{k}^{n}$ and $\mathcal{F}$ has Hilbert polynomial $P$, then $\mathcal{K}$ is m-regular.

Proof. We prove this by induction on $n$. If $n=0$, then $\mathbf{P}_{k}^{n}=\operatorname{Spec}(k)$ and any coherent module is 0-regular and any surjective map is surjective on global sections. Assume $n>0$. Consider an exact sequence as in the lemma. Let $P^{\prime} \in \mathbf{Q}[t]$ be the polynomial $P^{\prime}(t)=P(t)-P(t-1)$. Let $m^{\prime}$ be the integer which works for $n-1$, $r$, and $P^{\prime}$. By Lemmas 32.28 .7 and 32.26 .4 we may replace $k$ by a field extension, hence we may assume $k$ is infinite. Apply Lemma 32.28 .3 to the coherent sheaf $\mathcal{F}$. The Hilbert polynomial of $\mathcal{F}^{\prime}=i^{*} \mathcal{F}$ is $P^{\prime}$ (see proof of Lemma 32.28.13). Since $i^{*}$ is right exact we see that $\mathcal{F}^{\prime}$ is a quotient of $\mathcal{O}_{H}^{\oplus r}=i^{*} \mathcal{O}^{\oplus r}$. Thus the induction hypothesis applies to $\mathcal{F}^{\prime}$ on $H \cong \mathbf{P}_{k}^{n-1}$ (Lemma 32.28.2. . Note that the map $\mathcal{K}(-1) \rightarrow \mathcal{K}$ is injective as $\mathcal{K} \subset \mathcal{O}^{\oplus r}$ and has cokernel $i_{*} \mathcal{H}$ where $\mathcal{H}=i^{*} \mathcal{K}$. By
the snake lemma (Homology, Lemma 12.5.17) we obtain a commutative diagram with exact columns and rows

Thus the induction hypothesis applies to the exact sequence $0 \rightarrow \mathcal{H} \rightarrow \mathcal{O}_{H}^{\oplus r} \rightarrow$ $\mathcal{F}^{\prime} \rightarrow 0$ on $H \cong \mathbf{P}_{k}^{n-1}$ (Lemma 32.28.2 and $\mathcal{H}$ is $m^{\prime}$-regular. Recall that this implies that $\mathcal{H}$ is $d$-regular for all $d \geq m^{\prime}$ (Lemma 32.28.9).
Let $i \geq 2$ and $d \geq m^{\prime}$. It follows from the long exact cohomology sequence associated to the left column of the diagram above and the vanishing of $H^{i-1}(H, \mathcal{H}(d))$ that the map

$$
H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d-1)\right) \longrightarrow H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right)
$$

is injective. As these groups are zero for $d \gg 0$ (Cohomology of Schemes, Lemma 29.14.1 we conclude $H^{i}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right)$ are zero for all $d \geq m^{\prime}$ and $i \geq 2$.

We still have to control $H^{1}$. First we observe that all the maps

$$
H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}-1\right)\right) \rightarrow H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}\right)\right) \rightarrow H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}+1\right)\right) \rightarrow \ldots
$$

are surjective by the vanishing of $H^{1}(H, \mathcal{H}(d))$ for $d \geq m^{\prime}$. Suppose $d>m^{\prime}$ is such that

$$
H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d-1)\right) \longrightarrow H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right)
$$

is injective. Then $H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right) \rightarrow H^{0}(H, \mathcal{H}(d))$ is surjective. Consider the commutative diagram

By Lemma 32.28 .10 we see that the bottom horizontal arrow is surjective. Hence the right vertical arrow is surjective. We conclude that

$$
H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right) \longrightarrow H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d+1)\right)
$$

is injective. By induction we see that

$$
H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d-1)\right) \rightarrow H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right) \rightarrow H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d+1)\right) \rightarrow \ldots
$$

are all injective and we conclude that $H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d-1)\right)=0$ because of the eventual vanishing of these groups. Thus the dimensions of the groups $H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}(d)\right)$ for
$d \geq m^{\prime}$ are strictly decreasing until they become zero. It follows that the regularity of $\mathcal{K}$ is bounded by $m^{\prime}+\operatorname{dim}_{k} H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}\right)\right)$. On the other hand, by the vanishing of the higher cohomology groups we have

$$
\operatorname{dim}_{k} H^{1}\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}\right)\right)=-\chi\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}\right)\right)+\operatorname{dim}_{k} H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}\right)\right)
$$

Note that the $H^{0}$ has dimension bounded by the dimension of $H^{0}\left(\mathbf{P}_{k}^{n}, \mathcal{O}^{\oplus r}\left(m^{\prime}\right)\right)$ which is at most $r\binom{n+m^{\prime}}{n}$ if $m^{\prime}>0$ and zero if not. Finally, the term $\chi\left(\mathbf{P}_{k}^{n}, \mathcal{K}\left(m^{\prime}\right)\right)$ is equal to $r\binom{n+m^{\prime}}{n}-P\left(m^{\prime}\right)$. This gives a bound of the desired type finishing the proof of the lemma.

### 32.29. Glueing dimension one rings

09MX This section contains some algebraic preliminaries to proving that a finite set of codimension 1 points of a separated scheme is contained in an affine open.

09 MY Situation 32.29.1. Here we are given a commutative diagram of rings

where $K$ is a field and $A, B$ are subrings of $K$ with fraction field $K$. Finally, $R=A \times_{K} B=A \cap B$.

09 MZ Lemma 32.29.2. In Situation 32.29.1 assume that $B$ is a valuation ring. Then for every unit $u$ of $A$ either $u \in R$ or $u^{-1} \in R$.
Proof. Namely, if the image $c$ of $u$ in $K$ is in $B$, then $u \in R$. Otherwise, $c^{-1} \in B$ (Algebra, Lemma 10.49.3) and $u^{-1} \in R$.

The following lemma explains the meaning of the condition " $A \otimes B \rightarrow K$ is surjective" which comes up quite a bit in the following.

09N0 Lemma 32.29.3. In Situation 32.29.1 assume A is a Noetherian ring of dimension 1. The following are equivalent
(1) $A \otimes B \rightarrow K$ is not surjective,
(2) there exists a discrete valuation ring $\mathcal{O} \subset K$ containing both $A$ and $B$.

Proof. It is clear that (2) implies (1). On the other hand, if $A \otimes B \rightarrow K$ is not surjective, then the image $C \subset K$ is not a field hence $C$ has a nonzero maximal ideal $\mathfrak{m}$. Choose a valuation ring $\mathcal{O} \subset K$ dominating $C_{\mathfrak{m}}$. By Algebra, Lemma 10.118 .12 applied to $A \subset \mathcal{O}$ the $\operatorname{ring} \mathcal{O}$ is Noetherian. Hence $\mathcal{O}$ is a valuation ring by Algebra, Lemma 10.49.18.

09N1 Lemma 32.29.4. In Situation 32.29.1 assume
(1) $A$ is a Noetherian semi-local domain of dimension 1 ,
(2) $B$ is a discrete valuation ring,

Then we have the following two possibilities
(a) If $A^{*}$ is not contained in $R$, then $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)$ and $\operatorname{Spec}(B) \rightarrow$ $\operatorname{Spec}(R)$ are open immersions and $K=A \otimes_{R} B$.
(b) If $A^{*}$ is contained in $R$, then $B$ dominates one of the local rings of $A$ at a maximal ideal and $A \otimes B \rightarrow K$ is not surjective.

Proof. Assumption (a) implies there is a unit of $A$ whose image in $K$ lies in the maximal ideal of $B$. Then $u$ is a nonzerodivisor of $R$ and for every $a \in A$ there exists an $n$ such that $u^{n} a \in R$. It follows that $A=R_{u}$.

Let $\mathfrak{m}_{A}$ be the radical of $A$. Let $x \in \mathfrak{m}_{A}$ be a nonzero element. Since $\operatorname{dim}(A)=1$ we see that $K=A_{x}$. After replacing $x$ by $x^{n} u^{m}$ for some $n \geq 1$ and $m \in \mathbf{Z}$ we may assume $x$ maps to a unit of $B$. We see that for every $b \in B$ we have that $x^{n} b$ in the image of $R$ for some $n$. Thus $B=R_{x}$.

Let $z \in R$. If $z \notin \mathfrak{m}_{A}$ and $z$ does not map to an element of $\mathfrak{m}_{B}$, then $z$ is invertible. Thus $x+u$ is invertible in $R$. Hence $\operatorname{Spec}(R)=D(x) \cup D(u)$. We have seen above that $D(u)=\operatorname{Spec}(A)$ and $D(x)=\operatorname{Spec}(B)$.

Case (b). If $x \in \mathfrak{m}_{A}$, then $1+x$ is a unit and hence $1+x \in R$, i.e, $x \in R$. Thus we see that $\mathfrak{m}_{A} \subset R \subset A$. In fact, in this case $A$ is integral over $R$. Namely, write $A / \mathfrak{m}_{A}=\kappa_{1} \times \ldots \times \kappa_{n}$ as a product of fields. Say $x=\left(c_{1}, \ldots, c_{r}, 0, \ldots, 0\right)$ is an element with $c_{i} \neq 0$. Then

$$
x^{2}-x\left(c_{1}, \ldots, c_{r}, 1, \ldots, 1\right)=0
$$

Since $R$ contains all units we see that $A / \mathfrak{m}_{A}$ is integral over the image of $R$ in it, and hence $A$ is integral over $R$. It follows that $R \subset A \subset B$ as $B$ is integrally closed. Moreover, if $x \in \mathfrak{m}_{A}$ is nonzero, then $K=A_{x}=\bigcup x^{-n} A=\bigcup x^{-n} R$. Hence $x^{-1} \notin B$, i.e., $x \in \mathfrak{m}_{B}$. We conclude $\mathfrak{m}_{A} \subset \mathfrak{m}_{B}$. Thus $A \cap \mathfrak{m}_{B}$ is a maximal ideal of $A$ thereby finishing the proof.

09N2 Lemma 32.29.5. Let $B$ be a semi-local Noetherian domain of dimension 1. Let $B^{\prime}$ be the integral closure of $B$ in its fraction field. Then $B^{\prime}$ is a semi-local Dedekind domain. Let $x$ be a nonzero element of the radical of $B^{\prime}$. Then for every $y \in B^{\prime}$ there exists an $n$ such that $x^{n} y \in B$.

Proof. Let $\mathfrak{m}_{B}$ be the radical of $B$. The structure of $B^{\prime}$ results from Algebra, Lemma 10.119.16. Given $x, y \in B^{\prime}$ as in the statement of the lemma consider the subring $B \subset A \subset B^{\prime}$ generated by $x$ and $y$. Then $A$ is finite over $B$ (Algebra, Lemma 10.35.5). Since the fraction fields of $B$ and $A$ are the same we see that the finite module $A / B$ is supported on the set of closed points of $B$. Thus $\mathfrak{m}_{B}^{n} A \subset B$ for a suitable $n$. Moreover, $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow \operatorname{Spec}(A)$ is surjective (Algebra, Lemma 10.35.15), hence $A$ is semi-local as well. It also follows that $x$ is in the radical $\mathfrak{m}_{A}$ of $A$. Note that $\mathfrak{m}_{A}=\sqrt{\mathfrak{m}_{B} A}$. Thus $x^{m} y \in \mathfrak{m}_{B} A$ for some $m$. Then $x^{n m} y \in B$.

09N3 Lemma 32.29.6. In Situation 32.29.1 assume
(1) $A$ is a Noetherian semi-local domain of dimension 1 ,
(2) $B$ is a Noetherian semi-local domain of dimension 1,
(3) $A \otimes B \rightarrow K$ is surjective.

Then $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)$ and $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(R)$ are open immersions and $K=$ $A \otimes_{R} B$.

Proof. Special case: $B$ is integrally closed in $K$. This means that $B$ is a Dedekind domain (Algebra, Lemma 10.119.15) whence all of its localizations at maximal ideals are discrete valuation rings. Let $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{r}$ be the maximal ideals of $B$. We set

$$
R_{1}=A \times_{K} B_{\mathfrak{m}_{1}}
$$

Observing that $A \otimes_{R_{1}} B_{\mathfrak{m}_{1}} \rightarrow K$ is surjective we conclude from Lemma 32.29 .4 that $A$ and $B_{\mathfrak{m}_{1}}$ define open subschemes covering $\operatorname{Spec}\left(R_{1}\right)$ and that $K=A \otimes_{R_{1}} B_{\mathfrak{m}_{1}}$. In particular $R_{1}$ is a semi-local Noetherian ring of dimension 1. By induction we define

$$
R_{i+1}=R_{i} \times_{K} B_{\mathfrak{m}_{i+1}}
$$

for $i=1, \ldots, r-1$. Observe that $R=R_{n}$ because $B=B_{\mathfrak{m}_{1}} \cap \ldots \cap B_{\mathfrak{m}_{r}}$ (see Algebra, Lemma 10.149.6). It follows from the inductive procedure that $R \rightarrow A$ defines an open immersion $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)$. On the other hand, the maximal ideals $\mathfrak{n}_{i}$ of $R$ not in this open correspond to the maximal ideals $\mathfrak{m}_{i}$ of $B$ and in fact the ring map $R \rightarrow B$ defines an isomorphisms $R_{\mathfrak{n}_{i}} \rightarrow B_{\mathfrak{m}_{i}}$ (details omitted; hint: in each step we added exactly one maximal ideal to $\operatorname{Spec}\left(R_{i}\right)$ ). It follows that $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(R)$ is an open immersion as desired.

General case. Let $B^{\prime} \subset K$ be the integral closure of $B$. See Lemma 32.29.5. Then the special case applies to $R^{\prime}=A \times_{K} B^{\prime}$. Pick $x \in R^{\prime}$ which is not contained in the maximal ideals of $A$ and is contained in the maximal ideals of $B^{\prime}$ (see Algebra, Lemma 10.14.3. By Lemma 32.29.5 there exists an integer $n$ such that $x^{n} \in R=$ $A \times_{K} B$. Replace $x$ by $x^{n}$ so $x \in R$. For every $y \in R^{\prime}$ there exists an integer $n$ such that $x^{n} y \in R$. On the other hand, it is clear that $R_{x}^{\prime}=A$. Thus $R_{x}=A$. Exchanging the roles of $A$ and $B$ we also find an $y \in R$ such that $B=R_{y}$. Note that inverting both $x$ and $y$ leaves no primes except (0). Thus $K=R_{x y}=R_{x} \otimes_{R} R_{y}$. This finishes the proof.

09N4 Lemma 32.29.7. Let $K$ be a field. Let $A_{1}, \ldots, A_{r} \subset K$ be Noetherian semi-local rings of dimension 1 with fraction field $K$. If $A_{i} \otimes A_{j} \rightarrow K$ is surjective for all $i \neq j$, then there exists a Noetherian semi-local domain $A \subset K$ of dimension 1 containing $A_{1}, \ldots, A_{r}$ such that
(1) $A \rightarrow A_{i}$ induces an open immersion $j_{i}: \operatorname{Spec}\left(A_{i}\right) \rightarrow \operatorname{Spec}(A)$,
(2) $\operatorname{Spec}(A)$ is the union of the opens $j_{i}\left(\operatorname{Spec}\left(A_{i}\right)\right)$,
(3) each closed point of $\operatorname{Spec}(A)$ lies in exactly one of these opens.

Proof. Namely, we can take $A=A_{1} \cap \ldots \cap A_{r}$. First we note that (3), once (1) and (2) have been proven, follows from the assumption that $A_{i} \otimes A_{j} \rightarrow K$ is surjective since if $\mathfrak{m} \in j_{i}\left(\operatorname{Spec}\left(A_{i}\right)\right) \cap j_{j}\left(\operatorname{Spec}\left(A_{j}\right)\right)$, then $A_{i} \otimes A_{j} \rightarrow K$ ends up in $A_{\mathfrak{m}}$. To prove (1) and (2) we argue by induction on $r$. If $r>1$ by induction we have the results (1) and (2) for $B=A_{2} \cap \ldots \cap A_{r}$. Then we apply Lemma 32.29 .6 to see they hold for $A=A_{1} \cap B$.

09N5 Lemma 32.29.8. Let $A$ be a domain with fraction field $K$. Let $B_{1}, \ldots, B_{r} \subset K$ be Noetherian 1-dimensional semi-local rings whose fraction fields are $K$. If $A \otimes B_{i} \rightarrow$ $K$ are surjective for $i=1, \ldots, r$, then there exists an $x \in A$ such that $x^{-1}$ is in the radical of $B_{i}$ for $i=1, \ldots, r$.
Proof. Let $B_{i}^{\prime}$ be the integral closure of $B_{i}$ in $K$. Suppose we find a nonzero $x \in A$ such that $x^{-1}$ is in the radical of $B_{i}^{\prime}$ for $i=1, \ldots, r$. Then by Lemma 32.29.5, after replacing $x$ by a power we get $x^{-1} \in B_{i}$. Since $\operatorname{Spec}\left(B_{i}^{\prime}\right) \rightarrow \operatorname{Spec}\left(B_{i}\right)$ is surjective we see that $x^{-1}$ is then also in the radical of $B_{i}$. Thus we may assume that each $B_{i}$ is a semi-local Dedekind domain.
If $B_{i}$ is not local, then remove $B_{i}$ from the list and add back the finite collection of local rings $\left(B_{i}\right)_{\mathfrak{m}}$. Thus we may assume that $B_{i}$ is a discrete valuation ring for $i=1, \ldots, r$.

Let $v_{i}: K \rightarrow \mathbf{Z}, i=1, \ldots, r$ be the corresponding discrete valuations (see Algebra, Lemma 10.119.15. We are looking for a nonzero $x \in A$ with $v_{i}(x)<0$ for $i=$ $1, \ldots, r$. We will prove this by induction on $r$.
If $r=1$ and the result is wrong, then $A \subset B$ and the map $A \otimes B \rightarrow K$ is not surjective, contradiction.

If $r>1$, then by induction we can find a nonzero $x \in A$ such that $v_{i}(x)<0$ for $i=1, \ldots, r-1$. If $v_{r}(x)<0$ then we are done, so we may assume $v_{r}(x) \geq 0$. By the base case we can find $y \in A$ nonzero such that $v_{r}(y)<0$. After replacing $x$ by a power we may assume that $v_{i}(x)<v_{i}(y)$ for $i=1, \ldots, r-1$. Then $x+y$ is the element we are looking for.

0AB2 Lemma 32.29.9. Let $A$ be a Noetherian local ring of dimension 1. Let $L=\prod A_{\mathfrak{p}}$ where the product is over the minimal primes of $A$. Let $a_{1}, a_{2} \in \mathfrak{m}_{A}$ map to the same element of $L$. Then $a_{1}^{n}=a_{2}^{n}$ for some $n>0$.

Proof. Write $a_{1}=a_{2}+x$. Then $x$ maps to zero in $L$. Hence $x$ is a nilpotent element of $A$ because $\bigcap \mathfrak{p}$ is the radical of (0) and the annihilator $I$ of $x$ contains a power of the maximal ideal because $\mathfrak{p} \notin V(I)$ for all minimal primes. Say $x^{k}=0$ and $\mathfrak{m}^{n} \subset I$. Then
$a_{1}^{k+n}=a_{2}^{k+n}+\binom{n+k}{1} a_{2}^{n+k-1} x+\binom{n+k}{2} a_{2}^{n+k-2} x^{2}+\ldots+\binom{n+k}{k-1} a_{2}^{n+1} x^{k-1}=a_{2}^{n+k}$ because $a_{2} \in \mathfrak{m}_{A}$.

0AB3 Lemma 32.29.10. Let $A$ be a Noetherian local ring of dimension 1. Let $L=\prod A_{\mathfrak{p}}$ and $I=\bigcap \mathfrak{p}$ where the product and intersection are over the minimal primes of $A$. Let $f \in L$ be an element of the form $f=i+a$ where $a \in \mathfrak{m}_{A}$ and $i \in I L$. Then some power of $f$ is in the image of $A \rightarrow L$.

Proof. Since $A$ is Noetherian we have $I^{t}=0$ for some $t>0$. Suppose that we know that $f=a+i$ with $i \in I^{k} L$. Then $f^{n}=a^{n}+n a^{n-1} i \bmod I^{k+1} L$. Hence it suffices to show that $n a^{n-1} i$ is in the image of $I^{k} \rightarrow I^{k} L$ for some $n \gg 0$. To see this, pick a $g \in A$ such that $\mathfrak{m}_{A}=\sqrt{(g)}$ (Algebra, Lemma 10.59.7). Then $L=A_{g}$ for example by Algebra, Proposition 10.59.6. On the other hand, there is an $n$ such that $a^{n} \in(g)$. Hence we can clear denominators for elements of $L$ by multiplying by a high power of $a$.

0AB4 Lemma 32.29.11. Let $A$ be a Noetherian local ring of dimension 1. Let $L=\prod A_{\mathfrak{p}}$ where the product is over the minimal primes of $A$. Let $K \rightarrow L$ be an integral ring map. Then there exist $a \in \mathfrak{m}_{A}$ and $x \in K$ which map to the same element of $L$ such that $\mathfrak{m}_{A}=\sqrt{(a)}$.

Proof. By Lemma 32.29 .10 we may replace $A$ by $A /(\cap \mathfrak{p})$ and assume that $A$ is a reduced ring (some details omitted). We may also replace $K$ by the image of $K \rightarrow L$. Then $K$ is a reduced ring. The map $\operatorname{Spec}(L) \rightarrow \operatorname{Spec}(K)$ is surjective and closed (details omitted). Hence $\operatorname{Spec}(K)$ is a finite discrete space. It follows that $K$ is a finite product of fields.
Let $\mathfrak{p}_{j}, j=1, \ldots, m$ be the minimal primes of $A$. Set $L_{j}=f . f .\left(A_{j}\right)$ so that $L=\prod_{j=1, \ldots, m} L_{j}$. Let $A_{j}$ be the normalization of $A / \mathfrak{p}_{j}$. Then $A_{j}$ is a semi-local Dedekind domain with at least one maximal ideal, see Algebra, Lemma 10.119.16.

Let $n$ be the sum of the numbers of maximal ideals in $A_{1}, \ldots, A_{m}$. For such a maximal ideal $\mathfrak{m} \subset A_{j}$ we consider the function

$$
v_{\mathfrak{m}}: L \rightarrow L_{j} \rightarrow \mathbf{Z} \cup\{\infty\}
$$

where the second arrow is the discrete valuation corresponding to the discrete valuation ring $\left(A_{j}\right)_{\mathfrak{m}}$ extended by mapping 0 to $\infty$. In this way we obtain $n$ functions $v_{1}, \ldots, v_{n}: L \rightarrow \mathbf{Z} \cup\{\infty\}$. We will find an element $x \in K$ such that $v_{i}(x)<0$ for all $i=1, \ldots, n$.

First we claim that for each $i$ there exists an element $x \in K$ with $v_{i}(x)<0$. Namely, suppose that $v_{i}$ corresponds to $\mathfrak{m} \subset A_{j}$. If $v_{i}(x) \geq 0$ for all $x \in K$, then $K$ maps into $\left(A_{j}\right)_{\mathfrak{m}}$ inside of $L_{j}=f . f .\left(A_{j}\right)$. The image of $K$ in $L_{j}$ is a field over $L_{j}$ is algebraic by Algebra, Lemma 10.35.16. Combined we get a contradiction with Algebra, Lemma 10.49 .7
Suppose we have found an element $x \in K$ such that $v_{1}(x)<0, \ldots, v_{r}(x)<0$ for some $r<n$. If $v_{r+1}(x)<0$, then $x$ works for $r+1$. If not, then choose some $y \in K$ with $v_{r+1}(y)<0$ as is possible by the result of the previous paragraph. After replacing $x$ by $x^{n}$ for some $n>0$, we may assume $v_{i}(x)<v_{i}(y)$ for $i=1, \ldots, r$. Then $v_{j}(x+y)=v_{j}(x)<0$ for $j=1, \ldots, r$ by properties of valuations and similarly $v_{r+1}(x+y)=v_{r+1}(y)<0$. Arguing by induction, we find $x \in K$ with $v_{i}(x)<0$ for $i=1, \ldots, n$.

In particular, the element $x \in K$ has nonzero projection in each factor of $K$ (recall that $K$ is a finite product of fields and if some component of $x$ was zero, then one of the values $v_{i}(x)$ would be $\left.\infty\right)$. Hence $x$ is invertible and $x^{-1} \in K$ is an element with $\infty>v_{i}\left(x^{-1}\right)>0$ for all $i$. It follows from Lemma 32.29.5 that for some $e<0$ the element $x^{e} \in K$ maps to an element of $\mathfrak{m}_{A} / \mathfrak{p}_{j} \subset A / \mathfrak{p}_{j}$ for all $j=1, \ldots, m$. Observe that the cokernel of the map $\mathfrak{m}_{A} \rightarrow \prod \mathfrak{m}_{A} / \mathfrak{p}_{j}$ is annihilated by a power of $\mathfrak{m}_{A}$. Hence after replacing $e$ by a more negative $e$, we find an element $a \in \mathfrak{m}_{A}$ whose image in $\mathfrak{m}_{A} / \mathfrak{p}_{j}$ is equal to the image of $x^{e}$. The pair $\left(a, x^{e}\right)$ satisfies the conclusions of the lemma.

09N6 Lemma 32.29.12. Let $A$ be a ring. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}$ be a finite set of a primes of A. Let $S=A \backslash \bigcup \mathfrak{p}_{i}$. Then $S$ is a multiplicative system and $S^{-1} A$ is a semi-local ring whose maximal ideals correspond to the maximal elements of the set $\left\{\mathfrak{p}_{i}\right\}$.

Proof. If $a, b \in A$ and $a, b \in S$, then $a, b \notin \mathfrak{p}_{i}$ hence $a b \notin \mathfrak{p}_{i}$, hence $a b \in S$. Also $1 \in S$. Thus $S$ is a multiplicative subset of $A$. By the description of $\operatorname{Spec}\left(S^{-1} A\right)$ in Algebra, Lemma 10.16 .5 and by Algebra, Lemma 10.14 .2 we see that the primes of $S^{-1} A$ correspond to the primes of $A$ contained in one of the $\mathfrak{p}_{i}$. Hence the maximal ideals of $S^{-1} A$ correspond one-to-one with the maximal (w.r.t. inclusion) elements of the set $\left\{\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}\right\}$.

### 32.30. One dimensional Noetherian schemes

09N7 Some material leading up to a discussion of algebraic curves.
09N8 Lemma 32.30.1. Let $X$ be a scheme all of whose local rings are Noetherian of dimension $\leq 1$. Let $U \subset X$ be a retrocompact open. Denote $j: U \rightarrow X$ the inclusion morphism. Then $R^{p} j_{*} \mathcal{F}=0, p>0$ for every quasi-coherent $\mathcal{O}_{U}$-module $\mathcal{F}$.

Proof. We may check the vanishing of $R^{p} j_{*} \mathcal{F}$ at stalks. Formation of $R^{q} j_{*}$ commutes with flat base change, see Cohomology of Schemes, Lemma 29.5.2 Thus we may assume that $X$ is the spectrum of a Noetherian local ring of dimension $\leq 1$. In this case $X$ has a closed points $x$ and finitely many other points $x_{1}, \ldots, x_{n}$ which specialize to $x$ but not each other (see Algebra, Lemma 10.30.6). If $x \in U$, then $U=X$ and the result is clear. If not, then $U=\left\{x_{1}, \ldots, x_{r}\right\}$ for some $r$ after possibly renumbering the points. Then $U$ is affine (Schemes, Lemma 25.11.7). Thus the result by Cohomology of Schemes, Lemma 29.2 .3 .

09N9 Lemma 32.30.2. Let $X$ be an affine scheme all of whose local rings are Noetherian of dimension $\leq 1$. Then any quasi-compact open $U \subset X$ is affine.

Proof. Denote $j: U \rightarrow X$ the inclusion morphism. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{U}$-module. By Lemma 32.30 .1 the higher direct images $R^{p} j_{*} \mathcal{F}$ are zero. The $\mathcal{O}_{X^{-}}$ module $j_{*} \mathcal{F}$ is quasi-coherent (Schemes, Lemma 25.24.1). Hence it has vanishing higher cohomology groups by Cohomology of Schemes, Lemma 29.2.2. By the Leray spectral sequence Cohomology, Lemma 20.14.6 we have $H^{p}(U, \mathcal{F})=0$ for all $p>0$. Thus $U$ is affine, for example by Cohomology of Schemes, Lemma 29.3.1.

09NA Lemma 32.30.3. Let $X$ be a scheme. Let $U \subset X$ be an open. Assume
(1) $U$ is a retrocompact open of $X$,
(2) $X \backslash U$ is discrete, and
(3) for $x \in X \backslash U$ the local ring $\mathcal{O}_{X, x}$ is Noetherian of dimension $\leq 1$.

Then (1) there exists an invertible $\mathcal{O}_{X}$-module $\mathcal{L}$ and a section such that $U=X_{s}$ and (2) the map $\operatorname{Pic}(X) \rightarrow \operatorname{Pic}(U)$ is surjective.

Proof. Let $X \backslash U=\left\{x_{i} ; i \in I\right\}$. Choose affine opens $U_{i} \subset X$ with $x_{i} \in X$ and $x_{j} \notin U_{i}$ for $j \neq i$. This is possible by condition (2). Say $U_{i}=\operatorname{Spec}\left(A_{i}\right)$. Let $\mathfrak{m}_{i} \subset A_{i}$ be the maximal ideal corresponding to $x_{i}$. By our assumption on the local rings there are only a finite number of prime ideals $\mathfrak{q} \subset \mathfrak{m}_{i}, \mathfrak{q} \neq \mathfrak{m}_{i}$ (see Algebra, Lemma 10.30.6). Thus by prime avoidance (Algebra, Lemma 10.14 .2 ) we can find $f_{i} \in \mathfrak{m}_{i}$ not contained in any of those primes. Then $V\left(f_{i}\right)=\left\{\mathfrak{m}_{i}\right\} \amalg Z_{i}$ for some closed subset $Z_{i} \subset U_{i}$ because $Z_{i}$ is a retrocompact open subset of $V\left(f_{i}\right)$ closed under specialization, see Algebra, Lemma 10.40.7. After shrinking $U_{i}$ we may assume $V\left(f_{i}\right)=\left\{x_{i}\right\}$. Then

$$
\mathcal{U}: X=U \cup \bigcup U_{i}
$$

is an open covering of $X$. Consider the 2 -cocycle with values in $\mathcal{O}_{X}^{*}$ given by $f_{i}$ on $U \cap U_{i}$ and by $f_{i} / f_{j}$ on $U_{i} \cap U_{j}$. This defines a line bundle $\mathcal{L}$ such that the section $s$ defined by 1 on $U$ and $f_{i}$ on $U_{i}$ is as in the statement of the lemma.

Let $\mathcal{N}$ be an invertible $\mathcal{O}_{U}$-module. Let $N_{i}$ be the invertible $\left(A_{i}\right)_{f_{i}}$ module such that $\left.\mathcal{N}\right|_{U \cap U_{i}}$ is equal to $\tilde{N}_{i}$. Observe that $\left(A_{\mathfrak{m}_{i}}\right)_{f_{i}}$ is an Artinian ring (as a dimension zero Noetherian ring, see Algebra, Lemma 10.59.4. Thus it is a product of local rings (Algebra, Lemma 10.52.6) and hence has trivial Picard group. Thus, after shrinking $U_{i}$ (i.e., after replacing $A_{i}$ by $\left(A_{i}\right)_{g}$ for some $\left.g \in A_{i}, g \notin \mathfrak{m}_{i}\right)$ we can assume that $N_{i}=\left(A_{i}\right)_{f_{i}}$, i.e., that $\left.\mathcal{N}\right|_{U \cap U_{i}}$ is trivial. In this case it is clear how to extend $\mathcal{N}$ to an invertible sheaf over $X$ (by extending it by a trivial invertible module over each $U_{i}$ ).

09NB Lemma 32.30.4. Let $X$ be an integral separated scheme. Let $U \subset X$ be a nonempty affine open such that $X \backslash U$ is a finite set of points $x_{1}, \ldots, x_{r}$ with $\mathcal{O}_{X, x_{i}}$ Noetherian of dimension 1. Then there exists a globally generated invertible $\mathcal{O}_{X^{-}}$ module $\mathcal{L}$ and a section such that $U=X_{s}$.
Proof. Say $U=\operatorname{Spec}(A)$ and let $K$ be the fraction field of $X$. Write $B_{i}=\mathcal{O}_{X, x_{i}}$ and $\mathfrak{m}_{i}=\mathfrak{m}_{x_{i}}$. Since $x_{i} \notin U$ we see that the open $U \times_{X} \operatorname{Spec}\left(B_{i}\right)$ of $\operatorname{Spec}\left(B_{i}\right)$ has only one point, i.e., $U \times_{X} \operatorname{Spec}\left(B_{i}\right)=\operatorname{Spec}(K)$. Since $X$ is separated, we find that $\operatorname{Spec}(K)$ is a closed subscheme of $U \times \operatorname{Spec}\left(B_{i}\right)$, i.e., the map $A \otimes B_{i} \rightarrow K$ is a surjection. By Lemma 32.29 .8 we can find a nonzero $f \in A$ such that $f^{-1} \in \mathfrak{m}_{i}$ for $i=1, \ldots, r$. Pick opens $x_{i} \in U_{i} \subset X$ such that $f^{-1} \in \mathcal{O}\left(U_{i}\right)$. Then

$$
\mathcal{U}: X=U \cup \bigcup U_{i}
$$

is an open covering of $X$. Consider the 2-cocycle with values in $\mathcal{O}_{X}^{*}$ given by $f$ on $U \cap U_{i}$ and by 1 on $U_{i} \cap U_{j}$. This defines a line bundle $\mathcal{L}$ with two sections:
(1) a section $s$ defined by 1 on $U$ and $f^{-1}$ on $U_{i}$ is as in the statement of the lemma, and
(2) a section $t$ defined by $f$ on $U$ and 1 on $U_{i}$.

Note that $X_{t} \supset U_{1} \cup \ldots \cup U_{r}$. Hence $s, t$ generate $\mathcal{L}$ and the lemma is proved.
09NC Lemma 32.30.5. Let $X$ be a quasi-compact scheme. If for every $x \in X$ there exists a pair $(\mathcal{L}, s)$ consisting of a globally generated invertible sheaf $\mathcal{L}$ and a global section $s$ such that $x \in X_{s}$ and $X_{s}$ is affine, then $X$ has an ample invertible sheaf.

Proof. Since $X$ is quasi-compact we can find a finite collection $\left(\mathcal{L}_{i}, s_{i}\right), i=1, \ldots, n$ of pairs such that $X_{s_{i}}$ is affine and $X=\bigcup X_{s_{i}}$. Again because $X$ is quasi-compact we can find, for each $i$, a finite collection of sections $t_{i, j}, j=1, \ldots, m_{i}$ such that $X=\bigcup X_{t_{i, j}}$. Set $t_{i, 0}=s_{i}$. Consider the invertible sheaf

$$
\mathcal{L}=\mathcal{L}_{1} \otimes_{\mathcal{O}_{X}} \ldots \otimes_{\mathcal{O}_{X}} \mathcal{L}_{n}
$$

and the global sections

$$
\tau_{J}=t_{1, j_{1}} \otimes \ldots \otimes t_{n, j_{n}}
$$

By Properties, Lemma 27.26 .4 the open $X_{\tau_{J}}$ is affine as soon as $j_{i}=0$ for some $i$. It is a simple matter to see that these opens cover $X$. Hence $\mathcal{L}$ is ample by definition.

09ND Lemma 32.30.6. Let $X$ be a Noetherian integral separated scheme of dimension 1. Then $X$ has an ample invertible sheaf.

Proof. Choose an affine open covering $X=U_{1} \cup \ldots \cup U_{n}$. Since $X$ is Noetherian, each of the sets $X \backslash U_{i}$ is finite. Thus by Lemma 32.30 .4 we can find a pair $\left(\mathcal{L}_{i}, s_{i}\right)$ consisting of a globally generated invertible sheaf $\mathcal{L}_{i}$ and a global section $s_{i}$ such that $U_{i}=X_{s_{i}}$. We conclude that $X$ has an ample invertible sheaf by Lemma 32.30 .5

09NE Lemma 32.30.7. Let $X$ be a scheme. Let $Z_{1}, \ldots, Z_{n} \subset X$ be closed subschemes. Let $\mathcal{L}_{i}$ be an invertible sheaf on $Z_{i}$. Assume that
(1) $X$ is reduced,
(2) $X=\bigcup Z_{i}$ set theoretically, and
(3) $Z_{i} \cap Z_{j}$ is a discrete topological space for $i \neq j$.

Then there exists an invertible sheaf $\mathcal{L}$ on $X$ whose restriction to $Z_{i}$ is $\mathcal{L}_{i}$. Moreover, if we are given sections $s_{i} \in \Gamma\left(Z_{i}, \mathcal{L}_{i}\right)$ which are nonvanishing at the points of $Z_{i} \cap Z_{j}$, then we can choose $\mathcal{L}$ such that there exists a $s \in \Gamma(X, \mathcal{L})$ with $\left.s\right|_{Z_{i}}=s_{i}$ for all $i$.

Proof. Set $T=\bigcup_{i \neq j} Z_{i} \cap Z_{j}$. As $X$ is reduced we have

$$
X \backslash T=\bigcup\left(Z_{i} \backslash T\right)
$$

as schemes. Assumption (3) implies $T$ is a discrete subset of $X$. Thus for each $t \in T$ we can find an open $U_{t} \subset X$ with $t \in U_{t}$ but $t^{\prime} \notin U_{t}$ for $t^{\prime} \in T, t^{\prime} \neq t$. By shrinking $U_{t}$ if necessary, we may assume that there exist isomorphisms $\varphi_{t, i}$ : $\left.\mathcal{L}_{i}\right|_{U_{t} \cap Z_{i}} \rightarrow \mathcal{O}_{U_{t} \cap Z_{i}}$. Furthermore, for each $i$ choose an open covering

$$
Z_{i} \backslash T=\bigcup_{j} U_{i j}
$$

such that there exist isomorphisms $\varphi_{i, j}:\left.\mathcal{L}_{i}\right|_{U_{i j}} \cong \mathcal{O}_{U_{i j}}$. Observe that

$$
\mathcal{U}: X=\bigcup U_{t} \cup \bigcup U_{i j}
$$

is an open covering of $X$. We claim that we can use the isomorphisms $\varphi_{t, i}$ and $\varphi_{i, j}$ to define a 2 -cocycle with values in $\mathcal{O}_{X}^{*}$ for this covering that defines $\mathcal{L}$ as in the statement of the lemma.

Namely, if $i \neq i^{\prime}$, then $U_{i, j} \cap U_{i^{\prime}, j^{\prime}}=\emptyset$ and there is nothing to do. For $U_{i, j} \cap U_{i, j^{\prime}}$ we have $\mathcal{O}_{X}\left(U_{i, j} \cap U_{i, j^{\prime}}\right)=\mathcal{O}_{Z_{i}}\left(U_{i, j} \cap U_{i, j^{\prime}}\right)$ by the first remark of the proof. Thus the transition function for $\mathcal{L}_{i}$ (more precisely $\varphi_{i, j} \circ \varphi_{i, j^{\prime}}^{-1}$ ) defines the value of our cocycle on this intersection. For $U_{t} \cap U_{i, j}$ we can do the same thing. Finally, for $t \neq t^{\prime}$ we have

$$
U_{t} \cap U_{t^{\prime}}=\coprod\left(U_{t} \cap U_{t^{\prime}}\right) \cap Z_{i}
$$

and moreover the intersection $U_{t} \cap U_{t^{\prime}} \cap Z_{i}$ is contained in $Z_{i} \backslash T$. Hence by the same reasoning as before we see that

$$
\mathcal{O}_{X}\left(U_{t} \cap U_{t^{\prime}}\right)=\prod \mathcal{O}_{Z_{i}}\left(U_{t} \cap U_{t^{\prime}} \cap Z_{i}\right)
$$

and we can use the transition functions for $\mathcal{L}_{i}$ (more precisely $\varphi_{t, i} \circ \varphi_{t^{\prime}, i}^{-1}$ ) to define the value of our cocycle on $U_{t} \cap U_{t^{\prime}}$. This finishes the proof of existence of $\mathcal{L}$.

Given sections $s_{i}$ as in the last assertion of the lemma, in the argument above, we choose $U_{t}$ such that $\left.s_{i}\right|_{U_{t} \cap Z_{i}}$ is nonvanishing and we choose $\varphi_{t, i}$ such that $\varphi_{t, i}\left(\left.s_{i}\right|_{U_{t} \cap Z_{i}}\right)=1$. Then using 1 over $U_{t}$ and $\varphi_{i, j}\left(\left.s_{i}\right|_{U_{i, j}}\right)$ over $U_{i, j}$ will define a section of $\mathcal{L}$ which restricts to $s_{i}$ over $Z_{i}$.

09NW Remark 32.30.8. Let $A$ be a reduced ring. Let $I, J$ be ideals of $A$ such that $V(I) \cup V(J)=\operatorname{Spec}(A)$. Set $B=A / J$. Then $I \rightarrow I B$ is an isomorphism of $A$ modules. Namely, we have $I B=I+J / J=I /(I \cap J)$ and $I \cap J$ is zero because $A$ is reduced and $\operatorname{Spec}(A)=V(I) \cup V(J)=V(I \cap J)$. Thus for any projective $A$-module $P$ we also have $I P=I(P / J P)$.

09NX Lemma 32.30.9. Let $X$ be a Noetherian reduced separated scheme of dimension 1. Then $X$ has an ample invertible sheaf.

Proof. Let $Z_{i}, i=1, \ldots, n$ be the irreducible components of $X$. We view these as reduced closed subschemes of $X$. By Lemma 32.30.6 there exist ample invertible sheaves $\mathcal{L}_{i}$ on $Z_{i}$. Set $T=\bigcup_{i \neq j} Z_{i} \cap Z_{j}$. As $X$ is Noetherian of dimension 1 , the set $T$ is finite and consists of closed points of $X$. For each $i$ we may, possibly after replacing $\mathcal{L}_{i}$ by a power, choose $s_{i} \in \Gamma\left(Z_{i}, \mathcal{L}_{i}\right)$ such that $\left(Z_{i}\right)_{s_{i}}$ is affine and contains $T \cap Z_{i}$, see Properties, Lemma 27.29.6.

By Lemma 32.30 .7 we can find an invertible sheaf $\mathcal{L}$ on $X$ and $s \in \Gamma(X, \mathcal{L})$ such that $\left.(\mathcal{L}, s)\right|_{Z_{i}}=\left(\mathcal{L}_{i}, s_{i}\right)$. Observe that $X_{s}$ contains $T$ and is set theoretically equal to the affine closed subschemes $\left(Z_{i}\right)_{s_{i}}$. Thus it is affine by Limits, Lemma 31.10.3. To finish the proof, it suffices to find for every $x \in X, x \notin T$ an integer $m>0$ and a section $t \in \Gamma\left(X, \mathcal{L}^{\otimes m}\right)$ such that $X_{t}$ is affine and $x \in X_{t}$. Since $x \notin T$ we see that $x \in Z_{i}$ for some unique $i$, say $i=1$. Let $Z \subset X$ be the reduced closed subscheme whose underlying topological space is $Z_{2} \cup \ldots \cup Z_{n}$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal sheaf of $Z$. Denote that $\mathcal{I}_{1} \subset \mathcal{O}_{Z_{1}}$ the inverse image of this ideal sheaf under the inclusion morphism $Z_{1} \rightarrow X$. Observe that

$$
\Gamma\left(X, \mathcal{I} \mathcal{L}^{\otimes m}\right)=\Gamma\left(Z_{1}, \mathcal{I}_{1} \mathcal{L}_{1}^{\otimes m}\right)
$$

see Remark 32.30.8. Thus it suffices to find $m>0$ and $t \in \Gamma\left(Z_{1}, \mathcal{I}_{1} \mathcal{L}_{1}^{\otimes m}\right)$ with $x \in\left(Z_{1}\right)_{t}$ affine. Since $\mathcal{L}_{1}$ is ample and since $x$ is not in $Z_{1} \cap T=V\left(\mathcal{I}_{1}\right)$ we can find a section $t_{1} \in \Gamma\left(Z_{1}, \mathcal{I}_{1} \mathcal{L}_{1}^{\otimes m_{1}}\right)$ with $x \in\left(Z_{1}\right)_{t_{1}}$, see Properties, Proposition 27.26.13. Since $\mathcal{L}_{1}$ is ample we can find a section $t_{2} \in \Gamma\left(Z_{1}, \mathcal{L}_{1}^{\otimes m_{2}}\right)$ with $x \in\left(Z_{1}\right)_{t_{2}}$ and $\left(Z_{1}\right)_{t_{2}}$ affine, see Properties, Definition 27.26.1. Set $m=m_{1}+m_{2}$ and $t=t_{1} t_{2}$. Then $t \in \Gamma\left(Z_{1}, \mathcal{I}_{1} \mathcal{L}_{1}^{\otimes m}\right)$ with $x \in\left(Z_{1}\right)_{t}$ by construction and $\left(Z_{1}\right)_{t}$ is affine by Properties, Lemma 27.26.4.

09NY Lemma 32.30.10. Let $i: Z \rightarrow X$ be a closed immersion of schemes inducing a homeomorphism on underlying topological spaces. If the underlying topological space of $X$ is Noetherian and $\operatorname{dim}(X) \leq 1$, then $\operatorname{Pic}(X) \rightarrow \operatorname{Pic}(Z)$ is surjective.

Proof. Consider the short exact sequence

$$
0 \rightarrow(1+\mathcal{I})^{*} \rightarrow \mathcal{O}_{X}^{*} \rightarrow \mathcal{O}_{Z}^{*} \rightarrow 0
$$

of sheaves of abelian groups on $X$. Since $\operatorname{dim}(X) \leq 1$ we see that $H^{2}(X, \mathcal{F})=0$ for any abelian sheaf $\mathcal{F}$, see Cohomology, Proposition 20.21.6. Hence the map $H^{1}\left(X, \mathcal{O}_{X}^{*}\right) \rightarrow H^{1}\left(Z, \mathcal{O}_{Z}^{*}\right)$ is surjective. This proves the lemma by Cohomology, Lemma 20.7.1.

09NZ Proposition 32.30.11. Let $X$ be a Noetherian separated scheme of dimension 1. Then $X$ has an ample invertible sheaf.

Proof. Let $Z \subset X$ be the reduction of $X$. By Lemma 32.30 .9 the scheme $Z$ has an ample invertible sheaf. Thus by Lemma 32.30 .10 there exists an invertible $\mathcal{O}_{X^{-}}$ module $\mathcal{L}$ on $X$ whose restriction to $Z$ is ample. Then $\mathcal{L}$ is ample by an application of Cohomology of Schemes, Lemma 29.16.5.

09P0 Remark 32.30.12. In fact, if $X$ is a scheme whose reduction is a Noetherian separated scheme of dimension 1 , then $X$ has an ample invertible sheaf. The argument to prove this is the same as the proof of Proposition 32.30 .11 except one uses Limits, Lemma 31.10.4 instead of Cohomology of Schemes, Lemma 29.16.5.

### 32.31. Finding affine opens

09NF We continue the discussion started in Properties, Section 27.29. It turns out that we can find affines containing a finite given set of codimension 1 points on a separated scheme. See Proposition 32.31.7.
We will improve on the following lemma in Descent, Lemma 34.21.4.
09NG Lemma 32.31.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $X^{0}$ denote the set of generic points of irreducible components of $X$. If
(1) $f$ is separated,
(2) there is an open covering $X=\bigcup U_{i}$ such that $\left.f\right|_{U_{i}}: U_{i} \rightarrow X$ is an open immersion, and
(3) if $\xi, \xi^{\prime} \in X^{0}, \xi \neq \xi^{\prime}$, then $f(\xi) \neq f\left(\xi^{\prime}\right)$,
then $f$ is an open immersion.
Proof. Suppose that $y=f(x)=f\left(x^{\prime}\right)$. Pick a specialization $y_{0} \rightsquigarrow y$ where $y_{0}$ is a generic point of an irreducible component of $Y$. Since $f$ is locally on the source an isomorphism we can pick specializations $x_{0} \rightsquigarrow x$ and $x_{0}^{\prime} \rightsquigarrow x^{\prime}$ mapping to $y_{0} \rightsquigarrow y$. Note that $x_{0}, x_{0}^{\prime} \in X^{0}$. Hence $x_{0}=x_{0}^{\prime}$ by assumption (3). As $f$ is separated we conclude that $x=x^{\prime}$. Thus $f$ is an open immersion.

09NH Lemma 32.31.2. Let $X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. If
(1) $\mathcal{O}_{X, x}=\mathcal{O}_{S, s}$,
(2) $X$ is reduced,
(3) $X \rightarrow S$ is of finite type, and
(4) $S$ has finitely many irreducible components,
then there exists an open neighbourhood $U$ of $x$ such that $\left.f\right|_{U}$ is an open immersion.
Proof. We may remove the (finitely many) irreducible components of $S$ which do not contain $s$. We may replace $S$ by an affine open neighbourhood of $s$. We may replace $X$ by an affine open neighbourhood of $x$. Say $S=\operatorname{Spec}(A)$ and $X=\operatorname{Spec}(B)$. Let $\mathfrak{q} \subset B$, resp. $\mathfrak{p} \subset A$ be the prime ideal corresponding to $x$, resp. s. As $A$ is a reduced and all of the minimal primes of $A$ are contained in $\mathfrak{p}$ we see that $A \subset A_{\mathfrak{p}}$. As $X \rightarrow S$ is of finite type, $B$ is of finite type over $A$. Let $b_{1}, \ldots, b_{n} \in B$ be elements which generate $B$ over $A$ Since $A_{\mathfrak{p}}=B_{\mathfrak{q}}$ we can find $f \in A, f \notin \mathfrak{p}$ and $a_{i} \in A$ such that $b_{i}$ and $a_{i} / f$ have the same image in $B_{\mathfrak{q}}$. Thus we can find $g \in B, g \notin \mathfrak{q}$ such that $g\left(f b_{i}-a_{i}\right)=0$ in $B$. It follows that the image of $A_{f} \rightarrow B_{f g}$ contains the images of $b_{1}, \ldots, b_{n}$, in particular also the image of $g$. Choose $n \geq 0$ and $f^{\prime} \in A$ such that $f^{\prime} / f^{n}$ maps to the image of $g$ in $B_{f g}$. Since $A_{\mathfrak{p}}=B_{\mathfrak{q}}$ we see that $f^{\prime} \notin \mathfrak{p}$. We conclude that $A_{f f^{\prime}} \rightarrow B_{f g}$ is surjective. Finally, as $A_{f f^{\prime}} \subset A_{\mathfrak{p}}=B_{\mathfrak{q}}$ (see above) the map $A_{f f^{\prime}} \rightarrow B_{f g}$ is injective, hence an isomorphism.

09NI Lemma 32.31.3. Let $f: T \rightarrow X$ be a morphism of schemes. Let $X^{0}$, resp. $T^{0}$ denote the sets of generic points of irreducible components. Let $t_{1}, \ldots, t_{m} \in T$ be $a$ finite set of points with images $x_{j}=f\left(t_{j}\right)$. If
(1) $T$ is affine,
(2) $X$ is quasi-separated,
(3) $X^{0}$ is finite
(4) $f\left(T^{0}\right) \subset X^{0}$ and $f: T^{0} \rightarrow X^{0}$ is injective, and
(5) $\mathcal{O}_{X, x_{j}}=\mathcal{O}_{T, t_{j}}$,
then there exists an affine open of $X$ containing $x_{1}, \ldots, x_{r}$.
Proof. Using Limits, Proposition 31.10 .2 there is an immediate reduction to the case where $X$ and $T$ are reduced. Details omitted.

Assume $X$ and $T$ are reduced. We may write $T=\lim _{i \in I} T_{i}$ as a directed limit of schemes of finite presentation over $X$ with affine transition morphisms, see Limits, Lemma 31.6.1. Pick $i \in I$ such that $T_{i}$ is affine, see Limits, Lemma 31.3.10. Say $T_{i}=\operatorname{Spec}\left(R_{i}\right)$ and $T=\operatorname{Spec}(R)$. Let $R^{\prime} \subset R$ be the image of $R_{i} \rightarrow R$. Then $T^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$ is affine, reduced, of finite type over $X$, and $T \rightarrow T^{\prime}$ dominant. For $j=1, \ldots, r$ let $t_{j}^{\prime} \in T^{\prime}$ be the image of $t_{j}$. Consider the local ring maps

$$
\mathcal{O}_{X, x_{j}} \rightarrow \mathcal{O}_{T^{\prime}, t_{j}^{\prime}} \rightarrow \mathcal{O}_{T, t_{j}}
$$

Denote $\left(T^{\prime}\right)^{0}$ the set of generic points of irreducible components of $T^{\prime}$. Let $\xi \rightsquigarrow$ $t_{j}^{\prime}$ be a specialization with $\xi \in\left(T^{\prime}\right)^{0}$. As $T \rightarrow T^{\prime}$ is dominant we can choose $\eta \in T^{0}$ mapping to $\xi$ (warning: a priori we do not know that $\eta$ specializes to $t_{j}$ ). Assumption (3) applied to $\eta$ tells us that the image $\theta$ of $\xi$ in $X$ corresponds to a minimal prime of $\mathcal{O}_{X, x_{j}}$. Lifting $\xi$ via the isomorphism of (5) we obtain a specialization $\eta^{\prime} \rightsquigarrow t_{j}$ with $\eta^{\prime} \in X^{0}$ mapping to $\theta \rightsquigarrow x_{j}$. The injectivity of (4) shows that $\eta=\eta^{\prime}$. Thus every minimal prime of $\mathcal{O}_{T^{\prime}, t_{j}^{\prime}}$ lies below a minimal prime of $\mathcal{O}_{T, t_{j}}$. We conclude that $\mathcal{O}_{T^{\prime}, t_{j}^{\prime}} \rightarrow \mathcal{O}_{T, t_{j}}$ is injective, hence both maps above are isomorphisms.
By Lemma 32.31 .2 there exists an open $U \subset T^{\prime}$ containing all the points $t_{j}^{\prime}$ such that $U \rightarrow X$ is a local isomorphism as in Lemma 32.31.1. By that lemma we see that $U \rightarrow X$ is an open immersion. Finally, by Properties, Lemma 27.29.5 we can find an open $W \subset U \subset T^{\prime}$ containing all the $t_{j}^{\prime}$. The image of $W$ in $X$ is the desired affine open.

09NJ Lemma 32.31.4. Let $X$ be an integral separated scheme. Let $x_{1}, \ldots, x_{r} \in X$ be a finite set of points such that $\mathcal{O}_{X, x_{i}}$ is Noetherian of dimension $\leq 1$. Then there exists an affine open subscheme of $X$ containing all of $x_{1}, \ldots, x_{r}$.

Proof. Let $K$ be the field of rational functions of $X$. Set $A_{i}=\mathcal{O}_{X, x_{i}}$. Then $A_{i} \subset K$ and $K$ is the fraction field of $A_{i}$. Since $X$ is separated, and $x_{i} \neq x_{j}$ there cannot be a valuation ring $\mathcal{O} \subset K$ dominating both $A_{i}$ and $A_{j}$. Namely, considering the diagram

and applying the valuative criterion of separatedness (Schemes, Lemma 25.22.1) we would get $x_{i}=x_{j}$. Thus we see by Lemma 32.29 .3 that $A_{i} \otimes A_{j} \rightarrow K$ is surjective for all $i \neq j$. By Lemma 32.29.7 we see that $A=A_{1} \cap \ldots \cap A_{r}$ is a Noetherian semi-local rings with exactly $r$ maximal ideals $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{r}$ such that $A_{i}=A_{\mathfrak{m}_{i}}$. Moreover,

$$
\operatorname{Spec}(A)=\operatorname{Spec}\left(A_{1}\right) \cup \ldots \cup \operatorname{Spec}\left(A_{r}\right)
$$

is an open covering and the intersection of any two pieces of this covering is $\operatorname{Spec}(K)$. Thus the given morphisms $\operatorname{Spec}\left(A_{i}\right) \rightarrow X$ glue to a morphism of schemes

$$
\operatorname{Spec}(A) \longrightarrow X
$$

mapping $\mathfrak{m}_{i}$ to $x_{i}$ and inducing isomorphisms of local rings. Thus the result follows from Lemma 32.31.3.

09 NK Lemma 32.31.5. Let $A$ be a ring, $I \subset A$ an ideal, $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}$ primes of $A$, and $\bar{f} \in A / I$ an element. If $I \not \subset \mathfrak{p}_{i}$ for all $i$, then there exists an $f \in A, f \notin \mathfrak{p}_{i}$ which maps to $\bar{f}$ in $A / I$.

Proof. We may assume there are no inclusion relations among the $\mathfrak{p}_{i}$ (by removing the smaller primes). First pick any $f \in A$ lifting $\bar{f}$. Let $S$ be the set $s \in\{1, \ldots, r\}$ such that $f \in \mathfrak{p}_{s}$. If $S$ is empty we are done. If not, consider the ideal $J=I \prod_{i \notin S} \mathfrak{p}_{i}$. Note that $J$ is not contained in $\mathfrak{p}_{s}$ for $s \in S$ because there are no inclusions among the $\mathfrak{p}_{i}$ and because $I$ is not contained in any $\mathfrak{p}_{i}$. Hence we can choose $g \in J, g \notin \mathfrak{p}_{s}$ for $s \in S$ by Algebra, Lemma 10.14 .2 . Then $f+g$ is a solution to the problem posed by the lemma.

09NM Lemma 32.31.6. Let $X$ be a scheme. Let $T \subset X$ be finite set of points. Assume
(1) $X$ has finitely many irreducible components $Z_{1}, \ldots, Z_{t}$, and
(2) $Z_{i} \cap T$ is contained in an affine open of the reduced induced subscheme corresponding to $Z_{i}$.
Then there exists an affine open subscheme of $X$ containing $T$.
Proof. Using Limits, Proposition 31.10 .2 there is an immediate reduction to the case where $X$ is reduced. Details omitted. In the rest of the proof we endow every closed subset of $X$ with the induced reduced closed subscheme structure.

We argue by induction that we can find an affine open $U \subset Z_{1} \cup \ldots \cup Z_{r}$ containing $T \cap\left(Z_{1} \cup \ldots \cup Z_{r}\right)$. For $r=1$ this holds by assumption. Say $r>1$ and let $U \subset Z_{1} \cup \ldots \cup Z_{r-1}$ be an affine open containing $T \cap\left(Z_{1} \cup \ldots \cup Z_{r-1}\right)$. Let $V \subset X_{r}$ be an affine open containing $T \cap Z_{r}$ (exists by assumption). Then $U \cap V$ contains $T \cap\left(Z_{1} \cup \ldots \cup Z_{r-1}\right) \cap Z_{r}$. Hence

$$
\Delta=\left(U \cap Z_{r}\right) \backslash(U \cap V)
$$

does not contain any element of $T$. Note that $\Delta$ is a closed subset of $U$. By prime avoidance (Algebra, Lemma 10.14.2), we can find a standard open $U^{\prime}$ of $U$ containing $T \cap U$ and avoiding $\Delta$, i.e., $U^{\prime} \cap Z_{r} \subset U \cap V$. After replacing $U$ by $U^{\prime}$ we may assume that $U \cap V$ is closed in $U$.

Using that by the same arguments as above also the set $\Delta^{\prime}=\left(U \cap\left(Z_{1} \cup \ldots \cup Z_{r-1}\right)\right) \backslash$ $(U \cap V)$ does not contain any element of $T$ we find a $h \in \mathcal{O}(V)$ such that $D(h) \subset V$ contains $T \cap V$ and such that $U \cap D(h) \subset U \cap V$. Using that $U \cap V$ is closed in $U$ we can use Lemma 32.31 .5 to find an element $g \in \mathcal{O}(U)$ whose restriction to $U \cap V$ equals the restriction of $h$ to $U \cap V$ and such that $T \cap U \subset D(g)$. Then we can replace $U$ by $D(g)$ and $V$ by $D(h)$ to reach the situation where $U \cap V$ is closed in both $U$ and $V$. In this case the scheme $U \cup V$ is affine by Limits, Lemma 31.10.3. This proves the induction step and thereby the lemma.

Here is a conclusion we can draw from the material above.

09NN Proposition 32.31.7. Let $X$ be a separated scheme such that every quasi-compact open has a finite number of irreducible components. Let $x_{1}, \ldots, x_{r} \in X$ be points such that $\mathcal{O}_{X, x_{i}}$ is Noetherian of dimension $\leq 1$. Then there exists an affine open subscheme of $X$ containing all of $x_{1}, \ldots, x_{r}$.
Proof. We can replace $X$ by a quasi-compact open containing $x_{1}, \ldots, x_{r}$ hence we may assume that $X$ has finitely many irreducible components. By Lemma 32.31 .6 we reduce to the case where $X$ is integral. This case is Lemma 32.31.4.

### 32.32. Curves

0A22 In the stacks project we will use the following as our definition of a curve.
0A23 Definition 32.32.1. Let $k$ be a field. A curve is a variety of dimension 1 over $k$.
Two standard examples of curves over $k$ are the affine line $\mathbf{A}_{k}^{1}$ and the projective line $\mathbf{P}_{k}^{1}$. The scheme $X=\operatorname{Spec}(k[x, y] /(f))$ is a curve if and only if $f \in k[x, y]$ is irreducible.

Our definition of a curve has the same problems as our definition of a variety, see the discussion following Definition 32.3.1. Moreover, it means that every curve comes with a specified field of definition. For example $X=\operatorname{Spec}(\mathbf{C}[x])$ is a curve over $\mathbf{C}$ but we can also view it as a curve over $\mathbf{R}$. The scheme $\operatorname{Spec}(\mathbf{Z})$ isn't a curve, even though the schemes $\operatorname{Spec}(\mathbf{Z})$ and $\mathbf{A}_{\mathbf{F}_{p}}^{1}$ behave similarly in many respects.
0A24 Lemma 32.32.2. Let $X$ be an irreducible scheme of dimension $>0$ over a field $k$. Let $x \in X$ be a closed point. The open subscheme $X \backslash\{x\}$ is not proper over $k$.

Proof. Namely, choose a specialization $x^{\prime} \rightsquigarrow x$ with $x^{\prime} \neq x$ (for example take $x^{\prime}$ to be the generic point). By Schemes, Lemma 25.20 .4 there exists a morphism $\operatorname{Spec}(A) \rightarrow X$ where $A$ is a valuation ring such that the generic point of $A$ maps to $x^{\prime}$ and the closed point of $\operatorname{Spec}(A)$ maps to $x$. Clearly the morphism $\operatorname{Spec}(f . f .(A)) \rightarrow$ $X \backslash\{x\}$ does not extend to a morphism $\operatorname{Spec}(A) \rightarrow X \backslash\{x\}$. Hence the valuative criterion (Schemes, Proposition 25.20.6) shows that $X \rightarrow \operatorname{Spec}(k)$ is not universally closed, hence not proper.
0A25 Lemma 32.32.3. Let $X$ be a separated finite type scheme over a field $k$. If $\operatorname{dim}(X) \leq 1$ then $X$ is $H$-quasi-projective over $k$.

Proof. By Proposition 32.30 .11 the scheme $X$ has an ample invertible sheaf $\mathcal{L}$. By Morphisms, Lemma 28.39 .3 we see that $X$ is isomorphic to a locally closed subscheme of $\mathbf{P}_{k}^{n}$ over $\operatorname{Spec}(k)$. This is the definiton of being H-quasi-projective over $k$, see Morphisms, Definition 28.40.1.
0A26 Lemma 32.32.4. Let $X$ be a proper scheme over a field $k$. If $\operatorname{dim}(X) \leq 1$ then $X$ is $H$-projective over $k$.
Proof. By Lemma 32.32 .3 we see that $X$ is a locally closed subscheme of $\mathbf{P}_{k}^{n}$ for some field $k$. Since $X$ is proper over $k$ it follows that $X$ is a closed subscheme of $\mathbf{P}_{k}^{n}$ (Morphisms, Lemma 28.41.7).

Observe that if an affine scheme $X$ over $k$ is proper over $k$ then $X$ is finite over $k$ (Morphisms, Lemma 28.43.10) and hence has dimension 0 (Algebra, Lemma 10.52.2 and Proposition 10.59.6). Hence a scheme of dimension $>0$ over $k$ cannot be both affine and proper over $k$. Thus the possibilities in the following lemma are mutually exclusive.
$0 A 27$ Lemma 32.32.5. Let $X$ be a curve over $k$. Then either $X$ is an affine scheme or $X$ is $H$-projective over $k$.

Proof. By Lemma 32.32 .3 we may assume $X$ is a locally closed subscheme of $\mathbf{P}_{k}^{n}$ for some $n$. Let $\bar{X} \subset \overline{\mathbf{P}}_{k}^{n}$ be the scheme theoretic image of $X \rightarrow \mathbf{P}_{k}^{n}$, see Morphisms, Definition 28.6.2 and the description in Morphisms, Lemma 28.7.7. Since $X$ is irreducible, we see that $\bar{X}$ is irreducible. Then $\operatorname{dim}(X)=1 \Rightarrow \operatorname{dim}(\bar{X})=1$ for example by looking at the generic point, see Lemma 32.17.3. As $\bar{X}$ is Noetherian, it then follows that $\bar{X} \backslash X=\left\{x_{1}, \ldots, x_{n}\right\}$ is a finite set of closed points. By Lemma 32.30 .4 we can find a globally generated invertible sheaf $\mathcal{L}$ on $\bar{X}$ and a section $s \in \Gamma(X, \mathcal{L})$ such that $X=\bar{X}_{s}$.

Choose a basis $s=s_{0}, s_{1}, \ldots, s_{m}$ of the finite dimensional $k$-vector space $\Gamma(\bar{X}, \mathcal{L})$ (Cohomology of Schemes, Lemma 29.18.3). We obtain a corresponding morphism

$$
f: \bar{X} \longrightarrow \mathbf{P}_{k}^{m}
$$

such that the inverse image of $D_{+}\left(T_{0}\right)$ is $X$, see Constructions, Lemma 26.13.1. In particular, $f$ is non-constant, i.e., $\operatorname{Im}(f)$ has more than one point. A topological argument shows that $f$ maps the generic point $\eta$ of $\bar{X}$ to a nonclosed point of $\mathbf{P}_{k}^{n}$. Hence if $y \in \mathbf{P}_{k}^{n}$ is a closed point, then $f^{-1}(\{y\})$ is a closed set of $\bar{X}$ not containing $\eta$, hence finite. By Cohomology of Schemes, Lemma 29.20.2 ${ }^{3}$ we conclude that $f$ is finite. Hence $X=f^{-1}\left(D_{+}\left(T_{0}\right)\right)$ is affine.

The following lemma combined with Lemma 32.32 .2 tells us that given a separated scheme $X$ of dimension 1 and of finite type over $k$, then $X \backslash Z$ is affine, whenever the closed subset $Z$ meets every irreducible component of $X$.

0A28 Lemma 32.32.6. Let $X$ be a separated scheme of finite type over $k$. If $\operatorname{dim}(X) \leq 1$ and no irreducible component of $X$ is proper of dimension 1, then $X$ is affine.

Proof. Let $X=\bigcup X_{i}$ be the decomposition of $X$ into irreducible components. We think of $X_{i}$ as an integral scheme (using the reduced induced scheme structure, see Schemes, Definition 25.12.5). In particular $X_{i}$ is a singleton (hence affine) or a curve hence affine by Lemma 32.32 .5 Then $\coprod X_{i} \rightarrow X$ is finite surjective and $\coprod X_{i}$ is affine. Thus we see that $X$ is affine by Cohomology of Schemes, Lemma 29.13.3.

### 32.33. Degrees on curves

0AYQ We start defining the degree of an invertible sheaf and more generally a locally free sheaf on a proper scheme of dimension 1 over a field. In Section 32.26 we defined the Euler characteristic of a coherent sheaf $\mathcal{F}$ on a proper scheme $X$ over a field $k$ by the formula

$$
\chi(X, \mathcal{F})=\sum(-1)^{i} \operatorname{dim}_{k} H^{i}(X, \mathcal{F})
$$

[^87]0 AYR Definition 32.33.1. Let $k$ be a field, let $X$ be a proper scheme of dimension $\leq 1$ over $k$, and let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. The degree of $\mathcal{L}$ is defined by

$$
\operatorname{deg}(\mathcal{L})=\chi(X, \mathcal{L})-\chi\left(X, \mathcal{O}_{X}\right)
$$

More generally, if $\mathcal{E}$ is a locally free sheaf of rank $n$ we define the degree of $\mathcal{E}$ by

$$
\operatorname{deg}(\mathcal{E})=\chi(X, \mathcal{E})-n \chi\left(X, \mathcal{O}_{X}\right)
$$

Observe that this depends on the triple $\mathcal{E} / X / k$. If $X$ is disconnected and $\mathcal{E}$ is finite locally free (but not of constant rank), then one can modify the definition by summing the degrees of the restriction of $\mathcal{E}$ to the connected components of $X$. If $\mathcal{E}$ is just a coherent sheaf, there are several different ways of extending the definition ${ }^{4}$. In a series of lemmas we show that this definition has all the properties one expects of the degree.

0B59 Lemma 32.33.2. Let $k \subset k^{\prime}$ be an extension of fields. Let $X$ be a proper scheme of dimension $\leq 1$ over $k$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{X}$-module of constant rank $n$. Then the degree of $\mathcal{E} / X / k$ is equal to the degree of $\mathcal{E}_{k^{\prime}} / X_{k^{\prime}} / k^{\prime}$.

Proof. More precisely, set $X_{k^{\prime}}=X \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)$. Let $\mathcal{E}_{k^{\prime}}=p^{*} \mathcal{E}$ where $p$ : $X_{k^{\prime}} \rightarrow X$ is the projection. By Cohomology of Schemes, Lemma 29.5.2 we have $H^{i}\left(X_{k^{\prime}}, \mathcal{E}_{k^{\prime}}\right)=H^{i}(X, \mathcal{E}) \otimes_{k} k^{\prime}$ and $H^{i}\left(X_{k^{\prime}}, \mathcal{O}_{X_{k^{\prime}}}\right)=H^{i}\left(X, \mathcal{O}_{X}\right) \otimes_{k} k^{\prime}$. Hence we see that the Euler characteristics are unchanged, hence the degree is unchanged.

0AYS Lemma 32.33.3. Let $k$ be a field. Let $X$ be a proper scheme of dimension $\leq 1$ over $k$. Let $0 \rightarrow \mathcal{E}_{1} \rightarrow \mathcal{E}_{2} \rightarrow \mathcal{E}_{3} \rightarrow 0$ be a short exact sequence of locally free $\mathcal{O}_{X}$-modules. Then

$$
\operatorname{deg}\left(\mathcal{E}_{2}\right)=\operatorname{deg}\left(\mathcal{E}_{1}\right)+\operatorname{deg}\left(\mathcal{E}_{3}\right)
$$

Proof. Follows immediately from additivity of Euler characteristics (Lemma 32.26.2) and additivity of ranks.

0AYU Lemma 32.33.4. Let $k$ be a field. Let $f: X^{\prime} \rightarrow X$ be a birational morphism of proper schemes of dimension $\leq 1$ over $k$. Then

$$
\operatorname{deg}\left(f^{*} \mathcal{E}\right)=\operatorname{deg}(\mathcal{E})
$$

for every finite locally free sheaf of constant rank. More generally it suffices if $f$ induces a bijection between irreducible components of dimension 1 and isomorphisms of local rings at the corresponding generic points.

Proof. The morphism $f$ is proper (Morphisms, Lemma 28.41.7) and has fibres of dimension $\leq 0$. Hence $f$ is finite (Cohomology of Schemes, Lemma 29.20.2). Thus

$$
R f_{*} f^{*} \mathcal{E}=f_{*} f^{*} \mathcal{E}=\mathcal{E} \otimes_{\mathcal{O}_{X}} f_{*} \mathcal{O}_{X}
$$

Since $f$ induces an isomorphism on local rings at generic points of all irreducible components of dimension 1 we see that the kernel and cokernel

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{X} \rightarrow \mathcal{Q} \rightarrow 0
$$

[^88]have supports of dimension $\leq 0$. Note that tensoring this with $\mathcal{E}$ is still an exact sequence as $\mathcal{E}$ is locally free. We obtain
\[

$$
\begin{aligned}
\chi(X, \mathcal{E})-\chi\left(X^{\prime}, f^{*} \mathcal{E}\right) & =\chi(X, \mathcal{E})-\chi\left(X, f_{*} f^{*} \mathcal{E}\right) \\
& =\chi(X, \mathcal{E})-\chi\left(X, \mathcal{E} \otimes f_{*} \mathcal{O}_{X}\right) \\
& =\chi(X, \mathcal{K} \otimes \mathcal{E})-\chi(X, \mathcal{Q} \otimes \mathcal{E}) \\
& =n \chi(X, \mathcal{K})-n \chi(X, \mathcal{Q}) \\
& =n \chi\left(X, \mathcal{O}_{X}\right)-n \chi\left(X, f_{*} \mathcal{O}_{X}\right) \\
& =n \chi\left(X, \mathcal{O}_{X}\right)-n \chi\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)
\end{aligned}
$$
\]

which proves what we want. The first equality as $f$ is finite, see Cohomology of Schemes, Lemma 29.2.4. The second equality by projection formula, see Cohomology, Lemma 20.43.2 The third by additivity of Euler characteristics, see Lemma 32.26.2. The fourth by Lemma 32.26.3.

0AYV Lemma 32.33.5. Let $k$ be a field. Let $X$ be a proper curve over $k$ with generic point $\xi$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{X}$-module of rank $n$ and let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then

$$
\chi(X, \mathcal{E} \otimes \mathcal{F})=r \operatorname{deg}(\mathcal{E})+n \chi(X, \mathcal{F})
$$

where $r=\operatorname{dim}_{\kappa(\xi)} \mathcal{F}_{\xi}$ is the rank of $\mathcal{F}$.
Proof. Let $\mathcal{P}$ be the property of coherent sheaves $\mathcal{F}$ on $X$ expressing that the formula of the lemma holds. We claim that the assumptions (1) and (2) of Cohomology of Schemes, Lemma 29.12 .6 hold for $\mathcal{P}$. Namely, (1) holds because the Euler characteristc and the rank $r$ are additive in short exact sequences of coherent sheaves. And (2) holds too: If $Z=X$ then we may take $\mathcal{G}=\mathcal{O}_{X}$ and $\mathcal{P}\left(\mathcal{O}_{X}\right)$ is true by the definition of degree. If $i: Z \rightarrow X$ is the inclusion of a closed point we may take $\mathcal{G}=i_{*} \mathcal{O}_{Z}$ and $\mathcal{P}$ holds by Lemma 32.26.3 and the fact that $r=0$ in this case.

Let $k$ be a field. Let $X$ be a finite type scheme over $k$ of dimension $\leq 1$. Let $C_{i} \subset X, i=1, \ldots, t$ be the irreducible components of dimension 1 . We view $C_{i}$ as a scheme by using the induced reduced scheme structure. Let $\xi_{i} \in C_{i}$ be the generic point. The multiplicity of $C_{i}$ in $X$ is defined as the length

$$
m_{i}=\operatorname{length}_{\mathcal{O}_{X, \xi_{i}}} \mathcal{O}_{X, \xi_{i}}
$$

This makes sense because $\mathcal{O}_{X, \xi_{i}}$ is a zero dimensional Noetherian local ring and hence has finite length over itself (Algebra, Proposition 10.59.6). See Chow Homology, Section 41.10 for additional information. It turns out the degree of a locally free sheaf only depends on the restriction of the irreducible components.

0AYW Lemma 32.33.6. Let $k$ be a field. Let $X$ be a proper scheme of dimension $\leq 1$ over $k$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{X}$-module of rank $n$. Then

$$
\operatorname{deg}(\mathcal{E})=\sum m_{i} \operatorname{deg}\left(\left.\mathcal{E}\right|_{C_{i}}\right)
$$

where $C_{i} \subset X, i=1, \ldots, t$ are the irreducible components of dimension 1 with reduced induced scheme structure and $m_{i}$ is the multiplicity of $C_{i}$ in $X$.
Proof. Observe that the statement makes sense because $C_{i} \rightarrow \operatorname{Spec}(k)$ is proper of dimension 1 (Morphisms, Lemmas 28.41.6 and 28.41.4. Consider the open subscheme $U_{i}=X \backslash\left(\bigcup_{j \neq i} C_{j}\right)$ and let $X_{i} \subset X$ be the scheme theoretic closure
of $U_{i}$. Note that $X_{i} \cap U_{i}=U_{i}$ (scheme theoretically) and that $X_{i} \cap U_{j}=\emptyset$ (set theoretically) for $i \neq j$; this follows from the description of scheme theoretic closure in Morphisms, Lemma 28.7.7. Thus we may apply Lemma 32.33.4 to the morphism $X^{\prime}=\bigcup X_{i} \rightarrow X$. Since it is clear that $C_{i} \subset X_{i}$ (scheme theoretically) and that the multiplicity of $C_{i}$ in $X_{i}$ is equal to the multiplicity of $C_{i}$ in $X$, we see that we reduce to the case discussed in the following paragraph.
Assume $X$ is irreducible with generic point $\xi$. Let $C=X_{\text {red }}$ have multiplicity $m$. We have to show that $\operatorname{deg}(\mathcal{E})=m \operatorname{deg}\left(\left.\mathcal{E}\right|_{C}\right)$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal defining the closed subscheme $C$. Let $e \geq 0$ be minimal such that $\mathcal{I}^{e+1}=0$ (Cohomology of Schemes, Lemma 29.10.2. We argue by induction on $e$. If $e=0$, then $X=C$ and the result is immediate. Otherwise we set $\mathcal{F}=\mathcal{I}^{e}$ viewed as a coherent $\mathcal{O}_{C}$-module (Cohomology of Schemes, Lemma 29.9.8). Let $X^{\prime} \subset X$ be the closed subscheme cut out by the coherent ideal $\mathcal{I}^{e}$ and let $m^{\prime}$ be the multiplicity of $C$ in $X^{\prime}$. Taking stalks at $\xi$ of the short exact sequence

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow 0
$$

we find (use Algebra, Lemmas 10.51.3, 10.51.6, and 10.51.5 that

$$
m=\operatorname{length}_{\mathcal{O}_{X, \xi}} \mathcal{O}_{X, \xi}=\operatorname{dim}_{\kappa(\xi)} \mathcal{F}_{\xi}+\operatorname{length}_{\mathcal{O}_{X^{\prime}, \xi}} \mathcal{O}_{X^{\prime}, \xi}=r+m^{\prime}
$$

where $r$ is the rank of $\mathcal{F}$ as a coherent sheaf on $C$. Tensoring with $\mathcal{E}$ we obtain a short exact sequence

$$
\left.0 \rightarrow \mathcal{E}\right|_{C} \otimes \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{E} \otimes \mathcal{O}_{X^{\prime}} \rightarrow 0
$$

By induction we have $\chi\left(\mathcal{E} \otimes \mathcal{O}_{X^{\prime}}\right)=m^{\prime} \operatorname{deg}\left(\left.\mathcal{E}\right|_{C}\right)$. By Lemma 32.33.5 we have $\chi\left(\left.\mathcal{E}\right|_{C} \otimes \mathcal{F}\right)=r \operatorname{deg}\left(\left.\mathcal{E}\right|_{C}\right)+n \chi(\mathcal{F})$. Putting everything together we obtain the result.

0AYX Lemma 32.33.7. Let $k$ be a field, let $X$ be a proper scheme of dimension $\leq 1$ over $k$, and let $\mathcal{E}, \mathcal{V}$ be locally free $\mathcal{O}_{X}$-modules of constant finite rank. Then

$$
\operatorname{deg}(\mathcal{E} \otimes \mathcal{V})=\operatorname{rank}(\mathcal{E}) \operatorname{deg}(\mathcal{V})+\operatorname{rank}(\mathcal{V}) \operatorname{deg}(\mathcal{E})
$$

Proof. By Lemma 32.33 .6 and elementary arithmetic, we reduce to the case of a proper curve. This case follows from Lemma 32.33.5.
0AYY Lemma 32.33.8. Let $k$ be a field, let $X$ be a proper scheme of dimension $\leq 1$ over $k$. Let $D$ be an effective Cartier divisor on $X$. Then $D$ is finite over $\operatorname{Spec}(k)$ of degree $\operatorname{deg}(D)=\operatorname{dim}_{k} \Gamma\left(D, \mathcal{O}_{D}\right)$. For a locally free sheaf $\mathcal{E}$ of rank $n$ we have

$$
\operatorname{deg}(\mathcal{E}(D))=n \operatorname{deg}(D)+\operatorname{deg}(\mathcal{E})
$$

where $\mathcal{E}(D)=\mathcal{E} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(D)$.
Proof. Since $D$ is nowhere dense in $X$ (Divisors, Lemma 30.11.4) we see that $\operatorname{dim}(D) \leq 0$. Hence $D$ is finite over $k$ by Lemma 32.17 .2 . Since $k$ is a field, the morphism $D \rightarrow \operatorname{Spec}(k)$ is finite locally free and hence has a degree (Morphisms, Definition 28.45.1), which is clearly equal to $\operatorname{dim}_{k} \Gamma\left(D, \mathcal{O}_{D}\right)$ as stated in the lemma. By Divisors, Definition 30.11.14 there is a short exact sequence

$$
0 \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}(D) \rightarrow i_{*} i^{*} \mathcal{O}_{X}(D) \rightarrow 0
$$

where $i: D \rightarrow X$ is the closed immersion. Tensoring with $\mathcal{E}$ we obtain a short exact sequence

$$
0 \rightarrow \mathcal{E} \rightarrow \mathcal{E}(D) \rightarrow i_{*} i^{*} \mathcal{E}(D) \rightarrow 0
$$

The equation of the lemma follows from additivity of the Euler characteristic (Lemma 32.26.2) and Lemma 32.26.3.

0AYZ Lemma 32.33.9. Let $k$ be a field. Let $f: X \rightarrow Y$ be a nonconstant morphism of proper curves over $k$. Let $\mathcal{E}$ be a locally free $\mathcal{O}_{Y}$-module. Then

$$
\operatorname{deg}\left(f^{*} \mathcal{E}\right)=\operatorname{deg}(X / Y) \operatorname{deg}(\mathcal{E})
$$

Proof. The degree of $X$ over $Y$ is defined in Morphisms, Definition 28.47.8. Thus $f_{*} \mathcal{O}_{X}$ is a coherent $\mathcal{O}_{Y}$-module of $\operatorname{rank} \operatorname{deg}(X / Y)$, i.e., $\operatorname{deg}(X / Y)=\operatorname{dim}_{\kappa(\xi)}\left(f_{*} \mathcal{O}_{X}\right)_{\xi}$ where $\xi$ is the generic point of $Y$. Thus we obtain

$$
\begin{aligned}
\chi\left(X, f^{*} \mathcal{E}\right) & =\chi\left(Y, f_{*} f^{*} \mathcal{E}\right) \\
& =\chi\left(Y, \mathcal{E} \otimes f_{*} \mathcal{O}_{X}\right) \\
& =\operatorname{deg}(X / Y) \operatorname{deg}(\mathcal{E})+n \chi\left(Y, f_{*} \mathcal{O}_{X}\right) \\
& =\operatorname{deg}(X / Y) \operatorname{deg}(\mathcal{E})+n \chi\left(X, \mathcal{O}_{X}\right)
\end{aligned}
$$

as desired. The first equality as $f$ is finite, see Cohomology of Schemes, Lemma 29.2.4. The second equality by projection formula, see Cohomology, Lemma 20.43.2. The third equality by Lemma 32.33 .5

The following is a trivial but important consequence of the results on degrees above.
0B40 Lemma 32.33.10. Let $k$ be a field. Let $X$ be a proper curve over $k$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module.
(1) If $\mathcal{L}$ has a nonzero section, then $\operatorname{deg}(\mathcal{L}) \geq 0$.
(2) If $\mathcal{L}$ has a nonzero section $s$ which vanishes at a point, then $\operatorname{deg}(\mathcal{L})>0$.
(3) If $\mathcal{L}$ and $\mathcal{L}^{-1}$ have nonzero sections, then $\mathcal{L} \cong \mathcal{O}_{X}$.
(4) If $\operatorname{deg}(\mathcal{L}) \leq 0$ and $\mathcal{L}$ has a nonzero section, then $\mathcal{L} \cong \mathcal{O}_{X}$.

Proof. Let $s$ be a nonzero section of $\mathcal{L}$. Since $X$ is a curve, we see that $s$ is a regular section. Hence there is an effective Cartier divisor $D \subset X$ and an isomorphism $\mathcal{L} \rightarrow \mathcal{O}_{X}(D)$ mapping $s$ the the canonical section 1 of $\mathcal{O}_{X}(D)$, see Divisors, Lemma 30.11.21. Then $\operatorname{deg}(\mathcal{L})=\operatorname{deg}(D)$ by Lemma 32.33.8. As $\operatorname{deg}(D) \geq 0$ and $=0$ if and only if $D=\emptyset$, this proves (1) and (2).

In case (3) we see that $\operatorname{deg}(\mathcal{L})=0$ and $D=\emptyset$. Similarly for (4).
0B5X
Lemma 32.33.11. Let $k$ be a field. Let $X$ be a proper curve over $k$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Then $\mathcal{L}$ is ample if and only if $\operatorname{deg}(\mathcal{L})>0$.

Proof. If $\mathcal{L}$ is ample, then there exists an $n>0$ and a section $s \in H^{0}\left(X, \mathcal{L}^{\otimes n}\right)$ with $X_{s}$ affine. Since $X$ isn't affine (otherwise by Morphisms, Lemma $28.43 .10 X$ would be finite), we see that $s$ vanishes at some point. Hence $\operatorname{deg}\left(\mathcal{L}^{\otimes n}\right)>0$ by Lemma 32.33.10. By Lemma 32.33.7 we conclude that $\operatorname{deg}(\mathcal{L})=1 / n \operatorname{deg}\left(\mathcal{L}^{\otimes n}\right)>0$.
Assume $\operatorname{deg}(\mathcal{L})>0$. Then

$$
\operatorname{dim}_{k} H^{0}\left(X, \mathcal{L}^{\otimes n}\right) \geq \chi\left(X, \mathcal{L}^{n}\right)=n \operatorname{deg}(\mathcal{L})+\chi\left(X, \mathcal{O}_{X}\right)
$$

grows linearly with $n$. Hence for any finite collection of closed points $x_{1}, \ldots, x_{t}$ of $X$, we can find an $n$ such that $\operatorname{dim}_{k} H^{0}\left(X, \mathcal{L}^{\otimes n}\right)>\sum \operatorname{dim}_{k} \kappa\left(x_{i}\right)$. (Recall that by Hilbert Nullstellensatz, the extension fields $k \subset \kappa\left(x_{i}\right)$ are finite, see for example Morphisms, Lemma 28.20.3). Hence we can find a nonzero $s \in H^{0}\left(X, \mathcal{L}^{\otimes n}\right)$ vanishing in $x_{1}, \ldots, x_{t}$. In particular, if we choose $x_{1}, \ldots, x_{t}$ such that $X \backslash\left\{x_{1}, \ldots, x_{t}\right\}$
is affine, then $X_{s}$ is affine too (for example by Properties, Lemma 27.26.4 although if we choose our finite set such that $\left.\mathcal{L}\right|_{X \backslash\left\{x_{1}, \ldots, x_{t}\right\}}$ is trivial, then it is immediate). The conclusion is that we can find an $n>0$ and a nonzero section $s \in H^{0}\left(X, \mathcal{L}^{\otimes n}\right)$ such that $X_{s}$ is affine.
We will show that for every quasi-coherent sheaf of ideals $\mathcal{I}$ there exists an $m>0$ such that $H^{1}\left(X, \mathcal{I} \otimes \mathcal{L}^{\otimes m}\right)$ is zero. This will finish the proof by Cohomology of Schemes, Lemma 29.16.1. To see this we consider the maps

$$
\mathcal{I} \xrightarrow{s} \mathcal{I} \otimes \mathcal{L}^{\otimes n} \xrightarrow{s} \mathcal{I} \otimes \mathcal{L}^{\otimes 2 n} \xrightarrow{s} \ldots
$$

Since $\mathcal{I}$ is torsion free, these maps are injective and isomorphisms over $X_{s}$, hence the cokernels have vanishing $H^{1}$ (by Cohomology of Schemes, Lemma 29.9.10 for example). We conclude that the maps of vector spaces

$$
H^{1}(X, \mathcal{I}) \rightarrow H^{1}\left(X, \mathcal{I} \otimes \mathcal{L}^{\otimes n}\right) \rightarrow H^{1}\left(X, \mathcal{I} \otimes \mathcal{L}^{\otimes 2 n}\right) \rightarrow \ldots
$$

are surjective. On the other hand, the dimension of $H^{1}(X, \mathcal{I})$ is finite, and every element maps to zero eventually by Cohomology of Schemes, Lemma 29.16.4. Thus for some $e>0$ we see that $H^{1}\left(X, \mathcal{I} \otimes \mathcal{L}^{\otimes e n}\right)$ is zero. This finishes the proof.

0B5Y Lemma 32.33.12. Let $k$ be a field. Let $X$ be a proper scheme of dimension $\leq 1$ over $k$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $C_{i} \subset X, i=1, \ldots, t$ be the irreducible components of dimension 1. The following are equivalent:
(1) $\mathcal{L}$ is ample, and
(2) $\operatorname{deg}\left(\left.\mathcal{L}\right|_{C_{i}}\right)>0$ for $i=1, \ldots, t$.

Proof. Let $x_{1}, \ldots, x_{r} \in X$ be the isolated closed points. Think of $x_{i}=\operatorname{Spec}\left(\kappa\left(x_{i}\right)\right)$ as a scheme. Consider the morphism of schemes

$$
f: C_{1} \amalg \ldots \amalg C_{t} \amalg x_{1} \amalg \ldots \amalg x_{r} \longrightarrow X
$$

This is a finite surjective morphism of schemes proper over $k$ (details omitted). Thus $\mathcal{L}$ is ample if and only if $f^{*} \mathcal{L}$ is ample (Cohomology of Schemes, Lemma 29.16.2. Thus we conclude by Lemma 32.33.11.

0B8Y Lemma 32.33.13. Let $k$ be a field. Let $X$ be a curve over $k$. Let $x \in X$ be a closed point. We think of $x$ as a (reduced) closed subscheme of $X$ with sheaf of ideals $\mathcal{I}$. The following are equivalent
(1) $\mathcal{O}_{X, x}$ is regular,
(2) $\mathcal{O}_{X, x}$ is normal,
(3) $\mathcal{O}_{X, x}$ is a discrete valuation ring,
(4) $\mathcal{I}$ is an invertible $\mathcal{O}_{X}$-module,
(5) $x$ is an effective Cartier divisor on $X$.

If $k$ is perfect, these are also equivalent to
(6) $X \rightarrow \operatorname{Spec}(k)$ is smooth at $x$.

Proof. Since $X$ is a curve, the local ring $\mathcal{O}_{X, x}$ is a Noetherian local domain of dimension 1 (Lemma 32.17.3). Parts (4) and (5) are equivalent by definition and are equivalent to $\mathcal{I}_{x}=\mathfrak{m}_{x} \subset \mathcal{O}_{X, x}$ having one generator (Divisors, Lemma 30.12.2). The equivalence of (1), (2), (3), (4), and (5) therefore follows from Algebra, Lemma 10.118.7. The final statement follows from Lemma 32.20.8,

0B8Z Lemma 32.33.14. Let $k$ be an algebraically closed field. Let $X$ be a proper curve over $k$. Then there exist
(1) an invertible $\mathcal{O}_{X}$-module $\mathcal{L}$ with $\operatorname{dim}_{k} H^{0}(X, \mathcal{L})=1$ and $H^{1}(X, \mathcal{L})=0$, and
(2) an invertible $\mathcal{O}_{X}$-module $\mathcal{N}$ with $\operatorname{dim}_{k} H^{0}(X, \mathcal{N})=0$ and $H^{1}(X, \mathcal{N})=0$.

Proof. Choose a closed immersion $i: X \rightarrow \mathbf{P}_{k}^{n}$ (Lemma 32.32.4. Setting $\mathcal{L}=$ $i^{*} \mathcal{O}_{\mathbf{P}^{n}}(d)$ for $d \gg 0$ we see that there exists an invertible sheaf $\mathcal{L}$ with $H^{0}(X, \mathcal{L}) \neq 0$ and $H^{1}(X, \mathcal{L})=0$ (see Cohomology of Schemes, Lemma 29.16.1 for vanishing and the references therein for nonvanishing). We will finish the proof of (1) by descending induction on $t=\operatorname{dim}_{k} H^{0}(X, \mathcal{L})$. The base case $t=1$ is trivial. Assume $t>1$.

Let $U \subset X$ be the nonempty open subset of nonsingular points studied in Lemma 32.20.8. Let $s \in H^{0}(X, \mathcal{L})$ be nonzero. There exists a closed point $x \in U$ such that $s$ does not vanish in $x$. Let $\mathcal{I}$ be the ideal sheaf of $i: x \rightarrow X$ as in Lemma32.33.13, Look at the short exact sequence

$$
0 \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{L} \rightarrow \mathcal{L} \rightarrow i_{*} i^{*} \mathcal{L} \rightarrow 0
$$

Observe that $H^{0}\left(X, i_{*} i^{*} \mathcal{L}\right)=H^{0}\left(x, i^{*} \mathcal{L}\right)$ has dimension 1 as $x$ is a $k$-rational point ( $k$ is algebraically closed). Since $s$ does not vanish at $x$ we conclude that

$$
H^{0}(X, \mathcal{L}) \longrightarrow H^{0}\left(X, i_{*} i^{*} \mathcal{L}\right)
$$

is surjective. Hence $\operatorname{dim}_{k} H^{0}\left(X, \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right)=t-1$. Finally, the long exact sequence of cohomology also shows that $H^{1}\left(X, \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right)=0$ thereby finishing the proof of the induction step.

To get an invertible sheaf as in (2) take an invertible sheaf $\mathcal{L}$ as in (1) and do the argument in the previous paragraph one more time.

0B90 Lemma 32.33.15. Let $k$ be an algebraically closed field. Let $X$ be a proper curve over $k$. Set $g=\operatorname{dim}_{k} H^{1}\left(X, \mathcal{O}_{X}\right)$. For every invertible $\mathcal{O}_{X}$-module $\mathcal{L}$ with $\operatorname{deg}(\mathcal{L}) \geq 2 g-1$ we have $H^{1}(X, \mathcal{L})=0$.

Proof. Let $\mathcal{N}$ be the invertible module we found in Lemma 32.33 .14 part (2). The degree of $\mathcal{N}$ is $\chi(X, \mathcal{N})-\chi\left(X, \mathcal{O}_{X}\right)=0-(1-g)=g-1$. Hence the degree of $\mathcal{L} \otimes \mathcal{N}^{\otimes-1}$ is $\operatorname{deg}(\mathcal{L})-(g-1) \geq g$. Hence $\chi\left(X, \mathcal{L} \otimes \mathcal{N}^{\otimes-1}\right) \geq g+1-g=1$. Thus there is a nonzero global section $s$ whose zero scheme is an effective Cartier divisor $D$ of degree $\operatorname{deg}(\mathcal{L})-(g-1)$. This gives a short exact sequence

$$
0 \rightarrow \mathcal{N} \xrightarrow{s} \mathcal{L} \rightarrow i_{*}\left(\left.\mathcal{L}\right|_{D}\right) \rightarrow 0
$$

where $i: D \rightarrow X$ is the inclusion morphism. We conclude that $H^{0}(X, \mathcal{L})$ maps isomorphically to $H^{0}\left(D,\left.\mathcal{D}\right|_{D}\right)$ which has dimension $\operatorname{deg}(\mathcal{L})-(g-1)$. The result follows from the definition of degree.

### 32.34. Numerical intersections

0BEL In this section we play around with the Euler characteristic of coherent sheaves on proper schemes to obtain numerical intersection numbers for invertible modules. Our main tool will be the following lemma.

0BEM Lemma 32.34.1. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $\mathcal{F}$ be $a$ coherent $\mathcal{O}_{X}$-module. Let $\mathcal{L}_{1}, \ldots, \mathcal{L}_{r}$ be invertible $\mathcal{O}_{X}$-modules. The map

$$
\left(n_{1}, \ldots, n_{r}\right) \longmapsto \chi\left(X, \mathcal{F} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)
$$

is a numerical polynomial in $n_{1}, \ldots, n_{r}$ of total degree at most the dimension of the support of $\mathcal{F}$.
Proof. We prove this by induction on $\operatorname{dim}(\operatorname{Supp}(\mathcal{F}))$. If this number is zero, then the function is constant with value $\operatorname{dim}_{k} \Gamma(X, \mathcal{F})$ by Lemma 32.26.3. Assume $\operatorname{dim}(\operatorname{Supp}(\mathcal{F}))>0$.
If $\mathcal{F}$ has embedded associated points, then we can consider the short exact sequence $0 \rightarrow \mathcal{K} \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow 0$ constructed in Divisors, Lemma 30.4.5. Since the dimension of the support of $\mathcal{K}$ is strictly less, the result holds for $\mathcal{K}$ by induction hypothesis and with strictly smaller total degree. By additivity of the Euler characteristic (Lemma 32.26.2) it suffices to prove the result for $\mathcal{F}^{\prime}$. Thus we may assume $\mathcal{F}$ does not have embedded associated points.
If $i: Z \rightarrow X$ is a closed immersion and $\mathcal{F}=i_{*} \mathcal{G}$, then we see that the result for $X, \mathcal{F}, \mathcal{L}_{1}, \ldots, \mathcal{L}_{r}$ is equivalent to the result for $Z, \mathcal{G}, i^{*} \mathcal{L}_{1}, \ldots, i^{*} \mathcal{L}_{r}$ (since the cohomologies agree, see Cohomology of Schemes, Lemma 29.2.4. Applying Divisors, Lemma 30.4.6 we may assume that $X$ has no embedded components and $X=\operatorname{Supp}(\mathcal{F})$.

Pick a regular meromorphic section $s$ of $\mathcal{L}_{1}$, see Divisors, Lemma 30.20.13. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal of denominators of $s$ and consider the maps

$$
\mathcal{I F} \rightarrow \mathcal{F}, \quad \mathcal{I F} \rightarrow \mathcal{F} \otimes \mathcal{L}_{1}
$$

of Divisors, Lemma 30.20.16. These are injective and have cokernels $\mathcal{Q}, \mathcal{Q}^{\prime}$ supported on nowhere dense closed subschemes of $X=\operatorname{Supp}(\mathcal{F})$. Tensoring with the invertible module $\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}$ is exact, hence using additivity again we see that

$$
\begin{aligned}
& \chi\left(X, \mathcal{F} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)-\chi\left(X, \mathcal{F} \otimes \mathcal{L}_{1}^{\otimes n_{1}+1} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right) \\
& =\chi\left(\mathcal{Q} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)-\chi\left(\mathcal{Q}^{\prime} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)
\end{aligned}
$$

Thus we see that the function $P\left(n_{1}, \ldots, n_{r}\right)$ of the lemma has the property that

$$
P\left(n_{1}+1, n_{2}, \ldots, n_{r}\right)-P\left(n_{1}, \ldots, n_{r}\right)
$$

is a numerical polynomial of total degree $<$ the dimension of the support of $\mathcal{F}$. Of course by symmetry the same thing is true for

$$
P\left(n_{1}, \ldots, n_{i-1}, n_{i}+1, n_{i+1}, \ldots, n_{r}\right)-P\left(n_{1}, \ldots, n_{r}\right)
$$

for any $i \in\{1, \ldots, r\}$. A simple arithmetic argument shows that $P$ is a numerical polynomial of total degree at most $\operatorname{dim}(\operatorname{Supp}(\mathcal{F}))$.

The following lemma roughly shows that the leading coefficient only depends on the length of the coherent module in the generic points of its support.

0BEN Lemma 32.34.2. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Let $\mathcal{L}_{1}, \ldots, \mathcal{L}_{r}$ be invertible $\mathcal{O}_{X}$-modules. Let $d=$ $\operatorname{dim}(\operatorname{Supp}(\mathcal{F}))$. Let $Z_{i} \subset X$ be the irreducible components of $\operatorname{Supp}(\mathcal{F})$ of dimension d. Let $\xi_{i} \in Z_{i}$ be the generic point and set $m_{i}=$ length $_{\mathcal{O}_{X, \xi_{i}}}\left(\mathcal{F}_{\xi_{i}}\right)$ Then

$$
\chi\left(X, \mathcal{F} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)-\sum_{i} m_{i} \chi\left(Z_{i},\left.\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right|_{Z_{i}}\right)
$$

is a numerical polynomial in $n_{1}, \ldots, n_{r}$ of total degree $<d$.

Proof. Consider pairs $(\xi, Z)$ where $Z \subset X$ is an integral closed subscheme of dimension $d$ and $\xi$ is its generic point. Then the finite $\mathcal{O}_{X, \xi}$-module $\mathcal{F}_{\xi}$ has support contained in $\{\xi\}$ hence the length $m_{Z}=\operatorname{length}_{\mathcal{O}_{X, \xi}}\left(\mathcal{F}_{\xi}\right)$ is finite (Algebra, Lemma 10.61.3) and zero unless $Z=Z_{i}$ for some $i$. Thus the expression of the lemma can be written as

$$
E(\mathcal{F})=\chi\left(X, \mathcal{F} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)-\sum m_{Z} \chi\left(Z,\left.\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right|_{Z}\right)
$$

where the sum is over integral closed subschemes $Z \subset X$ of dimension $d$. The assignement $\mathcal{F} \mapsto E(\mathcal{F})$ is additive in short exact sequences $0 \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow$ $\mathcal{F}^{\prime \prime} \rightarrow 0$ of coherent $\mathcal{O}_{X}$-modules whose support has dimension $\leq d$. This follows from additvity of Euler characteristics (Lemma 32.26.2) and additivity of lengths (Algebra, Lemma 10.51.3). Let us apply Cohomology of Schemes, Lemma 29.12.3 to find a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that for each $j=1, \ldots, m$ there exists an integral closed subscheme $V_{j} \subset X$ and a sheaf of ideals $\mathcal{I}_{j} \subset \mathcal{O}_{V_{j}}$ such that

$$
\mathcal{F}_{j} / \mathcal{F}_{j-1} \cong\left(V_{j} \rightarrow X\right)_{*} \mathcal{I}_{j}
$$

By the additivity we remarked upon above it suffices to prove the result for each of the subquotients $\mathcal{F}_{j} / \mathcal{F}_{j-1}$. Thus it suffices to prove the result when $\mathcal{F}=(V \rightarrow$ $X)_{*} \mathcal{I}$ where $V \subset X$ is an integral closed subscheme of dimension $\leq d$. If $\operatorname{dim}(V)<d$ and more generally for $\mathcal{F}$ whose support has dimension $<d$, then the first term in $E(\mathcal{F})$ has total degree $<d$ by Lemma 32.34.1 and the second term is zero. If $\operatorname{dim}(V)=d$, then we can use the short exact sequence

$$
0 \rightarrow(V \rightarrow X)_{*} \mathcal{I} \rightarrow(V \rightarrow X)_{*} \mathcal{O}_{V} \rightarrow(V \rightarrow X)_{*}\left(\mathcal{O}_{V} / \mathcal{I}\right) \rightarrow 0
$$

The result holds for the middle sheaf because the only $Z$ occuring in the sum is $Z=V$ with $m_{Z}=1$ and because

$$
H^{i}\left(X,\left((V \rightarrow X)_{*} \mathcal{O}_{V}\right) \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right)=H^{i}\left(V,\left.\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{1}^{\otimes n_{1}}\right|_{V}\right)
$$

by the projection formula (Cohomology, Section 20.43) and Cohomology of Schemes, Lemma 29.2.4. so in this case we actually have $E(\mathcal{F})=0$. The result holds for the sheaf on the right because its support has dimension $<d$. Thus the result holds for the sheaf on the left and the lemma is proved.

0BEP Definition 32.34.3. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $i: Z \rightarrow X$ be a closed subscheme of dimension $d$. Let $\mathcal{L}_{1}, \ldots, \mathcal{L}_{d}$ be invertible $\mathcal{O}_{X}$-modules. We define the intersection number $\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)$ as the coefficient of $n_{1} \ldots n_{d}$ in the numerical polynomial

$$
\chi\left(X, i_{*} \mathcal{O}_{Z} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right)=\chi\left(Z,\left.\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right|_{Z}\right)
$$

In the special case that $\mathcal{L}_{1}=\ldots=\mathcal{L}_{d}=\mathcal{L}$ we write $\left(\mathcal{L}^{d} \cdot Z\right)$.
The displayed equality in the lemma follows from the projection formula (Cohomology, Section 20.43 and Cohomology of Schemes, Lemma 29.2.4 We prove a few lemmas for these intersection numbers.

0BEQ Lemma 32.34.4. In the situation of Definition 32.34.3 the intersection number $\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)$ is an integer.

Proof. Any numerical polynomial of degree $e$ in $n_{1}, \ldots, n_{d}$ can be written uniquely as a Z-linear combination of the functions $\binom{n_{1}}{k_{1}}\binom{n_{2}}{k_{2}} \ldots\binom{n_{d}}{k_{d}}$ with $k_{1}+\ldots+k_{d} \leq e$. Apply this with $e=d$. Left as an exercise.

0BER Lemma 32.34.5. In the situation of Definition 32.34.3 the intersection number $\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)$ is additive: if $\mathcal{L}_{i}=\mathcal{L}_{i}^{\prime} \otimes \mathcal{L}_{i}^{\prime \prime}$, then we have

$$
\left(\mathcal{L}_{1} \cdots \mathcal{L}_{i} \cdots \mathcal{L}_{d} \cdot Z\right)=\left(\mathcal{L}_{1} \cdots \mathcal{L}_{i}^{\prime} \cdots \mathcal{L}_{d} \cdot Z\right)+\left(\mathcal{L}_{1} \cdots \mathcal{L}_{i}^{\prime \prime} \cdots \mathcal{L}_{d} \cdot Z\right)
$$

Proof. This is true because by Lemma 32.34.1 the function
$\left(n_{1}, \ldots, n_{i-1}, n_{i}^{\prime}, n_{i}^{\prime \prime}, n_{i+1}, \ldots, n_{d}\right) \mapsto \chi\left(Z,\left.\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes\left(\mathcal{L}_{i}^{\prime}\right)^{\otimes n_{i}^{\prime}} \otimes\left(\mathcal{L}_{i}^{\prime \prime}\right)^{\otimes n_{i}^{\prime \prime}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right|_{Z}\right)$ is a numerical polynomial of total degree at most $d$ in $d+1$ variables.
0BES Lemma 32.34.6. In the situation of Definition 32.34.3 let $Z_{i} \subset Z$ be the irreducible components of dimension d. Let $m_{i}=$ length $\mathcal{O}_{X, \xi_{i}}\left(\mathcal{O}_{Z, \xi_{i}}\right)$ where $\xi_{i} \in Z_{i}$ is the generic point. Then

$$
\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)=\sum m_{i}\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z_{i}\right)
$$

Proof. Immediate from Lemma 32.34 .2 and the definitions.
0BET Lemma 32.34.7. Let $k$ be a field. Let $f: Y \rightarrow X$ be a morphism of proper schemes over $k$. Let $Z \subset Y$ be an integral closed subscheme of dimension $d$ and let $\mathcal{L}_{1}, \ldots, \mathcal{L}_{d}$ be invertible $\mathcal{O}_{X}$-modules. Then

$$
\left(f^{*} \mathcal{L}_{1} \cdots f^{*} \mathcal{L}_{d} \cdot Z\right)=\operatorname{deg}\left(\left.f\right|_{Z}: Z \rightarrow f(Z)\right)\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot f(Z)\right)
$$

where $\operatorname{deg}(Z \rightarrow f(Z))$ is as in Morphisms, Definition 28.47.8 or 0 if $\operatorname{dim}(f(Z))<d$.
Proof. The left hand side is computed using the coefficient of $n_{1} \ldots n_{d}$ in the function
$\chi\left(Y, \mathcal{O}_{Z} \otimes f^{*} \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes f^{*} \mathcal{L}_{d}^{\otimes n_{d}}\right)=\sum(-1)^{i} \chi\left(X, R^{i} f_{*} \mathcal{O}_{Z} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right)$
The equality follows from Lemma 32.26 .5 and the projection formula (Cohomology, Lemma 20.43.2. If $f(Z)$ has dimension $<d$, then the right hand side is a polynomial of total degree $<d$ by Lemma 32.34 .1 and the result is true. Assume $\operatorname{dim}(f(Z))=d$. Let $\xi \in f(Z)$ be the generic point. By dimension theory (see Lemmas 32.17 .3 and 32.17 .4 the generic point of $Z$ is the unique point of $Z$ mapping to $\xi$. Then $f: Z \rightarrow f(Z)$ is finite over a nonempty open of $f(Z)$, see Morphisms, Lemma 28.47.1 Thus $\operatorname{deg}(f: Z \rightarrow f(Z))$ is defined and in fact it is equal to the length of the stalk of $f_{*} \mathcal{O}_{Z}$ at $\xi$ over $\mathcal{O}_{X, \xi}$. Moreover, the stalk of $R^{i} f_{*} \mathcal{O}_{X}$ at $\xi$ is zero for $i>0$ because we just saw that $\left.f\right|_{Z}$ is finite in a neighbourhood of $\xi$ (so that Cohomology of Schemes, Lemma 29.9 .9 gives the vanishing). Thus the terms $\chi\left(X, R^{i} f_{*} \mathcal{O}_{Z} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right)$ with $i>0$ have total degree $<d$ and $\chi\left(X, f_{*} \mathcal{O}_{Z} \otimes \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right)=\operatorname{deg}(f: Z \rightarrow f(Z)) \chi\left(f(Z),\left.\mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right|_{f(Z)}\right)$ modulo a polynomial of total degree $<d$ by Lemma 32.34.2. The desired result follows.

0BEU Lemma 32.34.8. Let $k$ be a field. Let $X$ be proper over $k$. Let $Z \subset X$ be a closed subscheme of dimension d. Let $\mathcal{L}_{1}, \ldots, \mathcal{L}_{d}$ be invertible $\mathcal{O}_{X}$-modules. Assume there exists an effective Cartier divisor $D \subset Z$ such that $\left.\mathcal{L}_{1}\right|_{Z} \cong \mathcal{O}_{Z}(D)$. Then

$$
\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)=\left(\mathcal{L}_{2} \cdots \mathcal{L}_{d} \cdot D\right)
$$

Proof. We may replace $X$ by $Z$ and $\mathcal{L}_{i}$ by $\left.\mathcal{L}_{i}\right|_{Z}$. Thus we may assume $X=Z$ and $\mathcal{L}_{1}=\mathcal{O}_{X}(D)$. Then $\mathcal{L}_{1}^{-1}$ is the ideal sheaf of $D$ and we can consider the short exact sequence

$$
0 \rightarrow \mathcal{L}_{1}^{\otimes-1} \rightarrow \mathcal{O}_{X} \rightarrow \mathcal{O}_{D} \rightarrow 0
$$

Set $P\left(n_{1}, \ldots, n_{d}\right)=\chi\left(X, \mathcal{L}_{1}^{\otimes n_{1}} \otimes \ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right)$ and $Q\left(n_{1}, \ldots, n_{d}\right)=\chi\left(D, \mathcal{L}_{1}^{\otimes n_{1}} \otimes\right.$ $\left.\left.\ldots \otimes \mathcal{L}_{d}^{\otimes n_{d}}\right|_{D}\right)$. We conclude from additivity that

$$
P\left(n_{1}, \ldots, n_{d}\right)-P\left(n_{1}-1, n_{2}, \ldots, n_{d}\right)=Q\left(n_{1}, \ldots, n_{d}\right)
$$

Because the total degree of $P$ is at most $d$, we see that the coefficient of $n_{1} \ldots n_{d}$ in $P$ is equal to the coefficient of $n_{2} \ldots n_{d}$ in $Q$.

0BEV Lemma 32.34.9. Let $k$ be a field. Let $X$ be proper over $k$. Let $Z \subset X$ be a closed subscheme of dimension d. If $\mathcal{L}_{1}, \ldots, \mathcal{L}_{d}$ are ample, then $\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot Z\right)$ is positive.

Proof. We will prove this by induction on $d$. The case $d=0$ follows from Lemma 32.26 .3 . Assume $d>0$. By Lemma 32.34 .6 we may assume that $Z$ is an integral closed subscheme. In fact, we may replace $X$ by $Z$ and $\mathcal{L}_{i}$ by $\left.\mathcal{L}_{i}\right|_{Z}$ to reduce to the case $Z=X$ is a proper variety of dimension $d$. By Lemma 32.34 .5 we may replace $\mathcal{L}_{1}$ by a positive tensor power. Thus we may assume there exists a nonzero section $s \in \Gamma\left(X, \mathcal{L}_{1}\right)$ such that $X_{s}$ is affine (here we use the definition of ample invertible sheaf, see Properties, Definition 27.26.1). Observe that $X$ is not affine because proper and affine implies finite (Morphisms, Lemma 28.43.10) which contradicts $d>0$. It follows that $s$ has a nonempty vanising scheme $Z(s) \subset X$. Since $X$ is a variety, $s$ is a regular section of $\mathcal{L}_{1}$, so $Z(s)$ is an effective Cartier divisor, thus $Z(s)$ has codimension 1 in $X$, and hence $Z(s)$ has dimension $d-1$ (here we use material from Divisors, Sections 30.11 and 30.12 and from dimension theory as in Lemma 32.17.3). By Lemma 32.34.8 we have

$$
\left(\mathcal{L}_{1} \cdots \mathcal{L}_{d} \cdot X\right)=\left(\mathcal{L}_{2} \cdots \mathcal{L}_{d} \cdot Z(s)\right)
$$

By induction the right hand side is positive and the proof is complete.
OBEW Definition 32.34.10. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $\mathcal{L}$ be an ample invertible $\mathcal{O}_{X}$-module. For any closed subscheme the degree of $Z$ with respect to $\mathcal{L}$, denoted $\operatorname{deg}_{\mathcal{L}}(Z)$, is the the intersection number $\left(\mathcal{L}^{d} \cdot Z\right)$ where $d=\operatorname{dim}(Z)$.

By Lemma 32.34 .9 the degree of a subscheme is always a positive integer. We note that $\operatorname{deg}_{\mathcal{L}}(Z)=d$ if and only if

$$
\chi\left(Z,\left.\mathcal{L}^{\otimes n}\right|_{Z}\right)=\frac{d}{\operatorname{dim}(Z)!} n^{\operatorname{dim}(Z)}+\text { l.o.t }
$$

as can be seen using that

$$
\left(n_{1}+\ldots+n_{\operatorname{dim}(Z)}\right)^{\operatorname{dim}(Z)}=\operatorname{dim}(Z)!n_{1} \ldots n_{\operatorname{dim}(Z)}+\text { other terms }
$$

0BEX Lemma 32.34.11. Let $k$ be a field. Let $f: Y \rightarrow X$ be a finite dominant morphism of proper varieties over $k$. Let $\mathcal{L}$ be an ample invertible $\mathcal{O}_{X}$-module. Then

$$
\operatorname{deg}_{f^{*} \mathcal{L}}(Y)=\operatorname{deg}(f) \operatorname{deg}_{\mathcal{L}}(X)
$$

where $\operatorname{deg}(f)$ is as in Morphisms, Definition 28.47.8.
Proof. The statement makes sense becase $f^{*} \mathcal{L}$ is ample by Morphisms, Lemma 28.37.7. Having said this the result is a special case of Lemma 32.34.7.

Finally we relate the intersection number with a curve to the notion of degrees of invertible modules on curves introduced in Section 32.33,

0BEY Lemma 32.34.12. Let $k$ be a field. Let $X$ be a proper scheme over $k$. Let $Z \subset X$ be a closed subscheme of dimension $\leq 1$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Then

$$
(\mathcal{L} \cdot Z)=\operatorname{deg}\left(\left.\mathcal{L}\right|_{Z}\right)
$$

where $\operatorname{deg}\left(\left.\mathcal{L}\right|_{Z}\right)$ is as in Definition 32.33.1. If $\mathcal{L}$ is ample, then $\operatorname{deg}_{\mathcal{L}}(Z)=\operatorname{deg}\left(\left.\mathcal{L}\right|_{Z}\right)$.
Proof. This follows from the fact that the function $n \mapsto \chi\left(Z,\left.\mathcal{L}\right|_{Z} ^{\otimes n}\right)$ has degree 1 and hence the leading coefficient is the difference of consecutive values.
0BJ8 Proposition 32.34.13 (Asymptotic Riemann-Roch). Let $k$ be a field. Let $X$ be a proper scheme over $k$ of dimension $d$. Let $\mathcal{L}$ be an ample invertible $\mathcal{O}_{X}$-module. Then

$$
\operatorname{dim}_{k} \Gamma\left(X, \mathcal{L}^{\otimes n}\right) \sim c n^{d}+\text { l.o.t. }
$$

where $c=\operatorname{deg}_{\mathcal{L}}(X) / d$ ! is a positive constant.
Proof. This follows immediately from the definitions and Lemma 32.34.9.

## CHAPTER 33

## Topologies on Schemes

020K

### 33.1. Introduction

020L In this document we explain what the different topologies on the category of schemes are. Some references are Gro71 and BLR90. Before doing so we would like to point out that there are many different choices of sites (as defined in Sites, Definition 7.6.2 which give rise to the same notion of sheaf on the underlying category. Hence our choices may be slightly different from those in the references but ultimately lead to the same cohomology groups, etc.

### 33.2. The general procedure

020 M In this section we explain a general procedure for producing the sites we will be working with. Suppose we want to study sheaves over schemes with respect to some topology $\tau$. In order to get a site, as in Sites, Definition 7.6.2, of schemes with that topology we have to do some work. Namely, we cannot simply say "consider all schemes with the Zariski topology" since that would give a "big" category. Instead, in each section of this chapter we will proceed as follows:
(1) We define a class $\operatorname{Cov}_{\tau}$ of coverings of schemes satisfying the axioms of Sites, Definition 7.6.2. It will always be the case that a Zariski open covering of a scheme is a covering for $\tau$.
(2) We single out a notion of standard $\tau$-covering within the category of affine schemes.
(3) We define what is an "absolute" big $\tau$-site $S c h_{\tau}$. These are the sites one gets by appropriately choosing a set of schemes and a set of coverings.
(4) For any object $S$ of $S c h_{\tau}$ we define the big $\tau$-site $(S c h / S)_{\tau}$ and for suitable $\tau$ the small ${ }^{1} \tau$-site $S_{\tau}$.
(5) In addition there is a site $(A f f / S)_{\tau}$ using the notion of standard $\tau$-covering of affines whose category of sheaves is equivalent to the category of sheaves on $(S c h / S)_{\tau}$.
The above is a little clumsy in that we do not end up with a canonical choice for the $\operatorname{big} \tau$-site of a scheme, or even the small $\tau$-site of a scheme. If you are willing to ignore set theoretic difficulties, then you can work with classes and end up with canonical big and small sites...

[^89]
### 33.3. The Zariski topology

## 020N

020 O Definition 33.3.1. Let $T$ be a scheme. A Zariski covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is an open immersion and such that $T=\bigcup f_{i}\left(T_{i}\right)$.
This defines a (proper) class of coverings. Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2

020P Lemma 33.3.2. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is a Zariski covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a Zariski covering and for each $i$ we have a Zariski covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a Zariski covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a Zariski covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times{ }_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is a Zariski covering.

Proof. Omitted.
020Q Lemma 33.3.3. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be a Zariski covering of $T$. Then there exists a Zariski covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is a standard open of $T$, see Schemes, Definition 25.5.2. Moreover, we may choose each $U_{j}$ to be an open of one of the $T_{i}$.

Proof. Follows as $T$ is quasi-compact and standard opens form a basis for its topology. This is also proved in Schemes, Lemma 25.5.1.

Thus we define the corresponding standard coverings of affines as follows.

020R Definition 33.3.4. Compare Schemes, Definition | 25.5 .2 |
| :---: |
| Let $T$ | be an affine scheme. A standard Zariski covering of $T$ is a a Zariski covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ with each $U_{j} \rightarrow T$ inducing an isomorphism with a standard affine open of $T$.

020 Definition 33.3.5. A big Zariski site is any site $S c h_{Z a r}$ as in Sites, Definition 7.6 .2 constructed as follows:
(1) Choose any set of schemes $S_{0}$, and any set of Zariski coverings $\operatorname{Cov}_{0}$ among these schemes.
(2) As underlying category of $S c h_{Z a r}$ take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9 .2 starting with the set $S_{0}$.
(3) As coverings of Sch Zar choose any set of coverings as in Sets, Lemma 3.11 .1 starting with the category $S c h_{\alpha}$ and the class of Zariski coverings, and the set $\mathrm{Cov}_{0}$ chosen above.

It is shown in Sites, Lemma 7.8 .6 that, after having chosen the category $S c h_{\alpha}$, the category of sheaves on $S c h_{\alpha}$ does not depend on the choice of coverings chosen in (3) above. In other words, the topos $S h\left(S c h_{Z a r}\right)$ only depends on the choice of the category $S c h_{\alpha}$. It is shown in Sets, Lemma 3.9.9 that these categories are closed under many constructions of algebraic geometry, e.g., fibre products and taking open and closed subschemes. We can also show that the exact choice of $S c h_{\alpha}$ does not matter too much, see Section 33.10.
Another approach would be to assume the existence of a strongly inaccessible cardinal and to define $S c h_{Z a r}$ to be the category of schemes contained in a chosen
universe with set of coverings the Zariski coverings contained in that same universe.
Before we continue with the introduction of the big Zariski site of a scheme $S$, let us point out that the topology on a big Zariski site $S c h_{Z a r}$ is in some sense induced from the Zariski topology on the category of all schemes.

03WV Lemma 33.3.6. Let $S_{\text {L }} h_{Z a r}$ be a big Zariski site as in Definition 33.3.5. Let $T \in \mathrm{Ob}\left(S c h_{Z a r}\right)$. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an arbitrary Zariski covering of T. There exists a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S_{\text {Sch }}$ which is tautologically equivalent (see Sites, Definition 7.8.2) to $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.

Proof. Since each $T_{i} \rightarrow T$ is an open immersion, we see by Sets, Lemma 3.9.9 that each $T_{i}$ is isomorphic to an object $V_{i}$ of $S c h_{\text {Zar }}$. The covering $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ is tautologically equivalent to $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ (using the identity map on $I$ both ways). Moreover, $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ is combinatorially equivalent to a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c h_{Z a r}$ by Sets, Lemma 3.11.1.

020T Definition 33.3.7. Let $S$ be a scheme. Let $S c h_{Z a r}$ be a big Zariski site containing $S$.
(1) The big Zariski site of $S$, denoted $(S c h / S)_{Z a r}$, is the site $S c h_{Z a r} / S$ introduced in Sites, Section 7.24 .
(2) The small Zariski site of $S$, which we denote $S_{Z a r}$, is the full subcategory of $(S c h / S)_{Z a r}$ whose objects are those $U / S$ such that $U \rightarrow S$ is an open immersion. A covering of $S_{Z a r}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{Z a r}$ with $U \in \operatorname{Ob}\left(S_{Z a r}\right)$.
(3) The big affine Zariski site of $S$, denoted $(A f f / S)_{Z a r}$, is the full subcategory of $(S c h / S)_{Z a r}$ whose objects are affine $U / S$. A covering of $(A f f / S)_{Z a r}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{Z a r}$ which is a standard Zariski covering.
It is not completely clear that the small Zariski site and the big affine Zariski site are sites. We check this now.

020U Lemma 33.3.8. Let $S$ be a scheme. Let $S_{\text {S }}^{\text {Zar }}$ be a big Zariski site containing $S$. Both $S_{Z a r}$ and $(A f f / S)_{Z a r}$ are sites.

Proof. Let us show that $S_{Z a r}$ is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 7.6.2 Since $(S c h / S)_{Z a r}$ is a site, it suffices to prove that given any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{Z a r}$ with $U \in \mathrm{Ob}\left(S_{Z a r}\right)$ we also have $U_{i} \in \mathrm{Ob}\left(S_{Z a r}\right)$. This follows from the definitions as the composition of open immersions is an open immersion.
Let us show that $(A f f / S)_{Z a r}$ is a site. Reasoning as above, it suffices to show that the collection of standard Zariski coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2 Let $R$ be a ring. Let $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal. For each $i \in\{1, \ldots, n\}$ let $g_{i 1}, \ldots, g_{i n_{i}} \in R_{f_{i}}$ be elements generating the unit ideal of $R_{f_{i}}$. Write $g_{i j}=f_{i j} / f_{i}^{e_{i j}}$ which is possible. After replacing $f_{i j}$ by $f_{i} f_{i j}$ if necessary, we have that $D\left(f_{i j}\right) \subset D\left(f_{i}\right) \cong \operatorname{Spec}\left(R_{f_{i}}\right)$ is equal to $D\left(g_{i j}\right) \subset \operatorname{Spec}\left(R_{f_{i}}\right)$. Hence we see that the family of morphisms $\left\{D\left(g_{i j}\right) \rightarrow \operatorname{Spec}(R)\right\}$ is a standard Zariski covering. From these considerations it follows that (2) holds for standard Zariski coverings. We omit the verification of (1) and (3).

020V Lemma 33.3.9. Let $S$ be a scheme. Let $S_{\text {Lch }}$ be a big Zariski site containing $S$. The underlying categories of the sites $S_{\text {char }},(S c h / S)_{Z a r}, S_{Z a r}$, and $(A f f / S)_{Z a r}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The categories $(S c h / S)_{\text {Zar }}$, and $S_{Z a r}$ both have a final object, namely $S / S$.

Proof. For $S c h_{Z a r}$ it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S, V \rightarrow U, W \rightarrow U$ morphisms of schemes with $U, V, W \in \mathrm{Ob}\left(S c h_{Z a r}\right)$. The fibre product $V \times_{U} W$ in $S c h_{Z a r}$ is a fibre product in $S c h$ and is the fibre product of $V / S$ with $W / S$ over $U / S$ in the category of all schemes over $S$, and hence also a fibre product in $(S c h / S)_{Z a r}$. This proves the result for $(S c h / S)_{Z a r}$. If $U \rightarrow S, V \rightarrow U$ and $W \rightarrow U$ are open immersions then so is $V \times_{U} W \rightarrow S$ and hence we get the result for $S_{Z a r}$. If $U, V, W$ are affine, so is $V \times_{U} W$ and hence the result for $(A f f / S)_{Z a r}$.

Next, we check that the big affine site defines the same topos as the big site.
020W Lemma 33.3.10. Let $S$ be a scheme. Let $S_{\text {Sch }}$ Zar be big Zariski site containing $S$. The functor $(\text { Aff/S })_{Z a r} \rightarrow(S c h / S)_{Z a r}$ is a special cocontinuous functor. Hence it induces an equivalence of topoi from $\operatorname{Sh}\left((A f f / S)_{Z a r}\right)$ to $\operatorname{Sh}\left((S c h / S)_{Z a r}\right)$.

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) - (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u:(A f f / S)_{Z a r} \rightarrow(S c h / S)_{Z a r}$. Being cocontinuous just means that any Zariski covering of $T / S, T$ affine, can be refined by a standard Zariski covering of $T$. This is the content of Lemma 33.3.3. Hence (1) holds. We see $u$ is continuous simply because a standard Zariski covering is a Zariski covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that $u$ is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering.

Let us check that the notion of a sheaf on the small Zariski site corresponds to notion of a sheaf on $S$.

020X Lemma 33.3.11. The category of sheaves on $S_{Z a r}$ is equivalent to the category of sheaves on the underlying topological space of $S$.

Proof. We will use repeatedly that for any object $U / S$ of $S_{Z a r}$ the morphism $U \rightarrow S$ is an isomorphism onto an open subscheme. Let $\mathcal{F}$ be a sheaf on $S$. Then we define a sheaf on $S_{Z a r}$ by the rule $\mathcal{F}^{\prime}(U / S)=\mathcal{F}(\operatorname{Im}(U \rightarrow S))$. For the converse, we choose for every open subscheme $U \subset S$ an object $U^{\prime} / S \in \mathrm{Ob}\left(S_{Z a r}\right)$ with $\operatorname{Im}\left(U^{\prime} \rightarrow S\right)=U$ (here you have to use Sets, Lemma 3.9.9). Given a sheaf $\mathcal{G}$ on $S_{Z a r}$ we define a sheaf on $S$ by setting $\mathcal{G}(U)=\mathcal{G}\left(U^{\prime} / S\right)$. To see that $\mathcal{G}^{\prime}$ is a sheaf we use that for any open covering $U=\bigcup_{i \in I} U_{i}$ the covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is combinatorially equivalent to a covering $\left\{U_{j}^{\prime} \rightarrow U^{\prime}\right\}_{j \in J}$ in $S_{Z a r}$ by Sets, Lemma 3.11.1, and we use Sites, Lemma 7.8.4 Details omitted.

From now on we will not make any distinction between a sheaf on $S_{Z a r}$ or a sheaf on $S$. We will always use the procedures of the proof of the lemma to go between the two notions. Next, we establish some relationships between the topoi associated to these sites.

020Y Lemma 33.3.12. Let $S_{\text {Sch }}^{\text {Zar }}$ be a big Zariski site. Let $f: T \rightarrow S$ be a morphism in $S c h_{Z a r}$. The functor $T_{Z a r} \rightarrow(S c h / S)_{Z a r}$ is cocontinuous and induces a morphism of topoi

$$
i_{f}: S h\left(T_{Z a r}\right) \longrightarrow S h\left((S c h / S)_{Z a r}\right)
$$

For a sheaf $\mathcal{G}$ on $(S c h / S)_{\text {Zar }}$ we have the formula $\left(i_{f}^{-1} \mathcal{G}\right)(U / T)=\mathcal{G}(U / S)$. The functor $i_{f}^{-1}$ also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u: T_{Z a r} \rightarrow(S c h / S)_{Z a r}$. In other words, given and open immersion $j: U \rightarrow T$ corresponding to an object of $T_{Z a r}$ we set $u(U \rightarrow T)=$ $(f \circ j: U \rightarrow S)$. This functor commutes with fibre products, see Lemma 33.3.9. Moreover, $T_{Z a r}$ has equalizers (as any two morphisms with the same source and target are the same) and $u$ commutes with them. It is clearly cocontinuous. It is also continuous as $u$ transforms coverings to coverings and commutes with fibre products. Hence the lemma follows from Sites, Lemmas 7.20.5 and 7.20.6.

020Z Lemma 33.3.13. Let $S$ be a scheme. Let $S_{\text {Lch }}^{\text {Zar }}$ be a big Zariski site containing $S$. The inclusion functor $S_{Z a r} \rightarrow(S c h / S)_{Z a r}$ satisfies the hypotheses of Sites, Lemma 7.20.8 and hence induces a morphism of sites

$$
\pi_{S}:(S c h / S)_{Z a r} \longrightarrow S_{Z a r}
$$

and a morphism of topoi

$$
i_{S}: S h\left(S_{Z a r}\right) \longrightarrow S h\left((S c h / S)_{Z a r}\right)
$$

such that $\pi_{S} \circ i_{S}=i d$. Moreover, $i_{S}=i_{i d_{S}}$ with $i_{i d_{S}}$ as in Lemma 33.3.12. In particular the functor $i_{S}^{-1}=\pi_{S, *}$ is described by the rule $i_{S}^{-1}(\mathcal{G})(U / S)=\mathcal{G}(U / S)$.

Proof. In this case the functor $u: S_{Z a r} \rightarrow(S c h / S)_{Z a r}$, in addition to the properties seen in the proof of Lemma 33.3.12 above, also is fully faithful and transforms the final object into the final object. The lemma follows.

04BS Definition 33.3.14. In the situation of Lemma 33.3 .13 the functor $i_{S}^{-1}=\pi_{S, *}$ is often called the restriction to the small Zariski site, and for a sheaf $\mathcal{F}$ on the big Zariski site we denote $\left.\mathcal{F}\right|_{S_{Z a r}}$ this restriction.

With this notation in place we have for a sheaf $\mathcal{F}$ on the big site and a sheaf $\mathcal{G}$ on the big site that

$$
\begin{aligned}
& \operatorname{Mor}_{S h\left(S_{Z a r}\right)}\left(\left.\mathcal{F}\right|_{S_{Z_{a r}}}, \mathcal{G}\right)=\operatorname{Mor}_{S h\left((S c h / S)_{Z a r}\right)}\left(\mathcal{F}, i_{S, *} \mathcal{G}\right) \\
& \operatorname{Mor}_{S h\left(S_{Z a r}\right)}\left(\mathcal{G},\left.\mathcal{F}\right|_{S_{Z a r}}\right)=\operatorname{Mor}_{S h\left((S c h / S)_{Z a r}\right)}\left(\pi_{S}^{-1} \mathcal{G}, \mathcal{F}\right)
\end{aligned}
$$

Moreover, we have $\left.\left(i_{S, *} \mathcal{G}\right)\right|_{S_{Z a r}}=\mathcal{G}$ and we have $\left.\left(\pi_{S}^{-1} \mathcal{G}\right)\right|_{S_{Z a r}}=\mathcal{G}$.
0210 Lemma 33.3.15. Let $S_{\text {S }} h_{Z a r}$ be a big Zariski site. Let $f: T \rightarrow S$ be a morphism in Sch $_{Z a r}$. The functor

$$
u:(S c h / T)_{Z a r} \longrightarrow(S c h / S)_{Z a r}, \quad V / T \longmapsto V / S
$$

is cocontinuous, and has a continuous right adjoint

$$
v:(S c h / S)_{Z a r} \longrightarrow(S c h / T)_{Z a r}, \quad(U \rightarrow S) \longmapsto\left(U \times_{S} T \rightarrow T\right) .
$$

They induce the same morphism of topoi

$$
f_{b i g}: S h\left((S c h / T)_{Z a r}\right) \longrightarrow S h\left((S c h / S)_{Z a r}\right)
$$

We have $f_{\text {big }}^{-1}(\mathcal{G})(U / T)=\mathcal{G}(U / S)$. We have $f_{\text {big }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$. Also, $f_{\text {big }}^{-1}$ has a left adjoint $f_{\text {big! }}$ which commutes with fibre products and equalizers.

Proof. The functor $u$ is cocontinuous, continuous, and commutes with fibre products and equalizers (details omitted; compare with proof of Lemma 33.3.12). Hence Sites, Lemmas 7.20 .5 and 7.20 .6 apply and we deduce the formula for $f_{b i g}^{-1}$ and the existence of $f_{\text {big! }}$. Moreover, the functor $v$ is a right adjoint because given $U / T$ and $V / S$ we have $\operatorname{Mor}_{S}(u(U), V)=\operatorname{Mor}_{T}\left(U, V \times_{S} T\right)$ as desired. Thus we may apply Sites, Lemmas 7.21 .1 and 7.21 .2 to get the formula for $f_{b i g, *}$.

0211 Lemma 33.3.16. Let $S_{\text {L }}^{Z a r}$ be a big Zariski site. Let $f: T \rightarrow S$ be a morphism in Sch ${ }_{Z a r}$.
(1) We have $i_{f}=f_{\text {big }} \circ i_{T}$ with $i_{f}$ as in Lemma 33.3.12 and $i_{T}$ as in Lemma 33.3.13.
(2) The functor $S_{Z a r} \rightarrow T_{Z a r},(U \rightarrow S) \mapsto\left(U \times_{S} T \rightarrow T\right)$ is continuous and induces a morphism of topoi

$$
f_{\text {small }}: S h\left(T_{Z a r}\right) \longrightarrow S h\left(S_{Z a r}\right)
$$

The functors $f_{\text {small }}^{-1}$ and $f_{\text {small,* }}$ agree with the usual notions $f^{-1}$ and $f_{*}$ is we identify sheaves on $T_{Z a r}$, resp. $S_{Z a r}$ with sheaves on $T$, resp. $S$ via Lemma 33.3.11.
(3) We have a commutative diagram of morphisms of sites

so that $f_{\text {small }} \circ \pi_{T}=\pi_{S} \circ f_{\text {big }}$ as morphisms of topoi.
(4) We have $f_{\text {small }}=\pi_{S} \circ f_{\text {big }} \circ i_{T}=\pi_{S} \circ i_{f}$.

Proof. The equality $i_{f}=f_{b i g} \circ i_{T}$ follows from the equality $i_{f}^{-1}=i_{T}^{-1} \circ f_{b i g}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).

Statement (2): See Sites, Example 7.15.2.
Part (3) follows because $\pi_{S}$ and $\pi_{T}$ are given by the inclusion functors and $f_{\text {small }}$ and $f_{b i g}$ by the base change functor $U \mapsto U \times_{S} T$.
Statement (4) follows from (3) by precomposing with $i_{T}$.
In the situation of the lemma, using the terminology of Definition 33.3.14 we have: for $\mathcal{F}$ a sheaf on the big Zariski site of $T$

$$
\left.\left(f_{b i g, *} \mathcal{F}\right)\right|_{S_{Z a r}}=f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{T_{Z a r}}\right)
$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small Zariski site of $T$, resp. $S$ is given by $\pi_{T, *}$, resp. $\pi_{S, *}$. A similar formula involving pullbacks and restrictions is false.

0212 Lemma 33.3.17. Given schemes $X, Y, Y$ in $(S c h / S)_{Z a r}$ and morphisms $f$ : $X \rightarrow Y, g: Y \rightarrow Z$ we have $g_{\text {big }} \circ f_{\text {big }}=(g \circ f)_{\text {big }}$ and $g_{\text {small }} \circ f_{\text {small }}=(g \circ f)_{\text {small }}$.

Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 33.3.15. For the functors on the small sites this is Sheaves, Lemma 6.21.2 via the identification of Lemma 33.3.11.

We can think about a sheaf on the big Zariski site of $S$ as a collection of "usual" sheaves on all schemes over $S$.

0213 Lemma 33.3.18. Let $S$ be a scheme contained in a big Zariski site $S_{\text {S }} h_{Z a r}$. A sheaf $\mathcal{F}$ on the big Zariski site $(S c h / S)_{Z a r}$ is given by the following data:
(1) for every $T / S \in \mathrm{Ob}\left((S c h / S)_{Z a r}\right)$ a sheaf $\mathcal{F}_{T}$ on $T$,
(2) for every $f: T^{\prime} \rightarrow T$ in $(S c h / S)_{Z a r}$ a map $c_{f}: f^{-1} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$.

These data are subject to the following conditions:
(a) given any $f: T^{\prime} \rightarrow T$ and $g: T^{\prime \prime} \rightarrow T^{\prime}$ in $(S c h / S)_{Z a r}$ the composition $g^{-1} c_{f} \circ c_{g}$ is equal to $c_{f \circ g}$, and
(b) if $f: T^{\prime} \rightarrow T$ in $(S c h / S)_{Z a r}$ is an open immersion then $c_{f}$ is an isomorphism.

Proof. Given a sheaf $\mathcal{F}$ on $S h\left((S c h / S)_{Z a r}\right)$ we set $\mathcal{F}_{T}=i_{p}^{-1} \mathcal{F}$ where $p: T \rightarrow S$ is the structure morphism. Note that $\mathcal{F}_{T}(U)=\mathcal{F}\left(U^{\prime} / S\right)$ for any open $U \subset T$, and $U^{\prime} \rightarrow T$ an open immersion in $(S c h / T)_{Z a r}$ with image $U$, see Lemmas 33.3.11 and 33.3.12. Hence given $f: T^{\prime} \rightarrow T$ over $S$ and $U, U^{\prime} \rightarrow T$ we get a canonical $\operatorname{map} \mathcal{F}_{T}(U)=\mathcal{F}\left(U^{\prime} / S\right) \rightarrow \mathcal{F}\left(U^{\prime} \times_{T} T^{\prime} / S\right)=\mathcal{F}_{T^{\prime}}\left(f^{-1}(U)\right)$ where the middle is the restriction map of $\mathcal{F}$ with respect to the morphism $U^{\prime} \times_{T} T^{\prime} \rightarrow U^{\prime}$ over $S$. The collection of these maps are compatible with restrictions, and hence define an $f$-map $c_{f}$ from $\mathcal{F}_{T}$ to $\mathcal{F}_{T^{\prime}}$, see Sheaves, Definition 6.21 .7 and the discussion surrounding it. It is clear that $c_{f \circ g}$ is the composition of $c_{f}$ and $c_{g}$, since composition of restriction maps of $\mathcal{F}$ gives restriction maps.
Conversely, given a $\operatorname{system}\left(\mathcal{F}_{T}, c_{f}\right)$ as in the lemma we may define a presheaf $\mathcal{F}$ on $\operatorname{Sh}\left((S c h / S)_{\text {Zar }}\right)$ by simply setting $\mathcal{F}(T / S)=\mathcal{F}_{T}(T)$. As restriction mapping, given $f: T^{\prime} \rightarrow T$ we set for $s \in \mathcal{F}(T)$ the pullback $f^{*}(s)$ equal to $c_{f}(s)$ (where we think of $c_{f}$ as an $f$-map again). The condition on the $c_{f}$ guarantees that pullbacks satisfy the required functoriality property. We omit the verification that this is a sheaf. It is clear that the constructions so defined are mutually inverse.

### 33.4. The étale topology

0214 Let $S$ be a scheme. We would like to define the étale-topology on the category of schemes over $S$. According to our general principle we first introduce the notion of an étale covering.

0215 Definition 33.4.1. Let $T$ be a scheme. An étale covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is étale and such that $T=\bigcup f_{i}\left(T_{i}\right)$.
0216 Lemma 33.4.2. Any Zariski covering is an étale covering.
Proof. This is clear from the definitions and the fact that an open immersion is an étale morphism, see Morphisms, Lemma 28.36.9.

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.
0217 Lemma 33.4.3. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is an étale covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an étale covering and for each $i$ we have an étale covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an étale covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an étale covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is an étale covering.
Proof. Omitted.
0218 Lemma 33.4.4. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an étale covering of $T$. Then there exists an étale covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is an affine scheme. Moreover, we may choose each $U_{j}$ to be open affine in one of the $T_{i}$.

Proof. Omitted.
Thus we define the corresponding standard coverings of affines as follows.
0219 Definition 33.4.5. Let $T$ be an affine scheme. A standard étale covering of $T$ is a family $\left\{f_{j}: U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ with each $U_{j}$ is affine and étale over $T$ and $T=\bigcup f_{j}\left(U_{j}\right)$.

In the definition above we do not assume the morphisms $f_{j}$ are standard étale. The reason is that if we did then the standard étale coverings would not define a site on $A f f / S$, for example because of Algebra, Lemma 10.141 .15 part (4). On the other hand, an étale morphism of affines is automatically standard smooth, see Algebra, Lemma 10.141.2. Hence a standard étale covering is a standard smooth covering and a standard syntomic covering.
021A Definition 33.4.6. A big étale site is any site $S$ chétale $^{\text {a }}$ as in Sites, Definition 7.6 .2 constructed as follows:
(1) Choose any set of schemes $S_{0}$, and any set of étale coverings $\operatorname{Cov}_{0}$ among these schemes.
(2) As underlying category take any category $S_{c} h_{\alpha}$ constructed as in Sets, Lemma 3.9.2 starting with the set $S_{0}$.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of étale coverings, and the set $\operatorname{Cov}_{0}$ chosen above.

See the remarks following Definition 33.3 .5 for motivation and explanation regarding the definition of big sites.
Before we continue with the introduction of the big étale site of a scheme $S$, let us point out that the topology on a big étale site $S c h_{\text {étale }}$ is in some sense induced from the étale topology on the category of all schemes.
03WW Lemma 33.4.7. Let Schétale be a big étale site as in Definition 33.4.6. Let $T \in$ $\mathrm{Ob}($ Schétale $)$. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an arbitrary étale covering of $T$.
(1) There exists a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c c_{\text {étale }}$ which refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a standard étale covering, then it is tautologically equivalent to a covering in Schétale.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering in Schétale.

Proof. For each $i$ choose an affine open covering $T_{i}=\bigcup_{j \in J_{i}} T_{i j}$ such that each $T_{i j}$ maps into an affine open subscheme of $T$. By Lemma 33.4.3 the refinement $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an étale covering of $T$ as well. Hence we may assume each $T_{i}$ is affine, and maps into an affine open $W_{i}$ of $T$. Applying Sets, Lemma 3.9.9 we see that $W_{i}$ is isomorphic to an object of $S c h_{\text {Zar }}$. But then $T_{i}$ as a finite type scheme over $W_{i}$ is isomorphic to an object $V_{i}$ of $S c h_{Z a r}$ by a second application of Sets, Lemma 3.9.9. The covering $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ (because they are isomorphic). Moreover, $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ is combinatorially equivalent to a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c h_{Z a r}$ by Sets, Lemma 3.9.9. The covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes $T_{i}$ is isomorphic to an object of $S c h_{e ́ t a l e}$ by Sets, Lemma3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want.

021B Definition 33.4.8. Let $S$ be a scheme. Let $S c h_{e ́ t a l e}$ be a big étale site containing $S$.
(1) The big étale site of $S$, denoted $(S c h / S)_{\text {étale }}$, is the site $S c h_{\text {étale }} / S$ introduced in Sites, Section 7.24 .
(2) The small étale site of $S$, which we denote $S_{\text {étale }}$, is the full subcategory of $(S c h / S)_{\text {étale }}$ whose objects are those $U / S$ such that $U \rightarrow S$ is étale. A covering of $S_{\text {étale }}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {étale }}$ with $U \in$ $\mathrm{Ob}\left(S_{\text {étale }}\right)$.
(3) The big affine étale site of $S$, denoted $(A f f / S)_{\text {étale }}$, is the full subcategory of $(S c h / S)_{\text {étale }}$ whose objects are affine $U / S$. A covering of $(A f f / S)_{\text {étale }}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {étale }}$ which is a standard étale covering.

It is not completely clear that the big affine étale site or the small étale site are sites. We check this now.

021C Lemma 33.4.9. Let $S$ be a scheme. Let $S c h_{\text {étale }}$ be a big étale site containing $S$. Both $S_{\text {étale }}$ and $(A f f / S)_{\text {étale }}$ are sites.

Proof. Let us show that $S_{\text {étale }}$ is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 7.6.2. Since $(S c h / S)_{\text {étale }}$ is a site, it suffices to prove that given any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {étale }}$ with $U \in \mathrm{Ob}\left(S_{\text {étale }}\right)$ we also have $U_{i} \in \mathrm{Ob}\left(S_{\text {étale }}\right)$. This follows from the definitions as the composition of étale morphisms is an étale morphism.

Let us show that $(A f f / S)_{\text {étale }}$ is a site. Reasoning as above, it suffices to show that the collection of standard étale coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2. This is clear since for example, given a standard étale covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ and for each $i$ we have a standard étale covering $\left\{T_{i j} \rightarrow\right.$ $\left.T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a standard étale covering because $\bigcup_{i \in I} J_{i}$ is finite and each $T_{i j}$ is affine.

021D Lemma 33.4.10. Let $S$ be a scheme. Let $S_{\text {Sétale }}$ be a big étale site containing $S$. The underlying categories of the sites $S_{\text {chétale }},(S c h / S)_{\text {étale }}, S_{\text {étale }}$, and $(A f f / S)_{\text {étale }}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The categories $(S c h / S)_{\text {étale }}$, and $S_{\text {étale }}$ both have a final object, namely $S / S$.

Proof. For $S c h_{\text {étale }}$ it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S, V \rightarrow U, W \rightarrow U$ morphisms of schemes with $U, V, W \in \mathrm{Ob}\left(S c h_{\text {étale }}\right)$. The fibre product $V \times_{U} W$ in $S c h_{\text {étale }}$ is a fibre product in $S c h$ and is the fibre product of $V / S$ with $W / S$ over $U / S$ in the category of all schemes over $S$, and hence also a fibre product in $(S c h / S)_{\text {étale }}$. This proves the result for $(S c h / S)_{\text {étale }}$. If $U \rightarrow S, V \rightarrow U$ and $W \rightarrow U$ are étale then so is $V \times_{U} W \rightarrow S$ and hence we get the result for $S_{\text {étale }}$. If $U, V, W$ are affine, so is $V \times_{U} W$ and hence the result for $(A f f / S)_{\text {étale }}$.

Next, we check that the big affine site defines the same topos as the big site.
021E Lemma 33.4.11. Let $S$ be a scheme. Let $S c h_{\text {étale }}$ be a big étale site containing $S$. The functor $(A f f / S)_{\text {étale }} \rightarrow(S c h / S)_{\text {étale }}$ is special cocontinuous and induces an equivalence of topoi from $\operatorname{Sh}\left((A f f / S)_{\text {étale }}\right)$ to $\operatorname{Sh}\left((S c h / S)_{\text {étale }}\right)$.

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) - (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u:(A f f / S)_{\text {étale }} \rightarrow(S c h / S)_{\text {étale }}$. Being cocontinuous just means that any étale covering of $T / S, T$ affine, can be refined by a standard étale covering of $T$. This is the content of Lemma 33.4.4. Hence (1) holds. We see $u$ is continuous simply because a standard étale covering is a étale covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that $u$ is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering.

Next, we establish some relationships between the topoi associated to these sites.
021F Lemma 33.4.12. Let $S h_{\text {étale }}$ be a big étale site. Let $f: T \rightarrow S$ be a morphism in $S c h_{\text {étale }}$. The functor $T_{\text {étale }} \rightarrow(S c h / S)_{\text {étale }}$ is cocontinuous and induces a morphism of topoi

$$
i_{f}: S h\left(T_{\text {étale }}\right) \longrightarrow S h\left((S c h / S)_{\text {étale }}\right)
$$

For a sheaf $\mathcal{G}$ on $(S c h / S)_{\text {étale }}$ we have the formula $\left(i_{f}^{-1} \mathcal{G}\right)(U / T)=\mathcal{G}(U / S)$. The functor $i_{f}^{-1}$ also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u: T_{\text {étale }} \rightarrow(S c h / S)_{\text {étale }}$. In other words, given an étale morphism $j: U \rightarrow T$ corresponding to an object of $T_{\text {étale }}$ we set $u(U \rightarrow T)=$ $(f \circ j: U \rightarrow S)$. This functor commutes with fibre products, see Lemma 33.4.10. Let $a, b: U \rightarrow V$ be two morphisms in $T_{\text {étale }}$. In this case the equalizer of $a$ and $b$ (in the category of schemes) is

$$
V \times_{\Delta_{V / T}, V \times_{T} V,(a, b)} U \times_{T} U
$$

which is a fibre product of schemes étale over $T$, hence étale over $T$. Thus $T_{\text {étale }}$ has equalizers and $u$ commutes with them. It is clearly cocontinuous. It is also continuous as $u$ transforms coverings to coverings and commutes with fibre products. Hence the Lemma follows from Sites, Lemmas 7.20.5 and 7.20.6.

021G Lemma 33.4.13. Let $S$ be a scheme. Let $S_{\text {étale }}$ be a big étale site containing $S$. The inclusion functor $S_{\text {étale }} \rightarrow(S c h / S)_{\text {étale }}$ satisfies the hypotheses of Sites, Lemma 7.20 .8 and hence induces a morphism of sites

$$
\pi_{S}:(S c h / S)_{\text {étale }} \longrightarrow S_{\text {étale }}
$$

and a morphism of topoi

$$
i_{S}: S h\left(S_{\text {étale }}\right) \longrightarrow S h\left((S c h / S)_{\text {étale }}\right)
$$

such that $\pi_{S} \circ i_{S}=i d$. Moreover, $i_{S}=i_{i d_{S}}$ with $i_{i d_{S}}$ as in Lemma 33.4.12. In particular the functor $i_{S}^{-1}=\pi_{S, *}$ is described by the rule $i_{S}^{-1}(\mathcal{G})(U / S)=\mathcal{G}(U / S)$.

Proof. In this case the functor $u: S_{\text {étale }} \rightarrow(S c h / S)_{\text {étale }}$, in addition to the properties seen in the proof of Lemma 33.4 .12 above, also is fully faithful and transforms the final object into the final object. The lemma follows from Sites, Lemma 7.20 .8 .

04BT Definition 33.4.14. In the situation of Lemma 33.4 .13 the functor $i_{S}^{-1}=\pi_{S, *}$ is often called the restriction to the small étale site, and for a sheaf $\mathcal{F}$ on the big étale site we denote $\left.\mathcal{F}\right|_{S_{\text {étale }}}$ this restriction.

With this notation in place we have for a sheaf $\mathcal{F}$ on the big site and a sheaf $\mathcal{G}$ on the small site that

$$
\begin{aligned}
& \operatorname{Mor}_{S h\left(S_{\text {étale }}\right)}\left(\left.\mathcal{F}\right|_{S_{\text {étale }}}, \mathcal{G}\right)=\operatorname{Mor}_{S h\left((S c h / S)_{\text {étale }}\right)}\left(\mathcal{F}, i_{S, *} \mathcal{G}\right) \\
& \operatorname{Mor}_{S h\left(S_{\text {etale }}\right)}\left(\mathcal{G},\left.\mathcal{F}\right|_{S_{\text {etale }}}\right)=\operatorname{Mor}_{S h\left((S c h / S)_{\text {étale }}\right)}\left(\pi_{S}^{-1} \mathcal{G}, \mathcal{F}\right)
\end{aligned}
$$

Moreover, we have $\left.\left(i_{S, *} \mathcal{G}\right)\right|_{S_{\text {etale }}}=\mathcal{G}$ and we have $\left.\left(\pi_{S}^{-1} \mathcal{G}\right)\right|_{S_{\text {étale }}}=\mathcal{G}$.
021H Lemma 33.4.15. Let $S_{\text {chétale }}$ be a big étale site. Let $f: T \rightarrow S$ be a morphism in Schétale. The functor

$$
u:(S c h / T)_{\text {étale }} \longrightarrow(S c h / S)_{\text {étale }}, \quad V / T \longmapsto V / S
$$

is cocontinuous, and has a continuous right adjoint

$$
v:(S c h / S)_{\text {étale }} \longrightarrow(S c h / T)_{\text {étale }}, \quad(U \rightarrow S) \longmapsto\left(U \times_{S} T \rightarrow T\right)
$$

They induce the same morphism of topoi

$$
f_{b i g}: S h\left((S c h / T)_{\text {étale }}\right) \longrightarrow S h\left((S c h / S)_{\text {étale }}\right)
$$

We have $f_{\text {big }}^{-1}(\mathcal{G})(U / T)=\mathcal{G}(U / S)$. We have $f_{\text {big }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$. Also, $f_{\text {big }}^{-1}$ has a left adjoint $f_{\text {big! }}$ which commutes with fibre products and equalizers.

Proof. The functor $u$ is cocontinuous, continuous and commutes with fibre products and equalizers (details omitted; compare with the proof of Lemma 33.4.12). Hence Sites, Lemmas 7.20 .5 and 7.20 .6 apply and we deduce the formula for $f_{b i g}^{-1}$ and the existence of $f_{\text {big! }}$. Moreover, the functor $v$ is a right adjoint because given $U / T$ and $V / S$ we have $\operatorname{Mor}_{S}(u(U), V)=\operatorname{Mor}_{T}\left(U, V \times_{S} T\right)$ as desired. Thus we may apply Sites, Lemmas 7.21 .1 and 7.21 .2 to get the formula for $f_{b i g, *}$.

021 Lemma 33.4.16. Let $S_{\text {étale }}$ be a big étale site. Let $f: T \rightarrow S$ be a morphism in Schétale.
(1) We have $i_{f}=f_{\text {big }} \circ i_{T}$ with $i_{f}$ as in Lemma 33.4.12 and $i_{T}$ as in Lemma 33.4.13.
(2) The functor $S_{\text {étale }} \rightarrow T_{\text {étale }},(U \rightarrow S) \mapsto\left(U \times_{S} T \rightarrow T\right)$ is continuous and induces a morphism of topoi

$$
f_{\text {small }}: S h\left(T_{\text {étale }}\right) \longrightarrow S h\left(S_{\text {étale }}\right)
$$

We have $f_{\text {small }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$.
(3) We have a commutative diagram of morphisms of sites

so that $f_{\text {small }} \circ \pi_{T}=\pi_{S} \circ f_{\text {big }}$ as morphisms of topoi.
(4) We have $f_{\text {small }}=\pi_{S} \circ f_{\text {big }} \circ i_{T}=\pi_{S} \circ i_{f}$.

Proof. The equality $i_{f}=f_{b i g} \circ i_{T}$ follows from the equality $i_{f}^{-1}=i_{T}^{-1} \circ f_{b i g}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).

The functor $u: S_{\text {étale }} \rightarrow T_{\text {étale }}, u(U \rightarrow S)=\left(U \times_{S} T \rightarrow T\right)$ transforms coverings into coverings and commutes with fibre products, see Lemma 33.4.3 (3) and 33.4.10. Moreover, both $S_{\text {étale }}, T_{\text {étale }}$ have final objects, namely $S / S$ and $T / T$ and $u(S / S)=$ $T / T$. Hence by Sites, Proposition 7.15 .6 the functor $u$ corresponds to a morphism of sites $T_{\text {étale }} \rightarrow S_{\text {étale }}$. This in turn gives rise to the morphism of topoi, see Sites, Lemma 7.16.2. The description of the pushforward is clear from these references.

Part (3) follows because $\pi_{S}$ and $\pi_{T}$ are given by the inclusion functors and $f_{\text {small }}$ and $f_{b i g}$ by the base change functors $U \mapsto U \times_{S} T$.

Statement (4) follows from (3) by precomposing with $i_{T}$.
In the situation of the lemma, using the terminology of Definition 33.4.14 we have: for $\mathcal{F}$ a sheaf on the big étale site of $T$

$$
\left.\left(f_{\text {big }, *} \mathcal{F}\right)\right|_{S_{\text {étale }}}=f_{\text {small }, *}\left(\left.\mathcal{F}\right|_{T_{\text {étale }}}\right)
$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small étale site of $T$, resp. $S$ is given by $\pi_{T, *}$, resp. $\pi_{S, *}$. A similar formula involving pullbacks and restrictions is false.

021J Lemma 33.4.17. Given schemes $X, Y, Y$ in Schétale and morphisms $f: X \rightarrow Y$, $g: Y \rightarrow Z$ we have $g_{\text {big }} \circ f_{\text {big }}=(g \circ f)_{\text {big }}$ and $g_{\text {small }} \circ f_{\text {small }}=(g \circ f)_{\text {small }}$.

Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 33.4.15. For the functors on the small sites this follows from the description of the pushforward functors in Lemma 33.4.16.

We can think about a sheaf on the big étale site of $S$ as a collection of "usual" sheaves on all schemes over $S$.

021K Lemma 33.4.18. Let $S$ be a scheme contained in a big étale site $S_{\text {étale }}$. A sheaf $\mathcal{F}$ on the big étale site $(S c h / S)_{\text {étale }}$ is given by the following data:
(1) for every $T / S \in \mathrm{Ob}\left((S c h / S)_{\text {étale }}\right)$ a sheaf $\mathcal{F}_{T}$ on $T_{\text {étale }}$,
(2) for every $f: T^{\prime} \rightarrow T$ in $(S c h / S)_{\text {étale }}$ a map $c_{f}: f_{\text {small }}^{-1} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$.

These data are subject to the following conditions:
(a) given any $f: T^{\prime} \rightarrow T$ and $g: T^{\prime \prime} \rightarrow T^{\prime}$ in $(S c h / S)_{\text {étale }}$ the composition $g_{\text {small }}^{-1} c_{f} \circ c_{g}$ is equal to $c_{f \circ g}$, and
(b) if $f: T^{\prime} \rightarrow T$ in $(S c h / S)_{\text {étale }}$ is étale then $c_{f}$ is an isomorphism.

Proof. Given a sheaf $\mathcal{F}$ on $\operatorname{Sh}\left((S c h / S)_{\text {étale }}\right)$ we set $\mathcal{F}_{T}=i_{p}^{-1} \mathcal{F}$ where $p: T \rightarrow S$ is the structure morphism. Note that $\mathcal{F}_{T}(U)=\mathcal{F}(U / S)$ for any $U \rightarrow T$ in $T_{\text {étale }}$ see Lemma 33.4.12. Hence given $f: T^{\prime} \rightarrow T$ over $S$ and $U \rightarrow T$ we get a canonical $\operatorname{map} \mathcal{F}_{T}(U)=\mathcal{F}(U / S) \rightarrow \mathcal{F}\left(U \times_{T} T^{\prime} / S\right)=\mathcal{F}_{T^{\prime}}\left(U \times_{T} T^{\prime}\right)$ where the middle is the restriction map of $\mathcal{F}$ with respect to the morphism $U \times_{T} T^{\prime} \rightarrow U$ over $S$. The collection of these maps are compatible with restrictions, and hence define a $\operatorname{map} c_{f}^{\prime}: \mathcal{F}_{T} \rightarrow f_{\text {small }, *} \mathcal{F}_{T^{\prime}}$ where $u: T_{\text {étale }} \rightarrow T_{\text {étale }}^{\prime}$ is the base change functor associated to $f$. By adjunction of $f_{\text {small }, *}$ (see Sites, Section 7.14 with $f_{\text {small }}^{-1}$ this is the same as a map $c_{f}: f_{s m a l l}^{-1} \mathcal{F}_{T} \rightarrow \mathcal{F}_{T^{\prime}}$. It is clear that $c_{f \circ g}^{\prime}$ is the composition of $c_{f}^{\prime}$ and $f_{s m a l l, *} c_{g}^{\prime}$, since composition of restriction maps of $\mathcal{F}$ gives restriction maps, and this gives the desired relationship among $c_{f}, c_{g}$ and $c_{f \circ g}$.
Conversely, given a system $\left(\mathcal{F}_{T}, c_{f}\right)$ as in the lemma we may define a presheaf $\mathcal{F}$ on $\operatorname{Sh}\left((S c h / S)_{\text {étale }}\right)$ by simply setting $\mathcal{F}(T / S)=\mathcal{F}_{T}(T)$. As restriction mapping, given $f: T^{\prime} \rightarrow T$ we set for $s \in \mathcal{F}(T)$ the pullback $f^{*}(s)$ equal to $c_{f}(s)$ where we think of $c_{f}$ as a $\operatorname{map} \mathcal{F}_{T} \rightarrow f_{\text {small }, *} \mathcal{F}_{T^{\prime}}$ again. The condition on the $c_{f}$ guarantees that pullbacks satisfy the required functoriality property. We omit the verification that this is a sheaf. It is clear that the constructions so defined are mutually inverse.

### 33.5. The smooth topology

021 Y In this section we define the smooth topology. This is a bit pointless as it will turn out later (see More on Morphisms, Section 36.28) that this topology defines the same topos as the étale topology. But still it makes sense and it is used occasionally.
$021 Z$ Definition 33.5.1. Let $T$ be a scheme. An smooth covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is smooth and such that $T=\bigcup f_{i}\left(T_{i}\right)$.

0220 Lemma 33.5.2. Any étale covering is a smooth covering, and a fortiori, any Zariski covering is a smooth covering.

Proof. This is clear from the definitions, the fact that an étale morphism is smooth see Morphisms, Definition 28.36.1 and Lemma 33.4.2.

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.
0221 Lemma 33.5.3. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is an smooth covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a smooth covering and for each $i$ we have a smooth covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a smooth covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a smooth covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is a smooth covering.
Proof. Omitted.
0222 Lemma 33.5.4. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be a smooth covering of $T$. Then there exists a smooth covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is an affine scheme, and such that each morphism $U_{j} \rightarrow T$ is standard smooth, see Morphisms, Definition 28.34.1. Moreover, we may choose each $U_{j}$ to be open affine in one of the $T_{i}$.

Proof. Omitted, but see Algebra, Lemma 10.135 .10

Thus we define the corresponding standard coverings of affines as follows.
0223 Definition 33.5.5. Let $T$ be an affine scheme. A standard smooth covering of $T$ is a family $\left\{f_{j}: U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ with each $U_{j}$ is affine, $U_{j} \rightarrow T$ standard smooth and $T=\bigcup f_{j}\left(U_{j}\right)$.

03WY Definition 33.5.6. A big smooth site is any site $S c h_{\text {smooth }}$ as in Sites, Definition 7.6.2 constructed as follows:
(1) Choose any set of schemes $S_{0}$, and any set of smooth coverings $\operatorname{Cov}_{0}$ among these schemes.
(2) As underlying category take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9.2 starting with the set $S_{0}$.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of smooth coverings, and the set Cov chosen above.

See the remarks following Definition 33.3 .5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big smooth site of a scheme $S$, let us point out that the topology on a big smooth site $S c h_{\text {smooth }}$ is in some sense induced from the smooth topology on the category of all schemes.

03WZ Lemma 33.5.7. Let $S_{\text {. }} h_{\text {smooth }}$ be a big smooth site as in Definition 33.5.6. Let $T \in \mathrm{Ob}\left(S_{\text {smooth }}\right)$. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an arbitrary smooth covering of $T$.
(1) There exists a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S_{\text {smooth }}$ which refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a standard smooth covering, then it is tautologically equivalent to a covering of $S c h_{\text {smooth }}$.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering of Sch smooth .

Proof. For each $i$ choose an affine open covering $T_{i}=\bigcup_{j \in J_{i}} T_{i j}$ such that each $T_{i j}$ maps into an affine open subscheme of $T$. By Lemma 33.5.3 the refinement $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an smooth covering of $T$ as well. Hence we may assume each $T_{i}$ is affine, and maps into an affine open $W_{i}$ of $T$. Applying Sets, Lemma 3.9.9 we see that $W_{i}$ is isomorphic to an object of $S c h_{Z a r}$. But then $T_{i}$ as a finite type scheme over $W_{i}$ is isomorphic to an object $V_{i}$ of $S c h_{Z a r}$ by a second application of Sets, Lemma 3.9.9. The covering $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ (because they are isomorphic). Moreover, $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ is combinatorially equivalent to a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c h_{Z a r}$ by Sets, Lemma 3.9.9. The covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes $T_{i}$ is isomorphic to an object of $S c h_{\text {smooth }}$ by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want.

03X0 Definition 33.5.8. Let $S$ be a scheme. Let $S c h_{s m o o t h}$ be a big smooth site containing $S$.
(1) The big smooth site of $S$, denoted $(S c h / S)_{\text {smooth }}$, is the site $S c h_{\text {smooth }} / S$ introduced in Sites, Section 7.24
(2) The big affine smooth site of $S$, denoted $(A f f / S)_{\text {smooth }}$, is the full subcategory of $(S c h / S)_{\text {smooth }}$ whose objects are affine $U / S$. A covering of
$(A f f / S)_{\text {smooth }}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {smooth }}$ which is a standard smooth covering.

Next, we check that the big affine site defines the same topos as the big site.
06VC Lemma 33.5.9. Let $S$ be a scheme. Let $S_{\text {chétale }}$ be a big smooth site containing $S$. The functor $(\text { Aff } / S)_{\text {smooth }} \rightarrow(S c h / S)_{\text {smooth }}$ is special cocontinuous and induces an equivalence of topoi from $\operatorname{Sh}\left((A f f / S)_{\text {smooth }}\right)$ to $\operatorname{Sh}\left((S c h / S)_{\text {smooth }}\right)$.

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) - (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u:(A f f / S)_{\text {smooth }} \rightarrow(S c h / S)_{\text {smooth }}$. Being cocontinuous just means that any smooth covering of $T / S, T$ affine, can be refined by a standard smooth covering of $T$. This is the content of Lemma 33.5.4. Hence (1) holds. We see $u$ is continuous simply because a standard smooth covering is a smooth covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that $u$ is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering.

To be continued...
04HC Lemma 33.5.10. Let $S c h_{\text {smooth }}$ be a big smooth site. Let $f: T \rightarrow S$ be a morphism in Sch smooth. The functor

$$
u:(S c h / T)_{\text {smooth }} \longrightarrow(S c h / S)_{\text {smooth }}, \quad V / T \longmapsto V / S
$$

is cocontinuous, and has a continuous right adjoint

$$
v:(S c h / S)_{\text {smooth }} \longrightarrow(S c h / T)_{\text {smooth }}, \quad(U \rightarrow S) \longmapsto\left(U \times_{S} T \rightarrow T\right) .
$$

They induce the same morphism of topoi

$$
f_{\text {big }}: S h\left((S c h / T)_{\text {smooth }}\right) \longrightarrow S h\left((S c h / S)_{\text {smooth }}\right)
$$

We have $f_{\text {big }}^{-1}(\mathcal{G})(U / T)=\mathcal{G}(U / S)$. We have $f_{\text {big }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$. Also, $f_{\text {big }}^{-1}$ has a left adjoint $f_{\text {big! }}$ which commutes with fibre products and equalizers.
Proof. The functor $u$ is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 7.20 .5 and 7.20 .6 apply and we deduce the formula for $f_{b i g}^{-1}$ and the existence of $f_{b i g!}$. Moreover, the functor $v$ is a right adjoint because given $U / T$ and $V / S$ we have $\operatorname{Mor}_{S}(u(U), V)=\operatorname{Mor}_{T}\left(U, V \times_{S} T\right)$ as desired. Thus we may apply Sites, Lemmas 7.21 .1 and 7.21 .2 to get the formula for $f_{b i g, *}$.

### 33.6. The syntomic topology

0224 In this section we define the syntomic topology. This topology is quite interesting in that it often has the same cohomology groups as the fppf topology but is technically easier to deal with.

0225 Definition 33.6.1. Let $T$ be a scheme. An syntomic covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is syntomic and such that $T=\bigcup f_{i}\left(T_{i}\right)$.

0226 Lemma 33.6.2. Any smooth covering is a syntomic covering, and a fortiori, any étale or Zariski covering is a syntomic covering.

Proof. This is clear from the definitions and the fact that a smooth morphism is syntomic, see Morphisms, Lemma 28.34.7 and Lemma 33.5.2.

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2.
0227 Lemma 33.6.3. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is an syntomic covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a syntomic covering and for each $i$ we have a syntomic covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a syntomic covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a syntomic covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is a syntomic covering.

Proof. Omitted.
0228 Lemma 33.6.4. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be a syntomic covering of $T$. Then there exists a syntomic covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is an affine scheme, and such that each morphism $U_{j} \rightarrow T$ is standard syntomic, see Morphisms, Definition 28.31.1. Moreover, we may choose each $U_{j}$ to be open affine in one of the $T_{i}$.
Proof. Omitted, but see Algebra, Lemma 10.134.15
Thus we define the corresponding standard coverings of affines as follows.
0229 Definition 33.6.5. Let $T$ be an affine scheme. A standard syntomic covering of $T$ is a family $\left\{f_{j}: U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ with each $U_{j}$ is affine, $U_{j} \rightarrow T$ standard syntomic and $T=\bigcup f_{j}\left(U_{j}\right)$.

03X1 Definition 33.6.6. A big syntomic site is any site $S_{\text {S }} h_{\text {syntomic }}$ as in Sites, Definition 7.6.2 constructed as follows:
(1) Choose any set of schemes $S_{0}$, and any set of syntomic coverings $\operatorname{Cov}_{0}$ among these schemes.
(2) As underlying category take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9 .2 starting with the set $S_{0}$.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of syntomic coverings, and the set $\operatorname{Cov}_{0}$ chosen above.

See the remarks following Definition 33.3 .5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big syntomic site of a scheme $S$, let us point out that the topology on a big syntomic site $S c h_{\text {syntomic }}$ is in some sense induced from the syntomic topology on the category of all schemes.
03X2 Lemma 33.6.7. Let Sch syntomic be a big syntomic site as in Definition 33.6.6. Let $T \in \mathrm{Ob}\left(\right.$ Sch $\left._{\text {syntomic }}\right)$. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an arbitrary syntomic covering of $T$.
(1) There exists a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S_{\text {Sch }}^{\text {syntomic }}$ which refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a standard syntomic covering, then it is tautologically equivalent to a covering in Sch syntomic.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering in $S_{\text {syntomic }}$.

Proof. For each $i$ choose an affine open covering $T_{i}=\bigcup_{j \in J_{i}} T_{i j}$ such that each $T_{i j}$ maps into an affine open subscheme of $T$. By Lemma 33.6.3 the refinement $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an syntomic covering of $T$ as well. Hence we may assume each $T_{i}$ is affine, and maps into an affine open $W_{i}$ of $T$. Applying Sets, Lemma 3.9.9 we see that $W_{i}$ is isomorphic to an object of $S c h_{Z a r}$. But then $T_{i}$ as a finite type scheme over $W_{i}$ is isomorphic to an object $V_{i}$ of $S c h_{Z a r}$ by a second application of Sets, Lemma 3.9.9. The covering $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ (because they are isomorphic). Moreover, $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ is combinatorially equivalent to a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c h_{Z a r}$ by Sets, Lemma 3.9.9. The covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ is a covering as in (1). In the situation of (2), (3) each of the schemes $T_{i}$ is isomorphic to an object of $S c h_{Z a r}$ by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want.

03X3 Definition 33.6.8. Let $S$ be a scheme. Let $S c h_{\text {syntomic }}$ be a big syntomic site containing $S$.
(1) The big syntomic site of $S$, denoted $(S c h / S)_{\text {syntomic }}$, is the site $S c h_{\text {syntomic }} / S$ introduced in Sites, Section 7.24
(2) The big affine syntomic site of $S$, denoted $(A f f / S)_{\text {syntomic }}$, is the full subcategory of $(S c h / S)_{\text {syntomic }}$ whose objects are affine $U / S$. A covering of $(A f f / S)_{\text {syntomic }}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{\text {syntomic }}$ which is a standard syntomic covering.
Next, we check that the big affine site defines the same topos as the big site.
06VD Lemma 33.6.9. Let $S$ be a scheme. Let $S_{\text {schntomic }}$ be a big syntomic site containing $S$. The functor $(A f f / S)_{\text {syntomic }} \rightarrow(S c h / S)_{\text {syntomic }}$ is special cocontinuous and induces an equivalence of topoi from $\operatorname{Sh}\left((A f f / S)_{\text {syntomic }}\right)$ to $\operatorname{Sh}\left((S c h / S)_{\text {syntomic }}\right)$.

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) - (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u:(A f f / S)_{\text {syntomic }} \rightarrow(S c h / S)_{\text {syntomic }}$. Being cocontinuous just means that any syntomic covering of $T / S, T$ affine, can be refined by a standard syntomic covering of $T$. This is the content of Lemma 33.6.4. Hence (1) holds. We see $u$ is continuous simply because a standard syntomic covering is a syntomic covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that $u$ is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering.

To be continued...
04HD Lemma 33.6.10. Let $S c h_{\text {syntomic }}$ be a big syntomic site. Let $f: T \rightarrow S$ be a morphism in Sch syntomic. The functor

$$
u:(S c h / T)_{\text {syntomic }} \longrightarrow(S c h / S)_{\text {syntomic }}, \quad V / T \longmapsto V / S
$$

is cocontinuous, and has a continuous right adjoint

$$
v:(S c h / S)_{\text {syntomic }} \longrightarrow(S c h / T)_{\text {syntomic }}, \quad(U \rightarrow S) \longmapsto\left(U \times_{S} T \rightarrow T\right) .
$$

They induce the same morphism of topoi

$$
f_{\text {big }}: S h\left((S c h / T)_{\text {syntomic }}\right) \longrightarrow S h\left((S c h / S)_{\text {syntomic }}\right)
$$

We have $f_{\text {big }}^{-1}(\mathcal{G})(U / T)=\mathcal{G}(U / S)$. We have $f_{\text {big }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$. Also, $f_{\text {big }}^{-1}$ has a left adjoint $f_{\text {big! }}$ which commutes with fibre products and equalizers.

Proof. The functor $u$ is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for $f_{b i g}^{-1}$ and the existence of $f_{b i g!}$. Moreover, the functor $v$ is a right adjoint because given $U / T$ and $V / S$ we have $\operatorname{Mor}_{S}(u(U), V)=\operatorname{Mor}_{T}\left(U, V \times_{S} T\right)$ as desired. Thus we may apply Sites, Lemmas 7.21 .1 and 7.21 .2 to get the formula for $f_{b i g, *}$.

### 33.7. The fppf topology

021L Let $S$ be a scheme. We would like to define the fppf-topology ${ }^{2}$ on the category of schemes over $S$. According to our general principle we first introduce the notion of an fppf-covering.

021M Definition 33.7.1. Let $T$ be a scheme. An fppf covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is flat, locally of finite presentation and such that $T=\bigcup f_{i}\left(T_{i}\right)$.

021N Lemma 33.7.2. Any syntomic covering is an fppf covering, and a fortiori, any smooth, étale, or Zariski covering is an fppf covering.

Proof. This is clear from the definitions, the fact that a syntomic morphism is flat and locally of finite presentation, see Morphisms, Lemmas 28.31.6 and 28.31.7, and Lemma 33.6.2.

Next, we show that this notion satisfies the conditions of Sites, Definition 7.6.2,
0210 Lemma 33.7.3. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is an fppf covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fppf covering and for each $i$ we have an fppf covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an fppf covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fppf covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is an fppf covering.

Proof. The first assertion is clear. The second follows as the composition of flat morphisms is flat (see Morphisms, Lemma 28.25.5 and the composition of morphisms of finite presentation is of finite presentation (see Morphisms, Lemma 28.21 .3 ). The third follows as the base change of a flat morphism is flat (see Morphisms, Lemma 28.25.7) and the base change of a morphism of finite presentation is of finite presentation (see Morphisms, Lemma 28.21.4). Moreover, the base change of a surjective family of morphisms is surjective (proof omitted).

021P Lemma 33.7.4. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fppf covering of $T$. Then there exists an fppf covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is an affine scheme. Moreover, we may choose each $U_{j}$ to be open affine in one of the $T_{i}$.

Proof. This follows directly from the definitions using that a morphism which is flat and locally of finite presentation is open, see Morphisms, Lemma 28.25.9.

Thus we define the corresponding standard coverings of affines as follows.

[^90]021Q Definition 33.7.5. Let $T$ be an affine scheme. A standard fppf covering of $T$ is a family $\left\{f_{j}: U_{j} \rightarrow T\right\}_{j=1, \ldots, m}$ with each $U_{j}$ is affine, flat and of finite presentation over $T$ and $T=\bigcup f_{j}\left(U_{j}\right)$.
021R Definition 33.7.6. A big fppf site is any site $S c h_{f p p f}$ as in Sites, Definition 7.6.2 constructed as follows:
(1) Choose any set of schemes $S_{0}$, and any set of fppf coverings Cov ${ }_{0}$ among these schemes.
(2) As underlying category take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9 .2 starting with the set $S_{0}$.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of fppf coverings, and the set $\mathrm{Cov}_{0}$ chosen above.

See the remarks following Definition 33.3 .5 for motivation and explanation regarding the definition of big sites.
Before we continue with the introduction of the big fppf site of a scheme $S$, let us point out that the topology on a big fppf site $S c h_{f p p f}$ is in some sense induced from the fppf topology on the category of all schemes.

03WX Lemma 33.7.7. Let $S_{\text {Sh }}^{\text {fppf }}$ be a big fppf site as in Definition 33.7.6. Let $T \in$ $\mathrm{Ob}\left(S_{\text {fchpf }}\right)$. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an arbitrary fppf covering of $T$.
(1) There exists a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S_{\text {Sch }}^{\text {fppf }}$ which refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a standard fppf covering, then it is tautologically equivalent to a covering of $S_{\text {ch }}^{\text {fppf }}$.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a Zariski covering, then it is tautologically equivalent to a covering of Sch fppf .

Proof. For each $i$ choose an affine open covering $T_{i}=\bigcup_{j \in J_{i}} T_{i j}$ such that each $T_{i j}$ maps into an affine open subscheme of $T$. By Lemma 33.7.3 the refinement $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an fppf covering of $T$ as well. Hence we may assume each $T_{i}$ is affine, and maps into an affine open $W_{i}$ of $T$. Applying Sets, Lemma 3.9.9 we see that $W_{i}$ is isomorphic to an object of $S c h_{Z a r}$. But then $T_{i}$ as a finite type scheme over $W_{i}$ is isomorphic to an object $V_{i}$ of $S c h_{Z a r}$ by a second application of Sets, Lemma 3.9.9. The covering $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ refines $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ (because they are isomorphic). Moreover, $\left\{V_{i} \rightarrow T\right\}_{i \in I}$ is combinatorially equivalent to a covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ of $T$ in the site $S c h_{Z a r}$ by Sets, Lemma 3.9.9. The covering $\left\{U_{j} \rightarrow T\right\}_{j \in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes $T_{i}$ is isomorphic to an object of $S c h_{f p p f}$ by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want.
021S Definition 33.7.8. Let $S$ be a scheme. Let $S c h_{f p p f}$ be a big fppf site containing $S$.
(1) The big fppf site of $S$, denoted $(S c h / S)_{f p p f}$, is the site $S c h_{f p p f} / S$ introduced in Sites, Section 7.24 .
(2) The big affine fppf site of $S$, denoted $(A f f / S)_{f p p f}$, is the full subcategory of $(S c h / S)_{\text {fppf }}$ whose objects are affine $U / S$. A covering of $(A f f / S)_{f p p f}$ is any covering $\left\{U_{i} \rightarrow U\right\}$ of $(S c h / S)_{f p p f}$ which is a standard fppf covering.
It is not completely clear that the big affine fppf site is a site. We check this now.

021T Lemma 33.7.9. Let $S$ be a scheme. Let $S_{\text {Sch }}^{\text {fppf }}$ be a big fppf site containing $S$. Then $(A f f / S)_{f p p f}$ is a site.

Proof. Let us show that $(A f f / S)_{f p p f}$ is a site. Reasoning as in the proof of Lemma 33.4 .9 it suffices to show that the collection of standard fppf coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 7.6.2. This is clear since for example, given a standard fppf covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ and for each $i$ we have a standard fppf covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a standard fppf covering because $\bigcup_{i \in I} J_{i}$ is finite and each $T_{i j}$ is affine.

021U Lemma 33.7.10. Let $S$ be a scheme. Let $S c h_{f p p f}$ be a big fppf site containing $S$. The underlying categories of the sites $S c h_{f p p f},(S c h / S)_{f p p f}$, and $(A f f / S)_{f p p f}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The category $(S c h / S)_{\text {fppf }}$ has a final object, namely $S / S$.

Proof. For $S c h_{f p p f}$ it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \rightarrow S, V \rightarrow U, W \rightarrow U$ morphisms of schemes with $U, V, W \in \mathrm{Ob}\left(S c h_{f p p f}\right)$. The fibre product $V \times_{U} W$ in $S c h_{f p p f}$ is a fibre product in $S c h$ and is the fibre product of $V / S$ with $W / S$ over $U / S$ in the category of all schemes over $S$, and hence also a fibre product in $(S c h / S)_{f p p f}$. This proves the result for $(S c h / S)_{f p p f}$. If $U, V, W$ are affine, so is $V \times_{U} W$ and hence the result for $(A f f / S)_{f p p f}$.

Next, we check that the big affine site defines the same topos as the big site.
021V Lemma 33.7.11. Let $S$ be a scheme. Let $S c h_{f p p f}$ be a big fppf site containing $S$. The functor $(A f f / S)_{f p p f} \rightarrow(S c h / S)_{f p p f}$ is cocontinuous and induces an equivalence of topoi from $\operatorname{Sh}\left((A f f / S)_{\text {fppf }}\right)$ to $\operatorname{Sh}\left((S c h / S)_{f p p f}\right)$.

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 7.28.2. Thus we have to verify assumptions (1) - (5) of Sites, Lemma 7.28.1. Denote the inclusion functor $u:(A f f / S)_{f p p f} \rightarrow(S c h / S)_{f p p f}$. Being cocontinuous just means that any fppf covering of $T / S, T$ affine, can be refined by a standard fppf covering of $T$. This is the content of Lemma 33.7.4 Hence (1) holds. We see $u$ is continuous simply because a standard fppf covering is a fppf covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that $u$ is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering.

Next, we establish some relationships between the topoi associated to these sites.
021W Lemma 33.7.12. Let $S_{\text {S } h_{f p p f}}$ be a big fppf site. Let $f: T \rightarrow S$ be a morphism in Sch fppf. The functor

$$
u:(S c h / T)_{f p p f} \longrightarrow(S c h / S)_{f p p f}, \quad V / T \longmapsto V / S
$$

is cocontinuous, and has a continuous right adjoint

$$
v:(S c h / S)_{f p p f} \longrightarrow(S c h / T)_{f p p f}, \quad(U \rightarrow S) \longmapsto\left(U \times_{S} T \rightarrow T\right)
$$

They induce the same morphism of topoi

$$
f_{b i g}: S h\left((S c h / T)_{f p p f}\right) \longrightarrow S h\left((S c h / S)_{f p p f}\right)
$$

We have $f_{\text {big }}^{-1}(\mathcal{G})(U / T)=\mathcal{G}(U / S)$. We have $f_{\text {big }, *}(\mathcal{F})(U / S)=\mathcal{F}\left(U \times_{S} T / T\right)$. Also, $f_{\text {big }}^{-1}$ has a left adjoint $f_{\text {big! }}$ which commutes with fibre products and equalizers.

Proof. The functor $u$ is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 7.20.5 and 7.20.6 apply and we deduce the formula for $f_{b i g}^{-1}$ and the existence of $f_{b i g!}$. Moreover, the functor $v$ is a right adjoint because given $U / T$ and $V / S$ we have $\operatorname{Mor}_{S}(u(U), V)=\operatorname{Mor}_{T}\left(U, V \times_{S} T\right)$ as desired. Thus we may apply Sites, Lemmas 7.21 .1 and 7.21 .2 to get the formula for $f_{b i g, *}$.
021X Lemma 33.7.13. Given schemes $X, Y, Y$ in $(S c h / S)_{\text {fppf }}$ and morphisms $f$ : $X \rightarrow Y, g: Y \rightarrow Z$ we have $g_{b i g} \circ f_{b i g}=(g \circ f)_{b i g}$.
Proof. This follows from the simple description of pushforward and pullback for the functors on the big sites from Lemma 33.7.12.

### 33.8. The fpqc topology

022A
022B Definition 33.8.1. Let $T$ be a scheme. An fpqc covering of $T$ is a family of morphisms $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ of schemes such that each $f_{i}$ is flat and such that for every affine open $U \subset T$ there exists $n \geq 0$, a map $a:\{1, \ldots, n\} \rightarrow I$ and affine opens $V_{j} \subset T_{a(j)}, j=1, \ldots, n$ with $\bigcup_{j=1}^{n} f_{a(j)}\left(V_{j}\right)=U$.

To be sure this condition implies that $T=\bigcup f_{i}\left(T_{i}\right)$. It is slightly harder to recognize an fpqc covering, hence we provide some lemmas to do so.
03L7 Lemma 33.8.2. Let $T$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with target $T$. The following are equivalent
(1) $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering,
(2) each $f_{i}$ is flat and for every affine open $U \subset T$ there exist quasi-compact opens $U_{i} \subset T_{i}$ which are almost all empty, such that $U=\bigcup f_{i}\left(U_{i}\right)$,
(3) each $f_{i}$ is flat and there exists an affine open covering $T=\bigcup_{\alpha \in A} U_{\alpha}$ and for each $\alpha \in A$ there exist $i_{\alpha, 1}, \ldots, i_{\alpha, n(\alpha)} \in I$ and quasi-compact opens $U_{\alpha, j} \subset T_{i_{\alpha, j}}$ such that $U_{\alpha}=\bigcup_{j=1, \ldots, n(\alpha)} f_{i_{\alpha, j}}\left(U_{\alpha, j}\right)$.
If $T$ is quasi-separated, these are also equivalent to
(4) each $f_{i}$ is flat, and for every $t \in T$ there exist $i_{1}, \ldots, i_{n} \in I$ and quasicompact opens $U_{j} \subset T_{i_{j}}$ such that $\bigcup_{j=1, \ldots, n} f_{i_{j}}\left(U_{j}\right)$ is a (not necessarily open) neighbourhood of $t$ in $T$.

Proof. We omit the proof of the equivalence of (1), (2), and (3). From now on assume $T$ is quasi-separated. We prove (4) implies (2). Let $U \subset T$ be an affine open. To prove (2) it suffices to show that for every $t \in U$ there exist finitely many quasi-compact opens $U_{j} \subset T_{i_{j}}$ such that $f_{i_{j}}\left(U_{j}\right) \subset U$ and such that $\bigcup f_{i_{j}}\left(U_{j}\right)$ is a neighbourhood of $t$ in $U$. By assumption there do exist finitely many quasi-compact opens $U_{j}^{\prime} \subset T_{i_{j}}$ such that such that $\bigcup f_{i_{j}}\left(U_{j}^{\prime}\right)$ is a neighbourhood of $t$ in $T$. Since $T$ is quasi-separated we see that $U_{j}=U_{j}^{\prime} \cap f_{j}^{-1}(U)$ is quasi-compact open as desired. Since it is clear that (2) implies (4) the proof is finished.
040I Lemma 33.8.3. Let $T$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with target $T$. The following are equivalent
(1) $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering, and
(2) setting $T^{\prime}=\coprod_{i \in I} T_{i}$, and $f=\coprod_{i \in I} f_{i}$ the family $\left\{f: T^{\prime} \rightarrow T\right\}$ is an fpqc covering.

Proof. Suppose that $U \subset T$ is an affine open. If (1) holds, then we find $i_{1}, \ldots, i_{n} \in$ $I$ and affine opens $U_{j} \subset T_{i_{j}}$ such that $U=\bigcup_{j=1, \ldots, n} f_{i_{j}}\left(U_{j}\right)$. Then $U_{1} \amalg \ldots \amalg U_{n} \subset T^{\prime}$ is a quasi-compact open surjecting onto $U$. Thus $\left\{f: T^{\prime} \rightarrow T\right\}$ is an fpqc covering by Lemma 33.8.2. Conversely, if (2) holds then there exists a quasi-compact open $U^{\prime} \subset T^{\prime}$ with $U=f\left(U^{\prime}\right)$. Then $U_{j}=U^{\prime} \cap T_{j}$ is quasi-compact open in $T_{j}$ and empty for almost all $j$. By Lemma 33.8.2 we see that (1) holds.

03L8 Lemma 33.8.4. Let $T$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with target $T$. Assume that
(1) each $f_{i}$ is flat, and
(2) the family $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ can be refined by a fpqc covering of $T$.

Then $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is a fpqc covering of $T$.
Proof. Let $\left\{g_{j}: X_{j} \rightarrow T\right\}_{j \in J}$ be an fpqc covering refining $\left\{f_{i}: T_{i} \rightarrow T\right\}$. Suppose that $U \subset T$ is affine open. Choose $j_{1}, \ldots, j_{m} \in J$ and $V_{k} \subset X_{j_{k}}$ affine open such that $U=\bigcup g_{j_{k}}\left(V_{k}\right)$. For each $j$ pick $i_{j} \in I$ and a morphism $h_{j}: X_{j} \rightarrow T_{i_{j}}$ such that $g_{j}=f_{i_{j}} \circ h_{j}$. Since $h_{j_{k}}\left(V_{k}\right)$ is quasi-compact we can find a quasi-compact open $h_{j_{k}}\left(V_{k}\right) \subset U_{k} \subset f_{i_{j_{k}}}^{-1}(U)$. Then $U=\bigcup f_{i_{j_{k}}}\left(U_{k}\right)$. We conclude that $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering by Lemma 33.8.2.

03L9 Lemma 33.8.5. Let $T$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with target $T$. Assume that
(1) each $f_{i}$ is flat, and
(2) there exists an fpqc covering $\left\{g_{j}: S_{j} \rightarrow T\right\}_{j \in J}$ such that each $\left\{S_{j} \times_{T} T_{i} \rightarrow\right.$ $\left.S_{j}\right\}_{i \in I}$ is an fpqc covering.
Then $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is a fpqc covering of $T$.
Proof. We will use Lemma 33.8.2 without further mention. Let $U \subset T$ be an affine open. By (2) we can find quasi-compact opens $V_{j} \subset S_{j}$ for $j \in J$, almost all empty, such that $U=\bigcup g_{j}\left(V_{j}\right)$. Then for each $j$ we can choose quasi-compact opens $W_{i j} \subset S_{j} \times_{T} T_{i}$ for $i \in I$, almost all empty, with $V_{j}=\bigcup_{i} \operatorname{pr}_{1}\left(W_{i j}\right)$. Thus $\left\{S_{j} \times_{T} T_{i} \rightarrow T\right\}$ is an fpqc covering. Since this covering refines $\left\{f_{i}: T_{i} \rightarrow T\right\}$ we conclude by Lemma 33.8.4.

022C Lemma 33.8.6. Any fppf covering is an fpqc covering, and a fortiori, any syntomic, smooth, étale or Zariski covering is an fpqc covering.

Proof. We will show that an fppf covering is an fpqc covering, and then the rest follows from Lemma 33.7.2 Let $\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be an fppf covering. By definition this means that the $f_{i}$ are flat which checks the first condition of Definition 33.8.1. To check the second, let $V \subset U$ be an affine open subset. Write $f_{i}^{-1}(V)=\bigcup_{j \in J_{i}} V_{i j}$ for some affine opens $V_{i j} \subset U_{i}$. Since each $f_{i}$ is open (Morphisms, Lemma 28.25.9), we see that $V=\bigcup_{i \in I} \bigcup_{j \in J_{i}} f_{i}\left(V_{i j}\right)$ is an open covering of $V$. Since $V$ is quasicompact, this covering has a finite refinement. This finishes the proof.

The fpq ${ }^{3}$ topology cannot be treated in the same way as the fppf topology ${ }^{4}$ Namely, suppose that $R$ is a nonzero ring. We will see in Lemma 33.8.14 that

[^91]there does not exist a set $A$ of fpqc-coverings of $\operatorname{Spec}(R)$ such that every fpqccovering can be refined by an element of $A$. If $R=k$ is a field, then the reason for this unboundedness is that there does not exist a field extension of $k$ such that every field extension of $k$ is contained in it.
If you ignore set theoretic difficulties, then you run into presheaves which do not have a sheafification, see [Wat75, Theorem 5.5]. A mildly interesting option is to consider only those faithfully flat ring extensions $R \rightarrow R^{\prime}$ where the cardinality of $R^{\prime}$ is suitably bounded. (And if you consider all schemes in a fixed universe as in SGA4 then you are bounding the cardinality by a strongly inaccessible cardinal.) However, it is not so clear what happens if you change the cardinal to a bigger one.
For these reasons we do not introduce fpqc sites and we will not consider cohomology with respect to the fpqc-topology.
On the other hand, given a contravariant functor $F: S c h^{o p p} \rightarrow$ Sets it does make sense to ask whether $F$ satisfies the sheaf property for the fpqc topology, see below. Moreover, we can wonder about descent of object in the fpqc topology, etc. Simply put, for certain results the correct generality is to work with fpqc coverings.
022D Lemma 33.8.7. Let $T$ be a scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is an fpqc covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering and for each $i$ we have an fpqc covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is an fpqc covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering and $T^{\prime} \rightarrow T$ is a morphism of schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is an fpqc covering.
Proof. Part (1) is immediate. Recall that the composition of flat morphisms is flat and that the base change of a flat morphism is flat (Morphisms, Lemmas 28.25.7 and 28.25.5). Thus we can apply Lemma 33.8 .2 in each case to check that our families of morphisms are fpqc coverings.

Proof of (2). Assume $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering and for each $i$ we have an fpqc covering $\left\{f_{i j}: T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$. Let $U \subset T$ be an affine open. We can find quasi-compact opens $U_{i} \subset T_{i}$ for $i \in I$, almost all empty, such that $U=\bigcup f_{i}\left(U_{i}\right)$. Then for each $i$ we can choose quasi-compact opens $W_{i j} \subset T_{i j}$ for $j \in J_{i}$, almost all empty, with $U_{i}=\bigcup_{j} f_{i j}\left(U_{i j}\right)$. Thus $\left\{T_{i j} \rightarrow T\right\}$ is an fpqc covering.
Proof of (3). Assume $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering and $T^{\prime} \rightarrow T$ is a morphism of schemes. Let $U^{\prime} \subset T^{\prime}$ be an affine open which maps into the affine open $U \subset T$. Choose quasi-compact opens $U_{i} \subset T_{i}$, almost all empty, such that $U=\bigcup f_{i}\left(U_{i}\right)$. Then $U^{\prime} \times_{U} U_{i}$ is a quasi-compact open of $T^{\prime} \times_{T} T_{i}$ and $U^{\prime}=\bigcup \operatorname{pr}_{1}\left(U^{\prime} \times_{U} U_{i}\right)$. Since $T^{\prime}$ can be covered by such affine opens $U^{\prime} \subset T^{\prime}$ we see that $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is an fpqc covering by Lemma 33.8.2

022E Lemma 33.8.8. Let $T$ be an affine scheme. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of $T$. Then there exists an fpqc covering $\left\{U_{j} \rightarrow T\right\}_{j=1, \ldots, n}$ which is a refinement of $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ such that each $U_{j}$ is an affine scheme. Moreover, we may choose each $U_{j}$ to be open affine in one of the $T_{i}$.
Proof. This follows directly from the definition.
022F Definition 33.8.9. Let $T$ be an affine scheme. A standard fpqc covering of $T$ is a family $\left\{f_{j}: U_{j} \rightarrow T\right\}_{j=1, \ldots, n}$ with each $U_{j}$ is affine, flat over $T$ and $T=\bigcup f_{j}\left(U_{j}\right)$.

Since we do not introduce the affine site we have to show directly that the collection of all standard fpqc coverings satisfies the axioms.
03LA Lemma 33.8.10. Let $T$ be an affine scheme.
(1) If $T^{\prime} \rightarrow T$ is an isomorphism then $\left\{T^{\prime} \rightarrow T\right\}$ is a standard fpqc covering of $T$.
(2) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a standard fpqc covering and for each $i$ we have a standard fpqc covering $\left\{T_{i j} \rightarrow T_{i}\right\}_{j \in J_{i}}$, then $\left\{T_{i j} \rightarrow T\right\}_{i \in I, j \in J_{i}}$ is a standard fpqc covering.
(3) If $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ is a standard fpqc covering and $T^{\prime} \rightarrow T$ is a morphism of affine schemes then $\left\{T^{\prime} \times_{T} T_{i} \rightarrow T^{\prime}\right\}_{i \in I}$ is a standard fpqc covering.
Proof. This follows formally from the fact that compositions and base changes of flat morphisms are flat (Morphisms, Lemmas 28.25.7 and 28.25.5 and that fibre products of affine schemes are affine (Schemes, Lemma 25.17.2).

03LB Lemma 33.8.11. Let $T$ be a scheme. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with target $T$. Assume that
(1) each $f_{i}$ is flat, and
(2) every affine scheme $Z$ and morphism $h: Z \rightarrow T$ there exists a standard fpqc covering $\left\{Z_{j} \rightarrow Z\right\}_{j=1, \ldots, n}$ which refines the family $\left\{T_{i} \times_{T} Z \rightarrow Z\right\}_{i \in I}$. Then $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is a fpqc covering of $T$.
Proof. Let $T=\bigcup U_{\alpha}$ be an affine open covering. For each $\alpha$ the pullback family $\left\{T_{i} \times_{T} U_{\alpha} \rightarrow U_{\alpha}\right\}$ can be refined by a standard fpqc covering, hence is an fpqc covering by Lemma 33.8.4. As $\left\{U_{\alpha} \rightarrow T\right\}$ is an fpqc covering we conclude that $\left\{T_{i} \rightarrow T\right\}$ is an fpqc covering by Lemma 33.8.5.
022G Definition 33.8.12. Let $F$ be a contravariant functor on the category of schemes with values in sets.
(1) Let $\left\{U_{i} \rightarrow T\right\}_{i \in I}$ be a family of morphisms of schemes with fixed target. We say that $F$ satisfies the sheaf property for the given family if for any collection of elements $\xi_{i} \in F\left(U_{i}\right)$ such that $\left.\xi_{i}\right|_{U_{i} \times_{T} U_{j}}=\left.\xi_{j}\right|_{U_{i} \times_{T} U_{j}}$ there exists a unique element $\xi \in F(T)$ such that $\xi_{i}=\left.\xi\right|_{U_{i}}$ in $F\left(U_{i}\right)$.
(2) We say that $F$ satisfies the sheaf property for the fpqc topology if it satisfies the sheaf property for any fpqc covering.

We try to avoid using the terminology " $F$ is a sheaf" in this situation since we are not defining a category of fpqc sheaves as we explained above.

022H Lemma 33.8.13. Let $F$ be a contravariant functor on the category of schemes with values in sets. Then $F$ satisfies the sheaf property for the fpqc topology if and only if it satisfies
(1) the sheaf property for every Zariski covering, and
(2) the sheaf property for any standard fpqc covering.

Moreover, in the presence of (1) property (2) is equivalent to property
(2') the sheaf property for $\{V \rightarrow U\}$ with $V, U$ affine and $V \rightarrow U$ faithfully flat.
Proof. Assume (1) and (2) hold. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering. Let $s_{i} \in F\left(T_{i}\right)$ be a family of elements such that $s_{i}$ and $s_{j}$ map to the same element
of $F\left(T_{i} \times_{T} T_{j}\right)$. Let $W \subset T$ be the maximal open subset such that there exists a unique $s \in F(W)$ with $\left.s\right|_{f_{i}^{-1}(W)}=\left.s_{i}\right|_{f_{i}^{-1}(W)}$ for all $i$. Such a maximal open exists because $F$ satisfies the sheaf property for Zariski coverings; in fact $W$ is the union of all opens with this property. Let $t \in T$. We will show $t \in W$. To do this we pick an affine open $t \in U \subset T$ and we will show there is a unique $s \in F(U)$ with $\left.s\right|_{f_{i}^{-1}(U)}=\left.s_{i}\right|_{f_{i}^{-1}(U)}$ for all $i$.
By Lemma 33.8 .8 we can find a standard fpqc covering $\left\{U_{j} \rightarrow U\right\}_{j=1, \ldots, n}$ refining $\left\{U \times_{T} T_{i} \rightarrow \overline{U\}}\right.$, say by morphisms $h_{j}: U_{j} \rightarrow T_{i_{j}}$. By (2) we obtain a unique element $s \in F(U)$ such that $\left.s\right|_{U_{j}}=F\left(h_{j}\right)\left(s_{i_{j}}\right)$. Note that for any scheme $V \rightarrow U$ over $U$ there is a unique section $s_{V} \in F(V)$ which restricts to $F\left(h_{j} \circ \mathrm{pr}_{2}\right)\left(s_{i_{j}}\right)$ on $V \times_{U} U_{j}$ for $j=1, \ldots, n$. Namely, this is true if $V$ is affine by (2) as $\left\{V \times_{U} U_{j} \rightarrow V\right\}$ is a standard fpqc covering and in general this follows from (1) and the affine case by choosing an affine open covering of $V$. In particular, $s_{V}=\left.s\right|_{V}$. Now, taking $V=U \times_{T} T_{i}$ and using that $\left.s_{i_{j}}\right|_{T_{i_{j}} \times T_{T} T_{i}}=\left.s_{i}\right|_{T_{i_{j}} \times T_{T} T_{i}}$ we conclude that $\left.s\right|_{U \times_{T} T_{i}}=s_{V}=\left.s_{i}\right|_{U \times_{T} T_{i}}$ which is what we had to show.

Proof of the equivalence of (2) and (2') in the presence of (1). Suppose $\left\{T_{i} \rightarrow\right.$ $T\}$ is a standard fpqc covering, then $\coprod T_{i} \rightarrow T$ is a faithfully flat morphism of affine schemes. In the presence of (1) we have $F\left(\amalg T_{i}\right)=\prod F\left(T_{i}\right)$ and similarly $F\left(\left(\coprod T_{i}\right) \times_{T}\left(\coprod T_{i}\right)\right)=\prod F\left(T_{i} \times_{T} T_{i^{\prime}}\right)$. Thus the sheaf condition for $\left\{T_{i} \rightarrow T\right\}$ and $\left\{\amalg T_{i} \rightarrow T\right\}$ is the same.

The following lemma is here just to point out set theoretical difficulties do indeed arise and should be ignored by most readers.
0BBK Lemma 33.8.14. Let $R$ be a nonzero ring. There does not exist a set $A$ of fpqccoverings of $\operatorname{Spec}(R)$ such that every fpqc-covering can be refined by an element of $A$.

Proof. Let us first explain this when $R=k$ is a field. For any set $I$ consider the purely transcendental field extension $k \subset k_{I}=k\left(\left\{t_{i}\right\}_{i \in I}\right)$. Since $k \rightarrow k_{I}$ is faithfully flat we see that $\left\{\operatorname{Spec}\left(k_{I}\right) \rightarrow \operatorname{Spec}(k)\right\}$ is an fpqc covering. Let $A$ be a set and for each $\alpha \in A$ let $\mathcal{U}_{\alpha}=\left\{S_{\alpha, j} \rightarrow \operatorname{Spec}(k)\right\}_{j \in J_{\alpha}}$ be an fpqc covering. If $\mathcal{U}_{\alpha}$ refines $\left\{\operatorname{Spec}\left(k_{I}\right) \rightarrow \operatorname{Spec}(k)\right\}$ then the morphisms $S_{\alpha, j} \rightarrow \operatorname{Spec}(k)$ factor through $\operatorname{Spec}\left(k_{I}\right)$. Since $\mathcal{U}_{\alpha}$ is a covering, at least some $S_{\alpha, j}$ is nonempty. Pick a point point $s \in S_{\alpha, j}$. Since we have the factorization $S_{\alpha, j} \rightarrow \operatorname{Spec}\left(k_{I}\right) \rightarrow \operatorname{Spec}(k)$ we obtain a homomorphism of fields $k_{I} \rightarrow \kappa(s)$. In particular, we see that the cardinality of $\kappa(s)$ is at least the cardinality of $I$. Thus if we take $I$ to be a set of cardinality bigger than the cardinalities of the residue fields of all the schemes $S_{\alpha, j}$, then such a factorization does not exist and the lemma holds for $R=k$.

General case. Since $R$ is nonzero it has a maximal prime ideal $\mathfrak{m}$ with residue field $\kappa$. Let $I$ be a set and consider $R_{I}=S_{I}^{-1} R\left[\left\{t_{i}\right\}_{i \in I}\right]$ where $S_{I} \subset R\left[\left\{t_{i}\right\}_{i \in I}\right]$ is the multiplicative subset of $f \in R\left[\left\{t_{i}\right\}_{i \in I}\right]$ such that $f$ maps to a nonzero element of $R / \mathfrak{p}\left[\left\{t_{i}\right\}_{i \in I}\right.$ for all primes $\mathfrak{p}$ of $R$. Then $R_{I}$ is a faithfully flat $R$-algebra and $\left\{\operatorname{Spec}\left(R_{I}\right) \rightarrow \operatorname{Spec}(R)\right\}$ is an fpqc covering. We leave it as an exercise to the reader to show that $R_{I} \otimes_{R} \kappa \cong \kappa\left(\left\{t_{i}\right\}_{i \in I}\right)=\kappa_{I}$ with notation as above (hint: use that $R \rightarrow \kappa$ is surjective and that any $f \in R\left[\left\{t_{i}\right\}_{i \in I}\right]$ one of whose monomials occurs with coefficient 1 is an element of $S_{I}$ ). Let $A$ be a set and for each $\alpha \in A$ let $\mathcal{U}_{\alpha}=$ $\left\{S_{\alpha, j} \rightarrow \operatorname{Spec}(R)\right\}_{j \in J_{\alpha}}$ be an fpqc covering. If $\mathcal{U}_{\alpha}$ refines $\left\{\operatorname{Spec}\left(R_{I}\right) \rightarrow \operatorname{Spec}(R)\right\}$, then by base change we conclude that $\left\{S_{\alpha, j} \times_{\operatorname{Spec}(R)} \operatorname{Spec}(\kappa) \rightarrow \operatorname{Spec}(\kappa)\right\}$ refines
$\left\{\operatorname{Spec}\left(\kappa_{I}\right) \rightarrow \operatorname{Spec}(\kappa)\right\}$. Hence by the result of the previous paragraph, there exists an $I$ such that this is not the case and the lemma is proved.

### 33.9. Change of topologies

03FE Let $f: X \rightarrow Y$ be a morphism of schemes over a base scheme $S$. In this case we have the following morphisms of sites (with suitable choices of sites as in Remark 33.9.1 below):
(1) $(S c h / X)_{f p p f} \longrightarrow(S c h / Y)_{f p p f}$,
(2) $(S c h / X)_{\text {fppf }} \longrightarrow(S c h / Y)_{\text {syntomic }}$,
(3) $(S c h / X)_{\text {fppf }} \longrightarrow(S c h / Y)_{\text {smooth }}$,
(4) $(S c h / X)_{\text {fppf }} \longrightarrow(S c h / Y)_{\text {étale }}$,
(5) $(S c h / X)_{f p p f} \longrightarrow(S c h / Y)_{Z a r}$,
(6) $(S c h / X)_{\text {syntomic }} \longrightarrow(S c h / Y)_{\text {syntomic }}$,
(7) $(S c h / X)_{\text {syntomic }} \longrightarrow(S c h / Y)_{\text {smooth }}$,
(8) $(S c h / X)_{\text {syntomic }} \longrightarrow(S c h / Y)_{\text {étale }}$,
(9) $(S c h / X)_{\text {syntomic }} \longrightarrow(S c h / Y)_{Z a r}$,
(10) $(S c h / X)_{\text {smooth }} \longrightarrow(S c h / Y)_{\text {smooth }}$,
(11) $(S c h / X)_{\text {smooth }} \longrightarrow(S c h / Y)_{\text {étale }}$,
(12) $(S c h / X)_{\text {smooth }} \longrightarrow(S c h / Y)_{Z a r}$,
(13) $(S c h / X)_{\text {étale }} \longrightarrow(S c h / Y)_{\text {étale }}$,
(14) $(S c h / X)_{\text {étale }} \longrightarrow(S c h / Y)_{Z a r}$,
(15) $(S c h / X)_{Z a r} \longrightarrow(S c h / Y)_{Z a r}$,
(16) $(S c h / X)_{\text {fppf }} \longrightarrow Y_{\text {étale }}$,
(17) $(S c h / X)_{\text {syntomic }} \longrightarrow Y_{\text {étale }}$,
(18) $(S c h / X)_{\text {smooth }} \longrightarrow Y_{\text {étale }}$,
(19) $(S c h / X)_{\text {étale }} \longrightarrow Y_{\text {étale }}$,
(20) $(S c h / X)_{f p p f} \longrightarrow Y_{Z a r}$,
(21) $(S c h / X)_{\text {syntomic }} \longrightarrow Y_{Z a r}$,
(22) $(S c h / X)_{\text {smooth }} \longrightarrow Y_{Z a r}$,
(23) $(S c h / X)_{\text {étale }} \longrightarrow Y_{Z a r}$,
(24) $(S c h / X)_{Z a r} \longrightarrow Y_{Z a r}$,
(25) $X_{\text {étale }} \longrightarrow Y_{\text {étale }}$,
(26) $X_{\text {étale }} \longrightarrow Y_{\text {Zar }}$,
(27) $X_{Z a r} \longrightarrow Y_{Z a r}$,

In each case the underlying continuous functor $S c h / Y \rightarrow S c h / X$, or $Y_{\tau} \rightarrow S c h / X$ is the functor $Y^{\prime} / Y \mapsto X \times_{Y} Y^{\prime} / X$. Namely, in the sections above we have seen the morphisms $f_{\text {big }}:(S c h / X)_{\tau} \rightarrow(S c h / Y)_{\tau}$ and $f_{\text {small }}: X_{\tau} \rightarrow Y_{\tau}$ for $\tau$ as above. We also have seen the morphisms of sites $\pi_{Y}:(S c h / Y)_{\tau} \rightarrow Y_{\tau}$ for $\tau \in\{$ étale, Zariski\}. On the other hand, it is clear that the identity functor $(S c h / X)_{\tau} \rightarrow(S c h / X)_{\tau^{\prime}}$ defines a morphism of sites when $\tau$ is a stronger topology than $\tau^{\prime}$. Hence composing these gives the list of possible morphisms above.

Because of the simple description of the underlying functor it is clear that given morphisms of schemes $X \rightarrow Y \rightarrow Z$ the composition of two of the morphisms of sites above, e.g.,

$$
(S c h / X)_{\tau_{0}} \longrightarrow(S c h / Y)_{\tau_{1}} \longrightarrow(S c h / Z)_{\tau_{2}}
$$

is the corresponding morphism of sites associated to the morphism of schemes $X \rightarrow Z$.

03FF Remark 33.9.1. Take any category $S c h_{\alpha}$ constructed as in Sets, Lemma 3.9.2 starting with the set of schemes $\{X, Y, S\}$. Choose any set of coverings $\operatorname{Cov}_{\text {fppf }}$ on $S c h_{\alpha}$ as in Sets, Lemma 3.11.1 starting with the category $S c h_{\alpha}$ and the class of fppf coverings. Let $S c_{\text {fppf }}$ denote the big fppf site so obtained. Next, for $\tau \in\{$ Zariski, étale, smooth, syntomic $\}$ let $S c h_{\tau}$ have the same underlying category as $S c h_{f p p f}$ with coverings $\operatorname{Cov}_{\tau} \subset \operatorname{Cov}_{\text {fppf }}$ simply the subset of $\tau$-coverings. It is straightforward to check that this gives rise to a big site $S c h_{\tau}$.

### 33.10. Change of big sites

022 In this section we explain what happens on changing the big Zariski/fppf/étale sites.

Let $\tau, \tau^{\prime} \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. Given two big sites $S c h_{\tau}$ and $S c h_{\tau^{\prime}}^{\prime}$ we say that $S c h_{\tau}$ is contained in $S c h_{\tau^{\prime}}^{\prime}$ if $\mathrm{Ob}\left(S c h_{\tau}\right) \subset \operatorname{Ob}\left(S c h_{\tau^{\prime}}^{\prime}\right)$ and $\operatorname{Cov}\left(S c h_{\tau}\right) \subset \operatorname{Cov}\left(S c h_{\tau^{\prime}}^{\prime}\right)$. In this case $\tau$ is stronger than $\tau^{\prime}$, for example, no fppf site can be contained in an étale site.

022J Lemma 33.10.1. Any set of big Zariski sites is contained in a common big Zariski site. The same is true, mutatis mutandis, for big fppf and big étale sites.

Proof. This is true because the union of a set of sets is a set, and the constructions in Sets, Lemmas 3.9 .2 and 3.11 .1 allow one to start with any initially given set of schemes and coverings.

022K Lemma 33.10.2. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf \}. Suppose given big sites $S c h_{\tau}$ and $S c h_{\tau}^{\prime}$. Assume that $S c h_{\tau}$ is contained in Sch $h_{\tau}^{\prime}$. The inclusion functor $S c h_{\tau} \rightarrow S c h_{\tau}^{\prime}$ satisfies the assumptions of Sites, Lemma 7.20.8. There are morphisms of topoi

$$
\begin{array}{lll}
g: S h\left(S c h_{\tau}\right) & \longrightarrow & \operatorname{Sh}\left(S c h_{\tau}^{\prime}\right) \\
f: S h\left(S c h_{\tau}^{\prime}\right) & \longrightarrow & \operatorname{Sh}\left(S c h_{\tau}\right)
\end{array}
$$

such that $f \circ g \cong i d$. For any object $S$ of $S c h_{\tau}$ the inclusion functor $(S c h / S)_{\tau} \rightarrow$ $\left(S c h^{\prime} / S\right)_{\tau}$ satisfies the assumptions of Sites, Lemma 7.20.8 also. Hence similarly we obtain morphisms

$$
\begin{array}{rll}
g: \operatorname{Sh}\left((S c h / S)_{\tau}\right) & \longrightarrow & \operatorname{Sh}\left(\left(S c h^{\prime} / S\right)_{\tau}\right) \\
f: \operatorname{Sh}\left(\left(S c h^{\prime} / S\right)_{\tau}\right) & \longrightarrow & \operatorname{Sh}\left((S c h / S)_{\tau}\right)
\end{array}
$$

with $f \circ g \cong i d$.
Proof. Assumptions (b), (c), and (e) of Sites, Lemma 7.20.8 are immediate for the functors $S c h_{\tau} \rightarrow S c h_{\tau}^{\prime}$ and $(S c h / S)_{\tau} \rightarrow\left(S c h^{\prime} / S\right)_{\tau}$. Property (a) holds by Lemma $33.3 .6,33.4 .7,33.5 .7,33.6 .7$, or 33.7 .7 . Property (d) holds because fibre products in the categories $S c h_{\tau}, S c h_{\tau}^{\prime}$ exist and are compatible with fibre products in the category of schemes.

Discussion: The functor $g^{-1}=f_{*}$ is simply the restriction functor which associates to a sheaf $\mathcal{G}$ on $S c h_{\tau}^{\prime}$ the restriction $\left.\mathcal{G}\right|_{S c h_{\tau}}$. Hence this lemma simply says that given any sheaf of sets $\mathcal{F}$ on $S c h_{\tau}$ there exists a canonical sheaf $\mathcal{F}^{\prime}$ on $S c h_{\tau}^{\prime}$ such that $\left.\mathcal{F}\right|_{S c h_{\tau}^{\prime}}=\mathcal{F}^{\prime}$. In fact the sheaf $\mathcal{F}^{\prime}$ has the following description: it is the sheafification of the presheaf

$$
\text { Sch }_{\tau}^{\prime} \longrightarrow \text { Sets, } \quad V \longmapsto \operatorname{colim}_{V \rightarrow U} \mathcal{F}(U)
$$

where $U$ is an object of $S c h_{\tau}$. This is true because $\mathcal{F}^{\prime}=f^{-1} \mathcal{F}=\left(u_{p} \mathcal{F}\right)^{\#}$ according to Sites, Lemmas 7.20.5 and 7.20.8.

## CHAPTER 34

## Descent

### 34.1. Introduction

0239 In the chapter on topologies on schemes (see Topologies, Section 33.1) we introduced Zariski, étale, fppf, smooth, syntomic and fpqc coverings of schemes. In this chapter we discuss what kind of structures over schemes can be descended through such coverings. See for example Gro95a, Gro95b, Gro95e, Gro95f, Gro95c, and Gro95d]. This is also meant to introduce the notions of descent, descent data, effective descent data, in the less formal setting of descent questions for quasicoherent sheaves, schemes, etc. The formal notion, that of a stack over a site, is discussed in the chapter on stacks (see Stacks, Section 8.1).

### 34.2. Descent data for quasi-coherent sheaves

023 A In this chapter we will use the convention where the projection maps $\mathrm{pr}_{i}: X \times \ldots \times$ $X \rightarrow X$ are labeled starting with $i=0$. Hence we have $\mathrm{pr}_{0}, \mathrm{pr}_{1}: X \times X \rightarrow X$, $\mathrm{pr}_{0}, \mathrm{pr}_{1}, \mathrm{pr}_{2}: X \times X \times X \rightarrow X$, etc.

023B Definition 34.2.1. Let $S$ be a scheme. Let $\left\{f_{i}: S_{i} \rightarrow S\right\}_{i \in I}$ be a family of morphisms with target $S$.
(1) A descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasi-coherent sheaves with respect to the given family is given by a quasi-coherent sheaf $\mathcal{F}_{i}$ on $S_{i}$ for each $i \in I$, an isomorphism of quasi-coherent $\mathcal{O}_{S_{i} \times s S_{j}}$-modules $\varphi_{i j}: \mathrm{pr}_{0}^{*} \mathcal{F}_{i} \rightarrow \mathrm{pr}_{1}^{*} \mathcal{F}_{j}$ for each pair $(i, j) \in I^{2}$ such that for every triple of indices $(i, j, k) \in I^{3}$ the diagram

of $\mathcal{O}_{S_{i} \times{ }_{S} S_{j} \times{ }_{S} S_{k} \text {-modules commutes. This is called the cocycle condition. }}$
(2) A morphism $\psi:\left(\mathcal{F}_{i}, \varphi_{i j}\right) \rightarrow\left(\mathcal{F}_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data is given by a family $\psi=\left(\psi_{i}\right)_{i \in I}$ of morphisms of $\mathcal{O}_{S_{i}}$-modules $\psi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{F}_{i}^{\prime}$ such that all the diagrams

commute.

A good example to keep in mind is the following. Suppose that $S=\bigcup S_{i}$ is an open covering. In that case we have seen descent data for sheaves of sets in Sheaves, Section 6.33 where we called them "glueing data for sheaves of sets with respect to the given covering". Moreover, we proved that the category of glueing data is equivalent to the category of sheaves on $S$. We will show the analogue in the setting above when $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ is an fpqc covering.
In the extreme case where the covering $\{S \rightarrow S\}$ is given by id ${ }_{S}$ a descent datum is necessarily of the form $\left(\mathcal{F}, \mathrm{id}_{\mathcal{F}}\right)$. The cocycle condition guarantees that the identity on $\mathcal{F}$ is the only permitted map in this case. The following lemma shows in particular that to every quasi-coherent sheaf of $\mathcal{O}_{S}$-modules there is associated a unique descent datum with respect to any given family.
023C Lemma 34.2.2. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ and $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be families of morphisms of schemes with fixed target. Let $\left(g, \alpha: I \rightarrow J,\left(g_{i}\right)\right): \mathcal{U} \rightarrow \mathcal{V}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Let $\left(\mathcal{F}_{j}, \varphi_{j j^{\prime}}\right)$ be a descent datum for quasi-coherent sheaves with respect to the family $\left\{V_{j} \rightarrow V\right\}_{j \in J}$. Then
(1) The system

$$
\left(g_{i}^{*} \mathcal{F}_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right)
$$

is a descent datum with respect to the family $\left\{U_{i} \rightarrow U\right\}_{i \in I}$.
(2) This construction is functorial in the descent datum $\left(\mathcal{F}_{j}, \varphi_{j j^{\prime}}\right)$.
(3) Given a second morphism $\left(g^{\prime}, \alpha^{\prime}: I \rightarrow J,\left(g_{i}^{\prime}\right)\right)$ of families of maps with fixed target with $g=g^{\prime}$ there exists a functorial isomorphism of descent data

$$
\left(g_{i}^{*} \mathcal{F}_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right) \cong\left(\left(g_{i}^{\prime}\right)^{*} \mathcal{F}_{\alpha^{\prime}(i)},\left(g_{i}^{\prime} \times g_{i^{\prime}}^{\prime}\right)^{*} \varphi_{\alpha^{\prime}(i) \alpha^{\prime}\left(i^{\prime}\right)}\right)
$$

Proof. Omitted. Hint: The maps $g_{i}^{*} \mathcal{F}_{\alpha(i)} \rightarrow\left(g_{i}^{\prime}\right)^{*} \mathcal{F}_{\alpha^{\prime}(i)}$ which give the isomorphism of descent data in part (3) are the pullbacks of the maps $\varphi_{\alpha(i) \alpha^{\prime}(i)}$ by the morphisms $\left(g_{i}, g_{i}^{\prime}\right): U_{i} \rightarrow V_{\alpha(i)} \times V V_{\alpha^{\prime}(i)}$.

Any family $\mathcal{U}=\left\{S_{i} \rightarrow S\right\}_{i \in I}$ is a refinement of the trivial covering $\{S \rightarrow S\}$ in a unique way. For a quasi-coherent sheaf $\mathcal{F}$ on $S$ we denote simply $\left(\left.\mathcal{F}\right|_{S_{i}}\right.$, can $)$ the descent datum with respect to $\mathcal{U}$ obtained by the procedure above.
023D Definition 34.2.3. Let $S$ be a scheme. Let $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be a family of morphisms with target $S$.
(1) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{S}$-module. We call the unique descent on $\mathcal{F}$ datum with respect to the covering $\{S \rightarrow S\}$ the trivial descent datum.
(2) The pullback of the trivial descent datum to $\left\{S_{i} \rightarrow S\right\}$ is called the canonical descent datum. Notation: $\left(\left.\mathcal{F}\right|_{S_{i}}\right.$, can $)$.
(3) A descent datum $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for quasi-coherent sheaves with respect to the given covering is said to be effective if there exists a quasi-coherent sheaf $\mathcal{F}$ on $S$ such that $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ is isomorphic to $\left(\left.\mathcal{F}\right|_{S_{i}}\right.$, can $)$.

023 Lemma 34.2.4. Let $S$ be a scheme. Let $S=\bigcup U_{i}$ be an open covering. Any descent datum on quasi-coherent sheaves for the family $\mathcal{U}=\left\{U_{i} \rightarrow S\right\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_{S}$-modules to the category of descent data with respect to $\mathcal{U}$ is fully faithful.
Proof. This follows immediately from Sheaves, Section 6.33 and the fact that being quasi-coherent is a local property, see Modules, Definition 17.10.1.

To prove more we first need to study the case of modules over rings.

### 34.3. Descent for modules

023 F Let $R \rightarrow A$ be a ring map. By Simplicial, Example 14.5 .5 this gives rise to a cosimplicial $R$-algebra

$$
A \underset{\rightleftarrows}{\rightleftarrows} A \otimes_{R} A \underset{\rightleftarrows}{\rightleftarrows} A \otimes_{R} A \otimes_{R} A
$$

Let us denote this $(A / R)$ - so that $(A / R)_{n}$ is the $(n+1)$-fold tensor product of $A$ over $R$. Given a map $\varphi:[n] \rightarrow[m]$ the $R$-algebra map $(A / R) \bullet(\varphi)$ is the map

$$
a_{0} \otimes \ldots \otimes a_{n} \longmapsto \prod_{\varphi(i)=0} a_{i} \otimes \prod_{\varphi(i)=1} a_{i} \otimes \ldots \otimes \prod_{\varphi(i)=m} a_{i}
$$

where we use the convention that the empty product is 1 . Thus the first few maps, notation as in Simplicial, Section 14.5, are

| $\delta_{0}^{1}$ | $:$ | $a_{0}$ | $\mapsto$ | $1 \otimes a_{0}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\delta_{1}^{1}$ | $:$ | $a_{0}$ | $\mapsto$ | $a_{0} \otimes 1$ |
| $\sigma_{0}^{0}$ | $:$ | $a_{0} \otimes a_{1}$ | $\mapsto$ | $a_{0} a_{1}$ |
| $\delta_{0}^{2}$ | $:$ | $a_{0} \otimes a_{1}$ | $\mapsto$ | $1 \otimes a_{0} \otimes a_{1}$ |
| $\delta_{1}^{2}$ | $:$ | $a_{0} \otimes a_{1}$ | $\mapsto$ | $a_{0} \otimes 1 \otimes a_{1}$ |
| $\delta_{2}^{2}$ | $:$ | $a_{0} \otimes a_{1}$ | $\mapsto$ | $a_{0} \otimes a_{1} \otimes 1$ |
| $\sigma_{0}^{1}$ | $:$ | $a_{0} \otimes a_{1} \otimes a_{2}$ | $\mapsto$ | $a_{0} a_{1} \otimes a_{2}$ |
| $\sigma_{1}^{1}$ | $:$ | $a_{0} \otimes a_{1} \otimes a_{2}$ | $\mapsto$ | $a_{0} \otimes a_{1} a_{2}$ |

and so on.
An $R$-module $M$ gives rise to a cosimplicial $(A / R) \bullet$-module $(A / R) \bullet \otimes_{R} M$. In other words $M_{n}=(A / R)_{n} \otimes_{R} M$ and using the $R$-algebra maps $(A / R)_{n} \rightarrow(A / R)_{m}$ to define the corresponding maps on $M \otimes_{R}(A / R)_{\bullet}$.
The analogue to a descent datum for quasi-coherent sheaves in the setting of modules is the following.
023G Definition 34.3.1. Let $R \rightarrow A$ be a ring map.
(1) A descent datum $(N, \varphi)$ for modules with respect to $R \rightarrow A$ is given by an $A$-module $N$ and a isomorphism of $A \otimes_{R} A$-modules

$$
\varphi: N \otimes_{R} A \rightarrow A \otimes_{R} N
$$

such that the cocycle condition holds: the diagram of $A \otimes_{R} A \otimes_{R} A$-module maps

commutes (see below for notation).
(2) A morphism $(N, \varphi) \rightarrow\left(N^{\prime}, \varphi^{\prime}\right)$ of descent data is a morphism of $A$-modules $\psi: N \rightarrow N^{\prime}$ such that the diagram

is commutative.
In the definition we use the notation that $\varphi_{01}=\varphi \otimes \operatorname{id}_{A}, \varphi_{12}=\operatorname{id}_{A} \otimes \varphi$, and $\varphi_{02}(n \otimes 1 \otimes 1)=\sum a_{i} \otimes 1 \otimes n_{i}$ if $\varphi(n)=\sum a_{i} \otimes n_{i}$. All three are $A \otimes_{R} A \otimes_{R} A$ module homomorphisms. Equivalently we have

$$
\varphi_{i j}=\varphi \otimes_{(A / R)_{1},(A / R) \bullet\left(\tau_{i j}^{2}\right)}(A / R)_{2}
$$

where $\tau_{i j}^{2}:[1] \rightarrow[2]$ is the map $0 \mapsto i, 1 \mapsto j$. Namely, $(A / R) \bullet\left(\tau_{02}^{2}\right)\left(a_{0} \otimes a_{1}\right)=$ $a_{0} \otimes 1 \otimes a_{1}$, and similarly for the others ${ }^{1}$.
We need some more notation to be able to state the next lemma. Let $(N, \varphi)$ be a descent datum with respect to a ring map $R \rightarrow A$. For $n \geq 0$ and $i \in[n]$ we set

$$
N_{n, i}=A \otimes_{R} \ldots \otimes_{R} A \otimes_{R} N \otimes_{R} A \otimes_{R} \ldots \otimes_{R} A
$$

with the factor $N$ in the $i$ th spot. It is an $(A / R)_{n}$-module. If we introduce the maps $\tau_{i}^{n}:[0] \rightarrow[n], 0 \mapsto i$ then we see that

$$
N_{n, i}=N \otimes_{(A / R)_{0},(A / R) \bullet\left(\tau_{i}^{n}\right)}(A / R)_{n}
$$

For $0 \leq i \leq j \leq n$ we let $\tau_{i j}^{n}:[1] \rightarrow[n]$ be the map such that 0 maps to $i$ and 1 to $j$. Similarly to the above the homomorphism $\varphi$ induces isomorphisms

$$
\varphi_{i j}^{n}=\varphi \otimes_{(A / R)_{1},(A / R) \bullet\left(\tau_{i j}^{n}\right)}(A / R)_{n}: N_{n, i} \longrightarrow N_{n, j}
$$

of $(A / R)_{n}$-modules when $i<j$. If $i=j$ we set $\varphi_{i j}^{n}=\mathrm{id}$. Since these are all isomorphisms they allow us to move the factor $N$ to any spot we like. And the cocycle condition exactly means that it does not matter how we do this (e.g., as a composition of two of these or at once). Finally, for any $\beta:[n] \rightarrow[m]$ we define the morphism

$$
N_{\beta, i}: N_{n, i} \rightarrow N_{m, \beta(i)}
$$

as the unique $(A / R) \cdot(\beta)$-semi linear map such that

$$
N_{\beta, i}(1 \otimes \ldots \otimes n \otimes \ldots \otimes 1)=1 \otimes \ldots \otimes n \otimes \ldots \otimes 1
$$

for all $n \in N$. This hints at the following lemma.
023H Lemma 34.3.2. Let $R \rightarrow A$ be a ring map. Given a descent datum $(N, \varphi)$ we can associate to it a cosimplicial $(A / R) \bullet$-module $\left.N_{\bullet}\right]^{2}$ by the rules $N_{n}=N_{n, n}$ and given $\beta:[n] \rightarrow[m]$ setting we define

$$
N_{\bullet}(\beta)=\left(\varphi_{\beta(n) m}^{m}\right) \circ N_{\beta, n}: N_{n, n} \longrightarrow N_{m, m}
$$

This procedure is functorial in the descent datum.
Proof. Here are the first few maps where $\varphi(n \otimes 1)=\sum \alpha_{i} \otimes x_{i}$

| $\delta_{0}^{1}$ | $:$ | $N$ | $\rightarrow$ | $A \otimes N$ | $n$ | $\mapsto$ | $1 \otimes n$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\delta_{1}^{1}$ | $:$ | $N$ | $\rightarrow$ | $A \otimes N$ | $n$ | $\mapsto$ | $\sum \alpha_{i} \otimes x_{i}$ |
| $\sigma_{0}^{0}$ | $:$ | $A \otimes N$ | $\rightarrow$ | $N$ | $a_{0} \otimes n$ | $\mapsto$ | $a_{0} n$ |
| $\delta_{0}^{2}$ | $:$ | $A \otimes N$ | $\rightarrow$ | $A \otimes A \otimes N$ | $a_{0} \otimes n$ | $\mapsto$ | $1 \otimes a_{0} \otimes n$ |
| $\delta_{1}^{2}$ | $:$ | $A \otimes N$ | $\rightarrow$ | $A \otimes A \otimes N$ | $a_{0} \otimes n$ | $\mapsto$ | $a_{0} \otimes 1 \otimes n$ |
| $\delta_{2}^{2}$ | $:$ | $A \otimes N$ | $\rightarrow$ | $A \otimes A \otimes N$ | $a_{0} \otimes n$ | $\mapsto$ | $\sum a_{0} \otimes \alpha_{i} \otimes x_{i}$ |
| $\sigma_{0}^{1}$ | $:$ | $A \otimes A \otimes N$ | $\rightarrow$ | $A \otimes N$ | $a_{0} \otimes a_{1} \otimes n$ | $\mapsto$ | $a_{0} a_{1} \otimes n$ |
| $\sigma_{1}^{1}$ | $:$ | $A \otimes A \otimes N$ | $\rightarrow$ | $A \otimes N$ | $a_{0} \otimes a_{1} \otimes n$ | $\mapsto$ | $a_{0} \otimes a_{1} n$ |

[^92]with notation as in Simplicial, Section 14.5. We first verify the two properties $\sigma_{0}^{0} \circ \delta_{0}^{1}=\mathrm{id}$ and $\sigma_{0}^{0} \circ \delta_{1}^{1}=\mathrm{id}$. The first one, $\sigma_{0}^{0} \circ \delta_{0}^{1}=\mathrm{id}$, is clear from the explicit description of the morphisms above. To prove the second relation we have to use the cocycle condition (because it does not holds for an arbitrary isomorphism $\left.\varphi: N \otimes_{R} A \rightarrow A \otimes_{R} N\right)$. Write $p=\sigma_{0}^{0} \circ \delta_{1}^{1}: N \rightarrow N$. By the description of the maps above we deduce that $p$ is also equal to
$$
p=\varphi \otimes \operatorname{id}: N=\left(N \otimes_{R} A\right) \otimes_{\left(A \otimes_{R} A\right)} A \longrightarrow\left(A \otimes_{R} N\right) \otimes_{\left(A \otimes_{R} A\right)} A=N
$$

Since $\varphi$ is an isomorphism we see that $p$ is an isomorphism. Write $\varphi(n \otimes 1)=$ $\sum \alpha_{i} \otimes x_{i}$ for certain $\alpha_{i} \in A$ and $x_{i} \in N$. Then $p(n)=\sum \alpha_{i} x_{i}$. Next, write $\varphi\left(x_{i} \otimes 1\right)=\sum \alpha_{i j} \otimes y_{j}$ for certain $\alpha_{i j} \in A$ and $y_{j} \in N$. Then the cocycle condition says that

$$
\sum \alpha_{i} \otimes \alpha_{i j} \otimes y_{j}=\sum \alpha_{i} \otimes 1 \otimes x_{i}
$$

This means that $p(n)=\sum \alpha_{i} x_{i}=\sum \alpha_{i} \alpha_{i j} y_{j}=\sum \alpha_{i} p\left(x_{i}\right)=p(p(n))$. Thus $p$ is a projector, and since it is an isomorphism it is the identity.
To prove fully that $N_{\bullet}$ is a cosimplicial module we have to check all 5 types of relations of Simplicial, Remark 14.5 .3 . The relations on composing $\sigma$ 's are obvious. The relations on composing $\delta$ 's come down to the cocycle condition for $\varphi$. In exactly the same way as above one checks the relations $\sigma_{j} \circ \delta_{j}=\sigma_{j} \circ \delta_{j+1}=\mathrm{id}$. Finally, the other relations on compositions of $\delta$ 's and $\sigma$ 's hold for any $\varphi$ whatsoever.

Note that to an $R$-module $M$ we can associate a canonical descent datum, namely $\left(M \otimes_{R} A\right.$, can $)$ where $\operatorname{can}:\left(M \otimes_{R} A\right) \otimes_{R} A \rightarrow A \otimes_{R}\left(M \otimes_{R} A\right)$ is the obvious map: $(m \otimes a) \otimes a^{\prime} \mapsto a \otimes\left(m \otimes a^{\prime}\right)$.
023I Lemma 34.3.3. Let $R \rightarrow A$ be a ring map. Let $M$ be an $R$-module. The cosimplicial $(A / R)$--module associated to the canonical descent datum is isomorphic to the cosimplicial module $(A / R) \bullet \otimes_{R} M$.

Proof. Omitted.
023J Definition 34.3.4. Let $R \rightarrow A$ be a ring map. We say a descent datum $(N, \varphi)$ is effective if there exists an $R$-module $M$ and an isomorphism of descent data from $\left(M \otimes_{R} A\right.$, can $)$ to $(N, \varphi)$.

Let $R \rightarrow A$ be a ring map. Let $(N, \varphi)$ be a descent datum. We may take the cochain complex $s\left(N_{\bullet}\right)$ associated with $N_{\bullet}$ (see Simplicial, Section 14.25). It has the following shape:

$$
N \rightarrow A \otimes_{R} N \rightarrow A \otimes_{R} A \otimes_{R} N \rightarrow \ldots
$$

We can describe the maps. The first map is the map

$$
n \longmapsto 1 \otimes n-\varphi(n \otimes 1) .
$$

The second map on pure tensors has the values

$$
a \otimes n \longmapsto 1 \otimes a \otimes n-a \otimes 1 \otimes n+a \otimes \varphi(n \otimes 1)
$$

It is clear how the pattern continues.
In the special case where $N=A \otimes_{R} M$ we see that for any $m \in M$ the element $1 \otimes m$ is in the kernel of the first map of the cochain complex associated to the cosimplicial module $(A / R) \bullet \otimes_{R} M$. Hence we get an extended cochain complex
023K

$$
\begin{equation*}
0 \rightarrow M \rightarrow A \otimes_{R} M \rightarrow A \otimes_{R} A \otimes_{R} M \rightarrow \ldots \tag{34.3.4.1}
\end{equation*}
$$

Here we think of the 0 as being in degree -2 , the module $M$ in degree -1 , the module $A \otimes_{R} M$ in degree 0 , etc. Note that this complex has the shape

$$
0 \rightarrow R \rightarrow A \rightarrow A \otimes_{R} A \rightarrow A \otimes_{R} A \otimes_{R} A \rightarrow \ldots
$$

when $M=R$.
023L Lemma 34.3.5. Suppose that $R \rightarrow A$ has a section. Then for any $R$-module $M$ the extended cochain complex (34.3.4.1) is exact.

Proof. By Simplicial, Lemma 14.28 .4 the map $R \rightarrow(A / R) \bullet$ is a homotopy equivalence of cosimplicial $R$-algebras (here $R$ denotes the constant cosimplicial $R$ algebra). Hence $M \rightarrow(A / R) \bullet \otimes_{R} M$ is a homotopy equivalence in the category of cosimplicial $R$-modules, because $\otimes_{R} M$ is a functor from the category of $R$-algebras to the category of $R$-modules, see Simplicial, Lemma 14.28 .3 . This implies that the induced map of associated complexes is a homotopy equivalence, see Simplicial, Lemma 14.28.5. Since the complex associated to the constant cosimplicial $R$-module $M$ is the complex

$$
M \xrightarrow{0} M \xrightarrow{1} M \xrightarrow{0} M \xrightarrow{1} M \ldots
$$

we win (since the extended version simply puts an extra $M$ at the beginning).
023M Lemma 34.3.6. Suppose that $R \rightarrow A$ is faithfully flat, see Algebra, Definition 10.38.1. Then for any $R$-module $M$ the extended cochain complex 34.3.4.1) is exact.

Proof. Suppose we can show there exists a faithfully flat ring map $R \rightarrow R^{\prime}$ such that the result holds for the ring map $R^{\prime} \rightarrow A^{\prime}=R^{\prime} \otimes_{R} A$. Then the result follows for $R \rightarrow A$. Namely, for any $R$-module $M$ the cosimplicial module $\left(M \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}}$ $\left(A^{\prime} / R^{\prime}\right)$ • is just the cosimplicial module $R^{\prime} \otimes_{R}\left(M \otimes_{R}(A / R) \bullet\right)$. Hence the vanishing of cohomology of the complex associated to $\left(M \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}}\left(A^{\prime} / R^{\prime}\right)$ • implies the vanishing of the cohomology of the complex associated to $M \otimes_{R}(A / R)$ • by faithful flatness of $R \rightarrow R^{\prime}$. Similarly for the vanishing of cohomology groups in degrees -1 and 0 of the extended complex (proof omitted).

But we have such a faithful flat extension. Namely $R^{\prime}=A$ works because the ring map $R^{\prime}=A \rightarrow A^{\prime}=A \otimes_{A} A$ has a section $a \otimes a^{\prime} \mapsto a a^{\prime}$ and Lemma 34.3.5 applies.

Here is how the complex relates to the question of effectivity.
039W Lemma 34.3.7. Let $R \rightarrow A$ be a faithfully flat ring map. Let $(N, \varphi)$ be a descent datum. Then $(N, \varphi)$ is effective if and only if the canonical map

$$
A \otimes_{R} H^{0}\left(s\left(N_{\bullet}\right)\right) \longrightarrow N
$$

is an isomorphism.
Proof. If $(N, \varphi)$ is effective, then we may write $N=A \otimes_{R} M$ with $\varphi=$ can. It follows that $H^{0}\left(s\left(N_{\bullet}\right)\right)=M$ by Lemmas 34.3.3 and 34.3.6. Conversely, suppose the map of the lemma is an isomorphism. In this case set $M=H^{0}\left(s\left(N_{\bullet}\right)\right)$. This is an $R$-submodule of $N$, namely $M=\{n \in N \mid 1 \otimes n=\varphi(n \otimes 1)\}$. The only thing to check is that via the isomorphism $A \otimes_{R} M \rightarrow N$ the canonical descent data agrees with $\varphi$. We omit the verification.

039X Lemma 34.3.8. Let $R \rightarrow A$ be a ring map, and let $R \rightarrow R^{\prime}$ be faithfully flat. Set $A^{\prime}=R^{\prime} \otimes_{R}$ A. If all descent data for $R^{\prime} \rightarrow A^{\prime}$ are effective, then so are all descent data for $R \rightarrow A$.
Proof. Let $(N, \varphi)$ be a descent datum for $R \rightarrow A$. Set $N^{\prime}=R^{\prime} \otimes_{R} N=A^{\prime} \otimes_{A} N$, and denote $\varphi^{\prime}=\operatorname{id}_{R^{\prime}} \otimes \varphi$ the base change of the descend datum $\varphi$. Then $\left(N^{\prime}, \varphi^{\prime}\right)$ is a descent datum for $R^{\prime} \rightarrow A^{\prime}$ and $H^{0}\left(s\left(N_{\bullet}^{\prime}\right)\right)=R^{\prime} \otimes_{R} H^{0}\left(s\left(N_{\bullet}\right)\right)$. Moreover, the $\operatorname{map} A^{\prime} \otimes_{R^{\prime}} H^{0}\left(s\left(N_{\bullet}^{\prime}\right)\right) \rightarrow N^{\prime}$ is identified with the base change of the $A$-module map $A \otimes_{R} H^{0}(s(N)) \rightarrow N$ via the faithfully flat map $A \rightarrow A^{\prime}$. Hence we conclude by Lemma 34.3.7.

Here is the main result of this section. Its proof may seem a little clumsy; for a more highbrow approach see Remark 34.3.11 below.
023N Proposition 34.3.9. Let $R \rightarrow A$ be a faithfully flat ring map. Then
(1) any descent datum on modules with respect to $R \rightarrow A$ is effective,
(2) the functor $M \mapsto\left(A \otimes_{R} M\right.$, can $)$ from $R$-modules to the category of descent data is an equivalence, and
(3) the inverse functor is given by $(N, \varphi) \mapsto H^{0}\left(s\left(N_{\bullet}\right)\right)$.

Proof. We only prove (1) and omit the proofs of (2) and (3). As $R \rightarrow A$ is faithfully flat, there exists a faithfully flat base change $R \rightarrow R^{\prime}$ such that $R^{\prime} \rightarrow A^{\prime}=R^{\prime} \otimes_{R} A$ has a section (namely take $R^{\prime}=A$ as in the proof of Lemma 34.3.6). Hence, using Lemma 34.3 .8 we may assume that $R \rightarrow A$ as a section, say $\sigma: A \rightarrow R$. Let $(N, \varphi)$ be a descent datum relative to $R \rightarrow A$. Set

$$
M=H^{0}\left(s\left(N_{\bullet}\right)\right)=\{n \in N \mid 1 \otimes n=\varphi(n \otimes 1)\} \subset N
$$

By Lemma 34.3.7 it suffices to show that $A \otimes_{R} M \rightarrow N$ is an isomorphism.
Take an element $n \in N$. Write $\varphi(n \otimes 1)=\sum a_{i} \otimes x_{i}$ for certain $a_{i} \in A$ and $x_{i} \in N$. By Lemma 34.3.2 we have $n=\sum a_{i} x_{i}$ in $N$ (because $\sigma_{0}^{0} \circ \delta_{0}^{1}=\mathrm{id}$ in any cosimplicial object). Next, write $\varphi\left(x_{i} \otimes 1\right)=\sum a_{i j} \otimes y_{j}$ for certain $a_{i j} \in A$ and $y_{j} \in N$. The cocycle condition means that

$$
\sum a_{i} \otimes a_{i j} \otimes y_{j}=\sum a_{i} \otimes 1 \otimes x_{i}
$$

in $A \otimes_{R} A \otimes_{R} N$. We conclude two things from this. First, by applying $\sigma$ to the first $A$ we conclude that $\sum \sigma\left(a_{i}\right) \varphi\left(x_{i} \otimes 1\right)=\sum \sigma\left(a_{i}\right) \otimes x_{i}$ which means that $\sum \sigma\left(a_{i}\right) x_{i} \in M$. Next, by applying $\sigma$ to the middle $A$ and multiplying out we conclude that $\sum_{i} a_{i}\left(\sum_{j} \sigma\left(a_{i j}\right) y_{j}\right)=\sum a_{i} x_{i}=n$. Hence by the first conclusion we see that $A \otimes_{R} M \rightarrow N$ is surjective. Finally, suppose that $m_{i} \in M$ and $\sum a_{i} m_{i}=0$. Then we see by applying $\varphi$ to $\sum a_{i} m_{i} \otimes 1$ that $\sum a_{i} \otimes m_{i}=0$. In other words $A \otimes_{R} M \rightarrow N$ is injective and we win.

023 O Remark 34.3.10. Let $R$ be a ring. Let $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal. The $\operatorname{ring} A=\prod_{i} R_{f_{i}}$ is a faithfully flat $R$-algebra. We remark that the cosimplicial ring $(A / R)$ • has the following ring in degree $n$ :

$$
\prod_{i_{0}, \ldots, i_{n}} R_{f_{i_{0} \ldots f_{i_{n}}}}
$$

Hence the results above recover Algebra, Lemmas 10.22.1, 10.22 .2 and 10.23 .4 But the results above actually say more because of exactness in higher degrees. Namely, it implies that Cech cohomology of quasi-coherent sheaves on affines is trivial, see (insert future reference here).

039Y Remark 34.3.11. Let $R$ be a ring. Let $A$ • be a cosimplicial $R$-algebra. In this setting a descent datum corresponds to an cosimplicial $A_{\bullet}$-module $M_{\bullet}$ with the property that for every $n, m \geq 0$ and every $\varphi:[n] \rightarrow[m]$ the map $M(\varphi): M_{n} \rightarrow$ $M_{m}$ induces an isomorphism

$$
M_{n} \otimes_{A_{n}, A(\varphi)} A_{m} \longrightarrow M_{m}
$$

Let us call such a cosimplicial module a cartesian module. In this setting, the proof of Proposition 34.3.9 can be split in the following steps
(1) If $R \rightarrow R^{\prime}$ is faithfully flat, $R \rightarrow A$ any ring map, then descent data for $A / R$ are effective if descent data for $\left(R^{\prime} \otimes_{R} A\right) / R^{\prime}$ are effective.
(2) Let $A$ be an $R$-algebra. Descent data for $A / R$ correspond to cartesian $(A / R)$.-modules.
(3) If $R \rightarrow A$ has a section then $(A / R)$ • is homotopy equivalent to $R$, the constant cosimplicial $R$-algebra with value $R$.
(4) If $A \bullet \rightarrow B \bullet$ is a homotopy equivalence of cosimplicial $R$-algebras then the functor $M_{\bullet} \mapsto M_{\bullet} \otimes_{A_{\bullet}} B_{\bullet}$ induces an equivalence of categories between cartesian $A_{\bullet}$-modules and cartesian $B_{\bullet}$-modules.
For (1) see Lemma 34.3.8, Part (2) uses Lemma 34.3.2. Part (3) we have seen in the proof of Lemma 34.3.5 (it relies on Simplicial, Lemma 14.28.4). Moreover, part (4) is a triviality if you think about it right!

### 34.4. Descent for universally injective morphisms

08WE Numerous constructions in algebraic geometry are made using techniques of descent, such as constructing objects over a given space by first working over a somewhat larger space which projects down to the given space, or verifying a property of a space or a morphism by pulling back along a covering map. The utility of such techniques is of course dependent on identification of a wide class of effective descent morphisms. Early in the Grothendieckian development of modern algebraic geometry, the class of morphisms which are quasi-compact and faithfully flat was shown to be effective for descending objects, morphisms, and many properties thereof.

As usual, this statement comes down to a property of rings and modules. For a homomorphism $f: R \rightarrow S$ to be an effective descent morphism for modules, Grothendieck showed that it is sufficient for $f$ to be faithfully flat. However, this excludes many natural examples: for instance, any split ring homomorphism is an effective descent morphism. One natural example of this even arises in the proof of faithfully flat descent: for $f: R \rightarrow S$ any ring homomorphism, $1_{S} \otimes f: S \rightarrow S \otimes_{R} S$ is split by the multiplication map whether or not it is flat.

One may then ask whether one there is a natural ring-theoretic condition implying effective descent for modules which includes both the case of a faithfully flat morphism and that of a split ring homomorphism. It may surprise the reader (at least it surprised this author) to learn that a complete answer to this question has been known since around 1970! Namely, it is not hard to check that a necessary condition for $f: R \rightarrow S$ to be an effective descent morphism for modules is that $f$ must be universally injective in the category of $R$-modules, that is, for any $R$ module $M$, the map $1_{M} \otimes f: M \rightarrow M \otimes_{R} S$ must be injective. This then turns out to be a sufficient condition as well. For example, if $f$ is split in the category
of $R$-modules (but not necessarily in the category of rings), then $f$ is an effective descent morphism for modules.
The history of this result is a bit involved: it was originally asserted by Olivier Oli70, who called universally injective morphisms pure, but without a clear indication of proof. One can extract the result from the work of Joyal and Tierney [JT84, but to the best of our knowledge, the first free-standing proof to appear in the literature is that of Mesablishvili Mes00. The first purpose of this section is to expose Mesablishvili's proof; this requires little modification of his original presentation aside from correcting typos, with the one exception that we make explicit the relationship between the customary definition of a descent datum in algebraic geometry and the one used in Mes00. The proof turns to be entirely category-theoretic, and consequently can be put in the language of monads (and thus applied in other contexts); see [JT04.
The second purpose of this section is to collect some information about which properties of modules, algebras, and morphisms can be descended along universally injective ring homomorphisms. The cases of finite modules and flat modules were treated by Mesablishvili Mes02.

08WF 34.4.1. Category-theoretic preliminaries. We start by recalling a few basic notions from category theory which will simplify the exposition. In this subsection, fix an ambient category.

For two morphisms $g_{1}, g_{2}: B \rightarrow C$, recall that an equalizer of $g_{1}$ and $g_{2}$ is a morphism $f: A \rightarrow B$ which satisfies $g_{1} \circ f=g_{2} \circ f$ and is universal for this property. This second statement means that any commutative diagram

without the dashed arrow can be uniquely completed. We also say in this situation that the diagram

08WG

$$
\begin{equation*}
A \xrightarrow{f} B \xrightarrow[g_{2}]{\xrightarrow[g_{1}]{\longrightarrow}} C \tag{34.4.1.1}
\end{equation*}
$$

is an equalizer. Reversing arrows gives the definition of a coequalizer. See Categories, Sections 4.10 and 4.11 .

Since it involves a universal property, the property of being an equalizer is typically not stable under applying a covariant functor. Just as for monomorphisms and epimorphisms, one can get around this in some cases by exhibiting splittings.
08WH Definition 34.4.2. A split equalizer is a diagram 34.4.1.1 with $g_{1} \circ f=g_{2} \circ f$ for which there exist auxiliary morphisms $h: B \rightarrow A$ and $i: C \rightarrow B$ such that

08WI

$$
(34.4 .2 .1) \quad h \circ f=1_{A}, \quad f \circ h=i \circ g_{1}, \quad i \circ g_{2}=1_{B}
$$

The point is that the equalities among arrows force 34.4.1.1 to be an equalizer: the map $e$ factors uniquely through $f$ by writing $e=f \circ(h \circ e)$. Consequently, applying a covariant functor to a split equalizer gives a split equalizer; applying a contravariant functor gives a split coequalizer, whose definition is apparent.

08WJ 34.4.3. Universally injective morphisms. Recall that Rings denotes the category of commutative rings with 1 . For an object $R$ of Rings we denote $\operatorname{Mod}_{R}$ the category of $R$-modules.
08WK Remark 34.4.4. Any functor $F: \mathcal{A} \rightarrow \mathcal{B}$ of abelian categories which is exact and takes nonzero objects to nonzero objects reflects injections and surjections. Namely, exactness implies that $F$ preserves kernels and cokernels (compare with Homology, Section 12.7). For example, if $f: R \rightarrow S$ is a faithfully flat ring homomorphism, then $\bullet \otimes_{R} S: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{S}$ has these properties.

Let $R$ be a ring. Recall that a morphism $f: M \rightarrow N$ in $\operatorname{Mod}_{R}$ is universally injective if for all $P \in \operatorname{Mod}_{R}$, the morphism $f \otimes 1_{P}: M \otimes_{R} P \rightarrow N \otimes_{R} P$ is injective. See Algebra, Definition 10.81.1.
08WL Definition 34.4.5. A ring map $f: R \rightarrow S$ is universally injective if it is universally injective as a morphism in $\operatorname{Mod}_{R}$.
08WM Example 34.4.6. Any split injection in $\operatorname{Mod}_{R}$ is universally injective. In particular, any split injection in Rings is universally injective.

08WN Example 34.4.7. For a ring $R$ and $f_{1}, \ldots, f_{n} \in R$ generating the unit ideal, the morphism $R \rightarrow R_{f_{1}} \oplus \ldots \oplus R_{f_{n}}$ is universally injective. Although this is immediate from Lemma 34.4.8, it is instructive to check it directly: we immediately reduce to the case where $R$ is local, in which case some $f_{i}$ must be a unit and so the map $R \rightarrow R_{f_{i}}$ is an isomorphism.

08WP Lemma 34.4.8. Any faithfully flat ring map is universally injective.
Proof. This is a reformulation of Algebra, Lemma 10.81.11.
The key observation from Mes00 is that universal injectivity can be usefully reformulated in terms of a splitting, using the usual construction of an injective cogenerator in $\operatorname{Mod}_{R}$.
08WQ Definition 34.4.9. Let $R$ be a ring. Define the contravariant functor $C: \operatorname{Mod}_{R} \rightarrow$ $\operatorname{Mod}_{R}$ by setting

$$
C(M)=\operatorname{Hom}_{A b}(M, \mathbf{Q} / \mathbf{Z})
$$

with the $R$-action on $C(M)$ given by $r f(s)=f(r s)$.
This functor was denoted $M \mapsto M^{\vee}$ in More on Algebra, Section 15.46 ,
08WR Lemma 34.4.10. For a ring $R$, the functor $C: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ is exact and reflects injections and surjections.

Proof. Exactness is More on Algebra, Lemma 15.46 .6 and the other properties follow from this, see Remark 34.4.4.
08WS Remark 34.4.11. We will use frequently the standard adjunction between Hom and tensor product, in the form of the natural isomorphism of contravariant functors
$08 \mathrm{WT} \quad(34.4 .11 .1) \quad C\left(\bullet_{1} \otimes_{R} \bullet_{2}\right) \cong \operatorname{Hom}_{R}\left(\bullet_{1}, C\left(\bullet_{2}\right)\right): \operatorname{Mod}_{R} \times \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ taking $f: M_{1} \otimes_{R} M_{2} \rightarrow \mathbf{Q} / \mathbf{Z}$ to the map $m_{1} \mapsto\left(m_{2} \mapsto f\left(m_{1} \otimes m_{2}\right)\right)$. See Algebra, Lemma 10.13.5. A corollary of this observation is that if

is a split coequalizer diagram in $\operatorname{Mod}_{R}$, then so is

$$
C\left(M \otimes_{R} Q\right) \longrightarrow C\left(N \otimes_{R} Q\right) \longrightarrow C\left(P \otimes_{R} Q\right)
$$

for any $Q \in \operatorname{Mod}_{R}$.
08WU Lemma 34.4.12. Let $R$ be a ring. A morphism $f: M \rightarrow N$ in $\operatorname{Mod}_{R}$ is universally injective if and only if $C(f): C(N) \rightarrow C(M)$ is a split surjection.

Proof. By 34.4.11.1), for any $P \in \operatorname{Mod}_{R}$ we have a commutative diagram

If $f$ is universally injective, then $1_{C(M)} \otimes f: C(M) \otimes_{R} M \rightarrow C(M) \otimes_{R} N$ is injective, so both rows in the above diagram are surjective for $P=C(M)$. We may thus lift $1_{C(M)} \in \operatorname{Hom}_{R}(C(M), C(M))$ to some $g \in \operatorname{Hom}_{R}(C(N), C(M))$ splitting $C(f)$. Conversely, if $C(f)$ is a split surjection, then both rows in the above diagram are surjective, so by Lemma 34.4.10, $1_{P} \otimes f$ is injective.

08WV Remark 34.4.13. Let $f: M \rightarrow N$ be a universally injective morphism in $\operatorname{Mod}_{R}$. By choosing a splitting $g$ of $C(f)$, we may construct a functorial splitting of $C\left(1_{P} \otimes f\right)$ for each $P \in \operatorname{Mod}_{R}$. Namely, by (34.4.11.1) this amounts to splitting $\operatorname{Hom}_{R}(P, C(f))$ functorially in $P$, and this is achieved by the map $g \circ \bullet$.

08WW 34.4.14. Descent for modules and their morphisms. Throughout this subsection, fix a ring map $f: R \rightarrow S$. As seen in Section 34.3 we can use the language of cosimplicial algebras to talk about descent data for modules, but in this subsection we prefer a more down to earth terminology.

For $i=1,2,3$, let $S_{i}$ be the $i$-fold tensor product of $S$ over $R$. Define the ring homomorphisms $\delta_{0}^{1}, \delta_{1}^{1}: S_{1} \rightarrow S_{2}, \delta_{01}^{1}, \delta_{02}^{1}, \delta_{12}^{1}: S_{1} \rightarrow S_{3}$, and $\delta_{0}^{2}, \delta_{1}^{2}, \delta_{2}^{2}: S_{2} \rightarrow S_{3}$ by the formulas

$$
\begin{aligned}
\delta_{0}^{1}\left(a_{0}\right) & =1 \otimes a_{0} \\
\delta_{1}^{1}\left(a_{0}\right) & =a_{0} \otimes 1 \\
\delta_{0}^{2}\left(a_{0} \otimes a_{1}\right) & =1 \otimes a_{0} \otimes a_{1} \\
\delta_{1}^{2}\left(a_{0} \otimes a_{1}\right) & =a_{0} \otimes 1 \otimes a_{1} \\
\delta_{2}^{2}\left(a_{0} \otimes a_{1}\right) & =a_{0} \otimes a_{1} \otimes 1 \\
\delta_{01}^{1}\left(a_{0}\right) & =1 \otimes 1 \otimes a_{0} \\
\delta_{02}^{1}\left(a_{0}\right) & =1 \otimes a_{0} \otimes 1 \\
\delta_{12}^{1}\left(a_{0}\right) & =a_{0} \otimes 1 \otimes 1 .
\end{aligned}
$$

In other words, the upper index indicates the source ring, while the lower index indicates where to insert factors of 1 . (This notation is compatible with the notation introduced in Section 34.3.)

Recal ${ }^{3}$ from Definition 34.3.1 that for $M \in \operatorname{Mod}_{S}$, a descent datum on $M$ relative to $f$ is an isomorphism

$$
\theta: M \otimes_{S, \delta_{0}^{1}} S_{2} \longrightarrow M \otimes_{S, \delta_{1}^{1}} S_{2}
$$

of $S_{2}$-modules satisfying the cocycle condition
08WX

$$
\begin{equation*}
\left(\theta \otimes \delta_{2}^{2}\right) \circ\left(\theta \otimes \delta_{2}^{0}\right)=\left(\theta \otimes \delta_{2}^{1}\right): M \otimes_{S, \delta_{01}^{1}} S_{3} \rightarrow M \otimes_{S, \delta_{12}^{1}} S_{3} \tag{34.4.14.1}
\end{equation*}
$$

Let $D D_{S / R}$ be the category of $S$-modules equipped with descent data relative to $f$.
For example, for $M_{0} \in \operatorname{Mod}_{R}$ and a choice of isomorphism $M \cong M_{0} \otimes_{R} S$ gives rise to a descent datum by identifying $M \otimes_{S, \delta_{0}^{1}} S_{2}$ and $M \otimes_{S, \delta_{1}^{1}} S_{2}$ naturally with $M_{0} \otimes_{R} S_{2}$. This construction in particular defines a functor $f^{*}: \operatorname{Mod}_{R} \rightarrow D D_{S / R}$.
08WY Definition 34.4.15. The functor $f^{*}: \operatorname{Mod}_{R} \rightarrow D D_{S / R}$ is called base extension along $f$. We say that $f$ is a descent morphism for modules if $f^{*}$ is fully faithful. We say that $f$ is an effective descent morphism for modules if $f^{*}$ is an equivalence of categories.

Our goal is to show that for $f$ universally injective, we can use $\theta$ to locate $M_{0}$ within $M$. This process makes crucial use of some equalizer diagrams.

08WZ Lemma 34.4.16. For $(M, \theta) \in D D_{S / R}$, the diagram (34.4.16.1)

08X0

$$
M \xrightarrow{\theta \circ\left(1_{M} \otimes \delta_{0}^{1}\right)}>\otimes_{S, \delta_{1}^{1}} S_{2} \frac{\left(\theta \otimes \delta_{2}^{2}\right) \circ\left(1_{M} \otimes \delta_{0}^{2}\right)}{1_{M \otimes S_{2} \otimes \delta_{1}^{2}}} M \otimes_{S, \delta_{12}^{1}} S_{3}
$$

is a split equalizer.
Proof. Define the ring homomorphisms $\sigma_{0}^{0}: S_{2} \rightarrow S_{1}$ and $\sigma_{0}^{1}, \sigma_{1}^{1}: S_{3} \rightarrow S_{2}$ by the formulas

$$
\begin{aligned}
\sigma_{0}^{0}\left(a_{0} \otimes a_{1}\right) & =a_{0} a_{1} \\
\sigma_{0}^{1}\left(a_{0} \otimes a_{1} \otimes a_{2}\right) & =a_{0} a_{1} \otimes a_{2} \\
\sigma_{1}^{1}\left(a_{0} \otimes a_{1} \otimes a_{2}\right) & =a_{0} \otimes a_{1} a_{2}
\end{aligned}
$$

We then take the auxiliary morphisms to be $1_{M} \otimes \sigma_{0}^{0}: M \otimes_{S, \delta_{1}^{1}} S_{2} \rightarrow M$ and $1_{M} \otimes \sigma_{0}^{1}: M \otimes_{S, \delta_{12}^{1}} S_{3} \rightarrow M \otimes_{S, \delta_{1}^{1}} S_{2}$. Of the compatibilities required in 34.4.2.1, the first follows from tensoring the cocycle condition (34.4.14.1 with $\sigma_{1}^{1}$ and the others are immediate.

08X1 Lemma 34.4.17. For $(M, \theta) \in D D_{S / R}$, the diagram (34.4.17.1)
$08 \mathrm{X} 2 \quad C\left(M \otimes_{S, \delta_{12}^{1}} S_{3}\right) \xrightarrow[C\left(1_{M \otimes S_{2}} \otimes \delta_{1}^{2}\right)]{C} C\left(M \otimes_{S, \delta_{1}^{1}} S_{2}\right) \xrightarrow{C\left(\theta \circ\left(1_{M} \otimes \delta_{0}^{2}\right)\right)} \longrightarrow C(M)$.
obtained by applying $C$ to 34.4.16.1) is a split coequalizer.
Proof. Omitted.

[^93]08X3 Lemma 34.4.18. The diagram

08X4

is a split equalizer.
Proof. In Lemma 34.4.16, take $(M, \theta)=f^{*}(S)$.
This suggests a definition of a potential quasi-inverse functor for $f^{*}$.
08X5 Definition 34.4.19. Define the functor $f_{*}: D D_{S / R} \rightarrow \operatorname{Mod}_{R}$ by taking $f_{*}(M, \theta)$ to be the $R$-submodule of $M$ for which the diagram (34.4.19.1)

08X6

$$
f_{*}(M, \theta) \longrightarrow M \underset{1_{M} \otimes \delta_{1}^{1}}{\longrightarrow \quad \theta \circ\left(1_{M} \otimes \delta_{0}^{1}\right)} M \otimes_{S, \delta_{1}^{1}} S_{2}
$$

is an equalizer.
Using Lemma 34.4 .16 and the fact that the restriction functor $\operatorname{Mod}_{S} \rightarrow \operatorname{Mod}_{R}$ is right adjoint to the base extension functor $\bullet \otimes_{R} S: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{S}$, we deduce that $f_{*}$ is right adjoint to $f^{*}$.
We are ready for the key lemma. In the faithfully flat case this is a triviality (see Remark 34.4.21, but in the general case some argument is needed.

08X7 Lemma 34.4.20. If $f$ is universally injective, then the diagram (34.4.20.1)

08X8

$$
f_{*}(M, \theta) \otimes_{R} S \xrightarrow{\theta \circ\left(1_{M} \otimes \delta_{0}^{1}\right)} M \otimes_{S, \delta_{1}^{1}} S_{2} \frac{\left(\theta \otimes \delta_{2}^{2}\right) \circ\left(1_{M} \otimes \delta_{0}^{2}\right)}{1_{M \otimes S_{2} \otimes \delta_{1}^{2}}} M \otimes_{S, \delta_{12}^{1}} S_{3}
$$

obtained by tensoring (34.4.19.1) over $R$ with $S$ is an equalizer.
Proof. By Lemma 34.4.12 and Remark 34.4.13, the map $C\left(1_{N} \otimes f\right): C\left(N \otimes_{R} S\right) \rightarrow$ $C(N)$ can be split functorially in $N$. This gives the upper vertical arrows in the commutative diagram

in which the compositions along the columns are identity morphisms. The second row is the coequalizer diagram (34.4.17.1); this produces the dashed arrow. From the top right square, we obtain auxiliary morphisms $C\left(f_{*}(M, \theta)\right) \rightarrow C(M)$ and $C(M) \rightarrow C\left(M \otimes_{S, \delta_{1}^{1}} S_{2}\right)$ which imply that the first row is a split coequalizer diagram.

By Remark 34.4.11, we may tensor with $S$ inside $C$ to obtain the split coequalizer diagram

$$
C\left(M \otimes_{S, \delta_{2}^{2} \circ \delta_{1}^{1}} S_{3}\right) \xrightarrow[C\left(\left(\theta \otimes \delta_{2}^{2}\right) \circ\left(1_{M} \otimes \delta_{0}^{2}\right)\right)]{C\left(1_{\left.M \otimes S_{2} \otimes \delta_{1}^{2}\right)}^{\longrightarrow}\right.} C\left(M \otimes_{S, \delta_{1}^{1}} S_{2}\right) \xrightarrow{C\left(\theta \circ\left(1_{M} \otimes \delta_{0}^{1}\right)\right)} C\left(f_{*}(M, \theta) \otimes_{R} S\right) .
$$

By Lemma 34.4.10, we conclude 34.4.20.1 must also be an equalizer.
08X9 Remark 34.4.21. If $f$ is a split injection in $\operatorname{Mod}_{R}$, one can simplify the argument by splitting $f$ directly, without using $C$. Things are even simpler if $f$ is faithfully flat; in this case, the conclusion of Lemma 34.4.20 is immediate because tensoring over $R$ with $S$ preserves all equalizers.

08XA Theorem 34.4.22. The following conditions are equivalent.
(a) The morphism $f$ is a descent morphism for modules.
(b) The morphism $f$ is an effective descent morphism for modules.
(c) The morphism $f$ is universally injective.

Proof. It is clear that (b) implies (a). We now check that (a) implies (c). If $f$ is not universally injective, we can find $M \in \operatorname{Mod}_{R}$ such that the map $1_{M} \otimes f$ : $M \rightarrow M \otimes_{R} S$ has nontrivial kernel $N$. The natural projection $M \rightarrow M / N$ is not an isomorphism, but its image in $D D_{S / R}$ is an isomorphism. Hence $f^{*}$ is not fully faithful.

We finally check that (c) implies (b). By Lemma 34.4.20, for $(M, \theta) \in D D_{S / R}$, the natural map $f^{*} f_{*}(M, \theta) \rightarrow M$ is an isomorphism of $S$-modules. On the other hand, for $M_{0} \in \operatorname{Mod}_{R}$, we may tensor 34.4.18.1 with $M_{0}$ over $R$ to obtain an equalizer sequence, so $M_{0} \rightarrow f_{*} f^{*} M$ is an isomorphism. Consequently, $f_{*}$ and $f^{*}$ are quasi-inverse functors, proving the claim.

08XB 34.4.23. Descent for properties of modules. Throughout this subsection, fix a universally injective ring map $f: R \rightarrow S$, an object $M \in \operatorname{Mod}_{R}$, and a ring map $R \rightarrow A$. We now investigate the question of which properties of $M$ or $A$ can be checked after base extension along $f$. We start with some results from Mes02.
08XC Lemma 34.4.24. If $M \in \operatorname{Mod}_{R}$ is flat, then $C(M)$ is an injective $R$-module.
Proof. Let $0 \rightarrow N \rightarrow P \rightarrow Q \rightarrow 0$ be an exact sequence in $\operatorname{Mod}_{R}$. Since $M$ is flat,

$$
0 \rightarrow N \otimes_{R} M \rightarrow P \otimes_{R} M \rightarrow Q \otimes_{R} M \rightarrow 0
$$

is exact. By Lemma 34.4.10,

$$
0 \rightarrow C\left(Q \otimes_{R} M\right) \rightarrow C\left(P \otimes_{R} M\right) \rightarrow C\left(N \otimes_{R} M\right) \rightarrow 0
$$

is exact. By 34.4.11.1, this last sequence can be rewritten as

$$
0 \rightarrow \operatorname{Hom}_{R}(Q, C(M)) \rightarrow \operatorname{Hom}_{R}(P, C(M)) \rightarrow \operatorname{Hom}_{R}(N, C(M)) \rightarrow 0
$$

Hence $C(M)$ is an injective object of $\operatorname{Mod}_{R}$.
08XD Theorem 34.4.25. If $M \otimes_{R} S$ has one of the following properties as an $S$-module
(a) finitely generated;
(b) finitely presented;
(c) flat;
(d) faithfully flat;
(e) finite projective;
then so does $M$ as an $R$-module (and conversely).
Proof. To prove (a), choose a finite set $\left\{n_{i}\right\}$ of generators of $M \otimes_{R} S$ in $\operatorname{Mod}_{S}$. Write each $n_{i}$ as $\sum_{j} m_{i j} \otimes s_{i j}$ with $m_{i j} \in M$ and $s_{i j} \in S$. Let $F$ be the finite free $R$-module with basis $e_{i j}$ and let $F \rightarrow M$ be the $R$-module map sending $e_{i j}$ to $m_{i j}$. Then $F \otimes_{R} S \rightarrow M \otimes_{R} S$ is surjective, so $\operatorname{Coker}(F \rightarrow M) \otimes_{R} S$ is zero and hence $\operatorname{Coker}(F \rightarrow M)$ is zero. This proves (a).
To see (b) assume $M \otimes_{R} S$ is finitely presented. Then $M$ is finitely generated by (a). Choose a surjection $R^{\oplus n} \rightarrow M$ with kernel $K$. Then $K \otimes_{R} S \rightarrow S^{\oplus r} \rightarrow M \otimes_{R} S \rightarrow 0$ is exact. By Algebra, Lemma 10.5 .3 the kernel of $S^{\oplus r} \rightarrow M \otimes_{R} S$ is a finite $S$ module. Thus we can find finitely many elements $k_{1}, \ldots, k_{t} \in K$ such that the images of $k_{i} \otimes 1$ in $S^{\oplus r}$ generate the kernel of $S^{\oplus r} \rightarrow M \otimes_{R} S$. Let $K^{\prime} \subset K$ be the submodule generated by $k_{1}, \ldots, k_{t}$. Then $M^{\prime}=R^{\oplus r} / K^{\prime}$ is a finitely presented $R$ module with a morphism $M^{\prime} \rightarrow M$ such that $M^{\prime} \otimes_{R} S \rightarrow M \otimes_{R} S$ is an isomorphism. Thus $M^{\prime} \cong M$ as desired.
To prove (c), let $0 \rightarrow M^{\prime} \rightarrow M^{\prime \prime} \rightarrow M \rightarrow 0$ be a short exact sequence in $\operatorname{Mod}_{R}$. Since $\bullet \otimes_{R} S$ is a right exact functor, $M^{\prime \prime} \otimes_{R} S \rightarrow M \otimes_{R} S$ is surjective. So by Lemma 34.4 .10 the map $C\left(M \otimes_{R} S\right) \rightarrow C\left(M^{\prime \prime} \otimes_{R} S\right)$ is injective. If $M \otimes_{R} S$ is flat, then Lemma 34.4 .24 shows $C\left(M \otimes_{R} S\right)$ is an injective object of $\operatorname{Mod}_{S}$, so the injection $C\left(M \otimes_{R} S\right) \rightarrow C\left(M^{\prime \prime} \otimes_{R} S\right)$ is split in $\operatorname{Mod}_{S}$ and hence also in $\operatorname{Mod}_{R}$. Since $C\left(M \otimes_{R} S\right) \rightarrow C(M)$ is a split surjection by Lemma 34.4.12, it follows that $C(M) \rightarrow C\left(M^{\prime \prime}\right)$ is a split injection in $\operatorname{Mod}_{R}$. That is, the sequence

$$
0 \rightarrow C(M) \rightarrow C\left(M^{\prime \prime}\right) \rightarrow C\left(M^{\prime}\right) \rightarrow 0
$$

is split exact. For $N \in \operatorname{Mod}_{R}$, by 34.4.11.1 we see that

$$
0 \rightarrow C\left(M \otimes_{R} N\right) \rightarrow C\left(M^{\prime \prime} \otimes_{R} N\right) \rightarrow C\left(M^{\prime} \otimes_{R} N\right) \rightarrow 0
$$

is split exact. By Lemma 34.4.10.

$$
0 \rightarrow M^{\prime} \otimes_{R} N \rightarrow M^{\prime \prime} \otimes_{R} N \rightarrow M \otimes_{R} N \rightarrow 0
$$

is exact. This implies $M$ is flat over $R$. Namely, taking $M^{\prime}$ a free module surjecting onto $M$ we conclude that $\operatorname{Tor}_{1}^{R}(M, N)=0$ for all modules $N$ and we can use Algebra, Lemma 10.74.8. This proves (c).
To deduce (d) from (c), note that if $N \in \operatorname{Mod}_{R}$ and $M \otimes_{R} N$ is zero, then $M \otimes_{R}$ $S \otimes_{S}\left(N \otimes_{R} S\right) \cong\left(M \otimes_{R} N\right) \otimes_{R} S$ is zero, so $N \otimes_{R} S$ is zero and hence $N$ is zero.
To deduce (e) at this point, it suffices to recall that $M$ is finitely generated and projective if and only if it is finitely presented and flat. See Algebra, Lemma 10.77 .2 .

There is a variant for $R$-algebras.
08XE Theorem 34.4.26. If $A \otimes_{R} S$ has one of the following properties as an $S$-algebra
(a) of finite type;
(b) of finite presentation;
(c) formally unramified;
(d) unramified;
(e) étale;
then so does $A$ as an $R$-algebra (and of course conversely).

Proof. To prove (a), choose a finite set $\left\{x_{i}\right\}$ of generators of $A \otimes_{R} S$ over $S$. Write each $x_{i}$ as $\sum_{j} y_{i j} \otimes s_{i j}$ with $y_{i j} \in A$ and $s_{i j} \in S$. Let $F$ be the polynomial $R$ algebra on variables $e_{i j}$ and let $F \rightarrow M$ be the $R$-algebra map sending $e_{i j}$ to $y_{i j}$. Then $F \otimes_{R} S \rightarrow A \otimes_{R} S$ is surjective, so $\operatorname{Coker}(F \rightarrow A) \otimes_{R} S$ is zero and hence $\operatorname{Coker}(F \rightarrow A)$ is zero. This proves (a).
To see (b) assume $A \otimes_{R} S$ is a finitely presented $S$-algebra. Then $A$ is finite type over $R$ by (a). Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ with kernel $I$. Then $I \otimes_{R} S \rightarrow S\left[x_{1}, \ldots, x_{n}\right] \rightarrow A \otimes_{R} S \rightarrow 0$ is exact. By Algebra, Lemma 10.6.3 the kernel of $S\left[x_{1}, \ldots, x_{n}\right] \rightarrow A \otimes_{R} S$ is a finitely generated ideal. Thus we can find finitely many elements $y_{1}, \ldots, y_{t} \in I$ such that the images of $y_{i} \otimes 1$ in $S\left[x_{1}, \ldots, x_{n}\right]$ generate the kernel of $S\left[x_{1}, \ldots, x_{n}\right] \rightarrow A \otimes_{R} S$. Let $I^{\prime} \subset I$ be the ideal generated by $y_{1}, \ldots, y_{t}$. Then $A^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] / I^{\prime}$ is a finitely presented $R$-algebra with a morphism $A^{\prime} \rightarrow A$ such that $A^{\prime} \otimes_{R} S \rightarrow A \otimes_{R} S$ is an isomorphism. Thus $A^{\prime} \cong A$ as desired.

To prove (c), recall that $A$ is formally unramified over $R$ if and only if the module of relative differentials $\Omega_{A / R}$ vanishes, see Algebra, Lemma 10.144.2 or GD67, Proposition 17.2.1]. Since $\Omega_{\left(A \otimes_{R} S\right) / S}=\Omega_{A / R} \otimes_{R} S$, the vanishing descends by Theorem 34.4.22,

To deduce (d) from the previous cases, recall that $A$ is unramified over $R$ if and only if $A$ is formally unramified and of finite type over $R$, see Algebra, Lemma 10.147.2.

To prove (e), recall that by Algebra, Lemma 10.141 .8 or GD67, Théorème 17.6.1] the algebra $A$ is étale over $R$ if and only if $A$ is flat, unramified, and of finite presentation over $R$.

08XF Remark 34.4.27. It would make things easier to have a faithfully flat ring homomorphism $g: R \rightarrow T$ for which $T \rightarrow S \otimes_{R} T$ has some extra structure. For instance, if one could ensure that $T \rightarrow S \otimes_{R} T$ is split in Rings, then it would follow that every property of a module or algebra which is stable under base extension and which descends along faithfully flat morphisms also descends along universally injective morphisms. An obvious guess would be to find $g$ for which $T$ is not only faithfully flat but also injective in $\operatorname{Mod}_{R}$, but even for $R=\mathbf{Z}$ no such homomorphism can exist.

### 34.5. Fpqc descent of quasi-coherent sheaves

023 R The main application of flat descent for modules is the corresponding descent statement for quasi-coherent sheaves with respect to fpqc-coverings.
$023 S$ Lemma 34.5.1. Let $S$ be an affine scheme. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow S\right\}_{i=1, \ldots, n}$ be a standard fpqc covering of $S$, see Topologies, Definition 33.8.1. Any descent datum on quasi-coherent sheaves for $\mathcal{U}=\left\{U_{i} \rightarrow S\right\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_{S}$-modules to the category of descent data with respect to $\mathcal{U}$ is fully faithful.

Proof. This is a restatement of Proposition 34.3 .9 in terms of schemes. First, note that a descent datum $\xi$ for quasi-coherent sheaves with respect to $\mathcal{U}$ is exactly the same as a descent datum $\xi^{\prime}$ for quasi-coherent sheaves with respect to the covering $\mathcal{U}^{\prime}=\left\{\coprod_{i=1, \ldots, n} U_{i} \rightarrow S\right\}$. Moreover, effectivity for $\xi$ is the same as effectivity for
$\xi^{\prime}$. Hence we may assume $n=1$, i.e., $\mathcal{U}=\{U \rightarrow S\}$ where $U$ and $S$ are affine. In this case descent data correspond to descent data on modules with respect to the ring map

$$
\Gamma(S, \mathcal{O}) \longrightarrow \Gamma(U, \mathcal{O})
$$

Since $U \rightarrow S$ is surjective and flat, we see that this ring map is faithfully flat. In other words, Proposition 34.3 .9 applies and we win.

023T Proposition 34.5.2. Let $S$ be a scheme. Let $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow S\right\}$ be an fpqc covering, see Topologies, Definition 33.8.1. Any descent datum on quasi-coherent sheaves for $\mathcal{U}=\left\{U_{i} \rightarrow S\right\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_{S}$-modules to the category of descent data with respect to $\mathcal{U}$ is fully faithful.

Proof. Let $S=\bigcup_{j \in J} V_{j}$ be an affine open covering. For $j, j^{\prime} \in J$ we denote $V_{j j^{\prime}}=V_{j} \cap V_{j^{\prime}}$ the intersection (which need not be affine). For $V \subset S$ open we denote $\mathcal{U}_{V}=\left\{V \times_{S} U_{i} \rightarrow V\right\}_{i \in I}$ which is a fpqc-covering (Topologies, Lemma 33.8.7). By definition of an fpqc covering, we can find for each $j \in J$ a finite set $K_{j}$, a map $\underline{i}: K_{j} \rightarrow I$, affine opens $U_{\underline{i}(k), k} \subset U_{\underline{i}(k)}, k \in K_{j}$ such that $\mathcal{V}_{j}=\left\{U_{\underline{i}(k), k} \rightarrow V_{j}\right\}_{k \in K_{j}}$ is a standard fpqc covering of $V_{j}$. And of course, $\mathcal{V}_{j}$ is a refinement of $\mathcal{U}_{V_{j}}$. Picture

where the top horizontal arrows are morphisms of families of morphisms with fixed target (see Sites, Definition 7.8.1).
To prove the proposition you show successively the faithfulness, fullyness, and essential surjectivity of the functor from quasi-coherent sheaves to descent data.

Faithfulness. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent sheaves on $S$ and let $a, b: \mathcal{F} \rightarrow \mathcal{G}$ be homomorphisms of $\mathcal{O}_{S}$-modules. Suppose $\varphi_{i}^{*}(a)=\varphi^{*}(b)$ for all $i$. Pick $s \in S$. Then $s=\varphi_{i}(u)$ for some $i \in I$ and $u \in U_{i}$. Since $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{U_{i}, u}$ is flat, hence faithfully flat (Algebra, Lemma 10.38.17) we see that $a_{s}=b_{s}: \mathcal{F}_{s} \rightarrow \mathcal{G}_{s}$. Hence $a=b$.
Fully faithfulness. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent sheaves on $S$ and let $a_{i}: \varphi_{i}^{*} \mathcal{F} \rightarrow \varphi_{i}^{*} \mathcal{G}$ be homomorphisms of $\mathcal{O}_{U_{i}}$-modules such that $\operatorname{pr}_{0}^{*} a_{i}=\operatorname{pr}_{1}^{*} a_{j}$ on $U_{i} \times_{U} U_{j}$. We can pull back these morphisms to get morphisms

$$
a_{k}:\left.\left.\mathcal{F}\right|_{U_{\underline{i}(k), k}} \longrightarrow \mathcal{G}\right|_{U_{\underline{i}(k), k}}
$$

$k \in K_{j}$ with notation as above. Moreover, Lemma 34.2 .2 assures us that these define a morphism between (canonical) descent data on $\mathcal{V}_{j}$. Hence, by Lemma 34.5.1 we get correspondingly unique morphisms $a_{j}:\left.\left.\mathcal{F}\right|_{V_{j}} \rightarrow \mathcal{G}\right|_{V_{j}}$. To see that $\left.a_{j}\right|_{V_{j j^{\prime}}}=$ $\left.a_{j^{\prime}}\right|_{V_{j j^{\prime}}}$ we use that both $a_{j}$ and $a_{j^{\prime}}$ agree with the pullback of the morphism $\left(a_{i}\right)_{i \in I}$ of (canonical) descent data to any covering refining both $\mathcal{V}_{j, V_{j j^{\prime}}}$ and $\mathcal{V}_{j^{\prime}, V_{j j^{\prime}}}$, and using the faithfulness already shown. For example the covering $\mathcal{V}_{j j^{\prime}}=\left\{V_{k} \times{ }_{S} V_{k^{\prime}} \rightarrow\right.$ $\left.V_{j j^{\prime}}\right\}_{k \in K_{j}, k^{\prime} \in K_{j^{\prime}}}$ will do.
Essential surjectivity. Let $\xi=\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ be a descent datum for quasi-coherent sheaves relative to the covering $\mathcal{U}$. Pull back this descent datum to get descent
data $\xi_{j}$ for quasi-coherent sheaves relative to the coverings $\mathcal{V}_{j}$ of $V_{j}$. By Lemma 34.5.1 once again there exist quasi-coherent sheaves $\mathcal{F}_{j}$ on $V_{j}$ whose associated canonical descent datum is isomorphic to $\xi_{j}$. By fully faithfulness (proved above) we see there are isomorphisms

$$
\phi_{j j^{\prime}}:\left.\left.\mathcal{F}_{j}\right|_{V_{j j^{\prime}}} \longrightarrow \mathcal{F}_{j^{\prime}}\right|_{V_{j j^{\prime}}}
$$

corresponding to the isomorphism of descent data between the pullback of $\xi_{j}$ and $\xi_{j^{\prime}}$ to $\mathcal{V}_{j j^{\prime}}$. To see that these maps $\phi_{j j^{\prime}}$ satisfy the cocycle condition we use faithfulness (proved above) over the triple intersections $V_{j j^{\prime} j^{\prime \prime}}$. Hence, by Lemma 34.2.4 we see that the sheaves $\mathcal{F}_{j}$ glue to a quasi-coherent sheaf $\mathcal{F}$ as desired. We still have to verify that the canonical descent datum relative to $\mathcal{U}$ associated to $\mathcal{F}$ is isomorphic to the descent datum we started out with. This verification is omitted.

### 34.6. Descent of finiteness properties of modules

05 AY In this section we prove that one can check quasi-coherent module has a certain finiteness conditions by checking on the members of a covering.

05AZ Lemma 34.6.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a finite type $\mathcal{O}_{X_{i}}-$ module. Then $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module.

Proof. Omitted. For the affine case, see Algebra, Lemma 10.82.2.
09UB Lemma 34.6.2. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of locally ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{Y}$-modules. If
(1) $f$ is open as a map of topological spaces,
(2) $f$ is surjective and flat, and
(3) $f^{*} \mathcal{F}$ is of finite type,
then $\mathcal{F}$ is of finite type.
Proof. Let $y \in Y$ be a point. Choose a point $x \in X$ mapping to $y$. Choose an open $x \in U \subset X$ and elements $s_{1}, \ldots, s_{n}$ of $f^{*} \mathcal{F}(U)$ which generate $f^{*} \mathcal{F}$ over $U$. Since $f^{*} \mathcal{F}=f^{-1} \mathcal{F} \otimes_{f^{-1}} \mathcal{O}_{Y} \mathcal{O}_{X}$ we can after shrinking $U$ assume $s_{i}=\sum t_{i j} \otimes a_{i j}$ with $t_{i j} \in f^{-1} \mathcal{F}(U)$ and $a_{i j} \in \mathcal{O}_{X}(U)$. After shrinking $U$ further we may assume that $t_{i j}$ comes from a section $s_{i j} \in \mathcal{F}(V)$ for some $V \subset Y$ open with $f(U) \subset V$. Let $N$ be the number of sections $s_{i j}$ and consider the map

$$
\sigma=\left(s_{i j}\right):\left.\mathcal{O}_{V}^{\oplus} N \rightarrow \mathcal{F}\right|_{V}
$$

By our choice of the sections we see that $\left.f^{*} \sigma\right|_{U}$ is surjective. Hence for every $u \in U$ the map

$$
\sigma_{f(u)} \otimes_{\mathcal{O}_{Y, f(u)}} \mathcal{O}_{X, u}: \mathcal{O}_{X, u}^{\oplus} \longrightarrow \mathcal{F}_{f(u)} \otimes_{\mathcal{O}_{Y, f(u)}} \mathcal{O}_{X, u}
$$

is surjective. As $f$ is flat, the local ring map $\mathcal{O}_{Y, f(u)} \rightarrow \mathcal{O}_{X, u}$ is flat, hence faithfully flat (Algebra, Lemma 10.38.17). Hence $\sigma_{f(u)}$ is surjective. Since $f$ is open, $f(U)$ is an open neighbourhood of $y$ and the proof is done.

05B0 Lemma 34.6.3. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is an $\mathcal{O}_{X_{i}}$-module of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation.

Proof. Omitted. For the affine case, see Algebra, Lemma 10.82.2.

082U Lemma 34.6.4. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is locally generated by $r$ sections as an $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is locally generated by $r$ sections as an $\mathcal{O}_{X}$-module.

Proof. By Lemma 34.6.1 we see that $\mathcal{F}$ is of finite type. Hence Nakayama's lemma (Algebra, Lemma 10.19.1) implies that $\mathcal{F}$ is generated by $r$ sections in the neighbourhood of a point $x \in X$ if and only if $\operatorname{dim}_{\kappa(x)} \mathcal{F}_{x} \otimes \kappa(x) \leq r$. Choose an $i$ and a point $x_{i} \in X_{i}$ mapping to $x$. Then $\operatorname{dim}_{\kappa(x)} \mathcal{F}_{x} \otimes \kappa(x)=\operatorname{dim}_{\kappa\left(x_{i}\right)}\left(f_{i}^{*} \mathcal{F}\right)_{x_{i}} \otimes \kappa\left(x_{i}\right)$ which is $\leq r$ as $f_{i}^{*} \mathcal{F}$ is locally generated by $r$ sections.

05B1 Lemma 34.6.5. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a flat $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a flat $\mathcal{O}_{X}$-module.

Proof. Omitted. For the affine case, see Algebra, Lemma 10.82.2.
05B2 Lemma 34.6.6. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a finite locally free $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a finite locally free $\mathcal{O}_{X}$-module.
Proof. This follows from the fact that a quasi-coherent sheaf is finite locally free if and only if it is of finite presentation and flat, see Algebra, Lemma 10.77.2, Namely, if each $f_{i}^{*} \mathcal{F}$ is flat and of finite presentation, then so is $\mathcal{F}$ by Lemmas 34.6.5 and 34.6.3.

The definition of a locally projective quasi-coherent sheaf can be found in Properties, Section 27.21 .

05JZ Lemma 34.6.7. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fpqc covering such that each $f_{i}^{*} \mathcal{F}$ is a locally projective $\mathcal{O}_{X_{i}}$-module. Then $\mathcal{F}$ is a locally projective $\mathcal{O}_{X}$-module.

Proof. Omitted. For Zariski coverings this is Properties, Lemma 27.21.2, For the affine case this is Algebra, Theorem 10.94.5.

05 VF Remark 34.6.8. Being locally free is a property of quasi-coherent modules which does not descend in the fpqc topology. Namely, suppose that $R$ is a ring and that $M$ is a projective $R$-module which is a countable direct sum $M=\bigoplus L_{n}$ of rank 1 locally free modules, but not locally free, see Examples, Lemma 88.26.5. Then $M$ becomes free on making the faithfully flat base change

$$
R \longrightarrow \bigoplus_{m \geq 1} \bigoplus_{\left(i_{1}, \ldots, i_{m}\right) \in \mathbf{Z} \oplus m} L_{1}^{\otimes i_{1}} \otimes_{R} \ldots \otimes_{R} L_{m}^{\otimes i_{m}}
$$

But we don't know what happens for fppf coverings. In other words, we don't know the answer to the following question: Suppose $A \rightarrow B$ is a faithfully flat ring map of finite presentation. Let $M$ be an $A$-module such that $M \otimes_{A} B$ is free. Is $M$ a locally free $A$-module? It turns out that if $A$ is Noetherian, then the answer is yes. This follows from the results of Bas63. But in general we don't know the answer. If you know the answer, or have a reference, please email stacks.project@gmail.com.

We also add here two results which are related to the results above, but are of a slightly different nature.

05B3 Lemma 34.6.9. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Assume $f$ is a finite morphism. Then $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite type if and only if $f_{*} \mathcal{F}$ is an $\mathcal{O}_{Y}$-module of finite type.

Proof. As $f$ is finite it is affine. This reduces us to the case where $f$ is the morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ given by a finite ring map $A \rightarrow B$. Moreover, then $\mathcal{F}=\widetilde{M}$ is the sheaf of modules associated to the $B$-module $M$. Note that $M$ is finite as a $B$-module if and only if $M$ is finite as an $A$-module, see Algebra, Lemma 10.7.2, Combined with Properties, Lemma 27.16.1 this proves the lemma.

05B4 Lemma 34.6.10. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Assume $f$ is finite and of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation if and only if $f_{*} \mathcal{F}$ is an $\mathcal{O}_{Y}$-module of finite presentation.

Proof. As $f$ is finite it is affine. This reduces us to the case where $f$ is the morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ given by a finite and finitely presented ring map $A \rightarrow B$. Moreover, then $\mathcal{F}=\widetilde{M}$ is the sheaf of modules associated to the $B$ module $M$. Note that $M$ is finitely presented as a $B$-module if and only if $M$ is finitely presented as an $A$-module, see Algebra, Lemma 10.35.21. Combined with Properties, Lemma 27.16 .2 this proves the lemma.

### 34.7. Quasi-coherent sheaves and topologies

03 DR Let $S$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{S}$-module. Consider the functor

$$
\begin{equation*}
(S c h / S)^{o p p} \longrightarrow A b, \quad(f: T \rightarrow S) \longmapsto \Gamma\left(T, f^{*} \mathcal{F}\right) \tag{34.7.0.1}
\end{equation*}
$$

03DT Lemma 34.7.1. Let $S$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{S}$-module. Let $\tau \in$ \{Zariski, fpqc, fppf, étale, smooth, syntomic\}. The functor defined in 34.7.0.1) satisfies the sheaf condition with respect to any $\tau$-covering $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ of any scheme $T$ over $S$.

Proof. For $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$ a $\tau$-covering is also a fpqc-covering, see the results in Topologies, Lemmas 33.4.2, 33.5.2, 33.6.2, 33.7.2, and 33.8.6. Hence it suffices to prove the theorem for a fpqc covering. Assume that $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ is an fpqc covering where $f: T \rightarrow S$ is given. Suppose that we have a family of sections $s_{i} \in \Gamma\left(T_{i}, f_{i}^{*} f^{*} \mathcal{F}\right)$ such that $\left.s_{i}\right|_{T_{i} \times_{T} T_{j}}=\left.s_{j}\right|_{T_{i} \times_{T} T_{j}}$. We have to find the correspond section $s \in \Gamma\left(T, f^{*} \mathcal{F}\right)$. We can reinterpret the $s_{i}$ as a family of maps $\varphi_{i}: f_{i}^{*} \mathcal{O}_{T}=\mathcal{O}_{T_{i}} \rightarrow f_{i}^{*} f^{*} \mathcal{F}$ compatible with the canonical descent data associated to the quasi-coherent sheaves $\mathcal{O}_{T}$ and $f^{*} \mathcal{F}$ on $T$. Hence by Proposition 34.5 .2 we see that we may (uniquely) descend these to a map $\mathcal{O}_{T} \rightarrow f^{*} \mathcal{F}$ which gives us our section $s$.

We may in particular make the following definition.
03DU Definition 34.7.2. Let $\tau \in\{$ Zariski, $f p p f$, étale, smooth, syntomic $\}$. Let $S$ be a scheme. Let $S c h_{\tau}$ be a big site containing $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{S}$-module.
(1) The structure sheaf of the big site $(S c h / S)_{\tau}$ is the sheaf of rings $T / S \mapsto$ $\Gamma\left(T, \mathcal{O}_{T}\right)$ which is denoted $\mathcal{O}$ or $\mathcal{O}_{S}$.
(2) If $\tau=$ étale the structure sheaf of the small site $S_{\text {étale }}$ is the sheaf of rings $T / S \mapsto \Gamma\left(T, \mathcal{O}_{T}\right)$ which is denoted $\mathcal{O}$ or $\mathcal{O}_{S}$.
(3) The sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$ on the big site $(S c h / S)_{\tau}$ is the sheaf of $\mathcal{O}$-modules $(f: T \rightarrow S) \mapsto \Gamma\left(T, f^{*} \mathcal{F}\right)$ which is denoted $\mathcal{F}^{a}$ (and often simply $\mathcal{F}$ ).
(4) Let $\tau=$ étale (resp. $\tau=$ Zariski). The sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$ on the small site $S_{\text {étale }}$ (resp. $S_{Z a r}$ ) is the sheaf of $\mathcal{O}$-modules $(f: T \rightarrow$ $S) \mapsto \Gamma\left(T, f^{*} \mathcal{F}\right)$ which is denoted $\mathcal{F}^{a}$ (and often simply $\mathcal{F}$ ).

Note how we use the same notation $\mathcal{F}^{a}$ in each case. No confusion can really arise from this as by definition the rule that defines the sheaf $\mathcal{F}^{a}$ is independent of the site we choose to look at.

03FG Remark 34.7.3. In Topologies, Lemma 33.3.11 we have seen that the small Zariski site of a scheme $S$ is equivalent to $S$ as a topological space in the sense that the category of sheaves are naturally equivalent. Now that $S_{Z a r}$ is also endowed with a structure sheaf $\mathcal{O}$ we see that sheaves of modules on the ringed site $\left(S_{Z a r}, \mathcal{O}\right)$ agree with sheaves of modules on the ringed space $\left(S, \mathcal{O}_{S}\right)$.
070R Remark 34.7.4. Let $f: T \rightarrow S$ be a morphism of schemes. Each of the morphisms of sites $f_{\text {sites }}$ listed in Topologies, Section 33.9 becomes a morphism of ringed sites. Namely, each of these morphisms of sites $f_{\text {sites }}:(S c h / T)_{\tau} \rightarrow(S c h / S)_{\tau^{\prime}}$, or $f_{\text {sites }}:(S c h / S)_{\tau} \rightarrow S_{\tau^{\prime}}$ is given by the continuous functor $S^{\prime} / S \mapsto T \times{ }_{S} S^{\prime} / S$. Hence, given $S^{\prime} / S$ we let

$$
f_{\text {sites }}^{\sharp}: \mathcal{O}\left(S^{\prime} / S\right) \longrightarrow f_{\text {sites }, *} \mathcal{O}\left(S^{\prime} / S\right)=\mathcal{O}\left(S \times_{S} S^{\prime} / T\right)
$$

be the usual map $\operatorname{pr}_{S^{\prime}}^{\sharp}: \mathcal{O}\left(S^{\prime}\right) \rightarrow \mathcal{O}\left(T \times{ }_{S} S^{\prime}\right)$. Similarly, the morphism $i_{f}$ : $S h\left(T_{\tau}\right) \rightarrow \operatorname{Sh}\left((S c h / S)_{\tau}\right)$ for $\tau \in\{Z$ ar, étale $\}$, see Topologies, Lemmas 33.3 .12 and 33.4.12 becomes a morphism of ringed topoi because $i_{f}^{-1} \mathcal{O}=\mathcal{O}$. Here are some special cases:
(1) The morphism of big sites $f_{b i g}:(S c h / X)_{f p p f} \rightarrow(S c h / Y)_{f p p f}$, becomes a morphism of ringed sites

$$
\left(f_{b i g}, f_{b i g}^{\sharp}\right):\left((S c h / X)_{f p p f}, \mathcal{O}_{X}\right) \longrightarrow\left((S c h / Y)_{f p p f}, \mathcal{O}_{Y}\right)
$$

as in Modules on Sites, Definition 18.6.1. Similarly for the big syntomic, smooth, étale and Zariski sites.
(2) The morphism of small sites $f_{\text {small }}: X_{\text {étale }} \rightarrow Y_{\text {étale }}$ becomes a morphism of ringed sites

$$
\left(f_{\text {small }}, f_{\text {small }}^{\sharp}\right):\left(X_{\text {étale }}, \mathcal{O}_{X}\right) \longrightarrow\left(Y_{\text {étale }}, \mathcal{O}_{Y}\right)
$$

as in Modules on Sites, Definition 18.6.1. Similarly for the small Zariski site.

Let $S$ be a scheme. It is clear that given an $\mathcal{O}$-module on (say) $(S c h / S)_{Z a r}$ the pullback to (say) $(S c h / S)_{f p p f}$ is just the fppf-sheafification. To see what happens when comparing big and small sites we have the following.
070S Lemma 34.7.5. Let $S$ be a scheme. Denote

$$
\begin{array}{cccc}
i d_{\tau, Z a r} & : & (S c h / S)_{\tau} \rightarrow S_{Z a r}, & \tau \in\{\text { Zar, étale, smooth, syntomic, fppf }\} \\
\text { id } d_{\tau, \text { étale }} & : & (S c h / S)_{\tau} \rightarrow S_{\text {étale }}, & \tau \in\{\text { étale, smooth,syntomic, fppf }\} \\
i d_{\text {small }, \text { étale }, Z a r} & : & S_{\text {étale }} \rightarrow S_{Z a r}, &
\end{array}
$$

the morphisms of ringed sites of Remark 34.7.4. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{S}$-modules which we view a sheaf of $\mathcal{O}$-modules on $S_{Z a r}$. Then
(1) $\left(i d_{\tau, Z a r}\right)^{*} \mathcal{F}$ is the $\tau$-sheafification of the Zariski sheaf

$$
(f: T \rightarrow S) \longmapsto \Gamma\left(T, f^{*} \mathcal{F}\right)
$$

on $(S c h / S)_{\tau}$, and
(2) $\left(i d_{\text {small,étale,Zar }}\right)^{*} \mathcal{F}$ is the étale sheafification of the Zariski sheaf

$$
(f: T \rightarrow S) \longmapsto \Gamma\left(T, f^{*} \mathcal{F}\right)
$$

on $S_{\text {étale }}$.
Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules on $S_{\text {étale }}$. Then
(3) $\left(i d_{\tau, \text { étale }}\right)^{*} \mathcal{G}$ is the $\tau$-sheafification of the étale sheaf

$$
(f: T \rightarrow S) \longmapsto \Gamma\left(T, f_{\text {small }}^{*} \mathcal{G}\right)
$$

where $f_{\text {small }}: T_{\text {étale }} \rightarrow S_{\text {étale }}$ is the morphism of ringed small étale sites of Remark 34.7.4.
Proof. Proof of (1). We first note that the result is true when $\tau=Z a r$ because in that case we have the morphism of topoi $\left.i_{f}: S h\left(T_{Z a r}\right) \rightarrow S h(S c h / S)_{Z a r}\right)$ such that $\mathrm{id}_{\tau, \text { Zar }} \circ i_{f}=f_{\text {small }}$ as morphisms $T_{Z a r} \rightarrow S_{Z a r}$, see Topologies, Lemmas 33.3 .12 and 33.3.16. Since pullback is transitive (see Modules on Sites, Lemma 18.13.3 we see that $i_{f}^{*}\left(\mathrm{id}_{\tau, Z a r}\right)^{*} \mathcal{F}=f_{\text {small }}^{*} \mathcal{F}$ as desired. Hence, by the remark preceding this lemma we see that $\left(\mathrm{id}_{\tau, Z a r}\right)^{*} \mathcal{F}$ is the $\tau$-sheafification of the presheaf $T \mapsto \Gamma\left(T, f^{*} \mathcal{F}\right)$.
The proof of (3) is exactly the same as the proof of (1), except that it uses Topologies, Lemmas 33.4 .12 and 33.4 .16 . We omit the proof of (2).
03FH Remark 34.7.6. Remark 34.7.4 and Lemma 34.7 .5 have the following applications:
(1) Let $S$ be a scheme. The construction $\mathcal{F} \mapsto \mathcal{F}^{a}$ is the pullback under the morphism of ringed sites $\mathrm{id}_{\tau, Z a r}:\left((S c h / S)_{\tau}, \mathcal{O}\right) \rightarrow\left(S_{Z a r}, \mathcal{O}\right)$ or the morphism id small,étale $, Z a r:\left(S_{\text {étale }}, \mathcal{O}\right) \rightarrow\left(S_{Z a r}, \mathcal{O}\right)$.
(2) Let $f: X \rightarrow Y$ be a morphism of schemes. For any of the morphisms $f_{\text {sites }}$ of ringed sites of Remark 34.7.4 we have

$$
\left(f^{*} \mathcal{F}\right)^{a}=f_{\text {sites }}^{*} \mathcal{F}^{a}
$$

This follows from (1) and the fact that pullbacks are compatible with compositions of morphisms of ringed sites, see Modules on Sites, Lemma 18.13 .3

03DV Lemma 34.7.7. Let $S$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{S}$-module. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$.
(1) The sheaf $\mathcal{F}^{a}$ is a quasi-coherent $\mathcal{O}$-module on $(S c h / S)_{\tau}$, as defined in Modules on Sites, Definition 18.23.1.
(2) If $\tau=$ étale (resp. $\tau=$ Zariski), then the sheaf $\mathcal{F}^{a}$ is a quasi-coherent $\mathcal{O}$-module on $S_{\text {étale }}\left(r e s p . S_{Z a r}\right)$ as defined in Modules on Sites, Definition 18.23.1.

Proof. Let $\left\{S_{i} \rightarrow S\right\}$ be a Zariski covering such that we have exact sequences

$$
\bigoplus_{k \in K_{i}} \mathcal{O}_{S_{i}} \longrightarrow \bigoplus_{j \in J_{i}} \mathcal{O}_{S_{i}} \longrightarrow \mathcal{F} \longrightarrow 0
$$

for some index sets $K_{i}$ and $J_{i}$. This is possible by the definition of a quasi-coherent sheaf on a ringed space (See Modules, Definition 17.10.1).

Proof of (1). Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$. It is clear that $\left.\mathcal{F}^{a}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ also sits in an exact sequence

$$
\left.\left.\left.\bigoplus_{k \in K_{i}} \mathcal{O}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow \bigoplus_{j \in J_{i}} \mathcal{O}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow \mathcal{F}^{a}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow 0
$$

Hence $\mathcal{F}^{a}$ is quasi-coherent by Modules on Sites, Lemma 18.23.3.
Proof of (2). Let $\tau=$ étale. It is clear that $\left.\mathcal{F}^{a}\right|_{\left(S_{i}\right)_{\text {étale }}}$ also sits in an exact sequence

$$
\left.\left.\left.\bigoplus_{k \in K_{i}} \mathcal{O}\right|_{\left(S_{i}\right)_{\text {étale }}} \longrightarrow \bigoplus_{j \in J_{i}} \mathcal{O}\right|_{\left(S_{i}\right)_{\text {étale }}} \longrightarrow \mathcal{F}^{a}\right|_{\left(S_{i}\right)_{\text {étale }}} \longrightarrow 0
$$

Hence $\mathcal{F}^{a}$ is quasi-coherent by Modules on Sites, Lemma 18.23.3. The case $\tau=$ Zariski is similar (actually, it is really tautological since the corresponding ringed topoi agree).

03FI Lemma 34.7.8. Let $S$ be a scheme. Let
(a) $\tau \in\{$ Zariski,fppf, étale, smooth, syntomic $\}$ and $\mathcal{C}=(S c h / S)_{\tau}$, or
(b) let $\tau=$ étale and $\mathcal{C}=S_{\text {étale }}$, or
(c) let $\tau=$ Zariski and $\mathcal{C}=S_{\text {Zar }}$.

Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$. Let $U \in \operatorname{Ob}(\mathcal{C})$ be affine. Let $\left\{U_{i} \rightarrow U\right\}_{i=1, \ldots, n}$ be a standard affine $\tau$-covering in $\mathcal{C}$. Then
(1) $\mathcal{V}=\left\{\coprod_{i=1, \ldots, n} U_{i} \rightarrow U\right\}$ is a $\tau$-covering of $U$,
(2) $\mathcal{U}$ is a refinement of $\mathcal{V}$, and
(3) the induced map on Cech complexes (Cohomology on Sites, Equation (21.9.2.1))

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{V}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

is an isomorphism of complexes.
Proof. This follows because
$\left(\coprod_{i_{0}=1, \ldots, n} U_{i_{0}}\right) \times_{U} \ldots \times_{U}\left(\coprod_{i_{p}=1, \ldots, n} U_{i_{p}}\right)=\coprod_{i_{0}, \ldots, i_{p} \in\{1, \ldots, n\}} U_{i_{0}} \times_{U} \ldots \times_{U} U_{i_{p}}$ and the fact that $\mathcal{F}\left(\coprod_{a} V_{a}\right)=\prod_{a} \mathcal{F}\left(V_{a}\right)$ since disjoint unions are $\tau$-coverings.
03FJ Lemma 34.7.9. Let $S$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $S$. Let $\tau$, $\mathcal{C}, U, \mathcal{U}$ be as in Lemma 34.7.8. Then there is an isomorphism of complexes

$$
\mathcal{C}_{\mathcal{C}} \bullet\left(\mathcal{U}, \mathcal{F}^{a}\right) \cong s\left((A / R) \bullet \otimes_{R} M\right)
$$

(see Section 34.3) where $R=\Gamma\left(U, \mathcal{O}_{U}\right), M=\Gamma\left(U, \mathcal{F}^{a}\right)$ and $R \rightarrow A$ is a faithfully flat ring map. In particular

$$
\check{H}^{p}\left(\mathcal{U}, \mathcal{F}^{a}\right)=0
$$

for all $p \geq 1$.
Proof. By Lemma 34.7 .8 we see that $\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{a}\right)$ is isomorphic to $\check{\mathcal{C}} \bullet\left(\mathcal{V}, \mathcal{F}^{a}\right)$ where $\mathcal{V}=\{V \rightarrow U\}$ with $V=\coprod_{i=1, \ldots n} U_{i}$ affine also. Set $A=\Gamma\left(V, \mathcal{O}_{V}\right)$. Since $\{V \rightarrow U\}$ is a $\tau$-covering we see that $R \rightarrow A$ is faithfully flat. On the other hand, by definition of $\mathcal{F}^{a}$ we have that the degree $p$ term $\check{\mathcal{C}}^{p}\left(\mathcal{V}, \mathcal{F}^{a}\right)$ is

$$
\Gamma\left(V \times_{U} \ldots \times_{U} V, \mathcal{F}^{a}\right)=\Gamma\left(\operatorname{Spec}\left(A \otimes_{R} \ldots \otimes_{R} A\right), \mathcal{F}^{a}\right)=A \otimes_{R} \ldots \otimes_{R} A \otimes_{R} M
$$

We omit the verification that the maps of the chech complex agree with the maps in the complex $s\left((A / R) \bullet \otimes_{R} M\right)$. The vanishing of cohomology is Lemma 34.3.6.

03DW Proposition 34.7.10. Let $S$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $S$. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$.
(1) There is a canonical isomorphism

$$
H^{q}(S, \mathcal{F})=H^{q}\left((S c h / S)_{\tau}, \mathcal{F}^{a}\right)
$$

(2) There are canonical isomorphisms

$$
H^{q}(S, \mathcal{F})=H^{q}\left(S_{Z a r}, \mathcal{F}^{a}\right)=H^{q}\left(S_{\text {étale }}, \mathcal{F}^{a}\right)
$$

Proof. The result for $q=0$ is clear from the definition of $\mathcal{F}^{a}$. Let $\mathcal{C}=(S c h / S)_{\tau}$, or $\mathcal{C}=S_{\text {étale }}$, or $\mathcal{C}=S_{\text {Zar }}$.
We are going to apply Cohomology on Sites, Lemma 21.11.9 with $\mathcal{F}=\mathcal{F}^{a}, \mathcal{B} \subset$ $\mathrm{Ob}(\mathcal{C})$ the set of affine schemes in $\mathcal{C}$, and $\operatorname{Cov} \subset \operatorname{Cov}_{\mathcal{C}}$ the set of standard affine $\tau$-coverings. Assumption (3) of the lemma is satisfied by Lemma 34.7.9. Hence we conclude that $H^{p}\left(U, \mathcal{F}^{a}\right)=0$ for every affine object $U$ of $\mathcal{C}$.

Next, let $U \in \mathrm{Ob}(\mathcal{C})$ be any separated object. Denote $f: U \rightarrow S$ the structure morphism. Let $U=\bigcup U_{i}$ be an affine open covering. We may also think of this as a $\tau$-covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ of $U$ in $\mathcal{C}$. Note that $U_{i_{0}} \times{ }_{U} \ldots \times_{U} U_{i_{p}}=U_{i_{0}} \cap \ldots \cap U_{i_{p}}$ is affine as we assumed $U$ separated. By Cohomology on Sites, Lemma 21.11.7 and the result above we see that

$$
H^{p}\left(U, \mathcal{F}^{a}\right)=\check{H}^{p}\left(\mathcal{U}, \mathcal{F}^{a}\right)=H^{p}\left(U, f^{*} \mathcal{F}\right)
$$

the last equality by Cohomology of Schemes, Lemma 29.2.6. In particular, if $S$ is separated we can take $U=S$ and $f=\mathrm{id}_{S}$ and the proposition is proved. We suggest the reader skip the rest of the proof (or rewrite it to give a clearer exposition).

Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$ on $S$. Choose an injective resolution $\mathcal{F}^{a} \rightarrow$ $\mathcal{J}^{\bullet}$ on $\mathcal{C}$. Denote $\left.\mathcal{J}^{n}\right|_{S}$ the restriction of $\mathcal{J}^{n}$ to opens of $S$; this is a sheaf on the topological space $S$ as open coverings are $\tau$-coverings. We get a complex

$$
\left.\left.0 \rightarrow \mathcal{F} \rightarrow \mathcal{J}^{0}\right|_{S} \rightarrow \mathcal{J}^{1}\right|_{S} \rightarrow \ldots
$$

which is exact since its sections over any affine open $U \subset S$ is exact (by the vanishing of $H^{p}\left(U, \mathcal{F}^{a}\right), p>0$ seen above). Hence by Derived Categories, Lemma 13.18 .6 there exists map of complexes $\left.\mathcal{J}^{\bullet}\right|_{S} \rightarrow \mathcal{I}^{\bullet}$ which in particular induces a map

$$
R \Gamma\left(\mathcal{C}, \mathcal{F}^{a}\right)=\Gamma\left(S, \mathcal{J}^{\bullet}\right) \longrightarrow \Gamma\left(S, \mathcal{I}^{\bullet}\right)=R \Gamma(S, \mathcal{F})
$$

Taking cohomology gives the map $H^{n}\left(\mathcal{C}, \mathcal{F}^{a}\right) \rightarrow H^{n}(S, \mathcal{F})$ which we have to prove is an isomorphism. Let $\mathcal{U}: S=\bigcup U_{i}$ be an affine open covering which we may think of as a $\tau$-covering also. By the above we get a map of double complexes

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{J})=\check{\mathcal{C}}^{\bullet}\left(\mathcal{U},\left.\mathcal{J}\right|_{S}\right) \longrightarrow \check{\mathcal{C}}^{\bullet}(\mathcal{U}, \mathcal{I})
$$

This map induces a map of spectral sequences

$$
{ }^{\tau} E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}\left(\mathcal{F}^{a}\right)\right) \longrightarrow E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)
$$

The first spectral sequence converges to $H^{p+q}(\mathcal{C}, \mathcal{F})$ and the second to $H^{p+q}(S, \mathcal{F})$. On the other hand, we have seen that the induced maps ${ }^{\tau} E_{2}^{p, q} \rightarrow E_{2}^{p, q}$ are bijections (as all the intersections are separated being opens in affines). Whence also the maps $H^{n}\left(\mathcal{C}, \mathcal{F}^{a}\right) \rightarrow H^{n}(S, \mathcal{F})$ are isomorphisms, and we win.

03DX Proposition 34.7.11. Let $S$ be a scheme. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic\}.
(1) The functor $\mathcal{F} \mapsto \mathcal{F}^{a}$ defines an equivalence of categories

$$
Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \longrightarrow Q \operatorname{Coh}\left((S c h / S)_{\tau}, \mathcal{O}\right)
$$

between the category of quasi-coherent sheaves on $S$ and the category of quasi-coherent $\mathcal{O}$-modules on the big $\tau$ site of $S$.
(2) Let $\tau=$ étale, or $\tau=$ Zariski. The functor $\mathcal{F} \mapsto \mathcal{F}^{a}$ defines an equivalence of categories

$$
Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \longrightarrow Q \operatorname{Coh}\left(S_{\tau}, \mathcal{O}\right)
$$

between the category of quasi-coherent sheaves on $S$ and the category of quasi-coherent $\mathcal{O}$-modules on the small $\tau$ site of $S$.

Proof. We have seen in Lemma 34.7.7 that the functor is well defined. It is straightforward to show that the functor is fully faithful (we omit the verification). To finish the proof we will show that a quasi-coherent $\mathcal{O}$-module on $(S c h / S)_{\tau}$ gives rise to a descent datum for quasi-coherent sheaves relative to a $\tau$-covering of $S$. Having produced this descent datum we will appeal to Proposition 34.5.2 to get the corresponding quasi-coherent sheaf on $S$.

Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}$-modules on the $\operatorname{big} \tau$ site of $S$. By Modules on Sites, Definition 18.23 .1 there exists a $\tau$-covering $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ of $S$ such that each of the restrictions $\left.\mathcal{G}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ has a global presentation

$$
\left.\left.\left.\bigoplus_{k \in K_{i}} \mathcal{O}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow \bigoplus_{j \in J_{i}} \mathcal{O}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow \mathcal{G}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow 0
$$

for some index sets $J_{i}$ and $K_{i}$. We claim that this implies that $\left.\mathcal{G}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ is $\mathcal{F}_{i}^{a}$ for some quasi-coherent sheaf $\mathcal{F}_{i}$ on $S_{i}$. Namely, this is clear for the direct sums $\left.\bigoplus_{k \in K_{i}} \mathcal{O}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ and $\left.\bigoplus_{j \in J_{i}} \mathcal{O}\right|_{\left(S c h / S_{i}\right)_{\tau}}$. Hence we see that $\left.\mathcal{G}\right|_{\left(S c h / S_{i}\right)_{\tau}}$ is a cokernel of a map $\varphi: \mathcal{K}_{i}^{a} \rightarrow \mathcal{L}_{i}^{a}$ for some quasi-coherent sheaves $\mathcal{K}_{i}, \mathcal{L}_{i}$ on $S_{i}$. By the fully faithfulness of ()$^{a}$ we see that $\varphi=\phi^{a}$ for some map of quasi-coherent sheaves $\phi: \mathcal{K}_{i} \rightarrow \mathcal{L}_{i}$ on $S_{i}$. Then it is clear that $\left.\mathcal{G}\right|_{\left(S c h / S_{i}\right)_{\tau}} \cong \operatorname{Coker}(\phi)^{a}$ as claimed.
Since $\mathcal{G}$ lives on all of the category $\left(S c h / S_{i}\right)_{\tau}$ we see that

$$
\left.\left(\operatorname{pr}_{0}^{*} \mathcal{F}_{i}\right)^{a} \cong \mathcal{G}\right|_{\left(S c h /\left(S_{i} \times{ }_{S} S_{j}\right)\right)_{\tau}} \cong\left(\operatorname{pr}_{1}^{*} \mathcal{F}\right)^{a}
$$

as $\mathcal{O}$-modules on $\left(S c h /\left(S_{i} \times_{S} S_{j}\right)\right)_{\tau}$. Hence, using fully faithfulness again we get canonical isomorphisms

$$
\phi_{i j}: \operatorname{pr}_{0}^{*} \mathcal{F}_{i} \longrightarrow \operatorname{pr}_{1}^{*} \mathcal{F}_{j}
$$

of quasi-coherent modules over $S_{i} \times S_{j}$. We omit the verification that these satisfy the cocycle condition. Since they do we see by effectivity of descent for quasicoherent sheaves and the covering $\left\{S_{i} \rightarrow S\right\}$ (Proposition 34.5.2) that there exists a quasi-coherent sheaf $\mathcal{F}$ on $S$ with $\left.\mathcal{F}\right|_{S_{i}} \cong \mathcal{F}_{i}$ compatible with the given descent data. In other words we are given $\mathcal{O}$-module isomorphisms

$$
\phi_{i}:\left.\left.\mathcal{F}^{a}\right|_{\left(S c h / S_{i}\right)_{\tau}} \longrightarrow \mathcal{G}\right|_{\left(S c h / S_{i}\right)_{\tau}}
$$

which agree over $S_{i} \times{ }_{S} S_{j}$. Hence, since $\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}^{a}, \mathcal{G}\right)$ is a sheaf (Modules on Sites, Lemma 18.27.1, we conclude that there is a morphism of $\mathcal{O}$-modules $\mathcal{F}^{a} \rightarrow \mathcal{G}$ recovering the isomorphisms $\phi_{i}$ above. Hence this is an isomorphism and we win.

The case of the sites $S_{\text {étale }}$ and $S_{Z a r}$ is proved in the exact same manner.

05VG Lemma 34.7.12. Let $S$ be a scheme. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$. Let $\mathcal{P}$ be one of the properties of module $\$^{4}$ defined in Modules on Sites, Definitions 18.17.1, 18.23.1, and 18.28.1. The equivalences of categories

$$
Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \longrightarrow Q \operatorname{Coh}\left((S c h / S)_{\tau}, \mathcal{O}\right) \quad \text { and } \quad Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \longrightarrow Q \operatorname{Coh}\left(S_{\tau}, \mathcal{O}\right)
$$

defined by the rule $\mathcal{F} \mapsto \mathcal{F}^{a}$ seen in Proposition 34.7.11 have the property

$$
\mathcal{F} \text { has } \mathcal{P} \Leftrightarrow \mathcal{F}^{a} \text { has } \mathcal{P} \text { as an } \mathcal{O} \text {-module }
$$

except (possibly) when $\mathcal{P}$ is "locally free" or "coherent". If $\mathcal{P}=$ "coherent" the equivalence holds for $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow Q \operatorname{Coh}\left(S_{\tau}, \mathcal{O}\right)$ when $S$ is locally Noetherian and $\tau$ is Zariski or étale.

Proof. This is immediate for the global properties, i.e., those defined in Modules on Sites, Definition 18.17.1. For the local properties we can use Modules on Sites, Lemma 18.23 .3 to translate " $\mathcal{F}^{a}$ has $\mathcal{P}$ " into a property on the members of a covering of $X$. Hence the result follows from Lemmas 34.6.1, 34.6.3, 34.6.4, 34.6.5, and 34.6.6. Being coherent for a quasi-coherent module is the same as being of finite type over a locally Noetherian scheme (see Cohomology of Schemes, Lemma 29.9.1) hence this reduces to the case of finite type modules (details omitted).

06VE Lemma 34.7.13. Let $S$ be a scheme. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$. The functors
$Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \longrightarrow \operatorname{Mod}\left((\operatorname{Sch} / S)_{\tau}, \mathcal{O}\right) \quad$ and $\quad Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \longrightarrow \operatorname{Mod}\left(S_{\tau}, \mathcal{O}\right)$
defined by the rule $\mathcal{F} \mapsto \mathcal{F}^{a}$ seen in Proposition 34.7.11 are
(1) fully faithful,
(2) compatible with direct sums,
(3) compatible with colimits,
(4) right exact,
(5) exact as a functor $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow \operatorname{Mod}\left(S_{\text {étale }}, \mathcal{O}\right)$,
(6) not exact as a functor $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow \operatorname{Mod}\left((S c h / S)_{\tau}, \mathcal{O}\right)$ in general,
(7) given two quasi-coherent $\mathcal{O}_{S}$-modules $\mathcal{F}, \mathcal{G}$ we have $\left(\mathcal{F} \otimes \mathcal{O}_{S} \mathcal{G}\right)^{a}=\mathcal{F}^{a} \otimes_{\mathcal{O}}$ $\mathcal{G}^{a}$,
(8) given two quasi-coherent $\mathcal{O}_{S}$-modules $\mathcal{F}, \mathcal{G}$ such that $\mathcal{F}$ is of finite presentation we have $\left(\mathcal{H o m}_{\mathcal{O}_{S}}(\mathcal{F}, \mathcal{G})\right)^{a}=\mathcal{H o m}_{\mathcal{O}}\left(\mathcal{F}^{a}, \mathcal{G}^{a}\right)$, and
(9) given a short exact sequence $0 \rightarrow \mathcal{F}_{1}^{a} \rightarrow \mathcal{E} \rightarrow \mathcal{F}_{2}^{a} \rightarrow 0$ of $\mathcal{O}$-modules then $\mathcal{E}$ is quasi-coheren ${ }^{5}$, i.e., $\mathcal{E}$ is in the essential image of the functor.

Proof. Part (1) we saw in Proposition 34.7.11.
We have seen in Schemes, Section 25.24 that a colimit of quasi-coherent sheaves on a scheme is a quasi-coherent sheaf. Moreover, in Remark 34.7.6 we saw that $\mathcal{F} \mapsto \mathcal{F}^{a}$ is the pullback functor for a morphism of ringed sites, hence commutes with all colimits, see Modules on Sites, Lemma 18.14.3. Thus (3) and its special case (3) hold.

[^94]This also shows that the functor is right exact (i.e., commutes with finite colimits), hence (4).
The functor $Q \operatorname{Coh}\left(\mathcal{O}_{S}\right) \rightarrow Q \operatorname{Coh}\left(S_{\text {étale }}, \mathcal{O}\right), \mathcal{F} \mapsto \mathcal{F}^{a}$ is left exact because an étale morphism is flat, see Morphisms, Lemma 28.36.12. This proves (5).
To see (6), suppose that $S=\operatorname{Spec}(\mathbf{Z})$. Then 2: $\mathcal{O}_{S} \rightarrow \mathcal{O}_{S}$ is injective but the associated map of $\mathcal{O}$-modules on $(S c h / S)_{\tau}$ isn't injective because 2: $\mathbf{F}_{2} \rightarrow \mathbf{F}_{2}$ isn't injective and $\operatorname{Spec}\left(\mathbf{F}_{2}\right)$ is an object of $(S c h / S)_{\tau}$.
We omit the proofs of (7) and (8).
Let $0 \rightarrow \mathcal{F}_{1}^{a} \rightarrow \mathcal{E} \rightarrow \mathcal{F}_{2}^{a} \rightarrow 0$ be a short exact sequence of $\mathcal{O}$-modules with $\mathcal{F}_{1}$ and $\mathcal{F}_{2}$ quasi-coherent on $S$. Consider the restriction

$$
\left.0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{E}\right|_{S_{Z a r}} \rightarrow \mathcal{F}_{2}
$$

to $S_{Z a r}$. By Proposition 34.7 .10 we see that on any affine $U \subset S$ we have $H^{1}\left(U, \mathcal{F}_{1}^{a}\right)=H^{1}\left(U, \mathcal{F}_{1}\right)=0$. Hence the sequence above is also exact on the right. By Schemes, Section 25.24 we conclude that $\mathcal{F}=\left.\mathcal{E}\right|_{S_{Z a r}}$ is quasi-coherent. Thus we obtain a commutative diagram

To finish the proof it suffices to show that the top row is also right exact. To do this, denote once more $U=\operatorname{Spec}(A) \subset S$ an affine open of $S$. We have seen above that $0 \rightarrow \mathcal{F}_{1}(U) \rightarrow \mathcal{E}(U) \rightarrow \mathcal{F}_{2}(U) \rightarrow 0$ is exact. For any affine scheme $V / U$, $V=\operatorname{Spec}(B)$ the map $\mathcal{F}_{1}^{a}(V) \rightarrow \mathcal{E}(V)$ is injective. We have $\mathcal{F}_{1}^{a}(V)=\mathcal{F}_{1}(U) \otimes_{A} B$ by definition. The injection $\mathcal{F}_{1}^{a}(V) \rightarrow \mathcal{E}(V)$ factors as

$$
\mathcal{F}_{1}(U) \otimes_{A} B \rightarrow \mathcal{E}(U) \otimes_{A} B \rightarrow \mathcal{E}(U)
$$

Considering $A$-algebras $B$ of the form $B=A \oplus M$ we see that $\mathcal{F}_{1}(U) \rightarrow \mathcal{E}(U)$ is universally injective (see Algebra, Definition 10.81.1). Since $\mathcal{E}(U)=\mathcal{F}(U)$ we conclude that $\mathcal{F}_{1} \rightarrow \mathcal{F}$ remains injective after any base change, or equivalently that $\mathcal{F}_{1}^{a} \rightarrow \mathcal{F}^{a}$ is injective.

03LC Proposition 34.7.14. Let $f: T \rightarrow S$ be a morphism of schemes.
(1) The equivalences of categories of Proposition 34.7 .11 are compatible with pullback. More precisely, we have $f^{*}\left(\mathcal{G}^{a}\right)=\left(f^{*} \mathcal{G}\right)^{a}$ for any quasi-coherent sheaf $\mathcal{G}$ on $S$.
(2) The equivalences of categories of Proposition 34.7.11 part (1) are not compatible with pushforward in general.
(3) If $f$ is quasi-compact and quasi-separated, and $\tau \in\{$ Zariski, étale $\}$ then $f_{*}$ and $f_{\text {small,* }}$ preserve quasi-coherent sheaves and the diagram

is commutative, i.e., $f_{\text {small, } *}\left(\mathcal{F}^{a}\right)=\left(f_{*} \mathcal{F}\right)^{a}$.

Proof. Part (1) follows from the discussion in Remark 34.7.6. Part (2) is just a warning, and can be explained in the following way: First the statement cannot be made precise since $f_{*}$ does not transform quasi-coherent sheaves into quasi-coherent sheaves in general. Even if this is the case for $f$ (and any base change of $f$ ), then the compatibility over the big sites would mean that formation of $f_{*} \mathcal{F}$ commutes with any base change, which does not hold in general. An explicit example is the quasi-compact open immersion $j: X=\mathbf{A}_{k}^{2} \backslash\{0\} \rightarrow \mathbf{A}_{k}^{2}=Y$ where $k$ is a field. We have $j_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$ but after base change to $\operatorname{Spec}(k)$ by the 0 map we see that the pushforward is zero.

Let us prove (3) in case $\tau=$ étale. Note that $f$, and any base change of $f$, transforms quasi-coherent sheaves into quasi-coherent sheaves, see Schemes, Lemma 25.24.1. The equality $f_{\text {small,* }}\left(\mathcal{F}^{a}\right)=\left(f_{*} \mathcal{F}\right)^{a}$ means that for any étale morphism $g: U \rightarrow S$ we have $\Gamma\left(U, g^{*} f_{*} \mathcal{F}\right)=\Gamma\left(U \times{ }_{S} T,\left(g^{\prime}\right)^{*} \mathcal{F}\right)$ where $g^{\prime}: U \times_{S} T \rightarrow T$ is the projection. This is true by Cohomology of Schemes, Lemma 29.5.2.

071N Lemma 34.7.15. Let $f: T \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on $T$. For either the étale or Zariski topology, there are canonical isomorphisms $R^{i} f_{\text {small,* }}\left(\mathcal{F}^{a}\right)=\left(R^{i} f_{*} \mathcal{F}\right)^{a}$.

Proof. We prove this for the étale topology; we omit the proof in the case of the Zariski topology. By Cohomology of Schemes, Lemma 29.4.5 the sheaves $R^{i} f_{*} \mathcal{F}$ are quasi-coherent so that the assertion makes sense. The sheaf $R^{i} f_{\text {small }, *} \mathcal{F}^{a}$ is the sheaf associated to the presheaf

$$
U \longmapsto H^{i}\left(U \times_{S} T, \mathcal{F}^{a}\right)
$$

where $g: U \rightarrow S$ is an object of $S_{\text {étale }}$, see Cohomology on Sites, Lemma 21.8.4. By our conventions the right hand side is the étale cohomology of the restriction of $\mathcal{F}^{a}$ to the localization $T_{\text {étale }} / U \times_{S} T$ which equals $\left(U \times_{S} T\right)_{\text {étale }}$. By Proposition 34.7.10 this is presheaf the same as the presheaf

$$
U \longmapsto H^{i}\left(U \times_{S} T,\left(g^{\prime}\right)^{*} \mathcal{F}\right)
$$

where $g^{\prime}: U \times{ }_{S} T \rightarrow T$ is the projection. If $U$ is affine then this is the same as $H^{0}\left(U, R^{i} f_{*}^{\prime}\left(g^{\prime}\right)^{*} \mathcal{F}\right)$, see Cohomology of Schemes, Lemma 29.4.6. By Cohomology of Schemes, Lemma 29.5.2 this is equal to $H^{0}\left(U, g^{*} R^{i} f_{*} \mathcal{F}\right)$ which is the value of $\left(R^{i} f_{*} \mathcal{F}\right)^{a}$ on $U$. Thus the values of the sheaves of modules $R^{i} f_{\text {small }, *}\left(\mathcal{F}^{a}\right)$ and $\left(R^{i} f_{*} \mathcal{F}\right)^{a}$ on every affine object of $S_{\text {étale }}$ are canonically isomorphic which implies they are canonically isomorphic.

The results in this section say there is virtually no difference between quasi-coherent sheaves on $S$ and quasi-coherent sheaves on any of the sites associated to $S$ in the chapter on topologies. Hence one often sees statements on quasi-coherent sheaves formulated in either language, without restatements in the other.

### 34.8. Parasitic modules

07 AF Parasitic modules are those which are zero when restricted to schemes flat over the base scheme. Here is the formal definition.

06ZL Definition 34.8.1. Let $S$ be a scheme. Let $\tau \in\{$ Zar, étale, smooth, syntomic, fppf $\}$. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules on $(S c h / S)_{\tau}$.
(1) $\mathcal{F}$ is called parasiti ${ }^{6}$ if for every flat morphism $U \rightarrow S$ we have $\mathcal{F}(U)=0$.
(2) $\mathcal{F}$ is called parasitic for the $\tau$-topology if for every $\tau$-covering $\left\{U_{i} \rightarrow S\right\}_{i \in I}$ we have $\mathcal{F}\left(U_{i}\right)=0$ for all $i$.
If $\tau=f p p f$ this means that $\left.\mathcal{F}\right|_{U_{Z a r}}=0$ whenever $U \rightarrow S$ is flat and locally of finite presentation; similar for the other cases.

0755 Lemma 34.8.2. Let $S$ be a scheme. Let $\tau \in\{$ Zar, étale, smooth, syntomic, fppf $\}$. Let $\mathcal{G}$ be a presheaf of $\mathcal{O}$-modules on $(S c h / S)_{\tau}$.
(1) If $\mathcal{G}$ is parasitic for the $\tau$-topology, then $H_{\tau}^{p}(U, \mathcal{G})=0$ for every $U$ open in $S$, resp. étale over $S$, resp. smooth over $S$, resp. syntomic over $S$, resp. flat and locally of finite presentation over $S$.
(2) If $\mathcal{G}$ is parasitic then $H_{\tau}^{p}(U, \mathcal{G})=0$ for every $U$ flat over $S$.

Proof. Proof in case $\tau=f p p f$; the other cases are proved in the exact same way. The assumption means that $\mathcal{G}(U)=0$ for any $U \rightarrow S$ flat and locally of finite presentation. Apply Cohomology on Sites, Lemma 21.11 .9 to the subset $\mathcal{B} \subset \mathrm{Ob}\left((S c h / S)_{f p p f}\right)$ consisting of $U \rightarrow S$ flat and locally of finite presentation and the collection Cov of all fppf coverings of elements of $\mathcal{B}$.

07AG Lemma 34.8.3. Let $f: T \rightarrow S$ be a morphism of schemes. For any parasitic $\mathcal{O}$-module on $(S c h / T)_{\tau}$ the pushforward $f_{*} \mathcal{F}$ and the higher direct images $R^{i} f_{*} \mathcal{F}$ are parasitic $\mathcal{O}$-modules on $(S c h / S)_{\tau}$.
Proof. Recall that $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf

$$
U \mapsto H^{i}\left(\left(S c h / U \times_{S} T\right)_{\tau}, \mathcal{F}\right)
$$

see Cohomology on Sites, Lemma 21.8.4. If $U \rightarrow S$ is flat, then $U \times_{S} T \rightarrow T$ is flat as a base change. Hence the displayed group is zero by Lemma 34.8.2. If $\left\{U_{i} \rightarrow U\right\}$ is a $\tau$-covering then $U_{i} \times{ }_{S} T \rightarrow T$ is also flat. Hence it is clear that the sheafification of the displayed presheaf is zero on schemes $U$ flat over $S$.
0756 Lemma 34.8.4. Let $S$ be a scheme. Let $\tau \in\{Z a r$, étale $\}$. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules on $(S c h / S)_{\text {fppf }}$ such that
(1) $\left.\mathcal{G}\right|_{S_{\tau}}$ is quasi-coherent, and
(2) for every flat, locally finitely presented morphism $g: U \rightarrow S$ the canonical map $\left.g_{\tau, \text { small }}^{*}\left(\left.\mathcal{G}\right|_{S_{\tau}}\right) \rightarrow \mathcal{G}\right|_{U_{\tau}}$ is an isomorphism.
Then $H^{p}(U, \mathcal{G})=H^{p}\left(U,\left.\mathcal{G}\right|_{U_{\tau}}\right)$ for every $U$ flat and locally of finite presentation over $S$.

Proof. Let $\mathcal{F}$ be the pullback of $\left.\mathcal{G}\right|_{S_{\tau}}$ to the big fppf site $(S c h / S)_{f p p f}$. Note that $\mathcal{F}$ is quasi-coherent. There is a canonical comparison map $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ which by assumptions (1) and (2) induces an isomorphism $\left.\left.\mathcal{F}\right|_{U_{\tau}} \rightarrow \mathcal{G}\right|_{U_{\tau}}$ for all $g: U \rightarrow S$ flat and locally of finite presentation. Hence in the short exact sequences

$$
0 \rightarrow \operatorname{Ker}(\varphi) \rightarrow \mathcal{F} \rightarrow \operatorname{Im}(\varphi) \rightarrow 0
$$

and

$$
0 \rightarrow \operatorname{Im}(\varphi) \rightarrow \mathcal{G} \rightarrow \operatorname{Coker}(\varphi) \rightarrow 0
$$

the sheaves $\operatorname{Ker}(\varphi)$ and $\operatorname{Coker}(\varphi)$ are parasitic for the fppf topology. By Lemma 34.8.2 we conclude that $H^{p}(U, \mathcal{F}) \rightarrow H^{p}(U, \mathcal{G})$ is an isomorphism for $g: U \rightarrow S$

[^95]flat and locally of finite presentation. Since the result holds for $\mathcal{F}$ by Proposition 34.7 .10 we win.

### 34.9. Fpqc coverings are universal effective epimorphisms

023 P We apply the material above to prove an interesting result, namely Lemma 34.9.3. By Sites, Section 7.13 this lemma implies that the representable presheaves on any of the sites $(S c h / S)_{\tau}$ are sheaves for $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$. First we prove a helper lemma.

02KI Lemma 34.9.1. For a scheme $X$ denote $|X|$ the underlying set. Let $f: X \rightarrow S$ be a morphism of schemes. Then

$$
\left|X \times_{S} X\right| \rightarrow|X| \times_{|S|}|X|
$$

is surjective.
Proof. Follows immediately from the description of points on the fibre product in Schemes, Lemma 25.17.5.

03N0 Lemma 34.9.2. Let $\left\{f_{i}: T_{i} \rightarrow T\right\}_{i \in I}$ be a fpqc covering. Suppose that for each $i$ we have an open subset $W_{i} \subset T_{i}$ such that for all $i, j \in I$ we have $p r_{0}^{-1}\left(W_{i}\right)=$ $p r_{1}^{-1}\left(W_{j}\right)$ as open subsets of $T_{i} \times_{T} T_{j}$. Then there exists a unique open subset $W \subset T$ such that $W_{i}=f_{i}^{-1}(W)$ for each $i$.

Proof. Apply Lemma 34.9 .1 to the map $\coprod_{i \in I} T_{i} \rightarrow T$. It implies there exists a subset $W \subset T$ such that $W_{i}=f_{i}^{-1}(W)$ for each $i$, namely $W=\bigcup f_{i}\left(W_{i}\right)$. To see that $W$ is open we may work Zariski locally on $T$. Hence we may assume that $T$ is affine. Using the definition of a fpqc covering, this reduces us to the case where $\left\{f_{i}: T_{i} \rightarrow T\right\}$ is a standard fpqc covering. In this case we may apply Morphisms, Lemma 28.25 .10 to the morphism $\coprod T_{i} \rightarrow T$ to conclude that $W$ is open.

023Q Lemma 34.9.3. Let $\left\{T_{i} \rightarrow T\right\}$ be an fpqc covering, see Topologies, Definition 33.8.1. Then $\left\{T_{i} \rightarrow T\right\}$ is a universal effective epimorphism in the category of schemes, see Sites, Definition 7.13.1. In other words, every representable functor on the category of schemes satisfies the sheaf condition for the fpqc topology, see Topologies, Definition 33.8.12.

Proof. Let $S$ be a scheme. We have to show the following: Given morphisms $\varphi_{i}: T_{i} \rightarrow S$ such that $\left.\varphi_{i}\right|_{T_{i} \times{ }_{T} T_{j}}=\left.\varphi_{j}\right|_{T_{i} \times_{T} T_{j}}$ there exists a unique morphism $T \rightarrow S$ which restricts to $\varphi_{i}$ on each $T_{i}$. In other words, we have to show that the functor $h_{S}=\operatorname{Mor}_{S c h}(-, S)$ satisfies the sheaf property for the fpqc topology.

Thus Topologies, Lemma 33.8 .13 reduces us to the case of a Zariski covering and a covering $\{\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)\}$ with $R \rightarrow A$ faithfully flat. The case of a Zariski covering follows from Schemes, Lemma 25.14.1.

Suppose that $R \rightarrow A$ is a faithfully flat ring map. Denote $\pi: \operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)$ the corresponding morphism of schemes. It is surjective and flat. Let $f: \operatorname{Spec}(A) \rightarrow$ $S$ be a morphism such that $f \circ \operatorname{pr}_{1}=f \circ \operatorname{pr}_{2}$ as maps $\operatorname{Spec}\left(A \otimes_{R} A\right) \rightarrow S$. By Lemma 34.9.1 we see that as a map on the underlying sets $f$ is of the form $f=g \circ \pi$ for some (set theoretic) map $g: \operatorname{Spec}(R) \rightarrow S$. By Morphisms, Lemma 28.25.10 and the fact that $f$ is continuous we see that $g$ is continuous.

Pick $x \in \operatorname{Spec}(R)$. Choose $U \subset S$ affine open containing $g(x)$. Say $U=\operatorname{Spec}(B)$. By the above we may choose an $r \in R$ such that $x \in D(r) \subset g^{-1}(U)$. The restriction of $f$ to $\pi^{-1}(D(r))$ into $U$ corresponds to a ring map $B \rightarrow A_{r}$. The two induced ring maps $B \rightarrow A_{r} \otimes_{R_{r}} A_{r}=\left(A \otimes_{R} A\right)_{r}$ are equal by assumption on $f$. Note that $R_{r} \rightarrow A_{r}$ is faithfully flat. By Lemma 34.3.6 the equalizer of the two arrows $A_{r} \rightarrow A_{r} \otimes_{R_{r}} A_{r}$ is $R_{r}$. We conclude that $B \rightarrow A_{r}$ factors uniquely through a map $B \rightarrow R_{r}$. This map in turn gives a morphism of schemes $D(r) \rightarrow U \rightarrow S$, see Schemes, Lemma 25.6.4

What have we proved so far? We have shown that for any prime $\mathfrak{p} \subset R$, there exists a standard affine open $D(r) \subset \operatorname{Spec}(R)$ such that the morphism $\left.f\right|_{\pi^{-1}(D(r))}$ : $\pi^{-1}(D(r)) \rightarrow S$ factors uniquely though some morphism of schemes $D(r) \rightarrow S$. We omit the verification that these morphisms glue to the desired morphism $\operatorname{Spec}(R) \rightarrow$ $S$.

0BMN Lemma 34.9.4. Consider schemes $X, Y, Z$ and morphisms $a, b: X \rightarrow Y$ and $a$ morphism $c: Y \rightarrow Z$ with $c \circ a=c \circ b$. Set $d=c \circ a=c \circ b$. If there exists an fpqc covering $\left\{Z_{i} \rightarrow Z\right\}$ such that
(1) for all $i$ the morphism $Y \times_{c, Z} Z_{i} \rightarrow Z_{i}$ is the coequalizer of $(a, 1): X \times_{d, Z}$ $Z_{i} \rightarrow Y \times_{c, Z} Z_{i}$ and $(b, 1): X \times_{d, Z} Z_{i} \rightarrow Y \times_{c, Z} Z_{i}$, and
(2) for all $i$ and $i^{\prime}$ the morphism $Y \times{ }_{c, Z}\left(Z_{i} \times_{Z} Z_{i^{\prime}}\right) \rightarrow\left(Z_{i} \times_{Z} Z_{i^{\prime}}\right)$ is the coequalizer of $(a, 1): X \times_{d, Z}\left(Z_{i} \times{ }_{Z} Z_{i^{\prime}}\right) \rightarrow Y \times_{c, Z}\left(Z_{i} \times_{Z} Z_{i^{\prime}}\right)$ and $(b, 1):$ $X \times_{d, Z}\left(Z_{i} \times_{Z} Z_{i^{\prime}}\right) \rightarrow Y \times_{c, Z}\left(Z_{i} \times{ }_{Z} Z_{i^{\prime}}\right)$
then $c$ is the coequalizer of $a$ and $b$.
Proof. Namely, for a scheme $T$ a morphism $Z \rightarrow T$ is the same thing as a collection of morphism $Z_{i} \rightarrow T$ which agree on overlaps by Lemma 34.9.3.

### 34.10. Descent of finiteness properties of morphisms

02 KJ Another application of flat descent for modules is the following amusing and useful result. There is an algebraic version and a scheme theoretic version. (The "Noetherian" reader should consult Lemma 34.10.2 instead of the next lemma.)

02KK Lemma 34.10.1. Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $R \rightarrow B$ is of finite presentation and $A \rightarrow B$ faithfully flat and of finite presentation. Then $R \rightarrow A$ is of finite presentation.

Proof. Consider the algebra $C=B \otimes_{A} B$ together with the pair of maps $p, q$ : $B \rightarrow C$ given by $p(b)=b \otimes 1$ and $q(b)=1 \otimes b$. Of course the two compositions $A \rightarrow B \rightarrow C$ are the same. Note that as $p: B \rightarrow C$ is flat and of finite presentation (base change of $A \rightarrow B$ ), the ring map $R \rightarrow C$ is of finite presentation (as the composite of $R \rightarrow B \rightarrow C$ ).

We are going to use the criterion Algebra, Lemma 10.126 .2 to show that $R \rightarrow A$ is of finite presentation. Let $S$ be any $R$-algebra, and suppose that $S=\operatorname{colim}_{\lambda \in \Lambda} S_{\lambda}$ is written as a directed colimit of $R$-algebras. Let $A \rightarrow S$ be an $R$-algebra homomorphism. We have to show that $A \rightarrow S$ factors through one of the $S_{\lambda}$. Consider the rings $B^{\prime}=S \otimes_{A} B$ and $C^{\prime}=S \otimes_{A} C=B^{\prime} \otimes_{S} B^{\prime}$. As $B$ is faithfully flat of finite presentation over $A$, also $B^{\prime}$ is faithfully flat of finite presentation over $S$. By Algebra, Lemma 10.160.1 part (2) applied to the pair $\left(S \rightarrow B^{\prime}, B^{\prime}\right)$ and the system
$\left(S_{\lambda}\right)$ there exists a $\lambda_{0} \in \Lambda$ and a flat, finitely presented $S_{\lambda_{0}}$-algebra $B_{\lambda_{0}}$ such that $B^{\prime}=S \otimes_{S_{\lambda_{0}}} B_{\lambda_{0}}$. For $\lambda \geq \lambda_{0}$ set $B_{\lambda}=S_{\lambda} \otimes_{S_{\lambda_{0}}} B_{\lambda_{0}}$ and $C_{\lambda}=B_{\lambda} \otimes_{S_{\lambda}} B_{\lambda}$.
We interrupt the flow of the argument to show that $S_{\lambda} \rightarrow B_{\lambda}$ is faithfully flat for $\lambda$ large enough. (This should really be a separate lemma somewhere else, maybe in the chapter on limits.) Since $\operatorname{Spec}\left(B_{\lambda_{0}}\right) \rightarrow \operatorname{Spec}\left(S_{\lambda_{0}}\right)$ is flat and of finite presentation it is open (see Morphisms, Lemma 28.25.9). Let $I \subset S_{\lambda_{0}}$ be an ideal such that $V(I) \subset \operatorname{Spec}\left(S_{\lambda_{0}}\right)$ is the complement of the image. Note that formation of the image commutes with base change. Hence, since $\operatorname{Spec}\left(B^{\prime}\right) \rightarrow \operatorname{Spec}(S)$ is surjective, and $B^{\prime}=B_{\lambda_{0}} \otimes_{S_{\lambda_{0}}} S$ we see that $I S=S$. Thus for some $\lambda \geq \lambda_{0}$ we have $I S_{\lambda}=S_{\lambda}$. For this and all greater $\lambda$ the morphism $\operatorname{Spec}\left(B_{\lambda}\right) \rightarrow \operatorname{Spec}\left(S_{\lambda}\right)$ is surjective.

By analogy with the notation in the first paragraph of the proof denote $p_{\lambda}, q_{\lambda}$ : $B_{\lambda} \rightarrow C_{\lambda}$ the two canonical maps. Then $B^{\prime}=\operatorname{colim}_{\lambda \geq \lambda_{0}} B_{\lambda}$ and $C^{\prime}=\operatorname{colim}_{\lambda \geq \lambda_{0}} C_{\lambda}$. Since $B$ and $C$ are finitely presented over $R$ there exist (by Algebra, Lemma 10.126 .2 applied several times) a $\lambda \geq \lambda_{0}$ and an $R$-algebra maps $B \rightarrow B_{\lambda}, C \rightarrow C_{\lambda}$ such that the diagram

is commutative. OK, and this means that $A \rightarrow B \rightarrow B_{\lambda}$ maps into the equalizer of $p_{\lambda}$ and $q_{\lambda}$. By By Lemma 34.3.6 we see that $S_{\lambda}$ is the equalizer of $p_{\lambda}$ and $q_{\lambda}$. Thus we get the desired ring map $A \rightarrow S_{\lambda}$ and we win.

Here is an easier version of this dealing with the property of being of finite type.
0367 Lemma 34.10.2. Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $R \rightarrow B$ is of finite type and $A \rightarrow B$ faithfully flat and of finite presentation. Then $R \rightarrow A$ is of finite type.

Proof. By Algebra, Lemma 10.160 .2 there exists a commutative diagram

with $R \rightarrow A_{0}$ of finite presentation, $A_{0} \rightarrow B_{0}$ faithfully flat of finite presentation and $B=A \otimes_{A_{0}} B_{0}$. Since $R \rightarrow B$ is of finite type by assumption, we may add some elements to $A_{0}$ and assume that the map $B_{0} \rightarrow B$ is surjective! In this case, since $A_{0} \rightarrow B_{0}$ is faithfully flat, we see that as

$$
\left(A_{0} \rightarrow A\right) \otimes_{A_{0}} B_{0} \cong\left(B_{0} \rightarrow B\right)
$$

is surjective, also $A_{0} \rightarrow A$ is surjective. Hence we win.
02KL Lemma 34.10.3. Let

be a commutative diagram of morphisms of schemes. Assume that $f$ is surjective, flat and locally of finite presentation and assume that $p$ is locally of finite presentation (resp. locally of finite type). Then $q$ is locally of finite presentation (resp. locally of finite type).
Proof. The problem is local on $S$ and $Y$. Hence we may assume that $S$ and $Y$ are affine. Since $f$ is flat and locally of finite presentation, we see that $f$ is open (Morphisms, Lemma 28.25.9). Hence, since $Y$ is quasi-compact, there exist finitely many affine opens $X_{i} \subset X$ such that $Y=\bigcup f\left(X_{i}\right)$. Clearly we may replace $X$ by $\coprod X_{i}$, and hence we may assume $X$ is affine as well. In this case the lemma is equivalent to Lemma 34.10.1 (resp. Lemma 34.10.2) above.

We use this to improve some of the results on morphisms obtained earlier.
02KM Lemma 34.10.4. Let

be a commutative diagram of morphisms of schemes. Assume that
(1) $f$ is surjective, and syntomic (resp. smooth, resp. étale),
(2) $p$ is syntomic (resp. smooth, resp. étale).

Then $q$ is syntomic (resp. smooth, resp. étale).
Proof. Combine Morphisms, Lemmas 28.31.16, 28.34.19, and 28.36.19 with Lemma 34.10 .3 above.

Actually we can strengthen this result as follows.
05B5 Lemma 34.10.5. Let

be a commutative diagram of morphisms of schemes. Assume that
(1) $f$ is surjective, flat, and locally of finite presentation,
(2) $p$ is smooth (resp. étale).

Then $q$ is smooth (resp. étale).
Proof. Assume (1) and that $p$ is smooth. By Lemma 34.10.3 we see that $q$ is locally of finite presentation. By Morphisms, Lemma 28.25.11 we see that $q$ is flat. Hence now it suffices to show that the fibres of $q$ are smooth, see Morphisms, Lemma 28.34.3. Apply Varieties, Lemma 32.20 .9 to the flat surjective morphisms $X_{s} \rightarrow Y_{s}$ for $s \in S$ to conclude. We omit the proof of the étale case.

05B6 Remark 34.10.6. With the assumptions (1) and $p$ smooth in Lemma 34.10 .5 it is not automatically the case that $X \rightarrow Y$ is smooth. A counter example is $S=\operatorname{Spec}(k), X=\operatorname{Spec}(k[s]), Y=\operatorname{Spec}(k[t])$ and $f$ given by $t \mapsto s^{2}$. But see also Lemma 34.10 .7 for some information on the structure of $f$.

05B7 Lemma 34.10.7. Let

be a commutative diagram of morphisms of schemes. Assume that
(1) $f$ is surjective, flat, and locally of finite presentation,
(2) $p$ is syntomic.

Then both $q$ and $f$ are syntomic.
Proof. By Lemma 34.10 .3 we see that $q$ is of finite presentation. By Morphisms, Lemma 28.25.11 we see that $q$ is flat. By Morphisms, Lemma 28.31.10 it now suffices to show that the local rings of the fibres of $Y \rightarrow S$ and the fibres of $X \rightarrow Y$ are local complete intersection rings. To do this we may take the fibre of $X \rightarrow Y \rightarrow S$ at a point $s \in S$, i.e., we may assume $S$ is the spectrum of a field. Pick a point $x \in X$ with image $y \in Y$ and consider the ring map

$$
\mathcal{O}_{Y, y} \longrightarrow \mathcal{O}_{X, x}
$$

This is a flat local homomorphism of local Noetherian rings. The local ring $\mathcal{O}_{X, x}$ is a complete intersection. Thus may use Avramov's result, see Divided Power Algebra, Lemma 23.8.9, to conclude that both $\mathcal{O}_{Y, y}$ and $\mathcal{O}_{X, x} / \mathfrak{m}_{y} \mathcal{O}_{X, x}$ are complete intersection rings.

The following type of lemma is occasionally useful.
06NB Lemma 34.10.8. Let $X \rightarrow Y \rightarrow Z$ be morphism of schemes. Let $P$ be one of the following properties of morphisms of schemes: flat, locally finite type, locally finite presentation. Assume that $X \rightarrow Z$ has $P$ and that $\{X \rightarrow Y\}$ can be refined by an fppf covering of $Y$. Then $Y \rightarrow Z$ is $P$.

Proof. Let $\operatorname{Spec}(C) \subset Z$ be an affine open and let $\operatorname{Spec}(B) \subset Y$ be an affine open which maps into $\operatorname{Spec}(C)$. The assumption on $X \rightarrow Y$ implies we can find a standard affine fppf covering $\left\{\operatorname{Spec}\left(B_{j}\right) \rightarrow \operatorname{Spec}(B)\right\}$ and lifts $x_{j}: \operatorname{Spec}\left(B_{j}\right) \rightarrow X$. Since $\operatorname{Spec}\left(B_{j}\right)$ is quasi-compact we can find finitely many affine opens $\operatorname{Spec}\left(A_{i}\right) \subset X$ lying over $\operatorname{Spec}(B)$ such that the image of each $x_{j}$ is contained in the union $\bigcup \operatorname{Spec}\left(A_{i}\right)$. Hence after replacing each $\operatorname{Spec}\left(B_{j}\right)$ by a standard affine Zariski coverings of itself we may assume we have a standard affine fppf covering $\left\{\operatorname{Spec}\left(B_{i}\right) \rightarrow\right.$ $\operatorname{Spec}(B)\}$ such that each $\operatorname{Spec}\left(B_{i}\right) \rightarrow Y$ factors through an affine open $\operatorname{Spec}\left(A_{i}\right) \subset$ $X$ lying over $\operatorname{Spec}(B)$. In other words, we have ring maps $C \rightarrow B \rightarrow A_{i} \rightarrow B_{i}$ for each $i$. Note that we can also consider

$$
C \rightarrow B \rightarrow A=\prod A_{i} \rightarrow B^{\prime}=\prod B_{i}
$$

and that the ring map $B \rightarrow \prod B_{i}$ is faithfully flat and of finite presentation.
The case $P=$ flat. In this case we know that $C \rightarrow A$ is flat and we have to prove that $C \rightarrow B$ is flat. Suppose that $N \rightarrow N^{\prime} \rightarrow N^{\prime \prime}$ is an exact sequence of $C$-modules. We want to show that $N \otimes_{C} B \rightarrow N^{\prime} \otimes_{C} B \rightarrow N^{\prime \prime} \otimes_{C} B$ is exact. Let $H$ be its cohomology and let $H^{\prime}$ be the cohomology of $N \otimes_{C} B^{\prime} \rightarrow N^{\prime} \otimes_{C} B^{\prime} \rightarrow$ $N^{\prime \prime} \otimes_{C} B^{\prime}$. As $B \rightarrow B^{\prime}$ is flat we know that $H^{\prime}=H \otimes_{B} B^{\prime}$. On the other hand $N \otimes_{C} A \rightarrow N^{\prime} \otimes_{C} A \rightarrow N^{\prime \prime} \otimes_{C} A$ is exact hence has zero cohomology. Hence the
map $H \rightarrow H^{\prime}$ is zero (as it factors through the zero module). Thus $H^{\prime}=0$. As $B \rightarrow B^{\prime}$ is faithfully flat we conclude that $H=0$ as desired.

The case $P=$ locally finite type. In this case we know that $C \rightarrow A$ is of finite type and we have to prove that $C \rightarrow B$ is of finite type. Because $B \rightarrow B^{\prime}$ is of finite presentation (hence of finite type) we see that $A \rightarrow B^{\prime}$ is of finite type, see Algebra, Lemma 10.6.2. Therefore $C \rightarrow B^{\prime}$ is of finite type and we conclude by Lemma 34.10.2.

The case $P=$ locally finite presentation. In this case we know that $C \rightarrow A$ is of finite presentation and we have to prove that $C \rightarrow B$ is of finite presentation. Because $B \rightarrow B^{\prime}$ is of finite presentation and $B \rightarrow A$ of finite type we see that $A \rightarrow B^{\prime}$ is of finite presentation, see Algebra, Lemma 10.6.2. Therefore $C \rightarrow B^{\prime}$ is of finite presentation and we conclude by Lemma 34.10.1.

### 34.11. Local properties of schemes

0347 It often happens one can prove the members of a covering of a scheme have a certain property. In many cases this implies the scheme has the property too. For example, if $S$ is a scheme, and $f: S^{\prime} \rightarrow S$ is a surjective flat morphism such that $S^{\prime}$ is a reduced scheme, then $S$ is reduced. You can prove this by looking at local rings and using Algebra, Lemma 10.156 .2 . We say that the property of being reduced descends through flat surjective morphisms. Some results of this type are collected in Algebra, Section 10.156 .

On the other hand, there are examples of surjective flat morphisms $f: S^{\prime} \rightarrow S$ with $S$ reduced and $S^{\prime}$ not, for example the morphism $\operatorname{Spec}\left(k[x] /\left(x^{2}\right)\right) \rightarrow \operatorname{Spec}(k)$. Hence the property of being reduced does not ascend along flat morphisms. Having infinite residue fields is a property which does ascend along flat morphisms (but does not descend along surjective flat morphisms of course). Some results of this type are collected in Algebra, Section 10.155 .

Finally, we say that a property is local for the flat topology if it ascends along flat morphisms and descends along flat surjective morphisms. A somewhat silly example is the property of having residue fields of a given characteristic. To be more precise, and to tie this in with the various topologies on schemes, we make the following formal definition.

0348 Definition 34.11.1. Let $\mathcal{P}$ be a property of schemes. Let $\tau \in\{f p q c, f p p f$, syntomic, smooth, étale, Zariski\}. We say $\mathcal{P}$ is local in the $\tau$-topology if for any $\tau$-covering $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ (see Topologies, Section 33.2 we have

$$
S \text { has } \mathcal{P} \Leftrightarrow \text { each } S_{i} \text { has } \mathcal{P} .
$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $S$ if and only if it holds for any scheme $S^{\prime}$ isomorphic to $S$. In fact, if $\tau=f p q c, f p p f$, syntomic, smooth, étale, or Zariski, then if $S$ has $\mathcal{P}$ and $S^{\prime} \rightarrow S$ is flat, flat and locally of finite presentation, syntomic, smooth, étale, or an open immersion, then $S^{\prime}$ has $\mathcal{P}$. This is true because we can always extend $\left\{S^{\prime} \rightarrow S\right\}$ to a $\tau$-covering.
We have the following implications: $\mathcal{P}$ is local in the fpqc topology $\Rightarrow \mathcal{P}$ is local in the fppf topology $\Rightarrow \mathcal{P}$ is local in the syntomic topology $\Rightarrow \mathcal{P}$ is local in the smooth
topology $\Rightarrow \mathcal{P}$ is local in the étale topology $\Rightarrow \mathcal{P}$ is local in the Zariski topology. This follows from Topologies, Lemmas 33.4.2, 33.5.2, 33.6.2, 33.7.2, and 33.8.6.

0349 Lemma 34.11.2. Let $\mathcal{P}$ be a property of schemes. Let $\tau \in\{f p q c$, fppf, étale, smooth, syntomic\}. Assume that
(1) the property is local in the Zariski topology,
(2) for any morphism of affine schemes $S^{\prime} \rightarrow S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic, property $\mathcal{P}$ holds for $S^{\prime}$ if property $\mathcal{P}$ holds for $S$, and
(3) for any surjective morphism of affine schemes $S^{\prime} \rightarrow S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic, property $\mathcal{P}$ holds for $S$ if property $\mathcal{P}$ holds for $S^{\prime}$.

Then $\mathcal{P}$ is $\tau$ local on the base.
Proof. This follows almost immediately from the definition of a $\tau$-covering, see Topologies, Definition 33.8.133.7.1 33.4.1 33.5.1, or 33.6.1 and Topologies, Lemma 33.8.8, 33.7.4, 33.4.4 33.5.4, or 33.6.4 Details omitted.

034A Remark 34.11.3. In Lemma 34.11 .2 above if $\tau=$ smooth then in condition (3) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau=$ syntomic or $\tau=$ étale.

### 34.12. Properties of schemes local in the fppf topology

034B In this section we find some properties of schemes which are local on the base in the fppf topology.

034C Lemma 34.12.1. The property $\mathcal{P}(S)=$ " $S$ is locally Noetherian" is local in the fppf topology.

Proof. We will use Lemma 34.11.2. First we note that "being locally Noetherian" is local in the Zariski topology. This is clear from the definition, see Properties, Definition 27.5.1. Next, we show that if $S^{\prime} \rightarrow S$ is a flat, finitely presented morphism of affines and $S$ is locally Noetherian, then $S^{\prime}$ is locally Noetherian. This is Morphisms, Lemma 28.15.6. Finally, we have to show that if $S^{\prime} \rightarrow S$ is a surjective flat, finitely presented morphism of affines and $S^{\prime}$ is locally Noetherian, then $S$ is locally Noetherian. This follows from Algebra, Lemma 10.156.1. Thus (1), (2) and (3) of Lemma 34.11 .2 hold and we win.

0368 Lemma 34.12.2. The property $\mathcal{P}(S)=$ " $S$ is Jacobson" is local in the fppf topology.
Proof. We will use Lemma 34.11.2 First we note that "being Jacobson" is local in the Zariski topology. This is Properties, Lemma 27.6.3. Next, we show that if $S^{\prime} \rightarrow S$ is a flat, finitely presented morphism of affines and $S$ is Jacobson, then $S^{\prime}$ is Jacobson. This is Morphisms, Lemma 28.16.9. Finally, we have to show that if $f: S^{\prime} \rightarrow S$ is a surjective flat, finitely presented morphism of affines and $S^{\prime}$ is Jacobson, then $S$ is Jacobson. Say $S=\operatorname{Spec}(A)$ and $S^{\prime}=\operatorname{Spec}(B)$ and $S^{\prime} \rightarrow S$ given by $A \rightarrow B$. Then $A \rightarrow B$ is finitely presented and faithfully flat. Moreover, the ring $B$ is Jacobson, see Properties, Lemma 27.6.3.

By Algebra, Lemma 10.160 .6 there exists a diagram

with $A \rightarrow B^{\prime}$ finitely presented, faithfully flat and quasi-finite. In particular, $B \rightarrow$ $B^{\prime}$ is finite type, and we see from Algebra, Proposition 10.34 .18 that $B^{\prime}$ is Jacobson. Hence we may assume that $A \rightarrow B$ is quasi-finite as well as faithfully flat and of finite presentation.
Assume $A$ is not Jacobson to get a contradiction. According to Algebra, Lemma 10.34 .5 there exists a nonmaximal prime $\mathfrak{p} \subset A$ and an element $f \in A, f \notin \mathfrak{p}$ such that $V(\mathfrak{p}) \cap D(f)=\{\mathfrak{p}\}$.

This leads to a contradiction as follows. First let $\mathfrak{p} \subset \mathfrak{m}$ be a maximal ideal of $A$. Pick a prime $\mathfrak{m}^{\prime} \subset B$ lying over $\mathfrak{m}$ (exists because $A \rightarrow B$ is faithfully flat, see Algebra, Lemma 10.38.16. As $A \rightarrow B$ is flat, by going down see Algebra, Lemma 10.38.18, we can find a prime $\mathfrak{q} \subset \mathfrak{m}^{\prime}$ lying over $\mathfrak{p}$. In particular we see that $\mathfrak{q}$ is not maximal. Hence according to Algebra, Lemma 10.34.5 again the set $V(\mathfrak{q}) \cap D(f)$ is infinite (here we finally use that $B$ is Jacobson). All points of $V(\mathfrak{q}) \cap D(f)$ map to $V(\mathfrak{p}) \cap D(f)=\{\mathfrak{p}\}$. Hence the fibre over $\mathfrak{p}$ is infinite. This contradicts the fact that $A \rightarrow B$ is quasi-finite (see Algebra, Lemma 10.121.4 or more explicitly Morphisms, Lemma 28.20.10. Thus the lemma is proved.

0BAL Lemma 34.12.3. The property $\mathcal{P}(S)=$ "every quasi-compact open of $S$ has a finite number of irreducible components" is local in the fppf topology.

Proof. We will use Lemma 34.11.2. First we note that $\mathcal{P}$ is local in the Zariski topology. Next, we show that if $T \rightarrow S$ is a flat, finitely presented morphism of affines and $S$ has a finite number of irreducible components, then so does $T$. Namely, since $T \rightarrow S$ is flat, the generic points of $T$ map to the generic points of $S$, see Morphisms, Lemma 28.25.8. Hence it suffices to show that for $s \in S$ the fibre $T_{s}$ has a finite number of generic points. Note that $T_{s}$ is an affine scheme of finite type over $\kappa(s)$, see Morphisms, Lemma 28.15.4. Hence $T_{s}$ is Noetherian and has a finite number of irreducible components (Morphisms, Lemma 28.15.6 and Properties, Lemma 27.5.7). Finally, we have to show that if $T \rightarrow S$ is a surjective flat, finitely presented morphism of affines and $T$ has a finite number of irreducible components, then so does $S$. In this case the arguments above show that every generic point of $S$ is the image of a generic point of $T$ and the result is clear. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win.

### 34.13. Properties of schemes local in the syntomic topology

0369 In this section we find some properties of schemes which are local on the base in the syntomic topology.

036A Lemma 34.13.1. The property $\mathcal{P}(S)=$ " $S$ is locally Noetherian and $\left(S_{k}\right)$ " is local in the syntomic topology.

Proof. We will check (1), (2) and (3) of Lemma 34.11.2. As a syntomic morphism is flat of finite presentation (Morphisms, Lemmas 28.31 .7 and 28.31.6) we have already checked this for "being locally Noetherian" in the proof of Lemma 34.12.1.

We will use this without further mention in the proof. First we note that $\mathcal{P}$ is local in the Zariski topology. This is clear from the definition, see Cohomology of Schemes, Definition 29.11.1. Next, we show that if $S^{\prime} \rightarrow S$ is a syntomic morphism of affines and $S$ has $\mathcal{P}$, then $S^{\prime}$ has $\mathcal{P}$. This is Algebra, Lemma 10.155.4 (use Morphisms, Lemma 28.31 .2 and Algebra, Definition 10.134.1 and Lemma 10.133.3. Finally, we show that if $S^{\prime} \rightarrow S$ is a surjective syntomic morphism of affines and $S^{\prime}$ has $\mathcal{P}$, then $S$ has $\mathcal{P}$. This is Algebra, Lemma 10.156.5. Thus (1), (2) and (3) of Lemma 34.11.2 hold and we win.

036B Lemma 34.13.2. The property $\mathcal{P}(S)=$ " $S$ is Cohen-Macaulay" is local in the syntomic topology.

Proof. This is clear from Lemma 34.13.1 above since a scheme is Cohen-Macaulay if and only if it is locally Noetherian and $\left(S_{k}\right)$ for all $k \geq 0$, see Properties, Lemma 27.12 .3 .

### 34.14. Properties of schemes local in the smooth topology

034D In this section we find some properties of schemes which are local on the base in the smooth topology.
034E Lemma 34.14.1. The property $\mathcal{P}(S)=$ " $S$ is reduced" is local in the smooth topology.

Proof. We will use Lemma 34.11.2. First we note that "being reduced" is local in the Zariski topology. This is clear from the definition, see Schemes, Definition 25.12.1. Next, we show that if $S^{\prime} \rightarrow S$ is a smooth morphism of affines and $S$ is reduced, then $S^{\prime}$ is reduced. This is Algebra, Lemma 10.155.6. Finally, we show that if $S^{\prime} \rightarrow S$ is a surjective smooth morphism of affines and $S^{\prime}$ is reduced, then $S$ is reduced. This is Algebra, Lemma 10.156.2. Thus (1), (2) and (3) of Lemma 34.11 .2 hold and we win.

034F Lemma 34.14.2. The property $\mathcal{P}(S)=$ " $S$ is normal" is local in the smooth topology.
Proof. We will use Lemma 34.11.2 First we show "being normal" is local in the Zariski topology. This is clear from the definition, see Properties, Definition 27.7.1. Next, we show that if $S^{\prime} \rightarrow S$ is a smooth morphism of affines and $S$ is normal, then $S^{\prime}$ is normal. This is Algebra, Lemma 10.155.7. Finally, we show that if $S^{\prime} \rightarrow S$ is a surjective smooth morphism of affines and $S^{\prime}$ is normal, then $S$ is normal. This is Algebra, Lemma 10.156.3. Thus (1), (2) and (3) of Lemma 34.11 .2 hold and we win.

036C Lemma 34.14.3. The property $\mathcal{P}(S)=$ " $S$ is locally Noetherian and $\left(R_{k}\right)$ " is local in the smooth topology.

Proof. We will check (1), (2) and (3) of Lemma 34.11.2 As a smooth morphism is flat of finite presentation (Morphisms, Lemmas 28.34.9 and 28.34.8) we have already checked this for "being locally Noetherian" in the proof of Lemma 34.12.1. We will use this without further mention in the proof. First we note that $\mathcal{P}$ is local in the Zariski topology. This is clear from the definition, see Properties, Definition 27.12.1. Next, we show that if $S^{\prime} \rightarrow S$ is a smooth morphism of affines and $S$ has $\mathcal{P}$, then $S^{\prime}$ has $\mathcal{P}$. This is Algebra, Lemmas 10.155 .5 (use Morphisms, Lemma
28.34.2. Algebra, Lemmas 10.135 .4 and 10.138 .3 . Finally, we show that if $S^{\prime} \rightarrow S$ is a surjective smooth morphism of affines and $S^{\prime}$ has $\mathcal{P}$, then $S$ has $\mathcal{P}$. This is Algebra, Lemma 10.156.5. Thus (1), (2) and (3) of Lemma 34.11 .2 hold and we win.

036D Lemma 34.14.4. The property $\mathcal{P}(S)=$ " $S$ is regular" is local in the smooth topology.
Proof. This is clear from Lemma 34.14 .3 above since a locally Noetherian scheme is regular if and only if it is locally Noetherian and $\left(R_{k}\right)$ for all $k \geq 0$.

036 E Lemma 34.14.5. The property $\mathcal{P}(S)=$ " $S$ is Nagata" is local in the smooth topology.

Proof. We will check (1), (2) and (3) of Lemma 34.11.2, First we note that being Nagata is local in the Zariski topology. This is Properties, Lemma 27.13.6. Next, we show that if $S^{\prime} \rightarrow S$ is a smooth morphism of affines and $S$ is Nagata, then $S^{\prime}$ is Nagata. This is Morphisms, Lemma 28.18.1. Finally, we show that if $S^{\prime} \rightarrow S$ is a surjective smooth morphism of affines and $S^{\prime}$ is Nagata, then $S$ is Nagata. This is Algebra, Lemma 10.156.7. Thus (1), (2) and (3) of Lemma 34.11 .2 hold and we win.

### 34.15. Variants on descending properties

06QL Sometimes one can descend properties, which are not local. We put results of this kind in this section.

06QM Lemma 34.15.1. If $f: X \rightarrow Y$ is a flat and surjective morphism of schemes and $X$ is reduced, then $Y$ is reduced.
Proof. The result follows by looking at local rings (Schemes, Definition 25.12.1) and Algebra, Lemma 10.156.2.

06QN Lemma 34.15.2. Let $f: X \rightarrow Y$ be a morphism of algebraic spaces. If $f$ is locally of finite presentation, flat, and surjective and $X$ is regular, then $Y$ is regular.

Proof. This lemma reduces to the following algebra statement: If $A \rightarrow B$ is a faithfully flat, finitely presented ring homomorphism with $B$ Noetherian and regular, then $A$ is Noetherian and regular. We see that $A$ is Noetherian by Algebra, Lemma 10.156 .1 and regular by Algebra, Lemma 10.109 .9 .

### 34.16. Germs of schemes

04QQ
04QR Definition 34.16.1. Germs of schemes.
(1) A pair $(X, x)$ consisting of a scheme $X$ and a point $x \in X$ is called the germ of $X$ at $x$.
(2) A morphism of germs $f:(X, x) \rightarrow(S, s)$ is an equivalence class of morphisms of schemes $f: U \rightarrow S$ with $f(x)=s$ where $U \subset X$ is an open neighbourhood of $x$. Two such $f, f^{\prime}$ are said to be equivalent if and only if $f$ and $f^{\prime}$ agree in some open neighbourhood of $x$.
(3) We define the composition of morphisms of germs by composing representatives (this is well defined).

Before we continue we need one more definition.
04QS Definition 34.16.2. Let $f:(X, x) \rightarrow(S, s)$ be a morphism of germs. We say $f$ is étale (resp. smooth) if there exists a representative $f: U \rightarrow S$ of $f$ which is an étale morphism (resp. a smooth morphism) of schemes.

### 34.17. Local properties of germs

## 04QT

04N1 Definition 34.17.1. Let $\mathcal{P}$ be a property of germs of schemes. We say that $\mathcal{P}$ is étale local (resp. smooth local) if for any étale (resp. smooth) morphism of germs $\left(U^{\prime}, u^{\prime}\right) \rightarrow(U, u)$ we have $\mathcal{P}(U, u) \Leftrightarrow \mathcal{P}\left(U^{\prime}, u^{\prime}\right)$.

Let $(X, x)$ be a germ of a scheme. The dimension of $X$ at $x$ is the minimum of the dimensions of open neighbourhoods of $x$ in $X$, and any small enough open neighbourhood has this dimension. Hence this is an invariant of the isomorphism class of the germ. We denote this simply $\operatorname{dim}_{x}(X)$. The following lemma tells us that the assertion $\operatorname{dim}_{x}(X)=d$ is an étale local property of germs.

04N4 Lemma 34.17.2. Let $f: U \rightarrow V$ be an étale morphism of schemes. Let $u \in U$ and $v=f(u)$. Then $\operatorname{dim}_{u}(U)=\operatorname{dim}_{v}(V)$.

Proof. In the statement $\operatorname{dim}_{u}(U)$ is the dimension of $U$ at $u$ as defined in Topology, Definition 5.9.1 as the minimum of the Krull dimensions of open neighbourhoods of $u$ in $U$. Similarly for $\operatorname{dim}_{v}(V)$.
Let us show that $\operatorname{dim}_{v}(V) \geq \operatorname{dim}_{u}(U)$. Let $V^{\prime}$ be an open neighbourhood of $v$ in $V$. Then there exists an open neighbourhood $U^{\prime}$ of $u$ in $U$ contained in $f^{-1}\left(V^{\prime}\right)$ such that $\operatorname{dim}_{u}(U)=\operatorname{dim}\left(U^{\prime}\right)$. Suppose that $Z_{0} \subset Z_{1} \subset \ldots \subset Z_{n}$ is a chain of irreducible closed subschemes of $U^{\prime}$. If $\xi_{i} \in Z_{i}$ is the generic point then we have specializations $\xi_{n} \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_{0}$. This gives specializations $f\left(\xi_{n}\right) \rightsquigarrow f\left(\xi_{n-1}\right) \rightsquigarrow \ldots \rightsquigarrow f\left(\xi_{0}\right)$ in $V^{\prime}$. Note that $f\left(\xi_{j}\right) \neq f\left(\xi_{i}\right)$ if $i \neq j$ as the fibres of $f$ are discrete (see Morphisms, Lemma 28.36.7). Hence we see that $\operatorname{dim}\left(V^{\prime}\right) \geq n$. The inequality $\operatorname{dim}_{v}(V) \geq \operatorname{dim}_{u}(U)$ follows formally.
Let us show that $\operatorname{dim}_{u}(U) \geq \operatorname{dim}_{v}(V)$. Let $U^{\prime}$ be an open neighbourhood of $u$ in $U$. Note that $V^{\prime}=f\left(U^{\prime}\right)$ is an open neighbourhood of $v$ by Morphisms, Lemma 28.25.9. Hence $\operatorname{dim}\left(V^{\prime}\right) \geq \operatorname{dim}_{v}(V)$. Pick a chain $Z_{0} \subset Z_{1} \subset \ldots \subset Z_{n}$ of irreducible closed subschemes of $V^{\prime}$. Let $\xi_{i} \in Z_{i}$ be the generic point, so we have specializations $\xi_{n} \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_{0}$. Since $\xi_{0} \in f\left(U^{\prime}\right)$ we can find a point $\eta_{0} \in U^{\prime}$ with $f\left(\eta_{0}\right)=\xi_{0}$. Consider the map of local rings

$$
\mathcal{O}_{V^{\prime}, \xi_{0}} \longrightarrow \mathcal{O}_{U^{\prime}, \eta_{0}}
$$

which is a flat local ring map by Morphisms, Lemma 28.36.12 Note that the points $\xi_{i}$ correspond to primes of the ring on the left by Schemes, Lemma 25.13.2. Hence by going down (see Algebra, Section 10.40 for the displayed ring map we can find a sequence of specializations $\eta_{n} \rightsquigarrow \eta_{n-1} \rightsquigarrow \ldots \rightsquigarrow \eta_{0}$ in $U^{\prime}$ mapping to the sequence $\xi_{n} \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_{0}$ under $f$. This implies that $\operatorname{dim}_{u}(U) \geq \operatorname{dim}_{v}(V)$.
Let $(X, x)$ be a germ of a scheme. The isomorphism class of the local ring $\mathcal{O}_{X, x}$ is an invariant of the germ. The following lemma says that the property $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=d$ is an étale local property of germs.

04N8 Lemma 34.17.3. Let $f: U \rightarrow V$ be an étale morphism of schemes. Let $u \in U$ and $v=f(u)$. Then $\operatorname{dim}\left(\mathcal{O}_{U, u}\right)=\operatorname{dim}\left(\mathcal{O}_{V, v}\right)$.

Proof. The algebraic statement we are asked to prove is the following: If $A \rightarrow B$ is an étale ring map and $\mathfrak{q}$ is a prime of $B$ lying over $\mathfrak{p} \subset A$, then $\operatorname{dim}\left(A_{\mathfrak{p}}\right)=\operatorname{dim}\left(B_{\mathfrak{q}}\right)$. This is More on Algebra, Lemma 15.35 .2 .

Let $(X, x)$ be a germ of a scheme. The isomorphism class of the local ring $\mathcal{O}_{X, x}$ is an invariant of the germ. The following lemma says that the property " $\mathcal{O}_{X, x}$ is regular" is an étale local property of germs.

0AH7 Lemma 34.17.4. Let $f: U \rightarrow V$ be an étale morphism of schemes. Let $u \in U$ and $v=f(u)$. Then $\mathcal{O}_{U, u}$ is a regular local ring if and only if $\mathcal{O}_{V, v}$ is a regular local ring.

Proof. The algebraic statement we are asked to prove is the following: If $A \rightarrow B$ is an étale ring map and $\mathfrak{q}$ is a prime of $B$ lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}}$ is regular if and only if $B_{\mathfrak{q}}$ is regular. This is More on Algebra, Lemma 15.35.3.

### 34.18. Properties of morphisms local on the target

$02 \mathrm{KN} \quad$ Suppose that $f: X \rightarrow Y$ is a morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be a morphism of schemes. Let $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ be the base change of $f$ by $g$ :

Let $\mathcal{P}$ be a property of morphisms of schemes. Then we can wonder if (a) $\mathcal{P}(f) \Rightarrow$ $\mathcal{P}\left(f^{\prime}\right)$, and also whether the converse (b) $\mathcal{P}\left(f^{\prime}\right) \Rightarrow \mathcal{P}(f)$ is true. If (a) holds whenever $g$ is flat, then we say $\mathcal{P}$ is preserved under flat base change. If (b) holds whenever $g$ is surjective and flat, then we say $\mathcal{P}$ descends through flat surjective base changes. If $\mathcal{P}$ is preserved under flat base changes and descends through flat surjective base changes, then we say $\mathcal{P}$ is flat local on the target. Compare with the discussion in Section 34.11. This turns out to be a very important notion which we formalize in the following definition.
02KO Definition 34.18.1. Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in\{f p q c$, fppf, syntomic, smooth, étale, Zariski\}. We say $\mathcal{P}$ is $\tau$ local on the base, or $\tau$ local on the target, or local on the base for the $\tau$-topology if for any $\tau$ covering $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ (see Topologies, Section 33.2) and any morphism of schemes $f: X \rightarrow Y$ over $S$ we have

$$
f \text { has } \mathcal{P} \Leftrightarrow \text { each } Y_{i} \times_{Y} X \rightarrow Y_{i} \text { has } \mathcal{P} .
$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \rightarrow Y$ if and only if it holds for any arrow $X^{\prime} \rightarrow Y^{\prime}$ isomorphic to $X \rightarrow Y$. If a property is $\tau$-local on the target then it is preserved by base changes by morphisms which occur in $\tau$-coverings. Here is a formal statement.
04QU Lemma 34.18.2. Let $\tau \in\{f p q c$, fppf, syntomic, smooth, étale, Zariski\}. Let $\mathcal{P}$ be a property of morphisms which is $\tau$ local on the target. Let $f: X \rightarrow Y$ have property $\mathcal{P}$. For any morphism $Y^{\prime} \rightarrow Y$ which is flat, resp. flat and locally of finite
presentation, resp. syntomic, resp. étale, resp. an open immersion, the base change $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ of $f$ has property $\mathcal{P}$.

Proof. This is true because we can fit $Y^{\prime} \rightarrow Y$ into a family of morphisms which forms a $\tau$-covering.

A simple often used consequence of the above is that if $f: X \rightarrow Y$ has property $\mathcal{P}$ which is $\tau$-local on the target and $f(X) \subset V$ for some open subscheme $V \subset Y$, then also the induced morphism $X \rightarrow V$ has $\mathcal{P}$. Proof: The base change $f$ by $V \rightarrow Y$ gives $X \rightarrow V$.

06QP Lemma 34.18.3. Let $\tau \in\{f p p f$, syntomic, smooth, étale $\}$. Let $\mathcal{P}$ be a property of morphisms which is $\tau$ local on the target. For any morphism of schemes $f: X \rightarrow Y$ there exists a largest open $W(f) \subset Y$ such that the restriction $X_{W(f)} \rightarrow W(f)$ has $\mathcal{P}$. Moreover,
(1) if $g: Y^{\prime} \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale and the base change $f^{\prime}: X_{Y^{\prime}} \rightarrow Y^{\prime}$ has $\mathcal{P}$, then $g\left(Y^{\prime}\right) \subset W(f)$,
(2) if $g: Y^{\prime} \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale, then $W\left(f^{\prime}\right)=g^{-1}(W(f))$, and
(3) if $\left\{g_{i}: Y_{i} \rightarrow Y\right\}$ is a $\tau$-covering, then $g_{i}^{-1}(W(f))=W\left(f_{i}\right)$, where $f_{i}$ is the base change of $f$ by $Y_{i} \rightarrow Y$.

Proof. Consider the union $W$ of the images $g\left(Y^{\prime}\right) \subset Y$ of morphisms $g: Y^{\prime} \rightarrow Y$ with the properties:
(1) $g$ is flat and locally of finite presentation, syntomic, smooth, or étale, and
(2) the base change $Y^{\prime} \times_{g, Y} X \rightarrow Y^{\prime}$ has property $\mathcal{P}$.

Since such a morphism $g$ is open (see Morphisms, Lemma 28.25.9) we see that $W \subset Y$ is an open subset of $Y$. Since $\mathcal{P}$ is local in the $\tau$ topology the restriction $X_{W} \rightarrow W$ has property $\mathcal{P}$ because we are given a covering $\left\{Y^{\prime} \rightarrow W\right\}$ of $W$ such that the pullbacks have $\mathcal{P}$. This proves the existence and proves that $W(f)$ has property (1). To see property (2) note that $W\left(f^{\prime}\right) \supset g^{-1}(W(f))$ because $\mathcal{P}$ is stable under base change by flat and locally of finite presentation, syntomic, smooth, or étale morphisms, see Lemma 34.18.2. On the other hand, if $Y^{\prime \prime} \subset Y^{\prime}$ is an open such that $X_{Y^{\prime \prime}} \rightarrow Y^{\prime \prime}$ has property $\mathcal{P}$, then $Y^{\prime \prime} \rightarrow Y$ factors through $W$ by construction, i.e., $Y^{\prime \prime} \subset g^{-1}(W(f))$. This proves (2). Assertion (3) follows from (2) because each morphism $Y_{i} \rightarrow Y$ is flat and locally of finite presentation, syntomic, smooth, or étale by our definition of a $\tau$-covering.

02KP Lemma 34.18.4. Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in\{f p q c$, fppf, étale, smooth, syntomic $\}$. Assume that
(1) the property is preserved under flat, flat and locally of finite presentation, étale, smooth, or syntomic base change depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic (compare with Schemes, Definition 25.18.3),
(2) the property is Zariski local on the base.
(3) for any surjective morphism of affine schemes $S^{\prime} \rightarrow S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic, and any morphism of schemes $f: X \rightarrow S$ property $\mathcal{P}$ holds for $f$ if property $\mathcal{P}$ holds for the base change $f^{\prime}: X^{\prime}=S^{\prime} \times_{S} X \rightarrow S^{\prime}$.

Then $\mathcal{P}$ is $\tau$ local on the base.
Proof. This follows almost immediately from the definition of a $\tau$-covering, see Topologies, Definition 33.8.1 33.7.1 33.4.1 33.5.1, or 33.6.1 and Topologies, Lemma 33.8.8, 33.7.4, 33.4.4, 33.5.4, or 33.6.4, Details omitted.

034G Remark 34.18.5. (This is a repeat of Remark 34.11 .3 above.) In Lemma 34.18 .4 above if $\tau=$ smooth then in condition (3) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau=$ syntomic or $\tau=$ étale .
34.19. Properties of morphisms local in the fpqc topology on the target

02YJ In this section we find a large number of properties of morphisms of schemes which are local on the base in the fpqc topology. By contrast, in Examples, Section 88.55 we will show that the properties "projective" and "quasi-projective" are not local on the base even in the Zariski topology.
02KQ Lemma 34.19.1. The property $\mathcal{P}(f)=" f$ is quasi-compact" is fpqc local on the base.

Proof. A base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 25.19.3. Being quasi-compact is Zariski local on the base, see Schemes, Lemma 25.19.2. Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is quasi-compact. Then $X^{\prime}$ is quasi-compact, and $X^{\prime} \rightarrow X$ is surjective. Hence $X$ is quasi-compact. This implies that $f$ is quasi-compact. Therefore Lemma 34.18.4 applies and we win.

02KR Lemma 34.19.2. The property $\mathcal{P}(f)=$ " $f$ is quasi-separated" is fpqc local on the base.

Proof. Any base change of a quasi-separated morphism is quasi-separated, see Schemes, Lemma 25.21.13. Being quasi-separated is Zariski local on the base (from the definition or by Schemes, Lemma 25.21.7). Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is quasi-separated. This means that $\Delta^{\prime}: X^{\prime} \rightarrow X^{\prime} \times{ }_{S^{\prime}} X^{\prime}$ is quasi-compact. Note that $\Delta^{\prime}$ is the base change of $\Delta: X \rightarrow X \times_{S} X$ via $S^{\prime} \rightarrow S$. By Lemma 34.19.1 this implies $\Delta$ is quasi-compact, and hence $f$ is quasi-separated. Therefore Lemma 34.18.4 applies and we win.

02KS Lemma 34.19.3. The property $\mathcal{P}(f)=$ " $f$ is universally closed" is fpqc local on the base.
Proof. A base change of a universally closed morphism is universally closed by definition. Being universally closed is Zariski local on the base (from the definition or by Morphisms, Lemma 28.41 .2 . Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is universally closed. Let $T \rightarrow S$ be any morphism. Consider the diagram

in which both squares are cartesian. Thus the assumption implies that the middle vertical arrow is closed. The right horizontal arrows are flat, quasi-compact and surjective (as base changes of $S^{\prime} \rightarrow S$ ). Hence a subset of $T$ is closed if and only if its inverse image in $S^{\prime} \times{ }_{S} T$ is closed, see Morphisms, Lemma 28.25.10. An easy diagram chase shows that the right vertical arrow is closed too, and we conclude $X \rightarrow S$ is universally closed. Therefore Lemma 34.18.4 applies and we win.

02KT Lemma 34.19.4. The property $\mathcal{P}(f)=$ " $f$ is universally open" is fpqc local on the base.

Proof. The proof is the same as the proof of Lemma 34.19.3.
02KU Lemma 34.19.5. The property $\mathcal{P}(f)=$ " $f$ is separated" is fpqc local on the base.
Proof. A base change of a separated morphism is separated, see Schemes, Lemma 25.21.13. Being separated is Zariski local on the base (from the definition or by Schemes, Lemma 25.21.8). Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is separated. This means that $\Delta^{\prime}: X^{\prime} \rightarrow X^{\prime} \times_{S^{\prime}} X^{\prime}$ is a closed immersion, hence universally closed. Note that $\Delta^{\prime}$ is the base change of $\Delta: X \rightarrow$ $X \times{ }_{S} X$ via $S^{\prime} \rightarrow S$. By Lemma 34.19 .3 this implies $\Delta$ is universally closed. Since it is an immersion (Schemes, Lemma 25.21 .2 ) we conclude $\Delta$ is a closed immersion. Hence $f$ is separated. Therefore Lemma 34.18.4 applies and we win.

02KV Lemma 34.19.6. The property $\mathcal{P}(f)=$ " $f$ is surjective" is fpqc local on the base.
Proof. This is clear.
02KW Lemma 34.19.7. The property $\mathcal{P}(f)=$ " $f$ is universally injective" is fpqc local on the base.

Proof. A base change of a universally injective morphism is universally injective (this is formal). Being universally injective is Zariski local on the base; this is clear from the definition. Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is universally injective. Let $K$ be a field, and let $a, b: \operatorname{Spec}(K) \rightarrow X$ be two morphisms such that $f \circ a=f \circ b$. As $S^{\prime} \rightarrow S$ is surjective and by the discussion in Schemes, Section 25.13 there exists a field extension $K \subset K^{\prime}$ and a morphism $\operatorname{Spec}\left(K^{\prime}\right) \rightarrow S^{\prime}$ such that the following solid diagram commutes

As the square is cartesian we get the two dotted arrows $a^{\prime}, b^{\prime}$ making the diagram commute. Since $X^{\prime} \rightarrow S^{\prime}$ is universally injective we get $a^{\prime}=b^{\prime}$, by Morphisms, Lemma 28.11.2. Clearly this forces $a=b$ (by the discussion in Schemes, Section 25.13). Therefore Lemma 34.18.4 applies and we win.

An alternative proof would be to use the characterization of a universally injective morphism as one whose diagonal is surjective, see Morphisms, Lemma 28.11.2. The lemma then follows from the fact that the property of being surjective is fpqc local on the base, see Lemma 34.19.6. (Hint: use that the base change of the diagonal is the diagonal of the base change.)
02KX Lemma 34.19.8. The property $\mathcal{P}(f)=$ " $f$ is locally of finite type" is fpqc local on the base.

Proof. Being locally of finite type is preserved under base change, see Morphisms, Lemma 28.15.4 Being locally of finite type is Zariski local on the base, see Morphisms, Lemma 28.15.2. Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is locally of finite type. Let $U \subset X$ be an affine open. Then $U^{\prime}=S^{\prime} \times{ }_{S} U$ is affine and of finite type over $S^{\prime}$. Write $S=\operatorname{Spec}(R), S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$, $U=\operatorname{Spec}(A)$, and $U^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. We know that $R \rightarrow R^{\prime}$ is faithfully flat, $A^{\prime}=R^{\prime} \otimes_{R} A$ and $R^{\prime} \rightarrow A^{\prime}$ is of finite type. We have to show that $R \rightarrow A$ is of finite type. This is the result of Algebra, Lemma 10.125.1. It follows that $f$ is locally of finite type. Therefore Lemma 34.18.4 applies and we win.

02KY Lemma 34.19.9. The property $\mathcal{P}(f)=$ " $f$ is locally of finite presentation" is fpqc local on the base.

Proof. Being locally of finite presentation is preserved under base change, see Morphisms, Lemma 28.21.4. Being locally of finite type is Zariski local on the base, see Morphisms, Lemma 28.21.2. Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is locally of finite presentation. Let $U \subset X$ be an affine open. Then $U^{\prime}=S^{\prime} \times{ }_{S} U$ is affine and of finite type over $S^{\prime}$. Write $S=\operatorname{Spec}(R)$, $S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right), U=\operatorname{Spec}(A)$, and $U^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. We know that $R \rightarrow R^{\prime}$ is faithfully flat, $A^{\prime}=R^{\prime} \otimes_{R} A$ and $R^{\prime} \rightarrow A^{\prime}$ is of finite presentation. We have to show that $R \rightarrow A$ is of finite presentation. This is the result of Algebra, Lemma 10.125 .2 , It follows that $f$ is locally of finite presentation. Therefore Lemma 34.18.4 applies and we win.

02KZ Lemma 34.19.10. The property $\mathcal{P}(f)=" f$ is of finite type" is fpqc local on the base.

Proof. Combine Lemmas 34.19.1 and 34.19.8.
02L0 Lemma 34.19.11. The property $\mathcal{P}(f)=$ " $f$ is of finite presentation" is fpqc local on the base.

Proof. Combine Lemmas 34.19.1 34.19.2 and 34.19.9.
02L1 Lemma 34.19.12. The property $\mathcal{P}(f)=$ " $f$ is proper" is fpqc local on the base.
Proof. The lemma follows by combining Lemmas 34.19.3, 34.19.5 and 34.19.10.
02L2 Lemma 34.19.13. The property $\mathcal{P}(f)=$ " $f$ is flat" is fpqc local on the base.
Proof. Being flat is preserved under arbitrary base change, see Morphisms, Lemma 28.25.7. Being flat is Zariski local on the base by definition. Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is flat. Let $U \subset X$ be an affine open.

Then $U^{\prime}=S^{\prime} \times{ }_{S} U$ is affine. Write $S=\operatorname{Spec}(R), S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right), U=\operatorname{Spec}(A)$, and $U^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. We know that $R \rightarrow R^{\prime}$ is faithfully flat, $A^{\prime}=R^{\prime} \otimes_{R} A$ and $R^{\prime} \rightarrow A^{\prime}$ is flat. Goal: Show that $R \rightarrow A$ is flat. This follows immediately from Algebra, Lemma 10.38.8, Hence $f$ is flat. Therefore Lemma 34.18.4 applies and we win.

02L3 Lemma 34.19.14. The property $\mathcal{P}(f)=" f$ is an open immersion" is fpqc local on the base.

Proof. The property of being an open immersion is stable under base change, see Schemes, Lemma 25.18.2. The property of being an open immersion is Zariski local on the base (this is obvious). Finally, let $S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is an open immersion. Then $f^{\prime}$ is universally open, and universally injective. Hence we conclude that $f$ is universally open by Lemma 34.19.4 and universally injective by Lemma 34.19.7. In particular $f(X) \subset S$ is open, and we may replace $S$ by $f(S)$ and assume that $f$ is surjective. This implies that $f^{\prime}$ is an isomorphism and we have to show that $f$ is an isomorphism also. Since $f$ is universally injective we see that $f$ is bijective. Hence $f$ is a homeomorphism. Let $x \in X$ and choose $U \subset X$ an affine open neighbourhood of $x$. Since $f(U) \subset S$ is open, and $S$ is affine we may choose a standard open $D(g) \subset f(U)$ containing $f(x)$ where $g \in \Gamma\left(S, \mathcal{O}_{S}\right)$. It is clear that $U \cap f^{-1}(D(g))$ is still affine and still an open neighbourhood of $x$. Replace $U$ by $U \cap f^{-1}(D(g))$ and write $V=D(g) \subset S$ and $V^{\prime}$ the inverse image of $V$ in $S^{\prime}$. Note that $V^{\prime}$ is a standard open of $S^{\prime}$ as well and in particular that $V^{\prime}$ is affine. Since $f^{\prime}$ is an isomorphism we have $V^{\prime} \times{ }_{V} U \rightarrow V^{\prime}$ is an isomorphism. In terms of rings this means that

$$
\mathcal{O}\left(V^{\prime}\right) \longrightarrow \mathcal{O}\left(V^{\prime}\right) \otimes_{\mathcal{O}(V)} \mathcal{O}(U)
$$

is an isomorphism. Since $\mathcal{O}(V) \rightarrow \mathcal{O}\left(V^{\prime}\right)$ is faithfully flat this implies that $\mathcal{O}(V) \rightarrow$ $\mathcal{O}(U)$ is an isomorphism. Hence $U \cong V$ and we see that $f$ is an isomorphism. Therefore Lemma 34.18 .4 applies and we win.

02L4 Lemma 34.19.15. The property $\mathcal{P}(f)=" f$ is an isomorphism" is fpqc local on the base.

Proof. Combine Lemmas 34.19.6 and 34.19.14
02L5 Lemma 34.19.16. The property $\mathcal{P}(f)=$ " $f$ is affine" is fpqc local on the base.
Proof. A base change of an affine morphism is affine, see Morphisms, Lemma 28.12.8. Being affine is Zariski local on the base, see Morphisms, Lemma 28.12.3. Finally, let $g: S^{\prime} \rightarrow S$ be a flat surjective morphism of affine schemes, and let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is affine. In other words, $X^{\prime}$ is affine, say $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. Also write $S=\operatorname{Spec}(R)$ and $S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$. We have to show that $X$ is affine.

By Lemmas 34.19.1 and 34.19.5 we see that $X \rightarrow S$ is separated and quasi-compact. Thus $f_{*} \mathcal{O}_{X}$ is a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras, see Schemes, Lemma 25.24.1. Hence $f_{*} \mathcal{O}_{X}=\widetilde{A}$ for some $R$-algebra $A$. In fact $A=\Gamma\left(X, \mathcal{O}_{X}\right)$ of course. Also, by flat base change (see for example Cohomology of Schemes, Lemma 29.5.2) we have $g^{*} f_{*} \mathcal{O}_{X}=f_{*}^{\prime} \mathcal{O}_{X^{\prime}}$. In other words, we have $A^{\prime}=R^{\prime} \otimes_{R} A$. Consider the canonical morphism

$$
X \longrightarrow \operatorname{Spec}(A)
$$

over $S$ from Schemes, Lemma 25.6.4 By the above the base change of this morphism to $S^{\prime}$ is an isomorphism. Hence it is an isomorphism by Lemma 34.19.15. Therefore Lemma 34.18 .4 applies and we win.
02L6 Lemma 34.19.17. The property $\mathcal{P}(f)=" f$ is a closed immersion" is fpqc local on the base.

Proof. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{Y_{i} \rightarrow Y\right\}$ be an fpqc covering. Assume that each $f_{i}: Y_{i} \times_{Y} X \rightarrow Y_{i}$ is a closed immersion. This implies that each $f_{i}$ is affine, see Morphisms, Lemma 28.12.9. By Lemma 34.19.16 we conclude that $f$ is affine. It remains to show that $\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$ is surjective. For every $y \in Y$ there exists an $i$ and a point $y_{i} \in Y_{i}$ mapping to $y$. By Cohomology of Schemes, Lemma 29.5 .2 the sheaf $f_{i, *}\left(\mathcal{O}_{Y_{i} \times_{Y} X}\right)$ is the pullback of $f_{*} \mathcal{O}_{X}$. By assumption it is a quotient of $\mathcal{O}_{Y_{i}}$. Hence we see that

$$
\left(\mathcal{O}_{Y, y} \longrightarrow\left(f_{*} \mathcal{O}_{X}\right)_{y}\right) \otimes_{\mathcal{O}_{Y, y}} \mathcal{O}_{Y_{i}, y_{i}}
$$

is surjective. Since $\mathcal{O}_{Y_{i}, y_{i}}$ is faithfully flat over $\mathcal{O}_{Y, y}$ this implies the surjectivity of $\mathcal{O}_{Y, y} \longrightarrow\left(f_{*} \mathcal{O}_{X}\right)_{y}$ as desired.
02L7 Lemma 34.19.18. The property $\mathcal{P}(f)=$ " $f$ is quasi-affine" is fpqc local on the base.

Proof. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{g_{i}: Y_{i} \rightarrow Y\right\}$ be an fpqc covering. Assume that each $f_{i}: Y_{i} \times_{Y} X \rightarrow Y_{i}$ is quasi-affine. This implies that each $f_{i}$ is quasi-compact and separated. By Lemmas 34.19.1 and 34.19.5 this implies that $f$ is quasi-compact and separated. Consider the sheaf of $\mathcal{O}_{Y^{-}}$ algebras $\mathcal{A}=f_{*} \mathcal{O}_{X}$. By Schemes, Lemma 25.24 .1 it is a quasi-coherent $\mathcal{O}_{Y}$-algebra. Consider the canonical morphism

$$
j: X \longrightarrow \underline{\operatorname{Spec}}_{Y}(\mathcal{A})
$$

see Constructions, Lemma 26.4.7. By flat base change (see for example Cohomology of Schemes, Lemma 29.5.2 we have $g_{i}^{*} f_{*} \mathcal{O}_{X}=f_{i, *} \mathcal{O}_{X^{\prime}}$ where $g_{i}: Y_{i} \rightarrow Y$ are the given flat maps. Hence the base change $j_{i}$ of $j$ by $g_{i}$ is the canonical morphism of Constructions, Lemma 26.4.7 for the morphism $f_{i}$. By assumption and Morphisms, Lemma 28.13.3 all of these morphisms $j_{i}$ are quasi-compact open immersions. Hence, by Lemmas 34.19.1 and 34.19.14 we see that $j$ is a quasi-compact open immersion. Hence by Morphisms, Lemma 28.13.3 again we conclude that $f$ is quasi-affine.
02L8 Lemma 34.19.19. The property $\mathcal{P}(f)=" f$ is a quasi-compact immersion" is fpqc local on the base.

Proof. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{Y_{i} \rightarrow Y\right\}$ be an fpqc covering. Write $X_{i}=Y_{i} \times_{Y} X$ and $f_{i}: X_{i} \rightarrow Y_{i}$ the base change of $f$. Also denote $q_{i}: Y_{i} \rightarrow Y$ the given flat morphisms. Assume each $f_{i}$ is a quasi-compact immersion. By Schemes, Lemma 25.23 .7 each $f_{i}$ is separated. By Lemmas 34.19.1 and 34.19.5 this implies that $f$ is quasi-compact and separated. Let $X \rightarrow Z \rightarrow Y$ be the factorization of $f$ through its scheme theoretic image. By Morphisms, Lemma 28.6 .3 the closed subscheme $Z \subset Y$ is cut out by the quasi-coherent sheaf of ideals $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}\right)$ as $f$ is quasi-compact. By flat base change (see for example Cohomology of Schemes, Lemma 29.5.2 here we use $f$ is separated) we see $f_{i, *} \mathcal{O}_{X_{i}}$ is the pullback $q_{i}^{*} f_{*} \mathcal{O}_{X}$. Hence $\overline{Y_{i}} \times_{Y} Z$ is cut out by the quasi-coherent sheaf of
ideals $q_{i}^{*} \mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y_{i}} \rightarrow f_{i, *} \mathcal{O}_{X_{i}}\right)$. By Morphisms, Lemma 28.7.7 the morphisms $X_{i} \rightarrow Y_{i} \times_{Y} Z$ are open immersions. Hence by Lemma 34.19.14 we see that $X \rightarrow Z$ is an open immersion and hence $f$ is a immersion as desired (we already saw it was quasi-compact).
02L9 Lemma 34.19.20. The property $\mathcal{P}(f)=$ " $f$ is integral" is fpqc local on the base.
Proof. An integral morphism is the same thing as an affine, universally closed morphism. See Morphisms, Lemma 28.43.7. Hence the lemma follows on combining Lemmas 34.19.3 and 34.19.16

02LA Lemma 34.19.21. The property $\mathcal{P}(f)=" f$ is finite" is fpqc local on the base.
Proof. An finite morphism is the same thing as an integral morphism which is locally of finite type. See Morphisms, Lemma 28.43.4. Hence the lemma follows on combining Lemmas 34.19.8 and 34.19.20.
02VI Lemma 34.19.22. The properties $\mathcal{P}(f)=" f$ is locally quasi-finite" and $\mathcal{P}(f)=" f$ is quasi-finite" are fpqc local on the base.

Proof. Let $f: X \rightarrow S$ be a morphism of schemes, and let $\left\{S_{i} \rightarrow S\right\}$ be an fpqc covering such that each base change $f_{i}: X_{i} \rightarrow S_{i}$ is locally quasi-finite. We have already seen (Lemma 34.19.8) that "locally of finite type" is fpqc local on the base, and hence we see that $f$ is locally of finite type. Then it follows from Morphisms, Lemma 28.20.13 that $f$ is locally quasi-finite. The quasi-finite case follows as we have already seen that "quasi-compact" is fpqc local on the base (Lemma 34.19.1).

02VJ Lemma 34.19.23. The property $\mathcal{P}(f)=" f$ is locally of finite type of relative dimension $d$ " is fpqc local on the base.

Proof. This follows immediately from the fact that being locally of finite type is fpqc local on the base and Morphisms, Lemma 28.28.3.

02VK Lemma 34.19.24. The property $\mathcal{P}(f)=$ " $f$ is syntomic" is fpqc local on the base.
Proof. A morphism is syntomic if and only if it is locally of finite presentation, flat, and has locally complete intersections as fibres. We have seen already that being flat and locally of finite presentation are fpqc local on the base (Lemmas 34.19.13, and 34.19 .9 . Hence the result follows for syntomic from Morphisms, Lemma 28.31.12

02VL Lemma 34.19.25. The property $\mathcal{P}(f)=" f$ is smooth" is fpqc local on the base.
Proof. A morphism is smooth if and only if it is locally of finite presentation, flat, and has smooth fibres. We have seen already that being flat and locally of finite presentation are fpqc local on the base (Lemmas 34.19.13, and 34.19.9). Hence the result follows for smooth from Morphisms, Lemma 28.34.15.

02VM Lemma 34.19.26. The property $\mathcal{P}(f)=$ " $f$ is unramified" is fpqc local on the base. The property $\mathcal{P}(f)=" f$ is $G$-unramified" is fpqc local on the base.

Proof. A morphism is unramified (resp. G-unramified) if and only if it is locally of finite type (resp. finite presentation) and its diagonal morphism is an open immersion (see Morphisms, Lemma 28.35.13). We have seen already that being locally of finite type (resp. locally of finite presentation) and an open immersion is fpqc
local on the base (Lemmas 34.19.9, 34.19.8, and 34.19.14. Hence the result follows formally.

02VN Lemma 34.19.27. The property $\mathcal{P}(f)=$ " $f$ is étale" is fpqc local on the base.
Proof. A morphism is étale if and only if it flat and G-unramified. See Morphisms, Lemma 28.36.16. We have seen already that being flat and G-unramified are fpqc local on the base (Lemmas 34.19 .13 , and 34.19 .26 ). Hence the result follows.

02VO Lemma 34.19.28. The property $\mathcal{P}(f)=$ " $f$ is finite locally free" is fpqc local on the base. Let $d \geq 0$. The property $\mathcal{P}(f)=" f$ is finite locally free of degree $d "$ is fpqc local on the base.

Proof. Being finite locally free is equivalent to being finite, flat and locally of finite presentation (Morphisms, Lemma 28.45.2). Hence this follows from Lemmas 34.19.21, 34.19.13, and 34.19.9. If $f: Z \rightarrow U$ is finite locally free, and $\left\{U_{i} \rightarrow U\right\}$ is a surjective family of morphisms such that each pullback $Z \times_{U} U_{i} \rightarrow U_{i}$ has degree $d$, then $Z \rightarrow U$ has degree $d$, for example because we can read off the degree in a point $u \in U$ from the fibre $\left(f_{*} \mathcal{O}_{Z}\right)_{u} \otimes_{\mathcal{O}_{U, u}} \kappa(u)$.

02YK Lemma 34.19.29. The property $\mathcal{P}(f)=$ " $f$ is a monomorphism" is fpqc local on the base.

Proof. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\left\{S_{i} \rightarrow S\right\}$ be an fpqc covering, and assume each of the base changes $f_{i}: X_{i} \rightarrow S_{i}$ of $f$ is a monomorphism. Let $a, b: T \rightarrow X$ be two morphisms such that $f \circ a=f \circ b$. We have to show that $a=b$. Since $f_{i}$ is a monomorphism we see that $a_{i}=b_{i}$, where $a_{i}, b_{i}: S_{i} \times_{S} T \rightarrow X_{i}$ are the base changes. In particular the compositions $S_{i} \times_{S} T \rightarrow T \rightarrow X$ are equal. Since $\coprod S_{i} \times_{S} T \rightarrow T$ is an epimorphism (see e.g. Lemma 34.9.3) we conclude $a=b$.

0694 Lemma 34.19.30. The properties
$\mathcal{P}(f)=" f$ is a Koszul-regular immersion",
$\mathcal{P}(f)=" f$ is an $H_{1}$-regular immersion", and
$\mathcal{P}(f)=" f$ is a quasi-regular immersion"
are fpqc local on the base.
Proof. We will use the criterion of Lemma 34.18 .4 to prove this. By Divisors, Definition 30.18 .1 being a Koszul-regular (resp. $H_{1}$-regular, quasi-regular) immersion is Zariski local on the base. By Divisors, Lemma 30.18.4 being a Koszul-regular (resp. $H_{1}$-regular, quasi-regular) immersion is preserved under flat base change. The final hypothesis (3) of Lemma 34.18 .4 translates into the following algebra statement: Let $A \rightarrow B$ be a faithfully flat ring map. Let $I \subset A$ be an ideal. If $I B$ is locally on $\operatorname{Spec}(B)$ generated by a Koszul-regular (resp. $H_{1}$-regular, quasi-regular) sequence in $B$, then $I \subset A$ is locally on $\operatorname{Spec}(A)$ generated by a Koszul-regular (resp. $H_{1}$-regular, quasi-regular) sequence in $A$. This is More on Algebra, Lemma 15.24 .4
34.20. Properties of morphisms local in the fppf topology on the target

02 YL In this section we find some properties of morphisms of schemes for which we could not (yet) show they are local on the base in the fpqc topology which, however, are local on the base in the fppf topology.

02YM Lemma 34.20.1. The property $\mathcal{P}(f)=" f$ is an immersion" is fppf local on the base.

Proof. The property of being an immersion is stable under base change, see Schemes, Lemma 25.18.2. The property of being an immersion is Zariski local on the base. Finally, let $\pi: S^{\prime} \rightarrow S$ be a surjective morphism of affine schemes, which is flat and locally of finite presentation. Note that $\pi: S^{\prime} \rightarrow S$ is open by Morphisms, Lemma 28.25.9. Let $f: X \rightarrow S$ be a morphism. Assume that the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is an immersion. In particular we see that $f^{\prime}\left(X^{\prime}\right)=\pi^{-1}(f(X))$ is locally closed. Hence by Topology, Lemma 5.5.4 we see that $f(X) \subset S$ is locally closed. Let $Z \subset S$ be the closed subset $Z=f(X) \backslash f(X)$. By Topology, Lemma 5.5.4 again we see that $f^{\prime}\left(X^{\prime}\right)$ is closed in $S^{\prime} \backslash Z^{\prime}$. Hence we may apply Lemma 34.19.17 to the fpqc covering $\left\{S^{\prime} \backslash Z^{\prime} \rightarrow S \backslash Z\right\}$ and conclude that $f: X \rightarrow S \backslash Z$ is a closed immersion. In other words, $f$ is an immersion. Therefore Lemma 34.18.4 applies and we win.

### 34.21. Application of fpqc descent of properties of morphisms

02LB The following lemma may seem a bit frivolous but turns out is a useful tool in studying étale and unramified morphisms.

06NC Lemma 34.21.1. Let $f: X \rightarrow Y$ be a flat, quasi-compact, surjective monomorphism. Then $f$ is an isomorphism.
Proof. As $f$ is a flat, quasi-compact, surjective morphism we see $\{X \rightarrow Y\}$ is an fpqc covering of $Y$. The diagonal $\Delta: X \rightarrow X \times_{Y} X$ is an isomorphism. This implies that the base change of $f$ by $f$ is an isomorphism. Hence we see $f$ is an isomorphism by Lemma 34.19.15

We can use this lemma to show the following important result; we also give a proof avoiding fpqc descent. We will discuss this and related results in more detail in Étale Morphisms, Section 40.14

02LC Lemma 34.21.2. A universally injective étale morphism is an open immersion.
First proof. Let $f: X \rightarrow Y$ be an étale morphism which is universally injective. Then $f$ is open (Morphisms, Lemma 28.36.13) hence we can replace $Y$ by $f(X)$ and we may assume that $f$ is surjective. Then $f$ is bijective and open hence a homeomorphism. Hence $f$ is quasi-compact. Thus by Lemma 34.21.1 it suffices to show that $f$ is a monomorphism. As $X \rightarrow Y$ is étale the morphism $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is an open immersion by Morphisms, Lemma 28.35 .13 (and Morphisms, Lemma 28.36.16). As $f$ is universally injective $\Delta_{X / Y}$ is also surjective, see Morphisms, Lemma 28.11.2. Hence $\Delta_{X / Y}$ is an isomorphism, i.e., $X \rightarrow Y$ is a monomorphism.

Second proof. Let $f: X \rightarrow Y$ be an étale morphism which is universally injective. Then $f$ is open (Morphisms, Lemma 28.36.13) hence we can replace $Y$ by $f(X)$ and we may assume that $f$ is surjective. Since the hypotheses remain satisfied after any base change, we conclude that $f$ is a universal homeomorphism. Therefore $f$ is integral, see Morphisms, Lemma 28.44.3. It follows that $f$ is finite by Morphisms, Lemma 28.43.4. It follows that $f$ is finite locally free by Morphisms, Lemma 28.45.2. To finish the proof, it suffices that $f$ is finite locally free of degree 1 (a finite locally free morphism of degree 1 is an isomorphism). There is decomposition of $Y$ into
open and closed subschemes $V_{d}$ such that $f^{-1}\left(V_{d}\right) \rightarrow V_{d}$ is finite locally free of degree $d$, see Morphisms, Lemma 28.45.5. If $V_{d}$ is not empty, we can pick a morphism $\operatorname{Spec}(k) \rightarrow V_{d} \subset Y$ where $k$ is an algebraically closed field (just take the algebraic closure of the residue field of some point of $\left.V_{d}\right)$. Then $\operatorname{Spec}(k) \times_{Y} X \rightarrow \operatorname{Spec}(k)$ is a disjoint union of copies of $\operatorname{Spec}(k)$, by Morphisms, Lemma 28.36 .7 and the fact that $k$ is algebraically closed. However, since $f$ is universally injective, there can only be one copy and hence $d=1$ as desired.

We can reformulate the hypotheses in the lemma above a bit by using the following characterization of flat universally injective morphisms.

09NP Lemma 34.21.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $X^{0}$ denote the set of generic points of irreducible components of $X$. If
(1) $f$ is flat and separated,
(2) for $\xi \in X^{0}$ we have $\kappa(f(\xi))=\kappa(\xi)$, and
(3) if $\xi, \xi^{\prime} \in X^{0}, \xi \neq \xi^{\prime}$, then $f(\xi) \neq f\left(\xi^{\prime}\right)$,
then $f$ is universally injective.
Proof. We have to show that $\Delta: X \rightarrow X \times_{Y} X$ is surjective, see Morphisms, Lemma 28.11.2. As $X \rightarrow Y$ is separated, the image of $\Delta$ is closed. Thus if $\Delta$ is not surjective, we can find a generic point $\eta \in X \times_{S} X$ of an irreducible component of $X \times_{S} X$ which is not in the image of $\Delta$. The projection $\operatorname{pr}_{1}: X \times_{Y} X \rightarrow X$ is flat as a base change of the flat morphism $X \rightarrow Y$, see Morphisms, Lemma 28.25.7. Hence generalizations lift along $\mathrm{pr}_{1}$, see Morphisms, Lemma 28.25.8. We conclude that $\xi=\operatorname{pr}_{1}(\eta) \in X^{0}$. However, assumptions (2) and (3) guarantee that the scheme $\left(X \times_{Y} X\right)_{f(\xi)}$ has at most one point for every $\xi \in X^{0}$. In other words, we have $\Delta(\xi)=\eta$ a contradiction.

Thus we can reformulate Lemma 34.21 .2 as follows.
09NQ Lemma 34.21.4. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $X^{0}$ denote the set of generic points of irreducible components of $X$. If
(1) $f$ is étale and separated,
(2) for $\xi \in X^{0}$ we have $\kappa(f(\xi))=\kappa(\xi)$, and
(3) if $\xi, \xi^{\prime} \in X^{0}, \xi \neq \xi^{\prime}$, then $f(\xi) \neq f\left(\xi^{\prime}\right)$,
then $f$ is an open immersion.
Proof. Immediate from Lemmas 34.21 .3 and 34.21 .2 ,

### 34.22. Properties of morphisms local on the source

036 F It often happens one can prove a morphism has a certain property after precomposing with some other morphism. In many cases this implies the morphism has the property too. We formalize this in the following definition.

036G Definition 34.22.1. Let $\mathcal{P}$ be a property of morphisms of schemes. Let $\tau \in$ $\{$ Zariski, fpqc, fppf, étale, smooth, syntomic \}. We say $\mathcal{P}$ is $\tau$ local on the source, or local on the source for the $\tau$-topology if for any morphism of schemes $f: X \rightarrow Y$ over $S$, and any $\tau$-covering $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ we have

$$
f \text { has } \mathcal{P} \Leftrightarrow \text { each } X_{i} \rightarrow Y \text { has } \mathcal{P} .
$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \rightarrow Y$ if and only if it holds for any arrow $X^{\prime} \rightarrow Y^{\prime}$ isomorphic to $X \rightarrow Y$. If a property is $\tau$-local on the source then it is preserved by precomposing with morphisms which occur in $\tau$-coverings. Here is a formal statement.

04QV Lemma 34.22.2. Let $\tau \in\{f p q c$, fppf, syntomic, smooth, étale, Zariski $\}$. Let $\mathcal{P}$ be a property of morphisms which is $\tau$ local on the source. Let $f: X \rightarrow Y$ have property $\mathcal{P}$. For any morphism $a: X^{\prime} \rightarrow X$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. étale, resp. an open immersion, the composition $f \circ a: X^{\prime} \rightarrow Y$ has property $\mathcal{P}$.

Proof. This is true because we can fit $X^{\prime} \rightarrow X$ into a family of morphisms which forms a $\tau$-covering.

036H Lemma 34.22.3. Let $\mathcal{P}$ be a property of morphisms of schemes. Let $\tau \in\{f p q c$, fppf, étale, smooth, syntomic\}. Assume that
(1) the property is preserved under precomposing with flat, flat locally of finite presentation, étale, smooth or syntomic morphisms depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic,
(2) the property is Zariski local on the source,
(3) the property is Zariski local on the target,
(4) for any morphism of affine schemes $X \rightarrow Y$, and any surjective morphism of affine schemes $X^{\prime} \rightarrow X$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic, property $\mathcal{P}$ holds for $f$ if property $\mathcal{P}$ holds for the composition $f^{\prime}: X^{\prime} \rightarrow Y$.
Then $\mathcal{P}$ is $\tau$ local on the source.
Proof. This follows almost immediately from the definition of a $\tau$-covering, see Topologies, Definition 33.8.1 33.7.1 33.4.1 33.5.1, or 33.6.1 and Topologies, Lemma $33.8 .8,33.7 .4,33.4 .4,33.5 .4$, or 33.6 .4 Details omitted. (Hint: Use locality on the source and target to reduce the verification of property $\mathcal{P}$ to the case of a morphism between affines. Then apply (1) and (4).)

036I Remark 34.22.4. (This is a repeat of Remarks 34.11 .3 and 34.18 .5 above.) In Lemma 34.22 .3 above if $\tau=$ smooth then in condition (4) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau=$ syntomic or $\tau=$ étale.

### 34.23. Properties of morphisms local in the fpqc topology on the source

036J Here are some properties of morphisms that are fpqc local on the source.
036 K Lemma 34.23.1. The property $\mathcal{P}(f)=$ " $f$ is flat" is fpqc local on the source.
Proof. Since flatness is defined in terms of the maps of local rings (Morphisms, Definition 28.25.1 what has to be shown is the following algebraic fact: Suppose $A \rightarrow B \rightarrow C$ are local homomorphisms of local rings, and assume $B \rightarrow C$ are flat. Then $A \rightarrow B$ is flat if and only if $A \rightarrow C$ is flat. If $A \rightarrow B$ is flat, then $A \rightarrow C$ is flat by Algebra, Lemma 10.38.4. Conversely, assume $A \rightarrow C$ is flat. Note that $B \rightarrow C$ is faithfully flat, see Algebra, Lemma 10.38.17. Hence $A \rightarrow B$ is flat by Algebra, Lemma 10.38.10. (Also see Morphisms, Lemma 28.25.11 for a direct proof.)
34.25. PROPERTIES OF MORPHISMS LOCAL IN THE SYNTOMIC TOPOLOGY ON THE SOURK9

036L Lemma 34.23.2. Then property $\mathcal{P}(f: X \rightarrow Y)=$ "for every $x \in X$ the map of local rings $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is injective" is fpqc local on the source.

Proof. Omitted. This is just a (probably misguided) attempt to be playful.
34.24. Properties of morphisms local in the fppf topology on the source

036M Here are some properties of morphisms that are fppf local on the source.
036N Lemma 34.24.1. The property $\mathcal{P}(f)=" f$ is locally of finite presentation" is fppf local on the source.

Proof. Being locally of finite presentation is Zariski local on the source and the target, see Morphisms, Lemma 28.21.2. It is a property which is preserved under composition, see Morphisms, Lemma 28.21.3. This proves (1), (2) and (3) of Lemma 34.22 .3 . The final condition (4) is Lemma 34.10.1. Hence we win.

036O Lemma 34.24.2. The property $\mathcal{P}(f)=" f$ is locally of finite type" is fppf local on the source.

Proof. Being locally of finite type is Zariski local on the source and the target, see Morphisms, Lemma 28.15.2. It is a property which is preserved under composition, see Morphisms, Lemma 28.15.3, and a flat morphism locally of finite presentation is locally of finite type, see Morphisms, Lemma 28.21.8. This proves (1), (2) and (3) of Lemma 34.22.3. The final condition (4) is Lemma 34.10.2. Hence we win.

036P Lemma 34.24.3. The property $\mathcal{P}(f)=" f$ is open" is fppf local on the source.
Proof. Being an open morphism is clearly Zariski local on the source and the target. It is a property which is preserved under composition, see Morphisms, Lemma 28.23 .3 , and a flat morphism of finite presentation is open, see Morphisms, Lemma 28.25.9 This proves (1), (2) and (3) of Lemma 34.22.3. The final condition (4) follows from Morphisms, Lemma 28.25.10. Hence we win.

036Q Lemma 34.24.4. The property $\mathcal{P}(f)=" f$ is universally open" is fppf local on the source.

Proof. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering. Denote $f_{i}: X_{i} \rightarrow X$ the compositions. We have to show that $f$ is universally open if and only if each $f_{i}$ is universally open. If $f$ is universally open, then also each $f_{i}$ is universally open since the maps $X_{i} \rightarrow X$ are universally open and compositions of universally open morphisms are universally open (Morphisms, Lemmas 28.25 .9 and 28.23.3. Conversely, assume each $f_{i}$ is universally open. Let $Y^{\prime} \rightarrow Y$ be a morphism of schemes. Denote $X^{\prime}=Y^{\prime} \times_{Y} X$ and $X_{i}^{\prime}=Y^{\prime} \times_{Y} X_{i}$. Note that $\left\{X_{i}^{\prime} \rightarrow X^{\prime}\right\}_{i \in I}$ is an fppf covering also. The morphisms $f_{i}^{\prime}: X_{i}^{\prime} \rightarrow Y^{\prime}$ are open by assumption. Hence by the Lemma 34.24 .3 above we conclude that $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is open as desired.

### 34.25. Properties of morphisms local in the syntomic topology on the source

036R Here are some properties of morphisms that are syntomic local on the source.
036S Lemma 34.25.1. The property $\mathcal{P}(f)=" f$ is syntomic" is syntomic local on the source.

Proof. Combine Lemma 34.22 .3 with Morphisms, Lemma 28.31 .2 (local for Zariski on source and target), Morphisms, Lemma 28.31 .3 (pre-composing), and Lemma 34.10.4 (part (4)).

### 34.26. Properties of morphisms local in the smooth topology on the source

036 T Here are some properties of morphisms that are smooth local on the source.
036U Lemma 34.26.1. The property $\mathcal{P}(f)=$ " $f$ is smooth" is smooth local on the source.
Proof. Combine Lemma 34.22 .3 with Morphisms, Lemma 28.34 .2 (local for Zariski on source and target), Morphisms, Lemma 28.34 .4 (pre-composing), and Lemma 34.10.4 (part (4)).

### 34.27. Properties of morphisms local in the étale topology on the source

036 V Here are some properties of morphisms that are étale local on the source.
036W Lemma 34.27.1. The property $\mathcal{P}(f)=$ " $f$ is étale" is étale local on the source.
Proof. Combine Lemma 34.22 .3 with Morphisms, Lemma 28.36 .2 (local for Zariski on source and target), Morphisms, Lemma 28.36 .3 (pre-composing), and Lemma 34.10.4 (part (4)).

03X4 Lemma 34.27.2. The property $\mathcal{P}(f)=" f$ is locally quasi-finite" is étale local on the source.

Proof. We are going to use Lemma 34.22.3. By Morphisms, Lemma 28.20.11 the property of being locally quasi-finite is local for Zariski on source and target. By Morphisms, Lemmas 28.20 .12 and 28.36 .6 we see the precomposition of a locally quasi-finite morphism by an étale morphism is locally quasi-finite. Finally, suppose that $X \rightarrow Y$ is a morphism of affine schemes and that $X^{\prime} \rightarrow X$ is a surjective étale morphism of affine schemes such that $X^{\prime} \rightarrow Y$ is locally quasi-finite. Then $X^{\prime} \rightarrow Y$ is of finite type, and by Lemma 34.10 .2 we see that $X \rightarrow Y$ is of finite type also. Moreover, by assumption $X^{\prime} \rightarrow Y$ has finite fibres, and hence $X \rightarrow Y$ has finite fibres also. We conclude that $X \rightarrow Y$ is quasi-finite by Morphisms, Lemma 28.20.10. This proves the last assumption of Lemma 34.22 .3 and finishes the proof.

03YV Lemma 34.27.3. The property $\mathcal{P}(f)=" f$ is unramified" is étale local on the source. The property $\mathcal{P}(f)=" f$ is G-unramified" is étale local on the source.

Proof. We are going to use Lemma 34.22 .3 . By Morphisms, Lemma 28.35 .3 the property of being unramified (resp. G-unramified) is local for Zariski on source and target. By Morphisms, Lemmas 28.35 .4 and 28.36 .5 we see the precomposition of an unramified (resp. G-unramified) morphism by an étale morphism is unramified (resp. G-unramified). Finally, suppose that $X \rightarrow Y$ is a morphism of affine schemes and that $f: X^{\prime} \rightarrow X$ is a surjective étale morphism of affine schemes such that $X^{\prime} \rightarrow Y$ is unramified (resp. G-unramified). Then $X^{\prime} \rightarrow Y$ is of finite type (resp. finite presentation), and by Lemma 34.10 .2 (resp. Lemma 34.10 .1 ) we see that
$X \rightarrow Y$ is of finite type (resp. finite presentation) also. By Morphisms, Lemma 28.34 .16 we have a short exact sequence

$$
0 \rightarrow f^{*} \Omega_{X / Y} \rightarrow \Omega_{X^{\prime} / Y} \rightarrow \Omega_{X^{\prime} / X} \rightarrow 0
$$

As $X^{\prime} \rightarrow Y$ is unramified we see that the middle term is zero. Hence, as $f$ is faithfully flat we see that $\Omega_{X / Y}=0$. Hence $X \rightarrow Y$ is unramified (resp. Gunramified), see Morphisms, Lemma 28.35.2. This proves the last assumption of Lemma 34.22.3 and finishes the proof.

### 34.28. Properties of morphisms étale local on source-and-target

04 QW Let $\mathcal{P}$ be a property of morphisms of schemes. There is an intuitive meaning to the phrase " $\mathcal{P}$ is étale local on the source and target". However, it turns out that this notion is not the same as asking $\mathcal{P}$ to be both étale local on the source and étale local on the target. Before we discuss this further we give two silly examples.
04QX Example 34.28.1. Consider the property $\mathcal{P}$ of morphisms of schemes defined by the rule $\mathcal{P}(X \rightarrow Y)=$ " $Y$ is locally Noetherian". The reader can verify that this is étale local on the source and étale local on the target (omitted, see Lemma 34.12.1). But it is not true that if $f: X \rightarrow Y$ has $\mathcal{P}$ and $g: Y \rightarrow Z$ is étale, then $g \circ f$ has $\mathcal{P}$. Namely, $f$ could be the identity on $Y$ and $g$ could be an open immersion of a locally Noetherian scheme $Y$ into a non locally Noetherian scheme $Z$.

The following example is in some sense worse.
04QY Example 34.28.2. Consider the property $\mathcal{P}$ of morphisms of schemes defined by the rule $\mathcal{P}(f: X \rightarrow Y)=$ "for every $y \in Y$ which is a specialization of some $f(x)$, $x \in X$ the local ring $\mathcal{O}_{Y, y}$ is Noetherian". Let us verify that this is étale local on the source and étale local on the target. We will freely use Schemes, Lemma 25.13.2.
Local on the target: Let $\left\{g_{i}: Y_{i} \rightarrow Y\right\}$ be an étale covering. Let $f_{i}: X_{i} \rightarrow Y_{i}$ be the base change of $f$, and denote $h_{i}: X_{i} \rightarrow X$ the projection. Assume $\mathcal{P}(f)$. Let $f\left(x_{i}\right) \rightsquigarrow y_{i}$ be a specialization. Then $f\left(h_{i}\left(x_{i}\right)\right) \rightsquigarrow g_{i}\left(y_{i}\right)$ so $\mathcal{P}(f)$ implies $\mathcal{O}_{Y, g_{i}\left(y_{i}\right)}$ is Noetherian. Also $\mathcal{O}_{Y, g_{i}\left(y_{i}\right)} \rightarrow \mathcal{O}_{Y_{i}, y_{i}}$ is a localization of an étale ring map. Hence $\mathcal{O}_{Y_{i}, y_{i}}$ is Noetherian by Algebra, Lemma 10.30.1. Conversely, assume $\mathcal{P}\left(f_{i}\right)$ for all $i$. Let $f(x) \rightsquigarrow y$ be a specialization. Choose an $i$ and $y_{i} \in Y_{i}$ mapping to $y$. Since $x$ can be viewed as a point of $\operatorname{Spec}\left(\mathcal{O}_{Y, y}\right) \times_{Y} X$ and $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{Y_{i}, y_{i}}$ is faithfully flat, there exists a point $x_{i} \in \operatorname{Spec}\left(\mathcal{O}_{Y_{i}, y_{i}}\right) \times_{Y} X$ mapping to $x$. Then $x_{i} \in X_{i}$, and $f_{i}\left(x_{i}\right)$ specializes to $y_{i}$. Thus we see that $\mathcal{O}_{Y_{i}, y_{i}}$ is Noetherian by $\mathcal{P}\left(f_{i}\right)$ which implies that $\mathcal{O}_{Y, y}$ is Noetherian by Algebra, Lemma 10.156.1.
Local on the source: Let $\left\{h_{i}: X_{i} \rightarrow X\right\}$ be an étale covering. Let $f_{i}: X_{i} \rightarrow Y$ be the composition $f \circ h_{i}$. Assume $\mathcal{P}(f)$. Let $f\left(x_{i}\right) \rightsquigarrow y$ be a specialization. Then $f\left(h_{i}\left(x_{i}\right)\right) \rightsquigarrow y$ so $\mathcal{P}(f)$ implies $\mathcal{O}_{Y, y}$ is Noetherian. Thus $\mathcal{P}\left(f_{i}\right)$ holds. Conversely, assume $\mathcal{P}\left(f_{i}\right)$ for all $i$. Let $f(x) \rightsquigarrow y$ be a specialization. Choose an $i$ and $x_{i} \in X_{i}$ mapping to $x$. Then $y$ is a specialization of $f_{i}\left(x_{i}\right)=f(x)$. Hence $\mathcal{P}\left(f_{i}\right)$ implies $\mathcal{O}_{Y, y}$ is Noetherian as desired.
We claim that there exists a commutative diagram

with surjective étale vertical arrows, such that $h$ has $\mathcal{P}$ and $f$ does not have $\mathcal{P}$. Namely, let

$$
Y=\operatorname{Spec}\left(\mathbf{C}\left[x_{n} ; n \in \mathbf{Z}\right] /\left(x_{n} x_{m} ; n \neq m\right)\right)
$$

and let $X \subset Y$ be the open subscheme which is the complement of the point all of whose coordinates $x_{n}=0$. Let $U=X$, let $V=X \amalg Y$, let $a, b$ the obvious map, and let $h: U \rightarrow V$ be the inclusion of $U=X$ into the first summand of $V$. The claim above holds because $U$ is locally Noetherian, but $Y$ is not.

What should be the correct notion of a property which is étale local on the source-and-target? We think that, by analogy with Morphisms, Definition 28.14.1 it should be the following.

04QZ Definition 34.28.3. Let $\mathcal{P}$ be a property of morphisms of schemes. We say $\mathcal{P}$ is étale local on source-and-target if
(1) (stable under precomposing with étale maps) if $f: X \rightarrow Y$ is étale and $g: Y \rightarrow Z$ has $\mathcal{P}$, then $g \circ f$ has $\mathcal{P}$,
(2) (stable under étale base change) if $f: X \rightarrow Y$ has $\mathcal{P}$ and $Y^{\prime} \rightarrow Y$ is étale, then the base change $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ has $\mathcal{P}$, and
(3) (locality) given a morphism $f: X \rightarrow Y$ the following are equivalent
(a) $f$ has $\mathcal{P}$,
(b) for every $x \in X$ there exists a commutative diagram

with étale vertical arrows and $u \in U$ with $a(u)=x$ such that $h$ has $\mathcal{P}$.

It turns out this definition excludes the behavior seen in Examples 34.28.1 and 34.28.2 We will compare this to the definition in the paper DM69 by Deligne and Mumford in Remark 34.28.8. Moreover, a property which is étale local on the source-and-target is étale local on the source and étale local on the target. Finally, the converse is almost true as we will see in Lemma 34.28.6,

04R0 Lemma 34.28.4. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on source-and-target. Then
(1) $\mathcal{P}$ is étale local on the source,
(2) $\mathcal{P}$ is étale local on the target,
(3) $\mathcal{P}$ is stable under postcomposing with étale morphisms: if $f: X \rightarrow Y$ has $\mathcal{P}$ and $g: Y \rightarrow Z$ is étale, then $g \circ f$ has $\mathcal{P}$, and
(4) $\mathcal{P}$ has a permanence property: given $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ étale such that $g \circ f$ has $\mathcal{P}$, then $f$ has $\mathcal{P}$.

Proof. We write everything out completely.
Proof of (1). Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ be an étale covering of $X$. If each composition $h_{i}: X_{i} \rightarrow Y$ has $\mathcal{P}$, then for each $x \in X$ we can find an $i \in I$ and a point $x_{i} \in X_{i}$ mapping to $x$. Then $\left(X_{i}, x_{i}\right) \rightarrow(X, x)$ is an étale morphism of germs, and $\operatorname{id}_{Y}: Y \rightarrow Y$ is an étale morphism, and $h_{i}$ is as
in part (3) of Definition 34.28.3. Thus we see that $f$ has $\mathcal{P}$. Conversely, if $f$ has $\mathcal{P}$ then each $X_{i} \rightarrow Y$ has $\mathcal{P}$ by Definition 34.28 .3 part (1).
Proof of (2). Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ be an étale covering of $Y$. Write $X_{i}=Y_{i} \times_{Y} X$ and $h_{i}: X_{i} \rightarrow Y_{i}$ for the base change of $f$. If each $h_{i}: X_{i} \rightarrow Y_{i}$ has $\mathcal{P}$, then for each $x \in X$ we pick an $i \in I$ and a point $x_{i} \in X_{i}$ mapping to $x$. Then $\left(X_{i}, x_{i}\right) \rightarrow(X, x)$ is an étale morphism of germs, $Y_{i} \rightarrow Y$ is étale, and $h_{i}$ is as in part (3) of Definition 34.28.3. Thus we see that $f$ has $\mathcal{P}$. Conversely, if $f$ has $\mathcal{P}$, then each $X_{i} \rightarrow Y_{i}$ has $\mathcal{P}$ by Definition 34.28.3 part (2).

Proof of (3). Assume $f: X \rightarrow Y$ has $\mathcal{P}$ and $g: Y \rightarrow Z$ is étale. For every $x \in X$ we can think of $(X, x) \rightarrow(X, x)$ as an étale morphism of germs, $Y \rightarrow Z$ is an étale morphism, and $h=f$ is as in part (3) of Definition 34.28.3. Thus we see that $g \circ f$ has $\mathcal{P}$.

Proof of (4). Let $f: X \rightarrow Y$ be a morphism and $g: Y \rightarrow Z$ étale such that $g \circ f$ has $\mathcal{P}$. Then by Definition 34.28 .3 part (2) we see that $\mathrm{pr}_{Y}: Y \times_{Z} X \rightarrow Y$ has $\mathcal{P}$. But the morphism $(f, 1): X \rightarrow Y \times_{Z} X$ is étale as a section to the étale projection $\operatorname{pr}_{X}: Y \times_{Z} X \rightarrow X$, see Morphisms, Lemma 28.36.18. Hence $f=\operatorname{pr}_{Y} \circ(f, 1)$ has $\mathcal{P}$ by Definition 34.28 .3 part (1).

The following lemma is the analogue of Morphisms, Lemma 28.14.4
04R1 Lemma 34.28.5. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on source-and-target. Let $f: X \rightarrow Y$ be a morphism of schemes. The following are equivalent:
(a) $f$ has property $\mathcal{P}$,
(b) for every $x \in X$ there exists an étale morphism of germs a: $(U, u) \rightarrow$ $(X, x)$, an étale morphism $b: V \rightarrow Y$, and a morphism $h: U \rightarrow V$ such that $f \circ a=b \circ h$ and $h$ has $\mathcal{P}$,
(c) for any commutative diagram

with $a, b$ étale the morphism $h$ has $\mathcal{P}$,
(d) for some diagram as in (c) with $a: U \rightarrow X$ surjective $h$ has $\mathcal{P}$,
(e) there exists an étale covering $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ such that each base change $Y_{i} \times_{Y} X \rightarrow Y_{i}$ has $\mathcal{P}$,
(f) there exists an étale covering $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ such that each composition $X_{i} \rightarrow Y$ has $\mathcal{P}$,
(g) there exists an étale covering $\left\{Y_{i} \rightarrow Y\right\}_{i \in I}$ and for each $i \in I$ an étale covering $\left\{X_{i j} \rightarrow Y_{i} \times_{Y} X\right\}_{j \in J_{i}}$ such that each morphism $X_{i j} \rightarrow Y_{i}$ has $\mathcal{P}$.

Proof. The equivalence of (a) and (b) is part of Definition 34.28.3. The equivalence of (a) and (e) is Lemma 34.28.4 part (2). The equivalence of (a) and (f) is Lemma 34.28.4 part (1). As (a) is now equivalent to (e) and (f) it follows that (a) equivalent to (g).
It is clear that (c) implies (a). If (a) holds, then for any diagram as in (c) the morphism $f \circ a$ has $\mathcal{P}$ by Definition 34.28 .3 part (1), whereupon $h$ has $\mathcal{P}$ by Lemma
34.28.4 part (4). Thus (a) and (c) are equivalent. It is clear that (c) implies (d). To see that (d) implies (a) assume we have a diagram as in (c) with $a: U \rightarrow X$ surjective and $h$ having $\mathcal{P}$. Then $b \circ h$ has $\mathcal{P}$ by Lemma 34.28.4 part (3). Since $\{a: U \rightarrow X\}$ is an étale covering we conclude that $f$ has $\mathcal{P}$ by Lemma 34.28.4 part (1).

It seems that the result of the following lemma is not a formality, i.e., it actually uses something about the geometry of étale morphisms.

04R2 Lemma 34.28.6. Let $\mathcal{P}$ be a property of morphisms of schemes. Assume
(1) $\mathcal{P}$ is étale local on the source,
(2) $\mathcal{P}$ is étale local on the target, and
(3) $\mathcal{P}$ is stable under postcomposing with open immersions: if $f: X \rightarrow Y$ has $\mathcal{P}$ and $Y \subset Z$ is an open subscheme then $X \rightarrow Z$ has $\mathcal{P}$.
Then $\mathcal{P}$ is étale local on the source-and-target.
Proof. Let $\mathcal{P}$ be a property of morphisms of schemes which satisfies conditions (1), (2) and (3) of the lemma. By Lemma 34.22 .2 we see that $\mathcal{P}$ is stable under precomposing with étale morphisms. By Lemma 34.18.2 we see that $\mathcal{P}$ is stable under étale base change. Hence it suffices to prove part (3) of Definition 34.28.3 holds.

More precisely, suppose that $f: X \rightarrow Y$ is a morphism of schemes which satisfies Definition 34.28 .3 part (3)(b). In other words, for every $x \in X$ there exists an étale morphism $a_{x}: U_{x} \rightarrow X$, a point $u_{x} \in U_{x}$ mapping to $x$, an étale morphism $b_{x}: V_{x} \rightarrow Y$, and a morphism $h_{x}: U_{x} \rightarrow V_{x}$ such that $f \circ a_{x}=b_{x} \circ h_{x}$ and $h_{x}$ has $\mathcal{P}$. The proof of the lemma is complete once we show that $f$ has $\mathcal{P}$. Set $U=\coprod U_{x}$, $a=\coprod a_{x}, V=\coprod V_{x}, b=\coprod b_{x}$, and $h=\coprod h_{x}$. We obtain a commutative diagram

with $a, b$ étale, $a$ surjective. Note that $h$ has $\mathcal{P}$ as each $h_{x}$ does and $\mathcal{P}$ is étale local on the target. Because $a$ is surjective and $\mathcal{P}$ is étale local on the source, it suffices to prove that $b \circ h$ has $\mathcal{P}$. This reduces the lemma to proving that $\mathcal{P}$ is stable under postcomposing with an étale morphism.
During the rest of the proof we let $f: X \rightarrow Y$ be a morphism with property $\mathcal{P}$ and $g: Y \rightarrow Z$ is an étale morphism. Consider the following statements:
(Ø) With no additional assumptions $g \circ f$ has property $\mathcal{P}$.
(A) Whenever $Z$ is affine $g \circ f$ has property $\mathcal{P}$.
(AA) Whenever $X$ and $Z$ are affine $g \circ f$ has property $\mathcal{P}$.
(AAA) Whenever $X, Y$, and $Z$ are affine $g \circ f$ has property $\mathcal{P}$.
Once we have proved $(\emptyset)$ the proof of the lemma will be complete.
Claim 1: (AAA) $\Rightarrow$ (AA). Namely, let $f: X \rightarrow Y, g: Y \rightarrow Z$ be as above with $X, Z$ affine. As $X$ is affine hence quasi-compact we can find finitely many affine open $Y_{i} \subset$ $Y, i=1, \ldots, n$ such that $X=\bigcup_{i=1, \ldots, n} f^{-1}\left(Y_{i}\right)$. Set $X_{i}=f^{-1}\left(Y_{i}\right)$. By Lemma 34.18.2 each of the morphisms $X_{i} \rightarrow Y_{i}$ has $\mathcal{P}$. Hence $\coprod_{i=1, \ldots, n} X_{i} \rightarrow \coprod_{i=1, \ldots, n} Y_{i}$ has $\mathcal{P}$ as $\mathcal{P}$ is étale local on the target. By (AAA) applied to $\coprod_{i=1, \ldots, n} X_{i} \rightarrow$
$\coprod_{i=1, \ldots, n} Y_{i}$ and the étale morphism $\coprod_{i=1, \ldots, n} Y_{i} \rightarrow Z$ we see that $\coprod_{i=1, \ldots, n} X_{i} \rightarrow Z$ has $\mathcal{P}$. Now $\left\{\coprod_{i=1, \ldots, n} X_{i} \rightarrow X\right\}$ is an étale covering, hence as $\mathcal{P}$ is étale local on the source we conclude that $X \rightarrow Z$ has $\mathcal{P}$ as desired.
Claim 2: $(\mathrm{AAA}) \Rightarrow(\mathrm{A})$. Namely, let $f: X \rightarrow Y, g: Y \rightarrow Z$ be as above with $Z$ affine. Choose an affine open covering $X=\bigcup X_{i}$. As $\mathcal{P}$ is étale local on the source we see that each $\left.f\right|_{X_{i}}: X_{i} \rightarrow Y$ has $\mathcal{P}$. By (AA), which follows from (AAA) according to Claim 1, we see that $X_{i} \rightarrow Z$ has $\mathcal{P}$ for each $i$. Since $\left\{X_{i} \rightarrow X\right\}$ is an étale covering and $\mathcal{P}$ is étale local on the source we conclude that $X \rightarrow Z$ has $\mathcal{P}$.
Claim 3: (AAA) $\Rightarrow(\emptyset)$. Namely, let $f: X \rightarrow Y, g: Y \rightarrow Z$ be as above. Choose an affine open covering $Z=\bigcup Z_{i}$. Set $Y_{i}=g^{-1}\left(Z_{i}\right)$ and $X_{i}=f^{-1}\left(Y_{i}\right)$. By Lemma 34.18.2 each of the morphisms $X_{i} \rightarrow Y_{i}$ has $\mathcal{P}$. By (A), which follows from (AAA) according to Claim 2, we see that $X_{i} \rightarrow Z_{i}$ has $\mathcal{P}$ for each $i$. Since $\mathcal{P}$ is local on the target and $X_{i}=(g \circ f)^{-1}\left(Z_{i}\right)$ we conclude that $X \rightarrow Z$ has $\mathcal{P}$.
Thus to prove the lemma it suffices to prove (AAA). Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be as above $X, Y, Z$ affine. Note that an étale morphism of affines has universally bounded fibres, see Morphisms, Lemma 28.36.6 and Lemma 28.51.8. Hence we can do induction on the integer $n$ bounding the degree of the fibres of $Y \rightarrow Z$. See Morphisms, Lemma 28.51.7 for a description of this integer in the case of an étale morphism. If $n=1$, then $Y \rightarrow Z$ is an open immersion, see Lemma 34.21.2, and the result follows from assumption (3) of the lemma. Assume $n>1$.
Consider the following commutative diagram

Note that we have a decomposition into open and closed subschemes $Y \times_{Z} Y=$ $\Delta_{Y / Z}(Y) \amalg Y^{\prime}$, see Morphisms, Lemma 28.35.13. As a base change the degrees of the fibres of the second projection pr : $Y \times{ }_{Z} Y \rightarrow Y$ are bounded by $n$, see Morphisms, Lemma 28.51.4 On the other hand, $\operatorname{pr}_{\Delta(Y)}: \Delta(Y) \rightarrow Y$ is an isomorphism and every fibre has exactly one point. Thus, on applying Morphisms, Lemma 28.51 .7 we conclude the degrees of the fibres of the restriction $\mathrm{pr}_{Y^{\prime}}: Y^{\prime} \rightarrow Y$ are bounded by $n-1$. Set $X^{\prime}=f_{Y}^{-1}\left(Y^{\prime}\right)$. Picture

As $\mathcal{P}$ is étale local on the target and hence stable under étale base change (see Lemma 34.18.2 we see that $f_{Y}$ has $\mathcal{P}$. Hence, as $\mathcal{P}$ is étale local on the source, $f^{\prime}=\left.f_{Y}\right|_{X^{\prime}}$ has $\mathcal{P}$. By induction hypothesis we see that $X^{\prime} \rightarrow Y$ has $\mathcal{P}$. As $\mathcal{P}$ is local on the source, and $\left\{X \rightarrow X \times_{Z} Y, X^{\prime} \rightarrow X \times_{Y} Z\right\}$ is an étale covering, we conclude that prof $f_{Y}$ has $\mathcal{P}$. Note that $g \circ f$ can be viewed as a morphism $g \circ f: X \rightarrow g(Y)$. As pr $\circ f_{Y}$ is the pullback of $g \circ f: X \rightarrow g(Y)$ via the étale covering $\{Y \rightarrow g(Y)\}$, and as $\mathcal{P}$ is étale local on the target, we conclude that $g \circ f: X \rightarrow g(Y)$ has property $\mathcal{P}$. Finally, applying assumption (3) of the lemma once more we conclude that $g \circ f: X \rightarrow Z$ has property $\mathcal{P}$.

04R3 Remark 34.28.7. Using Lemma 34.28 .6 and the work done in the earlier sections of this chapter it is easy to make a list of types of morphisms which are étale local on the source-and-target. In each case we list the lemma which implies the property is étale local on the source and the lemma which implies the property is étale local on the target. In each case the third assumption of Lemma 34.28 .6 is trivial to check, and we omit it. Here is the list:
(1) flat, see Lemmas 34.23 .1 and 34.19 .13 .
(2) locally of finite presentation, see Lemmas 34.24 .1 and 34.19 .9
(3) locally finite type, see Lemmas 34.24 .2 and 34.19 .8 .
(4) universally open, see Lemmas 34.24 .4 and 34.19 .4 .
(5) syntomic, see Lemmas 34.25.1 and 34.19.24,
(6) smooth, see Lemmas 34.26.1 and 34.19.25.
(7) étale, see Lemmas 34.27.1 and 34.19.27,
(8) locally quasi-finite, see Lemmas 34.27 .2 and 34.19 .22 ,
(9) unramified, see Lemmas 34.27.3 and 34.19.26,
(10) G-unramified, see Lemmas 34.27.3 and 34.19.26, and
(11) add more here as needed.

04R4 Remark 34.28.8. At this point we have three possible definitions of what it means for a property $\mathcal{P}$ of morphisms to be "étale local on the source and target":
(ST) $\mathcal{P}$ is étale local on the source and $\mathcal{P}$ is étale local on the target,
(DM) (the definition in the paper DM69, Page 100] by Deligne and Mumford) for every diagram

with surjective étale vertical arrows we have $\mathcal{P}(h) \Leftrightarrow \mathcal{P}(f)$, and
(SP) $\mathcal{P}$ is étale local on the source-and-target.
In this section we have seen that $(\mathrm{SP}) \Rightarrow(\mathrm{DM}) \Rightarrow(\mathrm{ST})$. The Examples 34.28.1 and 34.28 .2 show that neither implication can be reversed. Finally, Lemma 34.28 .6 shows that the difference disappears when looking at properties of morphisms which are stable under postcomposing with open immersions, which in practice will always be the case.

### 34.29. Properties of morphisms of germs local on source-and-target

04R5 In this section we discuss the analogue of the material in Section 34.28 for morphisms of germs of schemes.
04NB Definition 34.29.1. Let $\mathcal{Q}$ be a property of morphisms of germs of schemes. We say $\mathcal{Q}$ is étale local on the source-and-target if for any commutative diagram

with étale vertical arrows we have $\mathcal{Q}(h) \Leftrightarrow \mathcal{Q}\left(h^{\prime}\right)$.

04R6 Lemma 34.29.2. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Consider the property $\mathcal{Q}$ of morphisms of germs defined by the rule

$$
\mathcal{Q}((X, x) \rightarrow(S, s)) \Leftrightarrow \text { there exists a representative } U \rightarrow S \text { which has } \mathcal{P}
$$

Then $\mathcal{Q}$ is étale local on the source-and-target as in Definition 34.29.1.
Proof. We first remark that as $\mathcal{P}$ is étale local on the source, see Lemma 34.28.4, if $(X, x) \rightarrow(S, s)$ has $\mathcal{P}$, then there are arbitrarily small neighbourhoods $U$ of $x$ in $X$ such that a representative $U \rightarrow S$ of $(X, x) \rightarrow(S, s)$ has $\mathcal{P}$. We will use this without further mention. Let

be as in Definition 34.29.1. We will use a rather pedantic notation in order to distinguish between morphisms of germs and their representatives in this proof.
If $\mathcal{P}(h)$ holds, then $\mathcal{P}$ holds for a representative $h_{1}: U_{1} \rightarrow V$ of $h$. Let $a_{1}: U_{1}^{\prime} \rightarrow U$ be a representative of $a$ which is étale with $a_{1}\left(U_{1}^{\prime}\right) \subset U_{1}$. As $\mathcal{P}$ is stable under precomposing with étale morphisms we see that $h_{1} \circ a_{1}: U_{1}^{\prime} \rightarrow V$ has $\mathcal{P}$. Moreover, $h_{1} \circ a_{1}: U_{1}^{\prime} \rightarrow V$ is a representative of $b \circ h^{\prime}$ by the commutativity of the diagram. Choose a representative $b_{1}: V_{1}^{\prime} \rightarrow V$ of $b$. Choose a representative $h_{1}^{\prime}: U_{2}^{\prime} \rightarrow V^{\prime}$ with $h_{1}^{\prime}\left(U_{1}^{\prime}\right) \subset V_{1}^{\prime}, U_{2}^{\prime} \subset U_{1}^{\prime}$, and $\left.\left(h_{1} \circ a_{1}\right)\right|_{U_{2}^{\prime}}=b_{1} \circ h_{1}^{\prime}$. Then we see that $b_{1} \circ h_{1}^{\prime}$ has $\mathcal{P}$. Hence $h^{\prime}$ has $\mathcal{P}$ by Lemma 34.28.4 part (4).
Conversely, suppose $\mathcal{P}\left(h^{\prime}\right)$ holds. Choose a representative $b_{1}: V_{1}^{\prime} \rightarrow V$ of $b$. Choose a representative $h_{1}^{\prime}: U_{1}^{\prime} \rightarrow V^{\prime}$ with $\mathcal{P}$ and with $h_{1}^{\prime}\left(U_{1}^{\prime}\right) \subset V_{1}^{\prime}$. Then $b_{1} \circ h_{1}^{\prime}$ has $\mathcal{P}$ by Lemma 34.28 .4 part (3). Moreover, $b_{1} \circ h_{1}^{\prime}: U_{1}^{\prime} \rightarrow V$ is a representative of $h \circ a$ by the commutativity of the diagram. Choose a representative $h_{1}: U_{1} \rightarrow V$ of $h$. Choose a representative $a_{1}: U_{2}^{\prime} \rightarrow U$ with $a_{1}\left(U_{2}^{\prime}\right) \subset U_{1}, U_{2}^{\prime} \subset U_{1}^{\prime}$, and $h_{1} \circ a_{1}=\left.\left(b_{1} \circ h_{1}^{\prime}\right)\right|_{U_{2}^{\prime}}$. The we see that $h_{1} \circ a_{1}$ has $\mathcal{P}$. As $\mathcal{P}$ is étale local on the source we conclude that $\left.h_{1}\right|_{a_{1}\left(U_{2}^{\prime}\right)}$ has $\mathcal{P}$ and we win.

04R7 Lemma 34.29.3. Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on source-and-target. Let $Q$ be the associated property of morphisms of germs, see Lemma 34.29.2. Let $f: X \rightarrow Y$ be a morphism of schemes. The following are equivalent:
(1) $f$ has property $\mathcal{P}$, and
(2) for every $x \in X$ the morphism of germs $(X, x) \rightarrow(Y, f(x))$ has property $\mathcal{Q}$.

Proof. The implication $(1) \Rightarrow(2)$ is direct from the definitions. The implication $(2) \Rightarrow(1)$ also follows from part (3) of Definition 34.28.3.
A morphism of germs $(X, x) \rightarrow(S, s)$ determines a well defined map of local rings. Hence the following lemma makes sense.
04ND Lemma 34.29.4. The property of morphisms of germs

$$
\mathcal{P}((X, x) \rightarrow(S, s))=\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x} \text { is flat }
$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 34.29.1 we obtain the following diagram of local homomorphisms of local rings

Note that the vertical arrows are localizations of étale ring maps, in particular they are essentially of finite presentation, flat, and unramified (see Algebra, Section 10.141). In particular the vertical maps are faithfully flat, see Algebra, Lemma 10.38.17. Now, if the upper horizontal arrow is flat, then the lower horizontal arrow is flat by an application of Algebra, Lemma 10.38 .10 with $R=\mathcal{O}_{V, v}, S=\mathcal{O}_{U, u}$ and $M=\mathcal{O}_{U^{\prime}, u^{\prime}}$. If the lower horizontal arrow is flat, then the ring map

$$
\mathcal{O}_{V^{\prime}, v^{\prime}} \otimes_{\mathcal{O}_{V, v}} \mathcal{O}_{U, u} \longleftarrow \mathcal{O}_{V^{\prime}, v^{\prime}}
$$

is flat by Algebra, Lemma 10.38.7. And the ring map

$$
\mathcal{O}_{U^{\prime}, u^{\prime}} \longleftarrow \mathcal{O}_{V^{\prime}, v^{\prime}} \otimes_{\mathcal{O}_{V, v}} \mathcal{O}_{U, u}
$$

is a localization of a map between étale ring extensions of $\mathcal{O}_{U, u}$, hence flat by Algebra, Lemma 10.141 .9 .

04NI Lemma 34.29.5. Consider a commutative diagram of morphisms of schemes

with étale vertical arrows and a point $v^{\prime} \in U^{\prime}$ mapping to $v \in U$. Then the morphism of fibres $U_{v^{\prime}}^{\prime} \rightarrow U_{v}$ is étale.

Proof. Note that $U_{v}^{\prime} \rightarrow U_{v}$ is étale as a base change of the étale morphism $U^{\prime} \rightarrow U$. The scheme $U_{v}^{\prime}$ is a scheme over $V_{v}^{\prime}$. By Morphisms, Lemma 28.36.7 the scheme $V_{v}^{\prime}$ is a disjoint union of spectra of finite separable field extensions of $\kappa(v)$. One of these is $v^{\prime}=\operatorname{Spec}\left(\kappa\left(v^{\prime}\right)\right)$. Hence $U_{v^{\prime}}^{\prime}$ is an open and closed subscheme of $U_{v}^{\prime}$ and it follows that $U_{v^{\prime}}^{\prime} \rightarrow U_{v}^{\prime} \rightarrow U_{v}$ is étale (as a composition of an open immersion and an étale morphism, see Morphisms, Section 28.36.

Given a morphism of germs of schemes $(X, x) \rightarrow(S, s)$ we can define the fibre as the isomorphism class of germs $\left(U_{s}, x\right)$ where $U \rightarrow S$ is any representative. We will often abuse notation and just write $\left(X_{s}, x\right)$.
04 NJ Lemma 34.29.6. Let $d \in\{0,1,2, \ldots, \infty\}$. The property of morphisms of germs

$$
\mathcal{P}_{d}((X, x) \rightarrow(S, s))=\text { the local ring } \mathcal{O}_{X_{s}, x} \text { of the fibre has dimension } d
$$

is étale local on the source-and-target.
Proof. Given a diagram as in Definition 34.29.1 we obtain an étale morphism of fibres $U_{v^{\prime}}^{\prime} \rightarrow U_{v}$ mapping $u^{\prime}$ to $u$, see Lemma 34.29.5. Hence the result follows from Lemma 34.17.3.

04NK Lemma 34.29.7. Let $r \in\{0,1,2, \ldots, \infty\}$. The property of morphisms of germs

$$
\mathcal{P}_{r}((X, x) \rightarrow(S, s)) \Leftrightarrow \operatorname{trdeg}_{\kappa(s)} \kappa(x)=r
$$

is étale local on the source-and-target.
Proof. Given a diagram as in Definition 34.29.1 we obtain the following diagram of local homomorphisms of local rings

Note that the vertical arrows are localizations of étale ring maps, in particular they are unramified (see Algebra, Section 10.141). Hence $\kappa(u) \subset \kappa\left(u^{\prime}\right)$ and $\kappa(v) \subset \kappa\left(v^{\prime}\right)$ are finite separable field extensions. Thus we have $\operatorname{trdeg}_{\kappa(v)} \kappa(u)=\operatorname{trdeg}_{\kappa\left(v^{\prime}\right)} \kappa(u)$ which proves the lemma.

Let $(X, x)$ be a germ of a scheme. The dimension of $X$ at $x$ is the minimum of the dimensions of open neighbourhoods of $x$ in $X$, and any small enough open neighbourhood has this dimension. Hence this is an invariant of the isomorphism class of the germ. We denote this simply $\operatorname{dim}_{x}(X)$.

04NL Lemma 34.29.8. Let $d \in\{0,1,2, \ldots, \infty\}$. The property of morphisms of germs

$$
\mathcal{P}_{d}((X, x) \rightarrow(S, s)) \Leftrightarrow \operatorname{dim}_{x}\left(X_{s}\right)=d
$$

is étale local on the source-and-target.
Proof. Given a diagram as in Definition 34.29.1 we obtain an étale morphism of fibres $U_{v^{\prime}}^{\prime} \rightarrow U_{v}$ mapping $u^{\prime}$ to $u$, see Lemma 34.29.5. Hence now the equality $\operatorname{dim}_{u}\left(U_{v}\right)=\operatorname{dim}_{u^{\prime}}\left(U_{v^{\prime}}^{\prime}\right)$ follows from Lemma 34.17.2.

### 34.30. Descent data for schemes over schemes

023 U Most of the arguments in this section are formal relying only on the definition of a descent datum. In Simplicial Spaces, Section 69.8 we will examine the relationship with simplicial schemes which will somewhat clarify the situation.

023V Definition 34.30.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) Let $V \rightarrow X$ be a scheme over $X$. A descent datum for $V / X / S$ is an isomorphism $\varphi: V \times_{S} X \rightarrow X \times_{S} V$ of schemes over $X \times_{S} X$ satisfying the cocycle condition that the diagram

commutes (with obvious notation).
(2) We also say that the pair $(V / X, \varphi)$ is a descent datum relative to $X \rightarrow S$.
(3) A morphism $f:(V / X, \varphi) \rightarrow\left(V^{\prime} / X, \varphi^{\prime}\right)$ of descent data relative to $X \rightarrow S$ is a morphism $f: V \rightarrow V^{\prime}$ of schemes over $X$ such that the diagram

commutes.
There are all kinds of "miraculous" identities which arise out of the definition above. For example the pullback of $\varphi$ via the diagonal morphism $\Delta: X \rightarrow X \times{ }_{S} X$ can be seen as a morphism $\Delta^{*} \varphi: V \rightarrow V$. This because $X \times_{\Delta, X \times{ }_{S} X}\left(V \times_{S} X\right)=V$ and also $X \times_{\Delta, X \times{ }_{S} X}\left(X \times_{S} V\right)=V$. In fact, $\Delta^{*} \varphi$ is equal to the identity. This is a good exercise if you are unfamiliar with this material.

02VP Remark 34.30.2. Let $X \rightarrow S$ be a morphism of schemes. Let $(V / X, \varphi)$ be a descent datum relative to $X \rightarrow S$. We may think of the isomorphism $\varphi$ as an isomorphism

$$
\left(X \times_{S} X\right) \times_{\operatorname{pr}_{0}, X} V \longrightarrow\left(X \times_{S} X\right) \times_{\operatorname{pr}_{1}, X} V
$$

of schemes over $X \times_{S} X$. So loosely speaking one may think of $\varphi$ as a map $\varphi$ : $\operatorname{pr}_{0}^{*} V \rightarrow \operatorname{pr}_{1}^{*} V^{7}$ The cocycle condition then says that $\operatorname{pr}_{02}^{*} \varphi=\operatorname{pr}_{12}^{*} \varphi \circ \operatorname{pr}_{01}^{*} \varphi$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

Here is the definition in case you have a family of morphisms with fixed target.
023W Definition 34.30.3. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be a family of morphisms with target $S$.
(1) A descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to the family $\left\{X_{i} \rightarrow S\right\}$ is given by a scheme $V_{i}$ over $X_{i}$ for each $i \in I$, an isomorphism $\varphi_{i j}: V_{i} \times{ }_{S} X_{j} \rightarrow X_{i} \times{ }_{S} V_{j}$ of schemes over $X_{i} \times{ }_{S} X_{j}$ for each pair $(i, j) \in I^{2}$ such that for every triple of indices $(i, j, k) \in I^{3}$ the diagram

of schemes over $X_{i} \times{ }_{S} X_{j} \times{ }_{S} X_{k}$ commutes (with obvious notation).
(2) A morphism $\psi:\left(V_{i}, \varphi_{i j}\right) \rightarrow\left(V_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data is given by a family $\psi=\left(\psi_{i}\right)_{i \in I}$ of morphisms of $X_{i}$-schemes $\psi_{i}: V_{i} \rightarrow V_{i}^{\prime}$ such that all the diagrams

commute.

[^96]This is the notion that comes up naturally for example when the question arises whether the fibred category of relative curves is a stack in the fpqc topology (it isn't - at least not if you stick to schemes).

02VQ Remark 34.30.4. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be a family of morphisms with target $S$. Let $\left(V_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow S\right\}$. We may think of the isomorphisms $\varphi_{i j}$ as isomorphisms

$$
\left(X_{i} \times_{S} X_{j}\right) \times_{\operatorname{pr}_{0}, X_{i}} V_{i} \longrightarrow\left(X_{i} \times_{S} X_{j}\right) \times_{\operatorname{pr}_{1}, X_{j}} V_{j}
$$

of schemes over $X_{i} \times_{S} X_{j}$. So loosely speaking one may think of $\varphi_{i j}$ as an isomorphism $\operatorname{pr}_{0}^{*} V_{i} \rightarrow \operatorname{pr}_{1}^{*} V_{j}$ over $X_{i} \times_{S} X_{j}$. The cocycle condition then says that $\operatorname{pr}_{02}^{*} \varphi_{i k}=\operatorname{pr}_{12}^{*} \varphi_{j k} \circ \operatorname{pr}_{01}^{*} \varphi_{i j}$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

The reason we will usually work with the version of a family consisting of a single morphism is the following lemma.

023X Lemma 34.30.5. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be a family of morphisms with target $S$. Set $X=\coprod_{i \in I} X_{i}$, and consider it as an $S$-scheme. There is a canonical equivalence of categories

$$
\begin{gathered}
\text { category of descent data } \\
\text { relative to the family }\left\{X_{i} \rightarrow S\right\}_{i \in I}
\end{gathered} \longrightarrow \begin{gathered}
\text { category of descent data } \\
\text { relative to } X / S
\end{gathered}
$$

which maps $\left(V_{i}, \varphi_{i j}\right)$ to $(V, \varphi)$ with $V=\coprod_{i \in I} V_{i}$ and $\varphi=\coprod \varphi_{i j}$.
Proof. Observe that $X \times_{S} X=\coprod_{i j} X_{i} \times_{S} X_{j}$ and similarly for higher fibre products. Giving a morphism $V \rightarrow X$ is exactly the same as giving a family $V_{i} \rightarrow X_{i}$. And giving a descent datum $\varphi$ is exactly the same as giving a family $\varphi_{i j}$.

023Y Lemma 34.30.6. Pullback of descent data for schemes over schemes.
(1) Let

be a commutative diagram of morphisms of schemes. The construction

$$
(V \rightarrow X, \varphi) \longmapsto f^{*}(V \rightarrow X, \varphi)=\left(V^{\prime} \rightarrow X^{\prime}, \varphi^{\prime}\right)
$$

where $V^{\prime}=X^{\prime} \times_{X} V$ and where $\varphi^{\prime}$ is defined as the composition

defines a functor from the category of descent data relative to $X \rightarrow S$ to the category of descent data relative to $X^{\prime} \rightarrow S^{\prime}$.
(2) Given two morphisms $f_{i}: X^{\prime} \rightarrow X, i=0,1$ making the diagram commute the functors $f_{0}^{*}$ and $f_{1}^{*}$ are canonically isomorphic.

Proof. We omit the proof of (1), but we remark that the morphism $\varphi^{\prime}$ is the morphism $(f \times f)^{*} \varphi$ in the notation introduced in Remark 34.30.2 For (2) we indicate which morphism $f_{0}^{*} V \rightarrow f_{1}^{*} V$ gives the functorial isomorphism. Namely, since $f_{0}$ and $f_{1}$ both fit into the commutative diagram we see there is a unique morphism $r: X^{\prime} \rightarrow X \times_{S} X$ with $f_{i}=\operatorname{pr}_{i} \circ r$. Then we take

$$
\begin{aligned}
f_{0}^{*} V & =X^{\prime} \times_{f_{0}, X} V \\
& =X^{\prime} \times_{\mathrm{pr}_{0} \circ r, X} V \\
& =X^{\prime} \times_{r, X \times S X}\left(X \times_{S} X\right) \times_{\mathrm{pr}_{0}, X} V \\
& \xrightarrow{\varphi} X^{\prime} \times_{r, X \times{ }_{S} X}\left(X \times_{S} X\right) \times_{\mathrm{pr}_{1}, X} V \\
& =X^{\prime} \times_{\mathrm{pr}_{1} \circ r, X} V \\
& =X^{\prime} \times_{f_{1}, X} V \\
& =f_{1}^{*} V
\end{aligned}
$$

We omit the verification that this works.
02VR Definition 34.30.7. With $S, S^{\prime}, X, X^{\prime}, f, a, a^{\prime}, h$ as in Lemma 34.30.6 the functor

$$
(V, \varphi) \longmapsto f^{*}(V, \varphi)
$$

constructed in that lemma is called the pullback functor on descent data.
02VS Lemma 34.30.8 (Pullback of descent data for schemes over families). Let $\mathcal{U}=$ $\left\{U_{i} \rightarrow S^{\prime}\right\}_{i \in I}$ and $\mathcal{V}=\left\{V_{j} \rightarrow S\right\}_{j \in J}$ be families of morphisms with fixed target. Let $\alpha: I \rightarrow J, h: S^{\prime} \rightarrow S$ and $g_{i}: U_{i} \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1.
(1) Let $\left(Y_{j}, \varphi_{j j^{\prime}}\right)$ be a descent datum relative to the family $\left\{V_{j} \rightarrow S^{\prime}\right\}$. The system

$$
\left(g_{i}^{*} Y_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right)
$$

(with notation as in Remark 34.30.4) is a descent datum relative to $\mathcal{V}$.
(2) This construction defines a functor between descent data relative to $\mathcal{U}$ and descent data relative to $\mathcal{V}$.
(3) Given a second $\alpha^{\prime}: I \rightarrow J, h^{\prime}: S^{\prime} \rightarrow S$ and $g_{i}^{\prime}: U_{i} \rightarrow V_{\alpha^{\prime}(i)}$ morphism of families of maps with fixed target, then if $h=h^{\prime}$ the two resulting functors between descent data are canonically isomorphic.
(4) These functors agree, via Lemma 34.30.5, with the pullback functors constructed in Lemma 34.30.6.
Proof. This follows from Lemma 34.30 .6 via the correspondence of Lemma 34.30 .5 .

02VT Definition 34.30.9. With $\mathcal{U}=\left\{U_{i} \rightarrow S^{\prime}\right\}_{i \in I}, \mathcal{V}=\left\{V_{j} \rightarrow S\right\}_{j \in J}, \alpha: I \rightarrow J$, $h: S^{\prime} \rightarrow S$, and $g_{i}: U_{i} \rightarrow V_{\alpha(i)}$ as in Lemma 34.30 .8 the functor

$$
\left(Y_{j}, \varphi_{j j^{\prime}}\right) \longmapsto\left(g_{i}^{*} Y_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right)
$$

constructed in that lemma is called the pullback functor on descent data.
If $\mathcal{U}$ and $\mathcal{V}$ have the same target $S$, and if $\mathcal{U}$ refines $\mathcal{V}$ (see Sites, Definition 7.8.1) but no explicit pair $\left(\alpha, g_{i}\right)$ is given, then we can still talk about the pullback functor since we have seen in Lemma 34.30 .8 that the choice of the pair does not matter (up to a canonical isomorphism).

023Z Definition 34.30.10. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) Given a scheme $U$ over $S$ we have the trivial descent datum of $U$ relative to id : $S \rightarrow S$, namely the identity morphism on $U$.
(2) By Lemma 34.30 .6 we get a canonical descent datum on $X \times{ }_{S} U$ relative to $X \rightarrow S$ by pulling back the trivial descent datum via $f$. We often denote $\left(X \times{ }_{S} U\right.$, can $)$ this descent datum.
(3) A descent datum $(V, \varphi)$ relative to $X / S$ is is called effective if $(V, \varphi)$ is isomorphic to the canonical descent datum $\left(X \times{ }_{S} U\right.$, can $)$ for some scheme $U$ over $S$.

Thus being effective means there exists a scheme $U$ over $S$ and an isomorphism $\psi: V \rightarrow X \times{ }_{S} U$ of $X$-schemes such that $\varphi$ is equal to the composition

$$
V \times_{S} X \xrightarrow{\psi \times \mathrm{id}_{X}} X \times_{S} U \times_{S} X=X \times_{S} X \times_{S} U \xrightarrow{\mathrm{id}_{X} \times \psi^{-1}} X \times_{S} V
$$

02VU Definition 34.30.11. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}$ be a family of morphisms with target $S$.
(1) Given a scheme $U$ over $S$ we have a canonical descent datum on the family of schemes $X_{i} \times{ }_{S} U$ by pulling back the trivial descent datum for $U$ relative to $\{\operatorname{id}: S \rightarrow S\}$. We denote this descent datum $\left(X_{i} \times{ }_{S} U\right.$, can $)$.
(2) A descent datum $\left(V_{i}, \varphi_{i j}\right)$ relative to $\left\{X_{i} \rightarrow S\right\}$ is called effective if there exists a scheme $U$ over $S$ such that $\left(V_{i}, \varphi_{i j}\right)$ is isomorphic to $\left(X_{i} \times{ }_{S} U\right.$, can $)$.

### 34.31. Fully faithfulness of the pullback functors

02 VV It turns out that the pullback functor between descent data for fpqc-coverings is fully faithful. In other words, morphisms of schemes satisfy fpqc descent. The goal of this section is to prove this. The reader is encouraged instead to prove this him/herself. The key is to use Lemma 34.9.3.

02VW Lemma 34.31.1. A surjective and flat morphism is an epimorphism in the category of schemes.

Proof. Suppose we have $h: X^{\prime} \rightarrow X$ surjective and flat and $a, b: X \rightarrow Y$ morphisms such that $a \circ h=b \circ h$. As $h$ is surjective we see that $a$ and $b$ agree on underlying topological spaces. Pick $x^{\prime} \in X^{\prime}$ and set $x=h\left(x^{\prime}\right)$ and $y=a(x)=b(x)$. Consider the local ring maps

$$
a_{x}^{\sharp}, b_{x}^{\sharp}: \mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}
$$

These become equal when composed with the flat local homomorphism $h_{x^{\prime}}^{\sharp}: \mathcal{O}_{X, x} \rightarrow$ $\mathcal{O}_{X^{\prime}, x^{\prime}}$. Since a flat local homomorphism is faithfully flat (Algebra, Lemma 10.38.17) we conclude that $h_{x^{\prime}}^{\sharp}$ is injective. Hence $a_{x}^{\sharp}=b_{x}^{\sharp}$ which implies $a=b$ as desired.

02VX Lemma 34.31.2. Let $h: S^{\prime} \rightarrow S$ be a surjective, flat morphism of schemes. The base change functor

$$
S c h / S \longrightarrow S c h / S^{\prime}, \quad X \longmapsto S^{\prime} \times_{S} X
$$

is faithful.

Proof. Let $X_{1}, X_{2}$ be schemes over $S$. Let $\alpha, \beta: X_{2} \rightarrow X_{1}$ be morphisms over $S$. If $\alpha, \beta$ base change to the same morphism then we get a commutative diagram as follows

Hence it suffices to show that $S^{\prime} \times_{S} X_{2} \rightarrow X_{2}$ is an epimorphism. As the base change of a surjective and flat morphism it is surjective and flat (see Morphisms, Lemmas 28.10 .4 and 28.25.7). Hence the lemma follows from Lemma 34.31.1.

0240 Lemma 34.31.3. In the situation of Lemma 34.30.6 assume that $f: X^{\prime} \rightarrow X$ is surjective and flat. Then the pullback functor is faithful.

Proof. Let $\left(V_{i}, \varphi_{i}\right), i=1,2$ be descend data for $X \rightarrow S$. Let $\alpha, \beta: V_{1} \rightarrow V_{2}$ be morphisms of descent data. Suppose that $f^{*} \alpha=f^{*} \beta$. Our task is to show that $\alpha=\beta$. Note that $\alpha, \beta$ are morphisms of schemes over $X$, and that $f^{*} \alpha, f^{*} \beta$ are simply the base changes of $\alpha, \beta$ to morphisms over $X^{\prime}$. Hence the lemma follows from Lemma 34.31.2.

Here is the key lemma of this section.
0241 Lemma 34.31.4. In the situation of Lemma 34.30.6 assume
(1) $\left\{f: X^{\prime} \rightarrow X\right\}$ is an fpqc covering (for example if $f$ is surjective, flat, and quasi-compact), and
(2) $f \times f: X^{\prime} \times_{S^{\prime}} X^{\prime} \rightarrow X \times{ }_{S} X$ is surjective and $f l a{ }^{8}$.

Then the pullback functor is fully faithful.
Proof. Assumption (1) implies that $f$ is surjective and flat. Hence the pullback functor is faithful by Lemma 34.31.3. Let $(V, \varphi)$ and $(W, \psi)$ be two descent data relative to $X \rightarrow S$. Set $\left(V^{\prime}, \varphi^{\prime}\right)=f^{*}(V, \varphi)$ and $\left(W^{\prime}, \psi^{\prime}\right)=f^{*}(W, \psi)$. Let $\alpha^{\prime}: V^{\prime} \rightarrow$ $W^{\prime}$ be a morphism of descent data for $X^{\prime}$ over $S^{\prime}$. We have to show there exists a morphism $\alpha: V \rightarrow W$ of descent data for $X$ over $S$ whose pullback is $\alpha^{\prime}$.
Recall that $V^{\prime}$ is the base change of $V$ by $f$ and that $\varphi^{\prime}$ is the base change of $\varphi$ by $f \times f$ (see Remark 34.30.2). By assumption the diagram

commutes. We claim the two compositions

$$
V^{\prime} \times_{V} V^{\prime} \xrightarrow{\mathrm{pr}_{i}} V^{\prime} \xrightarrow{\alpha^{\prime}} W^{\prime} \longrightarrow W, \quad i=0,1
$$

are the same. The reader is advised to prove this themselves rather than read the rest of this paragraph. (Please email if you find a nice clean argument.) Let $v_{0}, v_{1}$ be points of $V^{\prime}$ which map to the same point $v \in V$. Let $x_{i} \in X^{\prime}$ be the image of $v_{i}$, and let $x$ be the point of $X$ which is the image of $v$ in $X$. In other words, $v_{i}=\left(x_{i}, v\right)$ in $V^{\prime}=X^{\prime} \times_{X} V$. Write $\varphi(v, x)=\left(x, v^{\prime}\right)$ for some point $v^{\prime}$ of $V$. This is possible

[^97]because $\varphi$ is a morphism over $X \times_{S} X$. Denote $v_{i}^{\prime}=\left(x_{i}, v^{\prime}\right)$ which is a point of $V^{\prime}$. Then a calculation (using the definition of $\varphi^{\prime}$ ) shows that $\varphi^{\prime}\left(v_{i}, x_{j}\right)=\left(x_{i}, v_{j}^{\prime}\right)$. Denote $w_{i}=\alpha^{\prime}\left(v_{i}\right)$ and $w_{i}^{\prime}=\alpha^{\prime}\left(v_{i}^{\prime}\right)$. Now we may write $w_{i}=\left(x_{i}, u_{i}\right)$ for some point $u_{i}$ of $W$, and $w_{i}^{\prime}=\left(x_{i}, u_{i}^{\prime}\right)$ for some point $u_{i}^{\prime}$ of $W$. The claim is equivalent to the assertion: $u_{0}=u_{1}$. A formal calculation using the definition of $\psi^{\prime}$ (see Lemma 34.30 .6 shows that the commutativity of the diagram displayed above says that
$$
\left(\left(x_{i}, x_{j}\right), \psi\left(u_{i}, x\right)\right)=\left(\left(x_{i}, x_{j}\right),\left(x, u_{j}^{\prime}\right)\right)
$$
as points of $\left(X^{\prime} \times_{S^{\prime}} X^{\prime}\right) \times{ }_{X} \times_{S} X\left(X \times_{S} W\right)$ for all $i, j \in\{0,1\}$. This shows that $\psi\left(u_{0}, x\right)=\psi\left(u_{1}, x\right)$ and hence $u_{0}=u_{1}$ by taking $\psi^{-1}$. This proves the claim because the argument above was formal and we can take scheme points (in other words, we may take $\left.\left(v_{0}, v_{1}\right)=\mathrm{id}_{V^{\prime} \times{ }_{V} V^{\prime}}\right)$.
At this point we can use Lemma 34.9.3. Namely, $\left\{V^{\prime} \rightarrow V\right\}$ is a fpqc covering as the base change of the morphism $f: X^{\prime} \rightarrow X$. Hence, by Lemma 34.9.3 the morphism $\alpha^{\prime}: V^{\prime} \rightarrow W^{\prime} \rightarrow W$ factors through a unique morphism $\alpha: V \rightarrow W$ whose base change is necessarily $\alpha^{\prime}$. Finally, we see the diagram

commutes because its base change to $X^{\prime} \times{ }_{S^{\prime}} X^{\prime}$ commutes and the morphism $X^{\prime} \times{ }_{S^{\prime}}$ $X^{\prime} \rightarrow X \times_{S} X$ is surjective and flat (use Lemma 34.31.2). Hence $\alpha$ is a morphism of descent data $(V, \varphi) \rightarrow(W, \psi)$ as desired.

The following two lemmas have been obsoleted by the improved exposition of the previous material. But they are still true!

0242 Lemma 34.31.5. Let $X \rightarrow S$ be a morphism of schemes. Let $f: X \rightarrow X$ be $a$ selfmap of $X$ over $S$. In this case pullback by $f$ is isomorphic to the identity functor on the category of descent data relative to $X \rightarrow S$.
Proof. This is clear from Lemma 34.30 .6 since it tells us that $f^{*} \cong \mathrm{id}^{*}$.
0243 Lemma 34.31.6. Let $f: X^{\prime} \rightarrow X$ be a morphism of schemes over a base scheme $S$. Assume there exists a morphism $g: X \rightarrow X^{\prime}$ over $S$, for example if $f$ has a section. Then the pullback functor of Lemma 34.30.6 defines an equivalence of categories between the category of descent data relative to $X / S$ and $X^{\prime} / S$.

Proof. Let $g: X \rightarrow X^{\prime}$ be a morphism over $S$. Lemma 34.31 .5 above shows that the functors $f^{*} \circ g^{*}=(g \circ f)^{*}$ and $g^{*} \circ f^{*}=(f \circ g)^{*}$ are isomorphic to the respective identity functors as desired.

040J Lemma 34.31.7. Let $f: X \rightarrow X^{\prime}$ be a morphism of schemes over a base scheme $S$. Assume $X \rightarrow S$ is surjective and flat. Then the pullback functor of of Lemma 34.30 .6 is a faithful functor from the category of descent data relative to $X^{\prime} / S$ to the category of descent data relative to $X / S$.

Proof. We may factor $X \rightarrow X^{\prime}$ as $X \rightarrow X \times_{S} X^{\prime} \rightarrow X^{\prime}$. The first morphism has a section, hence induces an equivalence of categories of descent data by Lemma 34.31.6. The second morphism is surjective and flat, hence induces a faithful functor by Lemma 34.31 .3 .

040K Lemma 34.31.8. Let $f: X \rightarrow X^{\prime}$ be a morphism of schemes over a base scheme $S$. Assume $\{X \rightarrow S\}$ is an fpqc covering (for example if $f$ is surjective, flat and quasi-compact). Then the pullback functor of of Lemma 34.30.6 is a fully faithful functor from the category of descent data relative to $X^{\prime} / S$ to the category of descent data relative to $X / S$.
Proof. We may factor $X \rightarrow X^{\prime}$ as $X \rightarrow X \times_{S} X^{\prime} \rightarrow X^{\prime}$. The first morphism has a section, hence induces an equivalence of categories of descent data by Lemma 34.31 .6 . The second morphism is an fpqc covering hence induces a fully faithful functor by Lemma 34.31.4.

02VZ Lemma 34.31.9. Let $S$ be a scheme. Let $\mathcal{U}=\left\{U_{i} \rightarrow S\right\}_{i \in I}$, and $\mathcal{V}=\left\{V_{j} \rightarrow\right.$ $S\}_{j \in J}$, be families of morphisms with target $S$. Let $\alpha: I \rightarrow J$, id:S $\rightarrow S$ and $g_{i}: U_{i} \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Assume that for each $j \in J$ the family $\left\{g_{i}: U_{i} \rightarrow V_{j}\right\}_{\alpha(i)=j}$ is an fpqc covering of $V_{j}$. Then the pullback functor
descent data relative to $\mathcal{V} \longrightarrow$ descent data relative to $\mathcal{U}$
of Lemma 34.30 .8 is fully faithful.
Proof. Consider the morphism of schemes

$$
g: X=\coprod_{i \in I} U_{i} \longrightarrow Y=\coprod_{j \in J} V_{j}
$$

over $S$ which on the $i$ th component maps into the $\alpha(i)$ th component via the morphism $g_{\alpha(i)}$. We claim that $\{g: X \rightarrow Y\}$ is an fpqc covering of schemes. Namely, by Topologies, Lemma 33.8.3 for each $j$ the morphism $\left\{\coprod_{\alpha(i)=j} U_{i} \rightarrow V_{j}\right\}$ is an fpqc covering. Thus for every affine open $V \subset V_{j}$ (which we may think of as an affine open of $Y$ ) we can find finitely many affine opens $W_{1}, \ldots, W_{n} \subset \coprod_{\alpha(i)=j} U_{i}$ (which we may think of as affine opens of $X$ ) such that $V=\bigcup_{i=1, \ldots, n} g\left(W_{i}\right)$. This provides enough affine opens of $Y$ which can be covered by finitely many affine opens of $X$ so that Topologies, Lemma 33.8.2 part (3) applies, and the claim follows. Let us write $D D(X / S)$, resp. $D D(\mathcal{U})$ for the category of descent data with respect to $X / S$, resp. $\mathcal{U}$, and similarly for $Y / S$ and $\mathcal{V}$. Consider the diagram

This diagram is commutative, see the proof of Lemma 34.30.8. The vertical arrows are equivalences. Hence the lemma follows from Lemma 34.31 .4 which shows the top horizontal arrow of the diagram is fully faithful.
The next lemma shows that, in order to check effectiveness, we may always Zariski refine the given family of morphisms with target $S$.
02VY Lemma 34.31.10. Let $S$ be a scheme. Let $\mathcal{U}=\left\{U_{i} \rightarrow S\right\}_{i \in I}$, and $\mathcal{V}=\left\{V_{j} \rightarrow\right.$ $S\}_{j \in J}$, be families of morphisms with target $S$. Let $\alpha: I \rightarrow J$, id:S $\rightarrow S$ and $g_{i}: U_{i} \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1. Assume that for each $j \in J$ the family $\left\{g_{i}: U_{i} \rightarrow V_{j}\right\}_{\alpha(i)=j}$ is a Zariski covering (see Topologies, Definition 33.3.1) of $V_{j}$. Then the pullback functor
descent data relative to $\mathcal{V} \longrightarrow$ descent data relative to $\mathcal{U}$
of Lemma 34.30 .8 is an equivalence of categories. In particular, the category of schemes over $S$ is equivalent to the category of descent data relative to any Zariski covering of $S$.
Proof. The functor is faithful and fully faithful by Lemma 34.31.9, Let us indicate how to prove that it is essentially surjective. Let $\left(X_{i}, \varphi_{i i^{\prime}}\right)$ be a descend datum relative to $\mathcal{U}$. Fix $j \in J$ and set $I_{j}=\{i \in I \mid \alpha(i)=j\}$. For $i, i^{\prime} \in I_{j}$ note that there is a canonical morphism

$$
c_{i i^{\prime}}: U_{i} \times_{g_{i}, V_{j}, g_{i^{\prime}}} U_{i^{\prime}} \rightarrow U_{i} \times_{S} U_{i^{\prime}}
$$

Hence we can pullback $\varphi_{i i^{\prime}}$ by this morphism and set $\psi_{i i^{\prime}}=c_{i i^{\prime}}^{*} \varphi_{i i^{\prime}}$ for $i, i^{\prime} \in I_{j}$. In this way we obtain a descent datum $\left(X_{i}, \psi_{i i^{\prime}}\right)$ relative to the Zariski covering $\left\{g_{i}: U_{i} \rightarrow V_{i}\right\}_{i \in I_{j}}$. Note that $\psi_{i i^{\prime}}$ is an isomorphism from the open $X_{i, U_{i} \times{ }_{V_{j}} U_{i^{\prime}}}$ of $X_{i}$ to the corresponding open of $X_{i^{\prime}}$. It follows from Schemes, Section 25.14 that we may glue $\left(X_{i}, \psi_{i i^{\prime}}\right)$ into a scheme $Y_{j}$ over $V_{j}$. Moreover, the morphisms $\varphi_{i i^{\prime}}$ for $i \in I_{j}$ and $i^{\prime} \in I_{j^{\prime}}$ glue to a morphism $\varphi_{j j^{\prime}}: Y_{j} \times_{S} V_{j^{\prime}} \rightarrow V_{j} \times_{S} Y_{j^{\prime}}$ satisfying the cocycle condition (details omitted). Hence we obtain the desired descent datum $\left(Y_{j}, \varphi_{j j^{\prime}}\right)$ relative to $\mathcal{V}$.

02W0 Lemma 34.31.11. Let $S$ be a scheme. Let $\mathcal{U}=\left\{U_{i} \rightarrow S\right\}_{i \in I}$, and $\mathcal{V}=\left\{V_{j} \rightarrow\right.$ $S\}_{j \in J}$, be fpqc-coverings of $S$. If $\mathcal{U}$ is a refinement of $\mathcal{V}$, then the pullback functor
descent data relative to $\mathcal{V} \longrightarrow$ descent data relative to $\mathcal{U}$
is fully faithful. In particular, the category of schemes over $S$ is identified with a full subcategory of the category of descent data relative to any fpqc-covering of $S$.
Proof. Consider the fpqc-covering $\mathcal{W}=\left\{U_{i} \times_{S} V_{j} \rightarrow S\right\}_{(i, j) \in I \times J}$ of $S$. It is a refinement of both $\mathcal{U}$ and $\mathcal{V}$. Hence we have a 2 -commutative diagram of functors and categories

Notation as in the proof of Lemma 34.31 .9 and commutativity by Lemma 34.30 .8 part (3). Hence clearly it suffices to prove the functors $D D(\mathcal{V}) \rightarrow D D(\mathcal{W})$ and $D D(\mathcal{U}) \rightarrow D D(\mathcal{W})$ are fully faithful. This follows from Lemma 34.31 .9 as desired.

040L Remark 34.31.12. Lemma 34.31 .11 says that morphisms of schemes satisfy fpqc descent. In other words, given a scheme $S$ and schemes $X, Y$ over $S$ the functor

$$
(S c h / S)^{o p p} \longrightarrow S e t s, \quad T \longmapsto \operatorname{Mor}_{T}\left(X_{T}, Y_{T}\right)
$$

satisfies the sheaf condition for the fpqc topology. The simplest case of this is the following. Suppose that $T \rightarrow S$ is a surjective flat morphism of affines. Let $\psi_{0}: X_{T} \rightarrow Y_{T}$ be a morphism of schemes over $T$ which is compatible with the canonical descent data. Then there exists a unique morphism $\psi: X \rightarrow Y$ whose base change to $T$ is $\psi_{0}$. In fact this special case follows in a straightforward manner from Lemma 34.31.4. And, in turn, that lemma is a formal consequence of the following two facts: (a) the base change functor by a faithfully flat morphism is faithful, see Lemma 34.31 .2 and (b) a scheme satisfies the sheaf condition for the fpqc topology, see Lemma 34.9.3.

0AP4 Lemma 34.31.13. Let $X \rightarrow S$ be a surjective, quasi-compact, flat morphism of schemes. Let $(V, \varphi)$ be a descent datum relative to $X / S$. Suppose that for all $v \in V$ there exists an open subscheme $v \in W \subset V$ such that $\varphi\left(W \times{ }_{S} X\right) \subset X \times_{S} W$ and such that the descent datum $\left(W,\left.\varphi\right|_{W \times_{S} X}\right)$ is effective. Then $(V, \varphi)$ is effective.
Proof. Let $V=\bigcup W_{i}$ be an open covering with $\varphi\left(W_{i} \times{ }_{S} X\right) \subset X \times_{S} W_{i}$ and such that the descent datum $\left(W_{i},\left.\varphi\right|_{W_{i} \times_{S} X}\right)$ is effective. Let $U_{i} \rightarrow S$ be a scheme and let $\alpha_{i}:\left(X \times_{S} U_{i}\right.$, can $) \rightarrow\left(W_{i},\left.\varphi\right|_{W_{i} \times_{S} X}\right)$ be an isomorphism of descent data. For each pair of indices $(i, j)$ consider the open $\alpha_{i}^{-1}\left(W_{i} \cap W_{j}\right) \subset X \times{ }_{S} U_{i}$. Because everything is compatible with descent data and since $\{X \rightarrow S\}$ is an fpqc covering, we may apply Lemma 34.9 .2 to find an open $V_{i j} \subset V_{j}$ such that $\alpha_{i}^{-1}\left(W_{i} \cap W_{j}\right)=X \times{ }_{S} V_{i j}$. Now the identity morphism on $W_{i} \cap W_{j}$ is compatible with descent data, hence comes from a unique morphism $\varphi_{i j}: U_{i j} \rightarrow U_{j i}$ over $S$ (see Remark 34.31.12). Then $\left(U_{i}, U_{i j}, \varphi_{i j}\right)$ is a glueing data as in Schemes, Section 25.14 (proof omitted). Thus we may assume there is a scheme $U$ over $S$ such that $U_{i} \subset U$ is open, $U_{i j}=U_{i} \cap U_{j}$ and $\varphi_{i j}=\operatorname{id}_{U_{i} \cap U_{j}}$, see Schemes, Lemma 25.14.1. Pulling back to $X$ we can use the $\alpha_{i}$ to get the desired isomorphism $\alpha: X \times_{S} U \rightarrow V$.

### 34.32. Descending types of morphisms

02W1 In the following we study the question as to whether descent data for schemes relative to a fpqc-covering are effective. The first remark to make is that this is not always the case. We will see this in Algebraic Spaces, Example 52.14.2. Even projective morphisms do not always satisfy descent for fpqc-coverings, by Examples, Lemma 88.56.1.

On the other hand, if the schemes we are trying to descend are particularly simple, then it is sometime the case that for whole classes of schemes descent data are effective. We will introduce terminology here that describes this phenomenon abstractly, even though it may lead to confusion if not used correctly later on.

02W2 Definition 34.32.1. Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in\{$ Zariski, fpqc, fppf, étale, smooth, syntomic $\}$. We say morphisms of type $\mathcal{P}$ satisfy descent for $\tau$-coverings if for any $\tau$-covering $\mathcal{U}:\left\{U_{i} \rightarrow S\right\}_{i \in I}$ (see Topologies, Section 33.2), any descent datum $\left(X_{i}, \varphi_{i j}\right)$ relative to $\mathcal{U}$ such that each morphism $X_{i} \rightarrow U_{i}$ has property $\mathcal{P}$ is effective.

Note that in each of the cases we have already seen that the functor from schemes over $S$ to descent data over $\mathcal{U}$ is fully faithful (Lemma 34.31 .11 combined with the results in Topologies that any $\tau$-covering is also a fpqc-covering). We have also seen that descent data are always effective with respect to Zariski coverings (Lemma 34.31.10). It may be prudent to only study the notion just introduced when $\mathcal{P}$ is either stable under any base change or at least local on the base in the $\tau$-topology (see Definition 34.18.1) in order to avoid erroneous arguments (relying on $\mathcal{P}$ when descending halfway).

Here is the obligatory lemma reducing this question to the case of a covering given by a single morphism of affines.

02W3 Lemma 34.32.2. Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in\{f p q c$, fppf , étale, smooth, syntomic $\}$. Suppose that
(1) $\mathcal{P}$ is stable under any base change (see Schemes, Definition 25.18.3), and
(2) for any surjective morphism of affines $X \rightarrow S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether $\tau$ is fpqc, fppf, étale, smooth, or syntomic, any descent datum $(V, \varphi)$ relative to $X$ over $S$ such that $\mathcal{P}$ holds for $V \rightarrow X$ is effective.
Then morphisms of type $\mathcal{P}$ satisfy descent for $\tau$-coverings.
Proof. Let $S$ be a scheme. Let $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow S\right\}_{i \in I}$ be a $\tau$-covering of $S$. Let $\left(X_{i}, \varphi_{i i^{\prime}}\right)$ be a descent datum relative to $\mathcal{U}$ and assume that each morphism $X_{i} \rightarrow U_{i}$ has property $\mathcal{P}$. We have to show there exists a scheme $X \rightarrow S$ such that $\left(X_{i}, \varphi_{i i^{\prime}}\right) \cong\left(U_{i} \times_{S} X, c a n\right)$.
Before we start the proof proper we remark that for any family of morphisms $\mathcal{V}:\left\{V_{j} \rightarrow S\right\}$ and any morphism of families $\mathcal{V} \rightarrow \mathcal{U}$, if we pullback the descent datum $\left(X_{i}, \varphi_{i i^{\prime}}\right)$ to a descent datum $\left(Y_{j}, \varphi_{j j^{\prime}}\right)$ over $\mathcal{V}$, then each of the morphisms $Y_{j} \rightarrow V_{j}$ has property $\mathcal{P}$ also. This is true because we assumed that $\mathcal{P}$ is stable under any base change and the definition of pullback (see Definition 34.30.9). We will use this without further mention.

First, let us prove the lemma when $S$ is affine. By Topologies, Lemma 33.8.8, 33.7.4, 33.4.4, 33.5.4 or 33.6 .4 there exists a standard $\tau$-covering $\mathcal{V}:\left\{V_{j} \rightarrow S\right\}_{j=1, \ldots, m}$ which refines $\mathcal{U}$. The pullback functor $D D(\mathcal{U}) \rightarrow D D(\mathcal{V})$ between categories of descent data is fully faithful by Lemma 34.31.11. Hence it suffices to prove that the descend datum over the standard $\tau$-covering $\mathcal{V}$ is effective. By Lemma 34.30.5 this reduces to the covering $\left\{\coprod_{j=1, \ldots, m} V_{j} \rightarrow S\right\}$ for which we have assumed the result in property (2) of the lemma. Hence the lemma holds when $S$ is affine.
Assume $S$ is general. Let $V \subset S$ be an affine open. By the properties of site the family $\mathcal{U}_{V}=\left\{V \times_{S} U_{i} \rightarrow V\right\}_{i \in I}$ is a $\tau$-covering of $V$. Denote $\left(X_{i}, \varphi_{i i^{\prime}}\right)_{V}$ the restriction (or pullback) of the given descent datum to $\mathcal{U}_{V}$. Hence by what we just saw we obtain a scheme $X_{V}$ over $V$ whose canonical descent datum with respect to $\mathcal{U}_{V}$ is isomorphic to $\left(X_{i}, \varphi_{i i^{\prime}}\right)_{V}$. Suppose that $V^{\prime} \subset V$ is an affine open of $V$. Then both $X_{V^{\prime}}$ and $V^{\prime} \times_{V} X_{V}$ have canonical descent data isomorphic to $\left(X_{i}, \varphi_{i i^{\prime}}\right)_{V^{\prime}}$. Hence, by Lemma 34.31.11 again we obtain a canonical morphism $\rho_{V^{\prime}}^{V}: X_{V^{\prime}} \rightarrow X_{V}$ over $S$ which identifies $X_{V^{\prime}}$ with the inverse image of $V^{\prime}$ in $X_{V}$. We omit the verification that given affine opens $V^{\prime \prime} \subset V^{\prime} \subset V$ of $S$ we have $\rho_{V^{\prime \prime}}^{V}=\rho_{V^{\prime}}^{V} \circ \rho_{V^{\prime \prime}}^{V^{\prime}}$.
By Constructions, Lemma 26.2 .1 the data $\left(X_{V}, \rho_{V^{\prime}}^{V}\right)$ glue to a scheme $X \rightarrow S$. Moreover, we are given isomorphisms $V \times_{S} X \rightarrow X_{V}$ which recover the maps $\rho_{V^{\prime}}^{V}$. Unwinding the construction of the schemes $X_{V}$ we obtain isomorphisms

$$
V \times_{S} U_{i} \times_{S} X \longrightarrow V \times_{S} X_{i}
$$

compatible with the maps $\varphi_{i i^{\prime}}$ and compatible with restricting to smaller affine opens in $X$. This implies that the canonical descent datum on $U_{i} \times{ }_{S} X$ is isomorphic to the given descent datum and we win.

### 34.33. Descending affine morphisms

0244 In this section we show that "affine morphisms satisfy descent for fpqc-coverings". Here is the formal statement.

0245 Lemma 34.33.1. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be an fpqc covering, see Topologies, Definition 33.8.1. Let $\left(V_{i} / X_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow S\right\}$. If each morphism $V_{i} \rightarrow X_{i}$ is affine, then the descent datum is effective.

Proof. Being affine is a property of morphisms of schemes which is preserved under any base change, see Morphisms, Lemma 28.12.8. Hence Lemma 34.32.2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of affines. Say $X=\operatorname{Spec}(A)$ and $S=\operatorname{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let $(V, \varphi)$ be a descent datum relative to $X$ over $S$ and assume that $V \rightarrow X$ is affine. Then $V \rightarrow X$ being affine implies that $V=\operatorname{Spec}(B)$ for some $A$-algebra $B$ (see Morphisms, Definition 28.12.1). The isomorphism $\varphi$ corresponds to an isomorphism of rings

$$
\varphi^{\sharp}: B \otimes_{R} A \longleftarrow A \otimes_{R} B
$$

as $A \otimes_{R} A$-algebras. The cocycle condition on $\varphi$ says that

is commutative. Inverting these arrows we see that we have a descent datum for modules with respect to $R \rightarrow A$ as in Definition 34.3.1. Hence we may apply Proposition 34.3 .9 to obtain an $R$-module $C=\operatorname{Ker}\left(B \rightarrow A \otimes_{R} B\right)$ and an isomorphism $A \otimes_{R} C \cong B$ respecting descent data. Given any pair $c, c^{\prime} \in C$ the product $c c^{\prime}$ in $B$ lies in $C$ since the map $\varphi$ is an algebra homomorphism. Hence $C$ is an $R$-algebra whose base change to $A$ is isomorphic to $B$ compatibly with descent data. Applying Spec we obtain a scheme $U$ over $S$ such that $(V, \varphi) \cong\left(X \times_{S} U\right.$, can $)$ as desired.

03I0 Lemma 34.33.2. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be an fpqc covering, see Topologies, Definition 33.8.1. Let $\left(V_{i} / X_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow S\right\}$. If each morphism $V_{i} \rightarrow X_{i}$ is a closed immersion, then the descent datum is effective.

Proof. This is true because a closed immersion is an affine morphism (Morphisms, Lemma 28.12.9, and hence Lemma 34.33.1 applies.

### 34.34. Descending quasi-affine morphisms

0246 In this section we show that "quasi-affine morphisms satisfy descent for fpqccoverings". Here is the formal statement.

0247 Lemma 34.34.1. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be an fpqc covering, see Topologies, Definition 33.8.1. Let $\left(V_{i} / X_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow S\right\}$. If each morphism $V_{i} \rightarrow X_{i}$ is quasi-affine, then the descent datum is effective.

Proof. Being quasi-affine is a property of morphisms of schemes which is preserved under any base change, see Morphisms, Lemma 28.13.5. Hence Lemma 34.32.2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of affines. Say $X=\operatorname{Spec}(A)$ and $S=\operatorname{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let $(V, \varphi)$ be a descent datum relative to $X$ over $S$ and assume that $\pi: V \rightarrow X$ is quasi-affine.
According to Morphisms, Lemma 28.13 .3 this means that

$$
V \longrightarrow \underline{\operatorname{Spec}}_{X}\left(\pi_{*} \mathcal{O}_{V}\right)=W
$$

is a quasi-compact open immersion of schemes over $X$. The projections $\mathrm{pr}_{i}: X \times_{S}$ $X \rightarrow X$ are flat and hence we have

$$
\operatorname{pr}_{0}^{*} \pi_{*} \mathcal{O}_{V}=\left(\pi \times \operatorname{id}_{X}\right)_{*} \mathcal{O}_{V \times_{S} X}, \quad \operatorname{pr}_{1}^{*} \pi_{*} \mathcal{O}_{V}=\left(\operatorname{id}_{X} \times \pi\right)_{*} \mathcal{O}_{X \times_{S} V}
$$

by flat base change (Cohomology of Schemes, Lemma 29.5.2). Thus the isomorphism $\varphi: V \times_{S} X \rightarrow X \times_{S} V$ (which is an isomorphism over $X \times_{S} X$ ) induces an isomorphism of quasi-coherent sheaves of algebras

$$
\varphi^{\sharp}: \operatorname{pr}_{0}^{*} \pi_{*} \mathcal{O}_{V} \longrightarrow \operatorname{pr}_{1}^{*} \pi_{*} \mathcal{O}_{V}
$$

on $X \times_{S} X$. The cocycle condition for $\varphi$ implies the cocycle condition for $\varphi^{\sharp}$. Another way to say this is that it produces a descent datum $\varphi^{\prime}$ on the affine scheme $W$ relative to $X$ over $S$, which moreover has the property that the morphism $V \rightarrow W$ is a morphism of descent data. Hence by Lemma 34.33.1 (or by effectivity of descent for quasi-coherent algebras) we obtain a scheme $U^{\prime} \rightarrow S$ with an isomorphism $\left(W, \varphi^{\prime}\right) \cong\left(X \times_{S} U^{\prime}\right.$, can $)$ of descent data. We note in passing that $U^{\prime}$ is affine by Lemma 34.19.16
And now we can think of $V$ as a (quasi-compact) open $V \subset X \times_{S} U^{\prime}$ with the property that it is stable under the descent datum

$$
\text { can : } X \times_{S} U^{\prime} \times_{S} X \rightarrow X \times_{S} X \times_{S} U^{\prime},\left(x_{0}, u^{\prime}, x_{1}\right) \mapsto\left(x_{0}, x_{1}, u^{\prime}\right)
$$

In other words $\left(x_{0}, u^{\prime}\right) \in V \Rightarrow\left(x_{1}, u^{\prime}\right) \in V$ for any $x_{0}, x_{1}, u^{\prime}$ mapping to the same point of $S$. Because $X \rightarrow S$ is surjective we immediately find that $V$ is the inverse image of a subset $U \subset U^{\prime}$ under the morphism $X \times_{S} U^{\prime} \rightarrow U^{\prime}$. Because $X \rightarrow S$ is quasi-compact, flat and surjective also $X \times_{S} U^{\prime} \rightarrow U^{\prime}$ is quasi-compact flat and surjective. Hence by Morphisms, Lemma 28.25 .10 this subset $U \subset U^{\prime}$ is open and we win.

### 34.35. Descent data in terms of sheaves

02W4 Here is another way to think about descent data in case of a covering on a site.
02W5 Lemma 34.35.1. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$. Let $S c h_{\tau}$ be a big $\tau$-site. Let $S \in \mathrm{Ob}\left(S c h_{\tau}\right)$. Let $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be a covering in the site $(S c h / S)_{\tau}$. There is an equivalence of categories

$$
\left\{\begin{array}{c}
\text { descent data }\left(X_{i}, \varphi_{i i^{\prime}}\right) \text { such that } \\
\text { each } X_{i} \in \operatorname{Ob}\left((S c h / S)_{\tau}\right)
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { sheaves } F \text { on }(S c h / S)_{\tau} \text { such that } \\
\text { each } h_{S_{i}} \times F \text { is representable }
\end{array}\right\}
$$

Moreover,
(1) the objects representing $h_{S_{i}} \times F$ on the right hand side correspond to the schemes $X_{i}$ on the left hand side, and
(2) the sheaf $F$ is representable if and only if the corresponding descent datum $\left(X_{i}, \varphi_{i i^{\prime}}\right)$ is effective.

Proof. We have seen in Section 34.9 that representable presheaves are sheaves on the site $(S c h / S)_{\tau}$. Moreover, the Yoneda lemma (Categories, Lemma 4.3.5) guarantees that maps between representable sheaves correspond one to one with maps between the representing objects. We will use these remarks without further mention during the proof.

[^98]Let us construct the functor from right to left. Let $F$ be a sheaf on $(S c h / S)_{\tau}$ such that each $h_{S_{i}} \times F$ is representable. In this case let $X_{i}$ be a representing object in $(S c h / S)_{\tau}$. It comes equipped with a morphism $X_{i} \rightarrow S_{i}$. Then both $X_{i} \times{ }_{S} S_{i^{\prime}}$ and $S_{i} \times{ }_{S} X_{i^{\prime}}$ represent the sheaf $h_{S_{i}} \times F \times h_{S_{i^{\prime}}}$ and hence we obtain an isomorphism

$$
\varphi_{i i^{\prime}}: X_{i} \times_{S} S_{i^{\prime}} \rightarrow S_{i} \times_{S} X_{i^{\prime}}
$$

It is straightforward to see that the maps $\varphi_{i i^{\prime}}$ are morphisms over $S_{i} \times{ }_{S} S_{i^{\prime}}$ and satisfy the cocycle condition. The functor from right to left is given by this construction $F \mapsto\left(X_{i}, \varphi_{i i^{\prime}}\right)$.
Let us construct a functor from left to right. For each $i$ denote $F_{i}$ the sheaf $h_{X_{i}}$. The isomorphisms $\varphi_{i i^{\prime}}$ give isomorphisms

$$
\varphi_{i i^{\prime}}: F_{i} \times h_{S_{i^{\prime}}} \longrightarrow h_{S_{i}} \times F_{i^{\prime}}
$$

over $h_{S_{i}} \times h_{S_{i^{\prime}}}$. Set $F$ equal to the coequalizer in the following diagram

$$
\coprod_{i, i^{\prime}} F_{i} \times h_{S_{i^{\prime}}} \xrightarrow[\operatorname{pr}_{1} \circ \varphi_{i i^{\prime}}]{\mathrm{pr}_{0}} \coprod_{i} F_{i} \longrightarrow F
$$

The cocycle condition guarantees that $h_{S_{i}} \times F$ is isomorphic to $F_{i}$ and hence representable. The functor from left to right is given by this construction $\left(X_{i}, \varphi_{i i^{\prime}}\right) \mapsto F$.

We omit the verification that these constructions are mutually quasi-inverse functors. The final statements (1) and (2) follow from the constructions.

02W6 Remark 34.35.2. In the statement of Lemma 34.35.1 the condition that $h_{S_{i}} \times F$ is representable is equivalent to the condition that the restriction of $F$ to $\left(S c h / S_{i}\right)_{\tau}$ is representable.

## Derived Categories of Schemes

08CU

### 35.1. Introduction

08 CV In this chapter we discuss derived categories of modules on schemes. Most of the material discussed here can be found in TT90, BN93, BV03, and [LN07]. Of course there are many other references.

### 35.2. Conventions

08 CW If $\mathcal{A}$ is an abelian category and $M$ is an object of $\mathcal{A}$ then we also denote $M$ the object of $K(\mathcal{A})$ and/or $D(\mathcal{A})$ corresponding to the complex which has $M$ in degree 0 and is zero in all other degrees.

If we have a ring $A$, then $K(A)$ denotes the homotopy category of complexes of $A$-modules and $D(A)$ the associated derived category. Similarly, if we have a ringed space $\left(X, \mathcal{O}_{X}\right)$ the symbol $K\left(\mathcal{O}_{X}\right)$ denotes the homotopy category of complexes of $\mathcal{O}_{X}$-modules and $D\left(\mathcal{O}_{X}\right)$ the associated derived category.

### 35.3. Derived category of quasi-coherent modules

06 YZ In this section we discuss the relationship between quasi-coherent modules and all modules on a scheme $X$. A reference is TT90, Appendix B]. By the discussion in Schemes, Section 25.24 the embedding $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \subset \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ exhibits $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ as a weak Serre subcategory of the category of $\mathcal{O}_{X}$-modules. Denote

$$
D_{Q C o h}\left(\mathcal{O}_{X}\right) \subset D\left(\mathcal{O}_{X}\right)
$$

the subcategory of complexes whose cohomology sheaves are quasi-coherent, see Derived Categories, Section 13.13. Thus we obtain a canonical functor
06VT (35.3.0.1)

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

see Derived Categories, Equation 13.13.1.1.
08DT Lemma 35.3.1. Let $X$ be a scheme. Then $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ has direct sums.
Proof. By Injectives, Lemma 19.13 .4 the derived category $D\left(\mathcal{O}_{X}\right)$ has direct sums and they are computed by taking termwise direct sums of any representatives. Thus it is clear that the cohomology sheaf of a direct sum is the direct sum of the cohomology sheaves as taking direct sums is an exact functor (in any Grothendieck abelian category). The lemma follows as the direct sum of quasi-coherent sheaves is quasi-coherent, see Schemes, Section 25.24 .

We will need some information on derived limits. We warn the reader that in the lemma below the derived limit will typically not be an object of $D_{Q C o h}$.

0A0J Lemma 35.3.2. Let $X$ be a scheme. Let $\left(K_{n}\right)$ be an inverse system of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ such that the maps $H^{q}\left(K_{n+1}\right) \rightarrow H^{q}\left(K_{n}\right)$ are surjective for all $q \in \mathbf{Z}$ and $n \geq 1$. Then the derived limit $K=R \lim K_{n}$ in $D\left(\mathcal{O}_{X}\right)$ has cohomology sheaves $H^{q}(K)=$ $\lim H^{q}\left(K_{n}\right)$. Moreover, $R \lim H^{q}\left(K_{n}\right)=\lim H^{q}\left(K_{n}\right)$.
Proof. This follows from Cohomology, Lemma 20.31.6. Namely, let $\mathcal{B}$ be the set of affine opens of $X$. The vanishing (2)(a) follows from Cohomology of Schemes, Lemma 29.2.2 The vanishing (2)(b) of $R^{1}$ lim follows because the transition maps $H^{0}\left(U, H^{q}\left(K_{n+1}\right)\right) \rightarrow H^{0}\left(U, H^{q}\left(K_{n}\right)\right)$ are surjective for affine open subschemes of $X$ by Schemes, Lemma 25.7.5.

The following lemma will help us to "compute" a right derived functor on an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
08D3 Lemma 35.3.3. Let $X$ be a scheme. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Then the canonical map $E \rightarrow R \lim \tau_{\geq-n} E$ is an isomorphism ${ }^{1}$.

Proof. Denote $\mathcal{H}^{i}=H^{i}(E)$ the $i$ th cohomology sheaf of $E$. Let $\mathcal{B}$ be the set of affine open subsets of $X$. Then $H^{p}\left(U, \mathcal{H}^{i}\right)=0$ for all $p>0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$, see Cohomology of Schemes, Lemma 29.2.2. Thus the lemma follows from Cohomology, Lemma 20.31.4.

08D4 Lemma 35.3.4. Let $X$ be a scheme. Let $F: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow A b$ be an additive functor and $N \geq 0$ an integer. Assume that
(1) $F$ commutes with countable direct products,
(2) $R^{p} F(\mathcal{F})=0$ for all $p \geq N$ and $\mathcal{F}$ quasi-coherent.

Then for $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the maps $R^{p} F(E) \rightarrow R^{p} F\left(\tau_{\geq p-N+1} E\right)$ are isomorphisms.

Proof. By shifting the complex we see it suffices to prove the assertion for $p=0$. Write $E_{n}=\tau_{\geq-n} E$. We have $E=R \lim E_{n}$, see for $p=0$. Write $E_{n}=\tau_{\geq-n} E$. We have $E=\bar{R} \lim E_{n}$, see Lemma 35.3.3. Thus $R F(E)=R \lim R F\left(E_{n}\right)$ in $\bar{D}(A b)$ by Injectives, Lemma 19.13.6. Thus we have a short exact sequence

$$
0 \rightarrow R^{1} \lim R^{-1} F\left(E_{n}\right) \rightarrow R^{0} F(E) \rightarrow \lim R^{0} F\left(E_{n}\right) \rightarrow 0
$$

see More on Algebra, Remark 15.68.16. To finish the proof we will show that the term on the left is zero and that the term on the right equals $R^{0} F\left(E_{N-1}\right)$.
We have a distinguished triangle

$$
H^{-n}(E)[n] \rightarrow E_{n} \rightarrow E_{n-1} \rightarrow H^{-n}(E)[n+1]
$$

(Derived Categories, Remark 13.12.4) in $D\left(\mathcal{O}_{X}\right)$. Since $H^{-n}(E)$ is quasi-coherent we have

$$
R^{p} F\left(H^{-n}(E)[n]\right)=R^{p+n} F\left(H^{-n}(E)\right)=0
$$

for $p+n \geq N$ and

$$
R^{p} F\left(H^{-n}(E)[n+1]\right)=R^{p+n+1} F\left(H^{-n}(E)\right)=0
$$

for $p+n+1 \geq N$. We conclude that

$$
R^{p} F\left(E_{n}\right) \rightarrow R^{p} F\left(E_{n-1}\right)
$$

[^99]is an isomorphism for all $n \gg p$ and an isomorphism for $n \geq N$ for $p=0$. Thus the systems $R^{p} F\left(E_{n}\right)$ all satisfy the ML condition and $R^{1}$ lim gives zero (see discussion in More on Algebra, Section 15.68 . Moreover, the system $R^{0} F\left(\tau_{\geq-n} E\right)$ is constant starting with $n=N-1$ as desired.

The following lemma is the key ingredient to many of the results in this chapter.
06Z0 Lemma 35.3.5. Let $X=\operatorname{Spec}(A)$ be an affine scheme. All the functors in the diagram

are equivalences of triangulated categories. Moreover, for $E$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we have $H^{0}(X, E)=H^{0}\left(X, H^{0}(E)\right)$.

Proof. The functor $R \Gamma(X,-)$ gives a functor $D\left(\mathcal{O}_{X}\right) \rightarrow D(A)$ and hence by restriction a functor
06 VU

$$
\begin{equation*}
R \Gamma(X,-): D_{Q C o h}\left(\mathcal{O}_{X}\right) \longrightarrow D(A) . \tag{35.3.5.1}
\end{equation*}
$$

We will show this functor is quasi-inverse to 35.3 .0 .1 via the equivalence between quasi-coherent modules on $X$ and the category of $A$-modules.

Elucidation. Denote $\left(Y, \mathcal{O}_{Y}\right)$ the one point space with sheaf of rings given by $A$. Denote $\pi:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ the obvious morphism of ringed spaces. Then $R \Gamma(X,-)$ can be identified with $R \pi_{*}$ and the functor 35.3.0.1) via the equivalence $\operatorname{Mod}\left(\mathcal{O}_{Y}\right)=\operatorname{Mod}_{A}=Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ can be identified with $L \pi^{*}=\pi^{*}=^{\sim}$ (see Modules, Lemma 17.10 .5 and Schemes, Lemmas 25.7.1 and 25.7.5. Thus the functors

$$
D(A) \longleftrightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)
$$

are adjoint (by Cohomology, Lemma 20.29.1). In particular we obtain canonical adjunction mappings

$$
a: \widetilde{R \widetilde{\Gamma(X, E)}} \longrightarrow E
$$

for $E$ in $D\left(\mathcal{O}_{X}\right)$ and

$$
b: M^{\bullet} \longrightarrow R \Gamma\left(X, \widetilde{M^{\bullet}}\right)
$$

for $M^{\bullet}$ a complex of $A$-modules.
Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. We may apply Lemma 35.3.4 to the functor $F(-)=\Gamma(X,-)$ with $N=1$ by Cohomology of Schemes, Lemma 29.2.2. Hence

$$
R^{0} \Gamma(X, E)=R^{0} \Gamma\left(X, \tau_{\geq 0} E\right)=\Gamma\left(X, H^{0}(E)\right)
$$

(the last equality by definition of the canonical truncation). Using this we will show that the adjunction mappings $a$ and $b$ induce isomorphisms $H^{0}(a)$ and $H^{0}(b)$. Thus $a$ and $b$ are quasi-isomorphisms (as the statement is invariant under shifts) and the lemma is proved.

In both cases we use that ${ }^{\sim}$ is an exact functor (Schemes, Lemma 25.5.4). Namely, this implies that

$$
H^{0}(\widetilde{R \Gamma(X, E)})=R^{0} \widetilde{\Gamma(X, E)}=\Gamma\left(\widetilde{X, H^{0}(E)}\right)
$$

which is equal to $H^{0}(E)$ because $H^{0}(E)$ is quasi-coherent. Thus $H^{0}(a)$ is an isomorphism. For the other direction we have

$$
\left.H^{0}\left(R \Gamma\left(X, \widetilde{M^{\bullet}}\right)\right)=R^{0} \Gamma\left(X, \widetilde{M^{\bullet}}\right)=\Gamma\left(X, H^{0}\left(\widetilde{M^{\bullet}}\right)\right)=\Gamma\left(X, \widetilde{H^{0}\left(M^{\bullet}\right.}\right)\right)=H^{0}\left(M^{\bullet}\right)
$$

which proves that $H^{0}(b)$ is an isomorphism.
08DV Lemma 35.3.6. Let $X=\operatorname{Spec}(A)$ be an affine scheme. If $K^{\bullet}$ is a $K$-flat complex of A-modules, then $\widetilde{K^{\bullet}}$ is a $K$-flat complex of $\mathcal{O}_{X}$-modules.
Proof. By More on Algebra, Lemma 15.49 .5 we see that $K^{\bullet} \otimes_{A} A_{\mathfrak{p}}$ is a K-flat complex of $A_{\mathfrak{p}}$-modules for every $\mathfrak{p} \in \operatorname{Spec}(A)$. Hence we conclude from Cohomology, Lemma 20.27.4 (and Schemes, Lemma 25.5.4 that $\widetilde{K^{\bullet}}$ is K-flat.
08DW Lemma 35.3.7. Let $f: Y \rightarrow X$ be a morphism of schemes.
(1) The functor $L f^{*}$ sends $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.
(2) If $X$ and $Y$ are affine and $f$ is given by the ring map $A \rightarrow B$, then the diagram

commutes.
Proof. We first prove the diagram

commutes. This is clear from Lemma 35.3 .6 and the constructions of the functors in question. To see (1) let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. To see that $L f^{*} E$ has quasi-coherent cohomology sheaves we may work locally on $X$. Note that $L f^{*}$ is compatible with restricting to open subschemes. Hence we can assume that $f$ is a morphism of affine schemes as in (2). Then we can apply Lemma 35.3.5 to see that $E$ comes from a complex of $A$-modules. By the commutativity of the first diagram of the proof the same holds for $L f^{*} E$ and we conclude (1) is true.
08DX Lemma 35.3.8. Let $X$ be a scheme.
(1) For objects $K, L$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the derived tensor product $K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
(2) If $X=\operatorname{Spec}(A)$ is affine then

$$
\widetilde{M^{\bullet}} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \widetilde{K^{\bullet}}=M^{\bullet} \widetilde{\otimes_{A}^{\mathbf{L}} K^{\bullet}}
$$

for any pair of complexes of $A$-modules $K^{\bullet}, M^{\bullet}$.
Proof. The equality of (2) follows immediately from Lemma 35.3 .6 and the construction of the derived tensor product. To see (1) let $K, L$ be objects of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. To check that $K \otimes^{\mathbf{L}} L$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we may work locally on $X$, hence we may assume $X=\operatorname{Spec}(A)$ is affine. By Lemma 35.3 .5 we may represent $K$ and $L$ by complexes of $A$-modules. Then part (2) implies the result.

### 35.4. Total direct image

08DY The following lemma is the analogue of Cohomology of Schemes, Lemma 29.4.5.
08D5 Lemma 35.4.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that $f$ is quasi-separated and quasi-compact.
(1) The functor $R f_{*}$ sends $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}\left(\mathcal{O}_{S}\right)$.
(2) If $S$ is quasi-compact, there exists an integer $N=N(X, S, f)$ such that for an object $E$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ with $H^{m}(E)=0$ for $m>0$ we have $H^{m}\left(R f_{*} E\right)=0$ for $m \geq N$.
(3) In fact, if $S$ is quasi-compact we can find $N=N(X, S, f)$ such that for every morphism of schemes $S^{\prime} \rightarrow S$ the same conclusion holds for the functor $R\left(f^{\prime}\right)_{*}$ where $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ is the base change of $f$.

Proof. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. To prove (1) we have to show that $R f_{*} E$ has quasi-coherent cohomology sheaves. The question is local on $S$, hence we may assume $S$ is quasi-compact. Pick $N=N(X, S, f)$ as in Cohomology of Schemes, Lemma 29.4.5. Thus $R^{p} f_{*} \mathcal{F}=0$ for all quasi-coherent $\mathcal{O}_{X}$-modules $\mathcal{F}$ and all $p \geq N$ and the same remains true after base change.

First, assume $E$ is bounded below. We will show (1) and (2) and (3) hold for such $E$ with our choice of $N$. In this case we can for example use the spectral sequence

$$
R^{p} f_{*} H^{q}(E) \Rightarrow R^{p+q} f_{*} E
$$

(Derived Categories, Lemma 13.21.3), the quasi-coherence of $R^{p} f_{*} H^{q}(E)$, and the vanishing of $R^{p} f_{*} H^{q}(E)$ for $p \geq N$ to see that (1), (2), and (3) hold in this case.

Next we prove (2) and (3). Say $H^{m}(E)=0$ for $m>0$. Let $U \subset S$ be affine open. By Cohomology of Schemes, Lemma 29.4.6 and our choice of $N$ we have $H^{p}\left(f^{-1}(U), \mathcal{F}\right)=0$ for $p \geq N$ and any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$. Hence we may apply Lemma 35.3.4 to the functor $\Gamma\left(f^{-1}(U),-\right)$ to see that

$$
R \Gamma\left(U, R f_{*} E\right)=R \Gamma\left(f^{-1}(U), E\right)
$$

has vanishing cohomology in degrees $\geq N$. Since this holds for all $U \subset S$ affine open we conclude that $H^{m}\left(R f_{*} E\right)=0$ for $m \geq N$.

Next, we prove (1) in the general case. Recall that there is a distinguished triangle

$$
\tau_{\leq-n-1} E \rightarrow E \rightarrow \tau_{\geq-n} E \rightarrow\left(\tau_{\leq-n-1} E\right)[1]
$$

in $D\left(\mathcal{O}_{X}\right)$, see Derived Categories, Remark 13.12 .4 By (2) we see that $R f_{*} \tau_{\leq-n-1} E$ has vanishing cohomology sheaves in degrees $\geq-n+N$. Thus, given an integer $q$ we see that $R^{q} f_{*} E$ is equal to $R^{q} f_{*} \tau_{\geq-n} E$ for some $n$ and the result above applies.

08DZ Lemma 35.4.2. Let $f: X \rightarrow S$ be a quasi-separated and quasi-compact morphism of schemes. Then $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{S}\right)$ commutes with direct sums.
Proof. Let $E_{i}$ be a family of objects of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and set $E=\bigoplus E_{i}$. We want to show that the map

$$
\bigoplus R f_{*} E_{i} \longrightarrow R f_{*} E
$$

is an isomorphism. We will show it induces an isomorphism on cohomology sheaves in degree 0 which will imply the lemma. Choose an integer $N$ as in Lemma 35.4.1. Then $R^{0} f_{*} E=R^{0} f_{*} \tau_{\geq-N} E$ and $R^{0} f_{*} E_{i}=R^{0} f_{*} \tau_{\geq-N} E_{i}$ by the lemma cited.

Observe that $\tau_{\geq-N} E=\bigoplus \tau_{\geq-N} E_{i}$. Thus we may assume all of the $E_{i}$ have vanishing cohomology sheaves in degrees $<-N$. Next we use the spectral sequences

$$
R^{p} f_{*} H^{q}(E) \Rightarrow R^{p+q} f_{*} E \quad \text { and } \quad R^{p} f_{*} H^{q}\left(E_{i}\right) \Rightarrow R^{p+q} f_{*} E_{i}
$$

(Derived Categories, Lemma 13.21.3) to reduce to the case of a direct sum of quasi-coherent sheaves. This case is handled by Cohomology of Schemes, Lemma 29.6.1.

### 35.5. Affine morphisms

0AVV In this section we collect some information about pushforward along an affine morphism of schemes.

0818 Lemma 35.5.1. Let $f: X \rightarrow S$ be an affine morphism of schemes. Then $R f_{*}$ : $D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{S}\right)$ reflects isomorphisms.

Proof. The statement means that a morphism $\alpha: E \rightarrow F$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is an isomorphism if $R f_{*} \alpha$ is an isomorphism. We may check this on cohomology sheaves. In particular, the question is local on $S$. Hence we may assume $S$ and therefore $X$ is affine. In this case the statement is clear from the description of the derived categories $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ given in Lemma 35.3.5. Some details omitted.

08I9 Lemma 35.5.2. Let $f: X \rightarrow S$ be an affine morphism of schemes. For $E$ in $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ we have $R f_{*} L f^{*} E=E \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} f_{*} \mathcal{O}_{X}$.

Proof. Since $f$ is affine the map $f_{*} \mathcal{O}_{X} \rightarrow R f_{*} \mathcal{O}_{X}$ is an isomorphism (Cohomology of Schemes, Lemma 29.2.3). There is a canonical map $E \otimes^{\mathbf{L}} f_{*} \mathcal{O}_{X}=E \otimes^{\mathbf{L}} R f_{*} \mathcal{O}_{X} \rightarrow$ $R f_{*} L f^{*} E$ adjoint to the map

$$
L f^{*}\left(E \otimes^{\mathbf{L}} R f_{*} \mathcal{O}_{X}\right)=L f^{*} E \otimes^{\mathbf{L}} L f^{*} R f_{*} \mathcal{O}_{X} \longrightarrow L f^{*} E \otimes^{\mathbf{L}} \mathcal{O}_{X}=L f^{*} E
$$

coming from 1:Lf $E \rightarrow L f^{*} E$ and the canonical map $L f^{*} R f_{*} \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}$. To check the map so constructed is an isomorphism we may work locally on $S$. Hence we may assume $S$ and therefore $X$ is affine. In this case the statement is clear from the description of the derived categories $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $D_{Q C o h}\left(\mathcal{O}_{S}\right)$ and the functor $L f^{*}$ given in Lemmas 35.3.5 and 35.3.7. Some details omitted.

Let $Y$ be a scheme. Let $\mathcal{A}$ be a sheaf of $\mathcal{O}_{Y}$-algebras. We will denote $D_{Q \operatorname{Coh}}(\mathcal{A})$ the inverse image of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ under the restriction functor $D(\mathcal{A}) \rightarrow D\left(\mathcal{O}_{X}\right)$. In other words, $K \in D(\mathcal{A})$ is in $D_{Q C o h}(\mathcal{A})$ if and only if its cohomology sheaves are quasi-coherent as $\mathcal{O}_{X}$-modules. If $\mathcal{A}$ is quasi-coherent itself this is the same as asking the cohomology sheaves to be quasi-coherent as $\mathcal{A}$-modules, see Morphisms, Lemma 28.12.6.

0AVW Lemma 35.5.3. Let $f: X \rightarrow Y$ be an affine morphism of schemes. Then $f_{*}$ induces an equivalence

$$
\Phi: D_{Q C o h}\left(\mathcal{O}_{X}\right) \longrightarrow D_{Q \operatorname{Coh}}\left(f_{*} \mathcal{O}_{X}\right)
$$

whose composition with $D_{Q C o h}\left(f_{*} \mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ is $R f_{*}: D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right) \rightarrow$ $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$.

Proof. Recall that $R f_{*}$ is computed on an object $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ by choosing a K-injective complex $\mathcal{I}^{\bullet}$ of $\mathcal{O}_{X}$-modules representing $K$ and taking $f_{*} \mathcal{I}^{\bullet}$. Thus we let $\Phi(K)$ be the complex $f_{*} \mathcal{I} \bullet$ viewed as a complex of $f_{*} \mathcal{O}_{X}$-modules. Denote $g:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, f_{*} \mathcal{O}_{X}\right)$ the obvious morphism of ringed spaces. Then $g$ is a flat morphism of ringed spaces (see below for a description of the stalks) and $\Phi$ is the restriction of $R g_{*}$ to $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. We claim that $L g^{*}$ is a quasi-inverse. First, observe that $L g^{*}$ sends $D_{Q C o h}\left(f_{*} \mathcal{O}_{X}\right)$ into $D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)$ because $g^{*}$ transforms quasi-coherent modules into quasi-coherent modules (Modules, Lemma 17.10.4). To finish the proof it suffices to show that the adjunction mappings

$$
L g^{*} \Phi(K)=L g^{*} R g_{*} K \rightarrow K \quad \text { and } \quad M \rightarrow R g_{*} L g^{*} M=\Phi\left(L g^{*} M\right)
$$

are isomorphisms for $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $M \in D_{Q C o h}\left(f_{*} \mathcal{O}_{X}\right)$. This is a local question, hence we may assume $Y$ and therefore $X$ are affine.
Assume $Y=\operatorname{Spec}(B)$ and $X=\operatorname{Spec}(A)$. Let $\mathfrak{p}=x \in \operatorname{Spec}(A)=X$ be a point mapping to $\mathfrak{q}=y \in \operatorname{Spec}(B)=Y$. Then $\left(f_{*} \mathcal{O}_{X}\right)_{y}=A_{\mathfrak{q}}$ and $\mathcal{O}_{X, x}=A_{\mathfrak{p}}$ hence $g$ is flat. Hence $g^{*}$ is exact and $H^{i}\left(L g^{*} M\right)=g^{*} H^{i}(M)$ for any $M$ in $D\left(f_{*} \mathcal{O}_{X}\right)$. For $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we see that

$$
H^{i}(\Phi(K))=H^{i}\left(R f_{*} K\right)=f_{*} H^{i}(K)
$$

by the vanishing of higher direct images (Cohomology of Schemes, Lemma 29.2.3) and Lemma 35.3.4. Thus it suffice to show that

$$
g^{*} g_{*} \mathcal{F} \rightarrow \mathcal{F} \quad \text { and } \quad \mathcal{G} \rightarrow g_{*} g^{*} \mathcal{F}
$$

are isomorphisms where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module and $\mathcal{G}$ is a quasi-coherent $f_{*} \mathcal{O}_{X}$-module. This follows from Morphisms, Lemma 28.12.6.

### 35.6. Derived category of coherent modules

08 E 0 Let $X$ be a locally Noetherian scheme. In this case the category $\operatorname{Coh}\left(\mathcal{O}_{X}\right) \subset$ $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ of coherent $\mathcal{O}_{X}$-modules is a weak Serre subcategory, see Homology, Section 12.9 and Cohomology of Schemes, Lemma 29.9.2. Denote

$$
D_{C o h}\left(\mathcal{O}_{X}\right) \subset D\left(\mathcal{O}_{X}\right)
$$

the subcategory of complexes whose cohomology sheaves are coherent, see Derived Categories, Section 13.13. Thus we obtain a canonical functor

08E1 (35.6.0.1)

$$
D\left(\operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{\operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

see Derived Categories, Equation 13.13.1.1.
08E2 Lemma 35.6.1. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E$ be an object of $D_{\text {Coh }}^{b}\left(\mathcal{O}_{X}\right)$ such that the scheme theoretic support of $H^{i}(E)$ is proper over $S$ for all $i$. Then $R f_{*} E$ is an object of $D_{C o h}^{b}\left(\mathcal{O}_{S}\right)$.

Proof. Consider the spectral sequence

$$
R^{p} f_{*} H^{q}(E) \Rightarrow R^{p+q} f_{*} E
$$

see Derived Categories, Lemma 13.21.3. By assumption and Cohomology of Schemes, Remark 29.18 .2 the sheaves $R^{p} f_{*} H^{q}(E)$ are coherent. Hence $R^{p+q} f_{*} E$ is coherent, i.e., $E \in D_{C o h}\left(\mathcal{O}_{S}\right)$. Boundedness from below is trivial. Boundedness from above follows from Cohomology of Schemes, Lemma 29.4.5 or from Lemma 35.4.1.

### 35.7. The coherator

08D6 Let $X$ be a scheme. The coherator is a functor

$$
Q_{X}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)
$$

which is right adjoint to the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$. It exists for any scheme $X$ and moreover the adjunction mapping $Q_{X}(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism for every quasi-coherent module $\mathcal{F}$, see Properties, Proposition 27.23.4 Since $Q_{X}$ is left exact (as a right adjoint) we can consider its right derived extension

$$
R Q_{X}: D\left(\mathcal{O}_{X}\right) \longrightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)
$$

As this functor is constructed by applying $Q_{X}$ to a K-injective replacement we see that $R Q_{X}$ is a right adjoint to the canonical functor $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(\mathcal{O}_{X}\right)$.

08D7 Lemma 35.7.1. Let $f: X \rightarrow Y$ be an affine morphism of schemes. Then $f_{*}$ defines a derived functor $f_{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$. This functor has the property that

commutes.
Proof. The functor $f_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)$ is exact, see Cohomology of Schemes, Lemma 29.2.3. Hence $f_{*}$ defines a derived functor $f_{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow$ $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ by simply applying $f_{*}$ to any representative complex, see Derived Categories, Lemma 13.17.9. For any complex of $\mathcal{O}_{X}$-modules $\mathcal{F}^{\bullet}$ there is a canonical $\operatorname{map} f_{*} \mathcal{F}^{\bullet} \rightarrow R f_{*} \mathcal{F}^{\bullet}$. To finish the proof we show this is a quasi-isomorphism when $\mathcal{F}^{\bullet}$ is a complex with each $\mathcal{F}^{n}$ quasi-coherent. As the statement is invariant under shifts it suffices to show that $H^{0}\left(f_{*}\left(\mathcal{F}^{\bullet}\right)\right) \rightarrow R^{0} f_{*} \mathcal{F}^{\bullet}$ is an isomorphism. The statement is local on $Y$ hence we may assume $Y$ affine. By Lemma 35.4.1 we have $R^{0} f_{*} \mathcal{F}^{\bullet}=R^{0} f_{*} \tau_{\geq-n} \mathcal{F}^{\bullet}$ for all sufficiently large $n$. Thus we may assume $\mathcal{F}^{\bullet}$ bounded below. As each $\mathcal{F}^{n}$ is $f_{*}$-acyclic by Cohomology of Schemes, Lemma 29.2 .3 we see that $f_{*} \mathcal{F}^{\bullet} \rightarrow R f_{*} \mathcal{F}^{\bullet}$ is a quasi-isomorphism by Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7).

08D8 Lemma 35.7.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that
(1) $f$ is quasi-compact, quasi-separated, and flat, and
(2) denoting

$$
\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)
$$

the right derived functor of $f_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)$ the diagram

commutes.
Then $R Q_{Y} \circ R f_{*}=\Phi \circ R Q_{X}$.

Proof. Since $f$ is quasi-compact and quasi-separated, we see that $f_{*}$ preserve quasicoherence, see Schemes, Lemma 25.24.1. Recall that $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category (Properties, Proposition 27.23.4). Hence any $K$ in $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ can be represented by a K-injective complex $\mathcal{I}^{\bullet}$ of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, see Injectives, Theorem 19.12.6. Then we can define $\Phi(K)=f_{*} \mathcal{I}^{\bullet}$.
Since $f$ is flat, the functor $f^{*}$ is exact. Hence $f^{*}$ defines $f^{*}: D\left(\mathcal{O}_{Y}\right) \rightarrow D\left(\mathcal{O}_{X}\right)$ and also $f^{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. The functor $f^{*}=L f^{*}: D\left(\mathcal{O}_{Y}\right) \rightarrow$ $D\left(\mathcal{O}_{X}\right)$ is left adjoint to $R f_{*}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{Y}\right)$, see Cohomology, Lemma 20.29.1. Similarly, the functor $f^{*}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ is left adjoint to $\Phi$ : $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ by Derived Categories, Lemma 13.28.4.
Let $A$ be an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ and $E$ an object of $D\left(\mathcal{O}_{X}\right)$. Then

$$
\begin{aligned}
\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)}\left(A, R Q_{Y}\left(R f_{*} E\right)\right) & =\operatorname{Hom}_{D\left(\mathcal{O}_{Y}\right)}\left(A, R f_{*} E\right) \\
& =\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(f^{*} A, E\right) \\
& =\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)}\left(f^{*} A, R Q_{X}(E)\right) \\
& =\operatorname{Hom}_{D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)}\left(A, \Phi\left(R Q_{X}(E)\right)\right)
\end{aligned}
$$

This implies what we want.
08D9 Lemma 35.7.3. Let $X=\operatorname{Spec}(A)$ be an affine scheme. Then
(1) $Q_{X}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is the functor which sends $\mathcal{F}$ to the quasicoherent $\mathcal{O}_{X}$-module associated to the $A$-module $\Gamma(X, \mathcal{F})$,
(2) $R Q_{X}: D\left(\mathcal{O}_{X}\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$ is the functor which sends $E$ to the complex of quasi-coherent $\mathcal{O}_{X}$-modules associated to the object $R \Gamma(X, E)$ of $D(A)$,
(3) restricted to $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the functor $R Q_{X}$ defines a quasi-inverse to (35.3.0.1).

Proof. The functor $Q_{X}$ is the functor

$$
\mathcal{F} \mapsto \widetilde{\Gamma(X, \mathcal{F})}
$$

by Schemes, Lemma 25.7.1. This immediately implies (1) and (2). The third assertion follows from (the proof of) Lemma 35.3.5.
08DA Definition 35.7.4. Let $X$ be a scheme. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $T \subset X$ be a closed subset. We say $E$ is supported on $T$ if the cohomology sheaves $H^{i}(E)$ are supported on $T$.
08DB Proposition 35.7.5. Let $X$ be a quasi-compact scheme with affine diagonal. Then the functor 35.3.0.1)

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

is an equivalence with quasi-inverse given by $R Q_{X}$.
Proof. In this proof we will denote $i_{X}: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)$ the functor of the lemma. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and let $A$ be an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. We have to show that the adjunction maps

$$
R Q_{X}\left(i_{X}(A)\right) \rightarrow A \quad \text { and } \quad E \rightarrow i_{X}\left(R Q_{X}(E)\right)
$$

are isomorphisms. We will prove this by induction on $n$ : the smallest integer $n \geq 0$ such that $E$ and $i_{X}(A)$ are supported on a closed subset of $X$ which is contained in the union of $n$ affine opens of $X$.

Base case: $n=0$. In this case $E=0$, hence the map $E \rightarrow i_{X}\left(R Q_{X}(E)\right)$ is an isomorphism. Similarly $i_{X}(A)=0$. Thus the cohomology sheaves of $i_{X}(A)$ are zero. Since the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is fully faithful and exact, we conclude that the cohomology objects of $A$ are zero, i.e., $A=0$ and $R Q_{X}\left(i_{X}(A)\right) \rightarrow A$ is an isomorphism as well.

Induction step. Suppose that $E$ and $i_{X}(A)$ are supported on a closed subset $T$ of $X$ contained in $U_{1} \cup \ldots \cup U_{n}$ with $U_{i} \subset X$ affine open. Set $U=U_{n}$. The inclusion morphism $j: U \rightarrow X$ is flat and affine (Morphisms, Lemma 28.12.11). Consider the distinguished triangles

$$
A \rightarrow j_{*}\left(\left.A\right|_{U}\right) \rightarrow A^{\prime} \rightarrow A[1] \quad \text { and } \quad E \rightarrow R j_{*}\left(\left.E\right|_{U}\right) \rightarrow E^{\prime} \rightarrow E[1]
$$

where $j_{*}$ is as in Lemma 35.7.1. Note that $E \rightarrow R j_{*}\left(\left.E\right|_{U}\right)$ is a quasi-isomorphism over $U=U_{n}$. Since $i_{X} \circ j_{*}=R j_{*} \circ i_{U}$ by Lemma 35.7.1 and since $\left.i_{X}(A)\right|_{U}=i_{U}\left(\left.A\right|_{U}\right)$ we see that $i_{X}(A) \rightarrow i_{X}\left(j_{*}\left(\left.A\right|_{U}\right)\right)$ is a quasi-isomorphism over $U$. Hence $i_{X}\left(A^{\prime}\right)$ and $E^{\prime}$ are supported on the closed subset $T \backslash U$ of $X$ which is contained in $U_{1} \cup \ldots \cup U_{n-1}$. By induction hypothesis the statement is true for $A^{\prime}$ and $E^{\prime}$. By Derived Categories, Lemma 13.4 .3 it suffices to prove the maps

$$
R Q_{X}\left(i_{X}\left(j_{*}\left(\left.A\right|_{U}\right)\right)\right) \rightarrow j_{*}\left(\left.A\right|_{U}\right) \quad \text { and } \quad R j_{*}\left(\left.E\right|_{U}\right) \rightarrow i_{X}\left(R Q_{X}\left(\left.R j_{*} E\right|_{U}\right)\right)
$$

are isomorphisms. By Lemmas 35.7.1 and 35.7.2 we have

$$
R Q_{X}\left(i_{X}\left(j_{*}\left(\left.A\right|_{U}\right)\right)\right)=R Q_{X}\left(R j_{*}\left(i_{U}\left(\left.A\right|_{U}\right)\right)\right)=j_{*} R Q_{U}\left(i_{U}\left(\left.A\right|_{U}\right)\right)
$$

and

$$
i_{X}\left(R Q_{X}\left(R j_{*}\left(\left.E\right|_{U}\right)\right)\right)=i_{X}\left(j_{*} R Q_{U}\left(\left.E\right|_{U}\right)\right)=R j_{*}\left(i_{U}\left(R Q_{U}\left(\left.E\right|_{U}\right)\right)\right)
$$

Finally, the maps

$$
\left.R Q_{U}\left(i_{U}\left(\left.A\right|_{U}\right)\right) \rightarrow A\right|_{U} \quad \text { and }\left.\quad E\right|_{U} \rightarrow i_{U}\left(R Q_{U}\left(\left.E\right|_{U}\right)\right)
$$

are isomorphisms by Lemma 35.7.3. The result follows.
09T6 Remark 35.7.6. Analyzing the proof of Proposition 35.7.5 we see that we have shown the following. Let $X$ be a quasi-compact and quasi-separated scheme. Suppose that for every affine open $U \subset X$ the right derived functor

$$
\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)\right) \rightarrow D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)
$$

of the left exact functor $j_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{U}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ fits into a commutative diagram

Then the functor (35.3.0.1

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

is an equivalence with quasi-inverse given by $R Q_{X}$.

### 35.8. The coherator for Noetherian schemes

09 T 1 In the case of Noetherian schemes we can use the following lemma.
09T2 Lemma 35.8.1. Let $X$ be a Noetherian scheme. Let $\mathcal{J}$ be an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$. Then $\mathcal{J}$ is a flasque sheaf of $\mathcal{O}_{X}$-modules.

Proof. Let $U \subset X$ be an open subset and let $s \in \mathcal{J}(U)$ be a section. Let $\mathcal{I} \subset X$ be the quasi-coherent sheaf of ideals defining the reduced induced scheme structure on $X \backslash U$ (see Schemes, Definition 25.12.5). By Cohomology of Schemes, Lemma 29.10 .4 the section $s$ corresponds to a map $\sigma: \mathcal{I}^{n} \rightarrow \mathcal{J}$ for some $n$. As $\mathcal{J}$ is an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ we can extend $\sigma$ to a map $\tilde{s}: \mathcal{O}_{X} \rightarrow \mathcal{J}$. Then $\tilde{s}$ corresponds to a global section of $\mathcal{J}$ restricting to $s$.

09T3 Lemma 35.8.2. Let $f: X \rightarrow Y$ be a morphism of Noetherian schemes. Then $f_{*}$ on quasi-coherent sheaves has a right derived extension $\Phi: D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \rightarrow$ $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$ such that the diagram

commutes.
Proof. Since $X$ and $Y$ are Noetherian schemes the morphism is quasi-compact and quasi-separated (see Properties, Lemma 27.5.4 and Schemes, Remark 25.21.18). Thus $f_{*}$ preserve quasi-coherence, see Schemes, Lemma 25.24.1. Next, Let $K$ be an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right)$. Since $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category (Properties, Proposition 27.23.4, we can represent $K$ by a K-injective complex $\mathcal{I}^{\bullet}$ such that each $\mathcal{I}^{n}$ is an injective object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, see Injectives, Theorem 19.12.6. Thus we see that the functor $\Phi$ is defined by setting

$$
\Phi(K)=f_{*} \mathcal{I}^{\bullet}
$$

where the right hand side is viewed as an object of $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right)\right)$. To finish the proof of the lemma it suffices to show that the canonical map

$$
f_{*} \mathcal{I}^{\bullet} \longrightarrow R f_{*} \mathcal{I}^{\bullet}
$$

is an isomorphism in $D\left(\mathcal{O}_{Y}\right)$. To see this it suffices to prove the map induces an isomorphism on cohomology sheaves. Pick any $m \in \mathbf{Z}$. Let $N=N(X, Y, f)$ be as in Lemma 35.4.1. Consider the short exact sequence

$$
0 \rightarrow \sigma_{\geq m-N-1} \mathcal{I}^{\bullet} \rightarrow \mathcal{I}^{\bullet} \rightarrow \sigma_{\leq m-N-2} \mathcal{I}^{\bullet} \rightarrow 0
$$

of complexes of quasi-coherent sheaves on $X$. By Lemma 35.4.1 we see that the cohomology sheaves of $R f_{*} \sigma_{\leq m-N-2} \mathcal{I}^{\bullet}$ are zero in degrees $\geq m-1$. Thus we see that $R^{m} f_{*} \mathcal{I}^{\bullet}$ is isomorphic to $R^{m} f_{*} \sigma_{\geq m-N-1} \mathcal{I}^{\bullet}$. In other words, we may assume that $\mathcal{I}^{\bullet}$ is a bounded below complex of injective objects of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$. This follows from Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) via Cohomology, Lemma 20.13.5 and Lemma 35.8.1.
09 T 4 Proposition 35.8.3. Let $X$ be a Noetherian scheme. Then the functor 35.3.0.1)

$$
D\left(Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)\right) \longrightarrow D_{Q \operatorname{Coh}}\left(\mathcal{O}_{X}\right)
$$

is an equivalence with quasi-inverse given by $R Q_{X}$.

Proof. This follows using the exact same argument as in the proof of Proposition 35.7.5 using Lemma 35.8.2. See discussion in Remark 35.7.6.

### 35.9. Koszul complexes

08 CX Let $A$ be a ring and let $f_{1}, \ldots, f_{r}$ be a sequence of elements of $A$. We have defined the Koszul complex $K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ in More on Algebra, Definition 15.22.2. It is a chain complex sitting in degrees $r, \ldots, 0$. We turn this into a cochain complex $K^{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ by setting $K^{-n}\left(f_{1}, \ldots, f_{r}\right)=K_{n}\left(f_{1}, \ldots, f_{r}\right)$ and using the same differentials. In the rest of this section all the complexes will be cochain complexes.
We define a complex $I^{\bullet}\left(f_{1}, \ldots, f_{r}\right)$ such that we have a distinguished triangle

$$
I^{\bullet}\left(f_{1}, \ldots, f_{r}\right) \rightarrow A \rightarrow K^{\bullet}\left(f_{1}, \ldots, f_{r}\right) \rightarrow I^{\bullet}\left(f_{1}, \ldots, f_{r}\right)[1]
$$

in $K(A)$. In other words, we set

$$
I^{i}\left(f_{1}, \ldots, f_{r}\right)=\left\{\begin{array}{cc}
K^{i-1}\left(f_{1}, \ldots, f_{r}\right) & \text { if } i \leq 0 \\
0 & \text { else }
\end{array}\right.
$$

and we use the negative of the differential on $K^{\bullet}\left(f_{1}, \ldots, f_{r}\right)$. The maps in the distinguished triangle are the obvious ones. Note that $I^{0}\left(f_{1}, \ldots, f_{r}\right)=A^{\oplus r} \rightarrow A$ is given by multiplication by $f_{i}$ on the $i$ th factor. Hence $I^{\bullet}\left(f_{1}, \ldots, f_{r}\right) \rightarrow A$ factors as

$$
I^{\bullet}\left(f_{1}, \ldots, f_{r}\right) \rightarrow I \rightarrow A
$$

where $I=\left(f_{1}, \ldots, f_{r}\right)$. In fact, there is a short exact sequence

$$
0 \rightarrow H^{-1}\left(K^{\bullet}\left(f_{1}, \ldots, f_{s}\right)\right) \rightarrow H^{0}\left(I^{\bullet}\left(f_{1}, \ldots, f_{s}\right)\right) \rightarrow I \rightarrow 0
$$

and for every $i<0$ we have $H^{i}\left(I^{\bullet}\left(f_{1}, \ldots, f_{r}\right)\right)=H^{i-1}\left(K^{\bullet}\left(f_{1}, \ldots, f_{r}\right)\right.$. Observe that given a second sequence $g_{1}, \ldots, g_{r}$ of elements of $A$ there are canonical maps

$$
I^{\bullet}\left(f_{1} g_{1}, \ldots, f_{r} g_{r}\right) \rightarrow I^{\bullet}\left(f_{1}, \ldots, f_{r}\right) \quad \text { and } \quad K^{\bullet}\left(f_{1} g_{1}, \ldots, f_{r} g_{r}\right) \rightarrow K^{\bullet}\left(f_{1}, \ldots, f_{r}\right)
$$

compatible with the maps described above. The first of these maps is given by multiplication by $g_{i}$ on the $i$ th summand of $I^{0}\left(f_{1} g_{1}, \ldots, f_{r} g_{r}\right)=A^{\oplus r}$. In particular, given $f_{1}, \ldots, f_{r}$ we obtain an inverse system of complexes
$08 \mathrm{CY} \quad(35.9 .0 .1) \quad I^{\bullet}\left(f_{1}, \ldots, f_{r}\right) \leftarrow I^{\bullet}\left(f_{1}^{2}, \ldots, f_{r}^{2}\right) \leftarrow I^{\bullet}\left(f_{1}^{3}, \ldots, f_{r}^{3}\right) \leftarrow \ldots$
which will play an important role in that which is to follow. To easily formulate the following lemmas we fix some notation.

08CZ Situation 35.9.1. Here $A$ is a ring and $f_{1}, \ldots, f_{r}$ is a sequence of elements of $A$. We set $X=\operatorname{Spec}(A)$ and $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{r}\right) \subset X$. We denote $\mathcal{U}: U=$ $\bigcup_{i=1, \ldots, r} D\left(f_{i}\right)$ the given open covering of $U$.
Our first lemma is that the complexes above can be used to compute the cohomology of quasi-coherent sheaves on $U$. Suppose given a complex $I^{\bullet}$ of $A$-modules and an $A$-module $M$. Then we define $\operatorname{Hom}_{A}\left(I^{\bullet}, M\right)$ to be the complex with $n$th term $\operatorname{Hom}_{A}\left(I^{-n}, M\right)$ and differentials given as the contragredients of the differentials on $I^{\bullet}$.

08D0 Lemma 35.9.2. In Situation 35.9.1. Let $M$ be an $A$-module and denote $\mathcal{F}$ the associated $\mathcal{O}_{X}$-module. Then there is a canonical isomorphism of complexes

$$
\operatorname{colim}_{e} \operatorname{Hom}_{A}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right), M\right) \longrightarrow \check{\mathcal{C}}_{a l t}^{\bullet}(\mathcal{U}, \mathcal{F})
$$

functorial in $M$.

Proof. Recall that the alternating Čech complex is the subcomplex of the usual Čech complex given by alternating cochains, see Cohomology, Section 20.24. As usual we view a $p$-cochain in $\check{\mathcal{C}}_{\text {alt }}^{\bullet}(\mathcal{U}, \mathcal{F})$ as an alternating function $s$ on $\{1, \ldots, r\}^{p+1}$ whose value $s_{i_{0} \ldots i_{p}}$ at $\left(i_{0}, \ldots, i_{p}\right)$ lies in $M_{f_{i_{0}} \ldots f_{i_{p}}}=\mathcal{F}\left(U_{i_{0} \ldots i_{p}}\right)$. On the other hand, a $p$-cochain $t$ in $\operatorname{Hom}_{A}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right), M\right)$ is given by a map $t: \wedge^{p+1}\left(A^{\oplus r}\right) \rightarrow M$. Write $[i] \in A^{\oplus r}$ for the $i$ th basis element and write

$$
\left[i_{0}, \ldots, i_{p}\right]=\left[i_{0}\right] \wedge \ldots \wedge\left[i_{p}\right] \in \wedge^{p+1}\left(A^{\oplus r}\right)
$$

Then we send $t$ as above to $s$ with

$$
s_{i_{0} \ldots i_{p}}=\frac{t\left(\left[i_{0}, \ldots, i_{p}\right]\right)}{f_{i_{0}}^{e} \ldots f_{i_{p}}^{e}}
$$

It is clear that $s$ so defined is an alternating cochain. The construction of this map is compatible with the transition maps of the system as the transition map

$$
I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right) \leftarrow I^{\bullet}\left(f_{1}^{e+1}, \ldots, f_{r}^{e+1}\right)
$$

of the 35.9 .0 .1 sends $\left[i_{0}, \ldots, i_{p}\right]$ to $f_{i_{0}} \ldots f_{i_{p}}\left[i_{0}, \ldots, i_{p}\right]$. It is clear from the description of the localizations $M_{f_{i_{0}} \ldots f_{i_{p}}}$ in Algebra, Lemma 10.9 .9 that these maps define an isomorphism of cochain modules in degree $p$ in the limit. To finish the proof we have to show that the map is compatible with differentials. To see this recall that

$$
\begin{aligned}
d(s)_{i_{0} \ldots i_{p+1}} & =\sum_{j=0}^{p+1}(-1)^{j} s_{i_{0} \ldots \hat{i}_{j} \ldots i_{p}} \\
& =\sum_{j=0}^{p+1}(-1)^{j} \frac{t\left(\left[i_{0}, \ldots, \hat{i}_{j}, \ldots i_{p+1}\right]\right)}{f_{i_{0}}^{e} \ldots \hat{f}_{i_{j}}^{e} \ldots f_{i_{p+1}}^{e}}
\end{aligned}
$$

On the other hand, we have

$$
\begin{aligned}
\frac{d(t)\left(\left[i_{0}, \ldots, i_{p+1}\right]\right)}{f_{i_{0}}^{e} \ldots f_{i_{p+1}}^{e}} & =\frac{t\left(d\left[i_{0}, \ldots, i_{p+1}\right]\right)}{f_{i_{0}}^{e} \ldots f_{i_{p+1}}^{e}} \\
& =\frac{\sum_{j}(-1)^{j} f_{i_{j}}^{e} t\left(\left[i_{0}, \ldots, \hat{i}_{j}, \ldots i_{p+1}\right]\right)}{f_{i_{0}}^{e} \ldots f_{i_{p+1}}^{e}}
\end{aligned}
$$

The two formulas agree by inspection.
Suppose given a finite complex $I^{\bullet}$ of $A$-modules and a complex of $A$-modules $M^{\bullet}$. We obtain a double complex $H^{\bullet \bullet \bullet}=\operatorname{Hom}_{A}\left(I^{\bullet}, M^{\bullet}\right)$ where $H^{p, q}=\operatorname{Hom}_{A}\left(I^{p}, M^{q}\right)$. The first differential comes from the differential on $\operatorname{Hom}_{A}\left(I^{\bullet}, M^{q}\right)$ and the second from the differential on $M^{\bullet}$. Associated to this double complex is the total complex with degree $n$ term given by

$$
\bigoplus_{p+q=n} \operatorname{Hom}_{A}\left(I^{p}, M^{q}\right)
$$

and differential as in Homology, Definition 12.22.3. As our complex $I^{\bullet}$ has only finitely many nonzero terms, the direct sum displayed above is finite. The conventions for taking the total complex associated to a Čech complex of a complex are as in Cohomology, Section 20.26.

08D1 Lemma 35.9.3. In Situation 35.9.1. Let $M^{\bullet}$ be a complex of $A$-modules and denote $\mathcal{F}^{\bullet}$ the associated complex of $\mathcal{O}_{X}$-modules. Then there is a canonical isomorphism of complexes

$$
\operatorname{colim}_{e} \operatorname{Tot}\left(\operatorname{Hom}_{A}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right), M^{\bullet}\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right)
$$

functorial in $M^{\bullet}$.
Proof. Immediate from Lemma 35.9 .2 and our conventions for taking associated total complexes.

08D2 Lemma 35.9.4. In Situation 35.9.1. Let $\mathcal{F}^{\bullet}$ be a complex of quasi-coherent $\mathcal{O}_{X^{-}}$ modules. Then there is a canonical isomorphism

$$
\operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow R \Gamma\left(U, \mathcal{F}^{\bullet}\right)
$$

in $D(A)$ functorial in $\mathcal{F}^{\bullet}$.
Proof. Let $\mathcal{B}$ be the set of affine opens of $U$. Since the higher cohomology groups of a quasi-coherent module on an affine scheme are zero (Cohomology of Schemes, Lemma 29.2.2 this is a special case of Cohomology, Lemma 20.33.2.

In Situation 35.9.1 denote $I_{e}$ the object of $D\left(\mathcal{O}_{X}\right)$ corresponding to the complex of $A$-modules $I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right)$ via the equivalence of Lemma 35.3.5. The maps 35.9.0.1) give a system

$$
I_{1} \leftarrow I_{2} \leftarrow I_{3} \leftarrow \ldots
$$

Moreover, there is a compatible system of maps $I_{e} \rightarrow \mathcal{O}_{X}$ which become isomorphisms when restricted to $U$. Thus we see that for every object $E$ of $D\left(\mathcal{O}_{X}\right)$ there is a canonical map
08DC

$$
\begin{equation*}
\operatorname{colim}_{e} \operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(I_{e}, E\right) \longrightarrow H^{0}(U, E) \tag{35.9.4.1}
\end{equation*}
$$

constructed by sending a map $I_{e} \rightarrow E$ to its restriction to $U$ and using that $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\mathcal{O}_{U},\left.E\right|_{U}\right)=H^{0}(U, E)$.
08DD Proposition 35.9.5. In Situation 35.9.1. For every object $E$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the map 35.9.4.1) is an isomorphism.

Proof. By Lemma 35.3 .5 we may assume that $E$ is given by a complex of quasicoherent sheaves $\mathcal{F}^{\bullet}$. Let $M^{\bullet}=\Gamma\left(X, \mathcal{F}^{\bullet}\right)$ be the corresponding complex of $A$ modules. By Lemmas 35.9.3 and 35.9.4 we have quasi-isomorphisms

$$
\operatorname{colim}_{e} \operatorname{Tot}\left(\operatorname{Hom}_{A}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right), M^{\bullet}\right)\right) \longrightarrow \operatorname{Tot}\left(\check{\mathcal{C}}_{a l t}^{\bullet}\left(\mathcal{U}, \mathcal{F}^{\bullet}\right)\right) \longrightarrow R \Gamma\left(U, \mathcal{F}^{\bullet}\right)
$$

Taking $H^{0}$ on both sides we obtain

$$
\operatorname{colim}_{e} \operatorname{Hom}_{D(A)}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right), M^{\bullet}\right)=H^{0}(U, E)
$$

Since $\operatorname{Hom}_{D(A)}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right), M^{\bullet}\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(I_{e}, E\right)$ by Lemma 35.3.5 the lemma follows.

In Situation 35.9.1 denote $K_{e}$ the object of $D\left(\mathcal{O}_{X}\right)$ corresponding to the complex of $A$-modules $K^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right)$ via the equivalence of Lemma 35.3.5. Thus we have distinguished triangles

$$
I_{e} \rightarrow \mathcal{O}_{X} \rightarrow K_{e} \rightarrow I_{e}[1]
$$

and a system

$$
K_{1} \leftarrow K_{2} \leftarrow K_{3} \leftarrow \ldots
$$

compatible with the system $\left(I_{e}\right)$. Moreover, there is a compatible system of maps

$$
K_{e} \rightarrow H^{0}\left(K_{e}\right)=\mathcal{O}_{X} /\left(f_{1}^{e}, \ldots, f_{r}^{e}\right)
$$

08E3 Lemma 35.9.6. In Situation 35.9.1. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Assume that $\left.H^{i}(E)\right|_{U}=0$ for $i=-r+1, \ldots, 0$. Then given $s \in H^{0}(X, E)$ there exists an $e \geq 0$ and a morphism $K_{e} \rightarrow E$ such that $s$ is in the image of $H^{0}\left(X, K_{e}\right) \rightarrow$ $H^{0}(X, E)$.
Proof. Since $U$ is covered by $r$ affine opens we have $H^{j}(U, \mathcal{F})=0$ for $j \geq r$ and any quasi-coherent module (Cohomology of Schemes, Lemma 29.4.2. By Lemma 35.3.4 we see that $H^{0}(U, E)$ is equal to $H^{0}\left(U, \tau_{\geq-r+1} E\right)$. There is a spectral sequence

$$
H^{j}\left(U, H^{i}\left(\tau_{\geq-r+1} E\right)\right) \Rightarrow H^{i+j}\left(U, \tau_{\geq-N} E\right)
$$

see Derived Categories, Lemma 13.21.3. Hence $H^{0}(U, E)=0$ by our assumed vanishing of cohomology sheaves of $E$. We conclude that $\left.s\right|_{U}=0$. Think of $s$ as a morphism $\mathcal{O}_{X} \rightarrow E$ in $D\left(\mathcal{O}_{X}\right)$. By Proposition 35.9.5 the composition $I_{e} \rightarrow \mathcal{O}_{X} \rightarrow$ $E$ is zero for some $e$. By the distinguished triangle $I_{e} \rightarrow \mathcal{O}_{X} \rightarrow K_{e} \rightarrow I_{e}[1]$ we obtain a morphism $K_{e} \rightarrow E$ such that $s$ is the composition $\mathcal{O}_{X} \rightarrow K_{e} \rightarrow E$.

### 35.10. Pseudo-coherent and perfect complexes

08 E 4 In this section we make the connection between the general notions defined in Cohomology, Sections 20.38, 20.39, 20.40, and 20.41 and the corresponding notions for complexes of modules in More on Algebra, Sections 15.54, 15.55, and 15.61 .

08E5 Lemma 35.10.1. Let $X$ be a scheme. If $E$ is an m-pseudo-coherent object of $D\left(\mathcal{O}_{X}\right)$, then $H^{i}(E)$ is a quasi-coherent $\mathcal{O}_{X}$-module for $i>m$. If $E$ is pseudocoherent, then $E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

Proof. Locally $H^{i}(E)$ is isomorphic to $H^{i}\left(\mathcal{E}^{\bullet}\right)$ with $\mathcal{E} \bullet$ strictly perfect. The sheaves $\mathcal{E}^{i}$ are direct summands of finite free modules, hence quasi-coherent. The lemma follows.

08E6 Lemma 35.10.2. Let $X$ be a locally ringed space. A direct summand of a finite free $\mathcal{O}_{X}$-module is finite locally free.

Proof. Omitted.
08E7 Lemma 35.10.3. Let $X=\operatorname{Spec}(A)$ be an affine scheme. Let $M^{\bullet}$ be a complex of $A$-modules and let $E$ be the corresponding object of $D\left(\mathcal{O}_{X}\right)$. Then $E$ is an m-pseudo-coherent (resp. pseudo-coherent) as an object of $D\left(\mathcal{O}_{X}\right)$ if and only if $M^{\bullet}$ is m-pseudo-coherent (resp. pseudo-coherent) as a complex of A-modules.

Proof. It is immediate from the definitions that if $M^{\bullet}$ is $m$-pseudo-coherent, so is $E$. To prove the converse, assume $E$ is $m$-pseudo-coherent. As $X=\operatorname{Spec}(A)$ is quasi-compact with a basis for the topology given by standard opens, we can find a standard open covering $X=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ and strictly perfect complexes $\mathcal{E}_{i}^{\bullet}$ on $D\left(f_{i}\right)$ and maps $\alpha_{i}:\left.\mathcal{E}_{i}^{\bullet} \rightarrow E\right|_{U_{i}}$ inducing isomorphisms on $H^{j}$ for $j>m$ and surjections on $H^{m}$. By Cohomology, Lemma 20.38 .8 after refining the open covering we may assume $\alpha_{i}$ is given by a map of complexes $\left.\mathcal{E}_{i}^{\bullet} \rightarrow \widetilde{M_{\bullet} \bullet}\right|_{U_{i}}$ for each $i$. By Lemma 35.10 .2 the terms $\mathcal{E}_{i}^{n}$ are finite locally free modules. Hence after refining the open covering we may assume each $\mathcal{E}_{i}^{n}$ is a finite free $\mathcal{O}_{U_{i}}$-module. From the
definition it follows that $M_{f_{i}}^{\bullet}$ is an $m$-pseudo-coherent complex of $A_{f_{i}}$-modules. We conclude by applying More on Algebra, Lemma 15.54.14.
The case "pseudo-coherent" follows from the fact that $E$ is pseudo-coherent if and only if $E$ is $m$-pseudo-coherent for all $m$ (by definition) and the same is true for $M^{\bullet}$ by More on Algebra, Lemma 15.54 .5 .

08 E 8 Lemma 35.10.4. Let $X$ be a Noetherian scheme. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. For $m \in \mathbf{Z}$ the following are equivalent
(1) $H^{i}(E)$ is coherent for $i \geq m$ and zero for $i \gg 0$, and
(2) $E$ is m-pseudo-coherent.

In particular, $E$ is pseudo-coherent if and only if $E$ is an object of $D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$.
Proof. As $X$ is quasi-compact we see that in both (1) and (2) the object $E$ is bounded above. Thus the question is local on $X$ and we may assume $X$ is affine. Say $X=\operatorname{Spec}(A)$ for some Noetherian ring $A$. In this case $E$ corresponds to a complex of $A$-modules $M^{\bullet}$ by Lemma 35.3 .5 . By Lemma 35.10 .3 we see that $E$ is $m$-pseudo-coherent if and only if $M^{\bullet}$ is $m$-pseudo-coherent. On the other hand, $H^{i}(E)$ is coherent if and only if $H^{i}\left(M^{\bullet}\right)$ is a finite $A$-module (Properties, Lemma 27.16.1. Thus the result follows from More on Algebra, Lemma 15.54.16.

08E9 Lemma 35.10.5. Let $X=\operatorname{Spec}(A)$ be an affine scheme. Let $M^{\bullet}$ be a complex of $A$-modules and let $E$ be the corresponding object of $D\left(\mathcal{O}_{X}\right)$. Then
(1) E has tor amplitude in $[a, b]$ if and only if $M^{\bullet}$ has tor amplitude in $[a, b]$.
(2) $E$ has finite tor dimension if and only if $M^{\bullet}$ has finite tor dimension.

Proof. Part (2) follows trivially from part (1). In the proof of (1) we will use the equivalence $D(A)=D_{Q C o h}(X)$ of Lemma 35.3.5 without further mention. Assume $M^{\bullet}$ has tor amplitude in $[a, b]$. Then $K^{\bullet}$ is isomorphic in $D(A)$ to a complex $K^{\bullet}$ of flat $A$-modules with $K^{i}=0$ for $i \notin[a, b]$, see More on Algebra, Lemma 15.55.3. Then $E$ is isomorphic to $\widetilde{K^{\bullet}}$. Since each $\widetilde{K^{i}}$ is a flat $\mathcal{O}_{X}$-module, we see that $E$ has tor amplitude in $[a, b]$ by Cohomology, Lemma 20.40.3.
Assume that $E$ has tor amplitude in $[a, b]$. Then $E$ is bounded whence $M^{\bullet}$ is in $K^{-}(A)$. Thus we may replace $M^{\bullet}$ by a bounded above complex of $A$-modules. We may even choose a projective resolution and assume that $M^{\bullet}$ is a bounded above complex of free $A$-modules. Then for any $A$-module $N$ we have

$$
E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \widetilde{N} \cong \widetilde{M \bullet} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \widetilde{N} \cong \widetilde{M \bullet \otimes_{A}} N
$$

in $D\left(\mathcal{O}_{X}\right)$. Thus the vanishing of cohomology sheaves of the left hand side implies $M^{\bullet}$ has tor amplitude in $[a, b]$.

08EA Lemma 35.10.6. Let $X$ be a quasi-separated scheme. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $a \leq b$. The following are equivalent
(1) $E$ has tor amplitude in $[a, b]$, and
(2) for all $\mathcal{F}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ we have $H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{F}\right)=0$ for $i \notin[a, b]$.

Proof. It is clear that (1) implies (2). Assume (2). Let $U \subset X$ be an affine open. As $X$ is quasi-separated the morphism $j: U \rightarrow X$ is quasi-compact and separated, hence $j_{*}$ transforms quasi-coherent modules into quasi-coherent modules (Schemes, Lemma 25.24.1). Thus the functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)$ is essentially surjective. It follows that condition (2) implies the vanishing of $H^{i}\left(\left.E\right|_{U} \otimes_{\mathcal{O}_{U}}^{\mathbf{L}} \mathcal{G}\right)$ for
$i \notin[a, b]$ for all quasi-coherent $\mathcal{O}_{U}$-modules $\mathcal{G}$. Write $U=\operatorname{Spec}(A)$ and let $M^{\bullet}$ be the complex of $A$-modules corresponding to $\left.E\right|_{U}$ by Lemma 35.3 .5 . We have just shown that $M^{\bullet} \otimes_{A}^{\mathbf{L}} N$ has vanishing cohomology groups outside the range $[a, b]$, in other words $M^{\bullet}$ has tor amplitude in $[a, b]$. By Lemma 35.10.5 we conclude that $\left.E\right|_{U}$ has tor amplitude in $[a, b]$. This proves the lemma.

08EB Lemma 35.10.7. Let $X=\operatorname{Spec}(A)$ be an affine scheme. Let $M^{\bullet}$ be a complex of $A$-modules and let $E$ be the corresponding object of $D\left(\mathcal{O}_{X}\right)$. Then $E$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ if and only if $M^{\bullet}$ is perfect as an object of $D(A)$.

Proof. This is a logical consequence of Lemmas 35.10.3 and 35.10.5. Cohomology, Lemma 20.41.5, and More on Algebra, Lemma 15.61.2.

As a consequence of our description of pseudo-coherent complexes on schemes we can prove certain internal homs are quasi-coherent.

0A6H Lemma 35.10.8. Let $X$ be a scheme.
(1) If $L$ is in $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ and $K$ in $D\left(\mathcal{O}_{X}\right)$ is pseudo-coherent, then $R \mathcal{H}$ lom $(K, L)$ is in $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$.
(2) If $L$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $K$ in $D\left(\mathcal{O}_{X}\right)$ is perfect, then $R \mathcal{H o m}(K, L)$ is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.
(3) If $X=\operatorname{Spec}(A)$ is affine and $K, L \in D(A)$ then

$$
R \mathcal{H o m}(\widetilde{K}, \widetilde{L})=R \widetilde{\operatorname{Hom}(K}, L)
$$

in the following two cases
(a) $K$ is pseudo-coherent and $L$ is bounded below,
(b) $K$ is perfect and $L$ arbitrary.
(4) If $X=\operatorname{Spec}(A)$ and $K, L$ are in $D(A)$, then the nth cohomology sheaf of $R \mathcal{H o m}(\widetilde{K}, \widetilde{L})$ is the sheaf associated to the presheaf

$$
X \supset D(f) \longmapsto E x t_{A_{f}}^{n}\left(K \otimes_{A} A_{f}, L \otimes_{A} A_{f}\right)
$$

for $f \in A$.
Proof. The construction of the internal hom in the derived category of $\mathcal{O}_{X}$ commutes with localization (see Cohomology, Section 20.35). Hence to prove (1) and (2) we may replace $X$ by an affine open. By Lemmas 35.3.5, 35.10.3, and 35.10.7 in order to prove (1) and (2) it suffices to prove (3).

Part (3) follows from the computation of the internal hom of Cohomology, Lemma 20.38 .10 by representing $K$ by a bounded above (resp. finite) complex of finite projective $A$-modules and $L$ by a bounded below (resp. arbitrary) complex of $A$ modules.

To prove (4) recall that on any ringed space the $n$th cohomology sheaf of $R \mathcal{H}$ om $(A, B)$ is the sheaf associated to the presheaf

$$
U \mapsto \operatorname{Hom}_{D(U)}\left(\left.A\right|_{U},\left.B\right|_{U}[n]\right)=\operatorname{Ext}_{D\left(\mathcal{O}_{U}\right)}^{n}\left(\left.A\right|_{U},\left.B\right|_{U}\right)
$$

See Cohomology, Section 20.35. On the other hand, the restriction of $\widetilde{K}$ to a principal open $D(f)$ is the image of $K \otimes_{A} A_{f}$ and similarly for $L$. Hence (4) follows from the equivalence of categories of Lemma 35.3.5.

0ATN Lemma 35.10.9. Let $X$ be a scheme. Let $K, L, M$ be objects of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. There is a canonical map

$$
K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} R \mathcal{H o m}(M, L) \longrightarrow R \mathcal{H o m}\left(M, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)
$$

which is an isomorphism in the following cases
(1) $M$ perfect, or
(2) $K$ is perfect, or
(3) $M$ is pseudo-coherent, $L \in D^{+}\left(\mathcal{O}_{X}\right)$, and $K$ has finite tor dimension.

Proof. We leave the construction of the arrow to the reader (hint: use Cohomology, Lemmas 20.35.6 and 20.35.7). Lemma 35.10 .8 reduces cases (1) and (3) to the affine case which is treated in More on Algebra, Lemma 15.76.4. (You also have to use Lemmas 35.10.3, 35.10.7, and 35.10 .5 to do the translation into algebra.) If $K$ is perfect but no other assumptions are made, then we do not know that either side of the arrow is in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ but the result is still true because we can work locally and reduce to the case that $K$ is a finite complex of finite free modules in which case it is clear.

### 35.11. Descent finiteness properties of complexes

09UC This section is the analogue of Descent, Section 34.6 for objects of the derived category of a scheme. The easiest such result is probably the following.
09UD Lemma 35.11.1. Let $f: X \rightarrow Y$ be a surjective flat morphism of schemes (or more generally locally ringed spaces). Let $E \in D\left(\mathcal{O}_{Y}\right)$. Let $a, b \in \mathbf{Z}$. Then $E$ has tor-amplitude in $[a, b]$ if and only if $L f^{*} E$ has tor-amplitude in $[a, b]$.

Proof. Pullback always preserves tor-amplitude, see Cohomology, Lemma 20.40.4 We may check tor-amplitude in $[a, b]$ on stalks, see Cohomology, Lemma 20.40.5. A flat local ring homomorphism is faithfully flat by Algebra, Lemma 10.38.17. Thus the result follows from More on Algebra, Lemma 15.55.16.

09UE Lemma 35.11.2. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}$ be an fpqc covering of schemes. Let $E \in$ $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $m \in \mathbf{Z}$. Then $E$ is m-pseudo-coherent if and only if each $L f_{i}^{*} E$ is m-pseudo-coherent.
Proof. Pullback always preserves $m$-pseudo-coherence, see Cohomology, Lemma 20.39.3. Conversely, assume that $L f_{i}^{*} E$ is $m$-pseudo-coherent for all $i$. Let $U \subset X$ be an affine open. It suffices to prove that $\left.E\right|_{U}$ is $m$-pseudo-coherent. Since $\left\{f_{i}\right.$ : $\left.X_{i} \rightarrow X\right\}$ is an fpqc covering, we can find finitely many affine open $V_{j} \subset X_{a(j)}$ such that $f_{a(j)}\left(V_{j}\right) \subset U$ and $U=\bigcup f_{a(j)}\left(V_{j}\right)$. Set $V=\coprod V_{i}$. Thus we may replace $X$ by $U$ and $\left\{f_{i}: X_{i} \rightarrow X\right\}$ by $\{V \rightarrow U\}$ and assume that $X$ is affine and our covering is given by a single surjective flat morphism $\{f: Y \rightarrow X\}$ of affine schemes. In this case the result follows from More on Algebra, Lemma 15.54 .15 via Lemmas 35.3.5 and 35.10 .3 .

09UF Lemma 35.11.3. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}$ be an fppf covering of schemes. Let $E \in$ $D\left(\mathcal{O}_{X}\right)$. Let $m \in \mathbf{Z}$. Then $E$ is m-pseudo-coherent if and only if each $L f_{i}^{*} E$ is m-pseudo-coherent.
Proof. Pullback always preserves $m$-pseudo-coherence, see Cohomology, Lemma 20.39.3. Conversely, assume that $L f_{i}^{*} E$ is $m$-pseudo-coherent for all $i$. Let $U \subset X$ be an affine open. It suffices to prove that $\left.E\right|_{U}$ is $m$-pseudo-coherent. Since $\left\{f_{i}\right.$ :
$\left.X_{i} \rightarrow X\right\}$ is an fppf covering, we can find finitely many affine open $V_{j} \subset X_{a(j)}$ such that $f_{a(j)}\left(V_{j}\right) \subset U$ and $U=\bigcup f_{a(j)}\left(V_{j}\right)$. Set $V=\coprod V_{i}$. Thus we may replace $X$ by $U$ and $\left\{f_{i}: X_{i} \rightarrow X\right\}$ by $\{V \rightarrow U\}$ and assume that $X$ is affine and our covering is given by a single surjective flat morphism $\{f: Y \rightarrow X\}$ of finite presentation.
Since $f$ is flat the derived functor $L f^{*}$ is just given by $f^{*}$ and $f^{*}$ is exact. Hence $H^{i}\left(L f^{*} E\right)=f^{*} H^{i}(E)$. Since $L f^{*} E$ is $m$-pseudo-coherent, we see that $L f^{*} E \in$ $D^{-}\left(\mathcal{O}_{Y}\right)$. Since $f$ is surjective and flat, we see that $E \in D^{-}\left(\mathcal{O}_{X}\right)$. Let $i \in \mathbf{Z}$ be the largest integer such that $H^{i}(E)$ is nonzero. If $i<m$, then we are done. Otherwise, $f^{*} H^{i}(E)$ is a finite type $\mathcal{O}_{Y}$-module by Cohomology, Lemma 20.39.9, Then by Descent, Lemma 34.6.2 the $\mathcal{O}_{X}$-module $H^{i}(E)$ is of finite type. Thus, after replacing $X$ by the members of a finite affine open covering, we may assume there exists a map

$$
\alpha: \mathcal{O}_{X}^{\oplus n}[-i] \longrightarrow E
$$

such that $H^{i}(\alpha)$ is a surjection. Let $C$ be the cone of $\alpha$ in $D\left(\mathcal{O}_{X}\right)$. Pulling back to $Y$ and using Cohomology, Lemma 20.39.4 we find that $L f^{*} C$ is $m$-pseudo-coherent. Moreover $H^{j}(C)=0$ for $j \geq i$. Thus by induction on $i$ we see that $C$ is $m$-pseudocoherent. Using Cohomology, Lemma 20.39.4 again we conclude.

09UG Lemma 35.11.4. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}$ be an fpqc covering of schemes. Let $E \in$ $D\left(\mathcal{O}_{X}\right)$. Then $E$ is perfect if and only if each $L f_{i}^{*} E$ is perfect.

Proof. Pullback always preserves perfect complexes, see Cohomology, Lemma 20.41.6. Conversely, assume that $L f_{i}^{*} E$ is perfect for all $i$. Then the cohomology sheaves of each $L f_{i}^{*} E$ are quasi-coherent, see Lemma 35.10 .1 and Cohomology, Lemma 20.41.5. Since the morphisms $f_{i}$ is flat we see that $H^{p}\left(L f_{i}^{*} E\right)=f_{i}^{*} H^{p}(E)$. Thus the cohomology sheaves of $E$ are quasi-coherent by Descent, Proposition 34.5.2. Having said this the lemma follows formally from Cohomology, Lemma 20.41.5 and Lemmas 35.11.1 and 35.11.2.

09VA Lemma 35.11.5. Let $i: Z \rightarrow X$ be a morphism of ringed spaces such that $i$ is a closed immersion of underlying topological spaces and such that $i_{*} \mathcal{O}_{Z}$ is pseudocoherent as an $\mathcal{O}_{X}$-module. Let $E \in D\left(\mathcal{O}_{Z}\right)$. Then $E$ is m-pseudo-coherent if and only if $R i_{*} E$ is m-pseudo-coherent.

Proof. Throughout this proof we will use that $i_{*}$ is an exact functor, and hence that $R i_{*}=i_{*}$, see Modules, Lemma 17.6.1.
Assume $E$ is $m$-pseudo-coherent. Let $x \in X$. We will find a neighbourhood of $x$ such that $i_{*} E$ is $m$-peudo-coherent on it. If $x \notin Z$ then this is clear. Thus we may assume $x \in Z$. We will use that $U \cap Z$ for $x \in U \subset X$ open form a fundamental system of neighbourhoods of $x$ in $Z$. After shrinking $X$ we may assume $E$ is bounded above. We will argue by induction on the largest integer $p$ such that $H^{p}(E)$ is nonzero. If $p<m$, then there is nothing to prove. If $p \geq m$, then $H^{p}(E)$ is an $\mathcal{O}_{Z}$-module of finite type, see Cohomology, Lemma 20.39.9. Thus we may choose, after shrinking $X$, a map $\mathcal{O}_{Z}^{\oplus n}[-p] \rightarrow E$ which induces a surjection $\mathcal{O}_{Z}^{\oplus n} \rightarrow H^{p}(E)$. Choose a distinguished triangle

$$
\mathcal{O}_{Z}^{\oplus n}[-p] \rightarrow E \rightarrow C \rightarrow \mathcal{O}_{Z}^{\oplus n}[-p+1]
$$

We see that $H^{j}(C)=0$ for $j \geq p$ and that $C$ is $m$-pseudo-coherent by Cohomology, Lemma 20.39.4. By induction we see that $i_{*} C$ is $m$-pseudo-coherent on $X$.

Since $i_{*} \mathcal{O}_{Z}$ is $m$-pseudo-coherent on $X$ as well, we conclude from the distinguished triangle

$$
i_{*} \mathcal{O}_{Z}^{\oplus n}[-p] \rightarrow i_{*} E \rightarrow i_{*} C \rightarrow i_{*} \mathcal{O}_{Z}^{\oplus n}[-p+1]
$$

and Cohomology, Lemma 20.39 .4 that $i_{*} E$ is $m$-pseudo-coherent.
Assume that $i_{*} E$ is $m$-pseudo-coherent. Let $z \in Z$. We will find a neighbourhood of $z$ such that $E$ is $m$-peudo-coherent on it. We will use that $U \cap Z$ for $z \in U \subset X$ open form a fundamental system of neighbourhoods of $z$ in $Z$. After shrinking $X$ we may assume $i_{*} E$ and hence $E$ is bounded above. We will argue by induction on the largest integer $p$ such that $H^{p}(E)$ is nonzero. If $p<m$, then there is nothing to prove. If $p \geq m$, then $H^{p}\left(i_{*} E\right)=i_{*} H^{p}(E)$ is an $\mathcal{O}_{X}$-module of finite type, see Cohomology, Lemma 20.39.9. Choose a complex $\mathcal{E}^{\bullet}$ of $\mathcal{O}_{Z}$-modules representing $E$. We may choose, after shrinking $X$, a map $\alpha: \mathcal{O}_{X}^{\oplus n}[-p] \rightarrow i_{*} \mathcal{E}^{\bullet}$ which induces a surjection $\mathcal{O}_{X}^{\oplus n} \rightarrow i_{*} H^{p}\left(\mathcal{E}^{\bullet}\right)$. By adjunction we find a map $\alpha: \mathcal{O}_{Z}^{\oplus n}[-p] \rightarrow \mathcal{E}^{\bullet}$ which induces a surjection $\mathcal{O}_{Z}^{\oplus n} \rightarrow H^{p}\left(\mathcal{E}^{\bullet}\right)$. Choose a distinguished triangle

$$
\mathcal{O}_{Z}^{\oplus n}[-p] \rightarrow E \rightarrow C \rightarrow \mathcal{O}_{Z}^{\oplus n}[-p+1]
$$

We see that $H^{j}(C)=0$ for $j \geq p$. From the distinguished triangle

$$
i_{*} \mathcal{O}_{Z}^{\oplus n}[-p] \rightarrow i_{*} E \rightarrow i_{*} C \rightarrow i_{*} \mathcal{O}_{Z}^{\oplus n}[-p+1]
$$

the fact that $i_{*} \mathcal{O}_{Z}$ is pseudo-coherent and Cohomology, Lemma 20.39.4 we conclude that $i_{*} C$ is $m$-pseudo-coherent. By induction we conclude that $C$ is $m$-pseudocoherent. By Cohomology, Lemma 20.39.4 again we conclude that $E$ is $m$-pseudocoherent.

09VB Lemma 35.11.6. Let $f: X \rightarrow Y$ be a finite morphism of schemes such that $f_{*} \mathcal{O}_{X}$ is pseudo-coherent as an $\mathcal{O}_{Y}$-modul ${ }^{2}$. Let $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Then $E$ is m-pseudo-coherent if and only if $R f_{*} E$ is m-pseudo-coherent.

Proof. This is a translation of More on Algebra, Lemma 15.54.11 into the language of schemes. To do the translation, use Lemmas 35.3.5 and 35.10.3.

### 35.12. Lifting complexes

08EC Let $U \subset X$ be an open subspace of a ringed space and denote $j: U \rightarrow X$ the inclusion morphism. The functor $D\left(\mathcal{O}_{X}\right) \rightarrow D\left(\mathcal{O}_{U}\right)$ is essentially surjective as $R j_{*}$ is a right inverse to restriction. In this section we extend this to complexes with quasi-coherent cohomology sheaves, etc.

08ED Lemma 35.12.1. Let $X$ be a scheme and let $j: U \rightarrow X$ be a quasi-compact open immersion. The functors

$$
D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{U}\right) \quad \text { and } \quad D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}^{+}\left(\mathcal{O}_{U}\right)
$$

are essentially surjective. If $X$ is quasi-compact, then the functors

$$
D_{Q C o h}^{-}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}^{-}\left(\mathcal{O}_{U}\right) \quad \text { and } \quad D_{Q C o h}^{b}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}^{b}\left(\mathcal{O}_{U}\right)
$$

are essentially surjective.

[^100]Proof. The argument preceding the lemma applies for the first case because $R j_{*}$ maps $D_{Q C o h}\left(\mathcal{O}_{U}\right)$ into $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ by Lemma 35.4.1. It is clear that $R j_{*}$ maps $D_{Q C o h}^{+}\left(\mathcal{O}_{U}\right)$ into $D_{Q C o h}^{+}\left(\mathcal{O}_{X}\right)$ which implies the statement on bounded below complexes. Finally, Lemma 35.4.1 guarantees that $R j_{*}$ maps $D_{Q C o h}^{-}\left(\mathcal{O}_{U}\right)$ into $D_{Q C o h}^{-}\left(\mathcal{O}_{X}\right)$ if $X$ is quasi-compact. Combining these two we obtain the last statement.

08EE Lemma 35.12.2. Let $X$ be an affine scheme and let $U \subset X$ be a quasi-compact open subscheme. For any pseudo-coherent object $E$ of $D\left(\mathcal{O}_{U}\right)$ there exists a bounded above complex of finite free $\mathcal{O}_{X}$-modules whose restriction to $U$ is isomorphic to $E$.

Proof. By Lemma 35.10.1 we see that $E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$. By Lemma 35.12 .1 we may assume $E=E^{\prime} \mid U$ for some object $E^{\prime}$ of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Write $X=\operatorname{Spec}(A)$. By Lemma 35.3 .5 we can find a complex $M^{\bullet}$ of $A$-modules whose associated complex of $\mathcal{O}_{X}$-modules is a representative of $E^{\prime}$.

Choose $f_{1}, \ldots, f_{r} \in A$ such that $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{r}\right)$. By Lemma 35.10.3 the complexes $M_{f_{j}}^{\bullet}$ are pseudo-coherent complexes of $A_{f_{j}}$-modules. Let $n$ be an integer. Assume we have a map of complexes $\alpha: F^{\bullet} \rightarrow M^{\bullet}$ where $F^{\bullet}$ is bounded above, $F^{i}=0$ for $i<n$, each $F^{i}$ is a finite free $R$-module, such that

$$
H^{i}\left(\alpha_{f_{j}}\right): H^{i}\left(F_{f_{j}}^{\bullet}\right) \rightarrow H^{i}\left(M_{f_{j}}^{\bullet}\right)
$$

is an isomorphism for $i>n$ and surjective for $i=n$. Picture

Since each $M_{f_{j}}^{\bullet}$ has vanishing cohomology in large degrees we can find such a map for $n \gg 0$. By induction on $n$ we are going to extend this to a map of complexes $F^{\bullet} \rightarrow M^{\bullet}$ such that $H^{i}\left(\alpha_{f_{j}}\right)$ is an isomorphism for all $i$. The lemma will follow by taking $\widetilde{F^{\bullet}}$.

The induction step will be to extend the diagram above by adding $F^{n-1}$. Let $C^{\bullet}$ be the cone on $\alpha$ (Derived Categories, Definition 13.9.1). The long exact sequence of cohomology shows that $H^{i}\left(C_{f_{j}}^{\bullet}\right)=0$ for $i \geq n$. By More on Algebra, Lemma 15.54 .2 we see that $C_{f_{j}}^{\bullet}$ is $(n-1)$-pseudo-coherent. By More on Algebra, Lemma 15.54.3 we see that $H^{-1}\left(C_{f_{j}}^{\bullet}\right)$ is a finite $A_{f_{j}}$-module. Choose a finite free $A$-module $F^{n-1}$ and an $A$-module $\beta: F^{n-1} \rightarrow C^{-1}$ such that the composition $F^{n-1} \rightarrow C^{n-1} \rightarrow C^{n}$ is zero and such that $F_{f_{j}}^{n-1}$ surjects onto $H^{n-1}\left(C_{f_{j}}^{\bullet}\right)$. (Some details omitted; hint: clear denominators.) Since $C^{n-1}=M^{n-1} \oplus F^{n}$ we can write $\beta=\left(\alpha^{n-1},-d^{n-1}\right)$. The vanishing of the composition $F^{n-1} \rightarrow C^{n-1} \rightarrow C^{n}$ implies these maps fit into a morphism of complexes

Moreover, these maps define a morphism of distinguished triangles

Hence our choice of $\beta$ implies that the map of complexes $\left(F^{-1} \rightarrow \ldots\right) \rightarrow M^{\bullet}$ induces an isomorphism on cohomology localized at $f_{j}$ in degrees $\geq n$ and a surjection in degree -1 . This finishes the proof of the lemma.

08EF Lemma 35.12.3. Let $X$ be a quasi-compact and quasi-separated scheme. Let $E \in D_{Q C o h}^{b}\left(\mathcal{O}_{X}\right)$. There exists an integer $n_{0}>0$ such that $E x t_{D\left(\mathcal{O}_{X}\right)}^{n}(\mathcal{E}, E)=0$ for every finite locally free $\mathcal{O}_{X}$-module $\mathcal{E}$ and every $n \geq n_{0}$.
Proof. Recall that $\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{n}(\mathcal{E}, E)=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(\mathcal{E}, E[n])$. We have Mayer-Vietoris for morphisms in the derived category, see Cohomology, Lemma 20.30.6. Thus if $X=U \cup V$ and the result of the lemma holds for $\left.E\right|_{U},\left.E\right|_{V}$, and $\left.E\right|_{U \cap V}$ for some bound $n_{0}$, then the result holds for $E$ with bound $n_{0}+1$. Thus it suffices to prove the lemma when $X$ is affine, see Cohomology of Schemes, Lemma 29.4.1.

Assume $X=\operatorname{Spec}(A)$ is affine. Choose a complex of $A$-modules $M^{\bullet}$ whose associated complex of quasi-coherent modules represents $E$, see Lemma 35.3.5. Write $\mathcal{E}=\widetilde{P}$ for some $A$-module $P$. Since $\mathcal{E}$ is finite locally free, we see that $P$ is a finite projective $A$-module. We have

$$
\begin{aligned}
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(\mathcal{E}, E[n]) & =\operatorname{Hom}_{D(A)}\left(P, M^{\bullet}[n]\right) \\
& =\operatorname{Hom}_{K(A)}\left(P, M^{\bullet}[n]\right) \\
& =\operatorname{Hom}_{A}\left(P, H^{n}\left(M^{\bullet}\right)\right)
\end{aligned}
$$

The first equality by Lemma 35.3.5, the second equality by Derived Categories, Lemma 13.19 .8 , and the final equality because $\operatorname{Hom}_{A}(P,-)$ is an exact functor. As $E$ and hence $M^{\bullet}$ is bounded we get zero for all sufficiently large $n$.
08EG Lemma 35.12.4. Let $X$ be an affine scheme. Let $U \subset X$ be a quasi-compact open. For every perfect object $E$ of $D\left(\mathcal{O}_{U}\right)$ there exists an integer $r$ and a finite locally free sheaf $\mathcal{F}$ on $U$ such that $\mathcal{F}[-r] \oplus E$ is the restriction of a perfect object of $D\left(\mathcal{O}_{X}\right)$.
Proof. Say $X=\operatorname{Spec}(A)$. Recall that a perfect complex is pseudo-coherent, see Cohomology, Lemma 20.41.5. By Lemma 35.12 .2 we can find a bounded above complex $\mathcal{F}^{\bullet}$ of finite free $A$-modules such that $E$ is isomorphic to $\left.\mathcal{F}^{\bullet}\right|_{U}$ in $D\left(\mathcal{O}_{U}\right)$. By Cohomology, Lemma 20.41.5 and since $U$ is quasi-compact, we see that $E$ has finite tor dimension, say $E$ has tor amplitude in $[a, b]$. Pick $r<a$ and set

$$
\mathcal{F}=\operatorname{Ker}\left(\mathcal{F}^{r} \rightarrow \mathcal{F}^{r+1}\right)=\operatorname{Im}\left(\mathcal{F}^{r-1} \rightarrow \mathcal{F}^{r}\right)
$$

Since $E$ has tor amplitude in $[a, b]$ we see that $\left.\mathcal{F}\right|_{U}$ is flat (Cohomology, Lemma 20.40 .2 . Hence $\left.\mathcal{F}\right|_{U}$ is flat and of finite presentation, thus finite locally free (Properties, Lemma 27.20.2). It follows that

$$
\left.\left(\mathcal{F} \rightarrow \mathcal{F}^{r} \rightarrow \mathcal{F}^{r+1} \rightarrow \ldots\right)\right|_{U}
$$

is a strictly perfect complex on $U$ representing $E$. We obtain a distinguished triangle

$$
\left.\left.\left.\mathcal{F}\right|_{U}[-r-1] \rightarrow E \rightarrow\left(\mathcal{F}^{r} \rightarrow \mathcal{F}^{r+1} \rightarrow \ldots\right)\right|_{U} \rightarrow \mathcal{F}\right|_{U}[-r]
$$

Note that $\left(\mathcal{F}^{r} \rightarrow \mathcal{F}^{r+1} \rightarrow \ldots\right)$ is a perfect complex on $X$. To finish the proof it suffices to pick $r$ such that the map $\left.\mathcal{F}\right|_{U}[-r-1] \rightarrow E$ is zero in $D\left(\mathcal{O}_{U}\right)$, see Derived Categories, Lemma 13.4.10. By Lemma 35.12 .3 this holds if $r \ll 0$.

08EH Lemma 35.12.5. Let $X$ be an affine scheme. Let $U \subset X$ be a quasi-compact open. Let $E, E^{\prime}$ be objects of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ with $E$ perfect. For every map $\alpha:\left.\left.E\right|_{U} \rightarrow E^{\prime}\right|_{U}$ there exist maps

$$
E \stackrel{\beta}{\leftarrow} E_{1} \xrightarrow{\gamma} E^{\prime}
$$

of perfect complexes on $X$ such that $\beta: E_{1} \rightarrow E$ restricts to an isomorphism on $U$ and such that $\alpha=\left.\left.\gamma\right|_{U} \circ \beta\right|_{U} ^{-1}$. Moreover we can assume $E_{1}=E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}$ I for some perfect complex $I$ on $X$.

Proof. Write $X=\operatorname{Spec}(A)$. Write $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{r}\right)$. Choose finite complex of finite projective $A$-modules $M^{\bullet}$ representing $E$ (Lemma 35.10.7). Choose a complex of $A$-modules $\left(M^{\prime}\right)^{\bullet}$ representing $E^{\prime}$ (Lemma 35.3.5). In this case the complex $H^{\bullet}=\operatorname{Hom}_{A}\left(M^{\bullet},\left(M^{\prime}\right)^{\bullet}\right)$ is a complex of $A$-modules whose associated complex of quasi-coherent $\mathcal{O}_{X}$-modules represents $R \mathcal{H o m}\left(E, E^{\prime}\right)$, see Cohomology, Lemma 20.38.9. Then $\alpha$ determines an element $s$ of $H^{0}\left(U, R \mathcal{H} o m\left(E, E^{\prime}\right)\right)$, see Cohomology, Lemma 20.35.1. There exists an $e$ and a map

$$
\xi: I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right) \rightarrow \operatorname{Hom}_{A}\left(M^{\bullet},\left(M^{\prime}\right)^{\bullet}\right)
$$

corresponding to $s$, see Proposition 35.9.5. Letting $E_{1}$ be the object corresponding to complex of quasi-coherent $\mathcal{O}_{X}$-modules associated to

$$
\operatorname{Tot}\left(I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right) \otimes_{A} M^{\bullet}\right)
$$

we obtain $E_{1} \rightarrow E$ using the canonical map $I^{\bullet}\left(f_{1}^{e}, \ldots, f_{r}^{e}\right) \rightarrow A$ and $E_{1} \rightarrow E^{\prime}$ using $\xi$ and Cohomology, Lemma 20.35.1.

08EI Lemma 35.12.6. Let $X$ be an affine scheme. Let $U \subset X$ be a quasi-compact open. For every perfect object $F$ of $D\left(\mathcal{O}_{U}\right)$ the object $F \oplus F[1]$ is the restriction of a perfect object of $D\left(\mathcal{O}_{X}\right)$.

Proof. By Lemma 35.12 .4 we can find a perfect object $E$ of $D\left(\mathcal{O}_{X}\right)$ such that $\left.E\right|_{U}=\mathcal{F}[r] \oplus F$ for some finite locally free $\mathcal{O}_{U}$-module $\mathcal{F}$. By Lemma 35.12.5 we can find a morphism of perfect complexes $\alpha: E_{1} \rightarrow E$ such that $\left.\left.\left(E_{1}\right)\right|_{U} \cong E\right|_{U}$ and such that $\left.\alpha\right|_{U}$ is the map

$$
\left(\begin{array}{cc}
\operatorname{id}_{\mathcal{F}[r]} & 0 \\
0 & 0
\end{array}\right): \mathcal{F}[r] \oplus F \rightarrow \mathcal{F}[r] \oplus F
$$

Then the cone on $\alpha$ is a solution.
08EJ Lemma 35.12.7. Let $X$ be a quasi-compact and quasi-separated scheme. Let $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$. For any morphism $\alpha: E \rightarrow E^{\prime}$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ such that
(1) $E$ is perfect, and
(2) $E^{\prime}$ is supported on $T=V(f)$
there exists an $n \geq 0$ such that $f^{n} \alpha=0$.
Proof. We have Mayer-Vietoris for morphisms in the derived category, see Cohomology, Lemma 20.30.6. Thus if $X=U \cup V$ and the result of the lemma holds for $\left.f\right|_{U},\left.f\right|_{V}$, and $\left.f\right|_{U \cap V}$, then the result holds for $f$. Thus it suffices to prove the lemma when $X$ is affine, see Cohomology of Schemes, Lemma 29.4.1.

Let $X=\operatorname{Spec}(A)$. Then $f \in A$. We will use the equivalence $D(A)=D_{Q C o h}(X)$ of Lemma 35.3.5 without further mention. Represent $E$ by a finite complex of finite projective $A$-modules $P^{\bullet}$. This is possible by Lemma 35.10.7. Let $t$ be the largest integer such that $P^{t}$ is nonzero. The distinguished triangle

$$
P^{t}[-t] \rightarrow P^{\bullet} \rightarrow \sigma_{\leq t-1} P^{\bullet} \rightarrow P^{t}[-t+1]
$$

shows that by induction on the length of the complex $P^{\bullet}$ we can reduce to the case where $P^{\bullet}$ has a single nonzero term. This and the shift functor reduces us to the case where $P^{\bullet}$ consists of a single finite projective $A$-module $P$ in degree 0 . Represent $E^{\prime}$ by a complex $M^{\bullet}$ of $A$-modules. Then $\alpha$ corresponds to a map $P \rightarrow H^{0}\left(M^{\bullet}\right)$. Since the module $H^{0}\left(M^{\bullet}\right)$ is supported on $V(f)$ by assumption (2) we see that every element of $H^{0}\left(M^{\bullet}\right)$ is annihilated by a power of $f$. Since $P$ is a finite $A$-module the map $f^{n} \alpha: P \rightarrow H^{0}\left(M^{\bullet}\right)$ is zero for some $n$ as desired.

08EK Lemma 35.12.8. Let $X$ be an affine scheme. Let $T \subset X$ be a closed subset such that $X \backslash T$ is quasi-compact. Let $U \subset X$ be a quasi-compact open. For every perfect object $F$ of $D\left(\mathcal{O}_{U}\right)$ supported on $T \cap U$ the object $F \oplus F[1]$ is the restriction of $a$ perfect object $E$ of $D\left(\mathcal{O}_{X}\right)$ supported in $T$.

Proof. Say $T=V\left(g_{1}, \ldots, g_{s}\right)$. After replacing $g_{j}$ by a power we may assume multiplication by $g_{j}$ is zero on $F$, see Lemma 35.12.7. Choose $E$ as in Lemma 35.12.6 Note that $g_{j}: E \rightarrow E$ restricts to zero on $U$. Choose a distinguished triangle

$$
E \xrightarrow{g_{1}} E \rightarrow C_{1} \rightarrow E[1]
$$

By Derived Categories, Lemma 13.4 .10 the object $C_{1}$ restricts to $F \oplus F[1] \oplus F[1] \oplus$ $F[2]$ on $U$. Moreover, $g_{1}: C_{1} \rightarrow C_{1}$ has square zero by Derived Categories, Lemma 13.4.5. Namely, the diagram

is commutative since the compositions $E \xrightarrow{g_{1}} E \rightarrow C_{1}$ and $C_{1} \rightarrow E[1] \xrightarrow{g_{1}} E[1]$ are zero. Continuing, setting $C_{i+1}$ equal to the cone of the map $g_{i}: C_{i} \rightarrow C_{i}$ we obtain a perfect complex $C_{s}$ on $X$ supported on $T$ whose restriction to $U$ gives

$$
F \oplus F[1]^{\oplus s} \oplus F[2]^{\oplus\binom{s}{2}} \oplus \ldots \oplus F[s]
$$

Choose a morphisms of perfect complexes $\beta: C^{\prime} \rightarrow C_{s}$ and $\gamma: C^{\prime} \rightarrow C_{s}$ as in Lemma 35.12 .5 such that $\left.\beta\right|_{U}$ is an isomorphism and such that $\left.\left.\gamma\right|_{U} \circ \beta\right|_{U} ^{-1}$ is the morphism

$$
F \oplus F[1]^{\oplus s} \oplus F[2]^{\oplus\binom{s}{2}} \oplus \ldots \oplus F[s] \rightarrow F \oplus F[1]^{\oplus s} \oplus F[2]^{\oplus\binom{s}{2}} \oplus \ldots \oplus F[s]
$$

which is the identity on all summands except for $F$ where it is zero. By Lemma 35.12 .5 we also have $C^{\prime}=C_{s} \otimes^{\mathbf{L}} I$ for some perfect complex $I$ on $X$. Hence the nullity of $g_{j}^{2} \mathrm{id}_{C_{s}}$ implies the same thing for $C^{\prime}$. Thus $C^{\prime}$ is supported on $T$ as well. Then Cone $(\gamma)$ is a solution.

A special case of the following lemma can be found in Nee96.

09IM Lemma 35.12.9. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open. Let $T \subset X$ be a closed subset with $X \backslash T$ retrocompact in $X$. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $\alpha:\left.P \rightarrow E\right|_{U}$ be a map where $P$ is a perfect object of $D\left(\mathcal{O}_{U}\right)$ supported on $T \cap U$. Then there exists a map $\beta: R \rightarrow E$ where $R$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ supported on $T$ such that $P$ is a direct summand of $\left.R\right|_{U}$ in $D\left(\mathcal{O}_{U}\right)$ compatible $\alpha$ and $\left.\beta\right|_{U}$.

Proof. Since $X$ is quasi-compact there exists an integer $m$ such that $X=U \cup V_{1} \cup$ $\ldots \cup V_{m}$ for some affine opens $V_{j}$ of $X$. Arguing by induction on $m$ we see that we may assume $m=1$. In other words, we may assume that $X=U \cup V$ with $V$ affine. By Lemma 35.12 .8 we can choose a perfect object $Q$ in $D\left(\mathcal{O}_{V}\right)$ supported on $T \cap V$ and an isomorphism $\left.\left.Q\right|_{U \cap V} \rightarrow(P \oplus P[1])\right|_{U \cap V}$. By Lemma 35.12.5 we can replace $Q$ by $Q \otimes^{\mathbf{L}} I$ (still supported on $T \cap V$ ) and assume that the map

$$
\left.\left.\left.\left.Q\right|_{U \cap V} \rightarrow(P \oplus P[1])\right|_{U \cap V} \longrightarrow P\right|_{U \cap V} \longrightarrow E\right|_{U \cap V}
$$

lifts to $\left.Q \rightarrow E\right|_{V}$. By Cohomology, Lemma 20.30 .10 we find an morphism $a: R \rightarrow E$ of $D\left(\mathcal{O}_{X}\right)$ such that $\left.a\right|_{U}$ is isomorphic to $\left.P \oplus P[1] \rightarrow E\right|_{U}$ and $\left.a\right|_{V}$ isomorphic to $\left.Q \rightarrow E\right|_{V}$. Thus $R$ is perfect and supported on $T$ as desired.

09IN Remark 35.12.10. The proof of Lemma 35.12 .9 shows that

$$
\left.R\right|_{U}=P \oplus P^{\oplus n_{1}}[1] \oplus \ldots \oplus P^{\oplus n_{m}}[m]
$$

for some $m \geq 0$ and $n_{j} \geq 0$. Thus the highest degree cohomology sheaf of $\left.R\right|_{U}$ equals that of $P$. By repeating the construction for the map $P^{\oplus n_{1}}[1] \oplus \ldots \oplus P^{\oplus n_{m}}[m] \rightarrow$ $\left.R\right|_{U}$, taking cones, and using induction we can achieve equality of cohomology sheaves of $\left.R\right|_{U}$ and $P$ above any given degree.

### 35.13. Approximation by perfect complexes

08 EL In this section we discuss the observation, due to Neeman and Lipman, that a pseudo-coherent complex can be "approximated" by perfect complexes.

08EM Definition 35.13.1. Let $X$ be a scheme. Consider triples $(T, E, m)$ where
(1) $T \subset X$ is a closed subset,
(2) $E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$, and
(3) $m \in \mathbf{Z}$.

We say approximation holds for the triple $(T, E, m)$ if there exists a perfect object $P$ of $D\left(\mathcal{O}_{X}\right)$ supported on $T$ and a map $\alpha: P \rightarrow E$ which induces isomorphisms $H^{i}(P) \rightarrow H^{i}(E)$ for $i>m$ and a surjection $H^{m}(P) \rightarrow H^{m}(E)$.

Approximation cannot hold for every triple. Namely, it is clear that if approximation holds for the triple $(T, E, m)$, then
(1) $E$ is $m$-pseudo-coherent, see Cohomology, Definition 20.39.1, and
(2) the cohomology sheaves $H^{i}(E)$ are supported on $T$ for $i \geq m$.

Moreover, the "support" of a perfect complex is a closed subscheme whose complement is retrocompact in $X$ (details omitted). Hence we cannot expect approximation to hold without this assumption on $T$. This partly explains the conditions in the following definition.

08EN Definition 35.13.2. Let $X$ be a scheme. We say approximation by perfect complexes holds on $X$ if for any closed subset $T \subset X$ with $X \backslash T$ retro-compact in $X$
there exists an integer $r$ such that for every triple $(T, E, m)$ as in Definition 35.13.1 with
(1) $E$ is $(m-r)$-pseudo-coherent, and
(2) $H^{i}(E)$ is supported on $T$ for $i \geq m-r$
approximation holds.
We will prove that approximation by perfect complexes holds for quasi-compact and quasi-separated schemes. It seems that the second condition is necessary for our method of proof. It is possible that the first condition may be weakened to " $E$ is $m$-pseudo-coherent" by carefuly analyzing the arguments below.

08EP Lemma 35.13.3. Let $X$ be a scheme. Let $U \subset X$ be an open subscheme. Let $(T, E, m)$ be a triple as in Definition 35.13.1. If
(1) $T \subset U$,
(2) approximation holds for $\left(T,\left.E\right|_{U}, m\right)$, and
(3) the sheaves $H^{i}(E)$ for $i \geq m$ are supported on $T$,
then approximation holds for $(T, E, m)$.
Proof. Let $j: U \rightarrow X$ be the inclusion morphism. If $\left.P \rightarrow E\right|_{U}$ is an approximation of the triple $\left(T,\left.E\right|_{U}, m\right)$ over $U$, then $j_{!} P=R j_{*} P \rightarrow j_{!}\left(\left.E\right|_{U}\right) \rightarrow E$ is an approximation of $(T, E, m)$ over $X$. See Cohomology, Lemmas 20.30.9 and 20.41.10.

08EQ Lemma 35.13.4. Let $X$ be an affine scheme. Then approximation holds for every triple $(T, E, m)$ as in Definition 35.13.1 such that there exists an integer $r \geq 0$ with
(1) $E$ is m-pseudo-coherent,
(2) $H^{i}(E)$ is supported on $T$ for $i \geq m-r+1$,
(3) $X \backslash T$ is the union of $r$ affine opens.

In particular, approximation by perfect complexes holds for affine schemes.
Proof. Say $X=\operatorname{Spec}(A)$. Write $T=V\left(f_{1}, \ldots, f_{r}\right)$. (The case $r=0$, i.e., $T=X$ follows immediately from Lemma 35.10 .3 and the definitions.) Let ( $T, E, m$ ) be a triple as in the lemma. Let $t$ be the largest integer such that $H^{t}(E)$ is nonzero. We will proceed by induction on $t$. The base case is $t<m$; in this case the result is trivial. Now suppose that $t \geq m$. By Cohomology, Lemma 20.39 .9 the sheaf $H^{t}(E)$ is of finite type. Since it is quasi-coherent it is generated by finitely many sections (Properties, Lemma 27.16.1). For every $s \in \Gamma\left(X, H^{t}(E)\right)=H^{t}(X, E)$ (see proof of Lemma 35.3.5 we can find an $e>0$ and a morphism $K_{e}[-t] \rightarrow E$ such that $s$ is in the image of $H^{0}\left(K_{e}\right)=H^{t}\left(K_{e}[-t]\right) \rightarrow H^{t}(E)$, see Lemma 35.9.6. Taking a finite direct sum of these maps we obtain a map $P \rightarrow E$ where $P$ is a perfect complex supported on $T$, where $H^{i}(P)=0$ for $i>t$, and where $H^{t}(P) \rightarrow E$ is surjective. Choose a distinguished triangle

$$
P \rightarrow E \rightarrow E^{\prime} \rightarrow P[1]
$$

Then $E^{\prime}$ is $m$-pseudo-coherent (Cohomology, Lemma 20.39.4, $H^{i}\left(E^{\prime}\right)=0$ for $i \geq t$, and $H^{i}\left(E^{\prime}\right)$ is supported on $T$ for $i \geq m-r+1$. By induction we find an approximation $P^{\prime} \rightarrow E^{\prime}$ of $\left(T, E^{\prime}, m\right)$. Fit the composition $P^{\prime} \rightarrow E^{\prime} \rightarrow P$ [1] into a distringuished triangle $P \rightarrow P^{\prime \prime} \rightarrow P^{\prime} \rightarrow P[1]$ and extend the morphisms $P^{\prime} \rightarrow E^{\prime}$
and $P[1] \rightarrow P[1]$ into a morphism of distinguished triangles

using TR3. Then $P^{\prime \prime}$ is a perfect complex (Cohomology, Lemma 20.41.7) supported on $T$. An easy diagram chase shows that $P^{\prime \prime} \rightarrow E$ is the desired approximation.

08 ER Lemma 35.13.5. Let $X$ be a scheme. Let $X=U \cup V$ be an open covering with $U$ quasi-compact, $V$ affine, and $U \cap V$ quasi-compact. If approximation by perfect complexes holds on $U$, then approximation holds on $X$.

Proof. Let $T \subset X$ be a closed subset with $X \backslash T$ retro-compact in $X$. Let $r_{U}$ be the integer of Definition 35.13 .2 adapted to the pair $(U, T \cap U)$. Set $T^{\prime}=T \backslash U$. Note that $T^{\prime} \subset V$ and that $V \backslash T^{\prime}=(X \backslash T) \cap U \cap V$ is quasi-compact by our assumption on $T$. Let $r^{\prime}$ be the number of affines needed to cover $V \backslash T^{\prime}$. We claim that $r=\max \left(r_{U}, r^{\prime}\right)$ works for the pair $(X, T)$.

To see this choose a triple $(T, E, m)$ such that $E$ is $(m-r)$-pseudo-coherent and $H^{i}(E)$ is supported on $T$ for $i \geq m-r$. Let $t$ be the largest integer such that $\left.H^{t}(E)\right|_{U}$ is nonzero. (Such an integer exists as $U$ is quasi-compact and $\left.E\right|_{U}$ is ( $m-r$ )-pseudo-coherent.) We will prove that $E$ can be approximated by induction on $t$.

Base case: $t \leq m-r^{\prime}$. This means that $H^{i}(E)$ is supported on $T^{\prime}$ for $i \geq m-r^{\prime}$. Hence Lemma 35.13 .4 guarantees the existence of an approximation $\left.P \rightarrow E\right|_{V}$ of $\left(T^{\prime},\left.E\right|_{V}, m\right)$ on $V$. Applying Lemma 35.13 .3 we see that $\left(T^{\prime}, E, m\right)$ can be approximated. Such an approximation is also an approximation of $(T, E, m)$.

Induction step. Choose an approximation $\left.P \rightarrow E\right|_{U}$ of $\left(T \cap U,\left.E\right|_{U}, m\right)$. This in particular gives a surjection $H^{t}(P) \rightarrow H^{t}\left(\left.E\right|_{U}\right)$. By Lemma 35.12 .8 we can choose a perfect object $Q$ in $D\left(\mathcal{O}_{V}\right)$ supported on $T \cap V$ and an isomorphism $\left.\left.Q\right|_{U \cap V} \rightarrow(P \oplus P[1])\right|_{U \cap V}$. By Lemma 35.12 .5 we can replace $Q$ by $Q \otimes^{\mathbf{L}} I$ and assume that the map

$$
\left.\left.\left.\left.Q\right|_{U \cap V} \rightarrow(P \oplus P[1])\right|_{U \cap V} \longrightarrow P\right|_{U \cap V} \longrightarrow E\right|_{U \cap V}
$$

lifts to $\left.Q \rightarrow E\right|_{V}$. By Cohomology, Lemma 20.30.10 we find an morphism $a: R \rightarrow E$ of $D\left(\mathcal{O}_{X}\right)$ such that $\left.a\right|_{U}$ is isomorphic to $\left.P \oplus P[1] \rightarrow E\right|_{U}$ and $\left.a\right|_{V}$ isomorphic to $\left.Q \rightarrow E\right|_{V}$. Thus $R$ is perfect and supported on $T$ and the map $H^{t}(R) \rightarrow H^{t}(E)$ is surjective on restriction to $U$. Choose a distinguised triangle

$$
R \rightarrow E \rightarrow E^{\prime} \rightarrow R[1]
$$

Then $E^{\prime}$ is $(m-r)$-pseudo-coherent (Cohomology, Lemma 20.39.4), $\left.H^{i}\left(E^{\prime}\right)\right|_{U}=0$ for $i \geq t$, and $H^{i}\left(E^{\prime}\right)$ is supported on $T$ for $i \geq m-r$. By induction we find an approximation $R^{\prime} \rightarrow E^{\prime}$ of $\left(T, E^{\prime}, m\right)$. Fit the composition $R^{\prime} \rightarrow E^{\prime} \rightarrow R[1]$ into a distringuished triangle $R \rightarrow R^{\prime \prime} \rightarrow R^{\prime} \rightarrow R[1]$ and extend the morphisms $R^{\prime} \rightarrow E^{\prime}$
and $R[1] \rightarrow R[1]$ into a morphism of distinguished triangles

using TR3. Then $R^{\prime \prime}$ is a perfect complex (Cohomology, Lemma 20.41.7) supported on $T$. An easy diagram chase shows that $R^{\prime \prime} \rightarrow E$ is the desired approximation.

08ES Theorem 35.13.6. Let $X$ be a quasi-compact and quasi-separated scheme. Then approximation by perfect complexes holds on $X$.

Proof. This follows from the induction principle of Cohomology of Schemes, Lemma 29.4 .1 and Lemmas 35.13 .5 and 35.13 .4

### 35.14. Generating derived categories

09IP In this section we prove that the derived category $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ of a quasi-compact and quasi-separated scheme can be generated by a single perfect object. We urge the reader to read the proof of this result in the wonderful paper by Bondal and van den Bergh, see BV03.
09IQ Lemma 35.14.1. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U$ be a quasi-compact open subscheme. Let $P$ be a perfect object of $D\left(\mathcal{O}_{U}\right)$. Then $P$ is a direct summand of the restriction of a perfect object of $D\left(\mathcal{O}_{X}\right)$.
Proof. Special case of Lemma 35.12.9.
09IR Lemma 35.14.2. In Situation 35.9.1 denote $j: U \rightarrow X$ the open immersion

BN93, Proposition 6.1] $f_{1}, \ldots, f_{r}$ over $A$. For $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the following are equivalent
(1) $E=R j_{*}\left(\left.E\right|_{U}\right)$, and
(2) $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K[n], E)=0$ for all $n \in \mathbf{Z}$.

Proof. Choose a distinguished triangle $E \rightarrow R j_{*}\left(\left.E\right|_{U}\right) \rightarrow N \rightarrow E[1]$. Observe that

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(K[n], R j_{*}\left(\left.E\right|_{U}\right)\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.K\right|_{U}[n], E\right)=0
$$

for all $n$ as $\left.K\right|_{U}=0$. Thus it suffices to prove the result for $N$. In other words, we may assume that $E$ restricts to zero on $U$. Observe that there are distinguished triangles
$K^{\bullet}\left(f_{1}^{e_{1}}, \ldots, f_{i}^{e_{i}^{\prime}}, \ldots, f_{r}^{e_{r}}\right) \rightarrow K^{\bullet}\left(f_{1}^{e_{1}}, \ldots, f_{i}^{e_{i}^{\prime}+e_{i}^{\prime \prime}}, \ldots, f_{r}^{e_{r}}\right) \rightarrow K^{\bullet}\left(f_{1}^{e_{1}}, \ldots, f_{i}^{e_{i}^{\prime \prime}}, \ldots, f_{r}^{e_{r}}\right) \rightarrow \ldots$
of Koszul complexes, see More on Algebra, Lemma 15.22.11. Hence if $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(K[n], E)=$ 0 for all $n \in \mathbf{Z}$ then the same thing is true for the $K$ replaced by $K_{e}$ as in Lemma 35.9.6. Thus our lemma follows immediately from that one and the fact that $E$ is determined by the complex of $A$-modules $R \Gamma(X, E)$, see Lemma 35.3.5.
09IS Theorem 35.14.3. Let $X$ be a quasi-compact and quasi-separated scheme. The category $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ can be generated by a single perfect object. More precisely, there exists a perfect object $P$ of $D\left(\mathcal{O}_{X}\right)$ such that for $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the following are equivalent
(1) $E=0$, and
(2) $\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(P[n], E)=0$ for all $n \in \mathbf{Z}$.

Proof. We will prove this using the induction principle of Cohomology of Schemes, Lemma 29.4.1.

If $X$ is affine, then $\mathcal{O}_{X}$ is a perfect generator. This follows from Lemma 35.3.5.
Assume that $X=U \cup V$ is an open covering with $U$ quasi-compact such that the theorem holds for $U$ and $V$ is an affine open. Let $P$ be a perfect object of $D\left(\mathcal{O}_{U}\right)$ which is a generator for $D_{Q C o h}\left(\mathcal{O}_{U}\right)$. Using Lemma 35.14.1 we may choose a perfect object $Q$ of $D\left(\mathcal{O}_{X}\right)$ whose restriction to $U$ is a direct sum one of whose summands is $P$. Say $V=\operatorname{Spec}(A)$. Let $Z=X \backslash U$. This is a closed subset of $V$ with $V \backslash Z$ quasicompact. Choose $f_{1}, \ldots, f_{r} \in A$ such that $Z=V\left(f_{1}, \ldots, f_{r}\right)$. Let $K \in D\left(\mathcal{O}_{V}\right)$ be the perfect object corresponding to the Koszul complex on $f_{1}, \ldots, f_{r}$ over $A$. Note that since $K$ is supported on $Z \subset V$ closed, the pushforward $K^{\prime}=R(V \rightarrow X)_{*} K$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ whose restriction to $V$ is $K$ (see Cohomology, Lemma 20.41.10). We claim that $Q \oplus K^{\prime}$ is a generator for $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ such that there are no nontrivial maps from any shift of $Q \oplus K^{\prime}$ into $E$. By Cohomology, Lemma 20.30.9 we have $K^{\prime}=R(V \rightarrow X)!K$ and hence

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(K^{\prime}[n], E\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{V}\right)}\left(K[n],\left.E\right|_{V}\right)
$$

Thus by Lemma 35.14 .2 the vanishing of these groups implies that $\left.E\right|_{V}$ is isomorphic to $\left.R(U \cap V \rightarrow V)_{*} E\right|_{U \cap V}$. This implies that $E=\left.R(U \rightarrow X)_{*} E\right|_{U}$ (small detail omitted). If this is the case then

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(Q[n], E)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.Q\right|_{U}[n],\left.E\right|_{U}\right)
$$

which contains $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(P[n],\left.E\right|_{U}\right)$ as a direct summand. Thus by our choice of $P$ the vanishing of these groups implies that $\left.E\right|_{U}$ is zero. Whence $E$ is zero.

The following result is an strengthening of Theorem 35.14.3 proved using exactly the same methods. Let $T \subset X$ be a closed subset of a scheme $X$. Let's denote $D_{T}\left(\mathcal{O}_{X}\right)$ the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on $T$.

0A9A Lemma 35.14.4. Let $X$ be a quasi-compact and quasi-separated scheme. Let $T \subset X$ be a closed subset such that $X \backslash T$ is quasi-compact. With notation as above, the category $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ is generated by a single perfect object.

Proof. We will prove this using the induction principle of Cohomology of Schemes, Lemma 29.4.1.
Assume $X=\operatorname{Spec}(A)$ is affine. In this case there exist $f_{1}, \ldots, f_{r} \in A$ such that $T=V\left(f_{1}, \ldots, f_{r}\right)$. Let $K$ be the Koszul complex on $f_{1}, \ldots, f_{r}$ as in Lemma 35.14.2. Then $K$ is a perfect object with cohomology supported on $T$ and hence a perfect object of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$. On the other hand, if $E \in D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ and $\operatorname{Hom}(K, E[n])=0$ for all $n$, then Lemma 35.14 .2 tells us that $E=R j_{*}\left(\left.E\right|_{X \backslash T}\right)=0$. Hence $K$ generates $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$, (by our definition of generators of triangulated categories in Derived Categories, Definition 13.33.2).
Assume that $X=U \cup V$ is an open covering with $U$ quasi-compact such that the lemma holds for $U$ and $V$ is an affine open. Let $P$ be a perfect object of $D\left(\mathcal{O}_{U}\right)$ supported on $T \cap U$ which is a generator for $D_{Q C o h, T \cap U}\left(\mathcal{O}_{U}\right)$. Using Lemma 35.12.9 we may choose a perfect object $Q$ of $D\left(\mathcal{O}_{X}\right)$ supported on $T$ whose restriction to $U$

Rou08, Theorem 6.8]
is a direct sum one of whose summands is $P$. Write $V=\operatorname{Spec}(B)$. Let $Z=X \backslash U$. Then $Z$ is a closed subset of $V$ such that $V \backslash Z$ is quasi-compact. As $X$ is quasiseparated, it follows that $Z \cap T$ is a closed subset of $V$ such that $W=V \backslash(Z \cap T)$ is quasi-compact. Thus we can choose $g_{1}, \ldots, g_{s} \in B$ such that $Z \cap T=V\left(g_{1}, \ldots, g_{r}\right)$. Let $K \in D\left(\mathcal{O}_{V}\right)$ be the perfect object corresponding to the Koszul complex on $g_{1}, \ldots, g_{s}$ over $B$. Note that since $K$ is supported on $(Z \cap T) \subset V$ closed, the pushforward $K^{\prime}=R(V \rightarrow X)_{*} K$ is a perfect object of $D\left(\mathcal{O}_{X}\right)$ whose restriction to $V$ is $K$ (see Cohomology, Lemma 20.41.10). We claim that $Q \oplus K^{\prime}$ is a generator for $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$.
Let $E$ be an object of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ such that there are no nontrivial maps from any shift of $Q \oplus K^{\prime}$ into $E$. By Cohomology, Lemma 20.30.9 we have $K^{\prime}=R(V \rightarrow X)!K$ and hence

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(K^{\prime}[n], E\right)=\operatorname{Hom}_{D\left(\mathcal{O}_{V}\right)}\left(K[n],\left.E\right|_{V}\right)
$$

Thus by Lemma 35.14 .2 we have $\left.E\right|_{V}=\left.R j_{*} E\right|_{W}$ where $j: W \rightarrow V$ is the inclusion. Picture

Since $E$ is supported on $T$ we see that $\left.E\right|_{W}$ is supported on $T \cap W=T \cap U \cap V$ which is closed in $W$. We conclude that

$$
\left.E\right|_{V}=R j_{*}\left(\left.E\right|_{W}\right)=R j_{*}\left(R j_{*}^{\prime}\left(\left.E\right|_{U \cap V}\right)\right)=R j_{*}^{\prime \prime}\left(\left.E\right|_{U \cap V}\right)
$$

where the second equality is part (1) of Cohomology, Lemma 20.30.9. This implies that $E=\left.R(U \rightarrow X)_{*} E\right|_{U}$ (small detail omitted). If this is the case then

$$
\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(Q[n], E)=\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.Q\right|_{U}[n],\left.E\right|_{U}\right)
$$

which contains $\operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(P[n],\left.E\right|_{U}\right)$ as a direct summand. Thus by our choice of $P$ the vanishing of these groups implies that $\left.E\right|_{U}$ is zero. Whence $E$ is zero.

### 35.15. An example generator

0BQQ In this section we prove that the derived category of a projective scheme over a ring is generated by a vector bundle, in fact a direct sum of shifts of the structure sheaf.
The following lemma says that $\bigoplus_{n \geq 0} \mathcal{L}^{\otimes-n}$ is a generator if $\mathcal{L}$ is ample.
0BQR Lemma 35.15.1. Let $X$ be a scheme and $\mathcal{L}$ an ample invertible $\mathcal{O}_{X}$-module. If $K$ is a nonzero object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$, then for some $n \geq 0$ and $p \in \mathbf{Z}$ the cohomology group $H^{p}\left(X, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{L}^{\otimes n}\right)$ is nonzero.
Proof. Recall that as $X$ has an ample invertible sheaf, it is quasi-compact and separated (Properties, Definition 27.26.1 and Lemma 27.26.7). Thus we may apply Proposition 35.7 .5 and represent $K$ by a complex $\mathcal{F}^{\bullet}$ of quasi-coherent modules. Pick any $p$ such that $\mathcal{H}^{p}=\operatorname{Ker}\left(\mathcal{F}^{p} \rightarrow \mathcal{F}^{p+1}\right) / \operatorname{Im}\left(\mathcal{F}^{p-1} \rightarrow \mathcal{F}^{p}\right)$ is nonzero. Choose a point $x \in X$ such that the stalk $\mathcal{H}_{x}^{p}$ is nonzero. Choose an $n \geq 0$ and $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $X_{s}$ is an affine open neighbourhood of $x$. Choose $\tau \in \mathcal{H}^{p}\left(X_{s}\right)$ which maps to a nonzero element of the stalk $\mathcal{H}_{x}^{p}$; this is possible as $\mathcal{H}^{p}$ is quasi-coherent and $X_{s}$ is affine. Since taking sections over $X_{s}$ is an exact functor on quasi-coherent modules, we can find a section $\tau^{\prime} \in \mathcal{F}^{p}\left(X_{s}\right)$ mapping to zero in $\mathcal{F}^{p+1}\left(X_{s}\right)$ and
mapping to $\tau$ in $\mathcal{H}^{p}\left(X_{s}\right)$. By Properties, Lemma 27.17 .2 there exists an $m$ such that $\tau^{\prime} \otimes s^{\otimes m}$ is the image of a section $\tau^{\prime \prime} \in \Gamma\left(X, \mathcal{F}^{p} \otimes \mathcal{L}^{\otimes m n}\right)$. Applying the same lemma once more, we find $l \geq 0$ such that $\tau^{\prime \prime} \otimes s^{\otimes l}$ maps to zero in $\mathcal{F}^{p+1} \otimes \mathcal{L}^{\otimes(m+l) n}$. Then $\tau^{\prime \prime}$ gives a nonzero class in $H^{p}\left(X, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{L}^{(m+l) n}\right)$ as desired.

0BQS Lemma 35.15.2. Let $A$ be a ring. Let $X=\mathbf{P}_{A}^{n}$. For every $a \in \mathbf{Z}$ there exists an exact complex

$$
0 \rightarrow \mathcal{O}_{X}(a) \rightarrow \ldots \rightarrow \mathcal{O}_{X}(a+i)^{\oplus\binom{n+1}{i}} \rightarrow \ldots \rightarrow \mathcal{O}_{X}(a+n+1) \rightarrow 0
$$

of vectorbundles on $X$.
Proof. Recall that $\mathbf{P}_{A}^{n}$ is $\operatorname{Proj}\left(A\left[X_{0}, \ldots, X_{n}\right]\right)$, see Constructions, Definition 26.13.2, Consider the Koszul complex

$$
K_{\bullet}=K_{\bullet}\left(A\left[X_{0}, \ldots, X_{n}\right], X_{0}, \ldots, X_{n}\right)
$$

over $S=A\left[X_{0}, \ldots, X_{n}\right]$ on $X_{0}, \ldots, X_{n}$. Since $X_{0}, \ldots, X_{n}$ is clearly a regular sequence in the polynomial ring $S$, we see that (More on Algebra, Lemma 15.23.2) that the Koszul complex $K_{\bullet}$ is exact, except in degree 0 where the cohomology is $S /\left(X_{0}, \ldots, X_{n}\right)$. Note that $K_{\bullet}$ becomes a complex of graded modules if we put the generators of $K_{i}$ in degree $+i$. In other words an exact complex

$$
0 \rightarrow S(-n-1) \rightarrow \ldots \rightarrow S(-n-1+i)^{\oplus\binom{n}{i}} \rightarrow \ldots \rightarrow S \rightarrow S /\left(X_{0}, \ldots, X_{n}\right) \rightarrow 0
$$

Applying the exact functor ${ }^{\sim}$ functor of Constructions, Lemma 26.8.4 and using that the last term is in the kernel of this functor, we obtain the exact complex

$$
0 \rightarrow \mathcal{O}_{X}(-n-1) \rightarrow \ldots \rightarrow \mathcal{O}_{X}(-n-1+i)^{\oplus\binom{n+1}{i}} \rightarrow \ldots \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

Twisting by the invertible sheaves $\mathcal{O}_{X}(n+a)$ we get the exact complexes of the lemma.

0A9V Lemma 35.15.3. Let $A$ be a ring. Let $X=\mathbf{P}_{A}^{n}$. Then

$$
E=\mathcal{O}_{X} \oplus \mathcal{O}_{X}(-1) \oplus \ldots \oplus \mathcal{O}_{X}(-n)
$$

is a generator (Derived Categories, Definition 13.33.2) of $D_{Q C o h}(X)$.
Proof. Let $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Assume $\operatorname{Hom}(E, K[p])=0$ for all $p \in \mathbf{Z}$. We have to show that $K=0$. By Derived Categories, Lemma 13.33.3 we see that $\operatorname{Hom}\left(E^{\prime}, K[p]\right)$ is zero for all $E^{\prime} \in\langle E\rangle$ and $p \in \mathbf{Z}$. By Lemma 35.15.2 applied with $a=-n-1$ we see that $\mathcal{O}_{X}(-n-1) \in\langle E\rangle$ because it is quasi-isomorphic to a finite complex whose terms are finite direct sums of summands of $E$. Repeating the argument with $a=-n-2$ we see that $\mathcal{O}_{X}(-n-2) \in\langle E\rangle$. Arguing by induction we find that $\mathcal{O}_{X}(-m) \in\langle E\rangle$ for all $m \geq 0$. Since

$$
\operatorname{Hom}\left(\mathcal{O}_{X}(-m), K[p]\right)=H^{p}\left(X, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{O}_{X}(m)\right)=H^{p}\left(X, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{O}_{X}(1)^{\otimes m}\right)
$$

we conclude that $K=0$ by Lemma 35.15.1. (This also uses that $\mathcal{O}_{X}(1)$ is an ample invertible sheaf on $X$ which follows from Properties, Lemma 27.26.12.)

0BQT Remark 35.15.4. Let $f: X \rightarrow Y$ be a morphism of quasi-compact and quasiseparated schemes. Let $E \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ be a generator (see Theorem 35.14.3). Then the following are equivalent
(1) for $K \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we have $R f_{*} K=0$ if and only if $K=0$,
(2) $R f_{*}: D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ reflects isomorphisms, and
(3) $L f^{*} E$ is a generator for $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

The equivalence between (1) and (2) is a formal consequence of the fact that $R f_{*}$ : $D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ is an exact functor of triangulated categories. Similarly, the equivalence between (1) and (3) follows formally from the fact that $L f^{*}$ is the left adjoint to $R f_{*}$. These conditions hold if $f$ is affine (Lemma 35.5.1) or if $f$ is an open immersion, or if $f$ is a composition of such. We conclude that
(1) if $X$ is a quasi-affine scheme then $\mathcal{O}_{X}$ is a generator for $D_{Q C o h}\left(\mathcal{O}_{X}\right)$,
(2) if $X \subset \mathbf{P}_{A}^{n}$ is a quasi-compact locally closed subscheme, then $\mathcal{O}_{X} \oplus$ $\mathcal{O}_{X}(-1) \oplus \ldots \oplus \mathcal{O}_{X}(-n)$ is a generator for $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ by Lemma 35.15.3.

### 35.16. Compact and perfect objects

09M0 Let $X$ be a Noetherian scheme of finite dimension. By Cohomology, Proposition 20.21 .6 and Cohomology on Sites, Lemma 21.40 .4 the sheaves of modules $j_{!} \mathcal{O}_{U}$ are compact objects of $D\left(\mathcal{O}_{X}\right)$ for all opens $U \subset X$. These sheaves are typically not quasi-coherent, hence these do not give perfect object of the derived category $D\left(\mathcal{O}_{X}\right)$. However, if we restrict ourselves to complexes with quasi-coherent cohomology sheaves, then this does not happen. Here is the precise statement.

09M1 Proposition 35.16.1. Let $X$ be a quasi-compact and quasi-separated scheme. An object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is compact if and only if it is perfect.
Proof. By Cohomology, Lemma 20.42.1 the perfect objects define compact objects of $D\left(\mathcal{O}_{X}\right)$. Conversely, let $K$ be a compact object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. To show that $K$ is perfect, it suffices to show that $\left.K\right|_{U}$ is perfect for every affine open $U \subset X$, see Cohomology, Lemma 20.41.2 Observe that $j: U \rightarrow X$ is a quasi-compact and separated morphism. Hence $R j_{*}: D_{Q C o h}\left(\mathcal{O}_{U}\right) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$ commutes with direct sums, see Lemma 35.4.2. Thus the adjointness of restriction to $U$ and $R j_{*}$ implies that $\left.K\right|_{U}$ is a compact object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$. Hence we reduce to the case that $X$ is affine.

Assume $X=\operatorname{Spec}(A)$ is affine. By Lemma 35.3 .5 the problem is translated into the same problem for $D(A)$. For $D(A)$ the result is More on Algebra, Proposition 15.64 .3

The following result is a strengthening of Proposition 35.16.1. Let $T \subset X$ be a closed subset of a scheme $X$. As before $D_{T}\left(\mathcal{O}_{X}\right)$ denotes the the strictly full, saturated, triangulated subcategory consisting of complexes whose cohomology sheaves are supported on $T$. Since taking direct sums commutes with taking cohomology sheaves, it follows that $D_{T}\left(\mathcal{O}_{X}\right)$ has direct sums and that they are equal to direct sums in $D\left(\mathcal{O}_{X}\right)$.

0A9B Lemma 35.16.2. Let $X$ be a quasi-compact and quasi-separated scheme. Let $T \subset$ $X$ be a closed subset such that $X \backslash T$ is quasi-compact. An object of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ is compact if and only if it is perfect as an object of $D\left(\mathcal{O}_{X}\right)$.

Proof. We observe that $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ is a triangulated category with direct sums by the remark preceding the lemma. By Cohomology, Lemma 20.42.1 the perfect objects define compact objects of $D\left(\mathcal{O}_{X}\right)$ hence a fortiori of any subcategory preserved under taking direct sums. For the converse we will use there exists a generator $E \in D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$ which is a perfect complex of $\mathcal{O}_{X}$-modules, see Lemma 35.14.4. Hence by the above, $E$ is compact. Then it follows from Derived Categories, Proposition 13.34 .6 that $E$ is a classical generator of the full subcategory
of compact objects of $D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$. Thus any compact object can be constructed out of $E$ by a finite sequence of operations consisting of (a) taking shifts, (b) taking finite direct sums, (c) taking cones, and (d) taking direct summands. Each of these operations preserves the property of being perfect and the result follows.

The following lemma is an application of the ideas that go into the proof of the preceding lemma.

0A9C Lemma 35.16.3. Let $X$ be a quasi-compact and quasi-separated scheme. Let $T \subset X$ be a closed subset such that $U=X \backslash T$ is quasi-compact. Let $\alpha: P \rightarrow E$ be a morphism of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ with either
(1) $P$ is perfect and $E$ supported on $T$, or
(2) $P$ pseudo-coherent, $E$ supported on $T$, and $E$ bounded below.

Then there exists a perfect complex of $\mathcal{O}_{X}$-modules $I$ and a map $I \rightarrow \mathcal{O}_{X}[0]$ such that $I \otimes^{\mathbf{L}} P \rightarrow E$ is zero and such that $\left.I\right|_{U} \rightarrow \mathcal{O}_{U}[0]$ is an isomorphism.

Proof. Set $\mathcal{D}=D_{Q C o h, T}\left(\mathcal{O}_{X}\right)$. In both cases the complex $K=R \mathcal{H o m}(P, E)$ is an object of $\mathcal{D}$. See Lemma 35.10 .8 for quasi-coherence. It is clear that $K$ is supported on $T$ as formation of $R$ Hom commutes with restriction to opens. The map $\alpha$ defines an element of $H^{0}(K)=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}\left(\mathcal{O}_{X}[0], K\right)$. Then it suffices to prove the result for the map $\alpha: \mathcal{O}_{X}[0] \rightarrow K$.

Let $E \in \mathcal{D}$ be a perfect generator, see Lemma 35.14.4. Write

$$
K=\operatorname{hocolim} K_{n}
$$

as in Derived Categories, Lemma 13.34 .3 using the generator $E$. Since the functor $\mathcal{D} \rightarrow D\left(\mathcal{O}_{X}\right)$ commutes with direct sums, we see that $K=\operatorname{hocolim} K_{n}$ also in $D\left(\mathcal{O}_{X}\right)$. Since $\mathcal{O}_{X}$ is a compact object of $D\left(\mathcal{O}_{X}\right)$ we find an $n$ and a morphism $\alpha_{n}: \mathcal{O}_{X} \rightarrow K_{n}$ which gives rise to $\alpha$. By Derived Categories, Lemma 13.34.4 applied to the morphism $\mathcal{O}_{X}[0] \rightarrow K_{n}$ in the ambient category $D\left(\mathcal{O}_{X}\right)$ we see that $\alpha_{n}$ factors as $\mathcal{O}_{X}[0] \rightarrow Q \rightarrow K_{n}$ where $Q$ is an object of $\langle E\rangle$. We conclude that $Q$ is a perfect complex supported on $T$.

Choose a distinguished triangle

$$
I \rightarrow \mathcal{O}_{X}[0] \rightarrow Q \rightarrow I[1]
$$

By construction $I$ is perfect, the map $I \rightarrow \mathcal{O}_{X}[0]$ restricts to an isomorphism over $U$, and the composition $I \rightarrow K$ is zero as $\alpha$ factors through $Q$. This proves the lemma.

### 35.17. Derived categories as module categories

09M2 In this section we draw some conclusions of what has gone before. Before we do so we need a couple more lemmas.

09M3 Lemma 35.17.1. Let $X$ be a scheme. Let $K^{\bullet}$ be a complex of $\mathcal{O}_{X}$-modules whose cohomology sheaves are quasi-coherent. Let $(E, d)=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(K^{\bullet}, K^{\bullet}\right)$ be the endomorphism differential graded algebra. Then the functor

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, d) \longrightarrow D\left(\mathcal{O}_{X}\right)
$$

of Differential Graded Algebra, Lemma 22.25.3 has image contained in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$.

Proof. Let $P$ be a differential graded $E$-module with property (P) and let $F_{\bullet}$ be a filtration on $P$ as in Differential Graded Algebra, Section 22.13. Then we have

$$
P \otimes_{E} K^{\bullet}=\operatorname{hocolim} F_{i} P \otimes_{E} K^{\bullet}
$$

Each of the $F_{i} P$ has a finite filtration whose graded pieces are direct sums of $E[k]$. The result follows easily.

The following lemma can be strengthened (there is a uniformity in the vanishing over all $L$ with nonzero cohomology sheaves only in a fixed range).

09M4 Lemma 35.17.2. Let $X$ be a quasi-compact and quasi-separated scheme. Let $K$, $L$ be objects of $D\left(\mathcal{O}_{X}\right)$ with $K$ perfect and $L$ in $D_{Q C o h}^{b}\left(\mathcal{O}_{X}\right)$. Then Ext $D_{D\left(\mathcal{O}_{X}\right)}^{n}(K, L)$ is nonzero for only a finite number of $n$.

Proof. Since $K$ is perfect we have

$$
\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{i}(K, L)=H^{i}\left(X, K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)
$$

where $K^{\vee}$ is the "dual" perfect complex to $K$, see Cohomology, Lemma 20.41.11. Note that $P=K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L$ is in $D_{Q C o h}(X)$ by Lemmas 35.3.8 and 35.10.1 (to see that a perfect complex has quasi-coherent cohomology sheaves). On the other hand, the spectral sequence

$$
E_{1}^{p, q}=H^{p}\left(K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} H^{q}(L)\right) \Rightarrow H^{p+q}\left(K^{\vee} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L\right)=H^{p+q}(P)
$$

the boundedness of $L$, and the finite tor amplitude of $K^{\vee}$ show that $P$ has only finitely many nonzero cohomology sheaves. It follows that $H^{n}(X, P)=0$ for $n \ll 0$. But also $H^{n}(X, P)=0$ for $n \gg 0$ by Cohomology of Schemes, Lemma 29.4.4 and the spectral sequence expressing $H^{n}\left(X, P^{\bullet}\right)$ in terms of $H^{p}\left(X, H^{q}\left(P^{\bullet}\right)\right)$ using that the cohomology sheaves of $P$ are quasi-coherent.

The following result is taken from BV03.
09M5 Theorem 35.17.3. Let $X$ be a quasi-compact and quasi-separated scheme. Then there exist a differential graded algebra $(E, d)$ with only a finite number of nonzero cohomology groups $H^{i}(E)$ such that $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is equivalent to $D(E, d)$.

Proof. Let $K^{\bullet}$ be a K-injective complex of $\mathcal{O}$-modules which is perfect and generates $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Such a thing exists by Theorem 35.14 .3 and the existence of K-injective resolutions. We will show the theorem holds with

$$
(E, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(K^{\bullet}, K^{\bullet}\right)
$$

where Comp ${ }^{d g}\left(\mathcal{O}_{X}\right)$ is the differential graded category of complexes of $\mathcal{O}$-modules. Please see Differential Graded Algebra, Section 22.25 Since $K^{\bullet}$ is K-injective we have

$$
\begin{equation*}
H^{n}(E)=\operatorname{Ext}_{D\left(\mathcal{O}_{X}\right)}^{n}\left(K^{\bullet}, K^{\bullet}\right) \tag{35.17.3.1}
\end{equation*}
$$

for all $n \in \mathbf{Z}$. Only a finite number of these Exts are nonzero by Lemma 35.17.2, Consider the functor

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, \mathrm{~d}) \longrightarrow D\left(\mathcal{O}_{X}\right)
$$

of Differential Graded Algebra, Lemma 22.25.3. Since $K^{\bullet}$ is perfect, it defines a compact object of $D\left(\mathcal{O}_{X}\right)$, see Proposition 35.16.1 Combined with 35.17.3.1 the
functor above is fully faithful as follows from Differential Graded Algebra, Lemmas 22.25.5. It has a right adjoint

$$
R \operatorname{Hom}\left(K^{\bullet},-\right): D\left(\mathcal{O}_{X}\right) \longrightarrow D(E, \mathrm{~d})
$$

by Differential Graded Algebra, Lemmas 22.25 .4 which is a left quasi-inverse functor by generalities on adjoint functors. On the other hand, it follows from Lemma 35.17.1 that we obtain

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, \mathrm{~d}) \longrightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)
$$

and by our choice of $K^{\bullet}$ as a generator of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ the kernel of the adjoint restricted to $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is zero. A formal argument shows that we obtain the desired equivalence, see Derived Categories, Lemma 13.7.2,

09SU Remark 35.17.4. Let $X$ be a quasi-compact and quasi-separated scheme over a ring $R$. By the construction of the proof of Theorem 35.17 .3 there exists a differential graded algebra ( $A, \mathrm{~d}$ ) over $R$ such that $D_{Q C o h}(X)$ is $R$-linearly equivalent to $D(A, \mathrm{~d})$ as a triangulated category. One may ask: how unique is $(A, \mathrm{~d})$ ? The answer is (only) slightly better than just saying that $(A, \mathrm{~d})$ is well defined up to derived equivalence. Namely, suppose that $(B, \mathrm{~d})$ is a second such pair. Then we have

$$
(A, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(K^{\bullet}, K^{\bullet}\right)
$$

and

$$
(B, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(L^{\bullet}, L^{\bullet}\right)
$$

for some K-injective complexes $K^{\bullet}$ and $L^{\bullet}$ of $\mathcal{O}_{X}$-modules corresponding to perfect generators of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Set

$$
\Omega=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(K^{\bullet}, L^{\bullet}\right) \quad \Omega^{\prime}=\operatorname{Hom}_{\operatorname{Comp}^{d g}\left(\mathcal{O}_{X}\right)}\left(L^{\bullet}, K^{\bullet}\right)
$$

Then $\Omega$ is a differential graded $B^{o p p} \otimes_{R} A$-module and $\Omega^{\prime}$ is a differential graded $A^{o p p} \otimes_{R} B$-module. Moreover, the equivalence

$$
D(A, \mathrm{~d}) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right) \rightarrow D(B, \mathrm{~d})
$$

is given by the functor $-\otimes_{A}^{\mathbf{L}} \Omega^{\prime}$ and similarly for the quasi-inverse. Thus we are in the situation of Differential Graded Algebra, Remark 22.27.10. If we ever need this remark we will provide a precise statement with a detailed proof here.

0BQU Example 35.17.5. Let $A$ be a ring. Let $X=\mathbf{P}_{A}^{n}=\operatorname{Proj}(S)$ where $S=$ $A\left[X_{0}, \ldots, X_{n}\right]$. By Lemma 35.15 .3 we know that

$$
P=\mathcal{O}_{X} \oplus \mathcal{O}_{X}(-1) \oplus \ldots \oplus \mathcal{O}_{X}(-n)
$$

is a perfect generator of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Thus we can apply the arguments in the proof of Theorem 35.17 .3 to $P$. This produces a differential graded $A$-algebra $(E, d)$ such that $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is equivalent ot $D(E, d)$ and such that

$$
H^{i}(E)=\operatorname{Ext}_{X}^{i}(P, P)
$$

for all $i \in \mathbf{Z}$. As in the proof of Lemma 35.17 .2 we see that

$$
\operatorname{Ext}_{X}^{i}(P, P)=H^{i}\left(X, P^{\wedge} \otimes P\right)=\bigoplus_{0 \leq a, b \leq n} H^{i}\left(X, \mathcal{O}_{X}(a-b)\right)
$$

By the computation of cohomology of projective space (Cohomology of Schemes, Lemma 29.8.1 we find that these Ext-groups are zero unless $i=0$. For $i=0$ we get the (noncommutative) $A$-algebra

$$
R=\operatorname{Hom}_{D\left(\mathcal{O}_{X}\right)}(P, P)=\left(\begin{array}{ccccc}
S_{0} & S_{1} & S_{2} & \ldots & \ldots \\
0 & S_{0} & S_{1} & \ldots & \ldots \\
0 & 0 & S_{0} & \ldots & \ldots \\
\ldots & \ldots & \ldots & \ldots & \ldots \\
0 & \ldots & \ldots & \ldots & S_{0}
\end{array}\right)
$$

with obvious multiplication and addition. By Differential Graded Algebra, Lemma 22.27 .4 we find that $D(R)$ is equivalent to $D(E, d)$ as an $A$-linear triangulated category and hence that

$$
D_{Q C o h}\left(\mathcal{O}_{X}\right) \cong D(R)
$$

In words: the derived category of quasi-coherent modules on projective space is equivalent to the derived category of modules over a (noncommutative) algebra. This property of projective space appears to be quite unusual among all projective schemes over $A$.

### 35.18. Cohomology and base change, IV

08 ET This section continues the discussion of Cohomology of Schemes, Section 29.21 . First, we have a very general version of the projection formula for quasi-compact and quasi-separated morphisms of schemes and complexes with quasi-coherent cohomology sheaves.

08EU Lemma 35.18.1. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of schemes. For $E$ in $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ and $K$ in $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ the map

$$
R f_{*}(E) \otimes_{\mathcal{O}_{Y}}^{\mathbf{L}} K \longrightarrow R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} K\right)
$$

defined in Cohomology, Equation 20.43.2.1) is an isomorphism.
Proof. To check the map is an isomorphism we may work locally on $Y$. Hence we reduce to the case that $Y$ is affine.

Suppose that $K=\bigoplus K_{i}$ is a direct sum of some complexes $K_{i} \in D_{Q C o h}\left(\mathcal{O}_{Y}\right)$. If the statement holds for each $K_{i}$, then it holds for $K$. Namely, the functors $L f^{*}$ and $\otimes^{\mathbf{L}}$ preserve direct sums by construction and $R f_{*}$ commutes with direct sums (for complexes with quasi-coherent cohomology sheaves) by Lemma 35.4.2. Moreover, suppose that $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle in $D_{Q C o h}(Y)$. Then if the statement of the lemma holds for two of $K, L, M$, then it holds for the third (as the functors involved are exact functors of triangulated categories).
Assume $Y$ affine, say $Y=\operatorname{Spec}(A)$. The functor ${ }^{\sim}: D(A) \rightarrow D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ is an equivalence (Lemma 35.3.5). Let $T$ be the property for $K \in D(A)$ that the statement of the lemma holds for $\widetilde{K}$. The discussion above and More on Algebra, Remark 15.49 .11 shows that it suffices to prove $T$ holds for $A[k]$. This finishes the proof, as the statement of the lemma is clear for shifts of the structure sheaf.

08IA Definition 35.18.2. Let $S$ be a scheme. Let $X, Y$ be schemes over $S$. We say $X$ and $Y$ are Tor independent over $S$ if for every $x \in X$ and $y \in Y$ mapping to the same point $s \in S$ the rings $\mathcal{O}_{X, x}$ and $\mathcal{O}_{Y, y}$ are Tor independent over $\mathcal{O}_{S, s}$ (see More on Algebra, Definition 15.51.1.

08IB Lemma 35.18.3. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Let $f: X \rightarrow S$ be quasi-compact and quasi-separated. Consider the base change diagram

If $X$ and $S^{\prime}$ are Tor independent over $S$, then for all $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$ we have $R f_{*}^{\prime} L h^{*} E=L g^{*} R f_{*} E$.

Proof. For any object $E$ of $D\left(\mathcal{O}_{X}\right)$ we can use Cohomology, Remark 20.29 .2 to get a canonical base change map $L g^{*} R f_{*} E \rightarrow R f_{*}^{\prime} L h^{*} E$. To check this is an isomorphism we may work locally on $S^{\prime}$. Hence we may assume $g: S^{\prime} \rightarrow S$ is a morphism of affine schemes. In particular, $g$ is affine and it suffices to show that

$$
R g_{*} L g^{*} R f_{*} E \rightarrow R g_{*} R f_{*}^{\prime} L h^{*} E=R f_{*}\left(R h_{*} L h^{*} E\right)
$$

is an isomorphism, see Lemma 35.5.1 (and use Lemmas 35.3.7, 35.3.8, and 35.4.1 to see that the objects $R f_{*}^{\prime} L h^{*} E$ and $L g^{*} R f_{*} E$ have quasi-coherent cohomology sheaves). Note that $h$ is affine as well (Morphisms, Lemma 28.12.8). By Lemma 35.5.2 the map becomes a map

$$
R f_{*} E \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} g_{*} \mathcal{O}_{S^{\prime}} \longrightarrow R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} h_{*} \mathcal{O}_{X^{\prime}}\right)
$$

Observe that $h_{*} \mathcal{O}_{X^{\prime}}=f^{*} g_{*} \mathcal{O}_{S^{\prime}}$. Thus by Lemma 35.18.1 it suffices to prove that $L f^{*} g_{*} \mathcal{O}_{S^{\prime}}=f^{*} g_{*} \mathcal{O}_{S^{\prime}}$. This follows from our assumption that $X$ and $S^{\prime}$ are Tor independent over $S$. Namely, to check it we may work locally on $X$, hence we may also assume $X$ is affine. Say $X=\operatorname{Spec}(A), S=\operatorname{Spec}(R)$ and $S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$. Our assumption implies that $A$ and $R^{\prime}$ are Tor independent over $R$ (More on Algebra, Lemma 15.51.4, i.e., $\operatorname{Tor}_{i}^{R}\left(A, R^{\prime}\right)=0$ for $i>0$. In other words $A \otimes_{R}^{\mathbf{L}} R^{\prime}=A \otimes_{R} R^{\prime}$ which exactly means that $L f^{*} g_{*} \mathcal{O}_{S^{\prime}}=f^{*} g_{*} \mathcal{O}_{S^{\prime}}$ (use Lemma 35.3.7).

The following two lemmas remain true if we replace $\mathcal{G}$ with a bounded complex of quasi-coherent $\mathcal{O}_{X}$-modules each flat over $S$.

0A1D Lemma 35.18.4. Let $f: X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $E \in D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{X}$-module flat over $S$. Then formation of

$$
R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)
$$

commutes with arbitrary base change (see proof for precise statement).
Proof. The statement means the following. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes and consider the base change diagram

in other words $X^{\prime}=S^{\prime} \times_{S} X$. Set $E^{\prime}=L h^{*} E$ and $\mathcal{G}^{\prime}=h^{*} \mathcal{G}$ (here we do not use the derived pullback). The lemma asserts that we have

$$
L g^{*} R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)=R f_{*}^{\prime}\left(E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} \mathcal{G}^{\prime}\right)
$$

To prove this, note that in Cohomology, Remark 20.29 .2 we have constructed an arrow

$$
L g^{*} R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right) \longrightarrow R\left(f^{\prime}\right)_{*}\left(L h^{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)\right)=R\left(f^{\prime}\right)_{*}\left(E^{\prime} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L h^{*} \mathcal{G}\right)
$$

which we can compose with the $\operatorname{map} L h^{*} \mathcal{G} \rightarrow h^{*} \mathcal{G}$ to get a canonical map

$$
L g^{*} R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right) \longrightarrow R f_{*}^{\prime}\left(E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} \mathcal{G}^{\prime}\right)
$$

To check this map is an isomorphism we may work locally on $S^{\prime}$. Hence we may assume $g: S^{\prime} \rightarrow S$ is a morphism of affine schemes. In this case, we will use the induction principle to prove this map is always an isomorphism for any quasicompact and quasi-separated $X$ over $S$ (Cohomology of Schemes, Lemma 29.4.1.
Suppose $X=\operatorname{Spec}(A)$ is affine. The functor ${ }^{\sim}: D(A) \rightarrow D_{Q C o h}\left(\mathcal{O}_{X}\right)$ is an equivalence (Lemma 35.3.5). Let $T$ be the property for $K \in D(A)$ that the canonical arrow above is an isomorphism for $E=\widetilde{K}$. If we have $T\left(K_{i}\right)$ for a family of objects $K_{i}$, then we have $T\left(\bigoplus K_{i}\right)$. Namely, derived tensor product and derived pullback commute with direct sums and the same holds for total direct image in this case by Lemma 35.4.2. Moreover, if $T$ holds for two out of three objects of a distinguished triangle, then it holds for the third (Derived Categories, Lemma 13.4.3). By More on Algebra, Remark 15.49.11 this shows that it suffices to prove $T$ holds for $A[k]$. This reduces us to the case $E=\mathcal{O}_{X}$. In this case we are saying that $L g^{*} f_{*} \mathcal{G}=g^{*} f_{*} \mathcal{G}$ (by flatness of $\mathcal{G}$ over $S$ ) equals $f_{*}^{\prime} h^{*} \mathcal{G}$ which holds by Cohomology of Schemes, Lemma 29.5.1.

The induction step. Suppose that $X=U \cup V$ is an open covering with $U, V$, $U \cap V$ quasi-compact such that the result holds for the restriction of $E$ and $\mathcal{G}$ to $U, V$, and $U \cap V$. Denote $a=\left.f\right|_{U}, b=\left.f\right|_{V}$ and $c=\left.f\right|_{U \cap V}$. Let $a^{\prime}: U^{\prime} \rightarrow S^{\prime}$, $b^{\prime}: V^{\prime} \rightarrow S^{\prime}$ and $c^{\prime}: U^{\prime} \cap V^{\prime} \rightarrow S^{\prime}$ be the base changes of $a, b$, and $c$. Note that formation of $-\otimes^{\mathbf{L}}$ - commutes with restriction to opens. Set $H=E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$ and $H^{\prime}=E^{\prime} \otimes_{\mathcal{O}_{X^{\prime}}}^{\mathbf{L}} \mathcal{G}^{\prime}$. Using the distinguished triangles from relative Mayer-Vietoris (Cohomology, Lemma 20.30.8) we obtain a commutative diagram

Since the 2nd and 3rd horizontal arrows are isomorphisms so is the first (Derived Categories, Lemma 13.4.3 and the proof of the lemma is finished.

08IE Lemma 35.18.5. Let $f: X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{X}$-module flat over $S$. Then formation of

$$
R f_{*} R \mathcal{H o m}(E, \mathcal{G})
$$

commutes with arbitrary base change (see proof for precise statement).
Proof. The statement means the following. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes and consider the base change diagram

in other words $X^{\prime}=S^{\prime} \times_{S} X$. Set $E^{\prime}=L h^{*} E$ and $\mathcal{G}^{\prime}=h^{*} \mathcal{G}$ (here we do not use the derived pullback). The lemma asserts that we have

$$
L g^{*} R f_{*} R \mathcal{H o m}(E, \mathcal{G})=R f_{*}^{\prime} R \mathcal{H o m}\left(E^{\prime}, \mathcal{G}^{\prime}\right)
$$

To prove this, note that in Cohomology, Remark 20.35.11 we have constructed an arrow

$$
L g^{*} R f_{*} R \mathcal{H o m}(E, \mathcal{G}) \longrightarrow R\left(f^{\prime}\right)_{*} R \mathcal{H o m}\left(L h^{*} E, L h^{*} \mathcal{G}\right)
$$

which we can compose with the map $L h^{*} \mathcal{G} \rightarrow h^{*} \mathcal{G}$ to get a canonical map

$$
L g^{*} R f_{*} R \mathcal{H o m}(E, \mathcal{G}) \rightarrow R f_{*}^{\prime} R \mathcal{H o m}\left(E^{\prime}, \mathcal{G}^{\prime}\right)
$$

With these preliminaries out of the way, we deduce the result from Lemma 35.18.4. Namely, since $E$ is a perfect complex there exists a dual perfect complex $E_{d u a l}$, see Cohomology, Lemma 20.41.11, such that $R \mathcal{H o m}(E, \mathcal{G})=E_{\text {dual }} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$. We omit the verification that the base change map of Lemma 35.18 .4 for $E_{\text {dual }}$ agrees with the base change map for $E$ constructed above.
The following lemma will be used in the chapter on dualizing complexes.
0AA7 Lemma 35.18.6. Consider a cartesian square

of quasi-compact and quasi-separated schemes with $g$ and $f$ Tor independent. Assume $S=\operatorname{Spec}(R)$ and $S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$ affine. We have

$$
R \operatorname{Hom}\left(M, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} g_{*}^{\prime} \mathcal{O}_{X^{\prime}}\right)=R \operatorname{Hom}(M, K) \otimes_{R}^{\mathbf{L}} R^{\prime}
$$

(see Cohomology, Section 20.37 for notation) in the following two cases
(1) $M \in D\left(\mathcal{O}_{X}\right)$ is perfect and $K \in D_{Q C o h}(X)$, or
(2) $M \in D\left(\mathcal{O}_{X}\right)$ is pseudo-coherent, $K \in D_{Q C o h}^{+}(X)$, and $R^{\prime}$ has finite tor dimension over $R$.

Proof. Proof in case (1). The complex $R \mathcal{H} \operatorname{Hom}(M, K)$ is an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ by Lemma 35.10.8. There is a natural map

$$
R \mathcal{H o m}(M, K) \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} g_{*}^{\prime} \mathcal{O}_{X^{\prime}} \longrightarrow R \mathcal{H} \operatorname{lom}\left(M, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} g_{*}^{\prime} \mathcal{O}_{X^{\prime}}\right)
$$

which is an isomorphism, see Lemma 35.10.9. Hence, by replacing $K$ by $R \mathcal{H o m}(M, K)$ we reduce to proving

$$
R \Gamma\left(X, K \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} g_{*}^{\prime} \mathcal{O}_{X^{\prime}}\right)=R \Gamma(X, K) \otimes_{A}^{\mathbf{L}} A^{\prime}
$$

Note that the left hand side is equal to $R \Gamma\left(X^{\prime}, L\left(g^{\prime}\right)^{*} K\right)$ by Lemma 35.5.2. Hence the result follows from Lemma 35.18.3.

Proof in case (2). The exact same argument works; the only change is that we have to verify that Lemma 35.10 .9 applies. We have $g_{*}^{\prime} \mathcal{O}_{X^{\prime}}=R g_{*}^{\prime} \mathcal{O}_{X^{\prime}}=L f^{*} g_{*} \mathcal{O}_{X}$ the second equality by Lemma 35.18.3. Using Lemma 35.10.5 and Cohomology, Lemma 20.40.4 we conclude that $g_{*}^{\prime} \mathcal{O}_{X^{\prime}}$ has finite Tor dimension as desired.

### 35.19. Producing perfect complexes

0A1E The following lemma is our main technical tool for producing perfect complexes. Later versions of this result will reduce to this by Noetherian approximation, see Section 35.22 .

08EV Lemma 35.19.1. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D\left(\mathcal{O}_{X}\right)$ such that
(1) $E \in D_{C o h}^{b}\left(\mathcal{O}_{X}\right)$,
(2) the scheme theoretic support of $H^{i}(E)$ is proper over $S$ for all $i$,
(3) $E$ has finite tor dimension as an object of $D\left(f^{-1} \mathcal{O}_{S}\right)$.

Then $R f_{*} E$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$.
Proof. By Lemma 35.6 .1 we see that $R f_{*} E$ is an object of $D_{C o h}^{b}\left(\mathcal{O}_{S}\right)$. Hence $R f_{*} E$ is pseudo-coherent (Lemma 35.10.4). Hence it suffices to show that $R f_{*} E$ has finite tor dimension, see Cohomology, Lemma 20.41.5. By Lemma 35.10 .6 it suffices to check that $R f_{*}(E) \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}$ has universally bounded cohomology for all quasi-coherent sheaves $\mathcal{F}$ on $S$. Bounded from above is clear as $R f_{*}(E)$ is bounded from above. Let $T \subset X$ be the union of the supports of $H^{i}(E)$ for all $i$. Then $T$ is proper over $S$ by assumptions (1) and (2). In particular there exists a quasi-compact open $X^{\prime} \subset X$ containing $T$. Setting $f^{\prime}=\left.f\right|_{X^{\prime}}$ we have $R f_{*}(E)=R f_{*}^{\prime}\left(\left.E\right|_{X^{\prime}}\right)$ because $E$ restricts to zero on $X \backslash T$. Thus we may replace $X$ by $X^{\prime}$ and assume $f$ is quasi-compact. Moreover, $f$ is quasi-separated by Morphisms, Lemma 28.15.7. Now

$$
R f_{*}(E) \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}\right)=R f_{*}\left(E \otimes_{f^{-1} \mathcal{O}_{S}}^{\mathbf{L}} f^{-1} \mathcal{F}\right)
$$

by Lemma 35.18 .1 and Cohomology, Lemma 20.28.3. By assumption (3) the complex $E \otimes_{f^{-1} \mathcal{O}_{S}}^{\mathbf{L}} f^{-1} \mathcal{F}$ has cohomology sheaves in a given finite range, say $[a, b]$. Then $R f_{*}$ of it has cohomology in the range $[a, \infty)$ and we win.

We will generalize the following lemma to flat and proper morphisms over general bases in Lemma 35.22 .2 and to perfect proper morphisms in More on Morphisms, Lemma 36.43.12

0B6F Lemma 35.19.2. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a flat proper morphism of schemes. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Then $R f_{*} E$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$.

Proof. We claim that Lemma 35.19.1 applies. Conditions (1) and (2) are immediate. Condition (3) is local on $X$. Thus we may assume $X$ and $S$ affine and $E$ represented by a strictly perfect complex of $\mathcal{O}_{X}$-modules. Since $\mathcal{O}_{X}$ is flat as a sheaf of $f^{-1} \mathcal{O}_{S^{-} \text {-modules we find that condition (3) is satisfied. }}^{\text {(3) }}$.

### 35.20. Cohomology, Ext groups, and base change

08IC The results in this section will be used to verify one of Artin's criteria for Quot functors, Hilbert schemes, and other moduli problems.

0A1F Lemma 35.20.1. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}$-module flat over $S$ with scheme theoretic support proper over $S$. Then $K=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$ and there are functorial isomorphisms

$$
H^{i}\left(S, K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}\right) \longrightarrow H^{i}\left(X, E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)\right)
$$

for $\mathcal{F}$ quasi-coherent on $S$ compatible with boundary maps (see proof).
Proof. We have

$$
\mathcal{G} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}=\mathcal{G} \otimes_{f^{-1} \mathcal{O}_{S}}^{\mathbf{L}} f^{-1} \mathcal{F}=\mathcal{G} \otimes_{f^{-1} \mathcal{O}_{S}} f^{-1} \mathcal{F}=\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{* \mathcal{F}}
$$

the first equality by Cohomology, Lemma 20.28.3, the second as $\mathcal{G}$ is a flat $f^{-1} \mathcal{O}_{S^{-}}$ module, and the third by definition of pullbacks. Hence we obtain

$$
\begin{aligned}
H^{i}\left(X, E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)\right) & =H^{i}\left(X, E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}\right) \\
& =H^{i}\left(S, R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} L f^{*} \mathcal{F}\right)\right) \\
& =H^{i}\left(S, R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right) \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}\right) \\
& =H^{i}\left(S, K \otimes_{\mathcal{O}_{S}}^{\mathbf{F}} \mathcal{F}\right)
\end{aligned}
$$

The first equality by the above, the second by Leray (Cohomology, Lemma 20.14.1), and the third equality by Lemma 35.18.1. The object $K$ is perfect by Lemma 35.19.1. We check the lemma applies: Locally $E$ is isomorphic to a finite complex of finite free $\mathcal{O}_{X}$-modules. Hence locally $E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$ is isomorphic to a finite complex whose terms are finite direct sums of copies $\mathcal{G}$. This immediately implies the hypotheses on the cohomology sheaves $H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)$. The hypothesis on the tor dimension also follows as $\mathcal{G}$ is flat over $f^{-1} \mathcal{O}_{S}$.

The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ of quasi-coherent $\mathcal{O}_{S}$-modules, the isomorphisms fit into commutative diagrams

where the boundary maps come from the distinguished triangle

$$
K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{1} \rightarrow K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{2} \rightarrow K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{3} \rightarrow K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{1}[1]
$$

and the distinguished triangle in $D\left(\mathcal{O}_{X}\right)$ associated to the short exact sequence

$$
0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{1} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{2} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{3} \rightarrow 0
$$

This sequence is exact because $\mathcal{G}$ is flat over $S$. We omit the verification of the commutativity of the displayed diagram.

08ID Lemma 35.20.2. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}$-module flat over $S$ with scheme theoretic support proper over $S$.

Then $K=R f_{*} R \mathcal{H o m}(E, \mathcal{G})$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$ and there are functorial isomorphisms

$$
H^{i}\left(S, K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}\right) \longrightarrow E x t_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{* \mathcal{F})}\right.
$$

for $\mathcal{F}$ quasi-coherent on $S$ compatible with boundary maps (see proof).
Proof. Since $E$ is a perfect complex there exists a dual perfect complex $E_{d u a l}$, see Cohomology, Lemma 20.41.11. Observe that $\operatorname{RHom}(E, \mathcal{G})=E_{d u a l} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}$ and that

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)=H^{i}\left(X, E_{\text {dual }} \otimes_{\mathcal{O}_{X}}^{\mathbf{L}}\left(\mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)\right)
$$

by construction of $E_{\text {dual }}$. Thus the perfectness of $K$ and the isomorphisms follow from the corresponding results of Lemma 35.20 .1 applied to $E_{d u a l}$ and $\mathcal{G}$.
The statement on boundary maps means the following: Given a short exact sequence $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ then the isomorphisms fit into commutative diagrams

where the boundary maps come from the distinguished triangle

$$
K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{1} \rightarrow K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{2} \rightarrow K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{3} \rightarrow K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}_{1}[1]
$$

and the distinguished triangle in $D\left(\mathcal{O}_{X}\right)$ associated to the short exact sequence

$$
0 \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{1} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{2} \rightarrow \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}_{3} \rightarrow 0
$$

This sequence is exact because $\mathcal{G}$ is flat over $S$. We omit the verification of the commutativity of the displayed diagram.

08IF Lemma 35.20.3. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E \in D\left(\mathcal{O}_{X}\right)$ and $\mathcal{G}$ an $\mathcal{O}_{X}$-module. Assume
(1) $E \in D_{C o h}^{-}\left(\mathcal{O}_{X}\right)$, and
(2) $\mathcal{G}$ is a coherent $\mathcal{O}_{X}$-module flat over $S$ with scheme theoretic support is proper over $S$.
Then for every $m \in \mathbf{Z}$ there exists a perfect object $K$ of $D\left(\mathcal{O}_{S}\right)$ and functorial maps

$$
\alpha_{\mathcal{F}}^{i}: E x t_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right) \longrightarrow H^{i}\left(S, K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \mathcal{F}\right)
$$

for $\mathcal{F}$ quasi-coherent on $S$ compatible with boundary maps (see proof) such that $\alpha_{\mathcal{F}}^{i}$ is an isomorphism for $i \leq m$.
Proof. We may replace $X$ by a quasi-compact open neighbourhood of the support of $\mathcal{G}$, hence we may assume $X$ is Noetherian. In this case $X$ and $f$ are quasi-compact and quasi-separated. Choose an approximation $P \rightarrow E$ by a perfect complex $P$ of $(X, E,-m-1)$ (possible by Theorem 35.13.6). Then the induced map

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(E, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right) \longrightarrow \operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(P, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)
$$

is an isomorphism for $i \leq m$. Namely, the kernel, resp. cokernel of this map is a quotient, resp. submodule of

$$
\operatorname{Ext}_{\mathcal{O}_{X}}^{i}\left(C, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right) \quad \text { resp. } \quad \operatorname{Ext}_{\mathcal{O}_{X}}^{i+1}\left(C, \mathcal{G} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{F}\right)
$$

where $C$ is the cone of $P \rightarrow E$. Since $C$ has vanishing cohomology sheaves in degrees $\geq-m-1$ these Ext-groups are zero for $i \leq m+1$ by Derived Categories, Lemma 13.27 .3 . This reduces us to the case that $E$ is a perfect complex which is Lemma 35.20.2.

The statement on boundaries is explained in the proof of Lemma 35.20.2.

### 35.21. Limits and derived categories

09RC In this section we collect some results about the derived category of a scheme which is the limit of an inverse system of schemes. More precisely, we will work in the following setting.

09RD Situation 35.21.1. Let $S=\lim _{i \in I} S_{i}$ be a limit of a directed system of schemes over $S$ with affine transition morphisms $f_{i^{\prime} i}: S_{i^{\prime}} \rightarrow S_{i}$. We assume that $S_{i}$ is quasicompact and quasi-separated for all $i \in I$. We denote $f_{i}: S \rightarrow S_{i}$ the projection. We also fix an element $0 \in I$.

09RE Lemma 35.21.2. In Situation 35.21.1. Let $E_{0}$ and $K_{0}$ be objects of $D\left(\mathcal{O}_{S_{0}}\right)$. Set $E_{i}=L f_{i 0}^{*} E_{0}$ and $K_{i}=L f_{i 0}^{*} K_{0}$ for $i \geq 0$ and set $E=L f_{0}^{*} E_{0}$ and $K=L f_{0}^{*} K_{0}$. Then the map

$$
\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D\left(\mathcal{O}_{S_{i}}\right)}\left(E_{i}, K_{i}\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{S}\right)}(E, K)
$$

is an isomorphism if either
(1) $E_{0}$ is perfect and $K_{0} \in D_{Q C o h}\left(\mathcal{O}_{S_{0}}\right)$, or
(2) $E_{0}$ is pseudo-coherent and $K_{0} \in D_{Q C o h}\left(\mathcal{O}_{S_{0}}\right)$ has finite tor dimension.

Proof. For every open $U_{0} \subset S_{0}$ consider the condition $P$ that the canonical map

$$
\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D\left(\mathcal{O}_{U_{i}}\right)}\left(\left.E_{i}\right|_{U_{i}},\left.K_{i}\right|_{U_{i}}\right) \longrightarrow \operatorname{Hom}_{D\left(\mathcal{O}_{U}\right)}\left(\left.E\right|_{U},\left.K\right|_{U}\right)
$$

is an isomorphism, where $U=f_{0}^{-1}\left(U_{0}\right)$ and $U_{i}=f_{i 0}^{-1}\left(U_{0}\right)$. We will prove $P$ holds for all quasi-compact opens $U_{0}$ by the induction principle of Cohomology of Schemes, Lemma 29.4.1. Condition (2) of this lemma follows immediately from Mayer-Vietoris for hom in the derived category, see Cohomology, Lemma 20.30.6. Thus it suffices to prove the lemma when $S_{0}$ is affine.

Assume $S_{0}$ is affine. Say $S_{0}=\operatorname{Spec}\left(A_{0}\right), S_{i}=\operatorname{Spec}\left(A_{i}\right)$, and $S=\operatorname{Spec}(A)$. We will use Lemma 35.3.5 without further mention.

In case (1) the object $E_{0}^{\bullet}$ corresponds to a finite complex of finite projective $A_{0}$ modules, see Lemma 35.10.7. We may represent the object $K_{0}$ by a K-flat complex $K_{0}^{\bullet}$ of $A_{0}$-modules. In this situation we are trying to prove
$\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{D\left(A_{i}\right)}\left(E_{0}^{\bullet} \otimes_{A_{0}} A_{i}, K_{0}^{\bullet} \otimes_{A_{0}} A_{i}\right) \longrightarrow \operatorname{Hom}_{D(A)}\left(E_{0}^{\bullet} \otimes_{A_{0}} A, K_{0}^{\bullet} \otimes_{A_{0}} A\right)$
Because $E_{0}^{\bullet}$ is a bounded above complex of projective modules we can rewrite this as

$$
\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{K\left(A_{0}\right)}\left(E_{0}^{\bullet}, K_{0}^{\bullet} \otimes_{A_{0}} A_{i}\right) \longrightarrow \operatorname{Hom}_{K\left(A_{0}\right)}\left(E_{0}^{\bullet}, K_{0}^{\bullet} \otimes_{A_{0}} A\right)
$$

Since there are only a finite number of nonzero modules $E_{0}^{n}$ and since these are all finitely presented modules, this map is an isomorphism.
In case (2) the object $E_{0}$ corresponds to a bounded above complex $E_{0}^{\bullet}$ of finite free $A_{0}$-modules, see Lemma 35.10 .3 . We may represent $K_{0}$ by a finite complex $K_{0}^{\bullet}$
of flat $A_{0}$-modules, see Lemma 35.10 .5 and More on Algebra, Lemma 15.55.3. In particular $K_{0}^{\bullet}$ is K-flat and we can argue as before to arrive at the map

$$
\operatorname{colim}_{i \geq 0} \operatorname{Hom}_{K\left(A_{0}\right)}\left(E_{0}^{\bullet}, K_{0}^{\bullet} \otimes_{A_{0}} A_{i}\right) \longrightarrow \operatorname{Hom}_{K\left(A_{0}\right)}\left(E_{0}^{\bullet}, K_{0}^{\bullet} \otimes_{A_{0}} A\right)
$$

It is clear that this map is an isomorphism (only a finite number of terms are involved since $K_{0}^{\bullet}$ is bounded).

09RF Lemma 35.21.3. In Situation 35.21.1 the category of perfect objects of $D\left(\mathcal{O}_{S}\right)$ is the colimit of the categories of perfect objects of $D\left(\mathcal{O}_{S_{i}}\right)$.

Proof. For every open $U_{0} \subset S_{0}$ consider the condition $P$ that the functor

$$
\operatorname{colim}_{i \geq 0} D_{\text {perf }}\left(\mathcal{O}_{U_{i}}\right) \longrightarrow D_{\text {perf }}\left(\mathcal{O}_{U}\right)
$$

is an equivalence where $\operatorname{perf}$ indicates the full subcategory of perfect objects and where $U=f_{0}^{-1}\left(U_{0}\right)$ and $U_{i}=f_{i 0}^{-1}\left(U_{0}\right)$. We will prove $P$ holds for all quasicompact opens $U_{0}$ by the induction principle of Cohomology of Schemes, Lemma 29.4.1. First, we observe that we already know the functor is fully faithful by Lemma 35.21.2. Thus it suffices to prove essential surjectivity.

We first check condition (2) of the induction principle. Thus suppose that we have $S_{0}=U_{0} \cup V_{0}$ and that $P$ holds for $U_{0}, V_{0}$, and $U_{0} \cap V_{0}$. Let $E$ be a perfect object of $D\left(\mathcal{O}_{S}\right)$. We can find $i \geq 0$ and $E_{U, i}$ perfect on $U_{i}$ and $E_{V, i}$ perfect on $V_{i}$ whose pullback to $U$ and $V$ are isomorphic to $\left.E\right|_{U}$ and $\left.E\right|_{V}$. Denote

$$
a:\left.E_{U, i} \rightarrow\left(R f_{i, *} E\right)\right|_{U_{i}} \quad \text { and } \quad b:\left.E_{V, i} \rightarrow\left(R f_{i, *} E\right)\right|_{V_{i}}
$$

the maps adjoint to the isomorphisms $\left.L f_{i}^{*} E_{U, i} \rightarrow E\right|_{U}$ and $\left.L f_{i}^{*} E_{V, i} \rightarrow E\right|_{V}$. By fully faithfulness, after increasing $i$, we can find an isomorphism $c:\left.E_{U, i}\right|_{U_{i} \cap V_{i}} \rightarrow$ $\left.E_{V, i}\right|_{U_{i} \cap V_{i}}$ which pulls back to the identifications

$$
\left.\left.\left.L f_{i}^{*} E_{U, i}\right|_{U \cap V} \rightarrow E\right|_{U \cap V} \rightarrow L f_{i}^{*} E_{V, i}\right|_{U \cap V}
$$

Apply Cohomology, Lemma 20.30 .10 to get an object $E_{i}$ on $S_{i}$ and a map $d: E_{i} \rightarrow$ $R f_{i, *} E$ which restricts to the maps $a$ and $b$ over $U_{i}$ and $V_{i}$. Then it is clear that $E_{i}$ is perfect and that $d$ is adjoint to an isomorphism $L f_{i}^{*} E_{i} \rightarrow E$.
Finally, we check condition (1) of the induction principle, in other words, we check the lemma holds when $S_{0}$ is affine. Say $S_{0}=\operatorname{Spec}\left(A_{0}\right), S_{i}=\operatorname{Spec}\left(A_{i}\right)$, and $S=\operatorname{Spec}(A)$. Using Lemmas 35.3 .5 and 35.10 .7 we see that we have to show that

$$
D_{\text {perf }}(A)=\operatorname{colim} D_{\text {perf }}\left(A_{i}\right)
$$

This is clear from the fact that perfect complexes over rings are given by finite complexes of finite projective (hence finitely presented) modules. See More on Algebra, Lemma 15.61 .16 for details.

### 35.22. Cohomology and base change, V

0A1G A final section on cohomology and base change continueing the discussion of Sections 35.18 and 35.19 . An easy to grok special case is given in Remark 35.22 .3 .

0A1H Lemma 35.22.1. Let $f: X \rightarrow S$ be a morphism of finite presentation. Let $E \in D\left(\mathcal{O}_{X}\right)$ be a perfect object. Let $\mathcal{G}$ be a finitely presented $\mathcal{O}_{X}$-module, flat over $S$, with support proper over $S$. Then

$$
K=R f_{*}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \mathcal{G}\right)
$$

is a perfect object of $D\left(\mathcal{O}_{S}\right)$ and its formation commutes with arbitrary base change.

Proof. The statement on base change is Lemma 35.18.4. Thus it suffices to show that $K$ is a perfect object. If $S$ is Noetherian, then this follows from Lemma 35.20.1. We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.
The question is local on $S$, hence we may assume $S$ is affine. Say $S=\operatorname{Spec}(R)$. We write $R=$ colim $R_{i}$ as a filtered colimit of Noetherian rings $R_{i}$. By Limits, Lemma 31.9.1 there exists an $i$ and a scheme $X_{i}$ of finite presentation over $R_{i}$ whose base change to $R$ is $X$. By Limits, Lemma 31.9 .2 we may assume after increasing $i$, that there exists a finitely presented $\mathcal{O}_{X_{i}}$-module $\mathcal{G}_{i}$ whose pullback to $X$ is $\mathcal{G}$. After increasing $i$ we may assume $\mathcal{G}_{i}$ is flat over $R_{i}$, see Limits, Lemma 31.9.4. After increasing $i$ we may assume the support of $\mathcal{G}_{i}$ is proper over $R_{i}$, see Limits, Lemma 31.12.7. Finally, by Lemma 35.21.3 we may, after increasing $i$, assume there exists a perfect object $E_{i}$ of $D\left(\mathcal{O}_{X_{i}}\right)$ whose pullback to $X$ is $E$. Applying Lemma 35.20.1 to $X_{i} \rightarrow \operatorname{Spec}\left(R_{i}\right), E_{i}, \mathcal{G}_{i}$ and using the base change property already shown we obtain the result.

0B91 Lemma 35.22.2. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a flat proper morphism of finite presentation.
(1) Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Then $R f_{*} E$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$ and its formation commutes with arbitrary base change.
(2) Let $\mathcal{G}$ be an $\mathcal{O}_{X}$-module of finite presentation, flat over $S$. Then $R f_{*} \mathcal{G}$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$ and its formation commutes with arbitrary base change.

Proof. Special cases of Lemma 35.22.1 applied with $\mathcal{G}=\mathcal{O}_{X}$ and $E=\mathcal{O}_{X}$.
0A1I Remark 35.22.3. Let $R$ be a ring. Let $X$ be a scheme of finite presentation over $R$. Let $\mathcal{G}$ be a finitely presented $\mathcal{O}_{X}$-module flat over $R$ with scheme theoretic support proper over $R$. By Lemma 35.22 .1 there exists a finite complex of finite projective $R$-modules $M^{\bullet}$ such that we have

$$
R \Gamma\left(X_{R^{\prime}}, \mathcal{G}_{R^{\prime}}\right)=M^{\bullet} \otimes_{R} R^{\prime}
$$

functorially in the $R$-algebra $R^{\prime}$.
0A1J Lemma 35.22.4. Let $f: X \rightarrow S$ be a morphism of finite presentation. Let $E \in D\left(\mathcal{O}_{X}\right)$ be a perfect object. Let $\mathcal{G}$ be a finitely presented $\mathcal{O}_{X}$-module, flat over $S$, with support proper over $S$. Then

$$
K=R f_{*} R \mathcal{H o m}(E, \mathcal{G})
$$

is a perfect object of $D\left(\mathcal{O}_{S}\right)$ and its formation commutes with arbitrary base change.
Proof. The statement on base change is Lemma 35.18.5. Thus it suffices to show that $K$ is a perfect object. If $S$ is Noetherian, then this follows from Lemma 35.20 .2 , We will reduce to this case by Noetherian approximation. We encourage the reader to skip the rest of this proof.
The question is local on $S$, hence we may assume $S$ is affine. Say $S=\operatorname{Spec}(R)$. We write $R=$ colim $R_{i}$ as a filtered colimit of Noetherian rings $R_{i}$. By Limits, Lemma 31.9.1 there exists an $i$ and a scheme $X_{i}$ of finite presentation over $R_{i}$ whose base change to $R$ is $X$. By Limits, Lemma 31.9.2 we may assume after increasing $i$, that there exists a finitely presented $\mathcal{O}_{X_{i}}$-module $\mathcal{G}_{i}$ whose pullback to $X$ is $\mathcal{G}$. After increasing $i$ we may assume $\mathcal{G}_{i}$ is flat over $R_{i}$, see Limits, Lemma 31.9.4. After
increasing $i$ we may assume the support of $\mathcal{G}_{i}$ is proper over $R_{i}$, see Limits, Lemma 31.12.7. Finally, by Lemma 35.21 .3 we may, after increasing $i$, assume there exists a perfect object $E_{i}$ of $D\left(\mathcal{O}_{X_{i}}\right)$ whose pullback to $X$ is $E$. Applying Lemma 35.20.2 to $X_{i} \rightarrow \operatorname{Spec}\left(R_{i}\right), E_{i}, \mathcal{G}_{i}$ and using the base change property already shown we obtain the result.

### 35.23. Perfect complexes

0 BDH We first talk about jumping loci for betti numbers of perfect complexes. Given a complex $E$ on a scheme $X$ and a point $x$ of $X$ we often write $E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \kappa(x)$ instead of the more correct $L i_{x}^{*} E$, where $i_{x}: x \rightarrow X$ is the canonical morphism.

0BDI Lemma 35.23.1. Let $X$ be a scheme. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. For any $i \in \mathbf{Z}$ consider the function

$$
\beta_{i}: X \longrightarrow\{0,1,2, \ldots\}, \quad x \longmapsto \operatorname{dim}_{\kappa(x)} H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \kappa(x)\right)
$$

Then we have
(1) formation of $\beta_{i}$ commutes with arbitrary base change,
(2) the functions $\beta_{i}$ are upper semi-continuous, and
(3) the level sets of $\beta_{i}$ are locally constructible in $X$.

Proof. Consider a morphism of schemes $f: Y \rightarrow X$ and a point $y \in Y$. Let $x$ be the image of $y$ and consider the commutative diagram

Then we see that $L g^{*} \circ L i^{*}=L j^{*} \circ L f^{*}$. This implies that the function $\beta_{i}^{\prime}$ associated to the perfect complex $L f^{*} K$ is the pullback of the function $\beta_{i}$, in a formula: $\beta_{i}^{\prime}=\beta_{i} \circ f$. This is the meaning of (1).
Let $x \in X$. By More on Algebra, Lemma 15.62 .6 there exists an affine open neighbourhood $U$ of $x$ and $a \leq b$ such that $\left.K\right|_{U}$ is represented by a complex

$$
\ldots \rightarrow 0 \rightarrow \mathcal{O}_{U}^{\oplus \beta_{a}(x)} \rightarrow \mathcal{O}_{U}^{\oplus \beta_{a+1}(x)} \rightarrow \ldots \rightarrow \mathcal{O}_{U}^{\oplus \beta_{b-1}(x)} \rightarrow \mathcal{O}_{U}^{\oplus \beta_{b}(x)} \rightarrow 0 \rightarrow \ldots
$$

(This also uses earlier results to turn the problem into algebra, for example Lemmas 35.3 .5 and 35.10 .7 .) It follows immediately that $\beta_{i}\left(x^{\prime}\right) \leq \beta_{i}(x)$ for all $x^{\prime} \in U$. This proves that $\beta_{i}$ is upper semi-continuous.
To prove (3) we may assume that $X$ is affine and $K$ is given by a complex of finite free $\mathcal{O}_{X}$-modules (for example by arguing as in the previous paragraph, or by using Cohomology, Lemma 20.41.3). Thus we have to show that given a complex

$$
\mathcal{O}_{X}^{\oplus a} \rightarrow \mathcal{O}_{X}^{\oplus b} \rightarrow \mathcal{O}_{X}^{\oplus c}
$$

the function associated to a point $x \in X$ the dimension of the cohomology of $\kappa_{x}^{\oplus a} \rightarrow$ $\kappa_{x}^{\oplus b} \rightarrow \kappa_{x}^{\oplus c}$ in the middle has constructible level sets. Let $A \in \operatorname{Mat}\left(a \times b, \Gamma\left(X, \mathcal{O}_{X}\right)\right)$ be the matrix of the first arrow. The rank of the image of $A$ in $\operatorname{Mat}(a \times b, \kappa(x))$ is equal to $r$ if all $(r+1) \times(r+1)$-minors of $A$ vanish at $x$ and there is some $r \times r$-minor of $A$ which does not vanish at $x$. Thus the set of points where the rank is $r$ is a constructible locally closed set. Arguing similarly for the second arrow and putting everything together we obtain the desired result.

0BDJ Lemma 35.23.2. Let $X$ be a scheme. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. The function

$$
\chi_{E}: X \longrightarrow \mathbf{Z}, \quad x \longmapsto \sum(-1)^{i} \operatorname{dim}_{\kappa(x)} H^{i}\left(E \otimes_{\mathcal{O}_{X}}^{\mathbf{L}} \kappa(x)\right)
$$

is locally constant on $X$.
Proof. By Cohomology, Lemma 20.41.3 we see that we can, locally on $X$, represent $E$ by a finite complex $\mathcal{E}^{\bullet}$ of finite free $\mathcal{O}_{X}$-modules. On such an open the function $\chi_{E}$ is constant with value $\sum(-1)^{i} \operatorname{rank}\left(\mathcal{E}^{i}\right)$.
0BDK Lemma 35.23.3. Let $X$ be a scheme. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Given $i, r \in \mathbf{Z}$, there exists an open subscheme $U \subset X$ characterized by the following
(1) $\left.E\right|_{U} \cong H^{i}\left(\left.E\right|_{U}\right)[-i]$ and $H^{i}\left(\left.E\right|_{U}\right)$ is a locally free $\mathcal{O}_{U}$-module of rank $r$,
(2) a morphism $f: Y \rightarrow X$ factors through $U$ if and only if $L f^{*} E$ is isomorphic to a locally free module of rank $r$ placed in degree $i$.

Proof. Let $\beta_{j}: X \rightarrow\{0,1,2, \ldots\}$ for $j \in \mathbf{Z}$ be the functions of Lemma 35.23.1. Then the set

$$
W=\left\{x \in X \mid \beta_{j}(x) \leq 0 \text { for all } j \neq i\right\}
$$

is open in $X$ and its formation commutes with pullback to any $Y$ over $X$. This follows from the lemma using that apriori in a neighbourhood of any point only a finite number of the $\beta_{j}$ are nonzero. Thus we may replace $X$ by $W$ and assume that $\beta_{j}(x)=0$ for all $x \in X$ and all $j \neq i$. In this case $H^{i}(E)$ is a finite locally free module and $E \cong H^{i}(E)[-i]$, see for example More on Algebra, Lemma 15.62 .6 , Thus $X$ is the disjoint union of the open subschemes where the rank of $H^{i}(E)$ is fixed and we win.

0BDL Lemma 35.23.4. Let $X$ be a scheme. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect of tor-amplitude in $[a, b]$ for some $a, b \in \mathbf{Z}$. Then there exists a locally closed subscheme $j: Z \rightarrow X$ characterized by the following
(1) $H^{a}\left(L j^{*} E\right)$ is an invertible $\mathcal{O}_{Z}$-module, and
(2) a morphism $f: Y \rightarrow X$ factors through $Z$ if and only if $H^{a}\left(L f^{*} E\right)$ is an invertible $\mathcal{O}_{Y}$-module.
Moreover, if $f: Y \rightarrow X$ factors as $Y \xrightarrow{g} Z \rightarrow X$, then $H^{a}\left(L f^{*} E\right)=g^{*} H^{a}\left(L j^{*} E\right)$.
Proof. First, let $U \subset X$ be the open subscheme where the function $\beta_{a}$ of Lemma 35.23 .1 has values $\leq 1$. Since every $f$ as in (2) factors through $U$, we may replace $X$ by $U$ and assume that $\beta_{a}(x) \in\{0,1\}$ for all $x \in X$. We will show that in this case $Z$ is a closed subscheme. Namely, if $x \in X$ and $\beta_{a}(x)=0$, then there is an open neighbourhood of $x$ where $\beta_{a}=0$. In this way we see that set theoretically at least the result is true.

To get a scheme theoretic structure, consider a point $x \in X$ with $\beta_{a}(x)=1$. Set $\beta=\beta_{a+1}(x)$. By More on Algebra, Lemma 15.62 .6 there exists an affine open neighbourhood $U$ of $x$ and such that $\left.K\right|_{U}$ is represented by a complex

$$
\ldots \rightarrow 0 \rightarrow \mathcal{O}_{U} \xrightarrow{f_{1}, \ldots, f_{\beta}} \mathcal{O}_{U}^{\oplus \beta} \rightarrow \ldots \rightarrow \mathcal{O}_{U}^{\oplus \beta_{b-1}(x)} \rightarrow \mathcal{O}_{U}^{\oplus \beta_{b}(x)} \rightarrow 0 \rightarrow \ldots
$$

(This also uses earlier results to turn the problem into algebra, for example Lemmas 35.3 .5 and 35.10.7.) Now, if $g: Y \rightarrow U$ is any morphism of schemes such that $g^{\sharp}\left(f_{j}\right)$ is nonzero for some $j$, then $H^{0}\left(L g^{*} E\right)$ is not an invertible $\mathcal{O}_{Y}$-module (since it is annihilated by a nonzero function). And trivially it is an invertible $\mathcal{O}_{Y}$-module if $g^{\sharp}\left(f_{j}\right)=0$ for all $j$. Thus we see that over $U$ the closed subscheme cut out by
$f_{1}, \ldots, f_{\beta}$ works. This finishes the proof as the characterization of $Z$ shows that the locally constructed patches glue (details omitted).

### 35.24. Applications

0BDM Mostly applications of cohomology and base change. In the future we may generalize these results to the situation discussed in Lemma 35.22.1.

0BDN Lemma 35.24.1. Let $f: X \rightarrow S$ be a flat, proper morphism of finite presentation. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module of finite presentation, flat over $S$. For fixed $i \in \mathbf{Z}$ consider the function

$$
\beta_{i}: X \rightarrow\{0,1,2, \ldots\}, \quad s \longmapsto \operatorname{dim}_{\kappa(s)} H^{i}\left(X_{s}, \mathcal{F}_{s}\right)
$$

Then we have
(1) formation of $\beta_{i}$ commutes with arbitrary base change,
(2) the functions $\beta_{i}$ are upper semi-continuous, and
(3) the level sets of $\beta_{i}$ are locally constructible in $S$.

Proof. By cohomology and base change (more precisely by Lemma 35.22.2 the object $K=R f_{*} \mathcal{F}$ is a perfect object of the derived category of $S$ whose formation commutes with arbitrary base change. In particular we have

$$
H^{i}\left(X_{s}, \mathcal{F}_{s}\right)=H^{i}\left(K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \kappa(s)\right)
$$

Thus the lemma follows from Lemma 35.23 .1 .
0B9T Lemma 35.24.2. Let $f: X \rightarrow S$ be a flat, proper morphism of finite presentation. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module of finite presentation, flat over $S$. The function

$$
s \longmapsto \chi\left(X_{s}, \mathcal{F}_{s}\right)
$$

is locally constant on $S$. Formation of this function commutes with base change.
Proof. By cohomology and base change (more precisely by Lemma 35.22.2) the object $K=R f_{*} \mathcal{F}$ is a perfect object of the derived category of $S$ whose formation commutes with arbitrary base change. Thus we have to show the map

$$
s \longmapsto \sum(-1)^{i} \operatorname{dim}_{\kappa(s)} H^{i}\left(K \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \kappa(s)\right)
$$

is locally constant on $S$. This is Lemma 35.23 .2 .
0B9S Lemma 35.24.3. Let $f: X \rightarrow S$ be a flat, proper morphism of finite presentation. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module of finite presentation, flat over $S$. Fix $i, r \in \mathbf{Z}$. Then there exists an open subscheme $U \subset S$ with the following property: A morphism $T \rightarrow S$ factors through $U$ if and only if $R f_{T, *} \mathcal{F}_{T}$ is isomorphic to a finite locally free module of rank $r$ placed in degree $i$.

Proof. By cohomology and base change (more precisely by Lemma 35.22.2) the object $K=R f_{*} \mathcal{F}$ is a perfect object of the derived category of $S$ whose formation commutes with arbitrary base change. Thus this lemma follows immediately from Lemma 35.23.3.

### 35.25. Theorem of the cube

0BEZ The following lemma tells us that the diagonal of the Picard functor is representable by locally closed immersions under the assumptions made in the lemma.
0BDP Lemma 35.25.1. Let $f: X \rightarrow S$ be a flat, proper morphism of finite presentation. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. For a morphism $g: T \rightarrow S$ consider the base change diagram

Assume $\mathcal{O}_{T} \rightarrow p_{*} \mathcal{O}_{X_{T}}$ is an isomorphism for all $g: T \rightarrow S$. Then there is a locally closed subscheme $Z \subset S$ such that a morphism $g: T \rightarrow S$ factors through $Z$ if and only if there exists an invertible $\mathcal{O}_{T}$-module $\mathcal{N}$ with $p^{*} \mathcal{N} \cong q^{*} \mathcal{L}$.

Proof. Let $g: T \rightarrow S$ be a morphism. If there exists an $\mathcal{N}$ as in the lemma, then, using the projection formula Cohomology, Lemma 20.43.2 we see that the modules $p_{*}\left(q^{*} \mathcal{L}\right) \cong p_{*}\left(p^{*} \mathcal{N}\right) \cong \mathcal{N} \otimes_{\mathcal{O}_{S}} p_{*} \mathcal{O}_{X_{T}} \cong \mathcal{N} \quad$ and similarly $\quad p_{*}\left(q^{*} \mathcal{L}^{\otimes-1}\right) \cong \mathcal{N}^{\otimes-1}$ are invertible and we see that the map (cup product in degree 0 )

$$
p_{*}\left(q^{*} \mathcal{L}\right) \otimes_{\mathcal{O}_{T}} p_{*}\left(q^{*} \mathcal{L}^{\otimes-1}\right) \longrightarrow \mathcal{O}_{T}
$$

is an isomorphism. Conversely, suppose that we have $g: T \rightarrow S$ such that $p_{*}\left(q^{*} \mathcal{L}\right)$ and $p_{*}\left(q^{*} \mathcal{L}^{\otimes-1}\right)$ are invertible and such that the cup product map displayed above is an isomorphism. Then we see that locally on $T$ we have sections $\sigma$ in $p_{*}\left(q^{*} \mathcal{L}\right)$ and $\sigma^{\prime}$ in $p_{*}\left(q^{*} \mathcal{L}^{\otimes-1}\right)$ whose product is 1 . Thinking of $\sigma$ as a section of $q^{*} \mathcal{L}$ on $X_{T}$ and $\sigma^{\prime}$ as a section of $q^{*} \mathcal{L}^{\otimes-1}$ on $X_{T}$ with $\sigma \cdot \sigma^{\prime}=1$, we conclude that $\sigma: \mathcal{O}_{X_{T}} \rightarrow q^{*} \mathcal{L}$ is an isomorphism. In other words, we see that $p^{*} p_{*} q^{*} \mathcal{L} \cong q^{*} \mathcal{L}$. It is this alternative description of the condition on $g: T \rightarrow S$ that we will show is representable by a locally closed subscheme of $S$.

By cohomology and base change (more precisely by Lemma 35.22.2 we see that $E=R f_{*} \mathcal{L}$ is a perfect object of the derived category of $S$ and that its formation commutes with arbitrary change of base. Similarly for $E^{\prime}=R f_{*} \mathcal{L}^{\otimes-1}$. Since there is never any cohomology in degrees $<0$, we see that $E$ and $E^{\prime}$ have (locally) toramplitude in $[0, b]$ for some $b$. By Lemma 35.23 .4 we see that there exist locally closed subschemes $Z \subset S$ and $Z^{\prime} \subset S$ over which $H^{0}(E)$ and $H^{0}\left(E^{\prime}\right)$ become invertible modules compatible with pullback. After replacing $S$ by $Z \times_{S} Z^{\prime}$ (which is a locally closed subscheme of $X$ ) we may assume that $f_{*} \mathcal{L}$ and $f_{*} \mathcal{L}^{\otimes-1}$ are invertible $\mathcal{O}_{S}$-modules whose formation commutes with arbitrary change of base. Finally, the condition that the cupproduct is nonzero picks out an open subscheme and the proof is complete.

0BF0 Lemma 35.25.2. Let $f: X \rightarrow S$ and $\mathcal{L}$ be as in Lemma 35.25.1. If moreover the geometric fibres of $f$ are integral, then $Z$ is closed in $S$.

Proof. We first do a standard argument to reduce to the Noetherian case. Namely, the question is local on $S$, hence we may assume that $S=\operatorname{Spec}(R)$ is affine. Then we write $R=\operatorname{colim} R_{i}$ with $R_{i}$ of finite type over $\mathbf{Z}$. Set $S_{i}=\operatorname{Spec}\left(R_{i}\right)$. For some $i$ there exists a flat proper morphism $f_{i}: X_{i} \rightarrow S_{i}$ and an invertible $\mathcal{O}_{X_{i}}$-module $\mathcal{L}_{i}$ whose base change to $S$ gives back $f: X \rightarrow S$ and $\mathcal{L}$. See Limits, Lemmas 31.9.1,
31.7.6, 31.12.4, and 31.9.3. Then $R f_{i, *} \mathcal{O}_{X_{i}}$ is a perfect object of $D\left(\mathcal{O}_{S_{i}}\right)$ whose formation commutes with arbitrary base change. Let $T \subset S_{i}$ be the locally closed subscheme of $S_{i}$ constructed in Lemma 35.23 .4 for $R f_{i, *} \mathcal{O}_{X_{i}}$ with $a=0$. By our assumption that $f_{*} \mathcal{O}_{X}=\mathcal{O}_{S}$ universally we see that $S \rightarrow S_{i}$ factors through $T$. Set $Y=X_{i} \times_{S_{i}} T \rightarrow T$ and $\mathcal{M}=\left.\mathcal{L}_{i}\right|_{Y}$. By construction the morphism $g: Y \rightarrow T$ satisfies $g_{*} \mathcal{O}_{Y}=\mathcal{O}_{T}$ universally and we have a commutative diagram

$\mathcal{M}$

Thus if we can prove the lemma for $g$ and $\mathcal{M}$, then it follows for $f$ and $\mathcal{L}$. Since $T$ is Noetherian, we have reduced to the Noetherian case.

Assume $S$ is Noetherian. Since $Z$ is a locally closed subscheme of a Noetherian scheme it suffices to show that $Z$ is closed under specialization in order to prove that it is closed. By Properties, Lemma 27.5.10 and base change we see that it suffices to prove the lemma in case $S$ is the spectrum of a dvr $A$. In other words, suppose we have a flat proper morphism $X \rightarrow \operatorname{Spec}(A)$ with integral scheme theoretic fibres $X_{\eta}$ (generic), $X_{0}$ (closed) and an invertible $\mathcal{O}_{X}$-module $\mathcal{L}$ whose restriction to $X_{\eta}$ is trivial. Goal: show that $\mathcal{L}$ is trivial. This follows from Divisors, Lemma 30.23.1. However, we can prove this special case directly as follows: take a trivializing section $s \in \Gamma\left(X_{\eta}, \mathcal{L}_{\eta}\right)$. After replacing $s$ by $\pi^{n} s$ if necessary $(\pi \in A$ a uniformizer) we can assume that $s \in \Gamma(X, \mathcal{L})$. If $\left.s\right|_{X_{0}}=0$, then we see that $s$ is divisible by $\pi$ (because $X_{0}$ is the scheme theoretic fibre and $X$ is flat over $A$ ). Thus we may assume that $\left.s\right|_{X_{0}}$ is nonzero. Then the zero locus $Z(s)$ of $s$ is contained in $X_{0}$ but does not contain the generic point of $X_{0}$ (because $X_{0}$ is integral). This means that the $Z(s)$ has codimension $\geq 2$ in $X$ which contradicts Divisors, Lemma 30.12 .3 .

0BF1 Lemma 35.25.3. Consider a commutative diagram of schemes

with $f^{\prime}: X^{\prime} \rightarrow S$ and $f: X \rightarrow S$ satisfying the hypotheses of Lemma 35.25.1. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module and let $\mathcal{L}^{\prime}$ be the pullback to $X^{\prime}$. Let $Z \subset S$, resp. $Z^{\prime} \subset S$ be the locally closed subscheme constructed in Lemma 35.25.1 for $(f, \mathcal{L})$, resp. $\left(f^{\prime}, \mathcal{L}^{\prime}\right)$ so that $Z \subset Z^{\prime}$. If $s \in Z$ and

$$
H^{1}\left(X_{s}, \mathcal{O}\right) \longrightarrow H^{1}\left(X_{s}^{\prime}, \mathcal{O}\right)
$$

is injective, then $Z \cap U=Z^{\prime} \cap U$ for some open neighbourhood $U$ of $s$.
Proof. We may replace $S$ by $Z^{\prime}$. After shrinking $S$ to an affine open neighbourhood of $s$ we may assume that $\mathcal{L}^{\prime}=\mathcal{O}_{X^{\prime}}$. Let $E=R f_{*} \mathcal{L}$ and $E^{\prime}=R f_{*}^{\prime} \mathcal{L}^{\prime}=R f_{*}^{\prime} \mathcal{O}_{X^{\prime}}$. These are perfect complexes whose formation commutes with arbitrary change of base (Lemma 35.22.2). In particular we see that

$$
E \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \kappa(s)=R \Gamma\left(X_{s}, \mathcal{L}_{s}\right)=R \Gamma\left(X_{s}, \mathcal{O}_{X_{s}}\right)
$$

The second equality because $s \in Z$. Set $h_{i}=\operatorname{dim}_{\kappa(s)} H^{i}\left(X_{s}, \mathcal{O}_{X_{s}}\right)$. After shrinking $S$ we can represent $E$ by a complex

$$
\mathcal{O}_{S} \rightarrow \mathcal{O}_{S}^{\oplus h_{1}} \rightarrow \mathcal{O}_{S}^{\oplus h_{2}} \rightarrow \ldots
$$

see More on Algebra, Lemma 15.62 .6 (strictly speaking this also uses Lemmas 35.3 .5 and 35.10.7). Simlarly, we may assume $E^{\prime}$ is represented by a complex

$$
\mathcal{O}_{S} \rightarrow \mathcal{O}_{S}^{\oplus h_{1}^{\prime}} \rightarrow \mathcal{O}_{S}^{\oplus h_{2}^{\prime}} \rightarrow \ldots
$$

where $h_{i}^{\prime}=\operatorname{dim}_{\kappa(s)} H^{i}\left(X_{s}^{\prime}, \mathcal{O}_{X_{s}^{\prime}}\right)$. By functoriality of cohmology we have a map

$$
E \longrightarrow E^{\prime}
$$

in $D\left(\mathcal{O}_{S}\right)$ whose formation commutes with change of base. Since the complex representing $E$ is a finite complex of finite free modules and since $S$ is affine, we can choose a map of complexes

representing the given map $E \rightarrow E^{\prime}$. Since $s \in Z$ we see that the trivializing section of $\mathcal{L}_{s}$ pulls back to a trivializing section of $\mathcal{L}_{s}^{\prime}=\mathcal{O}_{X_{s}^{\prime}}$. Thus $a \otimes \kappa(s)$ is an isomorphism, hence after shrinking $S$ we see that $a$ is an isomorphism. Finally, we use the hypothesis that $H^{1}\left(X_{s}, \mathcal{O}\right) \rightarrow H^{1}\left(X_{s}^{\prime}, \mathcal{O}\right)$ is injective, to see that there exists a $h_{1} \times h_{1}$ minor of the matrix defining $b$ which maps to a nonzero element in $\kappa(s)$. Hence after shrinking $S$ we may assume that $b$ is injective. Howeover, since $\mathcal{L}^{\prime}=\mathcal{O}_{X^{\prime}}$ we see that $d^{\prime}=0$. It follows that $d=0$. In this way we see that the trivializing section of $\mathcal{L}_{s}$ lifts to a section of $\mathcal{L}$ over $X$. A straightforward toplogical argument (omitted) shows that this means that $\mathcal{L}$ is trivial after possibly shrinking $S$ a bit further.

0BF2 Lemma 35.25.4. Consider $n$ commutative diagrams of schemes

with $f_{i}: X_{i} \rightarrow S$ and $f: X \rightarrow S$ satisfying the hypotheses of Lemma 35.25.1. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module and let $\mathcal{L}_{i}$ be the pullback to $X_{i}$. Let $Z \subset S$, resp. $Z_{i} \subset S$ be the locally closed subscheme constructed in Lemma 35.25.1 for $(f, \mathcal{L})$, resp. $\left(f_{i}, \mathcal{L}_{i}\right)$ so that $Z \subset \bigcap_{i=1, \ldots, n} Z_{i}$. If $s \in Z$ and

$$
H^{1}\left(X_{s}, \mathcal{O}\right) \longrightarrow \bigoplus_{i=1, \ldots, n} H^{1}\left(X_{i, s}, \mathcal{O}\right)
$$

is injective, then $Z \cap U=\left(\bigcap_{i=1, \ldots, n} Z_{i}\right) \cap U$ (scheme theoretic intersection) for some open neighbourhood $U$ of $s$.
Proof. This lemma is a variant of Lemma 35.25 .3 and we strongly urge the reader to read that proof first; this proof is basically a copy of that proof with minor modifications. It follows from the descrioption of (scheme valued) points of $Z$ and the $Z_{i}$ that $Z \subset \bigcap_{i=1, \ldots, n} Z_{i}$ where we take the scheme theoretic intersection. Thus we
may replace $S$ by the scheme theoretic intersection $\bigcap_{i=1, \ldots, n} Z_{i}$. After shrinking $S$ to an affine open neighbourhood of $s$ we may assume that $\mathcal{L}_{i}=\mathcal{O}_{X_{i}}$ for $i=1, \ldots, n$. Let $E=R f_{*} \mathcal{L}$ and $E_{i}=R f_{i, *} \mathcal{L}_{i}=R f_{i, *} \mathcal{O}_{X_{i}}$. These are perfect complexes whose formation commutes with arbitrary change of base (Lemma 35.22.2). In particular we see that

$$
E \otimes_{\mathcal{O}_{S}}^{\mathbf{L}} \kappa(s)=R \Gamma\left(X_{s}, \mathcal{L}_{s}\right)=R \Gamma\left(X_{s}, \mathcal{O}_{X_{s}}\right)
$$

The second equality because $s \in Z$. Set $h_{j}=\operatorname{dim}_{\kappa(s)} H^{j}\left(X_{s}, \mathcal{O}_{X_{s}}\right)$. After shrinking $S$ we can represent $E$ by a complex

$$
\mathcal{O}_{S} \rightarrow \mathcal{O}_{S}^{\oplus h_{1}} \rightarrow \mathcal{O}_{S}^{\oplus h_{2}} \rightarrow \ldots
$$

see More on Algebra, Lemma 15.62 .6 (strictly speaking this also uses Lemmas 35.3 .5 and 35.10.7). Simlarly, we may assume $E_{i}$ is represented by a complex

$$
\mathcal{O}_{S} \rightarrow \mathcal{O}_{S}^{\oplus h_{i, 1}} \rightarrow \mathcal{O}_{S}^{\oplus h_{i, 2}} \rightarrow \ldots
$$

where $h_{i, j}=\operatorname{dim}_{\kappa(s)} H^{j}\left(X_{i, s}, \mathcal{O}_{X_{i, s}}\right)$. By functoriality of cohmology we have a map

$$
E \longrightarrow E_{i}
$$

in $D\left(\mathcal{O}_{S}\right)$ whose formation commutes with change of base. Since the complex representing $E$ is a finite complex of finite free modules and since $S$ is affine, we can choose a map of complexes

representing the given map $E \rightarrow E_{i}$. Since $s \in Z$ we see that the trivializing section of $\mathcal{L}_{s}$ pulls back to a trivializing section of $\mathcal{L}_{i, s}=\mathcal{O}_{X_{i, s}}$. Thus $a_{i} \otimes \kappa(s)$ is an isomorphism, hence after shrinking $S$ we see that $a_{i}$ is an isomorphism. Finally, we use the hypothesis that $H^{1}\left(X_{s}, \mathcal{O}\right) \rightarrow \bigoplus_{i=1, \ldots, n} H^{1}\left(X_{i, s}, \mathcal{O}\right)$ is injective, to see that there exists a $h_{1} \times h_{1}$ minor of the matrix defining $\oplus b_{i}$ which maps to a nonzero element in $\kappa(s)$. Hence after shrinking $S$ we may assume that $\left(b_{1}, \ldots, b_{n}\right)$ : $\mathcal{O}_{S}^{h_{1}} \rightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{S}^{h_{i, 1}}$ is injective. Howeover, since $\mathcal{L}_{i}=\mathcal{O}_{X_{i}}$ we see that $d_{i}=0$ for $i=1, \ldots n$. It follows that $d=0$ because $\left(b_{1}, \ldots, b_{n}\right) \circ d=\left(\oplus d_{i}\right) \circ\left(a_{1}, \ldots, a_{n}\right)$. In this way we see that the trivializing section of $\mathcal{L}_{s}$ lifts to a section of $\mathcal{L}$ over $X$. A straightforward toplogical argument (omitted) shows that this means that $\mathcal{L}$ is trivial after possibly shrinking $S$ a bit further.

0BF3 Lemma 35.25.5. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes satisfying the hypotheses of Lemma 35.25.1. Let $\sigma: S \rightarrow X$ and $\tau: S \rightarrow Y$ be sections of $f$ and $g$. Let $s \in S$. Let $\mathcal{L}$ be an invertible sheaf on $X \times_{S} Y$. If $(1 \times \tau)^{*} \mathcal{L}$ on $X,(\sigma \times 1)^{*} \mathcal{L}$ on $Y$, and $\left.\mathcal{L}\right|_{\left(X \times{ }_{S} Y\right)_{s}}$ are trivial, then there is an open neighbourhood $U$ of $s$ such that $\mathcal{L}$ is trivial over $\left(X \times_{S} Y\right)_{U}$.

Proof. By Künneth (Varieties, Lemma 32.23.1) the map

$$
H^{1}\left(X_{s} \times_{\operatorname{Spec}(\kappa(s)} Y_{s}, \mathcal{O}\right) \rightarrow H^{1}\left(X_{s}, \mathcal{O}\right) \oplus H^{1}\left(Y_{s}, \mathcal{O}\right)
$$

is injective. Thus we may apply Lemma 35.25 .4 to the two morphisms

$$
1 \times \tau: X \rightarrow X \times{ }_{S} Y \quad \text { and } \quad \sigma \times 1: Y \rightarrow X \times{ }_{S} Y
$$

to conclude.

0BF4 Theorem 35.25.6 (Theorem of the cube). Let $k$ be a field. Let $X, Y, Z$ be varieties with $k$-rational points $x, y, z$. Let $\mathcal{L}$ be an invertible module on $X \times Y \times Z$. If
(1) $\mathcal{L}$ is trivial over $x \times Y \times Z, X \times y \times Z$, and $X \times Y \times z$, and
(2) $X$ and $Y$ are geometrically integral and proper over $k$,
then $\mathcal{L}$ is trivial.
Proof. Since $X$ and $Y$ are geometrically integral and proper over $k$ the product $X \times_{k} Y$ is geometrically integral and proper over $k$. This implies that $H^{0}(X \times$ $\left.Y, \mathcal{O}_{X \times Y}\right)=k$ and that the same remains true after any base change. Thus we may apply Lemma 35.25.1 to the morphism

$$
p: X \times Y \times Z \longrightarrow Z
$$

and the invertible module $\mathcal{L}$ to get a locally closed subscheme $Z^{\prime} \subset Z$ such that $\left.\mathcal{L}\right|_{X \times Y \times Z^{\prime}}$ is the pullback of an invertible module $\mathcal{N}$ on $Z^{\prime}$. By Lemma 35.25 .2 we see that $Z^{\prime} \subset Z$ is a closed subscheme. Hence if $Z^{\prime}$ contains an open neighbourhood of $z$, then $Z^{\prime}=Z$ and we see that $\mathcal{L}=p^{*} \mathcal{N}$. Restricting to $x \times y \times Z$ we find that $\mathcal{N} \cong \mathcal{O}_{Z}$ and $\mathcal{L}$ is trivial. To get the desired open neighbourhood of $z$ apply Lemma 35.25 .5 to the morphism $p$, the point $z$, and the sections $\sigma: Z \rightarrow X \times Z$ and $\tau: Z \rightarrow Y \times Z$ given by $x$ and $y$.

### 35.26. Formal functions for a principal ideal

0BLA In this section we ask if completion and taking cohomology commute for sheaves of modules on schemes over an affine base $A$ when completion is with respect to a principal ideal in $A$. Of course, we have already discussed the theorem on formal functions in Cohomology of Schemes, Section 29.19. Moreover, we will see in Proétale Cohomology, Section 51.15 that derived completion commutes with derived cohomology in great generality. In this section we just collect a few simple special cases of this material that will help us with future developments.

0BLB Lemma 35.26.1. Let $A$ be a Noetherian ring complete with respect to a principal ideal $(f)$. Let $X$ be a scheme over $\operatorname{Spec}(A)$. Let

$$
\ldots \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{0}
$$

be an inverse system of $\mathcal{O}_{X}$-modules. Assume
(1) $\Gamma\left(X, \mathcal{F}_{0}\right)$ is a finite $A$-module,
(2) multiplication by $f$ on $\mathcal{F}_{n+1}$ factors through $\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$ to give a short exact sequence $0 \rightarrow \mathcal{F}_{n} \rightarrow \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{0} \rightarrow 0$
Then

$$
M=\lim \Gamma\left(X, \mathcal{F}_{n}\right)
$$

is a finite $A$-module, $f$ is a nonzerodivisor on $M$, and $M / f M$ is the image of $M$ in $\Gamma\left(X, \mathcal{F}_{0}\right)$.

Proof. Assumption (2) implies that $\mathcal{F}_{0}$ is annihilated by $f$ and then by induction that $\mathcal{F}_{n}$ is annihilated by $f^{n+1}$. Set $M_{n}=\Gamma\left(X, \mathcal{F}_{n}\right)$. Since $f^{n+1}$ annihilates $M_{n}$ we see that $\bigcap f^{n} M=0$. Since the kernel of $f: M_{n+1} \rightarrow M_{n+1}$ dies in $M_{n}$ by (2) we see that $f: M \rightarrow M$ is injective. The cokernel of $f: M \rightarrow M$ is the image of $M \rightarrow M_{0}$. Namely, if $m=\left(m_{n}\right)$ is an element of $M$ with $m_{0}=0$, then each $m_{n+1}$ is in the image of $M_{n} \rightarrow M_{n+1}$ by assumption (2). If $m_{n}^{\prime} \in M_{n}$ maps to $m_{n+1}$ then $f\left(m_{n}^{\prime}\right)=\left(m_{n}\right)$ in $M$. Since $A$ is Noetherian and $M_{0}$ is finite, we see
that $M / f M \subset M_{0}$ is a finite module. By Algebra, Lemma 10.95 .12 we conclude that $M$ is finite over $A$.

0BLC Lemma 35.26.2. Let $A$ be a ring. Let $f \in A$. Let $X$ be a scheme over $\operatorname{Spec}(A)$. Let

$$
\ldots \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{0}
$$

be an inverse system of $\mathcal{O}_{X}$-modules. Assume
(1) $H^{1}\left(X, \mathcal{F}_{0}\right)$ is an $A$-module of finite length,
(2) multiplication by $f$ on $\mathcal{F}_{n+1}$ factors through $\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$ to give a short exact sequence $0 \rightarrow \mathcal{F}_{n} \rightarrow \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{0} \rightarrow 0$,
Then the system $M_{n}=\Gamma\left(X, \mathcal{F}_{n}\right)$ satisfies the Mittag-Leffler condition.
Proof. By the short exact sequences and induction we see that $H_{n}^{1}=H^{1}\left(X, \mathcal{F}_{n}\right)$ is an $A$-module of finite length for all $n$. Fix $n$. Our goal is to show that

$$
Q_{m}=\operatorname{Coker}\left(M_{m} \rightarrow M_{n}\right), \quad m \geq n
$$

stabilizes for $m \gg n$. Note that $Q_{m} \subset H_{m-n}^{1}$ has finite length and that we have surjective maps $Q_{m+1} \rightarrow Q_{m}$ for all $m \geq n$. Applying cohomology to the short exact sequence

$$
0 \rightarrow \mathcal{F}_{m-n} \rightarrow \mathcal{F}_{m} \rightarrow \mathcal{F}_{n} \rightarrow 0
$$

we get an exact sequence

$$
0 \rightarrow Q_{m} \rightarrow H_{m-n}^{1} \rightarrow H_{m}^{1} \rightarrow H_{n}^{1}
$$

of finite length modules. Set $q_{m}=\operatorname{length}_{A}\left(Q_{m}\right)$ and $l_{m}=\operatorname{length}_{A}\left(H_{m}^{1}\right)$. Then we conclude that

$$
l_{m} \leq l_{m-n}-q_{m}+l_{n}
$$

Above we have seen that $q_{m+1} \geq q_{m}$ for all $n$. If the sequence does not stabilize then for some $m_{0}$ we have $q_{m}>l_{n}$ for all $m \geq m_{0}$. Then we would get

$$
l_{m} \leq l_{m-n}-q_{m}+l_{n} \leq l_{m-n}-1
$$

provided $m \geq m_{0}$. This would imply that the sequence $l_{m_{0}}, l_{m_{0}+n}, l_{m_{0}+2 n}, \ldots$ is strictly decreasing contradicting the fact that $l_{m}>q_{m}$ and the sequence $q_{m}$ is nondecreasing. Thus the sequence stabilizes.

0BLD Lemma 35.26.3. Let $A$ be a ring and $f \in A$. Let $X$ be a scheme over $A$. Let $\mathcal{F}$

BdJ14, Lemma 1.6] be a quasi-coherent $\mathcal{O}_{X}$-module. Assume that $\mathcal{F}\left[f^{n}\right]=\operatorname{Ker}\left(f^{n}: \mathcal{F} \rightarrow \mathcal{F}\right)$ stabilizes. Then

$$
R \Gamma\left(X, \lim \mathcal{F} / f^{n} \mathcal{F}\right)=R \Gamma(X, \mathcal{F})^{\wedge}
$$

where the right hand side indicates the derived completion with respect to the ideal $(f) \subset A$. Let $H^{p}$ be the pth cohomology group of this complex. Then there are short exact sequences

$$
0 \rightarrow R^{1} \lim H^{p-1}\left(X, \mathcal{F} / f^{n} \mathcal{F}\right) \rightarrow H^{p} \rightarrow \lim H^{p}\left(X, \mathcal{F} / f^{n} \mathcal{F}\right) \rightarrow 0
$$

and

$$
0 \rightarrow H^{0}\left(H^{p}(X, \mathcal{F})^{\wedge}\right) \rightarrow H^{p} \rightarrow T_{f}\left(H^{p+1}(X, \mathcal{F})\right) \rightarrow 0
$$

where $T_{f}(-)$ denote the $f$-adic Tate module as in More on Algebra, Example 15.73.4.

Proof. We start with the canonical identifications

$$
\begin{aligned}
R \Gamma(X, \mathcal{F})^{\wedge} & =R \lim R \Gamma(X, \mathcal{F}) \otimes_{A}^{\mathbf{L}}\left(A \xrightarrow{f^{n}} A\right) \\
& =R \lim R \Gamma\left(X, \mathcal{F} \xrightarrow{f^{n}} \mathcal{F}\right) \\
& =R \Gamma\left(X, R \lim \left(\mathcal{F} \xrightarrow{f^{n}} \mathcal{F}\right)\right)
\end{aligned}
$$

The first equality holds by More on Algebra, Lemma 15.72 .16 . The second by the projection formula, see Cohomology, Lemma 20.43.3. The third by Cohomology, Lemma 20.31.1. Note that by Lemma 35.3.2 we have $\lim \mathcal{F} / f^{n} \mathcal{F}=R \lim \mathcal{F} / f^{n} \mathcal{F}$. Thus to finish the proof of the first statement of the lemma it suffices to show that the pro-objects $\left(f^{n}: \mathcal{F} \rightarrow \mathcal{F}\right)$ and $\left(\mathcal{F} / f^{n} \mathcal{F}\right)$ are isomorphic. There is clearly a map from the first system to the second. Suppose that $\mathcal{F}\left[f^{c}\right]=\mathcal{F}\left[f^{c+1}\right]=\mathcal{F}\left[f^{c+2}\right]=\ldots$. Then we can define an arrow of systems in $D\left(\mathcal{O}_{X}\right)$ in the other direction by the diagrams

Since the top horizontal arrow is injective the complex in the top row is quasiisomorphic to $\mathcal{F} / f^{n+c} \mathcal{F}$. Some details omitted.

Since $R \Gamma(X,-)$ commutes with derived limits (Injectives, Lemma 19.13.6 we see that

$$
R \Gamma\left(X, \lim \mathcal{F} / f^{n} \mathcal{F}\right)=R \Gamma\left(X, R \lim \mathcal{F} / f^{n} \mathcal{F}\right)=R \lim R \Gamma\left(X, \mathcal{F} / f^{n} \mathcal{F}\right)
$$

(for first equality see first paragraph of proof). By More on Algebra, Remark 15.68 .16 we obtain exact sequences
$0 \rightarrow R^{1} \lim H^{p-1}\left(X, \mathcal{F} / f^{n} \mathcal{F}\right) \rightarrow H^{p}\left(X, \lim \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow \lim H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right) \rightarrow 0$
of $A$-modules. The second set of short exact sequences follow immediately from the discussion in More on Algebra, Example 15.73.4.

## CHAPTER 36

## More on Morphisms

## 02GX

### 36.1. Introduction

02GY In this chapter we continue our study of properties of morphisms of schemes. A fundamental reference is DG67.

### 36.2. Thickenings

04 EW The following terminology may not be completely standard, but it is convenient.
04EX Definition 36.2.1. Thickenings.
(1) We say a scheme $X^{\prime}$ is a thickening of a scheme $X$ if $X$ is a closed subscheme of $X^{\prime}$ and the underlying topological spaces are equal.
(2) We say a scheme $X^{\prime}$ is a first order thickening of a scheme $X$ if $X$ is a closed subscheme of $X^{\prime}$ and the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X^{\prime}}$ defining $X$ has square zero.
(3) Given two thickenings $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ a morphism of thickenings is a morphism $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ such that $f^{\prime}(X) \subset Y$, i.e., such that $\left.f^{\prime}\right|_{X}$ factors through the closed subscheme $Y$. In this situation we set $f=\left.f^{\prime}\right|_{X}: X \rightarrow$ $Y$ and we say that $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ is a morphism of thickenings.
(4) Let $S$ be a scheme. We similarly define thickenings over $S$, and morphisms of thickenings over $S$. This means that the schemes $X, X^{\prime}, Y, Y^{\prime}$ above are schemes over $S$, and that the morphisms $X \rightarrow X^{\prime}, Y \rightarrow Y^{\prime}$ and $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ are morphisms over $S$.

Finite order thickenings. Let $i_{X}: X \rightarrow X^{\prime}$ be a thickening. Any local section of the kernel $\mathcal{I}=\operatorname{Ker}\left(i_{X}^{\sharp}\right)$ is locally nilpotent. Let us say that $X \subset X^{\prime}$ is a finite order thickening if the ideal sheaf $\mathcal{I}$ is "globally" nilpotent, i.e., if there exists an $n \geq 0$ such that $\mathcal{I}^{n+1}=0$. Technically the class of finite order thickenings $X \subset X^{\prime}$ is much easier to handle than the general case. Namely, in this case we have a filtration

$$
0 \subset \mathcal{I}^{n} \subset \mathcal{I}^{n-1} \subset \ldots \subset \mathcal{I} \subset \mathcal{O}_{X^{\prime}}
$$

and we see that $X^{\prime}$ is filtered by closed subspaces

$$
X=X_{0} \subset X_{1} \subset \ldots \subset X_{n-1} \subset X_{n+1}=X^{\prime}
$$

such that each pair $X_{i} \subset X_{i+1}$ is a first order thickening over $S$. Using simple induction arguments many results proved for first order thickenings can be rephrased as results on finite order thickenings.
First order thickening are described as follows (see Modules, Lemma 17.24.11).

05YV Lemma 36.2.2. Let $X$ be a scheme over a base $S$. Consider a short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{A} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

of sheaves on $X$ where $\mathcal{A}$ is a sheaf of $f^{-1} \mathcal{O}_{S}$-algebras, $\mathcal{A} \rightarrow \mathcal{O}_{X}$ is a surjection of sheaves of $f^{-1} \mathcal{O}_{S}$-algebras, and $\mathcal{I}$ is its kernel. If
(1) $\mathcal{I}$ is an ideal of square zero in $\mathcal{A}$, and
(2) $\mathcal{I}$ is quasi-coherent as an $\mathcal{O}_{X}$-module
then $X^{\prime}=(X, \mathcal{A})$ is a scheme and $X \rightarrow X^{\prime}$ is a first order thickening over $S$. Moreover, any first order thickening over $S$ is of this form.

Proof. It is clear that $X^{\prime}$ is a locally ringed space. Let $U=\operatorname{Spec}(B)$ be an affine open of $X$. Set $A=\Gamma(U, \mathcal{A})$. Note that since $H^{1}(U, \mathcal{I})=0$ (see Cohomology of Schemes, Lemma 29.2.2 the map $A \rightarrow B$ is surjective. By assumption the kernel $I=\mathcal{I}(U)$ is an ideal of square zero in the ring $A$. By Schemes, Lemma 25.6.4 there is a canonical morphism of locally ringed spaces

$$
\left(U,\left.\mathcal{A}\right|_{U}\right) \longrightarrow \operatorname{Spec}(A)
$$

coming from the map $B \rightarrow \Gamma(U, \mathcal{A})$. Since this morphism fits into the commutative diagram

we see that it is a homeomorphism on underlying topological spaces. Thus to see that it is an isomorphism, it suffices to check it induces an isomorphism on the local rings. For $u \in U$ corresponding to the prime $\mathfrak{p} \subset A$ we obtain a commutative diagram of short exact sequences

The left and right vertical arrows are isomorphisms because $\mathcal{I}$ and $\mathcal{O}_{X}$ are quasicoherent sheaves. Hence also the middle map is an isomorphism. Hence every point of $X^{\prime}=(X, \mathcal{A})$ has an affine neighbourhood and $X^{\prime}$ is a scheme as desired.

06AD Lemma 36.2.3. Any thickening of an affine scheme is affine.
Proof. This is a special case of Limits, Proposition 31.10.2
Proof for a finite order thickening. Suppose that $X \subset X^{\prime}$ is a finite order thickening with $X$ affine. Then we may use Serre's criterion to prove $X^{\prime}$ is affine. More precisely, we will use Cohomology of Schemes, Lemma 29.3.1. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{\prime}}$-module. It suffices to show that $H^{1}\left(X^{\prime}, \mathcal{F}\right)=0$. Denote $i: X \rightarrow X^{\prime}$ the given closed immersion and denote $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}: \mathcal{O}_{X^{\prime}} \rightarrow i_{*} \mathcal{O}_{X}\right)$. By our discussion of finite order thickenings (following Definition 36.2.1) there exists an $n \geq 0$ and a filtration

$$
0=\mathcal{F}_{n+1} \subset \mathcal{F}_{n} \subset \mathcal{F}_{n-1} \subset \ldots \subset \mathcal{F}_{0}=\mathcal{F}
$$

by quasi-coherent submodules such that $\mathcal{F}_{a} / \mathcal{F}_{a+1}$ is annihilated by $\mathcal{I}$. Namely, we can take $\mathcal{F}_{a}=\mathcal{I}^{a} \mathcal{F}$. Then $\mathcal{F}_{a} / \mathcal{F}_{a+1}=i_{*} \mathcal{G}_{a}$ for some quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{G}_{a}$, see Morphisms, Lemma 28.4.1. We obtain

$$
H^{1}\left(X^{\prime}, \mathcal{F}_{a} / \mathcal{F}_{a+1}\right)=H^{1}\left(X^{\prime}, i_{*} \mathcal{G}_{a}\right)=H^{1}\left(X, \mathcal{G}_{a}\right)=0
$$

The second equality comes from Cohomology of Schemes, Lemma 29.2.4 and the last equality from Cohomology of Schemes, Lemma 29.2.2. Thus $\mathcal{F}$ has a finite filtration whose successive quotients have vanishing first cohomology and it follows by a simple induction argument that $H^{1}\left(X^{\prime}, \mathcal{F}\right)=0$.

09ZU Lemma 36.2.4. Let $S \subset S^{\prime}$ be a thickening of schemes. Let $X^{\prime} \rightarrow S^{\prime}$ be a morphism and set $X=S \times{ }_{S^{\prime}} X^{\prime}$. Then $\left(X \subset X^{\prime}\right) \rightarrow\left(S \subset S^{\prime}\right)$ is a morphism of thickenings. If $S \subset S^{\prime}$ is a first (resp. finite order) thickening, then $X \subset X^{\prime}$ is a first (resp. finite order) thickening.

Proof. Omitted.
0BPE Lemma 36.2.5. If $S \subset S^{\prime}$ and $S^{\prime} \subset S^{\prime \prime}$ are thickenings, then so is $S \subset S^{\prime \prime}$.
Proof. Omitted.
0BPF Lemma 36.2.6. The property of being a thickening is fpqc local. Similarly for first order thickenings.
Proof. The statement means the following: Let $X \rightarrow X^{\prime}$ be a morphism of schemes and let $\left\{g_{i}: X_{i}^{\prime} \rightarrow X^{\prime}\right\}$ be an fpqc covering such that the base change $X_{i} \rightarrow X_{i}^{\prime}$ is a thickening for all $i$. Then $X \rightarrow X^{\prime}$ is a thickening. Since the morphisms $g_{i}$ are jointly surjective we conclude that $X \rightarrow X^{\prime}$ is surjective. By Descent, Lemma 34.19 .17 we conclude that $X \rightarrow X^{\prime}$ is a closed immersion. Thus $X \rightarrow X^{\prime}$ is a thickening. We omit the proof in the case of first order thickenings.

09ZV Lemma 36.2.7. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(S \subset S^{\prime}\right)$ be a morphism of thickenings. Then
(1) $f$ is an affine morphism if and only if $f^{\prime}$ is an affine morphism,
(2) $f$ is a surjective morphism if and only if $f^{\prime}$ is a surjective morphism,
(3) $f$ is quasi-compact if and only if $f^{\prime}$ quasi-compact,
(4) $f$ is universally closed if and only if $f^{\prime}$ is universally closed,
(5) $f$ is integral if and only if $f^{\prime}$ is integral,
(6) $f$ is (quasi-)separated if and only if $f^{\prime}$ is (quasi-)separated,
(7) $f$ is universally injective if and only if $f^{\prime}$ is universally injective,
(8) $f$ is universally open if and only if $f^{\prime}$ is universally open, and
(9) add more here.

Proof. Observe that $S \rightarrow S^{\prime}$ and $X \rightarrow X^{\prime}$ are universal homeomorphisms (see for example Morphisms, Lemma 28.44.4). This immediately implies parts (2), (3), (4), (7), and (8). Part (1) follows from Lemma 36.2 .3 which tells us that there is a 1-to-1 correspondence between affine opens of $S$ and $S^{\prime}$ and between affine opens of $X$ and $X^{\prime}$. Part (5) follows from (1) and (4) by Morphisms, Lemma 28.43.7. Finally, note that

$$
S \times_{X} S=S \times_{X^{\prime}} S \rightarrow S \times_{X^{\prime}} S^{\prime} \rightarrow S^{\prime} \times_{X^{\prime}} S^{\prime}
$$

is a thickening (the two arrows are thickenings by Lemma 36.2.4. Hence applying (3) and (4) to the morphism $\left(S \subset S^{\prime}\right) \rightarrow\left(S \times_{X} S \rightarrow S^{\prime} \times_{X^{\prime}} S^{\prime}\right)$ we obtain (6).

09ZW Lemma 36.2.8. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(S \subset S^{\prime}\right)$ be a morphism of thickenings such that $X=S \times{ }_{S^{\prime}} X^{\prime}$. If $S \subset S^{\prime}$ is a finite order thickening, then
(1) $f$ is a closed immersion if and only if $f^{\prime}$ is a closed immersion,
(2) $f$ is locally of finite type if and only if $f^{\prime}$ is locally of finite type,
(3) $f$ is locally quasi-finite if and only if $f^{\prime}$ is locally quasi-finite,
(4) $f$ is locally of finite type of relative dimension $d$ if and only if $f^{\prime}$ is locally of finite type of relative dimension d,
(5) $\Omega_{X / S}=0$ if and only if $\Omega_{X^{\prime} / S^{\prime}}=0$,
(6) $f$ is unramified if and only if $f^{\prime}$ is unramified,
(7) $f$ is proper if and only if $f^{\prime}$ is proper,
(8) $f$ is finite if and only if $f^{\prime}$ is finite,
(9) $f$ is a monomorphism if and only if $f^{\prime}$ is a monomorphism,
(10) $f$ is an immersion if and only if $f^{\prime}$ is an immersion, and
(11) add more here.

Proof. The properties $\mathcal{P}$ listed in the lemma are all stable under base change, hence if $f^{\prime}$ has property $\mathcal{P}$, then so does $f$. See Schemes, Lemmas 25.18 .2 and 25.23 .5 and Morphisms, Lemmas 28.15.4, 28.20.13, 28.29.2, 28.33.10, 28.35.5, 28.41.5, and 28.43.6.

The interesting direction in each case is therefore to assume that $f$ has the property and deduce that $f^{\prime}$ has it too. By induction on the order of the thickening we may assume that $S \subset S^{\prime}$ is a first order thickening, see discussion immediately following Definition 36.2.1.

Most of the proofs will use a reduction to the affine case. Let $U^{\prime} \subset S^{\prime}$ be an affine open and let $V^{\prime} \subset X^{\prime}$ be an affine open lying over $U^{\prime}$. Let $U^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ and denote $I \subset A^{\prime}$ be the ideal defining the closed subscheme $U^{\prime} \cap S$. Say $V^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$. Then $V^{\prime} \cap X=\operatorname{Spec}\left(B^{\prime} / I B^{\prime}\right)$. Setting $A=A^{\prime} / I$ and $B=B^{\prime} / I B^{\prime}$ we get a commutative diagram

with exact rows and $I^{2}=0$.
The translation of (1) into algebra: If $A \rightarrow B$ is surjective, then $A^{\prime} \rightarrow B^{\prime}$ is surjective. This follows from Nakayama's lemma (Algebra, Lemma 10.19.1).

The translation of (2) into algebra: If $A \rightarrow B$ is a finite type ring map, then $A^{\prime} \rightarrow B^{\prime}$ is a finite type ring map. This follows from Nakayama's lemma (Algebra, Lemma 10.19.1) applied to a map $A^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow B^{\prime}$ such that $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ is surjective.

Proof of (3). Follows from (2) and that quasi-finiteness of a morphism which is locally of finite type can be checked on fibres, see Morphisms, Lemma 28.20.6.

Proof of (4). Follows from (2) and that the additional property of "being of relative dimension $d "$ can be checked on fibres (by definition, see Morphisms, Definition 28.29.1.

The translation of (5) into algebra: If $\Omega_{B / A}=0$, then $\Omega_{B^{\prime} / A^{\prime}}=0$. By Algebra, Lemma 10.130 .12 we have $0=\Omega_{B / A}=\Omega_{B^{\prime} / A^{\prime}} / I \Omega_{B^{\prime} / A^{\prime}}$. Hence $\Omega_{B^{\prime} / A^{\prime}}=0$ by Nakayama's lemma (Algebra, Lemma 10.19.1).
The translation of (6) into algebra: If $A \rightarrow B$ is unramified map, then $A^{\prime} \rightarrow B^{\prime}$ is unramified. Since $A \rightarrow B$ is of finite type we see that $A^{\prime} \rightarrow B^{\prime}$ is of finite type by (2) above. Since $A \rightarrow B$ is unramified we have $\Omega_{B / A}=0$. By part (5) we have $\Omega_{B^{\prime} / A^{\prime}}=0$. Thus $A^{\prime} \rightarrow B^{\prime}$ is unramified.

Proof of (7). Follows by combining (2) with results of Lemma 36.2.7 and the fact that proper equals quasi-compact + separated + locally of finite type + universally closed.
Proof of (8). Follows by combining (2) with results of Lemma 36.2.7 and using the fact that finite equals integral + locally of finite type (Morphisms, Lemma 28.43.4).

Proof of (9). As $f$ is a monomorphism we have $X=X \times_{S} X$. We may apply the results proved so far to the morphism of thickenings $\left(X \subset X^{\prime}\right) \rightarrow\left(X \times_{S} X \subset\right.$ $X^{\prime} \times{ }_{S^{\prime}} X^{\prime}$ ). We conclude $X^{\prime} \rightarrow X^{\prime} \times{ }_{S^{\prime}} X^{\prime}$ is a closed immersion by (1). In fact, it is a first order thickening as the ideal defining the closed immersion $X^{\prime} \rightarrow X^{\prime} \times{ }_{S^{\prime}} X^{\prime}$ is contained in the pullback of the ideal $\mathcal{I} \subset \mathcal{O}_{S^{\prime}}$ cutting out $S$ in $S^{\prime}$. Indeed, $X=X \times_{S} X=\left(X^{\prime} \times{ }_{S^{\prime}} X^{\prime}\right) \times_{S^{\prime}} S$ is contained in $X^{\prime}$. Hence by Morphisms, Lemma 28.33 .7 it suffices to show that $\Omega_{X^{\prime} / S^{\prime}}=0$ which follows from (5) and the corresponding statement for $X / S$.

Proof of (10). If $f: X \rightarrow S$ is an immersion, then it factors as $X \rightarrow U \rightarrow S$ where $U \rightarrow S$ is an open immersion and $X \rightarrow U$ is a closed immersion. Let $U^{\prime} \subset S^{\prime}$ be the open subscheme whose underlying topological space is the same as $U$. Then $X^{\prime} \rightarrow S^{\prime}$ factors through $U^{\prime}$ and we conclude that $X^{\prime} \rightarrow U^{\prime}$ is a closed immersion by part (1). This finishes the proof.

The following lemma is a variant on the preceding one. Rather than assume that the thickenings involved are finite order (which allows us to transfer the property of being locally of finite type from $f$ to $f^{\prime}$ ), we instead take as given that each of $f$ and $f^{\prime}$ is locally of finite type.
0BPG Lemma 36.2.9. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \rightarrow Y^{\prime}\right)$ be a morphism of thickenings. Assume $f$ and $f^{\prime}$ are locally of finite type and $X=Y \times_{Y^{\prime}} X^{\prime}$. Then
(1) $f$ is locally quasi-finite if and only if $f^{\prime}$ is locally quasi-finite,
(2) $f$ is finite if and only if $f^{\prime}$ is finite,
(3) $f$ is a closed immersion if and only if $f^{\prime}$ is a closed immersion,
(4) $\Omega_{X / Y}=0$ if and only if $\Omega_{X^{\prime} / Y^{\prime}}=0$,
(5) $f$ is unramified if and only if $f^{\prime}$ is unramified,
(6) $f$ is a monomorphism if and only if $f^{\prime}$ is a monomorphism,
(7) $f$ is an immersion if and only if $f^{\prime}$ is an immersion,
(8) $f$ is proper if and only if $f^{\prime}$ is proper, and
(9) add more here.

Proof. The properties $\mathcal{P}$ listed in the lemma are all stable under base change, hence if $f^{\prime}$ has property $\mathcal{P}$, then so does $f$. See Schemes, Lemmas 25.18.2 and 25.23 .5 and Morphisms, Lemmas 28.20.13, 28.29.2, 28.33.10, 28.35.5, 28.41.5, and 28.43.6. Hence in each case we need only to prove that if $f$ has the desired property, so does $f^{\prime}$.

A morphism is locally quasi-finite if and only if it is locally of finite type and the scheme theoretic fibres are discrete spaces, see Morphisms, Lemma 28.20.8. Since the underlying topological space is unchanged by passing to a thickening, we see that $f^{\prime}$ is locally quasi-finite if (and only if) $f$ is. This proves (1).
Case (2) follows from case (5) of Lemma 36.2 .7 and the fact that the finite morphisms are precisely the integral morphisms that are locally of finite type (Morphisms, Lemma 28.43.4.
Case (3). This follows immediately from Morphisms, Lemma 28.44.5.
Case (4) follows from the following algebra statement: Let $A$ be a ring and let $I \subset A$ be a locally nilpotent ideal. Let $B$ be a finite type $A$-algebra. If $\Omega_{(B / I B) /(A / I)}=0$, then $\Omega_{B / A}=0$. Namely, the assumption means that $I \Omega_{B / A}=0$, see Algebra, Lemma 10.130 .12 . On the other hand $\Omega_{B / A}$ is a finite $B$-module, see Algebra, Lemma 10.130.16 Hence the vanising of $\Omega_{B / A}$ follows from Nakayama's lemma (Algebra, Lemma 10.19.1) and the fact that $I B$ is contained in the radical of $B$.
Case (5) follows immediately from (4) and Morphisms, Lemma 28.35.2,
Proof of (6). As $f$ is a monomorphism we have $X=X \times_{Y} X$. We may apply the results proved so far to the morphism of thickenings $\left(X \subset X^{\prime}\right) \rightarrow\left(X \times_{Y} X \subset\right.$ $X^{\prime} \times_{Y^{\prime}} X^{\prime}$ ). We conclude $\Delta_{X^{\prime} / Y^{\prime}}: X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is a closed immersion by (3). In fact $\Delta_{X^{\prime} / Y^{\prime}}$ is a bijection on underlying sets, hence $\Delta_{X^{\prime} / Y^{\prime}}$ is a thickening. On the other hand $\Delta_{X^{\prime} / Y^{\prime}}$ is locally of finite presentation by Morphisms, Lemma 28.21.12. In other words, $\Delta_{X^{\prime} / Y^{\prime}}\left(X^{\prime}\right)$ is cut out by a quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X^{\prime} \times_{Y^{\prime}} X^{\prime}}$ of finite type. Since $\Omega_{X^{\prime} / Y^{\prime}}=0$ by (5) we see that the conormal sheaf of $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is zero by Morphisms, Lemma 28.33.7. In other words, $\mathcal{J} / \mathcal{J}^{2}=0$. This implies $\Delta_{X^{\prime} / Y^{\prime}}$ is an isomorphism, for example by Algebra, Lemma 10.20 .5 .

Proof of (7). If $f: X \rightarrow Y$ is an immersion, then it factors as $X \rightarrow V \rightarrow Y$ where $V \rightarrow Y$ is an open immersion and $X \rightarrow V$ is a closed immersion. Let $V^{\prime} \subset Y^{\prime}$ be the open subscheme whose underlying topological space is the same as $V$. Then $X^{\prime} \rightarrow V^{\prime}$ factors through $V^{\prime}$ and we conclude that $X^{\prime} \rightarrow V^{\prime}$ is a closed immersion by part (3).

Case (8) follows from Lemma 36.2.7 and the definition of proper morphisms as being the quasi-compact, universally closed, and separated morphisms that are locally of finite type.

### 36.3. First order infinitesimal neighbourhood

05 YW A natural construction of first order thickenings is the following. Suppose that $i: Z \rightarrow X$ be an immersion of schemes. Choose an open subscheme $U \subset X$ such that $i$ identifies $Z$ with a closed subscheme $Z \subset U$. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the quasi-coherent sheaf of ideals defining $Z$ in $U$. Then we can consider the closed subscheme $Z^{\prime} \subset U$ defined by the quasi-coherent sheaf of ideals $\mathcal{I}^{2}$.
04EY Definition 36.3.1. Let $i: Z \rightarrow X$ be an immersion of schemes. The first order infinitesimal neighbourhood of $Z$ in $X$ is the first order thickening $Z \subset Z^{\prime}$ over $X$ described above.

This thickening has the following universal property (which will assuage any fears that the construction above depends on the choice of the open $U$ ).

04EZ Lemma 36.3.2. Let $i: Z \rightarrow X$ be an immersion of schemes. The first order infinitesimal neighbourhood $Z^{\prime}$ of $Z$ in $X$ has the following universal property: Given any commutative diagram

where $T \subset T^{\prime}$ is a first order thickening over $X$, there exists a unique morphism $\left(a^{\prime}, a\right):\left(T \subset T^{\prime}\right) \rightarrow\left(Z \subset Z^{\prime}\right)$ of thickenings over $X$.

Proof. Let $U \subset X$ be the open used in the construction of $Z^{\prime}$, i.e., an open such that $Z$ is identified with a closed subscheme of $U$ cut out by the quasi-coherent sheaf of ideals $\mathcal{I}$. Since $|T|=\left|T^{\prime}\right|$ we see that $b\left(T^{\prime}\right) \subset U$. Hence we can think of $b$ as a morphism into $U$. Let $\mathcal{J} \subset \mathcal{O}_{T^{\prime}}$ be the ideal cutting out $T$. Since $b(T) \subset Z$ by the diagram above we see that $b^{\sharp}\left(b^{-1} \mathcal{I}\right) \subset \mathcal{J}$. As $T^{\prime}$ is a first order thickening of $T$ we see that $\mathcal{J}^{2}=0$ hence $b^{\sharp}\left(b^{-1}\left(\mathcal{I}^{2}\right)\right)=0$. By Schemes, Lemma 25.4.6 this implies that $b$ factors through $Z^{\prime}$. Denote $a^{\prime}: T^{\prime} \rightarrow Z^{\prime}$ this factorization and everything is clear.

04F0 Lemma 36.3.3. Let $i: Z \rightarrow X$ be an immersion of schemes. Let $Z \subset Z^{\prime}$ be the first order infinitesimal neighbourhood of $Z$ in $X$. Then the diagram

induces a map of conormal sheaves $\mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Z^{\prime}}$ by Morphisms, Lemma 28.32.3. This map is an isomorphism.

Proof. This is clear from the construction of $Z^{\prime}$ above.

### 36.4. Formally unramified morphisms

02H7 Recall that a ring map $R \rightarrow A$ is called formally unramified (see Algebra, Definition 10.144.1) if for every commutative solid diagram

where $I \subset B$ is an ideal of square zero, at most one dotted arrow exists which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

02H8 Definition 36.4.1. Let $f: X \rightarrow S$ be a morphism of schemes. We say $f$ is formally unramified if given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of affine schemes over $S$ there exists at most one dotted arrow making the diagram commute.

We first prove some formal lemmas, i.e., lemmas which can be proved by drawing the corresponding diagrams.
04F1 Lemma 36.4.2. If $f: X \rightarrow S$ is a formally unramified morphism, then given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of schemes over $S$ there exists at most one dotted arrow making the diagram commute. In other words, in Definition 36.4.1 the condition that $T$ be affine may be dropped.

Proof. This is true because a morphism is determined by its restrictions to affine opens.

02HA Lemma 36.4.3. A composition of formally unramified morphisms is formally unramified.

Proof. This is formal.
02HB Lemma 36.4.4. A base change of a formally unramified morphism is formally unramified.

Proof. This is formal.
02HC Lemma 36.4.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open such that $f(U) \subset V$. If $f$ is formally unramified, so is $\left.f\right|_{U}: U \rightarrow V$.

Proof. Consider a solid diagram

as in Definition 36.4.1. If $f$ is formally ramified, then there exists at most one $S$-morphism $a^{\prime}: T^{\prime} \rightarrow X$ such that $\left.a^{\prime}\right|_{T}=a$. Hence clearly there exists at most one such morphism into $U$.

02HD Lemma 36.4.6. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $X$ and $S$ are affine. Then $f$ is formally unramified if and only if $\mathcal{O}_{S}(S) \rightarrow \mathcal{O}_{X}(X)$ is a formally unramified ring map.

Proof. This is immediate from the definitions (Definition 36.4.1 and Algebra, Definition 10.144.1 by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 25.6.5.

Here is a characterization in terms of the sheaf of differentials.
02H9 Lemma 36.4.7. Let $f: X \rightarrow S$ be a morphism of schemes. Then $f$ is formally unramified if and only if $\Omega_{X / S}=0$.

Proof. We give two proofs.
First proof. It suffices to show that $\Omega_{X / S}$ is zero on the members of an affine open covering of $X$. Choose an affine open $U \subset X$ with $f(U) \subset V$ where $V \subset S$ is an affine open of $S$. By Lemma 36.4.5 the restriction $f_{U}: U \rightarrow V$ is formally unramified. By Morphisms, Lemma 28.33 .5 we see that $\left.\Omega_{X / S}\right|_{U}$ is the quasi-coherent sheaf associated to the $\mathcal{O}_{X}(U)$-module $\Omega_{\mathcal{O}_{X}(U) / \mathcal{O}_{S}(V)}$. By Lemma 36.4.6 we see that $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is a formally unramified ring map. Hence by Algebra, Lemma 10.144 .2 we conclude that $\left.\Omega_{X / S}\right|_{U}=0$ as desired.

Second proof. We recall some of the arguments of the proof of Morphisms, Lemma 28.33.5. Let $W \subset X \times_{S} X$ be an open such that $\Delta: X \rightarrow X \times_{S} X$ induces a closed immersion into $W$. Let $\mathcal{J} \subset \mathcal{O}_{W}$ be the ideal sheaf of this closed immersion. Let $X^{\prime} \subset W$ be the closed subscheme defined by the quasi-coherent sheaf of ideals $\mathcal{J}^{2}$. Consider the two morphisms $p_{1}, p_{2}: X^{\prime} \rightarrow X$ induced by the two projections $X \times_{S} X \rightarrow X$. Note that $p_{1}$ and $p_{2}$ agree when composed with $\Delta: X \rightarrow X^{\prime}$ and that $X \rightarrow X^{\prime}$ is a closed immersion defined by a an ideal whose square is zero. Moreover there is a short exact sequence

$$
0 \rightarrow \mathcal{J} / \mathcal{J}^{2} \rightarrow \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

and $\Omega_{X / S}=\mathcal{J} / \mathcal{J}^{2}$. Moreover, $\mathcal{J} / \mathcal{J}^{2}$ is generated by the local sections $p_{1}^{\sharp}(f)-p_{2}^{\sharp}(f)$ for $f$ a local section of $\mathcal{O}_{X}$.

Suppose that $f: X \rightarrow S$ is formally unramified. By assumption this means that $p_{1}=p_{2}$ when restricted to any affine open $T^{\prime} \subset X^{\prime}$. Hence $p_{1}=p_{2}$. By what was said above we conclude that $\Omega_{X / S}=\mathcal{J} / \mathcal{J}^{2}=0$.

Conversely, suppose that $\Omega_{X / S}=0$. Then $X^{\prime}=X$. Take any pair of morphisms $f_{1}^{\prime}, f_{2}^{\prime}: T^{\prime} \rightarrow X$ fitting as dotted arrows in the diagram of Definition 36.4.1. This gives a morphism $\left(f_{1}^{\prime}, f_{2}^{\prime}\right): T^{\prime} \rightarrow X \times_{S} X$. Since $\left.f_{1}^{\prime}\right|_{T}=\left.f_{2}^{\prime}\right|_{T}$ and $|T|=\left|T^{\prime}\right|$ we see that the image of $T^{\prime}$ under $\left(f_{1}^{\prime}, f_{2}^{\prime}\right)$ is contained in the open $W$ chosen above. Since $\left(f_{1}^{\prime}, f_{2}^{\prime}\right)(T) \subset \Delta(X)$ and since $T$ is defined by an ideal of square zero in $T^{\prime}$ we see that $\left(f_{1}^{\prime}, f_{2}^{\prime}\right)$ factors through $X^{\prime}$. As $X^{\prime}=X$ we conclude $f_{1}^{\prime}=f_{2}^{\prime}$ as desired.

02HE Lemma 36.4.8. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is unramified (resp. G-unramified), and
(2) the morphism $f$ is locally of finite type (resp. locally of finite presentation) and formally unramified.

Proof. Use Lemma 36.4.7 and Morphisms, Lemma 28.35.2.

### 36.5. Universal first order thickenings

04F2 Let $h: Z \rightarrow X$ be a morphism of schemes. A universal first order thickening of $Z$ over $X$ is a first order thickening $Z \subset Z^{\prime}$ over $X$ such that given any first order
thickening $T \subset T^{\prime}$ over $X$ and a solid commutative diagram

there exists a unique dotted arrow making the diagram commute. Note that in this situation $\left(a, a^{\prime}\right):\left(T \subset T^{\prime}\right) \rightarrow\left(Z \subset Z^{\prime}\right)$ is a morphism of thickenings over $X$. Thus if a universal first order thickening exists, then it is unique up to unique isomorphism. In general a universal first order thickening does not exist, but if $h$ is formally unramified then it does.

04F3 Lemma 36.5.1. Let $h: Z \rightarrow X$ be a formally unramified morphism of schemes. There exists a universal first order thickening $Z \subset Z^{\prime}$ of $Z$ over $X$.

Proof. During this proof we will say $Z \subset Z^{\prime}$ is a universal first order thickening of $Z$ over $X$ if it satisfies the condition of the lemma. We will construct the universal first order thickening $Z \subset Z^{\prime}$ over $X$ by glueing, starting with the affine case which is Algebra, Lemma 10.145.1. We begin with some general remarks.

If a universal first order thickening of $Z$ over $X$ exists, then it is unique up to unique isomorphism. Moreover, suppose that $V \subset Z$ and $U \subset X$ are open subschemes such that $h(V) \subset U$. Let $Z \subset Z^{\prime}$ be a universal first order thickening of $Z$ over $X$. Let $V^{\prime} \subset Z^{\prime}$ be the open subscheme such that $V=Z \cap V^{\prime}$. Then we claim that $V \subset V^{\prime}$ is the universal first order thickening of $V$ over $U$. Namely, suppose given any diagram

where $T \subset T^{\prime}$ is a first order thickening over $U$. By the universal property of $Z^{\prime}$ we obtain $\left(a, a^{\prime}\right):\left(T \subset T^{\prime}\right) \rightarrow\left(Z \subset Z^{\prime}\right)$. But since we have equality $|T|=\left|T^{\prime}\right|$ of underlying topological spaces we see that $a^{\prime}\left(T^{\prime}\right) \subset V^{\prime}$. Hence we may think of ( $a, a^{\prime}$ ) as a morphism of thickenings $\left(a, a^{\prime}\right):\left(T \subset T^{\prime}\right) \rightarrow\left(V \subset V^{\prime}\right)$ over $U$. Uniqueness is clear also. In a completely similar manner one proves that if $h(Z) \subset U$ and $Z \subset Z^{\prime}$ is a universal first order thickening over $U$, then $Z \subset Z^{\prime}$ is a universal first order thickening over $X$.

Before we glue affine pieces let us show that the lemma holds if $Z$ and $X$ are affine. Say $X=\operatorname{Spec}(R)$ and $Z=\operatorname{Spec}(S)$. By Algebra, Lemma 10.145.1 there exists a first order thickening $Z \subset Z^{\prime}$ over $X$ which has the universal property of the lemma for diagrams

where $T, T^{\prime}$ are affine. Given a general diagram we can choose an affine open covering $T^{\prime}=\bigcup T_{i}^{\prime}$ and we obtain morphisms $a_{i}^{\prime}: T_{i}^{\prime} \rightarrow Z^{\prime}$ over $X$ such that $\left.a_{i}^{\prime}\right|_{T_{i}}=\left.a\right|_{T_{i}}$. By uniqueness we see that $a_{i}^{\prime}$ and $a_{j}^{\prime}$ agree on any affine open of $T_{i}^{\prime} \cap T_{j}^{\prime}$. Hence the morphisms $a_{i}^{\prime}$ glue to a global morphism $a^{\prime}: T^{\prime} \rightarrow Z^{\prime}$ over $X$ as desired. Thus the lemma holds if $X$ and $Z$ are affine.

Choose an affine open covering $Z=\bigcup Z_{i}$ such that each $Z_{i}$ maps into an affine open $U_{i}$ of $X$. By Lemma 36.4.5 the morphisms $Z_{i} \rightarrow U_{i}$ are formally unramified. Hence by the affine case we obtain universal first order thickenings $Z_{i} \subset Z_{i}^{\prime}$ over $U_{i}$. By the general remarks above $Z_{i} \subset Z_{i}^{\prime}$ is also a universal first order thickening of $Z_{i}$ over $X$. Let $Z_{i, j}^{\prime} \subset Z_{i}^{\prime}$ be the open subscheme such that $Z_{i} \cap Z_{j}=Z_{i, j}^{\prime} \cap Z_{i}$. By the general remarks we see that both $Z_{i, j}^{\prime}$ and $Z_{j, i}^{\prime}$ are universal first order thickenings of $Z_{i} \cap Z_{j}$ over $X$. Thus, by the first of our general remarks, we see that there is a canonical isomorphism $\varphi_{i j}: Z_{i, j}^{\prime} \rightarrow Z_{j, i}^{\prime}$ inducing the identity on $Z_{i} \cap Z_{j}$. We claim that these morphisms satisfy the cocycle condition of Schemes, Section 25.14 (Verification omitted. Hint: Use that $Z_{i, j}^{\prime} \cap Z_{i, k}^{\prime}$ is the universal first order thickening of $Z_{i} \cap Z_{j} \cap Z_{k}$ which determines it up to unique isomorphism by what was said above.) Hence we can use the results of Schemes, Section 25.14 to get a first order thickening $Z \subset Z^{\prime}$ over $X$ which the property that the open subscheme $Z_{i}^{\prime} \subset Z^{\prime}$ with $Z_{i}=Z_{i}^{\prime} \cap Z$ is a universal first order thickening of $Z_{i}$ over $X$.

It turns out that this implies formally that $Z^{\prime}$ is a universal first order thickening of $Z$ over $X$. Namely, we have the universal property for any diagram

where $a(T)$ is contained in some $Z_{i}$. Given a general diagram we can choose an open covering $T^{\prime}=\bigcup T_{i}^{\prime}$ such that $a\left(T_{i}\right) \subset Z_{i}$. We obtain morphisms $a_{i}^{\prime}: T_{i}^{\prime} \rightarrow Z^{\prime}$ over $X$ such that $\left.a_{i}^{\prime}\right|_{T_{i}}=\left.a\right|_{T_{i}}$. We see that $a_{i}^{\prime}$ and $a_{j}^{\prime}$ necessarily agree on $T_{i}^{\prime} \cap T_{j}^{\prime}$ since both $\left.a_{i}^{\prime}\right|_{T_{i}^{\prime} \cap T_{j}^{\prime}}$ and $\left.a_{j}^{\prime}\right|_{T_{i}^{\prime} \cap T_{j}^{\prime}}$ are solutions of the problem of mapping into the universal first oder thickening $Z_{i}^{\prime} \cap Z_{j}^{\prime}$ of $Z_{i} \cap Z_{j}$ over $X$. Hence the morphisms $a_{i}^{\prime}$ glue to a global morphism $a^{\prime}: T^{\prime} \rightarrow Z^{\prime}$ over $X$ as desired. This finishes the proof.

04F4 Definition 36.5.2. Let $h: Z \rightarrow X$ be a formally unramified morphism of schemes.
(1) The universal first order thickening of $Z$ over $X$ is the thickening $Z \subset Z^{\prime}$ constructed in Lemma 36.5.1.
(2) The conormal sheaf of $Z$ over $X$ is the conormal sheaf of $Z$ in its universal first order thickening $Z^{\prime}$ over $X$.
We often denote the conormal sheaf $\mathcal{C}_{Z / X}$ in this situation.
Thus we see that there is a short exact sequence of sheaves

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{O}_{Z^{\prime}} \rightarrow \mathcal{O}_{Z} \rightarrow 0
$$

on $Z$. The following lemma proves that there is no conflict between this definition and the definition in case $Z \rightarrow X$ is an immersion.

04F5 Lemma 36.5.3. Let $i: Z \rightarrow X$ be an immersion of schemes. Then
(1) $i$ is formally unramified,
(2) the universal first order thickening of $Z$ over $X$ is the first order infinitesimal neighbourhood of $Z$ in $X$ of Definition 36.3.1, and
(3) the conormal sheaf of $i$ in the sense of Morphisms, Definition 28.32.1 agrees with the conormal sheaf of $i$ in the sense of Definition 36.5.2.

Proof. By Morphisms, Lemmas 28.35 .7 and 28.35 .8 an immersion is unramified, hence formally unramified by Lemma 36.4.8. The other assertions follow by combining Lemmas 36.3 .2 and 36.3 .3 and the definitions.

04F6 Lemma 36.5.4. Let $Z \rightarrow X$ be a formally unramified morphism of schemes. Then the universal first order thickening $Z^{\prime}$ is formally unramified over $X$.

Proof. There are two proofs. The first is to show that $\Omega_{Z^{\prime} / X}=0$ by working affine locally and applying Algebra, Lemma 10.145.5. Then Lemma 36.4.7 implies what we want. The second is a direct argument as follows.

Let $T \subset T^{\prime}$ be a first order thickening. Let

be a commutative diagram. Consider two morphisms $a, b: T^{\prime} \rightarrow Z^{\prime}$ fitting into the diagram. Set $T_{0}=c^{-1}(Z) \subset T$ and $T_{a}^{\prime}=a^{-1}(Z)$ (scheme theoretically). Since $Z^{\prime}$ is a first order thickening of $Z$, we see that $T^{\prime}$ is a first order thickening of $T_{a}^{\prime}$. Moreover, since $c=\left.a\right|_{T}$ we see that $T_{0}=T \cap T_{a}^{\prime}$ (scheme theoretically). As $T^{\prime}$ is a first order thickening of $T$ it follows that $T_{a}^{\prime}$ is a first order thickening of $T_{0}$. Now $\left.a\right|_{T_{a}^{\prime}}$ and $\left.b\right|_{T_{a}^{\prime}}$ are morphisms of $T_{a}^{\prime}$ into $Z^{\prime}$ over $X$ which agree on $T_{0}$ as morphisms into $Z$. Hence by the universal property of $Z^{\prime}$ we conclude that $\left.a\right|_{T_{a}^{\prime}}=\left.b\right|_{T_{a}^{\prime}}$. Thus $a$ and $b$ are morphism from the first order thickening $T^{\prime}$ of $T_{a}^{\prime}$ whose restrictions to $T_{a}^{\prime}$ agree as morphisms into $Z$. Thus using the universal property of $Z^{\prime}$ once more we conclude that $a=b$. In other words, the defining property of a formally unramified morphism holds for $Z^{\prime} \rightarrow X$ as desired.

04F7 Lemma 36.5.5. Consider a commutative diagram of schemes

with $h$ and $h^{\prime}$ formally unramified. Let $Z \subset Z^{\prime}$ be the universal first order thickening of $Z$ over $X$. Let $W \subset W^{\prime}$ be the universal first order thickening of $W$ over $Y$. There exists a canonical morphism $\left(f, f^{\prime}\right):\left(Z, Z^{\prime}\right) \rightarrow\left(W, W^{\prime}\right)$ of thickenings over
$Y$ which fits into the following commutative diagram

In particular the morphism $\left(f, f^{\prime}\right)$ of thickenings induces a morphism of conormal sheaves $f^{*} \mathcal{C}_{W / Y} \rightarrow \mathcal{C}_{Z / X}$.

Proof. The first assertion is clear from the universal property of $W^{\prime}$. The induced map on conormal sheaves is the map of Morphisms, Lemma 28.32 .3 applied to $\left(Z \subset Z^{\prime}\right) \rightarrow\left(W \subset W^{\prime}\right)$.

Lemma 36.5.6. Let

be a fibre product diagram in the category of schemes with $h^{\prime}$ formally unramified. Then $h$ is formally unramified and if $W \subset W^{\prime}$ is the universal first order thickening of $W$ over $Y$, then $Z=X \times_{Y} W \subset X \times_{Y} W^{\prime}$ is the universal first order thickening of $Z$ over $X$. In particular the canonical map $f^{*} \mathcal{C}_{W / Y} \rightarrow \mathcal{C}_{Z / X}$ of Lemma 36.5.5 is surjective.

Proof. The morphism $h$ is formally unramified by Lemma 36.4.4. It is clear that $X \times_{Y} W^{\prime}$ is a first order thickening. It is straightforward to check that it has the universal property because $W^{\prime}$ has the universal property (by mapping properties of fibre products). See Morphisms, Lemma 28.32 .4 for why this implies that the map of conormal sheaves is surjective.

04F9 Lemma 36.5.7. Let

be a fibre product diagram in the category of schemes with $h^{\prime}$ formally unramified and $g$ flat. In this case the corresponding map $Z^{\prime} \rightarrow W^{\prime}$ of universal first order thickenings is flat, and $f^{*} \mathcal{C}_{W / Y} \rightarrow \mathcal{C}_{Z / X}$ is an isomorphism.

Proof. Flatness is preserved under base change, see Morphisms, Lemma 28.25.7. Hence the first statement follows from the description of $W^{\prime}$ in Lemma 36.5.6. It is clear that $X \times_{Y} W^{\prime}$ is a first order thickening. It is straightforward to check that it has the universal property because $W^{\prime}$ has the universal property (by mapping properties of fibre products). See Morphisms, Lemma 28.32 .4 for why this implies that the map of conormal sheaves is an isomorphism.

04FA Lemma 36.5.8. Taking the universal first order thickenings commutes with taking opens. More precisely, let $h: Z \rightarrow X$ be a formally unramified morphism of schemes. Let $V \subset Z, U \subset X$ be opens such that $h(V) \subset U$. Let $Z^{\prime}$ be the universal first order thickening of $Z$ over $X$. Then $\left.h\right|_{V}: V \rightarrow U$ is formally unramified and the universal first order thickening of $V$ over $U$ is the open subscheme $V^{\prime} \subset Z^{\prime}$ such that $V=Z \cap V^{\prime}$. In particular, $\left.\mathcal{C}_{Z / X}\right|_{V}=\mathcal{C}_{V / U}$.

Proof. The first statement is Lemma 36.4.5. The compatibility of universal thickenings can be deduced from the proof of Lemma 36.5.1, or from Algebra, Lemma 10.145.4 or deduced from Lemma 36.5.7.

04FB Lemma 36.5.9. Let $h: Z \rightarrow X$ be a formally unramified morphism of schemes over $S$. Let $Z \subset Z^{\prime}$ be the universal first order thickening of $Z$ over $X$ with structure morphism $h^{\prime}: Z^{\prime} \rightarrow X$. The canonical map

$$
c_{h^{\prime}}:\left(h^{\prime}\right)^{*} \Omega_{X / S} \longrightarrow \Omega_{Z^{\prime} / S}
$$

induces an isomorphism $h^{*} \Omega_{X / S} \rightarrow \Omega_{Z^{\prime} / S} \otimes \mathcal{O}_{Z}$.
Proof. The map $c_{h^{\prime}}$ is the map defined in Morphisms, Lemma 28.33.8. If $i: Z \rightarrow$ $Z^{\prime}$ is the given closed immersion, then $i^{*} c_{h^{\prime}}$ is a map $h^{*} \Omega_{X / S} \rightarrow \Omega_{Z^{\prime} / S} \otimes \mathcal{O}_{Z}$. Checking that it is an isomorphism reduces to the affine case by localization, see Lemma 36.5.8 and Morphisms, Lemma 28.33.3. In this case the result is Algebra, Lemma 10.145 .5

04FC Lemma 36.5.10. Let $h: Z \rightarrow X$ be a formally unramified morphism of schemes over $S$. There is a canonical exact sequence

$$
\mathcal{C}_{Z / X} \rightarrow h^{*} \Omega_{X / S} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

The first arrow is induced by $d_{Z^{\prime} / S}$ where $Z^{\prime}$ is the universal first order neighbourhood of $Z$ over $X$.

Proof. We know that there is a canonical exact sequence

$$
\mathcal{C}_{Z / Z^{\prime}} \rightarrow \Omega_{Z^{\prime} / S} \otimes \mathcal{O}_{Z} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

see Morphisms, Lemma 28.33.15. Hence the result follows on applying Lemma 36.5.9.

067 V
Lemma 36.5.11. Let

be a commutative diagram of schemes where $i$ and $j$ are formally unramified. Then there is a canonical exact sequence

$$
\mathcal{C}_{Z / Y} \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / Y} \rightarrow 0
$$

where the first arrow comes from Lemma 36.5.5 and the second from Lemma 36.5.10.

Proof. Denote $Z \rightarrow Z^{\prime}$ the universal first order thickening of $Z$ over $X$. Denote $Z \rightarrow Z^{\prime \prime}$ the universal first order thickening of $Z$ over $Y$. By Lemma 36.5.10 here is a canonical morphism $Z^{\prime} \rightarrow Z^{\prime \prime}$ so that we have a commutative diagram

Apply Morphisms, Lemma 28.33 .18 to the left triangle to get an exact sequence

$$
\mathcal{C}_{Z / Z^{\prime \prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}} \rightarrow\left(i^{\prime}\right)^{*} \Omega_{Z^{\prime} / Z^{\prime \prime}} \rightarrow 0
$$

As $Z^{\prime \prime}$ is formally unramified over $Y$ (see Lemma 36.5.4) we have $\Omega_{Z^{\prime} / Z^{\prime \prime}}=\Omega_{Z / Y}$ (by combining Lemma 36.4.7 and Morphisms, Lemma 28.33.9). Then we have $\left(i^{\prime}\right)^{*} \Omega_{Z^{\prime} / Y}=i^{*} \Omega_{X / Y}$ by Lemma 36.5.9.

06AE Lemma 36.5.12. Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of schemes.
(1) If $Z \subset Z^{\prime}$ is the universal first order thickening of $Z$ over $X$ and $Y \subset Y^{\prime}$ is the universal first order thickening of $Y$ over $X$, then there is a morphism $Z^{\prime} \rightarrow Y^{\prime}$ and $Y \times_{Y^{\prime}} Z^{\prime}$ is the universal first order thickening of $Z$ over $Y$.
(2) There is a canonical exact sequence

$$
i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

where the maps come from Lemma 36.5.5 and $i: Z \rightarrow Y$ is the first morphism.

Proof. The map $h: Z^{\prime} \rightarrow Y^{\prime}$ in (1) comes from Lemma 36.5.5. The assertion that $Y \times_{Y^{\prime}} Z^{\prime}$ is the universal first order thickening of $Z$ over $Y$ is clear from the universal properties of $Z^{\prime}$ and $Y^{\prime}$. By Morphisms, Lemma 28.32 .5 we have an exact sequence

$$
\left(i^{\prime}\right)^{*} \mathcal{C}_{Y \times{ }_{Y^{\prime}} Z^{\prime} / Z^{\prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}} \rightarrow \mathcal{C}_{Z / Y \times{ }_{Y^{\prime}} Z^{\prime}} \rightarrow 0
$$

where $i^{\prime}: Z \rightarrow Y \times_{Y^{\prime}} Z^{\prime}$ is the given morphism. By Morphisms, Lemma 28.32.4 there exists a surjection $h^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{Y \times{ }_{Y^{\prime}} Z^{\prime} / Z^{\prime}}$. Combined with the equalities $\mathcal{C}_{Y / Y^{\prime}}=\mathcal{C}_{Y / X}, \mathcal{C}_{Z / Z^{\prime}}=\mathcal{C}_{Z / X}$, and $\mathcal{C}_{Z / Y \times_{Y^{\prime}} Z^{\prime}}=\mathcal{C}_{Z / Y}$ this proves the lemma.

### 36.6. Formally étale morphisms

02HF Recall that a ring map $R \rightarrow A$ is called formally étale (see Algebra, Definition 10.146.1) if for every commutative solid diagram

where $I \subset B$ is an ideal of square zero, there exists exactly one dotted arrow which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

02HG Definition 36.6.1. Let $f: X \rightarrow S$ be a morphism of schemes. We say $f$ is formally étale if given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of affine schemes over $S$ there exists exactly one dotted arrow making the diagram commute.

It is clear that a formally étale morphism is formally unramified. Hence if $f: X \rightarrow S$ is formally étale, then $\Omega_{X / S}$ is zero, see Lemma 36.4.7.

04FD Lemma 36.6.2. If $f: X \rightarrow S$ is a formally étale morphism, then given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of schemes over $S$ there exists exactly one dotted arrow making the diagram commute. In other words, in Definition 36.6.1 the condition that $T$ be affine may be dropped.

Proof. Let $T^{\prime}=\bigcup T_{i}^{\prime}$ be an affine open covering, and let $T_{i}=T \cap T_{i}^{\prime}$. Then we get morphisms $a_{i}^{\prime}: T_{i}^{\prime} \rightarrow X$ fitting into the diagram. By uniqueness we see that $a_{i}^{\prime}$ and $a_{j}^{\prime}$ agree on any affine open subscheme of $T_{i}^{\prime} \cap T_{j}^{\prime}$. Hence $a_{i}^{\prime}$ and $a_{j}^{\prime}$ agree on $T_{i}^{\prime} \cap T_{j}^{\prime}$. Thus we see that the morphisms $a_{i}^{\prime}$ glue to a global morphism $a^{\prime}: T^{\prime} \rightarrow X$. The uniqueness of $a^{\prime}$ we have seen in Lemma 36.4.2.

02HI Lemma 36.6.3. A composition of formally étale morphisms is formally étale.
Proof. This is formal.
02HJ Lemma 36.6.4. A base change of a formally étale morphism is formally étale.
Proof. This is formal.
02HK Lemma 36.6.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open subschemes such that $f(U) \subset V$. If $f$ is formally étale, so is $\left.f\right|_{U}: U \rightarrow V$.

Proof. Consider a solid diagram

as in Definition 36.6.1. If $f$ is formally ramified, then there exists exactly one $S$ morphism $a^{\prime}: T^{\prime} \rightarrow X$ such that $\left.a^{\prime}\right|_{T}=a$. Since $\left|T^{\prime}\right|=|T|$ we conclude that $a^{\prime}\left(T^{\prime}\right) \subset U$ which gives our unique morphism from $T^{\prime}$ into $U$.

04FE Lemma 36.6.6. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) $f$ is formally étale,
(2) $f$ is formally unramified and the universal first order thickening of $X$ over $S$ is equal to $X$,
(3) $f$ is formally unramified and $\mathcal{C}_{X / S}=0$, and
(4) $\Omega_{X / S}=0$ and $\mathcal{C}_{X / S}=0$.

Proof. Actually, the last assertion only make sense because $\Omega_{X / S}=0$ implies that $\mathcal{C}_{X / S}$ is defined via Lemma 36.4.7 and Definition 36.5.2. This also makes it clear that (3) and (4) are equivalent.

Either of the assumptions (1), (2), and (3) imply that $f$ is formally unramified. Hence we may assume $f$ is formally unramified. The equivalence of (1), (2), and (3) follow from the universal property of the universal first order thickening $X^{\prime}$ of $X$ over $S$ and the fact that $X=X^{\prime} \Leftrightarrow \mathcal{C}_{X / S}=0$ since after all by definition $\mathcal{C}_{X / S}=\mathcal{C}_{X / X^{\prime}}$ is the ideal sheaf of $X$ in $X^{\prime}$.

04FF Lemma 36.6.7. An unramified flat morphism is formally étale.
Proof. Say $X \rightarrow S$ is unramified and flat. Then $\Delta: X \rightarrow X \times_{S} X$ is an open immersion, see Morphisms, Lemma 28.35.13. We have to show that $\mathcal{C}_{X / S}$ is zero. Consider the two projections $p, q: X \times_{S} X \rightarrow X$. As $f$ is formally unramified (see Lemma 36.4.8), $q$ is formally unramified (see Lemma 36.4.4. As $f$ is flat, $p$ is flat, see Morphisms, Lemma 28.25.7. Hence $p^{*} \mathcal{C}_{X / S}=\mathcal{C}_{q}$ by Lemma 36.5.7 where $\mathcal{C}_{q}$ denotes the conormal sheaf of the formally unramified morphism $q: X \times_{S} X \rightarrow X$. But $\Delta(X) \subset X \times_{S} X$ is an open subscheme which maps isomorphically to $X$ via $q$. Hence by Lemma 36.5 .8 we see that $\left.\mathcal{C}_{q}\right|_{\Delta(X)}=\mathcal{C}_{X / X}=0$. In other words, the pullback of $\mathcal{C}_{X / S}$ to $X$ via the identity morphism is zero, i.e., $\mathcal{C}_{X / S}=0$.

02HL Lemma 36.6.8. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $X$ and $S$ are affine. Then $f$ is formally étale if and only if $\mathcal{O}_{S}(S) \rightarrow \mathcal{O}_{X}(X)$ is a formally étale ring map.

Proof. This is immediate from the definitions (Definition 36.6.1 and Algebra, Definition 10.146.1 by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 25.6.5.

02HM Lemma 36.6.9. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is étale, and
(2) the morphism $f$ is locally of finite presentation and formally étale.

Proof. Assume $f$ is étale. An étale morphism is locally of finite presentation, flat and unramified, see Morphisms, Section 28.36. Hence $f$ is locally of finite presentation and formally étale, see Lemma 36.6.7.
Conversely, suppose that $f$ is locally of finite presentation and formally étale. Being étale is local in the Zariski topology on $X$ and $S$, see Morphisms, Lemma 28.36.2, By Lemma 36.6.5 we can cover $X$ by affine opens $U$ which map into affine opens $V$ such that $U \rightarrow V$ is formally étale (and of finite presentation, see Morphisms, Lemma 28.21.2. By Lemma 36.6 .8 we see that the ring maps $\mathcal{O}(V) \rightarrow \mathcal{O}(U)$ are formally étale (and of finite presentation). We win by Algebra, Lemma 10.146.2. (We will give another proof of this implication when we discuss formally smooth morphisms.)

### 36.7. Infinitesimal deformations of maps

04 BU In this section we explain how a derivation can be used to infinitesimally move a map. Throughout this section we use that a sheaf on a thickening $X^{\prime}$ of $X$ can be seen as a sheaf on $X$.

04FG Lemma 36.7.1. Let $S$ be a scheme. Let $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ be two first order thickenings over $S$. Let $\left(a, a^{\prime}\right),\left(b, b^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be two morphisms of thickenings over $S$. Assume that
(1) $a=b$, and
(2) the two maps $a^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow \mathcal{C}_{X / X^{\prime}}$ (Morphisms, Lemma 28.32.3) are equal.

Then the map $\left(a^{\prime}\right)^{\sharp}-\left(b^{\prime}\right)^{\sharp}$ factors as

$$
\mathcal{O}_{Y^{\prime}} \rightarrow \mathcal{O}_{Y} \xrightarrow{D} a_{*} \mathcal{C}_{X / X^{\prime}} \rightarrow a_{*} \mathcal{O}_{X^{\prime}}
$$

where $D$ is an $\mathcal{O}_{S}$-derivation.
Proof. Instead of working on $Y$ we work on $X$. The advantage is that the pullback functor $a^{-1}$ is exact. Using (1) and (2) we obtain a commutive diagram with exact rows

Now it is a general fact that in such a situation the difference of the $\mathcal{O}_{S}$-algebra maps $\left(a^{\prime}\right)^{\sharp}$ and $\left(b^{\prime}\right)^{\sharp}$ is an $\mathcal{O}_{S^{-}}$-derivation from $a^{-1} \mathcal{O}_{Y}$ to $\mathcal{C}_{X / X^{\prime}}$. By adjointness of the functors $a^{-1}$ and $a_{*}$ this is the same thing as an $\mathcal{O}_{S}$-derivation from $\mathcal{O}_{Y}$ into $a_{*} \mathcal{C}_{X / X^{\prime}}$. Some details omitted.

Note that in the situation of the lemma above we may write $D$ as
04BV

$$
\begin{equation*}
D=\mathrm{d}_{Y / S} \circ \theta \tag{36.7.1.1}
\end{equation*}
$$

where $\theta$ is an $\mathcal{O}_{Y}$-linear map $\theta: \Omega_{Y / S} \rightarrow a_{*} \mathcal{C}_{X / X^{\prime}}$. Of course, then by adjunction again we may view $\theta$ as an $\mathcal{O}_{X}$-linear map $\theta: a^{*} \Omega_{Y / S} \rightarrow \mathcal{C}_{X / X^{\prime}}$.

02H5 Lemma 36.7.2. Let $S$ be a scheme. Let $\left(a, a^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ be a morphism of first order thickenings over $S$. Let

$$
\theta: a^{*} \Omega_{Y / S} \rightarrow \mathcal{C}_{X / X^{\prime}}
$$

be an $\mathcal{O}_{X}$-linear map. Then there exists a unique morphism of pairs $\left(b, b^{\prime}\right):(X \subset$ $\left.X^{\prime}\right) \rightarrow\left(Y \subset Y^{\prime}\right)$ such that (1) and (2) of Lemma 36.7.1 hold and the derivation $D$ and $\theta$ are related by Equation 36.7.1.1.

Proof. We simply set $b=a$ and we define $\left(b^{\prime}\right)^{\sharp}$ to be the map

$$
\left(a^{\prime}\right)^{\sharp}+D: a^{-1} \mathcal{O}_{Y^{\prime}} \rightarrow \mathcal{O}_{X^{\prime}}
$$

where $D$ is as in Equation 36.7.1.1. We omit the verification that $\left(b^{\prime}\right)^{\#}$ is a map of sheaves of $\mathcal{O}_{S}$-algebras and that (1) and (2) of Lemma 36.7.1 hold. Equation 36.7.1.1 holds by construction.

04FH Lemma 36.7.3. Let $S$ be a scheme. Let $X \subset X^{\prime}$ and $Y \subset Y^{\prime}$ be first order thickenings over $S$. Assume given a morphism $a: X \rightarrow Y$ and a map $A: a^{*} \mathcal{C}_{Y / Y^{\prime}} \rightarrow$ $\mathcal{C}_{X / X^{\prime}}$ of $\mathcal{O}_{X}$-modules. For an open subscheme $U^{\prime} \subset X^{\prime}$ consider morphisms $a^{\prime}:$ $U^{\prime} \rightarrow Y^{\prime}$ such that
(1) $a^{\prime}$ is a morphism over $S$,
(2) $\left.a^{\prime}\right|_{U}=\left.a\right|_{U}$, and
(3) the induced map $\left.\left.a^{*} \mathcal{C}_{Y / Y^{\prime}}\right|_{U} \rightarrow \mathcal{C}_{X / X^{\prime}}\right|_{U}$ is the restriction of $A$ to $U$.

Here $U=X \cap U^{\prime}$. Then the rule
$04 \mathrm{FI} \quad(36.7 .3 .1) \quad U^{\prime} \mapsto\left\{a^{\prime}: U^{\prime} \rightarrow Y^{\prime}\right.$ such that (1), (2), (3) hold.\}
defines a sheaf of sets on $X^{\prime}$.
Proof. Denote $\mathcal{F}$ the rule of the lemma. The restriction mapping $\mathcal{F}\left(U^{\prime}\right) \rightarrow \mathcal{F}\left(V^{\prime}\right)$ for $V^{\prime} \subset U^{\prime} \subset X^{\prime}$ of $\mathcal{F}$ is really the restriction map $\left.a^{\prime} \mapsto a^{\prime}\right|_{V^{\prime}}$. With this definition in place it is clear that $\mathcal{F}$ is a sheaf since morphisms are defined locally.

In the following lemma we identify sheaves on $X$ and any thickening of $X$.
04FJ Lemma 36.7.4. Same notation and assumptions as in Lemma 36.7.3. There is an action of the sheaf

$$
\mathcal{H o m}_{\mathcal{O}_{X}}\left(a^{*} \Omega_{Y / S}, \mathcal{C}_{X / X^{\prime}}\right)
$$

on the sheaf (36.7.3.1). Moreover, the action is simply transitive for any open $U^{\prime} \subset X^{\prime}$ over which the sheaf (36.7.3.1) has a section.
Proof. This is a combination of Lemmas 36.7.1, 36.7.2, and 36.7.3.
04FK Remark 36.7.5. A special case of Lemmas 36.7.1, 36.7.2, 36.7.3 and 36.7.4 is where $Y=Y^{\prime}$. In this case the map $A$ is always zero. The sheaf of Lemma 36.7.3 is just given by the rule

$$
U^{\prime} \mapsto\left\{a^{\prime}: U^{\prime} \rightarrow Y \text { over } S \text { with }\left.a^{\prime}\right|_{U}=\left.a\right|_{U}\right\}
$$

and we act on this by the sheaf $\operatorname{Hom}_{\mathcal{O}_{X}}\left(a^{*} \Omega_{Y / S}, \mathcal{C}_{X / X^{\prime}}\right)$. The action of a local section $\theta$ on $a^{\prime}$ is sometimes indicated by $\theta \cdot a^{\prime}$. Note that this means nothing else than the fact that $\left(a^{\prime}\right)^{\sharp}$ and $\left(\theta \cdot a^{\prime}\right)^{\sharp}$ differ by a derivation $D$ which is related to $\theta$ by Equation 36.7.1.1).
04FL Lemma 36.7.6. Let $S$ be a scheme. Let $X \subset X^{\prime}$ be a first order thickening over $S$. Let $Y$ be a scheme over $S$. Let $a^{\prime}, b^{\prime}: X^{\prime} \rightarrow Y$ be two morphisms over $S$ with $a=\left.a^{\prime}\right|_{X}=\left.b^{\prime}\right|_{X}$. This gives rise to a commutative diagram

Since the horizontal arrows are immersions with conormal sheaves $\mathcal{C}_{X / X^{\prime}}$ and $\Omega_{Y / S}$, by Morphisms, Lemma 28.32.3, we obtain a map $\theta: a^{*} \Omega_{Y / S} \rightarrow \mathcal{C}_{X / X^{\prime}}$. Then this $\theta$ and the derivation $D$ of Lemma 36.7.1 are related by Equation 36.7.1.1).

Proof. Omitted. Hint: The equality may be checked on affine opens where it comes from the following computation. If $f$ is a local section of $\mathcal{O}_{Y}$, then $1 \otimes f-f \otimes 1$ is a local section of $\mathcal{C}_{Y /\left(Y \times_{S} Y\right)}$ corresponding to $\mathrm{d}_{Y / S}(f)$. It is mapped to the local section $\left(a^{\prime}\right)^{\sharp}(f)-\left(b^{\prime}\right)^{\sharp}(f)=D(f)$ of $\mathcal{C}_{X / X^{\prime}}$. In other words, $\theta\left(\mathrm{d}_{Y / S}(f)\right)=D(f)$.

For later purposes we need a result that roughly states that the construction of Lemma 36.7.2 is compatible with étale localization.

04BX Lemma 36.7.7. Let

be a commutative diagram of schemes with $X_{2} \rightarrow X_{1}$ and $S_{2} \rightarrow S_{1}$ étale. Then the map $c_{f}: f^{*} \Omega_{X_{1} / S_{1}} \rightarrow \Omega_{X_{2} / S_{2}}$ of Morphisms, Lemma 28.33.8 is an isomorphism.

Proof. We recall that an étale morphism $U \rightarrow V$ is a smooth morphism with $\Omega_{U / V}=0$. Using this we see that Morphisms, Lemma 28.33.9 implies $\Omega_{X_{2} / S_{2}}=$ $\Omega_{X_{2} / S_{1}}$ and Morphisms, Lemma 28.34.16 implies that the map $f^{*} \Omega_{X_{1} / S_{1}} \rightarrow \Omega_{X_{2} / S_{1}}$ (for the morphism $f$ seen as a morphism over $S_{1}$ ) is an isomorphism. Hence the lemma follows.

04BY Lemma 36.7.8. Consider a commutative diagram of schemes

and assume that
(1) $i_{1}: T_{1} \rightarrow T_{1}^{\prime}$ is a first order thickening,
(2) $i_{2}: T_{2} \rightarrow T_{2}^{\prime}$ is a first order thickening, and
(3) $X_{2} \rightarrow X_{1}$ and $S_{2} \rightarrow S_{1}$ are étale.

Write $a_{i}=a_{i}^{\prime} \circ i_{k}$ for $k=1,2$. For any $\mathcal{O}_{T_{1}}$-linear map $\theta_{1}: a_{1}^{*} \Omega_{X_{1} / S_{1}} \rightarrow \mathcal{C}_{T_{1} / T_{1}^{\prime}}$ let $\theta_{2}$ be the composition

$$
a_{2}^{*} \Omega_{X_{2} / S_{2}}=h^{*} a_{1}^{*} \Omega_{X_{1} / S_{1}} \xrightarrow{h^{*} \theta_{1}} h^{*} \mathcal{C}_{T_{1} / T_{1}^{\prime}} \longrightarrow \mathcal{C}_{T_{2} / T_{2}^{\prime}}
$$

(equality sign is explained in the proof). Then the diagram

commutes where the actions $\theta_{2} \cdot a_{2}^{\prime}$ and $\theta_{1} \cdot a_{1}^{\prime}$ are as in Remark 36.7.5.
Proof. The equality sign comes from the identification $f^{*} \Omega_{X_{1} / S_{1}}=\Omega_{X_{2} / S_{2}}$ of Lemma 36.7.7. Namely, using this we have $a_{2}^{*} \Omega_{X_{2} / S_{2}}=a_{2}^{*} f^{*} \Omega_{X_{1} / S_{1}}=h^{*} a_{1}^{*} \Omega_{X_{1} / S_{1}}$ because $f \circ a_{2}=a_{1} \circ h$. Having said this, the commutativity of the diagram may
be checked on affine opens. Hence we may assume the schemes in the initial big diagram are affine. Thus we obtain a commutative diagram of rings

with $I_{1}^{2}=0$ and $I_{2}^{2}=0$ and moreover with the property that $A_{2} \otimes_{A_{1}} \Omega_{A_{1} / R_{1}} \rightarrow$ $\Omega_{A_{2} / R_{2}}$ is an isomorphism. Then $\theta_{1}: B_{1} / I_{1} \otimes_{A_{1}} \Omega_{A_{1} / R_{1}} \rightarrow I_{1}$ is $B_{1}$-linear. This gives an $R_{1}$-derivation $D_{1}=\theta_{1} \circ \mathrm{~d}_{A_{1} / R_{1}}: A_{1} \rightarrow I_{1}$. In a similar way we see that $\theta_{2}: B_{2} / I_{2} \otimes_{A_{2}} \Omega_{A_{2} / R_{2}} \rightarrow I_{2}$ gives rise to a $R_{2}$-derivation $D_{2}=\theta_{2} \circ \mathrm{~d}_{A_{2} / R_{2}}: A_{2} \rightarrow I_{2}$. The construction of $\theta_{2}$ implies the following compatibility between $\theta_{1}$ and $\theta_{2}$ : for every $x \in A_{1}$ we have

$$
h^{\prime}\left(D_{1}(x)\right)=D_{2}(f(x))
$$

as elements of $I_{2}$. Now by the construction of the action in Lemma 36.7.2 and Remark 36.7 .5 we know that $\theta_{1} \cdot a_{1}^{\prime}$ corresponds to the ring map $a_{1}^{\prime}+D_{1}: A_{1} \rightarrow B_{1}$ and $\theta_{2} \cdot a_{2}^{\prime}$ corresponds to the ring map $a_{2}^{\prime}+D_{2}: A_{2} \rightarrow B_{2}$. By the displayed equality above we obtain that $h^{\prime} \circ\left(a_{1}^{\prime}+D_{1}\right)=\left(a_{2}^{\prime}+D_{2}\right) \circ f$ as desired.

04BZ Remark 36.7.9. Lemma 36.7 .8 can be improved in the following way. Suppose that we have a commutative diagram of schemes as in Lemma 36.7.8 but we do not assume that $X_{2} \rightarrow X_{1}$ and $S_{2} \rightarrow S_{1}$ are étale. Next, suppose we have $\theta_{1}$ : $a_{1}^{*} \Omega_{X_{1} / S_{1}} \rightarrow \mathcal{I}_{1}$ and $\theta_{2}: a_{2}^{*} \Omega_{X_{2} / S_{2}} \rightarrow \mathcal{I}_{2}$ such that for a local section $t$ of $\mathcal{O}_{X_{1}}$ we have $\left(h^{\prime}\right)^{*} \theta_{1}\left(a_{1}^{*}\left(\mathrm{~d}_{X_{1} / S_{1}}(t)\right)\right)=\theta_{2}\left(a_{2}^{*}\left(\mathrm{~d}_{X_{2} / S_{2}}\left(f^{*} t\right)\right)\right)$, i.e., such that

is commutative where $D_{i}$ corresponds to $\theta_{i}$ as in Equation 36.7.1.1. Then we have the conclusion of Lemma 36.7.8. The importance of the condition that both $X_{2} \rightarrow X_{1}$ and $S_{2} \rightarrow S_{1}$ are étale is that it allows us to construct a $\theta_{2}$ from $\theta_{1}$.

### 36.8. Infinitesimal deformations of schemes

063X The following simple lemma is often a convenient tool to check whether an infinitesimal deformation of a map is flat.

063 Lemma 36.8.1. Let $\left(f, f^{\prime}\right):\left(X \subset X^{\prime}\right) \rightarrow\left(S \subset S^{\prime}\right)$ be a morphism of first order thickenings. Assume that $f$ is flat. Then the following are equivalent
(1) $f^{\prime}$ is flat and $X=S \times{ }_{S^{\prime}} X^{\prime}$, and
(2) the canonical map $f^{*} \mathcal{C}_{S / S^{\prime}} \rightarrow \mathcal{C}_{X / X^{\prime}}$ is an isomorphism.

Proof. As the problem is local on $X^{\prime}$ we may assume that $X, X^{\prime}, S, S^{\prime}$ are affine schemes. Say $S^{\prime}=\operatorname{Spec}\left(A^{\prime}\right), X^{\prime}=\operatorname{Spec}\left(B^{\prime}\right), S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$ with
$A=A^{\prime} / I$ and $B=B^{\prime} / J$ for some square zero ideals. Then we obtain the following commutative diagram

with exact rows. The canonical map of the lemma is the map

$$
I \otimes_{A} B=I \otimes_{A^{\prime}} B^{\prime} \longrightarrow J
$$

The assumption that $f$ is flat signifies that $A \rightarrow B$ is flat.
Assume (1). Then $A^{\prime} \rightarrow B^{\prime}$ is flat and $J=I B^{\prime}$. Flatness implies $\operatorname{Tor}_{1}^{A^{\prime}}\left(B^{\prime}, A\right)=0$ (see Algebra, Lemma 10.74.8). This means $I \otimes_{A^{\prime}} B^{\prime} \rightarrow B^{\prime}$ is injective (see Algebra, Remark 10.74.9. Hence we see that $I \otimes_{A} B \rightarrow J$ is an isomorphism.
Assume (2). Then it follows that $J=I B^{\prime}$, so that $X=S \times{ }_{S^{\prime}} X^{\prime}$. Moreover, we get $\operatorname{Tor}_{1}^{A^{\prime}}\left(B^{\prime}, A^{\prime} / I\right)=0$ by reversing the implications in the previous paragraph. Hence $B^{\prime}$ is flat over $A^{\prime}$ by Algebra, Lemma 10.98.8.

The following lemma is the "nilpotent" version of the "critère de platitude par fibres", see Section 36.13 .

06AF Lemma 36.8.2. Consider a commutative diagram

of thickenings. Assume
(1) $X^{\prime}$ is flat over $S^{\prime}$,
(2) $f$ is flat,
(3) $S \subset S^{\prime}$ is a finite order thickening, and
(4) $X=S \times{ }_{S^{\prime}} X^{\prime}$ and $Y=S \times{ }_{S^{\prime}} Y^{\prime}$.

Then $f^{\prime}$ is flat and $Y^{\prime}$ is flat over $S^{\prime}$ at all points in the image of $f^{\prime}$.
Proof. Immediate consequence of Algebra, Lemma 10.100 .8
Many properties of morphisms of schemes are preserved under flat deformations.
06AG Lemma 36.8.3. Consider a commutative diagram

of thickenings. Assume $S \subset S^{\prime}$ is a finite order thickening, $X^{\prime}$ and $Y^{\prime}$ flat over $S^{\prime}$ and $X=S \times{ }_{S^{\prime}} X^{\prime}$ and $Y=S \times{ }_{S^{\prime}} Y^{\prime}$. Then
(1) $f$ is flat if and only if $f^{\prime}$ is flat,
(2) $f$ is an isomorphism if and only if $f^{\prime}$ is an isomorphism,
(3) $f$ is an open immersion if and only if $f^{\prime}$ is an open immersion,

(4) $f$ is quasi-compact if and only if $f^{\prime}$ is quasi-compact,
(5) $f$ is universally closed if and only if $f^{\prime}$ is universally closed,
(6) $f$ is (quasi-) separated if and only if $f^{\prime}$ is (quasi-)separated,
(7) $f$ is a monomorphism if and only if $f^{\prime}$ is a monomorphism,
(8) $f$ is surjective if and only if $f^{\prime}$ is surjective,
(9) $f$ is universally injective if and only if $f^{\prime}$ is universally injective,
(10) $f$ is affine if and only if $f^{\prime}$ is affine,
(11) $f$ is locally of finite type if and only if $f^{\prime}$ is locally of finite type,
(12) $f$ is quasi-finite if and only if $f^{\prime}$ is quasi-finite,
(13) $f$ is locally of finite presentation if and only if $f^{\prime}$ is locally of finite presentation,
(14) $f$ is locally of finite type of relative dimension $d$ if and only if $f^{\prime}$ is locally of finite type of relative dimension $d$,
(15) $f$ is universally open if and only if $f^{\prime}$ is universally open,
(16) $f$ is syntomic if and only if $f^{\prime}$ is syntomic,
(17) $f$ is smooth if and only if $f^{\prime}$ is smooth,
(18) $f$ is unramified if and only if $f^{\prime}$ is unramified,
(19) $f$ is étale if and only if $f^{\prime}$ is étale,
(20) $f$ is proper if and only if $f^{\prime}$ is proper,
(21) $f$ is integral if and only if $f^{\prime}$ is integral,
(22) $f$ is finite if and only if $f^{\prime}$ is finite,
(23) $f$ is finite locally free (of rank d) if and only if $f^{\prime}$ is finite locally free (of rank d), and
(24) add more here.

Proof. The assumptions on $X$ and $Y$ mean that $f$ is the base change of $f^{\prime}$ by $X \rightarrow$ $X^{\prime}$. The properties $\mathcal{P}$ listed in (1) - (23) above are all stable under base change, hence if $f^{\prime}$ has property $\mathcal{P}$, then so does $f$. See Schemes, Lemmas 25.18.2, 25.19.3, 25.21 .13 , and 25.23 .5 and Morphisms, Lemmas 28.10 .4, 28.11.4, 28.12.8, 28.15.4, $28.20 .13,28.21 .4,28.29 .2,28.31 .4,28.34 .5,28.35 .5,28.36 .4,28.41 .5,28.43 .6$, and 28.45.4

The interesting direction in each case is therefore to assume that $f$ has the property and deduce that $f^{\prime}$ has it too. By induction on the order of the thickening we may assume that $S \subset S^{\prime}$ is a first order thickening, see discussion immediately following Definition 36.2.1. We make a couple of general remarks which we will use without further mention in the arguments below. (I) Let $W^{\prime} \subset S^{\prime}$ be an affine open and let $U^{\prime} \subset X^{\prime}$ and $V^{\prime} \subset Y^{\prime}$ be affine opens lying over $W^{\prime}$ with $f^{\prime}\left(U^{\prime}\right) \subset V^{\prime}$. Let $W^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$ and denote $I \subset R^{\prime}$ be the ideal defining the closed subscheme $W^{\prime} \cap S$. Say $U^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ and $V^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. Then we get a commutative diagram

with exact rows. Moreover, $I A^{\prime} \cong I \otimes_{R} A$ and $I B^{\prime} \cong I \otimes_{R} B$, see proof of Lemma 36.8.1. (II) The morphisms $X \rightarrow X^{\prime}$ and $Y \rightarrow Y^{\prime}$ are universal homeomorphisms.

Hence the topology of the maps $f$ and $f^{\prime}$ (after any base change) is identical. (III) If $f$ is flat, then $f^{\prime}$ is flat, see Lemma 36.8.2.
Ad (1). This is general remark (III).
Ad (2). Assume $f$ is an isomorphism. Choose an affine open $V^{\prime} \subset Y^{\prime}$ and set $U^{\prime}=\left(f^{\prime}\right)^{-1}\left(V^{\prime}\right)$. Then $V=Y \cap V^{\prime}$ is affine which implies that $V \cong f^{-1}(V)=$ $U=Y \times_{Y^{\prime}} U^{\prime}$ is affine. By Lemma 36.2 .3 we see that $U^{\prime}$ is affine. Hence $I B^{\prime} \cong$ $I \otimes_{R} B \cong I \otimes_{R} A \cong I A^{\prime}$ and $A \cong B$. By the exactness of the rows in the diagram above we see that $A^{\prime} \cong B^{\prime}$, i.e., $U^{\prime} \cong V^{\prime}$. Thus $f^{\prime}$ is an isomorphism.

Ad (3). Assume $f$ is an open immersion. Then $f$ is an isomorphism of $X$ with an open subscheme $V \subset Y$. Let $V^{\prime} \subset Y^{\prime}$ be the open subscheme whose underlying topological space is $V$. Then $f^{\prime}$ is a map from $X^{\prime}$ to $V^{\prime}$ which is an isomorphism by (2). Hence $f^{\prime}$ is an open immersion.
Ad (4). Immediate from remark (II). See also Lemma 36.2.7 for a more general statement.

Ad (5). Immediate from remark (II). See also Lemma 36.2 .7 for a more general statement.

Ad (6). Note that $X \times_{Y} X=Y \times_{Y^{\prime}}\left(X^{\prime} \times_{Y^{\prime}} X^{\prime}\right)$ so that $X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is a thickening of $X \times_{Y} X$. Hence the topology of the maps $\Delta_{X / Y}$ and $\Delta_{X^{\prime} / Y^{\prime}}$ matches and we win. See also Lemma 36.2 .7 for a more general statement.

Ad 77. Assume $f$ is a monomorphism. Consider the diagonal morphism $\Delta_{X^{\prime} / Y^{\prime}}$ : $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$. Because $f$ is a monomorphism and because $X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is a thickening of $X \times_{Y} X$ we see that $\Delta_{X^{\prime} / Y^{\prime}}$ is surjective. Hence Lemma 36.8 .2 implies that $X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is flat over $S^{\prime}$. Then (2) shows that $\Delta_{X^{\prime} / Y^{\prime}}$ is an isomorphism.
Ad (8). This is clear. See also Lemma 36.2 .7 for a more general statement.
Ad (9). Immediate from remark (II). See also Lemma 36.2.7 for a more general statement.

Ad (10). Assume $f$ is affine. Choose an affine open $V^{\prime} \subset Y^{\prime}$ and set $U^{\prime}=$ $\left(f^{\prime}\right)^{-1}\left(V^{\prime}\right)$. Then $V=Y \cap V^{\prime}$ is affine which implies that $U=Y \times_{Y^{\prime}} U^{\prime}$ is affine. By Lemma 36.2.3 we see that $U^{\prime}$ is affine. Hence $f^{\prime}$ is affine. See also Lemma 36.2.7 for a more general statement.
Ad 11). Via remark (I) comes down to proving $A^{\prime} \rightarrow B^{\prime}$ is of finite type if $A \rightarrow B$ is of finite type. Suppose that $x_{1}, \ldots, x_{n} \in B^{\prime}$ are elements whose images in $B$ generate $B$ as an $A$-algebra. Then $A^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ is surjective as both $A^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ is surjective and $I \otimes_{R} A\left[x_{1}, \ldots, x_{n}\right] \rightarrow I \otimes_{R} B$ is surjective. See also Lemma 36.2.8 for a more general statement.

Ad (12). Follows from (11) and that quasi-finiteness of a morphism of finite type can be checked on fibres, see Morphisms, Lemma 28.20.6. See also Lemma 36.2.8 for a more general statement.

Ad 13). Via remark (I) comes down to proving $A^{\prime} \rightarrow B^{\prime}$ is of finite presentation if $A \rightarrow B$ is of finite presentation. We may assume that $B^{\prime}=A^{\prime}\left[x_{1}, \ldots, x_{n}\right] / K^{\prime}$ for some ideal $K^{\prime}$ by 11 . We get a short exact sequence

$$
0 \rightarrow K^{\prime} \rightarrow A^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow B^{\prime} \rightarrow 0
$$

As $B^{\prime}$ is flat over $R^{\prime}$ we see that $K^{\prime} \otimes_{R^{\prime}} R$ is the kernel of the surjection $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow$ $B$. By assumption on $A \rightarrow B$ there exist finitely many $f_{1}^{\prime}, \ldots, f_{m}^{\prime} \in K^{\prime}$ whose images in $A\left[x_{1}, \ldots, x_{n}\right]$ generate this kernel. Since $I$ is nilpotent we see that $f_{1}^{\prime}, \ldots, f_{m}^{\prime}$ generate $K^{\prime}$ by Nakayama's lemma, see Algebra, Lemma 10.19.1.

Ad (14). Follows from (11) and general remark (II). See also Lemma 36.2 .8 for a more general statement.

Ad 15). Immediate from general remark (II). See also Lemma 36.2 .7 for a more general statement.

Ad (16). Assume $f$ is syntomic. By (13) $f^{\prime}$ is locally of finite presentation, by general remark (III) $f^{\prime}$ is flat and the fibres of $f^{\prime}$ are the fibres of $f$. Hence $f^{\prime}$ is syntomic by Morphisms, Lemma 28.31.11.

Ad (17). Assume $f$ is smooth. By $13 f^{\prime}$ is locally of finite presentation, by general remark (III) $f^{\prime}$ is flat, and the fibres of $f^{\prime}$ are the fibres of $f$. Hence $f^{\prime}$ is smooth by Morphisms, Lemma 28.34.3.

Ad (18). Assume $f$ unramified. By (11) $f^{\prime}$ is locally of finite type and the fibres of $f^{\prime}$ are the fibres of $f$. Hence $f^{\prime}$ is unramified by Morphisms, Lemma 28.35.12. See also Lemma 36.2 .8 for a more general statement.

Ad (19). Assume $f$ étale. By $\sqrt{13} f^{\prime}$ is locally of finite presentation, by general remark (III) $f^{\prime}$ is flat, and the fibres of $f^{\prime}$ are the fibres of $f$. Hence $f^{\prime}$ is étale by Morphisms, Lemma 28.36.8.

Ad (20). This follows from a combination of (6), (11), (4), and (5). See also Lemma 36.2 .8 for a more general statement.

Ad (21). Combine (5) and (10) with Morphisms, Lemma 28.43.7. See also Lemma 36.2 .7 for a more general statement.

Ad (22). Combine (21), and (11) with Morphisms, Lemma 28.43.4. See also Lemma 36.2 .8 for a more general statement.

Ad 23). Assume $f$ finite locally free. By (22) we see that $f^{\prime}$ is finite, by general remark (III) $f^{\prime}$ is flat, and by (13) $f^{\prime}$ is locally of finite presentation. Hence $f^{\prime}$ is finite locally free by Morphisms, Lemma 28.45.2.

### 36.9. Formally smooth morphisms

02GZ Michael Artin's position on differential criteria of smoothness (e.g., Morphisms, Lemma 28.34 .14 ) is that they are basically useless (in practice). In this section we introduce the notion of a formally smooth morphism $X \rightarrow S$. Such a morphism is characterized by the property that $T$-valued points of $X$ lift to infinitesimal thickenings of $T$ provided $T$ is affine. The main result is that a morphism which is formally smooth and locally of finite presentation is smooth, see Lemma 36.9.7. It turns out that this criterion is often easier to use than the differential criteria mentioned above.

Recall that a ring map $R \rightarrow A$ is called formally smooth (see Algebra, Definition 10.136.1 if for every commutative solid diagram

where $I \subset B$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

02H0 Definition 36.9.1. Let $f: X \rightarrow S$ be a morphism of schemes. We say $f$ is formally smooth if given any solid commutative diagram

where $T \subset T^{\prime}$ is a first order thickening of affine schemes over $S$ there exists a dotted arrow making the diagram commute.

In the cases of formally unramified and formally étale morphisms the condition that $T^{\prime}$ be affine could be dropped, see Lemmas 36.4.2 and 36.6.2. This is no longer true in the case of formally smooth morphisms. In fact, a slightly more natural condition would be that we should be able to fill in the dotted arrow Zariski locally on $T^{\prime}$. In fact, analyzing the proof of Lemma 36.9.7 shows that this would be equivalent to the definition as it currently stands.

02H1 Lemma 36.9.2. A composition of formally smooth morphisms is formally smooth.
Proof. Omitted.
02H2 Lemma 36.9.3. A base change of a formally smooth morphism is formally smooth.
Proof. Omitted, but see Algebra, Lemma 10.136 .2 for the algebraic version.
02HH Lemma 36.9.4. Let $f: X \rightarrow S$ be a morphism of schemes. Then $f$ is formally étale if and only if $f$ is formally smooth and formally unramified.

Proof. Omitted.
02H3 Lemma 36.9.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open subschemes such that $f(U) \subset V$. If $f$ is formally smooth, so is $\left.f\right|_{U}: U \rightarrow V$.

Proof. Consider a solid diagram

as in Definition 36.9.1. If $f$ is formally smooth, then there exists an $S$-morphism $a^{\prime}: T^{\prime} \rightarrow X$ such that $\left.a^{\prime}\right|_{T}=a$. Since the underlying sets of $T$ and $T^{\prime}$ are the same we see that $a^{\prime}$ is a morphism into $U$ (see Schemes, Section 25.3). And it clearly is a $V$-morphism as well. Hence the dotted arrow above as desired.

02H4 Lemma 36.9.6. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $X$ and $S$ are affine. Then $f$ is formally smooth if and only if $\mathcal{O}_{S}(S) \rightarrow \mathcal{O}_{X}(X)$ is a formally smooth ring map.

Proof. This is immediate from the definitions (Definition 36.9.1 and Algebra, Definition 10.136.1 by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 25.6.5

The following lemma is the main result of this section. It is a victory of the functorial point of view in that it implies (combined with Limits, Proposition 31.5.1) that we can recognize whether a morphism $f: X \rightarrow S$ is smooth in terms of "simple" properties of the functor $h_{X}: S c h / S \rightarrow$ Sets.

02H6 Lemma 36.9.7 (Infinitesimal lifting criterion). Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is smooth, and
(2) the morphism $f$ is locally of finite presentation and formally smooth.

Proof. Assume $f: X \rightarrow S$ is locally of finite presentation and formally smooth. Consider a pair of affine opens $\operatorname{Spec}(A)=U \subset X$ and $\operatorname{Spec}(R)=V \subset S$ such that $f(U) \subset V$. By Lemma 36.9 .5 we see that $U \rightarrow V$ is formally smooth. By Lemma 36.9 .6 we see that $R \rightarrow A$ is formally smooth. By Morphisms, Lemma 28.21 .2 we see that $R \rightarrow A$ is of finite presentation. By Algebra, Proposition 10.136 .13 we see that $R \rightarrow A$ is smooth. Hence by the definition of a smooth morphism we see that $X \rightarrow S$ is smooth.

Conversely, assume that $f: X \rightarrow S$ is smooth. Consider a solid commutative diagram

as in Definition 36.9.1. We will show the dotted arrow exists thereby proving that $f$ is formally smooth.
Let $\mathcal{F}$ be the sheaf of sets on $T^{\prime}$ of Lemma 36.7.3. see also Remark 36.7.5. Let

$$
\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{T}}\left(a^{*} \Omega_{X / S}, \mathcal{C}_{T / T^{\prime}}\right)
$$

be the sheaf of $\mathcal{O}_{T}$-modules on $T$ introduced in Lemma 36.7.4. Our goal is simply to show that $\mathcal{F}(T) \neq \emptyset$. In other words we are trying to show that $\mathcal{F}$ is a trivial $\mathcal{H}$-torsor on $T$ (see Cohomology, Section 20.5). There are two steps: (I) To show that $\mathcal{F}$ is a torsor we have to show that $\mathcal{F}_{t} \neq \emptyset$ for all $t \in T$ (see Cohomology, Definition 20.5.1). (II) To show that $\mathcal{F}$ is the trivial torsor it suffices to show that $H^{1}(T, \mathcal{H})=0$ (see Cohomology, Lemma 20.5 .3 - we may use either cohomology of $\mathcal{H}$ as an abelian sheaf or as an $\mathcal{O}_{T}$-module, see Cohomology, Lemma 20.14.3.

First we prove (I). To see this, for every $t \in T$ we can choose an affine open $U \subset T$ neighbourhood of $t$ such that $a(U)$ is contained in an affine open $\operatorname{Spec}(A)=W \subset X$ which maps to an affine open $\operatorname{Spec}(R)=V \subset S$. By Morphisms, Lemma 28.34.2t the $\operatorname{ring} \operatorname{map} R \rightarrow A$ is smooth. Hence by Algebra, Proposition 10.136 .13 the ring map $R \rightarrow A$ is formally smooth. Lemma 36.9 .6 in turn implies that $W \rightarrow V$ is formally
smooth. Hence we can lift $\left.a\right|_{U}: U \rightarrow W$ to a $V$-morphism $a^{\prime}: U^{\prime} \rightarrow W \subset X$ showing that $\mathcal{F}(U) \neq \emptyset$.
Finally we prove (II). By Morphisms, Lemma 28.33 .13 we see that $\Omega_{X / S}$ is of finite presentation (it is even finite locally free by Morphisms, Lemma 28.34.12). Hence $a^{*} \Omega_{X / S}$ is of finite presentation (see Modules, Lemma 17.11.4). Hence the sheaf $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{T}}\left(a^{*} \Omega_{X / S}, \mathcal{C}_{T / T^{\prime}}\right)$ is quasi-coherent by the discussion in Schemes, Section 25.24 Thus by Cohomology of Schemes, Lemma 29.2.2 we have $H^{1}(T, \mathcal{H})=0$ as desired.

Locally projective quasi-coherent modules are defined in Properties, Section 27.21.
06B5 Lemma 36.9.8. Let $f: X \rightarrow Y$ be a formally smooth morphism of schemes. Then $\Omega_{X / Y}$ is locally projective on $X$.

Proof. Choose $U \subset X$ and $V \subset Y$ affine open such that $f(U) \subset V$. By Lemma 36.9.5 $\left.f\right|_{U}: U \rightarrow V$ is formally smooth. Hence $\Gamma\left(V, \mathcal{O}_{V}\right) \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)$ is a formally smooth ring map, see Lemma 36.9.6. Hence by Algebra, Lemma 10.136.7 the $\Gamma\left(U, \mathcal{O}_{U}\right)$-module $\Omega_{\Gamma\left(U, \mathcal{O}_{U}\right) / \Gamma\left(V, \mathcal{O}_{V}\right)}$ is projective. Hence $\Omega_{U / V}$ is locally projective, see Properties, Section 27.21 .

06B6 Lemma 36.9.9. Let $f: X \rightarrow Y, g: Y \rightarrow S$ be morphisms of schemes. Assume $f$ is formally smooth. Then

$$
0 \rightarrow f^{*} \Omega_{Y / S} \rightarrow \Omega_{X / S} \rightarrow \Omega_{X / Y} \rightarrow 0
$$

(see Morphisms, Lemma 28.33.9) is short exact.
Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $B \rightarrow C$ formally smooth, then the sequence

$$
0 \rightarrow C \otimes_{B} \Omega_{B / A} \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0
$$

of Algebra, Lemma 10.130.7 is exact. This is Algebra, Lemma 10.136.9.
06B7 Lemma 36.9.10. Let $h: Z \rightarrow X$ be a formally unramified morphism of schemes over $S$. Assume that $Z$ is formally smooth over $S$. Then the canonical exact sequence

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / S} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

of Lemma 36.5.10 is short exact.
Proof. Let $Z \rightarrow Z^{\prime}$ be the universal first order thickening of $Z$ over $X$. From the proof of Lemma 36.5 .10 we see that our sequence is identified with the sequence

$$
\mathcal{C}_{Z / Z^{\prime}} \rightarrow \Omega_{Z^{\prime} / S} \otimes \mathcal{O}_{Z} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

Since $Z \rightarrow S$ is formally smooth we can locally on $Z^{\prime}$ find a left inverse $Z^{\prime} \rightarrow Z$ over $S$ to the inclusion map $Z \rightarrow Z^{\prime}$. Thus the sequence is locally split, see Morphisms, Lemma 28.33.16

067W Lemma 36.9.11. Let

be a commutative diagram of schemes where $i$ and $j$ are formally unramified and $f$ is formally smooth. Then the canonical exact sequence

$$
0 \rightarrow \mathcal{C}_{Z / Y} \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / Y} \rightarrow 0
$$

of Lemma 36.5.11 is exact and locally split.
Proof. Denote $Z \rightarrow Z^{\prime}$ the universal first order thickening of $Z$ over $X$. Denote $Z \rightarrow Z^{\prime \prime}$ the universal first order thickening of $Z$ over $Y$. By Lemma 36.5 .10 here is a canonical morphism $Z^{\prime} \rightarrow Z^{\prime \prime}$ so that we have a commutative diagram

In the proof of Lemma 36.5.11 we identified the sequence above with the sequence

$$
\mathcal{C}_{Z / Z^{\prime \prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}} \rightarrow\left(i^{\prime}\right)^{*} \Omega_{Z^{\prime} / Z^{\prime \prime}} \rightarrow 0
$$

Let $U^{\prime \prime} \subset Z^{\prime \prime}$ be an affine open. Denote $U \subset Z$ and $U^{\prime} \subset Z^{\prime}$ the corresponding affine open subschemes. As $f$ is formally smooth there exists a morphism $h: U^{\prime \prime} \rightarrow X$ which agrees with $i$ on $U$ and such that $f \circ h$ equals $\left.b\right|_{U^{\prime \prime}}$. Since $Z^{\prime}$ is the universal first order thickening we obtain a unique morphism $g: U^{\prime \prime} \rightarrow Z^{\prime}$ such that $g=a \circ h$. The universal property of $Z^{\prime \prime}$ implies that $k \circ g$ is the inclusion map $U^{\prime \prime} \rightarrow Z^{\prime \prime}$. Hence $g$ is a left inverse to $k$. Picture

Thus $g$ induces a map $\left.\left.\mathcal{C}_{Z / Z^{\prime}}\right|_{U} \rightarrow \mathcal{C}_{Z / Z^{\prime \prime}}\right|_{U}$ which is a left inverse to the map $\mathcal{C}_{Z / Z^{\prime \prime}} \rightarrow \mathcal{C}_{Z / Z^{\prime}}$ over $U$.

### 36.10. Smoothness over a Noetherian base

02 HW It turns out that if the base is Noetherian then we can get away with less in the formulation of formal smoothness. In some sense the following lemmas are the beginning of deformation theory.
02HX Lemma 36.10.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Assume that $S$ is locally Noetherian and $f$ locally of finite type. The following are equivalent:
(1) $f$ is smooth at $x$,
(2) for every solid commutative diagram

where $B^{\prime} \rightarrow B$ is a surjection of local rings with $\operatorname{Ker}\left(B^{\prime} \rightarrow B\right)$ of square zero, and $\alpha$ mapping the closed point of $\operatorname{Spec}(B)$ to $x$ there exists a dotted arrow making the diagram commute,
(3) same as in (2) but with $B^{\prime} \rightarrow B$ ranging over small extensions (see Algebra, Definition 10.139.1), and
(4) same as in (2) but with $B^{\prime} \rightarrow B$ ranging over small extensions such that $\alpha$ induces an isomorphism $\kappa(x) \rightarrow \kappa(\mathfrak{m})$ where $\mathfrak{m} \subset B$ is the maximal ideal.

Proof. Choose an affine neighbourhood $V \subset S$ of $f(x)$ and choose an affine neighbourhood $U \subset X$ of $x$ such that $f(U) \subset V$. For any "test" diagram as in (2) the morphism $\alpha$ will map $\operatorname{Spec}(B)$ into $U$ and the morphism $\beta$ will map $\operatorname{Spec}\left(B^{\prime}\right)$ into $V$ (see Schemes, Section 25.13). Hence the lemma reduces to the morphism $\left.f\right|_{U}: U \rightarrow V$ of affines. (Indeed, $V$ is Noetherian and $\left.f\right|_{U}$ is of finite type, see Properties, Lemma 27.5.2 and Morphisms, Lemma 28.15.2.) In this affine case the lemma is identical to Algebra, Lemma 10.139 .2 .

Sometimes it is useful to know that one only needs to check the lifting criterion for small extensions "centered" at points of finite type (see Morphisms, Section 28.16).

02HY Lemma 36.10.2. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that $S$ is locally Noetherian and $f$ locally of finite type. The following are equivalent:
(1) $f$ is smooth,
(2) for every solid commutative diagram

where $B^{\prime} \rightarrow B$ is a small extension of Artinian local rings and $\beta$ of finite type (!) there exists a dotted arrow making the diagram commute.

Proof. If $f$ is smooth, then the infinitesimal lifting criterion (Lemma 36.9.7) says $f$ is formally smooth and (2) holds.

Assume (2). The set of points $x \in X$ where $f$ is not smooth forms a closed subset $T$ of $X$. By the discussion in Morphisms, Section 28.16, if $T \neq \emptyset$ there exists a point $x \in T \subset X$ such that the morphism

$$
\operatorname{Spec}(\kappa(x)) \rightarrow X \rightarrow S
$$

is of finite type (namely, pick any point $x$ of $T$ which is closed in an affine open of $X)$. By Morphisms, Lemma 28.16 .2 given any local Artinian ring $B^{\prime}$ with residue field $\kappa(x)$ then any morphism $\beta: \operatorname{Spec}\left(B^{\prime}\right) \rightarrow S$ is of finite type. Thus we see that all the diagrams used in Lemma 36.10.1 (4) correspond to diagrams as in the current lemma (2). Whence $X \rightarrow S$ is smooth a $x$ a contradiction.

Here is a useful application.
0A43 Lemma 36.10.3. Let $f: X \rightarrow S$ be a finite type morphism of locally Noetherian schemes. Let $Z \subset S$ be a closed subscheme with $n$th infinitesimal neighbourhood $Z_{n} \subset S$. Set $X_{n}=Z_{n} \times_{S} X$.
(1) If $X_{n} \rightarrow Z_{n}$ is smooth for all $n$, then $f$ is smooth at every point of $f^{-1}(Z)$.
(2) If $X_{n} \rightarrow Z_{n}$ is étale for all $n$, then $f$ is étale at every point of $f^{-1}(Z)$.

Proof. Assume $X_{n} \rightarrow Z_{n}$ is smooth for all $n$. Let $x \in X$ be a point lying over a point of $Z$. Given a small extension $B^{\prime} \rightarrow B$ and morphisms $\alpha, \beta$ as in Lemma 36.10.1 part (3) the maximal ideal of $B^{\prime}$ is nilpotent (as $B^{\prime}$ is Artinian) and hence the morphism $\beta$ factors through $Z_{n}$ and $\alpha$ factors through $X_{n}$ for a suitable $n$.

Thus the lifting property for $X_{n} \rightarrow Z_{n}$ kicks in to get the desired dotted arrow in the diagram. This proves (1). Part (2) follows from (1) and the fact that a morphism is étale if and only if it is smooth of relative dimension 0 .

### 36.11. Pushouts in the category of schemes

07 RS In this section we collect some results on pushouts in the category of schemes. See Categories, Section 4.9 for a general discussion of pushouts in any category.

0BMP Lemma 36.11.1. Consider a commutative diagram of schemes

and set $c=a \circ i=b \circ j$. If there exists an fpqc covering $\left\{W_{i} \rightarrow W\right\}$ such that for all $i$ and $i^{\prime}$ the diagrams

are cocartesian, then so is the original diagram.
Proof. Namely, for a scheme $T$ a morphism $W \rightarrow T$ is the same thing as a collection of morphism $W_{i} \rightarrow T$ which agree on overlaps, see Descent, Lemma 34.9.3.

Next, we discuss existence in the case where both morphisms are closed immersions.
0B7M Lemma 36.11.2. Let $i: Z \rightarrow X$ and $j: Z \rightarrow Y$ be closed immersions of schemes. Then the pushout $Y \amalg_{Z} X$ exists in the category of schemes. Picture

The diagram is a fibre square, the morphisms $a: X \rightarrow W$ and $b: Y \rightarrow W$ are closed immersions, and there is a short exact sequence

$$
0 \rightarrow \mathcal{O}_{W} \rightarrow a_{*} \mathcal{O}_{X} \oplus b_{*} \mathcal{O}_{Y} \rightarrow c_{*} \mathcal{O}_{Z} \rightarrow 0
$$

where $c=a \circ i=b \circ j$.
Proof. As a topological space we set $Y \amalg_{Z} X$ equal to the pushout of the diagram in the category of topological spaces (Topology, Section 5.28). As a set this is just the pushout of the underlying sets. The topology is the quotient topology (details omitted). On $Y \amalg_{Z} X$ we have the maps of sheaves of rings

$$
b_{*} \mathcal{O}_{Y} \longrightarrow c_{*} \mathcal{O}_{Z} \longleftarrow a_{*} \mathcal{O}_{X}
$$

and we can define

$$
\mathcal{O}_{Y \amalg_{Z} X}=b_{*} \mathcal{O}_{Y} \times_{c_{*} \mathcal{O}_{Z}} a_{*} \mathcal{O}_{X}
$$

as the fibre product in the category of sheaves of rings. To prove that we obtain a scheme we have to show that every point has an affine open neighbourhood. This is clear for points not in the image of $c$.
Let $z \in Z$. Choose an affine open $U \subset X$ such that $z \in i^{-1} U$. Choose an affine open $V \subset Y$ such that $z \in j^{-1} V \subset i^{-1} U$. Choose an $f \in \Gamma\left(U, \mathcal{O}_{U}\right)$ such that $z \in i^{-1} D(f) \subset j^{-1} V$. Since $j(Z) \cap V$ is closed in $V$, there exists a $g \in \Gamma\left(V, \mathcal{O}_{V}\right)$ whose pullback to the scheme $j^{-1} V$ is equal to the restriction of $f$ to $j^{-1} V \subset i^{-1} U$. Then we see that after replacing $U$ by the standard open $D(f)$ and $V$ by the standard open $D(g)$ we have $z \in i^{-1} U=j^{-1} V$. Since the construction of the first paragraph is clearly compatible with restriction to compatible open subschemes, to prove that it produces a scheme we may assume $X, Y$, and $Z$ are affine.
If $X=\operatorname{Spec}(A), Y=\operatorname{Spec}(B)$, and $Z=\operatorname{Spec}(C)$ are affine, then More on Algebra, Lemma 15.5 .5 shows that $Y \amalg_{Z} X=\operatorname{Spec}\left(B \times_{C} A\right)$ as topological spaces. To finish the proof that $Y \times_{Z} X$ is a scheme, it suffices to show that on $\operatorname{Spec}\left(B \times_{C} A\right)$ the structure sheaf is the fibre product of the pushforwards. This follows by applying More on Algebra, Lemma 15.5 .3 to principal affine opens.

The scheme theoretic properties of the fibre product come from the fact that $B \times{ }_{C}$ $A \rightarrow A$ and $B \times_{C} A \rightarrow B$ are surjective ring maps and that $C \cong B \otimes_{B \times_{C} A} A$. We omit the verification of the universal property of the pushout.

An important case for us will be the case where one of the morphisms is a thickening and the other is an affine morphism.

07RT Lemma 36.11.3. Let $X \rightarrow X^{\prime}$ be a thickening of schemes and let $X \rightarrow Y$ be an affine morphism of schemes. Then there exists a pushout

in the category of schemes. Moreover $Y^{\prime}=Y \amalg_{X} X^{\prime}$ is a thickening of $Y$ and

$$
\mathcal{O}_{Y^{\prime}}=\mathcal{O}_{Y} \times_{f_{*} \mathcal{O}_{X}} f_{*}^{\prime} \mathcal{O}_{X^{\prime}}
$$

as sheaves on $|Y|=\left|Y^{\prime}\right|$.
Proof. We first construct $Y^{\prime}$ as a ringed space. Namely, as topological space we take $Y^{\prime}=Y$. Denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the map of topological spaces which equals $f$. As structure sheaf $\mathcal{O}_{Y^{\prime}}$ we take the right hand side of the equation of the lemma. To see that $Y^{\prime}$ is a scheme, we have to show that any point has an affine neighbourhood. Since the formation of the fibre product of sheaves commutes with restricting to opens, we may assume $Y$ is affine. Then $X$ is affine (as $f$ is affine) and $X^{\prime}$ is affine as well (see Lemma 36.2.3). Say $Y \leftarrow X \rightarrow X^{\prime}$ corresponds to $B \rightarrow A \leftarrow A^{\prime}$. Set $B^{\prime}=B \times{ }_{A} A^{\prime}$; this is the global sections of $\mathcal{O}_{Y^{\prime}}$. As $A^{\prime} \rightarrow A$ is surjective with locally nilpotent kernel we see that $B^{\prime} \rightarrow B$ is surjective with locally nilpotent kernel. Hence $\operatorname{Spec}\left(B^{\prime}\right)=\operatorname{Spec}(B)$ (as topological spaces). We claim that $Y^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$. To see this we will show for $g^{\prime} \in B^{\prime}$ with image $g \in B$ that $\mathcal{O}_{Y^{\prime}}(D(g))=B_{g^{\prime}}^{\prime}$. Namely, by More on Algebra, Lemma 15.5.3 we see that

$$
\left(B^{\prime}\right)_{g^{\prime}}=B_{g} \times_{A_{h}} A_{h^{\prime}}^{\prime}
$$

where $h \in A, h^{\prime} \in A^{\prime}$ are the images of $g^{\prime}$. Since $B_{g}$, resp. $A_{h}$, resp. $A_{h^{\prime}}^{\prime}$ is equal to $\mathcal{O}_{Y}(D(g))$, resp. $f_{*} \mathcal{O}_{X}(D(g))$, resp. $f_{*}^{\prime} \mathcal{O}_{X^{\prime}}(D(g))$ the claim follows.
Finally, we prove the universal property of the pushout holds for $Y^{\prime}$ and the morphisms $Y \rightarrow Y^{\prime}$ and $X^{\prime} \rightarrow Y^{\prime}$. Namely, let $S$ be a scheme and let $b: Y \rightarrow S$ and $a^{\prime}: X^{\prime} \rightarrow S$ be morphisms such that

commutes. Note that $a^{\prime}=b \circ f^{\prime}$ on underlying topological spaces. Denote also $\left(a^{\prime}\right)^{\#}$ : $b^{-1} \mathcal{O}_{S} \rightarrow f_{*}^{\prime} \mathcal{O}_{X^{\prime}}$ the map which is adjoint to $\left(a^{\prime}\right)^{\sharp}:\left(a^{\prime}\right)^{-1} \mathcal{O}_{S}=\left(f^{\prime}\right)^{-1} b^{-1} \mathcal{O}_{S} \rightarrow$ $\mathcal{O}_{X^{\prime}}$. Then we get a map

$$
b^{-1} \mathcal{O}_{S} \xrightarrow{\left(b^{\sharp},\left(a^{\prime}\right)^{\sharp}\right)} \mathcal{O}_{Y} \times{ }_{f_{*}} \mathcal{O}_{X} f_{*}^{\prime} \mathcal{O}_{X^{\prime}}=\mathcal{O}_{Y^{\prime}}
$$

which defines a morphism of ringed spaces $b^{\prime}: Y^{\prime} \rightarrow S$ compatible with $a^{\prime}$ and $b$. Since $Y \subset Y^{\prime}$ is a thickening it follows that $b^{\prime}$ is a morphism of locally ringed spaces, i.e., a morphism of schemes. This finishes the proof.

In the following lemma we use the fibre product of categories as defined in Categories, Example 4.30.3.

07RV Lemma 36.11.4. Let $X \rightarrow X^{\prime}$ be a thickening of schemes and let $X \rightarrow Y$ be an affine morphism of schemes. Let $Y^{\prime}=Y \amalg_{X} X^{\prime}$ be the pushout (see Lemma 36.11.3). Base change gives a functor

$$
F:\left(S c h / Y^{\prime}\right) \longrightarrow(S c h / Y) \times_{\left(S c h / Y^{\prime}\right)}\left(S c h / X^{\prime}\right)
$$

given by $V^{\prime} \longmapsto\left(V^{\prime} \times_{Y^{\prime}} Y, V^{\prime} \times_{Y^{\prime}} X^{\prime}, 1\right)$ which has a left adjoint

$$
G:(S c h / Y) \times_{\left(S c h / Y^{\prime}\right)}\left(S c h / X^{\prime}\right) \longrightarrow\left(S c h / Y^{\prime}\right)
$$

which sends the triple $\left(V, U^{\prime}, \varphi\right)$ to the pushout $V \amalg_{\left(V \times_{Y} X\right)} U^{\prime}$. Finally, $F \circ G$ is isomorphic to the identity functor.
Proof. Let $\left(V, U^{\prime}, \varphi\right)$ be an object of the fibre product category. Set $U=U^{\prime} \times X^{\prime} X$. Note that $U \rightarrow U^{\prime}$ is a thickening. Since $\varphi: V \times_{Y} X \rightarrow U^{\prime} \times_{X^{\prime}} X=U$ is an isomorphism we have a morphism $U \rightarrow V$ over $X \rightarrow Y$ which identifies $U$ with the fibre product $X \times_{Y} V$. In particular $U \rightarrow V$ is affine, see Morphisms, Lemma 28.12 .8 . Hence we can apply Lemma 36.11 .3 to get a pushout $V^{\prime}=V \amalg_{U} U^{\prime}$. Denote $V^{\prime} \rightarrow Y^{\prime}$ the morphism we obtain in virtue of the fact that $V^{\prime}$ is a pushout and because we are given morphisms $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ agreeing on $U$ as morphisms into $Y^{\prime}$. Setting $G\left(V, U^{\prime}, \varphi\right)=V^{\prime}$ gives the functor $G$.
Let us prove that $G$ is a left adjoint to $F$. Let $Z$ be a scheme over $Y^{\prime}$. We have to show that

$$
\operatorname{Mor}\left(V^{\prime}, Z\right)=\operatorname{Mor}\left(\left(V, U^{\prime}, \varphi\right), F(Z)\right)
$$

where the morphism sets are taking in their respective categories. Let $g^{\prime}: V^{\prime} \rightarrow Z$ be a morphism. Denote $\tilde{g}$, resp. $\tilde{f}^{\prime}$ the composition of $g^{\prime}$ with the morphism $V \rightarrow V^{\prime}$, resp. $U^{\prime} \rightarrow V^{\prime}$. Base change $\tilde{g}$, resp. $\tilde{f}^{\prime}$ by $Y \rightarrow Y^{\prime}$, resp. $X^{\prime} \rightarrow Y^{\prime}$ to get a morphism $g: V \rightarrow Z \times_{Y^{\prime}} Y$, resp. $f^{\prime}: U^{\prime} \rightarrow Z \times_{Y^{\prime}} X^{\prime}$. Then $\left(g, f^{\prime}\right)$ is an element of the right hand side of the equation above (details omitted). Conversely, suppose that $\left(g, f^{\prime}\right):\left(V, U^{\prime}, \varphi\right) \rightarrow F(Z)$ is an element of the right hand side. We may consider
the composition $\tilde{g}: V \rightarrow Z$, resp. $\tilde{f}^{\prime}: U^{\prime} \rightarrow Z$ of $g$, resp. $f$ by $Z \times_{Y^{\prime}} X^{\prime} \rightarrow Z$, resp. $Z \times_{Y^{\prime}} Y \rightarrow Z$. Then $\tilde{g}$ and $\tilde{f}^{\prime}$ agree as morphism from $U$ to $Z$. By the universal property of pushout, we obtain a morphism $g^{\prime}: V^{\prime} \rightarrow Z$, i.e., an element of the left hand side. We omit the verification that these constructions are mutually inverse.

To prove that $F \circ G$ is isomorphic to the identity we have to show that the adjunction mapping $\left(V, U^{\prime}, \varphi\right) \rightarrow F\left(G\left(V, U^{\prime}, \varphi\right)\right)$ is an isomorphism. To do this we may work affine locally. Say $X=\operatorname{Spec}(A), X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$, and $Y=\operatorname{Spec}(B)$. Then $A^{\prime} \rightarrow A$ and $B \rightarrow A$ are ring maps as in More on Algebra, Lemma 15.5.6 and $Y^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ with $B^{\prime}=B \times{ }_{A} A^{\prime}$. Next, $\operatorname{suppose}$ that $V=\operatorname{Spec}(D), U^{\prime}=\operatorname{Spec}\left(C^{\prime}\right)$ and $\varphi$ is given by an $A$-algebra isomorphism $D \otimes_{B} A \rightarrow C^{\prime} \otimes_{A^{\prime}} A=C^{\prime} / I C^{\prime}$. Set $D^{\prime}=D \times{ }_{C^{\prime} / I C^{\prime}} C^{\prime}$. In this case the statement we have to prove is that $D^{\prime} \otimes_{B^{\prime}} B \cong D$ and $D^{\prime} \otimes_{B^{\prime}} A^{\prime} \cong C^{\prime}$. This is a special case of More on Algebra, Lemma 15.5.6.

08KU Lemma 36.11.5. Let $X \rightarrow X^{\prime}$ be a thickening of schemes and let $X \rightarrow Y$ be an affine morphism of schemes. Let $Y^{\prime}=Y \amalg_{X} X^{\prime}$ be the pushout (see Lemma 36.11.3). Let $V^{\prime} \rightarrow Y^{\prime}$ be a morphism of schemes. Set $V=Y \times_{Y^{\prime}} V^{\prime}, U^{\prime}=X^{\prime} \times_{Y^{\prime}} V^{\prime}$, and $U=X \times_{Y^{\prime}} V^{\prime}$. There is an equivalence of categories between
(1) quasi-coherent $\mathcal{O}_{V^{\prime}}$-modules flat over $Y^{\prime}$, and
(2) the category of triples $\left(\mathcal{G}, \mathcal{F}^{\prime}, \varphi\right)$ where
(a) $\mathcal{G}$ is a quasi-coherent $\mathcal{O}_{V}$-module flat over $Y$,
(b) $\mathcal{F}^{\prime}$ is a quasi-coherent $\mathcal{O}_{U^{\prime}}$-module flat over $X$, and
(c) $\varphi:(U \rightarrow V)^{*} \mathcal{G} \rightarrow\left(U \rightarrow U^{\prime}\right)^{*} \mathcal{F}^{\prime}$ is an isomorphism of $\mathcal{O}_{U}$-modules.

The equivalence maps $\mathcal{G}^{\prime}$ to $\left(\left(V \rightarrow V^{\prime}\right)^{*} \mathcal{G}^{\prime},\left(U^{\prime} \rightarrow V^{\prime}\right)^{*} \mathcal{G}^{\prime}\right.$, can $)$. Suppose $\mathcal{G}^{\prime}$ corresponds to the triple $\left(\mathcal{G}, \mathcal{F}^{\prime}, \varphi\right)$. Then
(a) $\mathcal{G}^{\prime}$ is a finite type $\mathcal{O}_{V^{\prime}-\text {-module }}$ if and only if $\mathcal{G}$ and $\mathcal{F}^{\prime}$ are finite type $\mathcal{O}_{Y}$ and $\mathcal{O}_{U^{\prime}}$-modules.
(b) if $V^{\prime} \rightarrow Y^{\prime}$ is locally of finite presentation, then $\mathcal{G}^{\prime}$ is an $\mathcal{O}_{V^{\prime}}$-module of finite presentation if and only if $\mathcal{G}$ and $\mathcal{F}^{\prime}$ are $\mathcal{O}_{Y}$ and $\mathcal{O}_{U^{\prime}}$-modules of finite presentation.

Proof. A quasi-inverse functor assigns to the triple $\left(\mathcal{G}, \mathcal{F}^{\prime}, \varphi\right)$ the fibre product

$$
\left(V \rightarrow V^{\prime}\right)_{*} \mathcal{G} \times\left(U \rightarrow V^{\prime}\right)_{*} \mathcal{F}\left(U^{\prime} \rightarrow V^{\prime}\right)_{*} \mathcal{F}^{\prime}
$$

where $\mathcal{F}=\left(U \rightarrow U^{\prime}\right)^{*} \mathcal{F}^{\prime}$. This works, because on affines we recover the equivalence of More on Algebra, Lemma 15.5.13. Some details omitted.

Parts (a) and (b) follow from More on Algebra, Lemmas 15.5.12 and 15.5.14
07RX Lemma 36.11.6. In the situation of Lemma 36.11.4. If $V^{\prime}=G\left(V, U^{\prime}, \varphi\right)$ for some triple $\left(V, U^{\prime}, \varphi\right)$, then
(1) $V^{\prime} \rightarrow Y^{\prime}$ is locally of finite type if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are locally of finite type,
(2) $V^{\prime} \rightarrow Y^{\prime}$ is flat if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are flat,
(3) $V^{\prime} \rightarrow Y^{\prime}$ is flat and locally of finite presentation if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are flat and locally of finite presentation,
(4) $V^{\prime} \rightarrow Y^{\prime}$ is smooth if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are smooth,
(5) $V^{\prime} \rightarrow Y^{\prime}$ is étale if and only if $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ are étale, and
(6) add more here as needed.

If $W^{\prime}$ is flat over $Y^{\prime}$, then the adjunction mapping $G\left(F\left(W^{\prime}\right)\right) \rightarrow W^{\prime}$ is an isomorphism. Hence $F$ and $G$ define mutually quasi-inverse functors between the category of schemes flat over $Y^{\prime}$ and the category of triples $\left(V, U^{\prime}, \varphi\right)$ with $V \rightarrow Y$ and $U^{\prime} \rightarrow X^{\prime}$ flat.

Proof. Looking over affine pieces the assertions of this lemma are equivalent to the corresponding assertions of More on Algebra, Lemma 15.5.15.

### 36.12. Openness of the flat locus

0398 This result takes some work to prove, and (perhaps) deserves its own section. Here it is.

0399 Theorem 36.12.1. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a morphism which is locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module which is locally of finite presentation. Then

$$
U=\{x \in X \mid \mathcal{F} \text { is flat over } S \text { at } x\}
$$

is open in $X$.
Proof. We may test for openness locally on $X$ hence we may assume that $f$ is a morphism of affine schemes. In this case the theorem is exactly Algebra, Theorem 10.128.4.

047C Lemma 36.12.2. Let $S$ be a scheme. Let

be a cartesian diagram of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x^{\prime} \in X^{\prime}$ with images $x=g^{\prime}\left(x^{\prime}\right)$ and $s^{\prime}=g^{\prime}\left(x^{\prime}\right)$.
(1) If $\mathcal{F}$ is flat over $S$ at $x$, then $\left(g^{\prime}\right)^{*} \mathcal{F}$ is flat over $S^{\prime}$ at $x^{\prime}$.
(2) If $g$ is flat at $s^{\prime}$ and $\left(g^{\prime}\right)^{*} \mathcal{F}$ is flat over $S^{\prime}$ at $x^{\prime}$, then $\mathcal{F}$ is flat over $S$ at $x$.
In particular, if $g$ is flat, $f$ is locally of finite presentation, and $\mathcal{F}$ is locally of finite presentation, then formation of the open subset of Theorem 36.12.1 commutes with base change.

Proof. Consider the commutative diagram of local rings

Note that $\mathcal{O}_{X^{\prime}, x^{\prime}}$ is a localization of $\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{S, s}} \mathcal{O}_{S^{\prime}, s^{\prime}}$, and that $\left(\left(g^{\prime}\right)^{*} \mathcal{F}\right)_{x^{\prime}}$ is equal to $\mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{O}_{X^{\prime}, x^{\prime}}$. Hence the lemma follows from Algebra, Lemma 10.99.1.

### 36.13. Critère de platitude par fibres

039A
Consider a commutative diagram of schemes (left hand diagram)

and a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$. Given a point $x \in X$ lying over $s \in S$ with image $y=f(x)$ we consider the question: Is $\mathcal{F}$ flat over $Y$ at $x$ ? If $\mathcal{F}$ is flat over $S$ at $x$, then the theorem states this question is intimately related to the question of whether the restriction of $\mathcal{F}$ to the fibre

$$
\mathcal{F}_{s}=\left(X_{s} \rightarrow X\right)^{*} \mathcal{F}
$$

is flat over $Y_{s}$ at $x$. Below you will find a "Noetherian" version, a "finitely presented" version, and earlier we treated a "nilpotent" version, see Lemma 36.8.2.
Theorem 36.13.1. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in X$. Set $y=f(x)$ and $s \in S$ the image of $x$ in $S$. Assume $S, X, Y$ locally Noetherian, $\mathcal{F}$ coherent, and $\mathcal{F}_{x} \neq 0$. Then the following are equivalent:
(1) $\mathcal{F}$ is flat over $S$ at $x$, and $\mathcal{F}_{s}$ is flat over $Y_{s}$ at $x$, and
(2) $Y$ is flat over $S$ at $y$ and $\mathcal{F}$ is flat over $Y$ at $x$.

Proof. Consider the ring maps

$$
\mathcal{O}_{S, s} \longrightarrow \mathcal{O}_{Y, y} \longrightarrow \mathcal{O}_{X, x}
$$

and the module $\mathcal{F}_{x}$. The stalk of $\mathcal{F}_{s}$ at $x$ is the module $\mathcal{F}_{x} / \mathfrak{m}_{s} \mathcal{F}_{x}$ and the local ring of $Y_{s}$ at $y$ is $\mathcal{O}_{Y, y} / \mathfrak{m}_{s} \mathcal{O}_{Y, y}$. Thus the implication $(1) \Rightarrow(2)$ is Algebra, Lemma 10.98.15. If (2) holds, then the first ring map is faithfully flat and $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{Y, y}$ so by Algebra, Lemma 10.38 .4 we see that $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{S, s}$. Moreover, $\mathcal{F}_{x} / \mathfrak{m}_{s} \mathcal{F}_{x}$ is the base change of the flat module $\mathcal{F}_{x}$ by $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{Y, y} / \mathfrak{m}_{s} \mathcal{O}_{Y, y}$, hence flat by Algebra, Lemma 10.38.7.
Here is the non-Noetherian version.
039C Theorem 36.13.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X$ is locally of finite presentation over $S$,
(2) $\mathcal{F}$ an $\mathcal{O}_{X}$-module of finite presentation, and
(3) $Y$ is locally of finite type over $S$.

Let $x \in X$. Set $y=f(x)$ and let $s \in S$ be the image of $x$ in $S$. If $\mathcal{F}_{x} \neq 0$, then the following are equivalent:
(1) $\mathcal{F}$ is flat over $S$ at $x$, and $\mathcal{F}_{s}$ is flat over $Y_{s}$ at $x$, and
(2) $Y$ is flat over $S$ at $y$ and $\mathcal{F}$ is flat over $Y$ at $x$.

Moreover, the set of points $x$ where (1) and (2) hold is open in $\operatorname{Supp}(\mathcal{F})$.
Proof. Consider the ring maps

$$
\mathcal{O}_{S, s} \longrightarrow \mathcal{O}_{Y, y} \longrightarrow \mathcal{O}_{X, x}
$$

and the module $\mathcal{F}_{x}$. The stalk of $\mathcal{F}_{s}$ at $x$ is the module $\mathcal{F}_{x} / \mathfrak{m}_{s} \mathcal{F}_{x}$ and the local ring of $Y_{s}$ at $y$ is $\mathcal{O}_{Y, y} / \mathfrak{m}_{s} \mathcal{O}_{Y, y}$. Thus the implication $(1) \Rightarrow(2)$ is Algebra, Lemma
10.127.9. If (2) holds, then the first ring map is faithfully flat and $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{Y, y}$ so by Algebra, Lemma 10.38 .4 we see that $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{S, s}$. Moreover, $\mathcal{F}_{x} / \mathfrak{m}_{s} \mathcal{F}_{x}$ is the base change of the flat module $\mathcal{F}_{x}$ by $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{Y, y} / \mathfrak{m}_{s} \mathcal{O}_{Y, y}$, hence flat by Algebra, Lemma 10.38.7.

By Morphisms, Lemma 28.21.11 the morphism $f$ is locally of finite presentation. Consider the set

05 VI

$$
\begin{equation*}
U=\{x \in X \mid \mathcal{F} \text { flat at } x \text { over both } Y \text { and } S\} \tag{36.13.2.1}
\end{equation*}
$$

This set is open in $X$ by Theorem 36.12.1. Note that if $x \in U$, then $\mathcal{F}_{s}$ is flat at $x$ over $Y_{s}$ as a base change of a flat module under the morphism $Y_{s} \rightarrow Y$, see Morphisms, Lemma 28.25.6. Hence at every point of $U \cap \operatorname{Supp}(\mathcal{F})$ condition (1) is satisfied. On the other hand, it is clear that if $x \in \operatorname{Supp}(\mathcal{F})$ satisfies (1) and (2), then $x \in U$. Thus the open set we are looking for is $U \cap \operatorname{Supp}(\mathcal{F})$.

These theorems are often used in the following simplified forms. We give only the global statements - of course there are also pointwise versions.

039D Lemma 36.13.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over S. Assume
(1) $S, X, Y$ are locally Noetherian,
(2) $X$ is flat over $S$,
(3) for every $s \in S$ the morphism $f_{s}: X_{s} \rightarrow Y_{s}$ is flat.

Then $f$ is flat. If $f$ is also surjective, then $Y$ is flat over $S$.
Proof. This is a special case of Theorem 36.13.1.
039E Lemma 36.13.4. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over S. Assume
(1) $X$ is locally of finite presentation over $S$,
(2) $X$ is flat over $S$,
(3) for every $s \in S$ the morphism $f_{s}: X_{s} \rightarrow Y_{s}$ is flat, and
(4) $Y$ is locally of finite type over $S$.

Then $f$ is flat. If $f$ is also surjective, then $Y$ is flat over $S$.
Proof. This is a special case of Theorem 36.13.2.
05VJ Lemma 36.13.5. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X$ is locally of finite presentation over $S$,
(2) $\mathcal{F}$ an $\mathcal{O}_{X}$-module of finite presentation,
(3) $\mathcal{F}$ is flat over $S$, and
(4) $Y$ is locally of finite type over $S$.

Then the set

$$
U=\{x \in X \mid \mathcal{F} \text { flat at } x \text { over } Y\}
$$

is open in $X$ and its formation commutes with arbitrary base change: If $S^{\prime} \rightarrow S$ is a morphism of schemes, and $U^{\prime}$ is the set of points of $X^{\prime}=X \times{ }_{S} S^{\prime}$ where $\mathcal{F}^{\prime}=\mathcal{F} \times{ }_{S} S^{\prime}$ is flat over $Y^{\prime}=Y \times_{S} S^{\prime}$, then $U^{\prime}=U \times_{S} S^{\prime}$.

Proof. By Morphisms, Lemma 28.21.11 the morphism $f$ is locally of finite presentation. Hence $U$ is open by Theorem 36.12.1. Because we have assumed that $\mathcal{F}$ is flat over $S$ we see that Theorem 36.13.2 implies

$$
U=\left\{x \in X \mid \mathcal{F}_{s} \text { flat at } x \text { over } Y_{s}\right\}
$$

where $s$ always denotes the image of $x$ in $S$. (This description also works trivially when $\mathcal{F}_{x}=0$.) Moreover, the assumptions of the lemma remain in force for the morphism $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ and the sheaf $\mathcal{F}^{\prime}$. Hence $U^{\prime}$ has a similar description. In other words, it suffices to prove that given $s^{\prime} \in S^{\prime}$ mapping to $s \in S$ we have

$$
\left\{x^{\prime} \in X_{s^{\prime}}^{\prime} \mid \mathcal{F}_{s^{\prime}}^{\prime} \text { flat at } x^{\prime} \text { over } Y_{s^{\prime}}^{\prime}\right\}
$$

is the inverse image of the corresponding locus in $X_{s}$. This is true by Lemma 36.12 .2 because in the cartesian diagram

the horizontal morphisms are flat as they are base changes by the flat morphism $\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right) \rightarrow \operatorname{Spec}(\kappa(s))$.
05VK Lemma 36.13.6. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Assume
(1) $X$ is locally of finite presentation over $S$,
(2) $X$ is flat over $S$, and
(3) $Y$ is locally of finite type over $S$.

Then the set

$$
U=\{x \in X \mid X \text { flat at } x \text { over } Y\} .
$$

is open in $X$ and its formation commutes with arbitrary base change.
Proof. This is a special case of Lemma 36.13.5.
The following lemma is a variant of Algebra, Lemma 10.98 .4 . Note that the hypothesis that $\left(\mathcal{F}_{s}\right)_{x}$ is a flat $\mathcal{O}_{X s}, x$-module means that $\left(\mathcal{F}_{s}\right)_{x}$ is a free $\mathcal{O}_{X_{s}, x}$-module which is always the case if $x \in X_{s}$ is a generic point of an irreducible component of $X_{s}$ and $X_{s}$ is reduced (namely, in this case $\mathcal{O}_{X_{s}, x}$ is a field, see Algebra, Lemma 10.24.1.

080Q Lemma 36.13.7. Let $f: X \rightarrow S$ be a morphism of schemes of finite presentation. Let $\mathcal{F}$ be a finitely presented $\mathcal{O}_{X}$-module. Let $x \in X$ with image $s \in S$. If $\mathcal{F}$ is flat at $x$ over $S$ and $\left(\mathcal{F}_{s}\right)_{x}$ is a flat $\mathcal{O}_{X_{s}, x}$-module, then $\mathcal{F}$ is finite free in a neighbourhood of $x$.

Proof. If $\mathcal{F}_{x} \otimes \kappa(x)$ is zero, then $\mathcal{F}_{x}=0$ by Nakayama's lemma (Algebra, Lemma 10.19.1 and hence $\mathcal{F}$ is zero in a neighbourhood of $x$ (Modules, Lemma 17.9.5) and the lemma holds. Thus we may assume $\mathcal{F}_{x} \otimes \kappa(x)$ is not zero and we see that Theorem 36.13 .2 applies with $f=\mathrm{id}: X \rightarrow X$. We conclude that $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{X, x}$. Hence $\mathcal{F}_{x}$ is free, see Algebra, Lemma 10.77 .4 for example. Choose an open neighbourhood $x \in U \subset X$ and sections $s_{1}, \ldots, s_{r} \in \mathcal{F}(U)$ which map to a basis in $\mathcal{F}_{x}$. The corresponding map $\psi:\left.\mathcal{O}_{U}^{\oplus r} \rightarrow \mathcal{F}\right|_{U}$ is surjective after shrinking $U$ (Modules, Lemma 17.9.5). Then $\operatorname{Ker}(\psi)$ is of finite type (see Modules,

Lemma 17.11.3 and $\operatorname{Ker}(\psi)_{x}=0$. Whence after shrinking $U$ once more $\psi$ is an isomorphism.

### 36.14. Normalization revisited

081J Normalization commutes with smooth base change.
081K Lemma 36.14.1. Let $f: Y \rightarrow X$ be a smooth morphism of schemes. Let $\mathcal{A}$ be $a$ quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. The integral closure of $\mathcal{O}_{Y}$ in $f^{*} \mathcal{A}$ is equal to $f^{*} \mathcal{A}^{\prime}$ where $\mathcal{A}^{\prime} \subset \mathcal{A}$ is the integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$.

Proof. This is a translation of Algebra, Lemma 10.143 .4 into the language of schemes. Details omitted.

03GV Lemma 36.14.2 (Normalization commutes with smooth base change). Let

be a fibre square in the category of schemes. Assume $f_{1}$ is quasi-compact and quasiseparated, and $\varphi$ is smooth. Let $Y_{i} \rightarrow X_{i}^{\prime} \rightarrow X_{i}$ be the normalization of $X_{i}$ in $Y_{i}$. Then $X_{2}^{\prime} \cong X_{2} \times{ }_{X_{1}} X_{1}^{\prime}$.

Proof. The base change of the factorization $Y_{1} \rightarrow X_{1}^{\prime} \rightarrow X_{1}$ to $X_{2}$ is a factorization $Y_{2} \rightarrow X_{2} \times_{X_{1}} X_{1}^{\prime} \rightarrow X_{1}$ and $X_{2} \times_{X_{1}} X_{1}^{\prime} \rightarrow X_{1}$ is integral (Morphisms, Lemma 28.43.6. Hence we get a morphism $h: X_{2}^{\prime} \rightarrow X_{2} \times_{X_{1}} X_{1}^{\prime}$ by the universal property of Morphisms, Lemma 28.48.4. Observe that $X_{2}^{\prime}$ is the relative spectrum of the integral closure of $\mathcal{O}_{X_{2}}$ in $f_{2, *} \mathcal{O}_{Y_{2}}$. If $\mathcal{A}^{\prime} \subset f_{1, *} \mathcal{O}_{Y_{1}}$ denotes the integral closure of $\mathcal{O}_{X_{2}}$, then $X_{2} \times{ }_{X_{1}} X_{1}^{\prime}$ is the relative spectrum of $\varphi^{*} \mathcal{A}^{\prime}$, see Constructions, Lemma 26.4.6. By Cohomology of Schemes, Lemma 29.5 .2 we know that $f_{2, *} \mathcal{O}_{Y_{2}}=\varphi^{*} f_{1, *} \mathcal{O}_{Y_{1}}$. Hence the result follows from Lemma 36.14.1

07TD Lemma 36.14.3 (Normalization and smooth morphisms). Let $X \rightarrow Y$ be a smooth morphism of schemes. Assume every quasi-compact open of $Y$ has finitely many irreducible components. Then the same is true for $X$ and there is a canonical isomorphism $X^{\nu}=X \times_{Y} Y^{\nu}$ 。

Proof. By Descent, Lemma 34.12.3 every quasi-compact open of $X$ has finitely many irreducible components. Note that $X_{r e d}=X \times_{Y} Y_{\text {red }}$ as a scheme smooth over a reduced scheme is reduced, see Descent, Lemma 34.14.1. Hence we may assume that $X$ and $Y$ are reduced (as the normalization of a scheme is equal to the normalization of its reduction by definition). Next, note that $X^{\prime}=X \times_{Y} Y^{\nu}$ is a normal scheme by Descent, Lemma 34.14.2. The morphism $X^{\prime} \rightarrow Y^{\nu}$ is smooth (hence flat) thus the generic points of irreducible components of $X^{\prime}$ lie over generic points of irreducible components of $Y^{\nu}$. Since $Y^{\nu} \rightarrow Y$ is birational we conclude that $X^{\prime} \rightarrow X$ is birational too (because $X^{\prime} \rightarrow Y^{\nu}$ induces an isomorphism on fibres over generic points of $Y$ ). We conclude that there exists a factorization $X^{\nu} \rightarrow X^{\prime} \rightarrow X$, see Morphisms, Lemma 28.49 .4 which is an isomorphism as $X^{\prime}$ is normal and integral over $X$.

### 36.15. Normal morphisms

038Z In the article DM69 of Deligne and Mumford the notion of a normal morphism is mentioned. This is just one in a series of types ${ }^{1}$ of morphisms that can all be defined similarly. Over time we will add these in their own sections as needed.
0390 Definition 36.15.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres $X_{y}$ are locally Noetherian schemes.
(1) Let $x \in X$, and $y=f(x)$. We say that $f$ is normal at $x$ if $f$ is flat at $x$, and the scheme $X_{y}$ is geometrically normal at $x$ over $\kappa(y)$ (see Varieties, Definition 32.8.1.
(2) We say $f$ is a normal morphism if $f$ is normal at every point of $X$.

So the condition that the morphism $X \rightarrow Y$ is normal is stronger than just requiring all the fibres to be normal locally Noetherian schemes.

0391 Lemma 36.15.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume all fibres of $f$ are locally Noetherian. The following are equivalent
(1) $f$ is normal, and
(2) $f$ is flat and its fibres are geometrically normal schemes.

Proof. This follows directly from the definitions.
056W Lemma 36.15.3. A smooth morphism is normal.
Proof. Let $f: X \rightarrow Y$ be a smooth morphism. As $f$ is locally of finite presentation, see Morphisms, Lemma 28.34 .8 the fibres $X_{y}$ are locally of finite type over a field, hence locally Noetherian. Moreover, $f$ is flat, see Morphisms, Lemma 28.34.9. Finally, the fibres $X_{y}$ are smooth over a field (by Morphisms, Lemma 28.34.5) and hence geometrically normal by Varieties, Lemma 32.20.4. Thus $f$ is normal by Lemma 36.15.2.

We want to show that this notion is local on the source and target for the smooth topology. First we deal with the property of having locally Noetherian fibres.

0392 Lemma 36.15.4. The property $\mathcal{P}(f)=$ "the fibres of $f$ are locally Noetherian" is local in the fppf topology on the source and the target.

Proof. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{\varphi_{i}: Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fppf covering of $Y$. Denote $f_{i}: X_{i} \rightarrow Y_{i}$ the base change of $f$ by $\varphi_{i}$. Let $i \in I$ and let $y_{i} \in Y_{i}$ be a point. Set $y=\varphi_{i}\left(y_{i}\right)$. Note that

$$
X_{i, y_{i}}=\operatorname{Spec}\left(\kappa\left(y_{i}\right)\right) \times_{\operatorname{Spec}(\kappa(y))} X_{y}
$$

Moreover, as $\varphi_{i}$ is of finite presentation the field extension $\kappa(y) \subset \kappa\left(y_{i}\right)$ is finitely generated. Hence in this situation we have that $X_{y}$ is locally Noetherian if and only if $X_{i, y_{i}}$ is locally Noetherian, see Varieties, Lemma 32.9.1. This fact implies locality on the target.
Let $\left\{X_{i} \rightarrow X\right\}$ be an fppf covering of $X$. Let $y \in Y$. In this case $\left\{X_{i, y} \rightarrow X_{y}\right\}$ is an fppf covering of the fibre. Hence the locality on the source follows from Descent, Lemma 34.12.1.

[^101]0393 Lemma 36.15.5. The property $\mathcal{P}(f)=$ "the fibres of $f$ are locally Noetherian and $f$ is normal" is local in the fppf topology on the target and local in the smooth topology on the source.
Proof. We have $\mathcal{P}(f)=\mathcal{P}_{1}(f) \wedge \mathcal{P}_{2}(f) \wedge \mathcal{P}_{3}(f)$ where $\mathcal{P}_{1}(f)=$ "the fibres of $f$ are locally Noetherian", $\mathcal{P}_{2}(f)=" f$ is flat", and $\mathcal{P}_{3}(f)=$ "the fibres of $f$ are geometrically normal". We have already seen that $\mathcal{P}_{1}$ and $\mathcal{P}_{2}$ are local in the fppf topology on the source and the target, see Lemma 36.15.4 and Descent, Lemmas 34.19.13 and 34.23.1. Thus we have to deal with $\mathcal{P}_{3}$.

Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{\varphi_{i}: Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fpqc covering of $Y$. Denote $f_{i}: X_{i} \rightarrow Y_{i}$ the base change of $f$ by $\varphi_{i}$. Let $i \in I$ and let $y_{i} \in Y_{i}$ be a point. Set $y=\varphi_{i}\left(y_{i}\right)$. Note that

$$
X_{i, y_{i}}=\operatorname{Spec}\left(\kappa\left(y_{i}\right)\right) \times_{\operatorname{Spec}(\kappa(y))} X_{y}
$$

Hence in this situation we have that $X_{y}$ is geometrically normal if and only if $X_{i, y_{i}}$ is geometrically normal, see Varieties, Lemma 32.8.4. This fact implies $\mathcal{P}_{3}$ is fpqc local on the target.
Let $\left\{X_{i} \rightarrow X\right\}$ be a smooth covering of $X$. Let $y \in Y$. In this case $\left\{X_{i, y} \rightarrow X_{y}\right\}$ is a smooth covering of the fibre. Hence the locality of $\mathcal{P}_{3}$ for the smooth topology on the source follows from Descent, Lemma 34.14.2. Combining the above the lemma follows.

### 36.16. Regular morphisms

07R6 Compare with Section 36.15. The algebraic version of this notion is discussed in More on Algebra, Section 15.32 .

07R7 Definition 36.16.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres $X_{y}$ are locally Noetherian schemes.
(1) Let $x \in X$, and $y=f(x)$. We say that $f$ is regular at $x$ if $f$ is flat at $x$, and the scheme $X_{y}$ is geometrically regular at $x$ over $\kappa(y)$ (see Varieties, Definition 32.10.1.
(2) We say $f$ is a regular morphism if $f$ is regular at every point of $X$.

The condition that the morphism $X \rightarrow Y$ is regular is stronger than just requiring all the fibres to be regular locally Noetherian schemes.
07R8 Lemma 36.16.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume all fibres of $f$ are locally Noetherian. The following are equivalent
(1) $f$ is regular,
(2) $f$ is flat and its fibres are geometrically regular schemes,
(3) for every pair of affine opens $U \subset X, V \subset Y$ with $f(U) \subset V$ the ring map $\mathcal{O}(V) \rightarrow \mathcal{O}(U)$ is regular,
(4) there exists an open covering $Y=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}$ is regular, and
(5) there exists an affine open covering $Y=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring maps $\mathcal{O}\left(V_{j}\right) \rightarrow \mathcal{O}\left(U_{i}\right)$ are regular.
Proof. The equivalence of (1) and (2) is immediate from the definitions. Let $x \in X$ with $y=f(x)$. By definition $f$ is flat at $x$ if and only if $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ is a flat ring map, and $X_{y}$ is geometrically regular at $x$ over $\kappa(y)$ if and only
if $\mathcal{O}_{X_{y}, x}=\mathcal{O}_{X, x} / \mathfrak{m}_{y} \mathcal{O}_{X, x}$ is a geometrically regular algebra over $\kappa(y)$. Hence Whether or not $f$ is regular at $x$ depends only on the local homomorphism of local rings $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$. Thus the equivalence of (1) and (4) is clear.
Recall (More on Algebra, Definition 15.32.1) that a ring map $A \rightarrow B$ is regular if and only if it is flat and the fibre rings $B \otimes_{A} \kappa(\mathfrak{p})$ are Noetherian and geometrically regular for all primes $\mathfrak{p} \subset A$. By Varieties, Lemma 32.10 .3 this is equivalent to $\operatorname{Spec}\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$ being a geometrically regular scheme over $\kappa(\mathfrak{p})$. Thus we see that (2) implies (3). It is clear that (3) implies (5). Finally, assume (5). This implies that $f$ is flat (see Morphisms, Lemma 28.25.3). Moreover, if $y \in Y$, then $y \in V_{j}$ for some $j$ and we see that $X_{y}=\bigcup_{i \in I_{j}} U_{i, y}$ with each $U_{i, y}$ geometrically regular over $\kappa(y)$ by Varieties, Lemma 32.10.3. Another application of Varieties, Lemma 32.10 .3 shows that $X_{y}$ is geometrically regular. Hence (2) holds and the proof of the lemma is finished.

07R9 Lemma 36.16.3. A smooth morphism is regular.
Proof. Let $f: X \rightarrow Y$ be a smooth morphism. As $f$ is locally of finite presentation, see Morphisms, Lemma 28.34 .8 the fibres $X_{y}$ are locally of finite type over a field, hence locally Noetherian. Moreover, $f$ is flat, see Morphisms, Lemma 28.34.9. Finally, the fibres $X_{y}$ are smooth over a field (by Morphisms, Lemma 28.34.5) and hence geometrically regular by Varieties, Lemma 32.20.4. Thus $f$ is regular by Lemma 36.16.2.

07RA Lemma 36.16.4. The property $\mathcal{P}(f)=$ "the fibres of $f$ are locally Noetherian and $f$ is regular" is local in the fppf topology on the target and local in the smooth topology on the source.

Proof. We have $\mathcal{P}(f)=\mathcal{P}_{1}(f) \wedge \mathcal{P}_{2}(f) \wedge \mathcal{P}_{3}(f)$ where $\mathcal{P}_{1}(f)=$ "the fibres of $f$ are locally Noetherian", $\mathcal{P}_{2}(f)=" f$ is flat", and $\mathcal{P}_{3}(f)=$ "the fibres of $f$ are geometrically regular". We have already seen that $\mathcal{P}_{1}$ and $\mathcal{P}_{2}$ are local in the fppf topology on the source and the target, see Lemma 36.15.4 and Descent, Lemmas 34.19.13 and 34.23.1. Thus we have to deal with $\mathcal{P}_{3}$.
Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{\varphi_{i}: Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fpqc covering of $Y$. Denote $f_{i}: X_{i} \rightarrow Y_{i}$ the base change of $f$ by $\varphi_{i}$. Let $i \in I$ and let $y_{i} \in Y_{i}$ be a point. Set $y=\varphi_{i}\left(y_{i}\right)$. Note that

$$
X_{i, y_{i}}=\operatorname{Spec}\left(\kappa\left(y_{i}\right)\right) \times_{\operatorname{Spec}(\kappa(y))} X_{y} .
$$

Hence in this situation we have that $X_{y}$ is geometrically regular if and only if $X_{i, y_{i}}$ is geometrically regular, see Varieties, Lemma 32.10.4. This fact implies $\mathcal{P}_{3}$ is fpqc local on the target.
Let $\left\{X_{i} \rightarrow X\right\}$ be a smooth covering of $X$. Let $y \in Y$. In this case $\left\{X_{i, y} \rightarrow X_{y}\right\}$ is a smooth covering of the fibre. Hence the locality of $\mathcal{P}_{3}$ for the smooth topology on the source follows from Descent, Lemma 34.14.4. Combining the above the lemma follows.

### 36.17. Cohen-Macaulay morphisms

045Q Compare with Section 36.15 Note that, as pointed out in Algebra, Section 10.159 and Varieties, Section 32.11 "geometrically Cohen-Macaulay" is the same as plain Cohen-Macaulay.

045R Definition 36.17.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres $X_{y}$ are locally Noetherian schemes.
(1) Let $x \in X$, and $y=f(x)$. We say that $f$ is Cohen-Macaulay at $x$ if $f$ is flat at $x$, and the local ring of the scheme $X_{y}$ at $x$ is Cohen-Macaulay.
(2) We say $f$ is a Cohen-Macaulay morphism if $f$ is Cohen-Macaulay at every point of $X$.

Here is a translation.
045S Lemma 36.17.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume all fibres of $f$ are locally Noetherian. The following are equivalent
(1) $f$ is Cohen-Macaulay, and
(2) $f$ is flat and its fibres are Cohen-Macaulay schemes.

Proof. This follows directly from the definitions.
0AFG Lemma 36.17.3. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian schemes which is locally of finite type and Cohen-Macaulay. For every point $x$ in $X$ with image $y$ in $Y$,

$$
\operatorname{dim}_{x}(X)=\operatorname{dim}_{y}(Y)+\operatorname{dim}_{x}\left(X_{y}\right)
$$

where $X_{y}$ denotes the fiber over $y$.
Proof. After replacing $X$ by an open neighborhood of $x$, there is a natural number $d$ such that all fibers of $X \rightarrow Y$ have dimension $d$ at every point, see Morphisms, Lemma 28.29.4. Then $f$ is flat, locally of finite type and of relative dimension $d$. Hence the result follows from Morphisms, Lemma 28.29.6.

045T Lemma 36.17.4. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that all the fibres $X_{y}$ are locally Noetherian schemes. Let $Y^{\prime} \rightarrow Y$ be locally of finite type. Let $f^{\prime}: X^{\prime}=X_{Y^{\prime}} \rightarrow Y$ be the base change of $f$. Let $x^{\prime} \in X^{\prime}$ be a point with image $x \in X$.
(1) If $f$ is Cohen-Macaulay at $x$, then the base change $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is CohenMacaulay at $x^{\prime}$.
(2) If $Y^{\prime} \rightarrow Y$ is flat at $f^{\prime}\left(x^{\prime}\right)$ and $f^{\prime}$ is Cohen-Macaulay at $x^{\prime}$, then $f$ is Cohen-Macaulay at $x$.

Proof. Note that the assumption on $Y^{\prime} \rightarrow Y$ means that for $y^{\prime} \in Y^{\prime}$ mapping to $y \in Y$ the field extension $\kappa(y) \subset \kappa\left(y^{\prime}\right)$ is finitely generated. Hence also all the fibres $X_{y^{\prime}}^{\prime}=\left(X_{y}\right)_{\kappa\left(y^{\prime}\right)}$ are locally Noetherian, see Varieties, Lemma 32.9.1. Thus the lemma makes sense. Set $y^{\prime}=f^{\prime}\left(x^{\prime}\right)$ and $y=f(x)$. Hence we get the following commutative diagram of local rings

where the upper left corner is a localization of the tensor product of the upper right and lower left corners over the lower right corner.
Assume $f$ is Cohen-Macaulay at $x$. The flatness of $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ implies the flatness of $\mathcal{O}_{Y^{\prime}, y^{\prime}} \rightarrow \mathcal{O}_{X^{\prime}, x^{\prime}}$, see Algebra, Lemma 10.99.1. The fact that $\mathcal{O}_{X, x} / \mathfrak{m}_{y} \mathcal{O}_{X, x}$
is Cohen-Macaulay implies that $\mathcal{O}_{X^{\prime}, x^{\prime}} / \mathfrak{m}_{y^{\prime}} \mathcal{O}_{X^{\prime}, x^{\prime}}$, see Varieties, Lemma 32.11.1. Hence we see that $f^{\prime}$ is Cohen-Macaulay at $x^{\prime}$.
Assume $Y^{\prime} \rightarrow Y$ is flat at $y^{\prime}$ and $f^{\prime}$ is Cohen-Macaulay at $x^{\prime}$. The flatness of $\mathcal{O}_{Y^{\prime}, y^{\prime}} \rightarrow \mathcal{O}_{X^{\prime}, x^{\prime}}$ and $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{Y^{\prime}, y^{\prime}}$ implies the flatness of $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$, see Algebra, Lemma 10.99.1. The fact that $\mathcal{O}_{X^{\prime}, x^{\prime}} / \mathfrak{m}_{y^{\prime}} \mathcal{O}_{X^{\prime}, x^{\prime}}$ is Cohen-Macaulay implies that $\mathcal{O}_{X, x} / \mathfrak{m}_{y} \mathcal{O}_{X, x}$, see Varieties, Lemma 32.11.1. Hence we see that $f$ is Cohen-Macaulay at $x$.

045U Lemma 36.17.5. Let $f: X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. Let

$$
W=\{x \in X \mid f \text { is Cohen-Macaulay at } x\}
$$

Then
(1) $W=\left\{x \in X \mid \mathcal{O}_{X_{f(x)}, x}\right.$ is Cohen-Macaulay $\}$,
(2) $W$ is open in $X$,
(3) $W$ dense in every fibre of $X \rightarrow S$,
(4) the formation of $W$ commutes with arbitrary base change of $f$ : For any morphism $g: S^{\prime} \rightarrow S$, consider the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ of $f$ and the projection $g^{\prime}: X^{\prime} \rightarrow X$. Then the corresponding set $W^{\prime}$ for the morphism $f^{\prime}$ is equal to $W^{\prime}=\left(g^{\prime}\right)^{-1}(W)$.
Proof. As $f$ is flat with locally Noetherian fibres the equality in (1) holds by definition. Parts (2) and (3) follow from Algebra, Lemma 10.129.5. Part (4) follows either from Algebra, Lemma 10.129.7 or Varieties, Lemma 32.11.1.

054T Lemma 36.17.6. Let $f: X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. For $d \geq 0$ there exist opens $U_{d} \subset X$ with the following properties
(1) $W=\bigcup_{d \geq 0} U_{d}$ is dense in every fibre of $f$, and
(2) $U_{d} \rightarrow S \bar{i}$ s of relative dimension d (see Morphisms, Definition 28.29.1).

Proof. This follows by combining Lemma 36.17.5 with Morphisms, Lemma 28.29.4.

054U Lemma 36.17.7. Let $f: X \rightarrow S$ be a morphism of schemes which is flat and locally of finite presentation. Suppose $x^{\prime} \rightsquigarrow x$ is a specialization of points of $X$ with image $s^{\prime} \rightsquigarrow s$ in $S$. If $x$ is a generic point of an irreducible component of $X_{s}$ then $\operatorname{dim}_{x^{\prime}}\left(X_{s^{\prime}}\right)=\operatorname{dim}_{x}\left(X_{s}\right)$.
Proof. The point $x$ is contained in $U_{d}$ for some $d$, where $U_{d}$ as in Lemma 36.17.6.

045 V Lemma 36.17.8. The property $\mathcal{P}(f)=$ "the fibres of $f$ are locally Noetherian and $f$ is Cohen-Macaulay" is local in the fppf topology on the target and local in the syntomic topology on the source.

Proof. We have $\mathcal{P}(f)=\mathcal{P}_{1}(f) \wedge \mathcal{P}_{2}(f)$ where $\mathcal{P}_{1}(f)=$ " $f$ is flat", and $\mathcal{P}_{2}(f)=$ "the fibres of $f$ are locally Noetherian and Cohen-Macaulay". We know that $\mathcal{P}_{1}$ is local in the fppf topology on the source and the target, see Descent, Lemmas 34.19.13 and 34.23.1. Thus we have to deal with $\mathcal{P}_{2}$.

Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{\varphi_{i}: Y_{i} \rightarrow Y\right\}_{i \in I}$ be an fppf covering of $Y$. Denote $f_{i}: X_{i} \rightarrow Y_{i}$ the base change of $f$ by $\varphi_{i}$. Let $i \in I$ and let $y_{i} \in Y_{i}$ be a point. Set $y=\varphi_{i}\left(y_{i}\right)$. Note that

$$
X_{i, y_{i}}=\operatorname{Spec}\left(\kappa\left(y_{i}\right)\right) \times_{\operatorname{Spec}(\kappa(y))} X_{y}
$$

and that $\kappa(y) \subset \kappa\left(y_{i}\right)$ is a finitely generated field extension. Hence if $X_{y}$ is locally Noetherian, then $X_{i, y_{i}}$ is locally Noetherian, see Varieties, Lemma 32.9.1. And if in addition $X_{y}$ is Cohen-Macaulay, then $X_{i, y_{i}}$ is Cohen-Macaulay, see Varieties, Lemma 32.11.1. Thus $\mathcal{P}_{2}$ is fppf local on the target.
Let $\left\{X_{i} \rightarrow X\right\}$ be a syntomic covering of $X$. Let $y \in Y$. In this case $\left\{X_{i, y} \rightarrow X_{y}\right\}$ is a syntomic covering of the fibre. Hence the locality of $\mathcal{P}_{2}$ for the syntomic topology on the source follows from Descent, Lemma 34.13 .2 . Combining the above the lemma follows.

### 36.18. Slicing Cohen-Macaulay morphisms

056X The results in this section eventually lead to the assertion that the fppf topology is the same as the "finitely presented, flat, quasi-finite" topology. The following lemma is very closely related to Divisors, Lemma 30.15.9.

056Y Lemma 36.18.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Let $h \in \mathfrak{m}_{x} \subset \mathcal{O}_{X, x}$. Assume
(1) $f$ is locally of finite presentation,
(2) $f$ is flat at $x$, and
(3) the image $\bar{h}$ of $h$ in $\mathcal{O}_{X_{s}, x}=\mathcal{O}_{X, x} / \mathfrak{m}_{s} \mathcal{O}_{X, x}$ is a nonzerodivisor.

Then there exists an affine open neighbourhood $U \subset X$ of $x$ such that $h$ comes from $h \in \Gamma\left(U, \mathcal{O}_{U}\right)$ and such that $D=V(h)$ is an effective Cartier divisor in $U$ with $x \in D$ and $D \rightarrow S$ flat and locally of finite presentation.

Proof. We are going to prove this by reducing to the Noetherian case. By openness of flatness (see Theorem 36.12.1) we may assume, after replacing $X$ by an open neighbourhood of $x$, that $X \rightarrow S$ is flat. We may also assume that $X$ and $S$ are affine. After possible shrinking $X$ a bit we may assume that there exists an $h \in \Gamma\left(X, \mathcal{O}_{X}\right)$ which maps to our given $h$.
We may write $S=\operatorname{Spec}(A)$ and we may write $A=\operatorname{colim}_{i} A_{i}$ as a directed colimit of finite type $\mathbf{Z}$ algebras. Then by Algebra, Lemma 10.160 .1 or Limits, Lemmas 31.9.1, 31.7.2, and 31.9.1 we can find a cartesian diagram

with $f_{0}$ flat and of finite presentation, $X_{0}$ affine, and $S_{0}$ affine and Noetherian. Let $x_{0} \in X_{0}$, resp. $s_{0} \in S_{0}$ be the image of $x$, resp. $s$. We may also assume there exists an element $h_{0} \in \Gamma\left(X_{0}, \mathcal{O}_{X_{0}}\right)$ which restricts to $h$ on $X$. (If you used the algebra reference above then this is clear; if you used the references to the chapter on limits then this follows from Limits, Lemma 31.9.1 by thinking of $h$ as a morphism $X \rightarrow \mathbf{A}_{S}^{1}$.) Note that $\mathcal{O}_{X_{s}, x}$ is a localization of $\mathcal{O}_{\left(X_{0}\right)_{s_{0}}, x_{0}} \otimes_{\kappa\left(s_{0}\right)} \kappa(s)$, so that $\mathcal{O}_{\left(X_{0}\right)_{s_{0}}, x_{0}} \rightarrow \mathcal{O}_{X_{s}, x}$ is a flat local ring map, in particular faithfully flat.

Hence the image $\bar{h}_{0} \in \mathcal{O}_{\left(X_{0}\right)_{s_{0}}, x_{0}}$ is contained in $\mathfrak{m}_{\left(X_{0}\right)_{s_{0}}, x_{0}}$ and is a nonzerodivisor. We claim that after replacing $X_{0}$ by a principal open neighbourhood of $x_{0}$ the element $h_{0}$ is a nonzerodivisor in $B_{0}=\Gamma\left(X_{0}, \mathcal{O}_{X_{0}}\right)$ such that $B_{0} / h_{0} B_{0}$ is flat over $A_{0}=\Gamma\left(S_{0}, \mathcal{O}_{S_{0}}\right)$. If so then

$$
0 \rightarrow B_{0} \xrightarrow{h_{0}} B_{0} \rightarrow B_{0} / h_{0} B_{0} \rightarrow 0
$$

is a short exact sequence of flat $A_{0}$-modules. Hence this remains exact on tensoring with $A$ (by Algebra, Lemma 10.38.12) and the lemma follows.

It remains to prove the claim above. The corresponding algebra statement is the following (we drop the subscript ${ }_{0}$ here): Let $A \rightarrow B$ be a flat, finite type ring map of Noetherian rings. Let $\mathfrak{q} \subset B$ be a prime lying over $\mathfrak{p} \subset A$. Assume $h \in \mathfrak{q}$ maps to a nonzerodivisor in $B_{\mathfrak{q}} / \mathfrak{p} B_{\mathfrak{q}}$. Goal: show that after possible replacing $B$ by $B_{g}$ for some $g \in B, g \notin \mathfrak{q}$ the element $h$ becomes a nonzerodivisor and $B / h B$ becomes flat over $A$. By Algebra, Lemma 10.98 .2 we see that $h$ is a nonzerodivisor in $B_{\mathfrak{q}}$ and that $B_{\mathfrak{q}} / h B_{\mathfrak{q}}$ is flat over $A$. By openness of flatness, see Algebra, Theorem 10.128.4 or Theorem 36.12.1 we see that $B / h B$ is flat over $A$ after replacing $B$ by $B_{g}$ for some $g \in B, g \notin \mathfrak{q}$. Finally, let $I=\{b \in B \mid h b=0\}$ be the annihilator of $h$. Then $I B_{\mathfrak{q}}=0$ as $h$ is a nonzerodivisor in $B_{\mathfrak{q}}$. Also $I$ is finitely generated as $B$ is Noetherian. Hence there exists a $g \in B, g \notin \mathfrak{q}$ such that $I B_{g}=0$. After replacing $B$ by $B_{g}$ we see that $h$ is a nonzerodivisor.

06LI Lemma 36.18.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Let $h_{1}, \ldots, h_{r} \in \mathcal{O}_{X, x}$. Assume
(1) $f$ is locally of finite presentation,
(2) $f$ is flat at $x$, and
(3) the images of $h_{1}, \ldots, h_{r}$ in $\mathcal{O}_{X_{s}, x}=\mathcal{O}_{X, x} / \mathfrak{m}_{s} \mathcal{O}_{X, x}$ form a regular sequence.

Then there exists an affine open neighbourhood $U \subset X$ of $x$ such that $h_{1}, \ldots, h_{r}$ come from $h_{1}, \ldots, h_{r} \in \Gamma\left(U, \mathcal{O}_{U}\right)$ and such that $Z=V\left(h_{1}, \ldots, h_{r}\right) \rightarrow U$ is a regular immersion with $x \in Z$ and $Z \rightarrow S$ flat and locally of finite presentation. Moreover, the base change $Z_{S^{\prime}} \rightarrow U_{S^{\prime}}$ is a regular immersion for any scheme $S^{\prime}$ over $S$.

Proof. (Our conventions on regular sequences imply that $h_{i} \in \mathfrak{m}_{x}$ for each $i$.) The case $r=1$ follows from Lemma 36.18.1 combined with Divisors, Lemma 30.15.1 to see that $V\left(h_{1}\right)$ remains an effective Cartier divisor after base change. The case $r>1$ follows from a straightforward induction on $r$ (applying the result for $r=1$ exactly $r$ times; details omitted).

Another way to prove the lemma is using the material from Divisors, Section 30.19 . Namely, first by openness of flatness (see Theorem 36.12.1) we may assume, after replacing $X$ by an open neighbourhood of $x$, that $X \rightarrow S$ is flat. We may also assume that $X$ and $S$ are affine. After possible shrinking $X$ a bit we may assume that we have $h_{1}, \ldots, h_{r} \in \Gamma\left(X, \mathcal{O}_{X}\right)$. Set $Z=V\left(h_{1}, \ldots, h_{r}\right)$. Note that $X_{s}$ is a Noetherian scheme (because it is an algebraic $\kappa(s)$-scheme, see Varieties, Section 32.17 ) and that the topology on $X_{s}$ is induced from the topology on $X$ (see Schemes, Lemma 25.18.5. Hence after shrinking $X$ a bit more we may assume that $Z_{s} \subset X_{s}$ is a regular immersion cut out by the $r$ elements $\left.h_{i}\right|_{X_{s}}$, see Divisors, Lemma 30.17.8
and its proof. It is also clear that $r=\operatorname{dim}_{x}\left(X_{s}\right)-\operatorname{dim}_{x}\left(Z_{s}\right)$ because

$$
\begin{aligned}
\operatorname{dim}_{x}\left(X_{s}\right) & =\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)+\operatorname{trdeg}_{\kappa(s)}(\kappa(x)) \\
\operatorname{dim}_{x}\left(Z_{s}\right) & =\operatorname{dim}\left(\mathcal{O}_{Z_{s}, x}\right)+\operatorname{trdeg}_{\kappa(s)}(\kappa(x)) \\
\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right) & =\operatorname{dim}\left(\mathcal{O}_{Z_{s}, x}\right)+r
\end{aligned}
$$

the first two equalities by Algebra, Lemma 10.115 .3 and the second by $r$ times applying Algebra, Lemma 10.59 .12 . Hence Divisors, Lemma 30.19 .6 part (3) applies to show that (after Zariski shrinking $X$ ) the morphism $Z \rightarrow X$ is a regular immersion to which Divisors, Lemma 30.19.4 applies (which gives the flatness and the statement on base change).

056Z Lemma 36.18.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Assume
(1) $f$ is locally of finite presentation,
(2) $f$ is flat at $x$, and
(3) $\mathcal{O}_{X_{s}, x}$ has depth $\geq 1$.

Then there exists an affine open neighbourhood $U \subset X$ of $x$ and an effective Cartier divisor $D \subset U$ containing $x$ such that $D \rightarrow S$ is flat and of finite presentation.

Proof. Pick any $h \in \mathfrak{m}_{x} \subset \mathcal{O}_{X, x}$ which maps to a nonzerodivisor in $\mathcal{O}_{X_{s}, x}$ and apply Lemma 36.18.1.

0570 Lemma 36.18.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Assume
(1) $f$ is locally of finite presentation,
(2) $f$ is Cohen-Macaulay at $x$, and
(3) $x$ is a closed point of $X_{s}$.

Then there exists a regular immersion $Z \rightarrow X$ containing $x$ such that
(a) $Z \rightarrow S$ is flat and locally of finite presentation,
(b) $Z \rightarrow S$ is locally quasi-finite, and
(c) $Z_{s}=\{x\}$ set theoretically.

Proof. We may and do replace $S$ by an affine open neighbourhood of $s$. We will prove the lemma for affine $S$ by induction on $d=\operatorname{dim}_{x}\left(X_{s}\right)$.
The case $d=0$. In this case we show that we may take $Z$ to be an open neighbourhood of $x$. (Note that an open immersion is a regular immersion.) Namely, if $d=0$, then $X \rightarrow S$ is quasi-finite at $x$, see Morphisms, Lemma 28.29.5. Hence there exists an affine open neighbourhood $U \subset X$ such that $U \rightarrow S$ is quasi-finite, see Morphisms, Lemma 28.50.2. Thus after replacing $X$ by $U$ we see that the fibre $X_{s}$ is a finite discrete set. Hence after replacing $X$ by a further affine open neighbourhood of $X$ we see that that $f^{-1}(\{s\})=\{x\}$ (because the topology on $X_{s}$ is induced from the topology on $X$, see Schemes, Lemma 25.18.5). This proves the lemma in this case.

Next, assume $d>0$. Note that because $x$ is a closed point of its fibre the extension $\kappa(s) \subset \kappa(x)$ is finite (by the Hilbert Nullstellensatz, see Morphisms, Lemma 28.20.3). Thus we see

$$
\operatorname{depth}\left(\mathcal{O}_{X_{s}, x}\right)=\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)=d>0
$$

the first equality as $\mathcal{O}_{X_{s}, x}$ is Cohen-Macaulay and the second by Morphisms, Lemma 28.28.1. Thus we may apply Lemma 36.18 .3 to find a diagram

with $x \in D$. Note that $\mathcal{O}_{D_{s}, x}=\mathcal{O}_{X_{s}, x} /(\bar{h})$ for some nonzerodivisor $\bar{h}$, see Divisors, Lemma 30.15.1. Hence $\mathcal{O}_{D_{s}, x}$ is Cohen-Macaulay of dimension one less than the dimension of $\mathcal{O}_{X_{s}, x}$, see Algebra, Lemma 10.103 .2 for example. Thus the morphism $D \rightarrow S$ is flat, locally of finite presentation, and Cohen-Macaulay at $x$ with $\operatorname{dim}_{x}\left(D_{s}\right)=\operatorname{dim}_{x}\left(X_{s}\right)-1=d-1$. By induction hypothesis we can find a regular immersion $Z \rightarrow D$ having properties (a), (b), (c). As $Z \rightarrow D \rightarrow U$ are both regular immersions, we see that also $Z \rightarrow U$ is a regular immersion by Divisors, Lemma 30.18.7. This finishes the proof.

0571 Lemma 36.18.5. Let $f: X \rightarrow S$ be a flat morphism of schemes which is locally of finite presentation Let $s \in S$ be a point in the image of $f$. Then there exists $a$ commutative diagram

where $g: S^{\prime} \rightarrow S$ is flat, locally of finite presentation, locally quasi-finite, and $s \in g\left(S^{\prime}\right)$.

Proof. The fibre $X_{s}$ is not empty by assumption. Hence there exists a closed point $x \in X_{s}$ where $f$ is Cohen-Macaulay, see Lemma 36.17.5. Apply Lemma 36.18.4 and set $S^{\prime}=S$.

The following lemma shows that sheaves for the fppf topology are the same thing as sheaves for the "quasi-finite, flat, finite presentation" topology.
0572 Lemma 36.18.6. Let $S$ be a scheme. Let $\mathcal{U}=\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be an fppf covering of $S$, see Topologies, Definition 33.7.1. Then there exists an fppf covering $\mathcal{V}=\left\{T_{j} \rightarrow\right.$ $S\}_{j \in J}$ which refines (see Sites, Definition 7.8.1) $\mathcal{U}$ such that each $T_{j} \rightarrow S$ is locally quasi-finite.

Proof. For every $s \in S$ there exists an $i \in I$ such that $s$ is in the image of $S_{i} \rightarrow S$. By Lemma 36.18 .5 we can find a morphism $g_{s}: T_{s} \rightarrow S$ such that $s \in g_{s}\left(T_{s}\right)$ which is flat, locally of finite presentation and locally quasi-finite and such that $g_{s}$ factors through $S_{i} \rightarrow S$. Hence $\left\{T_{s} \rightarrow S\right\}$ is the desired covering of $S$ that refines $\mathcal{U}$.

### 36.19. Generic fibres

054 V Some results on the relationship between generic fibres and nearby fibres.
054W Lemma 36.19.1. Let $f: X \rightarrow Y$ be a finite type morphism of schemes. Assume $Y$ irreducible with generic point $\eta$. If $X_{\eta}=\emptyset$ then there exists a nonempty open $V \subset Y$ such that $X_{V}=V \times_{Y} X=\emptyset$.

Proof. Follows immediately from the more general Morphisms, Lemma 28.8.4.

05F5 Lemma 36.19.2. Let $f: X \rightarrow Y$ be a finite type morphism of schemes. Assume $Y$ irreducible with generic point $\eta$. If $X_{\eta} \neq \emptyset$ then there exists a nonempty open $V \subset Y$ such that $X_{V}=V \times_{Y} X \rightarrow V$ is surjective.
Proof. This follows, upon taking affine opens, from Algebra, Lemma 10.29.2. (Of course it also follows from generic flatness.)

054X Lemma 36.19.3. Let $f: X \rightarrow Y$ be a finite type morphism of schemes. Assume $Y$ irreducible with generic point $\eta$. If $Z \subset X$ is a closed subset with $Z_{\eta}$ nowhere dense in $X_{\eta}$, then there exists a nonempty open $V \subset Y$ such that $Z_{y}$ is nowhere dense in $X_{y}$ for all $y \in V$.
Proof. Let $Y^{\prime} \subset Y$ be the reduction of $Y$. Set $X^{\prime}=Y^{\prime} \times_{Y} X$ and $Z^{\prime}=Y^{\prime} \times_{Y} Z$. As $Y^{\prime} \rightarrow Y$ is a universal homeomorphism by Morphisms, Lemma 28.44.4 we see that it suffices to prove the lemma for $Z^{\prime} \subset X^{\prime} \rightarrow Y^{\prime}$. Thus we may assume that $Y$ is integral, see Properties, Lemma 27.3.4 By Morphisms, Proposition 28.27.1 there exists a nonempty affine open $V \subset Y$ such that $X_{V} \rightarrow V$ and $Z_{V} \rightarrow Z$ are flat and of finite presentation. We claim that $V$ works. Pick $y \in V$. If $Z_{y}$ has a nonempty interior, then $Z_{y}$ contains a generic point $\xi$ of an irreducible component of $X_{y}$. Note that $\eta \rightsquigarrow f(\xi)$. Since $Z_{V} \rightarrow V$ is flat we can choose a specialization $\xi^{\prime} \rightsquigarrow \xi, \xi^{\prime} \in Z$ with $f\left(\xi^{\prime}\right)=\eta$, see Morphisms, Lemma 28.25.8. By Lemma 36.17.7 we see that

$$
\operatorname{dim}_{\xi^{\prime}}\left(Z_{\eta}\right)=\operatorname{dim}_{\xi}\left(Z_{y}\right)=\operatorname{dim}_{\xi}\left(X_{y}\right)=\operatorname{dim}_{\xi^{\prime}}\left(X_{\eta}\right)
$$

Hence some irreducible component of $Z_{\eta}$ passing through $\xi^{\prime}$ has dimension $\operatorname{dim}_{\xi^{\prime}}\left(X_{\eta}\right)$ which contradicts the assumption that $Z_{\eta}$ is nowhere dense in $X_{\eta}$ and we win.
0573 Lemma 36.19.4. Let $f: X \rightarrow Y$ be a finite type morphism of schemes. Assume $Y$ irreducible with generic point $\eta$. Let $U \subset X$ be an open subscheme such that $U_{\eta}$ is scheme theoretically dense in $X_{\eta}$. Then there exists a nonempty open $V \subset Y$ such that $U_{y}$ is scheme theoretically dense in $X_{y}$ for all $y \in V$.
Proof. Let $Y^{\prime} \subset Y$ be the reduction of $Y$. Let $X^{\prime}=Y^{\prime} \times_{Y} X$ and $U^{\prime}=Y^{\prime} \times_{Y} U$. As $Y^{\prime} \rightarrow Y$ induces a bijection on points, and as $U^{\prime} \rightarrow U$ and $X^{\prime} \rightarrow X$ induce isomorphisms of scheme theoretic fibres, we may replace $Y$ by $Y^{\prime}$ and $X$ by $X^{\prime}$. Thus we may assume that $Y$ is integral, see Properties, Lemma 27.3.4. We may also replace $Y$ by a nonempty affine open. In other words we may assume that $Y=\operatorname{Spec}(A)$ where $A$ is a domain with fraction field $K$.

As $f$ is of finite type we see that $X$ is quasi-compact. Write $X=X_{1} \cup \ldots \cup X_{n}$ for some affine opens $X_{i}$. By Morphisms, Definition 28.7.1 we see that $U_{i}=X_{i} \cap U$ is an open subscheme of $X_{i}$ such that $U_{i, \eta}$ is scheme theoretically dense in $X_{i, \eta}$. Thus it suffices to prove the result for the pairs $\left(X_{i}, U_{i}\right)$, in other words we may assume that $X$ is affine.

Write $X=\operatorname{Spec}(B)$. Note that $B_{K}$ is Noetherian as it is a finite type $K$-algebra. Hence $U_{\eta}$ is quasi-compact. Thus we can find finitely many $g_{1}, \ldots, g_{m} \in B$ such that $D\left(g_{j}\right) \subset U$ and such that $U_{\eta}=D\left(g_{1}\right)_{\eta} \cup \ldots \cup D\left(g_{m}\right)_{\eta}$. The fact that $U_{\eta}$ is scheme theoretically dense in $X_{\eta}$ means that $B_{K} \rightarrow \bigoplus_{j}\left(B_{K}\right)_{g_{j}}$ is injective, see Morphisms, Example 28.7.4. By Algebra, Lemma 10.22 .4 this is equivalent to the injectivity of $B_{K} \rightarrow \bigoplus_{j=1, \ldots, m} B_{K}, b \mapsto\left(g_{1} b, \ldots, g_{m} b\right)$. Let $M$ be the cokernel of this map over $A$, i.e., such that we have an exact sequence

$$
0 \rightarrow I \rightarrow B \xrightarrow{\left(g_{1}, \ldots, g_{m}\right)} \bigoplus_{j=1, \ldots, m} B \rightarrow M \rightarrow 0
$$

After replacing $A$ by $A_{h}$ for some nonzero $h$ we may assume that $B$ is a flat, finitely presented $A$-algebra, and that $M$ is flat over $A$, see Algebra, Lemma 10.117.3. The flatness of $B$ over $A$ implies that $B$ is torsion free as an $A$-module, see More on Algebra, Lemma 15.16.9. Hence $B \subset B_{K}$. By assumption $I_{K}=0$ which implies that $I=0$ (as $I \subset B \subset B_{K}$ is a subset of $I_{K}$ ). Hence now we have a short exact sequence

$$
0 \rightarrow B \xrightarrow{\left(g_{1}, \ldots, g_{m}\right)} \bigoplus_{j=1, \ldots, m} B \rightarrow M \rightarrow 0
$$

with $M$ flat over $A$. Hence for every homomorphism $A \rightarrow \kappa$ where $\kappa$ is a field, we obtain a short exact sequence

$$
0 \rightarrow B \otimes_{A} \kappa \xrightarrow{\left(g_{1} \otimes 1, \ldots, g_{m} \otimes 1\right)} \bigoplus_{j=1, \ldots, m} B \otimes_{A} \kappa \rightarrow M \otimes_{A} \kappa \rightarrow 0
$$

see Algebra, Lemma 10.38.12, Reversing the arguments above this means that $\bigcup D\left(g_{j} \otimes 1\right)$ is scheme theoretically dense in $\operatorname{Spec}\left(B \otimes_{A} \kappa\right)$. As $\bigcup D\left(g_{j} \otimes 1\right)=$ $\bigcup D\left(g_{j}\right)_{\kappa} \subset U_{\kappa}$ we obtain that $U_{\kappa}$ is scheme theoretically dense in $X_{\kappa}$ which is what we wanted to prove.

Suppose given a morphism of schemes $f: X \rightarrow Y$ and a point $y \in Y$. Recall that the fibre $X_{y}$ is homeomorphic to the subset $f^{-1}(\{y\})$ of $X$ with induced topology, see Schemes, Lemma 25.18.5 Suppose given a closed subset $T(y) \subset X_{y}$. Let $T$ be the closure of $T(y)$ in $X$. Endow $T$ with the induced reduced scheme structure. Then $T$ is a closed subscheme of $X$ with the property that $T_{y}=T(y)$ set-theoretically. In fact $T$ is the smallest closed subscheme of $X$ with this property. Thus it is "harmless" to denote a closed subset of $X_{y}$ by $T_{y}$ if we so desire. In the following lemma we apply this to the generic fibre of $f$.

054Y Lemma 36.19.5. Let $f: X \rightarrow Y$ be a finite type morphism of schemes. Assume $Y$ irreducible with generic point $\eta$. Let $X_{\eta}=Z_{1, \eta} \cup \ldots \cup Z_{n, \eta}$ be a covering of the generic fibre by closed subsets of $X_{\eta}$. Let $Z_{i}$ be the closure of $Z_{i, \eta}$ in $X$ (see discussion above). Then there exists a nonempty open $V \subset Y$ such that $X_{y}=$ $Z_{1, y} \cup \ldots \cup Z_{n, y}$ for all $y \in V$.
Proof. If $Y$ is Noetherian then $U=X \backslash\left(Z_{1} \cup \ldots \cup Z_{n}\right)$ is of finite type over $Y$ and we can directly apply Lemma 36.19 .1 to get that $U_{V}=\emptyset$ for a nonempty open $V \subset Y$. In general we argue as follows. As the question is topological we may replace $Y$ by its reduction. Thus $Y$ is integral, see Properties, Lemma 27.3.4, After shrinking $Y$ we may assume that $X \rightarrow Y$ is flat, see Morphisms, Proposition 28.27.1. In this case every point $x$ in $X_{y}$ is a specialization of a point $x^{\prime} \in X_{\eta}$ by Morphisms, Lemma 28.25.8. As the $Z_{i}$ are closed in $X$ and cover the generic fibre this implies that $X_{y}=\bigcup Z_{i, y}$ for $y \in Y$ as desired.

The following lemma says that generic fibres of morphisms whose source is reduced are reduced.

054Z Lemma 36.19.6. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\eta \in Y$ be $a$ generic point of an irreducible component of $Y$. Then $\left(X_{\eta}\right)_{\text {red }}=\left(X_{r e d}\right)_{\eta}$.

Proof. Choose an affine neighbourhood $\operatorname{Spec}(A) \subset Y$ of $\eta$. Choose an affine open $\operatorname{Spec}(B) \subset X$ mapping into $\operatorname{Spec}(A)$ via the morphism $f$. Let $\mathfrak{p} \subset A$ be the minimal prime corresponding to $\eta$. Let $B_{\text {red }}$ be the quotient of $B$ by $\sqrt{(0)}$. The algebraic content of the lemma is that $B_{\text {red }} \otimes_{A} \kappa(\mathfrak{p})$ is reduced. To prove this, suppose that
$x \in B_{\text {red }} \otimes_{A} \kappa(\mathfrak{p})$ is nilpotent. Say $x^{n}=0$ for some $n>0$. Pick an $f \in A, f \notin \mathfrak{p}$ such that $f x$ is the image of $y \in B_{\text {red }}$. Then $g y^{n} \in \mathfrak{p} B_{\text {red }}$ for some $g \in A, g \notin \mathfrak{p}$. By Algebra, Lemma 10.24 .1 we see that $\mathfrak{p} A_{\mathfrak{p}}$ is locally nilpotent. By Algebra, Lemma 10.31 .2 we see that $\mathfrak{p}\left(B_{r e d}\right)_{\mathfrak{p}}$ is locally nilpotent. Hence we conclude that $g y^{n}$ is nilpotent in $\left(B_{r e d}\right)_{\mathfrak{p}}$. Thus there exists a $h \in A, h \notin \mathfrak{p}$ and an $m>0$ such that $h\left(g y^{n}\right)^{m}=0$ in $B_{\text {red }}$. This implies that $h g y$ is nilpotent in $B_{\text {red }}$, i.e., that $h g y=0$. Of course this means that $x=0$ as desired.

0550 Lemma 36.19.7. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that $Y$ is irreducible and $f$ is of finite type. There exists a diagram

where
(1) $V$ is a nonempty open of $Y$,
(2) $X_{V}=V \times_{Y} X$,
(3) $g: Y^{\prime} \rightarrow V$ is a finite universal homeomorphism,
(4) $X^{\prime}=\left(Y^{\prime} \times_{Y} X\right)_{\text {red }}=\left(Y^{\prime} \times_{V} X_{V}\right)_{\text {red }}$,
(5) $g^{\prime}$ is a finite universal homeomorphism,
(6) $Y^{\prime}$ is an integral affine scheme,
(7) $f^{\prime}$ is flat and of finite presentation, and
(8) the generic fibre of $f^{\prime}$ is geometrically reduced.

Proof. Let $V=\operatorname{Spec}(A)$ be a nonempty affine open of $Y$. By assumption the radical of $A$ is a prime ideal $\mathfrak{p}$. Let $K=f . f(A / \mathfrak{p})$ be the fraction field. Let $p$ be the characteristic of $K$ if positive and 1 if the characteristic is zero. By Varieties, Lemma 32.4.11 there exists a finite purely inseparable field extension $K \subset K^{\prime}$ such that $X_{K^{\prime}}$ is geometrically reduced over $K^{\prime}$. Choose elements $x_{1}, \ldots, x_{n} \in K^{\prime}$ which generate $K^{\prime}$ over $K$ and such that some $p$-power of $x_{i}$ is in $A / \mathfrak{p}$. Let $A^{\prime} \subset K^{\prime}$ be the finite $A$-subalgebra of $K^{\prime}$ generated by $x_{1}, \ldots, x_{n}$. Note that $A^{\prime}$ is a domain with fraction field $K^{\prime}$. By Algebra, Lemma 10.45 .6 we see that $A \rightarrow A^{\prime}$ is a universal homeomorphism. Set $Y^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. Set $X^{\prime}=\left(Y^{\prime} \times_{Y} X\right)_{\text {red }}$. The generic fibre of $X^{\prime} \rightarrow Y^{\prime}$ is $\left(X_{K}\right)_{\text {red }}$ by Lemma 36.19.6 which is geometrically reduced by construction. Note that $X^{\prime} \rightarrow X_{V}$ is a finite universal homeomorphism as the composition of the reduction morphism $X^{\prime} \rightarrow Y^{\prime} \times_{Y} X$ (see Morphisms, Lemma 28.44.4 and the base change of $g$. At this point all of the properties of the lemma hold except for possibly (7). This can be achieved by shrinking $Y^{\prime}$ and hence $V$, see Morphisms, Proposition 28.27.1.

0551 Lemma 36.19.8. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that $Y$ is irreducible and $f$ is of finite type. There exists a diagram

where
(1) $V$ is a nonempty open of $Y$,
(2) $X_{V}=V \times_{Y} X$,
(3) $g: Y^{\prime} \rightarrow V$ is surjective finite étale,
(4) $X^{\prime}=Y^{\prime} \times_{Y} X=Y^{\prime} \times_{V} X_{V}$,
(5) $g^{\prime}$ is surjective finite étale,
(6) $Y^{\prime}$ is an irreducible affine scheme, and
(7) all irreducible components of the generic fibre of $f^{\prime}$ are geometrically irreducible.

Proof. Let $V=\operatorname{Spec}(A)$ be a nonempty affine open of $Y$. By assumption the radical of $A$ is a prime ideal $\mathfrak{p}$. Let $K=f \cdot f(A / \mathfrak{p})$ be the fraction field. By Varieties, Lemma 32.6 .14 there exists a finite separable field extension $K \subset K^{\prime}$ such that all irreducible components of $X_{K^{\prime}}$ are geometrically irreducible over $K^{\prime}$. Choose an element $\alpha \in K^{\prime}$ which generates $K^{\prime}$ over $K$, see Fields, Lemma 9.18.1. Let $P(T) \in K[T]$ be the minimal polynomial for $\alpha$ over $K$. After replacing $\alpha$ by $f \alpha$ for some $f \in A, f \notin \mathfrak{p}$ we may assume that there exists a monic polynomial $T^{d}+$ $a_{1} T^{d-1}+\ldots+a_{d} \in A[T]$ which maps to $P(T) \in K[T]$ under the map $A[T] \rightarrow K[T]$. Set $A^{\prime}=A[T] /(P)$. Then $A \rightarrow A^{\prime}$ is a finite free ring map such that there exists a unique prime $\mathfrak{q}$ lying over $\mathfrak{p}$, such that $K=\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})=K^{\prime}$ is finite separable, and such that $\mathfrak{p} A_{\mathfrak{q}}^{\prime}$ is the maximal ideal of $A_{\mathfrak{q}}^{\prime}$. Hence $g: Y^{\prime}=\operatorname{Spec}\left(A^{\prime}\right) \rightarrow V=\operatorname{Spec}(A)$ is étale at $\mathfrak{q}$, see Algebra, Lemma 10.141.7. This means that there exists an open $W \subset \operatorname{Spec}\left(A^{\prime}\right)$ such that $\left.g\right|_{W}: W \rightarrow \operatorname{Spec}(A)$ is étale. Since $g$ is finite and since $\mathfrak{q}$ is the only point lying over $\mathfrak{p}$ we see that $Z=g\left(Y^{\prime} \backslash W\right)$ is a closed subset of $V$ not containing $\mathfrak{p}$. Hence after replacing $V$ by a principal affine open of $V$ which does not meet $Z$ we obtain that $g$ is finite étale.
0552 Lemma 36.19.9. Let $S$ be an integral scheme with generic point $\eta$. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes such that
(1) $f, g$ are locally of finite type,
(2) $X_{\eta}, Y_{\eta}$ are integral with generic points $x, y$, and
(3) $\kappa(x) \cong \kappa(y)$ as $\kappa(\eta)$-extensions.

Then there exist open subschemes $x \in U \subset X, y \in V \subset Y$ and an $S$-isomorphism $U \rightarrow V$ which induces the given isomorphism of residue fields.
Proof. The question is local around the points $\eta, x, y$. Hence we may replace $S$, $X, Y$ by affine neighbourhoods of $\eta, x, y$ and hence reduce to the case that $S, X, Y$ are affine. Say $S=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A), Y=\operatorname{Spec}(B)$. By Algebra, Lemma 10.117 .3 we may also assume that $A$ and $B$ are flat and of finite presentation over $R$. Denote $K=f . f .(R)$. The rings $A, B$ are torsion free as $R$-modules because $A$, $B$ are flat over $R$, see More on Algebra, Lemma 15.16.9. Since $A \otimes_{R} K$ and $B \otimes_{R} K$ are domains by assumption it follows that $A$ and $B$ are domains. Set $L=f . f .(A)$ and $M=f . f .(B)$. Let $\varphi: L \rightarrow M$ be the given isomorphism of $K$-extensions.
Choose elements $x_{1}, \ldots, x_{n} \in A$ which generate $A$ as an $R$-algebra, and choose elements $y_{1}, \ldots, y_{m} \in B$ which generate $B$ as an $R$-algebra. Write $\varphi\left(x_{i}\right)=b_{i} / b$ for some $b, b_{i} \in B$. In other words, $b$ is a common denominator for the elements $\varphi\left(x_{i}\right) \in M=f . f .(B)$. Similarly, write $\varphi^{-1}\left(y_{j}\right)=a_{j} / a$ for some $a, a_{j} \in A$. Note that $\varphi(a) \in B_{b}$ because $a$ can be written as a polynomial in the $x_{i}$. Similarly we have $\varphi^{-1}(b) \in A_{a}$. Thus $\varphi$ gives an isomorphism

$$
A_{a} \longrightarrow B_{b}
$$

of $R$-algebras and the lemma is proven.

## 05 KM

05F1 Lemma 36.20.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\xi \in A s s_{X / S}(\mathcal{F})$ and set $Z=\overline{\{\xi\}} \subset X$. If $f$ is locally of finite type and $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module, then there exists a nonempty open $V \subset Z$ such that for every $s \in f(V)$ the generic points of $V_{s}$ are elements of $A s s_{X / S}(\mathcal{F})$.
Proof. We may replace $S$ by an affine open neighbourhood of $f(\xi)$ and $X$ by an affine open neighbourhood of $\xi$. Hence we may assume $S=\operatorname{Spec}(A), X=$ $\operatorname{Spec}(B)$ and that $f$ is given by the finite type ring map $A \rightarrow B$, see Morphisms, Lemma 28.15.2. Moreover, we may write $\mathcal{F}=\widetilde{M}$ for some finite $B$-module $M$, see Properties, Lemma 27.16.1. Let $\mathfrak{q} \subset B$ be the prime corresponding to $\xi$ and let $\mathfrak{p} \subset A$ be the corresponding prime of $A$. By assumption $\mathfrak{q} \in \operatorname{Ass}_{B}\left(M \otimes_{A} \kappa(\mathfrak{p})\right)$, see Algebra, Remark 10.64 .6 and Divisors, Lemma 30.2.2. With this notation $Z=V(\mathfrak{q}) \subset \operatorname{Spec}(B)$. In particular $f(Z) \subset V(\mathfrak{p})$. Hence clearly it suffices to prove the lemma after replacing $A, B$, and $M$ by $A / \mathfrak{p} A, B / \mathfrak{p} B$, and $M / \mathfrak{p} M$. In other words we may assume that $A$ is a domain with fraction field $K$ and $\mathfrak{q} \subset B$ is an associated prime of $M \otimes_{A} K$.
At this point we can use generic flatness. Namely, by Algebra, Lemma 10.117.3 there exists a nonzero $g \in A$ such that $M_{g}$ is flat as an $A_{g}$-module. After replacing $A$ by $A_{g}$ we may assume that $M$ is flat as an $A$-module.
In this case, by Algebra, Lemma 10.64 .4 we see that $\mathfrak{q}$ is also an associated prime of $M$. Hence we obtain an injective $B$-module map $B / \mathfrak{q} \rightarrow M$. Let $Q$ be the cokernel so that we obtain a short exact sequence

$$
0 \rightarrow B / \mathfrak{q} \rightarrow M \rightarrow Q \rightarrow 0
$$

of finite $B$-modules. After applying generic flatness Algebra, Lemma 10.117 .3 once more, this time to the $B$-module $Q$, we may assume that $Q$ is a flat $A$-module. In particular we may assume the short exact sequence above is universally injective, see Algebra, Lemma 10.38 .12 In this situation $(B / \mathfrak{q}) \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right) \subset M \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right)$ for any prime $\mathfrak{p}^{\prime}$ of $A$. The lemma follows as a minimal prime $\mathfrak{q}^{\prime}$ of the support of $(B / \mathfrak{q}) \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right)$ is an associated prime of $(B / \mathfrak{q}) \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right)$ by Divisors, Lemma 30.2 .9 .

05 KN Lemma 36.20.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $U \subset X$ be an open subscheme. Assume
(1) $f$ is of finite type,
(2) $\mathcal{F}$ is of finite type,
(3) $Y$ is irreducible with generic point $\eta$, and
(4) $A s s_{X_{\eta}}\left(\mathcal{F}_{\eta}\right)$ is not contained in $U_{\eta}$.

Then there exists a nonempty open subscheme $V \subset Y$ such that for all $y \in V$ the set $A s s_{X_{y}}\left(\mathcal{F}_{y}\right)$ is not contained in $U_{y}$.
Proof. Let $\xi \in \operatorname{Ass}_{X_{\eta}}\left(\mathcal{F}_{\eta}\right)$ be a point which is not contained in $U_{\eta}$. Set $Z=\overline{\{\xi\}}$. By assumption $U \cap Z$ is not dense in the irreducible scheme $Z_{\eta}$. Hence by Lemma 36.19 .3 after replacing $Y$ by a nonempty open we may assume that $U_{y} \cap Z_{y}$ is nowhere dense in $Z_{y}$. On the other hand, by Lemma 36.20 .1 there exists a nonempty
open $V \subset Z$ such that every generic point of $V_{y}$ is an associated point of $\mathcal{F}_{y}$. By Lemma 36.19.2 the set $f(V)$ contains a nonempty open subset of $Y$ and we win.

05KP Lemma 36.20.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $U \subset X$ be an open subscheme. Assume
(1) $f$ is of finite type,
(2) $\mathcal{F}$ is of finite type,
(3) $Y$ is irreducible with generic point $\eta$, and
(4) $A s s_{X_{\eta}}\left(\mathcal{F}_{\eta}\right) \subset U_{\eta}$.

Then there exists a nonempty open subscheme $V \subset Y$ such that for all $y \in V$ we have $A s s_{X_{y}}\left(\mathcal{F}_{y}\right) \subset U_{y}$.

Proof. (This proof is the same as the proof of Lemma 36.19.4. We urge the reader to read that proof first.) Since the statement is about fibres it is clear that we may replace $Y$ by its reduction. Hence we may assume that $Y$ is integral, see Properties, Lemma 27.3.4. We may also assume that $Y=\operatorname{Spec}(A)$ is affine. Then $A$ is a domain with fraction field $K$.

As $f$ is of finite type we see that $X$ is quasi-compact. Write $X=X_{1} \cup \ldots \cup X_{n}$ for some affine opens $X_{i}$ and set $\mathcal{F}_{i}=\left.\mathcal{F}\right|_{X_{i}}$. By assumption the generic fibre of $U_{i}=X_{i} \cap U$ contains $\operatorname{Ass}_{X_{i, \eta}}\left(\mathcal{F}_{i, \eta}\right)$. Thus it suffices to prove the result for the triples $\left(X_{i}, \mathcal{F}_{i}, U_{i}\right)$, in other words we may assume that $X$ is affine.

Write $X=\operatorname{Spec}(B)$. Let $N$ be a finite $B$-module such that $\mathcal{F}=\tilde{N}$. Note that $B_{K}$ is Noetherian as it is a finite type $K$-algebra. Hence $U_{\eta}$ is quasi-compact. Thus we can find finitely many $g_{1}, \ldots, g_{m} \in B$ such that $D\left(g_{j}\right) \subset U$ and such that $U_{\eta}=D\left(g_{1}\right)_{\eta} \cup \ldots \cup D\left(g_{m}\right)_{\eta}$. Since $\operatorname{Ass}_{X_{\eta}}\left(\mathcal{F}_{\eta}\right) \subset U_{\eta}$ we see that $N_{K} \rightarrow \bigoplus_{j}\left(N_{K}\right)_{g_{j}}$ is injective. By Algebra, Lemma 10.22 .4 this is equivalent to the injectivity of $N_{K} \rightarrow \bigoplus_{j=1, \ldots, m} N_{K}, n \mapsto\left(g_{1} n, \ldots, g_{m} n\right)$. Let $I$ and $M$ be the kernel and cokernel of this map over $A$, i.e., such that we have an exact sequence

$$
0 \rightarrow I \rightarrow N \xrightarrow{\left(g_{1}, \ldots, g_{m}\right)} \bigoplus_{j=1, \ldots, m} N \rightarrow M \rightarrow 0
$$

After replacing $A$ by $A_{h}$ for some nonzero $h$ we may assume that $B$ is a flat, finitely presented $A$-algebra and that both $M$ and $N$ are flat over $A$, see Algebra, Lemma 10.117.3. The flatness of $N$ over $A$ implies that $N$ is torsion free as an $A$-module, see More on Algebra, Lemma 15.16.9. Hence $N \subset N_{K}$. By construction $I_{K}=0$ which implies that $I=0$ (as $I \subset N \subset N_{K}$ is a subset of $I_{K}$ ). Hence now we have a short exact sequence

$$
0 \rightarrow N \xrightarrow{\left(g_{1}, \ldots, g_{m}\right)} \bigoplus_{j=1, \ldots, m} N \rightarrow M \rightarrow 0
$$

with $M$ flat over $A$. Hence for every homomorphism $A \rightarrow \kappa$ where $\kappa$ is a field, we obtain a short exact sequence

$$
0 \rightarrow N \otimes_{A} \kappa \stackrel{\left(g_{1} \otimes 1, \ldots, g_{m} \otimes 1\right)}{\longrightarrow} \bigoplus_{j=1, \ldots, m} N \otimes_{A} \kappa \rightarrow M \otimes_{A} \kappa \rightarrow 0
$$

see Algebra, Lemma 10.38 .12 . Reversing the arguments above this means that $\bigcup D\left(g_{j} \otimes 1\right)$ contains $\operatorname{Ass}_{B \otimes_{A} \kappa}\left(N \otimes_{A} \kappa\right)$. As $\bigcup D\left(g_{j} \otimes 1\right)=\bigcup D\left(g_{j}\right)_{\kappa} \subset U_{\kappa}$ we obtain that $U_{\kappa}$ contains $\operatorname{Ass}_{X \otimes \kappa}(\mathcal{F} \otimes \kappa)$ which is what we wanted to prove.

05KQ Lemma 36.20.4. Let $f: X \rightarrow S$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $U \subset X$ be an open subscheme. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes, let $f^{\prime}: X^{\prime}=X_{S^{\prime}} \rightarrow S^{\prime}$ be the base change of $f$, let $g^{\prime}: X^{\prime} \rightarrow X$ be the projection, set $\mathcal{F}^{\prime}=\left(g^{\prime}\right)^{* \mathcal{F}}$, and set $U^{\prime}=\left(g^{\prime}\right)^{-1}(U)$. Finally, let $s^{\prime} \in S^{\prime}$ with image $s=g\left(s^{\prime}\right)$. In this case

$$
\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right) \subset U_{s} \Leftrightarrow \operatorname{Ass}_{X_{s^{\prime}}^{\prime}}^{\prime}\left(\mathcal{F}_{s^{\prime}}^{\prime}\right) \subset U_{s^{\prime}}^{\prime}
$$

Proof. This follows immediately from Divisors, Lemma 30.7.2. See also Divisors, Remark 30.7.3.

05KR Lemma 36.20.5. Let $f: X \rightarrow Y$ be a morphism of finite presentation. Let $\mathcal{F}$ be $a$ quasi-coherent $\mathcal{O}_{X}$-module of finite presentation. Let $U \subset X$ be an open subscheme such that $U \rightarrow Y$ is quasi-compact. Then the set

$$
E=\left\{y \in Y \mid A s s_{X_{y}}\left(\mathcal{F}_{y}\right) \subset U_{y}\right\}
$$

is locally constructible in $Y$.
Proof. Let $y \in Y$. We have to show that there exists an open neighbourhood $V$ of $y$ in $Y$ such that $E \cap V$ is constructible in $V$. Thus we may assume that $Y$ is affine. Write $Y=\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ of finite presentation whose base change to $Y$ recovers $f$. After possibly increasing $i$ we may assume there exists a quasi-coherent $\mathcal{O}_{X_{i}}$-module $\mathcal{F}_{i}$ of finite presentation whose pullback to $X$ is isomorphic to $\mathcal{F}$, see Limits, Lemma 31.9.2. After possibly increasing $i$ one more time we may assume there exists an open subscheme $U_{i} \subset X_{i}$ whose inverse image in $X$ is $U$, see Limits, Lemma 31.3.8. By Lemma 36.20.4 it suffices to prove the lemma for $f_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.
We will use the criterion of Topology, Lemma 5.15 .3 to prove that $E$ is constructible in case $Y$ is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E \cap Z$ either contains a nonempty open subset or is not dense in $Z$. This follows from Lemmas 36.20 .2 and 36.20 .3 applied to the base change $(X, \mathcal{F}, U) \times_{Y} Z$ over $Z$.

### 36.21. Reduced fibres

Lemma 36.21.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $Y$ irreducible with generic point $\eta$ and $f$ of finite type. If $X_{\eta}$ is nonreduced, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre $X_{y}$ is nonreduced.

Proof. Let $Y^{\prime} \subset Y$ be the reduction of $Y$. Let $X^{\prime} \rightarrow Y^{\prime}$ be the base change of $f$. Note that $Y^{\prime} \rightarrow Y$ induces a bijection on points and that $X^{\prime} \rightarrow X$ identifies fibres. Hence we may assume that $Y^{\prime}$ is reduced, i.e., integral, see Properties, Lemma 27.3.4. We may also replace $Y$ by an affine open. Hence we may assume that $Y=\operatorname{Spec}(A)$ with $A$ a domain. Denote $K=f . f .(A)$ the fraction field of A. Pick an affine open $\operatorname{Spec}(B)=U \subset X$ and a section $h_{\eta} \in \Gamma\left(U_{\eta}, \mathcal{O}_{U_{\eta}}\right)=B_{K}$ which is nonzero and nilpotent. After shrinking $Y$ we may assume that $h$ comes from $h \in \Gamma\left(U, \mathcal{O}_{U}\right)=B$. After shrinking $Y$ a bit more we may assume that $h$ is nilpotent. Let $I=\{b \in B \mid h b=0\}$ be the annihilator of $h$. Then $C=B / I$ is a
finite type $A$-algebra whose generic fiber $(B / I)_{K}$ is nonzero (as $h_{\eta} \neq 0$ ). We apply generic flatness to $A \rightarrow C$ and $A \rightarrow B / h B$, see Algebra, Lemma 10.117.3, and we obtain a $g \in A, g \neq 0$ such that $C_{g}$ is free as an $A_{g}$-module and $(B / h B)_{g}$ is flat as an $A_{g}$-module. Replace $Y$ by $D(g) \subset Y$. Now we have the short exact sequence

$$
0 \rightarrow C \rightarrow B \rightarrow B / h B \rightarrow 0
$$

with $B / h B$ flat over $A$ and with $C$ nonzero free as an $A$-module. It follows that for any homomorphism $A \rightarrow \kappa$ to a field the ring $C \otimes_{A} \kappa$ is nonzero and the sequence

$$
0 \rightarrow C \otimes_{A} \kappa \rightarrow B \otimes_{A} \kappa \rightarrow B / h B \otimes_{A} \kappa \rightarrow 0
$$

is exact, see Algebra, Lemma 10.38 .12 . Note that $B / h B \otimes_{A} \kappa=\left(B \otimes_{A} \kappa\right) / h\left(B \otimes_{A} \kappa\right)$ by right exactness of tensor product. Thus we conclude that multiplication by $h$ is not zero on $B \otimes_{A} \kappa$. This clearly means that for any point $y \in Y$ the element $h$ restricts to a nonzero element of $U_{y}$, whence $X_{y}$ is nonreduced.

0576 Lemma 36.21.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be any morphism, and denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the base change of $f$. Then

$$
\begin{array}{r}
\left\{y^{\prime} \in Y^{\prime} \mid X_{y^{\prime}}^{\prime} \text { is geometrically reduced }\right\} \\
=g^{-1}\left(\left\{y \in Y \mid X_{y} \text { is geometrically reduced }\right\}\right)
\end{array}
$$

Proof. This comes down to the statement that for $y^{\prime} \in Y^{\prime}$ with image $y \in Y$ the fibre $X_{y^{\prime}}^{\prime}=X_{y} \times_{y} y^{\prime}$ is geometrically reduced over $\kappa\left(y^{\prime}\right)$ if and only if $X_{y}$ is geometrically reduced over $\kappa(y)$. This follows from Varieties, Lemma 32.4.6.

0577 Lemma 36.21.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $Y$ irreducible with generic point $\eta$ and $f$ of finite type. If $X_{\eta}$ is not geometrically reduced, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre $X_{y}$ is not geometrically reduced.

Proof. Apply Lemma 36.19 .7 to get

with all the properties mentioned in that lemma. Let $\eta^{\prime}$ be the generic point of $Y^{\prime}$. Consider the morphism $X^{\prime} \rightarrow X_{Y^{\prime}}$ (which is the reduction morphism) and the resulting morphism of generic fibres $X_{\eta^{\prime}}^{\prime} \rightarrow X_{\eta^{\prime}}$. Since $X_{\eta^{\prime}}^{\prime}$ is geometrically reduced, and $X_{\eta}$ is not this cannot be an isomorphism, see Varieties, Lemma 32.4.6, Hence $X_{\eta^{\prime}}$ is nonreduced. Hence by Lemma 36.21 .1 the fibres of $X_{Y^{\prime}} \rightarrow \bar{Y}^{\prime}$ are nonreduced at all points $y^{\prime} \in V^{\prime}$ of a nonempty open $V^{\prime} \subset Y^{\prime}$. Since $g: Y^{\prime} \rightarrow V$ is a homeomorphism Lemma 36.21 .2 proves that $g\left(V^{\prime}\right)$ is the open we are looking for.

0578 Lemma 36.21.4. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume
(1) $Y$ is irreducible with generic point $\eta$,
(2) $X_{\eta}$ is geometrically reduced, and
(3) $f$ is of finite type.

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_{V} \rightarrow V$ has geometrically reduced fibres.

Proof. Let $Y^{\prime} \subset Y$ be the reduction of $Y$. Let $X^{\prime} \rightarrow Y^{\prime}$ be the base change of $f$. Note that $Y^{\prime} \rightarrow Y$ induces a bijection on points and that $X^{\prime} \rightarrow X$ identifies fibres. Hence we may assume that $Y^{\prime}$ is reduced, i.e., integral, see Properties, Lemma 27.3.4. We may also replace $Y$ by an affine open. Hence we may assume that $Y=\operatorname{Spec}(A)$ with $A$ a domain. Denote $K=f . f .(A)$ the fraction field of $A$. After shrinking $Y$ a bit we may also assume that $X \rightarrow Y$ is flat and of finite presentation, see Morphisms, Proposition 28.27.1.

As $X_{\eta}$ is geometrically reduced there exists an open dense subset $V \subset X_{\eta}$ such that $V \rightarrow \operatorname{Spec}(K)$ is smooth, see Varieties, Lemma 32.20.7. Let $U \subset X$ be the set of points where $f$ is smooth. By Morphisms, Lemma 28.34.15 we see that $V \subset U_{\eta}$. Thus the generic fibre of $U$ is dense in the generic fibre of $X$. Since $X_{\eta}$ is reduced, it follows that $U_{\eta}$ is scheme theoretically dense in $X_{\eta}$, see Morphisms, Lemma 28.7.8. We note that as $U \rightarrow Y$ is smooth all the fibres of $U \rightarrow Y$ are geometrically reduced. Thus it suffices to show that, after shrinking $Y$, for all $y \in Y$ the scheme $U_{y}$ is scheme theoretically dense in $X_{y}$, see Morphisms, Lemma 28.7.9. This follows from Lemma 36.19.4.

0579 Lemma 36.21.5. Let $f: X \rightarrow Y$ be a morphism of finite presentation. Then the set

$$
E=\left\{y \in Y \mid X_{y} \text { is geometrically reduced }\right\}
$$

is locally constructible in $Y$.
Proof. Let $y \in Y$. We have to show that there exists an open neighbourhood $V$ of $y$ in $Y$ such that $E \cap V$ is constructible in $V$. Thus we may assume that $Y$ is affine. Write $Y=\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ of finite presentation whose base change to $Y$ recovers $f$. By Lemma 36.21.2 it suffices to prove the lemma for $f_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15 .3 to prove that $E$ is constructible in case $Y$ is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E \cap Z$ either contains a nonempty open subset or is not dense in $Z$. If $X_{\xi}$ is geometrically reduced, then Lemma 36.21.4 (applied to the morphism $X_{Z} \rightarrow Z$ ) implies that all fibres $X_{y}$ are geometrically reduced for a nonempty open $V \subset Z$. If $X_{\xi}$ is not geometrically reduced, then Lemma 36.21.3 (applied to the morphism $X_{Z} \rightarrow Z$ ) implies that all fibres $X_{y}$ are geometrically reduced for a nonempty open $V \subset Z$. Thus we win.

### 36.22. Irreducible components of fibres

Lemma 36.22.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $Y$ irreducible with generic point $\eta$ and $f$ of finite type. If $X_{\eta}$ has $n$ irreducible components, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre $X_{y}$ has at least $n$ irreducible components.

Proof. As the question is purely topological we may replace $X$ and $Y$ by their reductions. In particular this implies that $Y$ is integral, see Properties, Lemma 27.3.4 Let $X_{\eta}=X_{1, \eta} \cup \ldots \cup X_{n, \eta}$ be the decomposition of $X_{\eta}$ into irreducible
components. Let $X_{i} \subset X$ be the reduced closed subscheme whose generic fibre is $X_{i, \eta}$. Note that $Z_{i, j}=X_{i} \cap X_{j}$ is a closed subset of $X_{i}$ whose generic fibre $Z_{i, j, \eta}$ is nowhere dense in $X_{i, \eta}$. Hence after shrinking $Y$ we may assume that $Z_{i, j, y}$ is nowhere dense in $X_{i, y}$ for every $y \in Y$, see Lemma 36.19.3. After shrinking $Y$ some more we may assume that $X_{y}=\bigcup X_{i, y}$ for $y \in Y$, see Lemma 36.19.5. Moreover, after shrinking $Y$ we may assume that each $X_{i} \rightarrow Y$ is flat and of finite presentation, see Morphisms, Proposition 28.27.1. The morphisms $X_{i} \rightarrow Y$ are open, see Morphisms, Lemma 28.25.9. Thus there exists an open neighbourhood $V$ of $\eta$ which is contained in $f\left(X_{i}\right)$ for each $i$. For each $y \in V$ the schemes $X_{i, y}$ are nonempty closed subsets of $X_{y}$, we have $X_{y}=\bigcup X_{i, y}$ and the intersections $Z_{i, j, y}=X_{i, y} \cap X_{j, y}$ are not dense in $X_{i, y}$. Clearly this implies that $X_{y}$ has at least $n$ irreducible components.

Lemma 36.22.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be any morphism, and denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the base change of $f$. Then

$$
\begin{array}{r}
\left\{y^{\prime} \in Y^{\prime} \mid X_{y^{\prime}}^{\prime} \text { is geometrically irreducible }\right\} \\
=g^{-1}\left(\left\{y \in Y \mid X_{y} \text { is geometrically irreducible }\right\}\right)
\end{array}
$$

Proof. This comes down to the statement that for $y^{\prime} \in Y^{\prime}$ with image $y \in Y$ the fibre $X_{y^{\prime}}^{\prime}=X_{y} \times_{y} y^{\prime}$ is geometrically irreducible over $\kappa\left(y^{\prime}\right)$ if and only if $X_{y}$ is geometrically irreducible over $\kappa(y)$. This follows from Varieties, Lemma 32.6.2.

Lemma 36.22.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let

$$
n_{X / Y}: Y \rightarrow\{0,1,2,3, \ldots, \infty\}
$$

be the function which associates to $y \in Y$ the number of irreducible components of $\left(X_{y}\right)_{K}$ where $K$ is a separably closed extension of $\kappa(y)$. This is well defined and if $g: Y^{\prime} \rightarrow Y$ is a morphism then

$$
n_{X^{\prime} / Y^{\prime}}=n_{X / Y} \circ g
$$

where $X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$.
Proof. Suppose that $y^{\prime} \in Y^{\prime}$ has image $y \in Y$. Suppose $K \supset \kappa(y)$ and $K^{\prime} \supset \kappa\left(y^{\prime}\right)$ are separably closed extensions. Then we may choose a commutative diagram

of fields. The result follows as the morphisms of schemes

$$
\left(X_{y^{\prime}}^{\prime}\right)_{K^{\prime}} \longleftarrow\left(X_{y^{\prime}}^{\prime}\right)_{K^{\prime \prime}}=\left(X_{y}\right)_{K^{\prime \prime}} \longrightarrow\left(X_{y}\right)_{K}
$$

induce bijections between irreducible components, see Varieties, Lemma 32.6.7.
0557 Lemma 36.22.4. Let $A$ be a domain with fraction field $K$. Let $P \in A\left[x_{1}, \ldots, x_{n}\right]$. Denote $\bar{K}$ the algebraic closure of $K$. Assume $P$ is irreducible in $\bar{K}\left[x_{1}, \ldots, x_{n}\right]$. Then there exists a $f \in A$ such that $P^{\varphi} \in \kappa\left[x_{1}, \ldots, x_{n}\right]$ is irreducible for all homomorphisms $\varphi: A_{f} \rightarrow \kappa$ into fields.

Proof. There exists an automorphism $\Psi$ of $A\left[x_{1}, \ldots, x_{n}\right]$ over $A$ such that $\Psi(P)=$ $a x_{n}^{d}+$ lower order terms in $x_{n}$ with $a \neq 0$, see Algebra, Lemma 10.114.2. We may replace $P$ by $\Psi(P)$ and we may replace $A$ by $A_{a}$. Thus we may assume that $P$ is monic in $x_{n}$ of degree $d>0$. For $i=1, \ldots, n-1$ let $d_{i}$ be the degree of $P$ in $x_{i}$. Note that this implies that $P^{\varphi}$ is monic of degree $d$ in $x_{n}$ and has degree $\leq d_{i}$ in $x_{i}$ for every homomorphism $\varphi: A \rightarrow \kappa$ where $\kappa$ is a field. Thus if $P^{\varphi}$ is reducible, then we can write

$$
P^{\varphi}=Q_{1} Q_{2}
$$

with $Q_{1}, Q_{2}$ monic of degree $e_{1}, e_{2} \geq 0$ in $x_{n}$ with $e_{1}+e_{2}=d$ and having degree $\leq d_{i}$ in $x_{i}$ for $i=1, \ldots, n-1$. In other words we can write

$$
\begin{equation*}
Q_{j}=x_{n}^{e_{j}}+\sum_{0 \leq l<e_{j}}\left(\sum_{L \in \mathcal{L}} a_{j, l, L} x^{L}\right) x_{n}^{l} \tag{36.22.4.1}
\end{equation*}
$$

where the sum is over the set $\mathcal{L}$ of multi-indices $L$ of the form $L=\left(l_{1}, \ldots, l_{n-1}\right)$ with $0 \leq l_{i} \leq d_{i}$. For any $e_{1}, e_{2} \geq 0$ with $e_{1}+e_{2}=d$ we consider the $A$-algebra

$$
B_{e_{1}, e_{2}}=A\left[\left\{a_{1, l, L}\right\}_{0 \leq l<e_{1}, L \in \mathcal{L}},\left\{a_{2, l, L}\right\}_{0 \leq l<e_{2}, L \in \mathcal{L}}\right] / \text { (relations) }
$$

where the (relations) is the ideal generated by the coefficients of the polynomial

$$
P-Q_{1} Q_{2} \in A\left[\left\{a_{1, l, L}\right\}_{0 \leq l<e_{1}, L \in \mathcal{L}},\left\{a_{2, l, L}\right\}_{0 \leq l<e_{2}, L \in \mathcal{L}}\right]\left[x_{1}, \ldots, x_{n}\right]
$$

with $Q_{1}$ and $Q_{2}$ defined as in (36.22.4.1). OK, and the assumption that $P$ is irreducible over $\bar{K}$ implies that there does not exist any $A$-algebra homomorphism $B_{e_{1}, e_{2}} \rightarrow \bar{K}$. By the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1 this means that $B_{e_{1}, e_{2}} \otimes_{A} K=0$. As $B_{e_{1}, e_{2}}$ is a finitely generated $A$-algebra this signifies that we can find an $f_{e_{1}, e_{2}} \in A$ such that $\left(B_{e_{1}, e_{2}}\right)_{f_{e_{1}, e_{2}}}=0$. By construction this means that if $\varphi: A_{f_{e_{1}, e_{2}}} \rightarrow \kappa$ is a homomorphism to a field, then $P^{\varphi}$ does not have a factorization $P^{\varphi}=Q_{1} Q_{2}$ with $Q_{1}$ of degree $e_{1}$ in $x_{n}$ and $Q_{2}$ of degree $e_{2}$ in $x_{n}$. Thus taking $f=\prod_{e 1, e_{2} \geq 0, e_{1}+e_{2}=d} f_{e_{1}, e_{2}}$ we win.

0559 Lemma 36.22.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume
(1) $Y$ is irreducible with generic point $\eta$,
(2) $X_{\eta}$ is geometrically irreducible, and
(3) $f$ is of finite type.

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_{V} \rightarrow V$ has geometrically irreducible fibres.

First proof of Lemma 36.22 .5 . We give two proofs of the lemma. These are essentially equivalent; the second is more self contained but a bit longer. Choose a diagram

as in Lemma 36.19.7. Note that the generic fibre of $f^{\prime}$ is the reduction of the geometric fibre of $f$ (see Lemma 36.19.6) and hence is geometrically irreducible. Suppose that the lemma holds for the morphism $f^{\prime}$. Then after shrinking $V$ all the fibres of $f^{\prime}$ are geometrically irreducible. As $X^{\prime}=\left(Y^{\prime} \times_{V} X_{V}\right)_{r e d}$ this implies that all the fibres of $Y^{\prime} \times_{V} X_{V}$ are geometrically irreducible. Hence by Lemma 36.22 .2 all the fibres of $X_{V} \rightarrow V$ are geometrically irreducible and we win. In this way we
see that we may assume that the generic fibre is geometrically reduced as well as geometrically irreducible and we may assume $Y=\operatorname{Spec}(A)$ with $A$ a domain.
Let $x \in X_{\eta}$ be the generic point. As $X_{\eta}$ is geometrically irreducible and reduced we see that $L=\kappa(x)$ is a finitely generated extension of $K=\kappa(\eta)=f . f .(A)$ which is geometrically reduced and geometrically irreducible, see Varieties, Lemmas 32.4.2 and 32.6.6. In particular the field extension $K \subset L$ is separable, see Algebra, Lemma 10.43.1. Hence we can find $x_{1}, \ldots, x_{r+1} \in L$ which generate $L$ over $K$ and such that $x_{1}, \ldots, x_{r}$ is a transcendence basis for $L$ over $K$, see Algebra, Lemma 10.41.3 Let $P \in K\left(x_{1}, \ldots, x_{r}\right)[T]$ be the minimal polynomial for $x_{r+1}$. Clearing denominators we may assume that $P$ has coefficients in $A\left[x_{1}, \ldots, x_{r}\right]$. Note that as $L$ is geometrically reduced and geometrically irreducible over $K$, the polynomial $P$ is irreducible in $\bar{K}\left[x_{1}, \ldots, x_{r}, T\right]$ where $\bar{K}$ is the algebraic closure of $K$. Denote

$$
B^{\prime}=A\left[x_{1}, \ldots, x_{r+1}\right] /\left(P\left(x_{r+1}\right)\right)
$$

and set $X^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$. By construction the fraction field of $B^{\prime}$ is isomorphic to $L=\kappa(x)$ as $K$-extensions. Hence there exists an open $U \subset X$, and open $U^{\prime} \subset X^{\prime}$ and a $Y$-isomorphism $U \rightarrow U^{\prime}$, see Lemma 36.19.9. Here is a diagram:

Note that $U_{\eta} \subset X_{\eta}$ and $U_{\eta}^{\prime} \subset X_{\eta}^{\prime}$ are dense opens. Thus after shrinking $Y$ by applying Lemma 36.19 .3 we obtain that $U_{y}$ is dense in $X_{y}$ and $U_{y}^{\prime}$ is dense in $X_{y}^{\prime}$ for all $y \in Y$. Thus it suffices to prove the lemma for $X^{\prime} \rightarrow Y$ which is the content of Lemma 36.22.4

Second proof of Lemma 36.22.5. Let $Y^{\prime} \subset Y$ be the reduction of $Y$. Let $X^{\prime} \rightarrow$ $X$ be the reduction of $X$. Note that $X^{\prime} \rightarrow X \rightarrow Y$ factors through $Y^{\prime}$, see Schemes, Lemma 25.12.6. As $Y^{\prime} \rightarrow Y$ and $X^{\prime} \rightarrow X$ are universal homeomorphisms by Morphisms, Lemma 28.44.4 we see that it suffices to prove the lemma for $X^{\prime} \rightarrow Y^{\prime}$. Thus we may assume that $X$ and $Y$ are reduced. In particular $Y$ is integral, see Properties, Lemma 27.3.4. Thus by Morphisms, Proposition 28.27.1 there exists a nonempty affine open $V \subset Y$ such that $X_{V} \rightarrow V$ is flat and of finite presentation. After replacing $Y$ by $V$ we may assume, in addition to (1), (2), (3) that $Y$ is integral affine, $X$ is reduced, and $f$ is flat and of finite presentation. In particular $f$ is universally open, see Morphisms, Lemma 28.25.9.
Pick a nonempty affine open $U \subset X$. Then $U \rightarrow Y$ is flat and of finite presentation with geometrically irreducible generic fibre. The complement $X_{\eta} \backslash U_{\eta}$ is nowhere dense. Thus after shrinking $Y$ we may assume $U_{y} \subset X_{y}$ is open dense for all $y \in Y$, see Lemma 36.19.3. Thus we may replace $X$ by $U$ and we reduce to the case where $Y$ is integral affine and $X$ is reduced affine, flat and of finite presentation over $Y$ with geometrically irreducible generic fibre $X_{\eta}$.

Write $X=\operatorname{Spec}(B)$ and $Y=\operatorname{Spec}(A)$. Then $A$ is a domain, $B$ is reduced, $A \rightarrow B$ is flat of finite presentation, and $B_{K}$ is geometrically irreducible over $K=f . f .(A)$. In particular we see that $B_{K}$ is a domain. Let $L=f . f .\left(B_{K}\right)$ be its fraction field. Note that $L$ is a finitely generated field extension of $K$ as $B$ is an $A$-algebra of finite presentation. Let $K \subset K^{\prime}$ be a finite purely inseparable extension such
that $\left(L \otimes_{K} K^{\prime}\right)_{\text {red }}$ is a separably generated field extension, see Algebra, Lemma 10.44.3. Choose $x_{1}, \ldots, x_{n} \in K^{\prime}$ which generate the field extension $K^{\prime}$ over $K$, and such that $x_{i}^{q_{i}} \in A$ for some prime power $q_{i}$ (proof existence $x_{i}$ omitted). Let $A^{\prime}$ be the $A$-subalgebra of $K^{\prime}$ generated by $x_{1}, \ldots, x_{n}$. Then $A^{\prime}$ is a finite $A$ subalgebra $A^{\prime} \subset K^{\prime}$ whose fraction field is $K^{\prime}$. Note that $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(A)$ is a universal homeomorphism, see Algebra, Lemma 10.45.6. Hence it suffices to prove the result after base changing to $\operatorname{Spec}\left(A^{\prime}\right)$. We are going to replace $A$ by $A^{\prime}$ and $B$ by $\left(B \otimes_{A} A^{\prime}\right)_{\text {red }}$ to arrive at the situation where $L$ is a separably generated field extension of $K$. Of course it may happen that $\left(B \otimes_{A} A^{\prime}\right)_{\text {red }}$ is no longer flat, or of finite presentation over $A^{\prime}$, but this can be remedied by replacing $A^{\prime}$ by $A_{f}^{\prime}$ for a suitable $f \in A^{\prime}$, see Algebra, Lemma 10.117.3

At this point we know that $A$ is a domain, $B$ is reduced, $A \rightarrow B$ is flat and of finite presentation, $B_{K}$ is a domain, and $L=f . f .\left(B_{K}\right)$ is a separably generated field extension of $K=f . f .(A)$. By Algebra, Lemma 10.41 .3 we may write $L=K\left(x_{1}, \ldots, x_{r+1}\right)$ where $x_{1}, \ldots, x_{r}$ are algebraically independent over $K$, and $x_{r+1}$ is separable over $K\left(x_{1}, \ldots, x_{r}\right)$. After clearing denominators we may assume that the minimal polynomial $P \in K\left(x_{1}, \ldots, x_{r}\right)[T]$ of $x_{r+1}$ over $K\left(x_{1}, \ldots, x_{r}\right)$ has coefficients in $A\left[x_{1}, \ldots, x_{r}\right]$. Note that since $L / K$ is separable and since $L$ is geometrically irreducible over $K$, the polynomial $P$ is irreducible over the algebraic closure $\bar{K}$ of $K$. Denote

$$
B^{\prime}=A\left[x_{1}, \ldots, x_{r+1}\right] /\left(P\left(x_{r+1}\right)\right) .
$$

By construction the fraction fields of $B$ and $B^{\prime}$ are isomorphic as $K$-extensions. Hence there exists an isomorphism of $A$-algebras $B_{h} \cong B_{h^{\prime}}^{\prime}$ for suitable $h \in B$ and $h^{\prime} \in B^{\prime}$, see Lemma 36.19.9. In other words $X$ and $X^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ have a common affine open $U$. Here is a diagram:

After shrinking $Y$ once more (by applying Lemma 36.19 .3 to $Z=X \backslash U$ in $X$ and $Z^{\prime}=X^{\prime} \backslash U$ in $X^{\prime}$ ) we see that $U_{y}$ is dense in $X_{y}$ and $U_{y}$ is dense in $X_{y}^{\prime}$ for all $y \in Y$. Thus it suffices to prove the lemma for $X^{\prime} \rightarrow Y$ which is the content of Lemma 36.22.4

Lemma 36.22.6. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $n_{X / Y}$ be the function on $Y$ counting the numbers of geometrically irreducible components of fibres of $f$ introduced in Lemma 36.22.3. Assume $f$ of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that $\left.n_{X / Y}\right|_{V}$ is constant.

Proof. Let $Z$ be the reduced induced scheme structure on $\overline{\{y\}}$. Let $f_{Z}: X_{Z} \rightarrow Z$ be the base change of $f$. Clearly it suffices to prove the lemma for $f_{Z}$ and the generic point of $Z$. Hence we may assume that $Y$ is an integral scheme, see Properties, Lemma 27.3.4. Our goal in this case is to produce a nonempty open $V \subset Y$ such that $\left.n_{X / Y}\right|_{V}$ is constant.
We apply Lemma 36.19 .8 to $f: X \rightarrow Y$ and we get $g: Y^{\prime} \rightarrow V \subset Y$. As $g: Y^{\prime} \rightarrow V$ is surjective finite étale, in particular open (see Morphisms, Lemma
28.36.13), it suffices to prove that there exists an open $V^{\prime} \subset Y^{\prime}$ such that $\left.n_{X^{\prime} / Y^{\prime}}\right|_{V^{\prime}}$ is constant, see Lemma 36.22.3. Thus we see that we may assume that all irreducible components of the generic fibre $X_{\eta}$ are geometrically irreducible over $\kappa(\eta)$.
At this point suppose that $X_{\eta}=X_{1, \eta} \cup \ldots \bigcup X_{n, \eta}$ is the decomposition of the generic fibre into (geometrically) irreducible components. In particular $n_{X / Y}(\eta)=$ $n$. Let $X_{i}$ be the closure of $X_{i, \eta}$ in $X$. After shrinking $Y$ we may assume that $X=\bigcup X_{i}$, see Lemma 36.19.5. After shrinking $Y$ some more we see that each fibre of $f$ has at least $n$ irreducible components, see Lemma 36.22.1. Hence $n_{X / Y}(y) \geq n$ for all $y \in Y$. After shrinking $Y$ some more we obtain that $X_{i, y}$ is geometrically irreducible for each $i$ and all $y \in Y$, see Lemma 36.22.5. Since $X_{y}=\bigcup X_{i, y}$ this shows that $n_{X / Y}(y) \leq n$ and finishes the proof.

055B Lemma 36.22.7. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $n_{X / Y}$ be the function on $Y$ counting the numbers of geometrically irreducible components of fibres of $f$ introduced in Lemma 36.22.3. Assume $f$ of finite presentation. Then the level sets

$$
E_{n}=\left\{y \in Y \mid n_{X / Y}(y)=n\right\}
$$

of $n_{X / Y}$ are locally constructible in $Y$.
Proof. Fix $n$. Let $y \in Y$. We have to show that there exists an open neighbourhood $V$ of $y$ in $Y$ such that $E_{n} \cap V$ is constructible in $V$. Thus we may assume that $Y$ is affine. Write $Y=\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ of finite presentation whose base change to $Y$ recovers $f$. By Lemma 36.22 .3 it suffices to prove the lemma for $f_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.
We will use the criterion of Topology, Lemma 5.15 .3 to prove that $E_{n}$ is constructible in case $Y$ is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_{n} \cap Z$ either contains a nonempty open subset or is not dense in $Z$. Let $\xi \in Z$ be the generic point. Then Lemma 36.22.6 shows that $n_{X / Y}$ is constant in a neighbourhood of $\xi$ in $Z$. This clearly implies what we want.

### 36.23. Connected components of fibres

055C
055D Lemma 36.23.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $Y$ irreducible with generic point $\eta$ and $f$ of finite type. If $X_{\eta}$ has $n$ connected components, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre $X_{y}$ has at least $n$ connected components.

Proof. As the question is purely topological we may replace $X$ and $Y$ by their reductions. In particular this implies that $Y$ is integral, see Properties, Lemma 27.3.4. Let $X_{\eta}=X_{1, \eta} \cup \ldots \cup X_{n, \eta}$ be the decomposition of $X_{\eta}$ into connected components. Let $X_{i} \subset X$ be the reduced closed subscheme whose generic fibre is $X_{i, \eta}$. Note that $Z_{i, j}=X_{i} \cap X_{j}$ is a closed subset of $X$ whose generic fibre $Z_{i, j, \eta}$ is empty. Hence after shrinking $Y$ we may assume that $Z_{i, j}=\emptyset$, see Lemma 36.19.1. After shrinking $Y$ some more we may assume that $X_{y}=\bigcup X_{i, y}$ for $y \in Y$, see Lemma 36.19.5. Moreover, after shrinking $Y$ we may assume that each $X_{i} \rightarrow Y$ is
flat and of finite presentation, see Morphisms, Proposition 28.27.1. The morphisms $X_{i} \rightarrow Y$ are open, see Morphisms, Lemma 28.25.9. Thus there exists an open neighbourhood $V$ of $\eta$ which is contained in $f\left(X_{i}\right)$ for each $i$. For each $y \in V$ the schemes $X_{i, y}$ are nonempty closed subsets of $X_{y}$, we have $X_{y}=\bigcup X_{i, y}$ and the intersections $Z_{i, j, y}=X_{i, y} \cap X_{j, y}$ are empty! Clearly this implies that $X_{y}$ has at least $n$ connected components.

055E Lemma 36.23.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be any morphism, and denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the base change of $f$. Then

$$
\left.\begin{array}{rl} 
& \left\{y^{\prime} \in Y^{\prime} \mid X_{y^{\prime}}^{\prime} \text { is geometrically connected }\right\} \\
=g^{-1}\left(\left\{y \in Y \mid X_{y} \text { is geometrically connected }\right\}\right.
\end{array}\right) .
$$

Proof. This comes down to the statement that for $y^{\prime} \in Y^{\prime}$ with image $y \in Y$ the fibre $X_{y^{\prime}}^{\prime}=X_{y} \times_{y} y^{\prime}$ is geometrically connected over $\kappa\left(y^{\prime}\right)$ if and only if $X_{y}$ is geometrically connected over $\kappa(y)$. This follows from Varieties, Lemma 32.5.3.

055F Lemma 36.23.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let

$$
n_{X / Y}: Y \rightarrow\{0,1,2,3, \ldots, \infty\}
$$

be the function which associates to $y \in Y$ the number of connected components of $\left(X_{y}\right)_{K}$ where $K$ is a separably closed extension of $\kappa(y)$. This is well defined and if $g: Y^{\prime} \rightarrow Y$ is a morphism then

$$
n_{X^{\prime} / Y^{\prime}}=n_{X / Y} \circ g
$$

where $X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$.
Proof. Suppose that $y^{\prime} \in Y^{\prime}$ has image $y \in Y$. Suppose $K \supset \kappa(y)$ and $K^{\prime} \supset \kappa\left(y^{\prime}\right)$ are separably closed extensions. Then we may choose a commutative diagram

of fields. The result follows as the morphisms of schemes

$$
\left(X_{y^{\prime}}^{\prime}\right)_{K^{\prime}} \leftarrow\left(X_{y^{\prime}}^{\prime}\right)_{K^{\prime \prime}}=\left(X_{y}\right)_{K^{\prime \prime}} \longrightarrow\left(X_{y}\right)_{K}
$$

induce bijections between connected components, see Varieties, Lemma 32.5.6.
055G Lemma 36.23.4. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume
(1) $Y$ is irreducible with generic point $\eta$,
(2) $X_{\eta}$ is geometrically connected, and
(3) $f$ is of finite type.

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_{V} \rightarrow V$ has geometrically connected fibres.
Proof. Choose a diagram

as in Lemma 36.19.8. Note that the generic fibre of $f^{\prime}$ is geometrically connected (for example by Lemma 36.23.3. Suppose that the lemma holds for the morphism $f^{\prime}$. This means that there exists a nonempty open $W \subset Y^{\prime}$ such that every fibre of $X^{\prime} \rightarrow Y^{\prime}$ over $W$ is geometrically connected. Then, as $g$ is an open morphism by Morphisms, Lemma 28.36 .13 all the fibres of $f$ at points of the nonempty open $V=g(W)$ are geometrically connected, see Lemma 36.23.3. In this way we see that we may assume that the irreducible components of the generic fibre $X_{\eta}$ are geometrically irreducible.

Let $Y^{\prime}$ be the reduction of $Y$, and set $X^{\prime}=Y^{\prime} \times_{Y} X$. Then it suffices to prove the lemma for the morphism $X^{\prime} \rightarrow Y^{\prime}$ (for example by Lemma 36.23.3 once again). Since the generic fibre of $X^{\prime} \rightarrow Y^{\prime}$ is the same as the generic fibre of $X \rightarrow Y$ we see that we may assume that $Y$ is irreducible and reduced (i.e., integral, see Properties, Lemma 27.3 .4 and that the irreducible components of the generic fibre $X_{\eta}$ are geometrically irreducible.
At this point suppose that $X_{\eta}=X_{1, \eta} \bigcup \ldots \bigcup X_{n, \eta}$ is the decomposition of the generic fibre into (geometrically) irreducible components. Let $X_{i}$ be the closure of $X_{i, \eta}$ in $X$. After shrinking $Y$ we may assume that $X=\bigcup X_{i}$, see Lemma 36.19.5. Let $Z_{i, j}=X_{i} \cap X_{j}$. Let

$$
\{1, \ldots, n\} \times\{1, \ldots, n\}=I \amalg J
$$

where $(i, j) \in I$ if $Z_{i, j, \eta}=\emptyset$ and $(i, j) \in J$ if $Z_{i, j, \eta} \neq \emptyset$. After shrinking $Y$ we may assume that $Z_{i, j}=\emptyset$ for all $(i, j) \in I$, see Lemma 36.19.1. After shrinking $Y$ we obtain that $X_{i, y}$ is geometrically irreducible for each $i$ and all $y \in Y$, see Lemma 36.22.5. After shrinking $Y$ some more we achieve the situation where each $Z_{i, j} \rightarrow Y$ is flat and of finite presentation for all $(i, j) \in J$, see Morphisms, Proposition 28.27.1. This means that $f\left(Z_{i, j}\right) \subset Y$ is open, see Morphisms, Lemma 28.25.9. We claim that

$$
V=\bigcap_{(i, j) \in J} f\left(Z_{i, j}\right)
$$

works, i.e., that $X_{y}$ is geometrically connected for each $y \in V$. Namely, the fact that $X_{\eta}$ is connected implies that the equivalence relation generated by the pairs in $J$ has only one equivalence class. Now if $y \in V$ and $K \supset \kappa(y)$ is a separably closed extension, then the irreducible components of $\left(X_{y}\right)_{K}$ are the fibres $\left(X_{i, y}\right)_{K}$. Moreover, we see by construction and $y \in V$ that $\left(X_{i, y}\right)_{K}$ meets $\left(X_{j, y}\right)_{K}$ if and only $(i, j) \in J$. Hence the remark on equivalence classes shows that $\left(X_{y}\right)_{K}$ is connected and we win.

055H Lemma 36.23.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $n_{X / Y}$ be the function on $Y$ counting the numbers of geometrically connected components of fibres of $f$ introduced in Lemma 36.23.3. Assume $f$ of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that $\left.n_{X / Y}\right|_{V}$ is constant.

Proof. Let $Z$ be the reduced induced scheme structure on $\overline{\{y\}}$. Let $f_{Z}: X_{Z} \rightarrow Z$ be the base change of $f$. Clearly it suffices to prove the lemma for $f_{Z}$ and the generic point of $Z$. Hence we may assume that $Y$ is an integral scheme, see Properties, Lemma 27.3.4. Our goal in this case is to produce a nonempty open $V \subset Y$ such that $\left.n_{X / Y}\right|_{V}$ is constant.
We apply Lemma 36.19 .8 to $f: X \rightarrow Y$ and we get $g: Y^{\prime} \rightarrow V \subset Y$. As $g: Y^{\prime} \rightarrow V$ is surjective finite étale, in particular open (see Morphisms, Lemma
28.36.13), it suffices to prove that there exists an open $V^{\prime} \subset Y^{\prime}$ such that $\left.n_{X^{\prime} / Y^{\prime}}\right|_{V^{\prime}}$ is constant, see Lemma 36.22 .3 . Thus we see that we may assume that all irreducible components of the generic fibre $X_{\eta}$ are geometrically irreducible over $\kappa(\eta)$. By Varieties, Lemma 32.6 .15 this implies that also the connected components of $X_{\eta}$ are geometrically connected.

At this point suppose that $X_{\eta}=X_{1, \eta} \bigcup \ldots \bigcup X_{n, \eta}$ is the decomposition of the generic fibre into (geometrically) connected components. In particular $n_{X / Y}(\eta)=$ $n$. Let $X_{i}$ be the closure of $X_{i, \eta}$ in $X$. After shrinking $Y$ we may assume that $X=\bigcup X_{i}$, see Lemma 36.19.5. After shrinking $Y$ some more we see that each fibre of $f$ has at least $n$ connected components, see Lemma 36.23.1. Hence $n_{X / Y}(y) \geq n$ for all $y \in Y$. After shrinking $Y$ some more we obtain that $X_{i, y}$ is geometrically connected for each $i$ and all $y \in Y$, see Lemma 36.23.4. Since $X_{y}=\bigcup X_{i, y}$ this shows that $n_{X / Y}(y) \leq n$ and finishes the proof.

055I Lemma 36.23.6. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $n_{X / Y}$ be the function on $Y$ counting the numbers of geometric connected components of fibres of $f$ introduced in Lemma 36.23.3. Assume $f$ of finite presentation. Then the level sets

$$
E_{n}=\left\{y \in Y \mid n_{X / Y}(y)=n\right\}
$$

of $n_{X / Y}$ are locally constructible in $Y$.
Proof. Fix $n$. Let $y \in Y$. We have to show that there exists an open neighbourhood $V$ of $y$ in $Y$ such that $E_{n} \cap V$ is constructible in $V$. Thus we may assume that $Y$ is affine. Write $Y=\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type Z-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ of finite presentation whose base change to $Y$ recovers $f$. By Lemma 36.23 .3 it suffices to prove the lemma for $f_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15 .3 to prove that $E_{n}$ is constructible in case $Y$ is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_{n} \cap Z$ either contains a nonempty open subset or is not dense in $Z$. Let $\xi \in Z$ be the generic point. Then Lemma 36.23.5 shows that $n_{X / Y}$ is constant in a neighbourhood of $\xi$ in $Z$. This clearly implies what we want.

055J Lemma 36.23.7. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that
(1) $S$ is the spectrum of a discrete valuation ring,
(2) $f$ is flat,
(3) $X$ is connected,
(4) the closed fibre $X_{s}$ is reduced.

Then the generic fibre $X_{\eta}$ is connected.
Proof. Write $Y=\operatorname{Spec}(R)$ and let $\pi \in R$ be a uniformizer. To get a contradiction assume that $X_{\eta}$ is disconnected. This means there exists a nontrivial idempotent $e \in \Gamma\left(X_{\eta}, \mathcal{O}_{X_{\eta}}\right)$. Let $U=\operatorname{Spec}(A)$ be any affine open in $X$. Note that $\pi$ is a nonzerodivisor on $A$ as $A$ is flat over $R$, see More on Algebra, Lemma 15.16 .9 for example. Then $\left.e\right|_{U_{\eta}}$ corresponds to an element $e \in A[1 / \pi]$. Let $z \in A$ be an element such that $e=z / \pi^{n}$ with $n \geq 0$ minimal. Note that $z^{2}=\pi^{n} z$. This means that $z \bmod \pi A$ is nilpotent if $n>0$. By assumption $A / \pi A$ is reduced, and hence
minimality of $n$ implies $n=0$. Thus we conclude that $e \in A$ ! In other words $e \in \Gamma\left(X, \mathcal{O}_{X}\right)$. As $X$ is connected it follows that $e$ is a trivial idempotent which is a contradiction.

### 36.24. Connected components meeting a section

055 K The results in this section are in particular applicable to a group scheme $G \rightarrow S$ and its neutral section $e: S \rightarrow G$.

055L Situation 36.24.1. Here $f: X \rightarrow Y$ be a morphism of schemes, and $s: Y \rightarrow X$ is a section of $f$. For every $y \in Y$ we denote $X_{y}^{0}$ the connected component of $X_{y}$ containing $s(y)$. Finally, we set $X^{0}=\bigcup_{y \in Y} X_{y}^{0}$.
055M Lemma 36.24.2. Let $f: X \rightarrow Y, s: Y \rightarrow X$ be as in Situation 36.24.1. If $g: Y^{\prime} \rightarrow Y$ is any morphism, consider the base change diagram

so that we obtain $\left(X^{\prime}\right)^{0} \subset X^{\prime}$. Then $\left(X^{\prime}\right)^{0}=\left(g^{\prime}\right)^{-1}\left(X^{0}\right)$.
Proof. Let $y^{\prime} \in Y^{\prime}$ with image $y \in Y$. We may think of $X_{y}^{0}$ as a closed subscheme of $X_{y}$, see for example Morphisms, Definition 28.26 .3 . As $s(y) \in X_{y}^{0}$ we conclude from Varieties, Lemma 32.5 .14 that $X_{y}^{0}$ is a geometrically connected scheme over $\kappa(y)$. Hence $X_{y}^{0} \times_{y} y^{\prime} \rightarrow X_{y^{\prime}}^{\prime}$ is a connected closed subscheme which contains $s^{\prime}\left(y^{\prime}\right)$. Thus $X_{y}^{0} \times_{y} y^{\prime} \subset\left(X_{y^{\prime}}^{\prime}\right)^{0}$. The other inclusion $X_{y}^{0} \times_{y} y^{\prime} \supset\left(X_{y^{\prime}}^{\prime}\right)^{0}$ is clear as the image of $\left(X_{y^{\prime}}^{\prime}\right)^{0}$ in $X_{y}$ is a connected subset of $X_{y}$ which contains $s(y)$.

055N Lemma 36.24.3. Let $f: X \rightarrow Y, s: Y \rightarrow X$ be as in Situation 36.24.1. Assume $f$ of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that the inverse image of $X^{0}$ in the base change $X_{V}$ is open and closed in $X_{V}$.

Proof. Let $Z \subset Y$ be the induced reduced closed subscheme structure on $\overline{\{y\}}$. Let $f_{Z}: X_{Z} \rightarrow Z$ and $s_{Z}: Z \rightarrow X_{Z}$ be the base changes of $f$ and $s$. By Lemma36.24.2 we have $\left(X_{Z}\right)^{0}=\left(X^{0}\right)_{Z}$. Hence it suffices to prove the lemma for the morphism $X_{Z} \rightarrow Z$ and the point $x \in X_{Z}$ which maps to the generic point of $Z$. In other words we have reduced the problem to the case where $Y$ is an integral scheme (see Properties, Lemma 27.3.4 with generic point $\eta$. Our goal is to show that after shrinking $Y$ the subset $X^{0}$ becomes an open and closed subset of $X$.

Note that the scheme $X_{\eta}$ is of finite type over a field, hence Noetherian. Thus its connected components are open as well as closed. Hence we may write $X_{\eta}=X_{\eta}^{0} \amalg T_{\eta}$ for some open and closed subset $T_{\eta}$ of $X_{\eta}$. Next, let $T \subset X$ be the closure of $T_{\eta}$ and let $X^{00} \subset X$ be the closure of $X_{\eta}^{0}$. Note that $T_{\eta}$, resp. $X_{\eta}^{0}$ is the generic fibre of $T$, resp. $X^{00}$, see discussion preceding Lemma 36.19.5. Moreover, that lemma implies that after shrinking $Y$ we may assume that $X=X^{00} \cup T$ (set theoretically). Note that $\left(T \cap X^{00}\right)_{\eta}=T_{\eta} \cap X_{\eta}^{0}=\emptyset$. Hence after shrinking $Y$ we may assume that $T \cap X^{00}=\emptyset$, see Lemma 36.19.1. In particular $X^{00}$ is open in $X$. Note that $X_{\eta}^{0}$ is connected and has a rational point, namely $s(\eta)$, hence it is geometrically connected, see Varieties, Lemma 32.5.14. Thus after shrinking $Y$ we may assume
that all fibres of $X^{00} \rightarrow Y$ are geometrically connected, see Lemma 36.23.4. At this point it follows that the fibres $X_{y}^{00}$ are open, closed, and connected subsets of $X_{y}$ containing $\sigma(y)$. It follows that $X^{0}=X^{00}$ and we win.

055P Lemma 36.24.4. Let $f: X \rightarrow Y, s: Y \rightarrow X$ be as in Situation 36.24.1. If $f$ is of finite presentation then $X^{0}$ is locally constructible in $X$.

Proof. Let $x \in X$. We have to show that there exists an open neighbourhood $U$ of $x$ such that $X^{0} \cap U$ is constructible in $U$. This reduces us to the case where $Y$ is affine. Write $Y=\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type Z-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow$ $\operatorname{Spec}\left(A_{i}\right)$ of finite presentation, endowed with a section $s_{i}: \operatorname{Spec}\left(A_{i}\right) \rightarrow X_{i}$ whose base change to $Y$ recovers $f$ and the section $s$. By Lemma 36.24 .2 it suffices to prove the lemma for $f_{i}, s_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.

Assume $Y$ is a Noetherian affine scheme. Since $f$ is of finite presentation, i.e., of finite type, we see that $X$ is a Noetherian scheme too, see Morphisms, Lemma 28.15.6. In order to prove the lemma in this case it suffices to show that for every irreducible closed subset $Z \subset X$ the intersection $Z \cap X^{0}$ either contains a nonempty open of $Z$ or is not dense in $Z$, see Topology, Lemma 5.15.3. Let $x \in Z$ be the generic point, and let $y=f(x)$. By Lemma 36.24.3 there exists a nonempty open subset $V \subset \overline{\{y\}}$ such that $X^{0} \cap X_{V}$ is open and closed in $X_{V}$. Since $f(Z) \subset \overline{\{y\}}$ and $f(x)=y \in V$ we see that $W=f^{-1}(V) \cap Z$ is a nonempty open subset of $Z$. It follows that $X^{0} \cap W$ is open and closed in $W$. Since $W$ is irreducible we see that $X^{0} \cap W$ is either empty or equal to $W$. This proves the lemma.

055Q Lemma 36.24.5. Let $f: X \rightarrow Y, s: Y \rightarrow X$ be as in Situation 36.24.1. Let $y \in Y$ be a point. Assume
(1) $f$ is of finite presentation and flat, and
(2) the fibre $X_{y}$ is geometrically reduced.

Then $X^{0}$ is a neighbourhood of $X_{y}^{0}$ in $X$.
Proof. We may replace $Y$ with an affine open neighbourhood of $y$. Write $Y=$ $\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ of finite presentation, endowed with a section $s_{i}: \operatorname{Spec}\left(A_{i}\right) \rightarrow X_{i}$ whose base change to $Y$ recovers $f$ and the section $s$. After possibly increasing $i$ we may also assume that $f_{i}$ is flat, see Limits, Lemma 31.7.6. Let $y_{i}$ be the image of $y$ in $Y_{i}$. Note that $X_{y}=$ $\left(X_{i, y_{i}}\right) \times_{y_{i}} y$. Hence $X_{i, y_{i}}$ is geometrically reduced, see Varieties, Lemma 32.4.6, By Lemma 36.24 .2 it suffices to prove the lemma for the system $f_{i}, s_{i}, y_{i} \in Y_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.

Assume $Y$ is the spectrum of a Noetherian ring. Since $f$ is of finite presentation, i.e., of finite type, we see that $X$ is a Noetherian scheme too, see Morphisms, Lemma 28.15.6. Let $x \in X^{0}$ be a point lying over $y$. By Topology, Lemma 5.15.4 it suffices to prove that for any irreducible closed $Z \subset X$ passing through $x$ the intersection $X^{0} \cap Z$ is dense in $Z$. In particular it suffices to prove that the generic point $x^{\prime} \in Z$ is in $X^{0}$. By Properties, Lemma 27.5.10 we can find a discrete valuation ring $R$ and a morphism $\operatorname{Spec}(R) \rightarrow X$ which maps the special point to $x$ and the generic point to $x^{\prime}$. We are going to think of $\operatorname{Spec}(R)$ as a scheme over $Y$ via the composition
$\operatorname{Spec}(R) \rightarrow X \rightarrow Y$. By Lemma 36.24 .2 we have that $\left(X_{R}\right)^{0}$ is the inverse image of $X^{0}$. By construction we have a second section $t: \operatorname{Spec}(R) \rightarrow X_{R}$ (besides the base change $s_{R}$ of $s$ ) of the structure morphism $X_{R} \rightarrow \operatorname{Spec}(R)$ such that $t\left(\eta_{R}\right)$ is a point of $X_{R}$ which maps to $x^{\prime}$ and $t\left(0_{R}\right)$ is a point of $X_{R}$ which maps to $x$. Note that $t\left(0_{R}\right)$ is in $\left(X_{R}\right)^{0}$ and that $t\left(\eta_{R}\right) \rightsquigarrow t\left(0_{R}\right)$. Thus it suffices to prove that this implies that $t\left(\eta_{R}\right) \in\left(X_{R}\right)^{0}$. Hence it suffices to prove the lemma in the case where $Y$ is the spectrum of a discrete valuation ring and $y$ its closed point.

Assume $Y$ is the spectrum of a discrete valuation ring and $y$ is its closed point. Our goal is to prove that $X^{0}$ is a neighbourhood of $X_{y}^{0}$. Note that $X_{y}^{0}$ is open and closed in $X_{y}$ as $X_{y}$ has finitely many irreducible components. Hence the complement $C=X_{y} \backslash X_{y}^{0}$ is closed in $X$. Thus $U=X \backslash C$ is an open neighbourhood of $X_{y}^{0}$ and $U^{0}=X^{0}$. Hence it suffices to prove the result for the morphism $U \rightarrow Y$. In other words, we may assume that $X_{y}$ is connected. Suppose that $X$ is disconnected, say $X=X_{1} \amalg \ldots \amalg X_{n}$ is a decomposition into connected components. Then $s(Y)$ is completely contained in one of the $X_{i}$. Say $s(Y) \subset X_{1}$. Then $X^{0} \subset X_{1}$. Hence we may replace $X$ by $X_{1}$ and assume that $X$ is connected. At this point Lemma 36.23.7 implies that $X_{\eta}$ is connected, i.e., $X^{0}=X$ and we win.

Lemma 36.24.6. Let $f: X \rightarrow Y, s: Y \rightarrow X$ be as in Situation 36.24.1. Assume
(1) $f$ is of finite presentation and flat, and
(2) all fibres of $f$ are geometrically reduced.

Then $X^{0}$ is open in $X$.
Proof. This is an immediate consequence of Lemma 36.24 .5

### 36.25. Dimension of fibres

05F6
05F7 Lemma 36.25.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $Y$ irreducible with generic point $\eta$ and $f$ of finite type. If $X_{\eta}$ has dimension $n$, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre $X_{y}$ has dimension $n$.

Proof. Let $Z=\left\{x \in X \mid \operatorname{dim}_{x}\left(X_{f(x)}\right)>n\right\}$. By Morphisms, Lemma 28.28.4 this is a closed subset of $X$. By assumption $Z_{\eta}=\emptyset$. Hence by Lemma 36.19.1 we may shrink $Y$ and assume that $Z=\emptyset$. Let $Z^{\prime}=\left\{x \in X \mid \operatorname{dim}_{x}\left(X_{f(x)}\right)>n-1\right\}=\{x \in$ $\left.X \mid \operatorname{dim}_{x}\left(X_{f(x)}\right)=n\right\}$. As before this is a closed subset of $X$. By assumption we have $Z_{\eta}^{\prime} \neq \emptyset$. Hence after shrinking $Y$ we may assume that $Z^{\prime} \rightarrow Y$ is surjective, see Lemma 36.19.2. Hence we win.

05F8 Lemma 36.25.2. Let $f: X \rightarrow Y$ be a morphism of finite type. Let

$$
n_{X / Y}: Y \rightarrow\{0,1,2,3, \ldots, \infty\}
$$

be the function which associates to $y \in Y$ the dimension of $X_{y}$. If $g: Y^{\prime} \rightarrow Y$ is a morphism then

$$
n_{X^{\prime} / Y^{\prime}}=n_{X / Y} \circ g
$$

where $X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$.
Proof. This follows from Morphisms, Lemma 28.28.3.

05F9 Lemma 36.25.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $n_{X / Y}$ be the function on $Y$ giving the dimension of fibres of $f$ introduced in Lemma 36.25.2. Assume $f$ of finite presentation. Then the level sets

$$
E_{n}=\left\{y \in Y \mid n_{X / Y}(y)=n\right\}
$$

of $n_{X / Y}$ are locally constructible in $Y$.
Proof. Fix $n$. Let $y \in Y$. We have to show that there exists an open neighbourhood $V$ of $y$ in $Y$ such that $E_{n} \cap V$ is constructible in $V$. Thus we may assume that $Y$ is affine. Write $Y=\operatorname{Spec}(A)$ and $A=\operatorname{colim} A_{i}$ as a directed limit of finite type Z-algebras. By Limits, Lemma 31.9.1 we can find an $i$ and a morphism $f_{i}: X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ of finite presentation whose base change to $Y$ recovers $f$. By Lemma 36.25 .2 it suffices to prove the lemma for $f_{i}$. Thus we reduce to the case where $Y$ is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.15 .3 to prove that $E_{n}$ is constructible in case $Y$ is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_{n} \cap Z$ either contains a nonempty open subset or is not dense in $Z$. Let $\xi \in Z$ be the generic point. Then Lemma 36.25.1 shows that $n_{X / Y}$ is constant in a neighbourhood of $\xi$ in $Z$. This implies what we want.

### 36.26. Limit arguments

05FA Some lemmas involving limits of schemes, and Noetherian approximation. We stick mostly to the affine case. Some of these lemmas are special cases of lemmas in the chapter on limits.

05FB Lemma 36.26.1. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation. Then there exists a cartesian diagram

such that
(1) $X_{0}, S_{0}$ are affine schemes,
(2) $S_{0}$ of finite type over $\mathbf{Z}$,
(3) $f_{0}$ is finite of finite type.

Proof. Write $S=\operatorname{Spec}(A)$ and $X=\operatorname{Spec}(B)$. As $f$ is of finite presentation we see that $B$ is of finite presentation as an $A$-algebra, see Morphisms, Lemma 28.21.2, Thus the lemma follows from Algebra, Lemma 10.126.15.

05FC Lemma 36.26.2. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation. Then there exists a diagram as in Lemma 36.26.1 such that there exists a coherent $\mathcal{O}_{X_{0}}$-module $\mathcal{F}_{0}$ with $g^{*} \mathcal{F}_{0}=\mathcal{F}$.

Proof. Write $S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$, and $\mathcal{F}=\widetilde{M}$. As $f$ is of finite presentation we see that $B$ is of finite presentation as an $A$-algebra, see Morphisms, Lemma
28.21.2. As $\mathcal{F}$ is of finite presentation over $\mathcal{O}_{X}$ we see that $M$ is of finite presentation as a $B$-module, see Properties, Lemma 27.16.2. Thus the lemma follows from Algebra, Lemma 10.126 .15 .

05FD Lemma 36.26.3. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation and flat over $S$. Then we may choose a diagram as in Lemma 36.26.2 and sheaf $\mathcal{F}_{0}$ such that in addition $\mathcal{F}_{0}$ is flat over $S_{0}$.
Proof. Write $S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$, and $\mathcal{F}=\widetilde{M}$. As $f$ is of finite presentation we see that $B$ is of finite presentation as an $A$-algebra, see Morphisms, Lemma 28.21.2. As $\mathcal{F}$ is of finite presentation over $\mathcal{O}_{X}$ we see that $M$ is of finite presentation as a $B$-module, see Properties, Lemma 27.16.2. As $\mathcal{F}$ is flat over $S$ we see that $M$ is flat over $A$, see Morphisms, Lemma 28.25.2. Thus the lemma follows from Algebra, Lemma 10.160.1

05FE Lemma 36.26.4. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation and flat. Then there exists a diagram as in Lemma 36.26.1 such that in addition $f_{0}$ is flat.

Proof. This is a special case of Lemma 36.26 .3 .
05FF Lemma 36.26.5. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is smooth. Then there exists a diagram as in Lemma 36.26.1 such that in addition $f_{0}$ is smooth.

Proof. Write $S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$, and as $f$ is smooth we see that $B$ is smooth as an $A$-algebra, see Morphisms, Lemma 28.34.2. Hence the lemma follows from Algebra, Lemma 10.136.14.

05FG Lemma 36.26.6. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation with geometrically reduced fibres. Then there exists a diagram as in Lemma 36.26.1 such that in addition $f_{0}$ has geometrically reduced fibres.

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

of affine schemes with $X_{0} \rightarrow S_{0}$ a finite type morphism of schemes of finite type over Z. By Lemma 36.21 .5 the set $E \subset S_{0}$ of points where the fibre of $f_{0}$ is geometrically reduced is a constructible subset. By Lemma 36.21 .2 we have $h(S) \subset E$. Write $S_{0}=\operatorname{Spec}\left(A_{0}\right)$ and $S=\operatorname{Spec}(A)$. Write $A=\operatorname{colim}_{i} A_{i}$ as a direct colimit of finite type $A_{0}$-algebras. By Limits, Lemma 31.3 .7 we see that $\operatorname{Spec}\left(A_{i}\right) \rightarrow S_{0}$ has image contained in $E$ for some $i$. After replacing $S_{0}$ by $\operatorname{Spec}\left(A_{i}\right)$ and $X_{0}$ by $X_{0} \times{ }_{S_{0}} \operatorname{Spec}\left(A_{i}\right)$ we see that all fibres of $f_{0}$ are geometrically reduced.

05FH Lemma 36.26.7. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation with geometrically irreducible fibres. Then there exists a diagram as in Lemma 36.26.1 such that in addition $f_{0}$ has geometrically irreducible fibres.

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

of affine schemes with $X_{0} \rightarrow S_{0}$ a finite type morphism of schemes of finite type over Z. By Lemma 36.22 .7 the set $E \subset S_{0}$ of points where the fibre of $f_{0}$ is geometrically irreducible is a constructible subset. By Lemma 36.22 .2 we have $h(S) \subset E$. Write $S_{0}=\operatorname{Spec}\left(A_{0}\right)$ and $S=\operatorname{Spec}(A)$. Write $A=\operatorname{colim}_{i} A_{i}$ as a direct colimit of finite type $A_{0}$-algebras. By Limits, Lemma 31.3 .7 we see that $\operatorname{Spec}\left(A_{i}\right) \rightarrow S_{0}$ has image contained in $E$ for some $i$. After replacing $S_{0}$ by $\operatorname{Spec}\left(A_{i}\right)$ and $X_{0}$ by $X_{0} \times S_{0} \operatorname{Spec}\left(A_{i}\right)$ we see that all fibres of $f_{0}$ are geometrically irreducible.

05FI Lemma 36.26.8. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation with geometrically connected fibres. Then there exists a diagram as in Lemma 36.26.1 such that in addition $f_{0}$ has geometrically connected fibres.

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

of affine schemes with $X_{0} \rightarrow S_{0}$ a finite type morphism of schemes of finite type over Z. By Lemma 36.23 .6 the set $E \subset S_{0}$ of points where the fibre of $f_{0}$ is geometrically connected is a constructible subset. By Lemma 36.23 .2 we have $h(S) \subset E$. Write $S_{0}=\operatorname{Spec}\left(A_{0}\right)$ and $S=\operatorname{Spec}(A)$. Write $A=\operatorname{colim}_{i} A_{i}$ as a direct colimit of finite type $A_{0}$-algebras. By Limits, Lemma 31.3 .7 we see that $\operatorname{Spec}\left(A_{i}\right) \rightarrow S_{0}$ has image contained in $E$ for some $i$. After replacing $S_{0}$ by $\operatorname{Spec}\left(A_{i}\right)$ and $X_{0}$ by $X_{0} \times{ }_{S_{0}} \operatorname{Spec}\left(A_{i}\right)$ we see that all fibres of $f_{0}$ are geometrically connected.

05FJ Lemma 36.26.9. Let $d \geq 0$ be an integer. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is of finite presentation all of whose fibres have dimension $d$. Then there exists a diagram as in Lemma 36.26.1 such that in addition all fibres of $f_{0}$ have dimension $d$.

Proof. Apply Lemma 36.26.1 to get a cartesian diagram

of affine schemes with $X_{0} \rightarrow S_{0}$ a finite type morphism of schemes of finite type over Z. By Lemma 36.25 .3 the set $E \subset S_{0}$ of points where the fibre of $f_{0}$ has dimension $d$ is a constructible subset. By Lemma 36.25 .2 we have $h(S) \subset E$. Write $S_{0}=\operatorname{Spec}\left(A_{0}\right)$ and $S=\operatorname{Spec}(A)$. Write $A=\operatorname{colim}_{i} A_{i}$ as a direct colimit of finite type $A_{0}$-algebras. By Limits, Lemma 31.3.7 we see that $\operatorname{Spec}\left(A_{i}\right) \rightarrow S_{0}$ has image contained in $E$ for some $i$. After replacing $S_{0}$ by $\operatorname{Spec}\left(A_{i}\right)$ and $X_{0}$ by $X_{0} \times{ }_{S_{0}} \operatorname{Spec}\left(A_{i}\right)$ we see that all fibres of $f_{0}$ have dimension $d$.

05FK Lemma 36.26.10. Let $f: X \rightarrow S$ be a morphism of affine schemes, which is standard syntomic (see Morphisms, Definition 28.31.1). Then there exists a diagram as in Lemma 36.26.1 such that in addition $f_{0}$ is standard syntomic.

Proof. This lemma is a copy of Algebra, Lemma 10.134.12.
05FL Lemma 36.26.11. (Noetherian approximation and combining properties.) Let $P$, $Q$ be properties of morphisms of schemes which are stable under base change. Let $f: X \rightarrow S$ be a morphism of finite presentation of affine schemes. Assume we can find cartesian diagrams

of affine schemes, with $S_{1}, S_{2}$ of finite type over $\mathbf{Z}$ and $f_{1}, f_{2}$ of finite type such that $f_{1}$ has property $P$ and $f_{2}$ has property $Q$. Then we can find a cartesian diagram

of affine schemes with $S_{0}$ of finite type over $\mathbf{Z}$ and $f_{0}$ of finite type such that $f_{0}$ has both property $P$ and property $Q$.
Proof. The given pair of diagrams correspond to cocartesian diagrams of rings

Let $A_{0} \subset A$ be a finite type $\mathbf{Z}$-subalgebra of $A$ containing the image of both $A_{1} \rightarrow A$ and $A_{2} \rightarrow A$. Such a subalgebra exists because by assumption both $A_{1}$ and $A_{2}$ are of finite type over $\mathbf{Z}$. Note that the rings $B_{0,1}=B_{1} \otimes_{A_{1}} A_{0}$ and $B_{0,2}=B_{2} \otimes_{A_{2}} A_{0}$ are finite type $A_{0}$-algebras with the property that $B_{0,1} \otimes_{A_{0}} A \cong B \cong B_{0,2} \otimes_{A_{0}} A$ as $A$-algebras. As $A$ is the directed colimit of its finite type $A_{0}$-subalgebras, by Limits, Lemma 31.9.1 we may assume after enlarging $A_{0}$ that there exists an isomorphism $B_{0,1} \cong B_{0,2}$ as $A_{0}$-algebras. Since properties $P$ and $Q$ are assumed stable under base change we conclude that setting $S_{0}=\operatorname{Spec}\left(A_{0}\right)$ and

$$
X_{0}=X_{1} \times_{S_{1}} S_{0}=\operatorname{Spec}\left(B_{0,1}\right) \cong \operatorname{Spec}\left(B_{0,2}\right)=X_{2} \times_{S_{2}} S_{0}
$$

works.

### 36.27. Étale neighbourhoods

02LD It turns out that some properties of morphisms are easier to study after doing an étale base change. It is convenient to introduce the following terminology.

02LE Definition 36.27.1. Let $S$ be a scheme. Let $s \in S$ be a point.
(1) An étale neighbourhood of $(S, s)$ is a pair $(U, u)$ together with an étale morphism of schemes $\varphi: U \rightarrow S$ such that $\varphi(u)=s$.
(2) A morphism of étale neighbourhoods $f:(V, v) \rightarrow(U, u)$ of $(S, s)$ is simply a morphism of $S$-schemes $f: V \rightarrow U$ such that $f(v)=u$.
(3) An elementary étale neighbourhood is an étale neighbourhood $\varphi:(U, u) \rightarrow$ $(S, s)$ such that $\kappa(s)=\kappa(u)$.
If $f:(V, v) \rightarrow(U, u)$ is a morphism of étale neighbourhoods, then $f$ is automatically étale, see Morphisms, Lemma 28.36.18. Hence it turns ( $V, v$ ) into an étale neighbourhood of $(U, u)$. Of course, since the composition of étale morphisms is étale (Morphisms, Lemma 28.36.3) we see that conversely any étale neighbourhood $(V, v)$ of $(U, u)$ is an étale neighbourhood of $(S, s)$ as well. We also remark that if $U \subset S$ is an open neighbourhood of $s$, then $(U, s) \rightarrow(S, s)$ is an étale neighbourhood. This follows from the fact that an open immersion is étale (Morphisms, Lemma 28.36.9. We will use these remarks without further mention throughout this section.

Note that $\kappa(s) \subset \kappa(u)$ is a finite separable extension if $(U, u) \rightarrow(S, s)$ is an étale neighbourhood, see Morphisms, Lemma 28.36.15.

02LF Lemma 36.27.2. Let $S$ be a scheme. Let $s \in S$. Let $\kappa(s) \subset k$ be a finite separable field extension. Then there exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ such that the field extension $\kappa(s) \subset \kappa(u)$ is isomorphic to $\kappa(s) \subset k$.
Proof. We may assume $S$ is affine. In this case the lemma follows from Algebra, Lemma 10.141.16

057A Lemma 36.27.3. Let $S$ be a scheme, and let $s$ be a point of $S$. The category of étale neighborhoods has the following properties:
(1) Let $\left(U_{i}, u_{i}\right)_{i=1,2}$ be two étale neighborhoods of $s$ in $S$. Then there exists a third étale neighborhood $(U, u)$ and morphisms $(U, u) \rightarrow\left(U_{i}, u_{i}\right), i=1,2$.
(2) Let $h_{1}, h_{2}:(U, u) \rightarrow\left(U^{\prime}, u^{\prime}\right)$ be two morphisms between étale neighborhoods of $s$. Assume $h_{1}, h_{2}$ induce the same map $\kappa\left(u^{\prime}\right) \rightarrow \kappa(u)$ of residue fields. Then there exist an étale neighborhood ( $U^{\prime \prime}, u^{\prime \prime}$ ) and a morphism $h:\left(U^{\prime \prime}, u^{\prime \prime}\right) \rightarrow(U, u)$ which equalizes $h_{1}$ and $h_{2}$, i.e., such that $h_{1} \circ h=h_{2} \circ h$.
Proof. For part (1), consider the fibre product $U=U_{1} \times_{S} U_{2}$. It is étale over both $U_{1}$ and $U_{2}$ because étale morphisms are preserved under base change, see Morphisms, Lemma 28.36.4. There is a point of $U$ mapping to both $u_{1}$ and $u_{2}$ for example by the description of points of a fibre product in Schemes, Lemma 25.17.5. For part (2), define $U^{\prime \prime}$ as the fibre product

Since $h_{1}$ and $h_{2}$ induce the same map of residue fields $\kappa\left(u^{\prime}\right) \rightarrow \kappa(u)$ there exists a point $u^{\prime \prime} \in U^{\prime \prime}$ lying over $u^{\prime}$ with $\kappa\left(u^{\prime \prime}\right)=\kappa\left(u^{\prime}\right)$. In particular $U^{\prime \prime} \neq \emptyset$. Moreover, since $U^{\prime}$ is étale over $S$, so is the fibre product $U^{\prime} \times{ }_{S} U^{\prime}$ (see Morphisms, Lemmas 28.36 .4 and 28.36.3). Hence the vertical arrow $\left(h_{1}, h_{2}\right)$ is étale by Morphisms, Lemma 28.36.18. Therefore $U^{\prime \prime}$ is étale over $U^{\prime}$ by base change, and hence also étale over $S$ (because compositions of étale morphisms are étale). Thus ( $\left.U^{\prime \prime}, u^{\prime \prime}\right)$ is a solution to the problem.

057B Lemma 36.27.4. Let $S$ be a scheme, and let $s$ be a point of $S$. The category of elementary étale neighborhoods of $(S, s)$ is cofiltered (see Categories, Definition 4.20.1).

Proof. This is immediate from the definitions and Lemma 36.27 .3 ,
05KS Lemma 36.27.5. Let $S$ be a scheme. Let $s \in S$. Then we have

$$
\mathcal{O}_{S, s}^{h}=\operatorname{colim}_{(U, u)} \mathcal{O}(U)
$$

where the colimit is over the filtered category which is opposite to the category of elementary étale neighbourhoods $(U, u)$ of $(S, s)$.

Proof. Let $\operatorname{Spec}(A) \subset S$ be an affine neighbourhood of $s$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to $s$. With these choices we have canonical isomorphisms $\mathcal{O}_{S, s}=A_{\mathfrak{p}}$ and $\kappa(s)=\kappa(\mathfrak{p})$. A cofinal system of elementary étale neighbourhoods is given by those elementary étale neighbourhoods $(U, u)$ such that $U$ is affine and $U \rightarrow S$ factors through $\operatorname{Spec}(A)$. In other words, we see that the right hand side is equal to $\operatorname{colim}_{(B, \mathfrak{q})} B$ where the colimit is over étale $A$-algebras $B$ endowed with a prime $\mathfrak{q}$ lying over $\mathfrak{p}$ with $\kappa(\mathfrak{p})=\kappa(\mathfrak{q})$. Thus the lemma follows from Algebra, Lemma 10.148 .21

### 36.28. Slicing smooth morphisms

055 S In this section we explain a result that roughly states that smooth coverings of a scheme $S$ can be refined by étale coverings. The technique to prove this relies on a slicing argument.

057C Lemma 36.28.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Let $h \in \mathfrak{m}_{x} \subset \mathcal{O}_{X, x}$. Assume
(1) $f$ is smooth at $x$, and
(2) the image $d \bar{h}$ of $d h$ in

$$
\Omega_{X_{s} / s, x} \otimes_{\mathcal{O}_{X_{s}, x}} \kappa(x)=\Omega_{X / S, x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

is nonzero.
Then there exists an affine open neighbourhood $U \subset X$ of $x$ such that $h$ comes from $h \in \Gamma\left(U, \mathcal{O}_{U}\right)$ and such that $D=V(h)$ is an effective Cartier divisor in $U$ with $x \in D$ and $D \rightarrow S$ smooth.

Proof. As $f$ is smooth at $x$ we may assume, after replacing $X$ by an open neighbourhood of $x$ that $f$ is smooth. In particular we see that $f$ is flat and locally of finite presentation. By Lemma 36.18.1 we already know there exists an open neighbourhood $U \subset X$ of $x$ such that $h$ comes from $h \in \Gamma\left(U, \mathcal{O}_{U}\right)$ and such that $D=V(h)$ is an effective Cartier divisor in $U$ with $x \in D$ and $D \rightarrow S$ flat and of finite presentation. By Morphisms, Lemma 28.33 .15 we have a short exact sequence

$$
\mathcal{C}_{D / U} \rightarrow i^{*} \Omega_{U / S} \rightarrow \Omega_{D / S} \rightarrow 0
$$

where $i: D \rightarrow U$ is the closed immersion and $\mathcal{C}_{D / U}$ is the conormal sheaf of $D$ in $U$. As $D$ is an effective Cartier divisor cut out by $h \in \Gamma\left(U, \mathcal{O}_{U}\right)$ we see that $\mathcal{C}_{D / U}=h \cdot \mathcal{O}_{S}$. Since $U \rightarrow S$ is smooth the sheaf $\Omega_{U / S}$ is finite locally free, hence its pullback $i^{*} \Omega_{U / S}$ is finite locally free also. The first arrow of the sequence maps
the free generator $h$ to the section $\left.\mathrm{d} h\right|_{D}$ of $i^{*} \Omega_{U / S}$ which has nonzero value in the fibre $\Omega_{U / S, x} \otimes \kappa(x)$ by assumption. By right exactness of $\otimes \kappa(x)$ we conclude that

$$
\operatorname{dim}_{\kappa(x)}\left(\Omega_{D / S, x} \otimes \kappa(x)\right)=\operatorname{dim}_{\kappa(x)}\left(\Omega_{U / S, x} \otimes \kappa(x)\right)-1
$$

By Morphisms, Lemma 28.34.14 we see that $\Omega_{U / S, x} \otimes \kappa(x)$ can be generated by at $\operatorname{most} \operatorname{dim}_{x}\left(U_{s}\right)$ elements. By the displayed formula we see that $\Omega_{D / S, x} \otimes \kappa(x)$ can be generated by at most $\operatorname{dim}_{x}\left(U_{s}\right)-1$ elements. Note that $\operatorname{dim}_{x}\left(D_{s}\right)=\operatorname{dim}_{x}\left(U_{s}\right)-1$ for example because $\operatorname{dim}\left(\mathcal{O}_{D_{s}, x}\right)=\operatorname{dim}\left(\mathcal{O}_{U_{s}, x}\right)-1$ by Algebra, Lemma 10.59.12 (also $D_{s} \subset U_{s}$ is effective Cartier, see Divisors, Lemma 30.15.1) and then using Morphisms, Lemma 28.28.1. Thus we conclude that $\Omega_{D / S, x} \otimes \kappa(x)$ can be generated by at most $\operatorname{dim}_{x}\left(D_{s}\right)$ elements and we conclude that $D \rightarrow S$ is smooth at $x$ by Morphisms, Lemma 28.34 .14 again. After shrinking $U$ we get that $D \rightarrow S$ is smooth and we win.

057D Lemma 36.28.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Assume
(1) $f$ is smooth at $x$, and
(2) the map

$$
\Omega_{X_{s} / s, x} \otimes_{\mathcal{O}_{X_{s}, x}} \kappa(x) \longrightarrow \Omega_{\kappa(x) / \kappa(s)}
$$

has a nonzero kernel.
Then there exists an affine open neighbourhood $U \subset X$ of $x$ and an effective Cartier divisor $D \subset U$ containing $x$ such that $D \rightarrow S$ is smooth.

Proof. Write $k=\kappa(s)$ and $R=\mathcal{O}_{X_{s}, x}$. Denote $\mathfrak{m}$ the maximal ideal of $R$ and $\kappa=R / \mathfrak{m}$ so that $\kappa=\kappa(x)$. As formation of modules of differentials commutes with localization (see Algebra, Lemma 10.130.8 we have $\Omega_{X_{s} / s, x}=\Omega_{R / k}$. By Algebra, Lemma 10.130 .9 there is an exact sequence

$$
\mathfrak{m} / \mathfrak{m}^{2} \xrightarrow{\mathrm{~d}} \Omega_{R / k} \otimes_{R} \kappa \rightarrow \Omega_{\kappa / k} \rightarrow 0 .
$$

Hence if (2) holds, there exists an element $\bar{h} \in \mathfrak{m}$ such that $\mathrm{d} \bar{h}$ is nonzero. Choose a lift $h \in \mathcal{O}_{X, x}$ of $\bar{h}$ and apply Lemma 36.28.1

057E Remark 36.28.3. The second condition in Lemma 36.28 .2 is necessary even if $x$ is a closed point of a positive dimensional fibre. An example is the following: Let $k$ be a field of characteristic $p>0$ which is imperfect. Let $a \in k$ be an element which is not a $p$ th power. Let $\mathfrak{m}=\left(x, y^{p}-a\right) \subset k[x, y]$. This corresponds to a closed point $w$ of $X=\mathbf{A}_{k}^{2}$. Set $S=\mathbf{A}_{k}^{1}$ and let $f: X \rightarrow S$ be the morphism corresponding to $k[x] \rightarrow k[x, y]$. Then there does not exist any commutative diagram

with $g$ étale and $w$ in the image of $h$. This is clear as the residue field extension $\kappa(f(w)) \subset \kappa(w)$ is purely inseparable, but for any $s^{\prime} \in S^{\prime}$ with $g\left(s^{\prime}\right)=f(w)$ the extension $\kappa(f(w)) \subset \kappa\left(s^{\prime}\right)$ would be separable.

If you assume the residue field extension is separable then the phenomenon of Remark 36.28 .3 does not happen. Here is the precise result.

057F Lemma 36.28.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Assume
(1) $f$ is smooth at $x$,
(2) the residue field extension $\kappa(s) \subset \kappa(x)$ is separable, and
(3) $x$ is not a generic point of $X_{s}$.

Then there exists an affine open neighbourhood $U \subset X$ of $x$ and an effective Cartier divisor $D \subset U$ containing $x$ such that $D \rightarrow S$ is smooth.

Proof. Write $k=\kappa(s)$ and $R=\mathcal{O}_{X_{s}, x}$. Denote $\mathfrak{m}$ the maximal ideal of $R$ and $\kappa=R / \mathfrak{m}$ so that $\kappa=\kappa(x)$. As formation of modules of differentials commutes with localization (see Algebra, Lemma 10.130.8) we have $\Omega_{X_{s} / s, x}=\Omega_{R / k}$. By assumption (2) and Algebra, Lemma 10.138.4 the map

$$
\mathrm{d}: \mathfrak{m} / \mathfrak{m}^{2} \longrightarrow \Omega_{R / k} \otimes_{R} \kappa(\mathfrak{m})
$$

is injective. Assumption (3) implies that $\mathfrak{m} / \mathfrak{m}^{2} \neq 0$. Thus there exists an element $\bar{h} \in \mathfrak{m}$ such that $\mathrm{d} \bar{h}$ is nonzero. Choose a lift $h \in \mathcal{O}_{X, x}$ of $\bar{h}$ and apply Lemma 36.28.1.

The subscheme $Z$ constructed in the following lemma is really a complete intersection in an affine open neighbourhood of $x$. If we ever need this we will explicitly formulate a separate lemma stating this fact.

057G Lemma 36.28.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point with image $s \in S$. Assume
(1) $f$ is smooth at $x$, and
(2) $x$ is a closed point of $X_{s}$ and $\kappa(s) \subset \kappa(x)$ is separable.

Then there exists an immersion $Z \rightarrow X$ containing $x$ such that
(1) $Z \rightarrow S$ is étale, and
(2) $Z_{s}=\{x\}$ set theoretically.

Proof. We may and do replace $S$ by an affine open neighbourhood of $s$. We may and do replace $X$ by an affine open neighbourhood of $x$ such that $X \rightarrow S$ is smooth. We will prove the lemma for smooth morphisms of affines by induction on $d=\operatorname{dim}_{x}\left(X_{s}\right)$.

The case $d=0$. In this case we show that we may take $Z$ to be an open neighbourhood of $x$. Namely, if $d=0$, then $X \rightarrow S$ is quasi-finite at $x$, see Morphisms, Lemma 28.29.5. Hence there exists an affine open neighbourhood $U \subset X$ such that $U \rightarrow S$ is quasi-finite, see Morphisms, Lemma 28.50.2. Thus after replacing $X$ by $U$ we see that $X$ is quasi-finite and smooth over $S$, hence smooth of relative dimension 0 over $S$, hence étale over $S$. Moreover, the fibre $X_{s}$ is a finite discrete set. Hence after replacing $X$ by a further affine open neighbourhood of $X$ we see that that $f^{-1}(\{s\})=\{x\}$ (because the topology on $X_{s}$ is induced from the topology on $X$, see Schemes, Lemma 25.18 .5 ). This proves the lemma in this case.

Next, assume $d>0$. Note that because $x$ is a closed point of its fibre the extension $\kappa(s) \subset \kappa(x)$ is finite (by the Hilbert Nullstellensatz, see Morphisms, Lemma 28.20.3). Thus we see $\Omega_{\kappa(x) / \kappa(s)}=0$ as this holds for algebraic separable field
extensions. Thus we may apply Lemma 36.28 .2 to find a diagram

with $x \in D$. Note that $\operatorname{dim}_{x}\left(D_{s}\right)=\operatorname{dim}_{x}\left(X_{s}\right)-1$ for example because $\operatorname{dim}\left(\mathcal{O}_{D_{s}, x}\right)=$ $\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)-1$ by Algebra, Lemma 10.59 .12 (also $D_{s} \subset X_{s}$ is effective Cartier, see Divisors, Lemma 30.15.1) and then using Morphisms, Lemma 28.28.1. Thus the morphism $D \rightarrow S$ is smooth with $\operatorname{dim}_{x}\left(D_{s}\right)=\operatorname{dim}_{x}\left(X_{s}\right)-1=d-1$. By induction hypothesis we can find an immersion $Z \rightarrow D$ as desired, which finishes the proof.

055U Lemma 36.28.6. Let $f: X \rightarrow S$ be a smooth morphism of schemes. Let $s \in S$ be a point in the image of $f$. Then there exists an étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a $S$-morphism $S^{\prime} \rightarrow X$.

First proof of Lemma 36.28.6. By assumption $X_{s} \neq \emptyset$. By Varieties, Lemma 32.20 .6 there exists a closed point $x \in X_{s}$ such that $\kappa(x)$ is a finite separable field extension of $\kappa(s)$. Hence by Lemma 36.28 .5 there exists an immersion $Z \rightarrow X$ such that $Z \rightarrow S$ is étale and such that $x \in Z$. Take $\left(S^{\prime}, s^{\prime}\right)=(Z, x)$.

Second proof of Lemma 36.28.6. Pick a point $x \in X$ with $f(x)=s$. Choose a diagram

with $\pi$ étale, $x \in U$ and $V=\operatorname{Spec}(R)$ affine, see Morphisms, Lemma 28.36.20. In particular $s \in V$. The morphism $\pi: U \rightarrow \mathbf{A}_{V}^{d}$ is open, see Morphisms, Lemma 28.36.13. Thus $W=\pi(V) \cap \mathbf{A}_{s}^{d}$ is a nonempty open subset of $\mathbf{A}_{s}^{d}$. Let $w \in W$ be a point with $\kappa(s) \subset \kappa(w)$ finite separable, see Varieties, Lemma 32.20.5. By Algebra, Lemma 10.113 .1 there exist $d$ elements $\bar{f}_{1}, \ldots, \bar{f}_{d} \in \kappa(s)\left[x_{1}, \ldots, x_{d}\right]$ which generate the maximal ideal corresponding to $w$ in $\kappa(s)\left[x_{1}, \ldots, x_{n}\right]$. After replacing $R$ by a principal localization we may assume there are $f_{1}, \ldots, f_{d} \in R\left[x_{1}, \ldots, x_{d}\right]$ which map to $\bar{f}_{1}, \ldots, \bar{f}_{d} \in \kappa(s)\left[x_{1}, \ldots, x_{d}\right]$. Consider the $R$-algebra

$$
R^{\prime}=R\left[x_{1}, \ldots, x_{d}\right] /\left(f_{1}, \ldots, f_{d}\right)
$$

and set $S^{\prime}=\operatorname{Spec}\left(R^{\prime}\right)$. By construction we have a closed immersion $j: S^{\prime} \rightarrow \mathbf{A}_{V}^{d}$ over $V$. By construction the fibre of $S^{\prime} \rightarrow V$ over $s$ is a single point $s^{\prime}$ whose residue field is finite separable over $\kappa(s)$. Let $\mathfrak{q}^{\prime} \subset R^{\prime}$ be the corresponding prime. By Algebra, Lemma 10.134.11 we see that $\left(R^{\prime}\right)_{g}$ is a relative global complete intersection over $R$ for some $g \in R^{\prime}, g \notin \mathfrak{q}$. Thus $S^{\prime} \rightarrow V$ is flat and of finite presentation in a neighbourhood of $s^{\prime}$, see Algebra, Lemma 10.134.14. By construction the scheme theoretic fibre of $S^{\prime} \rightarrow V$ over $s$ is $\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right)$. Hence it follows from Morphisms, Lemma 28.36.15 that $S^{\prime} \rightarrow S$ is étale at $s^{\prime}$. Set

$$
S^{\prime \prime}=U \times_{\pi, \mathbf{A}_{V}^{d}, j} S^{\prime}
$$

By construction there exists a point $s^{\prime \prime} \in S^{\prime \prime}$ which maps to $s^{\prime}$ via the projection $p: S^{\prime \prime} \rightarrow S^{\prime}$. Note that $p$ is étale as the base change of the étale morphism $\pi$, see Morphisms, Lemma 28.36.4. Choose a small affine neighbourhood $S^{\prime \prime \prime} \subset S^{\prime \prime}$ of $s^{\prime \prime}$
which maps into the nonempty open neighbourhood of $s^{\prime} \in S^{\prime}$ where the morphism $S^{\prime} \rightarrow S$ is étale. Then the étale neighbourhood $\left(S^{\prime \prime \prime}, s^{\prime \prime}\right) \rightarrow(S, s)$ is a solution to the problem posed by the lemma.
The following lemma shows that sheaves for the smooth topology are the same thing as sheaves for the étale topology.
055 V Lemma 36.28.7. Let $S$ be a scheme. Let $\mathcal{U}=\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be a smooth covering of $S$, see Topologies, Definition 33.5.1. Then there exists an étale covering $\mathcal{V}=$ $\left\{T_{j} \rightarrow S\right\}_{j \in J}$ (see Topologies, Definition 33.4.1) which refines (see Sites, Definition 7.8.1) $\mathcal{U}$.

Proof. For every $s \in S$ there exists an $i \in I$ such that $s$ is in the image of $S_{i} \rightarrow S$. By Lemma 36.28.6 we can find an étale morphism $g_{s}: T_{s} \rightarrow S$ such that $s \in g_{s}(T)_{s}$ and such that $g_{s}$ factors through $S_{i} \rightarrow S$. Hence $\left\{T_{s} \rightarrow S\right\}$ is an étale covering of $S$ that refines $\mathcal{U}$.

### 36.29. Finite free locally dominates étale

04 HE In this section we explain a result that roughly states that étale coverings of a scheme $S$ can be refined by Zariski coverings of finite locally free covers of $S$.

02LG Lemma 36.29.1. Let $S$ be a scheme. Let $s \in S$. Let $f:(U, u) \rightarrow(S, s)$ be an étale neighbourhood. There exists an affine open neighbourhood $s \in V \subset S$ and a surjective, finite locally free morphism $\pi: T \rightarrow V$ such that for every $t \in \pi^{-1}(s)$ there exists an open neighbourhood $t \in W_{t} \subset T$ and a commutative diagram

with $h_{t}(t)=u$.
Proof. The problem is local on $S$ hence we may replace $S$ by any open neighbourhood of $s$. We may also replace $U$ by an open neighbourhood of $u$. Hence, by Morphisms, Lemma 28.36 .14 we may assume that $U \rightarrow S$ is a standard étale morphism of affine schemes. In this case the lemma (with $V=S$ ) follows from Algebra, Lemma 10.141.18.
02LH Lemma 36.29.2. Let $f: U \rightarrow S$ be a surjective étale morphism of affine schemes. There exists a surjective, finite locally free morphism $\pi: T \rightarrow S$ and a finite open covering $T=T_{1} \cup \ldots \cup T_{n}$ such that each $T_{i} \rightarrow S$ factors through $U \rightarrow S$. Diagram:

where the south-west arrow is a Zariski-covering.
Proof. This is a restatement of Algebra, Lemma 10.141.19.

02LI Remark 36.29.3. In terms of topologies the lemmas above mean the following. Let $S$ be any scheme. Let $\left\{f_{i}: U_{i} \rightarrow S\right\}$ be an étale covering of $S$. There exists a Zariski open covering $S=\bigcup V_{j}$, for each $j$ a finite locally free, surjective morphism $W_{j} \rightarrow V_{j}$, and for each $j$ a Zariski open covering $\left\{W_{j, k} \rightarrow W_{j}\right\}$ such that the family $\left\{W_{j, k} \rightarrow S\right\}$ refines the given étale covering $\left\{f_{i}: U_{i} \rightarrow S\right\}$. What does this mean in practice? Well, for example, suppose we have a descent problem which we know how to solve for Zariski coverings and for fppf coverings of the form $\{\pi: T \rightarrow S\}$ with $\pi$ finite locally free and surjective. Then this descent problem has an affirmative answer for étale coverings as well. This trick was used by Gabber in his proof that $\operatorname{Br}(X)=\operatorname{Br}^{\prime}(X)$ for an affine scheme $X$, see Hoo82.

### 36.30. Étale localization of quasi-finite morphisms

04 HF Now we come to a series of lemmas around the theme "quasi-finite morphisms become finite after étale localization". The general idea is the following. Suppose given a morphism of schemes $f: X \rightarrow S$ and a point $s \in S$. Let $\varphi:(U, u) \rightarrow(S, s)$ be an étale neighbourhood of $s$ in $S$. Consider the fibre product $X_{U}=U \times{ }_{S} X$ and the basic diagram

02LJ (36.30.0.1)

where $V \subset X_{U}$ is open. Is there some standard model for the morphism $f_{U}: X_{U} \rightarrow$ $U$, or for the morphism $V \rightarrow U$ for suitable opens $V$ ? Of course the answer is no in general. But for quasi-finite morphisms we can say something.

02LK Lemma 36.30.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s=f(x)$. Assume that
(1) $f$ is locally of finite type, and
(2) $x \in X_{s}$ is isolated ${ }^{2}$.

Then there exist
(a) an elementary étale neighbourhood $(U, u) \rightarrow(S, s)$,
(b) an open subscheme $V \subset X_{U}$ (see 36.30.0.1)
such that
(i) $V \rightarrow U$ is a finite morphism,
(ii) there is a unique point $v$ of $V$ mapping to $u$ in $U$, and
(iii) the point $v$ maps to $x$ under the morphism $X_{U} \rightarrow X$, inducing $\kappa(x)=$ $\kappa(v)$.
Moreover, for any elementary étale neighbourhood $\left(U^{\prime}, u^{\prime}\right) \rightarrow(U, u)$ setting $V^{\prime}=$ $U^{\prime} \times_{U} V \subset X_{U^{\prime}}$ the triple $\left(U^{\prime}, u^{\prime}, V^{\prime}\right)$ satisfies the properties (i), (ii), and (iii) as well.
Proof. Let $Y \subset X, W \subset S$ be affine opens such that $f(Y) \subset W$ and such that $x \in Y$. Note that $x$ is also an isolated point of the fibre of the morphism $\left.f\right|_{Y}: Y \rightarrow$ $W$. If we can prove the theorem for $\left.f\right|_{Y}: Y \rightarrow W$, then the theorem follows for $f$. Hence we reduce to the case where $f$ is a morphism of affine schemes. This case is Algebra, Lemma 10.141.22.

[^102]In the preceding and following lemma we do not assume that the morphism $f$ is separated. This means that the opens $V, V_{i}$ created in them are not necessarily closed in $X_{U}$. Moreover, if we choose the neighbourhood $U$ to be affine, then each $V_{i}$ is affine, but the intersections $V_{i} \cap V_{j}$ need not be affine (in the nonseparated case).

02LL Lemma 36.30.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x_{1}, \ldots, x_{n} \in X$ be points having the same image $s$ in $S$. Assume that
(1) $f$ is locally of finite type, and
(2) $x_{i} \in X_{s}$ is isolated for $i=1, \ldots, n$.

Then there exist
(a) an elementary étale neighbourhood $(U, u) \rightarrow(S, s)$,
(b) for each $i$ an open subscheme $V_{i} \subset X_{U}$,
such that for each i we have
(i) $V_{i} \rightarrow U$ is a finite morphism,
(ii) there is a unique point $v_{i}$ of $V_{i}$ mapping to $u$ in $U$, and
(iii) the point $v_{i}$ maps to $x_{i}$ in $X$ and $\kappa\left(x_{i}\right)=\kappa\left(v_{i}\right)$.

Proof. We will use induction on $n$. Namely, suppose $(U, u) \rightarrow(S, s)$ and $V_{i} \subset X_{U}$, $i=1, \ldots, n-1$ work for $x_{1}, \ldots, x_{n-1}$. Since $\kappa(s)=\kappa(u)$ the fibre $\left(X_{U}\right)_{u}=X_{s}$. Hence there exists a unique point $x_{n}^{\prime} \in X_{u} \subset X_{U}$ corresponding to $x_{n} \in X_{s}$. Also $x_{n}^{\prime}$ is isolated in $X_{u}$. Hence by Lemma 36.30 .1 there exists an elementary étale neighbourhood $\left(U^{\prime}, u^{\prime}\right) \rightarrow(U, u)$ and an open $V_{n} \subset X_{U^{\prime}}$ which works for $x_{n}^{\prime}$ and hence for $x_{n}$. By the final assertion of Lemma 36.30.1 the open subschemes $V_{i}^{\prime}=U^{\prime} \times_{U} V_{i}$ for $i=1, \ldots, n-1$ still work with respect to $x_{1}, \ldots, x_{n-1}$. Hence we win.

If we allow a nontrivial field extension $\kappa(s) \subset \kappa(u)$, i.e., general étale neighbourhoods, then we can split the points as follows.

02LM Lemma 36.30.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x_{1}, \ldots, x_{n} \in X$ be points having the same image $s$ in $S$. Assume that
(1) $f$ is locally of finite type, and
(2) $x_{i} \in X_{s}$ is isolated for $i=1, \ldots, n$.

Then there exist
(a) an étale neighbourhood $(U, u) \rightarrow(S, s)$,
(b) for each $i$ an integer $m_{i}$ and open subschemes $V_{i, j} \subset X_{U}, j=1, \ldots, m_{i}$ such that we have
(i) each $V_{i, j} \rightarrow U$ is a finite morphism,
(ii) there is a unique point $v_{i, j}$ of $V_{i, j}$ mapping to $u$ in $U$ with $\kappa(u) \subset \kappa\left(v_{i, j}\right)$ finite purely inseparable,
(iv) if $v_{i, j}=v_{i^{\prime}, j^{\prime}}$, then $i=i^{\prime}$ and $j=j^{\prime}$, and
(iii) the points $v_{i, j}$ map to $x_{i}$ in $X$ and no other points of $\left(X_{U}\right)_{u}$ map to $x_{i}$.

Proof. This proof is a variant of the proof of Algebra, Lemma 10.141.24 in the language of schemes. By Morphisms, Lemma 28.20 .6 the morphism $f$ is quasifinite at each of the points $x_{i}$. Hence $\kappa(s) \subset \kappa\left(x_{i}\right)$ is finite for each $i$ (Morphisms, Lemma 28.20.5. For each $i$, let $\kappa(s) \subset L_{i} \subset \kappa\left(x_{i}\right)$ be the subfield such that $L_{i} / \kappa(s)$ is separable, and $\kappa\left(x_{i}\right) / L_{i}$ is purely inseparable. Choose a finite Galois extension
$\kappa(s) \subset L$ such that there exist $\kappa(s)$-embeddings $L_{i} \rightarrow L$ for $i=1, \ldots, n$. Choose an étale neighbourhood $(U, u) \rightarrow(S, s)$ such that $L \cong \kappa(u)$ as $\kappa(s)$-extensions (Lemma 36.27 .2 .

Let $y_{i, j}, j=1, \ldots, m_{i}$ be the points of $X_{U}$ lying over $x_{i} \in X$ and $u \in U$. By Schemes, Lemma 25.17 .5 these points $y_{i, j}$ correspond exactly to the primes in the rings $\kappa(u) \otimes_{\kappa(s)} \kappa\left(x_{i}\right)$. This also explains why there are finitely many; in fact $m_{i}=\left[L_{i}: \kappa(s)\right]$ but we do not need this. By our choice of $L$ (and elementary field theory) we see that $\kappa(u) \subset \kappa\left(y_{i, j}\right)$ is finite purely inseparable for each pair $i, j$. Also, by Morphisms, Lemma 28.20 .13 for example, the morphism $X_{U} \rightarrow U$ is quasi-finite at the points $y_{i, j}$ for all $i, j$.

Apply Lemma 36.30 .2 to the morphism $X_{U} \rightarrow U$, the point $u \in U$ and the points $y_{i, j} \in\left(X_{U}\right)_{u}$. This gives an étale neighbourhood $\left(U^{\prime}, u^{\prime}\right) \rightarrow(U, u)$ with $\kappa(u)=\kappa\left(u^{\prime}\right)$ and opens $V_{i, j} \subset X_{U^{\prime}}$ with the properties (i), (ii), and (iii) of that lemma. We claim that the étale neighbourhood $\left(U^{\prime}, u^{\prime}\right) \rightarrow(S, s)$ and the opens $V_{i, j} \subset X_{U^{\prime}}$ are a solution to the problem posed by the lemma. We omit the verifications.

02LN Lemma 36.30.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Let $x_{1}, \ldots, x_{n} \in X_{s}$. Assume that
(1) $f$ is locally of finite type,
(2) $f$ is separated, and
(3) $x_{1}, \ldots, x_{n}$ are pairwise distinct isolated points of $X_{s}$.

Then there exists an elementary étale neighbourhood $(U, u) \rightarrow(S, s)$ and a decomposition

$$
U \times_{S} X=W \amalg V_{1} \amalg \ldots \amalg V_{n}
$$

into open and closed subschemes such that the morphisms $V_{i} \rightarrow U$ are finite, the fibres of $V_{i} \rightarrow U$ over $u$ are singletons $\left\{v_{i}\right\}$, each $v_{i}$ maps to $x_{i}$ with $\kappa\left(x_{i}\right)=\kappa\left(v_{i}\right)$, and the fibre of $W \rightarrow U$ over $u$ contains no points mapping to any of the $x_{i}$.

Proof. Choose $(U, u) \rightarrow(S, s)$ and $V_{i} \subset X_{U}$ as in Lemma 36.30.2. Since $X_{U} \rightarrow$ $U$ is separated (Schemes, Lemma 25.21.13) and $V_{i} \rightarrow U$ is finite hence proper (Morphisms, Lemma 28.43.10) we see that $V_{i} \subset X_{U}$ is closed by Morphisms, Lemma 28.41.7. Hence $V_{i} \cap V_{j}$ is a closed subset of $V_{i}$ which does not contain $v_{i}$. Hence the image of $V_{i} \cap V_{j}$ in $U$ is a closed set (because $V_{i} \rightarrow U$ proper) not containing $u$. After shrinking $U$ we may therefore assume that $V_{i} \cap V_{j}=\emptyset$ for all $i, j$. This gives the decomposition as in the lemma.

Here is the variant where we reduce to purely inseparable field extensions.
02LO Lemma 36.30.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Let $x_{1}, \ldots, x_{n} \in X_{s}$. Assume that
(1) $f$ is locally of finite type,
(2) $f$ is separated, and
(3) $x_{1}, \ldots, x_{n}$ are pairwise distinct isolated points of $X_{s}$.

Then there exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and a decomposition

$$
U \times_{S} X=W \amalg \coprod_{i=1, \ldots, n} \coprod_{j=1, \ldots, m_{i}} V_{i, j}
$$

into open and closed subschemes such that the morphisms $V_{i, j} \rightarrow U$ are finite, the fibres of $V_{i, j} \rightarrow U$ over $u$ are singletons $\left\{v_{i, j}\right\}$, each $v_{i, j}$ maps to $x_{i}, \kappa(u) \subset \kappa\left(v_{i, j}\right)$
is purely inseparable, and the fibre of $W \rightarrow U$ over $u$ contains no points mapping to any of the $x_{i}$.

Proof. This is proved in exactly the same way as the proof of Lemma 36.30 .4 except that it uses Lemma 36.30.3 instead of Lemma 36.30.2.

The following version may be a little easier to parse.
02LP Lemma 36.30.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that
(1) $f$ is locally of finite type,
(2) $f$ is separated, and
(3) $X_{s}$ has at most finitely many isolated points.

Then there exists an elementary étale neighbourhood $(U, u) \rightarrow(S, s)$ and a decomposition

$$
U \times_{S} X=W \amalg V
$$

into open and closed subschemes such that the morphism $V \rightarrow U$ is finite, and the fibre $W_{u}$ of the morphism $W \rightarrow U$ contains no isolated points. In particular, if $f^{-1}(s)$ is a finite set, then $W_{u}=\emptyset$.

Proof. This is clear from Lemma 36.30 .4 by choosing $x_{1}, \ldots, x_{n}$ the complete set of isolated points of $X_{s}$ and setting $V=\bigcup V_{i}$.

### 36.31. Zariski's Main Theorem

02LQ We can use the results Section 36.30 to prove the scheme theoretic version of Zariski's main theorem.

03GW Lemma 36.31.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is of finite type and separated. Let $S^{\prime}$ be the normalization of $S$ in $X$, see Morphisms, Definition 28.48.3. Picture:

Then there exists an open subscheme $U^{\prime} \subset S^{\prime}$ such that
(1) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \rightarrow U^{\prime}$ is an isomorphism, and
(2) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \subset X$ is the set of points at which $f$ is quasi-finite.

Proof. By Morphisms, Lemma 28.50 .2 the subset $U \subset X$ of points where $f$ is quasi-finite is open. The lemma is equivalent to
(a) $U^{\prime}=f^{\prime}(U) \subset S^{\prime}$ is open,
(b) $U=f^{-1}\left(U^{\prime}\right)$, and
(c) $U \rightarrow U^{\prime}$ is an isomorphism.

Let $x \in U$ be arbitrary. We claim there exists an open neighbourhood $f^{\prime}(x) \in V \subset$ $S^{\prime}$ such that $\left(f^{\prime}\right)^{-1} V \rightarrow V$ is an isomorphism. We first prove the claim implies the lemma. Namely, then $\left(f^{\prime}\right)^{-1} V \cong V$ is both locally of finite type over $S$ (as an open subscheme of $X$ ) and for $v \in V$ the residue field extension $\kappa(v) \supset \kappa(\nu(v))$ is algebraic (as $V \subset S^{\prime}$ and $S^{\prime}$ is integral over $S$ ). Hence the fibres of $V \rightarrow S$ are discrete (Morphisms, Lemma 28.20.2 and $\left(f^{\prime}\right)^{-1} V \rightarrow S$ is locally quasi-finite
(Morphisms, Lemma 28.20.8). This implies $\left(f^{\prime}\right)^{-1} V \subset U$ and $V \subset U^{\prime}$. Since $x$ was arbitrary we see that (a), (b), and (c) are true.
Let $s=f(x)$. Let $(T, t) \rightarrow(S, s)$ be an elementary étale neighbourhood. Denote by a subscript ${ }_{T}$ the base change to $T$. Let $y=(x, t) \in X_{T}$ be the unique point in the fibre $X_{t}$ lying over $x$. Note that $U_{T} \subset X_{T}$ is the set of points where $f_{T}$ is quasi-finite, see Morphisms, Lemma 28.20.13. Note that

$$
X_{T} \xrightarrow{f_{T}^{\prime}} S_{T}^{\prime} \xrightarrow{\nu_{T}} T
$$

is the normalization of $T$ in $X_{T}$, see Lemma 36.14.2. Suppose that the claim holds for $y \in U_{T} \subset X_{T} \rightarrow S_{T}^{\prime} \rightarrow T$, i.e., suppose that we can find an open neighbourhood $f_{T}^{\prime}(y) \in V^{\prime} \subset S_{T}^{\prime}$ such that $\left(f_{T}^{\prime}\right)^{-1} V^{\prime} \rightarrow V^{\prime}$ is an isomorphism. The morphism $S_{T}^{\prime} \rightarrow S^{\prime}$ is étale hence the image $V \subset S^{\prime}$ of $V^{\prime}$ is open. Observe that $f^{\prime}(x) \in V$ as $f_{T}^{\prime}(y) \in V^{\prime}$. Observe that

is a fibre square (as $S_{T}^{\prime} \times{ }_{S^{\prime}} X=X_{T}$ ). Since the left vertical arrow is an isomorphism and $\left\{V^{\prime} \rightarrow V\right\}$ is a étale covering, we conclude that the right vertical arrow is an isomorphism by Descent, Lemma 34.19.15. In other words, the claim holds for $x \in U \subset X \rightarrow S^{\prime} \rightarrow S$.
By the result of the previous paragraph we may replace $S$ by an elementary étale neighbourhood of $s=f(x)$ in order to prove the claim. Thus we may assume there is a decomposition

$$
X=V \amalg W
$$

into open and closed subschemes where $V \rightarrow S$ is finite and $x \in V$, see Lemma 36.30 .4 Since $X$ is a disjoint union of $V$ and $W$ over $S$ and since $V \rightarrow S$ is finite we see that the normalization of $S$ in $X$ is the morphism

$$
X=V \amalg W \longrightarrow V \amalg W^{\prime} \longrightarrow S
$$

where $W^{\prime}$ is the normalization of $S$ in $W$, see Morphisms, Lemmas 28.48.9, 28.43.4, and 28.48.11. The claim follows and we win.

02LR Lemma 36.31.2. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is quasi-finite and separated. Let $S^{\prime}$ be the normalization of $S$ in $X$, see Morphisms, Definition 28.48.3. Picture:

Then $f^{\prime}$ is a quasi-compact open immersion and $\nu$ is integral. In particular $f$ is quasi-affine.

Proof. This follows from Lemma 36.31.1. Namely, by that lemma there exists an open subscheme $U^{\prime} \subset S^{\prime}$ such that $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right)=X(!)$ and $X \rightarrow U^{\prime}$ is an
isomorphism! In other words, $f^{\prime}$ is an open immersion. Note that $f^{\prime}$ is quasicompact as $f$ is quasi-compact and $\nu: S^{\prime} \rightarrow S$ is separated (Schemes, Lemma 25.21.15. It follows that $f$ is quasi-affine by Morphisms, Lemma 28.13.3.

05K0 Lemma 36.31.3. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is quasifinite and separated and assume that $S$ is quasi-compact and quasi-separated. Then there exists a factorization

where $j$ is a quasi-compact open immersion and $\pi$ is finite.
Proof. Let $X \rightarrow S^{\prime} \rightarrow S$ be as in the conclusion of Lemma 36.31.2. By Properties, Lemma 27.22.13 we can write $\nu_{*} \mathcal{O}_{S^{\prime}}=\operatorname{colim}_{i \in I} \mathcal{A}_{i}$ as a directed colimit of finite quasi-coherent $\mathcal{O}_{X}$-algebras $\mathcal{A}_{i} \subset \nu_{*} \mathcal{O}_{S^{\prime}}$. Then $\pi_{i}: T_{i}=\underline{\operatorname{Spec}_{S}}\left(\mathcal{A}_{i}\right) \rightarrow S$ is a finite morphism for each $i$. Note that the transition morphisms $T_{i^{\prime}} \rightarrow T_{i}$ are affine and that $S^{\prime}=\lim T_{i}$.

By Limits, Lemma 31.3 .8 there exists an $i$ and a quasi-compact open $U_{i} \subset T_{i}$ whose inverse image in $S^{\prime}$ equals $f^{\prime}(X)$. For $i^{\prime} \geq i$ let $U_{i^{\prime}}$ be the inverse image of $U_{i}$ in $T_{i^{\prime}}$. Then $X \cong f^{\prime}(X)=\lim _{i^{\prime} \geq i} U_{i^{\prime}}$, see Limits, Lemma 31.2.2. By Limits, Lemma 31.3 .13 we see that $X \rightarrow U_{i^{\prime}}$ is a closed immersion for some $i^{\prime} \geq i$. (In fact $X \cong U_{i^{\prime}}$ for sufficiently large $i^{\prime}$ but we don't need this.) Hence $X \rightarrow T_{i^{\prime}}$ is an immersion. By Morphisms, Lemma 28.3 .2 we can factor this as $X \rightarrow T \rightarrow T_{i^{\prime}}$ where the first arrow is an open immersion and the second a closed immersion. Thus we win.

02LS Lemma 36.31.4. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) $f$ is finite,
(2) $f$ is proper with finite fibres.
(3) $f$ is universally closed, separated, locally of finite type and has finite fibres.

Proof. We have (1) implies (2) by Morphisms, Lemmas 28.43.10, 28.20.10, and 28.43.9. By definition (2) implies (3).

Assume (3). Pick $s \in S$. By Morphisms, Lemma 28.20.7 we see that all the finitely many points of $X_{s}$ are isolated in $X_{s}$. Choose an elementary étale neighbourhood $(U, u) \rightarrow(S, s)$ and decomposition $X_{U}=V \amalg W$ as in Lemma 36.30.6. Note that $W_{u}=\emptyset$ because all points of $X_{s}$ are isolated. Since $f$ is universally closed we see that the image of $W$ in $U$ is a closed set not containing $u$. After shrinking $U$ we may assume that $W=\emptyset$. In other words we see that $X_{U}=V$ is finite over $U$. Since $s \in S$ was arbitrary this means there exists a family $\left\{U_{i} \rightarrow S\right\}$ of étale morphisms whose images cover $S$ such that the base changes $X_{U_{i}} \rightarrow U_{i}$ are finite. Note that $\left\{U_{i} \rightarrow S\right\}$ is an étale covering, see Topologies, Definition 33.4.1. Hence it is an fpqc covering, see Topologies, Lemma 33.8.6. Hence we conclude $f$ is finite by Descent, Lemma 34.19.21

As a consequence we have the following useful results.

02UP Lemma 36.31.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that $f$ is proper and $f^{-1}(\{s\})$ is a finite set. Then there exists an open neighbourhood $V \subset S$ of $s$ such that $\left.f\right|_{f^{-1}(V)}: f^{-1}(V) \rightarrow V$ is finite.

Proof. The morphism $f$ is quasi-finite at all the points of $f^{-1}(\{s\})$ by Morphisms, Lemma 28.20.7. By Morphisms, Lemma 28.50.2 the set of points at which $f$ is quasi-finite is an open $U \subset X$. Let $Z=X \backslash U$. Then $s \notin f(Z)$. Since $f$ is proper the set $f(Z) \subset S$ is closed. Choose any open neighbourhood $V \subset S$ of $s$ with $Z \cap V=\emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence it is quasi-finite (Morphisms, Lemma 28.20.9), hence has finite fibres (Morphisms, Lemma 28.20.10, hence is finite by Lemma 36.31.4.

0AH8 Lemma 36.31.6. Consider a commutative diagram of schemes

Let $s \in S$. Assume
(1) $X \rightarrow S$ is a proper morphism,
(2) $Y \rightarrow S$ is separated and locally of finite type, and
(3) the image of $X_{s} \rightarrow Y_{s}$ is finite.

Then there is an open subspace $U \subset S$ containing such that $X_{U} \rightarrow Y_{U}$ factors through a closed subscheme $Z \subset Y_{U}$ finite over $U$.

Proof. Let $Z \subset Y$ be the scheme theoretic image of $h$, see Morphisms, Section 28.6 . By Morphisms, Lemma 28.41 .9 the morphism $X \rightarrow Z$ is surjective and $Z \rightarrow S$ is proper. Thus $X_{s} \rightarrow Z_{s}$ is surjective. We see that either (3) implies $Z_{s}$ is finite. Hence $Z \rightarrow S$ is finite in an open neighbourhood of $s$ by Lemma 36.31.5.

03I1 Lemma 36.31.7. Let $f: Y \rightarrow X$ be a quasi-finite morphism. There exists a dense open $U \subset X$ such that $\left.f\right|_{f^{-1}(U)}: f^{-1}(U) \rightarrow U$ is finite.

Proof. If $U_{i} \subset X, i \in I$ is a collection of opens such that the restrictions $\left.f\right|_{f^{-1}\left(U_{i}\right)}$ : $f^{-1}\left(U_{i}\right) \rightarrow U_{i}$ are finite, then with $U=\bigcup U_{i}$ the restriction $\left.f\right|_{f^{-1}(U)}: f^{-1}(U) \rightarrow U$ is finite, see Morphisms, Lemma 28.43.3. Thus the problem is local on $X$ and we may assume that $X$ is affine.

Assume $X$ is affine. Write $Y=\bigcup_{j=1, \ldots, m} V_{j}$ with $V_{j}$ affine. This is possible since $f$ is quasi-finite and hence in particular quasi-compact. Each $V_{j} \rightarrow X$ is quasi-finite and separated. Let $\eta \in X$ be a generic point of an irreducible component of $X$. We see from Morphisms, Lemmas 28.20 .10 and 28.47 .1 that there exists an open neighbourhood $\eta \in U_{\eta}$ such that $f^{-1}\left(U_{\eta}\right) \cap V_{j} \rightarrow U_{\eta}$ is finite. We may choose $U_{\eta}$ such that it works for each $j=1, \ldots, m$. Note that the collection of generic points of $X$ is dense in $X$. Thus we see there exists a dense open $W=\bigcup_{\eta} U_{\eta}$ such that each $f^{-1}(W) \cap V_{j} \rightarrow W$ is finite. It suffices to show that there exists a dense open $U \subset W$ such that $\left.f\right|_{f^{-1}(U)}: f^{-1}(U) \rightarrow U$ is finite. Thus we may replace $X$ by an affine open subscheme of $W$ and assume that each $V_{j} \rightarrow X$ is finite.

Assume $X$ is affine, $Y=\bigcup_{j=1, \ldots, m} V_{j}$ with $V_{j}$ affine, and the restrictions $\left.f\right|_{V_{j}}$ : $V_{j} \rightarrow X$ are finite. Set

$$
\Delta_{i j}=\left(\overline{V_{i} \cap V_{j}} \backslash V_{i} \cap V_{j}\right) \cap V_{j}
$$

This is a nowhere dense closed subset of $V_{j}$ because it is the boundary of the open subset $V_{i} \cap V_{j}$ in $V_{j}$. By Morphisms, Lemma 28.45.7 the image $f\left(\Delta_{i j}\right)$ is a nowhere dense closed subset of $X$. By Topology, Lemma 5.20.2 the union $T=\bigcup f\left(\Delta_{i j}\right)$ is a nowhere dense closed subset of $X$. Thus $U=X \backslash T$ is a dense open subset of $X$. We claim that $\left.f\right|_{f^{-1}(U)}: f^{-1}(U) \rightarrow U$ is finite. To see this let $U^{\prime} \subset U$ be an affine open. Set $Y^{\prime}=f^{-1}\left(U^{\prime}\right)=U^{\prime} \times_{X} Y, V_{j}^{\prime}=Y^{\prime} \cap V_{j}=U^{\prime} \times_{X} V_{j}$. Consider the restriction

$$
f^{\prime}=\left.f\right|_{Y^{\prime}}: Y^{\prime} \longrightarrow U^{\prime}
$$

of $f$. This morphism now has the property that $Y^{\prime}=\bigcup_{j=1, \ldots, m} V_{j}^{\prime}$ is an affine open covering, each $V_{j}^{\prime} \rightarrow U^{\prime}$ is finite, and $V_{i}^{\prime} \cap V_{j}^{\prime}$ is (open and) closed both in $V_{i}^{\prime}$ and $V_{j}^{\prime}$. Hence $V_{i}^{\prime} \cap V_{j}^{\prime}$ is affine, and the map

$$
\mathcal{O}\left(V_{i}^{\prime}\right) \otimes_{\mathbf{z}} \mathcal{O}\left(V_{j}^{\prime}\right) \longrightarrow \mathcal{O}\left(V_{i}^{\prime} \cap V_{j}^{\prime}\right)
$$

is surjective. This implies that $Y^{\prime}$ is separated, see Schemes, Lemma 25.21.8, Finally, consider the commutative diagram

The south-east arrow is finite, hence proper, the horizontal arrow is surjective, and the south-west arrow is separated. Hence by Morphisms, Lemma 28.41 .8 we conclude that $Y^{\prime} \rightarrow U^{\prime}$ is proper. Since it is also quasi-finite, we see that it is finite by Lemma 36.31.4, and we win.
07RY Lemma 36.31.8. Let $f: X \rightarrow S$ be flat, locally of finite presentation, separated, locally quasi-finite with universally bounded fibres. Then there exist closed subsets

$$
\emptyset=Z_{-1} \subset Z_{0} \subset Z_{1} \subset Z_{2} \subset \ldots \subset Z_{n}=S
$$

such that with $S_{r}=Z_{r} \backslash Z_{r-1}$ the stratification $S=\coprod_{r=0, \ldots, n} S_{r}$ is characterized by the following universal property: Given $g: T \rightarrow S$ the projection $X \times_{S} T \rightarrow T$ is finite locally free of degree $r$ if and only if $g(T) \subset S_{r}$ (set theoretically).

Proof. Let $n$ be an integer bounding the degree of the fibres of $X \rightarrow S$. By Morphisms, Lemma 28.51.4 we see that any base change has degrees of fibres bounded by $n$ also. In particular, all the integers $r$ that occur in the statement of the lemma will be $\leq n$. We will prove the lemma by induction on $n$. The base case is $n=0$ which is obvious.

We claim the set of points $s \in S$ with $\operatorname{deg}_{\kappa(s)}\left(X_{s}\right)=n$ is an open subset $S_{n} \subset S$ and that $X \times_{S} S_{n} \rightarrow S_{n}$ is finite locally free of degree $n$. Namely, suppose that $s \in S$ is such a point. Choose an elementary étale morphism $(U, u) \rightarrow(S, s)$ and a decomposition $U \times_{S} X=W \amalg V$ as in Lemma 36.30.6. Since $V \rightarrow U$ is finite, flat, and locally of finite presentation, we see that $V \rightarrow U$ is finite locally free, see Morphisms, Lemma 28.45.2. After shrinking $U$ to a smaller neighbourhood of $u$ we may assume $V \rightarrow U$ is finite locally free of some degree $d$, see Morphisms,

Lemma 28.45.5. As $u \mapsto s$ and $W_{u}=\emptyset$ we see that $d=n$. Since $n$ is the maximum degree of a fibre we see that $W=\emptyset$ ! Thus $U \times_{S} X \rightarrow U$ is finite locally free of degree $n$. By Descent, Lemma 34.19 .28 we conclude that $X \rightarrow S$ is finite locally free of degree $n$ over $\operatorname{Im}(U \rightarrow S)$ which is an open neighbourhood of $s$ (Morphisms, Lemma 28.36.13. This proves the claim.
Let $S^{\prime}=S \backslash S_{n}$ endowed with the reduced induced scheme structure and set $X^{\prime}=X \times_{S} S^{\prime}$. Note that the degrees of fibres of $X^{\prime} \rightarrow S^{\prime}$ are universally bounded by $n-1$. By induction we find a stratification $S^{\prime}=S_{0} \amalg \ldots \amalg S_{n-1}$ adapted to the morphism $X^{\prime} \rightarrow S^{\prime}$. We claim that $S=\coprod_{r=0, \ldots, n} S_{r}$ works for the morphism $X \rightarrow S$. Let $g: T \rightarrow S$ be a morphism of schemes and assume that $X \times_{S} T \rightarrow T$ is finite locally free of degree $r$. As remarked above this implies that $r \leq n$. If $r=n$, then it is clear that $T \rightarrow S$ factors through $S_{n}$. If $r<n$, then $g(T) \subset S^{\prime}=S \backslash S_{d}$ (set theoretically) hence $T_{\text {red }} \rightarrow S$ factors through $S^{\prime}$, see Schemes, Lemma 25.12.6. Note that $X \times{ }_{S} T_{\text {red }} \rightarrow T_{\text {red }}$ is also finite locally free of degree $r$ as a base change. By the universal property of the stratification $S^{\prime}=\coprod_{r=0, \ldots, n-1} S_{r}$ we see that $g(T)=g\left(T_{r e d}\right)$ is contained in $S_{r}$. Conversely, suppose that we have $g: T \rightarrow S$ such that $g(T) \subset S_{r}$ (set theoretically). If $r=n$, then $g$ factors through $S_{n}$ and it is clear that $X \times_{S} T \rightarrow T$ is finite locally free of degree $n$ as a base change. If $r<n$, then $X \times{ }_{S} T \rightarrow T$ is a morphism which is separated, flat, and locally of finite presentation, such that the restriction to $T_{r e d}$ is finite locally free of degree $r$. Since $T_{r e d} \rightarrow T$ is a universal homeomorphism, we conclude that $X \times{ }_{S} T_{r e d} \rightarrow X \times{ }_{S} T$ is a universal homeomorphism too and hence $X \times_{S} T \rightarrow T$ is universally closed (as this is true for the finite morphism $X \times{ }_{S} T_{r e d} \rightarrow T_{r e d}$ ). It follows that $X \times{ }_{S} T \rightarrow T$ is finite, for example by Lemma 36.31.4. Then we can use Morphisms, Lemma 28.45 .2 to see that $X \times_{S} T \rightarrow T$ is finite locally free. Finally, the degree is $r$ as all the fibres have degree $r$.

07RZ Lemma 36.31.9. Let $f: X \rightarrow S$ be a morphism of schemes which is flat, locally of finite presentation, separated, and quasi-finite. Then there exist closed subsets

$$
\emptyset=Z_{-1} \subset Z_{0} \subset Z_{1} \subset Z_{2} \subset \ldots \subset S
$$

such that with $S_{r}=Z_{r} \backslash Z_{r-1}$ the stratification $S=\coprod S_{r}$ is characterized by the following universal property: Given a morphism $g: T \rightarrow S$ the projection $X \times{ }_{S} T \rightarrow$ $T$ is finite locally free of degree $r$ if and only if $g(T) \subset S_{r}$ (set theoretically). Moreover, the inclusion maps $S_{r} \rightarrow S$ are quasi-compact.

Proof. The question is local on $S$, hence we may assume that $S$ is affine. By Morphisms, Lemma 28.51 .8 the fibres of $f$ are universally bounded in this case. Hence the existence of the stratification follows from Lemma 36.31.8,

We will show that $U_{r}=S \backslash Z_{r} \rightarrow S$ is quasi-compact for each $r \geq 0$. This will prove the final statement by elementary topology. Since a composition of quasi-compact maps is quasi-compact it suffices to prove that $U_{r} \rightarrow U_{r-1}$ is quasi-compact. Choose an affine open $W \subset U_{r-1}$. Write $W=\operatorname{Spec}(A)$. Then $Z_{r} \cap W=V(I)$ for some ideal $I \subset A$ and $X \times_{S} \operatorname{Spec}(A / I) \rightarrow \operatorname{Spec}(A / I)$ is finite locally free of degree $r$. Note that $A / I=\operatorname{colim} A / I_{i}$ where $I_{i} \subset I$ runs through the finitely generated ideals. By Limits, Lemma 31.7.7 we see that $X \times_{S} \operatorname{Spec}\left(A / I_{i}\right) \rightarrow \operatorname{Spec}\left(A / I_{i}\right)$ is finite locally free of degree $r$ for some $i$. (This uses that $X \rightarrow S$ is of finite presentation, as it is locally of finite presentation, separated, and quasi-compact.) Hence $\operatorname{Spec}\left(A / I_{i}\right) \rightarrow \operatorname{Spec}(A)=W$ factors (set theoretically) through $Z_{r} \cap W$. It
follows that $Z_{r} \cap W=V\left(I_{i}\right)$ is the zero set of a finite subset of elements of $A$. This means that $W \backslash Z_{r}$ is a finite union of standard opens, hence quasi-compact, as desired.

086R Lemma 36.31.10. Let $f: X \rightarrow S$ be a flat, locally of finite presentation, separated, and locally quasi-finite morphism of schemes. Then there exist open subschemes

$$
S=U_{0} \supset U_{1} \supset U_{2} \supset \ldots
$$

such that a morphism $\operatorname{Spec}(k) \rightarrow S$ factors through $U_{d}$ if and only if $X \times{ }_{S} \operatorname{Spec}(k)$ has degree $\geq d$ over $k$.

Proof. The statement simply means that the collection of points where the degree of the fibre is $\geq d$ is open. Thus we can work locally on $S$ and assume $S$ is affine. In this case, for every $W \subset X$ quasi-compact open, the set of points $U_{d}(W)$ where the fibres of $W \rightarrow S$ have degree $\geq d$ is open by Lemma36.31.9. Since $U_{d}=\bigcup_{W} U_{d}(W)$ the result follows.
082V Lemma 36.31.11. Let $f: X \rightarrow S$ be a morphism of schemes which is flat, locally of finite presentation, and locally quasi-finite. Let $g \in \Gamma\left(X, \mathcal{O}_{X}\right)$ nonzero. Then there exist an open $V \subset X$ such that $\left.g\right|_{V} \neq 0$, an open $U \subset S$ fitting into $a$ commutative diagram

a quasi-coherent subsheaf $\mathcal{F} \subset \mathcal{O}_{U}$, an integer $r>0$, and an injective $\mathcal{O}_{U}$-module map $\mathcal{F}^{\oplus r} \rightarrow \pi_{*} \mathcal{O}_{V}$ whose image contains $\left.g\right|_{V}$.
Proof. We may assume $X$ and $S$ affine. We obtain a filtration $\emptyset=Z_{-1} \subset Z_{0} \subset$ $Z_{1} \subset Z_{2} \subset \ldots \subset Z_{n}=S$ as in Lemmas 36.31 .8 and 36.31.9, Let $T \subset X$ be the scheme theoretic support of the finite $\mathcal{O}_{X}$-module $\operatorname{Im}\left(g: \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}\right)$. Note that $T$ is the support of $g$ as a section of $\mathcal{O}_{X}$ (Modules, Definition 17.5.1) and for any open $V \subset X$ we have $\left.g\right|_{V} \neq 0$ if and only if $V \cap T \neq \emptyset$. Let $r$ be the smallest integer such that $f(T) \subset Z_{r}$ set theoretically. Let $\xi \in T$ be a generic point of an irreducible component of $T$ such that $f(\xi) \notin Z_{r-1}$ (and hence $f(\xi) \in Z_{r}$ ). We may replace $S$ by an affine neighbourhood of $f(\xi)$ contained in $S \backslash Z_{r-1}$. Write $S=\operatorname{Spec}(A)$ and let $I=\left(a_{1}, \ldots, a_{m}\right) \subset A$ be a finitely generated ideal such that $V(I)=Z_{r}$ (set theoretically, see Algebra, Lemma 10.28.1). Since the support of $g$ is contained in $f^{-1} V(I)$ by our choice of $r$ we see that there exists an integer $N$ such that $a_{j}^{N} g=0$ for $j=1, \ldots, m$. Replacing $a_{j}$ by $a_{j}^{r}$ we may assume that $I g=0$. For any $A$-module $M$ write $M[I]$ for the $I$-torsion of $M$, i.e., $M[I]=\{m \in M \mid I m=0\}$. Write $X=\operatorname{Spec}(B)$, so $g \in B[I]$. Since $A \rightarrow B$ is flat we see that

$$
B[I]=A[I] \otimes_{A} B \cong A[I] \otimes_{A / I} B / I B
$$

By our choice of $Z_{r}$, the $A / I$-module $B / I B$ is finite locally free of rank $r$. Hence after replacing $S$ by a smaller affine open neighbourhood of $f(\xi)$ we may assume that $B / I B \cong(A / I A)^{\oplus r}$ as $A / I$-modules. Choose a map $\psi: A^{\oplus r} \rightarrow B$ which reduces modulo $I$ to the isomorphism of the previous sentence. Then we see that the induced map

$$
A[I]^{\oplus r} \longrightarrow B[I]
$$

is an isomorphism. The lemma follows by taking $\mathcal{F}$ the quasi-coherent sheaf associated to the $A$-module $A[I]$ and the map $\mathcal{F}^{\oplus r} \rightarrow \pi_{*} \mathcal{O}_{V}$ the one corresponding to $A[I]^{\oplus r} \subset A^{\oplus r} \rightarrow B$.

07S0 Lemma 36.31.12. Let $f: X \rightarrow Y$ be a separated, locally quasi-finite morphism with $Y$ affine. Then every finite set of points of $X$ is contained in an open affine of $X$.

Proof. Let $x_{1}, \ldots, x_{n} \in X$. Choose a quasi-compact open $U \subset X$ with $x_{i} \in U$. Then $U \rightarrow Y$ is quasi-affine by Lemma 36.31.2. Hence there exists an affine open $V \subset U$ containing $x_{1}, \ldots, x_{n}$ by Properties, Lemma 27.29.5.

09Z0 Lemma 36.31.13. Let $U \rightarrow X$ be a surjective étale morphism of schemes. Assume $X$ is quasi-compact and quasi-separated. Then there exists a surjective integral morphism $Y \rightarrow X$, such that for every $y \in Y$ there is an open neighbourhood $V \subset Y$ such that $V \rightarrow X$ factors through $U$. In fact, we may assume $Y \rightarrow X$ is finite and of finite presentation.

Proof. Since $X$ is quasi-compact, there exist finitely many affine opens $U_{i} \subset U$ such that $U^{\prime}=\coprod U_{i} \rightarrow X$ is surjective. After replacing $U$ by $U^{\prime}$, we see that we may assume $U$ is affine. Then there exists an integer $d$ bounding the degree of the geometric fibres of $U \rightarrow X$ (see Morphisms, Lemma 28.51.8). We will prove the lemma by induction on $d$ for all quasi-compact and separated schemes $U$ mapping surjective and étale onto $X$. If $d=1$, then $U=X$ and the result holds with $Y=U$. Assume $d>1$.

We apply Lemma 36.31 .2 and we obtain a factorization

with $\pi$ integral and $j$ a quasi-compact open immersion. We may and do assume that $j(U)$ is scheme theoretically dense in $Y$. Note that

$$
U \times_{X} Y=U \amalg W
$$

where the first summand is the image of $U \rightarrow U \times_{X} Y$ (which is closed by Schemes, Lemma 25.21 .11 and open because it is étale as a morphism between schemes étale over $Y$ ) and the second summand is the (open and closed) complement. The image $V \subset Y$ of $W$ is an open subscheme containing $Y \backslash U$.

The étale morphism $W \rightarrow Y$ has geometric fibres of cardinality $<d$. Namely, this is clear for geometric points of $U \subset Y$ by inspection. Since $U \subset Y$ is dense, it holds for all geometric points of $Y$ for example by Lemma 36.31 .8 (the degree of the fibres of a quasi-compact étale morphism does not go up under specialization). Thus we may apply the induction hypothesis to $W \rightarrow V$ and find a surjective integral morphism $Z \rightarrow V$ with $Z$ a scheme, which Zariski locally factors through $W$. Choose a factorization $Z \rightarrow Z^{\prime} \rightarrow Y$ with $Z^{\prime} \rightarrow Y$ integral and $Z \rightarrow Z^{\prime}$ open immersion (Lemma 36.31.2. After replacing $Z^{\prime}$ by the scheme theoretic closure of $Z$ in $Z^{\prime}$ we may assume that $Z$ is scheme theoretically dense in $Z^{\prime}$. After doing this
we have $Z^{\prime} \times_{Y} V=Z$. Finally, let $T \subset Y$ be the induced reduced closed subscheme structure on $Y \backslash V$. Consider the morphism

$$
Z^{\prime} \amalg T \longrightarrow X
$$

This is a surjective integral morphism by construction. Since $T \subset U$ it is clear that the morphism $T \rightarrow X$ factors through $U$. On the other hand, let $z \in Z^{\prime}$ be a point. If $z \notin Z$, then $z$ maps to a point of $Y \backslash V \subset U$ and we find a neighbourhood of $z$ on which the morphism factors through $U$. If $z \in Z$, then we have a neighbourhood $V \subset Z$ which factors through $W \subset U \times_{X} Y$ and hence through $U$. This proves existence.
Assume we have found $Y \rightarrow X$ integral and surjective which Zariski locally factors through $U$. Choose a finite affine open covering $Y=\bigcup V_{j}$ such that $V_{j} \rightarrow X$ factors through $U$. We can write $Y=\lim Y_{i}$ with $Y_{i} \rightarrow X$ finite and of finite presentation, see Limits, Lemma 31.6.2. For large enough $i$ we can find affine opens $V_{i, j} \subset Y_{i}$ whose inverse image in $Y$ recovers $V_{j}$, see Limits, Lemma 31.3.8. For even larger $i$ the morphisms $V_{j} \rightarrow U$ over $X$ come from morphisms $V_{i, j} \rightarrow U$ over $X$, see Limits, Proposition 31.5.1. This finishes the proof.

### 36.32. Application to morphisms with connected fibres

057 H In this section we prove some lemmas that produce morphisms all of whose fibres are geometrically connected or geometrically integral. This will be useful in our study of the local structure of morphisms of finite type later.

057I Lemma 36.32.1. Consider a diagram of morphisms of schemes

an a point $y \in Y$. Assume
(1) $X \rightarrow Y$ is of finite presentation and flat,
(2) $Z \rightarrow Y$ is finite locally free,
(3) $Z_{y} \neq \emptyset$,
(4) all fibres of $X \rightarrow Y$ are geometrically reduced, and
(5) $X_{y}$ is geometrically connected over $\kappa(y)$.

Then there exists an open $X^{0} \subset X$ such that $X_{y}^{0}=X_{y}$ and such that all nonempty fibres of $X^{0} \rightarrow Y$ are geometrically connected.

Proof. In this proof we will use that flat, finite presentation, finite locally free are properties that are preserved under base change and composition. We will also use that a finite locally free morphism is both open and closed. You can find these facts as Morphisms, Lemmas 28.25.7, 28.21.4, 28.45.4, 28.25.5, 28.21.3, 28.45.3, 28.25.9, and 28.43.10.

Note that $X_{Z} \rightarrow Z$ is flat morphism of finite presentation which has a section $s$ coming from $\sigma$. Let $X_{Z}^{0}$ denote the subset of $X_{Z}$ defined in Situation 36.24.1. By Lemma 36.24.6 it is an open subset of $X_{Z}$.
The pullback $X_{Z \times_{Y} Z}$ of $X$ to $Z \times_{Y} Z$ comes equipped with two sections $s_{0}, s_{1}$, namely the base changes of $s$ by $\mathrm{pr}_{0}, \mathrm{pr}_{1}: Z \times_{Y} Z \rightarrow Z$. The construction of

Situation 36.24.1 gives two subsets $\left(X_{Z \times_{Y} Z}\right)_{s_{0}}^{0}$ and $\left(X_{Z \times{ }_{Y} Z}\right)_{s_{1}}^{0}$. By Lemma 36.24.2 these are the inverse images of $X_{Z}^{0}$ under the morphisms $1_{X} \times \mathrm{pr}_{0}, 1_{X} \times \mathrm{pr}_{1}$ : $X_{Z \times_{Y} Z} \rightarrow X_{Z}$. In particular these subsets are open.
Let $\left(Z \times_{Y} Z\right)_{y}=\left\{z_{1}, \ldots, z_{n}\right\}$. As $X_{y}$ is geometrically connected, we see that the fibres of $\left(X_{Z \times_{Y} Z}\right)_{s_{0}}^{0}$ and $\left(X_{Z \times_{Y} Z}\right)_{s_{1}}^{0}$ over each $z_{i}$ agree (being equal to the whole fibre). Another way to say this is that

$$
s_{0}\left(z_{i}\right) \in\left(X_{Z \times_{Y} Z}\right)_{s_{1}}^{0} \quad \text { and } \quad s_{1}\left(z_{i}\right) \in\left(X_{Z \times_{Y} Z}\right)_{s_{0}}^{0} .
$$

Since the sets $\left(X_{Z \times_{Y} Z}\right)_{s_{0}}^{0}$ and $\left(X_{Z \times_{Y} Z}\right)_{s_{1}}^{0}$ are open in $X_{Z \times_{Y} Z}$ there exists an open neighbourhood $W \subset Z \times_{Y} Z$ of $\left(Z \times_{Y} Z\right)_{y}$ such that

$$
s_{0}(W) \subset\left(X_{Z \times_{Y} Z}\right)_{s_{1}}^{0} \quad \text { and } \quad s_{1}(W) \subset\left(X_{Z \times_{Y} Z}\right)_{s_{0}}^{0}
$$

Then it follows directly from the construction in Situation 36.24.1 that

$$
p^{-1}(W) \cap\left(X_{Z \times_{Y} Z}\right)_{s_{0}}^{0}=p^{-1}(W) \cap\left(X_{Z \times_{Y} Z}\right)_{s_{1}}^{0}
$$

where $p: X_{Z \times_{Y} Z} \rightarrow Z \times_{W} Z$ is the projection. Because $Z \times_{Y} Z \rightarrow Y$ is finite locally free, hence open and closed, there exists an open neighbourhood $V \subset Y$ of $y$ such that $q^{-1}(V) \subset W$, where $q: Z \times_{Y} Z \rightarrow Y$ is the structure morphism. To prove the lemma we may replace $Y$ by $V$. After we do this we see that $X_{Z}^{0} \subset Y_{Z}$ is an open such that

$$
\left(1_{X} \times \operatorname{pr}_{0}\right)^{-1}\left(X_{Z}^{0}\right)=\left(1_{X} \times \operatorname{pr}_{1}\right)^{-1}\left(X_{Z}^{0}\right)
$$

This means that the image $X^{0} \subset X$ of $X_{Z}^{0}$ is an open such that $\left(X_{Z} \rightarrow X\right)^{-1}\left(X^{0}\right)=$ $X_{Z}^{0}$, see Descent, Lemma 34.9.2. At this point it is clear that $X^{0}$ is the desired open subscheme.
055W Lemma 36.32.2. Let $h: Y \rightarrow S$ be a morphism of schemes. Let $s \in S$ be a point. Let $T \subset Y_{s}$ be an open subscheme. Assume
(1) $h$ is flat and of finite presentation,
(2) all fibres of $h$ are geometrically reduced, and
(3) $T$ is geometrically connected over $\kappa(s)$.

Then we can find an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open $V \subset Y_{S^{\prime}}$ such that
(a) all fibres of $V \rightarrow S^{\prime}$ are geometrically connected,
(b) $V_{s^{\prime}}=T \times{ }_{s} s^{\prime}$.

Proof. The problem is clearly local on $S$, hence we may replace $S$ by an affine open neighbourhood of $s$. The topology on $Y_{s}$ is induced from the topology on $X$, see Schemes, Lemma 25.18.5. Hence we can find a quasi-compact open $V \subset Y$ such that $V_{s}=T$. The restriction of $h$ to $V$ is quasi-compact (as $S$ affine and $V$ quasi-compact), quasi-separated, locally of finite presentation, and flat hence flat of finite presentation. Thus after replacing $Y$ by $V$ we may assume, in addition to (1) and (2) that $Y_{s}=T$ and $S$ affine.

Pick a point $y \in Y_{s}$ such that $h$ is Cohen-Macaulay at $y$, see Lemma 36.17.5. By Lemma 36.18.4 there exists a diagram

such that $Z \rightarrow S$ is flat, locally of finite presentation, locally quasi-finite with $Z_{s}=\{z\}$. Apply Lemma 36.30.1 to find an elementary neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow$ $(S, s)$ and an open $Z^{\prime} \subset Z_{S^{\prime}}=S^{\prime} \times{ }_{S} Z$ with $Z^{\prime} \rightarrow S^{\prime}$ finite with a unique point $z^{\prime} \in Z^{\prime}$ lying over $s$. Note that $Z^{\prime} \rightarrow S^{\prime}$ is also locally of finite presentation and flat (as an open of the base change of $Z \rightarrow S$ ), hence $Z^{\prime} \rightarrow S^{\prime}$ is finite locally free, see Morphisms, Lemma 28.45.2. Note that $Y_{S^{\prime}} \rightarrow S^{\prime}$ is flat and of finite presentation with geometrically reduced fibres as a base change of $h$. Also $Y_{s^{\prime}}=Y_{s}$ is geometrically connected. Apply Lemma 36.32 .1 to $Z^{\prime} \rightarrow Y_{S^{\prime}}$ over $S^{\prime}$ to get $V \subset Y_{S^{\prime}}$ satisfying (2) whose fibres over $S^{\prime}$ are either empty or geometrically connected. As $V \rightarrow S^{\prime}$ is open (Morphisms, Lemma 28.25.9), after shrinking $S^{\prime}$ we may assume $V \rightarrow S^{\prime}$ is surjective, whence (1) holds.

057J Lemma 36.32.3. Let $h: Y \rightarrow S$ be a morphism of schemes. Let $s \in S$ be a point. Let $T \subset Y_{s}$ be an open subscheme. Assume
(1) $h$ is of finite presentation,
(2) $h$ is normal, and
(3) $T$ is geometrically irreducible over $\kappa(s)$.

Then we can find an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open $V \subset Y_{S^{\prime}}$ such that
(a) all fibres of $V \rightarrow S^{\prime}$ are geometrically integral,
(b) $V_{s^{\prime}}=T \times{ }_{s} s^{\prime}$.

Proof. Apply Lemma 36.32 .2 to find an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow$ $(S, s)$ and an open $V \subset Y_{S^{\prime}}$ such that all fibres of $V \rightarrow S^{\prime}$ are geometrically integral and $V_{s^{\prime}}=T \times{ }_{s} s^{\prime}$. Note that $V \rightarrow S^{\prime}$ is open, see Morphisms, Lemma 28.25.9 Hence after replacing $S^{\prime}$ by the image of $V \rightarrow S^{\prime}$ we see that all fibres of $V \rightarrow S^{\prime}$ are nonempty. As $V$ is an open of the base change of $h$ all fibres of $V \rightarrow S^{\prime}$ are geometrically normal, see Lemma 36.15.2. In particular, they are geometrically reduced. To finish the proof we have to show they are geometrically irreducible. But, if $t \in S^{\prime}$ then $V_{t}$ is of finite type over $\kappa(t)$ and hence $V_{t} \times_{\kappa(t)} \overline{\kappa(t)}$ is of finite type over $\overline{\kappa(t)}$ hence Noetherian. By choice of $S^{\prime} \rightarrow S$ the scheme $V_{t} \times_{\kappa(t)} \overline{\kappa(t)}$ is connected. Hence $V_{t} \times_{\kappa(t)} \overline{\kappa(t)}$ is irreducible by Properties, Lemma 27.7.6 and we win.

### 36.33. Application to the structure of finite type morphisms

052D The result in this section can be found in GR71. Loosely stated it says that a finite type morphism is étale locally on the source and target the composition of a finite morphism by a smooth morphism with geometrically connected fibres of relative dimension equal to the fibre dimension of the original morphism.

052E Lemma 36.33.1. Let $f: X \rightarrow S$ be a morphism. Let $x \in X$ and set $s=f(x)$. Assume that $f$ is locally of finite type and that $n=\operatorname{dim}_{x}\left(X_{s}\right)$. Then there exists $a$
commutative diagram

and a point $x^{\prime} \in X^{\prime}$ with $g\left(x^{\prime}\right)=x$ such that with $y=\pi\left(x^{\prime}\right)$ we have
(1) $h: Y \rightarrow S$ is smooth of relative dimension $n$,
(2) $g:\left(X^{\prime}, x^{\prime}\right) \rightarrow(X, x)$ is an elementary étale neighbourhood,
(3) $\pi$ is finite, and $\pi^{-1}(\{y\})=\left\{x^{\prime}\right\}$, and
(4) $\kappa(y)$ is a purely transcendental extension of $\kappa(s)$.

Moreover, if $f$ is locally of finite presentation then $\pi$ is of finite presentation.
Proof. The problem is local on $X$ and $S$, hence we may assume that $X$ and $S$ are affine. By Algebra, Lemma 10.124 .3 after replacing $X$ by a standard open neighbourhood of $x$ in $X$ we may assume there is a factorization

$$
X \xrightarrow{\pi} \mathbf{A}_{S}^{n} \longrightarrow S
$$

such that $\pi$ is quasi-finite and such that $\kappa(\pi(x))$ is purely transcendental over $\kappa(s)$. By Lemma 36.30.1 there exists an elementary étale neighbourhood

$$
(Y, y) \rightarrow\left(\mathbf{A}_{S}^{n}, \pi(x)\right)
$$

and an open $X^{\prime} \subset X \times{\mathbf{A}_{s}^{n}}^{Y}$ which contains a unique point $x^{\prime}$ lying over $y$ such that $X^{\prime} \rightarrow Y$ is finite. This proves (1) - (4) hold. For the final assertion, use Morphisms, Lemma 28.21.11.

057K Lemma 36.33.2. Let $f: X \rightarrow S$ be a morphism. Let $x \in X$ and set $s=f(x)$. Assume that $f$ is locally of finite type and that $n=\operatorname{dim}_{x}\left(X_{s}\right)$. Then there exists $a$ commutative diagram

and a point $x^{\prime} \in X^{\prime}$ with $g\left(x^{\prime}\right)=x$ such that with $y^{\prime}=\pi\left(x^{\prime}\right), s^{\prime}=h\left(y^{\prime}\right)$ we have
(1) $h: Y^{\prime} \rightarrow S^{\prime}$ is smooth of relative dimension $n$,
(2) all fibres of $Y^{\prime} \rightarrow S^{\prime}$ are geometrically integral,
(3) $g:\left(X^{\prime}, x^{\prime}\right) \rightarrow(X, x)$ is an elementary étale neighbourhood,
(4) $\pi$ is finite, and $\pi^{-1}\left(\left\{y^{\prime}\right\}\right)=\left\{x^{\prime}\right\}$,
(5) $\kappa\left(y^{\prime}\right)$ is a purely transcendental extension of $\kappa\left(s^{\prime}\right)$, and
(6) $e:\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ is an elementary étale neighbourhood.

Moreover, if $f$ is locally of finite presentation, then $\pi$ is of finite presentation.

Proof. The question is local on $S$, hence we may replace $S$ by an affine open neighbourhood of $s$. Next, we apply Lemma 36.33.1 to get a commutative diagram

where $h$ is smooth of relative dimension $n$ and $\kappa(y)$ is a purely transcendental extension of $\kappa(s)$. Since the question is local on $X$ also, we may replace $Y$ by an affine neighbourhood of $y$ (and $X^{\prime}$ by the inverse image of this under $\pi$ ). As $S$ is affine this guarantees that $Y \rightarrow S$ is quasi-compact, separated and smooth, in particular of finite presentation. Let $T$ be the connected component of $Y_{s}$ containing $y$. As $Y_{s}$ is Noetherian we see that $T$ is open. We also see that $T$ is geometrically connected over $\kappa(s)$ by Varieties, Lemma 32.5.14. Since $T$ is also smooth over $\kappa(s)$ it is geometrically normal, see Varieties, Lemma 32.20.4. We conclude that $T$ is geometrically irreducible over $\kappa(s)$ (as a connected Noetherian normal scheme is irreducible, see Properties, Lemma 27.7.6). Finally, note that the smooth morphism $h$ is normal by Lemma 36.15.3. At this point we have verified all assumption of Lemma 36.32 .3 hold for the morphism $h: Y \rightarrow S$ and open $T \subset Y_{s}$. As a result of applying Lemma 36.32 .3 we obtain $e: S^{\prime} \rightarrow S, s^{\prime} \in S^{\prime}, Y^{\prime}$ as in the commutative diagram

where $e:\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ is an elementary étale neighbourhood, and where $Y^{\prime} \subset$ $Y_{S^{\prime}}$ is an open neighbourhood all of whose fibres over $S^{\prime}$ are geometrically irreducible, such that $Y_{s^{\prime}}^{\prime}=T$ via the identification $Y_{s}=Y_{S^{\prime}, s^{\prime}}$. Let $\left(y, s^{\prime}\right) \in Y^{\prime}$ be the point corresponding to $y \in T$; this is also the unique point of $Y \times{ }_{S} S^{\prime}$ lying over $y$ with residue field equal to $\kappa(y)$ which maps to $s^{\prime}$ in $S^{\prime}$. Similarly, let $\left(x^{\prime}, s^{\prime}\right) \in X^{\prime} \times_{Y} Y^{\prime} \subset X^{\prime} \times_{S} S^{\prime}$ be the unique point over $x^{\prime}$ with residue field equal to $\kappa\left(x^{\prime}\right)$ lying over $s^{\prime}$. Then the outer part of this diagram is a solution to the problem posed in the lemma. Some minor details omitted.

057L Lemma 36.33.3. Assumption and notation as in Lemma 36.33.2. In addition to properties (1) - (6) we may also arrange it so that
(7) $S^{\prime}, Y^{\prime}, X^{\prime}$ are affine.

Proof. Note that if $Y^{\prime}$ is affine, then $X^{\prime}$ is affine as $\pi$ is finite. Choose an affine open neighbourhood $U^{\prime} \subset S^{\prime}$ of $s^{\prime}$. Choose an affine open neighbourhood $V^{\prime} \subset h^{-1}\left(U^{\prime}\right)$ of $y^{\prime}$. Let $W^{\prime}=h\left(V^{\prime}\right)$. This is an open neighbourhood of $s^{\prime}$ in $S^{\prime}$, see Morphisms, Lemma 28.34.10, contained in $U^{\prime}$. Choose an affine open neighbourhood $U^{\prime \prime} \subset$
$W^{\prime}$ of $s^{\prime}$. Then $h^{-1}\left(U^{\prime \prime}\right) \cap V^{\prime}$ is affine because it is equal to $U^{\prime \prime} \times_{U^{\prime}} V^{\prime}$. By construction $h^{-1}\left(U^{\prime \prime}\right) \cap V^{\prime} \rightarrow U^{\prime \prime}$ is a surjective smooth morphism whose fibres are (nonempty) open subschemes of geometrically integral fibres of $Y^{\prime} \rightarrow S^{\prime}$, and hence geometrically integral. Thus we may replace $S^{\prime}$ by $U^{\prime \prime}$ and $Y^{\prime}$ by $h^{-1}\left(U^{\prime \prime}\right) \cap V^{\prime}$.
The significance of the property $\pi^{-1}\left(\left\{y^{\prime}\right\}\right)=\left\{x^{\prime}\right\}$ is partially explained by the following lemma.
05B8 Lemma 36.33.4. Let $\pi: X \rightarrow Y$ be a finite morphism. Let $x \in X$ with $y=\pi(x)$ such that $\pi^{-1}(\{y\})=\{x\}$. Then
(1) For every neighbourhood $U \subset X$ of $x$ in $X$, there exists a neighbourhood $V \subset Y$ of $y$ such that $\pi^{-1}(V) \subset U$.
(2) The ring map $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ is finite.
(3) If $\pi$ is of finite presentation, then $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ is of finite presentation.
(4) For any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $\mathcal{F}_{x}=\pi_{*} \mathcal{F}_{y}$ as $\mathcal{O}_{Y, y}$-modules.

Proof. The first assertion is purely topological; use that $\pi$ is a continuous and closed map such that $\pi^{-1}(\{y\})=\{x\}$. To prove the second and third parts we may assume $X=\operatorname{Spec}(B)$ and $Y=\operatorname{Spec}(A)$. Then $A \rightarrow B$ is a finite ring map and $y$ corresponds to a prime $\mathfrak{p}$ of $A$ such that there exists a unique prime $\mathfrak{q}$ of $B$ lying over $\mathfrak{p}$. Then $B_{\mathfrak{q}}=B_{\mathfrak{p}}$, see Algebra, Lemma 10.40 .11 . In other words, the map $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is equal to the map $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{p}}$ you get from localizing $A \rightarrow B$ at $\mathfrak{p}$. Thus (2) and (3) follow from simple properties of localization (some details omitted). For the final statement, suppose that $\mathcal{F}=\widetilde{M}$ for some $B$-module $M$. Then $\mathcal{F}=M_{\mathfrak{q}}$ and $\pi_{*} \mathcal{F}_{y}=M_{\mathfrak{p}}$. By the above these localizations agree. Alternatively you can use part (1) and the definition of stalks to see that $\mathcal{F}_{x}=\pi_{*} \mathcal{F}_{y}$ directly.

### 36.34. Application to the fppf topology

05 WM We can use the above étale localization techniques to prove the following result describing the fppf topology as being equal to the topology "generated by" Zariski coverings and by coverings of the form $\{f: T \rightarrow S\}$ where $f$ is surjective finite locally free.
05WN Lemma 36.34.1. Let $S$ be a scheme. Let $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ be an fppf covering. Then there exist
(1) a Zariski open covering $S=\bigcup U_{j}$,
(2) surjective finite locally free morphisms $W_{j} \rightarrow U_{j}$,
(3) Zariski open coverings $W_{j}=\bigcup_{k} W_{j, k}$,
(4) surjective finite locally free morphisms $T_{j, k} \rightarrow W_{j, k}$
such that the fppf covering $\left\{T_{j, k} \rightarrow S\right\}$ refines the given covering $\left\{S_{i} \rightarrow S\right\}$.
Proof. We may assume that each $S_{i} \rightarrow S$ is locally quasi-finite, see Lemma 36.18.6.
Fix a point $s \in S$. Pick an $i \in I$ and a point $s_{i} \in S_{i}$ mapping to $s$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s\right) \rightarrow(S, s)$ such that there exists an open

$$
S_{i} \times_{S} S^{\prime} \supset V
$$

which contains a unique point $v \in V$ mapping to $s \in S^{\prime}$ and such that $V \rightarrow S^{\prime}$ is finite, see Lemma 36.30.1 Then $V \rightarrow S^{\prime}$ is finite locally free, because it is finite and because $S_{i} \times{ }_{S} S^{\prime} \rightarrow S^{\prime}$ is flat and locally of finite presentation as a base change of the morphism $S_{i} \rightarrow S$, see Morphisms, Lemmas 28.21.4, 28.25.7, and 28.45.2,

Hence $V \rightarrow S^{\prime}$ is open, and after shrinking $S^{\prime}$ we may assume that $V \rightarrow S^{\prime}$ is surjective finite locally free. Since we can do this for every point of $S$ we conclude that $\left\{S_{i} \rightarrow S\right\}$ can be refined by a covering of the form $\left\{V_{a} \rightarrow S\right\}_{a \in A}$ where each $V_{a} \rightarrow S$ factors as $V_{a} \rightarrow S_{a}^{\prime} \rightarrow S$ with $S_{a}^{\prime} \rightarrow S$ étale and $V_{a} \rightarrow S_{a}^{\prime}$ surjective finite locally free.

By Remark 36.29 .3 there exists a Zariski open covering $S=\bigcup U_{j}$, for each $j$ a finite locally free, surjective morphism $W_{j} \rightarrow U_{j}$, and for each $j$ a Zariski open covering $\left\{W_{j, k} \rightarrow W_{j}\right\}$ such that the family $\left\{W_{j, k} \rightarrow S\right\}$ refines the étale covering $\left\{S_{a}^{\prime} \rightarrow S\right\}$, i.e., for each pair $j, k$ there exists an $a(j, k)$ and a factorization $W_{j, K} \rightarrow S_{a}^{\prime} \rightarrow S$ of the morphism $W_{j, K} \rightarrow S$. Set $T_{j, k}=W_{j, k} \times{ }_{S_{a}^{\prime}} V_{a}$ and everything is clear.

### 36.35. Quasi-projective schemes

0B41 The term "quasi-projective scheme" has not yet been defined. A possible definition could be a scheme which has an ample invertible sheaf. However, if $X$ is a scheme over a base scheme $S$, then we say that $X$ is quasi-projective over $S$ if the morphism $X \rightarrow S$ is quasi-projective (Morphisms, Definition 28.40.1). Since the identity morphism of any scheme is quasi-projective, we see that a scheme quasi-projective over $S$ doesn't necessarily have an ample invertible sheaf. For this reason it seems better to leave the term "quasi-projective scheme" undefined.

0B42 Lemma 36.35.1. Let $S$ be a scheme which has an ample invertible sheaf. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $X \rightarrow S$ is quasi-projective,
(2) $X \rightarrow S$ is $H$-quasi-projective,
(3) there exists a quasi-compact open immersion $X \rightarrow X^{\prime}$ of schemes over $S$ with $X^{\prime} \rightarrow S$ projective,
(4) $X \rightarrow S$ is of finite type and $X$ has an ample invertible sheaf, and
(5) $X \rightarrow S$ is of finite type and there exists an $f$-very ample invertible sheaf.

Proof. The implication $(2) \Rightarrow(1)$ is Morphisms, Lemma 28.40.4. The implication $(1) \Rightarrow(2)$ is Morphisms, Lemma 28.42.15. The implication (2) $\Rightarrow$ (3) is Morphisms, Lemma 28.42.12
Assume $X \subset X^{\prime}$ is as in (3). In particular $X \rightarrow S$ is of finite type. By Morphisms, Lemma 28.42 .12 the morphism $X \rightarrow S$ is H-projective. Thus there exists a quasicompact immersion $i: X \rightarrow \mathbf{P}_{S}^{n}$. Hence $\mathcal{L}=i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1)$ is $f$-very ample. As $X \rightarrow S$ is quasi-compact we conclude from Morphisms, Lemma 28.38 .2 that $\mathcal{L}$ is $f$-ample. Thus $X \rightarrow S$ is quasi-projective by definition.

The implication (4) $\Rightarrow(2)$ is Morphisms, Lemma 28.39.3.
Assume the equivalent conditions (1), (2), (3) hold. Choose an immersion $i: X \rightarrow$ $\mathbf{P}_{S}^{n}$ over $S$. Let $\mathcal{L}$ be an ample invertible sheaf on $S$. To finish the proof we will show that $\mathcal{N}=f^{*} \mathcal{L} \otimes_{\mathcal{O}_{X}} i^{*} \mathcal{O}_{\mathbf{P}_{X}^{n}}(1)$ is ample on $X$. By Properties, Lemma 27.26 .14 we reduce to the case $X \xlongequal{X} \mathbf{P}_{S}^{n}$. Let $s \in \Gamma\left(S, \mathcal{L}^{\otimes d}\right)$ be a section such that the corresponding open $S_{s}$ is affine. Say $S_{s}=\operatorname{Spec}(A)$. Recall that $\mathbf{P}_{S}^{n}$ is the projective bundle associated to $\mathcal{O}_{S} T_{0} \oplus \ldots \oplus \mathcal{O}_{S} T_{n}$, see Constructions, Lemma 26.21 .4 and its proof. Let $s_{i} \in \Gamma\left(\mathbf{P}_{S}^{n}, \mathcal{O}(1)\right)$ be the global section corresponding to the section $T_{i}$ of $\mathcal{O}_{S} T_{0} \oplus \ldots \oplus \mathcal{O}_{S} T_{n}$. Then we see that $X_{f^{*} s \otimes s_{i}^{\otimes n}}$ is affine because it is equal to $\operatorname{Spec}\left(A\left[T_{0} / T_{i}, \ldots, T_{n} / T_{i}\right]\right)$. This proves that $\mathcal{N}$ is ample by definition.

The equivalence of (1) and (5) follows from Morphisms, Lemmas 28.38.2 and 28.39 .5

0B43 Lemma 36.35.2. Let $S$ be a scheme which has an ample invertible sheaf. Let $Q P_{S}$ be the full subcategory of the category of schemes over $S$ satisfying the equivalent conditions of Lemma 36.35.1.
(1) if $S^{\prime} \rightarrow S$ is a morphism of schemes and $S^{\prime}$ has an ample invertible sheaf, then base change determines a functor $Q P_{S} \rightarrow Q P_{S^{\prime}}$,
(2) if $X \in Q P_{S}$ and $Y \in Q P_{X}$, then $Y \in Q P_{S}$,
(3) the category $Q P_{S}$ is closed under fibre products,
(4) the category $Q P_{S}$ is closed under finite disjoint unions,
(5) if $X \rightarrow S$ is projective, then $X \in Q P_{S}$,
(6) if $X \rightarrow S$ is quasi-affine of finite type, then $X$ is in $Q P_{S}$,
(7) if $X \rightarrow S$ is quasi-finite and separated, then $X \in Q P_{S}$,
(8) if $X \rightarrow S$ is a quasi-compact immersion, then $X \in Q P_{S}$,
(9) add more here.

Proof. Part (1) follows from Morphisms, Lemma 28.40 .2
Part (2) follows from the fourth characterization of Lemma 36.35.1.
If $X \rightarrow S$ and $Y \rightarrow S$ are quasi-projective, then $X \times_{S} Y \rightarrow Y$ is quasi-projective by Morphisms, Lemma 28.40.2. Hence (3) follows from (2).
If $X=Y \amalg Z$ is a disjoint union of schemes and $\mathcal{L}$ is an invertible $\mathcal{O}_{X}$-module such that $\left.\mathcal{L}\right|_{Y}$ and $\left.\mathcal{L}\right|_{Z}$ are ample, then $\mathcal{L}$ is ample (details omitted). Thus part (4) follows from the fourth characterization of Lemma 36.35.1.

Part (5) follows from Morphisms, Lemma 28.42.11
Part (6) follows from Morphisms, Lemma 28.40.6.
Part (7) follows from part (6) and Lemma 36.31.2.
Part (8) follows from part (7) and Morphisms, Lemma 28.20.15

### 36.36. Projective schemes

0B44 This section is the analogue of Section 36.35 for projective morphisms.
0B45 Lemma 36.36.1. Let $S$ be a scheme which has an ample invertible sheaf. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $X \rightarrow S$ is projective,
(2) $X \rightarrow S$ is H-projective,
(3) $X \rightarrow S$ is quasi-projective and proper,
(4) $X \rightarrow S$ is $H$-quasi-projective and proper,
(5) $X \rightarrow S$ is proper and $X$ has an ample invertible sheaf,
(6) $X \rightarrow S$ is proper and there exists an $f$-ample invertible sheaf,
(7) $X \rightarrow S$ is proper and there exists an $f$-very ample invertible sheaf,
(8) there is a quasi-coherent graded $\mathcal{O}_{S}$-algebra $\mathcal{A}$ generated by $\mathcal{A}_{1}$ over $\mathcal{A}_{0}$ with $\mathcal{A}_{1}$ a finite type $\mathcal{O}_{S}$-module such that $X=\operatorname{Proj}_{S}(\mathcal{A})$.

Proof. Observe first that in each case the morphism $f$ is proper, see Morphisms, Lemmas 28.42 .3 and 28.42 .5 Hence it suffices to prove the equivalence of the notions in case $f$ is a proper morphism. We will use this without further mention in the following.

The equivalences $(1) \Leftrightarrow(3)$ and $(2) \Leftrightarrow(4)$ are Morphisms, Lemma 28.42.14.
The implication $(2) \Rightarrow(1)$ is Morphisms, Lemma 28.42.3.
The implications $(1) \Rightarrow(2)$ and $(3) \Rightarrow(4)$ are Morphisms, Lemma 28.42.15.
The implication $(1) \Rightarrow(7)$ is immediate from Morphisms, Definitions 28.42 .1 and 28.38.1.

The conditions (3) and (6) are equivalent by Morphisms, Definition 28.40.1.
Thus (1) - (4), (6) are equivalent and imply (7). By Lemma 36.35.1 conditions (3), (5), and (7) are equivalent. Thus we see that (1) - (7) are equivalent.

By Divisors, Lemma 30.24.5 we see that (8) implies (1). Conversely, if (2) holds, then we can choose a closed immersion

$$
i: X \longrightarrow \mathbf{P}_{S}^{n}=\underline{\operatorname{Proj}}_{S}\left(\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]\right)
$$

See Constructions, Lemma 26.21.4 for the equality. By Divisors, Lemma 30.25.1 we see that $X$ is the relative Proj of a quasi-coherent graded quotient algebra $\mathcal{A}$ of $\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]$. Then $\mathcal{A}$ satisfies the conditions of (8).
0B46 Lemma 36.36.2. Let $S$ be a scheme which has an ample invertible sheaf. Let $P_{S}$ be the full subcategory of the category of schemes over $S$ satisfying the equivalent conditions of Lemma 36.36.1.
(1) if $S^{\prime} \rightarrow S$ is a morphism of schemes and $S^{\prime}$ has an ample invertible sheaf, then base change determines a functor $P_{S} \rightarrow P_{S^{\prime}}$,
(2) if $X \in P_{S}$ and $Y \in P_{X}$, then $Y \in P_{S}$,
(3) the category $P_{S}$ is closed under fibre products,
(4) the category $P_{S}$ is closed under finite disjoint unions,
(5) if $X \rightarrow S$ is finite, then $X$ is in $P_{S}$,
(6) add more here.

Proof. Part (1) follows from Morphisms, Lemma 28.42.10.
Part (2) follows from the fifth characterization of Lemma 36.36.1 and the fact that compositions of proper morphisms are proper (Morphisms, Lemma 28.41.4).
If $X \rightarrow S$ and $Y \rightarrow S$ are projective, then $X \times_{S} Y \rightarrow Y$ is projective by Morphisms, Lemma 28.42.10. Hence (3) follows from (2).

If $X=Y \amalg Z$ is a disjoint union of schemes and $\mathcal{L}$ is an invertible $\mathcal{O}_{X}$-module such that $\left.\mathcal{L}\right|_{Y}$ and $\left.\mathcal{L}\right|_{Z}$ are ample, then $\mathcal{L}$ is ample (details omitted). Thus part (4) follows from the fifth characterization of Lemma 36.36.1.
Part (5) follows from Morphisms, Lemma 28.43.14.

### 36.37. Closed points in fibres

053 Q Some of the material in this section is taken from the preprint OP10.
053R Lemma 36.37.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $Z \subset X$ be $a$ closed subscheme. Let $s \in S$. Assume
(1) $S$ is irreducible with generic point $\eta$,
(2) $X$ is irreducible,
(3) $f$ is dominant,
(4) $f$ is locally of finite type,
(5) $\operatorname{dim}\left(X_{s}\right) \leq \operatorname{dim}\left(X_{\eta}\right)$,
(6) $Z$ is locally principal in $X$, and
(7) $Z_{\eta}=\emptyset$.

Then the fibre $Z_{s}$ is (set theoretically) a union of irreducible components of $X_{s}$.
Proof. Let $X_{\text {red }}$ denote the reduction of $X$. Then $Z \cap X_{\text {red }}$ is a locally principal closed subscheme of $X_{\text {red }}$, see Divisors, Lemma 30.11.10. Hence we may assume that $X$ is reduced. In other words $X$ is integral, see Properties, Lemma 27.3.4. In this case the morphism $X \rightarrow S$ factors through $S_{r e d}$, see Schemes, Lemma 25.12.6. Thus we may replace $S$ by $S_{r e d}$ and assume that $S$ is integral too.
The assertion that $f$ is dominant signifies that the generic point of $X$ is mapped to $\eta$, see Morphisms, Lemma 28.8.5. Moreover, the scheme $X_{\eta}$ is an integral scheme which is locally of finite type over the field $\kappa(\eta)$. Hence $d=\operatorname{dim}\left(X_{\eta}\right) \geq 0$ is equal to $\operatorname{dim}_{\xi}\left(X_{\eta}\right)$ for every point $\xi$ of $X_{\eta}$, see Algebra, Lemmas 10.113 .4 and 10.113.5. In view of Morphisms, Lemma 28.28.4 and condition (5) we conclude that $\operatorname{dim}_{x}\left(X_{s}\right)=d$ for every $x \in X_{s}$.
In the Noetherian case the assertion can be proved as follows. If the lemma does not holds there exists $x \in Z_{s}$ which is a generic point of an irreducible component of $Z_{s}$ but not a generic point of any irreducible component of $X_{s}$. Then we see that $\operatorname{dim}_{x}\left(Z_{s}\right) \leq d-1$, because $\operatorname{dim}_{x}\left(X_{s}\right)=d$ and in a neighbourhood of $x$ in $X_{s}$ the closed subscheme $Z_{s}$ does not contain any of the irreducible components of $X_{s}$. Hence after replacing $X$ by an open neighbourhood of $x$ we may assume that $\operatorname{dim}_{z}\left(Z_{f(z)}\right) \leq d-1$ for all $z \in Z$, see Morphisms, Lemma 28.28.4. Let $\xi^{\prime} \in Z$ be a generic point of an irreducible component of $Z$ and set $s^{\prime}=f(\xi)$. As $Z \neq X$ is locally principal we see that $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)=1$, see Algebra, Lemma 10.59 .10 (this is where we use $X$ is Noetherian). Let $\xi \in X$ be the generic point of $X$ and let $\xi_{1}$ be a generic point of any irreducible component of $X_{s^{\prime}}$ which contains $\xi^{\prime}$. Then we see that we have the specializations

$$
\xi \rightsquigarrow \xi_{1} \rightsquigarrow \xi^{\prime} .
$$

As $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)=1$ one of the two specializations has to be an equality. By assumption $s^{\prime} \neq \eta$, hence the first specialization is not an equality. Hence $\xi^{\prime}=\xi_{1}$ is a generic point of an irreducible component of $X_{s^{\prime}}$. Applying Morphisms, Lemma 28.28 .4 one more time this implies $\operatorname{dim}_{\xi^{\prime}}\left(Z_{s^{\prime}}\right)=\operatorname{dim}_{\xi^{\prime}}\left(X_{s^{\prime}}\right) \geq \operatorname{dim}\left(X_{\eta}\right)=d$ which gives the desired contradiction.
In the general case we reduce to the Noetherian case as follows. If the lemma is false then there exists a point $x \in X$ lying over $s$ such that $x$ is a generic point of an irreducible component of $Z_{s}$, but not a generic point of any of the irreducible components of $X_{s}$. Let $U \subset S$ be an affine neighbourhood of $s$ and let $V \subset X$ be an affine neighbourhood of $x$ with $f(V) \subset U$. Write $U=\operatorname{Spec}(A)$ and $V=\operatorname{Spec}(B)$ so that $\left.f\right|_{V}$ is given by a ring map $A \rightarrow B$. Let $\mathfrak{q} \subset B$, resp. $\mathfrak{p} \subset A$ be the prime corresponding to $x$, resp. $s$. After possibly shrinking $V$ we may assume $Z \cap V$ is cut out by some element $g \in B$. Denote $K=f . f .(A)$. What we know at this point is the following:
(1) $A \subset B$ is a finitely generated extension of domains,
(2) the element $g \otimes 1$ is invertible in $B \otimes_{A} K$,
(3) $d=\operatorname{dim}\left(B \otimes_{A} K\right)=\operatorname{dim}\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$,
(4) $g \otimes 1$ is not a unit of $B \otimes_{A} \kappa(\mathfrak{p})$, and
(5) $g \otimes 1$ is not in any of the minimal primes of $B \otimes_{A} \kappa(\mathfrak{p})$.

We are seeking a contradiction.
Pick elements $x_{1}, \ldots, x_{n} \in B$ which generate $B$ over $A$. For a finitely generated Z-algebra $A_{0} \subset A$ let $B_{0} \subset B$ be the $A_{0}$-subalgebra generated by $x_{1}, \ldots, x_{n}$, denote $K_{0}=f . f .\left(A_{0}\right)$, and set $\mathfrak{p}_{0}=A_{0} \cap \mathfrak{p}$. We claim that when $A_{0}$ is large enough then $(1)-(5)$ also hold for the system $\left(A_{0} \subset B_{0}, g, \mathfrak{p}_{0}\right)$.
We prove each of the conditions in turn. Part (1) holds by construction. For part (2) write $(g \otimes 1) h=1$ for some $h \otimes 1 / a \in B \otimes_{A} K$. Write $g=\sum a_{I} x^{I}, h=\sum a_{I}^{\prime} x^{I}$ (multi-index notation) for some coefficients $a_{I}, a_{I}^{\prime} \in A$. As soon as $A_{0}$ contains $a$ and the $a_{I}, a_{I}^{\prime}$ then (2) holds because $B_{0} \otimes_{A_{0}} K_{0} \subset B \otimes_{A} K$ (as localizations of the injective map $\left.B_{0} \rightarrow B\right)$. To achieve (3) consider the exact sequence

$$
0 \rightarrow I \rightarrow A\left[X_{1}, \ldots, X_{n}\right] \rightarrow B \rightarrow 0
$$

which defines $I$ where the second map sends $X_{i}$ to $x_{i}$. Since $\otimes$ is right exact we see that $I \otimes_{A} K$, respectively $I \otimes_{A} \kappa(\mathfrak{p})$ is the kernel of the surjection $K\left[X_{1}, \ldots, X_{n}\right] \rightarrow$ $B \otimes_{A} K$, respectively $\kappa(\mathfrak{p})\left[X_{1}, \ldots, X_{n}\right] \rightarrow B \otimes_{A} \kappa(\mathfrak{p})$. As a polynomial ring over a field is Noetherian there exist finitely many elements $h_{j} \in I, j=1, \ldots, m$ which generate $I \otimes_{A} K$ and $I \otimes_{A} \kappa(\mathfrak{p})$. Write $h_{j}=\sum a_{j, I} X^{I}$. As soon as $A_{0}$ contains all $a_{j, I}$ we get to the situation where

$$
B_{0} \otimes_{A_{0}} K_{0} \otimes_{K_{0}} K=B \otimes_{A} K \quad \text { and } \quad B_{0} \otimes_{A_{0}} \kappa\left(\mathfrak{p}_{0}\right) \otimes_{\kappa\left(\mathfrak{p}_{0}\right)} \kappa(\mathfrak{p})=B \otimes_{A} \kappa(\mathfrak{p})
$$

By either Morphisms, Lemma 28.28 .3 or Algebra, Lemma 10.115 .5 we see that the dimension equalities of (3) are satisfied. Part (4) is immediate. As $B_{0} \otimes_{A_{0}} \kappa\left(\mathfrak{p}_{0}\right) \subset$ $B \otimes_{A} \kappa(\mathfrak{p})$ each minimal prime of $B_{0} \otimes_{A_{0}} \kappa\left(\mathfrak{p}_{0}\right)$ lies under a minimal prime of $B \otimes_{A} \kappa(\mathfrak{p})$ by Algebra, Lemma 10.29.6. This implies that (5) holds. In this way we reduce the problem to the Noetherian case which we have dealt with above.
Here is an algebraic application of the lemma above. The fourth assumption of the lemma holds if $A \rightarrow B$ is flat, see Lemma 36.37.3.
053 L Lemma 36.37.2. Let $A \rightarrow B$ be a local homomorphism of local rings, and $g \in \mathfrak{m}_{B}$. Assume
(1) $A$ and $B$ are domains and $A \subset B$,
(2) $B$ is essentially of finite type over $A$,
(3) $g$ is not contained in any minimal prime over $\mathfrak{m}_{A} B$, and
(4) $\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)+\operatorname{trdeg}_{\kappa\left(\mathfrak{m}_{A}\right)}\left(\kappa\left(\mathfrak{m}_{B}\right)\right)=\operatorname{trdeg}_{A}(B)$.

Then $A \subset B / g B$, i.e., the generic point of $\operatorname{Spec}(A)$ is in the image of the morphism $\operatorname{Spec}(B / g B) \rightarrow \operatorname{Spec}(A)$.
Proof. Note that the two assertions are equivalent by Algebra, Lemma 10.29.6. To start the proof let $C$ be an $A$-algebra of finite type and $\mathfrak{q}$ a prime of $C$ such that $B=$ $C_{\mathfrak{q}}$. Of course we may assume that $C$ is a domain and that $g \in C$. After replacing $C$ by a localization we see that $\operatorname{dim}\left(C / \mathfrak{m}_{A} C\right)=\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)+\operatorname{trdeg}_{\kappa\left(\mathfrak{m}_{A}\right)}\left(\kappa\left(\mathfrak{m}_{B}\right)\right)$, see Morphisms, Lemma 28.28.1. Setting $K=f . f .(A)$ we see by the same reference that $\operatorname{dim}\left(C \otimes_{A} K\right)=\operatorname{trdeg}_{A}(B)$. Hence assumption (4) means that the generic and closed fibres of the morphism $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)$ have the same dimension.
Suppose that the lemma is false. Then $(B / g B) \otimes_{A} K=0$. This means that $g \otimes 1$ is invertible in $B \otimes_{A} K=C_{\mathfrak{q}} \otimes_{A} K$. As $C_{\mathfrak{q}}$ is a limit of principal localizations we conclude that $g \otimes 1$ is invertible in $C_{h} \otimes_{A} K$ for some $h \in C, h \notin \mathfrak{q}$. Thus
after replacing $C$ by $C_{h}$ we may assume that $(C / g C) \otimes_{A} K=0$. We do one more replacement of $C$ to make sure that the minimal primes of $C / \mathfrak{m}_{A} C$ correspond one-to-one with the minimal primes of $B / \mathfrak{m}_{A} B$. At this point we apply Lemma 36.37 .1 to $X=\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(A)=S$ and the locally closed subscheme $Z=$ $\operatorname{Spec}(C / g C)$. Since $Z_{K}=\emptyset$ we see that $Z \otimes \kappa\left(\mathfrak{m}_{A}\right)$ has to contain an irreducible component of $X \otimes \kappa\left(\mathfrak{m}_{A}\right)=\operatorname{Spec}\left(C / \mathfrak{m}_{A} C\right)$. But this contradicts the assumption that $g$ is not contained in any prime minimal over $\mathfrak{m}_{A} B$. The lemma follows.

Lemma 36.37.3. Let $A \rightarrow B$ be a local homomorphism of local rings. Assume
(1) $A$ and $B$ are domains and $A \subset B$,
(2) $B$ is essentially of finite type over $A$, and
(3) $B$ is flat over $A$.

Then we have

$$
\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)+\operatorname{trdeg}_{\kappa\left(\mathfrak{m}_{A}\right)}\left(\kappa\left(\mathfrak{m}_{B}\right)\right)=\operatorname{trdeg}_{A}(B) .
$$

Proof. Let $C$ be an $A$-algebra of finite type and $\mathfrak{q}$ a prime of $C$ such that $B=$ $C_{\mathfrak{q}}$. We may assume $C$ is a domain. We have $\operatorname{dim}_{\mathfrak{q}}\left(C / \mathfrak{m}_{A} C\right)=\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)+$ $\operatorname{trdeg}_{\kappa\left(\mathfrak{m}_{A}\right)}\left(\kappa\left(\mathfrak{m}_{B}\right)\right)$, see Morphisms, Lemma 28.28.1. Setting $K=f . f .(A)$ we see by the same reference that $\operatorname{dim}\left(C \otimes_{A} K\right)=\operatorname{trdeg}_{A}(B)$. Thus we are really trying to prove that $\operatorname{dim}_{\mathfrak{q}}\left(C / \mathfrak{m}_{A} C\right)=\operatorname{dim}\left(C \otimes_{A} K\right)$. Choose a valuation ring $A^{\prime}$ in $K$ dominating $A$, see Algebra, Lemma 10.49 .2 . Set $C^{\prime}=C \otimes_{A} A^{\prime}$. Choose a prime $\mathfrak{q}^{\prime}$ of $C^{\prime}$ lying over $\mathfrak{q}$; such a prime exists because

$$
C^{\prime} / \mathfrak{m}_{A^{\prime}} C^{\prime}=C / \mathfrak{m}_{A} C \otimes_{\kappa\left(\mathfrak{m}_{A}\right)} \kappa\left(\mathfrak{m}_{A^{\prime}}\right)
$$

which proves that $C / \mathfrak{m}_{A} C \rightarrow C^{\prime} / \mathfrak{m}_{A^{\prime}} C^{\prime}$ is faithfully flat. This also proves that $\operatorname{dim}_{\mathfrak{q}}\left(C / \mathfrak{m}_{A} C\right)=\operatorname{dim}_{\mathfrak{q}^{\prime}}\left(C^{\prime} / \mathfrak{m}_{A^{\prime}} C^{\prime}\right)$, see Algebra, Lemma 10.115.6. Note that $B^{\prime}=$ $C_{\mathfrak{q}^{\prime}}^{\prime}$ is a localization of $B \otimes_{A} A^{\prime}$. Hence $B^{\prime}$ is flat over $A^{\prime}$. The generic fibre $B^{\prime} \otimes_{A^{\prime}} K$ is a localization of $B \otimes_{A} K$. Hence $B^{\prime}$ is a domain. If we prove the lemma for $A^{\prime} \subset B^{\prime}$, then we get the equality $\operatorname{dim}_{\mathfrak{q}^{\prime}}\left(C^{\prime} / \mathfrak{m}_{A^{\prime}} C^{\prime}\right)=\operatorname{dim}\left(C^{\prime} \otimes_{A^{\prime}} K\right)$ which implies the desired equality $\operatorname{dim}_{\mathfrak{q}}\left(C / \mathfrak{m}_{A} C\right)=\operatorname{dim}\left(C \otimes_{A} K\right)$ by what was said above. This reduces the lemma to the case where $A$ is a valuation ring.

Let $A \subset B$ be as in the lemma with $A$ a valuation ring. As before write $B=C_{q}$ for some domain $C$ of finite type over $A$. By Algebra, Lemma 10.124 .9 we obtain $\operatorname{dim}\left(C / \mathfrak{m}_{A} C\right)=\operatorname{dim}\left(C \otimes_{A} K\right)$ and we win.

053U Lemma 36.37.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \rightsquigarrow x^{\prime}$ be $a$ specialization of points in $X$. Set $s=f(x)$ and $s^{\prime}=f\left(x^{\prime}\right)$. Assume
(1) $x^{\prime}$ is a closed point of $X_{s^{\prime}}$, and
(2) $f$ is locally of finite type.

Then the set

$$
\left\{x_{1} \in X \text { such that } f\left(x_{1}\right)=s \text { and } x_{1} \text { is closed in } X_{s} \text { and } x \rightsquigarrow x_{1} \rightsquigarrow x^{\prime}\right\}
$$

is dense in the closure of $x$ in $X_{s}$.
Proof. We apply Schemes, Lemma 25.20 .4 to the specialization $x \rightsquigarrow x^{\prime}$. This produces a morphism $\varphi: \operatorname{Spec}(B) \rightarrow X$ where $B$ is a valuation ring such that $\varphi$ maps the generic point to $x$ and the closed point to $x^{\prime}$. We may also assume that $\kappa(x)=f$.f. $(B)$. Let $A=B \cap \kappa(s)$. Note that this is a valuation ring (see

Algebra, Lemma 10.49.6 which dominates the image of $\mathcal{O}_{S, s^{\prime}} \rightarrow \kappa(s)$. Consider the commutative diagram

The generic (resp. closed) point of $B$ maps to a point $x_{A}$ (resp. $x_{A}^{\prime}$ ) of $X_{A}$ lying over the generic (resp. closed) point of $\operatorname{Spec}(A)$. Note that $x_{A}^{\prime}$ is a closed point of the special fibre of $X_{A}$ by Morphisms, Lemma 28.20.4. Note that the generic fibre of $X_{A} \rightarrow \operatorname{Spec}(A)$ is isomorphic to $X_{s}$. Thus we have reduced the lemma to the case where $S$ is the spectrum of a valuation ring, $s=\eta \in S$ is the generic point, and $s^{\prime} \in S$ is the closed point.

We will prove the lemma by induction on $\operatorname{dim}_{x}\left(X_{\eta}\right)$. If $\operatorname{dim}_{x}\left(X_{\eta}\right)=0$, then there are no other points of $X_{\eta}$ specializing to $x$ and $x$ is closed in its fibre, see Morphisms, Lemma 28.20.6, and the result holds. Assume $\operatorname{dim}_{x}\left(X_{\eta}\right)>0$.

Let $X^{\prime} \subset X$ be the reduced induced scheme structure on the irreducible closed subscheme $\overline{\{x\}}$ of $X$, see Schemes, Definition 25.12 .5 . To prove the lemma we may replace $X$ by $X^{\prime}$ as this only decreases $\operatorname{dim}_{x}\left(X_{\eta}\right)$. Hence we may also assume that $X$ is an integral scheme and that $x$ is its generic point. In addition, we may replace $X$ by an affine neighbourhood of $x^{\prime}$. Thus we have $X=\operatorname{Spec}(B)$ where $A \subset B$ is a finite type extension of domains. Note that in this case $\operatorname{dim}_{x}\left(X_{\eta}\right)=\operatorname{dim}\left(X_{\eta}\right)=$ $\operatorname{dim}\left(X_{s^{\prime}}\right)$, and that in fact $X_{s^{\prime}}$ is equidimensional, see Algebra, Lemma 10.124.9.

Let $W \subset X_{\eta}$ be a proper closed subset (this is the subset we want to "avoid"). As $X_{s}$ is of finite type over a field we see that $W$ has finitely many irreducible components $W=W_{1} \cup \ldots \cup W_{n}$. Let $\mathfrak{q}_{j} \subset B, j=1, \ldots, r$ be the corresponding prime ideals. Let $\mathfrak{q} \subset B$ be the maximal ideal corresponding to the point $x^{\prime}$. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{s} \subset B$ be the minimal primes lying over $\mathfrak{m}_{A} B$. There are finitely many as these correspond to the irreducible components of the Noetherian scheme $X_{s^{\prime}}$. Moreover, each of these irreducible components has dimension $>0$ (see above) hence we see that $\mathfrak{p}_{i} \neq \mathfrak{q}$ for all $i$. Now, pick an element $g \in \mathfrak{q}$ such that $g \notin \mathfrak{q}_{j}$ for all $j$ and $g \notin \mathfrak{p}_{i}$ for all $i$, see Algebra, Lemma 10.14.2. Denote $Z \subset X$ the locally principal closed subscheme defined by $h$. Let $Z_{\eta}=Z_{1, \eta} \cup \ldots \cup Z_{n, \eta}, n \geq 0$ be the decomposition of the generic fibre of $Z$ into irreducible components (finitely many as the generic fibre is Noetherian). Denote $Z_{i} \subset X$ the closure of $Z_{i, \eta}$. After replacing $X$ by a smaller affine neighbourhood we may assume that $x \in Z_{i}$ for each $i=1, \ldots, n$. By construction $Z \cap X_{s^{\prime}}$ does not contain any irreducible component of $X_{s^{\prime}}$. Hence by Lemma 36.37 .1 we conclude that $Z_{\eta} \neq \emptyset$ ! In other words $n \geq 1$. Letting $x_{1} \in Z_{1}$ be the generic point we see that $x_{1} \rightsquigarrow x^{\prime}$ and $f\left(x_{1}\right)=\eta$. Also, by construction $Z_{1, \eta} \cap W_{j} \subset W_{j}$ is a proper closed subset. Hence every irreducible component of $Z_{1, \eta} \cap W_{j}$ has codimension $\geq 2$ in $X_{\eta}$ whereas $\operatorname{codim}\left(Z_{1, \eta}, X_{\eta}\right)=1$ by Algebra, Lemma 10.59 .10 Thus $W \cap Z_{1, \eta}$ is a proper closed subset. At this point we see that the induction hypothesis applies to $Z_{1} \rightarrow S$ and the specialization $x_{1} \rightsquigarrow x^{\prime}$. This produces a closed point $x_{2}$ of $Z_{1, \eta}$ not contained in $W$ which specializes to $x^{\prime}$. Thus we obtain $x \rightsquigarrow x_{2} \rightsquigarrow x^{\prime}$, the point $x_{2}$ is closed in $X_{\eta}$, and $x_{2} \notin W$ as desired.

053V Remark 36.37.5. The proof of Lemma 36.37 .4 actually shows that there exists a sequence of specializations

$$
x \rightsquigarrow x_{1} \rightsquigarrow x_{2} \rightsquigarrow \ldots \rightsquigarrow x_{d} \rightsquigarrow x^{\prime}
$$

where all $x_{i}$ are in the fibre $X_{s}$, each specialization is immediate, and $x_{d}$ is a closed point of $X_{s}$. The integer $d=\operatorname{trdeg}_{\kappa(s)}(\kappa(x))=\operatorname{dim}(\overline{\{x\}})$ where the closure is taken in $X_{s}$. Moreover, the points $x_{i}$ can be chosen to avoid any closed subset of $X_{s}$ which does not contain the point $x$.

Examples, Section 88.31 shows that the following lemma is false if $A$ is not assumed Noetherian.

05GT Lemma 36.37.6. Let $\varphi: A \rightarrow B$ be a local ring map of local rings. Let $V \subset$ $\operatorname{Spec}(B)$ be an open subscheme which contains at least one prime not lying over $\mathfrak{m}_{A}$. Assume $A$ is Noetherian, $\varphi$ essentially of finite type, and $A / \mathfrak{m}_{A} \subset B / \mathfrak{m}_{B}$ is finite. Then there exists $a \mathfrak{q} \in V, \mathfrak{m}_{A} \neq \mathfrak{q} \cap A$ such that $A \rightarrow B / \mathfrak{q}$ is the localization of a quasi-finite ring map.
Proof. Since $A$ is Noetherian and $A \rightarrow B$ is essentially of finite type, we know that $B$ is Noetherian too. By Properties, Lemma 27.6 .4 the topological space $\operatorname{Spec}(B) \backslash\left\{\mathfrak{m}_{B}\right\}$ is Jacobson. Hence we can choose a closed point $\mathfrak{q}$ which is contained in the nonempty open

$$
V \backslash\left\{\mathfrak{q} \subset B \mid \mathfrak{m}_{A}=\mathfrak{q} \cap A\right\}
$$

(Nonempty by assumption, open because $\left\{\mathfrak{m}_{A}\right\}$ is a closed subset of $\operatorname{Spec}(A)$.) Then $\operatorname{Spec}(B / \mathfrak{q})$ has two points, namely $\mathfrak{m}_{B}$ and $\mathfrak{q}$ and $\mathfrak{q}$ does not lie over $\mathfrak{m}_{A}$. Write $B / \mathfrak{q}=C_{\mathfrak{m}}$ for some finite type $A$-algebra $C$ and prime ideal $\mathfrak{m}$. Then $A \rightarrow C$ is quasi-finite at $\mathfrak{m}$ by Algebra, Lemma 10.121 .2 (2). Hence by Algebra, Lemma 10.122 .14 we see that after replacing $C$ by a principal localization the ring map $A \rightarrow C$ is quasi-finite.

05GU Lemma 36.37.7. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ with image $s \in S$. Let $U \subset X$ be an open subscheme. Assume $f$ locally of finite type, $S$ locally Noetherian, $x$ a closed point of $X_{s}$, and assume there exists a point $x^{\prime} \in U$ with $x^{\prime} \rightsquigarrow x$ and $f\left(x^{\prime}\right) \neq s$. Then there exists a closed subscheme $Z \subset X$ such that (a) $x \in Z$, (b) $\left.f\right|_{Z}: Z \rightarrow S$ is quasi-finite at $x$, and (c) there exists a $z \in Z, z \in U$, $z \rightsquigarrow x$ and $f(z) \neq s$.

Proof. This is a reformulation of Lemma 36.37.6. Namely, set $A=\mathcal{O}_{S, s}$ and $B=\mathcal{O}_{X, x}$. Denote $V \subset \operatorname{Spec}(B)$ the inverse image of $U$. The ring map $f^{\sharp}: A \rightarrow B$ is essentially of finite type. By assumption there exists at least one point of $V$ which does not map to the closed point of $\operatorname{Spec}(A)$. Hence all the assumptions of Lemma 36.37 .6 hold and we obtain a prime $\mathfrak{q} \subset B$ which does not lie over $\mathfrak{m}_{A}$ and such that $A \rightarrow B / \mathfrak{q}$ is the localization of a quasi-finite ring map. Let $z \in X$ be the image of the point $\mathfrak{q}$ under the canonical morphism $\operatorname{Spec}(B) \rightarrow X$. Set $Z=\overline{\{z\}}$ with the induced reduced scheme structure. As $z \rightsquigarrow x$ we see that $x \in Z$ and $\mathcal{O}_{Z, x}=B / \mathfrak{q}$. By construction $Z \rightarrow S$ is quasi-finite at $x$.
05GV Remark 36.37.8. We can use Lemma 36.37 .6 or its variant Lemma 36.37 .7 to give an alternative proof of Lemma 36.37 .4 in case $S$ is locally Noetherian. Here is a rough sketch. Namely, first replace $S$ by the spectrum of the local ring at $s^{\prime}$. Then we may use induction on $\operatorname{dim}(S)$. The case $\operatorname{dim}(S)=0$ is trivial because
then $s^{\prime}=s$. Replace $X$ by the reduced induced scheme structure on $\overline{\{x\}}$. Apply Lemma 36.37.7 to $X \rightarrow S$ and $x^{\prime} \mapsto s^{\prime}$ and any nonempty open $U \subset X$ containing $x$. This gives us a closed subscheme $x^{\prime} \in Z \subset X$ a point $z \in Z$ such that $Z \rightarrow S$ is quasi-finite at $x^{\prime}$ and such that $f(z) \neq s^{\prime}$. Then $z$ is a closed point of $X_{f(z)}$, and $z \rightsquigarrow x^{\prime}$. As $f(z) \neq s^{\prime}$ we see $\operatorname{dim}\left(\mathcal{O}_{S, f(z)}\right)<\operatorname{dim}(S)$. Since $x$ is the generic point of $X$ we see $x \rightsquigarrow z$, hence $s=f(x) \rightsquigarrow f(z)$. Apply the induction hypothesis to $s \rightsquigarrow f(z)$ and $z \mapsto f(z)$ to win.
05GW Lemma 36.37.9. Suppose that $f: X \rightarrow S$ is locally of finite type, $S$ locally Noetherian, $x \in X$ a closed point of its fibre $X_{s}$, and $U \subset X$ an open subscheme such that $U \cap X_{s}=\emptyset$ and $x \in \bar{U}$, then the conclusions of Lemma 36.37.7 hold.

Proof. Namely, we can reduce this to the cited lemma as follows: First we replace $X$ and $S$ by affine neighbourhoods of $x$ and $s$. Then $X$ is Noetherian, in particular $U$ is quasi-compact (see Morphisms, Lemma 28.15.6 and Topology, Lemmas 5.8.2 and 5.11.13). Hence there exists a specialization $x^{\prime} \rightsquigarrow x$ with $x^{\prime} \in U$ (see Morphisms, Lemma 28.6.5). Note that $f\left(x^{\prime}\right) \neq s$. Thus we see all hypotheses of the lemma are satisfied and we win.

### 36.38. Stein factorization

03 GX Stein factorization is the statement that a proper morphism $f: X \rightarrow S$ with $f_{*} \mathcal{O}_{X}=\mathcal{O}_{S}$ has connected fibres.
03GY Lemma 36.38.1. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a universally closed and quasi-separated morphism. There exists a factorization

with the following properties:
(1) the morphism $f^{\prime}$ is universally closed, quasi-compact, quasi-separated and surjective,
(2) the morphism $\pi: S^{\prime} \rightarrow S$ is integral,
(3) we have $f_{*}^{\prime} \mathcal{O}_{X}=\mathcal{O}_{S^{\prime}}$,
(4) we have $S^{\prime}=\underline{\operatorname{Spec}}_{S}\left(f_{*} \mathcal{O}_{X}\right)$, and
(5) $S^{\prime}$ is the normalization of $S$ in $X$, see Morphisms, Definition 28.48.3.

Proof. By Morphisms, Lemma 28.41 .10 the morphism $f$ is quasi-compact. Hence the normalization $S^{\prime}$ of $S$ in $X$ is defined (Morphisms, Definition 28.48.3) we obtain the factorization and (5) and (2) hold by construction. By Morphisms, Lemma 28.48 .10 we see that (4) holds. The morphism $f^{\prime}$ is universally closed by Morphisms, Lemma 28.41.7. It is quasi-compact by Schemes, Lemma 25.21 .15 and quasi-separated by Schemes, Lemma 25.21.14.
To show the remaining statements we may assume the base scheme $S$ is affine, say $S=\operatorname{Spec}(R)$. Then $S^{\prime}=\operatorname{Spec}(A)$ with $A=\Gamma\left(X, \mathcal{O}_{X}\right)$ an integral $R$-algebra. Thus it is clear that $f_{*}^{\prime} \mathcal{O}_{X}$ is $\mathcal{O}_{S^{\prime}}$ (because $f_{*}^{\prime} \mathcal{O}_{X}$ is quasi-coherent, by Schemes, Lemma 25.24.1. and hence equal to $\widetilde{A}$ ). This proves (3).

Let us show that $f^{\prime}$ is surjective. As $f^{\prime}$ is universally closed (see above) the image of $f^{\prime}$ is a closed subset $V(I) \subset S^{\prime}=\operatorname{Spec}(A)$. Pick $h \in I$. Then $\left.h\right|_{X}=f^{\sharp}(h)$ is a
global section of the structure sheaf of $X$ which vanishes at every point. As $X$ is quasi-compact this means that $\left.h\right|_{X}$ is a nilpotent section, i.e., $h^{n} \mid X=0$ for some $n>0$. But $A=\Gamma\left(X, \mathcal{O}_{X}\right)$, hence $h^{n}=0$. In other words $I$ is contained in the radical ideal of $A$ and we conclude that $V(I)=S^{\prime}$ as desired.

03GZ Lemma 36.38.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Then $X_{s}$ is geometrically connected, if and only if for every étale neighbourhood $(U, u) \rightarrow$ $(S, s)$ the base change $X_{U} \rightarrow U$ has connected fibre $X_{u}$.

Proof. If $X_{s}$ is geometrically connected, then any base change of it is connected. On the other hand, suppose that $X_{s}$ is not geometrically connected. Then by Varieties, Lemma 32.5.11 we see that $X_{s} \times{ }_{\operatorname{Spec}(\kappa(s)} \operatorname{Spec}(k)$ is disconnected for some finite separable field extension $\kappa(s) \subset k$. By Lemma 36.27 .2 there exists an affine étale neighbourhood $(U, u) \rightarrow(S, s)$ such that $\kappa(s) \subset \kappa(u)$ is identified with $\kappa(s) \subset k$. In this case $X_{u}$ is disconnected.

03H0 Theorem 36.38.3 (Stein factorization; Noetherian case). Let $S$ be a locally Noetherian scheme. Let $f: X \rightarrow S$ be a proper morphism. There exists a factorization

with the following properties:
(1) the morphism $f^{\prime}$ is proper with geometrically connected fibres,
(2) the morphism $\pi: S^{\prime} \rightarrow S$ is finite,
(3) we have $f_{*}^{\prime} \mathcal{O}_{X}=\mathcal{O}_{S^{\prime}}$,
(4) we have $S^{\prime}=\underline{\operatorname{Spec}}_{S}\left(f_{*} \mathcal{O}_{X}\right)$, and
(5) $S^{\prime}$ is the normalization of $S$ in $X$, see Morphisms, Definition 28.48.3.

Proof. Let $f=\pi \circ f^{\prime}$ be the factorization of Lemma 36.38.1. Note that besides the conclusions of Lemma 36.38.1 we also have that $f^{\prime}$ is separated (Schemes, Lemma 25.21.14) and finite type (Morphisms, Lemma 28.15.8). Hence $f^{\prime}$ is proper. By Cohomology of Schemes, Proposition 29.18.1 we see that $f_{*} \mathcal{O}_{X}$ is a coherent $\mathcal{O}_{S^{-}}$ module. Hence we see that $\pi$ is finite, i.e., (2) holds.

This proves all but the most interesting assertion, namely that all the fibres of $f^{\prime}$ are geometrically connected. It is clear from the discussion above that we may replace $S$ by $S^{\prime}$, and we may therefore assume that $S$ is Noetherian, affine, $f: X \rightarrow S$ is proper, and $f_{*} \mathcal{O}_{X}=\mathcal{O}_{S}$. Let $s \in S$ be a point of $S$. We have to show that $X_{s}$ is geometrically connected. By Lemma 36.38 .2 we see that it suffices to show $X_{u}$ is connected for every étale neighbourhood $(U, u) \rightarrow(S, s)$. We may assume $U$ is affine. Thus $U$ is Noetherian (Morphisms, Lemma 28.15.6), the base change $f_{U}$ : $X_{U} \rightarrow U$ is proper (Morphisms, Lemma 28.41.5), and that also $\left(f_{U}\right)_{*} \mathcal{O}_{X_{U}}=\mathcal{O}_{U}$ (Cohomology of Schemes, Lemma 29.5.2). Hence after replacing ( $f: X \rightarrow S, s$ ) by the base change $\left(f_{U}: X_{U} \rightarrow U, u\right)$ it suffices to prove that the fibre $X_{s}$ is connected.

At this point we apply the theorem on formal functions, more precisely Cohomology of Schemes, Lemma 29.19.7. It tells us that

$$
\mathcal{O}_{S, s}^{\wedge}=\lim _{n} H^{0}\left(X_{n}, \mathcal{O}_{X_{n}}\right)
$$

where $X_{n}$ is the $n$th infinitesimal neighbourhood of $X_{s}$. Since the underlying topological space of $X_{n}$ is equal to that of $X_{s}$ we see that if $X_{s}=T_{1} \amalg T_{2}$ is a disjoint union of nonempty open and closed subschemes, then similarly $X_{n}=T_{1, n} \amalg T_{2, n}$ for all $n$. And this in turn means $H^{0}\left(X_{n}, \mathcal{O}_{X_{n}}\right)$ contains a nontrivial idempotent $e_{1, n}$, namely the function which is identically 1 on $T_{1, n}$ and identically 0 on $T_{2, n}$. It is clear that $e_{1, n+1}$ restricts to $e_{1, n}$ on $X_{n}$. Hence $e_{1}=\lim e_{1, n}$ is a nontrivial idempotent of the limit. This contradicts the fact that $\mathcal{O}_{S, s}^{\wedge}$ is a local ring. Thus the assumption was wrong, i.e., $X_{s}$ is connected, and we win.

03H2 Theorem 36.38.4 (Stein factorization; general case). Let $S$ be a scheme. Let $f: X \rightarrow S$ be a proper morphism. There exists a factorization

with the following properties:
(1) the morphism $f^{\prime}$ is proper with geometrically connected fibres,
(2) the morphism $\pi: S^{\prime} \rightarrow S$ is integral,
(3) we have $f_{*}^{\prime} \mathcal{O}_{X}=\mathcal{O}_{S^{\prime}}$,
(4) we have $S^{\prime}=\underline{\operatorname{Spec}_{S}}\left(f_{*} \mathcal{O}_{X}\right)$, and
(5) $S^{\prime}$ is the normalization of $S$ in $X$, see Morphisms, Definition 28.48.3.

Proof. We may apply Lemma 36.38 .1 to get the morphism $f^{\prime}: X \rightarrow S^{\prime}$. Note that besides the conclusions of Lemma 36.38.1 we also have that $f^{\prime}$ is separated (Schemes, Lemma 25.21.14) and finite type (Morphisms, Lemma 28.15.8). Hence $f^{\prime}$ is proper. At this point we have proved all of the statements except for the statement that $f^{\prime}$ has geometrically connected fibres.

We may assume that $S=\operatorname{Spec}(R)$ is affine. Set $R^{\prime}=\Gamma\left(X, \mathcal{O}_{X}\right)$. Then $S^{\prime}=$ $\operatorname{Spec}\left(R^{\prime}\right)$. Thus we may replace $S$ by $S^{\prime}$ and assume that $S=\operatorname{Spec}(R)$ is affine $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Next, let $s \in S$ be a point. Let $U \rightarrow S$ be an étale morphism of affine schemes and let $u \in U$ be a point mapping to $s$. Let $X_{U} \rightarrow U$ be the base change of $X$. By Lemma 36.38 .2 it suffices to show that the fibre of $X_{U} \rightarrow U$ over $u$ is connected. By Cohomology of Schemes, Lemma 29.5.2 we see that $\Gamma\left(X_{U}, \mathcal{O}_{X_{U}}\right)=\Gamma\left(U, \mathcal{O}_{U}\right)$. Hence we have to show: Given $S=\operatorname{Spec}(R)$ affine, $X \rightarrow S$ proper with $\Gamma\left(X, \mathcal{O}_{X}\right)=R$ and $s \in S$ is a point, the fibre $X_{s}$ is connected.

By Limits, Lemma 31.12 .6 we can write $(X \rightarrow S)=\lim \left(X_{i} \rightarrow S_{i}\right)$ with $X_{i} \rightarrow S_{i}$ proper and of finite presentation and $S_{i}$ Noetherian. For $i$ large enough $S_{i}$ is affine (Limits, Lemma 31.3.10). Say $S_{i}=\operatorname{Spec}\left(R_{i}\right)$. Let $R_{i}^{\prime}=\Gamma\left(X_{i}, \mathcal{O}_{X_{i}}\right)$. Observe that we have ring maps $R_{i} \rightarrow R_{i}^{\prime} \rightarrow R$. Namely, we have the first because $X_{i}$ is a scheme over $R_{i}$ and the second because we have $X \rightarrow X_{i}$ and $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Note that $R=\operatorname{colim} R_{i}^{\prime}$ by Limits, Lemma 31.3.3. Then

is commutative with $S_{i}^{\prime}=\operatorname{Spec}\left(R_{i}^{\prime}\right)$. Let $s_{i}^{\prime} \in S_{i}^{\prime}$ be the image of $s$. We have $X_{s}=\lim X_{i, s_{i}^{\prime}}$ because $X=\lim X_{i}, S=\lim S_{i}^{\prime}$, and $\kappa(s)=\operatorname{colim} \kappa\left(s_{i}^{\prime}\right)$. Now let $X_{s}=U \amalg V$ with $U$ and $V$ open and closed. Then $U, V$ are the inverse images of opens $U_{i}, V_{i}$ in $X_{i, s_{i}^{\prime}}$ (Limits, Lemma 31.3.8). By Theorem 36.38.3 the fibres of $X_{i} \rightarrow S_{i}^{\prime}$ are connected, hence either $U$ or $V$ is empty. This finishes the proof.

Here is an application.
0AY8 Lemma 36.38.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume
(1) $f$ is proper,
(2) $Y$ is integral with generic point $\xi$,
(3) $Y$ is normal,
(4) $X$ is reduced,
(5) every generic point of an irreducible component of $X$ maps to $\xi$,
(6) we have $H^{0}\left(X_{\xi}, \mathcal{O}\right)=\kappa(\xi)$.

Then $f_{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$ and $f$ has geometrically connected fibres.
Proof. Apply Theorem 36.38 .4 to get a factorization $X \rightarrow Y^{\prime} \rightarrow Y$. It is enough to show that $Y^{\prime}=Y$. This will follow from Morphisms, Lemma 28.49.5. Namely, $Y^{\prime}$ is reduced because $X$ is reduced (Morphisms, Lemma 28.48.7). The morphism $Y^{\prime} \rightarrow Y$ is integral by the theorem cited above. Every generic point of $Y^{\prime}$ lies over $\xi$ by Morphisms, Lemma 28.48 .8 and assumption (5). On the other hand, since $Y^{\prime}$ is the relative spectrum of $f_{*} \mathcal{O}_{X}$ we see that the scheme theoretic fibre $Y_{\xi}^{\prime}$ is the spectrum of $H^{0}\left(X_{\xi}, \mathcal{O}\right)$ which is equal to $\kappa(\xi)$ by assumption. Hence $Y^{\prime}$ is an integral scheme with function field equal to the function field of $Y$. This finishes the proof.

### 36.39. Descending separated locally quasi-finite morphisms

02W7 In this section we show that "separated locally quasi-finite morphisms satisfy descent for fppf-coverings". See Descent, Definition 34.32 .1 for terminology. This is in the marvellous (for many reasons) paper by Raynaud and Gruson hidden in the proof of GR71, Lemma 5.7.1]. It can also be found in Mur95, and [ABD ${ }^{+} \mathbf{6 6}$, Exposé X, Lemma 5.4] under the additional hypothesis that the morphism is locally of finite presentation. Here is the formal statement.

02W8 Lemma 36.39.1. Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be an fppf covering, see Topologies, Definition 33.7.1. Let $\left(V_{i} / X_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow S\right\}$. If each morphism $V_{i} \rightarrow X_{i}$ is separated and locally quasi-finite, then the descent datum is effective.

Proof. Being separated and being locally quasi-finite are properties of morphisms of schemes which are preserved under any base change, see Schemes, Lemma 25.21 .13 and Morphisms, Lemma 28.20.13. Hence Descent, Lemma 34.32 .2 applies and it suffices to prove the statement of the lemma in case the fppf-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of finite presentation of affines. Say $X=\operatorname{Spec}(A)$ and $S=\operatorname{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let $(V, \varphi)$ be a descent datum relative to $X$ over $S$ and assume that $\pi: V \rightarrow X$ is separated and locally quasi-finite.

Let $W^{1} \subset V$ be any affine open. Consider $W=\operatorname{pr}_{1}\left(\varphi\left(W^{1} \times_{S} X\right)\right) \subset V$. Here is a picture

Ok, and now since $X \rightarrow S$ is flat and of finite presentation it is universally open (Morphisms, Lemma 28.25.9). Hence we conclude that $W$ is open. Moreover, it is also clearly the case that $W$ is quasi-compact, and $W^{1} \subset W$. Moreover, we note that $\varphi\left(W \times_{S} X\right)=X \times_{S} W$ by the cocycle condition for $\varphi$. Hence we obtain a new descent datum $\left(W, \varphi^{\prime}\right)$ by restricting $\varphi$ to $W \times_{S} X$. Note that the morphism $W \rightarrow X$ is quasi-compact, separated and locally quasi-finite. This implies that it is separated and quasi-finite by definition. Hence it is quasi-affine by Lemma 36.31.2, Thus by Descent, Lemma 34.34 .1 we see that the descent datum $\left(W, \varphi^{\prime}\right)$ is effective.

In other words, we find that there exists an open covering $V=\bigcup W_{i}$ by quasicompact opens $W_{i}$ which are stable for the descent morphism $\varphi$. Moreover, for each such quasi-compact open $W \subset V$ the corresponding descent data $\left(W, \varphi^{\prime}\right)$ is effective. It is an exercise to show this means the original descent datum is effective by glueing the schemes obtained from descending the opens $W_{i}$ (details omitted).

### 36.40. Relative finite presentation

05GX Let $R \rightarrow A$ be a finite type ring map. Let $M$ be an $A$-module. In More on Algebra, Section 15.65 we defined what it means for $M$ to be finitely presented relative to $R$. We also proved this notion has good localization properties and glues. Hence we can define the corresponding global notion as follows.

05H1 Definition 36.40.1. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. We say $\mathcal{F}$ is finitely presented relative to $S$ or of finite presentation relative to $S$ if there exists an affine open covering $S=\bigcup V_{i}$ and for every $i$ an affine open covering $f^{-1}\left(V_{i}\right)=\bigcup_{j} U_{i j}$ such that $\mathcal{F}\left(U_{i j}\right)$ is a $\mathcal{O}_{X}\left(U_{i j}\right)$-module of finite presentation relative to $\mathcal{O}_{S}\left(V_{i}\right)$.
Note that this implies that $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module. If $X \rightarrow S$ is just locally of finite type, then $\mathcal{F}$ may be of finite presentation relative to $S$, without $X \rightarrow S$ being locally of finite presentation. We will see that $X \rightarrow S$ is locally of finite presentation if and only if $\mathcal{O}_{X}$ is of finite presentation relative to $S$.

09 T 7 Lemma 36.40.2. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is of finite presentation relative to $S$,
(2) for every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the $\mathcal{O}_{X}(U)$-module $\mathcal{F}(U)$ is finitely presented relative to $\mathcal{O}_{S}(V)$.
Moreover, if this is true, then for every open subschemes $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the restriction $\left.\mathcal{F}\right|_{U}$ is of finite presentation relative to $V$.

Proof. The final statement is clear from the equivalence of (1) and (2). It is also clear that (2) implies (1). Assume (1) holds. Let $S=\bigcup V_{i}$ and $f^{-1}\left(V_{i}\right)=\bigcup U_{i j}$ be affine open coverings as in Definition 36.40.1. Let $U \subset X$ and $V \subset S$ be as in (2). By More on Algebra, Lemma 15.65 .8 it suffices to find a standard open covering $U=\bigcup U_{k}$ of $U$ such that $\mathcal{F}\left(U_{k}\right)$ is finitely presented relative to $\mathcal{O}_{S}(V)$. In other words, for every $u \in U$ it suffices to find a standard affine open $u \in U^{\prime} \subset U$ such that $\mathcal{F}\left(U^{\prime}\right)$ is finitely presented relative to $\mathcal{O}_{S}(V)$. Pick $i$ such that $f(u) \in V_{i}$ and then pick $j$ such that $u \in U_{i j}$. By Schemes, Lemma 25.11.5 we can find $v \in V^{\prime} \subset V \cap V_{i}$ which is standard affine open in $V^{\prime}$ and $V_{i}$. Then $f^{-1} V^{\prime} \cap U$, resp. $f^{-1} V^{\prime} \cap U_{i j}$ are standard affine opens of $U$, resp. $U_{i j}$. Applying the lemma again we can find $u \in U^{\prime} \subset f^{-1} V^{\prime} \cap U \cap U_{i j}$ which is standard affine open in both $f^{-1} V^{\prime} \cap U$ and $f^{-1} V^{\prime} \cap U_{i j}$. Thus $U^{\prime}$ is also a standard affine open of $U$ and $U_{i j}$. By More on Algebra, Lemma 15.65 .4 the assumption that $\mathcal{F}\left(U_{i j}\right)$ is finitely presented relative to $\mathcal{O}_{S}\left(V_{i}\right)$ implies that $\mathcal{F}\left(U^{\prime}\right)$ is finitely presented relative to $\mathcal{O}_{S}\left(V_{i}\right)$. Since $\mathcal{O}_{X}\left(U^{\prime}\right)=\mathcal{O}_{X}\left(U^{\prime}\right) \otimes_{\mathcal{O}_{S}\left(V_{i}\right)} \mathcal{O}_{S}\left(V^{\prime}\right)$ we see from More on Algebra, Lemma 15.65 .5 that $\mathcal{F}\left(U^{\prime}\right)$ is finitely presented relative to $\mathcal{O}_{S}\left(V^{\prime}\right)$. Applying More on Algebra, Lemma 15.65 .4 again we conclude that $\mathcal{F}\left(U^{\prime}\right)$ is finitely presented relative to $\mathcal{O}_{S}(V)$. This finishes the proof.

09 T 8 Lemma 36.40.3. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module.
(1) If $f$ is locally of finite presentation, then $\mathcal{F}$ is of finite presentation relative to $S$ if and only if $\mathcal{F}$ is of finite presentation.
(2) The morphism $f$ is locally of finite presentation if and only if $\mathcal{O}_{X}$ is of finite presentation relative to $S$.

Proof. Follows immediately from the definitions, see discussion following More on Algebra, Definition 15.65.2.

09T9 Lemma 36.40.4. Let $\pi: X \rightarrow Y$ be a finite morphism of schemes locally of finite type over a base scheme $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then $\mathcal{F}$ is of finite presentation relative to $S$ if and only if $\pi_{*} \mathcal{F}$ is of finite presentation relative to $S$.

Proof. Translation of the result of More on Algebra, Lemma 15.65.3 into the language of schemes.

09TA Lemma 36.40.5. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $S^{\prime} \rightarrow S$ be a morphism of schemes, set $X^{\prime}=X \times_{S} S^{\prime}$ and denote $\mathcal{F}^{\prime}$ the pullback of $\mathcal{F}$ to $X^{\prime}$. If $\mathcal{F}$ is of finite presentation relative to $S$, then $\mathcal{F}^{\prime}$ is of finite presentation relative to $S^{\prime}$.

Proof. Translation of the result of More on Algebra, Lemma 15.65.5 into the language of schemes.

09TB Lemma 36.40.6. Let $X \rightarrow Y \rightarrow S$ be morphisms of schemes which are locally of finite type. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{Y}$-module. If $f: X \rightarrow Y$ is locally of
finite presentation and $\mathcal{G}$ of finite presentation relative to $S$, then $f^{*} \mathcal{G}$ is of finite presentation relative to $S$.

Proof. Translation of the result of More on Algebra, Lemma 15.65.6 into the language of schemes.

09TC Lemma 36.40.7. Let $X \rightarrow Y \rightarrow S$ be morphisms of schemes which are locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $Y \rightarrow S$ is locally of finite presentation and $\mathcal{F}$ is of finite presentation relative to $Y$, then $\mathcal{F}$ is of finite presentation relative to $S$.

Proof. Translation of the result of More on Algebra, Lemma 15.65.7 into the language of schemes.

09TD Lemma 36.40.8. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $0 \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime \prime} \rightarrow 0$ be a short exact sequence of quasi-coherent $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{F}^{\prime}, \mathcal{F}^{\prime \prime}$ are finitely presented relative to $S$, then so is $\mathcal{F}$.
(2) If $\mathcal{F}^{\prime}$ is a finite type $\mathcal{O}_{X}$-module and $\mathcal{F}$ is finitely presented relative to $S$, then $\mathcal{F}^{\prime \prime}$ is finitely presented relative to $S$.

Proof. Translation of the result of More on Algebra, Lemma 15.65 .9 into the language of schemes.

09TE Lemma 36.40.9. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}, \mathcal{F}^{\prime}$ be quasi-coherent $\mathcal{O}_{X}$-modules. If $\mathcal{F} \oplus \mathcal{F}^{\prime}$ is finitely presented relative to $S$, then so are $\mathcal{F}$ and $\mathcal{F}^{\prime}$.

Proof. Translation of the result of More on Algebra, Lemma 15.65 .10 into the language of schemes.

### 36.41. Relative pseudo-coherence

09UH This section is the analogue of More on Algebra, Section 15.66 for schemes. We strongly urge the reader to take a look at that section first.

09VC Lemma 36.41.1. Let $X \rightarrow S$ be a finite type morphism of affine schemes. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $m \in \mathbf{Z}$. The following are equivalent
(1) for some closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$ the object $R i_{*} E$ of $D\left(\mathcal{O}_{\mathbf{A}_{S}^{n}}\right)$ is $m$-pseudo-coherent, and
(2) for all closed immersions $i: X \rightarrow \mathbf{A}_{S}^{n}$ the object $R i_{*} E$ of $D\left(\mathcal{O}_{\mathbf{A}_{S}^{n}}\right)$ is m-pseudo-coherent.

Proof. Say $S=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A)$. Let $i$ correspond to the surjection $\alpha$ : $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ and let $X \rightarrow \mathbf{A}_{S}^{m}$ correspond to $\beta: R\left[y_{1}, \ldots, y_{m}\right] \rightarrow A$. Choose $f_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$ with $\alpha\left(f_{j}\right)=\beta\left(y_{j}\right)$ and $g_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$ with $\beta\left(g_{i}\right)=\alpha\left(x_{i}\right)$. Then we get a commutative diagram

corresponding to the commutative diagram of closed immersions

Thus it suffices to show that under a closed immersion

$$
f: \mathbf{A}_{S}^{m} \rightarrow \mathbf{A}_{S}^{n+m}
$$

an object $E$ of $D\left(\mathcal{O}_{\mathbf{A}_{S}^{m}}\right)$ is $m$-pseudo-coherent if and only if $R f_{*} E$ is $m$-pseudocoherent. This follows from Derived Categories of Schemes, Lemma 35.11.5 and the fact that $f_{*} \mathcal{O}_{\mathbf{A}_{S}^{m}}$ is a pseudo-coherent $\mathcal{O}_{\mathbf{A}_{S}^{n+m} \text {-module. The pseudo-coherence }}$ of $f_{*} \mathcal{O}_{\mathbf{A}_{S}^{m}}$ is straightforward to prove directly, but it also follows from Derived Categories of Schemes, Lemma 35.10.3 and More on Algebra, Lemma 15.66.3.

Recall that if $f: X \rightarrow S$ is a morphism of scheme which is locally of finite type, then for every pair of affine opens $U \subset X$ and $V \subset S$ such that $f(U) \subset V$, the ring $\operatorname{map} \mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is of finite type (Morphisms, Lemma 28.15.2. Hence there always exist closed immersions $U \rightarrow \mathbf{A}_{V}^{n}$ and the following definition makes sense.

09UI Definition 36.41.2. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Fix $m \in \mathbf{Z}$.
(1) We say $E$ is m-pseudo-coherent relative to $S$ if there exists an affine open covering $S=\bigcup V_{i}$ and for each $i$ an affine open covering $f^{-1}\left(V_{i}\right)=\bigcup U_{i j}$ such that the equivalent conditions of Lemma 36.41.1 are satisfied for each of the pairs $\left(U_{i j} \rightarrow V_{i},\left.E\right|_{U_{i j}}\right)$.
(2) We say $E$ is pseudo-coherent relative to $S$ if $E$ is $m$-pseudo-coherent relative to $S$ for all $m \in \mathbf{Z}$.
(3) We say $\mathcal{F}$ is m-pseudo-coherent relative to $S$ if $\mathcal{F}$ viewed as an object of $D\left(\mathcal{O}_{X}\right)$ is $m$-pseudo-coherent relative to $S$.
(4) We say $\mathcal{F}$ is pseudo-coherent relative to $S$ if $\mathcal{F}$ viewed as an object of $D\left(\mathcal{O}_{X}\right)$ is pseudo-coherent relative to $S$.

If $X$ is quasi-compact and $E$ is $m$-pseudo-coherent relative to $S$ for some $m$, then $E$ is bounded above. We first prove the condition of relative pseudo-coherence localizes well.

09VD Lemma 36.41.3. Let $S$ be an affine scheme. Let $V \subset S$ be a standard open. Let $X \rightarrow V$ be a finite type morphism of affine schemes. Let $U \subset X$ be an affine open. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. If the equivalent conditions of Lemma 36.41.1 are satisfied for the pair $(X \rightarrow V, E)$, then the equivalent conditions of Lemma 36.41.1 are satisfied for the pair $\left(U \rightarrow S,\left.E\right|_{U}\right)$.

Proof. Write $S=\operatorname{Spec}(R), V=D(f), X=\operatorname{Spec}(A)$, and $U=D(g)$. Assume the equivalent conditions of Lemma 36.41.1 are satisfied for the pair $(X \rightarrow V, E)$.
Choose $R_{f}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ surjective. Write $R_{f}=R\left[x_{0}\right] /\left(f x_{0}-1\right)$. Then $R\left[x_{0}, x_{1}, \ldots, x_{n}\right] \rightarrow A$ is surjective, and $R_{f}\left[x_{1}, \ldots, x_{n}\right]$ is pseudo-coherent as an $R\left[x_{0}, \ldots, x_{n}\right]$-module. Thus we have

$$
X \rightarrow \mathbf{A}_{V}^{n} \rightarrow \mathbf{A}_{S}^{n+1}
$$

and we can apply Derived Categories of Schemes, Lemma 35.11.5 to conclude that the pushfoward $E^{\prime}$ of $E$ to $\mathbf{A}_{S}^{n+1}$ is m-pseudo-coherent.
Choose an element $g^{\prime} \in R\left[x_{0}, x_{1}, \ldots, x_{n}\right]$ which maps to $g \in A$. Consider the surjection $R\left[x_{0}, \ldots, x_{n+1}\right] \rightarrow R\left[x_{0}, \ldots, x_{n}, 1 / g^{\prime}\right]$. We obtain

where the lower left arrow is an open immersion and the lower right arrow is a closed immersion. We conclude as before that the pushforward of $\left.E^{\prime}\right|_{D\left(g^{\prime}\right)}$ to $\mathbf{A}_{S}^{n+2}$ is m-pseudo-coherent. Since this is also the pushforward of $\left.E\right|_{U}$ to $\mathbf{A}_{S}^{n+2}$ we conclude the lemma is true.

09VE Lemma 36.41.4. Let $X \rightarrow S$ be a finite type morphism of affine schemes. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Let $m \in \mathbf{Z}$. Let $X=\bigcup U_{i}$ be a standard affine open covering. The following are equivalent
(1) the equivalent conditions of Lemma 36.41.1 hold for the pairs $\left(U_{i} \rightarrow\right.$ $\left.S,\left.E\right|_{U_{i}}\right)$,
(2) the equivalent conditions of Lemma 36.41.1 hold for the pair $(X \rightarrow S, E)$.

Proof. The implication $(2) \Rightarrow(1)$ is Lemma 36.41.3. Assume (1). Say $S=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A)$ and $U_{i}=D\left(f_{i}\right)$. Write $1=\sum f_{i} g_{i}$ in $A$. Consider the surjections

$$
R\left[x_{i}, y_{i}, z_{i}\right] \rightarrow R\left[x_{i}, y_{i}, z_{i}\right] /\left(\sum y_{i} z_{i}-1\right) \rightarrow A
$$

which sends $y_{i}$ to $f_{i}$ and $z_{i}$ to $g_{i}$. Note that $R\left[x_{i}, y_{i}, z_{i}\right] /\left(\sum y_{i} z_{i}-1\right)$ is pseudocoherent as an $R\left[x_{i}, y_{i}, z_{i}\right]$-module. Thus it suffices to prove that the pushforward of $E$ to $T=\operatorname{Spec}\left(R\left[x_{i}, y_{i}, z_{i}\right] /\left(\sum y_{i} z_{i}-1\right)\right)$ is $m$-pseudo-coherent, see Derived Categories of Schemes, Lemma 35.11.5. For each $i_{0}$ it suffices to prove the restriction of this pushforward to $W_{i_{0}}=\operatorname{Spec}\left(R\left[x_{i}, y_{i}, z_{i}, 1 / y_{i_{0}}\right] /\left(\sum y_{i} z_{i}-1\right)\right)$ is m-pseudocoherent. Note that there is a commutative diagram

which implies that the pushforward of $E$ to $T$ restricted to $W_{i_{0}}$ is the pushforward of $\left.E\right|_{U_{i_{0}}}$ to $W_{i_{0}}$. Since $R\left[x_{i}, y_{i}, z_{i}, 1 / y_{i_{0}}\right] /\left(\sum y_{i} z_{i}-1\right)$ is isomorphic to a polynomial ring over $R$ this proves what we want.

09UJ Lemma 36.41.5. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Fix $m \in \mathbf{Z}$. The following are equivalent
(1) $E$ is m-pseudo-coherent relative to $S$,
(2) for every affine opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the equivalent conditions of Lemma 36.41 .1 are satisfied for the pair $\left(U \rightarrow V,\left.E\right|_{U}\right)$.
Moreover, if this is true, then for every open subschemes $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the restriction $\left.E\right|_{U}$ is m-pseudo-coherent relative to $V$.

Proof. The final statement is clear from the equivalence of (1) and (2). It is also clear that (2) implies (1). Assume (1) holds. Let $S=\bigcup V_{i}$ and $f^{-1}\left(V_{i}\right)=\bigcup U_{i j}$ be affine open coverings as in Definition 36.41.2, Let $U \subset X$ and $V \subset S$ be as in (2). By Lemma 36.41.4 it suffices to find a standard open covering $U=\bigcup U_{k}$ of $U$ such that the equivalent conditions of Lemma 36.41.1 are satisfied for the pairs $\left(U_{k} \rightarrow V,\left.E\right|_{U_{k}}\right)$. In other words, for every $u \in U$ it suffices to find a standard affine open $u \in U^{\prime} \subset U$ such that the equivalent conditions of Lemma 36.41.1 are satisfied for the pair $\left(U^{\prime} \rightarrow V,\left.E\right|_{U^{\prime}}\right)$. Pick $i$ such that $f(u) \in V_{i}$ and then pick $j$ such that $u \in U_{i j}$. By Schemes, Lemma 25.11.5 we can find $v \in V^{\prime} \subset V \cap V_{i}$ which is standard affine open in $V^{\prime}$ and $V_{i}$. Then $f^{-1} V^{\prime} \cap U$, resp. $f^{-1} V^{\prime} \cap U_{i j}$ are standard affine opens of $U$, resp. $U_{i j}$. Applying the lemma again we can find $u \in U^{\prime} \subset f^{-1} V^{\prime} \cap U \cap U_{i j}$ which is standard affine open in both $f^{-1} V^{\prime} \cap U$ and $f^{-1} V^{\prime} \cap U_{i j}$. Thus $U^{\prime}$ is also a standard affine open of $U$ and $U_{i j}$. By Lemma 36.41.3 the assumption that the equivalent conditions of Lemma 36.41.1 are satisfied for the pair ( $U_{i j} \rightarrow V_{i},\left.E\right|_{U_{i j}}$ ) implies that the equivalent conditions of Lemma 36.41.1 are satisfied for the pair $\left(U^{\prime} \rightarrow V,\left.E\right|_{U^{\prime}}\right)$.
For objects of the derived category whose cohomology sheaves are quasi-coherent, we can relate relative $m$-pseudo-coherence to the notion defined in More on Algebra, Definition 15.66 .4 . We will use the fact that for an affine scheme $U=\operatorname{Spec}(A)$ the functor $R \Gamma(U,-)$ induces an equivalence between $D_{Q C o h}\left(\mathcal{O}_{U}\right)$ and $D(A)$, see Derived Categories of Schemes, Lemma 35.3.5. This functor is compatible with pullbacks: if $E$ is an object of $D_{Q C o h}\left(\mathcal{O}_{U}\right)$ and $A \rightarrow B$ is a ring map corresponding to a morphism of affine schemes $g: V=\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)=U$, then $R \Gamma\left(V, L g^{*} E\right)=R \Gamma(U, E) \otimes_{A}^{\mathbf{L}} B$. See Derived Categories of Schemes, Lemma 35.3.7.
09VF Lemma 36.41.6. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Fix $m \in \mathbf{Z}$. The following are equivalent
(1) $E$ is m-pseudo-coherent relative to $S$,
(2) there exists an affine open covering $S=\bigcup V_{i}$ and for each $i$ an affine open covering $f^{-1}\left(V_{i}\right)=\bigcup U_{i j}$ such that the complex of $\mathcal{O}_{X}\left(U_{i j}\right)$-modules $R \Gamma\left(U_{i j}, E\right)$ is m-pseudo-coherent relative to $\mathcal{O}_{S}\left(V_{i}\right)$, and
(3) for every affine opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$ the complex of $\mathcal{O}_{X}(U)$-modules $R \Gamma(U, E)$ is m-pseudo-coherent relative to $\mathcal{O}_{S}(V)$.
Proof. Let $U$ and $V$ be as in (2) and choose a closed immersion $i: U \rightarrow \mathbf{A}_{V}^{n}$. A formal argument, using Lemma 36.41 .5 , shows it suffices to prove that $R i_{*}\left(\left.E\right|_{U}\right)$ is $m$-pseudo-coherent if and only if $R \Gamma(U, E)$ is $m$-pseudo-coherent relative to $\mathcal{O}_{S}(V)$. Say $U=\operatorname{Spec}(A), V=\operatorname{Spec}(R)$, and $\mathbf{A}_{V}^{n}=\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right]\right.$. By the remarks preceding the lemma, $\left.E\right|_{U}$ is quasi-isomorphic to the complex of quasi-coherent sheaves on $U$ associated to the object $R \Gamma(U, E)$ of $D(A)$. Note that $R \Gamma(U, E)=$ $R \Gamma\left(\mathbf{A}_{V}^{n}, R i_{*}\left(\left.E\right|_{U}\right)\right)$ as $i$ is a closed immersion (and hence $i_{*}$ is exact). Thus $R i_{*} E$ is associated to $R \Gamma(U, E)$ viewed as an object of $D\left(R\left[x_{1}, \ldots, x_{n}\right]\right)$. We conclude as $m$-pseudo-coherence of $R i_{*}\left(\left.E\right|_{U}\right)$ is equivalent to $m$-pseudo-coherence of $R \Gamma(E, U)$ in $D\left(R\left[x_{1}, \ldots, x_{n}\right]\right)$ by Derived Categories of Schemes, Lemma 35.10.3 which is equivalent to $R \Gamma(U, E)$ is $m$-pseudo-coherent relative to $R=\mathcal{O}_{S}(V)$ by definition.

09VG Lemma 36.41.7. Let $i: X \rightarrow Y$ morphism of schemes locally of finite type over a base scheme $S$. Assume that $i$ induces a homeomorphism of $X$ with a closed subset
of $Y$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Then $E$ is m-pseudo-coherent relative to $S$ if and only if $R i_{*} E$ is m-pseudo-coherent relative to $S$.

Proof. By Morphisms, Lemma 28.44 .2 the morphism $i$ is affine. Thus we may assume $S, Y$, and $X$ are affine. Say $S=\operatorname{Spec}(R), Y=\operatorname{Spec}(A)$, and $X=\operatorname{Spec}(B)$. The condition means that $A / \operatorname{rad}(A) \rightarrow B / \operatorname{rad}(B)$ is surjective. As $B$ is of finite type over $A$, we can find $b_{1}, \ldots, b_{m} \in \operatorname{rad}(B)$ which generate $B$ as an $A$-algebra. Say $b_{j}^{N}=0$ for all $j$. Consider the diagram of rings

which translates into a diagram

of affine schemes. By Lemma 36.41 .5 we see that $E$ is $m$-pseudo-coherent relative to $S$ if and only if its pushforward to $\mathbf{A}_{S}^{n+m}$ is $m$-pseudo-coherent. By Derived Categories of Schemes, Lemma 35.11.5 we see that this is true if and only if its pushforward to $T$ is $m$-pseudo-coherent. The same lemma shows that this holds if and only if the pushforward to $\mathbf{A}_{S}^{n}$ is $m$-pseudo-coherent. Again by Lemma 36.41.5 this holds if and only if $R i_{*} E$ is $m$-pseudo-coherent relative to $S$.

09UK Lemma 36.41.8. Let $\pi: X \rightarrow Y$ be a finite morphism of schemes locally of finite type over a base scheme $S$. Let $E$ be an object of $D_{Q C o h}\left(\mathcal{O}_{X}\right)$. Then $E$ is m-pseudo-coherent relative to $S$ if and only if $R \pi_{*} E$ is m-pseudo-coherent relative to $S$.

Proof. Translation of the result of More on Algebra, Lemma 15.66.5 into the language of schemes. Observe that $R \pi_{*}$ indeed maps $D_{Q C o h}\left(\mathcal{O}_{X}\right)$ into $D_{Q C o h}\left(\mathcal{O}_{Y}\right)$ by Derived Categories of Schemes, Lemma 35.4.1. To do the translation use Lemma 36.41.5.

09UL Lemma 36.41.9. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\left(E, E^{\prime}, E^{\prime \prime}\right)$ be a distinguished triangle of $D\left(\mathcal{O}_{X}\right)$. Let $m \in \mathbf{Z}$.
(1) If $E$ is $(m+1)$-pseudo-coherent relative to $S$ and $E^{\prime}$ is m-pseudo-coherent relative to $S$ then $E^{\prime \prime}$ is m-pseudo-coherent relative to $S$.
(2) If $E, E^{\prime \prime}$ are m-pseudo-coherent relative to $S$, then $E^{\prime}$ is m-pseudo-coherent relative to $S$.
(3) If $E^{\prime}$ is ( $m+1$ )-pseudo-coherent relative to $S$ and $E^{\prime \prime}$ is m-pseudo-coherent relative to $S$, then $E$ is $(m+1)$-pseudo-coherent relative to $S$.
Moreover, if two out of three of $E, E^{\prime}, E^{\prime \prime}$ are pseudo-coherent relative to $S$, the so is the third.

Proof. Immediate from Lemma 36.41.5 and Cohomology, Lemma 20.39.4

09UM Lemma 36.41.10. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. Then
(1) $\mathcal{F}$ is $m$-pseudo-coherent relative to $S$ for all $m>0$,
(2) $\mathcal{F}$ is 0 -pseudo-coherent relative to $S$ if and only if $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$ module,
(3) $\mathcal{F}$ is $(-1)$-pseudo-coherent relative to $S$ if and only if $\mathcal{F}$ is quasi-coherent and finitely presented relative to $S$.

Proof. Part (1) is immediate from the definition. To see part (3) we may work locally on $X$ (both properties are local). Thus we may assume $X$ and $S$ are affine. Choose a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$. Then we see that $\mathcal{F}$ is $(-1)$-pseudocoherent relative to $S$ if and only if $i_{*} \mathcal{F}$ is $(-1)$-pseudo-coherent, which is true if and only if $i_{*} \mathcal{F}$ is an $\mathcal{O}_{\mathbf{A}_{S}^{n}}$-module of finite presentation, see Cohomology, Lemma 20.39.9. A module of finite presentation is quasi-coherent, see Modules, Lemma 17.11.2. By Morphisms, Lemma 28.4.1 we see that $\mathcal{F}$ is quasi-coherent if and only if $i_{*} \mathcal{F}$ is quasi-coherent. Having said this part (3) follows. The proof of (2) is similar but less involved.

09UN Lemma 36.41.11. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let $E, K$ be objects of $D\left(\mathcal{O}_{X}\right)$. If $E \oplus K$ is m-pseudo-coherent relative to $S$ so are $E$ and $K$.

Proof. Follows from Cohomology, Lemma 20.39 .6 and the definitions.
09UP Lemma 36.41.12. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let $\mathcal{F}^{\bullet}$ be a (locally) bounded above complex of $\mathcal{O}_{X}$-modules such that $\mathcal{F}^{i}$ is $(m-i)$-pseudo-coherent relative to $S$ for all $i$. Then $\mathcal{F}^{\bullet}$ is m-pseudocoherent relative to $S$.

Proof. Follows from Cohomology, Lemma 20.39 .7 and the definitions.
09UQ Lemma 36.41.13. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. If $E$ is (locally) bounded above and $H^{i}(E)$ is $(m-i)$-pseudo-coherent relative to $S$ for all $i$, then $E$ is $m$-pseudo-coherent relative to $S$.

Proof. Follows from Cohomology, Lemma 20.39 .8 and the definitions.
09UR Lemma 36.41.14. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $m \in \mathbf{Z}$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$ which is m-pseudo-coherent relative to $S$. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. Set $X^{\prime}=X \times_{S} S^{\prime}$ and denote $E^{\prime}$ the derived pullback of $E$ to $X^{\prime}$. If $S^{\prime}$ and $X$ are Tor independent over $S$, then $E^{\prime}$ is is m-pseudo-coherent relative to $S^{\prime}$.

Proof. The problem is local on $X$ and $X^{\prime}$ hence we may assume $X, S, S^{\prime}$, and $X^{\prime}$ are affine. Choose a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$ and denote $i^{\prime}: X^{\prime} \rightarrow \mathbf{A}_{S^{\prime}}^{n}$ the base change to $S^{\prime}$. Denote $g: X^{\prime} \rightarrow X$ and $g^{\prime}: \mathbf{A}_{S^{\prime}}^{n} \rightarrow \mathbf{A}_{S}^{n}$ the projections, so $E^{\prime}=L g^{*} E$. Since $X$ and $S^{\prime}$ are tor-independent over $S$, the base change map (Cohomology, Remark 20.29.2) induces an isomorphism

$$
R i_{*}^{\prime}\left(L g^{*} E\right)=L\left(g^{\prime}\right)^{*} R i_{*} E
$$

Namely, for a point $x^{\prime} \in X^{\prime}$ lying over $x \in X$ the base change map on stalks at $x^{\prime}$ is the map

$$
E_{x} \otimes_{\mathcal{O}_{\mathbf{A}_{S}^{n}, x}^{n}}^{\mathbf{L}} \mathcal{O}_{\mathbf{A}_{S^{\prime}}^{n}, x^{\prime}} \longrightarrow E_{x} \otimes_{\mathcal{O}_{X, x}}^{\mathbf{L}} \mathcal{O}_{X^{\prime}, x^{\prime}}
$$

coming from the closed immersions $i$ and $i^{\prime}$. Note that the source is quasi-isomorphic to a localization of $E_{x} \otimes_{\mathcal{O}_{S, s}}^{\mathbf{L}} \mathcal{O}_{S^{\prime}, s^{\prime}}$ which is isomorphic to the target as $\mathcal{O}_{X^{\prime}, x^{\prime}}$ is isomorphic to (the same) localization of $\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{S, s}}^{\mathbf{L}} \mathcal{O}_{S^{\prime}, s^{\prime}}$ by assumption. We conclude the lemma holds by an application of Cohomology, Lemma 20.39.3.

09US Lemma 36.41.15. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over a base $S$. Let $m \in \mathbf{Z}$. Let $E$ be an object of $D\left(\mathcal{O}_{Y}\right)$. Assume
(1) $\mathcal{O}_{X}$ is pseudo-coherent relative to $Y_{3}^{3}$, and
(2) $E$ is m-pseudo-coherent relative to $S$.

Then $L f^{*} E$ is $m$-pseudo-coherent relative to $S$.
Proof. The problem is local on $X$. Thus we may assume $X, Y$, and $S$ are affine. Arguing as in the proof of More on Algebra, Lemma 15.66 .13 we can find a commutative diagram

Observe that

$$
R i_{*} L f^{*} E=R i_{*} L i^{*} L p^{*} E=L p^{*} E \otimes_{\mathcal{O}_{\mathbf{A}_{Y}^{n}}}^{\mathbf{L}} R i_{*} \mathcal{O}_{X}
$$

by Derived Categories of Schemes, Lemma 35.18.1. By assumption and the fact that $Y$ is affine, we can represent $R i_{*} \mathcal{O}_{X}=i_{*} \mathcal{O}_{X}$ by a complexes of finite free $\mathcal{O}_{\mathbf{A}_{Y}^{n}-\text {-modules }} \mathcal{F}^{\bullet}$, with $\mathcal{F}^{i}=0$ for $i>0$ (details omitted; use Derived Categories of Schemes, Lemma 35.10 .3 and More on Algebra, Lemma 15.66.7. By assumption $E$ is bounded above, say $H^{i}(E)=0$ for $i>a$. Represent $E$ by a complex $\mathcal{E}^{\bullet}$ of $\mathcal{O}_{Y}$-modules with $\mathcal{E}^{i}=0$ for $i>a$. Then the derived tensor product above is represented by $\operatorname{Tot}\left(p^{*} \mathcal{E}^{\bullet} \otimes_{\mathcal{O}_{\mathbf{A}_{Y}^{n}}} \mathcal{F}^{\bullet}\right)$.
Thus we have to show that $j_{*} \operatorname{Tot}\left(p^{*} \mathcal{E}^{\bullet} \otimes_{\mathcal{O}_{\mathbf{A}_{Y}^{n}}} \mathcal{F}^{\bullet}\right)$ is $m$-pseudo-coherent as a complex of $\mathcal{O}_{\mathbf{A}_{S}^{n+m}-\text { modules. Note that }} \operatorname{Tot}\left(p^{*} \mathcal{E}^{\bullet} \otimes_{\left.\mathcal{O}_{\mathbf{A}_{Y}^{n}} \mathcal{F}^{\bullet}\right) \text { has a filtration by subcomplexes }}\right.$ with successive quotients the complexes $p^{*} \mathcal{E} \bullet \otimes_{\mathcal{O}_{\mathbf{A}_{Y}^{n}}} \mathcal{F}^{i}[-i]$. Note that for $i \ll 0$ the complexes $p^{*} \mathcal{E}^{\bullet} \otimes_{\mathcal{O}_{A_{Y}^{n}}} \mathcal{F}^{i}[-i]$ have zero cohomology in degrees $\leq m$ and hence are $m$-pseudo-coherent. Hence, applying Lemma 36.41 .9 and induction, it suffices to show that $p^{*} \mathcal{E}^{\bullet} \otimes_{\mathcal{O}_{\mathbf{A}_{Y}^{n}}} \mathcal{F}^{i}[-i]$ is pseudo-coherent relative to $S$ for all $i$. Note that $\mathcal{F}^{i}=0$ for $i>0$. Since also $\mathcal{F}^{i}$ is finite free this reduces to proving that $p^{*} \mathcal{E}^{\bullet}$ is $m$-pseudo-coherent relative to $R$ which follows from Lemma 36.41.14 for instance.

09UT Lemma 36.41.16. Let $f: X \rightarrow Y$ be a morphism of schemes locally of finite type over a base $S$. Let $m \in \mathbf{Z}$. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Assume $\mathcal{O}_{Y}$ is pseudo-coherent relative to $S^{4}$. Then the following are equivalent

[^103](1) $E$ is m-pseudo-coherent relative to $Y$, and
(2) $E$ is m-pseudo-coherent relative to $S$.

Proof. The question is local on $X$, hence we may assume $X, Y$, and $S$ are affine. Arguing as in the proof of More on Algebra, Lemma 15.66 .13 we can find a commutative diagram

The assumption that $\mathcal{O}_{Y}$ is pseudo-coherent relative to $S$ implies that $\mathcal{O}_{\mathbf{A}_{Y}^{m}}$ is pseudo-coherent relative to $\mathbf{A}_{S}^{m}$ (by flat base change; this can be seen by using for example Lemma 36.41.14). This in turn implies that $j_{*} \mathcal{O}_{\mathbf{A}_{Y}^{n}}$ is pseudo-coherent as an $\mathcal{O}_{\mathbf{A}_{S}^{n+m}}$-module. Then the equivalence of the lemma follows from Derived Categories of Schemes, Lemma 35.11.5.

09UU Lemma 36.41.17. Let

be a commutative diagram of schemes. Assume $i$ is a closed immersion and $P \rightarrow S$ flat and locally of finite presentation. Let $E$ be an object of $D\left(\mathcal{O}_{X}\right)$. Then the following are equivalent
(1) $E$ is $m$-pseudo-coherent relative to $S$,
(2) $R i_{*} E$ is m-pseudo-coherent relative to $S$, and
(3) $R i_{*} E$ is $m$-pseudo-coherent on $P$.

Proof. The equivalence of (1) and (2) is Lemma 36.41.8. The equivalence of (2) and (3) follows from Lemma 36.41 .16 applied to id : $P \rightarrow P$ provided we can show that $\mathcal{O}_{P}$ is pseudo-coherent relative to $S$. This follows from More on Algebra, Lemma 15.67 .4 and the definitions.

### 36.42. Pseudo-coherent morphisms

067X Avoid reading this section at all cost. If you need some of this material, first take a look at the corresponding algebra sections, see More on Algebra, Sections 15.54 , 15.66, and 15.67 . For now the only thing you need to know is that a ring map $A \rightarrow B$ is pseudo-coherent if and only if $B=A\left[x_{1}, \ldots, x_{n}\right] / I$ and $B$ as an $A\left[x_{1}, \ldots, x_{n}\right]$-module has a resolution by finite free $A\left[x_{1}, \ldots, x_{n}\right]$-modules.
067Y Lemma 36.42.1. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) there exist an affine open covering $S=\bigcup V_{j}$ and for each $j$ an affine open covering $f^{-1}\left(V_{j}\right)=\bigcup U_{j i}$ such that $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i j}\right)$ is a pseudocoherent ring map,
(2) for every pair of affine opens $U \subset X, V \subset S$ such that $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is pseudo-coherent, and
(3) $f$ is locally of finite type and $\mathcal{O}_{X}$ is pseudo-coherent relative to $S$.

Proof. To see the equivalence of (1) and (2) it suffices to check conditions (1)(a), (b), (c) of Morphisms, Definition 28.14.1for the property of being a pseudo-coherent ring map. These properties follow (using localization is flat) from More on Algebra, Lemmas 15.66.12, 15.66.11, and 15.66 .16 .
If (1) holds, then $f$ is locally of finite type as a pseudo-coherent ring map is of finite type by definition. Moreover, (1) implies via Lemma 36.41.6 and the definitions that $\mathcal{O}_{X}$ is pseudo-coherent relative to $S$. Conversely, if (3) holds, then we see that for every $U$ and $V$ as in (2) the ring $\mathcal{O}_{X}(U)$ is of finite type over $\mathcal{O}_{S}(V)$ and $\mathcal{O}_{X}(U)$ is as a module pseudo-coherent relative to $\mathcal{O}_{S}(V)$, see Lemmas 36.41.5 and 36.41.6. This is the definition of a pseudo-coherent ring map, hence (2) and (1) hold.

067Z Definition 36.42.2. A morphism of schemes $f: X \rightarrow S$ is called pseudo-coherent if the equivalent conditions of Lemma 36.42 .1 are satisfied. In this case we also say that $X$ is pseudo-coherent over $S$.

Beware that a base change of a pseudo-coherent morphism is not pseudo-coherent in general.

0680 Lemma 36.42.3. A flat base change of a pseudo-coherent morphism is pseudocoherent.

Proof. This translates into the following algebra result: Let $A \rightarrow B$ be a pseudocoherent ring map. Let $A \rightarrow A^{\prime}$ be flat. Then $A^{\prime} \rightarrow B \otimes_{A} A^{\prime}$ is pseudo-coherent. This follows from the more general More on Algebra, Lemma 15.66.12,

0681 Lemma 36.42.4. A composition of pseudo-coherent morphisms of schemes is pseudo-coherent.

Proof. This translates into the following algebra result: If $A \rightarrow B \rightarrow C$ are composable pseudo-coherent ring maps then $A \rightarrow C$ is pseudo-coherent. This follows from either More on Algebra, Lemma 15.66 .13 or More on Algebra, Lemma 15.66.15.

0682 Lemma 36.42.5. A pseudo-coherent morphism is locally of finite presentation.
Proof. Immediate from the definitions.
0695 Lemma 36.42.6. A flat morphism which is locally of finite presentation is pseudocoherent.

Proof. This follows from the fact that a flat ring map of finite presentation is pseudo-coherent (and even perfect), see More on Algebra, Lemma 15.67.4.

0683 Lemma 36.42.7. Let $f: X \rightarrow Y$ be a morphism of schemes pseudo-coherent over $a$ base scheme $S$. Then $f$ is pseudo-coherent.

Proof. This translates into the following algebra result: If $R \rightarrow A \rightarrow B$ are composable ring maps and $R \rightarrow A, R \rightarrow B$ pseudo-coherent, then $R \rightarrow B$ is pseudo-coherent. This follows from More on Algebra, Lemma 15.66.15.

0AVX Lemma 36.42.8. Let $f: X \rightarrow S$ be a finite morphism of schemes. Then $f$ is pseudo-coherent if and only if $f_{*} \mathcal{O}_{X}$ is pseudo-coherent as an $\mathcal{O}_{S}$-module.

Proof. Translated into algebra this lemma says the following: If $R \rightarrow A$ is a finite ring map, then $R \rightarrow A$ is pseudo-coherent as a ring map (which means by definition that $A$ as an $A$-module is pseudo-coherent relative to $R$ ) if and only if $A$ is pseudocoherent as an $R$-module. This follows from the more general More on Algebra, Lemma 15.66 .5 .

0684 Lemma 36.42.9. Let $f: X \rightarrow S$ be a morphism of schemes. If $S$ is locally Noetherian, then $f$ is pseudo-coherent if and only if $f$ is locally of finite type.

Proof. This translates into the following algebra result: If $R \rightarrow A$ is a finite type ring map with $R$ Noetherian, then $R \rightarrow A$ is pseudo-coherent if and only if $R \rightarrow A$ is of finite type. To see this, note that a pseudo-coherent ring map is of finite type by definition. Conversely, if $R \rightarrow A$ is of finite type, then we can write $A=R\left[x_{1}, \ldots, x_{n}\right] / I$ and it follows from More on Algebra, Lemma 15.54 .16 that $A$ is pseudo-coherent as an $R\left[x_{1}, \ldots, x_{n}\right]$-module, i.e., $R \rightarrow A$ is a pseudo-coherent ring map.

0696 Lemma 36.42.10. The property $\mathcal{P}(f)=$ " $f$ is pseudo-coherent" is fpqc local on the base.

Proof. We will use the criterion of Descent, Lemma 34.18 .4 to prove this. By Definition 36.42 .2 being pseudo-coherent is Zariski local on the base. By Lemma 36.42 .3 being pseudo-coherent is preserved under flat base change. The final hypothesis (3) of Descent, Lemma 34.18 .4 translates into the following algebra statement: Let $A \rightarrow B$ be a faithfully flat ring map. Let $C=A\left[x_{1}, \ldots, x_{n}\right] / I$ be an $A$-algebra. If $C \otimes_{A} B$ is pseudo-coherent as an $B\left[x_{1}, \ldots, x_{n}\right]$-module, then $C$ is pseudo-coherent as a $A\left[x_{1}, \ldots, x_{n}\right]$-module. This is More on Algebra, Lemma 15.54.15.

0697 Lemma 36.42.11. Let $A \rightarrow B$ be a flat ring map of finite presentation. Let $I \subset B$ be an ideal. Then $A \rightarrow B / I$ is pseudo-coherent if and only if $I$ is pseudo-coherent as a $B$-module.

Proof. Choose a presentation $B=A\left[x_{1}, \ldots, x_{n}\right] / J$. Note that $B$ is pseudocoherent as an $A\left[x_{1}, \ldots, x_{n}\right]$-module because $A \rightarrow B$ is a pseudo-coherent ring map by Lemma 36.42.6. Note that $A \rightarrow B / I$ is pseudo-coherent if and only if $B / I$ is pseudo-coherent as an $A\left[x_{1}, \ldots, x_{n}\right]$-module. By More on Algebra, Lemma 15.54.11 we see this is equivalent to the condition that $B / I$ is pseudo-coherent as an $B$ module. This proves the lemma as the short exact sequence $0 \rightarrow I \rightarrow B \rightarrow B / I \rightarrow 0$ shows that $I$ is pseudo-coherent if and only if $B / I$ is (see More on Algebra, Lemma 15.54.6.

The following lemma will be obsoleted by the stronger Lemma 36.42.13.
0698 Lemma 36.42.12. The property $\mathcal{P}(f)=" f$ is pseudo-coherent" is syntomic local on the source.

Proof. We will use the criterion of Descent, Lemma 34.22 .3 to prove this. It follows from Lemmas 36.42 .6 and 36.42 .4 that being pseudo-coherent is preserved under precomposing with flat morphisms locally of finite presentation, in particular under precomposing with syntomic morphisms (see Morphisms, Lemmas 28.31.7 and 28.31 .6 ). It is clear from Definition 36.42 .2 that being pseudo-coherent is Zariski local on the source and target. Hence, according to the aforementioned Descent, Lemma 34.22 .3 it suffices to prove the following: Suppose $X^{\prime} \rightarrow X \rightarrow Y$ are
morphisms of affine schemes with $X^{\prime} \rightarrow X$ syntomic and $X^{\prime} \rightarrow Y$ pseudo-coherent. Then $X \rightarrow Y$ is pseudo-coherent. To see this, note that in any case $X \rightarrow Y$ is of finite presentation by Descent, Lemma 34.10.1. Choose a closed immersion $X \rightarrow \mathbf{A}_{Y}^{n}$. By Algebra, Lemma 10.134 .18 we can find an affine open covering $X^{\prime}=$ $\bigcup_{i=1, \ldots, n} X_{i}^{\prime}$ and syntomic morphisms $W_{i} \rightarrow \mathbf{A}_{Y}^{n}$ lifting the morphisms $X_{i}^{\prime} \rightarrow X$, i.e., such that there are fibre product diagrams

After replacing $X^{\prime}$ by $\coprod X_{i}^{\prime}$ and setting $W=\amalg W_{i}$ we obtain a fibre product diagram

with $W \rightarrow \mathbf{A}_{Y}^{n}$ flat and of finite presentation and $X^{\prime} \rightarrow Y$ still pseudo-coherent. Since $W \rightarrow \mathbf{A}_{Y}^{n}$ is open (see Morphisms, Lemma 28.25 .9 ) and $X^{\prime} \rightarrow X$ is surjective we can find $f \in \Gamma\left(\mathbf{A}_{Y}^{n}, \mathcal{O}\right)$ such that $X \subset D(f) \subset \operatorname{Im}(h)$. Write $Y=\operatorname{Spec}(R), X=$ $\operatorname{Spec}(A), X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ and $W=\operatorname{Spec}(B), A=R\left[x_{1}, \ldots, x_{n}\right] / I$ and $A^{\prime}=B / I B$. Then $R \rightarrow A^{\prime}$ is pseudo-coherent. Picture

By Lemma 36.42.11 we see that $I B$ is pseudo-coherent as a $B$-module. The ring $\operatorname{map} R\left[x_{1}, \ldots, x_{n}\right]_{f} \rightarrow B_{f}$ is faithfully flat by our choice of $f$ above. This implies that $I_{f} \subset R\left[x_{1}, \ldots, x_{n}\right]_{f}$ is pseudo-coherent, see More on Algebra, Lemma 15.54.15. Applying Lemma 36.42.11 one more time we see that $R \rightarrow A$ is pseudo-coherent.

0699 Lemma 36.42.13. The property $\mathcal{P}(f)=$ " $f$ is pseudo-coherent" is fppf local on the source.

Proof. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\left\{g_{i}: X_{i} \rightarrow X\right\}$ be an fppf covering such that each composition $f \circ g_{i}$ is pseudo-coherent. According to Lemma 36.34.1 there exist
(1) a Zariski open covering $X=\bigcup U_{j}$,
(2) surjective finite locally free morphisms $W_{j} \rightarrow U_{j}$,
(3) Zariski open coverings $W_{j}=\bigcup_{k} W_{j, k}$,
(4) surjective finite locally free morphisms $T_{j, k} \rightarrow W_{j, k}$
such that the fppf covering $\left\{h_{j, k}: T_{j, k} \rightarrow X\right\}$ refines the given covering $\left\{X_{i} \rightarrow X\right\}$. Denote $\psi_{j, k}: T_{j, k} \rightarrow X_{\alpha(j, k)}$ the morphisms that witness the fact that $\left\{T_{j, k} \rightarrow X\right\}$ refines the given covering $\left\{X_{i} \rightarrow X\right\}$. Note that $T_{j, k} \rightarrow X$ is a flat, locally finitely presented morphism, so both $X_{i}$ and $T_{j, k}$ are pseudo-coherent over $X$ by Lemma 36.42.6. Hence $\psi_{j, k}: T_{j, k} \rightarrow X_{i}$ is pseudo-coherent, see Lemma 36.42.7. Hence $\overline{T_{j, k} \rightarrow S}$ is pseudo coherent as the composition of $\psi_{j, k}$ and $f \circ g_{\alpha(j, k)}$, see Lemma
36.42.4 Thus we see we have reduced the lemma to the case of a Zariski open covering (which is OK) and the case of a covering given by a single surjective finite locally free morphism which we deal with in the following paragraph.
Assume that $X^{\prime} \rightarrow X \rightarrow S$ is a sequence of morphisms of schemes with $X^{\prime} \rightarrow X$ surjective finite locally free and $X^{\prime} \rightarrow Y$ pseudo-coherent. Our goal is to show that $X \rightarrow S$ is pseudo-coherent. Note that by Descent, Lemma 34.10 .3 the morphism $X \rightarrow S$ is locally of finite presentation. It is clear that the problem reduces to the case that $X^{\prime}, X$ and $S$ are affine and $X^{\prime} \rightarrow X$ is free of some rank $r>0$. The corresponding algebra problem is the following: Suppose $R \rightarrow A \rightarrow A^{\prime}$ are ring maps such that $R \rightarrow A^{\prime}$ is pseudo-coherent, $R \rightarrow A$ is of finite presentation, and $A^{\prime} \cong A^{\oplus r}$ as an $A$-module. Goal: Show $R \rightarrow A$ is pseudo-coherent. The assumption that $R \rightarrow A^{\prime}$ is pseudo-coherent means that $A^{\prime}$ as an $A^{\prime}$-module is pseudo-coherent relative to $R$. By More on Algebra, Lemma 15.66 .5 this implies that $A^{\prime}$ as an $A$-module is pseudo-coherent relative to $R$. Since $A^{\prime} \cong A^{\oplus r}$ as an $A$-module we see that $A$ as an $A$-module is pseudo-coherent relative to $R$, see More on Algebra, Lemma 15.66 .8 . This by definition means that $R \rightarrow A$ is pseudo-coherent and we win.

### 36.43. Perfect morphisms

0685 In order to understand the material in this section you have to understand the material of the section on pseudo-coherent morphisms just a little bit. For now the only thing you need to know is that a ring map $A \rightarrow B$ is perfect if and only if it is pseudo-coherent and $B$ has finite tor dimension as an $A$-module.

0686 Lemma 36.43.1. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. The following are equivalent
(1) there exist an affine open covering $S=\bigcup V_{j}$ and for each $j$ an affine open covering $f^{-1}\left(V_{j}\right)=\bigcup U_{j i}$ such that $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i j}\right)$ is a perfect ring map, and
(2) for every pair of affine opens $U \subset X, V \subset S$ such that $f(U) \subset V$ the ring $\operatorname{map} \mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is perfect.

Proof. Assume (1) and let $U, V$ be as in (2). It follows from Lemma 36.42.1 that $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is pseudo-coherent. Hence it suffices to prove that the property of a ring map being "of finite tor dimension" satisfies conditions (1)(a), (b), (c) of Morphisms, Definition 28.14.1. These properties follow from More on Algebra, Lemmas 15.55.10, 15.55.13, and 15.55.15. Some details omitted.

0687 Definition 36.43.2. A morphism of schemes $f: X \rightarrow S$ is called perfect if the equivalent conditions of Lemma 36.42.1 are satisfied. In this case we also say that $X$ is perfect over $S$.

Note that a perfect morphism is in particular pseudo-coherent, hence locally of finite presentation. Beware that a base change of a perfect morphism is not perfect in general.

0688 Lemma 36.43.3. A flat base change of a perfect morphism is perfect.
Proof. This translates into the following algebra result: Let $A \rightarrow B$ be a perfect ring map. Let $A \rightarrow A^{\prime}$ be flat. Then $A^{\prime} \rightarrow B \otimes_{A} A^{\prime}$ is perfect. This result for
pseudo-coherent ring maps we have seen in Lemma 36.42.3. The corresponding fact for finite tor dimension follows from More on Algebra, Lemma 15.55.13.

0689 Lemma 36.43.4. A composition of perfect morphisms of schemes is perfect.
Proof. This translates into the following algebra result: If $A \rightarrow B \rightarrow C$ are composable perfect ring maps then $A \rightarrow C$ is perfect. We have seen this is the case for pseudo-coherent in Lemma 36.42.4 and its proof. By assumption there exist integers $n, m$ such that $B$ has tor dimension $\leq n$ over $A$ and $C$ has tor dimension $\leq m$ over $B$. Then for any $A$-module $M$ we have

$$
M \otimes_{A}^{\mathbf{L}} C=\left(M \otimes_{A}^{\mathbf{L}} B\right) \otimes_{B}^{\mathbf{L}} C
$$

and the spectral sequence of More on Algebra, Example 15.52 .4 shows that $\operatorname{Tor}_{p}^{A}(M, C)=$ 0 for $p>n+m$ as desired.

068A Lemma 36.43.5. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $f$ is flat and perfect, and
(2) $f$ is flat and locally of finite presentation.

Proof. The implication $(2) \Rightarrow(1)$ is More on Algebra, Lemma 15.67.4. The converse follows from the fact that a pseudo-coherent morphism is locally of finite presentation, see Lemma 36.42.5.

068B Lemma 36.43.6. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $S$ is regular and $f$ is locally of finite type. Then $f$ is perfect.

Proof. See More on Algebra, Lemma 15.67 .5
068C Lemma 36.43.7. A regular immersion of schemes is perfect. A Koszul-regular immersion of schemes is perfect.

Proof. Since a regular immersion is a Koszul-regular immersion, see Divisors, Lemma 30.18.2, it suffices to prove the second statement. This translates into the following algebraic statement: Suppose that $I \subset A$ is an ideal generated by a Koszul-regular sequence $f_{1}, \ldots, f_{r}$ of $A$. Then $A \rightarrow A / I$ is a perfect ring map. Since $A \rightarrow A / I$ is surjective this is a presentation of $A / I$ by a polynomial algebra over $A$. Hence it suffices to see that $A / I$ is pseudo-coherent as an $A$-module and has finite tor dimension. By definition of a Koszul sequence the Koszul complex $K\left(A, f_{1}, \ldots, f_{r}\right)$ is a finite free resolution of $A / I$. Hence $A / I$ is a perfect complex of $A$-modules and we win.

068D Lemma 36.43.8. Let

be a commutative diagram of morphisms of schemes. Assume $Y \rightarrow S$ smooth and $X \rightarrow S$ perfect. Then $f: X \rightarrow Y$ is perfect.

Proof. We can factor $f$ as the composition

$$
X \longrightarrow X \times_{S} Y \longrightarrow Y
$$

where the first morphism is the map $i=(1, f)$ and the second morphism is the projection. Since $Y \rightarrow S$ is flat, see Morphisms, Lemma 28.34.9, we see that $X \times_{S} Y \rightarrow Y$ is perfect by Lemma 36.43.3. As $Y \rightarrow S$ is smooth, also $X \times_{S} Y \rightarrow$ $X$ is smooth, see Morphisms, Lemma 28.34.5. Hence $i$ is a section of a smooth morphism, therefore $i$ is a regular immersion, see Divisors, Lemma 30.19.7. This implies that $i$ is perfect, see Lemma 36.43.7. We conclude that $f$ is perfect because the composition of perfect morphisms is perfect, see Lemma 36.43.4.
069A Remark 36.43.9. It is not true that a morphism between schemes $X, Y$ perfect over a base $S$ is perfect. An example is $S=\operatorname{Spec}(k), X=\operatorname{Spec}(k), Y=$ $\operatorname{Spec}\left(k[x] /\left(x^{2}\right)\right.$ and $X \rightarrow Y$ the unique $S$-morphism.

069B Lemma 36.43.10. The property $\mathcal{P}(f)=" f$ is perfect" is fpqc local on the base.
Proof. We will use the criterion of Descent, Lemma 34.18 .4 to prove this. By Definition 36.43 .2 being perfect is Zariski local on the base. By Lemma 36.43.3 being perfect is preserved under flat base change. The final hypothesis (3) of Descent, Lemma 34.18 .4 translates into the following algebra statement: Let $A \rightarrow B$ be a faithfully flat ring map. Let $C=A\left[x_{1}, \ldots, x_{n}\right] / I$ be an $A$-algebra. If $C \otimes_{A} B$ is perfect as an $B\left[x_{1}, \ldots, x_{n}\right]$-module, then $C$ is perfect as a $A\left[x_{1}, \ldots, x_{n}\right]$-module. This is More on Algebra, Lemma 15.61.12.

069C Lemma 36.43.11. Let $f: X \rightarrow S$ be a pseudo-coherent morphism of schemes. The following are equivalent
(1) $f$ is perfect,
(2) $\mathcal{O}_{X}$ locally has finite tor dimension as a sheaf of $f^{-1} \mathcal{O}_{S}$-modules, and
(3) for all $x \in X$ the ring $\mathcal{O}_{X, x}$ has finite tor dimension as an $\mathcal{O}_{S, f(x)}$-module.

Proof. The problem is local on $X$ and $S$. Hence we may assume that $X=\operatorname{Spec}(B)$, $S=\operatorname{Spec}(A)$ and $f$ corresponds to a pseudo-coherent ring map $A \rightarrow B$.
If (1) holds, then $B$ has finite tor dimension $d$ as $A$-module. Then $B_{\mathfrak{q}}$ has tor dimension $d$ as an $A_{\mathfrak{p}}$-module for all primes $\mathfrak{q} \subset B$ with $\mathfrak{p}=A \cap \mathfrak{q}$, see More on Algebra, Lemma 15.55 .14 Then $\mathcal{O}_{X}$ has tor dimension $d$ as a sheaf of $f^{-1} \mathcal{O}_{S^{-}}$ modules by Cohomology, Lemma 20.40.5. Thus (1) implies (2).

By Cohomology, Lemma 20.40.5 (2) implies (3).
Assume (3). We cannot use More on Algebra, Lemma 15.55 .14 to conclude as we are not given that the tor dimension of $B_{\mathfrak{q}}$ over $A_{\mathfrak{p}}$ is bounded independent of $\mathfrak{q}$. Choose a presentation $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$. Then $B$ is pseudo-coherent as a $A\left[x_{1}, \ldots, x_{n}\right]$-module. Let $\mathfrak{q} \subset A\left[x_{1}, \ldots, x_{n}\right]$ be a prime ideal lying over $\mathfrak{p} \subset A$. Then either $B_{\mathfrak{q}}$ is zero or by assumption it has finite tor dimension as an $A_{\mathfrak{p}}$ module. Since the fibres of $A \rightarrow A\left[x_{1}, \ldots, x_{n}\right]$ have finite global dimension, we can apply More on Algebra, Lemma 15.63 .7 to $A_{\mathfrak{p}} \rightarrow A\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}$ to see that $B_{\mathfrak{q}}$ is a perfect $A\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}$-module. Hence $B$ is a perfect $A\left[x_{1}, \ldots, x_{n}\right]$-module by More on Algebra, Lemma 15.63.6. Thus $A \rightarrow B$ is a perfect ring map by definition.
0B6G Lemma 36.43.12. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a perfect proper morphism of schemes. Let $E \in D\left(\mathcal{O}_{X}\right)$ be perfect. Then $R f_{*} E$ is a perfect object of $D\left(\mathcal{O}_{S}\right)$.

Proof. We claim that Derived Categories of Schemes, Lemma 35.19.1 applies. Conditions (1) and (2) are immediate. Condition (3) is local on $X$. Thus we may assume $X$ and $S$ affine and $E$ represented by a strictly perfect complex of $\mathcal{O}_{X}$-modules. Thus it suffices to show that $\mathcal{O}_{X}$ has finite tor dimension as a sheaf of $f^{-1} \mathcal{O}_{S^{-}}$ modules. This is equivalent to being perfect by Lemma 36.43.11.
069D Lemma 36.43.13. The property $\mathcal{P}(f)=$ " $f$ is perfect" is fppf local on the source.
Proof. Let $\left\{g_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering of schemes and let $f: X \rightarrow S$ be a morphism such that each $f \circ g_{i}$ is perfect. By Lemma 36.42 .13 we conclude that $f$ is pseudo-coherent. Hence by Lemma 36.43 .11 it suffices to check that $\mathcal{O}_{X, x}$ is an $\mathcal{O}_{S, f(x)}$-module of finite tor dimension for all $x \in X$. Pick $i \in I$ and $x_{i} \in X_{i}$ mapping to $x$. Then we see that $\mathcal{O}_{X_{i}, x_{i}}$ has finite tor dimension over $\mathcal{O}_{S, f(x)}$ and that $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X_{i}, x_{i}}$ is faithfully flat. The desired conclusion follows from More on Algebra, Lemma 15.55.16.

09RK Lemma 36.43.14. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of schemes. Assume
(1) $X$ is locally Noetherian,
(2) $j \circ i$ is a regular immersion, and
(3) $i$ is perfect.

Then $i$ and $j$ are regular immersions.
Proof. Since $X$ (and hence $Y$ ) is locally Noetherian all 4 types of regular immersions agree, and moreover we may check whether a morphism is a regular immersion on the level of local rings, see Divisors, Lemma 30.17.8. Thus the result follows from Divided Power Algebra, Lemma 23.7.5.

### 36.44. Local complete intersection morphisms

068 E In Divisors, Section 30.18 we have defined 4 different types of regular immersions: regular, Koszul-regular, $H_{1}$-regular, and quasi-regular. In this section we consider morphisms $f: X \rightarrow S$ which locally on $X$ factors as

where $i$ is a $*$-regular immersion for $* \in\left\{\emptyset, K\right.$ oszul, $\left.H_{1}, q u a s i\right\}$. However, we don't know how to prove that this condition is independent of the factorization if $*=\emptyset$, i.e., when we require $i$ to be a regular immersion. On the other hand, we want a local complete intersection morphism to be perfect, which is only going to be true if $*=$ Koszul or $*=\emptyset$. Hence we will define a local complete intersection morphism or Koszul morphism to be a morphism of schemes $f: X \rightarrow S$ that locally on $X$ has a factorization as above with $i$ a Koszul-regular immersion. To see that this works we first prove this is independent of the chosen factorizations.

069E Lemma 36.44.1. Let $S$ be a scheme. Let $U, P, P^{\prime}$ be schemes over $S$. Let $u \in U$. Let $i: U \rightarrow P, i^{\prime}: U \rightarrow P^{\prime}$ be immersions over $S$. Assume $P$ and $P^{\prime}$ smooth over $S$. Then the following are equivalent
(1) $i$ is a Koszul-regular immersion in a neighbourhood of $x$, and
(2) $i^{\prime}$ is a Koszul-regular immersion in a neighbourhood of $x$.

Proof. Assume $i$ is a Koszul-regular immersion in a neighbourhood of $x$. Consider the morphism $j=\left(i, i^{\prime}\right): U \rightarrow P \times_{S} P^{\prime}=P^{\prime \prime}$. Since $P^{\prime \prime}=P \times_{S} P^{\prime} \rightarrow P$ is smooth, it follows from Divisors, Lemma 30.19.8 that $j$ is a Koszul-regular immersion, whereupon it follows from Divisors, Lemma 30.19.11 that $i^{\prime}$ is a Koszul-regular immersion.

Before we state the definition, let us make the following simple remark. Let $f$ : $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $x \in X$. Then there exist an open neighbourhood $U \subset X$ and a factorization of $\left.f\right|_{U}$ as the composition of an immersion $i: U \rightarrow \mathbf{A}_{S}^{n}$ followed by the projection $\mathbf{A}_{S}^{n} \rightarrow S$ which is smooth. Picture

In fact you can do this with any affine open neighbourhood $U$ of $x$ in $X$, see Morphisms, Lemma 28.39.2.
069F Definition 36.44.2. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) Let $x \in X$. We say that $f$ is Koszul at $x$ if $f$ is of finite type at $x$ and there exists an open neighbourhood and a factorization of $\left.f\right|_{U}$ as $\pi \circ i$ where $i: U \rightarrow P$ is a Koszul-regular immersion and $\pi: P \rightarrow S$ is smooth.
(2) We say $f$ is a Koszul morphism, or that $f$ is a local complete intersection morphism if $f$ is Koszul at every point.

We have seen above that the choice of the factorization $\left.f\right|_{U}=\pi \circ i$ is irrelevant, i.e., given a factorization of $\left.f\right|_{U}$ as an immersion $i$ followed by a smooth morphism $\pi$, whether or not $i$ is Koszul regular in a neighbourhood of $x$ is an intrinsic property of $f$ at $x$. Let us record this here explicitly as a lemma so that we can refer to it
069G Lemma 36.44.3. Let $f: X \rightarrow S$ be a local complete intersection morphism. Let $P$ be a scheme smooth over $S$. Let $U \subset X$ be an open subscheme and $i: U \rightarrow P$ an immersion of schemes over $S$. Then $i$ is a Koszul-regular immersion.
Proof. This is the defining property of a local complete intersection morphism. See discussion above.

It seems like a good idea to collect here some properties in common with all Koszul morphisms.

069H Lemma 36.44.4. Let $f: X \rightarrow S$ be a local complete intersection morphism. Then
(1) $f$ is locally of finite presentation,
(2) $f$ is pseudo-coherent, and
(3) $f$ is perfect.

Proof. Since a perfect morphism is pseudo-coherent (because a perfect ring map is pseudo-coherent) and a pseudo-coherent morphism is locally of finite presentation (because a pseudo-coherent ring map is of finite presentation) it suffices to prove the last statement. Being perfect is a local property, hence we may assume that $f$ factors as $\pi \circ i$ where $\pi$ is smooth and $i$ is a Koszul-regular immersion. A Koszulregular immersion is perfect, see Lemma 36.43.7 A smooth morphism is perfect as
it is flat and locally of finite presentation, see Lemma 36.43.5. Finally a composition of perfect morphisms is perfect, see Lemma 36.43.4.
07DB Lemma 36.44.5. Let $f: X=\operatorname{Spec}(B) \rightarrow S=\operatorname{Spec}(A)$ be a morphism of affine schemes. Then $f$ is a local complete intersection morphism if and only if $A \rightarrow B$ is a local complete intersection homomorphism, see More on Algebra, Definition 15.25.2

Proof. Follows immediately from the definitions.
Beware that a base change of a Koszul morphism is not Koszul in general.
069I Lemma 36.44.6. A flat base change of a local complete intersection morphism is a local complete intersection morphism.

Proof. Omitted. Hint: This is true because a base change of a smooth morphism is smooth and a flat base change of a Koszul-regular immersion is a Koszul-regular immersion, see Divisors, Lemma 30.18.3.

069J Lemma 36.44.7. A composition of local complete intersection morphisms is a local complete intersection morphism.

Proof. Let $g: Y \rightarrow S$ and $f: X \rightarrow Y$ be local complete intersection morphisms. Let $x \in X$ and set $y=f(x)$. Choose an open neighbourhood $V \subset Y$ of $y$ and a factorization $\left.g\right|_{V}=\pi \circ i$ for some Koszul-regular immersion $i: V \rightarrow P$ and smooth morphism $\pi: P \rightarrow S$. Next choose an open neighbourhood $U$ of $x \in X$ and a factorization $\left.f\right|_{U}=\pi^{\prime} \circ i^{\prime}$ for some Koszul-regular immersion $i^{\prime}: U \rightarrow P^{\prime}$ and smooth morphism $\pi^{\prime}: P^{\prime} \rightarrow Y$. In fact, we may assume that $P^{\prime}=\mathbf{A}_{V}^{n}$, see discussion preceding and following Definition 36.44.2. Picture:

Set $P^{\prime \prime}=\mathbf{A}_{P}^{n}$. Then $U \rightarrow P^{\prime} \rightarrow P^{\prime \prime}$ is a Koszul-regular immersion as a composition of Koszul-regular immersions, namely $i^{\prime}$ and the flat base change of $i$ via $P^{\prime \prime} \rightarrow P$, see Divisors, Lemma 30.18 .3 and Divisors, Lemma 30.18.7. Also $P^{\prime \prime} \rightarrow P \rightarrow S$ is smooth as a composition of smooth morphisms, see Morphisms, Lemma 28.34.4. Hence we conclude that $X \rightarrow S$ is Koszul at $x$ as desired.

069K Lemma 36.44.8. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $f$ is flat and a local complete intersection morphism, and
(2) $f$ is syntomic.

Proof. Assume (2). By Morphisms, Lemma 28.31 .10 for every point $x$ of $X$ there exist affine open neighbourhoods $U$ of $x$ and $V$ of $f(x)$ such that $\left.f\right|_{U}: U \rightarrow V$ is standard syntomic. This means that $U=\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)\right) \rightarrow V=$ $\operatorname{Spec}(R)$ where $R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a relative global complete intersection over $R$. By Algebra, Lemma 10.134 .13 the sequence $f_{1}, \ldots, f_{c}$ is a regular sequence
in each local ring $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}$ for every prime $\mathfrak{q} \supset\left(f_{1}, \ldots, f_{c}\right)$. Consider the Koszul complex $K_{\bullet}=K_{\bullet}\left(R\left[x_{1}, \ldots, x_{n}\right], f_{1}, \ldots, f_{c}\right)$ with homology groups $H_{i}=$ $H_{i}\left(K_{\bullet}\right)$. By More on Algebra, Lemma 15.23 .2 we see that $\left(H_{i}\right)_{\mathfrak{q}}=0, i>0$ for every $\mathfrak{q}$ as above. On the other hand, by More on Algebra, Lemma 15.22.6 we see that $H_{i}$ is annihilated by $\left(f_{1}, \ldots, f_{c}\right)$. Hence we see that $H_{i}=0, i>0$ and $f_{1}, \ldots, f_{c}$ is a Koszul-regular sequence. This proves that $U \rightarrow V$ factors as a Koszul-regular immersion $U \rightarrow \mathbf{A}_{V}^{n}$ followed by a smooth morphism as desired.

Assume (1). Then $f$ is a flat and locally of finite presentation (Lemma 36.44.4). Hence, according to Morphisms, Lemma 28.31 .10 it suffices to show that the local rings $\mathcal{O}_{X_{s}, x}$ are local complete intersection rings. Choose, locally on $X$, a factorization $f=\pi \circ i$ for some Koszul-regular immersion $i: X \rightarrow P$ and smooth morphism $\pi: P \rightarrow S$. Note that $X \rightarrow P$ is a relative quasi-regular immersion over $S$, see Divisors, Definition 30.19.2. Hence according to Divisors, Lemma 30.19.4 we see that $X \rightarrow P$ is a regular immersion and the same remains true after any base change. Thus each fibre is a regular immersion, whence all the local rings of all the fibres of $X$ are local complete intersections.

069L Lemma 36.44.9. A regular immersion of schemes is a local complete intersection morphism. A Koszul-regular immersion of schemes is a local complete intersection morphism.

Proof. Since a regular immersion is a Koszul-regular immersion, see Divisors, Lemma 30.18.2, it suffices to prove the second statement. The second statement follows immediately from the definition.

069M Lemma 36.44.10. Let

be a commutative diagram of morphisms of schemes. Assume $Y \rightarrow S$ smooth and $X \rightarrow S$ is a local complete intersection morphism. Then $f: X \rightarrow Y$ is a local complete intersection morphism.

Proof. Immediate from the definitions.
The following lemma is of a different nature.
09RL Lemma 36.44.11. Let

be a commutative diagram of morphisms of schemes. Assume
(1) $S$ is locally Noetherian,
(2) $Y \rightarrow S$ is locally of finite type,
(3) $f: X \rightarrow Y$ is perfect,
(4) $X \rightarrow S$ is a local complete intersection morphism.

Then $X \rightarrow Y$ is a local complete intersection morphism and $Y \rightarrow S$ is Koszul at $f(x)$ for all $x \in X$.

Proof. In the course of this proof all schemes will be locally Noetherian and all rings will be Noetherian. We will use without further mention that regular sequences and Koszul regular sequences agree in this setting, see More on Algebra, Lemma 15.23.6. Moreover, whether an ideal (resp. ideal sheaf) is regular may be checked on local rings (resp. stalks), see Algebra, Lemma 10.67 .6 (resp. Divisors, Lemma 30.17.8

The question is local. Hence we may assume $S, X, Y$ are affine. In this situation we may choose a commutative diagram

whose horizontal arrows are closed immersions. Let $x \in X$ be a point and consider the corresponding commutative diagram of local rings

where $J$ and $I$ are the kernels of the horizontal arrows. Since $X \rightarrow S$ is a local complete intersection morphism, the ideal $J$ is generated by a regular sequence. Since $X \rightarrow Y$ is perfect the ring $\mathcal{O}_{X, x}$ has finite tor dimension over $\mathcal{O}_{Y, f(x)}$. Hence we may apply Divided Power Algebra, Lemma 23.7.6 to conclude that $I$ and $J / I$ are generated by regular sequences. By our initial remarks, this finishes the proof.

069N Lemma 36.44.12. The property $\mathcal{P}(f)=" f$ is a local complete intersection morphism" is fpqc local on the base.

Proof. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\left\{S_{i} \rightarrow S\right\}$ be an fpqc covering of $S$. Assume that each base change $f_{i}: X_{i} \rightarrow S_{i}$ of $f$ is a local complete intersection morphism. Note that this implies in particular that $f$ is locally of finite type, see Lemma 36.44.4 and Descent, Lemma 34.19.8. Let $x \in X$. Choose an open neighbourhood $U$ of $x$ and an immersion $j: U \rightarrow \mathbf{A}_{S}^{n}$ over $S$ (see discussion preceding Definition 36.44.2 . We have to show that $j$ is a Koszul-regular immersion. Since $f_{i}$ is a local complete intersection morphism, we see that the base change $j_{i}: U \times_{S} S_{i} \rightarrow \mathbf{A}_{S_{i}}^{n}$ is a Koszul-regular immersion, see Lemma 36.44.3. Because $\left\{\mathbf{A}_{S_{i}}^{n} \rightarrow \mathbf{A}_{S}^{n}\right\}$ is a fpqc covering we see from Descent, Lemma 34.19.30 that $j$ is a Koszul-regular immersion as desired.

069P Lemma 36.44.13. The property $\mathcal{P}(f)=" f$ is a local complete intersection morphism" is syntomic local on the source.

Proof. We will use the criterion of Descent, Lemma 34.22 .3 to prove this. It follows from Lemmas 36.44 .8 and 36.44 .7 that being a local complete intersection morphism is preserved under precomposing with syntomic morphisms. It is clear
from Definition 36.44 .2 that being a local complete intersection morphism is Zariski local on the source and target. Hence, according to the aforementioned Descent, Lemma 34.22 .3 it suffices to prove the following: Suppose $X^{\prime} \rightarrow X \rightarrow Y$ are morphisms of affine schemes with $X^{\prime} \rightarrow X$ syntomic and $X^{\prime} \rightarrow Y$ a local complete intersection morphism. Then $X \rightarrow Y$ is a local complete intersection morphism. To see this, note that in any case $X \rightarrow Y$ is of finite presentation by Descent, Lemma 34.10.1. Choose a closed immersion $X \rightarrow \mathbf{A}_{Y}^{n}$. By Algebra, Lemma 10.134.18 we can find an affine open covering $X^{\prime}=\bigcup_{i=1, \ldots, n} X_{i}^{\prime}$ and syntomic morphisms $W_{i} \rightarrow \mathbf{A}_{Y}^{n}$ lifting the morphisms $X_{i}^{\prime} \rightarrow X$, i.e., such that there are fibre product diagrams

After replacing $X^{\prime}$ by $\coprod X_{i}^{\prime}$ and setting $W=\amalg W_{i}$ we obtain a fibre product diagram of affine schemes

with $h: W \rightarrow \mathbf{A}_{Y}^{n}$ syntomic and $X^{\prime} \rightarrow Y$ still a local complete intersection morphism. Since $W \rightarrow \mathbf{A}_{Y}^{n}$ is open (see Morphisms, Lemma 28.25 .9 ) and $X^{\prime} \rightarrow X$ is surjective we see that $X$ is contained in the image of $W \rightarrow \mathbf{A}_{Y}^{n}$. Choose a closed immersion $W \rightarrow \mathbf{A}_{Y}^{n+m}$ over $\mathbf{A}_{Y}^{n}$. Now the diagram looks like

Because $h$ is syntomic and hence a local complete intersection morphism (see above) the morphism $W \rightarrow \mathbf{A}_{Y}^{n+m}$ is a Koszul-regular immersion. Because $X^{\prime} \rightarrow Y$ is a local complete intersection morphism the morphism $X^{\prime} \rightarrow \mathbf{A}_{Y}^{n+m}$ is a Koszulregular immersion. We conclude from Divisors, Lemma 30.18 .8 that $X^{\prime} \rightarrow W$ is a Koszul-regular immersion. Hence, since being a Koszul-regular immersion is fpqc local on the target (see Descent, Lemma 34.19.30 we conclude that $X \rightarrow \mathbf{A}_{Y}^{n}$ is a Koszul-regular immersion which is what we had to show.

06B8 Lemma 36.44.14. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Assume both $X$ and $Y$ are flat and locally of finite presentation over $S$. Then the set

$$
\{x \in X \mid f \text { Koszul at } x\}
$$

is open in $X$ and its formation commutes with arbitrary base change $S^{\prime} \rightarrow S$.
Proof. The set is open by definition (see Definition 36.44.2). Let $S^{\prime} \rightarrow S$ be a morphism of schemes. Set $X^{\prime}=S^{\prime} \times_{S} X, Y^{\prime}=S^{\prime} \times_{S} Y$, and denote $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ the base change of $f$. Let $x^{\prime} \in X^{\prime}$ be a point such that $f^{\prime}$ is Koszul at $x^{\prime}$. Denote $s^{\prime} \in S^{\prime}, x \in X, y^{\prime} \in Y^{\prime}, y \in Y, s \in S$ the image of $x^{\prime}$. Note that $f$ is locally of
finite presentation, see Morphisms, Lemma 28.21.11. Hence we may choose an affine neighbourhood $U \subset X$ of $x$ and an immersion $i: U \rightarrow \mathbf{A}_{Y}^{n}$. Denote $U^{\prime}=S^{\prime} \times{ }_{S} U$ and $i^{\prime}: U^{\prime} \rightarrow \mathbf{A}_{Y^{\prime}}^{n}$ the base change of $i$. The assumption that $f^{\prime}$ is Koszul at $x^{\prime}$ implies that $i^{\prime}$ is a Koszul-regular immersion in a neighbourhood of $x^{\prime}$, see Lemma 36.44.3. The scheme $X^{\prime}$ is flat and locally of finite presentation over $S^{\prime}$ as a base change of $X$ (see Morphisms, Lemmas 28.25.7 and 28.21.4). Hence $i^{\prime}$ is a relative $H_{1}$-regular immersion over $S^{\prime}$ in a neighbourhood of $x^{\prime}$ (see Divisors, Definition 30.19 .2 . Thus the base change $i_{s^{\prime}}^{\prime}: U_{s^{\prime}}^{\prime} \rightarrow \mathbf{A}_{Y_{s^{\prime}}^{\prime}}^{n}$ is a $H_{1}$-regular immersion in an open neighbourhood of $x^{\prime}$, see Divisors, Lemma 30.19.1 and the discussion following Divisors, Definition 30.19.2. Since $s^{\prime}=\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right) \rightarrow \operatorname{Spec}(\kappa(s))=s$ is a surjective flat universally open morphism (see Morphisms, Lemma 28.23.4) we conclude that the base change $i_{s}: U_{s} \rightarrow \mathbf{A}_{Y_{s}}^{n}$ is an $H_{1}$-regular immersion in a neighbourhood of $x$, see Descent, Lemma 34.19 .30 . Finally, note that $\mathbf{A}_{Y}^{n}$ is flat and locally of finite presentation over $S$, hence Divisors, Lemma 30.19 .6 implies that $i$ is a (Koszul)regular immersion in a neighbourhood of $x$ as desired.

06B9 Lemma 36.44.15. Let $f: X \rightarrow Y$ be a local complete intersection morphism of schemes. Then $f$ is unramified if and only if $f$ is formally unramified and in this case the conormal sheaf $\mathcal{C}_{X / Y}$ is finite locally free on $X$.

Proof. The first assertion follows immediately from Lemma 36.4 .8 and the fact that a local complete intersection morphism is locally of finite type. To compute the conormal sheaf of $f$ we choose, locally on $X$, a factorization of $f$ as $f=p \circ i$ where $i: X \rightarrow V$ is a Koszul-regular immersion and $V \rightarrow Y$ is smooth. By Lemma 36.9 .11 we see that $\mathcal{C}_{X / Y}$ is a locally direct summand of $\mathcal{C}_{X / V}$ which is finite locally free as $i$ is a Koszul-regular (hence quasi-regular) immersion, see Divisors, Lemma 30.18 .5

06BA Lemma 36.44.16. Let $Z \rightarrow Y \rightarrow X$ be formally unramified morphisms of schemes. Assume that $Z \rightarrow Y$ is a local complete intersection morphism. The exact sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

of Lemma 36.5.12 is short exact.
Proof. The question is local on $Z$ hence we may assume there exists a factorization $Z \rightarrow \mathbf{A}_{Y}^{n} \rightarrow Y$ of the morphism $Z \rightarrow Y$. Then we get a commutative diagram

As $Z \rightarrow Y$ is a local complete intersection morphism, we see that $Z \rightarrow \mathbf{A}_{Y}^{n}$ is a Koszul-regular immersion. Hence by Divisors, Lemma 30.18.6 the sequence

$$
0 \rightarrow\left(i^{\prime}\right)^{*} \mathcal{C}_{\mathbf{A}_{Y}^{n} / \mathbf{A}_{X}^{n}} \rightarrow \mathcal{C}_{Z / \mathbf{A}_{X}^{n}} \rightarrow \mathcal{C}_{Z / \mathbf{A}_{Y}^{n}} \rightarrow 0
$$

is exact and locally split. Note that $i^{*} \mathcal{C}_{Y / X}=\left(i^{\prime}\right)^{*} \mathcal{C}_{\mathbf{A}_{Y}^{n} / \mathbf{A}_{X}^{n}}$ by Lemma 36.5.7 and note that the diagram

is commutative. Hence the lower horizontal arrow is a locally split injection. This proves the lemma.

### 36.45. Exact sequences of differentials and conormal sheaves

06 BB In this section we collect some results on exact sequences of conormal sheaves and sheaves of differentials. In some sense these are all realizations of the triangle of cotangent complexes associated to a pair of composable morphisms of schemes.

In the sequences below each of the maps are as constructed in either Morphisms, Lemma 28.33.8 or Lemma 36.5.5 Let $g: Z \rightarrow Y$ and $f: Y \rightarrow X$ be morphisms of schemes.
(1) There is a canonical exact sequence

$$
g^{*} \Omega_{Y / X} \rightarrow \Omega_{Z / X} \rightarrow \Omega_{Z / Y} \rightarrow 0
$$

see Morphisms, Lemma 28.33.9. If $g: Z \rightarrow Y$ is formally smooth, then this sequence is a short exact sequence, see Lemma 36.9.9.
(2) If $g$ is formally unramified, then there is a canonical exact sequence

$$
\mathcal{C}_{Z / Y} \rightarrow g^{*} \Omega_{Y / X} \rightarrow \Omega_{Z / X} \rightarrow 0
$$

see Lemma 36.5.10. If $f \circ g: Z \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 36.9.10.
(3) If $g$ and $f \circ g$ are formally unramified, then there is a canonical exact sequence

$$
\mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow g^{*} \Omega_{Y / X} \rightarrow 0
$$

see Lemma 36.5.11. If $f: Y \rightarrow X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 36.9.11.
(4) If $g$ and $f$ are formally unramified, then there is a canonical exact sequence

$$
g^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

see Lemma 36.5.12. If $g: Z \rightarrow Y$ is a local complete intersection morphism, then this sequence is a short exact sequence, see Lemma 36.44.16.

### 36.46. Weakly étale morphisms

$094 \mathrm{~N} \quad$ A ring homomorphism $A \rightarrow B$ is weakly étale if both $A \rightarrow B$ and $B \otimes_{A} B \rightarrow B$ are flat, see More on Algebra, Definition 15.78.1. The analogous notion for morphisms of schemes is the following.

094P Definition 36.46.1. A morphism of schemes $X \rightarrow Y$ is weakly étale or absolutely flat if both $X \rightarrow Y$ and the diagonal morphism $X \rightarrow X \times_{Y} X$ are flat.

An étale morphism is weakly étale and conversely it turns out that a weakly étale morphism is indeed somewhat like an étale morphism. For example, if $X \rightarrow Y$ is weakly étale, then $L_{X / Y}=0$, as follows from Cotangent, Lemma 75.8.4. We will prove a very precise result relating weakly étale morphisms to étale morphisms later (see Pro-étale Cohomology, Section 51.9). In this section we stick with the basics.
094Q Lemma 36.46.2. Let $f: X \rightarrow Y$ be a morphism of schemes. The following are equivalent
(1) $X \rightarrow Y$ is weakly étale, and
(2) for every $x \in X$ the ring map $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is weakly étale.

Proof. Observe that under both assumptions (1) and (2) the morphism $f$ is flat. Thus we may assume $f$ is flat. Let $x \in X$ with image $y=f(x)$ in $Y$. There are canonical maps of rings

$$
\mathcal{O}_{X, x} \otimes \mathcal{O}_{Y, y} \mathcal{O}_{X, x} \longrightarrow \mathcal{O}_{X \times_{Y} X, \Delta_{X / Y}(x)} \longrightarrow \mathcal{O}_{X, x}
$$

where the first map is a localization (hence flat) and the second map is a surjection (hence an epimorphism of rings). Condition (1) means that for all $x$ the second arrow is flat. Condition (2) is that for all $x$ the composition is flat. These conditions are equivalent by Algebra, Lemma 10.38 .4 and More on Algebra, Lemma 15.78 .2 .

094R Lemma 36.46.3. Let $X \rightarrow Y$ be a morphism of schemes such that $X \rightarrow X \times_{Y} X$ is flat. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. If $\mathcal{F}$ is flat over $Y$, then $\mathcal{F}$ is flat over $X$.

Proof. Let $x \in X$ with image $y=f(x)$ in $Y$. Since $X \rightarrow X \times_{Y} X$ is flat, we see that $\mathcal{O}_{X, x} \otimes_{\mathcal{O}_{Y, y}} \mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X, x}$ is flat. Hence the result follows from More on Algebra, Lemma 15.78 .2 and the definitions.

094S Lemma 36.46.4. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is weakly étale.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is weakly étale.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is weakly étale.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is of weakly étale, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is weakly étale then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is weakly-étale.
Proof. Suppose given open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$. Then $U \times_{V} U \subset X \times_{Y} X$ is open (Schemes, Lemma 25.17.3) and the diagonal $\Delta_{U / V}$ of $\left.f\right|_{U}: U \rightarrow V$ is the restriction $\left.\Delta_{X / Y}\right|_{U}: U \rightarrow U \times_{V} U$. Since flatness is a local property of morphisms of schemes (Morphisms, Lemma 28.25.3) the final statement of the lemma is follows as well as the equivalence of (1) and (3). If $X$ and $Y$ are affine, then $X \rightarrow Y$ is weakly étale if and only if $\mathcal{O}_{Y}(Y) \rightarrow \mathcal{O}_{X}(X)$ is weakly étale (use again Morphisms, Lemma 28.25.3). Thus (1) and (3) are also equivalent to (2) and (4).

094T Lemma 36.46.5. Let $X \rightarrow Y \rightarrow Z$ be morphisms of schemes.
(1) If $X \rightarrow X \times_{Y} X$ and $Y \rightarrow Y \times_{Z} Y$ are flat, then $X \rightarrow X \times_{Z} X$ is flat.
(2) If $X \rightarrow Y$ and $Y \rightarrow Z$ are weakly étale, then $X \rightarrow Z$ is weakly étale.

Proof. Part (1) follows from the factorization

$$
X \rightarrow X \times_{Y} X \rightarrow X \times_{Z} X
$$

of the diagonal of $X$ over $Z$, the fact that

$$
X \times_{Y} X=\left(X \times_{Z} X\right) \times_{\left(Y \times_{Z} Y\right)} Y
$$

the fact that a base change of a flat morphism is flat, and the fact that the composition of flat morphisms is flat (Morphisms, Lemmas 28.25.7 and 28.25.5). Part (2) follows from part (1) and the fact (just used) that the composition of flat morphisms is flat.

094U Lemma 36.46.6. Let $X \rightarrow Y$ and $Y^{\prime} \rightarrow Y$ be morphisms of schemes and let $X^{\prime}=Y^{\prime} \times_{Y} X$ be the base change of $X$.
(1) If $X \rightarrow X \times_{Y} X$ is flat, then $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is flat.
(2) If $X \rightarrow Y$ is weakly étale, then $X^{\prime} \rightarrow Y^{\prime}$ is weakly étale.

Proof. Assume $X \rightarrow X \times_{Y} X$ is flat. The morphism $X^{\prime} \rightarrow X^{\prime} \times_{Y^{\prime}} X^{\prime}$ is the base change of $X \rightarrow X \times_{Y} X$ by $Y^{\prime} \rightarrow Y$. Hence it is flat by Morphisms, Lemmas 28.25.7. This proves (1). Part (2) follows from (1) and the fact (just used) that the base change of a flat morphism is flat.

094V Lemma 36.46.7. Let $X \rightarrow Y \rightarrow Z$ be morphisms of schemes. Assume that $X \rightarrow Y$ is flat and surjective and that $X \rightarrow X \times_{Z} X$ is flat. Then $Y \rightarrow Y \times_{Z} Y$ is flat.

Proof. Consider the commutative diagram

The top horizontal arrow is flat and the vertical arrows are flat. Hence $X$ is flat over $Y \times_{Z} Y$. By Morphisms, Lemma 28.25.11 we see that $Y$ is flat over $Y \times{ }_{Z} Y$.

094W Lemma 36.46.8. Let $f: X \rightarrow Y$ be a weakly étale morphism of schemes. Then $f$ is formally unramified, i.e., $\Omega_{X / Y}=0$.

Proof. Recall that $f$ is formally unramified if and only if $\Omega_{X / Y}=0$ by Lemma 36.4.7. Via Lemma 36.46 .4 and Morphisms, Lemma 28.33 .5 this follows from the case of rings which is More on Algebra, Lemma 15.78 .12

094X Lemma 36.46.9. Let $f: X \rightarrow Y$ be a morphism of schemes. Then $X \rightarrow Y$ is weakly étale in each of the following cases
(1) $X \rightarrow Y$ is a flat monomorphism,
(2) $X \rightarrow Y$ is an open immersion,
(3) $X \rightarrow Y$ is flat and unramified,
(4) $X \rightarrow Y$ is étale.

Proof. If (1) holds, then $\Delta_{X / Y}$ is an isomorphism, hence certainly $f$ is weakly étale. Case (2) is a special case of (1). The diagonal of an unramified morphism is an open immersion (Morphisms, Lemma 28.35.13), hence flat. Thus a flat unramified morphism is weakly étale. An étale morphism is flat and unramified (Morphisms, Lemma 28.36.5), hence (4) follows from (3).

094Y Lemma 36.46.10. Let $f: X \rightarrow Y$ be a morphism of schemes. If $Y$ is reduced and $f$ weakly étale, then $X$ is reduced.

Proof. Via Lemma 36.46 .4 this follows from the case of rings which is More on Algebra, Lemma 15.78 .8 .

The following lemma uses a nontrivial result about weakly étale ring maps.
094Z Lemma 36.46.11. Let $f: X \rightarrow Y$ be a morphism of schemes. The following are equivalent
(1) $f$ is weakly étale, and
(2) for $x \in X$ the local ring map $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ induces an isomorphism on strict henselizations.

Proof. Let $x \in X$ be a point with image $y=f(x)$ in $Y$. Choose a separable algebraic closure $\kappa^{s e p}$ of $\kappa(x)$. Let $\mathcal{O}_{X, x}^{s h}$ be the strict henselization corresponding to $\kappa^{s e p}$ and $\mathcal{O}_{Y, y}^{s h}$ the strict henselization relative to the separable algebraic closure of $\kappa(y)$ in $\kappa^{\text {sep }}$. Consider the commutative diagram

local homomorphisms of local rings, see Algebra, Lemma 10.148.26. Since the strict henselization is a filtered colimit of étale ring maps, More on Algebra, Lemma 15.78 .13 shows the horizontal maps are weakly étale. Moreover, the horizontal maps are faithfully flat by More on Algebra, Lemma 15.36 .1 .
Assume $f$ weakly étale. By Lemma 36.46 .2 the left vertical arrow is weakly étale. By More on Algebra, Lemmas 15.78.9and 15.78.11 the right vertical arrow is weakly étale. By More on Algebra, Theorem 15.78 .24 we conclude the right vertical map is an isomorphism.
Assume $\mathcal{O}_{Y, y}^{s h} \rightarrow \mathcal{O}_{X, x}^{s h}$ is an isomorphism. Then $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}^{s h}$ is weakly étale. Since $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X, x}^{s h}$ is faithfully flat we conclude that $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ is weakly étale by More on Algebra, Lemma 15.78.10. Thus (2) implies (1) by Lemma 36.46.2.

0950 Lemma 36.46.12. Let $f: X \rightarrow Y$ be a morphism of schemes. If $Y$ is a normal scheme and $f$ weakly étale, then $X$ is a normal scheme.

Proof. By More on Algebra, Lemma 15.36.6 a scheme $S$ is normal if and only if for all $s \in S$ the strict henselization of $\mathcal{O}_{S, s}$ is a normal domain. Hence the lemma follows from Lemma 36.46.11.

0951 Lemma 36.46.13. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. If $X, Y$ are weakly étale over $S$, then $f$ is weakly étale.

Proof. We will use Morphisms, Lemmas 28.25.7 and 28.25.5 without further mention. Write $X \rightarrow Y$ as the composition $X \rightarrow X \times{ }_{S} Y \rightarrow Y$. The second morphism is flat as the base change of the flat morphism $X \rightarrow S$. The first is the base change of the flat morphism $Y \rightarrow Y \times_{S} Y$ by the morphism $X \times_{S} Y \rightarrow Y \times_{S} Y$, hence flat. Thus $X \rightarrow Y$ is flat. The morphism $X \times_{Y} X \rightarrow X \times_{S} X$ is an immersion. Thus Lemma 36.46 .3 implies, that since $X$ is flat over $X \times_{S} X$ it follows that $X$ is flat over $X \times{ }_{Y} X$.

### 36.47. Reduced fibre theorem

09IJ In this section we discuss the simplest kind of theorem of the kind advertised by the title. Although the proof of the result is kind of laborious, in essence it follows in a straightforward manner from Epp's result on eliminating ramification, see More on Algebra, Theorem 15.82.23

Let $A$ be a Dedekind domain with fraction field $K$. Let $X$ be a scheme flat and of finite type over $A$. Let $L$ be a finite extension of $K$. Let $B$ be the integral closure of $A$ in $L$. Then $B$ is a Dedekind domain (Algebra, Lemma 10.119.16). Let $X_{B}=X \times_{\operatorname{Spec}(A)} \operatorname{Spec}(B)$ be the base change. Then $X_{B} \rightarrow \operatorname{Spec}(B)$ is of finite type (Morphisms, Lemma 28.15.4). Hence $X_{B}$ is Noetherian (Morphisms, Lemma 28.15.6). Thus the normalization $\nu: Y \rightarrow X_{B}$ exists (see Morphisms, Definition 28.49 .1 and the discussion following). Picture

09IK (36.47.0.1)

We sometimes call $Y$ the normalized base change of $X$. In general the morphism $\nu$ may not be finite. But if $A$ is a Nagata ring (a condition that is virtually always satisfied in practice) then $\nu$ is of finite and $Y$ is of finite type over $B$, see Morphisms, Lemmas 28.49.7 and 28.18.1.

Taking the normalized base change commutes with composition. More precisely, if $K \subset L \subset M$ are finite extensions of fields with integral closures $A \subset B \subset C$ then the normalized base change $Z$ of $Y \rightarrow \operatorname{Spec}(B)$ relative to $L \subset M$ is equal to the normalized base change of $X \rightarrow \operatorname{Spec}(A)$ relative to $K \subset M$.

09IL Theorem 36.47.1. Let $A$ be a Dedekind ring with fraction field $K$. Let $X$ be a scheme flat and of finite type over $A$. Assume $A$ is a Nagata ring. There exists a finite extension $K \subset L$ such that the normalized base change $Y$ is smooth over $\operatorname{Spec}(B)$ at all generic points of all fibres.

Proof. During the proof we will repeatedly use that formation of the set of points where a (flat, finitely presented) morphism like $X \rightarrow \operatorname{Spec}(A)$ is smooth commutes with base change, see Morphisms, Lemma 28.34.15.

We first choose a finite extension $K \subset L$ such that $\left(X_{L}\right)_{r e d}$ is geometrically reduced over $L$, see Varieties, Lemma 32.4.11. Since $Y \rightarrow\left(X_{B}\right)_{\text {red }}$ is birational we see applying Varieties, Lemma 32.4.8 that $Y_{L}$ is geometrically reduced over $L$ as well. Hence $Y_{L} \rightarrow \operatorname{Spec}(L)$ is smooth on a dense open $V \subset Y_{L}$ by Varieties, Lemma 32.20.7. Thus the smooth locus $U \subset Y$ of the morphism $Y \rightarrow \operatorname{Spec}(B)$ is open (by

Morphisms, Definition 28.34.1 and is dense in the generic fibre. Replacing $A$ by $B$ and $X$ by $Y$ we reduce to the case treated in the next paragraph.
Assume $X$ is normal and the smooth locus $U \subset X$ of $X \rightarrow \operatorname{Spec}(A)$ is dense in the generic fibre. This implies that $U$ is dense in all but finitely many fibres, see Lemma 36.19.3. Let $x_{1}, \ldots, x_{r} \in X \backslash U$ be the finitely many generic points of irreducible components of $X \backslash U$ which are moreover generic points of irreducible components of fibres of $X \rightarrow \operatorname{Spec}(A)$. Set $\mathcal{O}_{i}=\mathcal{O}_{X, x_{i}}$. Let $A_{i}$ be the localization of $A$ at the maximal ideal corresponding to the image of $x_{i}$ in $\operatorname{Spec}(A)$. By More on Algebra, Proposition 15.82 .25 there exist finite extensions $K \subset K_{i}$ which are solutions for the extension of discrete valuation rings $A_{i} \rightarrow \mathcal{O}_{i}$. Let $K \subset L$ be a finite extension dominating all of the extensions $K \subset K_{i}$. Then $K \subset L$ is still a solution for $A_{i} \rightarrow \mathcal{O}_{i}$ by More on Algebra, Lemma 15.82.4
Consider the diagram (36.47.0.1) with the extension $L / K$ we just produced. Note that $U_{B} \subset X_{B}$ is smooth over $B$, hence normal (for example use Algebra, Lemma 10.155.7). Thus $Y \rightarrow X_{B}$ is an isomorphism over $U_{B}$. Let $y \in Y$ be a generic point of an irreducible component of a fibre of $Y \rightarrow \operatorname{Spec}(B)$ lying over the maximal ideal $\mathfrak{m} \subset B$. Assume that $y \notin U_{B}$. Then $y$ maps to one of the points $x_{i}$. It follows that $\mathcal{O}_{Y, y}$ is a local ring of the integral closure of $\mathcal{O}_{i}$ in $R(X) \otimes_{K} L$ (details omitted). Hence because $K \subset L$ is a solution for $A_{i} \rightarrow \mathcal{O}_{i}$ we see that $B_{\mathfrak{m}} \rightarrow \mathcal{O}_{Y, y}$ is formally smooth (this is the definition of being a "solution"). In other words, $\mathfrak{m} \mathcal{O}_{Y, y}=\mathfrak{m}_{y}$ and the residue field extension is separable. Hence the local ring of the fibre at $y$ is $\kappa(y)$. This implies the fibre is smooth over $\kappa(\mathfrak{m})$ at $y$ for example by Algebra, Lemma 10.138.5. This finishes the proof.

0BRQ Lemma 36.47.2 (Variant over curves). Let $f: X \rightarrow S$ be a flat, finite type morphism of schemes. Assume $S$ is Nagata, integral with function field $K$, and regular of dimension 1. Then there exists a finite extension $L / K$ such that in the diagram

the morphism $g$ is smooth at all generic points of fibres. Here $T$ is the normalization of $S$ in $\operatorname{Spec}(L)$ and $\nu: Y \rightarrow X \times{ }_{S} T$ is the normalization.
Proof. Choose a finite affine open covering $S=\bigcup \operatorname{Spec}\left(A_{i}\right)$. Then $K$ is equal to the fraction field of $A_{i}$ for all $i$. Let $X_{i}=X \times_{S} \operatorname{Spec}\left(A_{i}\right)$. Choose $L_{i} / K$ as in Theorem 36.47 .1 for the morphism $X_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$. Let $B_{i} \subset L_{i}$ be the integral closure of $A_{i}$ and let $Y_{i}$ be the normalized base change of $X$ to $B_{i}$. Let $L / K$ be a finite extension dominating each $L_{i}$. Let $T_{i} \subset T$ be the inverse image of $\operatorname{Spec}\left(A_{i}\right)$. For each $i$ we get a commutative diagram

and in fact the left hand square is a normalized base change as discussed at the beginning of the section. In the proof of Theorem 36.47.1 we have seen that the
smooth locus of $Y \rightarrow T$ contains the inverse image in $g^{-1}\left(T_{i}\right)$ of the set of points where $Y_{i}$ is smooth over $B_{i}$. This proves the lemma.

0BRR Lemma 36.47.3 (Variant with separable extension). Let A be a Dedekind ring with fraction field $K$. Let $X$ be a scheme flat and of finite type over A. Assume $A$ is a Nagata ring and that for every generic point $\eta$ of an irreducible component of $X$ the field extension $K \subset \kappa(\eta)$ is separable. Then there exists a finite separable extension $K \subset L$ such that the normalized base change $Y$ is smooth over $\operatorname{Spec}(B)$ at all generic points of all fibres.

Proof. This is proved in exactly the same manner as Theorem 36.47.1 with a few minor modifications. The most important change is to use More on Algebra, Lemma 15.82 .26 instead of More on Algebra, Proposition 15.82.25. During the proof we will repeatedly use that formation of the set of points where a (flat, finitely presented) morphism like $X \rightarrow \operatorname{Spec}(A)$ is smooth commutes with base change, see Morphisms, Lemma 28.34.15
Since $X$ is flat over $A$ every generic point $\eta$ of $X$ maps to the generic point of $\operatorname{Spec}(A)$. After replacing $X$ by its reduction we may assume $X$ is reduced. In this case $X_{K}$ is geometrically reduced over $K$ by Varieties, Lemma 32.4.8. Hence $X_{K} \rightarrow \operatorname{Spec}(K)$ is smooth on a dense open by Varieties, Lemma 32.20.7. Thus the smooth locus $U \subset X$ of the morphism $X \rightarrow \operatorname{Spec}(A)$ is open (by Morphisms, Definition 28.34.1) and is dense in the generic fibre. This reduces us to the situation of the following paragraph.
Assume $X$ is normal and the smooth locus $U \subset X$ of $X \rightarrow \operatorname{Spec}(A)$ is dense in the generic fibre. This implies that $U$ is dense in all but finitely many fibres, see Lemma 36.19.3. Let $x_{1}, \ldots, x_{r} \in X \backslash U$ be the finitely many generic points of irreducible components of $X \backslash U$ which are moreover generic points of irreducible components of fibres of $X \rightarrow \operatorname{Spec}(A)$. Set $\mathcal{O}_{i}=\mathcal{O}_{X, x_{i}}$. Observe that the fraction field of $\mathcal{O}_{i}$ is the residue field of a generic point of $X$. Let $A_{i}$ be the localization of $A$ at the maximal ideal corresponding to the image of $x_{i}$ in $\operatorname{Spec}(A)$. We may apply More on Algebra, Lemma 15.82 .26 and we find finite separable extensions $K \subset K_{i}$ which are solutions for $A_{i} \rightarrow \mathcal{O}_{i}$. Let $K \subset L$ be a finite separable extension dominating all of the extensions $K \subset K_{i}$. Then $K \subset L$ is still a solution for $A_{i} \rightarrow \mathcal{O}_{i}$ by More on Algebra, Lemma 15.82.4
Consider the diagram 36.47.0.1 with the extension $L / K$ we just produced. Note that $U_{B} \subset X_{B}$ is smooth over $B$, hence normal (for example use Algebra, Lemma 10.155.7). Thus $Y \rightarrow X_{B}$ is an isomorphism over $U_{B}$. Let $y \in Y$ be a generic point of an irreducible component of a fibre of $Y \rightarrow \operatorname{Spec}(B)$ lying over the maximal ideal $\mathfrak{m} \subset B$. Assume that $y \notin U_{B}$. Then $y$ maps to one of the points $x_{i}$. It follows that $\mathcal{O}_{Y, y}$ is a local ring of the integral closure of $\mathcal{O}_{i}$ in $R(X) \otimes_{K} L$ (details omitted). Hence because $K \subset L$ is a solution for $A_{i} \rightarrow \mathcal{O}_{i}$ we see that $B_{\mathfrak{m}} \rightarrow \mathcal{O}_{Y, y}$ is formally smooth (this is the definition of being a "solution"). In other words, $\mathfrak{m} \mathcal{O}_{Y, y}=\mathfrak{m}_{y}$ and the residue field extension is separable. Hence the local ring of the fibre at $y$ is $\kappa(y)$. This implies the fibre is smooth over $\kappa(\mathfrak{m})$ at $y$ for example by Algebra, Lemma 10.138.5. This finishes the proof.
0BRS Lemma 36.47.4 (Variant with separable extensions over curves). Let $f: X \rightarrow S$ be a flat, finite type morphism of schemes. Assume $S$ is Nagata, integral with function field $K$, and regular of dimension 1. Assume the field extensions $K \subset \kappa(\eta)$
are separable for every generic point $\eta$ of an irreducible component of $X$. Then there exists a finite separable extension $L / K$ such that in the diagram

the morphism $g$ is smooth at all generic points of fibres. Here $T$ is the normalization of $S$ in $\operatorname{Spec}(L)$ and $\nu: Y \rightarrow X \times_{S} T$ is the normalization.

Proof. This follows from Lemma 36.47 .3 in exactly the same manner that Lemma 36.47 .2 follows from Theorem 36.47.1.

### 36.48. Ind-quasi-affine morphisms

0AP5 A bit of theory to be used later.
0AP6 Definition 36.48.1. A scheme $X$ is ind-quasi-affine if every quasi-compact open of $X$ is quasi-affine. Similarly, a morphism of schemes $X \rightarrow Y$ is ind-quasi-affine if $f^{-1}(V)$ is ind-quasi-affine for each affine open $V$ in $Y$.

An example of an ind-quasi-affine scheme is an open of an affine scheme or an open of a quasi-projective scheme. An ind-quasi-affine scheme $X$ is separated because any two affine opens $U, V$ are contained in a separated open subscheme of $X$, namely $U \cup V$. Similarly an ind-quasi-affine morphism is separated.

0AP7 Lemma 36.48.2. The property of being ind-quasi-affine is stable under base change.

Proof. Let $f: X \rightarrow Y$ be an ind-quasi-affine morphism. Let $Z$ be an affine scheme and let $Z \rightarrow Y$ be a morphism. To show: $Z \times_{Y} X$ is ind-quasi-affine. Let $W \subset Z \times_{Y} X$ be a quasi-compact open. We can find finitely many affine opens $V_{1}, \ldots, V_{n}$ of $Y$ and finitely many quasi-compact opens $U_{i} \subset f^{-1}\left(V_{i}\right)$ such that $Z$ maps into $\bigcup V) i$ and $W$ maps into $\bigcup U_{i}$. Then we may replace $Y$ by $\bigcup V_{i}$ and $X$ by $\bigcup W_{i}$. In this case $f^{-1}\left(V_{i}\right)$ is quasi-compact open (details omitted; use that $f$ is separated) and hence quasi-affine. Thus now $X \rightarrow Y$ is a quasi-affine morphism (Morphisms, Lemma 28.13.3) and the result follows from the fact that the base change of a quasi-affine morphism is quasi-affine (Morphisms, Lemma 28.13.5).

0AP8 Lemma 36.48.3. The property of being ind-quasi-affine is fpqc local on the base.
Proof. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\left\{g_{i}: Y_{i} \rightarrow Y\right\}$ be an fpqc covering such that the base change $f_{i}: X_{i} \rightarrow Y_{i}$ is ind-quasi-affine for all $i$. We will show $f$ is ind-quasi-affine. Namely, let $U \subset X$ be a quasi-compact open mapping into an affine open $V \subset Y$. We have to show that $U$ is quasi-affine. Let $V_{j} \subset Y_{i_{j}}$, $j=1, \ldots, m$ be affine opens such that $V=\bigcup g_{i_{j}}\left(V_{j}\right)$ (exist by definition of fpqc coverings). Then $V_{i} \times_{Y} X \rightarrow V_{i}$ is ind-quasi-affine as well. Hence we may replace $Y$ by $V$ and $\left\{g_{i}: Y_{i} \rightarrow Y\right\}$ by the finite covering $\left\{V_{j} \rightarrow V\right\}$. We may replace $X$ by $U$, because $V_{j} \times_{Y} U \subset V_{j} \times_{Y} X$ is open and hence $V_{j} \times_{Y} U \rightarrow V_{j}$ is ind-quasi-affine as well (ind-quasi-affineness is inherited by opens). Hence we may assume $X$ is quasi-compact and $Y$ affine. In this case we have to show that $X$ is quasi-affine and we know that $X_{i}$ is quasi-affine. Thus the result follows from Descent, Lemma 34.19.18.

0AP9 Lemma 36.48.4. A separated locally quasi-finite morphism of schemes is ind-quasi-affine.

Proof. Let $f: X \rightarrow Y$ be a separated locally quasi-finite morphism of schemes. Let $V \subset Y$ be affine and $U \subset f^{-1}(V)$ quasi-compact open. We have to show $U$ is quasi-affine. Since $U \rightarrow V$ is a separated quasi-finite morphism of schemes, this follows from Zariski's Main Theorem. See Lemma 36.31.2,

### 36.49. Relative morphisms

0BL0 In this section we prove a representability result which we will use in Fundamental Groups, Section 48.4 to prove a result on the category of finite étale coverings of a scheme. The material in this section is discussed in the correct generality in Criteria for Representability, Section 79.10

Let $S$ be a scheme. Let $Z$ and $X$ be schemes over $S$. Given a scheme $T$ over $S$ we can consider morphisms $b: T \times{ }_{S} Z \rightarrow T \times{ }_{S} X$ over $S$. Picture

0BL1 (36.49.0.1)

Of course, we can also think of $b$ as a morphism $b: T \times_{S} Z \rightarrow X$ such that

commutes. In this situation we can define a functor
0BL2 (36.49.0.2) $\quad \operatorname{Mor}_{S}(Z, X):(S c h / S)^{o p p} \longrightarrow S e t s, \quad T \longmapsto\{b$ as above $\}$
Here is a basic representability result.
05Y6 Lemma 36.49.1. Let $Z \rightarrow S$ and $X \rightarrow S$ be morphisms of affine schemes. Assume $\Gamma\left(Z, \mathcal{O}_{Z}\right)$ is a finite free $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Then $\operatorname{Mor}_{S}(Z, X)$ is representable by an affine scheme over $S$.
Proof. Write $S=\operatorname{Spec}(R)$. Choose a basis $\left\{e_{1}, \ldots, e_{m}\right\}$ for $\Gamma\left(Z, \mathcal{O}_{Z}\right)$ over $R$. Choose a presentation

$$
\Gamma\left(X, \mathcal{O}_{X}\right)=R\left[\left\{x_{i}\right\}_{i \in I}\right] /\left(\left\{f_{k}\right\}_{k \in K}\right)
$$

We will denote $\bar{x}_{i}$ the image of $x_{i}$ in this quotient. Write

$$
P=R\left[\left\{a_{i j}\right\}_{i \in I, 1 \leq j \leq m}\right] .
$$

Consider the $R$-algebra map

$$
\Psi: R\left[\left\{x_{i}\right\}_{i \in I}\right] \longrightarrow P \otimes_{R} \Gamma\left(Z, \mathcal{O}_{Z}\right), \quad x_{i} \longmapsto \sum_{j} a_{i j} \otimes e_{j} .
$$

Write $\Psi\left(f_{k}\right)=\sum c_{k j} \otimes e_{j}$ with $c_{k j} \in P$. Finally, denote $J \subset P$ the ideal generated by the elements $c_{k j}, k \in K, 1 \leq j \leq m$. We claim that $W=\operatorname{Spec}(P / J)$ represents the functor $\operatorname{Mor}_{S}(Z, X)$.

First, note that by construction $P / J$ is an $R$-algebra, hence a morphism $W \rightarrow S$. Second, by construction the map $\Psi$ factors through $\Gamma\left(X, \mathcal{O}_{X}\right)$, hence we obtain an $P / J$-algebra homomorphism

$$
P / J \otimes_{R} \Gamma\left(X, \mathcal{O}_{X}\right) \longrightarrow P / J \otimes_{R} \Gamma\left(Z, \mathcal{O}_{Z}\right)
$$

which determines a morphism $b_{\text {univ }}: W \times_{S} Z \rightarrow W \times_{S} X$. By the Yoneda lemma $b_{\text {univ }}$ determines a transformation of functors $W \rightarrow \operatorname{Mor}_{S}(Z, X)$ which we claim is an isomorphism. To show that it is an isomorphism it suffices to show that it induces a bijection of sets $W(T) \rightarrow \operatorname{Mor}_{S}(Z, X)(T)$ over any affine scheme $T$.
Suppose $T=\operatorname{Spec}\left(R^{\prime}\right)$ is an affine scheme over $S$ and $b \in \operatorname{Mor}_{S}(Z, X)(T)$. The structure morphism $T \rightarrow S$ defines an $R$-algebra structure on $R^{\prime}$ and $b$ defines an $R^{\prime}$-algebra map

$$
b^{\sharp}: R^{\prime} \otimes_{R} \Gamma\left(X, \mathcal{O}_{X}\right) \longrightarrow R^{\prime} \otimes_{R} \Gamma\left(Z, \mathcal{O}_{Z}\right)
$$

In particular we can write $b^{\sharp}\left(1 \otimes \bar{x}_{i}\right)=\sum \alpha_{i j} \otimes e_{j}$ for some $\alpha_{i j} \in R^{\prime}$. This corresponds to an $R$-algebra map $P \rightarrow R^{\prime}$ determined by the rule $a_{i j} \mapsto \alpha_{i j}$. This map factors through the quotient $P / J$ by the construction of the ideal $J$ to give a map $P / J \rightarrow R^{\prime}$. This in turn corresponds to a morphism $T \rightarrow W$ such that $b$ is the pullback of $b_{\text {univ }}$. Some details omitted.

0BL3 Lemma 36.49.2. Let $Z \rightarrow S$ and $X \rightarrow S$ be morphisms of schemes. If $Z \rightarrow S$ is finite locally free and $X \rightarrow S$ is affine, then $\operatorname{Mor}_{S}(Z, X)$ is representable by a scheme affine over $S$.

Proof. Choose an affine open covering $S=\bigcup U_{i}$ such that $\Gamma\left(Z \times{ }_{S} U_{i}, \mathcal{O}_{Z \times{ }_{S} U_{i}}\right)$ is finite free over $\mathcal{O}_{S}\left(U_{i}\right)$. Let $F_{i} \subset \operatorname{Mor}_{S}(Z, X)$ be the subfunctor which assigns to $T / S$ the empty set if $T \rightarrow S$ does not factor through $U_{i}$ and $\operatorname{Mor}_{S}(Z, X)(T)$ otherwise. Then the collection of these subfunctors satisfy the conditions (2)(a), (2)(b), (2)(c) of Schemes, Lemma 25.15 .4 which proves the lemma. Condition (2)(a) follows from Lemma 36.49 .1 and the other two follow from straightforward arguments.

The condition on the morphism $f: X \rightarrow S$ in the lemma below is very useful to prove statements like it. It holds if one of the following is true: $X$ is quasi-affine, $f$ is quasi-affine, $f$ is quasi-projective, $f$ is locally projective, there exists an ample invertible sheaf on $X$, there exists an $f$-ample invertible sheaf on $X$, or there exists an $f$-very ample invertible sheaf on $X$.

0BL4 Lemma 36.49.3. Let $Z \rightarrow S$ and $X \rightarrow S$ be morphisms of schemes. Assume
(1) $Z \rightarrow S$ is finite locally free, and
(2) for all $\left(s, x_{1}, \ldots, x_{d}\right)$ where $s \in S$ and $x_{1}, \ldots, x_{d} \in X_{s}$ there exists an affine open $U \subset X$ with $x_{1}, \ldots, x_{d} \in U$.
Then $\operatorname{Mor}_{S}(Z, X)$ is representable by a scheme.
Proof. Consider the set $I$ of pairs $(U, V)$ where $U \subset X$ and $V \subset S$ are affine open and $U \rightarrow S$ factors through $V$. For $i \in I$ denote $\left(U_{i}, V_{i}\right)$ the corresponding pair. Set $F_{i}=\operatorname{Mor}_{V_{i}}\left(Z_{V_{i}}, U_{i}\right)$. It is immediate that $F_{i}$ is a subfunctor of $\operatorname{Mor}_{S}(Z, X)$. Then we claim that conditions (2)(a), (2)(b), (2)(c) of Schemes, Lemma 25.15.4 which proves the lemma.
Condition (2)(a) follows from Lemma 36.49.2.

To check condition $(2)(\mathrm{b})$ consider $T / S$ and $b \in \operatorname{Mor}_{S}(Z, X)$. Thinking of $b$ as a morphism $T \times_{S} Z \rightarrow X$ we find an open $b^{-1}\left(U_{i}\right) \subset T \times_{S} Z$. Clearly, $b \in F_{i}(T)$ if and only if $b^{-1}\left(U_{i}\right)=T \times_{S} Z$. Since the projection $p: T \times_{S} Z \rightarrow T$ is finite hence closed, the set $U_{i, b} \subset T$ of points $t \in T$ with $p^{-1}(\{t\}) \subset b^{-1}\left(U_{i}\right)$ is open. Then $f: T^{\prime} \rightarrow T$ factors through $U_{i, b}$ if and only if $b \circ f \in F_{i}\left(T^{\prime}\right)$ and we are done checking (2)(b).
Finally, we check condition (2)(c) and this is where our condition on $X \rightarrow S$ is used. Namely, consider $T / S$ and $b \in \operatorname{Mor}_{S}(Z, X)$. It suffices to prove that every $t \in T$ is contained in one of the opens $U_{i, b}$ defined in the previous paragraph. This is equivalent to the condition that $b\left(p^{-1}(\{t\})\right) \subset U_{i}$ for some $i$ where $p: T \times{ }_{S} Z \rightarrow T$ is the projection and $b: T \times{ }_{S} Z \rightarrow X$ is the given morphism. Since $p$ is finite, the set $b\left(p^{-1}(\{t\})\right) \subset X$ is finite and contained in the fibre of $X \rightarrow S$ over the image $s$ of $t$ in $S$. Thus our condition on $X \rightarrow S$ exactly shows a suitable pair exists.

0BL5 Lemma 36.49.4. Let $Z \rightarrow S$ and $X \rightarrow S$ be morphisms of schemes. Assume $Z \rightarrow S$ is finite locally free and $X \rightarrow S$ is separated and locally quasi-finite. Then $\operatorname{Mor}_{S}(Z, X)$ is representable by a scheme.

Proof. This follows from Lemmas 36.49.3 and 36.31.12.

## CHAPTER 37

## More on Flatness

057M

### 37.1. Introduction

057 N In this chapter, we discuss some advanced results on flat modules and flat morphisms of schemes. Most of these results can be found in the paper [GR71 by Raynaud and Gruson.

Before reading this chapter we advise the reader to take a look at the following results (this list also serves as a pointer to previous results):
(1) General discussion on flat modules in Algebra, Section 10.38
(2) The relationship between Tor-groups and flatness, see Algebra, Section 10.74
(3) Criteria for flatness, see Algebra, Section 10.98 (Noetherian case), Algebra, Section 10.100 (Artinian case), Algebra, Section 10.127 (non-Noetherian case), and finally More on Morphisms, Section 36.13
(4) Generic flatness, see Algebra, Section 10.117 and Morphisms, Section 28.27
(5) Openness of the flat locus, see Algebra, Section 10.128 and More on Morphisms, Section 36.12.
(6) Flattening, see More on Algebra, Sections $15.10,15.11,15.12,15.13$, and 15.14
(7) Additional results in More on Algebra, Sections 15.15, 15.16, 15.19, and 15.20 .

### 37.2. Lemmas on étale localization

05 FM In this section we list some lemmas on étale localization which will be useful later in this chapter. Please skip this section on a first reading.

057R Lemma 37.2.1. Let $i: Z \rightarrow X$ be a closed immersion of affine schemes. Let $Z^{\prime} \rightarrow Z$ be an étale morphism with $Z^{\prime}$ affine. Then there exists an étale morphism $X^{\prime} \rightarrow X$ with $X^{\prime}$ affine such that $Z^{\prime} \cong Z \times_{X} X^{\prime}$ as schemes over $Z$.

Proof. See Algebra, Lemma 10.141.11.
05H2 Lemma 37.2.2. Let

be a commutative diagram of schemes with $X^{\prime} \rightarrow X$ and $S^{\prime} \rightarrow S$ étale. Let $s^{\prime} \in S^{\prime}$ be a point. Then

$$
X^{\prime} \times{ }_{S^{\prime}} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \longrightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

is étale.
Proof. This is true because $X^{\prime} \rightarrow X_{S^{\prime}}$ is étale as a morphism of schemes étale over $X$, see Morphisms, Lemma 28.36 .18 and the base change of an étale morphism is étale, see Morphisms, Lemma 28.36.4.

05B9 Lemma 37.2.3. Let $X \rightarrow T \rightarrow S$ be morphisms of schemes with $T \rightarrow S$ étale. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in X$ be a point. Then

$$
\mathcal{F} \text { flat over } S \text { at } x \Leftrightarrow \mathcal{F} \text { flat over } T \text { at } x
$$

In particular $\mathcal{F}$ is flat over $S$ if and only if $\mathcal{F}$ is flat over $T$.
Proof. As an étale morphism is a flat morphism (see Morphisms, Lemma 28.36.12) the implication " $\Leftarrow$ " follows from Algebra, Lemma 10.38 .4 For the converse assume that $\mathcal{F}$ is flat at $x$ over $S$. Denote $\tilde{x} \in X \times_{S} T$ the point lying over $x$ in $X$ and over the image of $x$ in $T$ in $T$. Then $\left(X \times_{S} T \rightarrow X\right)^{*} \mathcal{F}$ is flat at $\tilde{x}$ over $T$ via $\mathrm{pr}_{2}$ : $X \times_{S} T \rightarrow T$, see Morphisms, Lemma 28.25.6. The diagonal $\Delta_{T / S}: T \rightarrow T \times_{S} T$ is an open immersion; combine Morphisms, Lemmas 28.35.13 and 28.36.5. So $X$ is identified with open subscheme of $X \times_{S} T$, the restriction of $\mathrm{pr}_{2}$ to this open is the given morphism $X \rightarrow T$, the point $\tilde{x}$ corresponds to the point $x$ in this open, and $\left(X \times_{S} T \rightarrow X\right)^{*} \mathcal{F}$ restricted to this open is $\mathcal{F}$. Whence we see that $\mathcal{F}$ is flat at $x$ over $T$.

05BA Lemma 37.2.4. Let $T \rightarrow S$ be an étale morphism. Let $t \in T$ with image $s \in S$. Let $M$ be a $\mathcal{O}_{T, t}$-module. Then

$$
M \text { flat over } \mathcal{O}_{S, s} \Leftrightarrow M \text { flat over } \mathcal{O}_{T, t}
$$

Proof. We may replace $S$ by an affine neighbourhood of $s$ and after that $T$ by an affine neighbourhood of $t$. Set $\mathcal{F}=\left(\operatorname{Spec}\left(\mathcal{O}_{T, t}\right) \rightarrow T\right)_{*} \widetilde{M}$. This is a quasi-coherent sheaf (see Schemes, Lemma 25.24.1 or argue directly) on $T$ whose stalk at $t$ is $M$ (details omitted). Apply Lemma 37.2.3.

05VL Lemma 37.2.5. Let $S$ be a scheme and $s \in S$ a point. Denote $\mathcal{O}_{S, s}^{h}\left(\right.$ resp. $\left.\mathcal{O}_{S, s}^{s h}\right)$ the henselization (resp. strict henselization), see Algebra, Definition 10.148.18. Let $M^{s h}$ be a $\mathcal{O}_{S, s}^{s h}$-module. The following are equivalent
(1) $M^{\text {sh }}$ is flat over $\mathcal{O}_{S, s}$,
(2) $M^{s h}$ is flat over $\mathcal{O}_{S, s}^{h}$, and
(3) $M^{s h}$ is flat over $\mathcal{O}_{S, s}^{s h}$.

If $M^{s h}=M^{h} \otimes_{\mathcal{O}_{S, s}^{h}} \mathcal{O}_{S, s}^{s h}$ this is also equivalent to
(4) $M^{h}$ is flat over $\mathcal{O}_{S, s}$, and
(5) $M^{h}$ is flat over $\mathcal{O}_{S, s}^{h}$.

If $M^{h}=M \otimes_{\mathcal{O}_{S, s}} \mathcal{O}_{S, s}^{h}$ this is also equivalent to
(6) $M$ is flat over $\mathcal{O}_{S, s}$.

Proof. We may assume that $S$ is an affine scheme. It is shown in Algebra, Lemmas 10.148 .21 and 10.148 .27 that $\mathcal{O}_{S, s}^{h}$ and $\mathcal{O}_{S, s}^{s h}$ are filtered colimits of the rings $\mathcal{O}_{T, t}$ where $T \rightarrow S$ is étale and affine. Hence the local ring maps $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{S, s}^{h} \rightarrow \mathcal{O}_{S, s}^{s h}$ are flat as directed colimits of étale ring maps, see Algebra, Lemma 10.38.3. Hence $(3) \Rightarrow(2) \Rightarrow(1)$ and $(5) \Rightarrow(4)$ follow from Algebra, Lemma 10.38.4. Of course these maps are faithfully flat, see Algebra, Lemma 10.38.17. Hence the equivalences $(6) \Leftrightarrow(5)$ and $(5) \Leftrightarrow(3)$ follow from Algebra, Lemma 10.38.8. Thus it suffices to show that $(1) \Rightarrow(2) \Rightarrow(3)$ and $(4) \Rightarrow(5)$.
Assume (1). By Lemma 37.2 .4 we see that $M^{s h}$ is flat over $\mathcal{O}_{T, t}$ for any étale neighbourhood $(T, t) \rightarrow(S, s)$. Since $\mathcal{O}_{S, s}^{h}$ and $\mathcal{O}_{S, s}^{s h}$ are directed colimits of local rings of the form $\mathcal{O}_{T, t}$ (see above) we conclude that $M^{s h}$ is flat over $\mathcal{O}_{S, s}^{h}$ and $\mathcal{O}_{S, s}^{s h}$ by Algebra, Lemma 10.38 .6 . Thus (1) implies (2) and (3). Of course this implies also $(2) \Rightarrow(3)$ by replacing $\mathcal{O}_{S, s}$ by $\mathcal{O}_{S, s}^{h}$. The same argument applies to prove (4) $\Rightarrow(5)$.
05FN Lemma 37.2.6. Let $g: T \rightarrow S$ be a finite flat morphism of schemes. Let $\mathcal{G}$ be $a$ quasi-coherent $\mathcal{O}_{S}$-module. Let $t \in T$ be a point with image $s \in S$. Then

$$
t \in W e a k A s s\left(g^{*} \mathcal{G}\right) \Leftrightarrow s \in W e a k A s s(\mathcal{G})
$$

Proof. The implication " $\Leftarrow$ " follows immediately from Divisors, Lemma 30.6.4 Assume $t \in \operatorname{WeakAss}\left(g^{*} \mathcal{G}\right)$. Let $\operatorname{Spec}(A) \subset S$ be an affine open neighbourhood of $s$. Let $\mathcal{G}$ be the quasi-coherent sheaf associated to the $A$-module $M$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to $s$. As $g$ is finite flat we have $g^{-1}(\operatorname{Spec}(A))=$ $\operatorname{Spec}(B)$ for some finite flat $A$-algebra $B$. Note that $g^{*} \mathcal{G}$ is the quasi-coherent $\mathcal{O}_{\operatorname{Spec}(B)}$-module associated to the $B$-module $M \otimes_{A} B$ and $g_{*} g^{*} \mathcal{G}$ is the quasicoherent $\mathcal{O}_{\text {Spec }(A)}$-module associated to the $A$-module $M \otimes_{A} B$. By Algebra, Lemma 10.77.4 we have $B_{\mathfrak{p}} \cong A_{\mathfrak{p}}^{\oplus n}$ for some integer $n \geq 0$. Note that $n \geq 1$ as we assumed there exists at least one point of $T$ lying over $s$. Hence we see by looking at stalks that

$$
s \in \operatorname{Weak} \operatorname{Ass}(\mathcal{G}) \Leftrightarrow s \in \operatorname{Weak} \operatorname{Ass}\left(g_{*} g^{*} \mathcal{G}\right)
$$

Now the assumption that $t \in \operatorname{WeakAss}\left(g^{*} \mathcal{G}\right)$ implies that $s \in \operatorname{WeakAss}\left(g_{*} g^{*} \mathcal{G}\right)$ by Divisors, Lemma 30.6.3 and hence by the above $s \in \operatorname{WeakAss}(\mathcal{G})$.

05FP Lemma 37.2.7. Let $h: U \rightarrow S$ be an étale morphism of schemes. Let $\mathcal{G}$ be $a$ quasi-coherent $\mathcal{O}_{S}$-module. Let $u \in U$ be a point with image $s \in S$. Then

$$
u \in W e a k A s s\left(h^{*} \mathcal{G}\right) \Leftrightarrow s \in W e a k A s s(\mathcal{G})
$$

Proof. After replacing $S$ and $U$ by affine neighbourhoods of $s$ and $u$ we may assume that $g$ is a standard étale morphism of affines, see Morphisms, Lemma 28.36.14. Thus we may assume $S=\operatorname{Spec}(A)$ and $X=\operatorname{Spec}(A[x, 1 / g] /(f))$, where $f$ is monic and $f^{\prime}$ is invertible in $A[x, 1 / g]$. Note that $A[x, 1 / g] /(f)=(A[x] /(f))_{g}$ is also the localization of the finite free $A$-algebra $A[x] /(f)$. Hence we may think of $U$ as an open subscheme of the scheme $T=\operatorname{Spec}(A[x] /(f))$ which is finite locally free over $S$. This reduces us to Lemma 37.2.6 above.

### 37.3. The local structure of a finite type module

057P The key technical lemma that makes a lot of the arguments in this chapter work is the geometric Lemma 37.3.2.

057Q Lemma 37.3.1. Let $f: X \rightarrow S$ be a finite type morphism of affine schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in X$ with image $s=f(x)$ in $S$. Set $\mathcal{F}_{s}=\left.\mathcal{F}\right|_{X_{s}}$. Then there exist a closed immersion $i: Z \rightarrow X$ of finite presentation, and a quasi-coherent finite type $\mathcal{O}_{Z}$-module $\mathcal{G}$ such that $i_{*} \mathcal{G}=\mathcal{F}$ and $Z_{s}=\operatorname{Supp}\left(\mathcal{F}_{s}\right)$.
Proof. Say the morphism $f: X \rightarrow S$ is given by the ring map $A \rightarrow B$ and that $\mathcal{F}$ is the quasi-coherent sheaf associated to the $B$-module $M$. By Morphisms, Lemma 28.15 .2 we know that $A \rightarrow B$ is a finite type ring map, and by Properties, Lemma 27.16 .1 we know that $M$ is a finite $B$-module. In particular the support of $\mathcal{F}$ is the closed subscheme of $\operatorname{Spec}(B)$ cut out by the annihilator $I=\{x \in B \mid x m=$ $0 \forall m \in M\}$ of $M$, see Algebra, Lemma 10.39.5. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to $x$ and let $\mathfrak{p} \subset A$ be the prime ideal corresponding to $s$. Note that $X_{s}=\operatorname{Spec}\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$ and that $\mathcal{F}_{s}$ is the quasi-coherent sheaf associated to the $B \otimes_{A} \kappa(\mathfrak{p})$ module $M \otimes_{A} \kappa(\mathfrak{p})$. By Morphisms, Lemma 28.5.3 the support of $\mathcal{F}_{s}$ is equal to $V\left(I\left(B \otimes_{A} \kappa(\mathfrak{p})\right)\right)$. Since $B \otimes_{A} \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$ there exist finitely many elements $f_{1}, \ldots, f_{m} \in I$ such that

$$
I\left(B \otimes_{A} \kappa(\mathfrak{p})\right)=\left(f_{1}, \ldots, f_{n}\right)\left(B \otimes_{A} \kappa(\mathfrak{p})\right)
$$

Denote $i: Z \rightarrow X$ the closed subscheme cut out by $\left(f_{1}, \ldots, f_{m}\right)$, in a formula $Z=\operatorname{Spec}\left(B /\left(f_{1}, \ldots, f_{m}\right)\right)$. Since $M$ is annihilated by $I$ we can think of $M$ as an $B /\left(f_{1}, \ldots, f_{m}\right)$-module. In other words, $\mathcal{F}$ is the pushforward of a finite type module on $Z$. As $Z_{s}=\operatorname{Supp}\left(\mathcal{F}_{s}\right)$ by construction, this proves the lemma.
057S Lemma 37.3.2. Let $f: X \rightarrow S$ be morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in X$ with image $s=f(x)$ in $S$. Set $\mathcal{F}_{s}=\left.\mathcal{F}\right|_{X_{s}}$ and $n=\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$. Then we can construct
(1) elementary étale neighbourhoods $g:\left(X^{\prime}, x^{\prime}\right) \rightarrow(X, x)$, e: $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$,
(2) a commutative diagram

(3) a point $z^{\prime} \in Z^{\prime}$ with $i\left(z^{\prime}\right)=x^{\prime}, y^{\prime}=\pi\left(z^{\prime}\right), h\left(y^{\prime}\right)=s^{\prime}$,
(4) a finite type quasi-coherent $\mathcal{O}_{Z^{\prime}}$-module $\mathcal{G}$,
such that the following properties hold
(1) $X^{\prime}, Z^{\prime}, Y^{\prime}, S^{\prime}$ are affine schemes,
(2) $i$ is a closed immersion of finite presentation,
(3) $i_{*}(\mathcal{G}) \cong g^{*} \mathcal{F}$,
(4) $\pi$ is finite and $\pi^{-1}\left(\left\{y^{\prime}\right\}\right)=\left\{z^{\prime}\right\}$,
(5) the extension $\kappa\left(s^{\prime}\right) \subset \kappa\left(y^{\prime}\right)$ is purely transcendental,
(6) $h$ is smooth of relative dimension $n$ with geometrically integral fibres.

Proof. Let $V \subset S$ be an affine neighbourhood of $s$. Let $U \subset f^{-1}(V)$ be an affine neighbourhood of $x$. Then it suffices to prove the lemma for $\left.f\right|_{U}: U \rightarrow V$ and $\left.\mathcal{F}\right|_{U}$. Hence in the rest of the proof we assume that $X$ and $S$ are affine.

First, suppose that $X_{s}=\operatorname{Supp}\left(\mathcal{F}_{s}\right)$, in particular $n=\operatorname{dim}_{x}\left(X_{s}\right)$. Apply More on Morphisms, Lemmas 36.33 .2 and 36.33.3. This gives us a commutative diagram

and point $x^{\prime} \in X^{\prime}$. We set $Z^{\prime}=X^{\prime}, i=\mathrm{id}$, and $\mathcal{G}=g^{*} \mathcal{F}$ to obtain a solution in this case.

In general choose a closed immersion $Z \rightarrow X$ and a sheaf $\mathcal{G}$ on $Z$ as in Lemma 37.3.1. Applying the result of the previous paragraph to $Z \rightarrow S$ and $\mathcal{G}$ we obtain a diagram

and point $z^{\prime} \in Z^{\prime}$ satisfying all the required properties. We will use Lemma 37.2.1 to embed $Z^{\prime}$ into a scheme étale over $X$. We cannot apply the lemma directly as we want $X^{\prime}$ to be a scheme over $S^{\prime}$. Instead we consider the morphisms

$$
Z^{\prime} \longrightarrow Z \times_{S} S^{\prime} \longrightarrow X \times_{S} S^{\prime}
$$

The first morphism is étale by Morphisms, Lemma 28.36.18. The second is a closed immersion as a base change of a closed immersion. Finally, as $X, S, S^{\prime}, Z, Z^{\prime}$ are all affine we may apply Lemma 37.2.1 to get an étale morphism of affine schemes $X^{\prime} \rightarrow X \times{ }_{S} S^{\prime}$ such that

$$
Z^{\prime}=\left(Z \times_{S} S^{\prime}\right) \times_{\left(X \times_{S} S^{\prime}\right)} X^{\prime}=Z \times_{X} X^{\prime}
$$

As $Z \rightarrow X$ is a closed immersion of finite presentation, so is $Z^{\prime} \rightarrow X^{\prime}$. Let $x^{\prime} \in X^{\prime}$ be the point corresponding to $z^{\prime} \in Z^{\prime}$. Then the completed diagram

is a solution of the original problem.
057T Lemma 37.3.3. Assumptions and notation as in Lemma 37.3.2. If $f$ is locally of finite presentation then $\pi$ is of finite presentation. In this case the following are equivalent
(1) $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation in a neighbourhood of $x$,
(2) $\mathcal{G}$ is an $\mathcal{O}_{Z^{\prime}}$-module of finite presentation in a neighbourhood of $z^{\prime}$, and
(3) $\pi_{*} \mathcal{G}$ is an $\mathcal{O}_{Y^{\prime}-m o d u l e ~ o f ~ f i n i t e ~ p r e s e n t a t i o n ~ i n ~ a ~ n e i g h b o u r h o o d ~ o f ~}^{y^{\prime}}$.

Still assuming $f$ locally of finite presentation the following are equivalent to each other
(a) $\mathcal{F}_{x}$ is an $\mathcal{O}_{X, x}$-module of finite presentation,
(b) $\mathcal{G}_{z^{\prime}}$ is an $\mathcal{O}_{Z^{\prime}, z^{\prime}}$-module of finite presentation, and
(c) $\left(\pi_{*} \mathcal{G}\right)_{y^{\prime}}$ is an $\mathcal{O}_{Y^{\prime}, y^{\prime}}$-module of finite presentation.

Proof. Assume $f$ locally of finite presentation. Then $Z^{\prime} \rightarrow S$ is locally of finite presentation as a composition of such, see Morphisms, Lemma 28.21.3. Note that $Y^{\prime} \rightarrow S$ is also locally of finite presentation as a composition of a smooth and an étale morphism. Hence Morphisms, Lemma 28.21.11 implies $\pi$ is locally of finite presentation. Since $\pi$ is finite we conclude that it is also separated and quasicompact, hence $\pi$ is actually of finite presentation.
To prove the equivalence of (1), (2), and (3) we also consider: (4) $g^{*} \mathcal{F}$ is a $\mathcal{O}_{X^{\prime-}}$ module of finite presentation in a neighbourhood of $x^{\prime}$. The pullback of a module of finite presentation is of finite presentation, see Modules, Lemma 17.11.4. Hence (1) $\Rightarrow(4)$. The étale morphism $g$ is open, see Morphisms, Lemma 28.36.13. Hence for any open neighbourhood $U^{\prime} \subset X^{\prime}$ of $x^{\prime}$, the image $g\left(U^{\prime}\right)$ is an open neighbourhood of $x$ and the map $\left\{U^{\prime} \rightarrow g\left(U^{\prime}\right)\right\}$ is an étale covering. Thus $(4) \Rightarrow(1)$ by Descent, Lemma 34.6.3. Using Descent, Lemma 34.6.10 and some easy topological arguments (see More on Morphisms, Lemma 36.33.4) we see that $(4) \Leftrightarrow(2) \Leftrightarrow(3)$.
To prove the equivalence of (a), (b), (c) consider the ring maps

$$
\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X^{\prime}, x^{\prime}} \rightarrow \mathcal{O}_{Z^{\prime}, z^{\prime}} \leftarrow \mathcal{O}_{Y^{\prime}, y^{\prime}}
$$

The first ring map is faithfully flat. Hence $\mathcal{F}_{x}$ is of finite presentation over $\mathcal{O}_{X, x}$ if and only if $g^{*} \mathcal{F}_{x^{\prime}}$ is of finite presentation over $\mathcal{O}_{X^{\prime}, x^{\prime}}$, see Algebra, Lemma 10.82 .2 . The second ring map is surjective (hence finite) and finitely presented by assumption, hence $g^{*} \mathcal{F}_{x^{\prime}}$ is of finite presentation over $\mathcal{O}_{X^{\prime}, x^{\prime}}$ if and only if $\mathcal{G}_{z^{\prime}}$ is of finite presentation over $\mathcal{O}_{Z^{\prime}, z^{\prime}}$, see Algebra, Lemma 10.35.21. Because $\pi$ is finite, of finite presentation, and $\pi^{-1}\left(\left\{y^{\prime}\right\}\right)=\left\{x^{\prime}\right\}$ the ring homomorphism $\mathcal{O}_{Y^{\prime}, y^{\prime}} \leftarrow \mathcal{O}_{Z^{\prime}, z^{\prime}}$ is finite and of finite presentation, see More on Morphisms, Lemma 36.33.4. Hence $\mathcal{G}_{z^{\prime}}$ is of finite presentation over $\mathcal{O}_{Z^{\prime}, z^{\prime}}$ if and only if $\pi_{*} \mathcal{G}_{y^{\prime}}$ is of finite presentation over $\mathcal{O}_{Y^{\prime}, y^{\prime}}$, see Algebra, Lemma 10.35 .21 .
057U Lemma 37.3.4. Assumptions and notation as in Lemma 37.3.2. The following are equivalent
(1) $\mathcal{F}$ is flat over $S$ in a neighbourhood of $x$,
(2) $\mathcal{G}$ is flat over $S^{\prime}$ in a neighbourhood of $z^{\prime}$, and
(3) $\pi_{*} \mathcal{G}$ is flat over $S^{\prime}$ in a neighbourhood of $y^{\prime}$.

The following are equivalent also
(a) $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{S, s}$,
(b) $\mathcal{G}_{z^{\prime}}$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$, and
(c) $\left(\pi_{*} \mathcal{G}\right)_{y^{\prime}}$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.

Proof. To prove the equivalence of (1), (2), and (3) we also consider: (4) $g^{*} \mathcal{F}$ is flat over $S$ in a neighbourhood of $x^{\prime}$. We will use Lemma 37.2 .3 to equate flatness over $S$ and $S^{\prime}$ without further mention. The étale morphism $g$ is flat and open,
see Morphisms, Lemma 28.36.13 Hence for any open neighbourhood $U^{\prime} \subset X^{\prime}$ of $x^{\prime}$, the image $g\left(U^{\prime}\right)$ is an open neighbourhood of $x$ and the map $U^{\prime} \rightarrow g\left(U^{\prime}\right)$ is surjective and flat. Thus (4) $\Leftrightarrow(1)$ by Morphisms, Lemma 28.25.11 Note that

$$
\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)=\Gamma\left(Z^{\prime}, \mathcal{G}\right)=\Gamma\left(Y^{\prime}, \pi_{*} \mathcal{G}\right)
$$

Hence the flatness of $g^{*} \mathcal{F}, \mathcal{G}$ and $\pi_{*} \mathcal{G}$ over $S^{\prime}$ are all equivalent (this uses that $X^{\prime}$, $Z^{\prime}, Y^{\prime}$, and $S^{\prime}$ are all affine). Some omitted topological arguments (compare More on Morphisms, Lemma 36.33.4) regarding affine neighbourhoods now show that (4) $\Leftrightarrow(2) \Leftrightarrow(3)$.
To prove the equivalence of (a), (b), (c) consider the commutative diagram of local ring maps

We will use Lemma 37.2 .4 to equate flatness over $\mathcal{O}_{S, s}$ and $\mathcal{O}_{S^{\prime}, s^{\prime}}$ without further mention. The map $\gamma$ is faithfully flat. Hence $\mathcal{F}_{x}$ is flat over $\mathcal{O}_{S, s}$ if and only if $g^{*} \mathcal{F}_{x^{\prime}}$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$, see Algebra, Lemma 10.38 .9 . As $\mathcal{O}_{S^{\prime}, s^{\prime}}$ modules the modules $g^{*} \mathcal{F}_{x^{\prime}}, \mathcal{G}_{z^{\prime}}$, and $\pi_{*} \mathcal{G}_{y^{\prime}}$ are all isomorphic, see More on Morphisms, Lemma 36.33.4 This finishes the proof.

### 37.4. One step dévissage

05 H 3 In this section we explain what is a one step dévissage of a module. A one step dévissage exist étale locally on base and target. We discuss base change, Zariski shrinking and étale localization of a one step dévissage.
05H4 Definition 37.4.1. Let $S$ be a scheme. Let $X$ be locally of finite type over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $s \in S$ be a point. A one step dévissage of $\mathcal{F} / X / S$ over $s$ is given by morphisms of schemes over $S$

$$
X \stackrel{i}{\leftarrow} Z \xrightarrow{\pi} Y
$$

and a quasi-coherent $\mathcal{O}_{Z}$-module $\mathcal{G}$ of finite type such that
(1) $X, S, Z$ and $Y$ are affine,
(2) $i$ is a closed immersion of finite presentation,
(3) $\mathcal{F} \cong i_{*} \mathcal{G}$,
(4) $\pi$ is finite, and
(5) the structure morphism $Y \rightarrow S$ is smooth with geometrically irreducible fibres of dimension $\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$.
In this case we say $(Z, Y, i, \pi, \mathcal{G})$ is a one step dévissage of $\mathcal{F} / X / S$ over $s$.
Note that such a one step dévissage can only exist if $X$ and $S$ are affine. In the definition above we only require $X$ to be (locally) of finite type over $S$ and we continue working in this setting below. In [GR71 the authors use consistently the setup where $X \rightarrow S$ is locally of finite presentation and $\mathcal{F}$ quasi-coherent $\mathcal{O}_{X^{-}}$ module of finite type. The advantage of this choice is that it "makes sense" to ask for $\mathcal{F}$ to be of finite presentation as an $\mathcal{O}_{X}$-module, whereas in our setting it "does not make sense". Please see More on Morphisms, Section 36.40 for a discussion; the observations made there show that in our setup we may consider the condition of $\mathcal{F}$
being "locally of finite presentation relative to $S$ ", and we could work consistently with this notion. Instead however, we will rely on the results of Lemma 37.3.3 and the observations in Remark 37.6 .3 to deal with this issue in an ad hoc fashion whenever it comes up.

05H5 Definition 37.4.2. Let $S$ be a scheme. Let $X$ be locally of finite type over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $x \in X$ be a point with image $s$ in $S$. A one step dévissage of $\mathcal{F} / X / S$ at $x$ is a system $(Z, Y, i, \pi, \mathcal{G}, z, y)$, where $(Z, Y, i, \pi, \mathcal{G})$ is a one step dévissage of $\mathcal{F} / X / S$ over $s$ and
(1) $\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)=\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$,
(2) $z \in Z$ is a point with $i(z)=x$ and $\pi(z)=y$,
(3) we have $\pi^{-1}(\{y\})=\{z\}$,
(4) the extension $\kappa(s) \subset \kappa(y)$ is purely transcendental.

A one step dévissage of $\mathcal{F} / X / S$ at $x$ can only exist if $X$ and $S$ are affine. Condition (1) assures us that $Y \rightarrow S$ has relative dimension equal to $\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$ via condition (5) of Definition 37.4.1.

05H6 Lemma 37.4.3. Let $f: X \rightarrow S$ be morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in X$ with image $s=f(x)$ in $S$. Then there exists a commutative diagram of pointed schemes

such that $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and $\left(X^{\prime}, x^{\prime}\right) \rightarrow(X, x)$ are elementary étale neighbourhoods, and such that $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$ has a one step dévissage at $x^{\prime}$.

Proof. This is immediate from Definition 37.4 .2 and Lemma 37.3.2.
05H7 Lemma 37.4.4. Let $S, X, \mathcal{F}, s$ be as in Definition 37.4.1. Let $(Z, Y, i, \pi, \mathcal{G})$ be a one step dévissage of $\mathcal{F} / X / S$ over $s$. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be any morphism of pointed schemes. Given this data let $X^{\prime}, Z^{\prime}, Y^{\prime}, i^{\prime}, \pi^{\prime}$ be the base changes of $X, Z, Y, i, \pi$ via $S^{\prime} \rightarrow S$. Let $\mathcal{F}^{\prime}$ be the pullback of $\mathcal{F}$ to $X^{\prime}$ and let $\mathcal{G}^{\prime}$ be the pullback of $\mathcal{G}$ to $Z^{\prime}$. If $S^{\prime}$ is affine, then $\left(Z^{\prime}, Y^{\prime}, i^{\prime}, \pi^{\prime}, \mathcal{G}^{\prime}\right)$ is a one step dévissage of $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ over $s^{\prime}$.

Proof. Fibre products of affines are affine, see Schemes, Lemma 25.17.2. Base change preserves closed immersions, morphisms of finite presentation, finite morphisms, smooth morphisms, morphisms with geometrically irreducible fibres, and morphisms of relative dimension $n$, see Morphisms, Lemmas 28.2.4, 28.21.4, 28.43.6, 28.34.5 28.29.2, and More on Morphisms, Lemma 36.22.2. We have $i_{*}^{\prime} \mathcal{G}^{\prime} \cong \mathcal{F}^{\prime}$ because pushforward along the finite morphism $i$ commutes with base change, see Cohomology of Schemes, Lemma 29.5.1. We have $\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)=\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s^{\prime}}^{\prime}\right)\right)$ by Morphisms, Lemma 28.28.3 because

$$
\operatorname{Supp}\left(\mathcal{F}_{s}\right) \times_{s} s^{\prime}=\operatorname{Supp}\left(\mathcal{F}_{s^{\prime}}^{\prime}\right)
$$

This proves the lemma.

05H8 Lemma 37.4.5. Let $S, X, \mathcal{F}, x, s$ be as in Definition 37.4.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F} / X / S$ at $x$. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be a morphism of pointed schemes which induces an isomorphism $\kappa(s)=\kappa\left(s^{\prime}\right)$. Let $\left(Z^{\prime}, Y^{\prime}, i^{\prime}, \pi^{\prime}, \mathcal{G}^{\prime}\right)$ be as constructed in Lemma 37.4.4 and let $x^{\prime} \in X^{\prime}$ (resp. $z^{\prime} \in Z^{\prime}, y^{\prime} \in Y^{\prime}$ ) be the unique point mapping to both $x \in X$ (resp. $z \in Z, y \in Y$ ) and $s^{\prime} \in S^{\prime}$. If $S^{\prime}$ is affine, then $\left(Z^{\prime}, Y^{\prime}, i^{\prime}, \pi^{\prime}, \mathcal{G}^{\prime}, z^{\prime}, y^{\prime}\right)$ is a one step dévissage of $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ at $x^{\prime}$.

Proof. By Lemma 37.4.4 $\left(Z^{\prime}, Y^{\prime}, i^{\prime}, \pi^{\prime}, \mathcal{G}^{\prime}\right)$ is a one step dévissage of $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ over $s^{\prime}$. Properties (1)-(4) of Definition 37.4 .2 hold for ( $\left.Z^{\prime}, Y^{\prime}, i^{\prime}, \pi^{\prime}, \mathcal{G}^{\prime}, z^{\prime}, y^{\prime}\right)$ as the assumption that $\kappa(s)=\kappa\left(s^{\prime}\right)$ insures that the fibres $X_{s^{\prime}}^{\prime}, Z_{s^{\prime}}^{\prime}$, and $Y_{s^{\prime}}^{\prime}$ are isomorphic to $X_{s}, Z_{s}$, and $Y_{s}$.

05H9 Definition 37.4.6. Let $S, X, \mathcal{F}, x, s$ be as in Definition 37.4.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F} / X / S$ at $x$. Let us define a standard shrinking of this situation to be given by standard opens $S^{\prime} \subset S, X^{\prime} \subset X, Z^{\prime} \subset Z$, and $Y^{\prime} \subset Y$ such that $s \in S^{\prime}, x \in X^{\prime}, z \in Z^{\prime}$, and $y \in Y^{\prime}$ and such that

$$
\left(Z^{\prime}, Y^{\prime},\left.i\right|_{Z^{\prime}},\left.\pi\right|_{Z^{\prime}},\left.\mathcal{G}\right|_{Z^{\prime}}, z, y\right)
$$

is a one step dévissage of $\left.\mathcal{F}\right|_{X^{\prime}} / X^{\prime} / S^{\prime}$ at $x$.
05HA Lemma 37.4.7. With assumption and notation as in Definition 37.4.6 we have:

05HB

05HC
05HD
(1) If $S^{\prime} \subset S$ is a standard open neighbourhood of $s$, then setting $X^{\prime}=X_{S^{\prime}}$, $Z^{\prime}=Z_{S^{\prime}}$ and $Y^{\prime}=Y_{S^{\prime}}$ we obtain a standard shrinking.
(2) Let $W \subset Y$ be a standard open neighbourhood of $y$. Then there exists a standard shrinking with $Y^{\prime}=W \times_{S} S^{\prime}$.
(3) Let $U \subset X$ be an open neighbourhood of $x$. Then there exists a standard shrinking with $X^{\prime} \subset U$.

Proof. Part (1) is immediate from Lemma 37.4.5 and the fact that the inverse image of a standard open under a morphism of affine schemes is a standard open, see Algebra, Lemma 10.16.4

Let $W \subset Y$ as in (2). Because $Y \rightarrow S$ is smooth it is open, see Morphisms, Lemma 28.34.10. Hence we can find a standard open neighbourhood $S^{\prime}$ of $s$ contained in the image of $W$. Then the fibres of $W_{S^{\prime}} \rightarrow S^{\prime}$ are nonempty open subschemes of the fibres of $Y \rightarrow S$ over $S^{\prime}$ and hence geometrically irreducible too. Setting $Y^{\prime}=W_{S^{\prime}}$ and $Z^{\prime}=\pi^{-1}\left(Y^{\prime}\right)$ we see that $Z^{\prime} \subset Z$ is a standard open neighbourhood of $z$. Let $\bar{h} \in \Gamma\left(Z, \mathcal{O}_{Z}\right)$ be a function such that $Z^{\prime}=D(\bar{h})$. As $i: Z \rightarrow X$ is a closed immersion, we can find a function $h \in \Gamma\left(X, \mathcal{O}_{X}\right)$ such that $i^{\sharp}(h)=\bar{h}$. Take $X^{\prime}=D(h) \subset X$. In this way we obtain a standard shrinking as in (2).

Let $U \subset X$ be as in (3). We may after shrinking $U$ assume that $U$ is a standard open. By More on Morphisms, Lemma 36.33 .4 there exists a standard open $W \subset Y$ neighbourhood of $y$ such that $\pi^{-1}(W) \subset i^{-1}(U)$. Apply (2) to get a standard shrinking $X^{\prime}, S^{\prime}, Z^{\prime}, Y^{\prime}$ with $Y^{\prime}=W_{S^{\prime}}$. Since $Z^{\prime} \subset \pi^{-1}(W) \subset i^{-1}(U)$ we may replace $X^{\prime}$ by $X^{\prime} \cap U$ (still a standard open as $U$ is also standard open) without violating any of the conditions defining a standard shrinking. Hence we win.

05HE Lemma 37.4.8. Let $S, X, \mathcal{F}, x, s$ be as in Definition 37.4.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F} / X / S$ at $x$. Let

be a commutative diagram of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods. Then there exists a commutative diagram

of pointed schemes with the following properties:
(1) $\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ is an elementary étale neighbourhood and the morphism $S^{\prime \prime} \rightarrow S$ is the composition $S^{\prime \prime} \rightarrow S^{\prime} \rightarrow S$,
(2) $Y^{\prime \prime}$ is an open subscheme of $Y^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}$,
(3) $Z^{\prime \prime}=Z \times_{Y} Y^{\prime \prime}$,
(4) $\left(X^{\prime \prime}, x^{\prime \prime}\right) \rightarrow(X, x)$ is an elementary étale neighbourhood, and
(5) $\left(Z^{\prime \prime}, Y^{\prime \prime}, i^{\prime \prime}, \pi^{\prime \prime}, \mathcal{G}^{\prime \prime}, z^{\prime \prime}, y^{\prime \prime}\right)$ is a one step dévissage at $x^{\prime \prime}$ of the sheaf $\mathcal{F}^{\prime \prime}$.

Here $\mathcal{F}^{\prime \prime}$ (resp. $\mathcal{G}^{\prime \prime}$ ) is the pullback of $\mathcal{F}$ (resp. $\mathcal{G}$ ) via the morphism $X^{\prime \prime} \rightarrow X$ (resp. $\left.Z^{\prime \prime} \rightarrow Z\right)$ and $i^{\prime \prime}: Z^{\prime \prime} \rightarrow X^{\prime \prime}$ and $\pi^{\prime \prime}: Z^{\prime \prime} \rightarrow Y^{\prime \prime}$ are as in the diagram.

Proof. Let $\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ be any elementary étale neighbourhood with $S^{\prime \prime}$ affine. Let $Y^{\prime \prime} \subset Y^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}$ be any affine open neighbourhood containing the point $y^{\prime \prime}=\left(y^{\prime}, s^{\prime \prime}\right)$. Then we obtain an affine $\left(Z^{\prime \prime}, z^{\prime \prime}\right)$ by (3). Moreover $Z_{S^{\prime \prime}} \rightarrow X_{S^{\prime \prime}}$ is a closed immersion and $Z^{\prime \prime} \rightarrow Z_{S^{\prime \prime}}$ is an étale morphism. Hence Lemma 37.2.1 applies and we can find an étale morphism $X^{\prime \prime} \rightarrow X_{S^{\prime}}$ of affines such that $Z^{\prime \prime} \cong$ $X^{\prime \prime} \times_{X_{S^{\prime}}} Z_{S^{\prime}}$. Denote $i^{\prime \prime}: Z^{\prime \prime} \rightarrow X^{\prime \prime}$ the corresponding closed immersion. Setting $x^{\prime \prime}=i^{\prime \prime}\left(z^{\prime \prime}\right)$ we obtain a commutative diagram as in the lemma. Properties (1), (2), (3), and (4) hold by construction. Thus it suffices to show that (5) holds for a suitable choice of $\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ and $Y^{\prime \prime}$.

We first list those properties which hold for any choice of $\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ and $Y^{\prime \prime}$ as in the first paragraph. As we have $Z^{\prime \prime}=X^{\prime \prime} \times_{X} Z$ by construction we see that $i_{*}^{\prime \prime} \mathcal{G}^{\prime \prime}=\mathcal{F}^{\prime \prime}$ (with notation as in the statement of the lemma), see Cohomology of $\operatorname{Schemes}$, Lemma 29.5.1. Set $n=\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)=\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$. The morphism $Y^{\prime \prime} \rightarrow S^{\prime \prime}$ is smooth of relative dimension $n$ (because $Y^{\prime} \rightarrow S^{\prime}$ is smooth of relative dimension $n$ as the composition $Y^{\prime} \rightarrow Y_{S^{\prime}} \rightarrow S^{\prime}$ of an étale and smooth morphism of relative dimension $n$ and because base change preserves smooth morphisms of relative dimension $n$ ). We have $\kappa\left(y^{\prime \prime}\right)=\kappa(y)$ and $\kappa(s)=\kappa\left(s^{\prime \prime}\right)$ hence $\kappa\left(y^{\prime \prime}\right)$ is a purely transcendental extension of $\kappa\left(s^{\prime \prime}\right)$. The morphism of fibres $X_{s^{\prime \prime}}^{\prime \prime} \rightarrow X_{s}$ is an étale morphism of affine schemes over $\kappa(s)=\kappa\left(s^{\prime \prime}\right)$ mapping the point $x^{\prime \prime}$ to the
point $x$ and pulling back $\mathcal{F}_{s}$ to $\mathcal{F}_{s^{\prime \prime}}^{\prime \prime}$. Hence

$$
\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s^{\prime \prime}}^{\prime \prime}\right)\right)=\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)=n=\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)=\operatorname{dim}_{x^{\prime \prime}}\left(\operatorname{Supp}\left(\mathcal{F}_{s^{\prime \prime}}^{\prime \prime}\right)\right)
$$

because dimension is invariant under étale localization, see Descent, Lemma34.17.2. As $\pi^{\prime \prime}: Z^{\prime \prime} \rightarrow Y^{\prime \prime}$ is the base change of $\pi$ we see that $\pi^{\prime \prime}$ is finite and as $\kappa(y)=\kappa\left(y^{\prime \prime}\right)$ we see that $\pi^{-1}\left(\left\{y^{\prime \prime}\right\}\right)=\left\{z^{\prime \prime}\right\}$.

At this point we have verified all the conditions of Definition 37.4.1 except we have not verified that $Y^{\prime \prime} \rightarrow S^{\prime \prime}$ has geometrically irreducible fibres. Of course in general this is not going to be true, and it is at this point that we will use that $\kappa(s) \subset \kappa(y)$ is purely transcendental. Namely, let $T \subset Y_{s^{\prime}}^{\prime}$ be the irreducible component of $Y_{s^{\prime}}^{\prime}$ containing $y^{\prime}=\left(y, s^{\prime}\right)$. Note that $T$ is an open subscheme of $Y_{s^{\prime}}^{\prime}$ as this is a smooth scheme over $\kappa\left(s^{\prime}\right)$. By Varieties, Lemma 32.5.14 we see that $T$ is geometrically connected because $\kappa\left(s^{\prime}\right)=\kappa(s)$ is algebraically closed in $\kappa\left(y^{\prime}\right)=\kappa(y)$. As $T$ is smooth we see that $T$ is geometrically irreducible. Hence More on Morphisms, Lemma 36.32.3 applies and we can find an elementary étale morphism $\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ and an affine open $Y^{\prime \prime} \subset Y_{S^{\prime \prime}}^{\prime}$ such that all fibres of $Y^{\prime \prime} \rightarrow S^{\prime \prime}$ are geometrically irreducible and such that $T=Y_{s^{\prime \prime}}^{\prime \prime}$. After shrinking (first $Y^{\prime \prime}$ and then $S^{\prime \prime}$ ) we may assume that both $Y^{\prime \prime}$ and $S^{\prime \prime}$ are affine. This finishes the proof of the lemma.

05HF Lemma 37.4.9. Let $S, X, \mathcal{F}, s$ be as in Definition 37.4.1. Let $(Z, Y, i, \pi, \mathcal{G})$ be a one step dévissage of $\mathcal{F} / X / S$ over $s$. Let $\xi \in Y_{s}$ be the (unique) generic point. Then there exists an integer $r>0$ and an $\mathcal{O}_{Y}$-module map

$$
\alpha: \mathcal{O}_{Y}^{\oplus r} \longrightarrow \pi_{*} \mathcal{G}
$$

such that

$$
\alpha: \kappa(\xi)^{\oplus r} \longrightarrow\left(\pi_{*} \mathcal{G}\right)_{\xi} \otimes_{\mathcal{O}_{Y, \xi}} \kappa(\xi)
$$

is an isomorphism. Moreover, in this case we have

$$
\operatorname{dim}\left(\operatorname{Supp}\left(\operatorname{Coker}(\alpha)_{s}\right)\right)<\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)
$$

Proof. By assumption the schemes $S$ and $Y$ are affine. Write $S=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$. As $\pi$ is finite the $\mathcal{O}_{Y^{-}}$module $\pi_{*} \mathcal{G}$ is a finite type quasi-coherent $\mathcal{O}_{Y^{-}}$ module. Hence $\pi_{*} \mathcal{G}=\widetilde{N}$ for some finite $B$-module $N$. Let $\mathfrak{p} \subset B$ be the prime ideal corresponding to $\xi$. To obtain $\alpha$ set $r=\operatorname{dim}_{\kappa(\mathfrak{p})} N \otimes_{B} \kappa(\mathfrak{p})$ and pick $x_{1}, \ldots, x_{r} \in N$ which form a basis of $N \otimes_{B} \kappa(\mathfrak{p})$. Take $\alpha: B^{\oplus r} \rightarrow N$ to be the map given by the formula $\alpha\left(b_{1}, \ldots, b_{r}\right)=\sum b_{i} x_{i}$. It is clear that $\alpha: \kappa(\mathfrak{p})^{\oplus r} \rightarrow N \otimes_{B} \kappa(\mathfrak{p})$ is an isomorphism as desired. Finally, suppose $\alpha$ is any map with this property. Then $N^{\prime}=\operatorname{Coker}(\alpha)$ is a finite $B$-module such that $N^{\prime} \otimes \kappa(\mathfrak{p})=0$. By Nakayama's lemma (Algebra, Lemma 10.19.1) we see that $N_{\mathfrak{p}}^{\prime}=0$. Since the fibre $Y_{s}$ is geometrically irreducible of dimension $n$ with generic point $\xi$ and since we have just seen that $\xi$ is not in the support of $\operatorname{Coker}(\alpha)$ the last assertion of the lemma holds.

### 37.5. Complete dévissage

05 HG In this section we explain what is a complete dévissage of a module and prove that such exist. The material in this section is mainly bookkeeping.

05HH Definition 37.5.1. Let $S$ be a scheme. Let $X$ be locally of finite type over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $s \in S$ be a point. A complete dévissage of $\mathcal{F} / X / S$ over $s$ is given by a diagram

of schemes over $S$, finite type quasi-coherent $\mathcal{O}_{Z_{k}}$-modules $\mathcal{G}_{k}$, and $\mathcal{O}_{Y_{k}}$-module maps

$$
\alpha_{k}: \mathcal{O}_{Y_{k}}^{\oplus r_{k}} \longrightarrow \pi_{k, *} \mathcal{G}_{k}, \quad k=1, \ldots, n
$$

satisfying the following properties:
(1) $\left(Z_{1}, Y_{1}, i_{1}, \pi_{1}, \mathcal{G}_{1}\right)$ is a one step dévissage of $\mathcal{F} / X / S$ over $s$,
(2) the map $\alpha_{k}$ induces an isomorphism

$$
\kappa\left(\xi_{k}\right)^{\oplus r_{k}} \longrightarrow\left(\pi_{k, *} \mathcal{G}_{k}\right)_{\xi_{k}} \otimes_{\mathcal{O}_{Y_{k}, \xi_{k}}} \kappa\left(\xi_{k}\right)
$$

where $\xi_{k} \in\left(Y_{k}\right)_{s}$ is the unique generic point,
(3) for $k=2, \ldots, n$ the system $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}\right)$ is a one step dévissage of Coker $\left(\alpha_{k-1}\right) / Y_{k-1} / S$ over $s$,
(4) $\operatorname{Coker}\left(\alpha_{n}\right)=0$.

In this case we say that $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}\right)_{k=1, \ldots, n}$ is a complete dévissage of $\mathcal{F} / X / S$ over $s$.

05 HI Definition 37.5.2. Let $S$ be a scheme. Let $X$ be locally of finite type over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $x \in X$ be a point with image $s \in S$. A complete dévissage of $\mathcal{F} / X / S$ at $x$ is given by a system

$$
\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}, z_{k}, y_{k}\right)_{k=1, \ldots, n}
$$

such that $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}\right)$ is a complete dévissage of $\mathcal{F} / X / S$ over $s$, and such that
(1) $\left(Z_{1}, Y_{1}, i_{1}, \pi_{1}, \mathcal{G}_{1}, z_{1}, y_{1}\right)$ is a one step dévissage of $\mathcal{F} / X / S$ at $x$,
(2) for $k=2, \ldots, n$ the $\operatorname{system}\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, z_{k}, y_{k}\right)$ is a one step dévissage of Coker $\left(\alpha_{k-1}\right) / Y_{k-1} / S$ at $y_{k-1}$.

Again we remark that a complete dévissage can only exist if $X$ and $S$ are affine.
05HJ Lemma 37.5.3. Let $S, X, \mathcal{F}$, $s$ be as in Definition 37.5.1. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be any morphism of pointed schemes. Let $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}\right)_{k=1, \ldots, n}$ be a complete dévissage of $\mathcal{F} / X / S$ over $s$. Given this data let $X^{\prime}, Z_{k}^{\prime}, Y_{k}^{\prime}, i_{k}^{\prime}, \pi_{k}^{\prime}$ be the base changes of $X, Z_{k}, Y_{k}, i_{k}, \pi_{k}$ via $S^{\prime} \rightarrow S$. Let $\mathcal{F}^{\prime}$ be the pullback of $\mathcal{F}$ to $X^{\prime}$ and let $\mathcal{G}_{k}^{\prime}$ be
the pullback of $\mathcal{G}_{k}$ to $Z_{k}^{\prime}$. Let $\alpha_{k}^{\prime}$ be the pullback of $\alpha_{k}$ to $Y_{k}^{\prime}$. If $S^{\prime}$ is affine, then $\left(Z_{k}^{\prime}, Y_{k}^{\prime}, i_{k}^{\prime}, \pi_{k}^{\prime}, \mathcal{G}_{k}^{\prime}, \alpha_{k}^{\prime}\right)_{k=1, \ldots, n}$ is a complete dévissage of $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ over $s^{\prime}$.
Proof. By Lemma 37.4.4 we know that the base change of a one step dévissage is a one step dévissage. Hence it suffices to prove that formation of $\operatorname{Coker}\left(\alpha_{k}\right)$ commutes with base change and that condition (2) of Definition 37.5.1 is preserved by base change. The first is true as $\pi_{k, *}^{\prime} \mathcal{G}_{k}^{\prime}$ is the pullback of $\pi_{k, *} \mathcal{G}_{k}$ (by Cohomology of Schemes, Lemma 29.5.1) and because $\otimes$ is right exact. The second because by the same token we have

$$
\left(\pi_{k, *} \mathcal{G}_{k}\right)_{\xi_{k}} \otimes_{\mathcal{O}_{Y_{k}, \xi_{k}}} \kappa\left(\xi_{k}\right) \otimes_{\kappa\left(\xi_{k}\right)} \kappa\left(\xi_{k}^{\prime}\right) \cong\left(\pi_{k, *}^{\prime} \mathcal{G}_{k}^{\prime}\right)_{\xi_{k}^{\prime}} \otimes_{\mathcal{O}_{Y_{k}^{\prime}, \xi_{k}^{\prime}}} \kappa\left(\xi_{k}^{\prime}\right)
$$

with obvious notation.
05HK Lemma 37.5.4. Let $S, X, \mathcal{F}, x, s$ be as in Definition 37.5.2. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be a morphism of pointed schemes which induces an isomorphism $\kappa(s)=\kappa\left(s^{\prime}\right)$. Let $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}, z_{k}, y_{k}\right)_{k=1, \ldots, n}$ be a complete dévissage of $\mathcal{F} / X / S$ at $x$. Let $\left(Z_{k}^{\prime}, Y_{k}^{\prime}, i_{k}^{\prime}, \pi_{k}^{\prime}, \mathcal{G}_{k}^{\prime}, \alpha_{k}^{\prime}\right)_{k=1, \ldots, n}$ be as constructed in Lemma 37.5.3 and let $x^{\prime} \in X^{\prime}$ (resp. $z_{k}^{\prime} \in Z^{\prime}, y_{k}^{\prime} \in Y^{\prime}$ ) be the unique point mapping to both $x \in X$ (resp. $z_{k} \in Z_{k}$, $y_{k} \in Y_{k}$ ) and $s^{\prime} \in S^{\prime}$. If $S^{\prime}$ is affine, then $\left(Z_{k}^{\prime}, Y_{k}^{\prime}, i_{k}^{\prime}, \pi_{k}^{\prime}, \mathcal{G}_{k}^{\prime}, \alpha_{k}^{\prime}, z_{k}^{\prime}, y_{k}^{\prime}\right)_{k=1, \ldots, n}$ is a complete dévissage of $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ at $x^{\prime}$.

Proof. Combine Lemma 37.5 .3 and Lemma 37.4.5.
05HL Definition 37.5.5. Let $S, X, \mathcal{F}, x, s$ be as in Definition 37.5.2. Consider a complete dévissage $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}, z_{k}, y_{k}\right)_{k=1, \ldots, n}$ of $\mathcal{F} / X / S$ at $x$. Let us define a standard shrinking of this situation to be given by standard opens $S^{\prime} \subset S$, $X^{\prime} \subset X, Z_{k}^{\prime} \subset Z_{k}$, and $Y_{k}^{\prime} \subset Y_{k}$ such that $s_{k} \in S^{\prime}, x_{k} \in X^{\prime}, z_{k} \in Z^{\prime}$, and $y_{k} \in Y^{\prime}$ and such that

$$
\left(Z_{k}^{\prime}, Y_{k}^{\prime}, i_{k}^{\prime}, \pi_{k}^{\prime}, \mathcal{G}_{k}^{\prime}, \alpha_{k}^{\prime}, z_{k}, y_{k}\right)_{k=1, \ldots, n}
$$

is a one step dévissage of $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ at $x$ where $\mathcal{G}_{k}^{\prime}=\left.\mathcal{G}_{k}\right|_{Z_{k}^{\prime}}$ and $\mathcal{F}^{\prime}=\left.\mathcal{F}\right|_{X^{\prime}}$.
05HM Lemma 37.5.6. With assumption and notation as in Definition 37.5.5 we have:
05 HN
(1) If $S^{\prime} \subset S$ is a standard open neighbourhood of $s$, then setting $X^{\prime}=X_{S^{\prime}}$, $Z_{k}^{\prime}=Z_{S^{\prime}}$ and $Y_{k}^{\prime}=Y_{S^{\prime}}$ we obtain a standard shrinking.
05HP
(2) Let $W \subset Y_{n}$ be a standard open neighbourhood of $y$. Then there exists a standard shrinking with $Y_{n}^{\prime}=W \times_{S} S^{\prime}$.
05 HQ
(3) Let $U \subset X$ be an open neighbourhood of $x$. Then there exists a standard shrinking with $X^{\prime} \subset U$.

Proof. Part (1) is immediate from Lemmas 37.5.4 and 37.4.7.
Proof of (2). For convenience denote $X=Y_{0}$. We apply Lemma 37.4.7 (2) to find a standard shrinking $S^{\prime}, Y_{n-1}^{\prime}, Z_{n}^{\prime}, Y_{n}^{\prime}$ of the one step dévissage of $\operatorname{Coker}\left(\alpha_{n-1}\right) / Y_{n-1} / S$ at $y_{n-1}$ with $Y_{n}^{\prime}=W \times_{S} S^{\prime}$. We may repeat this procedure and find a standard shrinking $S^{\prime \prime}, Y_{n-2}^{\prime \prime}, Z_{n-1}^{\prime \prime}, Y_{n-1}^{\prime \prime}$ of the one step dévissage of $\operatorname{Coker}\left(\alpha_{n-2}\right) / Y_{n-2} / S$ at $y_{n-2}$ with $Y_{n-1}^{\prime \prime}=Y_{n-1}^{\prime} \times{ }_{S} S^{\prime \prime}$. We may continue in this manner until we obtain $S^{(n)}, Y_{0}^{(n)}, Z_{1}^{(n)}, Y_{1}^{(n)}$. At this point it is clear that we obtain our desired standard shrinking by taking $S^{(n)}$, $X^{(n)}, Z_{k}^{(n-k)} \times{ }_{S} S^{(n)}$, and $Y_{k}^{(n-k)} \times_{S} S^{(n)}$ with the desired property.
Proof of (3). We use induction on the length of the complete dévissage. First we apply Lemma 37.4.7 (3) to find a standard shrinking $S^{\prime}, X^{\prime}, Z_{1}^{\prime}, Y_{1}^{\prime}$ of the one
step dévissage of $\mathcal{F} / X / S$ at $x$ with $X^{\prime} \subset U$. If $n=1$, then we are done. If $n>1$, then by induction we can find a standard shrinking $S^{\prime \prime}, Y_{1}^{\prime \prime}, Z_{k}^{\prime \prime}$, and $Y_{k}^{\prime \prime}$ of the complete dévissage $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}, z_{k}, y_{k}\right)_{k=2, \ldots, n}$ of $\operatorname{Coker}\left(\alpha_{1}\right) / Y_{1} / S$ at $x$ such that $Y_{1}^{\prime \prime} \subset Y_{1}^{\prime}$. Using Lemma 37.4.7 2) we can find $S^{\prime \prime \prime} \subset S^{\prime}, X^{\prime \prime \prime} \subset X^{\prime}, Z_{1}^{\prime \prime \prime}$ and $Y_{1}^{\prime \prime \prime}=Y_{1}^{\prime \prime} \times_{S} S^{\prime \prime \prime}$ which is a standard shrinking. The solution to our problem is to take

$$
S^{\prime \prime \prime}, X^{\prime \prime \prime}, Z_{1}^{\prime \prime \prime}, Y_{1}^{\prime \prime \prime}, Z_{2}^{\prime \prime} \times_{S} S^{\prime \prime \prime}, Y_{2}^{\prime \prime} \times_{S} S^{\prime \prime \prime}, \ldots, Z_{n}^{\prime \prime} \times_{S} S^{\prime \prime \prime}, Y_{n}^{\prime \prime} \times_{S} S^{\prime \prime \prime}
$$

This ends the proof of the lemma.
05HR Proposition 37.5.7. Let $S$ be a scheme. Let $X$ be locally of finite type over $S$. Let $x \in X$ be a point with image $s \in S$. There exists a commutative diagram

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$ has a complete dévissage at $x$.

Proof. We prove this by induction on the integer $d=\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$. By Lemma 37.4 .3 there exists a diagram

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$ has a one step dévissage at $x^{\prime}$. The local nature of the problem implies that we may replace $(X, x) \rightarrow(S, s)$ by $\left(X^{\prime}, x^{\prime}\right) \rightarrow$ $\left(S^{\prime}, s^{\prime}\right)$. Thus after doing so we may assume that there exists a one step dévissage $\left(Z_{1}, Y_{1}, i_{1}, \pi_{1}, \mathcal{G}_{1}\right)$ of $\mathcal{F} / X / S$ at $x$.

We apply Lemma 37.4 .9 to find a map

$$
\alpha_{1}: \mathcal{O}_{Y_{1}}^{\oplus r_{1}} \longrightarrow \pi_{1, *} \mathcal{G}_{1}
$$

which induces an isomorphism of vector spaces over $\kappa\left(\xi_{1}\right)$ where $\xi_{1} \in Y_{1}$ is the unique generic point of the fibre of $Y_{1}$ over $s$. Moreover $\operatorname{dim}_{y_{1}}\left(\operatorname{Supp}\left(\operatorname{Coker}\left(\alpha_{1}\right)_{s}\right)\right)<$ $d$. It may happen that the stalk of $\operatorname{Coker}\left(\alpha_{1}\right)_{s}$ at $y_{1}$ is zero. In this case we may shrink $Y_{1}$ by Lemma 37.4.7 (2) and assume that $\operatorname{Coker}\left(\alpha_{1}\right)=0$ so we obtain a complete dévissage of length zero.

Assume now that the stalk of $\operatorname{Coker}\left(\alpha_{1}\right)_{s}$ at $y_{1}$ is not zero. In this case, by induction, there exists a commutative diagram

05HS

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $h^{*} \operatorname{Coker}\left(\alpha_{1}\right) / Y_{1}^{\prime} / S^{\prime}$ has a complete dévissage

$$
\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}, z_{k}, y_{k}\right)_{k=2, \ldots, n}
$$

at $y_{1}^{\prime}$. (In particular $i_{2}: Z_{2} \rightarrow Y_{1}^{\prime}$ is a closed immersion into $Y_{2}^{\prime}$.) At this point we apply Lemma 37.4 .8 to $S, X, \mathcal{F}, x, s$, the system $\left(Z_{1}, Y_{1}, i_{1}, \pi_{1}, \mathcal{G}_{1}\right)$ and diagram 37.5.7.1. We obtain a diagram

with all the properties as listed in the referenced lemma. In particular $Y_{1}^{\prime \prime} \subset$ $Y_{1}^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}$. Set $X_{1}=Y_{1}^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}$ and let $\mathcal{F}_{1}$ denote the pullback of $\operatorname{Coker}\left(\alpha_{1}\right)$. By Lemma 37.5.4 the system
05HT (37.5.7.2)

$$
\left(Z_{k} \times_{S^{\prime}} S^{\prime \prime}, Y_{k} \times{S^{\prime}} S^{\prime \prime}, i_{k}^{\prime \prime}, \pi_{k}^{\prime \prime}, \mathcal{G}_{k}^{\prime \prime}, \alpha_{k}^{\prime \prime}, z_{k}^{\prime \prime}, y_{k}^{\prime \prime}\right)_{k=2, \ldots, n}
$$

is a complete dévissage of $\mathcal{F}_{1}$ to $X_{1}$. Again, the nature of the problem allows us to replace $(X, x) \rightarrow(S, s)$ by $\left(X^{\prime \prime}, x^{\prime \prime}\right) \rightarrow\left(S^{\prime \prime}, s^{\prime \prime}\right)$. In this we see that we may assume:
(a) There exists a one step dévissage $\left(Z_{1}, Y_{1}, i_{1}, \pi_{1}, \mathcal{G}_{1}\right)$ of $\mathcal{F} / X / S$ at $x$,
(b) there exists an $\alpha_{1}: \mathcal{O}_{Y_{1}}^{\oplus r_{1}} \rightarrow \pi_{1, *} \mathcal{G}_{1}$ such that $\alpha \otimes \kappa\left(\xi_{1}\right)$ is an isomorphism,
(c) $Y_{1} \subset X_{1}$ is open, $y_{1}=x_{1}$, and $\left.\mathcal{F}_{1}\right|_{Y_{1}} \cong \operatorname{Coker}\left(\alpha_{1}\right)$, and
(d) there exists a complete dévissage $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}, z_{k}, y_{k}\right)_{k=2, \ldots, n}$ of $\mathcal{F}_{1} / X_{1} / S$ at $x_{1}$.
To finish the proof all we have to do is shrink the one step dévissage and the complete dévissage such that they fit together to a complete dévissage. (We suggest the reader do this on their own using Lemmas 37.4.7 and 37.5.6 instead of reading the proof that follows.) Since $Y_{1} \subset X_{1}$ is an open neighbourhood of $x_{1}$ we may apply Lemma 37.5 .6 (3) to find a standard shrinking $S^{\prime}, X_{1}^{\prime}, Z_{2}^{\prime}, Y_{2}^{\prime}, \ldots, Y_{n}^{\prime}$ of the datum (d) so that $X_{1}^{\prime} \subset Y_{1}$. Note that $X_{1}^{\prime}$ is also a standard open of the affine scheme $Y_{1}$. Next, we shrink the datum (a) as follows: first we shrink the base $S$ to $S^{\prime}$, see Lemma 37.4 .7 and then we shrink the result to $S^{\prime \prime}, X^{\prime \prime}, Z_{1}^{\prime \prime}, Y_{1}^{\prime \prime}$ using Lemma 37.4.7 (2) such that eventually $Y_{1}^{\prime \prime}=X_{1}^{\prime} \times_{S} S^{\prime \prime}$ and $S^{\prime \prime} \subset S^{\prime}$. Then we see that

$$
Z_{1}^{\prime \prime}, Y_{1}^{\prime \prime}, Z_{2}^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}, Y_{2}^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}, \ldots, Y_{n}^{\prime} \times{ }_{S^{\prime}} S^{\prime \prime}
$$

gives the complete dévissage we were looking for.
Some more bookkeeping gives the following consequence.
05 HU Lemma 37.5.8. Let $X \rightarrow S$ be a finite type morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $s \in S$ be a point. There exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and étale morphisms $h_{i}: Y_{i} \rightarrow X_{S^{\prime}}$, $i=1, \ldots, n$ such that for each $i$ there exists a complete dévissage of $\mathcal{F}_{i} / Y_{i} / S^{\prime}$ over $s^{\prime}$, where $\mathcal{F}_{i}$ is the pullback of $\mathcal{F}$ to $Y_{i}$ and such that $X_{s}=\left(X_{S^{\prime}}\right)_{s^{\prime}} \subset \bigcup h_{i}\left(Y_{i}\right)$.

Proof. For every point $x \in X_{s}$ we can find a diagram

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$ has a complete dévissage at $x^{\prime}$. As $X \rightarrow S$ is of finite type the fibre $X_{s}$ is quasi-compact, and since each $g: X^{\prime} \rightarrow X$ as above is open we can cover $X_{s}$ by a finite union of $g\left(X_{s^{\prime}}^{\prime}\right)$. Thus we can find a finite family of such diagrams

such that $X_{s}=\bigcup g_{i}\left(X_{i}^{\prime}\right)$. Set $S^{\prime}=S_{1}^{\prime} \times_{S} \ldots \times_{S} S_{n}^{\prime}$ and let $Y_{i}=X_{i} \times_{S_{i}^{\prime}} S^{\prime}$ be the base change of $X_{i}^{\prime}$ to $S^{\prime}$. By Lemma 37.5 .3 we see that the pullback of $\mathcal{F}$ to $Y_{i}$ has a complete dévissage over $s$ and we win.

### 37.6. Translation into algebra

05 HV It may be useful to spell out algebraically what it means to have a complete dévissage. We introduce the following notion (which is not that useful so we give it an impossibly long name).
05HW Definition 37.6.1. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over the prime $\mathfrak{p}$ of $R$. A elementary étale localization of the ring map $R \rightarrow S$ at $\mathfrak{q}$ is given by a commutative diagram of rings and accompanying primes

such that $R \rightarrow R^{\prime}$ and $S \rightarrow S^{\prime}$ are étale ring maps and $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right)$ and $\kappa(\mathfrak{q})=$ $\kappa\left(\mathfrak{q}^{\prime}\right)$.
05HX Definition 37.6.2. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{r}$ be a prime of $R$. Let $N$ be a finite $S$-module. A complete dévissage of $N / S / R$ over $\mathfrak{r}$ is given by $R$-algebra maps

finite $A_{i}$-modules $M_{i}$ and $B_{i}$-module maps $\alpha_{i}: B_{i}^{\oplus r_{i}} \rightarrow M_{i}$ such that
(1) $S \rightarrow A_{1}$ is surjective and of finite presentation,
(2) $B_{i} \rightarrow A_{i+1}$ is surjective and of finite presentation,
(3) $B_{i} \rightarrow A_{i}$ is finite,
(4) $R \rightarrow B_{i}$ is smooth with geometrically irreducible fibres,
(5) $N \cong M_{1}$ as $S$-modules,
(6) $\operatorname{Coker}\left(\alpha_{i}\right) \cong M_{i+1}$ as $B_{i}$-modules,
(7) $\alpha_{i}: \kappa\left(\mathfrak{p}_{i}\right)^{\oplus r_{i}} \rightarrow M_{i} \otimes_{B_{i}} \kappa\left(\mathfrak{p}_{i}\right)$ is an isomorphism where $\mathfrak{p}_{i}=\mathfrak{r} B_{i}$, and
(8) $\operatorname{Coker}\left(\alpha_{n}\right)=0$.

In this situation we say that $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}\right)_{i=1, \ldots, n}$ is a complete dévissage of $N / S / R$ over $\mathfrak{r}$.

05HY Remark 37.6.3. Note that the $R$-algebras $B_{i}$ for all $i$ and $A_{i}$ for $i \geq 2$ are of finite presentation over $R$. If $S$ is of finite presentation over $R$, then it is also the case that $A_{1}$ is of finite presentation over $R$. In this case all the ring maps in the complete dévissage are of finite presentation. See Algebra, Lemma 10.6.2. Still assuming $S$ of finite presentation over $R$ the following are equivalent
(1) $M$ is of finite presentation over $S$,
(2) $M_{1}$ is of finite presentation over $A_{1}$,
(3) $M_{1}$ is of finite presentation over $B_{1}$,
(4) each $M_{i}$ is of finite presentation both as an $A_{i}$-module and as a $B_{i}$-module. The equivalences (1) $\Leftrightarrow(2)$ and $(2) \Leftrightarrow(3)$ follow from Algebra, Lemma 10.35.21. If $M_{1}$ is finitely presented, so is $\operatorname{Coker}\left(\alpha_{1}\right)$ (see Algebra, Lemma 10.5.3) and hence $M_{2}$, etc.

05HZ Definition 37.6.4. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over the prime $\mathfrak{r}$ of $R$. Let $N$ be a finite $S$-module. A complete dévissage of $N / S / R$ at $\mathfrak{q}$ is given by a complete dévissage $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}\right)_{i=1, \ldots, n}$ of $N / S / R$ over $\mathfrak{r}$ and prime ideals $\mathfrak{q}_{i} \subset B_{i}$ lying over $\mathfrak{r}$ such that
(1) $\kappa(\mathfrak{r}) \subset \kappa\left(\mathfrak{q}_{i}\right)$ is purely transcendental,
(2) there is a unique prime $\mathfrak{q}_{i}^{\prime} \subset A_{i}$ lying over $\mathfrak{q}_{i} \subset B_{i}$,
(3) $\mathfrak{q}=\mathfrak{q}_{1}^{\prime} \cap S$ and $\mathfrak{q}_{i}=\mathfrak{q}_{i+1}^{\prime} \cap A_{i}$,
(4) $R \rightarrow B_{i}$ has relative dimension $\operatorname{dim}_{\mathfrak{q}_{i}}\left(\operatorname{Supp}\left(M_{i} \otimes_{R} \kappa(\mathfrak{r})\right)\right)$.

05I0 Remark 37.6.5. Let $A \rightarrow B$ be a finite type ring map and let $N$ be a finite $B$-module. Let $\mathfrak{q}$ be a prime of $B$ lying over the prime $\mathfrak{r}$ of $A$. Set $X=\operatorname{Spec}(B)$, $S=\operatorname{Spec}(A)$ and $\mathcal{F}=\widetilde{N}$ on $X$. Let $x$ be the point corresponding to $\mathfrak{q}$ and let $s \in S$ be the point corresponding to $\mathfrak{p}$. Then
(1) if there exists a complete dévissage of $\mathcal{F} / X / S$ over $s$ then there exists a complete dévissage of $N / B / A$ over $\mathfrak{p}$, and
(2) there exists a complete dévissage of $\mathcal{F} / X / S$ at $x$ if and only if there exists a complete dévissage of $N / B / A$ at $\mathfrak{q}$.
There is just a small twist in that we omitted the condition on the relative dimension in the formulation of "a complete dévissage of $N / B / A$ over $\mathfrak{p}$ " which is why the implication in (1) only goes in one direction. The notion of a complete dévissage at $\mathfrak{q}$ does have this condition built in. In any case we will only use that existence for $\mathcal{F} / X / S$ implies the existence for $N / B / A$.

05I1 Lemma 37.6.6. Let $R \rightarrow S$ be a finite type ring map. Let $M$ be a finite $S$ module. Let $\mathfrak{q}$ be a prime ideal of $S$. There exists an elementary étale localization $R^{\prime} \rightarrow S^{\prime}, \mathfrak{q}^{\prime}, \mathfrak{p}^{\prime}$ of the ring map $R \rightarrow S$ at $\mathfrak{q}$ such that there exists a complete dévissage of $\left(M \otimes_{S} S^{\prime}\right) / S^{\prime} / R^{\prime}$ at $\mathfrak{q}^{\prime}$.

Proof. This is a reformulation of Proposition 37.5.7 via Remark 37.6.5

### 37.7. Localization and universally injective maps

05DD
05DE Lemma 37.7.1. Let $R \rightarrow S$ be a ring map. Let $N$ be a $S$-module. Assume
(1) $\frac{R}{}$ is a local ring with maximal ideal $\mathfrak{m}$,
(2) $\bar{S}=S / \mathfrak{m} S$ is Noetherian, and
(3) $\bar{N}=N / \mathfrak{m}_{R} N$ is a finite $\bar{S}$-module.

Let $\Sigma \subset S$ be the multiplicative subset of elements which are not a zerodivisor on $\bar{N}$. Then $\Sigma^{-1} S$ is a semi-local ring whose spectrum consists of primes $\mathfrak{q} \subset S$ contained in an element of $A s s_{S}(\bar{N})$. Moreover, any maximal ideal of $\Sigma^{-1} S$ corresponds to an associated prime of $\bar{N}$ over $\bar{S}$.
Proof. Note that $\operatorname{Ass}_{S}(\bar{N})=\operatorname{Ass}_{\bar{S}}(\bar{N})$, see Algebra, Lemma 10.62.14. This is a finite set by Algebra, Lemma 10.62.5. Say $\left\{\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}\right\}=\operatorname{Ass}_{S}(\bar{N})$. We have $\Sigma=S \backslash\left(\cup \mathfrak{q}_{i}\right)$ by Algebra, Lemma 10.62.9. By the description of $\operatorname{Spec}\left(\Sigma^{-1} S\right)$ in Algebra, Lemma 10.16 .5 and by Algebra, Lemma 10.14 .2 we see that the primes of $\Sigma^{-1} S$ correspond to the primes of $S$ contained in one of the $\mathfrak{q}_{i}$. Hence the maximal ideals of $\Sigma^{-1} S$ correspond one-to-one with the maximal (w.r.t. inclusion) elements of the set $\left\{\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}\right\}$. This proves the lemma.
05DF Lemma 37.7.2. Assumption and notation as in Lemma 37.7.1. Assume moreover that
(1) $S$ is local and $R \rightarrow S$ is a local homomorphism,
(2) $S$ is essentially of finite presentation over $R$,
(3) $N$ is finitely presented over $S$, and
(4) $N$ is flat over $R$.

Then each $s \in \Sigma$ defines a universally injective $R$-module map $s: N \rightarrow N$, and the map $N \rightarrow \Sigma^{-1} N$ is $R$-universally injective.
Proof. By Algebra, Lemma 10.127 .4 the sequence $0 \rightarrow N \rightarrow N \rightarrow N / s N \rightarrow 0$ is exact and $N / s N$ is flat over $R$. This implies that $s: N \rightarrow N$ is universally injective, see Algebra, Lemma 10.38 .12 . The map $N \rightarrow \Sigma^{-1} N$ is universally injective as the directed colimit of the maps $s: N \rightarrow N$.

05DG Lemma 37.7.3. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Let $S \rightarrow S^{\prime}$ be a ring map. Assume
(1) $R \rightarrow S$ is a local homomorphism of local rings
(2) $S$ is essentially of finite presentation over $R$,
(3) $N$ is of finite presentation over $S$,
(4) $N$ is flat over $R$,
(5) $S \rightarrow S^{\prime}$ is flat, and
(6) the image of $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$ contains all primes $\mathfrak{q}$ of $S$ lying over $\mathfrak{m}_{R}$ such that $\mathfrak{q}$ is an associated prime of $N / \mathfrak{m}_{R} N$.
Then $N \rightarrow N \otimes_{S} S^{\prime}$ is $R$-universally injective.
Proof. Set $N^{\prime}=N \otimes_{R} S^{\prime}$. Consider the commutative diagram

where $\Sigma \subset S$ is the set of elements which are not a zerodivisor on $N / \mathfrak{m}_{R} N$. If we can show that the map $N \rightarrow \Sigma^{-1} N^{\prime}$ is universally injective, then $N \rightarrow N^{\prime}$ is too (see Algebra, Lemma 10.81.10).
By Lemma 37.7 .1 the ring $\Sigma^{-1} S$ is a semi-local ring whose maximal ideals correspond to associated primes of $N / \mathfrak{m}_{R} N$. Hence the image of $\operatorname{Spec}\left(\Sigma^{-1} S^{\prime}\right) \rightarrow$ $\operatorname{Spec}\left(\Sigma^{-1} S\right)$ contains all these maximal ideals by assumption. By Algebra, Lemma 10.38 .16 the ring map $\Sigma^{-1} S \rightarrow \Sigma^{-1} S^{\prime}$ is faithfully flat. Hence $\Sigma^{-1} N \rightarrow \Sigma^{-1} N^{\prime}$, which is the map

$$
N \otimes_{S} \Sigma^{-1} S \longrightarrow N \otimes_{S} \Sigma^{-1} S^{\prime}
$$

is universally injective, see Algebra, Lemmas 10.81.11 and 10.81.8. Finally, we apply Lemma 37.7 .2 to see that $N \rightarrow \Sigma^{-1} N$ is universally injective. As the composition of universally injective module maps is universally injective (see Algebra, Lemma 10.81.9 we conclude that $N \rightarrow \Sigma^{-1} N^{\prime}$ is universally injective and we win.

05DH Lemma 37.7.4. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Let $S \rightarrow S^{\prime}$ be a ring map. Assume
(1) $R \rightarrow S$ is of finite presentation and $N$ is of finite presentation over $S$,
(2) $N$ is flat over $R$,
(3) $S \rightarrow S^{\prime}$ is flat, and
(4) the image of $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$ contains all primes $\mathfrak{q}$ such that $\mathfrak{q}$ is an associated prime of $N \otimes_{R} \kappa(\mathfrak{p})$ where $\mathfrak{p}$ is the inverse image of $\mathfrak{q}$ in $R$.
Then $N \rightarrow N \otimes_{S} S^{\prime}$ is $R$-universally injective.
Proof. By Algebra, Lemma 10.81 .12 it suffices to show that $N_{\mathfrak{q}} \rightarrow\left(N \otimes_{R} S^{\prime}\right)_{\mathfrak{q}}$ is a $R_{\mathfrak{p}}$-universally injective for any prime $\mathfrak{q}$ of $S$ lying over $\mathfrak{p}$ in $R$. Thus we may apply Lemma 37.7 .3 to the ring maps $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}}^{\prime}$ and the module $N_{\mathfrak{q}}$.
The reader may want to compare the following lemma to Algebra, Lemmas 10.98.1 and 10.127 .4 and the results of Section 37.25 . In each case the conclusion is that the map $u: M \rightarrow N$ is universally injective with flat cokernel.

05FQ Lemma 37.7.5. Let $(R, \mathfrak{m})$ be a local ring. Let $u: M \rightarrow N$ be an $R$-module map. If $M$ is a projective $R$-module, $N$ is a flat $R$-module, and $\bar{u}: M / \mathfrak{m} M \rightarrow N / \mathfrak{m} N$ is injective then $u$ is universally injective.

Proof. By Algebra, Theorem 10.84 .4 the module $M$ is free. If we show the result holds for every finitely generated direct summand of $M$, then the lemma follows. Hence we may assume that $M$ is finite free. Write $N=\operatorname{colim}_{i} N_{i}$ as a directed colimit of finite free modules, see Algebra, Theorem 10.80.4. Note that $u: M \rightarrow N$ factors through $N_{i}$ for some $i$ (as $M$ is finite free). Denote $u_{i}: M \rightarrow N_{i}$ the corresponding $R$-module map. As $\bar{u}$ is injective we see that $\overline{u_{i}}: M / \mathfrak{m} M \rightarrow N_{i} / \mathfrak{m} N_{i}$ is injective and remains injective on composing with the maps $N_{i} / \mathfrak{m} N_{i} \rightarrow N_{i^{\prime}} / \mathfrak{m} N_{i^{\prime}}$ for all $i^{\prime} \geq i$. As $M$ and $N_{i^{\prime}}$ are finite free over the local ring $R$ this implies that $M \rightarrow N_{i^{\prime}}$ is a split injection for all $i^{\prime} \geq i$. Hence for any $R$-module $Q$ we see that $M \otimes_{R} Q \rightarrow N_{i^{\prime}} \otimes_{R} Q$ is injective for all $i^{\prime} \geq i$. As $-\otimes_{R} Q$ commutes with colimits we conclude that $M \otimes_{R} Q \rightarrow N_{i^{\prime}} \otimes_{R} Q$ is injective as desired.

05FR Lemma 37.7.6. Assumption and notation as in Lemma 37.7.1. Assume moreover that $N$ is projective as an $R$-module. Then each $s \in \Sigma$ defines a universally injective $R$-module map $s: N \rightarrow N$, and the map $N \rightarrow \Sigma^{-1} N$ is $R$-universally injective.

Proof. Pick $s \in \Sigma$. By Lemma 37.7.5 the map $s: N \rightarrow N$ is universally injective. The map $N \rightarrow \Sigma^{-1} N$ is universally injective as the directed colimit of the maps $s: N \rightarrow N$.

### 37.8. Completion and Mittag-Leffler modules

05DJ Lemma 37.8.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $A$ be a set. Assume $R$ is Noetherian and complete with respect to $I$. The completion $\left(\bigoplus_{\alpha \in A} R\right)^{\wedge}$ is flat and Mittag-Leffler.
Proof. By More on Algebra, Lemma 15.21 .1 the map $\left(\bigoplus_{\alpha \in A} R\right)^{\wedge} \rightarrow \prod_{\alpha \in A} R$ is universally injective. Thus, by Algebra, Lemmas 10.81 .7 and 10.88 .7 it suffices to show that $\prod_{\alpha \in A} R$ is flat and Mittag-Leffler. By Algebra, Proposition 10.89.5 (and Algebra, Lemma 10.89.4 we see that $\prod_{\alpha \in A} R$ is flat. Thus we conclude because a product of copies of $R$ is Mittag-Leffler, see Algebra, Lemma 10.90.3.
05DK Lemma 37.8.2. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Assume
(1) $R$ is Noetherian and I-adically complete,
(2) $M$ is flat over $R$, and
(3) $M / I M$ is a projective $R / I$-module.

Then the I-adic completion $M^{\wedge}$ is a flat Mittag-Leffler R-module.
Proof. Choose a surjection $F \rightarrow M$ where $F$ is a free $R$-module. By Algebra, Lemma 10.96 .9 the module $M^{\wedge}$ is a direct summand of the module $F^{\wedge}$. Hence it suffices to prove the lemma for $F$. In this case the lemma follows from Lemma 37.8.1.

In Lemmas 37.8 .3 and 37.8 .4 the assumption that $S$ be Noetherian holds if $R \rightarrow S$ is of finite type, see Algebra, Lemma 10.30.1.
05DL Lemma 37.8.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $R \rightarrow S$ be a ring map, and $N$ an $S$-module. Assume
(1) $R$ is a Noetherian ring,
(2) $S$ is a Noetherian ring,
(3) $N$ is a finite $S$-module, and
(4) for any finite $R$-module $Q$, any $\mathfrak{q} \in A s s_{S}\left(Q \otimes_{R} N\right)$ satisfies $I S+\mathfrak{q} \neq S$.

Then the map $N \rightarrow N^{\wedge}$ of $N$ into the I-adic completion of $N$ is universally injective as a map of $R$-modules.

Proof. We have to show that for any finite $R$-module $Q$ the map $Q \otimes_{R} N \rightarrow$ $Q \otimes_{R} N^{\wedge}$ is injective, see Algebra, Theorem 10.81.3. As there is a canonical map $Q \otimes_{R} N^{\wedge} \rightarrow\left(Q \otimes_{R} N\right)^{\wedge}$ it suffices to prove that the canonical map $Q \otimes_{R} N \rightarrow$ $\left(Q \otimes_{R} N\right)^{\wedge}$ is injective. Hence we may replace $N$ by $Q \otimes_{R} N$ and it suffices to prove the injectivity for the map $N \rightarrow N^{\wedge}$.
Let $K=\operatorname{Ker}\left(N \rightarrow N^{\wedge}\right)$. It suffices to show that $K_{\mathfrak{q}}=0$ for $\mathfrak{q} \in \operatorname{Ass}(N)$ as $N$ is a submodule of $\prod_{\mathfrak{q} \in \operatorname{Ass}(N)} N_{\mathfrak{q}}$, see Algebra, Lemma 10.62.19. Pick $\mathfrak{q} \in \operatorname{Ass}(N)$. By the last assumption we see that there exists a prime $\mathfrak{q}^{\prime} \supset I S+\mathfrak{q}$. Since $K_{\mathfrak{q}}$ is a localization of $K_{\mathfrak{q}^{\prime}}$ it suffices to prove the vanishing of $K_{\mathfrak{q}^{\prime}}$. Note that $K=\bigcap I^{n} N$, hence $K_{\mathfrak{q}^{\prime}} \subset \bigcap I^{n} N_{\mathfrak{q}^{\prime}}$. Hence $K_{\mathfrak{q}^{\prime}}=0$ by Algebra, Lemma 10.50.4.

05DM Lemma 37.8.4. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $R \rightarrow S$ be a ring map, and $N$ an $S$-module. Assume
(1) $R$ is a Noetherian ring,
(2) $S$ is a Noetherian ring,
(3) $N$ is a finite $S$-module,
(4) $N$ is flat over $R$, and
(5) for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} \kappa(\mathfrak{p})$ where $\mathfrak{p}=R \cap \mathfrak{q}$ we have $I S+\mathfrak{q} \neq S$.
Then the map $N \rightarrow N^{\wedge}$ of $N$ into the I-adic completion of $N$ is universally injective as a map of $R$-modules.

Proof. This follows from Lemma 37.8.3 because Algebra, Lemma 10.64 .5 and Remark 10.64 .6 guarantee that the set of associated primes of tensor products $N \otimes_{R} Q$ are contained in the set of associated primes of the modules $N \otimes_{R} \kappa(\mathfrak{p})$.

### 37.9. Projective modules

05DN The following lemma can be used to prove projectivity by Noetherian induction on the base, see Lemma 37.9.2.

05DP Lemma 37.9.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $R \rightarrow S$ be a ring map, and $N$ an $S$-module. Assume
(1) $R$ is Noetherian and I-adically complete,
(2) $R \rightarrow S$ is of finite type,
(3) $N$ is a finite $S$-module,
(4) $N$ is flat over $R$,
(5) $N / I N$ is projective as a $R / I$-module, and
(6) for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} \kappa(\mathfrak{p})$ where $\mathfrak{p}=R \cap \mathfrak{q}$ we have $I S+\mathfrak{q} \neq S$.
Then $N$ is projective as an $R$-module.
Proof. By Lemma 37.8 .4 the map $N \rightarrow N^{\wedge}$ is universally injective. By Lemma 37.8 .2 the module $N^{\wedge}$ is Mittag-Leffler. By Algebra, Lemma 10.88.7 we conclude that $N$ is Mittag-Leffler. Hence $N$ is countably generated, flat and Mittag-Leffler as an $R$-module, whence projective by Algebra, Lemma 10.92.1.

05FS Lemma 37.9.2. Let $R$ be a ring. Let $R \rightarrow S$ be a ring map. Assume
(1) $R$ is Noetherian,
(2) $R \rightarrow S$ is of finite type and flat, and
(3) every fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$ is geometrically integral over $\kappa(\mathfrak{p})$.

Then $S$ is projective as an $R$-module.
Proof. Consider the set

$$
\{I \subset R \mid S / I S \text { not projective as } R / I \text {-module }\}
$$

We have to show this set is empty. To get a contradiction assume it is nonempty. Then it contains a maximal element $I$. Let $J=\sqrt{I}$ be its radical. If $I \neq J$, then $S / J S$ is projective as a $R / J$-module, and $S / I S$ is flat over $R / I$ and $J / I$ is a nilpotent ideal in $R / I$. Applying Algebra, Lemma 10.76 .5 we see that $S / I S$ is a projective $R / I$-module, which is a contradiction. Hence we may assume that $I$ is
a radical ideal. In other words we are reduced to proving the lemma in case $R$ is a reduced ring and $S / I S$ is a projective $R / I$-module for every nonzero ideal $I$ of $R$.

Assume $R$ is a reduced ring and $S / I S$ is a projective $R / I$-module for every nonzero ideal $I$ of $R$. By generic flatness, Algebra, Lemma 10.117 .1 (applied to a localization $R_{g}$ which is a domain) or the more general Algebra, Lemma 10.117 .7 there exists a nonzero $f \in R$ such that $S_{f}$ is free as an $R_{f}$-module. Denote $R^{\wedge}=\lim R /\left(f^{n}\right)$ the $(f)$-adic completion of $R$. Note that the ring map

$$
R \longrightarrow R_{f} \times R^{\wedge}
$$

is a faithfully flat ring map, see Algebra, Lemma 10.96.2. Hence by faithfully flat descent of projectivity, see Algebra, Theorem 10.94 .5 it suffices to prove that $S \otimes_{R} R^{\wedge}$ is a projective $R^{\wedge}$-module. To see this we will use the criterion of Lemma 37.9.1. First of all, note that $S / f S=\left(S \otimes_{R} R^{\wedge}\right) / f\left(S \otimes_{R} R^{\wedge}\right)$ is a projective $R /(f)$ module and that $S \otimes_{R} R^{\wedge}$ is flat and of finite type over $R^{\wedge}$ as a base change of such. Next, suppose that $\mathfrak{p}^{\wedge}$ is a prime ideal of $R^{\wedge}$. Let $\mathfrak{p} \subset R$ be the corresponding prime of $R$. As $R \rightarrow S$ has geometrically integral fibre rings, the same is true for the fibre rings of any base change. Hence $\mathfrak{q}^{\wedge}=\mathfrak{p}^{\wedge}\left(S \otimes_{R} R^{\wedge}\right)$, is a prime ideals lying over $\mathfrak{p}^{\wedge}$ and it is the unique associated prime of $S \otimes_{R} \kappa\left(\mathfrak{p}^{\wedge}\right)$. Thus we win if $f\left(S \otimes_{R} R^{\wedge}\right)+\mathfrak{q}^{\wedge} \neq S \otimes_{R} R^{\wedge}$. This is true because $\mathfrak{p}^{\wedge}+f R^{\wedge} \neq R^{\wedge}$ as $f$ lies in the radical of the $f$-adically complete ring $R^{\wedge}$ and because $R^{\wedge} \rightarrow S \otimes_{R} R^{\wedge}$ is surjective on spectra as its fibres are nonempty (irreducible spaces are nonempty).

05FT Lemma 37.9.3. Let $R$ be a ring. Let $R \rightarrow S$ be a ring map. Assume
(1) $R \rightarrow S$ is of finite presentation and flat, and
(2) every fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$ is geometrically integral over $\kappa(\mathfrak{p})$.

Then $S$ is projective as an $R$-module.
Proof. We can find a cocartesian diagram of rings

such that $R_{0}$ is of finite type over $\mathbf{Z}$, the map $R_{0} \rightarrow S_{0}$ is of finite type and flat with geometrically integral fibres, see More on Morphisms, Lemmas 36.26.4, 36.26 .6 36.26.7, and 36.26.11. By Lemma 37.9 .2 we see that $S_{0}$ is a projective $R_{0}$-module. Hence $S=S_{0} \otimes_{R_{0}} R$ is a projective $R$-module, see Algebra, Lemma 10.93.1.

05FU Remark 37.9.4. Lemma 37.9.3 is a key step in the development of results in this chapter. The analogue of this lemma in GR71 is GR71, I Proposition 3.3.1]: If $R \rightarrow S$ is smooth with geometrically integral fibres, then $S$ is projective as an $R$-module. This is a special case of Lemma 37.9 .3 , but as we will later improve on this lemma anyway, we do not gain much from having a stronger result at this point. We briefly sketch the proof of this as it is given in GR71.
(1) First reduce to the case where $R$ is Noetherian as above.
(2) Since projectivity descends through faithfully flat ring maps, see Algebra, Theorem 10.94 .5 we may work locally in the fppf topology on $R$, hence
we may assume that $R \rightarrow S$ has a section $\sigma: S \rightarrow R$. (Just by the usual trick of base changing to $S$.) Set $I=\operatorname{Ker}(S \rightarrow R)$.
(3) Localizing a bit more on $R$ we may assume that $I / I^{2}$ is a free $R$-module and that the completion $S^{\wedge}$ of $S$ with respect to $I$ is isomorphic to $R\left[\left[t_{1}, \ldots, t_{n}\right]\right]$, see Morphisms, Lemma 28.34.20. Here we are using that $R \rightarrow S$ is smooth.
(4) To prove that $S$ is projective as an $R$-module, it suffices to prove that $S$ is flat, countably generated and Mittag-Leffler as an $R$-module, see Algebra, Lemma 10.92.1. The first two properties are evident. Thus it suffices to prove that $S$ is Mittag-Leffler as an $R$-module. By Algebra, Lemma 10.90 .4 the module $R\left[\left[t_{1}, \ldots, t_{n}\right]\right]$ is Mittag-Leffler over $R$. Hence Algebra, Lemma 10.88 .7 shows that it suffices to show that the $S \rightarrow S^{\wedge}$ is universally injective as a map of $R$-modules.
(5) Apply Lemma 37.7 .4 to see that $S \rightarrow S^{\wedge}$ is $R$-universally injective. Namely, as $R \rightarrow S$ has geometrically integral fibres, any associated point of any fibre ring is just the generic point of the fibre ring which is in the image of $\operatorname{Spec}\left(S^{\wedge}\right) \rightarrow \operatorname{Spec}(S)$.
There is an analogy between the proof as sketched just now, and the development of the arguments leading to the proof of Lemma 37.9.3. In both a completion plays an essential role, and both times the assumption of having geometrically integral fibres assures one that the map from $S$ to the completion of $S$ is $R$-universally injective.

### 37.10. Flat finite type modules, Part I

05I2 In some cases given a ring map $R \rightarrow S$ of finite presentation and a finite $S$-module $N$ the flatness of $N$ over $R$ implies that $N$ is of finite presentation. In this section we prove this is true "pointwise". We remark that the first proof of Proposition 37.10 .3 uses the geometric results of Section 37.3 but not the existence of a complete dévissage.

0513 Lemma 37.10.1. Let $(R, \mathfrak{m})$ be a local ring. Let $R \rightarrow S$ be a finitely presented flat ring map with geometrically integral fibres. Write $\mathfrak{p}=\mathfrak{m} S$. Let $\mathfrak{q} \subset S$ be a prime ideal lying over $\mathfrak{m}$. Let $N$ be a finite $S$-module. There exist $r \geq 0$ and an $S$-module map

$$
\alpha: S^{\oplus r} \longrightarrow N
$$

such that $\alpha: \kappa(\mathfrak{p})^{\oplus r} \rightarrow N \otimes_{S} \kappa(\mathfrak{p})$ is an isomorphism. For any such $\alpha$ the following are equivalent:
(1) $N_{\mathfrak{q}}$ is $R$-flat,
(2) $\alpha$ is $R$-universally injective and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat,
(3) $\alpha$ is injective and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat,
(4) $\alpha_{\mathfrak{p}}$ is an isomorphism and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat, and
(5) $\alpha_{\mathfrak{q}}$ is injective and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat.

Proof. To obtain $\alpha$ set $r=\operatorname{dim}_{\kappa(\mathfrak{p})} N \otimes_{S} \kappa(\mathfrak{p})$ and pick $x_{1}, \ldots, x_{r} \in N$ which form a basis of $N \otimes_{S} \kappa(\mathfrak{p})$. Define $\alpha\left(s_{1}, \ldots, s_{r}\right)=\sum s_{i} x_{i}$. This proves the existence.
Fix an $\alpha$. The most interesting implication is $(1) \Rightarrow(2)$ which we prove first. Assume (1). Because $S / \mathfrak{m} S$ is a domain with fraction field $\kappa(\mathfrak{p})$ we see that $(S / \mathfrak{m} S)^{\oplus r} \rightarrow N_{\mathfrak{p}} / \mathfrak{m} N_{\mathfrak{p}}=N \otimes_{S} \kappa(\mathfrak{p})$ is injective. Hence by Lemmas 37.7 .5 and
37.9.3. the map $S^{\oplus r} \rightarrow N_{\mathfrak{p}}$ is $R$-universally injective. It follows that $S^{\oplus r} \rightarrow N$ is $R$-universally injective, see Algebra, Lemma 10.81.10. Then also the localization $\alpha_{\mathfrak{q}}$ is $R$-universally injective, see Algebra, Lemma 10.81.13. We conclude that $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat by Algebra, Lemma 10.81.7.

The implication $(2) \Rightarrow(3)$ is immediate. If (3) holds, then $\alpha_{\mathfrak{p}}$ is injective as a localization of an injective module map. By Nakayama's lemma (Algebra, Lemma 10.19.1) $\alpha_{\mathfrak{p}}$ is surjective too. Hence $(3) \Rightarrow(4)$. If (4) holds, then $\alpha_{\mathfrak{p}}$ is an isomorphism, so $\alpha$ is injective as $S_{\mathfrak{q}} \rightarrow S_{\mathfrak{p}}$ is injective. Namely, elements of $S \backslash \mathfrak{p}$ are nonzerodivisors on $S$ by a combination of Lemmas 37.7.6 and 37.9.3. Hence (4) $\Rightarrow(5)$. Finally, if (5) holds, then $N_{\mathfrak{q}}$ is $R$-flat as an extension of flat modules, see Algebra, Lemma 10.38 .13 . Hence $(5) \Rightarrow(1)$ and the proof is finished.

05I4 Lemma 37.10.2. Let $(R, \mathfrak{m})$ be a local ring. Let $R \rightarrow S$ be a ring map of finite presentation. Let $N$ be a finite $S$-module. Let $\mathfrak{q}$ be a prime of $S$ lying over $\mathfrak{m}$. Assume that $N_{\mathfrak{q}}$ is flat over $R$, and assume there exists a complete dévissage of $N / S / R$ at $\mathfrak{q}$. Then $N$ is a finitely presented $S$-module, free as an $R$-module, and there exists an isomorphism

$$
N \cong B_{1}^{\oplus r_{1}} \oplus \ldots \oplus B_{n}^{\oplus r_{n}}
$$

as $R$-modules where each $B_{i}$ is a smooth $R$-algebra with geometrically irreducible fibres.

Proof. Let $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}, \mathfrak{q}_{i}\right)_{i=1, \ldots, n}$ be the given complete dévissage. We prove the lemma by induction on $n$. Note that $N$ is finitely presented as an $S$-module if and only if $M_{1}$ is finitely presented as an $B_{1}$-module, see Remark 37.6.3 Note that $N_{\mathfrak{q}} \cong\left(M_{1}\right)_{\mathfrak{q}_{1}}$ as $R$-modules because (a) $N_{\mathfrak{q}} \cong\left(M_{1}\right)_{\mathfrak{q}_{1}^{\prime}}$ where $\mathfrak{q}_{1}^{\prime}$ is the unique prime in $A_{1}$ lying over $\mathfrak{q}_{1}$ and (b) $\left(A_{1}\right)_{\mathfrak{q}_{1}^{\prime}}=\left(A_{1}\right)_{\mathfrak{q}_{1}}$ by Algebra, Lemma 10.40.11, so (c) $\left(M_{1}\right)_{\mathfrak{q}_{1}^{\prime}} \cong\left(M_{1}\right)_{\mathfrak{q}_{1}}$. Hence $\left(M_{1}\right)_{\mathfrak{q}_{1}}$ is a flat $R$-module. Thus we may replace $(S, N)$ by $\left(B_{1}, M_{1}\right)$ in order to prove the lemma. By Lemma 37.10.1 the $\operatorname{map} \alpha_{1}: B_{1}^{\oplus r_{1}} \rightarrow M_{1}$ is $R$-universally injective and $\operatorname{Coker}\left(\alpha_{1}\right)_{\mathfrak{q}}$ is $R$-flat. Note that $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}, \mathfrak{q}_{i}\right)_{i=2, \ldots, n}$ is a complete dévissage of $\operatorname{Coker}\left(\alpha_{1}\right) / B_{1} / R$ at $\mathfrak{q}_{1}$. Hence the induction hypothesis implies that $\operatorname{Coker}\left(\alpha_{1}\right)$ is finitely presented as a $B_{1}$-module, free as an $R$-module, and has a decomposition as in the lemma. This implies that $M_{1}$ is finitely presented as a $B_{1}$-module, see Algebra, Lemma 10.5.3. It further implies that $M_{1} \cong B_{1}^{\oplus r_{1}} \oplus \operatorname{Coker}\left(\alpha_{1}\right)$ as $R$-modules, hence a decomposition as in the lemma. Finally, $B_{1}$ is projective as an $R$-module by Lemma 37.9.3 hence free as an $R$-module by Algebra, Theorem 10.84.4. This finishes the proof.

05I5 Proposition 37.10.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be $a$ quasi-coherent sheaf on $X$. Let $x \in X$ with image $s \in S$. Assume that
(1) $f$ is locally of finite presentation,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat at $x$ over $S$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
V \subset X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

which contains the unique point of $X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ mapping to $x$ such that the pullback of $\mathcal{F}$ to $V$ is an $\mathcal{O}_{V}$-module of finite presentation and flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.

First proof. This proof is longer but does not use the existence of a complete dévissage. The problem is local around $x$ and $s$, hence we may assume that $X$ and $S$ are affine. During the proof we will finitely many times replace $S$ by an elementary étale neighbourhood of $(S, s)$. The goal is then to find (after such a replacement) an open $V \subset X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ containing $x$ such that $\left.\mathcal{F}\right|_{V}$ is flat over $S$ and finitely presented. Of course we may also replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ at any point of the proof, i.e., we may assume $S$ is a local scheme. We will prove the lemma by induction on the integer $n=\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$.

We can choose
(1) elementary étale neighbourhoods $g:\left(X^{\prime}, x^{\prime}\right) \rightarrow(X, x)$, $e:\left(S^{\prime}, s^{\prime}\right) \rightarrow$ $(S, s)$,
(2) a commutative diagram

(3) a point $z^{\prime} \in Z^{\prime}$ with $i\left(z^{\prime}\right)=x^{\prime}, y^{\prime}=\pi\left(z^{\prime}\right), h\left(y^{\prime}\right)=s^{\prime}$,
(4) a finite type quasi-coherent $\mathcal{O}_{Z^{\prime}}$-module $\mathcal{G}$,
as in Lemma 37.3.2. We are going to replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$, see remarks in first paragraph of the proof. Consider the diagram

Here we have base changed the schemes $X^{\prime}, Z^{\prime}, Y^{\prime}$ over $S^{\prime}$ via $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \rightarrow S^{\prime}$ and the scheme $X$ over $S$ via $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \rightarrow S$. It is still the case that $g$ is étale, see Lemma 37.2.2. After replacing $X$ by $X_{\mathcal{O}_{S^{\prime}, s^{\prime}}}, X^{\prime}$ by $X_{\mathcal{O}_{S^{\prime}, s^{\prime}}^{\prime}}^{\prime}, Z^{\prime}$ by $Z_{\mathcal{O}_{S^{\prime}, s^{\prime}}}^{\prime}$, and $Y^{\prime}$ by $Y_{\mathcal{O}_{S^{\prime}, s^{\prime}}^{\prime}}^{\prime}$ we may assume we have a diagram as Lemma 37.3 .2 where in addition $S=S^{\prime}$ is a local scheme with closed point $s$. By Lemmas 37.3.3 and 37.3.4 the result for $Y^{\prime} \rightarrow S$, the sheaf $\pi_{*} \mathcal{G}$, and the point $y^{\prime}$ implies the result for $X \rightarrow S, \mathcal{F}$ and $x$. Hence we may assume that $S$ is local and $X \rightarrow S$ is a smooth morphism of affines with geometrically irreducible fibres of dimension $n$.

The base case of the induction: $n=0$. As $X \rightarrow S$ is smooth with geometrically irreducible fibres of dimension 0 we see that $X \rightarrow S$ is an open immersion, see Descent, Lemma 34.21.2. As $S$ is local and the closed point is in the image of $X \rightarrow S$ we conclude that $X=S$. Thus we see that $\mathcal{F}$ corresponds to a finite flat $\mathcal{O}_{S, s}$ module. In this case the result follows from Algebra, Lemma 10.77 .4 which tells us that $\mathcal{F}$ is in fact finite free.

The induction step. Assume the result holds whenever the dimension of the support in the closed fibre is $<n$. Write $S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$ and $\mathcal{F}=\widetilde{N}$ for some $B$-module $N$. Note that $A$ is a local ring; denote its maximal ideal $\mathfrak{m}$. Then $\mathfrak{p}=\mathfrak{m} B$ is the unique minimal prime lying over $\mathfrak{m}$ as $X \rightarrow S$ has geometrically irreducible fibres. Finally, let $\mathfrak{q} \subset B$ be the prime corresponding to $x$. By Lemma 37.10.1 we can choose a map

$$
\alpha: B^{\oplus r} \rightarrow N
$$

such that $\kappa(\mathfrak{p})^{\oplus r} \rightarrow N \otimes_{B} \kappa(\mathfrak{p})$ is an isomorphism. Moreover, as $N_{\mathfrak{q}}$ is $A$-flat the lemma also shows that $\alpha$ is injective and that $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $A$-flat. Set $Q=$ $\operatorname{Coker}(\alpha)$. Note that the support of $Q / \mathfrak{m} Q$ does not contain $\mathfrak{p}$. Hence it is certainly the case that $\operatorname{dim}_{\mathfrak{q}}(\operatorname{Supp}(Q / \mathfrak{m} Q))<n$. Combining everything we know about $Q$ we see that the induction hypothesis applies to $Q$. It follows that there exists an elementary étale morphism $\left(S^{\prime}, s\right) \rightarrow(S, s)$ such that the conclusion holds for $Q \otimes_{A} A^{\prime}$ over $B \otimes_{A} A^{\prime}$ where $A^{\prime}=\mathcal{O}_{S^{\prime}, s^{\prime}}$. After replacing $A$ by $A^{\prime}$ we have an exact sequence

$$
0 \rightarrow B^{\oplus r} \rightarrow N \rightarrow Q \rightarrow 0
$$

(here we use that $\alpha$ is injective as mentioned above) of finite $B$-modules and we also get an element $g \in B, g \notin \mathfrak{q}$ such that $Q_{g}$ is finitely presented over $B_{g}$ and flat over $A$. Since localization is exact we see that

$$
0 \rightarrow B_{g}^{\oplus r} \rightarrow N_{g} \rightarrow Q_{g} \rightarrow 0
$$

is still exact. As $B_{g}$ and $Q_{g}$ are flat over $A$ we conclude that $N_{g}$ is flat over $A$, see Algebra, Lemma 10.38 .13 , and as $B_{g}$ and $Q_{g}$ are finitely presented over $B_{g}$ the same holds for $N_{g}$, see Algebra, Lemma 10.5.3.

Second proof. We apply Proposition 37.5 .7 to find a commutative diagram

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$ has a complete dévissage at $x$. (In particular $S^{\prime}$ and $X^{\prime}$ are affine.) By Morphisms, Lemma 28.25.11 we see that $g^{*} \mathcal{F}$ is flat at $x^{\prime}$ over $S$ and by Lemma 37.2 .3 we see that it is flat at $x^{\prime}$ over $S^{\prime}$. Via Remark 37.6.5 we deduce that

$$
\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right) / \Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right) / \Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)
$$

has a complete dévissage at the prime of $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ corresponding to $x^{\prime}$. We may base change this complete dévissage to the local ring $\mathcal{O}_{S^{\prime}, s^{\prime}}$ of $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$ at the prime corresponding to $s^{\prime}$. Thus Lemma 37.10.2 implies that

$$
\Gamma\left(X^{\prime}, \mathcal{F}^{\prime}\right) \otimes_{\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)} \mathcal{O}_{S^{\prime}, s^{\prime}}
$$

is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$ and of finite presentation over $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right) \otimes_{\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)} \mathcal{O}_{S^{\prime}, s^{\prime}}$. In other words, the restriction of $\mathcal{F}$ to $X^{\prime} \times{ }_{S^{\prime}} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is of finite presentation and flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$. Since the morphism $X^{\prime} \times{ }_{S^{\prime}} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \rightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is étale (Lemma 37.2.2) its image $V \subset X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is an open subscheme, and by étale descent the restriction of $\mathcal{F}$ to $V$ is of finite presentation and flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$. (Results used: Morphisms, Lemma 28.36.13. Descent, Lemma 34.6.3, and Morphisms, Lemma 28.25.11.)

05M9 Lemma 37.10.4. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $s \in S$. Then the set

$$
\left\{x \in X_{s} \mid \mathcal{F} \text { flat over } S \text { at } x\right\}
$$

is open in the fibre $X_{s}$.
Proof. Suppose $x \in U$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow$ $(S, s)$ and open $V \subset X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ as in Proposition 37.10.3. Note that $X_{s^{\prime}}=$ $X_{s}$ as $\kappa(s)=\kappa\left(s^{\prime}\right)$. If $x^{\prime} \in V \cap X_{s^{\prime}}$, then the pullback of $\mathcal{F}$ to $X \times_{S} S^{\prime}$ is flat over $S^{\prime}$ at $x^{\prime}$. Hence $\mathcal{F}$ is flat at $x^{\prime}$ over $S$, see Morphisms, Lemma 28.25.11. In other words $X_{s} \cap V \subset U$ is an open neighbourhood of $x$ in $U$.

05KT Lemma 37.10.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $x \in X$ with image $s \in S$. Assume that
(1) $f$ is locally of finite type,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat at $x$ over $S$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
V \subset X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

which contains the unique point of $X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ mapping to $x$ such that the pullback of $\mathcal{F}$ to $V$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.

Proof. (The only difference between this and Proposition 37.10 .3 is that we do not assume $f$ is of finite presentation.) The question is local on $X$ and $S$, hence we may assume $X$ and $S$ are affine. Write $X=\operatorname{Spec}(B), S=\operatorname{Spec}(A)$ and write $B=A\left[x_{1}, \ldots, x_{n}\right] / I$. In other words we obtain a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$. Denote $t=i(x) \in \mathbf{A}_{S}^{n}$. We may apply Proposition 37.10 .3 to $\mathbf{A}_{S}^{n} \rightarrow S$, the sheaf $i_{*} \mathcal{F}$ and the point $t$. We obtain an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
W \subset \mathbf{A}_{\mathcal{O}_{S^{\prime}, s^{\prime}}^{n}}^{n}
$$

such that the pullback of $i_{*} \mathcal{F}$ to $W$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$. This means that $V:=$ $W \cap\left(X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)\right)$ is the desired open subscheme.

05KU Lemma 37.10.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $s \in S$. Assume that
(1) $f$ is of finite presentation,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat over $S$ at every point of the fibre $X_{s}$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
V \subset X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

which contains the fibre $X_{s}=X \times_{S} s^{\prime}$ such that the pullback of $\mathcal{F}$ to $V$ is an $\mathcal{O}_{V}$-module of finite presentation and flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.
Proof. For every point $x \in X_{s}$ we can use Proposition 37.10 .3 to find an elementary étale neighbourhood $\left(S_{x}, s_{x}\right) \rightarrow(S, s)$ and an open $V_{x} \subset X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S_{x}, s_{x}}\right)$ such that $x \in X_{s}=X \times_{S} s_{x}$ is contained in $V_{x}$ and such that the pullback of $\mathcal{F}$ to $V_{x}$ is an $\mathcal{O}_{V_{x}}$-module of finite presentation and flat over $\mathcal{O}_{S_{x}, s_{x}}$. In particular we may
view the fibre $\left(V_{x}\right)_{s_{x}}$ as an open neighbourhood of $x$ in $X_{s}$. Because $X_{s}$ is quasicompact we can find a finite number of points $x_{1}, \ldots, x_{n} \in X_{s}$ such that $X_{s}$ is the union of the $\left(V_{x_{i}}\right)_{s_{x_{i}}}$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ which dominates each of the neighbourhoods $\left(S_{x_{i}}, s_{x_{i}}\right)$, see More on Morphisms, Lemma 36.27.4 Set $V=\bigcup V_{i}$ where $V_{i}$ is the inverse images of the open $V_{x_{i}}$ via the morphism

$$
X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \longrightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S_{x_{i}}, s_{x_{i}}}\right)
$$

By construction $V$ contains $X_{s}$ and by construction the pullback of $\mathcal{F}$ to $V$ is an $\mathcal{O}_{V}$-module of finite presentation and flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.

05KV Lemma 37.10.7. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $s \in S$. Assume that
(1) $f$ is of finite type,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat over $S$ at every point of the fibre $X_{s}$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
V \subset X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

which contains the fibre $X_{s}=X \times_{S} s^{\prime}$ such that the pullback of $\mathcal{F}$ to $V$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.

Proof. (The only difference between this and Lemma 37.10 .6 is that we do not assume $f$ is of finite presentation.) For every point $x \in X_{s}$ we can use Lemma 37.10 .5 to find an elementary étale neighbourhood $\left(S_{x}, s_{x}\right) \rightarrow(S, s)$ and an open $V_{x} \subset X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S_{x}, s_{x}}\right)$ such that $x \in X_{s}=X \times_{S} s_{x}$ is contained in $V_{x}$ and such that the pullback of $\mathcal{F}$ to $V_{x}$ is flat over $\mathcal{O}_{S_{x}, s_{x}}$. In particular we may view the fibre $\left(V_{x}\right)_{s_{x}}$ as an open neighbourhood of $x$ in $X_{s}$. Because $X_{s}$ is quasi-compact we can find a finite number of points $x_{1}, \ldots, x_{n} \in X_{s}$ such that $X_{s}$ is the union of the $\left(V_{x_{i}}\right)_{s_{x_{i}}}$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ which dominates each of the neighbourhoods $\left(S_{x_{i}}, s_{x_{i}}\right)$, see More on Morphisms, Lemma 36.27.4 Set $V=\bigcup V_{i}$ where $V_{i}$ is the inverse images of the open $V_{x_{i}}$ via the morphism

$$
X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \longrightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S_{x_{i}}, s_{x_{i}}}\right)
$$

By construction $V$ contains $X_{s}$ and by construction the pullback of $\mathcal{F}$ to $V$ is flat over $\mathcal{O}_{S^{\prime}, s^{\prime}}$.

05I6 Lemma 37.10.8. Let $S$ be a scheme. Let $X$ be locally of finite type over $S$. Let $x \in X$ with image $s \in S$. If $X$ is flat at $x$ over $S$, then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
V \subset X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

which contains the unique point of $X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ mapping to $x$ such that $V \rightarrow$ $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is flat and of finite presentation.

Proof. The question is local on $X$ and $S$, hence we may assume $X$ and $S$ are affine. Write $X=\operatorname{Spec}(B), S=\operatorname{Spec}(A)$ and write $B=A\left[x_{1}, \ldots, x_{n}\right] / I$. In other words we obtain a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$. Denote $t=i(x) \in \mathbf{A}_{S}^{n}$. We may apply

Proposition 37.10 .3 to $\mathbf{A}_{S}^{n} \rightarrow S$, the sheaf $\mathcal{F}=i_{*} \mathcal{O}_{X}$ and the point $t$. We obtain an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an open subscheme

$$
W \subset \mathbf{A}_{\mathcal{O}_{S^{\prime}, s^{\prime}}}^{n}
$$

such that the pullback of $i_{*} \mathcal{O}_{X}$ is flat and of finite presentation. This means that $V:=W \cap\left(X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)\right)$ is the desired open subscheme.

05I7 Lemma 37.10.9. Let $f: X \rightarrow S$ be a morphism which is locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. If $x \in X$ and $\mathcal{F}$ is flat at $x$ over $S$, then $\mathcal{F}_{x}$ is an $\mathcal{O}_{X, x}$-module of finite presentation.

Proof. Let $s=f(x)$. By Proposition 37.10 .3 there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ such that the pullback of $\mathcal{F}$ to $X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is of finite presentation in a neighbourhood of the point $x^{\prime} \in X_{s^{\prime}}=X_{s}$ corresponding to $x$. The ring map

$$
\mathcal{O}_{X, x} \longrightarrow \mathcal{O}_{X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right), x^{\prime}}=\mathcal{O}_{X \times{ }_{S} S^{\prime}, x^{\prime}}
$$

is flat and local as a localization of an étale ring map. Hence $\mathcal{F}_{x}$ is of finite presentation over $\mathcal{O}_{X, x}$ by descent, see Algebra, Lemma 10.82 .2 (and also that a flat local ring map is faithfully flat, see Algebra, Lemma 10.38.17).

05I8 Lemma 37.10.10. Let $f: X \rightarrow S$ be a morphism which is locally of finite type. Let $x \in X$ with image $s \in S$. If $f$ is flat at $x$ over $S$, then $\mathcal{O}_{X, x}$ is essentially of finite presentation over $\mathcal{O}_{S, s}$.

Proof. We may assume $X$ and $S$ affine. Write $X=\operatorname{Spec}(B), S=\operatorname{Spec}(A)$ and write $B=A\left[x_{1}, \ldots, x_{n}\right] / I$. In other words we obtain a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$. Denote $t=i(x) \in \mathbf{A}_{S}^{n}$. We may apply Lemma 37.10 .9 to $\mathbf{A}_{S}^{n} \rightarrow S$, the sheaf $\mathcal{F}=i_{*} \mathcal{O}_{X}$ and the point $t$. We conclude that $\mathcal{O}_{X, x}$ is of finite presentation over $\mathcal{O}_{\mathbf{A}_{S}^{n}, t}$ which implies what we want.

### 37.11. Extending properties from an open

0B47 In this section we collect a number of results of the form: If $f: X \rightarrow S$ is a flat morphism of schemes and $f$ satisfies some property over a dense open of $S$, then $f$ satisfies the same property over all of $S$.

081N Lemma 37.11.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $U \subset S$ be open. Assume
(1) $f$ is locally of finite presentation,
(2) $\mathcal{F}$ is of finite type and flat over $S$,
(3) $U \subset S$ is retrocompact and scheme theoretically dense,
(4) $\left.\mathcal{F}\right|_{f^{-1} U}$ is of finite presentation.

Then $\mathcal{F}$ is of finite presentation.
Proof. The problem is local on $X$ and $S$, hence we may assume $X$ and $S$ affine. Write $S=\operatorname{Spec}(A)$ and $X=\operatorname{Spec}(B)$. Let $N$ be a finite $B$-module such that $\mathcal{F}$ is the quasi-coherent sheaf associated to $N$. We have $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ for some $f_{i} \in A$, see Algebra, Lemma 10.28.1. As $U$ is schematically dense the map $A \rightarrow A_{f_{1}} \times \ldots \times A_{f_{n}}$ is injective. Pick a prime $\mathfrak{q} \subset B$ lying over $\mathfrak{p} \subset A$ corresponding to $x \in X$ mapping to $s \in S$. By Lemma 37.10 .9 the module $N_{\mathfrak{q}}$ is of finite presentation over $B_{\mathfrak{q}}$. Choose a surjection $\varphi: B^{\oplus m} \rightarrow N$ of $B$-modules.

Choose $k_{1}, \ldots, k_{t} \in \operatorname{Ker}(\varphi)$ and set $N^{\prime}=B^{\oplus m} / \sum B k_{j}$. There is a canonical surjection $N^{\prime} \rightarrow N$ and $N$ is the filtered colimit of the $B$-modules $N^{\prime}$ constructed in this manner. Thus we see that we can choose $k_{1}, \ldots, k_{t}$ such that (a) $N_{f_{i}}^{\prime} \cong N_{f_{i}}$, $i=1, \ldots, n$ and (b) $N_{\mathfrak{q}}^{\prime} \cong N_{\mathfrak{q}}$. This in particular implies that $N_{\mathfrak{q}}^{\prime}$ is flat over $A$. By openness of flatness, see Algebra, Theorem 10.128.4 we conclude that there exists a $g \in B, g \notin \mathfrak{q}$ such that $N_{g}^{\prime}$ is flat over $A$. Consider the commutative diagram

The bottom arrow is an isomorphism by choice of $k_{1}, \ldots, k_{t}$. The left vertical arrow is an injective map as $A \rightarrow \prod A_{f_{i}}$ is injective and $N_{g}^{\prime}$ is flat over $A$. Hence the top horizontal arrow is injective, hence an isomorphism. This proves that $N_{g}$ is of finite presentation over $B_{g}$. We conclude by applying Algebra, Lemma 10.23.2.

081P Lemma 37.11.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $U \subset S$ be open. Assume
(1) $f$ is locally of finite type and flat,
(2) $U \subset S$ is retrocompact and scheme theoretically dense,
(3) $\left.f\right|_{f^{-1} U}: f^{-1} U \rightarrow U$ is locally of finite presentation.

Then $f$ is of locally of finite presentation.
Proof. The question is local on $X$ and $S$, hence we may assume $X$ and $S$ affine. Choose a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$ and apply Lemma 37.11.1 to $i_{*} \mathcal{O}_{X}$. Some details omitted.

081L Lemma 37.11.3. Let $f: X \rightarrow S$ be a morphism of schemes which is flat and locally of finite type. Let $U \subset S$ be a dense open such that $X_{U} \rightarrow U$ has relative dimension $\leq e$, see Morphisms, Definition 28.29.1. If also either
(1) $f$ is locally of finite presentation, or
(2) $U \subset S$ is retrocompact,
then $f$ has relative dimension $\leq e$.
Proof. Proof in case (1). Let $W \subset X$ be the open subscheme constructed and studied in More on Morphisms, Lemmas 36.17.5 and 36.17.6. Note that every generic point of every fibre is contained in $W$, hence it suffices to prove the result for $W$. Since $W=\bigcup_{d \geq 0} U_{d}$, it suffices to prove that $U_{d}=\emptyset$ for $d>e$. Since $f$ is flat and locally of finite presentation it is open hence $f\left(U_{d}\right)$ is open (Morphisms, Lemma 28.25.9. Thus if $U_{d}$ is not empty, then $f\left(U_{d}\right) \cap U \neq \emptyset$ as desired.

Proof in case (2). We may replace $S$ by its reduction. Then $U$ is scheme theoretically dense. Hence $f$ is locally of finite presentation by Lemma 37.11.2. In this way we reduce to case (1).

0B48 Lemma 37.11.4. Let $f: X \rightarrow S$ be a morphism of schemes which is flat and proper. Let $U \subset S$ be a dense open such that $X_{U} \rightarrow U$ is finite. If also either $f$ is locally of finite presentation or $U \subset S$ is retrocompact, then $f$ is finite.

Proof. By Lemma 37.11 .3 the fibres of $f$ have dimension zero. Hence $f$ is quasifinite (Morphisms, Lemma 28.29.5 whence has finite fibres (Morphisms, Lemma 28.20.10. Hence $f$ is finite by More on Morphisms, Lemma 36.31.4.

081M Lemma 37.11.5. Let $f: X \rightarrow S$ be a morphism of schemes and $U \subset S$ an open. If
(1) $f$ is separated, locally of finite type, and flat,
(2) $f^{-1}(U) \rightarrow U$ is an isomorphism, and
(3) $U \subset S$ is retrocompact and scheme theoretically dense,
then $f$ is an open immersion.
Proof. By Lemma 37.11 .2 the morphism $f$ is locally of finite presentation. The image $f(X) \subset S$ is open (Morphisms, Lemma 28.25.9) hence we may replace $S$ by $f(X)$. Thus we have to prove that $f$ is an isomorphism. We may assume $S$ is affine. We can reduce to the case that $X$ is quasi-compact because it suffices to show that any quasi-compact open $X^{\prime} \subset X$ whose image is $S$ maps isomorphically to $S$. Thus we may assume $f$ is quasi-compact. All the fibers of $f$ have dimension 0 , see Lemma 37.11.3. Hence $f$ is quasi-finite, see Morphisms, Lemma 28.29.5. Let $s \in S$. Choose an elementary étale neighbourhood $g:(T, t) \rightarrow(S, s)$ such that $X \times_{S} T=V \amalg W$ with $V \rightarrow T$ finite and $W_{t}=\emptyset$, see More on Morphisms, Lemma 36.30.6. Denote $\pi: V \amalg W \rightarrow T$ the given morphism. Since $\pi$ is flat and locally of finite presentation, we see that $\pi(V)$ is open in $T$ (Morphisms, Lemma 28.25.9). After shrinking $T$ we may assume that $T=\pi(V)$. Since $f$ is an isomorphism over $U$ we see that $\pi$ is an isomorphism over $g^{-1} U$. Since $\pi(V)=T$ this implies that $\pi^{-1} g^{-1} U$ is contained in $V$. By Morphisms, Lemma 28.25.13 we see that $\pi^{-1} g^{-1} U \subset V \amalg W$ is scheme theoretically dense. Hence we deduce that $W=\emptyset$. Thus $X \times{ }_{S} T=V$ is finite over $T$. Shrinking $T$ once more we may assume $T$ is affine. Then $V$ is affine too and we see that

$$
\Gamma\left(T, \mathcal{O}_{T}\right)=\Gamma\left(g^{-1} U, \mathcal{O}_{T}\right)=\Gamma\left(\pi^{-1} g^{-1} U, \mathcal{O}_{V}\right)=\Gamma\left(V, \mathcal{O}_{V}\right)
$$

because the inverse image of $U$ is schematically dense in both $T$ and $V$ (see above). Thus $X \times{ }_{S} T \rightarrow T$ is an isomorphism. This implies that $f$ is an isomorphism, for example by Descent, Lemma 34.19.15.

### 37.12. Flat finitely presented modules

05I9 In some cases given a ring map $R \rightarrow S$ of finite presentation and a finitely presented $S$-module $N$ the flatness of $N$ over $R$ implies that $N$ is projective as an $R$-module, at least after replacing $S$ by an étale extension. In this section we collect a some results of this nature.

05IA Lemma 37.12.1. Let $R$ be a ring. Let $R \rightarrow S$ be a finitely presented flat ring map with geometrically integral fibres. Let $\mathfrak{q} \subset S$ be a prime ideal lying over the prime $\mathfrak{r} \subset R$. Set $\mathfrak{p}=\mathfrak{r} S$. Let $N$ be a finitely presented $S$-module. There exists $r \geq 0$ and an $S$-module map

$$
\alpha: S^{\oplus r} \longrightarrow N
$$

such that $\alpha: \kappa(\mathfrak{p})^{\oplus r} \rightarrow N \otimes_{S} \kappa(\mathfrak{p})$ is an isomorphism. For any such $\alpha$ the following are equivalent:
(1) $N_{\mathfrak{q}}$ is R-flat,
(2) there exists an $f \in R, f \notin \mathfrak{r}$ such that $\alpha_{f}: S_{f}^{\oplus r} \rightarrow N_{f}$ is $R_{f}$-universally injective and $a g \in S, g \notin \mathfrak{q}$ such that $\operatorname{Coker}(\alpha)_{g}$ is $R$-flat,
(3) $\alpha_{\mathfrak{r}}$ is $R_{\mathfrak{r}}$-universally injective and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat
(4) $\alpha_{\mathfrak{r}}$ is injective and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat,
(5) $\alpha_{\mathfrak{p}}$ is an isomorphism and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat, and
(6) $\alpha_{\mathfrak{q}}$ is injective and $\operatorname{Coker}(\alpha)_{\mathfrak{q}}$ is $R$-flat.

Proof. To obtain $\alpha$ set $r=\operatorname{dim}_{\kappa(\mathfrak{p})} N \otimes_{S} \kappa(\mathfrak{p})$ and pick $x_{1}, \ldots, x_{r} \in N$ which form a basis of $N \otimes_{S} \kappa(\mathfrak{p})$. Define $\alpha\left(s_{1}, \ldots, s_{r}\right)=\sum s_{i} x_{i}$. This proves the existence.
Fix a choice of $\alpha$. We may apply Lemma 37.10 .1 to the map $\alpha_{\mathfrak{r}}: S_{\mathfrak{r}}^{\oplus r} \rightarrow N_{\mathfrak{r}}$. Hence we see that $(1),(3),(4),(5)$, and (6) are all equivalent. Since it is also clear that (2) implies (3) we see that all we have to do is show that (1) implies (2).

Assume (1). By openness of flatness, see Algebra, Theorem 10.128.4, the set

$$
U_{1}=\left\{\mathfrak{q}^{\prime} \subset S \mid N_{\mathfrak{q}^{\prime}} \text { is flat over } R\right\}
$$

is open in $\operatorname{Spec}(S)$. It contains $\mathfrak{q}$ by assumption and hence $\mathfrak{p}$. Because $S^{\oplus r}$ and $N$ are finitely presented $S$-modules the set

$$
U_{2}=\left\{\mathfrak{q}^{\prime} \subset S \mid \alpha_{\mathfrak{q}^{\prime}} \text { is an isomorphism }\right\}
$$

is open in $\operatorname{Spec}(S)$, see Algebra, Lemma 10.78.2. It contains $\mathfrak{p}$ by (5). As $R \rightarrow S$ is finitely presented and flat the map $\Phi: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is open, see Algebra, Proposition 10.40 .8 . For any prime $\mathfrak{r}^{\prime} \in \Phi\left(U_{1} \cap U_{2}\right)$ we see that there exists a prime $\mathfrak{q}^{\prime}$ lying over $\mathfrak{r}^{\prime}$ such that $N_{\mathfrak{q}^{\prime}}$ is flat and such that $\alpha_{\mathfrak{q}^{\prime}}$ is an isomorphism, which implies that $\alpha \otimes \kappa\left(\mathfrak{p}^{\prime}\right)$ is an isomorphism where $\mathfrak{p}^{\prime}=\mathfrak{r}^{\prime} S$. Thus $\alpha_{\mathfrak{r}^{\prime}}$ is $R_{\mathfrak{r}^{\prime}}$-universally injective by the implication $(1) \Rightarrow(3)$. Hence if we pick $f \in R, f \notin \mathfrak{r}$ such that $D(f) \subset$ $\Phi\left(U_{1} \cap U_{2}\right)$ then we conclude that $\alpha_{f}$ is $R_{f}$-universally injective, see Algebra, Lemma 10.81.12. The same reasoning also shows that for any $\mathfrak{q}^{\prime} \in U_{1} \cap \Phi^{-1}\left(\Phi\left(U_{1} \cap U_{2}\right)\right)$ the module $\operatorname{Coker}(\alpha)_{\mathfrak{q}^{\prime}}$ is $R$-flat. Note that $\mathfrak{q} \in U_{1} \cap \Phi^{-1}\left(\Phi\left(U_{1} \cap U_{2}\right)\right)$. Hence we can find a $g \in S, g \notin \mathfrak{q}$ such that $D(g) \subset U_{1} \cap \Phi^{-1}\left(\Phi\left(U_{1} \cap U_{2}\right)\right)$ and we win.
05IB Lemma 37.12.2. Let $R \rightarrow S$ be a ring map of finite presentation. Let $N$ be a finitely presented $S$-module flat over $R$. Let $\mathfrak{r} \subset R$ be a prime ideal. Assume there exists a complete dévissage of $N / S / R$ over $\mathfrak{r}$. Then there exists an $f \in R, f \notin \mathfrak{r}$ such that

$$
N_{f} \cong B_{1}^{\oplus r_{1}} \oplus \ldots \oplus B_{n}^{\oplus r_{n}}
$$

as $R$-modules where each $B_{i}$ is a smooth $R_{f}$-algebra with geometrically irreducible fibres. Moreover, $N_{f}$ is projective as an $R_{f}$-module.
Proof. Let $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}\right)_{i=1, \ldots, n}$ be the given complete dévissage. We prove the lemma by induction on $n$. Note that the assertions of the lemma are entirely about the structure of $N$ as an $R$-module. Hence we may replace $N$ by $M_{1}$, and we may think of $M_{1}$ as a $B_{1}$-module. See Remark 37.6 .3 in order to see why $M_{1}$ is of finite presentation as a $B_{1}$-module. By Lemma 37.12.1 we may, after replacing $R$ by $R_{f}$ for some $f \in R, f \notin \mathfrak{r}$, assume the map $\alpha_{1}: B_{1}^{\oplus r_{1}} \rightarrow M_{1}$ is $R$-universally injective. Since $M_{1}$ and $B_{1}^{\oplus r_{1}}$ are $R$-flat and finitely presented as $B_{1}$-modules we see that $\operatorname{Coker}\left(\alpha_{1}\right)$ is $R$-flat (Algebra, Lemma 10.81.7) and finitely presented as a $B_{1}$-module. Note that $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}\right)_{i=2, \ldots, n}$ is a complete dévissage of $\operatorname{Coker}\left(\alpha_{1}\right)$. Hence the induction hypothesis implies that, after replacing $R$ by $R_{f}$ for some $f \in R, f \notin \mathfrak{r}$, we may assume that $\operatorname{Coker}\left(\alpha_{1}\right)$ has a decomposition as in the lemma and is projective. In particular $M_{1}=B_{1}^{\oplus r_{1}} \oplus \operatorname{Coker}\left(\alpha_{1}\right)$. This proves the statement regarding the decomposition. The statement on projectivity follows as $B_{1}$ is projective as an $R$-module by Lemma 37.9.3.

05IC Remark 37.12.3. There is a variant of Lemma 37.12 .2 where we weaken the flatness condition by assuming only that $N$ is flat at some given prime $\mathfrak{q}$ lying over $\mathfrak{r}$ but where we strengthen the dévissage condition by assuming the existence of a complete dévissage at $\mathfrak{q}$. Compare with Lemma 37.10.2.

The following is the main result of this section.
05ID Proposition 37.12.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be $a$ quasi-coherent sheaf on $X$. Let $x \in X$ with image $s \in S$. Assume that
(1) $f$ is locally of finite presentation,
(2) $\mathcal{F}$ is of finite presentation, and
(3) $\mathcal{F}$ is flat at $x$ over $S$.

Then there exists a commutative diagram of pointed schemes

whose horizontal arrows are elementary étale neighbourhoods such that $X^{\prime}, S^{\prime}$ are affine and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module.

Proof. By openness of flatness, see More on Morphisms, Theorem 36.12.1 we may replace $X$ by an open neighbourhood of $x$ and assume that $\mathcal{F}$ is flat over $S$. Next, we apply Proposition 37.5 .7 to find a diagram as in the statement of the proposition such that $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$ has a complete dévissage over $s^{\prime}$. (In particular $S^{\prime}$ and $X^{\prime}$ are affine.) By Morphisms, Lemma 28.25.11 we see that $g^{*} \mathcal{F}$ is flat over $S$ and by Lemma 37.2.3 we see that it is flat over $S^{\prime}$. Via Remark 37.6.5 we deduce that

$$
\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right) / \Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right) / \Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)
$$

has a complete dévissage over the prime of $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$ corresponding to $s^{\prime}$. Thus Lemma 37.12 .2 implies that the result of the proposition holds after replacing $S^{\prime}$ by a standard open neighbourhood of $s^{\prime}$.

In the rest of this section we prove a number of variants on this result. The first is a "global" version.

05KW Lemma 37.12.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $s \in S$. Assume that
(1) $f$ is of finite presentation,
(2) $\mathcal{F}$ is of finite presentation, and
(3) $\mathcal{F}$ is flat over $S$ at every point of the fibre $X_{s}$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of schemes

such that $g$ is étale, $X_{s} \subset g\left(X^{\prime}\right)$, the schemes $X^{\prime}, S^{\prime}$ are affine, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module.

Proof. For every point $x \in X_{s}$ we can use Proposition 37.12 .4 to find a commutative diagram

whose horizontal arrows are elementary étale neighbourhoods such that $Y_{x}, S_{x}$ are affine and such that $\Gamma\left(Y_{x}, g_{x}^{*} \mathcal{F}\right)$ is a projective $\Gamma\left(S_{x}, \mathcal{O}_{S_{x}}\right)$-module. In particular $g_{x}\left(Y_{x}\right) \cap X_{s}$ is an open neighbourhood of $x$ in $X_{s}$. Because $X_{s}$ is quasi-compact we can find a finite number of points $x_{1}, \ldots, x_{n} \in X_{s}$ such that $X_{s}$ is the union of the $g_{x_{i}}\left(Y_{x_{i}}\right) \cap X_{s}$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ which dominates each of the neighbourhoods $\left(S_{x_{i}}, s_{x_{i}}\right)$, see More on Morphisms, Lemma 36.27.4. We may also assume that $S^{\prime}$ is affine. Set $X^{\prime}=\coprod Y_{x_{i}} \times{ }_{S_{x_{i}}} S^{\prime}$ and endow it with the obvious morphism $g: X^{\prime} \rightarrow X$. By construction $g\left(X^{\prime}\right)$ contains $X_{s}$ and

$$
\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)=\bigoplus \Gamma\left(Y_{x_{i}}, g_{x_{i}}^{*} \mathcal{F}\right) \otimes_{\Gamma\left(S_{x_{i}}, \mathcal{O}_{S_{x_{i}}}\right)} \Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)
$$

This is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module, see Algebra, Lemma 10.93.1.
The following two lemmas are reformulations of the results above in case $\mathcal{F}=\mathcal{O}_{X}$.
05IE Lemma 37.12.6. Let $f: X \rightarrow S$ be locally of finite presentation. Let $x \in X$ with image $s \in S$. If $f$ is flat at $x$ over $S$, then there exists a commutative diagram of pointed schemes

whose horizontal arrows are elementary étale neighbourhoods such that $X^{\prime}, S^{\prime}$ are affine and such that $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module.
Proof. This is a special case of Proposition 37.12.4.
05KX Lemma 37.12.7. Let $f: X \rightarrow S$ be of finite presentation. Let $s \in S$. If $X$ is flat over $S$ at all points of $X_{s}$, then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of schemes

with $g$ étale, $X_{s} \subset g\left(X^{\prime}\right)$, such that $X^{\prime}, S^{\prime}$ are affine, and such that $\Gamma\left(X^{\prime}, \mathcal{O}_{X^{\prime}}\right)$ is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module.

Proof. This is a special case of Lemma 37.12.5.
The following lemmas explain consequences of Proposition 37.12 .4 in case we only assume the morphism and the sheaf are of finite type (and not necessarily of finite presentation).
05KY Lemma 37.12.8. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $x \in X$ with image $s \in S$. Assume that
(1) $f$ is locally of finite presentation,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat at $x$ over $S$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of pointed schemes

such that $X^{\prime} \rightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is étale, $\kappa(x)=\kappa\left(x^{\prime}\right)$, the scheme $X^{\prime}$ is affine of finite presentation over $\mathcal{O}_{S^{\prime}, s^{\prime}}$, the sheaf $g^{*} \mathcal{F}$ is of finite presentation over $\mathcal{O}_{X^{\prime}}$, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module.

Proof. To prove the lemma we may replace $(S, s)$ by any elementary étale neighbourhood, and we may also replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$. Hence by Proposition 37.10.3 we may assume that $\mathcal{F}$ is finitely presented and flat over $S$ in a neighbourhood of $x$. In this case the result follows from Proposition 37.12 .4 because Algebra, Theorem 10.84.4 assures us that projective $=$ free over a local ring.

05KZ Lemma 37.12.9. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $x \in X$ with image $s \in S$. Assume that
(1) $f$ is locally of finite type,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat at $x$ over $S$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of pointed schemes

such that $X^{\prime} \rightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is étale, $\kappa(x)=\kappa\left(x^{\prime}\right)$, the scheme $X^{\prime}$ is affine, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module.

Proof. (The only difference with Lemma 37.12 .8 is that we do not assume $f$ is of finite presentation.) The problem is local on $X$ and $S$. Hence we may assume $X$ and $S$ are affine, say $X=\operatorname{Spec}(B)$ and $S=\operatorname{Spec}(A)$. Since $B$ is a finite type $A$-algebra we can find a surjection $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$. In other words, we can choose a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$. Set $t=i(x)$ and $\mathcal{G}=i_{*} \mathcal{F}$. Note that $\mathcal{G}_{t} \cong \mathcal{F}_{x}$ are $\mathcal{O}_{S, s}$-modules. Hence $\mathcal{G}$ is flat over $S$ at $t$. We apply Lemma 37.12 .8 to the morphism $\mathbf{A}_{S}^{n} \rightarrow S$, the point $t$, and the sheaf $\mathcal{G}$. Thus we can find an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of pointed schemes

such that $Y \rightarrow \mathbf{A}_{\mathcal{O}_{S^{\prime}, s^{\prime}}}^{n}$ is étale, $\kappa(t)=\kappa(y)$, the scheme $Y$ is affine, and such that $\Gamma\left(Y, h^{*} \mathcal{G}\right)$ is a projective $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module. Then a solution to the original problem is given by the closed subscheme $X^{\prime}=Y \times \mathbf{A}_{S}^{n} X$ of $Y$.

05L0 Lemma 37.12.10. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $s \in S$. Assume that
(1) $f$ is of finite presentation,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat over $S$ at all points of $X_{s}$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of schemes

such that $X^{\prime} \rightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is étale, $X_{s}=g\left(\left(X^{\prime}\right)_{s^{\prime}}\right)$, the scheme $X^{\prime}$ is affine of finite presentation over $\mathcal{O}_{S^{\prime}, s^{\prime}}$, the sheaf $g^{*} \mathcal{F}$ is of finite presentation over $\mathcal{O}_{X^{\prime}}$, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module.

Proof. For every point $x \in X_{s}$ we can use Lemma 37.12 .8 to find an elementary étale neighbourhood $\left(S_{x}, s_{x}\right) \rightarrow(S, s)$ and a commutative diagram

such that $Y_{x} \rightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S_{x}, s_{x}}\right)$ is étale, $\kappa(x)=\kappa\left(y_{x}\right)$, the scheme $Y_{x}$ is affine of finite presentation over $\mathcal{O}_{S_{x}, s_{x}}$, the sheaf $g_{x}^{*} \mathcal{F}$ is of finite presentation over $\mathcal{O}_{Y_{x}}$, and such that $\Gamma\left(Y_{x}, g_{x}^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S_{x}, s_{x}}$-module. In particular $g_{x}\left(\left(Y_{x}\right)_{s_{x}}\right)$ is an open neighbourhood of $x$ in $X_{s}$. Because $X_{s}$ is quasi-compact we can find a finite number of points $x_{1}, \ldots, x_{n} \in X_{s}$ such that $X_{s}$ is the union of the $g_{x_{i}}\left(\left(Y_{x_{i}}\right)_{s_{x_{i}}}\right)$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ which dominates each of the neighbourhoods $\left(S_{x_{i}}, s_{x_{i}}\right)$, see More on Morphisms, Lemma 36.27.4. Set

$$
X^{\prime}=\coprod Y_{x_{i}} \times_{\operatorname{Spec}\left(\mathcal{O}_{S_{x_{i}}, s_{i}}\right)} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

and endow it with the obvious morphism $g: X^{\prime} \rightarrow X$. By construction $X_{s}=g\left(X_{s^{\prime}}^{\prime}\right)$ and

$$
\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)=\bigoplus \Gamma\left(Y_{x_{i}}, g_{x_{i}}^{*} \mathcal{F}\right) \otimes_{\mathcal{O}_{S_{x_{i}}, s_{x_{i}}}} \mathcal{O}_{S^{\prime}, s^{\prime}}
$$

This is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module as a direct sum of base changes of free modules. Some minor details omitted.

05L1 Lemma 37.12.11. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $s \in S$. Assume that
(1) $f$ is of finite type,
(2) $\mathcal{F}$ is of finite type, and
(3) $\mathcal{F}$ is flat over $S$ at all points of $X_{s}$.

Then there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram of schemes

such that $X^{\prime} \rightarrow X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is étale, $X_{s}=g\left(\left(X^{\prime}\right)_{s^{\prime}}\right)$, the scheme $X^{\prime}$ is affine, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module.

Proof. (The only difference with Lemma 37.12 .10 is that we do not assume $f$ is of finite presentation.) For every point $x \in X_{s}$ we can use Lemma 37.12 .9 to find an elementary étale neighbourhood $\left(S_{x}, s_{x}\right) \rightarrow(S, s)$ and a commutative diagram

such that $Y_{x} \rightarrow X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S_{x}, s_{x}}\right)$ is étale, $\kappa(x)=\kappa\left(y_{x}\right)$, the scheme $Y_{x}$ is affine, and such that $\Gamma\left(Y_{x}, g_{x}^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S_{x}, s_{x}}$-module. In particular $g_{x}\left(\left(Y_{x}\right)_{s_{x}}\right)$ is an open neighbourhood of $x$ in $X_{s}$. Because $X_{s}$ is quasi-compact we can find a finite number of points $x_{1}, \ldots, x_{n} \in X_{s}$ such that $X_{s}$ is the union of the $g_{x_{i}}\left(\left(Y_{x_{i}}\right)_{s_{x_{i}}}\right)$. Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ which dominates each of the neighbourhoods $\left(S_{x_{i}}, s_{x_{i}}\right)$, see More on Morphisms, Lemma 36.27.4. Set

$$
X^{\prime}=\coprod Y_{x_{i}} \times_{\operatorname{Spec}\left(\mathcal{O}_{S_{x_{i}}, s_{x_{i}}}\right)} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)
$$

and endow it with the obvious morphism $g: X^{\prime} \rightarrow X$. By construction $X_{s}=g\left(X_{s^{\prime}}^{\prime}\right)$ and

$$
\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)=\bigoplus \Gamma\left(Y_{x_{i}}, g_{x_{i}}^{*} \mathcal{F}\right) \otimes_{\mathcal{O}_{S_{x_{i}}, s_{x_{i}}}} \mathcal{O}_{S^{\prime}, s^{\prime}}
$$

This is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module as a direct sum of base changes of free modules.

### 37.13. Flat finite type modules, Part II

05IF The following lemma will be superseded by the stronger Lemma 37.13 .3 below.
05IG Lemma 37.13.1. Let $(R, \mathfrak{m})$ be a local ring. Let $R \rightarrow S$ be of finite presentation. Let $N$ be a finitely presented $S$-module which is free as an $R$-module. Let $M$ be an $R$-module. Let $\mathfrak{q}$ be a prime of $S$ lying over $\mathfrak{m}$. Then
(1) if $\mathfrak{q} \in$ WeakAsss $\left(M \otimes_{R} N\right)$ then $\mathfrak{m} \in$ WeakAss $_{R}(M)$ and $\overline{\mathfrak{q}} \in A s s_{\bar{S}}(\bar{N})$,
(2) if $\mathfrak{m} \in$ WeakAss ${ }_{R}(M)$ and $\overline{\mathfrak{q}} \in A s s_{\bar{S}}(\bar{N})$ is a maximal element then $\mathfrak{q} \in$ WeakAss $\left(M \otimes_{R} N\right)$.
Here $\bar{S}=S / \mathfrak{m} S, \overline{\mathfrak{q}}=\mathfrak{q} \bar{S}$, and $\bar{N}=N / \mathfrak{m} N$.
Proof. Suppose that $\overline{\mathfrak{q}} \notin \operatorname{Ass}_{\bar{S}}(\bar{N})$. By Algebra, Lemmas 10.62.9, 10.62.5, and 10.14 .2 there exists an element $\bar{g} \in \overline{\mathfrak{q}}$ which is not a zerodivisor on $\bar{N}$. Let $g \in \mathfrak{q}$ be an element which maps to $\bar{g}$ in $\overline{\mathfrak{q}}$. By Lemma 37.7.6 the map $g: N \rightarrow N$ is $R$-universally injective. In particular we see that $g: M \otimes_{R} N \rightarrow M \otimes_{R} N$ is injective. Clearly this implies that $\mathfrak{q} \notin \operatorname{WeakAss}_{S}\left(M \otimes_{R} N\right)$. We conclude that $\mathfrak{q} \in$ WeakAss $_{S}\left(M \otimes_{R} N\right)$ implies $\overline{\mathfrak{q}} \in \operatorname{Ass}_{\bar{S}}(\bar{N})$.

Assume $\mathfrak{q} \in \mathrm{WeakAss}_{S}\left(M \otimes_{R} N\right)$. Let $z \in M \otimes_{R} N$ be an element whose annihilator in $S$ has radical $\mathfrak{q}$. As $N$ is a free $R$-module, we can find a finite free direct summand $F \subset N$ such that $z \in M \otimes_{R} F$. The radical of the annihilator of $z \in M \otimes_{R} F$ in $R$ is $\mathfrak{m}$ (by our assumption on $z$ and because $\mathfrak{q}$ lies over $\mathfrak{m}$ ). Hence we see that $\mathfrak{m} \in \operatorname{WeakAss}\left(M \otimes_{R} F\right)$ which implies that $\mathfrak{m} \in \operatorname{WeakAss}(M)$ by Algebra, Lemma 10.65.3. This finishes the proof of (1).

Assume that $\mathfrak{m} \in \operatorname{WeakAss}_{R}(M)$ and $\overline{\mathfrak{q}} \in \operatorname{Ass}_{\bar{S}}(\bar{N})$ is a maximal element. Let $y \in M$ be an element whose annihilator $I=\operatorname{Ann}_{R}(y)$ has radical $\mathfrak{m}$. Then $R / I \subset M$ and by flatness of $N$ over $R$ we get $N / I N=R / I \otimes_{R} N \subset M \otimes_{R} N$. Hence it is enough to show that $\mathfrak{q} \in \operatorname{WeakAss}(N / I N)$. Write $\overline{\mathfrak{q}}=\left(\bar{g}_{1}, \ldots, \bar{g}_{n}\right)$ for some $\bar{g}_{i} \in \bar{S}$. Choose lifts $g_{i} \in \mathfrak{q}$. Consider the map

$$
\Psi: N / I N \longrightarrow N / I N^{\oplus n}, \quad z \longmapsto\left(g_{1} z, \ldots, g_{n} z\right)
$$

We may think of this as a map of free $R / I$-modules. As the ring $R / I$ is autoassociated (since $\mathfrak{m} / I$ is locally nilpotent) and since $\Psi \otimes R / \mathfrak{m}$ isn't injective (since $\overline{\mathfrak{q}} \in \operatorname{Ass}(\bar{N})$ ) we see by More on Algebra, Lemma 15.9 .4 that $\Psi$ isn't injective. Pick $z \in N / I N$ nonzero in the kernel of $\Psi$. The annihilator of $z$ contains $I$ and $g_{i}$, whence its radical $J=\sqrt{\operatorname{Ann}_{S}(z)}$ contains $\mathfrak{q}$. Let $\mathfrak{q}^{\prime} \supset J$ be a minimal prime over $J$. Then $\mathfrak{q}^{\prime} \in \operatorname{WeakAss}\left(M \otimes_{R} N\right)$ (by definition) and by (1) we see that $\overline{\mathfrak{q}}^{\prime} \in \operatorname{Ass}(\bar{N})$. Then since $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ by construction the maximality of $\overline{\mathfrak{q}}$ implies $\mathfrak{q}=\mathfrak{q}^{\prime}$ whence $\mathfrak{q} \in \operatorname{Weak} \operatorname{Ass}\left(M \otimes_{R} N\right)$. This proves part (2) of the lemma.

05IH Lemma 37.13.2. Let $S$ be a scheme. Let $f: X \rightarrow S$ be locally of finite type. Let $x \in X$ with image $s \in S$. Let $\mathcal{F}$ be a finite type quasi-coherent sheaf on $X$. Let $\mathcal{G}$ be a quasi-coherent sheaf on $S$. If $\mathcal{F}$ is flat at $x$ over $S$, then

$$
x \in W e a k A s s_{X}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}\right) \Leftrightarrow s \in \operatorname{WeakAss}_{S}(\mathcal{G}) \text { and } x \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)
$$

Proof. The question is local on $X$ and $S$, hence we may assume $X$ and $S$ are affine. Write $X=\operatorname{Spec}(B), S=\operatorname{Spec}(A)$ and write $B=A\left[x_{1}, \ldots, x_{n}\right] / I$. In other words we obtain a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$ over $S$. Denote $t=i(x) \in \mathbf{A}_{S}^{n}$. Note that $i_{*} \mathcal{F}$ is a finite type quasi-coherent sheaf on $\mathbf{A}_{S}^{n}$ which is flat at $t$ over $S$ and note that

$$
i_{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}\right)=i_{*} \mathcal{F} \otimes_{\mathcal{O}_{\mathbf{A}_{S}^{n}}} p^{*} \mathcal{G}
$$

where $p: \mathbf{A}_{S}^{n} \rightarrow S$ is the projection. Note that $t$ is a weakly associated point of $i_{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}\right)$ if and only if $x$ is a weakly associated point of $\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}$, see Divisors, Lemma 30.6.3 Similarly $x \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ if and only if $t \in \operatorname{Ass}_{\mathbf{A}_{s}^{n}}\left(\left(i_{*} \mathcal{F}\right)_{s}\right)$ (see Algebra, Lemma 10.62.14). Hence it suffices to prove the lemma in case $X=$ $\mathbf{A}_{S}^{n}$. In particular we may assume that $X \rightarrow S$ is of finite presentation.

Recall that $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ is a locally finite subset of the locally Noetherian scheme $X_{s}$, see Divisors, Lemma 30.2.5. After replacing $X$ by a suitable affine neighbourhood of $x$ we may assume that
$(*)$ if $x^{\prime} \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ and $x \rightsquigarrow x^{\prime}$ then $x=x^{\prime}$.
(Proof omitted. Hint: using Algebra, Lemma 10.14 .2 invert a function which does not vanish at $x$ but does vanish in all the finitely many points of $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ which are specializations of $x$ but not equal to $x$.) In words, no point of $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ is a proper specialization of $x$.

Suppose given a commutative diagram

of pointed schemes whose horizontal arrows are elementary étale neighbourhoods. Then it suffices to prove the statement for $x^{\prime}, s^{\prime}, g^{*} \mathcal{F}$ and $e^{*} \mathcal{G}$, see Lemma 37.2.7. Note that property $(*)$ is preserved by such an étale localization by the same lemma (if there is a proper specialization $x^{\prime} \rightsquigarrow x^{\prime \prime}$ on $X_{s^{\prime}}^{\prime}$ then this maps to a proper specialization on $X_{s}$ because the fibres of an étale morphism are discrete). We may also replace $S$ by the spectrum of its local ring as the condition of being an associated point of a quasi-coherent sheaf depends only on the stalk of the sheaf. Again property $(*)$ is preserved by this as well. Thus we may first apply Proposition 37.10 .3 to reduce to the case where $\mathcal{F}$ is of finite presentation and flat over $S$, whereupon we may use Proposition 37.12 .4 to reduce to the case that $X \rightarrow S$ is a morphism of affines and $\Gamma(X, \mathcal{F})$ is a finitely presented $\Gamma\left(X, \mathcal{O}_{X}\right)$ module which is projective as a $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Localizing $S$ once more we may assume that $\Gamma\left(S, \mathcal{O}_{S}\right)$ is a local ring such that $s$ corresponds to the maximal ideal. In this case Algebra, Theorem 10.84 .4 guarantees that $\Gamma(X, \mathcal{F})$ is free as an $\Gamma\left(S, \mathcal{O}_{S}\right)$ module. The implication $x \in \operatorname{WeakAss}_{X}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}\right) \Rightarrow s \in \operatorname{WeakAss}_{S}(\mathcal{G})$ and $x \in$ $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ follows from part (1) of Lemma 37.13.1. The converse implication follows from part (2) of Lemma 37.13 .1 as property (*) insures that the prime corresponding to $x$ gives rise to a maximal element of $\operatorname{Ass}_{\bar{S}}(\bar{N})$ exactly as in the statement of part (2) of Lemma 37.13.1.

05II Lemma 37.13.3. Let $R \rightarrow S$ be a ring map which is essentially of finite type. Let $N$ be a localization of a finite $S$-module flat over $R$. Let $M$ be an $R$-module. Then

$$
W e a k A s s_{S}\left(M \otimes_{R} N\right)=\bigcup_{\mathfrak{p} \in W_{e a k A s s_{R}(M)} A s s_{S \otimes_{R} \kappa(\mathfrak{p})}\left(N \otimes_{R} \kappa(\mathfrak{p})\right) .}
$$

Proof. This lemma is a translation of Lemma 37.13 .2 into algebra. Details of translation omitted.

05IJ Lemma 37.13.4. Let $f: X \rightarrow S$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent sheaf on $X$ which is flat over $S$. Let $\mathcal{G}$ be a quasi-coherent sheaf on $S$. Then we have

$$
W^{W e a k A s s_{X}}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}\right)=\bigcup_{s \in W e a k A s s_{S}(\mathcal{G})}{A s s s_{X_{s}}\left(\mathcal{F}_{s}\right), ~}
$$

Proof. Immediate consequence of Lemma 37.13.2.
05IK Theorem 37.13.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be $a$ quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X \rightarrow S$ is locally of finite presentation,
(2) $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite type, and
(3) the set of weakly associated points of $S$ is locally finite in $S$.

Then $U=\{x \in X \mid \mathcal{F}$ flat at $x$ over $S\}$ is open in $X$ and $\left.\mathcal{F}\right|_{U}$ is an $\mathcal{O}_{U}$-module of finite presentation and flat over $S$.

Proof. Let $x \in X$ be such that $\mathcal{F}$ is flat at $x$ over $S$. We have to find an open neighbourhood of $x$ such that $\mathcal{F}$ restricts to a $S$-flat finitely presented module on this neighbourhood. The problem is local on $X$ and $S$, hence we may assume that $X$ and $S$ are affine. As $\mathcal{F}_{x}$ is a finitely presented $\mathcal{O}_{X, x}$-module by Lemma 37.10 .9 we conclude from Algebra, Lemma 10.125 .5 there exists a finitely presented $\mathcal{O}_{X^{-}}$ module $\mathcal{F}^{\prime}$ and a map $\varphi: \mathcal{F}^{\prime} \rightarrow \mathcal{F}$ which induces an isomorphism $\varphi_{x}: \mathcal{F}_{x}^{\prime} \rightarrow \mathcal{F}_{x}$. In particular we see that $\mathcal{F}^{\prime}$ is flat over $S$ at $x$, hence by openness of flatness More on Morphisms, Theorem 36.12 .1 we see that after shrinking $X$ we may assume that $\mathcal{F}^{\prime}$ is flat over $S$. As $\mathcal{F}$ is of finite type after shrinking $X$ we may assume that $\varphi$ is surjective, see Modules, Lemma 17.9.4 or alternatively use Nakayama's lemma (Algebra, Lemma 10.19.1). By Lemma 37.13.4 we have

$$
\operatorname{WeakAss}_{X}\left(\mathcal{F}^{\prime}\right) \subset \bigcup_{s \in \operatorname{WeakAss}(S)} \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}^{\prime}\right)
$$

As WeakAss $(S)$ is finite by assumption and since $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}^{\prime}\right)$ is finite by Divisors, Lemma 30.2 .5 we conclude that WeakAss ${ }_{X}\left(\mathcal{F}^{\prime}\right)$ is finite. Using Algebra, Lemma 10.14 .2 we may, after shrinking $X$ once more, assume that WeakAss ${ }_{X}\left(\mathcal{F}^{\prime}\right)$ is contained in the generalization of $x$. Now consider $\mathcal{K}=\operatorname{Ker}(\varphi)$. We have WeakAss $_{X}(\mathcal{K}) \subset \operatorname{WeakAss}_{X}\left(\mathcal{F}^{\prime}\right)$ (by Divisors, Lemma 30.5.4 but on the other hand, $\varphi_{x}$ is an isomorphism, also $\varphi_{x^{\prime}}$ is an isomorphism for all $x^{\prime} \rightsquigarrow x$. We conclude that WeakAss ${ }_{X}(\mathcal{K})=\emptyset$ whence $\mathcal{K}=0$ by Divisors, Lemma 30.5.5.
05IL Lemma 37.13.6. Let $R \rightarrow S$ be a ring map of finite presentation. Let $M$ be $a$ finite $S$-module. Assume WeakAss $s_{S}(S)$ is finite. Then

$$
U=\left\{\mathfrak{q} \subset S \mid M_{\mathfrak{q}} \text { flat over } R\right\}
$$

is open in $\operatorname{Spec}(S)$ and for every $g \in S$ such that $D(g) \subset U$ the localization $M_{g}$ is a finitely presented $S_{g}$-module flat over $R$.
Proof. Follows immediately from Theorem 37.13.5.
05IM Lemma 37.13.7. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Assume the set of weakly associated points of $S$ is locally finite in $S$. Then the set of points $x \in X$ where $f$ is flat is an open subscheme $U \subset X$ and $U \rightarrow S$ is flat and locally of finite presentation.
Proof. The problem is local on $X$ and $S$, hence we may assume that $X$ and $S$ are affine. Then $X \rightarrow S$ corresponds to a finite type ring map $A \rightarrow B$. Choose a surjection $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ and consider $B$ as an $A\left[x_{1}, \ldots, x_{n}\right]$-module. An application of Lemma 37.13 .6 finishes the proof.

05IN Lemma 37.13.8. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type and flat. If $S$ is integral, then $f$ is locally of finite presentation.

Proof. Special case of Lemma 37.13.7.
053G Proposition 37.13.9. Let $R$ be a domain. Let $R \rightarrow S$ be a ring map of finite type. Let $M$ be a finite $S$-module.
(1) If $S$ is flat over $R$, then $S$ is a finitely presented $R$-algebra.
(2) If $M$ is flat as an $R$-module, then $M$ is finitely presented as an $S$-module.

Proof. Part (1) is a special case of Lemma 37.13 .8 . For Part (2) choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$. By Lemma 37.13 .6 we find that $M$ is finitely presented as an $R\left[x_{1}, \ldots, x_{n}\right]$-module. We conclude by Algebra, Lemma 10.6.4.

05IQ Remark 37.13.10 (Finite type version of Theorem 37.13.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Assume
(1) $X \rightarrow S$ is locally of finite type,
(2) $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite type, and
(3) the set of weakly associated points of $S$ is locally finite in $S$.

Then $U=\{x \in X \mid \mathcal{F}$ flat at $x$ over $S\}$ is open in $X$ and $\left.\mathcal{F}\right|_{U}$ is flat over $S$ and locally finitely presented relative to $S$ (see More on Morphisms, Definition 36.40.1). If we ever need this result in the stacks project we will convert this remark into a lemma with a proof.

05IR Remark 37.13.11 (Algebra version of Remark 37.13.10. Let $R \rightarrow S$ be a ring map of finite type. Let $M$ be a finite $S$-module. Assume WeakAss $(S)$ is finite. Then

$$
U=\left\{\mathfrak{q} \subset S \mid M_{\mathfrak{q}} \text { flat over } R\right\}
$$

is open in $\operatorname{Spec}(S)$ and for every $g \in S$ such that $D(g) \subset U$ the localization $M_{g}$ is flat over $R$ and an $S_{g}$-module finitely presented relative to $R$ (see More on Algebra, Definition 15.65 .2 . If we ever need this result in the stacks project we will convert this remark into a lemma with a proof.

### 37.14. Examples of relatively pure modules

05 IS In the short section we discuss some examples of results that will serve as motivation for the notion of a relatively pure module and the concept of an impurity which we will introduce later. Each of the examples is stated as a lemma. Note the similarity with the condition on associated primes to the conditions appearing in Lemmas 37.7.4 37.8.3 37.8.4 and 37.9.1 See also Algebra, Lemma 10.64.1 for a discussion.

05FV Lemma 37.14.1. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Assume
(1) $N$ is projective as an $R$-module, and
(2) $S / \mathfrak{m} S$ is Noetherian and $N / \mathfrak{m} N$ is a finite $S / \mathfrak{m} S$-module.

Then for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} \kappa(\mathfrak{p})$ where $\mathfrak{p}=R \cap \mathfrak{q}$ we have $\mathfrak{q}+\mathfrak{m} S \neq S$.

Proof. Note that the hypotheses of Lemmas 37.7.1 and 37.7.6 are satisfied. We will use the conclusions of these lemmas without further mention. Let $\Sigma \subset S$ be the multiplicative set of elements which are not zerodivisors on $N / \mathfrak{m} N$. The map $N \rightarrow \Sigma^{-1} N$ is $R$-universally injective. Hence we see that any $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} \kappa(\mathfrak{p})$ is also an associated prime of $\Sigma^{-1} N \otimes_{R} \kappa(\mathfrak{p})$. Clearly this implies that $\mathfrak{q}$ corresponds to a prime of $\Sigma^{-1} S$. Thus $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ where $\mathfrak{q}^{\prime}$ corresponds to an associated prime of $N / \mathfrak{m} N$ and we win.

The following lemma gives another (slightly silly) example of this phenomenon.
05IT Lemma 37.14.2. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. If $N$ is I-adically complete, then for any $R$-module $M$ and for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} M$ we have $\mathfrak{q}+I S \neq S$.

Proof. Let $S^{\wedge}$ denote the $I$-adic completion of $S$. Note that $N$ is an $S^{\wedge}$-module, hence also $N \otimes_{R} M$ is an $S^{\wedge}$-module. Let $z \in N \otimes_{R} M$ be an element such that
$\mathfrak{q}=\operatorname{Ann}_{S}(z)$. Since $z \neq 0$ we see that $\operatorname{Ann}_{S^{\wedge}}(z) \neq S^{\wedge}$. Hence $\mathfrak{q} S^{\wedge} \neq S^{\wedge}$. Hence there exists a maximal ideal $\mathfrak{m} \subset S^{\wedge}$ with $\mathfrak{q} S^{\wedge} \subset \mathfrak{m}$. Since $I S^{\wedge} \subset \mathfrak{m}$ by Algebra, Lemma 10.95 .6 we win.

Note that the following lemma gives an alternative proof of Lemma 37.14.1 as a projective module over a local ring is free, see Algebra, Theorem 10.84.4.

05 IU Lemma 37.14.3. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Assume $N$ is isomorphic as an $R$-module to a direct sum of finite $R$-modules. Then for any $R$-module $M$ and for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} M$ we have $\mathfrak{q}+\mathfrak{m} S \neq S$.

Proof. Write $N=\bigoplus_{i \in I} M_{i}$ with each $M_{i}$ a finite $R$-module. Let $M$ be an $R$ module and let $\mathfrak{q} \subset S$ be an associated prime of $N \otimes_{R} M$ such that $\mathfrak{q}+\mathfrak{m} S=S$. Let $z \in N \otimes_{R} M$ be an element with $\mathfrak{q}=\operatorname{Ann}_{S}(z)$. After modifying the direct sum decomposition a little bit we may assume that $z \in M_{1} \otimes_{R} M$ for some element $1 \in I$. Write $1=f+\sum x_{j} g_{j}$ for some $f \in \mathfrak{q}, x_{j} \in \mathfrak{m}$, and $g_{j} \in S$. For any $g \in S$ denote $g^{\prime}$ the $R$-linear map

$$
M_{1} \rightarrow N \xrightarrow{g} N \rightarrow M_{1}
$$

where the first arrow is the inclusion map, the second arrow is multiplication by $g$ and the third arrow is the projection map. Because each $x_{j} \in R$ we obtain the equality

$$
f^{\prime}+\sum x_{j} g_{j}^{\prime}=\operatorname{id}_{M_{1}} \in \operatorname{End}_{R}\left(M_{1}\right)
$$

By Nakayama's lemma (Algebra, Lemma 10.19.1) we see that $f^{\prime}$ is surjective, hence by Algebra, Lemma 10.15 .4 we see that $f^{\prime}$ is an isomorphism. In particular the map

$$
M_{1} \otimes_{R} M \rightarrow N \otimes_{R} M \xrightarrow{f} N \otimes_{R} M \rightarrow M_{1} \otimes_{R} M
$$

is an isomorphism. This contradicts the assumption that $f z=0$.
05IV Lemma 37.14.4. Let $R$ be a henselian local ring with maximal ideal $\mathfrak{m}$. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Assume $N$ is countably generated and Mittag-Leffler as an $R$-module. Then for any $R$-module $M$ and for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_{R} M$ we have $\mathfrak{q}+\mathfrak{m} S \neq S$.

Proof. This lemma reduces to Lemma 37.14 .3 by Algebra, Lemma 10.148.32.
Suppose $f: X \rightarrow S$ is a morphism of schemes and $\mathcal{F}$ is a quasi-coherent module on $X$. Let $\xi \in \operatorname{Ass}_{X / S}(\mathcal{F})$ and let $Z=\overline{\{\xi\}}$. Picture

Note that $f(Z) \subset \overline{\{f(\xi)\}}$ and that $f(Z)$ is closed if and only if equality holds, i.e., $f(Z)=\overline{\{f(\xi)\}}$. It follows from Lemma 37.14.1 that if $S, X$ are affine, the fibres $X_{s}$ are Noetherian, $\mathcal{F}$ is of finite type, and $\Gamma(X, \mathcal{F})$ is a projective $\Gamma\left(S, \mathcal{O}_{S}\right)$-module, then $f(Z)=\overline{\{f(\xi)\}}$ is a closed subset. Slightly different analogous statements holds for the cases described in Lemmas 37.14.2, 37.14.3, and 37.14.4.

### 37.15. Impurities

05IW We want to formalize the phenomenon of which we gave examples in Section 37.14 in terms of specializations of points of $\operatorname{Ass}_{X / S}(\mathcal{F})$. We also want to work locally around a point $s \in S$. In order to do so we make the following definitions.
05FW Situation 37.15.1. Here $S, X$ are schemes and $f: X \rightarrow S$ is a finite type morphism. Also, $\mathcal{F}$ is a finite type quasi-coherent $\mathcal{O}_{X}$-module. Finally $s$ is a point of $S$.

In this situation consider a morphism $g: T \rightarrow S$, a point $t \in T$ with $g(t)=s$, a specialization $t^{\prime} \rightsquigarrow t$, and a point $\xi \in X_{T}$ in the base change of $X$ lying over $t^{\prime}$. Picture

05IX

Moreover, denote $\mathcal{F}_{T}$ the pullback of $\mathcal{F}$ to $X_{T}$.
05IY Definition 37.15.2. In Situation 37.15.1 we say a diagram 37.15.1.1 defines an impurity of $\mathcal{F}$ above $s$ if $\xi \in \operatorname{Ass}_{X_{T} / T}\left(\mathcal{F}_{T}\right)$ and $\overline{\{\xi\}} \cap X_{t}=\emptyset$. We will indicate this by saying "let $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ be an impurity of $\mathcal{F}$ above $s$ ".
05FX Lemma 37.15.3. In Situation 37.15.1. If there exists an impurity of $\mathcal{F}$ above $s$, then there exists an impurity $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ of $\mathcal{F}$ above $s$ such that $g$ is locally of finite presentation and $t$ a closed point of the fibre of $g$ above $s$.

Proof. Let $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ be any impurity of $\mathcal{F}$ above $s$. We apply Limits, Lemma 31.13.1 to $t \in T$ and $Z=\overline{\{\xi\}}$ to obtain an open neighbourhood $V \subset T$ of $t$, a commutative diagram

and a closed subscheme $Z^{\prime} \subset X_{T^{\prime}}$ such that
(1) the morphism $b: T^{\prime} \rightarrow S$ is locally of finite presentation,
(2) we have $Z^{\prime} \cap X_{a(t)}=\emptyset$, and
(3) $Z \cap X_{V}$ maps into $Z^{\prime}$ via the morphism $X_{V} \rightarrow X_{T^{\prime}}$.

As $t^{\prime}$ specializes to $t$ we may replace $T$ by the open neighbourhood $V$ of $t$. Thus we have a commutative diagram

where $b \circ a=g$. Let $\xi^{\prime} \in X_{T^{\prime}}$ denote the image of $\xi$. By Divisors, Lemma 30.7.2 we see that $\xi^{\prime} \in \operatorname{Ass}_{X_{T^{\prime}} / T^{\prime}}\left(\mathcal{F}_{T^{\prime}}\right)$. Moreover, by construction the closure of $\overline{\left\{\xi^{\prime}\right\}}$ is
contained in the closed subset $Z^{\prime}$ which avoids the fibre $X_{a(t)}$. In this way we see that $\left(T^{\prime} \rightarrow S, a\left(t^{\prime}\right) \rightsquigarrow a(t), \xi^{\prime}\right)$ is an impurity of $\mathcal{F}$ above $s$.

Thus we may assume that $g: T \rightarrow S$ is locally of finite presentation. Let $Z=\overline{\{\xi\}}$. By assumption $Z_{t}=\emptyset$. By More on Morphisms, Lemma 36.19.1 this means that $Z_{t^{\prime \prime}}=\emptyset$ for $t^{\prime \prime}$ in an open subset of $\overline{\{t\}}$. Since the fibre of $T \rightarrow S$ over $s$ is a Jacobson scheme, see Morphisms, Lemma 28.16 .10 we find that there exist a closed point $t^{\prime \prime} \in \overline{\{t\}}$ such that $Z_{t^{\prime \prime}}=\emptyset$. Then $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t^{\prime \prime}, \xi\right)$ is the desired impurity.

05IZ Lemma 37.15.4. In Situation 37.15.1. Let $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ be an impurity of $\mathcal{F}$ above s. Assume $S$ is affine and that $T$ is written $T=\lim _{i \in I} T_{i}$ as a directed colimit of affine schemes over $S$. Then for some $i$ the triple $\left(T_{i} \rightarrow S, t_{i}^{\prime} \rightsquigarrow t_{i}, \xi_{i}\right)$ is an impurity of $\mathcal{F}$ above $s$.

Proof. The notation in the statement means this: Let $f_{i}: T \rightarrow T_{i}$ be the projection morphisms, let $t_{i}=f_{i}(t)$ and $t_{i}^{\prime}=f_{i}\left(t^{\prime}\right)$. Finally $\xi_{i} \in X_{T_{i}}$ is the image of $\xi$. By Divisors, Lemma 30.7 .2 it is true that $\xi_{i}$ is a point of the relative assassin of $\mathcal{F}_{T_{i}}$ over $T_{i}$. Thus the only point is to show that $\overline{\left\{\xi_{i}\right\}} \cap X_{t_{i}}=\emptyset$ for some $i$. Set $Z=\overline{\{\xi\}}$. Apply Limits, Lemma 31.13 .1 to this situation to obtain an open neighbourhood $V \subset T$ of $t$, a commutative diagram

and a closed subscheme $Z^{\prime} \subset X_{T^{\prime}}$ such that
(1) the morphism $b: T^{\prime} \rightarrow S$ is locally of finite presentation,
(2) we have $Z^{\prime} \cap X_{a(t)}=\emptyset$, and
(3) $Z \cap X_{V}$ maps into $Z^{\prime}$ via the morphism $X_{V} \rightarrow X_{T^{\prime}}$.

We may assume $V$ is an affine open of $T$, hence by Limits, Lemmas 31.3 .8 and 31.3 .10 we can find an $i$ and an affine open $V_{i} \subset T_{i}$ with $V=f_{i}^{-1}\left(V_{i}\right)$. By Limits, Proposition 31.5.1 after possibly increasing $i$ a bit we can find a morphism $a_{i}: V_{i} \rightarrow T^{\prime}$ such that $a=\left.a_{i} \circ f_{i}\right|_{V}$. The induced morphism $X_{T_{i}} \rightarrow X_{T^{\prime}}$ maps $\xi_{i}$ into $Z^{\prime}$. As $Z^{\prime} \cap X_{a(t)}=\emptyset$ we conclude that $\left(T_{i} \rightarrow S, t_{i}^{\prime} \rightsquigarrow t_{i}, \xi_{i}\right)$ is an impurity of $\mathcal{F}$ above $s$.

05J0 Lemma 37.15.5. In Situation 37.15.1. If there exists an impurity $(g: T \rightarrow$ $\left.S, t^{\prime} \rightsquigarrow t, \xi\right)$ of $\mathcal{F}$ above $s$ with $g$ quasi-finite at $t$, then there exists an impurity $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ such that $(T, t) \rightarrow(S, s)$ is an elementary étale neighbourhood.

Proof. Let $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ be an impurity of $\mathcal{F}$ above $s$ such that $g$ is quasi-finite at $t$. After shrinking $T$ we may assume that $g$ is locally of finite type. Apply More on Morphisms, Lemma 36.30 .1 to $T \rightarrow S$ and $t \mapsto s$. This gives us a diagram

where $(U, u) \rightarrow(S, s)$ is an elementary étale neighbourhood and $V \subset T \times{ }_{S} U$ is an open neighbourhood of $v=(t, u)$ such that $V \rightarrow U$ is finite and such that $v$ is the unique point of $V$ lying over $u$. Since the morphism $V \rightarrow T$ is étale hence flat we see that there exists a specialization $v^{\prime} \rightsquigarrow v$ such that $v^{\prime} \mapsto t^{\prime}$. Note that $\kappa\left(t^{\prime}\right) \subset \kappa\left(v^{\prime}\right)$ is finite separable. Pick any point $\zeta \in X_{v^{\prime}}$ mapping to $\xi \in X_{t^{\prime}}$. By Divisors, Lemma 30.7.2 we see that $\zeta \in \operatorname{Ass}_{X_{V} / V}\left(\mathcal{F}_{V}\right)$. Moreover, the closure $\overline{\{\zeta\}}$ does not meet the fibre $X_{v}$ as by assumption the closure $\overline{\{\xi\}}$ does not meet $X_{t}$. In other words $\left(V \rightarrow S, v^{\prime} \rightsquigarrow v, \zeta\right)$ is an impurity of $\mathcal{F}$ above $S$.

Next, let $u^{\prime} \in U^{\prime}$ be the image of $v^{\prime}$ and let $\theta \in X_{U}$ be the image of $\zeta$. Then $\theta \mapsto u^{\prime}$ and $u^{\prime} \rightsquigarrow u$. By Divisors, Lemma 30.7.2 we see that $\theta \in \operatorname{Ass}_{X_{U} / U}(\mathcal{F})$. Moreover, as $\pi: X_{V} \rightarrow X_{U}$ is finite we see that $\pi(\{\zeta\})=\overline{\{\pi(\zeta)\}}$. Since $v$ is the unique point of $V$ lying over $u$ we see that $X_{u} \cap \overline{\{\pi(\zeta)\}}=\emptyset$ because $X_{v} \cap \overline{\{\zeta\}}=\emptyset$. In this way we conclude that $\left(U \rightarrow S, u^{\prime} \rightsquigarrow u, \theta\right)$ is an impurity of $\mathcal{F}$ above $s$ and we win.

05J1 Lemma 37.15.6. In Situation 37.15.1. Assume that $S$ is locally Noetherian. If there exists an impurity of $\mathcal{F}$ above $s$, then there exists an impurity $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow\right.$ $t, \xi)$ of $\mathcal{F}$ above $s$ such that $g$ is quasi-finite at $t$.

Proof. We may replace $S$ by an affine neighbourhood of $s$. By Lemma 37.15 .3 we may assume that we have an impurity $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ of such that $g$ is locally of finite type and $t$ a closed point of the fibre of $g$ above $s$. We may replace $T$ by the reduced induced scheme structure on $\overline{\left\{t^{\prime}\right\}}$. Let $Z=\overline{\{\xi\}} \subset X_{T}$. By assumption $Z_{t}=\emptyset$ and the image of $Z \rightarrow T$ contains $t^{\prime}$. By More on Morphisms, Lemma 36.20.1 there exists a nonempty open $V \subset Z$ such that for any $w \in f(V)$ any generic point $\xi^{\prime}$ of $V_{w}$ is in $\operatorname{Ass}_{X_{T} / T}\left(\mathcal{F}_{T}\right)$. By More on Morphisms, Lemma 36.19 .2 there exists a nonempty open $W \subset T$ with $W \subset f(V)$. By More on Morphisms, Lemma 36.37.7 there exists a closed subscheme $T^{\prime} \subset T$ such that $t \in T^{\prime}, T^{\prime} \rightarrow S$ is quasi-finite at $t$, and there exists a point $z \in T^{\prime} \cap W, z \rightsquigarrow t$ which does not map to $s$. Choose any generic point $\xi^{\prime}$ of the nonempty scheme $V_{z}$. Then $\left(T^{\prime} \rightarrow S, z \rightsquigarrow t, \xi^{\prime}\right)$ is the desired impurity.

In the following we will use the henselization $S^{h}=\operatorname{Spec}\left(\mathcal{O}_{S, s}^{h}\right)$ of $S$ at $s$, see Étale Cohomology, Definition 49.33.2. Since $S^{h} \rightarrow S$ maps to closed point of $S^{h}$ to $s$ and induces an isomorphism of residue fields, we will indicate $s \in S^{h}$ this closed point also. Thus $\left(S^{h}, s\right) \rightarrow(S, s)$ is a morphism of pointed schemes.

05J2 Lemma 37.15.7. In Situation 37.15.1. If there exists an impurity ( $S^{h} \rightarrow S, s^{\prime} \rightsquigarrow$ $s, \xi$ ) of $\mathcal{F}$ above $s$ then there exists an impurity $\left(T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ of $\mathcal{F}$ above $s$ where $(T, t) \rightarrow(S, s)$ is an elementary étale neighbourhood.

Proof. We may replace $S$ by an affine neighbourhood of $s$. Say $S=\operatorname{Spec}(A)$ and $s$ corresponds to the prime $\mathfrak{p} \subset A$. Then $\mathcal{O}_{S, s}^{h}=\operatorname{colim}_{(T, t)} \Gamma\left(T, \mathcal{O}_{T}\right)$ where the limit is over the opposite of the cofiltered category of affine elementary étale neighbourhoods $(T, t)$ of $(S, s)$, see More on Morphisms, Lemma 36.27.5 and its proof. Hence $S^{h}=\lim _{i} T_{i}$ and we win by Lemma 37.15.4.

05J3 Lemma 37.15.8. In Situation 37.15 .1 the following are equivalent
(1) there exists an impurity $\left(S^{h} \rightarrow S, s^{\prime} \rightsquigarrow s, \xi\right)$ of $\mathcal{F}$ above $s$ where $S^{h}$ is the henselization of $S$ at $s$,
(2) there exists an impurity $\left(T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ of $\mathcal{F}$ above $s$ such that $(T, t) \rightarrow$ $(S, s)$ is an elementary étale neighbourhood, and
(3) there exists an impurity $\left(T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ of $\mathcal{F}$ above $s$ such that $T \rightarrow S$ is quasi-finite at $t$.
Proof. As an étale morphism is locally quasi-finite it is clear that (2) implies (3). We have seen that (3) implies (2) in Lemma 37.15.5. We have seen that (1) implies (2) in Lemma 37.15.7. Finally, if $\left(T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ is an impurity of $\mathcal{F}$ above $s$ such that $(T, t) \rightarrow(S, s)$ is an elementary étale neighbourhood, then we can choose a factorization $S^{h} \rightarrow T \rightarrow S$ of the structure morphism $S^{h} \rightarrow S$. Choose any point $s^{\prime} \in S^{h}$ mapping to $t^{\prime}$ and choose any $\xi^{\prime} \in X_{s^{\prime}}$ mapping to $\xi \in X_{t^{\prime}}$. Then ( $S^{h} \rightarrow S, s^{\prime} \rightsquigarrow s, \xi^{\prime}$ ) is an impurity of $\mathcal{F}$ above $s$. We omit the details.

### 37.16. Relatively pure modules

05BB The notion of a module pure relative to a base was introduced in GR71.
05J4 Definition 37.16.1. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module.
(1) Let $s \in S$. We say $\mathcal{F}$ is pure along $X_{s}$ if there is no impurity $(g: T \rightarrow$ $\left.S, t^{\prime} \rightsquigarrow t, \xi\right)$ of $\mathcal{F}$ above $s$ with $(T, t) \rightarrow(S, s)$ an elementary étale neighbourhood.
(2) We say $\mathcal{F}$ is universally pure along $X_{s}$ if there does not exist any impurity of $\mathcal{F}$ above $s$.
(3) We say that $X$ is pure along $X_{s}$ if $\mathcal{O}_{X}$ is pure along $X_{s}$.
(4) We say $\mathcal{F}$ is universally $S$-pure, or universally pure relative to $S$ if $\mathcal{F}$ is universally pure along $X_{s}$ for every $s \in S$.
(5) We say $\mathcal{F}$ is $S$-pure, or pure relative to $S$ if $\mathcal{F}$ is pure along $X_{s}$ for every $s \in S$.
(6) We say that $X$ is $S$-pure or pure relative to $S$ if $\mathcal{O}_{X}$ is pure relative to $S$.

We intentionally restrict ourselves here to morphisms which are of finite type and not just morphisms which are locally of finite type, see Remark 37.16 .2 for a discussion. In the situation of the definition Lemma 37.15 .8 tells us that the following are equivalent
(1) $\mathcal{F}$ is pure along $X_{s}$,
(2) there is no impurity $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ with $g$ quasi-finite at $t$,
(3) there does not exist any impurity of the form $\left(S^{h} \rightarrow S, s^{\prime} \rightsquigarrow s, \xi\right)$, where $S^{h}$ is the henselization of $S$ at $s$.
If we denote $X^{h}=X \times{ }_{S} S^{h}$ and $\mathcal{F}^{h}$ the pullback of $\mathcal{F}$ to $X^{h}$, then we can formulate the last condition in the following more positive way:
(4) All points of $\mathrm{Ass}_{X^{h} / S^{h}}\left(\mathcal{F}^{h}\right)$ specialize to points of $X_{s}$.

In particular, it is clear that $\mathcal{F}$ is pure along $X_{s}$ if and only if the pullback of $\mathcal{F}$ to $X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ is pure along $X_{s}$.

05J5 Remark 37.16.2. Let $f: X \rightarrow S$ be a morphism which is locally of finite type and $\mathcal{F}$ a quasi-coherent finite type $\mathcal{O}_{X}$-module. In this case it is still true that (1) and (2) above are equivalent because the proof of Lemma 37.15.5 does not use that $f$ is quasi-compact. It is also clear that (3) and (4) are equivalent. However, we don't know if (1) and (3) are equivalent. In this case it may sometimes be more
convenient to define purity using the equivalent conditions (3) and (4) as is done in GR71. On the other hand, for many applications it seems that the correct notion is really that of being universally pure.

A natural question to ask is if the property of being pure relative to the base is preserved by base change, i.e., if being pure is the same thing as being universally pure. It turns out that this is true over Noetherian base schemes (see Lemma 37.16 .5 ), or if the sheaf is flat (see Lemmas 37.18.3 and 37.18.4). It is not true in general, even if the morphism and the sheaf are of finite presentation, see Examples, Section 88.32 for a counter example. First we match our usage of "universally" to the usual notion.

05J6 Lemma 37.16.3. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $s \in S$. The following are equivalent
(1) $\mathcal{F}$ is universally pure along $X_{s}$, and
(2) for every morphism of pointed schemes $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ the pullback $\mathcal{F}_{S^{\prime}}$ is pure along $X_{s^{\prime}}$.
In particular, $\mathcal{F}$ is universally pure relative to $S$ if and only if every base change $\mathcal{F}_{S^{\prime}}$ of $\mathcal{F}$ is pure relative to $S^{\prime}$.

Proof. This is formal.
05J7 Lemma 37.16.4. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $s \in S$. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be a morphism of pointed schemes. If $S^{\prime} \rightarrow S$ is quasi-finite at $s^{\prime}$ and $\mathcal{F}$ is pure along $X_{s}$, then $\mathcal{F}_{S^{\prime}}$ is pure along $X_{s^{\prime}}$.

Proof. It $\left(T \rightarrow S^{\prime}, t^{\prime} \rightsquigarrow t, \xi\right)$ is an impurity of $\mathcal{F}_{S^{\prime}}$ above $s^{\prime}$ with $T \rightarrow S^{\prime}$ quasi-finite at $t$, then $\left(T \rightarrow S, t^{\prime} \rightarrow t, \xi\right)$ is an impurity of $\mathcal{F}$ above $s$ with $T \rightarrow S$ quasi-finite at $t$, see Morphisms, Lemma 28.20.12. Hence the lemma follows immediately from the characterization (2) of purity given following Definition 37.16.1

05J8 Lemma 37.16.5. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $s \in S$. If $\mathcal{O}_{S, s}$ is Noetherian then $\mathcal{F}$ is pure along $X_{s}$ if and only if $\mathcal{F}$ is universally pure along $X_{s}$.

Proof. First we may replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$, i.e., we may assume that $S$ is Noetherian. Next, use Lemma 37.15 .6 and characterization (2) of purity given in discussion following Definition 37.16.1 to conclude.

Purity satisfies flat descent.
05J9 Lemma 37.16.6. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $s \in S$. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be a morphism of pointed schemes. Assume $S^{\prime} \rightarrow S$ is flat at $s^{\prime}$.
(1) If $\mathcal{F}_{S^{\prime}}$ is pure along $X_{s^{\prime}}$, then $\mathcal{F}$ is pure along $X_{s}$.
(2) If $\mathcal{F}_{S^{\prime}}$ is universally pure along $X_{s^{\prime}}$, then $\mathcal{F}$ is universally pure along $X_{s}$.

Proof. Let $\left(T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ be an impurity of $\mathcal{F}$ above $s$. Set $T_{1}=T \times{ }_{S} S^{\prime}$, and let $t_{1}$ be the unique point of $T_{1}$ mapping to $t$ and $s^{\prime}$. Since $T_{1} \rightarrow T$ is flat at $t_{1}$, see Morphisms, Lemma 28.25.7, there exists a specialization $t_{1}^{\prime} \rightsquigarrow t_{1}$ lying over $t^{\prime} \rightsquigarrow t$, see Algebra, Section 10.40 . Choose a point $\xi_{1} \in X_{t_{1}^{\prime}}$ which corresponds to a
generic point of $\operatorname{Spec}\left(\kappa\left(t_{1}^{\prime}\right) \otimes_{\kappa\left(t^{\prime}\right)} \kappa(\xi)\right)$, see Schemes, Lemma 25.17.5. By Divisors, Lemma 30.7.2 we see that $\xi_{1} \in \operatorname{Ass}_{X_{T_{1}} / T_{1}}\left(\mathcal{F}_{T_{1}}\right)$. As the Zariski closure of $\left\{\xi_{1}\right\}$ in $X_{T_{1}}$ maps into the Zariski closure of $\{\xi\}$ in $X_{T}$ we conclude that this closure is disjoint from $X_{t_{1}}$. Hence $\left(T_{1} \rightarrow S^{\prime}, t_{1}^{\prime} \rightsquigarrow t_{1}, \xi_{1}\right)$ is an impurity of $\mathcal{F}_{S^{\prime}}$ above $s^{\prime}$. In other words we have proved the contrapositive to part (2) of the lemma. Finally, if $(T, t) \rightarrow(S, s)$ is an elementary étale neighbourhood, then $\left(T_{1}, t_{1}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ is an elementary étale neighbourhood too, and in this way we see that (1) holds.

05K1 Lemma 37.16.7. Let $i: Z \rightarrow X$ be a closed immersion of schemes of finite type over a scheme $S$. Let $s \in S$. Let $\mathcal{F}$ be a finite type, quasi-coherent sheaf on $Z$. Then $\mathcal{F}$ is (universally) pure along $Z_{s}$ if and only if $i_{*} \mathcal{F}$ is (universally) pure along $X_{s}$.

Proof. Omitted.

### 37.17. Examples of relatively pure sheaves

05 K 2 Here are some example cases where it is possible to see what purity means.
05K3 Lemma 37.17.1. Let $f: X \rightarrow S$ be a proper morphism of schemes. Then every finite type, quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ is universally pure relative to $S$. In particular $X$ is universally pure relative to $S$.
Proof. Let $\left(g: T \rightarrow S, t^{\prime} \rightsquigarrow t, \xi\right)$ be an impurity of $\mathcal{F}$ above $s \in S$. Since $f$ is proper, it is universally closed. Hence $f_{T}: X_{T} \rightarrow T$ is closed. Since $f_{T}(\xi)=t^{\prime}$ this implies that $t \in f(\overline{\{\xi\}})$ which is a contradiction.

05K4 Lemma 37.17.2. Let $f: X \rightarrow S$ be a separated, finite type morphism of schemes. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_{X}$-module. Assume that $\operatorname{Supp}\left(\mathcal{F}_{s}\right)$ is finite for every $s \in S$. Then the following are equivalent
(1) $\mathcal{F}$ is pure relative to $S$,
(2) the scheme theoretic support of $\mathcal{F}$ is finite over $S$, and
(3) $\mathcal{F}$ is universally pure relative to $S$.

In particular, given a quasi-finite separated morphism $X \rightarrow S$ we see that $X$ is pure relative to $S$ if and only if $X \rightarrow S$ is finite.

Proof. Let $Z \subset X$ be the scheme theoretic support of $\mathcal{F}$, see Morphisms, Definition 28.5.5. Then $Z \rightarrow S$ is a separated, finite type morphism of schemes with finite fibres. Hence it is separated and quasi-finite, see Morphisms, Lemma 28.20.10. By Lemma 37.16 .7 it suffices to prove the lemma for $Z \rightarrow S$ and the sheaf $\mathcal{F}$ viewed as a finite type quasi-coherent module on $Z$. Hence we may assume that $X \rightarrow S$ is separated and quasi-finite and that $\operatorname{Supp}(\mathcal{F})=X$.
It follows from Lemma 37.17 .1 and Morphisms, Lemma 28.43 .10 that (2) implies (3). Trivially (3) implies (1). Assume (1) holds. We will prove that (2) holds. It is clear that we may assume $S$ is affine. By More on Morphisms, Lemma 36.31 .3 we can find a diagram

with $\pi$ finite and $j$ a quasi-compact open immersion. If we show that $j$ is closed, then $j$ is a closed immersion and we conclude that $f=\pi \circ j$ is finite. To show that $j$ is closed it suffices to show that specializations lift along $j$, see Schemes, Lemma 25.19.8. Let $x \in X$, set $t^{\prime}=j(x)$ and let $t^{\prime} \rightsquigarrow t$ be a specialization. We have to show $t \in j(X)$. Set $s^{\prime}=f(x)$ and $s=\pi(t)$ so $s^{\prime} \rightsquigarrow s$. By More on Morphisms, Lemma 36.30 .4 we can find an elementary étale neighbourhood $(U, u) \rightarrow(S, s)$ and a decomposition

$$
T_{U}=T \times_{S} U=V \amalg W
$$

into open and closed subschemes, such that $V \rightarrow U$ is finite and there exists a unique point $v$ of $V$ mapping to $u$, and such that $v$ maps to $t$ in $T$. As $V \rightarrow T$ is étale, we can lift generalizations, see Morphisms, Lemmas 28.25.8 and 28.36.12. Hence there exists a specialization $v^{\prime} \rightsquigarrow v$ such that $v^{\prime}$ maps to $t^{\prime} \in T$. In particular we see that $v^{\prime} \in X_{U} \subset T_{U}$. Denote $u^{\prime} \in U$ the image of $t^{\prime}$. Note that $v^{\prime} \in \operatorname{Ass}_{X_{U} / U}(\mathcal{F})$ because $X_{u^{\prime}}$ is a finite discrete set and $X_{u^{\prime}}=\operatorname{Supp}\left(\mathcal{F}_{u^{\prime}}\right)$. As $\mathcal{F}$ is pure relative to $S$ we see that $v^{\prime}$ must specialize to a point in $X_{u}$. Since $v$ is the only point of $V$ lying over $u$ (and since no point of $W$ can be a specialization of $v^{\prime}$ ) we see that $v \in X_{u}$. Hence $t \in X$.

05K5 Lemma 37.17.3. Let $f: X \rightarrow S$ be a finite type, flat morphism of schemes with geometrically integral fibres. Then $X$ is universally pure over $S$.

Proof. Let $\xi \in X$ with $s^{\prime}=f(\xi)$ and $s^{\prime} \rightsquigarrow s$ a specialization of $S$. If $\xi$ is an associated point of $X_{s^{\prime}}$, then $\xi$ is the unique generic point because $X_{s^{\prime}}$ is an integral scheme. Let $\xi_{0}$ be the unique generic point of $X_{s}$. As $X \rightarrow S$ is flat we can lift $s^{\prime} \rightsquigarrow s$ to a specialization $\xi^{\prime} \rightsquigarrow \xi_{0}$ in $X$, see Morphisms, Lemma 28.25.8, The $\xi \rightsquigarrow \xi^{\prime}$ because $\xi$ is the generic point of $X_{s^{\prime}}$ hence $\xi \rightsquigarrow \xi_{0}$. This means that $\left(\operatorname{id}_{S}, s^{\prime} \rightarrow s, \xi\right)$ is not an impurity of $\mathcal{O}_{X}$ above $s$. Since the assumption that $f$ is finite type, flat with geometrically integral fibres is preserved under base change, we see that there doesn't exist an impurity after any base change. In this way we see that $X$ is universally $S$-pure.

05K6 Lemma 37.17.4. Let $f: X \rightarrow S$ be a finite type, affine morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module such that $f_{*} \mathcal{F}$ is locally projective on $S$, see Properties, Definition 27.21.1. Then $\mathcal{F}$ is universally pure over $S$.

Proof. After reducing to the case where $S$ is the spectrum of a henselian local ring this follows from Lemma 37.14.1.

### 37.18. A criterion for purity

05L2 We first prove that given a flat family of finite type quasi-coherent sheaves the points in the relative assassin specialize to points in the relative assassins of nearby fibres (if they specialize at all).

05L3 Lemma 37.18.1. Let $f: X \rightarrow S$ be a morphism of schemes of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $s \in S$. Assume that $\mathcal{F}$ is flat over $S$ at all points of $X_{s}$. Let $x^{\prime} \in A s s_{X / S}(\mathcal{F})$ with $f\left(x^{\prime}\right)=s^{\prime}$ such that $s^{\prime} \rightsquigarrow s$ is a specialization in $S$. If $x^{\prime}$ specializes to a point of $X_{s}$, then $x^{\prime} \rightsquigarrow x$ with $x \in A s s_{X_{s}}\left(\mathcal{F}_{s}\right)$.

Proof. Let $x^{\prime} \rightsquigarrow t$ be a specialization with $t \in X_{s}$. We may replace $X$ by an affine neighbourhood of $t$ and $S$ by an affine neighbourhood of $s$. Choose a closed
immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$. Then it suffices to prove the lemma for the module $i_{*} \mathcal{F}$ on $\mathbf{A}_{S}^{n}$ and the point $i\left(x^{\prime}\right)$. Hence we may assume $X \rightarrow S$ is of finite presentation.
Let $x^{\prime} \rightsquigarrow t$ be a specialization with $t \in X_{s}$. Set $A=\mathcal{O}_{S, s}, B=\mathcal{O}_{X, t}$, and $N=\mathcal{F}_{t}$. Note that $B$ is essentially of finite presentation over $A$ and that $N$ is a finite $B$ module flat over $A$. Also $N$ is a finitely presented $B$-module by Lemma 37.10 .9 , Let $\mathfrak{q}^{\prime} \subset B$ be the prime ideal corresponding to $x^{\prime}$ and let $\mathfrak{p}^{\prime} \subset A$ be the prime ideal corresponding to $s^{\prime}$. The assumption $x^{\prime} \in \operatorname{Ass}_{X / S}(\mathcal{F})$ means that $\mathfrak{q}^{\prime}$ is an associated prime of $N \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right)$. Let $\Sigma \subset B$ be the multiplicative subset of elements which are not zerodivisors on $N / \mathfrak{m}_{A} N$. By Lemma 37.7 .2 the map $N \rightarrow \Sigma^{-1} N$ is universally injective. In particular, we see that $N \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right) \rightarrow \Sigma^{-1} N \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right)$ is injective which implies that $\mathfrak{q}^{\prime}$ is an associated prime of $\Sigma^{-1} N \otimes_{A} \kappa\left(\mathfrak{p}^{\prime}\right)$ and hence $\mathfrak{q}^{\prime}$ is in the image of $\operatorname{Spec}\left(\Sigma^{-1} B\right) \rightarrow \operatorname{Spec}(B)$. Thus Lemma 37.7.1 implies that $\mathfrak{q}^{\prime} \subset \mathfrak{q}$ for some prime $\mathfrak{q} \in \operatorname{Ass}_{B}\left(N / \mathfrak{m}_{A} N\right)$ (which in particular implies that $\mathfrak{m}_{A}=A \cap \mathfrak{q}$ ). If $x \in X_{s}$ denotes the point corresponding to $\mathfrak{q}$, then $x \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ and $x^{\prime} \rightsquigarrow x$ as desired.

05L4 Lemma 37.18.2. Let $f: X \rightarrow S$ be a morphism of schemes of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. Let $s \in S$. Let $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ be an elementary étale neighbourhood and let

be a commutative diagram of morphisms of schemes. Assume
(1) $\mathcal{F}$ is flat over $S$ at all points of $X_{s}$,
(2) $X^{\prime} \rightarrow S^{\prime}$ is of finite type,
(3) $g^{*} \mathcal{F}$ is pure along $X_{s^{\prime}}^{\prime}$,
(4) $g: X^{\prime} \rightarrow X$ is étale, and
(5) $g\left(X^{\prime}\right)$ contains Ass $_{X_{s}}\left(\mathcal{F}_{s}\right)$.

In this situation $\mathcal{F}$ is pure along $X_{s}$ if and only if the image of $X^{\prime} \rightarrow X \times{ }_{S} S^{\prime}$ contains the points of $A s s_{X \times S} S^{\prime} / S^{\prime}\left(\mathcal{F} \times{ }_{S} S^{\prime}\right)$ lying over points in $S^{\prime}$ which specialize to $s^{\prime}$.

Proof. Since the morphism $S^{\prime} \rightarrow S$ is étale, we see that if $\mathcal{F}$ is pure along $X_{s}$, then $\mathcal{F} \times{ }_{S} S^{\prime}$ is pure along $X_{s}$, see Lemma 37.16.4 Since purity satisfies flat descent, see Lemma 37.16.6, we see that if $\mathcal{F} \times{ }_{S} S^{\prime}$ is pure along $X_{s^{\prime}}$, then $\mathcal{F}$ is pure along $X_{s}$. Hence we may replace $S$ by $S^{\prime}$ and assume that $S=S^{\prime}$ so that $g: X^{\prime} \rightarrow X$ is an étale morphism between schemes of finite type over $S$. Moreover, we may replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ and assume that $S$ is local.

First, assume that $\mathcal{F}$ is pure along $X_{s}$. In this case every point of $\operatorname{Ass}_{X / S}(\mathcal{F})$ specializes to a point of $X_{s}$ by purity. Hence by Lemma 37.18.1 we see that every point of $\operatorname{Ass}_{X / S}(\mathcal{F})$ specializes to a point of $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$. Thus every point of $\operatorname{Ass}_{X / S}(\mathcal{F})$ is in the image of $g$ (as the image is open and contains $\left.\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)\right)$.
Conversely, assume that $g\left(X^{\prime}\right)$ contains $\operatorname{Ass}_{X / S}(\mathcal{F})$. Let $S^{h}=\operatorname{Spec}\left(\mathcal{O}_{S, s}^{h}\right)$ be the henselization of $S$ at $s$. Denote $g^{h}:\left(X^{\prime}\right)^{h} \rightarrow X^{h}$ the base change of $g$ by $S^{h} \rightarrow S$, and denote $\mathcal{F}^{h}$ the pullback of $\mathcal{F}$ to $X^{h}$. By Divisors, Lemma 30.7.2 and Remark 30.7.3 the relative assassin $\operatorname{Ass}_{X^{h} / S^{h}}\left(\mathcal{F}^{h}\right)$ is the inverse image of $\operatorname{Ass}_{X / S}(\mathcal{F})$ via
the projection $X^{h} \rightarrow X$. As we have assumed that $g\left(X^{\prime}\right)$ contains $\operatorname{Ass}_{X / S}(\mathcal{F})$ we conclude that the base change $g^{h}\left(\left(X^{\prime}\right)^{h}\right)=g\left(X^{\prime}\right) \times_{S} S^{h}$ contains Ass $X^{h} / S^{h}\left(\mathcal{F}^{h}\right)$. In this way we reduce to the case where $S$ is the spectrum of a henselian local ring. Let $x \in \operatorname{Ass}_{X / S}(\mathcal{F})$. To finish the proof of the lemma we have to show that $x$ specializes to a point of $X_{s}$, see criterion (4) for purity in discussion following Definition 37.16.1. By assumption there exists a $x^{\prime} \in X^{\prime}$ such that $g\left(x^{\prime}\right)=x$. As $g: X^{\prime} \rightarrow X$ is étale, we see that $x^{\prime} \in \operatorname{Ass}_{X^{\prime} / S}\left(g^{*} \mathcal{F}\right)$, see Lemma 37.2.7 (applied to the morphism of fibres $X_{w}^{\prime} \rightarrow X_{w}$ where $w \in S$ is the image of $\left.x^{\prime}\right)$. Since $g^{*} \mathcal{F}$ is pure along $X_{s}^{\prime}$ we see that $x^{\prime} \rightsquigarrow y$ for some $y \in X_{s}^{\prime}$. Hence $x=g\left(x^{\prime}\right) \rightsquigarrow g(y)$ and $g(y) \in X_{s}$ as desired.

05L5 Lemma 37.18.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $s \in S$. Assume
(1) $f$ is of finite type,
(2) $\mathcal{F}$ is of finite type,
(3) $\mathcal{F}$ is flat over $S$ at all points of $X_{s}$, and
(4) $\mathcal{F}$ is pure along $X_{s}$.

Then $\mathcal{F}$ is universally pure along $X_{s}$.
Proof. We first make a preliminary remark. Suppose that $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ is an elementary étale neighbourhood. Denote $\mathcal{F}^{\prime}$ the pullback of $\mathcal{F}$ to $X^{\prime}=X \times_{S} S^{\prime}$. By the discussion following Definition 37.16 .1 we see that $\mathcal{F}^{\prime}$ is pure along $X_{s^{\prime}}^{\prime}$. Moreover, $\mathcal{F}^{\prime}$ is flat over $S^{\prime}$ along $X_{s^{\prime}}^{\prime}$. Then it suffices to prove that $\mathcal{F}^{\prime}$ is universally pure along $X_{s^{\prime}}^{\prime}$. Namely, given any morphism $(T, t) \rightarrow(S, s)$ of pointed schemes the fibre product $\left(T^{\prime}, t^{\prime}\right)=\left(T \times_{S} S^{\prime},\left(t, s^{\prime}\right)\right)$ is flat over $(T, t)$ and hence if $\mathcal{F}_{T^{\prime}}$ is pure along $X_{t^{\prime}}$ then $\mathcal{F}_{T}$ is pure along $X_{t}$ by Lemma 37.16.6. Thus during the proof we may always replace $(s, S)$ by an elementary étale neighbourhood. We may also replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ due to the local nature of the problem.
Choose an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram

such that $X^{\prime} \rightarrow X \times{ }_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is étale, $X_{s}=g\left(\left(X^{\prime}\right)_{s^{\prime}}\right)$, the scheme $X^{\prime}$ is affine, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module, see Lemma 37.12.11. Note that $X^{\prime} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ is of finite type (as a quasi-compact morphism which is the composition of an étale morphism and the base change of a finite type morphism). By our preliminary remarks in the first paragraph of the proof we may replace $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$. Hence we may assume there exists a commutative diagram

of schemes of finite type over $S$, where $g$ is étale, $X_{s} \subset g\left(X^{\prime}\right)$, with $S$ local with closed point $s$, with $X^{\prime}$ affine, and with $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ a free $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Note that in this case $g^{*} \mathcal{F}$ is universally pure over $S$, see Lemma 37.17.4.

In this situation we apply Lemma 37.18 .2 to deduce that $\operatorname{Ass}_{X / S}(\mathcal{F}) \subset g\left(X^{\prime}\right)$ from our assumption that $\mathcal{F}$ is pure along $X_{s}$ and flat over $S$ along $X_{s}$. By Divisors, Lemma 30.7.2 and Remark 30.7.3 we see that for any morphism of pointed schemes $(T, t) \rightarrow(S, s)$ we have

$$
\operatorname{Ass}_{X_{T} / T}\left(\mathcal{F}_{T}\right) \subset\left(X_{T} \rightarrow X\right)^{-1}\left(\operatorname{Ass}_{X / S}(\mathcal{F})\right) \subset g\left(X^{\prime}\right) \times_{S} T=g_{T}\left(X_{T}^{\prime}\right)
$$

Hence by Lemma 37.18 .2 applied to the base change of our displayed diagram to ( $T, t$ ) we conclude that $\mathcal{F}_{T}$ is pure along $X_{t}$ as desired.

05L6 Lemma 37.18.4. Let $f: X \rightarrow S$ be a finite type morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Assume $\mathcal{F}$ is flat over $S$. In this case $\mathcal{F}$ is pure relative to $S$ if and only if $\mathcal{F}$ is universally pure relative to $S$.
Proof. Immediate consequence of Lemma 37.18 .3 and the definitions.
05MA Lemma 37.18.5. Let $I$ be a directed partially ordered set. Let $\left(S_{i}, g_{i i^{\prime}}\right)$ be an inverse system of affine schemes over $I$. Set $S=\lim _{i} S_{i}$ and $s \in S$. Denote $g_{i}$ : $S \rightarrow S_{i}$ the projections and set $s_{i}=g_{i}(s)$. Suppose that $f: X \rightarrow S$ is a morphism of finite presentation, $\mathcal{F}$ a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation which is pure along $X_{s}$ and flat over $S$ at all points of $X_{s}$. Then there exists an $i \in I, a$ morphism of finite presentation $X_{i} \rightarrow S_{i}$, a quasi-coherent $\mathcal{O}_{X_{i}}$-module $\mathcal{F}_{i}$ of finite presentation which is pure along $\left(X_{i}\right)_{s_{i}}$ and flat over $S_{i}$ at all points of $\left(X_{i}\right)_{s_{i}}$ such that $X \cong X_{i} \times{ }_{S_{i}} S$ and such that the pullback of $\mathcal{F}_{i}$ to $X$ is isomorphic to $\mathcal{F}$.

Proof. Let $U \subset X$ be the set of points where $\mathcal{F}$ is flat over $S$. By More on Morphisms, Theorem 36.12.1 this is an open subscheme of $X$. By assumption $X_{s} \subset U$. As $X_{s}$ is quasi-compact, we can find a quasi-compact open $U^{\prime} \subset U$ with $X_{s} \subset U^{\prime}$. By Limits, Lemma 31.9.1 we can find an $i \in I$ and a morphism of finite presentation $f_{i}: X_{i} \rightarrow S_{i}$ whose base change to $S$ is isomorphic to $f_{i}$. Fix such a choice and set $X_{i^{\prime}}=X_{i} \times_{S_{i}} S_{i^{\prime}}$. Then $X=\lim _{i^{\prime}} X_{i^{\prime}}$ with affine transition morphisms. By Limits, Lemma 31.9 .2 we can, after possible increasing $i$ assume there exists a quasi-coherent $\mathcal{O}_{X_{i}}$-module $\mathcal{F}_{i}$ of finite presentation whose base change to $S$ is isomorphic to $\mathcal{F}$. By Limits, Lemma 31.3.8 after possibly increasing $i$ we may assume there exists an open $U_{i}^{\prime} \subset X_{i}$ whose inverse image in $X$ is $U^{\prime}$. Note that in particular $\left(X_{i}\right)_{s_{i}} \subset U_{i}^{\prime}$. By Limits, Lemma 31.9.4 (after increasing $i$ once more) we may assume that $\mathcal{F}_{i}$ is flat on $U_{i}^{\prime}$. In particular we see that $\mathcal{F}_{i}$ is flat along $\left(X_{i}\right)_{s_{i}}$.
Next, we use Lemma 37.12 .5 to choose an elementary étale neighbourhood $\left(S_{i}^{\prime}, s_{i}^{\prime}\right) \rightarrow$ ( $S_{i}, s_{i}$ ) and a commutative diagram of schemes

such that $g_{i}$ is étale, $\left(X_{i}\right)_{s_{i}} \subset g_{i}\left(X_{i}^{\prime}\right)$, the schemes $X_{i}^{\prime}, S_{i}^{\prime}$ are affine, and such that $\Gamma\left(X_{i}^{\prime}, g_{i}^{*} \mathcal{F}_{i}\right)$ is a projective $\Gamma\left(S_{i}^{\prime}, \mathcal{O}_{S_{i}^{\prime}}\right)$-module. Note that $g_{i}^{*} \mathcal{F}_{i}$ is universally pure over $S_{i}^{\prime}$, see Lemma 37.17.4 We may base change the diagram above to a diagram with morphisms $\left(S_{i^{\prime}}^{\prime}, s_{i^{\prime}}^{\prime}\right) \rightarrow\left(S_{i^{\prime}}, s_{i^{\prime}}\right)$ and $g_{i^{\prime}}: X_{i^{\prime}}^{\prime} \rightarrow X_{i^{\prime}}$ over $S_{i^{\prime}}$ for any $i^{\prime} \geq i$ and we may base change the diagram to a diagram with morphisms $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and $g: X^{\prime} \rightarrow X$ over $S$.

At this point we can use our criterion for purity. Set $W_{i}^{\prime} \subset X_{i} \times{ }_{S_{i}} S_{i}^{\prime}$ equal to the image of the étale morphism $X_{i}^{\prime} \rightarrow X_{i} \times_{S_{i}} S_{i}^{\prime}$. For every $i^{\prime} \geq i$ we have similarly the image $W_{i^{\prime}}^{\prime} \subset X_{i^{\prime}} \times{ }_{S_{i^{\prime}}} S_{i^{\prime}}^{\prime}$ and we have the image $W^{\prime} \subset X \times_{S} S^{\prime}$. Taking images commutes with base change, hence $W_{i^{\prime}}^{\prime}=W_{i}^{\prime} \times{ }_{S_{i}^{\prime}} S_{i^{\prime}}^{\prime}$ and $W^{\prime}=W_{i} \times_{S_{i}^{\prime}} S^{\prime}$. Because $\mathcal{F}$ is pure along $X_{s}$ the Lemma 37.18.2 implies that
$05 \mathrm{MB} \quad(37.18 .5 .1) \quad f^{-1}\left(\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)\right) \cap \operatorname{Ass}_{X \times{ }_{S} S^{\prime} / S^{\prime}}\left(\mathcal{F} \times{ }_{S} S^{\prime}\right) \subset W^{\prime}$
By More on Morphisms, Lemma 36.20.5 we see that

$$
E=\left\{t \in S^{\prime} \mid \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{t}\right) \subset W^{\prime}\right\} \quad \text { and } \quad E_{i^{\prime}}=\left\{t \in S_{i^{\prime}}^{\prime} \mid \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{i^{\prime}, t}\right) \subset W_{i^{\prime}}^{\prime}\right\}
$$

are locally constructible subsets of $S^{\prime}$ and $S_{i^{\prime}}^{\prime}$. By More on Morphisms, Lemma 36.20 .4 we see that $E_{i^{\prime}}$ is the inverse image of $E_{i}$ under the morphism $S_{i^{\prime}}^{\prime} \rightarrow$ $S_{i}^{\prime}$ and that $E$ is the inverse image of $E_{i}$ under the morphism $S^{\prime} \rightarrow S_{i}^{\prime}$. Thus Equation 37.18.5.1 is equivalent to the assertion that $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ maps into $E_{i}$. As $\mathcal{O}_{S^{\prime}, s^{\prime}}=\operatorname{colim}_{i^{\prime} \geq i} \mathcal{O}_{S_{i^{\prime}}^{\prime}, s_{i^{\prime}}^{\prime}}$ we see that $\operatorname{Spec}\left(\mathcal{O}_{S_{i^{\prime}}^{\prime}, s_{i^{\prime}}^{\prime}}\right)$ maps into $E_{i}$ for some $i^{\prime} \geq i$, see Limits, Lemma 31.3.7. Then, applying Lemma 37.18 .2 to the situation over $S_{i^{\prime}}$, we conclude that $\mathcal{F}_{i^{\prime}}$ is pure along $\left(X_{i^{\prime}}\right)_{s_{i^{\prime}}}$.
05MC Lemma 37.18.6. Let $f: X \rightarrow S$ be a morphism of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation flat over $S$. Then the set

$$
U=\left\{s \in S \mid \mathcal{F} \text { is pure along } X_{s}\right\}
$$

is open in $S$.
Proof. Let $s \in U$. Using Lemma 37.12 .5 we can find an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and a commutative diagram

such that $g$ is étale, $X_{s} \subset g\left(X^{\prime}\right)$, the schemes $X^{\prime}, S^{\prime}$ are affine, and such that $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module. Note that $g^{*} \mathcal{F}$ is universally pure over $S^{\prime}$, see Lemma 37.17.4 Set $W^{\prime} \subset X \times_{S} S^{\prime}$ equal to the image of the étale morphism $X^{\prime} \rightarrow X \times_{S} S^{\prime}$. Note that $W$ is open and quasi-compact over $S^{\prime}$. Set

$$
E=\left\{t \in S^{\prime} \mid \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{t}\right) \subset W^{\prime}\right\}
$$

By More on Morphisms, Lemma $36.20 .5 E$ is a constructible subset of $S^{\prime}$. By Lemma 37.18 .2 we see that $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right) \subset E$. By Morphisms, Lemma 28.22.4 we see that $E$ contains an open neighbourhood $V^{\prime}$ of $s^{\prime}$. Applying Lemma 37.18.2 once more we see that for any point $s_{1}$ in the image of $V^{\prime}$ in $S$ the sheaf $\mathcal{F}$ is pure along $X_{s_{1}}$. Since $S^{\prime} \rightarrow S$ is étale the image of $V^{\prime}$ in $S$ is open and we win.

### 37.19. How purity is used

05L7 Here are some examples of how purity can be used. The first lemma actually uses a slightly weaker form of purity.
05L8 Lemma 37.19.1. Let $f: X \rightarrow S$ be a morphism of finite type. Let $\mathcal{F}$ be a quasicoherent sheaf of finite type on $X$. Assume $S$ is local with closed point s. Assume $\mathcal{F}$ is pure along $X_{s}$ and that $\mathcal{F}$ is flat over $S$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of quasi-coherent $\mathcal{O}_{X}$-modules. Then the following are equivalent
(1) the map on stalks $\varphi_{x}$ is injective for all $x \in A s s_{X_{s}}\left(\mathcal{F}_{s}\right)$, and
(2) $\varphi$ is injective.

Proof. Let $\mathcal{K}=\operatorname{Ker}(\varphi)$. Our goal is to prove that $\mathcal{K}=0$. In order to do this it suffices to prove that WeakAss ${ }_{X}(\mathcal{K})=\emptyset$, see Divisors, Lemma 30.5.5. We have WeakAss $_{X}(\mathcal{K}) \subset$ WeakAss $_{X}(\mathcal{F})$, see Divisors, Lemma 30.5.4. As $\mathcal{F}$ is flat we see from Lemma 37.13 .4 that WeakAss ${ }_{X}(\mathcal{F}) \subset \operatorname{Ass}_{X / S}(\mathcal{F})$. By purity any point $x^{\prime}$ of $\operatorname{Ass}_{X / S}(\mathcal{F})$ is a generalization of a point of $X_{s}$, and hence is the specialization of a point $x \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$, by Lemma 37.18.1. Hence the injectivity of $\varphi_{x}$ implies the injectivity of $\varphi_{x^{\prime}}$, whence $\mathcal{K}_{x^{\prime}}=0$.

05MD Proposition 37.19.2. Let $f: X \rightarrow S$ be an affine, finitely presented morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation, flat over $S$. Then the following are equivalent
(1) $f_{*} \mathcal{F}$ is locally projective on $S$, and
(2) $\mathcal{F}$ is pure relative to $S$.

In particular, given a ring map $A \rightarrow B$ of finite presentation and a finitely presented $B$-module $N$ flat over $A$ we have: $N$ is projective as an $A$-module if and only if $\widetilde{N}$ on $\operatorname{Spec}(B)$ is pure relative to $\operatorname{Spec}(A)$.

Proof. The implication $(1) \Rightarrow(2)$ is Lemma 37.17 .4 Assume $\mathcal{F}$ is pure relative to $S$. Note that by Lemma 37.18 .3 this implies $\mathcal{F}$ remains pure after any base change. By Descent, Lemma 34.6 .7 it suffices to prove $f_{*} \mathcal{F}$ is fpqc locally projective on $S$. Pick $s \in S$. We will prove that the restriction of $f_{*} \mathcal{F}$ to an étale neighbourhood of $s$ is locally projective. Namely, by Lemma 37.12.5, after replacing $S$ by an affine elementary étale neighbourhood of $s$, we may assume there exists a diagram

of schemes affine and of finite presentation over $S$, where $g$ is étale, $X_{s} \subset g\left(X^{\prime}\right)$, and with $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ a projective $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Note that in this case $g^{*} \mathcal{F}$ is universally pure over $S$, see Lemma 37.17.4. Hence by Lemma 37.18.2 we see that the open $g\left(X^{\prime}\right)$ contains the points of $\operatorname{Ass}_{X / S}(\mathcal{F})$ lying over $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$. Set

$$
E=\left\{t \in S \mid \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{t}\right) \subset g\left(X^{\prime}\right)\right\}
$$

By More on Morphisms, Lemma $36.20 .5 E$ is a constructible subset of $S$. We have seen that $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \subset E$. By Morphisms, Lemma 28.22.4 we see that $E$ contains an open neighbourhood of $s$. Hence after replacing $S$ by an affine neighbourhood of $s$ we may assume that $\operatorname{Ass}_{X / S}(\mathcal{F}) \subset g\left(X^{\prime}\right)$. By Lemma 37.7.4 this means that

$$
\Gamma(X, \mathcal{F}) \longrightarrow \Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)
$$

is $\Gamma\left(S, \mathcal{O}_{S}\right)$-universally injective. By Algebra, Lemma 10.88 .7 we conclude that $\Gamma(X, \mathcal{F})$ is Mittag-Leffler as an $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Since $\Gamma(X, \mathcal{F})$ is countably generated and flat as a $\Gamma\left(S, \mathcal{O}_{S}\right)$-module, we conclude it is projective by Algebra, Lemma 10.92.1.

We can use the proposition to improve some of our earlier results. The following lemma is an improvement of Proposition 37.12.4.

05ME Lemma 37.19.3. Let $f: X \rightarrow S$ be a morphism which is locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module which is of finite presentation. Let $x \in X$ with $s=f(x) \in S$. If $\mathcal{F}$ is flat at $x$ over $S$ there exists an affine elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an affine open $U^{\prime} \subset X \times{ }_{S} S^{\prime}$ which contains $x^{\prime}=\left(x, s^{\prime}\right)$ such that $\Gamma\left(U^{\prime},\left.\mathcal{F}\right|_{U^{\prime}}\right)$ is a projective $\Gamma\left(S^{\prime}, \mathcal{O}_{S^{\prime}}\right)$-module.

Proof. During the proof we may replace $X$ by an open neighbourhood of $x$ and we may replace $S$ by an elementary étale neighbourhood of $s$. Hence, by openness of flatness (see More on Morphisms, Theorem 36.12.1) we may assume that $\mathcal{F}$ is flat over $S$. We may assume $S$ and $X$ are affine. After shrinking $X$ some more we may assume that any point of $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ is a generalization of $x$. This property is preserved on replacing $(S, s)$ by an elementary étale neighbourhood. Hence we may apply Lemma 37.12 .5 to arrive at the situation where there exists a diagram

of schemes affine and of finite presentation over $S$, where $g$ is étale, $X_{s} \subset g\left(X^{\prime}\right)$, and with $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ a projective $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Note that in this case $g^{*} \mathcal{F}$ is universally pure over $S$, see Lemma 37.17.4.

Let $U \subset g\left(X^{\prime}\right)$ be an affine open neighbourhood of $x$. We claim that $\left.\mathcal{F}\right|_{U}$ is pure along $U_{s}$. If we prove this, then the lemma follows because $\left.\mathcal{F}\right|_{U}$ will be pure relative to $S$ after shrinking $S$, see Lemma 37.18 .6 , whereupon the projectivity follows from Proposition 37.19.2. To prove the claim we have to show, after replacing $(S, s)$ by an arbitrary elementary étale neighbourhood, that any point $\xi$ of $\operatorname{Ass}_{U / S}\left(\left.\mathcal{F}\right|_{U}\right)$ lying over some $s^{\prime} \in S, s^{\prime} \rightsquigarrow s$ specializes to a point of $U_{s}$. Since $U \subset g\left(X^{\prime}\right)$ we can find a $\xi^{\prime} \in X^{\prime}$ with $g\left(\xi^{\prime}\right)=\xi$. Because $g^{*} \mathcal{F}$ is pure over $S$, using Lemma 37.18.1. we see there exists a specialization $\xi^{\prime} \rightsquigarrow x^{\prime}$ with $x^{\prime} \in \operatorname{Ass}_{X_{s}^{\prime}}\left(g^{*} \mathcal{F}_{s}\right)$. Then $g\left(x^{\prime}\right) \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ (see for example Lemma 37.2.7 applied to the étale morphism $X_{s}^{\prime} \rightarrow X_{s}$ of Noetherian schemes) and hence $g\left(x^{\prime}\right) \rightsquigarrow x$ by our choice of $X$ above! Since $x \in U$ we conclude that $g\left(x^{\prime}\right) \in U$. Thus $\xi=g\left(\xi^{\prime}\right) \rightsquigarrow g\left(x^{\prime}\right) \in U_{s}$ as desired.

The following lemma is an improvement of Lemma 37.12.9.
05MF Lemma 37.19.4. Let $f: X \rightarrow S$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module which is of finite type. Let $x \in X$ with $s=f(x) \in S$. If $\mathcal{F}$ is flat at $x$ over $S$ there exists an affine elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ and an affine open $U^{\prime} \subset X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ which contains $x^{\prime}=\left(x, s^{\prime}\right)$ such that $\Gamma\left(U^{\prime},\left.\mathcal{F}\right|_{U^{\prime}}\right)$ is a free $\mathcal{O}_{S^{\prime}, s^{\prime}}$-module.

Proof. The question is Zariski local on $X$ and $S$. Hence we may assume that $X$ and $S$ are affine. Then we can find a closed immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$ over $S$. It is clear that it suffices to prove the lemma for the sheaf $i_{*} \mathcal{F}$ on $\mathbf{A}_{S}^{n}$ and the point $i(x)$. In this way we reduce to the case where $X \rightarrow S$ is of finite presentation. After replacing $S$ by $\operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ and $X$ by an open of $X \times_{S} \operatorname{Spec}\left(\mathcal{O}_{S^{\prime}, s^{\prime}}\right)$ we may assume that $\mathcal{F}$ is of finite presentation, see Proposition 37.10.3. In this case we may appeal to Lemma 37.19 .3 and Algebra, Theorem 10.84.4 to conclude.

05U7 Lemma 37.19.5. Let $A \rightarrow B$ be a local ring map of local rings which is essentially of finite type. Let $N$ be a finite $B$-module which is flat as an $A$-module. If $A$ is henselian, then $N$ is a filtered colimit

$$
N=\operatorname{colim}_{i} F_{i}
$$

of free $A$-modules $F_{i}$ such that all transition maps $u_{i}: F_{i} \rightarrow F_{i^{\prime}}$ of the system induce injective maps $\bar{u}_{i}: F_{i} / \mathfrak{m}_{A} F_{i} \rightarrow F_{i^{\prime}} / \mathfrak{m}_{A} F_{i^{\prime}}$. Also, $N$ is a Mittag-Leffler A-module.
Proof. We can find a morphism of finite type $X \rightarrow S=\operatorname{Spec}(A)$ and a point $x \in X$ lying over the closed point $s$ of $S$ and a finite type quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ such that $\mathcal{F}_{x} \cong N$ as an $A$-module. After shrinking $X$ we may assume that each point of $\operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ specializes to $x$. By Lemma 37.19 .4 we see that there exists a fundamental system of affine open neighbourhoods $U_{i} \subset X$ of $x$ such that $\Gamma\left(U_{i}, \mathcal{F}\right)$ is a free $A$-module $F_{i}$. Note that if $U_{i^{\prime}} \subset U_{i}$, then

$$
F_{i} / \mathfrak{m}_{A} F_{i}=\Gamma\left(U_{i, s}, \mathcal{F}_{s}\right) \longrightarrow \Gamma\left(U_{i^{\prime}, s}, \mathcal{F}_{s}\right)=F_{i^{\prime}} / \mathfrak{m}_{A} F_{i^{\prime}}
$$

is injective because a section of the kernel would be supported at a closed subset of $X_{s}$ not meeting $x$ which is a contradiction to our choice of $X$ above. Since the maps $F_{i} \rightarrow F_{i^{\prime}}$ are $A$-universally injective (Lemma 37.7.5) it follows that $N$ is Mittag-Leffler by Algebra, Lemma 10.88.8.

The following lemma should be skipped if reading through for the first time.
0ASX Lemma 37.19.6. Let $A \rightarrow B$ be a local ring map of local rings which is essentially of finite type. Let $N$ be a finite $B$-module which is flat as an $A$-module. If $A$ is a valuation ring, then any element of $N$ has a content ideal $I \subset A$ (More on Algebra, Definition 15.18.1).
Proof. Let $A \subset A^{h}$ be the henselization. Let $B^{\prime}$ be the localization of $B \otimes_{A} A^{h}$ at the maximal ideal $\mathfrak{m}_{B} \otimes A^{h}+B \otimes \mathfrak{m}_{A^{h}}$. Then $B \rightarrow B^{\prime}$ is flat, hence faithfully flat. Let $N^{\prime}=N \otimes_{B} B^{\prime}$. Let $x \in N$ and let $x^{\prime} \in N^{\prime}$ be the image. We claim that for an ideal $I \subset A$ we have $x \in I N \Leftrightarrow x^{\prime} \in I N^{\prime}$. Namely, $N / I N \rightarrow N^{\prime} / I N^{\prime}$ is the tensor product of $B \rightarrow B^{\prime}$ with $N / I N$ and $B \rightarrow B^{\prime}$ is universally injective by Algebra, Lemma 10.81.11. By More on Algebra, Lemma 15.84 .5 and Algebra, Lemma 10.49.17 the map $A \rightarrow A^{h}$ defines an inclusion preserving bijection $I \mapsto I A^{h}$ on sets of ideals. We conclude that $x$ has a content ideal in $A$ if and only if $x^{\prime}$ has a content ideal in $A^{h}$. The assertion for $x^{\prime} \in N^{\prime}$ follows from Lemma 37.19.5 and Algebra, Lemma 10.88 .6

### 37.20. Flattening functors

05 MG Let $S$ be a scheme. Recall that a functor $F:(S c h / S)^{o p p} \rightarrow$ Sets is called limit preserving if for every directed inverse system $\left\{T_{i}\right\}_{i \in I}$ of affine schemes with limit $T$ we have $F(T)=\operatorname{colim}_{i} F\left(T_{i}\right)$.

05 MH Situation 37.20.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $u: \mathcal{F} \rightarrow \mathcal{G}$ be a homomorphism of quasi-coherent $\mathcal{O}_{X}$-modules. For any scheme $T$ over $S$ we will denote $u_{T}: \mathcal{F}_{T} \rightarrow \mathcal{G}_{T}$ the base change of $u$ to $T$, in other words, $u_{T}$ is the pullback of $u$ via the projection morphism $X_{T}=X \times_{S} T \rightarrow X$. In this situation we can consider the functor
(37.20.1.1)

05MI

$$
F_{\text {iso }}:(S c h / S)^{o p p} \longrightarrow \text { Sets, } \quad T \longrightarrow\left\{\begin{array}{ccc}
\{*\} & \text { if } & u_{T} \text { is an isomorphism }, \\
\emptyset & \text { else. }
\end{array}\right.
$$

There are variants $F_{i n j}, F_{\text {surj }}, F_{z e r o}$ where we ask that $u_{T}$ is injective, surjective, or zero.

05MJ Lemma 37.20.2. In Situation 37.20.1.
(1) Each of the functors $F_{i s o}, F_{i n j}, F_{\text {surj }}, F_{z e r o}$ satisfies the sheaf property for the fpqc topology.
(2) If $f$ is quasi-compact and $\mathcal{G}$ is of finite type, then $F_{\text {surj }}$ is limit preserving.
(3) If $f$ is quasi-compact and $\mathcal{F}$ of finite type, then $F_{\text {zero }}$ is limit preserving.
(4) If $f$ is quasi-compact, $\mathcal{F}$ is of finite type, and $\mathcal{G}$ is of finite presentation, then $F_{\text {iso }}$ is limit preserving.

Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of schemes over $S$. Set $X_{i}=X_{T_{i}}=$ $X \times_{S} T_{i}$ and $u_{i}=u_{T_{i}}$. Note that $\left\{X_{i} \rightarrow X_{T}\right\}_{i \in I}$ is an fpqc covering of $X_{T}$, see Topologies, Lemma 33.8.7. In particular, for every $x \in X_{T}$ there exists an $i \in I$ and an $x_{i} \in X_{i}$ mapping to $x$. Since $\mathcal{O}_{X_{T}, x} \rightarrow \mathcal{O}_{X_{i}, x_{i}}$ is flat, hence faithfully flat (see Algebra, Lemma 10.38.17) we conclude that $\left(u_{i}\right)_{x_{i}}$ is injective, surjective, bijective, or zero if and only if $\left(u_{T}\right)_{x}$ is injective, surjective, bijective, or zero. Whence part (1) of the lemma.

Proof of (2). Assume $f$ quasi-compact and $\mathcal{G}$ of finite type. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $S$-schemes and assume that $u_{T}$ is surjective. Set $X_{i}=X_{T_{i}}=$ $X \times{ }_{S} T_{i}$ and $u_{i}=u_{T_{i}}: \mathcal{F}_{i}=\mathcal{F}_{T_{i}} \rightarrow \mathcal{G}_{i}=\mathcal{G}_{T_{i}}$. To prove part (2) we have to show that $u_{i}$ is surjective for some $i$. Pick $i_{0} \in I$ and replace $I$ by $\left\{i \mid i \geq i_{0}\right\}$. Since $f$ is quasi-compact the scheme $X_{i_{0}}$ is quasi-compact. Hence we may choose affine opens $W_{1}, \ldots, W_{m} \subset X$ and an affine open covering $X_{i_{0}}=U_{1, i_{0}} \cup \ldots \cup U_{m, i_{0}}$ such that $U_{j, i_{0}}$ maps into $W_{j}$ under the projection morphism $X_{i_{0}} \rightarrow X$. For any $i \in I$ let $U_{j, i}$ be the inverse image of $U_{j, i_{0}}$. Setting $U_{j}=\lim _{i} U_{j, i}$ we see that $X_{T}=U_{1} \cup \ldots \cup U_{m}$ is an affine open covering of $X_{T}$. Now it suffices to show, for a given $j \in\{1, \ldots, m\}$ that $\left.u_{i}\right|_{U_{j, i}}$ is surjective for some $i=i(j) \in I$. Using Properties, Lemma 27.16.1 this translates into the following algebra problem: Let $A$ be a ring and let $u: M \rightarrow N$ be an $A$-module map. Suppose that $R=\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of $A$ algebras. If $N$ is a finite $A$-module and if $u \otimes 1: M \otimes_{A} R \rightarrow N \otimes_{A} R$ is surjective, then for some $i$ the map $u \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$ is surjective. This is Algebra, Lemma 10.126.3 part (2).

Proof of (3). Exactly the same arguments as given in the proof of (2) reduces this to the following algebra problem: Let $A$ be a ring and let $u: M \rightarrow N$ be an $A$-module map. Suppose that $R=\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of $A$-algebras. If $M$ is a finite $A$-module and if $u \otimes 1: M \otimes_{A} R \rightarrow N \otimes_{A} R$ is zero, then for some $i$ the map $u \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$ is zero. This is Algebra, Lemma 10.126 .3 part (1).
Proof of (4). Assume $f$ quasi-compact and $\mathcal{F}, \mathcal{G}$ of finite presentation. Arguing in exactly the same manner as in the previous paragraph (using in addition also Properties, Lemma 27.16.2 part (3) translates into the following algebra statement: Let $A$ be a ring and let $u: M \rightarrow N$ be an $A$-module map. Suppose that $R=$ $\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of $A$-algebras. Assume $M$ is a finite $A$-module, $N$ is a finitely presented $A$-module, and $u \otimes 1: M \otimes_{A} R \rightarrow N \otimes_{A} R$ is an isomorphism. Then for some $i$ the map $u \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$ is an isomorphism. This is Algebra, Lemma 10.126.3 part (3).
05 MK Situation 37.20.3. Let $\left(A, \mathfrak{m}_{A}\right)$ be a local ring. Denote $\mathcal{C}$ the category whose objects are $A$-algebras $A^{\prime}$ which are local rings such that the algebra structure
$A \rightarrow A^{\prime}$ is a local homomorphism of local rings. A morphism between objects $A^{\prime}, A^{\prime \prime}$ of $\mathcal{C}$ is a local homomorphism $A^{\prime} \rightarrow A^{\prime \prime}$ of $A$-algebras. Let $A \rightarrow B$ be a local ring map of local rings and let $M$ be a $B$-module. If $A^{\prime}$ is an object of $\mathcal{C}$ we set $B^{\prime}=B \otimes_{A} A^{\prime}$ and we set $M^{\prime}=M \otimes_{A} A^{\prime}$ as a $B^{\prime}$-module. Given $A^{\prime} \in \mathrm{Ob}(\mathcal{C})$, consider the condition

05ML
(37.20.3.1)

$$
\forall \mathfrak{q} \in V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right) \subset \operatorname{Spec}\left(B^{\prime}\right): M_{\mathfrak{q}}^{\prime} \text { is flat over } A^{\prime}
$$

Note the similarity with More on Algebra, Equation 15.13.1.1). In particular, if $A^{\prime} \rightarrow A^{\prime \prime}$ is a morphism of $\mathcal{C}$ and 37.20 .3 .1 holds for $A^{\prime}$, then it holds for $A^{\prime \prime}$, see More on Algebra, Lemma 15.13.2. Hence we obtain a functor

05MM

$$
F_{l f}: \mathcal{C} \longrightarrow \text { Sets, } \quad A^{\prime} \longrightarrow\left\{\begin{array}{cc}
\{*\} & \text { if } \frac{\sqrt{37.20 .3 .1})}{\emptyset} \text { holds },  \tag{37.20.3.2}\\
\emptyset & \text { else. }
\end{array}\right.
$$

05MN Lemma 37.20.4. In Situation 37.20.3.
(1) If $A^{\prime} \rightarrow A^{\prime \prime}$ is a flat morphism in $\mathcal{C}$ then $F_{f l}\left(A^{\prime}\right)=F_{l f}\left(A^{\prime \prime}\right)$.
(2) If $A \rightarrow B$ is essentially of finite presentation and $M$ is a $B$-module of finite presentation, then $F_{f l}$ is limit preserving: If $\left\{A_{i}\right\}_{i \in I}$ is a directed system of objects of $\mathcal{C}$, then $F_{f l}\left(\operatorname{colim}_{i} A_{i}\right)=\operatorname{colim}_{i} F_{f l}\left(A_{i}\right)$.

Proof. Part (1) is a special case of More on Algebra, Lemma 15.13.3. Part (2) is a special case of More on Algebra, Lemma 15.13.4.

05P4 Lemma 37.20.5. In Situation 37.20 .3 suppose that $B \rightarrow C$ is a local map of local A-algebras and that $M \cong N$ as $B$-modules. Denote $F_{l f}^{\prime}: \mathcal{C} \rightarrow$ Sets the functor associated to the pair $(C, N)$. If $B \rightarrow C$ is finite, then $F_{l f}=F_{l f}^{\prime}$.
Proof. Let $A^{\prime}$ be an object of $\mathcal{C}$. Set $C^{\prime}=C \otimes_{A} A^{\prime}$ and $N^{\prime}=N \otimes_{A} A^{\prime}$ similarly to the definitions of $B^{\prime}, M^{\prime}$ in Situation 37.20.3. Note that $M^{\prime} \cong N^{\prime}$ as $B^{\prime}$-modules. The assumption that $B \rightarrow C$ is finite has two consequences: (a) $\mathfrak{m}_{C}=\sqrt{\mathfrak{m}_{B} C}$ and (b) $B^{\prime} \rightarrow C^{\prime}$ is finite. Consequence (a) implies that

$$
V\left(\mathfrak{m}_{A^{\prime}} C^{\prime}+\mathfrak{m}_{C} C^{\prime}\right)=\left(\operatorname{Spec}\left(C^{\prime}\right) \rightarrow \operatorname{Spec}\left(B^{\prime}\right)\right)^{-1} V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right)
$$

Suppose $\mathfrak{q} \subset V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right)$. Then $M_{\mathfrak{q}}^{\prime}$ is flat over $A^{\prime}$ if and only if the $C_{\mathfrak{q}^{-}}^{\prime}$ module $N_{\mathfrak{q}}^{\prime}$ is flat over $A^{\prime}$ (because these are isomorphic as $A^{\prime}$-modules) if and only if for every maximal ideal $\mathfrak{r}$ of $C_{\mathfrak{q}}^{\prime}$ the module $N_{\mathfrak{r}}^{\prime}$ is flat over $A^{\prime}$ (see Algebra, Lemma 10.38.19). As $B_{\mathfrak{q}}^{\prime} \rightarrow C_{\mathfrak{q}}^{\prime}$ is finite by (b), the maximal ideals of $C_{\mathfrak{q}}^{\prime}$ correspond exactly to the primes of $C^{\prime}$ lying over $\mathfrak{q}$ (see Algebra, Lemma 10.35.20) and these primes are all contained in $V\left(\mathfrak{m}_{A^{\prime}} C^{\prime}+\mathfrak{m}_{C} C^{\prime}\right)$ by the displayed equation above. Thus the result of the lemma holds.

05P5 Lemma 37.20.6. In Situation 37.20.3 suppose that $B \rightarrow C$ is a flat local homomorphism of local rings. Set $N=M \otimes_{B} C$. Denote $F_{l f}^{\prime}: \mathcal{C} \rightarrow$ Sets the functor associated to the pair $(C, N)$. Then $F_{l f}=F_{l f}^{\prime}$.

Proof. Let $A^{\prime}$ be an object of $\mathcal{C}$. Set $C^{\prime}=C \otimes_{A} A^{\prime}$ and $N^{\prime}=N \otimes_{A} A^{\prime}=M^{\prime} \otimes_{B^{\prime}} C^{\prime}$ similarly to the definitions of $B^{\prime}, M^{\prime}$ in Situation 37.20.3. Note that

$$
V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right)=\operatorname{Spec}\left(\kappa\left(\mathfrak{m}_{B}\right) \otimes_{A} \kappa\left(\mathfrak{m}_{A^{\prime}}\right)\right)
$$

and similarly for $V\left(\mathfrak{m}_{A^{\prime}} C^{\prime}+\mathfrak{m}_{C} C^{\prime}\right)$. The ring map

$$
\kappa\left(\mathfrak{m}_{B}\right) \otimes_{A} \kappa\left(\mathfrak{m}_{A^{\prime}}\right) \longrightarrow \kappa\left(\mathfrak{m}_{C}\right) \otimes_{A} \kappa\left(\mathfrak{m}_{A^{\prime}}\right)
$$

is faithfully flat, hence $V\left(\mathfrak{m}_{A^{\prime}} C^{\prime}+\mathfrak{m}_{C} C^{\prime}\right) \rightarrow V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right)$ is surjective. Finally, if $\mathfrak{r} \in V\left(\mathfrak{m}_{A^{\prime}} C^{\prime}+\mathfrak{m}_{C} C^{\prime}\right)$ maps to $\mathfrak{q} \in V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right)$, then $M_{\mathfrak{q}}^{\prime}$ is flat over $A^{\prime}$ if and only if $N_{\mathrm{r}}^{\prime}$ is flat over $A^{\prime}$ because $B^{\prime} \rightarrow C^{\prime}$ is flat, see Algebra, Lemma 10.38.9. The lemma follows formally from these remarks.
05MP Situation 37.20.7. Let $f: X \rightarrow S$ be a smooth morphism with geometrically irreducible fibres. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. For any scheme $T$ over $S$ we will denote $\mathcal{F}_{T}$ the base change of $\mathcal{F}$ to $T$, in other words, $\mathcal{F}_{T}$ is the pullback of $\mathcal{F}$ via the projection morphism $X_{T}=X \times_{S} T \rightarrow X$. Note that $X_{T} \rightarrow T$ is smooth with geometrically irreducible fibres, see Morphisms, Lemma 28.34 .5 and More on Morphisms, Lemma 36.22.2. Let $p \geq 0$ be an integer. Given a point $t \in T$ consider the condition
$05 \mathrm{MQ} \quad(37.20 .7 .1) \quad \mathcal{F}_{T}$ is free of rank $p$ in a neighbourhood of $\xi_{t}$
where $\xi_{t}$ is the generic point of the fibre $X_{t}$. This condition for all $t \in T$ is stable under base change, and hence we obtain a functor

05 MR

$$
H_{p}:(S c h / S)^{\text {opp }} \longrightarrow \text { Sets, } \quad T \longrightarrow\left\{\begin{array}{cc}
\{*\} & \text { if } \mathcal{F}_{T} \text { satisfies } \begin{array}{c}
\text { 37.20.7.1 } \\
\emptyset
\end{array} \forall t \in T, \tag{37.20.7.2}
\end{array}\right.
$$

05MS Lemma 37.20.8. In Situation 37.20.7.
(1) The functor $H_{p}$ satisfies the sheaf property for the fpqc topology.
(2) If $\mathcal{F}$ is of finite presentation, then functor $H_{p}$ is limit preserving.

Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqq ${ }^{1}$ covering of schemes over $S$. Set $X_{i}=X_{T_{i}}=$ $X \times{ }_{S} T_{i}$ and denote $\mathcal{F}_{i}$ the pullback of $\mathcal{F}$ to $X_{i}$. Assume that $\mathcal{F}_{i}$ satisfies (37.20.7.1) for all $i$. Pick $t \in T$ and let $\xi_{t} \in X_{T}$ denote the generic point of $X_{t}$. We have to show that $\mathcal{F}$ is free in a neighbourhood of $\xi_{t}$. For some $i \in I$ we can find a $t_{i} \in T_{i}$ mapping to $t$. Let $\xi_{i} \in X_{i}$ denote the generic point of $X_{t_{i}}$, so that $\xi_{i}$ maps to $\xi_{t}$. The fact that $\mathcal{F}_{i}$ is free of rank $p$ in a neighbourhood of $\xi_{i}$ implies that $\left(\mathcal{F}_{i}\right)_{x_{i}} \cong \mathcal{O}_{X_{i}, x_{i}}^{\oplus p}$ which implies that $\mathcal{F}_{T, \xi_{t}} \cong \mathcal{O}_{X_{T}, \xi_{t}}^{\oplus p}$ as $\mathcal{O}_{X_{T}, \xi_{t}} \rightarrow \mathcal{O}_{X_{i}, x_{i}}$ is flat, see for example Algebra, Lemma 10.77.5. Thus there exists an affine neighbourhood $U$ of $\xi_{t}$ in $X_{T}$ and a surjection $\mathcal{O}_{U}^{\oplus p} \rightarrow \mathcal{F}_{U}=\left.\mathcal{F}_{T}\right|_{U}$, see Modules, Lemma 17.9.4. After shrinking $T$ we may assume that $U \rightarrow T$ is surjective. Hence $U \rightarrow T$ is a smooth morphism of affines with geometrically irreducible fibres. Moreover, for every $t^{\prime} \in T$ we see that the induced map

$$
\alpha: \mathcal{O}_{U, \xi_{t^{\prime}}}^{\oplus p} \longrightarrow \mathcal{F}_{U, \xi_{t^{\prime}}}
$$

is an isomorphism (since by the same argument as before the module on the right is free of rank $p$ ). It follows from Lemma 37.10.1 that

$$
\Gamma\left(U, \mathcal{O}_{U}^{\oplus p}\right) \otimes_{\Gamma\left(T, \mathcal{O}_{T}\right)} \mathcal{O}_{T, t^{\prime}} \longrightarrow \Gamma\left(U, \mathcal{F}_{U}\right) \otimes_{\Gamma\left(T, \mathcal{O}_{T}\right)} \mathcal{O}_{T, t^{\prime}}
$$

is injective for every $t^{\prime} \in T$. Hence we see the surjection $\alpha$ is an isomorphism. This finishes the proof of (1).
Assume that $\mathcal{F}$ is of finite presentation. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $S$-schemes and assume that $\mathcal{F}_{T}$ satisfies (37.20.7.1). Set $X_{i}=X_{T_{i}}=X \times{ }_{S} T_{i}$ and denote $\mathcal{F}_{i}$ the pullback of $\mathcal{F}$ to $X_{i}$. Let $U \subset X_{T}$ denote the open subscheme

[^104]of points where $\mathcal{F}_{T}$ is flat over $T$, see More on Morphisms, Theorem 36.12.1. By assumption every generic point of every fibre is a point of $U$, i.e., $U \rightarrow T$ is a smooth surjective morphism with geometrically irreducible fibres. We may shrink $U$ a bit and assume that $U$ is quasi-compact. Using Limits, Lemma 31.3.8 we can find an $i \in I$ and a quasi-compact open $U_{i} \subset X_{i}$ whose inverse image in $X_{T}$ is $U$. After increasing $i$ we may assume that $\left.\mathcal{F}_{i}\right|_{U_{i}}$ is flat over $T_{i}$, see Limits, Lemma 31.9.4. In particular, $\left.\mathcal{F}_{i}\right|_{U_{i}}$ is finite locally free hence defines a locally constant rank function $\rho: U_{i} \rightarrow\{0,1,2, \ldots\}$. Let $\left(U_{i}\right)_{p} \subset U_{i}$ denote the open and closed subset where $\rho$ has value $p$. Let $V_{i} \subset T_{i}$ be the image of $\left(U_{i}\right)_{p}$; note that $V_{i}$ is open and quasi-compact. By assumption the image of $T \rightarrow T_{i}$ is contained in $V_{i}$. Hence there exists an $i^{\prime} \geq i$ such that $T_{i^{\prime}} \rightarrow T_{i}$ factors through $V_{i}$ by Limits, Lemma 31.3.8. Then $\mathcal{F}_{i^{\prime}}$ satisfies 37.20.7.1 as desired. Some details omitted.

05MT Situation 37.20.9. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. For any scheme $T$ over $S$ we will denote $\mathcal{F}_{T}$ the base change of $\mathcal{F}$ to $T$, in other words, $\mathcal{F}_{T}$ is the pullback of $\mathcal{F}$ via the projection morphism $X_{T}=X \times_{S} T \rightarrow X$. Note that $X_{T} \rightarrow T$ is of finite type and that $\mathcal{F}_{T}$ is an $\mathcal{O}_{X_{T}}$-module of finite type, see Morphisms, Lemma 28.15.4 and Modules, Lemma 17.9.2. Let $n \geq 0$. We say that $\mathcal{F}_{T}$ is flat over $T$ in dimensions $\geq n$ if for every $t \in T$ the closed subset $Z \subset X_{t}$ of points where $\mathcal{F}_{T}$ is not flat over $T$ (see Lemma 37.10 .4 ) satisfies $\operatorname{dim}(Z)<n$ for all $t \in T$. Note that if this is the case, and if $T^{\prime} \rightarrow T$ is a morphism, then $\mathcal{F}_{T^{\prime}}$ is also flat in dimensions $\geq n$ over $T^{\prime}$, see Morphisms, Lemmas 28.25 .6 and 28.28 .3 . Hence we obtain a functor (37.20.9.1)
$05 \mathrm{MU} \quad F_{n}:(S c h / S)^{\text {opp }} \longrightarrow$ Sets, $\quad T \longrightarrow\left\{\begin{array}{cc}\{*\} & \text { if } \mathcal{F}_{T} \text { is flat over } T \text { in } \operatorname{dim} \geq n, \\ \emptyset & \text { else. }\end{array}\right.$
05MV Lemma 37.20.10. In Situation 37.20.9.
(1) The functor $F_{n}$ satisfies the sheaf property for the fpqc topology.
(2) If $f$ is quasi-compact and locally of finite presentation and $\mathcal{F}$ is of finite presentation, then the functor $F_{n}$ is limit preserving.

Proof. Let $\left\{T_{i} \rightarrow T\right\}_{i \in I}$ be an fpqc covering of schemes over $S$. Set $X_{i}=X_{T_{i}}=$ $X \times_{S} T_{i}$ and denote $\mathcal{F}_{i}$ the pullback of $\mathcal{F}$ to $X_{i}$. Assume that $\mathcal{F}_{i}$ is flat over $T_{i}$ in dimensions $\geq n$ for all $i$. Let $t \in T$. Choose an index $i$ and a point $t_{i} \in T_{i}$ mapping to $t$. Consider the cartesian diagram

As the lower horizontal morphism is flat we see from More on Morphisms, Lemma 36.12 .2 that the set $Z_{i} \subset X_{t_{i}}$ where $\mathcal{F}_{i}$ is not flat over $T_{i}$ and the set $Z \subset X_{t}$ where $\mathcal{F}_{T}$ is not flat over $T$ are related by the rule $Z_{i}=Z_{\kappa\left(t_{i}\right)}$. Hence we see that $\mathcal{F}_{T}$ is flat over $T$ in dimensions $\geq n$ by Morphisms, Lemma 28.28.3

Assume that $f$ is quasi-compact and locally of finite presentation and that $\mathcal{F}$ is of finite presentation. In this paragraph we first reduce the proof of (2) to the case where $f$ is of finite presentation. Let $T=\lim _{i \in I} T_{i}$ be a directed limit of affine $S$ schemes and assume that $\mathcal{F}_{T}$ is flat in dimensions $\geq n$. Set $X_{i}=X_{T_{i}}=X \times{ }_{S} T_{i}$ and
denote $\mathcal{F}_{i}$ the pullback of $\mathcal{F}$ to $X_{i}$. We have to show that $\mathcal{F}_{i}$ is flat in dimensions $\geq n$ for some $i$. Pick $i_{0} \in I$ and replace $I$ by $\left\{i \mid i \geq i_{0}\right\}$. Since $T_{i_{0}}$ is affine (hence quasi-compact) there exist finitely many affine opens $W_{j} \subset S, j=1, \ldots, m$ and an affine open overing $T_{i_{0}}=\bigcup_{j=1, \ldots, m} V_{j, i_{0}}$ such that $T_{i_{0}} \rightarrow S$ maps $V_{j, i_{0}}$ into $W_{j}$. For $i \geq i_{0}$ denote $V_{j, i}$ the inverse image of $V_{j, i_{0}}$ in $T_{i}$. If we can show, for each $j$, that there exists an $i$ such that $\mathcal{F}_{V_{j, i}}$ is flat in dimensions $\geq n$, then we win. In this way we reduce to the case that $S$ is affine. In this case $X$ is quasi-compact and we can choose a finite affine open covering $X=W_{1} \cup \ldots \cup W_{m}$. In this case the result for $(X \rightarrow S, \mathcal{F})$ is equivalent to the result for $\left(\coprod W_{j},\left.\coprod \mathcal{F}\right|_{W_{j}}\right)$. Hence we may assume that $f$ is of finite presentation.
Assume $f$ is of finite presentation and $\mathcal{F}$ is of finite presentation. Let $U \subset X_{T}$ denote the open subscheme of points where $\mathcal{F}_{T}$ is flat over $T$, see More on Morphisms, Theorem 36.12.1. By assumption the dimension of every fibre of $Z=X_{T} \backslash U$ over $T$ has dimension $\leq n$. By Limits, Lemma 31.14.3 we can find a closed subscheme $Z \subset Z^{\prime} \subset X_{T}$ such that $\operatorname{dim}\left(Z_{t}^{\prime}\right)<n$ for all $t \in T$ and such that $Z^{\prime} \rightarrow X_{T}$ is of finite presentation. By Limits, Lemmas 31.9.1 and 31.7.4 there exists an $i \in I$ and a closed subscheme $Z_{i}^{\prime} \subset X_{i}$ of finite presentation whose base change to $T$ is $Z^{\prime}$. By Limits, Lemma 31.14.1 we may assume all fibres of $Z_{i}^{\prime} \rightarrow T_{i}$ have dimension $<n$. By Limits, Lemma 31.9 .4 we may assume that $\left.\mathcal{F}_{i}\right|_{X_{i} \backslash T_{i}^{\prime}}$ is flat over $T_{i}$. This implies that $\mathcal{F}_{i}$ is flat in dimensions $\geq n$; here we use that $Z^{\prime} \rightarrow X_{T}$ is of finite presentation, and hence the complement $X_{T} \backslash Z^{\prime}$ is quasi-compact! Thus part (2) is proved and the proof of the lemma is complete.

05MW Situation 37.20.11. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. For any scheme $T$ over $S$ we will denote $\mathcal{F}_{T}$ the base change of $\mathcal{F}$ to $T$, in other words, $\mathcal{F}_{T}$ is the pullback of $\mathcal{F}$ via the projection morphism $X_{T}=X \times_{S} T \rightarrow X$. Since the base change of a flat module is flat we obtain a functor

05MX

$$
F_{\text {flat }}:(S c h / S)^{o p p} \longrightarrow \text { Sets, } \quad T \longrightarrow\left\{\begin{array}{cc}
\{*\} & \text { if } \mathcal{F}_{T} \text { is flat over } T  \tag{37.20.11.1}\\
\emptyset & \text { else }
\end{array}\right.
$$

05MY Lemma 37.20.12. In Situation 37.20.11.
(1) The functor $F_{\text {flat }}$ satisfies the sheaf property for the fpqc topology.
(2) If $f$ is quasi-compact and locally of finite presentation and $\mathcal{F}$ is of finite presentation, then the functor $F_{\text {flat }}$ is limit preserving.
Proof. Part (1) follows from the following statement: If $T^{\prime} \rightarrow T$ is a surjective flat morphism of schemes over $S$, then $\mathcal{F}_{T^{\prime}}$ is flat over $T^{\prime}$ if and only if $\mathcal{F}_{T}$ is flat over $T$, see More on Morphisms, Lemma 36.12.2. Part (2) follows from Limits, Lemma 31.9.4 after reducing to the case where $X$ and $S$ are affine (compare with the proof of Lemma 37.20.10.

### 37.21. Flattening stratifications

052 F Just the definitions and an important baby case.
05P6 Definition 37.21.1. Let $X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. We say that the universal flattening of $\mathcal{F}$ exists if the functor $F_{\text {flat }}$ defined in Situation 37.20 .11 is representable by a scheme $S^{\prime}$ over $S$. We say that the universal flattening of $X$ exists if the universal flattening of $\mathcal{O}_{X}$ exists.

Note that if the universal flattening $S_{2}^{2}$ of $\mathcal{F}$ exists, then the morphism $S^{\prime} \rightarrow S$ is a monomorphism of schemes such that $\mathcal{F}_{S^{\prime}}$ is flat over $S^{\prime}$ and such that a morphism $T \rightarrow S$ factors through $S^{\prime}$ if and only if $\mathcal{F}_{T}$ is flat over $T$.
We define (compare with Topology, Remark 5.27.5) a (locally finite, scheme theoretic) stratification of a scheme $S$ to be given by closed subschemes $Z_{i} \subset S$ indexed by a partially ordered set $I$ such that $S=\bigcup Z_{i}$ (set theoretically), such that every point of $S$ has a neighbourhood meeting only a finite number of $Z_{i}$, and such that

$$
Z_{i} \cap Z_{j}=\bigcup_{k \leq i, j} Z_{k}
$$

Setting $S_{i}=Z_{i} \backslash \bigcup_{j<i} Z_{j}$ the actual stratification is the decomposition $S=\coprod S_{i}$ into locally closed subschemes. We often only indicate the strata $S_{i}$ and leave the construction of the closed subschemes $Z_{i}$ to the reader. Given a stratification we obtain a monomorphism

$$
S^{\prime}=\coprod_{i \in I} S_{i} \longrightarrow S
$$

We will call this the monomorphism associated to the stratification. With this terminology we can define what it means to have a flattening stratification.

05P7 Definition 37.21.2. Let $X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. We say that $\mathcal{F}$ has a flattening stratification if the functor $F_{\text {flat }}$ defined in Situation 37.20 .11 is representable by a monomorphism $S^{\prime} \rightarrow S$ associated to a stratification of $S$ by locally closed subschemes. We say that $X$ has a flattening stratification if $\mathcal{O}_{X}$ has a flattening stratification.

When a flattening stratification exists, it is often important to understand the index set labeling the strata and its partial ordering. This often has to do with ranks of modules, as in the baby case below.

05P8 Lemma 37.21.3. Let $S$ be a scheme. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_{S^{-}}$ module. The closed subschemes

$$
S=Z_{-1} \supset Z_{0} \supset Z_{1} \supset Z_{2} \ldots
$$

defined by the fitting ideals of $\mathcal{F}$ have the following properties
(1) The intersection $\bigcap Z_{r}$ is empty.
(2) The functor $(S c h / S)^{o p p} \rightarrow$ Sets defined by the rule

$$
T \longmapsto\left\{\begin{array}{cc}
\{*\} & \text { if } \mathcal{F}_{T} \text { is locally generated by } \leq r \text { sections } \\
\emptyset & \text { otherwise }
\end{array}\right.
$$

is representable by the open subscheme $S \backslash Z_{r}$.
(3) The functor $F_{r}:(S c h / S)^{o p p} \rightarrow$ Sets defined by the rule

$$
T \longmapsto\left\{\left\{\begin{array}{cc}
\{*\} & \text { if } \mathcal{F}_{T} \text { locally free rank } r \\
\emptyset & \text { otherwise }
\end{array}\right.\right.
$$

is representable by the locally closed subscheme $Z_{r-1} \backslash Z_{r}$ of $S$.
If $\mathcal{F}$ is of finite presentation, then $Z_{r} \rightarrow S, S \backslash Z_{r} \rightarrow S$, and $Z_{r-1} \backslash Z_{r} \rightarrow S$ are of finite presentation.

[^105]Proof. We refer to More on Algebra, Section 15.6 for the construction of the fitting ideals in the algebraic setting. Here we will construct the sequence

$$
0=\mathcal{I}_{-1} \subset \mathcal{I}_{0} \subset \mathcal{I}_{1} \subset \ldots \subset \mathcal{O}_{S}
$$

of fitting ideals of $\mathcal{F}$ as an $\mathcal{O}_{S}$-module. Namely, if $U \subset X$ is open, and

$$
\left.\bigoplus_{i \in I} \mathcal{O}_{U} \rightarrow \mathcal{O}_{U}^{\oplus n} \rightarrow \mathcal{F}\right|_{U} \rightarrow 0
$$

is a presentation of $\mathcal{F}$ over $U$, then $\left.\mathcal{I}_{r}\right|_{U}$ is generated by the $(n-r) \times(n-r)$-minors of the matrix defining the first arrow of the presentation. In particular, $\mathcal{I}_{r}$ is locally generated by sections, whence quasi-coherent. If $U=\operatorname{Spec}(A)$ and $\left.\mathcal{F}\right|_{U}=\widetilde{M}$, then $\left.\mathcal{I}_{r}\right|_{U}$ is the ideal sheaf associated to the fitting ideal $\operatorname{Fit}_{r}(M)$ as in More on Algebra, Definition 15.6.3. Let $Z_{r} \subset S$ be the closed subscheme corresponding to $\mathcal{I}_{r}$.

For any morphism $g: T \rightarrow S$ we see from More on Algebra, Lemma 15.6.6 that $\mathcal{F}_{T}$ is locally generated by $\leq r$ sections if and only if $\mathcal{I}_{r} \cdot \mathcal{O}_{T}=\mathcal{O}_{T}$. This proves (2).
For any morphism $g: T \rightarrow S$ we see from More on Algebra, Lemma 15.6.7 that $\mathcal{F}_{T}$ is free of rank $r$ if and only if $\mathcal{I}_{r} \cdot \mathcal{O}_{T}=\mathcal{O}_{T}$ and $\mathcal{I}_{r-1} \cdot \mathcal{O}_{T}=0$. This proves (3).

The final statement of the lemma follows from the fact that if $\mathcal{F}$ is of finite presentation, then each of the morphisms $Z_{r} \rightarrow S$ is of finite presentation as $\mathcal{I}_{r}$ is locally generated by finitely many minors. This implies that $Z_{r-1} \backslash Z_{r}$ is a retrocompact open in $Z_{r}$ and hence the morphism $Z_{r-1} \backslash Z_{r} \rightarrow Z_{r}$ is of finite presentation as well.

Lemma 37.21 .3 notwithstanding the following lemma does not hold if $\mathcal{F}$ is a finite type quasi-coherent module. Namely, the stratification still exists but it isn't true that it represents the functor $F_{\text {flat }}$ in general.
05P9 Lemma 37.21.4. Let $S$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{S}$-module of finite presentation. There exists a flattening stratification $S^{\prime}=\coprod_{r \geq 0} S_{r}$ for $\mathcal{F}$ (relative to $i d_{S}: S \rightarrow S$ ) such that $\left.\mathcal{F}\right|_{S_{r}}$ is locally free of rank r. Moreover, each $S_{r} \rightarrow S$ is of finite presentation.

Proof. Suppose that $g: T \rightarrow S$ is a morphism of schemes such that the pullback $\mathcal{F}_{T}=g^{*} \mathcal{F}$ is flat. Then $\mathcal{F}_{T}$ is a flat $\mathcal{O}_{T}$-module of finite presentation. Hence $\mathcal{F}_{T}$ is finite locally free, see Properties, Lemma 27.20.2. Thus $T=\coprod_{r \geq 0} T_{r}$, where $\left.\mathcal{F}_{T}\right|_{T_{r}}$ is locally free of rank $r$. This implies that

$$
F_{f l a t}=\coprod_{r \geq 0} F_{r}
$$

in the category of Zariski sheaves on $S c h / S$ where $F_{r}$ is as in Lemma 37.21.3. It follows that $F_{\text {flat }}$ is represented by $\coprod_{r \geq 0}\left(Z_{r-1} \backslash Z_{r}\right)$ where $Z_{r}$ is as in Lemma 37.21.3.

We end this section showing that if we do not insist on a canonical stratification, then we can use generic flatness to construct some stratification such that our sheaf is flat over the strata.

0ASY Lemma 37.21.5 (Generic flatness stratification). Let $f: X \rightarrow S$ be a morphism of finite presentation between quasi-compact and quasi-separated schemes. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module of finite presentation. Then there exists a $t \geq 0$ and closed subschemes

$$
S \supset S_{0} \supset S_{1} \supset \ldots \supset S_{t}=\emptyset
$$

such that $S_{i} \rightarrow S$ is defined by a finite type ideal sheaf, $S_{0} \subset S$ is a thickening, and $\mathcal{F}$ pulled back to $X \times_{S}\left(S_{i} \backslash S_{i+1}\right)$ is flat over $S_{i} \backslash S_{i+1}$.
Proof. We can find a cartesian diagram

and a finitely presented $\mathcal{O}_{X_{0}}$-module $\mathcal{F}_{0}$ which pulls back to $\mathcal{F}$ such that $X_{0}$ and $S_{0}$ are of finite type over Z. See Limits, Proposition 31.4.4 and Lemmas 31.9.1 and 31.9.2. Thus we may assume $X$ and $S$ are of finite type over $\mathbf{Z}$ and $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module.
Assume $X$ and $S$ are of finite type over $\mathbf{Z}$ and $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module. In this case every quasi-coherent ideal is of finite type, hence we do not have to check the condition that $S_{i}$ is cut out by a finite type ideal. Set $S_{0}=S_{\text {red }}$ equal to the reduction of $S$. By generic flatness as stated in Morphisms, Proposition 28.27.2 there is a dense open $U_{0} \subset S_{0}$ such that $\mathcal{F}$ pulled back to $X \times_{S} U_{0}$ is flat over $U_{0}$. Let $S_{1} \subset S_{0}$ be the reduced closed subscheme whose underlying closed subset is $S \backslash U_{0}$. We continue in this way, provided $S_{1} \neq \emptyset$, to find $S_{0} \supset S_{1} \supset \ldots$. Because $S$ is Noetherian any descending chain of closed subsets stabilizes hence we see that $S_{t}=\emptyset$ for some $t \geq 0$.

### 37.22. Flattening stratification over an Artinian ring

05PA A flatting stratification exists when the base scheme is the spectrum of an Artinian ring.
05PB Lemma 37.22.1. Let $S$ be the spectrum of an Artinian ring. For any scheme $X$ over $S$, and any quasi-coherent $\mathcal{O}_{X}$-module there exists a universal flattening. In fact the universal flattening is given by a closed immersion $S^{\prime} \rightarrow S$, and hence is a flattening stratification for $\mathcal{F}$ as well.

Proof. Choose an affine open covering $X=\bigcup U_{i}$. Then $F_{\text {flat }}$ is the product of the functors associated to each of the pairs $\left(U_{i},\left.\mathcal{F}\right|_{U_{i}}\right)$. Hence it suffices to prove the result for each $\left(U_{i},\left.\mathcal{F}\right|_{U_{i}}\right)$. In the affine case the lemma follows immediately from More on Algebra, Lemma 15.11.2.

### 37.23. Flattening a map

05PC Theorem 37.23 .3 is the key to further flattening statements.
05PD Lemma 37.23.1. Let $S$ be a scheme. Let $g: X^{\prime} \rightarrow X$ be a flat morphism of schemes over $S$ with $X$ locally of finite type over $S$. Let $\mathcal{F}$ be a finite type $\mathcal{O}_{X^{-}}$ module which is flat over $S$. If $A s s_{X / S}(\mathcal{F}) \subset g\left(X^{\prime}\right)$ then the canonical map

$$
\mathcal{F} \longrightarrow g_{*} g^{*} \mathcal{F}
$$

is injective, and remains injective after any base change.
Proof. The final assertion means that $\mathcal{F}_{T} \rightarrow\left(g_{T}\right)_{*} g_{T}^{*} \mathcal{F}_{T}$ is injective for any morphism $T \rightarrow S$. The assumption $\operatorname{Ass}_{X / S}(\mathcal{F}) \subset g\left(X^{\prime}\right)$ is preserved by base change, see Divisors, Lemma 30.7.2 and Remark 30.7.3. The same holds for the assumption of flatness and finite type. Hence it suffices to prove the injectivity of the displayed
arrow. Let $\mathcal{K}=\operatorname{Ker}\left(\mathcal{F} \rightarrow g_{*} g^{*} \mathcal{F}\right)$. Our goal is to prove that $\mathcal{K}=0$. In order to do this it suffices to prove that WeakAss ${ }_{X}(\mathcal{K})=\emptyset$, see Divisors, Lemma 30.5.5. We have WeakAss ${ }_{X}(\mathcal{K}) \subset$ WeakAss $_{X}(\mathcal{F})$, see Divisors, Lemma 30.5.4. As $\mathcal{F}$ is flat we see from Lemma 37.13 .4 that $\operatorname{WeakAss}_{X}(\mathcal{F}) \subset \operatorname{Ass}_{X / S}(\mathcal{F})$. By assumption any point $x$ of $\operatorname{Ass}_{X / S}(\mathcal{F})$ is the image of some $x^{\prime} \in X^{\prime}$. Since $g$ is flat the local ring map $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{X^{\prime}, x^{\prime}}$ is faithfully flat, hence the map

$$
\mathcal{F}_{x} \longrightarrow g^{*} \mathcal{F}_{x^{\prime}}=\mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{O}_{X^{\prime}, x^{\prime}}
$$

is injective (see Algebra, Lemma 10.81.11). This implies that $\mathcal{K}_{x}=0$ as desired.
05PE Lemma 37.23.2. Let $A$ be a ring. Let $u: M \rightarrow N$ be a surjective map of $A$ modules. If $M$ is projective as an $A$-module, then there exists an ideal $I \subset A$ such that for any ring map $\varphi: A \rightarrow B$ the following are equivalent
(1) $u \otimes 1: M \otimes_{A} B \rightarrow N \otimes_{A} B$ is an isomorphism, and
(2) $\varphi(I)=0$.

Proof. As $M$ is projective we can find a projective $A$-module $C$ such that $F=$ $M \oplus C$ is a free $R$-module. By replacing $u$ by $u \oplus 1: F=M \oplus C \rightarrow N \oplus C$ we see that we may assume $M$ is free. In this case let $I$ be the ideal of $A$ generated by coefficients of all the elements of $\operatorname{Ker}(u)$ with respect to some (fixed) basis of $M$. The reason this works is that, since $u$ is surjective and $\otimes_{A} B$ is right exact, $\operatorname{Ker}(u \otimes 1)$ is the image of $\operatorname{Ker}(u) \otimes_{A} B$ in $M \otimes_{A} B$.

05PF Theorem 37.23.3. In Situation 37.20.1 assume
(1) $f$ is of finite presentation,
(2) $\mathcal{F}$ is of finite presentation, flat over $S$, and pure relative to $S$, and
(3) $u$ is surjective.

Then $F_{\text {iso }}$ is representable by a closed immersion $Z \rightarrow S$. Moreover $Z \rightarrow S$ is of finite presentation if $\mathcal{G}$ is of finite presentation.

Proof. We will use without further mention that $\mathcal{F}$ is universally pure over $S$, see Lemma 37.18.3. By Lemma 37.20.2 and Descent, Lemmas 34.33.2 and 34.35.1 the question is local for the étale topology on $S$. Hence it suffices to prove, given $s \in S$, that there exists an étale neighbourhood of $(S, s)$ so that the theorem holds.
Using Lemma 37.12.5 and after replacing $S$ by an elementary étale neighbourhood of $s$ we may assume there exists a commutative diagram

of schemes of finite presentation over $S$, where $g$ is étale, $X_{s} \subset g\left(X^{\prime}\right)$, the schemes $X^{\prime}$ and $S$ are affine, $\Gamma\left(X^{\prime}, g^{*} \mathcal{F}\right)$ a projective $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. Note that $g^{*} \mathcal{F}$ is universally pure over $S$, see Lemma 37.17.4. Hence by Lemma 37.18.2 we see that the open $g\left(X^{\prime}\right)$ contains the points of $\operatorname{Ass}_{X / S}(\mathcal{F})$ lying over $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$. Set

$$
E=\left\{t \in S \mid \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{t}\right) \subset g\left(X^{\prime}\right)\right\} .
$$

By More on Morphisms, Lemma 36.20.5 $E$ is a constructible subset of $S$. We have seen that $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \subset E$. By Morphisms, Lemma 28.22 .4 we see that $E$
contains an open neighbourhood of $s$. Hence after replacing $S$ by a smaller affine neighbourhood of $s$ we may assume that $\operatorname{Ass}_{X / S}(\mathcal{F}) \subset g\left(X^{\prime}\right)$.
Since we have assumed that $u$ is surjective we have $F_{i s o}=F_{i n j}$. From Lemma 37.23 .1 it follows that $u: \mathcal{F} \rightarrow \mathcal{G}$ is injective if and only if $g^{*} u: g^{*} \mathcal{F} \rightarrow g^{*} \mathcal{G}$ is injective, and the same remains true after any base change. Hence we have reduced to the case where, in addition to the assumptions in the theorem, $X \rightarrow S$ is a morphism of affine schemes and $\Gamma(X, \mathcal{F})$ is a projective $\Gamma\left(S, \mathcal{O}_{S}\right)$-module. This case follows immediately from Lemma 37.23 .2 ,

To see that $Z$ is of finite presentation if $\mathcal{G}$ is of finite presentation, combine Lemma 37.20 .2 part (4) with Limits, Remark 31.5.2.

07AI Lemma 37.23.4. Let $f: X \rightarrow S$ be a morphism of schemes which is of finite presentation, flat, and pure. Let $Y$ be a closed subscheme of $X$. Let $F=f_{*} Y$ be the Weil restriction functor of $Y$ along $f$, defined by

$$
F:(S c h / S)^{\text {opp }} \rightarrow \text { Sets, } \quad T \mapsto\left\{\begin{array}{cc}
\{*\} & \text { if } \quad Y_{T} \rightarrow X_{T} \text { is an isomorphism, } \\
\emptyset & \text { else. }
\end{array}\right.
$$

Then $F$ is representable by a closed immersion $Z \rightarrow S$. Moreover $Z \rightarrow S$ is of finite presentation if $Y \rightarrow S$ is.
Proof. Let $\mathcal{I}$ be the ideal sheaf defining $Y$ in $X$ and let $u: \mathcal{O}_{X} \rightarrow \mathcal{O}_{X} / \mathcal{I}$ be the surjection. Then for an $S$-scheme $T$, the closed immersion $Y_{T} \rightarrow X_{T}$ is an isomorphism if and only if $u_{T}$ is an isomorphism. Hence the result follows from Theorem 37.23.3.

### 37.24. Flattening in the local case

05 MZ In this section we start applying the earlier material to obtain a shadow of the flattening stratification.

05PG Theorem 37.24.1. In Situation 37.20.3 assume $A$ is henselian, $B$ is essentially of finite type over $A$, and $M$ is a finite $B$-module. Then there exists an ideal $I \subset A$ such that $A / I$ corepresents the functor $F_{l f}$ on the category $\mathcal{C}$. In other words given a local homomorphism of local rings $\varphi: A \rightarrow A^{\prime}$ with $B^{\prime}=B \otimes_{A} A^{\prime}$ and $M^{\prime}=M \otimes_{A} A^{\prime}$ the following are equivalent:
(1) $\forall \mathfrak{q} \in V\left(\mathfrak{m}_{A^{\prime}} B^{\prime}+\mathfrak{m}_{B} B^{\prime}\right) \subset \operatorname{Spec}\left(B^{\prime}\right): M_{\mathfrak{q}}^{\prime}$ is flat over $A^{\prime}$, and
(2) $\varphi(I)=0$.

If $B$ is essentially of finite presentation over $A$ and $M$ of finite presentation over $B$, then $I$ is a finitely generated ideal.

Proof. Choose a finite type ring map $A \rightarrow C$ and a finite $C$-module $N$ and a prime $\mathfrak{q}$ of $C$ such that $B=C_{\mathfrak{q}}$ and $M=N_{\mathfrak{q}}$. In the following, when we say "the theorem holds for $(N / C / A, \mathfrak{q})$ we mean that it holds for $(A \rightarrow B, M)$ where $B=C_{\mathfrak{q}}$ and $M=N_{\mathfrak{q}}$. By Lemma 37.20 .6 the functor $F_{l f}$ is unchanged if we replace $B$ by a local ring flat over $B$. Hence, since $A$ is henselian, we may apply Lemma 37.6.6 and assume that there exists a complete dévissage of $N / C / A$ at $\mathfrak{q}$.
Let $\left(A_{i}, B_{i}, M_{i}, \alpha_{i}, \mathfrak{q}_{i}\right)_{i=1, \ldots, n}$ be such a complete dévissage of $N / C / A$ at $\mathfrak{q}$. Let $\mathfrak{q}_{i}^{\prime} \subset A_{i}$ be the unique prime lying over $\mathfrak{q}_{i} \subset B_{i}$ as in Definition 37.6.4. Since $C \rightarrow A_{1}$ is surjective and $N \cong M_{1}$ as $C$-modules, we see by Lemma 37.20 .5 it suffices to prove the theorem holds for $\left(M_{1} / A_{1} / A, \mathfrak{q}_{1}^{\prime}\right)$. Since $B_{1} \rightarrow A_{1}$ is finite and
$\mathfrak{q}_{1}$ is the only prime of $B_{1}$ over $\mathfrak{q}_{1}^{\prime}$ we see that $\left(A_{1}\right)_{\mathfrak{q}_{1}^{\prime}} \rightarrow\left(B_{1}\right)_{\mathfrak{q}_{1}}$ is finite (see Algebra, Lemma 10.40.11 or More on Morphisms, Lemma 36.33.4). Hence by Lemma 37.20 .5 it suffices to prove the theorem holds for $\left(M_{1} / B_{1} / A, \mathfrak{q}_{1}\right)$.
At this point we may assume, by induction on the length $n$ of the dévissage, that the theorem holds for $\left(M_{2} / B_{2} / A, \mathfrak{q}_{2}\right)$. (If $n=1$, then $M_{2}=0$ which is flat over A.) Reversing the last couple of steps of the previous paragraph, using that $M_{2} \cong$ $\operatorname{Coker}\left(\alpha_{2}\right)$ as $B_{1}$-modules, we see that the theorem holds for $\left(\operatorname{Coker}\left(\alpha_{1}\right) / B_{1} / A, \mathfrak{q}_{1}\right)$.
Let $A^{\prime}$ be an object of $\mathcal{C}$. At this point we use Lemma 37.10.1 to see that if $\left(M_{1} \otimes_{A} A^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is flat over $A^{\prime}$ for a prime $\mathfrak{q}^{\prime}$ of $B_{1} \otimes_{A} A^{\prime}$ lying over $\mathfrak{m}_{A^{\prime}}$, then $\left(\operatorname{Coker}\left(\alpha_{1}\right) \otimes_{A} A^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is flat over $A^{\prime}$. Hence we conclude that $F_{l f}$ is a subfunctor of the functor $F_{l f}^{\prime}$ associated to the module $\operatorname{Coker}\left(\alpha_{1}\right)_{\mathfrak{q}_{1}}$ over $\left(B_{1}\right)_{\mathfrak{q}_{1}}$. By the previous paragraph we know $F_{l f}^{\prime}$ is corepresented by $A / J$ for some ideal $J \subset A$. Hence we may replace $A$ by $A / J$ and assume that $\operatorname{Coker}\left(\alpha_{1}\right)_{\mathfrak{q}_{1}}$ is flat over $A$.
Since $\operatorname{Coker}\left(\alpha_{1}\right)$ is a $B_{1}$-module for which there exist a complete dévissage of $N_{1} / B_{1} / A$ at $\mathfrak{q}_{1}$ and since $\operatorname{Coker}\left(\alpha_{1}\right)_{\mathfrak{q}_{1}}$ is flat over $A$ by Lemma 37.10 .2 we see that $\operatorname{Coker}\left(\alpha_{1}\right)$ is free as an $A$-module, in particular flat as an $A$-module. Hence Lemma 37.10.1 implies $F_{l f}\left(A^{\prime}\right)$ is nonempty if and only if $\alpha \otimes 1_{A^{\prime}}$ is injective. Let $N_{1}=\operatorname{Im}\left(\alpha_{1}\right) \subset M_{1}$ so that we have exact sequences

$$
0 \rightarrow N_{1} \rightarrow M_{1} \rightarrow \operatorname{Coker}\left(\alpha_{1}\right) \rightarrow 0 \quad \text { and } \quad B_{1}^{\oplus r_{1}} \rightarrow N_{1} \rightarrow 0
$$

The flatness of Coker $\left(\alpha_{1}\right)$ implies the first sequence is universally exact (see Algebra, Lemma 10.81.5. Hence $\alpha \otimes 1_{A^{\prime}}$ is injective if and only if $B_{1}^{\oplus r_{1}} \otimes_{A} A^{\prime} \rightarrow N_{1} \otimes_{A}$ $A^{\prime}$ is an isomorphism. Finally, Theorem 37.23 .3 applies to show this functor is corepresentable by $A / I$ for some ideal $I$ and we conclude $F_{l f}$ is corepresentable by $A / I$ also.
To prove the final statement, suppose that $A \rightarrow B$ is essentially of finite presentation and $M$ of finite presentation over $B$. Let $I \subset A$ be the ideal such that $F_{l f}$ is corepresented by $A / I$. Write $I=\bigcup I_{\lambda}$ where $I_{\lambda}$ ranges over the finitely generated ideals contained in $I$. Then, since $F_{l f}(A / I)=\{*\}$ we see that $F_{l f}\left(A / I_{\lambda}\right)=\{*\}$ for some $\lambda$, see Lemma 37.20 .4 part (2). Clearly this implies that $I=I_{\lambda}$.
05PH Remark 37.24.2. Here is a scheme theoretic reformulation of Theorem 37.24 .1 . Let $(X, x) \rightarrow(S, s)$ be a morphism of pointed schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Assume $S$ henselian local with closed point $s$. There exists a closed subscheme $Z \subset S$ with the following property: for any morphism of pointed schemes $(T, t) \rightarrow(S, s)$ the following are equivalent
(1) $\mathcal{F}_{T}$ is flat over $T$ at all points of the fibre $X_{t}$ which map to $x \in X_{s}$, and
(2) $\operatorname{Spec}\left(\mathcal{O}_{T, t}\right) \rightarrow S$ factors through $Z$.

Moreover, if $X \rightarrow S$ is of finite presentation at $x$ and $\mathcal{F}_{x}$ of finite presentation over $\mathcal{O}_{X, x}$, then $Z \rightarrow S$ is of finite presentation.
At this point we can obtain some very general results completely for free from the result above. Note that perhaps the most interesting case is when $E=X_{s}$ !
05PI Lemma 37.24.3. Let $S$ be the spectrum of a henselian local ring with closed point s. Let $X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $E \subset X_{s}$ be a subset. There exists a closed subscheme $Z \subset S$ with the following property: for any morphism of pointed schemes $(T, t) \rightarrow(S, s)$ the following are equivalent
(1) $\mathcal{F}_{T}$ is flat over $T$ at all points of the fibre $X_{t}$ which map to a point of $E \subset X_{s}$, and
(2) $\operatorname{Spec}\left(\mathcal{O}_{T, t}\right) \rightarrow S$ factors through $Z$.

Moreover, if $X \rightarrow S$ is locally of finite presentation, $\mathcal{F}$ is of finite presentation, and $E \subset X_{s}$ is closed and quasi-compact, then $Z \rightarrow S$ is of finite presentation.

Proof. For $x \in X_{s}$ denote $Z_{x} \subset S$ the closed subscheme we found in Remark 37.24.2. Then it is clear that $Z=\bigcap_{x \in E} Z_{x}$ works!

To prove the final statement assume $X$ locally of finite presentation, $\mathcal{F}$ of finite presentation and $Z$ closed and quasi-compact. First, choose finitely many affine opens $W_{j} \subset X$ such that $E \subset \bigcup W_{j}$. It clearly suffices to prove the result for each morphism $W_{j} \rightarrow S$ with sheaf $\left.\mathcal{F}\right|_{X_{j}}$ and closed subset $E \cap W_{j}$. Hence we may assume $X$ is affine. In this case, More on Algebra, Lemma 15.13 .4 shows that the functor defined by (1) is "limit preserving". Hence we can show that $Z \rightarrow S$ is of finite presentation exactly as in the last part of the proof of Theorem 37.24.1.

052G Remark 37.24.4. Tracing the proof of Lemma 37.24 .3 to its origins we find a long and winding road. But if we assume that
(1) $f$ is of finite type,
(2) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module,
(3) $E=X_{s}$, and
(4) $S$ is the spectrum of a Noetherian complete local ring.
then there is a proof relying completely on more elementary algebra as follows: first we reduce to the case where $X$ is affine by taking a finite affine open cover. In this case $Z$ exists by More on Algebra, Lemma 15.14.3. The key step in this proof is constructing the closed subscheme $Z$ step by step inside the truncations $\operatorname{Spec}\left(\mathcal{O}_{S, s} / \mathfrak{m}_{s}^{n}\right)$. This relies on the fact that flattening stratifications always exist when the base is Artinian, and the fact that $\mathcal{O}_{S, s}=\lim \mathcal{O}_{S, s} / \mathfrak{m}_{s}^{n}$.

### 37.25. Variants of a lemma

0ASZ In this section we discuss variants of Algebra, Lemmas 10.127.4 and 10.98.1. The most general version is Proposition 37.25 .13 , this was stated as GR71, Lemma 4.2.2] but the proof in loc.cit. only gives the weaker result as stated in Lemma 37.25.5. The intricate proof of Proposition 37.25 .13 is due to Ofer Gabber. As we currently have no application for the proposition we encourage the reader to skip to the next section after reading the proof of Lemma 37.25.5 this lemma will be used in the next section to prove Theorem 37.26.1.

0 AT0 Situation 37.25.1. Let $\varphi: A \rightarrow B$ be a local ring homomorphism of local rings which is essentially of finite type. Let $M$ be a flat $A$-module, $N$ a finite $B$-module and $u: N \rightarrow M$ an $A$-module map such that $\bar{u}: N / \mathfrak{m}_{A} N \rightarrow M / \mathfrak{m}_{A} M$ is injective.

In this situation it is our goal to show that $u$ is $A$-universally injective, $N$ is of finite presentation over $B$, and $N$ is flat as an $A$-module. If this is true, we will say the lemma holds in the given situation.

0AT1 Lemma 37.25.2. If in Situation 37.25.1 the ring $A$ is Noetherian then the lemma holds.

Proof. Applying Algebra, Lemma 10.98 .1 we see that $u$ is injective and that $N / u(M)$ is flat over $A$. Then $u$ is $A$-universally injective (Algebra, Lemma 10.38.12) and $N$ is $A$-flat (Algebra, Lemma 10.38.13). Since $B$ is Noetherian in this case we see that $N$ is of finite presentation.

0AT2 Lemma 37.25.3. Let $A_{0}$ be a local ring. If the lemma holds for every Situation 37.25 .1 with $A=A_{0}$, with $B$ a localization of a polynomial algebra over $A$, and $N$ of finite presentation over $B$, then the lemma holds for every Situation 37.25.1 with $A=A_{0}$.

Proof. Let $A \rightarrow B, u: N \rightarrow M$ be as in Situation 37.25.1. Write $B=C / I$ where $C$ is the localization of a polynomial algebra over $A$ at a prime. If we can show that $N$ is finitely presented as a $C$-module, then a fortiori this shows that $N$ is finitely presented as a $B$-module (see Algebra, Lemma 10.6.4). Hence we may assume that $B$ is the localization of a polynomial algebra. Next, write $N=B^{\oplus n} / K$ for some submodule $K \subset B^{\oplus n}$. Since $B / \mathfrak{m}_{A} B$ is Noetherian (as it is essentially of finite type over a field), there exist finitely many elements $k_{1}, \ldots, k_{s} \in K$ such that for $K^{\prime}=\sum B k_{i}$ and $N^{\prime}=B^{\oplus n} / K^{\prime}$ the canonical surjection $N^{\prime} \rightarrow N$ induces an isomorphism $N^{\prime} / \mathfrak{m}_{A} N^{\prime} \cong N / \mathfrak{m}_{A} N$. Now, if the lemma holds for the composition $u^{\prime}: N^{\prime} \rightarrow M$, then $u^{\prime}$ is injective, hence $N^{\prime}=N$ and $u^{\prime}=u$. Thus the lemma holds for the original situation.

0AT3 Lemma 37.25.4. If in Situation 37.25.1 the ring $A$ is henselian then the lemma holds.

Proof. It suffices to prove this when $B$ is essentially of finite presentation over $A$ and $N$ is of finite presentation over $B$, see Lemma 37.25 .3 Let us temporarily make the additional assumption that $N$ is flat over $A$. Then $N$ is a filtered colimit $N=\operatorname{colim}_{i} F_{i}$ of free $A$-modules $F_{i}$ such that the transition maps $u_{i i^{\prime}}: F_{i} \rightarrow F_{i^{\prime}}$ are injective modulo $\mathfrak{m}_{A}$, see Lemma 37.19.5. Each of the compositions $u_{i}: F_{i} \rightarrow M$ is $A$-universally injective by Lemma 37.7 .5 wherefore $u=\operatorname{colim} u_{i}$ is $A$-universally injective as desired.

Assume $A$ is a henselian local ring, $B$ is essentially of finite presentation over $A, N$ of finite presentation over $B$. By Theorem 37.24 .1 there exists a finitely generated ideal $I \subset A$ such that $N / I N$ is flat over $A / I$ and such that $N / I^{2} N$ is not flat over $A / I^{2}$ unless $I=0$. The result of the previous paragraph shows that the lemma holds for $u \bmod I: N / I N \rightarrow M / I M$ over $A / I$. Consider the commutative diagram

whose rows are exact by right exactness of $\otimes$ and the fact that $M$ is flat over $A$. Note that the left vertical arrow is the map $N / I N \otimes_{A / I} I / I^{2} \rightarrow M / I M \otimes_{A / I} I / I^{2}$, hence is injective. A diagram chase shows that the lower left arrow is injective, i.e., $\operatorname{Tor}_{A / I^{2}}^{1}\left(I / I^{2}, M / I^{2}\right)=0$ see Algebra, Remark 10.74.9. Hence $N / I^{2} N$ is flat over $A / I^{2}$ by Algebra, Lemma 10.98 .8 a contradiction unless $I=0$.

The following lemma discusses the special case of Situation 37.25 .1 where $M$ has a $B$-module structure and $u$ is $B$-linear. This is the case most often used in practice and it is significantly easier to prove than the general case.
0AT4 Lemma 37.25.5. Let $A \rightarrow B$ be a local ring homomorphism of local rings which is essentially of finite type. Let $u: N \rightarrow M$ be a $B$-module map. If $N$ is a finite $B$-module, $M$ is flat over $A$, and $\bar{u}: N / \mathfrak{m}_{A} N \rightarrow M / \mathfrak{m}_{A} M$ is injective, then $u$ is A-universally injective, $N$ is of finite presentation over $B$, and $N$ is flat over $A$.

Proof. Let $A \rightarrow A^{h}$ be the henselization of $A$. Let $B^{\prime}$ be the localization of $B \otimes_{A} A^{h}$ at the maximal ideal $\mathfrak{m}_{B} \otimes A^{h}+B \otimes \mathfrak{m}_{A^{h}}$. Since $B \rightarrow B^{\prime}$ is flat (hence faithfully flat, see Algebra, Lemma 10.38 .17 ), we may replace $A \rightarrow B$ with $A^{h} \rightarrow B^{\prime}$, the module $M$ by $M \otimes_{B} B^{\prime}$, the module $N$ by $N \otimes_{B} B^{\prime}$, and $u$ by $u \otimes \operatorname{id}_{B^{\prime}}$, see Algebra, Lemmas 10.82 .2 and 10.38 .9 . Thus we may assume that $A$ is a henselian local ring. In this case our lemma follows from the more general Lemma 37.25.4

0AT5 Lemma 37.25.6. If in Situation 37.25.1 the ring $A$ is a valuation ring then the lemma holds.

Proof. Recall that an $A$-module is flat if and only if it is torsion free, see More on Algebra, Lemma 15.16.10. Let $T \subset N$ be the $A$-torsion. Then $u(T)=0$ and $N / T$ is $A$-flat. Hence $N / T$ is finitely presented over $B$, see More on Algebra, Lemma 15.19.6. Thus $T$ is a finite $B$-module, see Algebra, Lemma 10.5 .3 . Since $N / T$ is $A$ flat we see that $T / \mathfrak{m}_{A} T \subset N / \mathfrak{m}_{A} N$, see Algebra, Lemma 10.38.12. As $\bar{u}$ is injective but $u(T)=0$, we conclude that $T / \mathfrak{m}_{A} T=0$. Hence $T=0$ by Nakayama's lemma, see Algebra, Lemma 10.19.1. At this point we have proved two out of the three assertions ( $N$ is $A$-flat and of finite presentation over $B$ ) and what is left is to show that $u$ is universally injective.
By Algebra, Theorem 10.81 .3 it suffices to show that $N \otimes_{A} Q \rightarrow M \otimes_{A} Q$ is injective for every finitely presented $A$-module $Q$. By More on Algebra, Lemma 15.85 .3 we may assume $Q=A /(a)$ with $a \in \mathfrak{m}_{A}$ nonzero. Thus it suffices to show that $N / a N \rightarrow M / a M$ is injective. Let $x \in N$ with $u(x) \in a M$. By Lemma 37.19.6 we know that $x$ has a content ideal $I \subset A$. Since $I$ is finitely generated (More on Algebra, Lemma 15.18 .2 and $A$ is a valuation ring, we have $I=(b)$ for some $b$ (by Algebra, Lemma 10.49.15). By More on Algebra, Lemma 15.18 .3 the element $u(x)$ has content ideal $I$ as well. Since $u(x) \in a M$ we see that $(b) \subset(a)$ by More on Algebra, Definition 15.18.1. Since $x \in b N$ we conclude $x \in a N$ as desired.

Consider the following situation
0AT6 (37.25.6.1)

$$
\begin{gathered}
A \rightarrow B \text { of finite presentation, } S \subset B \text { a multiplicative subset, and } \\
N \text { a finitely presented } S^{-1} B \text {-module }
\end{gathered}
$$

In this situation a pure spreadout is an affine open $U \subset \operatorname{Spec}(B)$ with $\operatorname{Spec}\left(S^{-1} B\right) \subset$ $U$ and a finitely presented $\mathcal{O}(U)$-module $N^{\prime}$ extending $N$ such that $N^{\prime}$ is $A$ projective and $N^{\prime} \rightarrow N=S^{-1} N^{\prime}$ is $A$-universally injective.
In 37.25 .6 .1 if $A \rightarrow A_{1}$ is a ring map, then we can base change: take $B_{1}=B \otimes_{A} A_{1}$, let $S_{1} \subset B_{1}$ be the image of $S$, and let $N_{1}=N \otimes_{A} A_{1}$. This works because $S_{1}^{-1} B_{1}=S^{-1} B \otimes_{A} A_{1}$. We will use this without further mention in the following.

0AT7 Lemma 37.25.7. In 37.25.6.1) if there exists a pure spreadout, then
(1) elements of $N$ have content ideals in $A$, and
(2) if $u: N \rightarrow M$ is a morphism to a flat $A$-module $M$ such that $N / \mathfrak{m} N \rightarrow$ $M / \mathfrak{m} M$ is injective for all maximal ideals $\mathfrak{m}$ of $A$, then $u$ is $A$-universally injective.
Proof. Choose $U, N^{\prime}$ as in the definition of a pure spreadout. Any element $x^{\prime} \in N^{\prime}$ has a content ideal in $A$ because $N^{\prime}$ is $A$-projective (this can easily be seen directly, but it also follows from More on Algebra, Lemma 15.18 .4 and Algebra, Example 10.90.1). Since $N^{\prime} \rightarrow N$ is $A$-universally injective, we see that the image $x \in N$ of any $x^{\prime} \in N^{\prime}$ has a content ideal in $A$ (it is the same as the content ideal of $x^{\prime}$ ). For a general $x \in N$ we choose $s \in S$ such that $s x$ is in the image of $N^{\prime} \rightarrow N$ and we use that $x$ and $s x$ have the same content ideal.
Let $u: N \rightarrow M$ be as in (2). To show that $u$ is $A$-universally injective, we may replace $A$ by a localization at a maximal ideal (small detail omitted). Assume $A$ is local with maximal ideal $\mathfrak{m}$. Pick $s \in S$ and consider the composition

$$
N^{\prime} \rightarrow N \xrightarrow{1 / s} N \xrightarrow{u} M
$$

Each of these maps is injective modulo $\mathfrak{m}$, hence the composition is $A$-universally injective by Lemma 37.7.5. Since $N=\operatorname{colim}_{s \in S}(1 / s) N^{\prime}$ we conclude that $u$ is $A$-inversally injective as a colimit of universally injective maps.

0AT8 Lemma 37.25.8. In 37.25.6.1) for every $\mathfrak{p} \in \operatorname{Spec}(A)$ there is a finitely generated ideal $I \subset \mathfrak{p} A_{\mathfrak{p}}$ such that over $A_{\mathfrak{p}} / I$ we have a pure spreadout.
Proof. We may replace $A$ by $A_{\mathfrak{p}}$. Thus we may asume $A$ is local and $\mathfrak{p}$ is the maximal ideal $\mathfrak{m}$ of $A$. We may write $N=S^{-1} N^{\prime}$ for some finitely presented $B$-module $N^{\prime}$ by clearing denominators in a presentation of $N$ over $S^{-1} B$. Since $B / \mathfrak{m} B$ is Noetherian, the kernel $K$ of $N^{\prime} / \mathfrak{m} N^{\prime} \rightarrow N / \mathfrak{m} N$ is finitely generated. Thus we can pick $s \in S$ such that $K$ is annihilated by $s$. After replacing $B$ by $B_{s}$ which is allowed as it just means passing to an affine open subscheme of $\operatorname{Spec}(B)$, we find that the elements of $S$ are injective on $N^{\prime} / \mathfrak{m} N^{\prime}$. At this point we choose a local subring $A_{0} \subset A$ essentially of finite type over $\mathbf{Z}$, a finite type ring map $A_{0} \rightarrow B_{0}$ such that $B=A \otimes_{A_{0}} B_{0}$, and a finite $B_{0}$-module $N_{0}^{\prime}$ such that $N^{\prime}=B \otimes_{B_{0}} N_{0}^{\prime}=A \otimes_{A_{0}} N_{0}^{\prime}$. We claim that $I=\mathfrak{m}_{A_{0}} A$ works. Namely, we have

$$
N^{\prime} / I N^{\prime}=N_{0}^{\prime} / \mathfrak{m}_{A_{0}} N_{0}^{\prime} \otimes_{\kappa_{A_{0}}} A / I
$$

which is free over $A / I$. Multiplication by the elements of $S$ is injective after dividing out by the maximal ideal, hence $N^{\prime} / I N^{\prime} \rightarrow N / I N$ is universally injective for example by Lemma 37.7.6.
0AT9 Lemma 37.25.9. In 37.25.6.1 assume $N$ is $A$-flat, $M$ is a flat $A$-module, and $u: N \rightarrow M$ is an $A$-module map such that $u \otimes i d_{\kappa(\mathfrak{p})}$ is injective for all $\mathfrak{p} \in \operatorname{Spec}(A)$. Then $u$ is $A$-universally injective.
Proof. By Algebra, Lemma 10.81 .14 it suffices to check that $N / I N \rightarrow M / I M$ is injective for every ideal $I \subset A$. After replacing $A$ by $A / I$ we see that it suffices to prove that $u$ is injective.

Proof that $u$ is injective. Let $x \in N$ be a nonzero element of the kernel of $u$. Then there exists a weakly associated prime $\mathfrak{p}$ of the module $A x$, see Algebra, Lemma 10.65.4 Replacing $A$ by $A_{\mathfrak{p}}$ we may assume $A$ is local and we find a nonzero element $y \in A x$ whose annihilator has radical equal to $\mathfrak{m}_{A}$, see Algebra, Lemma 10.65.2 Thus $\operatorname{Supp}(y) \subset \operatorname{Spec}\left(S^{-1} B\right)$ is nonempty and contained in the closed
fibre of $\operatorname{Spec}\left(S^{-1} B\right) \rightarrow \operatorname{Spec}(A)$. Let $I \subset \mathfrak{m}_{A}$ be a finitely generated ideal so that we have a pure spreadout over $A / I$, see Lemma 37.25.8. Then $I^{n} y=0$ for some $n$. Now $y \in \operatorname{Ann}_{M}\left(I^{n}\right)=\operatorname{Ann}_{A}\left(I^{n}\right) \otimes_{R} N$ by flatness. Thus, to get the desired contradiction, it suffices to show that

$$
\operatorname{Ann}_{A}\left(I^{n}\right) \otimes_{R} N \longrightarrow \operatorname{Ann}_{A}\left(I^{n}\right) \otimes_{R} M
$$

is injective. Since $N$ and $M$ are flat and since $\operatorname{Ann}_{A}\left(I^{n}\right)$ is annihilated by $I^{n}$, it suffices to show that $Q \otimes_{A} N \rightarrow Q \otimes_{A} M$ is injective for every $A$-module $Q$ annihilated by $I$. This holds by our choice of $I$ and Lemma 37.25.7 part (2).

0ATA Lemma 37.25.10. Let $A$ be a local domain. Let $S$ be a set of finitely generated ideals of $A$. Assume that $S$ is closed under products and such that $\bigcap_{I \in S} V(I)$ is the complement of the generic point of $\operatorname{Spec}(A)$. Then $\bigcap_{I \in S} I=(0)$.
Proof. Let $f \in A$ be nonzero. Then $V(f) \subset \bigcup_{I \in S} V(I)$. Since the constructible topology on $V(f)$ is quasi-compact (Topology, Lemma 5.22 .2 and Algebra, Lemma 10.25 .2 we find that $V(f) \subset V\left(I_{1}\right) \cup \ldots \cup V\left(I_{n}\right)$ for some $I_{j} \in S$. Because $I_{1} \ldots I_{n} \in$ $S$ we see that $V(f) \subset V(I)$ for some $I$. As $I$ is finitely generated this implies that $I^{m} \subset(f)$ for some $m$ and since $S$ is closed under products we see that $I \subset\left(f^{2}\right)$ for some $I \in S$. Then it is not possible to have $f \in I$.

0 LTB Lemma 37.25.11. Let $A$ be a local ring. Let $I, J \subset A$ be ideals. If $J$ is finitely generated and $I \subset J^{n}$ for all $n \geq 1$, then $V(I)$ contains the closed points of $\operatorname{Spec}(A) \backslash$ $V(J)$.

Proof. Let $\mathfrak{p} \subset A$ be a closed point of $\operatorname{Spec}(A) \backslash V(J)$. We want to show that $I \subset \mathfrak{p}$. If not, then some $f \in I$ maps to a nonzero element of $A / \mathfrak{p}$. Note that $V(J) \cap \operatorname{Spec}(A / \mathfrak{p})$ is the set of non-generic points. Hence by Lemma 37.25.10 applied to the collection of ideals $J^{n} A / \mathfrak{p}$ we conclude that the image of $f$ is zero in $A / \mathfrak{p}$.

0 ATC Lemma 37.25.12. Let $A$ be a local ring. Let $I \subset A$ be an ideal. Let $U \subset \operatorname{Spec}(A)$ be quasi-compact open. Let $M$ be an $A$-module. Assume that
(1) $M / I M$ is flat over $A / I$,
(2) $M$ is flat over $U$,

Then $M / I_{2} M$ is flat over $A / I_{2}$ where $I_{2}=\operatorname{Ker}\left(I \rightarrow \Gamma\left(U, I / I^{2}\right)\right)$.
Proof. It suffices to show that $M \otimes_{A} I / I_{2} \rightarrow I M / I_{2} M$ is injective, see Algebra, Lemma 10.98 .9 . This is true over $U$ by assumption (2). Thus it suffices to show that $M \otimes_{A} I / I_{2}$ injects into its sections over $U$. We have $M \otimes_{A} I / I_{2}=M / I M \otimes_{A} I / I_{2}$ and $M / I M$ is a filtered colimit of finite free $A / I$-modules (Algebra, Theorem 10.80.4). Hence it suffices to show that $I / I_{2}$ injects into its sections over $U$, which follows from the construction of $I_{2}$.

05U9 Proposition 37.25.13. Let $A \rightarrow B$ be a local ring homomorphism of local rings which is essentially of finite type. Let $M$ be a flat $A$-module, $N$ a finite $B$-module and $u: N \rightarrow M$ an A-module map such that $\bar{u}: N / \mathfrak{m}_{A} N \rightarrow M / \mathfrak{m}_{A} M$ is injective. Then $u$ is $A$-universally injective, $N$ is of finite presentation over $B$, and $N$ is flat over $A$.

Proof. We may assume that $B$ is the localization of a finitely presented $A$-algebra $B_{0}$ and that $N$ is the localization of a finitely presented $B_{0}$-module $M_{0}$, see Lemma
37.25.3 By Lemma 37.21.5 there exists a "generic flatness stratification" for $\widetilde{M}_{0}$ on $\operatorname{Spec}\left(B_{0}\right)$ over $\operatorname{Spec}(A)$. Translating back to $N$ we find a sequence of closed subschemes

$$
S=\operatorname{Spec}(A) \supset S_{0} \supset S_{1} \supset \ldots \supset S_{t}=\emptyset
$$

with $S_{i} \subset S$ cut out by a finitely generated ideal of $A$ such that the pullback of $\widetilde{N}$ to $\operatorname{Spec}(B) \times_{S}\left(S_{i} \backslash S_{i+1}\right)$ is flat over $S_{i} \backslash S_{i+1}$. We will prove the proposition by induction on $t$ (the base case $t=1$ will be proved in parallel with the other steps). Let $\operatorname{Spec}\left(A / J_{i}\right)$ be the scheme theoretic closure of $S_{i} \backslash S_{i+1}$.
Claim 1. $N / J_{i} N$ is flat over $A / J_{i}$. This is immediate for $i=t-1$ and follows from the induction hypothesis for $i>0$. Thus we may assume $t>1, S_{t-1} \neq \emptyset$, and $J_{0}=0$ and we have to prove that $N$ is flat. Let $J \subset A$ be the ideal defining $S_{1}$. By induction on $t$ again, we also have flatness modulo powers of $J$. Let $A^{h}$ be the henselization of $A$ and let $B^{\prime}$ be the localization of $B \otimes_{A} A^{h}$ at the maximal ideal $\mathfrak{m}_{B} \otimes A^{h}+B \otimes \mathfrak{m}_{A^{h}}$. Then $B \rightarrow B^{\prime}$ is faithfully flat. Set $N^{\prime}=N \otimes_{B} B^{\prime}$. Note that $N^{\prime}$ is $A^{h}$-flat if and only if $N$ is $A$-flat. By Theorem 37.24 .1 there is a smallest ideal $I \subset A^{h}$ such that $N^{\prime} / I N^{\prime}$ is flat over $A^{h} / I$, and $I$ is finitely generated. By the above $I \subset J^{n} A^{h}$ for all $n \geq 1$. Let $S_{i}^{h} \subset \operatorname{Spec}\left(A^{h}\right)$ be the inverse image of $S_{i} \subset \operatorname{Spec}(A)$. By Lemma 37.25 .11 we see that $V(I)$ contains the closed points of $U=\operatorname{Spec}\left(A^{h}\right)-S_{1}^{h}$. By construction $N^{\prime}$ is $A^{h}$-flat over $U$. By Lemma 37.25 .12 we see that $N^{\prime} / I_{2} N^{\prime}$ is flat over $A / I_{2}$, where $I_{2}=\operatorname{Ker}\left(I \rightarrow \Gamma\left(U, I / I^{2}\right)\right)$. Hence $I=I_{2}$ by minimality of $I$. This implies that $I=I^{2}$ locally on $U$, i.e., we have $I \mathcal{O}_{U, u}=(0)$ or $I \mathcal{O}_{U, u}=(1)$ for all $u \in U$. Since $V(I)$ contains the closed points of $U$ we see that $I=0$ on $U$. Since $U \subset \operatorname{Spec}\left(A^{h}\right)$ is scheme theoretically dense (because replaced $A$ by $A / J_{0}$ in the beginning of this paragraph), we see that $I=0$. Thus $N^{\prime}$ is $A^{h}$-flat and hence Claim 1 holds.
We return to the situation as laid out before Claim 1. With $A^{h}$ the henselization of $A$, with $B^{\prime}$ the localization of $B \otimes_{A} A^{h}$ at the maximal ideal $\mathfrak{m}_{B} \otimes A^{h}+B \otimes$ $\mathfrak{m}_{A^{h}}$, and with $N^{\prime}=N \otimes_{B} B^{\prime}$ we now see that the flattening ideal $I \subset A^{h}$ of Theorem 37.24.1 is nilpotent. If $\operatorname{nil}\left(A^{h}\right)$ denotes the ideal of nilpotent elements, then $\operatorname{nil}\left(A^{h}\right)=\operatorname{nil}(A) A^{h}$ (More on Algebra, Lemma 15.36.5. Hence there exists a finitely generated nilpotent ideal $I_{0} \subset A$ such that $N / I_{0} N$ is flat over $A / I_{0}$.
Claim 2. For every prime ideal $\mathfrak{p} \subset A$ the map $\kappa(\mathfrak{p}) \otimes_{A} N \rightarrow \kappa(\mathfrak{p}) \otimes_{A} M$ is injective. We say $\mathfrak{p}$ is bad it this is false. Suppose that $C$ is a nonempty chain of bad primes and set $\mathfrak{p}^{*}=\bigcup_{\mathfrak{p} \in C} \mathfrak{p}$. By Lemma 37.25 .8 there is a finitely generated ideal $\mathfrak{a} \subset \mathfrak{p}^{*} A_{\mathfrak{p}^{*}}$ such that there is a pure spreadout over $V(\mathfrak{a})$. If $\mathfrak{p}^{*}$ were good, then it would follow from Lemma 37.25 .7 that the points of $V(\mathfrak{a})$ are good. However, since $\mathfrak{a}$ is finitely generated and since $\mathfrak{p}^{*} A_{\mathfrak{p}^{*}}=\bigcup_{\mathfrak{p} \in C} A_{\mathfrak{p}^{*}}$ we see that $V(\mathfrak{a})$ contains a $\mathfrak{p} \in C$, contradiction. Hence $\mathfrak{p}^{*}$ is bad. By Zorn's lemma, if there exists a bad prime, there exists a maximal one, say $\mathfrak{p}$. In other words, we may assume every $\mathfrak{p}^{\prime} \supset \mathfrak{p}, \mathfrak{p}^{\prime} \neq \mathfrak{p}$ is good. In this case we see that for every $f \in A, f \notin \mathfrak{p}$ the map $u \otimes \mathrm{id}_{A /(\mathfrak{p}+f)}$ is universally injective, see Lemma 37.25.9. Thus it suffices to show that $N / \mathfrak{p} N$ is separated for the topology defined by the submodules $f(N / \mathfrak{p} N)$. Since $B \rightarrow B^{\prime}$ is faithfully flat, it is enough to prove the same for the module $N^{\prime} / \mathfrak{p} N^{\prime}$. By Lemma 37.19 .5 and More on Algebra, Lemma 15.18 .4 elements of $N^{\prime} / \mathfrak{p} N^{\prime}$ have content ideals in $A^{h} / \mathfrak{p} A^{h}$. Thus it suffices to show that $\bigcap_{f \in A, f \notin \mathfrak{p}} f\left(A^{h} / \mathfrak{p} A^{h}\right)=0$. Then it suffices to show the same for $A^{h} / \mathfrak{q} A^{h}$ for every prime $\mathfrak{q} \subset A^{h}$ minimal over $\mathfrak{p} A^{h}$. Because $A \rightarrow A^{h}$ is the henselization, every $\mathfrak{q}$ contracts to $\mathfrak{p}$ and every $\mathfrak{q}^{\prime} \supset \mathfrak{q}$,
$\mathfrak{q}^{\prime} \neq \mathfrak{q}$ contracts to a prime $\mathfrak{p}^{\prime}$ which strictly contains $\mathfrak{p}$. Thus we get the vanishing of the intersections from Lemma 37.25.10.

At this point we can put everything together. Namely, using Claim 1 and Claim 2 we see that $N / I_{0} N \rightarrow M / I_{0} M$ is $A / I_{0}$-universally injective by Lemma 37.25 .9 . Then the diagrams

show that the left vertical arrows are injective. Hence by Algebra, Lemma 10.98 .9 we see that $N$ is flat. In a similar way the universal injectivity of $u$ can be reduced (even without proving flatness of $N$ first) to the one modulo $I_{0}$. This finishes the proof.

### 37.26. Flat finite type modules, Part III

05 U 8 The following result is one of the main results of this chapter.
05UA Theorem 37.26.1. Let $f: X \rightarrow S$ be locally of finite type. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module of finite type. Let $x \in X$ with image $s \in S$. The following are equivalent
(1) $\mathcal{F}$ is flat at $x$ over $S$, and
(2) for every $x^{\prime} \in A s s_{X_{s}}\left(\mathcal{F}_{s}\right)$ which specializes to $x$ we have that $\mathcal{F}$ is flat at $x^{\prime}$ over $S$.

Proof. It is clear that (1) implies (2) as $\mathcal{F}_{x^{\prime}}$ is a localization of $\mathcal{F}_{x}$ for every point which specializes to $x$. Set $A=\mathcal{O}_{S, s}, B=\mathcal{O}_{X, x}$ and $N=\mathcal{F}_{x}$. Let $\Sigma \subset B$ be the multiplicative subset of $B$ of elements which act as nonzerodivisors on $N / \mathfrak{m}_{A} N$. Assumption (2) implies that $\Sigma^{-1} N$ is $A$-flat by the description of $\operatorname{Spec}\left(\Sigma^{-1} N\right)$ in Lemma 37.7.1. On the other hand, the map $N \rightarrow \Sigma^{-1} N$ is injective modulo $\mathfrak{m}_{A}$ by construction. Hence applying Lemma 37.25 .5 we win.

Now we apply this directly to obtain the following useful results.
05UB Lemma 37.26.2. Let $S$ be a local scheme with closed point s. Let $f: X \rightarrow S$ be locally of finite type. Let $\mathcal{F}$ be a finite type $\mathcal{O}_{X}$-module. Assume that
(1) every point of $A s s_{X / S}(\mathcal{F})$ specializes to a point of the closed fibre $X_{s}{ }^{3}$,
(2) $\mathcal{F}$ is flat over $S$ at every point of $X_{s}$.

Then $\mathcal{F}$ is flat over $S$.
Proof. This is immediate from the fact that it suffices to check for flatness at points of the relative assassin of $\mathcal{F}$ over $S$ by Theorem 37.26.1.

[^106]
### 37.27. Universal flattening

05PS If $f: X \rightarrow S$ is a proper, finitely presented morphism of schemes then one can find a universal flattening of $f$. In this section we discuss this and some of its variants.
05UC Lemma 37.27.1. In Situation 37.20.7. For each $p \geq 0$ the functor $H_{p}$ 37.20.7.2) is representable by a locally closed immersion $S_{p} \rightarrow S$. If $\mathcal{F}$ is of finite presentation, then $S_{p} \rightarrow S$ is of finite presentation.

Proof. For each $S$ we will prove the statement for all $p \geq 0$ concurrently. The functor $H_{p}$ is a sheaf for the fppf topology by Lemma 37.20.8. Hence combining Descent, Lemma 34.35.1, More on Morphisms, Lemma 36.39.1, and Descent, Lemma 34.20.1 we see that the question is local for the étale topology on $S$. In particular, the question is Zariski local on $S$.

For $s \in S$ denote $\xi_{s}$ the unique generic point of the fibre $X_{s}$. Note that for every $s \in S$ the restriction $\mathcal{F}_{s}$ of $\mathcal{F}$ is locally free of some rank $p(s) \geq 0$ in some neighbourhood of $\xi_{s}$. (As $X_{s}$ is irreducible and smooth this follows from generic flatness for $\mathcal{F}_{s}$ over $X_{s}$, see Algebra, Lemma 10.117.1 although this is overkill.) For future reference we note that

$$
p(s)=\operatorname{dim}_{\kappa\left(\xi_{s}\right)}\left(\mathcal{F}_{\xi_{s}} \otimes_{\mathcal{O}_{X, \xi_{s}}} \kappa\left(\xi_{s}\right)\right) .
$$

In particular $H_{p(s)}(s)$ is nonempty and $H_{q}(s)$ is empty if $q \neq p(s)$.
Let $U \subset X$ be an open subscheme. As $f: X \rightarrow S$ is smooth, it is open. It is immediate from 37.20 .7 .2 that the functor $H_{p}$ for the pair $\left(\left.f\right|_{U}: U \rightarrow f(U),\left.\mathcal{F}\right|_{U}\right)$ and the functor $\bar{H}_{p}$ for the pair $\left(\left.f\right|_{f^{-1}(f(U))},\left.\mathcal{F}\right|_{f^{-1}(f(U))}\right)$ are the same. Hence to prove the existence of $S_{p}$ over $f(U)$ we may always replace $X$ by $U$.
Pick $s \in S$. There exists an affine open neighbourhood $U$ of $\xi_{s}$ such that $\left.\mathcal{F}\right|_{U}$ can be generated by at most $p(s)$ elements. By the arguments above we see that in order to prove the statement for $H_{p(s)}$ in an neighbourhood of $s$ we may assume that $\mathcal{F}$ is generated by $p(s)$ elements, i.e., that there exists a surjection

$$
u: \mathcal{O}_{X}^{\oplus p(s)} \longrightarrow \mathcal{F}
$$

In this case it is clear that $H_{p(s)}$ is equal to $F_{\text {iso }} 37.20 .1 .1$ for the map $u$ (this follows immediately from Lemma 37.19.1 but also from Lemma 37.12.1 after shrinking a bit more so that both $S$ and $X$ are affine.) Thus we may apply Theorem 37.23 .3 to see that $H_{p(s)}$ is representable by a closed immersion in a neighbourhood of $s$.

The result follows formally from the above. Namely, the arguments above show that locally on $S$ the function $s \mapsto p(s)$ is bounded. Hence we may use induction on $p=\max _{s \in S} p(s)$. The functor $H_{p}$ is representable by a closed immersion $S_{p} \rightarrow S$ by the above. Replace $S$ by $S \backslash S_{p}$ which drops the maximum by at least one and we win by induction hypothesis.

To see that $S_{p} \rightarrow S$ is of finite presentation if $\mathcal{F}$ is of finite presentation combine Lemma 37.20.8 part (2) with Limits, Remark 31.5.2.

05UD Lemma 37.27.2. In Situation 37.20.9. Let $h: X^{\prime} \rightarrow X$ be an étale morphism. Set $\mathcal{F}^{\prime}=h^{*} \mathcal{F}$ and $f^{\prime}=f \circ h$. Let $F_{n}^{\prime}$ be (37.20.9.1) associated to $\left(f^{\prime}: X^{\prime} \rightarrow S, \mathcal{F}^{\prime}\right)$. Then $F_{n}$ is a subfunctor of $F_{n}^{\prime}$ and if $h\left(X^{\prime}\right) \supset A s s_{X / S}(\mathcal{F})$, then $F_{n}=F_{n}^{\prime}$.

Proof. Let $T \rightarrow S$ be any morphism. Then $h_{T}: X_{T}^{\prime} \rightarrow X_{T}$ is étale as a base change of the étale morphism $g$. For $t \in T$ denote $Z \subset X_{t}$ the set of points where $\mathcal{F}_{T}$ is not flat over $T$, and similarly denote $Z^{\prime} \subset X_{t}^{\prime}$ the set of points where $\mathcal{F}_{T}^{\prime}$ is not flat over $T$. As $\mathcal{F}_{T}^{\prime}=h_{T}^{*} \mathcal{F}_{T}$ we see that $Z^{\prime}=h_{t}^{-1}(Z)$, see Morphisms, Lemma 28.25.11. Hence $Z^{\prime} \rightarrow Z$ is an étale morphism, so $\operatorname{dim}\left(Z^{\prime}\right) \leq \operatorname{dim}(Z)$ (for example by Descent, Lemma 34.17 .2 or just because an étale morphism is smooth of relative dimension 0 ). This implies that $F_{n} \subset F_{n}^{\prime}$.
Finally, suppose that $h\left(X^{\prime}\right) \supset \operatorname{Ass}_{X / S}(\mathcal{F})$ and that $T \rightarrow S$ is a morphism such that $F_{n}^{\prime}(T)$ is nonempty, i.e., such that $\mathcal{F}_{T}^{\prime}$ is flat in dimensions $\geq n$ over $T$. Pick a point $t \in T$ and let $Z \subset X_{t}$ and $Z^{\prime} \subset X_{t}^{\prime}$ be as above. To get a contradiction assume that $\operatorname{dim}(Z) \geq n$. Pick a generic point $\xi \in Z$ corresponding to a component of dimension $\geq n$. Let $x \in \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{t}\right)$ be a generalization of $\xi$. Then $x$ maps to a point of $\operatorname{Ass}_{X / S}(\mathcal{F})$ by Divisors, Lemma 30.7.2 and Remark 30.7.3. Thus we see that $x$ is in the image of $h_{T}$, say $x=h_{T}\left(x^{\prime}\right)$ for some $x^{\prime} \in X_{T}^{\prime}$. But $x^{\prime} \notin Z^{\prime}$ as $x \rightsquigarrow \xi$ and $\operatorname{dim}\left(Z^{\prime}\right)<n$. Hence $\mathcal{F}_{T}^{\prime}$ is flat over $T$ at $x^{\prime}$ which implies that $\mathcal{F}_{T}$ is flat at $x$ over $T$ (by Morphisms, Lemma 28.25.11). Since this holds for every such $x$ we conclude that $\mathcal{F}_{T}$ is flat over $T$ at $\xi$ by Theorem 37.26 .1 which is the desired contradiction.

05UE Lemma 37.27.3. Assume that $X \rightarrow S$ is a smooth morphism of affine schemes with geometrically irreducible fibres of dimension $d$ and that $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module of finite presentation. Then $F_{d}=\coprod_{p=0, \ldots, c} H_{p}$ for some $c \geq 0$ with $F_{d}$ as in 37.20.9.1) and $H_{p}$ as in 37.20.7.2.
Proof. As $X$ is affine and $\mathcal{F}$ is quasi-coherent of finite presentation we know that $\mathcal{F}$ can be generated by $c \geq 0$ elements. Then $\operatorname{dim}_{\kappa(x)}\left(\mathcal{F}_{x} \otimes \kappa(x)\right)$ in any point $x \in X$ never exceeds $c$. In particular $H_{p}=\emptyset$ for $p>c$. Moreover, note that there certainly is an inclusion $\coprod H_{p} \rightarrow F_{d}$. Having said this the content of the lemma is that, if a base change $\mathcal{F}_{T}$ is flat in dimensions $\geq d$ over $T$ and if $t \in T$, then $\mathcal{F}_{T}$ is free of some rank $r$ in an open neighbourhood $U \subset X_{T}$ of the unique generic point $\xi$ of $X_{t}$. Namely, then $H_{r}$ contains the image of $U$ which is an open neighbourhood of $t$. The existence of $U$ follows from More on Morphisms, Lemma 36.13.7.
05UF Lemma 37.27.4. In Situation 37.20.9. Let $s \in S$ let $d \geq 0$. Assume
(1) there exists a complete dévissage of $\mathcal{F} / X / S$ over some point $s \in S$,
(2) $X$ is of finite presentation over $S$,
(3) $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation, and
(4) $\mathcal{F}$ is flat in dimensions $\geq d+1$ over $S$.

Then after possibly replacing $S$ by an open neighbourhood of $s$ the functor $F_{d}$ 37.20.9.1) is representable by a monomorphism $Z_{d} \rightarrow S$ of finite presentation.

Proof. A preliminary remark is that $X, S$ are affine schemes and that it suffices to prove $F_{d}$ is representable by a closed subscheme on the category of affine schemes over $S$. Hence throughout the proof of the lemma we work in the category of affine schemes over $S$.
Let $\left(Z_{k}, Y_{k}, i_{k}, \pi_{k}, \mathcal{G}_{k}, \alpha_{k}\right)_{k=1, \ldots, n}$ be a complete dévissage of $\mathcal{F} / X / S$ over $s$, see Definition 37.5.1. We will use induction on the length $n$ of the dévissage. Recall that $Y_{k} \rightarrow S$ is smooth with geometrically irreducible fibres, see Definition 37.4.1. Let $d_{k}$ be the relative dimension of $Y_{k}$ over $S$. Recall that $i_{k, *} \mathcal{G}_{k}=\operatorname{Coker}\left(\alpha_{k}\right)$
and that $i_{k}$ is a closed immersion. By the definitions referenced above we have $d_{1}=\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$ and

$$
d_{k}=\operatorname{dim}\left(\operatorname{Supp}\left(\operatorname{Coker}\left(\alpha_{k-1}\right)_{s}\right)\right)=\operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{G}_{k, s}\right)\right)
$$

for $k=2, \ldots, n$. It follows that $d_{1}>d_{2}>\ldots>d_{n} \geq 0$ because $\alpha_{k}$ is an isomorphism in the generic point of $\left(Y_{k}\right)_{s}$.
Note that $i_{1}$ is a closed immersion and $\mathcal{F}=i_{1, *} \mathcal{G}_{1}$. Hence for any morphism of schemes $T \rightarrow S$ with $T$ affine, we have $\mathcal{F}_{T}=i_{1, T, *} \mathcal{G}_{1, T}$ and $i_{1, T}$ is still a closed immersion of schemes over $T$. Thus $\mathcal{F}_{T}$ is flat in dimensions $\geq d$ over $T$ if and only if $\mathcal{G}_{1, T}$ is flat in dimensions $\geq d$ over $T$. Because $\pi_{1}: Z_{1} \rightarrow Y_{1}$ is finite we see in the same manner that $\mathcal{G}_{1, T}$ is flat in dimensions $\geq d$ over $T$ if and only if $\pi_{1, T, *} \mathcal{G}_{1, T}$ is flat in dimensions $\geq d$ over $T$. The same arguments work for "flat in dimensions $\geq d+1 "$ and we conclude in particular that $\pi_{1, *} \mathcal{G}_{1}$ is flat over $S$ in dimensions $\geq d+1$ by our assumption on $\mathcal{F}$.
Suppose that $d_{1}>d$. It follows from the discussion above that in particular $\pi_{1, *} \mathcal{G}_{1}$ is flat over $S$ at the generic point of $\left(Y_{1}\right)_{s}$. By Lemma 37.12.1 we may replace $S$ by an affine neighbourhood of $s$ and assume that $\alpha_{1}$ is $S$-universally injective. Because $\alpha_{1}$ is $S$-universally injective, for any morphism $T \rightarrow S$ with $T$ affine, we have a short exact sequence

$$
0 \rightarrow \mathcal{O}_{Y_{1}, T}^{\oplus r_{1}} \rightarrow \pi_{1, T, *} \mathcal{G}_{1, T} \rightarrow \operatorname{Coker}\left(\alpha_{1}\right)_{T} \rightarrow 0
$$

and still the first arrow is $T$-universally injective. Hence the set of points of $\left(Y_{1}\right)_{T}$ where $\pi_{1, T, *} \mathcal{G}_{1, T}$ is flat over $T$ is the same as the set of points of $\left(Y_{1}\right)_{T}$ where $\operatorname{Coker}\left(\alpha_{1}\right)_{T}$ is flat over $S$. In this way the question reduces to the sheaf $\operatorname{Coker}\left(\alpha_{1}\right)$ which has a complete dévissage of length $n-1$ and we win by induction.
If $d_{1}<d$ then $F_{d}$ is represented by $S$ and we win.
The last case is the case $d_{1}=d$. This case follows from a combination of Lemma 37.27 .3 and Lemma 37.27.1

05UG Theorem 37.27.5. In Situation 37.20.9. Assume moreover that $f$ is of finite presentation, that $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation, and that $\mathcal{F}$ is pure relative to $S$. Then $F_{n}$ is representable by a monomorphism $Z_{n} \rightarrow S$ of finite presentation.

Proof. The functor $F_{n}$ is a sheaf for the fppf topology by Lemma 37.20.10. Hence combining Descent, Lemma 34.35.1, More on Morphisms, Lemma 36.39.1, and Descent, Lemmas 34.19 .29 and 34.19 .11 we see that the question is local for the étale topology on $S$.
In particular the situation is local for the Zariski topology on $S$ and we may assume that $S$ is affine. In this case the dimension of the fibres of $f$ is bounded above, hence we see that $F_{n}$ is representable for $n$ large enough. Thus we may use descending induction on $n$. Suppose that we know $F_{n+1}$ is representable by a monomorphism $Z_{n+1} \rightarrow S$ of finite presentation. Consider the base change $X_{n+1}=Z_{n+1} \times_{S} X$ and the pullback $\mathcal{F}_{n+1}$ of $\mathcal{F}$ to $X_{n+1}$. The morphism $Z_{n+1} \rightarrow S$ is quasi-finite as it is a monomorphism of finite presentation, hence Lemma 37.16.4 implies that $\mathcal{F}_{n+1}$ is pure relative to $Z_{n+1}$. Since $F_{n}$ is a subfunctor of $F_{n+1}$ we conclude that in order to prove the result for $F_{n}$ it suffices to prove the result for the corresponding functor for the situation $\mathcal{F}_{n+1} / X_{n+1} / Z_{n+1}$. In this way we reduce to proving the
result for $F_{n}$ in case $S_{n+1}=S$, i.e., we may assume that $\mathcal{F}$ is flat in dimensions $\geq n+1$ over $S$.

Fix $n$ and assume $\mathcal{F}$ is flat in dimensions $\geq n+1$ over $S$. To finish the proof we have to show that $F_{n}$ is representable by a monomorphism $Z_{n} \rightarrow S$ of finite presentation. Since the question is local in the étale topology on $S$ it suffices to show that for every $s \in S$ there exists an elementary étale neighbourhood $\left(S^{\prime}, s^{\prime}\right) \rightarrow(S, s)$ such that the result holds after base change to $S^{\prime}$. Thus by Lemma 37.5.8 we may assume there exist étale morphisms $h_{j}: Y_{j} \rightarrow X, j=1, \ldots, m$ such that for each $i$ there exists a complete dévissage of $\mathcal{F}_{j} / Y_{j} / S$ over $s$, where $\mathcal{F}_{j}$ is the pullback of $\mathcal{F}$ to $Y_{j}$ and such that $X_{s} \subset \bigcup h_{j}\left(Y_{j}\right)$. Note that by Lemma 37.27 .2 the sheaves $\mathcal{F}_{j}$ are still flat over in dimensions $\geq n+1$ over $S$. Set $W=\bigcup h_{j}\left(Y_{j}\right)$, which is a quasi-compact open of $X$. As $\mathcal{F}$ is pure along $X_{s}$ we see that

$$
E=\left\{t \in S \mid \operatorname{Ass}_{X_{t}}\left(\mathcal{F}_{t}\right) \subset W\right\}
$$

contains all generalizations of $s$. By More on Morphisms, Lemma 36.20.5 $E$ is a constructible subset of $S$. We have seen that $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \subset E$. By Morphisms, Lemma 28.22.4 we see that $E$ contains an open neighbourhood of $s$. Hence after shrinking $S$ we may assume that $E=S$. It follows from Lemma 37.27 .2 that it suffices to prove the lemma for the functor $F_{n}$ associated to $X=\amalg Y_{j}$ and $\mathcal{F}=\coprod \mathcal{F}_{j}$. If $F_{j, n}$ denotes the functor for $Y_{j} \rightarrow S$ and the sheaf $\mathcal{F}_{i}$ we see that $F_{n}=\prod F_{j, n}$. Hence it suffices to prove each $F_{j, n}$ is representable by some monomorphism $Z_{j, n} \rightarrow S$ of finite presentation, since then

$$
Z_{n}=Z_{1, n} \times_{S} \ldots \times_{S} Z_{m, n}
$$

Thus we have reduced the theorem to the special case handled in Lemma 37.27.4.

We make explicit what the theorem means in terms of universal flattenings in the following lemma.

05UH Lemma 37.27.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module.
(1) If $f$ is of finite presentation, $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite presentation, and $\mathcal{F}$ is pure relative to $S$, then there exists a universal flattening $S^{\prime} \rightarrow S$ of $\mathcal{F}$. Moreover $S^{\prime} \rightarrow S$ is a monomorphism of finite presentation.
(2) If $f$ is of finite presentation and $X$ is pure relative to $S$, then there exists a universal flattening $S^{\prime} \rightarrow S$ of $X$. Moreover $S^{\prime} \rightarrow S$ is a monomorphism of finite presentation.
(3) If $f$ is proper and of finite presentation and $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of $f$ nite presentation, then there exists a universal flattening $S^{\prime} \rightarrow S$ of $\mathcal{F}$. Moreover $S^{\prime} \rightarrow S$ is a monomorphism of finite presentation.
(4) If $f$ is proper and of finite presentation then there exists a universal flattening $S^{\prime} \rightarrow S$ of $X$.

Proof. These statements follow immediately from Theorem 37.27 .5 applied to $F_{0}=$ $F_{\text {flat }}$ and the fact that if $f$ is proper then $\mathcal{F}$ is automatically pure over the base, see Lemma 37.17.1.

### 37.28. Blowing up and flatness

080X In this section we begin our discussion of results of the form: "After a blowup the strict transform becomes flat". We will use the following (more or less standard) notation in this section. If $X \rightarrow S$ is a morphism of schemes, $\mathcal{F}$ is a quasi-coherent module on $X$, and $T \rightarrow S$ is a morphism of schemes, then we denote $\mathcal{F}_{T}$ the pullback of $\mathcal{F}$ to the base change $X_{T}=X \times{ }_{S} T$.

080Y Remark 37.28.1. Let $S$ be a quasi-compact and quasi-separated scheme. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent module on $X$. Let $U \subset S$ be a quasi-compact open subscheme. Given a $U$-admissible blowup $S^{\prime} \rightarrow S$ we denote $X^{\prime}$ the strict transform of $X$ and $\mathcal{F}^{\prime}$ the strict transform of $\mathcal{F}$ which we think of as a quasi-coherent module on $X^{\prime}$ (via Divisors, Lemma 30.27.2). Let $P$ be a property of $\mathcal{F} / X / S$ which is stable under strict transform (as above) for $U$-admissible blowups. The general problem in this section is: Show (under auxiliary conditions on $\mathcal{F} / X / S)$ there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform $\mathcal{F}^{\prime} / X^{\prime} / S^{\prime}$ has $P$.
The general strategy will be to use that a composition of $U$-admissible blowups is a $U$-admissible blowup, see Divisors, Lemma 30.28.2. In fact, we will make use of the more precise Divisors, Lemma 30.26 .14 and combine it with Divisors, Lemma 30.27 .6 . The result is that it suffices to find a sequence of $U$-admissible blowups

$$
S=S_{0} \leftarrow S_{1} \leftarrow \ldots \leftarrow S_{n}
$$

such that, setting $\mathcal{F}_{0}=\mathcal{F}$ and $X_{0}=X$ and setting $\mathcal{F}_{i} / X_{i}$ equal to the strict transform of $\mathcal{F}_{i-1} / X_{i-1}$, we arrive at $\mathcal{F}_{n} / X_{n} / S_{n}$ with property $P$.
In particular, choose a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{S}$ such that $V(\mathcal{I})=S \backslash U$, see Properties, Lemma 27.24.1. Let $S^{\prime} \rightarrow S$ be the blowup in $\mathcal{I}$ and let $E \subset S^{\prime}$ be the exceptional divisor (Divisors, Lemma 30.26.4). Then we see that we've reduced the problem to the case where there exists an effective Cartier divisor $D \subset S$ whose support is $X \backslash U$. In particular we may assume $U$ is scheme theoretically dense in $S$ (Divisors, Lemma 30.11.4).

Suppose that $P$ is local on $S$ : If $S=\bigcup S_{i}$ is a finite open covering by quasi-compact opens and $P$ holds for $\mathcal{F}_{S_{i}} / X_{S_{i}} / S_{i}$ then $P$ holds for $\mathcal{F} / X / S$. In this case the general problem above is local on $S$ as well, i.e., if given $s \in S$ we can find a quasi-compact open neighbourhood $W$ of $s$ such that the problem for $\mathcal{F}_{W} / X_{W} / W$ is solvable, then the problem is solvable for $\mathcal{F} / X / S$. This follows from Divisors, Lemmas 30.28.3 and 30.28.4

0810 Lemma 37.28.2. Let $R$ be a ring and let $f \in R$. Let $r, d \geq 0$ be integers. Let $R \rightarrow S$ be a ring map and let $M$ be an $S$-module. Assume
(1) $R \rightarrow S$ is of finite presentation and flat,
(2) every fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$ is geometrically integral over $R$,
(3) $M$ is a finite $S$-module,
(4) $M_{f}$ is a finitely presented $S_{f}$-module,
(5) for all $\mathfrak{p} \in R$, $f \notin \mathfrak{p}$ with $\mathfrak{q}=\mathfrak{p} S$ the module $M_{\mathfrak{q}}$ is free of rank r over $S_{\mathfrak{q}}$. Then there exists a finitely generated ideal $I \subset R$ with $V(f)=V(I)$ such that for all $a \in I$ with $R^{\prime}=R\left[\frac{I}{a}\right]$ the quotient

$$
M^{\prime}=\left(M \otimes_{R} R^{\prime}\right) / a \text {-power torsion }
$$

over $S^{\prime}=S \otimes_{R} R^{\prime}$ satisfies the following: for every prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ there exists a $g \in S^{\prime}, g \notin \mathfrak{p}^{\prime} S^{\prime}$ such that $M_{g}^{\prime}$ is a free $S_{g}^{\prime}$-module of rank $r$.

Proof. This lemma is a generalization of More on Algebra, Lemma 15.20.3 we urge the reader to read that proof first. Choose a surjection $S^{\oplus n} \rightarrow M$, which is possible by (1). Choose a finite submodule $K \subset \operatorname{Ker}\left(S^{\oplus n} \rightarrow M\right)$ such that $S^{\oplus n} / K \rightarrow M$ becomes an isomorphism after inverting $f$. This is possible by (4). Set $M_{1}=S^{\oplus n} / K$ and suppose we can prove the lemma for $M_{1}$. Say $I \subset R$ is the corresponding ideal. Then for $a \in I$ the map

$$
M_{1}^{\prime}=\left(M_{1} \otimes_{R} R^{\prime}\right) / a \text {-power torsion } \longrightarrow M^{\prime}=\left(M \otimes_{R} R^{\prime}\right) / a \text {-power torsion }
$$

is surjective. It is also an isomorphism after inverting $a$ in $R^{\prime}$ as $R_{a}^{\prime}=R_{f}$, see Algebra, Lemma 10.69.4 But $a$ is a nonzerodivisor on $M_{1}^{\prime}$, whence the displayed map is an isomorphism. Thus it suffices to prove the lemma in case $M$ is a finitely presented $S$-module.

Assume $M$ is a finitely presented $S$-module satisfying (3). Then $J=\operatorname{Fit}_{r}(M) \subset S$ is a finitely generated ideal. By Lemma 37.9 .3 we can write $S$ as a direct summand of a free $R$-module: $\bigoplus_{\alpha \in A} R=S \oplus C$. For any element $h \in S$ writing $h=\sum a_{\alpha}$ in the decomposition above, we say that the $a_{\alpha}$ are the coefficents of $h$. Let $I^{\prime} \subset R$ be the ideal of coefficients of elements of $J$. Multiplication by an element of $S$ defines an $R$-linear map $S \rightarrow S$, hence $I^{\prime}$ is generated by the coefficients of the generators of $J$, i.e., $I^{\prime}$ is a finitely generated ideal. We claim that $I=f I^{\prime}$ works.

We first check that $V(f)=V(I)$. The inclusion $V(f) \subset V(I)$ is clear. Conversely, if $f \notin \mathfrak{p}$, then $\mathfrak{q}=\mathfrak{p} S$ is not an element of $V(J)$ by property (3) and the fact that formation of fitting ideals commute with base change (More on Algebra, Lemma 15.6.4). Hence there is an element of $J$ which does not map to zero in $S \otimes_{R} \kappa(\mathfrak{p})$. Thus there exists an element of $I^{\prime}$ which is not contained in $\mathfrak{p}$, so $\mathfrak{p} \notin V\left(f I^{\prime}\right)=V(I)$.

Let $a \in I$ and set $R^{\prime}=R\left[\frac{I}{a}\right]$. We may write $a=f a^{\prime}$ for some $a^{\prime} \in I^{\prime}$. By Algebra, Lemmas 10.69 .2 and 10.69 .5 we see that $I^{\prime} R^{\prime}=a^{\prime} R^{\prime}$ and $a^{\prime}$ is a nonzerodivisor in $R^{\prime}$. Set $S^{\prime}=S \otimes_{S} R^{\prime}$. Every element $g$ of $J S^{\prime}=\operatorname{Fit}_{r}\left(M \otimes_{S} S^{\prime}\right)$ can be written as $g=\sum_{\alpha} c_{\alpha}$ for some $c_{\alpha} \in I^{\prime} R^{\prime}$. Since $I^{\prime} R^{\prime}=a^{\prime} R^{\prime}$ we can write $c_{\alpha}=a^{\prime} c_{\alpha}^{\prime}$ for some $c_{\alpha}^{\prime} \in R^{\prime}$ and $g=\left(\sum c_{\alpha}^{\prime}\right) a^{\prime}=g^{\prime} a^{\prime}$ in $S^{\prime}$. Moreover, there is an $g_{0} \in J$ such that $a^{\prime}=c_{\alpha}$ for some $\alpha$. For this element we have $g_{0}=g_{0}^{\prime} a^{\prime}$ in $S^{\prime}$ where $g_{0}^{\prime}$ is a unit in $S^{\prime}$. Let $\mathfrak{p}^{\prime} \subset R^{\prime}$ be a prime ideal and $\mathfrak{q}^{\prime}=\mathfrak{p}^{\prime} S^{\prime}$. By the above we see that $J S_{\mathfrak{q}^{\prime}}^{\prime}$ is the principal ideal generated by the nonzerodivisor $a^{\prime}$. It follows from More on Algebra, Lemma 15.6 .8 that $M_{\mathfrak{q}^{\prime}}^{\prime}$ can be generated by $r$ elements. Since $M^{\prime}$ is finite, there exist $m_{1}, \ldots, m_{r} \in M^{\prime}$ and $g \in S^{\prime}, g \notin \mathfrak{q}^{\prime}$ such that the corresponding map $\left(S^{\prime}\right)^{\oplus r} \rightarrow M^{\prime}$ becomes surjective after inverting $g$.
Finally, consider the ideal $J^{\prime}=\operatorname{Fit}_{k-1}\left(M^{\prime}\right)$. Note that $J^{\prime} S_{g}^{\prime}$ is generated by the coefficients of relations between $m_{1}, \ldots, m_{r}$ (compatibility of fitting ideal with base change). Thus it suffices to show that $J^{\prime}=0$, see More on Algebra, Lemma 15.6.7. Since $R_{a}^{\prime}=R_{f}$ (Algebra, Lemma 10.69.4) and $M_{a}^{\prime}=M_{f}$ we see from (3) that $J_{a}^{\prime}$ maps to zero in $S_{\mathfrak{q}^{\prime \prime}}$ for any prime $\mathfrak{q}^{\prime \prime} \subset S^{\prime}$ of the form $\mathfrak{q}^{\prime \prime}=\mathfrak{p}^{\prime \prime} S^{\prime}$ where $\mathfrak{p}^{\prime \prime} \subset R_{a}^{\prime}$. Since $S_{a}^{\prime} \subset \prod_{\mathfrak{q}^{\prime \prime}}$ as above $S_{\mathfrak{q}^{\prime \prime}}^{\prime}\left(\right.$ as $\left(S_{a}^{\prime}\right)_{\mathfrak{p}^{\prime \prime}} \subset S_{\mathfrak{q}^{\prime \prime}}^{\prime}$ by Lemma 37.7.4 we see that $J^{\prime} R_{a}^{\prime}=0$. Since $a$ is a nonzerodivisor in $R^{\prime}$ we conclude that $J^{\prime}=0$ and we win.

0811 Lemma 37.28.3. Let $S$ be a quasi-compact and quasi-separated scheme. Let $X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent module on $X$. Let $U \subset S$ be a quasi-compact open. Assume
(1) $X \rightarrow S$ is affine, of finite presentation, flat, geometrically integral fibres,
(2) $\mathcal{F}$ is a module of finite type,
(3) $\mathcal{F}_{U}$ is of finite presentation,
(4) $\mathcal{F}$ is flat over $S$ at all generic points of fibres lying over points of $U$.

Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ and an open subscheme $V \subset X_{S^{\prime}}$ such that (a) the strict transform $\mathcal{F}^{\prime}$ of $\mathcal{F}$ restricts to a finitely locally free $\mathcal{O}_{V^{-}}$ module and (b) $V \rightarrow S^{\prime}$ is surjective.

Proof. Given $\mathcal{F} / X / S$ and $U \subset S$ with hypotheses as in the lemma, denote $P$ the property " $\mathcal{F}$ is flat over $S$ at all generic points of fibres". It is clear that $P$ is preserved under strict transform, see Divisors, Lemma 30.27 .3 and Morphisms, Lemma 28.25.6. It is also clear that $P$ is local on $S$. Hence any and all observations of Remark 37.28.1 apply to the problem posed by the lemma.

Consider the function $r: U \rightarrow \mathbf{Z}_{\geq 0}$ which assigns to $u \in U$ the integer

$$
r(u)=\operatorname{dim}_{\kappa\left(\xi_{u}\right)}\left(\mathcal{F}_{\xi_{u}} \otimes \kappa\left(\xi_{u}\right)\right)
$$

where $\xi_{u}$ is the generic point of the fibre $X_{u}$. By More on Morphisms, Lemma 36.13.7 and the fact that the image of an open in $X_{S}$ in $S$ is open, we see that $r(u)$ is locally constant. Accordingly $U=U_{0} \amalg U_{1} \amalg \ldots \amalg U_{c}$ is a finite disjoint union of open and closed subschemes where $r$ is constant with value $i$ on $U_{i}$. By Divisors, Lemma 30.28 .5 we can find a $U$-admissible blowup to decompose $S$ into the disjoint union of two schemes, the first containing $U_{0}$ and the second $U_{1} \cup \ldots \cup U_{c}$. Repeating this $c-1$ more times we may assume that $S$ is a disjoint union $S=S_{0} \amalg S_{1} \amalg \ldots \amalg S_{c}$ with $U_{i} \subset S_{i}$. Thus we may assume the function $r$ defined above is constant, say with value $r$.

By Remark 37.28.1 we see that we may assume that we have an effective Cartier divisor $D \subset S$ whose support is $S \backslash U$. Another application of Remark 37.28.1 combined with Divisors, Lemma 30.11 .2 tells us we may assume that $S=\operatorname{Spec}(R)$ and $D=\operatorname{Spec}(R /(f))$ for some nonzerodivisor $f \in R$. This case is handled by Lemma 37.28.2.

0812 Lemma 37.28.4. Let $A \rightarrow C$ be a finite locally free ring map of rank d. Let $h \in C$ be an element such that $C_{h}$ is étale over $A$. Let $J \subset C$ be an ideal. Set $I=$ Fit $_{0}(C / J)$ where we think of $C / J$ as a finite A-module. Then $I C_{h}=J J^{\prime}$ for some ideal $J^{\prime} \subset C_{h}$. If $J$ is finitely generated so are $I$ and $J^{\prime}$.

Proof. We will use basic properties of fitting ideals, see More on Algebra, Lemma 15.6.4. Then $I C$ is the fitting ideal of $C / J \otimes_{A} C$. Note that $C \rightarrow C \otimes_{A} C, c \mapsto 1 \otimes c$ has a section (the multiplication map). By assumption $C \rightarrow C \otimes_{A} C$ is étale at every prime in the image of $\operatorname{Spec}\left(C_{h}\right)$ under this section. Hence the multiplication $\operatorname{map} C \otimes_{A} C_{h} \rightarrow C_{h}$ is étale in particular flat, see Algebra, Lemma 10.141.9. Hence there exists a $C_{h}$-algebra such that $C \otimes_{A} C_{h} \cong C_{h} \oplus C^{\prime}$ as $C_{h}$-algebras, see Algebra, Lemma 10.141.10. Thus $(C / J) \otimes_{A} C_{h} \cong\left(C_{h} / J_{h}\right) \oplus C^{\prime} / I^{\prime}$ as $C_{h}$-modules for some ideal $I^{\prime} \subset C^{\prime}$. Hence $I C_{h}=J J^{\prime}$ with $J^{\prime}=\operatorname{Fit}_{0}\left(C^{\prime} / I^{\prime}\right)$ where we view $C^{\prime} / J^{\prime}$ as a $C_{h}$-module.

0813 Lemma 37.28.5. Let $A \rightarrow B$ be an étale ring map. Let $a \in A$ be a nonzerodivisor. Let $J \subset B$ be a finite type ideal with $V(J) \subset V(a B)$. For every $\mathfrak{q} \subset B$ there exists a finite type ideal $I \subset A$ with $V(I) \subset V(a)$ and $g \in B, g \notin \mathfrak{q}$ such that $I B_{g}=J J^{\prime}$ for some finite type ideal $J^{\prime} \subset B_{g}$.

Proof. We may replace $B$ by a principal localization at an element $g \in B, g \notin \mathfrak{q}$. Thus we may assume that $B$ is standard étale, see Algebra, Proposition 10.141.17, Thus we may assume $B$ is a localization of $C=A[x] /(f)$ for some monic $f \in A[x]$ of some degree $d$. Say $B=C_{h}$ for some $h \in C$. Choose elements $h_{1}, \ldots, h_{n} \in C$ which generate $J$ over $B$. The condition $V(J) \subset V(a B)$ signifies that $a^{m}=\sum b_{i} h_{i}$ in $B$ for some large $m$. Set $h_{n+1}=a^{m}$. As in Lemma 37.28 .4 we take $I=$ $\operatorname{Fit}_{0}\left(C /\left(h_{1}, \ldots, h_{r+1}\right)\right)$. Since the module $C /\left(h_{1}, \ldots, h_{r+1}\right)$ is annihilated by $a^{m}$ we see that $a^{d m} \in I$ which implies that $V(I) \subset V(a)$.

0814 Lemma 37.28.6. Let $S$ be a quasi-compact and quasi-separated scheme. Let $X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent module on $X$. Let $U \subset S$ be a quasi-compact open. Assume there exist finitely many commutative diagrams

where
(1) $e_{i}: S_{i} \rightarrow S$ are quasi-compact étale morphisms and $S=\bigcup e_{i}\left(S_{i}\right)$,
(2) $j_{i}: X_{i} \rightarrow X$ are étale morphisms and $X=\bigcup j_{i}\left(X_{i}\right)$,
(3) $S_{i}^{*} \rightarrow S_{i}$ is an $e_{i}^{-1}(U)$-admissible blowup such that the strict transform $\mathcal{F}_{i}^{*}$ of $j_{i}^{*} \mathcal{F}$ is flat over $S_{i}^{*}$.

Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform of $\mathcal{F}$ is flat over $S^{\prime}$.

Proof. We claim that the hypotheses of the lemma are preserved under $U$-admissible blowups. Namely, suppose $b: S^{\prime} \rightarrow S$ is a $U$-admissible blowup in the quasicoherent sheaf of ideals $\mathcal{I}$. Moreover, let $S_{i}^{\prime} \rightarrow S_{i}$ be the blowup in the quasicoherent sheaf of ideals $\mathcal{J}_{i}$. Then the collection of morphisms $e_{i}^{\prime}: S_{i}^{\prime}=S_{i} \times{ }_{S} S^{\prime} \rightarrow S^{\prime}$ and $j_{i}^{\prime}: X_{i}^{\prime}=X_{i} \times_{S} S^{\prime} \rightarrow X \times_{S} S^{\prime}$ satisfy conditions (1), (2), (3) for the strict transform $\mathcal{F}^{\prime}$ of $\mathcal{F}$ relative to the blowup $S^{\prime} \rightarrow S$. First, observe that $S_{i}^{\prime}$ is the blowup of $S_{i}$ in the pullback of $\mathcal{I}$, see Divisors, Lemma 30.26.3. Second, consider the blowup $S_{i}^{\prime *} \rightarrow S_{i}^{\prime}$ of $S_{i}^{\prime}$ in the pullback of the ideal $\mathcal{J}_{i}$. By Divisors, Lemma 30.26 .12 we get a commutative diagram

and all the morphisms in the diagram above are blowups. Hence by Divisors, Lemmas 30.27.3 and 30.27.6 we see

$$
\begin{aligned}
& \text { the strict transform of }\left(j_{i}^{\prime}\right)^{*} \mathcal{F}^{\prime} \text { under } S_{i}^{\prime *} \rightarrow S_{i}^{\prime} \\
= & \text { the strict transform of } j_{i}^{*} \mathcal{F} \text { under } S_{i}^{\prime *} \rightarrow S_{i} \\
= & \text { the strict transform of } \mathcal{F}_{i}^{\prime} \text { under } S_{i}^{\prime *} \rightarrow S_{i}^{\prime} \\
= & \text { the pullback of } \mathcal{F}_{i}^{*} \text { via } X_{i} \times S_{i} S_{i}^{\prime *} \rightarrow X_{i}
\end{aligned}
$$

which is therefore flat over $S_{i}^{\prime *}$ (Morphisms, Lemma 28.25.6). Having said this, we see that all observations of Remark 37.28 .1 apply to the problem of finding a $U$-admissible blowup such that the strict transform of $\mathcal{F}$ becomes flat over the base under assumptions as in the lemma. In particular, we may assume that $S \backslash U$ is the support of an effective Cartier divisor $D \subset S$. Another application of Remark 37.28 .1 combined with Divisors, Lemma 30.11.2 shows we may assume that $S=$ $\operatorname{Spec}(A)$ and $D=\operatorname{Spec}(A /(a))$ for some nonzerodivisor $a \in A$.

Pick an $i$ and $s \in S_{i}$. Lemma 37.28 .5 implies we can find an open neighbourhood $s \in W_{i} \subset S_{i}$ and a finite type quasi-coherent ideal $\mathcal{I} \subset \mathcal{O}_{S}$ such that $\mathcal{I} \cdot \mathcal{O}_{W_{i}}=\mathcal{J}_{i} \mathcal{J}_{i}^{\prime}$ for some finite type quasi-coherent ideal $\mathcal{J}_{i}^{\prime} \subset \mathcal{O}_{W_{i}}$ and such that $V(\mathcal{I}) \subset V(a)=$ $S \backslash U$. Since $S_{i}$ is quasi-compact we can replace $S_{i}$ by a finite collection $W_{1}, \ldots, W_{n}$ of these opens and assume that for each $i$ there exists a quasi-coherent sheaf of ideals $\mathcal{I}_{i} \subset \mathcal{O}_{S}$ such that $\mathcal{I}_{i} \cdot \mathcal{O}_{S_{i}}=\mathcal{J}_{i} \mathcal{J}_{i}^{\prime}$ for some finite type quasi-coherent ideal $\mathcal{J}_{i}^{\prime} \subset$ $\mathcal{O}_{S_{i}}$. As in the discussion of the first paragraph of the proof, consider the blowup $S^{\prime}$ of $S$ in the product $\mathcal{I}_{1} \ldots \mathcal{I}_{n}$ (this blowup is $U$-admissible by construction). The base change of $S^{\prime} \rightarrow S$ to $S_{i}$ is the blowup in

$$
\mathcal{J}_{i} \cdot \mathcal{J}_{i}^{\prime} \mathcal{I}_{1} \ldots \hat{\mathcal{I}}_{i} \ldots \mathcal{I}_{n}
$$

which factors through the given blowup $S_{i}^{*} \rightarrow S_{i}$ (Divisors, Lemma 30.26.12). In the notation of the diagram above this means that $S_{i}^{* *}=S_{i}^{\prime}$. Hence after replacing $S$ by $S^{\prime}$ we arrive in the situation that $j_{i}^{*} \mathcal{F}$ is flat over $S_{i}$. Hence $j_{i}^{*} \mathcal{F}$ is flat over $S$, see Lemma 37.2.3. By Morphisms, Lemma 28.25.11 we see that $\mathcal{F}$ is flat over $S$.

0815 Theorem 37.28.7. Let $S$ be a quasi-compact and quasi-separated scheme. Let $X$ be a scheme over $S$. Let $\mathcal{F}$ be a quasi-coherent module on $X$. Let $U \subset S$ be a quasi-compact open. Assume
(1) $X$ is quasi-compact,
(2) $X$ is locally of finite presentation over $S$,
(3) $\mathcal{F}$ is a module of finite type,
(4) $\mathcal{F}_{U}$ is of finite presentation, and
(5) $\mathcal{F}_{U}$ is flat over $U$.

Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform $\mathcal{F}^{\prime}$ of $\mathcal{F}$ is an $\mathcal{O}_{X \times{ }_{S} S^{\prime}-m o d u l e ~ o f ~ f i n i t e ~ p r e s e n t a t i o n ~ a n d ~ f l a t ~ o v e r ~} S^{\prime}$.

Proof. We first prove that we can find a $U$-admissible blowup such that the strict transform is flat. The question is étale local on the source and the target, see Lemma 37.28 .6 for a precise statement. In particular, we may assume that $S=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A)$ are affine. For $s \in S$ write $\mathcal{F}_{s}=\left.\mathcal{F}\right|_{X_{s}}$ (pullback of $\mathcal{F}$ to the fibre). As $X \rightarrow S$ is of finite type $d=\max _{s \in S} \operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)$ is an integer. We will do induction on $d$.

Let $x \in X$ be a point of $X$ lying over $s \in S$ with $\operatorname{dim}_{x}\left(\operatorname{Supp}\left(\mathcal{F}_{s}\right)\right)=d$. Apply Lemma 37.3.2 to get $g: X^{\prime} \rightarrow X, e: S^{\prime} \rightarrow S, i: Z^{\prime} \rightarrow X^{\prime}$, and $\pi: Z^{\prime} \rightarrow Y^{\prime}$. Observe that $Y^{\prime} \rightarrow S^{\prime}$ is a smooth morphism of affines with geometrically irreducible fibres of dimension $d$. Because the problem is étale local it suffices to prove the theorem for $g^{*} \mathcal{F} / X^{\prime} / S^{\prime}$. Because $i: Z^{\prime} \rightarrow X^{\prime}$ is a closed immersion of finite presentation (and since strict transform commutes with affine pushforward, see Divisors, Lemma 30.27 .4 it suffices to prove the flattening result for $\mathcal{G}$. Since $\pi$ is finite (hence also affine) it suffices to prove the flattening result for $\pi_{*} \mathcal{G} / Y^{\prime} / S^{\prime}$. Thus we may assume that $X \rightarrow S$ is a smooth morphism of affines with geometrically irreducible fibres of dimension $d$.

Next, we apply a blow up as in Lemma 37.28.3. Doing so we reach the situation where there exists an open $V \subset X$ surjecting onto $S$ such that $\left.\mathcal{F}\right|_{V}$ is finite locally free. Let $\xi \in X$ be the generic point of $X_{s}$. Let $r=\operatorname{dim}_{\kappa(\xi)} \mathcal{F}_{\xi} \otimes \kappa(\xi)$. Choose a map $\alpha: \mathcal{O}_{X}^{\oplus r} \rightarrow \mathcal{F}$ which induces an isomorphism $\kappa(\xi)^{\oplus r} \rightarrow \mathcal{F}_{\xi} \otimes \kappa(\xi)$. Because $\mathcal{F}$ is locally free over $V$ we find an open neighbourhood $W$ of $\xi$ where $\alpha$ is an isomorphism. Shrink $S$ to an affine open neighbourhood of $s$ such that $W \rightarrow S$ is surjective. Say $\mathcal{F}$ is the quasi-coherent module associated to the $A$-module $N$. Since $\mathcal{F}$ is flat over $S$ at all generic points of fibres (in fact at all points of $W$ ), we see that

$$
\alpha_{\mathfrak{p}}: A_{\mathfrak{p}}^{\oplus r} \rightarrow N_{\mathfrak{p}}
$$

is universally injective for all primes $\mathfrak{p}$ of $R$, see Lemma 37.10.1. Hence $\alpha$ is universally injective, see Algebra, Lemma 10.81.12. Set $\mathcal{H}=\operatorname{Coker}(\alpha)$. By Divisors, Lemma 30.27 .7 we see that, given a $U$-admissible blowup $S^{\prime} \rightarrow S$ the strict transforms of $\mathcal{F}^{\prime}$ and $\mathcal{H}^{\prime}$ fit into an exact sequence

$$
0 \rightarrow \mathcal{O}_{X \times{ }_{S} S^{\prime}}^{\oplus r} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{H}^{\prime} \rightarrow 0
$$

Hence Lemma 37.10.1 also shows that $\mathcal{F}^{\prime}$ is flat at a point $x^{\prime}$ if and only if $\mathcal{H}^{\prime}$ is flat at that point. In particular $\mathcal{H}_{U}$ is flat over $U$ and $\mathcal{H}_{U}$ is a module of finite presentation. We may apply the induction hypothesis to $\mathcal{H}$ to see that there exists a $U$-admissible blowup such that the strict transform $\mathcal{H}^{\prime}$ is flat as desired.

To finish the proof of the theorem we still have to show that $\mathcal{F}^{\prime}$ is a module of finite presentation (after possibly another $U$-admissible blowup). This follows from Lemma 37.11 .1 as we can assume $U \subset S$ is scheme theoretically dense (see third paragraph of Remark 37.28.1. This finishes the proof of the theorem.

### 37.29. Applications

081 Q In this section we apply some of the results above.
081R Lemma 37.29.1. Let $S$ be a quasi-compact and quasi-separated scheme. Let $X$ be a scheme over $S$. Let $U \subset S$ be a quasi-compact open. Assume
(1) $X \rightarrow S$ is of finite type and quasi-separated, and
(2) $X_{U} \rightarrow U$ is flat and locally of finite presentation.

Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform of $X$ is flat and of finite presentation over $S^{\prime}$.

Proof. Since $X \rightarrow S$ is quasi-compact and quasi-separated by assumption, the strict transform of $X$ with respect to a blowing up $S^{\prime} \rightarrow S$ is also quasi-compact and quasi-separated. Hence to prove the lemma it suffices to find a $U$-admissible
blowup such that the strict transform is flat and locally of finite presentation. Let $X=W_{1} \cup \ldots \cup W_{n}$ be a finite affine open covering. If we can find a $U$-admissible blowup $S_{i} \rightarrow S$ such that the strict transform of $W_{i}$ is flat and locally of finite presentation, then there exists a $U$-admissble blowing up $S^{\prime} \rightarrow S$ dominating all $S_{i} \rightarrow S$ which does the job (see Divisors, Lemma 30.28 .4 see also Remark 37.28.1). Hence we may assume $X$ is affine.

Assume $X$ is affine. By Morphisms, Lemma 28.39 .2 we can choose an immersion $j: X \rightarrow \mathbf{A}_{S}^{n}$ over $S$. Let $V \subset \mathbf{A}_{S}^{n}$ be a quasi-compact open subscheme such that $j$ induces a closed immersion $i: X \rightarrow V$ over $S$. Apply Theorem 37.28.7 to $V \rightarrow S$ and the quasi-coherent module $i_{*} \mathcal{O}_{X}$ to obtain a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform of $i_{*} \mathcal{O}_{X}$ is flat over $S^{\prime}$ and of finite presentation over $\mathcal{O}_{V \times{ }_{S} S^{\prime}}$. Let $X^{\prime}$ be the strict transform of $X$ with respect to $S^{\prime} \rightarrow S$. Let $i^{\prime}: X^{\prime} \rightarrow V \times{ }_{S} S^{\prime}$ be the induced morphism. Since taking strict transform commutes with pushforward along affine morphisms (Divisors, Lemma 30.27.4), we see that $i_{*}^{\prime} \mathcal{O}_{X^{\prime}}$ is flat over $S$ and of finite presentation as a $\mathcal{O}_{V \times{ }_{S} S^{\prime}}$-module. This implies the lemma.

0B49 Lemma 37.29.2. Let $S$ be a quasi-compact and quasi-separated scheme. Let $X$ be a scheme over $S$. Let $U \subset S$ be a quasi-compact open. Assume
(1) $X \rightarrow S$ is proper, and
(2) $X_{U} \rightarrow U$ is finite locally free.

Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform of $X$ is finite locally free over $S^{\prime}$.

Proof. By Lemma 37.29 .1 we may assume that $X \rightarrow S$ is flat and of finite presentation. After replacing $S$ by a $U$-admissible blow up if necessary, we may assume that $U \subset S$ is scheme theoretically dense. Then $f$ is finite by Lemma 37.11.4. Hence $f$ is finite locally free by Morphisms, Lemma 28.45.2.

081S Lemma 37.29.3. Let $\varphi: X \rightarrow S$ be a separated morphism of finite type with $S$ quasi-compact and quasi-separated. Let $U \subset S$ be a quasi-compact open such that $\varphi^{-1} U \rightarrow U$ is an isomorphism. Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform $X^{\prime}$ of $X$ is isomorphic to an open subscheme of $S^{\prime}$.

Proof. The discussion in Remark 37.28 .1 applies. Thus we may do a first $U$ admissible blowup and assume the complement $S \backslash U$ is the support of an effective Cartier divisor $D$. In particular $U$ is scheme theoretically dense in $S$. Next, we do another $U$-admissible blowup to get to the situation where $X \rightarrow S$ is flat and of finite presentation, see Lemma 37.29.1. In this case the result follows from Lemma 37.11 .5

The following lemma says that a proper modification can be dominated by a blowup.
081 Lemma 37.29.4. Let $\varphi: X \rightarrow S$ be a proper morphism with $S$ quasi-compact and quasi-separated. Let $U \subset S$ be a quasi-compact open such that $\varphi^{-1} U \rightarrow U$ is an isomorphism. Then there exists a $U$-admissible blowup $S^{\prime} \rightarrow S$ which dominates $X$, i.e., such that there exists a factorization $S^{\prime} \rightarrow X \rightarrow S$ of the blowup morphism.

Proof. The discussion in Remark 37.28.1 applies. Thus we may do a first $U$ admissible blowup and assume the complement $S \backslash U$ is the support of an effective Cartier divisor $D$. In particular $U$ is scheme theoretically dense in $S$. Choose
another $U$-admissible blowup $S^{\prime} \rightarrow S$ such that the strict transform $X^{\prime}$ of $X$ is an open subscheme of $S^{\prime}$, see Lemma 37.29.3. Since $X^{\prime} \rightarrow S^{\prime}$ is proper, and $U \subset S^{\prime}$ is dense, we see that $X^{\prime}=S^{\prime}$. Some details omitted.

## CHAPTER 38

## Groupoid Schemes

022L

### 38.1. Introduction

022 M This chapter is devoted to generalities concerning groupoid schemes. See for example the beautiful paper [KM97] by Keel and Mori.

### 38.2. Notation

Let $S$ be a scheme. If $U, T$ are schemes over $S$ we denote $U(T)$ for the set of $T$-valued points of $U$ over $S$. In a formula: $U(T)=\operatorname{Mor}_{S}(T, U)$. We try to reserve the letter $T$ to denote a "test scheme" over $S$, as in the discussion that follows. Suppose we are given schemes $X, Y$ over $S$ and a morphism of schemes $f: X \rightarrow Y$ over $S$. For any scheme $T$ over $S$ we get an induced map of sets

$$
f: X(T) \longrightarrow Y(T)
$$

which as indicated we denote by $f$ also. In fact this construction is functorial in the scheme $T / S$. Yoneda's Lemma, see Categories, Lemma 4.3.5, says that $f$ determines and is determined by this transformation of functors $f: h_{X} \rightarrow h_{Y}$. More generally, we use the same notation for maps between fibre products. For example, if $X, Y, Z$ are schemes over $S$, and if $m: X \times_{S} Y \rightarrow Z \times_{S} Z$ is a morphism of schemes over $S$, then we think of $m$ as corresponding to a collection of maps between $T$-valued points

$$
X(T) \times Y(T) \longrightarrow Z(T) \times Z(T)
$$

And so on and so forth.
We continue our convention to label projection maps starting with index 0 , so we have $\mathrm{pr}_{0}: X \times_{S} Y \rightarrow X$ and $\mathrm{pr}_{1}: X \times_{S} Y \rightarrow Y$.

### 38.3. Equivalence relations

022 O Recall that a relation $R$ on a set $A$ is just a subset of $R \subset A \times A$. We usually write $a R b$ to indicate $(a, b) \in R$. We say the relation is transitive if $a R b, b R c \Rightarrow a R c$. We say the relation is reflexive if $a R a$ for all $a \in A$. We say the relation is symmetric if $a R b \Rightarrow b R a$. A relation is called an equivalence relation if it is transitive, reflexive and symmetric.
In the setting of schemes we are going to relax the notion of a relation a little bit and just require $R \rightarrow A \times A$ to be a map. Here is the definition.
Definition 38.3.1. Let $S$ be a scheme. Let $U$ be a scheme over $S$.
(1) A pre-relation on $U$ over $S$ is any morphism $j: R \rightarrow U \times{ }_{S} U$. In this case we set $t=\operatorname{pr}_{0} \circ j$ and $s=\operatorname{pr}_{1} \circ j$, so that $j=(t, s)$.
(2) A relation on $U$ over $S$ is a monomorphism $j: R \rightarrow U \times{ }_{S} U$.
(3) A pre-equivalence relation is a pre-relation $j: R \rightarrow U \times{ }_{S} U$ such that the image of $j: R(T) \rightarrow U(T) \times U(T)$ is an equivalence relation for all $T / S$.
(4) We say a morphism $R \rightarrow U \times_{S} U$ is an equivalence relation on $U$ over $S$ if and only if for every $T / S$ the $T$-valued points of $R$ define an equivalence relation on the set of $T$-valued points of $U$.

In other words, an equivalence relation is a pre-equivalence relation such that $j$ is a relation.

02V8 Lemma 38.3.2. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j: R \rightarrow U \times{ }_{S} U$ be a pre-relation. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Finally, set

$$
R^{\prime}=\left(U^{\prime} \times_{S} U^{\prime}\right) \times_{U \times_{S} U} R \xrightarrow{j^{\prime}} U^{\prime} \times_{S} U^{\prime}
$$

Then $j^{\prime}$ is a pre-relation on $U^{\prime}$ over $S$. If $j$ is a relation, then $j^{\prime}$ is a relation. If $j$ is a pre-equivalence relation, then $j^{\prime}$ is a pre-equivalence relation. If $j$ is an equivalence relation, then $j^{\prime}$ is an equivalence relation.

Proof. Omitted.
02V9 Definition 38.3.3. Let $S$ be a scheme. Let $U$ be a scheme over $S$. Let $j: R \rightarrow$ $U \times_{S} U$ be a pre-relation. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. The prerelation $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times_{S} U^{\prime}$ is called the restriction, or pullback of the pre-relation $j$ to $U^{\prime}$. In this situation we sometimes write $R^{\prime}=\left.R\right|_{U^{\prime}}$.

022Q Lemma 38.3.4. Let $j: R \rightarrow U \times{ }_{S} U$ be a pre-relation. Consider the relation on points of the scheme $U$ defined by the rule

$$
x \sim y \Leftrightarrow \exists r \in R: t(r)=x, s(r)=y .
$$

If $j$ is a pre-equivalence relation then this is an equivalence relation.
Proof. Suppose that $x \sim y$ and $y \sim z$. Pick $r \in R$ with $t(r)=x, s(r)=y$ and pick $r^{\prime} \in R$ with $t\left(r^{\prime}\right)=y, s\left(r^{\prime}\right)=z$. Pick a field $K$ fitting into the following commutative diagram

Denote $x_{K}, y_{K}, z_{K}: \operatorname{Spec}(K) \rightarrow U$ the morphisms

$$
\begin{aligned}
& \operatorname{Spec}(K) \rightarrow \operatorname{Spec}(\kappa(r)) \rightarrow \operatorname{Spec}(\kappa(x)) \rightarrow U \\
& \operatorname{Spec}(K) \rightarrow \operatorname{Spec}(\kappa(r)) \rightarrow \operatorname{Spec}(\kappa(y)) \rightarrow U \\
& \operatorname{Spec}(K) \rightarrow \operatorname{Spec}\left(\kappa\left(r^{\prime}\right)\right) \rightarrow \operatorname{Spec}(\kappa(z)) \rightarrow U
\end{aligned}
$$

By construction $\left(x_{K}, y_{K}\right) \in j(R(K))$ and $\left(y_{K}, z_{K}\right) \in j(R(K))$. Since $j$ is a preequivalence relation we see that also $\left(x_{K}, z_{K}\right) \in j(R(K))$. This clearly implies that $x \sim z$.

The proof that $\sim$ is reflexive and symmetric is omitted.

### 38.4. Group schemes

022 R Let us recall that a group is a pair $(G, m)$ where $G$ is a set, and $m: G \times G \rightarrow G$ is a map of sets with the following properties:
(1) (associativity) $m\left(g, m\left(g^{\prime}, g^{\prime \prime}\right)\right)=m\left(m\left(g, g^{\prime}\right), g^{\prime \prime}\right)$ for all $g, g^{\prime}, g^{\prime \prime} \in G$,
(2) (identity) there exists a unique element $e \in G$ (called the identity, unit, or 1 of $G$ ) such that $m(g, e)=m(e, g)=g$ for all $g \in G$, and
(3) (inverse) for all $g \in G$ there exists a $i(g) \in G$ such that $m(g, i(g))=$ $m(i(g), g)=e$, where $e$ is the identity.
Thus we obtain a map $e:\{*\} \rightarrow G$ and a map $i: G \rightarrow G$ so that the quadruple ( $G, m, e, i$ ) satisfies the axioms listed above.
A homomorphism of groups $\psi:(G, m) \rightarrow\left(G^{\prime}, m^{\prime}\right)$ is a map of sets $\psi: G \rightarrow G^{\prime}$ such that $m^{\prime}\left(\psi(g), \psi\left(g^{\prime}\right)\right)=\psi\left(m\left(g, g^{\prime}\right)\right)$. This automatically insures that $\psi(e)=e^{\prime}$ and $i^{\prime}(\psi(g))=\psi(i(g))$. (Obvious notation.) We will use this below.
022S Definition 38.4.1. Let $S$ be a scheme.
(1) A group scheme over $S$ is a pair $(G, m)$, where $G$ is a scheme over $S$ and $m: G \times{ }_{S} G \rightarrow G$ is a morphism of schemes over $S$ with the following property: For every scheme $T$ over $S$ the pair $(G(T), m)$ is a group.
(2) A morphism $\psi:(G, m) \rightarrow\left(G^{\prime}, m^{\prime}\right)$ of group schemes over $S$ is a morphism $\psi: G \rightarrow G^{\prime}$ of schemes over $S$ such that for every $T / S$ the induced map $\psi: G(T) \rightarrow G^{\prime}(T)$ is a homomorphism of groups.
Let $(G, m)$ be a group scheme over the scheme $S$. By the discussion above (and the discussion in Section 38.2 we obtain morphisms of schemes over $S$ : (identity) $e$ : $S \rightarrow G$ and (inverse) $i: G \rightarrow G$ such that for every $T$ the quadruple $(G(T), m, e, i)$ satisfies the axioms of a group listed above.
Let $(G, m),\left(G^{\prime}, m^{\prime}\right)$ be group schemes over $S$. Let $f: G \rightarrow G^{\prime}$ be a morphism of schemes over $S$. It follows from the definition that $f$ is a morphism of group schemes over $S$ if and only if the following diagram is commutative:

022T Lemma 38.4.2. Let $(G, m)$ be a group scheme over $S$. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. The pullback $\left(G_{S^{\prime}}, m_{S^{\prime}}\right)$ is a group scheme over $S^{\prime}$.
Proof. Omitted.
047D Definition 38.4.3. Let $S$ be a scheme. Let $(G, m)$ be a group scheme over $S$.
(1) A closed subgroup scheme of $G$ is a closed subscheme $H \subset G$ such that $\left.m\right|_{H \times S H}$ factors through $H$ and induces a group scheme structure on $H$ over $S$.
(2) An open subgroup scheme of $G$ is an open subscheme $G^{\prime} \subset G$ such that $\left.m\right|_{G^{\prime} \times S G^{\prime}}$ factors through $G^{\prime}$ and induces a group scheme structure on $G^{\prime}$ over $S$.

Alternatively, we could say that $H$ is a closed subgroup scheme of $G$ if it is a group scheme over $S$ endowed with a morphism of group schemes $i: H \rightarrow G$ over $S$ which identifies $H$ with a closed subscheme of $G$.

047E Definition 38.4.4. Let $S$ be a scheme. Let $(G, m)$ be a group scheme over $S$.
(1) We say $G$ is a smooth group scheme if the structure morphism $G \rightarrow S$ is smooth.
(2) We say $G$ is a flat group scheme if the structure morphism $G \rightarrow S$ is flat.
(3) We say $G$ is a separated group scheme if the structure morphism $G \rightarrow S$ is separated.
Add more as needed.

### 38.5. Examples of group schemes

047F
022U Example 38.5.1 (Multiplicative group scheme). Consider the functor which associates to any scheme $T$ the group $\Gamma\left(T, \mathcal{O}_{T}^{*}\right)$ of units in the global sections of the structure sheaf. This is representable by the scheme

$$
\mathbf{G}_{m}=\operatorname{Spec}\left(\mathbf{Z}\left[x, x^{-1}\right]\right)
$$

The morphism giving the group structure is the morphism

$$
\begin{aligned}
\mathbf{G}_{m} \times \mathbf{G}_{m} & \rightarrow \mathbf{G}_{m} \\
\operatorname{Spec}\left(\mathbf{Z}\left[x, x^{-1}\right] \otimes_{\mathbf{Z}} \mathbf{Z}\left[x, x^{-1}\right]\right) & \rightarrow \operatorname{Spec}\left(\mathbf{Z}\left[x, x^{-1}\right]\right) \\
\mathbf{Z}\left[x, x^{-1}\right] \otimes_{\mathbf{Z}} \mathbf{Z}\left[x, x^{-1}\right] & \leftarrow \mathbf{Z}\left[x, x^{-1}\right] \\
x \otimes x & \leftarrow x
\end{aligned}
$$

Hence we see that $\mathbf{G}_{m}$ is a group scheme over $\mathbf{Z}$. For any scheme $S$ the base change $\mathbf{G}_{m, S}$ is a group scheme over $S$ whose functor of points is

$$
T / S \longmapsto \mathbf{G}_{m, S}(T)=\mathbf{G}_{m}(T)=\Gamma\left(T, \mathcal{O}_{T}^{*}\right)
$$

as before.
040M Example 38.5.2 (Roots of unity). Let $n \in \mathbf{N}$. Consider the functor which associates to any scheme $T$ the subgroup of $\Gamma\left(T, \mathcal{O}_{T}^{*}\right)$ consisting of $n$th roots of unity. This is representable by the scheme

$$
\mu_{n}=\operatorname{Spec}\left(\mathbf{Z}[x] /\left(x^{n}-1\right)\right)
$$

The morphism giving the group structure is the morphism

$$
\begin{aligned}
\mu_{n} \times \mu_{n} & \rightarrow \mu_{n} \\
\operatorname{Spec}\left(\mathbf{Z}[x] /\left(x^{n}-1\right) \otimes_{\mathbf{Z}} \mathbf{Z}[x] /\left(x^{n}-1\right)\right) & \rightarrow \operatorname{Spec}\left(\mathbf{Z}[x] /\left(x^{n}-1\right)\right) \\
\mathbf{Z}[x] /\left(x^{n}-1\right) \otimes_{\mathbf{Z}} \mathbf{Z}[x] /\left(x^{n}-1\right) & \leftarrow \mathbf{Z}[x] /\left(x^{n}-1\right) \\
x \otimes x & \leftarrow x
\end{aligned}
$$

Hence we see that $\mu_{n}$ is a group scheme over Z. For any scheme $S$ the base change $\mu_{n, S}$ is a group scheme over $S$ whose functor of points is

$$
T / S \longmapsto \mu_{n, S}(T)=\mu_{n}(T)=\left\{f \in \Gamma\left(T, \mathcal{O}_{T}^{*}\right) \mid f^{n}=1\right\}
$$

as before.
022V Example 38.5.3 (Additive group scheme). Consider the functor which associates to any scheme $T$ the group $\Gamma\left(T, \mathcal{O}_{T}\right)$ of global sections of the structure sheaf. This is representable by the scheme

$$
\mathbf{G}_{a}=\operatorname{Spec}(\mathbf{Z}[x])
$$

The morphism giving the group structure is the morphism

$$
\begin{aligned}
\mathbf{G}_{a} \times \mathbf{G}_{a} & \rightarrow \mathbf{G}_{a} \\
\operatorname{Spec}\left(\mathbf{Z}[x] \otimes_{\mathbf{z}} \mathbf{Z}[x]\right) & \rightarrow \operatorname{Spec}(\mathbf{Z}[x]) \\
\mathbf{Z}[x] \otimes_{\mathbf{Z}} \mathbf{Z}[x] & \leftarrow \mathbf{Z}[x] \\
x \otimes 1+1 \otimes x & \leftarrow x
\end{aligned}
$$

Hence we see that $\mathbf{G}_{a}$ is a group scheme over $\mathbf{Z}$. For any scheme $S$ the base change $\mathbf{G}_{a, S}$ is a group scheme over $S$ whose functor of points is

$$
T / S \longmapsto \mathbf{G}_{a, S}(T)=\mathbf{G}_{a}(T)=\Gamma\left(T, \mathcal{O}_{T}\right)
$$

as before.
022W Example 38.5.4 (General linear group scheme). Let $n \geq 1$. Consider the functor which associates to any scheme $T$ the group

$$
\operatorname{GL}_{n}\left(\Gamma\left(T, \mathcal{O}_{T}\right)\right)
$$

of invertible $n \times n$ matrices over the global sections of the structure sheaf. This is representable by the scheme

$$
\mathrm{GL}_{n}=\operatorname{Spec}\left(\mathbf{Z}\left[\left\{x_{i j}\right\}_{1 \leq i, j \leq n}\right][1 / d]\right)
$$

where $d=\operatorname{det}\left(\left(x_{i j}\right)\right)$ with $\left(x_{i j}\right)$ the $n \times n$ matrix with entry $x_{i j}$ in the $(i, j)$-spot. The morphism giving the group structure is the morphism

$$
\begin{aligned}
\mathrm{GL}_{n} \times \mathrm{GL}_{n} & \rightarrow \mathrm{GL}_{n} \\
\operatorname{Spec}\left(\mathbf{Z}\left[x_{i j}, 1 / d\right] \otimes_{\mathbf{Z}} \mathbf{Z}\left[x_{i j}, 1 / d\right]\right) & \rightarrow \operatorname{Spec}\left(\mathbf{Z}\left[x_{i j}, 1 / d\right]\right) \\
\mathbf{Z}\left[x_{i j}, 1 / d\right] \otimes_{\mathbf{Z}} \mathbf{Z}\left[x_{i j}, 1 / d\right] & \leftarrow \mathbf{Z}\left[x_{i j}, 1 / d\right] \\
\sum x_{i k} \otimes x_{k j} & \leftarrow x_{i j}
\end{aligned}
$$

Hence we see that $\mathrm{GL}_{n}$ is a group scheme over $\mathbf{Z}$. For any scheme $S$ the base change $\mathrm{GL}_{n, S}$ is a group scheme over $S$ whose functor of points is

$$
T / S \longmapsto \mathrm{GL}_{n, S}(T)=\mathrm{GL}_{n}(T)=\mathrm{GL}_{n}\left(\Gamma\left(T, \mathcal{O}_{T}\right)\right)
$$

as before.
022X Example 38.5.5. The determinant defines a morphisms of group schemes

$$
\operatorname{det}: \mathrm{GL}_{n} \longrightarrow \mathbf{G}_{m}
$$

over Z. By base change it gives a morphism of group schemes $\mathrm{GL}_{n, S} \rightarrow \mathbf{G}_{m, S}$ over any base scheme $S$.

03YW Example 38.5.6 (Constant group). Let $G$ be an abstract group. Consider the functor which associates to any scheme $T$ the group of locally constant maps $T \rightarrow G$ (where $T$ has the Zariski topology and $G$ the discrete topology). This is representable by the scheme

$$
G_{\operatorname{Spec}(\mathbf{Z})}=\coprod_{g \in G} \operatorname{Spec}(\mathbf{Z})
$$

The morphism giving the group structure is the morphism

$$
G_{\mathrm{Spec}(\mathbf{Z})} \times \times_{\operatorname{Spec}(\mathbf{Z})} G_{\mathrm{Spec}(\mathbf{Z})} \longrightarrow G_{\mathrm{Spec}(\mathbf{Z})}
$$

which maps the component corresponding to the pair $\left(g, g^{\prime}\right)$ to the component corresponding to $g g^{\prime}$. For any scheme $S$ the base change $G_{S}$ is a group scheme over $S$ whose functor of points is

$$
T / S \longmapsto G_{S}(T)=\{f: T \rightarrow G \text { locally constant }\}
$$

as before.

### 38.6. Properties of group schemes

045 W In this section we collect some simple properties of group schemes which hold over any base.

047G Lemma 38.6.1. Let $S$ be a scheme. Let $G$ be a group scheme over $S$. Then $G \rightarrow S$ is separated (resp. quasi-separated) if and only if the identity morphism $e: S \rightarrow G$ is a closed immersion (resp. quasi-compact).

Proof. We recall that by Schemes, Lemma 25.21 .12 we have that $e$ is an immersion which is a closed immersion (resp. quasi-compact) if $G \rightarrow S$ is separated (resp. quasi-separated). For the converse, consider the diagram

It is an exercise in the functorial point of view in algebraic geometry to show that this diagram is cartesian. In other words, we see that $\Delta_{G / S}$ is a base change of $e$. Hence if $e$ is a closed immersion (resp. quasi-compact) so is $\Delta_{G / S}$, see Schemes, Lemma 25.18.2 (resp. Schemes, Lemma 25.19.3.

047H Lemma 38.6.2. Let $S$ be a scheme. Let $G$ be a group scheme over $S$. Let $T$ be a scheme over $S$ and let $\psi: T \rightarrow G$ be a morphism over $S$. If $T$ is flat over $S$, then the morphism

$$
T \times_{S} G \longrightarrow G, \quad(t, g) \longmapsto m(\psi(t), g)
$$

is flat. In particular, if $G$ is flat over $S$, then $m: G \times{ }_{S} G \rightarrow G$ is flat.
Proof. Consider the diagram

The left top horizontal arrow is an isomorphism and the square is cartesian. Hence the lemma follows from Morphisms, Lemma 28.25.7.

047I Lemma 38.6.3. Let $(G, m, e, i)$ be a group scheme over the scheme $S$. Denote $f: G \rightarrow S$ the structure morphism. Assume $f$ is flat. Then there exist canonical isomorphisms

$$
\Omega_{G / S} \cong f^{*} \mathcal{C}_{S / G} \cong f^{*} e^{*} \Omega_{G / S}
$$

where $\mathcal{C}_{S / G}$ denotes the conormal sheaf of the immersion $e$. In particular, if $S$ is the spectrum of a field, then $\Omega_{G / S}$ is a free $\mathcal{O}_{G}$-module.

Proof. In Morphisms, Lemma 28.33 .5 we identified $\Omega_{G / S}$ with the conormal sheaf of the diagonal morphism $\Delta_{G / S}$. In the proof of Lemma 38.6.1 we showed that $\Delta_{G / S}$ is a base change of the immersion $e$ by the morphism $\left(g, g^{\prime}\right) \mapsto m\left(i(g), g^{\prime}\right)$. This morphism is isomorphic to the morphism $\left(g, g^{\prime}\right) \mapsto m\left(g, g^{\prime}\right)$ hence is flat by Lemma 38.6.2. Hence we get the first isomorphism by Morphisms, Lemma 28.32.4. By Morphisms, Lemma 28.33.16 we have $\mathcal{C}_{S / G} \cong e^{*} \Omega_{G / S}$.
If $S$ is the spectrum of a field, then $G \rightarrow S$ is flat, and any $\mathcal{O}_{S}$-module on $S$ is free.

0BF5 Lemma 38.6.4. Let $S$ be a scheme. Let $G$ be a group scheme over $S$. Let $s \in S$. Then the composition

$$
T_{G / S, e(s)} \oplus T_{G / S, e(s)}=T_{G \times_{S} G / S,(e(s), e(s))} \rightarrow T_{G / S, e(s)}
$$

is addition of tangent vectors. Here the $=$ comes from Varieties, Lemma 32.14.7 and the right arrow is induced from $m: G \times{ }_{S} G \rightarrow G$ via Varieties, Lemma 32.14.6.

Proof. We will use Varieties, Equation (32.14.3.1) and work with tangent vectors in fibres. An element $\theta$ in the first factor $T_{G_{s} / s, e(s)}$ is the image of $\theta$ via the $\operatorname{map} T_{G_{s} / s, e(s)} \rightarrow T_{G_{s} \times G_{s} / s,(e(s), e(s))}$ coming from $(1, e): G_{s} \rightarrow G_{s} \times G_{s}$. Since $m \circ(1, e)=1$ we see that $\theta$ maps to $\theta$ by functoriality. Since the map is linear we see that $\left(\theta_{1}, \theta_{2}\right)$ maps to $\theta_{1}+\theta_{2}$.

### 38.7. Properties of group schemes over a field

047J In this section we collect some properties of group schemes over a field. In the case of group schemes which are (locally) algebraic over a field we can say a lot more, see Section 38.8

047K Lemma 38.7.1. If $(G, m)$ is a group scheme over a field $k$, then the multiplication map $m: G \times_{k} G \rightarrow G$ is open.

Proof. The multiplication map is isomorphic to the projection map $\mathrm{pr}_{0}: G \times{ }_{k} G \rightarrow$ $G$ because the diagram

is commutative with isomorphisms as horizontal arrows. The projection is open by Morphisms, Lemma 28.23.4.

0B7N Lemma 38.7.2. If $(G, m)$ is a group scheme over a field $k$. Let $U \subset G$ open and $T \rightarrow G$ a morphism of schemes. Then the image of the composition $T \times_{k} U \rightarrow$ $G \times{ }_{k} G \rightarrow G$ is open.

Proof. For any field extension $k \subset K$ the morphism $G_{K} \rightarrow G$ is open (Morphisms, Lemma 28.23.4. Every point $\xi$ of $T \times_{k} U$ is the image of a morphism $(t, u)$ : $\operatorname{Spec}(K) \rightarrow T \times_{k} U$ for some $K$. Then the image of $T_{K} \times_{K} U_{K}=\left(T \times_{k} U\right)_{K} \rightarrow G_{K}$ contains the translate $t \cdot U_{K}$ which is open. Combining these facts we see that the image of $T \times_{k} U \rightarrow G$ contains an open neighbourhood of the image of $\xi$. Since $\xi$ was arbitrary we win.

047L Lemma 38.7.3. Let $G$ be a group scheme over a field. Then $G$ is a separated scheme.

Proof. Say $S=\operatorname{Spec}(k)$ with $k$ a field, and let $G$ be a group scheme over $S$. By Lemma 38.6.1 we have to show that $e: S \rightarrow G$ is a closed immersion. By Morphisms, Lemma 28.20 .2 the image of $e: S \rightarrow G$ is a closed point of $G$. It is clear that $\mathcal{O}_{G} \rightarrow e_{*} \mathcal{O}_{S}$ is surjective, since $e_{*} \mathcal{O}_{S}$ is a skyscraper sheaf supported at the neutral element of $G$ with value $k$. We conclude that $e$ is a closed immersion by Schemes, Lemma 25.24.2.

047M Lemma 38.7.4. Let $G$ be a group scheme over a field $k$. Then
(1) every local ring $\mathcal{O}_{G, g}$ of $G$ has a unique minimal prime ideal,
(2) there is exactly one irreducible component $Z$ of $G$ passing through e, and
(3) $Z$ is geometrically irreducible over $k$.

Proof. For any point $g \in G$ there exists a field extension $k \subset K$ and a $K$-valued point $g^{\prime} \in G(K)$ mapping to $g$. If we think of $g^{\prime}$ as a $K$-rational point of the group scheme $G_{K}$, then we see that $\mathcal{O}_{G, g} \rightarrow \mathcal{O}_{G_{K}, g^{\prime}}$ is a faithfully flat local ring map (as $G_{K} \rightarrow G$ is flat, and a local flat ring map is faithfully flat, see Algebra, Lemma 10.38.17). The result for $\mathcal{O}_{G_{K}, g^{\prime}}$ implies the result for $\mathcal{O}_{G, g}$, see Algebra, Lemma 10.29.5. Hence in order to prove (1) it suffices to prove it for $k$-rational points $g$ of $G$. In this case translation by $g$ defines an automorphism $G \rightarrow G$ which maps $e$ to $g$. Hence $\mathcal{O}_{G, g} \cong \mathcal{O}_{G, e}$. In this way we see that (2) implies (1), since irreducible components passing through $e$ correspond one to one with minimal prime ideals of $\mathcal{O}_{G, e}$.
In order to prove (2) and (3) it suffices to prove (2) when $k$ is algebraically closed. In this case, let $Z_{1}, Z_{2}$ be two irreducible components of $G$ passing through $e$. Since $k$ is algebraically closed the closed subscheme $Z_{1} \times_{k} Z_{2} \subset G \times_{k} G$ is irreducible too, see Varieties, Lemma 32.6.4. Hence $m\left(Z_{1} \times_{k} Z_{2}\right)$ is contained in an irreducible component of $G$. On the other hand it contains $Z_{1}$ and $Z_{2}$ since $\left.m\right|_{e \times G}=\operatorname{id}_{G}$ and $\left.m\right|_{G \times e}=\mathrm{id}_{G}$. We conclude $Z_{1}=Z_{2}$ as desired.

04L9 Remark 38.7.5. Warning: The result of Lemma 38.7.4 does not mean that every irreducible component of $G / k$ is geometrically irreducible. For example the group scheme $\mu_{3, \mathbf{Q}}=\operatorname{Spec}\left(\mathbf{Q}[x] /\left(x^{3}-1\right)\right)$ over $\mathbf{Q}$ has two irreducible components corresponding to the factorization $x^{3}-1=(x-1)\left(x^{2}+x+1\right)$. The first factor corresponds to the irreducible component passing through the identity, and the second irreducible component is not geometrically irreducible over $\operatorname{Spec}(\mathbf{Q})$.

047R Lemma 38.7.6. Let $G$ be a group scheme over a perfect field $k$. Then the reduction $G_{\text {red }}$ of $G$ is a closed subgroup scheme of $G$.

Proof. Omitted. Hint: Use that $G_{r e d} \times{ }_{k} G_{r e d}$ is reduced by Varieties, Lemmas 32.4 .3 and 32.4.7

047S Lemma 38.7.7. Let $k$ be a field. Let $\psi: G^{\prime} \rightarrow G$ be a morphism of group schemes over $k$. If $\psi\left(G^{\prime}\right)$ is open in $G$, then $\psi\left(G^{\prime}\right)$ is closed in $G$.

Proof. Let $U=\psi\left(G^{\prime}\right) \subset G$. Let $Z=G \backslash \psi\left(G^{\prime}\right)=G \backslash U$ with the reduced induced closed subscheme structure. By Lemma 38.7.2 the image of

$$
Z \times_{k} G^{\prime} \longrightarrow Z \times_{k} U \longrightarrow G
$$

is open (the first arrow is surjective). On the other hand, since $\psi$ is a homomorphism of group schemes, the image of $Z \times_{k} G^{\prime} \rightarrow G$ is contained in $Z$ (because translation by $\psi\left(g^{\prime}\right)$ preserves $U$ for all points $g^{\prime}$ of $G^{\prime}$; small detail omitted). Hence $Z \subset G$ is an open subset (although not necessarily an open subscheme). Thus $U=\psi\left(G^{\prime}\right)$ is closed.

047T Lemma 38.7.8. Let $i: G^{\prime} \rightarrow G$ be an immersion of group schemes over a field $k$. Then $i$ is a closed immersion, i.e., $i\left(G^{\prime}\right)$ is a closed subgroup scheme of $G$.

Proof. To show that $i$ is a closed immersion it suffices to show that $i\left(G^{\prime}\right)$ is a closed subset of $G$. Let $k \subset k^{\prime}$ be a perfect extension of $k$. If $i\left(G_{k^{\prime}}^{\prime}\right) \subset G_{k^{\prime}}$ is closed, then $i\left(G^{\prime}\right) \subset G$ is closed by Morphisms, Lemma 28.25.10 (as $G_{k^{\prime}} \rightarrow G$ is flat, quasi-compact and surjective). Hence we may and do assume $k$ is perfect. We will use without further mention that products of reduced schemes over $k$ are reduced. We may replace $G^{\prime}$ and $G$ by their reductions, see Lemma 38.7.6. Let $\overline{G^{\prime}} \subset G$ be the closure of $i\left(G^{\prime}\right)$ viewed as a reduced closed subscheme. By Varieties, Lemma 32.19.1 we conclude that $\overline{G^{\prime}} \times k$ $\overline{G^{\prime}}$ is the closure of the image of $G^{\prime} \times_{k} G^{\prime} \rightarrow G \times_{k} G$. Hence

$$
m\left(\overline{G^{\prime}} \times_{k} \overline{G^{\prime}}\right) \subset \overline{G^{\prime}}
$$

as $m$ is continuous. It follows that $\overline{G^{\prime}} \subset G$ is a (reduced) closed subgroup scheme. By Lemma 38.7.7 we see that $i\left(G^{\prime}\right) \subset \overline{G^{\prime}}$ is also closed which implies that $i\left(G^{\prime}\right)=\overline{G^{\prime}}$ as desired.

0B7P Lemma 38.7.9. Let $G$ be a group scheme over a field $k$. If $G$ is irreducible, then $G$ is quasi-compact.

Proof. Suppose that $k \subset K$ is a field extension. If $G_{K}$ is quasi-compact, then $G$ is too as $G_{K} \rightarrow G$ is surjective. By Lemma 38.7 .4 we see that $G_{K}$ is irreducible. Hence it suffices to prove the lemma after replacing $k$ by some extension. Choose $K$ to be an algebraically closed field extension of very large cardinality. Then by Varieties, Lemma 32.12 .2 , we see that $G_{K}$ is a Jacobson scheme all of whose closed points have residue field equal to $K$. In other words we may assume $G$ is a Jacobson scheme all of whose closed points have residue field $k$.
Let $U \subset G$ be a nonempty affine open. Let $g \in G(k)$. Then $g U \cap U \neq \emptyset$. Hence we see that $g$ is in the image of the morphism

$$
U \times_{\operatorname{Spec}(k)} U \longrightarrow G, \quad\left(u_{1}, u_{2}\right) \longmapsto u_{1} u_{2}^{-1}
$$

Since the image of this morphism is open (Lemma 38.7.1) we see that the image is all of $G$ (because $G$ is Jacobson and closed points are $k$-rational). Since $U$ is affine, so is $U \times_{\operatorname{Spec}(k)} U$. Hence $G$ is the image of a quasi-compact scheme, hence quasi-compact.
0B7Q Lemma 38.7.10. Let $G$ be a group scheme over a field $k$. If $G$ is connected, then $G$ is irreducible.

Proof. By Varieties, Lemma 32.5 .13 we see that $G$ is geometrically connected. If we show that $G_{K}$ is irreducible for some field extension $k \subset K$, then the lemma follows. Hence we may apply Varieties, Lemma 32.12 .2 to reduce to the case where $k$ is algebraically closed, $G$ is a Jacobson scheme, and all the closed points are $k$-rational.

Let $Z \subset G$ be the unique irreducible component of $G$ passing through the neutral element, see Lemma 38.7.4. Endowing $Z$ with the reduced induced closed subscheme structure, we see that $Z \times_{k} Z$ is reduced and irreducible (Varieties, Lemmas 32.4.7 and 32.6.4. We conclude that $\left.m\right|_{Z \times_{k} Z}: Z \times_{k} Z \rightarrow G$ factors through $Z$. Hence $Z$ becomes a closed subgroup scheme of $G$.

To get a contradiction, assume there exists another irreducible component $Z^{\prime} \subset G$. Then $Z \cap Z^{\prime}=\emptyset$ by Lemma 38.7.4. By Lemma 38.7.9 we see that $Z$ is quasicompact. Thus we may choose a quasi-compact open $U \subset G$ with $Z \subset U$ and $U \cap Z^{\prime}=\emptyset$. The image $W$ of $Z \times_{k} U \rightarrow G$ is open in $G$ by Lemma 38.7.2. On the other hand, $W$ is quasi-compact as the image of a quasi-compact space. We claim that $W$ is closed. If the claim is true, then $W \subset G \backslash Z^{\prime}$ is a proper open and closed subset of $G$, which contradicts the assumption that $G$ is connected.

Proof of the claim. Since $W$ is quasi-compact, we see that points in the closure of $W$ are specializations of points of $W$ (Morphisms, Lemma 28.6.5). Thus we have to show that any irreducible component $Z^{\prime \prime} \subset G$ of $G$ which meets $W$ is contained in $W$. As $G$ is Jacobson and closed points are rational, $Z^{\prime \prime} \cap W$ has a rational point $g \in Z^{\prime \prime}(k) \cap W(k)$ and hence $Z^{\prime \prime}=Z g$. But $W=m\left(Z \times_{k} W\right)$ by construction, so $Z^{\prime \prime} \cap W \neq \emptyset$ implies $Z^{\prime \prime} \subset W$.

0B7R Proposition 38.7.11. Let $G$ be a group scheme over a field $k$. There exists a canonical closed subgroup scheme $G^{0} \subset G$ with the following properties
(1) $G^{0} \rightarrow G$ is a flat closed immersion,
(2) $G^{0} \subset G$ is the connected component of the identity,
(3) $G^{0}$ is geometrically irreducible, and
(4) $G^{0}$ is quasi-compact.

Proof. Let $G^{0}$ be the connected component of the identity with its canonical scheme structure (Morphisms, Definition 28.26.3). By Varieties, Lemma 32.5.13 we see that $G^{0}$ is geometrically connected. Thus $G^{0} \times{ }_{k} G^{0}$ is connected (Varieties, Lemma 32.5.4. Thus $m\left(G^{0} \times{ }_{k} G^{0}\right) \subset G^{0}$ set theoretically. To see that this holds scheme theoretically, note that $G^{0} \times_{k} G^{0} \rightarrow G \times_{k} G$ is a flat closed immersion. By Morphisms, Lemma 28.26.1 it follows that $G^{0} \times_{k} G^{0}$ is a closed subscheme of
 Hence $G^{0}$ becomes a closed subgroup scheme of $G$. By Lemma 38.7.10 we see that $G^{0}$ is irreducible. By Lemma 38.7.4 we see that $G^{0}$ is geometrically irreducible. By Lemma 38.7.9 we see that $G^{0}$ is quasi-compact.

0B7T Lemma 38.7.12. Let $k$ be a field. Let $T=\operatorname{Spec}(A)$ where $A$ is a directed colimit of algebras which are finite products of copies of $k$. For any scheme $X$ over $k$ we have $\left|T \times_{k} X\right|=|T| \times|X|$ as topological spaces.

Proof. By taking an affine open covering we reduce to the case of an affine $X$. $\operatorname{Say} X=\operatorname{Spec}(B)$. Write $A=\operatorname{colim} A_{i}$ with $A_{i}=\prod_{t \in T_{i}} k$ and $T_{i}$ finite. Then $T_{i}=\left|\operatorname{Spec}\left(A_{i}\right)\right|$ with the discrete topology and the transition morphisms $A_{i} \rightarrow A_{i^{\prime}}$ are given by set maps $T_{i^{\prime}} \rightarrow T_{i}$. Thus $|T|=\lim T_{i}$ as a topological space, see

Limits, Lemma 31.3.2. Similarly we have

$$
\begin{aligned}
\left|T \times_{k} X\right| & =\left|\operatorname{Spec}\left(A \otimes_{k} B\right)\right| \\
& =\left|\operatorname{Spec}\left(\operatorname{colim} A_{i} \otimes_{k} B\right)\right| \\
& =\lim \left|\operatorname{Spec}\left(A_{i} \otimes_{k} B\right)\right| \\
& =\lim \left|\operatorname{Spec}\left(\prod_{t \in T_{i}} B\right)\right| \\
& =\lim T_{i} \times|X| \\
& =\left(\lim T_{i}\right) \times|X| \\
& =|T| \times|X|
\end{aligned}
$$

by the lemma above and the fact that limits commute with limits.
The following lemma says that in fact we can put a "algebraic profinite family of points" in an affine open. We urge the reader to read Lemma 38.8.6 first.
0B7U Lemma 38.7.13. Let $k$ be an algebraically closed field. Let $G$ be a group scheme over $k$. Assume that $G$ is Jacobson and that all closed points are $k$-rational. Let $T=\operatorname{Spec}(A)$ where $A$ is a directed colimit of algebras which are finite products of copies of $k$. For any morphism $f: T \rightarrow G$ there exists an affine open $U \subset G$ containing $f(T)$.

Proof. Let $G^{0} \subset G$ be the closed subgroup scheme found in Proposition 38.7.11. The first two paragraphs serve to reduce to the case $G=G^{0}$.

Observe that $T$ is a directed inverse limit of finite topological spaces (Limits, Lemma 31.3.2), hence profinite as a topological space (Topology, Definition 5.21.1). Let $W \subset G$ be a quasi-compact open containing the image of $T \rightarrow G$. After replacing $W$ by the image of $G^{0} \times W \rightarrow G \times G \rightarrow G$ we may assume that $W$ is invariant under the action of left translation by $G^{0}$, see Lemma 38.7.2. Consider the composition

$$
\psi=\pi \circ f: T \xrightarrow{f} W \xrightarrow{\pi} \pi_{0}(W)
$$

The space $\pi_{0}(W)$ is profinite (Topology, Lemma 5.22 .8 and Properties, Lemma 27.2.4). Let $F_{\xi} \subset T$ be the fibre of $T \rightarrow \pi_{0}(W)$ over $\xi \in \pi_{0}(W)$. Assume that for all $\xi$ we can find an affine open $U_{\xi} \subset W$ with $F \subset U$. Since $\psi: T \rightarrow \pi_{0}(W)$ is proper as a map of topological spaces (Topology, Lemma 5.16.7), we can find a quasi-compact open $V_{\xi} \subset \pi_{0}(W)$ such that $\psi^{-1}\left(V_{\xi}\right) \subset f^{-1}\left(U_{\xi}\right)$ (easy topological argument omitted). After replacing $U_{\xi}$ by $U_{\xi} \cap \pi^{-1}\left(V_{\xi}\right)$, which is open and closed in $U_{\xi}$ hence affine, we see that $U_{\xi} \subset \pi^{-1}\left(V_{\xi}\right)$ and $U_{\xi} \cap T=\psi^{-1}\left(V_{\xi}\right)$. By Topology, Lemma 5.21 .3 we can find a finite disjoint union decomposition $\pi_{0}(W)=\bigcup_{i=1, \ldots, n} V_{i}$ by quasi-compact opens such that $V_{i} \subset V_{\xi_{i}}$ for some $i$. Then we see that

$$
f(T) \subset \bigcup_{i=1, \ldots, n} U_{\xi_{i}} \cap \pi^{-1}\left(V_{i}\right)
$$

the right hand side of which is a finite disjoint union of affines, therefore affine.
Let $Z$ be a connected component of $G$ which meets $f(T)$. Then $Z$ has a $k$-rational point $z$ (because all residue fields of the scheme $T$ are isomorphic to $k$ ). Hence $Z=G^{0} z$. By our choice of $W$, we see that $Z \subset W$. The argument in the preceding paragraph reduces us to the problem of finding an affine open neighbhourhood of $f(T) \cap Z$ in $W$. After translation by a rational point we may assume that $Z=G^{0}$ (details omitted). Observe that the scheme theoretic inverse image $T^{\prime}=f^{-1}\left(G^{0}\right) \subset$
$T$ is a closed subscheme, which has the same type. After replacing $T$ by $T^{\prime}$ we may assume that $f(T) \subset G^{0}$. Choose an affine open neighbourhood $U \subset G$ of $e \in G$, so that in particular $U \cap G^{0}$ is nonempty. We will show there exists a $g \in G^{0}(k)$ such that $f(T) \subset g^{-1} U$. This will finish the proof as $g^{-1} U \subset W$ by the left $G^{0}$-invariance of $W$.

The arguments in the preceding two paragraphs allow us to pass to $G^{0}$ and reduce the problem to the following: Assume $G$ is irreducible and $U \subset G$ an affine open neighbourhood of $e$. Show that $f(T) \subset g^{-1} U$ for some $g \in G(k)$. Consider the morphism

$$
U \times_{k} T \longrightarrow G \times_{k} T, \quad(t, u) \longrightarrow\left(u f(t)^{-1}, t\right)
$$

which is an open immersion (because the extension of this morphism to $G \times_{k} T \rightarrow$ $G \times_{k} T$ is an isomorphism). By our assumption on $T$ we see that we have $\left|U \times_{k} T\right|=$ $|U| \times|T|$ and similarly for $G \times_{k} T$, see Lemma 38.7.12. Hence the image of the displayed open immersion is a finite union of boxes $\bigcup_{i=1, \ldots, n} U_{i} \times V_{i}$ with $V_{i} \subset T$ and $U_{i} \subset G$ quasi-compact open. This means that the possible opens $U f(t)^{-1}$, $t \in T$ are finite in number, say $U f\left(t_{1}\right)^{-1}, \ldots, U f\left(t_{r}\right)^{-1}$. Since $G$ is irreducible the intersection

$$
U f\left(t_{1}\right)^{-1} \cap \ldots \cap U f\left(t_{r}\right)^{-1}
$$

is nonempty and since $G$ is Jacobson with closed points $k$-rational, we can choose a $k$-valued point $g \in G(k)$ of this intersection. Then we see that $g \in U f(t)^{-1}$ for all $t \in T$ which means that $f(t) \in g^{-1} U$ as desired.

047V Remark 38.7.14. If $G$ is a group scheme over a field, is there always a quasicompact open and closed subgroup scheme? By Proposition 38.7.11 this question is only interesting if $G$ has infinitely many connected components (geometrically).

047U Lemma 38.7.15. Let $G$ be a group scheme over a field. There exists an open and closed subscheme $G^{\prime} \subset G$ which is a countable union of affines.

Proof. Let $e \in U(k)$ be a quasi-compact open neighbourhood of the identity element. By replacing $U$ by $U \cap i(U)$ we may assume that $U$ is invariant under the inverse map. As $G$ is separated this is still a quasi-compact set. Set

$$
G^{\prime}=\bigcup_{n \geq 1} m_{n}\left(U \times_{k} \ldots \times_{k} U\right)
$$

where $m_{n}: G \times_{k} \ldots \times_{k} G \rightarrow G$ is the $n$-slot multiplication map $\left(g_{1}, \ldots, g_{n}\right) \mapsto$ $m\left(m\left(\ldots\left(m\left(g_{1}, g_{2}\right), g_{3}\right), \ldots\right), g_{n}\right)$. Each of these maps are open (see Lemma 38.7.1) hence $G^{\prime}$ is an open subgroup scheme. By Lemma 38.7.7 it is also a closed subgroup scheme.

### 38.8. Properties of algebraic group schemes

0BF6 Recall that a scheme over a field $k$ is (locally) algebraic if it is (locally) of finite type over $\operatorname{Spec}(k)$, see Varieties, Definition 32.17.1. This is the sense of algebraic we are using in the title of this section.

045X Lemma 38.8.1. Let $k$ be a field. Let $G$ be a locally algebraic group scheme over $k$. Then $G$ is equidimensional and $\operatorname{dim}(G)=\operatorname{dim}_{g}(G)$ for all $g \in G$. For any closed point $g \in G$ we have $\operatorname{dim}(G)=\operatorname{dim}\left(\mathcal{O}_{G, g}\right)$.

Proof. Let us first prove that $\operatorname{dim}_{g}(G)=\operatorname{dim}_{g^{\prime}}(G)$ for any pair of points $g, g^{\prime} \in G$. By Morphisms, Lemma 28.28 .3 we may extend the ground field at will. Hence we may assume that both $g$ and $g^{\prime}$ are defined over $k$. Hence there exists an automorphism of $G$ mapping $g$ to $g^{\prime}$, whence the equality. By Morphisms, Lemma 28.28.1 we have $\operatorname{dim}_{g}(G)=\operatorname{dim}\left(\mathcal{O}_{G, g}\right)+\operatorname{trdeg}_{k}(\kappa(g))$. On the other hand, the dimension of $G$ (or any open subset of $G$ ) is the supremum of the dimensions of the local rings of of $G$, see Properties, Lemma 27.10.3. Clearly this is maximal for closed points $g$ in which case $\operatorname{trdeg}_{k}(\kappa(g))=0$ (by the Hilbert Nullstellensatz, see Morphisms, Section 28.16. Hence the lemma follows.

The following result is sometimes referred to as Cartier's theorem.
047N Lemma 38.8.2. Let $k$ be a field of characteristic 0 . Let $G$ be a locally algebraic group scheme over $k$. Then the structure morphism $G \rightarrow \operatorname{Spec}(k)$ is smooth, i.e., $G$ is a smooth group scheme.

Proof. By Lemma 38.6 .3 the module of differentials of $G$ over $k$ is free. Hence smoothness follows from Varieties, Lemma 32.20.1.

047 O Remark 38.8.3. Any group scheme over a field of characteristic 0 is reduced, see Per75, I, Theorem 1.1 and I, Corollary 3.9, and II, Theorem 2.4] and also [Per76, Proposition 4.2.8]. This was a question raised in Oor66 page 80]. We have seen in Lemma 38.8 .2 that this holds when the group scheme is locally of finite type.

047P Lemma 38.8.4. Let $k$ be a perfect field of characteristic $p>0$ (see Lemma 38.8.2 for the characteristic zero case). Let $G$ be a locally algebraic group scheme over $k$. If $G$ is reduced then the structure morphism $G \rightarrow \operatorname{Spec}(k)$ is smooth, i.e., $G$ is a smooth group scheme.

Proof. By Lemma 38.6 .3 the sheaf $\Omega_{G / k}$ is free. Hence the lemma follows from Varieties, Lemma 32.20.2.

047Q Remark 38.8.5. Let $k$ be a field of characteristic $p>0$. Let $\alpha \in k$ be an element which is not a $p$ th power. The closed subgroup scheme

$$
G=V\left(x^{p}+\alpha y^{p}\right) \subset \mathbf{G}_{a, k}^{2}
$$

is reduced and irreducible but not smooth (not even normal).
The following lemma is a special case of Lemma 38.7 .13 with a somewhat easier proof.

0B7S Lemma 38.8.6. Let $k$ be an algebraically closed field. Let $G$ be a locally algebraic group scheme over $k$. Let $g_{1}, \ldots, g_{n} \in G(k)$ be $k$-rational points. Then there exists an affine open $U \subset G$ containing $g_{1}, \ldots, g_{n}$.
Proof. We first argue by induction on $n$ that we may assume all $g_{i}$ are on the same connected component of $G$. Namely, if not, then we can find a decomposition $G=W_{1} \amalg W_{2}$ with $W_{i}$ open in $G$ and (after possibly renumbering) $g_{1}, \ldots, g_{r} \in W_{1}$ and $g_{r+1}, \ldots, g_{n} \in W_{2}$ for some $0<r<n$. By induction we can find affine opens $U_{1}$ and $U_{2}$ of $G$ with $g_{1}, \ldots, g_{r} \in U_{1}$ and $g_{r+1}, \ldots, g_{n} \in U_{2}$. Then

$$
g_{1}, \ldots, g_{n} \in\left(U_{1} \cap W_{1}\right) \cup\left(U_{2} \cap W_{2}\right)
$$

is a solution to the problem. Thus we may assume $g_{1}, \ldots, g_{n}$ are all on the same connected component of $G$. Translating by $g_{1}^{-1}$ we may assume $g_{1}, \ldots, g_{n} \in G^{0}$
where $G^{0} \subset G$ is as in Proposition 38.7.11. Choose an affine open neighbourhood $U$ of $e$, in particular $U \cap G^{0}$ is nonempty. Since $G^{0}$ is irreducible we see that

$$
G^{0} \cap\left(U g_{1}^{-1} \cap \ldots \cap U g_{n}^{-1}\right)
$$

is nonempty. Since $G \rightarrow \operatorname{Spec}(k)$ is locally of finite type, also $G^{0} \rightarrow \operatorname{Spec}(k)$ is locally of finite type, hence any nonempty open has a $k$-rational point. Thus we can pick $g \in G^{0}(k)$ with $g \in U g_{i}^{-1}$ for all $i$. Then $g_{i} \in g^{-1} U$ for all $i$ and $g^{-1} U$ is the affine open we were looking for.

0BF7 Lemma 38.8.7. Let $k$ be a field. Let $G$ be an algebraic group scheme over $k$. Then $G$ is quasi-projective over $k$.

Proof. By Varieties, Lemma 32.13.1 we may assume that $k$ is algebraically closed. Let $G^{0} \subset G$ be the connected component of $G$ as in Proposition38.7.11. Then every other connected component of $G$ has a $k$-rational point and hence is isomorphic to $G^{0}$ as a scheme. Since $G$ is quasi-compact and Noetherian, there are finitely many of these connected components. Thus we reduce to the case discussed in the next paragraph.

Let $G$ be a connected algebraic group scheme over an algebraically closed field $k$. If the characteristic of $k$ is zero, then $G$ is smooth over $k$ by Lemma 38.8.2, If the characteristic of $k$ is $p>0$, then we let $H=G_{r e d}$ be the reduction of $G$. By Divisors, Proposition 30.14 .8 it suffices to show that $H$ has an ample invertible sheaf. (For an algebraic scheme over $k$ having an ample invertible sheaf is equivalent to being quasiprojective over $k$, see for example the very general More on Morphisms, Lemma 36.35 .1 .) By Lemma 38.7 .6 we see that $H$ is a group scheme over $k$. By Lemma 38.8.4 we see that $H$ is smooth over $k$. This reduces us to the situation discussed in the next paragraph.

Let $G$ be a quasi-compact irreducible smooth group scheme over an algebraically closed field $k$. Observe that the local rings of $G$ are regular and hence UFDs (Varieties, Lemma 32.20 .3 and More on Algebra, Lemma 15.83.7). The complement of a nonempty affine open of $G$ is the support of an effective Cartier divisor $D$. This follows from Divisors, Lemma 30.13.6. (Observe that $G$ is separated by Lemma 38.7.3.) We conclude there exists an effective Cartier divisor $D \subset G$ such that $G \backslash D$ is affine. We will use below that for any $n \geq 1$ and $g_{1}, \ldots, g_{n} \in G(k)$ the complement $G \backslash \bigcup D g_{i}$ is affine. Namely, it is the intersection of the affine opens $G \backslash D g_{i} \cong G \backslash D$ in the separated scheme $G$.

We may choose the top row of the diagram

such that $U \neq \emptyset, j: U \rightarrow G$ is an open immersion, and $\pi$ is étale, see Morphisms, Lemma 28.36.20. There is a nonempty affine open $V \subset \mathbf{A}_{k}^{d}$ such that with $W=$ $\pi^{-1}(V)$ the morphism $\pi^{\prime}=\left.\pi\right|_{W}: W \rightarrow V$ is finite étale. In particular $\pi^{\prime}$ is finite locally free, say of degree $n$. Consider the effective Cartier divisor

$$
\mathcal{D}=\{(g, w) \mid m(g, j(w)) \in D\} \subset G \times W
$$

(This is the restriction to $G \times W$ of the pullback of $D \subset G$ under the flat morphism $m: G \times G \rightarrow G$.) Consider the closed subset ${ }^{1} T=\left(1 \times \pi^{\prime}\right)(\mathcal{D}) \subset G \times V$. Since $\pi^{\prime}$ is finite locally free, every irreducible component of $T$ has codimension 1 in $G \times V$. Since $G \times V$ is smooth over $k$ we conclude these components are effective Cartier divisors (Divisors, Lemma 30.12 .7 and lemmas cited above) and hence $T$ is the support of an effective Cartier divisor $E$ in $G \times V$. If $v \in V(k)$, then $\left(\pi^{\prime}\right)^{-1}(v)=\left\{w_{1}, \ldots, w_{n}\right\} \subset W(k)$ and we see that

$$
E_{v}=\bigcup_{i=1, \ldots, n} D j\left(w_{i}\right)^{-1}
$$

in $G$ set theoretically. In particular we see that $G \backslash E_{v}$ is affine open (see above). Moreover, if $g \in G(k)$, then there exists a $v \in V$ such that $g \notin E_{v}$. Namely, the set $W^{\prime}$ of $w \in W$ such that $g \notin D j(w)^{-1}$ is nonempty open and it suffices to pick $v$ such that the fibre of $W^{\prime} \rightarrow V$ over $v$ has $n$ elements.

Consider the invertible sheaf $\mathcal{M}=\mathcal{O}_{G \times V}(E)$ on $G \times V$. By Varieties, Lemma 32.24 .1 the isomorphism class $\mathcal{L}$ of the restriction $\mathcal{M}_{v}=\mathcal{O}_{G}\left(E_{v}\right)$ is independent of $v \in V(k)$. On the other hand, for every $g \in G(k)$ we can find a $v$ such that $g \notin E_{v}$ and such that $G \backslash E_{v}$ is affine. Thus the canonical section (Divisors, Definition 30.11.14) of $\mathcal{O}_{G}\left(E_{v}\right)$ corresponds to a section $s_{v}$ of $\mathcal{L}$ which does not vanish at $g$ and such that $G_{s_{v}}$ is affine. This means that $\mathcal{L}$ is ample by definition (Properties, Definition 27.26.1).

0BF8 Lemma 38.8.8. Let $k$ be a field. Let $G$ be a locally algebraic group scheme over $k$. Then the center of $G$ is a closed subgroup scheme of $G$.

Proof. Let $\operatorname{Aut}(G)$ denote the contravariant functor on the category of schemes over $k$ which associates to $S / k$ the set of automorphisms of the base change $G_{S}$ as a group scheme over $S$. There is a natural transformation

$$
G \longrightarrow \operatorname{Aut}(G), \quad g \longmapsto \operatorname{inn}_{g}
$$

sending an $S$-valued point $g$ of $G$ to the inner automorphism of $G$ determined by $g$. The center $C$ of $G$ is by definition the kernel of this transformation, i.e., the functor which to $S$ associates those $g \in G(S)$ whose associated inner automorphism is trivial. The statement of the lemma is that this functor is representable by a closed subgroup scheme of $G$.

Choose an integer $n \geq 1$. Let $G_{n} \subset G$ be the $n$th infinitesimal neighbourhood of the identity element $e$ of $G$. For every scheme $S / k$ the base change $G_{n, S}$ is the $n$th infinitesimal neighbourhood of $e_{S}: S \rightarrow G_{S}$. Thus we see that there is a natural transformation $\operatorname{Aut}(G) \rightarrow \operatorname{Aut}\left(G_{n}\right)$ where the right hand side is the functor of automorphisms of $G_{n}$ as a scheme ( $G_{n}$ isn't in general a group scheme). Observe that $G_{n}$ is the spectrum of an artinian local ring $A_{n}$ with residue field $k$ which has finite dimension as a $k$-vector space (Varieties, Lemma 32.17.2). Since every automorphism of $G_{n}$ induces in particular an invertible linear map $A_{n} \rightarrow A_{n}$, we obtain transformations of functors

$$
G \rightarrow \operatorname{Aut}(G) \rightarrow \operatorname{Aut}\left(G_{n}\right) \rightarrow \operatorname{GL}\left(A_{n}\right)
$$

[^107]The final group valued functor is representable, see Example 38.5.4 and the last arrow is visibly injective. Thus for every $n$ we obtain a closed subgroup scheme

$$
H_{n}=\operatorname{Ker}\left(G \rightarrow \operatorname{Aut}\left(G_{n}\right)\right)=\operatorname{Ker}\left(G \rightarrow \mathrm{GL}\left(A_{n}\right)\right)
$$

As a first approximation we set $H=\bigcap_{n \geq 1} H_{n}$ (scheme theoretic intersection). This is a closed subgroup scheme which contains the center $C$.

Let $h$ be an $S$-valued point of $H$ with $S$ locally Noetherian. Then the automorphism $\operatorname{inn}_{h}$ induces the identity on all the closed subschemes $G_{n, S}$. Consider the kernel $K=\operatorname{Ker}\left(\mathrm{inn}_{h}: G_{S} \rightarrow G_{S}\right)$. This is a closed subgroup scheme of $G_{S}$ over $S$ containing the closed subschemes $G_{n, S}$ for $n \geq 1$. This implies that $K$ contains an open neighbourhood of $e(S) \subset G_{S}$, see Algebra, Remark 10.50.6. Let $G^{0} \subset G$ be as in Proposition 38.7.11. Since $G^{0}$ is geometrically irreducible, we conclude that $K$ contains $G_{S}^{0}$ (for any nonempty open $U \subset G_{k^{\prime}}^{0}$ and any field extension $k^{\prime} / k$ we have $U \cdot U^{-1}=G_{k^{\prime}}^{0}$, see proof of Lemma 38.7.9. . Applying this with $S=H$ we find that $G^{0}$ and $H$ are subgroup schemes of $G$ whose points commute: for any scheme $S$ and any $S$-valued points $g \in G^{0}(S), h \in H(S)$ we have $g h=h g$ in $G(S)$.

Assume that $k$ is algebraically closed. Then we can pick a $k$-valued point $g_{i}$ in each irreducible component $G_{i}$ of $G$. Observe that in this case the connected components of $G$ are the irreducible components of $G$ are the translates of $G^{0}$ by our $g_{i}$. We claim that

$$
C=H \cap \bigcap_{i} \operatorname{Ker}\left(\operatorname{inn}_{g_{i}}: G \rightarrow G\right) \quad \text { (scheme theoretic intersection) }
$$

Namely, $C$ is contained in the right hand side. On the other hand, every $S$-valued point $h$ of the right hand side commutes with $G^{0}$ and with $g_{i}$ hence with everything in $G=\bigcup G^{0} g_{i}$.
The case of a general base field $k$ follows from the result for the algebraic closure $\bar{k}$ by descent. Namely, let $A \subset G_{\bar{k}}$ the closed subgroup scheme representing the center of $G_{\bar{k}}$. Then we have

$$
A \times_{\operatorname{Spec}(k)} \operatorname{Spec}(\bar{k})=\operatorname{Spec}(\bar{k}) \times_{\operatorname{Spec}(k)} A
$$

as closed subschemes of $G_{\bar{k} \otimes_{k} \bar{k}}$ by the functorial nature of the center. Hence we see that $A$ descends to a closed subgroup scheme $Z \subset G$ by Descent, Lemma 34.33.2 (and Descent, Lemma 34.19.17). Then $Z$ represents $C$ (small argument omitted) and the proof is complete.

### 38.9. Abelian varieties

0BF9 An excellent reference for this material is Mumford's book on abelian varieties, see Mum70. We encourage the reader to look there. There are many equivalent definitions; here is one.

03RO Definition 38.9.1. Let $k$ be a field. An abelian variety is a group scheme over $k$ which is also a proper, geometrically integral variety over $k$.

We prove a few lemmas about this notion and then we collect all the results together in Proposition 38.9.10.

0BFA Lemma 38.9.2. Let $k$ be a field. Let $A$ be an abelian variety over $k$. Then $A$ is projective.

Proof. This follows from Lemma 38.8.7 and More on Morphisms, Lemma 36.36.1.

0BFB Lemma 38.9.3. Let $k$ be a field. Let $A$ be an abelian variety over $k$. For any field extension $K / k$ the base change $A_{K}$ is an abelian variety over $K$.

Proof. Omitted. Note that this is why we insisted on $A$ being geometrically integral; without that condition this lemma (and many others below) would be wrong.

0BFC Lemma 38.9.4. Let $k$ be a field. Let $A$ be an abelian variety over $k$. Then $A$ is smooth over $k$.

Proof. If $k$ is perfect then this follows from Lemma 38.8.2 (characteristic zero) and Lemma 38.8.4 (positive characteristic). We can reduce the general case to this case by descent for smoothness (Descent, Lemma 34.19.25) and going to the perfect closure using Lemma 38.9.3.

0BFD Lemma 38.9.5. An abelian variety is an abelian group scheme, i.e., the group law is commutative.

Proof. Let $k$ be a field. Let $A$ be an abelian variety over $k$. By Lemma 38.9.3 we may replace $k$ by its algebraic closure. Consider the morphism

$$
h: A \times_{k} A \longrightarrow A \times_{k} A, \quad(x, y) \longmapsto\left(x, x y x^{-1} y^{-1}\right)
$$

This is a morphism over $A$ via the first projection on either side. Let $e \in A(k)$ be the unit. Then we see that $\left.c\right|_{e \times A}$ is constant with value $(e, e)$. By More on Morphisms, Lemma 36.31 .6 there exists an open neighbourhood $U \subset A$ of $e$ such that $\left.h\right|_{U \times A}$ factors through some $Z \subset U \times A$ finite over $U$. This means that for $x \in U(k)$ the morphism $A \rightarrow A, y \mapsto x y x^{-1} y^{-1}$ takes finitely many values. Of course this means it is constant with value $e$. Thus $(x, y) \mapsto x y x^{-1} y^{-1}$ is constant with value $e$ on $U \times A$ which implies that the group law on $A$ is abelian.

0BFE Lemma 38.9.6. Let $k$ be a field. Let $A$ be an abelian variety over $k$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{A}$-module. Then there is an isomorphism

$$
m_{1,2,3}^{*} \mathcal{L} \otimes m_{1}^{*} \mathcal{L} \otimes m_{2}^{*} \mathcal{L} \otimes m_{3}^{*} \mathcal{L} \cong m_{1,2}^{*} \mathcal{L} \otimes m_{1,3}^{*} \mathcal{L} \otimes m_{2,3}^{*} \mathcal{L}
$$

of invertible modules on $A \times_{k} A \times_{k} A$ where $m_{i_{1}, \ldots, i_{t}}: A \times_{k} A \times_{k} A \rightarrow A$ is the morphism $\left(x_{1}, x_{2}, x_{3}\right) \mapsto \sum x_{i_{j}}$.

Proof. Apply the theorem of the cube (Derived Categories of Schemes, Theorem 35.25 .6 to the difference

$$
\mathcal{M}=m_{1,2,3}^{*} \mathcal{L} \otimes m_{1}^{*} \mathcal{L} \otimes m_{2}^{*} \mathcal{L} \otimes m_{3}^{*} \mathcal{L} \otimes m_{1,2}^{*} \mathcal{L}^{\otimes-1} \otimes m_{1,3}^{*} \mathcal{L}^{\otimes-1} \otimes m_{2,3}^{*} \mathcal{L}^{\otimes-1}
$$

This works because the restriction of $\mathcal{M}$ to $A \times A \times e=A \times A$ is equal to

$$
n_{1,2}^{*} \mathcal{L} \otimes n_{1}^{*} \mathcal{L} \otimes n_{2}^{*} \mathcal{L} \otimes n_{1,2}^{*} \mathcal{L}^{\otimes-1} \otimes n_{1}^{*} \mathcal{L}^{\otimes-1} \otimes n_{2}^{*} \mathcal{L}^{\otimes-1} \cong \mathcal{O}_{A \times{ }_{k} A}
$$

where $n_{i_{1}, \ldots, i_{t}}: A \times_{k} A \rightarrow A$ is the morphism $\left(x_{1}, x_{2}\right) \mapsto \sum x_{i_{j}}$. Similarly for $A \times e \times A$ and $e \times A \times A$.

0BFF Lemma 38.9.7. Let $k$ be a field. Let $A$ be an abelian variety over $k$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{A}$-module. Then

$$
[n]^{*} \mathcal{L} \cong \mathcal{L}^{\otimes n(n+1) / 2} \otimes\left([-1]^{*} \mathcal{L}\right)^{\otimes n(n-1) / 2}
$$

where $[n]: A \rightarrow A$ sends $x$ to $x+x+\ldots+x$ with $n$ summands and where $[-1]:$ $A \rightarrow A$ is the inverse of $A$.

Proof. Consider the morphism $A \rightarrow A \times_{k} A \times_{k} A, x \mapsto(x, x,-x)$ where $-x=$ $[-1](x)$. Pulling back the relation of Lemma 38.9.6 we obtain

$$
\mathcal{L} \otimes \mathcal{L} \otimes \mathcal{L} \otimes[-1]^{*} \mathcal{L} \cong[2]^{*} \mathcal{L}
$$

which proves the result for $n=2$. By induction assume the result holds for $1,2, \ldots, n$. Then consider the morphism $A \rightarrow A \times_{k} A \times_{k} A, x \mapsto(x, x,[n-1] x)$. Pulling back the relation of Lemma 38.9.6 we obtain

$$
[n+1]^{*} \mathcal{L} \otimes \mathcal{L} \otimes \mathcal{L} \otimes[n-1]^{*} \mathcal{L} \cong[2]^{*} \mathcal{L} \otimes[n]^{*} \mathcal{L} \otimes[n]^{*} \mathcal{L}
$$

and the result follows by elementary arithmetic.
0BFG Lemma 38.9.8. Let $k$ be a field. Let $A$ be an abelian variety over $k$. Let $[d]$ : $A \rightarrow A$ be the multiplication by $d$. Then $[d]$ is finite locally free of degree $d^{2} \operatorname{dim}(A)$.

Proof. By Lemma 38.9.2 (and More on Morphisms, Lemma 36.36.1) we see that $A$ has an ample invertible module $\mathcal{L}$. Since $[-1]: A \rightarrow A$ is an automorphism, we see that $[-1]^{*} \mathcal{L}$ is an ample invertible $\mathcal{O}_{X}$-module as well. Thus $\mathcal{N}=\mathcal{L} \otimes[-1]^{*} \mathcal{L}$ is ample, see Properties, Lemma 27.26.5. Since $\mathcal{N} \cong[-1]^{*} \mathcal{N}$ we see that $[d]^{*} \mathcal{N} \cong$ $\mathcal{N} \otimes n^{2}$ by Lemma 38.9.7.
To get a contradiction $C \subset X$ be a proper curve contained in a fibre of $[d]$. Then $\left.\mathcal{N}^{\otimes d^{2}}\right|_{C} \cong \mathcal{O}_{C}$ is an ample invertible $\mathcal{O}_{C}$-module of degree 0 which contrdicts Varieties, Lemma 32.33 .11 for example. (You can also use Varieties, Lemma 32.34.9.) Thus every fibre of $[d]$ has dimension 0 and hence $[d]$ is finite for example by Cohomology of Schemes, Lemma 29.20.1. Moreover, since $A$ is smooth over $k$ by Lemma 38.9.4 we see that $[d]: A \rightarrow A$ is flat by Algebra, Lemma 10.127 .1 (we also use that schemes smooth over fields are regular and that regular rings are Cohen-Macaulay, see Varieties, Lemma 32.20 .3 and Algebra, Lemma 10.105.3). Thus $[d]$ is finite flat hence finite locally free by Morphisms, Lemma 28.45.2
Finally, we come to the formula for the degree. By Varieties, Lemma 32.34.11 we see that

$$
\operatorname{deg}_{\mathcal{N} \otimes d^{2}}(A)=\operatorname{deg}([d]) \operatorname{deg}_{\mathcal{N}}(A)
$$

Since the degree of $A$ with respect to $\mathcal{N} \otimes d^{2}$, respectively $\mathcal{N}$ is the coefficient of $n^{\operatorname{dim}(A)}$ in the polynomial

$$
n \longmapsto \chi\left(A, \mathcal{N}^{\otimes n d^{2}}\right), \quad \text { respectively } \quad n \longmapsto \chi\left(A, \mathcal{N}^{\otimes n}\right)
$$

we see that $\operatorname{deg}([d])=d^{2} \operatorname{dim}(A)$.
0BFH Lemma 38.9.9. Let $k$ be a field. Let $A$ be an abelian variety over $k$. Then $[d]: A \rightarrow A$ is étale if and only if $d$ is invertible in $k$.

Proof. Observe that $[d](x+y)=[d](x)+[d](y)$. Since translation by a point is an automorphism of $A$, we see that the set of points where $[d]: A \rightarrow A$ is étale is either empty or equal to $A$ (some details omitted). Thus it suffices to check whether $[d]$ is étale at the unit $e \in A(k)$. Since we know that $[d]$ is finite locally free (Lemma 38.9 .8 to see that it is étale at $e$ is equivalent to proving that $\mathrm{d}[d]: T_{A / k, e} \rightarrow T_{A / k, e}$ is injective. See Varieties, Lemma 32.14 .8 and Morphisms, Lemma 28.36.16. By Lemma 38.6 .4 we see that $\mathrm{d}[d]$ is given by multiplication by $d$ on $T_{A / k, e}$.

03RP Proposition 38.9.10. Let $A$ be an abelian variety over a field $k$. Then
(1) $A$ is projective over $k$,
(2) $A$ is a commutative group scheme,
(3) the morphism $[n]: A \rightarrow A$ is surjective for all $n \geq 1$,
(4) if $k$ is algebraically closed, then $A(k)$ is a divisible abelian group,
(5) $A[n]=\operatorname{Ker}([n]: A \rightarrow A)$ is a finite group scheme of degree $n^{2 \operatorname{dim} A}$ over $k$,
(6) $A[n]$ is étale over $k$ if and only if $n \in k^{*}$,
(7) if $n \in k^{*}$ and $k$ is algebraically closed, then $A(k)[n] \cong(\mathbf{Z} / n \mathbf{Z})^{\oplus 2 \operatorname{dim}(A)}$.

Proof. Part (1) follows from Lemma 38.9.2 Part (2) follows from Lemma 38.9.5. Part (3) follows from Lemma 38.9.8. If $k$ is algebraically closed then surjective morphisms of varieties over $k$ induce surjective maps on $k$-rational points, hence (4) follows from (3). Part (5) follows from Lemma 38.9 .8 and the fact that a base change of a finite locally free morphism of degree $N$ is a finite locally free morphism of degree $N$. Part (6) follows from Lemma 38.9.9. Namely, if $n$ is invertible in $k$, then $[n]$ is étale and hence $A[n]$ is étale over $k$. On the other hand, if $n$ is not invertible in $k$, then $[n]$ is not étale at $e$ and it follows that $A[n]$ is not étale over $k$ at $e$ (use Morphisms, Lemmas 28.36.16 and 28.35.15.

Assume $k$ is algebraically closed. Set $g=\operatorname{dim}(A)$. Let $\ell$ be a prime number which is invertible in $k$. Then we see that

$$
A[\ell](k)=A(k)[\ell]
$$

is a finite abelian group, annihilated by $\ell$, of order $\ell^{2 g}$. It follows that it is isomorphic to $(\mathbf{Z} / \ell \mathbf{Z})^{2 g}$ by the structure theory for finite abelian groups. Next, we consider the short exact sequence

$$
0 \rightarrow A(k)[\ell] \rightarrow A(k)\left[\ell^{2}\right] \xrightarrow{\ell} A(k)[\ell] \rightarrow 0
$$

Arguing similarly as above we conclude that $A(k)\left[\ell^{2}\right] \cong\left(\mathbf{Z} / \ell^{2} \mathbf{Z}\right)^{2 g}$. By induction on the exponent we find that $A(k)\left[\ell^{m}\right] \cong\left(\mathbf{Z} / \ell^{m} \mathbf{Z}\right)^{2 g}$. For composite integers $n$ prime to the characterisitc of $k$ we take primary parts and we find the correct shape of the $n$-torsion in $A(k)$.

### 38.10. Actions of group schemes

022 Y Let $(G, m)$ be a group and let $V$ be a set. Recall that a (left) action of $G$ on $V$ is given by a map $a: G \times V \rightarrow V$ such that
(1) (associativity) $a\left(m\left(g, g^{\prime}\right), v\right)=a\left(g, a\left(g^{\prime}, v\right)\right)$ for all $g, g^{\prime} \in G$ and $v \in V$, and
(2) (identity) $a(e, v)=v$ for all $v \in V$.

We also say that $V$ is a $G$-set (this usually means we drop the $a$ from the notation - which is abuse of notation). A map of $G$-sets $\psi: V \rightarrow V^{\prime}$ is any set map such that $\psi(a(g, v))=a(g, \psi(v))$ for all $v \in V$.

022Z Definition 38.10.1. Let $S$ be a scheme. Let $(G, m)$ be a group scheme over $S$.
(1) An action of $G$ on the scheme $X / S$ is a morphism $a: G \times{ }_{S} X \rightarrow X$ over $S$ such that for every $T / S$ the map $a: G(T) \times X(T) \rightarrow X(T)$ defines the structure of a $G(T)$-set on $X(T)$.
(2) Suppose that $X, Y$ are schemes over $S$ each endowed with an action of $G$. An equivariant or more precisely a G-equivariant morphism $\psi: X \rightarrow Y$ is a morphism of schemes over $S$ such that for every $T / S$ the map $\psi$ : $X(T) \rightarrow Y(T)$ is a morphism of $G(T)$-sets.
In situation (1) this means that the diagrams
03LD (38.10.1.1)

are commutative. In situation (2) this just means that the diagram

commutes.
07S1 Definition 38.10.2. Let $S, G \rightarrow S$, and $X \rightarrow S$ as in Definition 38.10.1. Let $a: G \times{ }_{S} X \rightarrow X$ be an action of $G$ on $X / S$. We say the action is free if for every scheme $T$ over $S$ the action $a: G(T) \times X(T) \rightarrow X(T)$ is a free action of the group $G(T)$ on the set $X(T)$.

07S2 Lemma 38.10.3. Situation as in Definition 38.10.2. The action a is free if and only if

$$
G \times_{S} X \rightarrow X \times_{S} X, \quad(g, x) \mapsto(a(g, x), x)
$$

is a monomorphism.
Proof. Immediate from the definitions.

### 38.11. Principal homogeneous spaces

0497 In Cohomology on Sites, Definition 21.5.1 we have defined a torsor for a sheaf of groups on a site. Suppose $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$ is a topology and $(G, m)$ is a group scheme over $S$. Since $\tau$ is stronger than the canonical topology (see Descent, Lemma 34.9.3) we see that $\underline{G}$ (see Sites, Definition 7.13.3) is a sheaf of groups on $(S c h / S)_{\tau}$. Hence we already know what it means to have a torsor for $\underline{G}$ on $(S c h / S)_{\tau}$. A special situation arises if this sheaf is representable. In the following definitions we define directly what it means for the representing scheme to be a $G$-torsor.

0498 Definition 38.11.1. Let $S$ be a scheme. Let $(G, m)$ be a group scheme over $S$. Let $X$ be a scheme over $S$, and let $a: G \times_{S} X \rightarrow X$ be an action of $G$ on $X$.
(1) We say $X$ is a pseudo $G$-torsor or that $X$ is formally principally homogeneous under $G$ if the induced morphism of schemes $G \times{ }_{S} X \rightarrow X \times_{S} X$, $(g, x) \mapsto(a(g, x), x)$ is an isomorphism of schemes over $S$.
(2) A pseudo $G$-torsor $X$ is called trivial if there exists an $G$-equivariant isomorphism $G \rightarrow X$ over $S$ where $G$ acts on $G$ by left multiplication.

It is clear that if $S^{\prime} \rightarrow S$ is a morphism of schemes then the pullback $X_{S^{\prime}}$ of a pseudo $G$-torsor over $S$ is a pseudo $G_{S^{\prime}}$-torsor over $S^{\prime}$.

0499 Lemma 38.11.2. In the situation of Definition 38.11.1.
(1) The scheme $X$ is a pseudo $G$-torsor if and only if for every scheme $T$ over $S$ the set $X(T)$ is either empty or the action of the group $G(T)$ on $X(T)$ is simply transitive.
(2) A pseudo $G$-torsor $X$ is trivial if and only if the morphism $X \rightarrow S$ has a section.
Proof. Omitted.
049A Definition 38.11.3. Let $S$ be a scheme. Let $(G, m)$ be a group scheme over $S$. Let $X$ be a pseudo $G$-torsor over $S$.
(1) We say $X$ is a principal homogeneous space or a $G$-torsor if there exists a fpqc covering ${ }^{2}\left\{S_{i} \rightarrow S\right\}_{i \in I}$ such that each $X_{S_{i}} \rightarrow S_{i}$ has a section (i.e., is a trivial pseudo $G_{S_{i}}$-torsor).
(2) Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. We say $X$ is a $G$-torsor in the $\tau$ topology, or a $\tau G$-torsor, or simply a $\tau$ torsor if there exists a $\tau$ covering $\left\{S_{i} \rightarrow S\right\}_{i \in I}$ such that each $X_{S_{i}} \rightarrow S_{i}$ has a section.
(3) If $X$ is a $G$-torsor, then we say that it is quasi-isotrivial if it is a torsor for the étale topology.
(4) If $X$ is a $G$-torsor, then we say that it is locally trivial if it is a torsor for the Zariski topology.

We sometimes say "let $X$ be a $G$-torsor over $S$ " to indicate that $X$ is a scheme over $S$ equipped with an action of $G$ which turns it into a principal homogeneous space over $S$. Next we show that this agrees with the notation introduced earlier when both apply.

049B Lemma 38.11.4. Let $S$ be a scheme. Let $(G, m)$ be a group scheme over $S$. Let $X$ be a scheme over $S$, and let $a: G \times_{S} X \rightarrow X$ be an action of $G$ on $X$. Let $\tau \in\{$ Zariski, étale, smooth,syntomic, fppf $\}$. Then $X$ is a $G$-torsor in the $\tau$-topology if and only if $\underline{X}$ is a $\underline{G}$-torsor on $(S c h / S)_{\tau}$.
Proof. Omitted.
049C Remark 38.11.5. Let $(G, m)$ be a group scheme over the scheme $S$. In this situation we have the following natural types of questions:
(1) If $X \rightarrow S$ is a pseudo $G$-torsor and $X \rightarrow S$ is surjective, then is $X$ necessarily a $G$-torsor?
(2) Is every $\underline{G}$-torsor on $(S c h / S)_{f p p f}$ representable? In other words, does every $\underline{G}$-torsor come from a fppf $G$-torsor?
(3) Is every $G$-torsor an fppf (resp. smooth, resp. étale, resp. Zariski) torsor? In general the answers to these questions is no. To get a positive answer we need to impose additional conditions on $G \rightarrow S$. For example: If $S$ is the spectrum of a field, then the answer to (1) is yes because then $\{X \rightarrow S\}$ is a fpqc covering trivializing $X$. If $G \rightarrow S$ is affine, then the answer to (2) is yes (insert future reference here). If $G=\mathrm{GL}_{n, S}$ then the answer to (3) is yes and in fact any $\mathrm{GL}_{n, S}$-torsor is locally trivial (insert future reference here).

[^108]
### 38.12. Equivariant quasi-coherent sheaves

03LE We think of "functions" as dual to "space". Thus for a morphism of spaces the map on functions goes the other way. Moreover, we think of the sections of a sheaf of modules as "functions". This leads us naturally to the direction of the arrows chosen in the following definition.

03LF Definition 38.12.1. Let $S$ be a scheme, let $(G, m)$ be a group scheme over $S$, and let $a: G \times{ }_{S} X \rightarrow X$ be an action of the group scheme $G$ on $X / S$. An $G$-equivariant quasi-coherent $\mathcal{O}_{X}$-module, or simply a equivariant quasi-coherent $\mathcal{O}_{X}$-module, is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-module, and $\alpha$ is a $\mathcal{O}_{G \times} X_{X}$-module map

$$
\alpha: a^{*} \mathcal{F} \longrightarrow \operatorname{pr}_{1}^{*} \mathcal{F}
$$

where $\mathrm{pr}_{1}: G \times_{S} X \rightarrow X$ is the projection such that
(1) the diagram

$$
\begin{aligned}
& \underset{\left(1_{G} \times a\right)^{*} \alpha}{\left(1_{G} \times a\right)^{*} \operatorname{pr}_{2}^{*} \mathcal{F} \xrightarrow[\operatorname{pr}_{12}^{*} \alpha]{ }} \underset{\uparrow}{\operatorname{pr}_{2}^{*} \mathcal{F}} \underset{\left(m \times 1_{X}\right)^{*} \alpha}{ } \\
& \left(1_{G} \times a\right)^{*} a^{*} \mathcal{F}=\left(m \times 1_{X}\right)^{*} a^{*} \mathcal{F}
\end{aligned}
$$

is a commutative in the category of $\mathcal{O}_{G \times{ }_{S} G \times{ }_{S} X}$-modules, and
(2) the pullback

$$
\left(e \times 1_{X}\right)^{*} \alpha: \mathcal{F} \longrightarrow \mathcal{F}
$$

is the identity map.
For explanation compare with the relevant diagrams of Equation 38.10.1.1.
Note that the commutativity of the first diagram guarantees that $\left(e \times 1_{X}\right)^{*} \alpha$ is an idempotent operator on $\mathcal{F}$, and hence condition (2) is just the condition that it is an isomorphism.

03LG Lemma 38.12.2. Let $S$ be a scheme. Let $G$ be a group scheme over $S$. Let $f: X \rightarrow Y$ be a $G$-equivariant morphism between $S$-schemes endowed with $G$ actions. Then pullback $f^{*}$ given by $(\mathcal{F}, \alpha) \mapsto\left(f^{*} \mathcal{F},\left(1_{G} \times f\right)^{*} \alpha\right)$ defines a functor from the category of $G$-equivariant sheaves on $X$ to the category of quasi-coherent $G$-equivariant sheaves on $Y$.
Proof. Omitted.

### 38.13. Groupoids

0230 Recall that a groupoid is a category in which every morphism is an isomorphism, see Categories, Definition 4.2.5. Hence a groupoid has a set of objects Ob, a set of arrows Arrows, a source and target map $s, t$ : Arrows $\rightarrow \mathrm{Ob}$, and a composition law $c$ : Arrows $\times_{s, \mathrm{Ob}, t}$ Arrows $\rightarrow$ Arrows. These maps satisfy exactly the following axioms
(1) (associativity) $c \circ(1, c)=c \circ(c, 1)$ as maps Arrows $\times_{s, \mathrm{Ob}, t}$ Arrows $\times_{s, \mathrm{Ob}, t}$

Arrows $\rightarrow$ Arrows,
(2) (identity) there exists a map $e: \mathrm{Ob} \rightarrow$ Arrows such that
(a) $s \circ e=t \circ e=\mathrm{id}$ as maps $\mathrm{Ob} \rightarrow \mathrm{Ob}$,
(b) $c \circ(1, e \circ s)=c \circ(e \circ t, 1)=1$ as maps Arrows $\rightarrow$ Arrows,
(3) (inverse) there exists a map $i$ : Arrows $\rightarrow$ Arrows such that
(a) $s \circ i=t, t \circ i=s$ as maps Arrows $\rightarrow \mathrm{Ob}$, and
(b) $c \circ(1, i)=e \circ t$ and $c \circ(i, 1)=e \circ s$ as maps Arrows $\rightarrow$ Arrows.

If this is the case the maps $e$ and $i$ are uniquely determined and $i$ is a bijection. Note that if $\left(\mathrm{Ob}^{\prime}\right.$, Arrows $\left.{ }^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is a second groupoid category, then a functor $f:(\mathrm{Ob}$, Arrows, $s, t, c) \rightarrow\left(\mathrm{Ob}^{\prime}\right.$, Arrows $\left.^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is given by a pair of set maps $f: \mathrm{Ob} \rightarrow \mathrm{Ob}^{\prime}$ and $f:$ Arrows $\rightarrow$ Arrows' such that $s^{\prime} \circ f=f \circ s, t^{\prime} \circ f=f \circ t$, and $c^{\prime} \circ(f, f)=f \circ c$. The compatibility with identity and inverse is automatic. We will use this below. (Warning: The compatibility with identity has to be imposed in the case of general categories.)

0231 Definition 38.13.1. Let $S$ be a scheme.
(1) A groupoid scheme over $S$, or simply a groupoid over $S$ is a quintuple $(U, R, s, t, c)$ where $U$ and $R$ are schemes over $S$, and $s, t: R \rightarrow U$ and $c: R \times_{s, U, t} R \rightarrow R$ are morphisms of schemes over $S$ with the following property: For any scheme $T$ over $S$ the quintuple

$$
(U(T), R(T), s, t, c)
$$

is a groupoid category in the sense described above.
(2) A morphism $f:(U, R, s, t, c) \rightarrow\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoid schemes over $S$ is given by morphisms of schemes $f: U \rightarrow U^{\prime}$ and $f: R \rightarrow R^{\prime}$ with the following property: For any scheme $T$ over $S$ the maps $f$ define a functor from the groupoid category $(U(T), R(T), s, t, c)$ to the groupoid category $\left(U^{\prime}(T), R^{\prime}(T), s^{\prime}, t^{\prime}, c^{\prime}\right)$.

Let $(U, R, s, t, c)$ be a groupoid over $S$. Note that, by the remarks preceding the definition and the Yoneda lemma, there are unique morphisms of schemes $e: U \rightarrow R$ and $i: R \rightarrow R$ over $S$ such that for every scheme $T$ over $S$ the induced map $e: U(T) \rightarrow R(T)$ is the identity, and $i: R(T) \rightarrow R(T)$ is the inverse of the groupoid category. The septuple ( $U, R, s, t, c, e, i$ ) satisfies commutative diagrams corresponding to each of the axioms (1), (2)(a), (2)(b), (3)(a) and (3)(b) above, and conversely given a septuple with this property the quintuple $(U, R, s, t, c)$ is a groupoid scheme. Note that $i$ is an isomorphism, and $e$ is a section of both $s$ and $t$. Moreover, given a groupoid scheme over $S$ we denote

$$
j=(t, s): R \longrightarrow U \times_{S} U
$$

which is compatible with our conventions in Section 38.3 above. We sometimes say "let $(U, R, s, t, c, e, i)$ be a groupoid over $S$ " to stress the existence of identity and inverse.

0232 Lemma 38.13.2. Given a groupoid scheme $(U, R, s, t, c)$ over $S$ the morphism $j: R \rightarrow U \times{ }_{S} U$ is a pre-equivalence relation.

Proof. Omitted. This is a nice exercise in the definitions.
0233 Lemma 38.13.3. Given an equivalence relation $j: R \rightarrow U$ over $S$ there is $a$ unique way to extend it to a groupoid ( $U, R, s, t, c$ ) over $S$.

Proof. Omitted. This is a nice exercise in the definitions.

02YE Lemma 38.13.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. In the commutative diagram

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry.

03C6 Lemma 38.13.5. Let $S$ be a scheme. Let $(U, R, s, t, c, e, i)$ be a groupoid over $S$. The diagram

03C7

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

Proof. The commutativity of the diagram follows from the axioms of a groupoid. Note that, in terms of groupoids, the top left vertical arrow assigns to a pair of morphisms $(\alpha, \beta)$ with the same target, the pair of morphisms $\left(\alpha, \alpha^{-1} \circ \beta\right)$. In any groupoid this defines a bijection between Arrows $\times_{t, \mathrm{Ob}, t}$ Arrows and Arrows $\times_{s, \mathrm{Ob}, t}$ Arrows. Hence the second assertion of the lemma. The last assertion follows from Lemma 38.13.4.

### 38.14. Quasi-coherent sheaves on groupoids

03 LH See the introduction of Section 38.12 for our choices in direction of arrows.
03LI Definition 38.14.1. Let $S$ be a scheme, let $(U, R, s, t, c)$ be a groupoid scheme over $S$. A quasi-coherent module on $(U, R, s, t, c)$ is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{U}$-module, and $\alpha$ is a $\mathcal{O}_{R}$-module map

$$
\alpha: t^{*} \mathcal{F} \longrightarrow s^{*} \mathcal{F}
$$

such that
(1) the diagram

is a commutative in the category of $\mathcal{O}_{R \times s, U, t} R^{\text {-modules, and }}$
(2) the pullback

$$
e^{*} \alpha: \mathcal{F} \longrightarrow \mathcal{F}
$$

is the identity map.
Compare with the commutative diagrams of Lemma 38.13.4.
The commutativity of the first diagram forces the operator $e^{*} \alpha$ to be idempotent. Hence the second condition can be reformulated as saying that $e^{*} \alpha$ is an isomorphism. In fact, the condition implies that $\alpha$ is an isomorphism.
077Q Lemma 38.14.2. Let $S$ be a scheme, let $(U, R, s, t, c)$ be a groupoid scheme over $S$. If $(\mathcal{F}, \alpha)$ is a quasi-coherent module on $(U, R, s, t, c)$ then $\alpha$ is an isomorphism.

Proof. Pull back the commutative diagram of Definition 38.14.1 by the morphism $(i, 1): R \rightarrow R \times_{s, U, t} R$. Then we see that $i^{*} \alpha \circ \alpha=s^{*} e^{*} \alpha$. Pulling back by the morphism $(1, i)$ we obtain the relation $\alpha \circ i^{*} \alpha=t^{*} e^{*} \alpha$. By the second assumption these morphisms are the identity. Hence $i^{*} \alpha$ is an inverse of $\alpha$.

03LJ Lemma 38.14.3. Let $S$ be a scheme. Consider a morphism $f:(U, R, s, t, c) \rightarrow$ $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoid schemes over $S$. Then pullback $f^{*}$ given by

$$
(\mathcal{F}, \alpha) \mapsto\left(f^{*} \mathcal{F}, f^{*} \alpha\right)
$$

defines a functor from the category of quasi-coherent sheaves on $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ to the category of quasi-coherent sheaves on $(U, R, s, t, c)$.

Proof. Omitted.
09 VH Lemma 38.14.4. Let $S$ be a scheme. Consider a morphism $f:(U, R, s, t, c) \rightarrow$ $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ of groupoid schemes over $S$. Assume that
(1) $f: U \rightarrow U^{\prime}$ is quasi-compact and quasi-separated,
(2) the square

is cartesian, and
(3) $s^{\prime}$ and $t^{\prime}$ are flat.

Then pushforward $f_{*}$ given by

$$
(\mathcal{F}, \alpha) \mapsto\left(f_{*} \mathcal{F}, f_{*} \alpha\right)
$$

defines a functor from the category of quasi-coherent sheaves on ( $U, R, s, t, c$ ) to the category of quasi-coherent sheaves on $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ which is right adjoint to pullback as defined in Lemma 38.14.3.
Proof. Since $U \rightarrow U^{\prime}$ is quasi-compact and quasi-separated we see that $f_{*}$ transforms quasi-coherent sheaves into quasi-coherent sheaves (Schemes, Lemma 25.24.1). Moreover, since the squares

and

are cartesian we find that $\left(t^{\prime}\right)^{*} f_{*} \mathcal{F}=f_{*} t^{*} \mathcal{F}$ and $\left(s^{\prime}\right)^{*} f_{*} \mathcal{F}=f_{*} s^{*} \mathcal{F}$, see Cohomology of Schemes, Lemma 29.5.2. Thus it makes sense to think of $f_{*} \alpha$ as a $\operatorname{map}\left(t^{\prime}\right)^{*} f_{*} \mathcal{F} \rightarrow\left(s^{\prime}\right)^{*} f_{*} \mathcal{F}$. A similar argument shows that $f_{*} \alpha$ satisfies the cocycle condition. The functor is adjoint to the pullback functor since pullback and pushforward on modules on ringed spaces are adjoint. Some details omitted.

077R Lemma 38.14.5. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. The category of quasi-coherent modules on $(U, R, s, t, c)$ has colimits.
Proof. Let $i \mapsto\left(\mathcal{F}_{i}, \alpha_{i}\right)$ be a diagram over the index category $\mathcal{I}$. We can form the colimit $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ which is a quasi-coherent sheaf on $U$, see Schemes, Section 25.24 Since colimits commute with pullback we see that $s^{*} \mathcal{F}=\operatorname{colim} s^{*} \mathcal{F}_{i}$ and similarly $t^{*} \mathcal{F}=\operatorname{colim} t^{*} \mathcal{F}_{i}$. Hence we can set $\alpha=\operatorname{colim} \alpha_{i}$. We omit the proof that $(\mathcal{F}, \alpha)$ is the colimit of the diagram in the category of quasi-coherent modules on ( $U, R, s, t, c)$.

077S Lemma 38.14.6. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. If $s, t$ are flat, then the category of quasi-coherent modules on $(U, R, s, t, c)$ is abelian.

Proof. Let $\varphi:(\mathcal{F}, \alpha) \rightarrow(\mathcal{G}, \beta)$ be a homomorphism of quasi-coherent modules on $(U, R, s, t, c)$. Since $s$ is flat we see that

$$
0 \rightarrow s^{*} \operatorname{Ker}(\varphi) \rightarrow s^{*} \mathcal{F} \rightarrow s^{*} \mathcal{G} \rightarrow s^{*} \operatorname{Coker}(\varphi) \rightarrow 0
$$

is exact and similarly for pullback by $t$. Hence $\alpha$ and $\beta$ induce isomorphisms $\kappa$ : $t^{*} \operatorname{Ker}(\varphi) \rightarrow s^{*} \operatorname{Ker}(\varphi)$ and $\lambda: t^{*} \operatorname{Coker}(\varphi) \rightarrow s^{*} \operatorname{Coker}(\varphi)$ which satisfy the cocycle condition. Then it is straightforward to verify that $(\operatorname{Ker}(\varphi), \kappa)$ and $(\operatorname{Coker}(\varphi), \lambda)$ are a kernel and cokernel in the category of quasi-coherent modules on $(U, R, s, t, c)$. Moreover, the condition $\operatorname{Coim}(\varphi)=\operatorname{Im}(\varphi)$ follows because it holds over $U$.

### 38.15. Colimits of quasi-coherent modules

07 TS In this section we prove some technical results saying that under suitable assumptions every quasi-coherent module on a groupoid is a filtered colimit of "small" quasi-coherent modules.

07TR Lemma 38.15.1. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $s, t$ are flat, quasi-compact, and quasi-separated. For any quasi-coherent module $\mathcal{G}$ on $U$, there exists a canonical isomorphism $\alpha: t^{*} t_{*} s^{*} \mathcal{G} \rightarrow s^{*} t_{*} s^{*} \mathcal{G}$ which turns $\left(t_{*} s^{*} \mathcal{G}, \alpha\right)$ into a quasi-coherent module on $(U, R, s, t, c)$. This construction defines a functor

$$
Q \operatorname{Coh}\left(\mathcal{O}_{U}\right) \longrightarrow Q \operatorname{Coh}(U, R, s, t, c)
$$

which is a right adjoint to the forgetful functor $(\mathcal{F}, \beta) \mapsto \mathcal{F}$.
Proof. The pushforward of a quasi-coherent module along a quasi-compact and quasi-separated morphism is quasi-coherent, see Schemes, Lemma 25.24.1. Hence $t_{*} s^{*} \mathcal{G}$ is quasi-coherent. With notation as in Lemma 38.13.4 we have

$$
t^{*} t_{*} s^{*} \mathcal{G}=\operatorname{pr}_{0, *} c^{*} s^{*} \mathcal{G}=\operatorname{pr}_{0, *} \operatorname{pr}_{1}^{*} s^{*} \mathcal{G}=s^{*} t_{*} s^{*} \mathcal{G}
$$

The middle equality because $s \circ c=s \circ \mathrm{pr}_{1}$ as morphisms $R \times_{s, U, t} R \rightarrow U$, and the first and the last equality because we know that base change and pushforward commute in these steps by Cohomology of Schemes, Lemma 29.5.2.

To verify the cocycle condition of Definition 38.14.1 for $\alpha$ and the adjointness property we describe the construction $\mathcal{G} \mapsto(\mathcal{G}, \alpha)$ in another way. Consider the groupoid scheme ( $R, R \times_{s, U, s} R, \mathrm{pr}_{0}, \mathrm{pr}_{1}, \mathrm{pr}_{02}$ ) associated to the equivalence relation $R \times_{s, U, s} R$ on $R$, see Lemma 38.13.3. There is a morphism

$$
f:\left(R, R \times_{s, U, s} R, \mathrm{pr}_{1}, \mathrm{pr}_{0}, \mathrm{pr}_{02}\right) \longrightarrow(U, R, s, t, c)
$$

of groupoid schemes given by $t: R \rightarrow U$ and $R \times_{t, U, t} R \rightarrow R$ given by $\left(r_{0}, r_{1}\right) \mapsto$ $r_{0} \circ r_{1}^{-1}$ (we omit the verification of the commutativity of the required diagrams). Since $t, s: R \rightarrow U$ are quasi-compact, quasi-separated, and flat, and since we have a cartesian square

by Lemma 38.13.5 it follows that Lemma 38.14.4 applies to $f$. Note that

$$
Q \operatorname{Coh}\left(R, R \times_{s, U, s} R, \operatorname{pr}_{0}, \operatorname{pr}_{1}, \operatorname{pr}_{02}\right)=Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)
$$

by the theory of descent of quasi-coherent sheaves as $\{t: R \rightarrow U\}$ is an fpqc covering, see Descent, Proposition 34.5.2. Observe that pullback along $f$ agrees with the forgetful functor and that pushforward agrees with the construction that assigns to $\mathcal{G}$ the pair $(\mathcal{G}, \alpha)$. We omit the precise verifications. Thus the lemma follows from Lemma 38.14.4

07TT Lemma 38.15.2. Let $f: Y \rightarrow X$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module, let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_{Y}$-module, and let $\varphi: \mathcal{G} \rightarrow f^{*} \mathcal{F}$ be a module map. Assume
(1) $\varphi$ is injective,
(2) $f$ is quasi-compact, quasi-separated, flat, and surjective,
(3) $X, Y$ are locally Noetherian, and
(4) $\mathcal{G}$ is a coherent $\mathcal{O}_{Y}$-module.

Then $\mathcal{F} \cap f_{*} \mathcal{G}$ defined as the pullback

is a coherent $\mathcal{O}_{X}$-module.

Proof. We will freely use the characterization of coherent modules of Cohomology of Schemes, Lemma 29.9 .1 as well as the fact that coherent modules form a Serre subcategory of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$, see Cohomology of Schemes, Lemma 29.9.3. If $f$ has a section $\sigma$, then we see that $\mathcal{F} \cap f_{*} \mathcal{G}$ is contained in the image of $\sigma^{*} \mathcal{G} \rightarrow \sigma^{*} f^{*} \mathcal{F}=\mathcal{F}$, hence coherent. In general, to show that $\mathcal{F} \cap f_{*} \mathcal{G}$ is coherent, it suffices the show that $f^{*}\left(\mathcal{F} \cap f_{*} \mathcal{G}\right)$ is coherent (see Descent, Lemma 34.6.1). Since $f$ is flat this is equal to $f^{*} \mathcal{F} \cap f^{*} f_{*} \mathcal{G}$. Since $f$ is flat, quasi-compact, and quasi-separated we see $f^{*} f_{*} \mathcal{G}=p_{*} q^{*} \mathcal{G}$ where $p, q: Y \times_{X} Y \rightarrow Y$ are the projections, see Cohomology of Schemes, Lemma 29.5.2. Since $p$ has a section we win.

Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid in schemes over $S$. Assume that $U$ is locally Noetherian. In the lemma below we say that a quasi-coherent sheaf ( $\mathcal{F}, \alpha)$ on $(U, R, s, t, c)$ is coherent if $\mathcal{F}$ is a coherent $\mathcal{O}_{U}$-module.

07 TU Lemma 38.15.3. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume that
(1) $U, R$ are Noetherian,
(2) $s, t$ are flat, quasi-compact, and quasi-separated.

Then every quasi-coherent module $(\mathcal{F}, \alpha)$ on $(U, R, s, t, c)$ is a filtered colimit of coherent modules.

Proof. We will use the characterization of Cohomology of Schemes, Lemma 29.9.1 of coherent modules on locally Noetherian scheme without further mention. Write $\mathcal{F}=\operatorname{colim} \mathcal{H}_{i}$ with $\mathcal{H}_{i}$ coherent, see Properties, Lemma 27.22.6. Given a quasicoherent sheaf $\mathcal{H}$ on $U$ we denote $t_{*} s^{*} \mathcal{H}$ the quasi-coherent sheaf on $(U, R, s, t, c)$ of Lemma 38.15.1. There is an adjunction map $\mathcal{F} \rightarrow t_{*} s^{*} \mathcal{F}$ in $Q \operatorname{Coh}(U, R, s, t, c)$. Consider the pullback diagram

in other words $\mathcal{F}_{i}=\mathcal{F} \cap t_{*} s^{*} \mathcal{H}_{i}$. Then $\mathcal{F}_{i}$ is coherent by Lemma 38.15.2. On the other hand, the diagram above is a pullback diagram in $Q \operatorname{Coh}(U, R, s, t, c)$ also as restriction to $U$ is an exact functor by (the proof of) Lemma 38.14.6. Finally, because $t$ is quasi-compact and quasi-separated we see that $t_{*}$ commutes with colimits (see Cohomology of Schemes, Lemma 29.6.1). Hence $t_{*} s^{*} \mathcal{F}=\operatorname{colim} t_{*} \mathcal{H}_{i}$ and hence $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ as desired.

Here is a curious lemma that is useful when working with groupoids on fields. In fact, this is the standard argument to prove that any representation of an algebraic group is a colimit of finite dimensional representations.

07TV Lemma 38.15.4. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume that
(1) $U, R$ are affine,
(2) there exist $e_{i} \in \mathcal{O}_{R}(R)$ such that every element $g \in \mathcal{O}_{R}(R)$ can be uniquely written as $\sum s^{*}\left(f_{i}\right) e_{i}$ for some $f_{i} \in \mathcal{O}_{U}(U)$.
Then every quasi-coherent module $(\mathcal{F}, \alpha)$ on $(U, R, s, t, c)$ is a filtered colimit of finite type quasi-coherent modules.

Proof. The assumption means that $\mathcal{O}_{R}(R)$ is a free $\mathcal{O}_{U}(U)$-module via $s$ with basis $e_{i}$. Hence for any quasi-coherent $\mathcal{O}_{U}$-module $\mathcal{G}$ we see that $s^{*} \mathcal{G}(R)=\bigoplus_{i} \mathcal{G}(U) e_{i}$.

We will write $s(-)$ to indicate pullback of sections by $s$ and similarly for other morphisms. Let $(\mathcal{F}, \alpha)$ be a quasi-coherent module on $(U, R, s, t, c)$. Let $\sigma \in \mathcal{F}(U)$. By the above we can write

$$
\alpha(t(\sigma))=\sum s\left(\sigma_{i}\right) e_{i}
$$

for some unique $\sigma_{i} \in \mathcal{F}(U)$ (all but finitely many are zero of course). We can also write

$$
c\left(e_{i}\right)=\sum \operatorname{pr}_{1}\left(f_{i j}\right) \operatorname{pr}_{0}\left(e_{j}\right)
$$

as functions on $R \times_{s, U, t} R$. Then the commutativity of the diagram in Definition 38.14.1 means that

$$
\sum \operatorname{pr}_{1}\left(\alpha\left(t\left(\sigma_{i}\right)\right)\right) \operatorname{pr}_{0}\left(e_{i}\right)=\sum \operatorname{pr}_{1}\left(s\left(\sigma_{i}\right) f_{i j}\right) \operatorname{pr}_{0}\left(e_{j}\right)
$$

(calculation omitted). Picking off the coefficients of $\operatorname{pr}_{0}\left(e_{l}\right)$ we see that $\alpha\left(t\left(\sigma_{l}\right)\right)=$ $\sum s\left(\sigma_{i}\right) f_{i l}$. Hence the submodule $\mathcal{G} \subset \mathcal{F}$ generated by the elements $\sigma_{i}$ defines a finite type quasi-coherent module preserved by $\alpha$. Hence it is a subobject of $\mathcal{F}$ in $Q \operatorname{Coh}(U, R, s, t, c)$. This submodule contains $\sigma$ (as one sees by pulling back the first relation by $e$ ). Hence we win.

We suggest the reader skip the rest of this section. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid in schemes over $S$. Let $\kappa$ be a cardinal. In the following we will say that a quasi-coherent sheaf $(\mathcal{F}, \alpha)$ on $(U, R, s, t, c)$ is $\kappa$-generated if $\mathcal{F}$ is a $\kappa$-generated $\mathcal{O}_{U}$-module, see Properties, Definition 27.23.1,

077T Lemma 38.15.5. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $\kappa$ be a cardinal. There exists a set $T$ and a family $\left(\mathcal{F}_{t}, \alpha_{t}\right)_{t \in T}$ of $\kappa$-generated quasicoherent modules on $(U, R, s, t, c)$ such that every $\kappa$-generated quasi-coherent module on $(U, R, s, t, c)$ is isomorphic to one of the $\left(\mathcal{F}_{t}, \alpha_{t}\right)$.

Proof. For each quasi-coherent module $\mathcal{F}$ on $U$ there is a (possibly empty) set of maps $\alpha: t^{*} \mathcal{F} \rightarrow s^{*} \mathcal{F}$ such that $(\mathcal{F}, \alpha)$ is a quasi-coherent modules on $(U, R, s, t, c)$. By Properties, Lemma 27.23 .2 there exists a set of isomorphism classes of $\kappa$ generated quasi-coherent $\mathcal{O}_{U}$-modules.

077U Lemma 38.15.6. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume that $s, t$ are flat. There exists a cardinal $\kappa$ such that every quasi-coherent module $(\mathcal{F}, \alpha)$ on ( $U, R, s, t, c$ ) is the directed colimit of its $\kappa$-generated quasi-coherent submodules.

Proof. In the statement of the lemma and in this proof a submodule of a quasicoherent module $(\mathcal{F}, \alpha)$ is a quasi-coherent submodule $\mathcal{G} \subset \mathcal{F}$ such that $\alpha\left(t^{*} \mathcal{G}\right)=$ $s^{*} \mathcal{G}$ as subsheaves of $s^{*} \mathcal{F}$. This makes sense because since $s, t$ are flat the pullbacks $s^{*}$ and $t^{*}$ are exact, i.e., preserve subsheaves. The proof will be a repeat of the proof of Properties, Lemma 27.23.3. We urge the reader to read that proof first.

Choose an affine open covering $U=\bigcup_{i \in I} U_{i}$. For each pair $i, j$ choose affine open coverings

$$
U_{i} \cap U_{j}=\bigcup_{k \in I_{i j}} U_{i j k} \quad \text { and } \quad s^{-1}\left(U_{i}\right) \cap t^{-1}\left(U_{j}\right)=\bigcup_{k \in J_{i j}} W_{i j k}
$$

Write $U_{i}=\operatorname{Spec}\left(A_{i}\right), U_{i j k}=\operatorname{Spec}\left(A_{i j k}\right), W_{i j k}=\operatorname{Spec}\left(B_{i j k}\right)$. Let $\kappa$ be any infinite cardinal $\geq$ than the cardinality of any of the sets $I, I_{i j}, J_{i j}$.

Let $(\mathcal{F}, \alpha)$ be a quasi-coherent module on $(U, R, s, t, c)$. Set $M_{i}=\mathcal{F}\left(U_{i}\right), M_{i j k}=$ $\mathcal{F}\left(U_{i j k}\right)$. Note that

$$
M_{i} \otimes_{A_{i}} A_{i j k}=M_{i j k}=M_{j} \otimes_{A_{j}} A_{i j k}
$$

and that $\alpha$ gives isomorphisms

$$
\left.\alpha\right|_{W_{i j k}}: M_{i} \otimes_{A_{i}, t} B_{i j k} \longrightarrow M_{j} \otimes_{A_{j}, s} B_{i j k}
$$

see Schemes, Lemma 25.7.3. Using the axiom of choice we choose a map

$$
(i, j, k, m) \mapsto S(i, j, k, m)
$$

which associates to every $i, j \in I, k \in I_{i j}$ or $k \in J_{i j}$ and $m \in M_{i}$ a finite subset $S(i, j, k, m) \subset M_{j}$ such that we have

$$
m \otimes 1=\sum_{m^{\prime} \in S(i, j, k, m)} m^{\prime} \otimes a_{m^{\prime}} \quad \text { or } \quad \alpha(m \otimes 1)=\sum_{m^{\prime} \in S(i, j, k, m)} m^{\prime} \otimes b_{m^{\prime}}
$$

in $M_{i j k}$ for some $a_{m^{\prime}} \in A_{i j k}$ or $b_{m^{\prime}} \in B_{i j k}$. Moreover, let's agree that $S(i, i, k, m)=$ $\{m\}$ for all $i, j=i, k, m$ when $k \in I_{i j}$. Fix such a collection $S(i, j, k, m)$
Given a family $\mathcal{S}=\left(S_{i}\right)_{i \in I}$ of subsets $S_{i} \subset M_{i}$ of cardinality at most $\kappa$ we set $\mathcal{S}^{\prime}=\left(S_{i}^{\prime}\right)$ where

$$
S_{j}^{\prime}=\bigcup_{(i, j, k, m) \text { such that } m \in S_{i}} S(i, j, k, m)
$$

Note that $S_{i} \subset S_{i}^{\prime}$. Note that $S_{i}^{\prime}$ has cardinality at most $\kappa$ because it is a union over a set of cardinality at most $\kappa$ of finite sets. Set $\mathcal{S}^{(0)}=\mathcal{S}, \mathcal{S}^{(1)}=\mathcal{S}^{\prime}$ and by induction $\mathcal{S}^{(n+1)}=\left(\mathcal{S}^{(n)}\right)^{\prime}$. Then set $\mathcal{S}^{(\infty)}=\bigcup_{n \geq 0} \mathcal{S}^{(n)}$. Writing $\mathcal{S}^{(\infty)}=\left(S_{i}^{(\infty)}\right)$ we see that for any element $m \in S_{i}^{(\infty)}$ the image of $m$ in $M_{i j k}$ can be written as a finite sum $\sum m^{\prime} \otimes a_{m^{\prime}}$ with $m^{\prime} \in S_{j}^{(\infty)}$. In this way we see that setting

$$
N_{i}=A_{i} \text {-submodule of } M_{i} \text { generated by } S_{i}^{(\infty)}
$$

we have

$$
N_{i} \otimes_{A_{i}} A_{i j k}=N_{j} \otimes_{A_{j}} A_{i j k} \quad \text { and } \quad \alpha\left(N_{i} \otimes_{A_{i}, t} B_{i j k}\right)=N_{j} \otimes_{A_{j}, s} B_{i j k}
$$

as submodules of $M_{i j k}$ or $M_{j} \otimes_{A_{j}, s} B_{i j k}$. Thus there exists a quasi-coherent submodule $\mathcal{G} \subset \mathcal{F}$ with $\mathcal{G}\left(U_{i}\right)=N_{i}$ such that $\alpha\left(t^{*} \mathcal{G}\right)=s^{*} \mathcal{G}$ as submodules of $s^{*} \mathcal{F}$. In other words, $\left(\mathcal{G},\left.\alpha\right|_{t^{*} \mathcal{G}}\right)$ is a submodule of $(\mathcal{F}, \alpha)$. Moreover, by construction $\mathcal{G}$ is $\kappa$-generated.
Let $\left\{\left(\mathcal{G}_{t}, \alpha_{t}\right)\right\}_{t \in T}$ be the set of $\kappa$-generated quasi-coherent submodules of $(\mathcal{F}, \alpha)$. If $t, t^{\prime} \in T$ then $\mathcal{G}_{t}+\mathcal{G}_{t^{\prime}}$ is also a $\kappa$-generated quasi-coherent submodule as it is the image of the map $\mathcal{G}_{t} \oplus \mathcal{G}_{t^{\prime}} \rightarrow \mathcal{F}$. Hence the system (ordered by inclusion) is directed. The arguments above show that every section of $\mathcal{F}$ over $U_{i}$ is in one of the $\mathcal{G}_{t}$ (because we can start with $\mathcal{S}$ such that the given section is an element of $\left.S_{i}\right)$. Hence colim ${ }_{t} \mathcal{G}_{t} \rightarrow \mathcal{F}$ is both injective and surjective as desired.

### 38.16. Groupoids and group schemes

03LK There are many ways to construct a groupoid out of an action $a$ of a group $G$ on a set $V$. We choose the one where we think of an element $g \in G$ as an arrow with source $v$ and target $a(g, v)$. This leads to the following construction for group actions of schemes.

0234 Lemma 38.16.1. Let $S$ be a scheme. Let $Y$ be a scheme over $S$. Let $(G, m)$ be a group scheme over $Y$ with identity $e_{G}$ and inverse $i_{G}$. Let $X / Y$ be a scheme over $Y$ and let $a: G \times_{Y} X \rightarrow X$ be an action of $G$ on $X / Y$. Then we get a groupoid scheme $(U, R, s, t, c, e, i)$ over $S$ in the following manner:
(1) We set $U=X$, and $R=G \times_{Y} X$.
(2) We set $s: R \rightarrow U$ equal to $(g, x) \mapsto x$.
(3) We set $t: R \rightarrow U$ equal to $(g, x) \mapsto a(g, x)$.
(4) We set $c: R \times_{s, U, t} R \rightarrow R$ equal to $\left((g, x),\left(g^{\prime}, x^{\prime}\right)\right) \mapsto\left(m\left(g, g^{\prime}\right), x^{\prime}\right)$.
(5) We set $e: U \rightarrow R$ equal to $x \mapsto\left(e_{G}(x), x\right)$.
(6) We set $i: R \rightarrow R$ equal to $(g, x) \mapsto\left(i_{G}(g), a(g, x)\right)$.

Proof. Omitted. Hint: It is enough to show that this works on the set level. For this use the description above the lemma describing $g$ as an arrow from $v$ to $a(g, v)$.
03LL Lemma 38.16.2. Let $S$ be a scheme. Let $Y$ be a scheme over $S$. Let $(G, m)$ be a group scheme over $Y$. Let $X$ be a scheme over $Y$ and let $a: G \times_{Y} X \rightarrow X$ be an action of $G$ on $X$ over $Y$. Let $(U, R, s, t, c)$ be the groupoid scheme constructed in Lemma 38.16.1. The rule $(\mathcal{F}, \alpha) \mapsto(\mathcal{F}, \alpha)$ defines an equivalence of categories between $G$-equivariant $\mathcal{O}_{X}$-modules and the category of quasi-coherent modules on $(U, R, s, t, c)$.

Proof. The assertion makes sense because $t=a$ and $s=\operatorname{pr}_{1}$ as morphisms $R=$ $G \times_{Y} X \rightarrow X$, see Definitions 38.12.1 and 38.14.1. Using the translation in Lemma 38.16.1 the commutativity requirements of the two definitions match up exactly.

### 38.17. The stabilizer group scheme

03LM Given a groupoid scheme we get a group scheme as follows.
0235 Lemma 38.17.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. The scheme $G$ defined by the cartesian square

is a group scheme over $U$ with composition law $m$ induced by the composition law c.

Proof. This is true because in a groupoid category the set of self maps of any object forms a group.
Since $\Delta$ is an immersion we see that $G=j^{-1}\left(\Delta_{U / S}\right)$ is a locally closed subscheme of $R$. Thinking of it in this way, the structure morphism $j^{-1}\left(\Delta_{U / S}\right) \rightarrow U$ is induced by either $s$ or $t$ (it is the same), and $m$ is induced by $c$.
0236 Definition 38.17.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. The group scheme $j^{-1}\left(\Delta_{U / S}\right) \rightarrow U$ is called the stabilizer of the groupoid scheme ( $U, R, s, t, c)$.
In the literature the stabilizer group scheme is often denoted $S$ (because the word stabilizer starts with an "s" presumably); we cannot do this since we have already used $S$ for the base scheme.

0237 Lemma 38.17.3. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$, and let $G / U$ be its stabilizer. Denote $R_{t} / U$ the scheme $R$ seen as a scheme over $U$ via the morphism $t: R \rightarrow U$. There is a canonical left action

$$
a: G \times_{U} R_{t} \longrightarrow R_{t}
$$

induced by the composition law $c$.
Proof. In terms of points over $T / S$ we define $a(g, r)=c(g, r)$.
04Q2 Lemma 38.17.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $G$ be the stabilizer group scheme of $R$. Let

$$
G_{0}=G \times_{U, p r_{0}}\left(U \times_{S} U\right)=G \times_{S} U
$$

as a group scheme over $U \times{ }_{S} U$. The action of $G$ on $R$ of Lemma 38.17.3 induces an action of $G_{0}$ on $R$ over $U \times_{S} U$ which turns $R$ into a pseudo $G_{0}$-torsor over $U \times{ }_{S} U$.

Proof. This is true because in a groupoid category $\mathcal{C}$ the set $\operatorname{Mor}_{\mathcal{C}}(x, y)$ is a principal homogeneous set under the group $\operatorname{Mor}_{\mathcal{C}}(y, y)$.

04Q3 Lemma 38.17.5. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $p \in U \times_{S} U$ be a point. Denote $R_{p}$ the scheme theoretic fibre of $j=(t, s): R \rightarrow U \times_{S} U$. If $R_{p} \neq \emptyset$, then the action

$$
G_{0, \kappa(p)} \times \kappa(p) R_{p} \longrightarrow R_{p}
$$

(see Lemma 38.17.4) which turns $R_{p}$ into a $G_{\kappa(p)}$-torsor over $\kappa(p)$.
Proof. The action is a pseudo-torsor by the lemma cited in the statement. And if $R_{p}$ is not the empty scheme, then $\left\{R_{p} \rightarrow p\right\}$ is an fpqc covering which trivializes the pseudo-torsor.

### 38.18. Restricting groupoids

02VA Consider a (usual) groupoid $\mathcal{C}=(\mathrm{Ob}$, Arrows, $s, t, c)$. Suppose we have a map of sets $g: \mathrm{Ob}^{\prime} \rightarrow \mathrm{Ob}$. Then we can construct a groupoid $\mathcal{C}^{\prime}=\left(\mathrm{Ob}^{\prime}\right.$, Arrows $\left.^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ by thinking of a morphism between elements $x^{\prime}, y^{\prime}$ of $\mathrm{Ob}^{\prime}$ as a morphisms in $\mathcal{C}$ between $g\left(x^{\prime}\right), g\left(y^{\prime}\right)$. In other words we set

$$
\text { Arrows }^{\prime}=\mathrm{Ob}^{\prime} \times_{g, \mathrm{Ob}, t} \text { Arrows } \times_{s, \mathrm{Ob}, g} \mathrm{Ob}^{\prime}
$$

with obvious choices for $s^{\prime}, t^{\prime}$, and $c^{\prime}$. There is a canonical functor $\mathcal{C}^{\prime} \rightarrow \mathcal{C}$ which is fully faithful, but not necessarily essentially surjective. This groupoid $\mathcal{C}^{\prime}$ endowed with the functor $\mathcal{C}^{\prime} \rightarrow \mathcal{C}$ is called the restriction of the groupoid $\mathcal{C}$ to $\mathrm{Ob}^{\prime}$.
02VB Lemma 38.18.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Consider the following diagram

where all the squares are fibre product squares. Then there is a canonical composition law $c^{\prime}: R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime} \rightarrow R^{\prime}$ such that $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is a groupoid scheme over $S$ and such that $U^{\prime} \rightarrow U, R^{\prime} \rightarrow R$ defines a morphism $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow$ $(U, R, s, t, c)$ of groupoid schemes over $S$. Moreover, for any scheme $T$ over $S$ the functor of groupoids

$$
\left(U^{\prime}(T), R^{\prime}(T), s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U(T), R(T), s, t, c)
$$

is the restriction (see above) of $(U(T), R(T), s, t, c)$ via the map $U^{\prime}(T) \rightarrow U(T)$.
Proof. Omitted.
02 VC Definition 38.18.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. The morphism of groupoids $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ constructed in Lemma 38.18.1 is called the restriction of $(U, R, s, t, c)$ to $U^{\prime}$. We sometime use the notation $R^{\prime}=\left.R\right|_{U^{\prime}}$ in this case.
02VD Lemma 38.18.3. The notions of restricting groupoids and (pre-)equivalence relations defined in Definitions 38.18.2 and 38.3 .3 agree via the constructions of Lem$\operatorname{mas} 38.13 .2$ and 38.13 .3 .
Proof. What we are saying here is that $R^{\prime}$ of Lemma 38.18.1 is also equal to

$$
R^{\prime}=\left(U^{\prime} \times_{S} U^{\prime}\right) \times_{U \times_{S} U} R \longrightarrow U^{\prime} \times_{S} U^{\prime}
$$

In fact this might have been a clearer way to state that lemma.
04ML Lemma 38.18.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $g$. Let $G$ be the stabilizer of $(U, R, s, t, c)$ and let $G^{\prime}$ be the stabilizer of $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$. Then $G^{\prime}$ is the base change of $G$ by $g$, i.e., there is a canonical identification $G^{\prime}=U^{\prime} \times_{g, U} G$.

Proof. Omitted.

### 38.19. Invariant subschemes

03LN In this section we discuss briefly the notion of an invariant subscheme.
03BC Definition 38.19.1. Let $(U, R, s, t, c)$ be a groupoid scheme over the base scheme $S$.
(1) A subset $W \subset U$ is set-theoretically $R$-invariant if $t\left(s^{-1}(W)\right) \subset W$.
(2) An open $W \subset U$ is $R$-invariant if $t\left(s^{-1}(W)\right) \subset W$.
(3) A closed subscheme $Z \subset U$ is called $R$-invariant if $t^{-1}(Z)=s^{-1}(Z)$. Here we use the scheme theoretic inverse image, see Schemes, Definition 25.17 .7
(4) A monomorphism of schemes $T \rightarrow U$ is $R$-invariant if $T \times{ }_{U, t} R=R \times{ }_{s, U} T$ as schemes over $R$.

For subsets and open subschemes $W \subset U$ the $R$-invariance is also equivalent to requiring that $s^{-1}(W)=t^{-1}(W)$ as subsets of $R$. If $W \subset U$ is an $R$-equivariant open subscheme then the restriction of $R$ to $W$ is just $R_{W}=s^{-1}(W)=t^{-1}(W)$. Similarly, if $Z \subset U$ is an $R$-invariant closed subscheme, then the restriction of $R$ to $Z$ is just $R_{Z}=s^{-1}(Z)=t^{-1}(Z)$.
03LO Lemma 38.19.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$.
(1) For any subset $W \subset U$ the subset $t\left(s^{-1}(W)\right)$ is set-theoretically $R$-invariant.
(2) If $s$ and $t$ are open, then for every open $W \subset U$ the open $t\left(s^{-1}(W)\right)$ is an $R$-invariant open subscheme.
(3) If $s$ and $t$ are open and quasi-compact, then $U$ has an open covering consisting of $R$-invariant quasi-compact open subschemes.

Proof. Part (1) follows from Lemmas 38.3 .4 and 38.13 .2 , namely, $t\left(s^{-1}(W)\right)$ is the set of points of $U$ equivalent to a point of $W$. Next, assume $s$ and $t$ open and $W \subset U$ open. Since $s$ is open the set $W^{\prime}=t\left(s^{-1}(W)\right)$ is an open subset of $U$. Finally, assume that $s, t$ are both open and quasi-compact. Then, if $W \subset U$ is a quasi-compact open, then also $W^{\prime}=t\left(s^{-1}(W)\right)$ is a quasi-compact open, and invariant by the discussion above. Letting $W$ range over all affine opens of $U$ we see (3).

0APA Lemma 38.19.3. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $s$ and $t$ quasi-compact and flat and $U$ quasi-separated. Let $W \subset U$ be quasi-compact open. Then $t\left(s^{-1}(W)\right)$ is an intersection of a nonempty family of quasi-compact open subsets of $U$.
Proof. Note that $s^{-1}(W)$ is quasi-compact open in $R$. As a continuous map $t$ maps the quasi-compact subset $s^{-1}(W)$ to a quasi-compact subset $t\left(s^{-1}(W)\right)$. As $t$ is flat and $s^{-1}(W)$ is closed under generalization, so is $t\left(s^{-1}(W)\right.$ ), see (Morphisms, Lemma 28.25 .8 and Topology, Lemma 5.18.5. Pick a quasi-compact open $W^{\prime} \subset U$ containing $t\left(s^{-1}(W)\right)$. By Properties, Lemma 27.2 .4 we see that $W^{\prime}$ is a spectral space (here we use that $U$ is quasi-separated). Then the lemma follows from Topology, Lemma 5.23.7 applied to $t\left(s^{-1}(W)\right) \subset W^{\prime}$.

0APB Lemma 38.19.4. Assumptions and notation as in Lemma 38.19.3. There exists an $R$-invariant open $V \subset U$ and a quasi-compact open $W^{\prime}$ such that $W \subset V \subset$ $W^{\prime} \subset U$.

Proof. Set $E=t\left(s^{-1}(W)\right)$. Recall that $E$ is set-theoretically $R$-invariant (Lemma 38.19.2. By Lemma 38.19 .3 there exists a quasi-compact open $W^{\prime}$ containing $E$. Let $Z=U \backslash W^{\prime}$ and consider $T=t\left(s^{-1}(Z)\right)$. Observe that $Z \subset T$ and that $E \cap T=\emptyset$ because $s^{-1}(E)=t^{-1}(E)$ is disjoint from $s^{-1}(Z)$. Since $T$ is the image of the closed subset $s^{-1}(Z) \subset R$ under the quasi-compact morphism $t: R \rightarrow U$ we see that any point $\xi$ in the closure $\bar{T}$ is the specialization of a point of $T$, see Morphisms, Lemma 28.6.5 (and Morphisms, Lemma 28.6.3 to see that the scheme theoretic image is the closure of the image). Say $\xi^{\prime} \rightsquigarrow \xi$ with $\xi^{\prime} \in T$. Suppose that $r \in R$ and $s(r)=\xi$. Since $s$ is flat we can find a specialization $r^{\prime} \rightsquigarrow r$ in $R$ such that $s\left(r^{\prime}\right)=\xi^{\prime}$ (Morphisms, Lemma 28.25.8). Then $t\left(r^{\prime}\right) \rightsquigarrow t(r)$. We conclude that $t\left(r^{\prime}\right) \in T$ as $T$ is set-theoretically invariant by Lemma 38.19.2. Thus $\bar{T}$ is a set-theoretically $R$-invariant closed subset and $V=U \backslash \bar{T}$ is the open we are looking for. It is contained in $W^{\prime}$ which finishes the proof.

### 38.20. Quotient sheaves

02VE Let $\tau \in\{$ Zariski, étale, fppf, smooth, syntomic $\}$. Let $S$ be a scheme. Let $j: R \rightarrow$ $U \times{ }_{S} U$ be a pre-relation over $S$. Say $U, R, S$ are objects of a $\tau$-site $S c h_{\tau}$ (see Topologies, Section 33.2). Then we can consider the functors

$$
h_{U}, h_{R}:(S c h / S)_{\tau}^{o p p} \longrightarrow \text { Sets. }
$$

These are sheaves, see Descent, Lemma 34.9.3. The morphism $j$ induces a map $j: h_{R} \rightarrow h_{U} \times h_{U}$. For each object $T \in \operatorname{Ob}\left((S c h / S)_{\tau}\right)$ we can take the equivalence relation $\sim_{T}$ generated by $j(T): R(T) \rightarrow U(T) \times U(T)$ and consider the quotient. Hence we get a presheaf
02VF $\quad(38.20 .0 .1) \quad(S c h / S)_{\tau}^{o p p} \longrightarrow S e t s, \quad T \longmapsto U(T) / \sim_{T}$
02VG Definition 38.20.1. Let $\tau, S$, and the pre-relation $j: R \rightarrow U \times_{S} U$ be as above. In this setting the quotient sheaf $U / R$ associated to $j$ is the sheafification of the presheaf 38.20 .0 .1 in the $\tau$-topology. If $j: R \rightarrow U \times{ }_{S} U$ comes from the action of a group scheme $G / S$ on $U$ as in Lemma 38.16 .1 then we sometimes denote the quotient sheaf $U / G$.

This means exactly that the diagram

$$
h_{R} \longrightarrow h_{U} \longrightarrow U / R
$$

is a coequalizer diagram in the category of sheaves of sets on $(S c h / S)_{\tau}$. Using the Yoneda embedding we may view $(S c h / S)_{\tau}$ as a full subcategory of sheaves on $(S c h / S)_{\tau}$ and hence identify schemes with representable functors. Using this abuse of notation we will often depict the diagram above simply

$$
R \xrightarrow[t]{\stackrel{s}{\longrightarrow}} U \longrightarrow U / R
$$

We will mostly work with the fppf topology when considering quotient sheaves of groupoids/equivalence relations.

03BD Definition 38.20.2. In the situation of Definition 38.20.1. We say that the prerelation $j$ has a representable quotient if the sheaf $U / R$ is representable. We will say a groupoid $(U, R, s, t, c)$ has a representable quotient if the quotient $U / R$ with $j=(t, s)$ is representable.

The following lemma characterizes schemes $M$ representing the quotient. It applies for example if $\tau=\operatorname{fppf}, U \rightarrow M$ is flat, of finite presentation and surjective, and $R \cong U \times_{M} U$.

03C5 Lemma 38.20.3. In the situation of Definition 38.20.1. Assume there is a scheme $M$, and a morphism $U \rightarrow M$ such that
(1) the morphism $U \rightarrow M$ equalizes $s, t$,
(2) the morphism $U \rightarrow M$ induces a surjection of sheaves $h_{U} \rightarrow h_{M}$ in the $\tau$-topology, and
(3) the induced map $(t, s): R \rightarrow U \times{ }_{M} U$ induces a surjection of sheaves $h_{R} \rightarrow h_{U \times_{M} U}$ in the $\tau$-topology.
In this case $M$ represents the quotient sheaf $U / R$.
Proof. Condition (1) says that $h_{U} \rightarrow h_{M}$ factors through $U / R$. Condition (2) says that $U / R \rightarrow h_{M}$ is surjective as a map of sheaves. Condition (3) says that $U / R \rightarrow h_{M}$ is injective as a map of sheaves. Hence the lemma follows.

The following lemma is wrong if we do not require $j$ to be a pre-equivalence relation (but just a pre-relation say).

045Y Lemma 38.20.4. Let $\tau \in\{$ Zariski, étale, fppf, smooth, syntomic $\}$. Let $S$ be a scheme. Let $j: R \rightarrow U \times_{S} U$ be a pre-equivalence relation over $S$. Assume $U, R, S$ are objects of $a \tau$-site $S c h_{\tau}$. For $T \in \mathrm{Ob}\left((S c h / S)_{\tau}\right)$ and $a, b \in U(T)$ the following are equivalent:
(1) $a$ and $b$ map to the same element of $(U / R)(T)$, and
(2) there exists a $\tau$-covering $\left\{f_{i}: T_{i} \rightarrow T\right\}$ of $T$ and morphisms $r_{i}: T_{i} \rightarrow R$ such that $a \circ f_{i}=s \circ r_{i}$ and $b \circ f_{i}=t \circ r_{i}$.
In other words, in this case the map of $\tau$-sheaves

$$
h_{R} \longrightarrow h_{U} \times_{U / R} h_{U}
$$

is surjective.
Proof. Omitted. Hint: The reason this works is that the presheaf 38.20.0.1 in this case is really given by $T \mapsto U(T) / j(R(T))$ as $j(R(T)) \subset U(T) \times U(T)$ is an equivalence relation, see Definition 38.3.1.

045Z Lemma 38.20.5. Let $\tau \in\{$ Zariski, étale, fppf, smooth, syntomic $\}$. Let $S$ be a scheme. Let $j: R \rightarrow U \times_{S} U$ be a pre-equivalence relation over $S$ and $g: U^{\prime} \rightarrow U$ a morphism of schemes over $S$. Let $j^{\prime}: R^{\prime} \rightarrow U^{\prime} \times_{S} U^{\prime}$ be the restriction of $j$ to $U^{\prime}$. Assume $U, U^{\prime}, R, S$ are objects of a $\tau$-site $S c h_{\tau}$. The map of quotient sheaves

$$
U^{\prime} / R^{\prime} \longrightarrow U / R
$$

is injective. If $g$ defines a surjection $h_{U^{\prime}} \rightarrow h_{U}$ of sheaves in the $\tau$-topology (for example if $\left\{g: U^{\prime} \rightarrow U\right\}$ is a $\tau$-covering), then $U^{\prime} / R^{\prime} \rightarrow U / R$ is an isomorphism.

Proof. Suppose $\xi, \xi^{\prime} \in\left(U^{\prime} / R^{\prime}\right)(T)$ are sections which map to the same section of $U / R$. Then we can find a $\tau$-covering $\mathcal{T}=\left\{T_{i} \rightarrow T\right\}$ of $T$ such that $\left.\xi\right|_{T_{i}},\left.\xi^{\prime}\right|_{T_{i}}$ are given by $a_{i}, a_{i}^{\prime} \in U^{\prime}\left(T_{i}\right)$. By Lemma 38.20 .4 and the axioms of a site we may after refining $\mathcal{T}$ assume there exist morphisms $r_{i}: T_{i} \rightarrow R$ such that $g \circ a_{i}=s \circ r_{i}$, $g \circ a_{i}^{\prime}=t \circ r_{i}$. Since by construction $R^{\prime}=R \times_{U \times_{S} U}\left(U^{\prime} \times_{S} U^{\prime}\right)$ we see that $\left(r_{i},\left(a_{i}, a_{i}^{\prime}\right)\right) \in R^{\prime}\left(T_{i}\right)$ and this shows that $a_{i}$ and $a_{i}^{\prime}$ define the same section of $U^{\prime} / R^{\prime}$ over $T_{i}$. By the sheaf condition this implies $\xi=\xi^{\prime}$.

If $h_{U^{\prime}} \rightarrow h_{U}$ is a surjection of sheaves, then of course $U^{\prime} / R^{\prime} \rightarrow U / R$ is surjective also. If $\left\{g: U^{\prime} \rightarrow U\right\}$ is a $\tau$-covering, then the map of sheaves $h_{U^{\prime}} \rightarrow h_{U}$ is surjective, see Sites, Lemma 7.13.4. Hence $U^{\prime} / R^{\prime} \rightarrow U / R$ is surjective also in this case.

02VH Lemma 38.20.6. Let $\tau \in\{$ Zariski, étale, fppf, smooth, syntomic\}. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ a morphism of schemes over $S$. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ to $U^{\prime}$. Assume $U, U^{\prime}, R, S$ are objects of a $\tau$-site $S c h_{\tau}$. The map of quotient sheaves

$$
U^{\prime} / R^{\prime} \longrightarrow U / R
$$

is injective. If the composition

$$
U^{\prime} \times_{g, U, t} \frac{h}{R \underset{p r_{1}}{\longrightarrow} R \underset{s}{\longrightarrow}} U
$$

defines a surjection of sheaves in the $\tau$-topology then the map is bijective. This holds for example if $\left\{h: U^{\prime} \times_{g, U, t} R \rightarrow U\right\}$ is a $\tau$-covering, or if $U^{\prime} \rightarrow U$ defines
a surjection of sheaves in the $\tau$-topology, or if $\left\{g: U^{\prime} \rightarrow U\right\}$ is a covering in the $\tau$-topology.

Proof. Injectivity follows on combining Lemmas 38.13 .2 and 38.20 .5 . To see surjectivity (see Sites, Section 7.12 for a characterization of surjective maps of sheaves) we argue as follows. Suppose that $T$ is a scheme and $\sigma \in U / R(T)$. There exists a covering $\left\{T_{i} \rightarrow T\right\}$ such that $\left.\sigma\right|_{T_{i}}$ is the image of some element $f_{i} \in U\left(T_{i}\right)$. Hence we may assume that $\sigma$ if the image of $f \in U(T)$. By the assumption that $h$ is a surjection of sheaves, we can find a $\tau$-covering $\left\{\varphi_{i}: T_{i} \rightarrow T\right\}$ and morphisms $f_{i}: T_{i} \rightarrow U^{\prime} \times_{g, U, t} R$ such that $f \circ \varphi_{i}=h \circ f_{i}$. Denote $f_{i}^{\prime}=\operatorname{pr}_{0} \circ f_{i}: T_{i} \rightarrow U^{\prime}$. Then we see that $f_{i}^{\prime} \in U^{\prime}\left(T_{i}\right)$ maps to $g \circ f_{i}^{\prime} \in U\left(T_{i}\right)$ and that $g \circ f_{i}^{\prime} \sim_{T_{i}} h \circ f_{i}=f \circ \varphi_{i}$ notation as in (38.20.0.1). Namely, the element of $R\left(T_{i}\right)$ giving the relation is $\mathrm{pr}_{1} \circ f_{i}$. This means that the restriction of $\sigma$ to $T_{i}$ is in the image of $U^{\prime} / R^{\prime}\left(T_{i}\right) \rightarrow U / R\left(T_{i}\right)$ as desired.

If $\{h\}$ is a $\tau$-covering, then it induces a surjection of sheaves, see Sites, Lemma 7.13.4. If $U^{\prime} \rightarrow U$ is surjective, then also $h$ is surjective as $s$ has a section (namely the neutral element $e$ of the groupoid scheme).

07S3 Lemma 38.20.7. Let $S$ be a scheme. Let $f:(U, R, j) \rightarrow\left(U^{\prime}, R^{\prime}, j^{\prime}\right)$ be a morphism between equivalence relations over $S$. Assume that

is cartesian. For any $\tau \in\{$ Zariski, étale, fppf, smooth,syntomic $\}$ the diagram

is a fibre product square of $\tau$-sheaves.
Proof. By Lemma 38.20 .4 the quotient sheaves have a simple description which we will use below without further mention. We first show that

$$
U \longrightarrow U^{\prime} \times_{U^{\prime} / R^{\prime}} U / R
$$

is injective. Namely, assume $a, b \in U(T)$ map to the same element on the right hand side. Then $f(a)=f(b)$. After replacing $T$ by the members of a $\tau$-covering we may assume that there exists an $r \in R(T)$ such that $a=s(r)$ and $b=t(r)$. Then $r^{\prime}=f(r)$ is a $T$-valued point of $R^{\prime}$ with $s^{\prime}\left(r^{\prime}\right)=t^{\prime}\left(r^{\prime}\right)$. Hence $r^{\prime}=e^{\prime}(f(a))$ (where $e^{\prime}$ is the identity of the groupoid scheme associated to $j^{\prime}$, see Lemma 38.13.3). Because the first diagram of the lemma is cartesian this implies that $r$ has to equal $e(a)$. Thus $a=b$.
Finally, we show that the displayed arrow is surjective. Let $T$ be a scheme over $S$ and let $\left(a^{\prime}, \bar{b}\right)$ be a section of the sheaf $U^{\prime} \times_{U^{\prime} / R^{\prime}} U / R$ over $T$. After replacing $T$ by the members of a $\tau$-covering we may assume that $\bar{b}$ is the class of an element $b \in U(T)$. After replacing $T$ by the members of a $\tau$-covering we may assume that there exists an $r^{\prime} \in R^{\prime}(T)$ such that $a^{\prime}=t\left(r^{\prime}\right)$ and $s^{\prime}\left(r^{\prime}\right)=f(b)$. Because the
first diagram of the lemma is cartesian we can find $r \in R(T)$ such that $s(r)=b$ and $f(r)=r^{\prime}$. Then it is clear that $a=t(r) \in U(T)$ is a section which maps to $\left(a^{\prime}, \bar{b}\right)$.

### 38.21. Descent in terms of groupoids

0APC Cartesian morphisms are defined as follows.
0APD Definition 38.21.1. Let $S$ be a scheme. Let $f:\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ be a morphism of groupoid schemes over $S$. We say $f$ is cartesian, or that ( $U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}$ ) is cartesian over $(U, R, s, t, c)$, if the diagram

is a fibre square in the category of schemes. A morphism of groupoid schemes cartesian over ( $U, R, s, t, c$ ) is a morphism of groupoid schemes compatible with the structure morphisms towards $(U, R, s, t, c)$.

Cartesian morphisms are related to descent data. First we prove a general lemma describing the category of cartesian groupoid schemes over a fixed groupoid scheme.

0APE Lemma 38.21.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. The category of groupoid schemes cartesian over $(U, R, s, t, c)$ is equivalent to the category of pairs $(V, \varphi)$ where $V$ is a scheme over $U$ and

$$
\varphi: V \times_{U, t} R \longrightarrow R \times_{s, U} V
$$

is an isomorphism over $R$ such that $e^{*} \varphi=i d_{V}$ and such that

$$
c^{*} \varphi=p r_{1}^{*} \varphi \circ p r_{0}^{*} \varphi
$$

as morphisms of schemes over $R \times_{s, U, t} R$.
Proof. The pullback notation in the lemma signifies base change. The displayed formula makes sense because

$$
\left(R \times_{s, U, t} R\right) \times_{\operatorname{pr}_{1}, R, \mathrm{pr}_{1}}\left(V \times_{U, t} R\right)=\left(R \times_{s, U, t} R\right) \times_{\operatorname{pr}_{0}, R, \mathrm{pr}_{0}}\left(R \times_{s, U} V\right)
$$

as schemes over $R \times_{s, U, t} R$.
Given $(V, \varphi)$ we set $U^{\prime}=V$ and $R^{\prime}=V \times_{U, t} R$. We set $t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ equal to the projection $V \times_{U, t} R \rightarrow V$. We set $s^{\prime}$ equal to $\varphi$ followed by the projection $R \times{ }_{s, U} V \rightarrow V$. We set $c^{\prime}$ equal to the composition

$$
\begin{aligned}
R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime} & \xrightarrow{\varphi, 1}\left(R \times_{s, U} V\right) \times_{V}\left(V \times_{U, t} R\right) \\
& \rightarrow R \times_{s, U} V \times_{U, t} R \\
& \xrightarrow{\varphi^{-1}, 1} V \times_{U, t}\left(R \times_{s, U, t} R\right) \\
& \xrightarrow{1, c} V \times_{U, t} R=R^{\prime}
\end{aligned}
$$

A computation, which we omit shows that we obtain a groupoid scheme over $(U, R, s, t, c)$. It is clear that this groupoid scheme is cartesian over $(U, R, s, t, c)$.

Conversely, given $f:\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, R, s, t, c)$ cartesian then the morphisms

$$
U^{\prime} \times_{U, t} R \stackrel{t^{\prime}, f}{\longleftarrow} R^{\prime} \xrightarrow{f, s^{\prime}} R \times_{s, U} U^{\prime}
$$

are isomorphisms and we can set $V=U^{\prime}$ and $\varphi$ equal to the composition $\left(f, s^{\prime}\right) \circ$ $\left(t^{\prime}, f\right)^{-1}$. We omit the proof that $\varphi$ satisfies the conditions in the lemma. We omit the proof that these constructions are mutually inverse.

Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Then we obtain a groupoid scheme $\left(X, X \times_{Y} X, \operatorname{pr}_{1}, \mathrm{pr}_{0}, c\right)$ over $S$. Namely, $j: X \times_{Y} X \rightarrow$ $X \times_{S} X$ is an equivalence relation and we can take the associated groupoid, see Lemma 38.13.3.

0APF Lemma 38.21.3. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. The construction of Lemma 38.21.2 determines an equivalence
category of groupoids schemes
cartesian over $\left(X, X \times_{Y} X, \ldots\right)$$\longrightarrow \begin{gathered}\text { category of descent data } \\ \text { relative to } X / Y\end{gathered}$
Proof. This is clear from Lemma 38.21 .2 and the definition of descent data on schemes in Descent, Definition 34.30.1.

### 38.22. Separation conditions

02 YG This really means conditions on the morphism $j: R \rightarrow U \times_{S} U$ when given a groupoid $(U, R, s, t, c)$ over $S$. As in the previous section we first formulate the corresponding diagram.

02YH Lemma 38.22.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. Let $G \rightarrow U$ be the stabilizer group scheme. The commutative diagram

the two left horizontal arrows are isomorphisms and the right square is a fibre product square.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry.

02YI Lemma 38.22.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. Let $G \rightarrow U$ be the stabilizer group scheme.
(1) The following are equivalent
(a) $j: R \rightarrow U \times_{S} U$ is separated,
(b) $G \rightarrow U$ is separated, and
(c) $e: U \rightarrow G$ is a closed immersion.
(2) The following are equivalent
(a) $j: R \rightarrow U \times{ }_{S} U$ is quasi-separated,
(b) $G \rightarrow U$ is quasi-separated, and
(c) $e: U \rightarrow G$ is quasi-compact.

Proof. The group scheme $G \rightarrow U$ is the base change of $R \rightarrow U \times_{S} U$ by the diagonal morphism $U \rightarrow U \times_{S} U$, see Lemma 38.17.1. Hence if $j$ is separated (resp. quasi-separated), then $G \rightarrow U$ is separated (resp. quasi-separated). (See Schemes, Lemma 25.21.13. Thus (a) $\Rightarrow$ (b) in both (1) and (2).
If $G \rightarrow U$ is separated (resp. quasi-separated), then the morphism $U \rightarrow G$, as a section of the structure morphism $G \rightarrow U$ is a closed immersion (resp. quasicompact), see Schemes, Lemma 25.21.12. Thus (b) $\Rightarrow$ (a) in both (1) and (2).
By the result of Lemma 38.22.1 (and Schemes, Lemmas 25.18.2 and 25.19.3) we see that if $e$ is a closed immersion (resp. quasi-compact) $\Delta_{R / U \times_{S} U}$ is a closed immersion (resp. quasi-compact). Thus (c) $\Rightarrow$ (a) in both (1) and (2).

### 38.23. Finite flat groupoids, affine case

03BE Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=$ $\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine. In this case we get two ring maps $s^{\sharp}, t^{\sharp}:$ $A \longrightarrow B$. Let $C$ be the equalizer of $s^{\sharp}$ and $t^{\sharp}$. In a formula
03BF (38.23.0.1)

$$
C=\left\{a \in A \mid t^{\sharp}(a)=s^{\sharp}(a)\right\} .
$$

We will sometimes call this the ring of $R$-invariant functions on $U$. What properties does $M=\operatorname{Spec}(C)$ have? The first observation is that the diagram

is commutative, i.e., the morphism $U \rightarrow M$ equalizes $s, t$. Moreover, if $T$ is any affine scheme, and if $U \rightarrow T$ is a morphism which equalizes $s, t$, then $U \rightarrow T$ factors through $U \rightarrow M$. In other words, $U \rightarrow M$ is a coequalizer in the category of affine schemes.
We would like to find conditions that guarantee the morphism $U \rightarrow M$ is really a "quotient" in the category of schemes. We will discuss this at length elsewhere (insert future reference here); here we just discuss some special cases. Namely, we will focus on the case where $s, t$ are finite locally free.

03BG Example 38.23.1. Let $k$ be a field. Let $U=\mathrm{GL}_{2, k}$. Let $B \subset \mathrm{GL}_{2}$ be the closed subgroup scheme of upper triangular matrices. Then the quotient sheaf $\mathrm{GL}_{2, k} / B$ (in the Zariski, étale or fppf topology, see Definition 38.20.1) is representable by the projective line: $\mathbf{P}^{1}=\mathrm{GL}_{2, k} / B$. (Details omitted.) On the other hand, the ring of invariant functions in this case is just $k$. Note that in this case the morphisms $s, t: R=\mathrm{GL}_{2, k} \times_{k} B \rightarrow \mathrm{GL}_{2, k}=U$ are smooth of relative dimension 3 .

Recall that in Exercises, Exercises 89.15 .6 and 89.15 .7 we have defined the determinant and the norm for finitely locally free modules and finite locally free ring extensions. If $\varphi: A \rightarrow B$ is a finite locally free ring map, then we will denote $\operatorname{Norm}_{\varphi}(b) \in A$ the norm of $b \in B$. In the case of a finite locally free morphism of schemes, the norm was constructed in Divisors, Lemma 30.14.5

03BH Lemma 38.23.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine, and $s, t: R \rightarrow U$ finite locally free. Let $C$ be as in 38.23.0.1). Let $f \in A$. Then $\operatorname{Norm}_{s^{\sharp}}\left(t^{\sharp}(f)\right) \in C$.

Proof. Consider the commutative diagram

of Lemma 38.13.4. Think of $f \in \Gamma\left(U, \mathcal{O}_{U}\right)$. The commutativity of the top part of the diagram shows that $p r_{0}^{\sharp}\left(t^{\sharp}(f)\right)=c^{\sharp}\left(t^{\sharp}(f)\right)$ as elements of $\Gamma\left(R \times_{S, U, t} R, \mathcal{O}\right)$. Looking at the right lower cartesian square the compatibility of the norm construction with base change shows that $s^{\sharp}\left(\operatorname{Norm}_{s^{\sharp}}\left(t^{\sharp}(f)\right)\right)=\operatorname{Norm}_{\mathrm{pr}_{1}}\left(c^{\sharp}\left(t^{\sharp}(f)\right)\right)$. Similarly we get $t^{\sharp}\left(\operatorname{Norm}_{s^{\sharp}}\left(t^{\sharp}(f)\right)\right)=\operatorname{Norm}_{\mathrm{pr}_{1}}\left(\operatorname{pr}_{0}^{\sharp}\left(t^{\sharp}(f)\right)\right)$. Hence by the first equality of this proof we see that $s^{\sharp}\left(\operatorname{Norm}_{s^{\sharp}}\left(t^{\sharp}(f)\right)\right)=t^{\sharp}\left(\operatorname{Norm}_{s^{\sharp}}\left(t^{\sharp}(f)\right)\right)$ as desired.

03BI Lemma 38.23.3. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $s, t: R \rightarrow U$ finite locally free. Then

$$
U=\coprod_{r \geq 1} U_{r}
$$

is a disjoint union of $R$-invariant opens such that the restriction $R_{r}$ of $R$ to $U_{r}$ has the property that $s, t: R_{r} \rightarrow U_{r}$ are finite locally free of rank $r$.

Proof. By Morphisms, Lemma 28.45.5 there exists a decomposition $U=\coprod_{r \geq 0} U_{r}$ such that $s: s^{-1}\left(U_{r}\right) \rightarrow U_{r}$ is finite locally free of rank $r$. As $s$ is surjective we see that $U_{0}=\emptyset$. Note that $u \in U_{r} \Leftrightarrow$ if and only if the scheme theoretic fibre $s^{-1}(u)$ has degree $r$ over $\kappa(u)$. Now, if $z \in R$ with $s(z)=u$ and $t(z)=u^{\prime}$ then using notation as in Lemma 38.13.4

$$
\operatorname{pr}_{1}^{-1}(z) \rightarrow \operatorname{Spec}(\kappa(z))
$$

is the base change of both $s^{-1}(u) \rightarrow \operatorname{Spec}(\kappa(u))$ and $s^{-1}\left(u^{\prime}\right) \rightarrow \operatorname{Spec}\left(\kappa\left(u^{\prime}\right)\right)$ by the lemma cited. Hence $u \in U_{r} \Leftrightarrow u^{\prime} \in U_{r}$, in other words, the open subsets $U_{r}$ are $R$-invariant. In particular the restriction of $R$ to $U_{r}$ is just $s^{-1}\left(U_{r}\right)$ and $s: R_{r} \rightarrow U_{r}$ is finite locally free of rank $r$. As $t: R_{r} \rightarrow U_{r}$ is isomorphic to $s$ by the inverse of $R_{r}$ we see that it has also rank $r$.

03BJ Lemma 38.23.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine, and $s, t: R \rightarrow U$ finite locally free. Let $C \subset A$ be as in 38.23.0.1). Then $A$ is integral over $C$.

Proof. First, by Lemma 38.23 .3 we know that $(U, R, s, t, c)$ is a disjoint union of groupoid schemes $\left(U_{r}, R_{r}, s, t, c\right)$ such that each $s, t: R_{r} \rightarrow U_{r}$ has constant rank $r$. As $U$ is quasi-compact, we have $U_{r}=\emptyset$ for almost all $r$. It suffices to prove the lemma for each ( $U_{r}, R_{r}, s, t, c$ ) and hence we may assume that $s, t$ are finite locally free of rank $r$.

Assume that $s, t$ are finite locally free of rank $r$. Let $f \in A$. Consider the element $x-f \in A[x]$, where we think of $x$ as the coordinate on $\mathbf{A}^{1}$. Since

$$
\left(U \times \mathbf{A}^{1}, R \times \mathbf{A}^{1}, s \times \operatorname{id}_{\mathbf{A}^{1}}, t \times \operatorname{id}_{\mathbf{A}^{1}}, c \times \operatorname{id}_{\mathbf{A}^{1}}\right)
$$

is also a groupoid scheme with finite source and target, we may apply Lemma 38.23 .2 to it and we see that $P(x)=\operatorname{Norm}_{s^{\sharp}}\left(t^{\sharp}(x-f)\right)$ is an element of $C[x]$. Because $s^{\sharp}: A \rightarrow B$ is finite locally free of rank $r$ we see that $P$ is monic of degree $r$. Moreover $P(f)=0$ by Cayley-Hamilton (Algebra, Lemma 10.15.1).

03BK Lemma 38.23.5. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine, and $s, t: R \rightarrow U$ finite locally free. Let $C \subset A$ be as in (38.23.0.1). Let $C \rightarrow C^{\prime}$ be a ring map, and set $U^{\prime}=\operatorname{Spec}\left(A \otimes_{C} C^{\prime}\right), R^{\prime}=\operatorname{Spec}\left(B \otimes_{C} C^{\prime}\right)$. Then
(1) the maps $s, t, c$ induce maps $s^{\prime}, t^{\prime}, c^{\prime}$ such that $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is a groupoid scheme, and
(2) there is a canonical map $\varphi: C^{\prime} \rightarrow C^{1}$ of $C^{\prime}$ into the $R^{\prime}$-invariant functions $C^{1}$ on $U^{\prime}$ with the properties
(a) for every $f \in C^{1}$ there exists an $n>0$ such that $f^{n}$ is in the image of $\varphi$, and
(b) for every $f \in \operatorname{Ker}(\varphi)$ there exists an $n>0$ such that $f^{n}=0$.
(3) if $C \rightarrow C^{\prime}$ is flat then $\varphi$ is an isomorphism.

Proof. The proof of part (1) is omitted. Let us denote $A^{\prime}=A \otimes_{C} C^{\prime}$ and $B^{\prime}=$ $B \otimes_{C} C^{\prime}$. Then we have

$$
C^{1}=\left\{x \in A^{\prime} \mid\left(t^{\prime}\right)^{\sharp}(x)=\left(s^{\prime}\right)^{\sharp}(x)\right\}=\left\{a \in A \otimes_{C} C^{\prime} \mid t^{\sharp} \otimes 1(x)=s^{\sharp} \otimes 1(x)\right\} .
$$

In other words, $C^{1}$ is the kernel of the difference map $\left(t^{\sharp}-s^{\sharp}\right) \otimes 1$ which is just the base change of the $C$-linear map $t^{\sharp}-s^{\sharp}: A \rightarrow B$ by $C \rightarrow C^{\prime}$. Hence (3) follows.

Proof of part (2)(b). Since $C \rightarrow A$ is integral (Lemma 38.23.4) and injective we see that $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(C)$ is surjective, see Algebra, Lemma 10.35.15. Thus also $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}\left(C^{\prime}\right)$ is surjective as a base change of a surjective morphism (Morphisms, Lemma 28.10.4). Hence $\operatorname{Spec}\left(C^{1}\right) \rightarrow \operatorname{Spec}\left(C^{\prime}\right)$ is surjective also. This implies that the kernel of $\varphi$ is contained in the radical of the ring $C^{\prime}$, i.e., (2)(b) holds.
Proof of part (2)(a). By Lemma 38.23 .3 we know that $A$ is a finite product of rings $A_{r}$ and $B$ is a finite product of rings $B_{r}$ such that the groupoid scheme decomposes accordingly (see the proof of Lemma 38.23 .4 ). Then also $C$ is a product of rings $C_{r}$ and correspondingly $C^{\prime}$ decomposes as a product. Hence we may and do assume that the ring maps $s^{\sharp}, t^{\sharp}: A \rightarrow B$ are finite locally free of a fixed rank $r$. Let $f \in C^{1} \subset A^{\prime}=A \otimes_{C} C^{\prime}$. We may replace $C^{\prime}$ by a finitely generated $C$-subalgebra of $C^{\prime}$ and hence we may assume that $C^{\prime}=C\left[X_{1}, \ldots, X_{n}\right] / I$ for some ideal $I$. Choose a lift $\tilde{f} \in A \otimes_{C} C\left[X_{i}\right]=A\left[X_{i}\right]$ of the element $f$. Note that $f^{r}=\operatorname{Norm}_{\left(s^{\prime}\right)^{\sharp}}\left(\left(t^{\prime}\right)^{\sharp}(f)\right)$ in $A$ as $t^{\sharp}(f)=s^{\sharp}(f)$. Hence we see that

$$
h=\operatorname{Norm}_{s^{\sharp} \otimes 1}\left(t^{\sharp} \otimes 1(f)\right) \in A\left[X_{i}\right]
$$

is invariant according to Lemma 38.23 .2 and maps to $f^{r}$ in $A^{\prime}$. Since $C \rightarrow C\left[X_{i}\right]$ is flat we see from (3) that $h \in C\left[X_{i}\right]$. Hence it follows that $f^{r}$ is in the image of $\varphi$.

03BL Lemma 38.23.6. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine, and $s, t: R \rightarrow U$ finite locally free. Let $C \subset A$ be as in 38.23.0.1). Then $U \rightarrow M=\operatorname{Spec}(C)$ has the following properties:
(1) the map on points $|U| \rightarrow|M|$ is surjective and $u_{0}, u_{1} \in|U|$ map to the same point if and only if there exists a $r \in|R|$ with $t(r)=u_{0}$ and $s(r)=$ $u_{1}$, in a formula

$$
|M|=|U| /|R|
$$

(2) for any algebraically closed field $k$ we have

$$
M(k)=U(k) / R(k)
$$

Proof. Let $k$ be an algebraically closed field. Since $C \rightarrow A$ is integral (Lemma 38.23 .4 and injective we see that $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(C)$ is surjective, see Algebra, Lemma 10.35.15. Thus $|U| \rightarrow|M|$ is surjective. Let $C \rightarrow k$ be a ring map. Since surjective morphisms are preserved under base change (Morphisms, Lemma 28.10.4) we see that $A \otimes_{C} k$ is not zero. Now $k \subset A \otimes_{C} k$ is a nonzero integral extension. Hence any residue field of $A \otimes_{C} k$ is an algebraic extension of $k$, hence equal to $k$. Thus we see that $U(k) \rightarrow M(k)$ is surjective.
Let $a_{0}, a_{1}: A \rightarrow k$ be ring maps. If there exists a ring map $b: B \rightarrow k$ such that $a_{0}=b \circ t^{\sharp}$ and $a_{1}=b \circ s^{\sharp}$ then we see that $\left.a_{0}\right|_{C}=\left.a_{1}\right|_{C}$ by definition. Conversely, suppose that $\left.a_{0}\right|_{C}=\left.a_{1}\right|_{C}$. Let us name this algebra map $c: C \rightarrow k$. Consider the diagram

We are trying to construct the dotted arrow, and if we do then part (2) follows, which in turn implies part (1). Since $A \rightarrow B$ is finite and faithfully flat there exist finitely many ring maps $b_{1}, \ldots, b_{n}: B \rightarrow k$ such that $b_{i} \circ s^{\sharp}=a_{1}$. If the dotted arrow does not exist, then we see that none of the $a_{i}^{\prime}=b_{i} \circ t^{\sharp}, i=1, \ldots, n$ is equal to $a_{0}$. Hence the maximal ideals

$$
\mathfrak{m}_{i}^{\prime}=\operatorname{Ker}\left(a_{i}^{\prime} \otimes 1: A \otimes_{C} k \rightarrow k\right)
$$

of $A \otimes_{C} k$ are distinct from $\mathfrak{m}=\operatorname{Ker}\left(a_{0} \otimes 1: A \otimes_{C} k \rightarrow k\right)$. By Algebra, Lemma 10.14.2 we would get an element $f \in A \otimes_{C} k$ with $f \in \mathfrak{m}$, but $f \notin \mathfrak{m}_{i}^{\prime}$ for $i=1, \ldots, n$. Consider the norm

$$
g=\operatorname{Norm}_{s^{\sharp} \otimes 1}\left(t^{\sharp} \otimes 1(f)\right) \in A \otimes_{C} k
$$

By Lemma 38.23 .2 this lies in the invariants $C^{1} \subset A \otimes_{C} k$ of the base change groupoid (base change via the map $c: C \rightarrow k$ ). On the one hand, $a_{1}(g) \in k^{*}$ since the value of $t^{\sharp}(f)$ at all the points (which correspond to $b_{1}, \ldots, b_{n}$ ) lying over $a_{1}$ is invertible (insert future reference on property determinant here). On the other hand, since $f \in \mathfrak{m}$, we see that $f$ is not a unit, hence $t^{\sharp}(f)$ is not a unit (as $t^{\sharp} \otimes 1$ is faithfully flat), hence its norm is not a unit (insert future reference on property determinant here). We conclude that $C^{1}$ contains an element which is not nilpotent and not a unit. We will now show that this leads to a contradiction. Namely, apply Lemma 38.23 .5 to the map $c: C \rightarrow C^{\prime}=k$, then we see that the map of $k$ into the invariants $C^{1}$ is injective and moreover, that for any element $x \in C^{1}$ there exists an integer $n>0$ such that $x^{n} \in k$. Hence every element of $C^{1}$ is either a unit or nilpotent.

03C8 Lemma 38.23.7. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over S. Assume
(1) $U=\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine, and
(2) there exist elements $x_{i} \in A, i \in I$ such that $B=\bigoplus_{i \in I} s^{\sharp}(A) t^{\sharp}\left(x_{i}\right)$.

Then $A=\bigoplus_{i \in I} C x_{i}$, and $B \cong A \otimes_{C} A$ where $C \subset A$ is the $R$-invariant functions on $U$ as in (38.23.0.1).

Proof. During this proof we will write $s, t: A \rightarrow B$ instead of $s^{\sharp}, t^{\sharp}$, and similarly $c: B \rightarrow B \otimes_{s, A, t} B$. We write $p_{0}: B \rightarrow B \otimes_{s, A, t} B, b \mapsto b \otimes 1$ and $p_{1}: B \rightarrow B \otimes_{s, A, t} B$, $b \mapsto 1 \otimes b$. By Lemma 38.13 .5 and the definition of $C$ we have the following commutative diagram

Moreover the tow left squares are cocartesian in the category of rings, and the top row is isomorphic to the diagram

$$
B \otimes_{t, A, t} B \underset{p_{0}}{\stackrel{p_{1}}{\leftarrow}} B \leftarrow_{t} A
$$

which is an equalizer diagram according to Descent, Lemma 34.3.6 because condition (2) implies in particular that $s$ (and hence also then isomorphic arrow $t$ ) is faithfully flat. The lower row is an equalizer diagram by definition of $C$. We can use the $x_{i}$ and get a commutative diagram

where in the right vertical arrow we map $x_{i}$ to $x_{i}$, in the middle vertical arrow we $\operatorname{map} x_{i}$ to $t\left(x_{i}\right)$ and in the left vertical arrow we map $x_{i}$ to $c\left(t\left(x_{i}\right)\right)=t\left(x_{i}\right) \otimes 1=$ $p_{0}\left(t\left(x_{i}\right)\right)$ (equality by the commutativity of the top part of the diagram in Lemma 38.13.4). Then the diagram commutes. Moreover the middle vertical arrow is an isomorphism by assumption. Since the left two squares are cocartesian we conclude that also the left vertical arrow is an isomorphism. On the other hand, the horizontal rows are exact (i.e., they are equalizers). Hence we conclude that also the right vertical arrow is an isomorphism.

03BM Proposition 38.23.8. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume
(1) $U=\operatorname{Spec}(A)$, and $R=\operatorname{Spec}(B)$ are affine,
(2) $s, t: R \rightarrow U$ finite locally free, and
(3) $j=(t, s)$ is an equivalence.

In this case, let $C \subset A$ be as in (38.23.0.1). Then $U \rightarrow M=\operatorname{Spec}(C)$ is finite locally free and $R=U \times_{M} U$. Moreover, $M$ represents the quotient sheaf $U / R$ in the fppf topology (see Definition 38.20.1).

Proof. During this proof we use the notation $s, t: A \rightarrow B$ instead of the notation $s^{\sharp}, t^{\sharp}$. By Lemma 38.20 .3 it suffices to show that $C \rightarrow A$ is finite locally free and that the map

$$
t \otimes s: A \otimes_{C} A \longrightarrow B
$$

is an isomorphism. First, note that $j$ is a monomorphism, and also finite (since already $s$ and $t$ are finite). Hence we see that $j$ is a closed immersion by Morphisms, Lemma 28.43.13. Hence $A \otimes_{C} A \rightarrow B$ is surjective.

We will perform base change by flat ring maps $C \rightarrow C^{\prime}$ as in Lemma 38.23.5, and we will use that formation of invariants commutes with flat base change, see part (3) of the lemma cited. We will show below that for every prime $\mathfrak{p} \subset C$, there exists a local flat ring map $C_{\mathfrak{p}} \rightarrow C_{\mathfrak{p}}^{\prime}$ such that the result holds after a base change to $C_{\mathfrak{p}}^{\prime}$. This implies immediately that $A \otimes_{C} A \rightarrow B$ is injective (use Algebra, Lemma 10.23.1). It also implies that $C \rightarrow A$ is flat, by combining Algebra, Lemmas 10.38.17, 10.38.19, and 10.38.8. Then since $U \rightarrow \operatorname{Spec}(C)$ is surjective also (Lemma 38.23.6) we conclude that $C \rightarrow A$ is faithfully flat. Then the isomorphism $B \cong A \otimes_{C} A$ implies that $A$ is a finitely presented $C$-module, see Algebra, Lemma 10.82 .2 Hence $A$ is finite locally free over $C$, see Algebra, Lemma 10.77.2.

By Lemma 38.23 .3 we know that $A$ is a finite product of rings $A_{r}$ and $B$ is a finite product of rings $B_{r}$ such that the groupoid scheme decomposes accordingly (see the proof of Lemma 38.23 .4 ). Then also $C$ is a product of rings $C_{r}$ and correspondingly $C^{\prime}$ decomposes as a product. Hence we may and do assume that the ring maps $s, t: A \rightarrow B$ are finite locally free of a fixed rank $r$.

The local ring maps $C_{\mathfrak{p}} \rightarrow C_{\mathfrak{p}}^{\prime}$ we are going to use are any local flat ring maps such that the residue field of $C_{\mathfrak{p}}^{\prime}$ is infinite. By Algebra, Lemma 10.151.1 such local ring maps exist.

Assume $C$ is a local ring with maximal ideal $\mathfrak{m}$ and infinite residue field, and assume that $s, t: A \rightarrow B$ is finite locally free of constant rank $r>0$. Since $C \subset A$ is integral (Lemma 38.23.4) all primes lying over $\mathfrak{m}$ are maximal, and all maximal ideals of $A$ lie over $\mathfrak{m}$. Similarly for $C \subset B$. Pick a maximal ideal $\mathfrak{m}^{\prime}$ of $A$ lying over $\mathfrak{m}$ (exists by Lemma 38.23 .6 . Since $t: A \rightarrow B$ is finite locally free there exist at most finitely many maximal ideals of $B$ lying over $\mathfrak{m}^{\prime}$. Hence we conclude (by Lemma 38.23 .6 again) that $A$ has finitely many maximal ideals, i.e., $A$ is semi-local. This in turn implies that $B$ is semi-local as well. OK, and now, because $t \otimes s: A \otimes_{C} A \rightarrow B$ is surjective, we can apply Algebra, Lemma 10.77 .7 to the ring map $C \rightarrow A$, the $A$-module $M=B$ (seen as an $A$-module via $t$ ) and the $C$-submodule $s(A) \subset B$. This lemma implies that there exist $x_{1}, \ldots, x_{r} \in A$ such that $M$ is free over $A$ on the basis $s\left(x_{1}\right), \ldots, s\left(x_{r}\right)$. Hence we conclude that $C \rightarrow A$ is finite free and $B \cong A \otimes_{C} A$ by applying Lemma 38.23.7.

### 38.24. Finite flat groupoids

03JD In this section we prove a lemma that will help to show that the quotient of a scheme by a finite flat equivalence relation is a scheme, provided that each equivalence class is contained in an affine. See Properties of Spaces, Proposition 53.13.1.

03JE Lemma 38.24.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over S. Assume $s, t$ are finite locally free. Let $u \in U$ be a point such that $t\left(s^{-1}(\{u\})\right)$
is contained in an affine open of $U$. Then there exists an $R$-invariant affine open neighbourhood of $u$ in $U$.
Proof. Since $s$ is finite locally free it has finite fibres. Hence $t\left(s^{-1}(\{u\})\right)=$ $\left\{u_{1}, \ldots, u_{n}\right\}$ is a finite set. Note that $u \in\left\{u_{1}, \ldots, u_{n}\right\}$. Let $W \subset U$ be an affine open containing $\left\{u_{1}, \ldots, u_{n}\right\}$, in particular $u \in W$. Consider $Z=R \backslash s^{-1}(W) \cap$ $t^{-1}(W)$. This is a closed subset of $R$. The image $t(Z)$ is a closed subset of $U$ which can be loosely described as the set of points of $U$ which are $R$-equivalent to a point of $U \backslash W$. Hence $W^{\prime}=U \backslash t(Z)$ is an $R$-invariant, open subscheme of $U$ contained in $W$, and $\left\{u_{1}, \ldots, u_{n}\right\} \subset W^{\prime}$. Picture

$$
\left\{u_{1}, \ldots, u_{n}\right\} \subset W^{\prime} \subset W \subset U
$$

Let $f \in \Gamma\left(W, \mathcal{O}_{W}\right)$ be an element such that $\left\{u_{1}, \ldots, u_{n}\right\} \subset D(f) \subset W^{\prime}$. Such an $f$ exists by Algebra, Lemma 10.14.2. By our choice of $W^{\prime}$ we have $s^{-1}\left(W^{\prime}\right) \subset t^{-1}(W)$, and hence we get a diagram

The vertical arrow is finite locally free by assumption. Set

$$
g=\operatorname{Norm}_{s}\left(t^{\sharp} f\right) \in \Gamma\left(W^{\prime}, \mathcal{O}_{W^{\prime}}\right)
$$

By construction $g$ is a function on $W^{\prime}$ which is nonzero in $u$, as $t^{\sharp}(f)$ is nonzero in each of the points of $R$ lying over $u$, since $f$ is nonzero in $u_{1}, \ldots, u_{n}$. Similarly, $D(g) \subset W^{\prime}$ is equal to the set of points $w$ such that $f$ is not zero in any of the points equivalent to $w$. This means that $D(g)$ is an $R$-invariant affine open of $W^{\prime}$. The final picture is

$$
\left\{u_{1}, \ldots, u_{n}\right\} \subset D(g) \subset D(f) \subset W^{\prime} \subset W \subset U
$$

and hence we win.

## More on Groupoid Schemes

04LA

### 39.1. Introduction

04LB This chapter is devoted to advanced topics on groupoid schemes. Even though the results are stated in terms of groupoid schemes, the reader should keep in mind the 2-cartesian diagram

04LC

where $[U / R]$ is the quotient stack, see Groupoids in Spaces, Remark 65.19.4. Many of the results are motivated by thinking about this diagram. See for example the beautiful paper KM97 by Keel and Mori.

### 39.2. Notation

04 LD We continue to abide by the conventions and notation introduced in Groupoids, Section 38.2

### 39.3. Useful diagrams

04LE We briefly restate the results of Groupoids, Lemmas 38.13.4 and 38.13.5 for easy reference in this chapter. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. In the commutative diagram

04LF

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

The diagram

04LG

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

### 39.4. Sheaf of differentials

04R8 The following lemma is the analogue of Groupoids, Lemma 38.6.3.
04R9 Lemma 39.4.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. The sheaf of differentials of $R$ seen as a scheme over $U$ via $t$ is a quotient of the pullback via $t$ of the conormal sheaf of the immersion $e: U \rightarrow R$. In a formula: there is a canonical surjection $t^{*} \mathcal{C}_{U / R} \rightarrow \Omega_{R / U}$. If $s$ is flat, then this map is an isomorphism.

Proof. Note that $e: U \rightarrow R$ is an immersion as it is a section of the morphism $s$, see Schemes, Lemma 25.21.12 Consider the following diagram

The square on the left is cartesian, because if $a \circ b=e$, then $b=i(a)$. The composition of the horizontal maps is the diagonal morphism of $t: R \rightarrow U$. The right top horizontal arrow is an isomorphism. Hence since $\Omega_{R / U}$ is the conormal sheaf of the composition it is isomorphic to the conormal sheaf of $(1, i)$. By Morphisms, Lemma 28.32 .4 we get the surjection $t^{*} \mathcal{C}_{U / R} \rightarrow \Omega_{R / U}$ and if $c$ is flat, then this is an isomorphism. Since $c$ is a base change of $s$ by the properties of Diagram (39.3.0.3) we conclude that if $s$ is flat, then $c$ is flat, see Morphisms, Lemma 28.25.7.

### 39.5. Properties of groupoids

02YD Let $(U, R, s, t, c)$ be a groupoid scheme. The idea behind the results in this section is that $s: R \rightarrow U$ is a base change of the morphism $U \rightarrow[U / R]$ (see Diagram (39.1.0.1). Hence the local properties of $s: R \rightarrow U$ should reflect local properties of the morphism $U \rightarrow[U / R]$. This doesn't work, because $[U / R]$ is not always an algebraic stack, and hence we cannot speak of geometric or algebraic properties of $U \rightarrow[U / R]$. But it turns out that we can make some of it work without even referring to the quotient stack at all.
Here is a first example of such a result. The open $W \subset U^{\prime}$ found in the lemma is roughly speaking the locus where the morphism $U^{\prime} \rightarrow[U / R]$ has property $\mathcal{P}$.

04LH Lemma 39.5.1. Let $S$ be a scheme. Let $(U, R, s, t, c, e, i)$ be a groupoid over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Denote $h$ the composition

$$
h: U^{\prime} \times_{g, U, t} R \xrightarrow[p r_{1}]{ } R \xrightarrow[s]{ } U
$$

Let $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ be properties of morphisms of schemes. Assume
(1) $\mathcal{R} \Rightarrow \mathcal{Q}$,
(2) $\mathcal{Q}$ is preserved under base change and composition,
(3) for any morphism $f: X \rightarrow Y$ which has $\mathcal{Q}$ there exists a largest open $W(\mathcal{P}, f) \subset X$ such that $\left.f\right|_{W(\mathcal{P}, f)}$ has $\mathcal{P}$, and
(4) for any morphism $f: X \rightarrow Y$ which has $\mathcal{Q}$, and any morphism $Y^{\prime} \rightarrow Y$ which has $\mathcal{R}$ we have $Y^{\prime} \times_{Y} W(\mathcal{P}, f)=W\left(\mathcal{P}, f^{\prime}\right)$, where $f^{\prime}: X_{Y^{\prime}} \rightarrow Y^{\prime}$ is the base change of $f$.
If $s, t$ have $\mathcal{R}$ and $g$ has $\mathcal{Q}$, then there exists an open subscheme $W \subset U^{\prime}$ such that $W \times_{g, U, t} R=W(\mathcal{P}, h)$.

Proof. Note that the following diagram is commutative

with both squares cartesian (this uses that the two maps $t \circ \operatorname{pr}_{i}: R \times_{t, U, t} R \rightarrow U$ are equal). Combining this with the properties of diagram (39.3.0.3) we get a commutative diagram

where both squares are cartesian.
Assume $s, t$ have $\mathcal{R}$ and $g$ has $\mathcal{Q}$. Then $h$ has $\mathcal{Q}$ as a composition of $s$ (which has $\mathcal{R}$ hence $\mathcal{Q}$ ) and a base change of $g$ (which has $\mathcal{Q}$ ). Thus $W(\mathcal{P}, h) \subset U^{\prime} \times_{g, U, t} R$ exists. By our assumptions we have $\operatorname{pr}_{01}^{-1}(W(\mathcal{P}, h))=\operatorname{pr}_{02}^{-1}(W(\mathcal{P}, h))$ since both are the largest open on which $c \circ(i, 1)$ has $\mathcal{P}$. Note that the projection $U^{\prime} \times_{g, U, t} R \rightarrow U^{\prime}$ has a section, namely $\sigma: U^{\prime} \rightarrow U^{\prime} \times_{g, U, t} R, u^{\prime} \mapsto\left(u^{\prime}, e\left(g\left(u^{\prime}\right)\right)\right)$. Also via the isomorphism

$$
\left(U^{\prime} \times_{g, U, t} R\right) \times_{U^{\prime}}\left(U^{\prime} \times_{g, U, t} R\right)=U^{\prime} \times_{g, U, t} R \times_{t, U, t} R
$$

the two projections of the left hand side to $U^{\prime} \times_{g, U, t} R$ agree with the morphisms $\operatorname{pr}_{01}$ and $\mathrm{pr}_{02}$ on the right hand side. Since $\operatorname{pr}_{01}^{-1}(W(\mathcal{P}, h))=\operatorname{pr}_{02}^{-1}(W(\mathcal{P}, h))$ we conclude that $W(\mathcal{P}, h)$ is the inverse image of a subset of $U$, which is necessarily the open set $W=\sigma^{-1}(W(\mathcal{P}, h))$.

04LI Remark 39.5.2. Warning: Lemma 39.5.1 should be used with care. For example, it applies to $\mathcal{P}=$ "flat", $\mathcal{Q}=$ "empty", and $\mathcal{R}=$ "flat and locally of finite presentation". But given a morphism of schemes $f: X \rightarrow Y$ the largest open $W \subset X$ such that $\left.f\right|_{W}$ is flat is not the set of points where $f$ is flat!

047W Remark 39.5.3. Notwithstanding the warning in Remark 39.5.2 there are some cases where Lemma 39.5.1 can be used without causing too much ambiguity. We give a list. In each case we omit the verification of assumptions (1) and (2) and we give references which imply (3) and (4). Here is the list:
(1) $\mathcal{Q}=\mathcal{R}=$ "locally of finite type", and $\mathcal{P}=$ "relative dimension $\leq d$ ". See Morphisms, Definition 28.29.1 and Morphisms, Lemmas 28.28.4 and 28.28 .3
(2) $\mathcal{Q}=\mathcal{R}=$ "locally of finite type", and $\mathcal{P}=$ "locally quasi-finite". This is the case $d=0$ of the previous item, see Morphisms, Lemma 28.29.5.
(3) $\mathcal{Q}=\mathcal{R}=$ "locally of finite type", and $\mathcal{P}=$ "unramified". See Morphisms, Lemmas 28.35 .3 and 28.35 .15 ,
What is interesting about the cases listed above is that we do not need to assume that $s, t$ are flat to get a conclusion about the locus where the morphism $h$ has property $\mathcal{P}$. We continue the list:
(4) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "flat". See More on Morphisms, Theorem 36.12.1 and Lemma 36.12.2.
(5) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "Cohen-Macaulay". See More on Morphisms, Definition 36.17.1 and More on Morphisms, Lemmas 36.17.4 and 36.17.5.
(6) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "syntomic" use Morphisms, Lemma 28.31.12 (the locus is automatically open).
(7) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "smooth". See Morphisms, Lemma 28.34.15 (the locus is automatically open).
(8) $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "étale". See Morphisms, Lemma 28.36.17 (the locus is automatically open).

Here is the second result. The $R$-invariant open $W \subset U$ should be thought of as the inverse image of the largest open of $[U / R]$ over which the morphism $U \rightarrow[U / R]$ has property $\mathcal{P}$.

03JC Lemma 39.5.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. Let $\tau \in\{$ Zariski, fppf, étale, smooth, syntomic $\}$, Let $\mathcal{P}$ be a property of morphisms of schemes which is $\tau$-local on the target (Descent, Definition 34.18.1). Assume $\{s: R \rightarrow U\}$ and $\{t: R \rightarrow U\}$ are coverings for the $\tau$-topology. Let $W \subset U$ be the maximal open subscheme such that $\left.s\right|_{s^{-1}(W)}: s^{-1}(W) \rightarrow W$ has property $\mathcal{P}$. Then $W$ is $R$-invariant, see Groupoids, Definition 38.19.1.

Proof. The existence and properties of the open $W \subset U$ are described in Descent, Lemma 34.18.3. In Diagram 39.3.0.2 let $W_{1} \subset R$ be the maximal open subscheme over which the morphism $\operatorname{pr}_{1}: R \times_{s, U, t} R \rightarrow R$ has property $\mathcal{P}$. It follows from the aforementioned Descent, Lemma 34.18 .3 and the assumption that $\{s: R \rightarrow U\}$ and $\{t: R \rightarrow U\}$ are coverings for the $\tau$-topology that $t^{-1}(W)=W_{1}=s^{-1}(W)$ as desired.

[^109]06QQ Lemma 39.5.5. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. Let $G \rightarrow U$ be its stabilizer group scheme. Let $\tau \in\{$ fppf, étale, smooth, syntomic $\}$. Let $\mathcal{P}$ be a property of morphisms which is $\tau$-local on the target. Assume $\{s: R \rightarrow U\}$ and $\{t: R \rightarrow U\}$ are coverings for the $\tau$-topology. Let $W \subset U$ be the maximal open subscheme such that $G_{W} \rightarrow W$ has property $\mathcal{P}$. Then $W$ is $R$-invariant (see Groupoids, Definition 38.19.1.

Proof. The existence and properties of the open $W \subset U$ are described in Descent, Lemma 34.18.3. The morphism

$$
G \times_{U, t} R \longrightarrow R \times_{s, U} G, \quad(g, r) \longmapsto\left(r, r^{-1} \circ g \circ r\right)
$$

is an isomorphism over $R$ (where $\circ$ denotes composition in the groupoid). Hence $s^{-1}(W)=t^{-1}(W)$ by the properties of $W$ proved in the aforementioned Descent, Lemma 34.18.3.

### 39.6. Comparing fibres

04LJ Let $(U, R, s, t, c, e, i)$ be a groupoid scheme over $S$. Diagram 39.3.0.2 gives us a way to compare the fibres of the map $s: R \rightarrow U$ in a groupoid. For a point $u \in U$ we will denote $F_{u}=s^{-1}(u)$ the scheme theoretic fibre of $s: R \rightarrow U$ over $u$. For example the diagram implies that if $u, u^{\prime} \in U$ are points such that $s(r)=u$ and $t(r)=u^{\prime}$, then $\left(F_{u}\right)_{\kappa(r)} \cong\left(F_{u^{\prime}}\right)_{\kappa(r)}$. This is a special case of the more general and more precise Lemma 39.6.1 below. To see this take $r^{\prime}=i(r)$.

A pair $(X, x)$ consisting of a scheme $X$ and a point $x \in X$ is sometimes called the germ of $X$ at $x$. A morphism of germs $f:(X, x) \rightarrow(S, s)$ is a morphism $f: U \rightarrow S$ defined on an open neighbourhood of $x$ with $f(x)=s$. Two such $f, f^{\prime}$ are said to give the same morphism of germs if and only if $f$ and $f^{\prime}$ agree in some open neighbourhood of $x$. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf $\}$. We temporarily introduce the following concept: We say that two morphisms of germs $f:(X, x) \rightarrow(S, s)$ and $f^{\prime}:\left(X^{\prime}, x^{\prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ are isomorphic locally on the base in the $\tau$-topology, if there exists a pointed scheme $\left(S^{\prime \prime}, s^{\prime \prime}\right)$ and morphisms of germs $g:\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow(S, s)$, and $g^{\prime}:\left(S^{\prime \prime}, s^{\prime \prime}\right) \rightarrow\left(S^{\prime}, s^{\prime}\right)$ such that
(1) $g$ and $g^{\prime}$ are an open immersion (resp. étale, smooth, syntomic, flat and locally of finite presentation) at $s^{\prime \prime}$,
(2) there exists an isomorphism

$$
\left(S^{\prime \prime} \times_{g, S, f} X, \tilde{x}\right) \cong\left(S^{\prime \prime} \times_{g^{\prime}, S^{\prime}, f^{\prime}} X^{\prime}, \tilde{x}^{\prime}\right)
$$

of germs over the germ $\left(S^{\prime \prime}, s^{\prime \prime}\right)$ for some choice of points $\tilde{x}$ and $\tilde{x}^{\prime}$ lying over $\left(s^{\prime \prime}, x\right)$ and $\left(s^{\prime \prime}, x^{\prime}\right)$.
Finally, we simply say that the maps of germs $f:(X, x) \rightarrow(S, s)$ and $f^{\prime}:\left(X^{\prime}, x^{\prime}\right) \rightarrow$ $\left(S^{\prime}, s^{\prime}\right)$ are flat locally on the base isomorphic if there exist $S^{\prime \prime}, s^{\prime \prime}, g, g^{\prime}$ as above but with (1) replaced by the condition that $g$ and $g^{\prime}$ are flat at $s^{\prime \prime}$ (this is much weaker than any of the $\tau$ conditions above as a flat morphism need not be open).

02YF Lemma 39.6.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. Let $r, r^{\prime} \in R$ with $t(r)=t\left(r^{\prime}\right)$ in $U$. Set $u=s(r), u^{\prime}=s\left(r^{\prime}\right)$. Denote $F_{u}=s^{-1}(u)$ and $F_{u^{\prime}}=s^{-1}\left(u^{\prime}\right)$ the scheme theoretic fibres.
(1) There exists a common field extension $\kappa(u) \subset k, \kappa\left(u^{\prime}\right) \subset k$ and an iso$\operatorname{morphism}\left(F_{u}\right)_{k} \cong\left(F_{u^{\prime}}\right)_{k}$.
(2) We may choose the isomorphism of (1) such that a point lying over $r$ maps to a point lying over $r^{\prime}$.
(3) If the morphisms $s$, $t$ are flat then the morphisms of germs $s:(R, r) \rightarrow$ $(U, u)$ and $s:\left(R, r^{\prime}\right) \rightarrow\left(U, u^{\prime}\right)$ are flat locally on the base isomorphic.
(4) If the morphisms $s$, $t$ are étale (resp. smooth, syntomic, or flat and locally of finite presentation) then the morphisms of germs $s:(R, r) \rightarrow(U, u)$ and $s:\left(R, r^{\prime}\right) \rightarrow\left(U, u^{\prime}\right)$ are locally on the base isomorphic in the étale (resp. smooth, syntomic, or fppf) topology.

Proof. We repeatedly use the properties and the existence of diagram 39.3.0.2). By the properties of the diagram (and Schemes, Lemma 25.17.5) there exists a point $\xi$ of $R \times_{s, U, t} R$ with $\operatorname{pr}_{0}(\xi)=r$ and $c(\xi)=r^{\prime}$. Let $\tilde{r}=\operatorname{pr}_{1}(\xi) \in R$.
Proof of (1). Set $k=\kappa(\tilde{r})$. Since $t(\tilde{r})=u$ and $s(\tilde{r})=u^{\prime}$ we see that $k$ is a common extension of both $\kappa(u)$ and $\kappa\left(u^{\prime}\right)$ and in fact that both $\left(F_{u}\right)_{k}$ and $\left(F_{u^{\prime}}\right)_{k}$ are isomorphic to the fibre of $\mathrm{pr}_{1}: R \times_{s, U, t} R \rightarrow R$ over $\tilde{r}$. Hence (1) is proved.
Part (2) follows since the point $\xi$ maps to $r$, resp. $r^{\prime}$.
Part (3) is clear from the above (using the point $\xi$ for $\tilde{u}$ and $\tilde{u}^{\prime}$ ) and the definitions.
If $s$ and $t$ are flat and of finite presentation, then they are open morphisms (Morphisms, Lemma 28.25 .9 . Hence the image of some affine open neighbourhood $V^{\prime \prime}$ of $\tilde{r}$ will cover an open neighbourhood $V$ of $u$, resp. $V^{\prime}$ of $u^{\prime}$. These can be used to show that properties (1) and (2) of the definition of "locally on the base isomorphic in the $\tau$-topology".

### 39.7. Cohen-Macaulay presentations

04LK Given any groupoid $(U, R, s, t, c)$ with $s, t$ flat and locally of finite presentation there exists an "equivalent" groupoid $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ such that $s^{\prime}$ and $t^{\prime}$ are CohenMacaulay morphisms (and locally of finite presentation). See More on Morphisms, Section 36.17 for more information on Cohen-Macaulay morphisms. Here "equivalent" can be taken to mean that the quotient stacks $[U / R]$ and $\left[U^{\prime} / R^{\prime}\right]$ are equivalent stacks, see Groupoids in Spaces, Section 65.19 and Section 65.24

0460 Lemma 39.7.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid over $S$. Assume $s$ and $t$ are flat and locally of finite presentation. Then there exists an open $U^{\prime} \subset U$ such that
(1) $t^{-1}\left(U^{\prime}\right) \subset R$ is the largest open subscheme of $R$ on which the morphism $s$ is Cohen-Macaulay,
(2) $s^{-1}\left(U^{\prime}\right) \subset R$ is the largest open subscheme of $R$ on which the morphism $t$ is Cohen-Macaulay,
(3) the morphism $\left.t\right|_{s^{-1}\left(U^{\prime}\right)}: s^{-1}\left(U^{\prime}\right) \rightarrow U$ is surjective,
(4) the morphism $\left.s\right|_{t^{-1}\left(U^{\prime}\right)}: t^{-1}\left(U^{\prime}\right) \rightarrow U$ is surjective, and
(5) the restriction $R^{\prime}=s^{-1}\left(U^{\prime}\right) \cap t^{-1}\left(U^{\prime}\right)$ of $R$ to $U^{\prime}$ defines a groupoid ( $U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}$ ) which has the property that the morphisms $s^{\prime}$ and $t^{\prime}$ are Cohen-Macaulay and locally of finite presentation.
Proof. Apply Lemma 39.5.1 with $g=$ id and $\mathcal{Q}=$ "locally of finite presentation", $\mathcal{R}=$ "flat and locally of finite presentation", and $\mathcal{P}=$ "Cohen-Macaulay", see Remark 39.5.3. This gives us an open $U^{\prime} \subset U$ such that Let $t^{-1}\left(U^{\prime}\right) \subset R$ is the largest open subscheme of $R$ on which the morphism $s$ is Cohen-Macaulay. This proves
(1). Let $i: R \rightarrow R$ be the inverse of the groupoid. Since $i$ is an isomorphism, and $s \circ i=t$ and $t \circ i=s$ we see that $s^{-1}\left(U^{\prime}\right)$ is also the largest open of $R$ on which $t$ is Cohen-Macaulay. This proves (2). By More on Morphisms, Lemma 36.17.5 the open subset $t^{-1}\left(U^{\prime}\right)$ is dense in every fibre of $s: R \rightarrow U$. This proves (3). Same argument for (4). Part (5) is a formal consequence of (1) and (2) and the discussion of restrictions in Groupoids, Section 38.18 .

### 39.8. Restricting groupoids

04 MM In this section we collect a bunch of lemmas on properties of groupoids which are inherited by restrictions. Most of these lemmas can be proved by contemplating the defining diagram

04MN
(39.8.0.1)

of a restriction. See Groupoids, Lemma 38.18.1.
04MP Lemma 39.8.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $g$.
(1) If $s, t$ are locally of finite type and $g$ is locally of finite type, then $s^{\prime}, t^{\prime}$ are locally of finite type.
(2) If $s, t$ are locally of finite presentation and $g$ is locally of finite presentation, then $s^{\prime}, t^{\prime}$ are locally of finite presentation.
(3) If $s, t$ are flat and $g$ is flat, then $s^{\prime}, t^{\prime}$ are flat.
(4) Add more here.

Proof. The property of being locally of finite type is stable under composition and arbitrary base change, see Morphisms, Lemmas 28.15.3 and 28.15.4. Hence (1) is clear from Diagram 39.8.0.1). For the other cases, see Morphisms, Lemmas 28.21.3, 28.21.4, 28.25.5, and 28.25.7.

The following lemma could have been used to prove the results of the preceding lemma in a more uniform way.
04MV Lemma 39.8.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $g$, and let $h=s \circ p r_{1}: U^{\prime} \times_{g, U, t} R \rightarrow U$. If $\mathcal{P}$ is a property of morphisms of schemes such that
(1) $h$ has property $\mathcal{P}$, and
(2) $\mathcal{P}$ is preserved under base change, then $s^{\prime}, t^{\prime}$ have property $\mathcal{P}$.
Proof. This is clear as $s^{\prime}$ is the base change of $h$ by Diagram 39.8.0.1) and $t^{\prime}$ is isomorphic to $s^{\prime}$ as a morphism of schemes.

04MW Lemma 39.8.3. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over S. Let $g: U^{\prime} \rightarrow U$ and $g^{\prime}: U^{\prime \prime} \rightarrow U^{\prime}$ be morphisms of schemes. Set $g^{\prime \prime}=g \circ g^{\prime}$. Let ( $U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}$ ) be the restriction of $R$ to $U^{\prime}$. Let $h=s \circ p r_{1}: U^{\prime} \times_{g, U, t} R \rightarrow U$, let $h^{\prime}=s^{\prime} \circ p r_{1}: U^{\prime \prime} \times_{g^{\prime}, U^{\prime}, t} R \rightarrow U^{\prime}$, and let $h^{\prime \prime}=s \circ p r_{1}: U^{\prime \prime} \times{ }_{g^{\prime \prime}, U, t} R \rightarrow U$. The following diagram is commutative

with both squares cartesian where the left upper horizontal arrow is given by the rule

$$
\begin{array}{rlc}
\left(U^{\prime} \times_{g, U, t} R\right) \times_{U}\left(U^{\prime \prime} \times{ }_{g^{\prime \prime}, U, t} R\right) & \longrightarrow & U^{\prime \prime} \times{ }_{g^{\prime}, U^{\prime}, t} R^{\prime} \\
\left(\left(u^{\prime}, r_{0}\right),\left(u^{\prime \prime}, r_{1}\right)\right) & \longmapsto & \left(u^{\prime \prime},\left(c\left(r_{1}, i\left(r_{0}\right)\right),\left(g^{\prime}\left(u^{\prime \prime}\right), u^{\prime}\right)\right)\right)
\end{array}
$$

with notation as explained in the proof.
Proof. We work this out by exploiting the functorial point of view and reducing the lemma to a statement on arrows in restrictions of a groupoid category. In the last formula of the lemma the notation $\left(\left(u^{\prime}, r_{0}\right),\left(u^{\prime \prime}, r_{1}\right)\right)$ indicates a $T$-valued point of $\left(U^{\prime} \times{ }_{g, U, t} R\right) \times_{U}\left(U^{\prime \prime} \times_{g^{\prime \prime}, U, t} R\right)$. This means that $u^{\prime}, u^{\prime \prime}, r_{0}, r_{1}$ are $T$-valued points of $U^{\prime}, U^{\prime \prime}, R, R$ and that $g\left(u^{\prime}\right)=t\left(r_{0}\right), g\left(g^{\prime}\left(u^{\prime \prime}\right)\right)=g^{\prime \prime}\left(u^{\prime \prime}\right)=t\left(r_{1}\right)$, and $s\left(r_{0}\right)=s\left(r_{1}\right)$. It would be more correct here to write $g \circ u^{\prime}=t \circ r_{0}$ and so on but this makes the notation even more unreadable. If we think of $r_{1}$ and $r_{0}$ as arrows in a groupoid category then we can represent this by the picture

$$
t\left(r_{0}\right)=g\left(u^{\prime}\right)<r_{0} s\left(r_{0}\right)=s\left(r_{1}\right) \xrightarrow{r_{1}} t\left(r_{1}\right)=g\left(g^{\prime}\left(u^{\prime \prime}\right)\right)
$$

This diagram in particular demonstrates that the composition $c\left(r_{1}, i\left(r_{0}\right)\right)$ makes sense. Recall that

$$
R^{\prime}=R \times{ }_{(t, s), U \times{ }_{S} U, g \times g} U^{\prime} \times_{S} U^{\prime}
$$

hence a $T$-valued point of $R^{\prime}$ looks like $\left(r,\left(u_{0}^{\prime}, u_{1}^{\prime}\right)\right)$ with $t(r)=g\left(u_{0}^{\prime}\right)$ and $s(r)=$ $g\left(u_{1}^{\prime}\right)$. In particular given $\left(\left(u^{\prime}, r_{0}\right),\left(u^{\prime \prime}, r_{1}\right)\right)$ as above we get the $T$-valued point $\left(c\left(r_{1}, i\left(r_{0}\right)\right),\left(g^{\prime}\left(u^{\prime \prime}\right), u^{\prime}\right)\right)$ of $R^{\prime}$ because we have $t\left(c\left(r_{1}, i\left(r_{0}\right)\right)\right)=t\left(r_{1}\right)=g\left(g^{\prime}\left(u^{\prime \prime}\right)\right)$ and $s\left(c\left(r_{1}, i\left(r_{0}\right)\right)\right)=s\left(i\left(r_{0}\right)\right)=t\left(r_{0}\right)=g\left(u^{\prime}\right)$. We leave it to the reader to show that the left square commutes with this definition.

To show that the left square is cartesian, suppose we are given $\left(v^{\prime \prime}, p^{\prime}\right)$ and $\left(v^{\prime}, p\right)$ which are $T$-valued points of $U^{\prime \prime} \times_{g^{\prime}, U^{\prime}, t} R^{\prime}$ and $U^{\prime} \times_{g, U, t} R$ with $v^{\prime}=s^{\prime}\left(p^{\prime}\right)$. This also means that $g^{\prime}\left(v^{\prime \prime}\right)=t^{\prime}\left(p^{\prime}\right)$ and $g\left(v^{\prime}\right)=t(p)$. By the discussion above we know that we can write $p^{\prime}=\left(r,\left(u_{0}^{\prime}, u_{1}^{\prime}\right)\right)$ with $t(r)=g\left(u_{0}^{\prime}\right)$ and $s(r)=g\left(u_{1}^{\prime}\right)$. Using this notation we see that $v^{\prime}=s^{\prime}\left(p^{\prime}\right)=u_{1}^{\prime}$ and $g^{\prime}\left(v^{\prime \prime}\right)=t^{\prime}\left(p^{\prime}\right)=u_{0}^{\prime}$. Here is a picture

$$
s(p) \xrightarrow{p} g\left(v^{\prime}\right)=g\left(u_{1}^{\prime}\right) \xrightarrow{r} g\left(u_{0}^{\prime}\right)=g\left(g^{\prime}\left(v^{\prime \prime}\right)\right)
$$

What we have to show is that there exists a unique $T$-valued point $\left(\left(u^{\prime}, r_{0}\right),\left(u^{\prime \prime}, r_{1}\right)\right)$ as above such that $v^{\prime}=u^{\prime}, p=r_{0}, v^{\prime \prime}=u^{\prime \prime}$ and $p^{\prime}=\left(c\left(r_{1}, i\left(r_{0}\right)\right),\left(g^{\prime}\left(u^{\prime \prime}\right), u^{\prime}\right)\right)$. Comparing the two diagrams above it is clear that we have no choice but to take

$$
\left(\left(u^{\prime}, r_{0}\right),\left(u^{\prime \prime}, r_{1}\right)\right)=\left(\left(v^{\prime}, p\right),\left(v^{\prime \prime}, c(r, p)\right)\right.
$$

Some details omitted.

04MX Lemma 39.8.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ and $g^{\prime}: U^{\prime \prime} \rightarrow U^{\prime}$ be morphisms of schemes. Set $g^{\prime \prime}=g \circ g^{\prime}$. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $R$ to $U^{\prime}$. Let $h=s \circ p r_{1}: U^{\prime} \times_{g, U, t} R \rightarrow U$, let $h^{\prime}=s^{\prime} \circ p r_{1}: U^{\prime \prime} \times{ }_{g^{\prime}, U^{\prime}, t} R \rightarrow U^{\prime}$, and let $h^{\prime \prime}=s \circ p r_{1}: U^{\prime \prime} \times{ }_{g^{\prime \prime}, U, t} R \rightarrow U$. Let $\tau \in\{$ Zariski, étale, smooth, syntomic, fppf,fpqc\}. Let $\mathcal{P}$ be a property of morphisms of schemes which is preserved under base change, and which is local on the target for the $\tau$-topology. If
(1) $h\left(U^{\prime} \times_{U} R\right)$ is open in $U$,
(2) $\left\{h: U^{\prime} \times_{U} R \rightarrow h\left(U^{\prime} \times_{U} R\right)\right\}$ is a $\tau$-covering,
(3) $h^{\prime}$ has property $\mathcal{P}$,
then $h^{\prime \prime}$ has property $\mathcal{P}$. Conversely, if
(a) $\{t: R \rightarrow U\}$ is a $\tau$-covering,
(d) $h^{\prime \prime}$ has property $\mathcal{P}$,
then $h^{\prime}$ has property $\mathcal{P}$.
Proof. This follows formally from the properties of the diagram of Lemma 39.8.3. In the first case, note that the image of the morphism $h^{\prime \prime}$ is contained in the image of $h$, as $g^{\prime \prime}=g \circ g^{\prime}$. Hence we may replace the $U$ in the lower right corner of the diagram by $h\left(U^{\prime} \times_{U} R\right)$. This explains the significance of conditions (1) and (2) in the lemma. In the second case, note that $\left\{\operatorname{pr}_{0}: U^{\prime} \times_{g, U, t} R \rightarrow U^{\prime}\right\}$ is a $\tau$-covering as a base change of $\tau$ and condition (a).

### 39.9. Properties of groupoids on fields

04LL A "groupoid on a field" indicates a groupoid scheme $(U, R, s, t, c)$ where $U$ is the spectrum of a field. It does not mean that $(U, R, s, t, c)$ is defined over a field, more precisely, it does not mean that the morphisms $s, t: R \rightarrow U$ are equal. Given any field $k$, an abstract group $G$ and a group homomorphism $\varphi: G \rightarrow \operatorname{Aut}(k)$ we obtain a groupoid scheme $(U, R, s, t, c)$ over $\mathbf{Z}$ by setting

$$
\begin{aligned}
U & =\operatorname{Spec}(k) \\
R & =\coprod_{g \in G} \operatorname{Spec}(k) \\
s & =\coprod_{g \in G} \operatorname{Spec}\left(\mathrm{id}_{k}\right) \\
t & =\coprod_{g \in G} \operatorname{Spec}(\varphi(g)) \\
c & =\operatorname{composition~in~} G
\end{aligned}
$$

This example still is a groupoid scheme over $\operatorname{Spec}\left(k^{G}\right)$. Hence, if $G$ is finite, then $U=\operatorname{Spec}(k)$ is finite over $\operatorname{Spec}\left(k^{G}\right)$. In some sense our goal in this section is to show that suitable finiteness conditions on $s, t$ force any groupoid on a field to be defined over a finite index subfield $k^{\prime} \subset k$.

If $k$ is a field and $(G, m)$ is a group scheme over $k$ with structure morphism $p: G \rightarrow$ $\operatorname{Spec}(k)$, then $(\operatorname{Spec}(k), G, p, p, m)$ is an example of a groupoid on a field (and in this case of course the whole structure is defined over a field). Hence this section can be viewed as the analogue of Groupoids, Section 38.7.

04LM Lemma 39.9.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. If $U$ is the spectrum of a field, then the composition morphism $c: R \times_{s, U, t} R \rightarrow R$ is open.

Proof. The composition is isomorphic to the projection map $\mathrm{pr}_{1}: R \times_{t, U, t} R \rightarrow R$ by Diagram 39.3.0.3). The projection is open by Morphisms, Lemma 28.23.4.

04LN Lemma 39.9.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. If $U$ is the spectrum of a field, then $R$ is a separated scheme.

Proof. By Groupoids, Lemma 38.7 .3 the stabilizer group scheme $G \rightarrow U$ is separated. By Groupoids, Lemma 38.22 .2 the morphism $j=(t, s): R \rightarrow U \times_{S} U$ is separated. As $U$ is the spectrum of a field the scheme $U \times_{S} U$ is affine (by the construction of fibre products in Schemes, Section 25.17). Hence $R$ is a separated scheme, see Schemes, Lemma 25.21.13

04LP Lemma 39.9.3. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. For any points $r, r^{\prime} \in R$ there exists a field extension $k \subset k^{\prime}$ and points $r_{1}, r_{2} \in R \times_{s, \operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)$ and a diagram

$$
R \leftarrow^{p r_{0}} R \times_{s, \operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right) \xrightarrow{\varphi} R \times_{s, \operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right) \xrightarrow{p r_{0}} R
$$

such that $\varphi$ is an isomorphism of schemes over $\operatorname{Spec}\left(k^{\prime}\right)$, we have $\varphi\left(r_{1}\right)=r_{2}$, $p r_{0}\left(r_{1}\right)=r$, and $p r_{0}\left(r_{2}\right)=r^{\prime}$.

Proof. This is a special case of Lemma 39.6.1 parts (1) and (2).
04LQ Lemma 39.9.4. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over S. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. Let $k \subset k^{\prime}$ be a field extension, $U^{\prime}=$ $\operatorname{Spec}\left(k^{\prime}\right)$ and let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $U^{\prime} \rightarrow U$. In the defining diagram

all the morphisms are surjective, flat, and universally open. The dotted arrow $R^{\prime} \rightarrow R$ is in addition affine.

Proof. The morphism $U^{\prime} \rightarrow U$ equals $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$, hence is affine, surjective and flat. The morphisms $s, t: R \rightarrow U$ and the morphism $U^{\prime} \rightarrow U$ are universally open by Morphisms, Lemma 28.23.4. Since $R$ is not empty and $U$ is the spectrum of a field the morphisms $s, t: R \rightarrow U$ are surjective and flat. Then you conclude by using Morphisms, Lemmas 28.10.4, 28.10.2, 28.23.3, 28.12.8, 28.12.7, 28.25.7, and 28.25.5.

04LR Lemma 39.9.5. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. For any point $r \in R$ there exist
(1) a field extension $k \subset k^{\prime}$ with $k^{\prime}$ algebraically closed,
(2) a point $r^{\prime} \in R^{\prime}$ where $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ is the restriction of $(U, R, s, t, c)$ via $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$
such that
(1) the point $r^{\prime}$ maps to $r$ under the morphism $R^{\prime} \rightarrow R$, and
(2) the maps $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow \operatorname{Spec}\left(k^{\prime}\right)$ induce isomorphisms $k^{\prime} \rightarrow \kappa\left(r^{\prime}\right)$.

Proof. Translating the geometric statement into a statement on fields, this means that we can find a diagram

where $i: k \rightarrow k^{\prime}$ is the embedding of $k$ into $k^{\prime}$, the maps $s, t: k \rightarrow \kappa(r)$ are induced by $s, t: R \rightarrow U$, and the map $\tau: k^{\prime} \rightarrow k^{\prime}$ is an automorphism. To produce such a diagram we may proceed in the following way:
(1) Pick $i: k \rightarrow k^{\prime}$ a field map with $k^{\prime}$ algebraically closed of very large transcendence degree over $k$.
(2) Pick an embedding $\sigma: \kappa(r) \rightarrow k^{\prime}$ such that $\sigma \circ s=i$. Such a $\sigma$ exists because we can just choose a transcendence basis $\left\{x_{\alpha}\right\}_{\alpha \in A}$ of $\kappa(r)$ over $k$ and find $y_{\alpha} \in k^{\prime}, \alpha \in A$ which are algebraically independent over $i(k)$, and $\operatorname{map} s(k)\left(\left\{x_{\alpha}\right\}\right)$ into $k^{\prime}$ by the rules $s(\lambda) \mapsto i(\lambda)$ for $\lambda \in k$ and $x_{\alpha} \mapsto y_{\alpha}$ for $\alpha \in A$. Then extend to $\tau: \kappa(\alpha) \rightarrow k^{\prime}$ using that $k^{\prime}$ is algebraically closed.
(3) Pick an automorphism $\tau: k^{\prime} \rightarrow k^{\prime}$ such that $\tau \circ i=\sigma \circ t$. To do this pick a transcendence basis $\left\{x_{\alpha}\right\}_{\alpha \in A}$ of $k$ over its prime field. On the one hand, extend $\left\{i\left(x_{\alpha}\right)\right\}$ to a transcendence basis of $k^{\prime}$ by adding $\left\{y_{\beta}\right\}_{\beta \in B}$ and extend $\left\{\sigma\left(t\left(x_{\alpha}\right)\right)\right\}$ to a transcendence basis of $k^{\prime}$ by adding $\left\{z_{\gamma}\right\}_{\gamma \in C}$. As $k^{\prime}$ is algebraically closed we can extend the isomorphism $\sigma \circ t \circ i^{-1}$ : $i(k) \rightarrow \sigma(t(k))$ to an isomorphism $\tau^{\prime}: \overline{i(k)} \rightarrow \overline{\sigma(t(k))}$ of their algebraic closures in $k^{\prime}$. As $k^{\prime}$ has large transcendence degree we see that the sets $B$ and $C$ have the same cardinality. Thus we can use a bijection $B \rightarrow C$ to extend $\tau^{\prime}$ to an isomorphism

$$
\overline{i(k)}\left(\left\{y_{\beta}\right\}\right) \longrightarrow \overline{\sigma(t(k))}\left(\left\{z_{\gamma}\right\}\right)
$$

and then since $k^{\prime}$ is the algebraic closure of both sides we see that this extends to an automorphism $\tau: k^{\prime} \rightarrow k^{\prime}$ as desired.
This proves the lemma.
04LS Lemma 39.9.6. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. If $r \in R$ is a point such that $s, t$ induce isomorphisms $k \rightarrow \kappa(r)$, then the map

$$
R \longrightarrow R, \quad x \longmapsto c(r, x)
$$

(see proof for precise notation) is an automorphism $R \rightarrow R$ which maps e to $r$.
Proof. This is completely obvious if you think about groupoids in a functorial way. But we will also spell it out completely. Denote $a: U \rightarrow R$ the morphism with image $r$ such that $s \circ a=\mathrm{id}_{U}$ which exists by the hypothesis that $s: k \rightarrow \kappa(r)$ is an
isomorphism. Similarly, denote $b: U \rightarrow R$ the morphism with image $r$ such that $t \circ b=\operatorname{id}_{U}$. Note that $b=a \circ(t \circ a)^{-1}$, in particular $a \circ s \circ b=b$.
Consider the morphism $\Psi: R \rightarrow R$ given on $T$-valued points by

$$
(f: T \rightarrow R) \longmapsto(c(a \circ t \circ f, f): T \rightarrow R)
$$

To see this is defined we have to check that $s \circ a \circ t \circ f=t \circ f$ which is obvious as $s \circ a=1$. Note that $\Phi(e)=a$, so that in order to prove the lemma it suffices to show that $\Phi$ is an automorphism of $R$. Let $\Phi: R \rightarrow R$ be the morphism given on $T$-valued points by

$$
(g: T \rightarrow R) \longmapsto(c(i \circ b \circ t \circ g, g): T \rightarrow R)
$$

This is defined because $s \circ i \circ b \circ t \circ g=t \circ b \circ t \circ g=t \circ g$. We claim that $\Phi$ and $\Psi$ are inverse to each other. To see this we compute

$$
\begin{aligned}
& c(a \circ t \circ c(i \circ b \circ t \circ g, g), c(i \circ b \circ t \circ g, g)) \\
& =c(a \circ t \circ i \circ b \circ t \circ g, c(i \circ b \circ t \circ g, g)) \\
& =c(a \circ s \circ b \circ t \circ g, c(i \circ b \circ t \circ g, g)) \\
& =c(b \circ t \circ g, c(i \circ b \circ t \circ g, g)) \\
& =c(c(b \circ t \circ g, i \circ b \circ t \circ g), g)) \\
& =c(e, g) \\
& =g
\end{aligned}
$$

where we have used the relation $a \circ s \circ b=b$ shown above. In the other direction we have

$$
\begin{aligned}
& c(i \circ b \circ t \circ c(a \circ t \circ f, f), c(a \circ t \circ f, f)) \\
& =c(i \circ b \circ t \circ a \circ t \circ f, c(a \circ t \circ f, f)) \\
& =c\left(i \circ a \circ(t \circ a)^{-1} \circ t \circ a \circ t \circ f, c(a \circ t \circ f, f)\right) \\
& =c(i \circ a \circ t \circ f, c(a \circ t \circ f, f)) \\
& =c(c(i \circ a \circ t \circ f, a \circ t \circ f), f) \\
& =c(e, f) \\
& =f
\end{aligned}
$$

The lemma is proved.
0B7V Lemma 39.9.7. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. If $U$ is the spectrum of a field, $W \subset R$ is open, and $Z \rightarrow R$ is a morphism of schemes, then the image of the composition $Z \times_{s, U, t} W \rightarrow R \times_{s, U, t} R \rightarrow R$ is open.

Proof. Write $U=\operatorname{Spec}(k)$. Consider a field extension $k \subset k^{\prime}$. Denote $U^{\prime}=$ $\operatorname{Spec}\left(k^{\prime}\right)$. Let $R^{\prime}$ be the restriction of $R$ via $U^{\prime} \rightarrow U$. Set $Z^{\prime}=Z \times_{R} R^{\prime}$ and $W^{\prime}=R^{\prime} \times_{R} W$. Consider a point $\xi=(z, w)$ of $Z \times_{s, U, t} W$. Let $r \in R$ be the image of $z$ under $Z \rightarrow R$. Pick $k^{\prime} \supset k$ and $r^{\prime} \in R^{\prime}$ as in Lemma 39.9.5. We can choose $z^{\prime} \in Z^{\prime}$ mapping to $z$ and $r^{\prime}$. Then we can find $\xi^{\prime} \in Z^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} W^{\prime}$ mapping to $z^{\prime}$ and $\xi$. The open $c\left(r^{\prime}, W^{\prime}\right)$ (Lemma 39.9.6) is contained in the image of $Z^{\prime} \times{ }_{s^{\prime}, U^{\prime}, t^{\prime}} W^{\prime} \rightarrow R^{\prime}$. Observe that $Z^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} W^{\prime}=\left(Z \times_{s, U, t} W\right) \times_{R \times_{s, U, t} R}\left(R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime}\right)$. Hence the image of $Z^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} W^{\prime} \rightarrow R^{\prime} \rightarrow R$ is contained in the image of $Z \times_{s, U, t} W \rightarrow$ $R$. As $R^{\prime} \rightarrow R$ is open (Lemma 39.9.4 we conclude the image contains an open neighbourhood of the image of $\xi$ as desired.

04LT Lemma 39.9.8. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. By abuse of notation denote $e \in R$ the image of the identity morphism $e: U \rightarrow R$. Then
(1) every local ring $\mathcal{O}_{R, r}$ of $R$ has a unique minimal prime ideal,
(2) there is exactly one irreducible component $Z$ of $R$ passing through e, and
(3) $Z$ is geometrically irreducible over $k$ via either $s$ or $t$.

Proof. Let $r \in R$ be a point. In this proof we will use the correspondence between irreducible components of $R$ passing through a point $r$ and minimal primes of the local ring $\mathcal{O}_{R, r}$ without further mention. Choose $k \subset k^{\prime}$ and $r^{\prime} \in R^{\prime}$ as in Lemma 39.9.5. Note that $\mathcal{O}_{R, r} \rightarrow \mathcal{O}_{R^{\prime}, r^{\prime}}$ is faithfully flat and local, see Lemma 39.9.4. Hence the result for $r^{\prime} \in R^{\prime}$ implies the result for $r \in R$. In other words we may assume that $s, t: k \rightarrow \kappa(r)$ are isomorphisms. By Lemma 39.9 .6 there exists an automorphism moving $e$ to $r$. Hence we may assume $r=e$, i.e., part (1) follows from part (2).
We first prove (2) in case $k$ is separably algebraically closed. Namely, let $X, Y \subset R$ be irreducible components passing through $e$. Then by Varieties, Lemma 32.6.4 and 32.6 .3 the scheme $X \times_{s, U, t} Y$ is irreducible as well. Hence $c\left(X \times_{s, U, t} Y\right) \subset R$ is an irreducible subset. We claim it contains both $X$ and $Y$ (as subsets of $R$ ). Namely, let $T$ be the spectrum of a field. If $x: T \rightarrow X$ is a $T$-valued point of $X$, then $c(x, e \circ s \circ x)=x$ and $e \circ s \circ x$ factors through $Y$ as $e \in Y$. Similarly for points of $Y$. This clearly implies that $X=Y$, i.e., there is a unique irreducible component of $R$ passing through $e$.

Proof of (2) and (3) in general. Let $k \subset k^{\prime}$ be a separable algebraic closure, and let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $(U, R, s, t, c)$ via $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$. By the previous paragraph there is exactly one irreducible component $Z^{\prime}$ of $R^{\prime}$ passing through $e^{\prime}$. Denote $e^{\prime \prime} \in R \times_{s, U} U^{\prime}$ the base change of $e$. As $R^{\prime} \rightarrow R \times_{s, U} U^{\prime}$ is faithfully flat, see Lemma 39.9.4 and $e^{\prime} \mapsto e^{\prime \prime}$ we see that there is exactly one irreducible component $Z^{\prime \prime}$ of $R \times_{s, k} k^{\prime}$ passing through $e^{\prime \prime}$. This implies, as $R \times_{k} k^{\prime} \rightarrow R$ is faithfully flat, that there is exactly one irreducible component $Z$ of $R$ passing through $e$. This proves (2).

To prove (3) let $Z^{\prime \prime \prime} \subset R \times_{k} k^{\prime}$ be an arbitrary irreducible component of $Z \times_{k} k^{\prime}$. By Varieties, Lemma 32.6 .12 we see that $Z^{\prime \prime \prime}=\sigma\left(Z^{\prime \prime}\right)$ for some $\sigma \in \operatorname{Gal}\left(k^{\prime} / k\right)$. Since $\sigma\left(e^{\prime \prime}\right)=e^{\prime \prime}$ we see that $e^{\prime \prime} \in Z^{\prime \prime \prime}$ and hence $Z^{\prime \prime \prime}=Z^{\prime \prime}$. This means that $Z$ is geometrically irreducible over $\operatorname{Spec}(k)$ via the morphism $s$. The same argument implies that $Z$ is geometrically irreducible over $\operatorname{Spec}(k)$ via the morphism $t$.

04LU Lemma 39.9.9. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. Assume $s, t$ are locally of finite type. Then
(1) $R$ is equidimensional,
(2) $\operatorname{dim}(R)=\operatorname{dim}_{r}(R)$ for all $r \in R$,
(3) for any $r \in R$ we have $\operatorname{trdeg}_{s(k)}(\kappa(r))=\operatorname{trdeg}_{t(k)}(\kappa(r))$, and
(4) for any closed point $r \in R$ we have $\operatorname{dim}(R)=\operatorname{dim}\left(\mathcal{O}_{R, r}\right)$.

Proof. Let $r, r^{\prime} \in R$. Then $\operatorname{dim}_{r}(R)=\operatorname{dim}_{r^{\prime}}(R)$ by Lemma 39.9.3 and Morphisms, Lemma 28.28.3. By Morphisms, Lemma 28.28.1 we have

$$
\operatorname{dim}_{r}(R)=\operatorname{dim}\left(\mathcal{O}_{R, r}\right)+\operatorname{trdeg}_{s(k)}(\kappa(r))=\operatorname{dim}\left(\mathcal{O}_{R, r}\right)+\operatorname{trdeg}_{t(k)}(\kappa(r))
$$

On the other hand, the dimension of $R$ (or any open subset of $R$ ) is the supremum of the dimensions of the local rings of of $R$, see Properties, Lemma 27.10.3. Clearly this is maximal for closed points $r$ in which case $\operatorname{trdeg}_{k}(\kappa(r))=0$ (by the Hilbert Nullstellensatz, see Morphisms, Section 28.16). Hence the lemma follows.

04MQ Lemma 39.9.10. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U=\operatorname{Spec}(k)$ with $k$ a field. Assume $s, t$ are locally of finite type. Then $\operatorname{dim}(R)=\operatorname{dim}(G)$ where $G$ is the stabilizer group scheme of $R$.

Proof. Let $Z \subset R$ be the irreducible component passing through $e$ (see Lemma 39.9.8 thought of as an integral closed subscheme of $R$. Let $k_{s}^{\prime}$, resp. $k_{t}^{\prime}$ be the integral closure of $s(k)$, resp. $t(k)$ in $\Gamma\left(Z, \mathcal{O}_{Z}\right)$. Recall that $k_{s}^{\prime}$ and $k_{t}^{\prime}$ are fields, see Varieties, Lemma 32.22.4. By Varieties, Proposition 32.25.1 we have $k_{s}^{\prime}=k_{t}^{\prime}$ as subrings of $\Gamma\left(Z, \mathcal{O}_{Z}\right)$. As $e$ factors through $Z$ we obtain a commutative diagram

This on the one hand shows that $k_{s}^{\prime}=s(k), k_{t}^{\prime}=t(k)$, so $s(k)=t(k)$, which combined with the diagram above implies that $s=t$ ! In other words, we conclude that $Z$ is a closed subscheme of $G=R \times{ }_{(t, s), U \times{ }_{S} U, \Delta} U$. The lemma follows as both $G$ and $R$ are equidimensional, see Lemma 39.9.9 and Groupoids, Lemma 38.8.1.
04MR Remark 39.9.11. Warning: Lemma 39.9 .10 is wrong without the condition that $s$ and $t$ are locally of finite type. An easy example is to start with the action

$$
\mathbf{G}_{m, \mathbf{Q}} \times \mathbf{Q} \mathbf{A}_{\mathbf{Q}}^{1} \rightarrow \mathbf{A}_{\mathbf{Q}}^{1}
$$

and restrict the corresponding groupoid scheme to the generic point of $\mathbf{A}_{\mathbf{Q}}^{1}$. In other words restrict via the morphism $\operatorname{Spec}(\mathbf{Q}(x)) \rightarrow \operatorname{Spec}(\mathbf{Q}[x])=\mathbf{A}_{\mathbf{Q}}^{1}$. Then you get a groupoid scheme $(U, R, s, t, c)$ with $U=\operatorname{Spec}(\mathbf{Q}(x))$ and

$$
R=\operatorname{Spec}\left(\mathbf{Q}(x)[y]\left[\frac{1}{P(x y)}, P \in \mathbf{Q}[T], P \neq 0\right]\right)
$$

In this case $\operatorname{dim}(R)=1$ and $\operatorname{dim}(G)=0$.
04RA Lemma 39.9.12. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over S. Assume
(1) $U=\operatorname{Spec}(k)$ with $k$ a field,
(2) $s, t$ are locally of finite type, and
(3) the characteristic of $k$ is zero.

Then $s, t: R \rightarrow U$ are smooth.
Proof. By Lemma 39.4.1 the sheaf of differentials of $R \rightarrow U$ is free. Hence smoothness follows from Varieties, Lemma 32.20.1.

04RB Lemma 39.9.13. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over S. Assume
(1) $U=\operatorname{Spec}(k)$ with $k$ a field,
(2) $s, t$ are locally of finite type,
(3) $R$ is reduced, and
(4) $k$ is perfect.

Then $s, t: R \rightarrow U$ are smooth.
Proof. By Lemma 39.4.1 the sheaf $\Omega_{R / U}$ is free. Hence the lemma follows from Varieties, Lemma 32.20.2.

### 39.10. Morphisms of groupoids on fields

04Q4 This section studies morphisms between groupoids on fields. This is slightly more general, but very akin to, studying morphisms of groupschemes over a field.
04Q5 Situation 39.10.1. Let $S$ be a scheme. Let $U=\operatorname{Spec}(k)$ be a scheme over $S$ with $k$ a field. Let $\left(U, R_{1}, s_{1}, t_{1}, c_{1}\right),\left(U, R_{2}, s_{2}, t_{2}, c_{2}\right)$ be groupoid schemes over $S$ with identical first component. Let $a: R_{1} \rightarrow R_{2}$ be a morphism such that (id $\left.{ }_{U}, a\right)$ defines a morphism of groupoid schemes over $S$, see Groupoids, Definition 38.13.1. In particular, the following diagrams commute

The following lemma is a generalization of Groupoids, Lemma 38.7.7.
04Q6 Lemma 39.10.2. Notation and assumptions as in Situation 39.10.1. If a $\left(R_{1}\right)$ is open in $R_{2}$, then $a\left(R_{1}\right)$ is closed in $R_{2}$.
Proof. Let $r_{2} \in R_{2}$ be a point in the closure of $a\left(R_{1}\right)$. We want to show $r_{2} \in a\left(R_{1}\right)$. Pick $k \subset k^{\prime}$ and $r_{2}^{\prime} \in R_{2}^{\prime}$ adapted to $\left(U, R_{2}, s_{2}, t_{2}, c_{2}\right)$ and $r_{2}$ as in Lemma 39.9.5. Let $R_{i}^{\prime}$ be the restriction of $R_{i}$ via the morphism $U^{\prime}=\operatorname{Spec}\left(k^{\prime}\right) \rightarrow U=\operatorname{Spec}(k)$. Let $a^{\prime}: R_{1}^{\prime} \rightarrow R_{2}^{\prime}$ be the base change of $a$. The diagram

is a fibre square. Hence the image of $a^{\prime}$ is the inverse image of the image of $a$ via the morphism $p_{2}: R_{2}^{\prime} \rightarrow R_{2}$. By Lemma 39.9 .4 the map $p_{2}$ is surjective and open. Hence by Topology, Lemma 5.5.4 we see that $r_{2}^{\prime}$ is in the closure of $a^{\prime}\left(R_{1}^{\prime}\right)$. This means that we may assume that $r_{2} \in R_{2}$ has the property that the maps $k \rightarrow \kappa\left(r_{2}\right)$ induced by $s_{2}$ and $t_{2}$ are isomorphisms.
In this case we can use Lemma 39.9.6. This lemma implies $c\left(r_{2}, a\left(R_{1}\right)\right)$ is an open neighbourhood of $r_{2}$. Hence $a\left(R_{1}\right) \cap c\left(r_{2}, a\left(R_{1}\right)\right) \neq \emptyset$ as we assumed that $r_{2}$ was a point of the closure of $a\left(R_{1}\right)$. Using the inverse of $R_{2}$ and $R_{1}$ we see this means $c_{2}\left(a\left(R_{1}\right), a\left(R_{1}\right)\right)$ contains $r_{2}$. As $c_{2}\left(a\left(R_{1}\right), a\left(R_{1}\right)\right) \subset a\left(c_{1}\left(R_{1}, R_{1}\right)\right)=a\left(R_{1}\right)$ we conclude $r_{2} \in a\left(R_{1}\right)$ as desired.

04Q7 Lemma 39.10.3. Notation and assumptions as in Situation 39.10.1. Let $Z \subset R_{2}$ be the reduced closed subscheme (see Schemes, Definition 25.12.5) whose underlying topological space is the closure of the image of $a: R_{1} \rightarrow R_{2}$. Then $c_{2}\left(Z \times_{s_{2}, U, t_{2}} Z\right) \subset$ $Z$ set theoretically.

Proof. Consider the commutative diagram

By Varieties, Lemma 32.19 .2 the closure of the image of the left vertical arrow is (set theoretically) $Z \times_{s_{2}, U, t_{2}} Z$. Hence the result follows.
04Q8 Lemma 39.10.4. Notation and assumptions as in Situation 39.10.1. Assume that $k$ is perfect. Let $Z \subset R_{2}$ be the reduced closed subscheme (see Schemes, Definition 25.12.5) whose underlying topological space is the closure of the image of $a: R_{1} \rightarrow$ $R_{2}$. Then

$$
\left(U, Z,\left.s_{2}\right|_{Z},\left.t_{2}\right|_{Z},\left.c_{2}\right|_{Z}\right)
$$

is a groupoid scheme over $S$.
Proof. We first explain why the statement makes sense. Since $U$ is the spectrum of a perfect field $k$, the scheme $Z$ is geometrically reduced over $k$ (via either projection), see Varieties, Lemma 32.4.3. Hence the scheme $Z \times_{s_{2}, U, t_{2}} Z \subset Z$ is reduced, see Varieties, Lemma 32.4.7. Hence by Lemma 39.10.3 we see that $c$ induces a morphism $Z \times_{s_{2}, U, t_{2}} Z \rightarrow Z$. Finally, it is clear that $e_{2}$ factors through $Z$ and that the map $i_{2}: R_{2} \rightarrow R_{2}$ preserves $Z$. Since the morphisms of the septuple $\left(U, R_{2}, s_{2}, t_{2}, c_{2}, e_{2}, i_{2}\right)$ satisfies the axioms of a groupoid, it follows that after restricting to $Z$ they satisfy the axioms.

04Q9 Lemma 39.10.5. Notation and assumptions as in Situation 39.10.1. If the image $a\left(R_{1}\right)$ is a locally closed subset of $R_{2}$ then it is a closed subset.

Proof. Let $k \subset k^{\prime}$ be a perfect closure of the field $k$. Let $R_{i}^{\prime}$ be the restriction of $R_{i}$ via the morphism $U^{\prime}=\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$. Note that the morphisms $R_{i}^{\prime} \rightarrow R_{i}$ are universal homeomorphisms as compositions of base changes of the universal homeomorphism $U^{\prime} \rightarrow U$ (see diagram in statement of Lemma 39.9.4). Hence it suffices to prove that $a^{\prime}\left(R_{1}^{\prime}\right)$ is closed in $R_{2}^{\prime}$. In other words, we may assume that $k$ is perfect.
If $k$ is perfect, then the closure of the image is a groupoid scheme $Z \subset R_{2}$, by Lemma 39.10.4. By the same lemma applied to $\operatorname{id}_{R_{1}}: R_{1} \rightarrow R_{1}$ we see that $\left(R_{2}\right)_{\text {red }}$ is a groupoid scheme. Thus we may apply Lemma 39.10 .2 to the morphism $\left.a\right|_{\left(R_{2}\right)_{\text {red }}}:\left(R_{2}\right)_{\text {red }} \rightarrow Z$ to conclude that $Z$ equals the image of $a$.
04QA Lemma 39.10.6. Notation and assumptions as in Situation 39.10.1. Assume that $a: R_{1} \rightarrow R_{2}$ is a quasi-compact morphism. Let $Z \subset R_{2}$ be the scheme theoretic image (see Morphisms, Definition 28.6.2) of $a: R_{1} \rightarrow R_{2}$. Then

$$
\left(U, Z,\left.s_{2}\right|_{Z},\left.t_{2}\right|_{Z},\left.c_{2}\right|_{Z}\right)
$$

is a groupoid scheme over $S$.

Proof. The main difficulty is to show that $\left.c_{2}\right|_{Z \times_{s_{2}, U, t_{2}} Z}$ maps into $Z$. Consider the commutative diagram

By Varieties, Lemma 32.19.3 we see that the scheme theoretic image of $a \times a$ is $Z \times_{s_{2}, U, t_{2}} Z$. By the commutativity of the diagram we conclude that $Z \times_{s_{2}, U, t_{2}} Z$ maps into $Z$ by the bottom horizontal arrow. As in the proof of Lemma 39.10.4 it is also true that $i_{2}(Z) \subset Z$ and that $e_{2}$ factors through $Z$. Hence we conclude as in the proof of that lemma.
04QB Lemma 39.10.7. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U$ is the spectrum of a field. Let $Z \subset U \times_{S} U$ be the reduced closed subscheme (see Schemes, Definition 25.12.5) whose underlying topological space is the closure of the image of $j=(t, s): R \rightarrow U \times_{S} U$. Then $p r_{02}\left(Z \times{ }_{p r_{1}, U, p r_{0}} Z\right) \subset Z$ set theoretically.
Proof. As $\left(U, U \times_{S} U, \mathrm{pr}_{1}, \mathrm{pr}_{0}, \mathrm{pr}_{02}\right)$ is a groupoid scheme over $S$ this is a special case of Lemma 39.10.3. But we can also prove it directly as follows.
Write $U=\operatorname{Spec}(k)$. Denote $R_{s}$ (resp. $Z_{s}$, resp. $U_{s}^{2}$ ) the scheme $R$ (resp. $Z$, resp. $U \times_{S} U$ ) viewed as a scheme over $k$ via $s$ (resp. $\left.\mathrm{pr}_{1}\right|_{Z}$, resp. pr ${ }_{1}$ ). Similarly, denote ${ }_{t} R$ (resp. ${ }_{t} Z$, resp. ${ }_{t} U^{2}$ ) the scheme $R$ (resp. $Z$, resp. $U \times{ }_{S} U$ ) viewed as a scheme over $k$ via $t$ (resp. $\left.\mathrm{pr}_{0}\right|_{Z}$, resp. $\mathrm{pr}_{0}$ ). The morphism $j$ induces morphisms of schemes $j_{s}: R_{s} \rightarrow U_{s}^{2}$ and ${ }_{t} j:{ }_{t} R \rightarrow{ }_{t} U^{2}$ over $k$. Consider the commutative diagram

By Varieties, Lemma 32.19 .2 we see that the closure of the image of $j_{s} \times{ }_{t} j$ is $Z_{s} \times_{k t} Z$. By the commutativity of the diagram we conclude that $Z_{s} \times{ }_{k}{ }_{t} Z$ maps into $Z$ by the bottom horizontal arrow.

04QC Lemma 39.10.8. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U$ is the spectrum of a perfect field. Let $Z \subset U \times{ }_{S} U$ be the reduced closed subscheme (see Schemes, Definition 25.12.5) whose underlying topological space is the closure of the image of $j=(t, s): R \rightarrow U \times{ }_{S} U$. Then

$$
\left(U, Z,\left.p r_{0}\right|_{Z},\left.p r_{1}\right|_{Z},\left.p r_{02}\right|_{Z \times_{p r_{1}, U, p r_{0}} Z}\right)
$$

is a groupoid scheme over $S$.
Proof. As $\left(U, U \times_{S} U, \mathrm{pr}_{1}, \mathrm{pr}_{0}, \mathrm{pr}_{02}\right)$ is a groupoid scheme over $S$ this is a special case of Lemma 39.10.4. But we can also prove it directly as follows.
We first explain why the statement makes sense. Since $U$ is the spectrum of a perfect field $k$, the scheme $Z$ is geometrically reduced over $k$ (via either projection), see Varieties, Lemma 32.4.3. Hence the scheme $Z \times_{\mathrm{pr}_{1}, U, \mathrm{pr}_{0}} Z \subset Z$ is reduced, see Varieties, Lemma 32.4.7. Hence by Lemma 39.10.7 we see that $\mathrm{pr}_{02}$ induces a morphism $Z \times_{\operatorname{pr}_{1}, U, \text { pr }_{0}} Z \rightarrow Z$. Finally, it is clear that $\Delta_{U / S}$ factors through $Z$
and that the map $\sigma: U \times_{S} U \rightarrow U \times_{S} U,(x, y) \mapsto(y, x)$ preserves $Z$. Since $\left(U, U \times_{S} U, \operatorname{pr}_{0}, \operatorname{pr}_{1}, \operatorname{pr}_{02}, \Delta_{U / S}, \sigma\right)$ satisfies the axioms of a groupoid, it follows that after restricting to $Z$ they satisfy the axioms.
04QD Lemma 39.10.9. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Assume $U$ is the spectrum of a field and assume $R$ is quasi-compact (equivalently $s, t$ are quasi-compact). Let $Z \subset U \times_{S} U$ be the scheme theoretic image (see Morphisms, Definition 28.6.2) of $j=(t, s): R \rightarrow U \times_{S} U$. Then

$$
\left(U, Z,\left.p r_{0}\right|_{Z},\left.p r_{1}\right|_{Z},\left.p r_{02}\right|_{\left.Z \times_{p r_{1}, U, p r_{0}} Z\right)}\right.
$$

is a groupoid scheme over $S$.
Proof. As $\left(U, U \times_{S} U, \mathrm{pr}_{1}, \mathrm{pr}_{0}, \mathrm{pr}_{02}\right)$ is a groupoid scheme over $S$ this is a special case of Lemma 39.10.6. But we can also prove it directly as follows.
The main difficulty is to show that $\left.\operatorname{pr}_{02}\right|_{Z \times_{\mathrm{pr}_{1}, U, \mathrm{pr}_{0}} Z}$ maps into $Z$. Write $U=$ $\operatorname{Spec}(k)$. Denote $R_{s}\left(\right.$ resp. $Z_{s}$, resp. $U_{s}^{2}$ ) the scheme $R$ (resp. $Z$, resp. $U \times_{S} U$ ) viewed as a scheme over $k$ via $s$ (resp. $\left.\mathrm{pr}_{1}\right|_{Z}$, resp. $\mathrm{pr}_{1}$ ). Similarly, denote ${ }_{t} R$ (resp. ${ }_{t} Z$, resp. ${ }_{t} U^{2}$ ) the scheme $R$ (resp. $Z$, resp. $U \times_{S} U$ ) viewed as a scheme over $k$ via $t$ (resp. $\left.\operatorname{pr}_{0}\right|_{Z}$, resp. $\mathrm{pr}_{0}$ ). The morphism $j$ induces morphisms of schemes $j_{s}: R_{s} \rightarrow U_{s}^{2}$ and ${ }_{t} j:{ }_{t} R \rightarrow{ }_{t} U^{2}$ over $k$. Consider the commutative diagram

By Varieties, Lemma 32.19 .3 we see that the scheme theoretic image of $j_{s} \times{ }_{t} j$ is $Z_{s} \times{ }_{k} Z$. By the commutativity of the diagram we conclude that $Z_{s} \times{ }_{k}{ }_{t} Z$ maps into $Z$ by the bottom horizontal arrow. As in the proof of Lemma 39.10 .8 it is also true that $\sigma(Z) \subset Z$ and that $\Delta_{U / S}$ factors through $Z$. Hence we conclude as in the proof of that lemma.

### 39.11. Slicing groupoids

04LV The following lemma shows that we may slice a Cohen-Macaulay groupoid scheme in order to reduce the dimension of the fibres, provided that the dimension of the stabilizer is small. This is an essential step in the process of improving a given presentation of a quotient stack.

04 MY Situation 39.11.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $g: U^{\prime} \rightarrow U$ be a morphism of schemes. Let $u \in U$ be a point, and let $u^{\prime} \in U^{\prime}$ be a point such that $g\left(u^{\prime}\right)=u$. Given these data, denote $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ the restriction of $(U, R, s, t, c)$ via the morphism $g$. Denote $G \rightarrow U$ the stabilizer group scheme of $R$, which is a locally closed subscheme of $R$. Denote $h$ the composition

$$
h=s \circ \operatorname{pr}_{1}: U^{\prime} \times_{g, U, t} R \longrightarrow U
$$

Denote $F_{u}=s^{-1}(u)$ (scheme theoretic fibre), and $G_{u}$ the scheme theoretic fibre of $G$ over $u$. Similarly for $R^{\prime}$ we denote $F_{u^{\prime}}^{\prime}=\left(s^{\prime}\right)^{-1}\left(u^{\prime}\right)$. Because $g\left(u^{\prime}\right)=u$ we have

$$
F_{u^{\prime}}^{\prime}=h^{-1}(u) \times_{\operatorname{Spec}(\kappa(u))} \operatorname{Spec}\left(\kappa\left(u^{\prime}\right)\right) .
$$

The point $e(u) \in R$ may be viewed as a point on $G_{u}$ and $F_{u}$ also, and $e^{\prime}\left(u^{\prime}\right)$ is a point of $R^{\prime}\left(\right.$ resp. $G_{u^{\prime}}^{\prime}$, resp. $F_{u^{\prime}}^{\prime}$ ) which maps to $e(u)$ in $R$ (resp. $G_{u}$, resp. $F_{u}$ ).

0461 Lemma 39.11.2. Let $S$ be a scheme. Let $(U, R, s, t, c, e, i)$ be a groupoid scheme over $S$. Let $G \rightarrow U$ be the stabilizer group scheme. Assume s and $t$ are CohenMacaulay and locally of finite presentation. Let $u \in U$ be a finite type point of the scheme U, see Morphisms, Definition 28.16.3. With notation as in Situation 39.11.1, set

$$
d_{1}=\operatorname{dim}\left(G_{u}\right), \quad d_{2}=\operatorname{dim}_{e(u)}\left(F_{u}\right)
$$

If $d_{2}>d_{1}$, then there exist an affine scheme $U^{\prime}$ and a morphism $g: U^{\prime} \rightarrow U$ such that (with notation as in Situation 39.11.1)
(1) $g$ is an immersion
(2) $u \in U^{\prime}$,
(3) $g$ is locally of finite presentation,
(4) the morphism $h: U^{\prime} \times_{g, U, t} R \longrightarrow U$ is Cohen-Macaulay at $(u, e(u))$, and
(5) we have $\operatorname{dim}_{e^{\prime}(u)}\left(F_{u}^{\prime}\right)=d_{2}-1$.

Proof. Let $\operatorname{Spec}(A) \subset U$ be an affine neighbourhood of $u$ such that $u$ corresponds to a closed point of $U$, see Morphisms, Lemma 28.16.4. Let $\operatorname{Spec}(B) \subset R$ be an affine neighbourhood of $e(u)$ which maps via $j$ into the open $\operatorname{Spec}(A) \times{ }_{S} \operatorname{Spec}(A) \subset$ $U \times_{S} U$. Let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to $u$. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to $e(u)$. Pictures:

Note that the two induced maps $s, t: \kappa(\mathfrak{m}) \rightarrow \kappa(\mathfrak{q})$ are equal and isomorphisms as $s \circ e=t \circ e=\mathrm{id}_{U}$. In particular we see that $\mathfrak{q}$ is a maximal ideal as well. The ring maps $s, t: A \rightarrow B$ are of finite presentation and flat. By assumption the ring

$$
\mathcal{O}_{F_{u}, e(u)}=B_{\mathfrak{q}} / s(\mathfrak{m}) B_{\mathfrak{q}}
$$

is Cohen-Macaulay of dimension $d_{2}$. The equality of dimension holds by Morphisms, Lemma 28.28.1.

Let $R^{\prime \prime}$ be the restriction of $R$ to $u=\operatorname{Spec}(\kappa(u))$ via the morphism $\operatorname{Spec}(\kappa(u)) \rightarrow$ $U$. As $u \rightarrow U$ is locally of finite type, we see that $\left(\operatorname{Spec}(\kappa(u)), R^{\prime \prime}, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}\right)$ is a groupoid scheme with $s^{\prime \prime}, t^{\prime \prime}$ locally of finite type, see Lemma 39.8.1. By Lemma 39.9.10 this implies that $\operatorname{dim}\left(G^{\prime \prime}\right)=\operatorname{dim}\left(R^{\prime \prime}\right)$. We also have $\operatorname{dim}\left(R^{\prime \prime}\right)=$ $\operatorname{dim}_{e^{\prime \prime}}\left(R^{\prime \prime}\right)=\operatorname{dim}\left(\mathcal{O}_{R^{\prime \prime}, e^{\prime \prime}}\right)$, see Lemma 39.9.9. By Groupoids, Lemma 38.18.4 we have $G^{\prime \prime}=G_{u}$. Hence we conclude that $\operatorname{dim}\left(\mathcal{O}_{R^{\prime \prime}, e^{\prime \prime}}\right)=d_{1}$.

As a scheme $R^{\prime \prime}$ is

$$
R^{\prime \prime}=R \times{ }_{\left(U \times{ }_{S} U\right)}\left(\operatorname{Spec}(\kappa(\mathfrak{m})) \times{ }_{S} \operatorname{Spec}(\kappa(\mathfrak{m}))\right)
$$

Hence an affine open neighbourhood of $e^{\prime \prime}$ is the spectrum of the ring

$$
B \otimes_{(A \otimes A)}(\kappa(\mathfrak{m}) \otimes \kappa(\mathfrak{m}))=B / s(\mathfrak{m}) B+t(\mathfrak{m}) B
$$

We conclude that

$$
\mathcal{O}_{R^{\prime \prime}, e^{\prime \prime}}=B_{\mathfrak{q}} / s(\mathfrak{m}) B_{\mathfrak{q}}+t(\mathfrak{m}) B_{\mathfrak{q}}
$$

and so now we know that this ring has dimension $d_{1}$.

We claim this implies we can find an element $f \in \mathfrak{m}$ such that

$$
\operatorname{dim}\left(B_{\mathfrak{q}} /\left(s(\mathfrak{m}) B_{\mathfrak{q}}+f B_{\mathfrak{q}}\right)<d_{2}\right.
$$

Namely, suppose $\mathfrak{n}_{j} \supset s(\mathfrak{m}) B_{\mathfrak{q}}, j=1, \ldots, m$ correspond to the minimal primes of the local ring $B_{\mathfrak{q}} / s(\mathfrak{m}) B_{\mathfrak{q}}$. There are finitely many as this ring is Noetherian (since it is essentially of finite type over a field - but also because a Cohen-Macaulay ring is Noetherian). By the Cohen-Macaulay condition we have $\operatorname{dim}\left(B_{\mathfrak{q}} / \mathfrak{n}_{j}\right)=d_{2}$, for example by Algebra, Lemma 10.103.4. Note that $\operatorname{dim}\left(B_{\mathfrak{q}} /\left(\mathfrak{n}_{j}+t(\mathfrak{m}) B_{\mathfrak{q}}\right)\right) \leq d_{1}$ as it is a quotient of the ring $\mathcal{O}_{R^{\prime \prime}, e^{\prime \prime}}=B_{\mathfrak{q}} / s(\mathfrak{m}) B_{\mathfrak{q}}+t(\mathfrak{m}) B_{\mathfrak{q}}$ which has dimension $d_{1}$. As $d_{1}<d_{2}$ this implies that $\mathfrak{m} \not \subset t^{-1}\left(\mathfrak{n}_{i}\right)$. By prime avoidance, see Algebra, Lemma 10.14.2, we can find $f \in \mathfrak{m}$ with $t(f) \notin \mathfrak{n}_{j}$ for $j=1, \ldots, m$. For this choice of $f$ we have the displayed inequality above, see Algebra, Lemma 10.59.12,

Set $A^{\prime}=A / f A$ and $U^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$. Then it is clear that $U^{\prime} \rightarrow U$ is an immersion, locally of finite presentation and that $u \in U^{\prime}$. Thus (1), (2) and (3) of the lemma hold. The morphism

$$
U^{\prime} \times_{g, U, t} R \longrightarrow U
$$

factors through $\operatorname{Spec}(A)$ and corresponds to the ring map

$$
B / t(f) B \rightleftharpoons A /(f) \otimes_{A, t} B \leftarrow^{s} A
$$

Now, we see $t(f)$ is not a zerodivisor on $B_{\mathfrak{q}} / s(\mathfrak{m}) B_{\mathfrak{q}}$ as this is a Cohen-Macaulay ring of positive dimension and $f$ is not contained in any minimal prime, see for example Algebra, Lemma 10.103.2. Hence by Algebra, Lemma 10.127 .5 we conclude that $s: A_{\mathfrak{m}} \rightarrow B_{\mathfrak{q}} / t(f) B_{\mathfrak{q}}$ is flat with fibre ring $B_{\mathfrak{q}} /\left(s(\mathfrak{m}) B_{\mathfrak{q}}+t(f) B_{\mathfrak{q}}\right)$ which is CohenMacaulay by Algebra, Lemma 10.103.2 again. This implies part (4) of the lemma. To see part (5) note that by Diagram (39.8.0.1) the fibre $F_{u}^{\prime}$ is equal to the fibre of $h$ over $u$. Hence $\operatorname{dim}_{e^{\prime}(u)}\left(F_{u}^{\prime}\right)=\operatorname{dim}\left(B_{\mathfrak{q}} /\left(s(\mathfrak{m}) B_{\mathfrak{q}}+t(f) B_{\mathfrak{q}}\right)\right)$ by Morphisms, Lemma 28.28.1 and the dimension of this ring is $d_{2}-1$ by Algebra, Lemma 10.103 .2 once more. This proves the final assertion of the lemma and we win.

Now that we know how to slice we can combine it with the preceding material to get the following "optimal" result. It is optimal in the sense that since $G_{u}$ is a locally closed subscheme of $F_{u}$ one always has the inequality $\operatorname{dim}\left(G_{u}\right)=\operatorname{dim}_{e(u)}\left(G_{u}\right) \leq$ $\operatorname{dim}_{e(u)}\left(F_{u}\right)$ so it is not possible to slice more than in the lemma.

04MZ Lemma 39.11.3. Let $S$ be a scheme. Let $(U, R, s, t, c, e, i)$ be a groupoid scheme over $S$. Let $G \rightarrow U$ be the stabilizer group scheme. Assume $s$ and $t$ are CohenMacaulay and locally of finite presentation. Let $u \in U$ be a finite type point of the scheme $U$, see Morphisms, Definition 28.16.3. With notation as in Situation 39.11.1 there exist an affine scheme $U^{\prime}$ and a morphism $g: U^{\prime} \rightarrow U$ such that
(1) $g$ is an immersion,
(2) $u \in U^{\prime}$,
(3) $g$ is locally of finite presentation,
(4) the morphism $h: U^{\prime} \times_{g, U, t} R \longrightarrow U$ is Cohen-Macaulay and locally of finite presentation,
(5) the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are Cohen-Macaulay and locally of finite presentation, and
(6) $\operatorname{dim}_{e(u)}\left(F_{u}^{\prime}\right)=\operatorname{dim}\left(G_{u}^{\prime}\right)$.

Proof. As $s$ is locally of finite presentation the scheme $F_{u}$ is locally of finite type over $\kappa(u)$. Hence $\operatorname{dim}_{e(u)}\left(F_{u}\right)<\infty$ and we may argue by induction on $\operatorname{dim}_{e(u)}\left(F_{u}\right)$.
If $\operatorname{dim}_{e(u)}\left(F_{u}\right)=\operatorname{dim}\left(G_{u}\right)$ there is nothing to prove. Assume $\operatorname{dim}_{e(u)}\left(F_{u}\right)>$ $\operatorname{dim}\left(G_{u}\right)$. This means that Lemma 39.11.2 applies and we find a morphism $g$ : $U^{\prime} \rightarrow U$ which has properties (1), (2), (3), instead of (6) we have $\operatorname{dim}_{e(u)}\left(F_{u}^{\prime}\right)<$ $\operatorname{dim}_{e(u)}\left(F_{u}\right)$, and instead of (4) and (5) we have that the composition

$$
h=s \circ \mathrm{pr}_{1}: U^{\prime} \times_{g, U, t} R \longrightarrow U
$$

is Cohen-Macaulay at the point $(u, e(u))$. We apply Remark 39.5.3 and we obtain an open subscheme $U^{\prime \prime} \subset U^{\prime}$ such that $U^{\prime \prime} \times_{g, U, t} R \subset U^{\prime} \times_{g, U, t} R$ is the largest open subscheme on which $h$ is Cohen-Macaulay. Since $(u, e(u)) \in U^{\prime \prime} \times_{g, U, t} R$ we see that $u \in U^{\prime \prime}$. Hence we may replace $U^{\prime}$ by $U^{\prime \prime}$ and assume that in fact $h$ is Cohen-Macaulay everywhere! By Lemma 39.8.2 we conclude that $s^{\prime}, t^{\prime}$ are locally of finite presentation and Cohen-Macaulay (use Morphisms, Lemma 28.21.4 and More on Morphisms, Lemma 36.17.4.
By construction $\operatorname{dim}_{e^{\prime}(u)}\left(F_{u}^{\prime}\right)<\operatorname{dim}_{e(u)}\left(F_{u}\right)$, so we may apply the induction hypothesis to $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ and the point $u \in U^{\prime}$. Note that $u$ is also a finite type point of $U^{\prime}$ (for example you can see this using the characterization of finite type points from Morphisms, Lemma 28.16.4). Let $g^{\prime}: U^{\prime \prime} \rightarrow U^{\prime}$ and ( $U^{\prime \prime}, R^{\prime \prime}, s^{\prime \prime}, t^{\prime \prime}, c^{\prime \prime}$ ) be the solution of the corresponding problem starting with $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ and the point $u \in U^{\prime}$. We claim that the composition

$$
g^{\prime \prime}=g \circ g^{\prime}: U^{\prime \prime} \longrightarrow U
$$

is a solution for the original problem. Properties (1), (2), (3), (5), and (6) are immediate. To see (4) note that the morphism

$$
h^{\prime \prime}=s \circ \operatorname{pr}_{1}: U^{\prime \prime} \times_{g^{\prime \prime}, U, t} R \longrightarrow U
$$

is locally of finite presentation and Cohen-Macaulay by an application of Lemma 39.8.4 (use More on Morphisms, Lemma 36.17 .8 to see that Cohen-Macaulay morphisms are fppf local on the target).

In case the stabilizer group scheme has fibres of dimension 0 this leads to the following slicing lemma.

04N0 Lemma 39.11.4. Let $S$ be a scheme. Let $(U, R, s, t, c, e, i)$ be a groupoid scheme over $S$. Let $G \rightarrow U$ be the stabilizer group scheme. Assume $s$ and $t$ are CohenMacaulay and locally of finite presentation. Let $u \in U$ be a finite type point of the scheme $U$, see Morphisms, Definition 28.16.3. Assume that $G \rightarrow U$ is locally quasi-finite. With notation as in Situation 39.11.1 there exist an affine scheme $U^{\prime}$ and a morphism $g: U^{\prime} \rightarrow U$ such that
(1) $g$ is an immersion,
(2) $u \in U^{\prime}$,
(3) $g$ is locally of finite presentation,
(4) the morphism $h: U^{\prime} \times_{g, U, t} R \longrightarrow U$ is flat, locally of finite presentation, and locally quasi-finite, and
(5) the morphisms $s^{\prime}, t^{\prime}: R^{\prime} \rightarrow U^{\prime}$ are flat, locally of finite presentation, and locally quasi-finite.

Proof. Take $g: U^{\prime} \rightarrow U$ as in Lemma 39.11.3. Since $h^{-1}(u)=F_{u}^{\prime}$ we see that $h$ has relative dimension $\leq 0$ at $(u, e(u))$. Hence, by Remark 39.5.3 we obtain an open subscheme $U^{\prime \prime} \subset U^{\prime}$ such that $u \in U^{\prime \prime}$ and $U^{\prime \prime} \times_{g, U, t} \bar{R}$ is the maximal open subscheme of $U^{\prime} \times_{g, U, t} R$ on which $h$ has relative dimension $\leq 0$. After replacing $U^{\prime}$ by $U^{\prime \prime}$ we see that $h$ has relative dimension $\leq 0$. This implies that $h$ is locally quasi-finite by Morphisms, Lemma 28.29.5. Since it is still locally of finite presentation and Cohen-Macaulay we see that it is flat, locally of finite presentation and locally quasi-finite, i.e., (4) above holds. This implies that $s^{\prime}$ is flat, locally of finite presentation and locally quasi-finite as a base change of $h$, see Lemma 39.8.2.

### 39.12. Étale localization of groupoids

03FK In this section we begin applying the étale localization techniques of More on Morphisms, Section 36.30 to groupoid schemes. More advanced material of this kind can be found in More on Groupoids in Spaces, Section66.13. Lemma 39.12 .2 will be used to prove results on algebraic spaces separated and quasi-finite over a scheme, namely Morphisms of Spaces, Proposition 54.47.2 and its corollary Morphisms of Spaces, Lemma 54.48.1.

03FL Lemma 39.12.1. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $p \in S$ be a point, and let $u \in U$ be a point lying over $p$. Assume that
(1) $U \rightarrow S$ is locally of finite type,
(2) $U \rightarrow S$ is quasi-finite at $u$,
(3) $U \rightarrow S$ is separated,
(4) $R \rightarrow S$ is separated,
(5) $s$, $t$ are flat and locally of finite presentation, and
(6) $s^{-1}(\{u\})$ is finite.

Then there exists an étale neighbourhood $\left(S^{\prime}, p^{\prime}\right) \rightarrow(S, p)$ with $\kappa(p)=\kappa\left(p^{\prime}\right)$ and $a$ base change diagram

where the equal signs are decompositions into open and closed subschemes such that
(a) there exists a point $u^{\prime}$ of $U^{\prime}$ mapping to $u$ in $U$,
(b) the fibre $\left(U^{\prime}\right)_{p^{\prime}}$ equals $t^{\prime}\left(\left(s^{\prime}\right)^{-1}\left(\left\{u^{\prime}\right\}\right)\right)$ set theoretically,
(c) the fibre $\left(R^{\prime}\right)_{p^{\prime}}$ equals $\left(s^{\prime}\right)^{-1}\left(\left(U^{\prime}\right)_{p^{\prime}}\right)$ set theoretically,
(d) the schemes $U^{\prime}$ and $R^{\prime}$ are finite over $S^{\prime}$,
(e) we have $s^{\prime}\left(R^{\prime}\right) \subset U^{\prime}$ and $t^{\prime}\left(R^{\prime}\right) \subset U^{\prime}$,
(f) we have $c^{\prime}\left(R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime}\right) \subset R^{\prime}$ where $c^{\prime}$ is the base change of $c$, and
(g) the morphisms $s^{\prime}, t^{\prime}, c^{\prime}$ determine a groupoid structure by taking the system $\left(U^{\prime}, R^{\prime},\left.s^{\prime}\right|_{R^{\prime}},\left.t^{\prime}\right|_{R^{\prime}},\left.c^{\prime}\right|_{R^{\prime} \times{ }_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime}}\right)$.

Proof. Let us denote $f: U \rightarrow S$ the structure morphism of $U$. By assumption (6) we can write $s^{-1}(\{u\})=\left\{r_{1}, \ldots, r_{n}\right\}$. Since this set is finite, we see that $s$ is quasifinite at each of these finitely many inverse images, see Morphisms, Lemma 28.20.7. Hence we see that $f \circ s: R \rightarrow S$ is quasi-finite at each $r_{i}$ (Morphisms, Lemma 28.20 .12 . Hence $r_{i}$ is isolated in the fibre $R_{p}$, see Morphisms, Lemma 28.20.6. Write $t\left(\left\{r_{1}, \ldots, r_{n}\right\}\right)=\left\{u_{1}, \ldots, u_{m}\right\}$. Note that it may happen that $m<n$ and note that $u \in\left\{u_{1}, \ldots, u_{m}\right\}$. Since $t$ is flat and locally of finite presentation, the morphism of fibres $t_{p}: R_{p} \rightarrow U_{p}$ is flat and locally of finite presentation (Morphisms, Lemmas 28.25.7 and 28.21.4), hence open (Morphisms, Lemma 28.25.9). The fact that each $r_{i}$ is isolated in $R_{p}$ implies that each $u_{j}=t\left(r_{i}\right)$ is isolated in $U_{p}$. Using Morphisms, Lemma 28.20.6 again, we see that $f$ is quasi-finite at $u_{1}, \ldots, u_{m}$.
Denote $F_{u}=s^{-1}(u)$ and $F_{u_{j}}=s^{-1}\left(u_{j}\right)$ the scheme theoretic fibres. Note that $F_{u}$ is finite over $\kappa(u)$ as it is locally of finite type over $\kappa(u)$ with finitely many points (for example it follows from the much more general Morphisms, Lemma 28.51.8). By Lemma 39.6.1 we see that $F_{u}$ and $F_{u_{j}}$ become isomorphic over a common field extension of $\kappa(u)$ and $\kappa\left(u_{j}\right)$. Hence we see that $F_{u_{j}}$ is finite over $\kappa\left(u_{j}\right)$. In particular we see $s^{-1}\left(\left\{u_{j}\right\}\right)$ is a finite set for each $j=1, \ldots, m$. Thus we see that assumptions (2) and (6) hold for each $u_{j}$ also (above we saw that $U \rightarrow S$ is quasi-finite at $\left.u_{j}\right)$. Hence the argument of the first paragraph applies to each $u_{j}$ and we see that $R \rightarrow U$ is quasi-finite at each of the points of

$$
\left\{r_{1}, \ldots, r_{N}\right\}=s^{-1}\left(\left\{u_{1}, \ldots, u_{m}\right\}\right)
$$

Note that $t\left(\left\{r_{1}, \ldots, r_{N}\right\}\right)=\left\{u_{1}, \ldots, u_{m}\right\}$ and $t^{-1}\left(\left\{u_{1}, \ldots, u_{m}\right\}\right)=\left\{r_{1}, \ldots, r_{N}\right\}$ since $R$ is a groupoid ${ }^{2}$. Moreover, we have $\operatorname{pr}_{0}\left(c^{-1}\left(\left\{r_{1}, \ldots, r_{N}\right\}\right)\right)=\left\{r_{1}, \ldots, r_{N}\right\}$ and $\operatorname{pr}_{1}\left(c^{-1}\left(\left\{r_{1}, \ldots, r_{N}\right\}\right)\right)=\left\{r_{1}, \ldots, r_{N}\right\}$. Similarly we get $e\left(\left\{u_{1}, \ldots, u_{m}\right\}\right) \subset$ $\left\{r_{1}, \ldots, r_{N}\right\}$ and $i\left(\left\{r_{1}, \ldots, r_{N}\right\}\right)=\left\{r_{1}, \ldots, r_{N}\right\}$.
We may apply More on Morphisms, Lemma36.30.4 to the pairs $\left(U \rightarrow S,\left\{u_{1}, \ldots, u_{m}\right\}\right)$ and $\left(R \rightarrow S,\left\{r_{1}, \ldots, r_{N}\right\}\right)$ to get an étale neighbourhood $\left(S^{\prime}, p^{\prime}\right) \rightarrow(S, p)$ which induces an identification $\kappa(p)=\kappa\left(p^{\prime}\right)$ such that $S^{\prime} \times{ }_{S} U$ and $S^{\prime} \times{ }_{S} R$ decompose as

$$
S^{\prime} \times_{S} U=U^{\prime} \amalg W, \quad S^{\prime} \times_{S} R=R^{\prime} \amalg W^{\prime}
$$

with $U^{\prime} \rightarrow S^{\prime}$ finite and $\left(U^{\prime}\right)_{p^{\prime}}$ mapping bijectively to $\left\{u_{1}, \ldots, u_{m}\right\}$, and $R^{\prime} \rightarrow S^{\prime}$ finite and $\left(R^{\prime}\right)_{p^{\prime}}$ mapping bijectively to $\left\{r_{1}, \ldots, r_{N}\right\}$. Moreover, no point of $W_{p^{\prime}}$ (resp. $\left(W^{\prime}\right)_{p^{\prime}}$ ) maps to any of the points $u_{j}$ (resp. $r_{i}$ ). At this point (a), (b), (c), and (d) of the lemma are satisfied. Moreover, the inclusions of (e) and (f) hold on fibres over $p^{\prime}$, i.e., $s^{\prime}\left(\left(R^{\prime}\right)_{p^{\prime}}\right) \subset\left(U^{\prime}\right)_{p^{\prime}}, t^{\prime}\left(\left(R^{\prime}\right)_{p^{\prime}}\right) \subset\left(U^{\prime}\right)_{p^{\prime}}$, and $c^{\prime}\left(\left(R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime}\right)_{p^{\prime}}\right) \subset$ $\left(R^{\prime}\right)_{p^{\prime}}$.
We claim that we can replace $S^{\prime}$ by a Zariski open neighbourhood of $p^{\prime}$ so that the inclusions of (e) and (f) hold. For example, consider the set $E=\left(\left.s^{\prime}\right|_{R^{\prime}}\right)^{-1}(W)$. This is open and closed in $R^{\prime}$ and does not contain any points of $R^{\prime}$ lying over $p^{\prime}$. Since $R^{\prime} \rightarrow S^{\prime}$ is closed, after replacing $S^{\prime}$ by $S^{\prime} \backslash\left(R^{\prime} \rightarrow S^{\prime}\right)(E)$ we reach a situation where $E$ is empty. In other words $s^{\prime}$ maps $R^{\prime}$ into $U^{\prime}$. Note that this property is preserved under further shrinking $S^{\prime}$. Similarly, we can arrange it so that $t^{\prime}$ maps $R^{\prime}$ into $U^{\prime}$. At this point (e) holds. In the same manner, consider the set $E=\left(\left.c^{\prime}\right|_{R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime}}\right)^{-1}\left(W^{\prime}\right)$. It is open and closed in the scheme $R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime}$

[^110]which is finite over $S^{\prime}$, and does not contain any points lying over $p^{\prime}$. Hence after replacing $S^{\prime}$ by $S^{\prime} \backslash\left(R^{\prime} \times_{s^{\prime}, U^{\prime}, t^{\prime}} R^{\prime} \rightarrow S^{\prime}\right)(E)$ we reach a situation where $E$ is empty. In other words we obtain the inclusion in (f). We may repeat the argument also with the identity $e^{\prime}: S^{\prime} \times_{S} U \rightarrow S^{\prime} \times{ }_{S} R$ and the inverse $i^{\prime}: S^{\prime} \times{ }_{S} R \rightarrow S^{\prime} \times{ }_{S} R$ so that we may assume (after shrinking $S^{\prime}$ some more) that $\left(\left.e^{\prime}\right|_{U^{\prime}}\right)^{-1}\left(W^{\prime}\right)=\emptyset$ and $\left(\left.i^{\prime}\right|_{R^{\prime}}\right)^{-1}\left(W^{\prime}\right)=\emptyset$.

At this point we see that we may consider the structure

$$
\left(U^{\prime}, R^{\prime},\left.s^{\prime}\right|_{R^{\prime}},\left.t^{\prime}\right|_{R^{\prime}},\left.c^{\prime}\right|_{R^{\prime} \times \chi_{t^{\prime}, U^{\prime}, s^{\prime}} R^{\prime}},\left.e^{\prime}\right|_{U^{\prime}},\left.i^{\prime}\right|_{R^{\prime}}\right)
$$

The axioms of a groupoid scheme over $S^{\prime}$ hold because they hold for the groupoid scheme $\left(S^{\prime} \times_{S} U, S^{\prime} \times_{S} R, s^{\prime}, t^{\prime}, c^{\prime}, e^{\prime}, i^{\prime}\right)$.

03X5 Lemma 39.12.2. Let $S$ be a scheme. Let $(U, R, s, t, c)$ be a groupoid scheme over $S$. Let $p \in S$ be a point, and let $u \in U$ be a point lying over $p$. Assume assumptions (1) - (6) of Lemma 39.12.1 hold as well as
(7) $j: R \rightarrow U \times{ }_{S} U$ is universally closed.

Then we can choose $\left(S^{\prime}, p^{\prime}\right) \rightarrow(S, p)$ and decompositions $S^{\prime} \times_{S} U=U^{\prime} \amalg W$ and $S^{\prime} \times{ }_{S} R=R^{\prime} \amalg W^{\prime}$ and $u^{\prime} \in U^{\prime}$ such that (a) - (g) of Lemma 39.12.1 hold as well as
(h) $R^{\prime}$ is the restriction of $S^{\prime} \times_{S} R$ to $U^{\prime}$.

Proof. We apply Lemma 39.12 .1 for the groupoid ( $U, R, s, t, c$ ) over the scheme $S$ with points $p$ and $u$. Hence we get an étale neighbourhood $\left(S^{\prime}, p^{\prime}\right) \rightarrow(S, p)$ and disjoint union decompositions

$$
S^{\prime} \times_{S} U=U^{\prime} \amalg W, \quad S^{\prime} \times_{S} R=R^{\prime} \amalg W^{\prime}
$$

and $u^{\prime} \in U^{\prime}$ satisfying conclusions (a), (b), (c), (d), (e), (f), and (g). We may shrink $S^{\prime}$ to a smaller neighbourhood of $p^{\prime}$ without affecting the conclusions (a) - (g). We will show that for a suitable shrinking conclusion (h) holds as well. Let us denote $j^{\prime}$ the base change of $j$ to $S^{\prime}$. By conclusion (e) it is clear that

$$
j^{\prime-1}\left(U^{\prime} \times{ }_{S^{\prime}} U^{\prime}\right)=R^{\prime} \amalg \text { Rest }
$$

for some open and closed Rest piece. Since $U^{\prime} \rightarrow S^{\prime}$ is finite by conclusion (d) we see that $U^{\prime} \times{ }_{S^{\prime}} U^{\prime}$ is finite over $S^{\prime}$. Since $j$ is universally closed, also $j^{\prime}$ is universally closed, and hence $\left.j^{\prime}\right|_{\text {Rest }}$ is universally closed too. By conclusions (b) and (c) we see that the fibre of

$$
\left.\left(U^{\prime} \times_{S^{\prime}} U^{\prime} \rightarrow S^{\prime}\right) \circ j^{\prime}\right|_{\text {Rest }}: \text { Rest } \longrightarrow S^{\prime}
$$

over $p^{\prime}$ is empty. Hence, since Rest $\rightarrow S^{\prime}$ is closed as a composition of closed morphisms, after replacing $S^{\prime}$ by $S^{\prime} \backslash \operatorname{Im}\left(\right.$ Rest $\left.\rightarrow S^{\prime}\right)$, we may assume that Rest $=\emptyset$. And this is exactly the condition that $R^{\prime}$ is the restriction of $S^{\prime} \times{ }_{S} R$ to the open subscheme $U^{\prime} \subset S^{\prime} \times{ }_{S} U$, see Groupoids, Lemma 38.18 .3 and its proof.

[^111]
### 39.13. Finite groupoids

0AB8 A groupoid scheme $(U, R, s, t, c)$ is sometimes called finite if the morphisms $s$ and $t$ are finite. This is potentially confusing as it doesn't imply that $U$ or $R$ or the quotient sheaf $U / R$ are finite over anything.
0AB9 Lemma 39.13.1. Let $(U, R, s, t, c)$ be a groupoid scheme over a scheme $S$. Assume $s, t$ are finite. There exists a sequence of $R$-invariant closed subschemes

$$
U=Z_{0} \supset Z_{1} \supset Z_{2} \supset \ldots
$$

such that $\bigcap Z_{r}=\emptyset$ and such that $s^{-1}\left(Z_{r-1}\right) \backslash s^{-1}\left(Z_{r}\right) \rightarrow Z_{r-1} \backslash Z_{r}$ is finite locally free of rank $r$.

Proof. Let $\left\{Z_{r}\right\}$ be the stratification of $U$ given by the fitting ideals of the finite type quasi-coherent modules $s_{*} \mathcal{O}_{R}$. See More on Flatness, Lemma 37.21.3. Since the identity $e: U \rightarrow R$ is a section to $s$ we see that $s_{*} \mathcal{O}_{R}$ contains $\mathcal{O}_{S}$ as a direct summand. Hence $U=Z_{-1}=Z_{0}$ (details omitted). Since formation of fitting ideals commutes with base change (More on Algebra, Lemma 15.6.4 we find that $s^{-1}\left(Z_{r}\right)$ corresponds to the $r$ th fitting ideal of $\mathrm{pr}_{1, *} \mathcal{O}_{R \times{ }_{s, U, t} R}$ because the lower right square of diagram (39.3.0.2 is cartesian. Using the fact that the lower left square is also cartesian we conclude that $s^{-1}\left(Z_{r}\right)=t^{-1}\left(Z_{r}\right)$, in other words $Z_{r}$ is $R$-invariant. The morphism $s^{-1}\left(Z_{r-1}\right) \backslash s^{-1}\left(Z_{r}\right) \rightarrow Z_{r-1} \backslash Z_{r}$ is finite locally free of rank $r$ because the module $s_{*} \mathcal{O}_{R}$ pulls back to a finite locally free module of rank $r$ on $Z_{r-1} \backslash Z_{r}$ by More on Flatness, Lemma 37.21.3.

0ABA Lemma 39.13.2. Let $(U, R, s, t, c)$ be a groupoid scheme over a scheme $S$. Assume $s, t$ are finite. There exists an open subscheme $W \subset U$ and a closed subscheme $W^{\prime} \subset W$ such that
(1) $W$ and $W^{\prime}$ are $R$-invariant,
(2) $U=t\left(s^{-1}(\bar{W})\right)$ set theoretically,
(3) $W$ is a thickening of $W^{\prime}$, and
(4) the maps $s^{\prime}$, $t^{\prime}$ of the restriction $\left(W^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ are finite locally free.

Proof. Consider the stratification $U=Z_{0} \supset Z_{1} \supset Z_{2} \supset \ldots$ of Lemma 39.13.1.
We will construct disjoint unions $W=\coprod_{r \geq 1} W_{r}$ and $W^{\prime}=\coprod_{r \geq 1} W_{r}^{\prime}$ with each $W_{r}^{\prime} \rightarrow W_{r}$ a thickening of $R$-invariant subschemes of $U$ such that the morphisms $s_{r}^{\prime}, t_{r}^{\prime}$ of the restrictions $\left(W_{r}^{\prime}, R_{r}^{\prime}, s_{r}^{\prime}, t_{r}^{\prime}, c_{r}^{\prime}\right)$ are finite locally free of rank $r$. To begin we set $W_{1}=W_{1}^{\prime}=U \backslash Z_{1}$. This is an $R$-invariant open subscheme of $U$, it is true that $W_{0}$ is a thickening of $W_{0}^{\prime}$, and the maps $s_{1}^{\prime}, t_{1}^{\prime}$ of the restriction $\left(W_{1}^{\prime}, R_{1}^{\prime}, s_{1}^{\prime}, t_{1}^{\prime}, c_{1}^{\prime}\right)$ are isomorphisms, i.e., finite locally free of rank 1 . Moreover, every point of $U \backslash Z_{1}$ is in $t\left(s^{-1}\left(\overline{W_{1}}\right)\right)$.
Assume we have found subschemes $W_{r}^{\prime} \subset W_{r} \subset U$ for $r \leq n$ such that
(1) $W_{1}, \ldots, W_{n}$ are disjoint,
(2) $W_{r}$ and $W_{r}^{\prime}$ are $R$-invariant,
(3) $U \backslash Z_{n} \subset \bigcup_{r \leq n} t\left(s^{-1}\left(\overline{W_{r}}\right)\right)$ set theoretically,
(4) $W_{r}$ is a thickening of $W_{r}^{\prime}$,
(5) the maps $s_{r}^{\prime}, t_{r}^{\prime}$ of the restriction $\left(W_{r}^{\prime}, R_{r}^{\prime}, s_{r}^{\prime}, t_{r}^{\prime}, c_{r}^{\prime}\right)$ are finite locally free of rank $r$.
Then we set

$$
W_{n+1}=Z_{n} \backslash\left(Z_{n+1} \cup \bigcup_{r \leq n} t\left(s^{-1}\left(\overline{W_{r}}\right)\right)\right)
$$

set theoretically and

$$
W_{n+1}^{\prime}=Z_{n} \backslash\left(Z_{n+1} \cup \bigcup_{r \leq n} t\left(s^{-1}\left(\overline{W_{r}}\right)\right)\right)
$$

scheme theoretically. Then $W_{n+1}$ is an $R$-invariant open subscheme of $U$ because $Z_{n+1} \backslash \overline{U \backslash Z_{n+1}}$ is open in $U$ and $\overline{U \backslash Z_{n+1}}$ is contained in the closed subset $\bigcup_{r \leq n} t\left(s^{-1}\left(\overline{W_{r}}\right)\right)$ we are removing by property (3) and the fact that $t$ is a closed morphism. It is clear that $W_{n+1}^{\prime}$ is a closed subscheme of $W_{n+1}$ with the same underlying topological space. Finally, properties (1), (2) and (3) are clear and property (5) follows from Lemma 39.13.1.
By Lemma 39.13.1 we have $\bigcap Z_{r}=\emptyset$. Hence every point of $U$ is contained in $U \backslash Z_{n}$ for some $n$. Thus we see that $U=\bigcup_{r \geq 1} t\left(s^{-1}\left(\overline{W_{r}}\right)\right)$ set theoretically and we see that (2) holds. Thus $W^{\prime} \subset W$ satisfy (1), (2), (3), and (4).
Let $(U, R, s, t, c)$ be a groupoid scheme. Given a point $u \in U$ the $R$-orbit of $u$ is the subset $t\left(s^{-1}(\{u\})\right)$ of $U$.
0 ABB Lemma 39.13.3. In Lemma 39.13.2 assume in addition that $s$ and $t$ are of finite presentation. Then
(1) the morphism $W^{\prime} \rightarrow W$ is of finite presentation, and
(2) if $u \in U$ is a point whose $R$-orbit consists of generic points of irreducible components of $U$, then $u \in W$.

Proof. In this case the stratification $U=Z_{0} \supset Z_{1} \supset Z_{2} \supset \ldots$ of Lemma 39.13.1 is given by closed immersions $Z_{k} \rightarrow U$ of finite presentation, see More on Flatness, Lemma 37.21.3. Part (1) follows immediately from this as $W^{\prime} \rightarrow W$ is locally given by intersecting the open $W$ by $Z_{r}$. To see part (2) let $\left\{u_{1}, \ldots, u_{n}\right\}$ be the orbit of $u$. Since the closed subschemes $Z_{k}$ are $R$-invariant and $\bigcap Z_{k}=\emptyset$, we find an $k$ such that $u_{i} \in Z_{k}$ and $u_{i} \notin Z_{k+1}$ for all $i$. The image of $Z_{k} \rightarrow U$ and $Z_{k+1} \rightarrow U$ is locally constructible (Morphisms, Theorem 28.22.3. Since $u_{i} \in U$ is a generic point of an irreducible component of $U$, there exists an open neighbourhood $U_{i}$ of $u_{i}$ which is contained in $Z_{k} \backslash Z_{k+1}$ set theoretically (Properties, Lemma 27.2.2). In the proof of Lemma 39.13 .2 we have constructed $W$ as a disjoint union 【 $W_{r}$ with $W_{r} \subset Z_{r-1} \backslash Z_{r}$ such that $U=\bigcup t\left(s^{-1}\left(\overline{W_{r}}\right)\right)$. As $\left\{u_{1}, \ldots, u_{n}\right\}$ is an $R$-orbit we see that $u \in t\left(s^{-1}\left(\overline{W_{r}}\right)\right)$ implies $u_{i} \in \overline{W_{r}}$ for some $i$ which implies $U_{i} \cap W_{r} \neq \emptyset$ which implies $r=k$. Thus we conclude that $u$ is in

$$
W_{k+1}=Z_{k} \backslash\left(Z_{k+1} \cup \bigcup_{r \leq k} t\left(s^{-1}\left(\overline{W_{r}}\right)\right)\right)
$$

as desired.
0ABC Lemma 39.13.4. Let $(U, R, s, t, c)$ be a groupoid scheme over a scheme $S$. Assume $s, t$ are finite and of finite presentation and $U$ quasi-separated. Let $u_{1}, \ldots, u_{m} \in U$ be points whose orbits consist of generic points of irreducible components of $U$. Then there exist $R$-invariant subschemes $V^{\prime} \subset V \subset U$ such that
(1) $u_{1}, \ldots, u_{m} \in V^{\prime}$,
(2) $V$ is open in $U$,
(3) $V^{\prime}$ and $V$ are affine,
(4) $V^{\prime} \subset V$ is a thickening of finite presentation,
(5) the morphisms $s^{\prime}, t^{\prime}$ of the restriction $\left(V^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ are finite locally free.

Proof. Let $W^{\prime} \subset W \subset U$ be as in Lemma 39.13.2 By Lemma 39.13.3 we get $u_{j} \in W$ and that $W^{\prime} \rightarrow W$ is a thickening of finite presentation. By Limits, Lemma 31.10 .3 it suffices to find an $R$-invariant affine open subscheme $V^{\prime}$ of $W^{\prime}$ containing $u_{j}$ (because then we can let $V \subset W$ be the corresponding open subscheme which will be affine). Thus we may replace ( $U, R, s, t, c$ ) by the restriction ( $W^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}$ ) to $W^{\prime}$. In other words, we may assume we have a groupoid scheme $(U, R, s, t, c)$ whose morphisms $s$ and $t$ are finite locally free. By Properties, Lemma 27.29.1 we can find an affine open containing the union of the orbits of $u_{1}, \ldots, u_{m}$. Finally, we can apply Groupoids, Lemma 38.24.1 to conclude.

The following lemma is a special case of Lemma 39.13 .4 but we redo the argument as it is slightly easier in this case (it avoids using Lemma 39.13.3).

0ABD Lemma 39.13.5. Let $(U, R, s, t, c)$ be a groupoid scheme over a scheme $S$. Assume $s, t$ finite, $U$ is locally Noetherian, and $u_{1}, \ldots, u_{m} \in U$ points whose orbits consist of generic points of irreducible components of $U$. Then there exist $R$-invariant subschemes $V^{\prime} \subset V \subset U$ such that
(1) $u_{1}, \ldots, u_{m} \in V^{\prime}$,
(2) $V$ is open in $U$,
(3) $V^{\prime}$ and $V$ are affine,
(4) $V^{\prime} \subset V$ is a thickening,
(5) the morphisms $s^{\prime}, t^{\prime}$ of the restriction $\left(V^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ are finite locally free.

Proof. Let $\left\{u_{j 1}, \ldots, u_{j n_{j}}\right\}$ be the orbit of $u_{j}$. Let $W^{\prime} \subset W \subset U$ be as in Lemma 39.13.2 Since $U=t\left(s^{-1}(\bar{W})\right)$ we see that at least one $u_{j i} \in \bar{W}$. Since $u_{j i}$ is a generic point of an irreducible component and $U$ locally Noetherian, this implies that $u_{j i} \in W$. Since $W$ is $R$-invariant, we conclude that $u_{j} \in W$ and in fact the whole orbit is contained in $W$. By Cohomology of Schemes, Lemma 29.13.3 it suffices to find an $R$-invariant affine open subscheme $V^{\prime}$ of $W^{\prime}$ containing $u_{1}, \ldots, u_{m}$ (because then we can let $V \subset W$ be the corresponding open subscheme which will be affine). Thus we may replace ( $U, R, s, t, c$ ) by the restriction ( $W^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}$ ) to $W^{\prime}$. In other words, we may assume we have a groupoid scheme $(U, R, s, t, c)$ whose morphisms $s$ and $t$ are finite locally free. By Properties, Lemma 27.29.1 we can find an affine open containing $\left\{u_{i j}\right\}$ (a locally Noetherian scheme is quasi-separated by Properties, Lemma 27.5.4. Finally, we can apply Groupoids, Lemma 38.24.1 to conclude.

0ABE Lemma 39.13.6. Let $(U, R, s, t, c)$ be a groupoid scheme over a scheme $S$ with $s, t$ integral. Let $g: U^{\prime} \rightarrow U$ be an integral morphism such that every $R$-orbit in $U$ meets $g\left(U^{\prime}\right)$. Let $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right)$ be the restriction of $R$ to $U^{\prime}$. If $u^{\prime} \in U^{\prime}$ is contained in an $R^{\prime}$-invariant affine open, then the image $u \in U$ is contained in an $R$-invariant affine open of $U$.

Proof. Let $W^{\prime} \subset U^{\prime}$ be an $R^{\prime}$-invariant affine open. Set $\tilde{R}=U^{\prime} \times_{g, U, t} R$ with maps $\operatorname{pr}_{0}: \tilde{R} \rightarrow U^{\prime}$ and $h=s \circ \operatorname{pr}_{1}: \tilde{R} \rightarrow U$. Observe that $\mathrm{pr}_{0}$ and $h$ are integral. It follows that $\tilde{W}=\operatorname{pr}_{0}^{-1}\left(W^{\prime}\right)$ is affine. Since $W^{\prime}$ is $R^{\prime}$-invariant, the image $W=h(\tilde{W})$ is set theoretically $R$-invariant and $\tilde{W}=h^{-1}(W)$ set theoretically (details omitted). Thus, if we can show that $W$ is open, then $W$ is a scheme and the morphism $\tilde{W} \rightarrow W$ is integral surjective which implies that $W$ is affine by Limits, Proposition 31.10.2,

However, our assumption on orbits meeting $U^{\prime}$ implies that $h: \tilde{R} \rightarrow U$ is surjective. Since an integral surjective morphism is submersive (Topology, Lemma 5.5.5 and Morphisms, Lemma 28.43.7) it follows that $W$ is open.

The following technical lemma produces "almost" invariant functions in the situation of a finite groupoid on a quasi-affine scheme.

0ABF Lemma 39.13.7. Let $(U, R, s, t, c)$ be a groupoid scheme with $s, t$ finite and of finite presentation. Let $u_{1}, \ldots, u_{m} \in U$ be points whose $R$-orbits consist of generic points of irreducible components of $U$. Let $j: U \rightarrow \operatorname{Spec}(A)$ be an immersion. Let $I \subset A$ be an ideal such that $j(U) \cap V(I)=\emptyset$ and $V(I) \cup j(U)$ is closed in $\operatorname{Spec}(A)$. Then there exists an $h \in I$ such that $j^{-1} D(h)$ is an $R$-invariant affine open subscheme of $U$ containing $u_{1}, \ldots, u_{m}$.

Proof. Let $u_{1}, \ldots, u_{m} \in V^{\prime} \subset V \subset U$ be as in Lemma 39.13.4. Since $U \backslash V$ is closed in $U, j$ an immersion, and $V(I) \cup j(U)$ is closed in $\operatorname{Spec}(A)$, we can find an ideal $J \subset I$ such that $V(J)=V(I) \cup j(U \backslash V)$. For example we can take the ideal of elements of $I$ which vanish on $j(U \backslash V)$. Thus we can replace $(U, R, s, t, c)$, $j: U \rightarrow \operatorname{Spec}(A)$, and $I$ by $\left(V^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right),\left.j\right|_{V^{\prime}}: V^{\prime} \rightarrow \operatorname{Spec}(A)$, and $J$. In other words, we may assume that $U$ is affine and that $s$ and $t$ are finite locally free. Take any $f \in I$ which does not vanish at all the points in the $R$-orbits of $u_{1}, \ldots, u_{m}$ (Algebra, Lemma 10.14.2). Consider

$$
g=\operatorname{Norm}_{s}\left(t^{\sharp}\left(j^{\sharp}(f)\right)\right) \in \Gamma\left(U, \mathcal{O}_{U}\right)
$$

Since $f \in I$ and since $V(I) \cup j(U)$ is closed we see that $U \cap D(f) \rightarrow D(f)$ is a closed immersion. Hence $f^{n} g$ is the image of an element $h \in I$ for some $n>0$. We claim that $h$ works. Namely, we have seen in Groupoids, Lemma 38.23.2 that $g$ is an $R$-invariant function, hence $D(g) \subset U$ is $R$-invariant. Since $f$ does not vanish on the orbit of $u_{j}$, the function $g$ does not vanish at $u_{j}$. Moreover, we have $V(g) \supset V\left(j^{\sharp}(f)\right)$ and hence $j^{-1} D(h)=D(g)$.
0 ABG Lemma 39.13.8. Let $(U, R, s, t, c)$ be a groupoid scheme. If $s, t$ are quasi-finite, and $u, u^{\prime} \in R$ are distinct points in the same orbit, then $u^{\prime}$ is not a specialization of $u$.
Proof. Let $r \in R$ with $s(r)=u$ and $t(r)=u^{\prime}$. If $u \rightsquigarrow u^{\prime}$ then we can find a nontrivial specialization $r \rightsquigarrow r^{\prime}$ with $s\left(r^{\prime}\right)=u^{\prime}$, see Schemes, Lemma 25.19.8. Set $u^{\prime \prime}=t\left(r^{\prime}\right)$. Note that $u^{\prime \prime} \neq u^{\prime}$ as there are no specializations in the fibres of a quasi-finite morphism. Hence we can continue and find a nontrivial specialization $r^{\prime} \rightsquigarrow r^{\prime \prime}$ with $s\left(r^{\prime \prime}\right)=u^{\prime \prime}$, etc. This shows that the orbit of $u$ contains an infinite sequence $u \rightsquigarrow u^{\prime} \rightsquigarrow u^{\prime \prime} \rightsquigarrow \ldots$ of specializiations which is nonsense as the orbit $t\left(s^{-1}(\{u\})\right)$ is finite.

0 ABH Lemma 39.13.9. Let $j: V \rightarrow \operatorname{Spec}(A)$ be a quasi-compact immersion of schemes. Let $f \in A$ be such that $j^{-1} D(f)$ is affine and $j(V) \cap V(f)$ is closed. Then $V$ is affine.

Proof. We encourage the reader to find their own proof of this lemma. Let $A^{\prime}=$ $\Gamma\left(V, \mathcal{O}_{V}\right)$. Then $j^{\prime}: V \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ is a quasi-compact open immersion, see Properties, Lemma 27.18.3. Let $f^{\prime} \in A^{\prime}$ be the image of $f$. Then $\left(j^{\prime}\right)^{-1} D\left(f^{\prime}\right)=j^{-1} D(f)$ is affine. On the other hand, $j^{\prime}(V) \cap V\left(f^{\prime}\right)$ is a subscheme of $\operatorname{Spec}\left(A^{\prime}\right)$ which maps isomorphically to the closed subscheme $j(V) \cap V(f)$ of $\operatorname{Spec}(A)$. Hence it is closed
in $\operatorname{Spec}\left(A^{\prime}\right)$ for example by Schemes, Lemma 25.21 .12 . Thus we may replace $A$ by $A^{\prime}$ and assume that $j$ is an open immersion and $A=\Gamma\left(V, \mathcal{O}_{V}\right)$.
In this case we claim that $j(V)=\operatorname{Spec}(A)$ which finishes the proof. If not, then we can find a principal affine open $D(g) \subset \operatorname{Spec}(A)$ which meets the complement and avoids the closed subset $j(V) \cap V(f)$. Note that $j$ maps $j^{-1} D(f)$ isomorphically onto $D(f)$, see Properties, Lemma 27.18.2 Hence $D(g)$ meets $V(f)$. On the other hand, $j^{-1} D(g)$ is a principal open of the affine open $j^{-1} D(f)$ hence affine. Hence by Properties, Lemma 27.18.2 again we see that $D(g)$ is isomorphic to $j^{-1} D(g) \subset$ $j^{-1} D(f)$ which implies that $D(g) \subset D(f)$. This contradiction finishes the proof.
0ABI Lemma 39.13.10. Let $(U, R, s, t, c)$ be a groupoid scheme. Let $u \in U$. Assume
(1) $s, t$ are finite morphisms,
(2) $U$ is separated and locally Noetherian,
(3) $\operatorname{dim}\left(\mathcal{O}_{U, u^{\prime}}\right) \leq 1$ for every point $u^{\prime}$ in the orbit of $u$.

Then $u$ is contained in an $R$-invariant affine open of $U$.
Proof. The $R$-orbit of $u$ is finite. By conditions (2) and (3) it is contained in an affine open $U^{\prime}$ of $U$, see Varieties, Proposition 32.31.7. Then $t\left(s^{-1}\left(U \backslash U^{\prime}\right)\right)$ is an $R$-invariant closed subset of $U$ which does not contain $u$. Thus $U \backslash t\left(s^{-1}\left(U \backslash U^{\prime}\right)\right)$ is an $R$-invariant open of $U^{\prime}$ containing $u$. Replacing $U$ by this open we may assume $U$ is quasi-affine.
By Lemma 39.13 .6 we may replace $U$ by its reduction and assume $U$ is reduced. This means $R$-invariant subschemes $W^{\prime} \subset W \subset U$ of Lemma 39.13 .2 are equal $W^{\prime}=W$. As $U=t\left(s^{-1}(\bar{W})\right)$ some point $u^{\prime}$ of the $R$-orbit of $u$ is contained in $\bar{W}$ and by Lemma 39.13.6 we may replace $U$ by $\bar{W}$ and $u$ by $u^{\prime}$. Hence we may assume there is a dense open $R$-invariant subscheme $W \subset U$ such that the morphisms $s_{W}, t_{W}$ of the restriction $\left(W, R_{W}, s_{W}, t_{W}, c_{W}\right)$ are finite locally free.
If $u \in W$ then we are done by Groupoids, Lemma 38.24.1 (because $W$ is quasiaffine so any finite set of points of $W$ is contained in an affine open, see Properties, Lemma 27.29.5. Thus we assume $u \notin W$ and hence none of the points of the orbit of $u$ is in $W$. Let $\xi \in U$ be a point with a nontrivial specialization to a point $u^{\prime}$ in the orbit of $u$. Since there are no specializations among the points in the orbit of $u$ (Lemma 39.13.8) we see that $\xi$ is not in the orbit. By assumption (3) we see that $\xi$ is a generic point of $U$ and hence $\xi \in W$. As $U$ is Noetherian there are finitely many of these points $\xi_{1}, \ldots, \xi_{m} \in W$. Because $s_{W}, t_{W}$ are flat the orbit of each $\xi_{j}$ consists of generic points of irreducible components of $W$ (and hence $U$ ).
Let $j: U \rightarrow \operatorname{Spec}(A)$ be an immersion of $U$ into an affine scheme (this is possible as $U$ is quasi-affine). Let $J \subset A$ be an ideal such that $V(J) \cap j(W)=\emptyset$ and $V(J) \cup j(W)$ is closed. Apply Lemma 39.13 .7 to the groupoid scheme $\left(W, R_{W}, s_{W}, t_{W}, c_{W}\right)$, the morphism $\left.j\right|_{W}: W \rightarrow \operatorname{Spec}(A)$, the points $\xi_{j}$, and the ideal $J$ to find an $f \in J$ such that $\left(\left.j\right|_{W}\right)^{-1} D(f)$ is an $R_{W}$-invariant affine open containing $\xi_{j}$ for all $j$. Since $f \in J$ we see that $j^{-1} D(f) \subset W$, i.e., $j^{-1} D(f)$ is an $R$-invariant affine open of $U$ contained in $W$ containing all $\xi_{j}$.
Let $Z$ be the reduced induced closed subscheme structure on

$$
U \backslash j^{-1} D(f)=j^{-1} V(f)
$$

Then $Z$ is set theoretically $R$-invariant (but it may not be scheme theoretically $R$-invariant). Let $\left(Z, R_{Z}, s_{Z}, t_{Z}, c_{Z}\right)$ be the restriction of $R$ to $Z$. Since $Z \rightarrow U$ is
finite, it follows that $s_{Z}$ and $t_{Z}$ are finite. Since $u \in Z$ the orbit of $u$ is in $Z$ and
 since $\xi_{j} \notin Z$ for all $j$, we see that $\operatorname{dim}\left(\mathcal{O}_{Z, u^{\prime}}\right) \leq 0$ for all $u^{\prime}$ in the orbit of $u$. In other words, the $R_{Z}$-orbit of $u$ consists of generic points of irreducible components of $Z$.
Let $I \subset A$ be an ideal such that $V(I) \cap j(U)=\emptyset$ and $V(I) \cup j(U)$ is closed. Apply Lemma 39.13 .7 to the groupoid scheme $\left(Z, R_{Z}, s_{Z}, t_{Z}, c_{Z}\right)$, the restruction $\left.j\right|_{Z}$, the ideal $I$, and the point $u \in Z$ to obtain $h \in I$ such that $j^{-1} D(h) \cap Z$ is an $R_{Z}$-invariant open affine containing $u$.

Consider the $R_{W}$-invariant (Groupoids, Lemma 38.23.2) function

$$
g=\operatorname{Norm}_{s_{W}}\left(t_{W}^{\sharp}\left(\left.j^{\sharp}(h)\right|_{W}\right)\right) \in \Gamma\left(W, \mathcal{O}_{W}\right)
$$

(In the following we only need the restriction of $g$ to $j^{-1} D(f)$ and in this case the norm is along a finite locally free morphism of affines.) We claim that

$$
V=\left(W_{g} \cap j^{-1} D(f)\right) \cup\left(j^{-1} D(h) \cap Z\right)
$$

is an $R$-invariant affine open of $U$ which finishes the proof of the lemma. It is set theoretically $R$-invariant by construction. As $V$ is a constuctible set, to see that it is open it suffices to show it is closed under generalization in $U$ (Topology, Lemma 5.18 .9 or the more general Topology, Lemma 5.22.5. Since $W_{g} \cap j^{-1} D(f)$ is open in $U$, it suffices to consider a specialization $u_{1} \rightsquigarrow u_{2}$ of $U$ with $u_{2} \in j^{-1} D(h) \cap Z$. This means that $h$ is nonzero in $j\left(u_{2}\right)$ and $u_{2} \in Z$. If $u_{1} \in Z$, then $j\left(u_{1}\right) \rightsquigarrow j\left(u_{2}\right)$ and since $h$ is nonzero in $j\left(u_{2}\right)$ it is nonzero in $j\left(u_{1}\right)$ which implies $u_{1} \in V$. If $u_{1} \notin Z$ and also not in $W_{g} \cap j^{-1} D(f)$, then $u_{1} \in W, u_{1} \notin W_{g}$ because the complement of $Z=j^{-1} V(f)$ is contained in $W \cap j^{-1} D(f)$. Hence there exists a point $r_{1} \in R$ with $s\left(r_{1}\right)=u_{1}$ such that $h$ is zero in $t\left(r_{1}\right)$. Since $s$ is finite we can find a specialization $r_{1} \rightsquigarrow r_{2}$ with $s\left(r_{2}\right)=u_{2}$. However, then we conclude that $f$ is zero in $u_{2}^{\prime}=t\left(r_{2}\right)$ which contradicts the fact that $j^{-1} D(h) \cap Z$ is $R$-invariant and $u_{2}$ is in it. Thus $V$ is open.

Observe that $V \subset j^{-1} D(h)$ for our function $h \in I$. Thus we obtain an immersion

$$
j^{\prime}: V \longrightarrow \operatorname{Spec}\left(A_{h}\right)
$$

Let $f^{\prime} \in A_{h}$ be the image of $f$. Then $\left(j^{\prime}\right)^{-1} D\left(f^{\prime}\right)$ is the principal open determined by $g$ in the affine open $j^{-1} D(f)$ of $U$. Hence $\left(j^{\prime}\right)^{-1} D(f)$ is affine. Finally, $j^{\prime}(V) \cap$ $V\left(f^{\prime}\right)=j^{\prime}\left(j^{-1} D(h) \cap Z\right)$ is closed in $\operatorname{Spec}\left(A_{h} /\left(f^{\prime}\right)\right)=\operatorname{Spec}\left((A / f)_{h}\right)=D(h) \cap V(f)$ by our choice of $h \in I$ and the ideal $I$. Hence we can apply Lemma 39.13.9 to conclude that $V$ is affine as claimed above.

### 39.14. Descending ind-quasi-affine morphisms

0APG Ind-quasi-affine morphisms were defined in More on Morphisms, Section 36.48. This section is the analogue of Descent, Section 34.34 for ind-quasi-affine-morphisms.

Let $X$ be a quasi-separated scheme. Let $E \subset X$ be a subset which is an intersection of a nonempty family of quasi-compact opens of $X$. Say $E=\bigcap_{i \in I} U_{i}$ with $U_{i} \subset X$ quasi-compact open and $I$ nonempty. By adding finite intersections we may assume that for $i, j \in I$ there exists a $k \in I$ with $U_{k} \subset U_{i} \cap U_{j}$. In this situation we have

0APH (39.14.0.1)

$$
\Gamma\left(E,\left.\mathcal{F}\right|_{E}\right)=\operatorname{colim} \Gamma\left(U_{i},\left.\mathcal{F}\right|_{U_{i}}\right)
$$

for any sheaf $\mathcal{F}$ defined on $X$. Namely, fix $i_{0} \in I$ and replace $X$ by $U_{i_{0}}$ and $I$ by $\left\{i \in I \mid U_{i} \subset U_{i_{0}}\right\}$. Then $X$ is quasi-compact and quasi-separated, hence a spectral space, see Properties, Lemma 27.2.4. Then we see the equality holds by Topology, Lemma 5.23.7 and Sheaves, Lemma 6.29.4. (In fact, the formula holds for higher cohomology groups as well if $\mathcal{F}$ is abelian, see Cohomology, Lemma 20.20.2, )

0API Lemma 39.14.1. Let $X$ be an ind-quasi-affine scheme. Let $E \subset X$ be an intersection of a nonempty family of quasi-compact opens of $X$. Set $A=\Gamma\left(E,\left.\mathcal{O}_{X}\right|_{E}\right)$ and $Y=\operatorname{Spec}(A)$. Then the canonical morphsm

$$
j:\left(E,\left.\mathcal{O}_{X}\right|_{E}\right) \longrightarrow\left(Y, \mathcal{O}_{Y}\right)
$$

of Schemes, Lemma 25.6.4 determines an isomorphism $\left(E,\left.\mathcal{O}_{X}\right|_{E}\right) \rightarrow\left(E^{\prime},\left.\mathcal{O}_{Y}\right|_{E^{\prime}}\right)$ where $E^{\prime} \subset Y$ is an intersection of quasi-compact opens. If $W \subset E$ is open in $X$, then $j(W)$ is open in $Y$.

Proof. Note that $\left(E,\left.\mathcal{O}_{X}\right|_{E}\right)$ is a locally ringed space so that Schemes, Lemma 25.6 .4 applies to $A \rightarrow \Gamma\left(E,\left.\mathcal{O}_{X}\right|_{E}\right)$. Write $E=\bigcap_{i \in I} U_{i}$ with $I \neq \emptyset$ and $U_{i} \subset X$ quasi-compact open. We may and do assume that for $i, j \in I$ there exists a $k \in I$ with $U_{k} \subset U_{i} \cap U_{j}$. Set $A_{i}=\Gamma\left(U_{i}, \mathcal{O}_{U_{i}}\right)$. We obtain commutative diagrams

Since $U_{i}$ is quasi-affine, we see that $U_{i} \rightarrow \operatorname{Spec}\left(A_{i}\right)$ is a quasi-compact open immersion. On the other hand $A=\operatorname{colim} A_{i}$. Hence $\operatorname{Spec}(A)=\lim \operatorname{Spec}\left(A_{i}\right)$ as topological spaces (Limits, Lemma 31.3.2). Since $E=\lim U_{i}$ (by Topology, Lemma 5.23 .7 ) we see that $E \rightarrow \operatorname{Spec}(A)$ is a homeomorphism onto its image $E^{\prime}$ and that $E^{\prime}$ is the intersection of the inverse images of the opens $U_{i} \subset \operatorname{Spec}\left(A_{i}\right)$ in $\operatorname{Spec}(A)$. For any $e \in E$ the local ring $\mathcal{O}_{X, e}$ is the value of $\mathcal{O}_{U_{i}, e}$ which is the same as the value on $\operatorname{Spec}(A)$.
To prove the final assertion of the lemma we argue as follows. Pick $i, j \in I$ with $U_{i} \subset U_{j}$. Consider the following commtuative diagrams

By Properties, Lemma 27.18.4 the first diagram is cartesian. Hence the second is cartesian as well. Passing to the limit we find that the third diagram is cartesian, so the top horizontal arrow of this diagram is an open immersion.

0APJ Lemma 39.14.2. Suppose given a cartesian diagram

of schemes. Let $E \subset Y$ be an intersection of a nonempty family of quasi-compact opens of $Y$. Then

$$
\Gamma\left(f^{-1}(E),\left.\mathcal{O}_{X}\right|_{f^{-1}(E)}\right)=\Gamma\left(E,\left.\mathcal{O}_{Y}\right|_{E}\right) \otimes_{A} B
$$

provided $Y$ is quasi-separated and $A \rightarrow B$ is flat.
Proof. Write $E=\bigcap_{i \in I} V_{i}$ with $V_{i} \subset Y$ quasi-compact open. We may and do assume that for $i, j \in I$ there exists a $k \in I$ with $V_{k} \subset V_{i} \cap V_{j}$. Then we have similarly that $f^{-1}(E)=\bigcap_{i \in I} f^{-1}\left(V_{i}\right)$ in $X$. Thus the result follows from equation 39.14.0.1 and the corresponding result for $V_{i}$ and $f^{-1}\left(V_{i}\right)$ which is Cohomology of Schemes, Lemma 29.5.2.

0APK Lemma 39.14.3 (Gabber). Let $S$ be a scheme. Let $\left\{X_{i} \rightarrow S\right\}_{i \in I}$ be an fpqc covering. Let $\left(V_{i} / X_{i}, \varphi_{i j}\right)$ be a descent datum relative to $\left\{X_{i} \rightarrow S\right\}$, see Descent, Definition 34.30.3. If each morphism $V_{i} \rightarrow X_{i}$ is ind-quasi-affine, then the descent datum is effective.

Proof. Being ind-quasi-affine is a property of morphisms of schemes which is preserved under any base change, see More on Morphisms, Lemma 36.48.2. Hence Descent, Lemma 34.32 .2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \rightarrow S\}$ flat surjective morphism of affines. Say $X=\operatorname{Spec}(A)$ and $S=\operatorname{Spec}(R)$ so that $R \rightarrow A$ is a faithfully flat ring map. Let $(V, \varphi)$ be a descent datum relative to $X$ over $S$ and assume that $V \rightarrow X$ is ind-quasi-affine, in other words, $V$ is ind-quasi-affine.

Let $(U, R, s, t, c)$ be the groupoid scheme over $S$ with $U=X$ and $R=X \times{ }_{S} X$ and $s, t, c$ as usual. By Groupoids, Lemma 38.21 .3 the pair $(V, \varphi)$ corresponds to a cartesian morphism $\left(U^{\prime}, R^{\prime}, s^{\prime}, t^{\prime}, c^{\prime}\right) \rightarrow(U, \overline{R, s, t, c})$ of groupoid schemes. Let $u^{\prime} \in$ $U^{\prime}$ be any point. By Groupoids, Lemmas 38.19.2, 38.19.3, and 38.19.4 we can choose $u^{\prime} \in W \subset E \subset U^{\prime}$ where $W$ is open and $R^{\prime}$-invariant, and $E$ is set-theoretically $R^{\prime}$-invariant and an intersection of a nonempty family of quasi-compact opens.

Translating back to $(V, \varphi)$, for any $v \in V$ we can find $v \in W \subset E \subset V$ with the following properties: (a) $W$ is open and $\varphi\left(W \times_{S} X\right)=X \times_{S} W$ and (b) $E$ an intersection of quasi-compact opens and $\varphi\left(E \times_{S} X\right)=X \times_{S} E$ set-theoretically. Here we use the notation $E \times{ }_{S} X$ to mean the inverse image of $E$ in $V \times_{S} X$ by the projection morphism and similarly for $X \times_{S} E$. By Lemma 39.14 .2 this implies that $\varphi$ defines an isomorphism

$$
\begin{aligned}
\Gamma\left(E,\left.\mathcal{O}_{V}\right|_{E}\right) \otimes_{R} A & =\Gamma\left(E \times_{S} X,\left.\mathcal{O}_{V \times_{S} X}\right|_{E \times_{S} X}\right) \\
& \rightarrow \Gamma\left(X \times_{S} E,\left.\mathcal{O}_{X \times_{S} V}\right|_{X \times_{S} E}\right) \\
& =A \otimes_{R} \Gamma\left(E,\left.\mathcal{O}_{V}\right|_{E}\right)
\end{aligned}
$$

of $A \otimes_{R} A$-algebras which we will call $\psi$. The cocycle condition for $\varphi$ tranlates into the cocycle condition for $\psi$ as in Descent, Definition 34.3.1 (details omitted). By Descent, Proposition 34.3.9 we find an $R$-algebra $R^{\prime}$ and an isomorphism $\chi$ : $R^{\prime} \otimes_{R} A \rightarrow \Gamma\left(E,\left.\mathcal{O}_{V}\right|_{E}\right)$ of $A$-algebras, compatible with $\psi$ and the canonical descent datum on $R^{\prime} \otimes_{R} A$.
By Lemma 39.14.1 we obtain a canonical "embedding"

$$
j:\left(E,\left.\mathcal{O}_{V}\right|_{E}\right) \longrightarrow \operatorname{Spec}\left(\Gamma\left(E,\left.\mathcal{O}_{V}\right|_{E}\right)\right)=\operatorname{Spec}\left(R^{\prime} \otimes_{R} A\right)
$$

of locally ringed spaces. The construction of this map is canonical and we get a commutative diagram

where $j^{\prime}$ and $j^{\prime \prime}$ come from the same construction applied to $E \times{ }_{S} X \subset V \times_{S} X$ and $X \times_{S} E \subset X \times_{S} V$ via $\chi$ and the identifications used to construct $\psi$. It follows that $j(W)$ is an open subscheme of $\operatorname{Spec}\left(R^{\prime} \otimes_{R} A\right)$ whose inverse image under the two projections $\operatorname{Spec}\left(R^{\prime} \otimes_{R} A \otimes_{R} A\right) \rightarrow \operatorname{Spec}\left(R^{\prime} \otimes_{R} A\right)$ are equal. By Descent, Lemma 34.9.2 we find an open $W_{0} \subset \operatorname{Spec}\left(R^{\prime}\right)$ whose base change to $\operatorname{Spec}(A)$ is $j(W)$. Contemplating the diagram above we see that the descent datum $\left(W,\left.\varphi\right|_{W \times_{S} X}\right)$ is effective. By Descent, Lemma 34.31 .13 we see that our descent datum is effective.

## CHAPTER 40

## Étale Morphisms of Schemes

### 40.1. Introduction

024K In this Chapter, we discuss étale morphisms of schemes. We illustrate some of the more important concepts by working with the Noetherian case. Our principal goal is to collect for the reader enough commutative algebra results to start reading a treatise on étale cohomology. An auxiliary goal is to provide enough evidence to ensure that the reader stops calling the phrase "the étale topology of schemes" an exercise in general nonsense, if (s)he does indulge in such blasphemy.

We will refer to the other chapters of the stacks project for standard results in algebraic geometry (on schemes and commutative algebra). We will provide detailed proofs of the new results that we state here.

### 40.2. Conventions

039 F In this chapter, frequently schemes will be assumed locally Noetherian and frequently rings will be assumed Noetherian. But in all the statements we will reiterate this when necessary, and make sure we list all the hypotheses! On the other hand, here are some general facts that we will use often and are useful to keep in mind:
(1) A ring homomorphism $A \rightarrow B$ of finite type with $A$ Noetherian is of finite presentation. See Algebra, Lemma 10.30.4.
(2) A morphism (locally) of finite type between locally Noetherian schemes is automatically (locally) of finite presentation. See Morphisms, Lemma 28.21 .9
(3) Add more like this here.

### 40.3. Unramified morphisms

024L We first define "unramified homomorphisms of local rings" for Noetherian local rings. We cannot use the term "unramified" as there already is a notion of an unramified ring map (Algebra, Section 10.147 ) and it is different. After discussing the notion a bit we globalize it to describe unramified morphisms of locally Noetherian schemes.

024M Definition 40.3.1. Let $A, B$ be Noetherian local rings. A local homomorphism $A \rightarrow B$ is said to be unramified homomorphism of local rings if
(1) $\mathfrak{m}_{A} B=\mathfrak{m}_{B}$,
(2) $\kappa\left(\mathfrak{m}_{B}\right)$ is a finite separable extension of $\kappa\left(\mathfrak{m}_{A}\right)$, and
(3) $B$ is essentially of finite type over $A$ (this means that $B$ is the localization of a finite type $A$-algebra at a prime).

This is the local version of the definition in Algebra, Section 10.147. In that section a ring map $R \rightarrow S$ is defined to be unramified if and only if it is of finite type, and $\Omega_{S / R}=0$. We say $R \rightarrow S$ is unramified at a prime $\mathfrak{q} \subset S$ if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is an unramified ring map. It is shown in Algebra, Lemmas 10.147 .5 and 10.147 .7 that given a ring map $R \rightarrow S$ of finite type, and a prime $\mathfrak{q}$ of $S$ lying over $\mathfrak{p} \subset R$, then we have

$$
R \rightarrow S \text { is unramified at } \mathfrak{q} \Leftrightarrow \mathfrak{p} S_{\mathfrak{q}}=\mathfrak{q} S_{\mathfrak{q}} \text { and } \kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}) \text { finite separable }
$$

Thus we see that for a local homomorphism of local rings the properties of our definition above are closely related to the question of being unramified. In fact, we have proved the following lemma.

039G Lemma 40.3.2. Let $A \rightarrow B$ be of finite type with $A$ a Noetherian ring. Let $\mathfrak{q}$ be a prime of $B$ lying over $\mathfrak{p} \subset A$. Then $A \rightarrow B$ is unramified at $\mathfrak{q}$ if and only if $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is an unramified homomorphism of local rings.

Proof. See discussion above.
We will characterize the property of being unramified in terms of completions. For a Noetherian local ring $A$ we denote $A^{\wedge}$ the completion of $A$ with respect to the maximal ideal. It is also a Noetherian local ring, see Algebra, Lemma 10.96.6

039H Lemma 40.3.3. Let $A, B$ be Noetherian local rings. Let $A \rightarrow B$ be a local homomorphism.
(1) if $A \rightarrow B$ is an unramified homomorphism of local rings, then $B^{\wedge}$ is a finite $A^{\wedge}$ module,
(2) if $A \rightarrow B$ is an unramified homomorphism of local rings and $\kappa\left(\mathfrak{m}_{A}\right)=$ $\kappa\left(\mathfrak{m}_{B}\right)$, then $A^{\wedge} \rightarrow B^{\wedge}$ is surjective,
(3) if $A \rightarrow B$ is an unramified homomorphism of local rings and $\kappa\left(\mathfrak{m}_{A}\right)$ is separably closed, then $A^{\wedge} \rightarrow B^{\wedge}$ is surjective,
(4) if $A$ and $B$ are complete discrete valuation rings, then $A \rightarrow B$ is an unramified homomorphism of local rings if and only the uniformizer for $A$ maps to a uniformizer for $B$, and the residue field extension is finite separable (and $B$ is essentially of finite type over $A$ ).

Proof. Part (1) is a special case of Algebra, Lemma 10.96.7. For part (2), note that the $\kappa\left(\mathfrak{m}_{A}\right)$-vector space $B^{\wedge} / \mathfrak{m}_{A^{\wedge}} B^{\wedge}$ is generated by 1 . Hence by Nakayama's lemma (Algebra, Lemma 10.19.1) the map $A^{\wedge} \rightarrow B^{\wedge}$ is surjective. Part (3) is a special case of part (2). Part (4) is immediate from the definitions.

039I Lemma 40.3.4. Let $A, B$ be Noetherian local rings. Let $A \rightarrow B$ be a local homomorphism such that $B$ is essentially of finite type over $A$. The following are equivalent
(1) $A \rightarrow B$ is an unramified homomorphism of local rings
(2) $A^{\wedge} \rightarrow B^{\wedge}$ is an unramified homomorphism of local rings, and
(3) $A^{\wedge} \rightarrow B^{\wedge}$ is unramified.

Proof. The equivalence of (1) and (2) follows from the fact that $\mathfrak{m}_{A} A^{\wedge}$ is the maximal ideal of $A^{\wedge}$ (and similarly for $B$ ) and faithful flatness of $B \rightarrow B^{\wedge}$. For
example if $A^{\wedge} \rightarrow B^{\wedge}$ is unramified, then $\mathfrak{m}_{A} B^{\wedge}=\left(\mathfrak{m}_{A} B\right) B^{\wedge}=\mathfrak{m}_{B} B^{\wedge}$ and hence $\mathfrak{m}_{A} B=\mathfrak{m}_{B}$.
Assume the equivalent conditions (1) and (2). By Lemma 40.3.3 we see that $A^{\wedge} \rightarrow$ $B^{\wedge}$ is finite. Hence $A^{\wedge} \rightarrow B^{\wedge}$ is of finite presentation, and by Algebra, Lemma 10.147.7 we conclude that $A^{\wedge} \rightarrow B^{\wedge}$ is unramified at $\mathfrak{m}_{B^{\wedge}}$. Since $B^{\wedge}$ is local we conclude that $A^{\wedge} \rightarrow B^{\wedge}$ is unramified.

Assume (3). By Algebra, Lemma 10.147 .5 we conclude that $A^{\wedge} \rightarrow B^{\wedge}$ is an unramified homomorphism of local rings, i.e., (2) holds.

024N Definition 40.3.5. (See Morphisms, Definition 28.35.1 for the definition in the general case.) Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be locally of finite type. Let $x \in X$.
(1) We say $f$ is unramified at $x$ if $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is an unramified homomorphism of local rings.
(2) The morphism $f: X \rightarrow Y$ is said to be unramified if it is unramified at all points of $X$.

Let us prove that this definition agrees with the definition in the chapter on morphisms of schemes. This in particular guarantees that the set of points where a morphism is unramified is open.

039J Lemma 40.3.6. Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be locally of finite type. Let $x \in X$. The morphism $f$ is unramified at $x$ in the sense of Definition 40.3 .5 if and only if it is unramified in the sense of Morphisms, Definition 28.35.1.

Proof. This follows from Lemma 40.3 .2 and the definitions.
Here are some results on unramified morphisms. The formulations as given in this list apply only to morphisms locally of finite type between locally Noetherian schemes. In each case we give a reference to the general result as proved earlier in the project, but in some cases one can prove the result more easily in the Noetherian case. Here is the list:
(1) Unramifiedness is local on the source and the target in the Zariski topology.
(2) Unramified morphisms are stable under base change and composition. See Morphisms, Lemmas 28.35.5 and 28.35.4.
(3) Unramified morphisms of schemes are locally quasi-finite and quasi-compact unramified morphisms are quasi-finite. See Morphisms, Lemma 28.35.10
(4) Unramified morphisms have relative dimension 0. See Morphisms, Definition 28.29.1 and Morphisms, Lemma 28.29.5
(5) A morphism is unramified if and only if all its fibres are unramified. That is, unramifiedness can be checked on the scheme theoretic fibres. See Morphisms, Lemma 28.35.12,
(6) Let $X$ and $Y$ be unramified over a base scheme $S$. Any $S$-morphism from $X$ to $Y$ is unramified. See Morphisms, Lemma 28.35.16.

### 40.4. Three other characterizations of unramified morphisms

024 O The following theorem gives three equivalent notions of being unramified at a point. See Morphisms, Lemma 28.35 .14 for (part of) the statement for general schemes.

024P Theorem 40.4.1. Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism of schemes which is locally of finite type. Let $x$ be a point of $X$. The following are equivalent
(1) $f$ is unramified at $x$,
(2) the stalk $\Omega_{X / Y, x}$ of the module of relative differentials at $x$ is trivial,
(3) there exist open neighbourhoods $U$ of $x$ and $V$ of $f(x)$, and a commutative diagram

where $i$ is a closed immersion defined by a quasi-coherent sheaf of ideals $\mathcal{I}$ such that the differentials dg for $g \in \mathcal{I}_{i(x)}$ generate $\Omega_{\mathbf{A}_{V}^{n} / V, i(x)}$, and
(4) the diagonal $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is a local isomorphism at $x$.

Proof. The equivalence of (1) and (2) is proved in Morphisms, Lemma 28.35.14
If $f$ is unramified at $x$, then $f$ is unramified in an open neighbourhood of $x$; this does not follow immediately from Definition 40.3 .5 of this chapter but it does follow from Morphisms, Definition 28.35.1 which we proved to be equivalent in Lemma 40.3.6. Choose affine opens $V \subset Y, U \subset X$ with $f(U) \subset V$ and $x \in U$, such that $f$ is unramified on $U$, i.e., $\left.f\right|_{U}: U \rightarrow V$ is unramified. By Morphisms, Lemma 28.35 .13 the morphism $U \rightarrow U \times_{V} U$ is an open immersion. This proves that (1) implies (4).

If $\Delta_{X / Y}$ is a local isomorphism at $x$, then $\Omega_{X / Y, x}=0$ by Morphisms, Lemma 28.33.7. Hence we see that (4) implies (2). At this point we know that (1), (2) and (4) are all equivalent.

Assume (3). The assumption on the diagram combined with Morphisms, Lemma 28.33 .15 show that $\Omega_{U / V, x}=0$. Since $\Omega_{U / V, x}=\Omega_{X / Y, x}$ we conclude (2) holds.

Finally, assume that (2) holds. To prove (3) we may localize on $X$ and $Y$ and assume that $X$ and $Y$ are affine. Say $X=\operatorname{Spec}(B)$ and $Y=\operatorname{Spec}(A)$. The point $x \in X$ corresponds to a prime $\mathfrak{q} \subset B$. Our assumption is that $\Omega_{B / A, \mathfrak{q}}=0$ (see Morphisms, Lemma 28.33 .5 for the relationship between differentials on schemes and modules of differentials in commutative algebra). Since $Y$ is locally Noetherian and $f$ locally of finite type we see that $A$ is Noetherian and $B \cong A\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$, see Properties, Lemma 27.5.2 and Morphisms, Lemma 28.15.2 In particular, $\Omega_{B / A}$ is a finite $B$-module. Hence we can find a single $g \in B, g \notin \mathfrak{q}$ such that the principal localization $\left(\Omega_{B / A}\right)_{g}$ is zero. Hence after replacing $B$ by $B_{g}$ we see that $\Omega_{B / A}=$ 0 (formation of modules of differentials commutes with localization, see Algebra, Lemma 10.130.8. This means that $\mathrm{d}\left(f_{j}\right)$ generate the kernel of the canonical map $\Omega_{A\left[x_{1}, \ldots, x_{n}\right] / A} \otimes_{A} B \rightarrow \Omega_{B / A}$. Thus the surjection $A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$ of $A$-algebras gives the commutative diagram of (3), and the theorem is proved.

How can we use this theorem? Well, here are a few remarks:
(1) Suppose that $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are two morphisms locally of finite type between locally Noetherian schemes. There is a canonical short exact sequence

$$
f^{*}\left(\Omega_{Y / Z}\right) \rightarrow \Omega_{X / Z} \rightarrow \Omega_{X / Y} \rightarrow 0
$$

see Morphisms, Lemma 28.33.9. The theorem therefore implies that if $g \circ f$ is unramified, then so is $f$. This is Morphisms, Lemma 28.35.16.
(2) Since $\Omega_{X / Y}$ is isomorphic to the conormal sheaf of the diagonal morphism (Morphisms, Lemma 28.33.7) we see that if $X \rightarrow Y$ is a monomorphism of locally Noetherian schemes and locally of finite type, then $X \rightarrow Y$ is unramified. In particular, open and closed immersions of locally Noetherian schemes are unramified. See Morphisms, Lemmas 28.35.7 and 28.35.8.
(3) The theorem also implies that the set of points where a morphism $f: X \rightarrow$ $Y$ (locally of finite type of locally Noetherian schemes) is not unramified is the support of the coherent sheaf $\Omega_{X / Y}$. This allows one to give a scheme theoretic definition to the "ramification locus".

### 40.5. The functorial characterization of unramified morphisms

024Q In basic algebraic geometry we learn that some classes of morphisms can be characterized functorially, and that such descriptions are quite useful. Unramified morphisms too have such a characterization.
024R Theorem 40.5.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $S$ is a locally Noetherian scheme, and $f$ is locally of finite type. Then the following are equivalent:
(1) $f$ is unramified,
(2) the morphism $f$ is formally unramified: for any affine $S$-scheme $T$ and subscheme $T_{0}$ of $T$ defined by a square-zero ideal, the natural map

$$
\operatorname{Hom}_{S}(T, X) \longrightarrow \operatorname{Hom}_{S}\left(T_{0}, X\right)
$$

is injective.
Proof. See More on Morphisms, Lemma 36.4 .8 for a more general statement and proof. What follows is a sketch of the proof in the current case.
Firstly, one checks both properties are local on the source and the target. This we may assume that $S$ and $X$ are affine. Say $X=\operatorname{Spec}(B)$ and $S=\operatorname{Spec}(R)$. Say $T=\operatorname{Spec}(C)$. Let $J$ be the square-zero ideal of $C$ with $T_{0}=\operatorname{Spec}(C / J)$. Assume that we are given the diagram

Secondly, one checks that the association $\phi^{\prime} \mapsto \phi^{\prime}-\phi$ gives a bijection between the set of liftings of $\bar{\phi}$ and the module $\operatorname{Der}_{R}(B, J)$. Thus, we obtain the implication $(1) \Rightarrow(2)$ via the description of unramified morphisms having trivial module of differentials, see Theorem 40.4.1.
To obtain the reverse implication, consider the surjection $q: C=\left(B \otimes_{R} B\right) / I^{2} \rightarrow$ $B=C / J$ defined by the square zero ideal $J=I / I^{2}$ where $I$ is the kernel of the multiplication map $B \otimes_{R} B \rightarrow B$. We already have a lifting $B \rightarrow C$ defined by, say, $b \mapsto b \otimes 1$. Thus, by the same reasoning as above, we obtain a bijective correspondence between liftings of id : $B \rightarrow C / J$ and $\operatorname{Der}_{R}(B, J)$. The hypothesis therefore implies that the latter module is trivial. But we know that $J \cong \Omega_{B / R}$. Thus, $B / R$ is unramified.

### 40.6. Topological properties of unramified morphisms

024 S The first topological result that will be of utility to us is one which says that unramified and separated morphisms have "nice" sections. The material in this section does not require any Noetherian hypotheses.

024 Proposition 40.6.1. Sections of unramified morphisms.
(1) Any section of an unramified morphism is an open immersion.
(2) Any section of a separated morphism is a closed immersion.
(3) Any section of an unramified separated morphism is open and closed.

Proof. Fix a base scheme $S$. If $f: X^{\prime} \rightarrow X$ is any $S$-morphism, then the graph $\Gamma_{f}: X^{\prime} \rightarrow X^{\prime} \times_{S} X$ is obtained as the base change of the diagonal $\Delta_{X / S}: X \rightarrow$ $X \times_{S} X$ via the projection $X^{\prime} \times_{S} X \rightarrow X \times_{S} X$. If $g: X \rightarrow S$ is separated (resp. unramified) then the diagonal is a closed immersion (resp. open immersion) by Schemes, Definition 25.21 .3 (resp. Morphisms, Lemma 28.35.13). Hence so is the graph as a base change (by Schemes, Lemma 25.18.2). In the special case $X^{\prime}=S$, we obtain (1), resp. (2). Part (3) follows on combining (1) and (2).

We can now explicitly describe the sections of unramified morphisms.
024U
Theorem 40.6.2. Let $Y$ be a connected scheme. Let $f: X \rightarrow Y$ be unramified and separated. Every section of $f$ is an isomorphism onto a connected component. There exists a bijective correspondence

$$
\text { sections of } f \leftrightarrow\left\{\begin{array}{c}
\text { connected components } X^{\prime} \text { of } X \text { such that } \\
\text { the induced map } X^{\prime} \rightarrow Y \text { is an isomorphism }
\end{array}\right\}
$$

In particular, given $x \in X$ there is at most one section passing through $x$.
Proof. Direct from Proposition 40.6.1 part (3).
The preceding theorem gives us some idea of the "rigidity" of unramified morphisms. Further indication is provided by the following proposition which, besides being intrinsically interesting, is also useful in the theory of the algebraic fundamental group (see Gro71, Exposé V]). See also the more general Morphisms, Lemma 28.35 .17 .

024V Proposition 40.6.3. Let $S$ is be a scheme. Let $\pi: X \rightarrow S$ be unramified and separated. Let $Y$ be an $S$-scheme and $y \in Y$ a point. Let $f, g: Y \rightarrow X$ be two $S$-morphisms. Assume
(1) $Y$ is connected
(2) $x=f(y)=g(y)$, and
(3) the induced maps $f^{\sharp}, g^{\sharp}: \kappa(x) \rightarrow \kappa(y)$ on residue fields are equal.

Then $f=g$.
Proof. The maps $f, g: Y \rightarrow X$ define maps $f^{\prime}, g^{\prime}: Y \rightarrow X_{Y}=Y \times_{S} X$ which are sections of the structure map $X_{Y} \rightarrow Y$. Note that $f=g$ if and only if $f^{\prime}=g^{\prime}$. The structure map $X_{Y} \rightarrow Y$ is the base change of $\pi$ and hence unramified and separated also (see Morphisms, Lemmas 28.35.5 and Schemes, Lemma 25.21.13). Thus according to Theorem 40.6.2 it suffices to prove that $f^{\prime}$ and $g^{\prime}$ pass through the same point of $X_{Y}$. And this is exactly what the hypotheses (2) and (3) guarantee, namely $f^{\prime}(y)=g^{\prime}(y) \in X_{Y}$.

0AKI Lemma 40.6.4. Let $S$ be a Noetherian scheme. Let $X \rightarrow S$ be a quasi-compact unramified morphism. Let $Y \rightarrow S$ be a morphism with $Y$ Noetherian. Then $\operatorname{Mor}_{S}(Y, X)$ is a finite set.
Proof. Assume first $X \rightarrow S$ is separated (which is often the case in practice). Since $Y$ is Noetherian it has finitely many connected components. Thus we may assume $Y$ is connected. Choose a point $y \in Y$ with image $s \in S$. Since $X \rightarrow S$ is unramified and quasi-compact then fibre $X_{s}$ is finite, say $X_{s}=\left\{x_{1}, \ldots, x_{n}\right\}$ and $\kappa(s) \subset \kappa\left(x_{i}\right)$ is a finite field extension. See Morphisms, Lemma 28.35.10, 28.20.5, and 28.20.10. For each $i$ there are at most finitely many $\kappa(s)$-algebra maps $\kappa\left(x_{i}\right) \rightarrow \kappa(y)$ (by elementary field theory). Thus $\operatorname{Mor}_{S}(Y, X)$ is finite by Proposition 40.6.3.
General case. There exists a nonempty open $U \subset X$ such that $X_{U} \rightarrow U$ is finite (in particular separated), see Morphisms, Lemma 28.47.1 (the lemma applies since we've already seen above that a quasi-compact unramified morphism is quasi-finite and since $X \rightarrow S$ is quasi-separated by Morphisms, Lemma 28.15.7). Let $Z \subset S$ be the reduced closed subscheme supported on the complement of $U$. By Noetherian induction, we see that $\operatorname{Mor}_{Z}\left(Y_{Z}, X_{Z}\right)$ is finite (details omitted). By the result of the first paragraph the set $\operatorname{Mor}_{U}\left(Y_{U}, X_{U}\right)$ is finite. Thus it suffices to show that

$$
\operatorname{Mor}_{S}(Y, X) \longrightarrow \operatorname{Mor}_{Z}\left(Y_{Z}, X_{Z}\right) \times \operatorname{Mor}_{U}\left(Y_{U}, X_{U}\right)
$$

is injective. This follows from the fact that the set of points where two morphisms $a, b: Y \rightarrow X$ agree is open in $Y$, due to the fact that $\Delta: X \rightarrow X \times_{S} X$ is open, see Morphisms, Lemma 28.35.13.

### 40.7. Universally injective, unramified morphisms

06ND Recall that a morphism of schemes $f: X \rightarrow Y$ is universally injective if any base change of $f$ is injective (on underlying topological spaces), see Morphisms, Definition 28.11.1. Universally injective and unramified morphisms can be characterized as follows.
05VH Lemma 40.7.1. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) $f$ is unramified and a monomorphism,
(2) $f$ is unramified and universally injective,
(3) $f$ is locally of finite type and a monomorphism,
(4) $f$ is universally injective, locally of finite type, and formally unramified,
(5) $f$ is locally of finite type and $X_{y}$ is either empty or $X_{y} \rightarrow y$ is an isomorphism for all $y \in Y$.
Proof. We have seen in More on Morphisms, Lemma 36.4.8 that being formally unramified and locally of finite type is the same thing as being unramified. Hence (4) is equivalent to (2). A monomorphism is certainly universally injective and formally unramified hence (3) implies (4). It is clear that (1) implies (3). Finally, if (2) holds, then $\Delta: X \rightarrow X \times_{S} X$ is both an open immersion (Morphisms, Lemma 28.35 .13 and surjective (Morphisms, Lemma 28.11.2 hence an isomorphism, i.e., $f$ is a monomorphism. In this way we see that (2) implies (1).
Condition (3) implies (5) because monomorphisms are preserved under base change (Schemes, Lemma 25.23.5) and because of the description of monomorphisms towards the spectra of fields in Schemes, Lemma 25.23.10. Condition (5) implies (4) by Morphisms, Lemmas 28.11.2 and 28.35.12.

This leads to the following useful characterization of closed immersions.
04XV Lemma 40.7.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) $f$ is a closed immersion,
(2) $f$ is a proper monomorphism,
(3) $f$ is proper, unramified, and universally injective,
(4) $f$ is universally closed, unramified, and a monomorphism,
(5) $f$ is universally closed, unramified, and universally injective,
(6) $f$ is universally closed, locally of finite type, and a monomorphism,
(7) $f$ is universally closed, universally injective, locally of finite type, and formally unramified.

Proof. The equivalence of $(4)-(7)$ follows immediately from Lemma 40.7.1.
Let $f: X \rightarrow S$ satisfy (6). Then $f$ is separated, see Schemes, Lemma 25.23 .3 and has finite fibres. Hence More on Morphisms, Lemma 36.31.4 shows $f$ is finite. Then Morphisms, Lemma 28.43.13 implies $f$ is a closed immersion, i.e., (1) holds.

Note that $(1) \Rightarrow(2)$ because a closed immersion is proper and a monomorphism (Morphisms, Lemma 28.41.6 and Schemes, Lemma 25.23.7). By Lemma 40.7.1 we see that (2) implies (3). It is clear that (3) implies (5).

Here is another result of a similar flavor.
04DG Lemma 40.7.3. Let $\pi: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that
(1) $\pi$ is finite,
(2) $\pi$ is unramified,
(3) $\pi^{-1}(\{s\})=\{x\}$, and
(4) $\kappa(s) \subset \kappa(x)$ is purely inseparabl $\ell^{1}$.

Then there exists an open neighbourhood $U$ of $s$ such that $\left.\pi\right|_{\pi^{-1}(U)}: \pi^{-1}(U) \rightarrow U$ is a closed immersion.

Proof. The question is local on $S$. Hence we may assume that $S=\operatorname{Spec}(A)$. By definition of a finite morphism this implies $X=\operatorname{Spec}(B)$. Note that the ring map $\varphi: A \rightarrow B$ defining $\pi$ is a finite unramified ring map. Let $\mathfrak{p} \subset A$ be the prime corresponding to $s$. Let $\mathfrak{q} \subset B$ be the prime corresponding to $x$. By Conditions (2), (3) and (4) imply that $B_{\mathfrak{q}} / \mathfrak{p} B_{\mathfrak{q}}=\kappa(\mathfrak{p})$. Algebra, Lemma 10.40.11 we have $B_{\mathfrak{q}}=B_{\mathfrak{p}}$ (note that a finite ring map satisfies going up, see Algebra, Section 10.40) Hence we see that $B_{\mathfrak{p}} / \mathfrak{p} B_{\mathfrak{p}}=\kappa(\mathfrak{p})$. As $B$ is a finite $A$-module we see from Nakayama's lemma (see Algebra, Lemma 10.19.1) that $B_{\mathfrak{p}}=\varphi\left(A_{\mathfrak{p}}\right)$. Hence (using the finiteness of $B$ as an $A$-module again) there exists a $f \in A, f \notin \mathfrak{p}$ such that $B_{f}=\varphi\left(A_{f}\right)$ as desired.

The topological results presented above will be used to give a functorial characterization of étale morphisms similar to Theorem 40.5.1.

[^112]40.8. Examples of unramified morphisms

024W Here are a few examples.
024X Example 40.8.1. Let $k$ be a field. Unramified quasi-compact morphisms $X \rightarrow$ $\operatorname{Spec}(k)$ are affine. This is true because $X$ has dimension 0 and is Noetherian, hence is a finite discrete set, and each point gives an affine open, so $X$ is a finite disjoint union of affines hence affine. Noether normalization forces $X$ to be the spectrum of a finite $k$-algebra $A$. This algebra is a product of finite separable field extensions of $k$. Thus, an unramified quasi-compact morphism to $\operatorname{Spec}(k)$ corresponds to a finite number of finite separable field extensions of $k$. In particular, an unramified morphism with a connected source and a one point target is forced to be a finite separable field extension. As we will see later, $X \rightarrow \operatorname{Spec}(k)$ is étale if and only if it is unramified. Thus, in this case at least, we obtain a very easy description of the étale topology of a scheme. Of course, the cohomology of this topology is another story.
024Y Example 40.8.2. Property (3) in Theorem 40.4.1 gives us a canonical source of examples for unramified morphisms. Fix a ring $R$ and an integer $n$. Let $I=$ $\left(g_{1}, \ldots, g_{m}\right)$ be an ideal in $R\left[x_{1}, \ldots, x_{n}\right]$. Let $\mathfrak{q} \subset R\left[x_{1}, \ldots, x_{n}\right]$ be a prime. Assume $I \subset \mathfrak{q}$ and that the matrix

$$
\left(\frac{\partial g_{i}}{\partial x_{j}}\right) \bmod \mathfrak{q} \in \quad \operatorname{Mat}(n \times m, \kappa(\mathfrak{q}))
$$

has rank $n$. Then the morphism $f: Z=\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right] / I\right) \rightarrow \operatorname{Spec}(R)$ is unramified at the point $x \in Z \subset \mathbf{A}_{R}^{n}$ corresponding to $\mathfrak{q}$. Clearly we must have $m \geq n$. In the extreme case $m=n$, i.e., the differential of the map $\mathbf{A}_{R}^{n} \rightarrow \mathbf{A}_{R}^{n}$ defined by the $g_{i}$ 's is an isomorphism of the tangent spaces, then $f$ is also flat $x$ and, hence, is an étale map (see Algebra, Definition 10.135.6. Lemma 10.135.7 and Example 10.135.8.
024Z Example 40.8.3. Fix an extension of number fields $L / K$ with rings of integers $\mathcal{O}_{L}$ and $\mathcal{O}_{K}$. The injection $K \rightarrow L$ defines a morphism $f: \operatorname{Spec}\left(\mathcal{O}_{L}\right) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{K}\right)$. As discussed above, the points where $f$ is unramified in our sense correspond to the set of points where $f$ is unramified in the conventional sense. In the conventional sense, the locus of ramification in $\operatorname{Spec}\left(\mathcal{O}_{L}\right)$ can be defined by vanishing set of the different; this is an ideal in $\mathcal{O}_{L}$. In fact, the different is nothing but the annihilator of the module $\Omega_{\mathcal{O}_{L} / \mathcal{O}_{K}}$. Similarly, the discriminant is an ideal in $\mathcal{O}_{K}$, namely it is the norm of the different. The vanishing set of the discriminant is precisely the set of points of $K$ which ramify in $L$. Thus, denoting by $X$ the complement of the closed subset defined by the different in $\operatorname{Spec}\left(\mathcal{O}_{L}\right)$, we obtain a morphism $X \rightarrow \operatorname{Spec}\left(\mathcal{O}_{L}\right)$ which is unramified. Furthermore, this morphism is also flat, as any local homomorphism of discrete valuation rings is flat, and hence this morphism is actually étale. If $L / K$ is Galois, then denoting by $Y$ the complement of the closed subset defined by the discriminant in $\operatorname{Spec}\left(\mathcal{O}_{K}\right)$, we see that we get even a finite étale morphism $X \rightarrow Y$. Thus, this is an example of a finite étale covering.

### 40.9. Flat morphisms

0250 This section simply exists to summarize the properties of flatness that will be useful to us. Thus, we will be content with stating the theorems precisely and giving references for the proofs.

After briefly recalling the necessary facts about flat modules over Noetherian rings, we state a theorem of Grothendieck which gives sufficient conditions for "hyperplane sections" of certain modules to be flat.

0251 Definition 40.9.1. Flatness of modules and rings.
(1) A module $N$ over a ring $A$ is said to be flat if the functor $M \mapsto M \otimes_{A} N$ is exact.
(2) If this functor is also faithful, we say that $N$ is faithfully flat over $A$.
(3) A morphism of rings $f: A \rightarrow B$ is said to be flat (resp. faithfully flat) if the functor $M \mapsto M \otimes_{A} B$ is exact (resp. faithful and exact).

Here is a list of facts with references to the algebra chapter.
(1) Free and projective modules are flat. This is clear for free modules and follows for projective modules as they are direct summands of free modules and $\otimes$ commutes with direct sums.
(2) Flatness is a local property, that is, $M$ is flat over $A$ if and only if $M_{\mathfrak{p}}$ is flat over $A_{\mathfrak{p}}$ for all $\mathfrak{p} \in \operatorname{Spec}(A)$. See Algebra, Lemma 10.38.19.
(3) If $M$ is a flat $A$-module and $A \rightarrow B$ is a ring map, then $M \otimes_{A} B$ is a flat $B$-module. See Algebra, Lemma 10.38.7.
(4) Finite flat modules over local rings are free. See Algebra, Lemma 10.77.4.
(5) If $f: A \rightarrow B$ is a morphism of arbitrary rings, $f$ is flat if and only if the induced maps $A_{f^{-1}(\mathfrak{q})} \rightarrow B_{\mathfrak{q}}$ are flat for all $\mathfrak{q} \in \operatorname{Spec}(B)$. See Algebra, Lemma 10.38 .19
(6) If $f: A \rightarrow B$ is a local homomorphism of local rings, $f$ is flat if and only if it is faithfully flat. See Algebra, Lemma 10.38.17.
(7) A map $A \rightarrow B$ of rings is faithfully flat if and only if it is flat and the induced map on spectra is surjective. See Algebra, Lemma 10.38 .16 .
(8) If $A$ is a noetherian local ring, the completion $A^{\wedge}$ is faithfully flat over $A$. See Algebra, Lemma 10.96.3.
(9) Let $A$ be a Noetherian local ring and $M$ an $A$-module. Then $M$ is flat over $A$ if and only if $M \otimes_{A} A^{\wedge}$ is flat over $A^{\wedge}$. (Combine the previous statement with Algebra, Lemma 10.38.8.)
Before we move on to the geometric category, we present Grothendieck's theorem, which provides a convenient recipe for producing flat modules.

0252 Theorem 40.9.2. Let $A, B$ be Noetherian local rings. Let $f: A \rightarrow B$ be a local homomorphism. If $M$ is a finite $B$-module that is flat as an $A$-module, and $t \in \mathfrak{m}_{B}$ is an element such that multiplication by $t$ is injective on $M / \mathfrak{m}_{A} M$, then $M / t M$ is also $A$-flat.

Proof. See Algebra, Lemma 10.98.1. See also Mat70a, Section 20].
0253 Definition 40.9.3. (See Morphisms, Definition 28.25.1). Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module.
(1) Let $x \in X$. We say $\mathcal{F}$ is flat over $Y$ at $x \in X$ if $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{Y, f(x) \text {-module. }}$ This uses the map $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ to think of $\mathcal{F}_{x}$ as a $\mathcal{O}_{Y, f(x)}$-module.
(2) Let $x \in X$. We say $f$ is flat at $x \in X$ if $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is flat.
(3) We say $f$ is flat if it is flat at all points of $X$.
(4) A morphism $f: X \rightarrow Y$ that is flat and surjective is sometimes said to be faithfully flat.

Once again, here is a list of results:
(1) The property (of a morphism) of being flat is, by fiat, local in the Zariski topology on the source and the target.
(2) Open immersions are flat. (This is clear because it induces isomorphisms on local rings.)
(3) Flat morphisms are stable under base change and composition. Morphisms, Lemmas 28.25.7 and 28.25.5
(4) If $f: X \rightarrow Y$ is flat, then the pullback functor $Q \operatorname{Coh}\left(\mathcal{O}_{Y}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is exact. This is immediate by looking at stalks.
(5) Let $f: X \rightarrow Y$ be a morphism of schemes, and assume $Y$ is quasi-compact and quasi-separated. In this case if the functor $f^{*}$ is exact then $f$ is flat. (Proof omitted. Hint: Use Properties, Lemma 27.22.1 to see that $Y$ has "enough" ideal sheaves and use the characterization of flatness in Algebra, Lemma 10.38.5.)

### 40.10. Topological properties of flat morphisms

0254 We "recall" below some openness properties that flat morphisms enjoy.
0255 Theorem 40.10.1. Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The set of points in $X$ where $\mathcal{F}$ is flat over $S$ is an open set. In particular the set of points where $f$ is flat is open in $X$.

Proof. See More on Morphisms, Theorem 36.12.1.
039K Theorem 40.10.2. Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism which is flat and locally of finite type. Then $f$ is (universally) open.

Proof. See Morphisms, Lemma 28.25.9.
0256 Theorem 40.10.3. A faithfully flat quasi-compact morphism is a quotient map for the Zariski topology.

Proof. See Morphisms, Lemma 28.25.10.
An important reason to study flat morphisms is that they provide the adequate framework for capturing the notion of a family of schemes parametrized by the points of another scheme. Naively one may think that any morphism $f: X \rightarrow S$ should be thought of as a family parametrized by the points of $S$. However, without a flatness restriction on $f$, really bizarre things can happen in this so-called family. For instance, we aren't guaranteed that relative dimension (dimension of the fibres) is constant in a family. Other numerical invariants, such as the Hilbert polynomial, too may change from fibre to fibre. Flatness prevents such things from happening and, therefore, provides some "continuity" to the fibres.

### 40.11. Étale morphisms

0257 In this section, we will define étale morphisms and prove a number of important properties about them. The most important one, no doubt, is the functorial characterization presented in Theorem 40.16.1. Following this, we will also discuss a few properties of rings which are insensitive to an étale extension (properties which hold for a ring if and only if they hold for all its étale extensions) to motivate the
basic tenet of étale cohomology - étale morphisms are the algebraic analogue of local isomorphisms.

As the title suggests, we will define the class of étale morphisms - the class of morphisms (whose surjective families) we shall deem to be coverings in the category of schemes over a base scheme $S$ in order to define the étale site $S_{\text {étale }}$. Intuitively, an étale morphism is supposed to capture the idea of a covering space and, therefore, should be close to a local isomorphism. If we're working with varieties over algebraically closed fields, this last statement can be made into a definition provided we replace "local isomorphism" with "formal local isomorphism" (isomorphism after completion). One can then give a definition over any base field by asking that the base change to the algebraic closure be étale (in the aforementioned sense). But, rather than proceeding via such aesthetically displeasing constructions, we will adopt a cleaner, albeit slightly more abstract, algebraic approach.

We first define "étale homomorphisms of local rings" for Noetherian local rings. We cannot use the term "étale", as there already is a notion of an étale ring map (Algebra, Section 10.141) and it is different.

0258 Definition 40.11.1. Let $A, B$ be Noetherian local rings. A local homomorphism $f: A \rightarrow B$ is said to be a étale homomorphism of local rings if it is flat and an unramified homomorphism of local rings (please see Definition 40.3.1).

This is the local version of the definition of an étale ring map in Algebra, Section 10.141 . The exact definition given in that section is that it is a smooth ring map of relative dimension 0. It is shown (in Algebra, Lemma 10.141.2) that an étale $R$-algebra $S$ always has a presentation

$$
S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)
$$

such that

$$
g=\operatorname{det}\left(\begin{array}{cccc}
\partial f_{1} / \partial x_{1} & \partial f_{2} / \partial x_{1} & \ldots & \partial f_{n} / \partial x_{1} \\
\partial f_{1} / \partial x_{2} & \partial f_{2} / \partial x_{2} & \ldots & \partial f_{n} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{n} & \partial f_{2} / \partial x_{n} & \ldots & \partial f_{n} / \partial x_{n}
\end{array}\right)
$$

maps to an invertible element in $S$. The following two lemmas link the two notions.
039L Lemma 40.11.2. Let $A \rightarrow B$ be of finite type with $A$ a Noetherian ring. Let $\mathfrak{q}$ be a prime of $B$ lying over $\mathfrak{p} \subset A$. Then $A \rightarrow B$ is étale at $\mathfrak{q}$ if and only if $A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ is an étale homomorphism of local rings.

Proof. See Algebra, Lemmas 10.141.3 (flatness of étale maps), 10.141.5 (étale maps are unramified) and 10.141.7 (flat and unramified maps are étale).

039M Lemma 40.11.3. Let $A, B$ be Noetherian local rings. Let $A \rightarrow B$ be a local homomorphism such that $B$ is essentially of finite type over $A$. The following are equivalent
(1) $A \rightarrow B$ is an étale homomorphism of local rings
(2) $A^{\wedge} \rightarrow B^{\wedge}$ is an étale homomorphism of local rings, and
(3) $A^{\wedge} \rightarrow B^{\wedge}$ is étale.

Moreover, in this case $B^{\wedge} \cong\left(A^{\wedge}\right)^{\oplus n}$ as $A^{\wedge}$-modules for some $n \geq 1$.

Proof. To see the equivalences of (1), (2) and (3), as we have the corresponding results for unramified ring maps (Lemma 40.3.4) it suffices to prove that $A \rightarrow B$ is flat if and only if $A^{\wedge} \rightarrow B^{\wedge}$ is flat. This is clear from our lists of properties of flat maps since the ring maps $A \rightarrow A^{\wedge}$ and $B \rightarrow B^{\wedge}$ are faithfully flat. For the final statement, by Lemma 40.3.3 we see that $B^{\wedge}$ is a finite flat $A^{\wedge}$ module. Hence it is finite free by our list of properties on flat modules in Section 40.9 .

The integer $n$ which occurs in the lemma above is nothing other than the degree [ $\left.\kappa\left(\mathfrak{m}_{B}\right): \kappa\left(\mathfrak{m}_{A}\right)\right]$ of the residue field extension. In particular, if $\kappa\left(\mathfrak{m}_{A}\right)$ is separably closed, we see that $A^{\wedge} \rightarrow B^{\wedge}$ is an isomorphism, which vindicates our earlier claims.

0259 Definition 40.11.4. (See Morphisms, Definition 28.36.1.) Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be a morphism of schemes which is locally of finite type.
(1) Let $x \in X$. We say $f$ is étale at $x \in X$ if $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is an étale homomorphism of local rings.
(2) The morphism is said to be étale if it is étale at all its points.

Let us prove that this definition agrees with the definition in the chapter on morphisms of schemes. This in particular guarantees that the set of points where a morphism is étale is open.

039N Lemma 40.11.5. Let $Y$ be a locally Noetherian scheme. Let $f: X \rightarrow Y$ be locally of finite type. Let $x \in X$. The morphism $f$ is étale at $x$ in the sense of Definition 40.11.4 if and only if it is unramified at $x$ in the sense of Morphisms, Definition 28.36.1.

Proof. This follows from Lemma 40.11.2 and the definitions.
Here are some results on étale morphisms. The formulations as given in this list apply only to morphisms locally of finite type between locally Noetherian schemes. In each case we give a reference to the general result as proved earlier in the project, but in some cases one can prove the result more easily in the Noetherian case. Here is the list:
(1) An étale morphism is unramified. (Clear from our definitions.)
(2) Étaleness is local on the source and the target in the Zariski topology.
(3) Étale morphisms are stable under base change and composition. See Morphisms, Lemmas 28.36.4 and 28.36.3
(4) Étale morphisms of schemes are locally quasi-finite and quasi-compact étale morphisms are quasi-finite. (This is true because it holds for unramified morphisms as seen earlier.)
(5) Étale morphisms have relative dimension 0. See Morphisms, Definition 28.29 .1 and Morphisms, Lemma 28.29.5
(6) A morphism is étale if and only if it is flat and all its fibres are étale. See Morphisms, Lemma 28.36.8.
(7) Étale morphisms are open. This is true because an étale morphism is flat, and Theorem 40.10.2.
(8) Let $X$ and $Y$ be étale over a base scheme $S$. Any $S$-morphism from $X$ to $Y$ is étale. See Morphisms, Lemma 28.36.18.

### 40.12. The structure theorem

025A We present a theorem which describes the local structure of étale and unramified morphisms. Besides its obvious independent importance, this theorem also allows us to make the transition to another definition of étale morphisms that captures the geometric intuition better than the one we've used so far.

To state it we need the notion of a standard étale ring map, see Algebra, Definition 10.141.14. Namely, suppose that $R$ is a ring and $f, g \in R[t]$ are polynomials such that
(a) $f$ is a monic polynomial, and
(b) $f^{\prime}=\mathrm{d} f / \mathrm{d} t$ is invertible in the localization $R[t]_{g} /(f)$.

Then the map

$$
R \longrightarrow R[t]_{g} /(f)=R[t, 1 / g] /(f)
$$

is a standard étale algebra, and any standard étale algebra is isomorphic to one of these. It is a pleasant exercise to prove that such a ring map is flat, and unramified and hence étale (as expected of course). A special case of a standard étale ring map is any ring map

$$
R \longrightarrow R[t]_{f^{\prime}} /(f)=R\left[t, 1 / f^{\prime}\right] /(f)
$$

with $f$ a monic polynomial, and any standard étale algebra is (isomorphic to) a principal localization of one of these.

025B Theorem 40.12.1. Let $f: A \rightarrow B$ be an étale homomorphism of local rings. Then there exist $f, g \in A[t]$ such that
(1) $B^{\prime}=A[t]_{g} /(f)$ is standard étale - see (a) and (b) above, and
(2) $B$ is isomorphic to a localization of $B^{\prime}$ at a prime.

Proof. Write $B=B_{\mathfrak{q}}^{\prime}$ for some finite type $A$-algebra $B^{\prime}$ (we can do this because $B$ is essentially of finite type over $A$ ). By Lemma 40.11.2 we see that $A \rightarrow B^{\prime}$ is étale at q. Hence we may apply Algebra, Proposition 10.141.17 to see that a principal localization of $B^{\prime}$ is standard étale.

Here is the version for unramified homomorphisms of local rings.
039 O Theorem 40.12.2. Let $f: A \rightarrow B$ be an unramified morphism of local rings. Then there exist $f, g \in A[t]$ such that
(1) $B^{\prime}=A[t]_{g} /(f)$ is standard étale - see (a) and (b) above, and
(2) $B$ is isomorphic to a quotient of a localization of $B^{\prime}$ at a prime.

Proof. Write $B=B_{\mathfrak{q}}^{\prime}$ for some finite type $A$-algebra $B^{\prime}$ (we can do this because $B$ is essentially of finite type over $A$ ). By Lemma 40.3 .2 we see that $A \rightarrow B^{\prime}$ is unramified at $\mathfrak{q}$. Hence we may apply Algebra, Proposition 10.147 .8 to see that a principal localization of $B^{\prime}$ is a quotient of a standard étale $A$-algebra.

Via standard lifting arguments, one then obtains the following geometric statement which will be of essential use to us.

025C Theorem 40.12.3. Let $\varphi: X \rightarrow Y$ be a morphism of schemes. Let $x \in X$. If $\varphi$ is étale at $x$, then there exist exist affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and
$\varphi(U) \subset V$ such that we have the following diagram

where $j$ is an open immersion, and $f \in R[t]$ is monic.
Proof. This is equivalent to Morphisms, Lemma 28.36.14 although the statements differ slightly.

### 40.13. Étale and smooth morphisms

039P An étale morphism is smooth of relative dimension zero. The projection $\mathbf{A}_{S}^{n} \rightarrow S$ is a standard example of a smooth morphism of relative dimension $n$. It turns out that any smooth morphism is étale locally of this form. Here is the precise statement.

039Q Theorem 40.13.1. Let $\varphi: X \rightarrow Y$ be a morphism of schemes. Let $x \in X$. If $\varphi$ is smooth at $x$, then there exist exist and integer $n \geq 0$ and affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and $\varphi(U) \subset V$ such that there exists a commutative diagram

where $\pi$ is étale.
Proof. See Morphisms, Lemma 28.36.20.

### 40.14. Topological properties of étale morphisms

025 F We present a few of the topological properties of étale and unramified morphisms. First, we give what Grothendieck calls the fundamental property of étale morphisms, see Gro71, Exposé I.5].

025G Theorem 40.14.1. Let $f: X \rightarrow Y$ be a morphism of schemes. The following are equivalent:
(1) $f$ is an open immersion,
(2) $f$ is universally injective and étale, and
(3) $f$ is a flat monomorphism, locally of finite presentation.

Proof. An open immersion is universally injective since any base change of an open immersion is an open immersion. Moreover, it is étale by Morphisms, Lemma 28.36.9. Hence (1) implies (2).

Assume $f$ is universally injective and étale. Since $f$ is étale it is flat and locally of finite presentation, see Morphisms, Lemmas 28.36.12 and 28.36.11. By Lemma 40.7 .1 we see that $f$ is a monomorphism. Hence (2) implies (3).

Assume $f$ is flat, locally of finite presentation, and a monomorphism. Then $f$ is open, see Morphisms, Lemma 28.25.9. Thus we may replace $Y$ by $f(X)$ and we may assume $f$ is surjective. Then $f$ is open and bijective hence a homeomorphism.

Hence $f$ is quasi-compact. Hence Descent, Lemma 34.21.1 shows that $f$ is an isomorphism and we win.

Here is another result of a similar flavor.
04DH Lemma 40.14.2. Let $\pi: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that
(1) $\pi$ is finite,
(2) $\pi$ is étale,
(3) $\pi^{-1}(\{s\})=\{x\}$, and
(4) $\kappa(s) \subset \kappa(x)$ is purely inseparabl $\ell^{2}$.

Then there exists an open neighbourhood $U$ of $s$ such that $\left.\pi\right|_{\pi^{-1}(U)}: \pi^{-1}(U) \rightarrow U$ is an isomorphism.

Proof. By Lemma 40.7.3 there exists an open neighbourhood $U$ of $s$ such that $\left.\pi\right|_{\pi^{-1}(U)}: \pi^{-1}(U) \rightarrow U$ is a closed immersion. But a morphism which is étale and a closed immersion is an open immersion (for example by Theorem 40.14.1). Hence after shrinking $U$ we obtain an isomorphism.

### 40.15. Topological invariance of the étale topology

06NE Next, we present an extremely crucial theorem which, roughly speaking, says that étaleness is a topological property.

025H Theorem 40.15.1. Let $X$ and $Y$ be two schemes over a base scheme $S$. Let $S_{0}$ be a closed subscheme of $S$ whose ideal sheaf has square zero. Denote $X_{0}$ (resp. $Y_{0}$ ) the base change $S_{0} \times_{S} X$ (resp. $S_{0} \times_{S} Y$ ). If $X$ is étale over $S$, then the map

$$
\operatorname{Mor}_{S}(Y, X) \longrightarrow \operatorname{Mor}_{S_{0}}\left(Y_{0}, X_{0}\right)
$$

is bijective.
Proof. After base changing via $Y \rightarrow S$, we may assume that $Y=S$. In this case the theorem states that any $S$-morphism $\sigma_{0}: S_{0} \rightarrow X$ actually factors uniquely through a section $S \rightarrow X$ of the étale structure morphism $X \rightarrow S$.

Existence. Since we have equality of underlying topological spaces $\left|S_{0}\right|=|S|$ and $\left|X_{0}\right|=|X|$, by Theorem 40.6.2, the section $\sigma_{0}$ is uniquely determined by a connected component $X^{\prime}$ of $X$ such that the base change $X_{0}^{\prime}=S_{0} \times_{S} X^{\prime}$ maps isomorphically to $S_{0}$. In particular, $X^{\prime} \rightarrow S$ is a universal homeomorphism and therefore universally injective. Since $X^{\prime} \rightarrow S$ is étale, it follows from Theorem40.14.1 that $X^{\prime} \rightarrow S$ is an isomorphism and, therefore, it has an inverse $\sigma$ which is the required section.

Uniqueness. This follows from Theorem 40.5.1, or directly from Theorem 40.6.2, or, if one carefuly observes, from our proof itself.

From the proof of preceeding theorem, we also obtain one direction of the promised functorial characterization of étale morphisms. The following theorem will be strengthened in Étale Cohomology, Theorem 49.46.1.

[^113]039R Theorem 40.15.2 (Une equivalence remarquable de catégories). Let $S$ be a scheme. Let $S_{0} \subset S$ be a closed subscheme defined by an ideal with square zero. The functor

$$
X \longmapsto X_{0}=S_{0} \times_{S} X
$$

defines an equivalence of categories

$$
\{\text { schemes } X \text { étale over } S\} \leftrightarrow\left\{\text { schemes } X_{0} \text { étale over } S_{0}\right\}
$$

Proof. By Theorem 40.15.1 we see that this functor is fully faithful. It remains to show that the functor is essentially surjective. Let $Y \rightarrow S_{0}$ be an étale morphism of schemes.
Suppose that the result holds if $S$ and $Y$ are affine. In that case, we choose an affine open covering $Y=\bigcup V_{j}$ such that each $V_{j}$ maps into an affine open of $S$. By assumption (affine case) we can find étale morphisms $W_{j} \rightarrow S$ such that $W_{j, 0} \cong V_{j}$ (as schemes over $S_{0}$ ). Let $W_{j, j^{\prime}} \subset W_{j}$ be the open subscheme whose underlying topological space corresponds to $V_{j} \cap V_{j^{\prime}}$. Because we have isomorphisms

$$
W_{j, j^{\prime}, 0} \cong V_{j} \cap V_{j^{\prime}} \cong W_{j^{\prime}, j, 0}
$$

as schemes over $S_{0}$ we see by fully faithfulness that we obtain isomorphisms $\theta_{j, j^{\prime}}$ : $W_{j, j^{\prime}} \rightarrow W_{j^{\prime}, j}$ of schemes over $S$. We omit the verification that these isomorphisms satisfy the cocycle condition of Schemes, Section 25.14 Applying Schemes, Lemma 25.14 .2 we obtain a scheme $X \rightarrow S$ by glueing the schemes $W_{j}$ along the identifications $\theta_{j, j^{\prime}}$. It is clear that $X \rightarrow S$ is étale and $X_{0} \cong Y$ by construction.

Thus it suffices to show the lemma in case $S$ and $Y$ are affine. Say $S=\operatorname{Spec}(R)$ and $S_{0}=\operatorname{Spec}(R / I)$ with $I^{2}=0$. By Algebra, Lemma 10.141 .2 we know that $Y$ is the spectrum of a ring $\bar{A}$ with

$$
\bar{A}=(R / I)\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{n}\right)
$$

such that

$$
\bar{g}=\operatorname{det}\left(\begin{array}{cccc}
\partial \bar{f}_{1} / \partial x_{1} & \partial \bar{f}_{2} / \partial x_{1} & \ldots & \partial \bar{f}_{n} / \partial x_{1} \\
\partial \bar{f}_{1} / \partial x_{2} & \partial \bar{f}_{2} / \partial x_{2} & \ldots & \partial \bar{f}_{n} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial \bar{f}_{1} / \partial x_{n} & \partial \bar{f}_{2} / \partial x_{n} & \ldots & \partial \bar{f}_{n} / \partial x_{n}
\end{array}\right)
$$

maps to an invertible element in $A$. Choose any lifts $f_{i} \in R\left[x_{1}, \ldots, x_{n}\right]$. Since $I$ is nilpotent it follows that the determinant of the matrix of partials of the $f_{i}$ is invertible in the algebra $A$ defined by

$$
A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)
$$

Hence $R \rightarrow A$ is étale and $(R / I) \otimes_{R} A \cong \bar{A}$. To prove the general case one argues with glueing affine pieces.

### 40.16. The functorial characterization

025J We finally present the promised functorial characterization. Thus there are four ways to think about étale morphisms of schemes:
(1) as a smooth morphism of relative dimension 0 ,
(2) as locally finitely presented, flat, and unramified morphisms,
(3) using the structure theorem, and
(4) using the functorial characterization.

025K Theorem 40.16.1. Let $f: X \rightarrow S$ be a morphism that is locally of finite presentation. The following are equivalent
(1) $f$ is étale,
(2) for all affine $S$-schemes $Y$, and closed subschemes $Y_{0} \subset Y$ defined by square-zero ideals, the natural map

$$
\operatorname{Mor}_{S}(Y, X) \longrightarrow \operatorname{Mor}_{S}\left(Y_{0}, X\right)
$$

is bijective.
Proof. This is More on Morphisms, Lemma 36.6.9,
This characterization says that solutions to the equations defining $X$ can be lifted uniquely through nilpotent thickenings.

### 40.17. Étale local structure of unramified morphisms

04HG In the chapter More on Morphisms, Section 36.30 the reader can find some results on the étale local structure of quasi-finite morphisms. In this section we want to combine this with the topological properties of unramified morphisms we have seen in this chapter. The basic overall picture to keep in mind is

see More on Morphisms, Equation 36.30.0.1. We start with a very general case.
04HH Lemma 40.17.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x_{1}, \ldots, x_{n} \in X$ be points having the same image $s$ in $S$. Assume $f$ is unramified at each $x_{i}$. Then there exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and opens $V_{i, j} \subset X_{U}, i=1, \ldots, n$, $j=1, \ldots, m_{i}$ such that
(1) $V_{i, j} \rightarrow U$ is a closed immersion passing through $u$,
(2) $u$ is not in the image of $V_{i, j} \cap V_{i^{\prime}, j^{\prime}}$ unless $i=i^{\prime}$ and $j=j^{\prime}$, and
(3) any point of $\left(X_{U}\right)_{u}$ mapping to $x_{i}$ is in some $V_{i, j}$.

Proof. By Morphisms, Definition 28.35 .1 there exists an open neighbourhood of each $x_{i}$ which is locally of finite type over $S$. Replacing $X$ by an open neighbourhood of $\left\{x_{1}, \ldots, x_{n}\right\}$ we may assume $f$ is locally of finite type. Apply More on Morphisms, Lemma 36.30 .3 to get the étale neighbourhood $(U, u)$ and the opens $V_{i, j}$ finite over $U$. By Lemma 40.7.3 after possibly shrinking $U$ we get that $V_{i, j} \rightarrow U$ is a closed immersion.

04HI Lemma 40.17.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x_{1}, \ldots, x_{n} \in X$ be points having the same image $s$ in $S$. Assume $f$ is separated and $f$ is unramified at each $x_{i}$. Then there exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and a disjoint union decomposition

$$
X_{U}=W \amalg \coprod_{i, j} V_{i, j}
$$

such that
(1) $V_{i, j} \rightarrow U$ is a closed immersion passing through $u$,
(2) the fibre $W_{u}$ contains no point mapping to any $x_{i}$.

In particular, if $f^{-1}(\{s\})=\left\{x_{1}, \ldots, x_{n}\right\}$, then the fibre $W_{u}$ is empty.

Proof. Apply Lemma 40.17.1. We may assume $U$ is affine, so $X_{U}$ is separated. Then $V_{i, j} \rightarrow X_{U}$ is a closed map, see Morphisms, Lemma 28.41.7. Suppose $(i, j) \neq$ $\left(i^{\prime}, j^{\prime}\right)$. Then $V_{i, j} \cap V_{i^{\prime}, j^{\prime}}$ is closed in $V_{i, j}$ and its image in $U$ does not contain $u$. Hence after shrinking $U$ we may assume that $V_{i, j} \cap V_{i^{\prime}, j^{\prime}}=\emptyset$. Moreover, $\bigcup V_{i, j}$ is a closed and open subscheme of $X_{U}$ and hence has an open and closed complement $W$. This finishes the proof.
The following lemma is in some sense much weaker than the preceding one but it may be useful to state it explicitly here. It says that a finite unramified morphism is étale locally on the base a closed immersion.

04HJ Lemma 40.17.3. Let $f: X \rightarrow S$ be a finite unramified morphism of schemes. Let $s \in S$. There exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and a disjoint union decomposition

$$
X_{U}=\coprod_{j} V_{j}
$$

such that each $V_{j} \rightarrow U$ is a closed immersion.
Proof. Since $X \rightarrow S$ is finite the fibre over $S$ is a finite set $\left\{x_{1}, \ldots, x_{n}\right\}$ of points of $X$. Apply Lemma 40.17 .2 to this set (a finite morphism is separated, see Morphisms, Section 28.43). The image of $W$ in $U$ is a closed subset (as $X_{U} \rightarrow U$ is finite, hence proper) which does not contain $u$. After removing this from $U$ we see that $W=\emptyset$ as desired.

### 40.18. Étale local structure of étale morphisms

04 HK This is a bit silly, but perhaps helps form intuition about étale morphisms. We simply copy over the results of Section 40.17 and change "closed immersion" into "isomorphism".

04HL Lemma 40.18.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x_{1}, \ldots, x_{n} \in X$ be points having the same image $s$ in $S$. Assume $f$ is étale at each $x_{i}$. Then there exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and opens $V_{i, j} \subset X_{U}, i=1, \ldots, n$, $j=1, \ldots, m_{i}$ such that
(1) $V_{i, j} \rightarrow U$ is an isomorphism,
(2) $u$ is not in the image of $V_{i, j} \cap V_{i^{\prime}, j^{\prime}}$ unless $i=i^{\prime}$ and $j=j^{\prime}$, and
(3) any point of $\left(X_{U}\right)_{u}$ mapping to $x_{i}$ is in some $V_{i, j}$.

Proof. An étale morphism is unramified, hence we may apply Lemma 40.17.1. Now $V_{i, j} \rightarrow U$ is a closed immersion and étale. Hence it is an open immersion, for example by Theorem 40.14.1. Replace $U$ by the intersection of the images of $V_{i, j} \rightarrow U$ to get the lemma.
04HM Lemma 40.18.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x_{1}, \ldots, x_{n} \in X$ be points having the same image $s$ in $S$. Assume $f$ is separated and $f$ is étale at each $x_{i}$. Then there exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and a disjoint union decomposition

$$
X_{U}=W \amalg \coprod_{i, j} V_{i, j}
$$

such that
(1) $V_{i, j} \rightarrow U$ is an isomorphism,
(2) the fibre $W_{u}$ contains no point mapping to any $x_{i}$.

In particular, if $f^{-1}(\{s\})=\left\{x_{1}, \ldots, x_{n}\right\}$, then the fibre $W_{u}$ is empty.

Proof. An étale morphism is unramified, hence we may apply Lemma 40.17.2. As in the proof of Lemma 40.18 .1 the morphisms $V_{i, j} \rightarrow U$ are open immersions and we win after replacing $U$ by the intersection of their images.

The following lemma is in some sense much weaker than the preceding one but it may be useful to state it explicitly here. It says that a finite étale morphism is étale locally on the base a "topological covering space", i.e., a finite product of copies of the base.

04HN Lemma 40.18.3. Let $f: X \rightarrow S$ be a finite étale morphism of schemes. Let $s \in S$. There exists an étale neighbourhood $(U, u) \rightarrow(S, s)$ and a disjoint union decomposition

$$
X_{U}=\coprod_{j} V_{j}
$$

such that each $V_{j} \rightarrow U$ is an isomorphism.
Proof. An étale morphism is unramified, hence we may apply Lemma 40.17.3. As in the proof of Lemma 40.18.1 we see that $V_{i, j} \rightarrow U$ is an open immersion and we win after replacing $U$ by the intersection of their images.

### 40.19. Permanence properties

025L In what follows, we present a few "permanence" properties of étale homomorphisms of Noetherian local rings (as defined in Definition 40.11.1). See More on Algebra, Sections 15.34 and 15.36 for the analogue of this material for the completion and henselization of a Noetherian local ring.

039 Lemma 40.19.1. Let $A, B$ be Noetherian local rings. Let $A \rightarrow B$ be a étale homomorphism of local rings. Then $\operatorname{dim}(A)=\operatorname{dim}(B)$.

Proof. See for example Algebra, Lemma 10.111.7.
039T Proposition 40.19.2. Let $A, B$ be Noetherian local rings. Let $f: A \rightarrow B$ be an étale homomorphism of local rings. Then $\operatorname{depth}(A)=\operatorname{depth}(B)$

Proof. See Algebra, Lemma 10.155 .2
025Q Proposition 40.19.3. Let $A, B$ be Noetherian local rings. Let $f: A \rightarrow B$ be an étale homomorphism of local rings. Then $A$ is Cohen-Macaulay if and only if $B$ is so.

Proof. A local ring $A$ is Cohen-Macaulay if and only $\operatorname{dim}(A)=\operatorname{depth}(A)$. As both of these invariants is preserved under an étale extension, the claim follows.

025N Proposition 40.19.4. Let $A, B$ be Noetherian local rings. Let $f: A \rightarrow B$ be an étale homomorphism of local rings. Then $A$ is regular if and only if $B$ is so.

Proof. If $B$ is regular, then $A$ is regular by Algebra, Lemma 10.109 .9 . Assume $A$ is regular. Let $\mathfrak{m}$ be the maximal ideal of $A$. Then $\operatorname{dim}_{\kappa(\mathfrak{m})} \mathfrak{m} / \mathfrak{m}^{2}=\operatorname{dim}(A)=\operatorname{dim}(B)$ (see Lemma 40.19.1). On the other hand, $\mathfrak{m} B$ is the maximal ideal of $B$ and hence $\mathfrak{m}_{B} / \mathfrak{m}_{B}=\mathfrak{m} B / \mathfrak{m}^{2} B$ is generated by at most $\operatorname{dim}(B)$ elements. Thus $B$ is regular. (You can also use the slightly more general Algebra, Lemma 10.111.8.)

025 O Proposition 40.19.5. Let $A, B$ be Noetherian local rings. Let $f: A \rightarrow B$ be an étale homomorphism of local rings. Then $A$ is reduced if and only if $B$ is so.

Proof. It is clear from the faithful flatness of $A \rightarrow B$ that if $B$ is reduced, so is $A$. See also Algebra, Lemma 10.156.2. Conversely, assume $A$ is reduced. By assumption $B$ is a localization of a finite type $A$-algebra $B^{\prime}$ at some prime $\mathfrak{q}$. After replacing $B^{\prime}$ by a localization we may assume that $B^{\prime}$ is étale over $A$, see Lemma 40.11.2 Then we see that Algebra, Lemma 10.155 .6 applies to $A \rightarrow B^{\prime}$ and $B^{\prime}$ is reduced. Hence $B$ is reduced.

039U Remark 40.19.6. The result on "reducedness" does not hold with a weaker definition of étale local ring maps $A \rightarrow B$ where one drops the assumption that $B$ is essentially of finite type over $A$. Namely, it can happen that a Noetherian local domain $A$ has nonreduced completion $A^{\wedge}$, see Examples, Section 88.15. But the ring $\operatorname{map} A \rightarrow A^{\wedge}$ is flat, and $\mathfrak{m}_{A} A^{\wedge}$ is the maximal ideal of $A^{\wedge}$ and of course $A$ and $A^{\wedge}$ have the same residue fields. This is why it is important to consider this notion only for ring extensions which are essentially of finite type (or essentially of finite presentation if $A$ is not Noetherian).

025P Proposition 40.19.7. Let $A, B$ be Noetherian local rings. Let $f: A \rightarrow B$ be an étale homomorphism of local rings. Then $A$ is a normal domain if and only if $B$ is so.

Proof. See Algebra, Lemma 10.156 .3 for descending normality. Conversely, assume $A$ is normal. By assumption $B$ is a localization of a finite type $A$-algebra $B^{\prime}$ at some prime $\mathfrak{q}$. After replacing $B^{\prime}$ by a localization we may assume that $B^{\prime}$ is étale over $A$, see Lemma 40.11.2. Then we see that Algebra, Lemma 10.155.7 applies to $A \rightarrow B^{\prime}$ and we conclude that $B^{\prime}$ is normal. Hence $B$ is a normal domain.

The preceeding propositions give some indication as to why we'd like to think of étale maps as "local isomorphisms". Another property that gives an excellent indication that we have the "right" definition is the fact that for C-schemes of finite type, a morphism is étale if and only if the associated morphism on analytic spaces (the $\mathbf{C}$-valued points given the complex topology) is a local isomorphism in the analytic sense (open embedding locally on the source). This fact can be proven with the aid of the structure theorem and the fact that the analytification commutes with the formation of the completed local rings - the details are left to the reader.

## CHAPTER 41

## Chow Homology and Chern Classes

### 41.1. Introduction

02P4 In this chapter we discuss Chow homology groups and the construction of chern classes of vector bundles as elements of operational Chow cohomology groups (everything with $\mathbf{Z}$-coefficients).
In the first part of this chapter we work on determinants of finite length modules, we define periodic complexes, their determinants, and properties of these. All of this is done to give a direct proof of the Key Lemma 41.7.1. Presumably a more standard approach to this lemma would be to use K-theory of local Noetherian rings.

Next, we introduce the basic setup we work with in the rest of this chapter in Section 41.8. To make the material a little bit more challenging we decided to treat a somewhat more general case than is usually done. Namely we assume our schemes $X$ are locally of finite type over a fixed locally Noetherian base scheme which is universally catenary and is endowed with a dimension function. These assumption suffice to be able to define the Chow homology groups $A_{*}(X)$ and the action of capping with chern classes on them. This is an indication that we should be able to define these also for algebraic stacks locally of finite type over such a base.

Next, we follow the first few chapters of Ful98 in order to define cycles, flat pullback, proper pushforward, and rational equivalence, except that we have been less precise about the supports of the cycles involved.

We diverge from the presentation given in [Ful98] by using the Key lemma mentioned above to prove a basic commutativity relation in Section 41.26 . Using this we prove that the operation of intersecting with an invertible sheaf passes through rational equivalence and is commutative, see Section 41.27. One more application of the Key lemma proves that the Gysin map of an effective Cartier divisor passes through rational equivalence, see Section 41.29. Having proved this, it is straightforward to define chern classes of vector bundles, prove additivity, prove the splitting principle, introduce chern characters, Todd classes, and state the Grothendieck-Riemann-Roch theorem.

In the appendix we collect some hints to different approaches to this material.
We will return to the Chow groups $A_{*}(X)$ for smooth projective varieties over algebraically closed fields in the next chapter. Using a moving lemma as in Sam56, Che58a, and Che58b and Serre's Tor-formula (see Ser00 or Ser65]) we will define a ring structure on $A_{*}(X)$. See Intersection Theory, Section 42.1ff.

### 41.2. Determinants of finite length modules

02P5 The material in this section is related to the material in the paper [KM76] and to the material in the thesis Ros09.
Given any field $\kappa$ and any finite dimensional $\kappa$-vector space $V$ we set $\operatorname{det}_{\kappa}(V)=$ $\wedge^{n}(V)$ where $n=\operatorname{dim}_{\kappa}(V)$. We will generalize this to finite length modules over local rings. If the local ring contains a field, then the determinant constructed below is a "usual" determinant, see Remark 41.2.8.
02P6 Definition 41.2.1. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. Let $M$ be a finite length $R$-module. Say $l=\operatorname{length}_{R}(M)$.
(1) Given elements $x_{1}, \ldots, x_{r} \in M$ we denote $\left\langle x_{1}, \ldots, x_{r}\right\rangle=R x_{1}+\ldots+R x_{r}$ the $R$-submodule of $M$ generated by $x_{1}, \ldots, x_{r}$.
(2) We will say an $l$-tuple of elements $\left(e_{1}, \ldots, e_{l}\right)$ of $M$ is admissible if $\mathfrak{m} e_{i} \in$ $\left\langle e_{1}, \ldots, e_{i-1}\right\rangle$ for $i=1, \ldots, l$.
(3) A symbol $\left[e_{1}, \ldots, e_{l}\right]$ will mean $\left(e_{1}, \ldots, e_{l}\right)$ is an admissible $l$-tuple.
(4) An admissible relation between symbols is one of the following:
(a) if $\left(e_{1}, \ldots, e_{l}\right)$ is an admissible sequence and for some $1 \leq a \leq l$ we have $e_{a} \in\left\langle e_{1}, \ldots, e_{a-1}\right\rangle$, then $\left[e_{1}, \ldots, e_{l}\right]=0$,
(b) if $\left(e_{1}, \ldots, e_{l}\right)$ is an admissible sequence and for some $1 \leq a \leq l$ we have $e_{a}=\lambda e_{a}^{\prime}+x$ with $\lambda \in R^{*}$, and $x \in\left\langle e_{1}, \ldots, e_{a-1}\right\rangle$, then

$$
\left[e_{1}, \ldots, e_{l}\right]=\bar{\lambda}\left[e_{1}, \ldots, e_{a-1}, e_{a}^{\prime}, e_{a+1}, \ldots, e_{l}\right]
$$

where $\bar{\lambda} \in \kappa^{*}$ is the image of $\lambda$ in the residue field, and
(c) if $\left(e_{1}, \ldots, e_{l}\right)$ is an admissible sequence and $\mathfrak{m} e_{a} \subset\left\langle e_{1}, \ldots, e_{a-2}\right\rangle$ then

$$
\left[e_{1}, \ldots, e_{l}\right]=-\left[e_{1}, \ldots, e_{a-2}, e_{a}, e_{a-1}, e_{a+1}, \ldots, e_{l}\right]
$$

(5) We define the determinant of the finite length $R$-module $M$ to be

$$
\operatorname{det}_{\kappa}(M)=\left\{\frac{\kappa \text {-vector space generated by symbols }}{\kappa \text {-linear combinations of admissible relations }}\right\}
$$

We stress that always $l=$ length $_{R}(M)$. We also stress that it does not follow that the symbol $\left[e_{1}, \ldots, e_{l}\right]$ is additive in the entries (this will typically not be the case). Before we can show that the determinant $\operatorname{det}_{\kappa}(M)$ actually has dimension 1 we have to show that it has dimension at most 1.

02P7 Lemma 41.2.2. With notations as above we have $\operatorname{dim}_{\kappa}\left(\operatorname{det}_{\kappa}(M)\right) \leq 1$.
Proof. Fix an admissible sequence $\left(f_{1}, \ldots, f_{l}\right)$ of $M$ such that

$$
\operatorname{length}_{R}\left(\left\langle f_{1}, \ldots, f_{i}\right\rangle\right)=i
$$

for $i=1, \ldots, l$. Such an admissible sequence exists exactly because $M$ has length $l$. We will show that any element of $\operatorname{det}_{\kappa}(M)$ is a $\kappa$-multiple of the symbol $\left[f_{1}, \ldots, f_{l}\right]$. This will prove the lemma.

Let $\left(e_{1}, \ldots, e_{l}\right)$ be an admissible sequence of $M$. It suffices to show that $\left[e_{1}, \ldots, e_{l}\right]$ is a multiple of $\left[f_{1}, \ldots, f_{l}\right]$. First assume that $\left\langle e_{1}, \ldots, e_{l}\right\rangle \neq M$. Then there exists an $i \in[1, \ldots, l]$ such that $e_{i} \in\left\langle e_{1}, \ldots, e_{i-1}\right\rangle$. It immediately follows from the first admissible relation that $\left[e_{1}, \ldots, e_{n}\right]=0$ in $\operatorname{det}_{\kappa}(M)$. Hence we may assume that $\left\langle e_{1}, \ldots, e_{l}\right\rangle=M$. In particular there exists a smallest index $i \in\{1, \ldots, l\}$ such that $f_{1} \in\left\langle e_{1}, \ldots, e_{i}\right\rangle$. This means that $e_{i}=\lambda f_{1}+x$ with $x \in\left\langle e_{1}, \ldots, e_{i-1}\right\rangle$ and $\lambda \in R^{*}$. By the second admissible relation this means that $\left[e_{1}, \ldots, e_{l}\right]=$
$\bar{\lambda}\left[e_{1}, \ldots, e_{i-1}, f_{1}, e_{i+1}, \ldots, e_{l}\right]$. Note that $\mathfrak{m} f_{1}=0$. Hence by applying the third admissible relation $i-1$ times we see that

$$
\left[e_{1}, \ldots, e_{l}\right]=(-1)^{i-1} \bar{\lambda}\left[f_{1}, e_{1}, \ldots, e_{i-1}, e_{i+1}, \ldots, e_{l}\right]
$$

Note that it is also the case that $\left\langle f_{1}, e_{1}, \ldots, e_{i-1}, e_{i+1}, \ldots, e_{l}\right\rangle=M$. By induction suppose we have proven that our original symbol is equal to a scalar times

$$
\left[f_{1}, \ldots, f_{j}, e_{j+1}, \ldots, e_{l}\right]
$$

for some admissible sequence $\left(f_{1}, \ldots, f_{j}, e_{j+1}, \ldots, e_{l}\right)$ whose elements generate $M$, i.e., with $\left\langle f_{1}, \ldots, f_{j}, e_{j+1}, \ldots, e_{l}\right\rangle=M$. Then we find the smallest $i$ such that $f_{j+1} \in\left\langle f_{1}, \ldots, f_{j}, e_{j+1}, \ldots, e_{i}\right\rangle$ and we go through the same process as above to see that

$$
\left[f_{1}, \ldots, f_{j}, e_{j+1}, \ldots, e_{l}\right]=(\text { scalar })\left[f_{1}, \ldots, f_{j}, f_{j+1}, e_{j+1}, \ldots, \hat{e_{i}}, \ldots, e_{l}\right]
$$

Continuing in this vein we obtain the desired result.
Before we show that $\operatorname{det}_{\kappa}(M)$ always has dimension 1, let us show that it agrees with the usual top exterior power in the case the module is a vector space over $\kappa$.

02P8 Lemma 41.2.3. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. Let $M$ be a finite length $R$-module which is annihilated by $\mathfrak{m}$. Let $l=\operatorname{dim}_{\kappa}(M)$. Then the map

$$
\operatorname{det}_{\kappa}(M) \longrightarrow \wedge_{\kappa}^{l}(M), \quad\left[e_{1}, \ldots, e_{l}\right] \longmapsto e_{1} \wedge \ldots \wedge e_{l}
$$

is an isomorphism.
Proof. It is clear that the rule described in the lemma gives a $\kappa$-linear map since all of the admissible relations are satisfied by the usual symbols $e_{1} \wedge \ldots \wedge e_{l}$. It is also clearly a surjective map. Since by Lemma 41.2 .2 the left hand side has dimension at most one we see that the map is an isomorphism.

02P9 Lemma 41.2.4. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. Let $M$ be a finite length $R$-module. The determinant $\operatorname{det}_{\kappa}(M)$ defined above is a $\kappa$-vector space of dimension 1. It is generated by the symbol $\left[f_{1}, \ldots, f_{l}\right]$ for any admissible sequence such that $\left\langle f_{1}, \ldots f_{l}\right\rangle=M$.
Proof. We know $\operatorname{det}_{\kappa}(M)$ has dimension at most 1 , and in fact that it is generated by $\left[f_{1}, \ldots, f_{l}\right]$, by Lemma 41.2 .2 and its proof. We will show by induction on $l=\operatorname{length}(M)$ that it is nonzero. For $l=1$ it follows from Lemma 41.2.3 Choose a nonzero element $f \in M$ with $\mathfrak{m} f=0$. Set $\bar{M}=M /\langle f\rangle$, and denote the quotient $\operatorname{map} x \mapsto \bar{x}$. We will define a surjective map

$$
\psi: \operatorname{det}_{k}(M) \rightarrow \operatorname{det}_{\kappa}(\bar{M})
$$

which will prove the lemma since by induction the determinant of $\bar{M}$ is nonzero.
We define $\psi$ on symbols as follows. Let $\left(e_{1}, \ldots, e_{l}\right)$ be an admissible sequence. If $f \notin\left\langle e_{1}, \ldots, e_{l}\right\rangle$ then we simply set $\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right)=0$. If $f \in\left\langle e_{1}, \ldots, e_{l}\right\rangle$ then we choose an $i$ minimal such that $f \in\left\langle e_{1}, \ldots, e_{i}\right\rangle$. We may write $e_{i}=\lambda f+x$ for some unit $\lambda \in R$ and $x \in\left\langle e_{1}, \ldots, e_{i-1}\right\rangle$. In this case we set

$$
\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right)=(-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]
$$

Note that it is indeed the case that $\left(\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right)$ is an admissible sequence in $\bar{M}$, so this makes sense. Let us show that extending this rule $\kappa$-linearly
to linear combinations of symbols does indeed lead to a map on determinants. To do this we have to show that the admissible relations are mapped to zero.
Type (a) relations. Suppose we have $\left(e_{1}, \ldots, e_{l}\right)$ an admissible sequence and for some $1 \leq a \leq l$ we have $e_{a} \in\left\langle e_{1}, \ldots, e_{a-1}\right\rangle$. Suppose that $f \in\left\langle e_{1}, \ldots, e_{i}\right\rangle$ with $i$ minimal. Then $i \neq a$ and $\bar{e}_{a} \in\left\langle\bar{e}_{1}, \ldots, \hat{\bar{e}}_{i}, \ldots, \bar{e}_{a-1}\right\rangle$ if $i<a$ or $\bar{e}_{a} \in$ $\left\langle\bar{e}_{1}, \ldots, \bar{e}_{a-1}\right\rangle$ if $i>a$. Thus the same admissible relation for $\operatorname{det}_{\kappa}(\bar{M})$ forces the symbol $\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]$ to be zero as desired.
Type (b) relations. Suppose we have $\left(e_{1}, \ldots, e_{l}\right)$ an admissible sequence and for some $1 \leq a \leq l$ we have $e_{a}=\lambda e_{a}^{\prime}+x$ with $\lambda \in R^{*}$, and $x \in\left\langle e_{1}, \ldots, e_{a-1}\right\rangle$. Suppose that $f \in\left\langle e_{1}, \ldots, e_{i}\right\rangle$ with $i$ minimal. Say $e_{i}=\mu f+y$ with $y \in\left\langle e_{1}, \ldots, e_{i-1}\right\rangle$. If $i<a$ then the desired equality is
$(-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]=(-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{a-1}, \bar{e}_{a}^{\prime}, \bar{e}_{a+1}, \ldots, \bar{e}_{l}\right]$ which follows from $\bar{e}_{a}=\lambda \bar{e}_{a}^{\prime}+\bar{x}$ and the corresponding admissible relation for $\operatorname{det}_{\kappa}(\bar{M})$. If $i>a$ then the desired equality is
$(-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]=(-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-1}, \bar{e}_{a}^{\prime}, \bar{e}_{a+1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]$
which follows from $\bar{e}_{a}=\lambda \bar{e}_{a}^{\prime}+\bar{x}$ and the corresponding admissible relation for $\operatorname{det}_{\kappa}(\bar{M})$. The interesting case is when $i=a$. In this case we have $e_{a}=\lambda e_{a}^{\prime}+x=$ $\mu f+y$. Hence also $e_{a}^{\prime}=\lambda^{-1}(\mu f+y-x)$. Thus we see that
$\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right)=(-1)^{i} \bar{\mu}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]=\psi\left(\bar{\lambda}\left[e_{1}, \ldots, e_{a-1}, e_{a}^{\prime}, e_{a+1}, \ldots, e_{l}\right]\right)$
as desired.
Type (c) relations. Suppose that $\left(e_{1}, \ldots, e_{l}\right)$ is an admissible sequence and $\mathfrak{m} e_{a} \subset$ $\left\langle e_{1}, \ldots, e_{a-2}\right\rangle$. Suppose that $f \in\left\langle e_{1}, \ldots, e_{i}\right\rangle$ with $i$ minimal. Say $e_{i}=\lambda f+x$ with $x \in\left\langle e_{1}, \ldots, e_{i-1}\right\rangle$. We distinguish 4 cases:

Case 1: $i<a-1$. The desired equality is

$$
\begin{aligned}
& (-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right] \\
& =(-1)^{i+1} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{a-2}, \bar{e}_{a}, \bar{e}_{a-1}, \bar{e}_{a+1}, \ldots, \bar{e}_{l}\right]
\end{aligned}
$$

which follows from the type (c) admissible relation for $\operatorname{det}_{\kappa}(\bar{M})$.
Case 2: $i>a$. The desired equality is

$$
\begin{aligned}
& (-1)^{i} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right] \\
& =(-1)^{i+1} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-2}, \bar{e}_{a}, \bar{e}_{a-1}, \bar{e}_{a+1}, \ldots, \bar{e}_{i-1}, \bar{e}_{i+1}, \ldots, \bar{e}_{l}\right]
\end{aligned}
$$

which follows from the type (c) admissible relation for $\operatorname{det}_{\kappa}(\bar{M})$.
Case 3: $i=a$. We write $e_{a}=\lambda f+\mu e_{a-1}+y$ with $y \in\left\langle e_{1}, \ldots, e_{a-2}\right\rangle$. Then

$$
\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right)=(-1)^{a} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-1}, \bar{e}_{a+1}, \ldots, \bar{e}_{l}\right]
$$

by definition. If $\bar{\mu}$ is nonzero, then we have $e_{a-1}=-\mu^{-1} \lambda f+\mu^{-1} e_{a}-\mu^{-1} y$ and we obtain

$$
\psi\left(-\left[e_{1}, \ldots, e_{a-2}, e_{a}, e_{a-1}, e_{a+1}, \ldots, e_{l}\right]\right)=(-1)^{a} \overline{\mu^{-1} \lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-2}, \bar{e}_{a}, \bar{e}_{a+1}, \ldots, \bar{e}_{l}\right]
$$

by definition. Since in $\bar{M}$ we have $\bar{e}_{a}=\mu \bar{e}_{a-1}+\bar{y}$ we see the two outcomes are equal by relation (a) for $\operatorname{det}_{\kappa}(\bar{M})$. If on the other hand $\bar{\mu}$ is zero, then we can write $e_{a}=\lambda f+y$ with $y \in\left\langle e_{1}, \ldots, e_{a-2}\right\rangle$ and we have

$$
\psi\left(-\left[e_{1}, \ldots, e_{a-2}, e_{a}, e_{a-1}, e_{a+1}, \ldots, e_{l}\right]\right)=(-1)^{a} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-1}, \bar{e}_{a+1}, \ldots, \bar{e}_{l}\right]
$$

which is equal to $\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right)$.
Case 4: $i=a-1$. Here we have

$$
\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right)=(-1)^{a-1} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-2}, \bar{e}_{a}, \ldots, \bar{e}_{l}\right]
$$

by definition. If $f \notin\left\langle e_{1}, \ldots, e_{a-2}, e_{a}\right\rangle$ then

$$
\psi\left(-\left[e_{1}, \ldots, e_{a-2}, e_{a}, e_{a-1}, e_{a+1}, \ldots, e_{l}\right]\right)=(-1)^{a+1} \bar{\lambda}\left[\bar{e}_{1}, \ldots, \bar{e}_{a-2}, \bar{e}_{a}, \ldots, \bar{e}_{l}\right]
$$

Since $(-1)^{a-1}=(-1)^{a+1}$ the two expressions are the same. Finally, assume $f \in$ $\left\langle e_{1}, \ldots, e_{a-2}, e_{a}\right\rangle$. In this case we see that $e_{a-1}=\lambda f+x$ with $x \in\left\langle e_{1}, \ldots, e_{a-2}\right\rangle$ and $e_{a}=\mu f+y$ with $y \in\left\langle e_{1}, \ldots, e_{a-2}\right\rangle$ for units $\lambda, \mu \in R$. We conclude that both $e_{a} \in\left\langle e_{1}, \ldots, e_{a-1}\right\rangle$ and $e_{a-1} \in\left\langle e_{1}, \ldots, e_{a-2}, e_{a}\right\rangle$. In this case a relation of type (a) applies to both $\left[e_{1}, \ldots, e_{l}\right]$ and $\left[e_{1}, \ldots, e_{a-2}, e_{a}, e_{a-1}, e_{a+1}, \ldots, e_{l}\right]$ and the compatibility of $\psi$ with these shown above to see that both

$$
\psi\left(\left[e_{1}, \ldots, e_{l}\right]\right) \quad \text { and } \quad \psi\left(\left[e_{1}, \ldots, e_{a-2}, e_{a}, e_{a-1}, e_{a+1}, \ldots, e_{l}\right]\right)
$$

are zero, as desired.
At this point we have shown that $\psi$ is well defined, and all that remains is to show that it is surjective. To see this let $\left(\bar{f}_{2}, \ldots, \bar{f}_{l}\right)$ be an admissible sequence in $\bar{M}$. We can choose lifts $f_{2}, \ldots, f_{l} \in M$, and then $\left(f, f_{2}, \ldots, f_{l}\right)$ is an admissible sequence in $M$. Since $\psi\left(\left[f, f_{2}, \ldots, f_{l}\right]\right)=\left[f_{2}, \ldots, f_{l}\right]$ we win.

Let $R$ be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. Note that if $\varphi$ : $M \rightarrow N$ is an isomorphism of finite length $R$-modules, then we get an isomorphism

$$
\operatorname{det}_{\kappa}(\varphi): \operatorname{det}_{\kappa}(M) \rightarrow \operatorname{det}_{\kappa}(N)
$$

simply by the rule

$$
\operatorname{det}_{\kappa}(\varphi)\left(\left[e_{1}, \ldots, e_{l}\right]\right)=\left[\varphi\left(e_{1}\right), \ldots, \varphi\left(e_{l}\right)\right]
$$

for any symbol $\left[e_{1}, \ldots, e_{l}\right]$ for $M$. Hence we see that $\operatorname{det}_{\kappa}$ is a functor
05M7

$$
\left\{\begin{array}{c}
\text { finite length } R \text {-modules }  \tag{41.2.4.1}\\
\text { with isomorphisms }
\end{array}\right\} \longrightarrow\left\{\begin{array}{c}
1 \text {-dimensional } \kappa \text {-vector spaces } \\
\text { with isomorphisms }
\end{array}\right\}
$$

This is typical for a "determinant functor" (see Knu02), as is the following additivity property.
02PA Lemma 41.2.5. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. For every short exact sequence

$$
0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0
$$

of finite length $R$-modules there exists a canonical isomorphism

$$
\gamma_{K \rightarrow L \rightarrow M}: \operatorname{det}_{\kappa}(K) \otimes_{\kappa} \operatorname{det}_{\kappa}(M) \longrightarrow \operatorname{det}_{\kappa}(L)
$$

defined by the rule on nonzero symbols

$$
\left[e_{1}, \ldots, e_{k}\right] \otimes\left[\bar{f}_{1}, \ldots, \bar{f}_{m}\right] \longrightarrow\left[e_{1}, \ldots, e_{k}, f_{1}, \ldots, f_{m}\right]
$$

with the following properties:
(1) For every isomorphism of short exact sequences, i.e., for every commutative diagram

with short exact rows and isomorphisms $u, v, w$ we have

$$
\gamma_{K^{\prime} \rightarrow L^{\prime} \rightarrow M^{\prime}} \circ\left(\operatorname{det}_{\kappa}(u) \otimes \operatorname{det}_{\kappa}(w)\right)=\operatorname{det}_{\kappa}(v) \circ \gamma_{K \rightarrow L \rightarrow M},
$$

(2) for every commutative square of finite length $R$-modules with exact rows and columns

the following diagram is commutative

where $\epsilon$ is the switch of the factors in the tensor product times $(-1)^{c g}$ with $c=$ length $_{R}(C)$ and $g=$ length $_{R}(G)$, and
(3) the map $\gamma_{K \rightarrow L \rightarrow M}$ agrees with the usual isomorphism if $0 \rightarrow K \rightarrow L \rightarrow$ $M \rightarrow 0$ is actually a short exact sequence of $\kappa$-vector spaces.

Proof. The significance of taking nonzero symbols in the explicit description of the map $\gamma_{K \rightarrow L \rightarrow M}$ is simply that if $\left(e_{1}, \ldots, e_{l}\right)$ is an admissible sequence in $K$, and $\left(\bar{f}_{1}, \ldots, \bar{f}_{m}\right)$ is an admissible sequence in $M$, then it is not guaranteed that $\left(e_{1}, \ldots, e_{l}, f_{1}, \ldots, f_{m}\right)$ is an admissible sequence in $L$ (where of course $f_{i} \in L$ signifies a lift of $\bar{f}_{i}$ ). However, if the symbol $\left[e_{1}, \ldots, e_{l}\right]$ is nonzero in $\operatorname{det}_{\kappa}(K)$, then necessarily $K=\left\langle e_{1}, \ldots, e_{k}\right\rangle$ (see proof of Lemma 41.2.2p, and in this case it is true that $\left(e_{1}, \ldots, e_{k}, f_{1}, \ldots, f_{m}\right)$ is an admissible sequence. Moreover, by the admissible relations of type (b) for $\operatorname{det}_{\kappa}(L)$ we see that the value of $\left[e_{1}, \ldots, e_{k}, f_{1}, \ldots, f_{m}\right]$ in $\operatorname{det}_{\kappa}(L)$ is independent of the choice of the lifts $f_{i}$ in this case also. Given this remark, it is clear that an admissible relation for $e_{1}, \ldots, e_{k}$ in $K$ translates into an admissible relation among $e_{1}, \ldots, e_{k}, f_{1}, \ldots, f_{m}$ in $L$, and similarly for an admissible relation among the $\bar{f}_{1}, \ldots, \bar{f}_{m}$. Thus $\gamma$ defines a linear map of vector spaces as claimed in the lemma.

By Lemma 41.2.4 we know $\operatorname{det}_{\kappa}(L)$ is generated by any single symbol $\left[x_{1}, \ldots, x_{k+m}\right]$ such that $\left(x_{1}, \ldots, x_{k+m}\right)$ is an admissible sequence with $L=\left\langle x_{1}, \ldots, x_{k+m}\right\rangle$. Hence it is clear that the map $\gamma_{K \rightarrow L \rightarrow M}$ is surjective and hence an isomorphism.

Property (1) holds because

$$
\begin{aligned}
& \operatorname{det}_{\kappa}(v)\left(\left[e_{1}, \ldots, e_{k}, f_{1}, \ldots, f_{m}\right]\right) \\
= & {\left[v\left(e_{1}\right), \ldots, v\left(e_{k}\right), v\left(f_{1}\right), \ldots, v\left(f_{m}\right)\right] } \\
= & \gamma_{K^{\prime} \rightarrow L^{\prime} \rightarrow M^{\prime}}\left(\left[u\left(e_{1}\right), \ldots, u\left(e_{k}\right)\right] \otimes\left[w\left(f_{1}\right), \ldots, w\left(f_{m}\right)\right]\right) .
\end{aligned}
$$

Property (2) means that given a symbol $\left[\alpha_{1}, \ldots, \alpha_{a}\right]$ generating $\operatorname{det}_{\kappa}(A)$, a symbol $\left[\gamma_{1}, \ldots, \gamma_{c}\right]$ generating $\operatorname{det}_{\kappa}(C)$, a symbol $\left[\zeta_{1}, \ldots, \zeta_{g}\right]$ generating $\operatorname{det}_{\kappa}(G)$, and a symbol $\left[\iota_{1}, \ldots, \iota_{i}\right]$ generating $\operatorname{det}_{\kappa}(I)$ we have

$$
\begin{aligned}
& {\left[\alpha_{1}, \ldots, \alpha_{a}, \tilde{\gamma}_{1}, \ldots, \tilde{\gamma}_{c}, \tilde{\zeta}_{1}, \ldots, \tilde{\zeta}_{g}, \tilde{\iota}_{1}, \ldots, \tilde{\iota}_{i}\right] } \\
= & (-1)^{c g}\left[\alpha_{1}, \ldots, \alpha_{a}, \tilde{\zeta}_{1}, \ldots, \tilde{\zeta}_{g}, \tilde{\gamma}_{1}, \ldots, \tilde{\gamma}_{c}, \tilde{\iota}_{1}, \ldots, \tilde{\iota}_{i}\right]
\end{aligned}
$$

(for suitable lifts $\tilde{x}$ in $E$ ) in $\operatorname{det}_{\kappa}(E)$. This holds because we may use the admissible relations of type (c) $c g$ times in the following order: move the $\tilde{\zeta}_{1}$ past the elements $\tilde{\gamma}_{c}, \ldots, \tilde{\gamma}_{1}$ (allowed since $\mathfrak{m} \tilde{\zeta}_{1} \subset A$ ), then move $\tilde{\zeta}_{2}$ past the elements $\tilde{\gamma}_{c}, \ldots, \tilde{\gamma}_{1}$ (allowed since $\mathfrak{m} \tilde{\zeta}_{2} \subset A+R \tilde{\zeta}_{1}$ ), and so on.
Part (3) of the lemma is obvious. This finishes the proof.
We can use the maps $\gamma$ of the lemma to define more general maps $\gamma$ as follows. Suppose that $(R, \mathfrak{m}, \kappa)$ is a local ring. Let $M$ be a finite length $R$-module and suppose we are given a finite filtration (see Homology, Definition 12.16.1)

$$
M=F^{n} \supset F^{n+1} \supset \ldots \supset F^{m-1} \supset F^{m}=0
$$

Then there is a canonical isomorphism

$$
\gamma_{(M, F)}: \bigotimes_{i} \operatorname{det}_{\kappa}\left(F^{i} / F^{i+1}\right) \longrightarrow \operatorname{det}_{\kappa}(M)
$$

well defined up to sign(!). One can make the sign explicit either by giving a well defined order of the terms in the tensor product (starting with higher indices unfortunately), and by thinking of the target category for the functor $\operatorname{det}_{\kappa}$ as the category of 1-dimensional super vector spaces. See [KM76, Section 1].

Here is another typical result for determinant functors. It is not hard to show. The tricky part is usually to show the existence of a determinant functor.

02PB Lemma 41.2.6. Let $(R, \mathfrak{m}, \kappa)$ be any local ring. The functor

$$
\operatorname{det}_{\kappa}:\left\{\begin{array}{c}
\text { finite length } R \text {-modules } \\
\text { with isomorphisms }
\end{array}\right\} \rightarrow\left\{\begin{array}{c}
1 \text {-dimensional } \kappa \text {-vector spaces } \\
\text { with isomorphisms }
\end{array}\right\}
$$

endowed with the maps $\gamma_{K \rightarrow L \rightarrow M}$ is characterized by the following properties
(1) its restriction to the subcategory of modules annihilated by $\mathfrak{m}$ is isomorphic to the usual determinant functor (see Lemma 41.2.3), and
(2) (1), (2) and (3) of Lemma 41.2.5 hold.

Proof. Omitted.

02PC Lemma 41.2.7. Let $\left(R^{\prime}, \mathfrak{m}^{\prime}\right) \rightarrow(R, \mathfrak{m})$ be a local ring homomorphism which induces an isomorphism on residue fields $\kappa$. Then for every finite length $R$-module the restriction $M_{R^{\prime}}$ is a finite length $R^{\prime}$-module and there is a canonical isomorphism

$$
\operatorname{det}_{R, \kappa}(M) \longrightarrow \operatorname{det}_{R^{\prime}, \kappa}\left(M_{R^{\prime}}\right)
$$

This isomorphism is functorial in $M$ and compatible with the isomorphisms $\gamma_{K \rightarrow L \rightarrow M}$ of Lemma 41.2.5 defined for $\operatorname{det}_{R, \kappa}$ and $\operatorname{det}_{R^{\prime}, \kappa}$.

Proof. If the length of $M$ as an $R$-module is $l$, then the length of $M$ as an $R^{\prime}$ module (i.e., $M_{R^{\prime}}$ ) is $l$ as well, see Algebra, Lemma 10.51.12. Note that an admissible sequence $x_{1}, \ldots, x_{l}$ of $M$ over $R$ is an admissible sequence of $M$ over $R^{\prime}$ as $\mathfrak{m}^{\prime}$ maps into $\mathfrak{m}$. The isomorphism is obtained by mapping the symbol $\left[x_{1}, \ldots, x_{l}\right] \in \operatorname{det}_{R, \kappa}(M)$ to the corresponding symbol $\left[x_{1}, \ldots, x_{l}\right] \in \operatorname{det}_{R^{\prime}, \kappa}(M)$. It is immediate to verify that this is functorial for isomorphisms and compatible with the isomorphisms $\gamma$ of Lemma 41.2.5.

0BDQ Remark 41.2.8. Let $(R, \mathfrak{m}, \kappa)$ be a local ring and assume either the characteristic of $\kappa$ is zero or it is $p$ and $p R=0$. Let $M_{1}, \ldots, M_{n}$ be finite length $R$-modules. We will show below that there exists an ideal $I \subset \mathfrak{m}$ annihilating $M_{i}$ for $i=1, \ldots, n$ and a section $\sigma: \kappa \rightarrow R / I$ of the canonical surjection $R / I \rightarrow \kappa$. The restriction $M_{i, \kappa}$ of $M_{i}$ via $\sigma$ is a $\kappa$-vector space of dimension $l_{i}=\operatorname{length}_{R}\left(M_{i}\right)$ and using Lemma 41.2.7 we see that

$$
\operatorname{det}_{\kappa}\left(M_{i}\right)=\wedge_{\kappa}^{l_{i}}\left(M_{i, \kappa}\right)
$$

These isomorphisms are compatible with the isomorphisms $\gamma_{K \rightarrow M \rightarrow L}$ of Lemma 41.2 .5 for short exact sequences of finite length $R$-modules annihilated by $I$. The conclusion is that verifying a property of $\operatorname{det}_{\kappa}$ often reduces to verifying corresponding properties of the usual determinant on the category finite dimensional vector spaces.
For $I$ we can take the annihilator (Algebra, Definition 10.39.3) of the module $M=$ $\bigoplus M_{i}$. In this case we see that $R / I \subset \operatorname{End}_{R}(M)$ hence has finite length. Thus $R / I$ is an Artinian local ring with residue field $\kappa$. Since an Artinian local ring is complete we see that $R / I$ has a coefficient ring by the Cohen structure theorem (Algebra, Theorem 10.152 .8 ) which is a field by our assumption on $R$.

Here is a case where we can compute the determinant of a linear map. In fact there is nothing mysterious about this in any case, see Example 41.2.10 for a random example.

02PD Lemma 41.2.9. Let $R$ be a local ring with residue field $\kappa$. Let $u \in R^{*}$ be a unit. Let $M$ be a module of finite length over $R$. Denote $u_{M}: M \rightarrow M$ the map multiplication by $u$. Then

$$
\operatorname{det}_{\kappa}\left(u_{M}\right): \operatorname{det}_{\kappa}(M) \longrightarrow \operatorname{det}_{\kappa}(M)
$$

is multiplication by $\bar{u}^{l}$ where $l=$ length $_{R}(M)$ and $\bar{u} \in \kappa^{*}$ is the image of $u$.
Proof. Denote $f_{M} \in \kappa^{*}$ the element such that $\operatorname{det}_{\kappa}\left(u_{M}\right)=f_{M} \operatorname{id}_{\operatorname{det}_{\kappa}(M)}$. Suppose that $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is a short exact sequence of finite $R$-modules. Then we see that $u_{k}, u_{L}, u_{M}$ give an isomorphism of short exact sequences. Hence by Lemma 41.2 .5 (1) we conclude that $f_{K} f_{M}=f_{L}$. This means that by induction on length it suffices to prove the lemma in the case of length 1 where it is trivial.

02PE Example 41.2.10. Consider the local ring $R=\mathbf{Z}_{p}$. Set $M=\mathbf{Z}_{p} /\left(p^{2}\right) \oplus \mathbf{Z}_{p} /\left(p^{3}\right)$. Let $u: M \rightarrow M$ be the map given by the matrix

$$
u=\left(\begin{array}{cc}
a & b \\
p c & d
\end{array}\right)
$$

where $a, b, c, d \in \mathbf{Z}_{p}$, and $a, d \in \mathbf{Z}_{p}^{*}$. In this case $\operatorname{det}_{\kappa}(u)$ equals multiplication by $a^{2} d^{3} \bmod p \in \mathbf{F}_{p}^{*}$. This can easily be seen by consider the effect of $u$ on the symbol $\left[p^{2} e, p e, p f, e, f\right]$ where $e=(0,1) \in M$ and $f=(1,0) \in M$.

### 41.3. Periodic complexes and Herbrand quotients

02 PF Of course there is a very general notion of periodic complexes. We can require periodicity of the maps, or periodicity of the objects. We will add these here as needed. For the moment we only need the following cases.
02PG Definition 41.3.1. Let $R$ be a ring.
(1) A 2-periodic complex over $R$ is given by a quadruple $(M, N, \varphi, \psi)$ consisting of $R$-modules $M, N$ and $R$-module maps $\varphi: M \rightarrow N, \psi: N \rightarrow M$ such that

$$
\ldots \longrightarrow M \xrightarrow{\varphi} N \stackrel{\psi}{\longrightarrow} M \xrightarrow{\varphi} N \longrightarrow \ldots
$$

is a complex. In this setting we define the cohomology modules of the complex to be the $R$-modules

$$
H^{0}(M, N, \varphi, \psi)=\operatorname{Ker}(\varphi) / \operatorname{Im}(\psi), \quad \text { and } \quad H^{1}(M, N, \varphi, \psi)=\operatorname{Ker}(\psi) / \operatorname{Im}(\varphi)
$$

We say the 2-periodic complex is exact if the cohomology groups are zero.
(2) A $(2,1)$-periodic complex over $R$ is given by a triple $(M, \varphi, \psi)$ consisting of an $R$-module $M$ and $R$-module maps $\varphi: M \rightarrow M, \psi: M \rightarrow M$ such that

$$
\ldots \longrightarrow M \xrightarrow{\varphi} M \xrightarrow{\psi} M \xrightarrow{\varphi} M \longrightarrow \ldots
$$

is a complex. Since this is a special case of a 2 -periodic complex we have its cohomology modules $H^{0}(M, \varphi, \psi), H^{1}(M, \varphi, \psi)$ and a notion of exactness.

In the following we will use any result proved for 2 -periodic complexes without further mention for $(2,1)$-periodic complexes. It is clear that the collection of 2-periodic complexes (resp. ( 2,1 )-periodic complexes) forms a category with morphisms $(f, g):(M, N, \varphi, \psi) \rightarrow\left(M^{\prime}, N^{\prime}, \varphi^{\prime}, \psi^{\prime}\right)$ pairs of morphisms $f: M \rightarrow M^{\prime}$ and $g: N \rightarrow N^{\prime}$ such that $\varphi^{\prime} \circ f=f \circ \varphi$ and $\psi^{\prime} \circ g=g \circ \psi$. In fact it is an abelian category, with kernels and cokernels as in Homology, Lemma 12.12.3. Also, note that a special case are the $(2,1)$-periodic complexes of the form $(M, 0, \psi)$. In this special case we have

$$
H^{0}(M, 0, \psi)=\operatorname{Coker}(\psi), \quad \text { and } \quad H^{1}(M, 0, \psi)=\operatorname{Ker}(\psi)
$$

02PH Definition 41.3.2. Let $R$ be a local ring. Let $(M, N, \varphi, \psi)$ be a 2-periodic complex over $R$ whose cohomology groups have finite length over $R$. In this case we define the multiplicity of $(M, N, \varphi, \psi)$ to be the integer

$$
e_{R}(M, N, \varphi, \psi)=\operatorname{length}_{R}\left(H^{0}(M, N, \varphi, \psi)\right)-\operatorname{length}_{R}\left(H^{1}(M, N, \varphi, \psi)\right)
$$

We will sometimes (especially in the case of a (2,1)-periodic complex with $\varphi=0$ ) call this the Herbrand quotien ${ }^{1}$
02PI Lemma 41.3.3. Let $R$ be a local ring.
(1) If $(M, N, \varphi, \psi)$ is a 2-periodic complex such that $M, N$ have finite length. Then $e_{R}(M, N, \varphi, \psi)=$ length $_{R}(M)-$ length $_{R}(N)$.
(2) If $(M, \varphi, \psi)$ is a $(2,1)$-periodic complex such that $M$ has finite length. Then $e_{R}(M, \varphi, \psi)=0$.
(3) Suppose that we have a short exact sequence of $(2,1)$-periodic complexes $0 \rightarrow\left(M_{1}, N_{1}, \varphi_{1}, \psi_{1}\right) \rightarrow\left(M_{2}, N_{2}, \varphi_{2}, \psi_{2}\right) \rightarrow\left(M_{3}, N_{3}, \varphi_{3}, \psi_{3}\right) \rightarrow 0$
If two out of three have cohomology modules of finite length so does the third and we have

$$
e_{R}\left(M_{2}, N_{2}, \varphi_{2}, \psi_{2}\right)=e_{R}\left(M_{1}, N_{1}, \varphi_{1}, \psi_{1}\right)+e_{R}\left(M_{3}, N_{3}, \varphi_{3}, \psi_{3}\right)
$$

Proof. Proof of (3). Abbreviate $A=\left(M_{1}, N_{1}, \varphi_{1}, \psi_{1}\right), B=\left(M_{2}, N_{2}, \varphi_{2}, \psi_{2}\right)$ and $C=\left(M_{3}, N_{3}, \varphi_{3}, \psi_{3}\right)$. We have a long exact cohomology sequence

$$
\ldots \rightarrow H^{1}(C) \rightarrow H^{0}(A) \rightarrow H^{0}(B) \rightarrow H^{0}(C) \rightarrow H^{1}(A) \rightarrow H^{1}(B) \rightarrow H^{1}(C) \rightarrow \ldots
$$

This gives a finite exact sequence

$$
0 \rightarrow I \rightarrow H^{0}(A) \rightarrow H^{0}(B) \rightarrow H^{0}(C) \rightarrow H^{1}(A) \rightarrow H^{1}(B) \rightarrow K \rightarrow 0
$$

with $0 \rightarrow K \rightarrow H^{1}(C) \rightarrow I \rightarrow 0$ a filtration. By additivity of the length function (Algebra, Lemma 10.51.3) we see the result. The proofs of (1) and (2) are omitted.

### 41.4. Periodic complexes and determinants

0 BDR Let $R$ be a local ring with residue field $\kappa$. Let $(M, \varphi, \psi)$ be a $(2,1)$-periodic complex over $R$. Assume that $M$ has finite length and that $(M, \varphi, \psi)$ is exact. We are going to use the determinant construction to define an invariant of this situation. See Section 41.2. Let us abbreviate $K_{\varphi}=\operatorname{Ker}(\varphi), I_{\varphi}=\operatorname{Im}(\varphi), K_{\psi}=\operatorname{Ker}(\psi)$, and $I_{\psi}=\operatorname{Im}(\psi)$. The short exact sequences

$$
0 \rightarrow K_{\varphi} \rightarrow M \rightarrow I_{\varphi} \rightarrow 0, \quad 0 \rightarrow K_{\psi} \rightarrow M \rightarrow I_{\psi} \rightarrow 0
$$

give isomorphisms
$\gamma_{\varphi}: \operatorname{det}_{\kappa}\left(K_{\varphi}\right) \otimes \operatorname{det}_{\kappa}\left(I_{\varphi}\right) \longrightarrow \operatorname{det}_{\kappa}(M), \quad \gamma_{\psi}: \operatorname{det}_{\kappa}\left(K_{\psi}\right) \otimes \operatorname{det}_{\kappa}\left(I_{\psi}\right) \longrightarrow \operatorname{det}_{\kappa}(M)$,
see Lemma 41.2.5. On the other hand the exactness of the complex gives equalities $K_{\varphi}=I_{\psi}$, and $K_{\psi}=I_{\varphi}$ and hence an isomorphism

$$
\sigma: \operatorname{det}_{\kappa}\left(K_{\varphi}\right) \otimes \operatorname{det}_{\kappa}\left(I_{\varphi}\right) \longrightarrow \operatorname{det}_{\kappa}\left(K_{\psi}\right) \otimes \operatorname{det}_{\kappa}\left(I_{\psi}\right)
$$

by switching the factors. Using this notation we can define our invariant.
02PJ Definition 41.4.1. Let $R$ be a local ring with residue field $\kappa$. Let $(M, \varphi, \psi)$ be a $(2,1)$-periodic complex over $R$. Assume that $M$ has finite length and that $(M, \varphi, \psi)$ is exact. The determinant of $(M, \varphi, \psi)$ is the element

$$
\operatorname{det}_{\kappa}(M, \varphi, \psi) \in \kappa^{*}
$$

[^114]such that the composition
$$
\operatorname{det}_{\kappa}(M) \xrightarrow{\gamma_{\psi} \circ \sigma \circ \gamma_{\varphi}^{-1}} \operatorname{det}_{\kappa}(M)
$$
is multiplication by $(-1)^{\operatorname{length}_{R}\left(I_{\varphi}\right) \operatorname{length}_{R}\left(I_{\psi}\right)} \operatorname{det}_{\kappa}(M, \varphi, \psi)$.
02PK Remark 41.4.2. Here is a more down to earth description of the determinant introduced above. Let $R$ be a local ring with residue field $\kappa$. Let $(M, \varphi, \psi)$ be a $(2,1)$-periodic complex over $R$. Assume that $M$ has finite length and that $(M, \varphi, \psi)$ is exact. Let us abbreviate $I_{\varphi}=\operatorname{Im}(\varphi), I_{\psi}=\operatorname{Im}(\psi)$ as above. Assume that $\operatorname{length}_{R}\left(I_{\varphi}\right)=a$ and length ${ }_{R}\left(I_{\psi}\right)=b$, so that $a+b=\operatorname{length}_{R}(M)$ by exactness. Choose admissible sequences $x_{1}, \ldots, x_{a} \in I_{\varphi}$ and $y_{1}, \ldots, y_{b} \in I_{\psi}$ such that the symbol $\left[x_{1}, \ldots, x_{a}\right]$ generates $\operatorname{det}_{\kappa}\left(I_{\varphi}\right)$ and the symbol $\left[x_{1}, \ldots, x_{b}\right]$ generates $\operatorname{det}_{\kappa}\left(I_{\psi}\right)$. Choose $\tilde{x}_{i} \in M$ such that $\varphi\left(\tilde{x}_{i}\right)=x_{i}$. Choose $\tilde{y}_{j} \in M$ such that $\psi\left(\tilde{y}_{j}\right)=y_{j}$. Then $\operatorname{det}_{\kappa}(M, \varphi, \psi)$ is characterized by the equality
$$
\left[x_{1}, \ldots, x_{a}, \tilde{y}_{1}, \ldots, \tilde{y}_{b}\right]=(-1)^{a b} \operatorname{det}_{\kappa}(M, \varphi, \psi)\left[y_{1}, \ldots, y_{b}, \tilde{x}_{1}, \ldots, \tilde{x}_{a}\right]
$$
in $\operatorname{det}_{\kappa}(M)$. This also explains the sign.
02PL Lemma 41.4.3. Let $R$ be a local ring with residue field $\kappa$. Let $(M, \varphi, \psi)$ be a $(2,1)$-periodic complex over $R$. Assume that $M$ has finite length and that $(M, \varphi, \psi)$ is exact. Then
$$
\operatorname{det}_{\kappa}(M, \varphi, \psi) \operatorname{det}_{\kappa}(M, \psi, \varphi)=1
$$

Proof. Omitted.
02PM Lemma 41.4.4. Let $R$ be a local ring with residue field $\kappa$. Let $(M, \varphi, \varphi)$ be a $(2,1)$-periodic complex over $R$. Assume that $M$ has finite length and that $(M, \varphi, \varphi)$ is exact. Then length $h_{R}(M)=2$ length $_{R}(\operatorname{Im}(\varphi))$ and

$$
\operatorname{det}_{\kappa}(M, \varphi, \varphi)=(-1)^{\operatorname{length}_{R}(\operatorname{Im}(\varphi))}=(-1)^{\frac{1}{2} \operatorname{length}_{R}(M)}
$$

Proof. Follows directly from the sign rule in the definitions.
02PN Lemma 41.4.5. Let $R$ be a local ring with residue field $\kappa$. Let $M$ be a finite length $R$-module.
(1) if $\varphi: M \rightarrow M$ is an isomorphism then $\operatorname{det}_{\kappa}(M, \varphi, 0)=\operatorname{det}_{\kappa}(\varphi)$.
(2) if $\psi: M \rightarrow M$ is an isomorphism then $\operatorname{det}_{\kappa}(M, 0, \psi)=\operatorname{det}_{\kappa}(\psi)^{-1}$.

Proof. Let us prove (1). Set $\psi=0$. Then we may, with notation as above Definition 41.4.1, identify $K_{\varphi}=I_{\psi}=0, I_{\varphi}=K_{\psi}=M$. With these identifications, the map

$$
\gamma_{\varphi}: \kappa \otimes \operatorname{det}_{\kappa}(M)=\operatorname{det}_{\kappa}\left(K_{\varphi}\right) \otimes \operatorname{det}_{\kappa}\left(I_{\varphi}\right) \longrightarrow \operatorname{det}_{\kappa}(M)
$$

is identified with $\operatorname{det}_{\kappa}\left(\varphi^{-1}\right)$. On the other hand the map $\gamma_{\psi}$ is identified with the identity map. Hence $\gamma_{\psi} \circ \sigma \circ \gamma_{\varphi}^{-1}$ is equal to $\operatorname{det}_{\kappa}(\varphi)$ in this case. Whence the result. We omit the proof of (2).

02PO Lemma 41.4.6. Let $R$ be a local ring with residue field $\kappa$. Suppose that we have a short exact sequence of $(2,1)$-periodic complexes

$$
0 \rightarrow\left(M_{1}, \varphi_{1}, \psi_{1}\right) \rightarrow\left(M_{2}, \varphi_{2}, \psi_{2}\right) \rightarrow\left(M_{3}, \varphi_{3}, \psi_{3}\right) \rightarrow 0
$$

with all $M_{i}$ of finite length, and each $\left(M_{1}, \varphi_{1}, \psi_{1}\right)$ exact. Then

$$
\operatorname{det}_{\kappa}\left(M_{2}, \varphi_{2}, \psi_{2}\right)=\operatorname{det}_{\kappa}\left(M_{1}, \varphi_{1}, \psi_{1}\right) \operatorname{det}_{\kappa}\left(M_{3}, \varphi_{3}, \psi_{3}\right) .
$$

in $\kappa^{*}$.

Proof. Let us abbreviate $I_{\varphi, i}=\operatorname{Im}\left(\varphi_{i}\right), K_{\varphi, i}=\operatorname{Ker}\left(\varphi_{i}\right), I_{\psi, i}=\operatorname{Im}\left(\psi_{i}\right)$, and $K_{\psi, i}=\operatorname{Ker}\left(\psi_{i}\right)$. Observe that we have a commutative square

of finite length $R$-modules with exact rows and columns. The top row is exact since it can be identified with the sequence $I_{\psi, 1} \rightarrow I_{\psi, 2} \rightarrow I_{\psi, 3} \rightarrow 0$ of images, and similarly for the bottom row. There is a similar diagram involving the modules $I_{\psi, i}$ and $K_{\psi, i}$. By definition $\operatorname{det}_{\kappa}\left(M_{2}, \varphi_{2}, \psi_{2}\right)$ corresponds, up to a sign, to the composition of the left vertical maps in the following diagram

The top and bottom squares are commutative up to sign by applying Lemma 41.2.5 (2). The middle square is trivially commutative (we are just switching factors). Hence we see that $\operatorname{det}_{\kappa}\left(M_{2}, \varphi_{2}, \psi_{2}\right)=\epsilon \operatorname{det}_{\kappa}\left(M_{1}, \varphi_{1}, \psi_{1}\right) \operatorname{det}_{\kappa}\left(M_{3}, \varphi_{3}, \psi_{3}\right)$ for some $\operatorname{sign} \epsilon$. And the sign can be worked out, namely the outer rectangle in the diagram above commutes up to

$$
\begin{aligned}
\epsilon & =(-1)^{\operatorname{length}\left(I_{\varphi, 1}\right) \operatorname{length}\left(K_{\varphi, 3}\right)+\operatorname{length}\left(I_{\psi, 1}\right) \operatorname{length}\left(K_{\psi, 3}\right)} \\
& =(-1)^{\operatorname{length}\left(I_{\varphi, 1}\right) \operatorname{length}\left(I_{\psi, 3}\right)+\operatorname{length}\left(I_{\psi, 1}\right) \operatorname{length}\left(I_{\varphi, 3}\right)}
\end{aligned}
$$

(proof omitted). It follows easily from this that the signs work out as well.
Example 41.4.7. Let $k$ be a field. Consider the ring $R=k[T] /\left(T^{2}\right)$ of dual numbers over $k$. Denote $t$ the class of $T$ in $R$. Let $M=R$ and $\varphi=u t, \psi=v t$ with $u, v \in k^{*}$. In this case $\operatorname{det}_{k}(M)$ has generator $e=[t, 1]$. We identify $I_{\varphi}=K_{\varphi}=$ $I_{\psi}=K_{\psi}=(t)$. Then $\gamma_{\varphi}(t \otimes t)=u^{-1}[t, 1]$ (since $u^{-1} \in M$ is a lift of $t \in I_{\varphi}$ ) and $\gamma_{\psi}(t \otimes t)=v^{-1}[t, 1]$ (same reason). Hence we see that $\operatorname{det}_{k}(M, \varphi, \psi)=-u / v \in k^{*}$.

02 PQ Example 41.4.8. Let $R=\mathbf{Z}_{p}$ and let $M=\mathbf{Z}_{p} /\left(p^{l}\right)$. Let $\varphi=p^{b} u$ and $\varphi=p^{a} v$ with $a, b \geq 0, a+b=l$ and $u, v \in \mathbf{Z}_{p}^{*}$. Then a computation as in Example 41.4.7 shows that

$$
\begin{aligned}
\operatorname{det}_{\mathbf{F}_{p}}\left(\mathbf{Z}_{p} /\left(p^{l}\right), p^{b} u, p^{a} v\right) & =(-1)^{a b} u^{a} / v^{b} \bmod p \\
& =(-1)^{\operatorname{ord}_{p}(\alpha) \operatorname{ord}_{p}(\beta)} \frac{\alpha^{\operatorname{ord}_{p}(\beta)}}{\beta^{\operatorname{ord}_{p}(\alpha)}} \bmod p
\end{aligned}
$$

with $\alpha=p^{b} u, \beta=p^{a} v \in \mathbf{Z}_{p}$. See Lemma 41.5.11 for a more general case (and a proof).
02PR Example 41.4.9. Let $R=k$ be a field. Let $M=k^{\oplus a} \oplus k^{\oplus b}$ be $l=a+b$ dimensional. Let $\varphi$ and $\psi$ be the following diagonal matrices

$$
\varphi=\operatorname{diag}\left(u_{1}, \ldots, u_{a}, 0, \ldots, 0\right), \quad \psi=\operatorname{diag}\left(0, \ldots, 0, v_{1}, \ldots, v_{b}\right)
$$

with $u_{i}, v_{j} \in k^{*}$. In this case we have

$$
\operatorname{det}_{k}(M, \varphi, \psi)=\frac{u_{1} \ldots u_{a}}{v_{1} \ldots v_{b}}
$$

This can be seen by a direct computation or by computing in case $l=1$ and using the additivity of Lemma 41.4.6.
02PS Example 41.4.10. Let $R=k$ be a field. Let $M=k^{\oplus a} \oplus k^{\oplus a}$ be $l=2 a$ dimensional. Let $\varphi$ and $\psi$ be the following block matrices

$$
\varphi=\left(\begin{array}{cc}
0 & U \\
0 & 0
\end{array}\right), \quad \psi=\left(\begin{array}{ll}
0 & V \\
0 & 0
\end{array}\right)
$$

with $U, V \in \operatorname{Mat}(a \times a, k)$ invertible. In this case we have

$$
\operatorname{det}_{k}(M, \varphi, \psi)=(-1)^{a} \frac{\operatorname{det}(U)}{\operatorname{det}(V)}
$$

This can be seen by a direct computation. The case $a=1$ is similar to the computation in Example 41.4.7.

02PT Example 41.4.11. Let $R=k$ be a field. Let $M=k^{\oplus 4}$. Let

$$
\varphi=\left(\begin{array}{cccc}
0 & 0 & 0 & 0 \\
u_{1} & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & u_{2} & 0
\end{array}\right) \quad \varphi=\left(\begin{array}{cccc}
0 & 0 & 0 & 0 \\
0 & 0 & v_{2} & 0 \\
0 & 0 & 0 & 0 \\
v_{1} & 0 & 0 & 0
\end{array}\right)
$$

with $u_{1}, u_{2}, v_{1}, v_{2} \in k^{*}$. Then we have

$$
\operatorname{det}_{k}(M, \varphi, \psi)=-\frac{u_{1} u_{2}}{v_{1} v_{2}}
$$

Next we come to the analogue of the fact that the determinant of a composition of linear endomorphisms is the product of the determinants. To avoid very long formulae we write $I_{\varphi}=\operatorname{Im}(\varphi)$, and $K_{\varphi}=\operatorname{Ker}(\varphi)$ for any $R$-module map $\varphi: M \rightarrow$ $M$. We also denote $\varphi \psi=\varphi \circ \psi$ for a pair of morphisms $\varphi, \psi: M \rightarrow M$.

02PU Lemma 41.4.12. Let $R$ be a local ring with residue field $\kappa$. Let $M$ be a finite length $R$-module. Let $\alpha, \beta, \gamma$ be endomorphisms of $M$. Assume that
(1) $I_{\alpha}=K_{\beta \gamma}$, and similarly for any permutation of $\alpha, \beta, \gamma$,
(2) $K_{\alpha}=I_{\beta \gamma}$, and similarly for any permutation of $\alpha, \beta, \gamma$.

Then
(1) The triple $(M, \alpha, \beta \gamma)$ is an exact $(2,1)$-periodic complex.
(2) The triple $\left(I_{\gamma}, \alpha, \beta\right)$ is an exact $(2,1)$-periodic complex.
(3) The triple $\left(M / K_{\beta}, \alpha, \gamma\right)$ is an exact $(2,1)$-periodic complex.
(4) We have

$$
\operatorname{det}_{\kappa}(M, \alpha, \beta \gamma)=\operatorname{det}_{\kappa}\left(I_{\gamma}, \alpha, \beta\right) \operatorname{det}_{\kappa}\left(M / K_{\beta}, \alpha, \gamma\right)
$$

Proof. It is clear that the assumptions imply part (1) of the lemma.
To see part (1) note that the assumptions imply that $I_{\gamma \alpha}=I_{\alpha \gamma}$, and similarly for kernels and any other pair of morphisms. Moreover, we see that $I_{\gamma \beta}=I_{\beta \gamma}=K_{\alpha} \subset$ $I_{\gamma}$ and similarly for any other pair. In particular we get a short exact sequence

$$
0 \rightarrow I_{\beta \gamma} \rightarrow I_{\gamma} \xrightarrow{\alpha} I_{\alpha \gamma} \rightarrow 0
$$

and similarly we get a short exact sequence

$$
0 \rightarrow I_{\alpha \gamma} \rightarrow I_{\gamma} \xrightarrow{\beta} I_{\beta \gamma} \rightarrow 0
$$

This proves $\left(I_{\gamma}, \alpha, \beta\right)$ is an exact (2,1)-periodic complex. Hence part (2) of the lemma holds.
To see that $\alpha, \gamma$ give well defined endomorphisms of $M / K_{\beta}$ we have to check that $\alpha\left(K_{\beta}\right) \subset K_{\beta}$ and $\gamma\left(K_{\beta}\right) \subset K_{\beta}$. This is true because $\alpha\left(K_{\beta}\right)=\alpha\left(I_{\gamma \alpha}\right)=I_{\alpha \gamma \alpha} \subset$ $I_{\alpha \gamma}=K_{\beta}$, and similarly in the other case. The kernel of the map $\alpha: M / K_{\beta} \rightarrow$ $M / K_{\beta}$ is $K_{\beta \alpha} / K_{\beta}=I_{\gamma} / K_{\beta}$. Similarly, the kernel of $\gamma: M / K_{\beta} \rightarrow M / K_{\beta}$ is equal to $I_{\alpha} / K_{\beta}$. Hence we conclude that (3) holds.
We introduce $r=\operatorname{length}_{R}\left(K_{\alpha}\right), s=\operatorname{length}_{R}\left(K_{\beta}\right)$ and $t=\operatorname{length}_{R}\left(K_{\gamma}\right)$. By the exact sequences above and our hypotheses we have $\operatorname{length}_{R}\left(I_{\alpha}\right)=s+t$, $\operatorname{length}_{R}\left(I_{\beta}\right)=r+t$, length ${ }_{R}\left(I_{\gamma}\right)=r+s$, and length $(M)=r+s+t$. Choose
(1) an admissible sequence $x_{1}, \ldots, x_{r} \in K_{\alpha}$ generating $K_{\alpha}$
(2) an admissible sequence $y_{1}, \ldots, y_{s} \in K_{\beta}$ generating $K_{\beta}$,
(3) an admissible sequence $z_{1}, \ldots, z_{t} \in K_{\gamma}$ generating $K_{\gamma}$,
(4) elements $\tilde{x}_{i} \in M$ such that $\beta \gamma \tilde{x}_{i}=x_{i}$,
(5) elements $\tilde{y}_{i} \in M$ such that $\alpha \gamma \tilde{y}_{i}=y_{i}$,
(6) elements $\tilde{z}_{i} \in M$ such that $\beta \alpha \tilde{z}_{i}=z_{i}$.

With these choices the sequence $y_{1}, \ldots, y_{s}, \alpha \tilde{z}_{1}, \ldots, \alpha \tilde{z}_{t}$ is an admissible sequence in $I_{\alpha}$ generating it. Hence, by Remark 41.4.2 the determinant $D=\operatorname{det}_{\kappa}(M, \alpha, \beta \gamma)$ is the unique element of $\kappa^{*}$ such that

$$
\begin{array}{r}
{\left[y_{1}, \ldots, y_{s}, \alpha \tilde{z}_{1}, \ldots, \alpha \tilde{z}_{s}, \tilde{x}_{1}, \ldots, \tilde{x}_{r}\right]} \\
=(-1)^{r(s+t)} D\left[x_{1}, \ldots, x_{r}, \gamma \tilde{y}_{1}, \ldots, \gamma \tilde{y}_{s}, \tilde{z}_{1}, \ldots, \tilde{z}_{t}\right]
\end{array}
$$

By the same remark, we see that $D_{1}=\operatorname{det}_{\kappa}\left(M / K_{\beta}, \alpha, \gamma\right)$ is characterized by

$$
\left[y_{1}, \ldots, y_{s}, \alpha \tilde{z}_{1}, \ldots, \alpha \tilde{z}_{t}, \tilde{x}_{1}, \ldots, \tilde{x}_{r}\right]=(-1)^{r t} D_{1}\left[y_{1}, \ldots, y_{s}, \gamma \tilde{x}_{1}, \ldots, \gamma \tilde{x}_{r}, \tilde{z}_{1}, \ldots, \tilde{z}_{t}\right]
$$

By the same remark, we see that $D_{2}=\operatorname{det}_{\kappa}\left(I_{\gamma}, \alpha, \beta\right)$ is characterized by

$$
