by applying the $\operatorname{Hom}_{R}(-, N)$ functor. Thus we get the long exact sequence from the snake lemma applied to this.

00LV Lemma 10.70.8. Let $R$ be a ring. Let $M, N$ be $R$-modules. Any $x \in R$ such that either $x N=0$, or $x M=0$ annihilates each of the $\operatorname{modules} \operatorname{Ext}_{R}^{i}(M, N)$.

Proof. Pick a free resolution $F_{\bullet}$ of $M$. Since $\operatorname{Ext}_{R}^{i}(M, N)$ is defined as the cohomology of the complex $\operatorname{Hom}_{R}\left(F_{\bullet}, N\right)$ the lemma is clear when $x N=0$. If $x M=0$, then we see that multiplication by $x$ on $F$ • lifts the zero map on $M$. Hence by Lemma 10.70 .5 we see that it induces the same map on Ext groups as the zero map.

08YR Lemma 10.70.9. Let $R$ be a Noetherian ring. Let $M, N$ be finite $R$-modules. Then $E x t_{R}^{i}(M, N)$ is a finite $R$-module for all $i$.

Proof. This holds because $\operatorname{Ext}_{R}^{i}(M, N)$ is computed as the cohomology groups of a complex $\operatorname{Hom}_{R}\left(F_{\bullet}, N\right)$ with each $F_{n}$ a finite free $R$-module, see Lemma 10.70.1.

### 10.71. Depth

00LE Here is our definition.
00LI Definition 10.71.1. Let $R$ be a ring, and $I \subset R$ an ideal. Let $M$ be a finite $R$-module. The $I$-depth of $M$, denoted $\operatorname{depth}_{I}(M)$, is defined as follows:
(1) if $I M \neq M$, then $\operatorname{depth}_{I}(M)$ is the supremum in $\{0,1,2, \ldots, \infty\}$ of the lengths of $M$-regular sequences in $I$,
(2) if $I M=M$ we set $\operatorname{depth}_{I}(M)=\infty$.

If $(R, \mathfrak{m})$ is local we call depth $\operatorname{dem}^{(M)}$ simply the depth of $M$.
Explanation. By Definition 10.67 .1 the empty sequence is not a regular sequence on the zero module, but for practical purposes it turns out to be convenient to set the depth of the 0 module equal to $+\infty$. Note that if $I=R$, then $\operatorname{depth}_{I}(M)=\infty$ for all finite $R$-modules $M$. If $I$ is contained in the radical ideal of $R$ (e.g., if $R$ is local and $I \subset \mathfrak{m}_{R}$ ), then $M \neq 0 \Rightarrow I M \neq M$ by Nakayama's lemma. A module $M$ has $I$-depth 0 if and only if $M$ is nonzero and $I$ does not contain an $M$-regular element.

Example 10.67 .2 shows depth does not behave well even if the ring is Noetherian, and Example 10.67 .3 shows that it does not behave well if the ring is local but non-Noetherian. We will see depth behaves well if the ring is local Noetherian.

0AUI Lemma 10.71.2. Let $R$ be a ring, $I \subset R$ an ideal, and $M$ a finite $R$-module. Then depth ${ }_{I}(M)$ is equal to the supremum of the lengths of sequences $f_{1}, \ldots, f_{r} \in I$ such that $f_{i}$ is a nonzerodivisor on $M /\left(f_{1}, \ldots, f_{i-1}\right) M$.
Proof. Suppose that $I M=M$. Then Lemma 10.19.1 shows there exists an $f \in I$ such that $f: M \rightarrow M$ is $\operatorname{id}_{M}$. Hence $f, 0,0,0, \ldots$ is an infinite sequence of successive nonzerodivisors and we see agreement holds in this case. If $I M \neq M$, then we see that a sequence as in the lemma is an $M$-regular sequence and we conclude that agreement holds as well.

00LK Lemma 10.71.3. Let $R$ be a Noetherian local ring. Let $M$ be a nonzero finite $R$-module. Then $\operatorname{dim}(\operatorname{Supp}(M)) \geq \operatorname{depth}(M)$.

Proof. If $f$ is an element of the maximal ideal of $R$ and a nonzerodivisor on $M$, then $\operatorname{dim}(\operatorname{Supp}(M / f M)) \leq \operatorname{dim}(\operatorname{Supp}(M))-1$, by Lemma 10.62.10. The result follows.

0AUJ Lemma 10.71.4. Let $R$ be a Noetherian ring, $I \subset R$ an ideal, and $M$ a finite nonzero $R$-module such that $I M \neq M$. Then $\operatorname{depth}_{I}(M)<\infty$.

Proof. Let $I \subset \mathfrak{p}$ be a prime ideal. As localization is flat we see that $M$-regular sequences in $I$ maps to $M_{\mathfrak{p}}$-regular sequences in $I_{\mathfrak{p}}$. Hence depth $I(M) \leq \operatorname{depth}_{I_{\mathfrak{p}}}\left(M_{\mathfrak{p}}\right)$. The latter is $\leq \operatorname{depth}\left(M_{\mathfrak{p}}\right)$ which is $<\infty$ by Lemma 10.71.3.

00LW Lemma 10.71.5. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $M$ be a nonzero finite $R$-module. Then $\operatorname{depth}(M)$ is equal to the smallest integer $i$ such that $\operatorname{Ext}_{R}^{i}(R / \mathfrak{m}, M)$ is nonzero.

Proof. Let $\delta(M)$ denote the depth of $M$ and let $i(M)$ denote the smallest integer $i$ such that $\operatorname{Ext}_{R}^{i}(R / \mathfrak{m}, M)$ is nonzero. We will see in a moment that $i(M)<\infty$. By Lemma 10.62 .18 we have $\delta(M)=0$ if and only if $i(M)=0$, because $\mathfrak{m} \in \operatorname{Ass}(M)$ exactly means that $i(M)=0$. Hence if $\delta(M)$ or $i(M)$ is $>0$, then we may choose $x \in \mathfrak{m}$ such that (a) $x$ is a nonzerodivisor on $M$, and (b) $\operatorname{depth}(M / x M)=\delta(M)-$ 1. Consider the long exact sequence of Ext-groups associated to the short exact sequence $0 \rightarrow M \rightarrow M \rightarrow M / x M \rightarrow 0$ by Lemma 10.70.6.

$$
\begin{aligned}
& 0 \rightarrow \operatorname{Hom}_{R}(\kappa, M) \rightarrow \operatorname{Hom}_{R}(\kappa, M) \rightarrow \operatorname{Hom}_{R}(\kappa, M / x M) \\
& \quad \rightarrow \operatorname{Ext}_{R}^{1}(\kappa, M) \rightarrow \operatorname{Ext}_{R}^{1}(\kappa, M) \rightarrow \operatorname{Ext}_{R}^{1}(\kappa, M / x M) \rightarrow \ldots
\end{aligned}
$$

Since $x \in \mathfrak{m}$ all the maps $\operatorname{Ext}_{R}^{i}(\kappa, M) \rightarrow \operatorname{Ext}_{R}^{i}(\kappa, M)$ are zero, see Lemma 10.70.8. Thus it is clear that $i(M / x M)=i(M)-1$. Induction on $\delta(M)$ finishes the proof.
00LX Lemma 10.71.6. Let $R$ be a local Noetherian ring. Let $0 \rightarrow N^{\prime} \rightarrow N \rightarrow N^{\prime \prime} \rightarrow 0$ be a short exact sequence of finite $R$-modules.
(1) $\operatorname{depth}\left(N^{\prime \prime}\right) \geq \min \left\{\operatorname{depth}(N), \operatorname{depth}\left(N^{\prime}\right)-1\right\}$
(2) $\operatorname{depth}\left(N^{\prime}\right) \geq \min \left\{\operatorname{depth}(N), \operatorname{depth}\left(N^{\prime \prime}\right)+1\right\}$

Proof. Use the characterization of depth using the Ext groups Ext ${ }^{i}(\kappa, N)$, see Lemma 10.71.5, and use the long exact cohomology sequence

$$
\begin{aligned}
& 0 \rightarrow \operatorname{Hom}_{R}\left(\kappa, N^{\prime}\right) \rightarrow \operatorname{Hom}_{R}(\kappa, N) \rightarrow \operatorname{Hom}_{R}\left(\kappa, N^{\prime \prime}\right) \\
& \quad \rightarrow \operatorname{Ext}_{R}^{1}\left(\kappa, N^{\prime}\right) \rightarrow \operatorname{Ext}_{R}^{1}(\kappa, N) \rightarrow \operatorname{Ext}_{R}^{1}\left(\kappa, N^{\prime \prime}\right) \rightarrow \ldots
\end{aligned}
$$

from Lemma 10.70 .6 .
090R Lemma 10.71.7. Let $R$ be a local Noetherian ring and $M$ a nonzero finite $R$ module.
(1) If $x \in \mathfrak{m}$ is a nonzerodivisor on $M$, then $\operatorname{depth}(M / x M)=\operatorname{depth}(M)-1$.
(2) Any $M$-regular sequence $x_{1}, \ldots, x_{r}$ can be extended to an $M$-regular sequence of length depth $(M)$.
Proof. Part (2) is a formal consequence of part (1). Let $x \in R$ be as in (1). By the short exact sequence $0 \rightarrow M \rightarrow M \rightarrow M / x M \rightarrow 0$ and Lemma 10.71.6 we see that the depth drops by at most 1 . On the other hand, if $x_{1}, \ldots, x_{\delta} \in \mathfrak{m}$ is a regular sequence for $M / x M$, then $x, x_{1}, \ldots, x_{r}$ is a regular sequence for $M$. Hence we see that the depth drops by at least 1 .
0BK4 Lemma 10.71.8. Let $(R, \mathfrak{m})$ be a local Noetherian ring and $M$ a finite $R$-module. For $\mathfrak{p} \in \operatorname{Ass}(M)$ we have $\operatorname{dim}(R / \mathfrak{p}) \geq \operatorname{depth}(M)$.
Proof. If $\mathfrak{m} \in \operatorname{Ass}(M)$ then $\operatorname{depth}(M)=0$ and there is nothing to prove. This proves the lemma if $\operatorname{depth}(M)=1$. We will prove the lemma in general by induction on $\operatorname{depth}(M)$ which we assume to be $>1$. Pick $x \in \mathfrak{m}$ with $x \notin \mathfrak{p}$ for $\mathfrak{p} \in \operatorname{Ass}(M)$. The existence of such an $x$ follows from Lemmas 10.14 .2 and 10.62 .5 Then $x$ is a nonzerodivisor on $M$ by Lemma 10.62.9. Hence $\operatorname{depth}\left(M / x^{n} M\right)=\operatorname{depth}(M)-1$ by Lemma 10.71.7. For $\mathfrak{p} \in \operatorname{Ass}(M)$ pick an embedding $R / \mathfrak{p} \subset M$. The Artin-Rees lemma (Lemma 10.50.2) shows that $(R / \mathfrak{p}) \cap x^{n} M$ is contained in $x(R / \mathfrak{p})$ for $n$ large enough. Thus the image $N \subset M / x^{n} M$ of $R / \mathfrak{p}$ is a submodule whose support is equal to $V(\mathfrak{p}+(x))$. By Lemma 10.59 .12 the dimension of this is $\operatorname{dim}(R / \mathfrak{p})-1$. It follows that $M / x^{n} M$ has an associated prime of $\operatorname{dimension} \operatorname{dim}(R / \mathfrak{p})-1$, see Lemmas 10.62 .8 and 10.62 .3 . By induction we find $\operatorname{dim}(R / \mathfrak{p})-1 \geq \operatorname{depth}(M)-1$ and we win.

0AUK Lemma 10.71.9. Let $(R, \mathfrak{m})$ be a Noetherian local ring. Let $R \rightarrow S$ be a finite ring map. Let $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{n}$ be the maximal ideals of $S$. Let $N$ be a finite $S$-module. Then

$$
\min _{i=1, \ldots, n} \operatorname{depth}\left(N_{\mathfrak{m}_{i}}\right)=\operatorname{depth}(N)
$$

Proof. By Lemmas $10.35 .18,10.35 .20$ and Lemma 10.35 .19 the maximal ideals of $S$ are exactly the primes of $S$ lying over $\mathfrak{m}$ and there are finitely many of them. Hence the statement of the lemma makes sense. We will prove the lemma by induction on $k=\min _{i=1, \ldots, n} \operatorname{depth}\left(N_{\mathfrak{m}_{i}}\right)$. If $k=0$, then $\operatorname{depth}\left(N_{\mathfrak{m}_{i}}\right)=0$ for some i. By Lemma 10.71 .5 this means $\mathfrak{m}_{i} S_{\mathfrak{m}_{i}}$ is an associated prime of $N_{\mathfrak{m}_{i}}$ and hence $\mathfrak{m}_{i}$ is an associated prime of $N$ (Lemma 10.62.16). By Lemma 10.62 .13 we see that $\mathfrak{m}$ is an associated prime of $N$ as an $R$-module. Whence $\operatorname{depth}(N)=0$. This proves the base case. If $k>0$, then we see that $\mathfrak{m}_{i} \notin \operatorname{Ass}_{S}(N)$. Hence $\mathfrak{m} \notin \operatorname{Ass}_{R}(N)$, again by Lemma 10.62.13. Thus we can find $f \in \mathfrak{m}$ which is not a zerodivisor on $N$, see Lemma 10.62 .18 . By Lemma 10.71 .7 all the depths drop exactly by 1 when passing from $N$ to $N / f N$ and the induction hypothesis does the rest.

### 10.72. Functorialities for Ext

087 M In this section we briefly discuss the functoriality of Ext with respect to change of ring, etc. Here is a list of items to work out.
(1) Given $R \rightarrow R^{\prime}$, an $R$-module $M$ and an $R^{\prime}$-module $N^{\prime}$ the $R$-module $\operatorname{Ext}_{R}^{i}\left(M, N^{\prime}\right)$ has a natural $R^{\prime}$-module structure. Moreover, there is a canonical $R^{\prime}$-linear map $\operatorname{Ext}_{R^{\prime}}^{i}\left(M \otimes_{R} R^{\prime}, N^{\prime}\right) \rightarrow \operatorname{Ext}_{R}^{i}\left(M, N^{\prime}\right)$.
(2) Given $R \rightarrow R^{\prime}$ and $R$-modules $M, N$ there is a natural $R$-module map $\operatorname{Ext}_{R}^{i}(M, N) \rightarrow \operatorname{Ext}_{R}^{i}\left(M, N \otimes_{R} R^{\prime}\right)$.
087 N Lemma 10.72.1. Given a flat ring map $R \rightarrow R^{\prime}$, an $R$-module $M$, and an $R^{\prime}$ module $N^{\prime}$ the natural map

$$
\operatorname{Ext}_{R^{\prime}}^{i}\left(M \otimes_{R} R^{\prime}, N^{\prime}\right) \rightarrow \operatorname{Ext}_{R}^{i}\left(M, N^{\prime}\right)
$$

is an isomorphism for $i \geq 0$.
Proof. Choose a free resolution $F_{\bullet}$ of $M$. Since $R \rightarrow R^{\prime}$ is flat we see that $F_{\bullet} \otimes_{R} R^{\prime}$ is a free resolution of $M \otimes_{R} R^{\prime}$ over $R^{\prime}$. The statement is that the map

$$
\operatorname{Hom}_{R^{\prime}}\left(F_{\bullet} \otimes_{R} R^{\prime}, N^{\prime}\right) \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}, N^{\prime}\right)
$$

induces an isomorphism on homology groups, which is true because it is an isomorphism of complexes by Lemma 10.13.3.

### 10.73. An application of Ext groups

02HN Here it is.
02HO Lemma 10.73.1. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $N \rightarrow$ $M$ be a homomorphism of finite $R$-modules. Suppose that there exists arbitrarily large $n$ such that $N / \mathfrak{m}^{n} N \rightarrow M / \mathfrak{m}^{n} M$ is a split injection. Then $N \rightarrow M$ is a split injection.

Proof. Assume $\varphi: N \rightarrow M$ satisfies the assumptions of the lemma. Note that this implies that $\operatorname{Ker}(\varphi) \subset \mathfrak{m}^{n} N$ for arbitrarily large $n$. Hence by Lemma 10.50 .4 we see that $\varphi$ is injection. Let $Q=M / N$ so that we have a short exact sequence

$$
0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0
$$

Let

$$
F_{2} \xrightarrow{d_{2}} F_{1} \xrightarrow{d_{1}} F_{0} \rightarrow Q \rightarrow 0
$$

be a finite free resolution of $Q$. We can choose a map $\alpha: F_{0} \rightarrow M$ lifting the map $F_{0} \rightarrow Q$. This induces a map $\beta: F_{1} \rightarrow N$ such that $\beta \circ d_{2}=0$. The extension above is split if and only if there exists a map $\gamma: F_{0} \rightarrow N$ such that $\beta=\gamma \circ d_{1}$. In other words, the class of $\beta$ in $\operatorname{Ext}_{R}^{1}(Q, N)$ is the obstruction to splitting the short exact sequence above.

Suppose $n$ is a large integer such that $N / \mathfrak{m}^{n} N \rightarrow M / \mathfrak{m}^{n} M$ is a split injection. This implies

$$
0 \rightarrow N / \mathfrak{m}^{n} N \rightarrow M / \mathfrak{m}^{n} M \rightarrow Q / \mathfrak{m}^{n} Q \rightarrow 0
$$

is still short exact. Also, the sequence

$$
F_{1} / \mathfrak{m}^{n} F_{1} \xrightarrow{d_{1}} F_{0} / \mathfrak{m}^{n} F_{0} \rightarrow Q / \mathfrak{m}^{n} Q \rightarrow 0
$$

is still exact. Arguing as above we see that the map $\bar{\beta}: F_{1} / \mathfrak{m}^{n} F_{1} \rightarrow N / \mathfrak{m}^{n} N$ induced by $\beta$ is equal to $\gamma_{n} \circ d_{1}$ for some map $\overline{\gamma_{n}}: F_{0} / \mathfrak{m}^{n} F_{0} \rightarrow N / \mathfrak{m}^{n}$. Since $F_{0}$ is free we can lift $\overline{\gamma_{n}}$ to a map $\gamma_{n}: F_{0} \rightarrow N$ and then we see that $\beta-\gamma_{n} \circ d_{1}$ is a map from $F_{1}$ into $\mathfrak{m}^{n} N$. In other words we conclude that

$$
\beta \in \operatorname{Im}\left(\operatorname{Hom}_{R}\left(F_{0}, N\right) \rightarrow \operatorname{Hom}_{R}\left(F_{1}, N\right)\right)+\mathfrak{m}^{n} \operatorname{Hom}_{R}\left(F_{1}, N\right)
$$

for this $n$.
Since we have this property for arbitrarily large $n$ by assumption we conclude (by Lemma 10.50 .2 that $\beta$ is actually in the image of the map $\operatorname{Hom}_{R}\left(F_{0}, N\right) \rightarrow$ $\operatorname{Hom}_{R}\left(F_{1}, N\right)$ as desired.

### 10.74. Tor groups and flatness

00 LY In this section we use some of the homological algebra developed in the previous section to explain what Tor groups are. Namely, suppose that $R$ is a ring and that $M, N$ are two $R$-modules. Choose a resolution $F \bullet$ of $M$ by free $R$-modules. See Lemma 10.70.1. Consider the homological complex

$$
F_{\bullet} \otimes_{R} N: \ldots \rightarrow F_{2} \otimes_{R} N \rightarrow F_{1} \otimes_{R} N \rightarrow F_{0} \otimes_{R} N
$$

We define $\operatorname{Tor}_{i}^{R}(M, N)$ to be the $i$ th homology group of this complex. The following lemma explains in what sense this is well defined.

00LZ Lemma 10.74.1. Let $R$ be a ring. Let $M_{1}, M_{2}, N$ be $R$-modules. Suppose that $F_{\bullet}$ is a free resolution of the module $M_{1}$ and that $G_{\bullet}$ is a free resolution of the module $M_{2}$. Let $\varphi: M_{1} \rightarrow M_{2}$ be a module map. Let $\alpha: F_{\bullet} \rightarrow G_{\bullet}$ be a map of complexes inducing $\varphi$ on $M_{1}=\operatorname{Coker}\left(d_{F, 1}\right) \rightarrow M_{2}=\operatorname{Coker}\left(d_{G, 1}\right)$, see Lemma 10.70.4. Then the induced maps

$$
H_{i}(\alpha): H_{i}\left(F_{\bullet} \otimes_{R} N\right) \longrightarrow H_{i}\left(G_{\bullet} \otimes_{R} N\right)
$$

are independent of the choice of $\alpha$. If $\varphi$ is an isomorphism, so are all the maps $H_{i}(\alpha)$. If $M_{1}=M_{2}, F_{\bullet}=G_{\bullet}$, and $\varphi$ is the identity, so are all the maps $H_{i}(\alpha)$.

Proof. The proof of this lemma is identical to the proof of Lemma 10.70.5.

Not only does this lemma imply that the Tor modules are well defined, but it also provides for the functoriality of the constructions $(M, N) \mapsto \operatorname{Tor}_{i}^{R}(M, N)$ in the first variable. Of course the functoriality in the second variable is evident. We leave it to the reader to see that each of the $\operatorname{Tor}_{i}^{R}$ is in fact a functor

$$
\operatorname{Mod}_{R} \times \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}
$$

Here $\operatorname{Mod}_{R}$ denotes the category of $R$-modules, and for the definition of the product category see Categories, Definition 4.2.20. Namely, given morphisms of $R$-modules $M_{1} \rightarrow M_{2}$ and $N_{1} \rightarrow N_{2}$ we get a commutative diagram

00M0 Lemma 10.74.2. Let $R$ be a ring and let $M$ be an $R$-module. Suppose that $0 \rightarrow N^{\prime} \rightarrow N \rightarrow N^{\prime \prime} \rightarrow 0$ is a short exact sequence of $R$-modules. There exists $a$ long exact sequence

$$
\begin{gathered}
M \otimes_{R} N^{\prime} \rightarrow M \otimes_{R} N \rightarrow M \otimes_{R} N^{\prime \prime} \rightarrow 0 \\
\operatorname{Tor}_{1}^{R}\left(M, N^{\prime}\right) \rightarrow \operatorname{Tor}_{1}^{R}(M, N) \rightarrow \operatorname{Tor}_{1}^{R}\left(M, N^{\prime \prime}\right) \rightarrow
\end{gathered}
$$

Proof. The proof of this is the same as the proof of Lemma 10.70.6.
Consider a homological double complex of $R$-modules

This means that $d_{i, j}: A_{i, j} \rightarrow A_{i-1, j}$ and $\delta_{i, j}: A_{i, j} \rightarrow A_{i, j-1}$ have the following properties
(1) Any composition of two $d_{i, j}$ is zero. In other words the rows of the double complex are complexes.
(2) Any composition of two $\delta_{i, j}$ is zero. In other words the columns of the double complex are complexes.
(3) For any pair $(i, j)$ we have $\delta_{i-1, j} \circ d_{i, j}=d_{i, j-1} \circ \delta_{i, j}$. In other words, all the squares commute.
The correct thing to do is to associate a spectral sequence to any such double complex. However, for the moment we can get away with doing something slightly easier.

Namely, for the purposes of this section only, given a double complex $\left(A_{\bullet}, \bullet, d, \delta\right)$ set $R(A)_{j}=\operatorname{Coker}\left(A_{1, j} \rightarrow A_{0, j}\right)$ and $U(A)_{i}=\operatorname{Coker}\left(A_{i, 1} \rightarrow A_{i, 0}\right)$. (The letters $R$
and $U$ are meant to suggest Right and Up.) We endow $R(A)$ • with the structure of a complex using the maps $\delta$. Similarly we endow $U(A)$. with the structure of a complex using the maps $d$. In other words we obtain the following huge commutative diagram

(This is no longer a double complex of course.) It is clear what a morphism $\Phi$ : $\left(A_{\bullet}, \bullet, d, \delta\right) \rightarrow\left(B_{\bullet \bullet}, d, \delta\right)$ of double complexes is, and it is clear that this induces morphisms of complexes $R(\Phi): R(A) \bullet \rightarrow R(B) \bullet$ and $U(\Phi): U(A) \bullet \rightarrow U(B)_{\bullet}$.

00M1 Lemma 10.74.3. Let $\left(A_{\bullet, \bullet}, d, \delta\right)$ be a double complex such that
(1) Each row $A_{\bullet, j}$ is a resolution of $R(A)_{j}$.
(2) Each column $A_{i, \bullet}$ is a resolution of $U(A)_{i}$.

Then there are canonical isomorphisms

$$
H_{i}(R(A) \bullet) \cong H_{i}(U(A) \bullet)
$$

The isomorphisms are functorial with respect to morphisms of double complexes with the properties above.

Proof. We will show that $\left.H_{i}(R(A) \bullet)\right)$ and $H_{i}(U(A) \bullet)$ are canonically isomorphic to a third group. Namely

$$
\mathbf{H}_{i}(A):=\frac{\left\{\left(a_{i, 0}, a_{i-1,1}, \ldots, a_{0, i}\right) \mid d\left(a_{i, 0}\right)=\delta\left(a_{i-1,1}\right), \ldots, d\left(a_{1, i-1}\right)=\delta\left(a_{0, i}\right)\right\}}{\left\{d\left(a_{i+1,0}\right)-\delta\left(a_{i, 1}\right), d\left(a_{i, 1}\right)-\delta\left(a_{i-1,2}\right), \ldots, d\left(a_{1, i}\right)-\delta\left(a_{0, i+1}\right)\right\}}
$$

Here we use the notational convention that $a_{i, j}$ denotes an element of $A_{i, j}$. In other words, an element of $\mathbf{H}_{i}$ is represented by a zig-zag, represented as follows for $i=2$

Naturally, we divide out by "trivial" zig-zags, namely the submodule generated by elements of the form $\left(0, \ldots, 0,-\delta\left(a_{t+1, t-i}\right), d\left(a_{t+1, t-i}\right), 0, \ldots, 0\right)$. Note that there
are canonical homomorphisms

$$
\mathbf{H}_{i}(A) \rightarrow H_{i}(R(A) \bullet), \quad\left(a_{i, 0}, a_{i-1,1}, \ldots, a_{0, i}\right) \mapsto \text { class of image of } a_{0, i}
$$

and

$$
\mathbf{H}_{i}(A) \rightarrow H_{i}(U(A) \bullet), \quad\left(a_{i, 0}, a_{i-1,1}, \ldots, a_{0, i}\right) \mapsto \text { class of image of } a_{i, 0}
$$

First we show that these maps are surjective. Suppose that $\bar{r} \in H_{i}(R(A) \bullet)$. Let $r \in R(A)_{i}$ be a cocycle representing the class of $\bar{r}$. Let $a_{0, i} \in A_{0, i}$ be an element which maps to $r$. Because $\delta(r)=0$, we see that $\delta\left(a_{0, i}\right)$ is in the image of $d$. Hence there exists an element $a_{1, i-1} \in A_{1, i-1}$ such that $d\left(a_{1, i-1}\right)=\delta\left(a_{0, i}\right)$. This in turn implies that $\delta\left(a_{1, i-1}\right)$ is in the kernel of $d$ (because $d\left(\delta\left(a_{1, i-1}\right)\right)=\delta\left(d\left(a_{1, i-1}\right)\right)=$ $\delta\left(\delta\left(a_{0, i}\right)\right)=0$. By exactness of the rows we find an element $a_{2, i-2}$ such that $d\left(a_{2, i-2}\right)=\delta\left(a_{1, i-1}\right)$. And so on until a full zig-zag is found. Of course surjectivity of $\mathbf{H}_{i} \rightarrow H_{i}(U(A))$ is shown similarly.

To prove injectivity we argue in exactly the same way. Namely, suppose we are given a zig-zag $\left(a_{i, 0}, a_{i-1,1}, \ldots, a_{0, i}\right)$ which maps to zero in $H_{i}(R(A)$ •). This means that $a_{0, i}$ maps to an element of $\operatorname{Coker}\left(A_{i, 1} \rightarrow A_{i, 0}\right)$ which is in the image of $\delta:$ $\operatorname{Coker}\left(A_{i+1,1} \rightarrow A_{i+1,0}\right) \rightarrow \operatorname{Coker}\left(A_{i, 1} \rightarrow A_{i, 0}\right)$. In other words, $a_{0, i}$ is in the image of $\delta \oplus d: A_{0, i+1} \oplus A_{1, i} \rightarrow A_{0, i}$. From the definition of trivial zig-zags we see that we may modify our zig-zag by a trivial one and assume that $a_{0, i}=0$. This immediately implies that $d\left(a_{1, i-1}\right)=0$. As the rows are exact this implies that $a_{1, i-1}$ is in the image of $d: A_{2, i-1} \rightarrow A_{1, i-1}$. Thus we may modify our zig-zag once again by a trivial zig-zag and assume that our zig-zag looks like ( $a_{i, 0}, a_{i-1,1}, \ldots, a_{2, i-2}, 0,0$ ). Continuing like this we obtain the desired injectivity.

If $\Phi:\left(A_{\bullet, \bullet}, d, \delta\right) \rightarrow\left(B_{\bullet, \bullet}, d, \delta\right)$ is a morphism of double complexes both of which satisfy the conditions of the lemma, then we clearly obtain a commutative diagram

This proves the functoriality.
00M2 Remark 10.74.4. The isomorphism constructed above is the "correct" one only up to signs. A good part of homological algebra is concerned with choosing signs for various maps and showing commutativity of diagrams with intervention of suitable signs. For the moment we will simply use the isomorphism as given in the proof above, and worry about signs later.

00M3 Lemma 10.74.5. Let $R$ be a ring. For any $i \geq 0$ the functors $\operatorname{Mod}_{R} \times \operatorname{Mod}_{R} \rightarrow$ $\operatorname{Mod}_{R},(M, N) \mapsto \operatorname{Tor}_{i}^{R}(M, N)$ and $(M, N) \mapsto \operatorname{Tor}_{i}^{R}(N, M)$ are canonically isomorphic.
Proof. Let $F_{\bullet}$ be a free resolution of the module $M$ and let $G_{\bullet}$ be a free resolution of the module $N$. Consider the double complex $\left(A_{i, j}, d, \delta\right)$ defined as follows:
(1) set $A_{i, j}=F_{i} \otimes_{R} G_{j}$,
(2) set $d_{i, j}: F_{i} \otimes_{R} G_{j} \rightarrow F_{i-1} \otimes G_{j}$ equal to $d_{F, i} \otimes \mathrm{id}$, and
(3) set $\delta_{i, j}: F_{i} \otimes_{R} G_{j} \rightarrow F_{i} \otimes G_{j-1}$ equal to id $\otimes d_{G, j}$.

This double complex is usually simply denoted $F_{\bullet} \otimes_{R} G_{\bullet}$.
Since each $G_{j}$ is free, and hence flat we see that each row of the double complex is exact except in homological degree 0 . Since each $F_{i}$ is free and hence flat we see that each column of the double complex is exact except in homological degree 0 . Hence the double complex satisfies the conditions of Lemma 10.74.3.
To see what the lemma says we compute $R(A) \bullet$ and $U(A)$ • Namely,

$$
\begin{aligned}
R(A)_{i} & =\operatorname{Coker}\left(A_{1, i} \rightarrow A_{0, i}\right) \\
& =\operatorname{Coker}\left(F_{1} \otimes_{R} G_{i} \rightarrow F_{0} \otimes_{R} G_{i}\right) \\
& =\operatorname{Coker}\left(F_{1} \rightarrow F_{0}\right) \otimes_{R} G_{i} \\
& =M \otimes_{R} G_{i}
\end{aligned}
$$

In fact these isomorphisms are compatible with the differentials $\delta$ and we see that $R(A)_{\bullet}=M \otimes_{R} G_{\bullet}$ as homological complexes. In exactly the same way we see that $U(A) \bullet=F_{\bullet} \otimes_{R} N$. We get

$$
\begin{aligned}
\operatorname{Tor}_{i}^{R}(M, N) & =H_{i}\left(F_{\bullet} \otimes_{R} N\right) \\
& =H_{i}\left(U(A)_{\bullet}\right) \\
& =H_{i}\left(R(A)_{\bullet}\right) \\
& =H_{i}\left(M \otimes_{R} G_{\bullet}\right) \\
& =H_{i}\left(G_{\bullet} \otimes_{R} M\right) \\
& =\operatorname{Tor}_{i}^{R}(N, M)
\end{aligned}
$$

Here the third equality is Lemma 10.74 .3 , and the fifth equality uses the isomorphism $V \otimes W=W \otimes V$ of the tensor product.
Functoriality. Suppose that we have $R$-modules $M_{\nu}, N_{\nu}, \nu=1,2$. Let $\varphi: M_{1} \rightarrow$ $M_{2}$ and $\psi: N_{1} \rightarrow N_{2}$ be morphisms of $R$-modules. Suppose that we have free resolutions $F_{\nu, \bullet}$ for $M_{\nu}$ and free resolutions $G_{\nu, \bullet}$ for $N_{\nu}$. By Lemma 10.70.4 we may choose maps of complexes $\alpha: F_{1, \bullet} \rightarrow F_{2, \bullet}$ and $\beta: G_{1, \bullet} \rightarrow G_{2, \bullet}$ compatible with $\varphi$ and $\psi$. We claim that the pair $(\alpha, \beta)$ induces a morphism of double complexes

$$
\alpha \otimes \beta: F_{1, \bullet} \otimes_{R} G_{1, \bullet} \longrightarrow F_{2, \bullet} \otimes_{R} G_{2, \bullet}
$$

This is really a very straightforward check using the rule that $F_{1, i} \otimes_{R} G_{1, j} \rightarrow F_{2, i} \otimes_{R}$ $G_{2, j}$ is given by $\alpha_{i} \otimes \beta_{j}$ where $\alpha_{i}$, resp. $\beta_{j}$ is the degree $i$, resp. $j$ component of $\alpha$, resp. $\beta$. The reader also readily verifies that the induced maps $R\left(F_{1, \bullet} \otimes_{R} G_{1, \bullet}\right) \bullet \rightarrow$ $R\left(F_{2, \bullet} \otimes_{R} G_{2, \bullet}\right) \bullet$ agrees with the map $M_{1} \otimes_{R} G_{1, \bullet} \rightarrow M_{2} \otimes_{R} G_{2, \bullet}$ induced by $\varphi \otimes \beta$. Similarly for the map induced on the $U(-)$ • complexes. Thus the statement on functoriality follows from the statement on functoriality in Lemma 10.74.3.

00M4 Remark 10.74.6. An interesting case occurs when $M=N$ in the above. In this case we get a canonical map $\operatorname{Tor}_{i}^{R}(M, M) \rightarrow \operatorname{Tor}_{i}^{R}(M, M)$. Note that this map is not the identity, because even when $i=0$ this map is not the identity! For example, if $V$ is a vector space of dimension $n$ over a field, then the switch map $V \otimes_{k} V \rightarrow V \otimes_{k} V$ has $\left(n^{2}+n\right) / 2$ eigenvalues +1 and $\left(n^{2}-n\right) / 2$ eigenvalues -1 . In characteristic 2 it is not even diagonalizable. Note that even changing the sign of the map will not get rid of this.
0AZ4 Lemma 10.74.7. Let $R$ be a Noetherian ring. Let $M, N$ be finite $R$-modules. Then $\operatorname{Tor}_{p}^{R}(M, N)$ is a finite $R$-module for all $p$.

Proof. This holds because $\operatorname{Tor}_{p}^{R}(M, N)$ is computed as the cohomology groups of a complex $F_{\bullet} \otimes_{R} N$ with each $F_{n}$ a finite free $R$-module, see Lemma 10.70.1.

00M5 Lemma 10.74.8. Let $R$ be a ring. Let $M$ be an $R$-module. The following are equivalent:
(1) The module $M$ is flat over $R$.
(2) For all $i>0$ the functor $\operatorname{Tor}_{i}^{R}(M,-)$ is zero.
(3) The functor $\operatorname{Tor}_{1}^{R}(M,-)$ is zero.
(4) For all ideals $I \subset R$ we have $\operatorname{Tor}_{1}^{R}(M, R / I)=0$.
(5) For all finitely generated ideals $I \subset R$ we have $\operatorname{Tor}_{1}^{R}(M, R / I)=0$.

Proof. Suppose $M$ is flat. Let $N$ be an $R$-module. Let $F_{\bullet}$ be a free resolution of $N$. Then $F \bullet \otimes_{R} M$ is a resolution of $N \otimes_{R} M$, by flatness of $M$. Hence all higher Tor groups vanish.

It now suffices to show that the last condition implies that $M$ is flat. Let $I \subset R$ be an ideal. Consider the short exact sequence $0 \rightarrow I \rightarrow R \rightarrow R / I \rightarrow 0$. Apply Lemma 10.74.2. We get an exact sequence

$$
\operatorname{Tor}_{1}^{R}(M, R / I) \rightarrow M \otimes_{R} I \rightarrow M \otimes_{R} R \rightarrow M \otimes_{R} R / I \rightarrow 0
$$

Since obviously $M \otimes_{R} R=M$ we conclude that the last hypothesis implies that $M \otimes_{R} I \rightarrow M$ is injective for every finitely generated ideal $I$. Thus $M$ is flat by Lemma 10.38 .5

00M6 Remark 10.74.9. The proof of Lemma 10.74 .8 actually shows that

$$
\operatorname{Tor}_{1}^{R}(M, R / I)=\operatorname{Ker}\left(I \otimes_{R} M \rightarrow M\right)
$$

### 10.75. Functorialities for Tor

00M7 In this section we briefly discuss the functoriality of Tor with respect to change of ring, etc. Here is a list of items to work out.
(1) Given a ring map $R \rightarrow R^{\prime}$, an $R$-module $M$ and an $R^{\prime}$-module $N^{\prime}$ the $R$-modules $\operatorname{Tor}_{i}^{R}\left(M, N^{\prime}\right)$ have a natural $R^{\prime}$-module structure.
(2) Given a ring map $R \rightarrow R^{\prime}$ and $R$-modules $M, N$ there is a natural $R$ module map $\operatorname{Tor}_{i}^{R}(M, N) \rightarrow \operatorname{Tor}_{i}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, N \otimes_{R} R^{\prime}\right)$.
(3) Given a ring map $R \rightarrow R^{\prime}$ an $R$-module $M$ and an $R^{\prime}$-module $N^{\prime}$ there exists a natural $R^{\prime}$-module map $\operatorname{Tor}_{i}^{R}\left(M, N^{\prime}\right) \rightarrow \operatorname{Tor}_{i}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, N^{\prime}\right)$.

00M8 Lemma 10.75.1. Given a flat ring map $R \rightarrow R^{\prime}$ and $R$-modules $M, N$ the natural $R$-module map $\operatorname{Tor}_{i}^{R}(M, N) \otimes_{R} R^{\prime} \rightarrow \operatorname{Tor}_{i}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, N \otimes_{R} R^{\prime}\right)$ is an isomorphism for all $i$.

Proof. Omitted. This is true because a free resolution $F_{\bullet}$ of $M$ over $R$ stays exact when tensoring with $R^{\prime}$ over $R$ and hence $\left(F_{\bullet} \otimes_{R} N\right) \otimes_{R} R^{\prime}$ computes the Tor groups over $R^{\prime}$.

The following lemma does not seem to fit anywhere else.
OBNF Lemma 10.75.2. Let $R$ be a ring. Let $M=\operatorname{colim} M_{i}$ be a filtered colimit of $R$-modules. Let $N$ be an $R$-module. Then $\operatorname{Tor}_{n}^{R}(M, N)=\operatorname{colim} \operatorname{Tor}_{n}^{R}\left(M_{i}, N\right)$ for all $n$.

Proof. Choose a free resolution $F_{\bullet}$ of $N$. Then $F_{\bullet} \otimes_{R} M=\operatorname{colim} F_{\bullet} \otimes_{R} M_{i}$ as complexes by Lemma 10.11.9. Thus the result by Lemma 10.8.9.

### 10.76. Projective modules

05 CD Some lemmas on projective modules.
05CE Definition 10.76.1. Let $R$ be a ring. An $R$-module $P$ is projective if and only if the functor $\operatorname{Hom}_{R}(P,-): \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ is an exact functor.

The functor $\operatorname{Hom}_{R}(M,-)$ is left exact for any $R$-module $M$, see Lemma 10.10 .1 . Hence the condition for $P$ to be projective really signifies that given a surjection of $R$-modules $N \rightarrow N^{\prime}$ the map $\operatorname{Hom}_{R}(P, N) \rightarrow \operatorname{Hom}_{R}\left(P, N^{\prime}\right)$ is surjective.
05CF Lemma 10.76.2. Let $R$ be a ring. Let $P$ be an $R$-module. The following are equivalent
(1) $P$ is projective,
(2) $P$ is a direct summand of a free $R$-module, and
(3) $\operatorname{Ext}_{R}^{1}(P, M)=0$ for every $R$-module $M$.

Proof. Assume $P$ is projective. Choose a surjection $\pi: F \rightarrow P$ where $F$ is a free $R$-module. As $P$ is projective there exists a $i \in \operatorname{Hom}_{R}(P, F)$ such that $i \circ \pi=\operatorname{id}_{P}$. In other words $F \cong \operatorname{Ker}(\pi) \oplus i(P)$ and we see that $P$ is a direct summand of $F$.
Conversely, assume that $P \oplus Q=F$ is a free $R$-module. Note that the free module $F=\bigoplus_{i \in I} R$ is projective as $\operatorname{Hom}_{R}(F, M)=\prod_{i \in I} M$ and the functor $M \mapsto \prod_{i \in I} M$ is exact. Then $\operatorname{Hom}_{R}(F,-)=\operatorname{Hom}_{R}(P,-) \times \operatorname{Hom}_{R}(Q,-)$ as functors, hence both $P$ and $Q$ are projective.
Assume $P \oplus Q=F$ is a free $R$-module. Then we have a free resolution $F_{\bullet}$ of the form

$$
\ldots F \xrightarrow{a} F \xrightarrow{b} F \rightarrow P \rightarrow 0
$$

where the maps $a, b$ alternate and are equal to the projector onto $P$ and $Q$. Hence the complex $\operatorname{Hom}_{R}\left(F_{\bullet}, M\right)$ is split exact in degrees $\geq 1$, whence we see the vanishing in (3).
Assume $\operatorname{Ext}_{R}^{1}(P, M)=0$ for every $R$-module $M$. Pick a free resolution $F_{\bullet} \rightarrow P$. Set $M=\operatorname{Im}\left(F_{1} \rightarrow F_{0}\right)=\operatorname{Ker}\left(F_{0} \rightarrow P\right)$. Consider the element $\xi \in \operatorname{Ext}_{R}^{1}(P, M)$ given by the class of the quotient map $\pi: F_{1} \rightarrow M$. Since $\xi$ is zero there exists a map $s: F_{0} \rightarrow M$ such that $\pi=s \circ\left(F_{1} \rightarrow F_{0}\right)$. Clearly, this means that

$$
F_{0}=\operatorname{Ker}(s) \oplus \operatorname{Ker}\left(F_{0} \rightarrow P\right)=P \oplus \operatorname{Ker}\left(F_{0} \rightarrow P\right)
$$

and we win.
065Q Lemma 10.76.3. A direct sum of projective modules is projective.
Proof. This is true by the characterization of projectives as direct summands of free modules in Lemma 10.76.2

07LV Lemma 10.76.4. Let $R$ be a ring. Let $I \subset R$ be a nilpotent ideal. Let $\bar{P}$ be a projective $R / I$-module. Then there exists a projective $R$-module $P$ such that $P / I P \cong \bar{P}$.

Proof. We can choose a set $A$ and a direct sum decomposition $\bigoplus_{\alpha \in A} R / I=\bar{P} \oplus \bar{K}$ for some $R / I$-module $\bar{K}$. Write $F=\bigoplus_{\alpha \in A} R$ for the free $R$-module on $A$. Choose a lift $p: F \rightarrow F$ of the projector $\bar{p}$ associated to the direct summand $\bar{P}$ of $\bigoplus_{\alpha \in A} R / I$. Note that $p^{2}-p \in \operatorname{End}_{R}(F)$ is a nilpotent endomorphism of $F$ (as $I$ is nilpotent and the matrix entries of $p^{2}-p$ are in $I$; more precisely, if $I^{n}=0$, then $\left.\left(p^{2}-p\right)^{n}=0\right)$. Hence by Lemma 10.31 .6 we can modify our choice of $p$ and assume that $p$ is a projector. Set $P=\operatorname{Im}(p)$.

05CG Lemma 10.76.5. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Assume
(1) I is nilpotent,
(2) $M / I M$ is a projective $R / I$-module,
(3) $M$ is a flat $R$-module.

Then $M$ is a projective $R$-module.
Proof. By Lemma 10.76 .4 we can find a projective $R$-module $P$ and an isomorphism $P / I P \rightarrow M / I M$. We are going to show that $M$ is isomorphic to $P$ which will finish the proof. Because $P$ is projective we can lift the map $P \rightarrow P / I P \rightarrow M / I M$ to an $R$-module map $P \rightarrow M$ which is an isomorphism modulo $I$. By Nakayama's Lemma 10.19 .1 the map $P \rightarrow M$ is surjective. It remains to show that $P \rightarrow M$ is injective. Since $I^{n}=0$ for some $n$, we can use the filtrations

$$
\begin{array}{r}
0=I^{n} M \subset I^{n-1} M \subset \ldots \subset I M \subset M \\
0=I^{n} P \subset I^{n-1} P \subset \ldots \subset I P \subset P
\end{array}
$$

to see that it suffices to show that the induced maps $I^{a} P / I^{a+1} P \rightarrow I^{a} M / I^{a+1} M$ are injective. Since both $P$ and $M$ are flat $R$-modules we can identify this with the map

$$
I^{a} / I^{a+1} \otimes_{R / I} P / I P \longrightarrow I^{a} / I^{a+1} \otimes_{R / I} M / I M
$$

induced by $P \rightarrow M$. Since we chose $P \rightarrow M$ such that the induced map $P / I P \rightarrow$ $M / I M$ is an isomorphism, we win.

### 10.77. Finite projective modules

00NV
00NW Definition 10.77.1. Let $R$ be a ring and $M$ an $R$-module.
(1) We say that $M$ is locally free if we can cover $\operatorname{Spec}(R)$ by standard opens $D\left(f_{i}\right), i \in I$ such that $M_{f_{i}}$ is a free $R_{f_{i}}$-module for all $i \in I$.
(2) We say that $M$ is finite locally free if we can choose the covering such that each $M_{f_{i}}$ is finite free.
(3) We say that $M$ is finite locally free of rank $r$ if we can choose the covering such that each $M_{f_{i}}$ is isomorhic to $R_{f_{i}}^{\oplus r}$.
Note that a finite locally free $R$-module is automatically finitely presented by Lemma 10.23.2.

00NX Lemma 10.77.2. Let $R$ be a ring and let $M$ be an $R$-module. The following are equivalent
(1) $M$ is finitely presented and $R$-flat,
(2) $M$ is finite projective,
(3) $M$ is a direct summand of a finite free $R$-module,
(4) $M$ is finitely presented and for all $\mathfrak{p} \in \operatorname{Spec}(R)$ the localization $M_{\mathfrak{p}}$ is free,
(5) $M$ is finitely presented and for all maximal ideals $\mathfrak{m} \subset R$ the localization $M_{\mathfrak{m}}$ is free,
(6) $M$ is finite and locally free,
(7) $M$ is finite locally free, and
(8) $M$ is finite, for every prime $\mathfrak{p}$ the module $M_{\mathfrak{p}}$ is free, and the function

$$
\rho_{M}: \operatorname{Spec}(R) \rightarrow \mathbf{Z}, \quad \mathfrak{p} \longmapsto \operatorname{dim}_{\kappa(\mathfrak{p})} M \otimes_{R} \kappa(\mathfrak{p})
$$

is locally constant in the Zariski topology.
Proof. First suppose $M$ is finite projective, i.e., (2) holds. Take a surjection $R^{n} \rightarrow$ $M$ and let $K$ be the kernel. Since $M$ is projective, $0 \rightarrow K \rightarrow R^{n} \rightarrow M \rightarrow 0$ splits. Hence $(2) \Rightarrow(3)$. The implication $(3) \Rightarrow(2)$ follows from the fact that a direct summand of a projective is projective, see Lemma 10.76 .2
Assume (3), so we can write $K \oplus M \cong R^{\oplus n}$. So $K$ is a direct summand of $R^{n}$ and thus finitely generated. This shows $M=R^{\oplus n} / K$ is finitely presented. In other words, $(3) \Rightarrow(1)$.
Assume $M$ is finitely presented and flat, i.e., (1) holds. We will prove that (7) holds. Pick any prime $\mathfrak{p}$ and $x_{1}, \ldots, x_{r} \in M$ which map to a basis of $M \otimes_{R} \kappa(\mathfrak{p})$. By Nakayama's Lemma 10.19 .1 these elements generate $M_{g}$ for some $g \in R, g \notin \mathfrak{p}$. The corresponding surjection $\varphi: R_{g}^{\oplus r} \rightarrow M_{g}$ has the following two properties: (a) $\operatorname{Ker}(\varphi)$ is a finite $R_{g}$-module (see Lemma 10.5.3) and $(\mathrm{b}) \operatorname{Ker}(\varphi) \otimes \kappa(\mathfrak{p})=0$ by flatness of $M_{g}$ over $R_{g}$ (see Lemma 10.38.12). Hence by Nakayama's lemma again there exists a $g^{\prime} \in R_{g}$ such that $\operatorname{Ker}(\varphi)_{g^{\prime}}=0$. In other words, $M_{g g^{\prime}}$ is free.
A finite locally free module is a finite module, see Lemma 10.23 .2 , hence $(7) \Rightarrow(6)$. It is clear that $(6) \Rightarrow(7)$ and that $(7) \Rightarrow(8)$.
A finite locally free module is a finitely presented module, see Lemma 10.23 .2 , hence $(7) \Rightarrow(4)$. Of course (4) implies (5). Since we may check flatness locally (see Lemma 10.38 .19 we conclude that (5) implies (1). At this point we have

Suppose that $M$ satisfies (1), (4), (5), (6), and (7). We will prove that (3) holds. It suffices to show that $M$ is projective. We have to show that $\operatorname{Hom}_{R}(M,-)$ is exact. Let $0 \rightarrow N^{\prime \prime} \rightarrow N \rightarrow N^{\prime} \rightarrow 0$ be a short exact sequence of $R$-module. We have to show that $0 \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime \prime}\right) \rightarrow \operatorname{Hom}_{R}(M, N) \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime}\right) \rightarrow 0$ is exact. As $M$ is finite locally free there exist a covering $\operatorname{Spec}(R)=\bigcup D\left(f_{i}\right)$ such that $M_{f_{i}}$ is finite free. By Lemma 10.10 .2 we see that

$$
0 \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime \prime}\right)_{f_{i}} \rightarrow \operatorname{Hom}_{R}(M, N)_{f_{i}} \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime}\right)_{f_{i}} \rightarrow 0
$$

is equal to $0 \rightarrow \operatorname{Hom}_{R_{f_{i}}}\left(M_{f_{i}}, N_{f_{i}}^{\prime \prime}\right) \rightarrow \operatorname{Hom}_{R_{f_{i}}}\left(M_{f_{i}}, N_{f_{i}}\right) \rightarrow \operatorname{Hom}_{R_{f_{i}}}\left(M_{f_{i}}, N_{f_{i}}^{\prime}\right) \rightarrow 0$ which is exact as $M_{f_{i}}$ is free and as the localization $0 \rightarrow N_{f_{i}}^{\prime \prime} \rightarrow N_{f_{i}} \rightarrow N_{f_{i}}^{\prime} \rightarrow 0$ is exact (as localization is exact). Whence we see that $0 \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime \prime}\right) \rightarrow$ $\operatorname{Hom}_{R}(M, N) \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime}\right) \rightarrow 0$ is exact by Lemma 10.23.2.

Finally, assume that (8) holds. Pick a maximal ideal $\mathfrak{m} \subset R$. Pick $x_{1}, \ldots, x_{r} \in M$ which map to a $\kappa(\mathfrak{m})$-basis of $M \otimes_{R} \kappa(\mathfrak{m})=M / \mathfrak{m} M$. In particular $\rho_{M}(\mathfrak{m})=r$. By Nakayama's Lemma 10.19 .1 there exists an $f \in R, f \notin \mathfrak{m}$ such that $x_{1}, \ldots, x_{r}$ generate $M_{f}$ over $R_{f}$. By the assumption that $\rho_{M}$ is locally constant there exists a $g \in R, g \notin \mathfrak{m}$ such that $\rho_{M}$ is constant equal to $r$ on $D(g)$. We claim that

$$
\Psi: R_{f g}^{\oplus r} \longrightarrow M_{f g}, \quad\left(a_{1}, \ldots, a_{r}\right) \longmapsto \sum a_{i} x_{i}
$$

is an isomorphism. This claim will show that $M$ is finite locally free, i.e., that (7) holds. To see the claim it suffices to show that the induced map on localizations $\Psi_{\mathfrak{p}}: R_{\mathfrak{p}}^{\oplus r} \rightarrow M_{\mathfrak{p}}$ is an isomorphism for all $\mathfrak{p} \in D(f g)$, see Lemma 10.23.1. By our choice of $f$ the map $\Psi_{\mathfrak{p}}$ is surjective. By assumption (8) we have $M_{\mathfrak{p}} \cong R_{\mathfrak{p}}^{\oplus \rho_{M}(\mathfrak{p})}$ and by our choice of $g$ we have $\rho_{M}(\mathfrak{p})=r$. Hence $\Psi_{\mathfrak{p}}$ determines a surjection $R_{\mathfrak{p}}^{\oplus r} \rightarrow M_{\mathfrak{p}} \cong R_{\mathfrak{p}}^{\oplus r}$ whence is an isomorphism by Lemma 10.15.4. (Of course this last fact follows from a simple matrix argument also.)
$00 N Y$ Remark 10.77.3. It is not true that a finite $R$-module which is $R$-flat is automatically projective. A counter example is where $R=\mathcal{C}^{\infty}(\mathbf{R})$ is the ring of infinitely differentiable functions on $\mathbf{R}$, and $M=R_{\mathfrak{m}}=R / I$ where $\mathfrak{m}=\{f \in R \mid f(0)=0\}$ and $I=\{f \in R|\exists \epsilon, \epsilon>0: f(x)=0 \forall x,|x|<\epsilon\}$.

00NZ Lemma 10.77.4. (Warning: see Remark 10.77.3.) Suppose $R$ is a local ring, and $M$ is a finite flat $R$-module. Then $M$ is finite free.

Proof. Follows from the equational criterion of flatness, see Lemma 10.38.11, Namely, suppose that $x_{1}, \ldots, x_{r} \in M$ map to a basis of $M / \mathfrak{m} M$. By Nakayama's Lemma 10.19 .1 these elements generate $M$. We want to show there is no relation among the $x_{i}$. Instead, we will show by induction on $n$ that if $x_{1}, \ldots, x_{n} \in M$ are linearly independent in the vector space $M / \mathfrak{m} M$ then they are independent over $R$.

The base case of the induction is where we have $x \in M, x \notin \mathfrak{m} M$ and a relation $f x=0$. By the equational criterion there exist $y_{j} \in M$ and $a_{j} \in R$ such that $x=\sum a_{j} y_{j}$ and $f a_{j}=0$ for all $j$. Since $x \notin \mathfrak{m} M$ we see that at least one $a_{j}$ is a unit and hence $f=0$.

Suppose that $\sum f_{i} x_{i}$ is a relation among $x_{1}, \ldots, x_{n}$. By our choice of $x_{i}$ we have $f_{i} \in \mathfrak{m}$. According to the equational criterion of flatness there exist $a_{i j} \in R$ and $y_{j} \in M$ such that $x_{i}=\sum a_{i j} y_{j}$ and $\sum f_{i} a_{i j}=0$. Since $x_{n} \notin \mathfrak{m} M$ we see that $a_{n j} \notin \mathfrak{m}$ for at least one $j$. Since $\sum f_{i} a_{i j}=0$ we get $f_{n}=\sum_{i=1}^{n-1}\left(-a_{i j} / a_{n j}\right) f_{i}$. The relation $\sum f_{i} x_{i}=0$ now can be rewritten as $\sum_{i=1}^{n-1} f_{i}\left(x_{i}+\left(-a_{i j} / a_{n j}\right) x_{n}\right)=0$. Note that the elements $x_{i}+\left(-a_{i j} / a_{n j}\right) x_{n}$ map to $n-1$ linearly independent elements of $M / \mathfrak{m} M$. By induction assumption we get that all the $f_{i}, i \leq n-1$ have to be zero, and also $f_{n}=\sum_{i=1}^{n-1}\left(-a_{i j} / a_{n j}\right) f_{i}$. This proves the induction step.

0001 Lemma 10.77.5. Let $R \rightarrow S$ be a flat local homomorphism of local rings. Let $M$ be a finite $R$-module. Then $M$ is finite projective over $R$ if and only if $M \otimes_{R} S$ is finite projective over $S$.

Proof. Suppose that $M \otimes_{R} S$ is finite projective over $S$. By Lemma 10.77 .2 it is finite free. Pick $x_{1}, \ldots, x_{r} \in M$ whose residue classes generate $M / \mathfrak{m}_{R} M$. Clearly we see that $x_{1} \otimes 1, \ldots, x_{r} \otimes 1$ are a basis for $M \otimes_{R} S$. This implies that the $\operatorname{map} R^{\oplus r} \rightarrow M,\left(a_{i}\right) \mapsto \sum a_{i} x_{i}$ becomes an isomorphism after tensoring with $S$. By faithful flatness of $R \rightarrow S$, see Lemma 10.38 .17 we see that it is an isomorphism.

02M9 Lemma 10.77.6. Let $R$ be a semi-local ring. Let $M$ be a finite locally free module. If $M$ has constant rank, then $M$ is free. In particular, if $R$ has connected spectrum, then $M$ is free.

Proof. Omitted. Hints: First show that $M / \mathfrak{m}_{i} M$ has the same dimension $d$ for all maximal ideal $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{n}$ of $R$ using the spectrum is connected. Next, show that there exist elements $x_{1}, \ldots, x_{d} \in M$ which form a basis for each $M / \mathfrak{m}_{i} M$ by the Chinese remainder theorem. Finally show that $x_{1}, \ldots, x_{d}$ is a basis for $M$.

Here is a technical lemma that is used in the chapter on groupoids.
03C1 Lemma 10.77.7. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$ and infinite residue field. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module and let $N \subset M$ be an $R$-submodule. Assume
(1) $S$ is semi-local and $\mathfrak{m} S$ is contained in the radical of $S$,
(2) $M$ is a finite free $S$-module, and
(3) $N$ generates $M$ as an $S$-module.

Then $N$ contains an $S$-basis of $M$.
Proof. Assume $M$ is free of rank $n$. Let $I=\operatorname{rad}(S)$. By Nakayama's Lemma 10.19.1 a sequence of elements $m_{1}, \ldots, m_{n}$ is a basis for $M$ if and only if $\bar{m}_{i} \in M / I M$ generate $M / I M$. Hence we may replace $M$ by $M / I M, N$ by $N /(N \cap I M), R$ by $R / \mathfrak{m}$, and $S$ by $S / I S$. In this case we see that $S$ is a finite product of fields $S=k_{1} \times \ldots \times k_{r}$ and $M=k_{1}^{\oplus n} \times \ldots \times k_{r}^{\oplus n}$. The fact that $N \subset M$ generates $M$ as an $S$-module means that there exist $x_{j} \in N$ such that a linear combination $\sum a_{j} x_{j}$ with $a_{j} \in S$ has a nonzero component in each factor $k_{i}^{\oplus n}$. Because $R=k$ is an infinite field, this means that also some linear combination $y=\sum c_{j} x_{j}$ with $c_{j} \in k$ has a nonzero component in each factor. Hence $y \in N$ generates a free direct summand $S y \subset M$. By induction on $n$ the result holds for $M / S y$ and the submodule $\bar{N}=N /(N \cap S y)$. In other words there exist $\bar{y}_{2}, \ldots, \bar{y}_{n}$ in $\bar{N}$ which (freely) generate $M / S y$. Then $y, y_{2}, \ldots, y_{n}$ (freely) generate $M$ and we win.

### 10.78. Open loci defined by module maps

05GD The set of primes where a given module map is surjective, or an isomorphism is sometimes open. In the case of finite projective modules we can look at the rank of the map.

05GE Lemma 10.78.1. Let $R$ be a ring. Let $\varphi: M \rightarrow N$ be a map of $R$-modules with $N$ a finite $R$-module. Then we have the equality

$$
\begin{aligned}
U & =\left\{\mathfrak{p} \subset R \mid \varphi_{\mathfrak{p}}: M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}} \text { is surjective }\right\} \\
& =\{\mathfrak{p} \subset R \mid \varphi \otimes \kappa(\mathfrak{p}): M \otimes \kappa(\mathfrak{p}) \rightarrow N \otimes \kappa(\mathfrak{p}) \text { is surjective }\}
\end{aligned}
$$

and $U$ is an open subset of $\operatorname{Spec}(R)$. Moreover, for any $f \in R$ such that $D(f) \subset U$ the $\operatorname{map} M_{f} \rightarrow N_{f}$ is surjective.

Proof. The equality in the displayed formula follows from Nakayama's lemma. Nakayama's lemma also implies that $U$ is open. See Lemma 10.19.1 especially part (3). If $D(f) \subset U$, then $M_{f} \rightarrow N_{f}$ is surjective on all localizations at primes of $R_{f}$, and hence it is surjective by Lemma 10.23.1.

05GF Lemma 10.78.2. Let $R$ be a ring. Let $\varphi: M \rightarrow N$ be a map of finitely presented $R$-modules. Then

$$
U=\left\{\mathfrak{p} \subset R \mid \varphi_{\mathfrak{p}}: M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}} \text { is an isomorphism }\right\}
$$

is an open subset of $\operatorname{Spec}(R)$.
Proof. Let $\mathfrak{p} \in U$. Pick a presentation $N=R^{\oplus n} / \sum_{j=1, \ldots, m} R k_{j}$. Denote $e_{i}$ the image in $N$ of the $i$ th basis vector of $R^{\oplus n}$. For each $i \in\{1, \ldots, n\}$ choose an element $m_{i} \in M_{\mathfrak{p}}$ such that $\varphi\left(m_{i}\right)=f_{i} e_{i}$ for some $f_{i} \in R, f_{i} \notin \mathfrak{p}$. This is possible as $\varphi_{\mathfrak{p}}$ is an isomorphism. Set $f=f_{1} \ldots f_{n}$ and let $\psi: R_{f}^{\oplus n} \rightarrow M$ be the map which maps the $i$ th basis vector to $m_{i} / f_{i}$. Note that $\varphi_{f} \circ \psi$ is the localization at $f$ of the given map $R^{\oplus n} \rightarrow N$. As $\varphi_{\mathfrak{p}}$ is an isomorphism we see that $\psi\left(k_{j}\right)$ is an element of $M$ which maps to zero in $M_{\mathfrak{p}}$. Hence we see that there exist $g_{j} \in R, g_{j} \notin \mathfrak{p}$ such that $g_{j} \psi\left(k_{j}\right)=0$. Setting $g=g_{1} \ldots g_{m}$, we see that $\psi_{g}$ factors through $N_{f g}$ to give a map $N_{f g} \rightarrow M_{f g}$. By construction this map is inverse to $\varphi_{f g}$. Hence $\varphi_{f g}$ is an isomorphism, which implies that $D(f g) \subset U$ as desired.

00 O 0 Lemma 10.78.3. Let $R$ be a ring. Let $\varphi: P_{1} \rightarrow P_{2}$ be a map of finite projective modules. Then
(1) The set $U$ of primes $\mathfrak{p} \in \operatorname{Spec}(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is injective is open and for any $f \in R$ such that $D(f) \subset U$ we have
(a) $P_{1, f} \rightarrow P_{2, f}$ is injective, and
(b) the module $\operatorname{Coker}(\varphi)_{f}$ is finite projective over $R_{f}$.
(2) The set $W$ of primes $\mathfrak{p} \in \operatorname{Spec}(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is surjective is open and for any $f \in R$ such that $D(f) \subset W$ we have
(a) $P_{1, f} \rightarrow P_{2, f}$ is surjective, and
(b) the module $\operatorname{Ker}(\varphi)_{f}$ is finite projective over $R_{f}$.
(3) The set $V$ of primes $\mathfrak{p} \in \operatorname{Spec}(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is an isomorphism is open and for any $f \in R$ such that $D(f) \subset V$ the $\operatorname{map} \varphi: P_{1, f} \rightarrow P_{2, f}$ is an isomorphism of modules over $R_{f}$.
Proof. To prove the set $U$ is open we may work locally on $\operatorname{Spec}(R)$. Thus we may replace $R$ by a suitable localization and assume that $P_{1}=R^{n_{1}}$ and $P_{2}=R^{n_{2}}$, see Lemma 10.77.2. In this case injectivity of $\varphi \otimes \kappa(\mathfrak{p})$ is equivalent to $n_{1} \leq n_{2}$ and some $n_{1} \times n_{1}$ minor $f$ of the matrix of $\varphi$ being invertible in $\kappa(\mathfrak{p})$. Thus $D(f) \subset U$. This argument also shows that $P_{1, \mathfrak{p}} \rightarrow P_{2, \mathfrak{p}}$ is injective for $\mathfrak{p} \in U$.
Now suppose $D(f) \subset U$. By the remark in the previous paragraph and Lemma 10.23.1 we see that $P_{1, f} \rightarrow P_{2, f}$ is injective, i.e., (1)(a) holds. By Lemma 10.77 .2 to prove (1)(b) it suffices to prove that $\operatorname{Coker}(\varphi)$ is finite projective locally on $D(f)$. Thus, as we saw above, we may assume that $P_{1}=R^{n_{1}}$ and $P_{2}=R^{n_{2}}$ and that some minor of the matrix of $\varphi$ is invertible in $R$. If the minor in question corresponds to the first $n_{1}$ basis vectors of $R^{n_{2}}$, then using the last $n_{2}-n_{1}$ basis vectors we get a $\operatorname{map} R^{n_{2}-n_{1}} \rightarrow R^{n_{2}} \rightarrow \operatorname{Coker}(\varphi)$ which is easily seen to be an isomorphism.
Openness of $W$ and (2)(a) for $d(f) \subset W$ follow from Lemma 10.78.1. Since $P_{2, f}$ is projective over $R_{f}$ we see that $\varphi_{f}: P_{1, f} \rightarrow P_{2, f}$ has a section and it follows that $\operatorname{Ker}(\varphi)_{f}$ is a direct summand of $P_{2, f}$. Therefore $\operatorname{Ker}(\varphi)_{f}$ is finite projective. Thus (2)(b) holds as well.

It is clear that $V=U \cap W$ is open and the other statement in (3) follows from (1)(a) and (2)(a).

### 10.79. Faithfully flat descent for projectivity of modules

058B
In the next few sections we prove, following Raynaud and Gruson GR71, that the projectivity of modules descends along faithfully flat ring maps. The idea of the proof is to use dévissage à la Kaplansky Kap58 to reduce to the case of countably generated modules. Given a well-behaved filtration of a module $M$, dévissage allows us to express $M$ as a direct sum of successive quotients of the filtering submodules (see Section 10.83 ). Using this technique, we prove that a projective module is a direct sum of countably generated modules (Theorem 10.83.5). To prove descent of projectivity for countably generated modules, we introduce a "Mittag-Leffler" condition on modules, prove that a countably generated module is projective if and only if it is flat and Mittag-Leffler (Theorem 10.92.3), and then show that the property of being a Mittag-Leffler module descends (Lemma 10.94.1). Finally, given an arbitrary module $M$ whose base change by a faithfully flat ring map is projective, we filter $M$ by submodules whose successive quotients are countably generated projective modules, and then by dévissage conclude $M$ is a direct sum of projectives, hence projective itself (Theorem 10.94.5).

We note that there is an error in the proof of faithfully flat descent of projectivity in GR71. There, descent of projectivity along faithfully flat ring maps is deduced from descent of projectivity along a more general type of ring map (GR71, Example 3.1.4(1) of Part II]). However, the proof of descent along this more general type of map is incorrect. In Gru73, Gruson explains what went wrong, although he does not provide a fix for the case of interest. Patching this hole in the proof of faithfully flat descent of projectivity comes down to proving that the property of being a Mittag-Leffler module descends along faithfully flat ring maps. We do this in Lemma 10.94.1.

### 10.80. Characterizing flatness

058 C In this section we discuss criteria for flatness. The main result in this section is Lazard's theorem (Theorem 10.80 .4 below), which says that a flat module is the colimit of a directed system of free finite modules. We remind the reader of the "equational criterion for flatness", see Lemma 10.38.11. It turns out that this can be massaged into a seemingly much stronger property.

058D Lemma 10.80.1. Let $M$ be an $R$-module. The following are equivalent:
(1) $M$ is flat.
(2) If $f: R^{n} \rightarrow M$ is a module map and $x \in \operatorname{Ker}(f)$, then there are module maps $h: R^{n} \rightarrow R^{m}$ and $g: R^{m} \rightarrow M$ such that $f=g \circ h$ and $x \in \operatorname{Ker}(h)$.
(3) Suppose $f: R^{n} \rightarrow M$ is a module map, $N \subset \operatorname{Ker}(f)$ any submodule, and $h: R^{n} \rightarrow R^{m}$ a map such that $N \subset \operatorname{Ker}(h)$ and $f$ factors through $h$. Then given any $x \in \operatorname{Ker}(f)$ we can find a map $h^{\prime}: R^{n} \rightarrow R^{m^{\prime}}$ such that $N+R x \subset \operatorname{Ker}\left(h^{\prime}\right)$ and $f$ factors through $h^{\prime}$.
(4) If $f: R^{n} \rightarrow M$ is a module map and $N \subset \operatorname{Ker}(f)$ is a finitely generated submodule, then there are module maps $h: R^{n} \rightarrow R^{m}$ and $g: R^{m} \rightarrow M$ such that $f=g \circ h$ and $N \subset \operatorname{Ker}(h)$.

Proof. That (1) is equivalent to (2) is just a reformulation of the equational criterion for flatness ${ }^{6}$. To show (2) implies (3), let $g: R^{m} \rightarrow M$ be the map such that $f$ factors as $f=g \circ h$. By (2) find $h^{\prime \prime}: R^{m} \rightarrow R^{m^{\prime}}$ such that $h^{\prime \prime}$ kills $h(x)$ and $g: R^{m} \rightarrow M$ factors through $h^{\prime \prime}$. Then taking $h^{\prime}=h^{\prime \prime} \circ h$ works. (3) implies (4) by induction on the number of generators of $N \subset \operatorname{Ker}(f)$ in (4). Clearly (4) implies (2).

058E Lemma 10.80.2. Let $M$ be an $R$-module. Then $M$ is flat if and only if the following condition holds: if $P$ is a finitely presented $R$-module and $f: P \rightarrow M a$ module map, then there is a free finite $R$-module $F$ and module maps $h: P \rightarrow F$ and $g: F \rightarrow M$ such that $f=g \circ h$.
Proof. This is just a reformulation of condition (4) from Lemma 10.80.1.
058F Lemma 10.80.3. Let $M$ be an $R$-module. Then $M$ is flat if and only if the following condition holds: for every finitely presented $R$-module $P$, if $N \rightarrow M$ is a surjective $R$-module map, then the induced map $\operatorname{Hom}_{R}(P, N) \rightarrow \operatorname{Hom}_{R}(P, M)$ is surjective.

Proof. First suppose $M$ is flat. We must show that if $P$ is finitely presented, then given a map $f: P \rightarrow M$, it factors through the map $N \rightarrow M$. By Lemma 10.80.2 the map $f$ factors through a map $F \rightarrow M$ where $F$ is free and finite. Since $F$ is free, this map factors through $N \rightarrow M$. Thus $f$ factors through $N \rightarrow M$.
Conversely, suppose the condition of the lemma holds. Let $f: P \rightarrow M$ be a map from a finitely presented module $P$. Choose a free module $N$ with a surjection $N \rightarrow M$ onto $M$. Then $f$ factors through $N \rightarrow M$, and since $P$ is finitely generated, $f$ factors through a free finite submodule of $N$. Thus $M$ satisfies the condition of Lemma 10.80 .2 , hence is flat.

058G Theorem 10.80.4 (Lazard's theorem). Let $M$ be an $R$-module. Then $M$ is flat if and only if it is the colimit of a directed system of free finite $R$-modules.

Proof. A colimit of a directed system of flat modules is flat, as taking directed colimits is exact and commutes with tensor product. Hence if $M$ is the colimit of a directed system of free finite modules then $M$ is flat.

For the converse, first recall that any module $M$ can be written as the colimit of a directed system of finitely presented modules, in the following way. Choose a surjection $f: R^{I} \rightarrow M$ for some set $I$, and let $K$ be the kernel. Let $E$ be the set of ordered pairs $(J, N)$ where $J$ is a finite subset of $I$ and $N$ is a finitely generated submodule of $R^{J} \cap K$. Then $E$ is made into a directed partially ordered set by defining $(J, N) \leq\left(J^{\prime}, N^{\prime}\right)$ if and only if $J \subset J^{\prime}$ and $N \subset N^{\prime}$. Define $M_{e}=R^{J} / N$ for $e=(J, N)$, and define $f_{e e^{\prime}}: M_{e} \rightarrow M_{e^{\prime}}$ to be the natural map for $e \leq e^{\prime}$. Then $\left(M_{e}, f_{e e^{\prime}}\right)$ is a directed system and the natural maps $f_{e}: M_{e} \rightarrow M$ induce an isomorphism $\operatorname{colim}_{e \in E} M_{e} \xrightarrow{\cong} M$.

[^22]Now suppose $M$ is flat. Let $I=M \times \mathbf{Z}$, write $\left(x_{i}\right)$ for the canonical basis of $R^{I}$, and take in the above discussion $f: R^{I} \rightarrow M$ to be the map sending $x_{i}$ to the projection of $i$ onto $M$. To prove the theorem it suffices to show that the $e \in E$ such that $M_{e}$ is free form a cofinal subset of $E$. So let $e=(J, N) \in E$ be arbitrary. By Lemma 10.80 .2 there is a free finite module $F$ and maps $h: R^{J} / N \rightarrow F$ and $g: F \rightarrow M$ such that the natural map $f_{e}: R^{J} / N \rightarrow M$ factors as $R^{J} / N \xrightarrow{h} F \xrightarrow{g} M$. We are going to realize $F$ as $M_{e^{\prime}}$ for some $e^{\prime} \geq e$.
Let $\left\{b_{1}, \ldots, b_{n}\right\}$ be a finite basis of $F$. Choose $n$ distinct elements $i_{1}, \ldots, i_{n} \in I$ such that $i_{\ell} \notin J$ for all $\ell$, and such that the image of $x_{i_{\ell}}$ under $f: R^{I} \rightarrow M$ equals the image of $b_{\ell}$ under $g: F \rightarrow M$. This is possible since every element of $M$ can be written as $f\left(x_{i}\right)$ for infinitely many distinct $i \in I$ (by our choice of $I$ ). Now let $J^{\prime}=J \cup\left\{i_{1}, \ldots, i_{n}\right\}$, and define $R^{J^{\prime}} \rightarrow F$ by $x_{i} \mapsto h\left(x_{i}\right)$ for $i \in J$ and $x_{i_{\ell}} \mapsto b_{\ell}$ for $\ell=1, \ldots, n$. Let $N^{\prime}=\operatorname{Ker}\left(R^{J^{\prime}} \rightarrow F\right)$. Observe:
(1) The square

is commutative, hence $N^{\prime} \subset K=\operatorname{Ker}(f)$;
(2) $R^{J^{\prime}} \rightarrow F$ is a surjection onto a free finite module, hence it splits and so $N^{\prime}$ is finitely generated;
(3) $J \subset J^{\prime}$ and $N \subset N^{\prime}$.

By (1) and (2) $e^{\prime}=\left(J^{\prime}, N^{\prime}\right)$ is in $E$, by (3) $e^{\prime} \geq e$, and by construction $M_{e^{\prime}}=$ $R^{J^{\prime}} / N^{\prime} \cong F$ is free.

### 10.81. Universally injective module maps

058 H Next we discuss universally injective module maps, which are in a sense complementary to flat modules (see Lemma 10.81.5). We follow Lazard's thesis Laz69; also see Lam99.

058I Definition 10.81.1. Let $f: M \rightarrow N$ be a map of $R$-modules. Then $f$ is called universally injective if for every $R$-module $Q$, the map $f \otimes_{R} \operatorname{id}_{Q}: M \otimes_{R} Q \rightarrow$ $N \otimes_{R} Q$ is injective. A sequence $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ of $R$-modules is called universally exact if it is exact and $M_{1} \rightarrow M_{2}$ is universally injective.

058J Example 10.81.2. Examples of universally exact sequences.
(1) A split short exact sequence is universally exact since tensoring commutes with taking direct sums.
(2) The colimit of a directed system of universally exact sequences is universally exact. This follows from the fact that taking directed colimits is exact and that tensoring commutes with taking colimits. In particular the colimit of a directed system of split exact sequences is universally exact. We will see below that, conversely, any universally exact sequence arises in this way.

Next we give a list of criteria for a short exact sequence to be universally exact. They are analogues of criteria for flatness given above. Parts (3)-(6) below correspond,
respectively, to the criteria for flatness given in Lemmas 10.38.11, 10.80.1, 10.80.3, and Theorem 10.80.4

058K Theorem 10.81.3. Let

$$
0 \rightarrow M_{1} \xrightarrow{f_{1}} M_{2} \xrightarrow{f_{2}} M_{3} \rightarrow 0
$$

be an exact sequence of $R$-modules. The following are equivalent:
(1) The sequence $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ is universally exact.
(2) For every finitely presented $R$-module $Q$, the sequence

$$
0 \rightarrow M_{1} \otimes_{R} Q \rightarrow M_{2} \otimes_{R} Q \rightarrow M_{3} \otimes_{R} Q \rightarrow 0
$$

is exact.
(3) Given elements $x_{i} \in M_{1}(i=1, \ldots, n)$, $y_{j} \in M_{2}(j=1, \ldots, m)$, and $a_{i j} \in R(i=1, \ldots, n, j=1, \ldots, m)$ such that for all $i$

$$
f_{1}\left(x_{i}\right)=\sum_{j} a_{i j} y_{j}
$$

there exists $z_{j} \in M_{1}(j=1, \ldots, m)$ such that for all $i$,

$$
x_{i}=\sum_{j} a_{i j} z_{j}
$$

(4) Given a commutative diagram of $R$-module maps

where $m$ and $n$ are integers, there exists a map $R^{m} \rightarrow M_{1}$ making the top triangle commute.
(5) For every finitely presented $R$-module $P$, the $R$-module map $\operatorname{Hom}_{R}\left(P, M_{2}\right) \rightarrow$ $\operatorname{Hom}_{R}\left(P, M_{3}\right)$ is surjective.
(6) The sequence $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ is the colimit of a directed system of split exact sequences of the form

$$
0 \rightarrow M_{1} \rightarrow M_{2, i} \rightarrow M_{3, i} \rightarrow 0
$$

where the $M_{3, i}$ are finitely presented.
Proof. Obviously (1) implies (2).
Next we show (2) implies (3). Let $f_{1}\left(x_{i}\right)=\sum_{j} a_{i j} y_{j}$ be relations as in (3). Let $\left(d_{j}\right)$ be a basis for $R^{m},\left(e_{i}\right)$ a basis for $R^{n}$, and $R^{m} \rightarrow R^{n}$ the map given by $d_{j} \mapsto$ $\sum_{i} a_{i j} e_{i}$. Let $Q$ be the cokernel of $R^{m} \rightarrow R^{n}$. Then tensoring $R^{m} \rightarrow R^{n} \rightarrow Q \rightarrow 0$ by the map $f_{1}: M_{1} \rightarrow M_{2}$, we get a commutative diagram

where $M_{1}^{\oplus m} \rightarrow M_{1}^{\oplus n}$ is given by

$$
\left(z_{1}, \ldots, z_{m}\right) \mapsto\left(\sum_{j} a_{1 j} z_{j}, \ldots, \sum_{j} a_{n j} z_{j}\right)
$$

and $M_{2}^{\oplus m} \rightarrow M_{2}^{\oplus n}$ is given similarly. We want to show $x=\left(x_{1}, \ldots, x_{n}\right) \in M_{1}^{\oplus n}$ is in the image of $M_{1}^{\oplus m} \rightarrow M_{1}^{\oplus n}$. By (2) the map $M_{1} \otimes Q \rightarrow M_{2} \otimes Q$ is injective, hence by exactness of the top row it is enough to show $x$ maps to 0 in $M_{2} \otimes Q$, and so by exactness of the bottom row it is enough to show the image of $x$ in $M_{2}^{\oplus n}$ is in the image of $M_{2}^{\oplus m} \rightarrow M_{2}^{\oplus n}$. This is true by assumption.
Condition (4) is just a translation of (3) into diagram form.
Next we show (4) implies (5). Let $\varphi: P \rightarrow M_{3}$ be a map from a finitely presented $R$-module $P$. We must show that $\varphi$ lifts to a map $P \rightarrow M_{2}$. Choose a presentation of $P$,

$$
R^{n} \xrightarrow{g_{1}} R^{m} \xrightarrow{g_{2}} P \rightarrow 0 .
$$

Using freeness of $R^{n}$ and $R^{m}$, we can construct $h_{2}: R^{m} \rightarrow M_{2}$ and then $h_{1}: R^{n} \rightarrow$ $M_{1}$ such that the following diagram commutes

By (4) there is a map $k_{1}: R^{m} \rightarrow M_{1}$ such that $k_{1} \circ g_{1}=h_{1}$. Now define $h_{2}^{\prime}: R^{m} \rightarrow$ $M_{2}$ by $h_{2}^{\prime}=h_{2}-f_{1} \circ k_{1}$. Then

$$
h_{2}^{\prime} \circ g_{1}=h_{2} \circ g_{1}-f_{1} \circ k_{1} \circ g_{1}=h_{2} \circ g_{1}-f_{1} \circ h_{1}=0
$$

Hence by passing to the quotient $h_{2}^{\prime}$ defines a map $\varphi^{\prime}: P \rightarrow M_{2}$ such that $\varphi^{\prime} \circ g_{2}=$ $h_{2}^{\prime}$. In a diagram, we have

where the top triangle commutes. We claim that $\varphi^{\prime}$ is the desired lift, i.e. that $f_{2} \circ \varphi^{\prime}=\varphi$. From the definitions we have

$$
f_{2} \circ \varphi^{\prime} \circ g_{2}=f_{2} \circ h_{2}^{\prime}=f_{2} \circ h_{2}-f_{2} \circ f_{1} \circ k_{1}=f_{2} \circ h_{2}=\varphi \circ g_{2}
$$

Since $g_{2}$ is surjective, this finishes the proof.
Now we show (5) implies (6). Write $M_{3}$ as the colimit of a directed system of finitely presented modules $M_{3, i}$, see Lemma 10.8.13. Let $M_{2, i}$ be the fiber product of $M_{3, i}$ and $M_{2}$ over $M_{3}$-by definition this is the submodule of $M_{2} \times M_{3, i}$ consisting of elements whose two projections onto $M_{3}$ are equal. Let $M_{1, i}$ be the kernel of the projection $M_{2, i} \rightarrow M_{3, i}$. Then we have a directed system of exact sequences

$$
0 \rightarrow M_{1, i} \rightarrow M_{2, i} \rightarrow M_{3, i} \rightarrow 0
$$

and for each $i$ a map of exact sequences

compatible with the directed system. From the definition of the fiber product $M_{2, i}$, it follows that the map $M_{1, i} \rightarrow M_{1}$ is an isomorphism. By (5) there is a map
$M_{3, i} \rightarrow M_{2}$ lifting $M_{3, i} \rightarrow M_{3}$, and by the universal property of the fiber product this gives rise to a section of $M_{2, i} \rightarrow M_{3, i}$. Hence the sequences

$$
0 \rightarrow M_{1, i} \rightarrow M_{2, i} \rightarrow M_{3, i} \rightarrow 0
$$

split. Passing to the colimit, we have a commutative diagram

with exact rows and outer vertical maps isomorphisms. Hence colim $M_{2, i} \rightarrow M_{2}$ is also an isomorphism and (6) holds.
Condition (6) implies (1) by Example 10.81.2 (2).
The previous theorem shows that a universally exact sequence is always a colimit of split short exact sequences. If the cokernel of a universally injective map is finitely presented, then in fact the map itself splits:

058L Lemma 10.81.4. Let

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

be an exact sequence of $R$-modules. Suppose $M_{3}$ is of finite presentation. Then

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

is universally exact if and only if it is split.
Proof. A split short exact sequence is always universally exact, see Example 10.81 .2 . Conversely, if the sequence is universally exact, then by Theorem 10.81 .3 (5) applied to $P=M_{3}$, the map $M_{2} \rightarrow M_{3}$ admits a section.

The following lemma shows how universally injective maps are complementary to flat modules.

058M Lemma 10.81.5. Let $M$ be an $R$-module. Then $M$ is flat if and only if any exact sequence of $R$-modules

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M \rightarrow 0
$$

is universally exact.
Proof. This follows from Lemma 10.80 .3 and Theorem 10.81 .3 (5).
058N Example 10.81.6. Non-split and non-flat universally exact sequences.
(1) In spite of Lemma 10.81 .4 it is possible to have a short exact sequence of $R$-modules

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

that is universally exact but non-split. For instance, take $R=\mathbf{Z}$, let $M_{1}=\bigoplus_{n=1}^{\infty} \mathbf{Z}$, let $M_{2}=\prod_{n=1}^{\infty} \mathbf{Z}$, and let $M_{3}$ be the cokernel of the inclusion $M_{1} \rightarrow M_{2}$. Then $M_{1}, M_{2}, M_{3}$ are all flat since they are torsionfree (More on Algebra, Lemma 15.16.11, so by Lemma 10.81 .5 .

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

is universally exact. However there can be no section $s: M_{3} \rightarrow M_{2}$. In fact, if $x$ is the image of $\left(2,2^{2}, 2^{3}, \ldots\right) \in M_{2}$ in $M_{3}$, then any module map
$s: M_{3} \rightarrow M_{2}$ must kill $x$. This is because $x \in 2^{n} M_{3}$ for any $n \geq 1$, hence $s(x)$ is divisible by $2^{n}$ for all $n \geq 1$ and so must be 0 .
(2) In spite of Lemma 10.81 .5 , it is possible to have a short exact sequence of $R$-modules

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

that is universally exact but with $M_{1}, M_{2}, M_{3}$ all non-flat. In fact if $M$ is any non-flat module, just take the split exact sequence

$$
0 \rightarrow M \rightarrow M \oplus M \rightarrow M \rightarrow 0
$$

For instance over $R=\mathbf{Z}$, take $M$ to be any torsion module.
(3) Taking the direct sum of an exact sequence as in (1) with one as in (2), we get a short exact sequence of $R$-modules

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

that is universally exact, non-split, and such that $M_{1}, M_{2}, M_{3}$ are all nonflat.

058P Lemma 10.81.7. Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a universally exact sequence of $R$-modules, and suppose $M_{2}$ is flat. Then $M_{1}$ and $M_{3}$ are flat.

Proof. Let $0 \rightarrow N \rightarrow N^{\prime} \rightarrow N^{\prime \prime} \rightarrow 0$ be a short exact sequence of $R$-modules. Consider the commutative diagram

(we have dropped the 0's on the boundary). By assumption the rows give short exact sequences and the arrow $M_{2} \otimes N \rightarrow M_{2} \otimes N^{\prime}$ is injective. Clearly this implies that $M_{1} \otimes N \rightarrow M_{1} \otimes N^{\prime}$ is injective and we see that $M_{1}$ is flat. In particular the left and middle columns give rise to short exact sequences. It follows from a diagram chase that the arrow $M_{3} \otimes N \rightarrow M_{3} \otimes N^{\prime}$ is injective. Hence $M_{3}$ is flat.

05CH Lemma 10.81.8. Let $R$ be a ring. Let $M \rightarrow M^{\prime}$ be a universally injective $R$ module map. Then for any $R$-module $N$ the map $M \otimes_{R} N \rightarrow M^{\prime} \otimes_{R} N$ is universally injective.

Proof. Omitted.
05CI Lemma 10.81.9. Let $R$ be a ring. A composition of universally injective $R$-module maps is universally injective.

Proof. Omitted.
05CJ Lemma 10.81.10. Let $R$ be a ring. Let $M \rightarrow M^{\prime}$ and $M^{\prime} \rightarrow M^{\prime \prime}$ be $R$-module maps. If their composition $M \rightarrow M^{\prime \prime}$ is universally injective, then $M \rightarrow M^{\prime}$ is universally injective.

Proof. Omitted.

05CK Lemma 10.81.11. Let $R \rightarrow S$ be a faithfully flat ring map. Then $R \rightarrow S$ is universally injective as a map of $R$-modules. In particular $R \cap I S=I$ for any ideal $I \subset R$.

Proof. Let $N$ be an $R$-module. We have to show that $N \rightarrow N \otimes_{R} S$ is injective. As $S$ is faithfully flat as an $R$-module, it suffices to prove this after tensoring with $S$. Hence it suffices to show that $N \otimes_{R} S \rightarrow N \otimes_{R} S \otimes_{R} S, n \otimes s \mapsto n \otimes 1 \otimes s$ is injective. This is true because there is a section, namely, $n \otimes s \otimes s^{\prime} \mapsto n \otimes s s^{\prime}$.

05CL Lemma 10.81.12. Let $R \rightarrow S$ be a ring map. Let $M \rightarrow M^{\prime}$ be a map of $S$ modules. The following are equivalent
(1) $M \rightarrow M^{\prime}$ is universally injective as a map of $R$-modules,
(2) for each prime $\mathfrak{q}$ of $S$ the map $M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}^{\prime}$ is universally injective as a map of $R$-modules,
(3) for each maximal ideal $\mathfrak{m}$ of $S$ the map $M_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}^{\prime}$ is universally injective as a map of $R$-modules,
(4) for each prime $\mathfrak{q}$ of $S$ the map $M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}^{\prime}$ is universally injective as a map of $R_{\mathfrak{p}}$-modules, where $\mathfrak{p}$ is the inverse image of $\mathfrak{q}$ in $R$, and
(5) for each maximal ideal $\mathfrak{m}$ of $S$ the map $M_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}^{\prime}$ is universally injective as a map of $R_{\mathfrak{p}}$-modules, where $\mathfrak{p}$ is the inverse image of $\mathfrak{m}$ in $R$.
Proof. Let $N$ be an $R$-module. Let $\mathfrak{q}$ be a prime of $S$ lying over the prime $\mathfrak{p}$ of $R$. Then we have

$$
\left(M \otimes_{R} N\right)_{\mathfrak{q}}=M_{\mathfrak{q}} \otimes_{R} N=M_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} N_{\mathfrak{p}} .
$$

Moreover, the same thing holds for $M^{\prime}$ and localization is exact. Also, if $N$ is an $R_{\mathfrak{p}}$-module, then $N_{\mathfrak{p}}=N$. Using this the equivalences can be proved in a straightforward manner.
For example, suppose that (5) holds. Let $K=\operatorname{Ker}\left(M \otimes_{R} N \rightarrow M^{\prime} \otimes_{R} N\right)$. By the remarks above we see that $K_{\mathfrak{m}}=0$ for each maximal ideal $\mathfrak{m}$ of $S$. Hence $K=0$ by Lemma 10.23.1. Thus (1) holds. Conversely, suppose that (1) holds. Take any $\mathfrak{q} \subset S$ lying over $\mathfrak{p} \subset R$. Take any module $N$ over $R_{\mathfrak{p}}$. Then by assumption $\operatorname{Ker}\left(M \otimes_{R} N \rightarrow M^{\prime} \otimes_{R} N\right)=0$. Hence by the formulae above and the fact that $N=N_{\mathfrak{p}}$ we see that $\operatorname{Ker}\left(M_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} N \rightarrow M_{\mathfrak{q}}^{\prime} \otimes_{R_{\mathfrak{p}}} N\right)=0$. In other words (4) holds. Of course (4) $\Rightarrow(5)$ is immediate. Hence (1), (4) and (5) are all equivalent. We omit the proof of the other equivalences.

05CM Lemma 10.81.13. Let $\varphi: A \rightarrow B$ be a ring map. Let $S \subset A$ and $S^{\prime} \subset B$ be multiplicative subsets such that $\varphi(S) \subset S^{\prime}$. Let $M \rightarrow M^{\prime}$ be a map of $B$-modules.
(1) If $M \rightarrow M^{\prime}$ is universally injective as a map of $A$-modules, then $\left(S^{\prime}\right)^{-1} M \rightarrow$ $\left(S^{\prime}\right)^{-1} M^{\prime}$ is universally injective as a map of $A$-modules and as a map of $S^{-1} A$-modules.
(2) If $M$ and $M^{\prime}$ are $\left(S^{\prime}\right)^{-1} B$-modules, then $M \rightarrow M^{\prime}$ is universally injective as a map of $A$-modules if and only if it is universally injective as a map of $S^{-1} A$-modules.

Proof. You can prove this using Lemma 10.81 .12 but you can also prove it directly as follows. Assume $M \rightarrow M^{\prime}$ is $A$-universally injective. Let $Q$ be an $A$-module. Then $Q \otimes_{A} M \rightarrow Q \otimes_{A} M^{\prime}$ is injective. Since localization is exact we see that $\left(S^{\prime}\right)^{-1}\left(Q \otimes_{A} M\right) \rightarrow\left(S^{\prime}\right)^{-1}\left(Q \otimes_{A} M^{\prime}\right)$ is injective. As $\left(S^{\prime}\right)^{-1}\left(Q \otimes_{A} M\right)=Q \otimes_{A}$ $\left(S^{\prime}\right)^{-1} M$ and similarly for $M^{\prime}$ we see that $Q \otimes_{A}\left(S^{\prime}\right)^{-1} M \rightarrow Q \otimes_{A}\left(S^{\prime}\right)^{-1} M^{\prime}$
is injective, hence $\left(S^{\prime}\right)^{-1} M \rightarrow\left(S^{\prime}\right)^{-1} M^{\prime}$ is universally injective as a map of $A$ modules. This proves the first part of (1). To see (2) we can use the following two facts: (a) if $Q$ is an $S^{-1} A$-module, then $Q \otimes_{A} S^{-1} A=Q$, i.e., tensoring with $Q$ over $A$ is the same thing as tensoring with $Q$ over $S^{-1} A$, (b) if $M$ is any $A$-module on which the elements of $S$ are invertible, then $M \otimes_{A} Q=M \otimes_{S^{-1} A} S^{-1} Q$. Part (2) follows from this immediately.

0AS5 Lemma 10.81.14. Let $R$ be a ring and let $M \rightarrow M^{\prime}$ be a map of $R$-modules. If $M^{\prime}$ is flat, then $M \rightarrow M^{\prime}$ is universally injective if and only if $M / I M \rightarrow M^{\prime} / I M^{\prime}$ is injective for every finitely generated ideal $I$ of $R$.

Proof. It suffices to show that $M \otimes_{R} Q \rightarrow M^{\prime} \otimes_{R} Q$ is injective for every finite $R$-module $Q$, see Theorem 10.81.3. Then $Q$ has a finite filtration $0=Q_{0} \subset Q_{1} \subset$ $\ldots \subset Q_{n}=Q$ by submodules whose subquotients are isomorphic to cyclic modules $R / I_{i}$, see Lemma 10.5.4 Since $M^{\prime}$ is flat, we obtain a filtration

of $M^{\prime} \otimes_{R} Q$ by submodules $M^{\prime} \otimes_{R} Q_{i}$ whose successive quotients are $M^{\prime} \otimes_{R} R / I_{i}=$ $M^{\prime} / I_{i} M^{\prime}$. A simple induction argument shows that it suffices to check $M / I_{i} M \rightarrow$ $M^{\prime} / I_{i} M^{\prime}$ is injective. Note that the collection of finitely generated ideals $I_{i}^{\prime} \subset I_{i}$ is a directed set. Thus $M / I_{i} M=\operatorname{colim} M / I_{i}^{\prime} M$ is a filtered colimit, similarly for $M^{\prime}$, the maps $M / I_{i}^{\prime} M \rightarrow M^{\prime} / I_{i}^{\prime} M^{\prime}$ are injective by assumption, and since filtered colimits are exact (Lemma 10.8.9) we conclude.

### 10.82. Descent for finite projective modules

058 Q In this section we give an elementary proof of the fact that the property of being a finite projective module descends along faithfully flat ring maps. The proof does not apply when we drop the finiteness condition. However, the method is indicative of the one we shall use to prove descent for the property of being a countably generated projective module - see the comments at the end of this section.

058R Lemma 10.82.1. Let $M$ be an $R$-module. Then $M$ is finite projective if and only if $M$ is finitely presented and flat.

Proof. This is part of Lemma 10.77.2. However, at this point we can give a more elegant proof of the implication $(1) \Rightarrow(2)$ of that lemma as follows. If $M$ is finitely presented and flat, then take a surjection $R^{n} \rightarrow M$. By Lemma 10.80 .3 applied to $P=M$, the map $R^{n} \rightarrow M$ admits a section. So $M$ is a direct summand of a free module and hence projective.

Here are some properties of modules that descend.
03C4 Lemma 10.82.2. Let $R \rightarrow S$ be a faithfully flat ring map. Let $M$ be an $R$-module. Then
(1) if the $S$-module $M \otimes_{R} S$ is of finite type, then $M$ is of finite type,
(2) if the $S$-module $M \otimes_{R} S$ is of finite presentation, then $M$ is of finite presentation,
(3) if the $S$-module $M \otimes_{R} S$ is flat, then $M$ is flat, and
(4) add more here as needed.

Proof. Assume $M \otimes_{R} S$ is of finite type. Let $y_{1}, \ldots, y_{m}$ be generators of $M \otimes_{R} S$ over $S$. Write $y_{j}=\sum x_{i} \otimes f_{i}$ for some $x_{1}, \ldots, x_{n} \in M$. Then we see that the map $\varphi: R^{\oplus n} \rightarrow M$ has the property that $\varphi \otimes \mathrm{id}_{S}: S^{\oplus n} \rightarrow M \otimes_{R} S$ is surjective. Since $R \rightarrow S$ is faithfully flat we see that $\varphi$ is surjective, and $M$ is finitely generated.
Assume $M \otimes_{R} S$ is of finite presentation. By (1) we see that $M$ is of finite type. Choose a surjection $R^{\oplus n} \rightarrow M$ and denote $K$ the kernel. As $R \rightarrow S$ is flat we see that $K \otimes_{R} S$ is the kernel of the base change $S^{\oplus n} \rightarrow M \otimes_{R} S$. As $M \otimes_{R} S$ is of finite presentation we conclude that $K \otimes_{R} S$ is of finite type. Hence by (1) we see that $K$ is of finite type and hence $M$ is of finite presentation.

Part (3) is Lemma 10.38.8.
058S Proposition 10.82.3. Let $R \rightarrow S$ be a faithfully flat ring map. Let $M$ be an $R$-module. If the $S$-module $M \otimes_{R} S$ is finite projective, then $M$ is finite projective.
Proof. Follows from Lemmas 10.82 .1 and 10.82 .2 .
The next few sections are about removing the finiteness assumption by using dévissage to reduce to the countably generated case. In the countably generated case, the strategy is to find a characterization of countably generated projective modules analogous to Lemma 10.82 .1 , and then to prove directly that this characterization descends. We do this by introducing the notion of a Mittag-Leffer module and proving that if a module $M$ is countably generated, then it is projective if and only if it is flat and Mittag-Leffler (Theorem 10.92.3). When $M$ is finitely generated, this statement reduces to Lemma 10.82.1 (since, according to Example 10.90.1 (1), a finitely generated module is Mittag-Leffler if and only if it is finitely presented).

### 10.83. Transfinite dévissage of modules

058 T In this section we introduce a dévissage technique for decomposing a module into a direct sum. The main result is that a projective module is a direct sum of countably generated modules (Theorem 10.83.5 below). We follow Kap58.
058U Definition 10.83.1. Let $M$ be an $R$-module. A direct sum dévissage of $M$ is a family of submodules $\left(M_{\alpha}\right)_{\alpha \in S}$, indexed by an ordinal $S$ and increasing (with respect to inclusion), such that:
(0) $M_{0}=0$;
(1) $M=\bigcup_{\alpha} M_{\alpha}$;
(2) if $\alpha \in S$ is a limit ordinal, then $M_{\alpha}=\bigcup_{\beta<\alpha} M_{\beta}$;
(3) if $\alpha+1 \in S$, then $M_{\alpha}$ is a direct summand of $M_{\alpha+1}$.

If moreover
(4) $M_{\alpha+1} / M_{\alpha}$ is countably generated for $\alpha+1 \in S$,
then $\left(M_{\alpha}\right)_{\alpha \in S}$ is called a Kaplansky dévissage of $M$.
The terminology is justified by the following lemma.
058V Lemma 10.83.2. Let $M$ be an $R$-module. If $\left(M_{\alpha}\right)_{\alpha \in S}$ is a direct sum dévissage of $M$, then $M \cong \bigoplus_{\alpha+1 \in S} M_{\alpha+1} / M_{\alpha}$.

Proof. By property (3) of a direct sum dévissage, there is an inclusion $M_{\alpha+1} / M_{\alpha} \rightarrow$ $M$ for each $\alpha \in S$. Consider the map

$$
f: \bigoplus_{\alpha+1 \in S} M_{\alpha+1} / M_{\alpha} \rightarrow M
$$

given by the sum of these inclusions. Transfinite induction on $S$ shows that the image contains $M_{\alpha}$ for every $\alpha \in S$ : for $\alpha=0$ this is true by ( 0 ); if $\alpha+1$ is a successor ordinal then it is clearly true; and if $\alpha$ is a limit ordinal and it is true for $\beta<\alpha$, then it is true for $\alpha$ by (2). Hence $f$ is surjective by (1).
Transfinite induction on $S$ also shows that for every $\beta \in S$ the restriction

$$
f_{\beta}: \bigoplus_{\alpha+1 \leq \beta} M_{\alpha+1} / M_{\alpha} \longrightarrow M
$$

of $f$ is injective: For $\beta=0$ it is true. If it is true for all $\beta^{\prime}<\beta$, then let $x$ be in the kernel and write $x=\left(x_{\alpha+1}\right)_{\alpha+1 \leq \beta}$ in terms of its components $x_{\alpha+1} \in M_{\alpha+1} / M_{\alpha}$. By property (3) both $\left(x_{\alpha+1}\right)_{\alpha+1<\beta}$ and $x_{\beta+1}$ map to 0 . Hence $x_{\beta+1}=0$ and, by the assumption that the restriction $f_{\beta^{\prime}}$ is injective for all $\beta^{\prime}<\beta$, also $x_{\alpha+1}=0$ for every $\alpha+1<\beta$. So $x=0$ and $f_{\beta}$ is injective, which finishes the induction. We conclude that $f$ is injective since $f_{\beta}$ is for each $\beta \in S$.

058W Lemma 10.83.3. Let $M$ be an $R$-module. Then $M$ is a direct sum of countably generated $R$-modules if and only if it admits a Kaplansky dévissage.

Proof. The lemma takes care of the "if" direction. Conversely, suppose $M=$ $\bigoplus_{i \in I} N_{i}$ where each $N_{i}$ is a countably generated $R$-module. Well-order $I$ so that we can think of it as an ordinal. Then setting $M_{i}=\bigoplus_{j<i} N_{j}$ gives a Kaplansky dévissage $\left(M_{i}\right)_{i \in I}$ of $M$.

058X Theorem 10.83.4. Suppose $M$ is a direct sum of countably generated $R$-modules. If $P$ is a direct summand of $M$, then $P$ is also a direct sum of countably generated $R$-modules.

Proof. Write $M=P \oplus Q$. We are going to construct a Kaplansky dévissage $\left(M_{\alpha}\right)_{\alpha \in S}$ of $M$ which, in addition to the defining properties (0)-(4), satisfies:
(5) Each $M_{\alpha}$ is a direct summand of $M$;
(6) $M_{\alpha}=P_{\alpha} \oplus Q_{\alpha}$, where $P_{\alpha}=P \cap M_{\alpha}$ and $Q=Q \cap M_{\alpha}$.
(Note: if properties (0)-(2) hold, then in fact property (3) is equivalent to property (5).)

To see how this implies the theorem, it is enough to show that $\left(P_{\alpha}\right)_{\alpha \in S}$ forms a Kaplansky dévissage of $P$. Properties (0), (1), and (2) are clear. By (5) and (6) for $\left(M_{\alpha}\right)$, each $P_{\alpha}$ is a direct summand of $M$. Since $P_{\alpha} \subset P_{\alpha+1}$, this implies $P_{\alpha}$ is a direct summand of $P_{\alpha+1}$; hence (3) holds for $\left(P_{\alpha}\right)$. For (4), note that

$$
M_{\alpha+1} / M_{\alpha} \cong P_{\alpha+1} / P_{\alpha} \oplus Q_{\alpha+1} / Q_{\alpha}
$$

so $P_{\alpha+1} / P_{\alpha}$ is countably generated because this is true of $M_{\alpha+1} / M_{\alpha}$.
It remains to construct the $M_{\alpha}$. Write $M=\bigoplus_{i \in I} N_{i}$ where each $N_{i}$ is a countably generated $R$-module. Choose a well-ordering of $I$. By transfinite induction we are going to define an increasing family of submodules $M_{\alpha}$ of $M$, one for each ordinal $\alpha$, such that $M_{\alpha}$ is a direct sum of some subset of the $N_{i}$.

For $\alpha=0$ let $M_{0}=0$. If $\alpha$ is a limit ordinal and $M_{\beta}$ has been defined for all $\beta<\alpha$, then define $M_{\alpha}=\bigcup_{\beta<\alpha} M_{\beta}$. Since each $M_{\beta}$ for $\beta<\alpha$ is a direct sum of a subset of the $N_{i}$, the same will be true of $M_{\alpha}$. If $\alpha+1$ is a successor ordinal and $M_{\alpha}$ has been defined, then define $M_{\alpha+1}$ as follows. If $M_{\alpha}=M$, then let $M_{\alpha+1}=M$. If not, choose the smallest $j \in I$ such that $N_{j}$ is not contained in $M_{\alpha}$. We will construct an infinite matrix $\left(x_{m n}\right), m, n=1,2,3, \ldots$ such that:
(1) $N_{j}$ is contained in the submodule of $M$ generated by the entries $x_{m n}$;
(2) if we write any entry $x_{k \ell}$ in terms of its $P$ - and $Q$-components, $x_{k \ell}=$ $y_{k \ell}+z_{k \ell}$, then the matrix $\left(x_{m n}\right)$ contains a set of generators for each $N_{i}$ for which $y_{k \ell}$ or $z_{k \ell}$ has nonzero component.
Then we define $M_{\alpha+1}$ to be the submodule of $M$ generated by $M_{\alpha}$ and all $x_{m n}$; by property (2) of the matrix $\left(x_{m n}\right), M_{\alpha+1}$ will be a direct sum of some subset of the $N_{i}$. To construct the matrix $\left(x_{m n}\right)$, let $x_{11}, x_{12}, x_{13}, \ldots$ be a countable set of generators for $N_{j}$. Then if $x_{11}=y_{11}+z_{11}$ is the decomposition into $P$ - and $Q$ components, let $x_{21}, x_{22}, x_{23}, \ldots$ be a countable set of generators for the sum of the $N_{i}$ for which $y_{11}$ or $z_{11}$ have nonzero component. Repeat this process on $x_{12}$ to get elements $x_{31}, x_{32}, \ldots$, the third row of our matrix. Repeat on $x_{21}$ to get the fourth row, on $x_{13}$ to get the fifth, and so on, going down along successive anti-diagonals as indicated below:

$$
\left(\begin{array}{lllll}
x_{11} & x_{12} & x_{13} & x_{14} & \cdots \\
x_{21}^{K} & x_{22} & x_{23}^{K} & \cdots & \\
x_{31}^{K} & x_{32} & \cdots & \cdots & \\
x_{41}^{K} & \cdots & & & \\
\cdots & & & & \\
\cdots & & & &
\end{array}\right)
$$

Transfinite induction on $I$ (using the fact that we constructed $M_{\alpha+1}$ to contain $N_{j}$ for the smallest $j$ such that $N_{j}$ is not contained in $M_{\alpha}$ ) shows that for each $i \in I$, $N_{i}$ is contained in some $M_{\alpha}$. Thus, there is some large enough ordinal $S$ satisfying: for each $i \in I$ there is $\alpha \in S$ such that $N_{i}$ is contained in $M_{\alpha}$. This means $\left(M_{\alpha}\right)_{\alpha \in S}$ satisfies property (1) of a Kaplansky dévissage of $M$. The family $\left(M_{\alpha}\right)_{\alpha \in S}$ moreover satisfies the other defining properties, and also (5) and (6) above: properties (0), (2), (4), and (6) are clear by construction; property (5) is true because each $M_{\alpha}$ is by construction a direct sum of some $N_{i}$; and (3) is implied by (5) and the fact that $M_{\alpha} \subset M_{\alpha+1}$.

As a corollary we get the result for projective modules stated at the beginning of the section.

058Y Theorem 10.83.5. If $P$ is a projective $R$-module, then $P$ is a direct sum of countably generated projective $R$-modules.

Proof. A module is projective if and only if it is a direct summand of a free module, so this follows from Theorem 10.83.4.

### 10.84. Projective modules over a local ring

058 Z In this section we prove a very cute result: a projective module $M$ over a local ring is free (Theorem 10.84 .4 below). Note that with the additional assumption that $M$ is finite, this result is Lemma 10.77.4 In general we have:

0590 Lemma 10.84.1. Let $R$ be a ring. Then every projective $R$-module is free if and only if every countably generated projective $R$-module is free.
Proof. Follows immediately from Theorem 10.83.5.
Here is a criterion for a countably generated module to be free.
0591 Lemma 10.84.2. Let $M$ be a countably generated $R$-module. Suppose any direct summand $N$ of $M$ satisfies: any element of $N$ is contained in a free direct summand of $N$. Then $M$ is free.

Proof. Let $x_{1}, x_{2}, \ldots$ be a countable set of generators for $M$. By the assumption on $M$, we can construct by induction free $R$-modules $F_{1}, F_{2}, \ldots$ such that for every positive integer $n, \bigoplus_{i=1}^{n} F_{i}$ is a direct summand of $M$ and contains $x_{1}, \ldots, x_{n}$. Then $M=\bigoplus_{i=1}^{\infty} F_{i}$.

0592 Lemma 10.84.3. Let $P$ be a projective module over a local ring $R$. Then any element of $P$ is contained in a free direct summand of $P$.

Proof. Since $P$ is projective it is a direct summand of some free $R$-module $F$, say $F=P \oplus Q$. Let $x \in P$ be the element that we wish to show is contained in a free direct summand of $P$. Let $B$ be a basis of $F$ such that the number of basis elements needed in the expression of $x$ is minimal, say $x=\sum_{i=1}^{n} a_{i} e_{i}$ for some $e_{i} \in B$ and $a_{i} \in R$. Then no $a_{j}$ can be expressed as a linear combination of the other $a_{i}$; for if $a_{j}=\sum_{i \neq j} a_{i} b_{i}$ for some $b_{i} \in R$, then replacing $e_{i}$ by $e_{i}+b_{i} e_{j}$ for $i \neq j$ and leaving unchanged the other elements of $B$, we get a new basis for $F$ in terms of which $x$ has a shorter expression.

Let $e_{i}=y_{i}+z_{i}, y_{i} \in P, z_{i} \in Q$ be the decomposition of $e_{i}$ into its $P$ - and $Q$ components. Write $y_{i}=\sum_{j=1}^{n} b_{i j} e_{j}+t_{i}$, where $t_{i}$ is a linear combination of elements in $B$ other than $e_{1}, \ldots, e_{n}$. To finish the proof it suffices to show that the matrix $\left(b_{i j}\right)$ is invertible. For then the map $F \rightarrow F$ sending $e_{i} \mapsto y_{i}$ for $i=1, \ldots, n$ and fixing $B \backslash\left\{e_{1}, \ldots, e_{n}\right\}$ is an isomorphism, so that $y_{1}, \ldots, y_{n}$ together with $B \backslash\left\{e_{1}, \ldots, e_{n}\right\}$ form a basis for $F$. Then the submodule $N$ spanned by $y_{1}, \ldots, y_{n}$ is a free submodule of $P ; N$ is a direct summand of $P$ since $N \subset P$ and both $N$ and $P$ are direct summands of $F$; and $x \in N$ since $x \in P$ implies $x=\sum_{i=1}^{n} a_{i} e_{i}=$ $\sum_{i=1}^{n} a_{i} y_{i}$.
Now we prove that $\left(b_{i j}\right)$ is invertible. Plugging $y_{i}=\sum_{j=1}^{n} b_{i j} e_{j}+t_{i}$ into $\sum_{i=1}^{n} a_{i} e_{i}=$ $\sum_{i=1}^{n} a_{i} y_{i}$ and equating the coefficients of $e_{j}$ gives $a_{j}=\sum_{i=1}^{n} a_{i} b_{i j}$. But as noted above, our choice of $B$ guarantees that no $a_{j}$ can be written as a linear combination of the other $a_{i}$. Thus $b_{i j}$ is a non-unit for $i \neq j$, and $1-b_{i i}$ is a non-unit-so in particular $b_{i i}$ is a unit-for all $i$. But a matrix over a local ring having units along the diagonal and non-units elsewhere is invertible, as its determinant is a unit.

0593 Theorem 10.84.4. If $P$ is a projective module over a local ring $R$, then $P$ is free.
Proof. Follows from Lemmas 10.84.1, 10.84.2, and 10.84.3.

### 10.85. Mittag-Leffler systems

0594 The purpose of this section is to define Mittag-Leffler systems and why it is a useful property.

In the following, $I$ will be a directed partially ordered set, see Categories, Definition 4.21.2. Let $\left(A_{i}, \varphi_{j i}: A_{j} \rightarrow A_{i}\right)$ be an inverse system of sets or of modules indexed by $I$, see Categories, Definition 4.21.2. This is a directed inverse system as we assumed $I$ directed. For each $i \in I$, the images $\varphi_{j i}\left(A_{j}\right) \subset A_{i}$ for $j \geq i$ form a decreasing family. Let $A_{i}^{\prime}=\bigcap_{j \geq i} \varphi_{j i}\left(A_{j}\right)$. Then $\varphi_{j i}\left(A_{j}^{\prime}\right) \subset A_{i}^{\prime}$ for $j \geq i$, hence by restricting we get a directed inverse system $\left(A_{i}^{\prime},\left.\varphi_{j i}\right|_{A_{j}^{\prime}}\right)$. From the construction of the limit of an inverse system in the category of sets or modules, we have $\lim A_{i}=\lim A_{i}^{\prime}$. The Mittag-Leffler condition on $\left(A_{i}, \varphi_{j i}\right)$ is that $A_{i}^{\prime}$ equals $\varphi_{j i}\left(A_{j}\right)$ for some $j \geq i$ (and hence equals $\varphi_{k i}\left(A_{k}\right)$ for all $\left.k \geq j\right)$ :
0595 Definition 10.85.1. Let $\left(A_{i}, \varphi_{j i}\right)$ be a directed inverse system of sets over $I$. Then we say $\left(A_{i}, \varphi_{j i}\right)$ is Mittag-Leffler inverse system if for each $i \in I$, the decreasing family $\varphi_{j i}\left(A_{j}\right) \subset A_{i}$ for $j \geq i$ stabilizes. Explicitly, this means that for each $i \in I$, there exists $j \geq i$ such that for $k \geq j$ we have $\varphi_{k i}\left(A_{k}\right)=\varphi_{j i}\left(A_{j}\right)$. If $\left(A_{i}, \varphi_{j i}\right)$ is a directed inverse system of modules over a ring $R$, we say that it is Mittag-Leffler if the underlying inverse system of sets is Mittag-Leffler.

Example 10.85.2. If $\left(A_{i}, \varphi_{j i}\right)$ is a directed inverse system of sets or of modules and the maps $\varphi_{j i}$ are surjective, then clearly the system is Mittag-Leffler. Conversely, suppose $\left(A_{i}, \varphi_{j i}\right)$ is Mittag-Leffler. Let $A_{i}^{\prime} \subset A_{i}$ be the stable image of $\varphi_{j i}\left(A_{j}\right)$ for $j \geq i$. Then $\left.\varphi_{j i}\right|_{A_{j}^{\prime}}: A_{j}^{\prime} \rightarrow A_{i}^{\prime}$ is surjective for $j \geq i$ and $\lim A_{i}=\lim A_{i}^{\prime}$. Hence the limit of the Mittag-Leffler system $\left(A_{i}, \varphi_{j i}\right)$ can also be written as the limit of a directed inverse system over $I$ with surjective maps.

0597 Lemma 10.85.3. Let $\left(A_{i}, \varphi_{j i}\right)$ be a directed inverse system over $I$. Suppose $I$ is countable. If $\left(A_{i}, \varphi_{j i}\right)$ is Mittag-Leffler and the $A_{i}$ are nonempty, then $\lim A_{i}$ is nonempty.

Proof. Let $i_{1}, i_{2}, i_{3}, \ldots$ be an enumeration of the elements of $I$. Define inductively a sequence of elements $j_{n} \in I$ for $n=1,2,3, \ldots$ by the conditions: $j_{1}=i_{1}$, and $j_{n} \geq i_{n}$ and $j_{n} \geq j_{m}$ for $m<n$. Then the sequence $j_{n}$ is increasing and forms a cofinal subset of $I$. Hence we may assume $I=\{1,2,3, \ldots\}$. So by Example 10.85.2 we are reduced to showing that the limit of an inverse system of nonempty sets with surjective maps indexed by the positive integers is nonempty. This is obvious.

The Mittag-Leffler condition will be important for us because of the following exactness property.

0598 Lemma 10.85.4. Let

$$
0 \rightarrow A_{i} \xrightarrow{f_{i}} B_{i} \xrightarrow{g_{i}} C_{i} \rightarrow 0
$$

be an exact sequence of directed inverse systems of abelian groups over I. Suppose $I$ is countable. If $\left(A_{i}\right)$ is Mittag-Leffler, then

$$
0 \rightarrow \lim A_{i} \rightarrow \lim B_{i} \rightarrow \lim C_{i} \rightarrow 0
$$

is exact.
Proof. Taking limits of directed inverse systems is left exact, hence we only need to prove surjectivity of $\lim B_{i} \rightarrow \lim C_{i}$. So let $\left(c_{i}\right) \in \lim C_{i}$. For each $i \in I$, let $E_{i}=g_{i}^{-1}\left(c_{i}\right)$, which is nonempty since $g_{i}: B_{i} \rightarrow C_{i}$ is surjective. The system of maps $\varphi_{j i}: B_{j} \rightarrow B_{i}$ for $\left(B_{i}\right)$ restrict to maps $E_{j} \rightarrow E_{i}$ which make $\left(E_{i}\right)$ into an inverse system of nonempty sets. It is enough to show that $\left(E_{i}\right)$ is Mittag-Leffler.

For then Lemma 10.85 .3 would show $\lim E_{i}$ is nonempty, and taking any element of $\lim E_{i}$ would give an element of $\lim B_{i}$ mapping to $\left(c_{i}\right)$.

By the injection $f_{i}: A_{i} \rightarrow B_{i}$ we will regard $A_{i}$ as a subset of $B_{i}$. Since $\left(A_{i}\right)$ is Mittag-Leffler, if $i \in I$ then there exists $j \geq i$ such that $\varphi_{k i}\left(A_{k}\right)=\varphi_{j i}\left(A_{j}\right)$ for $k \geq j$. We claim that also $\varphi_{k i}\left(E_{k}\right)=\varphi_{j i}\left(E_{j}\right)$ for $k \geq j$. Always $\varphi_{k i}\left(E_{k}\right) \subset \varphi_{j i}\left(E_{j}\right)$ for $k \geq j$. For the reverse inclusion let $e_{j} \in E_{j}$, and we need to find $x_{k} \in E_{k}$ such that $\varphi_{k i}\left(x_{k}\right)=\varphi_{j i}\left(e_{j}\right)$. Let $e_{k}^{\prime} \in E_{k}$ be any element, and set $e_{j}^{\prime}=\varphi_{k j}\left(e_{k}^{\prime}\right)$. Then $g_{j}\left(e_{j}-e_{j}^{\prime}\right)=c_{j}-c_{j}=0$, hence $e_{j}-e_{j}^{\prime}=a_{j} \in A_{j}$. Since $\varphi_{k i}\left(A_{k}\right)=\varphi_{j i}\left(A_{j}\right)$, there exists $a_{k} \in A_{k}$ such that $\varphi_{k i}\left(a_{k}\right)=\varphi_{j i}\left(a_{j}\right)$. Hence

$$
\varphi_{k i}\left(e_{k}^{\prime}+a_{k}\right)=\varphi_{j i}\left(e_{j}^{\prime}\right)+\varphi_{j i}\left(a_{j}\right)=\varphi_{j i}\left(e_{j}\right),
$$

so we can take $x_{k}=e_{k}^{\prime}+a_{k}$.

### 10.86. Inverse systems

03C9 In many papers (and in this section) the term inverse system is used to indicate an inverse system over the partially ordered set $(\mathbf{N}, \geq)$. We briefly discuss such systems in this section. This material will be discussed more broadly in Homology, Section 12.27. Suppose we are given a ring $R$ and a sequence of $R$-modules

$$
M_{1} \stackrel{\varphi_{2}}{\leftrightarrows} M_{2} \stackrel{\varphi_{3}}{\leftrightarrows} M_{3} \leftarrow \ldots
$$

with maps as indicated. By composing successive maps we obtain maps $\varphi_{i i^{\prime}}: M_{i} \rightarrow$ $M_{i^{\prime}}$ whenever $i \geq i^{\prime}$ such that moreover $\varphi_{i i^{\prime \prime}}=\varphi_{i^{\prime} i^{\prime \prime}} \circ \varphi_{i i^{\prime}}$ whenever $i \geq i^{\prime} \geq i^{\prime \prime}$. Conversely, given the system of maps $\varphi_{i i^{\prime}}$ we can set $\varphi_{i}=\varphi_{i(i-1)}$ and recover the maps displayed above. In this case

$$
\lim M_{i}=\left\{\left(x_{i}\right) \in \prod M_{i} \mid \varphi_{i}\left(x_{i}\right)=x_{i-1}, i=2,3, \ldots\right\}
$$

compare with Categories, Section 4.15 As explained in Homology, Section 12.27 this is actually a limit in the category of $R$-modules, as defined in Categories, Section 4.14

03CA Lemma 10.86.1. Let $R$ be a ring. Let $0 \rightarrow K_{i} \rightarrow L_{i} \rightarrow M_{i} \rightarrow 0$ be short exact sequences of $R$-modules, $i \geq 1$ which fit into maps of short exact sequences

If for every $i$ there exists a $c=c(i) \geq i$ such that $\operatorname{Im}\left(K_{c} \rightarrow K_{i}\right)=\operatorname{Im}\left(K_{j} \rightarrow K_{i}\right)$ for all $j \geq c$, then the sequence

$$
0 \rightarrow \lim K_{i} \rightarrow \lim L_{i} \rightarrow \lim M_{i} \rightarrow 0
$$

is exact.
Proof. This is a special case of the more general Lemma 10.85.4

### 10.87. Mittag-Leffler modules

0599 A Mittag-Leffler module is (very roughly) a module which can be written as a directed limit whose dual is a Mittag-Leffler system. To be able to give a precise definition we need to do a bit of work.
059A Definition 10.87.1. Let $\left(M_{i}, f_{i j}\right)$ be a directed system of $R$-modules. We say that $\left(M_{i}, f_{i j}\right)$ is a Mittag-Leffler directed system of modules if each $M_{i}$ is an $R$-module of finite presentation and if for every $R$-module $N$, the inverse system

$$
\left(\operatorname{Hom}_{R}\left(M_{i}, N\right), \operatorname{Hom}_{R}\left(f_{i j}, N\right)\right)
$$

is Mittag-Leffler.
We are going to characterize those $R$-modules that are colimits of Mittag-Leffler directed systems of modules.

059B Definition 10.87.2. Let $f: M \rightarrow N$ and $g: M \rightarrow M^{\prime}$ be maps of $R$-modules. Then we say $g$ dominates $f$ if for any $R$-module $Q$, we have $\operatorname{Ker}\left(f \otimes_{R} \operatorname{id}_{Q}\right) \subset$ $\operatorname{Ker}\left(g \otimes_{R} \operatorname{id}_{Q}\right)$.

It is enough to check this condition for finitely presented modules.
059C Lemma 10.87.3. Let $f: M \rightarrow N$ and $g: M \rightarrow M^{\prime}$ be maps of $R$-modules. Then $g$ dominates $f$ if and only if for any finitely presented $R$-module $Q$, we have $\operatorname{Ker}\left(f \otimes_{R} i d_{Q}\right) \subset \operatorname{Ker}\left(g \otimes_{R} i d_{Q}\right)$.
Proof. Suppose $\operatorname{Ker}\left(f \otimes_{R} \operatorname{id}_{Q}\right) \subset \operatorname{Ker}\left(g \otimes_{R} \operatorname{id}_{Q}\right)$ for all finitely presented modules $Q$. If $Q$ is an arbitrary module, write $Q=\operatorname{colim}_{i \in I} Q_{i}$ as a colimit of a directed system of finitely presented modules $Q_{i}$. Then $\operatorname{Ker}\left(f \otimes_{R} \mathrm{id}_{Q_{i}}\right) \subset \operatorname{Ker}\left(g \otimes_{R} \operatorname{id}_{Q_{i}}\right)$ for all $i$. Since taking directed colimits is exact and commutes with tensor product, it follows that $\operatorname{Ker}\left(f \otimes_{R} \operatorname{id}_{Q}\right) \subset \operatorname{Ker}\left(g \otimes_{R} \operatorname{id}_{Q}\right)$.
0AUM Lemma 10.87.4. Let $f: M \rightarrow N$ and $g: M \rightarrow M^{\prime}$ be maps of $R$-modules. Consider the pushout of $f$ and $g$,

Then $g$ dominates $f$ if and only if $f^{\prime}$ is universally injective.
Proof. Recall that $N^{\prime}$ is $M^{\prime} \oplus N$ modulo the submodule consisting of elements $(g(x),-f(x))$ for $x \in M$. From the construction of $N^{\prime}$ we have a short exact sequence

$$
0 \rightarrow \operatorname{Ker}(f) \cap \operatorname{Ker}(g) \rightarrow \operatorname{Ker}(f) \rightarrow \operatorname{Ker}\left(f^{\prime}\right) \rightarrow 0
$$

Since tensoring commutes with taking pushouts, we have such a short exact sequence

$$
0 \rightarrow \operatorname{Ker}\left(f \otimes \operatorname{id}_{Q}\right) \cap \operatorname{Ker}\left(g \otimes \operatorname{id}_{Q}\right) \rightarrow \operatorname{Ker}\left(f \otimes \operatorname{id}_{Q}\right) \rightarrow \operatorname{Ker}\left(f^{\prime} \otimes \operatorname{id}_{Q}\right) \rightarrow 0
$$

for every $R$-module $Q$. So $f^{\prime}$ is universally injective if and only if $\operatorname{Ker}\left(f \otimes \operatorname{id}_{Q}\right) \subset$ $\operatorname{Ker}\left(g \otimes \mathrm{id}_{Q}\right)$ for every $Q$, if and only if $g$ dominates $f$.
The above definition of domination is sometimes related to the usual notion of domination of maps as the following lemma shows.

059D Lemma 10.87.5. Let $f: M \rightarrow N$ and $g: M \rightarrow M^{\prime}$ be maps of $R$-modules. Suppose Coker $(f)$ is of finite presentation. Then $g$ dominates $f$ if and only if $g$ factors through $f$, i.e. there exists a module map $h: N \rightarrow M^{\prime}$ such that $g=h \circ f$.

Proof. Consider the pushout of $f$ and $g$ as in the statement of Lemma 10.87.4 From the construction of the pushout it follows that $\operatorname{Coker}\left(f^{\prime}\right)=\operatorname{Coker}(f)$, so $\operatorname{Coker}\left(f^{\prime}\right)$ is of finite presentation. Then by Lemma 10.81.4, $f^{\prime}$ is universally injective if and only if

$$
0 \rightarrow M^{\prime} \xrightarrow{f^{\prime}} N^{\prime} \rightarrow \operatorname{Coker}\left(f^{\prime}\right) \rightarrow 0
$$

splits. This is the case if and only if there is a map $h^{\prime}: N^{\prime} \rightarrow M^{\prime}$ such that $h^{\prime} \circ f^{\prime}=\mathrm{id}_{M^{\prime}}$. From the universal property of the pushout, the existence of such an $h^{\prime}$ is equivalent to $g$ factoring through $f$.

059E Proposition 10.87.6. Let $M$ be an $R$-module. Let $\left(M_{i}, f_{i j}\right)$ be a directed system of finitely presented $R$-modules, indexed by $I$, such that $M=\operatorname{colim} M_{i}$. Let $f_{i}$ : $M_{i} \rightarrow M$ be the canonical map. The following are equivalent:
(1) For every finitely presented $R$-module $P$ and module map $f: P \rightarrow M$, there exists a finitely presented $R$-module $Q$ and a module map $g: P \rightarrow Q$ such that $g$ and $f$ dominate each other, i.e., $\operatorname{Ker}\left(f \otimes_{R} i d_{N}\right)=\operatorname{Ker}\left(g \otimes_{R}\right.$ $\left.i d_{N}\right)$ for every $R$-module $N$.
(2) For each $i \in I$, there exists $j \geq i$ such that $f_{i j}: M_{i} \rightarrow M_{j}$ dominates $f_{i}: M_{i} \rightarrow M$.
(3) For each $i \in I$, there exists $j \geq i$ such that $f_{i j}: M_{i} \rightarrow M_{j}$ factors through $f_{i k}: M_{i} \rightarrow M_{k}$ for all $k \geq i$.
(4) For every $R$-module $N$, the inverse system $\left(\operatorname{Hom}_{R}\left(M_{i}, N\right), \operatorname{Hom}_{R}\left(f_{i j}, N\right)\right)$ is Mittag-Leffler.
(5) For $N=\prod_{s \in I} M_{s}$, the inverse system $\left(\operatorname{Hom}_{R}\left(M_{i}, N\right), \operatorname{Hom}_{R}\left(f_{i j}, N\right)\right)$ is Mittag-Leffler.

Proof. First we prove the equivalence of (1) and (2). Suppose (1) holds and let $i \in I$. Corresponding to the map $f_{i}: M_{i} \rightarrow M$, we can choose $g: M_{i} \rightarrow Q$ as in (1). Since $M_{i}$ and $Q$ are of finite presentation, so is $\operatorname{Coker}(g)$. Then by Lemma 10.87.5. $f_{i}: M_{i} \rightarrow M$ factors through $g: M_{i} \rightarrow Q$, say $f_{i}=h \circ g$ for some $h: Q \rightarrow M$. Then since $Q$ is finitely presented, $h$ factors through $M_{j} \rightarrow M$ for some $j \geq i$, say $h=f_{j} \circ h^{\prime}$ for some $h^{\prime}: Q \rightarrow M_{j}$. In total we have a commutative diagram

Thus $f_{i j}$ dominates $g$. But $g$ dominates $f_{i}$, so $f_{i j}$ dominates $f_{i}$.
Conversely, suppose (2) holds. Let $P$ be of finite presentation and $f: P \rightarrow M$ a module map. Then $f$ factors through $f_{i}: M_{i} \rightarrow M$ for some $i \in I$, say $f=f_{i} \circ g^{\prime}$ for some $g^{\prime}: P \rightarrow M_{i}$. Choose by (2) a $j \geq i$ such that $f_{i j}$ dominates $f_{i}$. We have
a commutative diagram

From the diagram and the fact that $f_{i j}$ dominates $f_{i}$, we find that $f$ and $f_{i j} \circ g^{\prime}$ dominate each other. Hence taking $g=f_{i j} \circ g^{\prime}: P \rightarrow M_{j}$ works.
Next we prove (2) is equivalent to (3). Let $i \in I$. It is always true that $f_{i}$ dominates $f_{i k}$ for $k \geq i$, since $f_{i}$ factors through $f_{i k}$. If (2) holds, choose $j \geq i$ such that $f_{i j}$ dominates $f_{i}$. Then since domination is a transitive relation, $f_{i j}$ dominates $f_{i k}$ for $k \geq i$. All $M_{i}$ are of finite presentation, so $\operatorname{Coker}\left(f_{i k}\right)$ is of finite presentation for $k \geq i$. By Lemma 10.87.5, $f_{i j}$ factors through $f_{i k}$ for all $k \geq i$. Thus (2) implies (3). On the other hand, if (3) holds then for any $R$-module $N, f_{i j} \otimes_{R} \mathrm{id}_{N}$ factors through $f_{i k} \otimes_{R} \mathrm{id}_{N}$ for $k \geq i$. So $\operatorname{Ker}\left(f_{i k} \otimes_{R} \operatorname{id}_{N}\right) \subset \operatorname{Ker}\left(f_{i j} \otimes_{R} \operatorname{id}_{N}\right)$ for $k \geq i$. But $\operatorname{Ker}\left(f_{i} \otimes_{R} \mathrm{id}_{N}: M_{i} \otimes_{R} N \rightarrow M \otimes_{R} N\right)$ is the union of $\operatorname{Ker}\left(f_{i k} \otimes_{R} \mathrm{id}_{N}\right)$ for $k \geq i$. Thus $\operatorname{Ker}\left(f_{i} \otimes_{R} \operatorname{id}_{N}\right) \subset \operatorname{Ker}\left(f_{i j} \otimes_{R} \mathrm{id}_{N}\right)$ for any $R$-module $N$, which by definition means $f_{i j}$ dominates $f_{i}$.

It is trivial that (3) implies (4) implies (5). We show (5) implies (3). Let $N=$ $\prod_{s \in I} M_{s}$. If (5) holds, then given $i \in I$ choose $j \geq i$ such that

$$
\operatorname{Im}\left(\operatorname{Hom}\left(M_{j}, N\right) \rightarrow \operatorname{Hom}\left(M_{i}, N\right)\right)=\operatorname{Im}\left(\operatorname{Hom}\left(M_{k}, N\right) \rightarrow \operatorname{Hom}\left(M_{i}, N\right)\right)
$$

for all $k \geq j$. Passing the product over $s \in I$ outside of the Hom's and looking at the maps on each component of the product, this says

$$
\operatorname{Im}\left(\operatorname{Hom}\left(M_{j}, M_{s}\right) \rightarrow \operatorname{Hom}\left(M_{i}, M_{s}\right)\right)=\operatorname{Im}\left(\operatorname{Hom}\left(M_{k}, M_{s}\right) \rightarrow \operatorname{Hom}\left(M_{i}, M_{s}\right)\right)
$$

for all $k \geq j$ and $s \in I$. Taking $s=j$ we have

$$
\operatorname{Im}\left(\operatorname{Hom}\left(M_{j}, M_{j}\right) \rightarrow \operatorname{Hom}\left(M_{i}, M_{j}\right)\right)=\operatorname{Im}\left(\operatorname{Hom}\left(M_{k}, M_{j}\right) \rightarrow \operatorname{Hom}\left(M_{i}, M_{j}\right)\right)
$$

for all $k \geq j$. Since $f_{i j}$ is the image of $\operatorname{id} \in \operatorname{Hom}\left(M_{j}, M_{j}\right)$ under $\operatorname{Hom}\left(M_{j}, M_{j}\right) \rightarrow$ $\operatorname{Hom}\left(M_{i}, M_{j}\right)$, this shows that for any $k \geq j$ there is $h \in \operatorname{Hom}\left(M_{k}, M_{j}\right)$ such that $f_{i j}=h \circ f_{i k}$. If $j \geq k$ then we can take $h=f_{k j}$. Hence (3) holds.

059F Definition 10.87.7. Let $M$ be an $R$-module. We say that $M$ is Mittag-Leffler if the equivalent conditions of Proposition 10.87 .6 hold.

In particular a finitely presented module is Mittag-Leffler.
059G Remark 10.87.8. Let $M$ be a flat $R$-module. By Lazard's theorem (Theorem 10.80.4 we can write $M=\operatorname{colim} M_{i}$ as the colimit of a directed system $\left(M_{i}, f_{i j}\right)$ where the $M_{i}$ are free finite $R$-modules. For $M$ to be Mittag-Leffler, it is enough for the inverse system of duals $\left(\operatorname{Hom}_{R}\left(M_{i}, R\right), \operatorname{Hom}_{R}\left(f_{i j}, R\right)\right)$ to be Mittag-Leffler. This follows from criterion (4) of Proposition 10.87 .6 and the fact that for a free finite $R$-module $F$, there is a functorial isomorphism $\operatorname{Hom}_{R}(F, R) \otimes_{R} N \cong \operatorname{Hom}_{R}(F, N)$ for any $R$-module $N$.

05CN Lemma 10.87.9. If $R$ is a ring and $M, N$ are Mittag-Leffler modules over $R$, then $M \otimes_{R} N$ is a Mittag-Leffler module.

Proof. Write $M=\operatorname{colim}_{i \in I} M_{i}$ and $N=\operatorname{colim}_{j \in J} N_{j}$ as directed colimits of finitely presented $R$-modules. Denote $f_{i i^{\prime}}: M_{i} \rightarrow M_{i^{\prime}}$ and $g_{j j^{\prime}}: N_{j} \rightarrow N_{j^{\prime}}$ the transition maps. Then $M_{i} \otimes_{R} N_{j}$ is a finitely presented $R$-module (see Lemma 10.11.14), and $M \otimes_{R} N=\operatorname{colim}_{(i, j) \in I \times J} M_{i} \otimes_{R} M_{j}$. Pick $(i, j) \in I \times J$. By the definition of a Mittag-Leffler module we have Proposition 10.87.6 (3) for both systems. In other words there exist $i^{\prime} \geq i$ and $j^{\prime} \geq j$ such that for every choice of $i^{\prime \prime} \geq i$ and $j^{\prime \prime} \geq j$ there exist maps $a: M_{i^{\prime \prime}} \rightarrow M_{i^{\prime}}$ and $b: M_{j^{\prime \prime}} \rightarrow M_{j^{\prime}}$ such that $f_{i i^{\prime}}=a \circ f_{i i^{\prime \prime}}$ and $g_{j j^{\prime}}=b \circ g_{j j^{\prime \prime}}$. Then it is clear that $a \otimes b: M_{i^{\prime \prime}} \otimes_{R} N_{j^{\prime \prime}} \rightarrow M_{i^{\prime}} \otimes_{R} N_{j^{\prime}}$ serves the same purpose for the system $\left(M_{i} \otimes_{R} N_{j}, f_{i i^{\prime}} \otimes g_{j j^{\prime}}\right)$. Thus by the characterization Proposition 10.87 .6 (3) we conclude that $M \otimes_{R} N$ is Mittag-Leffler.

05CP Lemma 10.87.10. Let $R$ be a ring and $M$ an $R$-module. Then $M$ is MittagLeffler if and only if for every finite free $R$-module $F$ and module map $f: F \rightarrow M$, there exists a finitely presented $R$-module $Q$ and a module map $g: F \rightarrow Q$ such that $g$ and $f$ dominate each other, i.e., $\operatorname{Ker}\left(f \otimes_{R} i d_{N}\right)=\operatorname{Ker}\left(g \otimes_{R} i d_{N}\right)$ for every $R$-module $N$.

Proof. Since the condition is clear weaker than condition (1) of Proposition 10.87 .6 we see that a Mittag-Leffler module satisfies the condition. Conversely, suppose that $M$ satisfies the condition and that $f: P \rightarrow M$ is an $R$-module map from a finitely presented $R$-module $P$ into $M$. Choose a surjection $F \rightarrow P$ where $F$ is a finite free $R$-module. By assumption we can find a map $F \rightarrow Q$ where $Q$ is a finitely presented $R$-module such that $F \rightarrow Q$ and $F \rightarrow M$ dominate each other. In particular, the kernel of $F \rightarrow Q$ contains the kernel of $F \rightarrow P$, hence we obtain an $R$-module map $g: P \rightarrow Q$ such that $F \rightarrow Q$ is equal to the composition $F \rightarrow P \rightarrow Q$. Let $N$ be any $R$-module and consider the commutative diagram

By assumption the kernels of $F \otimes_{R} N \rightarrow Q \otimes_{R} N$ and $F \otimes_{R} N \rightarrow M \otimes_{R} N$ are equal. Hence, as $F \otimes_{R} N \rightarrow P \otimes_{R} N$ is surjective, also the kernels of $P \otimes_{R} N \rightarrow Q \otimes_{R} N$ and $P \otimes_{R} N \rightarrow M \otimes_{R} N$ are equal.

05 CQ Lemma 10.87.11. Let $R \rightarrow S$ be a finite and finitely presented ring map. Let $M$ be an $S$-module. If $M$ is a Mittag-Leffler module over $S$ then $M$ is a Mittag-Leffler module over $R$.

Proof. Assume $M$ is a Mittag-Leffler module over $S$. Write $M=\operatorname{colim} M_{i}$ as a directed colimit of finitely presented $S$-modules $M_{i}$. As $M$ is Mittag-Leffler over $S$ there exists for each $i$ an index $j \geq i$ such that for all $k \geq j$ there is a factorization $f_{i j}=h \circ f_{i k}$ (where $h$ depends on $i$, the choice of $j$ and $k$ ). Note that by Lemma 10.35 .21 the modules $M_{i}$ are also finitely presented as $R$-modules. Moreover, all the maps $f_{i j}, f_{i k}, h$ are maps of $R$-modules. Thus we see that the system $\left(M_{i}, f_{i j}\right)$ satisfies the same condition when viewed as a system of $R$-modules. Thus $M$ is Mittag-Leffler as an $R$-module.

05CR Lemma 10.87.12. Let $R$ be a ring. Let $S=R / I$ for some finitely generated ideal I. Let $M$ be an $S$-module. Then $M$ is a Mittag-Leffler module over $R$ if and only if $M$ is a Mittag-Leffler module over $S$.

Proof. One implication follows from Lemma 10.87.11. To prove the other, assume $M$ is Mittag-Leffler as an $R$-module. Write $M=\operatorname{colim} M_{i}$ as a directed colimit of finitely presented $S$-modules. As $I$ is finitely generated, the ring $S$ is finite and finitely presented as an $R$-algebra, hence the modules $M_{i}$ are finitely presented as $R$-modules, see Lemma 10.35 .21 Next, let $N$ be any $S$-module. Note that for each $i$ we have $\operatorname{Hom}_{R}\left(M_{i}, N\right)=\operatorname{Hom}_{S}\left(M_{i}, N\right)$ as $R \rightarrow S$ is surjective. Hence the condition that the inverse system $\left(\operatorname{Hom}_{R}\left(M_{i}, N\right)\right)_{i}$ satisfies Mittag-Leffler, implies that the system $\left(\operatorname{Hom}_{S}\left(M_{i}, N\right)\right)_{i}$ satisfies Mittag-Leffler. Thus $M$ is Mittag-Leffler over $S$ by definition.

05CS Remark 10.87.13. Let $R \rightarrow S$ be a finite and finitely presented ring map. Let $M$ be an $S$-module which is Mittag-Leffler as an $R$-module. Then it is in general not the case that if $M$ is Mittag-Leffler as an $S$-module. For example suppose that $S$ is the ring of dual numbers over $R$, i.e., $S=R \oplus R \epsilon$ with $\epsilon^{2}=0$. Then an $S$-module consists of an $R$-module $M$ endowed with a square zero $R$-linear endomorphism $\epsilon: M \rightarrow M$. Now suppose that $M_{0}$ is an $R$-module which is not Mittag-Leffler. Choose a presentation $F_{1} \xrightarrow{u} F_{0} \rightarrow M_{0} \rightarrow 0$ with $F_{1}$ and $F_{0}$ free $R$-modules. Set $M=F_{1} \oplus F_{0}$ with

$$
\epsilon=\left(\begin{array}{ll}
0 & 0 \\
u & 0
\end{array}\right): M \longrightarrow M
$$

Then $M / \epsilon M \cong F_{1} \oplus M_{0}$ is not Mittag-Leffler over $R=S / \epsilon S$, hence not MittagLeffler over $S$ (see Lemma 10.87.12). On the other hand, $M / \epsilon M=M \otimes_{S} S / \epsilon S$ which would be Mittag-Leffler over $S$ if $M$ was, see Lemma 10.87.9.

### 10.88. Interchanging direct products with tensor

059 H Let $M$ be an $R$-module and let $\left(Q_{\alpha}\right)_{\alpha \in A}$ be a family of $R$-modules. Then there is a canonical map $M \otimes_{R}\left(\prod_{\alpha \in A} Q_{\alpha}\right) \rightarrow \prod_{\alpha \in A}\left(M \otimes_{R} Q_{\alpha}\right)$ given on pure tensors by $x \otimes\left(q_{\alpha}\right) \mapsto\left(x \otimes q_{\alpha}\right)$. This map is not necessarily injective or surjective, as the following example shows.

0591 Example 10.88.1. Take $R=\mathbf{Z}, M=\mathbf{Q}$, and consider the family $Q_{n}=\mathbf{Z} / n$ for $n \geq 1$. Then $\prod_{n}\left(M \otimes Q_{n}\right)=0$. However there is an injection $\mathbf{Q} \rightarrow M \otimes\left(\prod_{n} Q_{n}\right)$ obtained by tensoring the injection $\mathbf{Z} \rightarrow \prod_{n} Q_{n}$ by $M$, so $M \otimes\left(\prod_{n} Q_{n}\right)$ is nonzero. Thus $M \otimes\left(\prod_{n} Q_{n}\right) \rightarrow \prod_{n}\left(M \otimes Q_{n}\right)$ is not injective.
On the other hand, take again $R=\mathbf{Z}, M=\mathbf{Q}$, and let $Q_{n}=\mathbf{Z}$ for $n \geq 1$. The image of $M \otimes\left(\prod_{n} Q_{n}\right) \rightarrow \prod_{n}\left(M \otimes Q_{n}\right)=\prod_{n} M$ consists precisely of sequences of the form $\left(a_{n} / m\right)_{n \geq 1}$ with $a_{n} \in \mathbf{Z}$ and $m$ some nonzero integer. Hence the map is not surjective.

We determine below the precise conditions needed on $M$ for the map $M \otimes_{R}$ $\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow \prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$ to be surjective, bijective, or injective for all choices of $\left(Q_{\alpha}\right)_{\alpha \in A}$. This is relevant because the modules for which it is injective turn out to be exactly Mittag-Leffler modules (Proposition 10.88.5). In what follows, if $M$ is an $R$-module and $A$ a set, we write $M^{A}$ for the product $\prod_{\alpha \in A} M$.

059J Proposition 10.88.2. Let $M$ be an $R$-module. The following are equivalent:
(1) $M$ is finitely generated.
(2) For every family $\left(Q_{\alpha}\right)_{\alpha \in A}$ of $R$-modules, the canonical map $M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow$ $\prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$ is surjective.
(3) For every $R$-module $Q$ and every set $A$, the canonical map $M \otimes_{R} Q^{A} \rightarrow$ $\left(M \otimes_{R} Q\right)^{A}$ is surjective.
(4) For every set $A$, the canonical map $M \otimes_{R} R^{A} \rightarrow M^{A}$ is surjective.

Proof. First we prove (1) implies (2). Choose a surjection $R^{n} \rightarrow M$ and consider the commutative diagram

The top arrow is an isomorphism and the vertical arrows are surjections. We conclude that the bottom arrow is a surjection.

Obviously (2) implies (3) implies (4), so it remains to prove (4) implies (1). In fact for (1) to hold it suffices that the element $d=(x)_{x \in M}$ of $M^{M}$ is in the image of the map $f: M \otimes_{R} R^{M} \rightarrow M^{M}$. In this case $d=\sum_{i=1}^{n} f\left(x_{i} \otimes a_{i}\right)$ for some $x_{i} \in M$ and $a_{i} \in R^{M}$. If for $x \in M$ we write $p_{x}: M^{M} \rightarrow M$ for the projection onto the $x$-th factor, then

$$
x=p_{x}(d)=\sum_{i=1}^{n} p_{x}\left(f\left(x_{i} \otimes a_{i}\right)\right)=\sum_{i=1}^{n} p_{x}\left(a_{i}\right) x_{i}
$$

Thus $x_{1}, \ldots, x_{n}$ generate $M$.
Proposition 10.88.3. Let $M$ be an $R$-module. The following are equivalent:
(1) $M$ is finitely presented.
(2) For every family $\left(Q_{\alpha}\right)_{\alpha \in A}$ of $R$-modules, the canonical map $M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow$ $\prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$ is bijective.
(3) For every $R$-module $Q$ and every set $A$, the canonical map $M \otimes_{R} Q^{A} \rightarrow$ $\left(M \otimes_{R} Q\right)^{A}$ is bijective.
(4) For every set $A$, the canonical map $M \otimes_{R} R^{A} \rightarrow M^{A}$ is bijective.

Proof. First we prove (1) implies (2). Choose a presentation $R^{m} \rightarrow R^{n} \rightarrow M$ and consider the commutative diagram

The first two vertical arrows are isomorphisms and the rows are exact. This implies that the map $M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow \prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$ is surjective and, by a diagram chase, also injective. Hence (2) holds.

Obviously (2) implies (3) implies (4), so it remains to prove (4) implies (1). From Proposition 10.88.2, if (4) holds we already know that $M$ is finitely generated. So we can choose a surjection $F \rightarrow M$ where $F$ is free and finite. Let $K$ be the kernel. We must show $K$ is finitely generated. For any set $A$, we have a commutative
diagram

The map $f_{1}$ is an isomorphism by assumption, the map $f_{2}$ is a isomorphism since $F$ is free and finite, and the rows are exact. A diagram chase shows that $f_{3}$ is surjective, hence by Proposition 10.88 .2 we get that $K$ is finitely generated.

We need the following lemma for the next proposition.
059L Lemma 10.88.4. Let $M$ be an $R$-module, $P$ a finitely presented $R$-module, and $f: P \rightarrow M$ a map. Let $Q$ be an $R$-module and suppose $x \in \operatorname{Ker}(P \otimes Q \rightarrow M \otimes Q)$. Then there exists a finitely presented $R$-module $P^{\prime}$ and a map $f^{\prime}: P \rightarrow P^{\prime}$ such that $f$ factors through $f^{\prime}$ and $x \in \operatorname{Ker}\left(P \otimes Q \rightarrow P^{\prime} \otimes Q\right)$.

Proof. Write $M$ as a colimit $M=\operatorname{colim}_{i \in I} M_{i}$ of a directed system of finitely presented modules $M_{i}$. Since $P$ is finitely presented, the map $f: P \rightarrow M$ factors through $M_{j} \rightarrow M$ for some $j \in I$. Upon tensoring by $Q$ we have a commutative diagram

The image $y$ of $x$ in $M_{j} \otimes Q$ is in the kernel of $M_{j} \otimes Q \rightarrow M \otimes Q$. Since $M \otimes Q=$ $\operatorname{colim}_{i \in I}\left(M_{i} \otimes Q\right)$, this means $y$ maps to 0 in $M_{j^{\prime}} \otimes Q$ for some $j^{\prime} \geq j$. Thus we may take $P^{\prime}=M_{j^{\prime}}$ and $f^{\prime}$ to be the composite $P \rightarrow M_{j} \rightarrow M_{j^{\prime}}$.

059M Proposition 10.88.5. Let $M$ be an $R$-module. The following are equivalent:
(1) $M$ is Mittag-Leffler.
(2) For every family $\left(Q_{\alpha}\right)_{\alpha \in A}$ of $R$-modules, the canonical map $M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow$ $\prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$ is injective.

Proof. First we prove (1) implies (2). Suppose $M$ is Mittag-Leffler and let $x$ be in the kernel of $M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow \prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$. Write $M$ as a colimit $M=\operatorname{colim}_{i \in I} M_{i}$ of a directed system of finitely presented modules $M_{i}$. Then $M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)$ is the colimit of $M_{i} \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)$. So $x$ is the image of an element $x_{i} \in M_{i} \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)$. We must show that $x_{i}$ maps to 0 in $M_{j} \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)$ for some $j \geq i$. Since $M$ is Mittag-Leffler, we may choose $j \geq i$ such that $M_{i} \rightarrow M_{j}$ and $M_{i} \rightarrow M$ dominate each other. Then consider the commutative diagram

whose bottom two horizontal maps are isomorphisms, according to Proposition 10.88.3 Since $x_{i}$ maps to 0 in $\prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$, its image in $\prod_{\alpha}\left(M_{i} \otimes_{R} Q_{\alpha}\right)$ is in the kernel of the map $\prod_{\alpha}\left(M_{i} \otimes_{R} Q_{\alpha}\right) \rightarrow \prod_{\alpha}\left(M \otimes_{R} Q_{\alpha}\right)$. But this kernel equals the kernel of $\prod_{\alpha}\left(M_{i} \otimes_{R} Q_{\alpha}\right) \rightarrow \prod_{\alpha}\left(M_{j} \otimes_{R} Q_{\alpha}\right)$ according to the choice of $j$. Thus $x_{i}$ maps to 0 in $\prod_{\alpha}\left(M_{j} \otimes_{R} Q_{\alpha}\right)$ and hence to 0 in $M_{j} \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)$.
Now suppose (2) holds. We prove $M$ satisfies formulation (1) of being MittagLeffler from Proposition 10.87 .6 Let $f: P \rightarrow M$ be a map from a finitely presented module $P$ to $M$. Choose a set $B$ of representatives of the isomorphism classes of finitely presented $R$-modules. Let $A$ be the set of pairs $(Q, x)$ where $Q \in B$ and $x \in \operatorname{Ker}(P \otimes Q \rightarrow M \otimes Q)$. For $\alpha=(Q, x) \in A$, we write $Q_{\alpha}$ for $Q$ and $x_{\alpha}$ for $x$. Consider the commutative diagram

The top arrow is an injection by assumption, and the bottom arrow is an isomorphism by Proposition 10.88.3. Let $x \in P \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)$ be the element corresponding to $\left(x_{\alpha}\right) \in \prod_{\alpha}\left(P \otimes_{R} Q_{\alpha}\right)$ under this isomorphism. Then $x \in \operatorname{Ker}\left(P \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow\right.$ $\left.M \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)\right)$ since the top arrow in the diagram is injective. By Lemma 10.88.4. we get a finitely presented module $P^{\prime}$ and a map $f^{\prime}: P \rightarrow P^{\prime}$ such that $f: \bar{P} \rightarrow M$ factors through $f^{\prime}$ and $x \in \operatorname{Ker}\left(P \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right) \rightarrow P^{\prime} \otimes_{R}\left(\prod_{\alpha} Q_{\alpha}\right)\right)$. We have a commutative diagram

where both the top and bottom arrows are isomorphisms by Proposition 10.88 .3 . Thus since $x$ is in the kernel of the left vertical map, $\left(x_{\alpha}\right)$ is in the kernel of the right vertical map. This means $x_{\alpha} \in \operatorname{Ker}\left(P \otimes_{R} Q_{\alpha} \rightarrow P^{\prime} \otimes_{R} Q_{\alpha}\right)$ for every $\alpha \in A$. By the definition of $A$ this means $\operatorname{Ker}\left(P \otimes_{R} Q \rightarrow P^{\prime} \otimes_{R} Q\right) \supset \operatorname{Ker}\left(P \otimes_{R} Q \rightarrow M \otimes_{R} Q\right)$ for all finitely presented $Q$ and, since $f: P \rightarrow M$ factors through $f^{\prime}: P \rightarrow P^{\prime}$, actually equality holds. By Lemma 10.87.3, $f$ and $f^{\prime}$ dominate each other.
0AS6 Lemma 10.88.6. Let $M$ be a flat Mittag-Leffler module over $R$. Let $F$ be an $R$-module and let $x \in F \otimes_{R} M$. Then there exists a smallest submodule $F^{\prime} \subset F$ such that $x \in F^{\prime} \otimes_{R} M$.

Proof. Since $M$ is flat we have $F^{\prime} \otimes_{R} M \subset F \otimes_{R} M$ if $F^{\prime} \subset F$ is a submodule, hence the statement makes sense. Let $I=\left\{F^{\prime} \subset F \mid x \in F^{\prime} \otimes_{R} M\right\}$ and for $i \in I$ denote $F_{i} \subset F$ the corresponding submodule. Then $x$ maps to zero under the map

$$
F \otimes_{R} M \longrightarrow \prod\left(F / F_{i} \otimes_{R} M\right)
$$

whence by Proposition $10.88 .5 x$ maps to zero under the map

$$
F \otimes_{R} M \longrightarrow\left(\prod F / F_{i}\right) \otimes_{R} M
$$

Since $M$ is flat the kernel of this arrow is $\left(\bigcap F_{i}\right) \otimes_{R} M$ which proves the lemma.

059N Lemma 10.88.7. Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a universally exact sequence of $R$-modules. Then:
(1) If $M_{2}$ is Mittag-Leffler, then $M_{1}$ is Mittag-Leffler.
(2) If $M_{1}$ and $M_{3}$ are Mittag-Leffler, then $M_{2}$ is Mittag-Leffler.

Proof. For any family $\left(Q_{\alpha}\right)_{\alpha \in A}$ of $R$-modules we have a commutative diagram

with exact rows. Thus (1) and (2) follow from Proposition 10.88.5

0AS7 Lemma 10.88.8. If $M=\operatorname{colim} M_{i}$ is the colimit of a directed system of MittagLeffler R-modules $M_{i}$ with universally injective transition maps, then $M$ is MittagLeffler.

Proof. Let $\left(Q_{\alpha}\right)_{\alpha \in A}$ be a family of $R$-modules. We have to show that $M \otimes_{R}$ $\left(\prod Q_{\alpha}\right) \rightarrow \prod M \otimes_{R} Q_{\alpha}$ is injective and we know that $M_{i} \otimes_{R}\left(\prod Q_{\alpha}\right) \rightarrow \prod M_{i} \otimes_{R} Q_{\alpha}$ is injective for each $i$, see Proposition 10.88 .5 Since $\otimes$ commutes with filtered colimits, it suffices to show that $\prod M_{i} \otimes_{R} Q_{\alpha} \rightarrow \prod M \otimes_{R} Q_{\alpha}$ is injective. This is clear as each of the maps $M_{i} \otimes_{R} Q_{\alpha} \rightarrow M \otimes_{R} Q_{\alpha}$ is injective by our assumption that the transition maps are universally injective.

059P Lemma 10.88.9. If $M=\bigoplus_{i \in I} M_{i}$ is a direct sum of $R$-modules, then $M$ is Mittag-Leffler if and only if each $M_{i}$ is Mittag-Leffler.

Proof. The "only if" direction follows from Lemma 10.88 .7 (1) and the fact that a split short exact sequence is universally exact. The converse follows from Lemma 10.88 .8 but we can also argue it directly as follows. First note that if $I$ is finite then this follows from Lemma 10.88 .7 (2). For general $I$, if all $M_{i}$ are Mittag-Leffler then we prove the same of $M$ by verifying condition (1) of Proposition 10.87 .6 Let $f: P \rightarrow M$ be a map from a finitely presented module $P$. Then $f$ factors as $P \xrightarrow{f^{\prime}} \bigoplus_{i^{\prime} \in I^{\prime}} M_{i^{\prime}} \hookrightarrow \bigoplus_{i \in I} M_{i}$ for some finite subset $I^{\prime}$ of $I$. By the finite case $\bigoplus_{i^{\prime} \in I^{\prime}} M_{i^{\prime}}$ is Mittag-Leffler and hence there exists a finitely presented module $Q$ and a map $g: P \rightarrow Q$ such that $g$ and $f^{\prime}$ dominate each other. Then also $g$ and $f$ dominate each other.

05CT Lemma 10.88.10. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. If $S$ is Mittag-Leffler as an $R$-module, and $M$ is flat and Mittag-Leffler as an $S$-module, then $M$ is Mittag-Leffler as an R-module.

Proof. We deduce this from the characterization of Proposition 10.88.5. Namely, suppose that $Q_{\alpha}$ is a family of $R$-modules. Consider the composition

The first arrows is injective as $M$ is flat over $S$ and $S$ is Mittag-Leffler over $R$ and the second arrow is injective as $M$ is Mittag-Leffler over $S$. Hence $M$ is Mittag-Leffler over $R$.

### 10.89. Coherent rings

05 CU We use the discussion on interchanging $\Pi$ and $\otimes$ to determine for which rings products of flat modules are flat. It turns out that these are the so-called coherent rings. You may be more familiar with the notion of a coherent $\mathcal{O}_{X}$-module on a ringed space, see Modules, Section 17.12 ,

05CV Definition 10.89.1. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) We say $M$ is a coherent module if it is finitely generated and every finitely generated submodule of $M$ is finitely presented over $R$.
(2) We say $R$ is a coherent ring if it is coherent as a module over itself.

Thus a ring is coherent if and only if every finitely generated ideal is finitely presented as a module. The category of coherent modules is abelian.

05CW Lemma 10.89.2. Let $R$ be a ring.
(1) A finite submodule of a coherent module is coherent.
(2) Let $\varphi: N \rightarrow M$ be a homomorphism from a finite module to a coherent module. Then $\operatorname{Ker}(\varphi)$ is finite.
(3) Let $\varphi: N \rightarrow M$ be a homomorphism of coherent modules. Then $\operatorname{Ker}(\varphi)$ and Coker $(\varphi)$ are coherent modules.
(4) Given a short exact sequence of $R$-modules $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ if two out of three are coherent so is the third.

Proof. The first statement is immediate from the definition. During the rest of the proof we will use the results of Lemma 10.5 .3 without further mention.

Let $\varphi: N \rightarrow M$ satisfy the assumptions of (2). Suppose that $N$ is generated by $x_{1}, \ldots, x_{n}$. By Definition 10.89 .1 the kernel $K$ of the induced map $\bigoplus_{i=1}^{n} R \rightarrow M$, $e_{i} \mapsto \varphi\left(x_{i}\right)$ is of finite type. Hence $\operatorname{Ker}(\varphi)$ which is the image of the composition $K \rightarrow \bigoplus_{i=1}^{n} R \rightarrow N$ is of finite type. This proves (2).

Let $\varphi: N \rightarrow M$ satisfy the assumptions of (3). By (2) the kernel of $\varphi$ is of finite type and hence by (1) it is coherent.
With the same hypotheses let us show that $\operatorname{Coker}(\varphi)$ is coherent. Since $M$ is finite so is $\operatorname{Coker}(\varphi)$. Let $\bar{x}_{i} \in \operatorname{Coker}(\varphi)$. We have to show that the kernel of the
associated morphism $\bar{\Psi}: \bigoplus_{i=1}^{n} R \rightarrow \operatorname{Coker}(\varphi)$ is finite. Choose $x_{i} \in M$ lifting $\bar{x}_{i}$. Thus $\bar{\Psi}$ lifts to $\Psi: \bigoplus_{i=1}^{n} R \rightarrow M$. Consider the following diagram

By the snake lemma we get a short exact sequence $0 \rightarrow \operatorname{Ker}(\Psi) \rightarrow \operatorname{Ker}(\bar{\Psi}) \rightarrow$ $\operatorname{Im}(\varphi) \rightarrow 0$. Hence we see that $\operatorname{Ker}(\bar{\Psi})$ is finite.
Statement (4) follows from (3).
Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a short exact sequence of $R$-modules. It suffices to prove that if $M_{1}$ and $M_{3}$ are coherent so is $M_{2}$. By Lemma 10.5 .3 we see that $M_{2}$ is finite. Let $x_{1}, \ldots, x_{n}$ be finitely many elements of $M_{2}$. We have to show that the module of relations $K$ between them is finite. Consider the following commutative diagram

with obvious notation. By the snake lemma we get an exact sequence $0 \rightarrow K \rightarrow$ $K_{3} \rightarrow M_{1}$ where $K_{3}$ is the module of relations among the images of the $x_{i}$ in $M_{3}$. Since $M_{3}$ is coherent we see that $K_{3}$ is a finite module. Since $M_{1}$ is coherent we see that the image $I$ of $K_{3} \rightarrow M_{1}$ is coherent. Hence $K$ is the kernel of the map $K_{3} \rightarrow I$ between a finite module and a coherent module and hence finite by (2).

05CX Lemma 10.89.3. Let $R$ be a ring. If $R$ is coherent, then a module is coherent if and only if it is finitely presented.

Proof. It is clear that a coherent module is finitely presented (over any ring). Conversely, if $R$ is coherent, then $R^{\oplus n}$ is coherent and so is the cokernel of any $\operatorname{map} R^{\oplus m} \rightarrow R^{\oplus n}$, see Lemma 10.89.2.

05CY Lemma 10.89.4. A Noetherian ring is a coherent ring.
Proof. By Lemma 10.30 .4 any finite $R$-module is finitely presented. In particular any ideal of $R$ is finitely presented.

05CZ Proposition 10.89.5. Let $R$ be a ring. The following are equivalent
(1) $R$ is coherent,
(2) any product of flat $R$-modules is flat, and
(3) for every set $A$ the module $R^{A}$ is flat.

Proof. Assume $R$ coherent, and let $Q_{\alpha}, \alpha \in A$ be a set of flat $R$-modules. We have to show that $I \otimes_{R} \prod_{\alpha} Q_{\alpha} \rightarrow \prod Q_{\alpha}$ is injective for every finitely generated ideal $I$ of $R$, see Lemma 10.38.5. Since $R$ is coherent $I$ is an $R$-module of finite presentation. Hence $I \otimes_{R} \prod_{\alpha} Q_{\alpha}=\prod I \otimes_{R} Q_{\alpha}$ by Proposition 10.88.3. The desired injectivity follows as $I \otimes_{R} Q_{\alpha} \rightarrow Q_{\alpha}$ is injective by flatness of $Q_{\alpha}$.
The implication $(2) \Rightarrow(3)$ is trivial.

Assume that the $R$-module $R^{A}$ is flat for every set $A$. Let $I$ be a finitely generated ideal in $R$. Then $I \otimes_{R} R^{A} \rightarrow R^{A}$ is injective by assumption. By Proposition 10.88.2 and the finiteness of $I$ the image is equal to $I^{A}$. Hence $I \otimes_{R} R^{A}=I^{A}$ for every set $A$ and we conclude that $I$ is finitely presented by Proposition 10.88.3.

### 10.90. Examples and non-examples of Mittag-Leffler modules

059Q We end this section with some examples and non-examples of Mittag-Leffler modules.

Example 10.90.1. Mittag-Leffler modules.
(1) Any finitely presented module is Mittag-Leffler. This follows, for instance, from Proposition 10.87.6(1). In general, it is true that a finitely generated module is Mittag-Leffler if and only it is finitely presented. This follows from Propositions 10.88.2, 10.88.3, and 10.88.5.
(2) A free module is Mittag-Leffler since it satisfies condition (1) of Proposition 10.87 .6
(3) By the previous example together with Lemma 10.88.9, projective modules are Mittag-Leffler.

We also want to add to our list of examples power series rings over a Noetherian ring $R$. This will be a consequence the following lemma.

059S Lemma 10.90.2. Let $M$ be a flat $R$-module. The following are equivalent
(1) $M$ is Mittag-Leffler, and
(2) if $F$ is a finite free $R$-module and $x \in F \otimes_{R} M$, then there exists a smallest submodule $F^{\prime}$ of $F$ such that $x \in F^{\prime} \otimes_{R} M$.

Proof. The implication $(1) \Rightarrow(2)$ is a special case of Lemma 10.88 .6 Assume (2). By Theorem 10.80 .4 we can write $M$ as the colimit $M=\operatorname{colim}_{i \in I} M_{i}$ of a directed system $\left(M_{i}, f_{i j}\right)$ of finite free $R$-modules. By Remark 10.87 .8 , it suffices to show that the inverse system $\left(\operatorname{Hom}_{R}\left(M_{i}, R\right), \operatorname{Hom}_{R}\left(f_{i j}, R\right)\right)$ is Mittag-Leffler. In other words, fix $i \in I$ and for $j \geq i$ let $Q_{j}$ be the image of $\operatorname{Hom}_{R}\left(M_{j}, R\right) \rightarrow \operatorname{Hom}_{R}\left(M_{i}, R\right)$; we must show that the $Q_{j}$ stabilize.
Since $M_{i}$ is free and finite, we can make the identification $\operatorname{Hom}_{R}\left(M_{i}, M_{j}\right)=$ $\operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M_{j}$ for all $j$. Using the fact that the $M_{j}$ are free, it follows that for $j \geq i, Q_{j}$ is the smallest submodule of $\operatorname{Hom}_{R}\left(M_{i}, R\right)$ such that $f_{i j} \in Q_{j} \otimes_{R} M_{j}$. Under the identification $\operatorname{Hom}_{R}\left(M_{i}, M\right)=\operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M$, the canonical map $f_{i}: M_{i} \rightarrow M$ is in $\operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M$. By the assumption on $M$, there exists a smallest submodule $Q$ of $\operatorname{Hom}_{R}\left(M_{i}, R\right)$ such that $f_{i} \in Q \otimes_{R} M$. We are going to show that the $Q_{j}$ stabilize to $Q$.
For $j \geq i$ we have a commutative diagram

Since $f_{i j} \in Q_{j} \otimes_{R} M_{j}$ maps to $f_{i} \in \operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M$, it follows that $f_{i} \in$ $Q_{j} \otimes_{R} M$. Hence, by the choice of $Q$, we have $Q \subset Q_{j}$ for all $j \geq i$.

Since the $Q_{j}$ are decreasing and $Q \subset Q_{j}$ for all $j \geq i$, to show that the $Q_{j}$ stabilize to $Q$ it suffices to find a $j \geq i$ such that $Q_{j} \subset Q$. As an element of

$$
\operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M=\operatorname{colim}_{j \in J}\left(\operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M_{j}\right)
$$

$f_{i}$ is the colimit of $f_{i j}$ for $j \geq i$, and $f_{i}$ also lies in the submodule

$$
\operatorname{colim}_{j \in J}\left(Q \otimes_{R} M_{j}\right) \subset \operatorname{colim}_{j \in J}\left(\operatorname{Hom}_{R}\left(M_{i}, R\right) \otimes_{R} M_{j}\right)
$$

It follows that for some $j \geq i, f_{i j}$ lies in $Q \otimes_{R} M_{j}$. Since $Q_{j}$ is the smallest submodule of $\operatorname{Hom}_{R}\left(M_{i}, R\right)$ with $f_{i j} \in Q_{j} \otimes_{R} M_{j}$, we conclude $Q_{j} \subset Q$.

05D0 Lemma 10.90.3. Let $R$ be a Noetherian ring and $A$ a set. Then $M=R^{A}$ is a flat and Mittag-Leffler R-module.

Proof. Combining Lemma 10.89 .4 and Proposition 10.89 .5 we see that $M$ is flat over $R$. We show that $M$ satisfies the condition of Lemma 10.90.2, Let $F$ be a free finite $R$-module. If $F^{\prime}$ is any submodule of $F$ then it is finitely presented since $R$ is Noetherian. So by Proposition 10.88 .3 we have a commutative diagram

by which we can identify the map $F^{\prime} \otimes_{R} M \rightarrow F \otimes_{R} M$ with $\left(F^{\prime}\right)^{A} \rightarrow F^{A}$. Hence if $x \in F \otimes_{R} M$ corresponds to $\left(x_{\alpha}\right) \in F^{A}$, then the submodule of $F^{\prime}$ of $F$ generated by the $x_{\alpha}$ is the smallest submodule of $F$ such that $x \in F^{\prime} \otimes_{R} M$.

059T Lemma 10.90.4. Let $R$ be a Noetherian ring and $n$ a positive integer. Then the $R$-module $M=R\left[\left[t_{1}, \ldots, t_{n}\right]\right]$ is flat and Mittag-Leffler.
Proof. As an $R$-module, we have $M=R^{A}$ for a (countable) set $A$. Hence this lemma is a special case of Lemma 10.90 .3
059U Example 10.90.5. Non Mittag-Leffler modules.
(1) By Example 10.88.1 and Proposition 10.88.5 Q is not a Mittag-Leffler Z-module.
(2) We prove below (Theorem 10.92.3) that for a flat and countably generated module, projectivity is equivalent to being Mittag-Leffler. Thus any flat, countably generated, non-projective module $M$ is an example of a non-Mittag-Leffler module. For such an example, see Remark 10.77.3.
(3) Let $k$ be a field. Let $R=k[[x]]$. The $R$-module $M=\prod_{n \in \mathbf{N}} R /\left(x^{n}\right)$ is not Mittag-Leffler. Namely, consider the element $\xi=\left(\xi_{1}, \xi_{2}, \xi_{3}, \ldots\right)$ defined by $\xi_{2^{m}}=x^{2^{m-1}}$ and $\xi_{n}=0$ else, so

$$
\xi=\left(0, x, 0, x^{2}, 0,0,0, x^{4}, 0,0,0,0,0,0,0, x^{8}, \ldots\right)
$$

Then the annihilator of $\xi$ in $M / x^{2^{m}} M$ is generated $x^{2^{m-1}}$ for $m \gg 0$. But if $M$ was Mittag-Leffler, then there would exist a finite $R$-module $Q$ and an element $\xi^{\prime} \in Q$ such that the annihilator of $\xi^{\prime}$ in $Q / x^{l} Q$ agrees with the annihilator of $\xi$ in $M / x^{l} M$ for all $l \geq 1$, see Proposition 10.87.6 (1). Now you can prove there exists an integer $a \geq 0$ such that the annihilator of $\xi^{\prime}$ in $Q / x^{l} Q$ is generated by either $x^{a}$ or $\overline{x^{l}-a}$ for all $l \gg 0$ (depending on whether $\xi^{\prime} \in Q$ is torsion or not). The combination of the above would
give for all $l=2^{m} \gg 0$ the equality $a=l / 2$ or $l-a=l / 2$ which is nonsensical.
(4) The same argument shows that ( $x$ )-adic completion of $\bigoplus_{n \in \mathbf{N}} R /\left(x^{n}\right)$ is not Mittag-Leffler over $R=k[[x]]$ (hint: $\xi$ is actually an element of this completion).
(5) Let $R=k[a, b] /\left(a^{2}, a b, b^{2}\right)$. Let $S$ be the finitely presented $R$-algebra with presentation $S=R[t] /(a t-b)$. Then as an $R$-module $S$ is countably generated and indecomposable (details omitted). On the other hand, $R$ is Artinian local, hence complete local, hence a henselian local ring, see Lemma 10.148 .10 . If $S$ was Mittag-Leffler as an $R$-module, then it would be a direct sum of finite $R$-modules by Lemma 10.148.32. Thus we conclude that $S$ is not Mittag-Leffler as an $R$-module.

### 10.91. Countably generated Mittag-Leffler modules

05D1 It turns out that countably generated Mittag-Leffler modules have a particularly simple structure.

059W Lemma 10.91.1. Let $M$ be an $R$-module. Write $M=\operatorname{colim}_{i \in I} M_{i}$ where $\left(M_{i}, f_{i j}\right)$ is a directed system of finitely presented R-modules. If $M$ is Mittag-Leffler and countably generated, then there is a directed countable subset $I^{\prime} \subset I$ such that $M \cong \operatorname{colim}_{i \in I^{\prime}} M_{i}$.
Proof. Let $x_{1}, x_{2}, \ldots$ be a countable set of generators for $M$. For each $x_{n}$ choose $i \in I$ such that $x_{n}$ is in the image of the canonical map $f_{i}: M_{i} \rightarrow M$; let $I_{0}^{\prime} \subset I$ be the set of all these $i$. Now since $M$ is Mittag-Leffler, for each $i \in I_{0}^{\prime}$ we can choose $j \in I$ such that $j \geq i$ and $f_{i j}: M_{i} \rightarrow M_{j}$ factors through $f_{i k}: M_{i} \rightarrow M_{k}$ for all $k \geq i$ (condition (3) of Proposition 10.87.6; let $I_{1}^{\prime}$ be the union of $I_{0}^{\prime}$ with all of these $j$. Since $I_{1}^{\prime}$ is a countable, we can enlarge it to a countable directed set $I_{2}^{\prime} \subset I$. Now we can apply the same procedure to $I_{2}^{\prime}$ as we did to $I_{0}^{\prime}$ to get a new countable set $I_{3}^{\prime} \subset I$. Then we enlarge $I_{3}^{\prime}$ to a countable directed set $I_{4}^{\prime}$. Continuing in this way-adding in a $j$ as in Proposition 10.87 .6 (3) for each $i \in I_{\ell}^{\prime}$ if $\ell$ is odd and enlarging $I_{\ell}^{\prime}$ to a directed set if $\ell$ is even-we get a sequence of subsets $I_{\ell}^{\prime} \subset I$ for $\ell \geq 0$. The union $I^{\prime}=\bigcup I_{\ell}^{\prime}$ satisfies:
(1) $I^{\prime}$ is countable and directed;
(2) each $x_{n}$ is in the image of $f_{i}: M_{i} \rightarrow M$ for some $i \in I^{\prime}$;
(3) if $i \in I^{\prime}$, then there is $j \in I^{\prime}$ such that $j \geq i$ and $f_{i j}: M_{i} \rightarrow M_{j}$ factors through $f_{i k}: M_{i} \rightarrow M_{k}$ for all $k \in I$ with $k \geq i$. In particular $\operatorname{Ker}\left(f_{i k}\right) \subset \operatorname{Ker}\left(f_{i j}\right)$ for $k \geq i$.
We claim that the canonical map $\operatorname{colim}_{i \in I^{\prime}} M_{i} \rightarrow \operatorname{colim}_{i \in I} M_{i}=M$ is an isomorphism. By (2) it is surjective. For injectivity, suppose $x \in \operatorname{colim}_{i \in I^{\prime}} M_{i}$ maps to 0 in $\operatorname{colim}_{i \in I} M_{i}$. Representing $x$ by an element $\tilde{x} \in M_{i}$ for some $i \in I^{\prime}$, this means that $f_{i k}(\tilde{x})=0$ for some $k \in I, k \geq i$. But then by (3) there is $j \in I^{\prime}, j \geq i$, such that $f_{i j}(\tilde{x})=0$. Hence $x=0$ in $\operatorname{colim}_{i \in I^{\prime}} M_{i}$.
Lemma 10.91.1 implies that a countably generated Mittag-Leffler module $M$ over $R$ is the colimit of a system

$$
M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow M_{4} \rightarrow \ldots
$$

with each $M_{n}$ a finitely presented $R$-module. To see this argue as in the proof of Lemma 10.85 .3 to see that a countable directed partially ordered set has a cofinal
subset isomorphic to ( $\mathbf{N}, \geq$ ). Suppose $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ and $M=R /\left(x_{i}\right)$. Then $M$ is finitely generated but not finitely presented, hence not Mittag-Leffler (see Example 10.90.1 part (1)). But of course you can write $M=\operatorname{colim}_{n} M_{n}$ by taking $M_{n}=R /\left(x_{1}, \ldots, x_{n}\right)$, hence the condition that you can write $M$ as such a limit does not imply that $M$ is Mittag-Leffler.

05D2 Lemma 10.91.2. Let $R$ be a ring. Let $M$ be an $R$-module. Assume $M$ is MittagLeffler and countably generated. For any $R$-module map $f: P \rightarrow M$ with $P$ finitely generated there exists an endomorphism $\alpha: M \rightarrow M$ such that
(1) $\alpha: M \rightarrow M$ factors through a finitely presented $R$-module, and (2) $\alpha \circ f=f$.

Proof. Write $M=\operatorname{colim}_{i \in I} M_{i}$ as a directed colimit of finitely presented $R$ modules with $I$ countable, see Lemma 10.91.1. The transition maps are denoted $f_{i j}$ and we use $f_{i}: M_{i} \rightarrow M$ to denote the canonical maps into $M$. Set $N=\prod_{s \in I} M_{s}$. Denote

$$
M_{i}^{*}=\operatorname{Hom}_{R}\left(M_{i}, N\right)=\prod_{s \in I} \operatorname{Hom}_{R}\left(M_{i}, M_{s}\right)
$$

so that $\left(M_{i}^{*}\right)$ is an inverse system of $R$-modules over $I$. Note that $\operatorname{Hom}_{R}(M, N)=$ $\lim M_{i}^{*}$. As $M$ is Mittag-Leffler, we find for every $i \in I$ an index $k(i) \geq i$ such that

$$
E_{i}:=\bigcap_{i^{\prime} \geq i} \operatorname{Im}\left(M_{i^{\prime}}^{*} \rightarrow M_{i}^{*}\right)=\operatorname{Im}\left(M_{k(i)}^{*} \rightarrow M_{i}^{*}\right)
$$

Choose and fix $j \in I$ such that $\operatorname{Im}(P \rightarrow M) \subset \operatorname{Im}\left(M_{j} \rightarrow M\right)$. This is possible as $P$ is finitely generated. Set $k=k(j)$. Let $x=\left(0, \ldots, 0, \mathrm{id}_{M_{k}}, 0, \ldots, 0\right) \in M_{k}^{*}$ and note that this maps to $y=\left(0, \ldots, 0, f_{j k}, 0, \ldots, 0\right) \in M_{j}^{*}$. By our choice of $k$ we see that $y \in E_{j}$. By Example 10.85 .2 the transition maps $E_{i} \rightarrow E_{j}$ are surjective for each $i \geq j$ and $\lim E_{i}=\lim M_{i}^{*}=\operatorname{Hom}_{R}(M, N)$. Hence Lemma 10.85.3 guarantees there exists an element $z \in \operatorname{Hom}_{R}(M, N)$ which maps to $y$ in $E_{j} \subset M_{j}^{*}$. Let $z_{k}$ be the $k$ th component of $z$. Then $z_{k}: M \rightarrow M_{k}$ is a homomorphism such that

commutes. Let $\alpha: M \rightarrow M$ be the composition $f_{k} \circ z_{k}: M \rightarrow M_{k} \rightarrow M$. Then $\alpha$ factors through a finitely presented module by construction and $\alpha \circ f_{j}=f_{j}$. Since the image of $f$ is contained in the image of $f_{j}$ this also implies that $\alpha \circ f=f$.

We will see later (see Lemma 10.148 .32 ) that Lemma 10.91 .2 means that a countably generated Mittag-Leffler module over a henselian local ring is a direct sum of finitely presented modules.

### 10.92. Characterizing projective modules

059 V The goal of this section is to prove that a module is projective if and only if it is flat, Mittag-Leffler, and a direct sum of countably generated modules (Theorem 10.92 .3 below).

059X Lemma 10.92.1. Let $M$ be an $R$-module. If $M$ is flat, Mittag-Leffler, and countably generated, then $M$ is projective.

Proof. By Lazard's theorem (Theorem 10.80.4), we can write $M=\operatorname{colim}_{i \in I} M_{i}$ for a directed system of finite free $R$-modules $\left(M_{i}, f_{i j}\right)$ indexed by a set $I$. By Lemma 10.91.1, we may assume $I$ is countable. Now let

$$
0 \rightarrow N_{1} \rightarrow N_{2} \rightarrow N_{3} \rightarrow 0
$$

be an exact sequence of $R$-modules. We must show that applying $\operatorname{Hom}_{R}(M,-)$ preserves exactness. Since $M_{i}$ is finite free,

$$
0 \rightarrow \operatorname{Hom}_{R}\left(M_{i}, N_{1}\right) \rightarrow \operatorname{Hom}_{R}\left(M_{i}, N_{2}\right) \rightarrow \operatorname{Hom}_{R}\left(M_{i}, N_{3}\right) \rightarrow 0
$$

is exact for each $i$. Since $M$ is Mittag-Leffler, $\left(\operatorname{Hom}_{R}\left(M_{i}, N_{1}\right)\right)$ is a Mittag-Leffler inverse system. So by Lemma 10.85.4.

$$
0 \rightarrow \lim _{i \in I} \operatorname{Hom}_{R}\left(M_{i}, N_{1}\right) \rightarrow \lim _{i \in I} \operatorname{Hom}_{R}\left(M_{i}, N_{2}\right) \rightarrow \lim _{i \in I} \operatorname{Hom}_{R}\left(M_{i}, N_{3}\right) \rightarrow 0
$$

is exact. But for any $R$-module $N$ there is a functorial isomorphism $\operatorname{Hom}_{R}(M, N) \cong$ $\lim _{i \in I} \operatorname{Hom}_{R}\left(M_{i}, N\right)$, so

$$
0 \rightarrow \operatorname{Hom}_{R}\left(M, N_{1}\right) \rightarrow \operatorname{Hom}_{R}\left(M, N_{2}\right) \rightarrow \operatorname{Hom}_{R}\left(M, N_{3}\right) \rightarrow 0
$$

is exact.
059Y Remark 10.92.2. Lemma 10.92 .1 does not hold without the countable generation assumption. For example, the $\mathbf{Z}$-module $M=\mathbf{Z}[[x]]$ is flat and Mittag-Leffler but not projective. It is Mittag-Leffler by Lemma 10.90.4. Subgroups of free abelian groups are free, hence a projective $\mathbf{Z}$-module is in fact free and so are its submodules. Thus to show $M$ is not projective it suffices to produce a non-free submodule. Fix a prime $p$ and consider the submodule $N$ consisting of power series $f(x)=\sum a_{i} x^{i}$ such that for every integer $m \geq 1, p^{m}$ divides $a_{i}$ for all but finitely many $i$. Then $\sum a_{i} p^{i} x^{i}$ is in $N$ for all $a_{i} \in \mathbf{Z}$, so $N$ is uncountable. Thus if $N$ were free it would have uncountable rank and the dimension of $N / p N$ over $\mathbf{Z} / p$ would be uncountable. This is not true as the elements $x^{i} \in N / p N$ for $i \geq 0$ span $N / p N$.

059Z Theorem 10.92.3. Let $M$ be an $R$-module. Then $M$ is projective if and only it satisfies:
(1) $M$ is flat,
(2) $M$ is Mittag-Leffler,
(3) $M$ is a direct sum of countably generated $R$-modules.

Proof. First suppose $M$ is projective. Then $M$ is a direct summand of a free module, so $M$ is flat and Mittag-Leffler since these properties pass to direct summands. By Kaplansky's theorem (Theorem 10.83.5, $M$ satisfies (3).
Conversely, suppose $M$ satisfies (1)-(3). Since being flat and Mittag-Leffler passes to direct summands, $M$ is a direct sum of flat, Mittag-Leffler, countably generated $R$-modules. Lemma 10.92 .1 implies $M$ is a direct sum of projective modules. Hence $M$ is projective.

05A0 Lemma 10.92.4. Let $f: M \rightarrow N$ be universally injective map of $R$-modules. Suppose $M$ is a direct sum of countably generated $R$-modules, and suppose $N$ is flat and Mittag-Leffler. Then $M$ is projective.

Proof. By Lemmas 10.81 .7 and $10.88 .7, M$ is flat and Mittag-Leffler, so the conclusion follows from Theorem 10.92 .3

05A1 Lemma 10.92.5. Let $R$ be a Noetherian ring and let $M$ be a $R$-module. Suppose $M$ is a direct sum of countably generated $R$-modules, and suppose there is a universally injective map $M \rightarrow R\left[\left[t_{1}, \ldots, t_{n}\right]\right]$ for some $n$. Then $M$ is projective.

Proof. Follows from Lemmas 10.92 .4 and 10.90 .4

### 10.93. Ascending properties of modules

05A2 All of the properties of a module in Theorem 10.92 .3 ascend along arbitrary ring maps:

05A3 Lemma 10.93.1. Let $R \rightarrow S$ be a ring map. Let $M$ be an $R$-module. Then:
(1) If $M$ is flat, then the $S$-module $M \otimes_{R} S$ is flat.
(2) If $M$ is Mittag-Leffler, then the $S$-module $M \otimes_{R} S$ is Mittag-Leffler.
(3) If $M$ is a direct sum of countably generated $R$-modules, then the $S$-module $M \otimes_{R} S$ is a direct sum of countably generated $S$-modules.
(4) If $M$ is projective, then the $S$-module $M \otimes_{R} S$ is projective.

Proof. All are obvious except (2). For this, use formulation (3) of being MittagLeffler from Proposition 10.87 .6 and the fact that tensoring commutes with taking colimits.

### 10.94. Descending properties of modules

05A4 We address the faithfully flat descent of the properties from Theorem 10.92 .3 that characterize projectivity. In the presence of flatness, the property of being a MittagLeffler module descends:

05A5 Lemma 10.94.1. Let $R \rightarrow S$ be a faithfully flat ring map. Let $M$ be an $R$-module. If the $S$-module $M \otimes_{R} S$ is Mittag-Leffler, then $M$ is Mittag-Leffler.

Proof. Write $M=\operatorname{colim}_{i \in I} M_{i}$ as a directed colimit of finitely presented $R$-modules $M_{i}$. Using Proposition 10.87.6, we see that we have to prove that for each $i \in I$ there exists $i \leq j, j \in I$ such that $M_{i} \rightarrow M_{j}$ dominates $M_{i} \rightarrow M$.

Take $N$ the pushout

Then the lemma is equivalent to the existence of $j$ such that $M_{j} \rightarrow N$ is universally injective, see Lemma 10.87.4. Observe that the tensorization by $S$

Is a pushout diagram. So because $M \otimes_{R} S=\operatorname{colim}_{i \in I} M_{i} \otimes_{R} S$ expresses $M \otimes_{R} S$ as a colimit of $S$-modules of finite presentation, and $M \otimes_{R} S$ is Mittag-Leffler, there exists $j \geq i$ such that $M_{j} \otimes_{R} S \rightarrow N \otimes_{R} S$ is universally injective. So using that $R \rightarrow S$ is faithfully flat we conclude that $M_{j} \rightarrow N$ is universally injective too.

At this point the faithfully flat descent of countably generated projective modules follows easily.
05A6 Lemma 10.94.2. Let $R \rightarrow S$ be a faithfully flat ring map. Let $M$ be an $R$-module. If the $S$-module $M \otimes_{R} S$ is countably generated and projective, then $M$ is countably generated and projective.

Proof. Follows from Lemma 10.82.2, Lemma 10.94.1, the fact that countable generation descends, and Theorem 10.92.3

All that remains is to use dévissage to reduce descent of projectivity in the general case to the countably generated case. First, two simple lemmas.

05A7 Lemma 10.94.3. Let $R \rightarrow S$ be a ring map, let $M$ be an $R$-module, and let $Q$ be a countably generated $S$-submodule of $M \otimes_{R} S$. Then there exists a countably generated $R$-submodule $P$ of $M$ such that $\operatorname{Im}\left(P \otimes_{R} S \rightarrow M \otimes_{R} S\right)$ contains $Q$.
Proof. Let $y_{1}, y_{2}, \ldots$ be generators for $Q$ and write $y_{j}=\sum_{k} x_{j k} \otimes s_{j k}$ for some $x_{j k} \in M$ and $s_{j k} \in S$. Then take $P$ be the submodule of $M$ generated by the $x_{j k}$.

05A8 Lemma 10.94.4. Let $R \rightarrow S$ be a ring map, and let $M$ be an $R$-module. Suppose $M \otimes_{R} S=\bigoplus_{i \in I} Q_{i}$ is a direct sum of countably generated $S$-modules $Q_{i}$. If $N$ is a countably generated submodule of $M$, then there is a countably generated submodule $N^{\prime}$ of $M$ such that $N^{\prime} \supset N$ and $\operatorname{Im}\left(N^{\prime} \otimes_{R} S \rightarrow M \otimes_{R} S\right)=\bigoplus_{i \in I^{\prime}} Q_{i}$ for some subset $I^{\prime} \subset I$.

Proof. Let $N_{0}^{\prime}=N$. We construct by induction an increasing sequence of countably generated submodules $N_{\ell}^{\prime} \subset M$ for $\ell=0,1,2, \ldots$ such that: if $I_{\ell}^{\prime}$ is the set of $i \in I$ such that the projection of $\operatorname{Im}\left(N_{\ell}^{\prime} \otimes_{R} S \rightarrow M \otimes_{R} S\right)$ onto $Q_{i}$ is nonzero, then $\operatorname{Im}\left(N_{\ell+1}^{\prime} \otimes_{R} S \rightarrow M \otimes_{R} S\right)$ contains $Q_{i}$ for all $i \in I_{\ell}^{\prime}$. To construct $N_{\ell+1}^{\prime}$ from $N_{\ell}^{\prime}$, let $Q$ be the sum of (the countably many) $Q_{i}$ for $i \in I_{\ell}^{\prime}$, choose $P$ as in Lemma 10.94 .3 , and then let $N_{\ell+1}^{\prime}=N_{\ell}^{\prime}+P$. Having constructed the $N_{\ell}^{\prime}$, just take $N^{\prime}=\bigcup_{\ell} N_{\ell}^{\prime}$ and $I^{\prime}=\bigcup_{\ell} I_{\ell}^{\prime}$.

05A9 Theorem 10.94.5. Let $R \rightarrow S$ be a faithfully flat ring map. Let $M$ be an $R$ module. If the $S$-module $M \otimes_{R} S$ is projective, then $M$ is projective.

Proof. We are going to construct a Kaplansky dévissage of $M$ to show that it is a direct sum of projective modules and hence projective. By Theorem 10.83 .5 we can write $M \otimes_{R} S=\bigoplus_{i \in I} Q_{i}$ as a direct sum of countably generated $S$-modules $Q_{i}$. Choose a well-ordering on $M$. By transfinite induction we are going to define an increasing family of submodules $M_{\alpha}$ of $M$, one for each ordinal $\alpha$, such that $M_{\alpha} \otimes_{R} S$ is a direct sum of some subset of the $Q_{i}$.
For $\alpha=0$ let $M_{0}=0$. If $\alpha$ is a limit ordinal and $M_{\beta}$ has been defined for all $\beta<\alpha$, then define $M_{\beta}=\bigcup_{\beta<\alpha} M_{\beta}$. Since each $M_{\beta} \otimes_{R} S$ for $\beta<\alpha$ is a direct sum of a subset of the $Q_{i}$, the same will be true of $M_{\alpha} \otimes_{R} S$. If $\alpha+1$ is a successor ordinal and $M_{\alpha}$ has been defined, then define $M_{\alpha+1}$ as follows. If $M_{\alpha}=M$, then let $M_{\alpha+1}=M$. Otherwise choose the smallest $x \in M$ (with respect to the fixed well-ordering) such that $x \notin M_{\alpha}$. Since $S$ is flat over $R,\left(M / M_{\alpha}\right) \otimes_{R} S=M \otimes_{R} S / M_{\alpha} \otimes_{R} S$, so since $M_{\alpha} \otimes_{R} S$ is a direct sum of some $Q_{i}$, the same is true of $\left(M / M_{\alpha}\right) \otimes_{R} S$. By Lemma 10.94.4 we can find a countably generated $R$-submodule $P$ of $M / M_{\alpha}$ containing the image of $x$ in $M / M_{\alpha}$ and such that $P \otimes_{R} S$ (which equals $\operatorname{Im}\left(P \otimes_{R} S \rightarrow M \otimes_{R} S\right.$ )
since $S$ is flat over $R$ ) is a direct sum of some $Q_{i}$. Since $M \otimes_{R} S=\bigoplus_{i \in I} Q_{i}$ is projective and projectivity passes to direct summands, $P \otimes_{R} S$ is also projective. Thus by Lemma 10.94.2, $P$ is projective. Finally we define $M_{\alpha+1}$ to be the preimage of $P$ in $M$, so that $M_{\alpha+1} / M_{\alpha}=P$ is countably generated and projective. In particular $M_{\alpha}$ is a direct summand of $M_{\alpha+1}$ since projectivity of $M_{\alpha+1} / M_{\alpha}$ implies the sequence $0 \rightarrow M_{\alpha} \rightarrow M_{\alpha+1} \rightarrow M_{\alpha+1} / M_{\alpha} \rightarrow 0$ splits.
Transfinite induction on $M$ (using the fact that we constructed $M_{\alpha+1}$ to contain the smallest $x \in M$ not contained in $M_{\alpha}$ ) shows that each $x \in M$ is contained in some $M_{\alpha}$. Thus, there is some large enough ordinal $S$ satisfying: for each $x \in M$ there is $\alpha \in S$ such that $x \in M_{\alpha}$. This means $\left(M_{\alpha}\right)_{\alpha \in S}$ satisfies property (1) of a Kaplansky dévissage of $M$. The other properties are clear by construction. We conclude $M=\bigoplus_{\alpha+1 \in S} M_{\alpha+1} / M_{\alpha}$. Since each $M_{\alpha+1} / M_{\alpha}$ is projective by construction, $M$ is projective.

### 10.95. Completion

00M9 Suppose that $R$ is a ring and $I$ is an ideal. We define the completion of $R$ with respect to $I$ to be the limit

$$
R^{\wedge}=\lim _{n} R / I^{n}
$$

An element of $R^{\wedge}$ is given by a sequence of elements $f_{n} \in R / I^{n}$ such that $f_{n} \equiv$ $f_{n+1} \bmod I^{n}$ for all $n$. We will view $R^{\wedge}$ as an $R$-algebra. Similarly, if $M$ is an $R$-module then we define the completion of $M$ with respect to $I$ to be the limit

$$
M^{\wedge}=\lim _{n} M / I^{n} M
$$

An element of $M^{\wedge}$ is given by a sequence of elements $m_{n} \in M / I^{n} M$ such that $m_{n} \equiv m_{n+1} \bmod I^{n} M$ for all $n$. We will view $M^{\wedge}$ as an $R^{\wedge}$-module. From this description it is clear that there are always canonical maps

$$
M \longrightarrow M^{\wedge} \quad \text { and } \quad M \otimes_{R} R^{\wedge} \longrightarrow M^{\wedge}
$$

Moreover, given a map $\varphi: M \rightarrow N$ of modules we get an induced map $\varphi^{\wedge}: M^{\wedge} \rightarrow$ $N^{\wedge}$ on completions making the diagram

commute. In general completion is not an exact functor, see Examples, Section 88.8 Here are some initial positive results.

0315 Lemma 10.95.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $\varphi: M \rightarrow N$ be $a$ map of $R$-modules.
(1) If $M / I M \rightarrow N / I N$ is surjective, then $M^{\wedge} \rightarrow N^{\wedge}$ is surjective.
(2) If $M \rightarrow N$ is surjective, then $M^{\wedge} \rightarrow N^{\wedge}$ is surjective.
(3) If $0 \rightarrow K \rightarrow M \rightarrow N \rightarrow 0$ is a short exact sequence of $R$-modules and $N$ is flat, then $0 \rightarrow K^{\wedge} \rightarrow M^{\wedge} \rightarrow N^{\wedge} \rightarrow 0$ is a short exact sequence.
(4) The map $M \otimes_{R} R^{\wedge} \rightarrow M^{\wedge}$ is surjective for any finite $R$-module $M$.

Proof. Assume $M / I M \rightarrow N / I N$ is surjective. Then the map $M / I^{n} M \rightarrow N / I^{n} N$ is surjective for each $n \geq 1$ by Nakayama's lemma. More precisely, apply Lemma 10.19.1 part (11) to the map $M / I^{n} M \rightarrow N / I^{n} N$ over the ring $R / I^{n}$ and the
nilpotent ideal $I / I^{n}$ to see this. Set $K_{n}=\left\{x \in M \mid \varphi(x) \in I^{n} N\right\}$. Thus we get short exact sequences

$$
0 \rightarrow K_{n} / I^{n} M \rightarrow M / I^{n} M \rightarrow N / I^{n} N \rightarrow 0
$$

We claim that the canonical map $K_{n+1} / I^{n+1} M \rightarrow K_{n} / I^{n} M$ is surjective. Namely, if $x \in K_{n}$ write $\varphi(x)=\sum z_{j} n_{j}$ with $z_{j} \in I^{n}, n_{j} \in N$. By assumption we can write $n_{j}=\varphi\left(m_{j}\right)+\sum z_{j k} n_{j k}$ with $m_{j} \in M, z_{j k} \in I$ and $n_{j k} \in N$. Hence

$$
\varphi\left(x-\sum z_{j} m_{j}\right)=\sum z_{j} z_{j k} n_{j k}
$$

This means that $x^{\prime}=x-\sum z_{j} m_{j} \in K_{n+1}$ maps to $x$ which proves the claim. Now we may apply Lemma 10.86 .1 to the inverse system of short exact sequences above to see (1). Part (2) is a special case of (1). If the assumptions of (3) hold, then for each $n$ the sequence

$$
0 \rightarrow K / I^{n} K \rightarrow M / I^{n} M \rightarrow N / I^{n} N \rightarrow 0
$$

is short exact by Lemma 10.38.12. Hence we can directly apply Lemma 10.86.1 to conclude (3) is true. To see (4) choose generators $x_{i} \in M, i=1, \ldots, n$. Then the map $R^{\oplus n} \rightarrow M,\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum a_{i} x_{i}$ is surjective. Hence by (2) we see $\left(R^{\wedge}\right)^{\oplus n} \rightarrow M^{\wedge},\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum a_{i} x_{i}$ is surjective. Assertion (4) follows from this.

0BNG Lemma 10.95.2. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $0 \rightarrow M \rightarrow N \rightarrow$ $Q \rightarrow 0$ be an exact sequence of $R$-modules such that $Q$ is annihilated by a power of $I$. Then completion produces an exact sequence $0 \rightarrow M^{\wedge} \rightarrow N^{\wedge} \rightarrow Q \rightarrow 0$. In particular, $\left(I^{n} M\right)^{\wedge}=\operatorname{Ker}\left(M^{\wedge} \rightarrow M / I^{n} M\right)$ for all $n$.

Proof. Say $I^{c} Q=0$. It is immediate that the canonical map $Q \rightarrow Q^{\wedge}$ is an isomorphism. By Lemma 10.95 .1 we see that $N^{\wedge} \rightarrow Q \rightarrow 0$ is exact. Denote $\varphi: M \rightarrow N$ the given map.
Let $\left(y_{n}\right), y_{n} \in N$ represent an element of $N^{\wedge}$ which maps to zero in $Q$. Then $y_{n}=\varphi\left(x_{n}\right)$ for some $x_{n} \in M$ for $n \geq c$. We have $x_{n+1}-x_{n} \in \varphi^{-1}\left(I^{n} N\right)$. Since $I^{c} Q=0$ we see that $I^{n} N \subset I^{n-c} \varphi(M)=\varphi\left(I^{n-c} M\right)$ for $n \geq c$. Hence $x_{n+1}-x_{n} \in I^{n-c} M$. Thus $\left(x_{n+c}\right)$ gives a well defined element of $M^{\wedge}$ which maps to our element $\left(y_{n}\right)$ in $N^{\wedge}$.
Let $\left(x_{n}\right), x_{n} \in M$ represent an element of $M^{\wedge}$ which maps to zero in $N^{\wedge}$. Then $\varphi\left(x_{n}\right) \in I^{n} N$. Arguing as above we can find $x_{n}^{\prime} \in I^{n-c} M$ such that $\varphi\left(x_{n}-x_{n}^{\prime}\right)=0$ hence $x_{n}=x_{n}^{\prime}$. This implies that the element $\left(x_{n}\right)$ is zero in $M^{\wedge}$.
0317 Definition 10.95.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. We say $M$ is $I$-adically complete if the map

$$
M \longrightarrow M^{\wedge}=\lim _{n} M / I^{n} M
$$

is an isomorphism ${ }^{77}$. We say $R$ is $I$-adically complete if $R$ is $I$-adically complete as an $R$-module.

It is not true that the completion of an $R$-module $M$ with respect to $I$ is $I$-adically complete. For an example see Examples, Section 88.6. Here is a lemma from an unpublished note of Lenstra and de Smit.

[^23]0318 Lemma 10.95.4. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Denote $K_{n}=\operatorname{Ker}\left(M^{\wedge} \rightarrow M / I^{n} M\right)$. Then $M^{\wedge}$ is I-adically complete if and only if $K_{n}$ is equal to $I^{n} M^{\wedge}$ for all $n \geq 1$.

Proof. The module $I^{n} M^{\wedge}$ is contained in $K_{n}$. Thus for each $n \geq 1$ there is a canonical exact sequence

$$
0 \rightarrow K_{n} / I^{n} M^{\wedge} \rightarrow M^{\wedge} / I^{n} M^{\wedge} \rightarrow M / I^{n} M \rightarrow 0
$$

As $I^{n} M^{\wedge}$ maps onto $I^{n} M / I^{n+1} M$ we see that $K_{n+1}+I^{n} M^{\wedge}=K_{n}$. Thus the inverse system $\left\{K_{n} / I^{n} M^{\wedge}\right\}_{n \geq 1}$ has surjective transition maps. By Lemma 10.86.1 we see that there is a short exact sequence

$$
0 \rightarrow \lim _{n} K_{n} / I^{n} M^{\wedge} \rightarrow\left(M^{\wedge}\right)^{\wedge} \rightarrow M^{\wedge} \rightarrow 0
$$

Hence $M^{\wedge}$ is complete if and only if $K_{n} / I^{n} M^{\wedge}=0$ for all $n \geq 1$.
05GG Lemma 10.95.5. Let $R$ be a ring. Let $I$ be a finitely generated ideal of $R$. Let $M$ be an $R$-module. Then

Mat78 Theorem 15]
(1) the completion $M^{\wedge}$ is I-adically complete, and
(2) $I^{n} M^{\wedge}=\operatorname{Ker}\left(M^{\wedge} \rightarrow M / I^{n} M\right)=\left(I^{n} M\right)^{\wedge}$ for all $n \geq 1$.

In particular $R^{\wedge}$ is I-adically complete, $I^{n} R^{\wedge}=\left(I^{n}\right)^{\wedge}$, and $R^{\wedge} / I^{n} R^{\wedge}=R / I^{n}$.
Proof. By Lemma 10.95 .2 we have the second equality in (2). Let $K_{n}=\operatorname{Ker}\left(M^{\wedge} \rightarrow\right.$ $\left.M / I^{n} M\right)$. By Lemma 10.95 .4 it suffices to show that $K_{n}=I^{n} M^{\wedge}$. Write $I=$ $\left(f_{1}, \ldots, f_{t}\right)$. Let $z \in K_{n}$. Write $z=\left(\bar{z}_{m}\right)$ with $\bar{z}_{m} \in M / I^{m} M$. Choose $z_{m} \in M$ mapping to $\bar{z}_{m}$ in $M / I^{m} M$. Then $z_{m+1}=z_{m} \bmod I^{m}$. Write $z_{n+1}=z_{n}+\delta_{n}$, $z_{n+2}=z_{n+1}+\delta_{n+1}$, etc. Then $\delta_{m} \in I^{m} M$. Thus the infinite sum

$$
z=z_{n}+\delta_{n}+\delta_{n+1}+\delta_{n+2}+\ldots
$$

converges in $M^{\wedge}$. For $m \geq n$ we have $\delta_{m} \in I^{m} M$ hence we can write

$$
\delta_{m}=\sum_{j_{1}+\ldots+j_{t}=n} f_{1}^{j_{1}} \ldots f_{t}^{j_{t}} \alpha_{J, m}
$$

with $\alpha_{J, m} \in I^{m-n} M$. Our assumption $z \in K_{n}$ means $z_{n} \in I^{n} M$ hence we can also write

$$
z_{n}=\sum_{j_{1}+\ldots+j_{t}=n} f_{1}^{j_{1}} \ldots f_{t}^{j_{t}} \alpha_{J}
$$

with $\alpha_{J} \in M$. Then we can set

$$
z_{J}=\alpha_{J}+\alpha_{J, n}+\alpha_{J, n+1}+\alpha_{J, n+2}+\ldots
$$

as an element of $M^{\wedge}$. By construction $z=\sum_{J} f_{1}^{j_{1}} \ldots f_{t}^{j_{t}} z_{J}$. Hence $z$ is an element of $I^{n} M^{\wedge}$ as desired.

05GI Lemma 10.95.6. Let $R$ be a ring, let $I \subset R$ be an ideal, and let $R^{\wedge}=\lim R / I^{n}$.
(1) any element of $R^{\wedge}$ which maps to $a$ unit of $R / I$ is a unit,
(2) any element of $1+I$ maps to an invertible element of $R^{\wedge}$,
(3) any element of $1+I R^{\wedge}$ is invertible in $R^{\wedge}$, and
(4) the ideals $I R^{\wedge}$ and $\operatorname{Ker}\left(R^{\wedge} \rightarrow R / I\right)$ are contained in the radical of $R^{\wedge}$.

Proof. Let $x \in R^{\wedge}$ map to a unit $x_{1}$ in $R / I$. Then $x$ maps to a unit $x_{n}$ in $R / I^{n}$ for every $n$ by Lemma 10.31.3. Hence $y=\left(x_{n}^{-1}\right) \in \lim R / I^{n}=R^{\wedge}$ is an inverse to $x$. Parts (2) and (3) follow immediately from (1). Part (4) follows from (1) and Lemma 10.18.1.

090S Lemma 10.95.7. Let $A$ be a ring. Let $I=\left(f_{1}, \ldots, f_{r}\right)$ be a finitely generated ideal. If $M \rightarrow \lim M / f_{i}^{n} M$ is surjective for each $i$, then $M \rightarrow \lim M / I^{n} M$ is surjective.

Proof. Note that $\lim M / I^{n} M=\lim M /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right) M$ as $I^{n} \supset\left(f_{1}^{n}, \ldots, f_{r}^{n}\right) \supset$ $I^{r n}$. An element $\xi$ of $\lim M /\left(f_{1}^{n}, \ldots, f_{r}^{n}\right) M$ can be symbolically written as

$$
\xi=\sum_{n \geq 0} \sum_{i} f_{i}^{n} x_{n, i}
$$

with $x_{n, i} \in M$. If $M \rightarrow \lim M / f_{i}^{n} M$ is surjective, then there is an $x_{i} \in M$ mapping to $\sum x_{n, i} f_{i}^{n}$ in $\lim M / f_{i}^{n} M$. Then $x=\sum x_{i}$ maps to $\xi$ in $\lim M / I^{n} M$.

090T Lemma 10.95.8. Let $A$ be a ring. Let $I \subset J \subset A$ be ideals. If $M$ is $J$-adically complete and $I$ is finitely generated, then $M$ is I-adically complete.

Proof. Assume $M$ is $J$-adically complete and $I$ is finitely generated. We have $\bigcap I^{n} M=0$ because $\bigcap J^{n} M=0$. By Lemma 10.95 .7 it suffices to prove the surjectivity of $M \rightarrow \lim M / I^{n} M$ in case $I$ is generated by a single element. Say $I=(f)$. Let $x_{n} \in M$ with $x_{n+1}-x_{n} \in f^{n} M$. We have to show there exists an $x \in M$ such that $x_{n}-x \in f^{n} M$ for all $n$. As $x_{n+1}-x_{n} \in J^{n} M$ and as $M$ is $J$-adically complete, there exists an element $x \in M$ such that $x_{n}-x \in J^{n} M$. Replacing $x_{n}$ by $x_{n}-x$ we may assume that $x_{n} \in J^{n} M$. To finish the proof we will show that this implies $x_{n} \in I^{n} M$. Namely, write $x_{n}-x_{n+1}=f^{n} z_{n}$. Then

$$
x_{n}=f^{n}\left(z_{n}+f z_{n+1}+f^{2} z_{n+2}+\ldots\right)
$$

The sum $z_{n}+f z_{n+1}+f^{2} z_{n+2}+\ldots$ converges in $M$ as $f^{c} \in J^{c}$. The sum $f^{n}\left(z_{n}+\right.$ $\left.f z_{n+1}+f^{2} z_{n+2}+\ldots\right)$ converges in $M$ to $x_{n}$ because the partial sums equal $x_{n}-x_{n+c}$ and $x_{n+c} \in J^{n+c} M$.

0319 Lemma 10.95.9. Let $R$ be a ring. Let $I, J$ be ideals of $R$. Assume there exist integers $c, d>0$ such that $I^{c} \subset J$ and $J^{d} \subset I$. Then completion with respect to $I$ agrees with completion with respect to $J$ for any $R$-module. In particular an $R$-module $M$ is I-adically complete if and only if it is $J$-adically complete.

Proof. Consider the system of maps $M / I^{n} M \rightarrow M / J^{\lfloor n / d\rfloor} M$ and the system of maps $M / J^{m} M \rightarrow M / I^{\lfloor m / c\rfloor} M$ to get mutually inverse maps between the completions.

031A Lemma 10.95.10. Let $R$ be a ring. Let $I$ be an ideal of $R$. Let $M$ be an $I$ adically complete $R$-module, and let $K \subset M$ be an $R$-submodule. The following are equivalent
(1) $K=\bigcap\left(K+I^{n} M\right)$ and
(2) $M / K$ is I-adically complete.

Proof. Set $N=M / K$. By Lemma 10.95 .1 the map $M=M^{\wedge} \rightarrow N^{\wedge}$ is surjective. Hence $N \rightarrow N^{\wedge}$ is surjective. It is easy to see that the kernel of $N \rightarrow N^{\wedge}$ is the module $\bigcap\left(K+I^{n} M\right) / K$.

031B Lemma 10.95.11. Let $R$ be a ring. Let $I$ be an ideal of $R$. Let $M$ be an $R$-module. If (a) $R$ is $I$-adically complete, (b) $M$ is a finite $R$-module, and (c) $\cap I^{n} M=(0)$, then $M$ is I-adically complete.

Proof. By Lemma 10.95.1 the map $M=M \otimes_{R} R=M \otimes_{R} R^{\wedge} \rightarrow M^{\wedge}$ is surjective. The kernel of this map is $\bigcap I^{n} M$ hence zero by assumption. Hence $M \cong M^{\wedge}$ and $M$ is complete.

031D Lemma 10.95.12. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Assume
(1) $R$ is I-adically complete,
(2) $\bigcap_{n \geq 1} I^{n} M=(0)$, and
(3) $M / I M$ is a finite $R / I$-module.

Then $M$ is a finite $R$-module.
Proof. Let $x_{1}, \ldots, x_{n} \in M$ be elements whose images in $M / I M$ generate $M / I M$ as a $R / I$-module. Denote $M^{\prime} \subset M$ the $R$-submodule generated by $x_{1}, \ldots, x_{n}$. By Lemma 10.95 .1 the $\operatorname{map}\left(M^{\prime}\right)^{\wedge} \rightarrow M^{\wedge}$ is surjective. Since $\bigcap I^{n} M=0$ we see in particular that $\bigcap I^{n} M^{\prime}=(0)$. Hence by Lemma 10.95 .11 we see that $M^{\prime}$ is complete, and we conclude that $M^{\prime} \rightarrow M^{\wedge}$ is surjective. Finally, the kernel of $M \rightarrow M^{\wedge}$ is zero since it is equal to $\bigcap I^{n} M=(0)$. Hence we conclude that $M \cong M^{\prime} \cong M^{\wedge}$ is finitely generated.

### 10.96. Completion for Noetherian rings

0BNH In this section we discuss completion with respect to ideals in Noetherian rings.
00MA Lemma 10.96.1. Suppose $R$ is Noetherian.
(1) If $N \rightarrow M$ is an injective map of finite $R$-modules, then the map on completions $N^{\wedge} \rightarrow M^{\wedge}$ is injective.
(2) If $M$ is a finite $R$-module, then $M^{\wedge}=M \otimes_{R} R^{\wedge}$.

Proof. For the first statement, by the Artin-Rees Lemma 10.50 .2 , we have a constant $c$ such that $I^{n} M \cap N$ equals $I^{n-c}\left(I^{c} M \cap N\right) \subset I^{n-c} N$. Thus if $\left(n_{i}\right) \in N^{\wedge}$ maps to zero in $M^{\wedge}$, then each $n_{i}$ maps to zero in $N / I^{i-c} N$. And hence $n_{i-c}=0$. Thus $N^{\wedge} \rightarrow M^{\wedge}$ is injective.

For the second statement let $0 \rightarrow K \rightarrow R^{t} \rightarrow M \rightarrow 0$ be the presentation of $M$ corresponding to the generators $x_{1}, \ldots, x_{t}$ of $M$. By Lemma 10.95.1 $\left(R^{t}\right)^{\wedge} \rightarrow M^{\wedge}$ is surjective, and for any finitely generated $R$-module the canonical map $M \otimes_{R} R^{\wedge} \rightarrow$ $M^{\wedge}$ is surjective. Hence to prove the second statement it suffices to prove the kernel of $\left(R^{t}\right)^{\wedge} \rightarrow M^{\wedge}$ is exactly $K^{\wedge}$.
Let $\left(x_{n}\right) \in\left(R^{t}\right)^{\wedge}$ be in the kernel. Note that each $x_{n}$ is in the image of the map $K / I^{n} K \rightarrow\left(R / I^{n}\right)^{t}$. Choose $c$ such that $\left(I^{n}\right)^{t} \cap K \subset I^{n-c} K$, which is possible by Artin-Rees (Lemma 10.50.2). For each $n \geq 0$ choose $y_{n} \in K / I^{n+c} K$ mapping to $x_{n+c}$, and set $z_{n}=y_{n} \bmod I^{n} K$. The elements $z_{n}$ satisfy $z_{n+1}-z_{n} \bmod I^{n} K=$ $y_{n+1}-y_{n} \bmod I^{n} K$, and $y_{n+1}-y_{n} \in I^{n+c} R^{t}$ by construction. Hence $z_{n+1}=$ $z_{n} \bmod I^{n} K$ by the choice of $c$ above. In other words $\left(z_{n}\right) \in K^{\wedge}$ maps to $\left(x_{n}\right)$ as desired.

00MB Lemma 10.96.2. Let $R$ be a Noetherian ring. Let $I \subset R$ be an ideal.
(1) The ring map $R \rightarrow R^{\wedge}$ is flat.
(2) The functor $M \mapsto M^{\wedge}$ is exact on the category of finitely generated $R$ modules.

Proof. Consider $I \otimes_{R} R^{\wedge} \rightarrow R \otimes_{R} R^{\wedge}=R^{\wedge}$. According to Lemma 10.96.1 this is identified with $I^{\wedge} \rightarrow R^{\wedge}$ and $I^{\wedge} \rightarrow R^{\wedge}$ is injective. Part (1) follows from Lemma 10.38.5. Part (2) follows from part (1) and Lemma 10.96.1 part (2).

00MC Lemma 10.96.3. Let $R$ be a Noetherian local ring. Let $\mathfrak{m} \subset R$ be the maximal ideal. Let $I \subset \mathfrak{m}$ be an ideal. The ring map $R \rightarrow R^{\wedge}$ is faithfully flat. In particular the completion with respect to $\mathfrak{m}$, namely $\lim _{n} R / \mathfrak{m}^{n}$ is faithfully flat.

Proof. By Lemma 10.96 .2 it is flat. The composition $R \rightarrow R^{\wedge} \rightarrow R / \mathfrak{m}$ where the last map is the projection map $R^{\wedge} \rightarrow R / I$ combined with $R / I \rightarrow R / \mathfrak{m}$ shows that $\mathfrak{m}$ is in the image of $\operatorname{Spec}\left(R^{\wedge}\right) \rightarrow \operatorname{Spec}(R)$. Hence the map is faithfully flat by Lemma 10.38 .15

031C Lemma 10.96.4. Let $R$ be a Noetherian ring. Let $I$ be an ideal of $R$. Let $M$ be an $R$-module. Then the completion $M^{\wedge}$ of $M$ with respect to $I$ is $I$-adically complete, $I^{n} M^{\wedge}=\left(I^{n} M\right)^{\wedge}$, and $M^{\wedge} / I^{n} M^{\wedge}=M / I^{n} M$.

Proof. This is a special case of Lemma 10.95 .5 because $I$ is a finitely generated ideal.

05GH Lemma 10.96.5. Let $R$ be a ring. Let $I \subset R$ be an ideal. Assume
(1) $R / I$ is a Noetherian ring,
(2) $I$ is finitely generated.

Then $R^{\wedge}$ is a Noetherian ring complete with respect to $I R^{\wedge}$.
Proof. By Lemma 10.95 .5 we see that $R^{\wedge}$ is $I$-adically complete. Hence it is also $I R^{\wedge}$-adically complete. Since $R^{\wedge} / I R^{\wedge}=R / I$ is Noetherian we see that after replacing $R$ by $R^{\wedge}$ we may in addition to assumptions (1) and (2) assume that also $R$ is $I$-adically complete.

Let $f_{1}, \ldots, f_{t}$ be generators of $I$. Then there is a surjection of rings $R / I\left[T_{1}, \ldots, T_{t}\right] \rightarrow$ $\bigoplus I^{n} / I^{n+1}$ mapping $T_{i}$ to the element $\bar{f}_{i} \in I / I^{2}$. Hence $\bigoplus I^{n} / I^{n+1}$ is a Noetherian ring. Let $J \subset R$ be an ideal. Consider the ideal

$$
\bigoplus J \cap I^{n} / J \cap I^{n+1} \subset \bigoplus I^{n} / I^{n+1}
$$

Let $\bar{g}_{1}, \ldots, \bar{g}_{m}$ be generators of this ideal. We may choose $\bar{g}_{j}$ to be a homogeneous element of degree $d_{j}$ and we may pick $g_{j} \in J \cap I^{d_{j}}$ mapping to $\bar{g}_{j} \in J \cap I^{d_{j}} / J \cap I^{d_{j}+1}$. We claim that $g_{1}, \ldots, g_{m}$ generate $J$.

Let $x \in J \cap I^{n}$. There exist $a_{j} \in I^{\max \left(0, n-d_{j}\right)}$ such that $x-\sum a_{j} g_{j} \in J \cap I^{n+1}$. The reason is that $J \cap I^{n} / J \cap I^{n+1}$ is equal to $\sum \bar{g}_{j} I^{n-d_{j}} / I^{n-d_{j}+1}$ by our choice of $g_{1}, \ldots, g_{m}$. Hence starting with $x \in J$ we can find a sequence of vectors $\left(a_{1, n}, \ldots, a_{m, n}\right)_{n \geq 0}$ with $a_{j, n} \in I^{\max \left(0, n-d_{j}\right)}$ such that

$$
x=\sum_{n=0, \ldots, N} \sum_{j=1, \ldots, m} a_{j, n} g_{j} \bmod I^{N+1}
$$

Setting $A_{j}=\sum_{n \geq 0} a_{j, n}$ we see that $x=\sum A_{j} g_{j}$ as $R$ is complete. Hence $J$ is finitely generated and we win.

0316 Lemma 10.96.6. Let $R$ be a Noetherian ring. Let $I$ be an ideal of $R$. The completion $R^{\wedge}$ of $R$ with respect to $I$ is Noetherian.

Proof. This is a consequence of Lemma 10.96.5. It can also be seen directly as follows. Choose generators $f_{1}, \ldots, f_{n}$ of $I$. Consider the map

$$
R\left[\left[x_{1}, \ldots, x_{n}\right]\right] \longrightarrow R^{\wedge}, \quad x_{i} \longmapsto f_{i}
$$

This is a well defined and surjective ring map (details omitted). Since $R\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ is Noetherian (see Lemma 10.30.2) we win.

Suppose $R \rightarrow S$ is a local homomorphism of local rings $(R, \mathfrak{m})$ and $(S, \mathfrak{n})$. Let $S^{\wedge}$ be the completion of $S$ with respect to $\mathfrak{n}$. In general $S^{\wedge}$ is not the $\mathfrak{m}$-adic completion of $S$. If $\mathfrak{n}^{t} \subset \mathfrak{m} S$ for some $t \geq 1$ then we do have $S^{\wedge}=\lim S / \mathfrak{m}^{n} S$ by Lemma 10.95.9. In some cases this even implies that $S^{\wedge}$ is finite over $R^{\wedge}$.

0394 Lemma 10.96.7. Let $R \rightarrow S$ be a local homomorphism of local rings $(R, \mathfrak{m})$ and $(S, \mathfrak{n})$. Let $R^{\wedge}$, resp. $S^{\wedge}$ be the completion of $R$, resp. $S$ with respect to $\mathfrak{m}$, resp. $\mathfrak{n}$. If $\mathfrak{m}$ and $\mathfrak{n}$ are finitely generated and $\operatorname{dim}_{\kappa(\mathfrak{m})} S / \mathfrak{m} S<\infty$, then
(1) $S^{\wedge}$ is equal to the $\mathfrak{m}$-adic completion of $S$, and
(2) $S^{\wedge}$ is a finite $R^{\wedge}$-module.

Proof. We have $\mathfrak{m} S \subset \mathfrak{n}$ because $R \rightarrow S$ is a local ring map. The assumption $\operatorname{dim}_{\kappa(\mathfrak{m})} S / \mathfrak{m} S<\infty$ implies that $S / \mathfrak{m} S$ is an Artinian ring, see Lemma 10.52 .2 . Hence has dimension 0, see Lemma 10.59.4 hence $\mathfrak{n}=\sqrt{\mathfrak{m} S}$. This and the fact that $\mathfrak{n}$ is finitely generated implies that $\mathfrak{n}^{t} \subset \mathfrak{m} S$ for some $t \geq 1$. By Lemma 10.95.9 we see that $S^{\wedge}$ can be identified with the $\mathfrak{m}$-adic completion of $S$. As $\mathfrak{m}$ is finitely generated we see from Lemma 10.95 .5 that $S^{\wedge}$ and $R^{\wedge}$ are $\mathfrak{m}$-adically complete. At this point we may apply Lemma 10.95 .12 to $S^{\wedge}$ as an $R^{\wedge}$-module to conclude.

07N9 Lemma 10.96.8. Let $R$ be a Noetherian ring. Let $R \rightarrow S$ be a finite ring map. Let $\mathfrak{p} \subset R$ be a prime and let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{m}$ be the primes of $S$ lying over $\mathfrak{p}$ (Lemma 10.35.19). Then

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} S=S_{\mathfrak{q}_{1}}^{\wedge} \times \ldots \times S_{\mathfrak{q}_{m}}^{\wedge}
$$

where the local rings $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}_{i}}$ are completed with respect to their maximal ideals.
Proof. We may replace $R$ by the localization $R_{\mathfrak{p}}$ and $S$ by $S_{\mathfrak{p}}=S \otimes_{R} R_{\mathfrak{p}}$. Hence we may assume that $R$ is a local Noetherian ring and that $\mathfrak{p}=\mathfrak{m}$ is its maximal ideal. The $\mathfrak{q}_{i} S_{\mathfrak{q}_{i}}$-adic completion $S_{\mathfrak{q}_{i}}^{\wedge}$ is equal to the $\mathfrak{m}$-adic completion by Lemma 10.96.7. For every $n \geq 1$ prime ideals of $S / \mathfrak{m}^{n} S$ are in 1-to-1 correspondence with the maximal ideals $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{m}$ of $S$ (by going up for $S$ over $R$, see Lemma 10.35.20). Hence $S / \mathfrak{m}^{n} S=\prod S_{\mathfrak{q}_{i}} / \mathfrak{m}^{n} S_{\mathfrak{q}_{i}}$ by Lemma 10.52 .6 (using for example Proposition 10.59.6 to see that $S / \mathfrak{m}^{n} S$ is Artinian). Hence the $\mathfrak{m}$-adic completion $S^{\wedge}$ of $S$ is equal to $\prod S_{\mathfrak{q}_{i}}^{\wedge}$. Finally, we have $R^{\wedge} \otimes_{R} S=S^{\wedge}$ by Lemma 10.96.1.

05D3 Lemma 10.96.9. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $0 \rightarrow K \rightarrow P \rightarrow$ $M \rightarrow 0$ be a short exact sequence of $R$-modules. If $M$ is flat over $R$ and $M / I M$ is a projective $R / I$-module, then the sequence of I-adic completions

$$
0 \rightarrow K^{\wedge} \rightarrow P^{\wedge} \rightarrow M^{\wedge} \rightarrow 0
$$

is a split exact sequence.
Proof. As $M$ is flat, each of the sequences

$$
0 \rightarrow K / I^{n} K \rightarrow P / I^{n} P \rightarrow M / I^{n} M \rightarrow 0
$$

is short exact, see Lemma 10.38 .12 and the sequence $0 \rightarrow K^{\wedge} \rightarrow P^{\wedge} \rightarrow M^{\wedge} \rightarrow 0$ is a short exact sequence, see Lemma 10.95.1. It suffices to show that we can find splittings $s_{n}: M / I^{n} M \rightarrow P / I^{n} P$ such that $s_{n+1} \bmod I^{n}=s_{n}$. We will construct these $s_{n}$ by induction on $n$. Pick any splitting $s_{1}$, which exists as $M / I M$ is a projective $R / I$-module. Assume given $s_{n}$ for some $n>0$. Set $P_{n+1}=\{x \in P \mid$ $\left.x \bmod I^{n} P \in \operatorname{Im}\left(s_{n}\right)\right\}$. The $\operatorname{map} \pi: P_{n+1} / I^{n+1} P_{n+1} \rightarrow M / I^{n+1} M$ is surjective (details omitted). As $M / I^{n+1} M$ is projective as a $R / I^{n+1}$-module by Lemma 10.76 .5 we may choose a section $t: M / I^{n+1} M \rightarrow P_{n+1} / I^{n+1} P_{n+1}$ of $\pi$. Setting $s_{n+1}$ equal to the composition of $t$ with the canonical map $P_{n+1} / I^{n+1} P_{n+1} \rightarrow$ $P / I^{n+1} P$ works.

### 10.97. Taking limits of modules

09B7 In this section we discuss what happens when we take a limit of modules.
09B8 Lemma 10.97.1. Let $A$ be a ring. Let $I \subset A$ be an ideal. Let $\left(M_{n}\right)$ be an inverse system of $A$-modules. Set $M=\lim M_{n}$. If $M_{n}=M_{n+1} / I^{n} M_{n+1}$ and $I$ is finitely generated then $M / I^{n} M=M_{n}$ and $M$ is I-adically complete.

Proof. As $M_{n+1} \rightarrow M_{n}$ is surjective, the map $M \rightarrow M_{1}$ is surjective. Pick $x_{t} \in M$, $t \in T$ mapping to generators of $M_{1}$. This gives a map $\bigoplus_{t \in T} A \rightarrow M$. Note that the images of $x_{t}$ in $M_{n}$ generate $M_{n}$ for all $n$ too. Consider the exact sequences

$$
0 \rightarrow K_{n} \rightarrow \bigoplus_{t \in T} A / I^{n} \rightarrow M_{n} \rightarrow 0
$$

We claim the map $K_{n+1} \rightarrow K_{n}$ is surjective. Namely, if $y \in K_{n}$ choose a lift $y^{\prime} \in \bigoplus_{t \in T} A / I^{n+1}$. Then $y^{\prime}$ maps to an element of $I^{n} M_{n+1}$ by our assumption $M_{n}=M_{n+1} / I^{n} M_{n+1}$. Hence we can modify our choice of $y^{\prime}$ by an element of $\bigoplus_{t \in T} I^{n} / I^{n+1}$ so that $y^{\prime}$ maps to zero in $M_{n+1}$. Then $y^{\prime} \in K_{n+1}$ maps to $y$. Hence $\left(K_{n}\right)$ is a sequence of modules with surjective transition maps and we obtain an exact sequence

$$
0 \rightarrow \lim K_{n} \rightarrow\left(\bigoplus_{t \in T} A\right)^{\wedge} \rightarrow M \rightarrow 0
$$

by Lemma 10.86.1. Fix an integer $m$. As $I$ is finitely generated, the completion with respect to $I$ is complete and $\left(\bigoplus_{t \in T} A\right)^{\wedge} / I^{m}\left(\bigoplus_{t \in T} A\right)^{\wedge}=\bigoplus_{t \in T} A / I^{m}$ (Lemma 10.95.5. We obtain a short exact sequence

$$
\left(\lim K_{n}\right) / I^{m}\left(\lim K_{n}\right) \rightarrow \bigoplus_{t \in T} A / I^{m} \rightarrow M / I^{m} M \rightarrow 0
$$

Since $\lim K_{n} \rightarrow K_{m}$ is surjective we conclude that $M / I^{m} M=M_{m}$. It follows in particular that $M$ is $I$-adically complete.

### 10.98. Criteria for flatness

00 MD In this section we prove some important technical lemmas in the Noetherian case. We will (partially) generalize these to the non-Noetherian case in Section 10.127 .

00ME Lemma 10.98.1. Suppose that $R \rightarrow S$ is a local homomorphism of Noetherian local rings. Denote $\mathfrak{m}$ the maximal ideal of $R$. Let $M$ be a flat $R$-module and $N a$ finite $S$-module. Let $u: N \rightarrow M$ be a map of $R$-modules. If $\bar{u}: N / \mathfrak{m} N \rightarrow M / \mathfrak{m} M$ is injective then $u$ is injective. In this case $M / u(N)$ is flat over $R$.

Proof. First we claim that $u_{n}: N / \mathfrak{m}^{n} N \rightarrow M / \mathfrak{m}^{n} M$ is injective for all $n \geq 1$. We proceed by induction, the base case is that $\bar{u}=u_{1}$ is injective. By our assumption that $M$ is flat over $R$ we have a short exact sequence $0 \rightarrow M \otimes_{R} \mathfrak{m}^{n} / \mathfrak{m}^{n+1} \rightarrow$ $M / \mathfrak{m}^{n+1} M \rightarrow M / \mathfrak{m}^{n} M \rightarrow 0$. Also, $M \otimes_{R} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}=M / \mathfrak{m} M \otimes_{R / \mathfrak{m}} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$. We have a similar exact sequence $N \otimes_{R} \mathfrak{m}^{n} / \mathfrak{m}^{n+1} \rightarrow N / \mathfrak{m}^{n+1} N \rightarrow N / \mathfrak{m}^{n} N \rightarrow 0$ for $N$ except we do not have the zero on the left. We also have $N \otimes_{R} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}=$ $N / \mathfrak{m} N \otimes_{R / \mathfrak{m}} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$. Thus the map $u_{n+1}$ is injective as both $u_{n}$ and the map $\bar{u} \otimes \mathrm{id}_{\mathfrak{m}^{n} / \mathfrak{m}^{n+1}}$ are.
By Krull's intersection theorem (Lemma 10.50.4) applied to $N$ over the ring $S$ and the ideal $\mathfrak{m} S$ we have $\bigcap \mathfrak{m}^{n} N=0$. Thus the injectivity of $u_{n}$ for all $n$ implies $u$ is injective.
To show that $M / u(N)$ is flat over $R$, it suffices to show that $I \otimes_{R} M / u(N) \rightarrow$ $M / u(N)$ is injective for every ideal $I \subset R$, see Lemma 10.38.5. Consider the diagram

The arrow $M \otimes_{R} I \rightarrow M$ is injective. By the snake lemma (Lemma 10.4.1) we see that it suffices to prove that $N / I N$ injects into $M / I M$. Note that $R / I \rightarrow S / I S$ is a local homomorphism of Noetherian local rings, $N / I N \rightarrow M / I M$ is a map of $R / I$-modules, $N / I N$ is finite over $S / I S$, and $M / I M$ is flat over $R / I$ and $u \bmod I$ : $N / I N \rightarrow M / I M$ is injective modulo $\mathfrak{m}$. Thus we may apply the first part of the proof to $u \bmod I$ and we conclude.
00MF Lemma 10.98.2. Suppose that $R \rightarrow S$ is a flat and local ring homomorphism of Noetherian local rings. Denote $\mathfrak{m}$ the maximal ideal of $R$. Suppose $f \in S$ is a nonzerodivisor in $S / \mathfrak{m} S$. Then $S / f S$ is flat over $R$, and $f$ is a nonzerodivisor in $S$.

Proof. Follows directly from Lemma 10.98.1.
00MG Lemma 10.98.3. Suppose that $R \rightarrow S$ is a flat and local ring homomorphism of Noetherian local rings. Denote $\mathfrak{m}$ the maximal ideal of $R$. Suppose $f_{1}, \ldots, f_{c}$ is a sequence of elements of $S$ such that the images $\bar{f}_{1}, \ldots, \bar{f}_{c}$ form a regular sequence in $S / \mathfrak{m} S$. Then $f_{1}, \ldots, f_{c}$ is a regular sequence in $S$ and each of the quotients $S /\left(f_{1}, \ldots, f_{i}\right)$ is flat over $R$.

Proof. Induction and Lemma 10.98.2.
00 MH Lemma 10.98.4. Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Let $\mathfrak{m}$ be the maximal ideal of $R$. Let $M$ be a finite $S$-modules. Suppose that (a) $M / \mathfrak{m} M$ is a free $S / \mathfrak{m} S$-module, and (b) $M$ is flat over $R$. Then $M$ is free and $S$ is flat over $R$.
Proof. Let $\bar{x}_{1}, \ldots, \bar{x}_{n}$ be a basis for the free module $M / \mathfrak{m} M$. Choose $x_{1}, \ldots, x_{n} \in$ $M$ with $x_{i}$ mapping to $\bar{x}_{i}$. Let $u: S^{\oplus n} \rightarrow M$ be the map which maps the $i$ th
standard basis vector to $x_{i}$. By Lemma 10.98.1 we see that $u$ is injective. On the other hand, by Nakayama's Lemma 10.19.1 the map is surjective. The lemma follows.
00MI Lemma 10.98.5. Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Let $\mathfrak{m}$ be the maximal ideal of $R$. Let $0 \rightarrow F_{e} \rightarrow F_{e-1} \rightarrow \ldots \rightarrow F_{0}$ be a finite complex of finite $S$-modules. Assume that each $F_{i}$ is $R$-flat, and that the complex $0 \rightarrow F_{e} / \mathfrak{m} F_{e} \rightarrow F_{e-1} / \mathfrak{m} F_{e-1} \rightarrow \ldots \rightarrow F_{0} / \mathfrak{m} F_{0}$ is exact. Then $0 \rightarrow F_{e} \rightarrow F_{e-1} \rightarrow$ $\ldots \rightarrow F_{0}$ is exact, and moreover the module $\operatorname{Coker}\left(F_{1} \rightarrow F_{0}\right)$ is $R$-flat.

Proof. By induction on $e$. If $e=1$, then this is exactly Lemma 10.98.1. If $e>1$, we see by Lemma 10.98 .1 that $F_{e} \rightarrow F_{e-1}$ is injective and that $C=\operatorname{Coker}\left(F_{e} \rightarrow F_{e-1}\right)$ is a finite $S$-module flat over $R$. Hence we can apply the induction hypothesis to the complex $0 \rightarrow C \rightarrow F_{e-2} \rightarrow \ldots \rightarrow F_{0}$. We deduce that $C \rightarrow F_{e-2}$ is injective and the exactness of the complex follows, as well as the flatness of the cokernel of $F_{1} \rightarrow F_{0}$.

In the rest of this section we prove two versions of what is called the "local criterion of flatness". Note also the interesting Lemma 10.127.1 below.

00MJ Lemma 10.98.6. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa=R / \mathfrak{m}$. Let $M$ be an $R$-module. If $\operatorname{Tor}_{1}^{R}(\kappa, M)=0$, then for every finite length $R$-module $N$ we have $\operatorname{Tor}_{1}^{R}(N, M)=0$.
Proof. By descending induction on the length of $N$. If the length of $N$ is 1 , then $N \cong \kappa$ and we are done. If the length of $N$ is more than 1 , then we can fit $N$ into a short exact sequence $0 \rightarrow N^{\prime} \rightarrow N \rightarrow N^{\prime \prime} \rightarrow 0$ where $N^{\prime}, N^{\prime \prime}$ are finite length $R$-modules of smaller length. The vanishing of $\operatorname{Tor}_{1}^{R}(N, M)$ follows from the vanishing of $\operatorname{Tor}_{1}^{R}\left(N^{\prime}, M\right)$ and $\operatorname{Tor}_{1}^{R}\left(N^{\prime \prime}, M\right)$ (induction hypothesis) and the long exact sequence of Tor groups, see Lemma 10.74.2.
00MK Lemma 10.98.7 (Local criterion for flatness). Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Let $\mathfrak{m}$ be the maximal ideal of $R$, and let $\kappa=R / \mathfrak{m}$. Let $M$ be a finite $S$-module. If $\operatorname{Tor}_{1}^{R}(\kappa, M)=0$, then $M$ is flat over $R$.
Proof. Let $I \subset R$ be an ideal. By Lemma 10.38 .5 it suffices to show that $I \otimes_{R} M \rightarrow$ $M$ is injective. By Remark 10.74 .9 we see that this kernel is equal to $\operatorname{Tor}_{1}^{R}(M, R / I)$. By Lemma 10.98 .6 we see that $J \otimes_{R} M \rightarrow M$ is injective for all ideals of finite colength.

Choose $n \gg 0$ and consider the following short exact sequence

$$
0 \rightarrow I \cap \mathfrak{m}^{n} \rightarrow I \oplus \mathfrak{m}^{n} \rightarrow I+\mathfrak{m}^{n} \rightarrow 0
$$

This is a sub sequence of the short exact sequence $0 \rightarrow R \rightarrow R^{\oplus 2} \rightarrow R \rightarrow 0$. Thus we get the diagram

Note that $I+\mathfrak{m}^{n}$ and $\mathfrak{m}^{n}$ are ideals of finite colength. Thus a diagram chase shows that $\operatorname{Ker}\left(\left(I \cap \mathfrak{m}^{n}\right) \otimes_{R} M \rightarrow M\right) \rightarrow \operatorname{Ker}\left(I \otimes_{R} M \rightarrow M\right)$ is surjective. We conclude in particular that $K=\operatorname{Ker}\left(I \otimes_{R} M \rightarrow M\right)$ is contained in the image
of $\left(I \cap \mathfrak{m}^{n}\right) \otimes_{R} M$ in $I \otimes_{R} M$. By Artin-Rees, Lemma 10.50 .2 we see that $K$ is contained in $\mathfrak{m}^{n-c}\left(I \otimes_{R} M\right)$ for some $c>0$ and all $n \gg 0$. Since $I \otimes_{R} M$ is a finite $S$-module (!) and since $S$ is Noetherian, we see that this implies $K=0$. Namely, the above implies $K$ maps to zero in the $\mathfrak{m} S$-adic completion of $I \otimes_{R} M$. But the map from $S$ to its $\mathfrak{m} S$-adic completion is faithfully flat by Lemma 10.96.3. Hence $K=0$, as desired.

In the following we often encounter the conditions " $M / I M$ is flat over $R / I$ and $\operatorname{Tor}_{1}^{R}(R / I, M)=0$ ". The following lemma gives some consequences of these conditions (it is a generalization of Lemma 10.98.6).

051C Lemma 10.98.8. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. If $M / I M$ is flat over $R / I$ and $\operatorname{Tor}_{1}^{R}(R / I, M)=0$ then
(1) $M / I^{n} M$ is flat over $R / I^{n}$ for all $n \geq 1$, and
(2) for any module $N$ which is annihilated by $I^{m}$ for some $m \geq 0$ we have $\operatorname{Tor}_{1}^{R}(N, M)=0$.
In particular, if $I$ is nilpotent, then $M$ is flat over $R$.
Proof. Assume $M / I M$ is flat over $R / I$ and $\operatorname{Tor}_{1}^{R}(R / I, M)=0$. Let $N$ be an $R / I$-module. Choose a short exact sequence

$$
0 \rightarrow K \rightarrow \bigoplus_{i \in I} R / I \rightarrow N \rightarrow 0
$$

By the long exact sequence of Tor and the vanishing of $\operatorname{Tor}_{1}^{R}(R / I, M)$ we get

$$
0 \rightarrow \operatorname{Tor}_{1}^{R}(N, M) \rightarrow K \otimes_{R} M \rightarrow\left(\bigoplus_{i \in I} R / I\right) \otimes_{R} M \rightarrow N \otimes_{R} M \rightarrow 0
$$

But since $K, \bigoplus_{i \in I} R / I$, and $N$ are all annihilated by $I$ we see that

$$
\begin{aligned}
K \otimes_{R} M & =K \otimes_{R / I} M / I M \\
\left(\bigoplus_{i \in I} R / I\right) \otimes_{R} M & =\left(\bigoplus_{i \in I} R / I\right) \otimes_{R / I} M / I M \\
N \otimes_{R} M & =N \otimes_{R / I} M / I M
\end{aligned}
$$

As $M / I M$ is flat over $R / I$ we conclude that

$$
0 \rightarrow K \otimes_{R / I} M / I M \rightarrow\left(\bigoplus_{i \in I} R / I\right) \otimes_{R / I} M / I M \rightarrow N \otimes_{R /} M / I M \rightarrow 0
$$

is exact. Combining this with the above we conclude that $\operatorname{Tor}_{1}^{R}(N, M)=0$ for any $R$-module $N$ annihilated by $I$.
In particular, if we apply this to the module $I / I^{2}$, then we conclude that the sequence

$$
0 \rightarrow I^{2} \otimes_{R} M \rightarrow I \otimes_{R} M \rightarrow I / I^{2} \otimes_{R} M \rightarrow 0
$$

is short exact. This implies that $I^{2} \otimes_{R} M \rightarrow M$ is injective and it implies that $I / I^{2} \otimes_{R / I} M / I M=I M / I^{2} M$.

Let us prove that $M / I^{2} M$ is flat over $R / I^{2}$. Let $I^{2} \subset J$ be an ideal. We have to show that $J / I^{2} \otimes_{R / I^{2}} M / I^{2} M \rightarrow M / I^{2} M$ is injective, see Lemma 10.38.5. As $M / I M$ is flat over $R / I$ we know that the $\operatorname{map}(I+J) / I \otimes_{R / I} M / I M \rightarrow M / I M$ is injective. The sequence

$$
(I \cap J) / I^{2} \otimes_{R / I^{2}} M / I^{2} M \rightarrow J / I^{2} \otimes_{R / I^{2}} M / I^{2} M \rightarrow(I+J) / I \otimes_{R / I} M / I M \rightarrow 0
$$

is exact, as you get it by tensoring the exact sequence $0 \rightarrow(I \cap J) \rightarrow J \rightarrow$ $(I+J) / I \rightarrow 0$ by $M / I^{2} M$. Hence suffices to prove the injectivity of the map ( $I \cap$ $J) / I^{2} \otimes_{R / I} M / I M \rightarrow I M / I^{2} M$. However, the map $(I \cap J) / I^{2} \rightarrow I / I^{2}$ is injective and as $M / I M$ is flat over $R / I$ the map $(I \cap J) / I^{2} \otimes_{R / I} M / I M \rightarrow I / I^{2} \otimes_{R / I} M / I M$ is injective. Since we have previously seen that $I / I^{2} \otimes_{R / I} M / I M=I M / I^{2} M$ we obtain the desired injectivity.
Hence we have proven that the assumptions imply: (a) $\operatorname{Tor}_{1}^{R}(N, M)=0$ for all $N$ annihilated by $I$, (b) $I^{2} \otimes_{R} M \rightarrow M$ is injective, and (c) $M / I^{2} M$ is flat over $R / I^{2}$. Thus we can continue by induction to get the same results for $I^{n}$ for all $n \geq 1$.

0AS8 Lemma 10.98.9. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module.
(1) If $M / I M$ is flat over $R / I$ and $M \otimes_{R} I / I^{2} \rightarrow I M / I^{2} M$ is injective, then $M / I^{2} M$ is flat over $R / I^{2}$.
(2) If $M / I M$ is flat over $R / I$ and $M \otimes_{R} I^{n} / I^{n+1} \rightarrow I^{n} M / I^{n+1} M$ is injective for $n=1, \ldots, k$, then $M / I^{k+1} M$ is flat over $R / I^{k+1}$.
Proof. The first statement is a consequence of Lemma 10.98 .8 applied with $R$ replaced by $R / I^{2}$ and $M$ replaced by $M / I^{2} M$ using that

$$
\operatorname{Tor}_{1}^{R / I^{2}}\left(M / I^{2} M, R / I\right)=\operatorname{Ker}\left(M \otimes_{R} I / I^{2} \rightarrow I M / I^{2} M\right)
$$

see Remark 10.74 .9 . The second statement follows in the same manner using induction on $n$ to show that $M / I^{n+1} M$ is flat over $R / I^{n+1}$ for $n=1, \ldots, k$. Here we use that

$$
\operatorname{Tor}_{1}^{R / I^{n+1}}\left(M / I^{n+1} M, R / I\right)=\operatorname{Ker}\left(M \otimes_{R} I^{n} / I^{n+1} \rightarrow I^{n} M / I^{n+1} M\right)
$$

for every $n$.
00ML Lemma 10.98.10 (Variant of the local criterion). Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Let $I \neq R$ be an ideal in $R$. Let $M$ be a finite $S$-module. If $\operatorname{Tor}_{1}^{R}(M, R / I)=0$ and $M / I M$ is flat over $R / I$, then $M$ is flat over $R$.

Proof. First proof: By Lemma 10.98 .8 we see that $\operatorname{Tor}_{1}^{R}(\kappa, M)$ is zero where $\kappa$ is the residue field of $R$. Hence we see that $M$ is flat over $R$ by Lemma 10.98.7.

Second proof: Let $\mathfrak{m}$ be the maximal ideal of $R$. We will show that $\mathfrak{m} \otimes_{R} M \rightarrow M$ is injective, and then apply Lemma 10.98.7. Suppose that $\sum f_{i} \otimes x_{i} \in \mathfrak{m} \otimes_{R} M$ and that $\sum f_{i} x_{i}=0$ in $M$. By the equational criterion for flatness Lemma 10.38.11 applied to $M / I M$ over $R / I$ we see there exist $\bar{a}_{i j} \in R / I$ and $\bar{y}_{j} \in M / I M$ such that $x_{i} \bmod I M=\sum_{j} \bar{a}_{i j} \bar{y}_{j}$ and $0=\sum_{i}\left(f_{i} \bmod I\right) \bar{a}_{i j}$. Let $a_{i j} \in R$ be a lift of $\bar{a}_{i j}$ and similarly let $y_{j} \in M$ be a lift of $\bar{y}_{j}$. Then we see that

$$
\begin{aligned}
\sum f_{i} \otimes x_{i} & =\sum f_{i} \otimes x_{i}+\sum f_{i} a_{i j} \otimes y_{j}-\sum f_{i} \otimes a_{i j} y_{j} \\
& =\sum f_{i} \otimes\left(x_{i}-\sum a_{i j} y_{j}\right)+\sum\left(\sum f_{i} a_{i j}\right) \otimes y_{j}
\end{aligned}
$$

Since $x_{i}-\sum a_{i j} y_{j} \in I M$ and $\sum f_{i} a_{i j} \in I$ we see that there exists an element in $I \otimes_{R} M$ which maps to our given element $\sum f_{i} \otimes x_{i}$ in $\mathfrak{m} \otimes_{R} M$. But $I \otimes_{R} M \rightarrow M$ is injective by assumption (see Remark 10.74.9) and we win.

In particular, in the situation of Lemma 10.98 .10 , suppose that $I=(x)$ is generated by a single element $x$ which is a nonzerodivisor in $R$. Then $\operatorname{Tor}_{1}^{R}(M, R /(x))=(0)$ if and only if $x$ is a nonzerodivisor on $M$.

0523 Lemma 10.98.11. Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let $M$ be an S-module. Assume
(1) $R$ is a Noetherian ring,
(2) $S$ is a Noetherian ring,
(3) $M$ is a finite $S$-module, and
(4) for each $n \geq 1$ the module $M / I^{n} M$ is flat over $R / I^{n}$.

Then for every $\mathfrak{q} \in V(I S)$ the localization $M_{\mathfrak{q}}$ is flat over $R$. In particular, if $S$ is local and $I S$ is contained in its maximal ideal, then $M$ is flat over $R$.

Proof. We are going to use Lemma 10.98 .10 . By assumption $M / I M$ is flat over $R / I$. Hence it suffices to check that $\operatorname{Tor}_{1}^{R}(M, R / I)$ is zero on localization at $\mathfrak{q}$. By Remark 10.74 .9 this Tor group is equal to $K=\operatorname{Ker}\left(I \otimes_{R} M \rightarrow M\right)$. We know for each $n \geq 1$ that the kernel $\operatorname{Ker}\left(I / I^{n} \otimes_{R / I^{n}} M / I^{n} M \rightarrow M / I^{n} M\right)$ is zero. Since there is a module map $I / I^{n} \otimes_{R / I^{n}} M / I^{n} M \rightarrow\left(I \otimes_{R} M\right) / I^{n-1}\left(I \otimes_{R} M\right)$ we conclude that $K \subset I^{n-1}\left(I \otimes_{R} M\right)$ for each $n$. By the Artin-Rees lemma, and more precisely Lemma 10.50 .5 we conclude that $K_{\mathfrak{q}}=0$, as desired.

00MM Lemma 10.98.12. Let $R \rightarrow R^{\prime} \rightarrow R^{\prime \prime}$ be ring maps. Let $M$ be an $R$-module. Suppose that $M \otimes_{R} R^{\prime}$ is flat over $R^{\prime}$. Then the natural map $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime}\right) \otimes_{R^{\prime}} R^{\prime \prime} \rightarrow$ $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime \prime}\right)$ is onto.

Proof. Let $F_{\bullet}$ be a free resolution of $M$ over $R$. The complex $F_{2} \otimes_{R} R^{\prime} \rightarrow F_{1} \otimes_{R}$ $R^{\prime} \rightarrow F_{0} \otimes_{R} R^{\prime}$ computes $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime}\right)$. The complex $F_{2} \otimes_{R} R^{\prime \prime} \rightarrow F_{1} \otimes_{R} R^{\prime \prime} \rightarrow$ $F_{0} \otimes_{R} R^{\prime \prime}$ computes $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime \prime}\right)$. Note that $F_{i} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} R^{\prime \prime}=F_{i} \otimes_{R} R^{\prime \prime}$. Let $K^{\prime}=\operatorname{Ker}\left(F_{1} \otimes_{R} R^{\prime} \rightarrow F_{0} \otimes_{R} R^{\prime}\right)$ and similarly $K^{\prime \prime}=\operatorname{Ker}\left(F_{1} \otimes_{R} R^{\prime \prime} \rightarrow F_{0} \otimes_{R} R^{\prime \prime}\right)$. Thus we have an exact sequence

$$
0 \rightarrow K^{\prime} \rightarrow F_{1} \otimes_{R} R^{\prime} \rightarrow F_{0} \otimes_{R} R^{\prime} \rightarrow M \otimes_{R} R^{\prime} \rightarrow 0
$$

By the assumption that $M \otimes_{R} R^{\prime}$ is flat over $R^{\prime}$, the sequence $0 \rightarrow K^{\prime} \otimes_{R^{\prime}} R^{\prime \prime} \rightarrow$ $F_{1} \otimes_{R} R^{\prime \prime} \rightarrow F_{0} \otimes_{R} R^{\prime \prime} \rightarrow M \otimes_{R} R^{\prime \prime} \rightarrow 0$ is still exact. This means that $K^{\prime \prime}=$ $K^{\prime} \otimes_{R^{\prime}} R^{\prime \prime}$. Since $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime}\right)$ is a quotient of $K^{\prime}$ and $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime \prime}\right)$ is a quotient of $K^{\prime \prime}$ we win.

00MN Lemma 10.98.13. Let $R \rightarrow R^{\prime}$ be a ring map. Let $I \subset R$ be an ideal and $I^{\prime}=I R^{\prime}$. Let $M$ be an $R$-module and set $M^{\prime}=M \otimes_{R} R^{\prime}$. The natural map $\operatorname{Tor}_{1}^{R}\left(R^{\prime} / I^{\prime}, M\right) \rightarrow \operatorname{Tor}_{1}^{R^{\prime}}\left(R^{\prime} / I^{\prime}, M^{\prime}\right)$ is surjective.

Proof. Let $F_{2} \rightarrow F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0$ be a free resolution of $M$ over $R$. Set $F_{i}^{\prime}=F_{i} \otimes_{R} R^{\prime}$. The sequence $F_{2}^{\prime} \rightarrow F_{1}^{\prime} \rightarrow F_{0}^{\prime} \rightarrow M^{\prime} \rightarrow 0$ may no longer be exact at $F_{1}^{\prime}$. A free resolution of $M^{\prime}$ over $R^{\prime}$ therefore looks like

$$
F_{2}^{\prime} \oplus F_{2}^{\prime \prime} \rightarrow F_{1}^{\prime} \rightarrow F_{0}^{\prime} \rightarrow M^{\prime} \rightarrow 0
$$

for a suitable free module $F_{2}^{\prime \prime}$ over $R^{\prime}$. Next, note that $F_{i} \otimes_{R} R^{\prime} / I^{\prime}=F_{i}^{\prime} / I F_{i}^{\prime}=$ $F_{i}^{\prime} / I^{\prime} F_{i}^{\prime}$. So the complex $F_{2}^{\prime} / I^{\prime} F_{2}^{\prime} \rightarrow F_{1}^{\prime} / I^{\prime} F_{1}^{\prime} \rightarrow F_{0}^{\prime} / I^{\prime} F_{0}^{\prime}$ computes $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime} / I^{\prime}\right)$. On the other hand $F_{i}^{\prime} \otimes_{R^{\prime}} R^{\prime} / I^{\prime}=F_{i}^{\prime} / I^{\prime} F_{i}^{\prime}$ and similarly for $F_{2}^{\prime \prime}$. Thus the complex
$F_{2}^{\prime} / I^{\prime} F_{2}^{\prime} \oplus F_{2}^{\prime \prime} / I^{\prime} F_{2}^{\prime \prime} \rightarrow F_{1}^{\prime} / I^{\prime} F_{1}^{\prime} \rightarrow F_{0}^{\prime} / I^{\prime} F_{0}^{\prime}$ computes $\operatorname{Tor}_{1}^{R^{\prime}}\left(M^{\prime}, R^{\prime} / I^{\prime}\right)$. Since the vertical map on complexes

clearly induces a surjection on cohomology we win.
00MO Lemma 10.98.14. Let

be a commutative diagram of local homomorphisms of local Noetherian rings. Let $I \subset R$ be a proper ideal. Let $M$ be a finite $S$-module. Denote $I^{\prime}=I R^{\prime}$ and $M^{\prime}=M \otimes_{S} S^{\prime}$. Assume that
(1) $S^{\prime}$ is a localization of the tensor product $S \otimes_{R} R^{\prime}$,
(2) $M / I M$ is flat over $R / I$,
(3) $\operatorname{Tor}_{1}^{R}(M, R / I) \rightarrow \operatorname{Tor}_{1}^{R^{\prime}}\left(M^{\prime}, R^{\prime} / I^{\prime}\right)$ is zero.

Then $M^{\prime}$ is flat over $R^{\prime}$.
Proof. Since $S^{\prime}$ is a localization of $S \otimes_{R} R^{\prime}$ we see that $M^{\prime}$ is a localization of $M \otimes_{R} R^{\prime}$. Note that by Lemma 10.38 .7 the module $M / I M \otimes_{R / I} R^{\prime} / I^{\prime}=M \otimes_{R}$ $R^{\prime} / I^{\prime}\left(M \otimes_{R} R^{\prime}\right)$ is flat over $R^{\prime} / I^{\prime}$. Hence also $M^{\prime} / I^{\prime} M^{\prime}$ is flat over $R^{\prime} / I^{\prime}$ as the localization of a flat module is flat. By Lemma 10.98 .10 it suffices to show that $\operatorname{Tor}_{1}^{R^{\prime}}\left(M^{\prime}, R^{\prime} / I^{\prime}\right)$ is zero. Since $M^{\prime}$ is a localization of $M \otimes_{R} R^{\prime}$, the last assumption implies that it suffices to show that $\operatorname{Tor}_{1}^{R}(M, R / I) \otimes_{R} R^{\prime} \rightarrow \operatorname{Tor}_{1}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, R^{\prime} / I^{\prime}\right)$ is surjective.

By Lemma 10.98 .13 we see that $\operatorname{Tor}_{1}^{R}\left(M, R^{\prime} / I^{\prime}\right) \rightarrow \operatorname{Tor}_{1}^{R^{\prime}}\left(M \otimes_{R} R^{\prime}, R^{\prime} / I^{\prime}\right)$ is surjective. So now it suffices to show that $\operatorname{Tor}_{1}^{R}(M, R / I) \otimes_{R} R^{\prime} \rightarrow \operatorname{Tor}_{1}^{R}\left(M, R^{\prime} / I^{\prime}\right)$ is surjective. This follows from Lemma 10.98 .12 by looking at the ring maps $R \rightarrow R / I \rightarrow R^{\prime} / I^{\prime}$ and the module $M$.

Please compare the lemma below to Lemma 10.100 .8 (the case of a nilpotent ideal) and Lemma 10.127 .8 (the case of finitely presented algebras).

00MP Lemma 10.98.15 (Critère de platitude par fibres; Noetherian case). Let $R, S$, $S^{\prime}$ be Noetherian local rings and let $R \rightarrow S \rightarrow S^{\prime}$ be local ring homomorphisms. Let $\mathfrak{m} \subset R$ be the maximal ideal. Let $M$ be an $S^{\prime}$-module. Assume
(1) The module $M$ is finite over $S^{\prime}$.
(2) The module $M$ is not zero.
(3) The module $M / \mathfrak{m} M$ is a flat $S / \mathfrak{m} S$-module.
(4) The module $M$ is a flat $R$-module.

Then $S$ is flat over $R$ and $M$ is a flat $S$-module.

Proof. Set $I=\mathfrak{m} S \subset S$. Then we see that $M / I M$ is a flat $S / I$-module because of (3). Since $\mathfrak{m} \otimes_{R} S^{\prime} \rightarrow I \otimes_{S} S^{\prime}$ is surjective we see that also $\mathfrak{m} \otimes_{R} M \rightarrow I \otimes_{S} M$ is surjective. Consider

$$
\mathfrak{m} \otimes_{R} M \rightarrow I \otimes_{S} M \rightarrow M
$$

As $M$ is flat over $R$ the composition is injective and so both arrows are injective. In particular $\operatorname{Tor}_{1}^{S}(S / I, M)=0$ see Remark 10.74.9. By Lemma 10.98.10 we conclude that $M$ is flat over $S$. Note that since $M / \mathfrak{m}_{S^{\prime}} M$ is not zero by Nakayama's Lemma 10.19 .1 we see that actually $M$ is faithfully flat over $S$ by Lemma 10.38 .15 (since it forces $\left.M / \mathfrak{m}_{S} M \neq 0\right)$.

Consider the exact sequence $0 \rightarrow \mathfrak{m} \rightarrow R \rightarrow \kappa \rightarrow 0$. This gives an exact sequence $0 \rightarrow \operatorname{Tor}_{1}^{R}(\kappa, S) \rightarrow \mathfrak{m} \otimes_{R} S \rightarrow I \rightarrow 0$. Since $M$ is flat over $S$ this gives an exact sequence $0 \rightarrow \operatorname{Tor}_{1}^{R}(\kappa, S) \otimes_{S} M \rightarrow \mathfrak{m} \otimes_{R} M \rightarrow I \otimes_{S} M \rightarrow 0$. By the above this implies that $\operatorname{Tor}_{1}^{R}(\kappa, S) \otimes_{S} M=0$. Since $M$ is faithfully flat over $S$ this implies that $\operatorname{Tor}_{1}^{R}(\kappa, S)=0$ and we conclude that $S$ is flat over $R$ by Lemma 10.98.7.

### 10.99. Base change and flatness

051D Some lemmas which deal with what happens with flatness when doing a base change.
00MQ Lemma 10.99.1. Let

be a commutative diagram of local homomorphisms of local rings. Assume that $S^{\prime}$ is a localization of the tensor product $S \otimes_{R} R^{\prime}$. Let $M$ be an $S$-module and set $M^{\prime}=S^{\prime} \otimes_{S} M$.
(1) If $M$ is flat over $R$ then $M^{\prime}$ is flat over $R^{\prime}$.
(2) If $M^{\prime}$ is flat over $R^{\prime}$ and $R \rightarrow R^{\prime}$ is flat then $M$ is flat over $R$.

In particular we have
(3) If $S$ is flat over $R$ then $S^{\prime}$ is flat over $R^{\prime}$.
(4) If $R^{\prime} \rightarrow S^{\prime}$ and $R \rightarrow R^{\prime}$ are flat then $S$ is flat over $R$.

Proof. Proof of (1). If $M$ is flat over $R$, then $M \otimes_{R} R^{\prime}$ is flat over $R^{\prime}$ by Lemma 10.38.7. If $W \subset S \otimes_{R} R^{\prime}$ is the multiplicative subset such that $W^{-1}\left(S \otimes_{R} R^{\prime}\right)=S^{\prime}$ then $M^{\prime}=W^{-1}\left(M \otimes_{R} R^{\prime}\right)$. Hence $M^{\prime}$ is flat over $R^{\prime}$ as the localization of a flat module, see Lemma 10.38 .19 part (5). This proves (1) and in particular, we see that (3) holds.
Proof of (2). Suppose that $M^{\prime}$ is flat over $R^{\prime}$ and $R \rightarrow R^{\prime}$ is flat. By (3) applied to the diagram reflected in the northwest diagonal we see that $S \rightarrow S^{\prime}$ is flat. Thus $S \rightarrow S^{\prime}$ is faithfully flat by Lemma 10.38.17. We are going to use the criterion of Lemma 10.38 .5 (3) to show that $M$ is flat. Let $I \subset R$ be an ideal. If $I \otimes_{R} M \rightarrow M$ has a kernel, so does $\left(I \otimes_{R} M\right) \otimes_{S} S^{\prime} \rightarrow M \otimes_{S} S^{\prime}=M^{\prime}$. Note that $I \otimes_{R} R^{\prime}=I R^{\prime}$ as $R \rightarrow R^{\prime}$ is flat, and that

$$
\left(I \otimes_{R} M\right) \otimes_{S} S^{\prime}=\left(I \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}}\left(M \otimes_{S} S^{\prime}\right)=I R^{\prime} \otimes_{R^{\prime}} M^{\prime}
$$

From flatness of $M^{\prime}$ over $R^{\prime}$ we conclude that this maps injectively into $M^{\prime}$. This concludes the proof of (2), and hence (4) is true as well.

### 10.100. Flatness criteria over Artinian rings

051 E We discuss some flatness criteria for modules over Artinian rings. Note that an Artinian local ring has a nilpotent maximal ideal so that the following two lemmas apply to Artinian local rings.

051F Lemma 10.100.1. Let $(R, \mathfrak{m})$ be a local ring with nilpotent maximal ideal $\mathfrak{m}$. Let $M$ be a flat $R$-module. If $A$ is a set and $x_{\alpha} \in M, \alpha \in A$ is a collection of elements of $M$, then the following are equivalent:
(1) $\left\{\bar{x}_{\alpha}\right\}_{\alpha \in A}$ forms a basis for the vector space $M / \mathfrak{m} M$ over $R / \mathfrak{m}$, and
(2) $\left\{x_{\alpha}\right\}_{\alpha \in A}$ forms a basis for $M$ over $R$.

Proof. The implication $(2) \Rightarrow(1)$ is immediate. We will prove the other implication by using induction on $n$ to show that $\left\{x_{\alpha}\right\}_{\alpha \in A}$ forms a basis for $M / \mathfrak{m}^{n} M$ over $R / \mathfrak{m}^{n}$. The case $n=1$ holds by assumption (1). Assume the statement holds for some $n \geq 1$. By Nakayama's Lemma 10.19 .1 the elements $x_{\alpha}$ generate $M$, in particular $M / \mathfrak{m}^{n+1} M$. The exact sequence $0 \rightarrow \mathfrak{m}^{n} / \mathfrak{m}^{n+1} \rightarrow R / \mathfrak{m}^{n+1} \rightarrow R / \mathfrak{m}^{n} \rightarrow 0$ gives on tensoring with $M$ the exact sequence

$$
0 \rightarrow \mathfrak{m}^{n} M / \mathfrak{m}^{n+1} M \rightarrow M / \mathfrak{m}^{n+1} M \rightarrow M / \mathfrak{m}^{n} M \rightarrow 0
$$

Here we are using that $M$ is flat. Moreover, we have $\mathfrak{m}^{n} M / \mathfrak{m}^{n+1} M=M / \mathfrak{m} M \otimes_{R / \mathfrak{m}}$ $\mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ by flatness of $M$ again. Now suppose that $\sum f_{\alpha} x_{\alpha}=0$ in $M / \mathfrak{m}^{n+1} M$. Then by induction hypothesis $f_{\alpha} \in \mathfrak{m}^{n}$ for each $\alpha$. By the short exact sequence above we then conclude that $\sum \bar{f}_{\alpha} \otimes \bar{x}_{\alpha}$ is zero in $\mathfrak{m}^{n} / \mathfrak{m}^{n+1} \otimes_{R / \mathfrak{m}} M / \mathfrak{m} M$. Since $\bar{x}_{\alpha}$ forms a basis we conclude that each of the congruence classes $\bar{f}_{\alpha} \in \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ is zero and we win.

051G Lemma 10.100.2. Let $R$ be a local ring with nilpotent maximal ideal. Let $M$ be an $R$-module. The following are equivalent
(1) $M$ is flat over $R$,
(2) $M$ is a free $R$-module, and
(3) $M$ is a projective $R$-module.

Proof. Since any projective module is flat (as a direct summand of a free module) and every free module is projective, it suffices to prove that a flat module is free. Let $M$ be a flat module. Let $A$ be a set and let $x_{\alpha} \in M, \alpha \in A$ be elements such that $\overline{x_{\alpha}} \in M / \mathfrak{m} M$ forms a basis over the residue field of $R$. By Lemma 10.100.1 the $x_{\alpha}$ are a basis for $M$ over $R$ and we win.

051H Lemma 10.100.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Let $A$ be a set and let $x_{\alpha} \in M, \alpha \in A$ be a collection of elements of $M$. Assume
(1) I is nilpotent,
(2) $\left\{\bar{x}_{\alpha}\right\}_{\alpha \in A}$ forms a basis for $M / I M$ over $R / I$, and
(3) $\operatorname{Tor}_{1}^{R}(R / I, M)=0$.

Then $M$ is free on $\left\{x_{\alpha}\right\}_{\alpha \in A}$ over $R$.
Proof. Let $R, I, M,\left\{x_{\alpha}\right\}_{\alpha \in A}$ be as in the lemma and satisfy assumptions (1), (2), and (3). By Nakayama's Lemma 10.19 .1 the elements $x_{\alpha}$ generate $M$ over $R$. The assumption $\operatorname{Tor}_{1}^{R}(R / I, M)=0$ implies that we have a short exact sequence

$$
0 \rightarrow I \otimes_{R} M \rightarrow M \rightarrow M / I M \rightarrow 0
$$

Let $\sum f_{\alpha} x_{\alpha}=0$ be a relation in $M$. By choice of $x_{\alpha}$ we see that $f_{\alpha} \in I$. Hence we conclude that $\sum f_{\alpha} \otimes x_{\alpha}=0$ in $I \otimes_{R} M$. The map $I \otimes_{R} M \rightarrow I / I^{2} \otimes_{R / I} M / I M$ and the fact that $\left\{x_{\alpha}\right\}_{\alpha \in A}$ forms a basis for $M / I M$ implies that $f_{\alpha} \in I^{2}$ ! Hence we conclude that there are no relations among the images of the $x_{\alpha}$ in $M / I^{2} M$. In other words, we see that $M / I^{2} M$ is free with basis the images of the $x_{\alpha}$. Using the $\operatorname{map} I \otimes_{R} M \rightarrow I / I^{3} \otimes_{R / I^{2}} M / I^{2} M$ we then conclude that $f_{\alpha} \in I^{3}$ ! And so on. Since $I^{n}=0$ for some $n$ by assumption (1) we win.

051I Lemma 10.100.4. Let $\varphi: R \rightarrow R^{\prime}$ be a ring map. Let $I \subset R$ be an ideal. Let $M$ be an $R$-module. Assume
(1) $M / I M$ is flat over $R / I$, and
(2) $R^{\prime} \otimes_{R} M$ is flat over $R^{\prime}$.

Set $I_{2}=\varphi^{-1}\left(\varphi\left(I^{2}\right) R^{\prime}\right)$. Then $M / I_{2} M$ is flat over $R / I_{2}$.
Proof. We may replace $R, M$, and $R^{\prime}$ by $R / I_{2}, M / I_{2} M$, and $R^{\prime} / \varphi(I)^{2} R^{\prime}$. Then $I^{2}=0$ and $\varphi$ is injective. By Lemma 10.98 .8 and the fact that $I^{2}=0$ it suffices to prove that $\operatorname{Tor}_{1}^{R}(R / I, M)=K=\operatorname{Ker}\left(I \otimes_{R} M \rightarrow M\right)$ is zero. Set $M^{\prime}=M \otimes_{R} R^{\prime}$ and $I^{\prime}=I R^{\prime}$. By assumption the map $I^{\prime} \otimes_{R^{\prime}} M^{\prime} \rightarrow M^{\prime}$ is injective. Hence $K$ maps to zero in

$$
I^{\prime} \otimes_{R^{\prime}} M^{\prime}=I^{\prime} \otimes_{R} M=I^{\prime} \otimes_{R / I} M / I M
$$

Then $I \rightarrow I^{\prime}$ is an injective map of $R / I$-modules. Since $M / I M$ is flat over $R / I$ the map

$$
I \otimes_{R / I} M / I M \longrightarrow I^{\prime} \otimes_{R / I} M / I M
$$

is injective. This implies that $K$ is zero in $I \otimes_{R} M=I \otimes_{R / I} M / I M$ as desired.
051J Lemma 10.100.5. Let $\varphi: R \rightarrow R^{\prime}$ be a ring map. Let $I \subset R$ be an ideal. Let $M$ be an R-module. Assume
(1) $I$ is nilpotent,
(2) $R \rightarrow R^{\prime}$ is injective,
(3) $M / I M$ is flat over $R / I$, and
(4) $R^{\prime} \otimes_{R} M$ is flat over $R^{\prime}$.

Then $M$ is flat over $R$.
Proof. Define inductively $I_{1}=I$ and $I_{n+1}=\varphi^{-1}\left(\varphi\left(I_{n}\right)^{2} R^{\prime}\right)$ for $n \geq 1$. Note that by Lemma 10.100.4 we find that $M / I_{n} M$ is flat over $R / I_{n}$ for each $n \geq 1$. It is clear that $\varphi\left(I_{n}\right) \subset \varphi(I)^{2^{n}} R^{\prime}$. Since $I$ is nilpotent we see that $\varphi\left(I_{n}\right)=0$ for some $n$. As $\varphi$ is injective we conclude that $I_{n}=0$ for some $n$ and we win.

Here is the local Artinian version of the local criterion for flatness.
051K Lemma 10.100.6. Let $R$ be an Artinian local ring. Let $M$ be an $R$-module. Let $I \subset R$ be a proper ideal. The following are equivalent
(1) $M$ is flat over $R$, and
(2) $M / I M$ is flat over $R / I$ and $\operatorname{Tor}_{1}^{R}(R / I, M)=0$.

Proof. The implication $(1) \Rightarrow(2)$ follows immediately from the definitions. Assume $M / I M$ is flat over $R / I$ and $\operatorname{Tor}_{1}^{R}(R / I, M)=0$. By Lemma 10.100.2 this implies that $M / I M$ is free over $R / I$. Pick a set $A$ and elements $x_{\alpha} \in M$ such that the images in $M / I M$ form a basis. By Lemma 10.100 .3 we conclude that $M$ is free and in particular flat.

It turns out that flatness descends along injective homomorphism whose source is an Artinian ring.

051L Lemma 10.100.7. Let $R \rightarrow S$ be a ring map. Let $M$ be an $R$-module. Assume
(1) $R$ is Artinian
(2) $R \rightarrow S$ is injective, and
(3) $M \otimes_{R} S$ is a flat $S$-module.

Then $M$ is a flat $R$-module.
Proof. First proof: Let $I \subset R$ be the radical of $R$. Then $I$ is nilpotent and $M / I M$ is flat over $R / I$ as $R / I$ is a product of fields, see Section 10.52 . Hence $M$ is flat by an application of Lemma 10.100.5.
Second proof: By Lemma 10.52 .6 we may write $R=\prod R_{i}$ as a finite product of local Artinian rings. This induces similar product decompositions for both $R$ and $S$. Hence we reduce to the case where $R$ is local Artinian (details omitted).
Assume that $R \rightarrow S, M$ are as in the lemma satisfying (1), (2), and (3) and in addition that $R$ is local with maximal ideal $\mathfrak{m}$. Let $A$ be a set and $x_{\alpha} \in A$ be elements such that $\bar{x}_{\alpha}$ forms a basis for $M / \mathfrak{m} M$ over $R / \mathfrak{m}$. By Nakayama's Lemma 10.19.1 we see that the elements $x_{\alpha}$ generate $M$ as an $R$-module. Set $N=S \otimes_{R} M$ and $I=\mathfrak{m} S$. Then $\left\{1 \otimes x_{\alpha}\right\}_{\alpha \in A}$ is a family of elements of $N$ which form a basis for $N / I N$. Moreover, since $N$ is flat over $S$ we have $\operatorname{Tor}_{1}^{S}(S / I, N)=0$. Thus we conclude from Lemma 10.100 .3 that $N$ is free on $\left\{1 \otimes x_{\alpha}\right\}_{\alpha \in A}$. The injectivity of $R \rightarrow S$ then guarantees that there cannot be a nontrivial relation among the $x_{\alpha}$ with coefficients in $R$.

Please compare the lemma below to Lemma 10.98 .15 (the case of Noetherian local rings) and Lemma 10.127 .8 (the case of finitely presented algebras).
06A5 Lemma 10.100.8 (Critère de platitude par fibres: Nilpotent case). Let

be a commutative diagram in the category of rings. Let $I \subset R$ be a nilpotent ideal and $M$ an $S^{\prime}$-module. Assume
(1) The module $M / I M$ is a flat $S / I S$-module.
(2) The module $M$ is a flat $R$-module.

Then $M$ is a flat $S$-module and $S_{\mathfrak{q}}$ is flat over $R$ for every $\mathfrak{q} \subset S$ such that $M \otimes_{S} \kappa(\mathfrak{q})$ is nonzero.

Proof. As $M$ is flat over $R$ tensoring with the short exact sequence $0 \rightarrow I \rightarrow R \rightarrow$ $R / I \rightarrow 0$ gives a short exact sequence

$$
0 \rightarrow I \otimes_{R} M \rightarrow M \rightarrow M / I M \rightarrow 0
$$

Note that $I \otimes_{R} M \rightarrow I S \otimes_{S} M$ is surjective. Combined with the above this means both maps in

$$
I \otimes_{R} M \rightarrow I S \otimes_{S} M \rightarrow M
$$

are injective. Hence $\operatorname{Tor}_{1}^{S}(I S, M)=0$ (see Remark 10.74.9) and we conclude that $M$ is a flat $S$-module by Lemma 10.98 .8 . To finish we need to show that $S_{\mathfrak{q}}$ is flat
over $R$ for any prime $\mathfrak{q} \subset S$ such that $M \otimes_{S} \kappa(\mathfrak{q})$ is nonzero. This follows from Lemma 10.38 .15 and 10.38 .10 .

### 10.101. What makes a complex exact?

00MR Some of this material can be found in the paper BE73 by Buchsbaum and Eisenbud.

00 MS Situation 10.101.1. Here $R$ is a ring, and we have a complex

$$
0 \rightarrow R^{n_{e}} \xrightarrow{\varphi_{e}} R^{n_{e-1}} \xrightarrow{\varphi_{e-1}} \ldots \xrightarrow{\varphi_{i+1}} R^{n_{i}} \xrightarrow{\varphi_{i}} R^{n_{i-1}} \xrightarrow{\varphi_{i-1}} \ldots \xrightarrow{\varphi_{1}} R^{n_{0}}
$$

In other words we require $\varphi_{i} \circ \varphi_{i+1}=0$ for $i=1, \ldots, e-1$.
00MT Lemma 10.101.2. In Situation 10.101.1. Suppose $R$ is a local ring with maximal ideal $\mathfrak{m}$. Suppose that for some $i, e \leq i \leq 1$ some matrix coefficient of the map $\varphi_{i}$ is invertible. Then the complex $0 \rightarrow R^{n_{e}} \rightarrow R^{n_{e-1}} \rightarrow \ldots \rightarrow R^{n_{0}}$ is isomorphic to the direct sum of a complex $0 \rightarrow R^{n_{e}} \rightarrow \ldots \rightarrow R^{n_{i}-1} \rightarrow R^{n_{i-1}-1} \rightarrow \ldots \rightarrow R^{n_{0}}$ and the complex $0 \rightarrow 0 \rightarrow \ldots \rightarrow R \rightarrow R \rightarrow 0 \rightarrow \ldots \rightarrow 0$ where the map $R \rightarrow R$ is the identity map.

Proof. The assumption means, after a change of basis of $R^{n_{i}}$ and $R^{n_{i-1}}$ that the first basis vector of $R^{n_{i}}$ is mapped via $\varphi_{i}$ to the first basis vector of $R^{n_{i-1}}$. Let $e_{j}$ denote the $j$ th basis vector of $R^{n_{i}}$ and $f_{k}$ the $k$ th basis vector of $R^{n_{i-1}}$. Write $\varphi_{i}\left(e_{j}\right)=\sum a_{j k} f_{k}$. So $a_{1 k}=0$ unless $k=1$ and $a_{11}=1$. Change basis on $R^{n_{i}}$ again by setting $e_{j}^{\prime}=e_{j}-a_{j 1} e_{1}$ for $j>1$. After this change of coordinates we have $a_{j 1}=0$ for $j>1$. Note the image of $R^{n_{i+1}} \rightarrow R^{n_{i}}$ is contained in the subspace spanned by $e_{j}, j>1$. Note also that $R^{n_{i-1}} \rightarrow R^{n_{i-2}}$ has to annihilate $f_{1}$ since it is in the image. These conditions and the shape of the matrix $\left(a_{j k}\right)$ for $\varphi_{i}$ imply the lemma.

Let us say that an acyclic complex of the form $\ldots \rightarrow 0 \rightarrow R \rightarrow R \rightarrow 0 \rightarrow \ldots$ is trivial. The lemma above clearly says that any finite complex of finite free modules over a local ring is up to direct sums with trivial complexes the same as a complex all of whose maps have all matrix coefficients in the maximal ideal.

00MU Lemma 10.101.3. In Situation 10.101.1. Let $R$ be a Artinian local ring. Suppose that $0 \rightarrow R^{n_{e}} \rightarrow R^{n_{e-1}} \rightarrow \ldots \rightarrow R^{n_{0}}$ is an exact complex. Then the complex is isomorphic to a direct sum of trivial complexes.

Proof. By induction on the integer $\sum n_{i}$. Clearly $\operatorname{Ass}(R)=\{\mathfrak{m}\}$. Pick $x \in R$, $x \neq 0, \mathfrak{m} x=0$. Pick a basis vector $e_{i} \in R^{n_{e}}$. Since $x e_{i}$ is not mapped to zero by exactness of the complex we deduce that some matrix coefficient of the map $R^{n_{e}} \rightarrow R^{n_{e-1}}$ is not in $\mathfrak{m}$. Lemma 10.101 .2 then allows us to decrease $\sum n_{i}$.

Below we define the rank of a map of finite free modules. This is just one possible definition of rank. It is just the definition that works in this section; there are others that may be more convenient in other settings.

00MV Definition 10.101.4. Let $R$ be a ring. Suppose that $\varphi: R^{m} \rightarrow R^{n}$ is a map of finite free modules.
(1) The rank of $\varphi$ is the maximal $r$ such that $\wedge^{r} \varphi: \wedge^{r} R^{m} \rightarrow \wedge^{r} R^{n}$ is nonzero.
(2) We let $I(\varphi) \subset R$ be the ideal generated by the $r \times r$ minors of the matrix of $\varphi$, where $r$ is the rank as defined above.

00MW Lemma 10.101.5. In Situation 10.101.1, suppose the complex is isomorphic to $a$ direct sum of trivial complexes. Then we have
(1) the maps $\varphi_{i}$ have rank $r_{i}=n_{i}-n_{i+1}+\ldots+(-1)^{e-i-1} n_{e-1}+(-1)^{e-i} n_{e}$,
(2) for all $i, 1 \leq i \leq e$ we have $\operatorname{rank}\left(\varphi_{i+1}\right)+\operatorname{rank}\left(\varphi_{i}\right)=n_{i}$,
(3) each $I\left(\varphi_{i}\right)=R$.

Proof. We may assume the complex is the direct sum of trivial complexes. Then for each $i$ we can split the standard basis elements of $R^{n_{i}}$ into those that map to a basis element of $R^{n_{i-1}}$ and those that are mapped to zero (and these are mapped onto by basis elements of $R^{n_{i+1}}$ ). Using descending induction starting with $i=e$ it is easy to prove that there are $r_{i+1}$-basis elements of $R^{n_{i}}$ which are mapped to zero and $r_{i}$ which are mapped to basis elements of $R^{n_{i-1}}$. From this the result follows.

00MX Lemma 10.101.6. Let $R$ be a local Noetherian ring. Suppose that $\varphi: R^{m} \rightarrow R^{n}$ is a map of finite free modules. The following are equivalent
(1) $\varphi$ is injective.
(2) the rank of $\varphi$ is $m$ and either $I(\varphi)=R$ or it contains a nonzerodivisor.

Proof. If any matrix coefficient of $\varphi$ is not in $\mathfrak{m}$, then we apply Lemma 10.101.2 to write $\varphi$ as the sum of $1: R \rightarrow R$ and a map $\varphi^{\prime}: R^{m-1} \rightarrow R^{n-1}$. It is easy to see that the lemma for $\varphi^{\prime}$ implies the lemma for $\varphi$. Thus we may assume from the outset that all the matrix coefficients of $\varphi$ are in $\mathfrak{m}$.

Suppose $\varphi$ is injective. We may assume $m>0$. Let $\mathfrak{q} \in \operatorname{Ass}(R)$. Let $x \in R$ be an element whose annihilator is $\mathfrak{q}$. Note that $\varphi$ induces a injective map $x R^{m} \rightarrow x R^{n}$ which is isomorphic to the map $\varphi_{\mathfrak{q}}:(R / \mathfrak{q})^{m} \rightarrow(R / \mathfrak{q})^{n}$ induced by $\varphi$. Since $R / \mathfrak{q}$ is a domain we deduce immediately by localizing to its fraction field that the rank of $\varphi_{\mathfrak{q}}$ is $m$ and that $I\left(\varphi_{\mathfrak{q}}\right)$ is not the zero ideal. Hence we conclude by Lemma 10.62.18.

Conversely, assume that the rank of $\varphi$ is $m$ and that $I(\varphi)$ contains a nonzerodivisor $x$. The rank being $m$ implies $n \geq m$. By Lemma 10.14.4 we can find a map $\psi: R^{n} \rightarrow R^{m}$ such that $\psi \circ \varphi=x \operatorname{id}_{R^{m}}$. Thus $\varphi$ is injective.

00MY Lemma 10.101.7. In Situation 10.101.1. Suppose $R$ is a local Noetherian ring with maximal ideal $\mathfrak{m}$. Assume $\mathfrak{m} \in A s s(R)$, in other words $R$ has depth 0 . Suppose that the complex is exact. In this case the complex is isomorphic to a direct sum of trivial complexes.

Proof. The proof is the same as in Lemma 10.101.3, except using Lemma 10.101.6 to guarantee that $I\left(\varphi_{e}\right)=R$, and hence some matrix coefficient of $\varphi_{e}$ is not in $\mathfrak{m}$.

00MZ Lemma 10.101.8. In Situation 10.101.1, suppose $R$ is a local Noetherian ring, and suppose that the complex is exact. Let $x$ be an element of the maximal ideal which is a nonzerodivisor. The complex $0 \rightarrow(R / x R)^{n_{e}} \rightarrow \ldots \rightarrow(R / x R)^{n_{1}}$ is still exact.

Proof. Follows easily from the snake lemma.
00N0 Lemma 10.101.9 (Acyclicity lemma). Let $R$ be a local Noetherian ring. Let $0 \rightarrow$ $M_{e} \rightarrow M_{e-1} \rightarrow \ldots \rightarrow M_{0}$ be a complex of finite $R$-modules. Assume depth $\left(M_{i}\right) \geq i$.

Let $i$ be the largest index such that the complex is not exact at $M_{i}$. If $i>0$ then $\operatorname{Ker}\left(M_{i} \rightarrow M_{i-1}\right) / \operatorname{Im}\left(M_{i+1} \rightarrow M_{i}\right)$ has depth $\geq 1$.
Proof. Let $H=\operatorname{Ker}\left(M_{i} \rightarrow M_{i-1}\right) / \operatorname{Im}\left(M_{i+1} \rightarrow M_{i}\right)$ be the cohomology group in question. We may break the complex into short exact sequences $0 \rightarrow M_{e} \rightarrow$ $M_{e-1} \rightarrow K_{e-2} \rightarrow 0,0 \rightarrow K_{j} \rightarrow M_{j} \rightarrow K_{j-1} \rightarrow 0$, for $i+2 \leq j \leq e-2$, $0 \rightarrow K_{i+1} \rightarrow M_{i+1} \rightarrow B_{i} \rightarrow 0,0 \rightarrow K_{i} \rightarrow M_{i} \rightarrow M_{i-1}$, and $0 \rightarrow B_{i} \rightarrow K_{i} \rightarrow$ $H \rightarrow 0$. We proceed up through these complexes to prove the statements about depths, repeatedly using Lemma 10.71 .6 First of all, since $\operatorname{depth}\left(M_{e}\right) \geq e$, and $\operatorname{depth}\left(M_{e-1}\right) \geq e-1$ we deduce that $\operatorname{depth}\left(K_{e-2}\right) \geq e-1$. At this point the sequences $0 \rightarrow K_{j} \rightarrow M_{j} \rightarrow K_{j-1} \rightarrow 0$ for $i+2 \leq j \leq e-2$ imply similarly that $\operatorname{depth}\left(K_{j-1}\right) \geq j$ for $i+2 \leq j \leq e-2$. The sequence $0 \rightarrow K_{i+1} \rightarrow M_{i+1} \rightarrow B_{i} \rightarrow 0$ then shows that $\operatorname{depth}\left(B_{i}\right) \geq i+1$. The sequence $0 \rightarrow K_{i} \rightarrow M_{i} \rightarrow M_{i-1}$ shows that depth $\left(K_{i}\right) \geq 1$ since $M_{i}$ has depth $\geq i \geq 1$ by assumption. The sequence $0 \rightarrow B_{i} \rightarrow K_{i} \rightarrow H \rightarrow 0$ then implies the result.

00N1 Proposition 10.101.10. In Situation 10.101.1, suppose $R$ is a local Noetherian ring. The complex is exact if and only if for all $i, 1 \leq i \leq e$ the following two conditions are satisfied:
(1) we have $\operatorname{rank}\left(\varphi_{i+1}\right)+\operatorname{rank}\left(\varphi_{i}\right)=n_{i}$, and
(2) $I\left(\varphi_{i}\right)=R$, or $I\left(\varphi_{i}\right)$ contains a regular sequence of length $i$.

Proof. This proof is very similar to the proof of Lemma 10.101 .6 . As in the proof of Lemma 10.101 .6 we may assume that all matrix entries of each $\varphi_{i}$ are elements of the maximal ideal. We may also assume that $e \geq 1$.

Assume the complex is exact. Let $q \in \operatorname{Ass}(R)$. (There is at least one such prime.) Note that the ring $R_{\mathfrak{q}}$ has depth 0 . We apply Lemmas 10.101 .7 and 10.101 .5 to the localized complex over $R_{\mathfrak{q}}$. All of the ideals $I\left(\varphi_{i}\right)_{\mathfrak{q}}, e \geq i \geq 1$ are equal to $R_{\mathfrak{q}}$. Thus none of the ideals $I\left(\varphi_{i}\right)$ is contained in $\mathfrak{q}$. This implies that $I\left(\varphi_{e}\right) I\left(\varphi_{e-1}\right) \ldots I\left(\varphi_{1}\right)$ is not contained in any of the associated primes of $R$. By Lemma 10.14.2 we may choose $x \in I\left(\varphi_{e}\right) I\left(\varphi_{e-1}\right) \ldots I\left(\varphi_{1}\right), x \notin \mathfrak{q}$ for all $q \in \operatorname{Ass}(R)$. According to Lemma 10.101 .8 the complex $0 \rightarrow(R / x R)^{n_{e}} \rightarrow \ldots \rightarrow(R / x R)^{n_{1}}$ is exact. By induction on $e$ all the ideals $I\left(\varphi_{i}\right) / x R$ have a regular sequence of length $i-1$. This proves that $I\left(\varphi_{i}\right)$ contains a regular sequence of length $i$.

Assume the two conditions on the ranks of $\varphi_{i}$ and the ideals $I\left(\varphi_{i}\right)$ is satisfied. Note that $I\left(\varphi_{i}\right) \subset \mathfrak{m}$ for all $i$ because of what was said in the first paragraph of the proof. Hence the assumption in particular implies that $\operatorname{depth}(R) \geq e$. By induction on the dimension of $R$ we may assume the complex is exact when localized at any nonmaximal prime of $R$. Thus $\operatorname{Ker}\left(\varphi_{i}\right) / \operatorname{Im}\left(\varphi_{i+1}\right)$ has support $\{\mathfrak{m}\}$ and hence (if nonzero) depth 0 . By Lemma 10.101 .9 we see that the complex is exact.

### 10.102. Cohen-Macaulay modules

00N2 Here we show that Cohen-Macaulay modules have good properties. We postpone using Ext groups to establish the connection with duality and so on.
00N3 Definition 10.102.1. Let $R$ be a Noetherian local ring. Let $M$ be a finite $R$ module. We say $M$ is Cohen-Macaulay if $\operatorname{dim}(\operatorname{Support}(M))=\operatorname{depth}(M)$.
We start with an innocuous observation.

0AAD Lemma 10.102.2. Let $R \rightarrow S$ be a surjective homomorphism of Noetherian local rings. Let $N$ be a finite $S$-module. Then $N$ is Cohen-Macaulay as an $S$-module if and only if $N$ is Cohen-Macaulay as an $R$-module.

Proof. Omitted.
Let $R$ be a local Noetherian ring. Let $M$ be a Cohen-Macaulay module, and let $f_{1}, \ldots, f_{d}$ be an $M$-regular sequence with $d=\operatorname{dim}(\operatorname{Support}(M))$. We say that $g \in \mathfrak{m}$ is good with respect to $\left(M, f_{1}, \ldots, f_{d}\right)$ if for all $i=0,1, \ldots, d-1$ we have $\operatorname{dim}\left(\operatorname{Support}(M) \cap V\left(g, f_{1}, \ldots, f_{i}\right)\right)=d-i-1$. This is equivalent to the condition that $\operatorname{dim}\left(\operatorname{Support}\left(M /\left(f_{1}, \ldots, f_{i}\right) M\right) \cap V(g)\right)=d-i-1$ for $i=0,1, \ldots, d-1$.

00N4 Lemma 10.102.3. Notation and assumptions as above. If $g$ is good with respect to $\left(M, f_{1}, \ldots, f_{d}\right)$, then (a) $g$ is a nonzerodivisor on $M$, and (b) $M / g M$ is CohenMacaulay with maximal regular sequence $f_{1}, \ldots, f_{d-1}$.

Proof. We prove the lemma by induction on $d$. If $d=0$, then $M$ is finite and there is no case to which the lemma applies. If $d=1$, then we have to show that $g: M \rightarrow M$ is injective. The kernel $K$ has support $\{\mathfrak{m}\}$ because by assumption $\operatorname{dim} \operatorname{Supp}(M) \cap V(g)=0$. Hence $K$ has finite length. Hence $f_{1}: K \rightarrow K$ injective implies the length of the image is the length of $K$, and hence $f_{1} K=K$, which by Nakayama's Lemma 10.19.1 implies $K=0$. Also, $\operatorname{dim} \operatorname{Supp}(M / g M)=0$ and so $M / g M$ is Cohen-Macaulay of depth 0 .

For $d>1$ we essentially argue in the same way. Let $K \subset M$ be the kernel of multiplication by $g$. As above $f_{1}: K \rightarrow K$ cannot be surjective if $K \neq 0$ Consider the commutative diagram

$$
\begin{array}{llccccccc}
0 & \rightarrow & M & \xrightarrow{f_{1}} & M & \rightarrow & M / f_{1} M & \rightarrow & 0 \\
& & \downarrow & & \downarrow g & & \downarrow g & & \\
0 & \rightarrow & M & \xrightarrow{f_{1}} & M & \rightarrow & M / f_{1} M & \rightarrow & 0
\end{array}
$$

This shows that the kernel $K_{1}$ of $g: M / f_{1} M \rightarrow M / f_{1} M$ cannot be zero if $K$ is not zero. But $g$ is good for $\left(M / f_{1} M, f_{2}, \ldots, f_{d}\right)$, as is easy seen from the definition. We conclude that $K_{1}=0$, and so $K=0$. From the snake lemma we see that $0 \rightarrow M / g M \rightarrow M / g M \rightarrow M /\left(f_{1}, g\right) M \rightarrow 0$ is exact. By induction, we have that $M /\left(g, f_{1}\right) M$ is Cohen-Macaulay with regular sequence $f_{2}, \ldots, f_{d-1}$. Thus $M / g M$ is Cohen-Macaulay with regular sequence $f_{1}, \ldots, f_{d-1}$.

00N5 Lemma 10.102.4. Let $R$ be a Noetherian local ring. Let $M$ be a Cohen-Macaulay module over $R$. Suppose $g \in \mathfrak{m}$ is such that $\operatorname{dim}(\operatorname{Supp}(M) \cap V(g))=\operatorname{dim}(\operatorname{Supp}(M))-$ 1. Then (a) $g$ is a nonzerodivisor on $M$, and (b) $M / g M$ is Cohen-Macaulay of depth one less.

Proof. Choose a $M$-regular sequence $f_{1}, \ldots, f_{d}$ with $d=\operatorname{dim}(\operatorname{Supp}(M))$. If $g$ is is good with respect to $\left(M, f_{1}, \ldots, f_{d}\right)$ we win by Lemma 10.102.3. In particular the lemma holds if $d=1$. (The case $d=0$ does not occur.) Assume $d>1$. Choose an element $h \in R$ such that (a) $h$ is good with respect to $\left(M, f_{1}, \ldots, f_{d}\right)$, and (b) $\operatorname{dim}\left(\operatorname{Supp}(M) \cap V(h, g)=d-2\right.$. To see $h$ exists, let $\left\{\mathfrak{q}_{i}\right\}$ be the (finite) set of minimal primes of the closed sets $\operatorname{Supp}(M), \operatorname{Supp}(M) \cap V\left(f_{1}, \ldots, f_{i}\right), i=1, \ldots, d-1$, and $\operatorname{Supp}(M) \cap V(g)$. None of these $\mathfrak{q}_{i}$ is equal to $\mathfrak{m}$ and hence we may find $h \in \mathfrak{m}$, $h \notin \mathfrak{q}_{i}$ by Lemma 10.14.2, It is clear that $h$ satisfies (a) and (b). At this point we may apply Lemma 10.102 .3 to conclude that $M / h M$ is Cohen-Macaulay. By (b) we
see that the pair $(M / h M, g)$ satisfies the induction hypothesis. Hence $M /(h, g) M$ is Cohen-Macaulay, and $g: M / h M \rightarrow M / h M$ is injective. From this it follows easily that $g: M \rightarrow M$ is injective, by a snake lemma argument. This in its turn implies that $h: M / g M \rightarrow M / g M$ is injective. Combined with the fact that $M /(g, h) M$ is Cohen-Macaulay this finishes the proof.

00N6 Proposition 10.102.5. Let $R$ be a Noetherian local ring, with maximal ideal $\mathfrak{m}$. Let $M$ be a Cohen-Macaulay module over $R$ whose support has dimension $d$. Suppose that $g_{1}, \ldots, g_{c}$ are elements of $\mathfrak{m}$ such that $\operatorname{dim}\left(\operatorname{Supp}\left(M /\left(g_{1}, \ldots, g_{c}\right) M\right)\right)=$ $d-c$. Then $g_{1}, \ldots, g_{c}$ is an $M$-regular sequence, and can be extended to a maximal $M$-regular sequence.

Proof. Let $Z=\operatorname{Supp}(M) \subset \operatorname{Spec}(R)$. By Lemma 10.59 .12 in the chain $Z \supset$ $Z \cap V\left(g_{1}\right) \supset \ldots \supset Z \cap V\left(g_{1}, \ldots, g_{c}\right)$ each step decreases the dimension at most by 1. Hence by assumption each step decreases the dimension by exactly 1 each time. Thus we may successively apply Lemma 10.102 .4 to the modules $M /\left(g_{1}, \ldots, g_{i}\right)$ and the element $g_{i+1}$.

To extend $g_{1}, \ldots, g_{c}$ by one element if $c<d$ we simply choose an element $g_{c+1} \in \mathfrak{m}$ which is not in any of the finitely many minimal primes of $Z \cap V\left(g_{1}, \ldots, g_{c}\right)$, using Lemma 10.14.2.

00NF Definition 10.102.6. Let $R$ be a Noetherian local ring. A finite module $M$ over $R$ is called a maximal Cohen-Macaulay module if $\operatorname{depth}(M)=\operatorname{dim}(R)$.

In other words, a maximal Cohen-Macaulay module over a Noetherian local ring is a finite module with the largest possible depth over that ring. Equivalently, a maximal Cohen-Macaulay module over a Noetherian local ring $R$ is a CohenMacaulay module of dimension equal to the dimension of the ring. In particular, if $M$ is a Cohen-Macaulay $R$-module with $\operatorname{Spec}(R)=\operatorname{Supp}(M)$, then $M$ is maximal Cohen-Macaulay. Thus the following two lemmas are on maximal Cohen-Macaulay modules.

0AAE Lemma 10.102.7. Let $R$ be a Noetherian local ring. Assume there exists a CohenMacaulay module $M$ with $\operatorname{Spec}(R)=\operatorname{Supp}(M)$. Then any maximal chain of ideals $\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{n}$ has length $n=\operatorname{dim}(R)$.

Proof. We will prove this by induction on $\operatorname{dim}(R)$. If $\operatorname{dim}(R)=0$, then the statement is clear. Assume $\operatorname{dim}(R)>0$. Then $n>0$. Choose an element $x \in \mathfrak{p}_{1}$, with $x$ not in any of the minimal primes of $R$, and in particular $x \notin \mathfrak{p}_{0}$. (See Lemma 10.14.2 ) Then $\operatorname{dim}(R / x R)=\operatorname{dim}(R)-1$ by Lemma 10.59.12. The module $M / x M$ is Cohen-Macaulay over $R / x R$ by Proposition 10.102.5 and Lemma 10.102.2. The support of $M / x M$ is $\operatorname{Spec}(R / x R)$ by Lemma 10.39.8. By induction the chain $\mathfrak{p}_{1} / x R \subset \ldots \subset \mathfrak{p}_{n} / x R$ in $R / x R$ has length $\operatorname{dim}(R / x R)=\operatorname{dim}(R)-1$.

0AAF Lemma 10.102.8. Suppose $R$ is a Noetherian local ring. Assume there exists a Cohen-Macaulay module $M$ with $\operatorname{Spec}(R)=\operatorname{Supp}(M)$. Then for a prime $\mathfrak{p} \subset R$ we have

$$
\operatorname{dim}(R)=\operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}(R / \mathfrak{p})
$$

Proof. Follows immediately from Lemma 10.102 .7

0AAG Lemma 10.102.9. Suppose $R$ is a Noetherian local ring. Let $M$ be a CohenMacaulay module over $R$. For any prime $\mathfrak{p} \subset R$ the module $M_{\mathfrak{p}}$ is Cohen-Macaulay over $R_{p}$.
Proof. Choose a maximal chain of primes $\mathfrak{p}=\mathfrak{p}_{c} \subset \mathfrak{p}_{c-1} \subset \ldots \subset \mathfrak{p}_{1} \subset \mathfrak{m}$. If we prove the result for $M_{\mathfrak{p}_{1}}$ over $R_{\mathfrak{p}_{1}}$, then the lemma will follow by induction on $c$. Thus we may assume that there is no prime strictly between $\mathfrak{p}$ and $\mathfrak{m}$.

If $M_{\mathfrak{p}}=0$, then the lemma holds. Assume $M_{\mathfrak{p}} \neq 0$. We have $\operatorname{dim}\left(\operatorname{Supp}\left(M_{\mathfrak{p}}\right)\right) \leq$ $\operatorname{dim}(\operatorname{Supp}(M))-1$ as a chain of primes in the support of $M_{\mathfrak{p}}$ is a chain a primes in the support of $M$ not including $\mathfrak{m}$. Thus it suffices to show that the depth of $M_{\mathfrak{p}}$ is at least the depth of $M$ minus 1 . We will prove by induction on the depth of $M$ that there exists an $M$-regular sequence $f_{1}, \ldots, f_{\text {depth }(M)-1}$ in $\mathfrak{p}$. This will prove the lemma since localization at $\mathfrak{p}$ is exact. Since $\operatorname{depth}(M)=\operatorname{dim}((\operatorname{Supp}(M)) \geq$ $\operatorname{dim}\left(\operatorname{Supp}\left(M_{\mathfrak{p}}\right)\right)+1 \geq 1$ we see that the base case happens when the depth of $M$ is 1 and this case is trivial. Assume the depth of $M$ is at least 2.
Let $I \subset R$ be the annihilator of $M$ such that $\operatorname{Spec}(R / I)=V(I)=\operatorname{Supp}(M)$ (Lemma 10.39.5). By Lemmas 10.102.2 and 10.102.7 every maximal chain of primes in $V(I)$ has length $\geq 2$. Hence none of the minimal primes of $V(I)$ are equal to $\mathfrak{p}$. Thus we can use Lemma 10.14 .2 to find a $f_{1} \in \mathfrak{p}$ which is not contained in any of the minimal primes of $V(I)$. Then $f_{1}$ is a nonzerodivisor on $M$ and $M / f_{1} M$ has depth exactly one less by Lemma 10.102.4. By induction we can extend to an $M$-regular sequence $f_{1}, \ldots, f_{r} \in \mathfrak{p}$ with $r=\operatorname{depth}(M)-1$ as desired.

0AAH Definition 10.102.10. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. We say $M$ is Cohen-Macaulay if $M_{\mathfrak{p}}$ is a Cohen-Macaulay module over $R_{\mathfrak{p}}$ for all primes $\mathfrak{p}$ of $R$.
By Lemma 10.102 .9 it suffices to check this in the maximal ideals of $R$.
OAAI Lemma 10.102.11. Let $R$ be a Noetherian ring. Let $M$ be a Cohen-Macaulay module over $R$. Then $M \otimes_{R} R\left[x_{1}, \ldots, x_{n}\right]$ is a Cohen-Macaulay module over $R\left[x_{1}, \ldots, x_{n}\right]$.
Proof. By induction on the number of variables it suffices to prove this for $M[x]=$ $M \otimes_{R} R[x]$ over $R[x]$. Let $\mathfrak{m} \subset R[x]$ be a maximal ideal, and let $\mathfrak{p}=R \cap \mathfrak{m}$. Let $f_{1}, \ldots, f_{d}$ be a $M_{\mathfrak{p}}$-regular sequence in the maximal ideal of $R_{\mathfrak{p}}$ of length $d=$ $\operatorname{dim}\left(\operatorname{Supp}\left(M_{\mathfrak{p}}\right)\right)$. Note that since $R[x]$ is flat over $R$ the localization $R[x]_{\mathfrak{m}}$ is flat over $R_{\mathfrak{p}}$. Hence, by Lemma 10.67 .5 , the sequence $f_{1}, \ldots, f_{d}$ is a $M[x]_{\mathfrak{m}}$-regular sequence of length $d$ in $R[x]_{\mathfrak{m}}$. The quotient

$$
Q=M[x]_{\mathfrak{m}} /\left(f_{1}, \ldots, f_{d}\right) M[x]_{\mathfrak{m}}=M_{\mathfrak{p}} /\left(f_{1}, \ldots, f_{d}\right) M_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} R[x]_{\mathfrak{m}}
$$

has support equal to the primes lying over $\mathfrak{p}$ because $R_{\mathfrak{p}} \rightarrow R[x]_{\mathfrak{m}}$ is flat and the support of $M_{\mathfrak{p}} /\left(f_{1}, \ldots, f_{d}\right) M_{\mathfrak{p}}$ is equal to $\{\mathfrak{p}\}$ (details omitted; hint: follows from Lemmas 10.39 .4 and 10.39 .5 . Hence the dimension is 1 . To finish the proof it suffices to find a single $Q$-regular element $f \in \mathfrak{m}$. Since $\mathfrak{m}$ is a maximal ideal, the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{m})$ is finite (Theorem 10.33.1). Hence we can find $f \in \mathfrak{m}$ which viewed as a polynomial in $x$ has leading coefficient not in $\mathfrak{p}$. Such an $f$ acts as a nonzerodivisor on

$$
M_{\mathfrak{p}} /\left(f_{1}, \ldots, f_{d}\right) M_{\mathfrak{p}} \otimes_{R} R[x]=\bigoplus_{n \geq 0} M_{\mathfrak{p}} /\left(f_{1}, \ldots, f_{d}\right) M_{\mathfrak{p}} \cdot x^{n}
$$

and hence acts as a nonzerodivisor on $Q$.

### 10.103. Cohen-Macaulay rings

00N7 Most of the results of this section are special cases of the results in Section 10.102 .
00N8 Definition 10.103.1. A Noetherian local ring $R$ is called Cohen-Macaulay if it is Cohen-Macaulay as a module over itself.

Note that this is equivalent to requiring the existence of a $R$-regular sequence $x_{1}, \ldots, x_{d}$ of the maximal ideal such that $R /\left(x_{1}, \ldots, x_{d}\right)$ has dimension 0 . We will usually just say "regular sequence" and not " $R$-regular sequence".

02JN Lemma 10.103.2. Let $R$ be a Noetherian local Cohen-Macaulay ring with maximal ideal $\mathfrak{m}$. Let $x_{1}, \ldots, x_{c} \in \mathfrak{m}$ be elements. Then

$$
x_{1}, \ldots, x_{c} \text { is a regular sequence } \Leftrightarrow \operatorname{dim}\left(R /\left(x_{1}, \ldots, x_{c}\right)\right)=\operatorname{dim}(R)-c
$$

If so $x_{1}, \ldots, x_{c}$ can be extended to a regular sequence of length $\operatorname{dim}(R)$ and each quotient $R /\left(x_{1}, \ldots, x_{i}\right)$ is a Cohen-Macaulay ring of dimension $\operatorname{dim}(R)-i$.

Proof. Special case of Proposition 10.102.5.
00N9 Lemma 10.103.3. Let $R$ be Noetherian local. Suppose $R$ is Cohen-Macaulay of dimension d. Any maximal chain of ideals $\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{n}$ has length $n=d$.

Proof. Special case of Lemma 10.102.7.
00NA Lemma 10.103.4. Suppose $R$ is a Noetherian local Cohen-Macaulay ring of dimension d. For any prime $\mathfrak{p} \subset R$ we have

$$
\operatorname{dim}(R)=\operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}(R / \mathfrak{p})
$$

Proof. Follows immediately from Lemma 10.103.3. (Also, this is a special case of Lemma 10.102.8.)

00NB Lemma 10.103.5. Suppose $R$ is a Cohen-Macaulay local ring. For any prime $\mathfrak{p} \subset R$ the ring $R_{\mathfrak{p}}$ is Cohen-Macaulay as well.

Proof. Special case of Lemma 10.102 .9 ,
00NC Definition 10.103.6. A Noetherian ring $R$ is called Cohen-Macaulay if all its local rings are Cohen-Macaulay.

00ND Lemma 10.103.7. Suppose $R$ is a Cohen-Macaulay ring. Any polynomial algebra over $R$ is Cohen-Macaulay.

Proof. Special case of Lemma 10.102.11.
00NE Lemma 10.103.8. Let $R$ be a Noetherian local Cohen-Macaulay ring of dimension d. Let $0 \rightarrow K \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$ be an exact sequence of $R$-modules. Then either $\operatorname{depth}(K)>\operatorname{depth}(M)$ or $\operatorname{depth}(K)=\operatorname{depth}(M)=d$.

Proof. If $\operatorname{depth}(M)=0$ the lemma is clear. Let $x \in \mathfrak{m}$ be a nonzerodivisor on $M$ and on $R$. Then $x$ is a nonzerodivisor on $M$ and on $K$ and it follows by an easy diagram chase that $0 \rightarrow K / x K \rightarrow(R / x R)^{n} \rightarrow M / x M \rightarrow 0$ is exact. Thus the result follows from the result for $K / x K$ over $R / x R$ which has smaller dimension.

00NG Lemma 10.103.9. Let $R$ be a local Noetherian Cohen-Macaulay ring of dimension d. Let $M$ be a finite $R$ module of depth $e$. There exists an exact complex

$$
0 \rightarrow K \rightarrow F_{d-e-1} \rightarrow \ldots \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

with each $F_{i}$ finite free and $K$ maximal Cohen-Macaulay.
Proof. Immediate from the definition and Lemma 10.103.8.
06LC Lemma 10.103.10. Let $\varphi: A \rightarrow B$ be a map of local rings. Assume that $B$ is Noetherian and Cohen-Macaulay and that $\mathfrak{m}_{B}=\sqrt{\varphi\left(\mathfrak{m}_{A}\right) B}$. Then there exists a sequence of elements $f_{1}, \ldots, f_{\operatorname{dim}(B)}$ in $A$ such that $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{\operatorname{dim}(B)}\right)$ is a regular sequence in $B$.

Proof. By induction on $\operatorname{dim}(B)$ it suffices to prove: If $\operatorname{dim}(B) \geq 1$, then we can find an element $f$ of $A$ which maps to a nonzerodivisor in $B$. By Lemma 10.103.2 it suffices to find $f \in A$ whose image in $B$ is not contained in any of the finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ of $B$. By the assumption that $\mathfrak{m}_{B}=\sqrt{\varphi\left(\mathfrak{m}_{A}\right) B}$ we see that $\mathfrak{m}_{A} \not \subset \varphi^{-1}\left(\mathfrak{q}_{i}\right)$. Hence we can find $f$ by Lemma 10.14.2.

### 10.104. Catenary rings

00NH
00NI Definition 10.104.1. A ring $R$ is said to be catenary if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$, all maximal chains of primes $\mathfrak{p}=\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{e}=\mathfrak{q}$ have the same (finite) length.

02IH Lemma 10.104.2. A ring $R$ is catenary if and only if the topological space $\operatorname{Spec}(R)$ is catenary (see Topology, Definition 5.10.4).
Proof. Immediate from the definition and the characterization of irreducible closed subsets in Lemma 10.25.1.

In general it is not the case that a finitely generated $R$-algebra is catenary if $R$ is. Thus we make the following definition.

00NL Definition 10.104.3. A ring $R$ is said to be universally catenary if $R$ is Noetherian and every $R$ algebra of finite type is catenary.

By Lemma 10.104 .6 this just means that $R$ is Noetherian and that each polynomial algebra $R\left[x_{1}, \ldots, x_{n}\right]$ is catenary.
00NJ Lemma 10.104.4. Any localization of a (universally) catenary ring is (universally) catenary.

Proof. Let $A$ be a ring and let $S \subset A$ be a multiplicative subset. The description of $\operatorname{Spec}\left(S^{-1} A\right)$ in Lemma 10.16 .5 shows that if $A$ is catenary, then so is $S^{-1} A$. If $S^{-1} A \rightarrow C$ is of finite type, then $C=S^{-1} B$ for some finite type ring map $A \rightarrow B$. Hence if $A$ is universally catenary, then $B$ is catenary and we see that $C$ is catenary too. Combined wtih Lemma 10.30 .1 this proves the lemma.

0AUN Lemma 10.104.5. Let $R$ be a ring. The following are equivalent
(1) $R$ is catenary,
(2) $R_{\mathfrak{p}}$ is catenary for all prime ideals $\mathfrak{p}$,
(3) $R_{\mathfrak{m}}$ is catenary for all maximal ideals $\mathfrak{m}$.

Assume $R$ is Noetherian. The following are equivalent
(1) $R$ is universally catenary,
(2) $R_{\mathfrak{p}}$ is universally catenary for all prime ideals $\mathfrak{p}$,
(3) $R_{\mathfrak{m}}$ is universally catenary for all maximal ideals $\mathfrak{m}$.

Proof. The implication $(1) \Rightarrow(2)$ follows from Lemma 10.104.4 in both cases. The implication $(2) \Rightarrow(3)$ is immediate in both cases. Assume $R \mathfrak{m}$ is catenary for all maximal ideals $\mathfrak{m}$ of $R$. If $\mathfrak{p} \subset \mathfrak{q}$ are primes in $R$, then choose a maximal ideal $\mathfrak{q} \subset \mathfrak{m}$. Chains of primes ideals between $\mathfrak{p}$ and $\mathfrak{q}$ are in 1-to-1 correspondence with chains of prime ideals between $\mathfrak{p} R_{\mathfrak{m}}$ and $\mathfrak{q} R_{\mathfrak{m}}$ hence we see $R$ is catenary. Assume $R$ is Noetherian and $R_{\mathfrak{m}}$ is universally catenary for all maximal ideals $\mathfrak{m}$ of $R$. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q}$ be a prime ideal of $S$ lying over the prime $\mathfrak{p} \subset R$. Choose a maximal ideal $\mathfrak{p} \subset \mathfrak{m}$ in $R$. Then $R_{\mathfrak{p}}$ is a localization of $R_{\mathfrak{m}}$ hence universally catenary by Lemma 10.104.4. Then $S_{\mathfrak{p}}$ is catenary as a finite type ring over $R_{\mathfrak{p}}$. Hence $S_{\mathfrak{q}}$ is catenary as a localization. Thus $S$ is catenary by the first case treated above.

00NK Lemma 10.104.6. Any quotient of a (universally) catenary ring is (universally) catenary.

Proof. Let $A$ be a ring and let $I \subset A$ be an ideal. The description of $\operatorname{Spec}(A / I)$ in Lemma 10.16 .7 shows that if $A$ is catenary, then so is $A / I$. If $A / I \rightarrow B$ is of finite type, then $A \rightarrow B$ is of finite type. Hence if $A$ is universally catenary, then $B$ is catenary. Combined wtih Lemma 10.30 .1 this proves the lemma.
0AUP Lemma 10.104.7. Let $R$ be a Noetherian ring.
(1) $R$ is catenary if and only if $R / \mathfrak{p}$ is catenary for every minimal prime $\mathfrak{p}$.
(2) $R$ is universally catenary if and only if $R / \mathfrak{p}$ is universally catenary for every minimal prime $\mathfrak{p}$.
Proof. If $\mathfrak{a} \subset \mathfrak{b}$ is an inclusion of primes of $R$, then we can find a minimal prime $\mathfrak{p} \subset \mathfrak{a}$ and the first assertion is clear. We omit the proof of the second.

00NM Lemma 10.104.8. A Cohen-Macaulay ring is universally catenary. More generally, if $R$ is a Noetherian ring and $M$ is a Cohen-Macaulay $R$-module with $\operatorname{Supp}(M)=\operatorname{Spec}(R)$, then $R$ is universally catenary.

Proof. Since a polynomial algebra over $R$ is Cohen-Macaulay, by Lemma 10.103.7. it suffices to show that a Cohen-Macaulay ring is catenary. Let $R$ be CohenMacaulay and $\mathfrak{p} \subset \mathfrak{q}$ primes of $R$. By definition $R_{\mathfrak{q}}$ and $R_{\mathfrak{p}}$ are Cohen-Macaulay. Take a maximal chain of primes $\mathfrak{p}=\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{n}=\mathfrak{q}$. Next choose a maximal chain of primes $\mathfrak{q}_{0} \subset \mathfrak{q}_{1} \subset \ldots \subset \mathfrak{q}_{m}=\mathfrak{p}$. By Lemma 10.103.3 we have $n+m=\operatorname{dim}\left(R_{\mathfrak{q}}\right)$. And we have $m=\operatorname{dim}\left(R_{\mathfrak{p}}\right)$ by the same lemma. Hence $n=\operatorname{dim}\left(R_{\mathfrak{q}}\right)-\operatorname{dim}\left(R_{\mathfrak{p}}\right)$ is independent of choices.
To prove the more general statement, argue exactly as above but using Lemmas 10.102 .11 and 10.102 .7 .

### 10.105. Regular local rings

00 NN It is not that easy to show that all prime localizations of a regular local ring are regular. In fact, quite a bit of the material developed so far is geared towards a proof of this fact. See Proposition 10.109 .5 and trace back the references.

00NO Lemma 10.105.1. Let $R$ be a regular local ring with maximal ideal $\mathfrak{m}$. The graded ring $\bigoplus \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ is isomorphic to the graded polynomial algebra $\kappa(\mathfrak{m})\left[X_{1}, \ldots, X_{d}\right]$.

Proof. Let $x_{1}, \ldots, x_{d}$ be a minimal set of generators for the maximal ideal $\mathfrak{m}$. By Definition 10.59 .9 this implies that $\operatorname{dim}(R)=d$. Write $\kappa=\kappa(\mathfrak{m})$. There is a surjection $\kappa\left[X_{1}, \ldots, X_{d}\right] \rightarrow \bigoplus \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$, which maps the class of $x_{i}$ in $\mathfrak{m} / \mathfrak{m}^{2}$ to $X_{i}$. Since $d(R)=d$ by Proposition 10.59 .8 we know that the numerical polynomial $n \mapsto \operatorname{dim}_{\kappa} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ has degree $d-1$. By Lemma 10.57 .10 we conclude that the surjection $\kappa\left[X_{1}, \ldots, X_{d}\right] \rightarrow \bigoplus \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ is an isomorphism.

00NP Lemma 10.105.2. Any regular local ring is a domain.
Proof. We will use that $\bigcap \mathfrak{m}^{n}=0$ by Lemma 10.50.4. Let $f, g \in R$ such that $f g=0$. Suppose that $f \in \mathfrak{m}^{a}$ and $g \in \mathfrak{m}^{b}$, with $a, b$ maximal. Since $f g=0 \in$ $\mathfrak{m}^{a+b+1}$ we see from the result of Lemma 10.105.1 that either $f \in \mathfrak{m}^{a+1}$ or $g \in \mathfrak{m}^{b+1}$. Contradiction.

00NQ Lemma 10.105.3. Let $R$ be a regular local ring and let $x_{1}, \ldots, x_{d}$ be a minimal set of generators for the maximal ideal $\mathfrak{m}$. Then $x_{1}, \ldots, x_{d}$ is a regular sequence, and each $R /\left(x_{1}, \ldots, x_{c}\right)$ is a regular local ring of dimension $d-c$. In particular $R$ is Cohen-Macaulay.

Proof. Note that $R / x_{1} R$ is a Noetherian local ring of dimension $\geq d-1$ by Lemma 10.59 .12 with $x_{2}, \ldots, x_{d}$ generating the maximal ideal. Hence it is a regular local ring by definition. Since $R$ is a domain by Lemma $10.105 .2 x_{1}$ is a nonzerodivisor.

00NR Lemma 10.105.4. Let $R$ be a regular local ring. Let $I \subset R$ be an ideal such that $R / I$ is a regular local ring as well. Then there exists a minimal set of generators $x_{1}, \ldots, x_{d}$ for the maximal ideal $\mathfrak{m}$ of $R$ such that $I=\left(x_{1}, \ldots, x_{c}\right)$ for some $0 \leq$ $c \leq d$.
Proof. Say $\operatorname{dim}(R)=d$ and $\operatorname{dim}(R / I)=d-c$. Denote $\overline{\mathfrak{m}}=\mathfrak{m} / I$ the maximal ideal of $R / I$. Let $\kappa=R / \mathfrak{m}$. We have

$$
\operatorname{dim}_{\kappa}\left(\left(I+\mathfrak{m}^{2}\right) / \mathfrak{m}^{2}\right)=\operatorname{dim}_{\kappa}\left(\mathfrak{m} / \mathfrak{m}^{2}\right)-\operatorname{dim}\left(\overline{\mathfrak{m}} / \overline{\mathfrak{m}}^{2}\right)=d-(d-c)=c
$$

by the definition of a regular local ring. Hence we can choose $x_{1}, \ldots, x_{c} \in I$ whose images in $\mathfrak{m} / \mathfrak{m}^{2}$ are linearly independent and supplement with $x_{c+1}, \ldots, x_{d}$ to get a minimal system of generators of $\mathfrak{m}$. The induced map $R /\left(x_{1}, \ldots, x_{c}\right) \rightarrow R / I$ is a surjection between regular local rings of the same dimension (Lemma 10.105.3). It follows that the kernel is zero, i.e., $I=\left(x_{1}, \ldots, x_{c}\right)$. Namely, if not then we would have $\operatorname{dim}(R / I)<\operatorname{dim}\left(R /\left(x_{1}, \ldots, x_{c}\right)\right)$ by Lemmas 10.105 .2 and 10.59.12.
00NS Lemma 10.105.5. Let $R$ be a Noetherian local ring. Let $x \in \mathfrak{m}$. Let $M$ be a finite $R$-module such that $x$ is a nonzerodivisor on $M$ and $M / x M$ is free over $R / x R$. Then $M$ is free over $R$.
Proof. Let $m_{1}, \ldots, m_{r}$ be elements of $M$ which map to a $R / x R$-basis of $M / x M$. By Nakayama's Lemma 10.19.1 $m_{1}, \ldots, m_{r}$ generate $M$. If $\sum a_{i} m_{i}=0$ is a relation, then $a_{i} \in x R$ for all $i$. Hence $a_{i}=b_{i} x$ for some $b_{i} \in R$. Hence the kernel $K$ of $R^{r} \rightarrow M$ satisfies $x K=K$ and hence is zero by Nakayama's lemma.

00NT Lemma 10.105.6. Let $R$ be a regular local ring. Any maximal Cohen-Macaulay module over $R$ is free.

Proof. Let $M$ be a maximal Cohen-Macaulay module over $R$. Let $x \in \mathfrak{m}$ be part of a regular sequence generating $\mathfrak{m}$. Then $x$ is a nonzerodivisor on $M$ by Proposition 10.102 .5 and $M / x M$ is a maximal Cohen-Macaulay module over $R / x R$. By induction on $\operatorname{dim}(R)$ we see that $M / x M$ is free. We win by Lemma 10.105.5.

00NU Lemma 10.105.7. Suppose $R$ is a Noetherian local ring. Let $x \in \mathfrak{m}$ be a nonzerodivisor such that $R / x R$ is a regular local ring. Then $R$ is a regular local ring. More generally, if $x_{1}, \ldots, x_{r}$ is a regular sequence in $R$ such that $R /\left(x_{1}, \ldots, x_{r}\right)$ is a regular local ring, then $R$ is a regular local ring.

Proof. This is true because $x$ together with the lifts of a system of minimal generators of the maximal ideal of $R / x R$ will give $\operatorname{dim}(R)$ generators of $\mathfrak{m}$. Use Lemma 10.59.12. The last statement follows from the first and induction.

07DX Lemma 10.105.8. Let $\left(R_{i}, \varphi_{i i^{\prime}}\right)$ be a directed system of local rings whose transition maps are local ring maps. If each $R_{i}$ is a regular local ring and $R=\operatorname{colim} R_{i}$ is Noetherian, then $R$ is a regular local ring.

Proof. Let $\mathfrak{m} \subset R$ be the maximal ideal; it is the colimit of the maximal ideal $\mathfrak{m}_{i} \subset$ $R_{i}$. We prove the lemma by induction on $d=\operatorname{dim} \mathfrak{m} / \mathfrak{m}^{2}$. If $d=0$, then $R=R / \mathfrak{m}$ is a field and $R$ is a regular local ring. If $d>0$ pick an $x \in \mathfrak{m}, x \notin \mathfrak{m}^{2}$. For some $i$ we can find an $x_{i} \in \mathfrak{m}_{i}$ mapping to $x$. Note that $R / x R=\operatorname{colim}_{i^{\prime} \geq i} R_{i^{\prime}} / x_{i} R_{i^{\prime}}$ is a Noetherian local ring. By Lemma 10.105 .3 we see that $R_{i^{\prime}} / x_{i} R_{i^{\prime}}$ is a regular local ring. Hence by induction we see that $R / x R$ is a regular local ring. Since each $R_{i}$ is a domain (Lemma 10.105.1) we see that $R$ is a domain. Hence $x$ is a nonzerodivisor and we conclude that $R$ is a regular local ring by Lemma 10.105.7.

### 10.106. Epimorphisms of rings

04 VM In any category there is a notion of an epimorphism. Some of this material is taken from Laz69] and Maz68.

04VN Lemma 10.106.1. Let $R \rightarrow S$ be a ring map. The following are equivalent
(1) $R \rightarrow S$ is an epimorphism,
(2) the two ring maps $S \rightarrow S \otimes_{R} S$ are equal,
(3) either of the ring maps $S \rightarrow S \otimes_{R} S$ is an isomorphism, and
(4) the ring map $S \otimes_{R} S \rightarrow S$ is an isomorphism.

Proof. Omitted.
04VP Lemma 10.106.2. The composition of two epimorphisms of rings is an epimorphism.

Proof. Omitted. Hint: This is true in any category.
04VQ Lemma 10.106.3. If $R \rightarrow S$ is an epimorphism of rings and $R \rightarrow R^{\prime}$ is any ring map, then $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ is an epimorphism.

Proof. Omitted. Hint: True in any category with pushouts.
04VR Lemma 10.106.4. If $A \rightarrow B \rightarrow C$ are ring maps and $A \rightarrow C$ is an epimorphism, so is $B \rightarrow C$.

Proof. Omitted. Hint: This is true in any category.

This means in particular, that if $R \rightarrow S$ is an epimorphism with image $\bar{R} \subset S$, then $\bar{R} \rightarrow S$ is an epimorphism. Hence while proving results for epimorphisms we may often assume the map is injective. The following lemma means in particular that every localization is an epimorphism.

04VS Lemma 10.106.5. Let $R \rightarrow S$ be a ring map. The following are equivalent:
(1) $R \rightarrow S$ is an epimorphism, and
(2) $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{p}}$ is an epimorphism for each prime $\mathfrak{p}$ of $R$.

Proof. Since $S_{\mathfrak{p}}=R_{\mathfrak{p}} \otimes_{R} S$ (see Lemma 10.11.15) we see that (1) implies (2) by Lemma 10.106.3. Conversely, assume that (2) holds. Let $a, b: S \rightarrow A$ be two ring maps from $S$ to a ring $A$ equalizing the map $R \rightarrow S$. By assumption we see that for every prime $\mathfrak{p}$ of $R$ the induced maps $a_{\mathfrak{p}}, b_{\mathfrak{p}}: S_{\mathfrak{p}} \rightarrow A_{\mathfrak{p}}$ are the same. Hence $a=b$ as $A \subset \prod_{\mathfrak{p}} A_{\mathfrak{p}}$, see Lemma 10.23.1.

04VT Lemma 10.106.6. Let $R \rightarrow S$ be a ring map. The following are equivalent
(1) $R \rightarrow S$ is an epimorphism and finite, and
(2) $R \rightarrow S$ is surjective.

Proof. (This lemma seems to have been reproved many times in the literature, and has many different proofs.) It is clear that a surjective ring map is an epimorphism. Suppose that $R \rightarrow S$ is a finite ring map such that $S \otimes_{R} S \rightarrow S$ is an isomorphism. Our goal is to show that $R \rightarrow S$ is surjective. Assume $S / R$ is not zero. The exact sequence $R \rightarrow S \rightarrow S / R \rightarrow 0$ leads to an exact sequence

$$
R \otimes_{R} S \rightarrow S \otimes_{R} S \rightarrow S / R \otimes_{R} S \rightarrow 0
$$

Our assumption implies that the first arrow is an isomorphism, hence we conclude that $S / R \otimes_{R} S=0$. Hence also $S / R \otimes_{R} S / R=0$. By Lemma 10.5.4 there exists a surjection of $R$-modules $S / R \rightarrow R / I$ for some proper ideal $I \subset R$. Hence there exists a surjection $S / R \otimes_{R} S / R \rightarrow R / I \otimes_{R} R / I=R / I \neq 0$, contradiction.

04VU Lemma 10.106.7. A faithfully flat epimorphism is an isomorphism.
Proof. This is clear from Lemma 10.106.1 part (3) as the map $S \rightarrow S \otimes_{R} S$ is the map $R \rightarrow S$ tensored with $S$.

04VV Lemma 10.106.8. If $k \rightarrow S$ is an epimorphism and $k$ is a field, then $S=k$ or $S=0$.

Proof. This is clear from the result of Lemma 10.106 .7 (as any nonzero algebra over $k$ is faithfully flat), or by arguing directly that $R \rightarrow R \otimes_{k} R$ cannot be surjective unless $\operatorname{dim}_{k}(R) \leq 1$.

04VW Lemma 10.106.9. Let $R \rightarrow S$ be an epimorphism of rings. Then
(1) $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is injective, and
(2) for $\mathfrak{q} \subset S$ lying over $\mathfrak{p} \subset R$ we have $\kappa(\mathfrak{p})=\kappa(\mathfrak{q})$.

Proof. Let $\mathfrak{p}$ be a prime of $R$. The fibre of the map is the spectrum of the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$. By Lemma 10.106 .3 the map $\kappa(\mathfrak{p}) \rightarrow S \otimes_{R} \kappa(\mathfrak{p})$ is an epimorphism, and hence by Lemma 10.106 .8 we have either $S \otimes_{R} \kappa(\mathfrak{p})=0$ or $S \otimes_{R} \kappa(\mathfrak{p})=\kappa(\mathfrak{p})$ which proves (1) and (2).

04VX Lemma 10.106.10. Let $R$ be a ring. Let $M, N$ be $R$-modules. Let $\left\{x_{i}\right\}_{i \in I}$ be a set of generators of $M$. Let $\left\{y_{j}\right\}_{j \in J}$ be a set of generators of $N$. Let $\left\{m_{j}\right\}_{j \in J}$ be a family of elements of $M$ with $m_{j}=0$ for all but finitely many $j$. Then

$$
\sum_{j \in J} m_{j} \otimes y_{j}=0 \text { in } M \otimes_{R} N
$$

is equivalent to the following: There exist $a_{i, j} \in R$ with $a_{i, j}=0$ for all but finitely many pairs $(i, j)$ such that

$$
\begin{aligned}
m_{j} & =\sum_{i \in I} a_{i, j} x_{i} \quad \text { for all } j \in J, \\
0 & =\sum_{j \in J} a_{i, j} y_{j} \quad \text { for all } i \in I .
\end{aligned}
$$

Proof. The sufficiency is immediate. Suppose that $\sum_{j \in J} m_{j} \otimes y_{j}=0$. Consider the short exact sequence

$$
0 \rightarrow K \rightarrow \bigoplus_{j \in J} R \rightarrow N \rightarrow 0
$$

where the $j$ th basis vector of $\bigoplus_{j \in J} R$ maps to $y_{j}$. Tensor this with $M$ to get the exact sequence

$$
K \otimes_{R} M \rightarrow \bigoplus_{j \in J} M \rightarrow N \otimes_{R} M \rightarrow 0
$$

The assumption implies that there exist elements $k_{i} \in K$ such that $\sum k_{i} \otimes x_{i}$ maps to the element $\left(m_{j}\right)_{j \in J}$ of the middle. Writing $k_{i}=\left(a_{i, j}\right)_{j \in J}$ and we obtain what we want.

04VY Lemma 10.106.11. Let $\varphi: R \rightarrow S$ be a ring map. Let $g \in S$. The following are equivalent:
(1) $g \otimes 1=1 \otimes g$ in $S \otimes_{R} S$, and
(2) there exist $n \geq 0$ and elements $y_{i}, z_{j} \in S$ and $x_{i, j} \in R$ for $1 \leq i, j \leq n$ such that
(a) $g=\sum_{i, j \leq n} x_{i, j} y_{i} z_{j}$,
(b) for each $j$ we have $\sum x_{i, j} y_{i} \in \varphi(R)$, and
(c) for each $i$ we have $\sum x_{i, j} z_{j} \in \varphi(R)$.

Proof. It is clear that (2) implies (1). Conversely, suppose that $g \otimes 1=1 \otimes g$. Choose generators $\left\{s_{i}\right\}_{i \in I}$ of $S$ as an $R$-module with $0,1 \in I$ and $s_{0}=1$ and $s_{1}=g$. Apply Lemma 10.106 .10 to the relation $g \otimes s_{0}+(-1) \otimes s_{1}=0$. We see that there exist $a_{i, j} \in R$ such that $g=\sum_{i} a_{i, 0} s_{i},-1=\sum_{i} a_{i, 1} s_{i}$, and for $j \neq 0,1$ we have $0=\sum_{i} a_{i, j} s_{i}$, and moreover for all $i$ we have $\sum_{j} a_{i, j} s_{j}=0$. Then we have

$$
\sum_{i, j \neq 0} a_{i, j} s_{i} s_{j}=-g+a_{0,0}
$$

and for each $j \neq 0$ we have $\sum_{i \neq 0} a_{i, j} s_{i} \in R$. This proves that $-g+a_{0,0}$ can be written as in (2). It follows that $g$ can be written as in (2). Details omitted. Hint: Show that the set of elements of $S$ which have an expression as in (2) form an $R$-subalgebra of $S$.

04VZ Remark 10.106.12. Let $R \rightarrow S$ be a ring map. Sometimes the set of elements $g \in S$ such that $g \otimes 1=1 \otimes g$ is called the epicenter of $S$. It is an $R$-algebra. By the construction of Lemma 10.106 .11 we get for each $g$ in the epicenter a matrix factorization

$$
(g)=Y X Z
$$

with $X \in \operatorname{Mat}(n \times n, R), Y \in \operatorname{Mat}(1 \times n, S)$, and $Z \in \operatorname{Mat}(n \times 1, S)$. Namely, let $x_{i, j}, y_{i}, z_{j}$ be as in part (2) of the lemma. Set $X=\left(x_{i, j}\right)$, let $y$ be the row vector whose entries are the $y_{i}$ and let $z$ be the column vector whose entries are the $z_{j}$. With this notation conditions (b) and (c) of Lemma 10.106.11 mean exactly that $Y X \in \operatorname{Mat}(1 \times n, R), X Z \in \operatorname{Mat}(n \times 1, R)$. It turns out to be very convenient to consider the triple of matrices $(X, Y X, X Z)$. Given $n \in \mathbf{N}$ and a triple $(P, U, V)$ we say that $(P, U, V)$ is a $n$-triple associated to $g$ if there exists a matrix factorization as above such that $P=X, U=Y X$ and $V=X Z$.

04W0 Lemma 10.106.13. Let $R \rightarrow S$ be an epimorphism of rings. Then the cardinality of $S$ is at most the cardinality of $R$. In a formula: $|S| \leq|R|$.

Proof. The condition that $R \rightarrow S$ is an epimorphism means that each $g \in S$ satisfies $g \otimes 1=1 \otimes g$, see Lemma 10.106.1. We are going to use the notation introduced in Remark 10.106 .12 Suppose that $g, g^{\prime} \in S$ and suppose that $(P, U, V)$ is an $n$-triple which is associated to both $g$ and $g^{\prime}$. Then we claim that $g=g^{\prime}$. Namely, write $(P, U, V)=(X, Y X, X Z)$ for a matrix factorization $(g)=Y X Z$ of $g$ and write $(P, U, V)=\left(X^{\prime}, Y^{\prime} X^{\prime}, X^{\prime} Z^{\prime}\right)$ for a matrix factorization $\left(g^{\prime}\right)=Y^{\prime} X^{\prime} Z^{\prime}$ of $g^{\prime}$. Then we see that

$$
(g)=Y X Z=U Z=Y^{\prime} X^{\prime} Z=Y^{\prime} P Z=Y^{\prime} X Z=Y^{\prime} V=Y^{\prime} X^{\prime} Z^{\prime}=\left(g^{\prime}\right)
$$

and hence $g=g^{\prime}$. This implies that the cardinality of $S$ is bounded by the number of possible triples, which has cardinality at $\operatorname{most}_{\sup _{n \in \mathbf{N}}|R|^{n} \text {. If } R \text { is infinite then }}$ this is at most $|R|$, see Kun83, Ch. I, 10.13].
If $R$ is a finite ring then the argument above only proves that $S$ is at worst countable. In fact in this case $R$ is Artinian and the map $R \rightarrow S$ is surjective. We omit the proof of this case.

08YS Lemma 10.106.14. Let $R \rightarrow S$ be an epimorphism of rings. Let $N_{1}, N_{2}$ be $S$ modules. Then $\operatorname{Hom}_{S}\left(N_{1}, N_{2}\right)=\operatorname{Hom}_{R}\left(N_{1}, N_{2}\right)$. In other words, the restriction functor $\operatorname{Mod}_{S} \rightarrow \operatorname{Mod}_{R}$ is fully faithful.

Proof. Let $\varphi: N_{1} \rightarrow N_{2}$ be an $R$-linear map. For any $x \in N_{1}$ consider the map $S \otimes_{R} S \rightarrow N_{2}$ defined by the rule $g \otimes g^{\prime} \mapsto g \varphi\left(g^{\prime} x\right)$. Since both maps $S \rightarrow S \otimes_{R} S$ are isomorphisms (Lemma 10.106.1), we conclude that $g \varphi\left(g^{\prime} x\right)=g g^{\prime} \varphi(x)=\varphi\left(g g^{\prime} x\right)$. Thus $\varphi$ is $S$-linear.

### 10.107. Pure ideals

04PQ The material in this section is discussed in many papers, see for example [az67], Bko70, and DM83.

04PR Definition 10.107.1. Let $R$ be a ring. We say that $I \subset R$ is pure if the quotient ring $R / I$ is flat over $R$.

04PS Lemma 10.107.2. Let $R$ be a ring. Let $I \subset R$ be an ideal. The following are equivalent:
(1) I is pure,
(2) for every ideal $J \subset R$ we have $J \cap I=I J$,
(3) for every finitely generated ideal $J \subset R$ we have $J \cap I=J I$,
(4) for every $x \in R$ we have $(x) \cap I=x I$,
(5) for every $x \in I$ we have $x=y x$ for some $y \in I$,
(6) for every $x_{1}, \ldots, x_{n} \in I$ there exists a $y \in I$ such that $x_{i}=y x_{i}$ for all $i=1, \ldots, n$,
(7) for every prime $\mathfrak{p}$ of $R$ we have $I R_{\mathfrak{p}}=0$ or $I R_{\mathfrak{p}}=R_{\mathfrak{p}}$,
(8) $\operatorname{Supp}(I)=\operatorname{Spec}(R) \backslash V(I)$,
(9) $I$ is the kernel of the map $R \rightarrow(1+I)^{-1} R$,
(10) $R / I \cong S^{-1} R$ as $R$-algebras for some multiplicative subset $S$ of $R$, and (11) $R / I \cong(1+I)^{-1} R$ as $R$-algebras.

Proof. For any ideal $J$ of $R$ we have the short exact sequence $0 \rightarrow J \rightarrow R \rightarrow$ $R / J \rightarrow 0$. Tensoring with $R / I$ we get an exact sequence $J \otimes_{R} R / I \rightarrow R / I \rightarrow$ $R / I+J \rightarrow 0$ and $J \otimes_{R} R / I=R / J I$. Thus the equivalence of (1), (2), and (3) follows from Lemma 10.38.5 Moreover, these imply (4).
The implication (4) $\Rightarrow(5)$ is trivial. Assume (5) and let $x_{1}, \ldots, x_{n} \in I$. Choose $y_{i} \in$ $I$ such that $x_{i}=y_{i} x_{i}$. Let $y \in I$ be the element such that $1-y=\prod_{i=1, \ldots, n}\left(1-y_{i}\right)$. Then $x_{i}=y x_{i}$ for all $i=1, \ldots, n$. Hence (6) holds, and it follows that (5) $\Leftrightarrow(6)$.
Assume (5). Let $x \in I$. Then $x=y x$ for some $y \in I$. Hence $x(1-y)=0$, which shows that $x$ maps to zero in $(1+I)^{-1} R$. Of course the kernel of the map $R \rightarrow(1+I)^{-1} R$ is always contained in $I$. Hence we see that (5) implies (9). Assume (9). Then for any $x \in I$ we see that $x(1-y)=0$ for some $y \in I$. In other words, $x=y x$. We conclude that (5) is equivalent to (9).
Assume (5). Let $\mathfrak{p}$ be a prime of $R$. If $\mathfrak{p} \notin V(I)$, then $I R_{\mathfrak{p}}=R_{\mathfrak{p}}$. If $\mathfrak{p} \in V(I)$, in other words, if $I \subset \mathfrak{p}$, then $x \in I$ implies $x(1-y)=0$ for some $y \in I$, implies $x$ maps to zero in $R_{\mathfrak{p}}$, i.e., $I R_{\mathfrak{p}}=0$. Thus we see that (7) holds.
Assume (7). Then $(R / I)_{\mathfrak{p}}$ is either 0 or $R_{\mathfrak{p}}$ for any prime $\mathfrak{p}$ of $R$. Hence by Lemma 10.38 .19 we see that (1) holds. At this point we see that all of (1) - (7) and (9) are equivalent.
As $I R_{\mathfrak{p}}=I_{\mathfrak{p}}$ we see that (7) implies (8). Finally, if (8) holds, then this means exactly that $I_{\mathfrak{p}}$ is the zero module if and only if $\mathfrak{p} \in V(I)$, which is clearly saying that (7) holds. Now (1) - (9) are equivalent.

Assume (1) - (9) hold. Then $R / I \subset(1+I)^{-1} R$ by (9) and the map $R / I \rightarrow$ $(1+I)^{-1} R$ is also surjective by the description of localizations at primes afforded by (7). Hence (11) holds.
The implication $(11) \Rightarrow(10)$ is trivial. And (10) implies that (1) holds because a localization of $R$ is flat over $R$, see Lemma 10.38 .19 .

04PT Lemma 10.107.3. Let $R$ be a ring. If $I, J \subset R$ are pure ideals, then $V(I)=V(J)$ implies $I=J$.

Proof. For example, by property (7) of Lemma 10.107.2 we see that $I=\operatorname{Ker}(R \rightarrow$ $\prod_{\mathfrak{p} \in V(I)} R_{\mathfrak{p}}$ ) can be recovered from the closed subset associated to it.

04 PU Lemma 10.107.4. Let $R$ be a ring. The rule $I \mapsto V(I)$ determines a bijection
$\{I \subset R$ pure $\} \leftrightarrow\{Z \subset \operatorname{Spec}(R)$ closed and closed under generalizations $\}$
Proof. Let $I$ be a pure ideal. Then since $R \rightarrow R / I$ is flat, by going up generalizations lift along the map $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$. Hence $V(I)$ is closed under generalizations. This shows that the map is well defined. By Lemma 10.107 .3 the map is injective. Suppose that $Z \subset \operatorname{Spec}(R)$ is closed and closed under generalizations.

Let $J \subset R$ be the radical ideal such that $Z=V(J)$. Let $I=\{x \in R: x \in x J\}$. Note that $I$ is an ideal. We claim that $I$ is pure and that $V(I)=V(J)$. If the claim is true then the map of the lemma is surjective and the lemma holds.
Note that $I \subset J$, so that $V(J) \subset V(I)$. Let $I \subset \mathfrak{p}$ be a prime. Consider the multiplicative subset $S=(R \backslash \mathfrak{p})(1+J)$. By definition of $I$ and $I \subset \mathfrak{p}$ we see that $0 \notin S$. Hence we can find a prime $\mathfrak{q}$ of $R$ which is disjoint from $S$, see Lemmas 10.9.4 and 10.16.5. Hence $\mathfrak{q} \subset \mathfrak{p}$ and $\mathfrak{q} \cap(1+J)=\emptyset$. This implies that $\mathfrak{q}+J$ is a proper ideal of $R$. Let $\mathfrak{m}$ be a maximal ideal containing $\mathfrak{q}+J$. Then we get $\mathfrak{m} \in V(J)$ and hence $\mathfrak{q} \in V(J)=Z$ as $Z$ was assumed to be closed under generalization. This in turn implies $\mathfrak{p} \in V(J)$ as $\mathfrak{q} \subset \mathfrak{p}$. Thus we see that $V(I)=V(J)$.
Finally, since $V(I)=V(J)$ (and $J$ radical) we see that $J=\sqrt{I}$. Pick $x \in I$, so that $x=x y$ for some $y \in J$ by definition. Then $x=x y=x y^{2}=\ldots=x y^{n}$. Since $y^{n} \in I$ for some $n>0$ we conclude that property (5) of Lemma 10.107 .2 holds and we see that $I$ is indeed pure.

05KK Lemma 10.107.5. Let $R$ be a ring. Let $I \subset R$ be an ideal. The following are equivalent
(1) I is pure and finitely generated,
(2) I is generated by an idempotent,
(3) $I$ is pure and $V(I)$ is open, and
(4) $R / I$ is a projective $R$-module.

Proof. If (1) holds, then $I=I \cap I=I^{2}$ by Lemma 10.107.2. Hence $I$ is generated by an idempotent by Lemma 10.20 .5 . Thus $(1) \Rightarrow(2)$. If (2) holds, then $I=(e)$ and $R=(1-e) \oplus(e)$ as an $R$-module hence $R / I$ is flat and $I$ is pure and $V(I)=D(1-e)$ is open. Thus $(2) \Rightarrow(1)+(3)$. Finally, assume (3). Then $V(I)$ is open and closed, hence $V(I)=D(1-e)$ for some idempotent $e$ of $R$, see Lemma 10.20.3. The ideal $J=(e)$ is a pure ideal such that $V(J)=V(I)$ hence $I=J$ by Lemma 10.107.3. In this way we see that $(3) \Rightarrow(2)$. By Lemma 10.77 .2 we see that (4) is equivalent to the assertion that $I$ is pure and $R / I$ finitely presented. Moreover, $R / I$ is finitely presented if and only if $I$ is finitely generated, see Lemma 10.5.3. Hence (4) is equivalent to (1).

We can use the above to characterize those rings for which every finite flat module is finitely presented.

052 U Lemma 10.107.6. Let $R$ be a ring. The following are equivalent:
(1) every $Z \subset \operatorname{Spec}(R)$ which is closed and closed under generalizations is also open, and
(2) any finite flat $R$-module is finite locally free.

Proof. If any finite flat $R$-module is finite locally free then the support of $R / I$ where $I$ is a pure ideal is open. Hence the implication $(2) \Rightarrow(1)$ follows from Lemma 10.107.3

For the converse assume that $R$ satisfies (1). Let $M$ be a finite flat $R$-module. The support $Z=\operatorname{Supp}(M)$ of $M$ is closed, see Lemma 10.39.5. On the other hand, if $\mathfrak{p} \subset \mathfrak{p}^{\prime}$, then by Lemma 10.77 .4 the module $M_{\mathfrak{p}^{\prime}}$ is free, and $M_{\mathfrak{p}}=M_{\mathfrak{p}^{\prime}} \otimes_{R_{\mathfrak{p}^{\prime}}} R_{\mathfrak{p}}$ Hence $\mathfrak{p}^{\prime} \in \operatorname{Supp}(M) \Rightarrow \mathfrak{p} \in \operatorname{Supp}(M)$, in other words, the support is closed under generalization. As $R$ satisfies (1) we see that the support of $M$ is open and closed.

Suppose that $M$ is generated by $r$ elements $m_{1}, \ldots, m_{r}$. The modules $\wedge^{i}(M)$, $i=1, \ldots, r$ are finite flat $R$-modules also, because $\wedge^{i}(M)_{\mathfrak{p}}=\wedge^{i}\left(M_{\mathfrak{p}}\right)$ is free over $R_{\mathfrak{p}}$. Note that $\operatorname{Supp}\left(\wedge^{i+1}(M)\right) \subset \operatorname{Supp}\left(\wedge^{i}(M)\right)$. Thus we see that there exists a decomposition

$$
\operatorname{Spec}(R)=U_{0} \amalg U_{1} \amalg \ldots \amalg U_{r}
$$

by open and closed subsets such that the support of $\wedge^{i}(M)$ is $U_{r} \cup \ldots \cup U_{i}$ for all $i=0, \ldots, r$. Let $\mathfrak{p}$ be a prime of $R$, and say $\mathfrak{p} \in U_{i}$. Note that $\wedge^{i}(M) \otimes_{R} \kappa(\mathfrak{p})=$ $\wedge^{i}\left(M \otimes_{R} \kappa(\mathfrak{p})\right)$. Hence, after possibly renumbering $m_{1}, \ldots, m_{r}$ we may assume that $m_{1}, \ldots, m_{i}$ generate $M \otimes_{R} \kappa(\mathfrak{p})$. By Nakayama's Lemma 10.19.1 we get a surjection

$$
R_{f}^{\oplus i} \longrightarrow M_{f}, \quad\left(a_{1}, \ldots, a_{i}\right) \longmapsto \sum a_{i} m_{i}
$$

for some $f \in R, f \notin \mathfrak{p}$. We may also assume that $D(f) \subset U_{i}$. This means that $\wedge^{i}\left(M_{f}\right)=\wedge^{i}(M)_{f}$ is a flat $R_{f}$ module whose support is all of $\operatorname{Spec}\left(R_{f}\right)$. By the above it is generated by a single element, namely $m_{1} \wedge \ldots \wedge m_{i}$. Hence $\wedge^{i}(M)_{f} \cong R_{f} / J$ for some pure ideal $J \subset R_{f}$ with $V(J)=\operatorname{Spec}\left(R_{f}\right)$. Clearly this means that $J=(0)$, see Lemma 10.107.3. Thus $m_{1} \wedge \ldots \wedge m_{i}$ is a basis for $\wedge^{i}\left(M_{f}\right)$ and it follows that the displayed map is injective as well as surjective. This proves that $M$ is finite locally free as desired.

### 10.108. Rings of finite global dimension

00 O 2 The following lemma is often used to compare different projective resolutions of a given module.

00O3 Lemma 10.108.1 (Schanuel's lemma). Let $R$ be a ring. Let $M$ be an $R$-module. Suppose that $0 \rightarrow K \rightarrow P_{1} \rightarrow M \rightarrow 0$ and $0 \rightarrow L \rightarrow P_{2} \rightarrow M \rightarrow 0$ are two short exact sequences, with $P_{i}$ projective. Then $K \oplus P_{2} \cong L \oplus P_{1}$.

Proof. Consider the module $N$ defined by the short exact sequence $0 \rightarrow N \rightarrow$ $P_{1} \oplus P_{2} \rightarrow M \rightarrow 0$, where the last map is the sum of the two maps $P_{i} \rightarrow M$. It is easy to see that the projection $N \rightarrow P_{1}$ is surjective with kernel $L$, and that $N \rightarrow P_{2}$ is surjective with kernel $K$. Since $P_{i}$ are projective we have $N \cong K \oplus P_{2} \cong L \oplus P_{1}$.

0004 Definition 10.108.2. Let $R$ be a ring. Let $M$ be an $R$-module. We say $M$ has finite projective dimension if it has a finite length resolution by projective $R$ modules. The minimal length of such a resolution is called the projective dimension of $M$.

It is clear that the projective dimension of $M$ is 0 if and only if $M$ is a projective module. The following lemma explains to what extent the projective dimension is independent of the choice of a projective resolution.

0005 Lemma 10.108.3. Let $R$ be a ring. Suppose that $M$ is an $R$-module of projective dimension d. Suppose that $F_{e} \rightarrow F_{e-1} \rightarrow \ldots \rightarrow F_{0} \rightarrow M \rightarrow 0$ is exact with $F_{i}$ projective and $e \geq d-1$. Then the kernel of $F_{e} \rightarrow F_{e-1}$ is projective (or the kernel of $F_{0} \rightarrow M$ is projective in case $e=0$ ).

Proof. We prove this by induction on $d$. If $d=0$, then $M$ is projective. In this case there is a splitting $F_{0}=\operatorname{Ker}\left(F_{0} \rightarrow M\right) \oplus M$, and hence $\operatorname{Ker}\left(F_{0} \rightarrow M\right)$ is projective. This finishes the proof if $e=0$, and if $e>0$, then replacing $M$ by $\operatorname{Ker}\left(F_{0} \rightarrow M\right)$ we decrease $e$.

Next assume $d>0$. Let $0 \rightarrow P_{d} \rightarrow P_{d-1} \rightarrow \ldots \rightarrow P_{0} \rightarrow M \rightarrow 0$ be a minimal length finite resolution with $P_{i}$ projective. According to Schanuel's Lemma 10.108.1 we have $P_{0} \oplus \operatorname{Ker}\left(F_{0} \rightarrow M\right) \cong F_{0} \oplus \operatorname{Ker}\left(P_{0} \rightarrow M\right)$. This proves the case $d=1$, $e=0$, because then the right hand side is $F_{0} \oplus P_{1}$ which is projective. Hence now we may assume $e>0$. The module $F_{0} \oplus \operatorname{Ker}\left(P_{0} \rightarrow M\right)$ has the finite projective resolution $0 \rightarrow P_{d} \oplus F_{0} \rightarrow P_{d-1} \oplus F_{0} \rightarrow \ldots \rightarrow P_{1} \oplus F_{0} \rightarrow \operatorname{Ker}\left(P_{0} \rightarrow M\right) \oplus F_{0} \rightarrow 0$ of length $d-1$. By induction on $d$ we see that the kernel of $F_{e} \oplus P_{0} \rightarrow F_{e-1} \oplus P_{0}$ is projective. This implies the lemma.

065R Lemma 10.108.4. Let $R$ be a ring. Let $M$ be an $R$-module. Let $n \geq 0$. The following are equivalent
(1) $M$ has projective dimension $\leq n$,
(2) $\operatorname{Ext}_{R}^{i}(M, N)=0$ for all $R$-modules $N$ and all $i \geq n+1$, and
(3) $E x t_{R}^{n+1}(M, N)=0$ for all $R$-modules $N$.

Proof. Assume (1). Choose a free resolution $F_{\bullet} \rightarrow M$ of $M$. Denote $d_{e}: F_{e} \rightarrow$ $F_{e-1}$. By Lemma 10.108 .3 we see that $P_{e}=\operatorname{Ker}\left(d_{e}\right)$ is projective for $e \geq n-$ 1. This implies that $F_{e} \cong P_{e} \oplus P_{e-1}$ for $e \geq n$ where $d_{e}$ maps the summand $P_{e-1}$ isomorphically to $P_{e-1}$ in $F_{e-1}$. Hence, for any $R$-module $N$ the complex $\operatorname{Hom}_{R}\left(F_{\bullet}, N\right)$ is split exact in degrees $\geq n+1$. Whence (2) holds. The implication $(2) \Rightarrow(3)$ is trivial.
Assume (3) holds. If $n=0$ then $M$ is projective by Lemma 10.76 .2 and we see that (1) holds. If $n>0$ choose a free $R$-module $F$ and a surjection $F \rightarrow M$ with kernel $K$. By Lemma 10.70 .7 and the vanishing of $\operatorname{Ext}_{R}^{i}(F, N)$ for all $i>0$ by part (1) we see that $\operatorname{Ext}_{R}^{n}(K, N)=0$ for all $R$-modules $N$. Hence by induction we see that $K$ has projective dimension $\leq n-1$. Then $M$ has projective dimension $\leq n$ as any finite projective resolution of $K$ gives a projective resolution of length one more for $M$ by adding $F$ to the front.

065 S Lemma 10.108.5. Let $R$ be a ring. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of $R$-modules.
(1) If $M$ has projective dimension $\leq n$ and $M^{\prime \prime}$ has projective dimension $\leq n+1$, then $M^{\prime}$ has projective dimension $\leq n$.
(2) If $M^{\prime}$ and $M^{\prime \prime}$ have projective dimension $\leq n$ then $M$ has projective dimension $\leq n$.
(3) If $M^{\prime}$ has projective dimension $\leq n$ and $M$ has projective dimension $\leq$ $n+1$ then $M^{\prime \prime}$ has projective dimension $\leq n+1$.

Proof. Combine the characterization of projective dimension in Lemma 10.108.4 with the long exact sequence of ext groups in Lemma 10.70.7.
0006 Definition 10.108.6. Let $R$ be a ring. The ring $R$ is said to have finite global dimension if there exists an integer $n$ such that every $R$-module has a resolution by projective $R$-modules of length at most $n$. The minimal such $n$ is then called the global dimension of $R$.

The argument in the proof of the following lemma can be found in the paper Aus55 by Auslander.

065T Lemma 10.108.7. Let $R$ be a ring. The following are equivalent
(1) $R$ has finite global dimension $\leq n$,
(2) every finite $R$-module has projective dimension $\leq n$, and
(3) every cyclic $R$-module $R / I$ has projective dimension $\leq n$.

Proof. It is clear that $(1) \Rightarrow(3)$. Assume (3). Since every finite $R$-module has a finite filtration by cyclic modules, see Lemma 10.5 .4 we see that (2) follows by Lemma 10.108.5

Assume (2). Let $M$ be an arbitrary $R$-module. Choose a set $E \subset M$ of generators of $M$. Choose a well ordering on $E$. For $e \in E$ denote $M_{e}$ the submodule of $M$ generated by the elements $e^{\prime} \in E$ with $e^{\prime} \leq e$. Then $M=\bigcup_{e \in E} M_{e}$. Note that for each $e \in E$ the quotient

$$
M_{e} / \bigcup_{e^{\prime}<e} M_{e^{\prime}}
$$

is either zero or generated by one element, hence has projective dimension $\leq n$. To finish the proof we claim that any time we have a well-ordered set $E$ and a module $M=\bigcup_{e \in E} M_{e}$ such that the quotients $M_{e} / \bigcup_{e^{\prime}<e} M_{e^{\prime}}$ have projective dimension $\leq n$, then $M$ has projective dimension $\leq n$.

We may prove this statement by induction on $n$. If $n=0$, then we will show, by transfinite induction that $M$ is projective. Namely, for each $e \in E$ we may choose a splitting $M_{e}=\bigcup_{e^{\prime}<e} M_{e^{\prime}} \oplus P_{e}$ because $P_{e}=M_{e} / \bigcup_{e^{\prime}<e} M_{e^{\prime}}$ is projective. Hence it follows that $M=\bigoplus_{e \in E} P_{e}$ and we conclude that $M$ is projective, see Lemma 10.76 .3

If $n>0$, then for $e \in E$ we denote $F_{e}$ the free $R$-module on the set of elements of $M_{e}$. Then we have a system of short exact sequences

$$
0 \rightarrow K_{e} \rightarrow F_{e} \rightarrow M_{e} \rightarrow 0
$$

over the well-ordered set $E$. Note that the transition maps $F_{e^{\prime}} \rightarrow F_{e}$ and $K_{e^{\prime}} \rightarrow K_{e}$ are injective too. Set $F=\bigcup F_{e}$ and $K=\bigcup K_{e}$. Then

$$
0 \rightarrow K_{e} / \bigcup_{e^{\prime}<e} K_{e^{\prime}} \rightarrow F_{e} / \bigcup_{e^{\prime}<e} F_{e^{\prime}} \rightarrow M_{e} / \bigcup_{e^{\prime}<e} M_{e^{\prime}} \rightarrow 0
$$

is a short exact sequence of $R$-modules too and $F_{e} / \bigcup_{e^{\prime}<e} F_{e^{\prime}}$ is the free $R$-module on the set of elements in $M_{e}$ which are not contained in $\bigcup_{e^{\prime}<e} M_{e^{\prime}}$. Hence by Lemma 10.108 .5 we see that the projective dimension of $K_{e} / \bigcup_{e^{\prime}<e} K_{e^{\prime}}$ is at most $n-1$. By induction we conclude that $K$ has projective dimension at most $n-1$. Whence $M$ has projective dimension at most $n$ and we win.

0008 Lemma 10.108.8. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S \subset R$ be $a$ multiplicative subset.
(1) If $M$ has projective dimension $\leq n$, then $S^{-1} M$ has projective dimension $\leq n$ over $S^{-1} R$.
(2) If $R$ has finite global dimension $\leq n$, then $S^{-1} R$ has finite global dimension $\leq n$.

Proof. Let $0 \rightarrow P_{n} \rightarrow P_{n-1} \rightarrow \ldots \rightarrow P_{0} \rightarrow M \rightarrow 0$ be a projective resolution. As localization is exact, see Proposition 10.9.12, and as each $S^{-1} P_{i}$ is a projective $S^{-1} R$-module, see Lemma 10.93 .1 , we see that $0 \rightarrow S^{-1} P_{n} \rightarrow \ldots \rightarrow S^{-1} P_{0} \rightarrow$ $S^{-1} M \rightarrow 0$ is a projective resolution of $S^{-1} M$. This proves (1). Let $M^{\prime}$ be an $S^{-1} R$-module. Note that $M^{\prime}=S^{-1} M^{\prime}$. Hence we see that (2) follows from (1).

### 10.109. Regular rings and global dimension

065 U We can use the material on rings of finite global dimension to give another characterization of regular local rings.

00 O 7 Proposition 10.109.1. Let $R$ be a regular local ring of dimension d. Every finite $R$-module $M$ of depth e has a finite free resolution

$$
0 \rightarrow F_{d-e} \rightarrow \ldots \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

In particular a regular local ring has global dimension $\leq d$.
Proof. This is clear in view of Lemma 10.105 .6 and Lemma 10.103 .9
0009 Lemma 10.109.2. Let $R$ be a Noetherian ring. Then $R$ has finite global dimension if and only if there exists an integer $n$ such that for all maximal ideals $\mathfrak{m}$ of $R$ the ring $R_{\mathfrak{m}}$ has global dimension $\leq n$.

Proof. We saw, Lemma 10.108 .8 that if $R$ has finite global dimension $n$, then all the localizations $R_{\mathfrak{m}}$ have finite global dimension at most $n$. Conversely, suppose that all the $R_{\mathfrak{m}}$ have global dimension $n$. Let $M$ be a finite $R$-module. Let $0 \rightarrow$ $K_{n} \rightarrow F_{n-1} \rightarrow \ldots \rightarrow F_{0} \rightarrow M \rightarrow 0$ be a resolution with $F_{i}$ finite free. Then $K_{n}$ is a finite $R$-module. According to Lemma 10.108 .3 and the assumption all the modules $K_{n} \otimes_{R} R_{\mathfrak{m}}$ are projective. Hence by Lemma 10.77 .2 the module $K_{n}$ is finite projective.

00OA Lemma 10.109.3. Suppose that $R$ is a Noetherian local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. In this case the projective dimension of $\kappa$ is $\geq \operatorname{dim}_{\kappa} \mathfrak{m} / \mathfrak{m}^{2}$.

Proof. Let $x_{1}, \ldots x_{n}$ be elements of $\mathfrak{m}$ whose images in $\mathfrak{m} / \mathfrak{m}^{2}$ form a basis. Consider the Koszul complex on $x_{1}, \ldots, x_{n}$. This is the complex

$$
0 \rightarrow \wedge^{n} R^{n} \rightarrow \wedge^{n-1} R^{n} \rightarrow \wedge^{n-2} R^{n} \rightarrow \ldots \rightarrow \wedge^{i} R^{n} \rightarrow \ldots \rightarrow R^{n} \rightarrow R
$$

with maps given by

$$
e_{j_{1}} \wedge \ldots \wedge e_{j_{i}} \longmapsto \sum_{a=1}^{i}(-1)^{i+1} x_{j_{a}} e_{j_{1}} \wedge \ldots \wedge \hat{e}_{j_{a}} \wedge \ldots \wedge e_{j_{i}}
$$

It is easy to see that this is a complex $K_{\bullet}\left(R, x_{\bullet}\right)$. Note that the cokernel of the last map of $K_{\bullet}\left(R, x_{\bullet}\right)$ is clearly $\kappa$.

Now, let $F_{\bullet} \rightarrow \kappa$ by any finite resolution by finite free $R$-modules. By Lemma 10.101 .2 we may assume all the maps in the complex $F_{\bullet}$ have to property that $\operatorname{Im}\left(F_{i} \rightarrow F_{i-1}\right) \subset \mathfrak{m} F_{i-1}$, because removing a trivial summand from the resolution can at worst shorten the resolution. By Lemma 10.70 .4 we can find a map of complexes $\alpha: K_{\bullet}\left(R, x_{\bullet}\right) \rightarrow F_{\bullet}$ inducing the identity on $\kappa$. We will prove by induction that the maps $\alpha_{i}: \wedge^{i} R^{n}=K_{i}\left(R, x_{\bullet}\right) \rightarrow F_{i}$ have the property that $\alpha_{i} \otimes \kappa: \wedge^{i} \kappa^{n} \rightarrow F_{i} \otimes \kappa$ are injective. This will prove the lemma since it clearly shows that $F_{n} \neq 0$.

The result is clear for $i=0$ because the composition $R \xrightarrow{\alpha_{0}} F_{0} \rightarrow \kappa$ is nonzero. Note that $F_{0}$ must have rank 1 since otherwise the map $F_{1} \rightarrow F_{0}$ whose cokernel is a single copy of $\kappa$ cannot have image contained in $\mathfrak{m} F_{0}$. For $\alpha_{1}$ we use that
$x_{1}, \ldots, x_{n}$ is a minimal set of generators for $\mathfrak{m}$. Namely, we saw above that $F_{0}=R$ and $F_{1} \rightarrow F_{0}=R$ has image $\mathfrak{m}$. We have a commutative diagram

$$
\begin{array}{cccc}
R^{n}=K_{1}\left(R, x_{\bullet}\right) & \rightarrow & K_{0}\left(R, x_{\bullet}\right) & = \\
\downarrow & & \downarrow \\
F_{1} & \rightarrow & F_{0} & = \\
& & \downarrow
\end{array}
$$

where the rightmost vertical arrow is given by multiplication by a unit. Hence we see that the image of the composition $R^{n} \rightarrow F_{1} \rightarrow F_{0}=R$ is also equal to $\mathfrak{m}$. Thus the map $R^{n} \otimes \kappa \rightarrow F_{1} \otimes \kappa$ has to be injective since $\operatorname{dim}_{\kappa}\left(\mathfrak{m} / \mathfrak{m}^{2}\right)=n$.
Suppose the injectivity of $\alpha_{j} \otimes \kappa$ has been proved for all $j \leq i-1$. Consider the commutative diagram

$$
\begin{array}{clcl}
\wedge^{i} R^{n}=K_{i}\left(R, x_{\bullet}\right) & \rightarrow & K_{i-1}\left(R, x_{\bullet}\right) & = \\
\downarrow & & \downarrow \\
& F_{i} & \rightarrow & F_{i-1}
\end{array}
$$

We know that $\wedge^{i-1} \kappa^{n} \rightarrow F_{i-1} \otimes \kappa$ is injective. This proves that $\wedge^{i-1} \kappa^{n} \otimes_{\kappa} \mathfrak{m} / \mathfrak{m}^{2} \rightarrow$ $F_{i-1} \otimes \mathfrak{m} / \mathfrak{m}^{2}$ is injective. Also, by our choice of the complex, $F_{i}$ maps into $\mathfrak{m} F_{i-1}$, and similarly for the Koszul complex. Hence we get a commutative diagram

$$
\begin{array}{ccc}
\wedge^{i} \kappa^{n} & \rightarrow & \wedge^{i-1} \kappa^{n} \otimes \mathfrak{m} / \mathfrak{m}^{n} \\
\downarrow & & \downarrow \\
F_{i} \otimes \kappa & \rightarrow & F_{i-1} \otimes \mathfrak{m} / \mathfrak{m}^{2}
\end{array}
$$

At this point it suffices to verify the map $\wedge^{i} \kappa^{n} \rightarrow \wedge^{i-1} \kappa^{n} \otimes \mathfrak{m} / \mathfrak{m}^{n}$ is injective, which can be done by hand.

00OB Lemma 10.109.4. Let $R$ be a Noetherian local ring. Suppose that the residue field $\kappa$ has finite projective dimension $n$ over $R$. In this case $\operatorname{dim}(R) \geq n$.

Proof. Let $F$ • be a finite resolution of $\kappa$ by finite free $R$-modules. By Lemma 10.101 .2 we may assume all the maps in the complex $F_{\bullet}$ have to property that $\operatorname{Im}\left(F_{i} \rightarrow F_{i-1}\right) \subset \mathfrak{m} F_{i-1}$, because removing a trivial summand from the resolution can at worst shorten the resolution. Say $F_{n} \neq 0$ and $F_{i}=0$ for $i>n$, so that the projective dimension of $\kappa$ is $n$. By Proposition 10.101 .10 we see that $\operatorname{depth}_{I\left(\varphi_{n}\right)}(R) \geq n$ since $I\left(\varphi_{n}\right)$ cannot equal $R$ by our choice of the complex. Thus by Lemma 10.71 .3 also $\operatorname{dim}(R) \geq n$.

00OC Proposition 10.109.5. A Noetherian local ring whose residue field has finite projective dimension is a regular local ring. In particular a Noetherian local ring of finite global dimension is a regular local ring.

Proof. By Lemmas 10.109 .3 and 10.109 .4 we see that $\operatorname{dim}(R) \geq \operatorname{dim}{ }_{\kappa}\left(\mathfrak{m} / \mathfrak{m}^{2}\right)$. Thus the result follows immediately from Definition 10.59 .9

0AFS Lemma 10.109.6. A Noetherian local ring $R$ is a regular local ring if and only if it has finite global dimension. In this case $R_{\mathfrak{p}}$ is a regular local ring for all primes $\mathfrak{p}$.

Proof. By Propositions 10.109 .5 and 10.109 .1 we see that a Noetherian local ring is a regular local ring if and only if it has finite global dimension. Furthermore, any localization $R_{\mathfrak{p}}$ has finite global dimension, see Lemma 10.108 .8 , and hence is a regular local ring.

By Lemma 10.109.6 it makes sense to make the following definition, because it does not conflict with the earlier definition of a regular local ring.

00OD Definition 10.109.7. A Noetherian ring $R$ is said to be regular if all the localizations $R_{\mathfrak{p}}$ at primes are regular local rings.

It is enough to require the local rings at maximal ideals to be regular. Note that this is not the same as asking $R$ to have finite global dimension, even assuming $R$ is Noetherian. This is because there is an example of a regular Noetherian ring which does not have finite global dimension, namely because it does not have finite dimension.

00OE Lemma 10.109.8. Let $R$ be a Noetherian ring. The following are equivalent:
(1) $R$ has finite global dimension $n$,
(2) there exists an integer $n$ such that all the localizations $R_{\mathfrak{m}}$ at maximal ideals are regular of dimension $\leq n$ with equality for at least one $\mathfrak{m}$, and
(3) there exists an integer $n$ such that all the localizations $R_{\mathfrak{p}}$ at prime ideals are regular of dimension $\leq n$ with equality for at least one $\mathfrak{p}$.

Proof. This is a reformulation of Lemma 10.109 .2 in view of the discussion surrounding Definition 10.109.7. See especially Propositions 10.109.1 and 10.109.5.

00OF Lemma 10.109.9. Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Assume that $R \rightarrow S$ is flat and that $S$ is regular. Then $R$ is regular.

Proof. Let $\mathfrak{m} \subset R$ be the maximal ideal and let $\kappa=R / \mathfrak{m}$ be the residue field. Let $d=\operatorname{dim} S$. Choose any resolution $F_{\bullet} \rightarrow \kappa$ with each $F_{i}$ a finite free $R$-module. Set $K_{d}=\operatorname{Ker}\left(F_{d-1} \rightarrow F_{d-2}\right)$. By flatness of $R \rightarrow S$ the complex $0 \rightarrow K_{d} \otimes_{R} S \rightarrow$ $F_{d-1} \otimes_{R} S \rightarrow \ldots \rightarrow F_{0} \otimes_{R} S \rightarrow \kappa \otimes_{R} S \rightarrow 0$ is still exact. Because the global dimension of $S$ is $d$, see Proposition 10.109.1, we see that $K_{d} \otimes_{R} S$ is a finite free $S$ module (see also Lemma 10.108.3). By Lemma 10.77 .5 we see that $K_{d}$ is a finite free $R$-module. Hence $\kappa$ has finite projective dimension and $R$ is regular by Proposition 10.109.5.

### 10.110. Auslander-Buchsbaum

090U The following result can be found in AB57.
090V Proposition 10.110.1. Let $R$ be a Noetherian local ring. Let $M$ be a nonzero finite $R$-module which has finite projective dimension $p d_{R}(M)$. Then we have

$$
\operatorname{depth}(R)=p d_{R}(M)+\operatorname{depth}(M)
$$

Proof. We prove this by induction on depth $(M)$. The most interesting case is the case $\operatorname{depth}(M)=0$. In this case, let

$$
0 \rightarrow R^{n_{e}} \rightarrow R^{n_{e-1}} \rightarrow \ldots \rightarrow R^{n_{0}} \rightarrow M \rightarrow 0
$$

be a minimal finite free resolution, so $e=\operatorname{pd}_{R}(M)$. By Lemma 10.101 .2 we may assume all matrix coefficients of the maps in the complex are contained in the maximal ideal of $R$. Then on the one hand, by Proposition 10.101 .10 we see that $\operatorname{depth}(R) \geq e$. On the other hand, breaking the long exact sequence into short
exact sequences

$$
\begin{aligned}
& 0 \rightarrow R^{n_{e}} \rightarrow R^{n_{e-1}} \rightarrow K_{e-2} \rightarrow 0 \\
& 0 \rightarrow K_{e-2} \rightarrow R^{n_{e-2}} \rightarrow K_{e-3} \rightarrow 0 \\
& \cdots, \\
& 0 \rightarrow K_{0} \rightarrow R^{n_{0}} \rightarrow M \rightarrow 0
\end{aligned}
$$

we see, using Lemma 10.71.6, that

$$
\begin{array}{r}
\operatorname{depth}\left(K_{e-2}\right) \geq \operatorname{depth}(R)-1, \\
\operatorname{depth}\left(K_{e-3}\right) \geq \operatorname{depth}(R)-2, \\
\ldots, \\
\operatorname{depth}\left(K_{0}\right) \geq \operatorname{depth}(R)-(e-1), \\
\operatorname{depth}(M) \geq \operatorname{depth}(R)-e
\end{array}
$$

and since $\operatorname{depth}(M)=0$ we conclude $\operatorname{depth}(R) \leq e$. This finishes the proof of the case $\operatorname{depth}(M)=0$.

Induction step. If $\operatorname{depth}(M)>0$, then we pick $x \in \mathfrak{m}$ which is a nonzerodivisor on both $M$ and $R$. This is possible, because either $\operatorname{pd}_{R}(M)>0$ and $\operatorname{depth}(R)>0$ by the aforementioned Proposition 10.101 .10 or $\mathrm{pd}_{R}(M)=0$ in which case $M$ is finite free hence also $\operatorname{depth}(R)=\operatorname{depth}(M)>0$. Thus $\operatorname{depth}(R \oplus M)>0$ by Lemma 10.71.6 (for example) and we can find an $x \in \mathfrak{m}$ which is a nonzerodivisor on both $R$ and $M$. Let

$$
0 \rightarrow R^{n_{e}} \rightarrow R^{n_{e-1}} \rightarrow \ldots \rightarrow R^{n_{0}} \rightarrow M \rightarrow 0
$$

be a minimal resolution as above. An application of the snake lemma shows that

$$
0 \rightarrow(R / x R)^{n_{e}} \rightarrow(R / x R)^{n_{e-1}} \rightarrow \ldots \rightarrow(R / x R)^{n_{0}} \rightarrow M / x M \rightarrow 0
$$

is a minimal resolution too. Thus $\operatorname{pd}_{R}(M)=\operatorname{pd}_{R / x R}(M / x M)$. By Lemma 10.71.7 we have $\operatorname{depth}(R / x R)=\operatorname{depth}(R)-1$ and $\operatorname{depth}(M / x M)=\operatorname{depth}(M)-1$. Till now depths have all been depths as $R$ modules, but we observe that $\operatorname{depth}_{R}(M / x M)=$ $\operatorname{depth}_{R / x R}(M / x M)$ and similarly for $R / x R$. By induction hypothesis we see that the Auslander-Buchsbaum formula holds for $M / x M$ over $R / x R$. Since the depths of both $R / x R$ and $M / x M$ have decreased by one and the projective dimension has not changed we conclude.

### 10.111. Homomorphisms and dimension

00 OG This section contains a collection of easy results relating dimensions of rings when there are maps between them.

00 OH Lemma 10.111.1. Suppose $R \rightarrow S$ is a ring map satisfying either going up, see Definition 10.40.1, or going down see Definition 10.40.1. Assume in addition that $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective. Then $\operatorname{dim}(R) \leq \operatorname{dim}(S)$.
Proof. Assume going up. Take any chain $\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{e}$ of prime ideals in $R$. By surjectivity we may choose a prime $\mathfrak{q}_{0}$ mapping to $\mathfrak{p}_{0}$. By going up we may extend this to a chain of length $e$ of primes $\mathfrak{q}_{i}$ lying over $\mathfrak{p}_{i}$. Thus $\operatorname{dim}(S) \geq \operatorname{dim}(R)$. The case of going down is exactly the same. See also Topology, Lemma 5.18 .8 for a purely topological version.

00OI Lemma 10.111.2. Suppose that $R \rightarrow S$ is a ring map with the going up property, see Definition 10.40.1. If $\mathfrak{q} \subset S$ is a maximal ideal. Then the inverse image of $\mathfrak{q}$ in $R$ is a maximal ideal too.

Proof. Trivial.
00OJ Lemma 10.111.3. Suppose that $R \rightarrow S$ is a ring map such that $S$ is integral over $R$. Then $\operatorname{dim}(R) \geq \operatorname{dim}(S)$, and every closed point of $\operatorname{Spec}(S)$ maps to a closed point of $\operatorname{Spec}(R)$.

Proof. Immediate from Lemmas 10.35 .18 and 10.111 .2 and the definitions.
00OK Lemma 10.111.4. Suppose $R \subset S$ and $S$ integral over $R$. Then $\operatorname{dim}(R)=$ $\operatorname{dim}(S)$.

Proof. This is a combination of Lemmas $10.35 .20,10.35 .15,10.111 .1$, and 10.111 .3 .

00OL Definition 10.111.5. Suppose that $R \rightarrow S$ is a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of $R$. The local ring of the fibre at $\mathfrak{q}$ is the local ring

$$
S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}=(S / \mathfrak{p} S)_{\mathfrak{q}}=\left(S \otimes_{R} \kappa(\mathfrak{p})\right)_{\mathfrak{q}}
$$

00OM Lemma 10.111.6. Let $R \rightarrow S$ be a homomorphism of Noetherian rings. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$. Then

$$
\operatorname{dim}\left(S_{\mathfrak{q}}\right) \leq \operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)
$$

Proof. We use the characterization of dimension of Proposition 10.59.8. Let $x_{1}, \ldots, x_{d}$ be elements of $\mathfrak{p}$ generating an ideal of definition of $R_{\mathfrak{p}}$ with $d=\operatorname{dim}\left(R_{\mathfrak{p}}\right)$. Let $y_{1}, \ldots, y_{e}$ be elements of $\mathfrak{q}$ generating an ideal of definition of $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ with $e=\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)$. It is clear that $S_{\mathfrak{q}} /\left(x_{1}, \ldots, x_{d}, y_{1}, \ldots, y_{e}\right)$ has a nilpotent maximal ideal. Hence $x_{1}, \ldots, x_{d}, y_{1}, \ldots, y_{e}$ generate an ideal of definition if $S_{\mathfrak{q}}$.

00ON Lemma 10.111.7. Let $R \rightarrow S$ be a homomorphism of Noetherian rings. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$. Assume the going down property holds for $R \rightarrow S$ (for example if $R \rightarrow S$ is flat, see Lemma 10.38.18). Then

$$
\operatorname{dim}\left(S_{\mathfrak{q}}\right)=\operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)
$$

Proof. By Lemma 10.111 .6 we have an inequality $\operatorname{dim}\left(S_{\mathfrak{q}}\right) \leq \operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)$. To get equality, choose a chain of primes $\mathfrak{p} S \subset \mathfrak{q}_{0} \subset \mathfrak{q}_{1} \subset \ldots \subset \mathfrak{q}_{d}=\mathfrak{q}$ with $d=$ $\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)$. On the other hand, choose a chain of primes $\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{e}=\mathfrak{p}$ with $e=\operatorname{dim}\left(R_{\mathfrak{p}}\right)$. By the going down theorem we may choose $\mathfrak{q}_{-1} \subset \mathfrak{q}_{0}$ lying over $\mathfrak{p}_{e-1}$. And then we may choose $\mathfrak{q}_{-2} \subset \mathfrak{q}_{e-1}$ lying over $\mathfrak{p}_{e-2}$. Inductively we keep going until we get a chain $\mathfrak{q}_{-e} \subset \ldots \subset \mathfrak{q}_{d}$ of length $e+d$.

031E Lemma 10.111.8. Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Assume
(1) $R$ is regular,
(2) $S / \mathfrak{m}_{R} S$ is regular, and
(3) $R \rightarrow S$ is flat.

Then $S$ is regular.

Proof. By Lemma 10.111 .7 we have $\operatorname{dim}(S)=\operatorname{dim}(R)+\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)$. Pick generators $x_{1}, \ldots, x_{d} \in \mathfrak{m}_{R}$ with $d=\operatorname{dim}(R)$, and pick $y_{1}, \ldots, y_{e} \in \mathfrak{m}_{S}$ which generate the maximal ideal of $S / \mathfrak{m}_{R} S$ with $e=\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)$. Then we see that $x_{1}, \ldots, x_{d}, y_{1}, \ldots, y_{e}$ are elements which generate the maximal ideal of $S$ and $e+d=$ $\operatorname{dim}(S)$.
The lemma below will later be used to show that rings of finite type over a field are Cohen-Macaulay if and only if they are quasi-finite flat over a polynomial ring. It is a partial converse to Lemma 10.127.1.

00R5 Lemma 10.111.9. Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Assume $R$ Cohen-Macaulay. If $S$ is finite flat over $R$, or if $S$ is flat over $R$ and $\operatorname{dim}(S) \leq \operatorname{dim}(R)$, then $S$ is Cohen-Macaulay and $\operatorname{dim}(R)=\operatorname{dim}(S)$.
Proof. Let $x_{1}, \ldots, x_{d} \in \mathfrak{m}_{R}$ be a regular sequence of length $d=\operatorname{dim}(R)$. By Lemma 10.67 .5 this maps to a regular sequence in $S$. Hence $S$ is Cohen-Macaulay if $\operatorname{dim}(S) \leq d$. This is true if $S$ is finite flat over $R$ by Lemma 10.111.4 And in the second case we assumed it.

### 10.112. The dimension formula

02 II Recall the definitions of catenary (Definition 10.104.1) and universally catenary (Definition 10.104.3).
02IJ Lemma 10.112.1. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over the prime $\mathfrak{p}$ of $R$. Assume that
(1) $R$ is Noetherian,
(2) $R \rightarrow S$ is of finite type,
(3) $R, S$ are domains, and
(4) $R \subset S$.

Then we have

$$
\operatorname{height}(\mathfrak{q}) \leq \operatorname{height}(\mathfrak{p})+\operatorname{trdeg}_{R}(S)-\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})
$$

with equality if $R$ is universally catenary.
Proof. Suppose that $R \subset S^{\prime} \subset S$ is a finitely generated $R$-subalgebra of $S$. In this case set $\mathfrak{q}^{\prime}=S^{\prime} \cap \mathfrak{q}$. The lemma for the ring maps $R \rightarrow S^{\prime}$ and $S^{\prime} \rightarrow S$ implies the lemma for $R \rightarrow S$ by additivity of transcendence degree in towers of fields (Fields, Lemma 9.25.5. Hence we can use induction on the number of generators of $S$ over $R$ and reduce to the case where $S$ is generated by one element over $R$.
Case I: $S=R[x]$ is a polynomial algebra over $R$. In this case we have $\operatorname{trdeg}_{R}(S)=1$. Also $R \rightarrow S$ is flat and hence

$$
\operatorname{dim}\left(S_{\mathfrak{q}}\right)=\operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)
$$

see Lemma 10.111.7. Let $\mathfrak{r}=\mathfrak{p} S$. Then $\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})=1$ is equivalent to $\mathfrak{q}=\mathfrak{r}$, and implies that $\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)=0$. In the same vein $\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})=0$ is equivalent to having a strict inclusion $\mathfrak{r} \subset \mathfrak{q}$, which implies that $\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)=1$. Thus we are done with case I with equality in every instance.

Case II: $S=R[x] / \mathfrak{n}$ with $\mathfrak{n} \neq 0$. In this case we have $\operatorname{trdeg}_{R}(S)=0$. Denote $\mathfrak{q}^{\prime} \subset R[x]$ the prime corresponding to $\mathfrak{q}$. Thus we have

$$
S_{\mathfrak{q}}=(R[x])_{\mathfrak{q}^{\prime}} / \mathfrak{n}(R[x])_{\mathfrak{q}^{\prime}}
$$

By the previous case we have $\operatorname{dim}\left((R[x])_{\mathfrak{q}^{\prime}}\right)=\operatorname{dim}\left(R_{\mathfrak{p}}\right)+1-\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})$. Since $\mathfrak{n} \neq 0$ we see that the dimension of $S_{\mathfrak{q}}$ decreases by at least one, see Lemma 10.59 .12 , which proves the inequality of the lemma. To see the equality in case $R$ is universally catenary note that $\mathfrak{n} \subset R[x]$ is a height one prime as it corresponds to a nonzero prime in $f . f .(R)[x]$. Hence any maximal chain of primes in $R[x]_{\mathfrak{q}^{\prime}} / \mathfrak{n}$ corresponds to a maximal chain of primes with length 1 greater between $\mathfrak{q}^{\prime}$ and (0) in $R[x]$. If $R$ is universally catenary these all have the same length equal to the height of $\mathfrak{q}^{\prime}$. This proves that $\operatorname{dim}\left(R[x]_{\mathfrak{q}^{\prime}} / \mathfrak{n}\right)=\operatorname{dim}\left(R[x]_{\mathfrak{q}^{\prime}}\right)-1$ as desired.

The following lemma says that generically finite maps tend to be quasi-finite in codimension 1.

02MA Lemma 10.112.2. Let $A \rightarrow B$ be a ring map. Assume
(1) $A \subset B$ is an extension of domains.
(2) $A$ is Noetherian,
(3) $A \rightarrow B$ is of finite type, and
(4) the extension $f . f .(A) \subset f . f .(B)$ is finite.

Let $\mathfrak{p} \subset A$ be a prime of height 1. Then there are at most finitely many primes of $B$ lying over $\mathfrak{p}$ and they all have height 1.
Proof. By the dimension formula (Lemma 10.112.1) for any prime $\mathfrak{q}$ lying over $\mathfrak{p}$ we have

$$
\operatorname{dim}\left(B_{\mathfrak{q}}\right) \leq \operatorname{dim}\left(A_{\mathfrak{p}}\right)-\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})
$$

As the domain $B_{\mathfrak{q}}$ has at least 2 prime ideals we see that $\operatorname{dim}\left(B_{\mathfrak{q}}\right) \geq 1$. We conclude that $\operatorname{dim}\left(B_{\mathfrak{q}}\right)=1$ and that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is algebraic. Hence $\mathfrak{q}$ defines a closed point of its fibre $\operatorname{Spec}\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$, see Lemma 10.34.9. Since $B \otimes_{A} \kappa(\mathfrak{p})$ is a Noetherian ring the fibre $\operatorname{Spec}\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$ is a Noetherian topological space, see Lemma 10.30 .5 A Noetherian topological space consisting of closed points is finite, see for example Topology, Lemma 5.8.2.

### 10.113. Dimension of finite type algebras over fields

0000 In this section we compute the dimension of a polynomial ring over a field. We also prove that the dimension of a finite type domain over a field is the dimension of its local rings at maximal ideals. We will establish the connection with the transcendence degree over the ground field in Section 10.115 .
00OP Lemma 10.113.1. Let $\mathfrak{m}$ be a maximal ideal in $k\left[x_{1}, \ldots, x_{n}\right]$. The ideal $\mathfrak{m}$ is generated by $n$ elements. The dimension of $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}}$ is $n$. Hence $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}}$ is a regular local ring of dimension $n$.
Proof. By the Hilbert Nullstellensatz (Theorem 10.33.1) we know the residue field $\kappa=\kappa(\mathfrak{m})$ is a finite extension of $k$. Denote $\alpha_{i} \in \kappa$ the image of $x_{i}$. Denote $\kappa_{i}=k\left(\alpha_{1}, \ldots, \alpha_{i}\right) \subset \kappa, i=1, \ldots, n$ and $\kappa_{0}=k$. Note that $\kappa_{i}=k\left[\alpha_{1}, \ldots, \alpha_{i}\right]$ by field theory. Define inductively elements $f_{i} \in \mathfrak{m} \cap k\left[x_{1}, \ldots, x_{i}\right]$ as follows: Let $P_{i}(T) \in \kappa_{i-1}[T]$ be the monic minimal polynomial of $\alpha_{i}$ over $\kappa_{i-1}$. Let $Q_{i}(T) \in$ $k\left[x_{1}, \ldots, x_{i-1}\right][T]$ be a monic lift of $P_{i}(T)$ (of the same degree). Set $f_{i}=Q_{i}\left(x_{i}\right)$. Note that if $d_{i}=\operatorname{deg}_{T}\left(P_{i}\right)=\operatorname{deg}_{T}\left(Q_{i}\right)=\operatorname{deg}_{x_{i}}\left(f_{i}\right)$ then $d_{1} d_{2} \ldots d_{i}=\left[\kappa_{i}: k\right]$ by Fields, Lemmas 9.7.6 and 9.9.2.
We claim that for all $i=0,1, \ldots, n$ there is an isomorphism

$$
\psi_{i}: k\left[x_{1}, \ldots, x_{i}\right] /\left(f_{1}, \ldots, f_{i}\right) \cong \kappa_{i}
$$

By construction the composition $k\left[x_{1}, \ldots, x_{i}\right] \rightarrow k\left[x_{1}, \ldots, x_{n}\right] \rightarrow \kappa$ is surjective onto $\kappa_{i}$ and $f_{1}, \ldots, f_{i}$ are in the kernel. This gives a surjective homomorphism. We prove $\psi_{i}$ is injective by induction. It is clear for $i=0$. Given the statement for $i$ we prove it for $i+1$. The ring extension $k\left[x_{1}, \ldots, x_{i}\right] /\left(f_{1}, \ldots, f_{i}\right) \rightarrow$ $k\left[x_{1}, \ldots, x_{i+1}\right] /\left(f_{1}, \ldots, f_{i+1}\right)$ is generated by 1 element over a field and one irreducible equation. By elementary field theory $k\left[x_{1}, \ldots, x_{i+1}\right] /\left(f_{1}, \ldots, f_{i+1}\right)$ is a field, and hence $\psi_{i}$ is injective.

This implies that $\mathfrak{m}=\left(f_{1}, \ldots, f_{n}\right)$. Moreover, we also conclude that

$$
k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{i}\right) \cong \kappa_{i}\left[x_{i+1}, \ldots, x_{n}\right] .
$$

Hence $\left(f_{1}, \ldots, f_{i}\right)$ is a prime ideal. Thus

$$
(0) \subset\left(f_{1}\right) \subset\left(f_{1}, f_{2}\right) \subset \ldots \subset\left(f_{1}, \ldots, f_{n}\right)=\mathfrak{m}
$$

is a chain of primes of length $n$. The lemma follows.
000Q Proposition 10.113.2. A polynomial algebra in $n$ variables over a field is a regular ring. It has global dimension n. All localizations at maximal ideals are regular local rings of dimension $n$.
Proof. By Lemma 10.113 .1 all localizations $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}}$ at maximal ideals are regular local rings of dimension $n$. Hence we conclude by Lemma 10.109.8.

00 OR Lemma 10.113.3. Let $k$ be a field. Let $\mathfrak{p} \subset \mathfrak{q} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be a pair of primes. Any maximal chain of primes between $\mathfrak{p}$ and $\mathfrak{q}$ has length height $(\mathfrak{q})-\operatorname{height}(\mathfrak{p})$.
Proof. By Proposition 10.113 .2 any local ring of $k\left[x_{1}, \ldots, x_{n}\right]$ is regular. Hence all local rings are Cohen-Macaulay, see Lemma 10.105.3. The local rings at maximal ideals have dimension $n$ hence every maximal chain of primes in $k\left[x_{1}, \ldots, x_{n}\right]$ has length $n$, see Lemma 10.103 .3 . Hence every maximal chain of primes between ( 0 ) and $\mathfrak{p}$ has length height $(\mathfrak{p})$, see Lemma 10.103 .4 for example. Putting these together leads to the assertion of the lemma.

00 OS Lemma 10.113.4. Let $k$ be a field. Let $S$ be a finite type $k$-algebra which is an integral domain. Then $\operatorname{dim}(S)=\operatorname{dim}\left(S_{\mathfrak{m}}\right)$ for any maximal ideal $\mathfrak{m}$ of $S$. In words: every maximal chain of primes has length equal to the dimension of $S$.

Proof. Write $S=k\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{p}$. By Proposition 10.113 .2 and Lemma 10.113 .3 all the maximal chains of primes in $S$ (which necessarily end with a maximal ideal) have length $n-\operatorname{height}(\mathfrak{p})$. Thus this number is the dimension of $S$ and of $S_{\mathfrak{m}}$ for any maximal ideal $\mathfrak{m}$ of $S$.

Recall that we defined the dimension $\operatorname{dim}_{x}(X)$ of a topological space $X$ at a point $x$ in Topology, Definition 5.9.1.

00OT Lemma 10.113.5. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $X=$ $\operatorname{Spec}(S)$. Let $\mathfrak{p} \subset S$ be a prime ideal and let $x \in X$ be the corresponding point. The following numbers are equal
(1) $\operatorname{dim}_{x}(X)$,
(2) $\max \operatorname{dim}(Z)$ where the maximum is over those irreducible components $Z$ of $X$ passing through $x$, and
(3) min $\operatorname{dim}\left(S_{\mathfrak{m}}\right)$ where the minimum is over maximal ideals $\mathfrak{m}$ with $\mathfrak{p} \subset \mathfrak{m}$.

Proof. Let $X=\bigcup_{i \in I} Z_{i}$ be the decomposition of $X$ into its irreducible components. There are finitely many of them (see Lemmas 10.30 .3 and 10.30.5). Let $I^{\prime}=\left\{i \mid x \in Z_{i}\right\}$, and let $T=\bigcup_{i \notin I^{\prime}} Z_{i}$. Then $U=X \backslash T$ is an open subset of $X$ containing the point $x$. The number (2) is $\max _{i \in I^{\prime}} \operatorname{dim}\left(Z_{i}\right)$. For any open $W \subset U$, with $x \in W$ the irreducible components of $W$ are the irreducible sets $W_{i}=Z_{i} \cap W$ for $i \in I^{\prime}$. Note that each $W_{i}, i \in I^{\prime}$ contains a closed point because $X$ is Jacobson, see Section 10.34 . Since $W_{i} \subset Z_{i}$ we have $\operatorname{dim}\left(W_{i}\right) \leq \operatorname{dim}\left(Z_{i}\right)$. The existence of a closed point implies, via Lemma 10.113.4, that there is a chain of irreducible closed subsets of length equal to $\operatorname{dim}\left(Z_{i}\right)$ in the open $W_{i}$. Thus $\operatorname{dim}\left(W_{i}\right)=\operatorname{dim}\left(Z_{i}\right)$ for any $i \in I^{\prime}$. Hence $\operatorname{dim}(W)$ is equal to the number (2). This proves that $(1)=(2)$.
Let $\mathfrak{m} \supset \mathfrak{p}$ be any maximal ideal containing $\mathfrak{p}$. Let $x_{0} \in X$ be the corresponding point. First of all, $x_{0}$ is contained in all the irreducible components $Z_{i}, i \in I^{\prime}$. Let $\mathfrak{q}_{i}$ denote the minimal primes of $S$ corresponding to the irreducible components $Z_{i}$. For each $i$ such that $x_{0} \in Z_{i}$ (which is equivalent to $\mathfrak{m} \supset \mathfrak{q}_{i}$ ) we have a surjection

$$
S_{\mathfrak{m}} \longrightarrow S_{\mathfrak{m}} / \mathfrak{q}_{i} S_{\mathfrak{m}}=\left(S / \mathfrak{q}_{i}\right)_{\mathfrak{m}}
$$

Moreover, the primes $\mathfrak{q}_{i} S_{\mathfrak{m}}$ so obtained exhaust the minimal primes of the Noetherian local ring $S_{\mathfrak{m}}$, see Lemma 10.25.3. We conclude, using Lemma 10.113.4 that the dimension of $S_{\mathfrak{m}}$ is the maximum of the dimensions of the $Z_{i}$ passing through $x_{0}$. To finish the proof of the lemma it suffices to show that we can choose $x_{0}$ such that $x_{0} \in Z_{i} \Rightarrow i \in I^{\prime}$. Because $S$ is Jacobson (as we saw above) it is enough to show that $V(\mathfrak{p}) \backslash T$ (with $T$ as above) is nonempty. And this is clear since it contains the point $x$ (i.e. $\mathfrak{p}$ ).
00OU Lemma 10.113.6. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $X=$ $\operatorname{Spec}(S)$. Let $\mathfrak{m} \subset S$ be a maximal ideal and let $x \in X$ be the associated closed point. Then $\operatorname{dim}_{x}(X)=\operatorname{dim}\left(S_{\mathfrak{m}}\right)$.
Proof. This is a special case of Lemma 10.113.5.
00OV Lemma 10.113.7. Let $k$ be a field. Let $S$ be a finite type $k$ algebra. Assume that $S$ is Cohen-Macaulay. Then $\operatorname{Spec}(S)=\coprod T_{d}$ is a finite disjoint union of open and closed subsets $T_{d}$ with $T_{d}$ equidimensional (see Topology, Definition 5.9.5) of dimension d. Equivalently, $S$ is a product of rings $S_{d}, d=0, \ldots, \operatorname{dim}(S)$ such that every maximal ideal $\mathfrak{m}$ of $S_{d}$ has height $d$.
Proof. The equivalence of the two statements follows from Lemma 10.22 .3 . Let $\mathfrak{m} \subset S$ be a maximal ideal. Every maximal chain of primes in $S_{\mathfrak{m}}$ has the same length equal to $\operatorname{dim}\left(S_{\mathfrak{m}}\right)$, see Lemma 10.103.3. Hence, the dimension of the irreducible components passing through the point corresponding to $\mathfrak{m}$ all have dimension equal to $\operatorname{dim}\left(S_{\mathfrak{m}}\right)$, see Lemma 10.113.4. Since $\operatorname{Spec}(S)$ is a Jacobson topological space the intersection of any two irreducible components of it contains a closed point if nonempty, see Lemmas 10.34 .2 and 10.34 .4 . Thus we have shown that any two irreducible components that meet have the same dimension. The lemma follows easily from this, and the fact that $\operatorname{Spec}(S)$ has a finite number of irreducible components (see Lemmas 10.30 .3 and 10.30.5.

### 10.114. Noether normalization

00 OW In this section we prove variants of the Noether normalization lemma. The key ingredient we will use is contained in the following two lemmas.

051M Lemma 10.114.1. Let $n \in \mathbf{N}$. Let $N$ be a finite nonempty set of multi-indices $\nu=\left(\nu_{1}, \ldots, \nu_{n}\right)$. Given $e=\left(e_{1}, \ldots, e_{n}\right)$ we set $e \cdot \nu=\sum e_{i} \nu_{i}$. Then for $e_{1} \gg e_{2} \gg$ $\ldots \gg e_{n-1} \gg e_{n}$ we have: If $\nu, \nu^{\prime} \in N$ then

$$
\left(e \cdot \nu=e \cdot \nu^{\prime}\right) \Leftrightarrow\left(\nu=\nu^{\prime}\right)
$$

Proof. Say $N=\left\{\nu_{j}\right\}$ with $\nu_{j}=\left(\nu_{j 1}, \ldots, \nu_{j n}\right)$. Let $A_{i}=\max _{j} \nu_{j i}-\min _{j} \nu_{j i}$. If for each $i$ we have $e_{i-1}>A_{i} e_{i}+A_{i+1} e_{i+1}+\ldots+A_{n} e_{n}$ then the lemma holds. For suppose that $e \cdot\left(\nu-\nu^{\prime}\right)=0$. Then for $n \geq 2$,

$$
e_{1}\left(\nu_{1}-\nu_{1}^{\prime}\right)=\sum_{i=2}^{n} e_{i}\left(\nu_{i}^{\prime}-\nu_{i}\right)
$$

We may assume that $\left(\nu_{1}-\nu_{1}^{\prime}\right) \geq 0$. If $\left(\nu_{1}-\nu_{1}^{\prime}\right)>0$, then

$$
e_{1}\left(\nu_{1}-\nu_{1}^{\prime}\right) \geq e_{1}>A_{2} e_{2}+\ldots+A_{n} e_{n} \geq \sum_{i=2}^{n} e_{i}\left|\nu_{i}^{\prime}-\nu_{i}\right| \geq \sum_{i=2}^{n} e_{i}\left(\nu_{i}^{\prime}-\nu_{i}\right)
$$

This contradiction implies that $\nu_{1}^{\prime}=\nu_{1}$. By induction, $\nu_{i}^{\prime}=\nu_{i}$ for $2 \leq i \leq n$.
051N Lemma 10.114.2. Let $R$ be a ring. Let $g \in R\left[x_{1}, \ldots, x_{n}\right]$ be an element which is nonconstant, i.e., $g \notin R$. For $e_{1} \gg e_{2} \gg \ldots \gg e_{n-1} \gg e_{n}=1$ the polynomial

$$
g\left(x_{1}+x_{n}^{e_{1}}, x_{2}+x_{n}^{e_{2}}, \ldots, x_{n-1}+x_{n}^{e_{n-1}}, x_{n}\right)=a x_{n}^{d}+\text { lower order terms in } x_{n}
$$

where $d>0$ and $a \in R$ is one of the nonzero coefficients of $g$.
Proof. Write $g=\sum_{\nu \in N} a_{\nu} x^{\nu}$ with $a_{\nu} \in R$ not zero. Here $N$ is a finite set of multi-indices as in Lemma 10.114.1 and $x^{\nu}=x_{1}^{\nu_{1}} \ldots x_{n}^{\nu_{n}}$. Note that the leading term in

$$
\left(x_{1}+x_{n}^{e_{1}}\right)^{\nu_{1}} \ldots\left(x_{n-1}+x_{n}^{e_{n-1}}\right)^{\nu_{n-1}} x_{n}^{\nu_{n}} \quad \text { is } x_{n}^{e_{1} \nu_{1}+\ldots+e_{n-1} \nu_{n-1}+\nu_{n}} .
$$

Hence the lemma follows from Lemma 10.114.1 which guarantees that there is exactly one nonzero term $a_{\nu} x^{\nu}$ of $g$ which gives rise to the leading term of $g\left(x_{1}+\right.$ $\left.x_{n}^{e_{1}}, x_{2}+x_{n}^{e_{2}}, \ldots, x_{n-1}+x_{n}^{e_{n-1}}, x_{n}\right)$, i.e., $a=a_{\nu}$ for the unique $\nu \in N$ such that $e \cdot \nu$ is maximal.

00OX Lemma 10.114.3. Let $k$ be a field. Let $S=k\left[x_{1}, \ldots, x_{n}\right] / I$ for some ideal I. If $I \neq 0$, then there exist $y_{1}, \ldots, y_{n-1} \in k\left[x_{1}, \ldots, x_{n}\right]$ such that $S$ is finite over $k\left[y_{1}, \ldots, y_{n-1}\right]$. Moreover we may choose $y_{i}$ to be in the $\mathbf{Z}$-subalgebra of $k\left[x_{1}, \ldots, x_{n}\right]$ generated by $x_{1}, \ldots, x_{n}$.

Proof. Pick $f \in I, f \neq 0$. It suffices to show the lemma for $k\left[x_{1}, \ldots, x_{n}\right] /(f)$ since $S$ is a quotient of that ring. We will take $y_{i}=x_{i}-x_{n}^{e_{i}}, i=1, \ldots, n-1$ for suitable integers $e_{i}$. When does this work? It suffices to show that $\overline{x_{n}} \in k\left[x_{1}, \ldots, x_{n}\right] /(f)$ is integral over the ring $k\left[y_{1}, \ldots, y_{n-1}\right]$. The equation for $\overline{x_{n}}$ over this ring is

$$
f\left(y_{1}+x_{n}^{e_{1}}, \ldots, y_{n-1}+x_{n}^{e_{n-1}}, x_{n}\right)=0
$$

Hence we are done if we can show there exists integers $e_{i}$ such that the leading coefficient with respect to $x_{n}$ of the equation above is a nonzero element of $k$. This can be achieved for example by choosing $e_{1} \gg e_{2} \gg \ldots \gg e_{n-1}$, see Lemma 10.114.2.

00OY Lemma 10.114.4. Let $k$ be a field. Let $S=k\left[x_{1}, \ldots, x_{n}\right] / I$ for some ideal $I$. There exist $r \geq 0$, and $y_{1}, \ldots, y_{r} \in k\left[x_{1}, \ldots, x_{n}\right]$ such that (a) the map $k\left[y_{1}, \ldots, y_{r}\right] \rightarrow$ $S$ is injective, and (b) the map $k\left[y_{1}, \ldots, y_{r}\right] \rightarrow S$ is finite. In this case the integer $r$ is the dimension of $S$. Moreover we may choose $y_{i}$ to be in the Z-subalgebra of $k\left[x_{1}, \ldots, x_{n}\right]$ generated by $x_{1}, \ldots, x_{n}$.

Proof. By induction on $n$, with $n=0$ being trivial. If $I=0$, then take $r=n$ and $y_{i}=x_{i}$. If $I \neq 0$, then choose $y_{1}, \ldots, y_{n-1}$ as in Lemma 10.114.3. Let $S^{\prime} \subset S$ be the subring generated by the images of the $y_{i}$. By induction we can choose $r$ and $z_{1}, \ldots, z_{r} \in k\left[y_{1}, \ldots, y_{n-1}\right]$ such that (a), (b) hold for $k\left[z_{1}, \ldots, z_{r}\right] \rightarrow S^{\prime}$. Since $S^{\prime} \rightarrow S$ is injective and finite we see (a), (b) hold for $k\left[z_{1}, \ldots, z_{r}\right] \rightarrow S$. The last assertion follows from Lemma 10.111.4.

00OZ Lemma 10.114.5. Let $k$ be a field. Let $S$ be a finite type $k$ algebra and denote $X=\operatorname{Spec}(S)$. Let $\mathfrak{q}$ be a prime of $S$, and let $x \in X$ be the corresponding point. There exists a $g \in S, g \notin \mathfrak{q}$ such that $\operatorname{dim}\left(S_{g}\right)=\operatorname{dim}_{x}(X)=: d$ and such that there exists a finite injective map $k\left[y_{1}, \ldots, y_{d}\right] \rightarrow S_{g}$.

Proof. Note that by definition $\operatorname{dim}_{x}(X)$ is the minimum of the dimensions of $S_{g}$ for $g \in S, g \notin \mathfrak{q}$, i.e., the minimum is attained. Thus the lemma follows from Lemma 10.114.4

051P Lemma 10.114.6. Let $k$ be a field. Let $\mathfrak{q} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be a prime ideal. Set $r=\operatorname{trdeg}_{k} \kappa(\mathfrak{q})$. Then there exists a finite ring map $\varphi: k\left[y_{1}, \ldots, y_{n}\right] \rightarrow k\left[x_{1}, \ldots, x_{n}\right]$ such that $\varphi^{-1}(\mathfrak{q})=\left(y_{r+1}, \ldots, y_{n}\right)$.
Proof. By induction on $n$. The case $n=0$ is clear. Assume $n>0$. If $r=n$, then $\mathfrak{q}=(0)$ and the result is clear. Choose a nonzero $f \in \mathfrak{q}$. Of course $f$ is nonconstant. After applying an automorphism of the form

$$
k\left[x_{1}, \ldots, x_{n}\right] \longrightarrow k\left[x_{1}, \ldots, x_{n}\right], \quad x_{n} \mapsto x_{n}, \quad x_{i} \mapsto x_{i}+x_{n}^{e_{i}}(i<n)
$$

we may assume that $f$ is monic in $x_{n}$ over $k\left[x_{1}, \ldots, x_{n}\right]$, see Lemma 10.114.2. Hence the ring map

$$
k\left[y_{1}, \ldots, y_{n}\right] \longrightarrow k\left[x_{1}, \ldots, x_{n}\right], \quad y_{n} \mapsto f, \quad y_{i} \mapsto x_{i}(i<n)
$$

is finite. Moreover $y_{n} \in \mathfrak{q} \cap k\left[y_{1}, \ldots, y_{n}\right]$ by construction. Thus $\mathfrak{q} \cap k\left[y_{1}, \ldots, y_{n}\right]=$ $\mathfrak{p} k\left[y_{1}, \ldots, y_{n}\right]+\left(y_{n}\right)$ where $\mathfrak{p} \subset k\left[y_{1}, \ldots, y_{n-1}\right]$ is a prime ideal. Note that $\kappa(\mathfrak{p}) \subset$ $\kappa(\mathfrak{q})$ is finite, and hence $r=\operatorname{trdeg}_{k} \kappa(\mathfrak{p})$. Apply the induction hypothesis to the pair $\left(k\left[y_{1}, \ldots, y_{n-1}\right], \mathfrak{p}\right)$ and we obtain a finite ring map $k\left[z_{1}, \ldots, z_{n-1}\right] \rightarrow$ $k\left[y_{1}, \ldots, y_{n-1}\right]$ such that $\mathfrak{p} \cap k\left[z_{1}, \ldots, z_{n-1}\right]=\left(z_{r+1}, \ldots, z_{n-1}\right)$. We extend the ring map $k\left[z_{1}, \ldots, z_{n-1}\right] \rightarrow k\left[y_{1}, \ldots, y_{n-1}\right]$ to a ring map $k\left[z_{1}, \ldots, z_{n}\right] \rightarrow k\left[y_{1}, \ldots, y_{n}\right]$ by mapping $z_{n}$ to $y_{n}$. The composition of the ring maps

$$
k\left[z_{1}, \ldots, z_{n}\right] \rightarrow k\left[y_{1}, \ldots, y_{n}\right] \rightarrow k\left[x_{1}, \ldots, x_{n}\right]
$$

solves the problem.
07NA Lemma 10.114.7. Let $R \rightarrow S$ be an injective finite type map of domains. Then there exists an integer $d$ and factorization

$$
R \rightarrow R\left[y_{1}, \ldots, y_{d}\right] \rightarrow S^{\prime} \rightarrow S
$$

by injective maps such that $S^{\prime}$ is finite over $R\left[y_{1}, \ldots, y_{d}\right]$ and such that $S_{f}^{\prime} \cong S_{f}$ for some nonzero $f \in R$.

Proof. Pick $x_{1}, \ldots, x_{n} \in S$ which generate $S$ over $R$. Let $K=f . f .(R)$ and $S_{K}=$ $S \otimes_{R} K$. By Lemma 10.114.4 we can find $y_{1}, \ldots, y_{d} \in S$ such that $K\left[y_{1}, \ldots, y_{d}\right] \rightarrow$ $S_{K}$ is a finite injective map. Note that $y_{i} \in S$ because we may pick the $y_{j}$ in the Z-algebra generated by $x_{1}, \ldots, x_{n}$. As a finite ring map is integral (see Lemma 10.35 .3 we can find monic $P_{i} \in K\left[y_{1}, \ldots, y_{d}\right][T]$ such that $P_{i}\left(x_{i}\right)=0$ in $S_{K}$. Let $f \in R$ be a nonzero element such that $f P_{i} \in R\left[y_{1}, \ldots, y_{d}\right][T]$ for all $i$. Set $x_{i}^{\prime}=f x_{i}$
and let $S^{\prime} \subset S$ be the subalgebra generated by $y_{1}, \ldots, y_{d}$ and $x_{1}^{\prime}, \ldots, x_{n}^{\prime}$. Note that $x_{i}^{\prime}$ is integral over $R\left[y_{1}, \ldots, y_{d}\right]$ as we have $Q_{i}\left(x_{i}^{\prime}\right)=0$ where $Q_{i}=f^{\mathrm{deg}_{T}\left(P_{i}\right)} P_{i}(T / f)$ which is a monic polynomial in $T$ with coefficients in $R\left[y_{1}, \ldots, y_{d}\right]$ by our choice of $f$. Hence $R\left[y_{1}, \ldots, y_{n}\right] \subset S^{\prime}$ is finite by Lemma 10.35.5. By construction $S_{f}^{\prime} \cong S_{f}$ and we win.

### 10.115. Dimension of finite type algebras over fields, reprise

07 NB This section is a continuation of Section 10.113 . In this section we establish the connection between dimension and transcendence degree over the ground field for finite type domains over a field.

00P0 Lemma 10.115.1. Let $k$ be a field. Let $S$ be a finite type $k$ algebra which is an integral domain. Let $K=f . f .(S)$ be the field of fractions of $S$. Let $r=\operatorname{trdeg}(K / k)$ be the transcendence degree of $K$ over $k$. Then $\operatorname{dim}(S)=r$. Moreover, the local ring of $S$ at every maximal ideal has dimension $r$.

Proof. We may write $S=k\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{p}$. By Lemma 10.113 .3 all local rings of $S$ at maximal ideals have the same dimension. Apply Lemma 10.114.4. We get a finite injective ring map

$$
k\left[y_{1}, \ldots, y_{d}\right] \rightarrow S
$$

with $d=\operatorname{dim}(S)$. Clearly, $k\left(y_{1}, \ldots, y_{d}\right) \subset K$ is a finite extension and we win.
06RP Lemma 10.115.2. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{q} \subset \mathfrak{q}^{\prime} \subset S$ be distinct prime ideals. Then trdeg ${ }_{k} \kappa\left(\mathfrak{q}^{\prime}\right)<\operatorname{trdeg}_{k} \kappa(\mathfrak{q})$.

Proof. By Lemma 10.115 .1 we have $\operatorname{dim} V(\mathfrak{q})=\operatorname{trdeg}_{k} \kappa(\mathfrak{q})$ and similarly for $\mathfrak{q}^{\prime}$. Hence the result follows as the strict inclusion $V\left(\mathfrak{q}^{\prime}\right) \subset V(\mathfrak{q})$ implies a strict inequality of dimensions.

The following lemma generalizes Lemma 10.113 .6 .
00P1 Lemma 10.115.3. Let $k$ be a field. Let $S$ be a finite type $k$ algebra. Let $X=$ $\operatorname{Spec}(S)$. Let $\mathfrak{p} \subset S$ be a prime ideal, and let $x \in X$ be the corresponding point. Then we have

$$
\operatorname{dim}_{x}(X)=\operatorname{dim}\left(S_{\mathfrak{p}}\right)+\operatorname{trdeg}_{k} \kappa(\mathfrak{p})
$$

Proof. By Lemma 10.115 .1 we know that $r=\operatorname{trdeg}_{k} \kappa(\mathfrak{p})$ is equal to the dimension of $V(\mathfrak{p})$. Pick any maximal chain of primes $\mathfrak{p} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{r}$ starting with $\mathfrak{p}$ in $S$. This has length $r$ by Lemma 10.113.4. Let $\mathfrak{q}_{j}, j \in J$ be the minimal primes of $S$ which are contained in $\mathfrak{p}$. These correspond $1-1$ to minimal primes in $S_{\mathfrak{p}}$ via the rule $\mathfrak{q}_{j} \mapsto \mathfrak{q}_{j} S_{\mathfrak{p}}$. By Lemma 10.113 .5 we know that $\operatorname{dim}_{x}(X)$ is equal to the maximum of the dimensions of the rings $S / \mathfrak{q}_{j}$. For each $j$ pick a maximal chain of primes $\mathfrak{q}_{j} \subset \mathfrak{p}_{1}^{\prime} \subset \ldots \subset \mathfrak{p}_{s(j)}^{\prime}=\mathfrak{p}$. Then $\operatorname{dim}\left(S_{\mathfrak{p}}\right)=\max _{j \in J} s(j)$. Now, each chain

$$
\mathfrak{q}_{i} \subset \mathfrak{p}_{1}^{\prime} \subset \ldots \subset \mathfrak{p}_{s(j)}^{\prime}=\mathfrak{p} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{r}
$$

is a maximal chain in $S / \mathfrak{q}_{j}$, and by what was said before we have $\operatorname{dim}_{x}(X)=$ $\max _{j \in J} r+s(j)$. The lemma follows.

The following lemma says that the codimension of one finite type Spec in another is the difference of heights.

00P2 Lemma 10.115.4. Let $k$ be a field. Let $S^{\prime} \rightarrow S$ be a surjection of finite type $k$ algebras. Let $\mathfrak{p} \subset S$ be a prime ideal, and let $\mathfrak{p}^{\prime}$ be the corresponding prime ideal of $S^{\prime}$. Let $X=\operatorname{Spec}(S)$, resp. $X^{\prime}=\operatorname{Spec}\left(S^{\prime}\right)$, and let $x \in X$, resp. $x^{\prime} \in X^{\prime}$ be the point corresponding to $\mathfrak{p}$, resp. $\mathfrak{p}^{\prime}$. Then

$$
\operatorname{dim}_{x^{\prime}} X^{\prime}-\operatorname{dim}_{x} X=\operatorname{height}\left(\mathfrak{p}^{\prime}\right)-\operatorname{height}(\mathfrak{p})
$$

Proof. Immediate from Lemma 10.115 .3 ,
00P3 Lemma 10.115.5. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $k \subset K$ be a field extension. Then $\operatorname{dim}(S)=\operatorname{dim}\left(K \otimes_{k} S\right)$.

Proof. By Lemma 10.114 .4 there exists a finite injective map $k\left[y_{1}, \ldots, y_{d}\right] \rightarrow S$ with $d=\operatorname{dim}(S)$. Since $K$ is flat over $k$ we also get a finite injective map $K\left[y_{1}, \ldots, y_{d}\right] \rightarrow K \otimes_{k} S$. The result follows from Lemma 10.111.4.

00P4 Lemma 10.115.6. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Set $X=$ $\operatorname{Spec}(S)$. Let $k \subset K$ be a field extension. Set $S_{K}=K \otimes_{k} S$, and $X_{K}=\operatorname{Spec}\left(S_{K}\right)$. Let $\mathfrak{q} \subset S$ be a prime corresponding to $x \in X$ and let $\mathfrak{q}_{K} \subset S_{K}$ be a prime corresponding to $x_{K} \in X_{K}$ lying over $\mathfrak{q}$. Then $\operatorname{dim}_{x} X=\operatorname{dim}_{x_{K}} X_{K}$.
Proof. Choose a presentation $S=k\left[x_{1}, \ldots, x_{n}\right] / I$. This gives a presentation $K \otimes_{k}$ $S=K\left[x_{1}, \ldots, x_{n}\right] /\left(K \otimes_{k} I\right)$. Let $\mathfrak{q}_{K}^{\prime} \subset K\left[x_{1}, \ldots, x_{n}\right]$, resp. $\mathfrak{q}^{\prime} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the corresponding primes. Consider the following commutative diagram of Noetherian local rings

Both vertical arrows are flat because they are localizations of the flat ring maps $S \rightarrow S_{K}$ and $k\left[x_{1}, \ldots, x_{n}\right] \rightarrow K\left[x_{1}, \ldots, x_{n}\right]$. Moreover, the vertical arrows have the same fibre rings. Hence, we see from Lemma 10.111 .7 that $\operatorname{height}\left(\mathfrak{q}^{\prime}\right)-\operatorname{height}(\mathfrak{q})=$ $\operatorname{height}\left(\mathfrak{q}_{K}^{\prime}\right)-\operatorname{height}\left(\mathfrak{q}_{K}\right)$. Denote $x^{\prime} \in X^{\prime}=\operatorname{Spec}\left(k\left[x_{1}, \ldots, x_{n}\right]\right)$ and $x_{K}^{\prime} \in X_{K}^{\prime}=$ $\operatorname{Spec}\left(K\left[x_{1}, \ldots, x_{n}\right]\right)$ the points corresponding to $\mathfrak{q}^{\prime}$ and $\mathfrak{q}_{K}^{\prime}$. By Lemma 10.115.4 and what we showed above we have

$$
\begin{aligned}
n-\operatorname{dim}_{x} X & =\operatorname{dim}_{x^{\prime}} X^{\prime}-\operatorname{dim}_{x} X \\
& =\operatorname{height}\left(\mathfrak{q}^{\prime}\right)-\operatorname{\operatorname {height}(\mathfrak {q})} \\
& =\operatorname{height}\left(\mathfrak{q}_{K}^{\prime}\right)-\operatorname{\operatorname {height}(\mathfrak {q}_{K})} \\
& =\operatorname{dim}_{x_{K}^{\prime}} X_{K}^{\prime}-\operatorname{dim}_{x_{K}} X_{K} \\
& =n-\operatorname{dim}_{x_{K}} X_{K}
\end{aligned}
$$

and the lemma follows.

### 10.116. Dimension of graded algebras over a field

00P5 Here is a basic result.
00P6 Lemma 10.116.1. Let $k$ be a field. Let $S$ be a finitely generated graded algebra over $k$. Assume $S_{0}=k$. Let $P(T) \in \mathbf{Q}[T]$ be the polynomial such that $\operatorname{dim}\left(S_{d}\right)=$ $P(d)$ for all $d \gg 0$. See Proposition 10.57.7. Then
(1) The irrelevant ideal $S_{+}$is a maximal ideal $\mathfrak{m}$.
(2) Any minimal prime of $S$ is a homogeneous ideal and is contained in $S_{+}=$ $\mathfrak{m}$.
(3) We have $\operatorname{dim}(S)=\operatorname{deg}(P)+1=\operatorname{dim}_{x} \operatorname{Spec}(S)$ (with the convention that $\operatorname{deg}(0)=-1)$ where $x$ is the point corresponding to the maximal ideal $S_{+}=\mathfrak{m}$.
(4) The Hilbert function of the local ring $R=S_{\mathfrak{m}}$ is equal to the Hilbert function of $S$.

Proof. The first statement is obvious. The second follows from Lemma 10.56.8, The equality $\operatorname{dim}(S)=\operatorname{dim}_{x} \operatorname{Spec}(S)$ follows from the fact that every irreducible component passes through $x$ according to (2). Hence we may compute this dimension as the dimension of the local ring $R=S_{\mathfrak{m}}$ with $\mathfrak{m}=S_{+}$by Lemma 10.113.6. Since $\mathfrak{m}^{d} / \mathfrak{m}^{d+1} \cong \mathfrak{m}^{d} R / \mathfrak{m}^{d+1} R$ we see that the Hilbert function of the local ring $R$ is equal to the Hilbert function of $S$, which is (4). We conclude the last equality of (3) by Proposition 10.59 .8

### 10.117. Generic flatness

051Q Basically this says that a finite type algebra over a domain becomes flat after inverting a single element of the domain. There are several versions of this result (in increasing order of strength).
051R Lemma 10.117.1. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume
(1) $R$ is Noetherian,
(2) $R$ is a domain,
(3) $R \rightarrow S$ is of finite type, and
(4) $M$ is a finite type $S$-module.

Then there exists a nonzero $f \in R$ such that $M_{f}$ is a free $R_{f}$-module.
Proof. Let $K$ be the fraction field of $R$. Set $S_{K}=K \otimes_{R} S$. This is an algebra of finite type over $K$. We will argue by induction on $d=\operatorname{dim}\left(S_{K}\right)$ (which is finite for example by Noether normalization, see Section 10.114). Fix $d \geq 0$. Assume we know that the lemma holds in all cases where $\operatorname{dim}\left(S_{K}\right)<d$.
Suppose given $R \rightarrow S$ and $M$ as in the lemma with $\operatorname{dim}\left(S_{K}\right)=d$. By Lemma 10.61.1 there exists a filtration $0 \subset M_{1} \subset M_{2} \subset \ldots \subset M_{n}=M$ so that $M_{i} / M_{i-1}$ is isomorphic to $S / \mathfrak{q}$ for some prime $\mathfrak{q}$ of $S$. Note that $\operatorname{dim}\left((S / \mathfrak{q})_{K}\right) \leq \operatorname{dim}\left(S_{K}\right)$. Also, note that an extension of free modules is free (see basic notion 50). Thus we may assume $M=S$ and that $S$ is a domain of finite type over $R$.
If $R \rightarrow S$ has a nontrivial kernel, then take a nonzero $f \in R$ in this kernel. In this case $S_{f}=0$ and the lemma holds. (This is really the case $d=-1$ and the start of the induction.) Hence we may assume that $R \rightarrow S$ is a finite type extension of Noetherian domains.
Apply Lemma 10.114 .7 and replace $R$ by $R_{f}$ (with $f$ as in the lemma) to get a factorization

$$
R \subset R\left[y_{1}, \ldots, y_{d}\right] \subset S
$$

where the second extension is finite. Note that $f . f .\left(R\left[y_{1}, \ldots, y_{d}\right]\right) \subset f . f .(S)$ is a finite extension of fields. Choose $z_{1}, \ldots, z_{r} \in S$ which form a basis for $f . f$.( $S$ ) over $f . f .\left(R\left[y_{1}, \ldots, y_{d}\right]\right)$. This gives a short exact sequence

$$
0 \rightarrow R\left[y_{1}, \ldots, y_{d}\right]^{\oplus r} \xrightarrow{\left(z_{1}, \ldots, z_{r}\right)} S \rightarrow N \rightarrow 0
$$

By construction $N$ is a finite $R\left[y_{1}, \ldots, y_{d}\right]$-module whose support does not contain the generic point (0) of $\operatorname{Spec}\left(R\left[y_{1}, \ldots, y_{d}\right]\right)$. By Lemma 10.39 .5 there exists a nonzero $g \in R\left[y_{1}, \ldots, y_{d}\right]$ such that $g$ annihilates $N$, so we may view $N$ as a finite module over $S^{\prime}=R\left[y_{1}, \ldots, y_{d}\right] /(g)$. Since $\operatorname{dim}\left(S_{K}^{\prime}\right)<d$ by induction there exists a nonzero $f \in R$ such that $N_{f}$ is a free $R_{f}$-module. Since $\left(R\left[y_{1}, \ldots, y_{d}\right]\right)_{f} \cong R_{f}\left[y_{1}, \ldots, y_{d}\right]$ is free also we conclude by the already mentioned fact that an extension of free modules is free.

051S Lemma 10.117.2. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume
(1) $R$ is a domain,
(2) $R \rightarrow S$ is of finite presentation, and
(3) $M$ is an $S$-module of finite presentation.

Then there exists a nonzero $f \in R$ such that $M_{f}$ is a free $R_{f}$-module.
Proof. Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. For $g \in R\left[x_{1}, \ldots, x_{n}\right]$ denote $\bar{g}$ its image in $S$. We may write $M=S^{\oplus t} / \sum S n_{i}$ for some $n_{i} \in S^{\oplus t}$. Write $n_{i}=$ $\left(\bar{g}_{i 1}, \ldots, \bar{g}_{i t}\right)$ for some $g_{i j} \in R\left[x_{1}, \ldots, x_{n}\right]$. Let $R_{0} \subset R$ be the subring generated by all the coefficients of all the elements $g_{i}, g_{i j} \in R\left[x_{1}, \ldots, x_{n}\right]$. Define $S_{0}=$ $R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. Define $M_{0}=S_{0}^{\oplus t} / \sum S_{0} n_{i}$. Then $R_{0}$ is a domain of finite type over $\mathbf{Z}$ and hence Noetherian (see Lemma 10.30.1). Moreover via the injection $R_{0} \rightarrow R$ we have $S \cong R \otimes_{R_{0}} S_{0}$ and $M \cong R \otimes_{R_{0}} M_{0}$. Applying Lemma 10.117.1 we obtain a nonzero $f \in R_{0}$ such that $\left(M_{0}\right)_{f}$ is a free $\left(R_{0}\right)_{f}$-module. Hence $M_{f}=R_{f} \otimes_{\left(R_{0}\right)_{f}}\left(M_{0}\right)_{f}$ is a free $R_{f}$-module.

051 Lemma 10.117.3. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume
(1) $R$ is a domain,
(2) $R \rightarrow S$ is of finite type, and
(3) $M$ is a finite type $S$-module.

Then there exists a nonzero $f \in R$ such that
(a) $M_{f}$ and $S_{f}$ are free as $R_{f}$-modules, and
(b) $S_{f}$ is a finitely presented $R_{f}$-algebra and $M_{f}$ is a finitely presented $S_{f}$ module.

Proof. We first prove the lemma for $S=R\left[x_{1}, \ldots, x_{n}\right]$, and then we deduce the result in general.
Assume $S=R\left[x_{1}, \ldots, x_{n}\right]$. Choose elements $m_{1}, \ldots, m_{t}$ which generate $M$. This gives a short exact sequence

$$
0 \rightarrow N \rightarrow S^{\oplus t} \xrightarrow{\left(m_{1}, \ldots, m_{t}\right)} M \rightarrow 0
$$

Denote $K$ the fraction field of $R$. Denote $S_{K}=K \otimes_{R} S=K\left[x_{1}, \ldots, x_{n}\right]$, and similarly $N_{K}=K \otimes_{R} N, M_{K}=K \otimes_{R} M$. As $R \rightarrow K$ is flat the sequence remains flat after tensoring with $K$. As $S_{K}=K\left[x_{1}, \ldots, x_{n}\right]$ is a Noetherian ring (see Lemma 10.30.1) we can find finitely many elements $n_{1}^{\prime}, \ldots, n_{s}^{\prime} \in N_{K}$ which generate it. Choose $n_{1}, \ldots, n_{r} \in N$ such that $n_{i}^{\prime}=\sum a_{i j} n_{j}$ for some $a_{i j} \in K$. Set

$$
M^{\prime}=S^{\oplus t} / \sum_{i=1, \ldots, r} S n_{i}
$$

By construction $M^{\prime}$ is a finitely presented $S$-module, and there is a surjection $M^{\prime} \rightarrow M$ which induces an isomorphism $M_{K}^{\prime} \cong M_{K}$. We may apply Lemma 10.117.2 to $R \rightarrow S$ and $M^{\prime}$ and we find an $f \in R$ such that $M_{f}^{\prime}$ is a free $R_{f}$-module.

Thus $M_{f}^{\prime} \rightarrow M_{f}$ is a surjection of modules over the domain $R_{f}$ where the source is a free module and which becomes an isomorphism upon tensoring with $K$. Thus it is injective as $M_{f}^{\prime} \subset M_{K}^{\prime}$ as it is free over the domain $R_{f}$. Hence $M_{f}^{\prime} \rightarrow M_{f}$ is an isomorphism and the result is proved.
For the general case, choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$. Think of both $S$ and $M$ as finite modules over $R\left[x_{1}, \ldots, x_{n}\right]$. By the special case proved above there exists a nonzero $f \in R$ such that both $S_{f}$ and $M_{f}$ are free as $R_{f}$-modules and finitely presented as $R_{f}\left[x_{1}, \ldots, x_{n}\right]$-modules. Clearly this implies that $S_{f}$ is a finitely presented $R_{f}$-algebra and that $M_{f}$ is a finitely presented $S_{f}$-module.

Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Consider the following condition on an element $f \in R$ :

051U

$$
\left\{\begin{array}{cc}
S_{f} & \text { is of finite presentation over } R_{f}  \tag{10.117.3.1}\\
M_{f} & \text { is of finite presentation as } S_{f} \text {-module } \\
S_{f}, M_{f} & \text { are free as } R_{f} \text {-modules }
\end{array}\right.
$$

We define
051V

$$
\begin{equation*}
U(R \rightarrow S, M)=\bigcup_{f \in R \text { with } 10.117 .3 .1} D(f) \tag{10.117.3.2}
\end{equation*}
$$

which is an open subset of $\operatorname{Spec}(R)$.
051W Lemma 10.117.4. Let $R \rightarrow S$ be a ring map. Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a short exact sequence of $S$-modules. Then

$$
U\left(R \rightarrow S, M_{1}\right) \cap U\left(R \rightarrow S, M_{3}\right) \subset U\left(R \rightarrow S, M_{2}\right)
$$

Proof. Let $u \in U\left(R \rightarrow S, M_{1}\right) \cap U\left(R \rightarrow S, M_{3}\right)$. Choose $f_{1}, f_{3} \in R$ such that $u \in D\left(f_{1}\right), u \in D\left(f_{3}\right)$ and such that 10.117.3.1 holds for $f_{1}$ and $M_{1}$ and for $f_{3}$ and $M_{3}$. Then set $f=f_{1} f_{3}$. Then $u \in D(f)$ and 10.117.3.1 holds for $f$ and both $M_{1}$ and $M_{3}$. An extension of free modules is free, and an extension of finitely presented modules is finitely presented (Lemma 10.5.3). Hence we see that 10.117.3.1 holds for $f$ and $M_{2}$. Thus $u \in U\left(R \rightarrow S, M_{2}\right)$ and we win.

051X Lemma 10.117.5. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Let $f \in R$. Using the identification $\operatorname{Spec}\left(R_{f}\right)=D(f)$ we have $U\left(R_{f} \rightarrow S_{f}, M_{f}\right)=$ $D(f) \cap U(R \rightarrow S, M)$.

Proof. Suppose that $u \in U\left(R_{f} \rightarrow S_{f}, M_{f}\right)$. Then there exists an element $g \in$ $R_{f}$ such that $u \in D(g)$ and such that 10.117.3.1 holds for the pair $\left(\left(R_{f}\right)_{g} \rightarrow\right.$ $\left.\left(S_{f}\right)_{g},\left(M_{f}\right)_{g}\right)$. Write $g=a / f^{n}$ for some $a \in R$. Set $h=a f$. Then $R_{h}=\left(R_{f}\right)_{g}$, $S_{h}=\left(S_{f}\right)_{g}$, and $M_{h}=\left(M_{f}\right)_{g}$. Moreover $u \in D(h)$. Hence $u \in U(R \rightarrow S, M)$. Conversely, suppose that $u \in D(f) \cap U(R \rightarrow S, M)$. Then there exists an element $g \in R$ such that $u \in D(g)$ and such that 10.117.3.1 holds for the pair $\left(R_{g} \rightarrow S_{g}, M_{g}\right)$. Then it is clear that 10.117.3.1) also holds for the pair $\left(R_{f g} \rightarrow\right.$ $\left.S_{f g}, M_{f g}\right)=\left(\left(R_{f}\right)_{g} \rightarrow\left(S_{f}\right)_{g},\left(M_{f}\right)_{g}\right)$. Hence $u \in U\left(R_{f} \rightarrow S_{f}, M_{f}\right)$ and we win.

051Y Lemma 10.117.6. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Let $U \subset \operatorname{Spec}(R)$ be a dense open. Assume there is a covering $U=\bigcup_{i \in I} D\left(f_{i}\right)$ of opens such that $U\left(R_{f_{i}} \rightarrow S_{f_{i}}, M_{f_{i}}\right)$ is dense in $D\left(f_{i}\right)$ for each $i \in I$. Then $U(R \rightarrow S, M)$ is dense in $\operatorname{Spec}(R)$.

Proof. In view of Lemma 10.117 .5 this is a purely topological statement. Namely, by that lemma we see that $U(R \rightarrow S, M) \cap D\left(f_{i}\right)$ is dense in $D\left(f_{i}\right)$ for each $i \in I$. By Topology, Lemma 5.20.4 we see that $U(R \rightarrow S, M) \cap U$ is dense in $U$. Since $U$ is dense in $\operatorname{Spec}(R)$ we conclude that $U(R \rightarrow S, M)$ is dense in $\operatorname{Spec}(R)$.

051Z Lemma 10.117.7. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume
(1) $R \rightarrow S$ is of finite type,
(2) $M$ is a finite $S$-module, and
(3) $R$ is reduced.

Then there exists a subset $U \subset \operatorname{Spec}(R)$ such that
(1) $U$ is open and dense in $\operatorname{Spec}(R)$,
(2) for every $u \in U$ there exists an $f \in R$ such that $u \in D(f) \subset U$ and such that we have
(a) $M_{f}$ and $S_{f}$ are free over $R_{f}$,
(b) $S_{f}$ is a finitely presented $R_{f}$-algebra, and
(c) $M_{f}$ is a finitely presented $S_{f}$-module.

Proof. Note that the lemma is equivalent to the statement that the open $U(R \rightarrow$ $S, M)$, see Equation 10.117.3.2, is dense in $\operatorname{Spec}(R)$. We first prove the lemma for $S=R\left[x_{1}, \ldots, x_{n}\right]$, and then we deduce the result in general.

Proof of the case $S=R\left[x_{1}, \ldots, x_{n}\right]$ and $M$ any finite module over $S$. Note that in this case $S_{f}=R_{f}\left[x_{1}, \ldots, x_{n}\right]$ is free and of finite presentation over $R_{f}$, so we do not have to worry about the conditions regarding $S$, only those that concern $M$. We will use induction on $n$.

There exists a finite filtration

$$
0 \subset M_{1} \subset M_{2} \subset \ldots \subset M_{t}=M
$$

such that $M_{i} / M_{i-1} \cong S / J_{i}$ for some ideal $J_{i} \subset S$, see Lemma 10.5.4 Since a finite intersection of dense opens is dense open, we see from Lemma 10.117.4 that it suffices to prove the lemma for each of the modules $R / J_{i}$. Hence we may assume that $M=S / J$ for some ideal $J$ of $S=R\left[x_{1}, \ldots, x_{n}\right]$.
Let $I \subset R$ be the ideal generated by the coefficients of elements of $J$. Let $U_{1}=$ $\operatorname{Spec}(R) \backslash V(I)$ and let

$$
U_{2}=\operatorname{Spec}(R) \backslash \overline{U_{1}} .
$$

Then it is clear that $U=U_{1} \cup U_{2}$ is dense in $\operatorname{Spec}(R)$. Let $f \in R$ be an element such that either (a) $D(f) \subset U_{1}$ or (b) $D(f) \subset U_{2}$. If for any such $f$ the lemma holds for the pair ( $R_{f} \rightarrow R_{f}\left[x_{1}, \ldots, x_{n}\right], M_{f}$ ) then by Lemma 10.117.6 we see that $U(R \rightarrow S, M)$ is dense in $\operatorname{Spec}(R)$. Hence we may assume either (a) $I=R$, or (b) $V(I)=\operatorname{Spec}(R)$.
In case (b) we actually have $I=0$ as $R$ is reduced! Hence $J=0$ and $M=S$ and the lemma holds in this case.

In case (a) we have to do a little bit more work. Note that every element of $I$ is actually the coefficient of a monomial of an element of $J$, because the set of coefficients of elements of $J$ forms an ideal (details omitted). Hence we find an element

$$
g=\sum_{K \in E} a_{K} x^{K} \in J
$$

where $E$ is a finite set of multi-indices $K=\left(k_{1}, \ldots, k_{n}\right)$ with at least one coefficient $a_{K_{0}}$ a unit in $R$. Actually we can find one which has a coefficient equal to 1 as $1 \in I$ in case (a). Let $m=\#\left\{K \in E \mid a_{K}\right.$ is not a unit $\}$. Note that $0 \leq m \leq \# E-1$. We will argue by induction on $m$.
The case $m=0$. In this case all the coefficients $a_{K}, K \in E$ of $g$ are units and $E \neq \emptyset$. If $E=\left\{K_{0}\right\}$ is a singleton and $K_{0}=(0, \ldots, 0)$, then $g$ is a unit and $J=S$ so the result holds for sure. (This happens in particular when $n=0$ and it provides the base case of the induction on $n$.) If not $E=\{(0, \ldots, 0)\}$, then at least one $K$ is not equal to $(0, \ldots, 0)$, i.e., $g \notin R$. At this point we employ the usual trick of Noether normalization. Namely, we consider

$$
G\left(y_{1}, \ldots, y_{n}\right)=g\left(y_{1}+y_{n}^{e_{1}}, y_{2}+y_{n}^{e_{2}}, \ldots, y_{n-1}+y_{n}^{e_{n-1}}, y_{n}\right)
$$

with $0 \ll e_{n-1} \ll e_{n-2} \ll \ldots \ll e_{1}$. By Lemma 10.114 .2 it follows that $G\left(y_{1}, \ldots, y_{n}\right)$ as a polynomial in $y_{n}$ looks like

$$
a_{K} y_{n}^{k_{n}+\sum_{i=1, \ldots, n-1} e_{i} k_{i}}+\text { lower order terms in } y_{n}
$$

As $a_{K}$ is a unit we conclude that $M=R\left[x_{1}, \ldots, x_{n}\right] / J$ is finite over $R\left[y_{1}, \ldots, y_{n-1}\right]$. Hence $U\left(R \rightarrow R\left[x_{1}, \ldots, x_{n}\right], M\right)=U\left(R \rightarrow R\left[y_{1}, \ldots, y_{n-1}\right], M\right)$ and we win by induction on $n$.
The case $m>0$. Pick a multi-index $K \in E$ such that $a_{K}$ is not a unit. As before set $U_{1}=\operatorname{Spec}\left(R_{a_{K}}\right)=\operatorname{Spec}(R) \backslash V\left(a_{K}\right)$ and set

$$
U_{2}=\operatorname{Spec}(R) \backslash \overline{U_{1}}
$$

Then it is clear that $U=U_{1} \cup U_{2}$ is dense in $\operatorname{Spec}(R)$. Let $f \in R$ be an element such that either (a) $D(f) \subset U_{1}$ or (b) $D(f) \subset U_{2}$. If for any such $f$ the lemma holds for the pair $\left(R_{f} \rightarrow R_{f}\left[x_{1}, \ldots, x_{n}\right], M_{f}\right)$ then by Lemma 10.117.6 we see that $U(R \rightarrow S, M)$ is dense in $\operatorname{Spec}(R)$. Hence we may assume either (a) $a_{K} R=R$, or (b) $V\left(a_{K}\right)=\operatorname{Spec}(R)$. In case (a) the number $m$ drops, as $a_{K}$ has turned into a unit. In case (b), since $R$ is reduced, we conclude that $a_{K}=0$. Hence the set $E$ decreases so the number $m$ drops as well. In both cases we win by induction on $m$.

At this point we have proven the lemma in case $S=R\left[x_{1}, \ldots, x_{n}\right]$. Assume that $(R \rightarrow S, M)$ is an arbitrary pair satisfying the conditions of the lemma. Choose a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$. Observe that, with the notation introduced in 10.117.3.2, we have

$$
U(R \rightarrow S, M)=U\left(R \rightarrow R\left[x_{1}, \ldots, x_{n}\right], S\right) \cap U\left(R \rightarrow R\left[x_{1}, \ldots, x_{n}\right], S\right)
$$

Hence as we've just finished proving the right two opens are dense also the open on the left is dense.

### 10.118. Around Krull-Akizuki

00P7 One application of Krull-Akizuki is to show that there are plenty of discrete valuation rings. More generally in this section we show how to construct discrete valuation rings dominating Noetherian local rings.

First we show how to dominate a Noetherian local domain by a 1-dimensional Noetherian local domain by blowing up the maximal ideal.

00P8 Lemma 10.118.1. Let $R$ be a local Noetherian domain with fraction field $K$. Assume $R$ is not a field. Then there exist $R \subset R^{\prime} \subset K$ with
(1) $R^{\prime}$ local Noetherian of dimension 1,
(2) $R \rightarrow R^{\prime}$ a local ring map, i.e., $R^{\prime}$ dominates $R$, and
(3) $R \rightarrow R^{\prime}$ essentially of finite type.

Proof. Choose any valuation ring $A \subset K$ dominating $R$ (which exist by Lemma 10.49.2. Denote $v$ the corresponding valuation. Let $x_{1}, \ldots, x_{r}$ be a minimal set of generators of the maximal ideal $\mathfrak{m}$ of $R$. We may and do assume that $v\left(x_{r}\right)=$ $\min \left\{v\left(x_{1}\right), \ldots, v\left(x_{r}\right)\right\}$. Consider the ring

$$
S=R\left[x_{1} / x_{r}, x_{2} / x_{r}, \ldots, x_{r-1} / x_{r}\right] \subset K
$$

Note that $\mathfrak{m} S=x_{r} S$ is a principal ideal. Note that $S \subset A$ and that $v\left(x_{r}\right)>0$, hence we see that $x_{r} S \neq S$. Choose a minimal prime $\mathfrak{q}$ over $x_{r} S$. Then $\operatorname{height}(\mathfrak{q})=1$ by Lemma 10.59 .10 and $\mathfrak{q}$ lies over $\mathfrak{m}$. Hence we see that $R^{\prime}=S_{\mathfrak{q}}$ is a solution.

0BHZ Lemma 10.118.2 (Kollár). Let $(R, \mathfrak{m})$ be a local Noetherian ring. Then exactly one of the following holds:
(1) $(R, \mathfrak{m})$ is Artinian,
(2) $(R, \mathfrak{m})$ is regular of dimension 1 ,
(3) $\operatorname{depth}(R) \geq 2$, or
(4) there exists a finite ring map $R \rightarrow R^{\prime}$ which is not an isomorphism whose kernel and cokernel are annihilated by a power of $\mathfrak{m}$ such that $\mathfrak{m}$ is not an associated prime of $R^{\prime}$.

Proof. Observe that $(R, \mathfrak{m})$ is not Artinian if and only if $V(\mathfrak{m}) \subset \operatorname{Spec}(R)$ is nowhere dense. See Proposition 10.59.6. We assume this from now on.
Let $J \subset R$ be the largest ideal killed by a power of $\mathfrak{m}$. If $J \neq 0$ then $R \rightarrow R / J$ shows that ( $R, \mathfrak{m}$ ) is as in (4).

Otherwise $J=0$. In particular $\mathfrak{m}$ is not an associated prime of $R$ and we see that there is a nonzerodivisor $x \in \mathfrak{m}$ by Lemma 10.62.18. If $\mathfrak{m}$ is not an associated prime of $R / x R$ then $\operatorname{depth}(R) \geq 2$ by the same lemma. Thus we are left with the case when there is an $y \in R, y \notin x R$ such that $y \mathfrak{m} \subset x R$.
If $y \mathfrak{m} \subset x \mathfrak{m}$ then we can consider the $\operatorname{map} \varphi: \mathfrak{m} \rightarrow \mathfrak{m}, f \mapsto y f / x$ (well defined as $x$ is a nonzerodivisor). By the determinantal trick of Lemma 10.15 .2 there exists a monic polynomial $P$ with coefficients in $R$ such that $P(\varphi)=0$. We conclude that $P(y / x)=0$ in $R_{x}$. Let $R^{\prime} \subset R_{x}$ be the ring generated by $R$ and $y / x$. Then $R \subset R^{\prime}$ and $R^{\prime} / R$ is a finite $R$-module annihilated by a power of $x$. Thus $R$ is as in (4).

Otherwise there is a $t \in \mathfrak{m}$ such that $y t=u x$ for some unit $u$ of $R$. After replacing $t$ by $u^{-1} t$ we get $y t=x$. In particular $y$ is a nonzerodivisor. For any $t^{\prime} \in m$ we have $y t^{\prime}=x s$ for some $s \in R$. Thus $y\left(t^{\prime}-s t\right)=x s-x s=0$. Since $y$ is not a zero-divisor this implies that $t^{\prime}=t s$ and so $\mathfrak{m}=(t)$. Thus $(R, \mathfrak{m})$ is regular of dimension 1 .

00P9 Lemma 10.118.3. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$. Assume $R$ is Noetherian, has dimension 1 , and that $\operatorname{dim}\left(\mathfrak{m} / \mathfrak{m}^{2}\right)>1$. Then there exists a ring map $R \rightarrow R^{\prime}$ such that
(1) $R \rightarrow R^{\prime}$ is finite,
(2) $R \rightarrow R^{\prime}$ is not an isomorphism,
(3) the kernel and cokernel of $R \rightarrow R^{\prime}$ are annihilated by a power of $\mathfrak{m}$, and
(4) $\mathfrak{m}$ is not an associated prime of $R^{\prime}$.

This is taken from a forthcoming paper by János Kollár entitled "Variants of normality for Noetherian schemes".

Proof. This follows from Lemma 10.118 .2 and the fact that $R$ is not Artinian, not regular, and does not have depth $\geq 2$ (the last part because the depth does not exceed the dimension by Lemma 10.71.3.

00PA Example 10.118.4. Consider the Noetherian local ring

$$
R=k[[x, y]] /\left(y^{2}\right)
$$

It has dimension 1 and it is Cohen-Macaulay. An example of an extension as in Lemma 10.118 .3 is the extension

$$
k[[x, y]] /\left(y^{2}\right) \subset k[[x, z]] /\left(z^{2}\right), \quad y \mapsto x z
$$

in other words it is gotten by adjoining $y / x$ to $R$. The effect of repeating the construction $n>1$ times is to adjoin the element $y / x^{n}$.

00PB Example 10.118.5. Let $k$ be a field of characteristic $p>0$ such that $k$ has infinite degree over its subfield $k^{p}$ of $p$ th powers. For example $k=\mathbf{F}_{p}\left(t_{1}, t_{2}, t_{3}, \ldots\right)$. Consider the ring

$$
A=\left\{\sum a_{i} x^{i} \in k[[x]] \text { such that }\left[k^{p}\left(a_{0}, a_{1}, a_{2}, \ldots\right): k^{p}\right]<\infty\right\}
$$

Then $A$ is a discrete valuation ring and its completion is $A^{\wedge}=k[[x]]$. Note that the field extension $f . f .(A) \subset f . f .(k[[x]])$ is infinite purely inseparable. Choose any $f \in k[[x]], f \notin A$. Let $R=A[f] \subset k[[x]]$. Then $R$ is a Noetherian local domain of dimension 1 whose completion $R^{\wedge}$ is nonreduced (think!).

00PC Remark 10.118.6. Suppose that $R$ is a 1 -dimensional semi-local Noetherian domain. If there is a maximal ideal $\mathfrak{m} \subset R$ such that $R_{\mathfrak{m}}$ is not regular, then we may apply Lemma 10.118 .3 to $(R, \mathfrak{m})$ to get a finite ring extension $R \subset R_{1}$. (For example one can do this so that $\operatorname{Spec}\left(R_{1}\right) \rightarrow \operatorname{Spec}(R)$ is the blow up of $\operatorname{Spec}(R)$ in the ideal $\mathfrak{m}$.) Of course $R_{1}$ is a 1 -dimensional semi-local Noetherian domain with the same fraction field as $R$. If $R_{1}$ is not a regular semi-local ring, then we may repeat the construction to get $R_{1} \subset R_{2}$. Thus we get a sequence

$$
R \subset R_{1} \subset R_{2} \subset R_{3} \subset \ldots
$$

of finite ring extensions which may stop if $R_{n}$ is regular for some $n$. Resolution of singularities would be the claim that eventually $R_{n}$ is indeed regular. In reality this is not the case. Namely, there exists a characteristic 0 Noetherian local domain $A$ of dimension 1 whose completion is nonreduced, see [FR70, Proposition 3.1] or our Examples, Section 88.15. For an example in characteristic $p>0$ see Example 10.118.5. Since the construction of blowing up commutes with completion it is easy to see the sequence never stabilizes. See Ben73] for a discussion (mostly in positive characteristic). On the other hand, if the completion of $R$ in all of its maximal ideals is reduced, then the procedure stops (insert future reference here).

00PD Lemma 10.118.7. Let $A$ be a ring. The following are equivalent.
(1) The ring $A$ is a discrete valuation ring.
(2) The ring $A$ is a valuation ring and Noetherian.
(3) The ring $A$ is a regular local ring of dimension 1.
(4) The ring $A$ is a Noetherian local domain with maximal ideal $\mathfrak{m}$ generated by a single nonzero element.
(5) The ring $A$ is a Noetherian local normal domain of dimension 1.

In this case if $\pi$ is a generator of the maximal ideal of $A$, then every element of $A$ can be uniquely written as $u \pi^{n}$, where $u \in A$ is a unit.

Proof. The equivalence of (1) and (2) is Lemma 10.49.18. Moreover, in the proof of Lemma 10.49 .18 we saw that if $A$ is a discrete valuation ring, then $A$ is a PID, hence (3). Note that a regular local ring is a domain (see Lemma 10.105.2). Using this the equivalence of (3) and (4) follows from dimension theory, see Section 10.59 .
Assume (3) and let $\pi$ be a generator of the maximal ideal $\mathfrak{m}$. For all $n \geq 0$ we have $\operatorname{dim}_{A / \mathfrak{m}} \mathfrak{m}^{n} / \mathfrak{m}^{n+1}=1$ because it is generated by $\pi^{n}$ (and it cannot be zero). In particular $\mathfrak{m}^{n}=\left(\pi^{n}\right)$ and the graded ring $\bigoplus \mathfrak{m}^{n} / \mathfrak{m}^{n+1}$ is isomorphic to the polynomial ring $A / \mathfrak{m}[T]$. For $x \in A \backslash\{0\}$ define $v(x)=\max \left\{n \mid x \in \mathfrak{m}^{n}\right\}$. In other words $x=u \pi^{v(x)}$ with $u \in A^{*}$. By the remarks above we have $v(x y)=v(x)+v(y)$ for all $x, y \in A \backslash\{0\}$. We extend this to the field of fractions $K$ of $A$ by setting $v(a / b)=v(a)-v(b)$ (well defined by multiplicativity shown above). Then it is clear that $A$ is the set of elements of $K$ which have valuation $\geq 0$. Hence we see that $A$ is a valuation ring by Lemma 10.49.16.

A valuation ring is a normal domain by Lemma 10.49.10. Hence we see that the equivalent conditions (1) - (3) imply (5). Assume (5). Suppose that $\mathfrak{m}$ cannot be generated by 1 element to get a contradiction. Then Lemma 10.118 .3 implies there is a finite ring map $A \rightarrow A^{\prime}$ which is an isomorphism after inverting any nonzero element of $\mathfrak{m}$ but not an isomorphism. In particular $A^{\prime} \subset f . f .(A)$. Since $A \rightarrow A^{\prime}$ is finite it is integral (see Lemma 10.35.3). Since $A$ is normal we get $A=A^{\prime}$ a contradiction.

09DZ Definition 10.118.8. Let $A$ be a discrete valuation ring. A uniformizer is an element $\pi \in A$ which generates the maximal ideal of $A$.

By Lemma 10.118.7 any two uniformizers of a discrete valuation ring are associates.
00PE Lemma 10.118.9. Let $R$ be a domain with fraction field $K$. Let $M$ be an $R$ submodule of $K^{\oplus r}$. Assume $R$ is local Noetherian of dimension 1. For any nonzero $x \in R$ we have length ${ }_{R}(R / x R)<\infty$ and

$$
\text { length }_{R}(M / x M) \leq r \cdot \text { length }_{R}(R / x R)
$$

Proof. If $x$ is a unit then the result is true. Hence we may assume $x \in \mathfrak{m}$ the maximal ideal of $R$. Since $x$ is not zero and $R$ is a domain we have $\operatorname{dim}(R / x R)=0$, and hence $R / x R$ has finite length. Consider $M \subset K^{\oplus r}$ as in the lemma. We may assume that the elements of $M$ generate $K^{\oplus r}$ as a $K$-vector space after replacing $K^{\oplus r}$ by a smaller subspace if necessary.

Suppose first that $M$ is a finite $R$-module. In that case we can clear denominators and assume $M \subset R^{\oplus r}$. Since $M$ generates $K^{\oplus r}$ as a vectors space we see that $R^{\oplus r} / M$ has finite length. In particular there exists an integer $c \geq 0$ such that $x^{c} R^{\oplus r} \subset M$. Note that $M \supset x M \supset x^{2} M \supset \ldots$ is a sequence of modules with successive quotients each isomorphic to $M / x M$. Hence we see that

$$
n \operatorname{length}_{R}(M / x M)=\operatorname{length}_{R}\left(M / x^{n} M\right)
$$

The same argument for $M=R^{\oplus r}$ shows that

$$
n \operatorname{length}_{R}\left(R^{\oplus r} / x R^{\oplus r}\right)=\operatorname{length}_{R}\left(R^{\oplus r} / x^{n} R^{\oplus r}\right)
$$

By our choice of $c$ above we see that $x^{n} M$ is sandwiched between $x^{n} R^{\oplus r}$ and $x^{n+c} R^{\oplus r}$. This easily gives that

$$
r(n+c) \operatorname{length}_{R}(R / x R) \geq n \operatorname{length}_{R}(M / x M) \geq r(n-c) \operatorname{length}_{R}(R / x R)
$$

Hence in the finite case we actually get the result of the lemma with equality.
Suppose now that $M$ is not finite. Suppose that the length of $M / x M$ is $\geq k$ for some natural number $k$. Then we can find

$$
0 \subset N_{0} \subset N_{1} \subset N_{2} \subset \ldots N_{k} \subset M / x M
$$

with $N_{i} \neq N_{i+1}$ for $i=0, \ldots k-1$. Choose an element $m_{i} \in M$ whose congruence class $\bmod x M$ falls into $N_{i}$ but not into $N_{i-1}$ for $i=1, \ldots, k$. Consider the finite $R$-module $M^{\prime}=R m_{1}+\ldots+R m_{k} \subset M$. Let $N_{i}^{\prime} \subset M^{\prime} / x M^{\prime}$ be the inverse image of $N_{i}$. It is clear that $N_{i}^{\prime} \neq N_{i+1}^{\prime}$ by our choice of $m_{i}$. Hence we see that $\operatorname{length}_{R}\left(M^{\prime} / x M^{\prime}\right) \geq k$. By the finite case we conclude $k \leq r \operatorname{length}_{R}(R / x R)$ as desired.

Here is a first application.
031F Lemma 10.118.10. Let $R \rightarrow S$ be a homomorphism of domains inducing an injection of fraction fields $K \subset L$. If $R$ is Noetherian local of dimension 1 and $[L: K]<\infty$ then
(1) each prime ideal $\mathfrak{n}_{i}$ of $S$ lying over the maximal ideal $\mathfrak{m}$ of $R$ is maximal,
(2) there are finitely many of these, and
(3) $\left[\kappa\left(\mathfrak{n}_{i}\right): \kappa(\mathfrak{m})\right]<\infty$ for each $i$.

Proof. Pick $x \in \mathfrak{m}$ nonzero. Apply Lemma 10.118 .9 to the submodule $S \subset L \cong$ $K^{\oplus n}$ where $n=[L: K]$. Thus the ring $S / x S$ has finite length over $R$. It follows that $S / \mathfrak{m} S$ has finite length over $\kappa(\mathfrak{m})$. In other words, $\operatorname{dim}_{\kappa(\mathfrak{m})} S / \mathfrak{m} S$ is finite (Lemma 10.51.6). Thus $S / \mathfrak{m} S$ is Artinian (Lemma 10.52.2). The structural results on Artinian rings implies parts (1) and (2), see for example Lemma 10.52.6. Part (3) is implied by the finiteness established above.

00PF Lemma 10.118.11. Let $R$ be a domain with fraction field $K$. Let $M$ be an $R$ submodule of $K^{\oplus r}$. Assume $R$ is Noetherian of dimension 1. For any nonzero $x \in R$ we have length ${ }_{R}(M / x M)<\infty$.
Proof. Since $R$ has dimension 1 we see that $x$ is contained in finitely many primes $\mathfrak{m}_{i}, i=1, \ldots, n$, each maximal. Since $R$ is Noetherian we see that $R / x R$ is Artinian, see Proposition 10.59.6. Hence $R / x R$ is a quotient of $\prod R / \mathfrak{m}_{i}^{e_{i}}$ for certain $e_{i}$ because that $\mathfrak{m}_{1}^{e_{1}} \ldots \mathfrak{m}_{n}^{e_{n}} \subset(x)$ for suitably large $e_{i}$ as $R / x R$ is Artinian (see Section 10.52). Hence $M / x M$ similarly decomposes as a product $\Pi(M / x M)_{\mathfrak{m}_{i}}=\prod M /\left(\mathfrak{m}_{i}^{e_{i}}, x\right) M$ of its localizations at the $\mathfrak{m}_{i}$. By Lemma 10.118.9 applied to $M_{\mathfrak{m}_{i}}$ over $R_{\mathfrak{m}_{i}}$ we see each $M_{\mathfrak{m}_{i}} / x M_{\mathfrak{m}_{i}}=(M / x M)_{\mathfrak{m}_{i}}$ has finite length over $R_{\mathfrak{m}_{i}}$. It easily follows that $M / x M$ has finite length over $R$.

00PG Lemma 10.118.12 (Krull-Akizuki). Let $R$ be a domain with fraction field $K$. Let $K \subset L$ be a finite extension of fields. Assume $R$ is Noetherian and $\operatorname{dim}(R)=1$. In this case any ring $A$ with $R \subset A \subset L$ is Noetherian.

Proof. To begin we may assume that $L$ is the fraction field of $A$ by replacing $L$ by the fraction field of $A$ if necessary. Let $I \subset A$ be an ideal. Clearly $I$ generates $L$ as a $K$-vector space. Hence we see that $I \cap R \neq(0)$. Pick any nonzero $x \in I \cap R$.

Then we get $I / x A \subset A / x A$. By Lemma 10.118.11 the $R$-module $A / x A$ has finite length as an $R$-module. Hence $I / x A$ has finite length as an $R$-module. Hence $I$ is finitely generated as an ideal in $A$.

00PH Lemma 10.118.13. Let $R$ be a Noetherian local domain with fraction field $K$. Assume that $R$ is not a field. Let $K \subset L$ be a finitely generated field extension. Then there exists discrete valuation ring $A$ with fraction field $L$ which dominates $R$.

Proof. If $L$ is not finite over $K$ choose a transcendence basis $x_{1}, \ldots, x_{r}$ of $L$ over $K$ and replace $R$ by $R\left[x_{1}, \ldots, x_{r}\right]$ localized at the maximal ideal generated by $\mathfrak{m}_{R}$ and $x_{1}, \ldots, x_{r}$. Thus we may assume $K \subset L$ finite.

By Lemma 10.118 .1 we may assume $\operatorname{dim}(R)=1$.
Let $A \subset L$ be the integral closure of $R$ in $L$. By Lemma 10.118 .12 this is Noetherian. By Lemma 10.35 .15 there is a prime ideal $\mathfrak{q} \subset A$ lying over the maximal ideal of $R$. By Lemma 10.118 .7 the ring $A_{\mathfrak{q}}$ is a discrete valuation ring dominating $R$ as desired.

### 10.119. Factorization

0340 Here are some notions and relations between them that are typically taught in a first year course on algebra at the undergraduate level.

034P Definition 10.119.1. Let $R$ be a domain.
(1) Elements $x, y \in R$ are called associates if there exists a unit $u \in R^{*}$ such that $x=u y$.
(2) An element $x \in R$ is called irreducible if it is nonzero, not a unit and whenever $x=y z, y, z \in R$, then $y$ is either a unit or an associate of $x$.
(3) An element $x \in R$ is called prime if the ideal generated by $x$ is a prime ideal.

034Q Lemma 10.119.2. Let $R$ be a domain. Let $x, y \in R$. Then $x, y$ are associates if and only if $(x)=(y)$.

Proof. If $x=u y$ for some unit $u \in R$, then $(x) \subset(y)$ and $y=u^{-1} x$ so also $(y) \subset(x)$. Conversely, suppose that $(x)=(y)$. Then $x=f y$ and $y=g x$ for some $f, g \in A$. Then $x=f g x$ and since $R$ is a domain $f g=1$. Thus $x$ and $y$ are associates.

034R Lemma 10.119.3. Let $R$ be a domain. Consider the following conditions:
(1) The ring $R$ satisfies the ascending chain condition for principal ideals.
(2) Every nonzero, nonunit element $a \in R$ has a factorization $a=b_{1} \ldots b_{k}$ with each $b_{i}$ an irreducible element of $R$.
Then (1) implies (2).
Proof. Let $x$ be a nonzero element, not a unit, which does not have a factorization into irreducibles. Set $x_{1}=x$. We can write $x=y z$ where neither $y$ nor $z$ is irreducible or a unit. Then either $y$ does not have a factorization into irreducibles, in which case we set $x_{2}=y$, or $z$ does not have a factorization into irreducibles, in which case we set $x_{2}=z$. Continuing in this fashion we find a sequence

$$
x_{1}\left|x_{2}\right| x_{3} \mid \ldots
$$

of elements of $R$ with $x_{n} / x_{n+1}$ not a unit. This gives a strictly increasing sequence of principal ideals $\left(x_{1}\right) \subset\left(x_{2}\right) \subset\left(x_{3}\right) \subset \ldots$ thereby finishing the proof.

034S Definition 10.119.4. A unique factorization domain, abbreviated UFD, is a domain $R$ such that if $x \in R$ is a nonzero, nonunit, then $x$ has a factorization into irreducibles, and if

$$
x=a_{1} \ldots a_{m}=b_{1} \ldots b_{n}
$$

are factorizations into irreducibles then $n=m$ and there exists a permutation $\sigma:\{1, \ldots, n\} \rightarrow\{1, \ldots, n\}$ such that $a_{i}$ and $b_{\sigma(i)}$ are associates.

034T Lemma 10.119.5. Let $R$ be a domain. Assume every nonzero, nonunit factors into irreducibles. Then $R$ is a UFD if and only if every irreducible element is prime.

Proof. Assume $R$ is a UFD and let $x \in R$ be an irreducible element. Say $a b \in(x)$, i.e., $a b=c x$. Choose factorizations $a=a_{1} \ldots a_{n}, b=b_{1} \ldots b_{m}$, and $c=c_{1} \ldots c_{r}$. By uniqueness of the factorization

$$
a_{1} \ldots a_{n} b_{1} \ldots b_{m}=c_{1} \ldots c_{r} x
$$

we find that $x$ is an associate of one of the elements $a_{1}, \ldots, b_{m}$. In other words, either $a \in(x)$ or $b \in(x)$ and we conclude that $x$ is prime.

Assume every irreducible element is prime. We have to prove that factorization into irreducibles is unique up to permutation and taking associates. Say $a_{1} \ldots a_{m}=$ $b_{1} \ldots b_{n}$ with $a_{i}$ and $b_{j}$ irreducible. Since $a_{1}$ is prime, we see that $b_{j} \in\left(a_{1}\right)$ for some $j$. After renumbering we may assume $b_{1} \in\left(a_{1}\right)$. Then $b_{1}=a_{1} u$ and since $b_{1}$ is irreducible we see that $u$ is a unit. Hence $a_{1}$ and $b_{1}$ are associates and $a_{2} \ldots a_{n}=$ $u b_{2} \ldots b_{m}$. By induction on $n+m$ we see that $n=m$ and $a_{i}$ associate to $b_{\sigma(i)}$ for $i=2, \ldots, n$ as desired.

0AFT Lemma 10.119.6. Let $R$ be a Noetherian domain. Then $R$ is a UFD if and only if every height 1 prime ideal is principal.

Proof. Assume $R$ is a UFD and let $\mathfrak{p}$ be a height 1 prime ideal. Take $x \in \mathfrak{p}$ nonzero and let $x=a_{1} \ldots a_{n}$ be a factorization into irreducibles. Since $\mathfrak{p}$ is prime we see that $a_{i} \in \mathfrak{p}$ for some $i$. By Lemma 10.119 .5 the ideal $\left(a_{i}\right)$ is prime. Since $\mathfrak{p}$ has height 1 we conclude that $\left(a_{i}\right)=\mathfrak{p}$.
Assume every height 1 prime is principal. Since $R$ is Noetherian every nonzero nonunit element $x$ has a factorization into irreducibles, see Lemma 10.119.3. It suffices to prove that an irreducible element $x$ is prime, see Lemma 10.119.5. Let $(x) \subset \mathfrak{p}$ be a prime minimal over $(x)$. Then $\mathfrak{p}$ has height 1 by Lemma 10.59.10. By assumption $\mathfrak{p}=(y)$. Hence $x=y z$ and $z$ is a unit as $x$ is irreducible. Thus $(x)=(y)$ and we see that $x$ is prime.

0AFU Lemma 10.119.7 (Nagata's criterion for factoriality). Let A be a domain. Let $S \subset A$ be a multiplicative subset generated by prime elements. Let $x \in A$ be irreducible. Then
(1) the image of $x$ in $S^{-1} A$ is irreducible or a unit, and
(2) $x$ is prime if and only if the image of $x$ in $S^{-1} A$ is a unit or a prime element in $S^{-1} A$.
Moreover, then $A$ is a UFD if and only if every element of $A$ has a factorization into irreducibles and $S^{-1} A$ is a UFD.

Proof. Say $x=\alpha \beta$ for $\alpha, \beta \in S^{-1} A$. Then $\alpha=a / s$ and $\beta=b / s^{\prime}$ for $a, b \in A$, $s, s^{\prime} \in S$. Thus we get $s s^{\prime} x=a b$. By assumption we can write $s s^{\prime}=p_{1} \ldots p_{r}$ for some prime elements $p_{i}$. For each $i$ the element $p_{i}$ divides either $a$ or $b$. Dividing we find a factorization $x=a^{\prime} b^{\prime}$ and $a=s^{\prime \prime} a^{\prime}, b=s^{\prime \prime \prime} b^{\prime}$ for some $s^{\prime \prime}, s^{\prime \prime \prime} \in S$. As $x$ is irreducible, either $a^{\prime}$ or $b^{\prime}$ is a unit. Tracing back we find that either $\alpha$ or $\beta$ is a unit. This proves (1).
Suppose $x$ is prime. Then $A /(x)$ is a domain. Hence $S^{-1} A / x S^{-1} A=S^{-1}(A /(x))$ is a domain or zero. Thus $x$ maps to a prime element or a unit.
Suppose that the image of $x$ in $S^{-1} A$ is a unit. Then $y x=s$ for some $s \in S$ and $y \in A$. By assumption $s=p_{1} \ldots p_{r}$ with $p_{i}$ a prime element. For each $i$ either $p_{i}$ divides $y$ or $p_{i}$ divides $x$. In the second case $p_{i}$ and $x$ are associates (as $x$ is irreducible) and we are done. But if the first case happens for all $i=1, \ldots, r$, then $x$ is a unit which is a contradiction.

Suppose that the image of $x$ in $S^{-1} A$ is a prime element. Assume $a, b \in A$ and $a b \in(x)$. Then $s a=x y$ or $s b=x y$ for some $s \in S$ and $y \in A$. Say the first case happens. By assumption $s=p_{1} \ldots p_{r}$ with $p_{i}$ a prime element. For each $i$ either $p_{i}$ divides $y$ or $p_{i}$ divides $x$. In the second case $p_{i}$ and $x$ are associates (as $x$ is irreducible) and we are done. If the first case happens for all $i=1, \ldots, r$, then $a \in(x)$ as desired. This completes the proof of (2).

The final statement of the lemma follows from (1) and (2) and Lemma 10.119.5.
0BC1 Lemma 10.119.8. A polynomial ring over a UFD is a UFD. In particular, if $k$ is a field, then $k\left[x_{1}, \ldots, x_{n}\right]$ is a UFD.
Proof. Let $R$ be a UFD. Let $S \subset R$ be the multiplicative subset generated by prime elements. Since every nonunit of $R$ is a product of prime elements we see that $K=S^{-1} R$ is the fraction field of $R$. Observe that every prime element of $R$ maps to a prime element of $R[x]$ and that $S^{-1}(R[x])=S^{-1} R[x]=K[x]$ is a UFD (and even a PID). Thus we may apply Lemma 10.119.7 to conclude.

0AFV Lemma 10.119.9. A unique factorization domain is normal.
Proof. Let $R$ be a UFD. Let $x$ be an element of the fraction field of $R$ which is integral over $R$. Say $x^{d}-a_{1} x^{d-1}-\ldots-a_{d}=0$ with $a_{i} \in R$. We can write $x=u p_{1}^{e_{1}} \ldots p_{r}^{e_{r}}$ with $u$ a unit, $e_{i} \in \mathbf{Z}$, and $p_{1}, \ldots, p_{r}$ irreducible elements which are not associates. To prove the lemma we have to show $e_{i} \geq 0$. If not, say $e_{1}<0$, then for $N \gg 0$ we get

$$
u^{d} p_{2}^{d e_{2}+N} \ldots p_{r}^{d e_{r}+N}=p_{1}^{-d e_{1}} p_{2}^{N} \ldots p_{r}^{N}\left(\sum_{i=1, \ldots, d} a_{i} x^{d-i}\right) \in\left(p_{1}\right)
$$

which contradicts uniqueness of factorization in $R$.
034U Definition 10.119.10. A principal ideal domain, abbreviated PID, is a domain $R$ such that every ideal is a principal ideal.

034V Lemma 10.119.11. A principal ideal domain is a unique factorization domain.
Proof. As a PID is Noetherian this follows from Lemma 10.119 .6
034W Definition 10.119.12. A Dedekind domain is a domain $R$ such that every nonzero ideal $I \subset R$ can be written as a product

$$
I=\mathfrak{p}_{1} \ldots \mathfrak{p}_{r}
$$

of nonzero prime ideals uniquely up to permutation of the $\mathfrak{p}_{i}$.
0AUQ Lemma 10.119.13. A PID is a Dedekind domain.
Proof. Let $R$ be a PID. Since every nonzero ideal of $R$ is principal, and $R$ is a UFD (Lemma 10.119.11), this follows from the fact that every irreducible element in $R$ is prime (Lemma 10.119.5) so that factorizations of elements turn into factorizations into primes.

09 ME Lemma 10.119.14. Let $A$ be a ring. Let $I$ and $J$ be nonzero ideals of $A$ such that $I J=(f)$ for some nonzerodivisor $f \in A$. Then $I$ and $J$ are finitely generated ideals and finitely locally free of rank 1 as $A$-modules.

Proof. It suffices to show that $I$ and $J$ are finite locally free $A$-modules of rank 1, see Lemma 10.77.2. To do this, write $f=\sum_{i=1, \ldots, n} x_{i} y_{i}$ with $x_{i} \in I$ and $y_{i} \in J$. We can also write $x_{i} y_{i}=a_{i} f$ for some $a_{i} \in A$. Since $f$ is a nonzerodivisor we see that $\sum a_{i}=1$. Thus it suffices to show that each $I_{a_{i}}$ and $J_{a_{i}}$ is free of rank 1 over $A_{a_{i}}$. After replacing $A$ by $A_{a_{i}}$ we conclude that $f=x y$ for some $x \in I$ and $y \in J$. Note that both $x$ and $y$ are nonzerodivisors. We claim that $I=(x)$ and $J=(y)$ which finishes the proof. Namely, if $x^{\prime} \in I$, then $x^{\prime} y=a f=a x y$ for some $a \in A$. Hence $x^{\prime}=a x$ and we win.

034X Lemma 10.119.15. Let $R$ be a ring. The following are equivalent
(1) $R$ is a Dedekind domain,
(2) $R$ is a Noetherian domain, and for every maximal ideal $\mathfrak{m}$ the local ring $R_{\mathfrak{m}}$ is a discrete valuation ring, and
(3) $R$ is a Noetherian, normal domain, and $\operatorname{dim}(R) \leq 1$.

Proof. Assume (1). The argument is nontrivial because we did not assume that $R$ was Noetherian in our definition of a Dedekind domain. Let $\mathfrak{p} \subset R$ be a prime ideal. Observe that $\mathfrak{p} \neq \mathfrak{p}^{2}$ by uniqueness of the factorizations in the definition. Pick $x \in \mathfrak{p}$ with $x \notin \mathfrak{p}^{2}$. Let $y \in \mathfrak{p}$ be a second element (for example $y=0$ ). Write $(x, y)=\mathfrak{p}_{1} \ldots \mathfrak{p}_{r}$. Since $(x, y) \subset \mathfrak{p}$ at least one of the primes $\mathfrak{p}_{i}$ is contained in $\mathfrak{p}$. But as $x \notin \mathfrak{p}^{2}$ there is at most one. Thus exactly one of $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}$ is contained in $\mathfrak{p}$, say $\mathfrak{p}_{1} \subset \mathfrak{p}$. We conclude that $(x, y) R_{\mathfrak{p}}=\mathfrak{p}_{1} R_{\mathfrak{p}}$ is prime for every choice of $y$. We claim that $(x) R_{\mathfrak{p}}=\mathfrak{p} R_{\mathfrak{p}}$. Namely, pick $y \in \mathfrak{p}$. By the above applied with $y^{2}$ we see that $\left(x, y^{2}\right) R_{\mathfrak{p}}$ is prime. Hence $y \in\left(x, y^{2}\right) R_{\mathfrak{p}}$, i.e., $y=a x+b y^{2}$ in $R_{\mathfrak{p}}$. Thus $(1-b y) y=a x \in(x) R_{\mathfrak{p}}$, i.e., $y \in(x) R_{\mathfrak{p}}$ as desired.
Writing $(x)=\mathfrak{p}_{1} \ldots \mathfrak{p}_{r}$ anew with $\mathfrak{p}_{1} \subset \mathfrak{p}$ we conclude that $\mathfrak{p}_{1} R_{\mathfrak{p}}=\mathfrak{p} R_{\mathfrak{p}}$, i.e., $\mathfrak{p}_{1}=\mathfrak{p}$. Moreover, $\mathfrak{p}_{1}=\mathfrak{p}$ is a finitely generated ideal of $R$ by Lemma 10.119.14 We conclude that $R$ is Noetherian by Lemma 10.27.9. Moreover, it follows that $R_{\mathfrak{m}}$ is a discrete valuation ring for every prime ideal $\mathfrak{p}$, see Lemma 10.118.7.

The equivalence of (2) and (3) follows from Lemmas 10.36.10 and 10.118.7. Assume (2) and (3) are satisfied. Let $I \subset R$ be an ideal. We will construct a factorization of $I$. If $I$ is prime, then there is nothing to prove. If not, pick $I \subset \mathfrak{p}$ with $\mathfrak{p} \subset R$ maximal. Let $J=\{x \in R \mid x \mathfrak{p} \subset I\}$. We claim $J \mathfrak{p}=I$. It suffices to check this after localization at the maximal ideals $\mathfrak{m}$ of $A$ (the formation of $J$ commutes with localization and we use Lemma 10.23.1). Then either $\mathfrak{p} R_{\mathfrak{m}}=R_{\mathfrak{m}}$ and the result is clear, or $\mathfrak{p} R_{\mathfrak{m}}=\mathfrak{m} R_{\mathfrak{m}}$. In the last case $\mathfrak{p} R_{\mathfrak{m}}=(\pi)$ and the case where $\mathfrak{p}$ is principal is immediate. By Noetherian induction the ideal $J$ has a factorization
and we obtain the desired factorization of $I$. We omit the proof of uniqueness of the factorization.
The following is a variant of the Krull-Akizuki lemma.
09IG Lemma 10.119.16. Let $A$ be a Noetherian domain of dimension 1 with fraction field $K . L e t K \subset L$ be a finite extension. Let $B$ be the integral closure of $A$ in $L$. Then $B$ is a Dedekind domain and $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective, has finite fibres, and induces finite residue field extensions.

Proof. By Krull-Akizuki (Lemma 10.118.12) the ring $B$ is Noetherian. By Lemma 10.111.4 $\operatorname{dim}(B)=1$. Thus $B$ is a Dedekind domain by Lemma 10.119.15 Surjectivity of the map on spectra follows from Lemma 10.35.15. The last two statements follow from Lemma 10.118.10.

### 10.120. Orders of vanishing

02MB
02 MC Lemma 10.120.1. Let $R$ be a semi-local Noetherian ring of dimension 1. If $a, b \in R$ are nonzerodivisors then

$$
\text { length }_{R}(R /(a b))=\text { length }_{R}(R /(a))+\text { length }_{R}(R /(b))
$$

and these lengths are finite.
Proof. We saw the finiteness in Lemma 10.118.11. Additivity holds since there is a short exact sequence $0 \rightarrow R /(a) \rightarrow R /(a b) \rightarrow R /(b) \rightarrow 0$ where the first map is given by multiplication by $b$. (Use length is additive, see Lemma 10.51.3.)
02 MD Definition 10.120.2. Suppose that $K$ is a field, and $R \subset K$ is a loca $\sqrt{8}_{8}$ Noetherian subring of dimension 1 with fraction field $K$. In this case we define the order of vanishing along $R$

$$
\operatorname{ord}_{R}: K^{*} \longrightarrow \mathbf{Z}
$$

by the rule

$$
\operatorname{ord}_{R}(x)=\operatorname{length}_{R}(R /(x))
$$

if $x \in R$ and we set $\operatorname{ord}_{R}(x / y)=\operatorname{ord}_{R}(x)-\operatorname{ord}_{R}(y)$ for $x, y \in R$ both nonzero.
We can use the order of vanishing to compare lattices in a vector space. Here is the definition.
02ME Definition 10.120.3. Let $R$ be a Noetherian local domain of dimension 1 with fraction field $K$. Let $V$ be a finite dimensional $K$-vector space. A lattice in $V$ is a finite $R$-submodule $M \subset V$ such that $V=K \otimes_{R} M$.

The condition $V=K \otimes_{R} M$ signifies that $M$ contains a basis for the vector space $K$. We remark that in many places in the literature the notion of a lattice may be defined only in case the ring $R$ is a discrete valuation ring. If $R$ is a discrete valuation ring then any lattice is a free $R$-module, and this may not be the case in general.
02MF Lemma 10.120.4. Let $R$ be a Noetherian local domain of dimension 1 with fraction field $K$. Let $V$ be a finite dimensional $K$-vector space.

[^24](1) If $M$ is a lattice in $V$ and $M \subset M^{\prime} \subset V$ is an $R$-submodule of $V$ containing $M$ then the following are equivalent
(a) $M^{\prime}$ is a lattice,
(b) length ${ }_{R}\left(M^{\prime} / M\right)$ is finite, and
(c) $M^{\prime}$ is finitely generated.
(2) If $M$ is a lattice in $V$ and $M^{\prime} \subset M$ is an $R$-submodule of $M$ then $M^{\prime}$ is a lattice if and only if length ${ }_{R}\left(M / M^{\prime}\right)$ is finite.
(3) If $M, M^{\prime}$ are lattices in $V$, then so are $M \cap M^{\prime}$ and $M+M^{\prime}$.
(4) If $M \subset M^{\prime} \subset M^{\prime \prime} \subset V$ are lattices in $V$ then
$$
\text { length }_{R}\left(M^{\prime \prime} / M\right)=\text { length }_{R}\left(M^{\prime} / M\right)+\text { length }_{R}\left(M^{\prime \prime} / M^{\prime}\right)
$$
(5) If $M, M^{\prime}, N, N^{\prime}$ are lattices in $V$ and $N \subset M \cap M^{\prime}, M+M^{\prime} \subset N^{\prime}$, then we have
\[

$$
\begin{aligned}
& \text { length }_{R}\left(M / M \cap M^{\prime}\right)-\text { length }_{R}\left(M^{\prime} / M \cap M^{\prime}\right) \\
= & \operatorname{length}_{R}(M / N)-\text { length }_{R}\left(M^{\prime} / N\right) \\
= & \operatorname{length}_{R}\left(M+M^{\prime} / M^{\prime}\right)-\operatorname{length}_{R}\left(M+M^{\prime} / M\right) \\
= & \operatorname{length}_{R}\left(N^{\prime} / M^{\prime}\right)-\operatorname{length}_{R}\left(N^{\prime} / M\right)
\end{aligned}
$$
\]

Proof. Proof of (1). Assume (1)(a). Say $y_{1}, \ldots, y_{m}$ generate $M^{\prime}$. Then each $y_{i}=x_{i} / f_{i}$ for some $x_{i} \in M$ and nonzero $f_{i} \in R$. Hence we see that $f_{1} \ldots f_{m} M^{\prime} \subset$ $M$. Since $R$ is Noetherian local of dimension 1 we see that $\mathfrak{m}^{n} \subset\left(f_{1} \ldots f_{m}\right)$ for some $n$ (for example combine Lemmas 10.59 .12 and Proposition 10.59 .6 or combine Lemmas 10.118.9 and 10.51.4). In other words $\mathfrak{m}^{n} M^{\prime} \subset M$ for some $n$ Hence length $\left(M^{\prime} / M\right)<\infty$ by Lemma 10.51.8 in other words (1)(b) holds. Assume (1)(b). Then $M^{\prime} / M$ is a finite $R$-module (see Lemma 10.51.2). Hence $M^{\prime}$ is a finite $R$-module as an extension of finite $R$-modules. Hence (1)(c). The implication $(1)(\mathrm{c}) \Rightarrow(1)$ (a) follows from the remark following Definition 10.120 .3 .
Proof of (2). Suppose $M$ is a lattice in $V$ and $M^{\prime} \subset M$ is an $R$-submodule. We have seen in (1) that if $M^{\prime}$ is a lattice, then length ${ }_{R}\left(M / M^{\prime}\right)<\infty$. Conversely, assume that length ${ }_{R}\left(M / M^{\prime}\right)<\infty$. Then $M^{\prime}$ is finitely generated as $R$ is Noetherian and for some $n$ we have $\mathfrak{m}^{n} M \subset M^{\prime}$ (Lemma 10.51.4). Hence it follows that $M^{\prime}$ contains a basis for $V$, and $M^{\prime}$ is a lattice.
Proof of (3). Assume $M, M^{\prime}$ are lattices in $V$. Since $R$ is Noetherian the submodule $M \cap M^{\prime}$ of $M$ is finite. As $M$ is a lattice we can find $x_{1}, \ldots, x_{n} \in M$ which form a $K$-basis for $V$. Because $M^{\prime}$ is a lattice we can write $x_{i}=y_{i} / f_{i}$ with $y_{i} \in M^{\prime}$ and $f_{i} \in R$. Hence $f_{i} x_{i} \in M \cap M^{\prime}$. Hence $M \cap M^{\prime}$ is a lattice also. The fact that $M+M^{\prime}$ is a lattice follows from part (1).
Part (4) follows from additivity of lengths (Lemma 10.51.3) and the exact sequence

$$
0 \rightarrow M^{\prime} / M \rightarrow M^{\prime \prime} / M \rightarrow M^{\prime \prime} / M^{\prime} \rightarrow 0
$$

Part (5) follows from repeatedly applying part (4).
02MG Definition 10.120.5. Let $R$ be a Noetherian local domain of dimension 1 with fraction field $K$. Let $V$ be a finite dimensional $K$-vector space. Let $M, M^{\prime}$ be two lattices in $V$. The distance between $M$ and $M^{\prime}$ is the integer

$$
d\left(M, M^{\prime}\right)=\operatorname{length}_{R}\left(M / M \cap M^{\prime}\right)-\operatorname{length}_{R}\left(M^{\prime} / M \cap M^{\prime}\right)
$$

of Lemma 10.120.4 part (5).

In particular, if $M^{\prime} \subset M$, then $d\left(M, M^{\prime}\right)=\operatorname{length}_{R}\left(M / M^{\prime}\right)$.
02MH Lemma 10.120.6. Let $R$ be a Noetherian local domain of dimension 1 with fraction field $K$. Let $V$ be a finite dimensional $K$-vector space. This distance function has the property that

$$
d\left(M, M^{\prime \prime}\right)=d\left(M, M^{\prime}\right)+d\left(M^{\prime}, M^{\prime \prime}\right)
$$

whenever given three lattices $M, M^{\prime}, M^{\prime \prime}$ of $V$. In particular we have $d\left(M, M^{\prime}\right)=$ $-d\left(M^{\prime}, M\right)$.

## Proof. Omitted.

02MI Lemma 10.120.7. Let $R$ be a Noetherian local domain of dimension 1 with fraction field $K$. Let $V$ be a finite dimensional $K$-vector space. Let $\varphi: V \rightarrow V$ be $a$ $K$-linear isomorphism. For any lattice $M \subset V$ we have

$$
d(M, \varphi(M))=\operatorname{ord}_{R}(\operatorname{det}(\varphi))
$$

Proof. We can see that the integer $d(M, \varphi(M))$ does not depend on the lattice $M$ as follows. Suppose that $M^{\prime}$ is a second such lattice. Then we see that

$$
\begin{aligned}
d(M, \varphi(M)) & =d\left(M, M^{\prime}\right)+d\left(M^{\prime}, \varphi(M)\right) \\
& =d\left(M, M^{\prime}\right)+d\left(\varphi\left(M^{\prime}\right), \varphi(M)\right)+d\left(M^{\prime}, \varphi\left(M^{\prime}\right)\right)
\end{aligned}
$$

Since $\varphi$ is an isomorphism we see that $d\left(\varphi\left(M^{\prime}\right), \varphi(M)\right)=d\left(M^{\prime}, M\right)=-d\left(M, M^{\prime}\right)$, and hence $d(M, \varphi(M))=d\left(M^{\prime}, \varphi\left(M^{\prime}\right)\right)$. Moreover, both sides of the equation (of the lemma) are additive in $\varphi$, i.e.,

$$
\operatorname{ord}_{R}(\operatorname{det}(\varphi \circ \psi))=\operatorname{ord}_{R}(\operatorname{det}(\varphi))+\operatorname{ord}_{R}(\operatorname{det}(\psi))
$$

and also

$$
\begin{aligned}
d(M, \varphi(\psi((M))) & =d(M, \psi(M))+d(\psi(M), \varphi(\psi(M))) \\
& =d(M, \psi(M))+d(M, \varphi(M))
\end{aligned}
$$

by the independence shown above. Hence it suffices to prove the lemma for generators of $\mathrm{GL}(V)$. Choose an isomorphism $K^{\oplus n} \cong V$. Then $\mathrm{GL}(V)=\mathrm{GL}_{n}(K)$ is generated by elementary matrices $E$. The result is clear for $E$ equal to the identity matrix. If $E=E_{i j}(\lambda)$ with $i \neq j, \lambda \in K, \lambda \neq 0$, for example

$$
E_{12}(\lambda)=\left(\begin{array}{ccc}
1 & \lambda & \ldots \\
0 & 1 & \ldots \\
\ldots & \ldots & \ldots
\end{array}\right)
$$

then with respect to a different basis we get $E_{12}(1)$. The result is clear for $E=$ $E_{12}(1)$ by taking as lattice $R^{\oplus n} \subset K^{\oplus n}$. Finally, if $E=E_{i}(a)$, with $a \in K^{*}$ for example

$$
E_{1}(a)=\left(\begin{array}{ccc}
a & 0 & \ldots \\
0 & 1 & \ldots \\
\ldots & \ldots & \ldots
\end{array}\right)
$$

then $E_{1}(a)\left(R^{\oplus b}\right)=a R \oplus R^{\oplus n-1}$ and it is clear that $d\left(R^{\oplus n}, a R \oplus R^{\oplus n-1}\right)=\operatorname{ord}_{R}(a)$ as desired.

02MJ Lemma 10.120.8. Let $A \rightarrow B$ be a ring map. Assume
(1) $A$ is a Noetherian local domain of dimension 1,
(2) $A \subset B$ is a finite extension of domains.

Let $K=f . f .(A)$ and $L=f . f .(B)$ so that $L$ is a finite field extension of $K$. Let $y \in L^{*}$ and $x=N m_{L / K}(y)$. In this situation $B$ is semi-local. Let $\mathfrak{m}_{i}, i=1, \ldots, n$ be the maximal ideals of $B$. Then

$$
\operatorname{ord}_{A}(x)=\sum_{i}\left[\kappa\left(\mathfrak{m}_{i}\right): \kappa\left(\mathfrak{m}_{A}\right)\right] \operatorname{ord}_{B_{\mathfrak{m}_{i}}}(y)
$$

where ord is defined as in Definition 10.120.2.
Proof. The ring $B$ is semi-local by Lemma 10.112 .2 . Write $y=b / b^{\prime}$ for some $b, b^{\prime} \in B$. By the additivity of ord and multiplicativity of Nm it suffices to prove the lemma for $y=b$ or $y=b^{\prime}$. In other words we may assume $y \in B$. In this case the left hand side of the formula is

$$
\sum\left[\kappa\left(\mathfrak{m}_{i}\right): \kappa\left(\mathfrak{m}_{A}\right)\right] \operatorname{length}_{B_{\mathfrak{m}_{i}}}\left((B / y B)_{\mathfrak{m}_{i}}\right)
$$

By Lemma 10.51 .12 this is equal to length $A(B / y B)$. By Lemma 10.120.7 we have

$$
\operatorname{length}_{A}(B / y B)=d(B, y B)=\operatorname{ord}_{A}\left(\operatorname{det}_{K}(L \xrightarrow{y} L)\right)
$$

Since $x=\operatorname{Nm}_{L / K}(y)=\operatorname{det}_{K}(L \xrightarrow{y} L)$ by definition the lemma is proved.
We can extend some of the results above to reduced 1-dimensional Noetherian local rings which are not domains by the following lemma.

07 K 3 Lemma 10.120.9. Let $(R, \mathfrak{m})$ be a reduced Noetherian local ring of dimension 1 and let $x \in \mathfrak{m}$ be a nonzerodivisor. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ be the minimal primes of $R$. Then

$$
\operatorname{length}_{R}(R /(x))=\sum_{i} \operatorname{ord}_{R / \mathfrak{q}_{i}}(x)
$$

Proof. Note that $R_{i}=R / \mathfrak{q}_{i}$ is a Noetherian 1-dimensional local domain. Denote $K_{i}=f . f .\left(R_{i}\right)$. If $x$ is a unit in $R$, then both sides are zero. Hence we may assume $x \in \mathfrak{m}$. Consider the map $\Psi: R \rightarrow \prod R_{i}$. As $R$ is reduced this map is injective, see Lemma 10.16.2. By Lemma 10.24 .4 we have $Q(R)=\prod K_{i}$. Hence the finite $R$-module Coker $(\Psi)$ is annihilated by a nonzerodivisor $y \in R$, hence has support $\{\mathfrak{m}\}$, is annihilated by some power of $x$ and has finite length over $R$, see Lemma 10.61.3. Consider the short exact sequence

$$
0 \rightarrow R \rightarrow \prod R_{i} \rightarrow \operatorname{Coker}(\Psi) \rightarrow 0
$$

Applying multiplication by $x^{n}$ to this for $n \gg 0$ we obtain from the snake lemma

$$
0 \rightarrow \operatorname{Coker}(\Psi) \rightarrow R / x^{n} R \rightarrow \prod R_{i} / x^{n} R_{i} \rightarrow \operatorname{Coker}(\Psi) \rightarrow 0
$$

Thus we see that

$$
\operatorname{length}_{R}\left(R / x^{n} R\right)=\operatorname{length}_{R}\left(\prod R_{i} / x^{n} R_{i}\right)=\sum \operatorname{length}_{R}\left(R_{i} / x^{n} R_{i}\right)
$$

by Lemma 10.51 .3 By Lemma 10.51 .5 we have length ${ }_{R}\left(R_{i} / x^{n} R_{i}\right)=\operatorname{length}_{R_{i}}\left(R_{i} / x^{n} R_{i}\right)$. Now the result follows from the additivity of Lemma 10.120.1 and the definition of the order of vanishing along $R_{i}$.

02QF Lemma 10.120.10. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $M$ be a finite $R$-module. Let $x \in R$. Assume that
(1) $\operatorname{dim}(\operatorname{Supp}(M)) \leq 1$, and
(2) $\operatorname{dim}(\operatorname{Supp}(M / x M)) \leq 0$.

Write $\operatorname{Supp}(M)=\left\{\mathfrak{m}, \mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$. Then

$$
\text { length }_{R}\left(M_{x}\right)-\text { length }_{R}\left({ }_{x} M\right)=\sum_{i=1, \ldots, t} \operatorname{ord}_{R / \mathfrak{q}_{i}}(x) \text { length }_{R_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right)
$$

where $M_{x}=M / x M$ and ${ }_{x} M=\operatorname{Ker}(x: M \rightarrow M)$.
Proof. We first make some preparatory remarks. The result of the lemma holds if $M$ has finite length, i.e., if $t=0$, because in this case the exact sequence $0 \rightarrow$ ${ }_{x} M \rightarrow M \rightarrow M \rightarrow M_{x} \rightarrow 0$ and additivity of length shows that length ${ }_{R}\left(M_{x}\right)=$ length $_{R}\left({ }_{x} M\right)$. Also, if we have a short exact sequence $0 \rightarrow M \rightarrow M^{\prime} \rightarrow M^{\prime \prime} \rightarrow 0$ of modules satisfying (1) and (2), then lemma for 2 out of 3 of these implies the lemma for the third by the snake lemma.
Denote $M_{i}$ the image of $M$ in $M_{\mathfrak{q}_{i}}$, so $\operatorname{Supp}\left(M_{i}\right)=\left\{\mathfrak{m}, \mathfrak{q}_{i}\right\}$. The kernel and cokernel of the map $M \rightarrow \bigoplus M_{i}$ have support $\{\mathfrak{m}\}$ and hence have finite length. By our preparatory remarks, it follows that it suffices to prove the lemma for each $M_{i}$. Thus we may assume that $\operatorname{Supp}(M)=\{\mathfrak{m}, \mathfrak{q}\}$. In this case we can filter $M$ by powers of $\mathfrak{q}$. Again additivity shows that it suffices to prove the lemma in the case $M$ is annihilated by $\mathfrak{q}$. In this case we can view $M$ as a $R / \mathfrak{q}$-module, i.e., we may assume that $R$ is a Noetherian local domain of dimension 1 with fraction field $K$. Dividing by the torsion submodule, i.e., by the kernel of $M \rightarrow M \otimes_{R} K=V$ (the torsion has finite length hence is handled by our preliminary remarks) we may assume that $M \subset V$ is a lattice. Then length $\left({ }_{x} M\right)=0$ and length ${ }_{R}\left(M_{x}\right)=d(M, x M)$. Since $\operatorname{length}_{K}(V)=\operatorname{dim}_{K}(V)$ we see that $\operatorname{det}(x: V \rightarrow V)=x^{\operatorname{dim}_{K}(V)}$ and $\operatorname{ord}_{R}(\operatorname{det}(x:$ $V \rightarrow V))=\operatorname{dim}_{K}(V) \operatorname{ord}_{R}(x)$. Thus the lemma follows from Lemma 10.120.7 in this particular case.

02QG Lemma 10.120.11. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $I \subset R$ be an ideal and let $x \in R$. Assume $x$ is a nonzerodivisor on $R / I$ and that $\operatorname{dim}(R / I)=1$. Then

$$
\text { length }_{R}(R /(x, I))=\sum_{i} \text { length }_{R}\left(R /\left(x, \mathfrak{q}_{i}\right)\right) \text { length }_{R_{\mathfrak{q}_{i}}}\left((R / I)_{\mathfrak{q}_{i}}\right)
$$

where $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{n}$ are the minimal primes over $I$. More generally if $M$ is any finite Cohen-Macaulay module of dimension 1 over $R$ and $\operatorname{dim}(\operatorname{Supp}(M / x M))=0$, then

$$
\operatorname{length}_{R}(M / x M)=\sum_{i} \operatorname{length}_{R}\left(R /\left(x, \mathfrak{q}_{i}\right)\right) \operatorname{length}_{R_{\mathfrak{q}_{i}}}\left(M_{\mathfrak{q}_{i}}\right)
$$

where $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ are the minimal primes of the support of $M$.
Proof. These are special cases of Lemma 10.120.10

### 10.121. Quasi-finite maps

02 MK Consider a ring map $R \rightarrow S$ of finite type. A map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is quasifinite at a point if that point is isolated in its fibre. This means that the fibre is zero dimensional at that point. In this section we study the basic properties of this important but technical notion. More advanced material can be found in the next section.

00PJ Lemma 10.121.1. Let $k$ be a field. Let $S$ be a finite type $k$ algebra. Let $\mathfrak{q}$ be a prime of $S$. The following are equivalent:
(1) $\mathfrak{q}$ is an isolated point of $\operatorname{Spec}(S)$,
(2) $S_{\mathfrak{q}}$ is finite over $k$,
(3) there exists a $g \in S, g \notin \mathfrak{q}$ such that $D(g)=\{\mathfrak{q}\}$,
(4) $\operatorname{dim}_{\mathfrak{q}} \operatorname{Spec}(S)=0$,
(5) $\mathfrak{q}$ is a closed point of $\operatorname{Spec}(S)$ and $\operatorname{dim}\left(S_{\mathfrak{q}}\right)=0$, and
(6) the field extension $k \subset \kappa(\mathfrak{q})$ is finite and $\operatorname{dim}\left(S_{\mathfrak{q}}\right)=0$.

In this case $S=S_{\mathfrak{q}} \times S^{\prime}$ for some finite type $k$-algebra $S^{\prime}$. Also, the element $g$ as in (3) has the property $S_{\mathfrak{q}}=S_{g}$.

Proof. Suppose $\mathfrak{q}$ is an isolated point of $\operatorname{Spec}(S)$, i.e., $\{\mathfrak{q}\}$ is open in $\operatorname{Spec}(S)$. Because $\operatorname{Spec}(S)$ is a Jacobson space (see Lemmas 10.34.2 and 10.34.4 we see that $\mathfrak{q}$ is a closed point. Hence $\{\mathfrak{q}\}$ is open and closed in $\operatorname{Spec}(S)$. By Lemmas 10.20.3 and 10.22 .3 we may write $S=S_{1} \times S_{2}$ with $\mathfrak{q}$ corresponding to the only point $\operatorname{Spec}\left(S_{1}\right)$. Hence $S_{1}=S_{\mathfrak{q}}$ is a zero dimensional ring of finite type over $k$. Hence it is finite over $k$ for example by Lemma 10.114.4. We have proved (1) implies (2).
Suppose $S_{\mathfrak{q}}$ is finite over $k$. Then $S_{\mathfrak{q}}$ is Artinian local, see Lemma 10.52 .2 So $\operatorname{Spec}\left(S_{\mathfrak{q}}\right)=\left\{\mathfrak{q} S_{\mathfrak{q}}\right\}$ by Lemma 10.52 .6 . Consider the exact sequence $0 \rightarrow K \rightarrow S \rightarrow$ $S_{\mathfrak{q}} \rightarrow Q \rightarrow 0$. It is clear that $K_{\mathfrak{q}}=Q_{\mathfrak{q}}=0$. Also, $K$ is a finite $S$-module as $S$ is Noetherian and $Q$ is a finite $S$-modules since $S_{\mathfrak{q}}$ is finite over $k$. Hence there exists $g \in S, g \notin \mathfrak{q}$ such that $K_{g}=Q_{g}=0$. Thus $S_{\mathfrak{q}}=S_{g}$ and $D(g)=\{\mathfrak{q}\}$. We have proved that (2) implies (3).

Suppose $D(g)=\{\mathfrak{q}\}$. Since $D(g)$ is open by construction of the topology on $\operatorname{Spec}(S)$ we see that $\mathfrak{q}$ is an isolated point of $\operatorname{Spec}(S)$. We have proved that (3) implies (1). In other words (1), (2) and (3) are equivalent.

Assume $\operatorname{dim}_{\mathfrak{q}} \operatorname{Spec}(S)=0$. This means that there is some open neighbourhood of $\mathfrak{q}$ in $\operatorname{Spec}(S)$ which has dimension zero. Then there is an open neighbourhood of the form $D(g)$ which has dimension zero. Since $S_{g}$ is Noetherian we conclude that $S_{g}$ is Artinian and $D(g)=\operatorname{Spec}\left(S_{g}\right)$ is a finite discrete set, see Proposition 10.59.6. Thus $\mathfrak{q}$ is an isolated point of $D(g)$ and, by the equivalence of (1) and (2) above applied to $\mathfrak{q} S_{g} \subset S_{g}$, we see that $S_{\mathfrak{q}}=\left(S_{g}\right)_{\mathfrak{q} S_{g}}$ is finite over $k$. Hence (4) implies (2). It is clear that (1) implies (4). Thus (1) - (4) are all equivalent.

Lemma 10.113 .6 gives the implication $(5) \Rightarrow(4)$. The implication $(4) \Rightarrow(6)$ follows from Lemma 10.115.3. The implication $(6) \Rightarrow(5)$ follows from Lemma 10.34.9. At this point we know (1) - (6) are equivalent.

The two statements at the end of the lemma we saw during the course of the proof of the equivalence of (1), (2) and (3) above.

00PK Lemma 10.121.2. Let $R \rightarrow S$ be a ring map of finite type. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Let $F=\operatorname{Spec}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)$ be the fibre of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$, see Remark 10.16.8. Denote $\overline{\mathfrak{q}} \in F$ the point corresponding to $\mathfrak{q}$. The following are equivalent
(1) $\overline{\mathfrak{q}}$ is an isolated point of $F$,
(2) $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ is finite over $\kappa(\mathfrak{p})$,
(3) there exists a $g \in S, g \notin \mathfrak{q}$ such that the only prime of $D(g)$ mapping to $\mathfrak{p}$ is $\mathfrak{q}$,
(4) $\operatorname{dim}_{\overline{\mathfrak{q}}}(F)=0$,
(5) $\overline{\mathfrak{q}}$ is a closed point of $F$ and $\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)=0$, and
(6) the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite and $\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)=0$.

Proof. Note that $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}=\left(S \otimes_{R} \kappa(\mathfrak{p})\right)_{\bar{q}}$. Moreover $S \otimes_{R} \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$. The conditions correspond exactly to the conditions of Lemma 10.121.1 for the $\kappa(\mathfrak{p})$-algebra $S \otimes_{R} \kappa(\mathfrak{p})$ and the prime $\overline{\mathfrak{q}}$, hence they are equivalent.
00PL Definition 10.121.3. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime.
(1) If the equivalent conditions of Lemma 10.121 .2 are satisfied then we say $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$.
(2) We say a ring map $A \rightarrow B$ is quasi-finite if it is of finite type and quasifinite at all primes of $B$.
00PM Lemma 10.121.4. Let $R \rightarrow S$ be a finite type ring map. Then $R \rightarrow S$ is quasifinite if and only if for all primes $\mathfrak{p} \subset R$ the fibre $S \otimes_{R} \kappa(\mathfrak{p})$ is finite over $\kappa(\mathfrak{p})$.

Proof. If the fibres are finite then the map is clearly quasi-finite. For the converse, note that $S \otimes_{R} \kappa(\mathfrak{p})$ is a $\kappa(\mathfrak{p})$-algebra of finite type over $k$ of dimension 0 . Hence it is finite over $k$ for example by Lemma 10.114.4.
077H Lemma 10.121.5. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Let $f \in R, f \notin \mathfrak{p}$ and $g \in S, g \notin \mathfrak{q}$. Then $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$ if and only if $R_{f} \rightarrow S_{f g}$ is quasi-finite at $\mathfrak{q} S_{f g}$.
Proof. The fibre of $\operatorname{Spec}\left(S_{f g}\right) \rightarrow \operatorname{Spec}\left(R_{f}\right)$ is homeomorphic to an open subset of the fibre of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$. Hence the lemma follows from part (1) of the equivalent conditions of Lemma 10.121.2.

00PN Lemma 10.121.6. Let

be a commutative diagram of rings with primes as indicated. Assume $R \rightarrow S$ of finite type, and $S \otimes_{R} R^{\prime} \rightarrow S^{\prime}$ surjective. If $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$, then $R^{\prime} \rightarrow S^{\prime}$ is quasi-finite at $\mathfrak{q}^{\prime}$.
Proof. Write $S \otimes_{R} \kappa(\mathfrak{p})=S_{1} \times S_{2}$ with $S_{1}$ finite over $\kappa(\mathfrak{p})$ and such that $\mathfrak{q}$ corresponds to a point of $S_{1}$ as in Lemma 10.121.1. Because $S \otimes_{R} R^{\prime} \rightarrow S^{\prime}$ surjective the canonical map $\left(S \otimes_{R} \kappa(\mathfrak{p})\right) \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{p}^{\prime}\right) \rightarrow S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)$ is surjective. Let $S_{i}^{\prime}$ be the image of $S_{i} \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{p}^{\prime}\right)$ in $S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)$. Then $S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)=S_{1}^{\prime} \times S_{2}^{\prime}$ and $S_{1}^{\prime}$ is finite over $\kappa\left(\mathfrak{p}^{\prime}\right)$. The map $S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right) \rightarrow \kappa\left(\mathfrak{q}^{\prime}\right)$ factors through $S_{1}^{\prime}$ (i.e. it annihilates the factor $S_{2}^{\prime}$ ) because the map $S \otimes_{R} \kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{q})$ factors through $S_{1}$ (i.e. it annihilates the factor $S_{2}$ ). Thus $\mathfrak{q}^{\prime}$ corresponds to a point of $\operatorname{Spec}\left(S_{1}^{\prime}\right)$ in the disjoint union decomposition of the fibre: $\operatorname{Spec}\left(S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)\right)=\operatorname{Spec}\left(S_{1}^{\prime}\right) \amalg \operatorname{Spec}\left(S_{1}^{\prime}\right)$. (See Lemma 10.20 .2 ) Since $S_{1}^{\prime}$ is finite over a field, it is Artinian ring, and hence $\operatorname{Spec}\left(S_{1}^{\prime}\right)$ is a finite discrete set. (See Proposition 10.59.6) We conclude $\mathfrak{q}^{\prime}$ is isolated in its fibre as desired.

00 PO Lemma 10.121.7. A composition of quasi-finite ring maps is quasi-finite.
Proof. Suppose $A \rightarrow B$ and $B \rightarrow C$ are quasi-finite ring maps. By Lemma 10.6.2 we see that $A \rightarrow C$ is of finite type. Let $\mathfrak{r} \subset C$ be a prime of $C$ lying over $\mathfrak{q} \subset B$ and $\mathfrak{p} \subset A$. Since $A \rightarrow B$ and $B \rightarrow C$ are quasi-finite at $\mathfrak{q}$ and $\mathfrak{r}$ respectively, then
there exist $b \in B$ and $c \in C$ such that $\mathfrak{q}$ is the only prime of $D(b)$ which maps to $\mathfrak{p}$ and similarly $\mathfrak{r}$ is the only prime of $D(c)$ which maps to $\mathfrak{q}$. If $c^{\prime} \in C$ is the image of $b \in B$, then $\mathfrak{r}$ is the only prime of $D\left(c c^{\prime}\right)$ which maps to $\mathfrak{p}$. Therefore $A \rightarrow C$ is quasi-finite at $\mathfrak{r}$.
00PP Lemma 10.121.8. Let $R \rightarrow S$ be a ring map of finite type. Let $R \rightarrow R^{\prime}$ be any ring map. Set $S^{\prime}=R^{\prime} \otimes_{R} S$.
(1) The set $\left\{\mathfrak{q}^{\prime} \mid R^{\prime} \rightarrow S^{\prime}\right.$ quasi-finite at $\left.\mathfrak{q}^{\prime}\right\}$ is the inverse image of the corresponding set of $\operatorname{Spec}(S)$ under the canonical map $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$.
(2) If $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ is surjective, then $R \rightarrow S$ is quasi-finite if and only if $R^{\prime} \rightarrow S^{\prime}$ is quasi-finite.
(3) Any base change of a quasi-finite ring map is quasi-finite.

Proof. Let $\mathfrak{p}^{\prime} \subset R^{\prime}$ be a prime lying over $\mathfrak{p} \subset R$. Then the fibre ring $S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)$ is the base change of the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$ by the field extension $\kappa(\mathfrak{p}) \rightarrow \kappa\left(\mathfrak{p}^{\prime}\right)$. Hence the first assertion follows from the invariance of dimension under field extension (Lemma 10.115.6) and Lemma 10.121.1. The stability of quasi-finite maps under base change follows from this and the stability of finite type property under base change. The second assertion follows since the assumption implies that given a prime $\mathfrak{q} \subset S$ we can find a prime $\mathfrak{q}^{\prime} \subset S^{\prime}$ lying over it.

The following lemma is not quite about quasi-finite ring maps, but it does not seem to fit anywhere else so well.
02ML Lemma 10.121.9. Let $R \rightarrow S$ be a ring map of finite type. Let $\mathfrak{p} \subset R$ be a minimal prime. Assume that there are at most finitely many primes of $S$ lying over $\mathfrak{p}$. Then there exists a $g \in R, g \notin \mathfrak{p}$ such that the ring map $R_{g} \rightarrow S_{g}$ is finite.
Proof. Let $x_{1}, \ldots, x_{n}$ be generators of $S$ over $R$. Since $\mathfrak{p}$ is a minimal prime we have that $\mathfrak{p} R_{\mathfrak{p}}$ is a locally nilpotent ideal, see Lemma 10.24.1. Hence $\mathfrak{p} S_{\mathfrak{p}}$ is a locally nilpotent ideal, see Lemma 10.31.2 By assumption the finite type $\kappa(\mathfrak{p})$-algebra $S_{\mathfrak{p}} / \mathfrak{p} S_{\mathfrak{p}}$ has finitely many primes. Hence (for example by Lemmas 10.60 .3 and 10.114.4 $\kappa(\mathfrak{p}) \rightarrow S_{\mathfrak{p}} / \mathfrak{p} S_{\mathfrak{p}}$ is a finite ring map. Thus we may find monic polynomials $\overline{P_{i} \in R_{\mathfrak{p}}}[X]$ such that $P_{i}\left(x_{i}\right)$ maps to zero in $S_{\mathfrak{p}} / \mathfrak{p} S_{\mathfrak{p}}$. By what we said above there exist $e_{i} \geq 1$ such that $P\left(x_{i}\right)^{e_{i}}=0$ in $S_{\mathfrak{p}}$. Let $g_{1} \in R, g_{1} \notin \mathfrak{p}$ be an element such that $P_{i} \in R\left[1 / g_{1}\right]$ for all $i$. Next, let $g_{2} \in R, g_{2} \notin \mathfrak{p}$ be an element such that $P\left(x_{i}\right)^{e_{i}}=0$ in $S_{g_{1} g_{2}}$. Setting $g=g_{1} g_{2}$ we win.

### 10.122. Zariski's Main Theorem

00PI In this section our aim is to prove the algebraic version of Zariski's Main theorem. This theorem will be the basis of many further developments in the theory of schemes and morphisms of schemes later in the project.
Let $R \rightarrow S$ be a ring map of finite type. Our goal in this section is to show that the set of points of $\operatorname{Spec}(S)$ where the map is quasi-finite is open (Theorem 10.122.13). In fact, it will turn out that there exists a finite ring map $R \rightarrow S^{\prime}$ such that in some sense the quasi-finite locus of $S / R$ is open in $\operatorname{Spec}\left(S^{\prime}\right)$ (but we will not prove this in the algebra chapter since we do not develop the language of schemes here for the case where $R \rightarrow S$ is quasi-finite see Lemma 10.122 .15 . These statements are somewhat tricky to prove and we do it by a long list of lemmas concerning integral and finite extensions of rings. This material may be found in Ray70, and Pes66. We also found notes by Thierry Coquand helpful.

00PQ Lemma 10.122.1. Let $\varphi: R \rightarrow S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi\left(a_{0}\right)+\varphi\left(a_{1}\right) t+\ldots+\varphi\left(a_{n}\right) t^{n}=0$. Then $\varphi\left(a_{n}\right) t$ is integral over $R$.
Proof. Namely, multiply the equation $\varphi\left(a_{0}\right)+\varphi\left(a_{1}\right) t+\ldots+\varphi\left(a_{n}\right) t^{n}=0$ with $\varphi\left(a_{n}\right)^{n-1}$ and write it as $\varphi\left(a_{0} a_{n}^{n-1}\right)+\varphi\left(a_{1} a_{n}^{n-2}\right)\left(\varphi\left(a_{n}\right) t\right)+\ldots+\left(\varphi\left(a_{n}\right) t\right)^{n}=0$.
The following lemma is in some sense the key lemma in this section.
00PT Lemma 10.122.2. Let $R$ be a ring. Let $\varphi: R[x] \rightarrow S$ be a ring map. Let $t \in S$. Assume that (a) $t$ is integral over $R[x]$, and (b) there exists a monic $p \in R[x]$ such that $t \varphi(p) \in \operatorname{Im}(\varphi)$. Then there exists a $q \in R[x]$ such that $t-\varphi(q)$ is integral over $R$.

Proof. Write $t \varphi(p)=\varphi(r)$ for some $r \in R[x]$. Using euclidean division, write $r=q p+r^{\prime}$ with $q, r^{\prime} \in R[x]$ and $\operatorname{deg}\left(r^{\prime}\right)<\operatorname{deg}(p)$. We may replace $t$ by $t-\varphi(q)$ which is still integral over $R[x]$, so that we obtain $t \varphi(p)=\varphi\left(r^{\prime}\right)$. In the ring $S_{t}$ we may write this as $\varphi(p)-(1 / t) \varphi\left(r^{\prime}\right)=0$. This implies that $\varphi(x)$ gives an element of the localization $S_{t}$ which is integral over $\varphi(R)[1 / t] \subset S_{t}$. On the other hand, $t$ is integral over the subring $\varphi(R)[\varphi(x)] \subset S$. Combined we conclude that $t$ is integral over the subring $\varphi(R)[1 / t] \subset S_{t}$, see Lemma 10.35.6. In other words there exists an equation of the form $t^{d}+\sum_{i<d}\left(\varphi\left(r_{i}\right) / t^{n_{i}}\right) t^{\imath}=0$ in $S_{t}$ with $r_{i} \in R$. This means that $t^{d+N}+\sum_{i<d} \varphi\left(r_{i}\right) t^{i+N-n_{i}}=0$ in $S$ for some $N$ large enough. In other words $t$ is integral over $R$.

00PU Lemma 10.122.3. Let $R$ be a ring and let $\varphi: R[x] \rightarrow S$ be a ring map. Let $t \in S$. If $t$ is integral over $R[x]$, then there exists an $\ell \geq 0$ such that for every $a \in R$ the element $\varphi(a)^{\ell} t$ is integral over $\varphi_{a}: R[y] \rightarrow S$, defined by $y \mapsto \varphi(a x)$ and $r \mapsto \varphi(r)$ for $r \in R$.
Proof. Say $t^{d}+\sum_{i<d} \varphi\left(f_{i}\right) t^{i}=0$ with $f_{i} \in R[x]$. Let $\ell$ be the maximum degree in $x$ of all the $f_{i}$. Multiply the equation by $\varphi(a)^{\ell}$ to get $\varphi(a)^{\ell} t^{d}+\sum_{i<d} \varphi\left(a^{\ell} f_{i}\right) t^{i}=0$. Note that each $\varphi\left(a^{\ell} f_{i}\right)$ is in the image of $\varphi_{a}$. The result follows from Lemma 10.122.1.

00PV Lemma 10.122.4. Let $R$ be a ring. Let $\varphi: R[x] \rightarrow S$ be a ring map. Let $t \in S$. Assume $t$ is integral over $R[x]$. Let $p \in R[x], p=a_{0}+a_{1} x+\ldots+a_{k} x^{k}$ such that $t \varphi(p) \in \operatorname{Im}(\varphi)$. Then there exists a $q \in R[x]$ and $n \geq 0$ such that $\varphi\left(a_{k}\right)^{n} t-\varphi(q)$ is integral over $R$.
Proof. By Lemma 10.122 .3 there exists an $\ell \geq 0$ such that the element $\varphi\left(a_{k}\right)^{\ell} t$ is integral over the map $\varphi^{\prime}: R[y] \rightarrow S, \varphi^{\prime}(y)=\varphi\left(a_{k} x\right)$ and $\varphi^{\prime}(r)=\varphi(r)$, for $r \in R$. The polynomial $p^{\prime}=a_{k}^{k-1} a_{0}+a_{k}^{k-2} a_{1} y+\ldots+y^{k}$ is monic and $t \varphi^{\prime}\left(p^{\prime}\right)=$ $\varphi\left(a_{k}^{k-1}\right) t \varphi(p) \in \operatorname{Im}(\varphi)$. By definition of $\varphi^{\prime}$ this implies there exists a $n \geq k-1$ such that $\varphi\left(a_{k}^{n}\right) t \varphi^{\prime}\left(p^{\prime}\right) \in \operatorname{Im}\left(\varphi^{\prime}\right)$. If also $n \geq \ell$, then $\varphi\left(a_{k}\right)^{n} t$ is still integral over $R[y]$. By Lemma 10.122 .2 we see that $\varphi\left(a_{k}\right)^{n} t-\varphi^{\prime}(q)$ is integral over $R$ for some $q \in R[y]$. Again by the simple relationship between $\varphi^{\prime}$ and $\varphi$ this implies the lemma.
00PW Situation 10.122.5. Let $R$ be a ring. Let $\varphi: R[x] \rightarrow S$ be finite. Let

$$
J=\{g \in S \mid g S \subset \operatorname{Im}(\varphi)\}
$$

be the "conductor ideal" of $\varphi$. Assume $\varphi(R) \subset S$ integrally closed in $S$.
00PX Lemma 10.122.6. In Situation 10.122.5. Suppose $u \in S, a_{0}, \ldots, a_{k} \in R, u \varphi\left(a_{0}+\right.$ $\left.a_{1} x+\ldots+a_{k} x^{k}\right) \in J$. Then there exists an $m \geq 0$ such that $u \varphi\left(a_{k}\right)^{m} \in J$.

Proof. Assume that $S$ is generated by $t_{1}, \ldots, t_{n}$ as an $R[x]$-module. In this case $J=\left\{g \in S \mid g t_{i} \in \operatorname{Im}(\varphi)\right.$ for all $\left.i\right\}$. Note that each element $u t_{i}$ is integral over $R[x]$, see Lemma 10.35 .3 . We have $\varphi\left(a_{0}+a_{1} x+\ldots+a_{k} x^{k}\right) u t_{i} \in \operatorname{Im}(\varphi)$. By Lemma 10.122 .4 , for each $i$ there exists an integer $n_{i}$ and an element $q_{i} \in R[x]$ such that $\varphi\left(a_{k}^{n_{i}}\right) u t_{i}-\varphi\left(q_{i}\right)$ is integral over $R$. By assumption this element is in $\varphi(R)$ and hence $\varphi\left(a_{k}^{n_{i}}\right) u t_{i} \in \operatorname{Im}(\varphi)$. It follows that $m=\max \left\{n_{1}, \ldots, n_{n}\right\}$ works.

00PY Lemma 10.122.7. In Situation 10.122.5. Suppose $u \in S, a_{0}, \ldots, a_{k} \in R$, $u \varphi\left(a_{0}+\right.$ $\left.a_{1} x+\ldots+a_{k} x^{k}\right) \in \sqrt{J}$. Then $u \varphi\left(a_{i}\right) \in \sqrt{J}$ for all $i$.
Proof. Under the assumptions of the lemma we have $u^{n} \varphi\left(a_{0}+a_{1} x+\ldots+a_{k} x^{k}\right)^{n} \in$ $J$ for some $n \geq 1$. By Lemma 10.122 .6 we deduce $u^{n} \varphi\left(a_{k}^{n m}\right) \in J$ for some $m \geq 1$. Thus $u \varphi\left(a_{k}\right) \in \sqrt{J}$, and so $u \varphi\left(a_{0}+a_{1} x+\ldots+a_{k} x^{k}\right)-u \varphi\left(a_{k}\right)=u \varphi\left(a_{0}+a_{1} x+\right.$ $\left.\ldots+a_{k-1} x^{k-1}\right) \in \sqrt{J}$. We win by induction on $k$.
This lemma suggests the following definition.
00PZ Definition 10.122.8. Given an inclusion of rings $R \subset S$ and an element $x \in S$ we say that $x$ is strongly transcendental over $R$ if whenever $u\left(a_{0}+a_{1} x+\ldots+a_{k} x^{k}\right)=0$ with $u \in S$ and $a_{i} \in R$, then we have $u a_{i}=0$ for all $i$.

Note that if $S$ is a domain then this is the same as saying that $x$ as an element of the fraction field of $S$ is transcendental over the fraction field of $R$.

00Q0 Lemma 10.122.9. Suppose $R \subset S$ is an inclusion of reduced rings and suppose that $x \in S$ is strongly transcendental over $R$. Let $\mathfrak{q} \subset S$ be a minimal prime and let $\mathfrak{p}=R \cap \mathfrak{q}$. Then the image of $x$ in $S / \mathfrak{q}$ is strongly transcendental over the subring $R / \mathfrak{p}$.
Proof. Suppose $u\left(a_{0}+a_{1} x+\ldots+a_{k} x^{k}\right) \in \mathfrak{q}$. By Lemma 10.24.1 the local ring $S_{\mathfrak{q}}$ is a field, and hence $u\left(a_{0}+a_{1} x+\ldots+a_{k} x^{k}\right)$ is zero in $S_{\mathfrak{q}}$. Thus $u u^{\prime}\left(a_{0}+a_{1} x+\right.$ $\left.\ldots+a_{k} x^{k}\right)=0$ for some $u^{\prime} \in S, u^{\prime} \notin \mathfrak{q}$. Since $x$ is strongly transcendental over $R$ we get $u u^{\prime} a_{i}=0$ for all $i$. This in turn implies that $u a_{i} \in \mathfrak{q}$.

00Q1 Lemma 10.122.10. Suppose $R \subset S$ is an inclusion of domains and let $x \in S$. Assume $x$ is (strongly) transcendental over $R$ and that $S$ is finite over $R[x]$. Then $R \rightarrow S$ is not quasi-finite at any prime of $S$.
Proof. As a first case, assume that $R$ is normal, see Definition 10.36.11. By Lemma 10.36 .14 we see that $R[x]$ is normal. Take a prime $\mathfrak{q} \subset S$, and set $\mathfrak{p}=R \cap \mathfrak{q}$. Assume that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite. This would be the case if $R \rightarrow S$ is quasifinite at $\mathfrak{q}$. Let $\mathfrak{r}=R[x] \cap \mathfrak{q}$. Then since $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}) \subset \kappa(\mathfrak{q})$ we see that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r})$ is finite too. Thus the inclusion $\mathfrak{r} \supset \mathfrak{p} R[x]$ is strict. By going down for $R[x] \subset S$, see Proposition 10.37.7, we find a prime $\mathfrak{q}^{\prime} \subset \mathfrak{q}$, lying over the prime $\mathfrak{p} R[x]$. Hence the fibre $\operatorname{Spec}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)$ contains a point not equal to $\mathfrak{q}$, namely $\mathfrak{q}^{\prime}$, whose closure contains $\mathfrak{q}$ and hence $\mathfrak{q}$ is not isolated in its fibre.
If $R$ is not normal, let $R \subset R^{\prime} \subset K$ be the integral closure $R^{\prime}$ of $R$ in its field of fractions $K$. Let $S \subset S^{\prime} \subset L$ be the subring $S^{\prime}$ of the field of fractions $L$ of $S$ generated by $R^{\prime}$ and $S$. Note that by construction the map $S \otimes_{R} R^{\prime} \rightarrow S^{\prime}$ is surjective. This implies that $R^{\prime}[x] \subset S^{\prime}$ is finite. Also, the map $S \subset S^{\prime}$ induces a surjection on Spec, see Lemma 10.35.15. We conclude by Lemma 10.121 .6 and the normal case we just discussed.

00Q2 Lemma 10.122.11. Suppose $R \subset S$ is an inclusion of reduced rings. Assume $x \in S$ be strongly transcendental over $R$, and $S$ finite over $R[x]$. Then $R \rightarrow S$ is not quasi-finite at any prime of $S$.

Proof. Let $\mathfrak{q} \subset S$ be any prime. Choose a minimal prime $\mathfrak{q}^{\prime} \subset \mathfrak{q}$. According to Lemmas 10.122 .9 and 10.122 .10 the extension $R /\left(R \cap \mathfrak{q}^{\prime}\right) \subset S / \mathfrak{q}^{\prime}$ is not quasi-finite at the prime corresponding to $\mathfrak{q}$. By Lemma 10.121 .6 the extension $R \rightarrow S$ is not quasi-finite at $\mathfrak{q}$.

00Q8 Lemma 10.122.12. Let $R$ be a ring. Let $S=R[x] / I$. Let $\mathfrak{q} \subset S$ be a prime. Assume $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$. Let $S^{\prime} \subset S$ be the integral closure of $R$ in $S$. Then there exists an element $g \in S^{\prime}, g \notin \mathfrak{q}$ such that $S_{g}^{\prime} \cong S_{g}$.

Proof. Let $\mathfrak{p}$ be the image of $\mathfrak{q}$ in $\operatorname{Spec}(R)$. The assumption that $R \rightarrow S$ is quasifinite at $\mathfrak{q}$ implies there exists an $f \in I, f=a_{n} x^{n}+\ldots+a_{0}$ such that some $a_{i} \notin \mathfrak{p}$. In particular there exists a relation $b_{m} x^{m}+\ldots+b_{0}=0$ with $b_{j} \in S^{\prime}, j=0, \ldots, m$ and $b_{j} \notin \mathfrak{q} \cap S^{\prime}$ for some $j$. We prove the lemma by induction on $m$.
The case $b_{m} \in \mathfrak{q}$. In this case we have $b_{m} x \in S^{\prime}$ by Lemma 10.122.1. Set $b_{m-1}^{\prime}=$ $b_{m} x+b_{m-1}$. Then

$$
b_{m-1}^{\prime} x^{m-1}+b_{m-2} x^{m-2}+\ldots+b_{0}=0
$$

Since $b_{m-1}^{\prime}$ is congruent to $b_{m-1}$ modulo $S^{\prime} \cap \mathfrak{q}$ we see that it is still the case that one of $b_{m-1}^{\prime}, b_{m-2}, \ldots, b_{0}$ is not in $S^{\prime} \cap \mathfrak{q}$. Thus we win by induction on $m$.
The case $b_{m} \notin \mathfrak{q}$. In this case $x$ is integral over $S_{b_{m}}^{\prime}$, in fact $b_{m} x \in S^{\prime}$ by Lemma 10.122.1. Hence the injective map $S_{b_{m}}^{\prime} \rightarrow S_{b_{m}}$ is also surjective, i.e., an isomorphism as desired.

00Q9 Theorem 10.122.13 (Zariski's Main Theorem). Let $R$ be a ring. Let $R \rightarrow S$ be a finite type $R$-algebra. Let $S^{\prime} \subset S$ be the integral closure of $R$ in $S$. Let $\mathfrak{q} \subset S$ be a prime of $S$. If $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$ then there exists a $g \in S^{\prime}, g \notin \mathfrak{q}$ such that $S_{g}^{\prime} \cong S_{g}$.
Proof. There exist finitely many elements $x_{1}, \ldots, x_{n} \in S$ such that $S$ is finite over the $R$-sub algebra generated by $x_{1}, \ldots, x_{n}$. (For example generators of $S$ over $R$.) We prove the proposition by induction on the minimal such number $n$.
The case $n=0$ is trivial, because in this case $S^{\prime}=S$, see Lemma 10.35.3.
The case $n=1$. We may and do replace $R$ by its integral closure in $S$, in particular this means that $R \subset S$. Consider the map $\varphi: R[x] \rightarrow S, x \mapsto x_{1}$. (We will see that $\varphi$ is not injective below.) By assumption $\varphi$ is finite. Hence we are in Situation 10.122 .5 . Let $J \subset S$ be the "conductor ideal" defined in Situation 10.122.5 Consider the diagram

According to Lemma 10.122 .7 the image of $x$ in the quotient $S / \sqrt{J}$ is strongly transcendental over $R /(R \cap \sqrt{J})$. Hence by Lemma 10.122.11 the ring map $R /(R \cap$ $\sqrt{J}) \rightarrow S / \sqrt{J}$ is not quasi-finite at any prime of $S / \sqrt{J}$. By Lemma 10.121 .6 we
deduce that $\mathfrak{q}$ does not lie in $V(J) \subset \operatorname{Spec}(S)$. Thus there exists an element $s \in J$, $s \notin \mathfrak{q}$. By definition of $J$ we may write $s=\varphi(f)$ for some polynomial $f \in R[x]$. Now let $I=\operatorname{Ker}(R[x] \rightarrow S)$. Since $\varphi(f) \in J$ we get $(R[x] / I)_{f} \cong S_{\varphi(f)}$. Also $s \notin \mathfrak{q}$ means that $f \notin \varphi^{-1}(\mathfrak{q})$. Thus $\varphi^{-1}(\mathfrak{q})$ is a prime of $R[x] / I$ at which $R \rightarrow R[x] / I$ is quasifinite, see Lemma 10.121.5. Let $C \subset R[x] / I$ be the integral closure of $R$. By Lemma 10.122 .12 there exists an element $h \in C, h \notin \varphi^{-1}(\mathfrak{q})$ such that $C_{h} \cong(R[x] / I)_{h}$. We conclude that $(R[x] / I)_{f h}=S_{\varphi(f h)}$ is isomorphic to a principal localization $C_{h^{\prime}}$ of $C$ for some $h^{\prime} \in C, h^{\prime} \notin \varphi^{-1}(\mathfrak{q})$. Since $\varphi(C) \subset S^{\prime}$ we get $g=\varphi\left(h^{\prime}\right) \in S^{\prime}, g \notin \mathfrak{q}$ and moreover the injective map $S_{g}^{\prime} \rightarrow S_{g}$ is also surjective because by our choice of $h^{\prime}$ the map $C_{h^{\prime}} \rightarrow S_{g}$ is surjective.

The case $n>1$. Consider the subring $R^{\prime} \subset S$ which is the integral closure of $R\left[x_{1}, \ldots, x_{n-1}\right]$ in $S$. By Lemma 10.121 .6 the extension $S / R^{\prime}$ is quasi-finite at $\mathfrak{q}$. Also, note that $S$ is finite over $R^{\prime}\left[x_{n}\right]$. By the case $n=1$ above, there exists a $g^{\prime} \in R^{\prime}, g^{\prime} \notin \mathfrak{q}$ such that $\left(R^{\prime}\right)_{g^{\prime}} \cong S_{g^{\prime}}$. At this point we cannot apply induction to $R \rightarrow R^{\prime}$ since $R^{\prime}$ may not be finite type over $R$. Since $S$ is finitely generated over $R$ we deduce in particular that $\left(R^{\prime}\right)_{g^{\prime}}$ is finitely generated over $R$. Say the elements $g^{\prime}$, and $y_{1} /\left(g^{\prime}\right)^{n_{1}}, \ldots, y_{N} /\left(g^{\prime}\right)^{n_{N}}$ with $y_{i} \in R^{\prime}$ generate $\left(R^{\prime}\right)_{g^{\prime}}$ over $R$. Let $R^{\prime \prime}$ be the $R$-sub algebra of $R^{\prime}$ generated by $x_{1}, \ldots, x_{n-1}, y_{1}, \ldots, y_{N}, g^{\prime}$. This has the property $\left(R^{\prime \prime}\right)_{g^{\prime}} \cong S_{g^{\prime}}$. Surjectivity because of how we chose $y_{i}$, injectivity because $R^{\prime \prime} \subset R^{\prime}$, and localization is exact. Note that $R^{\prime \prime}$ is finite over $R\left[x_{1}, \ldots, x_{n-1}\right]$ because of our choice of $R^{\prime}$, see Lemma 10.35.4. Let $\mathfrak{q}^{\prime \prime}=R^{\prime \prime} \cap \mathfrak{q}$. Since $\left(R^{\prime \prime}\right)_{\mathfrak{q}^{\prime \prime}}=S_{\mathfrak{q}}$ we see that $R \rightarrow R^{\prime \prime}$ is quasi-finite at $\mathfrak{q}^{\prime \prime}$, see Lemma 10.121 .2 . We apply our induction hypothesis to $R \rightarrow R^{\prime \prime}, \mathfrak{q}^{\prime \prime}$ and $x_{1}, \ldots, x_{n-1} \in R^{\prime \prime}$ and we find a subring $R^{\prime \prime \prime} \subset R^{\prime \prime}$ which is integral over $R$ and an element $g^{\prime \prime} \in R^{\prime \prime \prime}, g^{\prime \prime} \notin \mathfrak{q}^{\prime \prime}$ such that $\left(R^{\prime \prime \prime}\right)_{g^{\prime \prime}} \cong\left(R^{\prime \prime}\right)_{g^{\prime \prime}}$. Write the image of $g^{\prime}$ in $\left(R^{\prime \prime}\right)_{g^{\prime \prime}}$ as $g^{\prime \prime \prime} /\left(g^{\prime \prime}\right)^{n}$ for some $g^{\prime \prime \prime} \in R^{\prime \prime \prime}$. Set $g=g^{\prime \prime} g^{\prime \prime \prime} \in R^{\prime \prime \prime}$. Then it is clear that $g \notin \mathfrak{q}$ and $\left(R^{\prime \prime \prime}\right)_{g} \cong S_{g}$. Since by construction we have $R^{\prime \prime \prime} \subset S^{\prime}$ we also have $S_{g}^{\prime} \cong S_{g}$ as desired.

00QA Lemma 10.122.14. Let $R \rightarrow S$ be a finite type ring map. The set of points $\mathfrak{q}$ of $\operatorname{Spec}(S)$ at which $S / R$ is quasi-finite is open in $\operatorname{Spec}(S)$.

Proof. Let $\mathfrak{q} \subset S$ be a point at which the ring map is quasi-finite. By Theorem 10.122 .13 there exists an integral ring extension $R \rightarrow S^{\prime}, S^{\prime} \subset S$ and an element $g \in S^{\prime}, g \notin \mathfrak{q}$ such that $S_{g}^{\prime} \cong S_{g}$. Since $S$ and hence $S_{g}$ are of finite type over $R$ we may find finitely many elements $y_{1}, \ldots, y_{N}$ of $S^{\prime}$ such that $S_{g}^{\prime \prime} \cong S$ where $S^{\prime \prime} \subset S^{\prime}$ is the sub $R$-algebra generated by $g, y_{1}, \ldots, y_{N}$. Since $S^{\prime \prime}$ is finite over $R$ (see Lemma 10.35.4) we see that $S^{\prime \prime}$ is quasi-finite over $R$ (see Lemma 10.121.4). It is easy to see that this implies that $S_{g}^{\prime \prime}$ is quasi-finite over $R$, for example because the property of being quasi-finite at a prime depends only on the local ring at the prime. Thus we see that $S_{g}$ is quasi-finite over $R$. By the same token this implies that $R \rightarrow S$ is quasi-finite at every prime of $S$ which lies in $D(g)$.

00QB Lemma 10.122.15. Let $R \rightarrow S$ be a finite type ring map. Suppose that $S$ is quasi-finite over $R$. Let $S^{\prime} \subset S$ be the integral closure of $R$ in $S$. Then
(1) $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}\left(S^{\prime}\right)$ is a homeomorphism onto an open subset,
(2) if $g \in S^{\prime}$ and $D(g)$ is contained in the image of the map, then $S_{g}^{\prime} \cong S_{g}$, and
(3) there exists a finite $R$-algebra $S^{\prime \prime} \subset S^{\prime}$ such that (1) and (2) hold for the ring map $S^{\prime \prime} \rightarrow S$.

Proof. Because $S / R$ is quasi-finite we may apply Theorem 10.122 .13 to each point $\mathfrak{q}$ of $\operatorname{Spec}(S)$. Since $\operatorname{Spec}(S)$ is quasi-compact, see Lemma 10.16.10, we may choose a finite number of $g_{i} \in S^{\prime}, i=1, \ldots, n$ such that $S_{g_{i}}^{\prime}=S_{g_{i}}$, and such that $g_{1}, \ldots, g_{n}$ generate the unit ideal in $S$ (in other words the standard opens of $\operatorname{Spec}(S)$ associated to $g_{1}, \ldots, g_{n}$ cover all of $\left.\operatorname{Spec}(S)\right)$.
Suppose that $D(g) \subset \operatorname{Spec}\left(S^{\prime}\right)$ is contained in the image. Then $D(g) \subset \bigcup D\left(g_{i}\right)$. In other words, $g_{1}, \ldots, g_{n}$ generate the unit ideal of $S_{g}^{\prime}$. Note that $S_{g g_{i}}^{\prime} \cong S_{g g_{i}}$ by our choice of $g_{i}$. Hence $S_{g}^{\prime} \cong S_{g}$ by Lemma 10.23 .2 .
We construct a finite algebra $S^{\prime \prime} \subset S^{\prime}$ as in (3). To do this note that each $S_{g_{i}}^{\prime} \cong S_{g_{i}}$ is a finite type $R$-algebra. For each $i$ pick some elements $y_{i j} \in S^{\prime}$ such that each $S_{g_{i}}^{\prime}$ is generated as $R$-algebra by $1 / g_{i}$ and the elements $y_{i j}$. Then set $S^{\prime \prime}$ equal to the sub $R$-algebra of $S^{\prime}$ generated by all $g_{i}$ and all the $y_{i j}$. Details omitted.

### 10.123. Applications of Zariski's Main Theorem

03GB Here is an immediate application characterizing the finite maps of 1-dimensional semi-local rings among the quasi-finite ones as those where equality always holds in the formula of Lemma 10.120 .8 .
02MM Lemma 10.123.1. Let $A \subset B$ be an extension of domains. Assume
(1) $A$ is a local Noetherian ring of dimension 1,
(2) $A \rightarrow B$ is of finite type, and
(3) the extension $K=f . f .(A) \subset L=f . f .(B)$ is a finite field extension.

Then $B$ is semi-local. Let $x \in \mathfrak{m}_{A}, x \neq 0$. Let $\mathfrak{m}_{i}, i=1, \ldots, n$ be the maximal ideals of $B$. Then

$$
[L: K] \operatorname{ord}_{A}(x) \geq \sum_{i}\left[\kappa\left(\mathfrak{m}_{i}\right): \kappa\left(\mathfrak{m}_{A}\right)\right] \operatorname{ord}_{B_{\mathfrak{m}_{i}}}(x)
$$

where ord is defined as in Definition 10.120.2. We have equality if and only if $A \rightarrow B$ is finite.

Proof. The ring $B$ is semi-local by Lemma 10.112.2. Let $B^{\prime}$ be the integral closure of $A$ in $B$. By Lemma 10.122 .15 we can find a finite $A$-subalgebra $C \subset B^{\prime}$ such that on setting $\mathfrak{n}_{i}=C \cap \mathfrak{m}_{i}$ we have $C_{\mathfrak{n}_{i}} \cong B_{\mathfrak{m}_{i}}$ and the primes $\mathfrak{n}_{1}, \ldots, \mathfrak{n}_{n}$ are pairwise distinct. The ring $C$ is semi-local by Lemma 10.112 .2 Let $\mathfrak{p}_{j}, j=1, \ldots, m$ be the other maximal ideals of $C$ (the "missing points"). By Lemma 10.120 .8 we have

$$
\operatorname{ord}_{A}\left(x^{[L: K]}\right)=\sum_{i}\left[\kappa\left(\mathfrak{n}_{i}\right): \kappa\left(\mathfrak{m}_{A}\right)\right] \operatorname{ord}_{C_{\mathfrak{n}_{i}}}(x)+\sum_{j}\left[\kappa\left(\mathfrak{p}_{j}\right): \kappa\left(\mathfrak{m}_{A}\right)\right] \operatorname{ord}_{C_{\mathfrak{p}_{j}}}(x)
$$

hence the inequality follows. In case of equality we conclude that $m=0$ (no "missing points"). Hence $C \subset B$ is an inclusion of semi-local rings inducing a bijection on maximal ideals and an isomorphism on all localizations at maximal ideals. So if $b \in B$, then $I=\{x \in C \mid x b \in C\}$ is an ideal of $C$ which is not contained in any of the maximal ideals of $C$, and hence $I=C$, hence $b \in C$. Thus $B=C$ and $B$ is finite over $A$.

Here is a more standard application of Zariski's main theorem to the structure of local homomorphisms of local rings.

052V Lemma 10.123.2. Let $\left(R, \mathfrak{m}_{R}\right) \rightarrow\left(S, \mathfrak{m}_{S}\right)$ be a local homomorphism of local rings. Assume
(1) $R \rightarrow S$ is essentially of finite type,
(2) $\kappa\left(\mathfrak{m}_{R}\right) \subset \kappa\left(\mathfrak{m}_{S}\right)$ is finite, and
(3) $\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)=0$.

Then $S$ is the localization of a finite $R$-algebra.
Proof. Let $S^{\prime}$ be a finite type $R$-algebra such that $S=S_{\mathfrak{q}^{\prime}}^{\prime}$ for some prime $\mathfrak{q}^{\prime}$ of $S^{\prime}$. By Definition 10.121 .3 we see that $R \rightarrow S^{\prime}$ is quasi-finite at $\mathfrak{q}^{\prime}$. After replacing $S^{\prime}$ by $S_{g^{\prime}}^{\prime}$ for some $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ we may assume that $R \rightarrow S^{\prime}$ is quasi-finite, see Lemma 10.122 .14 . Then by Lemma 10.122 .15 there exists a finite $R$-algebra $S^{\prime \prime}$ and elements $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ and $g^{\prime \prime} \in S^{\prime \prime}$ such that $S_{g^{\prime}}^{\prime} \cong S_{g^{\prime \prime}}^{\prime \prime}$ as $R$-algebras. This proves the lemma.

07 NC Lemma 10.123.3. Let $R \rightarrow S$ be a ring map, $\mathfrak{q}$ a prime of $S$ lying over $\mathfrak{p}$ in $R$. If
(1) $R$ is Noetherian,
(2) $R \rightarrow S$ is of finite type, and
(3) $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$,
then $R_{\mathfrak{p}}^{\wedge} \otimes_{R} S=S_{\mathfrak{q}}^{\wedge} \times B$ for some $R_{\mathfrak{p}}^{\wedge}$-algebra $B$.
Proof. There exists a finite $R$-algebra $S^{\prime} \subset S$ and an element $g \in S^{\prime}, g \notin \mathfrak{q}^{\prime}=S^{\prime} \cap \mathfrak{q}$ such that $S_{g}^{\prime}=S_{g}$ and in particular $S_{\mathfrak{q}^{\prime}}^{\prime}=S_{\mathfrak{q}}$, see Lemma 10.122.15. We have

$$
R_{\mathfrak{p}}^{\wedge} \otimes_{R} S^{\prime}=\left(S_{\mathfrak{q}^{\prime}}^{\prime}\right)^{\wedge} \times B^{\prime}
$$

by Lemma 10.96.8. Note that we have a commutative diagram

where the right vertical is an isomorphism and the lower horizontal arrow is the projection map of the product decomposition above. The lemma follows.

### 10.124. Dimension of fibres

00QC We study the behaviour of dimensions of fibres, using Zariski's main theorem. Recall that we defined the dimension $\operatorname{dim}_{x}(X)$ of a topological space $X$ at a point $x$ in Topology, Definition 5.9.1.

00QD Definition 10.124.1. Suppose that $R \rightarrow S$ is of finite type, and let $\mathfrak{q} \subset S$ be a prime lying over a prime $\mathfrak{p}$ of $R$. We define the relative dimension of $S / R$ at $\mathfrak{q}$, denoted $\operatorname{dim}_{\mathfrak{q}}(S / R)$, to be the dimension of $\operatorname{Spec}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)$ at the point corresponding to $\mathfrak{q}$. We let $\operatorname{dim}(S / R)$ be the supremum of $\operatorname{dim}_{\mathfrak{q}}(S / R)$ over all $\mathfrak{q}$. This is called the relative dimension of $S / R$.

In particular, $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$ if and only if $\operatorname{dim}_{\mathfrak{q}}(S / R)=0$. The following lemma is more or less a reformulation of Zariski's Main Theorem.

00QE Lemma 10.124.2. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime. Suppose that $\operatorname{dim}_{\mathfrak{q}}(S / R)=n$. There exists a $g \in S, g \notin \mathfrak{q}$ such that $S_{g}$ is quasifinite over a polynomial algebra $R\left[t_{1}, \ldots, t_{n}\right]$.

Proof. The ring $\bar{S}=S \otimes_{R} \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$. Let $\overline{\mathfrak{q}}$ be the prime of $\bar{S}$ corresponding to $\mathfrak{q}$. By definition of the dimension of a topological space at a point there exists an open $U \subset \operatorname{Spec}(\bar{S})$ with $\bar{q} \in U$ and $\operatorname{dim}(U)=n$. Since the topology on $\operatorname{Spec}(\bar{S})$ is induced from the topology on $\operatorname{Spec}(S)$ (see Remark 10.16.8), we can find a $g \in S, g \notin \mathfrak{q}$ with image $\bar{g} \in \bar{S}$ such that $D(\bar{g}) \subset U$. Thus after replacing $S$ by $S_{g}$ we see that $\operatorname{dim}(\bar{S})=n$.
Next, choose generators $x_{1}, \ldots, x_{N}$ for $S$ as an $R$-algebra. By Lemma 10.114.4 there exist elements $y_{1}, \ldots, y_{n}$ in the $\mathbf{Z}$-subalgebra of $S$ generated by $x_{1}, \ldots, x_{N}$ such that the map $R\left[t_{1}, \ldots, t_{n}\right] \rightarrow S, t_{i} \mapsto y_{i}$ has the property that $\kappa(\mathfrak{p})\left[t_{1} \ldots, t_{n}\right] \rightarrow \bar{S}$ is finite. In particular, $S$ is quasi-finite over $R\left[t_{1}, \ldots, t_{n}\right]$ at $\mathfrak{q}$. Hence, by Lemma 10.122 .14 we may replace $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ such that $R\left[t_{1}, \ldots, t_{n}\right] \rightarrow S$ is quasi-finite.

0520 Lemma 10.124.3. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of $R$. Assume
(1) $R \rightarrow S$ is of finite type,
(2) $\operatorname{dim}_{\mathfrak{q}}(S / R)=n$, and
(3) $\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})=r$.

Then there exist $f \in R, f \notin \mathfrak{p}, g \in S, g \notin \mathfrak{q}$ and a quasi-finite ring map

$$
\varphi: R_{f}\left[x_{1}, \ldots, x_{n}\right] \longrightarrow S_{g}
$$

such that $\varphi^{-1}\left(\mathfrak{q} S_{g}\right)=\left(\mathfrak{p}, x_{r+1}, \ldots, x_{n}\right) R_{f}\left[x_{r+1}, \ldots, x_{n}\right]$
Proof. After replacing $S$ by a principal localization we may assume there exists a quasi-finite ring map $\varphi: R\left[t_{1}, \ldots, t_{n}\right] \rightarrow S$, see Lemma 10.124.2. Set $\mathfrak{q}^{\prime}=\varphi^{-1}(\mathfrak{q})$. Let $\overline{\mathfrak{q}}^{\prime} \subset \kappa(\mathfrak{p})\left[t_{1}, \ldots, t_{n}\right]$ be the prime corresponding to $\mathfrak{q}^{\prime}$. By Lemma 10.114.6 there exists a finite ring map $\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right] \rightarrow \kappa(\mathfrak{p})\left[t_{1}, \ldots, t_{n}\right]$ such that the inverse image of $\overline{\mathfrak{q}}^{\prime}$ is $\left(x_{r+1}, \ldots, x_{n}\right)$. Let $\bar{h}_{i} \in \kappa(\mathfrak{p})\left[t_{1}, \ldots, t_{n}\right]$ be the image of $x_{i}$. We can find an element $f \in R, f \notin \mathfrak{p}$ and $h_{i} \in R_{f}\left[t_{1}, \ldots, t_{n}\right]$ which map to $\bar{h}_{i}$ in $\kappa(\mathfrak{p})\left[t_{1}, \ldots, t_{n}\right]$. Then the ring map

$$
R_{f}\left[x_{1}, \ldots, x_{n}\right] \longrightarrow R_{f}\left[t_{1}, \ldots, t_{n}\right]
$$

becomes finite after tensoring with $\kappa(\mathfrak{p})$. In particular, $R_{f}\left[t_{1}, \ldots, t_{n}\right]$ is quasifinite over $R_{f}\left[x_{1}, \ldots, x_{n}\right]$ at the prime $\mathfrak{q}^{\prime} R_{f}\left[t_{1}, \ldots, t_{n}\right]$. Hence, by Lemma 10.122.14 there exists a $g \in R_{f}\left[t_{1}, \ldots, t_{n}\right], g \notin \mathfrak{q}^{\prime} R_{f}\left[t_{1}, \ldots, t_{n}\right]$ such that $R_{f}\left[x_{1}, \ldots, x_{n}\right] \rightarrow$ $R_{f}\left[t_{1}, \ldots, t_{n}, 1 / g\right]$ is quasi-finite. Thus we see that the composition

$$
R_{f}\left[x_{1}, \ldots, x_{n}\right] \longrightarrow R_{f}\left[t_{1}, \ldots, t_{n}, 1 / g\right] \longrightarrow S_{\varphi(g)}
$$

is quasi-finite and we win.
00QF Lemma 10.124.4. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. If $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$, then $\operatorname{dim}\left(S_{\mathfrak{q}}\right) \leq \operatorname{dim}\left(R_{\mathfrak{p}}\right)$.
Proof. If $R_{\mathfrak{p}}$ is Noetherian (and hence $S_{\mathfrak{q}}$ Noetherian since it is essentially of finite type over $R_{\mathfrak{p}}$ ) then this follows immediately from Lemma 10.111 .6 and the definitions. In the general case we can use Zariski's Main Theorem 10.122.13 to write $S_{\mathfrak{q}}=S_{\mathfrak{q}^{\prime}}^{\prime}$ for some ring $S^{\prime}$ integral over $R_{\mathfrak{p}}$. Thus the result follows from Lemma 10.111 .3

00QG Lemma 10.124.5. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Suppose there is a quasi-finite $k$-algebra map $k\left[t_{1}, \ldots, t_{n}\right] \subset S$. Then $\operatorname{dim}(S) \leq n$.

Proof. By Lemma 10.113 .1 the dimension of any local ring of $k\left[t_{1}, \ldots, t_{n}\right]$ is at most $n$. Thus the result follows from Lemma 10.124.4

00QH Lemma 10.124.6. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime. Suppose that $\operatorname{dim}_{\mathfrak{q}}(S / R)=n$. There exists an open neighbourhood $V$ of $\mathfrak{q}$ in $\operatorname{Spec}(S)$ such that $\operatorname{dim}_{\mathfrak{q}^{\prime}}(S / R) \leq n$ for all $\mathfrak{q}^{\prime} \in V$.
Proof. By Lemma 10.124 .2 we see that we may assume that $S$ is quasi-finite over a polynomial algebra $R\left[t_{1}, \ldots, t_{n}\right]$. Considering the fibres, we reduce to Lemma 10.124.5.

In other words, the lemma says that the set of points where the fibre has dimension $\leq n$ is open in $\operatorname{Spec}(S)$. The next lemma says that formation of this open commutes with base change. If the ring map is of finite presentation then this set is quasicompact open (see below).
00QI Lemma 10.124.7. Let $R \rightarrow S$ be a finite type ring map. Let $R \rightarrow R^{\prime}$ be any ring map. Set $S^{\prime}=R^{\prime} \otimes_{R} S$ and denote $f: \operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$ the associated map on spectra. Let $n \geq 0$. The inverse image $f^{-1}\left(\left\{\mathfrak{q} \in \operatorname{Spec}(S) \mid \operatorname{dim}_{\mathfrak{q}}(S / R) \leq n\right\}\right)$ is equal to $\left\{\mathfrak{q}^{\prime} \in \operatorname{Spec}\left(S^{\prime}\right) \mid \operatorname{dim}_{\mathfrak{q}^{\prime}}\left(S^{\prime} / R^{\prime}\right) \leq n\right\}$.

Proof. The condition is formulated in terms of dimensions of fibre rings which are of finite type over a field. Combined with Lemma 10.115 .6 this yields the lemma.

00QJ Lemma 10.124.8. Let $R \rightarrow S$ be a ring homomorphism of finite presentation. Let $n \geq 0$. The set

$$
V_{n}=\left\{\mathfrak{q} \in \operatorname{Spec}(S) \mid \operatorname{dim}_{\mathfrak{q}}(S / R) \leq n\right\}
$$

is a quasi-compact open subset of $\operatorname{Spec}(S)$.
Proof. It is open by Lemma 10.124.6. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ be a presentation of $S$. Let $R_{0}$ be the Z-subalgebra of $R$ generated by the coefficients of the polynomials $f_{i}$. Let $S_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Then $S=R \otimes_{R_{0}} S_{0}$. By Lemma 10.124.7 $V_{n}$ is the inverse image of an open $V_{0, n}$ under the quasi-compact continuous map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}\left(S_{0}\right)$. Since $S_{0}$ is Noetherian we see that $V_{0, n}$ is quasi-compact.
00QK Lemma 10.124.9. Let $R$ be a valuation ring with residue field $k$ and field of fractions $K$. Let $S$ be a domain containing $R$ such that $S$ is of finite type over $R$. If $S \otimes_{R} k$ is not the zero ring then

$$
\operatorname{dim}\left(S \otimes_{R} k\right)=\operatorname{dim}\left(S \otimes_{R} K\right)
$$

In fact, $\operatorname{Spec}\left(S \otimes_{R} k\right)$ is equidimensional.
Proof. It suffices to show that $\operatorname{dim}_{\mathfrak{q}}(S / k)$ is equal to $\operatorname{dim}\left(S \otimes_{R} K\right)$ for every prime $\mathfrak{q}$ of $S$ containing $\mathfrak{m}_{R} S$. Pick such a prime. By Lemma 10.124 .6 the inequality $\operatorname{dim}_{\mathfrak{q}}(S / k) \geq \operatorname{dim}\left(S \otimes_{R} K\right)$ holds. Set $n=\operatorname{dim}_{\mathfrak{q}}(S / k)$. By Lemma 10.124 .2 after replacing $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ there exists a quasi-finite ring map $R\left[t_{1}, \ldots, t_{n}\right] \rightarrow S$. If $\operatorname{dim}\left(S \otimes_{R} K\right)<n$, then $K\left[t_{1}, \ldots, t_{n}\right] \rightarrow S \otimes_{R} K$ has a nonzero kernel. Say $f=\sum a_{I} t_{1}^{i_{1}} \ldots t_{n}^{i_{n}}$. After dividing $f$ by a nonzero coefficient of $f$ with minimal valuation, we may assume $f \in R\left[t_{1}, \ldots, t_{n}\right]$ and some $a_{I}$ does not map to zero in $k$. Hence the ring map $k\left[t_{1}, \ldots, t_{n}\right] \rightarrow S \otimes_{R} k$ has a nonzero kernel which implies that $\operatorname{dim}\left(S \otimes_{R} k\right)<n$. Contradiction.

### 10.125. Algebras and modules of finite presentation

05N4 In this section we discuss some standard results where the key feature is that the assumption involves a finite type or finite presentation assumption.

00QP Lemma 10.125.1. Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. Set $S^{\prime}=R^{\prime} \otimes_{R} S$. Then $R \rightarrow S$ is of finite type if and only if $R^{\prime} \rightarrow S^{\prime}$ is of finite type.
Proof. It is clear that if $R \rightarrow S$ is of finite type then $R^{\prime} \rightarrow S^{\prime}$ is of finite type. Assume that $R^{\prime} \rightarrow S^{\prime}$ is of finite type. Say $y_{1}, \ldots, y_{m}$ generate $S^{\prime}$ over $R^{\prime}$. Write $y_{j}=\sum_{i} a_{i j} \otimes x_{j i}$ for some $a_{i j} \in R^{\prime}$ and $x_{j i} \in S$. Let $A \subset S$ be the $R$-subalgebra generated by the $x_{i j}$. By flatness we have $A^{\prime}:=R^{\prime} \otimes_{R} A \subset S^{\prime}$, and by construction $y_{j} \in A^{\prime}$. Hence $A^{\prime}=S^{\prime}$. By faithful flatness $A=S$.

00QQ Lemma 10.125.2. Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. Set $S^{\prime}=R^{\prime} \otimes_{R} S$. Then $R \rightarrow S$ is of finite presentation if and only if $R^{\prime} \rightarrow S^{\prime}$ is of finite presentation.

Proof. It is clear that if $R \rightarrow S$ is of finite presentation then $R^{\prime} \rightarrow S^{\prime}$ is of finite presentation. Assume that $R^{\prime} \rightarrow S^{\prime}$ is of finite presentation. By Lemma 10.125.1 we see that $R \rightarrow S$ is of finite type. Write $S=R\left[x_{1}, \ldots, x_{n}\right] / I$. By flatness $S^{\prime}=R^{\prime}\left[x_{1}, \ldots, x_{n}\right] / R^{\prime} \otimes I$. Say $g_{1}, \ldots, g_{m}$ generate $R^{\prime} \otimes I$ over $R^{\prime}\left[x_{1}, \ldots, x_{n}\right]$. Write $g_{j}=\sum_{i} a_{i j} \otimes f_{j i}$ for some $a_{i j} \in R^{\prime}$ and $f_{j i} \in I$. Let $J \subset I$ be the ideal generated by the $f_{i j}$. By flatness we have $R^{\prime} \otimes_{R} J \subset R^{\prime} \otimes_{R} I$, and both are ideals over $R^{\prime}\left[x_{1}, \ldots, x_{n}\right]$. By construction $g_{j} \in R^{\prime} \otimes_{R} J$. Hence $R^{\prime} \otimes_{R} J=R^{\prime} \otimes_{R} I$. By faithful flatness $J=I$.

05N5 Lemma 10.125.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $S \subset R$ be a multiplicative subset. Set $R^{\prime}=S^{-1}(R / I)=S^{-1} R / S^{-1} I$.
(1) For any finite $R^{\prime}$-module $M^{\prime}$ there exists a finite $R$-module $M$ such that $S^{-1}(M / I M) \cong M^{\prime}$.
(2) For any finitely presented $R^{\prime}$-module $M^{\prime}$ there exists a finitely presented $R$-module $M$ such that $S^{-1}(M / I M) \cong M^{\prime}$.
Proof. Proof of (1). Choose a short exact sequence $0 \rightarrow K^{\prime} \rightarrow\left(R^{\prime}\right)^{\oplus n} \rightarrow M^{\prime} \rightarrow 0$. Let $K \subset R^{\oplus n}$ be the inverse image of $K^{\prime}$ under the map $R^{\oplus n} \rightarrow\left(R^{\prime}\right)^{\oplus n}$. Then $M=R^{\oplus n} / K$ works.
Proof of (2). Choose a presentation $\left(R^{\prime}\right)^{\oplus m} \rightarrow\left(R^{\prime}\right)^{\oplus n} \rightarrow M^{\prime} \rightarrow 0$. Suppose that the first map is given by the matrix $A^{\prime}=\left(a_{i j}^{\prime}\right)$ and the second map is determined by generators $x_{i}^{\prime} \in M^{\prime}, i=1, \ldots, n$. As $R^{\prime}=S^{-1}(R / I)$ we can choose $s \in S$ and a matrix $A=\left(a_{i j}\right)$ with coefficients in $R$ such that $a_{i j}^{\prime}=a_{i j} / s \bmod S^{-1} I$. Let $M$ be the finitely presented $R$-module with presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$ where the first map is given by the matrix $A$ and the second map is determined by generators $x_{i} \in M, i=1, \ldots, n$. Then the map $M \rightarrow M^{\prime}, x_{i} \mapsto x_{i}^{\prime}$ induces an isomorphism $S^{-1}(M / I M) \cong M^{\prime}$.

05N6 Lemma 10.125.4. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset. Let $M$ be an $R$-module.
(1) If $S^{-1} M$ is a finite $S^{-1} R$-module then there exists a finite $R$-module $M^{\prime}$ and a map $M^{\prime} \rightarrow M$ which induces an isomorphism $S^{-1} M^{\prime} \rightarrow S^{-1} M$.
(2) If $S^{-1} M$ is a finitely presented $S^{-1} R$-module then there exists an $R$ module $M^{\prime}$ of finite presentation and a map $M^{\prime} \rightarrow M$ which induces an isomorphism $S^{-1} M^{\prime} \rightarrow S^{-1} M$.

Proof. Proof of (1). Let $x_{1}, \ldots, x_{n} \in M$ be elements which generate $S^{-1} M$ as an $S^{-1} R$-module. Let $M^{\prime}$ be the $R$-submodule of $M$ generated by $x_{1}, \ldots, x_{n}$.
Proof of (2). Let $x_{1}, \ldots, x_{n} \in M$ be elements which generate $S^{-1} M$ as an $S^{-1} R$ module. Let $K=\operatorname{Ker}\left(R^{\oplus n} \rightarrow M\right)$ where the map is given by the rule $\left(a_{1}, \ldots, a_{n}\right) \mapsto$ $\sum a_{i} x_{i}$. By Lemma 10.5 .3 we see that $S^{-1} K$ is a finite $S^{-1} R$-module. By (1) we can find a finite submodule $K^{\prime} \subset K$ with $S^{-1} K^{\prime}=S^{-1} K$. Take $M^{\prime}=\operatorname{Coker}\left(K^{\prime} \rightarrow\right.$ $\left.R^{\oplus n}\right)$.

05GJ Lemma 10.125.5. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $M$ be an $R$-module.
(1) If $M_{\mathfrak{p}}$ is a finite $R_{\mathfrak{p}}$-module then there exists a finite $R$-module $M^{\prime}$ and a map $M^{\prime} \rightarrow M$ which induces an isomorphism $M_{\mathfrak{p}}^{\prime} \rightarrow M_{\mathfrak{p}}$.
(2) If $M_{\mathfrak{p}}$ is a finitely presented $R_{\mathfrak{p}}$-module then there exists an $R$-module $M^{\prime}$ of finite presentation and a map $M^{\prime} \rightarrow M$ which induces an isomorphism $M_{\mathfrak{p}}^{\prime} \rightarrow M_{\mathfrak{p}}$.
Proof. This is a special case of Lemma 10.125 .4
00QR Lemma 10.125.6. Let $\varphi: R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Assume
(1) $S$ is of finite presentation over $R$,
(2) $\varphi$ induces an isomorphism $R_{\mathfrak{p}} \cong S_{\mathfrak{q}}$.

Then there exist $f \in R, f \notin \mathfrak{p}$ and an $R_{f}$-algebra $C$ such that $S_{f} \cong R_{f} \times C$ as $R_{f}$-algebras.
Proof. Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. Let $a_{i} \in R_{\mathfrak{p}}$ be an element mapping to the image of $x_{i}$ in $S_{\mathfrak{q}}$. Write $a_{i}=b_{i} / f$ for some $f \in R, f \notin \mathfrak{p}$. After replacing $R$ by $R_{f}$ and $x_{i}$ by $x_{i}-a_{i}$ we may assume that $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$ such that $x_{i}$ maps to zero in $S_{\mathfrak{q}}$. Then if $c_{j}$ denotes the constant term of $g_{i}$ we conclude that $c_{i}$ maps to zero in $R_{\mathfrak{p}}$. After another replacement of $R$ we may assume that the constant coefficients $c_{j}$ of the $g_{j}$ are zero. Thus we obtain an $R$-algebra map $S \rightarrow R, x_{i} \mapsto 0$ whose kernel is the ideal $\left(x_{1}, \ldots, x_{n}\right)$.
Note that $\mathfrak{q}=\mathfrak{p} S+\left(x_{1}, \ldots, x_{n}\right)$. Write $g_{j}=\sum a_{j i} x_{i}+$ h.o.t. $\quad$ Since $S_{\mathfrak{q}}=R_{\mathfrak{p}}$ we have $\mathfrak{p} \otimes \kappa(\mathfrak{p})=\mathfrak{q} \otimes \kappa(\mathfrak{q})$. It follows that $m \times n$ matrix $A=\left(a_{i j}\right)$ defines a surjective map $\kappa(\mathfrak{p})^{\oplus m} \rightarrow \kappa(\mathfrak{p})^{\oplus n}$. Thus after inverting some element of $R$ not in $\mathfrak{p}$ we may assume there are $b_{i j} \in R$ such that $\sum b_{i j} g_{j}=x_{i}+$ h.o.t.. We conclude that $\left(x_{1}, \ldots, x_{n}\right)=\left(x_{1}, \ldots, x_{n}\right)^{2}$ in $S$. It follows from Lemma 10.20.5 that $\left(x_{1}, \ldots, x_{n}\right)$ is generated by an idempotent $e$. Setting $C=e S$ finishes the proof.

00QS Lemma 10.125.7. Let $R$ be a ring. Let $S, S^{\prime}$ be of finite presentation over $R$. Let $\mathfrak{q} \subset S$ and $\mathfrak{q}^{\prime} \subset S^{\prime}$ be primes. If $S_{\mathfrak{q}} \cong S_{\mathfrak{q}^{\prime}}$ as $R$-algebras, then there exist $g \in S$, $g \notin \mathfrak{q}$ and $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $S_{g} \cong S_{g^{\prime}}^{\prime}$ as $R$-algebras.
Proof. Let $\psi: S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}^{\prime}}$ be the isomorphism of the hypothesis of the lemma. Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{r}\right)$ and $S^{\prime}=R\left[y_{1}, \ldots, y_{m}\right] / J$. For each $i=$ $1, \ldots, n$ choose a fraction $h_{i} / g_{i}$ with $h_{i}, g_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$ and $g_{i} \bmod J$ not in $\mathfrak{q}^{\prime}$ which represents the image of $x_{i}$ under $\psi$. After replacing $S^{\prime}$ by $S_{g_{1} \ldots g_{n}}^{\prime}$ and
$R\left[y_{1}, \ldots, y_{m}, y_{m+1}\right]$ (mapping $y_{m+1}$ to $1 /\left(g_{1} \ldots g_{n}\right)$ ) we may assume that $\psi\left(x_{i}\right)$ is the image of some $h_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$. Consider the elements $f_{j}\left(h_{1}, \ldots, h_{n}\right) \in$ $R\left[y_{1}, \ldots, y_{m}\right]$. Since $\psi$ kills each $f_{j}$ we see that there exists a $g \in R\left[y_{1}, \ldots, y_{m}\right]$, $g \bmod J \notin \mathfrak{q}^{\prime}$ such that $g f_{j}\left(h_{1}, \ldots, h_{n}\right) \in J$ for each $j=1, \ldots, r$. After replacing $S^{\prime}$ by $S_{g}^{\prime}$ and $R\left[y_{1}, \ldots, y_{m}, y_{m+1}\right]$ as before we may assume that $f_{j}\left(h_{1}, \ldots, h_{n}\right) \in J$. Thus we obtain a ring map $S \rightarrow S^{\prime}, x_{i} \mapsto h_{i}$ which induces $\psi$ on local rings. By Lemma 10.6 .2 the map $S^{\prime} \rightarrow S$ is of finite presentation. By Lemma 10.125 .6 we may assume that $S=S^{\prime} \times C$. Thus localizing $S$ at the idempotent corresponding to the factor $C$ we obtain the result.

07RD Lemma 10.125.8. Let $R$ be a ring. Let $I \subset R$ be a locally nilpotent ideal. Let $S \rightarrow S^{\prime}$ be an $R$-algebra map such that $S \rightarrow S^{\prime} / I S^{\prime}$ is surjective and such that $S^{\prime}$ is of finite type over $R$. Then $S \rightarrow S^{\prime}$ is surjective.
Proof. Write $S^{\prime}=R\left[x_{1}, \ldots, x_{m}\right] / K$ for some ideal $K$. By assumption there exist $g_{j}=x_{j}+\sum \delta_{j, J} x^{J} \in R\left[x_{1}, \ldots, x_{n}\right]$ with $\delta_{j, J} \in I$ and with $g_{j} \bmod K \in \operatorname{Im}\left(S \rightarrow S^{\prime}\right)$. Hence it suffices to show that $g_{1}, \ldots, g_{m}$ generate $R\left[x_{1}, \ldots, x_{n}\right]$. Let $R_{0} \subset R$ be a finitely generated $\mathbf{Z}$-subalgebra of $R$ containing at least the $\delta_{j, J}$. Then $R_{0} \cap I$ is a nilpotent ideal (by Lemma 10.31.4). It follows that $R_{0}\left[x_{1}, \ldots, x_{n}\right]$ is generated by $g_{1}, \ldots, g_{m}$ (because $x_{j} \mapsto g_{j}$ defines an automorphism of $R_{0}\left[x_{1}, \ldots, x_{m}\right]$; details omitted). Since $R$ is the union of the subrings $R_{0}$ we win.

087P Lemma 10.125.9. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $S \rightarrow S^{\prime}$ be an $R$-algebra map. Let $I S \subset \mathfrak{q} \subset S$ be a prime ideal. Assume that
(1) $S \rightarrow S^{\prime}$ is surjective,
(2) $S_{\mathfrak{q}} / I S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}}^{\prime} / I S_{\mathfrak{q}}^{\prime}$ is an isomorphism,
(3) $S$ is of finite type over $R$,
(4) $S^{\prime}$ of finite presentation over $R$, and
(5) $S_{\mathfrak{q}}^{\prime}$ is flat over $R$.

Then $S_{g} \rightarrow S_{g}^{\prime}$ is an isomorphism for some $g \in S, g \notin \mathfrak{q}$.
Proof. Let $J=\operatorname{Ker}\left(S \rightarrow S^{\prime}\right)$. By Lemma 10.6.2 $J$ is a finitely generated ideal. Since $S_{\mathfrak{q}}^{\prime}$ is flat over $R$ we see that $J_{\mathfrak{q}} / I J_{\mathfrak{q}} \subset S_{\mathfrak{q}} / I S_{\mathfrak{q}}$ (apply Lemma 10.38 .12 to $0 \rightarrow J \rightarrow S \rightarrow S^{\prime} \rightarrow 0$ ). By assumption (2) we see that $J_{\mathfrak{q}} / I J_{\mathfrak{q}}$ is zero. By Nakayama's lemma (Lemma 10.19.1) we see that there exists a $g \in S, g \notin \mathfrak{q}$ such that $J_{g}=0$. Hence $S_{g} \cong S_{g}^{\prime}$ as desired.
07RE Lemma 10.125.10. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $S \rightarrow S^{\prime}$ be an $R$-algebra map. Assume that
(1) I is locally nilpotent,
(2) $S / I S \rightarrow S^{\prime} / I S^{\prime}$ is an isomorphism,
(3) $S$ is of finite type over $R$,
(4) $S^{\prime}$ of finite presentation over $R$, and
(5) $S^{\prime}$ is flat over $R$.

Then $S \rightarrow S^{\prime}$ is an isomorphism.
Proof. By Lemma 10.125 .8 the map $S \rightarrow S^{\prime}$ is surjective. As $I$ is locally nilpotent, so are the ideals $I S$ and $I S^{\prime}$ (Lemma 10.31.2). Hence every prime ideal $\mathfrak{q}$ of $S$ contains $I S$ and (trivially) $S_{\mathfrak{q}} / I S_{\mathfrak{q}} \cong S_{\mathfrak{q}}^{\prime} / I S_{\mathfrak{q}}^{\prime}$. Thus Lemma 10.125 .9 applies and we see that $S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}}^{\prime}$ is an isomorphism for every prime $\mathfrak{q} \subset S$. It follows that $S \rightarrow S^{\prime}$ is injective for example by Lemma 10.23 .1 .

### 10.126. Colimits and maps of finite presentation

00QL In this section we prove some preliminary lemmas which will eventually help us prove result using absolute Noetherian reduction. We begin discussing how we will think about colimits in this section.

Let $(\Lambda, \geq)$ a partially ordered set. A system of rings over $\Lambda$ is given by a ring $R_{\lambda}$ for every $\lambda \in \Lambda$, and a morphism $R_{\lambda} \rightarrow R_{\mu}$ whenever $\lambda \leq \mu$. These morphisms have to satisfy the rule that $R_{\lambda} \rightarrow R_{\mu} \rightarrow R_{\nu}$ is equal to the map $R_{\lambda} \rightarrow R_{\nu}$ for all $\lambda \leq \mu \leq \nu$. See Categories, Section 4.21. We will often assume that $(I, \leq)$ is directed, which means that $\Lambda$ is nonempty and given $\lambda, \mu \in \Lambda$ there exists a $\nu \in \Lambda$ with $\lambda \leq \nu$ and $\mu \leq \nu$. Recall that the colimit colim ${ }_{\lambda} R_{\lambda}$ is sometimes called a "direct limit" in this case (but we will not use this terminology).
00QN Lemma 10.126.1. Let $R \rightarrow A$ be a ring map. There exists a directed system $A_{\lambda}$ of $R$-algebras of finite presentation such that $A=\operatorname{colim}_{\lambda} A_{\lambda}$. If $A$ is of finite type over $R$ we may arrange it so that all the transition maps are surjective.
Proof. Compare with the proof of Lemma 10.8.13. Consider any finite subset $S \subset A$, and any finite collection of polynomial relations $E$ among the elements of $S$. So each $s \in S$ corresponds to $x_{s} \in A$ and each $e \in E$ consists of a polynomial $f_{e} \in R\left[X_{s} ; s \in S\right]$ such that $f_{e}\left(x_{s}\right)=0$. Let $A_{S, E}=R\left[X_{s} ; s \in S\right] /\left(f_{e} ; e \in E\right)$ which is a finitely presented $R$-algebra. There are canonical maps $A_{S, E} \rightarrow A$. If $S \subset S^{\prime}$ and if the elements of $E$ correspond, via the map $R\left[X_{s} ; s \in S\right] \rightarrow R\left[X_{s} ; s \in S^{\prime}\right]$, to a subset of $E^{\prime}$, then there is an obvious map $A_{S, E} \rightarrow A_{S^{\prime}, E^{\prime}}$ commuting with the maps to $A$. Thus, setting $\Lambda$ equal the set of pairs $(S, E)$ with ordering by inclusion as above, we get a directed partially ordered set. It is clear that the colimit of this directed system is $A$.
For the last statement, suppose $A=R\left[x_{1}, \ldots, x_{n}\right] / I$. In this case, consider the subset $\Lambda^{\prime} \subset \Lambda$ consisting of those systems $(S, E)$ above with $S=\left\{x_{1}, \ldots, x_{n}\right\}$. It is easy to see that still $A=\operatorname{colim}_{\lambda^{\prime} \in \Lambda^{\prime}} A_{\lambda^{\prime}}$. Moreover, the transition maps are clearly surjective.

It turns out that we can characterize ring maps of finite presentation as follows. This in some sense says that the algebras of finite presentation are the "compact" objects in the category of $R$-algebras.

00QO Lemma 10.126.2. Let $\varphi: R \rightarrow S$ be a ring map. Then $\varphi$ is of finite presentation if and only if for every directed system $A_{\lambda}$ of $R$-algebras we have

$$
\operatorname{colim}_{\lambda} \operatorname{Hom}_{R}\left(S, A_{\lambda}\right)=\operatorname{Hom}_{R}\left(S, \operatorname{colim}_{\lambda} A_{\lambda}\right)
$$

Proof. Suppose $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. If $\chi: S \rightarrow \operatorname{colim} A_{\lambda}$ is a map, then each $x_{i}$ maps to some element in the image of some $A_{\lambda_{i}}$. We may pick $\mu \geq \lambda_{i}$, $i=1, \ldots, n$ and assume $\chi\left(x_{i}\right)$ is the image of $y_{i} \in A_{\mu}$ for $i=1, \ldots, n$. Consider $z_{j}=f_{j}\left(y_{1}, \ldots, y_{n}\right) \in A_{\mu}$. Since $\chi$ is a homomorphism the image of $z_{j}$ in colim ${ }_{\lambda} A_{\lambda}$ is zero. Hence there exists a $\mu_{j} \geq \mu$ such that $z_{j}$ maps to zero in $A_{\mu_{j}}$. Pick $\nu \geq \mu_{j}$, $j=1, \ldots, m$. Then the images of $z_{1}, \ldots, z_{m}$ are zero in $A_{\nu}$. This exactly means that the $y_{i}$ map to elements $y_{i}^{\prime} \in A_{\nu}$ which satisfy the relations $f_{j}\left(y_{1}^{\prime}, \ldots, y_{n}^{\prime}\right)=0$. Thus we obtain a ring map $S \rightarrow A_{\nu}$ as desired.
Conversely, suppose the displayed formula holds always. By Lemma 10.126.1 we may write $S=\operatorname{colim}_{\lambda} S_{\lambda}$ with $S_{\lambda}$ of finite presentation over $R$. Then the identity
map factors as

$$
S \rightarrow S_{\lambda} \rightarrow S
$$

for some $\lambda$. This implies that $S$ is finitely presented over $S_{\lambda}$ by Lemma 10.6.2 part (4) applied to $S \rightarrow S_{\lambda} \rightarrow S$. Applying part (2) of the same lemma to $R \rightarrow S_{\lambda} \rightarrow S$ we conclude that $S$ is of finite presentation over $R$.

But more is true. Namely, given $R=\operatorname{colim}_{\lambda} R_{\lambda}$ we see that the category of finitely presented $R$-modules is equivalent to the limit of the category of finitely presented $R_{\lambda}$-modules. Similarly for the categories of finitely presented $R$-algebras.

05LI Lemma 10.126.3. Let $A$ be a ring and let $M, N$ be $A$-modules. Suppose that $R=\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of $A$-algebras.
(1) If $M$ is a finite $A$-module, and $u, u^{\prime}: M \rightarrow N$ are $A$-module maps such that $u \otimes 1=u^{\prime} \otimes 1: M \otimes_{A} R \rightarrow N \otimes_{A} R$ then for some $i$ we have $u \otimes 1=u^{\prime} \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$.
(2) If $N$ is a finite $A$-module and $u: M \rightarrow N$ is an $A$-module map such that $u \otimes 1: M \otimes_{A} R \rightarrow N \otimes_{A} R$ is surjective, then for some $i$ the map $u \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$ is surjective.
(3) If $N$ is a finitely presented $A$-module, and $v: N \otimes_{A} R \rightarrow M \otimes_{A} R$ is an $R$ module map, then there exists an $i$ and an $R_{i}$-module map $v_{i}: N \otimes_{A} R_{i} \rightarrow$ $M \otimes_{A} R_{i}$ such that $v=v_{i} \otimes 1$.
(4) If $M$ is a finite $A$-module, $N$ is a finitely presented $A$-module, and $u$ : $M \rightarrow N$ is an $R$-module map such that $u \otimes 1: M \otimes_{A} R \rightarrow N \otimes_{A} R$ is an isomorphism, then for some $i$ the map $u \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$ is an isomorphism.

Proof. To prove (1) assume $u$ is as in (1) and let $x_{1}, \ldots, x_{m} \in M$ be generators. Since $N \otimes_{A} R=\operatorname{colim}_{i} N \otimes_{A} R_{i}$ we may pick an $i \in I$ such that $u\left(x_{j}\right) \otimes 1=u^{\prime}\left(x_{j}\right) \otimes 1$ in $M \otimes_{A} R_{i}, j=1, \ldots, m$. For such an $i$ we have $u \otimes 1=u^{\prime} \otimes 1: M \otimes_{A} R_{i} \rightarrow N \otimes_{A} R_{i}$.
To prove (2) assume $u \otimes 1$ surjective and let $y_{1}, \ldots, y_{m} \in N$ be generators. Since $N \otimes_{A} R=\operatorname{colim}_{i} N \otimes_{A} R_{i}$ we may pick an $i \in I$ and $z_{j} \in M \otimes_{A} R_{i}, j=1, \ldots, m$ whose images in $N \otimes_{A} R$ equal $y_{j} \otimes 1$. For such an $i$ the map $u \otimes 1: M \otimes_{A} R_{i} \rightarrow$ $N \otimes_{A} R_{i}$ is surjective.
To prove (3) let $y_{1}, \ldots, y_{m} \in N$ be generators. Let $K=\operatorname{Ker}\left(A^{\oplus m} \rightarrow N\right)$ where the map is given by the rule $\left(a_{1}, \ldots, a_{m}\right) \mapsto \sum a_{j} x_{j}$. Let $k_{1}, \ldots, k_{t}$ be generators for $K$. Say $k_{s}=\left(k_{s 1}, \ldots, k_{s m}\right)$. Since $M \otimes_{A} R=\operatorname{colim}_{i} M \otimes_{A} R_{i}$ we may pick an $i \in I$ and $z_{j} \in M \otimes_{A} R_{i}, j=1, \ldots, m$ whose images in $M \otimes_{A} R$ equal $v\left(y_{j} \otimes 1\right)$. We want to use the $z_{j}$ to define the map $v_{i}: N \otimes_{A} R_{i} \rightarrow M \otimes_{A} R_{i}$. Since $K \otimes_{A} R_{i} \rightarrow$ $R_{i}^{\oplus m} \rightarrow N \otimes_{A} R_{i} \rightarrow 0$ is a presentation, it suffices to check that $\xi_{s}=\sum_{j} k_{s j} z_{j}$ is zero in $M \otimes_{A} R_{i}$ for each $s=1, \ldots, t$. This may not be the case, but since the image of $\xi_{s}$ in $M \otimes_{A} R$ is zero we see that it will be the case after increasing $i$ a bit.
To prove (4) assume $u \otimes 1$ is an isomorphism, that $M$ is finite, and that $N$ is finitely presented. Let $v: N \otimes_{A} R \rightarrow M \otimes_{A} R$ be an inverse to $u \otimes 1$. Apply part (3) to get a map $v_{i}: N \otimes_{A} R_{i} \rightarrow M \otimes_{A} R_{i}$ for some $i$. Apply part (1) to see that, after increasing $i$ we have $v_{i} \circ(u \otimes 1)=\operatorname{id}_{M \otimes_{R} R_{i}}$ and $(u \otimes 1) \circ v_{i}=\operatorname{id}_{N \otimes_{R} R_{i}}$.
05N7 Lemma 10.126.4. Suppose that $R=\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of rings. Then the category of finitely presented $R$-modules is the colimit of the categories of finitely presented $R_{\lambda}$-modules. More precisely
(1) Given a finitely presented $R$-module $M$ there exists a $\lambda \in \Lambda$ and a finitely presented $R_{\lambda}$-module $M_{\lambda}$ such that $M \cong M_{\lambda} \otimes_{R_{\lambda}} R$.
(2) Given a $\lambda \in \Lambda$, finitely presented $R_{\lambda}$-modules $M_{\lambda}, N_{\lambda}$, and an $R$-module $\operatorname{map} \varphi: M_{\lambda} \otimes_{R_{\lambda}} R \rightarrow N_{\lambda} \otimes_{R_{\lambda}} R$, then there exists a $\mu \geq \lambda$ and an $R_{\mu}$-module map $\varphi_{\mu}: M_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow N_{\lambda} \otimes_{R_{\lambda}} R_{\mu}$ such that $\varphi=\varphi_{\mu} \otimes 1_{R}$.
(3) Given a $\lambda \in \Lambda$, finitely presented $R_{\lambda}$-modules $M_{\lambda}, N_{\lambda}$, and $R$-module maps $\varphi_{\lambda}, \psi_{\lambda}: M_{\lambda} \rightarrow N_{\lambda}$ such that $\varphi \otimes 1_{R}=\psi \otimes 1_{R}$, then $\varphi \otimes 1_{R_{\mu}}=\psi \otimes 1_{R_{\mu}}$ for some $\mu \geq \lambda$.
Proof. To prove (1) choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. Suppose that the first map is given by the matrix $A=\left(a_{i j}\right)$. We can choose a $\lambda \in \Lambda$ and a matrix $A_{\lambda}=\left(a_{\lambda, i j}\right)$ with coefficients in $R_{\lambda}$ which maps to $A$ in $R$. Then we simply let $M_{\lambda}$ be the $R_{\lambda}$-module with presentation $R_{\lambda}^{\oplus m} \rightarrow R_{\lambda}^{\oplus n} \rightarrow M_{\lambda} \rightarrow 0$ where the first arrow is given by $A_{\lambda}$.
Parts (2) and (3) follow from Lemma 10.126.3.
05N8 Lemma 10.126.5. Let $A$ be a ring and let $B, C$ be $A$-algebras. Suppose that $R=\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of $A$-algebras.
(1) If $B$ is a finite type $A$-algebra, and $u, u^{\prime}: B \rightarrow C$ are $A$-algebra maps such that $u \otimes 1=u^{\prime} \otimes 1: B \otimes_{A} R \rightarrow C \otimes_{A} R$ then for some $i$ we have $u \otimes 1=u^{\prime} \otimes 1: B \otimes_{A} R_{i} \rightarrow C \otimes_{A} R_{i}$.
(2) If $C$ is a finite type $A$-algebra and $u: B \rightarrow C$ is an $A$-algebra map such that $u \otimes 1: B \otimes_{A} R \rightarrow C \otimes_{A} R$ is surjective, then for some $i$ the map $u \otimes 1: B \otimes_{A} R_{i} \rightarrow C \otimes_{A} R_{i}$ is surjective.
(3) If $C$ is of finite presentation over $A$ and $v: C \otimes_{A} R \rightarrow B \otimes_{A} R$ is an $R$ algebra map, then there exists an $i$ and an $R_{i}$-algebra map $v_{i}: C \otimes_{A} R_{i} \rightarrow$ $B \otimes_{A} R_{i}$ such that $v=v_{i} \otimes 1$.
(4) If $B$ is a finite type $A$-algebra, $C$ is a finitely presented $A$-algebra, and $u \otimes 1: B \otimes_{A} R \rightarrow C \otimes_{A} R$ is an isomorphism, then for some $i$ the map $u \otimes 1: B \otimes_{A} R_{i} \rightarrow C \otimes_{A} R_{i}$ is an isomorphism.

Proof. To prove (1) assume $u$ is as in (1) and let $x_{1}, \ldots, x_{m} \in B$ be generators. Since $B \otimes_{A} R=\operatorname{colim}_{i} B \otimes_{A} R_{i}$ we may pick an $i \in I$ such that $u\left(x_{j}\right) \otimes 1=u^{\prime}\left(x_{j}\right) \otimes 1$ in $B \otimes_{A} R_{i}, j=1, \ldots, m$. For such an $i$ we have $u \otimes 1=u^{\prime} \otimes 1: B \otimes_{A} R_{i} \rightarrow C \otimes_{A} R_{i}$.
To prove (2) assume $u \otimes 1$ surjective and let $y_{1}, \ldots, y_{m} \in C$ be generators. Since $B \otimes_{A} R=\operatorname{colim}_{i} B \otimes_{A} R_{i}$ we may pick an $i \in I$ and $z_{j} \in B \otimes_{A} R_{i}, j=1, \ldots, m$ whose images in $C \otimes_{A} R$ equal $y_{j} \otimes 1$. For such an $i$ the map $u \otimes 1: B \otimes_{A} R_{i} \rightarrow C \otimes_{A} R_{i}$ is surjective.
To prove (3) let $c_{1}, \ldots, c_{m} \in C$ be generators. Let $K=\operatorname{Ker}\left(A\left[x_{1}, \ldots, x_{m}\right] \rightarrow N\right)$ where the map is given by the rule $x_{j} \mapsto \sum c_{j}$. Let $f_{1}, \ldots, f_{t}$ be generators for $K$ as an ideal in $A\left[x_{1}, \ldots, x_{m}\right]$. We think of $f_{j}=f_{j}\left(x_{1}, \ldots, x_{m}\right)$ as a polynomial. Since $B \otimes_{A} R=\operatorname{colim}_{i} B \otimes_{A} R_{i}$ we may pick an $i \in I$ and $z_{j} \in B \otimes_{A} R_{i}, j=1, \ldots, m$ whose images in $B \otimes_{A} R$ equal $v\left(c_{j} \otimes 1\right)$. We want to use the $z_{j}$ to define a map $v_{i}: C \otimes_{A} R_{i} \rightarrow B \otimes_{A} R_{i}$. Since $K \otimes_{A} R_{i} \rightarrow R_{i}\left[x_{1}, \ldots, x_{m}\right] \rightarrow C \otimes_{A} R_{i} \rightarrow 0$ is a presentation, it suffices to check that $\xi_{s}=f_{j}\left(z_{1}, \ldots, z_{m}\right)$ is zero in $B \otimes_{A} R_{i}$ for each $s=1, \ldots, t$. This may not be the case, but since the image of $\xi_{s}$ in $B \otimes_{A} R$ is zero we see that it will be the case after increasing $i$ a bit.
To prove (4) assume $u \otimes 1$ is an isomorphism, that $B$ is a finite type $A$-algebra, and that $C$ is a finitely presented $A$-algebra. Let $v: B \otimes_{A} R \rightarrow C \otimes_{A} R$ be an inverse
to $u \otimes 1$. Let $v_{i}: C \otimes_{A} R_{i} \rightarrow B \otimes_{A} R_{i}$ be as in part (3). Apply part (1) to see that, after increasing $i$ we have $v_{i} \circ(u \otimes 1)=\operatorname{id}_{B \otimes_{R} R_{i}}$ and $(u \otimes 1) \circ v_{i}=\operatorname{id}_{C \otimes_{R} R_{i}}$.

05N9 Lemma 10.126.6. Suppose that $R=\operatorname{colim}_{i \in I} R_{i}$ is a directed colimit of rings. Then the category of finitely presented $R$-algebras is the colimit of the categories of finitely presented $R_{\lambda}$-algebras. More precisely
(1) Given a finitely presented $R$-algebra $A$ there exists a $\lambda \in \Lambda$ and a finitely presented $R_{\lambda}$-algebra $A_{\lambda}$ such that $A \cong A_{\lambda} \otimes_{R_{\lambda}} R$.
(2) Given a $\lambda \in \Lambda$, finitely presented $R_{\lambda}$-algebras $A_{\lambda}, B_{\lambda}$, and an $R$-algebra $\operatorname{map} \varphi: A_{\lambda} \otimes_{R_{\lambda}} R \rightarrow B_{\lambda} \otimes_{R_{\lambda}} R$, then there exists a $\mu \geq \lambda$ and an $R_{\mu}$-algebra map $\varphi_{\mu}: A_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow B_{\lambda} \otimes_{R_{\lambda}} R_{\mu}$ such that $\varphi=\varphi_{\mu} \otimes 1_{R}$.
(3) Given a $\lambda \in \Lambda$, finitely presented $R_{\lambda}$-algebras $A_{\lambda}, B_{\lambda}$, and $R$-algebra maps $\varphi_{\lambda}, \psi_{\lambda}: A_{\lambda} \rightarrow B_{\lambda}$ such that $\varphi \otimes 1_{R}=\psi \otimes 1_{R}$, then $\varphi \otimes 1_{R_{\mu}}=\psi \otimes 1_{R_{\mu}}$ for some $\mu \geq \lambda$.
Proof. To prove (1) choose a presentation $A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. We can choose a $\lambda \in \Lambda$ and elements $f_{\lambda, j} \in R_{\lambda}\left[x_{1}, \ldots, x_{n}\right]$ mapping to $f_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$. Then we simply let $A_{\lambda}=R_{\lambda}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{\lambda, 1}, \ldots, f_{\lambda, m}\right)$.
Parts (3) and (4) follow from Lemma 10.126.5.
00QT Lemma 10.126.7. Suppose $R \rightarrow S$ is a local homomorphism of local rings. There exists a directed set $(\Lambda, \leq)$, and a system of local homomorphisms $R_{\lambda} \rightarrow S_{\lambda}$ of local rings such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$.
(2) Each $R_{\lambda}$ is essentially of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is essentially of finite type over $R_{\lambda}$.

Proof. Denote $\varphi: R \rightarrow S$ the ring map. Let $\mathfrak{m} \subset R$ be the maximal ideal of $R$ and let $\mathfrak{n} \subset S$ be the maximal ideal of $S$. Let

$$
\Lambda=\{(A, B) \mid A \subset R, B \subset S, \# A<\infty, \# B<\infty, \varphi(A) \subset B\}
$$

As partial ordering we take the inclusion relation. For each $\lambda=(A, B) \in \Lambda$ we let $R_{\lambda}^{\prime}$ be the sub Z-algebra generated by $a \in A$, and we let $S_{\lambda}^{\prime}$ be the sub Z-algebra generated by $b, b \in B$. Let $R_{\lambda}$ be the localization of $R_{\lambda}^{\prime}$ at the prime ideal $R_{\lambda}^{\prime} \cap \mathfrak{m}$ and let $S_{\lambda}$ be the localization of $S_{\lambda}^{\prime}$ at the prime ideal $S_{\lambda}^{\prime} \cap \mathfrak{n}$. In a picture

The transition maps are clear. We leave the proofs of the other assertions to the reader.

00QU Lemma 10.126.8. Suppose $R \rightarrow S$ is a local homomorphism of local rings. Assume that $S$ is essentially of finite type over $R$. Then there exists a directed set $(\Lambda, \leq)$, and a system of local homomorphisms $R_{\lambda} \rightarrow S_{\lambda}$ of local rings such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$.
(2) Each $R_{\lambda}$ is essentially of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is essentially of finite type over $R_{\lambda}$.
(4) For each $\lambda \leq \mu$ the map $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ presents $S_{\mu}$ as the localization of a quotient of $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu}$.
Proof. Denote $\varphi: R \rightarrow S$ the ring map. Let $\mathfrak{m} \subset R$ be the maximal ideal of $R$ and let $\mathfrak{n} \subset S$ be the maximal ideal of $S$. Let $x_{1}, \ldots, x_{n} \in S$ be elements such that $S$ is a localization of the sub $R$-algebra of $S$ generated by $x_{1}, \ldots, x_{n}$. In other words, $S$ is a quotient of a localization of the polynomial ring $R\left[x_{1}, \ldots, x_{n}\right]$.
Let $\Lambda=\{A \subset R \mid \# A<\infty\}$ be the set of finite subsets of $R$. As partial ordering we take the inclusion relation. For each $\lambda=A \in \Lambda$ we let $R_{\lambda}^{\prime}$ be the sub Z-algebra generated by $a \in A$, and we let $S_{\lambda}^{\prime}$ be the sub Z-algebra generated by $\varphi(a), a \in A$ and the elements $x_{1}, \ldots, x_{n}$. Let $R_{\lambda}$ be the localization of $R_{\lambda}^{\prime}$ at the prime ideal $R_{\lambda}^{\prime} \cap \mathfrak{m}$ and let $S_{\lambda}$ be the localization of $S_{\lambda}^{\prime}$ at the prime ideal $S_{\lambda}^{\prime} \cap \mathfrak{n}$. In a picture

It is clear that if $A \subset B$ corresponds to $\lambda \leq \mu$ in $\Lambda$, then there are canonical maps $R_{\lambda} \rightarrow R_{\mu}$, and $S_{\lambda} \rightarrow S_{\mu}$ and we obtain a system over the directed set $\Lambda$.

The assertion that $R=\operatorname{colim} R_{\lambda}$ is clear because all the maps $R_{\lambda} \rightarrow R$ are injective and any element of $R$ eventually is in the image. The same argument works for $S=\operatorname{colim} S_{\lambda}$. Assertions (2), (3) are true by construction. The final assertion holds because clearly the maps $S_{\lambda}^{\prime} \otimes_{R_{\lambda}^{\prime}} R_{\mu}^{\prime} \rightarrow S_{\mu}^{\prime}$ are surjective.

00QV Lemma 10.126.9. Suppose $R \rightarrow S$ is a local homomorphism of local rings. Assume that $S$ is essentially of finite presentation over $R$. Then there exists a directed set $(\Lambda, \leq)$, and a system of local homomorphism $R_{\lambda} \rightarrow S_{\lambda}$ of local rings such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$.
(2) Each $R_{\lambda}$ is essentially of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is essentially of finite type over $R_{\lambda}$.
(4) For each $\lambda \leq \mu$ the map $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ presents $S_{\mu}$ as the localization of $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu}$ at a prime ideal.

Proof. By assumption we may choose an isomorphism $\Phi:\left(R\left[x_{1}, \ldots, x_{n}\right] / I\right)_{\mathfrak{q}} \rightarrow S$ where $I \subset R\left[x_{1}, \ldots, x_{n}\right]$ is a finitely generated ideal, and $\mathfrak{q} \subset R\left[x_{1}, \ldots, x_{n}\right] / I$ is a prime. (Note that $R \cap \mathfrak{q}$ is equal to the maximal ideal $\mathfrak{m}$ of $R$.) We also choose generators $f_{1}, \ldots, f_{m} \in I$ for the ideal $I$. Write $R$ in any way as a colimit $R=\operatorname{colim} R_{\lambda}$ over a directed set $(\Lambda, \leq)$, with each $R_{\lambda}$ local and essentially of finite type over $\mathbf{Z}$. There exists some $\lambda_{0} \in \Lambda$ such that $f_{j}$ is the image of some $f_{j, \lambda_{0}} \in R_{\lambda_{0}}\left[x_{1}, \ldots, x_{n}\right]$. For all $\lambda \geq \lambda_{0}$ denote $f_{j, \lambda} \in R_{\lambda}\left[x_{1}, \ldots, x_{n}\right]$ the image of $f_{j, \lambda_{0}}$. Thus we obtain a system of ring maps

$$
R_{\lambda}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1, \lambda}, \ldots, f_{n, \lambda}\right) \rightarrow R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right) \rightarrow S
$$

Set $\mathfrak{q}_{\lambda}$ the inverse image of $\mathfrak{q}$. Set $S_{\lambda}=\left(R_{\lambda}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1, \lambda}, \ldots, f_{n, \lambda}\right)\right)_{\mathfrak{q}_{\lambda}}$. We leave it to the reader to see that this works.

00QW Remark 10.126.10. Suppose that $R \rightarrow S$ is a local homomorphism of local rings, which is essentially of finite presentation. Take any system $(\Lambda, \leq), R_{\lambda} \rightarrow S_{\lambda}$ with the properties listed in Lemma 10.126.8. What may happen is that this is the
"wrong" system, namely, it may happen that property (4) of Lemma 10.126 .9 is not satisfied. Here is an example. Let $k$ be a field. Consider the ring

$$
R=k\left[\left[z, y_{1}, y_{2}, \ldots\right]\right] /\left(y_{i}^{2}-z y_{i+1}\right)
$$

Set $S=R / z R$. As system take $\Lambda=\mathbf{N}$ and $R_{n}=k\left[\left[z, y_{1}, \ldots, y_{n}\right]\right] /\left(\left\{y_{i}^{2}-\right.\right.$ $\left.\left.z y_{i+1}\right\}_{i \leq n-1}\right)$ and $S_{n}=R_{n} /\left(z, y_{n}^{2}\right)$. All the maps $S_{n} \otimes_{R_{n}} R_{n+1} \rightarrow S_{n+1}$ are not localizations (i.e., isomorphisms in this case) since $1 \otimes y_{n+1}^{2}$ maps to zero. If we take instead $S_{n}^{\prime}=R_{n} / z R_{n}$ then the maps $S_{n}^{\prime} \otimes_{R_{n}} R_{n+1} \rightarrow S_{n+1}^{\prime}$ are isomorphisms. The moral of this remark is that we do have to be a little careful in choosing the systems.
00QX Lemma 10.126.11. Suppose $R \rightarrow S$ is a local homomorphism of local rings. Assume that $S$ is essentially of finite presentation over $R$. Let $M$ be a finitely presented $S$-module. Then there exists a directed set $(\Lambda, \leq)$, and a system of local homomorphisms $R_{\lambda} \rightarrow S_{\lambda}$ of local rings together with $S_{\lambda}$-modules $M_{\lambda}$, such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$. The colimit of the system $M_{\lambda}$ is $M$.
(2) Each $R_{\lambda}$ is essentially of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is essentially of finite type over $R_{\lambda}$.
(4) Each $M_{\lambda}$ is finite over $S_{\lambda}$.
(5) For each $\lambda \leq \mu$ the map $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ presents $S_{\mu}$ as the localization of $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu}$ at a prime ideal.
(6) For each $\lambda \leq \mu$ the map $M_{\lambda} \otimes_{S_{\lambda}} S_{\mu} \rightarrow M_{\mu}$ is an isomorphism.

Proof. As in the proof of Lemma 10.126 .9 we may first write $R=\operatorname{colim} R_{\lambda}$ as a directed colimit of local $\mathbf{Z}$-algebras which are essentially of finite type. Next, we may assume that for some $\lambda_{1} \in \Lambda$ there exist $f_{j, \lambda_{1}} \in R_{\lambda_{1}}\left[x_{1}, \ldots, x_{n}\right]$ such that

$$
S=\operatorname{colim}_{\lambda \geq \lambda_{1}} S_{\lambda}, \text { with } S_{\lambda}=\left(R_{\lambda}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1, \lambda}, \ldots, f_{m, \lambda}\right)\right)_{\mathfrak{q}_{\lambda}}
$$

Choose a presentation

$$
S^{\oplus s} \rightarrow S^{\oplus t} \rightarrow M \rightarrow 0
$$

of $M$ over $S$. Let $A \in \operatorname{Mat}(t \times s, S)$ be the matrix of the presentation. For some $\lambda_{2} \in \Lambda, \lambda_{2} \geq \lambda_{1}$ we can find a matrix $A_{\lambda_{2}} \in \operatorname{Mat}\left(t \times s, S_{\lambda_{2}}\right)$ which maps to $A$. For all $\lambda \geq \lambda_{2}$ we let $M_{\lambda}=\operatorname{Coker}\left(S_{\lambda}^{\oplus s} \xrightarrow{A_{\lambda}} S_{\lambda}^{\oplus t}\right)$. We leave it to the reader to see that this works.
00QY Lemma 10.126.12. Suppose $R \rightarrow S$ is a ring map. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_{\lambda} \rightarrow S_{\lambda}$ such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$.
(2) Each $R_{\lambda}$ is of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is of finite type over $R_{\lambda}$.

Proof. This is the non-local version of Lemma 10.126.7. Proof is similar and left to the reader.
00QZ Lemma 10.126.13. Suppose $R \rightarrow S$ is a ring map. Assume that $S$ is of finite type over $R$. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_{\lambda} \rightarrow S_{\lambda}$ such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$.
(2) Each $R_{\lambda}$ is of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is of finite type over $R_{\lambda}$.
(4) For each $\lambda \leq \mu$ the map $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ presents $S_{\mu}$ as a quotient of $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu}$.
Proof. This is the non-local version of Lemma 10.126.8. Proof is similar and left to the reader.

00R0 Lemma 10.126.14. Suppose $R \rightarrow S$ is a ring map. Assume that $S$ is of finite presentation over $R$. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_{\lambda} \rightarrow S_{\lambda}$ such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$.
(2) Each $R_{\lambda}$ is of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is of finite type over $R_{\lambda}$.
(4) For each $\lambda \leq \mu$ the map $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ is an isomorphism.

Proof. This is the non-local version of Lemma 10.126.9. Proof is similar and left to the reader.

00R1 Lemma 10.126.15. Suppose $R \rightarrow S$ is a ring map. Assume that $S$ is of finite presentation over $R$. Let $M$ be a finitely presented $S$-module. Then there exists $a$ directed set $(\Lambda, \leq)$, and a system of ring maps $R_{\lambda} \rightarrow S_{\lambda}$ together with $S_{\lambda}$-modules $M_{\lambda}$, such that
(1) The colimit of the system $R_{\lambda} \rightarrow S_{\lambda}$ is equal to $R \rightarrow S$. The colimit of the system $M_{\lambda}$ is $M$.
(2) Each $R_{\lambda}$ is of finite type over $\mathbf{Z}$.
(3) Each $S_{\lambda}$ is of finite type over $R_{\lambda}$.
(4) Each $M_{\lambda}$ is finite over $S_{\lambda}$.
(5) For each $\lambda \leq \mu$ the map $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ is an isomorphism.
(6) For each $\lambda \leq \mu$ the map $M_{\lambda} \otimes_{S_{\lambda}} S_{\mu} \rightarrow M_{\mu}$ is an isomorphism.

In particular, for every $\lambda \in \Lambda$ we have

$$
M=M_{\lambda} \otimes_{S_{\lambda}} S=M_{\lambda} \otimes_{R_{\lambda}} R
$$

Proof. This is the non-local version of Lemma 10.126.11 Proof is similar and left to the reader.

### 10.127. More flatness criteria

00R3 The following lemma is often used in algebraic geometry to show that a finite morphism from a normal surface to a smooth surface is flat. It is a partial converse to Lemma 10.111 .9 because an injective finite local ring map certainly satisfies condition (3).

00R4 Lemma 10.127.1. Let $R \rightarrow S$ be a local homomorphism of Noetherian local rings. Assume
(1) $R$ is regular,
(2) $S$ Cohen-Macaulay,
(3) $\operatorname{dim}(S)=\operatorname{dim}(R)+\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)$.

Then $R \rightarrow S$ is flat.
Proof. By induction on $\operatorname{dim}(R)$. The case $\operatorname{dim}(R)=0$ is trivial, because then $R$ is a field. Assume $\operatorname{dim}(R)>0$. By (3) this implies that $\operatorname{dim}(S)>0$. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ be the minimal primes of $S$. Note that $\mathfrak{q}_{i} \not \supset \mathfrak{m}_{R} S$ since

$$
\operatorname{dim}\left(S / \mathfrak{q}_{i}\right)=\operatorname{dim}(S)>\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)
$$

the first equality by Lemma 10.103 .3 and the inequality by (3). Thus $\mathfrak{p}_{i}=R \cap \mathfrak{q}_{i}$ is not equal to $\mathfrak{m}_{R}$. Pick $x \in \mathfrak{m}, x \notin \mathfrak{m}^{2}$, and $x \notin \mathfrak{p}_{i}$, see Lemma 10.14.2. Hence we see that $x$ is not contained in any of the minimal primes of $S$. Hence $x$ is a nonzerodivisor on $S$ by (2), see Lemma 10.103 .2 and $S / x S$ is Cohen-Macaulay with $\operatorname{dim}(S / x S)=\operatorname{dim}(S)-1$. By (1) and Lemma 10.105 .3 the ring $R / x R$ is regular with $\operatorname{dim}(R / x R)=\operatorname{dim}(R)-1$. By induction we see that $R / x R \rightarrow S / x S$ is flat. Hence we conclude by Lemma 10.98 .10 and the remark following it.

07DY Lemma 10.127.2. Let $R \rightarrow S$ be a homomorphism of Noetherian local rings. Assume that $R$ is a regular local ring and that a regular system of parameters maps to a regular sequence in $S$. Then $R \rightarrow S$ is flat.

Proof. Suppose that $x_{1}, \ldots, x_{d}$ are a system of parameters of $R$ which map to a regular sequence in $S$. Note that $S /\left(x_{1}, \ldots, x_{d}\right) S$ is flat over $R /\left(x_{1}, \ldots, x_{d}\right)$ as the latter is a field. Then $x_{d}$ is a nonzerodivisor in $S /\left(x_{1}, \ldots, x_{d-1}\right) S$ hence $S /\left(x_{1}, \ldots, x_{d-1}\right) S$ is flat over $R /\left(x_{1}, \ldots, x_{d-1}\right)$ by the local criterion of flatness (see Lemma 10.98 .10 and remarks following). Then $x_{d-1}$ is a nonzerodivisor in $S /\left(x_{1}, \ldots, x_{d-2}\right) S$ hence $S /\left(x_{1}, \ldots, x_{d-2}\right) S$ is flat over $R /\left(x_{1}, \ldots, x_{d-2}\right)$ by the local criterion of flatness (see Lemma 10.98 .10 and remarks following). Continue till one reaches the conclusion that $S$ is flat over $R$.

The following lemma is the key to proving that results for finitely presented modules over finitely presented rings over a base ring follow from the corresponding results for finite modules in the Noetherian case.

00R6 Lemma 10.127.3. Let $R \rightarrow S, M, \Lambda, R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}$ be as in Lemma 10.126.11. Assume that $M$ is flat over $R$. Then for some $\lambda \in \Lambda$ the module $M_{\lambda}$ is flat over $R_{\lambda}$.

Proof. Pick some $\lambda \in \Lambda$ and consider

$$
\operatorname{Tor}_{1}^{R_{\lambda}}\left(M_{\lambda}, R_{\lambda} / \mathfrak{m}_{\lambda}\right)=\operatorname{Ker}\left(\mathfrak{m}_{\lambda} \otimes_{R_{\lambda}} M_{\lambda} \rightarrow M_{\lambda}\right)
$$

See Remark 10.74.9. The right hand side shows that this is a finitely generated $S_{\lambda}$-module (because $S_{\lambda}$ is Noetherian and the modules in question are finite). Let $\xi_{1}, \ldots, \xi_{n}$ be generators. Because $M$ is flat over $R$ we have that $0=\operatorname{Ker}\left(\mathfrak{m}_{\lambda} R \otimes_{R}\right.$ $M \rightarrow M)$. Since $\otimes$ commutes with colimits we see there exists a $\lambda^{\prime} \geq \lambda$ such that each $\xi_{i}$ maps to zero in $\mathfrak{m}_{\lambda} R_{\lambda^{\prime}} \otimes_{R_{\lambda^{\prime}}} M_{\lambda^{\prime}}$. Hence we see that

$$
\operatorname{Tor}_{1}^{R_{\lambda}}\left(M_{\lambda}, R_{\lambda} / \mathfrak{m}_{\lambda}\right) \longrightarrow \operatorname{Tor}_{1}^{R_{\lambda^{\prime}}}\left(M_{\lambda^{\prime}}, R_{\lambda^{\prime}} / \mathfrak{m}_{\lambda} R_{\lambda^{\prime}}\right)
$$

is zero. Note that $M_{\lambda} \otimes_{R_{\lambda}} R_{\lambda} / \mathfrak{m}_{\lambda}$ is flat over $R_{\lambda} / \mathfrak{m}_{\lambda}$ because this last ring is a field. Hence we may apply Lemma 10.98 .14 to get that $M_{\lambda^{\prime}}$ is flat over $R_{\lambda^{\prime}}$.

Using the lemma above we can start to reprove the results of Section 10.98 in the non-Noetherian case.

046Y Lemma 10.127.4. Suppose that $R \rightarrow S$ is a local homomorphism of local rings. Denote $\mathfrak{m}$ the maximal ideal of $R$. Let $u: M \rightarrow N$ be a map of $S$-modules. Assume
(1) $S$ is essentially of finite presentation over $R$,
(2) $M, N$ are finitely presented over $S$,
(3) $N$ is flat over $R$, and
(4) $\bar{u}: M / \mathfrak{m} M \rightarrow N / \mathfrak{m} N$ is injective.

Then $u$ is injective, and $N / u(M)$ is flat over $R$.

Proof. By Lemma 10.126 .11 and its proof we can find a system $R_{\lambda} \rightarrow S_{\lambda}$ of local ring maps together with maps of $S_{\lambda}$-modules $u_{\lambda}: M_{\lambda} \rightarrow N_{\lambda}$ satisfying the conclusions (1) - (6) for both $N$ and $M$ of that lemma and such that the colimit of the maps $u_{\lambda}$ is $u$. By Lemma 10.127 .3 we may assume that $N_{\lambda}$ is flat over $R_{\lambda}$ for all sufficiently large $\lambda$. Denote $\mathfrak{m}_{\lambda} \subset R_{\lambda}$ the maximal ideal and $\kappa_{\lambda}=R_{\lambda} / \mathfrak{m}_{\lambda}$, resp. $\kappa=R / \mathfrak{m}$ the residue fields.

Consider the map

$$
\Psi_{\lambda}: M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda} \otimes_{\kappa_{\lambda}} \kappa \longrightarrow M / \mathfrak{m} M
$$

Since $S_{\lambda} / \mathfrak{m}_{\lambda} S_{\lambda}$ is essentially of finite type over the field $\kappa_{\lambda}$ we see that the tensor product $S_{\lambda} / \mathfrak{m}_{\lambda} S_{\lambda} \otimes_{\kappa_{\lambda}} \kappa$ is essentially of finite type over $\kappa$. Hence it is a Noetherian ring and we conclude the kernel of $\Psi_{\lambda}$ is finitely generated. Since $M / \mathfrak{m} M$ is the colimit of the system $M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda}$ and $\kappa$ is the colimit of the fields $\kappa_{\lambda}$ there exists a $\lambda^{\prime}>\lambda$ such that the kernel of $\Psi_{\lambda}$ is generated by the kernel of

$$
\Psi_{\lambda, \lambda^{\prime}}: M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda} \otimes_{\kappa_{\lambda}} \kappa_{\lambda^{\prime}} \longrightarrow M_{\lambda^{\prime}} / \mathfrak{m}_{\lambda^{\prime}} M_{\lambda^{\prime}}
$$

By construction there exists a multiplicative subset $W \subset S_{\lambda} \otimes_{R_{\lambda}} R_{\lambda^{\prime}}$ such that $S_{\lambda^{\prime}}=W^{-1}\left(S_{\lambda} \otimes_{R_{\lambda}} R_{\lambda^{\prime}}\right)$ and

$$
W^{-1}\left(M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda} \otimes_{\kappa_{\lambda}} \kappa_{\lambda^{\prime}}\right)=M_{\lambda^{\prime}} / \mathfrak{m}_{\lambda^{\prime}} M_{\lambda^{\prime}}
$$

Now suppose that $x$ is an element of the kernel of

$$
\Psi_{\lambda^{\prime}}: M_{\lambda^{\prime}} / \mathfrak{m}_{\lambda^{\prime}} M_{\lambda^{\prime}} \otimes_{\kappa_{\lambda^{\prime}}} \kappa \longrightarrow M / \mathfrak{m} M
$$

Then for some $w \in W$ we have $w x \in M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda} \otimes \kappa$. Hence $w x \in \operatorname{Ker}\left(\Psi_{\lambda}\right)$. Hence $w x$ is a linear combination of elements in the kernel of $\Psi_{\lambda, \lambda^{\prime}}$. Hence $w x=0$ in $M_{\lambda^{\prime}} / \mathfrak{m}_{\lambda^{\prime}} M_{\lambda^{\prime}} \otimes_{\kappa_{\lambda^{\prime}}} \kappa$, hence $x=0$ because $w$ is invertible in $S_{\lambda^{\prime}}$. We conclude that the kernel of $\Psi_{\lambda^{\prime}}$ is zero for all sufficiently large $\lambda^{\prime}$ !

By the result of the preceding paragraph we may assume that the kernel of $\Psi_{\lambda}$ is zero for all $\lambda$ sufficiently large, which implies that the map $M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda} \rightarrow M / \mathfrak{m} M$ is injective. Combined with $\bar{u}$ being injective this formally implies that also $\overline{u_{\lambda}}$ : $M_{\lambda} / \mathfrak{m}_{\lambda} M_{\lambda} \rightarrow N_{\lambda} / \mathfrak{m}_{\lambda} N_{\lambda}$ is injective. By Lemma 10.98.1 we conclude that (for all sufficiently large $\lambda$ ) the map $u_{\lambda}$ is injective and that $N_{\lambda} / u_{\lambda}\left(M_{\lambda}\right)$ is flat over $R_{\lambda}$. The lemma follows.

046Z Lemma 10.127.5. Suppose that $R \rightarrow S$ is a local ring homomorphism of local rings. Denote $\mathfrak{m}$ the maximal ideal of $R$. Suppose
(1) $S$ is essentially of finite presentation over $R$,
(2) $S$ is flat over $R$, and
(3) $f \in S$ is a nonzerodivisor in $S / \mathfrak{m} S$.

Then $S / f S$ is flat over $R$, and $f$ is a nonzerodivisor in $S$.
Proof. Follows directly from Lemma 10.127 .4
0470 Lemma 10.127.6. Suppose that $R \rightarrow S$ is a local ring homomorphism of local rings. Denote $\mathfrak{m}$ the maximal ideal of $R$. Suppose
(1) $R \rightarrow S$ is essentially of finite presentation,
(2) $R \rightarrow S$ is flat, and
(3) $f_{1}, \ldots, f_{c}$ is a sequence of elements of $S$ such that the images $\bar{f}_{1}, \ldots, \bar{f}_{c}$ form a regular sequence in $S / \mathfrak{m} S$.

Then $f_{1}, \ldots, f_{c}$ is a regular sequence in $S$ and each of the quotients $S /\left(f_{1}, \ldots, f_{i}\right)$ is flat over $R$.

Proof. Induction and Lemma 10.127.5.
Here is the version of the local criterion of flatness for the case of local ring maps which are locally of finite presentation.
0471 Lemma 10.127.7. Let $R \rightarrow S$ be a local homomorphism of local rings. Let $I \neq R$ be an ideal in $R$. Let $M$ be an $S$-module. Assume
(1) $S$ is essentially of finite presentation over $R$,
(2) $M$ is of finite presentation over $S$,
(3) $\operatorname{Tor}_{1}^{R}(M, R / I)=0$, and
(4) $M / I M$ is flat over $R / I$.

Then $M$ is flat over $R$.
Proof. Let $\Lambda, R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}$ be as in Lemma 10.126.11. Denote $I_{\lambda} \subset R_{\lambda}$ the inverse image of $I$. In this case the system $R / I \rightarrow S / I S, M / I M, R_{\lambda} \rightarrow S_{\lambda} / I_{\lambda} S_{\lambda}$, and $M_{\lambda} / I_{\lambda} M_{\lambda}$ satisfies the conclusions of Lemma 10.126 .11 as well. Hence by Lemma 10.127 .3 we may assume (after shrinking the index set $\Lambda$ ) that $M_{\lambda} / I_{\lambda} M_{\lambda}$ is flat for all $\lambda$. Pick some $\lambda$ and consider

$$
\operatorname{Tor}_{1}^{R_{\lambda}}\left(M_{\lambda}, R_{\lambda} / I_{\lambda}\right)=\operatorname{Ker}\left(I_{\lambda} \otimes_{R_{\lambda}} M_{\lambda} \rightarrow M_{\lambda}\right)
$$

See Remark 10.74.9. The right hand side shows that this is a finitely generated $S_{\lambda}$-module (because $S_{\lambda}$ is Noetherian and the modules in question are finite). Let $\xi_{1}, \ldots, \xi_{n}$ be generators. Because $\operatorname{Tor}_{R}^{1}(M, R / I)=0$ and since $\otimes$ commutes with colimits we see there exists a $\lambda^{\prime} \geq \lambda$ such that each $\xi_{i}$ maps to zero in $\operatorname{Tor}_{1}^{R_{\lambda^{\prime}}}\left(M_{\lambda^{\prime}}, R_{\lambda^{\prime}} / I_{\lambda^{\prime}}\right)$. The composition of the maps

is surjective up to a localization by the reasons indicated. The localization is necessary since $M_{\lambda^{\prime}}$ is not equal to $M_{\lambda} \otimes_{R_{\lambda}} R_{\lambda^{\prime}}$. Namely, it is equal to $M_{\lambda} \otimes_{S_{\lambda}} S_{\lambda^{\prime}}$ and $S_{\lambda^{\prime}}$ is the localization of $S_{\lambda} \otimes_{R_{\lambda}} R_{\lambda^{\prime}}$ whence the statement up to a localization (or tensoring with $S_{\lambda^{\prime}}$ ). Note that Lemma 10.98 .12 applies to the first and third arrows because $M_{\lambda} / I_{\lambda} M_{\lambda}$ is flat over $R_{\lambda} / I_{\lambda}$ and because $M_{\lambda^{\prime}} / I_{\lambda} M_{\lambda^{\prime}}$ is flat over $R_{\lambda^{\prime}} / I_{\lambda} R_{\lambda^{\prime}}$ as it is a base change of the flat module $M_{\lambda} / I_{\lambda} M_{\lambda}$. The composition maps the generators $\xi_{i}$ to zero as we explained above. We finally conclude that $\operatorname{Tor}_{1}^{R_{\lambda^{\prime}}}\left(M_{\lambda^{\prime}}, R_{\lambda^{\prime}} / I_{\lambda^{\prime}}\right)$ is zero. This implies that $M_{\lambda^{\prime}}$ is flat over $R_{\lambda^{\prime}}$ by Lemma 10.98.10.

Please compare the lemma below to Lemma 10.98 .15 (the case of Noetherian local rings) and Lemma 10.100 .8 (the case of a nilpotent ideal in the base).
00R7 Lemma 10.127.8 (Critère de platitude par fibres). Let $R, S$, $S^{\prime}$ be local rings and let $R \rightarrow S \rightarrow S^{\prime}$ be local ring homomorphisms. Let $M$ be an $S^{\prime}$-module. Let $\mathfrak{m} \subset R$ be the maximal ideal. Assume
(1) The ring maps $R \rightarrow S$ and $R \rightarrow S^{\prime}$ are essentially of finite presentation.
(2) The module $M$ is of finite presentation over $S^{\prime}$.
(3) The module $M$ is not zero.
(4) The module $M / \mathfrak{m} M$ is a flat $S / \mathfrak{m} S$-module.
(5) The module $M$ is a flat $R$-module.

Then $S$ is flat over $R$ and $M$ is a flat $S$-module.
Proof. As in the proof of Lemma 10.126 .9 we may first write $R=\operatorname{colim} R_{\lambda}$ as a directed colimit of local $\mathbf{Z}$-algebras which are essentially of finite type. Denote $\mathfrak{p}_{\lambda}$ the maximal ideal of $R$. Next, we may assume that for some $\lambda_{1} \in \Lambda$ there exist $f_{j, \lambda_{1}} \in R_{\lambda_{1}}\left[x_{1}, \ldots, x_{n}\right]$ such that

$$
S=\operatorname{colim}_{\lambda \geq \lambda_{1}} S_{\lambda}, \text { with } S_{\lambda}=\left(R_{\lambda}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1, \lambda}, \ldots, f_{u, \lambda}\right)\right)_{\mathfrak{q}_{\lambda}}
$$

For some $\lambda_{2} \in \Lambda, \lambda_{2} \geq \lambda_{1}$ there exist $g_{j, \lambda_{2}} \in R_{\lambda_{2}}\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]$ with images $\bar{g}_{j, \lambda_{2}} \in S_{\lambda_{2}}\left[y_{1}, \ldots, y_{m}\right]$ such that

$$
S^{\prime}=\operatorname{colim}_{\lambda \geq \lambda_{2}} S_{\lambda}^{\prime}, \text { with } S_{\lambda}^{\prime}=\left(S_{\lambda}\left[y_{1}, \ldots, y_{m}\right] /\left(\bar{g}_{1, \lambda}, \ldots, \bar{g}_{v, \lambda}\right)\right)_{\bar{q}_{\lambda}^{\prime}}
$$

Note that this also implies that

$$
S_{\lambda}^{\prime}=\left(R_{\lambda}\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] /\left(g_{1, \lambda}, \ldots, g_{v, \lambda}\right)\right)_{\mathfrak{q}_{\lambda}^{\prime}}
$$

Choose a presentation

$$
\left(S^{\prime}\right)^{\oplus s} \rightarrow\left(S^{\prime}\right)^{\oplus t} \rightarrow M \rightarrow 0
$$

of $M$ over $S^{\prime}$. Let $A \in \operatorname{Mat}\left(t \times s, S^{\prime}\right)$ be the matrix of the presentation. For some $\lambda_{3} \in \Lambda, \lambda_{3} \geq \lambda_{2}$ we can find a matrix $A_{\lambda_{3}} \in \operatorname{Mat}\left(t \times s, S_{\lambda_{3}}\right)$ which maps to $A$. For all $\lambda \geq \lambda_{3}$ we let $M_{\lambda}=\operatorname{Coker}\left(\left(S_{\lambda}^{\prime}\right)^{\oplus s} \xrightarrow{A_{\lambda}}\left(S_{\lambda}^{\prime}\right)^{\oplus t}\right)$.
With these choices, we have for each $\lambda_{3} \leq \lambda \leq \mu$ that $S_{\lambda} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}$ is a localization, $S_{\lambda}^{\prime} \otimes_{S_{\lambda}} S_{\mu} \rightarrow S_{\mu}^{\prime}$ is a localization, and the map $M_{\lambda} \otimes_{S_{\lambda}^{\prime}} S_{\mu} \rightarrow M_{\mu}$ is an isomorphism. This also implies that $S_{\lambda}^{\prime} \otimes_{R_{\lambda}} R_{\mu} \rightarrow S_{\mu}^{\prime}$ is a localization. Thus, since $M$ is flat over $R$ we see by Lemma 10.127 .3 that for all $\lambda$ big enough the module $M_{\lambda}$ is flat over $R_{\lambda}$. Moreover, note that $\mathfrak{m}=\operatorname{colim} \mathfrak{p}_{\lambda}, S / \mathfrak{m} S=\operatorname{colim} S_{\lambda} / \mathfrak{p}_{\lambda} S_{\lambda}$, $S^{\prime} / \mathfrak{m} S^{\prime}=\operatorname{colim} S_{\lambda}^{\prime} / \mathfrak{p}_{\lambda} S_{\lambda}^{\prime}$, and $M / \mathfrak{m} M=\operatorname{colim} M_{\lambda} / \mathfrak{p}_{\lambda} M_{\lambda}$. Also, for each $\lambda_{3} \leq \lambda \leq$ $\mu$ we see (from the properties listed above) that

$$
S_{\lambda}^{\prime} / \mathfrak{p}_{\lambda} S_{\lambda}^{\prime} \otimes_{S_{\lambda} / \mathfrak{p}_{\lambda} S_{\lambda}} S_{\mu} / \mathfrak{p}_{\mu} S_{\mu} \longrightarrow S_{\mu}^{\prime} / \mathfrak{p}_{\mu} S_{\mu}^{\prime}
$$

is a localization, and the map

$$
M_{\lambda} / \mathfrak{p}_{\lambda} M_{\lambda} \otimes_{S_{\lambda}^{\prime} / \mathfrak{p}_{\lambda} S_{\lambda}^{\prime}} S_{\mu} / \mathfrak{p}_{\mu} S_{\mu}^{\prime} \longrightarrow M_{\mu} / \mathfrak{p}_{\mu} M_{\mu}
$$

is an isomorphism. Hence the system $\left(S_{\lambda} / \mathfrak{p}_{\lambda} S_{\lambda} \rightarrow S_{\lambda}^{\prime} / \mathfrak{p}_{\lambda} S_{\lambda}^{\prime}, M_{\lambda} / \mathfrak{p}_{\lambda} M_{\lambda}\right)$ is a system as in Lemma 10.126 .11 as well. We may apply Lemma 10.127 .3 again because $M / \mathfrak{m} M$ is assumed flat over $S / \mathfrak{m} S$ and we see that $M_{\lambda} / \mathfrak{p}_{\lambda} M_{\lambda}$ is flat over $S_{\lambda} / \mathfrak{p}_{\lambda} S_{\lambda}$ for all $\lambda$ big enough. Thus for $\lambda$ big enough the data $R_{\lambda} \rightarrow S_{\lambda} \rightarrow S_{\lambda}^{\prime}, M_{\lambda}$ satisfies the hypotheses of Lemma 10.98.15. Pick such a $\lambda$. Then $S=S_{\lambda} \otimes_{R_{\lambda}} R$ is flat over $R$, and $M=M_{\lambda} \otimes_{S_{\lambda}} S_{\lambda}^{\prime}$ is flat over $S$ (since the base change of a flat module is flat).

The following is an easy consequence of the "critère de platitude par fibres" Lemma 10.127.8. For more results of this kind see More on Flatness, Section 37.1.

05UV Lemma 10.127.9. Let $R, S, S^{\prime}$ be local rings and let $R \rightarrow S \rightarrow S^{\prime}$ be local ring homomorphisms. Let $M$ be an $S^{\prime}$-module. Let $\mathfrak{m} \subset R$ be the maximal ideal. Assume
(1) $R \rightarrow S^{\prime}$ is essentially of finite presentation,
(2) $R \rightarrow S$ is essentially of finite type,
(3) $M$ is of finite presentation over $S^{\prime}$,
(4) $M$ is not zero,
(5) $M / \mathfrak{m} M$ is a flat $S / \mathfrak{m} S$-module, and
(6) $M$ is a flat $R$-module.

Then $S$ is essentially of finite presentation and flat over $R$ and $M$ is a flat $S$-module.
Proof. As $S$ is essentially of finite presentation over $R$ we can write $S=C_{\bar{q}}$ for some finite type $R$-algebra $C$. Write $C=R\left[x_{1}, \ldots, x_{n}\right] / I$. Denote $\mathfrak{q} \subset R\left[x_{1}, \ldots, x_{n}\right]$ be the prime ideal corresponding to $\overline{\mathfrak{q}}$. Then we see that $S=B / J$ where $B=$ $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}$ is essentially of finite presentation over $R$ and $J=I B$. We can find $f_{1}, \ldots, f_{k} \in J$ such that the images $\bar{f}_{i} \in B / \mathfrak{m} B$ generate the image $\bar{J}$ of $J$ in the Noetherian ring $B / \mathfrak{m} B$. Hence there exist finitely generated ideals $J^{\prime} \subset J$ such that $B / J^{\prime} \rightarrow B / J$ induces an isomorphism

$$
\left(B / J^{\prime}\right) \otimes_{R} R / \mathfrak{m} \longrightarrow B / J \otimes_{R} R / \mathfrak{m}=S / \mathfrak{m} S
$$

For any $J^{\prime}$ as above we see that Lemma 10.127 .8 applies to the ring maps

$$
R \longrightarrow B / J^{\prime} \longrightarrow S^{\prime}
$$

and the module $M$. Hence we conclude that $B / J^{\prime}$ is flat over $R$ for any choice $J^{\prime}$ as above. Now, if $J^{\prime} \subset J^{\prime} \subset J$ are two finitely generated ideals as above, then we conclude that $B / J^{\prime} \rightarrow B / J^{\prime \prime}$ is a surjective map between flat $R$-algebras which are essentially of finite presentation which is an isomorphism modulo $\mathfrak{m}$. Hence Lemma 10.127 .4 implies that $B / J^{\prime}=B / J^{\prime \prime}$, i.e., $J^{\prime}=J^{\prime \prime}$. Clearly this means that $J$ is finitely generated, i.e., $S$ is essentially of finite presentation over $R$. Thus we may apply Lemma 10.127 .8 to $R \rightarrow S \rightarrow S^{\prime}$ and we win.

### 10.128. Openness of the flat locus

00R8
00R9 Lemma 10.128.1. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $f_{1}, \ldots, f_{i}$ be elements of $S$. Assume that $S$ is Cohen-Macaulay and equidimensional of dimension $d$, and that $\operatorname{dim} V\left(f_{1}, \ldots, f_{i}\right) \leq d-i$. Then equality holds and $f_{1}, \ldots, f_{i}$ forms a regular sequence in $S_{\mathfrak{q}}$ for every prime $\mathfrak{q}$ of $V\left(f_{1}, \ldots, f_{i}\right)$.

Proof. If $S$ is Cohen-Macaulay and equidimensional of dimension $d$, then we have $\operatorname{dim}\left(S_{\mathfrak{m}}\right)=d$ for all maximal ideals $\mathfrak{m}$ of $S$, see Lemma 10.113.7. By Proposition 10.102 .5 we see that for all maximal ideals $\mathfrak{m} \in V\left(f_{1}, \ldots, f_{i}\right)$ the sequence is a regular sequence in $S_{\mathfrak{m}}$ and the local ring $S_{\mathfrak{m}} /\left(f_{1}, \ldots, f_{i}\right)$ is Cohen-Macaulay of dimension $d-i$. This actually means that $S /\left(f_{1}, \ldots, f_{i}\right)$ is Cohen-Macaulay and equidimensional of dimension $d-i$.

00RA Lemma 10.128.2. Suppose that $R \rightarrow S$ is a ring map which is finite type, flat. Let d be an integer such that all fibres $S \otimes_{R} \kappa(\mathfrak{p})$ are Cohen-Macaulay and equidimensional of dimension d. Let $f_{1}, \ldots, f_{i}$ be elements of $S$. The set
$\left\{\mathfrak{q} \in V\left(f_{1}, \ldots, f_{i}\right) \mid f_{1}, \ldots, f_{i}\right.$ are a regular sequence in $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ where $\left.\mathfrak{p}=R \cap \mathfrak{q}\right\}$ is open in $V\left(f_{1}, \ldots, f_{i}\right)$.

Proof. Write $\bar{S}=S /\left(f_{1}, \ldots, f_{i}\right)$. Suppose $\mathfrak{q}$ is an element of the set defined in the lemma, and $\mathfrak{p}$ is the corresponding prime of $R$. We will use relative dimension as defined in Definition 10.124.1. First, note that $d=\operatorname{dim}_{\mathfrak{q}}(S / R)=\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)+$ $\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})$ by Lemma 10.115.3. Since $f_{1}, \ldots, f_{i}$ form a regular sequence in the Noetherian local ring $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ general dimension theory tells us that $\operatorname{dim}\left(\bar{S}_{\mathfrak{q}} / \mathfrak{p} \bar{S}_{\mathfrak{q}}\right)=$ $\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)-i$. By the same Lemma 10.115.3 we then conclude that $\operatorname{dim}_{\mathfrak{q}}(\bar{S} / R)=$ $\operatorname{dim}\left(\bar{S}_{\mathfrak{q}} / \mathfrak{p} \bar{S}_{\mathfrak{q}}\right)+\operatorname{trdeg}_{\kappa(\mathfrak{p})} \kappa(\mathfrak{q})=d-i$. By Lemma 10.124 .6 we have $\operatorname{dim}_{\mathfrak{q}^{\prime}}(\bar{S} / R) \leq$ $d-i$ for all $\mathfrak{q}^{\prime} \in V\left(f_{1}, \ldots, f_{i}\right)=\operatorname{Spec}(\bar{S})$ in a neighbourhood of $\mathfrak{q}$. Thus after replacing $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ we may assume that the inequality holds for all $\mathfrak{q}^{\prime}$. The result follows from Lemma 10.128.1.

00RB Lemma 10.128.3. Let $R \rightarrow S$ is a ring map. Consider a finite homological complex of finite free $S$-modules:

$$
F_{\bullet}: 0 \rightarrow S^{n_{e}} \xrightarrow{\varphi_{e}} S^{n_{e-1}} \xrightarrow{\varphi_{e-1}} \ldots \xrightarrow{\varphi_{i+1}} S^{n_{i}} \xrightarrow{\varphi_{i}} S^{n_{i-1}} \xrightarrow{\varphi_{i-1}} \ldots \xrightarrow{\varphi_{1}} S^{n_{0}}
$$

For every prime $\mathfrak{q}$ of $S$ consider the complex $\bar{F}_{\bullet, \mathfrak{q}}=F_{\bullet, \mathfrak{q}} \otimes_{R} \kappa(\mathfrak{p})$ where $\mathfrak{p}$ is inverse image of $\mathfrak{q}$ in $R$. Assume there exists an integer $d$ such that $R \rightarrow S$ is finite type, flat with fibres $S \otimes_{R} \kappa(\mathfrak{p})$ Cohen-Macaulay of dimension $d$. The set

$$
\left\{\mathfrak{q} \in \operatorname{Spec}(S) \mid \bar{F}_{\bullet, \mathfrak{q}} \text { is exact }\right\}
$$

is open in $\operatorname{Spec}(S)$.
Proof. Let $\mathfrak{q}$ be an element of the set defined in the lemma. We are going to use Proposition 10.101 .10 to show there exists a $g \in S, g \notin \mathfrak{q}$ such that $D(g)$ is contained in the set defined in the lemma. In other words, we are going to show that after replacing $S$ by $S_{g}$, the set of the lemma is all of $\operatorname{Spec}(S)$. Thus during the proof we will, finitely often, replace $S$ by such a localization. Recall that Proposition 10.101 .10 characterizes exactness of complexes in terms of ranks of the maps $\varphi_{i}$ and the ideals $I\left(\varphi_{i}\right)$, in case the ring is local. We first address the rank condition. Set $r_{i}=n_{i}-n_{i+1}+\ldots+(-1)^{e-i} n_{e}$. Note that $r_{i}+r_{i+1}=n_{i}$ and note that $r_{i}$ is the expected rank of $\varphi_{i}$ (in the exact case).

By Lemma 10.98 .5 we see that if $\bar{F}_{\bullet, \mathfrak{q}}$ is exact, then the localization $F_{\bullet, \mathfrak{q}}$ is exact. In particular the complex $F_{\bullet}$ becomes exact after localizing by an element $g \in S$, $g \notin \mathfrak{q}$. In this case Proposition 10.101 .10 applied to all localizations of $S$ at prime ideals implies that all $\left(r_{i}+1\right) \times\left(r_{i}+1\right)$-minors of $\varphi_{i}$ are zero. Thus we see that the rank of of $\varphi_{i}$ is at most $r_{i}$.

Let $I_{i} \subset S$ denote the ideal generated by the $r_{i} \times r_{i}$-minors of the matrix of $\varphi_{i}$. By Proposition 10.101 .10 the complex $\bar{F}_{\bullet, \mathfrak{q}}$ is exact if and only if for every $1 \leq i \leq e$ we have either $\left(I_{i}\right)_{\mathfrak{q}}=S_{\mathfrak{q}}$ or $\left(I_{i}\right)_{\mathfrak{q}}$ contains a $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$-regular sequence of length $i$. Namely, by our choice of $r_{i}$ above and by the bound on the ranks of the $\varphi_{i}$ this is the only way the conditions of Proposition 10.101 .10 can be satisfied.

If $\left(I_{i}\right)_{\mathfrak{q}}=S_{\mathfrak{q}}$, then after localizing $S$ at some element $g \notin \mathfrak{q}$ we may assume that $I_{i}=S$. Clearly, this is an open condition.

If $\left(I_{i}\right)_{\mathfrak{q}} \neq S_{\mathfrak{q}}$, then we have a sequence $f_{1}, \ldots, f_{i} \in\left(I_{i}\right)_{\mathfrak{q}}$ which form a regular sequence in $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$. Note that for any prime $\mathfrak{q}^{\prime} \subset S$ such that $\left(f_{1}, \ldots, f_{i}\right) \not \subset \mathfrak{q}^{\prime}$ we have $\left(I_{i}\right)_{\mathfrak{q}^{\prime}}=S_{\mathfrak{q}^{\prime}}$. Thus the result follows from Lemma 10.128 .2 .

00RC Theorem 10.128.4. Let $R$ be a ring. Let $R \rightarrow S$ be a ring map of finite presentation. Let $M$ be a finitely presented $S$-module. The set

$$
\left\{\mathfrak{q} \in \operatorname{Spec}(S) \mid M_{\mathfrak{q}} \text { is flat over } R\right\}
$$

is open in $\operatorname{Spec}(S)$.
Proof. Let $\mathfrak{q} \in \operatorname{Spec}(S)$ be a prime. Let $\mathfrak{p} \subset R$ be the inverse image of $\mathfrak{q}$ in $R$. Note that $M_{\mathfrak{q}}$ is flat over $R$ if and only if it is flat over $R_{\mathfrak{p}}$. Let us assume that $M_{\mathfrak{q}}$ is flat over $R$. We claim that there exists a $g \in S, g \notin \mathfrak{q}$ such that $M_{g}$ is flat over $R$.

We first reduce to the case where $R$ and $S$ are of finite type over Z. Choose a directed partially ordered set $\Lambda$ and a $\operatorname{system}\left(R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}\right)$ as in Lemma 10.126.15. Set $\mathfrak{p}_{\lambda}$ equal to the inverse image of $\mathfrak{p}$ in $R_{\lambda}$. Set $\mathfrak{q}_{\lambda}$ equal to the inverse image of $\mathfrak{q}$ in $S_{\lambda}$. Then the system

$$
\left(\left(R_{\lambda}\right)_{\mathfrak{p}_{\lambda}},\left(S_{\lambda}\right)_{\mathfrak{q}_{\lambda}},\left(M_{\lambda}\right)_{\mathfrak{q}_{\lambda}}\right)
$$

is a system as in Lemma 10.126.11. Hence by Lemma 10.127 .3 we see that for some $\lambda$ the module $M_{\lambda}$ is flat over $R_{\lambda}$ at the prime $\mathfrak{q}_{\lambda}$. Suppose we can prove our claim for the system $\left(R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}, \mathfrak{q}_{\lambda}\right)$. In other words, suppose that we can find a $g \in S_{\lambda}, g \notin \mathfrak{q}_{\lambda}$ such that $\left(M_{\lambda}\right)_{g}$ is flat over $R_{\lambda}$. By Lemma 10.126 .15 we have $M=M_{\lambda} \otimes_{R_{\lambda}} R$ and hence also $M_{g}=\left(M_{\lambda}\right)_{g} \otimes_{R_{\lambda}} R$. Thus by Lemma 10.38.7 we deduce the claim for the system $(R \rightarrow S, M, \mathfrak{q})$.

At this point we may assume that $R$ and $S$ are of finite type over $\mathbf{Z}$. We may write $S$ as a quotient of a polynomial ring $R\left[x_{1}, \ldots, x_{n}\right]$. Of course, we may replace $S$ by $R\left[x_{1}, \ldots, x_{n}\right]$ and assume that $S$ is a polynomial ring over $R$. In particular we see that $R \rightarrow S$ is flat and all fibres rings $S \otimes_{R} \kappa(\mathfrak{p})$ have global dimension $n$.
Choose a resolution $F_{\bullet}$ of $M$ over $S$ with each $F_{i}$ finite free, see Lemma 10.70.1. Let $K_{n}=\operatorname{Ker}\left(F_{n-1} \rightarrow F_{n-2}\right)$. Note that $\left(K_{n}\right)_{\mathfrak{q}}$ is flat over $R$, since each $F_{i}$ is flat over $R$ and by assumption on $M$, see Lemma 10.38.13. In addition, the sequence

$$
0 \rightarrow K_{n} / \mathfrak{p} K_{n} \rightarrow F_{n-1} / \mathfrak{p} F_{n-1} \rightarrow \ldots \rightarrow F_{0} / \mathfrak{p} F_{0} \rightarrow M / \mathfrak{p} M \rightarrow 0
$$

is exact upon localizing at $\mathfrak{q}$, because of vanishing of $\operatorname{Tor}_{i}^{R_{\mathfrak{p}}}\left(\kappa(\mathfrak{p}), M_{\mathfrak{q}}\right)$. Since the global dimension of $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ is $n$ we conclude that $K_{n} / \mathfrak{p} K_{n}$ localized at $\mathfrak{q}$ is a finite free module over $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$. By Lemma $10.98 .4\left(K_{n}\right)_{\mathfrak{q}}$ is free over $S_{\mathfrak{q}}$. In particular, there exists a $g \in S, g \notin \mathfrak{q}$ such that $\left(\overline{K_{n}}\right)_{g}$ is finite free over $S_{g}$.
By Lemma 10.128 .3 there exists a further localization $S_{g}$ such that the complex

$$
0 \rightarrow K_{n} \rightarrow F_{n-1} \rightarrow \ldots \rightarrow F_{0}
$$

is exact on all fibres of $R \rightarrow S$. By Lemma 10.98 .5 this implies that the cokernel of $F_{1} \rightarrow F_{0}$ is flat. This proves the theorem in the Noetherian case.

### 10.129. Openness of Cohen-Macaulay loci

00RD In this section we characterize the Cohen-Macaulay property of finite type algebras in terms of flatness. We then use this to prove the set of points where such an algebra is Cohen-Macaulay is open.
00RE Lemma 10.129.1. Let $S$ be a finite type algebra over a field $k$. Let $\varphi: k\left[y_{1}, \ldots, y_{d}\right] \rightarrow$ $S$ be a finite ring map. As subsets of $\operatorname{Spec}(S)$ we have

$$
\left\{\mathfrak{q} \mid S_{\mathfrak{q}} \text { flat over } k\left[y_{1}, \ldots, y_{d}\right]\right\}=\left\{\mathfrak{q} \mid S_{\mathfrak{q}} C M \text { and } \operatorname{dim}_{\mathfrak{q}}(S / k)=d\right\}
$$

For notation see Definition 10.124.1.
Proof. Let $\mathfrak{q} \subset S$ be a prime. Denote $\mathfrak{p}=k\left[y_{1}, \ldots, y_{d}\right] \cap \mathfrak{q}$. Note that always $\operatorname{dim}\left(S_{\mathfrak{q}}\right) \leq \operatorname{dim}\left(k\left[y_{1}, \ldots, y_{d}\right]_{\mathfrak{p}}\right)$ by Lemma 10.124 .4 for example. Moreover, the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite and hence $\operatorname{trdeg}_{k}(\kappa(\mathfrak{p}))=\operatorname{trdeg}_{k}(\kappa(\mathfrak{q}))$.

Let $\mathfrak{q}$ be an element of the left hand side. Then Lemma 10.111 .9 applies and we conclude that $S_{\mathfrak{q}}$ is Cohen-Macaulay and $\operatorname{dim}\left(S_{\mathfrak{q}}\right)=\operatorname{dim}\left(k\left[y_{1}, \ldots, y_{d}\right]_{\mathfrak{p}}\right)$. Combined with the equality of transcendence degrees above and Lemma 10.115 .3 this implies that $\operatorname{dim}_{\mathfrak{q}}(S / k)=d$. Hence $\mathfrak{q}$ is an element of the right hand side.
Let $\mathfrak{q}$ be an element of the right hand side. By the equality of transcendence degrees above, the assumption that $\operatorname{dim}_{\mathfrak{q}}(S / k)=d$ and Lemma 10.115 .3 we conclude that $\operatorname{dim}\left(S_{\mathfrak{q}}\right)=\operatorname{dim}\left(k\left[y_{1}, \ldots, y_{d}\right]_{\mathfrak{p}}\right)$. Hence Lemma 10.127.1 applies and we see that $\mathfrak{q}$ is an element of the left hand side.

00RF Lemma 10.129.2. Let $S$ be a finite type algebra over a field $k$. The set of primes $\mathfrak{q}$ such that $S_{\mathfrak{q}}$ is Cohen-Macaulay is open in $S$.

This lemma is a special case of Lemma 10.129 .4 below, so you can skip straight to the proof of that lemma if you like.

Proof. Let $\mathfrak{q} \subset S$ be a prime such that $S_{\mathfrak{q}}$ is Cohen-Macaulay. We have to show there exists a $g \in S, g \notin \mathfrak{q}$ such that the ring $S_{g}$ is Cohen-Macaulay. For any $g \in S, g \notin \mathfrak{q}$ we may replace $S$ by $S_{g}$ and $\mathfrak{q}$ by $\mathfrak{q} S_{g}$. Combining this with Lemmas 10.114 .5 and 10.115 .3 we may assume that there exists a finite injective ring map $k\left[y_{1}, \ldots, y_{d}\right] \rightarrow S$ with $d=\operatorname{dim}\left(S_{\mathfrak{q}}\right)+\operatorname{trdeg}_{k}(\kappa(\mathfrak{q}))$. Set $\mathfrak{p}=k\left[y_{1}, \ldots, y_{d}\right] \cap \mathfrak{q}$. By construction we see that $\mathfrak{q}$ is an element of the right hand side of the displayed equality of Lemma 10.129.1. Hence it is also an element of the left hand side.
By Theorem 10.128 .4 we see that for some $g \in S, g \notin \mathfrak{q}$ the ring $S_{g}$ is flat over $k\left[y_{1}, \ldots, y_{d}\right]$. Hence by the equality of Lemma 10.129.1 again we conclude that all local rings of $S_{g}$ are Cohen-Macaulay as desired.
00RG Lemma 10.129.3. Let $k$ be a field. Let $S$ be a finite type $k$ algebra. The set of Cohen-Macaulay primes forms a dense open $U \subset \operatorname{Spec}(S)$.

Proof. The set is open by Lemma 10.129.2, It contains all minimal primes $\mathfrak{q} \subset S$ since the local ring at a minimal prime $S_{\mathfrak{q}}$ has dimension zero and hence is CohenMacaulay.

00RH Lemma 10.129.4. Let $R$ be a ring. Let $R \rightarrow S$ be of finite presentation and flat. For any $d \geq 0$ the set

$$
\left\{\begin{array}{c}
\mathfrak{q} \in \operatorname{Spec}(S) \text { such that setting } \mathfrak{p}=R \cap \mathfrak{q} \text { the fibre ring } \\
S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}} \text { is Cohen-Macaulay and } \operatorname{dim}_{\mathfrak{q}}(S / R)=d
\end{array}\right\}
$$

is open in $\operatorname{Spec}(S)$.
Proof. Let $\mathfrak{q}$ be an element of the set indicated, with $\mathfrak{p}$ the corresponding prime of $R$. We have to find a $g \in S, g \notin \mathfrak{q}$ such that all fibre rings of $R \rightarrow S_{g}$ are CohenMacaulay. During the course of the proof we may (finitely many times) replace $S$ by $S_{g}$ for a $g \in S, g \notin \mathfrak{q}$. Thus by Lemma 10.124 .2 we may assume there is a quasifinite ring map $R\left[t_{1}, \ldots, t_{d}\right] \rightarrow S$ with $d=\operatorname{dim}_{\mathfrak{q}}(S / R)$. Let $\mathfrak{q}^{\prime}=R\left[t_{1}, \ldots, t_{d}\right] \cap \mathfrak{q}$. By Lemma 10.129.1 we see that the ring map

$$
R\left[t_{1}, \ldots, t_{d}\right]_{\mathfrak{q}^{\prime}} / \mathfrak{p} R\left[t_{1}, \ldots, t_{d}\right]_{\mathfrak{q}^{\prime}} \longrightarrow S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}
$$

is flat. Hence by the critère de platitude par fibres Lemma 10.127 .8 we see that $R\left[t_{1}, \ldots, t_{d}\right]_{\mathfrak{q}^{\prime}} \rightarrow S_{\mathfrak{q}}$ is flat. Hence by Theorem 10.128.4 we see that for some $g \in S$, $g \notin \mathfrak{q}$ the ring map $R\left[t_{1}, \ldots, t_{d}\right] \rightarrow S_{g}$ is flat. Replacing $S$ by $S_{g}$ we see that for every prime $\mathfrak{r} \subset S$, setting $\mathfrak{r}^{\prime}=R\left[t_{1}, \ldots, t_{d}\right] \cap \mathfrak{r}$ and $\mathfrak{p}^{\prime}=R \cap \mathfrak{r}$ the local ring map $R\left[t_{1}, \ldots, t_{d}\right]_{\mathfrak{r}^{\prime}} \rightarrow S_{\mathfrak{r}}$ is flat. Hence also the base change

$$
R\left[t_{1}, \ldots, t_{d}\right]_{\mathfrak{r}^{\prime}} / \mathfrak{p}^{\prime} R\left[t_{1}, \ldots, t_{d}\right]_{\mathfrak{r}^{\prime}} \longrightarrow S_{\mathfrak{r}} / \mathfrak{p}^{\prime} S_{\mathfrak{r}}
$$

is flat. Hence by Lemma 10.129 .1 applied with $k=\kappa\left(\mathfrak{p}^{\prime}\right)$ we see $\mathfrak{r}$ is in the set of the lemma as desired.

00RI Lemma 10.129.5. Let $R$ be a ring. Let $R \rightarrow S$ be flat of finite presentation. The set of primes $\mathfrak{q}$ such that the fibre ring $S_{\mathfrak{q}} \otimes_{R} \kappa(\mathfrak{p})$, with $\mathfrak{p}=R \cap \mathfrak{q}$ is Cohen-Macaulay is open and dense in every fibre of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$.
Proof. The set, call it $W$, is open by Lemma 10.129.4. It is dense in the fibres because the intersection of $W$ with a fibre is the corresponding set of the fibre to which Lemma 10.129 .3 applies.

00RJ Lemma 10.129.6. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $k \subset K$ be a field extension, and set $S_{K}=K \otimes_{k} S$. Let $\mathfrak{q} \subset S$ be a prime of $S$. Let $\mathfrak{q}_{K} \subset S_{K}$ be a prime of $S_{K}$ lying over $\mathfrak{q}$. Then $S_{\mathfrak{q}}$ is Cohen-Macaulay if and only if $\left(S_{K}\right)_{\mathfrak{q}_{K}}$ is Cohen-Macaulay.

Proof. During the course of the proof we may (finitely many times) replace $S$ by $S_{g}$ for any $g \in S, g \notin \mathfrak{q}$. Hence using Lemma 10.114 .5 we may assume that $\operatorname{dim}(S)=\operatorname{dim}_{\mathfrak{q}}(S / k)=: d$ and find a finite injective map $k\left[x_{1}, \ldots, x_{d}\right] \rightarrow S$. Note that this also induces a finite injective map $K\left[x_{1}, \ldots, x_{d}\right] \rightarrow S_{K}$ by base change. By Lemma 10.115.6 we have $\operatorname{dim}_{\mathfrak{q}_{K}}\left(S_{K} / K\right)=d$. Set $\mathfrak{p}=k\left[x_{1}, \ldots, x_{d}\right] \cap \mathfrak{q}$ and $\mathfrak{p}_{K}=$ $K\left[x_{1}, \ldots, x_{d}\right] \cap \mathfrak{q}_{K}$. Consider the following commutative diagram of Noetherian local rings

By Lemma 10.129.1 we have to show that the left vertical arrow is flat if and only if the right vertical arrow is flat. Because the bottom arrow is flat this equivalence holds by Lemma 10.99.1.
00RK Lemma 10.129.7. Let $R$ be a ring. Let $R \rightarrow S$ be of finite type. Let $R \rightarrow R^{\prime}$ be any ring map. Set $S^{\prime}=R^{\prime} \otimes_{R} S$. Denote $f: \operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$ the map associated to the ring map $S \rightarrow S^{\prime}$. Set $W$ equal to the set of primes $\mathfrak{q}$ such that
the fibre ring $S_{\mathfrak{q}} \otimes_{R} \kappa(\mathfrak{p}), \mathfrak{p}=R \cap \mathfrak{q}$ is Cohen-Macaulay, and let $W^{\prime}$ denote the analogue for $S^{\prime} / R^{\prime}$. Then $W^{\prime}=f^{-1}(W)$.
Proof. Trivial from Lemma 10.129 .6 and the definitions.
00RL Lemma 10.129.8. Let $R$ be a ring. Let $R \rightarrow S$ be a ring map which is (a) flat, (b) of finite presentation, (c) has Cohen-Macaulay fibres. Then we can write $S=S_{0} \times \ldots \times S_{n}$ as a product of $R$-algebras $S_{d}$ such that each $S_{d}$ satisfies (a), (b), (c) and has all fibres equidimensional of dimension $d$.

Proof. For each integer $d$ denote $W_{d} \subset \operatorname{Spec}(S)$ the set defined in Lemma 10.129.4 Clearly we have $\operatorname{Spec}(S)=\coprod W_{d}$, and each $W_{d}$ is open by the lemma we just quoted. Hence the result follows from Lemma 10.22 .3 .

### 10.130. Differentials

00RM In this section we define the module of differentials of a ring map.
00RN Definition 10.130.1. Let $\varphi: R \rightarrow S$ be a ring map and let $M$ be an $S$-module. A derivation, or more precisely an $R$-derivation into $M$ is a map $D: S \rightarrow M$ which is additive, annihilates elements of $\varphi(R)$, and satisfies the Leibniz rule: $D(a b)=$ $a D(b)+D(a) b$.
Note that $D(r a)=r D(a)$ if $r \in R$ and $a \in S$. The set of all $R$-derivations forms an $S$-module: Given two $R$-derivations $D, D^{\prime}$ the sum $D+D^{\prime}: S \rightarrow M$, $a \mapsto D(a)+D^{\prime}(a)$ is an $R$-derivation, and given an $R$-derivation $D$ and an element $c \in S$ the scalar multiple $c D: S \rightarrow M, a \mapsto c D(a)$ is an $R$-derivation. We denote this $S$-module

$$
\operatorname{Der}_{R}(S, M)
$$

Also, if $\alpha: M \rightarrow N$ is an $S$-module map, then the composition $\alpha \circ D$ is an $R$ derivation into $N$. In this way the assignment $M \mapsto \operatorname{Der}_{R}(S, M)$ is a covariant functor.
Consider the following map of free $S$-modules

$$
\bigoplus_{(a, b) \in S^{2}} S[(a, b)] \oplus \bigoplus_{(f, g) \in S^{2}} S[(f, g)] \oplus \bigoplus_{r \in R} S[r] \longrightarrow \bigoplus_{a \in S} S[a]
$$

defined by the rules

$$
[(a, b)] \longmapsto[a+b]-[a]-[b], \quad[(f, g)] \longmapsto[f g]-f[g]-g[f], \quad[r] \longmapsto[\varphi(r)]
$$

with obvious notation. Let $\Omega_{S / R}$ be the cokernel of this map. There is a map $\mathrm{d}: S \rightarrow \Omega_{S / R}$ which maps $a$ to the class $\mathrm{d} a$ of $[a]$ in the cokernel. This is an $R$-derivation by the relations imposed on $\Omega_{S / R}$, in other words

$$
\mathrm{d}(a+b)=\mathrm{d} a+\mathrm{d} b, \quad \mathrm{~d}(f g)=f \mathrm{~d} g+g \mathrm{~d} f, \quad \mathrm{~d} r=0
$$

where $a, b, f, g \in S$ and $r \in R$.
07BK Definition 10.130.2. The pair $\left(\Omega_{S / R}, \mathrm{~d}\right)$ is called the module of Kähler differentials or the module of differentials of $S$ over $R$.

00RO Lemma 10.130.3. The module of differentials of $S$ over $R$ has the following universal property. The map

$$
\operatorname{Hom}_{S}\left(\Omega_{S / R}, M\right) \longrightarrow \operatorname{Der}_{R}(S, M), \quad \alpha \longmapsto \alpha \circ d
$$

is an isomorphism of functors.

Proof. By definition an $R$-derivation is a rule which associates to each $a \in S$ an element $D(a) \in M$. Thus $D$ gives rise to a map $[D]: \bigoplus S[a] \rightarrow M$. However, the conditions of being an $R$-derivation exactly mean that $[D]$ annihilates the image of the map in the displayed presentation of $\Omega_{S / R}$ above.
031G Lemma 10.130.4. Let $I$ be a directed partially ordered set. Let $\left(R_{i} \rightarrow S_{i}, \varphi_{i i^{\prime}}\right)$ be a system of ring maps over I, see Categories, Section 4.21. Then we have

$$
\Omega_{S / R}=\operatorname{colim}_{i} \Omega_{S_{i} / R_{i}}
$$

Proof. This is clear from the presentation of $\Omega_{S / R}$ given above.
00RP Lemma 10.130.5. Suppose that $R \rightarrow S$ is surjective. Then $\Omega_{S / R}=0$.
Proof. You can see this either because all $R$-derivations clearly have to be zero, or because the map in the presentation of $\Omega_{S / R}$ is surjective.
Suppose that

00RQ

is a commutative diagram of rings. In this case there is a natural map of modules of differentials fitting into the commutative diagram

To construct the map just use the obvious map between the presentations for $\Omega_{S / R}$ and $\Omega_{S^{\prime} / R^{\prime}}$. Namely,

$$
\begin{aligned}
& \bigoplus S^{\prime}\left[\left(a^{\prime}, b^{\prime}\right)\right] \oplus \bigoplus S^{\prime}\left[\left(f^{\prime}, g^{\prime}\right)\right] \oplus \bigoplus S^{\prime}\left[r^{\prime}\right] \longrightarrow \bigoplus S^{\prime}\left[a^{\prime}\right] \\
& {[(a, b)] \mapsto[(\varphi(a), \varphi(b))] } \\
& {[(f, g)] } \mapsto[(\varphi(f), \varphi(g))] \\
& {[r] } \mapsto[\psi(r)] \\
& \bigoplus S[(a, b)] \oplus \bigoplus S[(f, g)] \oplus \bigoplus S[r] \longrightarrow[a] \mapsto[\varphi(a)]
\end{aligned}
$$

The result is simply that $f \mathrm{~d} g \in \Omega_{S / R}$ is mapped to $\varphi(f) \mathrm{d} \varphi(g)$.
00RR Lemma 10.130.6. In diagram 10.130.5.1), suppose that $S \rightarrow S^{\prime}$ is surjective with kernel $I \subset S$. Then $\Omega_{S / R} \rightarrow \Omega_{S^{\prime} / R^{\prime}}$ is surjective with kernel generated as an $S$-module by the elements da, where $a \in S$ is such that $\varphi(a) \in \beta\left(R^{\prime}\right)$. (This includes in particular the elements $d(i), i \in I$.)

Proof. Consider the map of presentations above. Clearly the right vertical map of free modules is surjective. Thus the map is surjective. A diagram chase shows that the following elements generate the kernel as an $S$-module for sure: $i \mathrm{~d} a, i \in$ $I, a \in S$, and $\mathrm{d} a$, with $a \in S$ such that $\varphi(a)=\beta\left(r^{\prime}\right)$ for some $r^{\prime} \in R^{\prime}$. Note that $\varphi(i)=\varphi(i a)=0=\beta(0)$, and that $\mathrm{d}(i a)=i \mathrm{~d} a+a \mathrm{~d} i$. Hence $i \mathrm{~d} a=\mathrm{d}(i a)-a \mathrm{~d} i$ is an $S$-linear combination of elements of the second kind.

00RS Lemma 10.130.7. Let $A \rightarrow B \rightarrow C$ be ring maps. Then there is a canonical exact sequence

$$
C \otimes_{B} \Omega_{B / A} \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0
$$

of $C$-modules.
Proof. We get a diagram 10.130.5.1 by putting $R=A, S=C, R^{\prime}=B$, and $S^{\prime}=C$. By Lemma 10.130 .6 the map $\Omega_{C / A} \rightarrow \Omega_{C / B}$ is surjective, and the kernel is generated by the elements $\mathrm{d}(c)$, where $c \in C$ is in the image of $B \rightarrow C$. The lemma follows.

00RT Lemma 10.130.8. Let $\varphi: A \rightarrow B$ be a ring map.
(1) If $S \subset A$ is a multiplicative subset mapping to invertible elements of $B$, then $\Omega_{B / A}=\Omega_{B / S^{-1} A}$.
(2) If $S \subset B$ is a multiplicative subset then $S^{-1} \Omega_{B / A}=\Omega_{S^{-1} B / A}$.

Proof. To show the equality of (1) it is enough to show that any $A$-derivation $D: B \rightarrow M$ annihilates the elements $\varphi(s)^{-1}$. This is clear from the Leibniz rule applied to $1=\varphi(s) \varphi(s)^{-1}$. To show (2) note that there is an obvious map $S^{-1} \Omega_{B / A} \rightarrow \Omega_{S^{-1} B / A}$. To show it is an isomorphism it is enough to show that there is a $A$-derivation $\mathrm{d}^{\prime}$ of $S^{-1} B$ into $S^{-1} \Omega_{B / A}$. To define it we simply set $\mathrm{d}^{\prime}(b / s)=(1 / s) \mathrm{d} b-\left(1 / s^{2}\right) b \mathrm{~d} s$. Details omitted.

00RU Lemma 10.130.9. In diagram 10.130.5.1), suppose that $S \rightarrow S^{\prime}$ is surjective with kernel $I \subset S$, and assume that $R^{\prime}=R$. Then there is a canonical exact sequence of $S^{\prime}$-modules

$$
I / I^{2} \longrightarrow \Omega_{S / R} \otimes_{S} S^{\prime} \longrightarrow \Omega_{S^{\prime} / R} \longrightarrow 0
$$

The leftmost map is characterized by the rule that $f \in I$ maps to $d f \otimes 1$.
Proof. The middle term is $\Omega_{S / R} \otimes_{S} S / I$. For $f \in I$ denote $\bar{f}$ the image of $f$ in $I / I^{2}$. To show that the map $\bar{f} \mapsto \mathrm{~d} f \otimes 1$ is well defined we just have to check that $\mathrm{d} f_{1} f_{2} \otimes 1=0$ if $f_{1}, f_{2} \in I$. And this is clear from the Leibniz rule $\mathrm{d} f_{1} f_{2} \otimes 1=$ $\left(f_{1} \mathrm{~d} f_{2}+f_{2} \mathrm{~d} f_{1}\right) \otimes 1=\mathrm{d} f_{2} \otimes f_{1}+\mathrm{d} f_{1} \otimes f_{2}=0$. A similar computation show this map is $S^{\prime}=S / I$-linear.

The map $\Omega_{S / R} \otimes_{S} S^{\prime} \rightarrow \Omega_{S^{\prime} / R}$ is the canonical $S^{\prime}$-linear map associated to the $S$-linear map $\Omega_{S / R} \rightarrow \Omega_{S^{\prime} / R}$. It is surjective because $\Omega_{S / R} \rightarrow \Omega_{S^{\prime} / R}$ is surjective by Lemma 10.130 .6

The composite of the two maps is zero because $\mathrm{d} f$ maps to zero in $\Omega_{S^{\prime} / R}$ for $f \in I$. Note that exactness just says that the kernel of $\Omega_{S / R} \rightarrow \Omega_{S^{\prime} / R}$ is generated as an $S$ submodule by the submodule $I \Omega_{S / R}$ together with the elements $\mathrm{d} f$, with $f \in I$. We know by Lemma 10.130 .6 that this kernel is generated by the elements $\mathrm{d}(a)$ where $\varphi(a)=\beta(r)$ for some $r \in R$. But then $a=\alpha(r)+a-\alpha(r)$, so $\mathrm{d}(a)=\mathrm{d}(a-\alpha(r))$. And $a-\alpha(r) \in I$ since $\varphi(a-\alpha(r))=\varphi(a)-\varphi(\alpha(r))=\beta(r)-\beta(r)=0$. We conclude the elements $\mathrm{d} f$ with $f \in I$ already generate the kernel as an $S$-module, as desired.

02HP Lemma 10.130.10. In diagram 10.130.5.1), suppose that $S \rightarrow S^{\prime}$ is surjective with kernel $I \subset S$, and assume that $R^{\prime}=R$. Moreover, assume that there exists an
$R$-algebra map $S^{\prime} \rightarrow S$ which is a right inverse to $S \rightarrow S^{\prime}$. Then the exact sequence of $S^{\prime}$-modules of Lemma 10.130 .9 turns into a short exact sequence

$$
0 \longrightarrow I / I^{2} \longrightarrow \Omega_{S / R} \otimes_{S} S^{\prime} \longrightarrow \Omega_{S^{\prime} / R} \longrightarrow 0
$$

which is even a split short exact sequence.
Proof. Let $\beta: S^{\prime} \rightarrow S$ be the right inverse to the surjection $\alpha: S \rightarrow S^{\prime}$, so $S=I \oplus \beta\left(S^{\prime}\right)$. Clearly we can use $\beta: \Omega_{S^{\prime} / R} \rightarrow \Omega_{S / R}$, to get a right inverse to the $\operatorname{map} \Omega_{S / R} \otimes_{S} S^{\prime} \rightarrow \Omega_{S^{\prime} / R}$. On the other hand, consider the map

$$
D: S \longrightarrow I / I^{2}, \quad x \longmapsto x-\beta(\alpha(x))
$$

It is easy to show that $D$ is an $R$-derivation (omitted). Moreover $x D(s)=0$ if $x \in$ $I, s \in S$. Hence, by the universal property $D$ induces a map $\tau: \Omega_{S / R} \otimes_{R} S^{\prime} \rightarrow I / I^{2}$. We omit the verification that it is a left inverse to $\mathrm{d}: I / I^{2} \rightarrow \Omega_{S / R} \otimes_{S} S^{\prime}$. Hence we win.

02HQ Lemma 10.130.11. Let $R \rightarrow S$ be a ring map. Let $I \subset S$ be an ideal. Let $n \geq 1$ be an integer. Set $S^{\prime}=S / I^{n+1}$. The map $\Omega_{S / R} \rightarrow \Omega_{S^{\prime} / R}$ induces an isomorphism

$$
\Omega_{S / R} \otimes_{S} S / I^{n} \longrightarrow \Omega_{S^{\prime} / R} \otimes_{S^{\prime}} S / I^{n}
$$

Proof. This follows from Lemma 10.130 .9 and the fact that $\mathrm{d}\left(I^{n+1}\right) \subset I^{n} \Omega_{S / R}$ by the Leibniz rule for d .

00RV Lemma 10.130.12. Suppose that we have ring maps $R \rightarrow R^{\prime}$ and $R \rightarrow S$. Set $S^{\prime}=S \otimes_{R} R^{\prime}$, so that we obtain a diagram 10.130.5.1). Then the canonical map defined above induces an isomorphism $\Omega_{S / R} \otimes_{R} R^{\prime}=\Omega_{S^{\prime} / R^{\prime}}$.
Proof. Let d ${ }^{\prime}: S^{\prime}=S \otimes_{R} R^{\prime} \rightarrow \Omega_{S / R} \otimes_{R} R^{\prime}$ denote the map d $\left(\sum a_{i} \otimes x_{i}\right)=$ $\mathrm{d}\left(a_{i}\right) \otimes x_{i}$. It exists because the map $S \times R^{\prime} \rightarrow \Omega_{S / R} \otimes_{R} R^{\prime},(a, x) \mapsto \mathrm{d} a \otimes_{R} x$ is $R$ bilinear. This is an $R^{\prime}$-derivation, as can be verified by a simple computation. We will show that $\left(\Omega_{S / R} \otimes_{R} R^{\prime}, \mathrm{d}^{\prime}\right)$ satisfies the universal property. Let $D: S^{\prime} \rightarrow M^{\prime}$ be an $R^{\prime}$ derivation into an $S^{\prime}$-module. The composition $S \rightarrow S^{\prime} \rightarrow M^{\prime}$ is an $R$-derivation, hence we get an $S$-linear map $\varphi_{D}: \Omega_{S / R} \rightarrow M^{\prime}$. We may tensor this with $R^{\prime}$ and get the map $\varphi_{D}^{\prime}: \Omega_{S / R} \otimes_{R} R^{\prime} \rightarrow M^{\prime}, \varphi_{D}^{\prime}(\eta \otimes x)=x \varphi_{D}(\eta)$. It is clear that $D=\varphi_{D}^{\prime} \circ \mathrm{d}^{\prime}$.

The multiplication map $S \otimes_{R} S \rightarrow S$ is the $R$-algebra map which maps $a \otimes b$ to $a b$ in $S$. It is also an $S$-algebra map, if we think of $S \otimes_{R} S$ as an $S$-algebra via either of the maps $S \rightarrow S \otimes_{R} S$.

00RW Lemma 10.130.13. Let $R \rightarrow S$ be a ring map. Let $J=\operatorname{Ker}\left(S \otimes_{R} S \rightarrow S\right)$ be the kernel of the multiplication map. There is a canonical isomorphism of $S$-modules $\Omega_{S / R} \rightarrow J / J^{2}, a d b \mapsto a \otimes b-a b \otimes 1$.
Proof. First we show that the rule $a \mathrm{~d} b \mapsto a \otimes b-a b \otimes 1$ is well defined. In order to do this we have to show that $\mathrm{d} r$ and $a \mathrm{~d} b+b \mathrm{~d} a-d(a b)$ map to zero. The first because $r \otimes 1-1 \otimes r=0$ by definition of the tensor product. The second because $(a \otimes b-a b \otimes 1)+(b \otimes a-b a \otimes 1)-(1 \otimes a b-a b \otimes 1)=(a \otimes 1-1 \otimes a)(1 \otimes b-b \otimes 1)$ is in $J^{2}$.

We construct a map in the other direction. We may think of $S \rightarrow S \otimes_{R} S, a \mapsto a \otimes 1$ as the base change of $R \rightarrow S$. Hence we have $\Omega_{S \otimes_{R} S / S}=\Omega_{S / R} \otimes_{S}\left(S \otimes_{R} S\right)$, by Lemma 10.130.12. At this point the sequence of Lemma 10.130 .9 gives a map

$$
J / J^{2} \rightarrow \Omega_{S \otimes_{R} S / S} \otimes_{S \otimes_{R} S} S=\left(\Omega_{S / R} \otimes_{S}\left(S \otimes_{R} S\right)\right) \otimes_{S \otimes_{R} S} S=\Omega_{S / R}
$$

We leave it to the reader to see it is the inverse of the map above.
00RX Lemma 10.130.14. If $S=R\left[x_{1}, \ldots, x_{n}\right]$, then $\Omega_{S / R}$ is a finite free $S$-module with basis $d x_{1}, \ldots, d x_{n}$.
Proof. We first show that $\mathrm{d} x_{1}, \ldots, \mathrm{~d} x_{n}$ generate $\Omega_{S / R}$ as an $S$-module. To prove this we show that $\mathrm{d} g$ can be expressed as a sum $\sum g_{i} \mathrm{~d} x_{i}$ for any $g \in R\left[x_{1}, \ldots, x_{n}\right]$. We do this by induction on the (total) degree of $g$. It is clear if the degree of $g$ is 0 , because then $\mathrm{d} g=0$. If the degree of $g$ is $>0$, then we may write $g$ as $c+\sum g_{i} x_{i}$ with $c \in R$ and $\operatorname{deg}\left(g_{i}\right)<\operatorname{deg}(g)$. By the Leibniz rule we have $\mathrm{d} g=\sum g_{i} \mathrm{~d} x_{i}+\sum x_{i} \mathrm{~d} g_{i}$, and hence we win by induction.
Consider the $R$-derivation $\partial / \partial x_{i}: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow R\left[x_{1}, \ldots, x_{n}\right]$. (We leave it to the reader to define this; the defining property being that $\partial / \partial x_{i}\left(x_{j}\right)=\delta_{i j}$.) By the universal property this corresponds to an $S$-module map $l_{i}: \Omega_{S / R} \rightarrow R\left[x_{1}, \ldots, x_{n}\right]$ which maps $\mathrm{d} x_{i}$ to 1 and $\mathrm{d} x_{j}$ to 0 for $j \neq i$. Thus it is clear that there are no $S$-linear relations among the elements $\mathrm{d} x_{1}, \ldots, \mathrm{~d} x_{n}$.

00RY Lemma 10.130.15. Suppose $R \rightarrow S$ is of finite presentation. Then $\Omega_{S / R}$ is a finitely presented $S$-module.
Proof. Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Write $I=\left(f_{1}, \ldots, f_{m}\right)$. According to Lemma 10.130 .9 there is an exact sequence of $S$-modules

$$
I / I^{2} \rightarrow \Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R\left[x_{1}, \ldots, x_{n}\right]} S \rightarrow \Omega_{S / R} \rightarrow 0
$$

The result follows from the fact that $I / I^{2}$ is a finite $S$-module (generated by the images of the $f_{i}$ ), and that the middle term is finite free by Lemma 10.130.14.
00RZ Lemma 10.130.16. Suppose $R \rightarrow S$ is of finite type. Then $\Omega_{S / R}$ is finitely generated $S$-module.
Proof. This is very similar to, but easier than the proof of Lemma 10.130.15.

### 10.131. Finite order differential operators

09 CH In this section we introduce differential operators of finite order.
09CI Definition 10.131.1. Let $R \rightarrow S$ be a ring map. Let $M, N$ be $S$-modules. Let $k \geq 0$ be an integer. We inductively define a differential operator $D: M \rightarrow N$ of order $k$ to be an $R$-linear map such that for all $g \in S$ the map $m \mapsto D(g m)-g D(m)$ is a differential operator of order $k-1$. For the base case $k=0$ we define a differential operator of order 0 to be an $S$-linear map.
If $D: M \rightarrow N$ is a differential operator of order $k$, then for all $g \in S$ the map $g D$ is a differential operator of order $k$. The sum of two differential operators of order $k$ is another. Hence the set of all these

$$
\operatorname{Diff}^{k}(M, N)=\operatorname{Diff}_{S / R}^{k}(M, N)
$$

is an $S$-module. We have

$$
\operatorname{Diff}^{0}(M, N) \subset \operatorname{Diff}^{1}(M, N) \subset \operatorname{Diff}^{2}(M, N) \subset \ldots
$$

09CJ Lemma 10.131.2. Let $R \rightarrow S$ be a ring map. Let $L, M, N$ be $S$-modules. If $D: L \rightarrow M$ and $D^{\prime}: M \rightarrow N$ are differential operators of order $k$ and $k^{\prime}$, then $D^{\prime} \circ D$ is a differential operator of order $k+k^{\prime}$.

Proof. Let $g \in S$. Then the map which sends $x \in L$ to

$$
D^{\prime}(D(g x))-g D^{\prime}(D(x))=D^{\prime}(D(g x))-D^{\prime}(g D(x))+D^{\prime}(g D(x))-g D^{\prime}(D(x))
$$

is a sum of two compositions of differential operators of lower order. Hence the lemma follows by induction on $k+k^{\prime}$.

09CK Lemma 10.131.3. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Let $k \geq 0$. There exists an $S$-module $P_{S / R}^{k}(M)$ and a canonical isomorphism

$$
\operatorname{Diff}_{S / R}^{k}(M, N)=\operatorname{Hom}_{S}\left(P_{S / R}^{k}(M), N\right)
$$

functorial in the $S$-module $N$.
Proof. The existence of $P_{S / R}^{k}(M)$ follows from general category theoretic arguments (insert future reference here), but we will also give a construction. Set $F=\bigoplus_{m \in M} S[m]$ where $[m]$ is a symbol indicating the basis element in the summand corresponding to $m$. Given any differential operator $D: M \rightarrow N$ we obtain an $S$-linear map $L_{D}: F \rightarrow N$ sending $[m]$ to $D(m)$. If $D$ has order 0 , then $L_{D}$ annihilates the elements

$$
\left[m+m^{\prime}\right]-[m]-\left[m^{\prime}\right], \quad g_{0}[m]-\left[g_{0} m\right]
$$

where $g_{0} \in S$ and $m, m^{\prime} \in M$. If $D$ has order 1 , then $L_{D}$ annihilates the elements

$$
\left[m+m^{\prime}\right]-[m]-\left[m^{\prime}\right], \quad f[m]-[f m], \quad g_{0} g_{1}[m]-g_{0}\left[g_{1} m\right]-g_{1}\left[g_{0} m\right]+\left[g_{1} g_{0} m\right]
$$

where $f \in R, g_{0}, g_{1} \in S$, and $m \in M$. If $D$ has order $k$, then $L_{D}$ annihilates the elements $\left[m+m^{\prime}\right]-[m]-\left[m^{\prime}\right], f[m]-[f m]$, and the elements

$$
g_{0} g_{1} \ldots g_{k}[m]-\sum g_{0} \ldots \hat{g}_{i} \ldots g_{k}\left[g_{i} m\right]+\ldots+(-1)^{k+1}\left[g_{0} \ldots g_{k} m\right]
$$

Conversely, if $L: F \rightarrow N$ is an $S$-linear map annihilating all the elements listed in the previous sentence, then $m \mapsto L([m])$ is a differential operator of order $k$. Thus we see that $P_{S / R}^{k}(M)$ is the quotient of $F$ by the submodule generated by these elements.

09CL Definition 10.131.4. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. The module $P_{S / R}^{k}(M)$ constructed in Lemma 10.131 .3 is called the module of principal parts of order $k$ of $M$.

Note that the inclusions

$$
\operatorname{Diff}^{0}(M, N) \subset \operatorname{Diff}^{1}(M, N) \subset \operatorname{Diff}^{2}(M, N) \subset \ldots
$$

correspond via Yoneda's lemma (Categories, Lemma 4.3.5) to surjections

$$
\ldots \rightarrow P_{S / R}^{2}(M) \rightarrow P_{S / R}^{1}(M) \rightarrow P_{S / R}^{0}(M)=M
$$

09CM Example 10.131.5. Let $R \rightarrow S$ be a ring map and let $N$ be an $S$-module. Observe that $\operatorname{Diff}^{1}(S, N)=\operatorname{Der}_{R}(S, N) \oplus N$. Namely, if $D: S \rightarrow N$ is a differential operator of order 1 then $\sigma_{D}: S \rightarrow N$ defined by $\sigma_{D}(g):=D(g)-g D(1)$ is an $R$-derivation and $D=\sigma_{D}+\lambda_{D(1)}$ where $\lambda_{x}: S \rightarrow N$ is the linear map sending $g$ to $g x$. It follows that $P_{S / R}^{1}=\Omega_{S / R} \oplus S$ by the universal property of $\Omega_{S / R}$.

09CN Lemma 10.131.6. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. There is a canonical short exact sequence

$$
0 \rightarrow \Omega_{S / R} \otimes_{S} M \rightarrow P_{S / R}^{1}(M) \rightarrow M \rightarrow 0
$$

functorial in $M$ called the sequence of principal parts.
Proof. The map $P_{S / R}^{1}(M) \rightarrow M$ is given above. Let $N$ be an $S$-module and let $D: M \rightarrow N$ be a differential operator of order 1 . For $m \in M$ the map

$$
g \longmapsto D(g m)-g D(m)
$$

is an $R$-derivation $S \rightarrow N$ by the axioms for differential operators of order 1 . Thus it corresponds to a linear map $D_{m}: \Omega_{S / R} \rightarrow N$ determined by the rule $a \mathrm{~d} b \mapsto a D(b m)-a b D(m)$ (see Lemma 10.130.3). The map

$$
\Omega_{S / R} \times M \longrightarrow N, \quad(\eta, m) \longmapsto D_{m}(\eta)
$$

is $S$-bilinear (details omitted) and hence determines an $S$-linear map

$$
\sigma_{D}: \Omega_{S / R} \otimes_{S} M \rightarrow N
$$

In this way we obtain a map $\operatorname{Diff}^{1}(M, N) \rightarrow \operatorname{Hom}_{S}\left(\Omega_{S / R} \otimes_{S} M, N\right), D \mapsto \sigma_{D}$ functorial in $N$. By the Yoneda lemma this corresponds a map $\Omega_{S / R} \otimes_{S} M \rightarrow$ $P_{S / R}^{1}(M)$. It is immediate from the construction that this map is functorial in $M$. The sequence

$$
\Omega_{S / R} \otimes_{S} M \rightarrow P_{S / R}^{1}(M) \rightarrow M \rightarrow 0
$$

is exact because for every module $N$ the sequence

$$
0 \rightarrow \operatorname{Hom}_{S}(M, N) \rightarrow \operatorname{Diff}^{1}(M, N) \rightarrow \operatorname{Hom}_{S}\left(\Omega_{S / R} \otimes_{S} M, N\right)
$$

is exact by inspection.
To see that $\Omega_{S / R} \otimes_{S} M \rightarrow P_{S / R}^{1}(M)$ is injective we argue as follows. Choose an exact sequence

$$
0 \rightarrow M^{\prime} \rightarrow F \rightarrow M \rightarrow 0
$$

with $F$ a free $S$-module. This induces an exact sequence

$$
0 \rightarrow \operatorname{Diff}^{1}(M, N) \rightarrow \operatorname{Diff}^{1}(F, N) \rightarrow \operatorname{Diff}^{1}\left(M^{\prime}, N\right)
$$

for all $N$. This proves that in the commutative diagram

the middle column is exact. The left column is exact by right exactness of $\Omega_{S / R} \otimes_{S}$ -. By the snake lemma (see Section 10.4) it suffices to prove exactness on the left for the free module $F$. Using that $P_{S / R}^{1}(-)$ commutes with direct sums we
reduce to the case $M=S$. This case is a consequence of the discussion in Example 10.131.5.

09 CP Remark 10.131.7. Suppose given a commutative diagram of rings

a $B$-module $M$, a $B^{\prime}$-module $M^{\prime}$, and a $B$-linear map $M \rightarrow M^{\prime}$. Then we get a compatible system of module maps

These maps are compatible with further composition of maps of this type. The easiest way to see this is to use the description of the modules $P_{B / A}^{k}(M)$ in terms of generators and relations in the proof of Lemma 10.131 .3 but it can also be seen directly from the universal property of these modules. Moreover, these maps are compatible with the short exact sequences of Lemma 10.131 .6 .

### 10.132. The naive cotangent complex

00S0 Let $R \rightarrow S$ be a ring map. Denote $R[S]$ the polynomial ring whose variables are the elements $s \in S$. Let's denote $[s] \in R[S]$ the variable corresponding to $s \in S$. Thus $R[S]$ is a free $R$-module on the basis elements $\left[s_{1}\right] \ldots\left[s_{n}\right]$ where $s_{1}, \ldots, s_{n}$ is an unordered sequence of elements of $S$. There is a canonical surjection

07BL (10.132.0.1)

$$
R[S] \longrightarrow S, \quad[s] \longmapsto s
$$

whose kernel we denote $I \subset R[S]$. It is a simple observation that $I$ is generated by the elements $\left[s+s^{\prime}\right]-[s]-\left[s^{\prime}\right],[s]\left[s^{\prime}\right]-\left[s s^{\prime}\right]$ and $[r]-r$. According to Lemma 10.130 .9 there is a canonical map

07BM

$$
\begin{equation*}
I / I^{2} \longrightarrow \Omega_{R[S] / R} \otimes_{R[S]} S \tag{10.132.0.2}
\end{equation*}
$$

whose cokernel is canonically isomorphic to $\Omega_{S / R}$. Observe that the $S$-module $\Omega_{R[S] / R} \otimes_{R[S]} S$ is free on the generators d $[s]$.

07BN Definition 10.132.1. Let $R \rightarrow S$ be a ring map. The naive cotangent complex $N L_{S / R}$ is the chain complex 10.132 .0 .2

$$
N L_{S / R}=\left(I / I^{2} \longrightarrow \Omega_{R[S] / R} \otimes_{R[S]} S\right)
$$

with $I / I^{2}$ placed in (homological) degree 1 and $\Omega_{R[S] / R} \otimes_{R[S]} S$ placed in degree 0 . We will denote $H_{1}\left(L_{S / R}\right)=H_{1}\left(N L_{S / R}\right)^{9}$ the homology in degree 1 .

[^25]Before we continue let us say a few words about the actual cotangent complex (Cotangent, Section 75.3). Given a ring map $R \rightarrow S$ there exists a canonical simplicial $R$-algebra $P_{\bullet}$ whose terms are polynomial algebras and which comes equipped with a canonical homotopy equivalence

$$
P_{\bullet} \longrightarrow S
$$

The cotangent complex $L_{S / R}$ of $S$ over $R$ is defined as the chain complex associated to the cosimplicial module

$$
\Omega_{P_{\bullet} / R} \otimes_{P_{\bullet}} S
$$

The naive cotangent complex as defined above is canonically isomorphic to the truncation $\tau_{\leq 1} L_{S / R}$ (see Homology, Section 12.13 and Cotangent, Section 75.10. In particular, it is indeed the case that $H_{1}\left(N L_{S / R}\right)=H_{1}\left(L_{S / R}\right)$ so our definition is compatible with the one using the cotangent complex. Moreover, $H_{0}\left(L_{S / R}\right)=$ $H_{0}\left(N L_{S / R}\right)=\Omega_{S / R}$ as we've seen above.
Let $R \rightarrow S$ be a ring map. A presentation of $S$ over $R$ is a surjection $\alpha: P \rightarrow S$ of $R$-algebras where $P$ is a polynomial algebra (on a set of variables). Often, when $S$ is of finite type over $R$ we will indicate this by saying: "Let $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ be a presentation of $S / R$ ", or "Let $0 \rightarrow I \rightarrow R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S \rightarrow 0$ be a presentation of $S / R$ " if we want to indicate that $I$ is the kernel of the presentation. Note that the map $R[S] \rightarrow S$ used to define the naive cotangent complex is an example of a presentation.
Note that for every presentation $\alpha$ we obtain a two term chain complex of $S$-modules

$$
N L(\alpha): I / I^{2} \longrightarrow \Omega_{P / R} \otimes_{P} S
$$

Here the term $I / I^{2}$ is placed in degree 1 and the term $\Omega_{P / R} \otimes S$ is placed in degree 0 . The class of $f \in I$ in $I / I^{2}$ is mapped to $\mathrm{d} f \otimes 1$ in $\Omega_{P / R} \otimes S$. The cokernel of this complex is canonically $\Omega_{S / R}$, see Lemma 10.130 .9 . We call the complex $N L(\alpha)$ the naive cotangent complex associated to the presentation $\alpha: P \rightarrow S$ of $S / R$. Note that if $P=R[S]$ with its canonical surjection onto $S$, then we recover $N L_{S / R}$. If $P=R\left[x_{1}, \ldots, x_{n}\right]$ then will sometimes use the notation $I / I^{2} \rightarrow \bigoplus_{i=1, \ldots, n} S \mathrm{~d} x_{i}$ to denote this complex.
Suppose we are given a commutative diagram

06RQ

of rings. Let $\alpha: P \rightarrow S$ be a presentation of $S$ over $R$ and let $\alpha: P^{\prime} \rightarrow S^{\prime}$ be a presentation of $S^{\prime}$ over $R^{\prime}$. A morphism of presentations from $\alpha: P \rightarrow S$ to $\alpha^{\prime}: P^{\prime} \rightarrow S^{\prime}$ is defined to be an $R$-algebra map

$$
\varphi: P \rightarrow P^{\prime}
$$

such that $\phi \circ \alpha=\alpha^{\prime} \circ \varphi$. Note that in this case $\varphi(I) \subset I^{\prime}$, where $I=\operatorname{Ker}(\alpha)$ and $I^{\prime}=\operatorname{Ker}\left(\alpha^{\prime}\right)$. Thus $\varphi$ induces a map of $S$-modules $I / I^{2} \rightarrow I^{\prime} /\left(I^{\prime}\right)^{2}$ and by functoriality of differentials also an $S$-module map $\Omega_{P / R} \otimes S \rightarrow \Omega_{P^{\prime} / R^{\prime}} \otimes S^{\prime}$. These maps are compatible with the differentials of $N L(\alpha)$ and $N L\left(\alpha^{\prime}\right)$ and we obtain a map of naive cotangent complexes

$$
N L(\alpha) \longrightarrow N L\left(\alpha^{\prime}\right)
$$

It is often convenient to consider the induced map $N L(\alpha) \otimes_{S} S^{\prime} \rightarrow N L\left(\alpha^{\prime}\right)$.
In the special case that $P=R[S]$ and $P^{\prime}=R^{\prime}\left[S^{\prime}\right]$ the map $\phi: S \rightarrow S^{\prime}$ induces a canonical ring map $\varphi: P \rightarrow P^{\prime}$ by the rule $[s] \mapsto[\phi(s)]$. Hence the construction above determines canonical(!) maps of chain complexes

$$
N L_{S / R} \longrightarrow N L_{S^{\prime} / R^{\prime}}, \quad \text { and } \quad N L_{S / R} \otimes_{S} S^{\prime} \longrightarrow N L_{S^{\prime} / R^{\prime}}
$$

associated to the diagram 10.132 .1 .1 . Note that this construction is compatible with composition: given a commutative diagram

we see that the composition of

$$
N L_{S / R} \longrightarrow N L_{S^{\prime} / R^{\prime}} \longrightarrow N L_{S^{\prime \prime} / R^{\prime \prime}}
$$

is the map $N L_{S / R} \rightarrow N L_{S^{\prime \prime} / R^{\prime \prime}}$ given by the outer square.
It turns out that $N L(\alpha)$ is homotopy equivalent to $N L_{S / R}$ and that the maps constructed above are well defined up to homotopy (homotopies of maps of complexes are discussed in Homology, Section 12.12 but we also spell out the exact meaning of the statements in the lemma below in its proof).

00S1 Lemma 10.132.2. Suppose given a diagram 10.132.1.1). Let $\alpha: P \rightarrow S$ and $\alpha^{\prime}: P^{\prime} \rightarrow S^{\prime}$ be presentations.
(1) There exists a morphism of presentations from $\alpha$ to $\alpha^{\prime}$.
(2) Any two morphisms of presentations induce homotopic morphisms of complexes $N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right)$.
(3) The construction is compatible with compositions of morphisms of presentations (see proof for exact statement).
(4) If $R \rightarrow R^{\prime}$ and $S \rightarrow S^{\prime}$ are isomorphisms, then for any map $\varphi$ of presentations from $\alpha$ to $\alpha^{\prime}$ the induced map $N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right)$ is a homotopy equivalence and a quasi-isomorphism.
In particular, comparing $\alpha$ to the canonical presentation 10.132.0.1) we conclude there is a quasi-isomorphism $N L(\alpha) \rightarrow N L_{S / R}$ well defined up to homotopy and compatible with all functorialities (up to homotopy).

Proof. Since $P$ is a polynomial algebra over $R$ we can write $P=R\left[x_{a}, a \in A\right]$ for some set $A$. As $\alpha^{\prime}$ is surjective, we can choose for every $a \in A$ an element $f_{a} \in P^{\prime}$ such that $\alpha^{\prime}\left(f_{a}\right)=\phi\left(\alpha\left(x_{a}\right)\right)$. Let $\varphi: P=R\left[x_{a}, a \in A\right] \rightarrow P^{\prime}$ be the unique $R$-algebra map such that $\varphi\left(x_{a}\right)=f_{a}$. This gives the morphism in (1).

Let $\varphi$ and $\varphi^{\prime}$ morphisms of presentations from $\alpha$ to $\alpha^{\prime}$. Let $I=\operatorname{Ker}(\alpha)$ and $I^{\prime}=\operatorname{Ker}\left(\alpha^{\prime}\right)$. We have to construct the diagonal map $h$ in the diagram

where the vertical maps are induced by $\varphi, \varphi^{\prime}$ such that

$$
\varphi_{1}-\varphi_{1}^{\prime}=h \circ \mathrm{~d} \quad \text { and } \quad \varphi_{0}-\varphi_{0}^{\prime}=\mathrm{d} \circ h
$$

Consider the map $D=\varphi-\varphi^{\prime}: P \rightarrow P^{\prime}$. Since both $\varphi$ and $\varphi$ are compatible with $\alpha$ and $\alpha^{\prime}$ we conclude that $\varphi-\varphi^{\prime}: P \rightarrow I^{\prime}$. Also $\varphi-\varphi^{\prime}$ is $R$-linear and

$$
\left(\varphi-\varphi^{\prime}\right)(f g)=\varphi(f)\left(\varphi-\varphi^{\prime}\right)(g)+\left(\varphi-\varphi^{\prime}\right)(f) \varphi^{\prime}(g)
$$

Hence the induced map $D: P \rightarrow I^{\prime} /\left(I^{\prime}\right)^{2}$ is a $R$-derivation. Thus we obtain a canonical map $h: \Omega_{P / R} \otimes_{P} S \rightarrow I^{\prime} /\left(I^{\prime}\right)^{2}$ such that $D=h \circ \mathrm{~d}$. A calculation (omitted) shows that $h$ is the desired homotopy.
Suppose that we have a commutative diagram

and that
(1) $\alpha: P \rightarrow S$,
(2) $\alpha^{\prime}: P^{\prime} \rightarrow S^{\prime}$, and
(3) $\alpha^{\prime \prime}: P^{\prime \prime} \rightarrow S^{\prime \prime}$
are presentations. Suppose that
(1) $\varphi: P \rightarrow P$ is a morphism of presentations from $\alpha$ to $\alpha^{\prime}$ and
(2) $\varphi^{\prime}: P^{\prime} \rightarrow P^{\prime \prime}$ is a morphism of presentations from $\alpha^{\prime}$ to $\alpha^{\prime \prime}$.

Then it is immediate that $\varphi^{\prime} \circ \varphi: P \rightarrow P^{\prime \prime}$ is a morphism of presentations from $\alpha$ to $\alpha^{\prime \prime}$ and that the induced map $N L(\alpha) \rightarrow N L\left(\alpha^{\prime \prime}\right)$ of naive cotangent complexes is the composition of the maps $N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right)$ and $N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right)$ induced by $\varphi$ and $\varphi^{\prime}$.

In the simple case of complexes with 2 terms a quasi-isomorphism is just a map that induces an isomorphism on both the cokernel and the kernel of the maps between the terms. Note that homotopic maps of 2 term complexes (as explained above) define the same maps on kernel and cokernel. Hence if $\varphi$ is a map from a presentation $\alpha$ of $S$ over $R$ to itself, then the induced map $N L(\alpha) \rightarrow N L(\alpha)$ is a quasi-isomorphism being homotopic to the identity by part (2). To prove (4) in full generality, consider a morphism $\varphi^{\prime}$ from $\alpha^{\prime}$ to $\alpha$ which exists by (1). The compositions $N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right) \rightarrow N L(\alpha)$ and $N L\left(\alpha^{\prime}\right) \rightarrow N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right)$ are homotopic to the identity maps by (3), hence these maps are homotopy equivalences by definition. It follows formally that both maps $N L(\alpha) \rightarrow N L\left(\alpha^{\prime}\right)$ and $N L\left(\alpha^{\prime}\right) \rightarrow$ $N L(\alpha)$ are quasi-isomorphisms. Some details omitted.

08Q1 Lemma 10.132.3. Let $A \rightarrow B$ be a polynomial algebra. Then $N L_{B / A}$ is homotopy equivalent to the chain complex $\left(0 \rightarrow \Omega_{B / A}\right)$ with $\Omega_{B / A}$ in degree 0 .
Proof. Follows from Lemma 10.132 .2 and the fact that $\operatorname{id}_{B}: B \rightarrow B$ is a presentation of $B$ over $A$ with zero kernel.

The following lemma is part of the motivation for introducing the naive cotangent complex. The cotangent complex extends this to a genuine long exact cohomology sequence. If $B \rightarrow C$ is a local complete intersection, then one can extend the sequence with a zero on the left, see More on Algebra, Lemma 15.25.6.

00S2 Lemma 10.132.4 (Jacobi-Zariski sequence). Let $A \rightarrow B \rightarrow C$ be ring maps. Choose a presentation $\alpha: A\left[x_{s}, s \in S\right] \rightarrow B$ with kernel $I$. Choose a presentation $\beta:$ $B\left[y_{t}, t \in T\right] \rightarrow C$ with kernel $J$. Let $\gamma: A\left[x_{s}, y_{t}\right] \rightarrow C$ be the induced presentation of $C$ with kernel $K$. Then we get a canonical commutative diagram

with exact rows. We get the following exact sequence of homology groups
$H_{1}\left(N L_{B / A} \otimes_{B} C\right) \rightarrow H_{1}\left(L_{C / A}\right) \rightarrow H_{1}\left(L_{C / B}\right) \rightarrow C \otimes_{B} \Omega_{B / A} \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0$ of $C$-modules extending the sequence of Lemma 10.130.7. If $\operatorname{Tor}_{1}^{B}\left(\Omega_{B / A}, C\right)=0$, then $H_{1}\left(N L_{B / A} \otimes_{B} C\right)=H_{1}\left(L_{B / A}\right) \otimes_{B} C$.
Proof. The precise definition of the maps is omitted. The exactness of the top row follows as the $\mathrm{d} x_{s}, \mathrm{~d} y_{t}$ form a basis for the middle module. The map $\gamma$ factors

$$
A\left[x_{s}, y_{t}\right] \rightarrow B\left[y_{t}\right] \rightarrow C
$$

with surjective first arrow and second arrow equal to $\beta$. Thus we see that $K \rightarrow J$ is surjective. Moreover, the kernel of the first displayed arrow is $I A\left[x_{s}, y_{t}\right]$. Hence $I / I^{2} \otimes C$ surjects onto the kernel of $K / K^{2} \rightarrow J / J^{2}$. Finally, we can use Lemma 10.132 .2 to identify the terms as homology groups of the naive cotangent complexes. The final assertion follows as the degree 0 term of the complex $N L_{B / A}$ is a free $B$ module.

07VC Remark 10.132.5. Let $A \rightarrow B$ and $\phi: B \rightarrow C$ be ring maps. Then the composition $N L_{B / A} \rightarrow N L_{C / A} \rightarrow N L_{C / B}$ is homotopy equivalent to zero. Namely, this composition is the functoriality of the naive cotangent complex for the square

Write $J=\operatorname{Ker}(B[C] \rightarrow C)$. An explicit homotopy is given by the map $\Omega_{A[B] / A} \otimes_{A}$ $B \rightarrow J / J^{2}$ which maps the basis element d $[b]$ to the class of $[\phi(b)]-b$ in $J / J^{2}$.

07BP Lemma 10.132.6. Let $A \rightarrow B$ be a surjective ring map with kernel $I$. Then $N L_{B / A}$ is homotopy equivalent to the chain complex $\left(I / I^{2} \rightarrow 0\right)$ with $I / I^{2}$ in degree 1. In particular $H_{1}\left(L_{B / A}\right)=I / I^{2}$.

Proof. Follows from Lemma 10.132 .2 and the fact that $A \rightarrow B$ is a presentation of $B$ over $A$.

065 V Lemma 10.132.7. Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $A \rightarrow C$ is surjective (so also $B \rightarrow C$ is). Denote $I=\operatorname{Ker}(A \rightarrow C)$ and $J=\operatorname{Ker}(B \rightarrow C)$. Then the sequence

$$
I / I^{2} \rightarrow J / J^{2} \rightarrow \Omega_{B / A} \otimes_{B} B / J \rightarrow 0
$$

is exact.
Proof. Follows from Lemma 10.132 .4 and the description of the naive cotangent complexes $N L_{C / B}$ and $N L_{C / A}$ in Lemma 10.132.6.

00S4 Lemma 10.132.8 (Flat base change). Let $R \rightarrow S$ be a ring map. Let $\alpha: P \rightarrow S$ be a presentation. Let $R \rightarrow R^{\prime}$ be a flat ring map. Let $\alpha^{\prime}: P^{\prime} \otimes_{R} R^{\prime} \rightarrow S^{\prime}=S \otimes_{R} R^{\prime}$ be the induced presentation. Then $N L(\alpha) \otimes_{R} R^{\prime}=N L(\alpha) \otimes_{S} S^{\prime}=N L\left(\alpha^{\prime}\right)$. In particular, the canonical map

$$
N L_{S / R} \otimes_{R} R^{\prime} \longrightarrow N L_{S \otimes_{R} R^{\prime} / R^{\prime}}
$$

is a homotopy equivalence if $R \rightarrow R^{\prime}$ is flat.
Proof. This is true because $\operatorname{Ker}\left(\alpha^{\prime}\right)=R^{\prime} \otimes_{R} \operatorname{Ker}(\alpha)$ since $R \rightarrow R^{\prime}$ is flat.
07BQ Lemma 10.132.9. Let $R_{i} \rightarrow S_{i}$ be a system of ring maps over the directed partially ordered set $I$. Set $R=\operatorname{colim} R_{i}$ and $S=\operatorname{colim} S_{i}$. Then $N L_{S / R}=\operatorname{colim} N L_{S_{i} / R_{i}}$.
Proof. Recall that $N L_{S / R}$ is the complex $I / I^{2} \rightarrow \bigoplus_{s \in S} S \mathrm{~d}[s]$ where $I \subset R[S]$ is the kernel of the canonical presentation $R[S] \rightarrow S$. Now it is clear that $R[S]=$ $\operatorname{colim} R_{i}\left[S_{i}\right]$ and similarly that $I=\operatorname{colim} I_{i}$ where $I_{i}=\operatorname{Ker}\left(R_{i}\left[S_{i}\right] \rightarrow S_{i}\right)$. Hence the lemma is clear.

07BR Lemma 10.132.10. If $S \subset A$ is a multiplicative subset of $A$, then $N L_{S^{-1} A / A}$ is homotopy equivalent to the zero complex.
Proof. Since $A \rightarrow S^{-1} A$ is flat we see that $N L_{S^{-1} A / A} \otimes_{A} S^{-1} A \rightarrow N L_{S^{-1} A / S^{-1} A}$ is a homotopy equivalence by flat base change (Lemma 10.132.8). Since the source of the arrow is isomorphic to $N L_{S^{-1} A / A}$ and the target of the arrow is zero (by Lemma 10.132.6 we win.
07BS Lemma 10.132.11. Let $S \subset A$ is a multiplicative subset of $A$. Let $S^{-1} A \rightarrow B$ be a ring map. Then $N L_{B / A} \rightarrow N L_{B / S^{-1} A}$ is an homotopy equivalence.
Proof. Choose a presentation $\alpha: P \rightarrow B$ of $B$ over $A$. Then $\beta: S^{-1} P \rightarrow B$ is a presentation of $B$ over $S^{-1} A$. A direct computation shows that we have $N L(\alpha)=$ $N L(\beta)$ which proves the lemma as the naive cotangent complex is well defined up to homotopy by Lemma 10.132 .2 .

08JZ Lemma 10.132.12. Let $A \rightarrow B$ be a ring map. Let $g \in B$. Suppose $\alpha: P \rightarrow B$ is a presentation with kernel $I$. Then a presentation of $B_{g}$ over $A$ is the map

$$
\beta: P[x] \longrightarrow B_{g}
$$

extending $\alpha$ and sending $x$ to $1 / g$. The kernel $J$ of $\beta$ is generated by $I$ and the element $f x-1$ where $f \in P$ is an element mapped to $g \in B$ by $\alpha$. In this situation we have
(1) $J / J^{2}=\left(I / I^{2}\right)_{g} \oplus B_{g}(f x-1)$,
(2) $\Omega_{P[x] / A} \otimes_{P[x]} B_{g}=\Omega_{P / A} \otimes_{P} B_{g} \oplus B_{g} d x$,
(3) $N L(\beta)=N L(\alpha) \otimes_{B} B_{g} \oplus\left(B_{g} \xrightarrow{g} B_{g}\right)$

Hence the canonical map $N L_{B / A} \otimes_{B} B_{g} \rightarrow N L_{B_{g} / A}$ is a homotopy equivalence.
Proof. Since $P[x] /(I, f x-1)=B[x] /(g x-1)=B_{g}$ we get the statement about $I$ and $f x-1$ generating $J$. To prove the other statements one can use the commutative diagram

with exact rows of Lemma 10.132 .4 . Then the only question left over is: why is $\left(I / I^{2}\right)_{g} \rightarrow J / J^{2}$ injective? It is enough to show that $\alpha\left(I \cap J^{2}\right)=0$ where $\alpha: I \rightarrow I_{f} / I_{f}^{2}$ is the canonical map. So consider the extension of $\alpha$ to the $P$ algebra map $\pi: P[x] \rightarrow P_{f} / I_{f}^{2}$ given by $\pi(x)=1 / f$, and note that $\pi\left(J^{2}\right)=$ $\pi(J)^{2}=\pi(I[x])^{2}=0$, since $\pi(f x-1)=0$ implies $\pi(J)=\pi(I[x])$.

00S7 Lemma 10.132.13. Let $A \rightarrow B$ be a ring map. Let $S \subset B$ be a multiplicative subset. The canonical map $N L_{B / A} \otimes_{B} S^{-1} B \rightarrow N L_{S^{-1} B / A}$ is a quasi-isomorphism.

Proof. We have $S^{-1} B=\operatorname{colim}_{g \in S} B_{g}$ where we think of $S$ as a directed partially ordered set (ordering by divisibility), see Lemma 10.9.9. By Lemma 10.132.12 each of the maps $N L_{B / A} \otimes_{B} B_{g} \rightarrow N L_{B_{g} / A}$ are quasi-isomorphisms. The lemma follows from Lemma 10.132 .9 .

00S3 Lemma 10.132.14. Let $R$ be a ring. Let $A_{1} \rightarrow A_{0}$, and $B_{1} \rightarrow B_{0}$ be two two term complexes. Suppose that there exist morphisms of complexes $\varphi: A_{\bullet} \rightarrow B_{\bullet}$ and $\psi: B_{\bullet} \rightarrow A_{\bullet}$ such that $\varphi \circ \psi$ and $\psi \circ \varphi$ are homotopic to the identity maps. Then $A_{1} \oplus B_{0} \cong B_{1} \oplus A_{0}$ as $R$-modules.

Proof. Choose a map $h: A_{0} \rightarrow B_{1}$ such that

$$
\operatorname{id}_{A_{1}}-\psi_{1} \circ \varphi_{1}=h \circ d_{A} \text { and } \operatorname{id}_{A_{0}}-\psi_{0} \circ \varphi_{0}=d_{A} \circ h
$$

Similarly, choose a map $h^{\prime}: B_{0} \rightarrow A_{1}$ such that

$$
\operatorname{id}_{B_{1}}-\varphi_{1} \circ \psi_{1}=h \circ d_{B} \text { and } \operatorname{id}_{B_{0}}-\varphi_{0} \circ \psi_{0}=d_{B} \circ h
$$

A trivial computation shows that

$$
\left(\begin{array}{cc}
\operatorname{id}_{A_{1}} & -h^{\prime} \circ \psi_{1}+h \circ \psi_{0} \\
0 & \operatorname{id}_{B_{0}}
\end{array}\right)=\left(\begin{array}{cc}
\psi_{1} & h \\
-d_{B} & \varphi_{0}
\end{array}\right)\left(\begin{array}{cc}
\varphi_{1} & -h^{\prime} \\
d_{A} & \psi_{0}
\end{array}\right)
$$

This shows that both matrices on the right hand side are invertible and proves the lemma.

00S5 Lemma 10.132.15. Let $R \rightarrow S$ be a ring map of finite type. For any presentations $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$, and $\beta: R\left[y_{1}, \ldots, y_{m}\right] \rightarrow S$ we have

$$
I / I^{2} \oplus S^{\oplus m} \cong J / J^{2} \oplus S^{\oplus n}
$$

as $S$-modules where $I=\operatorname{Ker}(\alpha)$ and $J=\operatorname{Ker}(\beta)$.
Proof. See Lemmas 10.132 .2 and 10.132 .14
00S6 Lemma 10.132.16. Let $R \rightarrow S$ be a ring map of finite type. Let $g \in S$. For any presentations $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$, and $\beta: R\left[y_{1}, \ldots, y_{m}\right] \rightarrow S_{g}$ we have

$$
\left(I / I^{2}\right)_{g} \oplus S_{g}^{\oplus m} \cong J / J^{2} \oplus S_{g}^{\oplus n}
$$

as $S_{g}$-modules where $I=\operatorname{Ker}(\alpha)$ and $J=\operatorname{Ker}(\beta)$.
Proof. By Lemma 10.132 .15 , we see that it suffices to prove this for a single choice of $\alpha$ and $\beta$. Thus we may take $\beta$ the presentation of Lemma 10.132 .12 and the result is clear.

### 10.133. Local complete intersections

00S8 The property of being a local complete intersection is somehow an intrinsic property of a Noetherian local ring. However, for the moment we just define this property for finite type algebras over a field.
00S9 Definition 10.133.1. Let $k$ be a field. Let $S$ be a finite type $k$-algebra.
(1) We say that $S$ is a global complete intersection over $k$ if there exists a presentation $S=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ such that $\operatorname{dim}(S)=n-c$.
(2) We say that $S$ is a local complete intersection over $k$ if there exists a covering $\operatorname{Spec}(S)=\bigcup D\left(g_{i}\right)$ such that each of the rings $S_{g_{i}}$ is a global complete intersection over $k$.
We will also use the convention that the zero ring is a global complete intersection over $k$.

Suppose $S$ is a global complete intersection $S=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ as in the definition. Recall that $\operatorname{dim}(S)=n-c$ means that all irreducible components of $\operatorname{Spec}(S)$ have dimension $\leq n-c$. Since all maximal ideals of the polynomial ring have local rings of dimension $n$ we conclude that all irreducible components of $\operatorname{Spec}(S)$ have dimension $\geq n-c$. See $\operatorname{Section} 10.59$. In other words, $\operatorname{Spec}(S)$ is equidimensional of dimension $n-c$.
00SA Lemma 10.133.2. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $g \in S$.
(1) If $S$ is a global complete intersection so is $S_{g}$.
(2) If $S$ is a local complete intersection so is $S_{g}$.

Proof. The second statement follows immediately from the first. For the first, say that $S=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ with $n-c=\operatorname{dim}(S)$. By the remarks above $S$ is equidimensional of dimension $n-c$, so $\operatorname{dim}\left(S_{g}\right)=n-c$ as well (or it is the zero ring in which case the lemma is true by convention). Let $g^{\prime} \in$ $k\left[x_{1}, \ldots, x_{n}\right]$ be an element whose residue class corresponds to $g$. Then $S_{g}=$ $k\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, x_{n+1} g^{\prime}-1\right)$ as desired.

00SB Lemma 10.133.3. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. If $S$ is a local complete intersection, then $S$ is a Cohen-Macaulay ring.

Proof. Choose a maximal prime $\mathfrak{m}$ of $S$. We have to show that $S_{\mathfrak{m}}$ is CohenMacaulay. By assumption we may assume $S=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ with $\operatorname{dim}(S)=n-c$. Let $\mathfrak{m}^{\prime} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the maximal ideal corresponding to $\mathfrak{m}$. According to Proposition 10.113 .2 the local ring $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$ is regular local of dimension $n$. In particular it is Cohen-Macaulay by Lemma 10.105.3. By dimension theory (see Section 10.59 the ring $S_{\mathfrak{m}}=k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}} /\left(f_{1}, \ldots, f_{c}\right)$ has dimension $\geq n-c$. By assumption $\operatorname{dim}\left(S_{\mathfrak{m}}\right) \leq n-c$. Thus we get equality. This implies that $f_{1}, \ldots, f_{c}$ is a regular sequence in $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$ and that $S_{\mathfrak{m}}$ is Cohen-Macaulay, see Proposition 10.102.5.

The following is the technical key to the rest of the material in this section. An important feature of this lemma is that we may choose any presentation for the ring $S$, but that condition (1) does not depend on this choice.

00SC Lemma 10.133.4. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{q}$ be a prime of $S$. Choose any presentation $S=k\left[x_{1}, \ldots, x_{n}\right] / I$. Let $\mathfrak{q}^{\prime}$ be the prime
of $k\left[x_{1}, \ldots, x_{n}\right]$ corresponding to $\mathfrak{q}$. Set $c=\operatorname{height}\left(\mathfrak{q}^{\prime}\right)-\operatorname{height}(\mathfrak{q})$, in other words $\operatorname{dim}_{\mathfrak{q}}(S)=n-c$ (see Lemma 10.115.4). The following are equivalent
(1) There exists a $g \in S, g \notin \mathfrak{q}$ such that $S_{g}$ is a global complete intersection over $k$.
(2) The ideal $I_{\mathfrak{q}^{\prime}} \subset k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$ can be generated by $c$ elements.
(3) The conormal module $\left(I / I^{2}\right)_{\mathfrak{q}}$ can be generated by c elements over $S_{\mathfrak{q}}$.
(4) The conormal module $\left(I / I^{2}\right)_{\mathfrak{q}}$ is a free $S_{\mathfrak{q}}$-module of rank c.
(5) The ideal $I_{\mathfrak{q}^{\prime}}$ can be generated by a regular sequence in the regular local ring $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$.
In this case any celements of $I_{\mathfrak{q}^{\prime}}$ which generate $I_{\mathfrak{q}^{\prime}} / \mathfrak{q}^{\prime} I_{\mathfrak{q}^{\prime}}$ form a regular sequence in the local ring $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$.
Proof. Set $R=k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$. This is a Cohen-Macaulay local ring of dimension $\operatorname{height}\left(\mathfrak{q}^{\prime}\right)$, see for example Lemma 10.133.3. Moreover, $\bar{R}=R / I R=R / I_{\mathfrak{q}^{\prime}}=S_{\mathfrak{q}}$ is a quotient of dimension height $(\mathfrak{q})$. Let $f_{1}, \ldots, f_{c} \in I_{\mathfrak{q}^{\prime}}$ be elements which generate $\left(I / I^{2}\right)_{\mathfrak{q}}$. By Lemma 10.19.1 we see that $f_{1}, \ldots, f_{c}$ generate $I_{\mathfrak{q}^{\prime}}$. Since the dimensions work out, we conclude by Proposition 10.102 .5 that $f_{1}, \ldots, f_{c}$ is a regular sequence in $R$. By Lemma 10.68 .2 we see that $\left(I / I^{2}\right)_{\mathfrak{q}}$ is free. These arguments show that (2), (3), (4) are equivalent and that they imply the last statement of the lemma, and therefore they imply (5).
If (5) holds, say $I_{\mathfrak{q}^{\prime}}$ is generated by a regular sequence of length $e$, then height $(\mathfrak{q})=$ $\operatorname{dim}\left(S_{\mathfrak{q}}\right)=\operatorname{dim}\left(k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}\right)-e=\operatorname{height}\left(\mathfrak{q}^{\prime}\right)-e$ by dimension theory, see Section 10.59 . We conclude that $e=c$. Thus (5) implies (2).

We continue with the notation introduced in the first paragraph. For each $f_{i}$ we may find $d_{i} \in k\left[x_{1}, \ldots, x_{n}\right], d_{i} \notin \mathfrak{q}^{\prime}$ such that $f_{i}^{\prime}=d_{i} f_{i} \in k\left[x_{1}, \ldots, x_{n}\right]$. Then it is still true that $I_{\mathfrak{q}^{\prime}}=\left(f_{1}^{\prime}, \ldots, f_{c}^{\prime}\right) R$. Hence there exists a $g^{\prime} \in k\left[x_{1}, \ldots, x_{n}\right], g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $I_{g^{\prime}}=\left(f_{1}^{\prime}, \ldots, f_{c}^{\prime}\right)$. Moreover, pick $g^{\prime \prime} \in k\left[x_{1}, \ldots, x_{n}\right], g^{\prime \prime} \notin \mathfrak{q}^{\prime}$ such that $\operatorname{dim}\left(S_{g^{\prime \prime}}\right)=\operatorname{dim}_{\mathfrak{q}} \operatorname{Spec}(S)$. By Lemma 10.115 .4 this dimension is equal to $n-c$. Finally, set $g$ equal to the image of $g^{\prime} g^{\prime \prime}$ in $S$. Then we see that

$$
S_{g} \cong k\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}^{\prime}, \ldots, f_{c}^{\prime}, x_{n+1} g^{\prime} g^{\prime \prime}-1\right)
$$

and by our choice of $g^{\prime \prime}$ this ring has dimension $n-c$. Therefore it is a global complete intersection. Thus each of (2), (3), and (4) implies (1).
Assume (1). Let $S_{g} \cong k\left[y_{1}, \ldots, y_{m}\right] /\left(f_{1}, \ldots, f_{t}\right)$ be a presentation of $S_{g}$ as a global complete intersection. Write $J=\left(f_{1}, \ldots, f_{t}\right)$. Let $\mathfrak{q}^{\prime \prime} \subset k\left[y_{1}, \ldots, y_{m}\right]$ be the prime corresponding to $\mathfrak{q} S_{g}$. Note that $t=m-\operatorname{dim}\left(S_{g}\right)=\operatorname{height}\left(\mathfrak{q}^{\prime \prime}\right)-\operatorname{height}(\mathfrak{q})$, see Lemma 10.115 .4 for the last equality. As seen in the proof of Lemma 10.133 .3 (and also above) the elements $f_{1}, \ldots, f_{t}$ form a regular sequence in the local ring $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{q}^{\prime \prime}}$. By Lemma 10.68 .2 we see that $\left(J / J^{2}\right)_{\mathfrak{q}}$ is free of rank $t$. By Lemma 10.132.16 we have

$$
J / J^{2} \oplus S_{g}^{n} \cong\left(I / I^{2}\right)_{g} \oplus S_{g}^{m}
$$

Thus $\left(I / I^{2}\right)_{\mathfrak{q}}$ is free of rank $t+n-m=m-\operatorname{dim}\left(S_{g}\right)+n-m=n-\operatorname{dim}\left(S_{g}\right)=$ $\operatorname{height}\left(\mathfrak{q}^{\prime}\right)-\operatorname{height}(\mathfrak{q})=c$. Thus we obtain (4).

The result of Lemma 10.133 .4 suggests the following definition.
00SD Definition 10.133.5. Let $k$ be a field. Let $S$ be a local $k$-algebra essentially of finite type over $k$. We say $S$ is a complete intersection (over $k$ ) if there exists a local $k$-algebra $R$ and elements $f_{1}, \ldots, f_{c} \in \mathfrak{m}_{R}$ such that
(1) $R$ is essentially of finite type over $k$,
(2) $R$ is a regular local ring,
(3) $f_{1}, \ldots, f_{c}$ form a regular sequence in $R$, and
(4) $S \cong R /\left(f_{1}, \ldots, f_{c}\right)$ as $k$-algebras.

By the Cohen structure theorem (see Theorem 10.152.8) any complete Noetherian local ring may be written as the quotient of some regular complete local ring. Hence we may use the definition above to define the notion of a complete intersection ring for any complete Noetherian local ring. We will discuss this in Divided Power Algebra, Section 23.8. In the meantime the following lemma shows that such a definition makes sense.

00SE Lemma 10.133.6. Let $A \rightarrow B \rightarrow C$ be surjective local ring homomorphisms. Assume $A$ and $B$ are regular local rings. The following are equivalent
(1) $\operatorname{Ker}(A \rightarrow C)$ is generated by a regular sequence,
(2) $\operatorname{Ker}(A \rightarrow C)$ is generated by $\operatorname{dim}(A)-\operatorname{dim}(C)$ elements,
(3) $\operatorname{Ker}(B \rightarrow C)$ is generated by a regular sequence, and
(4) $\operatorname{Ker}(B \rightarrow C)$ is generated by $\operatorname{dim}(B)-\operatorname{dim}(C)$ elements.

Proof. A regular local ring is Cohen-Macaulay, see Lemma 10.105.3. Hence the equivalences $(1) \Leftrightarrow(2)$ and $(3) \Leftrightarrow(4)$, see Proposition 10.102.5. By Lemma 10.105.4 the ideal $\operatorname{Ker}(A \rightarrow B)$ can be generated by $\operatorname{dim}(A)-\operatorname{dim}(B)$ elements. Hence we see that (4) implies (2).

It remains to show that (1) implies (4). We do this by induction on $\operatorname{dim}(A)-\operatorname{dim}(B)$. The case $\operatorname{dim}(A)-\operatorname{dim}(B)=0$ is trivial. Assume $\operatorname{dim}(A)>\operatorname{dim}(B)$. Write $I=\operatorname{Ker}(A \rightarrow C)$ and $J=\operatorname{Ker}(A \rightarrow B)$. Note that $J \subset I$. Our assumption is that the minimal number of generators of $I$ is $\operatorname{dim}(A)-\operatorname{dim}(C)$. Let $\mathfrak{m} \subset A$ be the maximal ideal. Consider the maps

$$
J / \mathfrak{m} J \rightarrow I / \mathfrak{m} I \rightarrow \mathfrak{m} / \mathfrak{m}^{2}
$$

By Lemma 10.105 .4 and its proof the composition is injective. Take any element $x \in J$ which is not zero in $J / \mathfrak{m} J$. By the above and Nakayama's lemma $x$ is an element of a minimal set of generators of $I$. Hence we may replace $A$ by $A / x A$ and $I$ by $I / x A$ which decreases both $\operatorname{dim}(A)$ and the minimal number of generators of $I$ by 1 . Thus we win.

00SF Lemma 10.133.7. Let $k$ be a field. Let $S$ be a local $k$-algebra essentially of finite type over $k$. The following are equivalent:
(1) $S$ is a complete intersection over $k$,
(2) for any surjection $R \rightarrow S$ with $R$ a regular local ring essentially of finite presentation over $k$ the ideal $\operatorname{Ker}(R \rightarrow S)$ can be generated by a regular sequence,
(3) for some surjection $R \rightarrow S$ with $R$ a regular local ring essentially of finite presentation over $k$ the ideal $\operatorname{Ker}(R \rightarrow S)$ can be generated by $\operatorname{dim}(R)-$ $\operatorname{dim}(S)$ elements,
(4) there exists a global complete intersection $A$ over $k$ and a prime $\mathfrak{a}$ of $A$ such that $S \cong A_{\mathfrak{a}}$, and
(5) there exists a local complete intersection $A$ over $k$ and a prime $\mathfrak{a}$ of $A$ such that $S \cong A_{\mathfrak{a}}$.

Proof. It is clear that (2) implies (1) and (1) implies (3). It is also clear that (4) implies (5). Let us show that (3) implies (4). Thus we assume there exists a surjection $R \rightarrow S$ with $R$ a regular local ring essentially of finite presentation over $k$ such that the ideal $\operatorname{Ker}(R \rightarrow S)$ can be generated by $\operatorname{dim}(R)-\operatorname{dim}(S)$ elements. We may write $R=\left(k\left[x_{1}, \ldots, x_{n}\right] / J\right)_{\mathfrak{q}}$ for some $J \subset k\left[x_{1}, \ldots, x_{n}\right]$ and some prime $\mathfrak{q} \subset k\left[x_{1}, \ldots, x_{n}\right]$ with $J \subset \mathfrak{q}$. Let $I \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the kernel of the map $k\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ so that $S \cong\left(k\left[x_{1}, \ldots, x_{n}\right] / I\right)_{\mathfrak{q}}$. By assumption $(I / J)_{\mathfrak{q}}$ is generated by $\operatorname{dim}(R)-\operatorname{dim}(S)$ elements. We conclude that $I_{\mathfrak{q}}$ can be generated by $\operatorname{dim}\left(k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}\right)-\operatorname{dim}(S)$ elements by Lemma 10.133.6. From Lemma 10.133.4 we see that for some $g \in k\left[x_{1}, \ldots, x_{n}\right], g \notin \mathfrak{q}$ the algebra $\left(k\left[x_{1}, \ldots, x_{n}\right] / I\right)_{g}$ is a global complete intersection and $S$ is isomorphic to a local ring of it.

To finish the proof of the lemma we have to show that (5) implies (2). Assume (5) and let $\pi: R \rightarrow S$ be a surjection with $R$ a regular local $k$-algebra essentially of finite type over $k$. By assumption we have $S=A_{\mathfrak{a}}$ for some local complete intersection $A$ over $k$. Choose a presentation $R=\left(k\left[y_{1}, \ldots, y_{m}\right] / J\right)_{\mathfrak{q}}$ with $J \subset \mathfrak{q} \subset k\left[y_{1}, \ldots, y_{m}\right]$. We may and do assume that $J$ is the kernel of the map $k\left[y_{1}, \ldots, y_{m}\right] \rightarrow R$. Let $I \subset k\left[y_{1}, \ldots, y_{m}\right]$ be the kernel of the map $k\left[y_{1}, \ldots, y_{m}\right] \rightarrow S=A_{\mathfrak{a}}$. Then $J \subset I$ and $(I / J)_{\mathfrak{q}}$ is the kernel of the surjection $\pi: R \rightarrow S$. So $S=\left(k\left[y_{1}, \ldots, y_{m}\right] / I\right)_{\mathfrak{q}}$.
By Lemma 10.125 .7 we see that there exist $g \in A, g \notin \mathfrak{a}$ and $g^{\prime} \in k\left[y_{1}, \ldots, y_{m}\right]$, $g^{\prime} \notin \mathfrak{q}$ such that $A_{g} \cong\left(k\left[y_{1}, \ldots, y_{m}\right] / I\right)_{g^{\prime}}$. After replacing $A$ by $A_{g}$ and $k\left[y_{1}, \ldots, y_{m}\right]$ by $k\left[y_{1}, \ldots, y_{m+1}\right]$ we may assume that $A \cong k\left[y_{1}, \ldots, y_{m}\right] / I$. Consider the surjective maps of local rings

$$
k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{q}} \rightarrow R \rightarrow S
$$

We have to show that the kernel of $R \rightarrow S$ is generated by a regular sequence. By Lemma 10.133 .4 we know that $k\left[y_{1}, \ldots, y_{m}\right]_{\mathfrak{q}} \rightarrow A_{\mathfrak{a}}=S$ has this property (as $A$ is a local complete intersection over $k$ ). We win by Lemma 10.133.6.

00SG Lemma 10.133.8. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{q}$ be $a$ prime of $S$. The following are equivalent:
(1) The local ring $S_{\mathfrak{q}}$ is a complete intersection ring (Definition 10.133.5).
(2) There exists a $g \in S, g \notin \mathfrak{q}$ such that $S_{g}$ is a local complete intersection over $k$.
(3) There exists a $g \in S, g \notin \mathfrak{q}$ such that $S_{g}$ is a global complete intersection over $k$.
(4) For any presentation $S=k\left[x_{1}, \ldots, x_{n}\right] / I$ with $\mathfrak{q}^{\prime} \subset k\left[x_{1}, \ldots, x_{n}\right]$ corresponding to $\mathfrak{q}$ any of the equivalent conditions (1) - (5) of Lemma 10.133.4 hold.

Proof. This is a combination of Lemmas 10.133.4 and 10.133.7 and the definitions.

00SH Lemma 10.133.9. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. The following are equivalent:
(1) The ring $S$ is a local complete intersection over $k$.
(2) All local rings of $S$ are complete intersection rings over $k$.
(3) All localizations of $S$ at maximal ideals are complete intersection rings over $k$.

Proof. This follows from Lemma 10.133 .8 the fact that $\operatorname{Spec}(S)$ is quasi-compact and the definitions.

The following lemma says that being a complete intersection is preserved under change of base field (in a strong sense).
00SI Lemma 10.133.10. Let $k \subset K$ be a field extension. Let $S$ be a finite type algebra over $k$. Let $\mathfrak{q}_{K}$ be a prime of $S_{K}=K \otimes_{k} S$ and let $\mathfrak{q}$ be the corresponding prime of $S$. Then $S_{\mathfrak{q}}$ is a complete intersection over $k$ (Definition 10.133.5) if and only if $\left(S_{K}\right)_{\mathfrak{q}_{K}}$ is a complete intersection over $K$.
Proof. Choose a presentation $S=k\left[x_{1}, \ldots, x_{n}\right] / I$. This gives a presentation $S_{K}=K\left[x_{1}, \ldots, x_{n}\right] / I_{K}$ where $I_{K}=K \otimes_{k} I$. Let $\mathfrak{q}_{K}^{\prime} \subset K\left[x_{1}, \ldots, x_{n}\right]$, resp. $\mathfrak{q}^{\prime} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the corresponding prime. We will show that the equivalent conditions of Lemma 10.133 .4 hold for the pair ( $S=k\left[x_{1}, \ldots, x_{n}\right] / I, \mathfrak{q}$ ) if and only if they hold for the pair $\left(S_{K}=K\left[x_{1}, \ldots, x_{n}\right] / I_{K}, \mathfrak{q}_{K}\right)$. The lemma will follow from this (see Lemma 10.133.8).
By Lemma 10.115 .6 we have $\operatorname{dim}_{\mathfrak{q}} S=\operatorname{dim}_{\mathfrak{q}_{K}} S_{K}$. Hence the integer $c$ occurring in Lemma 10.133 .4 is the same for the pair ( $S=k\left[x_{1}, \ldots, x_{n}\right] / I, \mathfrak{q}$ ) as for the pair $\left(S_{K}=K\left[x_{1}, \ldots, x_{n}\right] / I_{K}, \mathfrak{q}_{K}\right)$. On the other hand we have

$$
\begin{aligned}
I \otimes_{k\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}^{\prime}\right) \otimes_{\kappa\left(\mathfrak{q}^{\prime}\right)} \kappa\left(\mathfrak{q}_{K}^{\prime}\right) & =I \otimes_{k\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}_{K}^{\prime}\right) \\
& =I \otimes_{k\left[x_{1}, \ldots, x_{n}\right]} K\left[x_{1}, \ldots, x_{n}\right] \otimes_{K\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}_{K}^{\prime}\right) \\
& =\left(K \otimes_{k} I\right) \otimes_{K\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}_{K}^{\prime}\right) \\
& =I_{K} \otimes_{K\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}_{K}^{\prime}\right)
\end{aligned}
$$

Therefore, $\operatorname{dim}_{\kappa\left(\mathfrak{q}^{\prime}\right)} I \otimes_{k\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}^{\prime}\right)=\operatorname{dim}_{\kappa\left(\mathfrak{q}_{K}^{\prime}\right)} I_{K} \otimes_{K\left[x_{1}, \ldots, x_{n}\right]} \kappa\left(\mathfrak{q}_{K}^{\prime}\right)$. Thus it follows from Nakayama's Lemma 10.19.1 that the minimal number of generators of $I_{\mathfrak{q}^{\prime}}$ is the same as the minimal number of generators of $\left(I_{K}\right)_{\mathfrak{q}_{K}^{\prime}}$. Thus the lemma follows from characterization (2) of Lemma 10.133.4.
00SJ Lemma 10.133.11. Let $k \rightarrow K$ be a field extension. Let $S$ be a finite type $k$ algebra. Then $S$ is a local complete intersection over $k$ if and only if $S \otimes_{k} K$ is a local complete intersection over $K$.

Proof. This follows from a combination of Lemmas 10.133 .9 and 10.133 .10 . But we also give a different proof here (based on the same principles).
Set $S^{\prime}=S \otimes_{k} K$. Let $\alpha: k\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ be a presentation with kernel $I$. Let $\alpha^{\prime}: K\left[x_{1}, \ldots, x_{n}\right] \rightarrow S^{\prime}$ be the induced presentation with kernel $I^{\prime}$.
Suppose that $S$ is a local complete intersection. Pick a prime $\mathfrak{q} \subset S^{\prime}$. Denote $\mathfrak{q}^{\prime}$ the corresponding prime of $K\left[x_{1}, \ldots, x_{n}\right], \mathfrak{p}$ the corresponding prime of $S$, and $\mathfrak{p}^{\prime}$ the corresponding prime of $k\left[x_{1}, \ldots, x_{n}\right]$. Consider the following diagram of Noetherian local rings

By Lemma 10.133 .4 we know that $S_{\mathfrak{p}}$ is cut out by some regular sequence $f_{1}, \ldots, f_{e}$ in $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{p}^{\prime}}$. Since the right vertical arrow is flat we see that the images of
$f_{1}, \ldots, f_{c}$ form a regular sequence in $K\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$. Because tensoring with $K$ over $k$ is an exact functor we have $S_{\mathfrak{q}}^{\prime}=K\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}} /\left(f_{1}, \ldots, f_{e}\right)$. Hence by Lemma 10.133.4 again we see that $S^{\prime}$ is a local complete intersection in a neighbourhood of $\mathfrak{q}$. Since $\mathfrak{q}$ was arbitrary we see that $S^{\prime}$ is a local complete intersection over $K$.

Suppose that $S^{\prime}$ is a local complete intersection. Pick a maximal ideal $\mathfrak{m}$ of $S$. Let $\mathfrak{m}^{\prime}$ denote the corresponding maximal ideal of $k\left[x_{1}, \ldots, x_{n}\right]$. Denote $\kappa=\kappa(\mathfrak{m})$ the residue field. By Remark 10.16 .8 the primes of $S^{\prime}$ lying over $\mathfrak{m}$ correspond to primes in $K \otimes_{k} \kappa$. By the Hilbert-Nullstellensatz Theorem 10.33.1 we have $[\kappa: k]<\infty$. Hence $K \otimes_{k} \kappa$ is finite nonzero over $K$. Hence $K \otimes_{k} \kappa$ has a finite number $>0$ of primes which are all maximal, each of which has a residue field finite over $K$ (see Section 10.52 ). Hence there are finitely many $>0$ prime ideals $\mathfrak{n} \subset S^{\prime}$ lying over $\mathfrak{m}$, each of which is maximal and has a residue field which is finite over $K$. Pick one, say $\mathfrak{n} \subset S^{\prime}$, and let $\mathfrak{n}^{\prime} \subset K\left[x_{1}, \ldots, x_{n}\right]$ denote the corresponding prime ideal of $K\left[x_{1}, \ldots, x_{n}\right]$. Note that since $V\left(\mathfrak{m} S^{\prime}\right)$ is finite, we see that $\mathfrak{n}$ is an isolated closed point of it, and we deduce that $\mathfrak{m} S_{\mathfrak{n}}^{\prime}$ is an ideal of definition of $S_{\mathfrak{n}}^{\prime}$. This implies that $\operatorname{dim}\left(S_{\mathfrak{m}}\right) \geq \operatorname{dim}\left(S_{\mathfrak{n}}^{\prime}\right)$, for example by Lemma 10.111 .6 or by the characterization of dimension in terms of minimal number of generators of ideal of definition, see Section 10.59 . (In reality the dimensions are equal but we do not need this.) Consider the corresponding diagram of Noetherian local rings

According to Lemma 10.132 .8 we have $N L(\alpha) \otimes_{S} S^{\prime}=N L\left(\alpha^{\prime}\right)$, in particular $I^{\prime} /\left(I^{\prime}\right)^{2}=I / I^{2} \otimes_{S} S^{\prime}$. Thus $\left(I / I^{2}\right)_{\mathfrak{m}} \otimes_{S_{\mathfrak{m}}} \kappa$ and $\left(I^{\prime} /\left(I^{\prime}\right)^{2}\right)_{\mathfrak{n}} \otimes_{S_{\mathfrak{n}}^{\prime}} \kappa(\mathfrak{n})$ have the same dimension. Since $\left(I^{\prime} /\left(I^{\prime}\right)^{2}\right)_{\mathfrak{n}}$ is free of rank $n-\operatorname{dim} S_{\mathfrak{n}}^{\prime}$ we deduce that $\left(I / I^{2}\right)_{\mathfrak{m}}$ can be generated by $n-\operatorname{dim} S_{\mathfrak{n}}^{\prime} \leq n-\operatorname{dim} S_{\mathfrak{m}}$ elements. By Lemma 10.133 .4 we see that $S$ is a local complete intersection in a neighbourhood of $\mathfrak{m}$. Since $\mathfrak{m}$ was any maximal ideal we conclude that $S$ is a local complete intersection.

We end with a lemma which we will later use to prove that given ring maps $T \rightarrow$ $A \rightarrow B$ where $B$ is syntomic over $T$, and $B$ is syntomic over $A$, then $A$ is syntomic over $T$.

02JP Lemma 10.133.12. Let

be a commutative square of local rings. Assume
(1) $R$ and $\bar{S}=S / \mathfrak{m}_{R} S$ are regular local rings,
(2) $A=R / I$ and $B=S / J$ for some ideals $I, J$,
(3) $J \subset S$ and $\bar{J}=J / \mathfrak{m}_{R} \cap J \subset \bar{S}$ are generated by regular sequences, and
(4) $A \rightarrow B$ and $R \rightarrow S$ are flat.

Then $I$ is generated by a regular sequence.

Proof. Set $\bar{B}=B / \mathfrak{m}_{R} B=B / \mathfrak{m}_{A} B$ so that $\bar{B}=\bar{S} / \bar{J}$. Let $f_{1}, \ldots, f_{\bar{c}} \in J$ be elements such that $\bar{f}_{1}, \ldots, \bar{f}_{\bar{c}} \in \bar{J}$ form a regular sequence generating $\bar{J}$. Note that $\bar{c}=\operatorname{dim}(\bar{S})-\operatorname{dim}(\bar{B})$, see Lemma 10.133.6. By Lemma 10.98.3 the ring $S /\left(f_{1}, \ldots, f_{\bar{c}}\right)$ is flat over $R$. Hence $S /\left(f_{1}, \ldots, f_{\bar{c}}\right)+I S$ is flat over $A$. The map $S /\left(f_{1}, \ldots, f_{\bar{c}}\right)+I S \rightarrow B$ is therefore a surjection of finite $S / I S$-modules flat over $A$ which is an isomorphism modulo $\mathfrak{m}_{A}$, and hence an isomorphism by Lemma 10.98.1. In other words, $J=\left(f_{1}, \ldots, f_{\bar{c}}\right)+I S$.
By Lemma 10.133 .6 again the ideal $J$ is generated by a regular sequence of $c=$ $\operatorname{dim}(S)-\operatorname{dim}(B)$ elements. Hence $J / \mathfrak{m}_{S} J$ is a vector space of dimension $c$. By the description of $J$ above there exist $g_{1}, \ldots, g_{c-\bar{c}} \in I$ such that $J$ is generated by $f_{1}, \ldots, f_{\bar{c}}, g_{1}, \ldots, g_{c-\bar{c}}$ (use Nakayama's Lemma 10.19.1). Consider the ring $A^{\prime}=$ $R /\left(g_{1}, \ldots, g_{c-\bar{c}}\right)$ and the surjection $A^{\prime} \rightarrow A$. We see from the above that $B=$ $S /\left(f_{1}, \ldots, f_{\bar{c}}, g_{1}, \ldots, g_{c-\bar{c}}\right)$ is flat over $A^{\prime}\left(\right.$ as $S /\left(f_{1}, \ldots, f_{\bar{c}}\right)$ is flat over $\left.R\right)$. Hence $A^{\prime} \rightarrow B$ is injective (as it is faithfully flat, see Lemma 10.38.17). Since this map factors through $A$ we get $A^{\prime}=A$. Note that $\operatorname{dim}(B)=\operatorname{dim}(A)+\operatorname{dim}(\bar{B})$, and $\operatorname{dim}(S)=\operatorname{dim}(R)+\operatorname{dim}(\bar{S})$, see Lemma 10.111.7. Hence $c-\bar{c}=\operatorname{dim}(R)-\operatorname{dim}(A)$ by elementary algebra. Thus $I=\left(g_{1}, \ldots, g_{c-\bar{c}}\right)$ is generated by a regular sequence according to Lemma 10.133 .6 .

### 10.134. Syntomic morphisms

00SK Syntomic ring maps are flat finitely presented ring maps all of whose fibers are local complete intersections. We discuss general local complete intersection ring maps in More on Algebra, Section 15.25

00SL Definition 10.134.1. A ring map $R \rightarrow S$ is called syntomic, or we say $S$ is a flat local complete intersection over $R$ if it is flat, of finite presentation, and if all of its fibre rings $S \otimes_{R} \kappa(\mathfrak{p})$ are local complete intersections, see Definition 10.133.1.

Clearly, an algebra over a field is syntomic over the field if and only if it is a local complete intersection. Here is a pleasing feature of this definition.

00SM Lemma 10.134.2. Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. Set $S^{\prime}=R^{\prime} \otimes_{R} S$. Then $R \rightarrow S$ is syntomic if and only if $R^{\prime} \rightarrow S^{\prime}$ is syntomic.

Proof. By Lemma 10.125 .2 and Lemma 10.38 .8 this holds for the property of being flat and for the property of being of finite presentation. The map $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow$ $\operatorname{Spec}(R)$ is surjective, see Lemma 10.38 .16 . Thus it suffices to show given primes $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p} \subset R$ that $S \otimes_{R} \kappa(\mathfrak{p})$ is a local complete intersection if and only if $S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)$ is a local complete intersection. Note that $S^{\prime} \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)=$ $S \otimes_{R} \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{p}^{\prime}\right)$. Thus Lemma 10.133.11 applies.

00SN Lemma 10.134.3. Any base change of a syntomic map is syntomic.
Proof. This is true for being flat, for being of finite presentation, and for having local complete intersections as fibres by Lemmas 10.38.7, 10.6.2 and 10.133.11.

00 SO Lemma 10.134.4. Let $R \rightarrow S$ be a ring map. Suppose we have $g_{1}, \ldots g_{m} \in S$ which generate the unit ideal such that each $R \rightarrow S_{g_{i}}$ is syntomic. Then $R \rightarrow S$ is syntomic.

Proof. This is true for being flat and for being of finite presentation by Lemmas 10.38 .19 and 10.23 .3 . The property of having fibre rings which are local complete intersections is local on $S$ by its very definition, see Definition 10.133.1.

00SP Definition 10.134.5. Let $R \rightarrow S$ be a ring map. We say that $R \rightarrow S$ is a relative global complete intersection if we are given a presentation $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ such that every nonempty fibre has dimension $n-c$.

The following lemma is occasionally useful to find global presentations.
07CF Lemma 10.134.6. Let $S$ be a finitely presented $R$-algebra which has a presentation $S=R\left[x_{1}, \ldots, x_{n}\right] / I$ such that $I / I^{2}$ is free over $S$. Then $S$ has a presentation $S=R\left[y_{1}, \ldots, y_{m}\right] /\left(f_{1}, \ldots, f_{c}\right)$ such that $\left(f_{1}, \ldots, f_{c}\right) /\left(f_{1}, \ldots, f_{c}\right)^{2}$ is free with basis given by the classes of $f_{1}, \ldots, f_{c}$.
Proof. Note that $I$ is a finitely generated ideal by Lemma 10.6.3. Let $f_{1}, \ldots, f_{c} \in I$ be elements which map to a basis of $I / I^{2}$. By Nakayama's lemma (Lemma 10.19.1) there exists a $g \in 1+I$ such that

$$
g \cdot I \subset\left(f_{1}, \ldots, f_{c}\right)
$$

Hence we see that

$$
S \cong R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)[1 / g] \cong R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, g x_{n+1}-1\right)
$$

as desired. It follows that $f_{1}, \ldots, f_{c}, g x_{n+1}-1$ form a basis for $\left(f_{1}, \ldots, f_{c}, g x_{n+1}-\right.$ 1)/ $\left(f_{1}, \ldots, f_{c}, g x_{n+1}-1\right)^{2}$ for example by applying Lemma 10.132 .12 .

00SQ Example 10.134.7. Let $n, m \geq 1$ be integers. Consider the ring map

$$
\begin{aligned}
R=\mathbf{Z}\left[a_{1}, \ldots, a_{n+m}\right] & \longrightarrow S=\mathbf{Z}\left[b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{m}\right] \\
a_{1} & \longmapsto b_{1}+c_{1} \\
a_{2} & \longmapsto b_{2}+b_{1} c_{1}+c_{2} \\
\ldots & \cdots \\
a_{n+m} & \longmapsto b_{n} c_{m}
\end{aligned}
$$

In other words, this is the unique ring map of polynomial rings as indicated such that the polynomial factorization

$$
x^{n}+a_{1} x^{n-1}+\ldots+a_{n+m}=\left(x^{n}+b_{1} x^{n-1}+\ldots+b_{n}\right)\left(x^{m}+c_{1} x^{m-1}+\ldots+c_{m}\right)
$$

holds. Note that $S$ is generated by $n+m$ elements over $R$ (namely, $b_{i}, c_{j}$ ) and that there are $n+m$ equations (namely $a_{k}=a_{k}\left(b_{i}, c_{j}\right)$ ). In order to show that $S$ is a relative global complete intersection over $R$ it suffices to prove that all fibres have dimension 0 .

To prove this, let $R \rightarrow k$ be a ring map into a field $k$. Say $a_{i}$ maps to $\alpha_{i} \in k$. Consider the fibre ring $S_{k}=k \otimes_{R} S$. Let $k \rightarrow K$ be a field extension. A $k$-algebra map of $S_{k} \rightarrow K$ is the same thing as finding $\beta_{1}, \ldots, \beta_{n}, \gamma_{1}, \ldots, \gamma_{m} \in K$ such that
$x^{n}+\alpha_{1} x^{n-1}+\ldots+\alpha_{n+m}=\left(x^{n}+\beta_{1} x^{n-1}+\ldots+\beta_{n}\right)\left(x^{m}+\gamma_{1} x^{m-1}+\ldots+\gamma_{m}\right)$.
Hence we see there are at most finitely many choices of such $n+m$-tuples in $K$. This proves that all fibres have finitely many closed points (use Hilbert's Nullstellensatz to see they all correspond to solutions in $\bar{k}$ for example) and hence that $R \rightarrow S$ is a relative global complete intersection.

Another way to argue this is to show $\mathbf{Z}\left[a_{1}, \ldots, a_{n+m}\right] \rightarrow \mathbf{Z}\left[b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{m}\right]$ is actually also a finite ring map. Namely, by Lemma 10.37 .5 each of $b_{i}, c_{j}$ is integral over $R$, and hence $R \rightarrow S$ is finite by Lemma 10.35 .4
00SR Example 10.134.8. Consider the ring map

$$
\begin{aligned}
& R=\mathbf{Z}\left[a_{1}, \ldots, a_{n}\right] \longrightarrow S=\mathbf{Z}\left[\alpha_{1}, \ldots, \alpha_{n}\right] \\
& a_{1} \longmapsto \alpha_{1}+\ldots+\alpha_{n} \\
& \ldots \cdots \\
& a_{n} \longmapsto \\
& \alpha_{1} \ldots \alpha_{n}
\end{aligned}
$$

In other words this is the unique ring map of polynomial rings as indicated such that

$$
x^{n}+a_{1} x^{n-1}+\ldots+a_{n}=\prod_{i=1}^{n}\left(x+\alpha_{i}\right)
$$

holds in $\mathbf{Z}\left[\alpha_{i}, x\right]$. Another way to say this is that $a_{i}$ maps to the $i$ th elementary symmetric function in $\alpha_{1}, \ldots, \alpha_{n}$. Note that $S$ is generated by $n$ elements over $R$ subject to $n$ equations. Hence to show that $S$ is a global relative complete intersection over $R$ we have to show that the fibre rings $S \otimes_{R} \kappa(\mathfrak{p})$ have dimension 0 . This follows as in Example 10.134 .7 because the ring map $\mathbf{Z}\left[a_{1}, \ldots, a_{n}\right] \rightarrow$ $\mathbf{Z}\left[\alpha_{1}, \ldots, \alpha_{n}\right]$ is actually finite since each $\alpha_{i} \in S$ satisfies the monic equation $x^{n}-$ $a_{1} x^{n-1}+\ldots+(-1)^{n} a_{n}$ over $R$.
03HS Lemma 10.134.9. Suppose that $A$ is a ring, and $P(x)=x^{n}+b_{1} x^{n-1}+\ldots+b_{n} \in$ $A \backslash x\rfloor$ is a monic polynomial over $A$. Then there exists a syntomic, finite locally free, faithfully flat ring extension $A \subset A^{\prime}$ such that $P(x)=\prod_{i=1, \ldots, n}\left(x-\beta_{i}\right)$ for certain $\beta_{i} \in A^{\prime}$.
Proof. Take $A^{\prime}=A \otimes_{R} S$, where $R$ and $S$ are as in Example 10.134.8, where $R \rightarrow A$ maps $a_{i}$ to $b_{i}$, and let $\beta_{i}=-1 \otimes \alpha_{i}$.

00SS Lemma 10.134.10. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ be a relative global complete intersection over $R$.
(1) For any $R \rightarrow R^{\prime}$ the base change $R^{\prime} \otimes_{R} S=R^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a relative global complete intersection.
(2) For any $g \in S$ which is the image of $h \in R\left[x_{1}, \ldots, x_{n}\right]$ the ring $S_{g}=$ $R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, h x_{n+1}-1\right)$ is a relative global complete intersection.
(3) If $R \rightarrow S$ factors as $R \rightarrow R_{f} \rightarrow S$ for some $f \in R$. Then the ring $S=R_{f}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a relative global complete intersection over $R_{f}$.

Proof. By Lemma 10.115 .5 the fibres of a base change have the same dimension as the fibres of the original map. Moreover $R^{\prime} \otimes_{R} R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)=$ $R^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$. Thus (1) follows. The proof of (2) is that the localization at one element can be described as $S_{g} \cong S\left[x_{n+1}\right] /\left(g x_{n+1}-1\right)$. Assertion (3) follows from (1) since under the assumptions of (3) we have $R_{f} \otimes_{R} S \cong S$.
00ST Lemma 10.134.11. Let $R$ be a ring. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$. We will find $h \in R\left[x_{1}, \ldots, x_{n}\right]$ which maps to $g \in S$ such that

$$
S_{g}=R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, h x_{n+1}-1\right)
$$

is a relative global complete intersection over $R$ in each of the following cases:
(1) Let $I \subset R$ be an ideal. If the fibres of $\operatorname{Spec}(S / I S) \rightarrow \operatorname{Spec}(R / I)$ have dimension $n-c$, then we can find $(h, g)$ as above such that $g$ maps to $1 \in S / I S$.
(2) Let $\mathfrak{p} \subset R$ be a prime. If $\operatorname{dim}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)=n-c$, then we can find $(h, g)$ as above such that $g$ maps to a unit of $S \otimes_{R} \kappa(\mathfrak{p})$.
(3) Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. If $\operatorname{dim}_{\mathfrak{q}}(S / R)=n-c$, then we can find $(h, g)$ as above such that $g \notin \mathfrak{q}$.

Proof. Ad (1). By Lemma 10.124 .6 there exists an open subset $W \subset \operatorname{Spec}(S)$ containing $V(I S)$ such that all fibres of $W \rightarrow \operatorname{Spec}(R)$ have dimension $\leq n-c$. Say $W=\operatorname{Spec}(S) \backslash V(J)$. Then $V(J) \cap V(I S)=\emptyset$ hence we can find a $g \in J$ which maps to $1 \in S / I S$. Let $h \in R\left[x_{1}, \ldots, x_{n}\right]$ be any preimage of $g$.
Ad (2). By Lemma 10.124 .6 there exists an open subset $W \subset \operatorname{Spec}(S)$ containing $\operatorname{Spec}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)$ such that all fibres of $W \rightarrow \operatorname{Spec}(R)$ have dimension $\leq n-c$. Say $W=\operatorname{Spec}(S) \backslash V(J)$. Then $V\left(J \cdot S \otimes_{R} \kappa(\mathfrak{p})\right)=\emptyset$. Hence we can find a $g \in J$ which maps to a unit in $S \otimes_{R} \kappa(\mathfrak{p})$ (details omitted). Let $h \in R\left[x_{1}, \ldots, x_{n}\right]$ be any preimage of $g$.
Ad (3). By Lemma 10.124 .6 there exists a $g \in S, g \notin \mathfrak{q}$ such that all nonempty fibres of $R \rightarrow S_{g}$ have dimension $\leq n-c$. Let $h \in R\left[x_{1}, \ldots, x_{n}\right]$ be any element that maps to $g$.
The following lemma says we can do absolute Noetherian approximation for relative complete intersections.
00SU Lemma 10.134.12. Let $R$ be a ring. Let $S$ be a relative global complete intersection with presentation $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$. There exist a finite type Z-subalgebra $R_{0} \subset R$ such that $f_{i} \in R_{0}\left[x_{1}, \ldots, x_{n}\right]$ and such that

$$
S_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

is a relative global intersection over $R_{0}$.
Proof. Let $R_{0} \subset R$ be the $\mathbf{Z}$-algebra of $R$ generated by all the coefficients of the polynomials $f_{1}, \ldots, f_{c}$. Let $S_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$. Clearly, $S=R \otimes_{R_{0}} S_{0}$. Pick a prime $\mathfrak{q} \subset S$ and denote $\mathfrak{p} \subset R, \mathfrak{q}_{0} \subset S_{0}$, and $\mathfrak{p}_{0} \subset R_{0}$ the primes it lies over. Because $\operatorname{dim}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)=n-c$ we also have $\operatorname{dim}\left(S_{0} \otimes_{R_{0}} \kappa\left(\mathfrak{p}_{0}\right)\right)=n-c$, see Lemma 10.115.5. By Lemma 10.124 .6 there exists a $g \in S_{0}, g \notin \mathfrak{q}_{0}$ such that all nonempty fibres of $R_{0} \rightarrow\left(S_{0}\right)_{g}$ have dimension $\leq n-c$. As $\mathfrak{q}$ was arbitrary and $\operatorname{Spec}(S)$ quasi-compact, we can find finitely many $g_{1}, \ldots, g_{m} \in S_{0}$ such that (a) for $j=1, \ldots, m$ the nonempty fibres of $R_{0} \rightarrow\left(S_{0}\right)_{g_{j}}$ have dimension $\leq n-c$ and (b) the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}\left(S_{0}\right)$ is contained in $D\left(g_{1}\right) \cup \ldots \cup D\left(g_{m}\right)$. In other words, the images of $g_{1}, \ldots, g_{m}$ in $S=R \otimes_{R_{0}} S_{0}$ generate the unit ideal. After increasing $R_{0}$ we may assume that $g_{1}, \ldots, g_{m}$ generate the unit ideal in $S_{0}$. By (a) the nonempty fibres of $R_{0} \rightarrow S_{0}$ all have dimension $\leq n-c$ and we conclude.
00SV Lemma 10.134.13. Let $R$ be a ring. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ be a relative global complete intersection. For every prime $\mathfrak{q}$ of $S$, let $\mathfrak{q}^{\prime}$ denote the corresponding prime of $R\left[x_{1}, \ldots, x_{n}\right]$. Then
(1) $f_{1}, \ldots, f_{c}$ is a regular sequence in the local ring $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$,
(2) each of the rings $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}} /\left(f_{1}, \ldots, f_{i}\right)$ is flat over $R$, and
(3) the $S$-module $\left(f_{1}, \ldots, f_{c}\right) /\left(f_{1}, \ldots, f_{c}\right)^{2}$ is free with basis given by the elements $f_{i} \bmod \left(f_{1}, \ldots, f_{c}\right)^{2}$.

Proof. First, by Lemma 10.68.2, part (3) follows from part (1). Parts (1) and (2) immediately reduce to the Noetherian case by Lemma 10.134 .12 (some minor details omitted). Assume $R$ is Noetherian. By Lemma 10.133.4 for example we see that $f_{1}, \ldots, f_{c}$ form a regular sequence in the local ring $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}} \otimes_{R}$ $\kappa(\mathfrak{p})$. Moreover, the local ring $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$ is flat over $R_{\mathfrak{p}}$. Since $R$, and hence $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}^{\prime}}$ is Noetherian we may apply Lemma 10.98 .3 to conclude.
00SW Lemma 10.134.14. A relative global complete intersection is syntomic, i.e., flat.
Proof. Let $R \rightarrow S$ be a relative global complete intersection. The fibres are global complete intersections, and $S$ is of finite presentation over $R$. Thus the only thing to prove is that $R \rightarrow S$ is flat. This is true by (2) of Lemma 10.134 .13 .
00SY Lemma 10.134.15. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of $R$. The following are equivalent:
(1) There exists an element $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is syntomic.
(2) There exists an element $g \in S, g \notin \mathfrak{q}$ such that $S_{g}$ is a relative global complete intersection over $R$.
(3) There exists an element $g \in S, g \notin \mathfrak{q}$, such that $R \rightarrow S_{g}$ is of finite presentation, the local ring map $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is flat, and the local ring $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ is a complete intersection ring over $\kappa(\mathfrak{p})$ (see Definition 10.133.5).
Proof. The implication $(1) \Rightarrow(3)$ is Lemma 10.133 .8 . The implication $(2) \Rightarrow(1)$ is Lemma 10.134.14 It remains to show that (3) implies (2).

Assume (3). After replacing $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ we may assume $S$ is finitely presented over $R$. Choose a presentation $S=R\left[x_{1}, \ldots, x_{n}\right] / I$. Let $c=n-\operatorname{dim}_{\mathfrak{q}}(S / R)$. Let $\mathfrak{q}^{\prime} \subset R\left[x_{1}, \ldots, x_{n}\right]$ be the prime corresponding to $\mathfrak{q}$. Write $\kappa(\mathfrak{p})=k$. Note that $S \otimes_{R} k=k\left[x_{1}, \ldots, x_{n}\right] / \bar{I}$ where $\bar{I} \subset k\left[x_{1}, \ldots, x_{n}\right]$ is the ideal generated by the image of $I$. Let $\overline{\mathfrak{q}}^{\prime} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the prime ideal generated by the image of $\mathfrak{q}^{\prime}$. By Lemma 10.133.8 we see that Lemma 10.133 .4 holds for $\bar{I}$ and $\overline{\mathfrak{q}}^{\prime}$. Thus the dimension of $\overline{\bar{q}^{\prime}} / \overline{\mathfrak{q}}^{\prime} \bar{I}_{\overline{\mathfrak{q}}^{\prime}}$ over $\kappa\left(\overline{\mathfrak{q}}^{\prime}\right)$ is $c$. Pick $f_{1}, \ldots, f_{c} \in I$ mapping to a basis of this vector space. The images $\bar{f}_{j} \in \bar{I}$ generate $\bar{I}_{\bar{q}^{\prime}}$ (by Lemma 10.133.4). Set $S^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$. Let $J$ be the kernel of the surjection $S^{\prime} \rightarrow S$. Since $S$ is of finite presentation $J$ is a finitely generated ideal (Lemma 10.6.2). Consider the short exact sequence

$$
0 \rightarrow J \rightarrow S^{\prime} \rightarrow S \rightarrow 0
$$

As $S_{\mathfrak{q}}$ is flat over $R$ we see that $J_{\mathfrak{q}^{\prime}} \otimes_{R} k \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime} \otimes_{R} k$ is injective (Lemma 10.38.12). However, by construction $S_{\mathfrak{q}^{\prime}}^{\prime} \otimes_{R} k$ maps isomorphically to $S_{\mathfrak{q}} \otimes_{R} k$. Hence we conclude that $J_{\mathfrak{q}^{\prime}} \otimes_{R} k=J_{\mathfrak{q}^{\prime}} / \mathfrak{p} J_{\mathfrak{q}^{\prime}}=0$. By Nakayama's lemma (Lemma 10.19.1) we conclude that there exists a $g \in R\left[x_{1}, \ldots, x_{n}\right], g \notin \mathfrak{q}^{\prime}$ such that $J_{g}=0$. In other words $S_{g}^{\prime} \cong S_{g}$. After further localizing we see that $S^{\prime}$ (and hence $S$ ) becomes a relative global complete intersection by Lemma 10.134 .11 as desired.
07BT Lemma 10.134.16. Let $R$ be a ring. Let $S=R\left[x_{1}, \ldots, x_{n}\right] / I$ for some finitely generated ideal $I$. If $g \in S$ is such that $S_{g}$ is syntomic over $R$, then $\left(I / I^{2}\right)_{g}$ is a finite projective $S_{g}$-module.
Proof. By Lemma 10.134 .15 there exist finitely many elements $g_{1}, \ldots, g_{m} \in S$ which generate the unit ideal in $S_{g}$ such that each $S_{g g_{j}}$ is a relative global complete intersection over $R$. Since it suffices to prove that $\left(I / I^{2}\right)_{g g_{j}}$ is finite projective, see

Lemma 10.77 .2 we may assume that $S_{g}$ is a relative global complete intersection. In this case the result follows from Lemmas 10.132.16 and 10.134.13,

00SZ Lemma 10.134.17. Let $R \rightarrow S, S \rightarrow S^{\prime}$ be ring maps.
(1) If $R \rightarrow S$ and $S \rightarrow S^{\prime}$ are syntomic, then $R \rightarrow S^{\prime}$ is syntomic.
(2) If $R \rightarrow S$ and $S \rightarrow S^{\prime}$ are relative global complete intersections, then $R \rightarrow S^{\prime}$ is a relative global complete intersection.
Proof. Assume $R \rightarrow S$ and $S \rightarrow S^{\prime}$ are syntomic. This implies that $R \rightarrow S^{\prime}$ is flat by Lemma 10.38.4. It also implies that $R \rightarrow S^{\prime}$ is of finite presentation by Lemma 10.6.2. Thus it suffices to show that the fibres of $R \rightarrow S^{\prime}$ are local complete intersections. Choose a prime $\mathfrak{p} \subset R$. We have a factorization

$$
\kappa(\mathfrak{p}) \rightarrow S \otimes_{R} \kappa(\mathfrak{p}) \rightarrow S^{\prime} \otimes_{R} \kappa(\mathfrak{p})
$$

By assumption $S \otimes_{R} \kappa(\mathfrak{p})$ is a local complete intersection, and by Lemma 10.134.3 we see that $S \otimes_{R} \kappa(\mathfrak{p})$ is syntomic over $S \otimes_{R} \kappa(\mathfrak{p})$. After replacing $S$ by $S \otimes_{R} \kappa(\mathfrak{p})$ and $S^{\prime}$ by $S^{\prime} \otimes_{R} \kappa(\mathfrak{p})$ we may assume that $R$ is a field. Say $R=k$.
Choose a prime $\mathfrak{q}^{\prime} \subset S^{\prime}$ lying over the prime $\mathfrak{q}$ of $S$. Our goal is to find a $g^{\prime} \in S^{\prime}$, $g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $S_{g^{\prime}}^{\prime}$ is a global complete intersection over $k$. Choose a $g \in S, g \notin \mathfrak{q}$ such that $S_{g}=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a global complete intersection over $k$. Since $S_{g} \rightarrow S_{g}^{\prime}$ is still syntomic also, and $g \notin \mathfrak{q}^{\prime}$ we may replace $S$ by $S_{g}$ and $S^{\prime}$ by $S_{g}^{\prime}$ and assume that $S=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a global complete intersection over $k$. Next we choose a $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $S^{\prime}=S\left[y_{1}, \ldots, y_{m}\right] /\left(h_{1}, \ldots, h_{d}\right)$ is a relative global complete intersection over $S$. Hence we have reduced to part (2) of the lemma.

Suppose that $R \rightarrow S$ and $S \rightarrow S^{\prime}$ are relative global complete intersections. Say $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ and $S^{\prime}=S\left[y_{1}, \ldots, y_{m}\right] /\left(h_{1}, \ldots, h_{d}\right)$. Then

$$
S^{\prime} \cong R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] /\left(f_{1}, \ldots, f_{c}, h_{1}^{\prime}, \ldots, h_{d}^{\prime}\right)
$$

for some lifts $h_{j}^{\prime} \in R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]$ of the $h_{j}$. Hence it suffices to bound the dimensions of the fibres. Thus we may yet again assume $R=k$ is a field. In this case we see that we have a ring, namely $S$, which is of finite type over $k$ and equidimensional of dimension $n-c$, and a finite type ring map $S \rightarrow S^{\prime}$ all of whose nonempty fibre rings are equidimensional of dimension $m-d$. Then, by Lemma 10.111.6 for example applied to localizations at maximal ideals of $S^{\prime}$, we see that $\operatorname{dim}\left(S^{\prime}\right) \leq n-c+m-d$ as desired.
The following lemma will be improved later, see Smoothing Ring Maps, Proposition 16.4.2.

00 T Lemma 10.134.18. Let $R$ be a ring and let $I \subset R$ be an ideal. Let $R / I \rightarrow \bar{S}$ be a syntomic map. Then there exists elements $\bar{g}_{i} \in \bar{S}$ which generate the unit ideal of $\bar{S}$ such that each $\bar{S}_{g_{i}} \cong S_{i} / I S_{i}$ for some relative global complete intersection $S_{i}$ over $R$.

Proof. By Lemma 10.134 .15 we find a collection of elements $\bar{g}_{i} \in \bar{S}$ which generate the unit ideal of $\bar{S}$ such that each $\bar{S}_{g_{i}}$ is a relative global complete intersection over $R / I$. Hence we may assume that $\bar{S}$ is a relative global complete intersection. Write $\bar{S}=(R / I)\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{c}\right)$ as in Definition 10.134.5. Choose $f_{1}, \ldots, f_{c} \in R\left[x_{1}, \ldots, x_{n}\right]$ lifting $\bar{f}_{1}, \ldots, \bar{f}_{c}$. Set $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$.

Note that $S / I S \cong \bar{S}$. By Lemma 10.134 .11 we can find $g \in S$ mapping to 1 in $\bar{S}$ such that $S_{g}$ is a relative global complete intersection over $R$. Since $\bar{S} \cong S_{g} / I S_{g}$ this finishes the proof.

### 10.135. Smooth ring maps

00 T 1 Let us motivate the definition of a smooth ring map by an example. Suppose $R$ is a ring and $S=R[x, y] /(f)$ for some nonzero $f \in R[x, y]$. In this case there is an exact sequence

$$
S \rightarrow S \mathrm{~d} x \oplus S \mathrm{~d} y \rightarrow \Omega_{S / R} \rightarrow 0
$$

where the first arrow maps 1 to $\frac{\partial f}{\partial x} \mathrm{~d} x+\frac{\partial f}{\partial y} \mathrm{~d} y$ see Section 10.132 . We conclude that $\Omega_{S / R}$ is locally free of rank 1 if the partial derivatives of $f$ generate the unit ideal in $S$. In this case $S$ is smooth of relative dimension 1 over $R$. But it can happen that $\Omega_{S / R}$ is locally free of rank 2 namely if both partial derivatives of $f$ are zero. For example if for a prime $p$ we have $p=0$ in $R$ and $f=x^{p}+y^{p}$ then this happens. Here $R \rightarrow S$ is a relative global complete intersection of relative dimension 1 which is not smooth. Hence, in order to check that a ring map is smooth it is not sufficient to check whether the module of differentials is free. The correct condition is the following.
00T2 Definition 10.135.1. A ring map $R \rightarrow S$ is smooth if it is of finite presentation and the naive cotangent complex $N L_{S / R}$ is quasi-isomorphic to a finite projective $S$-module placed in degree 0 .

In particular, if $R \rightarrow S$ is smooth then the module $\Omega_{S / R}$ is a finite projective $S$-module. Moreover, by Lemma 10.135 .2 the naive cotangent complex of any presentation has the same structure. Thus, for a surjection $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ with kernel $I$ the map

$$
I / I^{2} \longrightarrow \Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R\left[x_{1}, \ldots, x_{n}\right]} S
$$

is a split injection. In other words $\bigoplus_{i=1}^{n} S \mathrm{~d} x_{i} \cong I / I^{2} \oplus \Omega_{S / R}$ as $S$-modules. This implies that $I / I^{2}$ is a finite projective $S$-module too!
05GK Lemma 10.135.2. Let $R \rightarrow S$ be a ring map of finite presentation. If for some presentation $\alpha$ of $S$ over $R$ the naive cotangent complex $N L(\alpha)$ is quasi-isomorphic to a finite projective $S$-module placed in degree 0 , then this holds for any presentation.

Proof. Immediate from Lemma 10.132 .2 ,
00T3 Lemma 10.135.3. Let $R \rightarrow S$ be a smooth ring map. Any localization $S_{g}$ is smooth over $R$. If $f \in R$ maps to an invertible element of $S$, then $R_{f} \rightarrow S$ is smooth.

Proof. By Lemma 10.132 .13 the naive cotangent complex for $S_{g}$ over $R$ is the base change of the naive cotangent complex of $S$ over $R$. The assumption is that the naive cotangent complex of $S / R$ is $\Omega_{S / R}$ and that this is a finite projective $S$-module. Hence so is its base change. Thus $S_{g}$ is smooth over $R$.
The second assertion follows in the same way from Lemma 10.132.11.
00T4 Lemma 10.135.4. Let $R \rightarrow S$ be a smooth ring map. Let $R \rightarrow R^{\prime}$ be any ring map. Then the base change $R^{\prime} \rightarrow S^{\prime}=R^{\prime} \otimes_{R} S$ is smooth.

Proof. Let $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ be a presentation with kernel $I$. Let $\alpha^{\prime}$ : $R^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow R^{\prime} \otimes_{R} S$ be the induced presentation. Let $I^{\prime}=\operatorname{Ker}\left(\alpha^{\prime}\right)$. Since $0 \rightarrow I \rightarrow R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S \rightarrow 0$ is exact, the sequence $R^{\prime} \otimes_{R} I \rightarrow R^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow$ $R^{\prime} \otimes_{R} S \rightarrow 0$ is exact. Thus $R^{\prime} \otimes_{R} I \rightarrow I^{\prime}$ is surjective. By Definition 10.135.1 there is a short exact sequence

$$
0 \rightarrow I / I^{2} \rightarrow \Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R\left[x_{1}, \ldots, x_{n}\right]} S \rightarrow \Omega_{S / R} \rightarrow 0
$$

and the $S$-module $\Omega_{S / R}$ is finite projective. In particular $I / I^{2}$ is a direct summand of $\Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R\left[x_{1}, \ldots, x_{n}\right]} S$. Consider the commutative diagram

Since the right vertical map is an isomorphism we see that the left vertical map is injective and surjective by what was said above. Thus we conclude that $N L\left(\alpha^{\prime}\right)$ is quasi-isomorphic to $\Omega_{S^{\prime} / R^{\prime}} \cong S^{\prime} \otimes_{S} \Omega_{S / R}$. And this is finite projective since it is the base change of a finite projective module.

00 T 5 Lemma 10.135.5. Let $k$ be a field. Let $S$ be a smooth $k$-algebra. Then $S$ is a local complete intersection.

Proof. By Lemmas 10.135 .4 and 10.133 .11 it suffices to prove this when $k$ is algebraically closed. Choose a presentation $\alpha: k\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ with kernel $I$. Let $\mathfrak{m}$ be a maximal ideal of $S$, and let $\mathfrak{m}^{\prime} \supset I$ be the corresponding maximal ideal of $k\left[x_{1}, \ldots, x_{n}\right]$. We will show that condition (5) of Lemma 10.133 .4 holds (with $\mathfrak{m}$ instead of $\mathfrak{q}$ ). We may write $\mathfrak{m}^{\prime}=\left(x_{1}-a_{1}, \ldots, x_{n}-a_{n}\right)$ for some $a_{i} \in k$, because $k$ is algebraically closed, see Theorem 10.33.1. By our assumption that $k \rightarrow S$ is smooth the $S$-module map d : $I / I^{2} \rightarrow \bigoplus_{i=1}^{n} S \mathrm{~d} x_{i}$ is a split injection. Hence the corresponding map $I / \mathfrak{m}^{\prime} I \rightarrow \bigoplus \kappa\left(\mathfrak{m}^{\prime}\right) \mathrm{d} x_{i}$ is injective. Say $\operatorname{dim}_{\kappa\left(\mathfrak{m}^{\prime}\right)}\left(I / \mathfrak{m}^{\prime} I\right)=c$ and pick $f_{1}, \ldots, f_{c} \in I$ which map to a $\kappa\left(\mathfrak{m}^{\prime}\right)$-basis of $I / \mathfrak{m}^{\prime} I$. By Nakayama's Lemma 10.19 .1 we see that $f_{1}, \ldots, f_{c}$ generate $I_{\mathfrak{m}^{\prime}}$ over $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$. Consider the commutative diagram

(proof commutativity omitted). The middle vertical map is the one defining the naive cotangent complex of $\alpha$. Note that the right lower horizontal arrow induces an isomorphism $\bigoplus \kappa\left(\mathfrak{m}^{\prime}\right) \mathrm{d} x_{i} \rightarrow \mathfrak{m}^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{2}$. Hence our generators $f_{1}, \ldots, f_{c}$ of $I_{\mathfrak{m}^{\prime}}$ map to a collection of elements in $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$ whose classes in $\mathfrak{m}^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{2}$ are linearly independent over $\kappa\left(\mathfrak{m}^{\prime}\right)$. Therefore they form a regular sequence in the ring $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}^{\prime}}$ by Lemma 10.105.3. This verifies condition (5) of Lemma 10.133.4 hence $S_{g}$ is a global complete intersection over $k$ for some $g \in S, g \notin \mathfrak{m}$. As this works for any maximal ideal of $S$ we conclude that $S$ is a local complete intersection over $k$.

00 T 6 Definition 10.135.6. Let $R$ be a ring. Given integers $n \geq c \geq 0$ and $f_{1}, \ldots, f_{c} \in$ $R\left[x_{1}, \ldots, x_{n}\right]$ we say

$$
S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

is a standard smooth algebra over $R$ if the polynomial

$$
g=\operatorname{det}\left(\begin{array}{cccc}
\partial f_{1} / \partial x_{1} & \partial f_{2} / \partial x_{1} & \ldots & \partial f_{c} / \partial x_{1} \\
\partial f_{1} / \partial x_{2} & \partial f_{2} / \partial x_{2} & \ldots & \partial f_{c} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{c} & \partial f_{2} / \partial x_{c} & \ldots & \partial f_{c} / \partial x_{c}
\end{array}\right)
$$

maps to an invertible element in $S$.
00 T 7 Lemma 10.135.7. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)=R\left[x_{1}, \ldots, x_{n}\right] / I$ be a standard smooth algebra. Then
(1) the ring map $R \rightarrow S$ is smooth,
(2) the $S$-module $\Omega_{S / R}$ is free on $d x_{c+1}, \ldots, d x_{n}$,
(3) the $S$-module $I / I^{2}$ is free on the classes of $f_{1}, \ldots, f_{c}$,
(4) for any $g \in S$ the ring map $R \rightarrow S_{g}$ is standard smooth,
(5) for any ring map $R \rightarrow R^{\prime}$ the base change $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ is standard smooth,
(6) if $f \in R$ maps to an invertible element in $S$, then $R_{f} \rightarrow S$ is standard smooth, and
(7) the ring $S$ is a relative global complete intersection over $R$.

Proof. Consider the naive cotangent complex of the given presentation

$$
\left(f_{1}, \ldots, f_{c}\right) /\left(f_{1}, \ldots, f_{c}\right)^{2} \longrightarrow \bigoplus_{i=1}^{n} S \mathrm{~d} x_{i}
$$

Let us compose this map with the projection onto the first $c$ direct summands of the direct sum. According to the definition of a standard smooth algebra the classes $f_{i} \bmod \left(f_{1}, \ldots, f_{c}\right)^{2}$ map to a basis of $\bigoplus_{i=1}^{c} S \mathrm{~d} x_{i}$. We conclude that $\left(f_{1}, \ldots, f_{c}\right) /\left(f_{1}, \ldots, f_{c}\right)^{2}$ is free of rank $c$ with a basis given by the elements $f_{i} \bmod$ $\left(f_{1}, \ldots, f_{c}\right)^{2}$, and that the homology in degree 0 , i.e., $\Omega_{S / R}$, of the naive cotangent complex is a free $S$-module with basis the images of $\mathrm{d} x_{c+j}, j=1, \ldots, n-c$. In particular, this proves $R \rightarrow S$ is smooth.

The proofs of (4) and (6) are omitted. But see the example below and the proof of Lemma 10.134.10.

Let $\varphi: R \rightarrow R^{\prime}$ be any ring map. Denote $S^{\prime}=R^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}^{\varphi}, \ldots, f_{c}^{\varphi}\right)$ where $f^{\varphi}$ is the polynomial obtained from $f \in R\left[x_{1}, \ldots, x_{n}\right]$ by applying $\varphi$ to all the coefficients. Then $S^{\prime} \cong R^{\prime} \otimes_{R} S$. Moreover, the determinant of Definition 10.135 .6 for $S^{\prime} / R^{\prime}$ is equal to $g^{\varphi}$. Its image in $S^{\prime}$ is therefore the image of $g$ via $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S \rightarrow S^{\prime}$ and hence invertible. This proves (5).

To prove (7) it suffices to show that $S \otimes_{R} \kappa(\mathfrak{p})$ has dimension $n-c$. By (5) it suffices to prove that any standard smooth algebra $k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ over a field $k$ has dimension $n-c$. We already know that $k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a local complete intersection by Lemma 10.135.5. Hence, since $I / I^{2}$ is free of rank $c$ we see that it dimension $n-c$, by Lemma 10.133.4 for example.

00 T 8 Example 10.135.8. Let $R$ be a ring. Let $f_{1}, \ldots, f_{c} \in R\left[x_{1}, \ldots, x_{n}\right]$. Let

$$
h=\operatorname{det}\left(\begin{array}{cccc}
\partial f_{1} / \partial x_{1} & \partial f_{2} / \partial x_{1} & \ldots & \partial f_{c} / \partial x_{1} \\
\partial f_{1} / \partial x_{2} & \partial f_{2} / \partial x_{2} & \ldots & \partial f_{c} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{c} & \partial f_{2} / \partial x_{c} & \ldots & \partial f_{c} / \partial x_{c}
\end{array}\right)
$$

Set $S=R\left[x_{1}, \ldots, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, x_{n+1} h-1\right)$. This is an example of a standard smooth algebra, except that the presentation is wrong and the variables should be in the following order: $x_{1}, \ldots, x_{c}, x_{n+1}, x_{c+1}, \ldots, x_{n}$.

00T9 Lemma 10.135.9. A composition of standard smooth ring maps is standard smooth.

Proof. Suppose that $R \rightarrow S$ and $S \rightarrow S^{\prime}$ are standard smooth. We choose presentations $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ and $S^{\prime}=S\left[y_{1}, \ldots, y_{m}\right] /\left(g_{1}, \ldots, g_{d}\right)$. Choose elements $g_{j}^{\prime} \in R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]$ mapping to the $g_{j}$. In this way we see $S^{\prime}=R\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right] /\left(f_{1}, \ldots, f_{c}, g_{1}^{\prime}, \ldots, g_{d}^{\prime}\right)$. To show that $S^{\prime}$ is standard smooth it suffices to verify that the determinant

$$
\operatorname{det}\left(\begin{array}{cccccc}
\partial f_{1} / \partial x_{1} & \ldots & \partial f_{c} / \partial x_{1} & \partial g_{1} / \partial x_{1} & \ldots & \partial g_{d} / \partial x_{1} \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{c} & \ldots & \partial f_{c} / \partial x_{c} & \partial g_{1} / \partial x_{c} & \ldots & \partial g_{d} / \partial x_{c} \\
0 & \ldots & 0 & \partial g_{1} / \partial y_{1} & \ldots & \partial g_{d} / \partial y_{1} \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
0 & \ldots & 0 & \partial g_{1} / \partial y_{d} & \ldots & \partial g_{d} / \partial y_{d}
\end{array}\right)
$$

is invertible in $S^{\prime}$. This is clear since it is the product of the two determinants which were assumed to be invertible by hypothesis.

00TA Lemma 10.135.10. Let $R \rightarrow S$ be a smooth ring map. There exists an open covering of $\operatorname{Spec}(S)$ by standard opens $D(g)$ such that each $S_{g}$ is standard smooth over $R$. In particular $R \rightarrow S$ is syntomic.

Proof. Choose a presentation $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ with kernel $I=\left(f_{1}, \ldots, f_{m}\right)$. For every subset $E \subset\{1, \ldots, m\}$ consider the open subset $U_{E}$ where the classes $f_{e}, e \in E$ freely generate the finite projective $S$-module $I / I^{2}$, see Lemma 10.78 .3 . We may cover $\operatorname{Spec}(S)$ by standard opens $D(g)$ each completely contained in one of the opens $U_{E}$. For such a $g$ we look at the presentation

$$
\beta: R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] \longrightarrow S_{g}
$$

mapping $x_{n+1}$ to $1 / g$. Setting $J=\operatorname{Ker}(\beta)$ we use Lemma 10.132 .12 to see that $J / J^{2} \cong\left(I / I^{2}\right)_{g} \oplus S_{g}$ is free. We may and do replace $S$ by $S_{g}$. Then using Lemma 10.134 .6 we may assume we have a presentation $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ with kernel $I=\left(f_{1}, \ldots, f_{c}\right)$ such that $I / I^{2}$ is free on the classes of $f_{1}, \ldots, f_{c}$.

Using the presentation $\alpha$ obtained at the end of the previous paragraph, we more or less repeat this argument with the basis elements $\mathrm{d} x_{1}, \ldots, \mathrm{~d} x_{n}$ of $\Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R}$. Namely, for any subset $E \subset\{1, \ldots, n\}$ of cardinality $c$ we may consider the open subset $U_{E}$ of $\operatorname{Spec}(S)$ where the differential of $N L(\alpha)$ composed with the projection

$$
S^{\oplus c} \cong I / I^{2} \longrightarrow \Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R\left[x_{1}, \ldots, x_{n}\right]} S \longrightarrow \bigoplus_{i \in E} S \mathrm{~d} x_{i}
$$

is an isomorphism. Again we may find a covering of $\operatorname{Spec}(S)$ by (finitely many) standard opens $D(g)$ such that each $D(g)$ is completely contained in one of the opens
$U_{E}$. By renumbering, we may assume $E=\{1, \ldots, c\}$. For a $g$ with $D(g) \subset U_{E}$ we look at the presentation

$$
\beta: R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] \rightarrow S_{g}
$$

mapping $x_{n+1}$ to $1 / g$. Setting $J=\operatorname{Ker}(\beta)$ we conclude from Lemma 10.132 .12 that $J=\left(f_{1}, \ldots, f_{c}, f x_{n+1}-1\right)$ where $\alpha(f)=g$ and that the composition

$$
J / J^{2} \longrightarrow \Omega_{R\left[x_{1}, \ldots, x_{n+1}\right] / R} \otimes_{R\left[x_{1}, \ldots, x_{n+1}\right]} S_{g} \longrightarrow \bigoplus_{i=1}^{c} S_{g} \mathrm{~d} x_{i} \oplus S_{g} \mathrm{~d} x_{n+1}
$$

is an isomorphism. Reordering the coordinates as $x_{1}, \ldots, x_{c}, x_{n+1}, x_{c+1}, \ldots, x_{n}$ we we conclude that $S_{g}$ is standard smooth over $R$ as desired.

This finishes the proof as standard smooth algebras are syntomic (Lemmas 10.135.7 and 10.134.14 and being syntomic over $R$ is local on $S$ (Lemma 10.134.4).

00TB Definition 10.135.11. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$. We say $R \rightarrow S$ is smooth at $\mathfrak{q}$ if there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is smooth.

For ring maps of finite presentation we can characterize this as follows.
07BU Lemma 10.135.12. Let $R \rightarrow S$ be of finite presentation. Let $\mathfrak{q}$ be a prime of $S$. The following are equivalent
(1) $R \rightarrow S$ is smooth at $\mathfrak{q}$,
(2) $H_{1}\left(L_{S / R}\right)_{\mathfrak{q}}=0$ and $\Omega_{S / R, \mathfrak{q}}$ is a projective $S_{\mathfrak{q}}$-module, and
(3) $H_{1}\left(L_{S / R}\right)_{\mathfrak{q}}=0$ and $\Omega_{S / R, \mathfrak{q}}$ is a flat $S_{\mathfrak{q}}$-module.

Proof. We will use without further mention that formation of the naive cotangent complex commutes with localization, see Section 10.132 , especially Lemma 10.132.13. It is clear that (1) implies (2) implies (3). Assume (3) holds. Note that $\Omega_{S / R}$ is a finitely presented $S$-module, see Lemma 10.130.15. Hence $\Omega_{S / R, \mathfrak{q}}$ is a finite free module by Lemma 10.77 .4 . Writing $S_{\mathfrak{q}}$ as the colimit of principal localizations we see from Lemma 10.126 .4 that we can find a $g \in S, g \notin \mathfrak{q}$ such that $\left(\Omega_{S / R}\right)_{g}$ is finite free. Choose a presentation $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ with kernel $I$. We may work with $N L(\alpha)$ instead of $N L_{S / R}$, see Lemma 10.132.2. The surjection

$$
\Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R} S \rightarrow \Omega_{S / R} \rightarrow 0
$$

has a right inverse after inverting $g$ because $\left(\Omega_{S / R}\right)_{g}$ is projective. Hence the image of d : $\left(I / I^{2}\right)_{g} \rightarrow \Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R} \otimes_{R} S_{g}$ is a direct summand and this map has a right inverse too. We conclude that $H_{1}\left(L_{S / R}\right)_{g}$ is a quotient of $\left(I / I^{2}\right)_{g}$. In particular $H_{1}\left(L_{S / R}\right)_{g}$ is a finite $S_{g}$-module. Thus the vanishing of $H_{1}\left(L_{S / R}\right)_{\mathfrak{q}}$ implies the vanishing of $H_{1}\left(L_{S / R}\right)_{g g^{\prime}}$ for some $g^{\prime} \in S, g^{\prime} \notin \mathfrak{q}$. Then $R \rightarrow S_{g g^{\prime}}$ is smooth by definition.

00TC Lemma 10.135.13. Let $R \rightarrow S$ be a ring map. Then $R \rightarrow S$ is smooth if and only if $R \rightarrow S$ is smooth at every prime $\mathfrak{q}$ of $S$.

Proof. The direct implication is trivial. Suppose that $R \rightarrow S$ is smooth at every prime $\mathfrak{q}$ of $S$. Since $\operatorname{Spec}(S)$ is quasi-compact, see Lemma 10.16.10, there exists a finite covering $\operatorname{Spec}(S)=\bigcup D\left(g_{i}\right)$ such that each $S_{g_{i}}$ is smooth. By Lemma 10.23 .3 this implies that $S$ is of finite presentation over $R$. According to Lemma 10.132.13 we see that $N L_{S / R} \otimes_{S} S_{g_{i}}$ is quasi-isomorphic to a finite projective $S_{g_{i}}$-module. By Lemma 10.77 .2 this implies that $N L_{S / R}$ is quasi-isomorphic to a finite projective $S$-module.

00TD Lemma 10.135.14. A composition of smooth ring maps is smooth.
Proof. This follows from a combination of Lemmas 10.135.10, 10.135.9 and 10.135 .13 (You can also prove this in many different ways; including easier ones.)

00TE Lemma 10.135.15. Let $R$ be a ring. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ be a relative global complete intersection. Let $\mathfrak{q} \subset S$ be a prime. Then $R \rightarrow S$ is smooth at $\mathfrak{q}$ if and only if there exists a subset $I \subset\{1, \ldots, n\}$ of cardinality $c$ such that the polynomial

$$
g_{I}=\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{j=1, \ldots, c, i \in I}
$$

does not map to an element of $\mathfrak{q}$.
Proof. By Lemma 10.134 .13 we see that the naive cotangent complex associated to the given presentation of $S$ is the complex

$$
\bigoplus_{j=1}^{c} S \cdot f_{j} \longrightarrow \bigoplus_{i=1}^{n} S \cdot \mathrm{~d} x_{i}, \quad f_{j} \longmapsto \sum \frac{\partial f_{j}}{\partial x_{i}} \mathrm{~d} x_{i}
$$

The maximal minors of the matrix giving the map are exactly the polynomials $g_{I}$.
Assume $g_{I}$ maps to $g \in S$, with $g \notin \mathfrak{q}$. Then the algebra $S_{g}$ is smooth over $R$. Namely, its naive cotangent complex is quasi-isomorphic to the complex above localized at $g$, see Lemma 10.132.13. And by construction it is quasi-isomorphic to a free rank $n-c$ module in degree 0 .

Conversely, suppose that all $g_{I}$ end up in $\mathfrak{q}$. In this case the complex above tensored with $\kappa(\mathfrak{q})$ does not have maximal rank, and hence there is no localization by an element $g \in S, g \notin \mathfrak{q}$ where this map becomes a split injection. By Lemma 10.132.13 again there is no such localization which is smooth over $R$.

00 TF Lemma 10.135.16. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of $R$. Assume
(1) there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is of finite presentation,
(2) the local ring homomorphism $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is flat,
(3) the fibre $S \otimes_{R} \kappa(\mathfrak{p})$ is smooth over $\kappa(\mathfrak{p})$ at the prime corresponding to $\mathfrak{q}$.

Then $R \rightarrow S$ is smooth at $\mathfrak{q}$.
Proof. By Lemmas 10.134 .15 and 10.135 .5 we see that there exists a $g \in S$ such that $S_{g}$ is a relative global complete intersection. Replacing $S$ by $S_{g}$ we may assume $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a relative global complete intersection. For any subset $I \subset\{1, \ldots, n\}$ of cardinality $c$ consider the polynomial $g_{I}=\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)_{j=1, \ldots, c, i \in I}$ of Lemma 10.135.15. Note that the image $\bar{g}_{I}$ of $g_{I}$ in the polynomial ring $\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right]$ is the determinant of the partial derivatives of the images $\bar{f}_{j}$ of the $f_{j}$ in the ring $\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right]$. Thus the lemma follows by applying Lemma 10.135 .15 both to $R \rightarrow S$ and to $\kappa(\mathfrak{p}) \rightarrow S \otimes_{R} \kappa(\mathfrak{p})$.

Note that the sets $U, V$ in the following lemma are open by definition.
00TG Lemma 10.135.17. Let $R \rightarrow S$ be a ring map of finite presentation. Let $R \rightarrow R^{\prime}$ be a flat ring map. Denote $S^{\prime}=R^{\prime} \otimes_{R} S$ the base change. Let $U \subset \operatorname{Spec}(S)$ be the set of primes at which $R \rightarrow S$ is smooth. Let $V \subset \operatorname{Spec}\left(S^{\prime}\right)$ the set of primes at which $R^{\prime} \rightarrow S^{\prime}$ is smooth. Then $V$ is the inverse image of $U$ under the map $f: \operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$.

Proof. By Lemma 10.132 .8 we see that $N L_{S / R} \otimes_{S} S^{\prime}$ is homotopy equivalent to $N L_{S^{\prime} / R^{\prime}}$. This already implies that $f^{-1}(U) \subset V$.
Let $\mathfrak{q}^{\prime} \subset S^{\prime}$ be a prime lying over $\mathfrak{q} \subset S$. Assume $\mathfrak{q}^{\prime} \in V$. We have to show that $\mathfrak{q} \in U$. Since $S \rightarrow S^{\prime}$ is flat, we see that $S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime}$ is faithfully flat (Lemma 10.38.17). Thus the vanishing of $H_{1}\left(L_{S^{\prime} / R^{\prime}}\right)_{\mathfrak{q}^{\prime}}$ implies the vanishing of $H_{1}\left(L_{S / R}\right)_{\mathfrak{q}}$. By Lemma 10.77 .5 applied to the $S_{\mathfrak{q}}$-module $\left(\Omega_{S / R}\right)_{\mathfrak{q}}$ and the map $S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime}$ we see that $\left(\Omega_{S / R}\right)_{\mathfrak{q}}$ is projective. Hence $R \rightarrow S$ is smooth at $\mathfrak{q}$ by Lemma 10.135.12,

02UQ Lemma 10.135.18. Let $k \subset K$ be a field extension. Let $S$ be a finite type algebra over $k$. Let $\mathfrak{q}_{K}$ be a prime of $S_{K}=K \otimes_{k} S$ and let $\mathfrak{q}$ be the corresponding prime of $S$. Then $S$ is smooth over $k$ at $\mathfrak{q}$ if and only if $S_{K}$ is smooth at $\mathfrak{q}_{K}$ over $K$.

Proof. This is a special case of Lemma 10.135.17.
04B1 Lemma 10.135.19. Let $R$ be a ring and let $I \subset R$ be an ideal. Let $R / I \rightarrow \bar{S}$ be a smooth ring map. Then there exists elements $\bar{g}_{i} \in \bar{S}$ which generate the unit ideal of $\bar{S}$ such that each $\bar{S}_{g_{i}} \cong S_{i} / I S_{i}$ for some (standard) smooth ring $S_{i}$ over $R$.

Proof. By Lemma 10.135.10 we find a collection of elements $\bar{g}_{i} \in \bar{S}$ which generate the unit ideal of $\bar{S}$ such that each $\bar{S}_{g_{i}}$ is standard smooth over $R / I$. Hence we may assume that $\bar{S}$ is standard smooth over $R / I$. Write $\bar{S}=(R / I)\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{c}\right)$ as in Definition 10.135.6. Choose $f_{1}, \ldots, f_{c} \in R\left[x_{1}, \ldots, x_{n}\right]$ lifting $\bar{f}_{1}, \ldots, \bar{f}_{c}$. Set $S=R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, x_{n+1} \Delta-1\right)$ where $\Delta=\operatorname{det}\left(\frac{\partial f_{j}}{\partial x_{i}}\right)_{i, j=1, \ldots, c}$ as in Example 10.135.8. This proves the lemma.

### 10.136. Formally smooth maps

00 TH In this section we define formally smooth ring maps. It will turn out that a ring map of finite presentation is formally smooth if and only if it is smooth, see Proposition 10.136 .13

00TI Definition 10.136.1. Let $R \rightarrow S$ be a ring map. We say $S$ is formally smooth over $R$ if for every commutative solid diagram

where $I \subset A$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute.

00TJ Lemma 10.136.2. Let $R \rightarrow S$ be a formally smooth ring map. Let $R \rightarrow R^{\prime}$ be any ring map. Then the base change $S^{\prime}=R^{\prime} \otimes_{R} S$ is formally smooth over $R^{\prime}$.

Proof. Let a solid diagram

as in Definition 10.136 .1 be given. By assumption the longer dotted arrow exists. By the universal property of tensor product we obtain the shorter dotted arrow.

031H Lemma 10.136.3. A composition of formally smooth ring maps is formally smooth.

Proof. Omitted. (Hint: This is completely formal, and follows from considering a suitable diagram.)

00TK Lemma 10.136.4. A polynomial ring over $R$ is formally smooth over $R$.
Proof. Suppose we have a diagram as in Definition 10.136 .1 with $S=R\left[x_{j} ; j \in J\right]$. Then there exists a dotted arrow simply by choosing lifts $a_{j} \in A$ of the elements in $A / I$ to which the elements $x_{j}$ map to under the top horizontal arrow.

00TL Lemma 10.136.5. Let $R \rightarrow S$ be a ring map. Let $P \rightarrow S$ be a surjective $R$-algebra map from a polynomial ring $P$ onto $S$. Denote $J \subset P$ the kernel. Then $R \rightarrow S$ is formally smooth if and only if there exists an $R$-algebra map $\sigma: S \rightarrow P / J^{2}$ which is a right inverse to the surjection $P / J^{2} \rightarrow S$.

Proof. Assume $R \rightarrow S$ is formally smooth. Consider the commutative diagram

By assumption the dotted arrow exists. This proves that $\sigma$ exists.
Conversely, suppose we have a $\sigma$ as in the lemma. Let a solid diagram

as in Definition 10.136 .1 be given. Because $P$ is formally smooth by Lemma 10.136 .4 , there exists an $R$-algebra homomorphism $\psi: P \rightarrow A$ which lifts the map $P \rightarrow S \rightarrow A / I$. Clearly $\psi(J) \subset I$ and since $I^{2}=0$ we conclude that $\psi\left(J^{2}\right)=0$. Hence $\psi$ factors as $\bar{\psi}: P / J^{2} \rightarrow A$. The desired dotted arrow is the composition $\bar{\psi} \circ \sigma: S \rightarrow A$.

00TM Remark 10.136.6. Lemma 10.136 .5 holds more generally whenever $P$ is formally smooth over $R$.

031I Lemma 10.136.7. Let $R \rightarrow S$ be a ring map. Let $P \rightarrow S$ be a surjective $R$-algebra map from a polynomial ring $P$ onto $S$. Denote $J \subset P$ the kernel. Then $R \rightarrow S$ is formally smooth if and only if the sequence

$$
0 \rightarrow J / J^{2} \rightarrow \Omega_{P / R} \otimes_{R} S \rightarrow \Omega_{S / R} \rightarrow 0
$$

of Lemma 10.130 .9 is a split exact sequence.
Proof. Assume $S$ is formally smooth over $R$. By Lemma 10.136 .5 this means there exists an $R$-algebra map $S \rightarrow P / J^{2}$ which is a left inverse to the canonical map $P / J^{2} \rightarrow S$. This means that

$$
P / J^{2} \cong S \oplus J / J^{2}
$$

as $R$-algebras. Note that the middle term of the exact sequence is $\Omega_{P / R} \otimes_{P} S \cong$ $\Omega_{\left(P / J^{2}\right) / R} \otimes_{R} S$ by Lemma 10.130.11. A direct computation shows that

$$
\Omega_{\left(S \oplus J / J^{2}\right) / R} \otimes_{\left(S \oplus J / J^{2}\right)} S=\Omega_{S / R} \oplus J / J^{2}
$$

as desired.
Assume the exact sequence of the lemma is split exact. Choose a splitting $\sigma$ : $\Omega_{S / R} \rightarrow \Omega_{P / R} \otimes_{R} S$. For each $\lambda \in S$ choose $x_{\lambda} \in P$ which maps to $\lambda$. Next, for each $\lambda \in S$ choose $f_{\lambda} \in J$ such that

$$
\mathrm{d} f_{\lambda}=\mathrm{d} x_{\lambda}-\sigma(\mathrm{d} \lambda)
$$

in the middle term of the exact sequence. We claim that $s: \lambda \mapsto x_{\lambda}-f_{\lambda} \bmod J^{2}$ is an $R$-algebra homomorphism $s: S \rightarrow P / J^{2}$. To prove this we will repeatedly use that if $h \in J$ and $\mathrm{d} h=0$ in $\Omega_{P / R} \otimes_{R} S$, then $h \in J^{2}$. Let $\lambda, \mu \in S$. Then $\sigma(\mathrm{d} \lambda+\mathrm{d} \mu-\mathrm{d}(\lambda+\mu))=0$. This implies

$$
\mathrm{d}\left(x_{\lambda}+x_{\mu}-x_{\lambda+\mu}-f_{\lambda}-f_{\mu}+f_{\lambda+\mu}\right)=0
$$

which means that $x_{\lambda}+x_{\mu}-x_{\lambda+\mu}-f_{\lambda}-f_{\mu}+f_{\lambda+\mu} \in J^{2}$, which in turn means that $s(\lambda)+s(\mu)=s(\lambda+\mu)$. Similarly, we have $\sigma(\lambda \mathrm{d} \mu+\mu \mathrm{d} \lambda-\mathrm{d} \lambda \mu)=0$ which implies that

$$
\mu\left(\mathrm{d} x_{\lambda}-\mathrm{d} f_{\lambda}\right)+\lambda\left(\mathrm{d} x_{\mu}-\mathrm{d} f_{\mu}\right)-\mathrm{d} x_{\lambda \mu}-\mathrm{d} f_{\lambda \mu}=0
$$

in the middle term of the exact sequence. Moreover we have

$$
\mathrm{d}\left(x_{\lambda} x_{\mu}\right)=x_{\lambda} \mathrm{d} x_{\mu}+x_{\mu} \mathrm{d} x_{\lambda}=\lambda \mathrm{d} x_{\mu}+\mu \mathrm{d} x_{\lambda}
$$

in the middle term again. Combined these equations mean that $x_{\lambda} x_{\mu}-x_{\lambda \mu}-\mu f_{\lambda}-$ $\lambda f_{\mu}+f_{\lambda \mu} \in J^{2}$ which means that $s(\lambda) s(\mu)=s(\lambda \mu)$. If $\lambda \in R$, then $\mathrm{d} \lambda=0$ and we see that $\mathrm{d} f_{\lambda}=\mathrm{d} x_{\lambda}$, hence $\lambda-x_{\lambda}+f_{\lambda} \in J^{2}$ and hence $s(\lambda)=\lambda$ as desired. At this point we can apply Lemma 10.136 .5 to conclude that $S / R$ is formally smooth.

031J Proposition 10.136.8. Let $R \rightarrow S$ be a ring map. Consider a formally smooth $R$-algebra $P$ and a surjection $P \rightarrow S$ with kernel $J$. The following are equivalent
(1) $S$ is formally smooth over $R$,
(2) for some $P \rightarrow S$ as above there exists a section to $P / J^{2} \rightarrow S$,
(3) for all $P \rightarrow S$ as above there exists a section to $P / J^{2} \rightarrow S$,
(4) for some $P \rightarrow S$ as above the sequence $0 \rightarrow J / J^{2} \rightarrow \Omega_{P / R} \otimes S \rightarrow \Omega_{S / R} \rightarrow$ 0 is split exact,
(5) for all $P \rightarrow S$ as above the sequence $0 \rightarrow J / J^{2} \rightarrow \Omega_{P / R} \otimes S \rightarrow \Omega_{S / R} \rightarrow 0$ is split exact, and
(6) the naive cotangent complex $N L_{S / R}$ is quasi-isomorphic to a projective $S$-module placed in degree 0 .
Proof. It is clear that (1) implies (3) implies (2), see first part of the proof of Lemma 10.136 .5 . It is also true that (3) implies (5) implies (4) and that (2) implies (4), see first part of the proof of Lemma 10.136.7. Finally, Lemma 10.136 .7 applied to the canonical surjection $R[S] \rightarrow S$ 10.132.0.1) shows that (1) implies (6).
Assume (4) and let's prove (6). Consider the sequence of Lemma 10.132.4 associated to the ring maps $R \rightarrow P \rightarrow S$. By the implication (1) $\Rightarrow$ (6) proved above we see that $N L_{P / R} \otimes_{R} S$ is quasi-isomorphic to $\Omega_{P / R} \otimes_{P} S$ placed in degree 0 . Hence $H_{1}\left(N L_{P / R} \otimes_{P} S\right)=0$. Since $P \rightarrow S$ is surjective we see that $N L_{S / P}$ is homotopy equivalent to $J / J^{2}$ placed in degree 1 (Lemma 10.132.6). Thus we obtain the exact
sequence $0 \rightarrow H_{1}\left(L_{S / R}\right) \rightarrow J / J^{2} \rightarrow \Omega_{P / R} \otimes_{P} S \rightarrow \Omega_{S / R} \rightarrow 0$. By assumption we see that $H_{1}\left(L_{S / R}\right)=0$ and that $\Omega_{S / R}$ is a projective $S$-module. Thus (6) follows.
Finally, let's prove that (6) implies (1). The assumption means that the complex $J / J^{2} \rightarrow \Omega_{P / R} \otimes S$ where $P=R[S]$ and $P \rightarrow S$ is the canonical surjection (10.132.0.1). Hence Lemma 10.136 .7 shows that $S$ is formally smooth over $R$.

031K Lemma 10.136.9. Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $B \rightarrow C$ is formally smooth. Then the sequence

$$
0 \rightarrow \Omega_{B / A} \otimes_{B} C \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0
$$

of Lemma 10.130 .7 is a split short exact sequence.
Proof. Follows from Proposition 10.136 .8 and Lemma 10.132.4.
06A6 Lemma 10.136.10. Let $A \rightarrow B \rightarrow C$ be ring maps with $A \rightarrow C$ formally smooth and $B \rightarrow C$ surjective with kernel $J \subset B$. Then the exact sequence

$$
0 \rightarrow J / J^{2} \rightarrow \Omega_{B / A} \otimes_{B} C \rightarrow \Omega_{C / A} \rightarrow 0
$$

of Lemma 10.130 .9 is split exact.
Proof. Follows from Proposition 10.136.8. Lemma 10.132.4, and Lemma 10.130.9.

06A7 Lemma 10.136.11. Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $A \rightarrow C$ is surjective (so also $B \rightarrow C$ is) and $A \rightarrow B$ formally smooth. Denote $I=\operatorname{Ker}(A \rightarrow C)$ and $J=\operatorname{Ker}(B \rightarrow C)$. Then the sequence

$$
0 \rightarrow I / I^{2} \rightarrow J / J^{2} \rightarrow \Omega_{B / A} \otimes_{B} B / J \rightarrow 0
$$

of Lemma 10.132.7 is split exact.
Proof. Since $A \rightarrow B$ is formally smooth there exists a ring map $\sigma: B \rightarrow A / I^{2}$ whose composition with $A \rightarrow B$ equals the quotient map $A \rightarrow A / I^{2}$. Then $\sigma$ induces a map $J / J^{2} \rightarrow I / I^{2}$ which is inverse to the map $I / I^{2} \rightarrow J / J^{2}$.

031L Lemma 10.136.12. Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Assume
(1) $I^{2}=0$,
(2) $R \rightarrow S$ is flat, and
(3) $R / I \rightarrow S / I S$ is formally smooth.

Then $R \rightarrow S$ is formally smooth.
Proof. Assume (1), (2) and (3). Let $P=R\left[\left\{x_{t}\right\}_{t \in T}\right] \rightarrow S$ be a surjection of $R$ algebras with kernel $J$. Thus $0 \rightarrow J \rightarrow P \rightarrow S \rightarrow 0$ is a short exact sequence of flat $R$-modules. This implies that $I \otimes_{R} S=I S, I \otimes_{R} P=I P$ and $I \otimes_{R} J=I J$ as well as $J \cap I P=I J$. We will use throughout the proof that

$$
\Omega_{(S / I S) /(R / I)}=\Omega_{S / R} \otimes_{S}(S / I S)=\Omega_{S / R} \otimes_{R} R / I=\Omega_{S / R} / I \Omega_{S / R}
$$

and similarly for $P$ (see Lemma 10.130.12). By Lemma 10.136.7 the sequence
031M
(10.136.12.1) $\quad 0 \rightarrow J /\left(I J+J^{2}\right) \rightarrow \Omega_{P / R} \otimes_{P} S / I S \rightarrow \Omega_{S / R} \otimes_{S} S / I S \rightarrow 0$
is split exact. Of course the middle term is $\bigoplus_{t \in T} S / I S \mathrm{~d} x_{t}$. Choose a splitting $\sigma: \Omega_{P / R} \otimes_{P} S / I S \rightarrow J /\left(I J+J^{2}\right)$. For each $t \in T$ choose an element $f_{t} \in J$ which maps to $\sigma\left(\mathrm{d} x_{t}\right)$ in $J /\left(I J+J^{2}\right)$. This determines a unique $S$-module map

$$
\tilde{\sigma}: \Omega_{P / R} \otimes_{R} S=\bigoplus S \mathrm{~d} x_{t} \longrightarrow J / J^{2}
$$

with the property that $\tilde{\sigma}\left(\mathrm{d} x_{t}\right)=f_{t}$. As $\sigma$ is a section to d the difference

$$
\Delta=\mathrm{id}_{J / J^{2}}-\tilde{\sigma} \circ \mathrm{d}
$$

is a self map $J / J^{2} \rightarrow J / J^{2}$ whose image is contained in $\left(I J+J^{2}\right) / J^{2}$. In particular $\Delta\left(\left(I J+J^{2}\right) / J^{2}\right)=0$ because $I^{2}=0$. This means that $\Delta$ factors as

$$
J / J^{2} \rightarrow J /\left(I J+J^{2}\right) \xrightarrow{\bar{\Delta}}\left(I J+J^{2}\right) / J^{2} \rightarrow J / J^{2}
$$

where $\bar{\Delta}$ is a $S / I S$-module map. Using again that the sequence 10.136 .12 .1 is split, we can find a $S / I S$-module map $\bar{\delta}: \Omega_{P / R} \otimes_{P} S / I S \rightarrow\left(I J+J^{2}\right) / J^{2}$ such that $\bar{\delta} \circ d$ is equal to $\bar{\Delta}$. In the same manner as above the map $\bar{\delta}$ determines an $S$-module map $\delta: \Omega_{P / R} \otimes_{P} S \rightarrow J / J^{2}$. After replacing $\tilde{\sigma}$ by $\tilde{\sigma}+\delta$ a simple computation shows that $\Delta=0$. In other words $\tilde{\sigma}$ is a section of $J / J^{2} \rightarrow \Omega_{P / R} \otimes_{P} S$. By Lemma 10.136 .7 we conclude that $R \rightarrow S$ is formally smooth.

00TN Proposition 10.136.13. Let $R \rightarrow S$ be a ring map. The following are equivalent
(1) $R \rightarrow S$ is of finite presentation and formally smooth,
(2) $R \rightarrow S$ is smooth.

Proof. Follows from Proposition 10.136.8 and Definition 10.135.1. (Note that $\Omega_{S / R}$ is a finitely presented $S$-module if $R \rightarrow S$ is of finite presentation, see Lemma 10.130.15.)

00TP Lemma 10.136.14. Let $R \rightarrow S$ be a smooth ring map. Then there exists a subring $R_{0} \subset R$ of finite type over $\mathbf{Z}$ and a smooth ring map $R_{0} \rightarrow S_{0}$ such that $S \cong R \otimes_{R_{0}} S_{0}$.

Proof. We are going to use that smooth is equivalent to finite presentation and formally smooth, see Proposition 10.136 .13 . Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and denote $I=\left(f_{1}, \ldots, f_{m}\right)$. Choose a right inverse $\sigma: S \rightarrow R\left[x_{1}, \ldots, x_{n}\right] / I^{2}$ to the projection to $S$ as in Lemma 10.136.5. Choose $h_{i} \in R\left[x_{1}, \ldots, x_{n}\right]$ such that $\sigma\left(x_{i} \bmod I\right)=h_{i} \bmod I^{2}$. The fact that $\sigma$ is an $R$-algebra homomorphism $R\left[x_{1}, \ldots, x_{n}\right] / I \rightarrow R\left[x_{1}, \ldots, x_{n}\right] / I^{2}$ is equivalent to the condition that

$$
f_{j}\left(h_{1}, \ldots, h_{n}\right)=\sum_{j_{1} j_{2}} a_{j_{1} j_{2}} f_{j_{1}} f_{j_{2}}
$$

for certain $a_{k l} \in R\left[x_{1}, \ldots, x_{n}\right]$. Let $R_{0} \subset R$ be the subring generated over $\mathbf{Z}$ by all the coefficients of the polynomials $f_{j}, h_{i}, a_{k l}$. Set $S_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$, with $I_{0}=\left(f_{1}, \ldots, f_{m}\right)$. Let $\sigma_{0}: S_{0} \rightarrow R_{0}\left[x_{1}, \ldots, x_{n}\right] / I_{0}^{2}$ defined by the rule $x_{i} \mapsto h_{i} \bmod I_{0}^{2}$; this works since the $a_{l k}$ are defined over $R_{0}$ and satisfy the same relations. Thus by Lemma 10.136 .5 the ring $S_{0}$ is formally smooth over $R_{0}$.

06CM Lemma 10.136.15. Let $R \rightarrow S$ be a ring map. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. Set $S^{\prime}=S \otimes_{R} R^{\prime}$. Then $R \rightarrow S$ is formally smooth if and only if $R^{\prime} \rightarrow S^{\prime}$ is formally smooth.

Proof. If $R \rightarrow S$ is formally smooth, then $R^{\prime} \rightarrow S^{\prime}$ is formally smooth by Lemma 10.136.2 To prove the converse, assume $R^{\prime} \rightarrow S^{\prime}$ is formally smooth. Note that $N \otimes_{R} R^{\prime}=N \otimes_{S} S^{\prime}$ for any $S$-module $N$. In particular $S \rightarrow S^{\prime}$ is faithfully flat also. Choose a polynomial ring $P=R\left[\left\{x_{i}\right\}_{i \in I}\right]$ and a surjection of $R$-algebras $P \rightarrow S$ with kernel $J$. Note that $P^{\prime}=P \otimes_{R} R^{\prime}$ is a polynomial algebra over $R^{\prime}$. Since
$R \rightarrow R^{\prime}$ is flat the kernel $J^{\prime}$ of the surjection $P^{\prime} \rightarrow S^{\prime}$ is $J \otimes_{R} R^{\prime}$. Hence the split exact sequence (see Lemma 10.136.7)

$$
0 \rightarrow J^{\prime} /\left(J^{\prime}\right)^{2} \rightarrow \Omega_{P^{\prime} / R^{\prime}} \otimes_{P^{\prime}} S^{\prime} \rightarrow \Omega_{S^{\prime} / R^{\prime}} \rightarrow 0
$$

is the base change via $S \rightarrow S^{\prime}$ of the corresponding sequence

$$
J / J^{2} \rightarrow \Omega_{P / R} \otimes_{P} S \rightarrow \Omega_{S / R} \rightarrow 0
$$

see Lemma 10.130 .9 . As $S \rightarrow S^{\prime}$ is faithfully flat we conclude two things: (1) this sequence (without ${ }^{\prime}$ ) is exact too, and (2) $\Omega_{S / R}$ is a projective $S$-module. Namely, $\Omega_{S^{\prime} / R^{\prime}}$ is projective as a direct sum of the free module $\Omega_{P^{\prime} / R^{\prime}} \otimes_{P^{\prime}} S^{\prime}$ and $\Omega_{S / R} \otimes_{S} S^{\prime}=\Omega_{S^{\prime} / R^{\prime}}$ by what we said above. Thus (2) follows by descent of projectivity through faithfully flat ring maps, see Theorem 10.94.5. Hence the sequence $0 \rightarrow J / J^{2} \rightarrow \Omega_{P / R} \otimes_{P} S \rightarrow \Omega_{S / R} \rightarrow 0$ is exact also and we win by applying Lemma 10.136 .7 once more.

It turns out that smooth ring maps satisfy the following strong lifting property.
07K4 Lemma 10.136.16. Let $R \rightarrow S$ be a smooth ring map. Given a commutative solid diagram

where $I \subset A$ is a locally nilpotent ideal, a dotted arrow exists which makes the diagram commute.

Proof. By Lemma 10.136 .14 we can extend the diagram to a commutative diagram

with $R_{0} \rightarrow S_{0}$ smooth, $R_{0}$ of finite type over $\mathbf{Z}$, and $S=S_{0} \otimes_{R_{0}} R$. Let $x_{1}, \ldots, x_{n} \in$ $S_{0}$ be generators of $S_{0}$ over $R_{0}$. Let $a_{1}, \ldots, a_{n}$ be elements of $A$ which map to the same elements in $A / I$ as the elements $x_{1}, \ldots, x_{n}$. Denote $A_{0} \subset A$ the subring generated by the image of $R_{0}$ and the elements $a_{1}, \ldots, a_{n}$. Set $I_{0}=A_{0} \cap I$. Then $A_{0} / I_{0} \subset A / I$ and $S_{0} \rightarrow A / I$ maps into $A_{0} / I_{0}$. Thus it suffices to find the dotted arrow in the diagram

The ring $A_{0}$ is of finite type over $\mathbf{Z}$ by construction. Hence $A_{0}$ is Noetherian, whence $I_{0}$ is nilpotent, see Lemma 10.31.4. Say $I_{0}^{n}=0$. By Proposition 10.136.13 we can successively lift the $R_{0}$-algebra map $S_{0} \rightarrow A_{0} / I_{0}$ to $S_{0} \rightarrow A_{0} / I_{0}^{2}, S_{0} \rightarrow A_{0} / I_{0}^{3}, \ldots$, and finally $S_{0} \rightarrow A_{0} / I_{0}^{n}=A_{0}$.

### 10.137. Smoothness and differentials

05D4 Some results on differentials and smooth ring maps.
04B2 Lemma 10.137.1. Given ring maps $A \rightarrow B \rightarrow C$ with $B \rightarrow C$ smooth, then the sequence

$$
0 \rightarrow C \otimes_{B} \Omega_{B / A} \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0
$$

of Lemma 10.130 .7 is exact.
Proof. This follows from the more general Lemma 10.136 .9 because a smooth ring map is formally smooth, see Proposition 10.136 .13 . But it also follows directly from Lemma 10.132 .4 since $H_{1}\left(L_{C / B}\right)=0$ is part of the definition of smoothness of $B \rightarrow C$.

06A8 Lemma 10.137.2. Let $A \rightarrow B \rightarrow C$ be ring maps with $A \rightarrow C$ smooth and $B \rightarrow C$ surjective with kernel $J \subset B$. Then the exact sequence

$$
0 \rightarrow J / J^{2} \rightarrow \Omega_{B / A} \otimes_{B} C \rightarrow \Omega_{C / A} \rightarrow 0
$$

of Lemma 10.130 .9 is split exact.
Proof. This follows from the more general Lemma 10.136 .10 because a smooth ring map is formally smooth, see Proposition 10.136.13.

06A9 Lemma 10.137.3. Let $A \rightarrow B \rightarrow C$ be ring maps. Assume $A \rightarrow C$ is surjective (so also $B \rightarrow C$ is) and $A \rightarrow B$ smooth. Denote $I=\operatorname{Ker}(A \rightarrow C)$ and $J=$ $\operatorname{Ker}(B \rightarrow C)$. Then the sequence

$$
0 \rightarrow I / I^{2} \rightarrow J / J^{2} \rightarrow \Omega_{B / A} \otimes_{B} B / J \rightarrow 0
$$

of Lemma 10.132.7 is exact.
Proof. This follows from the more general Lemma 10.136 .11 because a smooth ring map is formally smooth, see Proposition 10.136.13.

05D5 Lemma 10.137.4. Let $\varphi: R \rightarrow S$ be a smooth ring map. Let $\sigma: S \rightarrow R$ be a left inverse to $\varphi$. Set $I=\operatorname{Ker}(\sigma)$. Then
(1) $I / I^{2}$ is a finite locally free $R$-module, and
(2) if $I / I^{2}$ is free, then $S^{\wedge} \cong R\left[\left[t_{1}, \ldots, t_{d}\right]\right]$ as $R$-algebras, where $S^{\wedge}$ is the $I$-adic completion of $S$.

Proof. By Lemma 10.130 .10 applied to $R \rightarrow S \rightarrow R$ we see that $I / I^{2}=\Omega_{S / R} \otimes_{S, \sigma}$ $R$. Since by definition of a smooth morphism the module $\Omega_{S / R}$ is finite locally free over $S$ we deduce that (1) holds. If $I / I^{2}$ is free, then choose $f_{1}, \ldots, f_{d} \in I$ whose images in $I / I^{2}$ form an $R$-basis. Consider the $R$-algebra map defined by

$$
\Psi: R\left[\left[x_{1}, \ldots, x_{d}\right]\right] \longrightarrow S^{\wedge}, \quad x_{i} \longmapsto f_{i}
$$

Denote $P=R\left[\left[x_{1}, \ldots, x_{d}\right]\right]$ and $J=\left(x_{1}, \ldots, x_{d}\right) \subset P$. We write $\Psi_{n}: P / J^{n} \rightarrow S / I^{n}$ for the induced map of quotient rings. Note that $S / I^{2}=\varphi(R) \oplus I / I^{2}$. Thus $\Psi_{2}$ is an isomorphism. Denote $\sigma_{2}: S / I^{2} \rightarrow P / J^{2}$ the inverse of $\Psi_{2}$. We will prove by induction on $n$ that for all $n>2$ there exists an inverse $\sigma_{n}: S / I^{n} \rightarrow P / J^{n}$ of $\Psi_{n}$.

Namely, as $S$ is formally smooth over $R$ (by Proposition 10.136 .13 ) we see that in the solid diagram

of $R$-algebras we can fill in the dotted arrow by some $R$-algebra map $\tau: S \rightarrow P / J^{n}$ making the diagram commute. This induces an $R$-algebra map $\bar{\tau}: S / I^{n} \rightarrow P / J^{n}$ which is equal to $\sigma_{n-1}$ modulo $J^{n}$. By construction the map $\Psi_{n}$ is surjective and now $\bar{\tau} \circ \Psi_{n}$ is an $R$-algebra endomorphism of $P / J^{n}$ which maps $x_{i}$ to $x_{i}+\delta_{i, n}$ with $\delta_{i, n} \in J^{n-1} / J^{n}$. It follows that $\Psi_{n}$ is an isomorphism and hence it has an inverse $\sigma_{n}$. This proves the lemma.

### 10.138. Smooth algebras over fields

00TQ Warning: The following two lemmas do not hold over nonperfect fields in general.
00TR Lemma 10.138.1. Let $k$ be an algebraically closed field. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{m} \subset S$ be a maximal ideal. Then

$$
\operatorname{dim}_{\kappa(\mathfrak{m})} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{m})=\operatorname{dim}_{\kappa(\mathfrak{m})} \mathfrak{m} / \mathfrak{m}^{2}
$$

Proof. Consider the exact sequence

$$
\mathfrak{m} / \mathfrak{m}^{2} \rightarrow \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{m}) \rightarrow \Omega_{\kappa(\mathfrak{m}) / k} \rightarrow 0
$$

of Lemma 10.130 .9 . We would like to show that the first map is an isomorphism. Since $k$ is algebraically closed the composition $k \rightarrow \kappa(\mathfrak{m})$ is an isomorphism by Theorem 10.33.1. So the surjection $S \rightarrow \kappa(\mathfrak{m})$ splits as a map of $k$-algebras, and Lemma 10.130 .10 shows that the sequence above is exact on the left. Since $\Omega_{\kappa(\mathfrak{m}) / k}=0$, we win.

00TS Lemma 10.138.2. Let $k$ be an algebraically closed field. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{m} \subset S$ be a maximal ideal. The following are equivalent:
(1) The ring $S_{\mathfrak{m}}$ is a regular local ring.
(2) We have $\operatorname{dim}_{\kappa(\mathfrak{m})} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{m}) \leq \operatorname{dim}\left(S_{\mathfrak{m}}\right)$.
(3) We have $\operatorname{dim}_{\kappa(\mathfrak{m})} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{m})=\operatorname{dim}\left(S_{\mathfrak{m}}\right)$.
(4) There exists a $g \in S, g \notin \mathfrak{m}$ such that $S_{g}$ is smooth over $k$. In other words $S / k$ is smooth at $\mathfrak{m}$.

Proof. Note that (1), (2) and (3) are equivalent by Lemma 10.138.1 and Definition 10.109.7.

Assume that $S$ is smooth at $\mathfrak{m}$. By Lemma 10.135 .10 we see that $S_{g}$ is standard smooth over $k$ for a suitable $g \in S, g \notin \mathfrak{m}$. Hence by Lemma 10.135 .7 we see that $\Omega_{S_{g} / k}$ is free of rank $\operatorname{dim}\left(S_{g}\right)$. Hence by Lemma 10.138.1 we see that $\operatorname{dim}\left(S_{m}\right)=$ $\operatorname{dim}\left(\mathfrak{m} / \mathfrak{m}^{2}\right)$ in other words $S_{\mathfrak{m}}$ is regular.
Conversely, suppose that $S_{\mathfrak{m}}$ is regular. Let $d=\operatorname{dim}\left(S_{\mathfrak{m}}\right)=\operatorname{dim} \mathfrak{m} / \mathfrak{m}^{2}$. Choose a presentation $S=k\left[x_{1}, \ldots, x_{n}\right] / I$ such that $x_{i}$ maps to an element of $\mathfrak{m}$ for all $i$. In other words, $\mathfrak{m}^{\prime \prime}=\left(x_{1}, \ldots, x_{n}\right)$ is the corresponding maximal ideal of $k\left[x_{1}, \ldots, x_{n}\right]$. Note that we have a short exact sequence

$$
I / \mathfrak{m}^{\prime \prime} I \rightarrow \mathfrak{m}^{\prime \prime} /\left(\mathfrak{m}^{\prime \prime}\right)^{2} \rightarrow \mathfrak{m} /(\mathfrak{m})^{2} \rightarrow 0
$$

Pick $c=n-d$ elements $f_{1}, \ldots, f_{d} \in I$ such that their images in $\mathfrak{m}^{\prime \prime} /\left(\mathfrak{m}^{\prime \prime}\right)^{2}$ span the kernel of the map to $\mathfrak{m} /(\mathfrak{m})^{2}$. This is clearly possible. Denote $J=\left(f_{1}, \ldots, f_{c}\right)$. So $J \subset I$. Denote $S^{\prime}=k\left[x_{1}, \ldots, x_{n}\right] / J$ so there is a surjection $S^{\prime} \rightarrow S$. Denote $\mathfrak{m}^{\prime}=\mathfrak{m}^{\prime \prime} S^{\prime}$ the corresponding maximal ideal of $S^{\prime}$. Hence we have

By our choice of $J$ the exact sequence

$$
J / \mathfrak{m}^{\prime \prime} J \rightarrow \mathfrak{m}^{\prime \prime} /\left(\mathfrak{m}^{\prime \prime}\right)^{2} \rightarrow \mathfrak{m}^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{2} \rightarrow 0
$$

shows that $\operatorname{dim}\left(\mathfrak{m}^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{2}\right)=d$. Since $S_{\mathfrak{m}^{\prime}}^{\prime}$ surjects onto $S_{\mathfrak{m}}$ we see that $\operatorname{dim}\left(S_{\mathfrak{m}^{\prime}}\right) \geq$ d. Hence by the discussion preceding Definition 10.59 .9 we conclude that $S_{\mathfrak{m}^{\prime}}^{\prime}$ is regular of dimension $d$ as well. Because $S^{\prime}$ was cut out by $c=n-d$ equations we conclude that there exists a $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{m}^{\prime}$ such that $S_{g^{\prime}}^{\prime}$ is a global complete intersection over $k$, see Lemma 10.133 .4 . Also the map $S_{\mathfrak{m}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{m}}$ is a surjection of Noetherian local domains of the same dimension and hence an isomorphism. By Lemma 10.125 .7 we see that $S_{g^{\prime}}^{\prime} \cong S_{g}$ for some $g \in S, g \notin \mathfrak{m}$ and $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{m}^{\prime}$. All in all we conclude that after replacing $S$ by a principal localization we may assume that $S$ is a global complete intersection.

At this point we may write $S=k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ with $\operatorname{dim} S=n-c$. Recall that the naive cotangent complex of this algebra is given by

$$
\bigoplus S \cdot f_{j} \rightarrow \bigoplus S \cdot \mathrm{~d} x_{i}
$$

see Lemma 10.134.13. By Lemma 10.135 .15 in order to show that $S$ is smooth at $\mathfrak{m}$ we have to show that one of the $c \times c$ minors $g_{I}$ of the matrix " $A$ " giving the map above does not vanish at $\mathfrak{m}$. By Lemma 10.138 .1 the matrix $A \bmod \mathfrak{m}$ has rank $c$. Thus we win.

00TT Lemma 10.138.3. Let $k$ be any field. Let $S$ be a finite type $k$-algebra. Let $X=\operatorname{Spec}(S)$. Let $\mathfrak{q} \subset S$ be a prime corresponding to $x \in X$. The following are equivalent:
(1) The $k$-algebra $S$ is smooth at $\mathfrak{q}$ over $k$.
(2) We have $\operatorname{dim}_{\kappa(\mathfrak{q})} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{q}) \leq \operatorname{dim}_{x} X$.
(3) We have $\operatorname{dim}_{\kappa(\mathfrak{q})} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{q})=\operatorname{dim}_{x} X$.

Moreover, in this case the local ring $S_{\mathfrak{q}}$ is regular.
Proof. If $S$ is smooth at $\mathfrak{q}$ over $k$, then there exists a $g \in S, g \notin \mathfrak{q}$ such that $S_{g}$ is standard smooth over $k$, see Lemma 10.135.10. A standard smooth algebra over $k$ has a module of differentials which is free of rank equal to the dimension, see Lemma 10.135 .7 (use that a relative global complete intersection over a field has dimension equal to the number of variables minus the number of equations). Thus we see that (1) implies (3). To finish the proof of the lemma it suffices to show that (2) implies (1) and that it implies that $S_{\mathfrak{q}}$ is regular.

Assume (2). By Nakayama's Lemma 10.19.1 we see that $\Omega_{S / k, \mathfrak{q}}$ can be generated by $\leq \operatorname{dim}_{x} X$ elements. We may replace $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ such that $\Omega_{S / k}$ is generated by at most $\operatorname{dim}_{x} X$ elements. Let $K \supset k$ be an algebraically closed
field extension such that there exists a $k$-algebra map $\psi: \kappa(\mathfrak{q}) \rightarrow K$. Consider $S_{K}=K \otimes_{k} S$. Let $\mathfrak{m} \subset S_{K}$ be the maximal ideal corresponding to the surjection

$$
S_{K}=K \otimes_{k} S \longrightarrow K \otimes_{k} \kappa(\mathfrak{q}) \xrightarrow{\operatorname{id}_{K} \otimes \psi} K
$$

Note that $\mathfrak{m} \cap S=\mathfrak{q}$, in other words $\mathfrak{m}$ lies over $\mathfrak{q}$. By Lemma 10.115 .6 the dimension of $X_{K}=\operatorname{Spec}\left(S_{K}\right)$ at the point corresponding to $\mathfrak{m}$ is $\operatorname{dim}_{x} X$. By Lemma 10.113 .6 this is equal to $\operatorname{dim}\left(\left(S_{K}\right)_{\mathfrak{m}}\right)$. By Lemma 10.130 .12 the module of differentials of $S_{K}$ over $K$ is the base change of $\Omega_{S / k}$, hence also generated by at most $\operatorname{dim}_{x} X=\operatorname{dim}\left(\left(S_{K}\right)_{\mathfrak{m}}\right)$ elements. By Lemma 10.138 .2 we see that $S_{K}$ is smooth at $\mathfrak{m}$ over $K$. By Lemma 10.135 .17 this implies that $S$ is smooth at $\mathfrak{q}$ over $k$. This proves (1). Moreover, we know by Lemma 10.138 .2 that the local ring $\left(S_{K}\right)_{\mathfrak{m}}$ is regular. Since $S_{\mathfrak{q}} \rightarrow\left(S_{K}\right)_{\mathfrak{m}}$ is flat we conclude from Lemma 10.109 .9 that $S_{\mathfrak{q}}$ is regular.

The following lemma can be significantly generalized (in several different ways).
00 TU Lemma 10.138.4. Let $k$ be a field. Let $R$ be a Noetherian local ring containing $k$. Assume that the residue field $\kappa=R / \mathfrak{m}$ is a finitely generated separable extension of $k$. Then the map

$$
d: \mathfrak{m} / \mathfrak{m}^{2} \longrightarrow \Omega_{R / k} \otimes_{R} \kappa(\mathfrak{m})
$$

is injective.
Proof. We may replace $R$ by $R / \mathfrak{m}^{2}$. Hence we may assume that $\mathfrak{m}^{2}=0$. By assumption we may write $\kappa=k\left(\bar{x}_{1}, \ldots, \bar{x}_{r}, \bar{y}\right)$ where $\bar{x}_{1}, \ldots, \bar{x}_{r}$ is a transcendence basis of $\kappa$ over $k$ and $\bar{y}$ is separable algebraic over $k\left(\bar{x}_{1}, \ldots, \bar{x}_{r}\right)$. Say its minimal equation is $P(\bar{y})=0$ with $P(T)=T^{d}+\sum_{i<d} a_{i} T^{i}$, with $a_{i} \in k\left(\bar{x}_{1}, \ldots, \bar{x}_{r}\right)$ and $P^{\prime}(\bar{y}) \neq 0$. Choose any lifts $x_{i} \in R$ of the elements $\bar{x}_{i} \in \kappa$. This gives a commutative diagram

of $k$-algebras. We want to extend the left upwards arrow $\varphi$ to a $k$-algebra map from $\kappa$ to $R$. To do this choose any $y \in R$ lifting $\bar{y}$. To see that it defines a $k$-algebra map defined on $\kappa \cong k\left(\bar{x}_{1}, \ldots, \bar{x}_{r}\right)[T] /(P)$ all we have to show is that we may choose $y$ such that $P^{\varphi}(y)=0$. If not then we compute for $\delta \in \mathfrak{m}$ that

$$
P(y+\delta)=P(y)+P^{\prime}(y) \delta
$$

because $\mathfrak{m}^{2}=0$. Since $P^{\prime}(y) \delta=P^{\prime}(\bar{y}) \delta$ we see that we can adjust our choice as desired. This shows that $R \cong \kappa \oplus \mathfrak{m}$ as $k$-algebras! From a direct computation of $\Omega_{\kappa \oplus \mathfrak{m} / k}$ the lemma follows.

00TV Lemma 10.138.5. Let $k$ be a field. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{q} \subset S$ be a prime. Assume $\kappa(\mathfrak{q})$ is separable over $k$. The following are equivalent:
(1) The algebra $S$ is smooth at $\mathfrak{q}$ over $k$.
(2) The ring $S_{\mathfrak{q}}$ is regular.

Proof. Denote $R=S_{\mathfrak{q}}$ and denote its maximal by $\mathfrak{m}$ and its residue field $\kappa$. By Lemma 10.138 .4 and 10.130 .9 we see that there is a short exact sequence

$$
0 \rightarrow \mathfrak{m} / \mathfrak{m}^{2} \rightarrow \Omega_{R / k} \otimes_{R} \kappa \rightarrow \Omega_{\kappa / k} \rightarrow 0
$$

Note that $\Omega_{R / k}=\Omega_{S / k, \mathfrak{q}}$, see Lemma 10.130.8. Moreover, since $\kappa$ is separable over $k$ we have $\operatorname{dim}_{\kappa} \Omega_{\kappa / k}=\operatorname{trdeg}_{k}(\kappa)$. Hence we get

$$
\operatorname{dim}_{\kappa} \Omega_{R / k} \otimes_{R} \kappa=\operatorname{dim}_{\kappa} \mathfrak{m} / \mathfrak{m}^{2}+\operatorname{trdeg}_{k}(\kappa) \geq \operatorname{dim} R+\operatorname{trdeg}_{k}(\kappa)=\operatorname{dim}_{\mathfrak{q}} S
$$

(see Lemma 10.115 .3 for the last equality) with equality if and only if $R$ is regular. Thus we win by applying Lemma 10.138.3.

00TW Lemma 10.138.6. Let $R \rightarrow S$ be a Q-algebra map. Let $f \in S$ be such that $\Omega_{S / R}=S d f \oplus C$ for some $S$-submodule $C$. Then
(1) $f$ is not nilpotent, and
(2) if $S$ is a Noetherian local ring, then $f$ is a nonzerodivisor in $S$.

Proof. For $a \in S$ write $\mathrm{d}(a)=\theta(a) \mathrm{d} f+c(a)$ for some $\theta(a) \in S$ and $c(a) \in C$. Consider the $R$-derivation $S \rightarrow S, a \mapsto \theta(a)$. Note that $\theta(f)=1$.
If $f^{n}=0$ with $n>1$ minimal, then $0=\theta\left(f^{n}\right)=n f^{n-1}$ contradicting the minimality of $n$. We conclude that $f$ is not nilpotent.

Suppose $f a=0$. If $f$ is a unit then $a=0$ and we win. Assume $f$ is not a unit. Then $0=\theta(f a)=f \theta(a)+a$ by the Leibniz rule and hence $a \in(f)$. By induction suppose we have shown $f a=0 \Rightarrow a \in\left(f^{n}\right)$. Then writing $a=f^{n} b$ we get $0=$ $\theta\left(f^{n+1} b\right)=(n+1) f^{n} b+f^{n+1} \theta(b)$. Hence $a=f^{n} b=-f^{n+1} \theta(b) /(n+1) \in\left(f^{n+1}\right)$. Since in the Noetherian local ring $S$ we have $\bigcap\left(f^{n}\right)=0$, see Lemma 10.50.4 we win.

The following is probably quite useless in applications.
00TX Lemma 10.138.7. Let $k$ be a field of characteristic 0. Let $S$ be a finite type $k$-algebra. Let $\mathfrak{q} \subset S$ be a prime. The following are equivalent:
(1) The algebra $S$ is smooth at $\mathfrak{q}$ over $k$.
(2) The $S_{\mathfrak{q}}$-module $\Omega_{S / k, \mathfrak{q}}$ is (finite) free.
(3) The ring $S_{\mathfrak{q}}$ is regular.

Proof. In characteristic zero any field extension is separable and hence the equivalence of (1) and (3) follows from Lemma 10.138.5. Also (1) implies (2) by definition of smooth algebras. Assume that $\Omega_{S / k, \mathfrak{q}}$ is free over $S_{\mathfrak{q}}$. We are going to use the notation and observations made in the proof of Lemma 10.138.5. So $R=S_{\mathfrak{q}}$ with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. Our goal is to prove $R$ is regular.
If $\mathfrak{m} / \mathfrak{m}^{2}=0$, then $\mathfrak{m}=0$ and $R \cong \kappa$. Hence $R$ is regular and we win.
If $\mathfrak{m} / \mathfrak{m}^{2} \neq 0$, then choose any $f \in \mathfrak{m}$ whose image in $\mathfrak{m} / \mathfrak{m}^{2}$ is not zero. By Lemma 10.138 .4 we see that $\mathrm{d} f$ has nonzero image in $\Omega_{R / k} / \mathfrak{m} \Omega_{R / k}$. By assumption $\Omega_{R / k}=\Omega_{S / k, \mathfrak{q}}$ is finite free and hence by Nakayama's Lemma 10.19.1 we see that $\mathrm{d} f$ generates a direct summand. We apply Lemma 10.138.6 to deduce that $f$ is a nonzerodivisor in $R$. Furthermore, by Lemma 10.130 .9 we get an exact sequence

$$
(f) /\left(f^{2}\right) \rightarrow \Omega_{R / k} \otimes_{R} R / f R \rightarrow \Omega_{(R / f R) / k} \rightarrow 0
$$

This implies that $\Omega_{(R / f R) / k}$ is finite free as well. Hence by induction we see that $R / f R$ is a regular local ring. Since $f \in \mathfrak{m}$ was a nonzerodivisor we conclude that $R$ is regular, see Lemma 10.105 .7 .

00TY Example 10.138.8. Lemma 10.138 .7 does not hold in characteristic $p>0$. The standard examples are the ring maps

$$
\mathbf{F}_{p} \longrightarrow \mathbf{F}_{p}[x] /\left(x^{p}\right)
$$

whose module of differentials is free but is clearly not smooth, and the ring map ( $p>2$ )

$$
\mathbf{F}_{p}(t) \rightarrow \mathbf{F}_{p}(t)[x, y] /\left(x^{p}+y^{2}+\alpha\right)
$$

which is not smooth at the prime $\mathfrak{q}=\left(y, x^{p}-\alpha\right)$ but is regular.
Using the material above we can characterize smoothness at the generic point in terms of field extensions.

07ND Lemma 10.138.9. Let $R \rightarrow S$ be an injective finite type ring map with $R$ and $S$ domains. Then $R \rightarrow S$ is smooth at $\mathfrak{q}=(0)$ if and only if $f . f .(R) \subset f . f .(S)$ is a separable extension of fields.

Proof. Assume $R \rightarrow S$ is smooth at (0). We may replace $S$ by $S_{g}$ for some nonzero $g \in S$ and assume that $R \rightarrow S$ is smooth. Set $K=f . f .(R)$. Then $K \rightarrow S \otimes_{R} K$ is smooth (Lemma 10.135.4). Moreover, for any field extension $K \subset K^{\prime}$ the ring map $K^{\prime} \rightarrow S \otimes_{R} K^{\prime}$ is smooth as well. Hence $S \otimes_{R} K^{\prime}$ is a regular ring by Lemma 10.138.3, in particular reduced. It follows that $S \otimes_{R} K$ is a geometrically reduced over $K$. Hence $f . f .(S)$ is geometrically reduced over $K$, see Lemma 10.42.3. Hence $f . f .(S) / K$ is separable by Lemma 10.43 .1 .
Conversely, assume that $f . f .(R) \subset f . f .(S)$ is separable. We may assume $R \rightarrow S$ is of finite presentation, see Lemma 10.29.1. It suffices to prove that $K \rightarrow S \otimes_{R} K$ is smooth at (0), see Lemma 10.135.17. This follows from Lemma 10.138.5, the fact that a field is a regular ring, and the assumption that $f . f .(R) \rightarrow f . f .(S)$ is separable.

### 10.139. Smooth ring maps in the Noetherian case

02HR
02HS Definition 10.139.1. Let $\varphi: B^{\prime} \rightarrow B$ be a ring map. We say $\varphi$ is a small extension if $B^{\prime}$ and $B$ are local Artinian rings, $\varphi$ is surjective and $I=\operatorname{Ker}(\varphi)$ has length 1 as a $B^{\prime}$-module.

Clearly this means that $I^{2}=0$ and that $I=(x)$ for some $x \in B^{\prime}$ such that $\mathfrak{m}^{\prime} x=0$ where $\mathfrak{m}^{\prime} \subset B^{\prime}$ is the maximal ideal.
02HT Lemma 10.139.2. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime ideal of $S$ lying over $\mathfrak{p} \subset R$. Assume $R$ is Noetherian and $R \rightarrow S$ of finite type. The following are equivalent:
(1) $R \rightarrow S$ is smooth at $\mathfrak{q}$,
(2) for every surjection of local $R$-algebras $\left(B^{\prime}, \mathfrak{m}^{\prime}\right) \rightarrow(B, \mathfrak{m})$ with $\operatorname{Ker}\left(B^{\prime} \rightarrow\right.$ $B)$ having square zero and every solid commutative diagram

such that $\mathfrak{q}=S \cap \mathfrak{m}$ there exists a dotted arrow making the diagram commute,
(3) same as in (2) but with $B^{\prime} \rightarrow B$ ranging over small extensions, and
(4) same as in (2) but with $B^{\prime} \rightarrow B$ ranging over small extensions such that in addition $S \rightarrow B$ induces an isomorphism $\kappa(\mathfrak{q}) \cong \kappa(\mathfrak{m})$.

Proof. Assume (1). This means there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is smooth. By Proposition 10.136 .13 we know that $R \rightarrow S_{g}$ is formally smooth. Note that given any diagram as in (2) the map $S \rightarrow B$ factors automatically through $S_{\mathfrak{q}}$ and a fortiori through $S_{g}$. The formal smoothness of $S_{g}$ over $R$ gives us a morphism $S_{g} \rightarrow B^{\prime}$ fitting into a similar diagram with $S_{g}$ at the upper left corner. Composing with $S \rightarrow S_{g}$ gives the desired arrow. In other words, we have shown that (1) implies (2).

Clearly (2) implies (3) and (3) implies (4).
Assume (4). We are going to show that (1) holds, thereby finishing the proof of the lemma. Choose a presentation $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. This is possible as $S$ is of finite type over $R$ and therefore of finite presentation (see Lemma 10.30.4). Set $I=\left(f_{1}, \ldots, f_{m}\right)$. Consider the naive cotangent complex

$$
\mathrm{d}: I / I^{2} \longrightarrow \bigoplus_{j=1}^{m} S \mathrm{~d} x_{j}
$$

of this presentation (see Section 10.132). It suffices to show that when we localize this complex at $\mathfrak{q}$ then the map becomes a split injection, see Lemma 10.135.12, Denote $S^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] / I^{2}$. By Lemma 10.130.11 we have

$$
S \otimes_{S^{\prime}} \Omega_{S^{\prime} / R}=S \otimes_{R\left[x_{1}, \ldots, x_{n}\right]} \Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R}=\bigoplus_{j=1}^{m} S \mathrm{~d} x_{j}
$$

Thus the map

$$
\mathrm{d}: I / I^{2} \longrightarrow S \otimes_{S^{\prime}} \Omega_{S^{\prime} / R}
$$

is the same as the map in the naive cotangent complex above. In particular the truth of the assertion we are trying to prove depends only on the three rings $R \rightarrow S^{\prime} \rightarrow S$. Let $\mathfrak{q}^{\prime} \subset R\left[x_{1}, \ldots, x_{n}\right]$ be the prime ideal corresponding to $\mathfrak{q}$. Since localization commutes with taking modules of differentials (Lemma 10.130.8) we see that it suffices to show that the map

02HU

$$
\begin{equation*}
\mathrm{d}: I_{\mathfrak{q}^{\prime}} / I_{\mathfrak{q}^{\prime}}^{2} \longrightarrow S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}^{\prime}}^{\prime}} \Omega_{S_{\mathfrak{q}^{\prime}}^{\prime} / R} \tag{10.139.2.1}
\end{equation*}
$$

coming from $R \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is a split injection.
Let $N \in \mathbf{N}$ be an integer. Consider the ring

$$
B_{N}^{\prime}=S_{\mathfrak{q}^{\prime}}^{\prime} /\left(\mathfrak{q}^{\prime}\right)^{N} S_{\mathfrak{q}^{\prime}}^{\prime}=\left(S^{\prime} /\left(\mathfrak{q}^{\prime}\right)^{N} S^{\prime}\right)_{\mathfrak{q}^{\prime}}
$$

and its quotient $B_{N}=B_{N}^{\prime} / I B_{N}^{\prime}$. Note that $B_{N} \cong S_{\mathfrak{q}} / \mathfrak{q}^{N} S_{\mathfrak{q}}$. Observe that $B_{N}^{\prime}$ is an Artinian local ring since it is the quotient of a local Noetherian ring by a power of its maximal ideal. Consider a filtration of the kernel $I_{N}$ of $B_{N}^{\prime} \rightarrow B_{N}$ by $B_{N}^{\prime}$-submodules

$$
0 \subset J_{N, 1} \subset J_{N, 2} \subset \ldots \subset J_{N, n(N)}=I_{N}
$$

such that each successive quotient $J_{N, i} / J_{N, i-1}$ has length 1. (As $B_{N}^{\prime}$ is Artinian such a filtration exists.) This gives a sequence of small extensions

$$
B_{N}^{\prime} \rightarrow B_{N}^{\prime} / J_{N, 1} \rightarrow B_{N}^{\prime} / J_{N, 2} \rightarrow \ldots \rightarrow B_{N}^{\prime} / J_{N, n(N)}=B_{N}^{\prime} / I_{N}=B_{N}=S_{\mathfrak{q}} / \mathfrak{q}^{N} S_{\mathfrak{q}}
$$

Applying condition (4) successively to these small extensions starting with the map $S \rightarrow B_{N}$ we see there exists a commutative diagram

Clearly the ring map $S \rightarrow B_{N}^{\prime}$ factors as $S \rightarrow S_{\mathfrak{q}} \rightarrow B_{N}^{\prime}$ where $S_{\mathfrak{q}} \rightarrow B_{N}^{\prime}$ is a local homomorphism of local rings. Moreover, since the maximal ideal of $B_{N}^{\prime}$ to the $N$ th power is zero we conclude that $S_{\mathfrak{q}} \rightarrow B_{N}^{\prime}$ factors through $S_{\mathfrak{q}} /(\mathfrak{q})^{N} S_{\mathfrak{q}}=B_{N}$. In other words we have shown that for all $N \in \mathbf{N}$ the surjection of $R$-algebras $B_{N}^{\prime} \rightarrow B_{N}$ has a splitting.
Consider the presentation

$$
I_{N} \rightarrow B_{N} \otimes_{B_{N}^{\prime}} \Omega_{B_{N}^{\prime} / R} \rightarrow \Omega_{B_{N} / R} \rightarrow 0
$$

coming from the surjection $B_{N}^{\prime} \rightarrow B_{N}$ with kernel $I_{N}$ (see Lemma 10.130.9). By the above the $R$-algebra map $B_{N}^{\prime} \rightarrow B_{N}$ has a right inverse. Hence by Lemma 10.130 .10 we see that the sequence above is split exact! Thus for every $N$ the map

$$
I_{N} \longrightarrow B_{N} \otimes_{B_{N}^{\prime}} \Omega_{B_{N}^{\prime} / R}
$$

is a split injection. The rest of the proof is gotten by unwinding what this means exactly. Note that

$$
I_{N}=I_{\mathfrak{q}^{\prime}} /\left(I_{\mathfrak{q}^{\prime}}^{2}+\left(\mathfrak{q}^{\prime}\right)^{N} \cap I_{\mathfrak{q}^{\prime}}\right)
$$

By Artin-Rees (Lemma 10.50.2 we find a $c \geq 0$ such that

$$
S_{\mathfrak{q}} / \mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} I_{N}=S_{\mathfrak{q}} / \mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} I_{\mathfrak{q}^{\prime}} / I_{\mathfrak{q}^{\prime}}^{2}
$$

for all $N \geq c$ (these tensor product are just a fancy way of dividing by $\mathfrak{q}^{N-c}$ ). We may of course assume $c \geq 1$. By Lemma 10.130 .11 we see that

$$
S_{\mathfrak{q}^{\prime}}^{\prime} /\left(\mathfrak{q}^{\prime}\right)^{N-c} S_{\mathfrak{q}^{\prime}}^{\prime} \otimes_{S_{\mathfrak{q}^{\prime}}^{\prime}} \Omega_{B_{N}^{\prime} / R}=S_{\mathfrak{q}^{\prime}}^{\prime} /\left(\mathfrak{q}^{\prime}\right)^{N-c} S_{\mathfrak{q}^{\prime}}^{\prime} \otimes_{S_{\mathfrak{q}^{\prime}}^{\prime}} \Omega_{S_{\mathfrak{q}^{\prime}}^{\prime} / R}
$$

we can further tensor this by $B_{N}=S_{\mathfrak{q}} / \mathfrak{q}^{N}$ to see that

$$
S_{\mathfrak{q}} / \mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}^{\prime}}^{\prime}} \Omega_{B_{N}^{\prime} / R}=S_{\mathfrak{q}} / \mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}^{\prime}}^{\prime}} \Omega_{S_{\mathfrak{q}^{\prime}}^{\prime} / R} .
$$

Since a split injection remains a split injection after tensoring with anything we see that

$$
S_{\mathfrak{q}} / \mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}} 10.139 .2 .1=S_{\mathfrak{q}} / \mathfrak{q}^{N-c} S_{\mathfrak{q}} \otimes_{S_{\mathfrak{q}}}\left(I_{N} \longrightarrow B_{N} \otimes_{B_{N}^{\prime}} \Omega_{B_{N}^{\prime} / R}\right)
$$

is a split injection for all $N \geq c$. By Lemma 10.73.1 we see that 10.139.2.1 is a split injection. This finishes the proof.

### 10.140. Overview of results on smooth ring maps

00 TZ Here is a list of results on smooth ring maps that we proved in the preceding sections. For more precise statements and definitions please consult the references given.
(1) A ring map $R \rightarrow S$ is smooth if it is of finite presentation and the naive cotangent complex of $S / R$ is quasi-isomorphic to a finite projective $S$ module in degree 0 , see Definition 10.135.1.
(2) If $S$ is smooth over $R$, then $\Omega_{S / R}$ is a finite projective $S$-module, see discussion following Definition 10.135.1.
(3) The property of being smooth is local on $S$, see Lemma 10.135.13.
(4) The property of being smooth is stable under base change, see Lemma 10.135.4
(5) The property of being smooth is stable under composition, see Lemma 10.135 .14
(6) A smooth ring map is syntomic, in particular flat, see Lemma 10.135.10.
(7) A finitely presented, flat ring map with smooth fibre rings is smooth, see Lemma 10.135 .16
(8) A finitely presented ring map $R \rightarrow S$ is smooth if and only if it is formally smooth, see Proposition 10.136.13.
(9) If $R \rightarrow S$ is a finite type ring map with $R$ Noetherian then to check that $R \rightarrow S$ is smooth it suffices to check the lifting property of formal smoothness along small extensions of Artinian local rings, see Lemma 10.139 .2
(10) A smooth ring map $R \rightarrow S$ is the base change of a smooth ring map $R_{0} \rightarrow S_{0}$ with $R_{0}$ of finite type over $\mathbf{Z}$, see Lemma 10.136.14.
(11) Formation of the set of points where a ring map is smooth commutes with flat base change, see Lemma 10.135.17.
(12) If $S$ is of finite type over an algebraically closed field $k$, and $\mathfrak{m} \subset S$ a maximal ideal, then the following are equivalent
(a) $S$ is smooth over $k$ in a neighbourhood of $\mathfrak{m}$,
(b) $S_{\mathfrak{m}}$ is a regular local ring,
(c) $\operatorname{dim}\left(S_{\mathfrak{m}}\right)=\operatorname{dim}_{\kappa(m)} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{m})$.
see Lemma 10.138 .2 .
(13) If $S$ is of finite type over a field $k$, and $\mathfrak{q} \subset S$ a prime ideal, then the following are equivalent
(a) $S$ is smooth over $k$ in a neighbourhood of $\mathfrak{q}$,
(b) $\operatorname{dim}_{\mathfrak{q}}(S / k)=\operatorname{dim}_{\kappa(\mathfrak{q})} \Omega_{S / k} \otimes_{S} \kappa(\mathfrak{q})$.
see Lemma 10.138 .3 .
(14) If $S$ is smooth over a field, then all its local rings are regular, see Lemma 10.138.3.
(15) If $S$ is of finite type over a field $k, \mathfrak{q} \subset S$ a prime ideal, the field extension $k \subset \kappa(\mathfrak{q})$ is separable and $S_{\mathfrak{q}}$ is regular, then $S$ is smooth over $k$ at $\mathfrak{q}$, see Lemma 10.138 .5
(16) If $S$ is of finite type over a field $k$, if $k$ has characteristic 0 , if $\mathfrak{q} \subset S$ a prime ideal, and if $\Omega_{S / k, \mathfrak{q}}$ is free, then $S$ is smooth over $k$ at $\mathfrak{q}$, see Lemma 10.138 .7

Some of these results were proved using the notion of a standard smooth ring map, see Definition 10.135.6. This is the analogue of what a relative global complete intersection map is for the case of syntomic morphisms. It is also the easiest way to make examples.

### 10.141. Étale ring maps

00 U 0 An étale ring map is a smooth ring map whose relative dimension is equal to zero. This is the same as the following slightly more direct definition.

00U1 Definition 10.141.1. Let $R \rightarrow S$ be a ring map. We say $R \rightarrow S$ is étale if it is of finite presentation and the naive cotangent complex $N L_{S / R}$ is quasi-isomorphic to zero. Given a prime $\mathfrak{q}$ of $S$ we say that $R \rightarrow S$ is étale at $\mathfrak{q}$ if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is étale.

In particular we see that $\Omega_{S / R}=0$ if $S$ is étale over $R$. If $R \rightarrow S$ is smooth, then $R \rightarrow S$ is étale if and only if $\Omega_{S / R}=0$. From our results on smooth ring maps we automatically get a whole host of results for étale maps. We summarize these in Lemma 10.141 .3 below. But before we do so we prove that any étale ring map is standard smooth.

00U9 Lemma 10.141.2. Any étale ring map is standard smooth. More precisely, if $R \rightarrow S$ is étale, then there exists a presentation $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)$ such that the image of $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)$ is invertible in $S$.

Proof. Let $R \rightarrow S$ be étale. Choose a presentation $S=R\left[x_{1}, \ldots, x_{n}\right] / I$. As $R \rightarrow S$ is étale we know that

$$
\mathrm{d}: I / I^{2} \longrightarrow \bigoplus_{i=1, \ldots, n} S \mathrm{~d} x_{i}
$$

is an isomorphism, in particular $I / I^{2}$ is a free $S$-module. Thus by Lemma 10.134.6 we may assume (after possibly changing the presentation), that $I=\left(f_{1}, \ldots, f_{c}\right)$ such that the classes $f_{i} \bmod I^{2}$ form a basis of $I / I^{2}$. It follows immediately from the fact that the displayed map above is an isomorphism that $c=n$ and that $\operatorname{det}\left(\partial f_{j} / \partial x_{i}\right)$ is invertible in $S$.

00U2 Lemma 10.141.3. Results on étale ring maps.
(1) The ring map $R \rightarrow R_{f}$ is étale for any ring $R$ and any $f \in R$.
(2) Compositions of étale ring maps are étale.
(3) A base change of an étale ring map is étale.
(4) The property of being étale is local: Given a ring map $R \rightarrow S$ and elements $g_{1}, \ldots, g_{m} \in S$ which generate the unit ideal such that $R \rightarrow S_{g_{j}}$ is étale for $j=1, \ldots, m$ then $R \rightarrow S$ is étale.
(5) Given $R \rightarrow S$ of finite presentation, and a flat ring map $R \rightarrow R^{\prime}$, set $S^{\prime}=R^{\prime} \otimes_{R} S$. The set of primes where $R^{\prime} \rightarrow S^{\prime}$ is étale is the inverse image via $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(S)$ of the set of primes where $R \rightarrow S$ is étale.
(6) An étale ring map is syntomic, in particular flat.
(7) If $S$ is finite type over a field $k$, then $S$ is étale over $k$ if and only if $\Omega_{S / k}=0$.
(8) Any étale ring map $R \rightarrow S$ is the base change of an étale ring map $R_{0} \rightarrow$ $S_{0}$ with $R_{0}$ of finite type over $\mathbf{Z}$.
(9) Let $A=\operatorname{colim} A_{i}$ be a filtered colimit of rings. Let $A \rightarrow B$ be an étale ring map. Then there exists an étale ring map $A_{i} \rightarrow B_{i}$ for some $i$ such that $B \cong A \otimes_{A_{i}} B_{i}$.
(10) Let $A$ be a ring. Let $S$ be a multiplicative subset of $A$. Let $S^{-1} A \rightarrow B^{\prime}$ be étale. Then there exists an étale ring map $A \rightarrow B$ such that $B^{\prime} \cong S^{-1} B$.

Proof. In each case we use the corresponding result for smooth ring maps with a small argument added to show that $\Omega_{S / R}$ is zero.
Proof of (1). The ring map $R \rightarrow R_{f}$ is smooth and $\Omega_{R_{f} / R}=0$.

Proof of (2). The composition $A \rightarrow C$ of smooth maps $A \rightarrow B$ and $B \rightarrow C$ is smooth, see Lemma 10.135 .14 . By Lemma 10.130 .7 we see that $\Omega_{C / A}$ is zero as both $\Omega_{C / B}$ and $\Omega_{B / A}$ are zero.
Proof of (3). Let $R \rightarrow S$ be étale and $R \rightarrow R^{\prime}$ be arbitrary. Then $R^{\prime} \rightarrow S^{\prime}=R^{\prime} \otimes_{R} S$ is smooth, see Lemma 10.135.4. Since $\Omega_{S^{\prime} / R^{\prime}}=S^{\prime} \otimes_{S} \Omega_{S / R}$ by Lemma 10.130 .12 we conclude that $\Omega_{S^{\prime} / R^{\prime}}=0$. Hence $R^{\prime} \rightarrow S^{\prime}$ is étale.
Proof of (4). Assume the hypotheses of (4). By Lemma 10.135 .13 we see that $R \rightarrow S$ is smooth. We are also given that $\Omega_{S_{g_{i}} / R}=\left(\Omega_{S / R}\right)_{g_{i}}=0$ for all $i$. Then $\Omega_{S / R}=0$, see Lemma 10.23 .2 .
Proof of (5). The result for smooth maps is Lemma 10.135.17. In the proof of that lemma we used that $N L_{S / R} \otimes_{S} S^{\prime}$ is homotopy equivalent to $N L_{S^{\prime} / R^{\prime}}$. This reduces us to showing that if $M$ is a finitely presented $S$-module the set of primes $\mathfrak{q}^{\prime}$ of $S^{\prime}$ such that $\left(M \otimes_{S} S^{\prime}\right)_{\mathfrak{q}^{\prime}}=0$ is the inverse image of the set of primes $\mathfrak{q}$ of $S$ such that $M_{\mathfrak{q}}=0$. This is true (proof omitted).
Proof of (6). Follows directly from the corresponding result for smooth ring maps (Lemma 10.135.10).
Proof of (7). Follows from Lemma 10.138 .3 and the definitions.
Proof of (8). Lemma 10.136 .14 gives the result for smooth ring maps. The resulting smooth ring map $R_{0} \rightarrow S_{0}$ satisfies the hypotheses of Lemma 10.129.8, and hence we may replace $S_{0}$ by the factor of relative dimension 0 over $R_{0}$.
Proof of (9). Follows from (8) since $R_{0} \rightarrow A$ will factor through $A_{i}$ for some $i$.
Proof of (10). Follows from (9), (1), and (2) since $S^{-1} A$ is a filtered colimit of principal localizations of $A$.

Next we work out in more detail what it means to be étale over a field.
00U3 Lemma 10.141.4. Let $k$ be a field. A ring map $k \rightarrow S$ is étale if and only if $S$ is isomorphic as a $k$-algebra to a finite product of finite separable extensions of $k$.
Proof. If $k \rightarrow k^{\prime}$ is a finite separable field extension then we can write $k^{\prime}=k(\alpha) \cong$ $k[x] /(f)$. Here $f$ is the minimal polynomial of the element $\alpha$. Since $k^{\prime}$ is separable over $k$ we have $\operatorname{gcd}\left(f, f^{\prime}\right)=1$. This implies that $\mathrm{d}: k^{\prime} \cdot f \rightarrow k^{\prime} \cdot \mathrm{d} x$ is an isomorphism. Hence $k \rightarrow k^{\prime}$ is étale.
Conversely, suppose that $k \rightarrow S$ is étale. Let $\bar{k}$ be an algebraic closure of $k$. Then $S \otimes_{k} \bar{k}$ is étale over $\bar{k}$. Suppose we have the result over $\bar{k}$. Then $S \otimes_{k} \bar{k}$ is reduced and hence $S$ is reduced. Also, $S \otimes_{k} \bar{k}$ is finite over $\bar{k}$ and hence $S$ is finite over $k$. Hence $S$ is a finite product $S=\prod k_{i}$ of fields, see Lemma 10.52 .2 and Proposition 10.59.6. The result over $\bar{k}$ means $S \otimes_{k} \bar{k}$ is isomorphic to a finite product of copies of $\bar{k}$, which implies that each $k \subset k_{i}$ is finite separable, see for example Lemmas 10.43 .1 and 10.43 .3 . Thus we have reduced to the case $k=\bar{k}$. In this case Lemma 10.138 .2 (combined with $\Omega_{S / k}=0$ ) we see that $S_{\mathfrak{m}} \cong k$ for all maximal ideals $\mathfrak{m} \subset S$. This implies the result because $S$ is the product of the localizations at its maximal ideals by Lemma 10.52 .2 and Proposition 10.59 .6 again.

00U4 Lemma 10.141.5. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p}$ in $R$. If $S / R$ is étale at $\mathfrak{q}$ then
(1) we have $\mathfrak{p} S_{\mathfrak{q}}=\mathfrak{q} S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and
(2) the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable.

Proof. First we may replace $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ and assume that $R \rightarrow S$ is étale. Then the lemma follows from Lemma 10.141 .4 by unwinding the fact that $S \otimes_{R} \kappa(\mathfrak{p})$ is étale over $\kappa(\mathfrak{p})$.
00U5 Lemma 10.141.6. An étale ring map is quasi-finite.
Proof. Let $R \rightarrow S$ be an étale ring map. By definition $R \rightarrow S$ is of finite type. For any prime $\mathfrak{p} \subset R$ the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$ is étale over $\kappa(\mathfrak{p})$ and hence a finite products of fields finite separable over $\kappa(\mathfrak{p})$, in particular finite over $\kappa(\mathfrak{p})$. Thus $R \rightarrow S$ is quasi-finite by Lemma 10.121 .4 .

00U6 Lemma 10.141.7. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over a prime $\mathfrak{p}$ of $R$. If
(1) $R \rightarrow S$ is of finite presentation,
(2) $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is flat
(3) $\mathfrak{p} S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and
(4) the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable,
then $R \rightarrow S$ is étale at $\mathfrak{q}$.
Proof. Apply Lemma 10.121 .2 to find a $g \in S, g \notin \mathfrak{q}$ such that $\mathfrak{q}$ is the only prime of $S_{g}$ lying over $\mathfrak{p}$. We may and do replace $S$ by $S_{g}$. Then $S \otimes_{R} \kappa(\mathfrak{p})$ has a unique prime, hence is a local ring, hence is equal to $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}} \cong \kappa(\mathfrak{q})$. By Lemma 10.135 .16 there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is smooth. Replace $S$ by $S_{g}$ again we may assume that $R \rightarrow S$ is smooth. By Lemma 10.135 .10 we may even assume that $R \rightarrow S$ is standard smooth, say $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$. Since $S \otimes_{R} \kappa(\mathfrak{p})=\kappa(\mathfrak{q})$ has dimension 0 we conclude that $n=c$, i.e., if $R \rightarrow S$ is étale.

08WD Lemma 10.141.8. A ring map is étale if and only if it is flat, unramified, and of finite presentation.

Proof. This follows by combining Lemmas 10.141 .3 (flatness of étale maps), 10.141 .5 (étale maps are unramified), and 10.141.7 (flat and unramified maps of finite presentation are étale).

Here is a completely new phenomenon.
00U7 Lemma 10.141.9. Let $R \rightarrow S$ and $R \rightarrow S^{\prime}$ be étale. Then any $R$-algebra map $S^{\prime} \rightarrow S$ is étale.

Proof. First of all we note that $S^{\prime} \rightarrow S$ is of finite presentation by Lemma 10.6.2, Let $\mathfrak{q} \subset S$ be a prime ideal lying over the primes $\mathfrak{q}^{\prime} \subset S^{\prime}$ and $\mathfrak{p} \subset R$. By Lemma 10.141.5 the ring map $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}} \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime} / \mathfrak{p} S_{\mathfrak{q}^{\prime}}^{\prime}$ is a map finite separable extensions of $\kappa(\mathfrak{p})$. In particular it is flat. Hence by Lemma 10.127 .8 we see that $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is flat. Thus $S^{\prime} \rightarrow S$ is flat. Moreover, the above also shows that $\mathfrak{q}^{\prime} S_{\mathfrak{q}}$ is the maximal ideal of $S_{\mathfrak{q}}$ and that the residue field extension of $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is finite separable. Hence from Lemma 10.141.7 we conclude that $S^{\prime} \rightarrow S$ is étale at $\mathfrak{q}$. Since being étale is local (see Lemma 10.141.3) we win.

00U8 Lemma 10.141.10. Let $\varphi: R \rightarrow S$ be a ring map. If $R \rightarrow S$ is surjective, flat and finitely presented then there exist an idempotent $e \in R$ such that $S=R_{e}$.

Proof. Since $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is a homeomorphism onto a closed subset (see Lemma 10.16.7) and is open (see Proposition 10.40.8) we see that the image is $D(e)$ for some idempotent $e \in R$ (see Lemma 10.20.3). Thus $R_{e} \rightarrow S$ induces a bijection on spectra. Now this map induces an isomorphism on all local rings for example by Lemmas 10.77 .4 and 10.19 .1 . Then it follows that $R_{e} \rightarrow S$ is also injective, for example see Lemma 10.23.1

04D1 Lemma 10.141.11. Let $R$ be a ring and let $I \subset R$ be an ideal. Let $R / I \rightarrow \bar{S}$ be an étale ring map. Then there exists an étale ring map $R \rightarrow S$ such that $\bar{S} \cong S / I S$ as $R / I$-algebras.

Proof. By Lemma 10.141 .2 we can write $\bar{S}=(R / I)\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{n}\right)$ as in Definition 10.135.6 with $\bar{\Delta}=\operatorname{det}\left(\frac{\partial \bar{f}_{i}}{\partial x_{j}}\right)_{i, j=1, \ldots, n}$ invertible in $\bar{S}$. Just take some lifts $f_{i}$ and set $S=R\left[x_{1}, \ldots, x_{n}, x_{n+1}\right] /\left(f_{1}, \ldots, f_{c}, x_{n+1} \Delta-1\right)$ where $\Delta=\operatorname{det}\left(\frac{\partial f_{i}}{\partial x_{j}}\right)_{i, j=1, \ldots, c}$ as in Example 10.135.8. This proves the lemma.

05YT Lemma 10.141.12. Consider a commutative diagram

with exact rows where $B^{\prime} \rightarrow B$ and $A^{\prime} \rightarrow A$ are surjective ring maps whose kernels are ideals of square zero. If $A \rightarrow B$ is étale, and $J=I \otimes_{A} B$, then $A^{\prime} \rightarrow B^{\prime}$ is étale.

Proof. By Lemma 10.141 .11 there exists an étale ring map $A^{\prime} \rightarrow C$ such that $C / I C=B$. Then $A^{\prime} \rightarrow C$ is formally smooth (by Proposition 10.136.13) hence we get an $A^{\prime}$-algebra map $\varphi: C \rightarrow B^{\prime}$. Since $A^{\prime} \rightarrow C$ is flat we have $I \otimes_{A} B=$ $I \otimes_{A} C / I C=I C$. Hence the assumption that $J=I \otimes_{A} B$ implies that $\varphi$ induces an isomorphism $I C \rightarrow J$ and an isomorphism $C / I C \rightarrow B^{\prime} / I B^{\prime}$, whence $\varphi$ is an isomorphism.

00UA Example 10.141.13. Let $n, m \geq 1$ be integers. Consider the ring map

$$
\begin{aligned}
R=\mathbf{Z}\left[a_{1}, \ldots, a_{n+m}\right] & \longrightarrow S=\mathbf{Z}\left[b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{m}\right] \\
a_{1} & \longmapsto b_{1}+c_{1} \\
a_{2} & \longmapsto b_{2}+b_{1} c_{1}+c_{2} \\
\ldots & \cdots \\
a_{n+m} & \longmapsto b_{n} c_{m}
\end{aligned}
$$

of Example 10.134.7. Write symbolically

$$
S=R\left[b_{1}, \ldots, c_{m}\right] /\left(\left\{a_{k}\left(b_{i}, c_{j}\right)-a_{k}\right\}_{k=1, \ldots, n+m}\right)
$$

where for example $a_{1}\left(b_{i}, c_{j}\right)=b_{1}+c_{1}$. The matrix of partial derivatives is

$$
\left(\begin{array}{ccccccc}
1 & c_{1} & \ldots & c_{m} & 0 & \ldots & 0 \\
0 & 1 & c_{1} & \ldots & c_{m} & \ldots & 0 \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
0 & \ldots & 0 & 1 & c_{1} & \ldots & c_{m} \\
1 & b_{1} & \ldots & b_{n} & 0 & \ldots & 0 \\
0 & 1 & b_{1} & \ldots & b_{n} & \ldots & 0 \\
\ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\
0 & \ldots & 0 & 1 & b_{1} & \ldots & b_{n}
\end{array}\right)
$$

The determinant $\Delta$ of this matrix is better known as the resultant of the polynomials $g=x^{n}+b_{1} x^{n-1}+\ldots+b_{n}$ and $h=x^{m}+c_{1} x^{m-1}+\ldots+c_{m}$, and the matrix above is known as the Sylvester matrix associated to $g, h$. In a formula $\Delta=\operatorname{Res}_{x}(g, h)$. The Sylvester matrix is the transpose of the matrix of the linear map

$$
\begin{aligned}
S[x]_{<m} \oplus S[x]_{<n} & \longrightarrow S[x]_{<n+m} \\
a \oplus b & \longmapsto a g+b h
\end{aligned}
$$

Let $\mathfrak{q} \subset S$ be any prime. By the above the following are equivalent:
(1) $R \rightarrow S$ is étale at $\mathfrak{q}$,
(2) $\Delta=\operatorname{Res}_{x}(g, h) \notin \mathfrak{q}$,
(3) the images $\bar{g}, \bar{h} \in \kappa(\mathfrak{q})[x]$ of the polynomials $g$, $h$ are relatively prime in $\kappa(\mathfrak{q})[x]$.
The equivalence of (2) and (3) holds because the image of the Sylvester matrix in $\operatorname{Mat}(n+m, \kappa(\mathfrak{q}))$ has a kernel if and only if the polynomials $\bar{g}, \bar{h}$ have a factor in common. We conclude that the ring map

$$
R \longrightarrow S\left[\frac{1}{\Delta}\right]=S\left[\frac{1}{\operatorname{Res}_{x}(g, h)}\right]
$$

is étale.
Lemma 10.141 .2 tells us that it does not really make sense to define a standard étale morphism to be a standard smooth morphism of relative dimension 0 . As a model for an étale morphism we take the example given by a finite separable extension $k \subset k^{\prime}$ of fields. Namely, we can always find an element $\alpha \in k^{\prime}$ such that $k^{\prime}=k(\alpha)$ and such that the minimal polynomial $f(x) \in k[x]$ of $\alpha$ has derivative $f^{\prime}$ which is relatively prime to $f$.

00UB Definition 10.141.14. Let $R$ be a ring. Let $g, f \in R[x]$. Assume that $f$ is monic and the derivative $f^{\prime}$ is invertible in the localization $R[x]_{g} /(f)$. In this case the ring map $R \rightarrow R[x]_{g} /(f)$ is said to be standard étale.
00UC Lemma 10.141.15. Let $R \rightarrow R[x]_{g} /(f)$ be standard étale.
(1) The ring map $R \rightarrow R[x]_{g} /(f)$ is étale.
(2) For any ring map $R \rightarrow R^{\prime}$ the base change $R^{\prime} \rightarrow R^{\prime}[x]_{g} /(f)$ of the standard étale ring map $R \rightarrow R[x]_{g} /(f)$ is standard étale.
(3) Any principal localization of $R[x]_{g} /(f)$ is standard étale over $R$.
(4) A composition of standard étale maps is not standard étale in general.

Proof. Omitted. Here is an example for (4). The ring map $\mathbf{F}_{2} \rightarrow \mathbf{F}_{2^{2}}$ is standard étale. The ring map $\mathbf{F}_{2^{2}} \rightarrow \mathbf{F}_{2^{2}} \times \mathbf{F}_{2^{2}} \times \mathbf{F}_{2^{2}} \times \mathbf{F}_{2^{2}}$ is standard étale. But the ring $\operatorname{map} \mathbf{F}_{2} \rightarrow \mathbf{F}_{2^{2}} \times \mathbf{F}_{2^{2}} \times \mathbf{F}_{2^{2}} \times \mathbf{F}_{2^{2}}$ is not standard étale.

Standard étale morphisms are a convenient way to produce étale maps. Here is an example.
00UD Lemma 10.141.16. Let $R$ be a ring. Let $\mathfrak{p}$ be a prime of $R$. Let $\kappa(\mathfrak{p}) \subset L$ be a finite separable field extension. There exists an étale ring map $R \rightarrow R^{\prime}$ together with a prime $\mathfrak{p}^{\prime}$ lying over $\mathfrak{p}$ such that the field extension $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{p}^{\prime}\right)$ is isomorphic to $\kappa(\mathfrak{p}) \subset L$.

Proof. By the theorem of the primitive element we may write $L=\kappa(\mathfrak{p})[\alpha]$. Let $\bar{f} \in \kappa(\mathfrak{p})[x]$ denote the minimal polynomial for $\alpha$ (in particular this is monic). After replacing $\alpha$ by $c \alpha$ for some $c \in R, c \notin \mathfrak{p}$ we may assume all the coefficients of $\bar{f}$ are in the image of $R \rightarrow \kappa(\mathfrak{p})$ (verification omitted). Thus we can find a monic polynomial $f \in R[x]$ which maps to $\bar{f}$ in $\kappa(\mathfrak{p})[x]$. Since $\kappa(\mathfrak{p}) \subset L$ is separable, we see that $\operatorname{gcd}\left(\bar{f}, \bar{f}^{\prime}\right)=1$. Hence there is an element $\gamma \in L$ such that $\bar{f}^{\prime}(\alpha) \gamma=1$. Thus we get a $R$-algebra map

$$
\begin{aligned}
R\left[x, 1 / f^{\prime}\right] /(f) & \longrightarrow L \\
x & \longmapsto \alpha \\
1 / f^{\prime} & \longmapsto \gamma
\end{aligned}
$$

The left hand side is a standard étale algebra $R^{\prime}$ over $R$ and the kernel of the ring map gives the desired prime.
00UE Proposition 10.141.17. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime. If $R \rightarrow S$ is étale at $\mathfrak{q}$, then there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is standard étale.

Proof. The following proof is a little roundabout and there may be ways to shorten it.

Step 1. By Definition 10.141 .1 there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is étale. Thus we may assume that $S$ is étale over $R$.
Step 2. By Lemma 10.141 .3 there exists an étale ring map $R_{0} \rightarrow S_{0}$ with $R_{0}$ of finite type over $\mathbf{Z}$, and a ring map $R_{0} \rightarrow R$ such that $R=R \otimes_{R_{0}} S_{0}$. Denote $\mathfrak{q}_{0}$ the prime of $S_{0}$ corresponding to $\mathfrak{q}$. If we show the result for $\left(R_{0} \rightarrow S_{0}, \mathfrak{q}_{0}\right)$ then the result follows for $(R \rightarrow S, \mathfrak{q})$ by base change. Hence we may assume that $R$ is Noetherian.
Step 3. Note that $R \rightarrow S$ is quasi-finite by Lemma 10.141.6. By Lemma 10.122 .15 there exists a finite ring map $R \rightarrow S^{\prime}$, an $R$-algebra map $S^{\prime} \rightarrow S$, an element $g^{\prime} \in S^{\prime}$ such that $g^{\prime} \notin \mathfrak{q}$ such that $S^{\prime} \rightarrow S$ induces an isomorphism $S_{g^{\prime}}^{\prime} \cong S_{g^{\prime}}$. (Note that of course $S^{\prime}$ is not étale over $R$ in general.) Thus we may assume that (a) $R$ is Noetherian, (b) $R \rightarrow S$ is finite and (c) $R \rightarrow S$ is étale at $\mathfrak{q}$ (but no longer necessarily étale at all primes).
Step 4. Let $\mathfrak{p} \subset R$ be the prime corresponding to $\mathfrak{q}$. Consider the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$. This is a finite algebra over $\kappa(\mathfrak{p})$. Hence it is Artinian (see Lemma 10.52 .2 and so a finite product of local rings

$$
S \otimes_{R} \kappa(\mathfrak{p})=\prod_{i=1}^{n} A_{i}
$$

see Proposition 10.59.6. One of the factors, say $A_{1}$, is the local ring $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ which is isomorphic to $\kappa(\mathfrak{q})$, see Lemma 10.141.5. The other factors correspond to the other primes, say $\mathfrak{q}_{2}, \ldots, \mathfrak{q}_{n}$ of $S$ lying over $\mathfrak{p}$.

Step 5. We may choose a nonzero element $\alpha \in \kappa(\mathfrak{q})$ which generates the finite separable field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ (so even if the field extension is trivial we do not allow $\alpha=0)$. Note that for any $\lambda \in \kappa(\mathfrak{p})^{*}$ the element $\lambda \alpha$ also generates $\kappa(\mathfrak{q})$ over $\kappa(\mathfrak{p})$. Consider the element

$$
\bar{t}=(\alpha, 0, \ldots, 0) \in \prod_{i=1}^{n} A_{i}=S \otimes_{R} \kappa(\mathfrak{p})
$$

After possibly replacing $\alpha$ by $\lambda \alpha$ as above we may assume that $\bar{t}$ is the image of $t \in S$. Let $I \subset R[x]$ be the kernel of the $R$-algebra map $R[x] \rightarrow S$ which maps $x$ to $t$. Set $S^{\prime}=R[x] / I$, so $S^{\prime} \subset S$. Here is a diagram

By construction the primes $\mathfrak{q}_{j}, j \geq 2$ of $S$ all lie over the prime $(\mathfrak{p}, x)$ of $R[x]$, whereas the prime $\mathfrak{q}$ lies over a different prime of $R[x]$ because $\alpha \neq 0$.
Step 6. Denote $\mathfrak{q}^{\prime} \subset S^{\prime}$ the prime of $S^{\prime}$ corresponding to $\mathfrak{q}$. By the above $\mathfrak{q}$ is the only prime of $S$ lying over $\mathfrak{q}^{\prime}$. Thus we see that $S_{\mathfrak{q}}=S_{\mathfrak{q}^{\prime}}$, see Lemma 10.40.11 (we have going up for $S^{\prime} \rightarrow S$ by Lemma 10.35 .20 since $S^{\prime} \rightarrow S$ is finite as $R \rightarrow S$ is finite). It follows that $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is finite and injective as the localization of the finite injective ring map $S^{\prime} \rightarrow S$. Consider the maps of local rings

$$
R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}
$$

The second map is finite and injective. We have $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}=\kappa(\mathfrak{q})$, see Lemma 10.141.5. Hence a fortiori $S_{\mathfrak{q}} / \mathfrak{q}^{\prime} S_{\mathfrak{q}}=\kappa(\mathfrak{q})$. Since

$$
\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{q}^{\prime}\right) \subset \kappa(\mathfrak{q})
$$

and since $\alpha$ is in the image of $\kappa\left(\mathfrak{q}^{\prime}\right)$ in $\kappa(\mathfrak{q})$ we conclude that $\kappa\left(\mathfrak{q}^{\prime}\right)=\kappa(\mathfrak{q})$. Hence by Nakayama's Lemma 10.19 .1 applied to the $S_{\mathfrak{q}^{\prime}}^{\prime}$-module map $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$, the map $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is surjective. In other words, $S_{\mathfrak{q}^{\prime}}^{\prime} \cong S_{\mathfrak{q}}$.
Step 7. By Lemma 10.125 .7 there exist $g \in S, g \notin \mathfrak{q}$ and $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $S_{g^{\prime}}^{\prime} \cong S_{g}$. As $R$ is Noetherian the ring $S^{\prime}$ is finite over $R$ because it is an $R$ submodule of the finite $R$-module $S$. Hence after replacing $S$ by $S^{\prime}$ we may assume that (a) $R$ is Noetherian, (b) $S$ finite over $R$, (c) $S$ is étale over $R$ at $\mathfrak{q}$, and (d) $S=R[x] / I$.
Step 8. Consider the ring $S \otimes_{R} \kappa(\mathfrak{p})=\kappa(\mathfrak{p})[x] / \bar{I}$ where $\bar{I}=I \cdot \kappa(\mathfrak{p})[x]$ is the ideal generated by $I$ in $\kappa(\mathfrak{p})[x]$. As $\kappa(\mathfrak{p})[x]$ is a PID we know that $\bar{I}=(\bar{h})$ for some monic $\bar{h} \in \kappa(\mathfrak{p})$. After replacing $\bar{h}$ by $\lambda \cdot \bar{h}$ for some $\lambda \in \kappa(\mathfrak{p})$ we may assume that $\bar{h}$ is the image of some $h \in R[x]$. (The problem is that we do not know if we may choose $h$ monic.) Also, as in Step 4 we know that $S \otimes_{R} \kappa(\mathfrak{p})=A_{1} \times \ldots \times A_{n}$ with $A_{1}=\kappa(\mathfrak{q})$ a finite separable extension of $\kappa(\mathfrak{p})$ and $A_{2}, \ldots, A_{n}$ local. This implies that

$$
\bar{h}=\bar{h}_{1} \bar{h}_{2}^{e_{2}} \ldots \bar{h}_{n}^{e_{n}}
$$

for certain pairwise coprime irreducible monic polynomials $\bar{h}_{i} \in \kappa(\mathfrak{p})[x]$ and certain $e_{2}, \ldots, e_{n} \geq 1$. Here the numbering is chosen so that $A_{i}=\kappa(\mathfrak{p})[x] /\left(\bar{h}_{i}^{e_{i}}\right)$ as $\kappa(\mathfrak{p})[x]$ algebras. Note that $\bar{h}_{1}$ is the minimal polynomial of $\alpha \in \kappa(\mathfrak{q})$ and hence is a separable polynomial (its derivative is prime to itself).

Step 9. Let $m \in I$ be a monic element; such an element exists because the ring extension $R \rightarrow R[x] / I$ is finite hence integral. Denote $\bar{m}$ the image in $\kappa(\mathfrak{p})[x]$. We may factor

$$
\bar{m}=\overline{k h}_{1}^{d_{1}} \bar{h}_{2}^{d_{2}} \ldots \bar{h}_{n}^{d_{n}}
$$

for some $d_{1} \geq 1, d_{j} \geq e_{j}, j=2, \ldots, n$ and $\bar{k} \in \kappa(\mathfrak{p})[x]$ prime to all the $\bar{h}_{i}$. Set $f=m^{l}+h$ where $l \operatorname{deg}(m)>\operatorname{deg}(h)$, and $l \geq 2$. Then $f$ is monic as a polynomial over $R$. Also, the image $\bar{f}$ of $f$ in $\kappa(\mathfrak{p})[x]$ factors as
$\bar{f}=\bar{h}_{1} \bar{h}_{2}^{e_{2}} \ldots \bar{h}_{n}^{e_{n}}+\bar{k}^{l} \bar{h}_{1}^{l d_{1}} \bar{h}_{2}^{l d_{2}} \ldots \bar{h}_{n}^{l d_{n}}=\bar{h}_{1}\left(\bar{h}_{2}^{e_{2}} \ldots \bar{h}_{n}^{e_{n}}+\bar{k}^{l} \bar{h}_{1}^{l d_{1}-1} \bar{h}_{2}^{l d_{2}} \ldots \bar{h}_{n}^{l d_{n}}\right)=\bar{h}_{1} \bar{w}$
with $\bar{w}$ a polynomial relatively prime to $\bar{h}_{1}$. Set $g=f^{\prime}$ (the derivative with respect to $x$ ).

Step 10. The ring map $R[x] \rightarrow S=R[x] / I$ has the properties: (1) it maps $f$ to zero, and (2) it maps $g$ to an element of $S \backslash \mathfrak{q}$. The first assertion is clear since $f$ is an element of $I$. For the second assertion we just have to show that $g$ does not $\underline{\text { map to zero in }} \kappa(\mathfrak{q})=\kappa(\mathfrak{p})[x] /\left(\bar{h}_{1}\right)$. The image of $g$ in $\kappa(\mathfrak{p})[x]$ is the derivative of $\bar{f}$. Thus (2) is clear because

$$
\bar{g}=\frac{\mathrm{d} \bar{f}}{\mathrm{~d} x}=\bar{w} \frac{\mathrm{~d} \bar{h}_{1}}{\mathrm{~d} x}+\bar{h}_{1} \frac{\mathrm{~d} \bar{w}}{\mathrm{~d} x},
$$

$\bar{w}$ is prime to $\bar{h}_{1}$ and $\bar{h}_{1}$ is separable.
Step 11. We conclude that $\varphi: R[x] /(f) \rightarrow S$ is a surjective ring map, $R[x]_{g} /(f)$ is étale over $R$ (because it is standard étale, see Lemma 10.141.15) and $\varphi(g) \notin \mathfrak{q}$. Pick an element $g^{\prime} \in R[x] /(f)$ such that also $\varphi\left(g^{\prime}\right) \notin \mathfrak{q}$ and $S_{\varphi\left(g^{\prime}\right)}$ is étale over $R$ (which exists since $S$ is étale over $R$ at $\mathfrak{q})$. Then the ring map $R[x]_{g g^{\prime}} /(f) \rightarrow S_{\varphi(g)}$ is a surjective map of étale algebras over $R$. Hence it is étale by Lemma 10.141.9. Hence it is a localization by Lemma 10.141 .10 . Thus a localization of $S$ at an element not in $\mathfrak{q}$ is isomorphic to a localization of a standard étale algebra over $R$ which is what we wanted to show.

The following two lemmas say that the étale topology is coarser than the topology generated by Zariski coverings and finite flat morphisms. They should be skipped on a first reading.

00UF Lemma 10.141.18. Let $R \rightarrow S$ be a standard étale morphism. There exists $a$ ring map $R \rightarrow S^{\prime}$ with the following properties
(1) $R \rightarrow S^{\prime}$ is finite, finitely presented, and flat (in other words $S^{\prime}$ is finite projective as an $R$-module),
(2) $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ is surjective,
(3) for every prime $\mathfrak{q} \subset S$, lying over $\mathfrak{p} \subset R$ and every prime $\mathfrak{q}^{\prime} \subset S^{\prime}$ lying over $\mathfrak{p}$ there exists a $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that the ring map $R \rightarrow S_{g^{\prime}}^{\prime}$ factors through a map $\varphi: S \rightarrow S_{g^{\prime}}^{\prime}$ with $\varphi^{-1}\left(\mathfrak{q}^{\prime} S_{g^{\prime}}^{\prime}\right)=\mathfrak{q}$.
Proof. Let $S=R[x]_{g} /(f)$ be a presentation of $S$ as in Definition 10.141.14. Write $f=x^{n}+a_{1} x^{n-1}+\ldots+a_{n}$ with $a_{i} \in R$. By Lemma 10.134 .9 there exists a finite locally free and faithfully flat ring map $R \rightarrow S^{\prime}$ such that $f=\prod\left(x-\alpha_{i}\right)$ for certain $\alpha_{i} \in S^{\prime}$. Hence $R \rightarrow S^{\prime}$ satisfies conditions (1), (2). Let $\mathfrak{q} \subset R[x] /(f)$ be a prime
ideal with $g \notin \mathfrak{q}$ (i.e., it corresponds to a prime of $S$ ). Let $\mathfrak{p}=R \cap \mathfrak{q}$ and let $\mathfrak{q}^{\prime} \subset S^{\prime}$ be a prime lying over $\mathfrak{p}$. Note that there are $n$ maps of $R$-algebras

$$
\begin{aligned}
\varphi_{i}: R[x] /(f) & \longrightarrow S^{\prime} \\
x & \longmapsto \alpha_{i}
\end{aligned}
$$

To finish the proof we have to show that for some $i$ we have (a) the image of $\varphi_{i}(g)$ in $\kappa\left(\mathfrak{q}^{\prime}\right)$ is not zero, and (b) $\varphi_{i}^{-1}\left(\mathfrak{q}^{\prime}\right)=\mathfrak{q}$. Because then we can just take $g^{\prime}=\varphi_{i}(g)$, and $\varphi=\varphi_{i}$ for that $i$.
Let $\bar{f}$ denote the image of $f$ in $\kappa(\mathfrak{p})[x]$. Note that as a point of $\operatorname{Spec}(\kappa(\mathfrak{p})[x] /(\bar{f}))$ the prime $\mathfrak{q}$ corresponds to an irreducible factor $f_{1}$ of $\bar{f}$. Moreover, $g \notin \mathfrak{q}$ means that $f_{1}$ does not divide the image $\bar{g}$ of $g$ in $\kappa(\mathfrak{p})[x]$. Denote $\bar{\alpha}_{1}, \ldots, \bar{\alpha}_{n}$ the images of $\alpha_{1}, \ldots, \alpha_{n}$ in $\kappa\left(\mathfrak{q}^{\prime}\right)$. Note that the polynomial $\bar{f}$ splits completely in $\kappa\left(\mathfrak{q}^{\prime}\right)[x]$, namely

$$
\bar{f}=\prod_{i}\left(x-\bar{\alpha}_{i}\right)
$$

Moreover $\varphi_{i}(g)$ reduces to $\bar{g}\left(\bar{\alpha}_{i}\right)$. It follows we may pick $i$ such that $f_{1}\left(\bar{\alpha}_{i}\right)=0$ and $\bar{g}\left(\bar{\alpha}_{i}\right) \neq 0$. For this $i$ properties (a) and (b) hold. Some details omitted.

00UG Lemma 10.141.19. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is étale, and
(2) $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective.

Then there exists a ring map $R \rightarrow S^{\prime}$ such that
(1) $R \rightarrow S^{\prime}$ is finite, finitely presented, and flat (in other words it is finite projective as an $R$-module),
(2) $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ is surjective,
(3) for every prime $\mathfrak{q}^{\prime} \subset S^{\prime}$ there exists a $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that the ring map $R \rightarrow S_{g^{\prime}}^{\prime}$ factors as $R \rightarrow S \rightarrow S_{g^{\prime}}^{\prime}$.
Proof. By Proposition 10.141 .17 and the quasi-compactness of $\operatorname{Spec}(S)$ (see Lemma 10.16 .10 we can find $g_{1}, \ldots, g_{n} \in S$ generating the unit ideal of $S$ such that each $R \rightarrow S_{g_{i}}$ is standard étale. If we prove the lemma for the ring map $R \rightarrow$ $\prod_{i=1, \ldots, n} S_{g_{i}}$ then the lemma follows for the ring map $R \rightarrow S$. Hence we may assume that $S=\prod_{i=1, \ldots, n} S_{i}$ is a finite product of standard étale morphisms.
For each $i$ choose a ring map $R \rightarrow S_{i}^{\prime}$ as in Lemma 10.141 .18 adapted to the standard étale morphism $R \rightarrow S_{i}$. Set $S^{\prime}=S_{1}^{\prime} \otimes_{R} \ldots \otimes_{R} S_{n}^{\prime}$; we will use the $R$-algebra maps $S_{i}^{\prime} \rightarrow S^{\prime}$ without further mention below. We claim this works. Properties (1) and (2) are immediate. For property (3) suppose that $\mathfrak{q}^{\prime} \subset S^{\prime}$ is a prime. Denote $\mathfrak{p}$ its image in $\operatorname{Spec}(R)$. Choose $i \in\{1, \ldots, n\}$ such that $\mathfrak{p}$ is in the image of $\operatorname{Spec}\left(S_{i}\right) \rightarrow \operatorname{Spec}(R)$; this is possible by assumption. Set $\mathfrak{q}_{i}^{\prime} \subset S_{i}^{\prime}$ the image of $\mathfrak{q}^{\prime}$ in the spectrum of $S_{i}^{\prime}$. By construction of $S_{i}^{\prime}$ there exists a $g_{i}^{\prime} \in S_{i}^{\prime}$ such that $R \rightarrow\left(S_{i}^{\prime}\right)_{g_{i}^{\prime}}$ factors as $R \rightarrow S_{i} \rightarrow\left(S_{i}^{\prime}\right)_{g_{i}^{\prime}}$. Hence also $R \rightarrow S_{g_{i}^{\prime}}^{\prime}$ factors as

$$
R \rightarrow S_{i} \rightarrow\left(S_{i}^{\prime}\right)_{g_{i}^{\prime}} \rightarrow S_{g_{i}^{\prime}}^{\prime}
$$

as desired.
00UH Lemma 10.141.20. Let $R$ be a ring. Let $f \in R[x]$ be a monic polynomial. Let $\mathfrak{p}$ be a prime of $R$. Let $f \bmod \mathfrak{p}=\bar{g} \bar{h}$ be a factorization of the image of $f$ in $\kappa(\mathfrak{p})[x]$. If $\operatorname{gcd}(\bar{g}, \bar{h})=1$, then there exist
(1) an étale ring map $R \rightarrow R^{\prime}$,
(2) a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p}$, and
(3) a factorization $f=g h$ in $R^{\prime}[x]$
such that
(1) $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right)$,
(2) $\bar{g}=g \bmod \mathfrak{p}^{\prime}, \bar{h}=h \bmod \mathfrak{p}^{\prime}$, and
(3) the polynomials $g, h$ generate the unit ideal in $R^{\prime}[x]$.

Proof. Suppose $\bar{g}=\bar{b}_{0} x^{n}+\bar{b}_{1} x^{n-1}+\ldots+\bar{b}_{n}$, and $\bar{h}=\bar{c}_{0} x^{m}+\bar{c}_{1} x^{m-1}+\ldots+\bar{c}_{m}$ with $\bar{b}_{0}, \bar{c}_{0} \in \kappa(\mathfrak{p})$ nonzero. After localizing $R$ at some element of $R$ not contained in $\mathfrak{p}$ we may assume $\bar{b}_{0}$ is the image of an invertible element $b_{0} \in R$. Replacing $\bar{g}$ by $\bar{g} / b_{0}$ and $\bar{h}$ by $b_{0} \bar{h}$ we reduce to the case where $\bar{g}, \bar{h}$ are monic (verification omitted). Say $\bar{g}=x^{n}+\bar{b}_{1} x^{n-1}+\ldots+\bar{b}_{n}$, and $\bar{h}=x^{m}+\bar{c}_{1} x^{m-1}+\ldots+\bar{c}_{m}$. Write $f=x^{n+m}+a_{1} x^{n-1}+\ldots+a_{n+m}$. Consider the fibre product

$$
R^{\prime}=R \otimes_{\mathbf{Z}\left[a_{1}, \ldots, a_{n+m}\right]} \mathbf{Z}\left[b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{m}\right]
$$

where the map $\mathbf{Z}\left[a_{k}\right] \rightarrow \mathbf{Z}\left[b_{i}, c_{j}\right]$ is as in Examples 10.134 .7 and 10.141.13 By construction there is an $R$-algebra map

$$
R^{\prime}=R \otimes_{\mathbf{Z}\left[a_{1}, \ldots, a_{n+m}\right]} \mathbf{Z}\left[b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{m}\right] \longrightarrow \kappa(\mathfrak{p})
$$

which maps $b_{i}$ to $\bar{b}_{i}$ and $c_{j}$ to $\bar{c}_{j}$. Denote $\mathfrak{p}^{\prime} \subset R^{\prime}$ the kernel of this map. Since by assumption the polynomials $\bar{g}, \bar{h}$ are relatively prime we see that the element $\Delta=\operatorname{Res}_{x}(g, h) \in \mathbf{Z}\left[b_{i}, c_{j}\right]$ (see Example 10.141.13) does not map to zero in $\kappa(\mathfrak{p})$ under the displayed map. We conclude that $R \rightarrow R^{\prime}$ is étale at $\mathfrak{p}^{\prime}$. In fact a solution to the problem posed in the lemma is the ring map $R \rightarrow R^{\prime}[1 / \Delta]$ and the prime $\mathfrak{p}^{\prime} R^{\prime}[1 / \Delta]$. Because $\operatorname{Res}_{x}(f, g)$ is invertible in this ring the Sylvester matrix is invertible over $R^{\prime}$ and hence $1=a g+b h$ for some $a, b \in R^{\prime}[x]$ see Example 10.141 .13

The following lemmas say roughly that after an étale extension a quasi-finite ring map becomes finite. To help interpret the results recall that the locus where a finite type ring map is quasi-finite is open (see Lemma 10.122.14) and that formation of this locus commutes with arbitrary base change (see Lemma 10.121.8).
00UI Lemma 10.141.21. Let $R \rightarrow S^{\prime} \rightarrow S$ be ring maps. Let $\mathfrak{p} \subset R$ be a prime. Let $g \in S^{\prime}$ be an element. Assume
(1) $R \rightarrow S^{\prime}$ is integral,
(2) $R \rightarrow S$ is finite type,
(3) $S_{g}^{\prime} \cong S_{g}$, and
(4) $g$ invertible in $S^{\prime} \otimes_{R} \kappa(\mathfrak{p})$.

Then there exists a $f \in R, f \notin \mathfrak{p}$ such that $R_{f} \rightarrow S_{f}$ is finite.
Proof. By assumption the image $T$ of $V(g) \subset \operatorname{Spec}\left(S^{\prime}\right)$ under the morphism $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ does not contain $\mathfrak{p}$. By Section 10.40 especially, Lemma 10.40 .6 we see $T$ is closed. Pick $f \in R, f \notin \mathfrak{p}$ such that $T \cap V(f)=\emptyset$. Then we see that $g$ becomes invertible in $S_{f}^{\prime}$. Hence $S_{f}^{\prime} \cong S_{f}$. Thus $S_{f}$ is both of finite type and integral over $R_{f}$, hence finite.

00UJ Lemma 10.141.22. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p} \subset R$. Assume $R \rightarrow S$ finite type and quasi-finite at $\mathfrak{q}$. Then there exists
(1) an étale ring $\operatorname{map} R \rightarrow R^{\prime}$,
(2) a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p}$,
(3) a product decomposition

$$
R^{\prime} \otimes_{R} S=A \times B
$$

with the following properties
(1) $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right)$,
(2) $R^{\prime} \rightarrow A$ is finite,
(3) A has exactly one prime $\mathfrak{r}$ lying over $\mathfrak{p}^{\prime}$, and
(4) $\mathfrak{r}$ lies over $\mathfrak{q}$.

Proof. Let $S^{\prime} \subset S$ be the integral closure of $R$ in $S$. Let $\mathfrak{q}^{\prime}=S^{\prime} \cap \mathfrak{q}$. By Zariski's Main Theorem 10.122 .13 there exists a $g \in S^{\prime}, g \notin \mathfrak{q}^{\prime}$ such that $S_{g}^{\prime} \cong S_{g}$. Consider the fibre rings $F=S \otimes_{R} \kappa(\mathfrak{p})$ and $F^{\prime}=S^{\prime} \otimes_{R} \kappa(\mathfrak{p})$. Denote $\overline{\mathfrak{q}}^{\prime}$ the prime of $F^{\prime}$ corresponding to $\mathfrak{q}^{\prime}$. Since $F^{\prime}$ is integral over $\kappa(\mathfrak{p})$ we see that $\overline{\mathfrak{q}}^{\prime}$ is a closed point of $\operatorname{Spec}\left(F^{\prime}\right)$, see Lemma 10.35.17. Note that $\mathfrak{q}$ defines an isolated closed point $\overline{\mathfrak{q}}$ of $\operatorname{Spec}(F)$ (see Definition 10.121 .3 . Since $S_{g}^{\prime} \cong S_{g}$ we have $F_{g}^{\prime} \cong F_{g}$, so $\overline{\mathfrak{q}}$ and $\overline{\mathfrak{q}}^{\prime}$ have isomorphic open neighbourhoods in $\operatorname{Spec}(F)$ and $\operatorname{Spec}\left(F^{\prime}\right)$. We conclude the set $\left\{\overline{\mathfrak{q}}^{\prime}\right\} \subset \operatorname{Spec}\left(F^{\prime}\right)$ is open. Combined with $\mathfrak{q}^{\prime}$ being closed (shown above) we conclude that $\overline{\mathfrak{q}}^{\prime}$ defines an isolated closed point of $\operatorname{Spec}\left(F^{\prime}\right)$ as well.

An additional small remark is that under the map $\operatorname{Spec}(F) \rightarrow \operatorname{Spec}\left(F^{\prime}\right)$ the point $\overline{\mathfrak{q}}$ is the only point mapping to $\overline{\mathfrak{q}}^{\prime}$. This follows from the discussion above.

By Lemma 10.22 .3 we may write $F^{\prime}=F_{1}^{\prime} \times F_{2}^{\prime}$ with $\operatorname{Spec}\left(F_{1}^{\prime}\right)=\left\{\bar{q}^{\prime}\right\}$. Since $F^{\prime}=$ $S^{\prime} \otimes_{R} \kappa(\mathfrak{p})$, there exists an $s^{\prime} \in S^{\prime}$ which maps to the element $(r, 0) \in F_{1}^{\prime} \times F_{2}^{\prime}=F^{\prime}$ for some $r \in R, r \notin \mathfrak{p}$. In fact, what we will use about $s^{\prime}$ is that it is an element of $S^{\prime}$, not contained in $\mathfrak{q}^{\prime}$, and contained in any other prime lying over $\mathfrak{p}$.

Let $f(x) \in R[x]$ be a monic polynomial such that $f\left(s^{\prime}\right)=0$. Denote $\bar{f} \in \kappa(\mathfrak{p})[x]$ the image. We can factor it as $\bar{f}=x^{e} \bar{h}$ where $\bar{h}(0) \neq 0$. By Lemma 10.141.20 we can find an étale ring extension $R \rightarrow R^{\prime}$, a prime $\mathfrak{p}^{\prime}$ lying over $\mathfrak{p}$, and a factorization $f=h i$ in $R^{\prime}[x]$ such that $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right), x^{e}=h \bmod \mathfrak{p}^{\prime}, \bar{i}=i \bmod \mathfrak{p}^{\prime}$, and we can write $a h+b i=1$ in $R^{\prime}[x]$ (for suitable $a, b$ ).
Consider the elements $h\left(s^{\prime}\right), i\left(s^{\prime}\right) \in R^{\prime} \otimes_{R} S^{\prime}$. By construction we have $h\left(s^{\prime}\right) i\left(s^{\prime}\right)=$ $f\left(s^{\prime}\right)=0$. On the other hand they generate the unit ideal since $a\left(s^{\prime}\right) h\left(s^{\prime}\right)+$ $b\left(s^{\prime}\right) i\left(s^{\prime}\right)=1$. Thus we see that $R^{\prime} \otimes_{R} S^{\prime}$ is the product of the localizations at these elements:

$$
R^{\prime} \otimes_{R} S^{\prime}=\left(R^{\prime} \otimes_{R} S^{\prime}\right)_{h\left(s^{\prime}\right)} \times\left(R^{\prime} \otimes_{R} S^{\prime}\right)_{i\left(s^{\prime}\right)}=S_{1}^{\prime} \times S_{2}^{\prime}
$$

Moreover this product decomposition is compatible with the product decomposition we found for the fibre ring $F^{\prime}$; this comes from our choice of $s^{\prime}, h$ which guarantee that $\overline{\mathfrak{q}}^{\prime}$ is the only prime of $F^{\prime}$ which does not contain the image of $h\left(s^{\prime}\right)$ in $F^{\prime}$. Here we use that the fibre ring of $R^{\prime} \otimes_{R} S^{\prime}$ over $R^{\prime}$ at $\mathfrak{p}^{\prime}$ is the same as $F^{\prime}$ due to the fact that $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right)$. It follows that $S_{1}^{\prime}$ has exactly one prime, say $\mathfrak{r}^{\prime}$, lying over $\mathfrak{p}^{\prime}$ and that this prime lies over $\mathfrak{q}$. Hence the element $g \in S^{\prime}$ maps to an element of $S_{1}^{\prime}$ not contained in $\mathfrak{r}^{\prime}$.
The base change $R^{\prime} \otimes_{R} S$ inherits a similar product decomposition

$$
R^{\prime} \otimes_{R} S=\left(R^{\prime} \otimes_{R} S\right)_{h\left(s^{\prime}\right)} \times\left(R^{\prime} \otimes_{R} S\right)_{i\left(s^{\prime}\right)}=S_{1} \times S_{2}
$$

It follows from the above that $S_{1}$ has exactly one prime, say $\mathfrak{r}$, lying over $\mathfrak{p}^{\prime}$ (consider the fibre ring as above), and that this prime lies over $\mathfrak{q}$.
Now we may apply Lemma 10.141 .21 to the ring maps $R^{\prime} \rightarrow S_{1}^{\prime} \rightarrow S_{1}$, the prime $\mathfrak{p}^{\prime}$ and the element $g$ to see that after replacing $R^{\prime}$ by a principal localization we can assume that $S_{1}$ is finite over $R^{\prime}$ as desired.

00UK Lemma 10.141.23. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume $R \rightarrow S$ finite type. Then there exists
(1) an étale ring map $R \rightarrow R^{\prime}$,
(2) a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p}$,
(3) a product decomposition

$$
R^{\prime} \otimes_{R} S=A_{1} \times \ldots \times A_{n} \times B
$$

with the following properties
(1) we have $\kappa(\mathfrak{p})=\kappa\left(\mathfrak{p}^{\prime}\right)$,
(2) each $A_{i}$ is finite over $R^{\prime}$,
(3) each $A_{i}$ has exactly one prime $\mathfrak{r}_{i}$ lying over $\mathfrak{p}^{\prime}$, and
(4) $R^{\prime} \rightarrow B$ not quasi-finite at any prime lying over $\mathfrak{p}^{\prime}$.

Proof. Denote $F=S \otimes_{R} \kappa(\mathfrak{p})$ the fibre ring of $S / R$ at the prime $\mathfrak{p}$. As $F$ is of finite type over $\kappa(\mathfrak{p})$ it is Noetherian and hence $\operatorname{Spec}(F)$ has finitely many isolated closed points. If there are no isolated closed points, i.e., no primes $\mathfrak{q}$ of $S$ over $\mathfrak{p}$ such that $S / R$ is quasi-finite at $\mathfrak{q}$, then the lemma holds. If there exists at least one such prime $\mathfrak{q}$, then we may apply Lemma 10.141.22. This gives a diagram

as in said lemma. Since the residue fields at $\mathfrak{p}$ and $\mathfrak{p}^{\prime}$ are the same, the fibre rings of $S / R$ and $(A \times B) / R^{\prime}$ are the same. Hence, by induction on the number of isolated closed points of the fibre we may assume that the lemma holds for $R^{\prime} \rightarrow B$ and $\mathfrak{p}^{\prime}$. Thus we get an étale ring map $R^{\prime} \rightarrow R^{\prime \prime}$, a prime $\mathfrak{p}^{\prime \prime} \subset R^{\prime \prime}$ and a decomposition

$$
R^{\prime \prime} \otimes_{R^{\prime}} B^{\prime}=A_{2} \times \ldots \times A_{n} \times B
$$

We omit the verification that the ring map $R \rightarrow R^{\prime \prime}$, the prime $\mathfrak{p}^{\prime \prime}$ and the resulting decomposition

$$
R^{\prime \prime} \otimes_{R} S=\left(R^{\prime \prime} \otimes_{R^{\prime}} A_{1}\right) \times A_{2} \times \ldots \times A_{n} \times B
$$

is a solution to the problem posed in the lemma.
00UL Lemma 10.141.24. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume $R \rightarrow S$ finite type. Then there exists
(1) an étale ring $\operatorname{map} R \rightarrow R^{\prime}$,
(2) a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p}$,
(3) a product decomposition

$$
R^{\prime} \otimes_{R} S=A_{1} \times \ldots \times A_{n} \times B
$$

with the following properties
(1) each $A_{i}$ is finite over $R^{\prime}$,
(2) each $A_{i}$ has exactly one prime $\mathfrak{r}_{i}$ lying over $\mathfrak{p}^{\prime}$,
(3) the finite field extensions $\kappa\left(\mathfrak{p}^{\prime}\right) \subset \kappa\left(\mathfrak{r}_{i}\right)$ are purely inseparable, and
(4) $R^{\prime} \rightarrow B$ not quasi-finite at any prime lying over $\mathfrak{p}^{\prime}$.

Proof. The strategy of the proof is to make two étale ring extensions: first we control the residue fields, then we apply Lemma 10.141 .23 .
Denote $F=S \otimes_{R} \kappa(\mathfrak{p})$ the fibre ring of $S / R$ at the prime $\mathfrak{p}$. As in the proof of Lemma 10.141 .23 there are finitely may primes, say $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{n}$ of $S$ lying over $R$ at which the ring map $R \rightarrow S$ is quasi-finite. Let $\kappa(\mathfrak{p}) \subset L_{i} \subset \kappa\left(\mathfrak{q}_{i}\right)$ be the subfield such that $\kappa(\mathfrak{p}) \subset L_{i}$ is separable, and the field extension $L_{i} \subset \kappa\left(\mathfrak{q}_{i}\right)$ is purely inseparable. Let $\kappa(\mathfrak{p}) \subset L$ be a finite Galois extension into which $L_{i}$ embeds for $i=1, \ldots, n$. By Lemma 10.141.16 we can find an étale ring extension $R \rightarrow R^{\prime}$ together with a prime $\mathfrak{p}^{\prime}$ lying over $\mathfrak{p}$ such that the field extension $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{p}^{\prime}\right)$ is isomorphic to $\kappa(\mathfrak{p}) \subset L$. Thus the fibre ring of $R^{\prime} \otimes_{R} S$ at $\mathfrak{p}^{\prime}$ is isomorphic to $F \otimes_{\kappa(\mathfrak{p})} L$. The primes lying over $\mathfrak{q}_{i}$ correspond to primes of $\kappa\left(\mathfrak{q}_{i}\right) \otimes_{\kappa(\mathfrak{p})} L$ which is a product of fields purely inseparable over $L$ by our choice of $L$ and elementary field theory. These are also the only primes over $\mathfrak{p}^{\prime}$ at which $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ is quasi-finite, by Lemma 10.121 .8 . Hence after replacing $R$ by $R^{\prime}, \mathfrak{p}$ by $\mathfrak{p}^{\prime}$, and $S$ by $R^{\prime} \otimes_{R} S$ we may assume that for all primes $\mathfrak{q}$ lying over $\mathfrak{p}$ for which $S / R$ is quasi-finite the field extensions $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ are purely inseparable.

Next apply Lemma 10.141 .23 . The result is what we want since the field extensions do not change under this étale ring extension.

### 10.142. Local homomorphisms

053 K Lemma 10.142.1. Let $\left(R, \mathfrak{m}_{R}\right) \rightarrow\left(S, \mathfrak{m}_{S}\right)$ be a local homomorphism of local rings. Assume $S$ is the localization of an étale ring extension of $R$. Then there exists a finite, finitely presented, faithfully flat ring map $R \rightarrow S^{\prime}$ such that for every maximal ideal $\mathfrak{m}^{\prime}$ of $S^{\prime}$ there is a factorization

$$
R \rightarrow S \rightarrow S_{\mathfrak{m}^{\prime}}^{\prime}
$$

of the ring map $R \rightarrow S_{\mathfrak{m}^{\prime}}^{\prime}$.
Proof. Write $S=T_{\mathfrak{q}}$ for some étale $R$-algebra $T$. By Proposition 10.141 .17 we may assume $T$ is standard étale. Apply Lemma 10.141 .18 to the ring map $R \rightarrow T$ to get $R \rightarrow S^{\prime}$. Then in particular for every maximal ideal $\mathfrak{m}^{\prime}$ of $S^{\prime}$ we get a factorization $\varphi: T \rightarrow S_{g^{\prime}}^{\prime}$ for some $g^{\prime} \notin \mathfrak{m}^{\prime}$ such that $\mathfrak{q}=\varphi^{-1}\left(\mathfrak{m}^{\prime} S_{g^{\prime}}^{\prime}\right)$. Thus $\varphi$ induces the desired local ring map $S \rightarrow S_{\mathfrak{m}^{\prime}}^{\prime}$.

### 10.143. Integral closure and smooth base change

03GC
03GD Lemma 10.143.1. Let $R$ be a ring. Let $f \in R[x]$ be a monic polynomial. Let $R \rightarrow B$ be a ring map. If $h \in B[x] /(f)$ is integral over $R$, then the element $f^{\prime} h$ can be written as $f^{\prime} h=\sum_{i} b_{i} x^{i}$ with $b_{i} \in B$ integral over $R$.
Proof. Say $h^{e}+r_{1} h^{e-1}+\ldots+r_{e}=0$ in the ring $B[x] /(f)$ with $r_{i} \in R$. There exists a finite free ring extension $B \subset B^{\prime}$ such that $f=\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{d}\right)$ for some $\alpha_{i} \in B^{\prime}$, see Lemma 10.134.9. Note that each $\alpha_{i}$ is integral over $R$. We may
represent $h=h_{0}+h_{1} x+\ldots+h_{d-1} x^{d-1}$ with $h_{i} \in B$. Then it is a universal fact that

$$
f^{\prime} h \equiv \sum_{i=1, \ldots, d} h\left(\alpha_{i}\right)\left(x-\alpha_{1}\right) \ldots\left(\widehat{x-\alpha_{i}}\right) \ldots\left(x-\alpha_{d}\right)
$$

as elements of $B[x] /(f)$. You prove this by evaluating both sides at the points $\alpha_{i}$ over the ring $B_{\text {univ }}=\mathbf{Z}\left[\alpha_{i}, h_{j}\right]$ (some details omitted). By our assumption that $h$ satisfies $h^{e}+r_{1} h^{e-1}+\ldots+r_{e}=0$ in the ring $B[x] /(f)$ we see that

$$
h\left(\alpha_{i}\right)^{e}+r_{1} h\left(\alpha_{i}\right)^{e-1}+\ldots+r_{e}=0
$$

in $B^{\prime}$. Hence $h\left(\alpha_{i}\right)$ is integral over $R$. Using the formula above we see that $f^{\prime} h \equiv$ $\sum_{j=0, \ldots, d-1} b_{j}^{\prime} x^{j}$ in $B^{\prime}[x] /(f)$ with $b_{j}^{\prime} \in B^{\prime}$ integral over $R$. However, since $f^{\prime} h \in$ $B[x] /(f)$ and since $1, x, \ldots, x^{d-1}$ is a $B^{\prime}$-basis for $B^{\prime}[x] /(f)$ we see that $b_{j}^{\prime} \in B$ as desired.

03GE Lemma 10.143.2. Let $R \rightarrow S$ be an étale ring map. Let $R \rightarrow B$ be any ring map. Let $A \subset B$ be the integral closure of $R$ in $B$. Let $A^{\prime} \subset S \otimes_{R} B$ be the integral closure of $S$ in $S \otimes_{R} B$. Then the canonical map $S \otimes_{R} A \rightarrow A^{\prime}$ is an isomorphism.

Proof. The map $S \otimes_{R} A \rightarrow A^{\prime}$ is injective because $A \subset B$ and $R \rightarrow S$ is flat. We are going to use repeatedly that taking integral closure commutes with localization, see Lemma 10.35 .9 . Hence we may localize on $S$, by Lemma 10.23 .2 (the criterion for checking whether an $S$-module map is an isomorphism). Thus we may assume that $S=R[x]_{g} /(f)=(R[x] /(f))_{g}$ is standard étale over $R$, see Proposition 10.141.17. Applying localization one more time we see that $A^{\prime}$ is $\left(A^{\prime \prime}\right)_{g}$ where $A^{\prime \prime}$ is the integral closure of $R[x] /(f)$ in $B[x] /(f)$. Suppose that $a \in A^{\prime \prime}$. It suffices to show that $a$ is in $S \otimes_{R} A$. By Lemma 10.143.1 we see that $f^{\prime} a=\sum a_{i} x^{i}$ with $a_{i} \in A$. Since $f^{\prime}$ is invertible in $B[x]_{g} /(f)$ (by definition of a standard étale ring map) we conclude that $a \in S \otimes_{R} A$ as desired.

03GF Example 10.143.3. Let $p$ be a prime number. The ring extension

$$
R=\mathbf{Z}[1 / p] \subset R^{\prime}=\mathbf{Z}[1 / p][x] /\left(x^{p-1}+\ldots+x+1\right)
$$

has the following property: For $d<p$ there exist elements $\alpha_{0}, \ldots, \alpha_{d-1} \in R^{\prime}$ such that

$$
\prod_{0 \leq i<j<d}\left(\alpha_{i}-\alpha_{j}\right)
$$

is a unit in $R^{\prime}$. Namely, take $\alpha_{i}$ equal to the class of $x^{i}$ in $R^{\prime}$ for $i=0, \ldots, p-1$. Then we have

$$
T^{p}-1=\prod_{i=0, \ldots, p-1}\left(T-\alpha_{i}\right)
$$

in $R^{\prime}[T]$. Namely, the $\operatorname{ring} \mathbf{Q}[x] /\left(x^{p-1}+\ldots+x+1\right)$ is a field because the cyclotomic polynomial $x^{p-1}+\ldots+x+1$ is irreducible over $\mathbf{Q}$ and the $\alpha_{i}$ are pairwise distinct roots of $T^{p}-1$, whence the equality. Taking derivatives on both sides and substituting $T=\alpha_{i}$ we obtain

$$
p \alpha_{i}^{p-1}=\left(\alpha_{i}-\alpha_{1}\right) \ldots\left(\widehat{\alpha_{i}-\alpha_{i}}\right) \ldots\left(\alpha_{i}-\alpha_{1}\right)
$$

and we see this is invertible in $R^{\prime}$.
03GG Lemma 10.143.4. Let $R \rightarrow S$ be a smooth ring map. Let $R \rightarrow B$ be any ring map. Let $A \subset B$ be the integral closure of $R$ in $B$. Let $A^{\prime} \subset S \otimes_{R} B$ be the integral closure of $S$ in $S \otimes_{R} B$. Then the canonical map $S \otimes_{R} A \rightarrow A^{\prime}$ is an isomorphism.

Proof. Arguing as in the proof of Lemma 10.143 .2 we may localize on $S$. Hence we may assume that $R \rightarrow S$ is a standard smooth ring map, see Lemma 10.135.10. By definition of a standard smooth ring map we see that $S$ is étale over a polynomial ring $R\left[x_{1}, \ldots, x_{n}\right]$. Since we have seen the result in the case of an étale ring extension (Lemma 10.143 .2 ) this reduces us to the case where $S=R[x]$. Thus we have to show

$$
f=\sum b_{i} x^{i} \text { integral over } R[x] \Leftrightarrow \text { each } b_{i} \text { integral over } R
$$

The implication from right to left holds because the set of elements in $B[x]$ integral over $R[x]$ is a ring (Lemma 10.35.7) and contains $x$.
Suppose that $f \in B[x]$ is integral over $R[x]$, and assume that $f=\sum_{i<d} b_{i} x^{i}$ has degree $<d$. Since integral closure and localization commute, it suffices to show there exist distinct primes $p, q$ such that each $b_{i}$ is integral both over $R[1 / p]$ and over $R[1 / q]$. Hence, we can find a finite free ring extension $R \subset R^{\prime}$ such that $R^{\prime}$ contains $\alpha_{1}, \ldots, \alpha_{d}$ with the property that $\prod_{i<j}\left(\alpha_{i}-\alpha_{j}\right)$ is a unit in $R^{\prime}$, see Example 10.143.3 In this case we have the universal equality

$$
f=\sum_{i} f\left(\alpha_{i}\right) \frac{\left(x-\alpha_{1}\right) \ldots\left(\widehat{x-\alpha_{i}}\right) \ldots\left(x-\alpha_{d}\right)}{\left(\alpha_{i}-\alpha_{1}\right) \ldots\left(\widehat{\alpha_{i}-\alpha_{i}}\right) \ldots\left(\alpha_{i}-\alpha_{d}\right)}
$$

OK, and the elements $f\left(\alpha_{i}\right)$ are integral over $R^{\prime}$ since $\left(R^{\prime} \otimes_{R} B\right)[x] \rightarrow R^{\prime} \otimes_{R} B$, $h \mapsto h\left(\alpha_{i}\right)$ is a ring map. Hence we see that the coefficients of $f$ in $\left(R^{\prime} \otimes_{R} B\right)[x]$ are integral over over $R^{\prime}$. Since $R^{\prime}$ is finite over $R$ (hence integral over $R$ ) we see that they are integral over $R$ also, as desired.

### 10.144. Formally unramified maps

00UM It turns out to be logically more efficient to define the notion of a formally unramified map before introducing the notion of a formally étale one.

00UN Definition 10.144.1. Let $R \rightarrow S$ be a ring map. We say $S$ is formally unramified over $R$ if for every commutative solid diagram

where $I \subset A$ is an ideal of square zero, there exists at most one dotted arrow making the diagram commute.

00UO Lemma 10.144.2. Let $R \rightarrow S$ be a ring map. The following are equivalent:
(1) $R \rightarrow S$ is formally unramified,
(2) the module of differentials $\Omega_{S / R}$ is zero.

Proof. Let $J=\operatorname{Ker}\left(S \otimes_{R} S \rightarrow S\right)$ be the kernel of the multiplication map. Let $A_{\text {univ }}=S \otimes_{R} S / J^{2}$. Recall that $I_{\text {univ }}=J / J^{2}$ is isomorphic to $\Omega_{S / R}$, see Lemma 10.130.13. Moreover, the two $R$-algebra maps $\sigma_{1}, \sigma_{2}: S \rightarrow A_{\text {univ }}, \sigma_{1}(s)=s \otimes$ $1 \bmod J^{2}$, and $\sigma_{2}(s)=1 \otimes s \bmod J^{2}$ differ by the universal derivation $\mathrm{d}: S \rightarrow$ $\Omega_{S / R}=I_{\text {univ }}$.
Assume $R \rightarrow S$ formally unramified. Then we see that $\sigma_{1}=\sigma_{2}$. Hence $\mathrm{d}(s)=0$ for all $s \in S$. Hence $\Omega_{S / R}=0$.

Assume that $\Omega_{S / R}=0$. Let $A, I, R \rightarrow A, S \rightarrow A / I$ be a solid diagram as in Definition 10.144.1. Let $\tau_{1}, \tau_{2}: S \rightarrow A$ be two dotted arrows making the diagram commute. Consider the $R$-algebra map $A_{\text {univ }} \rightarrow A$ defined by the rule $s_{1} \otimes s_{2} \mapsto$ $\tau_{1}\left(s_{1}\right) \tau_{2}\left(s_{2}\right)$. We omit the verification that this is well defined. Since $A_{\text {univ }} \cong S$ as $I_{\text {univ }}=\Omega_{S / R}=0$ we conclude that $\tau_{1}=\tau_{2}$.
04E8 Lemma 10.144.3. Let $R \rightarrow S$ be a ring map. The following are equivalent:
(1) $R \rightarrow S$ is formally unramified,
(2) $R \rightarrow S_{\mathfrak{q}}$ is formally unramified for all primes $\mathfrak{q}$ of $S$, and
(3) $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is formally unramified for all primes $\mathfrak{q}$ of $S$ with $\mathfrak{p}=R \cap \mathfrak{q}$.

Proof. We have seen in Lemma 10.144 .2 that (1) is equivalent to $\Omega_{S / R}=0$. Similarly, by Lemma 10.130 .8 we see that (2) and (3) are equivalent to $\left(\Omega_{S / R}\right)_{\mathfrak{q}}=0$ for all $\mathfrak{q}$. Hence the equivalence follows from Lemma 10.23.1.

04E9 Lemma 10.144.4. Let $A \rightarrow B$ be a formally unramified ring map.
(1) For $S \subset A$ a multiplicative subset, $S^{-1} A \rightarrow S^{-1} B$ is formally unramified.
(2) For $S \subset B$ a multiplicative subset, $A \rightarrow S^{-1} B$ is formally unramified.

Proof. Follows from Lemma 10.144.3. (You can also deduce it from Lemma 10.144.2 combined with Lemma 10.130.8.)

07QE Lemma 10.144.5. Let $R$ be a ring. Let $I$ be a directed partially ordered set. Let $\left(S_{i}, \varphi_{i i^{\prime}}\right)$ be a system of $R$-algebras over $I$. If each $R \rightarrow S_{i}$ is formally unramified, then $S=\operatorname{colim}_{i \in I} S_{i}$ is formally unramified over $R$

Proof. Consider a diagram as in Definition 10.144.1. By assumption there exists at most one $R$-algebra map $S_{i} \rightarrow A$ lifting the compositions $S_{i} \rightarrow S \rightarrow A / I$. Since every element of $S$ is in the image of one of the maps $S_{i} \rightarrow S$ we see that there is at most one map $S \rightarrow A$ fitting into the diagram.

### 10.145. Conormal modules and universal thickenings

04EA It turns out that one can define the first infinitesimal neighbourhood not just for a closed immersion of schemes, but already for any formally unramified morphism. This is based on the following algebraic fact.
04EB Lemma 10.145.1. Let $R \rightarrow S$ be a formally unramified ring map. There exists a surjection of $R$-algebras $S^{\prime} \rightarrow S$ whose kernel is an ideal of square zero with the following universal property: Given any commutative diagram

where $I \subset A$ is an ideal of square zero, there is a unique $R$-algebra map $a^{\prime}: S^{\prime} \rightarrow A$ such that $S^{\prime} \rightarrow A \rightarrow A / I$ is equal to $S^{\prime} \rightarrow S \rightarrow A / I$.

Proof. Choose a set of generators $z_{i} \in S, i \in I$ for $S$ as an $R$-algebra. Let $P=R\left[\left\{x_{i}\right\}_{i \in I}\right]$ denote the polynomial ring on generators $x_{i}, i \in I$. Consider the $R$-algebra map $P \rightarrow S$ which maps $x_{i}$ to $z_{i}$. Let $J=\operatorname{Ker}(P \rightarrow S)$. Consider the map

$$
\mathrm{d}: J / J^{2} \longrightarrow \Omega_{P / R} \otimes_{P} S
$$

see Lemma 10.130 .9 . This is surjective since $\Omega_{S / R}=0$ by assumption, see Lemma 10.144.2. Note that $\Omega_{P / R}$ is free on $\mathrm{d} x_{i}$, and hence the module $\Omega_{P / R} \otimes_{P} S$ is free over $S$. Thus we may choose a splitting of the surjection above and write

$$
J / J^{2}=K \oplus \Omega_{P / R} \otimes_{P} S
$$

Let $J^{2} \subset J^{\prime} \subset J$ be the ideal of $P$ such that $J^{\prime} / J^{2}$ is the second summand in the decomposition above. Set $S^{\prime}=P / J^{\prime}$. We obtain a short exact sequence

$$
0 \rightarrow J / J^{\prime} \rightarrow S^{\prime} \rightarrow S \rightarrow 0
$$

and we see that $J / J^{\prime} \cong K$ is a square zero ideal in $S^{\prime}$. Hence

is a diagram as above. In fact we claim that this is an initial object in the category of diagrams. Namely, let $(I \subset A, a, b)$ be an arbitrary diagram. We may choose an $R$-algebra map $\beta: P \rightarrow A$ such that

is commutative. Now it may not be the case that $\beta\left(J^{\prime}\right)=0$, in other words it may not be true that $\beta$ factors through $S^{\prime}=P / J^{\prime}$. But what is clear is that $\beta\left(J^{\prime}\right) \subset I$ and since $\beta(J) \subset I$ and $I^{2}=0$ we have $\beta\left(J^{2}\right)=0$. Thus the "obstruction" to finding a morphism from $\left(J / J^{\prime} \subset S^{\prime}, 1, R \rightarrow S^{\prime}\right)$ to $(I \subset A, a, b)$ is the corresponding $S$-linear map $\bar{\beta}: J^{\prime} / J^{2} \rightarrow I$. The choice in picking $\beta$ lies in the choice of $\beta\left(x_{i}\right)$. A different choice of $\beta$, say $\beta^{\prime}$, is gotten by taking $\beta^{\prime}\left(x_{i}\right)=\beta\left(x_{i}\right)+\delta_{i}$ with $\delta_{i} \in I$. In this case, for $g \in J^{\prime}$, we obtain

$$
\beta^{\prime}(g)=\beta(g)+\sum_{i} \delta_{i} \frac{\partial g}{\partial x_{i}} .
$$

Since the map d $\left.\right|_{J^{\prime} / J^{2}}: J^{\prime} / J^{2} \rightarrow \Omega_{P / R} \otimes_{P} S$ given by $g \mapsto \frac{\partial g}{\partial x_{i}} \mathrm{~d} x_{i}$ is an isomorphism by construction, we see that there is a unique choice of $\delta_{i} \in I$ such that $\beta^{\prime}(g)=0$ for all $g \in J^{\prime}$. (Namely, $\delta_{i}$ is $-\bar{\beta}(g)$ where $g \in J^{\prime} / J^{2}$ is the unique element with $\frac{\partial g}{\partial x_{j}}=1$ if $i=j$ and 0 else.) The uniqueness of the solution implies the uniqueness required in the lemma.

In the situation of Lemma 10.145 .1 the $R$-algebra map $S^{\prime} \rightarrow S$ is unique up to unique isomorphism.

04EC Definition 10.145.2. Let $R \rightarrow S$ be a formally unramified ring map.
(1) The universal first order thickening of $S$ over $R$ is the surjection of $R$ algebras $S^{\prime} \rightarrow S$ of Lemma 10.145.1.
(2) The conormal module of $R \rightarrow S$ is the kernel $I$ of the universal first order thickening $S^{\prime} \rightarrow S$, seen as a $S$-module.
We often denote the conormal module $C_{S / R}$ in this situation.

04ED Lemma 10.145.3. Let $I \subset R$ be an ideal of a ring. The universal first order thickening of $R / I$ over $R$ is the surjection $R / I^{2} \rightarrow R / I$. The conormal module of $R / I$ over $R$ is $C_{(R / I) / R}=I / I^{2}$.

Proof. Omitted.
04EE Lemma 10.145.4. Let $A \rightarrow B$ be a formally unramified ring map. Let $\varphi: B^{\prime} \rightarrow B$ be the universal first order thickening of $B$ over $A$.
(1) Let $S \subset A$ be a multiplicative subset. Then $S^{-1} B^{\prime} \rightarrow S^{-1} B$ is the universal first order thickening of $S^{-1} B$ over $S^{-1} A$. In particular $S^{-1} C_{B / A}=$ $C_{S^{-1} B / S^{-1} A}$.
(2) Let $S \subset B$ be a multiplicative subset. Then $S^{\prime}=\varphi^{-1}(S)$ is a multiplicative subset in $B^{\prime}$ and $\left(S^{\prime}\right)^{-1} B^{\prime} \rightarrow S^{-1} B$ is the universal first order thickening of $S^{-1} B$ over $A$. In particular $S^{-1} C_{B / A}=C_{S^{-1} B / A}$.
Note that the lemma makes sense by Lemma 10.144.4.
Proof. With notation and assumptions as in (1). Let $\left(S^{-1} B\right)^{\prime} \rightarrow S^{-1} B$ be the universal first order thickening of $S^{-1} B$ over $S^{-1} A$. Note that $S^{-1} B^{\prime} \rightarrow S^{-1} B$ is a surjection of $S^{-1} A$-algebras whose kernel has square zero. Hence by definition we obtain a map $\left(S^{-1} B\right)^{\prime} \rightarrow S^{-1} B^{\prime}$ compatible with the maps towards $S^{-1} B$. Consider any commutative diagram

where $I \subset D$ is an ideal of square zero. Since $B^{\prime}$ is the universal first order thickening of $B$ over $A$ we obtain an $A$-algebra map $B^{\prime} \rightarrow D$. But it is clear that the image of $S$ in $D$ is mapped to invertible elements of $D$, and hence we obtain a compatible map $S^{-1} B^{\prime} \rightarrow D$. Applying this to $D=\left(S^{-1} B\right)^{\prime}$ we see that we get a map $S^{-1} B^{\prime} \rightarrow\left(S^{-1} B\right)^{\prime}$. We omit the verification that this map is inverse to the map described above.

With notation and assumptions as in (2). Let $\left(S^{-1} B\right)^{\prime} \rightarrow S^{-1} B$ be the universal first order thickening of $S^{-1} B$ over $A$. Note that $\left(S^{\prime}\right)^{-1} B^{\prime} \rightarrow S^{-1} B$ is a surjection of $A$-algebras whose kernel has square zero. Hence by definition we obtain a map $\left(S^{-1} B\right)^{\prime} \rightarrow\left(S^{\prime}\right)^{-1} B^{\prime}$ compatible with the maps towards $S^{-1} B$. Consider any commutative diagram

where $I \subset D$ is an ideal of square zero. Since $B^{\prime}$ is the universal first order thickening of $B$ over $A$ we obtain an $A$-algebra map $B^{\prime} \rightarrow D$. But it is clear that the image of $S^{\prime}$ in $D$ is mapped to invertible elements of $D$, and hence we obtain a compatible map $\left(S^{\prime}\right)^{-1} B^{\prime} \rightarrow D$. Applying this to $D=\left(S^{-1} B\right)^{\prime}$ we see that we get a map $\left(S^{\prime}\right)^{-1} B^{\prime} \rightarrow\left(S^{-1} B\right)^{\prime}$. We omit the verification that this map is inverse to the map described above.

04EF Lemma 10.145.5. Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $A \rightarrow B$ formally unramified. Let $B^{\prime} \rightarrow B$ be the universal first order thickening of $B$ over $A$. Then $B^{\prime}$ is formally unramified over $A$, and the canonical map $\Omega_{A / R} \otimes_{A} B \rightarrow \Omega_{B^{\prime} / R} \otimes_{B^{\prime}} B$ is an isomorphism.

Proof. We are going to use the construction of $B^{\prime}$ from the proof of Lemma 10.145.1 although in principle it should be possible to deduce these results formally from the definition. Namely, we choose a presentation $B=P / J$, where $P=A\left[x_{i}\right]$ is a polynomial ring over $A$. Next, we choose elements $f_{i} \in J$ such that $\mathrm{d} f_{i}=\mathrm{d} x_{i} \otimes 1$ in $\Omega_{P / A} \otimes_{P} B$. Having made these choices we have $B^{\prime}=P / J^{\prime}$ with $J^{\prime}=\left(f_{i}\right)+J^{2}$, see proof of Lemma 10.145.1.
Consider the canonical exact sequence

$$
J^{\prime} /\left(J^{\prime}\right)^{2} \rightarrow \Omega_{P / A} \otimes_{P} B^{\prime} \rightarrow \Omega_{B^{\prime} / A} \rightarrow 0
$$

see Lemma 10.130 .9 . By construction the classes of the $f_{i} \in J^{\prime}$ map to elements of the module $\Omega_{P / A} \otimes_{P} B^{\prime}$ which generate it modulo $J^{\prime} / J^{2}$ by construction. Since $J^{\prime} / J^{2}$ is a nilpotent ideal, we see that these elements generate the module altogether (by Nakayama's Lemma 10.19.1). This proves that $\Omega_{B^{\prime} / A}=0$ and hence that $B^{\prime}$ is formally unramified over $A$, see Lemma 10.144 .2 ,
Since $P$ is a polynomial ring over $A$ we have $\Omega_{P / R}=\Omega_{A / R} \otimes_{A} P \oplus \bigoplus P \mathrm{~d} x_{i}$. We are going to use this decomposition. Consider the following exact sequence

$$
J^{\prime} /\left(J^{\prime}\right)^{2} \rightarrow \Omega_{P / R} \otimes_{P} B^{\prime} \rightarrow \Omega_{B^{\prime} / R} \rightarrow 0
$$

see Lemma 10.130.9. We may tensor this with $B$ and obtain the exact sequence

$$
J^{\prime} /\left(J^{\prime}\right)^{2} \otimes_{B^{\prime}} B \rightarrow \Omega_{P / R} \otimes_{P} B \rightarrow \Omega_{B^{\prime} / R} \otimes_{B^{\prime}} B \rightarrow 0
$$

If we remember that $J^{\prime}=\left(f_{i}\right)+J^{2}$ then we see that the first arrow annihilates the submodule $J^{2} /\left(J^{\prime}\right)^{2}$. In terms of the direct sum decomposition $\Omega_{P / R} \otimes_{P} B=$ $\Omega_{A / R} \otimes_{A} B \oplus \bigoplus B \mathrm{~d} x_{i}$ given we see that the submodule $\left(f_{i}\right) /\left(J^{\prime}\right)^{2} \otimes_{B^{\prime}} B$ maps isomorphically onto the summand $\bigoplus B \mathrm{~d} x_{i}$. Hence what is left of this exact sequence is an isomorphism $\Omega_{A / R} \otimes_{A} B \rightarrow \Omega_{B^{\prime} / R} \otimes_{B^{\prime}} B$ as desired.

### 10.146. Formally étale maps

00UP
00UQ Definition 10.146.1. Let $R \rightarrow S$ be a ring map. We say $S$ is formally étale over $R$ if for every commutative solid diagram

where $I \subset A$ is an ideal of square zero, there exists a unique dotted arrow making the diagram commute.
Clearly a ring map is formally étale if and only if it is both formally smooth and formally unramified.

00UR Lemma 10.146.2. Let $R \rightarrow S$ be a ring map of finite presentation. The following are equivalent:
(1) $R \rightarrow S$ is formally étale,
(2) $R \rightarrow S$ is étale.

Proof. Assume that $R \rightarrow S$ is formally étale. Then $R \rightarrow S$ is smooth by Proposition 10.136 .13 By Lemma 10.144 .2 we have $\Omega_{S / R}=0$. Hence $R \rightarrow S$ is étale by definition.

Assume that $R \rightarrow S$ is étale. Then $R \rightarrow S$ is formally smooth by Proposition 10.136 .13 . By Lemma 10.144 .2 it is formally unramified. Hence $R \rightarrow S$ is formally étale.

031N Lemma 10.146.3. Let $R$ be a ring. Let $I$ be a directed partially ordered set. Let $\left(S_{i}, \varphi_{i i^{\prime}}\right)$ be a system of $R$-algebras over I. If each $R \rightarrow S_{i}$ is formally étale, then $S=\operatorname{colim}_{i \in I} S_{i}$ is formally étale over $R$

Proof. Consider a diagram as in Definition 10.146.1. By assumption we get unique $R$-algebra maps $S_{i} \rightarrow A$ lifting the compositions $S_{i} \rightarrow S \rightarrow A / I$. Hence these are compatible with the transition maps $\varphi_{i i^{\prime}}$ and define a lift $S \rightarrow A$. This proves existence. The uniqueness is clear by restricting to each $S_{i}$.

04EG Lemma 10.146.4. Let $R$ be a ring. Let $S \subset R$ be any multiplicative subset. Then the ring map $R \rightarrow S^{-1} R$ is formally étale.

Proof. Let $I \subset A$ be an ideal of square zero. What we are saying here is that given a ring map $\varphi: R \rightarrow A$ such that $\varphi(f) \bmod I$ is invertible for all $f \in S$ we have also that $\varphi(f)$ is invertible in $A$ for all $f \in S$. This is true because $A^{*}$ is the inverse image of $(A / I)^{*}$ under the canonical map $A \rightarrow A / I$.

### 10.147. Unramified ring maps

00US The definition of a G-unramified ring map is the one from EGA. The definition of an unramified ring map is the one from Ray70.

00UT Definition 10.147.1. Let $R \rightarrow S$ be a ring map.
(1) We say $R \rightarrow S$ is unramified if $R \rightarrow S$ is of finite type and $\Omega_{S / R}=0$.
(2) We say $R \rightarrow S$ is $G$-unramified if $R \rightarrow S$ is of finite presentation and $\Omega_{S / R}=0$.
(3) Given a prime $\mathfrak{q}$ of $S$ we say that $S$ is unramified at $\mathfrak{q}$ if there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is unramified.
(4) Given a prime $\mathfrak{q}$ of $S$ we say that $S$ is $G$-unramified at $\mathfrak{q}$ if there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is G-unramified.
Of course a G-unramified map is unramified.
00UU Lemma 10.147.2. Let $R \rightarrow S$ be a ring map. The following are equivalent
(1) $R \rightarrow S$ is formally unramified and of finite type, and
(2) $R \rightarrow S$ is unramified.

Moreover, also the following are equivalent
(1) $R \rightarrow S$ is formally unramified and of finite presentation, and
(2) $R \rightarrow S$ is $G$-unramified.

Proof. Follows from Lemma 10.144 .2 and the definitions.
00UV Lemma 10.147.3. Properties of unramified and $G$-unramified ring maps.
(1) The base change of an unramified ring map is unramified. The base change of a G-unramified ring map is G-unramified.
(2) The composition of unramified ring maps is unramified. The composition of G-unramified ring maps is G-unramified.
(3) Any principal localization $R \rightarrow R_{f}$ is $G$-unramified and unramified.
(4) If $I \subset R$ is an ideal, then $R \rightarrow R / I$ is unramified. If $I \subset R$ is a finitely generated ideal, then $R \rightarrow R / I$ is $G$-unramified.
(5) An étale ring map is $G$-unramified and unramified.
(6) If $R \rightarrow S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime and $\left(\Omega_{S / R}\right)_{\mathfrak{q}}=0$, then $R \rightarrow S$ is unramified (resp. $G$-unramified) at $\mathfrak{q}$.
(7) If $R \rightarrow S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime and $\Omega_{S / R} \otimes_{S} \kappa(\mathfrak{q})=0$, then $R \rightarrow S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.
(8) If $R \rightarrow S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime lying over $\mathfrak{p} \subset R$ and $\left(\Omega_{S \otimes_{R} \kappa(\mathfrak{p}) / \kappa(\mathfrak{p})}\right)_{\mathfrak{q}}=0$, then $R \rightarrow S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.
(9) If $R \rightarrow S$ is of finite type (resp. presentation), $\mathfrak{q} \subset S$ is a prime lying over $\mathfrak{p} \subset R$ and $\left(\Omega_{S \otimes_{R} \kappa(\mathfrak{p}) / \kappa(\mathfrak{p})}\right) \otimes_{S \otimes_{R} \kappa(\mathfrak{p})} \kappa(\mathfrak{q})=0$, then $R \rightarrow S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.
(10) If $R \rightarrow S$ is a ring map, $g_{1}, \ldots, g_{m} \in S$ generate the unit ideal and $R \rightarrow S_{g_{j}}$ is unramified (resp. $G$-unramified) for $j=1, \ldots, m$, then $R \rightarrow S$ is unramified (resp. G-unramified).
(11) If $R \rightarrow S$ is a ring map which is unramified (resp. G-unramified) at every prime of $S$, then $R \rightarrow S$ is unramified (resp. $G$-unramified).
(12) If $R \rightarrow S$ is $G$-unramified, then there exists a finite type $\mathbf{Z}$-algebra $R_{0}$ and a G-unramified ring map $R_{0} \rightarrow S_{0}$ and a ring map $R_{0} \rightarrow R$ such that $S=R \otimes_{R_{0}} S_{0}$.
(13) If $R \rightarrow S$ is unramified, then there exists a finite type $\mathbf{Z}$-algebra $R_{0}$ and an unramified ring map $R_{0} \rightarrow S_{0}$ and a ring map $R_{0} \rightarrow R$ such that $S$ is a quotient of $R \otimes_{R_{0}} S_{0}$.
Proof. We prove each point, in order.
Ad (1). Follows from Lemmas 10.130 .12 and 10.13 .2 .
Ad (2). Follows from Lemmas 10.130.7 and 10.13.2.
Ad (3). Follows by direct computation of $\Omega_{R_{f} / R}$ which we omit.
Ad (4). We have $\Omega_{(R / I) / R}=0$, see Lemma 10.130 .5 , and the ring map $R \rightarrow R / I$ is of finite type. If $I$ is a finitely generated ideal then $R \rightarrow R / I$ is of finite presentation.
Ad (5). See discussion following Definition 10.141.1.
Ad (6). In this case $\Omega_{S / R}$ is a finite $S$-module (see Lemma 10.130.16) and hence there exists a $g \in S, g \notin \mathfrak{q}$ such that $\left(\Omega_{S / R}\right)_{g}=0$. By Lemma 10.130 .8 this means that $\Omega_{S_{g} / R}=0$ and hence $R \rightarrow S_{g}$ is unramified as desired.
Ad (7). Use Nakayama's lemma (Lemma 10.19.1) to see that the condition is equivalent to the condition of (6).

Ad (8) \& (9). These are equivalent in the same manner that (6) and (7) are equivalent. Moreover $\Omega_{S \otimes_{R} \kappa(\mathfrak{p}) / \kappa(\mathfrak{p})}=\Omega_{S / R} \otimes_{S}\left(S \otimes_{R} \kappa(\mathfrak{p})\right)$ by Lemma 10.130 .12 . Hence we see that (9) is equivalent to (7) since the $\kappa(\mathfrak{q})$ vector spaces in both are canonically isomorphic.

Ad (10). Follows from from Lemmas 10.23 .2 and 10.130 .8
Ad (11). Follows from (6) and (7) and the fact that the spectrum of $S$ is quasicompact.
Ad (12). Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. As $\Omega_{S / R}=0$ we can write

$$
\mathrm{d} x_{i}=\sum h_{i j} \mathrm{~d} g_{j}+\sum a_{i j k} g_{j} \mathrm{~d} x_{k}
$$

in $\Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R}$ for some $h_{i j}, a_{i j k} \in R\left[x_{1}, \ldots, x_{n}\right]$. Choose a finitely generated Zsubalgebra $R_{0} \subset R$ containing all the coefficients of the polynomials $g_{i}, h_{i j}, a_{i j k}$. Set $S_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. This works.

Ad (13). Write $S=R\left[x_{1}, \ldots, x_{n}\right] / I$. As $\Omega_{S / R}=0$ we can write

$$
\mathrm{d} x_{i}=\sum h_{i j} \mathrm{~d} g_{i j}+\sum g_{i k}^{\prime} \mathrm{d} x_{k}
$$

in $\Omega_{R\left[x_{1}, \ldots, x_{n}\right] / R}$ for some $h_{i j} \in R\left[x_{1}, \ldots, x_{n}\right]$ and $g_{i j}, g_{i k}^{\prime} \in I$. Choose a finitely generated Z-subalgebra $R_{0} \subset R$ containing all the coefficients of the polynomials $g_{i j}, h_{i j}, g_{i k}^{\prime}$. Set $S_{0}=R_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(g_{i j}, g_{i k}^{\prime}\right)$. This works.
02FL Lemma 10.147.4. Let $R \rightarrow S$ be a ring map. If $R \rightarrow S$ is unramified, then there exists an idempotent $e \in S \otimes_{R} S$ such that $S \otimes_{R} S \rightarrow S$ is isomorphic to $S \otimes_{R} S \rightarrow\left(S \otimes_{R} S\right)_{e}$.

Proof. Let $J=\operatorname{Ker}\left(S \otimes_{R} S \rightarrow S\right)$. By assumption $J / J^{2}=0$, see Lemma 10.130.13. Since $S$ is of finite type over $R$ we see that $J$ is finitely generated, namely by $x_{i} \otimes 1-1 \otimes x_{i}$, where $x_{i}$ generate $S$ over $R$. We win by Lemma 10.20.5.

00UW Lemma 10.147.5. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p}$ in $R$. If $S / R$ is unramified at $\mathfrak{q}$ then
(1) we have $\mathfrak{p} S_{\mathfrak{q}}=\mathfrak{q} S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and
(2) the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable.

Proof. We may first replace $S$ by $S_{g}$ for some $g \in S, g \notin \mathfrak{q}$ and assume that $R \rightarrow S$ is unramified. The base change $S \otimes_{R} \kappa(\mathfrak{p})$ is unramified over $\kappa(\mathfrak{p})$ by Lemma 10.147 .3 . By Lemma 10.138 .3 it is smooth hence étale over $\kappa(\mathfrak{p})$. Hence we see that $S \otimes_{R} \kappa(\mathfrak{p})=(R \backslash \mathfrak{p})^{-1} S / \mathfrak{p} S$ is a product of finite separable field extensions of $\kappa(\mathfrak{p})$ by Lemma 10.141.4. This implies the lemma.

02UR Lemma 10.147.6. Let $R \rightarrow S$ be a finite type ring map. Let $\mathfrak{q}$ be a prime of $S$. If $R \rightarrow S$ is unramified at $\mathfrak{q}$ then $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$. In particular, an unramified ring map is quasi-finite.

Proof. An unramified ring map is of finite type. Thus it is clear that the second statement follows from the first. To see the first statement apply the characterization of Lemma 10.121 .2 part (2) using Lemma 10.147 .5 .

02 FM Lemma 10.147.7. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over a prime $\mathfrak{p}$ of $R$. If
(1) $R \rightarrow S$ is of finite type,
(2) $\mathfrak{p} S_{\mathfrak{q}}$ is the maximal ideal of the local ring $S_{\mathfrak{q}}$, and
(3) the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable,
then $R \rightarrow S$ is unramified at $\mathfrak{q}$.

Proof. By Lemma 10.147 .3 (8) it suffices to show that $\Omega_{S \otimes_{R} \kappa(\mathfrak{p}) / \kappa(\mathfrak{p})}$ is zero when localized at $\mathfrak{q}$. Hence we may replace $S$ by $S \otimes_{R} \kappa(\mathfrak{p})$ and $R$ by $\kappa(\mathfrak{p})$. In other words, we may assume that $R=k$ is a field and $S$ is a finite type $k$-algebra. In this case the hypotheses imply that $S_{\mathfrak{q}} \cong \kappa(\mathfrak{q})$ and hence $S=\kappa(\mathfrak{q}) \times S^{\prime}$ (see Lemma 10.121.1). Hence $\left(\Omega_{S / k}\right)_{\mathfrak{q}}=\Omega_{\kappa(\mathfrak{q}) / k}$ which is zero as desired.

0395 Proposition 10.147.8. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime. If $R \rightarrow S$ is unramified at $\mathfrak{q}$, then there exist
(1) $a g \in S, g \notin \mathfrak{q}$,
(2) a standard étale ring map $R \rightarrow S^{\prime}$, and
(3) a surjective $R$-algebra map $S^{\prime} \rightarrow S_{g}$.

Proof. This proof is the "same" as the proof of Proposition 10.141.17. The proof is a little roundabout and there may be ways to shorten it.

Step 1. By Definition 10.147 .1 there exists a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is unramified. Thus we may assume that $S$ is unramified over $R$.

Step 2. By Lemma 10.147 .3 there exists an unramified ring map $R_{0} \rightarrow S_{0}$ with $R_{0}$ of finite type over $\mathbf{Z}$, and a ring map $R_{0} \rightarrow R$ such that $S$ is a quotient of $R \otimes_{R_{0}} S_{0}$. Denote $\mathfrak{q}_{0}$ the prime of $S_{0}$ corresponding to $\mathfrak{q}$. If we show the result for $\left(R_{0} \rightarrow S_{0}, \mathfrak{q}_{0}\right)$ then the result follows for $(R \rightarrow S, \mathfrak{q})$ by base change. Hence we may assume that $R$ is Noetherian.

Step 3. Note that $R \rightarrow S$ is quasi-finite by Lemma 10.147.6. By Lemma 10.122 .15 there exists a finite ring map $R \rightarrow S^{\prime}$, an $R$-algebra map $S^{\prime} \rightarrow S$, an element $g^{\prime} \in S^{\prime}$ such that $g^{\prime} \notin \mathfrak{q}$ such that $S^{\prime} \rightarrow S$ induces an isomorphism $S_{g^{\prime}}^{\prime} \cong S_{g^{\prime}}$. (Note that $S^{\prime}$ may not unramified over $R$.) Thus we may assume that (a) $R$ is Noetherian, (b) $R \rightarrow S$ is finite and (c) $R \rightarrow S$ is unramified at $\mathfrak{q}$ (but no longer necessarily unramified at all primes).

Step 4. Let $\mathfrak{p} \subset R$ be the prime corresponding to $\mathfrak{q}$. Consider the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$. This is a finite algebra over $\kappa(\mathfrak{p})$. Hence it is Artinian (see Lemma 10.52 .2 and so a finite product of local rings

$$
S \otimes_{R} \kappa(\mathfrak{p})=\prod_{i=1}^{n} A_{i}
$$

see Proposition 10.59.6. One of the factors, say $A_{1}$, is the local ring $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ which is isomorphic to $\kappa(\mathfrak{q})$, see Lemma 10.147.5. The other factors correspond to the other primes, say $\mathfrak{q}_{2}, \ldots, \mathfrak{q}_{n}$ of $S$ lying over $\mathfrak{p}$.

Step 5 . We may choose a nonzero element $\alpha \in \kappa(\mathfrak{q})$ which generates the finite separable field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ (so even if the field extension is trivial we do not allow $\alpha=0)$. Note that for any $\lambda \in \kappa(\mathfrak{p})^{*}$ the element $\lambda \alpha$ also generates $\kappa(\mathfrak{q})$ over $\kappa(\mathfrak{p})$. Consider the element

$$
\bar{t}=(\alpha, 0, \ldots, 0) \in \prod_{i=1}^{n} A_{i}=S \otimes_{R} \kappa(\mathfrak{p})
$$

After possibly replacing $\alpha$ by $\lambda \alpha$ as above we may assume that $\bar{t}$ is the image of $t \in S$. Let $I \subset R[x]$ be the kernel of the $R$-algebra map $R[x] \rightarrow S$ which maps $x$ to
$t$. Set $S^{\prime}=R[x] / I$, so $S^{\prime} \subset S$. Here is a diagram

By construction the primes $\mathfrak{q}_{j}, j \geq 2$ of $S$ all lie over the prime $(\mathfrak{p}, x)$ of $R[x]$, whereas the prime $\mathfrak{q}$ lies over a different prime of $R[x]$ because $\alpha \neq 0$.

Step 6. Denote $\mathfrak{q}^{\prime} \subset S^{\prime}$ the prime of $S^{\prime}$ corresponding to $\mathfrak{q}$. By the above $\mathfrak{q}$ is the only prime of $S$ lying over $\mathfrak{q}^{\prime}$. Thus we see that $S_{\mathfrak{q}}=S_{\mathfrak{q}^{\prime}}$, see Lemma 10.40.11 (we have going up for $S^{\prime} \rightarrow S$ by Lemma 10.35 .20 since $S^{\prime} \rightarrow S$ is finite as $R \rightarrow S$ is finite). It follows that $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is finite and injective as the localization of the finite injective ring map $S^{\prime} \rightarrow S$. Consider the maps of local rings

$$
R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}
$$

The second map is finite and injective. We have $S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}=\kappa(\mathfrak{q})$, see Lemma 10.147.5. Hence a fortiori $S_{\mathfrak{q}} / \mathfrak{q}^{\prime} S_{\mathfrak{q}}=\kappa(\mathfrak{q})$. Since

$$
\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{q}^{\prime}\right) \subset \kappa(\mathfrak{q})
$$

and since $\alpha$ is in the image of $\kappa\left(\mathfrak{q}^{\prime}\right)$ in $\kappa(\mathfrak{q})$ we conclude that $\kappa\left(\mathfrak{q}^{\prime}\right)=\kappa(\mathfrak{q})$. Hence by Nakayama's Lemma 10.19 .1 applied to the $S_{\mathfrak{q}^{\prime}}^{\prime}$-module map $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$, the map $S_{\mathfrak{q}^{\prime}}^{\prime} \rightarrow S_{\mathfrak{q}}$ is surjective. In other words, $S_{\mathfrak{q}^{\prime}}^{\prime} \cong S_{\mathfrak{q}}$.

Step 7. By Lemma 10.125 .7 there exist $g \in S, g \notin \mathfrak{q}$ and $g^{\prime} \in S^{\prime}, g^{\prime} \notin \mathfrak{q}^{\prime}$ such that $S_{g^{\prime}}^{\prime} \cong S_{g}$. As $R$ is Noetherian the ring $S^{\prime}$ is finite over $R$ because it is an $R$ submodule of the finite $R$-module $S$. Hence after replacing $S$ by $S^{\prime}$ we may assume that (a) $R$ is Noetherian, (b) $S$ finite over $R$, (c) $S$ is unramified over $R$ at $\mathfrak{q}$, and (d) $S=R[x] / I$.

Step 8. Consider the ring $S \otimes_{R} \kappa(\mathfrak{p})=\kappa(\mathfrak{p})[x] / \bar{I}$ where $\bar{I}=I \cdot \kappa(\mathfrak{p})[x]$ is the ideal generated by $I$ in $\kappa(\mathfrak{p})[x]$. As $\kappa(\mathfrak{p})[x]$ is a PID we know that $\bar{I}=(\bar{h})$ for some monic $\bar{h} \in \kappa(\mathfrak{p})$. After replacing $\bar{h}$ by $\lambda \cdot \bar{h}$ for some $\lambda \in \kappa(\mathfrak{p})$ we may assume that $\bar{h}$ is the image of some $h \in R[x]$. (The problem is that we do not know if we may choose $h$ monic.) Also, as in Step 4 we know that $S \otimes_{R} \kappa(\mathfrak{p})=A_{1} \times \ldots \times A_{n}$ with $A_{1}=\kappa(\mathfrak{q})$ a finite separable extension of $\kappa(\mathfrak{p})$ and $A_{2}, \ldots, A_{n}$ local. This implies that

$$
\bar{h}=\bar{h}_{1} \bar{h}_{2}^{e_{2}} \ldots \bar{h}_{n}^{e_{n}}
$$

for certain pairwise coprime irreducible monic polynomials $\bar{h}_{i} \in \kappa(\mathfrak{p})[x]$ and certain $e_{2}, \ldots, e_{n} \geq 1$. Here the numbering is chosen so that $A_{i}=\kappa(\mathfrak{p})[x] /\left(\bar{h}_{i}^{e_{i}}\right)$ as $\kappa(\mathfrak{p})[x]-$ algebras. Note that $\bar{h}_{1}$ is the minimal polynomial of $\alpha \in \kappa(\mathfrak{q})$ and hence is a separable polynomial (its derivative is prime to itself).

Step 9. Let $m \in I$ be a monic element; such an element exists because the ring extension $R \rightarrow R[x] / I$ is finite hence integral. Denote $\bar{m}$ the image in $\kappa(\mathfrak{p})[x]$. We may factor

$$
\bar{m}=\overline{k h}_{1}^{d_{1}} \bar{h}_{2}^{d_{2}} \ldots \bar{h}_{n}^{d_{n}}
$$

for some $d_{1} \geq 1, d_{j} \geq e_{j}, j=2, \ldots, n$ and $\bar{k} \in \kappa(\mathfrak{p})[x]$ prime to all the $\bar{h}_{i}$. Set $f=m^{l}+h$ where $l \operatorname{deg}(m)>\operatorname{deg}(h)$, and $l \geq 2$. Then $f$ is monic as a polynomial
over $R$. Also, the image $\bar{f}$ of $f$ in $\kappa(\mathfrak{p})[x]$ factors as
$\bar{f}=\bar{h}_{1} \bar{h}_{2}^{e_{2}} \ldots \bar{h}_{n}^{e_{n}}+\bar{k}^{l} \bar{h}_{1}^{l d_{1}}{ }_{2}^{l d_{2}} \ldots \bar{h}_{n}^{l d_{n}}=\bar{h}_{1}\left(\bar{h}_{2}^{e_{2}} \ldots \bar{h}_{n}^{e_{n}}+\bar{k}^{l} \bar{h}_{1}^{l d_{1}-1} \bar{h}_{2}^{l d_{2}} \ldots \bar{h}_{n}^{l d_{n}}\right)=\bar{h}_{1} \bar{w}$ with $\bar{w}$ a polynomial relatively prime to $\bar{h}_{1}$. Set $g=f^{\prime}$ (the derivative with respect to $x$ ).
Step 10. The ring map $R[x] \rightarrow S=R[x] / I$ has the properties: (1) it maps $f$ to zero, and (2) it maps $g$ to an element of $S \backslash \mathfrak{q}$. The first assertion is clear since $f$ is an element of $I$. For the second assertion we just have to show that $g$ does not map to zero in $\kappa(\mathfrak{q})=\kappa(\mathfrak{p})[x] /\left(\bar{h}_{1}\right)$. The image of $g$ in $\kappa(\mathfrak{p})[x]$ is the derivative of $\bar{f}$. Thus (2) is clear because

$$
\bar{g}=\frac{\mathrm{d} \bar{f}}{\mathrm{~d} x}=\bar{w} \frac{\mathrm{~d} \bar{h}_{1}}{\mathrm{~d} x}+\bar{h}_{1} \frac{\mathrm{~d} \bar{w}}{\mathrm{~d} x},
$$

$\bar{w}$ is prime to $\bar{h}_{1}$ and $\bar{h}_{1}$ is separable.
Step 11. We conclude that $\varphi: R[x] /(f) \rightarrow S$ is a surjective ring map, $R[x]_{g} /(f)$ is étale over $R$ (because it is standard étale, see Lemma 10.141.15) and $\varphi(g) \notin \mathfrak{q}$. Thus the map $(R[x] /(f))_{g} \rightarrow S_{\varphi(g)}$ is the desired surjection.
00UX Lemma 10.147.9. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over $\mathfrak{p} \subset R$. Assume that $R \rightarrow S$ is of finite type and unramified at $\mathfrak{q}$. Then there exist
(1) an étale ring map $R \rightarrow R^{\prime}$,
(2) a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p}$.
(3) a product decomposition

$$
R^{\prime} \otimes_{R} S=A \times B
$$

with the following properties
(1) $R^{\prime} \rightarrow A$ is surjective, and
(2) $\mathfrak{p}^{\prime} A$ is a prime of $A$ lying over $\mathfrak{p}^{\prime}$ and over $\mathfrak{q}$.

Proof. We may replace ( $R \rightarrow S, \mathfrak{p}, \mathfrak{q}$ ) with any base change ( $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S, \mathfrak{p}^{\prime}, \mathfrak{q}^{\prime}$ ) by a étale ring map $R \rightarrow R^{\prime}$ with a prime $\mathfrak{p}^{\prime}$ lying over $\mathfrak{p}$, and a choice of $\mathfrak{q}^{\prime}$ lying over both $\mathfrak{q}$ and $\mathfrak{p}^{\prime}$. Note also that given $R \rightarrow R^{\prime}$ and $\mathfrak{p}^{\prime}$ a suitable $\mathfrak{q}^{\prime}$ can always be found.
The assumption that $R \rightarrow S$ is of finite type means that we may apply Lemma 10.141.24. Thus we may assume that $S=A_{1} \times \ldots \times A_{n} \times B$, that each $R \rightarrow A_{i}$ is finite with exactly one prime $\mathfrak{r}_{i}$ lying over $\mathfrak{p}$ such that $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{r}_{i}\right)$ is purely inseparable and that $R \rightarrow B$ is not quasi-finite at any prime lying over $\mathfrak{p}$. Then clearly $\mathfrak{q}=\mathfrak{r}_{i}$ for some $i$, since an unramified morphism is quasi-finite (see Lemma 10.147.6). Say $\mathfrak{q}=\mathfrak{r}_{1}$. By Lemma 10.147 .5 we see that $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{r}_{1}\right)$ is separable hence the trivial field extension, and that $\mathfrak{p}\left(A_{1}\right)_{\mathfrak{r}_{1}}$ is the maximal ideal. Also, by Lemma 10.40 .11 (which applies to $R \rightarrow A_{1}$ because a finite ring map satisfies going up by Lemma 10.35 .20 we have $\left(A_{1}\right)_{\mathfrak{r}_{1}}=\left(A_{1}\right)_{\mathfrak{p}}$. It follows from Nakayama's Lemma 10.19.1 that the map of local rings $R_{\mathfrak{p}} \rightarrow\left(A_{1}\right)_{\mathfrak{p}}=\left(A_{1}\right)_{\mathfrak{r}_{1}}$ is surjective. Since $A_{1}$ is finite over $R$ we see that there exists a $f \in R, f \notin \mathfrak{p}$ such that $R_{f} \rightarrow\left(A_{1}\right)_{f}$ is surjective. After replacing $R$ by $R_{f}$ we win.
00UY Lemma 10.147.10. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p}$ be a prime of $R$. If $R \rightarrow S$ is unramified then there exist
(1) an étale ring map $R \rightarrow R^{\prime}$,
(2) a prime $\mathfrak{p}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{p}$.
(3) a product decomposition

$$
R^{\prime} \otimes_{R} S=A_{1} \times \ldots \times A_{n} \times B
$$

with the following properties
(1) $R^{\prime} \rightarrow A_{i}$ is surjective,
(2) $\mathfrak{p}^{\prime} A_{i}$ is a prime of $A_{i}$ lying over $\mathfrak{p}^{\prime}$, and
(3) there is no prime of $B$ lying over $\mathfrak{p}^{\prime}$.

Proof. We may apply Lemma 10.141.24. Thus, after an étale base change, we may assume that $S=A_{1} \times \ldots \times A_{n} \times B$, that each $R \rightarrow A_{i}$ is finite with exactly one prime $\mathfrak{r}_{i}$ lying over $\mathfrak{p}$ such that $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{r}_{i}\right)$ is purely inseparable, and that $R \rightarrow B$ is not quasi-finite at any prime lying over $\mathfrak{p}$. Since $R \rightarrow S$ is quasi-finite (see Lemma 10.147 .6 we see there is no prime of $B$ lying over $\mathfrak{p}$. By Lemma 10.147 .5 we see that $\kappa(\mathfrak{p}) \subset \kappa\left(\mathfrak{r}_{i}\right)$ is separable hence the trivial field extension, and that $\mathfrak{p}\left(A_{i}\right)_{\mathfrak{r}_{i}}$ is the maximal ideal. Also, by Lemma 10.40 .11 (which applies to $R \rightarrow A_{i}$ because a finite ring map satisfies going up by Lemma 10.35 .20 we have $\left(A_{i}\right)_{\mathfrak{r}_{i}}=\left(A_{i}\right)_{\mathfrak{p}}$. It follows from Nakayama's Lemma 10.19.1 that the map of local rings $R_{\mathfrak{p}} \rightarrow\left(A_{i}\right)_{\mathfrak{p}}=\left(A_{i}\right)_{\mathfrak{r}_{i}}$ is surjective. Since $A_{i}$ is finite over $R$ we see that there exists a $f \in R, f \notin \mathfrak{p}$ such that $R_{f} \rightarrow\left(A_{i}\right)_{f}$ is surjective. After replacing $R$ by $R_{f}$ we win.

### 10.148. Henselian local rings

04GE In this section we discuss a bit the notion of a henselian local ring. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. For $a \in R$ we denote $\bar{a}$ the image of $a$ in $\kappa$. For a polynomial $f \in R[T]$ we often denote $\bar{f}$ the image of $f$ in $\kappa[T]$. Given a polynomial $f \in R[T]$ we denote $f^{\prime}$ the derivative of $f$ with respect to $T$. Note that $\bar{f}^{\prime}=\overline{f^{\prime}}$.

04GF Definition 10.148.1. Let $(R, \mathfrak{m}, \kappa)$ be a local ring.
(1) We say $R$ is henselian if for every monic $f \in R[T]$ and every root $a_{0} \in \kappa$ of $\bar{f}$ such that $\overline{f^{\prime}}\left(a_{0}\right) \neq 0$ there exists an $a \in R$ such that $f(a)=0$ and $a_{0}=\bar{a}$.
(2) We say $R$ is strictly henselian if $R$ is henselian and its residue field is separably algebraically closed.
Note that the condition $\overline{f^{\prime}}\left(a_{0}\right) \neq 0$ is equivalent to the condition that $a_{0}$ is a simple root of the polynomial $\bar{f}$. In fact, it implies that the lift $a \in R$, if it exists, is unique.
$06 R \mathrm{Lemma}$ 10.148.2. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $f \in R[T]$. Let $a, b \in R$ such that $f(a)=f(b)=0, a=b \bmod \mathfrak{m}$, and $f^{\prime}(a) \notin \mathfrak{m}$. Then $a=b$.

Proof. Write $f(x+y)-f(x)=f^{\prime}(x) y+g(x, y) y^{2}$ in $R[x, y]$ (this is possible as one sees by expanding $f(x+y)$; details omitted). Then we see that $0=f(b)-f(a)=$ $f(a+(b-a))-f(a)=f^{\prime}(a)(b-a)+c(b-a)^{2}$ for some $c \in R$. By assumption $f^{\prime}(a)$ is a unit in $R$. Hence $(b-a)\left(1+f^{\prime}(a)^{-1} c(b-a)\right)=0$. By assumption $b-a \in \mathfrak{m}$, hence $1+f^{\prime}(a)^{-1} c(b-a)$ is a unit in $R$. Hence $b-a=0$ in $R$.

Here is the characterization of henselian local rings.
04GG Lemma 10.148.3. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. The following are equivalent
(1) $R$ is henselian,
(2) for every $f \in R[T]$ and every root $a_{0} \in \kappa$ of $\bar{f}$ such that $\overline{f^{\prime}}\left(a_{0}\right) \neq 0$ there exists an $a \in R$ such that $f(a)=0$ and $a_{0}=\bar{a}$,
(3) for any monic $f \in R[T]$ and any factorization $\bar{f}=g_{0} h_{0}$ with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=$ 1 there exists a factorization $f=g h$ in $R[T]$ such that $g_{0}=\bar{g}$ and $h_{0}=\bar{h}$,
(4) for any monic $f \in R[T]$ and any factorization $\bar{f}=g_{0} h_{0}$ with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=$ 1 there exists a factorization $f=g h$ in $R[T]$ such that $g_{0}=\bar{g}$ and $h_{0}=\bar{h}$ and moreover $\operatorname{deg}_{T}(g)=\operatorname{deg}_{T}\left(g_{0}\right)$,
(5) for any $f \in R[T]$ and any factorization $\bar{f}=g_{0} h_{0}$ with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=1$ there exists a factorization $f=g h$ in $R[T]$ such that $g_{0}=\bar{g}$ and $h_{0}=\bar{h}$,
(6) for any $f \in R[T]$ and any factorization $\bar{f}=g_{0} h_{0}$ with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=1$ there exists a factorization $f=g h$ in $R[T]$ such that $g_{0}=\bar{g}$ and $h_{0}=\bar{h}$ and moreover $\operatorname{deg}_{T}(g)=\operatorname{deg}_{T}\left(g_{0}\right)$,
(7) for any étale ring map $R \rightarrow S$ and prime $\mathfrak{q}$ of $S$ lying over $\mathfrak{m}$ with $\kappa=\kappa(\mathfrak{q})$ there exists a section $\tau: S \rightarrow R$ of $R \rightarrow S$,
(8) for any étale ring map $R \rightarrow S$ and prime $\mathfrak{q}$ of $S$ lying over $\mathfrak{m}$ with $\kappa=\kappa(\mathfrak{q})$ there exists a section $\tau: S \rightarrow R$ of $R \rightarrow S$ with $\mathfrak{q}=\tau^{-1}(\mathfrak{m})$,
(9) any finite $R$-algebra is a product of local rings,
(10) any finite $R$-algebra is a finite product of local rings,
(11) any finite type $R$-algebra $S$ can be written as $A \times B$ with $R \rightarrow A$ finite and $R \rightarrow B$ not quasi-finite at any prime lying over $\mathfrak{m}$,
(12) any finite type $R$-algebra $S$ can be written as $A \times B$ with $R \rightarrow A$ finite such that each irreducible component of $\operatorname{Spec}\left(B \otimes_{R} \kappa\right)$ has dimension $\geq 1$, and
(13) any quasi-finite $R$-algebra $S$ can be written as $S=A \times B$ with $R \rightarrow A$ finite such that $B \otimes_{R} \kappa=0$.

Proof. Here is a list of the easier implications:
$2 \Rightarrow 1$ because in (2) we consider all polynomials and in (1) only monic ones,
$5 \Rightarrow 3$ because in (5) we consider all polynomials and in (3) only monic ones,
$6 \Rightarrow 4$ because in (6) we consider all polynomials and in (4) only monic ones,
$4 \Rightarrow 3$ is obvious,
$6 \Rightarrow 5$ is obvious,
$8 \Rightarrow 7$ is obvious,
$10 \Rightarrow 9$ is obvious,
$11 \Leftrightarrow 12$ by definition of being quasi-finite at a prime,
$11 \Rightarrow 13$ by definition of being quasi-finite,
Proof of $1 \Rightarrow 8$. Assume (1). Let $R \rightarrow S$ be étale, and let $\mathfrak{q} \subset S$ be a prime ideal such that $\kappa(\mathfrak{q}) \cong \kappa$. By Proposition 10.141 .17 we can find a $g \in S, g \notin \mathfrak{q}$ such that $R \rightarrow S_{g}$ is standard étale. After replacing $S$ by $S_{g}$ we may assume that $S=R[t]_{g} /(f)$ is standard étale. Since the prime $\mathfrak{q}$ has residue field $\kappa$ it corresponds to a root $a_{0}$ of $\bar{f}$ which is not a root of $\bar{g}$. By definition of a standard étale algebra this also means that $\overline{f^{\prime}}\left(a_{0}\right) \neq 0$. Since also $f$ is monic by definition of a standard étale algebra again we may use that $R$ is henselian to conclude that there exists an $a \in R$ with $a_{0}=\bar{a}$ such that $f(a)=0$. This implies that $g(a)$ is a unit of $R$ and we obtain the desired map $\tau: S=R[t]_{g} /(f) \rightarrow R$ by the rule $t \mapsto a$. By construction $\tau^{-1}(\mathfrak{q})=\mathfrak{m}$. This proves (8) holds.

Proof of $7 \Rightarrow 8$. (This is really unimportant and should be skipped.) Assume (7) holds and assume $R \rightarrow S$ is étale. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ be the other primes of $S$ lying over $\mathfrak{m}$. Then we can find a $g \in S, g \notin \mathfrak{q}$ and $g \in \mathfrak{q}_{i}$ for $i=1, \ldots, r$, see Lemma 10.14.2. Apply (7) to the étale ring map $R \rightarrow S_{g}$ and the prime $\mathfrak{q} S_{g}$. This gives a
section $\tau_{g}: S_{g} \rightarrow R$ such that the composition $\tau: S \rightarrow S_{g} \rightarrow R$ has the property $\tau^{-1}(\mathfrak{q})=\mathfrak{m}$. Minor details omitted.
Proof of $8 \Rightarrow 11$. Assume (8) and let $R \rightarrow S$ be a finite type ring map. Apply Lemma 10.141.23. We find an étale ring map $R \rightarrow R^{\prime}$ and a prime $\mathfrak{m}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{m}$ with $\kappa=\kappa\left(\mathfrak{m}^{\prime}\right)$ such that $R^{\prime} \otimes_{R} S=A^{\prime} \times B^{\prime}$ with $A^{\prime}$ finite over $R^{\prime}$ and $B^{\prime}$ not quasi-finite over $R^{\prime}$ at any prime lying over $\mathfrak{m}^{\prime}$. Apply (8) to get a section $\tau: R^{\prime} \rightarrow R$ with $\mathfrak{m}=\tau^{-1}\left(\mathfrak{m}^{\prime}\right)$. Then use that

$$
S=\left(S \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}, \tau} R=\left(A^{\prime} \times B^{\prime}\right) \otimes_{R^{\prime}, \tau} R=\left(A^{\prime} \otimes_{R^{\prime}, \tau} R\right) \times\left(B^{\prime} \otimes_{R^{\prime}, \tau} R\right)
$$

which gives a decomposition as in (11).
Proof of $8 \Rightarrow 10$. Assume (8) and let $R \rightarrow S$ be a finite ring map. Apply Lemma 10.141.23. We find an étale ring map $R \rightarrow R^{\prime}$ and a prime $\mathfrak{m}^{\prime} \subset R^{\prime}$ lying over $\mathfrak{m}$ with $\kappa=\kappa\left(\mathfrak{m}^{\prime}\right)$ such that $R^{\prime} \otimes_{R} S=A_{1}^{\prime} \times \ldots \times A_{n}^{\prime} \times B^{\prime}$ with $A_{i}^{\prime}$ finite over $R^{\prime}$ having exactly one prime over $\mathfrak{m}^{\prime}$ and $B^{\prime}$ not quasi-finite over $R^{\prime}$ at any prime lying over $\mathfrak{m}^{\prime}$. Apply (8) to get a section $\tau: R^{\prime} \rightarrow R$ with $\mathfrak{m}=\tau^{-1}\left(\mathfrak{m}^{\prime}\right)$. Then we obtain

$$
\begin{aligned}
S & =\left(S \otimes_{R} R^{\prime}\right) \otimes_{R^{\prime}, \tau} R \\
& =\left(A_{1}^{\prime} \times \ldots \times A_{n}^{\prime} \times B^{\prime}\right) \otimes_{R^{\prime}, \tau} R \\
& =\left(A_{1}^{\prime} \otimes_{R^{\prime}, \tau} R\right) \times \ldots \times\left(A_{1}^{\prime} \otimes_{R^{\prime}, \tau} R\right) \times\left(B^{\prime} \otimes_{R^{\prime}, \tau} R\right) \\
& =A_{1} \times \ldots \times A_{n} \times B
\end{aligned}
$$

The factor $B$ is finite over $R$ but $R \rightarrow B$ is not quasi-finite at any prime lying over $\mathfrak{m}$. Hence $B=0$. The factors $A_{i}$ are finite $R$-algebras having exactly one prime lying over $\mathfrak{m}$, hence they are local rings. This proves that $S$ is a finite product of local rings.

Proof of $9 \Rightarrow 10$. This holds because if $S$ is finite over the local ring $R$, then it has at most finitely many maximal ideals. Namely, by going up for $R \rightarrow S$ the maximal ideals of $S$ all lie over $\mathfrak{m}$, and $S / \mathfrak{m} S$ is Artinian hence has finitely many primes.

Proof of $10 \Rightarrow 1$. Assume (10). Let $f \in R[T]$ be a monic polynomial and $a_{0} \in \kappa$ a simple root of $\bar{f}$. Then $S=R[T] /(f)$ is a finite $R$-algebra. Applying (10) we get $S=A_{1} \times \ldots \times A_{r}$ is a finite product of local $R$-algebras. In particular we see that $S / \mathfrak{m} S=\prod A_{i} / \mathfrak{m} A_{i}$ is the decomposition of $\kappa[T] /(\bar{f})$ as a product of local rings. This means that one of the factors, say $A_{1} / \mathfrak{m} A_{1}$ is the quotient $\kappa[T] /(\bar{f}) \rightarrow \kappa[T] /\left(T-a_{0}\right)$. Since $A_{1}$ is a summand of the finite free $R$-module $S$ it is a finite free $R$-module itself. As $A_{1} / \mathfrak{m} A_{1}$ is a $\kappa$-vector space of dimension 1 we see that $A_{1} \cong R$ as an $R$-module. Clearly this means that $R \rightarrow A_{1}$ is an isomorphism. Let $a \in R$ be the image of $T$ under the map $R[T] \rightarrow S \rightarrow A_{1} \rightarrow R$. Then $f(a)=0$ and $\bar{a}=a_{0}$ as desired.

Proof of $13 \Rightarrow 1$. Assume (13). Let $f \in R[T]$ be a monic polynomial and $a_{0} \in \kappa$ a simple root of $\bar{f}$. Then $S_{1}=R[T] /(f)$ is a finite $R$-algebra. Let $g \in R[T]$ be any element such that $\bar{g}=\bar{f} /\left(T-a_{0}\right)$. Then $S=\left(S_{1}\right)_{g}$ is a quasi-finite $R$-algebra such that $S \otimes_{R} \kappa \cong \kappa[T]_{\bar{g}} /(\bar{f}) \cong \kappa[T] /\left(T-a_{0}\right) \cong \kappa$. Applying (13) to $S$ we get $S=A \times B$ with $A$ finite over $R$ and $B \otimes_{R} \kappa=0$. In particular we see that $\kappa \cong S / \mathfrak{m} S=A / \mathfrak{m} A$. Since $A$ is a summand of the flat $R$-algebra $S$ we see that it is finite flat, hence free over $R$. As $A / \mathfrak{m} A$ is a $\kappa$-vector space of dimension 1 we see that $A \cong R$ as an $R$-module. Clearly this means that $R \rightarrow A$ is an isomorphism. Let $a \in R$ be the
image of $T$ under the map $R[T] \rightarrow S \rightarrow A \rightarrow R$. Then $f(a)=0$ and $\bar{a}=a_{0}$ as desired.
Proof of $8 \Rightarrow 2$. Assume (8). Let $f \in R[T]$ be any polynomial and let $a_{0} \in \kappa$ be a simple root. Then the algebra $S=R[T]_{f^{\prime}} /(f)$ is étale over $R$. Let $\mathfrak{q} \subset S$ be the prime generated by $\mathfrak{m}$ and $T-b$ where $b \in R$ is any element such that $\bar{b}=a_{0}$. Apply (8) to $S$ and $\mathfrak{q}$ to get $\tau: S \rightarrow R$. Then the image $\tau(T)=a \in R$ works in (2).

At this point we see that $(1),(2),(7),(8),(9),(10),(11),(12),(13)$ are all equivalent. The weakest assertion of (3), (4), (5) and (6) is (3) and the strongest is (6). Hence we still have to prove that (3) implies (1) and (1) implies (6).

Proof of $3 \Rightarrow 1$. Assume (3). Let $f \in R[T]$ be monic and let $a_{0} \in \kappa$ be a simple root of $\bar{f}$. This gives a factorization $\bar{f}=\left(T-a_{0}\right) h_{0}$ with $h_{0}\left(a_{0}\right) \neq 0$, so $\operatorname{gcd}\left(T-a_{0}, h_{0}\right)=1$. Apply (3) to get a factorization $f=g h$ with $\bar{g}=T-a_{0}$ and $\bar{h}=h_{0}$. Set $S=$ $R[T] /(f)$ which is a finite free $R$-algebra. We will write $g, h$ also for the images of $g$ and $h$ in $S$. Then $g S+h S=S$ by Nakayama's Lemma 10.19.1 as the equality holds modulo $\mathfrak{m}$. Since $g h=f=0$ in $S$ this also implies that $g S \cap h S=0$. Hence by the Chinese Remainder theorem we obtain $S=S /(g) \times S /(h)$. This implies that $A=S /(g)$ is a summand of a finite free $R$-module, hence finite free. Moreover, the rank of $A$ is 1 as $A / \mathfrak{m} A=\kappa[T] /\left(T-a_{0}\right)$. Thus the map $R \rightarrow A$ is an isomorphism. Setting $a \in R$ equal to the image of $T$ under the maps $R[T] \rightarrow S \rightarrow A \rightarrow R$ gives an element of $R$ with $f(a)=0$ and $\bar{a}=a_{0}$.
Proof of $1 \Rightarrow 6$. Assume (1) or equivalently all of (1), (2), (7), (8), (9), (10), (11), (12), (13). Let $f \in R[T]$ be a polynomial. Suppose that $\bar{f}=g_{0} h_{0}$ is a factorization with $\operatorname{gcd}\left(g_{0}, h_{0}\right)=1$. We may and do assume that $g_{0}$ is monic. Consider $S=R[T] /(f)$. Because we have the factorization we see that the coefficients of $f$ generate the unit ideal in $R$. This implies that $S$ has finite fibres over $R$, hence is quasi-finite over $R$. It also implies that $S$ is flat over $R$ by Lemma 10.98 .2 . Combining (13) and (10) we may write $S=A_{1} \times \ldots \times A_{n} \times B$ where each $A_{i}$ is local and finite over $R$, and $B \otimes_{R} \kappa=0$. After reordering the factors $A_{1}, \ldots, A_{n}$ we may assume that
$\kappa[T] /\left(g_{0}\right)=A_{1} / \mathfrak{m} A_{1} \times \ldots \times A_{r} / \mathfrak{m} A_{r}, \kappa[T] /\left(h_{0}\right)=A_{r+1} / \mathfrak{m} A_{r+1} \times \ldots \times A_{n} / \mathfrak{m} A_{n}$
as quotients of $\kappa[T]$. The finite flat $R$-algebra $A=A_{1} \times \ldots \times A_{r}$ is free as an $R$ module, see Lemma 10.77.4. Its rank is $\operatorname{deg}_{T}\left(g_{0}\right)$. Let $g \in R[T]$ be the characteristic polynomial of the $R$-linear operator $T: A \rightarrow A$. Then $g$ is a monic polynomial of degree $\operatorname{deg}_{T}(g)=\operatorname{deg}_{T}\left(g_{0}\right)$ and moreover $\bar{g}=g_{0}$. By Cayley-Hamilton (Lemma 10.15.1 we see that $g\left(T_{A}\right)=0$ where $T_{A}$ indicates the image of $T$ in $A$. Hence we obtain a well defined surjective map $R[T] /(g) \rightarrow A$ which is an isomorphism by Nakayama's Lemma 10.19.1. The map $R[T] \rightarrow A$ factors through $R[T] /(f)$ by construction hence we may write $f=g h$ for some $h$. This finishes the proof.

04GH Lemma 10.148.4. Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring.
(1) If $R \subset S$ is a finite ring extension then $S$ is a finite product of henselian local rings.
(2) If $R \subset S$ is a finite local homomorphism of local rings, then $S$ is a henselian local ring.
(3) If $R \rightarrow S$ is a finite type ring map, and $\mathfrak{q}$ is a prime of $S$ lying over $\mathfrak{m}$ at which $R \rightarrow S$ is quasi-finite, then $S_{\mathfrak{q}}$ is henselian.
(4) If $R \rightarrow S$ is quasi-finite then $S_{\mathfrak{q}}$ is henselian for every prime $\mathfrak{q}$ lying over $\mathfrak{m}$.

Proof. Part (2) implies part (1) since $S$ as in part (1) is a finite product of its localizations at the primes lying over $\mathfrak{m}$. Part (2) follows from Lemma 10.148.3 part (10) since any finite $S$-algebra is also a finite $R$-algebra. If $R \rightarrow S$ and $\mathfrak{q}$ are as in (3), then $S_{\mathfrak{q}}$ is a local ring of a finite $R$-algebra by Lemma 10.148 .3 part (11). Hence (3) follows from (1). Part (4) follows from part (3).

04GI Lemma 10.148.5. A filtered colimit of henselian local rings along local homomorphisms is henselian.

Proof. Categories, Lemma 4.21.3 says that this is really just a question about a colimit of henselian local rings over a directed partially ordered set. Let $\left(R_{i}, \varphi_{i i^{\prime}}\right)$ be such a system with each $\varphi_{i i^{\prime}}$ local. Then $R=\operatorname{colim}_{i} R_{i}$ is local, and its residue field $\kappa$ is colim $\kappa_{i}$ (argument omitted). Suppose that $f \in R[T]$ is monic and that $a_{0} \in \kappa$ is a simple root of $\bar{f}$. Then for some large enough $i$ there exists an $f_{i} \in R_{i}[T]$ mapping to $f$ and an $a_{0, i} \in \kappa_{i}$ mapping to $a_{0}$. Since $\overline{f_{i}}\left(a_{0, i}\right) \in \kappa_{i}$, resp. $\overline{f_{i}^{\prime}}\left(a_{0, i}\right) \in \kappa_{i}$ maps to $0=\bar{f}\left(a_{0}\right) \in \kappa$, resp. $0 \neq \overline{f^{\prime}}\left(a_{0}\right) \in \kappa$ we conclude that $a_{0, i}$ is a simple root of $\overline{f_{i}}$. As $R_{i}$ is henselian we can find $a_{i} \in R_{i}$ such that $f_{i}\left(a_{i}\right)=0$ and $a_{0, i}=\overline{a_{i}}$. Then the image $a \in R$ of $a_{i}$ is the desired solution. Thus $R$ is henselian.

04GJ Lemma 10.148.6. Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring. Any finite type $R$ algebra $S$ can be written as $S=A_{1} \times \ldots \times A_{n} \times B$ with $A_{i}$ local and finite over $R$ and $R \rightarrow B$ not quasi-finite at any prime of $B$ lying over $\mathfrak{m}$.

Proof. This is a combination of parts (11) and (10) of Lemma 10.148.3.
06DD Lemma 10.148.7. Let $(R, \mathfrak{m}, \kappa)$ be a strictly henselian local ring. Any finite type $R$-algebra $S$ can be written as $S=A_{1} \times \ldots \times A_{n} \times B$ with $A_{i}$ local and finite over $R$ and $\kappa \subset \kappa\left(\mathfrak{m}_{A_{i}}\right)$ finite purely inseparable and $R \rightarrow B$ not quasi-finite at any prime of $B$ lying over $\mathfrak{m}$.

Proof. First write $S=A_{1} \times \ldots \times A_{n} \times B$ as in Lemma 10.148.6. The field extension $\kappa \subset \kappa\left(\mathfrak{m}_{A_{i}}\right)$ is finite and $\kappa$ is separably algebraically closed, hence it is finite purely inseparable.

04GK Lemma 10.148.8. Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring. The category of finite étale ring extensions $R \rightarrow S$ is equivalent to the category of finite étale algebras $\kappa \rightarrow \bar{S}$ via the functor $S \mapsto S / \mathfrak{m} S$.

Proof. Denote $\mathcal{C} \rightarrow \mathcal{D}$ the functor of categories of the statement. Suppose that $R \rightarrow S$ is finite étale. Then we may write

$$
S=A_{1} \times \ldots \times A_{n}
$$

with $A_{i}$ local and finite étale over $S$, use either Lemma 10.148 .6 or Lemma 10.148 .3 part (10). In particular $A_{i} / \mathfrak{m} A_{i}$ is a finite separable field extension of $\kappa$, see Lemma 10.141.5. Thus we see that every object of $\mathcal{C}$ and $\mathcal{D}$ decomposes canonically into irreducible pieces which correspond via the given functor. Next, suppose that $S_{1}$, $S_{2}$ are finite étale over $R$ such that $\kappa_{1}=S_{1} / \mathfrak{m} S_{1}$ and $\kappa_{2}=S_{2} / \mathfrak{m} S_{2}$ are fields (finite separable over $\kappa)$. Then $S_{1} \otimes_{R} S_{2}$ is finite étale over $R$ and we may write

$$
S_{1} \otimes_{R} S_{2}=A_{1} \times \ldots \times A_{n}
$$

as before. Then we see that $\operatorname{Hom}_{R}\left(S_{1}, S_{2}\right)$ is identified with the set of indices $i \in\{1, \ldots, n\}$ such that $S_{2} \rightarrow A_{i}$ is an isomorphism. To see this use that given any $R$-algebra map $\varphi: S_{1} \rightarrow S_{2}$ the map $\varphi \times 1: S_{1} \otimes_{R} S_{2} \rightarrow S_{2}$ is surjective, and hence is equal to projection onto one of the factors $A_{i}$. But in exactly the same way we see that $\operatorname{Hom}_{\kappa}\left(\kappa_{1}, \kappa_{2}\right)$ is identified with the set of indices $i \in\{1, \ldots, n\}$ such that $\kappa_{2} \rightarrow A_{i} / \mathfrak{m} A_{i}$ is an isomorphism. By the discussion above these sets of indices match, and we conclude that our functor is fully faithful. Finally, let $\kappa \subset \kappa^{\prime}$ be a finite separable field extension. By Lemma 10.141 .16 there exists an étale ring map $R \rightarrow S$ and a prime $\mathfrak{q}$ of $S$ lying over $\mathfrak{m}$ such that $\kappa \subset \kappa(\mathfrak{q})$ is isomorphic to the given extension. By part (1) we may write $S=A_{1} \times \ldots \times A_{n} \times B$. Since $R \rightarrow S$ is quasi-finite we see that there exists no prime of $B$ over $\mathfrak{m}$. Hence $S_{\mathfrak{q}}$ is equal to $A_{i}$ for some $i$. Hence $R \rightarrow A_{i}$ is finite étale and produces the given residue field extension. Thus the functor is essentially surjective and we win.

04GL Lemma 10.148.9. Let $(R, \mathfrak{m}, \kappa)$ be a strictly henselian local ring. Let $R \rightarrow S$ be an unramified ring map. Then

$$
S=A_{1} \times \ldots \times A_{n} \times B
$$

with each $R \rightarrow A_{i}$ surjective and no prime of $B$ lying over $\mathfrak{m}$.
Proof. First write $S=A_{1} \times \ldots \times A_{n} \times B$ as in Lemma 10.148.6. Now we see that $R \rightarrow A_{i}$ is finite unramified and $A_{i}$ local. Hence the maximal ideal of $A_{i}$ is $\mathfrak{m} A_{i}$ and its residue field $A_{i} / \mathfrak{m} A_{i}$ is a finite separable extension of $\kappa$, see Lemma 10.147.5. However, the condition that $R$ is strictly henselian means that $\kappa$ is separably algebraically closed, so $\kappa=A_{i} / \mathfrak{m} A_{i}$. By Nakayama's Lemma 10.19.1 we conclude that $R \rightarrow A_{i}$ is surjective as desired.

04GM Lemma 10.148.10. Let $(R, \mathfrak{m}, \kappa)$ be a complete local ring, see Definition 10.152.1. Then $R$ is henselian.

Proof. Let $f \in R[T]$ be monic. Denote $f_{n} \in R / \mathfrak{m}^{n+1}[T]$ the image. Denote $f_{n}^{\prime}$ the derivative of $f_{n}$ with respect to $T$. Let $a_{0} \in \kappa$ be a simple root of $f_{0}$. We lift this to a solution of $f$ over $R$ inductively as follows: Suppose given $a_{n} \in R / \mathfrak{m}^{n+1}$ such that $a_{n} \bmod \mathfrak{m}=a_{0}$ and $f_{n}\left(a_{n}\right)=0$. Pick any element $b \in R / \mathfrak{m}^{n+2}$ such that $a_{n}=b \bmod \mathfrak{m}^{n+1}$. Then $f_{n+1}(b) \in \mathfrak{m}^{n+1} / \mathfrak{m}^{n+2}$. Set

$$
a_{n+1}=b-f_{n+1}(b) / f_{n+1}^{\prime}(b)
$$

(Newton's method). This makes sense as $f_{n+1}^{\prime}(b) \in R / \mathfrak{m}^{n+1}$ is invertible by the condition on $a_{0}$. Then we compute $f_{n+1}\left(a_{n+1}\right)=f_{n+1}(b)-f_{n+1}(b)=0$ in $R / \mathfrak{m}^{n+2}$. Since the system of elements $a_{n} \in R / \mathfrak{m}^{n+1}$ so constructed is compatible we get an element $a \in \lim R / \mathfrak{m}^{n}=R$ (here we use that $R$ is complete). Moreover, $f(a)=0$ since it maps to zero in each $R / \mathfrak{m}^{n}$. Finally $\bar{a}=a_{0}$ and we win.

06RS Lemma 10.148.11. Let $(R, \mathfrak{m})$ be a local ring of dimension 0 . Then $R$ is henselian.
Proof. Let $R \rightarrow S$ be a finite ring map. By Lemma 10.148 .3 it suffices to show that $S$ is a product of local rings. By Lemma $10.35 .19 S$ has finitely many primes $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{r}$ which all lie over $\mathfrak{m}$. There are no inclusions among these primes, see Lemma 10.35.18. hence they are all maximal. Every element of $\mathfrak{m}_{1} \cap \ldots \cap \mathfrak{m}_{r}$ is nilpotent by Lemma 10.16 .2 . It follows $S$ is the product of the localizations of $S$ at the primes $\mathfrak{m}_{i}$ by Lemma 10.52 .5 .

08 HQ Lemma 10.148.12. Let $R \rightarrow S$ be a ring map with $S$ henselian local. Given
(1) an étale ring $\operatorname{map} R \rightarrow A$,
(2) a prime $\mathfrak{q}$ of $A$ lying over $\mathfrak{p}=R \cap \mathfrak{m}_{S}$,
(3) a $\kappa(\mathfrak{p})$-algebra map $\kappa(\mathfrak{q}) \rightarrow S / \mathfrak{m}_{S}$,
then there exists a unique homomorphism of $R$-algebras $f: A \rightarrow S$ such that $\mathfrak{q}=f^{-1}\left(\mathfrak{m}_{S}\right)$.

Proof. Consider $A \otimes_{R} S$. This is an étale algebra over $S$, see Lemma 10.141.3. Moreover, the kernel

$$
\mathfrak{q}^{\prime}=\operatorname{Ker}\left(A \otimes_{R} S \rightarrow \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{m}_{S}\right) \rightarrow \kappa\left(\mathfrak{m}_{S}\right)\right)
$$

of the map using the map given in (3) is a prime ideal lying over $\mathfrak{m}_{S}$ with residue field equal to the residue field of $S$. Hence by Lemma 10.148 .3 there exists a unique splitting $\tau: A \otimes_{R} S \rightarrow S$ with $\tau^{-1}\left(\mathfrak{m}_{S}\right)=\mathfrak{q}^{\prime}$. Set $f$ equal to the composition $A \rightarrow A \otimes_{R} S \rightarrow S$.

08HR Lemma 10.148.13. Let $R \rightarrow S$ be a ring map with $S$ henselian local. Given
(1) an $R$-algebra $A$ which is a filtered colimit of étale $R$-algebras,
(2) a prime $\mathfrak{q}$ of $A$ lying over $\mathfrak{p}=R \cap \mathfrak{m}_{S}$,
(3) a $\kappa(\mathfrak{p})$-algebra map $\kappa(\mathfrak{q}) \rightarrow S / \mathfrak{m}_{S}$,
then there exists a unique homomorphism of $R$-algebras $f: A \rightarrow S$ such that $\mathfrak{q}=f^{-1}\left(\mathfrak{m}_{S}\right)$.

Proof. Write $A=\operatorname{colim} A_{i}$ as a filtered colimit of étale $R$-algebras. Set $\mathfrak{q}_{i}=A_{i} \cap \mathfrak{q}$. We obtain $f_{i}: A_{i} \rightarrow S$ by applying Lemma 10.148.12 Set $f=\operatorname{colim} f_{i}$.

08HS Lemma 10.148.14. Let $R$ be a ring. Let $A \rightarrow B$ be an $R$-algebra homomorphism. If $A$ and $B$ are filtered colimits of étale $R$-algebras, then $B$ is a filtered colimit of étale $A$-algebras.
Proof. Write $A=\operatorname{colim} A_{i}$ and $B=\operatorname{colim} B_{j}$ as filtered colimits with $A_{i}$ and $B_{j}$ étale over $R$. For each $i$ we can find a $j$ such that $A_{i} \rightarrow B$ factors through $B_{j}$, see Lemma 10.126 .2 . The factorization $A_{i} \rightarrow B_{j}$ is étale by Lemma 10.141.9. Since $A \rightarrow A \otimes_{A_{i}} B_{j}$ is étale (Lemma 10.141 .3 ) it suffices to prove that $B=\operatorname{colim} A \otimes_{A_{i}} B_{j}$ where the colimit is over pairs $(i, j)$ and factorizations $A_{i} \rightarrow B_{j} \rightarrow B$ of $A_{i} \rightarrow B$ (this is a directed system; details omitted). This is clear because colim $A \otimes_{A_{i}} B_{j}=$ $A \otimes_{A} B=B$.

08HT Lemma 10.148.15. Let $R$ be a ring. Given a commutative diagram of ring maps

where $S, S^{\prime}$ are henselian local, $S, S^{\prime}$ are filtered colimits of étale $R$-algebras, $K$ is a field and the arrows $S \rightarrow K$ and $S^{\prime} \rightarrow K$ identify $K$ with the residue field of both $S$ and $S^{\prime}$. Then there exists an unique $R$-algebra isomorphism $S \rightarrow S^{\prime}$ compatible with the maps to $K$.

Proof. Follows immediately from Lemma 10.148.13.
04GN Lemma 10.148.16. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. There exists a local ring map $R \rightarrow R^{h}$ with the following properties
(1) $R^{h}$ is henselian,
(2) $R^{h}$ is a filtered colimit of étale $R$-algebras,
(3) $\mathfrak{m} R^{h}$ is the maximal ideal of $R^{h}$, and
(4) $\kappa=R^{h} / \mathfrak{m} R^{h}$.

Proof. Consider the category of pairs $(S, \mathfrak{q})$ where $R \rightarrow S$ is an étale ring map, and $\mathfrak{q}$ is a prime of $S$ lying over $\mathfrak{m}$ with $\kappa=\kappa(\mathfrak{q})$. A morphism of pairs $(S, \mathfrak{q}) \rightarrow\left(S^{\prime}, \mathfrak{q}^{\prime}\right)$ is given by an $R$-algebra map $\varphi: S \rightarrow S^{\prime}$ such that $\varphi^{-1}\left(\mathfrak{q}^{\prime}\right)=\mathfrak{q}$. We set

$$
R^{h}=\operatorname{colim}_{(S, \mathfrak{q})} S
$$

This clearly implies that $R^{h}$ is canonical, since no choices were made in this construction. Moreover, property (2) is clear.
Let us show that the category of pairs is filtered, see Categories, Definition 4.19.1. The category contains the pair $(R, \mathfrak{m})$ and hence is not empty, which proves part (1) of Categories, Definition 4.19.1. Note that for any pair $(S, \mathfrak{q})$ the prime ideal $\mathfrak{q}$ is maximal, for example since $\kappa \rightarrow S / \mathfrak{q} \subset \kappa(\mathfrak{q})$ are isomorphisms. Suppose that $(S, \mathfrak{q})$ and $\left(S^{\prime}, \mathfrak{q}^{\prime}\right)$ are two objects. Set $S^{\prime \prime}=S \otimes_{R} S^{\prime}$ and $\mathfrak{q}^{\prime \prime}=\mathfrak{q} S^{\prime \prime}+\mathfrak{q}^{\prime} S^{\prime \prime}$. Then $S^{\prime \prime} / \mathfrak{q}^{\prime \prime}=S / \mathfrak{q} \otimes_{R} S^{\prime} / \mathfrak{q}^{\prime}=\kappa$ by what we said above. Moreover, $R \rightarrow S^{\prime \prime}$ is étale by Lemma 10.141 .3 . This proves part (2) of Categories, Definition 4.19.1. Next, suppose that $\varphi, \psi:(S, \mathfrak{q}) \rightarrow\left(S^{\prime}, \mathfrak{q}^{\prime}\right)$ are two morphisms of pairs. Consider

$$
S^{\prime \prime}=\left(S^{\prime} \otimes_{\varphi, S, \psi} S^{\prime}\right) \otimes_{S^{\prime} \otimes_{R} S^{\prime}} S^{\prime}
$$

with prime ideal

$$
\mathfrak{q}^{\prime \prime}=\left(\mathfrak{q}^{\prime} \otimes S^{\prime}+S^{\prime} \otimes \mathfrak{q}^{\prime}\right) \otimes S^{\prime}+\left(S^{\prime} \otimes_{\varphi, S, \psi} S^{\prime}\right) \otimes \mathfrak{q}^{\prime}
$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that $S^{\prime \prime}$ is étale over $R$. Moreover, the canonical map $S^{\prime} \rightarrow S^{\prime \prime}$ (using the right most factor for example) equalizes $\varphi$ and $\psi$. This proves part (3) of Categories, Definition 4.19.1. Hence we conclude that $R^{h}$ consists of triples $(S, \mathfrak{q}, f)$ with $f \in S$, and two such triples $(S, \mathfrak{q}, f),\left(S^{\prime}, \mathfrak{q}^{\prime}, f^{\prime}\right)$ define the same element of $R^{h}$ if and only if there exists a pair ( $S^{\prime \prime}, \mathfrak{q}^{\prime \prime}$ ) and morphisms of pairs $\varphi:(S, \mathfrak{q}) \rightarrow\left(S^{\prime \prime}, \mathfrak{q}^{\prime \prime}\right)$ and $\varphi^{\prime}:\left(S^{\prime}, \mathfrak{q}^{\prime}\right) \rightarrow\left(S^{\prime \prime}, \mathfrak{q}^{\prime \prime}\right)$ such that $\varphi(f)=\varphi^{\prime}\left(f^{\prime}\right)$.

Suppose that $x \in R^{h}$. Represent $x$ by a triple $(S, \mathfrak{q}, f)$. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ be the other primes of $S$ lying over $\mathfrak{m}$. Then we can find a $g \in S, g \notin \mathfrak{q}$ and $g \in \mathfrak{q}_{i}$ for $i=1, \ldots, r$, see Lemma 10.14.2. Consider the morphism of pairs $(S, \mathfrak{q}) \rightarrow\left(S_{g}, \mathfrak{q} S_{g}\right)$. In this way we see that we may always assume that $x$ is given by a triple $(S, \mathfrak{q}, f)$ where $\mathfrak{q}$ is the only prime of $S$ lying over $\mathfrak{m}$, i.e., $\sqrt{\mathfrak{m} S}=\mathfrak{q}$. But since $R \rightarrow S$ is étale, we have $\mathfrak{m} S_{\mathfrak{q}}=\mathfrak{q} S_{\mathfrak{q}}$, see Lemma 10.141.5. Hence we actually get that $\mathfrak{m} S=\mathfrak{q}$.
Suppose that $x \notin \mathfrak{m} R^{h}$. Represent $x$ by a triple $(S, \mathfrak{q}, f)$ with $\mathfrak{m} S=\mathfrak{q}$. Then $f \notin \mathfrak{m} S$, i.e., $f \notin \mathfrak{q}$. Hence $(S, \mathfrak{q}) \rightarrow\left(S_{f}, \mathfrak{q} S_{f}\right)$ is a morphism of pairs such that the image of $f$ becomes invertible. Hence $x$ is invertible with inverse represented by the triple $\left(S_{f}, \mathfrak{q} S_{f}, 1 / f\right)$. We conclude that $R^{h}$ is a local ring with maximal ideal $\mathfrak{m} R^{h}$. The residue field is $\kappa$ since we can define $R^{h} / \mathfrak{m} R^{h} \rightarrow \kappa$ by mapping a triple $(S, \mathfrak{q}, f)$ to the residue class of $f$ module $\mathfrak{q}$.
We still have to show that $R^{h}$ is henselian. Namely, suppose that $P \in R^{h}[T]$ is a monic polynomial and $a_{0} \in \kappa$ is a simple root of the reduction $\bar{P} \in \kappa[T]$. Then we can find a pair $(S, \mathfrak{q})$ such that $P$ is the image of a monic polynomial $Q \in S[T]$. Since $S \rightarrow R^{h}$ induces an isomorphism of residue fields we see that $S^{\prime}=S[T] /(Q)$ has a
prime ideal $\mathfrak{q}^{\prime}=\left(\mathfrak{q}, T-a_{0}\right)$ at which $S \rightarrow S^{\prime}$ is standard étale. Moreover, $\kappa=\kappa\left(\mathfrak{q}^{\prime}\right)$. Pick $g \in S^{\prime}, g \notin \mathfrak{q}^{\prime}$ such that $S^{\prime \prime}=S_{g}^{\prime}$ is étale over $S$. Then $(S, \mathfrak{q}) \rightarrow\left(S^{\prime \prime}, \mathfrak{q}^{\prime} S^{\prime \prime}\right)$ is a morphism of pairs. Now that triple $\left(S^{\prime \prime}, \mathfrak{q}^{\prime} S^{\prime \prime}\right.$, class of $T$ ) determines an element $a \in R^{h}$ with the properties $P(a)=0$, and $\bar{a}=a_{0}$ as desired.
04GP Lemma 10.148.17. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $\kappa \subset \kappa^{\text {sep }}$ be a separable algebraic closure. There exists a commutative diagram

with the following properties
(1) the map $R^{h} \rightarrow R^{s h}$ is local
(2) $R^{\text {sh }}$ is strictly henselian,
(3) $R^{s h}$ is a filtered colimit of étale $R$-algebras,
(4) $\mathfrak{m} R^{\text {sh }}$ is the maximal ideal of $R^{s h}$, and
(5) $\kappa^{s e p}=R^{s h} / \mathfrak{m} R^{s h}$.

Proof. This can be proved using the method followed in the proof of Lemma 10.148.16. The only difference is that, instead of pairs, one uses triples ( $S, \mathfrak{q}, \alpha$ ) where $R \rightarrow S$ étale, $\mathfrak{q}$ is a prime of $S$ lying over $\mathfrak{m}$, and $\alpha: \kappa(\mathfrak{q}) \rightarrow \kappa^{s e p}$ is an embedding of extensions of $\kappa$.

But we can also deduce the result directly from the result of Lemma 10.148.16, Namely, for any finite separable field sub extension $\kappa \subset \kappa^{\prime} \subset \kappa^{\text {sep }}$ there exists a unique (up to unique isomorphism) finite étale local ring extension $R^{h} \subset R^{h}\left(\kappa^{\prime}\right)$ whose residue field extension extension reproduces the given extension, see Lemma 10.148.8. Hence we can set

$$
R^{s h}=\bigcup_{\kappa \subset \kappa^{\prime} \subset \kappa^{s e p}} R^{h}\left(\kappa^{\prime}\right)
$$

The arrows in this system, compatible with the arrows on the level of residue fields, exist by Lemma 10.148 .8 . This will produce a henselian local ring by Lemma 10.148.5 since each of the rings $R^{h}\left(\kappa^{\prime}\right)$ is henselian by Lemma 10.148.4 By construction the residue field extension induced by $R^{h} \rightarrow R^{s h}$ is the field extension $\kappa \subset \kappa^{s e p}$. We omit the proof that $R^{s h}$ is a colimit of étale $R$-algebras.

04GQ Definition 10.148.18. Let $(R, \mathfrak{m}, \kappa)$ be a local ring.
(1) The local ring map $R \rightarrow R^{h}$ constructed in Lemma 10.148.16 is called the henselization of $R$.
(2) Given a separable algebraic closure $\kappa \subset \kappa^{\text {sep }}$ the local ring map $R \rightarrow R^{\text {sh }}$ constructed in Lemma 10.148 .17 is called the strict henselization of $R$ with respect to $\kappa \subset \kappa^{\text {sep }}$.
(3) A local ring map $R \rightarrow R^{\text {sh }}$ is called a strict henselization of $R$ if it is isomorphic to one of the local ring maps constructed in Lemma 10.148.17
The maps $R \rightarrow R^{h} \rightarrow R^{s h}$ are flat local ring homomorphisms. By Lemma 10.148.15 the $R$-algebras $R^{h}$ and $R^{s h}$ are well defined up to unique isomorphism by the conditions that they are henselian local, filtered colimits of étale $R$-algebras with residue field $\kappa$ and $\kappa^{\text {sep }}$. We will discuss this and the close relationship between $R$ and its henselization in More on Algebra, Section 15.36. In the rest of this section
we prove some lemmas we discuss functoriality properties of (strict) henselizations. This should make it clear exactly how canonical these constructions really are.

04GR Lemma 10.148.19. Let $R \rightarrow S$ be a local map of local rings. Let $S \rightarrow S^{h}$ be the henselization. Let $R \rightarrow A$ be an étale ring map and let $\mathfrak{q}$ be a prime of $A$ lying over $\mathfrak{m}_{R}$ such that $R / \mathfrak{m}_{R} \cong \kappa(\mathfrak{q})$. Then there exists a unique morphism of rings $f: A \rightarrow S^{h}$ fitting into the commutative diagram

such that $f^{-1}\left(\mathfrak{m}_{S^{h}}\right)=\mathfrak{q}$.
Proof. This is a special case of Lemma 10.148.12
04GS Lemma 10.148.20. Let $R \rightarrow S$ be a local map of local rings. Let $R \rightarrow R^{h}$ and $S \rightarrow S^{h}$ be the henselizations. There exists a unique local ring map $R^{h} \rightarrow S^{h}$ fitting into the commutative diagram

Proof. Follows immediately from Lemma 10.148.13.
Here is a slightly different construction of the henselization.
04GV Lemma 10.148.21. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Consider the category of pairs $(S, \mathfrak{q})$ where $R \rightarrow S$ is étale and $\mathfrak{q}$ is a prime lying over $\mathfrak{p}$ such that $\kappa(\mathfrak{p})=\kappa(\mathfrak{q})$. This category is filtered and

$$
\left(R_{\mathfrak{p}}\right)^{h}=\operatorname{colim}_{(S, \mathfrak{q})} S=\operatorname{colim}_{(S, \mathfrak{q})} S_{\mathfrak{q}}
$$

canonically.
Proof. A morphism of pairs $(S, \mathfrak{q}) \rightarrow\left(S^{\prime}, \mathfrak{q}^{\prime}\right)$ is given by an $R$-algebra map $\varphi$ : $S \rightarrow S^{\prime}$ such that $\varphi^{-1}\left(\mathfrak{q}^{\prime}\right)=\mathfrak{q}$. Let us show that the category of pairs is filtered, see Categories, Definition 4.19.1. The category contains the pair $(R, \mathfrak{p})$ and hence is not empty, which proves part (1) of Categories, Definition 4.19.1. Suppose that $(S, \mathfrak{q})$ and $\left(S^{\prime}, \mathfrak{q}^{\prime}\right)$ are two pairs. Note that $\mathfrak{q}$, resp. $\mathfrak{q}^{\prime}$ correspond to primes of the fibre rings $S \otimes \kappa(\mathfrak{p})$, resp. $S^{\prime} \otimes \kappa(\mathfrak{p})$ with residue fields $\kappa(\mathfrak{p})$, hence they correspond to maximal ideals of $S \otimes \kappa(\mathfrak{p})$, resp. $S^{\prime} \otimes \kappa(\mathfrak{p})$. Set $S^{\prime \prime}=S \otimes_{R} S^{\prime}$. By the above there exists a unique prime $\mathfrak{q}^{\prime \prime} \subset S^{\prime \prime}$ lying over $\mathfrak{q}$ and over $\mathfrak{q}^{\prime}$ whose residue field is $\kappa(\mathfrak{p})$. The ring map $R \rightarrow S^{\prime \prime}$ is étale by Lemma 10.141.3. This proves part (2) of Categories, Definition 4.19.1. Next, suppose that $\varphi, \psi:(S, \mathfrak{q}) \rightarrow\left(S^{\prime}, \mathfrak{q}^{\prime}\right)$ are two morphisms of pairs. Consider

$$
S^{\prime \prime}=\left(S^{\prime} \otimes_{\varphi, S, \psi} S^{\prime}\right) \otimes_{S^{\prime} \otimes_{R} S^{\prime}} S^{\prime}
$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that $S^{\prime \prime}$ is étale over $R$. The fibre ring of $S^{\prime \prime}$ over $\mathfrak{p}$ is

$$
F^{\prime \prime}=\left(F^{\prime} \otimes_{\varphi, F, \psi} F^{\prime}\right) \otimes_{F^{\prime} \otimes_{\kappa(\mathfrak{p})} F^{\prime}} F^{\prime}
$$

where $F^{\prime}, F$ are the fibre rings of $S^{\prime}$ and $S$. Since $\varphi$ and $\psi$ are morphisms of pairs the map $F^{\prime} \rightarrow \kappa(\mathfrak{p})$ corresponding to $\mathfrak{p}^{\prime}$ extends to a map $F^{\prime \prime} \rightarrow \kappa(\mathfrak{p})$ and in turn corresponds to a prime ideal $\mathfrak{q}^{\prime \prime} \subset S^{\prime \prime}$ whose residue field is $\kappa(\mathfrak{p})$. The canonical map $S^{\prime} \rightarrow S^{\prime \prime}$ (using the right most factor for example) is a morphism of pairs $\left(S^{\prime}, \mathfrak{q}^{\prime}\right) \rightarrow\left(S^{\prime \prime}, \mathfrak{q}^{\prime \prime}\right)$ which equalizes $\varphi$ and $\psi$. This proves part (3) of Categories, Definition 4.19.1. Hence we conclude that the category is filtered.

Recall that in the proof of Lemma 10.148 .16 we constructed $\left(R_{\mathfrak{p}}\right)^{h}$ as the corresponding colimit but starting with $R_{\mathfrak{p}}$ and its maximal ideal $\mathfrak{p} R_{\mathfrak{p}}$. Now, given any pair $(S, \mathfrak{q})$ for $(R, \mathfrak{p})$ we obtain a pair $\left(S_{\mathfrak{p}}, \mathfrak{q} S_{\mathfrak{p}}\right)$ for $\left(R_{\mathfrak{p}}, \mathfrak{p} R_{\mathfrak{p}}\right)$. Moreover, in this situation

$$
S_{\mathfrak{p}}=\operatorname{colim}_{f \in R, f \notin \mathfrak{p}} S_{f}
$$

Hence in order to show the equalities of the lemma, it suffices to show that any pair $\left(S_{l o c}, \mathfrak{q}_{l o c}\right)$ for $\left(R_{\mathfrak{p}}, \mathfrak{p} R_{\mathfrak{p}}\right)$ is of the form $\left(S_{\mathfrak{p}}, \mathfrak{q} S_{\mathfrak{p}}\right)$ for some pair $(S, \mathfrak{q})$ over $(R, \mathfrak{p})$ (some details omitted). This follows from Lemma 10.141.3.

08HU Lemma 10.148.22. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Let $R \rightarrow R^{h}$ and $S \rightarrow S^{h}$ be the henselizations of $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$. The local ring map $R^{h} \rightarrow S^{h}$ of Lemma 10.148.20 identifies $S^{h}$ with the henselization of $R^{h} \otimes_{R} S$ at the unique prime lying over $\mathfrak{m}^{h}$ and $\mathfrak{q}$.

Proof. By Lemma 10.148.21 we see that $R^{h}$, resp. $S^{h}$ are filtered colimits of étale $R$, resp. $S$-algebras. Hence we see that $R^{h} \otimes_{R} S$ is a filtered colimit of étale $S$ algebras $A_{i}$ (Lemma 10.141.3). By Lemma 10.148 .14 we see that $S^{h}$ is a filtered colimit of étale $R^{h} \otimes_{R} S$-algebras. Since moreover $S^{h}$ is a henselian local ring with residue field equal to $\kappa(\mathfrak{q})$, the statement follows from the uniqueness result of Lemma 10.148 .15 .

05WP Lemma 10.148.23. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over $\mathfrak{p}$ in $R$. Assume $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$. The commutative diagram

of Lemma 10.148 .20 identifies $S_{\mathfrak{q}}^{h}$ with the localization of $R_{\mathfrak{p}}^{h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ at the prime generated $\overline{b y \mathfrak{q}}$.

Proof. Note that $R_{\mathfrak{p}}^{h} \otimes_{R} S$ is quasi-finite over $R_{\mathfrak{p}}^{h}$ at the prime ideal corresponding to $\mathfrak{q}$, see Lemma 10.121.6. Hence the localization $S^{\prime}$ of $R_{\mathfrak{p}}^{h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is henselian, see Lemma 10.148.4 As a localization $S^{\prime}$ is a filtered colimit of étale $R_{\mathfrak{p}}^{h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}^{-}}$ algebras. By Lemma 10.148 .22 we see that $S_{\mathfrak{q}}^{h}$ is the henselization of $R_{\mathfrak{p}}^{h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$. Thus $S^{\prime}=S_{\mathfrak{q}}^{h}$ by the uniqueness result of Lemma 10.148.15

05WQ Lemma 10.148.24. Let $R$ be a local ring with henselization $R^{h}$. Let $I \subset \mathfrak{m}_{R}$. Then $R^{h} / I R^{h}$ is the henselization of $R / I$.

Proof. This is a special case of Lemma 10.148 .23

04GT Lemma 10.148.25. Let $\varphi: R \rightarrow S$ be a local map of local rings. Let $S / \mathfrak{m}_{S} \subset \kappa^{\text {sep }}$ be a separable algebraic closure. Let $S \rightarrow S^{\text {sh }}$ be the strict henselization of $S$ with respect to $S / \mathfrak{m}_{S} \subset \kappa^{\text {sep }}$. Let $R \rightarrow A$ be an étale ring map and let $\mathfrak{q}$ be a prime of $A$ lying over $\mathfrak{m}_{R}$. Given any commutative diagram

there exists a unique morphism of rings $f: A \rightarrow S^{s h}$ fitting into the commutative diagram

such that $f^{-1}\left(\mathfrak{m}_{S^{h}}\right)=\mathfrak{q}$ and the induced map $\kappa(\mathfrak{q}) \rightarrow \kappa^{\text {sep }}$ is the given one.
Proof. This is a special case of Lemma 10.148.12.
04GU Lemma 10.148.26. Let $R \rightarrow S$ be a local map of local rings. Choose separable algebraic closures $R / \mathfrak{m}_{R} \subset \kappa_{1}^{\text {sep }}$ and $S / \mathfrak{m}_{S} \subset \kappa_{2}^{\text {sep }}$. Let $R \rightarrow R^{\text {sh }}$ and $S \rightarrow S^{\text {sh }}$ be the corresponding strict henselizations. Given any commutative diagram

There exists a unique local ring map $R^{s h} \rightarrow S^{s h}$ fitting into the commutative diagram

and inducing $\phi$ on the residue fields of $R^{s h}$ and $S^{s h}$.
Proof. Follows immediately from Lemma 10.148.13.
04GW Lemma 10.148.27. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $\kappa(\mathfrak{p}) \subset \kappa^{\text {sep }}$ be a separable algebraic closure. Consider the category of triples ( $S, \mathfrak{q}, \phi$ ) where $R \rightarrow S$ is étale, $\mathfrak{q}$ is a prime lying over $\mathfrak{p}$, and $\phi: \kappa(\mathfrak{q}) \rightarrow \kappa^{\text {sep }}$ is a $\kappa(\mathfrak{p})$-algebra map. This category is filtered and

$$
\left(R_{\mathfrak{p}}\right)^{s h}=\operatorname{colim}_{(S, \mathfrak{q}, \phi)} S=\operatorname{colim}_{(S, \mathfrak{q}, \phi)} S_{\mathfrak{q}}
$$

canonically.
Proof. A morphism of triples $(S, \mathfrak{q}, \phi) \rightarrow\left(S^{\prime}, \mathfrak{q}^{\prime}, \phi^{\prime}\right)$ is given by an $R$-algebra map $\varphi: S \rightarrow S^{\prime}$ such that $\varphi^{-1}\left(\mathfrak{q}^{\prime}\right)=\mathfrak{q}$ and such that $\phi^{\prime} \circ \varphi=\phi$. Let us show that the category of pairs is filtered, see Categories, Definition 4.19.1. The category contains the triple $\left(R, \mathfrak{p}, \kappa(\mathfrak{p}) \subset \kappa^{\text {sep }}\right)$ and hence is not empty, which proves part
(1) of Categories, Definition 4.19.1. Suppose that $(S, \mathfrak{q}, \phi)$ and $\left(S^{\prime}, \mathfrak{q}^{\prime}, \phi^{\prime}\right)$ are two triples. Note that $\mathfrak{q}$, resp. $\mathfrak{q}^{\prime}$ correspond to primes of the fibre rings $S \otimes \kappa(\mathfrak{p})$, resp. $S^{\prime} \otimes \kappa(\mathfrak{p})$ with residue fields finite separable over $\kappa(\mathfrak{p})$ and $\phi$, resp. $\phi^{\prime}$ correspond to maps into $\kappa^{s e p}$. Hence this data corresponds to $\kappa(\mathfrak{p})$-algebra maps

$$
\phi: S \otimes_{R} \kappa(\mathfrak{p}) \longrightarrow \kappa^{s e p}, \quad \phi^{\prime}: S^{\prime} \otimes_{R} \kappa(\mathfrak{p}) \longrightarrow \kappa^{s e p}
$$

Set $S^{\prime \prime}=S \otimes_{R} S^{\prime}$. Combining the maps the above we get a unique $\kappa(\mathfrak{p})$-algebra map

$$
\phi^{\prime \prime}=\phi \otimes \phi^{\prime}: S^{\prime \prime} \otimes_{R} \kappa(\mathfrak{p}) \longrightarrow \kappa^{s e p}
$$

whose kernel corresponds to a prime $\mathfrak{q}^{\prime \prime} \subset S^{\prime \prime}$ lying over $\mathfrak{q}$ and over $\mathfrak{q}^{\prime}$, and whose residue field maps via $\phi^{\prime \prime}$ to the compositum of $\phi(\kappa(\mathfrak{q}))$ and $\phi^{\prime}\left(\kappa\left(\mathfrak{q}^{\prime}\right)\right)$ in $\kappa^{\text {sep }}$. The ring $\operatorname{map} R \rightarrow S^{\prime \prime}$ is étale by Lemma 10.141.3. Hence $\left(S^{\prime \prime}, \mathfrak{q}^{\prime \prime}, \phi^{\prime \prime}\right)$ is a triple dominating both $(S, \mathfrak{q}, \phi)$ and $\left(S^{\prime}, \mathfrak{q}^{\prime}, \phi^{\prime}\right)$. This proves part (2) of Categories, Definition 4.19.1. Next, suppose that $\varphi, \psi:(S, \mathfrak{q}, \phi) \rightarrow\left(S^{\prime}, \mathfrak{q}^{\prime}, \phi^{\prime}\right)$ are two morphisms of pairs. Consider

$$
S^{\prime \prime}=\left(S^{\prime} \otimes_{\varphi, S, \psi} S^{\prime}\right) \otimes_{S^{\prime} \otimes_{R} S^{\prime}} S^{\prime}
$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that $S^{\prime \prime}$ is étale over $R$. The fibre ring of $S^{\prime \prime}$ over $\mathfrak{p}$ is

$$
F^{\prime \prime}=\left(F^{\prime} \otimes_{\varphi, F, \psi} F^{\prime}\right) \otimes_{F^{\prime} \otimes_{\kappa(\mathfrak{p})} F^{\prime}} F^{\prime}
$$

where $F^{\prime}, F$ are the fibre rings of $S^{\prime}$ and $S$. Since $\varphi$ and $\psi$ are morphisms of triples the $\operatorname{map} \phi^{\prime}: F^{\prime} \rightarrow \kappa^{s e p}$ extends to a map $\phi^{\prime \prime}: F^{\prime \prime} \rightarrow \kappa^{s e p}$ which in turn corresponds to a prime ideal $\mathfrak{q}^{\prime \prime} \subset S^{\prime \prime}$. The canonical map $S^{\prime} \rightarrow S^{\prime \prime}$ (using the right most factor for example) is a morphism of triples $\left(S^{\prime}, \mathfrak{q}^{\prime}, \phi^{\prime}\right) \rightarrow\left(S^{\prime \prime}, \mathfrak{q}^{\prime \prime}, \phi^{\prime \prime}\right)$ which equalizes $\varphi$ and $\psi$. This proves part (3) of Categories, Definition 4.19.1. Hence we conclude that the category is filtered.

We still have to show that the colimit $R_{\text {colim }}$ of the system is equal to the strict henselization of $R_{\mathfrak{p}}$ with respect to $\kappa^{\text {sep }}$. To see this note that the system of triples $(S, \mathfrak{q}, \phi)$ contains as a subsystem the pairs $(S, \mathfrak{q})$ of Lemma 10.148.21. Hence $R_{\text {colim }}$ contains $R_{\mathfrak{p}}^{h}$ by the result of that lemma. Moreover, it is clear that $R_{\mathfrak{p}}^{h} \subset R_{\text {colim }}$ is a directed colimit of étale ring extensions. It follows that $R_{\text {colim }}$ is henselian by Lemmas 10.148 .4 and 10.148 .5 . Finally, by Lemma 10.141 .16 we see that the residue field of $R_{\text {colim }}$ is equal to $\kappa^{\text {sep }}$. Hence we conclude that $R_{\text {colim }}$ is strictly henselian and hence equals the strict henselization of $R_{\mathfrak{p}}$ as desired. Some details omitted.

08HV Lemma 10.148.28. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. Choose separable algebraic closures $\kappa(\mathfrak{p}) \subset \kappa_{1}^{\text {sep }}$ and $\kappa(\mathfrak{q}) \subset \kappa_{2}^{\text {sep }}$. Let $R^{\text {sh }}$ and $S^{s h}$ be the corresponding strict henselizations of $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$. Given any commutative diagram

The local ring map $R^{\text {sh }} \rightarrow S^{s h}$ of Lemma 10.148 .26 identifies $S^{s h}$ with the strict henselization of $R^{\text {sh }} \otimes_{R} S$ at a prime lying over $\mathfrak{m}^{\text {sh }}$ and $\mathfrak{q}$.

Proof. The proof is identical to the proof of Lemma 10.148 .22 except that it uses Lemma 10.148.27 instead of Lemma 10.148.21.

05WR Lemma 10.148.29. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{q}$ be a prime of $S$ lying over $\mathfrak{p}$ in $R$. Let $\kappa(\mathfrak{q}) \subset \kappa^{\text {sep }}$ be a separable algebraic closure. Assume $R \rightarrow S$ is quasi-finite at $\mathfrak{q}$. The commutative diagram

of Lemma 10.148 .26 identifies $S_{\mathfrak{q}}^{\text {sh }}$ with a localization of $R_{\mathfrak{p}}^{s h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$.
Proof. The residue field of $R_{\mathfrak{p}}^{s h}$ is the separable algebraic closure of $\kappa(\mathfrak{p})$ in $\kappa^{\text {sep }}$. Note that $R_{\mathfrak{p}}^{s h} \otimes_{R} S$ is quasi-finite over $R_{\mathfrak{p}}^{s h}$ at the prime ideal corresponding to $\mathfrak{q}$, see Lemma 10.121.6. Hence the localization $S^{\prime}$ of $R_{\mathfrak{p}}^{s h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is henselian, see Lemma 10.148.4 Note that the residue field of $S^{\prime}$ is $\kappa^{\text {sep }}$ since it contains both the separable algebraic closure of $\kappa(\mathfrak{p})$ and $\kappa(\mathfrak{q})$. Furthermore, as a localization $S^{\prime}$ is a filtered colimit of étale $R_{\mathfrak{p}}^{s h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$-algebras. By Lemma 10.148 .28 we see that $S_{\mathfrak{q}}^{s h}$ is a strict henselization of $R_{\mathfrak{p}}^{s h} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$. Thus $S^{\prime}=S_{\mathfrak{q}}^{h}$ by the uniqueness result of Lemma 10.148.15.

05WS Lemma 10.148.30. Let $R$ be a local ring with strict henselization $R^{\text {sh }}$. Let $I \subset \mathfrak{m}_{R}$. Then $R^{s h} / I R^{s h}$ is a strict henselization of $R / I$.

Proof. This is a special case of Lemma 10.148.29.
04GX Lemma 10.148.31. Let $\varphi: R \rightarrow S$ be a local homomorphism of strictly henselian local rings. Let $P_{1}, \ldots, P_{n} \in R\left[x_{1}, \ldots, x_{n}\right]$ be polynomials such that $R\left[x_{1}, \ldots, x_{n}\right] /\left(P_{1}, \ldots, P_{n}\right)$ is étale over $R$. Then the map

$$
R^{n} \longrightarrow S^{n}, \quad\left(h_{1}, \ldots, h_{n}\right) \longmapsto\left(\varphi\left(h_{1}\right), \ldots, \varphi\left(h_{n}\right)\right)
$$

induces a bijection between

$$
\left\{\left(r_{1}, \ldots, r_{n}\right) \in R^{n} \mid P_{i}\left(r_{1}, \ldots, r_{n}\right)=0, i=1, \ldots, n\right\}
$$

and

$$
\left\{\left(s_{1}, \ldots, s_{n}\right) \in S^{n} \mid P_{i}^{\prime}\left(s_{1}, \ldots, s_{n}\right)=0, i=1, \ldots, n\right\}
$$

where $P_{i}^{\prime} \in S\left[x_{1}, \ldots, x_{n}\right]$ are the images of the $P_{i}$ under $\varphi$.
Proof. The first solution set is canonically isomorphic to the set

$$
\operatorname{Hom}_{R}\left(R\left[x_{1}, \ldots, x_{n}\right] /\left(P_{1}, \ldots, P_{n}\right), R\right)
$$

As $R$ is henselian the map $R \rightarrow R / \mathfrak{m}_{R}$ induces a bijection between this set and the set of solutions in the residue field $R / \mathfrak{m}_{R}$, see Lemma 10.148.3. The same is true for $S$. Now since $R\left[x_{1}, \ldots, x_{n}\right] /\left(P_{1}, \ldots, P_{n}\right)$ is étale over $R$ and $R / \mathfrak{m}_{R}$ is separably algebraically closed we see that $R / \mathfrak{m}_{R}\left[x_{1}, \ldots, x_{n}\right] /\left(\overline{P_{1}}, \ldots, \overline{P_{n}}\right)$ is a finite product of copies of $R / \mathfrak{m}_{R}$. Hence the tensor product

$$
R / \mathfrak{m}_{R}\left[x_{1}, \ldots, x_{n}\right] /\left(\overline{P_{1}}, \ldots, \overline{P_{n}}\right) \otimes_{R / \mathfrak{m}_{R}} S / \mathfrak{m}_{S}=S / \mathfrak{m}_{S}\left[x_{1}, \ldots, x_{n}\right] /\left(\overline{P_{1}^{\prime}}, \ldots, \overline{P_{n}^{\prime}}\right)
$$

is also a finite product of copies of $S / \mathfrak{m}_{S}$ with the same index set. This proves the lemma.

05D6 Lemma 10.148.32. Let $R$ be a henselian local ring. Any countably generated Mittag-Leffler module over $R$ is a direct sum of finitely presented $R$-modules.

Proof. Let $M$ be a countably generated and Mittag-Leffler $R$-module. We claim that for any element $x \in M$ there exists a direct sum decomposition $M=N \oplus K$ with $x \in N$, the module $N$ finitely presented, and $K$ Mittag-Leffler.

Suppose the claim is true. Choose generators $x_{1}, x_{2}, x_{3}, \ldots$ of $M$. By the claim we can inductively find direct sum decompositions

$$
M=N_{1} \oplus N_{2} \oplus \ldots \oplus N_{n} \oplus K_{n}
$$

with $N_{i}$ finitely presented, $x_{1}, \ldots, x_{n} \in N_{1} \oplus \ldots \oplus N_{n}$, and $K_{n}$ Mittag-Leffler. Repeating ad infinitum we see that $M=\bigoplus N_{i}$.

We still have to prove the claim. Let $x \in M$. By Lemma 10.91 .2 there exists an endomorphism $\alpha: M \rightarrow M$ such that $\alpha$ factors through a finitely presented module, and $\alpha(x)=x$. Say $\alpha$ factors as

$$
M \xrightarrow{\pi} P \xrightarrow{i} M
$$

Set $a=\pi \circ \alpha \circ i: P \rightarrow P$, so $i \circ a \circ \pi=\alpha^{3}$. By Lemma 10.15.2 there exists a monic polynomial $P \in R[T]$ such that $P(a)=0$. Note that this implies formally that $\alpha^{2} P(\alpha)=0$. Hence we may think of $M$ as a module over $R[T] /\left(T^{2} P\right)$. Assume that $x \neq 0$. Then $\alpha(x)=x$ implies that $0=\alpha^{2} P(\alpha) x=P(1) x$ hence $P(1)=0$ in $R / I$ where $I=\{r \in R \mid r x=0\}$ is the annihilator of $x$. As $x \neq 0$ we see $I \subset \mathfrak{m}_{R}$, hence 1 is a root of $\bar{P}=P \bmod \mathfrak{m}_{R} \in R / \mathfrak{m}_{R}[T]$. As $R$ is henselian we can find a factorization

$$
T^{2} P=\left(T^{2} Q_{1}\right) Q_{2}
$$

for some $Q_{1}, Q_{2} \in R[T]$ with $Q_{2}=(T-1)^{e} \bmod \mathfrak{m}_{R} R[T]$ and $Q_{1}(1) \neq 0 \bmod \mathfrak{m}_{R}$, see Lemma 10.148.3. Let $N=\operatorname{Im}\left(\alpha^{2} Q_{1}(\alpha): M \rightarrow M\right)$ and $K=\operatorname{Im}\left(Q_{2}(\alpha)\right.$ : $M \rightarrow M)$. As $T^{2} Q_{1}$ and $Q_{2}$ generate the unit ideal of $R[T]$ we get a direct sum decomposition $M=N \oplus K$. Moreover, $Q_{2}$ acts as zero on $N$ and $T^{2} Q_{1}$ acts as zero on $K$. Note that $N$ is a quotient of $P$ hence is finitely generated. Also $x \in N$ because $\alpha^{2} Q_{1}(\alpha) x=Q_{1}(1) x$ and $Q_{1}(1)$ is a unit in $R$. By Lemma 10.88 .9 the modules $N$ and $K$ are Mittag-Leffler. Finally, the finitely generated module $N$ is finitely presented as a finitely generated Mittag-Leffler module is finitely presented, see Example 10.90.1 part (1).

### 10.149. Serre's criterion for normality

0310 We introduce the following properties of Noetherian rings.
031P Definition 10.149.1. Let $R$ be a Noetherian ring. Let $k \geq 0$ be an integer.
(1) We say $R$ has property $\left(R_{k}\right)$ if for every prime $\mathfrak{p}$ of height $\leq k$ the local ring $R_{\mathfrak{p}}$ is regular. We also say that $R$ is regular in codimension $\leq k$.
(2) We say $R$ has property $\left(S_{k}\right)$ if for every prime $\mathfrak{p}$ the local ring $R_{\mathfrak{p}}$ has depth at least $\min \left\{k, \operatorname{dim}\left(R_{\mathfrak{p}}\right)\right\}$.
(3) Let $M$ be a finite $R$-module. We say $M$ has property $\left(S_{k}\right)$ if for every prime $\mathfrak{p}$ the module $M_{\mathfrak{p}}$ has depth at least $\min \left\{k, \operatorname{dim}\left(\operatorname{Supp}\left(M_{\mathfrak{p}}\right)\right)\right\}$.

Any Noetherian ring has property $\left(S_{0}\right)$ (and so does any finite module over it). Our convention that $\operatorname{dim}(\emptyset)=-\infty$ guarantees that the zero module has property $\left(S_{k}\right)$ for all $k$.

031Q Lemma 10.149.2. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. The following are equivalent:
(1) $M$ has no embedded associated prime, and
(2) $M$ has property $\left(S_{1}\right)$.

Proof. Let $\mathfrak{p}$ be an embedded associated prime of $M$. Then there exists another associated prime $\mathfrak{q}$ of $M$ such that $\mathfrak{p} \supset \mathfrak{q}$. In particular this implies that $\operatorname{dim}\left(\operatorname{Supp}\left(M_{\mathfrak{p}}\right)\right) \geq 1\left(\right.$ since $\mathfrak{q}$ is in the support as well). On the other hand $\mathfrak{p} R_{\mathfrak{p}}$ is associated to $M_{\mathfrak{p}}$ (Lemma 10.62.15) and hence depth $\left(M_{\mathfrak{p}}\right)=0$ (see Lemma 10.62.18). In other words $\left(S_{1}\right)$ does not hold. Conversely, if $\left(S_{1}\right)$ does not hold then there exists a prime $\mathfrak{p}$ such that $\operatorname{dim}\left(\operatorname{Supp}\left(M_{\mathfrak{p}}\right)\right) \geq 1$ and $\operatorname{depth}\left(M_{\mathfrak{p}}\right)=0$. Then we see (arguing backwards using the lemmas cited above) that $\mathfrak{p}$ is an embedded associated prime.

031R Lemma 10.149.3. Let $R$ be a Noetherian ring. The following are equivalent:
(1) $R$ is reduced, and
(2) $R$ has properties $\left(R_{0}\right)$ and $\left(S_{1}\right)$.

Proof. Suppose that $R$ is reduced. Then $R_{\mathfrak{p}}$ is a field for every minimal prime $\mathfrak{p}$ of $R$, according to Lemma 10.24.1. Hence we have $\left(R_{0}\right)$. Let $\mathfrak{p}$ be a prime of height $\geq 1$. Then $A=R_{\mathfrak{p}}$ is a reduced local ring of dimension $\geq 1$. Hence its maximal ideal $\mathfrak{m}$ is not an associated prime since this would mean there exists a $x \in \mathfrak{m}$ with annihilator $\mathfrak{m}$ so $x^{2}=0$. Hence the depth of $A=R_{\mathfrak{p}}$ is at least one, by Lemma 10.62.9. This shows that $\left(S_{1}\right)$ holds.

Conversely, assume that $R$ satisfies $\left(R_{0}\right)$ and $\left(S_{1}\right)$. If $\mathfrak{p}$ is a minimal prime of $R$, then $R_{\mathfrak{p}}$ is a field by $\left(R_{0}\right)$, and hence is reduced. If $\mathfrak{p}$ is not minimal, then we see that $R_{\mathfrak{p}}$ has depth $\geq 1$ by $\left(S_{1}\right)$ and we conclude there exists an element $t \in \mathfrak{p} R_{\mathfrak{p}}$ such that $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}[1 / t]$ is injective. This implies that $R_{\mathfrak{p}}$ is a subring of localizations of $R$ at primes of smaller height. Thus by induction on the height we conclude that $R$ is reduced.

031S Lemma 10.149.4 (Serre's criterion for normality). Let $R$ be a Noetherian ring. The following are equivalent:
(1) $R$ is a normal ring, and
(2) $R$ has properties $\left(R_{1}\right)$ and $\left(S_{2}\right)$.

Proof. Proof of $(1) \Rightarrow(2)$. Assume $R$ is normal, i.e., all localizations $R_{\mathfrak{p}}$ at primes are normal domains. In particular we see that $R$ has $\left(R_{0}\right)$ and $\left(S_{1}\right)$ by Lemma 10.149.3. Hence it suffices to show that a local Noetherian normal domain $R$ of dimension $d$ has depth $\geq \min (2, d)$ and is regular if $d=1$. The assertion if $d=1$ follows from Lemma 10.118 .7

Let $R$ be a local Noetherian normal domain with maximal ideal $\mathfrak{m}$ and dimension $d \geq 2$. Apply Lemma 10.118 .2 to $R$. It is clear that $R$ does not fall into cases (1) or (2) of the lemma. Let $R \rightarrow R^{\prime}$ as in (4) of the lemma. Since $R$ is a domain we have $R \subset R^{\prime}$. Since $\mathfrak{m}$ is not an associated prime of $R^{\prime}$ there exists an $x \in \mathfrak{m}$ which is a nonzerodivisor on $R^{\prime}$. Then $R_{x}=R_{x}^{\prime}$ so $R$ and $R^{\prime}$ are domains with the same fraction field. But finiteness of $R \subset R^{\prime}$ implies every element of $R^{\prime}$ is integral over $R$ (Lemma 10.35.3) and we conclude that $R=R^{\prime}$ as $R$ is normal. This means (4) does not happen. Thus we get the remaining possibility (3), i.e., $\operatorname{depth}(R) \geq 2$ as desired.

Proof of $(2) \Rightarrow(1)$. Assume $R$ satisfies $\left(R_{1}\right)$ and $\left(S_{2}\right)$. By Lemma 10.149.3 we conclude that $R$ is reduced. Hence it suffices to show that if $R$ is a reduced local Noetherian ring of dimension $d$ satisfying $\left(S_{2}\right)$ and $\left(R_{1}\right)$ then $R$ is a normal domain. If $d=0$, the result is clear. If $d=1$, then the result follows from Lemma 10.118.7.

Let $R$ be a reduced local Noetherian ring with maximal ideal $\mathfrak{m}$ and dimension $d \geq 2$ which satisfies $\left(R_{1}\right)$ and $\left(S_{2}\right)$. By Lemma 10.36 .15 it suffices to show that $R$ is integrally closed in its total ring of fractions $Q(R)$. Pick $x \in Q(R)$ which is integral over $R$. Then $R^{\prime}=R[x]$ is a finite ring extension of $R$ (Lemma 10.35.5). Because $\operatorname{dim}\left(R_{\mathfrak{p}}\right)<d$ for every nonmaximal prime $\mathfrak{p} \subset R$ we have $R_{\mathfrak{p}}=R_{\mathfrak{p}}^{\prime}$ by induction. Hence the support of $R^{\prime} / R$ is $\{\mathfrak{m}\}$. It follows that $R^{\prime} / R$ is annihilated by a power of $\mathfrak{m}$ (Lemma 10.61.4). By Lemma 10.118 .2 this contradicts the assumption that the depth of $R$ is $\geq 2=\min (2, d)$ and the proof is complete.

0567 Lemma 10.149.5. A regular ring is normal.
Proof. Let $R$ be a regular ring. By Lemma 10.149 .4 it suffices to prove that $R$ is $\left(R_{1}\right)$ and $\left(S_{2}\right)$. As a regular local ring is Cohen-Macaulay, see Lemma 10.105.3 it is clear that $R$ is $\left(S_{2}\right)$. Property $\left(R_{1}\right)$ is immediate.

031T Lemma 10.149.6. Let $R$ be a Noetherian normal domain with fraction field $K$. Then
(1) for any nonzero $a \in R$ the quotient $R / a R$ has no embedded primes, and all its associated primes have height 1
(2)

$$
R=\bigcap_{h e i g h t(\mathfrak{p})=1} R_{\mathfrak{p}}
$$

(3) For any nonzero $x \in K$ the quotient $R /(R \cap x R)$ has no embedded primes, and all its associates primes have height 1.

Proof. By Lemma 10.149.4 we see that $R$ has $\left(S_{2}\right)$. Hence for any nonzero element $a \in R$ we see that $R / a R$ has $\left(S_{1}\right)$ (use Lemma 10.71 .6 for example) Hence $R / a R$ has no embedded primes (Lemma 10.149.2). We conclude the associated primes of $R / a R$ are exactly the minimal primes $\mathfrak{p}$ over $(a)$, which have height 1 as $a$ is not zero (Lemma 10.59.10). This proves (1).

Thus, given $b \in R$ we have $b \in a R$ if and only if $b \in a R_{\mathfrak{p}}$ for every minimal prime $\mathfrak{p}$ over ( $a$ ) (see Lemma 10.62 .19 . These primes all have height 1 as seen above so $b / a \in R$ if and only if $b / a \in R_{\mathfrak{p}}$ for all height 1 primes. Hence (2) holds.

For (3) write $x=a / b$. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{r}$ be the minimal primes over ( $a b$ ). These all have height 1 by the above. Then we see that $R \cap x R=\bigcap_{i=1, \ldots, r}\left(R \cap x R_{\mathfrak{p}_{i}}\right)$ by part (2) of the lemma. Hence $R /(R \cap x R)$ is a submodule of $\bigoplus R /\left(R \cap x R_{\mathfrak{p}_{i}}\right)$. As $R_{\mathfrak{p}_{i}}$ is a discrete valuation ring (by property $\left(R_{1}\right)$ for the Noetherian normal domain $R$, see Lemma 10.149.4 we have $x R_{\mathfrak{p}_{i}}=\mathfrak{p}_{i}^{e_{i}} R_{\mathfrak{p}_{i}}$ for some $e_{i} \in \mathbf{Z}$. Hence the direct sum is equal to $\bigoplus_{e_{i}>0} R / \mathfrak{p}_{i}^{\left(e_{i}\right)}$, see Definition 10.63.1. By Lemma 10.63.2 the only associated prime of the module $R / \mathfrak{p}^{(n)}$ is $\mathfrak{p}$. Hence the set of associate primes of $R /(R \cap x R)$ is a subset of $\left\{\mathfrak{p}_{i}\right\}$ and there are no inclusion relations among them. This proves (3).

### 10.150. Formal smoothness of fields

031 U In this section we show that field extensions are formally smooth if and only if they are separable. However, we first prove finitely generated field extensions are separable algebraic if and only if they are formally unramified.
090W Lemma 10.150.1. Let $k \subset K$ be a finitely generated field extension. The following are equivalent
(1) $K$ is a finite separable field extension of $k$,
(2) $\Omega_{K / k}=0$,
(3) $K$ is formally unramified over $k$,
(4) $K$ is unramified over $k$,
(5) $K$ is formally étale over $k$,
(6) $K$ is étale over $k$.

Proof. The equivalence of (2) and (3) is Lemma 10.144.2. By Lemma 10.141.4 we see that (1) is equivalent to (6). Property (6) implies (5) and (4) which both in turn imply (3) (Lemmas 10.146.2, 10.147.3, and 10.147.2. Thus it suffices to show that (2) implies (1). Choose a finitely generated $k$-subalgebra $A \subset K$ such that $K$ is the fraction field of the domain $A$. Set $S=A \backslash\{0\}$. Since $0=\Omega_{K / k}=S^{-1} \Omega_{A / k}$ (Lemma 10.130.8) and since $\Omega_{A / k}$ is finitely generated (Lemma 10.130.16), we can replace $A$ by a localization $A_{f}$ to reduce to the case that $\Omega_{A / k}=0$ (details omitted). Then $A$ is unramified over $k$, hence $K / k$ is finite separable for example by Lemma 10.147.5 applied with $\mathfrak{q}=(0)$.

031W Lemma 10.150.2. Let $K$ be a field of characteristic $p>0$. Let $a \in K$. Then $d a=0$ in $\Omega_{K / \mathbf{F}_{p}}$ if and only if $a$ is a pth power.
Proof. By Lemma 10.130 .4 we see that there exists a subfield $\mathbf{F}_{p} \subset L \subset K$ such that $\mathbf{F}_{p} \subset L$ is a finitely generated field extension and such that $\mathrm{d} a$ is zero in $\Omega_{L / \mathbf{F}_{p}}$. Hence we may assume that $K$ is a finitely generated field extension of $\mathbf{F}_{p}$.
Choose a transcendence basis $x_{1}, \ldots, x_{r} \in K$ such that $K$ is finite separable over $\mathbf{F}_{p}\left(x_{1}, \ldots, x_{r}\right)$. We remark that the result holds for the purely transcendental subfield $\mathbf{F}_{p}\left(x_{1}, \ldots, x_{r}\right) \subset K$. Namely,

$$
\Omega_{\mathbf{F}_{p}\left(x_{1}, \ldots, x_{r}\right) / \mathbf{F}_{p}}=\bigoplus_{i=1}^{r} \mathbf{F}_{p}\left(x_{1}, \ldots, x_{r}\right) \mathrm{d} x_{i}
$$

and any rational function all of whose partial derivatives are zero is a $p$ th power. Moreover, we also have

$$
\Omega_{K / \mathbf{F}_{p}}=\bigoplus_{i=1}^{r} K \mathrm{~d} x_{i}
$$

since $\mathbf{F}_{p}\left(x_{1}, \ldots, x_{r}\right) \subset K$ is finite separable (computation omitted). Suppose $a \in K$ is an element such that $\mathrm{d} a=0$ in the module of differentials. By our choice of $x_{i}$ we see that the minimal polynomial $P(T) \in k\left(x_{1}, \ldots, x_{r}\right)[T]$ of $a$ is separable. Write

$$
P(T)=T^{d}+\sum_{i=1}^{d} a_{i} T^{d-i}
$$

and hence

$$
0=\mathrm{d} P(a)=\sum_{i=1}^{d} a^{d-i} \mathrm{~d} a_{i}
$$

in $\Omega_{K / \mathbf{F}_{p}}$. By the description of $\Omega_{K / \mathbf{F}_{p}}$ above and the fact that $P$ was the minimal polynomial of $a$, we see that this implies $\mathrm{d} a_{i}=0$. Hence $a_{i}=b_{i}^{p}$ for each $i$. Therefore by Fields, Lemma 9.27 .2 we see that $a$ is a $p$ th power.

07DZ Lemma 10.150.3. Let $k$ be a field of characteristic $p>0$. Let $a_{1}, \ldots, a_{n} \in k$ be elements such that $d a_{1}, \ldots, d a_{n}$ are linearly independent in $\Omega_{k / \mathbf{F}_{p}}$. Then the field extension $k\left(a_{1}^{1 / p}, \ldots, a_{n}^{1 / p}\right)$ has degree $p^{n}$ over $k$.

Proof. By induction on $n$. If $n=1$ the result is Lemma 10.150.2. For the induction step, suppose that $k\left(a_{1}^{1 / p}, \ldots, a_{n-1}^{1 / p}\right)$ has degree $p^{n-1}$ over $k$. We have to show that $a_{n}$ does not map to a $p$ th power in $k\left(a_{1}^{1 / p}, \ldots, a_{n-1}^{1 / p}\right)$. If it does then we can write

$$
\begin{aligned}
a_{n} & =\left(\sum_{I=\left(i_{1}, \ldots, i_{n-1}\right), 0 \leq i_{j} \leq p-1} \lambda_{I} a_{1}^{i_{1} / p} \ldots a_{n-1}^{i_{n-1} / p}\right)^{p} \\
& =\sum_{I=\left(i_{1}, \ldots, i_{n-1}\right), 0 \leq i_{j} \leq p-1} \lambda_{I}^{p} a_{1}^{i_{1}} \ldots a_{n-1}^{i_{n-1}}
\end{aligned}
$$

Applying d we see that $\mathrm{d} a_{n}$ is linearly dependent on $\mathrm{d} a_{i}, i<n$. This is a contradiction.
031X Lemma 10.150.4. Let $k$ be a field of characteristic $p>0$. The following are equivalent:
(1) the field extension $K / k$ is separable (see Definition 10.41.1), and
(2) the map $K \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{K / \mathbf{F}_{p}}$ is injective.

Proof. Write $K$ as a directed colimit $K=\operatorname{colim}_{i} K_{i}$ of finitely generated field extensions $k \subset K_{i}$. By definition $K$ is separable if and only if each $K_{i}$ is separable over $k$, and by Lemma 10.130 .4 we see that $K \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{K / \mathbf{F}_{p}}$ is injective if and only if each $K_{i} \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{K_{i} / \mathbf{F}_{p}}$ is injective. Hence we may assume that $K / k$ is a finitely generated field extension.

Assume $k \subset K$ is a finitely generated field extension which is separable. Choose $x_{1}, \ldots, x_{r+1} \in K$ as in Lemma 10.41.3. In this case there exists an irreducible polynomial $G\left(X_{1}, \ldots, X_{r+1}\right) \in k\left[X_{1}, \ldots, X_{r+1}\right]$ such that $G\left(x_{1}, \ldots, x_{r+1}\right)=0$ and such that $\partial G / \partial X_{r+1}$ is not identically zero. Moreover $K$ is the field of fractions of the domain. $S=K\left[X_{1}, \ldots, X_{r+1}\right] /(G)$. Write

$$
G=\sum a_{I} X^{I}, \quad X^{I}=X_{1}^{i_{1}} \ldots X_{r+1}^{i_{r+1}}
$$

Using the presentation of $S$ above we see that

$$
\Omega_{S / \mathbf{F}_{p}}=\frac{S \otimes_{k} \Omega_{k} \oplus \bigoplus_{i=1, \ldots, r+1} S \mathrm{~d} X_{i}}{\left\langle\sum X^{I} \mathrm{~d} a_{I}+\sum \partial G / \partial X_{i} \mathrm{~d} X_{i}\right\rangle}
$$

Since $\Omega_{K / \mathbf{F}_{p}}$ is the localization of the $S$-module $\Omega_{S / \mathbf{F}_{p}}$ (see Lemma 10.130.8 we conclude that

$$
\Omega_{K / \mathbf{F}_{p}}=\frac{K \otimes_{k} \Omega_{k} \oplus \bigoplus_{i=1, \ldots, r+1} K \mathrm{~d} X_{i}}{\left\langle\sum X^{I} \mathrm{~d} a_{I}+\sum \partial G / \partial X_{i} \mathrm{~d} X_{i}\right\rangle}
$$

Now, since the polynomial $\partial G / \partial X_{r+1}$ is not identically zero we conclude that the $\operatorname{map} K \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{S / \mathbf{F}_{p}}$ is injective as desired.
Assume $k \subset K$ is a finitely generated field extension and that $K \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{K / \mathbf{F}_{p}}$ is injective. (This part of the proof is the same as the argument proving Lemma 10.43.1.) Let $x_{1}, \ldots, x_{r}$ be a transcendence basis of $K$ over $k$ such that the degree of inseparability of the finite extension $k\left(x_{1}, \ldots, x_{r}\right) \subset K$ is minimal. If $K$ is separable over $k\left(x_{1}, \ldots, x_{r}\right)$ then we win. Assume this is not the case to get a contradiction. Then there exists an element $\alpha \in K$ which is not separable over $k\left(x_{1}, \ldots, x_{r}\right)$. Let $P(T) \in k\left(x_{1}, \ldots, x_{r}\right)[T]$ be its minimal polynomial. Because $\alpha$
is not separable actually $P$ is a polynomial in $T^{p}$. Clear denominators to get an irreducible polynomial

$$
G\left(X_{1}, \ldots, X_{r}, T\right)=\sum a_{I, i} X^{I} T^{i} \in k\left[X_{1}, \ldots, X_{r}, T\right]
$$

such that $G\left(x_{1}, \ldots, x_{r}, \alpha\right)=0$ in $L$. Note that this means $k\left[X_{1}, \ldots, X_{r}, T\right] /(G) \subset$ $L$. We may assume that for some pair $\left(I_{0}, i_{0}\right)$ the coefficient $a_{I_{0}, i_{0}}=1$. We claim that $\mathrm{d} G / \mathrm{d} X_{i}$ is not identically zero for at least one $i$. Namely, if this is not the case, then $G$ is actually a polynomial in $X_{1}^{p}, \ldots, X_{r}^{p}, T^{p}$. Then this means that

$$
\sum_{(I, i) \neq\left(I_{0}, i_{0}\right)} x^{I} \alpha^{i} \mathrm{~d} a_{I, i}
$$

is zero in $\Omega_{K / \mathbf{F}_{p}}$. Note that there is no $k$-linear relation among the elements

$$
\left\{x^{I} \alpha^{i} \mid a_{I, i} \neq 0 \text { and }(I, i) \neq\left(I_{0}, i_{0}\right)\right\}
$$

of $K$. Hence the assumption that $K \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{K / \mathbf{F}_{p}}$ is injective this implies that $\mathrm{d} a_{I, i}=0$ in $\Omega_{k / \mathbf{F}_{p}}$ for all $(I, i)$. By Lemma 10.150 .2 we see that each $a_{I, i}$ is a $p$ th power, which implies that $G$ is a $p$ th power contradicting the irreducibility of $G$. Thus, after renumbering, we may assume that $\mathrm{d} G / \mathrm{d} X_{1}$ is not zero. Then we see that $x_{1}$ is separably algebraic over $k\left(x_{2}, \ldots, x_{r}, \alpha\right)$, and that $x_{2}, \ldots, x_{r}, \alpha$ is a transcendence basis of $L$ over $k$. This means that the degree of inseparability of the finite extension $k\left(x_{2}, \ldots, x_{r}, \alpha\right) \subset L$ is less than the degree of inseparability of the finite extension $k\left(x_{1}, \ldots, x_{r}\right) \subset L$, which is a contradiction.

031Y Lemma 10.150.5. Let $k \subset K$ be an extension of fields. If $K$ is formally smooth over $k$, then $K$ is a separable extension of $k$.

Proof. Assume $K$ is formally smooth over $k$. By Lemma 10.136 .9 we see that $K \otimes_{k}$ $\Omega_{k / \mathbf{Z}} \rightarrow \Omega_{K / \mathbf{Z}}$ is injective. Hence $K$ is separable over $k$ by Lemma 10.150.4.

031Z Lemma 10.150.6. Let $k \subset K$ be an extension of fields. Then $K$ is formally smooth over $k$ if and only if $H_{1}\left(L_{K / k}\right)=0$.

Proof. This follows from Proposition 10.136 .8 and the fact that a vector spaces is free (hence projective).

0320 Lemma 10.150.7. Let $k \subset K$ be an extension of fields.
(1) If $K$ is purely transcendental over $k$, then $K$ is formally smooth over $k$.
(2) If $K$ is separable algebraic over $k$, then $K$ is formally smooth over $k$.
(3) If $K$ is separable over $k$, then $K$ is formally smooth over $k$.

Proof. For (1) write $K=k\left(x_{j} ; j \in J\right)$. Suppose that $A$ is a $k$-algebra, and $I \subset A$ is an ideal of square zero. Let $\varphi: K \rightarrow A / I$ be a $k$-algebra map. Let $a_{j} \in A$ be an element such that $a_{j} \bmod I=\varphi\left(x_{j}\right)$. Then it is easy to see that there is a unique $k$-algebra map $K \rightarrow A$ which maps $x_{j}$ to $a_{j}$ and which reduces to $\varphi \bmod I$. Hence $k \subset K$ is formally smooth.

In case (2) we see that $k \subset K$ is a colimit of étale ring extensions. An étale ring map is formally étale (Lemma 10.146.2). Hence this case follows from Lemma 10.146.3 and the trivial observation that a formally étale ring map is formally smooth.
In case (3), write $K=\operatorname{colim} K_{i}$ as the filtered colimit of its finitely generated sub $k$-extensions. By Definition 10.41 .1 each $K_{i}$ is separable algebraic over a purely transcendental extension of $k$. Hence $K_{i} / k$ is formally smooth by cases (1) and (2)
and Lemma 10.136.3. Thus $H_{1}\left(L_{K_{i} / k}\right)=0$ by Lemma 10.150.6. Hence $H_{1}\left(L_{K / k}\right)=$ 0 by Lemma 10.132.9. Hence $K / k$ is formally smooth by Lemma 10.150.6 again.
0321 Lemma 10.150.8. Let $k$ be a field.
(1) If the characteristic of $k$ is zero, then any extension field of $k$ is formally smooth over $k$.
(2) If the characteristic of $k$ is $p>0$, then $k \subset K$ is formally smooth if and only if it is a separable field extension.
Proof. Combine Lemmas 10.150 .5 and 10.150 .7 .
Here we put together all the different characterizations of separable field extensions.
0322 Proposition 10.150.9. Let $k \subset K$ be a field extension. If the characteristic of $k$ is zero then
(1) $K$ is separable over $k$,
(2) $K$ is geometrically reduced over $k$,
(3) $K$ is formally smooth over $k$,
(4) $H_{1}\left(L_{K / k}\right)=0$, and
(5) the map $K \otimes_{k} \Omega_{k / \mathbf{Z}} \rightarrow \Omega_{K / \mathbf{Z}}$ is injective.

If the characteristic of $k$ is $p>0$, then the following are equivalent:
(1) $K$ is separable over $k$,
(2) the ring $K \otimes_{k} k^{1 / p}$ is reduced,
(3) $K$ is geometrically reduced over $k$,
(4) the map $K \otimes_{k} \Omega_{k / \mathbf{F}_{p}} \rightarrow \Omega_{K / \mathbf{F}_{p}}$ is injective,
(5) $H_{1}\left(L_{K / k}\right)=0$, and
(6) $K$ is formally smooth over $k$.

Proof. This is a combination of Lemmas 10.43.1, 10.150.8 10.150.5 and 10.150.4

Here is yet another characterization of finitely generated separable field extensions.
037X Lemma 10.150.10. Let $k \subset K$ be a finitely generated field extension. Then $K$ is separable over $k$ if and only if $K$ is the localization of a smooth $k$-algebra.

Proof. Choose a finite type $k$-algebra $R$ which is a domain whose fraction field is $K$. Lemma 10.138 .9 says that $k \rightarrow R$ is smooth at (0) if and only if $K / k$ is separable. This proves the lemma.
07BV Lemma 10.150.11. Let $k \subset K$ be a field extension. Then $K$ is a filtered colimit of global complete intersection algebras over $k$. If $K / k$ is separable, then $K$ is a filtered colimit of smooth algebras over $k$.

Proof. Suppose that $E \subset K$ is a finite subset. It suffices to show that there exists a $k$ subalgebra $A \subset K$ which contains $E$ and which is a global complete intersection (resp. smooth) over $k$. The separable/smooth case follows from Lemma 10.150.10. In general let $L \subset K$ be the subfield generated by $E$. Pick a transcendence basis $x_{1}, \ldots, x_{d} \in L$ over $k$. The extension $k\left(x_{1}, \ldots, x_{d}\right) \subset L$ is finite. Say $L=$ $k\left(x_{1}, \ldots, x_{d}\right)\left[y_{1}, \ldots, y_{r}\right]$. Pick inductively polynomials $P_{i} \in k\left(x_{1}, \ldots, x_{d}\right)\left[Y_{1}, \ldots, Y_{r}\right]$ such that $P_{i}=P_{i}\left(Y_{1}, \ldots, Y_{i}\right)$ is monic in $Y_{i}$ over $k\left(x_{1}, \ldots, x_{d}\right)\left[Y_{1}, \ldots, Y_{i-1}\right]$ and maps to the minimum polynomial of $y_{i}$ in $k\left(x_{1}, \ldots, x_{d}\right)\left[y_{1}, \ldots, y_{i-1}\right]\left[Y_{i}\right]$. Then it is clear that $P_{1}, \ldots, P_{r}$ is a regular sequence in $k\left(x_{1}, \ldots, x_{r}\right)\left[Y_{1}, \ldots, Y_{r}\right]$ and that $L=$
$k\left(x_{1}, \ldots, x_{r}\right)\left[Y_{1}, \ldots, Y_{r}\right] /\left(P_{1}, \ldots, P_{r}\right)$. If $h \in k\left[x_{1}, \ldots, x_{d}\right]$ is a polynomial such that $P_{i} \in k\left[x_{1}, \ldots, x_{d}, 1 / h, Y_{1}, \ldots, Y_{r}\right]$, then we see that $P_{1}, \ldots, P_{r}$ is a regular sequence in $k\left[x_{1}, \ldots, x_{d}, 1 / h, Y_{1}, \ldots, Y_{r}\right]$ and $A=k\left[x_{1}, \ldots, x_{d}, 1 / h, Y_{1}, \ldots, Y_{r}\right] /\left(P_{1}, \ldots, P_{r}\right)$ is a global complete intersection. After adjusting our choice of $h$ we may assume $E \subset A$ and we win.

### 10.151. Constructing flat ring maps

03C2 The following lemma is occasionally useful.
03C3 Lemma 10.151.1. Let $(R, \mathfrak{m}, k)$ be a local ring. Let $k \subset K$ be a field extension. There exists a local ring $\left(R^{\prime}, \mathfrak{m}^{\prime}, k^{\prime}\right)$, a flat local ring map $R \rightarrow R^{\prime}$ such that $\mathfrak{m}^{\prime}=$ $\mathfrak{m} R^{\prime}$ and such that $k \subset k^{\prime}$ is isomorphic to $k \subset K$.

Proof. Suppose that $k \subset k^{\prime}=k(\alpha)$ is a monogenic extension of fields. Then $k^{\prime}$ is the residue field of a flat local extension $R \subset R^{\prime}$ as in the lemma. Namely, if $\alpha$ is transcendental over $k$, then we let $R^{\prime}$ be the localization of $R[x]$ at the prime $\mathfrak{m} R[x]$. If $\alpha$ is algebraic with minimal polynomial $T^{d}+\sum \bar{\lambda}_{i} T^{d-i}$, then we let $R^{\prime}=R[T] /\left(T^{d}+\sum \lambda_{i} T^{d-i}\right)$.
Consider the collection of triples $\left(k^{\prime}, R \rightarrow R^{\prime}, \phi\right)$, where $k \subset k^{\prime} \subset K$ is a subfield, $R \rightarrow R^{\prime}$ is a local ring map as in the lemma, and $\phi: R^{\prime} \rightarrow k^{\prime}$ induces an isomorphism $R^{\prime} / \mathfrak{m} R^{\prime} \cong k^{\prime}$ of $k$-extensions. These form a "big" category $\mathcal{C}$ with morphisms $\left(k_{1}, R_{1}, \phi_{1}\right) \rightarrow\left(k_{2}, R_{2}, \phi_{2}\right)$ given by ring maps $\psi: R_{1} \rightarrow R_{2}$ such that

commutes. This implies that $k_{1} \subset k_{2}$.
Suppose that $I$ is a directed partially ordered set, and $\left(\left(R_{i}, k_{i}, \phi_{i}\right), \psi_{i i^{\prime}}\right)$ is a system over $I$, see Categories, Section 4.21. In this case we can consider

$$
R^{\prime}=\operatorname{colim}_{i \in I} R_{i}
$$

This is a local ring with maximal ideal $\mathfrak{m} R^{\prime}$, and residue field $k^{\prime}=\bigcup_{i \in I} k_{i}$. Moreover, the ring map $R \rightarrow R^{\prime}$ is flat as it is a colimit of flat maps (and tensor products commute with directed colimits). Hence we see that ( $R^{\prime}, k^{\prime}, \phi^{\prime}$ ) is an "upper bound" for the system.
An almost trivial application of Zorn's Lemma would finish the proof if $\mathcal{C}$ was a set, but it isn't. (Actually, you can make this work by finding a reasonable bound on the cardinals of the local rings occurring.) To get around this problem we choose a well ordering on $K$. For $x \in K$ we let $K(x)$ be the subfield of $K$ generated by all elements of $K$ which are $\leq x$. By transfinite induction on $x \in K$ we will produce ring maps $R \subset R(x)$ as in the lemma with residue field extension $k \subset K(x)$. Moreover, by construction we will have that $R(x)$ will contain $R(y)$ for all $y \leq x$. Namely, if $x$ has a predecessor $x^{\prime}$, then $K(x)=K\left(x^{\prime}\right)[x]$ and hence we can let $R\left(x^{\prime}\right) \subset R(x)$ be the local ring extension constructed in the first paragraph of the proof. If $x$ does not have a predecessor, then we first set $R^{\prime}(x)=\operatorname{colim}_{x^{\prime}<x} R\left(x^{\prime}\right)$ as in the third paragraph of the proof. The residue field of $R^{\prime}(x)$ is $K^{\prime}(x)=\bigcup_{x^{\prime}<x} K\left(x^{\prime}\right)$. Since $K(x)=K^{\prime}(x)[x]$ we see that we can use the construction of the first paragraph of the proof to produce $R^{\prime}(x) \subset R(x)$. This finishes the proof of the lemma.

09E0 Lemma 10.151.2. Let $(R, \mathfrak{m}, k)$ be a local ring. If $k \subset K$ is a separable algebraic extension, then there exists a directed partially ordered set $I$ and a system of finite étale extensions $R \subset R_{i}, i \in I$ of local rings such that $R^{\prime}=\operatorname{colim} R_{i}$ has residue field $K$ (as extension of $k$ ).

Proof. Let $R \subset R^{\prime}$ be the extension constructed in the proof of Lemma 10.151.1. By construction $R^{\prime}=\operatorname{colim}_{\alpha \in A} R_{\alpha}$ where $A$ is a well-ordered set and the transition maps $R_{\alpha} \rightarrow R_{\alpha+1}$ are finite étale and $R_{\alpha}=\operatorname{colim}_{\beta<\alpha} R_{\beta}$ if $\alpha$ is not a successor. We will prove the result by transfinite induction.

Suppose the result holds for $R_{\alpha}$, i.e., $R_{\alpha}=\operatorname{colim} R_{i}$ with $R_{i}$ finite étale over $R$. Since $R_{\alpha} \rightarrow R_{\alpha+1}$ is finite étale there exists an $i$ and a finite étale extension $R_{i} \rightarrow R_{i, 1}$ such that $R_{\alpha+1}=R_{\alpha} \otimes_{R_{i}} R_{i, 1}$. Thus $R_{\alpha+1}=\operatorname{colim}_{i^{\prime} \geq i} R_{i^{\prime}} \otimes_{R_{i}} R_{i, 1}$ and the result holds for $\alpha+1$. Suppose $\alpha$ is not a successor and the result holds for $R_{\beta}$ for all $\beta<\alpha$. Since every finite subset $E \subset R_{\alpha}$ is contained in $R_{\beta}$ for some $\beta<\alpha$ and we see that $E$ is contained in a finite étale subextension by assumption. Thus the result holds for $R_{\alpha}$.

07NE Lemma 10.151.3. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime and let $\kappa(\mathfrak{p}) \subset L$ be a finite extension of fields. Then there exists a finite free ring map $R \rightarrow S$ such that $\mathfrak{q}=\mathfrak{p} S$ is prime and $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is isomorphic to the given extension $\kappa(\mathfrak{p}) \subset L$.

Proof. By induction of the degree of $\kappa(\mathfrak{p}) \subset L$. If the degree is 1 , then we take $R=S$. In general, if there exists a sub extension $\kappa(\mathfrak{p}) \subset L^{\prime} \subset L$ then we win by induction on the degree (by first constructing $R \subset S^{\prime}$ corresponding to $L^{\prime} / \kappa(\mathfrak{p})$ and then construction $S^{\prime} \subset S$ corresponding to $L / L^{\prime}$ ). Thus we may assume that $L \supset \kappa(\mathfrak{p})$ is generated by a single element $\alpha \in L$. Let $X^{d}+\sum_{i<d} a_{i} X^{i}$ be the minimal polynomial of $\alpha$ over $\kappa(\mathfrak{p})$, so $a_{i} \in \kappa(\mathfrak{p})$. We may write $a_{i}$ as the image of $f_{i} / g$ for some $f_{i}, g \in R$ and $g \notin \mathfrak{p}$. After replacing $\alpha$ by $g \alpha$ (and correspondingly replacing $a_{i}$ by $g^{d-i} a_{i}$ ) we may assume that $a_{i}$ is the image of some $f_{i} \in R$. Then we simply take $S=R[x] /\left(x^{d}+\sum f_{i} x^{i}\right)$.

### 10.152. The Cohen structure theorem

0323 Here is a fundamental notion in commutative algebra.
0324 Definition 10.152.1. Let $(R, \mathfrak{m})$ be a local ring. We say $R$ is a complete local ring if the canonical map

$$
R \longrightarrow \lim _{n} R / \mathfrak{m}^{n}
$$

to the completion of $R$ with respect to $\mathfrak{m}$ is an isomorphism ${ }^{10}$
Note that an Artinian local ring $R$ is a complete local ring because $\mathfrak{m}_{R}^{n}=0$ for some $n>0$. In this section we mostly focus on Noetherian complete local rings.

0325 Lemma 10.152.2. Let $R$ be a Noetherian complete local ring. Any quotient of $R$ is also a Noetherian complete local ring. Given a finite ring map $R \rightarrow S$, then $S$ is a product of Noetherian complete local rings.

[^26]Proof. The ring $S$ is Noetherian by Lemma 10.30.1. As an $R$-module $S$ is complete by Lemma 10.96.1. Hence $S$ is the product of the completions at its maximal ideals by Lemma 10.96.8.

032B Lemma 10.152.3. Let $(R, \mathfrak{m})$ be a complete local ring. If $\mathfrak{m}$ is a finitely generated ideal then $R$ is Noetherian.

Proof. See Lemma 10.96 .5
0326 Definition 10.152.4. Let $(R, \mathfrak{m})$ be a complete local ring. A subring $\Lambda \subset R$ is called a coefficient ring if the following conditions hold:
(1) $\Lambda$ is a complete local ring with maximal ideal $\Lambda \cap \mathfrak{m}$,
(2) the residue field of $\Lambda$ maps isomorphically to the residue field of $R$, and
(3) $\Lambda \cap \mathfrak{m}=p \Lambda$, where $p$ is the characteristic of the residue field of $R$.

Let us make some remarks on this definition. We split the discussion into the following cases:
(1) The local ring $R$ contains a field. This happens if either $\mathbf{Q} \subset R$, or $p R=0$ where $p$ is the characteristic of $R / \mathfrak{m}$. In this case a coefficient ring $\Lambda$ is a field contained in $R$ which maps isomorphically to $R / \mathfrak{m}$.
(2) The characteristic of $R / \mathfrak{m}$ is $p>0$ but no power of $p$ is zero in $R$. In this case $\Lambda$ is a complete discrete valuation ring with uniformizer $p$ and residue field $R / \mathfrak{m}$.
(3) The characteristic of $R / \mathfrak{m}$ is $p>0$, and for some $n>1$ we have $p^{n-1} \neq 0$, $p^{n}=0$ in $R$. In this case $\Lambda$ is an Artinian local ring whose maximal ideal is generated by $p$ and which has residue field $R / \mathfrak{m}$.
The complete discrete valuation rings with uniformizer $p$ above play a special role and we baptize them as follows.

0327 Definition 10.152.5. A Cohen ring is a complete discrete valuation ring with uniformizer $p$ a prime number.

0328 Lemma 10.152.6. Let $p$ be a prime number. Let $k$ be a field of characteristic $p$. There exists a Cohen ring $\Lambda$ with $\Lambda / p \Lambda \cong k$.

Proof. First note that the $p$-adic integers $\mathbf{Z}_{p}$ form a Cohen ring for $\mathbf{F}_{p}$. Let $k$ be an arbitrary field of characteristic $p$. Let $\mathbf{Z}_{p} \rightarrow R$ be a flat local ring map such that $\mathfrak{m}_{R}=p R$ and $R / p R=k$, see Lemma 10.151.1. Then clearly $R$ is a discrete valuation ring. Hence its completion is a Cohen ring for $k$.

0329 Lemma 10.152.7. Let $p>0$ be a prime. Let $\Lambda$ be a Cohen ring with residue field of characteristic $p$. For every $n \geq 1$ the ring map

$$
\mathbf{Z} / p^{n} \mathbf{Z} \rightarrow \Lambda / p^{n} \Lambda
$$

is formally smooth.
Proof. If $n=1$, this follows from Proposition 10.150 .9 . For general $n$ we argue by induction on $n$. Namely, if $\mathbf{Z} / p^{n} \mathbf{Z} \rightarrow \Lambda / p^{n} \Lambda$ is formally smooth, then we can apply Lemma 10.136 .12 to the ring map $\mathbf{Z} / p^{n+1} \mathbf{Z} \rightarrow \Lambda / p^{n+1} \Lambda$ and the ideal $I=\left(p^{n}\right) \subset \mathbf{Z} / p^{n+1} \mathbf{Z}$.

032A Theorem 10.152.8 (Cohen structure theorem). Let $(R, \mathfrak{m})$ be a complete local ring.
(1) $R$ has a coefficient ring (see Definition 10.152.4),
(2) if $\mathfrak{m}$ is a finitely generated ideal, then $R$ is isomorphic to a quotient

$$
\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] / I
$$

where $\Lambda$ is either a field or a Cohen ring.
Proof. Let us prove a coefficient ring exists. First we prove this in case the characteristic of the residue field $\kappa$ is zero. Namely, in this case we will prove by induction on $n>0$ that there exists a section

$$
\varphi_{n}: \kappa \longrightarrow R / \mathfrak{m}^{n}
$$

to the canonical map $R / \mathfrak{m}^{n} \rightarrow \kappa=R / \mathfrak{m}$. This is trivial for $n=1$. If $n>1$, let $\varphi_{n-1}$ be given. The field extension $\mathbf{Q} \subset \kappa$ is formally smooth by Proposition 10.150 .9 . Hence we can find the dotted arrow in the following diagram

This proves the induction step. Putting these maps together

$$
\lim _{n} \varphi_{n}: \kappa \longrightarrow R=\lim _{n} R / \mathfrak{m}^{n}
$$

gives a map whose image is the desired coefficient ring.
Next, we prove the existence of a coefficient ring in the case where the characteristic of the residue field $\kappa$ is $p>0$. Namely, choose a Cohen ring $\Lambda$ with $\kappa=\Lambda / p \Lambda$, see Lemma 10.152.6. In this case we will prove by induction on $n>0$ that there exists a map

$$
\varphi_{n}: \Lambda / p^{n} \Lambda \longrightarrow R / \mathfrak{m}^{n}
$$

whose composition with the reduction $\operatorname{map} R / \mathfrak{m}^{n} \rightarrow \kappa$ produces the given isomorphism $\Lambda / p \Lambda=\kappa$. This is trivial for $n=1$. If $n>1$, let $\varphi_{n-1}$ be given. The ring $\operatorname{map} \mathbf{Z} / p^{n} \mathbf{Z} \rightarrow \Lambda / p^{n} \Lambda$ is formally smooth by Lemma 10.152.7. Hence we can find the dotted arrow in the following diagram

This proves the induction step. Putting these maps together

$$
\lim _{n} \varphi_{n}: \Lambda=\lim _{n} \Lambda / p^{n} \Lambda \longrightarrow R=\lim _{n} R / \mathfrak{m}^{n}
$$

gives a map whose image is the desired coefficient ring.
The final statement of the theorem is now clear. Namely, if $y_{1}, \ldots, y_{n}$ are generators of the ideal $\mathfrak{m}$, then we can use the map $\Lambda \rightarrow R$ just constructed to get a map

$$
\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \longrightarrow R, \quad x_{i} \longmapsto y_{i} .
$$

This map is surjective on each $R / \mathfrak{m}^{n}$ and hence is surjective as $R$ is complete. Some details omitted.

032C Remark 10.152.9. If $k$ is a field then the power series ring $k\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ is a Noetherian complete local regular ring of dimension $d$. If $\Lambda$ is a Cohen ring then $\Lambda\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ is a complete local Noetherian regular ring of dimension $d+1$. Hence the Cohen structure theorem implies that any Noetherian complete local ring is a quotient of a regular local ring. In particular we see that a Noetherian complete local ring is universally catenary, see Lemma 10.104 .8 and Lemma 10.105 .3 .
032D Lemma 10.152.10. Let $(R, \mathfrak{m})$ be a Noetherian complete local domain. Then there exists a $R_{0} \subset R$ with the following properties
(1) $R_{0}$ is a regular complete local ring,
(2) $R_{0} \subset R$ is finite and induces an isomorphism on residue fields,
(3) $R_{0}$ is either isomorphic to $k\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ where $k$ is a field or $\Lambda\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ where $\Lambda$ is a Cohen ring.

Proof. Let $\Lambda$ be a coefficient ring of $R$. Since $R$ is a domain we see that either $\Lambda$ is a field or $\Lambda$ is a Cohen ring.
Case I: $\Lambda=k$ is a field. Let $d=\operatorname{dim}(R)$. Choose $x_{1}, \ldots, x_{d} \in \mathfrak{m}$ which generate an ideal of definition $I \subset R$. (See Section 10.59.) By Lemma 10.95 .9 we see that $R$ is $I$ adically complete as well. Consider the map $R_{0}=k\left[\left[X_{1}, \ldots, X_{d}\right]\right] \rightarrow R$ which maps $X_{i}$ to $x_{i}$. Note that $R_{0}$ is complete with respect to the ideal $I_{0}=\left(X_{1}, \ldots, X_{d}\right)$, and that $R / I_{0} R \cong R / I R$ is finite over $k=R_{0} / I_{0}$ (because $\operatorname{dim}(R / I)=0$, see Section 10.59.) Hence we conclude that $R_{0} \rightarrow R$ is finite by Lemma 10.95.12. Since $\operatorname{dim}(R)=\operatorname{dim}\left(R_{0}\right)$ this implies that $R_{0} \rightarrow R$ is injective (see Lemma 10.111.3), and the lemma is proved.
Case II: $\Lambda$ is a Cohen ring. Let $d+1=\operatorname{dim}(R)$. Let $p>0$ be the characteristic of the residue field $k$. As $R$ is a domain we see that $p$ is a nonzerodivisor in $R$. Hence $\operatorname{dim}(R / p R)=d$, see Lemma 10.59 .12 Choose $x_{1}, \ldots, x_{d} \in R$ which generate an ideal of definition in $R / p R$. Then $I=\left(p, x_{1}, \ldots, x_{d}\right)$ is an ideal of definition of $R$. By Lemma 10.95 .9 we see that $R$ is $I$-adically complete as well. Consider the map $R_{0}=\Lambda\left[\left[X_{1}, \ldots, X_{d}\right]\right] \rightarrow R$ which maps $X_{i}$ to $x_{i}$. Note that $R_{0}$ is complete with respect to the ideal $I_{0}=\left(p, X_{1}, \ldots, X_{d}\right)$, and that $R / I_{0} R \cong R / I R$ is finite over $k=R_{0} / I_{0}$ (because $\operatorname{dim}(R / I)=0$, see Section 10.59.) Hence we conclude that $R_{0} \rightarrow R$ is finite by Lemma 10.95.12. Since $\operatorname{dim}(R)=\operatorname{dim}\left(R_{0}\right)$ this implies that $R_{0} \rightarrow R$ is injective (see Lemma 10.111.3), and the lemma is proved.

### 10.153. Japanese rings

0BI1 In this section we being to discuss finiteness of integral closure.
032 F Definition 10.153.1. Let $R$ be a domain with field of fractions $K$.
(1) We say $R$ is $N$-1 if the integral closure of $R$ in $K$ is a finite $R$-module.
(2) We say $R$ is $N$-2 or Japanese if for any finite extension $K \subset L$ of fields the integral closure of $R$ in $L$ is finite over $R$.

The main interest in these notions is for Noetherian rings, but here is a nonNoetherian example.
0350 Example 10.153.2. Let $k$ be a field. The domain $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ is $\mathrm{N}-2$, but not Noetherian. The reason is the following. Suppose that $R \subset L$ and the field $L$ is a finite extension of the fraction field of $R$. Then there exists an integer $n$ such that $L$ comes from a finite extension $k\left(x_{1}, \ldots, x_{n}\right) \subset L_{0}$ by adjoining the (transcendental)
elements $x_{n+1}, x_{n+2}$, etc. Let $S_{0}$ be the integral closure of $k\left[x_{1}, \ldots, x_{n}\right]$ in $L_{0}$. By Proposition 10.154 .16 below it is true that $S_{0}$ is finite over $k\left[x_{1}, \ldots, x_{n}\right]$. Moreover, the integral closure of $R$ in $L$ is $S=S_{0}\left[x_{n+1}, x_{n+2}, \ldots\right]$ (use Lemma 10.36.8) and hence finite over $R$. The same argument works for $R=\mathbf{Z}\left[x_{1}, x_{2}, x_{3}, \ldots\right]$.
032G Lemma 10.153.3. Let $R$ be a domain. If $R$ is $N-1$ then so is any localization of $R$. Same for $N-2$.

Proof. These statements hold because taking integral closure commutes with localization, see Lemma 10.35.9.

032H Lemma 10.153.4. Let $R$ be a domain. Let $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal. If each domain $R_{f_{i}}$ is $N-1$ then so is $R$. Same for $N-2$.

Proof. Assume $R_{f_{i}}$ is N-2 (or N-1). Let $L$ be a finite extension of the fraction field of $R$ (equal to the fraction field in the N-1 case). Let $S$ be the integral closure of $R$ in $L$. By Lemma 10.35 .9 we see that $S_{f_{i}}$ is the integral closure of $R_{f_{i}}$ in $L$. Hence $S_{f_{i}}$ is finite over $\overline{R_{f_{i}}}$ by assumption. Thus $S$ is finite over $R$ by Lemma 10.23.2.
032 Lemma 10.153.5. Let $R$ be a domain. Let $R \subset S$ be a quasi-finite extension of domains (for example finite). Assume $R$ is $N-2$ and Noetherian. Then $S$ is N-2.

Proof. Let $K=f . f .(R) \subset L=f . f .(S)$. Note that this is a finite field extension (for example by Lemma 10.121 .2 (2) applied to the fibre $S \otimes_{R} K$, and the definition of a quasi-finite ring map). Let $S^{\prime}$ be the integral closure of $R$ in $S$. Then $S^{\prime}$ is contained in the integral closure of $R$ in $L$ which is finite over $R$ by assumption. As $R$ is Noetherian this implies $S^{\prime}$ is finite over $R$. By Lemma 10.122 .15 there exist elements $g_{1}, \ldots, g_{n} \in S^{\prime}$ such that $S_{g_{i}}^{\prime} \cong S_{g_{i}}$ and such that $g_{1}, \ldots, g_{n}$ generate the unit ideal in $S$. Hence it suffices to show that $S^{\prime}$ is N-2 by Lemmas 10.153 .3 and 10.153.4 Thus we have reduced to the case where $S$ is finite over $R$.

Assume $R \subset S$ with hypotheses as in the lemma and moreover that $S$ is finite over $R$. Let $M$ be a finite field extension of the fraction field of $S$. Then $M$ is also a finite field extension of $f . f(R)$ and we conclude that the integral closure $T$ of $R$ in $M$ is finite over $R$. By Lemma 10.35 .14 we see that $T$ is also the integral closure of $S$ in $M$ and we win by Lemma 10.35 .13 .
032J Lemma 10.153.6. Let $R$ be a Noetherian domain. If $R\left[z, z^{-1}\right]$ is $N-1$, then so is $R$.

Proof. Let $R^{\prime}$ be the integral closure of $R$ in its field of fractions $K$. Let $S^{\prime}$ be the integral closure of $R\left[z, z^{-1}\right]$ in its field of fractions. Clearly $R^{\prime} \subset S^{\prime}$. Since $K\left[z, z^{-1}\right]$ is a normal domain we see that $S^{\prime} \subset K\left[z, z^{-1}\right]$. Suppose that $f_{1}, \ldots, f_{n} \in S^{\prime}$ generate $S^{\prime}$ as $R\left[z, z^{-1}\right]$-module. Say $f_{i}=\sum a_{i j} z^{j}$ (finite sum), with $a_{i j} \in K$. For any $x \in R^{\prime}$ we can write

$$
x=\sum h_{i} f_{i}
$$

with $h_{i} \in R\left[z, z^{-1}\right]$. Thus we see that $R^{\prime}$ is contained in the finite $R$-submodule $\sum R a_{i j} \subset K$. Since $R$ is Noetherian we conclude that $R^{\prime}$ is a finite $R$-module.
032K Lemma 10.153.7. Let $R$ be a Noetherian domain, and let $R \subset S$ be a finite extension of domains. If $S$ is $N-1$, then so is $R$. If $S$ is $N-2$, then so is $R$.

Proof. Omitted. (Hint: Integral closures of $R$ in extension fields are contained in integral closures of $S$ in extension fields.)

032L Lemma 10.153.8. Let $R$ be a Noetherian normal domain with fraction field $K$. Let $K \subset L$ be a finite separable field extension. Then the integral closure of $R$ in $L$ is finite over $R$.

Proof. Consider the trace pairing (Fields, Definition 9.19.6)

$$
L \times L \longrightarrow K, \quad(x, y) \longmapsto\langle x, y\rangle:=\operatorname{Trace}_{L / K}(x y)
$$

Since $L / K$ is separable this is nondegenerate (Fields, Lemma 9.19.7). Moreover, if $x \in L$ is integral over $R$, then $\operatorname{Trace}_{L / K}(x)$ is integral over $R$ also, and since $R$ is normal we see $\operatorname{Trace}_{L / K}(x) \in R$. Pick $x_{1}, \ldots, x_{n} \in L$ which are integral over $R$ and which form a $K$-basis of $L$. Then the integral closure $S \subset L$ is contained in the $R$-module

$$
M=\left\{y \in L \mid\left\langle x_{i}, y\right\rangle \in R, i=1, \ldots, n\right\}
$$

By linear algebra we see that $M \cong R^{\oplus n}$ as an $R$-module. Hence $S \subset R^{\oplus n}$ is a finitely generated $R$-module as $R$ is Noetherian.

03B7 Example 10.153.9. Lemma 10.153 .8 does not work if the ring is not Noetherian. For example consider the action of $G=\{+1,-1\}$ on $A=\mathbf{C}\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ where -1 acts by mapping $x_{i}$ to $-x_{i}$. The invariant ring $R=A^{G}$ is the $\mathbf{C}$-algebra generated by all $x_{i} x_{j}$. Hence $R \subset A$ is not finite. But $R$ is a normal domain with fraction field $K=L^{G}$ the $G$-invariants in the fraction field $L$ of $A$. And clearly $A$ is the integral closure of $R$ in $L$.

The following lemma can sometimes be used as a substitute for Lemma 10.153 .8 in case of purely inseparable extensions.

0AE0 Lemma 10.153.10. Let $R$ be a Noetherian normal domain with fraction field $K$ of characteristic $p>0$. Let $a \in K$ be an element such that there exists a derivation $D: R \rightarrow R$ with $D(a) \neq 0$. Then the integral closure of $R$ in $L=K[x] /\left(x^{p}-a\right)$ is finite over $R$.

Proof. After replacing $x$ by $f x$ and $a$ by $f^{p} a$ for some $f \in R$ we may assume $a \in R$. Hence also $D(a) \in R$. We will show by induction on $i \leq p-1$ that if

$$
y=a_{0}+a_{1} x+\ldots+a_{i} x^{i}, \quad a_{j} \in K
$$

is integral over $R$, then $D(a)^{i} a_{j} \in R$. Thus the integral closure is contained in the finite $R$-module with basis $D(a)^{-p+1} x^{j}, j=0, \ldots, p-1$. Since $R$ is Noetherian this proves the lemma.

If $i=0$, then $y=a_{0}$ is integral over $R$ if and only if $a_{0} \in R$ and the statement is true. Suppose the statement holds for some $i<p-1$ and suppose that

$$
y=a_{0}+a_{1} x+\ldots+a_{i+1} x^{i+1}, \quad a_{j} \in K
$$

is integral over $R$. Then

$$
y^{p}=a_{0}^{p}+a_{1}^{p} a+\ldots+a_{i+1}^{p} a^{i+1}
$$

is an element of $R$ (as it is in $K$ and integral over $R$ ). Applying $D$ we obtain

$$
\left(a_{1}^{p}+2 a_{2}^{p} a+\ldots+(i+1) a_{i+1}^{p} a^{i}\right) D(a)
$$

is in $R$. Hence it follows that

$$
D(a) a_{1}+2 D(a) a_{2} x+\ldots+(i+1) D(a) a_{i+1} x^{i}
$$

is integral over $R$. By induction we find $D(a)^{i+1} a_{j} \in R$ for $j=1, \ldots, i+1$. (Here we use that $1, \ldots, i+1$ are invertible.) Hence $D(a)^{i+1} a_{0}$ is also in $R$ because it is the difference of $y$ and $\sum_{j>0} D(a)^{i+1} a_{j} x^{j}$ which are integral over $R$ (since $x$ is integral over $R$ as $a \in R$ ).

032M Lemma 10.153.11. A Noetherian domain of characteristic zero is N-1 if and only if it is N-2 (i.e., Japanese).

Proof. This is clear from Lemma 10.153 .8 since every field extension in characteristic zero is separable.

032N Lemma 10.153.12. Let $R$ be a Noetherian domain with fraction field $K$ of characteristic $p>0$. Then $R$ is N-2 if and only if for every finite purely inseparable extension $K \subset L$ the integral closure of $R$ in $L$ is finite over $R$.

Proof. Assume the integral closure of $R$ in every finite purely inseparable field extension of $K$ is finite. Let $K \subset L$ be any finite extension. We have to show the integral closure of $R$ in $L$ is finite over $R$. Choose a finite normal field extension $K \subset M$ containing $L$. As $R$ is Noetherian it suffices to show that the integral closure of $R$ in $M$ is finite over $R$. By Fields, Lemma 9.26 .3 there exists a subextension $K \subset M_{\text {insep }} \subset M$ such that $M_{\text {insep }} / K$ is purely inseparable, and $M / M_{\text {insep }}$ is separable. By assumption the integral closure $R^{\prime}$ of $R$ in $M_{\text {insep }}$ is finite over $R$. By Lemma 10.153 .8 the integral closure $R^{\prime \prime}$ of $R^{\prime}$ in $M$ is finite over $R^{\prime}$. Then $R^{\prime \prime}$ is finite over $R$ by Lemma 10.7.3. Since $R^{\prime \prime}$ is also the integral closure of $R$ in $M$ (see Lemma 10.35.14) we win.

032 O Lemma 10.153.13. Let $R$ be a Noetherian domain. If $R$ is $N-1$ then $R[x]$ is $N-1$. If $R$ is $N$-2 then $R[x]$ is $N$-2.

Proof. Assume $R$ is N-1. Let $R^{\prime}$ be the integral closure of $R$ which is finite over $R$. Hence also $R^{\prime}[x]$ is finite over $R[x]$. The ring $R^{\prime}[x]$ is normal (see Lemma 10.36.8), hence N-1. This proves the first assertion.

For the second assertion, by Lemma 10.153 .7 it suffices to show that $R^{\prime}[x]$ is $\mathrm{N}-2$. In other words we may and do assume that $R$ is a normal N-2 domain. In characteristic zero we are done by Lemma 10.153 .11 . In characteristic $p>0$ we have to show that the integral closure of $R[x]$ is finite in any finite purely inseparable extension of $f . f .(R[x])=K(x) \subset L$ with $K=f . f .(R)$. Clearly there exists a finite purely inseparable field extension $K \subset L^{\prime}$ and $q=p^{e}$ such that $L \subset L^{\prime}\left(x^{1 / q}\right)$. As $R[x]$ is Noetherian it suffices to show that the integral closure of $R[x]$ in $L^{\prime}\left(x^{1 / q}\right)$ is finite over $R[x]$. And this integral closure is equal to $R^{\prime}\left[x^{1 / q}\right]$ with $R \subset R^{\prime} \subset L^{\prime}$ the integral closure of $R$ in $L^{\prime}$. Since $R$ is N-2 we see that $R^{\prime}$ is finite over $R$ and hence $R^{\prime}\left[x^{1 / q}\right]$ is finite over $R[x]$.

0332 Lemma 10.153.14. Let $R$ be a Noetherian domain. If there exists an $f \in R$ such that $R_{f}$ is normal then

$$
U=\left\{\mathfrak{p} \in \operatorname{Spec}(R) \mid R_{\mathfrak{p}} \text { is normal }\right\}
$$

is open in $\operatorname{Spec}(R)$.
Proof. It is clear that the standard open $D(f)$ is contained in $U$. By Serre's criterion Lemma 10.149 .4 we see that $\mathfrak{p} \notin U$ implies that for some $\mathfrak{q} \subset \mathfrak{p}$ we have either
(1) Case I: $\operatorname{depth}\left(R_{\mathfrak{q}}\right)<2$ and $\operatorname{dim}\left(R_{\mathfrak{q}}\right) \geq 2$, and
(2) Case II: $R_{\mathfrak{q}}$ is not regular and $\operatorname{dim}\left(R_{\mathfrak{q}}\right)=1$.

This in particular also means that $R_{\mathfrak{q}}$ is not normal, and hence $f \in \mathfrak{q}$. In case I we see that $\operatorname{depth}\left(R_{\mathfrak{q}}\right)=\operatorname{depth}\left(R_{\mathfrak{q}} / f R_{\mathfrak{q}}\right)+1$. Hence such a prime $\mathfrak{q}$ is the same thing as an embedded associated prime of $R / f R$. In case II $\mathfrak{q}$ is an associated prime of $R / f R$ of height 1 . Thus there is a finite set $E$ of such primes $\mathfrak{q}$ (see Lemma 10.62.5) and

$$
\operatorname{Spec}(R) \backslash U=\bigcup_{\mathfrak{q} \in E} V(\mathfrak{q})
$$

as desired.
0333 Lemma 10.153.15. Let $R$ be a Noetherian domain. Assume
(1) there exists a nonzero $f \in R$ such that $R_{f}$ is normal, and
(2) for every maximal ideal $\mathfrak{m} \subset R$ the local ring $R_{\mathfrak{m}}$ is $N-1$.

Then $R$ is $N-1$.
Proof. Set $K=f . f .(R)$. Suppose that $R \subset R^{\prime} \subset K$ is a finite extension of $R$ contained in $K$. Note that $R_{f}=R_{f}^{\prime}$ since $R_{f}$ is already normal. Hence by Lemma 10.153.14 the set of primes $\mathfrak{p}^{\prime} \in \operatorname{Spec}\left(R^{\prime}\right)$ with $R_{\mathfrak{p}^{\prime}}^{\prime}$ non-normal is closed in $\operatorname{Spec}\left(R^{\prime}\right)$. Since $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ is closed the image of this set is closed in $\operatorname{Spec}(R)$. For such a ring $R^{\prime}$ denote $Z_{R^{\prime}} \subset \operatorname{Spec}(R)$ this image.

Pick a maximal ideal $\mathfrak{m} \subset R$. Let $R_{\mathfrak{m}} \subset R_{\mathfrak{m}}^{\prime}$ be the integral closure of the local ring in $K$. By assumption this is a finite ring extension. By Lemma 10.35 .9 we can find finitely many elements $r_{1}, \ldots, r_{n} \in K$ integral over $R$ such that $R_{\mathfrak{m}}^{\prime}$ is generated by $r_{1}, \ldots, r_{n}$ over $R_{\mathfrak{m}}$. Let $R^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] \subset K$. With this choice it is clear that $\mathfrak{m} \notin Z_{R^{\prime}}$.
As $\operatorname{Spec}(R)$ is quasi-compact, the above shows that we can find a finite collection $R \subset R_{i}^{\prime} \subset K$ such that $\bigcap Z_{R_{i}^{\prime}}=\emptyset$. Let $R^{\prime}$ be the subring of $K$ generated by all of these. It is finite over $R$. Also $Z_{R^{\prime}}=\emptyset$. Namely, every prime $\mathfrak{p}^{\prime}$ lies over a prime $\mathfrak{p}_{i}^{\prime}$ such that $\left(R_{i}^{\prime}\right)_{\mathfrak{p}_{i}^{\prime}}$ is normal. This implies that $R_{\mathfrak{p}^{\prime}}^{\prime}=\left(R_{i}^{\prime}\right)_{\mathfrak{p}_{i}^{\prime}}$ is normal too. Hence $R^{\prime}$ is normal, in other words $R^{\prime}$ is the integral closure of $R$ in $K$.

032P Lemma 10.153 .16 (Tate). Let $R$ be a ring. Let $x \in R$. Assume
(1) $R$ is a normal Noetherian domain,
(2) $R / x R$ is a domain and $N$-2,
(3) $R \cong \lim _{n} R / x^{n} R$ is complete with respect to $x$.

Then $R$ is $N$-2.
Proof. We may assume $x \neq 0$ since otherwise the lemma is trivial. Let $K$ be the fraction field of $R$. If the characteristic of $K$ is zero the lemma follows from (1), see Lemma 10.153.11. Hence we may assume that the characteristic of $K$ is $p>0$, and we may apply Lemma 10.153 .12 Thus given $K \subset L$ be a finite purely inseparable field extension we have to show that the integral closure $S$ of $R$ in $L$ is finite over $R$.

Let $q$ be a power of $p$ such that $L^{q} \subset K$. By enlarging $L$ if necessary we may assume there exists an element $y \in L$ such that $y^{q}=x$. Since $R \rightarrow S$ induces a homeomorphism of spectra (see Lemma 10.45.6) there is a unique prime ideal $\mathfrak{q} \subset S$ lying over the prime ideal $\mathfrak{p}=x R$. It is clear that

$$
\mathfrak{q}=\left\{f \in S \mid f^{q} \in \mathfrak{p}\right\}=y S
$$

since $y^{q}=x$. Hence $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$ are discrete valuation rings, see Lemma 10.118.7. By Lemma 10.118 .10 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is a finite field extension. Hence the integral closure $S^{\prime} \subset \kappa(\mathfrak{q})$ of $R / x R$ is finite over $R / x R$ by assumption (2). Since $S / y S \subset S^{\prime}$ this implies that $S / y S$ is finite over $R$. Note that $S / y^{n} S$ has a finite filtration whose subquotients are the modules $y^{i} S / y^{i+1} S \cong S / y S$. Hence we see that each $S / y^{n} S$ is finite over $R$. In particular $S / x S$ is finite over $R$. Also, it is clear that $\bigcap x^{n} S=(0)$ since an element in the intersection has $q$ th power contained in $\bigcap x^{n} R=(0)$ (Lemma 10.50.4). Thus we may apply Lemma 10.95 .12 to conclude that $S$ is finite over $R$, and we win.

032Q Lemma 10.153.17. Let $R$ be a ring. If $R$ is Noetherian, a domain, and N-2, then so is $R[[x]]$.

Proof. Observe that $R[[x]]$ is Noetherian by Lemma 10.30 .2 Let $R^{\prime} \supset R$ be the integral closure of $R$ in its fraction field. Because $R$ is $\mathrm{N}-2$ this is finite over $R$. Hence $R^{\prime}[[x]]$ is finite over $R[[x]]$. By Lemma 10.36 .9 we see that $R^{\prime}[[x]]$ is a normal domain. Apply Lemma 10.153 .16 to the element $x \in R^{\prime}[[x]]$ to see that $R^{\prime}[[x]]$ is $\mathrm{N}-2$. Then Lemma 10.153 .7 shows that $R[[x]]$ is $\mathrm{N}-2$.

### 10.154. Nagata rings

032E Here is the definition.
032R Definition 10.154.1. Let $R$ be a ring.
(1) We say $R$ is universally Japanese if for any finite type ring map $R \rightarrow S$ with $S$ a domain we have that $S$ is $\mathrm{N}-2$ (i.e., Japanese).
(2) We say that $R$ is a Nagata ring if $R$ is Noetherian and for every prime ideal $\mathfrak{p}$ the $\operatorname{ring} R / \mathfrak{p}$ is $\mathrm{N}-2$.

It is clear that a Noetherian universally Japanese ring is a Nagata ring. It is our goal to show that a Nagata ring is universally Japanese. This is not obvious at all, and requires some work. But first, here is a useful lemma.
03GH Lemma 10.154.2. Let $R$ be a Nagata ring. Let $R \rightarrow S$ be essentially of finite type with $S$ reduced. Then the integral closure of $R$ in $S$ is finite over $R$.
Proof. As $S$ is essentially of finite type over $R$ it is Noetherian and has finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{m}$, see Lemma 10.30 .6 . Since $S$ is reduced we have $S \subset \prod S_{\mathfrak{q}_{i}}$ and each $S_{\mathfrak{q}_{i}}=K_{i}$ is a field, see Lemmas 10.24.4 and 10.24.1. It suffices to show that the integral closure $A_{i}^{\prime}$ of $R$ in each $K_{i}$ is finite over $R$. This is true because $R$ is Noetherian and $A \subset \prod A_{i}^{\prime}$. Let $\mathfrak{p}_{i} \subset R$ be the prime of $R$ corresponding to $\mathfrak{q}_{i}$. As $S$ is essentially of finite type over $R$ we see that $K_{i}=S_{\mathfrak{q}_{i}}=\kappa\left(\mathfrak{q}_{i}\right)$ is a finitely generated field extension of $\kappa\left(\mathfrak{p}_{i}\right)$. Hence the algebraic closure $L_{i}$ of $\kappa\left(\mathfrak{p}_{i}\right)$ in $\subset K_{i}$ is finite over $\kappa\left(\mathfrak{p}_{i}\right)$, see Fields, Lemma 9.25.10. It is clear that $A_{i}^{\prime}$ is the integral closure of $R / \mathfrak{p}_{i}$ in $L_{i}$, and hence we win by definition of a Nagata ring.

0351 Lemma 10.154.3. Let $R$ be a ring. To check that $R$ is universally Japanese it suffices to show: If $R \rightarrow S$ is of finite type, and $S$ a domain then $S$ is N-1.

Proof. Namely, assume the condition of the lemma. Let $R \rightarrow S$ be a finite type ring map with $S$ a domain. Let $f . f .(S) \subset L$ be a finite extension of its fraction field. Then there exists a finite ring extension $S \subset S^{\prime} \subset L$ with $f . f .\left(S^{\prime}\right)=L$. By assumption $S^{\prime}$ is $\mathrm{N}-1$, and hence the integral closure $S^{\prime \prime}$ of $S^{\prime}$ in $L$ is finite over $S^{\prime}$.

Thus $S^{\prime \prime}$ is finite over $S$ (Lemma 10.7.3) and $S^{\prime \prime}$ is the integral closure of $S$ in $L$ (Lemma 10.35.14). We conclude that $R$ is universally Japanese.
032S Lemma 10.154.4. If $R$ is universally Japanese then any algebra essentially of finite type over $R$ is universally Japanese.
Proof. The case of an algebra of finite type over $R$ is immediate from the definition. The general case follows on applying Lemma 10.153.3.
032T Lemma 10.154.5. Let $R$ be a Nagata ring. If $R \rightarrow S$ is a quasi-finite ring map (for example finite) then $S$ is a Nagata ring also.

Proof. First note that $S$ is Noetherian as $R$ is Noetherian and a quasi-finite ring map is of finite type. Let $\mathfrak{q} \subset S$ be a prime ideal, and set $\mathfrak{p}=R \cap \mathfrak{q}$. Then $R / \mathfrak{p} \subset S / \mathfrak{q}$ is quasi-finite and hence we conclude that $S / \mathfrak{q}$ is N-2 by Lemma 10.153 .5 as desired.

032U Lemma 10.154.6. A localization of a Nagata ring is a Nagata ring.
Proof. Clear from Lemma 10.153.3.
032V Lemma 10.154.7. Let $R$ be a ring. Let $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal.
(1) If each $R_{f_{i}}$ is universally Japanese then so is $R$.
(2) If each $R_{f_{i}}$ is Nagata then so is $R$.

Proof. Let $\varphi: R \rightarrow S$ be a finite type ring map so that $S$ is a domain. Then $\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{n}\right)$ generate the unit ideal in $S$. Hence if each $S_{f_{i}}=S_{\varphi\left(f_{i}\right)}$ is N-1 then so is $S$, see Lemma 10.153.4. This proves (1).

If each $R_{f_{i}}$ is Nagata, then each $R_{f_{i}}$ is Noetherian and hence $R$ is Noetherian, see Lemma 10.23.2. And if $\mathfrak{p} \subset R$ is a prime, then we see each $R_{f_{i}} / \mathfrak{p} R_{f_{i}}=(R / \mathfrak{p})_{f_{i}}$ is $\mathrm{N}-2$ and hence we conclude $R / \mathfrak{p}$ is $\mathrm{N}-2$ by Lemma 10.153.4. This proves (2).
032W Lemma 10.154.8. A Noetherian complete local ring is a Nagata ring.
Proof. Let $R$ be a complete local Noetherian ring. Let $\mathfrak{p} \subset R$ be a prime. Then $R / \mathfrak{p}$ is also a complete local Noetherian ring, see Lemma 10.152.2. Hence it suffices to show that a Noetherian complete local domain $R$ is $\mathrm{N}-2$. By Lemmas 10.153 .5 and 10.152 .10 we reduce to the case $R=k\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ where $k$ is a field or $R=\Lambda\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ where $\Lambda$ is a Cohen ring.
In the case $k\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ we reduce to the statement that a field is N-2 by Lemma 10.153.17. This is clear. In the case $\Lambda\left[\left[X_{1}, \ldots, X_{d}\right]\right]$ we reduce to the statement that a Cohen ring $\Lambda$ is $\mathrm{N}-2$. Applying Lemma 10.153 .16 once more with $x=p \in \Lambda$ we reduce yet again to the case of a field. Thus we win.

032X Definition 10.154.9. Let $(R, \mathfrak{m})$ be a Noetherian local ring. We say $R$ is analytically unramified if its completion $R^{\wedge}=\lim _{n} R / \mathfrak{m}^{n}$ is reduced. A prime ideal $\mathfrak{p} \subset R$ is said to be analytically unramified if $R / \mathfrak{p}$ is analytically unramified.
At this point we know the following are true for any Noetherian local ring $R$ : The map $R \rightarrow R^{\wedge}$ is a faithfully flat local ring homomorphism (Lemma 10.96.3). The completion $R^{\wedge}$ is Noetherian (Lemma 10.96.5) and complete (Lemma 10.96.4). Hence the completion $R^{\wedge}$ is a Nagata ring (Lemma 10.154.8). Moreover, we have seen in Section 10.152 that $R^{\wedge}$ is a quotient of a regular local ring (Theorem 10.152 .8 , and hence universally catenary (Remark 10.152.9).

032Y Lemma 10.154.10. Let $(R, \mathfrak{m})$ be a Noetherian local ring.
(1) If $R$ is analytically unramified, then $R$ is reduced.
(2) If $R$ is analytically unramified, then each minimal prime of $R$ is analytically unramified.
(3) If $R$ is reduced with minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$, and each $\mathfrak{q}_{i}$ is analytically unramified, then $R$ is analytically unramified.
(4) If $R$ is analytically unramified, then the integral closure of $R$ in its total ring of fractions $Q(R)$ is finite over $R$.
(5) If $R$ is a domain and analytically unramified, then $R$ is N-1.

Proof. In this proof we will use the remarks immediately following Definition 10.154.9. As $R \rightarrow R^{\wedge}$ is a faithfully flat local ring homomorphism it is injective and (1) follows.

Let $\mathfrak{q}$ be a minimal prime of $R$, and assume $R$ is analytically unramified. Then $\mathfrak{q}$ is an associated prime of $R$ (see Proposition 10.62.6). Hence there exists an $f \in R$ such that $\{x \in R \mid f x=0\}=\mathfrak{q}$. Note that $(R / \mathfrak{q})^{\wedge}=R^{\wedge} / \mathfrak{q}^{\wedge}$, and that $\left\{x \in R^{\wedge} \mid f x=0\right\}=\mathfrak{q}^{\wedge}$, because completion is exact (Lemma 10.96.2). If $x \in R^{\wedge}$ is such that $x^{2} \in \mathfrak{q}^{\wedge}$, then $f x^{2}=0$ hence $(f x)^{2}=0$ hence $f x=0$ hence $x \in \mathfrak{q}^{\wedge}$. Thus $\mathfrak{q}$ is analytically unramified and (2) holds.

Assume $R$ is reduced with minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$, and each $\mathfrak{q}_{i}$ is analytically unramified. Then $R \rightarrow R / \mathfrak{q}_{1} \times \ldots \times R / \mathfrak{q}_{t}$ is injective. Since completion is exact (see Lemma 10.96.2) we see that $R^{\wedge} \subset\left(R / \mathfrak{q}_{1}\right)^{\wedge} \times \ldots \times\left(R / \mathfrak{q}_{t}\right)^{\wedge}$. Hence (3) is clear.
Assume $R$ is analytically unramified. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{s}$ be the minimal primes of $R^{\wedge}$. Then we see that

$$
Q\left(R^{\wedge}\right)=R_{\mathfrak{p}_{1}}^{\wedge} \times \ldots \times R_{\mathfrak{p}_{s}}^{\wedge}
$$

with each $R_{\mathfrak{p}_{i}}^{\wedge}$ a field as $R^{\wedge}$ is reduced (see Lemma 10.24.4). Hence the integral closure $S$ of $R^{\wedge}$ in $Q\left(R^{\wedge}\right)$ is equal to $S=S_{1} \times \ldots \times S_{s}$ with $S_{i}$ the integral closure of $R^{\wedge} / \mathfrak{p}_{i}$ in its fraction field. In particular $S$ is finite over $R^{\wedge}$. Denote $R^{\prime}$ the integral closure of $R$ in $Q(R)$. As $R \rightarrow R^{\wedge}$ is flat we see that $R^{\prime} \otimes_{R} R^{\wedge} \subset$ $Q(R) \otimes_{R} R^{\wedge} \subset Q\left(R^{\wedge}\right)$. Moreover $R^{\prime} \otimes_{R} R^{\wedge}$ is integral over $R^{\wedge}$ (Lemma 10.35.11). Hence $R^{\prime} \otimes_{R} R^{\wedge} \subset S$ is a $R^{\wedge}$-submodule. As $R^{\wedge}$ is Noetherian it is a finite $R^{\wedge}$ module. Thus we may find $f_{1}, \ldots, f_{n} \in R^{\prime}$ such that $R^{\prime} \otimes_{R} R^{\wedge}$ is generated by the elements $f_{i} \otimes 1$ as a $R^{\wedge}$-module. By faithful flatness we see that $R^{\prime}$ is generated by $f_{1}, \ldots, f_{n}$ as an $R$-module. This proves (4).
Part (5) is a special case of part (4).
032 Z Lemma 10.154.11. Let $R$ be a Noetherian local ring. Let $\mathfrak{p} \subset R$ be a prime. Assume
(1) $R_{\mathfrak{p}}$ is a discrete valuation ring, and
(2) $\mathfrak{p}$ is analytically unramified.

Then for any associated prime $\mathfrak{q}$ of $R^{\wedge} / \mathfrak{p} R^{\wedge}$ the local ring $\left(R^{\wedge}\right)_{\mathfrak{q}}$ is a discrete valuation ring.

Proof. Assumption (2) says that $R^{\wedge} / \mathfrak{p} R^{\wedge}$ is a reduced ring. Hence an associated prime $\mathfrak{q} \subset R^{\wedge}$ of $R^{\wedge} / \mathfrak{p} R^{\wedge}$ is the same thing as a minimal prime over $\mathfrak{p} R^{\wedge}$. In particular we see that the maximal ideal of $\left(R^{\wedge}\right)_{\mathfrak{q}}$ is $\mathfrak{p}\left(R^{\wedge}\right)_{\mathfrak{q}}$. Choose $x \in R$ such that $x R_{\mathfrak{p}}=\mathfrak{p} R_{\mathfrak{p}}$. By the above we see that $x \in\left(R^{\wedge}\right)_{\mathfrak{q}}$ generates the maximal ideal.

As $R \rightarrow R^{\wedge}$ is faithfully flat we see that $x$ is a nonzerodivisor in $\left(R^{\wedge}\right)_{\mathfrak{q}}$. Hence we win.

0330 Lemma 10.154.12. Let $(R, \mathfrak{m})$ be a Noetherian local domain. Let $x \in \mathfrak{m}$. Assume (1) $x \neq 0$,
(2) $R / x R$ has no embedded primes, and
(3) for each associated prime $\mathfrak{p} \subset R$ of $R / x R$ we have
(a) the local ring $R_{\mathfrak{p}}$ is regular, and
(b) $\mathfrak{p}$ is analytically unramified.

Then $R$ is analytically unramified.
Proof. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{t}$ be the associated primes of the $R$-module $R / x R$. Since $R / x R$ has no embedded primes we see that each $\mathfrak{p}_{i}$ has height 1 , and is a minimal prime over $(x)$. For each $i$, let $\mathfrak{q}_{i 1}, \ldots, \mathfrak{q}_{i s_{i}}$ be the associated primes of the $R^{\wedge}$-module $R^{\wedge} / \mathfrak{p}_{i} R^{\wedge}$. By Lemma 10.154 .11 we see that $\left(R^{\wedge}\right)_{\mathfrak{q}_{i j}}$ is regular. By Lemma 10.64 .3 we see that

$$
\operatorname{Ass}_{R^{\wedge}}\left(R^{\wedge} / x R^{\wedge}\right)=\bigcup_{\mathfrak{p} \in \operatorname{Ass}_{R}(R / x R)} \operatorname{Ass}_{R^{\wedge}}\left(R^{\wedge} / \mathfrak{p} R^{\wedge}\right)=\left\{\mathfrak{q}_{i j}\right\}
$$

Let $y \in R^{\wedge}$ with $y^{2}=0$. As $\left(R^{\wedge}\right)_{\mathfrak{q}_{i j}}$ is regular, and hence a domain (Lemma 10.105 .2 we see that $y$ maps to zero in $\left(R^{\wedge}\right)_{\mathfrak{q}_{i j}}$. Hence $y$ maps to zero in $R^{\wedge} / x R^{\wedge}$ by Lemma 10.62.19. Hence $y=x y^{\prime}$. Since $x$ is a nonzerodivisor (as $R \rightarrow R^{\wedge}$ is flat) we see that $\left(y^{\prime}\right)^{2}=0$. Hence we conclude that $y \in \bigcap x^{n} R^{\wedge}=(0)$ (Lemma 10.50.4.

0331 Lemma 10.154.13. Let $(R, \mathfrak{m})$ be a local ring. If $R$ is Noetherian, a domain, and Nagata, then $R$ is analytically unramified.

Proof. By induction on $\operatorname{dim}(R)$. The case $\operatorname{dim}(R)=0$ is trivial. Hence we assume $\operatorname{dim}(R)=d$ and that the lemma holds for all Noetherian Nagata domains of dimension $<d$.
Let $R \subset S$ be the integral closure of $R$ in the field of fractions of $R$. By assumption $S$ is a finite $R$-module. By Lemma 10.154 .5 we see that $S$ is Nagata. By Lemma 10.111.4 we see $\operatorname{dim}(R)=\operatorname{dim}(S)$. Let $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{t}$ be the maximal ideals of $S$. Each of these lies over the maximal ideal $\mathfrak{m}$ of $R$. Moreover

$$
\left(\mathfrak{m}_{1} \cap \ldots \cap \mathfrak{m}_{t}\right)^{n} \subset \mathfrak{m} S
$$

for sufficiently large $n$ as $S / \mathfrak{m} S$ is Artinian. By Lemma $10.96 .2 R^{\wedge} \rightarrow S^{\wedge}$ is an injective map, and by the Chinese Remainder Lemma 10.14 .3 combined with Lemma 10.95 .9 we have $S^{\wedge}=\prod S_{i}^{\wedge}$ where $S_{i}^{\wedge}$ is the completion of $S$ with respect to the maximal ideal $\mathfrak{m}_{i}$. Hence it suffices to show that $S_{\mathfrak{m}_{i}}$ is analytically unramified. In other words, we have reduced to the case where $R$ is a Noetherian normal Nagata domain.

Assume $R$ is a Noetherian, normal, local Nagata domain. Pick a nonzero $x \in \mathfrak{m}$ in the maximal ideal. We are going to apply Lemma 10.154.12. We have to check properties (1), (2), (3)(a) and (3)(b). Property (1) is clear. We have that $R / x R$ has no embedded primes by Lemma 10.149.6. Thus property (2) holds. The same lemma also tells us each associated prime $\mathfrak{p}$ of $R / x R$ has height 1 . Hence $R_{\mathfrak{p}}$ is a 1 -dimensional normal domain hence regular (Lemma 10.118.7). Thus (3)(a) holds. Finally (3)(b) holds by induction hypothesis, since $R / \mathfrak{p}$ is Nagata (by Lemma
10.154 .5 or directly from the definition). Thus we conclude $R$ is analytically unramified.

0BI2 Lemma 10.154.14. Let $(R, \mathfrak{m})$ be a Noetherian local ring. The following are equivalent
(1) $R$ is Nagata,
(2) for $R \rightarrow S$ finite with $S$ a domain and $\mathfrak{m}^{\prime} \subset S$ maximal the local ring $S_{\mathfrak{m}^{\prime}}$ is analytically unramified,
(3) for $(R, \mathfrak{m}) \rightarrow\left(S, \mathfrak{m}^{\prime}\right)$ finite local homomorphism with $S$ a domain, then $S$ is analytically unramified.
Proof. Assume $R$ is Nagata and let $R \rightarrow S$ and $\mathfrak{m}^{\prime} \subset S$ be as in (2). Then $S$ is Nagata by Lemma 10.154.5. Hence the local ring $S_{\mathfrak{m}^{\prime}}$ is Nagata (Lemma 10.154.6). Thus it is analytically unramified by Lemma 10.154 .13 . It is clear that (2) implies (3).

Assume (3) holds. Let $\mathfrak{p} \subset R$ be a prime ideal and let $f . f .(R / \mathfrak{p}) \subset L$ be a finite extension of fields. To prove (1) we have to show that the integral closure of $R / \mathfrak{p}$ is finite over $R / \mathfrak{p}$. Choose $x_{1}, \ldots, x_{n} \in L$ which generate $L$ over $f . f .(R / \mathfrak{p})$. For each $i$ let $P_{i}(T)=T^{d_{i}}+a_{i, 1} T^{d_{i}-1}+\ldots+a_{i, d_{i}}$ be the minimal polynomial for $x_{i}$ over $f . f .(R / \mathfrak{p})$. After replacing $x_{i}$ by $f_{i} x_{i}$ for a suitable $f_{i} \in R, f_{i} \notin \mathfrak{p}$ we may assume $a_{i, j} \in R / \mathfrak{p}$. In fact, after further multiplying by elements of $\mathfrak{m}$, we may assume $a_{i, j} \in$ $\mathfrak{m} / \mathfrak{p} \subset R / \mathfrak{p}$ for all $i, j$. Having done this let $S=R / \mathfrak{p}\left[x_{1}, \ldots, x_{n}\right] \subset L$. Then $S$ is finite over $R$, a domain, and $S / \mathfrak{m} S$ is a quotient of $R / \mathfrak{m}\left[T_{1}, \ldots, T_{n}\right] /\left(T_{1}^{d_{1}}, \ldots, T_{n}^{d_{n}}\right)$. Hence $S$ is local. By (3) $S$ is analytically unramified and by Lemma 10.154 .10 we find that its integral closure $S^{\prime}$ in $L$ is finite over $S$. Since $S^{\prime}$ is also the integral closure of $R / \mathfrak{p}$ in $L$ we win.

The following proposition says in particular that an algebra of finite type over a Nagata ring is a Nagata ring.

0334 Proposition 10.154.15 (Nagata). Let $R$ be a ring. The following are equivalent:
(1) $R$ is a Nagata ring,
(2) any finite type $R$-algebra is Nagata, and
(3) $R$ is universally Japanese and Noetherian.

Proof. It is clear that a Noetherian universally Japanese ring is universally Nagata (i.e., condition (2) holds). Let $R$ be a Nagata ring. We will show that any finitely generated $R$-algebra $S$ is Nagata. This will prove the proposition.
Step 1. There exists a sequence of ring maps $R=R_{0} \rightarrow R_{1} \rightarrow R_{2} \rightarrow \ldots \rightarrow R_{n}=S$ such that each $R_{i} \rightarrow R_{i+1}$ is generated by a single element. Hence by induction it suffices to prove $S$ is Nagata if $S \cong R[x] / I$.
Step 2. Let $\mathfrak{q} \subset S$ be a prime of $S$, and let $\mathfrak{p} \subset R$ be the corresponding prime of $R$. We have to show that $S / \mathfrak{q}$ is $\mathrm{N}-2$. Hence we have reduced to the proving the following: $\left(^{*}\right)$ Given a Nagata domain $R$ and a monogenic extension $R \subset S$ of domains then $S$ is $\mathrm{N}-2$.
Step 3. Let $R$ be a Nagata domain and $R \subset S$ a monogenic extension of domains. Let $R \subset R^{\prime}$ be the integral closure of $R$ in its fraction field. Let $S^{\prime}$ be the subring of $f . f$. $(S)$ generated by $R^{\prime}$ and $S$. As $R^{\prime}$ is finite over $R$ (by the Nagata property) also $S^{\prime}$ is finite over $S$. Since $S$ is Noetherian it suffices to prove that $S^{\prime}$ is $\mathrm{N}-2$
(Lemma 10.153.7). Hence we have reduced to proving the following: (**) Given a normal Nagata domain $R$ and a monogenic extension $R \subset S$ of domains then $S$ is N-2.
Step 4: Let $R$ be a normal Nagata domain and let $R \subset S$ be a monogenic extension of domains. Suppose the extension of fraction fields $f . f .(R) \subset f . f .(S)$ is purely transcendental. In this case $S=R[x]$. By Lemma 10.153 .13 we see that $S$ is N2. Hence we have reduced to proving the following: (**) Given a normal Nagata domain $R$ and a monogenic extension $R \subset S$ of domains inducing a finite extension of fraction fields then $S$ is $\mathrm{N}-2$.
Step 5. Let $R$ be a normal Nagata domain and let $R \subset S$ be a monogenic extension of domains inducing a finite extension of fraction fields $K=f . f .(R) \subset f . f .(S)=L$. Choose an element $x \in S$ which generates $S$ as an $R$-algebra. Let $L \subset M$ be a finite extension of fields. Let $R^{\prime}$ be the integral closure of $R$ in $M$. Then the integral closure $S^{\prime}$ of $S$ in $M$ is equal to the integral closure of $R^{\prime}[x]$ in $M$. Also $f . f .\left(R^{\prime}\right)=M$, and $R \subset R^{\prime}$ is finite (by the Nagata property of $R$ ). This implies that $R^{\prime}$ is a Nagata ring (Lemma 10.154.5). To show that $S^{\prime}$ is finite over $S$ is the same as showing that $S^{\prime}$ is finite over $R^{\prime}[x]$. Replace $R$ by $R^{\prime}$ and $S$ by $S^{\prime}$ to reduce to the following statement: $\left({ }^{* * *}\right)$ Given a normal Nagata domain $R$ with fraction field $K$, and $x \in K$, the ring $S \subset K$ generated by $R$ and $x$ is $\mathrm{N}-1$.
Step 6. Let $R$ be a normal Nagata domain with fraction field $K$. Let $x=b / a \in K$. We have to show that the ring $S \subset K$ generated by $R$ and $x$ is $\mathrm{N}-1$. Note that $S_{a} \cong R_{a}$ is normal. Hence by Lemma 10.153 .15 it suffices to show that $S_{\mathfrak{m}}$ is N-1 for every maximal ideal $\mathfrak{m}$ of $S$.

With assumptions as in the preceding paragraph, pick such a maximal ideal and set $\mathfrak{n}=R \cap \mathfrak{m}$. The residue field extension $\kappa(\mathfrak{n}) \subset \kappa(\mathfrak{m})$ is finite (Theorem 10.33.1) and generated by the image of $x$. Hence there exists a monic polynomial $f(X)=$ $X^{d}+\sum_{i=1, \ldots, d} a_{i} X^{d-i}$ with $f(x) \in \mathfrak{m}$. Let $K \subset K^{\prime \prime}$ be a finite extension of fields such that $f(X)$ splits completely in $K^{\prime \prime}[X]$. Let $R^{\prime}$ be the integral closure of $R$ in $K^{\prime \prime}$. Let $S^{\prime} \subset K^{\prime}$ be the subring generated by $R^{\prime}$ and $x$. As $R$ is Nagata we see $R^{\prime}$ is finite over $R$ and Nagata (Lemma 10.154.5). Moreover, $S^{\prime}$ is finite over $S$. If for every maximal ideal $\mathfrak{m}^{\prime}$ of $S^{\prime}$ the local ring $S_{\mathfrak{m}^{\prime}}^{\prime}$ is N-1, then $S_{\mathfrak{m}}^{\prime}$ is N-1 by Lemma 10.153.15, which in turn implies that $S_{\mathfrak{m}}$ is $\mathrm{N}-1$ by Lemma 10.153.7. After replacing $R$ by $R^{\prime}$ and $S$ by $S^{\prime}$, and $\mathfrak{m}$ by any of the maximal ideals $\mathfrak{m}^{\prime}$ lying over $\mathfrak{m}$ we reach the situation where the polynomial $f$ above split completely: $f(X)=\prod_{i=1, \ldots, d}\left(X-a_{i}\right)$ with $a_{i} \in R$. Since $f(x) \in \mathfrak{m}$ we see that $x-a_{i} \in \mathfrak{m}$ for some $i$. Finally, after replacing $x$ by $x-a_{i}$ we may assume that $x \in \mathfrak{m}$.
To recapitulate: $R$ is a normal Nagata domain with fraction field $K, x \in K$ and $S$ is the subring of $K$ generated by $x$ and $R$, finally $\mathfrak{m} \subset S$ is a maximal ideal with $x \in \mathfrak{m}$. We have to show $S_{\mathfrak{m}}$ is N-1.

We will show that Lemma 10.154 .12 applies to the local ring $S_{\mathfrak{m}}$ and the element $x$. This will imply that $S_{\mathfrak{m}}$ is analytically unramified, whereupon we see that it is $\mathrm{N}-1$ by Lemma 10.154.10.
We have to check properties (1), (2), (3)(a) and (3)(b). Property (1) is trivial. Let $I=\operatorname{Ker}(R[X] \rightarrow S)$ where $X \mapsto x$. We claim that $I$ is generated by all linear forms $a X+b$ such that $a x=b$ in $K$. Clearly all these linear forms are in $I$. If $g=a_{d} X^{d}+\ldots a_{1} X+a_{0} \in I$, then we see that $a_{d} x$ is integral over $R$ (Lemma
10.122.1 and hence $b:=a_{d} x \in R$ as $R$ is normal. Then $g-\left(a_{d} X-b\right) X^{d-1} \in I$ and we win by induction on the degree. As a consequence we see that

$$
S / x S=R[X] /(X, I)=R / J
$$

where

$$
J=\{b \in R \mid a x=b \text { for some } a \in R\}=x R \cap R
$$

By Lemma 10.149 .6 we see that $S / x S=R / J$ has no embedded primes as an $R$ module, hence as an $R / J$-module, hence as an $S / x S$-module, hence as an $S$-module. This proves property (2). Take such an associated prime $\mathfrak{q} \subset S$ with the property $\mathfrak{q} \subset \mathfrak{m}$ (so that it is an associated prime of $S_{\mathfrak{m}} / x S_{\mathfrak{m}}$ - it does not matter for the arguments). Then $\mathfrak{q}$ is minimal over $x S$ and hence has height 1 . By the sequence of equalities above we see that $\mathfrak{p}=R \cap \mathfrak{q}$ is an associated prime of $R / J$, and so has height 1 (see Lemma 10.149.6). Thus $R_{\mathfrak{p}}$ is a discrete valuation ring and therefore $R_{\mathfrak{p}} \subset S_{\mathfrak{q}}$ is an equality. This shows that $S_{\mathfrak{q}}$ is regular. This proves property (3)(a). Finally, $(S / \mathfrak{q})_{\mathfrak{m}}$ is a localization of $S / \mathfrak{q}$, which is a quotient of $S / x S=R / J$. Hence $(S / \mathfrak{q})_{\mathfrak{m}}$ is a localization of a quotient of the Nagata ring $R$, hence Nagata (Lemmas 10.154 .5 and 10.154 .6 ) and hence analytically unramified (Lemma 10.154.13). This shows (3)(b) holds and we are done.

0335 Proposition 10.154.16. The following types of rings are Nagata and in particular universally Japanese:
(1) fields,
(2) Noetherian complete local rings,
(3) $\mathbf{Z}$,
(4) Dedekind domains with fraction field of characteristic zero,
(5) finite type ring extensions of any of the above.

Proof. The Noetherian complete local ring case is Lemma 10.154.8. In the other cases you just check if $R / \mathfrak{p}$ is N-2 for every prime ideal $\mathfrak{p}$ of the ring. This is clear whenever $R / \mathfrak{p}$ is a field, i.e., $\mathfrak{p}$ is maximal. Hence for the Dedekind ring case we only need to check it when $\mathfrak{p}=(0)$. But since we assume the fraction field has characteristic zero Lemma 10.153 .11 kicks in.
09E1 Example 10.154.17. A discrete valuation ring is Nagata if and only if it is N-2 (this follows immediately from the definition). The discrete valuation ring $A$ of Example 10.118 .5 is not Nagata, i.e., it is not N-2. Namely, the finite extension $A \subset R=A[f]$ is not $\mathrm{N}-1$. To see this say $f=\sum a_{i} x^{i}$. For every $n \geq 1$ set $g_{n}=\sum_{i<n} a_{i} x^{i} \in A$. Then $h_{n}=\left(f-g_{n}\right) / x^{n}$ is an element of the fraction field of $R$ and $h_{n}^{p} \in k^{p}[[x]] \subset A$. Hence the integral closure $R^{\prime}$ of $R$ contains $h_{1}, h_{2}, h_{3}, \ldots$. Now, if $R^{\prime}$ were finite over $R$ and hence $A$, then $f=x^{n} h_{n}+g_{n}$ would be contained in the submodule $A+x^{n} R^{\prime}$ for all $n$. By Artin-Rees this would imply $f \in A$ (Lemma 10.50.4, a contradiction.

09E2 Lemma 10.154.18. Let $(A, \mathfrak{m})$ be a Noetherian local domain which is Nagata and has fraction field of characteristic $p$. If $a \in A$ has a pth root in $A^{\wedge}$, then $a$ is has a pth root in $A$.
Proof. Consider the ring extension $A \subset B=A[x] /\left(x^{p}-a\right)$. If $a$ does not have a $p$ th root in $A$, then $B$ is a domain whose completion isn't reduced. This contradicts our earlier results, as $B$ is a Nagata (Proposition 10.154.15) and hence analytically unramified by Lemma 10.154 .13 .

### 10.155. Ascending properties

0336 In this section we start proving some algebraic facts concerning the "ascent" of properties of rings. To do this for depth of rings one uses the following result on ascending depth of modules, see DG67, IV, Proposition 6.3.1].

0338 Lemma 10.155.1. We have

$$
\operatorname{depth}\left(M \otimes_{R} N\right)=\operatorname{depth}(M)+\operatorname{depth}\left(N / \mathfrak{m}_{R} N\right)
$$

DG67, IV,
Proposition 6.3.1]
where $R \rightarrow S$ is a local homomorphism of local Noetherian rings, $M$ is a finite $R$-module, and $N$ is a finite $S$-module flat over $R$.

Proof. In the statement and in the proof below, we take the depth of $M$ as an $R$-module, the depth of $M \otimes_{R} N$ as an $S$-module, and the depth of $N / \mathfrak{M}_{R} N$ as an $S / \mathfrak{m}_{R} S$-module. Denote $n$ the right hand side. First assume that $n$ is zero. Then both $\operatorname{depth}(M)=0$ and $\operatorname{depth}\left(N / \mathfrak{m}_{R} N\right)=0$. This means there is a $z \in M$ whose annihilator is $\mathfrak{m}_{R}$ and a $\bar{y} \in N / \mathfrak{m}_{R} N$ whose annihilator is $\mathfrak{m}_{S} / \mathfrak{m}_{R} S$. Let $y \in N$ be a lift of $\bar{y}$. Since $N$ is flat over $R$ the map $z: R / \mathfrak{m}_{R} \rightarrow M$ produces an injective $\operatorname{map} N / \mathfrak{m}_{R} N \rightarrow M \otimes_{R} N$. Hence the annihilator of $z \otimes y$ is $\mathfrak{m}_{S}$. Thus $\operatorname{depth}\left(M \otimes_{R} N\right)=0$ as well.

Assume $n>0$. If depth $\left(N / \mathfrak{m}_{R} N\right)>0$, then choose an $f \in \mathfrak{m}_{S}$ which maps to an $N / \mathfrak{m}_{R} N$-regular element $\bar{f} \in S / \mathfrak{m}_{R} S$. Then $\operatorname{depth}\left(N / \mathfrak{m}_{R} N\right)=\operatorname{depth}\left(N /\left(f, \mathfrak{m}_{R}\right) N\right)+$ 1 by Lemma 10.71.7. According to Lemma 10.98.1 the element $f \in S$ is a $N$-regular element and $N / f N$ is flat over $R$. Hence by induction on $n$ we have

$$
\operatorname{depth}\left(M \otimes_{R} N / f N\right)=\operatorname{depth}(M)+\operatorname{depth}\left(N /\left(f, \mathfrak{m}_{R}\right) N\right)
$$

Because $N / f N$ is flat over $R$ the sequence

$$
0 \rightarrow M \otimes_{R} N \rightarrow M \otimes_{R} N \rightarrow M \otimes_{R} N / f N \rightarrow 0
$$

is exact where the first map is multiplication by $f$ (Lemma 10.38.12). Hence by Lemma 10.71 .7 we find that $\operatorname{depth}\left(M \otimes_{R} N\right)=\operatorname{depth}\left(M \otimes_{R} N / f N\right)+1$ and we conclude that equality holds in the formula of the lemma.

If $n>0$, but $\operatorname{depth}\left(N / \mathfrak{m}_{R} N\right)=0$, then we can choose an $M$-regular element $f \in \mathfrak{m}_{R}$. As $N$ is flat over $R$ it is also the case that $f$ is $M \otimes_{R} N$-regular. By induction on $n$ again we have

$$
\operatorname{depth}\left(M / f M \otimes_{R} N\right)=\operatorname{depth}(M / f M)+\operatorname{depth}\left(N / \mathfrak{m}_{R} N\right)
$$

In this case $\operatorname{depth}\left(M \otimes_{R} N\right)=\operatorname{depth}\left(M / f M \otimes_{R} N\right)+1$ and $\operatorname{depth}(M)=\operatorname{depth}(M / f M)+$ 1 by Lemma 10.71 .7 and we conclude that equality holds in the formula of the lemma.

0337 Lemma 10.155.2. Suppose that $R \rightarrow S$ is a flat and local ring homomorphism of Noetherian local rings. Then

$$
\operatorname{depth}(S)=\operatorname{depth}(R)+\operatorname{depth}\left(S / \mathfrak{m}_{R} S\right)
$$

Proof. This is a special case of Lemma 10.155.1.
045J Lemma 10.155.3. Let $R \rightarrow S$ be a local homomorphism of local Noetherian rings. Assume
(1) $S / \mathfrak{m}_{R} S$ is Cohen-Macaulay, and
(2) $R \rightarrow S$ is flat.

Then $S$ is Cohen-Macaulay if and only if $R$ is Cohen-Macaulay.
Proof. This follows from the definitions combined with Lemmas 10.155 .2 and 10.111.7.

0339 Lemma 10.155.4. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $R$ is Noetherian,
(2) $S$ is Noetherian,
(3) $\varphi$ is flat,
(4) the fibre rings $S \otimes_{R} \kappa(\mathfrak{p})$ are $\left(S_{k}\right)$, and
(5) $R$ has property $\left(S_{k}\right)$.

Then $S$ has property $\left(S_{k}\right)$.
Proof. Let $\mathfrak{q}$ be a prime of $S$ lying over a prime $\mathfrak{p}$ of $R$. By Lemma 10.155 .2 we have

$$
\operatorname{depth}\left(S_{\mathfrak{q}}\right)=\operatorname{depth}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)+\operatorname{depth}\left(R_{\mathfrak{p}}\right)
$$

On the other hand, we have

$$
\operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right) \geq \operatorname{dim}\left(S_{\mathfrak{q}}\right)
$$

by Lemma 10.111.6. (Actually equality holds, by Lemma 10.111 .7 but strictly speaking we do not need this.) Finally, as the fibre rings of the map are assumed $\left(S_{k}\right)$ we see that $\operatorname{depth}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right) \geq \min \left(k, \operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)\right)$. Thus the lemma follows by the following string of inequalities

$$
\begin{aligned}
\operatorname{depth}\left(S_{\mathfrak{q}}\right) & =\operatorname{depth}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)+\operatorname{depth}\left(R_{\mathfrak{p}}\right) \\
& \geq \min \left(k, \operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)\right)+\min \left(k, \operatorname{dim}\left(R_{\mathfrak{p}}\right)\right) \\
& =\min \left(2 k, \operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)+k, k+\operatorname{dim}\left(R_{\mathfrak{p}}\right), \operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)+\operatorname{dim}\left(R_{\mathfrak{p}}\right)\right) \\
& \geq \min \left(k, \operatorname{dim}\left(S_{\mathfrak{q}}\right)\right)
\end{aligned}
$$

as desired.
033A Lemma 10.155.5. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $R$ is Noetherian,
(2) $S$ is Noetherian
(3) $\varphi$ is flat,
(4) the fibre rings $S \otimes_{R} \kappa(\mathfrak{p})$ are regular, and
(5) $R$ has property $\left(R_{k}\right)$.

Then $S$ has property $\left(R_{k}\right)$.
Proof. Let $\mathfrak{q}$ be a prime of $S$ lying over a prime $\mathfrak{p}$ of $R$. Assume that $\operatorname{dim}\left(S_{\mathfrak{q}}\right) \leq k$. Since $\operatorname{dim}\left(S_{\mathfrak{q}}\right)=\operatorname{dim}\left(R_{\mathfrak{p}}\right)+\operatorname{dim}\left(S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}\right)$ by Lemma 10.111 .7 we see that $\operatorname{dim}\left(R_{\mathfrak{p}}\right) \leq$ $k$. Hence $R_{\mathfrak{p}}$ is regular by assumption. It follows that $S_{\mathfrak{q}}$ is regular by Lemma 10.111.8.

033B Lemma 10.155.6. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is smooth,
(2) $R$ is reduced.

Then $S$ is reduced.

Proof. First assume $R$ is Noetherian. In this case being reduced is the same as having properties $\left(S_{1}\right)$ and $\left(R_{0}\right)$, see Lemma 10.149 .3 . Note that $S$ is Noetherian, and $R \rightarrow S$ is flat with regular fibres (see the list of results on smooth ring maps in Section 10.140 . Hence we may apply Lemmas 10.155 .4 and 10.155 .5 and we see that $S$ is $\left(S_{1}\right)$ and $\left(R_{0}\right)$, in other words reduced by Lemma 10.149.3 again.

In the general case we may find a finitely generated $\mathbf{Z}$-subalgebra $R_{0} \subset R$ and a smooth ring map $R_{0} \rightarrow S_{0}$ such that $S \cong R \otimes_{R_{0}} S_{0}$, see remark (10) in Section 10.140. Now, if $x \in S$ is an element with $x^{2}=0$, then we can enlarge $R_{0}$ and assume that $x$ comes from an element $x_{0} \in S_{0}$. After enlarging $R_{0}$ once more we may assume that $x_{0}^{2}=0$ in $S_{0}$. However, since $R_{0} \subset R$ is reduced we see that $S_{0}$ is reduced and hence $x_{0}=0$ as desired.

033C Lemma 10.155.7. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is smooth,
(2) $R$ is normal.

Then $S$ is normal.
Proof. First assume $R$ is Noetherian. In this case being normal is the same as having properties $\left(S_{2}\right)$ and $\left(R_{1}\right)$, see Lemma 10.149.4. Note that $S$ is Noetherian, and $R \rightarrow S$ is flat with regular fibres (see the list of results on smooth ring maps in Section 10.140 . Hence we may apply Lemmas 10.155 .4 and 10.155 .5 and we see that $S$ is $\left(S_{2}\right)$ and $\left(R_{1}\right)$, in other words normal by Lemma 10.149.4 again.

The general case. First note that $R$ is reduced and hence $S$ is reduced by Lemma 10.155.6. Let $\mathfrak{q}$ be a prime of $S$ and let $\mathfrak{p}$ be the corresponding prime of $R$. Note that $R_{\mathfrak{p}}$ is a normal domain. We have to show that $S_{\mathfrak{q}}$ is a normal domain. To do this we may replace $R$ by $R_{\mathfrak{p}}$ and $S$ by $S_{\mathfrak{p}}$. Hence we may assume that $R$ is a normal domain.

Assume $R \rightarrow S$ smooth, and $R$ a normal domain. We may find a finitely generated Z-subalgebra $R_{0} \subset R$ and a smooth ring map $R_{0} \rightarrow S_{0}$ such that $S \cong R \otimes_{R_{0}} S_{0}$, see remark (10) in Section 10.140 . As $R_{0}$ is a Nagata domain (see Proposition 10.154.16) we see that its integral closure $R_{0}^{\prime}$ is finite over $R_{0}$. Moreover, as $R$ is a normal domain it is clear that $R_{0}^{\prime} \subset R$. Hence we may replace $R_{0}$ by $R_{0}^{\prime}$ and $S_{0}$ by $R_{0}^{\prime} \otimes_{R_{0}} S_{0}$ and assume that $R_{0}$ is a normal Noetherian domain. By the first paragraph of the proof we conclude that $S_{0}$ is a normal ring (it need not be a domain of course). In this way we see that $R=\bigcup R_{\lambda}$ is the union of normal Noetherian domains and correspondingly $S=\operatorname{colim} R_{\lambda} \otimes_{R_{0}} S_{0}$ is the colimit of normal rings. This implies that $S$ is a normal ring. Some details omitted.

07NF Lemma 10.155.8. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is smooth,
(2) $R$ is a regular ring.

Then $S$ is regular.
Proof. This follows from Lemma 10.155.5 applied for all $\left(R_{k}\right)$ using Lemma 10.138 .3 to see that the hypotheses are satisfied.

### 10.156. Descending properties

033D In this section we start proving some algebraic facts concerning the "descent" of properties of rings. It turns out that it is often "easier" to descend properties than it is to ascend them. In other words, the assumption on the ring map $R \rightarrow S$ are often weaker than the assumptions in the corresponding lemma of the preceding section. However, we warn the reader that the results on descent are often useless unless the corresponding ascent can also be shown! Here is a typical result which illustrates this phenomenon.

033E Lemma 10.156.1. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is faithfully flat, and
(2) $S$ is Noetherian.

Then $R$ is Noetherian.
Proof. Let $I_{0} \subset I_{1} \subset I_{2} \subset \ldots$ be a growing sequence of ideals of $R$. By assumption we have $I_{n} S=I_{n+1} S=I_{n+2} S=\ldots$ for some $n$. Since $R \rightarrow S$ is flat we have $I_{k} S=$ $I_{k} \otimes_{R} S$. Hence, as $R \rightarrow S$ is faithfully flat we see that $I_{n} S=I_{n+1} S=I_{n+2} S=\ldots$ implies that $I_{n}=I_{n+1}=I_{n+2}=\ldots$ as desired.

033F Lemma 10.156.2. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is faithfully flat, and
(2) $S$ is reduced.

Then $R$ is reduced.
Proof. This is clear as $R \rightarrow S$ is injective.
033G Lemma 10.156.3. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is faithfully flat, and
(2) $S$ is a normal ring.

Then $R$ is a normal ring.
Proof. Since $S$ is reduced it follows that $R$ is reduced. Let $\mathfrak{p}$ be a prime of $R$. We have to show that $R_{\mathfrak{p}}$ is a normal domain. Since $S_{\mathfrak{p}}$ is faithfully over $R_{\mathfrak{p}}$ too we may assume that $R$ is local with maximal ideal $\mathfrak{m}$. Let $\mathfrak{q}$ be a prime of $S$ lying over $\mathfrak{m}$. Then we see that $R \rightarrow S_{\mathfrak{q}}$ is faithfully flat (Lemma 10.38.17). Hence we may assume $S$ is local as well. In particular $S$ is a normal domain. Since $R \rightarrow S$ is faithfully flat and $S$ is a normal domain we see that $R$ is a domain. Next, suppose that $a / b$ is integral over $R$ with $a, b \in R$. Then $a / b \in S$ as $S$ is normal. Hence $a \in b S$. This means that $a: R \rightarrow R / b R$ becomes the zero map after base change to $S$. By faithful flatness we see that $a \in b R$, so $a / b \in R$. Hence $R$ is normal.

07 NG Lemma 10.156.4. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is faithfully flat, and
(2) $S$ is a regular ring.

Then $R$ is a regular ring.
Proof. We see that $R$ is Noetherian by Lemma 10.156.1. Let $\mathfrak{p} \subset R$ be a prime. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$. Then Lemma 10.109 .9 applies to $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ and we conclude that $R_{\mathfrak{p}}$ is regular. Since $\mathfrak{p}$ was arbitrary we see $R$ is regular.

0352 Lemma 10.156.5. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is faithfully flat, and
(2) $S$ is Noetherian and has property $\left(S_{k}\right)$.

Then $R$ is Noetherian and has property $\left(S_{k}\right)$.
Proof. We have already seen that (1) and (2) imply that $R$ is Noetherian, see Lemma 10.156.1. Let $\mathfrak{p} \subset R$ be a prime ideal. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$ which corresponds to a minimal prime of the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$. Then $A=R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}=B$ is a flat local ring homomorphism of Noetherian local rings with $\mathfrak{m}_{A} B$ an ideal of definition of $B$. Hence $\operatorname{dim}(A)=\operatorname{dim}(B)$ (Lemma 10.111.7) and $\operatorname{depth}(A)=\operatorname{depth}(B)\left(\right.$ Lemma 10.155.2). Hence since $B$ has $\left(S_{k}\right)$ we see that $A$ has $\left(S_{k}\right)$.

0353 Lemma 10.156.6. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is faithfully flat, and
(2) $S$ is Noetherian and has property $\left(R_{k}\right)$.

Then $R$ is Noetherian and has property $\left(R_{k}\right)$.
Proof. We have already seen that (1) and (2) imply that $R$ is Noetherian, see Lemma 10.156.1. Let $\mathfrak{p} \subset R$ be a prime ideal and assume $\operatorname{dim}\left(R_{\mathfrak{p}}\right) \leq k$. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$ which corresponds to a minimal prime of the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$. Then $A=R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}=B$ is a flat local ring homomorphism of Noetherian local rings with $\mathfrak{m}_{A} B$ an ideal of definition of $B$. Hence $\operatorname{dim}(A)=\operatorname{dim}(B)$ (Lemma 10.111.7. As $S$ has $\left(R_{k}\right)$ we conclude that $B$ is a regular local ring. By Lemma 10.109 .9 we conclude that $A$ is regular.

0354 Lemma 10.156.7. Let $R \rightarrow S$ be a ring map. Assume that
(1) $R \rightarrow S$ is smooth and surjective on spectra, and
(2) $S$ is a Nagata ring.

Then $R$ is a Nagata ring.
Proof. Recall that a Nagata ring is the same thing as a Noetherian universally Japanese ring (Proposition 10.154.15). We have already seen that $R$ is Noetherian in Lemma 10.156.1. Let $R \rightarrow A$ be a finite type ring map into a domain. According to Lemma 10.154 .3 it suffices to check that $A$ is $\mathrm{N}-1$. It is clear that $B=A \otimes_{R} S$ is a finite type $S$-algebra and hence Nagata (Proposition 10.154.15). Since $A \rightarrow B$ is smooth (Lemma 10.135.4) we see that $B$ is reduced (Lemma 10.155.6). Since $B$ is Noetherian it has only a finite number of minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ (see Lemma 10.30.6. As $A \rightarrow B$ is flat each of these lies over ( 0 ) $\subset A$ (by going down, see Lemma 10.38.18) The total ring of fractions $Q(B)$ is the product of the $L_{i}=$ $f . f .\left(B / \mathfrak{q}_{i}\right)$ Lemmas 10.24.4 and 10.24.1). Moreover, the integral closure $B^{\prime}$ of $B$ in $Q(B)$ is the product of the integral closures $B_{i}^{\prime}$ of the $B / \mathfrak{q}_{i}$ in the factors $L_{i}$ (compare with Lemma 10.36 .15 ). Since $B$ is universally Japanese the ring extensions $B / \mathfrak{q}_{i} \subset$ $B_{i}^{\prime}$ are finite and we conclude that $B^{\prime}=\prod B_{i}^{\prime}$ is finite over $B$. Since $A \rightarrow B$ is flat we see that any nonzerodivisor on $A$ maps to a nonzerodivisor on $B$. The corresponding map

$$
Q(A) \otimes_{A} B=(A \backslash\{0\})^{-1} A \otimes_{A} B=(A \backslash\{0\})^{-1} B \rightarrow Q(B)
$$

is injective (we used Lemma 10.11.15). Via this map $A^{\prime}$ maps into $B^{\prime}$. This induces a map

$$
A^{\prime} \otimes_{A} B \longrightarrow B^{\prime}
$$

which is injective (by the above and the flatness of $A \rightarrow B$ ). Since $B^{\prime}$ is a finite $B$-module and $B$ is Noetherian we see that $A^{\prime} \otimes_{A} B$ is a finite $B$-module. Hence there exist finitely many elements $x_{i} \in A^{\prime}$ such that the elements $x_{i} \otimes 1$ generate $A^{\prime} \otimes_{A} B$ as a $B$-module. Finally, by faithful flatness of $A \rightarrow B$ we conclude that the $x_{i}$ also generated $A^{\prime}$ as an $A$-module, and we win.
0355 Remark 10.156.8. The property of being "universally catenary" does not descend; not even along étale ring maps. In Examples, Section 88.16 there is a construction of a finite ring map $A \rightarrow B$ with $A$ local Noetherian and not universally catenary, $B$ semi-local with two maximal ideals $\mathfrak{m}, \mathfrak{n}$ with $B_{\mathfrak{m}}$ and $B_{\mathfrak{n}}$ regular of dimension 2 and 1 respectively, and the same residue fields as that of $A$. Moreover, $\mathfrak{m}_{A}$ generates the maximal ideal in both $B_{\mathfrak{m}}$ and $B_{\mathfrak{n}}$ (so $A \rightarrow B$ is unramified as well as finite). By Lemma 10.147 .10 there exists a local étale ring map $A \rightarrow A^{\prime}$ such that $B \otimes_{A} A^{\prime}=B_{1} \times B_{2}$ decomposes with $A^{\prime} \rightarrow B_{i}$ surjective. This shows that $A^{\prime}$ has two minimal primes $\mathfrak{q}_{i}$ with $A^{\prime} / \mathfrak{q}_{i} \cong B_{i}$. Since $B_{i}$ is regular local (since it is étale over either $B_{\mathfrak{m}}$ or $B_{\mathfrak{n}}$ ) we conclude that $A^{\prime}$ is universally catenary.

### 10.157. Geometrically normal algebras

037Y In this section we put some applications of ascent and descent of properties of rings.
037Z Lemma 10.157.1. Let $k$ be a field. Let $A$ be a $k$-algebra. The following properties of $A$ are equivalent:
(1) $k^{\prime} \otimes_{k} A$ is a normal ring for every field extension $k \subset k^{\prime}$,
(2) $k^{\prime} \otimes_{k} A$ is a normal ring for every finitely generated field extension $k \subset k^{\prime}$, and
(3) $k^{\prime} \otimes_{k} A$ is a normal ring for every finite purely inseparable extension $k \subset$ $k^{\prime}$.
where normal ring is as defined in Definition 10.36.11.
Proof. It is clear that $(1) \Rightarrow(2) \Rightarrow(3)$.
Assume (2) and let $k \subset k^{\prime}$ be any field extension. Then we can write $k^{\prime}=\operatorname{colim}_{i} k_{i}$ as a directed colimit of finitely generated field extensions. Hence we see that $k^{\prime} \otimes_{k}$ $A=\operatorname{colim}_{i} k_{i} \otimes_{k} A$ is a directed colimit of normal rings. Thus we see that $k^{\prime} \otimes_{k} A$ is a normal ring by Lemma 10.36.16. Hence (1) holds.

Assume (3) and let $k \subset K$ be a finitely generated field extension. By Lemma 10.44 .3 we can find a diagram

where $k \subset k^{\prime}, K \subset K^{\prime}$ are finite purely inseparable field extensions such that $k^{\prime} \subset K^{\prime}$ is separable. By Lemma 10.150 .10 there exists a smooth $k^{\prime}$-algebra $B$ such that $K^{\prime}$ is the fraction field of $B$. Now we can argue as follows: Step $1: k^{\prime} \otimes_{k} A$ is a normal ring because we assumed (3). Step 2: $B \otimes_{k^{\prime}} k^{\prime} \otimes_{k} A$ is a normal ring as $k^{\prime} \otimes_{k} A \rightarrow B \otimes_{k^{\prime}} k^{\prime} \otimes_{k} A$ is smooth (Lemma 10.135.4) and ascent of normality along smooth maps (Lemma 10.155.7). Step 3. $K^{\prime} \otimes_{k^{\prime}} k^{\prime} \otimes_{k} A=K^{\prime} \otimes_{k} A$ is a normal ring as it is a localization of a normal ring (Lemma 10.36.13). Step 4. Finally $K \otimes_{k} A$ is a normal ring by descent of normality along the faithfully flat ring map $K \otimes_{k} A \rightarrow K^{\prime} \otimes_{k} A$ (Lemma 10.156.3). This proves the lemma.

0380 Definition 10.157.2. Let $k$ be a field. A $k$-algebra $R$ is called geometrically normal over $k$ if the equivalent conditions of Lemma 10.157.1 hold.

06DE Lemma 10.157.3. Let $k$ be a field. A localization of a geometrically normal $k$-algebra is geometrically normal.

Proof. This is clear as being a normal ring is checked at the localizations at prime ideals.

06DF Lemma 10.157.4. Let $k$ be a field. Let $A, B$ be $k$-algebras. Assume $A$ is geometrically normal over $k$ and $B$ is a normal ring. Then $A \otimes_{k} B$ is a normal ring.

Proof. Let $\mathfrak{r}$ be a prime ideal of $A \otimes_{k} B$. Denote $\mathfrak{p}$, resp. $\mathfrak{q}$ the corresponding prime of $A$, resp. $B$. Then $\left(A \otimes_{k} B\right)_{\mathfrak{r}}$ is a localization of $A_{\mathfrak{p}} \otimes_{k} B_{\mathfrak{q}}$. Hence it suffices to prove the result for the ring $A_{\mathfrak{p}} \otimes_{k} B_{\mathfrak{q}}$, see Lemma 10.36 .13 and Lemma 10.157 .3 . Thus we may assume $A$ and $B$ are domains.

Assume that $A$ and $B$ are domains with fractions fields $K$ and $L$. Note that $B$ is the filtered colimit of its finite type normal $k$-sub algebras (as $k$ is a Nagata ring, see Proposition 10.154 .16 , and hence the integral closure of a finite type $k$-sub algebra is still a finite type $k$-sub algebra by Proposition 10.154.15). By Lemma 10.36 .16 we reduce to the case that $B$ is of finite type over $k$.

Assume that $A$ and $B$ are domains with fractions fields $K$ and $L$ and $B$ of finite type over $k$. In this case the ring $K \otimes_{k} B$ is of finite type over $K$, hence Noetherian (Lemma 10.30.1). In particular $K \otimes_{k} B$ has finitely many minimal primes (Lemma 10.30.6. Since $A \rightarrow A \otimes_{k} B$ is flat, this implies that $A \otimes_{k} B$ has finitely many minimal primes (by going down for flat ring maps - Lemma 10.38.18- these primes all lie over $(0) \subset A)$. Thus it suffices to prove that $A \otimes_{k} B$ is integrally closed in its total ring of fractions (Lemma 10.36.15).
We claim that $K \otimes_{k} B$ and $A \otimes_{k} L$ are both normal rings. If this is true then any element $x$ of $Q\left(A \otimes_{k} B\right)$ which is integral over $A \otimes_{k} B$ is (by Lemma 10.36.12) contained in $K \otimes_{k} B \cap A \otimes_{k} L=A \otimes_{k} B$ and we're done. Since $A \otimes_{K} L$ is a normal ring by assumption, it suffices to prove that $K \otimes_{k} B$ is normal.
As $A$ is geometrically normal over $k$ we see $K$ is geometrically normal over $k$ (Lemma 10.157.3 hence $K$ is geometrically reduced over $k$. Hence $K=\bigcup K_{i}$ is the union of finitely generated field extensions of $k$ which are geometrically reduced (Lemma 10.42 .2 ). Each $K_{i}$ is the localization of a smooth $k$-algebra (Lemma 10.150.10). So $K_{i} \otimes_{k} B$ is the localization of a smooth $B$-algebra hence normal (Lemma 10.155.7). Thus $K \otimes_{k} B$ is a normal ring (Lemma 10.36.16) and we win.

### 10.158. Geometrically regular algebras

045 K Let $k$ be a field. Let $A$ be a Noetherian $k$-algebra. Let $k \subset K$ be a finitely generated field extension. Then the ring $K \otimes_{k} A$ is Noetherian as well, see Lemma 10.30.7. Thus the following lemma makes sense.

0381 Lemma 10.158.1. Let $k$ be a field. Let $A$ be a $k$-algebra. Assume $A$ is Noetherian. The following properties of $A$ are equivalent:
(1) $k^{\prime} \otimes_{k} A$ is regular for every finitely generated field extension $k \subset k^{\prime}$, and
(2) $k^{\prime} \otimes_{k} A$ is regular for every finite purely inseparable extension $k \subset k^{\prime}$.

Here regular ring is as in Definition 10.109.7.
Proof. The lemma makes sense by the remarks preceding the lemma. It is clear that $(1) \Rightarrow(2)$.
Assume (2) and let $k \subset K$ be a finitely generated field extension. By Lemma 10.44 .3 we can find a diagram

where $k \subset k^{\prime}, K \subset K^{\prime}$ are finite purely inseparable field extensions such that $k^{\prime} \subset K^{\prime}$ is separable. By Lemma 10.150 .10 there exists a smooth $k^{\prime}$-algebra $B$ such that $K^{\prime}$ is the fraction field of $B$. Now we can argue as follows: Step $1: k^{\prime} \otimes_{k} A$ is a regular ring because we assumed (2). Step 2: $B \otimes_{k^{\prime}} k^{\prime} \otimes_{k} A$ is a regular ring as $k^{\prime} \otimes_{k} A \rightarrow B \otimes_{k^{\prime}} k^{\prime} \otimes_{k} A$ is smooth (Lemma 10.135.4) and ascent of regularity along smooth maps (Lemma 10.155.8). Step 3. $K^{\prime} \otimes_{k^{\prime}} k^{\prime} \otimes_{k} A=K^{\prime} \otimes_{k} A$ is a regular ring as it is a localization of a regular ring (immediate from the definition). Step 4. Finally $K \otimes_{k} A$ is a regular ring by descent of regularity along the faithfully flat ring map $K \otimes_{k} A \rightarrow K^{\prime} \otimes_{k} A$ (Lemma 10.156.4). This proves the lemma.

0382 Definition 10.158.2. Let $k$ be a field. Let $R$ be a Noetherian $k$-algebra. The $k$-algebra $R$ is called geometrically regular over $k$ if the equivalent conditions of Lemma 10.158.1 hold.

It is clear from the definition that $K \otimes_{k} R$ is a geometrically regular algebra over $K$ for any finitely generated field extension $K$ of $k$. We will see later (More on Algebra, Proposition 15.27.1 that it suffices to check $R \otimes_{k} k^{\prime}$ is regular whenever $k \subset k^{\prime} \subset k^{1 / p}$ (finite).

07NH Lemma 10.158.3. Let $k$ be a field. Let $A \rightarrow B$ be a faithfully flat $k$-algebra map. If $B$ is geometrically regular over $k$, so is $A$.

Proof. Assume $B$ is geometrically regular over $k$. Let $k \subset k^{\prime}$ be a finite, purely inseparable extension. Then $A \otimes_{k} k^{\prime} \rightarrow B \otimes_{k} k^{\prime}$ is faithfully flat as a base change of $A \rightarrow B$ (by Lemmas 10.29 .3 and 10.38 .7 ) and $B \otimes_{k} k^{\prime}$ is regular by our assumption on $B$ over $k$. Then $A \otimes_{k} k^{\prime}$ is regular by Lemma 10.156.4.

07QF Lemma 10.158.4. Let $k$ be a field. Let $A \rightarrow B$ be a smooth ring map of $k$ algebras. If $A$ is geometrically regular over $k$, then $B$ is geometrically regular over $k$.

Proof. Let $k \subset k^{\prime}$ be a finitely generated field extension. Then $A \otimes_{k} k^{\prime} \rightarrow B \otimes_{k} k^{\prime}$ is a smooth ring map (Lemma 10.135.4) and $A \otimes_{k} k^{\prime}$ is regular. Hence $B \otimes_{k} k^{\prime}$ is regular by Lemma 10.155.8.
07QG Lemma 10.158.5. Let $k$ be a field. Let $A$ be an algebra over $k$. Let $k=\operatorname{colim} k_{i}$ be a directed colimit of subfields. If $A$ is geometrically regular over each $k_{i}$, then $A$ is geometrically regular over $k$.
Proof. Let $k \subset k^{\prime}$ be a finite purely inseparable field extension. We can get $k^{\prime}$ by adjoining finitely many variables to $k$ and imposing finitely many polynomial relations. Hence we see that there exists an $i$ and a finite purely inseparable field
extension $k_{i} \subset k_{i}^{\prime}$ such that $k_{i}=k \otimes_{k_{i}} k_{i}^{\prime}$. Thus $A \otimes_{k} k^{\prime}=A \otimes_{k_{i}} k_{i}^{\prime}$ and the lemma is clear.

07QH Lemma 10.158.6. Let $k \subset k^{\prime}$ be a separable algebraic field extension. Let $A$ be an algebra over $k^{\prime}$. Then $A$ is geometrically regular over $k$ if and only if it is geometrically regular over $k^{\prime}$.

Proof. Let $k \subset L$ be a finite purely inseparable field extension. Then $L^{\prime}=k^{\prime} \otimes_{k} L$ is a field (see material in Fields, Section 9.27) and $A \otimes_{k} L=A \otimes_{k^{\prime}} L^{\prime}$. Hence if $A$ is geometrically regular over $k^{\prime}$, then $A$ is geometrically regular over $k$.

Assume $A$ is geometrically regular over $k$. Since $k^{\prime}$ is the filtered colimit of finite extensions of $k$ we may assume by Lemma 10.158 .5 that $k^{\prime} / k$ is finite separable. Consider the ring maps

$$
k^{\prime} \rightarrow A \otimes_{k} k^{\prime} \rightarrow A
$$

Note that $A \otimes_{k} k^{\prime}$ is geometrically regular over $k^{\prime}$ as a base change of $A$ to $k^{\prime}$. Note that $A \otimes_{k} k^{\prime} \rightarrow A$ is the base change of $k^{\prime} \otimes_{k} k^{\prime} \rightarrow k^{\prime}$ by the map $k^{\prime} \rightarrow A$. Since $k^{\prime} / k$ is an étale extension of rings, we see that $k^{\prime} \otimes_{k} k^{\prime} \rightarrow k^{\prime}$ is étale (Lemma 10.141.3). Hence $A$ is geometrically regular over $k^{\prime}$ by Lemma 10.158.4

### 10.159. Geometrically Cohen-Macaulay algebras

045 L This section is a bit of a misnomer, since Cohen-Macaulay algebras are automatically geometrically Cohen-Macaulay. Namely, see Lemma 10.129 .6 and Lemma 10.159 .2 below.

045M Lemma 10.159.1. Let $k$ be a field and let $k \subset K$ and $k \subset L$ be two field extensions such that one of them is a field extension of finite type. Then $K \otimes_{k} L$ is a Noetherian Cohen-Macaulay ring.

Proof. The ring $K \otimes_{k} L$ is Noetherian by Lemma 10.30.7. Say $K$ is a finite extension of the purely transcendental extension $k\left(t_{1}, \ldots, t_{r}\right)$. Then $k\left(t_{1}, \ldots, t_{r}\right) \otimes_{k}$ $L \rightarrow K \otimes_{k} L$ is a finite free ring map. By Lemma 10.111 .9 it suffices to show that $k\left(t_{1}, \ldots, t_{r}\right) \otimes_{k} L$ is Cohen-Macaulay. This is clear because it is a localization of the polynomial ring $L\left[t_{1}, \ldots, t_{r}\right]$. (See for example Lemma 10.103 .7 for the fact that a polynomial ring is Cohen-Macaulay.)

045N Lemma 10.159.2. Let $k$ be a field. Let $S$ be a Noetherian $k$-algebra. Let $k \subset K$ be a finitely generated field extension, and set $S_{K}=K \otimes_{k} S$. Let $\mathfrak{q} \subset S$ be a prime of $S$. Let $\mathfrak{q}_{K} \subset S_{K}$ be a prime of $S_{K}$ lying over $\mathfrak{q}$. Then $S_{\mathfrak{q}}$ is Cohen-Macaulay if and only if $\left(S_{K}\right)_{\mathfrak{q}_{K}}$ is Cohen-Macaulay.

Proof. By Lemma 10.30 .7 the ring $S_{K}$ is Noetherian. Hence $S_{\mathfrak{q}} \rightarrow\left(S_{K}\right)_{\mathfrak{q}_{K}}$ is a flat local homomorphism of Noetherian local rings. Note that the fibre

$$
\left(S_{K}\right)_{\mathfrak{q}_{K}} / \mathfrak{q}\left(S_{K}\right)_{\mathfrak{q}_{K}} \cong\left(\kappa(\mathfrak{q}) \otimes_{k} K\right)_{\mathfrak{q}^{\prime}}
$$

is the localization of the Cohen-Macaulay (Lemma 10.159.1) ring $\kappa(\mathfrak{q}) \otimes_{k} K$ at a suitable prime ideal $\mathfrak{q}^{\prime}$. Hence the lemma follows from Lemma 10.155.3.

### 10.160. Colimits and maps of finite presentation, II

07 RF This section is a continuation of Section 10.126
We start with an application of the openness of flatness. It says that we can approximate flat modules by flat modules which is useful.

02JO Lemma 10.160.1. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume that
(1) $R \rightarrow S$ is of finite presentation,
(2) $M$ is a finitely presented $S$-module, and
(3) $M$ is flat over $R$.

In this case we have the following:
(1) There exists a finite type $\mathbf{Z}$-algebra $R_{0}$ and a finite type ring map $R_{0} \rightarrow S_{0}$ and a finite $S_{0}$-module $M_{0}$ such that $M_{0}$ is flat over $R_{0}$, together with a ring maps $R_{0} \rightarrow R$ and $S_{0} \rightarrow S$ and an $S_{0}$-module map $M_{0} \rightarrow M$ such that $S \cong R \otimes_{R_{0}} S_{0}$ and $M=S \otimes_{S_{0}} M_{0}$.
(2) If $R=\operatorname{colim}_{\lambda \in \Lambda} R_{\lambda}$ is written as a directed colimit, then there exists a $\lambda$ and a ring map $R_{\lambda} \rightarrow S_{\lambda}$ of finite presentation, and an $S_{\lambda}$-module $M_{\lambda}$ of finite presentation such that $M_{\lambda}$ is flat over $R_{\lambda}$ and such that $S=R \otimes_{R_{\lambda}} S_{\lambda}$ and $M=S \otimes_{S_{\lambda}} M_{\lambda}$.
(3) If

$$
(R \rightarrow S, M)=\operatorname{colim}_{\lambda \in \Lambda}\left(R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}\right)
$$

is written as a directed colimit such that
(a) $R_{\mu} \otimes_{R_{\lambda}} S_{\lambda} \rightarrow S_{\mu}$ and $S_{\mu} \otimes_{S_{\lambda}} M_{\lambda} \rightarrow M_{\mu}$ are isomorphisms for $\mu \geq \lambda$,
(b) $R_{\lambda} \rightarrow S_{\lambda}$ is of finite presentation,
(c) $M_{\lambda}$ is a finitely presented $S_{\lambda}$-module,
then for all sufficiently large $\lambda$ the module $M_{\lambda}$ is flat over $R_{\lambda}$.
Proof. We first write $(R \rightarrow S, M)$ as the directed colimit of a system $\left(R_{\lambda} \rightarrow\right.$ $\left.S_{\lambda}, M_{\lambda}\right)$ as in as in Lemma 10.126 .15 . Let $\mathfrak{q} \subset S$ be a prime. Let $\mathfrak{p} \subset R, \mathfrak{q}_{\lambda} \subset S_{\lambda}$, and $\mathfrak{p}_{\lambda} \subset R_{\lambda}$ the corresponding primes. As seen in the proof of Theorem 10.128 .4

$$
\left(\left(R_{\lambda}\right)_{\mathfrak{p}_{\lambda}},\left(S_{\lambda}\right)_{\mathfrak{q}_{\lambda}},\left(M_{\lambda}\right)_{\mathfrak{q}_{\lambda}}\right)
$$

is a system as in Lemma 10.126.11 and hence by Lemma 10.127 .3 we see that for some $\lambda_{\mathfrak{q}} \in \Lambda$ for all $\lambda \geq \lambda_{\mathfrak{q}}$ the module $M_{\lambda}$ is flat over $R_{\lambda}$ at the prime $\mathfrak{q}_{\lambda}$.

By Theorem 10.128 .4 we get an open subset $U_{\lambda} \subset \operatorname{Spec}\left(S_{\lambda}\right)$ such that $M_{\lambda}$ flat over $R_{\lambda}$ at all the primes of $U_{\lambda}$. Denote $V_{\lambda} \subset \operatorname{Spec}(S)$ the inverse image of $U_{\lambda}$ under the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}\left(S_{\lambda}\right)$. The argument above shows that for every $\mathfrak{q} \in \operatorname{Spec}(S)$ there exists a $\lambda_{\mathfrak{q}}$ such that $\mathfrak{q} \in V_{\lambda}$ for all $\lambda \geq \lambda_{\mathfrak{q}}$. Since $\operatorname{Spec}(S)$ is quasi-compact we see this implies there exists a single $\lambda_{0} \in \Lambda$ such that $V_{\lambda_{0}}=\operatorname{Spec}(S)$.
The complement $\operatorname{Spec}\left(S_{\lambda_{0}}\right) \backslash U_{\lambda_{0}}$ is $V(I)$ for some ideal $I \subset S_{\lambda_{0}}$. As $V_{\lambda_{0}}=\operatorname{Spec}(S)$ we see that $I S=S$. Choose $f_{1}, \ldots, f_{r} \in I$ and $s_{1}, \ldots, s_{n} \in S$ such that $\sum f_{i} s_{i}=1$. Since colim $S_{\lambda}=S$, after increasing $\lambda_{0}$ we may assume there exist $s_{i, \lambda_{0}} \in S_{\lambda_{0}}$ such that $\sum f_{i} s_{i, \lambda_{0}}=1$. Hence for this $\lambda_{0}$ we have $U_{\lambda_{0}}=\operatorname{Spec}\left(S_{\lambda_{0}}\right)$. This proves (1).
Proof of (2). Let $\left(R_{0} \rightarrow S_{0}, M_{0}\right)$ be as in (1) and suppose that $R=\operatorname{colim} R_{\lambda}$. Since $R_{0}$ is a finite type $\mathbf{Z}$ algebra, there exists a $\lambda$ and a map $R_{0} \rightarrow R_{\lambda}$ such that $R_{0} \rightarrow R_{\lambda} \rightarrow R$ is the given map $R_{0} \rightarrow R$ (see Lemma 10.126.2). Then, part (2) follows by taking $S_{\lambda}=R_{\lambda} \otimes_{R_{0}} S_{0}$ and $M_{\lambda}=S_{\lambda} \otimes_{S_{0}} M_{0}$.

Finally, we come to the proof of (3). Let $\left(R_{\lambda} \rightarrow S_{\lambda}, M_{\lambda}\right)$ be as in (3). Choose ( $R_{0} \rightarrow S_{0}, M_{0}$ ) and $R_{0} \rightarrow R$ as in (1). As in the proof of (2), there exists a $\lambda_{0}$ and a ring map $R_{0} \rightarrow R_{\lambda_{0}}$ such that $R_{0} \rightarrow R_{\lambda_{0}} \rightarrow R$ is the given map $R_{0} \rightarrow R$. Since $S_{0}$ is of finite presentation over $R_{0}$ and since $S=\operatorname{colim} S_{\lambda}$ we see that for some $\lambda_{1} \geq \lambda_{0}$ we get an $R_{0}$-algebra map $S_{0} \rightarrow S_{\lambda_{1}}$ such that the composition $S_{0} \rightarrow S_{\lambda_{1}} \rightarrow S$ is the given map $S_{0} \rightarrow S$ (see Lemma 10.126 .2 ). For all $\lambda \geq \lambda_{1}$ this gives maps

$$
\Psi_{\lambda}: R_{\lambda} \otimes_{R_{0}} S_{0} \longrightarrow R_{\lambda} \otimes_{R_{\lambda_{1}}} S_{\lambda_{1}} \cong S_{\lambda}
$$

the last isomorphism by assumption. By construction colim ${ }_{\lambda} \Psi_{\lambda}$ is an isomorphism. Hence $\Psi_{\lambda}$ is an isomorphism for all $\lambda$ large enough by Lemma 10.126.6. In the same vein, there exists a $\lambda_{2} \geq \lambda_{1}$ and an $S_{0}$-module map $M_{0} \rightarrow M_{\lambda_{2}}$ such that $M_{0} \rightarrow M_{\lambda_{2}} \rightarrow M$ is the given map $M_{0} \rightarrow M$ (see Lemma 10.126.3). For $\lambda \geq \lambda_{2}$ there is an induced map

$$
S_{\lambda} \otimes_{S_{0}} M_{0} \longrightarrow S_{\lambda} \otimes_{S_{\lambda_{2}}} M_{\lambda_{2}} \cong M_{\lambda}
$$

and for $\lambda$ large enough this map is an isomorphism by Lemma 10.126.4. This implies (3) because $M_{0}$ is flat over $R_{0}$.

034Y Lemma 10.160.2. Let $R \rightarrow A \rightarrow B$ be ring maps. Assume $A \rightarrow B$ faithfully flat of finite presentation. Then there exists a commutative diagram

with $R \rightarrow A_{0}$ of finite presentation, $A_{0} \rightarrow B_{0}$ faithfully flat of finite presentation and $B=A \otimes_{A_{0}} B_{0}$.

Proof. We first prove the lemma with $R$ replaced Z. By Lemma 10.160.1 there exists a diagram

where $A_{0}$ is of finite type over $\mathbf{Z}, B_{0}$ is flat of finite presentation over $A_{0}$ such that $B=A \otimes_{A_{0}} B_{0}$. As $A_{0} \rightarrow B_{0}$ is flat of finite presentation we see that the image of $\operatorname{Spec}\left(B_{0}\right) \rightarrow \operatorname{Spec}\left(A_{0}\right)$ is open, see Proposition 10.40.8. Hence the complement of the image is $V\left(I_{0}\right)$ for some ideal $I_{0} \subset A_{0}$. As $A \rightarrow B$ is faithfully flat the $\operatorname{map} \operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is surjective, see Lemma 10.38 .16 . Now we use that the base change of the image is the image of the base change. Hence $I_{0} A=A$. Pick a relation $\sum f_{i} r_{i}=1$, with $r_{i} \in A, f_{i} \in I_{0}$. Then after enlarging $A_{0}$ to contain the elements $r_{i}$ (and correspondingly enlarging $B_{0}$ ) we see that $A_{0} \rightarrow B_{0}$ is surjective on spectra also, i.e., faithfully flat.
Thus the lemma holds in case $R=\mathbf{Z}$. In the general case, take the solution $A_{0}^{\prime} \rightarrow B_{0}^{\prime}$ just obtained and set $A_{0}=A_{0}^{\prime} \otimes_{\mathbf{z}} R, B_{0}=B_{0}^{\prime} \otimes_{\mathbf{z}} R$.

07RG Lemma 10.160.3. Let $A=\operatorname{colim}_{i \in I} A_{i}$ be a directed colimit of rings. Let $0 \in I$ and $\varphi_{0}: B_{0} \rightarrow C_{0}$ a map of $A_{0}$-algebras. Assume
(1) $A \otimes_{A_{0}} B_{0} \rightarrow A \otimes_{A_{0}} C_{0}$ is finite,
(2) $C_{0}$ is of finite type over $B_{0}$.

Then there exists an $i \geq 0$ such that the map $A_{i} \otimes_{A_{0}} B_{0} \longrightarrow A_{i} \otimes_{A_{0}} C_{0}$ is finite.
Proof. Let $x_{1}, \ldots, x_{m}$ be generators for $C_{0}$ over $B_{0}$. Pick monic polynomials $P_{j} \in A \otimes_{A_{0}} B_{0}[T]$ such that $P_{j}\left(1 \otimes x_{j}\right)=0$ in $A \otimes_{A_{0}} C_{0}$. For some $i \geq 0$ we can find $P_{j, i} \in A_{i} \otimes_{A_{0}} B_{0}[T]$ mapping to $P_{j}$. Since $\otimes$ commutes with colimits we see that $P_{j, i}\left(1 \otimes x_{j}\right)$ is zero in $A_{i} \otimes_{A_{0}} C_{0}$ after possibly increasing $i$. Then this $i$ works.

07RH Lemma 10.160.4. Let $A=\operatorname{colim}_{i \in I} A_{i}$ be a directed colimit of rings. Let $0 \in I$ and $\varphi_{0}: B_{0} \rightarrow C_{0}$ a map of $A_{0}$-algebras. Assume
(1) $A \otimes_{A_{0}} B_{0} \rightarrow A \otimes_{A_{0}} C_{0}$ is surjective,
(2) $C_{0}$ is of finite type over $B_{0}$.

Then for some $i \geq 0$ the map $A_{i} \otimes_{A_{0}} B_{0} \longrightarrow A_{i} \otimes_{A_{0}} C_{0}$ is surjective.
Proof. Let $x_{1}, \ldots, x_{m}$ be generators for $C_{0}$ over $B_{0}$. Pick $b_{j} \in A \otimes_{A_{0}} B_{0}$ mapping to $1 \otimes x_{j}$ in $A \otimes_{A_{0}} C_{0}$. For some $i \geq 0$ we can find $b_{j, i} \in A_{i} \otimes_{A_{0}} B_{0}$ mapping to $b_{j}$. Then this $i$ works.

07RI Lemma 10.160.5. Let $A=\operatorname{colim}_{i \in I} A_{i}$ be a directed colimit of rings. Let $0 \in I$ and $\varphi_{0}: B_{0} \rightarrow C_{0}$ a map of $A_{0}$-algebras. Assume
(1) $A \otimes_{A_{0}} B_{0} \longrightarrow A \otimes_{A_{0}} C_{0}$ is étale,
(2) $B_{0} \rightarrow C_{0}$ is of finite presentation.

Then for some $i \geq 0$ the map $A_{i} \otimes_{A_{0}} B_{0} \longrightarrow A_{i} \otimes_{A_{0}} C_{0}$ is étale.
Proof. Note that $B_{0} \rightarrow C_{0}$ is of finite presentation, see Lemma 10.6.2, Write $C_{0}=B_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1,0}, \ldots, f_{m, 0}\right)$. Write $B_{i}=A_{i} \otimes_{A_{0}} B_{0}$ and $C_{i}=A_{i} \otimes_{A_{0}} C_{0}$. Note that $C_{i}=B_{i}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1, i}, \ldots, f_{m, i}\right)$ where $f_{j, i}$ is the image of $f_{j, 0}$ in the polynomial ring over $B_{i}$. Write $B=A \otimes_{A_{0}} B_{0}$ and $C=A \otimes_{A_{0}} C_{0}$. Note that $C=B\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ where $f_{j}$ is the image of $f_{j, 0}$ in the polynomial ring over $B$. The assumption is that the map

$$
\mathrm{d}:\left(f_{1}, \ldots, f_{m}\right) /\left(f_{1}, \ldots, f_{m}\right)^{2} \longrightarrow \bigoplus C \mathrm{~d} x_{k}
$$

is an isomorphism. Thus for sufficiently large $i$ we can find elements

$$
\xi_{k, i} \in\left(f_{1, i}, \ldots, f_{m, i}\right) /\left(f_{1, i}, \ldots, f_{m, i}\right)^{2}
$$

with $\mathrm{d} \xi_{k, i}=\mathrm{d} x_{k}$ in $\bigoplus C_{i} \mathrm{~d} x_{k}$. Moreover, on increasing $i$ if necessary, we see that $\sum\left(\partial f_{j, i} / \partial x_{k}\right) \xi_{k, i}=f_{j, i} \bmod \left(f_{1, i}, \ldots, f_{m, i}\right)^{2}$ since this is true in the limit. Then this $i$ works.

The following lemma is an application of the results above which doesn't seem to fit well anywhere else.

034 Z Lemma 10.160.6. Let $R \rightarrow S$ be a faithfully flat ring map of finite presentation. Then there exists a commutative diagram

where $R \rightarrow S^{\prime}$ is quasi-finite, faithfully flat and of finite presentation.

Proof. As a first step we reduce this lemma to the case where $R$ is of finite type over Z. By Lemma 10.160 .2 there exists a diagram

where $R_{0}$ is of finite type over $\mathbf{Z}$, and $S_{0}$ is faithfully flat of finite presentation over $R_{0}$ such that $S=R \otimes_{R_{0}} S_{0}$. If we prove the lemma for the ring map $R_{0} \rightarrow S_{0}$, then the lemma follows for $R \rightarrow S$ by base change, as the base change of a quasi-finite ring map is quasi-finite, see Lemma 10.121.8. (Of course we also use that base changes of flat maps are flat and base changes of maps of finite presentation are of finite presentation.)
Assume $R \rightarrow S$ is a faithfully flat ring map of finite presentation and that $R$ is Noetherian (which we may assume by the preceding paragraph). Let $W \subset$ $\operatorname{Spec}(S)$ be the open set of Lemma 10.129 .4 . As $R \rightarrow S$ is faithfully flat the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective, see Lemma 10.38.16. By Lemma 10.129 .5 the map $W \rightarrow \operatorname{Spec}(R)$ is also surjective. Hence by replacing $S$ with a product $S_{g_{1}} \times$ $\ldots \times S_{g_{m}}$ we may assume $W=\operatorname{Spec}(S)$; here we use that $\operatorname{Spec}(R)$ is quasi-compact (Lemma 10.16.10), and that the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is open (Proposition 10.40.8. Suppose that $\mathfrak{p} \subset R$ is a prime. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$ which corresponds to a maximal ideal of the fibre ring $S \otimes_{R} \kappa(\mathfrak{p})$. The Noetherian local ring $\bar{S}_{\mathfrak{q}}=S_{\mathfrak{q}} / \mathfrak{p} S_{\mathfrak{q}}$ is Cohen-Macaulay, say of dimension $d$. We may choose $f_{1}, \ldots, f_{d}$ in the maximal ideal of $S_{\mathfrak{q}}$ which map to a regular sequence in $\bar{S}_{\mathfrak{q}}$. Choose a common denominator $g \in S, g \notin \mathfrak{q}$ of $f_{1}, \ldots, f_{d}$, and consider the $R$-algebra

$$
S^{\prime}=S_{g} /\left(f_{1}, \ldots, f_{d}\right)
$$

By construction there is a prime ideal $\mathfrak{q}^{\prime} \subset S^{\prime}$ lying over $\mathfrak{p}$ and corresponding to $\mathfrak{q}$ (via $S_{g} \rightarrow S_{g}^{\prime}$ ). Also by construction the ring map $R \rightarrow S^{\prime}$ is quasi-finite at $\mathfrak{q}$ as the local ring

$$
S_{\mathfrak{q}^{\prime}}^{\prime} / \mathfrak{p} S_{\mathfrak{q}^{\prime}}^{\prime}=S_{\mathfrak{q}} /\left(f_{1}, \ldots, f_{d}\right)+\mathfrak{p} S_{\mathfrak{q}}=\bar{S}_{\mathfrak{q}} /\left(\bar{f}_{1}, \ldots, \bar{f}_{d}\right)
$$

has dimension zero, see Lemma 10.121.2. Also by construction $R \rightarrow S^{\prime}$ is of finite presentation. Finally, by Lemma 10.98 .3 the local ring map $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}^{\prime}}^{\prime}$ is flat (this is where we use that $R$ is Noetherian). Hence, by openness of flatness (Theorem 10.128.4, and openness of quasi-finiteness (Lemma 10.122.14) we may after replacing $g$ by $g g^{\prime}$ for a suitable $g^{\prime} \in S, g^{\prime} \notin \mathfrak{q}$ assume that $R \rightarrow S^{\prime}$ is flat and quasi-finite. The image $\operatorname{Spec}\left(S^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ is open and contains $\mathfrak{p}$. In other words we have shown a ring $S^{\prime}$ as in the statement of the lemma exists (except possibly the faithfulness part) whose image contains any given prime. Using one more time the quasi-compactness of $\operatorname{Spec}(R)$ we see that a finite product of such rings does the job.

## CHAPTER 11

## Brauer groups

### 11.1. Introduction

073X A reference are the lectures by Serre in the Seminaire Cartan, see Ser55a. Serre in turn refers to Deu68] and ANT44. We changed some of the proofs, in particular we used a fun argument of Rieffel to prove Wedderburn's theorem. Very likely this change is not an improvement and we strongly encourage the reader to read the original exposition by Serre.

### 11.2. Noncommutative algebras

073 Y Let $k$ be a field. In this chapter an algebra $A$ over $k$ is a possibly noncommutative ring $A$ together with a ring map $k \rightarrow A$ such that $k$ maps into the center of $A$ and such that 1 maps to an identity element of $A$. An $A$-module is a right $A$-module such that the identity of $A$ acts as the identity.
$073 Z$ Definition 11.2.1. Let $A$ be a $k$-algebra. We say $A$ is finite if $\operatorname{dim}_{k}(A)<\infty$. In this case we write $[A: k]=\operatorname{dim}_{k}(A)$.
0740 Definition 11.2.2. A skew field is a possibly noncommutative ring with an identity element 1 , with $1 \neq 0$, in which every nonzero element has a multiplicative inverse.

A skew field is a $k$-algebra for some $k$ (e.g., for the prime field contained in it). We will use below that any module over a skew field is free because a maximal linearly independent set of vectors forms a basis and exists by Zorn's lemma.

0741 Definition 11.2.3. Let $A$ be a $k$-algebra. We say an $A$-module $M$ is simple if it is nonzero and the only $A$-submodules are 0 and $M$. We say $A$ is simple if the only two-sided ideals of $A$ are 0 and $A$.
0742 Definition 11.2.4. A $k$-algebra $A$ is central if the center of $A$ is the image of $k \rightarrow A$.

0743 Definition 11.2.5. Given a $k$-algebra $A$ we denote $A^{o p}$ the $k$-algebra we get by reversing the order of multiplication in $A$. This is called the opposite algebra.

### 11.3. Wedderburn's theorem

0744 The following cute argument can be found in a paper of Rieffel, see Rie65. The proof could not be simpler (quote from Carl Faith's review).
0745 Lemma 11.3.1. Let $A$ be a possibly noncommutative ring with 1 which contains no nontrivial two-sided ideal. Let $M$ be a nonzero right ideal in $A$, and view $M$ as a right $A$-module. Then $A$ coincides with the bicommutant of $M$.

Proof. Let $A^{\prime}=\operatorname{End}_{A}(M)$, and let $A^{\prime \prime}=\operatorname{End}_{A^{\prime}}(M)$ (the bicommutant of $M$ ). Let $R: A \rightarrow A^{\prime \prime}$ be the natural homomorphism $R(a)(m)=m a$. Then $R$ is injective, since $R(1)=\operatorname{id}_{M}$ and $A$ contains no nontrivial two-sided ideal. We claim that $R(M)$ is a right ideal in $A^{\prime \prime}$. Namely, $R(m) a^{\prime \prime}=R\left(m a^{\prime \prime}\right)$ for $a^{\prime \prime} \in A^{\prime \prime}$ and $m$ in $M$, because left multiplication of $M$ by any element $n$ of $M$ represents an element of $A^{\prime}$, and so $(n m) a^{\prime \prime}=n\left(m a^{\prime \prime}\right)$, that is, $\left(R(m) a^{\prime \prime}\right)(n)=R\left(m a^{\prime \prime}\right)(n)$ for all $n$ in $M$. Finally, the product ideal $A M$ is a two-sided ideal, and so $A=A M$. Thus $R(A)=R(A) R(M)$, so that $R(A)$ is a right ideal in $A^{\prime \prime}$. But $R(A)$ contains the identity element of $A^{\prime \prime}$, and so $R(A)=A^{\prime \prime}$.

0746 Lemma 11.3.2. Let $A$ be a k-algebra. If $A$ is finite, then
(1) A has a simple module,
(2) any nonzero module contains a simple submodule,
(3) a simple module over $A$ has finite dimension over $k$, and
(4) if $M$ is a simple $A$-module, then $E n d_{A}(M)$ is a skew field.

Proof. Of course (1) follows from (2) since $A$ is a nonzero $A$-module. For (2), any submodule of minimal (finite) dimension as a $k$-vector space will be simple. There exists a finite dimensional one because a cyclic submodule is one. If $M$ is simple, then $m A \subset M$ is a sub-module, hence we see (3). Any nonzero element of $\operatorname{End}_{A}(M)$ is an isomorphism, hence (4) holds.

0747 Theorem 11.3.3. Let $A$ be a simple finite $k$-algebra. Then $A$ is a matrix algebra over a finite $k$-algebra $K$ which is a skew field.

Proof. We may choose a simple submodule $M \subset A$ and then the $k$-algebra $K=$ $\operatorname{End}_{A}(M)$ is a skew field, see Lemma 11.3.2. By Lemma 11.3.1 we see that $A=$ $\operatorname{End}_{K}(M)$. Since $K$ is a skew field and $M$ is finitely generated (since $\operatorname{dim}_{k}(M)<$ $\infty)$ we see that $M$ is finite free as a left $K$-module. It follows immediately that $A \cong \operatorname{Mat}\left(n \times n, K^{o p}\right)$.

### 11.4. Lemmas on algebras

0748 Let $A$ be a $k$-algebra. Let $B \subset A$ be a subalgebra. The centralizer of $B$ in $A$ is the subalgebra

$$
C=\{y \in A \mid x y=y x \text { for all } x \in B\} .
$$

It is a $k$-algebra.
0749 Lemma 11.4.1. Let $A, A^{\prime}$ be $k$-algebras. Let $B \subset A, B^{\prime} \subset A^{\prime}$ be subalgebras with centralizers $C, C^{\prime}$. Then the centralizer of $B \otimes_{k} B^{\prime}$ in $A \otimes_{k} A^{\prime}$ is $C \otimes_{k} C^{\prime}$.

Proof. Denote $C^{\prime \prime} \subset A \otimes_{k} A^{\prime}$ the centralizer of $B \otimes_{k} B^{\prime}$. It is clear that $C \otimes_{k} C^{\prime} \subset$ $C^{\prime \prime}$. Conversely, every element of $C^{\prime \prime}$ commutes with $B \otimes 1$ hence is contained in $C \otimes_{k} A^{\prime}$. Similarly $C^{\prime \prime} \subset A \otimes_{k} C^{\prime}$. Thus $C^{\prime \prime} \subset C \otimes_{k} A^{\prime} \cap A \otimes_{k} C^{\prime}=C \otimes_{k} C^{\prime}$.

074A Lemma 11.4.2. Let $A$ be a finite simple $k$-algebra. Then the center $k^{\prime}$ of $A$ is a finite field extension of $k$.

Proof. Write $A=\operatorname{Mat}(n \times n, K)$ for some skew field $K$ finite over $k$, see Theorem 11.3.3. By Lemma 11.4.1 the center of $A$ is $k \otimes_{k} k^{\prime}$ where $k^{\prime} \subset K$ is the center of $K$. Since the center of a skew field is a field, we win.

074B Lemma 11.4.3. Let $V$ be a $k$ vector space. Let $K$ be a central $k$-algebra which is a skew field. Let $W \subset V \otimes_{k} K$ be a two-sided $K$-sub vector space. Then $W$ is generated as a left $K$-vector space by $W \cap(V \otimes 1)$.

Proof. Let $V^{\prime} \subset V$ be the $k$-sub vector space generated by $v \in V$ such that $v \otimes 1 \in W$. Then $V^{\prime} \otimes_{k} K \subset W$ and we have

$$
W /\left(V^{\prime} \otimes_{k} K\right) \subset\left(V / V^{\prime}\right) \otimes_{k} K
$$

If $\bar{v} \in V / V^{\prime}$ is a nonzero vector such that $\bar{v} \otimes 1$ is contained in $W / V^{\prime} \otimes_{k} K$, then we see that $v \otimes 1 \in W$ where $v \in V$ lifts $\bar{v}$. This contradicts our construction of $V^{\prime}$. Hence we may replace $V$ by $V / V^{\prime}$ and $W$ by $W / V^{\prime} \otimes_{k} K$ and it suffices to prove that $W \cap(V \otimes 1)$ is nonzero if $W$ is nonzero.
To see this let $w \in W$ be a nonzero element which can be written as $w=$ $\sum_{i=1, \ldots, n} v_{i} \otimes k_{i}$ with $n$ minimal. We may right multiply with $k_{1}^{-1}$ and assume that $k_{1}=1$. If $n=1$, then we win because $v_{1} \otimes 1 \in W$. If $n>1$, then we see that for any $c \in K$

$$
c v-v c=\sum_{i=2, \ldots, n} v_{i} \otimes\left(c k_{i}-k_{i} c\right) \in W
$$

and hence $c k_{i}-k_{i} c=0$ by minimality of $n$. This implies that $k_{i}$ is in the center of $K$ which is $k$ by assumption. Hence $v=\left(v_{1}+\sum k_{i} v_{i}\right) \otimes 1$ contradicting the minimality of $n$.

074C Lemma 11.4.4. Let $A$ be a $k$-algebra. Let $K$ be a central $k$-algebra which is a skew field. Then any two-sided ideal $I \subset A \otimes_{k} K$ is of the form $J \otimes_{k} K$ for some two-sided ideal $J \subset A$. In particular, if $A$ is simple, then so is $A \otimes_{k} K$.

Proof. Set $J=\{a \in A \mid a \otimes 1 \in I\}$. This is a two-sided ideal of $A$. And $I=J \otimes_{k} K$ by Lemma 11.4.3.

074D Lemma 11.4.5. Let $R$ be a possibly noncommutative ring. Let $n \geq 1$ be an integer. Let $R_{n}=\operatorname{Mat}(n \times n, R)$.
(1) The functors $M \mapsto M^{\oplus n}$ and $N \mapsto N e_{11}$ define quasi-inverse equivalences of categories $\operatorname{Mod}_{R} \leftrightarrow \operatorname{Mod}_{R_{n}}$.
(2) A two-sided ideal of $R_{n}$ is of the form $I R_{n}$ for some two-sided ideal I of $R$.
(3) The center of $R_{n}$ is equal to the center of $R$.

Proof. Part (1) proves itself. If $J \subset R_{n}$ is a two-sided ideal, then $J=\bigoplus e_{i i} J e_{j j}$ and all of the summands $e_{i i} J e_{j j}$ are equal to each other and are a two-sided ideal $I$ of $R$. This proves (2). Part (3) is clear.

074E Lemma 11.4.6. Let $A$ be a finite simple $k$-algebra.
(1) There exists exactly one simple $A$-module $M$ up to isomorphism.
(2) Any finite $A$-module is a direct sum of copies of a simple module.
(3) Two finite $A$-modules are isomorphic if and only if they have the same dimension over $k$.
(4) If $A=\operatorname{Mat}(n \times n, K)$ with $K$ a finite skew field extension of $k$, then $M=K^{\oplus n}$ is a simple A-module and $\operatorname{End}_{A}(M)=K^{o p}$.
(5) If $M$ is a simple $A$-module, then $L=E n d_{A}(M)$ is a skew field finite over $k$ acting on the left on $M$, we have $A=E n d_{L}(M)$, and the centers of $A$ and $L$ agree. Also $[A: k][L: k]=\operatorname{dim}_{k}(M)^{2}$.
(6) For a finite $A$-module $N$ the algebra $B=E n d_{A}(N)$ is a matrix algebra over the skew field $L$ of (5). Moreover $\operatorname{End}_{B}(N)=A$.

Proof. By Theorem 11.3.3 we can write $A=\operatorname{Mat}(n \times n, K)$ for some finite skew field extension $K$ of $k$. By Lemma 11.4.5 the category of modules over $A$ is equivalent to the category of modules over $K$. Thus (1), (2), and (3) hold because every module over $K$ is free. Part (4) holds because the equivalence transforms the $K$ module $K$ to $M=K^{\oplus n}$. Using $M=K^{\oplus n}$ in (5) we see that $L=K^{o p}$. The statement about the center of $L=K^{o p}$ follows from Lemma 11.4.5. The statement about $\operatorname{End}_{L}(M)$ follows from the explicit form of $M$. The formula of dimensions is clear. Part (6) follows as $N$ is isomorphic to a direct sum of copies of a simple module.

074F Lemma 11.4.7. Let $A, A^{\prime}$ be two simple $k$-algebras one of which is finite and central over $k$. Then $A \otimes_{k} A^{\prime}$ is simple.

Proof. Suppose that $A^{\prime}$ is finite and central over $k$. Write $A^{\prime}=\operatorname{Mat}\left(n \times n, K^{\prime}\right)$, see Theorem 11.3.3. Then the center of $K^{\prime}$ is $k$ and we conclude that $A \otimes_{k} K^{\prime}$ is simple by Lemma 11.4.4 Hence $A \otimes_{k} A^{\prime}=\operatorname{Mat}\left(n \times n, A \otimes_{k} K^{\prime}\right)$ is simple by Lemma 11.4.5.

074G Lemma 11.4.8. The tensor product of finite central simple algebras over $k$ is finite, central, and simple.

Proof. Combine Lemmas 11.4.1 and 11.4.7
074H Lemma 11.4.9. Let $A$ be a finite central simple algebra over $k$. Let $k \subset k^{\prime}$ be a field extension. Then $A^{\prime}=A \otimes_{k} k^{\prime}$ is a finite central simple algebra over $k^{\prime}$.

Proof. Combine Lemmas 11.4.1 and 11.4.7.
074I Lemma 11.4.10. Let $A$ be a finite central simple algebra over $k$. Then $A \otimes_{k} A^{o p} \cong$ $\operatorname{Mat}(n \times n, k)$ where $n=[A: k]$.

Proof. By Lemma 11.4 .8 the algebra $A \otimes_{k} A^{o p}$ is simple. Hence the map

$$
A \otimes_{k} A^{o p} \longrightarrow \operatorname{End}_{k}(A), \quad a \otimes a^{\prime} \longmapsto\left(x \mapsto a x a^{\prime}\right)
$$

is injective. Since both sides of the arrow have the same dimension we win.

### 11.5. The Brauer group of a field

$074 \mathrm{~J} \quad$ Let $k$ be a field. Consider two finite central simple algebras $A$ and $B$ over $k$. We say $A$ and $B$ are similar if there exist $n, m>0$ such that $\operatorname{Mat}(n \times n, A) \cong \operatorname{Mat}(m \times m, B)$ as $k$-algebras.

074K Lemma 11.5.1. Similarity.
(1) Similarity defines an equivalence relation on the set isomorphism classes of finite central simple algebras over $k$.
(2) Every similarity class contains a unique (up to isomorphism) finite central skew field extension of $k$.
(3) If $A=\operatorname{Mat}(n \times n, K)$ and $B=\operatorname{Mat}\left(m \times m, K^{\prime}\right)$ for some finite central skew fields $K, K^{\prime}$ over $k$ then $A$ and $B$ are similar if and only if $K \cong K^{\prime}$ as $k$-algebras.

Proof. Note that by Wedderburn's theorem (Theorem 11.3.3) we can always write a finite central simple algebra as a matrix algebra over a finite central skew field. Hence it suffices to prove the third assertion. To see this it suffices to show that if $A=\operatorname{Mat}(n \times n, K) \cong \operatorname{Mat}\left(m \times m, K^{\prime}\right)=B$ then $K \cong K^{\prime}$. To see this note that for a simple module $M$ of $A$ we have $\operatorname{End}_{A}(M)=K^{o p}$, see Lemma 11.4.6. Hence $A \cong B$ implies $K^{o p} \cong\left(K^{\prime}\right)^{o p}$ and we win.
Given two finite central simple $k$-algebras $A, B$ the tensor product $A \otimes_{k} B$ is another, see Lemma 11.4.8. Moreover if $A$ is similar to $A^{\prime}$, then $A \otimes_{k} B$ is similar to $A^{\prime} \otimes_{k} B$ because tensor products and taking matrix algebras commute. Hence tensor product defines an operation on equivalence classes of finite central simple algebras which is clearly associative and commutative. Finally, Lemma 11.4.10 shows that $A \otimes_{k} A^{o p}$ is isomorphic to a matrix algebra, i.e., that $A \otimes_{k} A^{o p}$ is in the similarity class of $k$. Thus we obtain an abelian group.
074L Definition 11.5.2. Let $k$ be a field. The Brauer group of $k$ is the abelian group of similarity classes of finite central simple $k$-algebras defined above. Notation $\operatorname{Br}(k)$.
For any map of fields $k \rightarrow k^{\prime}$ we obtain a group homomorphism

$$
\operatorname{Br}(k) \longrightarrow \operatorname{Br}\left(k^{\prime}\right), \quad A \longmapsto A \otimes_{k} k^{\prime}
$$

see Lemma 11.4.9. In other words, $\operatorname{Br}(-)$ is a functor from the category of fields to the category of abelian groups. Observe that the Brauer group of a field is zero if and only if every finite central skew field extension $k \subset K$ is trivial.

074M Lemma 11.5.3. The Brauer group of an algebraically closed field is zero.
Proof. Let $k \subset K$ be a finite central skew field extension. For any element $x \in K$ the subring $k[x] \subset K$ is a commutative finite integral $k$-sub algebra, hence a field, see Algebra, Lemma 10.35 .17 . Since $k$ is algebraically closed we conclude that $k[x]=k$. Since $x$ was arbitrary we conclude $k=K$.

074N Lemma 11.5.4. Let $A$ be a finite central simple algebra over a field $k$. Then $[A: k]$ is a square.
Proof. This is true because $A \otimes_{k} \bar{k}$ is a matrix algebra over $\bar{k}$ by Lemma 11.5.3.

### 11.6. Skolem-Noether

074P
074Q Theorem 11.6.1. Let $A$ be a finite central simple $k$-algebra. Let $B$ be a simple $k$-algebra. Let $f, g: B \rightarrow A$ be two $k$-algebra homomorphisms. Then there exists an invertible element $x \in A$ such that $f(b)=x g(b) x^{-1}$ for all $b \in B$.
Proof. Choose a simple $A$-module $M$. Set $L=\operatorname{End}_{A}(M)$. Then $L$ is a skew field with center $k$ which acts on the left on $M$, see Lemmas 11.3 .2 and 11.4.6. Then $M$ has two $B \otimes_{k} L^{o p}$-module structures defined by $m \cdot_{1}(b \otimes l)=\operatorname{lmf}(b)$ and $m \cdot 2(b \otimes l)=\operatorname{lmg}(b)$. The $k$-algebra $B \otimes_{k} L^{o p}$ is simple by Lemma 11.4.7. Since $B$ is simple, the existence of a $k$-algebra homomorphism $B \rightarrow A$ implies that $B$ is finite. Thus $B \otimes_{k} L^{o p}$ is finite simple and we conlude the two $B \otimes_{k} L^{o p}$-module structures on $M$ are isomorphic by Lemma 11.4.6. Hence we find $\varphi: M \rightarrow M$ intertwining these operations. In particular $\varphi$ is in the commutant of $L$ which implies that $\varphi$ is multiplication by some $x \in A$, see Lemma 11.4.6. Working out the definitions we see that $x$ is a solution to our problem.

074R Lemma 11.6.2. Let $A$ be a finite simple $k$-algebra. Any automorphism of $A$ is inner. In particular, any automorphism of $\operatorname{Mat}(n \times n, k)$ is inner.

Proof. Note that $A$ is a finite central simple algebra over the center of $A$ which is a finite field extension of $k$, see Lemma 11.4.2. Hence the Skolem-Noether theorem (Theorem 11.6.1) applies.

### 11.7. The centralizer theorem

074S
074 T Theorem 11.7.1. Let $A$ be a finite central simple algebra over $k$, and let $B$ be a simple subalgebra of $A$. Then
(1) the centralizer $C$ of $B$ in $A$ is simple,
(2) $[A: k]=[B: k][C: k]$, and
(3) the centralizer of $C$ in $A$ is $B$.

Proof. Throughout this proof we use the results of Lemma 11.4 .6 freely. Choose a simple $A$-module $M$. Set $L=\operatorname{End}_{A}(M)$. Then $L$ is a skew field with center $k$ which acts on the left on $M$ and $A=\operatorname{End}_{L}(M)$. Then $M$ is a right $B \otimes_{k} L^{o p}$-module and $C=\operatorname{End}_{B \otimes_{k} L^{o p}}(M)$. Since the algebra $B \otimes_{k} L^{o p}$ is simple by Lemma 11.4.7 we see that $C$ is simple (by Lemma 11.4.6 again).

Write $B \otimes_{k} L^{o p}=\operatorname{Mat}(m \times m, K)$ for some skew field $K$ finite over $k$. Then $C=\operatorname{Mat}\left(n \times n, K^{o p}\right)$ if $M$ is isomorphic to a direct sum of $n$ copies of the simple $B \otimes_{k} L^{o p}$-module $K^{\oplus m}$ (the lemma again). Thus we have $\operatorname{dim}_{k}(M)=n m[K: k]$, $[B: k][L: k]=m^{2}[K: k],[C: k]=n^{2}[K: k]$, and $[A: k][L: k]=\operatorname{dim}_{k}(M)^{2}$ (by the lemma again). We conclude that (2) holds.
Part (3) follows because of (2) applied to $C \subset A$ shows that $[B: k]=\left[C^{\prime}: k\right]$ where $C^{\prime}$ is the centralizer of $C$ in $A$ (and the obvious fact that $B \subset C^{\prime}$ ).

074 U Lemma 11.7.2. Let $A$ be a finite central simple algebra over $k$, and let $B$ be a simple subalgebra of $A$. If $B$ is a central $k$-algebra, then $A=B \otimes_{k} C$ where $C$ is the (central simple) centralizer of $B$ in $A$.

Proof. We have $\operatorname{dim}_{k}(A)=\operatorname{dim}_{k}\left(B \otimes_{k} C\right)$ by Theorem 11.7.1. By Lemma 11.4.7 the tensor product is simple. Hence the natural map $B \otimes_{k} C \rightarrow A$ is injective hence an isomorphism.

074V Lemma 11.7.3. Let $A$ be a finite central simple algebra over $k$. If $K \subset A$ is a subfield, then the following are equivalent
(1) $[A: k]=[K: k]^{2}$,
(2) $K$ is its own centralizer, and
(3) $K$ is a maximal commutative subring.

Proof. Theorem 11.7.1 shows that (1) and (2) are equivalent. It is clear that (3) and (2) are equivalent.

074W Lemma 11.7.4. Let $A$ be a finite central skew field over $k$. Then every maximal subfield $K \subset A$ satisfies $[A: k]=[K: k]^{2}$.

Proof. Special case of Lemma 11.7 .3 .

### 11.8. Splitting fields

074X
074 Y Definition 11.8.1. Let $A$ be a finite central simple $k$-algebra. We say a field extension $k \subset k^{\prime}$ splits $A$, or $k^{\prime}$ is a splitting field for $A$ if $A \otimes_{k} k^{\prime}$ is a matrix algebra over $k^{\prime}$.

Another way to say this is that the class of $A$ maps to zero under the map $\operatorname{Br}(k) \rightarrow$ $\operatorname{Br}\left(k^{\prime}\right)$.
074Z Theorem 11.8.2. Let A be a finite central simple $k$-algebra. Let $k \subset k^{\prime}$ be a finite field extension. The following are equivalent
(1) $k^{\prime}$ splits $A$, and
(2) there exists a finite central simple algebra $B$ similar to $A$ such that $k^{\prime} \subset B$ and $[B: k]=\left[k^{\prime}: k\right]^{2}$.
Proof. Assume (2). It suffices to show that $B \otimes_{k} k^{\prime}$ is a matrix algebra. We know that $B \otimes_{k} B^{o p} \cong \operatorname{End}_{k}(B)$. Since $k^{\prime}$ is the centralizer of $k^{\prime}$ in $B^{o p}$ by Lemma 11.7.3 we see that $B \otimes_{k} k^{\prime}$ is the centralizer of $k \otimes k^{\prime}$ in $B \otimes_{k} B^{o p}=\operatorname{End}_{k}(B)$. Of course this centralizer is just $\operatorname{End}_{k^{\prime}}(B)$ where we view $B$ as a $k^{\prime}$ vector space via the embedding $k^{\prime} \rightarrow B$. Thus the result.
Assume (1). This means that we have an isomorphism $A \otimes_{k} k^{\prime} \cong \operatorname{End}_{k^{\prime}}(V)$ for some $k^{\prime}$-vector space $V$. Let $B$ be the commutant of $A$ in $\operatorname{End}_{k}(V)$. Note that $k^{\prime}$ sits in $B$. By Lemma 11.7 .2 the classes of $A$ and $B$ add up to zero in $\operatorname{Br}(k)$. From the dimension formula in Theorem 11.7.1 we see that

$$
[B: k][A: k]=\operatorname{dim}_{k}(V)^{2}=\left[k^{\prime}: k\right]^{2} \operatorname{dim}_{k^{\prime}}(V)^{2}=\left[k^{\prime}: k\right]^{2}[A: k] .
$$

Hence $[B: k]=\left[k^{\prime}: k\right]^{2}$. Thus we have proved the result for the opposite to the Brauer class of $A$. However, $k^{\prime}$ splits the Brauer class of $A$ if and only if it splits the Brauer class of the opposite algebra, so we win anyway.

0750 Lemma 11.8.3. A maximal subfield of a finite central skew field $K$ over $k$ is a splitting field for $K$.
Proof. Combine Lemma 11.7 .4 with Theorem 11.8 .2
0751 Lemma 11.8.4. Consider a finite central skew field $K$ over $k$. Let $d^{2}=[K: k]$. For any finite splitting field $k^{\prime}$ for $K$ the degree $\left[k^{\prime}: k\right]$ is divisible by $d$.
Proof. By Theorem 11.8 .2 there exists a finite central simple algebra $B$ in the Brauer class of $K$ such that $[B: k]=\left[k^{\prime}: k\right]^{2}$. By Lemma 11.5.1 we see that $B=\operatorname{Mat}(n \times n, K)$ for some $n$. Then $\left[k^{\prime}: k\right]^{2}=n^{2} d^{2}$ whence the result.

0752 Proposition 11.8.5. Consider a finite central skew field $K$ over $k$. There exists a maximal subfield $k \subset k^{\prime} \subset K$ which is separable over $k$. In particular, every Brauer class has a finite separable spitting field.

Proof. Since every Brauer class is represented by a finite central skew field over $k$, we see that the second statement follows from the first by Lemma 11.8.3.
To prove the first statement, suppose that we are given a separable subfield $k^{\prime} \subset K$. Then the centralizer $K^{\prime}$ of $k^{\prime}$ in $K$ has center $k^{\prime}$, and the problem reduces to finding a maximal subfield of $K^{\prime}$ separable over $k^{\prime}$. Thus it suffices to prove, if $k \neq K$, that
we can find an element $x \in K, x \notin k$ which is separable over $k$. This statement is clear in characteristic zero. Hence we may assume that $k$ has characteristic $p>0$. If the ground field $k$ is finite then, the result is clear as well (because extensions of finite fields are always separable). Thus we may assume that $k$ is an infinite field of positive characteristic.

To get a contradiction assume no element of $K$ is separable over $k$. By the discussion in Fields, Section 9.27 this means the minimal polynomial of any $x \in K$ is of the form $T^{q}-a$ where $q$ is a power of $p$ and $a \in k$. Since it is clear that every element of $K$ has a minimal polynomial of degree $\leq \operatorname{dim}_{k}(K)$ we conclude that there exists a fixed $p$-power $q$ such that $x^{q} \in k$ for all $x \in K$.
Consider the map

$$
(-)^{q}: K \longrightarrow K
$$

and write it out in terms of a $k$-basis $\left\{a_{1}, \ldots, a_{n}\right\}$ of $K$ with $a_{1}=1$. So

$$
\left(\sum x_{i} a_{i}\right)^{q}=\sum f_{i}\left(x_{1}, \ldots, x_{n}\right) a_{i}
$$

Since multiplication on $A$ is $k$-bilinear we see that each $f_{i}$ is a polynomial in $x_{1}, \ldots, x_{n}$ (details omitted). The choice of $q$ above and the fact that $k$ is infinite shows that $f_{i}$ is identically zero for $i \geq 2$. Hence we see that it remains zero on extending $k$ to its algebraic closure $\bar{k}$. But the algebra $A \otimes_{k} \bar{k}$ is a matrix algebra, which implies there are some elements whose $q$ th power is not central (e.g., $e_{11}$ ). This is the desired contradiction.

The results above allow us to characterize finite central simple algebras as follows.
0753 Lemma 11.8.6. Let $k$ be a field. For a $k$-algebra $A$ the following are equivalent
(1) $A$ is finite central simple $k$-algebra,
(2) $A$ is a finite dimensional $k$-vector space, $k$ is the center of $A$, and $A$ has no nontrivial two-sided ideal,
(3) there exists $d \geq 1$ such that $A \otimes_{k} \bar{k} \cong \operatorname{Mat}(d \times d, \bar{k})$,
(4) there exists $d \geq 1$ such that $A \otimes_{k} k^{\text {sep }} \cong \operatorname{Mat}\left(d \times d, k^{\text {sep }}\right)$,
(5) there exist $d \geq 1$ and a finite Galois extension $k \subset k^{\prime}$ such that $A \otimes_{k} k^{\prime} \cong$ $\operatorname{Mat}\left(d \times d, k^{\prime}\right)$,
(6) there exist $n \geq 1$ and a finite central skew field $K$ over $k$ such that $A \cong$ $\operatorname{Mat}(n \times n, K)$.
The integer $d$ is called the degree of $A$.
Proof. The equivalence of (1) and (2) is a consequence of the definitions, see Section 11.2. Assume (1). By Proposition 11.8.5 there exists a separable splitting field $k \subset k^{\prime}$ for $A$. Of course, then a Galois closure of $k^{\prime} / k$ is a splitting field also. Thus we see that (1) implies (5). It is clear that (5) $\Rightarrow$ (4) $\Rightarrow$ (3). Assume (3). Then $A \otimes_{k} \bar{k}$ is a finite central simple $\bar{k}$-algebra for example by Lemma 11.4.5. This trivially implies that $A$ is a finite central simple $k$-algebra. Finally, the equivalence of (1) and (6) is Wedderburn's theorem, see Theorem 11.3.3.

## CHAPTER 12

## Homological Algebra

00ZU

### 12.1. Introduction

00ZV Basic homological algebra will be explained in this document. We add as needed in the other parts, since there is clearly an infinite amount of this stuff around. A reference is ML63.

### 12.2. Basic notions

00ZW The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.
(1) Nothing yet.

### 12.3. Preadditive and additive categories

09SE Here is the definition of a preadditive category.
00ZY Definition 12.3.1. A category $\mathcal{A}$ is called preadditive if each morphism set $\operatorname{Mor}_{\mathcal{A}}(x, y)$ is endowed with the structure of an abelian group such that the compositions

$$
\operatorname{Mor}(x, y) \times \operatorname{Mor}(y, z) \longrightarrow \operatorname{Mor}(x, z)
$$

are bilinear. A functor $F: \mathcal{A} \rightarrow \mathcal{B}$ of preadditive categories is called additive if and only if $F: \operatorname{Mor}(x, y) \rightarrow \operatorname{Mor}(F(x), F(y))$ is a homomorphism of abelian groups for all $x, y \in \operatorname{Ob}(\mathcal{A})$.
In particular for every $x, y$ there exists at least one morphism $x \rightarrow y$, namely the zero map.

00ZZ Lemma 12.3.2. Let $\mathcal{A}$ be a preadditive category. Let $x$ be an object of $\mathcal{A}$. The following are equivalent
(1) $x$ is an initial object,
(2) $x$ is a final object, and
(3) $i d_{x}=0$ in $\operatorname{Mor}_{\mathcal{A}}(x, x)$.

Furthermore, if such an object 0 exists, then a morphism $\alpha: x \rightarrow y$ factors through 0 if and only if $\alpha=0$.

Proof. Omitted.
0100 Definition 12.3.3. In a preadditive category $\mathcal{A}$ we call zero object, and we denote it 0 any final and initial object as in Lemma 12.3 .2 above.

0101 Lemma 12.3.4. Let $\mathcal{A}$ be a preadditive category. Let $x, y \in \operatorname{Ob}(\mathcal{A})$. If the product $x \times y$ exists, then so does the coproduct $x \amalg y$. If the coproduct $x \amalg y$ exists, then so does the product $x \times y$. In this case also $x \amalg y \cong x \times y$.

Proof. Suppose that $z=x \times y$ with projections $p: z \rightarrow x$ and $q: z \rightarrow y$. Denote $i: x \rightarrow z$ the morphism corresponding to $(1,0)$. Denote $j: y \rightarrow z$ the morphism corresponding to $(0,1)$. Thus we have the commutative diagram

where the diagonal compositions are zero. It follows that $i \circ p+j \circ q: z \rightarrow z$ is the identity since it is a morphism which upon composing with $p$ gives $p$ and upon composing with $q$ gives $q$. Suppose given morphisms $a: x \rightarrow w$ and $b: y \rightarrow w$. Then we can form the map $a \circ p+b \circ q: z \rightarrow w$. In this way we get a bijection $\operatorname{Mor}(z, w)=\operatorname{Mor}(x, w) \times \operatorname{Mor}(y, w)$ which show that $z=x \amalg y$.

We leave it to the reader to construct the morphisms $p, q$ given a coproduct $x \amalg y$ instead of a product.

0102 Definition 12.3.5. Given a pair of objects $x, y$ in a preadditive category $\mathcal{A}$ we call direct sum, and we denote it $x \oplus y$ the product $x \times y$ endowed with the morphisms $i, j, p, q$ as in Lemma 12.3.4 above.

0103 Remark 12.3.6. Note that the proof of Lemma 12.3 .4 shows that given $p$ and $q$ the morphisms $i, j$ are uniquely determined by the rules $p \circ i=\mathrm{id}_{x}, q \circ j=\mathrm{id}_{y}$, $p \circ j=0, q \circ i=0$. Moreover, we automatically have $i \circ p+j \circ q=\mathrm{id}_{x \oplus y}$. Similarly, given $i, j$ the morphisms $p$ and $q$ are uniquely determined. Finally, given objects $x, y, z$ and morphisms $i: x \rightarrow z, j: y \rightarrow z, p: z \rightarrow x$ and $q: z \rightarrow y$ such that $p \circ i=\operatorname{id}_{x}, q \circ j=\operatorname{id}_{y}, p \circ j=0, q \circ i=0$ and $i \circ p+j \circ q=\operatorname{id}_{z}$, then $z$ is the direct sum of $x$ and $y$ with the four morphisms equal to $i, j, p, q$.

0105 Lemma 12.3.7. Let $\mathcal{A}, \mathcal{B}$ be preadditive categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor. Then $F$ transforms direct sums to direct sums and zero to zero.

Proof. Suppose $F$ is additive. A direct sum $z$ of $x$ and $y$ is characterized by having morphisms $i: x \rightarrow z, j: y \rightarrow z, p: z \rightarrow x$ and $q: z \rightarrow y$ such that $p \circ i=\mathrm{id}_{x}$, $q \circ j=\mathrm{id}_{y}, p \circ j=0, q \circ i=0$ and $i \circ p+j \circ q=\mathrm{id}_{z}$, according to Remark 12.3.6. Clearly $F(x), F(y), F(z)$ and the morphisms $F(i), F(j), F(p), F(q)$ satisfy exactly the same relations (by additivity) and we see that $F(z)$ is a direct sum of $F(x)$ and $F(y)$.

0104 Definition 12.3.8. A category $\mathcal{A}$ is called additive if it is preadditive and finite products exist, in other words it has a zero object and direct sums.

Namely the empty product is a finite product and if it exists, then it is a final object.

0106 Definition 12.3.9. Let $\mathcal{A}$ be a preadditive category. Let $f: x \rightarrow y$ be a morphism.
(1) A kernel of $f$ is a morphism $i: z \rightarrow x$ such that (a) $f \circ i=0$ and (b) for any $i^{\prime}: z^{\prime} \rightarrow x$ such that $f \circ i^{\prime}=0$ there exists a unique morphism $g: z^{\prime} \rightarrow z$ such that $i^{\prime}=i \circ g$.
(2) If the kernel of $f$ exists, then we denote this $\operatorname{Ker}(f) \rightarrow x$.
(3) A cokernel of $f$ is a morphism $p: y \rightarrow z$ such that (a) $p \circ f=0$ and (b) for any $p^{\prime}: y \rightarrow z^{\prime}$ such that $p^{\prime} \circ f=0$ there exists a unique morphism $g: z \rightarrow z^{\prime}$ such that $p^{\prime}=g \circ p$.
(4) If a cokernel of $f$ exists we denote this $y \rightarrow \operatorname{Coker}(f)$.
(5) If a kernel of $f$ exists, then a coimage of $f$ is a cokernel for the morphism $\operatorname{Ker}(f) \rightarrow x$.
(6) If a kernel and coimage exist then we denote this $x \rightarrow \operatorname{Coim}(f)$.
(7) If a cokernel of $f$ exists, then the image of $f$ is a kernel of the morphism $y \rightarrow \operatorname{Coker}(f)$.
(8) If a cokernel and image of $f$ exist then we denote this $\operatorname{Im}(f) \rightarrow y$.

We first relate the direct sum to kernels as follows.
09QG Lemma 12.3.10. Let $\mathcal{C}$ be a preadditive category. Let $x \oplus y$ with morphisms $i, j, p, q$ as in Lemma 12.3.4 be a direct sum in $\mathcal{C}$. Then $i: x \rightarrow x \oplus y$ is a kernel of $q: x \oplus y \rightarrow y$. Dually, $p$ is a cokernel for $j$.

Proof. Let $f: z \rightarrow x \oplus y$ be a morphism such that $q \circ f=0$. We have to show that there exists a unique morphism $g: z \rightarrow x$ such that $f=i \circ g$. Since $i \circ p+j \circ q$ is the identity on $x \oplus y$ we see that

$$
f=(i \circ p+j \circ q) \circ f=i \circ p \circ f
$$

and hence $g=p \circ f$ works. Uniquess holds because $p \circ i$ is the identity on $x$. The proof of the second statement is dual.

0107 Lemma 12.3.11. Let $f: x \rightarrow y$ be a morphism in a preadditive category such that the kernel, cokernel, image and coimage all exist. Then $f$ can be factored uniquely as $x \rightarrow \operatorname{Coim}(f) \rightarrow \operatorname{Im}(f) \rightarrow y$.

Proof. There is a canonical morphism $\operatorname{Coim}(f) \rightarrow y$ because $\operatorname{Ker}(f) \rightarrow x \rightarrow y$ is zero. The composition $\operatorname{Coim}(f) \rightarrow y \rightarrow \operatorname{Coker}(f)$ is zero, because it is the unique morphism which gives rise to the morphism $x \rightarrow y \rightarrow \operatorname{Coker}(f)$ which is zero. Hence $\operatorname{Coim}(f) \rightarrow y$ factors uniquely through $\operatorname{Im}(f) \rightarrow y$, which gives us the desired map.

0108 Example 12.3.12. Let $k$ be a field. Consider the category of filtered vector spaces over $k$. (See Definition 12.16.1.) Consider the filtered vector spaces $(V, F)$ and $(W, F)$ with $V=W=k$ and

$$
F^{i} V=\left\{\begin{array}{lll}
V & \text { if } & i<0 \\
0 & \text { if } & i \geq 0
\end{array} \text { and } F^{i} W=\left\{\begin{array}{cll}
W & \text { if } & i \leq 0 \\
0 & \text { if } & i>0
\end{array}\right.\right.
$$

The map $f: V \rightarrow W$ corresponding to $\mathrm{id}_{k}$ on the underlying vector spaces has trivial kernel and cokernel but is not an isomorphism. Note also that $\operatorname{Coim}(f)=V$ and $\operatorname{Im}(f)=W$. This means that the category of filtered vector spaces over $k$ is not abelian.

### 12.4. Karoubian categories

09SF Skip this section on a first reading.
09SG Definition 12.4.1. Let $\mathcal{C}$ be a preadditive category. We say $\mathcal{C}$ is Karoubian if every idempotent endomorphism of an object of $\mathcal{C}$ has a kernel.

The dual notion would be that every idempotent endomorphism of an object has a cokernel. However, in view of the (dual of the) following lemma that would be an equivalent notion.

09SH Lemma 12.4.2. Let $\mathcal{C}$ be a preadditive category. The following are equivalent
(1) $\mathcal{C}$ is Karoubian,
(2) every idempotent endomorphism of an object of $\mathcal{C}$ has a cokernel, and
(3) given an idempotent endomorphism $p: z \rightarrow z$ of $\mathcal{C}$ there exists a direct sum decomposition $z=x \oplus y$ such that $p$ corresponds to the projection onto $y$.

Proof. Assume (1) and let $p: z \rightarrow z$ be as in (3). Let $x=\operatorname{Ker}(p)$ and $y=$ $\operatorname{Ker}(1-p)$. There are maps $x \rightarrow z$ and $y \rightarrow z$. Since $(1-p) p=0$ we see that $p: z \rightarrow z$ factors through $y$, hence we obtain a morphism $z \rightarrow y$. Similarly we obtain a morphism $z \rightarrow x$. We omit the verification that these four morphisms induce an isomorphism $x=y \oplus z$ as in Remark 12.3.6. Thus (1) $\Rightarrow$ (3). The implication $(2) \Rightarrow(3)$ is dual. Finally, condition (3) implies (1) and (2) by Lemma 12.3.10.

05QV Lemma 12.4.3. Let $\mathcal{D}$ be a preadditive category.
(1) If $\mathcal{D}$ has countable products and kernels of maps which have a right inverse, then $\mathcal{D}$ is Karoubian.
(2) If $\mathcal{D}$ has countable coproducts and cokernels of maps which have a left inverse, then $\mathcal{D}$ is Karoubian.

Proof. Let $X$ be an object of $\mathcal{D}$ and let $e: X \rightarrow X$ be an idempotent. The functor

$$
W \longmapsto \operatorname{Ker}\left(\operatorname{Mor}_{\mathcal{D}}(W, X) \xrightarrow{e} \operatorname{Mor}_{\mathcal{D}}(W, X)\right)
$$

if representable if and only if $e$ has a kernel. Note that for any abelian group $A$ and idempotent endomorphism $e: A \rightarrow A$ we have

$$
\operatorname{Ker}(e: A \rightarrow A)=\operatorname{Ker}\left(\Phi: \prod_{n \in \mathbf{N}} A \rightarrow \prod_{n \in \mathbf{N}} A\right)
$$

where

$$
\Phi\left(a_{1}, a_{2}, a_{3}, \ldots\right)=\left(e a_{1}+(1-e) a_{2}, e a_{2}+(1-e) a_{3}, \ldots\right)
$$

Moreover, $\Phi$ has the right inverse

$$
\Psi\left(a_{1}, a_{2}, a_{3}, \ldots\right)=\left(a_{1},(1-e) a_{1}+e a_{2},(1-e) a_{2}+e a_{3}, \ldots\right)
$$

Hence (1) holds. The proof of (2) is dual (using the dual definition of a Karoubian category, namely condition (2) of Lemma 12.4.2.

### 12.5. Abelian categories

00ZX An abelian category is a category satisfying just enough axioms so the snake lemma holds. An axiom (that is sometimes forgotten) is that the canonical map Coim $(f) \rightarrow$ $\operatorname{Im}(f)$ of Lemma 12.3 .11 is always an isomorphism. Example 12.3 .12 shows that it is necessary.
0109 Definition 12.5.1. A category $\mathcal{A}$ is abelian if it is additive, if all kernels and cokernels exist, and if the natural map $\operatorname{Coim}(f) \rightarrow \operatorname{Im}(f)$ is an isomorphism for all morphisms $f$ of $\mathcal{A}$.

010A Lemma 12.5.2. Let $\mathcal{A}$ be a preadditive category. The additions on sets of morphisms make $\mathcal{A}^{\text {opp }}$ into a preadditive category. Furthermore, $\mathcal{A}$ is additive if and only if $\mathcal{A}^{\text {opp }}$ is additive, and $\mathcal{A}$ is abelian if and only if $\mathcal{A}^{\text {opp }}$ is abelian.

Proof. Omitted.
010B Definition 12.5.3. Let $f: x \rightarrow y$ be a morphism in an abelian category.
(1) We say $f$ is injective if $\operatorname{Ker}(f)=0$.
(2) We say $f$ is surjective if $\operatorname{Coker}(f)=0$.

If $x \rightarrow y$ is injective, then we say that $x$ is a subobject of $y$ and we use the notation $x \subset y$. If $x \rightarrow y$ is surjective, then we say that $y$ is a quotient of $x$.

010C Lemma 12.5.4. Let $f: x \rightarrow y$ be a morphism in an abelian category. Then
(1) $f$ is injective if and only if $f$ is a monomorphism, and
(2) $f$ is surjective if and only if $f$ is an epimorphism.

Proof. Omitted.
In an abelian category, if $x \subset y$ is a subobject, then we denote

$$
y / x=\operatorname{Coker}(x \rightarrow y)
$$

010D Lemma 12.5.5. Let $\mathcal{A}$ be an abelian category. All finite limits and finite colimits exist in $\mathcal{A}$.

Proof. To show that finite limits exist it suffices to show that finite products and equalizers exist, see Categories, Lemma 4.18.4. Finite products exist by definition and the equalizer of $a, b: x \rightarrow y$ is the kernel of $a-b$. The argument for finite colimits is similar but dual to this.

05PJ Example 12.5.6. Let $\mathcal{A}$ be an abelian category. Pushouts and fibre products in $\mathcal{A}$ have the following simple descriptions:
(1) If $a: x \rightarrow y, b: z \rightarrow y$ are morphisms in $\mathcal{A}$, then we have the fibre product: $x \times_{y} z=\operatorname{Ker}((a,-b): x \oplus z \rightarrow y)$.
(2) If $a: y \rightarrow x, b: y \rightarrow z$ are morphisms in $\mathcal{A}$, then we have the pushout: $x \amalg_{y} z=\operatorname{Coker}((a,-b): y \rightarrow x \oplus z)$.

010 E Definition 12.5.7. Let $\mathcal{A}$ be an additive category. We say a sequence of morphisms

$$
\ldots \rightarrow x \rightarrow y \rightarrow z \rightarrow \ldots
$$

in $\mathcal{A}$ is a complex if the composition of any two (drawn) arrows is zero. If $\mathcal{A}$ is abelian then we say a sequence as above is exact at $y$ if $\operatorname{Im}(x \rightarrow y)=\operatorname{Ker}(y \rightarrow z)$.

We say it is exact if it is exact at every object. A short exact sequence is an exact complex of the form

$$
0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0 .
$$

In the following lemma we assume the reader knows what it means for a sequence of abelian groups to be exact.

05AA Lemma 12.5.8. Let $\mathcal{A}$ be an abelian category. Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a complex of $\mathcal{A}$.
(1) $M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ is exact if and only if

$$
0 \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(M_{3}, N\right) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(M_{2}, N\right) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(M_{1}, N\right)
$$

is an exact sequence of abelian groups for all objects $N$ of $\mathcal{A}$, and
(2) $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3}$ is exact if and only if

$$
0 \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(N, M_{1}\right) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(N, M_{2}\right) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(N, M_{1}\right)
$$

is an exact sequence of abelian groups for all objects $N$ of $\mathcal{A}$.
Proof. Omitted. Hint: See Algebra, Lemma 10.10.1.
010F Definition 12.5.9. Let $\mathcal{A}$ be an abelian category. Let $i: A \rightarrow B$ and $q: B \rightarrow C$ be morphisms of $\mathcal{A}$ such that $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ is a short exact sequence. We say the short exact sequence is split if there exist morphisms $j: C \rightarrow B$ and $p: B \rightarrow A$ such that $(B, i, j, p, q)$ is the direct sum of $A$ and $C$.

010G Lemma 12.5.10. Let $\mathcal{A}$ be an abelian category. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence.
(1) Given a morphism $s: C \rightarrow B$ left inverse to $B \rightarrow C$, there exists a unique $\pi: B \rightarrow A$ such that $(s, \pi)$ splits the short exact sequence as in Definition 12.5.9.
(2) Given a morphism $\pi: B \rightarrow A$ right inverse to $A \rightarrow B$, there exists a unique $s: C \rightarrow B$ such that $(s, \pi)$ splits the short exact sequence as in Definition 12.5.9.

Proof. Omitted.
08N2 Lemma 12.5.11. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram.
(1) The diagram is cartesian if and only if

$$
0 \rightarrow w \xrightarrow{(g, f)} x \oplus y \xrightarrow{(k,-h)} z
$$

is exact.
(2) The diagram is cocartesian if and only if

$$
w \xrightarrow{(g,-f)} x \oplus y \xrightarrow{(k, h)} z \rightarrow 0
$$

is exact.

Proof. Let $u=(g, f): w \rightarrow x \oplus y$ and $v=(k,-h): x \oplus y \rightarrow z$. Let $p: x \oplus y \rightarrow x$ and $q: x \oplus y \rightarrow y$ be the canonical projections. Let $i: \operatorname{Ker}(v) \rightarrow x \oplus y$ be the canonical injection. By Example 12.5.6, the diagram is cartesian if and only if there exists an isomorphism $r: \operatorname{Ker}(v) \rightarrow w$ with $f \circ r=q \circ i$ and $g \circ r=p \circ i$. The sequence $0 \rightarrow w \xrightarrow{u} x \oplus y \xrightarrow{v} z$ is exact if and only if there exists an isomorphism $r: \operatorname{Ker}(v) \rightarrow w$ with $u \circ r=i$. But given $r: \operatorname{Ker}(v) \rightarrow w$, we have $f \circ r=q \circ i$ and $g \circ r=p \circ i$ if and only if $q \circ u \circ r=f \circ r=q \circ i$ and $p \circ u \circ r=g \circ r=p \circ i$, hence if and only if $u \circ r=i$. This proves (1), and then (2) follows by duality.

08N3 Lemma 12.5.12. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram.
(1) If the diagram is cartesian, then the morphism $\operatorname{Ker}(f) \rightarrow \operatorname{Ker}(k)$ induced by $g$ is an isomorphism.
(2) If the diagram is cocartesian, then the morphism Coker $(f) \rightarrow \operatorname{Coker}(k)$ induced by $h$ is an isomorphism.

Proof. Suppose the diagram is cartesian. Let $e: \operatorname{Ker}(f) \rightarrow \operatorname{Ker}(k)$ be induced by $g$. Let $i: \operatorname{Ker}(f) \rightarrow w$ and $j: \operatorname{Ker}(k) \rightarrow x$ be the canonical injections. There exists $t: \operatorname{Ker}(k) \rightarrow w$ with $f \circ t=0$ and $g \circ t=j$. Hence, there exists $u: \operatorname{Ker}(k) \rightarrow \operatorname{Ker}(f)$ with $i \circ u=t$. It follows $g \circ i \circ u \circ e=g \circ t \circ e=j \circ e=g \circ i$ and $f \circ i \circ u \circ e=0=f \circ i$, hence $i \circ u \circ e=i$. Since $i$ is a monomorphism this implies $u \circ e=\operatorname{id}_{\operatorname{Ker}(f)}$. Furthermore, we have $j \circ e \circ u=g \circ i \circ u=g \circ t=j$. Since $j$ is a monomorphism this implies $e \circ u=\operatorname{id}_{\operatorname{Ker}(k)}$. This proves (1). Now, (2) follows by duality.

08N4 Lemma 12.5.13. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram.
(1) If the diagram is cartesian and $k$ is an epimorphism, then the diagram is cocartesian and $f$ is an epimorphism.
(2) If the diagram is cocartesian and $g$ is a monomorphism, then the diagram is cartesian and $h$ is a monomorphism.

Proof. Suppose the diagram is cartesian and $k$ is an epimorphism. Let $u=(g, f)$ : $w \rightarrow x \oplus y$ and let $v=(k,-h): x \oplus y \rightarrow z$. As $k$ is an epimorphism, $v$ is an epimorphism, too. Therefore and by Lemma 12.5 .11 , the sequence $0 \rightarrow w \xrightarrow{u}$ $x \oplus y \xrightarrow{v} z \rightarrow 0$ is exact. Thus, the diagram is cocartesian by Lemma 12.5.11. Finally, $f$ is an epimorphism by Lemma 12.5 .12 and Lemma 12.5.4. This proves (1), and (2) follows by duality.

05PK Lemma 12.5.14. Let $\mathcal{A}$ be an abelian category.
(1) If $x \rightarrow y$ is surjective, then for every $z \rightarrow y$ the projection $x \times_{y} z \rightarrow z$ is surjective.
(2) If $x \rightarrow y$ is injective, then for every $x \rightarrow z$ the morphism $z \rightarrow z \amalg_{x} y$ is injective.

Proof. Immediately from Lemma 12.5 .4 and Lemma 12.5.13.
08N5 Lemma 12.5.15. Let $\mathcal{A}$ be an abelian category. Let $f: x \rightarrow y$ and $g: y \rightarrow z$ be morphisms with $g \circ f=0$. Then, the following statements are equivalent:
(1) The sequence $x \xrightarrow{f} y \xrightarrow{g} z$ is exact.
(2) For every $h: w \rightarrow y$ with $g \circ h=0$ there exist an object $v$, an epimorphism $k: v \rightarrow w$ and a morphism $l: v \rightarrow x$ with $h \circ k=f \circ l$.

Proof. Let $i: \operatorname{Ker}(g) \rightarrow y$ be the canonical injection. Let $p: x \rightarrow \operatorname{Coim}(f)$ be the canonical projection. Let $j: \operatorname{Im}(f) \rightarrow \operatorname{Ker}(g)$ be the canonical injection.

Suppose (1) holds. Let $h: w \rightarrow y$ with $g \circ h=0$. There exists $c: w \rightarrow \operatorname{Ker}(g)$ with $i \circ c=h$. Let $v=x \times_{\operatorname{Ker}(g)} w$ with canonical projections $k: v \rightarrow w$ and $l: v \rightarrow x$, so that $c \circ k=p \circ l$. Then, $h \circ k=i \circ c \circ k=i \circ j \circ p \circ l=f \circ l$. As $j \circ p$ is an epimorphism by hypothesis, $k$ is an epimorphism by Lemma 12.5.13. This implies (2).

Suppose (2) holds. Then, $g \circ i=0$. So, there are an object $w$, an epimorphism $k: w \rightarrow \operatorname{Ker}(g)$ and a morphism $l: w \rightarrow x$ with $f \circ l=i \circ k$. It follows $i \circ j \circ p \circ l=$ $f \circ l=i \circ k$. Since $i$ is a monomorphism we see that $j \circ p \circ l=k$ is an epimorphism. So, $j$ is an epimorphisms and thus an isomorphism. This implies (1).

08N6 Lemma 12.5.16. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram.
(1) If the first row is exact and $k$ is a monomorphism, then the induced sequence $\operatorname{Ker}(\alpha) \rightarrow \operatorname{Ker}(\beta) \rightarrow \operatorname{Ker}(\gamma)$ is exact.
(2) If the second row is exact and $g$ is an epimorphism, then the induced sequence Coker $(\alpha) \rightarrow \operatorname{Coker}(\beta) \rightarrow \operatorname{Coker}(\gamma)$ is exact.

Proof. Suppose the first row is exact and $k$ is a monomorphism. Let $a: \operatorname{Ker}(\alpha) \rightarrow$ $\operatorname{Ker}(\beta)$ and $b: \operatorname{Ker}(\beta) \rightarrow \operatorname{Ker}(\gamma)$ be the induced morphisms. Let $h: \operatorname{Ker}(\alpha) \rightarrow$ $x, i: \operatorname{Ker}(\beta) \rightarrow y$ and $j: \operatorname{Ker}(\gamma) \rightarrow z$ be the canonical injections. As $j$ is a monomorphism we have $b \circ a=0$. Let $c: s \rightarrow \operatorname{Ker}(\beta)$ with $b \circ c=0$. Then, $g \circ i \circ c=j \circ b \circ c=0$. By Lemma 12.5 .15 there are an object $t$, an epimorphism $d: t \rightarrow s$ and a morphism $e: t \rightarrow x$ with $i \circ c \circ d=f \circ e$. Then, $k \circ \alpha \circ e=$ $\beta \circ f \circ e=\beta \circ i \circ c \circ d=0$. As $k$ is a monomorphism we get $\alpha \circ e=0$. So, there exists $m: t \rightarrow \operatorname{Ker}(\alpha)$ with $h \circ m=e$. It follows $i \circ a \circ m=f \circ h \circ m=f \circ e=i \circ c \circ d$. As $i$ is a monomorphism we get $a \circ m=c \circ d$. Thus, Lemma 12.5.15 implies (1), and then (2) follows by duality.

010H Lemma 12.5.17. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram with exact rows.
(1) There exists a unique morphism $\delta: \operatorname{Ker}(\gamma) \rightarrow \operatorname{Coker}(\alpha)$ such that the diagram

commutes, where $\pi$ and $\pi^{\prime}$ are the canonical projections and $\iota$ and $\iota^{\prime}$ are the canonical coprojections.
(2) The induced sequence

$$
\operatorname{Ker}(\alpha) \xrightarrow{f^{\prime}} \operatorname{Ker}(\beta) \xrightarrow{g^{\prime}} \operatorname{Ker}(\gamma) \xrightarrow{\delta} \operatorname{Coker}(\alpha) \xrightarrow{k^{\prime}} \operatorname{Coker}(\beta) \xrightarrow{l^{\prime}} \operatorname{Coker}(\gamma)
$$

is exact. If $f$ is injective then so is $f^{\prime}$, and if $l$ is surjective then so is $l^{\prime}$.
Proof. As $\pi$ is an epimorphism and $\iota$ is a monomorphism by Lemma 12.5.13, uniqueness of $\delta$ is clear. Let $p=y \times_{z} \operatorname{Ker}(\gamma)$ and $q=\operatorname{Coker}(\alpha) \amalg_{u} v$. Let $h$ : $\operatorname{Ker}(\beta) \rightarrow y, i: \operatorname{Ker}(\gamma) \rightarrow z$ and $j: \operatorname{Ker}(\pi) \rightarrow p$ be the canonical injections. Let $p: u \rightarrow \operatorname{Coker}(\alpha)$ be the canonical projection. Keeping in mind Lemma 12.5.13 we get a commutative diagram with exact rows

As $l \circ \beta \circ \pi^{\prime}=\gamma \circ i \circ \pi=0$ and as the third row of the diagram above is exact, there is an $a: p \rightarrow u$ with $k \circ a=\beta \circ \pi^{\prime}$. As the upper right quadrangle of the diagram above is cartesian, Lemma 12.5 .12 yields an epimorphism $b: x \rightarrow \operatorname{Ker}(\pi)$ with $\pi^{\prime} \circ j \circ b=f$. It follows $k \circ a \circ j \circ b=\beta \circ \pi^{\prime} \circ j \circ b=\beta \circ f=k \circ \alpha$. As $k$ is a monomorphism this implies $a \circ j \circ b=\alpha$. It follows $p \circ a \circ j \circ b=p \circ \alpha=0$. As $b$ is an epimorphism this implies $p \circ a \circ j=0$. Therefore, as the top row of the diagram above is exact, there exists $\delta: \operatorname{Ker}(\gamma) \rightarrow \operatorname{Coker}(\alpha)$ with $\delta \circ \pi=p \circ a$. It follows $\iota \circ \delta \circ \pi=\iota \circ p \circ a=\iota^{\prime} \circ k \circ a=\iota^{\prime} \circ \beta \circ \pi^{\prime}$ as desired.

As the upper right quadrangle in the diagram above is cartesian there is a $c$ : $\operatorname{Ker}(\beta) \rightarrow p$ with $\pi^{\prime} \circ c=h$ and $\pi \circ c=g^{\prime}$. It follows $\iota \circ \delta \circ g^{\prime}=\iota \circ \delta \circ \pi \circ c=$ $\iota^{\prime} \circ \beta \circ \pi^{\prime} \circ c=\iota^{\prime} \circ \beta \circ h=0$. As $\iota$ is a monomorphism this implies $\delta \circ g^{\prime}=0$.

Next, let $d: r \rightarrow \operatorname{Ker}(\gamma)$ with $\delta \circ d=0$. Applying Lemma 12.5 .15 to the exact sequence $p \xrightarrow{\pi} \operatorname{Ker}(\gamma) \rightarrow 0$ and $d$ yields an object $s$, an epimorphism $m: s \rightarrow r$ and a morphism $n: s \rightarrow p$ with $\pi \circ n=d \circ m$. As $p \circ a \circ n=\delta \circ d \circ m=0$, applying Lemma 12.5 .15 to the exact sequence $x \xrightarrow{\alpha} u \xrightarrow{p} \operatorname{Coker}(\alpha)$ and $a \circ n$ yields an object $t$, an epimorphism $\varepsilon: t \rightarrow s$ and a morphism $\zeta: t \rightarrow x$ with $a \circ n \circ \varepsilon=\alpha \circ \zeta$. It holds $\beta \circ \pi^{\prime} \circ n \circ \varepsilon=k \circ \alpha \circ \zeta=\beta \circ f \circ \zeta$. Let $\eta=\pi^{\prime} \circ n \circ \varepsilon-f \circ \zeta: t \rightarrow y$. Then, $\beta \circ \eta=0$. It follows that there is a $\vartheta: t \rightarrow \operatorname{Ker}(\beta)$ with $\eta=h \circ \vartheta$. It holds $i \circ g^{\prime} \circ \vartheta=g \circ h \circ \vartheta=g \circ \pi^{\prime} \circ n \circ \varepsilon-g \circ f \circ \zeta=i \circ \pi \circ n \circ \varepsilon=i \circ d \circ m \circ \varepsilon$. As $i$ is a monomorphism we get $g^{\prime} \circ \vartheta=d \circ m \circ \varepsilon$. Thus, as $m \circ \varepsilon$ is an epimorphism, Lemma 12.5 .15 implies that $\operatorname{Ker}(\beta) \xrightarrow{g^{\prime}} \operatorname{Ker}(\gamma) \xrightarrow{\delta} \operatorname{Coker}(\alpha)$ is exact. Then, the claim follows by Lemma 12.5 .16 and duality.

08N7 Lemma 12.5.18. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram with exact rows. Then, the induced diagram

commutes.
Proof. Omitted.
05QA Lemma 12.5.19. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram with exact rows.
(1) If $\alpha, \gamma$ are surjective and $\delta$ is injective, then $\beta$ is surjective.
(2) If $\beta, \delta$ are injective and $\alpha$ is surjective, then $\gamma$ is injective.

Proof. Assume $\alpha, \gamma$ are surjective and $\delta$ is injective. We may replace $w^{\prime}$ by $\operatorname{Im}\left(w^{\prime} \rightarrow x^{\prime}\right)$, i.e., we may assume that $w^{\prime} \rightarrow x^{\prime}$ is injective. We may replace $z$ by $\operatorname{Im}(y \rightarrow z)$, i.e., we may assume that $y \rightarrow z$ is surjective. Then we may apply Lemma 12.5 .17 to

to conclude that $\operatorname{Ker}(y \rightarrow z) \rightarrow \operatorname{Ker}\left(y^{\prime} \rightarrow z^{\prime}\right)$ is surjective. Finally, we apply Lemma 12.5.17 to

to conclude that $x \rightarrow x^{\prime}$ is surjective. This proves (1). The proof of (2) is dual to this.

05QB Lemma 12.5.20. Let $\mathcal{A}$ be an abelian category. Let

ES52, Lemma 4.5
page 16]
be a commutative diagram with exact rows. If $\beta, \delta$ are isomorphisms, $\epsilon$ is injective, and $\alpha$ is surjective then $\gamma$ is an isomorphism.

Proof. Immediate consequence of Lemma 12.5.19,
12.6. Extensions

010I
010J Definition 12.6.1. Let $\mathcal{A}$ be an abelian category. Let $A, C \in \operatorname{Ob}(\mathcal{A})$. An extension $E$ of $B$ by $A$ is a short exact sequence

$$
0 \rightarrow A \rightarrow E \rightarrow B \rightarrow 0 .
$$

By abuse of language we often omit mention of the morphisms $A \rightarrow E$ and $E \rightarrow B$, although they are definitively part of the structure of an extension.

010 K Definition 12.6.2. Let $\mathcal{A}$ be an abelian category. Let $A, B \in \operatorname{Ob}(\mathcal{A})$. The set of isomorphism classes of extensions of $B$ by $A$ is denoted

$$
\operatorname{Ext}_{\mathcal{A}}(B, A)
$$

This is called the Ext-group.
This definition works, because by our conventions $\mathcal{A}$ is a set, and hence $\operatorname{Ext}_{\mathcal{A}}(B, A)$ is a set. In any of the cases of "big" abelian categories listed in Categories, Remark 4.2 .2 . one can check by hand that $\operatorname{Ext}_{\mathcal{A}}(B, A)$ is a set as well. Also, we will see later that this is always the case when $\mathcal{A}$ has either enough projectives or enough injectives. Insert future reference here.

Actually we can turn $\operatorname{Ext}_{\mathcal{A}}(-,-)$ into a functor

$$
\mathcal{A}^{o p p} \times \mathcal{A} \longrightarrow S e t s, \quad(A, B) \longmapsto \operatorname{Ext}_{\mathcal{A}}(A, B)
$$

as follows:
(1) Given a morphism $B^{\prime} \rightarrow B$ and an extension $E$ of $B$ by $A$ we define $E^{\prime}=E \times_{B} B^{\prime}$ so that we have the following commutative diagram of short exact sequences

The extension $E^{\prime}$ is called the pullback of $E$ via $B^{\prime} \rightarrow B$.
(2) Given a morphism $A \rightarrow A^{\prime}$ and an extension $E$ of $B$ by $A$ we define $E^{\prime}=A^{\prime} \amalg_{A} E$ so that we have the following commutative diagram of short exact sequences

The extension $E^{\prime}$ is called the pushout of $E$ via $A \rightarrow A^{\prime}$.
To see that this defines a functor as indicated above there are several things to verify. First of all functoriality in the variable $B$ requires that $\left(E \times{ }_{B} B^{\prime}\right) \times_{B^{\prime}} B^{\prime \prime}=E \times{ }_{B} B^{\prime \prime}$ which is a general property of fibre products. Dually one deals with functoriality in the variable $A$. Finally, given $A \rightarrow A^{\prime}$ and $B^{\prime} \rightarrow B$ we have to show that

$$
A^{\prime} \amalg_{A}\left(E \times_{B} B^{\prime}\right) \cong\left(A^{\prime} \amalg_{A} E\right) \times_{B} B^{\prime}
$$

as extensions of $B^{\prime}$ by $A^{\prime}$. Recall that $A^{\prime} \amalg_{A} E$ is a quotient of $A^{\prime} \oplus E$. Thus the right hand side is a quotient of $A^{\prime} \oplus E \times{ }_{B} B^{\prime}$, and it is straightforward to see that the kernel is exactly what you need in order to get the left hand side.
Note that if $E_{1}$ and $E_{2}$ are extensions of $B$ by $A$, then $E_{1} \oplus E_{2}$ is an extension of $B \oplus B$ by $A \oplus A$. We pull back by the diagonal map $B \rightarrow B \oplus B$ and we push out by the sum map $A \oplus A \rightarrow A$ to get an extension $E_{1}+E_{2}$ of $B$ by $A$.

The extension $E_{1}+E_{2}$ is called the Baer sum of the given extensions.
010L Lemma 12.6.3. The construction $\left(E_{1}, E_{2}\right) \mapsto E_{1}+E_{2}$ above defines a commutative group law on $\operatorname{Ext}_{\mathcal{A}}(B, A)$ which is functorial in both variables.

Proof. Omitted.

05E2 Lemma 12.6.4. Let $\mathcal{A}$ be an abelian category. Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a short exact sequence in $\mathcal{A}$.
(1) There is a canonical six term exact sequence of abelian groups

for all objects $N$ of $\mathcal{A}$, and
(2) there is a canonical six term exact sequence of abelian groups

Proof. Omitted. Hint: The boundary maps are defined using either the pushout or pullback of the given short exact sequence.

### 12.7. Additive functors

010M Recall that we defined, in Categories, Definition 4.23.1 the notion of a "right exact", "left exact" and "exact" functor in the setting of a functor between categories that have finite (co)limits. Thus this applies in particular to functors between abelian categories.

010N Lemma 12.7.1. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a functor.
(1) If $F$ is either left or right exact, then it is additive.
(2) If $F$ is additive then it is left exact if and only if for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ the sequence $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C)$ is exact.
(3) If $F$ is additive then it is right exact if and only if for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ the sequence $F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0$ is exact.
(4) If $F$ is additive then it is exact if and only if for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ the sequence $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0$ is exact.

Proof. Let us first note that if $F$ commutes with the empty limit or the empty colimit, then $F(0)=0$. In particular $F$ applied to the zero morphism is zero. We will use this below without mention.

Suppose that $F$ is left exact, i.e., commutes with finite limits. Then $F(A \times A)=$ $F(A) \times F(A)$ with projections $F(p)$ and $F(q)$. Hence $F(A \oplus A)=F(A) \oplus F(A)$ with all four morphisms $F(i), F(j), F(p), F(q)$ equal to their counterparts in $\mathcal{B}$ as they satisfy the same relations, see Remark 12.3.6. Then $f=F(p+q)$ is a morphism $f: F(A) \oplus F(A) \rightarrow F(A)$ such that $f \circ F(i)=F(p \circ i+q \circ i)=F\left(\operatorname{id}_{A}\right)=\operatorname{id}_{F(A)}$. And similarly $f \circ F(j)=\mathrm{id}_{A}$. We conclude that $F(p+q)=F(p)+F(q)$. For any pair of morphisms $a, b: B \rightarrow A$ the map $g=F(i \circ a+j \circ b): F(B) \rightarrow F(A) \oplus F(A)$
is a morphism such that $F(p) \circ g=F(p \circ(i \circ a+j \circ b))=F(a)$ and similarly $F(q) \circ g=F(b)$. Hence $g=F(i) \circ F(a)+F(j) \circ F(b)$. The sum of $a$ and $b$ is the composition

$$
B \xrightarrow{i \circ a+j \circ b} A \oplus A \xrightarrow{p+q} A .
$$

Applying $F$ we get

$$
F(B) \xrightarrow{F(i) \circ F(a)+F(j) \circ F(b)} F(A) \oplus F(A) \xrightarrow{F(p)+F(q)} A
$$

where we used the expressions for $f$ and $g$ obtained above. Hence $F$ is additive ${ }^{1}$
Denote $f: B \rightarrow C$ a map from $B$ to $C$. Exactness of $0 \rightarrow A \rightarrow B \rightarrow C$ just means that $A=\operatorname{Ker}(f)$. Clearly the kernel of $f$ is the equalizer of the two maps $f$ and 0 from $B$ to $C$. Hence if $F$ commutes with limits, then $F(\operatorname{Ker}(f))=\operatorname{Ker}(F(f))$ which exactly means that $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C)$ is exact.
Conversely, suppose that $F$ is additive and transforms any short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ into an exact sequence $0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C)$. Because it is additive it commutes with direct sums and hence finite products in $\mathcal{A}$. To show it commutes with finite limits it therefore suffices to show that it commutes with equalizers. But equalizers in an abelian category are the same as the kernel of the difference map, hence it suffices to show that $F$ commutes with taking kernels. Let $f: A \rightarrow B$ be a morphism. Factor $f$ as $A \rightarrow I \rightarrow B$ with $f^{\prime}: A \rightarrow I$ surjective and $i: I \rightarrow B$ injective. (This is possible by the definition of an abelian category.) Then it is clear that $\operatorname{Ker}(f)=\operatorname{Ker}\left(f^{\prime}\right)$. Also $0 \rightarrow \operatorname{Ker}\left(f^{\prime}\right) \rightarrow A \rightarrow I \rightarrow 0$ and $0 \rightarrow I \rightarrow B \rightarrow B / I \rightarrow 0$ are short exact. By the condition imposed on $F$ we see that $0 \rightarrow F\left(\operatorname{Ker}\left(f^{\prime}\right)\right) \rightarrow F(A) \rightarrow F(I)$ and $0 \rightarrow F(I) \rightarrow F(B) \rightarrow F(B / I)$ are exact. Hence it is also the case that $F\left(\operatorname{Ker}\left(f^{\prime}\right)\right)$ is the kernel of the map $F(A) \rightarrow F(B)$, and we win.

The proof of (3) is similar to the proof of (2). Statement (4) is a combination of (2) and (3).

010 Lemma 12.7.2. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. For every pair of objects $A, B$ of $\mathcal{A}$ the functor $F$ induces an abelian group homomorphism

$$
\operatorname{Ext}_{\mathcal{A}}(B, A) \longrightarrow \operatorname{Ext}_{\mathcal{B}}(F(B), F(A))
$$

which maps the extension $E$ to $F(E)$.
Proof. Omitted.
The following lemma is used in the proof that the category of abelian sheaves on a site is abelian, where the functor $b$ is sheafification.

03A3 Lemma 12.7.3. Let $a: \mathcal{A} \rightarrow \mathcal{B}$ and $b: \mathcal{B} \rightarrow \mathcal{A}$ be functors. Assume that
(1) $\mathcal{A}, \mathcal{B}$ are additive categories, $a, b$ are additive functors, and $a$ is right adjoint to $b$,
(2) $\mathcal{B}$ is abelian and $b$ is left exact, and
(3) $b a \cong i d_{\mathcal{A}}$.

Then $\mathcal{A}$ is abelian.

[^27]Proof. As $\mathcal{B}$ is abelian we see that all finite limits and colimits exist in $\mathcal{B}$ by Lemma 12.5.5. Since $b$ is a left adjoint we see that $b$ is also right exact and hence exact, see Categories, Lemma 4.24.5. Let $\varphi: B_{1} \rightarrow B_{2}$ be a morphism of $\mathcal{B}$. In particular, if $K=\operatorname{Ker}\left(B_{1} \rightarrow B_{2}\right)$, then $K$ is the equalizer of 0 and $\varphi$ and hence $b K$ is the equalizer of 0 and $b \varphi$, hence $b K$ is the kernel of $b \varphi$. Similarly, if $Q=\operatorname{Coker}\left(B_{1} \rightarrow B_{2}\right)$, then $Q$ is the coequalizer of 0 and $\varphi$ and hence $b Q$ is the coequalizer of 0 and $b \varphi$, hence $b Q$ is the cokernel of $b \varphi$. Thus we see that every morphism of the form $b \varphi$ in $\mathcal{A}$ has a kernel and a cokernel. However, since $b a \cong$ id we see that every morphism of $\mathcal{A}$ is of this form, and we conclude that kernels and cokernels exist in $\mathcal{A}$. In fact, the argument shows that if $\psi: A_{1} \rightarrow A_{2}$ is a morphism then

$$
\operatorname{Ker}(\psi)=b \operatorname{Ker}(a \psi), \quad \text { and } \quad \operatorname{Coker}(\psi)=b \operatorname{Coker}(a \psi)
$$

Now we still have to show that $\operatorname{Coim}(\psi)=\operatorname{Im}(\psi)$. We do this as follows. First note that since $\mathcal{A}$ has kernels and cokernels it has all finite limits and colimits (see proof of Lemma 12.5 .5 . Hence we see by Categories, Lemma 4.24 .5 that $a$ is left exact and hence transforms kernels (=equalizers) into kernels.

$$
\begin{array}{rlr}
\operatorname{Coim}(\psi) & =\operatorname{Coker}\left(\operatorname{Ker}(\psi) \rightarrow A_{1}\right) & \text { by definition } \\
& =b \operatorname{Coker}\left(a\left(\operatorname{Ker}(\psi) \rightarrow A_{1}\right)\right) & \text { by formula above } \\
& \left.=b \operatorname{Coker}\left(\operatorname{Ker}(a \psi) \rightarrow a A_{1}\right)\right) & a \text { preserves kernels } \\
& =b \operatorname{Coim}(a \psi) & \text { by definition } \\
& =b \operatorname{Im}(a \psi) & \mathcal{B} \text { is abelian } \\
& =b \operatorname{Ker}\left(a A_{2} \rightarrow \operatorname{Coker}(a \psi)\right) & \text { by definition } \\
& =\operatorname{Ker}\left(b a A_{2} \rightarrow b \operatorname{Coker}(a \psi)\right) & b \text { preserves kernels } \\
& =\operatorname{Ker}\left(A_{2} \rightarrow b \operatorname{Coker}(a \psi)\right) & b a=\operatorname{id} \mathcal{A} \\
& =\operatorname{Ker}\left(A_{2} \rightarrow \operatorname{Coker}(\psi)\right) & \text { by formula above } \\
& =\operatorname{Im}(\psi) & \text { by definition }
\end{array}
$$

Thus the lemma holds.

### 12.8. Localization

05QC In this section we note how Gabriel-Zisman localization interacts with the additive structure on a category.
05QD Lemma 12.8.1. Let $\mathcal{C}$ be a preadditive category. Let $S$ be a left or right multiplicative system. There exists a canonical preadditive structure on $S^{-1} \mathcal{C}$ such that the localization functor $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$ is additive.

Proof. We will prove this in the case $S$ is a left multiplicative system. The case where $S$ is a right multiplicative system is dual. Suppose that $X, Y$ are objects of $\mathcal{C}$ and that $\alpha, \beta: X \rightarrow Y$ are morphisms in $S^{-1} \mathcal{C}$. According to Categories, Lemma 4.26 .5 we may represent these by pairs $s^{-1} f, s^{-1} g$ with common denominator $s$. In this case we define $\alpha+\beta$ to be the equivalence class of $s^{-1}(f+g)$. In the rest of the proof we show that this is well defined and that composition is bilinear. Once this is done it is clear that $Q$ is an additive functor.
Let us show construction above is well defined. An abstract way of saying this is that filtered colimits of abelian groups agree with filtered colimits of sets and to use Categories, Equation 4.26.7.1. We can work this out in a bit more detail
as follows. Say $s: Y \rightarrow Y_{1}$ and $f, g: X \rightarrow Y_{1}$. Suppose we have a second representation of $\alpha, \beta$ as $\left(s^{\prime}\right)^{-1} f^{\prime},\left(s^{\prime}\right)^{-1} g^{\prime}$ with $s^{\prime}: Y \rightarrow Y_{2}$ and $f^{\prime}, g^{\prime}: X \rightarrow Y_{2}$. By Categories, Remark 4.26.7 we can find a morphism $s_{3}: Y \rightarrow Y_{3}$ and morphisms $a_{1}: Y_{1} \rightarrow Y_{3}, a_{2}: Y_{2} \rightarrow Y_{3}$ such that $a_{1} \circ s=s_{3}=a_{2} \circ s^{\prime}$ and also $a_{1} \circ f=a_{2} \circ f^{\prime}$ and $a_{1} \circ g=a_{2} \circ g^{\prime}$. Hence we see that $s^{-1}(f+g)$ is equivalent to

$$
\begin{aligned}
s_{3}^{-1}\left(a_{1} \circ(f+g)\right) & =s_{3}^{-1}\left(a_{1} \circ f+a_{1} \circ g\right) \\
& =s_{3}^{-1}\left(a_{2} \circ f^{\prime}+a_{2} \circ g^{\prime}\right) \\
& =s_{3}^{-1}\left(a_{2} \circ\left(f^{\prime}+g^{\prime}\right)\right)
\end{aligned}
$$

which is equivalent to $\left(s^{\prime}\right)^{-1}\left(f^{\prime}+g^{\prime}\right)$.
Fix $s: Y \rightarrow Y^{\prime}$ and $f, g: X \rightarrow Y^{\prime}$ with $\alpha=s^{-1} f$ and $\beta=s^{-1} g$ as morphisms $X \rightarrow Y$ in $S^{-1} \mathcal{C}$. To show that composition is bilinear first consider the case of a morphism $\gamma: Y \rightarrow Z$ in $S^{-1} \mathcal{C}$. Say $\gamma=t^{-1} h$ for some $h: Y \rightarrow Z^{\prime}$ and $t: Z \rightarrow Z^{\prime}$ in $S$. Using LMS2 we choose morphisms $a: Y^{\prime} \rightarrow Z^{\prime \prime}$ and $t^{\prime}: Z^{\prime} \rightarrow Z^{\prime \prime}$ in $S$ such that $a \circ s=t^{\prime} \circ h$. Picture

Then $\gamma \circ \alpha=\left(t^{\prime} \circ t\right)^{-1}(a \circ f)$ and $\gamma \circ \beta=\left(t^{\prime} \circ t\right)^{-1}(a \circ g)$. Hence we see that $\gamma \circ(\alpha+\beta)$ is represented by $\left(t^{\prime} \circ t\right)^{-1}(a \circ(f+g))=\left(t^{\prime} \circ t\right)^{-1}(a \circ f+a \circ g)$ which represents $\gamma \circ \alpha+\gamma \circ \beta$.

Finally, assume that $\delta: W \rightarrow X$ is another morphism of $S^{-1} \mathcal{C}$. Say $\delta=r^{-1} i$ for some $i: W \rightarrow X^{\prime}$ and $r: X \rightarrow X^{\prime}$ in $S$. We claim that we can find a morphism $s: Y^{\prime} \rightarrow Y^{\prime \prime}$ in $S$ and morphisms $a^{\prime \prime}, b^{\prime \prime}: X^{\prime} \rightarrow Y^{\prime \prime}$ such that the following diagram commutes

Namely, using LMS2 we can first choose $s_{1}: Y^{\prime} \rightarrow Y_{1}, s_{2}: Y^{\prime} \rightarrow Y_{2}$ in $S$ and $a: X^{\prime} \rightarrow Y_{1}, b: X^{\prime} \rightarrow Y_{2}$ such that $a \circ s=s_{1} \circ f$ and $b \circ s=s_{2} \circ f$. Then using that the category $Y^{\prime} / S$ is filtered (see Categories, Remark 4.26.7), we can find a $s^{\prime}: Y^{\prime} \rightarrow Y^{\prime \prime}$ and morphisms $a^{\prime}: Y_{1} \rightarrow Y^{\prime \prime}, b^{\prime}: Y_{2} \rightarrow Y^{\prime \prime}$ such that $s^{\prime}=a^{\prime} \circ s_{1}$ and $s^{\prime}=b^{\prime} \circ s_{2}$. Setting $a^{\prime \prime}=a^{\prime} \circ a$ and $b^{\prime \prime}=b^{\prime} \circ b$ works. At this point we see that the compositions $\alpha \circ \delta$ and $\beta \circ \delta$ are represented by $\left(s^{\prime} \circ s\right)^{-1} a^{\prime \prime}$ and $\left(s^{\prime} \circ s\right)^{-1} b^{\prime \prime}$. Hence $\alpha \circ \delta+\beta \circ \delta$ is represented by $\left(s^{\prime} \circ s\right)^{-1}\left(a^{\prime \prime}+b^{\prime \prime}\right)$ which by the diagram again is a representative of $(\alpha+\beta) \circ \delta$.

05QE Lemma 12.8.2. Let $\mathcal{C}$ be an additive category. Let $S$ be a left or right multiplicative system. Then $S^{-1} \mathcal{C}$ is an additive category and the localization functor $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$ is additive.
Proof. By Lemma 12.8.1 we see that $S^{-1} \mathcal{C}$ is preadditive and that $Q$ is additive. Recall that the functor $Q$ commutes with finite colimits (resp. finite limits), see Categories, Lemmas 4.26.9 and 4.26.17. We conclude that $S^{-1} \mathcal{C}$ has a zero object and direct sums, see Lemmas 12.3 .2 and 12.3 .4 .

The following lemma describes the kernel (see Definition 12.9.5) of the localization functor in case we invert a multiplicative system.
05QF Lemma 12.8.3. Let $\mathcal{C}$ be an additive category. Let $S$ be a multiplicative system. Let $X$ be an object of $\mathcal{C}$. The following are equivalent
(1) $Q(X)=0$ in $S^{-1} \mathcal{C}$,
(2) there exists $Y \in \operatorname{Ob}(\mathcal{C})$ such that $0: X \rightarrow Y$ is an element of $S$, and
(3) there exists $Z \in \operatorname{Ob}(\mathcal{C})$ such that $0: Z \rightarrow X$ is an element of $S$.

Proof. If (2) holds we see that $0=Q(0): Q(X) \rightarrow Q(Y)$ is an isomorphism. In the additive category $S^{-1} \mathcal{C}$ this implies that $Q(X)=0$. Hence (2) $\Rightarrow$ (1). Similarly, $(3) \Rightarrow(1)$. Suppose that $Q(X)=0$. This implies that the morphism $f: 0 \rightarrow X$ is transformed into an isomorphism in $S^{-1} \mathcal{C}$. Hence by Categories, Lemma 4.26.21 there exists a morphism $g: Z \rightarrow 0$ such that $f g \in S$. This proves (1) $\Rightarrow$ (3). Similarly, $(1) \Rightarrow(2)$.

05QG Lemma 12.8.4. Let $\mathcal{A}$ be an abelian category.
(1) If $S$ is a left multiplicative system, then the category $S^{-1} \mathcal{A}$ has cokernels and the functor $Q: \mathcal{A} \rightarrow S^{-1} \mathcal{A}$ commutes with them.
(2) If $S$ is a right multiplicative system, then the category $S^{-1} \mathcal{A}$ has kernels and the functor $Q: \mathcal{A} \rightarrow S^{-1} \mathcal{A}$ commutes with them.
(3) If $S$ is a multiplicative system, then the category $S^{-1} \mathcal{A}$ is abelian and the functor $Q: \mathcal{A} \rightarrow S^{-1} \mathcal{A}$ is exact.
Proof. Assume $S$ is a left multiplicative system. Let $a: X \rightarrow Y$ be a morphism of $S^{-1} \mathcal{A}$. Then $a=s^{-1} f$ for some $s: Y \rightarrow Y^{\prime}$ in $S$ and $f: X \rightarrow Y^{\prime}$. Since $Q(s)$ is an isomorphism we see that the existence of $\operatorname{Coker}(a: X \rightarrow Y)$ is equivalent to the existence of $\operatorname{Coker}\left(Q(f): X \rightarrow Y^{\prime}\right)$. Since $\operatorname{Coker}(Q(f))$ is the coequalizer of 0 and $Q(f)$ we see that $\operatorname{Coker}(Q(f))$ is represented by $Q(\operatorname{Coker}(f))$ by Categories, Lemma 4.26.9. This proves (1).
Part (2) is dual to part (1).
If $S$ is a multiplicative system, then $S$ is both a left and a right multiplicative system. Thus we see that $S^{-1} \mathcal{A}$ has kernels and cokernels and $Q$ commutes with kernels and cokernels. To finish the proof of (3) we have to show that Coim $=\mathrm{Im}$ in $S^{-1} \mathcal{A}$. Again using that any arrow in $S^{-1} \mathcal{A}$ is isomorphic to an arrow $Q(f)$ we see that the result follows from the result for $\mathcal{A}$.

### 12.9. Serre subcategories

02MN In Ser53, Chapter I, Section 1] a notion of a "class" of abelian groups is defined. This notion has been extended to abelian categories by many authors (in slightly different ways). We will use the following variant which is virtually identical to Serre's original definition.

02MO Definition 12.9.1. Let $\mathcal{A}$ be an abelian category.
(1) A Serre subcategory of $\mathcal{A}$ is a nonempty full subcategory $\mathcal{C}$ of $\mathcal{A}$ such that given an exact sequence

$$
A \rightarrow B \rightarrow C
$$

with $A, C \in \mathrm{Ob}(\mathcal{C})$, then also $B \in \mathrm{Ob}(\mathcal{C})$.
(2) A weak Serre subcategory of $\mathcal{A}$ is a nonempty full subcategory $\mathcal{C}$ of $\mathcal{A}$ such that given an exact sequence

$$
A_{0} \rightarrow A_{1} \rightarrow A_{2} \rightarrow A_{3} \rightarrow A_{4}
$$

with $A_{0}, A_{1}, A_{3}, A_{4}$ in $\mathcal{C}$, then also $A_{2}$ in $\mathcal{C}$.
In some references the second notion is called a "thick" subcategory and in other references the first notion is called a "thick" subcategory. However, it seems that the notion of a Serre subcategory is universally accepted to be the one defined above. Note that in both cases the category $\mathcal{C}$ is abelian and that the inclusion functor $\mathcal{C} \rightarrow \mathcal{A}$ is a fully faithful exact functor. Let's characterize these types of subcategories in more detail.

02MP Lemma 12.9.2. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{C}$ be a subcategory of $\mathcal{A}$. Then $\mathcal{C}$ is a Serre subcategory if and only if the following conditions are satisfied:
(1) $0 \in \mathrm{Ob}(\mathcal{C})$,
(2) $\mathcal{C}$ is a strictly full subcategory of $\mathcal{A}$,
(3) any subobject or quotient of an object of $\mathcal{C}$ is an object of $\mathcal{C}$,
(4) if $A \in \operatorname{Ob}(\mathcal{A})$ is an extension of objects of $\mathcal{C}$ then also $A \in \operatorname{Ob}(\mathcal{C})$.

Moreover, a Serre subcategory is an abelian category and the inclusion functor is exact.

Proof. Omitted.
0754 Lemma 12.9.3. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{C}$ be a subcategory of $\mathcal{A}$. Then $\mathcal{C}$ is a weak Serre subcategory if and only if the following conditions are satisfied:
(1) $0 \in \operatorname{Ob}(\mathcal{C})$,
(2) $\mathcal{C}$ is a strictly full subcategory of $\mathcal{A}$,
(3) kernels and cokernels in $\mathcal{A}$ of morphisms between objects of $\mathcal{C}$ are in $\mathcal{C}$,
(4) if $A \in \operatorname{Ob}(\mathcal{A})$ is an extension of objects of $\mathcal{C}$ then also $A \in \operatorname{Ob}(\mathcal{C})$.

Moreover, a weak Serre subcategory is an abelian category and the inclusion functor is exact.

Proof. Omitted.
02MQ Lemma 12.9.4. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. Then the full subcategory of objects $C$ of $\mathcal{A}$ such that $F(C)=0$ forms a Serre subcategory of $\mathcal{A}$.

Proof. Omitted.
02 MR Definition 12.9.5. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. Then the full subcategory of objects $C$ of $\mathcal{A}$ such that $F(C)=0$ is called the kernel of the functor $F$, and is sometimes denoted $\operatorname{Ker}(F)$.

Any Serre subcategory of an abelian category is the kernel of an exact functor. In Examples, Section 88.64 we discuss this for Serre's original example of torsion groups.

02 MS Lemma 12.9.6. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{C} \subset \mathcal{A}$ be a Serre subcategory. There exists an abelian category $\mathcal{A} / \mathcal{C}$ and an exact functor

$$
F: \mathcal{A} \longrightarrow \mathcal{A} / \mathcal{C}
$$

which is essentially surjective and whose kernel is $\mathcal{C}$. The category $\mathcal{A} / \mathcal{C}$ and the functor $F$ are characterized by the following universal property: For any exact functor $G: \mathcal{A} \rightarrow \mathcal{B}$ such that $\mathcal{C} \subset \operatorname{Ker}(G)$ there exists a factorization $G=H \circ F$ for a unique exact functor $H: \mathcal{A} / \mathcal{C} \rightarrow \mathcal{B}$.

Proof. Consider the set of arrows of $\mathcal{A}$ defined by the following formula

$$
S=\{f \in \operatorname{Arrows}(\mathcal{A}) \mid \operatorname{Ker}(f), \operatorname{Coker}(f) \in \operatorname{Ob}(\mathcal{C})\}
$$

We claim that $S$ is a multiplicative system. To prove this we have to check MS1, MS2, MS3, see Categories, Definition 4.26.1.

It is clear that identities are elements of $S$. Suppose that $f: A \rightarrow B$ and $g: B \rightarrow C$ are elements of $S$. There are exact sequences

$$
\begin{gathered}
0 \rightarrow \operatorname{Ker}(f) \rightarrow \operatorname{Ker}(g f) \rightarrow \operatorname{Ker}(g) \\
\operatorname{Coker}(f) \rightarrow \operatorname{Coker}(g f) \rightarrow \operatorname{Coker}(g) \rightarrow 0
\end{gathered}
$$

Hence it follows that $g f \in S$. This proves MS1. (In fact, a similar argument will show that $S$ is a saturated multiplicative system, see Categories, Definition 4.26.20.)

Consider a solid diagram

with $t \in S$. Set $W=C \amalg_{A} B=\operatorname{Coker}((t,-g): A \rightarrow C \oplus B)$. Then $\operatorname{Ker}(t) \rightarrow \operatorname{Ker}(s)$ is surjective and $\operatorname{Coker}(t) \rightarrow \operatorname{Coker}(s)$ is an isomorphism. Hence $s$ is an element of $S$. This proves LMS2 and the proof of RMS2 is dual.

Finally, consider morphisms $f, g: B \rightarrow C$ and a morphism $s: A \rightarrow B$ in $S$ such that $f \circ s=g \circ s$. This means that $(f-g) \circ s=0$. In turn this means that $I=\operatorname{Im}(f-g) \subset C$ is a quotient of $\operatorname{Coker}(s)$ hence an object of $\mathcal{C}$. Thus $t: C \rightarrow C^{\prime}=C / I$ is an element of $S$ such that $t \circ(f-g)=0$, i.e., such that $t \circ f=t \circ g$. This proves LMS3 and the proof of RMS3 is dual.
Having proved that $S$ is a multiplicative system we set $\mathcal{A} / \mathcal{C}=S^{-1} \mathcal{A}$, and we set $F$ equal to the localization functor $Q$. By Lemma 12.8 .4 the category $\mathcal{A} / \mathcal{C}$ is abelian and $F$ is exact. If $X$ is in the kernel of $F=Q$, then by Lemma 12.8 .3 we see that $0: X \rightarrow Z$ is an element of $S$ and hence $X$ is an object of $\mathcal{C}$, i.e., the kernel of $F$ is $\mathcal{C}$. Finally, if $G$ is as in the statement of the lemma, then $G$ turns every element of $S$ into an isomorphism. Hence we obtain the functor $H: \mathcal{A} / \mathcal{C} \rightarrow \mathcal{B}$ from the universal property of localization, see Categories, Lemma 4.26.8.

06XK Lemma 12.9.7. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor. Then $\mathcal{C}=\operatorname{Ker}(F)$ if and only if the induced functor $\bar{F}: \mathcal{A} / \mathcal{C} \rightarrow \mathcal{B}$ is faithful.

Proof. The "only if" direction is true because the kernel of $\bar{F}$ is zero by construction. Namely, if $f: X \rightarrow Y$ is a morphism in $\mathcal{A} / \mathcal{C}$ such that $\bar{F}(f)=0$, then $\bar{F}(\operatorname{Im}(f))=\operatorname{Im}(\bar{F}(f))=0$, hence $\operatorname{Im}(f)=0$ by the assumption on the kernel of $F$. Thus $f=0$.
For the "if" direction, let $X$ be an object of $\mathcal{A}$ such that $F(X)=0$. Then $\bar{F}\left(\operatorname{id}_{X}\right)=$ $\operatorname{id}_{\bar{F}(X)}=0$, thus $\operatorname{id}_{X}=0$ in $\mathcal{A} / \mathcal{C}$ by faithfulness of $\bar{F}$. Hence $X=0$ in $\mathcal{A} / \mathcal{C}$, that is $X \in \mathrm{Ob}(\mathcal{C})$.

### 12.10. K-groups

02MT
02 MU Definition 12.10.1. Let $\mathcal{A}$ be an abelian category. We denote $K_{0}(\mathcal{A})$ the zeroth $K$-group of $\mathcal{A}$. It is the abelian group constructed as follows. Take the free abelian group on the objects on $\mathcal{A}$ and for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ impose the relation $[B]-[A]-[C]=0$.

Another way to say this is that there is a presentation

$$
\bigoplus_{A \rightarrow B \rightarrow C \text { ses }} \mathbf{Z}[A \rightarrow B \rightarrow C] \longrightarrow \bigoplus_{A \in \operatorname{Ob}(\mathcal{A})} \mathbf{Z}[A] \longrightarrow K_{0}(\mathcal{A}) \longrightarrow 0
$$

with $[A \rightarrow B \rightarrow C] \mapsto[B]-[A]-[C]$ of $K_{0}(\mathcal{A})$. The short exact sequence $0 \rightarrow 0 \rightarrow 0 \rightarrow 0 \rightarrow 0$ leads to the relation $[0]=0$ in $K_{0}(\mathcal{A})$. There are no settheoretical issues as all of our categories are "small" if not mentioned otherwise. Some examples of $K$-groups for categories of modules over rings where computed in Algebra, Section 10.54

02MV Lemma 12.10.2. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor between abelian categories. Then $F$ induces a homomorphism of $K$-groups $K_{0}(F): K_{0}(\mathcal{A}) \rightarrow K_{0}(\mathcal{B})$ by simply setting $K_{0}(F)([A])=[F(A)]$.

Proof. Proves itself.
Suppose we are given an object $M$ of an abelian category $\mathcal{A}$ and a complex of the form

02MW

$$
\begin{equation*}
\ldots \longrightarrow M \xrightarrow{\varphi} M \stackrel{\psi}{\longrightarrow} M \xrightarrow{\varphi} M \longrightarrow \ldots \tag{12.10.2.1}
\end{equation*}
$$

In this situation we define

$$
H^{0}(M, \varphi, \psi)=\operatorname{Ker}(\psi) / \operatorname{Im}(\varphi), \quad \text { and } \quad H^{1}(M, \varphi, \psi)=\operatorname{Ker}(\varphi) / \operatorname{Im}(\psi)
$$

02MX Lemma 12.10.3. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{C} \subset \mathcal{A}$ be a Serre subcategory and set $\mathcal{B}=\mathcal{A} / \mathcal{C}$.
(1) The exact functors $\mathcal{C} \rightarrow \mathcal{A}$ and $\mathcal{A} \rightarrow \mathcal{B}$ induce an exact sequence

$$
K_{0}(\mathcal{C}) \rightarrow K_{0}(\mathcal{A}) \rightarrow K_{0}(\mathcal{B}) \rightarrow 0
$$

of $K$-groups, and
(2) the kernel of $K_{0}(\mathcal{C}) \rightarrow K_{0}(\mathcal{A})$ is equal to the collection of elements of the form

$$
\left[H^{0}(M, \varphi, \psi)\right]-\left[H^{1}(M, \varphi, \psi)\right]
$$

where $(M, \varphi, \psi)$ is a complex as in 12.10.2.1) with the property that it becomes exact in $\mathcal{B}$; in other words that $H^{0}(M, \varphi, \psi)$ and $H^{1}(M, \varphi, \psi)$ are objects of $\mathcal{C}$.

Proof. We omit the proof of (1). The proof of (2) is in a sense completely combinatorial. First we remark that any class of the type $\left[H^{0}(M, \varphi, \psi)\right]-\left[H^{1}(M, \varphi, \psi)\right]$ is zero in $K_{0}(\mathcal{A})$ by the following calculation

$$
\begin{aligned}
0 & =[M]-[M] \\
& =[\operatorname{Ker}(\varphi)]+[\operatorname{Im}(\varphi)]-[\operatorname{Ker}(\psi)]-[\operatorname{Im}(\psi)] \\
& =[\operatorname{Ker}(\varphi) / \operatorname{Im}(\psi)]-[\operatorname{Ker}(\psi) / \operatorname{Im}(\varphi)] \\
& =\left[H^{1}(M, \varphi, \psi)\right]-\left[H^{0}(M, \varphi, \psi)\right]
\end{aligned}
$$

as desired. Hence it suffices to show that any element in the kernel of $K_{0}(\mathcal{C}) \rightarrow$ $K_{0}(\mathcal{A})$ is of this form.

Any element $x$ in $K_{0}(\mathcal{C})$ can be represented as the difference $x=[P]-[Q]$ of two objects of $\mathcal{C}$ (fun exercise). Suppose that this element maps to zero in $K_{0}(\mathcal{A})$. This means that there exist
(1) a finite set $I=I^{+} \amalg I^{-}$,
(2) for each $i \in I$ a short exact sequence

$$
0 \rightarrow A_{i} \rightarrow B_{i} \rightarrow C_{i} \rightarrow 0
$$

in the abelian category $\mathcal{A}$
such that

$$
[P]-[Q]=\sum_{i \in I^{+}}\left(\left[B_{i}\right]-\left[A_{i}\right]-\left[C_{i}\right]\right)-\sum_{i \in I^{-}}\left(\left[B_{i}\right]-\left[A_{i}\right]-\left[C_{i}\right]\right)
$$

in the free abelian group on the objects of $\mathcal{A}$. We can rewrite this as

$$
[P]+\sum_{i \in I^{+}}\left(\left[A_{i}\right]+\left[C_{i}\right]\right)+\sum_{i \in I^{-}}\left[B_{i}\right]=[Q]+\sum_{i \in I^{-}}\left(\left[A_{i}\right]+\left[C_{i}\right]\right)+\sum_{i \in I^{+}}\left[B_{i}\right]
$$

Since the right and left hand side should contain the same objects of $\mathcal{A}$ counted with multiplicity, this means there should be a bijection $\tau$ between the terms which occur above. Set

$$
T^{+}=\{p\} \amalg\{a, c\} \times I^{+} \amalg\{b\} \times I^{-}
$$

and

$$
T^{-}=\{q\} \amalg\{a, c\} \times I^{-} \amalg\{b\} \times I^{+} .
$$

Set $T=T^{+} \amalg T^{-}=\{p, q\} \amalg\{a, b, c\} \times I$. For $t \in T$ define

$$
O(t)=\left\{\begin{array}{ccc}
P & \text { if } & t=p \\
Q & \text { if } & t=q \\
A_{i} & \text { if } & t=(a, i) \\
B_{i} & \text { if } & t=(b, i) \\
C_{i} & \text { if } & t=(c, i)
\end{array}\right.
$$

Hence we can view $\tau: T^{+} \rightarrow T^{-}$as a bijection such that $O(t)=O(\tau(t))$ for all $t \in T^{+}$. Let $t_{0}^{-}=\tau(p)$ and let $t_{0}^{+} \in T^{+}$be the unique element such that $\tau\left(t_{0}^{+}\right)=q$. Consider the object

$$
M^{+}=\bigoplus_{t \in T^{+}} O(t)
$$

By using $\tau$ we see that it is equal to the object

$$
M^{-}=\bigoplus_{t \in T^{-}} O(t)
$$

Consider the map

$$
\varphi: M^{+} \longrightarrow M^{-}
$$

which on the summand $O(t)=A_{i}$ corresponding to $t=(a, i), i \in I^{+}$uses the $\operatorname{map} A_{i} \rightarrow B_{i}$ into the summand $O((b, i))=B_{i}$ of $M^{-}$and on the summand $O(t)=B_{i}$ corresponding to $(b, i), i \in I^{-}$uses the map $B_{i} \rightarrow C_{i}$ into the summand $O((c, i))=C_{i}$ of $M^{-}$. The map is zero on the summands corresponding to $p$ and $(c, i), i \in I^{+}$. Similarly, consider the map

$$
\psi: M^{-} \longrightarrow M^{+}
$$

which on the summand $O(t)=A_{i}$ corresponding to $t=(a, i), i \in I^{-}$uses the map $A_{i} \rightarrow B_{i}$ into the summand $O((b, i))=B_{i}$ of $M^{+}$and on the summand $O(t)=B_{i}$ corresponding to $(b, i), i \in I^{+}$uses the map $B_{i} \rightarrow C_{i}$ into the summand $O((c, i))=C_{i}$ of $M^{+}$. The map is zero on the summands corresponding to $q$ and $(c, i), i \in I^{-}$.

Note that the kernel of $\varphi$ is equal to the direct sum of the summand $P$ and the summands $O((c, i))=C_{i}, i \in I^{+}$and the subobjects $A_{i}$ inside the summands $O((b, i))=B_{i}, i \in I^{-}$. The image of $\psi$ is equal to the direct sum of the summands $O((c, i))=C_{i}, i \in I^{+}$and the subobjects $A_{i}$ inside the summands $O((b, i))=B_{i}$, $i \in I^{-}$. In other words we see that

$$
P \cong \operatorname{Ker}(\varphi) / \operatorname{Im}(\psi)
$$

In exactly the same way we see that

$$
Q \cong \operatorname{Ker}(\psi) / \operatorname{Im}(\varphi)
$$

Since as we remarked above the existence of the bijection $\tau$ shows that $M^{+}=M^{-}$ we see that the lemma follows.

### 12.11. Cohomological delta-functors

010P
010 Q Definition 12.11.1. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. A cohomological $\delta$-functor or simply a $\delta$-functor from $\mathcal{A}$ to $\mathcal{B}$ is given by the following data:
(1) a collection $F^{n}: \mathcal{A} \rightarrow \mathcal{B}, n \geq 0$ of additive functors, and
(2) for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of $\mathcal{A}$ a collection $\delta_{A \rightarrow B \rightarrow C}: F^{n}(C) \rightarrow F^{n+1}(A), n \geq 0$ of morphisms of $\mathcal{B}$.
These data are assumed to satisfy the following axioms
(1) for every short exact sequence as above the sequence

is exact, and
(2) for every morphism $(A \rightarrow B \rightarrow C) \rightarrow\left(A^{\prime} \rightarrow B^{\prime} \rightarrow C^{\prime}\right)$ of short exact sequences of $\mathcal{A}$ the diagrams

are commutative.
Note that this in particular implies that $F^{0}$ is left exact.
010R Definition 12.11.2. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $\left(F^{n}, \delta_{F}\right)$ and $\left(G^{n}, \delta_{G}\right)$ be $\delta$-functors from $\mathcal{A}$ to $\mathcal{B}$. A morphism of $\delta$-functors from $F$ to $G$ is a collection of transformation of functors $t^{n}: F^{n} \rightarrow G^{n}, n \geq 0$ such that for every short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ of $\mathcal{A}$ the diagrams

are commutative.
010 S Definition 12.11.3. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $F=\left(F^{n}, \delta_{F}\right)$ be a $\delta$ functor from $\mathcal{A}$ to $\mathcal{B}$. We say $F$ is a universal $\delta$-functor if an only if for every $\delta$-functor $G=\left(G^{n}, \delta_{G}\right)$ and any morphism of functors $t: F^{0} \rightarrow G^{0}$ there exists a unique morphism of $\delta$-functors $\left\{t^{n}\right\}_{n \geq 0}: F \rightarrow G$ such that $t=t^{0}$.
010 T Lemma 12.11.4. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $F=\left(F^{n}, \delta_{F}\right)$ be a $\delta$-functor from $\mathcal{A}$ to $\mathcal{B}$. Suppose that for every $n>0$ and any $A \in \operatorname{Ob}(\mathcal{A})$ there exists an injective morphism $u: A \rightarrow B$ (depending on $A$ and $n$ ) such that $F^{n}(u): F^{n}(A) \rightarrow$ $F^{n}(B)$ is zero. Then $F$ is a universal $\delta$-functor.

Proof. Let $G=\left(G^{n}, \delta_{G}\right)$ be a $\delta$-functor from $\mathcal{A}$ to $\mathcal{B}$ and let $t: F^{0} \rightarrow G^{0}$ be a morphism of functors. We have to show there exists a unique morphism of $\delta$ functors $\left\{t^{n}\right\}_{n \geq 0}: F \rightarrow G$ such that $t=t^{0}$. We construct $t^{n}$ by induction on $n$. For $n=0$ we set $t^{0}=t$. Suppose we have already constructed a unique sequence of transformation of functors $t^{i}$ for $i \leq n$ compatible with the maps $\delta$ in degrees $\leq n$.
Let $A \in \operatorname{Ob}(\mathcal{A})$. By assumption we may choose a embedding $u: A \rightarrow B$ such that $F^{n+1}(u)=0$. Let $C=B / u(A)$. The long exact cohomology sequence for
the short exact sequence $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ and the $\delta$-functor $F$ gives that $F^{n+1}(A)=\operatorname{Coker}\left(F^{n}(B) \rightarrow F^{n}(C)\right)$ by our choice of $u$. Since we have already defined $t^{n}$ we can set

$$
t_{A}^{n+1}: F^{n+1}(A) \rightarrow G^{n+1}(A)
$$

equal to the unique map such that

commutes. This is clearly uniquely determined by the requirements imposed. We omit the verification that this defines a transformation of functors.

010 U Lemma 12.11.5. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a functor. If there exists a universal $\delta$-functor $\left(F^{n}, \delta_{F}\right)$ from $\mathcal{A}$ to $\mathcal{B}$ with $F^{0}=F$, then it is determined up to unique isomorphism of $\delta$-functors.

Proof. Immediate from the definitions.

### 12.12. Complexes

010 V Of course the notions of a chain complex and a cochain complex are dual and you only have to read one of the two parts of this section. So pick the one you like. (Actually, this doesn't quite work right since the conventions on numbering things are not adapted to an easy transition between chain and cochain complexes.)
A chain complex $A_{\bullet}$ in an additive category $\mathcal{A}$ is a complex

$$
\ldots \rightarrow A_{n+1} \xrightarrow{d_{n+1}} A_{n} \xrightarrow{d_{n}} A_{n-1} \rightarrow \ldots
$$

of $\mathcal{A}$. In other words, we are given an object $A_{i}$ of $\mathcal{A}$ for all $i \in \mathbf{Z}$ and for all $i \in \mathbf{Z}$ a morphism $d_{i}: A_{i} \rightarrow A_{i-1}$ such that $d_{i-1} \circ d_{i}=0$ for all $i$. A morphism of chain complexes $f: A \bullet B$ • is given by a family of morphisms $f_{i}: A_{i} \rightarrow B_{i}$ such that all the diagrams

commute. The category of chain complexes of $\mathcal{A}$ is denoted $\operatorname{Ch}(\mathcal{A})$. The full subcategory consisting of objects of the form

$$
\ldots \rightarrow A_{2} \rightarrow A_{1} \rightarrow A_{0} \rightarrow 0 \rightarrow 0 \rightarrow \ldots
$$

is denoted $\mathrm{Ch}_{\geq 0}(\mathcal{A})$. In other words, a chain complex $A_{\bullet}$ belongs to $\mathrm{Ch}_{\geq 0}(\mathcal{A})$ if and only if $A_{i}=0$ for all $i<0$. A homotopy $h$ between a pair of morphisms of chain complexes $f, g: A_{\bullet} \rightarrow B_{\bullet}$ is is a collection of morphisms $h_{i}: A_{i} \rightarrow B_{i+1}$ such that we have

$$
f_{i}-g_{i}=d_{i+1} \circ h_{i}+h_{i-1} \circ d_{i}
$$

for all $i$. Clearly, the notions of chain complex, morphism of chain complexes, and homotopies between morphisms of chain complexes makes sense even in a preadditive category.

010W Lemma 12.12.1. Let $\mathcal{A}$ be an additive category. Let $f, g: B_{\bullet} \rightarrow C \bullet$ be morphisms of chain complexes. Suppose given morphisms of chain complexes $a: A_{\bullet} \rightarrow B_{\bullet}$, and $c: C_{\bullet} \rightarrow D_{\bullet}$. If $\left\{h_{i}: B_{i} \rightarrow C_{i+1}\right\}$ defines a homotopy between $f$ and $g$, then $\left\{c_{i+1} \circ h_{i} \circ a_{i}\right\}$ defines a homotopy between $c \circ f \circ a$ and $c \circ g \circ a$.

Proof. Omitted.
In particular this means that it makes sense to define the category of chain complexes with maps up to homotopy. We'll return to this later.

010X Definition 12.12.2. Let $\mathcal{A}$ be an additive category. We say a morphism $a: A_{\bullet} \rightarrow$ $B_{\bullet}$ is a homotopy equivalence if there exists a morphism $b: B_{\bullet} \rightarrow A_{\bullet}$ such that there exists a homotopy between $a \circ b$ and $\operatorname{id}_{A}$ and there exists a homotopy between $b \circ a$ and $\mathrm{id}_{B}$. If there exists such a morphism between $A_{\bullet}$ and $B_{\bullet}$, then we say that $A_{\bullet}$ and $B$ • are homotopy equivalent.

In other words, two complexes are homotopy equivalent if they become isomorphic in the category of complexes up to homotopy.

010Y Lemma 12.12.3. Let $\mathcal{A}$ be an abelian category.
(1) The category of chain complexes in $\mathcal{A}$ is abelian.
(2) A morphism of complexes $f: A_{\bullet} \rightarrow B_{\bullet}$ is injective if and only if each $f_{n}: A_{n} \rightarrow B_{n}$ is injective.
(3) A morphism of complexes $f: A \bullet \rightarrow B \bullet$ is surjective if and only if each $f_{n}: A_{n} \rightarrow B_{n}$ is surjective.
(4) A sequence of chain complexes

$$
A_{\bullet} \xrightarrow{f} B_{\bullet} \xrightarrow{g} C_{\bullet}
$$

is exact at $B$. if and only if each sequence

$$
A_{i} \xrightarrow{f_{i}} B_{i} \xrightarrow{g_{i}} C_{i}
$$

is exact at $B_{i}$.
Proof. Omitted.
For any $i \in \mathbf{Z}$ the $i$ th homology group of a chain complex $A_{\bullet}$ in an abelian category is defined by the following formula

$$
H_{i}\left(A_{\bullet}\right)=\operatorname{Ker}\left(d_{i}\right) / \operatorname{Im}\left(d_{i+1}\right) .
$$

If $f: A_{\bullet} \rightarrow B_{\bullet}$ is a morphism of chain complexes of $\mathcal{A}$ then we get an induced morphism $H_{i}(f): H_{i}\left(A_{\bullet}\right) \rightarrow H_{i}\left(B_{\bullet}\right)$ because clearly $f_{i}\left(\operatorname{Ker}\left(d_{i}: A_{i} \rightarrow A_{i-1}\right)\right) \subset$ $\operatorname{Ker}\left(d_{i}: B_{i} \rightarrow B_{i-1}\right)$, and similarly for $\operatorname{Im}\left(d_{i+1}\right)$. Thus we obtain a functor

$$
H_{i}: \operatorname{Ch}(\mathcal{A}) \longrightarrow \mathcal{A}
$$

010Z Definition 12.12.4. Let $\mathcal{A}$ be an abelian category.
(1) A morphism of chain complexes $f: A_{\bullet} \rightarrow B_{\bullet}$ is called a quasi-isomorphism if the induced map $H_{i}(f): H_{i}\left(A_{\bullet}\right) \rightarrow H_{i}\left(B_{\bullet}\right)$ is an isomorphism for all $i \in \mathbf{Z}$.
(2) A chain complex $A_{\bullet}$ is called acyclic if all of its homology objects $H_{i}\left(A_{\bullet}\right)$ are zero.

0110 Lemma 12.12.5. Let $\mathcal{A}$ be an abelian category.
(1) If the maps $f, g: A_{\bullet} \rightarrow B_{\bullet}$ are homotopic, then the induced maps $H_{i}(f)$ and $H_{i}(g)$ are equal.
(2) If the map $f: A_{\bullet} \rightarrow B \bullet$ is a homotopy equivalence, then $f$ is a quasiisomorphism.
Proof. Omitted.
0111 Lemma 12.12.6. Let $\mathcal{A}$ be an abelian category. Suppose that

$$
0 \rightarrow A_{\bullet} \rightarrow B_{\bullet} \rightarrow C_{\bullet} \rightarrow 0
$$

is a short exact sequence of chain complexes of $\mathcal{A}$. Then there is a canonical long exact homology sequence

Proof. Omitted. The maps come from the Snake Lemma 12.5 .17 applied to the diagrams

A cochain complex $A^{\bullet}$ in an additive category $\mathcal{A}$ is a complex

$$
\ldots \rightarrow A^{n-1} \xrightarrow{d^{n-1}} A^{n} \xrightarrow{d^{n}} A^{n+1} \rightarrow \ldots
$$

of $\mathcal{A}$. In other words, we are given an object $A^{i}$ of $\mathcal{A}$ for all $i \in \mathbf{Z}$ and for all $i \in \mathbf{Z}$ a morphism $d^{i}: A^{i} \rightarrow A^{i+1}$ such that $d^{i+1} \circ d^{i}=0$ for all $i$. A morphism of cochain complexes $f: A^{\bullet} \rightarrow B^{\bullet}$ is given by a family of morphisms $f^{i}: A^{i} \rightarrow B^{i}$ such that all the diagrams

commute. The category of cochain complexes of $\mathcal{A}$ is denoted $\operatorname{CoCh}(\mathcal{A})$. The full subcategory consisting of objects of the form

$$
\ldots \rightarrow 0 \rightarrow 0 \rightarrow A^{0} \rightarrow A^{1} \rightarrow A^{2} \rightarrow \ldots
$$

is denoted $\mathrm{CoCh}_{\geq 0}(\mathcal{A})$. In other words, a cochain complex $A^{\bullet}$ belongs to the subcategory $\mathrm{CoCh}_{\geq 0}(\mathcal{A})$ if and only if $A^{i}=0$ for all $i<0$. A homotopy $h$ between
a pair of morphisms of cochain complexes $f, g: A^{\bullet} \rightarrow B^{\bullet}$ is is a collection of morphisms $h^{i}: A^{i} \rightarrow B^{i-1}$ such that we have

$$
f^{i}-g^{i}=d^{i-1} \circ h^{i}+h^{i+1} \circ d^{i}
$$

for all $i$. Clearly, the notions of cochain complex, morphism of cochain complexes, and homotopies between morphisms of cochain complexes makes sense even in a preadditive category.

0112 Lemma 12.12.7. Let $\mathcal{A}$ be an additive category. Let $f, g: B^{\bullet} \rightarrow C^{\bullet}$ be morphisms of cochain complexes. Suppose given morphisms of cochain complexes $a: A^{\bullet} \rightarrow B^{\bullet}$, and $c: C^{\bullet} \rightarrow D^{\bullet}$. If $\left\{h^{i}: B^{i} \rightarrow C^{i-1}\right\}$ defines a homotopy between $f$ and $g$, then $\left\{c^{i-1} \circ h^{i} \circ a^{i}\right\}$ defines a homotopy between $c \circ f \circ a$ and $c \circ g \circ a$.

Proof. Omitted.
In particular this means that it makes sense to define the category of cochain complexes with maps up to homotopy. We'll return to this later.

0113 Definition 12.12.8. Let $\mathcal{A}$ be an additive category. We say a morphism $a: A^{\bullet} \rightarrow$ $B^{\bullet}$ is a homotopy equivalence if there exists a morphism $b: B^{\bullet} \rightarrow A^{\bullet}$ such that there exists a homotopy between $a \circ b$ and $\operatorname{id}_{A}$ and there exists a homotopy between $b \circ a$ and $\operatorname{id}_{B}$. If there exists such a morphism between $A^{\bullet}$ and $B^{\bullet}$, then we say that $A^{\bullet}$ and $B^{\bullet}$ are homotopy equivalent.

In other words, two complexes are homotopy equivalent if they become isomorphic in the category of complexes up to homotopy.

0114 Lemma 12.12.9. Let $\mathcal{A}$ be an abelian category.
(1) The category of cochain complexes in $\mathcal{A}$ is abelian.
(2) A morphism of cochain complexes $f: A^{\bullet} \rightarrow B^{\bullet}$ is injective if and only if each $f^{n}: A^{n} \rightarrow B^{n}$ is injective.
(3) A morphism of cochain complexes $f: A^{\bullet} \rightarrow B^{\bullet}$ is surjective if and only if each $f^{n}: A^{n} \rightarrow B^{n}$ is surjective.
(4) A sequence of cochain complexes

$$
A^{\bullet} \xrightarrow{f} B^{\bullet} \xrightarrow{g} C^{\bullet}
$$

is exact at $B^{\bullet}$ if and only if each sequence

$$
A^{i} \xrightarrow{f^{i}} B^{i} \xrightarrow{g^{i}} C^{i}
$$

is exact at $B^{i}$.
Proof. Omitted.
For any $i \in \mathbf{Z}$ the $i$ th cohomology group of a cochain complex $A^{\bullet}$ is defined by the following formula

$$
H^{i}\left(A^{\bullet}\right)=\operatorname{Ker}\left(d^{i}\right) / \operatorname{Im}\left(d^{i-1}\right)
$$

If $f: A^{\bullet} \rightarrow B^{\bullet}$ is a morphism of cochain complexes of $\mathcal{A}$ then we get an induced morphism $H^{i}(f): H^{i}\left(A^{\bullet}\right) \rightarrow H^{i}\left(B^{\bullet}\right)$ because clearly $f^{i}\left(\operatorname{Ker}\left(d^{i}: A^{i} \rightarrow A^{i+1}\right)\right) \subset$ $\operatorname{Ker}\left(d^{i}: B^{i} \rightarrow B^{i+1}\right)$, and similarly for $\operatorname{Im}\left(d^{i-1}\right)$. Thus we obtain a functor

$$
H^{i}: \operatorname{CoCh}(\mathcal{A}) \longrightarrow \mathcal{A}
$$

0115 Definition 12.12.10. Let $\mathcal{A}$ be an abelian category.
(1) A morphism of cochain complexes $f: A^{\bullet} \rightarrow B^{\bullet}$ of $\mathcal{A}$ is called a quasiisomorphism if the induced maps $H^{i}(f): H^{i}\left(A^{\bullet}\right) \rightarrow H^{i}\left(B^{\bullet}\right)$ is an isomorphism for all $i \in \mathbf{Z}$.
(2) A cochain complex $A^{\bullet}$ is called acyclic if all of its cohomology objects $H^{i}\left(A^{\bullet}\right)$ are zero.

0116
Lemma 12.12.11. Let $\mathcal{A}$ be an abelian category.
(1) If the maps $f, g: A^{\bullet} \rightarrow B^{\bullet}$ are homotopic, then the induced maps $H^{i}(f)$ and $H^{i}(g)$ are equal.
(2) If $f: A^{\bullet} \rightarrow B^{\bullet}$ is a homotopy equivalence, then $f$ is a quasi-isomorphism.

Proof. Omitted.
0117 Lemma 12.12.12. Let $\mathcal{A}$ be an abelian category. Suppose that

$$
0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0
$$

is a short exact sequence of chain complexes of $\mathcal{A}$. Then there is a canonical long exact homology sequence

Proof. Omitted. The maps come from the Snake Lemma 12.5 .17 applied to the diagrams

### 12.13. Truncation of complexes

0118 Let $\mathcal{A}$ be an abelian category. Let $A_{\bullet}$ be a chain complex. There are several ways to truncate the complex $A_{\bullet}$.
(1) The "stupid" truncation $\sigma_{\leq n}$ is the subcomplex $\sigma_{\leq n} A \bullet$ defined by the rule $\left(\sigma_{\leq n} A_{\bullet}\right)_{i}=0$ if $i>n$ and $\left(\sigma_{\leq n} A_{\bullet}\right)_{i}=A_{i}$ if $i \leq \bar{n}$. In a picture

Note the property $\sigma_{\leq n} A_{\bullet} / \sigma_{\leq n-1} A_{\bullet}=A_{n}[-n]$.
(2) The "stupid" truncation $\sigma_{\geq n}$ is the quotient complex $\sigma_{\geq n} A$ • defined by the rule $\left(\sigma_{\geq n} A_{\bullet}\right)_{i}=A_{i}$ if $i \geq n$ and $\left(\sigma_{\geq n} A_{\bullet}\right)_{i}=0$ if $i<n$. In a picture

The map of complexes $\sigma_{\geq n} A_{\bullet} \rightarrow \sigma_{\geq n+1} A_{\bullet}$ is surjective with kernel $A_{n}[-n]$.
(3) The canonical truncation $\tau_{\geq n} A_{\bullet}$ is defined by the picture

Note that these complexes have the property that

$$
H_{i}\left(\tau_{\geq n} A_{\bullet}\right)=\left\{\begin{array}{cll}
H_{i}\left(A_{\bullet}\right) & \text { if } \quad i \geq n \\
0 & \text { if } \quad i<n
\end{array}\right.
$$

(4) The canonical truncation $\tau_{\leq n} A_{\bullet}$ is defined by the picture

Note that these complexes have the property that

$$
H_{i}\left(\tau_{\leq n} A_{\bullet}\right)=\left\{\begin{array}{cll}
H_{i}\left(A_{\bullet}\right) & \text { if } \quad i \leq n \\
0 & \text { if } \quad i>n
\end{array}\right.
$$

Let $\mathcal{A}$ be an abelian category. Let $A^{\bullet}$ be a cochain complex. There are four ways to truncate the complex $A^{\bullet}$.
(1) The "stupid" truncation $\sigma_{\geq n}$ is the subcomplex $\sigma_{\geq n} A^{\bullet}$ defined by the rule $\left(\sigma_{\geq n} A^{\bullet}\right)^{i}=0$ if $i<n$ and $\left(\sigma_{\geq n} A^{\bullet}\right)^{i}=A_{i}$ if $i \geq \bar{n}$. In a picture

Note the property $\sigma_{\geq n} A^{\bullet} / \sigma_{\geq n+1} A^{\bullet}=A^{n}[-n]$.
(2) The "stupid" truncation $\sigma_{\leq n}$ is the quotient complex $\sigma_{\leq n} A^{\bullet}$ defined by the rule $\left(\sigma_{\leq n} A^{\bullet}\right)^{i}=0$ if $i>n$ and $\left(\sigma_{\leq n} A^{\bullet}\right)^{i}=A^{i}$ if $i \leq n$. In a picture

The map of complexes $\sigma_{\leq n} A^{\bullet} \rightarrow \sigma_{\leq n-1} A^{\bullet}$ is surjective with kernel $A^{n}[-n]$.
(3) The canonical truncation $\tau_{\leq n} A^{\bullet}$ is defined by the picture

Note that these complexes have the property that

$$
H^{i}\left(\tau_{\leq n} A^{\bullet}\right)=\left\{\begin{array}{ccc}
H^{i}\left(A^{\bullet}\right) & \text { if } & i \leq n \\
0 & \text { if } & i>n
\end{array}\right.
$$

(4) The canonical truncation $\tau_{\geq n} A^{\bullet}$ is defined by the picture

Note that these complexes have the property that

$$
H^{i}\left(\tau_{\geq n} A^{\bullet}\right)=\left\{\begin{array}{ccc}
0 & \text { if } \quad i<n \\
H^{i}\left(A^{\bullet}\right) & \text { if } \quad i \geq n
\end{array}\right.
$$

### 12.14. Homotopy and the shift functor

0119 It is an annoying feature that signs and indices have to be part of any discussion of homological algebrd ${ }^{2}$

011A Definition 12.14.1. Let $\mathcal{A}$ be an additive category. Let $A$ be a chain complex with boundary maps $d_{A, n}: A_{n} \rightarrow A_{n-1}$. For any $k \in \mathbf{Z}$ we define the $k$-shifted chain complex $A[k]$ • as follows:
(1) we set $A[k]_{n}=A_{n+k}$, and
(2) we set $d_{A[k], n}: A[k]_{n} \rightarrow A[k]_{n-1}$ equal to $d_{A[k], n}=(-1)^{k} d_{A, n+k}$.

If $f: A_{\bullet} \rightarrow B_{\bullet}$ is a morphism of chain complexes, then we let $f[k]: A[k] \bullet \rightarrow B[k] \bullet$ be the morphism of chain complexes with $f[k]_{n}=f_{k+n}$.

Of course this means we have functors $[k]: \operatorname{Ch}(\mathcal{A}) \rightarrow \operatorname{Ch}(\mathcal{A})$ which mutually commute (on the nose, without any intervening isomorphisms of functors), such that $A[k][l]_{\bullet}=A[k+l]_{\bullet}$ and with $[0]=\operatorname{id}_{\mathrm{Ch}(\mathcal{A})}$.

011B Definition 12.14.2. Let $\mathcal{A}$ be an abelian category. Let $A$ • be a chain complex with boundary maps $d_{A, n}: A_{n} \rightarrow A_{n-1}$. For any $k \in \mathbf{Z}$ we identify $H_{i+k}\left(A_{\bullet}\right) \rightarrow$ $H_{i}\left(A[k]_{\bullet}\right)$ via the identification $A_{i+k}=A[k]_{i}$.
This identification is functorial in $A_{\bullet}$. Note that since no signs are involved in this definition we actually get a compatible system of identifications of all the homology objects $H_{i-k}\left(A[k]_{\bullet}\right)$, which are further compatible with the identifications $A[k][l]_{\bullet}=A[k+l]_{\bullet}$ and with $[0]=\operatorname{id}_{\mathrm{Ch}(\mathcal{A})}$.
Let $\mathcal{A}$ be an additive category. Suppose that $A_{\bullet}$ and $B_{\bullet}$ are chain complexes, $a, b: A_{\bullet} \rightarrow B_{\bullet}$ are morphisms of chain complexes, and $\left\{h_{i}: A_{i} \rightarrow B_{i+1}\right\}$ is a homotopy between $a$ and $b$. Recall that this means that $a_{i}-b_{i}=d_{i+1} \circ h_{i}+h_{i-1} \circ d_{i}$.

[^28]What if $a=b$ ? Then we obtain the formula $0=d_{i+1} \circ h_{i}+h_{i-1} \circ d_{i}$, in other words, $-d_{i+1} \circ h_{i}=h_{i-1} \circ d_{i}$. By definition above this means the collection $\left\{h_{i}\right\}$ above defines a morphism of chain complexes

$$
A_{\bullet} \longrightarrow B[1]_{\bullet} .
$$

Such a thing is the same as a morphism $A[-1] \bullet \rightarrow B \bullet$ by our remarks above. This proves the following lemma.

011C Lemma 12.14.3. Let $\mathcal{A}$ be an additive category. Suppose that $A_{\bullet}$ and $B$ • are chain complexes. Given any morphism of chain complexes $a: A_{\bullet} \rightarrow B_{\bullet}$ there is $a$ bijection between the set of homotopies from a to a and $\operatorname{Mor}_{C h(\mathcal{A})}\left(A_{\bullet}, B[1]_{\bullet}\right)$. More generally, the set of homotopies between $a$ and $b$ is either empty or a principal homogeneous space under the group $\operatorname{Mor}_{C h(\mathcal{A})}\left(A_{\bullet}, B[1]_{\bullet}\right)$.

Proof. See above.
011D Lemma 12.14.4. Let $\mathcal{A}$ be an abelian category. Let

$$
0 \rightarrow A_{\bullet} \rightarrow B_{\bullet} \rightarrow C_{\bullet} \rightarrow 0
$$

be a sort exact sequence of complexes. Suppose that $\left\{s_{n}: C_{n} \rightarrow B_{n}\right\}$ is a family of morphisms which split the short exact sequences $0 \rightarrow A_{n} \rightarrow B_{n} \rightarrow C_{n} \rightarrow 0$. Let $\pi_{n}: B_{n} \rightarrow A_{n}$ be the associated projections, see Lemma 12.5.10. Then the family of morphisms

$$
\pi_{n-1} \circ d_{B, n} \circ s_{n}: C_{n} \rightarrow A_{n-1}
$$

define a morphism of complexes $\delta(s): C_{\bullet} \rightarrow A[-1]_{\bullet}$.
Proof. Denote $i: A_{\bullet} \rightarrow B_{\bullet}$ and $q: B_{\bullet} \rightarrow C_{\bullet}$ the maps of complexes in the short exact sequence. Then $i_{n-1} \circ \pi_{n-1} \circ d_{B, n} \circ s_{n}=d_{B, n} \circ s_{n}-s_{n-1} \circ d_{C, n}$. Hence $i_{n-2} \circ d_{A, n-1} \circ \pi_{n-1} \circ d_{B, n} \circ s_{n}=d_{B, n-1} \circ\left(d_{B, n} \circ s_{n}-s_{n-1} \circ d_{C, n}\right)=$ $-d_{B, n-1} \circ s_{n-1} \circ d_{C, n}$ as desired.

011E Lemma 12.14.5. Notation and assumptions as in Lemma 12.14.4 above. The morphism of complexes $\delta(s): C_{\bullet} \rightarrow A[-1] \bullet$ induces the maps

$$
H_{i}(\delta(s)): H_{i}\left(C_{\bullet}\right) \longrightarrow H_{i}\left(A[-1]_{\bullet}\right)=H_{i-1}\left(A_{\bullet}\right)
$$

which occur in the long exact homology sequence associated to the short exact sequence of chain complexes by Lemma 12.12.6.

Proof. Omitted.
011F Lemma 12.14.6. Notation and assumptions as in Lemma 12.14.4 above. Suppose $\left\{s_{n}^{\prime}: C_{n} \rightarrow B_{n}\right\}$ is a second choice of splittings. Write $s_{n}^{\prime}=s_{n}+i_{n} \circ h_{n}$ for some unique morphisms $h_{n}: C_{n} \rightarrow A_{n}$. The family of maps $\left\{h_{n}: C_{n} \rightarrow A[-1]_{n+1}\right\}$ is a homotopy between the associated morphisms $\delta(s), \delta\left(s^{\prime}\right): C \bullet \rightarrow A[-1]_{\bullet}$.

Proof. Omitted.
011G Definition 12.14.7. Let $\mathcal{A}$ be an additive category. Let $A$ be a cochain complex with boundary maps $d_{A}^{n}: A^{n} \rightarrow A^{n+1}$. For any $k \in \mathbf{Z}$ we define the $k$-shifted cochain complex $A[k]^{\bullet}$ as follows:
(1) we set $A[k]^{n}=A^{n+k}$, and
(2) we set $d_{A[k]}^{n}: A[k]^{n} \rightarrow A[k]^{n+1}$ equal to $d_{A[k]}^{n}=(-1)^{k} d_{A}^{n+k}$.

If $f: A^{\bullet} \rightarrow B^{\bullet}$ is a morphism of cochain complexes, then we let $f[k]: A[k]^{\bullet} \rightarrow B[k]^{\bullet}$ be the morphism of cochain complexes with $f[k]^{n}=f^{k+n}$.
Of course this means we have functors $[k]: \operatorname{CoCh}(\mathcal{A}) \rightarrow \operatorname{CoCh}(\mathcal{A})$ which mutually commute (on the nose, without any intervening isomorphisms of functors) and such that $A[k][l]^{\bullet}=A[k+l]^{\bullet}$ and with $[0]=\operatorname{id}_{\operatorname{CoCh}(\mathcal{A})}$.
011H Definition 12.14.8. Let $\mathcal{A}$ be an abelian category. Let $A^{\bullet}$ be a cochain complex with boundary maps $d_{A}^{n}: A^{n} \rightarrow A^{n+1}$. For any $k \in \mathbf{Z}$ we identify $H^{i+k}\left(A^{\bullet}\right) \longrightarrow$ $H^{i}\left(A[k]^{\bullet}\right)$ via the identification $A^{i+k}=A[k]^{i}$.

This identification is functorial in $A^{\bullet}$. Note that since no signs are involved in this definition we actually get a compatible system of identifications of all the homology objects $H^{i-k}(A[k] \bullet$, which are further compatible with the identifications $A[k][l]^{\bullet}=A[k+l]^{\bullet}$ and with $[0]=\operatorname{id}_{\operatorname{CoCh}(\mathcal{A})}$.
Let $\mathcal{A}$ be an additive category. Suppose that $A^{\bullet}$ and $B^{\bullet}$ are cochain complexes, $a, b: A^{\bullet} \rightarrow B^{\bullet}$ are morphisms of cochain complexes, and $\left\{h^{i}: A^{i} \rightarrow B^{i-1}\right\}$ is a homotopy between $a$ and $b$. Recall that this means that $a^{i}-b^{i}=d^{i-1} \circ h^{i}+h^{i+1} \circ d^{i}$. What if $a=b$ ? Then we obtain the formula $0=d^{i-1} \circ h^{i}+h^{i+1} \circ d^{i}$, in other words, $-d^{i-1} \circ h^{i}=h^{i+1} \circ d^{i}$. By definition above this means the collection $\left\{h^{i}\right\}$ above defines a morphism of cochain complexes

$$
A^{\bullet} \longrightarrow B[-1]^{\bullet}
$$

Such a thing is the same as a morphism $A[1]^{\bullet} \rightarrow B^{\bullet}$ by our remarks above. This proves the following lemma.

011 Lemma 12.14.9. Let $\mathcal{A}$ be an additive category. Suppose that $A^{\bullet}$ and $B^{\bullet}$ are cochain complexes. Given any morphism of cochain complexes $a: A^{\bullet} \rightarrow B^{\bullet}$ there is a bijection between the set of homotopies from a to a and $\operatorname{Mor}_{\operatorname{CoCh}(\mathcal{A})}\left(A^{\bullet}, B[-1] \bullet\right)$. More generally, the set of homotopies between $a$ and $b$ is either empty or a principal homogeneous space under the group $\operatorname{Mor}_{\operatorname{CoCh}(\mathcal{A})}\left(A^{\bullet}, B[-1]^{\bullet}\right)$.
Proof. See above.
011J Lemma 12.14.10. Let $\mathcal{A}$ be an additive category. Let

$$
0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0
$$

be a complex (!) of complexes. Suppose that we are given splittings $B^{n}=A^{n} \oplus C^{n}$ compatible with the maps in the displayed sequence. Let $s^{n}: C^{n} \rightarrow B^{n}$ and $\pi^{n}$ : $B^{n} \rightarrow A^{n}$ be the corresponding maps. Then the family of morphisms

$$
\pi^{n+1} \circ d_{B}^{n} \circ s^{n}: C^{n} \rightarrow A^{n+1}
$$

define a morphism of complexes $\delta: C^{\bullet} \rightarrow A[1]^{\bullet}$.
Proof. Denote $i: A^{\bullet} \rightarrow B^{\bullet}$ and $q: B^{\bullet} \rightarrow C^{\bullet}$ the maps of complexes in the short exact sequence. Then $i^{n+1} \circ \pi^{n+1} \circ d_{B}^{n} \circ s^{n}=d_{B}^{n} \circ s^{n}-s^{n+1} \circ d_{C}^{n}$. Hence $i^{n+2} \circ d_{A}^{n+1} \circ \pi^{n+1} \circ d_{B}^{n} \circ s^{n}=d_{B}^{n+1} \circ\left(d_{B}^{n} \circ s^{n}-s^{n+1} \circ d_{C}^{n}\right)=-d_{B}^{n+1} \circ s^{n+1} \circ d_{C}^{n}$ as desired.

011K Lemma 12.14.11. Notation and assumptions as in Lemma 12.14 .10 above. Assume in addition that $\mathcal{A}$ is abelian. The morphism of complexes $\delta: C^{\bullet} \rightarrow A[1] \bullet$ induces the maps

$$
H^{i}(\delta): H^{i}\left(C^{\bullet}\right) \longrightarrow H^{i}\left(A[1]^{\bullet}\right)=H^{i+1}\left(A^{\bullet}\right)
$$

which occur in the long exact homology sequence associated to the short exact sequence of cochain complexes by Lemma 12.12.12.

Proof. Omitted.
011L Lemma 12.14.12. Notation and assumptions as in Lemma 12.14.10. Let $\alpha$ : $A^{\bullet} \rightarrow B^{\bullet}, \beta: B^{\bullet} \rightarrow C^{\bullet}$ be the given morphisms of complexes. Suppose $\left(s^{\prime}\right)^{n}$ : $C^{n} \rightarrow B^{n}$ and $\left(\pi^{\prime}\right)^{n}: B^{n} \rightarrow A^{n}$ is a second choice of splittings. Write $\left(s^{\prime}\right)^{n}=$ $s^{n}+\alpha^{n} \circ h^{n}$ and $\left(\pi^{\prime}\right)^{n}=\pi^{n}+g^{n} \circ \beta^{n}$ for some unique morphisms $h^{n}: C^{n} \rightarrow A^{n}$ and $g^{n}: C^{n} \rightarrow A^{n}$. Then
(1) $g^{n}=-h^{n}$, and
(2) the family of maps $\left\{g^{n}: C^{n} \rightarrow A[1]^{n-1}\right\}$ is a homotopy between $\delta, \delta^{\prime}$ : $C^{\bullet} \rightarrow A[1]^{\bullet}$, more precisely $\left(\delta^{\prime}\right)^{n}=\delta^{n}+g^{n+1} \circ d_{C}^{n}+d_{A[1]}^{n-1} \circ g^{n}$.

Proof. As $\left(s^{\prime}\right)^{n}$ and $\left(\pi^{\prime}\right)^{n}$ are splittings we have $\left(\pi^{\prime}\right)^{n} \circ\left(s^{\prime}\right)^{n}=0$. Hence

$$
0=\left(\pi^{n}+g^{n} \circ \beta^{n}\right) \circ\left(s^{n}+\alpha^{n} \circ h^{n}\right)=g^{n} \circ \beta^{n} \circ s^{n}+\pi^{n} \circ \alpha^{n} \circ h^{n}=g^{n}+h^{n}
$$

which proves (1). We compute $\left(\delta^{\prime}\right)^{n}$ as follows

$$
\left(\pi^{n+1}+g^{n+1} \circ \beta^{n+1}\right) \circ d_{B}^{n} \circ\left(s^{n}+\alpha^{n} \circ h^{n}\right)=\delta^{n}+g^{n+1} \circ d_{C}^{n}+d_{A}^{n} \circ h^{n}
$$

Since $h^{n}=-g^{n}$ and since $d_{A[1]}^{n-1}=-d_{A}^{n}$ we conclude that (2) holds.

### 12.15. Graded objects

09MF We make the following definition.
0125 Definition 12.15.1. Let $\mathcal{A}$ be an additive category. The category of graded objects of $\mathcal{A}$, denoted $\operatorname{Gr}(\mathcal{A})$, is the category with
(1) objects $A=\left(A^{i}\right)$ are families of objects $A^{i}, i \in \mathbf{Z}$ of objects of $\mathcal{A}$, and
(2) morphisms $f: A=\left(A^{i}\right) \rightarrow B=\left(B^{i}\right)$ are families of morphisms $f^{i}: A^{i} \rightarrow$ $B^{i}$ of $\mathcal{A}$.

If $\mathcal{A}$ has countable direct sums, then we can asssociate to an object $A=\left(A^{i}\right)$ of $\operatorname{Gr}(\mathcal{A})$ the object

$$
A=\bigoplus_{i \in \mathbf{Z}} A^{i}
$$

and set $k^{i} A=A^{i}$. In this case $\operatorname{Gr}(\mathcal{A})$ is equivalent to the category of pairs $(A, k)$ consisting of an object $A$ of $\mathcal{A}$ and a direct sum decomposition

$$
A=\bigoplus_{i \in \mathbf{Z}} k^{i} A
$$

by direct summands indexed by $\mathbf{Z}$ and a morphism $(A, k) \rightarrow(B, k)$ of such objects is given by a morphism $\varphi: A \rightarrow B$ of $\mathcal{A}$ such that $\varphi\left(k^{i} A\right) \subset k^{i} B$ for all $i \in$ Z. Whenever our additive category $\mathcal{A}$ has countable direct sums we will use this equivalence without further mention.

However, with our definitions an additive or abelian category does not necessarily have all (countable) direct sums. In this case our definition still makes sense. For example, if $\mathcal{A}=\operatorname{Vect}_{k}$ is the category of finite dimensional vector spaces over a field $k$, then $\operatorname{Gr}\left(\operatorname{Vect}_{k}\right)$ is the category of vector spaces with a given gradation all of whose graded pieces are finite dimensional, and not the category of finite dimensional vector spaces with a given graduation.

0126 Lemma 12.15.2. Let $\mathcal{A}$ be an abelian category. The category of graded objects $G r(\mathcal{A})$ is abelian.

Proof. Let $f: A=\left(A^{i}\right) \rightarrow B=\left(B^{i}\right)$ be a morphism of graded objects of $\mathcal{A}$ given by morphisms $f^{i}: A^{i} \rightarrow B^{i}$ of $\mathcal{A}$. Then we have $\operatorname{Ker}(f)=\left(\operatorname{Ker}\left(f^{i}\right)\right)$ and $\operatorname{Coker}(f)=\left(\operatorname{Coker}\left(f^{i}\right)\right)$ in the category $\operatorname{Gr}(\mathcal{A})$. Since we have $\operatorname{Im}=\operatorname{Coim}$ in $\mathcal{A}$ we see the same thing holds in $\operatorname{Gr}(\mathcal{A})$.
0AMH Remark 12.15.3 (Warning). There are abelian categories $\mathcal{A}$ having countable direct sums but where countable direct sums are not exact. An example is the opposite of the category of abelian sheaves on $\mathbf{R}$. Namely, the category of abelian sheaves on $\mathbf{R}$ has countable products, but countable products are not exact. For such a category the functor $\operatorname{Gr}(\mathcal{A}) \rightarrow \mathcal{A},\left(A^{i}\right) \mapsto \bigoplus A^{i}$ described above is not exact. It is still true that $\operatorname{Gr}(\mathcal{A})$ is equivalent to the category of graded objects $(A, k)$ of $\mathcal{A}$, but the kernel in the category of graded objects of a map $\varphi:(A, k) \rightarrow(B, k)$ is not equal to $\operatorname{Ker}(\varphi)$ endowed with a direct sum decomposition, but rather it is the direct sum of the kernels of the maps $k^{i} A \rightarrow k^{i} B$.

09MG Definition 12.15.4. Let $\mathcal{A}$ be an additive category. If $A=\left(A^{i}\right)$ is a graded object, then the $k$ th shift $A[k]$ is the graded object with $A[k]^{i}=A^{k+i}$.
If $A$ and $B$ are graded objects of $\mathcal{A}$, then we have
$09 \mathrm{MH} \quad(12.15 .4 .1) \quad \operatorname{Hom}_{\operatorname{Gr}(\mathcal{A})}(A, B[k])=\operatorname{Hom}_{\operatorname{Gr}(\mathcal{A})}(A[-k], B)$
and an element of this group is sometimes called a map of graded objects homogeneous of degree $k$.
Given any set $G$ we can define $G$-graded objects of $\mathcal{A}$ as the category whose objects are $A=\left(A^{g}\right)_{g \in G}$ families of objects parametrized by elements of $G$. Morphisms $f: A \rightarrow B$ are defined as families of maps $f^{g}: A^{g} \rightarrow B^{g}$ where $g$ runs over the elements of $G$. If $G$ is an abelian group, then we can (unambiguously) define shift functors $[g]$ on the category of $G$-graded objects by the rule $(A[g])^{g_{0}}=A^{g+g_{0}}$. A particular case of this type of construction is when $G=\mathbf{Z} \times \mathbf{Z}$. In this case the objects of the category are called bigraded objects of $\mathcal{A}$. The $(p, q)$ component of a bigraded object $A$ is usually denoted $A^{p, q}$. For $(a, b) \in \mathbf{Z} \times \mathbf{Z}$ we write $A[a, b]$ in stead of $A[(a, b)]$. A morphism $A \rightarrow A[a, b]$ is sometimes called a map of bidegree $(a, b)$.

### 12.16. Filtrations

0120 A nice reference for this material is [Del71, Section 1]. (Note that our conventions regarding abelian categories are different.)
0121 Definition 12.16.1. Let $\mathcal{A}$ be an abelian category.
(1) A decreasing filtration $F$ on an object $A$ is a family $\left(F^{n} A\right)_{n \in \mathbf{Z}}$ of subobjects of $A$ such that

$$
A \supset \ldots \supset F^{n} A \supset F^{n+1} A \supset \ldots \supset 0
$$

(2) A filtered object of $\mathcal{A}$ is pair $(A, F)$ consisting of an object $A$ of $\mathcal{A}$ and a decreasing filtration $F$ on $A$.
(3) A morphism $(A, F) \rightarrow(B, F)$ of filtered objects is given by a morphism $\varphi: A \rightarrow B$ of $\mathcal{A}$ such that $\varphi\left(F^{i} A\right) \subset F^{i} B$ for all $i \in \mathbf{Z}$.
(4) The category of filtered objects is denoted $\operatorname{Fil}(\mathcal{A})$.
(5) Given a filtered object $(A, F)$ and a subobject $X \subset A$ the induced filtration on $X$ is the filtration with $F^{n} X=X \cap F^{n} A$.
(6) Given a filtered object $(A, F)$ and a surjection $\pi: A \rightarrow Y$ the quotient filtration is the filtration with $F^{n} Y=\pi\left(F^{n} A\right)$.
(7) A filtration $F$ on an object $A$ is said to be finite if there exist $n, m$ such that $F^{n} A=A$ and $F^{m} A=0$.
(8) Given a filtered object $(A, F)$ we say $\bigcap F^{i} A$ exists if there exists a biggest subobject of $A$ contained in all $F^{i} A$. We say $\bigcup F^{i} A$ exists if there exists a smallest subobject of $A$ containing all $F^{i} A$.
(9) The filtration on a filtered object $(A, F)$ is said to be separated if $\bigcap_{i} F^{i} A=$ 0 and exhaustive if $\bigcup F^{i} A=A$.

By abuse of notation we say that a morphism $f:(A, F) \rightarrow(B, F)$ of filtered objects is injective if $f: A \rightarrow B$ is injective in the abelian category $\mathcal{A}$. Similarly we say $f$ is surjective if $f: A \rightarrow B$ is surjective in the category $\mathcal{A}$. Being injective (resp. surjective) is equivalent to being a monomorphism (resp. epimorphism) in $\operatorname{Fil}(\mathcal{A})$. By Lemma 12.16 .2 this is also equivalent to having zero kernel (resp. cokernel).
0122 Lemma 12.16.2. Let $\mathcal{A}$ be an abelian category. The category of filtered objects Fil( $\mathcal{A})$ has the following properties:
(1) It is an additive category.
(2) It has a zero object.
(3) It has kernels and cokernels, images and coimages.
(4) In general it is not an abelian category.

Proof. It is clear that $\operatorname{Fil}(\mathcal{A})$ is additive with direct sum given by $(A, F) \oplus(B, F)=$ $(A \oplus B, F)$ where $F^{p}(A \oplus B)=F^{p} A \oplus F^{p} B$. The kernel of a morphism $f:(A, F) \rightarrow$ $(B, F)$ of filtered objects is the injection $\operatorname{Ker}(f) \subset A$ where $\operatorname{Ker}(f)$ is endowed with the induced filtration. The cokernel of a morphism $f: A \rightarrow B$ of filtered objects is the surjection $B \rightarrow \operatorname{Coker}(f)$ where $\operatorname{Coker}(f)$ is endowed with the quotient filtration. Since all kernels and cokernels exist, so do all coimages and images. See Example 12.3 .12 for the last statement.

0123 Definition 12.16.3. Let $\mathcal{A}$ be an abelian category. A morphism $f: A \rightarrow B$ of filtered objects of $\mathcal{A}$ is said to be strict if $f\left(F^{i} A\right)=f(A) \cap F^{i} B$ for all $i \in \mathbf{Z}$.
This also equivalent to requiring that $f^{-1}\left(F^{i} B\right)=F^{i} A+\operatorname{Ker}(f)$ for all $i \in \mathbf{Z}$. We characterize strict morphisms as follows.

05SI Lemma 12.16.4. Let $\mathcal{A}$ be an abelian category. Let $f: A \rightarrow B$ be a morphism of filtered objects of $\mathcal{A}$. The following are equivalent
(1) $f$ is strict,
(2) the morphism Coim $(f) \rightarrow \operatorname{Im}(f)$ of Lemma 12.3.11 is an isomorphism.

Proof. Note that $\operatorname{Coim}(f) \rightarrow \operatorname{Im}(f)$ is an isomorphism of objects of $\mathcal{A}$, and that part (2) signifies that it is an isomorphism of filtered objects. By the description of kernels and cokernels in the proof of Lemma 12.16 .2 we see that the filtration on $\operatorname{Coim}(f)$ is the quotient filtration coming from $A \rightarrow \operatorname{Coim}(f)$. Similarly, the filtration on $\operatorname{Im}(f)$ is the induced filtration coming from the injection $\operatorname{Im}(f) \rightarrow$ $B$. The definition of strict is exactly that the quotient filtration is the induced filtration.

05SK Lemma 12.16.5. Let $\mathcal{A}$ be an abelian category. Let $f: A \rightarrow B$ be a strict monomorphism of filtered objects. Let $g: A \rightarrow C$ be a morphism of filtered objects. Then $f \oplus g: A \rightarrow B \oplus C$ is a strict monomorphism.
Proof. Clear from the definitions.
05SL Lemma 12.16.6. Let $\mathcal{A}$ be an abelian category. Let $f: B \rightarrow A$ be a strict epimorphism of filtered objects. Let $g: C \rightarrow A$ be a morphism of filtered objects. Then $f \oplus g: B \oplus C \rightarrow A$ is a strict epimorphism.

Proof. Clear from the definitions.
0124 Lemma 12.16.7. Let $\mathcal{A}$ be an abelian category. Let $(A, F),(B, F)$ be filtered objects. Let $u: A \rightarrow B$ be a morphism of filtered objects. If $u$ is injective then $u$ is strict if and only if the filtration on $A$ is the induced filtration. If $u$ is surjective then $u$ is strict if and only if the filtration on $B$ is the quotient filtration.

Proof. This is immediate from the definition.
05SJ Lemma 12.16.8. Let $\mathcal{A}$ be an abelian category. Let $f: A \rightarrow B, g: B \rightarrow C$ be strict morphisms of filtered objects.
(1) In general the composition $g \circ f$ is not strict.
(2) If $g$ is injective, then $g \circ f$ is strict.
(3) If $f$ is surjective, then $g \circ f$ is strict.

Proof. Let $B$ a vector space over a field $k$ with basis $e_{1}, e_{2}$, with the filtration $F^{n} B=B$ for $n<0$, with $F^{0} B=k e_{1}$, and $F^{n} B=0$ for $n>0$. Now take $A=k\left(e_{1}+e_{2}\right)$ and $C=B / k e_{2}$ with filtrations induced by $B$, i.e., such that $A \rightarrow B$ and $B \rightarrow C$ are strict (Lemma 12.16.7). Then $F^{n}(A)=A$ for $n<0$ and $F^{n}(A)=0$ for $n \geq 0$. Also $F^{n}(C)=C$ for $n \leq 0$ and $F^{n}(C)=0$ for $n>0$. So the (nonzero) composition $A \rightarrow C$ is not strict.

Assume $g$ is injective. Then

$$
\begin{aligned}
g\left(f\left(F^{p} A\right)\right) & =g\left(f(A) \cap F^{p} B\right) \\
& =g(f(A)) \cap g\left(F^{p}(B)\right) \\
& =(g \circ f)(A) \cap\left(g(B) \cap F^{p} C\right) \\
& =(g \circ f)(A) \cap F^{p} C .
\end{aligned}
$$

The first equality as $f$ is strict, the second because $g$ is injective, the third because $g$ is strict, and the fourth because $(g \circ f)(A) \subset g(B)$.
Assume $f$ is surjective. Then

$$
\begin{aligned}
(g \circ f)^{-1}\left(F^{i} C\right) & =f^{-1}\left(F^{i} B+\operatorname{Ker}(g)\right) \\
& =f^{-1}\left(F^{i} B\right)+f^{-1}(\operatorname{Ker}(g)) \\
& =F^{i} A+\operatorname{Ker}(f)+\operatorname{Ker}(g \circ f) \\
& =F^{i} A+\operatorname{Ker}(g \circ f)
\end{aligned}
$$

The first equality because $g$ is strict, the second because $f$ is surjective, the third because $f$ is strict, and the last because $\operatorname{Ker}(f) \subset \operatorname{Ker}(g \circ f)$.
The following lemma says that subobjects of a filtered object have a well defined filtration independent of a choice of writing the object as a cokernel.

0129 Lemma 12.16.9. Let $\mathcal{A}$ be an abelian category. Let $(A, F)$ be a filtered object of $\mathcal{A}$. Let $X \subset Y \subset A$ be subobjects of $A$. On the object

$$
Y / X=\operatorname{Ker}(A / X \rightarrow A / Y)
$$

the quotient filtration coming from the induced filtration on $Y$ and the induced filtration coming from the quotient filtration on $A / X$ agree. Any of the morphisms $X \rightarrow Y, X \rightarrow A, Y \rightarrow A, Y \rightarrow A / X, Y \rightarrow Y / X, Y / X \rightarrow A / X$ are strict (with induced/quotient filtrations).

Proof. The quotient filtration $Y / X$ is given by $F^{p}(Y / X)=F^{p} Y /\left(X \cap F^{p} Y\right)=$ $F^{p} Y / F^{p} X$ because $F^{p} Y=Y \cap F^{p} A$ and $F^{p} X=X \cap F^{p} A$. The induced filtration from the injection $Y / X \rightarrow A / X$ is given by

$$
\begin{aligned}
F^{p}(Y / X) & =Y / X \cap F^{p}(A / X) \\
& =Y / X \cap\left(F^{p} A+X\right) / X \\
& =\left(Y \cap F^{p} A\right) /\left(X \cap F^{p} A\right) \\
& =F^{p} Y / F^{p} X .
\end{aligned}
$$

Hence the first statement of the lemma. The proof of the other cases is similar.
05SM Lemma 12.16.10. Let $\mathcal{A}$ be an abelian category. Let $A, B, C \in \operatorname{Fil}(\mathcal{A})$. Let $f: A \rightarrow B$ and $g: A \rightarrow C$ be morphisms Then there exists a pushout

in $\operatorname{Fil}(\mathcal{A})$. If $f$ is strict, so is $f^{\prime}$.
Proof. Set $C \amalg_{A} B$ equal to $\operatorname{Coker}((1,-1): A \rightarrow C \oplus B)$ in $\operatorname{Fil}(\mathcal{A})$. This cokernel exists, by Lemma 12.16.2. It is a pushout, see Example 12.5.6. Note that $F^{p}\left(C \times{ }_{A}\right.$ $B)$ is the image of $F^{p} C \oplus F^{p} B$. Hence

$$
\left.\left(f^{\prime}\right)^{-1}\left(F^{p}\left(C \times_{A} B\right)\right)=g\left(f^{-1}\left(F^{p} B\right)\right)\right)+F^{p} C
$$

Whence the last statement.
05SN Lemma 12.16.11. Let $\mathcal{A}$ be an abelian category. Let $A, B, C \in \operatorname{Fil}(\mathcal{A})$. Let $f: B \rightarrow A$ and $g: C \rightarrow A$ be morphisms Then there exists a pushout

in $\operatorname{Fil}(\mathcal{A})$. If $f$ is strict, so is $f^{\prime}$.
Proof. This lemma is dual to Lemma 12.16.10.
Let $\mathcal{A}$ be an abelian category. Let $(A, F)$ be a filtered object of $\mathcal{A}$. We denote $\operatorname{gr}_{F}^{p}(A)=\operatorname{gr}^{p}(A)$ the object $F^{p} A / F^{p+1} A$ of $\mathcal{A}$. This defines an additive functor

$$
\operatorname{gr}^{p}: \operatorname{Fil}(\mathcal{A}) \longrightarrow \mathcal{A}, \quad(A, F) \longmapsto \operatorname{gr}^{p}(A)
$$

Recall that we have defined the category $\operatorname{Gr}(\mathcal{A})$ of graded objects of $\mathcal{A}$ in Section 12.15. For $(A, F)$ in $\operatorname{Fil}(\mathcal{A})$ we may set

$$
\operatorname{gr}(A)=\text { the graded object of } \mathcal{A} \text { whose } p \text { th graded piece is } \operatorname{gr}^{p}(A)
$$

and if $\mathcal{A}$ has countable direct sums, then we simply have

$$
\operatorname{gr}(A)=\bigoplus \operatorname{gr}^{p}(A)
$$

This defines an additive functor

$$
\text { gr }: \operatorname{Fil}(\mathcal{A}) \longrightarrow \operatorname{Gr}(\mathcal{A}), \quad(A, F) \longmapsto \operatorname{gr}(A)
$$

## 05SP

Lemma 12.16.12. Let $\mathcal{A}$ be an abelian category.
(1) Let $A$ be a filtered object and $X \subset A$. Then for each $p$ the sequence

$$
0 \rightarrow g r^{p}(X) \rightarrow g r^{p}(A) \rightarrow g r^{p}(A / X) \rightarrow 0
$$ is exact (with induced filtration on $X$ and quotient filtration on $A / X$ ).

(2) Let $f: A \rightarrow B$ be a morphism of filtered objects of $\mathcal{A}$. Then for each $p$ the sequences

$$
0 \rightarrow g r^{p}(\operatorname{Ker}(f)) \rightarrow g r^{p}(A) \rightarrow g r^{p}(\operatorname{Coim}(f)) \rightarrow 0
$$

and

$$
0 \rightarrow g r^{p}(\operatorname{Im}(f)) \rightarrow g r^{p}(B) \rightarrow g r^{p}(\operatorname{Coker}(f)) \rightarrow 0
$$

are exact.
Proof. We have $F^{p+1} X=X \cap F^{p+1} A$, hence map $\operatorname{gr}^{p}(X) \rightarrow \operatorname{gr}^{p}(A)$ is injective. Dually the map $\operatorname{gr}^{p}(A) \rightarrow \operatorname{gr}^{p}(A / X)$ is surjective. The kernel of $F^{p} A / F^{p+1} A \rightarrow$ $A / X+F^{p+1} A$ is clearly $F^{p+1} A+X \cap F^{p} A / F^{p+1} A=F^{p} X / F^{p+1} X$ hence exactness in the middle. The two short exact sequence of (2) are special cases of the short exact sequence of (1).

0127 Lemma 12.16.13. Let $\mathcal{A}$ be an abelian category. Let $f: A \rightarrow B$ be a morphism of finite filtered objects of $\mathcal{A}$. The following are equivalent
(1) $f$ is strict,
(2) the morphism $\operatorname{Coim}(f) \rightarrow \operatorname{Im}(f)$ is an isomorphism,
(3) $\operatorname{gr}(\operatorname{Coim}(f)) \rightarrow \operatorname{gr}(\operatorname{Im}(f))$ is an isomorphism,
(4) the sequence $\operatorname{gr}(\operatorname{Ker}(f)) \rightarrow \operatorname{gr}(A) \rightarrow \operatorname{gr}(B)$ is exact,
(5) the sequence $\operatorname{gr}(A) \rightarrow \operatorname{gr}(B) \rightarrow \operatorname{gr}(\operatorname{Coker}(f))$ is exact, and
(6) the sequence

$$
0 \rightarrow \operatorname{gr}(\operatorname{Ker}(f)) \rightarrow \operatorname{gr}(A) \rightarrow \operatorname{gr}(B) \rightarrow \operatorname{gr}(\operatorname{Coker}(f)) \rightarrow 0
$$

is exact.
Proof. The equivalence of (1) and (2) is Lemma 12.16 .4 . By Lemma 12.16 .12 we see that (4), (5), (6) imply (3) and that (3) implies (4), (5), (6). Hence it suffices to show that (3) implies (2). Thus we have to show that if $f: A \rightarrow B$ is an injective and surjective map of finite filtered objects which induces and isomorphism $\operatorname{gr}(A) \rightarrow \operatorname{gr}(B)$, then $f$ induces an isomorphism of filtered objects. In other words, we have to show that $f\left(F^{p} A\right)=F^{p} B$ for all $p$. As the filtrations are finite we may
prove this by descending induction on $p$. Suppose that $f\left(F^{p+1} A\right)=F^{p+1} B$. Then commutative diagram

and the five lemma imply that $f\left(F^{p} A\right)=F^{p} B$.
0128 Lemma 12.16.14. Let $\mathcal{A}$ be an abelian category. Let $A \rightarrow B \rightarrow C$ be a complex of filtered objects of $\mathcal{A}$. Assume $\alpha: A \rightarrow B$ and $\beta: B \rightarrow C$ are strict morphisms of filtered objects. Then $\operatorname{gr}(\operatorname{Ker}(\beta) / \operatorname{Im}(\alpha))=\operatorname{Ker}(\operatorname{gr}(\beta)) / \operatorname{Im}(\operatorname{gr}(\alpha)))$.
Proof. This follows formally from Lemma 12.16 .12 and the fact that $\operatorname{Coim}(\alpha) \cong$ $\operatorname{Im}(\alpha)$ and $\operatorname{Coim}(\beta) \cong \operatorname{Im}(\beta)$ by Lemma 12.16.4.

05QH Lemma 12.16.15. Let $\mathcal{A}$ be an abelian category. Let $A \rightarrow B \rightarrow C$ be a complex of filtered objects of $\mathcal{A}$. Assume $A, B, C$ have finite filtrations and that $\operatorname{gr}(A) \rightarrow$ $g r(B) \rightarrow \operatorname{gr}(C)$ is exact. Then
(1) for each $p \in \mathbf{Z}$ the sequence $g r^{p}(A) \rightarrow g r^{p}(B) \rightarrow g r^{p}(C)$ is exact,
(2) for each $p \in \mathbf{Z}$ the sequence $F^{p}(A) \rightarrow F^{p}(B) \rightarrow F^{p}(C)$ is exact,
(3) for each $p \in \mathbf{Z}$ the sequence $A / F^{p}(A) \rightarrow B / F^{p}(B) \rightarrow C / F^{p}(C)$ is exact,
(4) the maps $A \rightarrow B$ and $B \rightarrow C$ are strict, and
(5) $A \rightarrow B \rightarrow C$ is exact (as a sequence in $\mathcal{A}$ ).

Proof. Part (1) is immediate from the definitions. We will prove (3) by induction on the length of the filtrations. If each of $A, B, C$ has only one nonzero graded part, then (3) holds as $\operatorname{gr}(A)=A$, etc. Let $n$ be the largest integer such that at least one of $F^{n} A, F^{n} B, F^{n} C$ is nonzero. Set $A^{\prime}=A / F^{n} A, B^{\prime}=B / F^{n} B, C^{\prime}=C / F^{n} C$ with induced filtrations. Note that $\operatorname{gr}(A)=F^{n} A \oplus \operatorname{gr}\left(A^{\prime}\right)$ and similarly for $B$ and $C$. The induction hypothesis applies to $A^{\prime} \rightarrow B^{\prime} \rightarrow C^{\prime}$, which implies that $A / F^{p}(A) \rightarrow B / F^{p}(B) \rightarrow C / F^{p}(C)$ is exact for $p \geq n$. To conclude the same for $p=n+1$, i.e., to prove that $A \rightarrow B \rightarrow C$ is exact we use the commutative diagram

whose rows are short exact sequences of objects of $\mathcal{A}$. The proof of (2) is dual. Of course (5) follows from (2).

To prove (4) denote $f: A \rightarrow B$ and $g: B \rightarrow C$ the given morphisms. We know that $f\left(F^{p}(A)\right)=\operatorname{Ker}\left(F^{p}(B) \rightarrow F^{p}(C)\right)$ by (2) and $f(A)=\operatorname{Ker}(g)$ by (5). Hence $f\left(F^{p}(A)\right)=\operatorname{Ker}\left(F^{p}(B) \rightarrow F^{p}(C)\right)=\operatorname{Ker}(g) \cap F^{p}(B)=f(A) \cap F^{p}(B)$ which proves that $f$ is strict. The proof that $g$ is strict is dual to this.

### 12.17. Spectral sequences

011M A nice discussion of spectral sequences may be found in Eis95. See also [McC01], Lan02, etc.

011N Definition 12.17.1. Let $\mathcal{A}$ be an abelian category.
(1) A spectral sequence in $\mathcal{A}$ is given by a system $\left(E_{r}, d_{r}\right)_{r \geq 1}$ where each $E_{r}$ is an object of $\mathcal{A}$, each $d_{r}: E_{r} \rightarrow E_{r}$ is a morphism such that $d_{r} \circ d_{r}=0$ and $E_{r+1}=\operatorname{Ker}\left(d_{r}\right) / \operatorname{Im}\left(d_{r}\right)$ for $r \geq 1$.
(2) A morphism of spectral sequences $f:\left(E_{r}, d_{r}\right)_{r \geq 1} \rightarrow\left(E_{r}^{\prime}, d_{r}^{\prime}\right)_{r \geq 1}$ is given by a family of morphisms $f_{r}: E_{r} \rightarrow E_{r}^{\prime}$ such that $f_{r} \circ d_{r}=d_{r}^{\prime} \circ f_{r}$ and such that $f_{r+1}$ is the morphism induced by $f_{r}$ via the identifications $E_{r+1}=\operatorname{Ker}\left(d_{r}\right) / \operatorname{Im}\left(d_{r}\right)$ and $E_{r+1}^{\prime}=\operatorname{Ker}\left(d_{r}^{\prime}\right) / \operatorname{Im}\left(d_{r}^{\prime}\right)$.
We will sometimes loosen this definition somewhat and allow $E_{r+1}$ to be an object with a given isomorphism $E_{r+1} \rightarrow \operatorname{Ker}\left(d_{r}\right) / \operatorname{Im}\left(d_{r}\right)$. In addition we sometimes have a system $\left(E_{r}, d_{r}\right)_{r \geq r_{0}}$ for some $r_{0} \in \mathbf{Z}$ satisfying the properties of the definition above for indices $\geq r_{0}$. We will also call this a spectral sequence since by a simple renumbering it falls under the definition anyway. In fact, the cases $r_{0}=0$ and $r_{0}=-1$ can be found in the literature.

Given a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 1}$ we define

$$
0=B_{1} \subset B_{2} \subset \ldots \subset B_{r} \subset \ldots \subset Z_{r} \subset \ldots \subset Z_{2} \subset Z_{1}=E_{1}
$$

by the following simple procedure. Set $B_{2}=\operatorname{Im}\left(d_{1}\right)$ and $Z_{2}=\operatorname{Ker}\left(d_{1}\right)$. Then it is clear that $d_{2}: Z_{2} / B_{2} \rightarrow Z_{2} / B_{2}$. Hence we can define $B_{3}$ as the unique subobject of $E_{1}$ containing $B_{2}$ such that $B_{3} / B_{2}$ is the image of $d_{2}$. Similarly we can define $Z_{3}$ as the unique subobject of $E_{1}$ containing $B_{2}$ such that $Z_{3} / B_{2}$ is the kernel of $d_{2}$. And so on and so forth. In particular we have

$$
E_{r}=Z_{r} / B_{r}
$$

for all $r \geq 1$. In case the spectral sequence starts at $r=r_{0}$ then we can similarly construct $B_{i}, Z_{i}$ as subobjects in $E_{r_{0}}$. In fact, in the literature one sometimes finds the notation
$0=B_{r}\left(E_{r}\right) \subset B_{r+1}\left(E_{r}\right) \subset B_{r+2}\left(E_{r}\right) \subset \ldots \subset Z_{r+2}\left(E_{r}\right) \subset Z_{r+1}\left(E_{r}\right) \subset Z_{r}\left(E_{r}\right)=E_{r}$
to denote the filtration described above but starting with $E_{r}$.
0110 Definition 12.17.2. Let $\mathcal{A}$ be an abelian category. Let $\left(E_{r}, d_{r}\right)_{r \geq 1}$ be a spectral sequence.
(1) If the subobjects $Z_{\infty}=\bigcap Z_{r}$ and $B_{\infty}=\bigcup B_{r}$ of $E_{1}$ exist then we define the $l i m i{ }^{3}$ of the spectral sequence to be the object $E_{\infty}=Z_{\infty} / B_{\infty}$.
(2) We say that the spectral sequence degenerates at $E_{r}$ if the differentials $d_{r}, d_{r+1}, \ldots$ are all zero.

Note that if the spectral sequence degenerates at $E_{r}$, then we have $E_{r}=E_{r+1}=$ $\ldots=E_{\infty}$ (and the limit exists of course). Also, almost any abelian category we will encounter has countable sums and intersections.

[^29]0AMI Remark 12.17.3 (Variant). It is often the case that the terms of a spectral sequence have additional structure, for example a grading or a bigrading. To accomodate this (and to get around certain technical issues) we introduce the following notion. Let $\mathcal{A}$ be an abelian category. Let $\left(T_{r}\right)_{r \geq 1}$ be a sequence of translation or shift functors, i.e., $T_{r}: \mathcal{A} \rightarrow \mathcal{A}$ is an isomorphism of categories. In this setting a spectral sequence is given by a system $\left(E_{r}, d_{r}\right)_{r \geq 1}$ where each $E_{r}$ is an object of $\mathcal{A}$, each $d_{r}: E_{r} \rightarrow T_{r} E_{r}$ is a morphism such that $\bar{T}_{r} d_{r} \circ d_{r}=0$ so that

$$
\ldots \longrightarrow T_{r}^{-1} E_{r} \xrightarrow{T_{r}^{-1} d_{r}} E_{r} \xrightarrow{d_{r}} T_{r} E_{r} \xrightarrow{T_{r} d_{r}} T_{r}^{2} E_{r} \longrightarrow \ldots
$$

is a complex and $E_{r+1}=\operatorname{Ker}\left(d_{r}\right) / \operatorname{Im}\left(T_{r}^{-1} d_{r}\right)$ for $r \geq 1$. It is clear what a morphism of spectral sequences means in this setting. In this setting we can still define

$$
0=B_{1} \subset B_{2} \subset \ldots \subset B_{r} \subset \ldots \subset Z_{r} \subset \ldots \subset Z_{2} \subset Z_{1}=E_{1}
$$

and $Z_{\infty}$ and $B_{\infty}$ (if they exist) as above.

### 12.18. Spectral sequences: exact couples

011P
011Q Definition 12.18.1. Let $\mathcal{A}$ be an abelian category.
(1) An exact couple is a datum $(A, E, \alpha, f, g)$ where $A, E$ are objects of $\mathcal{A}$ and $\alpha, f, g$ are morphisms as in the following diagram

with the property that the kernel of each arrow is the image of its predecessor. So $\operatorname{Ker}(\alpha)=\operatorname{Im}(f), \operatorname{Ker}(f)=\operatorname{Im}(g)$, and $\operatorname{Ker}(g)=\operatorname{Im}(\alpha)$.
(2) A morphism of exact couplest $:(A, E, \alpha, f, g) \rightarrow\left(A^{\prime}, E^{\prime}, \alpha^{\prime}, f^{\prime}, g^{\prime}\right)$ is given by morphisms $t_{A}: A \rightarrow A^{\prime}$ and $t_{E}: E \rightarrow E^{\prime}$ such that $\alpha^{\prime} \circ t_{A}=t_{A} \circ \alpha$, $f^{\prime} \circ t_{E}=t_{A} \circ f$, and $g^{\prime} \circ t_{A}=t_{E} \circ g$.
011R Lemma 12.18.2. Let $(A, E, \alpha, f, g)$ be an exact couple in an abelian category $\mathcal{A}$. Set
(1) $d=g \circ f: E \rightarrow E$ so that $d \circ d=0$,
(2) $E^{\prime}=\operatorname{Ker}(d) / \operatorname{Im}(d)$,
(3) $A^{\prime}=\operatorname{Im}(\alpha)$,
(4) $\alpha^{\prime}: A^{\prime} \rightarrow A^{\prime}$ induced by $\alpha$,
(5) $f^{\prime}: E^{\prime} \rightarrow A^{\prime}$ induced by $f$,
(6) $g^{\prime}: A^{\prime} \rightarrow E^{\prime}$ induced by " $g \circ \alpha^{-1 "}$ ".

Then we have
(1) $\operatorname{Ker}(d)=f^{-1}(\operatorname{Ker}(g))=f^{-1}(\operatorname{Im}(\alpha))$,
(2) $\operatorname{Im}(d)=g(\operatorname{Im}(f))=g(\operatorname{Ker}(\alpha))$,
(3) $\left(A^{\prime}, E^{\prime}, \alpha^{\prime}, f^{\prime}, g^{\prime}\right)$ is an exact couple.

## Proof. Omitted.

Hence it is clear that given an exact couple $(A, E, \alpha, f, g)$ we get a spectral sequence by setting $E_{1}=E, d_{1}=d, E_{2}=E^{\prime}, d_{2}=d^{\prime}=g^{\prime} \circ f^{\prime}, E_{3}=E^{\prime \prime}, d_{3}=d^{\prime \prime}=g^{\prime \prime} \circ f^{\prime \prime}$, and so on.

011 S Definition 12.18.3. Let $\mathcal{A}$ be an abelian category. Let $(A, E, \alpha, f, g)$ be an exact couple. The spectral sequence associated to the exact couple is the spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 1}$ with $E_{1}=E, d_{1}=d, E_{2}=E^{\prime}, d_{2}=d^{\prime}=g^{\prime} \circ f^{\prime}, E_{3}=E^{\prime \prime}$, $d_{3}=d^{\prime \prime}=g^{\prime \prime} \circ f^{\prime \prime}$, and so on.
011 Lemma 12.18.4. Let $\mathcal{A}$ be an abelian category. Let $(A, E, \alpha, f, g)$ be an exact couple. Let $\left(E_{r}, d_{r}\right)_{r \geq 1}$ be the spectral sequence associated to the exact couple. In this case we have

$$
0=B_{1} \subset \ldots \subset B_{r+1}=g\left(\operatorname{Ker}\left(\alpha^{r}\right)\right) \subset \ldots \subset Z_{r+1}=f^{-1}\left(\operatorname{Im}\left(\alpha^{r}\right)\right) \subset \ldots \subset Z_{1}=E
$$

and the map $d_{r+1}: E_{r+1} \rightarrow E_{r+1}$ is described by the following rule: For any (test) object $T$ of $\mathcal{A}$ and any elements $x: T \rightarrow Z_{r+1}$ and $y: T \rightarrow A$ such that $f \circ x=\alpha^{r} \circ y$ we have

$$
d_{r+1} \circ \bar{x}=\overline{g \circ y}
$$

where $\bar{x}: T \rightarrow E_{r+1}$ is the induced morphism.
Proof. Omitted.
Note that in the situation of the lemma we obviously have

$$
B_{\infty}=g\left(\bigcup_{r} \operatorname{Ker}\left(\alpha^{r}\right)\right) \subset Z_{\infty}=f^{-1}\left(\bigcap_{r} \operatorname{Im}\left(\alpha^{r}\right)\right)
$$

provided $\bigcup \operatorname{Ker}\left(\alpha^{r}\right)$ and $\bigcap \operatorname{Im}\left(\alpha^{r}\right)$ exist. This produces as limit $E_{\infty}=Z_{\infty} / B_{\infty}$, see Definition 12.17.2

0AMJ Remark 12.18.5 (Variant). Let $\mathcal{A}$ be an abelian category. Let $S, T: \mathcal{A} \rightarrow$ $\mathcal{A}$ be shift functors, i.e., isomorphisms of categories. We will indicate the $n$-fold compositions by $S^{n} A$ and $T^{n} A$ for $A \in \operatorname{Ob}(\mathcal{A})$ and $n \in \mathbf{Z}$. In this situation an exact couple is a datum $(A, E, \alpha, f, g)$ where $A, E$ are objects of $\mathcal{A}$ and $\alpha: A \rightarrow T^{-1} A$, $f: E \rightarrow A, g: A \rightarrow S E$ are morphisms such that

$$
T E \xrightarrow{T f} T A \xrightarrow{T \alpha} A \xrightarrow{g} S E \xrightarrow{S f} S A
$$

is an exact complex. Let's visualize this as follows

We set $d=g \circ f: E \rightarrow S E$. Then $d \circ S^{-1} d=g \circ f \circ S^{-1} g \circ S^{-1} f=0$ because $f \circ S^{-1} g=0$. Set $E^{\prime}=\operatorname{Ker}(d) / \operatorname{Im}\left(S^{-1} d\right)$. Set $A^{\prime}=\operatorname{Im}(T \alpha)$. Let $\alpha^{\prime}: A^{\prime} \rightarrow T^{-1} A^{\prime}$ induced by $\alpha$. Let $f^{\prime}: E^{\prime} \rightarrow A^{\prime}$ be induced by $f$ which works because $f(\operatorname{Ker}(d)) \subset$ $\operatorname{Ker}(g)=\operatorname{Im}(T \alpha)$. Finally, let $g^{\prime}: A^{\prime} \rightarrow T S E^{\prime}$ induced by " $T g \circ(T \alpha)^{-1},{ }^{4}$.
In exactly the same way as above we find
(1) $\operatorname{Ker}(d)=f^{-1}(\operatorname{Ker}(g))=f^{-1}(\operatorname{Im}(T \alpha))$,
(2) $\operatorname{Im}(d)=g(\operatorname{Im}(f))=g(\operatorname{Ker}(\alpha))$,
(3) $\left(A^{\prime}, E^{\prime}, \alpha^{\prime}, f^{\prime}, g^{\prime}\right)$ is an exact couple for the shift functors $T S$ and $T$.

[^30]We obtain a spectral sequence (as in Remark 12.17.3 with $E_{1}=E, E_{2}=E^{\prime}$, etc, with $d_{r}: E_{r} \rightarrow T^{r-1} S E_{r}$ for all $r \geq 1$. Lemma 12.18 .4 tells us that

$$
S B_{r+1}=g\left(\operatorname{Ker}\left(T^{-r+1} \alpha \circ \ldots \circ T^{-1} \alpha \circ \alpha\right)\right)
$$

and

$$
Z_{r+1}=f^{-1}\left(\operatorname{Im}\left(T \alpha \circ T^{2} \alpha \circ \ldots \circ T^{r} \alpha\right)\right)
$$

in this situation. The description of the map $d_{r+1}$ is similar to that given in the lemma. (It may be easier to use these explicit descriptions to prove one gets a spectral sequence from such an exact couple.)

### 12.19. Spectral sequences: differential objects

## 011U

011 V Definition 12.19.1. Let $\mathcal{A}$ be an abelian category. A differential object of $\mathcal{A}$ is a pair $(A, d)$ consisting of an object $A$ of $\mathcal{A}$ endowed with a selfmap $d$ such that $d \circ d=0$. A morphism of differential objects $(A, d) \rightarrow(B, d)$ is given by a morphism $\alpha: A \rightarrow B$ such that $d \circ \alpha=\alpha \circ d$.

011W Lemma 12.19.2. Let $\mathcal{A}$ be an abelian category. The category of differential objects of $\mathcal{A}$ is abelian.

Proof. Omitted.
011X Definition 12.19.3. For a differential object $(A, d)$ we denote

$$
H(A, d)=\operatorname{Ker}(d) / \operatorname{Im}(d)
$$

its homology.
011 Lemma 12.19.4. Let $\mathcal{A}$ be an abelian category. Let $0 \rightarrow(A, d) \rightarrow(B, d) \rightarrow$ $(C, d) \rightarrow 0$ be a short exact sequence of differential objects. Then we get an exact homology sequence

$$
\ldots \rightarrow H(C, d) \rightarrow H(A, d) \rightarrow H(B, d) \rightarrow H(C, d) \rightarrow \ldots
$$

Proof. Apply Lemma 12.12 .12 to the short exact sequence of complexes

$$
\begin{array}{lllllllll}
0 & \rightarrow & A & \rightarrow & B & C & C & \rightarrow & 0 \\
& & \downarrow & & \downarrow & & \downarrow & & \\
0 & \rightarrow & A & \rightarrow & B & C & \rightarrow & 0 \\
& & \downarrow & & \downarrow & & \downarrow & & \\
0 & \rightarrow & A & \rightarrow & B & \rightarrow & C & \rightarrow & 0
\end{array}
$$

where the vertical arrows are $d$.
We come to an important example of a spectral sequence. Let $\mathcal{A}$ be an abelian category. Let $(A, d)$ be a differential object of $\mathcal{A}$. Let $\alpha:(A, d) \rightarrow(A, d)$ be an endomorphism of this differential object. If we assume $\alpha$ injective, then we get a short exact sequence

$$
0 \rightarrow(A, d) \rightarrow(A, d) \rightarrow(A / \alpha A, d) \rightarrow 0
$$

of differential objects. By the Lemma 12.19 .4 we get an exact couple

where $g$ is the canonical map and $f$ is the map defined in the snake lemma. Thus we get an associated spectral sequence! Since in this case we have $E_{1}=H(A / \alpha A, d)$ we see that it makes sense to define $E_{0}=A / \alpha A$ and $d_{0}=d$. In other words, we start the spectral sequence with $r=0$. According to our conventions in Section 12.17 we define a sequence of subobjects

$$
0=B_{0} \subset \ldots \subset B_{r} \subset \ldots \subset Z_{r} \subset \ldots \subset Z_{0}=E_{0}
$$

with the property that $E_{r}=Z_{r} / B_{r}$. Namely we have for $r \geq 1$ that
(1) $B_{r}$ is the image of $\left(\alpha^{r-1}\right)^{-1}(d A)$ under the natural map $A \rightarrow A / \alpha A$,
(2) $Z_{r}$ is the image of $d^{-1}\left(\alpha^{r} A\right)$ under the natural map $A \rightarrow A / \alpha A$, and
(3) $d_{r}: E_{r} \rightarrow E_{r}$ is given as follows: given an element $z \in Z_{r}$ choose an element $y \in A$ such that $d(z)=\alpha^{r}(y)$. Then $d_{r}\left(z+B_{r}+\alpha A\right)=y+B_{r}+\alpha A$.
Warning: It is not necessarily the case that $\alpha A \subset\left(\alpha^{r-1}\right)^{-1}(d A)$, nor $\alpha A \subset$ $d^{-1}\left(\alpha^{r} A\right)$. It is true that $\left(\alpha^{r-1}\right)^{-1}(d A) \subset d^{-1}\left(\alpha^{r} A\right)$. We have

$$
E_{r}=\frac{d^{-1}\left(\alpha^{r} A\right)+\alpha A}{\left(\alpha^{r-1}\right)^{-1}(d A)+\alpha A}
$$

It is not hard to verify directly that $(1)-(3)$ give a spectral sequence.
$011 Z$ Definition 12.19.5. Let $\mathcal{A}$ be an abelian category. Let $(A, d)$ be a differential object of $\mathcal{A}$. Let $\alpha: A \rightarrow A$ be an injective selfmap of $A$ which commutes with $d$. The spectral sequence associated to $(A, d, \alpha)$ is the spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ described above.

0AMK Remark 12.19.6 (Variant). Let $\mathcal{A}$ be an abelian category and let $S, T: \mathcal{A} \rightarrow$ $\mathcal{A}$ be shift functors, i.e., isomorphisms of categories. Assume that $T S=S T$ as functors. Consider pairs $(A, d)$ consisting of an object $A$ of $\mathcal{A}$ and a morphism $d: A \rightarrow S A$ such that $d \circ S^{-1} d=0$. The category of these objects is abelian. We define $H(A, d)=\operatorname{Ker}(d) / \operatorname{Im}\left(S^{-1} d\right)$ and we observe that $H(S A, S d)=S H(A, d)$ (canonical isomorphism). Given a short exact sequence

$$
0 \rightarrow(A, d) \rightarrow(B, d) \rightarrow(C, d) \rightarrow 0
$$

we obtain a long exact homology sequence

$$
\ldots \rightarrow S^{-1} H(C, d) \rightarrow H(A, d) \rightarrow H(B, d) \rightarrow H(C, d) \rightarrow S H(A, d) \rightarrow \ldots
$$

(note the shifts in the boundary maps). Since $S T=T S$ the functor $T$ defines a shift functor on pairs by setting $T(A, d)=(T A, T d)$. Next, let $\alpha:(A, d) \rightarrow T^{-1}(A, d)$ be injective with cokernel $(Q, d)$. Then we get an exact couple as in Remark 12.18 .5 with shift functors $T S$ and $T$ given by

$$
\left(H(A, d), S^{-1} H(Q, d), \bar{\alpha}, f, g\right)
$$

where $\bar{\alpha}: H(A, d) \rightarrow T^{-1} H(A, d)$ is induced by $\alpha$, the map $f: S^{-1} H(Q, d) \rightarrow$ $H(A, d)$ is the boundary map and $g: H(A, d) \rightarrow T H(Q, d)=T S\left(S^{-1} H(Q, d)\right)$ is induced by the quotient map $A \rightarrow T Q$. Thus we get a spectral sequence as
above with $E_{1}=S^{-1} H(Q, d)$ and differentials $d_{r}: E_{r} \rightarrow T^{r} S E_{r}$. As above we set $E_{0}=S^{-1} Q$ and $d_{0}: E_{0} \rightarrow S E_{0}$ given by $S^{-1} d: S^{-1} Q \rightarrow Q$. If according to our conventions we define $B_{r} \subset Z_{r} \subset E_{0}$, then we have for $r \geq 1$ that
(1) $S B_{r}$ is the image of

$$
\left(T^{-r+1} \alpha \circ \ldots \circ T^{-1} \alpha\right)^{-1} \operatorname{Im}\left(T^{-r} S^{-1} d\right)
$$

under the natural map $T^{-1} A \rightarrow Q$,
(2) $Z_{r}$ is the image of

$$
\left(S^{-1} T^{-1} d\right)^{-1} \operatorname{Im}\left(\alpha \circ \ldots \circ T^{r-1} \alpha\right)
$$

under the natural map $S^{-1} T^{-1} A \rightarrow S^{-1} Q$.
The differentials can be described as follows: if $x \in Z_{r}$, then pick $x^{\prime} \in S^{-1} T^{-1} A$ mapping to $x$. Then $S^{-1} T^{-1} d\left(x^{\prime}\right)$ is $\left(\alpha \circ \ldots \circ T^{r-1} \alpha\right)(y)$ for some $y \in T^{r-1} A$. Then $d_{r}(x) \in T^{r} S E_{r}$ is represented by the class of the image of $y$ in $T^{r} S E_{0}=T^{r} Q$ modulo $T^{r} S B_{r}$.

### 12.20. Spectral sequences: filtered differential objects

012A We can build a spectral sequence starting with a filtered differential object.
012B Definition 12.20.1. Let $\mathcal{A}$ be an abelian category. A filtered differential object $(K, F, d)$ is a filtered object $(K, F)$ of $\mathcal{A}$ endowed with an endomorphism $d:(K, F) \rightarrow(K, F)$ whose square is zero: $d \circ d=0$.

To describe the spectral sequence associated to such an object we assume, for the moment, that $\mathcal{A}$ is an abelian category which has countable direct sums and countable direct sums are exact (this is not automatic, see Remark 12.15.3). Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. Note that each $F^{n} K$ is a differential object by itself. Consider the object $A=\bigoplus F^{n} K$ and endow it with a differential $d$ by using $d$ on each summand. Then $(A, d)$ is a differential object of $\mathcal{A}$ which comes equipped with a grading. Consider the map

$$
\alpha: A \rightarrow A
$$

which is given by the inclusions $F^{n} A \rightarrow F^{n-1} A$. This is clearly an injective morphism of differential objects $\alpha:(A, d) \rightarrow(A, d)$. Hence, by Definition 12.19 .5 we get a spectral sequence. We will call this the spectral sequence associated to the filtered differential object ( $K, F, d$ ).

Let us figure out the terms of this spectral sequence. First, note that $A / \alpha A=\operatorname{gr}(K)$ endowed with its differential $d=\operatorname{gr}(d)$. Hence we see that

$$
E_{0}=\operatorname{gr}(K), \quad d_{0}=\operatorname{gr}(d)
$$

Hence the homology of the graded differential object $\operatorname{gr}(K)$ is the next term:

$$
E_{1}=H(\operatorname{gr}(K), \operatorname{gr}(d))
$$

In addition we see that $E_{0}$ is a graded object of $\mathcal{A}$ and that $d_{0}$ is compatible with the grading. Hence clearly $E_{1}$ is a graded object as well. But it turns out that the differential $d_{1}$ does not preserve this grading; instead it shifts the degree by 1 .
To work this out precisely, we define

$$
Z_{r}^{p}=\frac{F^{p} K \cap d^{-1}\left(F^{p+r} K\right)+F^{p+1} K}{F^{p+1} K}
$$

and

$$
B_{r}^{p}=\frac{F^{p} K \cap d\left(F^{p-r+1} K\right)+F^{p+1} K}{F^{p+1} K}
$$

This notation, although quite natural, seems to be different from the notation in most places in the literature. Perhaps it does not matter, since the literature does not seem to have a consistent choice of notation either. With these choices we see that $B_{r} \subset E_{0}$, resp. $Z_{r} \subset E_{0}$ (as defined in Section 12.19 ) is equal to $\bigoplus_{p} B_{r}^{p}$, resp. $\bigoplus_{p} Z_{r}^{p}$. Hence if we define

$$
E_{r}^{p}=Z_{r}^{p} / B_{r}^{p}
$$

for $r \geq 0$ and $p \in \mathbf{Z}$, then we have $E_{r}=\bigoplus_{p} E_{r}^{p}$. We can define a differential $d_{r}^{p}: E_{r}^{p} \rightarrow E_{r}^{p+r}$ by the rule

$$
z+F^{p+1} K \longmapsto d z+F^{p+r+1} K
$$

where $z \in F^{p} K \cap d^{-1}\left(F^{p+r} K\right)$.
012C Lemma 12.20.2. Let $\mathcal{A}$ be an abelian category. Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. There is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ in $\operatorname{Gr}(\mathcal{A})$ associated to $(K, F, d)$ such that $d_{r}: E_{r} \rightarrow E_{r}[r]$ for all $r$ and such that the graded pieces $E_{r}^{p}$ and maps $d_{r}^{p}: E_{r}^{p} \rightarrow E_{r}^{p+r}$ are as given above. Furthermore, $E_{0}^{p}=g r^{p} K, d_{0}^{p}=g r^{p}(d)$, and $E_{1}^{p}=H\left(g r^{p} K, d\right)$.

Proof. If $\mathcal{A}$ has countable direct sums and if countable direct sums are exact, then this follows from the discussion above. In general, we proceed as follows; we strongly suggest the reader skip this proof. Consider the object $A=\left(F^{p+1} K\right)$ of $\operatorname{Gr}(\mathcal{A})$, i.e., we put $F^{p+1} K$ in degree $p$ (the funny shift in numbering to get numbering correct later on). We endow it with a differential $d$ by using $d$ on each component. Then $(A, d)$ is a differential object of $\operatorname{Gr}(\mathcal{A})$. Consider the map

$$
\alpha: A \rightarrow A[-1]
$$

which is given in degree $p$ by the inclusions $F^{p+1} A \rightarrow F^{p} A$. This is clearly an injective morphism of differential objects $\alpha:(A, d) \rightarrow(A, d)[-1]$. Hence, we can apply Remark 12.19.6 with $S=$ id and $T=[1]$. The corresponding spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ in $\operatorname{Gr}(\mathcal{A})$ is the spectral sequence we are looking for. Let us unwind the definitions a bit. First of all we have $E_{r}=\left(E_{r}^{p}\right)$ is an object of $\operatorname{Gr}(\mathcal{A})$. Then, since $T^{r} S=[r]$ we have $d_{r}: E_{r} \rightarrow E_{r}[r]$ which means that $d_{r}^{p}: E_{r}^{p} \rightarrow E_{r}^{p+r}$.

To see that the description of the graded pieces hold, we argue as above. Namely, first we have $E_{0}=\operatorname{Coker}(\alpha: A \rightarrow A[-1])$ and by our choice of numbering above this gives $E_{0}^{p}=\operatorname{gr}^{p} K$. The first differential is given by $d_{0}^{p}=\operatorname{gr}^{p} d: E_{0}^{p} \rightarrow E_{0}^{p}$. Next, the description of the boundaries $B_{r}$ and the cocycles $Z_{r}$ in Remark 12.19 .6 translates into a straightforward manner into the formulae for $Z_{r}^{p}$ and $B_{r}^{p}$ given above.

012D Lemma 12.20.3. Let $\mathcal{A}$ be an abelian category. Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. The spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ associated to $(K, F, d)$ has

$$
d_{1}^{p}: E_{1}^{p}=H\left(g r^{p} K\right) \longrightarrow H\left(g r^{p+1} K\right)=E_{1}^{p+1}
$$

equal to the boundary map in homology associated to the short exact sequence of differential objects

$$
0 \rightarrow g r^{p+1} K \rightarrow F^{p} K / F^{p+2} K \rightarrow g r^{p} K \rightarrow 0 .
$$

Proof. This is clear from the formula for the differential $d_{1}^{p}$ given just above Lemma 12.20.2.

012 E Definition 12.20.4. Let $\mathcal{A}$ be an abelian category. Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. The induced filtration on $H(K, d)$ is the filtration defined by $F^{p} H(K, d)=\operatorname{Im}\left(H\left(F^{p} K, d\right) \rightarrow H(K, d)\right)$.

Writing out what this means we see that

$$
F^{p} H(K, d)=\frac{\operatorname{Ker}(d) \cap F^{p} K+\operatorname{Im}(d)}{\operatorname{Im}(d)}
$$

and hence we see that

$$
\operatorname{gr}^{p} H(K)=\frac{\operatorname{Ker}(d) \cap F^{p} K+\operatorname{Im}(d)}{\operatorname{Ker}(d) \cap F^{p+1} K+\operatorname{Im}(d)}=\frac{\operatorname{Ker}(d) \cap F^{p} K}{\operatorname{Ker}(d) \cap F^{p+1} K+\operatorname{Im}(d) \cap F^{p} K}
$$

012F Lemma 12.20.5. Let $\mathcal{A}$ be an abelian category. Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. If $Z_{\infty}^{p}$ and $B_{\infty}^{p}$ exist (see proof), then
(1) the limit $E_{\infty}$ exists and is graded having $E_{\infty}^{p}=Z_{\infty}^{p} / B_{\infty}^{p}$ in degree $p$, and
(2) the associated graded $\operatorname{gr}(H(K))$ of the cohomology of $K$ is a graded subquotient of the graded limit object $E_{\infty}$.

Proof. The objects $Z_{\infty}, B_{\infty}$, and the limit $E_{\infty}=Z_{\infty} / B_{\infty}$ of Definition 12.17.2 are objects of $\operatorname{Gr}(\mathcal{A})$ by our construction of the spectral sequence in the proof of Lemma 12.20.2. Since $Z_{r}=\bigoplus Z_{r}^{p}$ and $B_{r}=\bigoplus B_{r}^{p}$, if we assume that

$$
Z_{\infty}^{p}=\bigcap_{r} Z_{r}^{p}=\frac{\bigcap_{r}\left(F^{p} K \cap d^{-1}\left(F^{p+r} K\right)+F^{p+1} K\right)}{F^{p+1} K}
$$

and

$$
B_{\infty}^{p}=\bigcup_{r} B_{r}^{p}=\frac{\bigcup_{r}\left(F^{p} K \cap d\left(F^{p-r+1} K\right)+F^{p+1} K\right)}{F^{p+1} K}
$$

exist, then $Z_{\infty}$ and $B_{\infty}$ exist with degree $p$ parts $Z_{\infty}^{p}$ and $B_{\infty}^{p}$ (follows from an elementary argument about unions and intersections of graded subobjects). Thus

$$
E_{\infty}^{p}=\frac{\bigcap_{r}\left(F^{p} K \cap d^{-1}\left(F^{p+r} K\right)+F^{p+1} K\right)}{\bigcup_{r}\left(F^{p} K \cap d\left(F^{p-r+1} K\right)+F^{p+1} K\right)}
$$

where the top and bottom exist. We have
$012 \mathrm{G} \quad(12.20 .5 .1) \quad \operatorname{Ker}(d) \cap F^{p} K+F^{p+1} K \subset \bigcap_{r}\left(F^{p} K \cap d^{-1}\left(F^{p+r} K\right)+F^{p+1} K\right)$
and
012H
(12.20.5.2) $\bigcup_{r}\left(F^{p} K \cap d\left(F^{p-r+1} K\right)+F^{p+1} K\right) \subset \operatorname{Im}(d) \cap F^{p} K+F^{p+1} K$.

Thus a subquotient of $E_{\infty}^{p}$ is

$$
\frac{\operatorname{Ker}(d) \cap F^{p} K+F^{p+1} K}{\operatorname{Im}(d) \cap F^{p} K+F^{p+1} K}=\frac{\operatorname{Ker}(d) \cap F^{p} K}{\operatorname{Im}(d) \cap F^{p} K+\operatorname{Ker}(d) \cap F^{p+1} K}
$$

Comparing with the formula given for $\operatorname{gr}^{p} H(K)$ in the discussion following Definition 12.20 .4 we conclude.

012 I Definition 12.20.6. Let $\mathcal{A}$ be an abelian category. Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. We say the spectral sequence associated to ( $K, F, d$ )
(1) weakly converges to $H(K)$ if $\operatorname{gr} H(K)=E_{\infty}$ via Lemma 12.20.5.
(2) abuts to $H(K)$ if it weakly converges to $H(K)$ and we have $\bigcap F^{p} H(K)=0$ and $\bigcup F^{p} H(K)=H(K)$,

Unfortunately, it seems hard to find a consistent terminology for these notions in the literature.

012J Lemma 12.20.7. Let $\mathcal{A}$ be an abelian category. Let $(K, F, d)$ be a filtered differential object of $\mathcal{A}$. The associated spectral sequence
(1) weakly converges to $H(K)$ if and only if for every $p \in \mathbf{Z}$ we have equality in equations 12.20.5.2 and 12.20.5.1),
(2) abuts to $H(K)$ if and only if it weakly converges to $H(K)$ and $\bigcap_{p}(\operatorname{Ker}(d) \cap$ $\left.F^{p} K+\operatorname{Im}(d)\right)=\operatorname{Im}(d)$ and $\bigcup_{p}\left(\operatorname{Ker}(d) \cap F^{p} K+\operatorname{Im}(d)\right)=\operatorname{Ker}(d)$.

Proof. Immediate from the discussions above.

### 12.21. Spectral sequences: filtered complexes

012K
012L Definition 12.21.1. Let $\mathcal{A}$ be an abelian category. A filtered complex $K^{\bullet}$ of $\mathcal{A}$ is a complex of $\operatorname{Fil}(\mathcal{A})$ (see Definition 12.16.1).

We will denote the filtration on the objects by $F$. Thus $F^{p} K^{n}$ denotes the $p$ th step in the filtration of the $n$th term of the complex. Note that each $F^{p} K^{\bullet}$ is a complex of $\mathcal{A}$. Hence we could also have defined a filtered complex as a filtered object in the (abelian) category of complexes of $\mathcal{A}$. In particular gr $K^{\bullet}$ is a graded object of the category of complexes of $\mathcal{A}$.

To describe the spectral sequence associated to such an object we assume, for the moment, that $\mathcal{A}$ is an abelian category which has countable direct sums and countable direct sums are exact (this is not automatic, see Remark 12.15.3). Let us denote $d$ the differential of $K$. Forgetting the grading we can think of $\bigoplus K^{n}$ as a filtered differential object of $\mathcal{A}$. Hence according to Section 12.20 we obtain a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$. In this section we work out the terms of this spectral sequence, and we endow the terms of this spectral sequence with additional structure coming from the grading of $K$.
First we point out that $E_{0}^{p}=\operatorname{gr}^{p} K^{\bullet}$ is a complex and hence is graded. Thus $E_{0}$ is bigraded in a natural way. It is customary to use the bigrading

$$
E_{0}=\bigoplus_{p, q} E_{0}^{p, q}, \quad E_{0}^{p, q}=\operatorname{gr}^{p} K^{p+q}
$$

The idea is that $p+q$ should be thought of as the total degree of the (co)homology classes. Also, $p$ is called the filtration degree, and $q$ is called the complementary degree. The differential $d_{0}$ is compatible with this bigrading in the following way

$$
d_{0}=\bigoplus d_{0}^{p, q}, \quad d_{0}^{p, q}: E_{0}^{p, q} \rightarrow E_{0}^{p, q+1}
$$

Namely, $d_{0}^{p}$ is just the differential on the complex $\operatorname{gr}^{p} K^{\bullet}$ (which occurs as $\operatorname{gr}^{p} E_{0}$ just shifted a bit).

To go further we identify the objects $B_{r}^{p}$ and $Z_{r}^{p}$ introduced in Section 12.20 as graded objects and we work out the corresponding decompositions of the differentials. We do this in a completely straightforward manner, but again we warn the
reader that our notation is not the same as notation found elsewhere. We define

$$
Z_{r}^{p, q}=\frac{F^{p} K^{p+q} \cap d^{-1}\left(F^{p+r} K^{p+q+1}\right)+F^{p+1} K^{p+q}}{F^{p+1} K^{p+q}}
$$

and

$$
B_{r}^{p, q}=\frac{F^{p} K^{p+q} \cap d\left(F^{p-r+1} K^{p+q-1}\right)+F^{p+1} K^{p+q}}{F^{p+1} K^{p+q}}
$$

and of course $E_{r}^{p, q}=Z_{r}^{p, q} / B_{r}^{p, q}$. With these definitions it is completely clear that $Z_{r}^{p}=\bigoplus_{q} Z_{r}^{p, q}, B_{r}^{p}=\bigoplus_{q} B_{r}^{p, q}$, and $E_{r}^{p}=\bigoplus_{q} E_{r}^{p, q}$. Moreover, we have

$$
0 \subset \ldots \subset B_{r}^{p, q} \subset \ldots \subset Z_{r}^{p, q} \subset \ldots \subset E_{0}^{p, q}
$$

Also, the map $d_{r}^{p}$ decomposes as the direct sum of the maps

$$
d_{r}^{p, q}: E_{r}^{p, q} \longrightarrow E_{r}^{p+r, q-r+1}, \quad z+F^{p+1} K^{p+q} \mapsto d z+F^{p+r+1} K^{p+q+1}
$$

where $z \in F^{p} K^{p+q} \cap d^{-1}\left(F^{p+r} K^{p+q+1}\right)$.
012 M Lemma 12.21.2. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. There is a spectral sequence $\left(E_{r}, d_{r}\right)_{r>0}$ in the category of bigraded objects of $\mathcal{A}$ associated to $\left(K^{\bullet}, F\right)$ such that $d_{r}$ has bidegree $(r,-r+1)$ and such that $E_{r}$ has bigraded pieces $E_{r}^{p, q}$ and maps $d_{r}^{p, q}: E_{r}^{p, q} \rightarrow E_{r}^{p+r, q-r+1}$ as given above. Furthermore, we have $E_{0}^{p, q}=g r^{p}\left(K^{p+q}\right), d_{0}^{p, q}=g r^{p}\left(d^{p+q}\right)$, and $E_{1}^{p, q}=H^{p+q}\left(g r^{p}\left(K^{\bullet}\right)\right)$.

Proof. If $\mathcal{A}$ has countable direct sums and if countable direct sums are exact, then this follows from the discussion above. In general, we proceed as follows; we strongly suggest the reader skip this proof. Consider the bigraded object $A=\left(F^{p+1} K^{p+1+q}\right)$ of $\mathcal{A}$, i.e., we put $F^{p+1} K^{p+1+q}$ in degree $(p, q)$ (the funny shift in numbering to get numbering correct later on). We endow it with a differential $d: A \rightarrow A[0,1]$ by using $d$ on each component. Then $(A, d)$ is a differential bigraded object. Consider the map

$$
\alpha: A \rightarrow A[-1,1]
$$

which is given in degree $(p, q)$ by the inclusion $F^{p+1} K^{p+q} \rightarrow F^{p} K^{p+q}$. This is an injective morphism of differential objects $\alpha:(A, d) \rightarrow(A, d)[-1,1]$. Hence, we can apply Remark 12.19 .6 with $S=[0,1]$ and $T=[1,-1]$. The corresponding spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ of bigraded objects is the spectral sequence we are looking for. Let us unwind the definitions a bit. First of all we have $E_{r}=\left(E_{r}^{p, q}\right)$. Then, since $T^{r} S=\left[r,-r+1\right.$ we have $d_{r}: E_{r} \rightarrow E_{r}[r,-r+1]$ which means that $d_{r}^{p}: E_{r}^{p, q} \rightarrow E_{r}^{p+r, q-r+1}$.

To see that the description of the graded pieces hold, we argue as above. Namely, first we have

$$
E_{0}=\operatorname{Coker}(\alpha: A \rightarrow A[-1,1])[0,-1]=\operatorname{Coker}(\alpha[0,-1]: A[0,-1] \rightarrow A[-1,0])
$$

and by our choice of numbering above this gives

$$
E_{0}^{p, q}=\operatorname{Coker}\left(F^{p+1} K^{p+q} \rightarrow F^{p} K^{p+q}\right)=\operatorname{gr}^{p} K^{p+q}
$$

The first differential is given by $d_{0}^{p, q}=\operatorname{gr}^{p} d^{p+q}: E_{0}^{p, q} \rightarrow E_{0}^{p, q+1}$. Next, the description of the boundaries $B_{r}$ and the cocycles $Z_{r}$ in Remark 12.19 .6 translates into a straightforward manner into the formulae for $Z_{r}^{p, q}$ and $B_{r}^{p, q}$ given above.

012N Lemma 12.21.3. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. Assume $\mathcal{A}$ has countable direct sums. Let $\left(E_{r}, d_{r}\right)_{r \geq 0}$ be the spectral sequence associated to $\left(K^{\bullet}, F\right)$.
(1) The map
$d_{1}^{p, q}: E_{1}^{p, q}=H^{p+q}\left(g r^{p}\left(K^{\bullet}\right)\right) \longrightarrow E_{1}^{p+1, q}=H^{p+q+1}\left(g r^{p+1}\left(K^{\bullet}\right)\right)$
is equal to the boundary map in cohomology associated to the short exact sequence of complexes

$$
0 \rightarrow g r^{p+1}\left(K^{\bullet}\right) \rightarrow F^{p} K^{\bullet} / F^{p+2} K^{\bullet} \rightarrow g r^{p+1}\left(K^{\bullet}\right) \rightarrow 0
$$

(2) Assume that $d\left(F^{p} K\right) \subset F^{p+1} K$ for all $p \in \mathbf{Z}$. Then $d$ induces the zero differential on $g r^{p}\left(K^{\bullet}\right)$ and hence $E_{1}^{p, q}=g r^{p}\left(K^{\bullet}\right)^{p+q}$. Furthermore, in this case

$$
d_{1}^{p, q}: E_{1}^{p, q}=g r^{p}\left(K^{\bullet}\right)^{p+q} \longrightarrow E_{1}^{p, q}=g r^{p+1}\left(K^{\bullet}\right)^{p+q+1}
$$

is the morphism induced by $d$.
Proof. This is clear from the formula given for the diffirential $d_{1}^{p, q}$ just above Lemma 12.21.2.

012 O Lemma 12.21.4. Let $\mathcal{A}$ be an abelian category. Let $\alpha:\left(K^{\bullet}, F\right) \rightarrow\left(L^{\bullet}, F\right)$ be a morphism of filtered complexes of $\mathcal{A}$. Let $\left(E_{r}(K), d_{r}\right)_{r \geq 0}$, resp. $\left(E_{r}(L), d_{r}\right)_{r \geq 0}$ be the spectral sequence associated to $\left(K^{\bullet}, F\right)$, resp. $\left(L^{\bullet}, F\right)$. The morphism $\alpha$ induces a canonical morphism of spectral sequences $\left\{\alpha_{r}: E_{r}(K) \rightarrow E_{r}(L)\right\}_{r \geq 0}$ compatible with the bigradings.

Proof. Obvious from the explicit representation of the terms of the spectral sequences.

012P Definition 12.21.5. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. The induced filtration on $H^{n}\left(K^{\bullet}\right)$ is the filtration defined by $F^{p} H^{n}\left(K^{\bullet}\right)=$ $\operatorname{Im}\left(H^{n}\left(F^{p} K^{\bullet}\right) \rightarrow H^{n}\left(K^{\bullet}\right)\right)$.

Writing out what this means we see that

$$
\begin{equation*}
F^{p} H^{n}\left(K^{\bullet}, d\right)=\frac{\operatorname{Ker}(d) \cap F^{p} K^{n}+\operatorname{Im}(d) \cap K^{n}}{\operatorname{Im}(d) \cap K^{n}} \tag{12.21.5.1}
\end{equation*}
$$

and hence we see that
0BDT

$$
\operatorname{gr}^{p} H^{n}\left(K^{\bullet}\right)=\frac{\operatorname{Ker}(d) \cap F^{p} K^{n}}{\operatorname{Ker}(d) \cap F^{p+1} K^{n}+\operatorname{Im}(d) \cap F^{p} K^{n}}
$$

(one intermediate step omitted).
012Q Lemma 12.21.6. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. If $Z_{\infty}^{p, q}$ and $B_{\infty}^{p, q}$ exist (see proof), then
(1) the limit $E_{\infty}$ exists and is a bigraded object having $E_{\infty}^{p, q}=Z_{\infty}^{p, q} / B_{\infty}^{p, q}$ in bidegree $(p, q)$,
(2) the pth graded part $g r^{p} H^{n}\left(K^{\bullet}\right)$ of the nth cohomology object of $K^{\bullet}$ is a subquotient of $E_{\infty}^{p, n-p}$.

Proof. The objects $Z_{\infty}, B_{\infty}$, and the limit $E_{\infty}=Z_{\infty} / B_{\infty}$ of Definition 12.17.2 are bigraded objects of $\mathcal{A}$ by our construction of the spectral sequence in Lemma 12.21.2. Since $Z_{r}=\bigoplus Z_{r}^{p, q}$ and $B_{r}=\bigoplus B_{r}^{p, q}$, if we assume that

$$
Z_{\infty}^{p, q}=\bigcap_{r} Z_{r}^{p, q}=\bigcap_{r} \frac{F^{p} K^{p+q} \cap d^{-1}\left(F^{p+r} K^{p+q+1}\right)+F^{p+1} K^{p+q}}{F^{p+1} K^{p+q}}
$$

and

$$
B_{\infty}^{p, q}=\bigcup_{r} B_{r}^{p, q}=\bigcup_{r} \frac{F^{p} K^{p+q} \cap d\left(F^{p-r+1} K^{p+q-1}\right)+F^{p+1} K^{p+q}}{F^{p+1} K^{p+q}}
$$

exist, then $Z_{\infty}$ and $B_{\infty}$ exist with bidegree $(p, q)$ parts $Z_{\infty}^{p, q}$ and $B_{\infty}^{p, q}$ (follows from an elementary argument about unions and intersections of bigraded objects). Thus

$$
E_{\infty}^{p, q}=\frac{\bigcap_{r}\left(F^{p} K^{p+q} \cap d^{-1}\left(F^{p+r} K^{p+q+1}\right)+F^{p+1} K^{p+q}\right)}{\bigcup_{r}\left(F^{p} K^{p+q} \cap d\left(F^{p-r+1} K^{p+q-1}\right)+F^{p+1} K^{p+q}\right)}
$$

where the top and the bottom exist. With $n=p+q$ we have
(12.21.6.1)

012S $\quad \operatorname{Ker}(d) \cap F^{p} K^{n}+F^{p+1} K^{n} \subset \bigcap_{r}\left(F^{p} K^{n} \cap d^{-1}\left(F^{p+r} K^{n+1}\right)+F^{p+1} K^{n}\right)$
and
(12.21.6.2)

012T

$$
\bigcup_{r}\left(F^{p} K^{n} \cap d\left(F^{p-r+1} K^{n-1}\right)+F^{p+1} K^{n}\right) \subset \operatorname{Im}(d) \cap F^{p} K^{n}+F^{p+1} K^{n}
$$

Thus a subquotient of $E_{\infty}^{p, q}$ is

$$
\frac{\operatorname{Ker}(d) \cap F^{p} K^{n}+F^{p+1} K^{n}}{\operatorname{Im}(d) \cap F^{p} K^{n}+F^{p+1} K^{n}}=\frac{\operatorname{Ker}(d) \cap F^{p} K^{n}}{\operatorname{Im}(d) \cap F^{p} K^{n}+\operatorname{Ker}(d) \cap F^{p+1} K^{n}}
$$

Comparing with 12.21.5.2 we conclude.
0BDU Definition 12.21.7. Let $\mathcal{A}$ be an abelian category. Let $\left(E_{r}, d_{r}\right)_{r \geq r_{0}}$ be a spectral sequence of bigraded objects of $\mathcal{A}$ with $d_{r}$ of bidegree $(r,-r+1)$. We say such a spectral sequence is
(1) regular if for all $p, q \in \mathbf{Z}$ there is a $b=b(p, q)$ such that the maps $d_{r}^{p, q}$ : $E_{r}^{p, q} \rightarrow E_{r}^{p+r, q-r+1}$ are zero for $r \geq b$,
(2) coregular if for all $p, q \in \mathbf{Z}$ there is a $b=b(p, q)$ such that the maps $d_{r}^{p-r, q+r-1}: E^{p-r, q+r-1} \rightarrow E_{r}^{p, q}$ are zero for $r \geq b$,
(3) bounded if for all $n$ there are only a finite number of nonzero $E_{r_{0}}^{p, n-p}$,
(4) bounded below if for all $n$ there is a $b=b(n)$ such that $E_{r_{0}}^{p, n-p}=0$ for $p \geq b$.
(5) bounded above if for all $n$ there is a $b=b(n)$ such that $E_{r_{0}}^{p, n-p}=0$ for $p \leq b$.
Bounded below means that if we look at $E_{r}^{p, q}$ on the line $p+q=n$ (whose slope is -1 ) we obtain zeros as $(p, q)$ moves down and to the right. As mentioned above there is no consistent terminology regarding these notions in the literature.
0BDV Lemma 12.21.8. In the situation of Definition 12.21.7. Let $Z_{r}^{p, q}, B_{r}^{p, q} \subset E_{r_{0}}^{p, q}$ be the $(p, q)$-graded parts of $Z_{r}, B_{r}$ defined as in Section 12.17.
(1) The spectral sequence is regular if and only if for all $p, q$ there exists an $r=r(p, q)$ such that $Z_{r}^{p, q}=Z_{r+1}^{p, q}=\ldots$
(2) The spectral sequence is coregular if and only if for all $p, q$ there exists an $r=r(p, q)$ such that $B_{r}^{p, q}=B_{r+1}^{p, q}=\ldots$
(3) The spectral sequence is bounded if and only if it is both bounded below and bounded above.
(4) If the spectral sequence is bounded below, then it is regular.
(5) If the spectral sequence is bounded above, then it is coregular.

Proof. Omitted. Hint: If $E_{r}^{p, q}=0$, then we have $E_{r^{\prime}}^{p, q}=0$ for all $r^{\prime} \geq r$.

012 U Definition 12.21.9. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. We say the spectral sequence associated to $\left(K^{\bullet}, F\right)$
(1) weakly converges to $H^{*}\left(K^{\bullet}\right)$ if $\operatorname{gr}^{p} H^{n}\left(K^{\bullet}\right)=E_{\infty}^{p, n-p}$ via Lemma 12.21 .6 for all $p, n \in \mathbf{Z}$,
(2) abuts to $H^{*}\left(K^{\bullet}\right)$ if it weakly converges to $H^{*}\left(K^{\bullet}\right)$ and $\bigcap_{p} F^{p} H^{n}\left(K^{\bullet}\right)=0$ and $\bigcup_{p} F^{p} H^{n}\left(K^{\bullet}\right)=H^{n}\left(K^{\bullet}\right)$ for all $n$,
(3) converges to $H^{*}\left(K^{\bullet}\right)$ if it is regular, abuts to $H^{*}\left(K^{\bullet}\right)$, and $H^{n}\left(K^{\bullet}\right)=$ $\lim _{p} H^{n}\left(K^{\bullet}\right) / F^{p} H^{n}\left(K^{\bullet}\right)$.

Weak convergence, abutment, or convergence is symbolized by the notation $E_{r}^{p, q} \Rightarrow$ $H^{p+q}\left(K^{\bullet}\right)$. As mentioned above there is no consistent terminology regarding these notions in the literature.

012V Lemma 12.21.10. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. The associated spectral sequence
(1) weakly converges to $H^{*}\left(K^{\bullet}\right)$ if and only if for every $p, q \in \mathbf{Z}$ we have equality in equations (12.21.6.2) and (12.21.6.1),
(2) abuts to $H^{*}(K)$ if and only if it weakly converges to $H^{*}\left(K^{\bullet}\right)$ and we have $\bigcap_{p}\left(\operatorname{Ker}(d) \cap F^{p} K^{n}+\operatorname{Im}(d) \cap K^{n}\right)=\operatorname{Im}(d) \cap K^{n}$ and $\bigcup_{p}\left(\operatorname{Ker}(d) \cap F^{p} K^{n}+\right.$ $\left.\operatorname{Im}(d) \cap K^{n}\right)=\operatorname{ker}(d) \cap K^{n}$.

Proof. Immediate from the discussions above.
012W Lemma 12.21.11. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. Assume that the filtration on each $K^{n}$ is finite (see Definition 12.16.1). Then
(1) the spectral sequence associated to $\left(K^{\bullet}, F\right)$ is bounded,
(2) the filtration on each $H^{n}\left(K^{\bullet}\right)$ is finite,
(3) the spectral sequence associated to $\left(K^{\bullet}, F\right)$ converges to $H^{*}\left(K^{\bullet}\right)$,
(4) if $\mathcal{C} \subset \mathcal{A}$ is a weak Serre subcategory and for some $r$ we have $E_{r}^{p, q} \in \mathcal{C}$ for all $p, q \in \mathbf{Z}$, then $H^{n}\left(K^{\bullet}\right)$ is in $\mathcal{C}$.

Proof. Part (1) follows as $E_{0}^{p, n-p}=\operatorname{gr}^{p} K^{n}$. Part (2) is clear from Equation (12.21.5.1). We will use Lemma 12.21 .10 to prove that the spectral sequence weakly converges. Fix $p, n \in \mathbf{Z}$. Looking at the right hand side of 12.21.6.1) we see that we get $F^{p} K^{n} \cap \operatorname{Ker}(d)+F^{p+1} K^{n}$ because $F^{p+r} K^{n}=0$ for $r \gg 0$. Thus 12.21.6.1) is an equality. Look at the left hand side of 12.21 .6 .1 . The expression is equal to the right hand side since $F^{p-r+1} K^{n-1}=K^{n-1}$ for $r \gg 0$. Thus 12.21.6.1) is an equality. Since the filtration on $H^{n}\left(K^{\bullet}\right)$ is finite by (2) we see that we have abutment. To prove we have convergence we have to show the spectral sequence is regular which follows as it is bounded (Lemma 12.21 .8 ) and we have to show that $H^{n}\left(K^{\bullet}\right)=\lim H^{n}\left(K^{\bullet}\right) / F^{p} H^{n}\left(K^{\bullet}\right)$ which follows from the fact that the filtration on $H^{*}\left(K^{\bullet}\right)$ is finite proved in part (2).

Proof of (4). Assume that for some $r \geq 0$ we have $E_{r}^{p, q} \in \mathcal{C}$ for some weak Serre subcategory $\mathcal{C}$ of $\mathcal{A}$. Then $E_{r+1}^{p, q}$ is in $\mathcal{C}$ as well, see Lemma 12.9.3. By boundedness proved above (which implies that the spectral sequence is both regular and coregular, see Lemma 12.21 .8 we can find an $r^{\prime} \geq r$ such that $E_{\infty}^{p, q}=E_{r^{\prime}}^{p, q}$ for all $p, q$ with $p+q=n$. Thus $H^{n}\left(K^{\bullet}\right)$ is an object of $\mathcal{A}$ which has a finite filtration whose graded pieces are in $\mathcal{C}$. This implies that $H^{n}\left(K^{\bullet}\right)$ is in $\mathcal{C}$ by Lemma 12.9.3.

0BDW Lemma 12.21.12. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. Assume that the filtration on each $K^{n}$ is finite (see Definition 12.16.1) and that for some $r$ we have only a finite number of nonzero $E_{r}^{p, q}$. Then only a finite number of $H^{n}\left(K^{\bullet}\right)$ are nonzero and we have

$$
\sum(-1)^{n}\left[H^{n}\left(K^{\bullet}\right)\right]=\sum(-1)^{p+q}\left[E_{r}^{p, q}\right]
$$

in $K_{0}\left(\mathcal{A}^{\prime}\right)$ where $\mathcal{A}^{\prime}$ is the smallest weak Serre subcategory of $\mathcal{A}$ containing the objects $E_{r}^{p, q}$.

Proof. Denote $E_{r}^{\text {even }}$ and $E_{r}^{\text {odd }}$ the even and odd part of $E_{r}$ defined as the direct sum of the $(p, q)$ components with $p+q$ even and odd. The differential $d_{r}$ defines maps $\varphi: E_{r}^{\text {even }} \rightarrow E_{r}^{\text {odd }}$ and $\psi: E_{r}^{\text {odd }} \rightarrow E_{r}^{\text {even }}$ whose compositions either way give zero. Then we see that

$$
\begin{aligned}
{\left[E_{r}^{\text {even }}\right]-\left[E_{r}^{\text {odd }}\right] } & =[\operatorname{Ker}(\varphi)]+[\operatorname{Im}(\varphi)]-[\operatorname{Ker}(\psi)]-[\operatorname{Im}(\psi)] \\
& =[\operatorname{Ker}(\varphi) / \operatorname{Im}(\psi)]-[\operatorname{Ker}(\psi) / \operatorname{Im}(\varphi] \\
& =\left[E_{r+1}^{\text {even }}\right]-\left[E_{r+1}^{\text {odd }}\right]
\end{aligned}
$$

Note that all the intervening objects are in the smallest Serre subcategory containing containing the objects $E_{r}^{p, q}$. Continuing in this manner we see that we can increase $r$ at will. Since there are only a finite number of pairs $(p, q)$ for which $E_{r}^{p, q}$ is nonzero, a property which is inherited by $E_{r+1}, E_{r+2}, \ldots$, we see that we may assume that $d_{r}=0$. At this stage we see that $H^{n}\left(K^{\bullet}\right)$ has a finite filtration (Lemma 12.21.11 whose graded pieces are exactly the $E_{r}^{p, n-p}$ and the result is clear.

The following lemma is more a kind of sanity check for our definitions. Surely, if we have a filtered complex such that for every $n$ we have

$$
H^{n}\left(F^{p} K^{\bullet}\right)=0 \text { for } p \gg 0 \quad \text { and } \quad H^{n}\left(F^{p} K^{\bullet}\right)=H^{n}\left(K^{\bullet}\right) \text { for } p \ll 0
$$

then the corresponding spectral sequence should converge?
0BK5 Lemma 12.21.13. Let $\mathcal{A}$ be an abelian category. Let $\left(K^{\bullet}, F\right)$ be a filtered complex of $\mathcal{A}$. Assume
(1) for every $n$ there exist $p_{0}(n)$ such that $H^{n}\left(F^{p} K^{\bullet}\right)=0$ for $p \geq p_{0}(n)$,
(2) for every $n$ there exist $p_{1}(n)$ such that $H^{n}\left(F^{p} K^{\bullet}\right) \rightarrow H^{n}\left(K^{\bullet}\right)$ is an isomorphism for $p \leq p_{1}(n)$.
Then
(1) the spectral sequence associated to $\left(K^{\bullet}, F\right)$ is bounded,
(2) the filtration on each $H^{n}\left(K^{\bullet}\right)$ is finite,
(3) the spectral sequence associated to $\left(K^{\bullet}, F\right)$ converges to $H^{*}\left(K^{\bullet}\right)$.

Proof. Fix $n$. Using the long exact cohomology sequence associated to the short exact sequence of complexes

$$
0 \rightarrow F^{p+1} K^{\bullet} \rightarrow F^{p} K^{\bullet} \rightarrow \operatorname{gr}^{p} K^{\bullet} \rightarrow 0
$$

we find that $E_{1}^{p, n-p}=0$ for $p \geq \max \left(p_{0}(n), p_{0}(n+1)\right)$ and $p<\min \left(p_{1}(n), p_{1}(n+1)\right)$. Hence the spectral sequence is bounded (Definition 12.21.7). This proves (1).
It is clear from the assumptions and Definition 12.21 .5 that the filtration on $H^{n}\left(K^{\bullet}\right)$ is finite. This proves (2).

Next we prove that the spectral sequence weakly converges to $H^{*}\left(K^{\bullet}\right)$ using Lemma 12.21.10. Let us show that we have equality in 12.21.6.1. Namely, for $p+r>$ $p_{0}(n+1)$ the map

$$
d: F^{p} K^{n} \cap d^{-1}\left(F^{p+r} K^{n+1}\right) \rightarrow F^{p+r} K^{n+1}
$$

ends up in the image of $d: F^{p+r} K^{n} \rightarrow F^{p+r} K^{n+1}$ because the complex $F^{p+r} K^{\bullet}$ is exact in degree $n+1$. We conclude that $F^{p} K^{n} \cap d^{-1}\left(F^{p+r} K^{n+1}\right)=d\left(F^{p+r} K^{n}\right)+$ $\operatorname{Ker}(d) \cap F^{p} K^{n}$. Hence for such $r$ we have

$$
\operatorname{Ker}(d) \cap F^{p} K^{n}+F^{p+1} K^{n}=F^{p} K^{n} \cap d^{-1}\left(F^{p+r} K^{n+1}\right)+F^{p+1} K^{n}
$$

which proves the desired equality. To show that we have equality in 12.21 .6 .2 we use that for $p-r+1<p_{1}(n-1)$ we have

$$
d\left(F^{p-r+1} K^{n-1}\right)=\operatorname{Im}(d) \cap F^{p-r+1} K^{n}
$$

because the map $F^{p-r+1} K^{\bullet} \rightarrow K^{\bullet}$ induces an isomorphism on cohomology in degree $n-1$. This shows that we have

$$
F^{p} K^{n} \cap d\left(F^{p-r+1} K^{n-1}\right)+F^{p+1} K^{n}=\operatorname{Im}(d) \cap F^{p} K^{n}+F^{p+1} K^{n}
$$

for such $r$ which proves the desired equality.
To see that the spectral sequence abuts to $H^{*}\left(K^{\bullet}\right)$ using Lemma 12.21 .10 we have to show that $\bigcap_{p}\left(\operatorname{Ker}(d) \cap F^{p} K^{n}+\operatorname{Im}(d) \cap K^{n}\right)=\operatorname{Im}(d) \cap K^{n}$ and $\bigcup_{p}\left(\operatorname{Ker}(d) \cap F^{p} K^{n}+\right.$ $\left.\operatorname{Im}(d) \cap K^{n}\right)=\operatorname{ker}(d) \cap K^{n}$. For $p \geq p_{0}(n)$ we have $\operatorname{Ker}(d) \cap F^{p} K^{n}+\operatorname{Im}(d) \cap K^{n}=$ $\operatorname{Im}(d) \cap K^{n}$ and for $p \leq p_{1}(n)$ we have $\operatorname{Ker}(d) \cap F^{p} K^{n}+\operatorname{Im}(d) \cap K^{n}=\operatorname{ker}(d) \cap K^{n}$. Combining weak convergence, abutment, and boundedness we see that (2) and (3) are true.

### 12.22. Spectral sequences: double complexes

012X
012 Y Definition 12.22.1. Let $\mathcal{A}$ be an additive category. A double complex in $\mathcal{A}$ is given by a system $\left(\left\{A^{p, q}, d_{1}^{p, q}, d_{2}^{p, q}\right\}_{p, q \in \mathbf{Z}}\right)$, where each $A^{p, q}$ is an object of $\mathcal{A}$ and $d_{1}^{p, q}: A^{p, q} \rightarrow A^{p+1, q}$ and $d_{2}^{p, q}: A^{p, q} \rightarrow A^{p, q+1}$ are morphisms of $\mathcal{A}$ such that the following rules hold:
(1) $d_{1}^{p+1, q} \circ d_{1}^{p, q}=0$
(2) $d_{2}^{p, q+1} \circ d_{2}^{p, q}=0$
(3) $d_{1}^{p, q+1} \circ d_{2}^{p, q}=d_{2}^{p+1, q} \circ d_{1}^{p, q}$
for all $p, q \in \mathbf{Z}$.
This is just the cochain version of the definition. It says that each $A^{p, \bullet}$ is a cochain complex and that each $d_{1}^{p, \bullet}$ is a morphism of complexes $A^{p, \bullet} \rightarrow A^{p+1, \bullet}$ such that $d_{1}^{p+1, \bullet} \circ d_{1}^{p, \bullet}=0$ as morphisms of complexes. In other words a double complex can
be seen as a complex of complexes. So in the diagram

any square commutes. Warning: In the literature one encounters a different definition where a "bicomplex" or a "double complex" has the property that the squares in the diagram anti-commute.

0A5J Example 12.22.2. Let $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be abelian categories. Suppose that

$$
\otimes: \mathcal{A} \times \mathcal{B} \longrightarrow \mathcal{C}, \quad(X, Y) \longmapsto X \otimes Y
$$

is a functor which is bilinear on morphisms, see Categories, Definition 4.2.20 for the definition of $\mathcal{A} \times \mathcal{B}$. Given a complexes $X^{\bullet}$ of $\mathcal{A}$ and $Y^{\bullet}$ of $\mathcal{B}$ we obtain a double complex

$$
K^{\bullet, \bullet}=X^{\bullet} \otimes Y^{\bullet}
$$

in $\mathcal{C}$. Here the first differential $K^{p, q} \rightarrow K^{p+1, q}$ is the morphism $X^{p} \otimes Y^{q} \rightarrow$ $X^{p+1} \otimes Y^{q}$ induced by the morphism $X^{p} \rightarrow X^{p+1}$ and the identity on $Y^{q}$. Similarly for the second differential.

Let $A^{\bullet \bullet}$ be a double complex. It is customary to denote $H_{I}^{p}\left(A^{\bullet \bullet}\right)$ the complex with terms $\operatorname{Ker}\left(d_{1}^{p, q}\right) / \operatorname{Im}\left(d_{1}^{p-1, q}\right)$ (varying $q$ ) and differential induced by $d_{2}$. Then $H_{I I}^{q}\left(H_{I}^{p}\left(A^{\bullet \bullet \bullet}\right)\right)$ denotes its cohomology in degree $q$. It is also customary to denote $H_{I I}^{q}\left(A^{\bullet \bullet \bullet}\right)$ the complex with terms $\operatorname{Ker}\left(d_{2}^{p, q}\right) / \operatorname{Im}\left(d_{2}^{p, q-1}\right)$ (varying $p$ ) and differential induced by $d_{1}$. Then $H_{I}^{p}\left(H_{I I}^{q}\left(A^{\bullet \bullet}\right)\right)$ denotes its cohomology in degree $q$. It will turn out that these cohomology groups show up as the terms in the spectral sequence for a filtration on the associated to total complex.

012 Z Definition 12.22.3. Let $\mathcal{A}$ be an additive category. Let $A^{\bullet \bullet}$ be a double complex. The associated simple complex $s A^{\bullet}$, also sometimes called the associated total complex is given by

$$
s A^{n}=\bigoplus_{n=p+q} A^{p, q}
$$

(if it exists) with differential

$$
d_{s A}^{n}=\sum_{n=p+q}\left(d_{1}^{p, q}+(-1)^{p} d_{2}^{p, q}\right)
$$

Alternatively, we sometimes write $\operatorname{Tot}\left(A^{\bullet \bullet \bullet}\right)$ to denote this complex.
If countable direct sums exist in $\mathcal{A}$ or if for each $n$ at most finitely many $A^{p, n-p}$ are nonzero, then $s A^{\bullet}$ exists. Note that the definition is not symmetric in the indices $(p, q)$.

There are two natural filtrations on the simple complex $s A^{\bullet}$ associated to the double complex $A^{\bullet \bullet \bullet}$. Namely, we define

$$
F_{I}^{p}\left(s A^{n}\right)=\bigoplus_{i+j=n, i \geq p} A^{i, j} \quad \text { and } \quad F_{I I}^{p}\left(s A^{n}\right)=\bigoplus_{i+j=n, j \geq p} A^{i, j}
$$

It is immediately verified that $\left(s A^{\bullet}, F_{I}\right)$ and $\left(s A^{\bullet}, F_{I I}\right)$ are filtered complexes. By Section 12.21 we obtain two spectral sequences. It is customary to denote $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)_{r \geq 0}$ the spectral sequence associated to the filtration $F_{I}$ and to denote $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$ the spectral sequence associated to the filtration $F_{I I}$. Here is a description of these spectral sequences.

0130 Lemma 12.22.4. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet \bullet}$ be a double complex. The spectral sequences associated to $K^{\bullet \bullet}$ have the following terms:
(1) ${ }^{\prime} E_{0}^{p, q}=K^{p, q}$ with' $d_{0}^{p, q}=(-1)^{p} d_{2}^{p, q}: K^{p, q} \rightarrow K^{p, q+1}$,
(2) ${ }^{\prime \prime} E_{0}^{p, q}=K^{q, p}$ with ${ }^{\prime \prime} d_{0}^{p, q}=d_{1}^{q, p}: K^{q, p} \rightarrow K^{q+1, p}$,
(3) ${ }^{\prime} E_{1}^{p, q}=H^{q}\left(K^{p, \bullet}\right)$ with ${ }^{\prime} d_{1}^{p, q}=H^{q}\left(d_{1}^{p, \bullet}\right)$,
(4) ${ }^{\prime \prime} E_{1}^{p, q}=H^{q}\left(K^{\bullet, p}\right)$ with ${ }^{\prime \prime} d_{1}^{p, q}=(-1)^{q} H^{q}\left(d_{2}^{\bullet, p}\right)$,
(5) ${ }^{\prime} E_{2}^{p, q}=H_{I}^{p}\left(H_{I I}^{q}\left(K^{\bullet \bullet \bullet}\right)\right)$,
(6) ${ }^{\prime \prime} E_{2}^{p, q}=H_{I I}^{p}\left(H_{I}^{q}\left(K^{\bullet \bullet \bullet}\right)\right)$.

## Proof. Omitted.

These spectral sequences define two filtrations on $H^{n}\left(s K^{\bullet}\right)$. We will denote these $F_{I}$ and $F_{I I}$.
0131 Definition 12.22.5. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet \bullet \bullet}$ be a double complex. We say the spectral sequence $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)_{r \geq 0}$ weakly converges to $H^{n}\left(s K^{\bullet}\right)$, abuts to $H^{n}\left(s K^{\bullet}\right)$, or converges to $H^{n}\left(s K^{\bullet}\right)$ if Definition 12.21 .9 applies. Similarly we say the spectral sequence $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$ weakly converges to $H^{n}\left(s K^{\bullet}\right)$, abuts to $H^{n}\left(s K^{\bullet}\right)$, or converges to $H^{n}\left(s K^{\bullet}\right)$ if Definition 12.21 .9 applies.

As mentioned above there is no consistent terminology regarding these notions in the literature. In the situation of the definition, we have weak convergence of the first spectral sequence if for all $n$

$$
\operatorname{gr}_{F_{I}}\left(H^{n}\left(s K^{\bullet}\right)\right)=\oplus_{p+q=n}^{\prime} E_{\infty}^{p, q}
$$

via the canonical comparison of Lemma 12.21 .6 Similarly the second spectral sequence ( $\left.{ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$ weakly converges if for all $n$

$$
\operatorname{gr}_{F_{I I}}\left(H^{n}\left(s K^{\bullet}\right)\right)=\oplus_{p+q=n}{ }^{\prime \prime} E_{\infty}^{p, q}
$$

via the canonical comparison of Lemma 12.21 .6
0132 Lemma 12.22.6. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet \bullet \bullet}$ be a double complex. Assume that for every $n \in \mathbf{Z}$ there are only finitely many nonzero $K^{p, q}$ with $p+q=$ n. Then
(1) the two spectral sequences associated to $K^{\bullet \bullet \bullet}$ are bounded,
(2) the filtrations $F_{I}, F_{I I}$ on each $H^{n}\left(K^{\bullet}\right)$ are finite,
(3) the spectral sequences $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)_{r \geq 0}$ and $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$ converge to $H^{*}\left(s K^{\bullet}\right)$,
(4) if $\mathcal{C} \subset \mathcal{A}$ is a weak Serre subcategory and for some $r$ we have ' $E_{r}^{p, q} \in \mathcal{C}$ for all $p, q \in \mathbf{Z}$, then $H^{n}\left(s K^{\bullet}\right)$ is in $\mathcal{C}$. Similarly for $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$.
Proof. Follows immediately from Lemma 12.21.11.
Here is our first application of spectral sequences.

0133 Lemma 12.22.7. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a complex. Let $A^{\bullet \bullet}$ be a double complex. Let $\alpha^{p}: K^{p} \rightarrow A^{p, 0}$ be morphisms. Assume that
(1) For every $n \in \mathbf{Z}$ there are only finitely many nonzero $A^{p, q}$ with $p+q=n$.
(2) We have $A^{p, q}=0$ if $q<0$.
(3) The morphisms $\alpha^{p}$ give rise to a morphism of complexes $\alpha: K^{\bullet} \rightarrow A^{\bullet}, 0$.
(4) The complex $A^{p, \bullet}$ is exact in all degrees $q \neq 0$ and the morphism $K^{p} \rightarrow$ $A^{p, 0}$ induces an isomorphism $K^{p} \rightarrow \operatorname{Ker}\left(d_{2}^{p, 0}\right)$.
Then $\alpha$ induces a quasi-isomorphism

$$
K^{\bullet} \longrightarrow s A^{\bullet}
$$

of complexes. Moreover, there is a variant of this lemma involving the second variable $q$ instead of $p$.

Proof. The map is simply the map given by the morphisms $K^{n} \rightarrow A^{n, 0} \rightarrow s A^{n}$, which are easily seen to define a morphism of complexes. Consider the spectral sequence $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)_{r \geq 0}$ associated to the double complex $A^{\bullet \bullet \bullet}$. By Lemma 12.22 .6 this spectral sequence converges and the induced filtration on $H^{n}\left(s A^{\bullet}\right)$ is finite for each $n$. By Lemma 12.22 .4 and assumption (4) we have ' $E_{1}^{p, q}=0$ unless $q=0$ and ' $E_{1}^{p, 0}=K^{p}$ with differential ' $d_{1}^{p, 0}$ identified with $d_{K}^{p}$. Hence ' $E_{2}^{p, 0}=$ $H^{p}\left(K^{\bullet}\right)$ and zero otherwise. This clearly implies $d_{2}^{p, q}=d_{3}^{p, q}=\ldots=0$ for degree reasons. Hence we conclude that $H^{n}\left(s A^{\bullet}\right)=H^{n}\left(K^{\bullet}\right)$. We omit the verification that this identification is given by the morphism of complexes $K^{\bullet} \rightarrow s A^{\bullet}$ introduced above.

08BI Remark 12.22.8. Let $\mathcal{A}$ be an additive category. Let $A^{\bullet \bullet \bullet \bullet}$ be a triple complex. The associated total complex is the complex with terms

$$
\operatorname{Tot}^{n}\left(A^{\bullet, \bullet, \bullet}\right)=\bigoplus_{p+q+r=n} A^{p, q, r}
$$

and differential

$$
d_{\operatorname{Tot}(A \bullet \bullet, \bullet)}^{n}=\sum_{p+q+r=n} d_{1}^{p, q, r}+(-1)^{p} d_{2}^{p, q, r}+(-1)^{p+q} d_{3}^{p, q, r}
$$

With this definition a simple calculation shows that the associated total complex is equal to

$$
\operatorname{Tot}\left(A^{\bullet, \bullet, \bullet}\right)=\operatorname{Tot}\left(\operatorname{Tot}_{12}\left(A^{\bullet, \bullet, \bullet}\right)\right)=\operatorname{Tot}\left(\operatorname{Tot}_{23}\left(A^{\bullet, \bullet, \bullet}\right)\right)
$$

In other words, we can either first combine the first two of the variables and then combine sum of those with the last, or we can first combine the last two variables and then combine the first with the sum of the last two.

09IZ Lemma 12.22.9. Let $M^{\bullet}$ be a complex of abelian groups. Let

$$
\ldots \rightarrow A_{2}^{\bullet} \rightarrow A_{1}^{\bullet} \rightarrow A_{0}^{\bullet} \rightarrow M^{\bullet} \rightarrow 0
$$

be an exact complex of complexes of abelian groups such that for all $p \in \mathbf{Z}$ the complexes

$$
\ldots \rightarrow \operatorname{Ker}\left(d_{A_{2}^{\bullet}}^{p}\right) \rightarrow \operatorname{Ker}\left(d_{A_{1}}^{p}\right) \rightarrow \operatorname{Ker}\left(d_{A_{0}^{\bullet}}^{p}\right) \rightarrow \operatorname{Ker}\left(d_{M \bullet}^{p}\right) \rightarrow 0
$$

are exact as well. Set $A^{p, q}=A_{-p}^{q}$ to obtain a double complex. Then $\operatorname{Tot}\left(A^{\bullet \bullet \bullet}\right) \rightarrow$ $M^{\bullet}$ induced by $A_{0}^{\bullet} \rightarrow M^{\bullet}$ is a quasi-isomorphism.

Proof. Write $T^{\bullet}=\operatorname{Tot}\left(A^{\bullet \bullet}\right)$. Let $x \in \operatorname{Ker}\left(\mathrm{~d}_{T}^{0} \bullet\right)$ represent a cohomology class $\xi$. Write $x=\sum_{i=n, \ldots, 0} x_{i}$ with $x_{i} \in A_{i}^{i}$. Assume $n>0$. Then $x_{n}$ is in the kernel of $d_{A_{n}^{\prime}}^{n}$ and maps to zero in the cohomology of $A_{n-1}^{\bullet}$ (because it maps to an element which is the boundary of $x_{n-1}$ up to sign). The condition on exactness of kernels of differentials implies that the cohomology class of $x_{n}$ is in the image of $H^{n}\left(A_{n+1}^{\bullet}\right) \rightarrow H^{n}\left(A_{n}^{\bullet}\right)$ (details omitted). Thus we can modify $x$ by a boundary and reach the situation where $x_{n}$ is a boundary. Modifying $x$ once more we see that we may assume $x_{n}=0$. By induction we see that every cohomology class $\xi$ is represented by a cocycle $x=x_{0}$. Finally, the condition on exactness of kernels tells us two such cocycles $x_{0}$ and $x_{0}^{\prime}$ are cohomologous if and only if their image in $H^{0}\left(M^{\bullet}\right)$ are the same.

09J0 Lemma 12.22.10. Let $M^{\bullet}$ be a complex of abelian groups. Let

$$
0 \rightarrow M^{\bullet} \rightarrow A_{0}^{\bullet} \rightarrow A_{1}^{\bullet} \rightarrow A_{2}^{\bullet} \rightarrow \ldots
$$

be an exact complex of complexes of abelian groups such that for all $p \in \mathbf{Z}$ the complexes

$$
0 \rightarrow \operatorname{Coker}\left(d_{M \bullet}^{p}\right) \rightarrow \operatorname{Coker}\left(d_{A_{0}}^{p}\right) \rightarrow \operatorname{Coker}\left(d_{A_{1}}^{p}\right) \rightarrow \operatorname{Coker}\left(d_{A_{2}^{\bullet}}^{p}\right) \rightarrow \ldots
$$

are exact as well. Set $A^{p, q}=A_{p}^{q}$ to obtain a double complex. Let $\operatorname{Tot}_{\pi}\left(A^{\bullet \bullet \bullet}\right)$ be the product total complex associated to the double complex (see proof). Then the map $M^{\bullet} \rightarrow \operatorname{Tot}_{\pi}\left(A^{\bullet \bullet}\right)$ induced by $M^{\bullet} \rightarrow A_{0}^{\bullet}$ is a quasi-isomorphism.

Proof. Abbreviating $T^{\bullet}=\operatorname{Tot}_{\pi}\left(A^{\bullet \bullet \bullet}\right)$ we define

$$
T^{n}=\prod_{p+q=n} A^{p, q}=\prod_{p+q=n} A_{p}^{q}
$$

As differential we use

$$
\mathrm{d}\left(\left(x_{p, q}\right)\right)=\left(f_{p}\left(x_{p-1, q}\right)+(-1)^{p} \mathrm{~d}_{A_{p}^{\bullet}}\left(x_{p, q-1}\right)\right)
$$

Let $x \in \operatorname{Ker}\left(\mathrm{~d}_{T}^{0} \bullet\right)$ represent a cohomology class $\xi \in H^{0}\left(T^{\bullet}\right)$. Write $x=\left(x_{i}\right)$ with $x_{i} \in A_{i}^{-i}$. Note that $x_{0}$ maps to zero in $\operatorname{Coker}\left(A_{1}^{-1} \rightarrow A_{1}^{0}\right)$. Hence we see that $x_{0}=m_{0}+\mathrm{d}(y)$ for some $m_{0} \in M^{0}$. Then $\mathrm{d}\left(m_{0}\right)=0$ because $\mathrm{d}\left(x_{0}\right)=0$ as $x$ is a cocycle. Thus, replacing $\xi$ by something in the image of $H^{0}\left(M^{\bullet}\right) \rightarrow H^{0}\left(T^{\bullet}\right)$ we may assume that $x_{0}$ is in the image of $\mathrm{d}: A_{0}^{-1} \rightarrow A_{0}^{0}$.

Assume $x_{0} \in \operatorname{Im}\left(A_{0}^{-1} \rightarrow A_{0}^{0}\right)$. We claim that in this case $\xi=0$. To prove this we find, by induction on $n$ elements $y_{1}, \ldots, y_{n}$ with $y_{i} \in A_{i}^{-i-1}$ such that $x_{0}=\mathrm{d}\left(y_{0}\right)$ and $x_{j}=f_{j-1}\left(y_{j-1}\right)+(-1)^{j} \mathrm{~d}\left(y_{j}\right)$. This is clear for $n=0$. Proof of induction step is omitted. Taking $y=\left(y_{i}\right)$ we find that $\mathrm{d}(y)=\xi$.

This shows that $H^{0}\left(M^{\bullet}\right) \rightarrow H^{0}\left(T^{\bullet}\right)$ is surjective. We omit the proof of injectivity.

### 12.23. Injectives

 injective if for every injection $A \hookrightarrow B$ and every morphism $A \rightarrow J$ there exists amorphism $B \rightarrow J$ making the following diagram commute

Here is the obligatory characterization of injective objects.
0136 Lemma 12.23.2. Let $\mathcal{A}$ be an abelian category. Let $I$ be an object of $\mathcal{A}$. The following are equivalent:
(1) The object I is injective.
(2) The functor $B \mapsto \operatorname{Hom}_{\mathcal{A}}(B, I)$ is exact.
(3) Any short exact sequence

$$
0 \rightarrow I \rightarrow A \rightarrow B \rightarrow 0
$$

in $\mathcal{A}$ is split.
(4) We have $\operatorname{Ext}_{\mathcal{A}}(B, I)=0$ for all $B \in \operatorname{Ob}(\mathcal{A})$.

Proof. Omitted.
0137 Lemma 12.23.3. Let $\mathcal{A}$ be an abelian category. Suppose $I_{\omega}, \omega \in \Omega$ is a set of injective objects of $\mathcal{A}$. If $\prod_{\omega \in \Omega} I_{\omega}$ exists then it is injective.
Proof. Omitted.
0138 Definition 12.23.4. Let $\mathcal{A}$ be an abelian category. We say $\mathcal{A}$ has enough injectives if every object $A$ has an injective morphism $A \rightarrow J$ into an injective object $J$.

0139 Definition 12.23.5. Let $\mathcal{A}$ be an abelian category. We say that $\mathcal{A}$ has functorial injective embeddings if there exists a functor

$$
J: \mathcal{A} \longrightarrow \operatorname{Arrows}(\mathcal{A})
$$

such that
(1) $s \circ J=\operatorname{id}_{\mathcal{A}}$,
(2) for any object $A \in \operatorname{Ob}(\mathcal{A})$ the morphism $J(A)$ is injective, and
(3) for any object $A \in \operatorname{Ob}(\mathcal{A})$ the object $t(J(A))$ is an injective object of $\mathcal{A}$. We will denote such a functor by $A \mapsto(A \rightarrow J(A))$.

### 12.24. Projectives

## 013A

013B Definition 12.24.1. Let $\mathcal{A}$ be an abelian category. An object $P \in \operatorname{Ob}(\mathcal{A})$ is called projective if for every surjection $A \rightarrow B$ and every morphism $P \rightarrow B$ there exists a morphism $P \rightarrow A$ making the following diagram commute

Here is the obligatory characterization of projective objects.
013C Lemma 12.24.2. Let $\mathcal{A}$ be an abelian category. Let $P$ be an object of $\mathcal{A}$. The following are equivalent:
(1) The object $P$ is projective.
(2) The functor $B \mapsto \operatorname{Hom}_{\mathcal{A}}(P, B)$ is exact.
(3) Any short exact sequence

$$
0 \rightarrow A \rightarrow B \rightarrow P \rightarrow 0
$$

in $\mathcal{A}$ is split.
(4) We have $\operatorname{Ext}_{\mathcal{A}}(P, A)=0$ for all $A \in \operatorname{Ob}(\mathcal{A})$.

Proof. Omitted.
013D Lemma 12.24.3. Let $\mathcal{A}$ be an abelian category. Suppose $P_{\omega}, \omega \in \Omega$ is a set of projective objects of $\mathcal{A}$. If $\coprod_{\omega \in \Omega} P_{\omega}$ exists then it is projective.
Proof. Omitted.
013 E Definition 12.24.4. Let $\mathcal{A}$ be an abelian category. We say $\mathcal{A}$ has enough projectives if every object $A$ has an surjective morphism $P \rightarrow A$ from an projective object $P$ onto it.

013 F Definition 12.24.5. Let $\mathcal{A}$ be an abelian category. We say that $\mathcal{A}$ has functorial projective surjections if there exists a functor

$$
P: \mathcal{A} \longrightarrow \operatorname{Arrows}(\mathcal{A})
$$

such that
(1) $t \circ J=\operatorname{id}_{\mathcal{A}}$,
(2) for any object $A \in \operatorname{Ob}(\mathcal{A})$ the morphism $P(A)$ is surjective, and
(3) for any object $A \in \operatorname{Ob}(\mathcal{A})$ the object $s(P(A))$ is an projective object of $\mathcal{A}$.
We will denote such a functor by $A \mapsto(P(A) \rightarrow A)$.

### 12.25. Injectives and adjoint functors

015 Y Here are some lemmas on adjoint functors and their relationship with injectives. See also Lemma 12.7.3.
$015 Z$ Lemma 12.25.1. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $u: \mathcal{A} \rightarrow \mathcal{B}$ and $v: \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume
(1) $u$ is right adjoint to $v$, and
(2) $v$ transforms injective maps into injective maps.

Then $u$ transforms injectives into injectives.
Proof. Let $I$ be an injective object of $\mathcal{A}$. Let $\varphi: N \rightarrow M$ be an injective map in $\mathcal{B}$ and let $\alpha: N \rightarrow u I$ be a morphism. By adjointness we get a morphism $\alpha: v N \rightarrow I$ and by assumption $v \varphi: v N \rightarrow v M$ is injective. Hence as $I$ is an injective object we get a morphism $\beta: v M \rightarrow I$ extending $\alpha$. By adjointness again this corresponds to a morphism $\beta: M \rightarrow u I$ as desired.

03B8 Remark 12.25.2. Let $\mathcal{A}, \mathcal{B}, u: \mathcal{A} \rightarrow \mathcal{B}$ and $v: \mathcal{B} \rightarrow \mathcal{A}$ be as in Lemma 12.25.1. In the presence of assumption (1) assumption (2) is equivalent to requiring that $v$ is exact. Moreover, condition (2) is necessary. Here is an example. Let $A \rightarrow B$ be a ring map. Let $u: \operatorname{Mod}_{B} \rightarrow \operatorname{Mod}_{A}$ be $u(N)=N_{A}$ and let $v: \operatorname{Mod}_{A} \rightarrow \operatorname{Mod}_{B}$ be $v(M)=M \otimes_{A} B$. Then $u$ is right adjoint to $v$, and $u$ is exact and $v$ is right exact, but $v$ does not transform injective maps into injective maps in general (i.e., $v$ is
not left exact). Moreover, it is not the case that $u$ transforms injective $B$-modules into injective $A$-modules. For example, if $A=\mathbf{Z}$ and $B=\mathbf{Z} / p \mathbf{Z}$, then the injective $B$-module $\mathbf{Z} / p \mathbf{Z}$ is not an injective $\mathbf{Z}$-module. In fact, the lemma applies to this example if and only if the ring map $A \rightarrow B$ is flat.
0160 Lemma 12.25.3. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $u: \mathcal{A} \rightarrow \mathcal{B}$ and $v: \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume
(1) $u$ is right adjoint to $v$,
(2) $v$ transforms injective maps into injective maps,
(3) $\mathcal{A}$ has enough injectives, and
(4) $v B=0$ implies $B=0$ for any $B \in \operatorname{Ob}(\mathcal{B})$.

Then $\mathcal{B}$ has enough injectives.
Proof. Pick $B \in \operatorname{Ob}(\mathcal{B})$. Pick an injection $v B \rightarrow I$ for $I$ an injective object of $\mathcal{A}$. According to Lemma 12.25 .1 and the assumptions the corresponding map $B \rightarrow u I$ is the injection of $B$ into an injective object.

03B9 Remark 12.25.4. Let $\mathcal{A}, \mathcal{B}, u: \mathcal{A} \rightarrow \mathcal{B}$ and $v: \mathcal{B} \rightarrow \mathcal{A}$ be as In Lemma 12.25 .3 . In the presence of conditions (1) and (2) condition (4) is equivalent to $v$ being faithful. Moreover, condition (4) is needed. An example is to consider the case where the functors $u$ and $v$ are both the zero functor.

0161 Lemma 12.25.5. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $u: \mathcal{A} \rightarrow \mathcal{B}$ and $v: \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume
(1) $u$ is right adjoint to $v$,
(2) $v$ transforms injective maps into injective maps,
(3) $\mathcal{A}$ has enough injectives,
(4) $v B=0$ implies $B=0$ for any $B \in \operatorname{Ob}(\mathcal{B})$, and
(5) $\mathcal{A}$ has functorial injective hulls.

Then $\mathcal{B}$ has functorial injective hulls.
Proof. Let $A \mapsto(A \rightarrow J(A))$ be a functorial injective hull on $\mathcal{A}$. Then $B \mapsto(B \rightarrow$ $u J(v B)$ ) is a functorial injective hull on $\mathcal{B}$. Compare with the proof of Lemma 12.25 .3 .

0793 Lemma 12.25.6. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $u: \mathcal{A} \rightarrow \mathcal{B}$ be a functor. If there exists a subset $\mathcal{P} \subset \mathrm{Ob}(\mathcal{B})$ such that
(1) every object of $\mathcal{B}$ is a quotient of an element of $\mathcal{P}$, and
(2) for every $P \in \mathcal{P}$ there exists an object $Q$ of $\mathcal{A}$ such that $\operatorname{Hom}_{\mathcal{A}}(Q, A)=$ $\operatorname{Hom}_{\mathcal{B}}(P, u(A))$ functorially in $A$,
then there exists a left adjoint $v$ of $u$.
Proof. By the Yoneda lemma (Categories, Lemma 4.3.5) the object $Q$ of $\mathcal{A}$ corresponding to $P$ is defined up to unique isomorphism by the formula $\operatorname{Hom}_{\mathcal{A}}(Q, A)=$ $\operatorname{Hom}_{\mathcal{B}}(P, u(A))$. Let us write $Q=v(P)$. Denote $i_{P}: P \rightarrow u(v(P))$ the map corresponding to $\operatorname{id}_{v(P)}$ in $\operatorname{Hom}_{\mathcal{A}}(v(P), v(P))$. Functoriality in (2) implies that the bijection is given by

$$
\operatorname{Hom}_{\mathcal{A}}(v(P), A) \rightarrow \operatorname{Hom}_{\mathcal{B}}(P, u(A)), \quad \varphi \mapsto u(\varphi) \circ i_{P}
$$

For any pair of elements $P_{1}, P_{2} \in \mathcal{P}$ there is a canonical map

$$
\operatorname{Hom}_{\mathcal{B}}\left(P_{2}, P_{1}\right) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(v\left(P_{2}\right), v\left(P_{1}\right)\right), \quad \varphi \mapsto v(\varphi)
$$

which is characterized by the rule $u(v(\varphi)) \circ i_{P_{2}}=i_{P_{1}} \circ \varphi$ in $\operatorname{Hom}_{\mathcal{B}}\left(P_{2}, u\left(v\left(P_{1}\right)\right)\right)$. Note that $\varphi \mapsto v(\varphi)$ is compatible with composition; this can be seen directly from the characterization. Hence $P \mapsto v(P)$ is a functor from the full subcategory of $\mathcal{B}$ whose objects are the elements of $\mathcal{P}$.
Given an arbitrary object $B$ of $\mathcal{B}$ choose an exact sequence

$$
P_{2} \rightarrow P_{1} \rightarrow B \rightarrow 0
$$

which is possible by assumption (1). Define $v(B)$ to be the object of $\mathcal{A}$ fitting into the exact sequence

$$
v\left(P_{2}\right) \rightarrow v\left(P_{1}\right) \rightarrow v(B) \rightarrow 0
$$

Then

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{A}}(v(B), A) & =\operatorname{Ker}\left(\operatorname{Hom}_{\mathcal{A}}\left(v\left(P_{1}\right), A\right) \rightarrow \operatorname{Hom}_{\mathcal{A}}\left(v\left(P_{2}\right), A\right)\right) \\
& =\operatorname{Ker}\left(\operatorname{Hom}_{\mathcal{B}}\left(P_{1}, u(A)\right) \rightarrow \operatorname{Hom}_{\mathcal{B}}\left(P_{2}, u(A)\right)\right) \\
& =\operatorname{Hom}_{\mathcal{B}}(B, u(A))
\end{aligned}
$$

Hence we see that we may take $\mathcal{P}=\operatorname{Ob}(\mathcal{B})$, i.e., we see that $v$ is everywhere defined.

### 12.26. Essentially constant systems

0A2D In this section we discuss essentially constant systems with values in additive categories.
0A2E Lemma 12.26.1. Let $\mathcal{I}$ be a category, let $\mathcal{A}$ be a pre-additive Karoubian category, and let $M: \mathcal{I} \rightarrow \mathcal{A}$ be a diagram.
(1) Assume $\mathcal{I}$ is filtered. The following are equivalent
(a) $M$ is essentially constant,
(b) $X=$ colim $M$ exists and there exists a cofinal filtered subcategory $\mathcal{I}^{\prime} \subset \mathcal{I}$ and for $i^{\prime} \in \mathrm{Ob}\left(\mathcal{I}^{\prime}\right)$ a direct sum decomposition $M_{i^{\prime}}=X_{i^{\prime}} \oplus Z_{i^{\prime}}$ such that $X_{i^{\prime}}$ maps isomorphically to $X$ and $Z_{i^{\prime}}$ to zero in $M_{i^{\prime \prime}}$ for some $i^{\prime} \rightarrow i^{\prime \prime}$ in $\mathcal{I}^{\prime}$.
(2) Assume $\mathcal{I}$ is cofiltered. The following are equivalent
(a) $M$ is essentially constant,
(b) $X=\lim M$ exists and there exists an initial cofiltered subcategory $\mathcal{I}^{\prime} \subset \mathcal{I}$ and for $i^{\prime} \in \mathrm{Ob}\left(\mathcal{I}^{\prime}\right)$ a direct sum decomposition $M_{i^{\prime}}=X_{i^{\prime}} \oplus Z_{i^{\prime}}$ such that $X$ maps isomorphically to $X_{i^{\prime}}$ and $M_{i^{\prime \prime}} \rightarrow Z_{i^{\prime}}$ is zero for some $i^{\prime \prime} \rightarrow i^{\prime}$ in $\mathcal{I}^{\prime}$.

Proof. Assume (1)(a), i.e., $\mathcal{I}$ is filtered and $M$ is essentially constant. Let $X=$ $\operatorname{colim} M_{i}$. Choose $i$ and $X \rightarrow M_{i}$ as in Categories, Definition 4.22.1. Let $\mathcal{I}^{\prime}$ be the full subcategory consisting of objects which are the target of a morphism with source $i$. Suppose $i^{\prime} \in \operatorname{Ob}\left(\mathcal{I}^{\prime}\right)$ and choose a morphism $i \rightarrow i^{\prime}$. Then $X \rightarrow M_{i} \rightarrow M_{i^{\prime}}$ composed with $M_{i^{\prime}} \rightarrow X$ is the identity on $X$. As $\mathcal{A}$ is Karoubian, we find a direct summand decomposition $M_{i^{\prime}}=X_{i^{\prime}} \oplus Z_{i^{\prime}}$, where $Z_{i^{\prime}}=\operatorname{Ker}\left(M_{i^{\prime}} \rightarrow X\right)$ and $X_{i^{\prime}}$ maps isomorphically to $X$. Pick $i \rightarrow k$ and $i^{\prime} \rightarrow k$ such that $M_{i^{\prime}} \rightarrow X \rightarrow M_{i} \rightarrow M_{k}$ equals $M_{i^{\prime}} \rightarrow M_{k}$ as in Categories, Definition 4.22.1. Then we see that $M_{i^{\prime}} \rightarrow M_{k}$ annihilates $Z_{i^{\prime}}$. Thus (1)(b) holds.
Assume (1)(b), i.e., $\mathcal{I}$ is filtered and we have $\mathcal{I}^{\prime} \subset \mathcal{I}$ and for $i^{\prime} \in \operatorname{Ob}\left(\mathcal{I}^{\prime}\right)$ a direct sum decomposition $M_{i^{\prime}}=X_{i^{\prime}} \oplus Z_{i^{\prime}}$ as stated in the lemma. To see that $M$ is essentially
constant we can replace $\mathcal{I}$ by $\mathcal{I}^{\prime}$, see Categories, Lemmas 4.22.8 and 4.17.2. Pick any $i \in \operatorname{Ob}(\mathcal{I})$ and denote $X \rightarrow M_{i}$ the inverse of the isomorphism $X_{i} \rightarrow X$ followed by the inclusion map $X_{i} \rightarrow M_{i}$. If $j$ is a second object, then choose $j \rightarrow k$ such that $Z_{j} \rightarrow M_{k}$ is zero. Since $\mathcal{I}$ is filtered we may also assume there is a morphism $i \rightarrow k$ (after possibly increasing $k$ ). Then $M_{j} \rightarrow X \rightarrow M_{i} \rightarrow M_{k}$ and $M_{j} \rightarrow M_{k}$ both annihilate $Z_{j}$. Thus after postcomposing by a morphism $M_{k} \rightarrow M_{l}$ which annihilates the summand $Z_{k}$, we find that $M_{j} \rightarrow X \rightarrow M_{i} \rightarrow M_{l}$ and $M_{j} \rightarrow M_{l}$ are equal, i.e., $M$ is essentially constant.

The proof of (2) is dual.
0A2F Lemma 12.26.2. Let $\mathcal{I}$ be a category. Let $\mathcal{A}$ be an additive, Karoubian category. Let $F: \mathcal{I} \rightarrow \mathcal{A}$ and $G: \mathcal{I} \rightarrow \mathcal{A}$ be functors. The following are equivalent
(1) $\operatorname{colim}_{\mathcal{I}} F \oplus G$ exists, and
(2) $\operatorname{colim}_{\mathcal{I}} F$ and $\operatorname{colim}_{\mathcal{I}} G$ exist.

In this case $\operatorname{colim}_{\mathcal{I}} F \oplus G=\operatorname{colim}_{\mathcal{I}} F \oplus \operatorname{colim}_{\mathcal{I}} G$.
Proof. Assume (1) holds. Set $W=\operatorname{colim}_{\mathcal{I}} F \oplus G$. Note that the projection onto $F$ defines natural tranformation $F \oplus G \rightarrow F \oplus G$ which is idempotent. Hence we obtain an idempotent endomorphism $W \rightarrow W$ by Categories, Lemma 4.14.7. Since $\mathcal{A}$ is Karoubian we get a corresponding direct sum decomposition $W=X \oplus Y$, see Lemma 12.4.2. A straightforward argument (omitted) shows that $X=\operatorname{colim}_{\mathcal{I}} F$ and $Y=\operatorname{colim}_{\mathcal{I}} G$. Thus (2) holds. We omit the proof that (2) implies (1).

0A2G Lemma 12.26.3. Let $\mathcal{I}$ be a filtered category. Let $\mathcal{A}$ be an additive, Karoubian category. Let $F: \mathcal{I} \rightarrow \mathcal{A}$ and $G: \mathcal{I} \rightarrow \mathcal{A}$ be functors. The following are equivalent
(1) $F \oplus G: \mathcal{I} \rightarrow \mathcal{A}$ is essentially constant, and
(2) $F$ and $G$ are essentially constant.

Proof. Assume (1) holds. In particular $W=\operatorname{colim}_{\mathcal{I}} F \oplus G$ exists and hence by Lemma 12.26 .2 we have $W=X \oplus Y$ with $X=\operatorname{colim}_{\mathcal{I}} F$ and $Y=\operatorname{colim}_{\mathcal{I}} G$. A straightforward argument (omitted) using for example the characterization of Categories, Lemma 4.22 .6 shows that $F$ is essentially constant with value $X$ and $G$ is essentially constant with value $Y$. Thus (2) holds. The proof that (2) implies (1) is omitted.

### 12.27. Inverse systems

02 MY Let $\mathcal{C}$ be a category. In Categories, Section 4.21 we defined the notion of an inverse system over a partially ordered set (with values in the category $\mathcal{C}$ ). If the partially ordered set is $\mathbf{N}=\{1,2,3, \ldots\}$ with the usual ordering such an inverse system over $\mathbf{N}$ is often simply called an inverse system. It consists quite simply of a pair $\left(M_{i}, f_{i i^{\prime}}\right)$ where each $M_{i}, i \in \mathbf{N}$ is an object of $\mathcal{C}$, and for each $i>i^{\prime}, i, i^{\prime} \in \mathbf{N}$ a morphism $f_{i i^{\prime}}: M_{i} \rightarrow M_{i^{\prime}}$ such that moreover $f_{i^{\prime} i^{\prime \prime}} \circ f_{i i^{\prime}}=f_{i i^{\prime \prime}}$ whenever this makes sense. It is clear that in fact it suffices to give the morphisms $M_{2} \rightarrow M_{1}$, $M_{3} \rightarrow M_{2}$, and so on. Hence an inverse system is frequently pictured as follows

$$
M_{1} \stackrel{\varphi_{2}}{\leftrightarrows} M_{2} \stackrel{\varphi_{3}}{\leftrightarrows} M_{3} \leftarrow \ldots
$$

Moreover, we often omit the transition maps $\varphi_{i}$ from the notation and we simply say "let $\left(M_{i}\right)$ be an inverse system".

The collection of all inverse systems with values in $\mathcal{C}$ forms a category with the obvious notion of morphism.
02MZ Lemma 12.27.1. Let $\mathcal{C}$ be a category.
(1) If $\mathcal{C}$ is an additive category, then the category of inverse systems with values in $\mathcal{C}$ is an additive cateogry.
(2) If $\mathcal{C}$ is an abelian category, then the category of inverse systems with values in $\mathcal{C}$ is an abelian cateogry. A sequence $\left(K_{i}\right) \rightarrow\left(L_{i}\right) \rightarrow\left(M_{i}\right)$ of inverse systems is exact if and only if each $K_{i} \rightarrow L_{i} \rightarrow N_{i}$ is exact.
Proof. Omitted.
The limit (see Categories, Section 4.21) of such an inverse system is denoted $\lim M_{i}$, or $\lim _{i} M_{i}$. If $\mathcal{C}$ is the category of abelian groups (or sets), then the limit always exists and in fact can be described as follows

$$
\lim _{i} M_{i}=\left\{\left(x_{i}\right) \in \prod M_{i} \mid \varphi_{i}\left(x_{i}\right)=x_{i-1}, i=2,3, \ldots\right\}
$$

see Categories, Section 4.15. However, given a short exact sequence

$$
0 \rightarrow\left(A_{i}\right) \rightarrow\left(B_{i}\right) \rightarrow\left(C_{i}\right) \rightarrow 0
$$

of inverse systems of abelian groups it is not always the case that the associated system of limits is exact. In order to discuss this further we introduce the following notion.

02N0 Definition 12.27.2. Let $\mathcal{C}$ be an abelian category. We say the inverse system $\left(A_{i}\right)$ satisfies the Mittag-Leffler condition, or for short is $M L$, if for every $i$ there exists a $c=c(i) \geq i$ such that

$$
\operatorname{Im}\left(A_{k} \rightarrow A_{i}\right)=\operatorname{Im}\left(A_{c} \rightarrow A_{i}\right)
$$

for all $k \geq c$.
It turns out that the Mittag-Leffler condition is good enough to ensure that the limfunctor is exact, provided one works within the abelian category of abelian groups, or abelian sheaves, etc. It is shown in a paper by A. Neeman (see Nee02]) that this condition is not strong enough in a general abelian category (where limits of inverse systems exist).
02N1 Lemma 12.27.3. Let

$$
0 \rightarrow\left(A_{i}\right) \rightarrow\left(B_{i}\right) \rightarrow\left(C_{i}\right) \rightarrow 0
$$

be a short exact sequence of inverse systems of abelian groups.
(1) In any case the sequence

$$
0 \rightarrow \lim _{i} A_{i} \rightarrow \lim _{i} B_{i} \rightarrow \lim _{i} C_{i}
$$

is exact.
(2) If $\left(B_{i}\right)$ is $M L$, then also $\left(C_{i}\right)$ is $M L$.
(3) If $\left(A_{i}\right)$ is $M L$, then

$$
0 \rightarrow \lim _{i} A_{i} \rightarrow \lim _{i} B_{i} \rightarrow \lim _{i} C_{i} \rightarrow 0
$$

is exact.
Proof. Nice exercise. See Algebra, Lemma 10.86.1 for part (3).

070B Lemma 12.27.4. Let

$$
\left(A_{i}\right) \rightarrow\left(B_{i}\right) \rightarrow\left(C_{i}\right) \rightarrow\left(D_{i}\right)
$$

be an exact sequence of inverse systems of abelian groups. If the system $\left(A_{i}\right)$ is $M L$, then the sequence

$$
\lim _{i} B_{i} \rightarrow \lim _{i} C_{i} \rightarrow \lim _{i} D_{i}
$$

is exact.
Proof. Let $Z_{i}=\operatorname{Ker}\left(C_{i} \rightarrow D_{i}\right)$ and $I_{i}=\operatorname{Im}\left(A_{i} \rightarrow B_{i}\right)$. Then $\lim Z_{i}=\operatorname{Ker}\left(\lim C_{i} \rightarrow\right.$ $\left.\lim D_{i}\right)$ and we get a short exact sequence of systems

$$
0 \rightarrow\left(I_{i}\right) \rightarrow\left(B_{i}\right) \rightarrow\left(Z_{i}\right) \rightarrow 0
$$

Moreover, by Lemma 12.27 .3 we see that $\left(I_{i}\right)$ has (ML), thus another application of Lemma 12.27 .3 shows that $\lim B_{i} \rightarrow \lim Z_{i}$ is surjective which proves the lemma.

The following characterization of essentially constant inverse systems shows in particular that they have ML.

070C Lemma 12.27.5. Let $\mathcal{A}$ be an abelian category. Let $\left(A_{i}\right)$ be an inverse system in $\mathcal{A}$ with limit $A=\lim A_{i}$. Then $\left(A_{i}\right)$ is essentially constant (see Categories, Definition 4.22.1) if and only if there exists an $i$ and for all $j \geq i$ a direct sum decomposition $A_{j}=A \oplus Z_{j}$ such that (a) the maps $A_{j^{\prime}} \rightarrow A_{j}$ are compatible with the direct sum decompositions, (b) for all $j$ there exists some $j^{\prime} \geq j$ such that $Z_{j^{\prime}} \rightarrow Z_{j}$ is zero.
Proof. Assume $\left(A_{i}\right)$ is essentially constant. Then there exists an $i$ and a morphism $A_{i} \rightarrow A$ such that for all $j \geq i$ there exists a $j^{\prime} \geq j$ such that $A_{j^{\prime}} \rightarrow A_{j}$ factors as $A_{j^{\prime}} \rightarrow A_{i} \rightarrow A \rightarrow A_{j}$ (the last map comes from $A=\lim A_{i}$ ). Hence setting $Z_{j}=\operatorname{Ker}\left(A_{j} \rightarrow A\right)$ for all $j \geq i$ works. Proof of the converse is omitted.

070D Lemma 12.27.6. Let

$$
0 \rightarrow\left(A_{i}\right) \rightarrow\left(B_{i}\right) \rightarrow\left(C_{i}\right) \rightarrow 0
$$

be an exact sequence of inverse systems of abelian groups. If $\left(A_{i}\right)$ has ML and $\left(C_{i}\right)$ is essentially constant, then $\left(B_{i}\right)$ has $M L$.
Proof. After renumbering we may assume that $C_{i}=C \oplus Z_{i}$ compatible with transition maps and that for all $i$ there exists an $i^{\prime} \geq i$ such that $Z_{i^{\prime}} \rightarrow Z_{i}$ is zero, see Lemma 12.27.5. Pick $i$. Let $c \geq i$ by an integer such that $\operatorname{Im}\left(A_{c} \rightarrow A\right)=$ $\operatorname{Im}\left(A_{i^{\prime}} \rightarrow A_{i}\right)$ for all $i^{\prime} \geq c$. Let $c^{\prime} \geq c$ be an integer such that $Z_{c^{\prime}} \rightarrow Z_{c}$ is zero. For $i^{\prime} \geq c^{\prime}$ consider the maps

Because $Z_{c^{\prime}} \rightarrow Z_{c}$ is zero the image $\operatorname{Im}\left(B_{c^{\prime}} \rightarrow B_{c}\right)$ is an extension $C$ by a subgroup $A^{\prime} \subset A_{c}$ which contains the image of $A_{c^{\prime}} \rightarrow A_{c}$. Hence $\operatorname{Im}\left(B_{c^{\prime}} \rightarrow B_{i}\right)$ is an extension of $C$ by the image of $A^{\prime}$ which is the image of $A_{c} \rightarrow A_{i}$ by our choice of c. In exactly the same way one shows that $\operatorname{Im}\left(B_{i^{\prime}} \rightarrow B_{i}\right)$ is an extension of $C$ by the image of $A_{c} \rightarrow A_{i}$. Hence $\operatorname{Im}\left(B_{c^{\prime}} \rightarrow B_{i}\right)=\operatorname{Im}\left(B_{i^{\prime}} \rightarrow B_{i}\right)$ and we win.

The "correct" version of the following lemma is More on Algebra, Lemma 15.68 .2 .
070E Lemma 12.27.7. Let

$$
\left(A_{i}^{-2} \rightarrow A_{i}^{-1} \rightarrow A_{i}^{0} \rightarrow A_{i}^{1}\right)
$$

be an inverse system of complexes of abelian groups and denote $A^{-2} \rightarrow A^{-1} \rightarrow$ $A^{0} \rightarrow A^{1}$ its limit. Denote $\left(H_{i}^{-1}\right)$, $\left(H_{i}^{0}\right)$ the inverse systems of cohomologies, and denote $H^{-1}$, $H^{0}$ the cohomologies of $A^{-2} \rightarrow A^{-1} \rightarrow A^{0} \rightarrow A^{1}$. If $\left(A_{i}^{-2}\right)$ and $\left(A_{i}^{-1}\right)$ are $M L$ and $\left(H_{i}^{-1}\right)$ is essentially constant, then $H^{0}=\lim H_{i}^{0}$.
Proof. Let $Z_{i}^{j}=\operatorname{Ker}\left(A_{i}^{j} \rightarrow A_{i}^{j+1}\right)$ and $I_{i}^{j}=\operatorname{Im}\left(A_{i}^{j-1} \rightarrow A_{i}^{j}\right)$. Note that $\lim Z_{i}^{0}=$ $\operatorname{Ker}\left(\lim A_{i}^{0} \rightarrow \lim A_{i}^{1}\right)$ as taking kernels commutes with limits. The systems $\left(I_{i}^{-1}\right)$ and $\left(I_{i}^{0}\right)$ have ML as quotients of the systems $\left(A_{i}^{-2}\right)$ and $\left(A_{i}^{-1}\right)$, see Lemma 12.27.3 Thus an exact sequence

$$
0 \rightarrow\left(I_{i}^{-1}\right) \rightarrow\left(Z_{i}^{-1}\right) \rightarrow\left(H_{i}^{-1}\right) \rightarrow 0
$$

of inverse systems where $\left(I_{i}^{-1}\right)$ has ML and where $\left(H_{i}^{-1}\right)$ is essentially constant by assumption. Hence $\left(Z_{i}^{-1}\right)$ has ML by Lemma 12.27.6. The exact sequence

$$
0 \rightarrow\left(Z_{i}^{-1}\right) \rightarrow\left(A_{i}^{-1}\right) \rightarrow\left(I_{i}^{0}\right) \rightarrow 0
$$

and an application of Lemma 12.27 .3 shows that $\lim A_{i}^{-1} \rightarrow \lim I_{i}^{0}$ is surjective. Finally, the exact sequence

$$
0 \rightarrow\left(I_{i}^{0}\right) \rightarrow\left(Z_{i}^{0}\right) \rightarrow\left(H_{i}^{0}\right) \rightarrow 0
$$

and Lemma 12.27 .3 show that $\lim I_{i}^{0} \rightarrow \lim Z_{i}^{0} \rightarrow \lim H_{i}^{0} \rightarrow 0$ is exact. Putting everything together we win.

Sometimes we need a version of the lemma above where we take limits over big ordinals.

0AAT Lemma 12.27.8. Let $\alpha$ be an ordinal. Let $K_{\beta}^{\bullet}, \beta<\alpha$ be an inverse system of complexes of abelian groups over $\alpha$. If for all $\beta<\alpha$ the complex $K_{\beta}^{\bullet}$ is acyclic and the map

$$
K_{\beta}^{n} \longrightarrow \lim _{\gamma<\beta} K_{\gamma}^{n}
$$

is surjective, then the complex $\lim _{\beta<\alpha} K_{\beta}^{\bullet}$ is acyclic.
Proof. By transfinite induction we prove this holds for every ordinal $\alpha$ and every system as in the lemma. In particular, whilst proving the result for $\alpha$ we may assume the complexes $\lim _{\gamma<\beta} K_{\gamma}^{n}$ are acyclic.
Let $x \in \lim _{\beta<\alpha} K_{\alpha}^{0}$ with $\mathrm{d}(x)=0$. We will find a $y \in K_{\alpha}^{-1}$ with $\mathrm{d}(y)=x$. Write $x=\left(x_{\beta}\right)$ where $x_{\beta} \in K_{\beta}^{0}$ is the image of $x$ for $\beta<\alpha$. We will construct $y=\left(y_{\beta}\right)$ by transfinite induction.
For $\beta=0$ let $y_{0} \in K_{0}^{-1}$ be any element with $\mathrm{d}\left(y_{0}\right)=x_{0}$.
For $\beta=\gamma+1$ a successor, we have to find an element $y_{\beta}$ which maps both to $y_{\gamma}$ by the transition map $f: K_{\beta}^{\bullet} \rightarrow K_{\gamma}^{\bullet}$ and to $x_{\beta}$ under the differential. As a
first approximation we choose $y_{\beta}^{\prime}$ with $\mathrm{d}\left(y_{\beta}^{\prime}\right)=x_{\beta}$. Then the difference $y_{\gamma}-f\left(y_{\beta}^{\prime}\right)$ is in the kernel of the differential, hence equal to $\mathrm{d}\left(z_{\gamma}\right)$ for some $z_{\gamma} \in K_{\gamma}^{-2}$. By assumption, the map $f^{-2}: K_{\beta}^{-2} \rightarrow K_{\gamma}^{-2}$ is surjective. Hence we write $z_{\gamma}=f\left(z_{\beta}\right)$ and change $y_{\beta}^{\prime}$ into $y_{\beta}=y_{\beta}^{\prime}+\mathrm{d}\left(z_{\beta}\right)$ which works.

If $\beta$ is a limit ordinal, then we have the element $\left(y_{\gamma}\right)_{\gamma<\beta}$ in $\lim _{\gamma<\beta} K_{\gamma}^{-1}$ whose differential is the image of $x_{\beta}$. Thus we can argue in exactly the same manner as above using the termwise surjective map of complexes $f: K_{\beta}^{\bullet} \rightarrow \lim _{\gamma<\beta} K_{\gamma}^{\bullet}$ and the fact (see first paragraph of proof) that we may assume $\lim _{\gamma<\beta} K_{\gamma}^{\bullet}$ is acyclic by induction.

### 12.28. Exactness of products

060K Lemma 12.28.1. Let $I$ be a set. For $i \in I$ let $L_{i} \rightarrow M_{i} \rightarrow N_{i}$ be a complex of abelian groups. Let $H_{i}=\operatorname{Ker}\left(M_{i} \rightarrow N_{i}\right) / \operatorname{Im}\left(L_{i} \rightarrow M_{i}\right)$ be the cohomology. Then

$$
\prod^{L_{i}} \rightarrow \prod^{M_{i}} \rightarrow \prod^{N_{i}}
$$

is a complex of abelian groups with homology $\prod H_{i}$.
Proof. Omitted.

## CHAPTER 13

## Derived Categories

05QI

### 13.1. Introduction

05QJ We first discuss triangulated categories and localization in triangulated categories. Next, we prove that the homotopy category of complexes in an additive category is a triangulated category. Once this is done we define the derived category of an abelian category as the localization of the of homotopy category with respect to quasi-isomorphisms. A good reference is Verdier's thesis Ver96.

### 13.2. Triangulated categories

0143 Triangulated categories are a convenient tool to describe the type of structure inherent in the derived category of an abelian category. Some references are $\mathbf{V e r 9 6}$, KS06, and Nee01.

### 13.3. The definition of a triangulated category

05 QK In this section we collect most of the definitions concerning triangulated and pretriangulated categories.
0144 Definition 13.3.1. Let $\mathcal{D}$ be an additive category. Let $[n]: \mathcal{D} \rightarrow \mathcal{D}, E \mapsto E[n]$ be a collection of additive functors indexed by $n \in \mathbf{Z}$ such that $[n] \circ[m]=[n+m]$ and $[0]=$ id (equality as functors). In this situation we define a triangle to be a sextuple $(X, Y, Z, f, g, h)$ where $X, Y, Z \in \mathrm{Ob}(\mathcal{D})$ and $f: X \rightarrow Y, g: Y \rightarrow Z$ and $h: Z \rightarrow X[1]$ are morphisms of $\mathcal{D}$. A morphism of triangles $(X, Y, Z, f, g, h) \rightarrow$ $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)$ is given by morphisms $a: X \rightarrow X^{\prime}, b: Y \rightarrow Y^{\prime}$ and $c: Z \rightarrow Z^{\prime}$ of $\mathcal{D}$ such that $b \circ f=f^{\prime} \circ a, c \circ g=g^{\prime} \circ b$ and $a[1] \circ h=h^{\prime} \circ c$.

A morphism of triangles is visualized by the following commutative diagram

Here is the definition of a triangulated category as given in Verdier's thesis.
0145 Definition 13.3.2. A triangulated category consists of a triple $\left(\mathcal{D},\{[n]\}_{n \in \mathbf{Z}}, \mathcal{T}\right)$ where
(1) $\mathcal{D}$ is an additive category,
(2) $[n]: \mathcal{D} \rightarrow \mathcal{D}, E \mapsto E[n]$ is a collection of additive functors indexed by $n \in \mathbf{Z}$ such that $[n] \circ[m]=[n+m]$ and $[0]=\mathrm{id}$ (equality as functors), and
(3) $\mathcal{T}$ is a set of triangles called the distinguished triangles
subject to the following conditions
TR1 Any triangle isomorphic to a distinguished triangle is a distinguished triangle. Any triangle of the form $(X, X, 0, \mathrm{id}, 0,0)$ is distinguished. For any morphism $f: X \rightarrow Y$ of $\mathcal{D}$ there exists a distinguished triangle of the form $(X, Y, Z, f, g, h)$.
TR2 The triangle $(X, Y, Z, f, g, h)$ is distinguished if and only if the triangle $(Y, Z, X[1], g, h,-f[1])$ is.
TR3 Given a solid diagram

whose rows are distinguished triangles and which satisfies $b \circ f=f^{\prime} \circ a$, there exists a morphism $c: Z \rightarrow Z^{\prime}$ such that $(a, b, c)$ is a morphism of triangles.
TR4 Given objects $X, Y, Z$ of $\mathcal{D}$, and morphisms $f: X \rightarrow Y, g: Y \rightarrow Z$, and distinguished triangles $\left(X, Y, Q_{1}, f, p_{1}, d_{1}\right),\left(X, Z, Q_{2}, g \circ f, p_{2}, d_{2}\right)$, and $\left(Y, Z, Q_{3}, g, p_{3}, d_{3}\right)$, there exist morphisms $a: Q_{1} \rightarrow Q_{2}$ and $b: Q_{2} \rightarrow Q_{3}$ such that
(a) $\left(Q_{1}, Q_{2}, Q_{3}, a, b, p_{1}[1] \circ d_{3}\right)$ is a distinguished triangle,
(b) the triple $\left(\operatorname{id}_{X}, g, a\right)$ is a morphism of triangles $\left(X, Y, Q_{1}, f, p_{1}, d_{1}\right) \rightarrow$ $\left(X, Z, Q_{2}, g \circ f, p_{2}, d_{2}\right)$, and
(c) the triple $\left(f, \mathrm{id}_{Z}, b\right)$ is a morphism of triangles $\left(X, Z, Q_{2}, g \circ f, p_{2}, d_{2}\right) \rightarrow$ $\left(Y, Z, Q_{3}, g, p_{3}, d_{3}\right)$.
We will call $(\mathcal{D},[], \mathcal{T})$ a pre-triangulated category if TR1, TR2 and TR3 hold $\underbrace{1}_{1}$
The explanation of TR4 is that if you think of $Q_{1}$ as $Y / X, Q_{2}$ as $Z / X$ and $Q_{3}$ as $Z / Y$, then TR4(a) expresses the isomorphism $(Z / X) /(Y / X) \cong Z / Y$ and TR4(b) and TR4(c) express that we can compare the triangles $X \rightarrow Y \rightarrow Q_{1} \rightarrow X[1]$ etc with morphisms of triangles. For a more precise reformulation of this idea see the proof of Lemma 13.10 .2 .

The sign in TR2 means that if $(X, Y, Z, f, g, h)$ is a distinguished triangle then in the long sequence

05QL

$$
\begin{equation*}
\ldots \rightarrow Z[-1] \xrightarrow{-h[-1]} X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1] \xrightarrow{-f[1]} Y[1] \xrightarrow{-g[1]} Z[1] \rightarrow \ldots \tag{13.3.2.1}
\end{equation*}
$$

each four term sequence gives a distinguished triangle.
As usual we abuse notation and we simply speak of a (pre-)triangulated category $\mathcal{D}$ without explicitly introducing notation for the additional data. The notion of a pre-triangulated category is useful in finding statements equivalent to TR4.

We have the following definition of a triangulated functor.

[^31]014V Definition 13.3.3. Let $\mathcal{D}, \mathcal{D}^{\prime}$ be pre-triangulated categories. An exact functor, or a triangulated functor from $\mathcal{D}$ to $\mathcal{D}^{\prime}$ is a functor $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ together with given functorial isomorphisms $\xi_{X}: F(X[1]) \rightarrow F(X)[1]$ such that for every distinguished triangle $(X, Y, Z, f, g, h)$ of $\mathcal{D}$ the triangle $\left(F(X), F(Y), F(Z), F(f), F(g), \xi_{X} \circ F(h)\right)$ is a distinguished triangle of $\mathcal{D}^{\prime}$.

An exact functor is additive, see Lemma 13.4.15. When we say two triangulated categories are equivalent we mean that they are equivalent in the 2-category of triangulated categories. A 2-morphism $a:(F, \xi) \rightarrow\left(F^{\prime}, \xi^{\prime}\right)$ in this 2-category is simply a transformation of functors $a: F \rightarrow F^{\prime}$ which is compatible with $\xi$ and $\xi^{\prime}$, i.e.,

commutes.
05QM Definition 13.3.4. Let $(\mathcal{D},[], \mathcal{T})$ be a pre-triangulated category. A pre-triangulated subcategory ${ }^{2}$ is a pair $\left(\mathcal{D}^{\prime}, \mathcal{T}^{\prime}\right)$ such that
(1) $\mathcal{D}^{\prime}$ is an additive subcategory of $\mathcal{D}$ which is preserved under [1] and $[-1]$,
(2) $\mathcal{T}^{\prime} \subset \mathcal{T}$ is a subset such that for every $(X, Y, Z, f, g, h) \in \mathcal{T}^{\prime}$ we have $X, Y, Z \in \operatorname{Ob}\left(\mathcal{D}^{\prime}\right)$ and $f, g, h \in \operatorname{Arrows}\left(\mathcal{D}^{\prime}\right)$, and
(3) $\left(\mathcal{D}^{\prime},[], \mathcal{T}^{\prime}\right)$ is a pre-triangulated category.

If $\mathcal{D}$ is a triangulated category, then we say $\left(\mathcal{D}^{\prime}, \mathcal{T}^{\prime}\right)$ is a triangulated subcategory if it is a pre-triangulated subcategory and $\left(\mathcal{D}^{\prime},[], \mathcal{T}^{\prime}\right)$ is a triangulated category.
In this situation the inclusion functor $\mathcal{D}^{\prime} \rightarrow \mathcal{D}$ is an exact functor with $\xi_{X}: X[1] \rightarrow$ $X[1]$ given by the identity on $X[1]$.

We will see in Lemma 13.4.1 that for a distinguished triangle $(X, Y, Z, f, g, h)$ in a pre-triangulated category the composition $g \circ f: X \rightarrow Z$ is zero. Thus the sequence 13.3.2.1 is a complex. A homological functor is one that turns this complex into a long exact sequence.
0147 Definition 13.3.5. Let $\mathcal{D}$ be a pre-triangulated category. Let $\mathcal{A}$ be an abelian category. An additive functor $H: \mathcal{D} \rightarrow \mathcal{A}$ is called homological if for every distinguished triangle ( $X, Y, Z, f, g, h$ ) the sequence

$$
H(X) \rightarrow H(Y) \rightarrow H(Z)
$$

is exact in the abelian category $\mathcal{A}$. An additive functor $H: \mathcal{D}^{\text {opp }} \rightarrow \mathcal{A}$ is called cohomological if the corresponding functor $\mathcal{D} \rightarrow \mathcal{A}^{\text {opp }}$ is homological.

If $H: \mathcal{D} \rightarrow \mathcal{A}$ is a homological functor we often write $H^{n}(X)=H(X[n])$ so that $H(X)=H^{0}(X)$. Our discussion of TR2 above implies that a distinguished triangle ( $X, Y, Z, f, g, h$ ) determines a long exact sequence

0148

$$
\begin{equation*}
H^{-1}(Z) \xrightarrow{H(h[-1])} H^{0}(X) \xrightarrow{H(f)} H^{0}(Y) \xrightarrow{H(g)} H^{0}(Z) \xrightarrow{H(h)} H^{1}(X) \tag{13.3.5.1}
\end{equation*}
$$

[^32]This will be called the long exact sequence associated to the distinguished triangle and the homological functor. As indicated we will not use any signs for the morphisms in the long exact sequence. This has the side effect that maps in the long exact sequence associated to the rotation (TR2) of a distinguished triangle differ from the maps in the sequence above by some signs.

0150 Definition 13.3.6. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{D}$ be a triangulated category. A $\delta$-functor from $\mathcal{A}$ to $\mathcal{D}$ is given by a functor $G: \mathcal{A} \rightarrow \mathcal{D}$ and a rule which assigns to every short exact sequence

$$
0 \rightarrow A \xrightarrow{a} B \xrightarrow{b} C \rightarrow 0
$$

a morphism $\delta=\delta_{A \rightarrow B \rightarrow C}: G(C) \rightarrow G(A)[1]$ such that
(1) the triangle $\left(G(A), G(B), G(C), G(a), G(b), \delta_{A \rightarrow B \rightarrow C}\right)$ is a distinguished triangle of $\mathcal{D}$ for any short exact sequence as above, and
(2) for every morphism $(A \rightarrow B \rightarrow C) \rightarrow\left(A^{\prime} \rightarrow B^{\prime} \rightarrow C^{\prime}\right)$ of short exact sequences the diagram

is commutative.
In this situation we call $\left(G(A), G(B), G(C), G(a), G(b), \delta_{A \rightarrow B \rightarrow C}\right)$ the image of the short exact sequence under the given $\delta$-functor.

Note how a $\delta$-functor comes equipped with additional structure. Strictly speaking it does not make sense to say that a given functor $\mathcal{A} \rightarrow \mathcal{D}$ is a $\delta$-functor, but we will often do so anyway.

### 13.4. Elementary results on triangulated categories

05QN Most of the results in this section are proved for pre-triangulated categories and a fortiori hold in any triangulated category.

0146 Lemma 13.4.1. Let $\mathcal{D}$ be a pre-triangulated category. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle. Then $g \circ f=0, h \circ g=0$ and $f[1] \circ h=0$.

Proof. By TR1 we know $(X, X, 0,1,0,0)$ is a distinguished triangle. Apply TR3 to

Of course the dotted arrow is the zero map. Hence the commutativity of the diagram implies that $g \circ f=0$. For the other cases rotate the triangle, i.e., apply TR2.

0149 Lemma 13.4.2. Let $\mathcal{D}$ be a pre-triangulated category. For any object $W$ of $\mathcal{D}$ the functor $\operatorname{Hom}_{\mathcal{D}}(W,-)$ is homological, and the functor $\operatorname{Hom}_{\mathcal{D}}(-, W)$ is cohomological.

Proof. Consider a distinguished triangle $(X, Y, Z, f, g, h)$. We have already seen that $g \circ f=0$, see Lemma 13.4.1. Suppose $a: W \rightarrow Y$ is a morphism such that $g \circ a=0$. Then we get a commutative diagram

Both rows are distinguished triangles (use TR1 for the top row). Hence we can fill the dotted arrow $b$ (first rotate using TR2, then apply TR3, and then rotate back). This proves the lemma.
014A Lemma 13.4.3. Let $\mathcal{D}$ be a pre-triangulated category. Let

$$
(a, b, c):(X, Y, Z, f, g, h) \rightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)
$$

be a morphism of distinguished triangles. If two among a,b,c are isomorphisms so is the third.

Proof. Assume that $a$ and $c$ are isomorphisms. For any object $W$ of $\mathcal{D}$ write $H_{W}(-)=\operatorname{Hom}_{\mathcal{D}}(W,-)$. Then we get a commutative diagram of abelian groups

By assumption the right two and left two vertical arrows are bijective. As $H_{W}$ is homological by Lemma 13.4 .2 and the five lemma (Homology, Lemma 12.5.20) it follows that the middle vertical arrow is an isomorphism. Hence by Yoneda's lemma, see Categories, Lemma 4.3.5 we see that $b$ is an isomorphism. This implies the other cases by rotating (using TR2).
09WA Remark 13.4.4. Let $\mathcal{D}$ be an additive category with translation functors $[n]$ as in Definition 13.3.1. Let us call a triangle $(X, Y, Z, f, g, h)$ specia $\}^{3}$ if for every object $W$ of $\mathcal{D}$ the long sequence of abelian groups

$$
\ldots \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, X) \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, Y) \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, Z) \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, X[1]) \rightarrow \ldots
$$

is exact. The proof of Lemma 13.4.3 shows that if

$$
(a, b, c):(X, Y, Z, f, g, h) \rightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)
$$

is a morphism of special triangles and if two among $a, b, c$ are isomorphisms so is the third. There is a dual statement for co-special triangles, i.e., triangles which turn into long exact sequences on applying the functor $\operatorname{Hom}_{\mathcal{D}}(-, W)$. Thus distinguished triangles are special and co-special, but in general there are many more (co-)special triangles, then there are distinguished triangles.

05QP Lemma 13.4.5. Let $\mathcal{D}$ be a pre-triangulated category. Let

$$
(0, b, 0),\left(0, b^{\prime}, 0\right):(X, Y, Z, f, g, h) \rightarrow(X, Y, Z, f, g, h)
$$

be endomorphisms of a distinguished triangle. Then $b b^{\prime}=0$.

[^33]Proof. Picture

Applying Lemma 13.4.2 we find dotted arrows $\alpha$ and $\beta$ such that $b^{\prime}=f \circ \alpha$ and $b=\beta \circ g$. Then $b b^{\prime}=\beta \circ g \circ f \circ \alpha=0$ as $g \circ f=0$ by Lemma 13.4.1.

05QQ Lemma 13.4.6. Let $\mathcal{D}$ be a pre-triangulated category. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle. If

is commutative and $a^{2}=a, c^{2}=c$, then there exists a morphism $b: Y \rightarrow Y$ with $b^{2}=b$ such that $(a, b, c)$ is an endomorphism of the triangle $(X, Y, Z, f, g, h)$.

Proof. By TR3 there exists a morphism $b^{\prime}$ such that $\left(a, b^{\prime}, c\right)$ is an endomorphism of $(X, Y, Z, f, g, h)$. Then $\left(0,\left(b^{\prime}\right)^{2}-b^{\prime}, 0\right)$ is also an endomorphism. By Lemma 13.4.5 we see that $\left(b^{\prime}\right)^{2}-b^{\prime}$ has square zero. Set $b=b^{\prime}-\left(2 b^{\prime}-1\right)\left(\left(b^{\prime}\right)^{2}-b^{\prime}\right)=$ $3\left(b^{\prime}\right)^{2}-2\left(b^{\prime}\right)^{3}$. A computation shows that $(a, b, c)$ is an endomorphism and that $b^{2}-b=\left(4\left(b^{\prime}\right)^{2}-4 b^{\prime}-3\right)\left(\left(b^{\prime}\right)^{2}-b^{\prime}\right)^{2}=0$.

014B Lemma 13.4.7. Let $\mathcal{D}$ be a pre-triangulated category. Let $f: X \rightarrow Y$ be a morphism of $\mathcal{D}$. There exists a distinguished triangle $(X, Y, Z, f, g, h)$ which is unique up to (nonunique) isomorphism of triangles. More precisely, given a second such distinguished triangle $\left(X, Y, Z^{\prime}, f, g^{\prime}, h^{\prime}\right)$ there exists an isomorphism

$$
(1,1, c):(X, Y, Z, f, g, h) \longrightarrow\left(X, Y, Z^{\prime}, f, g^{\prime}, h^{\prime}\right)
$$

Proof. Existence by TR1. Uniqueness up to isomorphism by TR3 and Lemma 13.4.3.

05QR Lemma 13.4.8. Let $\mathcal{D}$ be a pre-triangulated category. Let $f: X \rightarrow Y$ be $a$ morphism of $\mathcal{D}$. The following are equivalent
(1) $f$ is an isomorphism,
(2) $(X, Y, 0, f, 0,0)$ is a distinguished triangle, and
(3) for any distinguished triangle $(X, Y, Z, f, g, h)$ we have $Z=0$.

Proof. By TR1 the triangle ( $X, X, 0,1,0,0$ ) is distinguished. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle. By TR3 there is a map of distinguished triangles $(1, f, 0):(X, X, 0) \rightarrow(X, Y, Z)$. If $f$ is an isomorphism, then $(1, f, 0)$ is an isomorphism of triangles by Lemma 13.4 .3 and $Z=0$. Conversely, if $Z=0$, then $(1, f, 0)$ is an isomorphism of triangles as well, hence $f$ is an isomorphism.

05QS Lemma 13.4.9. Let $\mathcal{D}$ be a pre-triangulated category. Let $(X, Y, Z, f, g, h)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)$ be triangles. The following are equivalent
(1) $\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Z \oplus Z^{\prime}, f \oplus f^{\prime}, g \oplus g^{\prime}, h \oplus h^{\prime}\right)$ is a distinguished triangle,
(2) both $(X, Y, Z, f, g, h)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)$ are distinguished triangles.

Proof. Assume (2). By TR1 we may choose a distinguished triangle ( $X \oplus X^{\prime}, Y \oplus$ $\left.Y^{\prime}, Q, f \oplus f^{\prime}, g^{\prime \prime}, h^{\prime \prime}\right)$. By TR3 we can find morphisms of distinguished triangles $(X, Y, Z, f, g, h) \rightarrow\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Q, f \oplus f^{\prime}, g^{\prime \prime}, h^{\prime \prime}\right)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right) \rightarrow$ $\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Q, f \oplus f^{\prime}, g^{\prime \prime}, h^{\prime \prime}\right)$. Taking the direct sum of these morphisms we obtain a morphism of triangles

$$
\begin{gathered}
\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Z \oplus Z^{\prime}, f \oplus f^{\prime}, g \oplus g^{\prime}, h \oplus h^{\prime}\right) \\
\downarrow(1,1, c) \\
\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Q, f \oplus f^{\prime}, g^{\prime \prime}, h^{\prime \prime}\right)
\end{gathered}
$$

In the terminology of Remark 13.4.4 this is a map of special triangles (because a direct sum of special triangles is special) and we conclude that $c$ is an isomorphism. Thus (1) holds.
Assume (1). We will show that $(X, Y, Z, f, g, h)$ is a distinguished triangle. First observe that ( $X, Y, Z, f, g, h$ ) is a special triangle (terminology from Remark 13.4.4) as a direct summand of the distinguished hence special triangle $\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Z \oplus\right.$ $\left.Z^{\prime}, f \oplus f^{\prime}, g \oplus g^{\prime}, h \oplus h^{\prime}\right)$. Using TR1 let ( $\left.X, Y, Q, f, g^{\prime \prime}, h^{\prime \prime}\right)$ be a distinguished triangle. By TR3 there exists a morphism of distinguished triangles $\left(X \oplus X^{\prime}, Y \oplus Y^{\prime}, Z \oplus\right.$ $\left.Z^{\prime}, f \oplus f^{\prime}, g \oplus g^{\prime}, h \oplus h^{\prime}\right) \rightarrow\left(X, Y, Q, f, g^{\prime \prime}, h^{\prime \prime}\right)$. Composing this with the inclusion map we get a morphism of triangles

$$
(1,1, c):(X, Y, Z, f, g, h) \longrightarrow\left(X, Y, Q, f, g^{\prime \prime}, h^{\prime \prime}\right)
$$

By Remark 13.4 .4 we find that $c$ is an isomorphism and we conclude that (2) holds.

05QT Lemma 13.4.10. Let $\mathcal{D}$ be a pre-triangulated category. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle.
(1) If $h=0$, then there exists a right inverse $s: Z \rightarrow Y$ to $g$.
(2) For any right inverse $s: Z \rightarrow Y$ of $g$ the map $f \oplus s: X \oplus Z \rightarrow Y$ is an isomorphism.
(3) For any objects $X^{\prime}, Z^{\prime}$ of $\mathcal{D}$ the triangle $\left(X^{\prime}, X^{\prime} \oplus Z^{\prime}, Z^{\prime},(1,0),(0,1), 0\right)$ is distinguished.

Proof. To see (1) use that $\operatorname{Hom}_{\mathcal{D}}(Z, Y) \rightarrow \operatorname{Hom}_{\mathcal{D}}(Z, Z) \rightarrow \operatorname{Hom}_{\mathcal{D}}(Z, X[1])$ is exact by Lemma 13.4.2. By the same token, if $s$ is as in (2), then $h=0$ and the sequence

$$
0 \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, X) \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, Y) \rightarrow \operatorname{Hom}_{\mathcal{D}}(W, Z) \rightarrow 0
$$

is split exact (split by $s: Z \rightarrow Y$ ). Hence by Yoneda's lemma we see that $X \oplus Z \rightarrow Y$ is an isomorphism. The last assertion follows from TR1 and Lemma 13.4.9.

05QU Lemma 13.4.11. Let $\mathcal{D}$ be a pre-triangulated category. Let $f: X \rightarrow Y$ be a morphism of $\mathcal{D}$. The following are equivalent
(1) $f$ has a kernel,
(2) f has a cokernel,
(3) $f$ is isomorphic to a map $K \oplus Z \rightarrow Z \oplus Q$ induced by $i d_{Z}$.

Proof. Any morphism isomorphic to a map of the form $X^{\prime} \oplus Z \rightarrow Z \oplus Y^{\prime}$ has both a kernel and a cokernel. Hence $(3) \Rightarrow(1),(2)$. Next we prove (1) $\Rightarrow$ (3). Suppose first that $f: X \rightarrow Y$ is a monomorphism, i.e., its kernel is zero. By TR1 there exists a distinguished triangle $(X, Y, Z, f, g, h)$. By Lemma 13.4.1 the composition
$h[-1] \circ f=0$. As $f$ is a monomorphism we see that $h[-1]=0$ and hence $h=0$. Then Lemma 13.4.10 implies that $Y=X \oplus Z$, i.e., we see that (3) holds. Next, assume $f$ has a kernel $K$. As $K \rightarrow X$ is a monomorphism we conclude $X=K \oplus X^{\prime}$ and $\left.f\right|_{X^{\prime}}: X^{\prime} \rightarrow Y$ is a monomorphism. Hence $Y=X^{\prime} \oplus Y^{\prime}$ and we win. The implication $(2) \Rightarrow(3)$ is dual to this.
05QW Lemma 13.4.12. Let $\mathcal{D}$ be a pre-triangulated category. If $\mathcal{D}$ has countable products, then $\mathcal{D}$ is Karoubian. If $\mathcal{D}$ has countable coproducts, then $\mathcal{D}$ is Karoubian.

Proof. Assume $\mathcal{D}$ has countable products. By Homology, Lemma 12.4.3 it suffices to check that morphisms which have a right inverse have kernels. Any morphism which has a right inverse is an epimorphism, hence has a kernel by Lemma 13.4.11. The second statement is dual to the first.

The following lemma makes it slightly easier to prove that a pre-triangulated category is triangulated.
014C Lemma 13.4.13. Let $\mathcal{D}$ be a pre-triangulated category. In order to prove $T R 4$ it suffices to show that given any pair of composable morphisms $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ there exist
(1) isomorphisms $i: X^{\prime} \rightarrow X, j: Y^{\prime} \rightarrow Y$ and $k: Z^{\prime} \rightarrow Z$, and then setting $f^{\prime}=j^{-1}$ fi: $X^{\prime} \rightarrow Y^{\prime}$ and $g^{\prime}=k^{-1} g j: Y^{\prime} \rightarrow Z^{\prime}$ there exist
(2) distinguished triangles $\left(X^{\prime}, Y^{\prime}, Q_{1}, f^{\prime}, p_{1}, d_{1}\right),\left(X^{\prime}, Z^{\prime}, Q_{2}, g^{\prime} \circ f^{\prime}, p_{2}, d_{2}\right)$ and $\left(Y^{\prime}, Z^{\prime}, Q_{3}, g^{\prime}, p_{3}, d_{3}\right)$, such that the assertion of $T R 4$ holds.

Proof. The replacement of $X, Y, Z$ by $X^{\prime}, Y^{\prime}, Z^{\prime}$ is harmless by our definition of distinguished triangles and their isomorphisms. The lemma follows from the fact that the distinguished triangles $\left(X^{\prime}, Y^{\prime}, Q_{1}, f^{\prime}, p_{1}, d_{1}\right),\left(X^{\prime}, Z^{\prime}, Q_{2}, g^{\prime} \circ f^{\prime}, p_{2}, d_{2}\right)$ and $\left(Y^{\prime}, Z^{\prime}, Q_{3}, g^{\prime}, p_{3}, d_{3}\right)$ are unique up to isomorphism by Lemma 13.4.7.

05QX Lemma 13.4.14. Let $\mathcal{D}$ be a pre-triangulated category. Assume that $\mathcal{D}^{\prime}$ is an additive full subcategory of $\mathcal{D}$. The following are equivalent
(1) there exists a set of triangles $\mathcal{T}^{\prime}$ such that $\left(\mathcal{D}^{\prime}, \mathcal{T}^{\prime}\right)$ is a pre-triangulated subcategory of $\mathcal{D}$,
(2) $\mathcal{D}^{\prime}$ is preserved under $[1],[-1]$ and given any morphism $f: X \rightarrow Y$ in $\mathcal{D}^{\prime}$ there exists a distinguished triangle $(X, Y, Z, f, g, h)$ in $\mathcal{D}$ such that $Z$ is isomorphic to an object of $\mathcal{D}^{\prime}$.
In this case $\mathcal{T}^{\prime}$ is the set of distinguished triangles $(X, Y, Z, f, g, h)$ of $\mathcal{D}$ such that $X, Y, Z \in \operatorname{Ob}\left(\mathcal{D}^{\prime}\right)$ and $f, g, h \in \operatorname{Arrows}\left(\mathcal{D}^{\prime}\right)$. Finally, if $\mathcal{D}$ is a triangulated category, then (1) and (2) are also equivalent to
(3) $\mathcal{D}^{\prime}$ is a triangulated subcategory.

Proof. Omitted.
05QY Lemma 13.4.15. An exact functor of pre-triangulated categories is additive.
Proof. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor of pre-triangulated categories. Since $\left(0,0,0,1_{0}, 1_{0}, 0\right)$ is a distinguished triangle of $\mathcal{D}$ the triangle

$$
\left(F(0), F(0), F(0), 1_{F(0)}, 1_{F(0)}, F(0)\right)
$$

is distinguished in $\mathcal{D}^{\prime}$. This implies that $1_{F(0)} \circ 1_{F(0)}$ is zero, see Lemma 13.4.1. Hence $F(0)$ is the zero object of $\mathcal{D}^{\prime}$. This also implies that $F$ applied to any zero morphism is zero (since a morphism in an additive category is zero if and only if it
factors through the zero object). Next, using that $(X, X \oplus Y, Y,(1,0),(0,1), 0)$ is a distinguished triangle, we see that $(F(X), F(X \oplus Y), F(Y), F(1,0), F(0,1), 0)$ is one too. This implies that the map $F(1,0) \oplus F(0,1): F(X) \oplus F(Y) \rightarrow F(X \oplus Y)$ is an isomorphism, see Lemma 13.4.10. We omit the rest of the argument.

05SQ Lemma 13.4.16. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be a fully faithful exact functor of pretriangulated categories. Then a triangle $(X, Y, Z, f, g, h)$ of $\mathcal{D}$ is distinguished if and only if $(F(X), F(Y), F(Z), F(f), F(g), F(h))$ is distinguished in $\mathcal{D}^{\prime}$.

Proof. The "only if" part is clear. Assume $(F(X), F(Y), F(Z))$ is distinguished in $\mathcal{D}^{\prime}$. Pick a distinguished triangle $\left(X, Y, Z^{\prime}, f, g^{\prime}, h^{\prime}\right)$ in $\mathcal{D}$. By Lemma 13.4.7 there exists an isomorphism of triangles

$$
\left(1,1, c^{\prime}\right):(F(X), F(Y), F(Z)) \longrightarrow\left(F(X), F(Y), F\left(Z^{\prime}\right)\right)
$$

Since $F$ is fully faithful, there exists a morphism $c: Z \rightarrow Z^{\prime}$ such that $F(c)=c^{\prime}$. Then $(1,1, c)$ is an isomorphism between $(X, Y, Z)$ and $\left(X, Y, Z^{\prime}\right)$. Hence $(X, Y, Z)$ is distinguished by TR1.

014Y Lemma 13.4.17. Let $\mathcal{D}, \mathcal{D}^{\prime}, \mathcal{D}^{\prime \prime}$ be pre-triangulated categories. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ and $F^{\prime}: \mathcal{D}^{\prime} \rightarrow \mathcal{D}^{\prime \prime}$ be exact functors. Then $F^{\prime} \circ F$ is an exact functor.

Proof. Omitted.
05QZ Lemma 13.4.18. Let $\mathcal{D}$ be a pre-triangulated category. Let $\mathcal{A}$ be an abelian category. Let $H: \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor.
(1) Let $\mathcal{D}^{\prime}$ be a pre-triangulated category. Let $F: \mathcal{D}^{\prime} \rightarrow \mathcal{D}$ be an exact functor. Then the composition $G \circ F$ is a homological functor as well.
(2) Let $\mathcal{A}^{\prime}$ be an abelian category. Let $G: \mathcal{A} \rightarrow \mathcal{A}^{\prime}$ be an exact functor. Then $G \circ H$ is a homological functor as well.
Proof. Omitted.
0151 Lemma 13.4.19. Let $\mathcal{D}$ be a triangulated category. Let $\mathcal{A}$ be an abelian category. Let $G: \mathcal{A} \rightarrow \mathcal{D}$ be a $\delta$-functor.
(1) Let $\mathcal{D}^{\prime}$ be a triangulated category. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor. Then the composition $F \circ G$ is a $\delta$-functor as well.
(2) Let $\mathcal{A}^{\prime}$ be an abelian category. Let $H: \mathcal{A}^{\prime} \rightarrow \mathcal{A}$ be an exact functor. Then $G \circ H$ is a $\delta$-functor as well.

Proof. Omitted.
05 SR Lemma 13.4.20. Let $\mathcal{D}$ be a triangulated category. Let $\mathcal{A}$ be an abelian category. Let $G: \mathcal{A} \rightarrow \mathcal{D}$ be a $\delta$-functor. Let $H: \mathcal{D} \rightarrow \mathcal{B}$ be a homological functor. Assume that $H^{-1}(G(A))=0$ for all $A$ in $\mathcal{A}$. Then the collection

$$
\left\{H^{n} \circ G, H^{n}\left(\delta_{A \rightarrow B \rightarrow C}\right)\right\}_{n \geq 0}
$$

is a $\delta$-functor from $\mathcal{A} \rightarrow \mathcal{B}$, see Homology, Definition 12.11.1.
Proof. The notation signifies the following. If $0 \rightarrow A \xrightarrow{a} B \xrightarrow{b} C \rightarrow 0$ is a short exact sequence in $\mathcal{A}$, then

$$
\delta=\delta_{A \rightarrow B \rightarrow C}: G(C) \rightarrow G(A)[1]
$$

is a morphism in $\mathcal{D}$ such that $(G(A), G(B), G(C), a, b, \delta)$ is a distinguished triangle, see Definition 13.3.6. Then $H^{n}(\delta): H^{n}(G(C)) \rightarrow H^{n}(G(A)[1])=H^{n+1}(G(A))$ is
clearly functorial in the short exact sequence. Finally, the long exact cohomology sequence 13.3.5.1 combined with the vanishing of $H^{-1}(G(C))$ gives a long exact sequence

$$
0 \rightarrow H^{0}(G(A)) \rightarrow H^{0}(G(B)) \rightarrow H^{0}(G(C)) \xrightarrow{H^{0}(\delta)} H^{1}(G(A)) \rightarrow \ldots
$$

in $\mathcal{B}$ as desired.

The proof of the following result uses TR4.
05R0 Proposition 13.4.21. Let $\mathcal{D}$ be a triangulated category. Any commutative diagram

can be extended to a diagram

where all the squares are commutative, except for the lower right square which is anticommutative. Moreover, each of the rows and columns are distinguished triangles. Finally, the morphisms on the bottom row (resp. right column) are obtained from the morphisms of the top row (resp. left column) by applying [1].

Proof. During this proof we avoid writing the arrows in order to make the proof legible. Choose distinguished triangles $(X, Y, Z),\left(X^{\prime}, Y^{\prime}, Z^{\prime}\right),\left(X, X^{\prime}, X^{\prime \prime}\right),\left(Y, Y^{\prime}, Y^{\prime \prime}\right)$, and $\left(X, Y^{\prime}, A\right)$. Note that the morphism $X \rightarrow Y^{\prime}$ is both equal to the composition $X \rightarrow Y \rightarrow Y^{\prime}$ and equal to the composition $X \rightarrow X^{\prime} \rightarrow Y^{\prime}$. Hence, we can find morphisms
(1) $a: Z \rightarrow A$ and $b: A \rightarrow Y^{\prime \prime}$, and
(2) $a^{\prime}: X^{\prime \prime} \rightarrow A$ and $b^{\prime}: A \rightarrow Z^{\prime}$
as in TR4. Denote $c: Y^{\prime \prime} \rightarrow Z[1]$ the composition $Y^{\prime \prime} \rightarrow Y[1] \rightarrow Z[1]$ and denote $c^{\prime}: Z^{\prime} \rightarrow X^{\prime \prime}[1]$ the composition $Z^{\prime} \rightarrow X^{\prime}[1] \rightarrow X^{\prime \prime}[1]$. The conclusion of our application TR4 are that
(1) $\left(Z, A, Y^{\prime \prime}, a, b, c\right),\left(X^{\prime \prime}, A, Z^{\prime}, a^{\prime}, b^{\prime}, c^{\prime}\right)$ are distinguished triangles,
(2) $(X, Y, Z) \rightarrow\left(X, Y^{\prime}, A\right),\left(X, Y^{\prime}, A\right) \rightarrow\left(Y, Y^{\prime}, Y^{\prime \prime}\right),\left(X, X^{\prime}, X^{\prime \prime}\right) \rightarrow\left(X, Y^{\prime}, A\right)$, $\left(X, Y^{\prime}, A\right) \rightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}\right)$ are morphisms of triangles.

First using that $\left(X, X^{\prime}, X^{\prime \prime}\right) \rightarrow\left(X, Y^{\prime}, A\right)$ and $\left(X, Y^{\prime}, A\right) \rightarrow\left(Y, Y^{\prime}, Y^{\prime \prime}\right)$. are morphisms of triangles we see the first of the commutative diagrams

is commutative. The second is commutative too using that $(X, Y, Z) \rightarrow\left(X, Y^{\prime}, A\right)$ and $\left(X, Y^{\prime}, A\right) \rightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}\right)$ are morphisms of triangles. At this point we choose a distinguished triangle $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$ starting with the map $b \circ a^{\prime}: X^{\prime \prime} \rightarrow Y^{\prime \prime}$.

Next we apply TR4 one more time to the morphisms $X^{\prime \prime} \rightarrow A \rightarrow Y^{\prime \prime}$ and the triangles $\left(X^{\prime \prime}, A, Z^{\prime}, a^{\prime}, b^{\prime}, c^{\prime}\right),\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$, and $\left(A, Y^{\prime \prime}, Z[1], b, c,-a[1]\right)$ to get morphisms $a^{\prime \prime}: Z^{\prime} \rightarrow Z^{\prime \prime}$ and $b^{\prime \prime}: Z^{\prime \prime} \rightarrow Z[1]$. Then $\left(Z^{\prime}, Z^{\prime \prime}, Z[1], a^{\prime \prime}, b^{\prime \prime},-b^{\prime}[1] \circ a[1]\right)$ is a distinguished triangle, hence also $\left(Z, Z^{\prime}, Z^{\prime \prime},-b^{\prime} \circ a, a^{\prime \prime},-b^{\prime \prime}\right)$ and hence also $\left(Z, Z^{\prime}, Z^{\prime \prime}, b^{\prime} \circ a, a^{\prime \prime}, b^{\prime \prime}\right)$. Moreover, $\left(X^{\prime \prime}, A, Z^{\prime}\right) \rightarrow\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$ and $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right) \rightarrow$ $\left(A, Y^{\prime \prime}, Z[1], b, c,-a[1]\right)$ are morphisms of triangles. At this point we have defined all the distinguished triangles and all the morphisms, and all that's left is to verify some commutativity relations.

To see that the middle square in the diagram commutes, note that the arrow $Y^{\prime} \rightarrow Z^{\prime}$ factors as $Y^{\prime} \rightarrow A \rightarrow Z^{\prime}$ because $\left(X, Y^{\prime}, A\right) \rightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}\right)$ is a morphism of triangles. Similarly, the morphism $Y^{\prime} \rightarrow Y^{\prime \prime}$ factors as $Y^{\prime} \rightarrow A \rightarrow Y^{\prime \prime}$ because $\left(X, Y^{\prime}, A\right) \rightarrow\left(Y, Y^{\prime}, Y^{\prime \prime}\right)$ is a morphism of triangles. Hence the middle square commutes because the square with sides $\left(A, Z^{\prime}, Z^{\prime \prime}, Y^{\prime \prime}\right)$ commutes as $\left(X^{\prime \prime}, A, Z^{\prime}\right) \rightarrow\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$ is a morphism of triangles (by TR4). The square with sides $\left(Y^{\prime \prime}, Z^{\prime \prime}, Y[1], Z[1]\right)$ commutes because $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right) \rightarrow\left(A, Y^{\prime \prime}, Z[1], b, c,-a[1]\right)$ is a morphism of triangles and $c: Y^{\prime \prime} \rightarrow Z[1]$ is the composition $Y^{\prime \prime} \rightarrow Y[1] \rightarrow Z[1]$. The square with sides $\left(Z^{\prime}, X^{\prime}[1], X^{\prime \prime}[1], Z^{\prime \prime}\right)$ is commutative because $\left(X^{\prime \prime}, A, Z^{\prime}\right) \rightarrow$ $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$ is a morphism of triangles and $c^{\prime}: Z^{\prime} \rightarrow X^{\prime \prime}[1]$ is the composition $Z^{\prime} \rightarrow X^{\prime}[1] \rightarrow X^{\prime \prime}[1]$. Finally, we have to show that the square with sides $\left(Z^{\prime \prime}, X^{\prime \prime}[1], Z[1], X[2]\right)$ anticommutes. This holds because $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right) \rightarrow$ $\left(A, Y^{\prime \prime}, Z[1], b, c,-a[1]\right)$ is a morphism of triangles and we're done.

### 13.5. Localization of triangulated categories

05R1 In order to construct the derived category starting from the homotopy category of complexes, we will use a localization process.

05R2 Definition 13.5.1. Let $\mathcal{D}$ be a pre-triangulated category. We say a multiplicative system $S$ is compatible with the triangulated structure if the following two conditions hold:

MS5 For $s \in S$ we have $s[n] \in S$ for all $n \in \mathbf{Z}$.

MS6 Given a solid commutative square

whose rows are distinguished triangles with $s, s^{\prime} \in S$ there exists a morphism $s^{\prime \prime}: Z \rightarrow Z^{\prime}$ in $S$ such that $\left(s, s^{\prime}, s^{\prime \prime}\right)$ is a morphism of triangles.

It turns out that these axioms are not independent of the axioms defining multiplicative systems.

05R3 Lemma 13.5.2. Let $\mathcal{D}$ be a pre-triangulated category. Let $S$ be a set of morphisms of $\mathcal{D}$ and assume that axioms MS1, MS5, MS6 hold (see Categories, Definition 4.26.1 and Definition 13.5.1). Then MS2 holds.

Proof. Suppose that $f: X \rightarrow Y$ is a morphism of $\mathcal{D}$ and $t: X \rightarrow X^{\prime}$ an element of $S$. Choose a distinguished triangle $(X, Y, Z, f, g, h)$. Next, choose a distinguished triangle ( $X^{\prime}, Y^{\prime}, Z, f^{\prime}, g^{\prime}, t[1] \circ h$ ) (here we use TR1 and TR2). By MS5, MS6 (and TR2 to rotate) we can find the dotted arrow in the commutative diagram

with moreover $s^{\prime} \in S$. This proves LMS2. The proof of RMS2 is dual.
05R4 Lemma 13.5.3. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor of pre-triangulated categories. Let

$$
S=\{f \in \operatorname{Arrows}(\mathcal{D}) \mid F(f) \text { is an isomorphism }\}
$$

Then $S$ is a saturated (see Categories, Definition 4.26.20) multiplicative system compatible with the triangulated structure on $\mathcal{D}$.

Proof. We have to prove axioms MS1 - MS6, see Categories, Definitions 4.26.1 and 4.26 .20 and Definition 13.5.1. MS1, MS4, and MS5 are direct from the definitions. MS6 follows from TR3 and Lemma 13.4.3. By Lemma 13.5.2 we conclude that MS2 holds. To finish the proof we have to show that MS3 holds. To do this let $f, g: X \rightarrow Y$ be morphisms of $\mathcal{D}$, and let $t: Z \rightarrow X$ be an element of $S$ such that $f \circ t=g \circ t$. As $\mathcal{D}$ is additive this simply means that $a \circ t=0$ with $a=f-g$. Choose a distinguished triangle $(Z, X, Q, t, d, h)$ using TR1. Since $a \circ t=0$ we see by Lemma 13.4 .2 there exists a morphism $i: Q \rightarrow Y$ such that $i \circ d=a$. Finally, using TR1 again we can choose a triangle $(Q, Y, W, i, j, k)$. Here is a picture

OK, and now we apply the functor $F$ to this diagram. Since $t \in S$ we see that $F(Q)=0$, see Lemma 13.4.8. Hence $F(j)$ is an isomorphism by the same lemma, i.e., $j \in S$. Finally, $j \circ a=j \circ i \circ d=0$ as $j \circ i=0$. Thus $j \circ f=j \circ g$ and we see that LMS3 holds. The proof of RMS3 is dual.

05R5 Lemma 13.5.4. Let $H: \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor between a pre-triangulated category and an abelian category. Let

$$
S=\left\{f \in \operatorname{Arrows}(\mathcal{D}) \mid H^{i}(f) \text { is an isomorphism for all } i \in \mathbf{Z}\right\}
$$

Then $S$ is a saturated (see Categories, Definition 4.26.20) multiplicative system compatible with the triangulated structure on $\mathcal{D}$.

Proof. We have to prove axioms MS1 - MS6, see Categories, Definitions 4.26.1 and 4.26 .20 and Definition 13.5.1. MS1, MS4, and MS5 are direct from the definitions. MS6 follows from TR3 and the long exact cohomology sequence (13.3.5.1). By Lemma 13.5 .2 we conclude that MS2 holds. To finish the proof we have to show that MS3 holds. To do this let $f, g: X \rightarrow Y$ be morphisms of $\mathcal{D}$, and let $t: Z \rightarrow X$ be an element of $S$ such that $f \circ t=g \circ t$. As $\mathcal{D}$ is additive this simply means that $a \circ t=0$ with $a=f-g$. Choose a distinguished triangle ( $Z, X, Q, t, g, h$ ) using TR1 and TR2. Since $a \circ t=0$ we see by Lemma 13.4 .2 there exists a morphism $i: Q \rightarrow Y$ such that $i \circ g=a$. Finally, using TR1 again we can choose a triangle $(Q, Y, W, i, j, k)$. Here is a picture

OK, and now we apply the functors $H^{i}$ to this diagram. Since $t \in S$ we see that $H^{i}(Q)=0$ by the long exact cohomology sequence 13.3.5.1. Hence $H^{i}(j)$ is an isomorphism for all $i$ by the same argument, i.e., $j \in S$. Finally, $j \circ a=j \circ i \circ g=0$ as $j \circ i=0$. Thus $j \circ f=j \circ g$ and we see that LMS3 holds. The proof of RMS3 is dual.

05R6 Proposition 13.5.5. Let $\mathcal{D}$ be a pre-triangulated category. Let $S$ be a multiplicative system compatible with the triangulated structure. Then there exists a unique structure of a pre-triangulated category on $S^{-1} \mathcal{D}$ such that the localization functor $Q: \mathcal{D} \rightarrow S^{-1} \mathcal{D}$ is exact. Moreover, if $\mathcal{D}$ is a triangulated category, so is $S^{-1} \mathcal{D}$.

Proof. We have seen that $S^{-1} \mathcal{D}$ is an additive category and that the localization functor $Q$ is additive in Homology, Lemma 12.8.2, It is clear that we may define $Q(X)[n]=Q(X[n])$ since $\mathcal{S}$ is preserved under the shift functors [ $n$ ] by MS5. Finally, we say a triangle of $S^{-1} \mathcal{D}$ is distinguished if it is isomorphic to the image of a distinguished triangle under the localization functor $Q$.

Proof of TR1. The only thing to prove here is that if $a: Q(X) \rightarrow Q(Y)$ is a morphism of $S^{-1} \mathcal{D}$, then $a$ fits into a distinguish triangle. Write $a=Q(s)^{-1} \circ Q(f)$ for some $s: Y \rightarrow Y^{\prime}$ in $S$ and $f: X \rightarrow Y^{\prime}$. Choose a distinguished triangle
$\left(X, Y^{\prime}, Z, f, g, h\right)$ in $\mathcal{D}$. Then we see that $(Q(X), Q(Y), Q(Z), a, Q(g) \circ Q(s), Q(h))$ is a distinguished triangle of $S^{-1} \mathcal{D}$.
Proof of TR2. This is immediate from the definitions.
Proof of TR3. Note that the existence of the dotted arrow which is required to exist may be proven after replacing the two triangles by isomorphic triangles. Hence we may assume given distinguished triangles $(X, Y, Z, f, g, h)$ and ( $X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}$ ) of $\mathcal{D}$ and a commutative diagram

in $S^{-1} \mathcal{D}$. Now we apply Categories, Lemma 4.26 .10 to find a morphism $f^{\prime \prime}: X^{\prime \prime} \rightarrow$ $Y^{\prime \prime}$ in $\mathcal{D}$ and a commutative diagram

in $\mathcal{D}$ with $s, t \in S$ and $a=s^{-1} k, b=t^{-1} l$. At this point we can use TR3 for $\mathcal{D}$ and MS6 to find a commutative diagram

with $r \in S$. It follows that setting $c=Q(r)^{-1} Q(m)$ we obtain the desired morphism of triangles

This proves the first statement of the lemma. If $\mathcal{D}$ is also a triangulated category, then we still have to prove TR4 in order to show that $S^{-1} \mathcal{D}$ is triangulated as well. To do this we reduce by Lemma 13.4 .13 to the following statement: Given composable morphisms $a: Q(X) \rightarrow Q(Y)$ and $b: Q(Y) \rightarrow Q(Z)$ we have to produce an octahedron after possibly replacing $Q(X), Q(Y), Q(Z)$ by isomorphic objects. To do this we may first replace $Y$ by an object such that $a=Q(f)$ for some morphism $f: X \rightarrow Y$ in $\mathcal{D}$. (More precisely, write $a=s^{-1} f$ with $s: Y \rightarrow Y^{\prime}$ in $S$ and $f: X \rightarrow Y^{\prime}$. Then replace $Y$ by $Y^{\prime}$.) After this we similarly replace $Z$ by an object such that $b=Q(g)$ for some morphism $g: Y \rightarrow Z$. Now we can find distinguished triangles $\left(X, Y, Q_{1}, f, p_{1}, d_{1}\right),\left(X, Z, Q_{2}, g \circ f, p_{2}, d_{2}\right)$, and
$\left(Y, Z, Q_{3}, g, p_{3}, d_{3}\right)$ in $\mathcal{D}$ (by TR1), and morphisms $a: Q_{1} \rightarrow Q_{2}$ and $b: Q_{2} \rightarrow Q_{3}$ as in TR4. Then it is immediately verified that applying the functor $Q$ to all these data gives a corresponding structure in $S^{-1} \mathcal{D}$

The universal property of the localization of a triangulated category is as follows (we formulate this for pre-triangulated categories, hence it holds a fortiori for triangulated categories).

05R7 Lemma 13.5.6. Let $\mathcal{D}$ be a pre-triangulated category. Let $S$ be a multiplicative system compatible with the triangulated category. Let $Q: \mathcal{D} \rightarrow S^{-1} \mathcal{D}$ be the localization functor, see Proposition 13.5.5.
(1) If $H: \mathcal{D} \rightarrow \mathcal{A}$ is a homological functor into an abelian category $\mathcal{A}$ such that $H(s)$ is an isomorphism for all $s \in S$, then the unique factorization $H^{\prime}: S^{-1} \mathcal{D} \rightarrow \mathcal{A}$ such that $H=H^{\prime} \circ Q$ (see Categories, Lemma 4.26.8) is a homological functor too.
(2) If $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ is an exact functor into a pre-triangulated category $\mathcal{D}^{\prime}$ such that $F(s)$ is an isomorphism for all $s \in S$, then the unique factorization $F^{\prime}: S^{-1} \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ such that $F=F^{\prime} \circ Q$ (see Categories, Lemma 4.26.8) is an exact functor too.

Proof. This lemma proves itself. Details omitted.
The following lemma describes the kernel (see Definition 13.6.5) of the localization functor.

05R8 Lemma 13.5.7. Let $\mathcal{D}$ be a pre-triangulated category. Let $S$ be a multiplicative system compatible with the triangulated structure. Let $Z$ be an object of $\mathcal{D}$. The following are equivalent
(1) $Q(Z)=0$ in $S^{-1} \mathcal{D}$,
(2) there exists $Z^{\prime} \in \mathrm{Ob}(\mathcal{D})$ such that $0: Z \rightarrow Z^{\prime}$ is an element of $S$,
(3) there exists $Z^{\prime} \in \mathrm{Ob}(\mathcal{D})$ such that $0: Z^{\prime} \rightarrow Z$ is an element of $S$, and
(4) there exists an object $Z^{\prime}$ and a distinguished triangle $\left(X, Y, Z \oplus Z^{\prime}, f, g, h\right)$ such that $f \in S$.
If $S$ is saturated, then these are also equivalent to
(4) the morphism $0 \rightarrow Z$ is an element of $S$,
(5) the morphism $Z \rightarrow 0$ is an element of $S$,
(6) there exists a distinguished triangle $(X, Y, Z, f, g, h)$ such that $f \in S$.

Proof. The equivalence of (1), (2), and (3) is Homology, Lemma 12.8.3. If (2) holds, then $\left(Z^{\prime}[-1], Z^{\prime}[-1] \oplus Z, Z,(1,0),(0,1), 0\right)$ is a distinguised triangle (see Lemma 13.4.10 with " $0 \in S$ ". By rotating we conclude that (4) holds. If $\left(X, Y, Z \oplus Z^{\prime}, f, g, h\right)$ is a distinguished triangle with $f \in S$ then $Q(f)$ is an isomorphism hence $Q\left(Z \oplus Z^{\prime}\right)=0$ hence $Q(Z)=0$. Thus (1)-(4) are all equivalent.

Next, assume that $S$ is saturated. Note that each of (4), (5), (6) implies one of the equivalent conditions $(1)-(4)$. Suppose that $Q(Z)=0$. Then $0 \rightarrow Z$ is a morphism of $\mathcal{D}$ which becomes an isomorphism in $S^{-1} \mathcal{D}$. According to Categories, Lemma 4.26 .21 the fact that $S$ is saturated implies that $0 \rightarrow Z$ is in $S$. Hence $(1) \Rightarrow$ (4). Dually (1) $\Rightarrow$ (5). Finally, if $0 \rightarrow Z$ is in $S$, then the triangle ( $0, Z, Z, 0, \mathrm{id}_{Z}, 0$ ) is distinguished by TR1 and TR2 and is a triangle as in (4).

05R9 Lemma 13.5.8. Let $\mathcal{D}$ be a triangulated category. Let $S$ be a saturated multiplicative system in $\mathcal{D}$ that is compatible with the triangulated structure. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle in $\mathcal{D}$. Consider the category of morphisms of triangles

$$
\mathcal{I}=\left\{\left(s, s^{\prime}, s^{\prime \prime}\right):(X, Y, Z, f, g, h) \rightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right) \mid s, s^{\prime}, s^{\prime \prime} \in S\right\}
$$

Then $\mathcal{I}$ is a filtered category and the functors $\mathcal{I} \rightarrow X / S, \mathcal{I} \rightarrow Y / S$, and $\mathcal{I} \rightarrow Z / S$ are cofinal.

Proof. We strongly suggest the reader skip the proof of this lemma and instead work it out on a napkin.
The first remark is that using rotation of distinguished triangles (TR2) gives an equivalence of categories between $\mathcal{I}$ and the corresponding category for the distinguished triangle $(Y, Z, X[1], g, h,-f[1])$. Using this we see for example that if we prove the functor $\mathcal{I} \rightarrow X / S$ is cofinal, then the same thing is true for the functors $\mathcal{I} \rightarrow Y / S$ and $\mathcal{I} \rightarrow Z / S$.
Note that if $s: X \rightarrow X^{\prime}$ is a morphism of $S$, then using MS2 we can find $s^{\prime}: Y \rightarrow Y^{\prime}$ and $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ such that $f^{\prime} \circ s=s^{\prime} \circ f$, whereupon we can use MS6 to complete this into an object of $\mathcal{I}$. Hence the functor $\mathcal{I} \rightarrow X / S$ is surjective on objects. Using rotation as above this implies the same thing is true for the functors $\mathcal{I} \rightarrow Y / S$ and $\mathcal{I} \rightarrow Z / S$.

Suppose given objects $s_{1}: X \rightarrow X_{1}$ and $s_{2}: X \rightarrow X_{2}$ in $X / S$ and a morphism $a:$ $X_{1} \rightarrow X_{2}$ in $X / S$. Since $S$ is saturated, we see that $a \in S$, see Categories, Lemma 4.26.21. By the argument of the previous paragraph we can complete $s_{1}: X \rightarrow X_{1}$ to an object $\left(s_{1}, s_{1}^{\prime}, s_{1}^{\prime \prime}\right):(X, Y, Z, f, g, h) \rightarrow\left(X_{1}, Y_{1}, Z_{1}, f_{1}, g_{1}, h_{1}\right)$ in $\mathcal{I}$. Then we can repeat and find $(a, b, c):\left(X_{1}, Y_{1}, Z_{1}, f_{1}, g_{1}, h_{1}\right) \rightarrow\left(X_{2}, Y_{2}, Z_{2}, f_{2}, g_{2}, h_{2}\right)$ with $a, b, c \in S$ completing the given $a: X_{1} \rightarrow X_{2}$. But then $(a, b, c)$ is a morphism in $\mathcal{I}$. In this way we conclude that the fuctor $\mathcal{I} \rightarrow X / S$ is also surjective on arrows. Using rotation as above, this implies the same thing is true for the functors $\mathcal{I} \rightarrow Y / S$ and $\mathcal{I} \rightarrow Z / S$.
The category $\mathcal{I}$ is nonempty as the identity provides an object. This proves the condition (1) of the definition of a filtered category, see Categories, Definition 4.19.1.
We check condition (2) of Categories, Definition 4.19.1 for the category $\mathcal{I}$. Suppose given objects $\left(s_{1}, s_{1}^{\prime}, s_{1}^{\prime \prime}\right):(X, Y, Z, f, g, h) \rightarrow\left(X_{1}, Y_{1}, Z_{1}, f_{1}, g_{1}, h_{1}\right)$ and $\left(s_{2}, s_{2}^{\prime}, s_{2}^{\prime \prime}\right):$ $(X, Y, Z, f, g, h) \rightarrow\left(X_{2}, Y_{2}, Z_{2}, f_{2}, g_{2}, h_{2}\right)$ in $\mathcal{I}$. We want to find an object of $\mathcal{I}$ which is the target of an arrow from both $\left(X_{1}, Y_{1}, Z_{1}, f_{1}, g_{1}, h_{1}\right)$ and $\left(X_{2}, Y_{2}, Z_{2}, f_{2}, g_{2}, h_{2}\right)$. By Categories, Remark 4.26.7 the categories $X / S, Y / S, Z / S$ are filtered. Thus we can find $X \rightarrow X_{3}$ in $X / S$ and morphisms $s: X_{2} \rightarrow X_{3}$ and $a: X_{1} \rightarrow$ $X_{3}$. By the above we can find a morphism $\left(s, s^{\prime}, s^{\prime \prime}\right):\left(X_{2}, Y_{2}, Z_{2}, f_{2}, g_{2}, h_{2}\right) \rightarrow$ $\left(X_{3}, Y_{3}, Z_{3}, f_{3}, g_{3}, h_{3}\right)$ with $s^{\prime}, s^{\prime \prime} \in S$. After replacing $\left(X_{2}, Y_{2}, Z_{2}\right)$ by $\left(X_{3}, Y_{3}, Z_{3}\right)$ we may assume that there exists a morphism $a: X_{1} \rightarrow X_{2}$ in $X / S$. Repeating the argument for $Y$ and $Z$ (by rotating as above) we may assume there is a morphism $a: X_{1} \rightarrow X_{2}$ in $X / S, b: Y_{1} \rightarrow Y_{2}$ in $Y / S$, and $c: Z_{1} \rightarrow Z_{2}$ in $Z / S$. However, these morphisms do not necessarily give rise to a morphism of distinguished triangles. On the other hand, the necessary diagrams do commute in $S^{-1} \mathcal{D}$. Hence we see (for example) that there exists a morphism $s_{2}^{\prime}: Y_{2} \rightarrow Y_{3}$ in $S$ such that $s_{2}^{\prime} \circ f_{2} \circ a=s_{2}^{\prime} \circ b \circ f_{1}$. Another replacement of $\left(X_{2}, Y_{2}, Z_{2}\right)$ as above then gets us to
the situation where $f_{2} \circ a=b \circ f_{1}$. Rotating and applying the same argument two more times we see that we may assume $(a, b, c)$ is a morphism of triangles. This proves condition (2).
Next we check condition (3) of Categories, Definition 4.19.1. Suppose ( $s_{1}, s_{1}^{\prime}, s_{1}^{\prime \prime}$ ) : $(X, Y, Z) \rightarrow\left(X_{1}, Y_{1}, Z_{1}\right)$ and $\left(s_{2}, s_{2}^{\prime}, s_{2}^{\prime \prime}\right):(X, Y, Z) \rightarrow\left(X_{2}, Y_{2}, Z_{2}\right)$ are objects of $\mathcal{I}$, and suppose $(a, b, c),\left(a^{\prime}, b^{\prime}, c^{\prime}\right)$ are two morphisms between them. Since $a \circ s_{1}=$ $a^{\prime} \circ s_{1}$ there exists a morphism $s_{3}: X_{2} \rightarrow X_{3}$ such that $s_{3} \circ a=s_{3} \circ a^{\prime}$. Using the surjectivity statement we can complete this to a morphism of triangles ( $s_{3}, s_{3}^{\prime}, s_{3}^{\prime \prime}$ ) : $\left(X_{2}, Y_{2}, Z_{2}\right) \rightarrow\left(X_{3}, Y_{3}, Z_{3}\right)$ with $s_{3}, s_{3}^{\prime}, s_{3}^{\prime \prime} \in S$. Thus $\left(s_{3} \circ s_{2}, s_{3}^{\prime} \circ s_{2}^{\prime}, s_{3}^{\prime \prime} \circ s_{2}^{\prime \prime}\right):$ $(X, Y, Z) \rightarrow\left(X_{3}, Y_{3}, Z_{3}\right)$ is also an object of $\mathcal{I}$ and after composing the maps $(a, b, c),\left(a^{\prime}, b^{\prime}, c^{\prime}\right)$ with $\left(s_{3}, s_{3}^{\prime}, s_{3}^{\prime \prime}\right)$ we obtain $a=a^{\prime}$. By rotating we may do the same to get $b=b^{\prime}$ and $c=c^{\prime}$.
Finally, we check that $\mathcal{I} \rightarrow X / S$ is cofinal, see Categories, Definition 4.17.1. The first condition is true as the functor is surjective. Suppose that we have an object $s: X \rightarrow X^{\prime}$ in $X / S$ and two objects $\left(s_{1}, s_{1}^{\prime}, s_{1}^{\prime \prime}\right):(X, Y, Z, f, g, h) \rightarrow$ $\left(X_{1}, Y_{1}, Z_{1}, f_{1}, g_{1}, h_{1}\right)$ and $\left(s_{2}, s_{2}^{\prime}, s_{2}^{\prime \prime}\right):(X, Y, Z, f, g, h) \rightarrow\left(X_{2}, Y_{2}, Z_{2}, f_{2}, g_{2}, h_{2}\right)$ in $\mathcal{I}$ as well as morphisms $t_{1}: X^{\prime} \rightarrow X_{1}$ and $t_{2}: X^{\prime} \rightarrow X_{2}$ in $X / S$. By property (2) of $\mathcal{I}$ proved above we can find morphisms $\left(s_{3}, s_{3}^{\prime}, s_{3}^{\prime \prime}\right):\left(X_{1}, Y_{1}, Z_{1}, f_{1}, g_{1}, h_{1}\right) \rightarrow$ $\left(X_{3}, Y_{3}, Z_{3}, f_{3}, g_{3}, h_{3}\right)$ and $\left(s_{4}, s_{4}^{\prime}, s_{4}^{\prime \prime}\right):\left(X_{2}, Y_{2}, Z_{2}, f_{2}, g_{2}, h_{2}\right) \rightarrow\left(X_{3}, Y_{3}, Z_{3}, f_{3}, g_{3}, h_{3}\right)$ in $\mathcal{I}$. We would be done if the compositions $X^{\prime} \rightarrow X_{1} \rightarrow X_{3}$ and $X^{\prime} \rightarrow X_{1} \rightarrow X_{3}$ where equal (see displayed equation in Categories, Definition 4.17.1). If not, then, because $X / S$ is filtered, we can choose a morphism $X_{3} \rightarrow X_{4}$ in $S$ such that the compositions $X^{\prime} \rightarrow X_{1} \rightarrow X_{3} \rightarrow X_{4}$ and $X^{\prime} \rightarrow X_{1} \rightarrow X_{3} \rightarrow X_{4}$ are equal. Then we finally complete $X_{3} \rightarrow X_{4}$ to a morphism $\left(X_{3}, Y_{3}, Z_{3}\right) \rightarrow\left(X_{4}, Y_{4}, Z_{4}\right)$ in $\mathcal{I}$ and compose with that morphism to see that the result is true.

### 13.6. Quotients of triangulated categories

05RA Given a triangulated category and a triangulated subcategory we can construct another triangulated category by taking the "quotient". The construction uses a localization. This is similar to the quotient of an abelian category by a Serre subcategory, see Homology, Section 12.9. Before we do the actual construction we briefly discuss kernels of exact functors.

05RB Definition 13.6.1. Let $\mathcal{D}$ be a pre-triangulated category. We say a full pretriangulated subcategory $\mathcal{D}^{\prime}$ of $\mathcal{D}$ is saturated if whenever $X \oplus Y$ is isomorphic to an object of $\mathcal{D}^{\prime}$ then both $X$ and $Y$ are isomorphic to objects of $\mathcal{D}^{\prime}$.
A saturated triangulated subcategory is sometimes called a thick triangulated subcategory. In some references, this is only used for strictly full triangulated subcategories (and sometimes the definition is written such that it implies strictness). There is another notion, that of an épaisse triangulated subcategory. The definition is that given a commutative diagram

where the second line is a distinguished triangle and $S$ and $T$ isomorphic to objects of $\mathcal{D}^{\prime}$, then also $X$ and $Y$ are isomorphic to objects of $\mathcal{D}$. It turns out that this
13.6. QUOTIENTS OF TRIANGULATED CATEGORIES
is equivalent to being saturated (this is elementary and can be found in Ric89a) and the notion of a saturated category is easier to work with.

05RC Lemma 13.6.2. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor of pre-triangulated categories. Let $\mathcal{D}^{\prime \prime}$ be the full subcategory of $\mathcal{D}$ with objects

$$
\operatorname{Ob}\left(\mathcal{D}^{\prime \prime}\right)=\{X \in \operatorname{Ob}(\mathcal{D}) \mid F(X)=0\}
$$

Then $\mathcal{D}^{\prime \prime}$ is a strictly full saturated pre-triangulated subcategory of $\mathcal{D}$. If $\mathcal{D}$ is a triangulated category, then $\mathcal{D}^{\prime \prime}$ is a triangulated subcategory.

Proof. It is clear that $\mathcal{D}^{\prime \prime}$ is preserved under [1] and [-1]. If ( $\left.X, Y, Z, f, g, h\right)$ is a distinguished triangle of $\mathcal{D}$ and $F(X)=F(Y)=0$, then also $F(Z)=0$ as $(F(X), F(Y), F(Z), F(f), F(g), F(h))$ is distinguished. Hence we may apply Lemma 13.4 .14 to see that $\mathcal{D}^{\prime \prime}$ is a pre-triangulated subcategory (respectively a triangulated subcategory if $\mathcal{D}$ is a triangulated category). The final assertion of being saturated follows from $F(X) \oplus F(Y)=0 \Rightarrow F(X)=F(Y)=0$.

05RD Lemma 13.6.3. Let $H: \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor of a pre-triangulated category into an abelian category. Let $\mathcal{D}^{\prime}$ be the full subcategory of $\mathcal{D}$ with objects

$$
\mathrm{Ob}\left(\mathcal{D}^{\prime}\right)=\{X \in \operatorname{Ob}(\mathcal{D}) \mid H(X[n])=0 \text { for all } n \in \mathbf{Z}\}
$$

Then $\mathcal{D}^{\prime}$ is a strictly full saturated pre-triangulated subcategory of $\mathcal{D}$. If $\mathcal{D}$ is a triangulated category, then $\mathcal{D}^{\prime}$ is a triangulated subcategory.

Proof. It is clear that $\mathcal{D}^{\prime}$ is preserved under [1] and [-1]. If $(X, Y, Z, f, g, h)$ is a distinguished triangle of $\mathcal{D}$ and $H(X[n])=H(Y[n])=0$ for all $n$, then also $H(Z[n])=0$ for all $n$ by the long exact sequence 13.3.5.1). Hence we may apply Lemma 13.4 .14 to see that $\mathcal{D}^{\prime}$ is a pre-triangulated subcategory (respectively a triangulated subcategory if $\mathcal{D}$ is a triangulated category). The assertion of being saturated follows from

$$
\begin{aligned}
H((X \oplus Y)[n])=0 & \Rightarrow H(X[n] \oplus Y[n])=0 \\
& \Rightarrow H(X[n]) \oplus H(Y[n])=0 \\
& \Rightarrow H(X[n])=H(Y[n])=0
\end{aligned}
$$

for all $n \in \mathbf{Z}$.
05RE Lemma 13.6.4. Let $H: \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor of a pre-triangulated category into an abelian category. Let $\mathcal{D}_{H}^{+}, \mathcal{D}_{H}^{-}, \mathcal{D}_{H}^{b}$ be the full subcategory of $\mathcal{D}$ with objects

$$
\begin{gathered}
\operatorname{Ob}\left(\mathcal{D}_{H}^{+}\right)=\{X \in \operatorname{Ob}(\mathcal{D}) \mid H(X[n])=0 \text { for all } n \ll 0\} \\
\operatorname{Ob}\left(\mathcal{D}_{H}^{-}\right)=\{X \in \operatorname{Ob}(\mathcal{D}) \mid H(X[n])=0 \text { for all } n \gg 0\} \\
\operatorname{Ob}\left(\mathcal{D}_{H}^{b}\right)=\{X \in \operatorname{Ob}(\mathcal{D}) \mid H(X[n])=0 \text { for all }|n| \gg 0\}
\end{gathered}
$$

Each of these is a strictly full saturated pre-triangulated subcategory of $\mathcal{D}$. If $\mathcal{D}$ is a triangulated category, then each is a triangulated subcategory.

Proof. Let us prove this for $\mathcal{D}_{H}^{+}$. It is clear that it is preserved under [1] and [ -1 . If $(X, Y, Z, f, g, h)$ is a distinguished triangle of $\mathcal{D}$ and $H(X[n])=H(Y[n])=0$ for all $n \ll 0$, then also $H(Z[n])=0$ for all $n \ll 0$ by the long exact sequence 13.3 .5 .1 . Hence we may apply Lemma 13.4 .14 to see that $\mathcal{D}_{H}^{+}$is a pre-triangulated subcategory (respectively a triangulated subcategory if $\mathcal{D}$ is a triangulated category). The
assertion of being saturated follows from

$$
\begin{aligned}
H((X \oplus Y)[n])=0 & \Rightarrow H(X[n] \oplus Y[n])=0 \\
& \Rightarrow H(X[n]) \oplus H(Y[n])=0 \\
& \Rightarrow H(X[n])=H(Y[n])=0
\end{aligned}
$$

for all $n \in \mathbf{Z}$.
$05 R \mathrm{D}$ Definition 13.6.5. Let $\mathcal{D}$ be a (pre-)triangulated category.
(1) Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor. The kernel of $F$ is the strictly full saturated (pre-)triangulated subcategory described in Lemma 13.6.2
(2) Let $H: \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor. The kernel of $H$ is the strictly full saturated (pre-)triangulated subcategory described in Lemma 13.6.3. These are sometimes denoted $\operatorname{Ker}(F)$ or $\operatorname{Ker}(H)$.

The proof of the following lemma uses TR4.
05RG Lemma 13.6.6. Let $\mathcal{D}$ be a triangulated category. Let $\mathcal{D}^{\prime} \subset \mathcal{D}$ be a full triangulated subcategory. Set
$05 \mathrm{RH} \quad(13.6 .6 .1) \quad S=\left\{\begin{array}{c}f \in \operatorname{Arrows}(\mathcal{D}) \text { such that there exists a distinguished triangle } \\ (X, Y, Z, f, g, h) \text { of } \mathcal{D} \text { with } Z \text { isomorphic to an object of } \mathcal{D}^{\prime}\end{array}\right\}$
Then $S$ is a multiplicative system compatible with the triangulated structure on $\mathcal{D}$. In this situation the following are equivalent
(1) $S$ is a saturated multiplicative system,
(2) $\mathcal{D}^{\prime}$ is a saturated triangulated subcategory.

Proof. To prove the first assertion we have to prove that MS1, MS2, MS3 and MS5, MS6 hold.
Proof of MS1. It is clear that identities are in $S$ because ( $X, X, 0,1,0,0$ ) is distinguished for every object $X$ of $\mathcal{D}$ and because 0 is an object of $\mathcal{D}^{\prime}$. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be composable morphisms contained in $S$. Choose distinguished triangles $\left(X, Y, Q_{1}, f, p_{1}, d_{1}\right),\left(X, Z, Q_{2}, g \circ f, p_{2}, d_{2}\right)$, and $\left(Y, Z, Q_{3}, g, p_{3}, d_{3}\right)$. By assumption we know that $Q_{1}$ and $Q_{3}$ are isomorphic to objects of $\mathcal{D}^{\prime}$. By TR4 we know there exists a distinguished triangle $\left(Q_{1}, Q_{2}, Q_{3}, a, b, c\right)$. Since $\mathcal{D}^{\prime}$ is a triangulated subcategory we conclude that $Q_{2}$ is isomorphic to an object of $\mathcal{D}^{\prime}$. Hence $g \circ f \in S$.
Proof of MS3. Let $a: X \rightarrow Y$ be a morphism and let $t: Z \rightarrow X$ be an element of $S$ such that $a \circ t=0$. To prove LMS3 it suffices to find an $s \in S$ such that $s \circ a=0$, compare with the proof of Lemma 13.5.3. Choose a distinguished triangle $(Z, X, Q, t, g, h)$ using TR1 and TR2. Since $a \circ t=0$ we see by Lemma 13.4.2 there exists a morphism $i: Q \rightarrow Y$ such that $i \circ g=a$. Finally, using TR1 again we can choose a triangle $(Q, Y, W, i, s, k)$. Here is a picture

Since $t \in S$ we see that $Q$ is isomorphic to an object of $\mathcal{D}^{\prime}$. Hence $s \in S$. Finally, $s \circ a=s \circ i \circ g=0$ as $s \circ i=0$ by Lemma 13.4.1. We conclude that LMS3 holds. The proof of RMS3 is dual.
Proof of MS5. Follows as distinguished triangles and $\mathcal{D}^{\prime}$ are stable under translations

Proof of MS6. Suppose given a commutative diagram

with $s, s^{\prime} \in S$. By Proposition 13.4.21 we can extend this to a nine square diagram. As $s, s^{\prime}$ are elements of $S$ we see that $X^{\prime \prime}, Y^{\prime \prime}$ are isomorphic to objects of $\mathcal{D}^{\prime}$. Since $\mathcal{D}^{\prime}$ is a full triangulated subcategory we see that $Z^{\prime \prime}$ is also isomorphic to an object of $\mathcal{D}^{\prime}$. Whence the morphism $Z \rightarrow Z^{\prime}$ is an element of $S$. This proves MS6.

MS2 is a formal consequence of MS1, MS5, and MS6, see Lemma 13.5.2. This finishes the proof of the first assertion of the lemma.

Let's assume that $S$ is saturated. (In the following we will use rotation of distinguished triangles without further mention.) Let $X \oplus Y$ be an object isomorphic to an object of $\mathcal{D}^{\prime}$. Consider the morphism $f: 0 \rightarrow X$. The composition $0 \rightarrow X \rightarrow X \oplus Y$ is an element of $S$ as $(0, X \oplus Y, X \oplus Y, 0,1,0)$ is a distinguished triangle. The composition $Y[-1] \rightarrow 0 \rightarrow X$ is an element of $S$ as $(X, X \oplus Y, Y,(1,0),(0,1), 0)$ is a distinguished triangle, see Lemma 13.4.10. Hence $0 \rightarrow X$ is an element of $S$ (as $S$ is saturated). Thus $X$ is isomorphic to an object of $\mathcal{D}^{\prime}$ as desired.

Finally, assume $\mathcal{D}^{\prime}$ is a saturated triangulated subcategory. Let

$$
W \xrightarrow{h} X \xrightarrow{g} Y \xrightarrow{f} Z
$$

be composable morphisms of $\mathcal{D}$ such that $f g, g h \in S$. We will build up a picture of objects as in the diagram below.

First choose distinguished triangles $\left(W, X, Q_{1}\right),\left(X, Y, Q_{2}\right),\left(Y, Z, Q_{3}\right)\left(W, Y, Q_{12}\right)$, and $\left(X, Z, Q_{23}\right)$. Denote $s: Q_{2} \rightarrow Q_{1}[1]$ the composition $Q_{2} \rightarrow X[1] \rightarrow Q_{1}[1]$. Denote $t: Q_{3} \rightarrow Q_{2}[1]$ the composition $Q_{3} \rightarrow Y[1] \rightarrow Q_{2}[1]$. By TR4 applied to the composition $W \rightarrow X \rightarrow Y$ and the composition $X \rightarrow Y \rightarrow Z$ there exist a distinguished triangles $\left(Q_{1}, Q_{12}, Q_{2}\right)$ and $\left(Q_{2}, Q_{23}, Q_{3}\right)$ which use the morphisms $s$ and $t$. The objects $Q_{12}$ and $Q_{23}$ are isomorphic to objects of $\mathcal{D}^{\prime}$ as $W \rightarrow Y$ and $X \rightarrow Z$ are assumed in $S$. Hence also $s[1] t$ is an element of $S$ as $S$ is closed under compositions and shifts. Note that $s[1] t=0$ as $Y[1] \rightarrow Q_{2}[1] \rightarrow X[2]$ is zero, see Lemma 13.4.1. Hence $Q_{3} \oplus Q_{1}[2]$ is isomorphic to an object of $\mathcal{D}^{\prime}$, see Lemma
13.4.10. By assumption on $\mathcal{D}^{\prime}$ we conclude that $Q_{3}, Q_{1}$ are isomorphic to objects of $\mathcal{D}^{\prime}$. Looking at the distinguished triangle $\left(Q_{1}, Q_{12}, Q_{2}\right)$ we conclude that $Q_{2}$ is also isomorphic to an object of $\mathcal{D}^{\prime}$. Looking at the distinguished triangle ( $X, Y, Q_{2}$ ) we finally conclude that $g \in S$. (It is also follows that $h, f \in S$, but we don't need this.)
05RI Definition 13.6.7. Let $\mathcal{D}$ be a triangulated category. Let $\mathcal{B}$ be a full triangulated subcategory. We define the quotient category $\mathcal{D} / \mathcal{B}$ by the formula $\mathcal{D} / \mathcal{B}=S^{-1} \mathcal{D}$, where $S$ is the multiplicative system of $\mathcal{D}$ associated to $\mathcal{B}$ via Lemma 13.6.6. The localization functor $Q: \mathcal{D} \rightarrow \mathcal{D} / \mathcal{B}$ is called the quotient functor in this case.

Note that the quotient functor $Q: \mathcal{D} \rightarrow \mathcal{D} / \mathcal{B}$ is an exact functor of triangulated categories, see Proposition 13.5.5. The universal property of this construction is the following.
05RJ Lemma 13.6.8. Let $\mathcal{D}$ be a triangulated category. Let $\mathcal{B}$ be a full triangulated subcategory of $\mathcal{D}$. Let $Q: \mathcal{D} \rightarrow \mathcal{D} / \mathcal{B}$ be the quotient functor.
(1) If $H: \mathcal{D} \rightarrow \mathcal{A}$ is a homological functor into an abelian category $\mathcal{A}$ such that $\mathcal{B} \subset \operatorname{Ker}(H)$ then there exists a unique factorization $H^{\prime}: \mathcal{D} / \mathcal{B} \rightarrow \mathcal{A}$ such that $H=H^{\prime} \circ Q$ and $H^{\prime}$ is a homological functor too.
(2) If $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ is an exact functor into a pre-triangulated category $\mathcal{D}^{\prime}$ such that $\mathcal{B} \subset \operatorname{Ker}(F)$ then there exists a unique factorization $F^{\prime}: \mathcal{D} / \mathcal{B} \rightarrow \mathcal{D}^{\prime}$ such that $F=F^{\prime} \circ Q$ and $F^{\prime}$ is an exact functor too.

Proof. This lemma follows from Lemma 13.5.6. Namely, if $f: X \rightarrow Y$ is a morphism of $\mathcal{D}$ such that for some distinguished triangle $(X, Y, Z, f, g, h)$ the object $Z$ is isomorphic to an object of $\mathcal{B}$, then $H(f)$, resp. $F(f)$ is an isomorphism under the assumptions of (1), resp. (2). Details omitted.

The kernel of the quotient functor can be described as follows.
05RK Lemma 13.6.9. Let $\mathcal{D}$ be a triangulated category. Let $\mathcal{B}$ be a full triangulated subcategory. The kernel of the quotient functor $Q: \mathcal{D} \rightarrow \mathcal{D} / \mathcal{B}$ is the strictly full subcategory of $\mathcal{D}$ whose objects are

$$
\mathrm{Ob}(\operatorname{Ker}(Q))=\left\{\begin{array}{l}
Z \in \operatorname{Ob}(\mathcal{D}) \text { such that there exists a } Z^{\prime} \in \mathrm{Ob}(\mathcal{D}) \\
\text { such that } Z \oplus Z^{\prime} \text { is isomorphic to an object of } \mathcal{B}
\end{array}\right\}
$$

In other words it is the smallest strictly full saturated triangulated subcategory of $\mathcal{D}$ containing $\mathcal{B}$.
Proof. First note that the kernel is automatically a strictly full triangulated subcategory containing summands of any of its objects, see Lemma 13.6.2. The description of its objects follows from the definitions and Lemma 13.5.7 part (4).

Let $\mathcal{D}$ be a triangulated category. At this point we have constructions which induce order preserving maps between
(1) the partially ordered set of multiplicative systems $S$ in $\mathcal{D}$ compatible with the triangulated structure, and
(2) the partially ordered set of full triangulated subcategories $\mathcal{B} \subset \mathcal{D}$. Namely, the constructions are given by $S \mapsto \mathcal{B}(S)=\operatorname{Ker}\left(Q: \mathcal{D} \rightarrow S^{-1} \mathcal{D}\right)$ and $\mathcal{B} \mapsto S(\mathcal{B})$ where $S(\mathcal{B})$ is the multiplicative set of 13.6.6.1), i.e.,
$S(\mathcal{B})=\left\{\begin{array}{c}f \in \operatorname{Arrows}(\mathcal{D}) \text { such that there exists a distinguished triangle } \\ (X, Y, Z, f, g, h) \text { of } \mathcal{D} \text { with } Z \text { isomorphic to an object of } \mathcal{B}\end{array}\right\}$

Note that it is not the case that these operations are mutually inverse.
05RL Lemma 13.6.10. Let $\mathcal{D}$ be a triangulated category. The operations described above have the following properties
(1) $S(\mathcal{B}(S))$ is the "saturation" of $S$, i.e., it is the smallest saturated multiplicative system in $\mathcal{D}$ containing $S$, and
(2) $\mathcal{B}(S(\mathcal{B}))$ is the "saturation" of $\mathcal{B}$, i.e., it is the smallest strictly full saturated triangulated subcategory of $\mathcal{D}$ containing $\mathcal{B}$.
In particular, the constructions define mutually inverse maps between the (partially ordered) set of saturated multiplicative systems in $\mathcal{D}$ compatible with the triangulated structure on $\mathcal{D}$ and the (partially ordered) set of strictly full saturated triangulated subcategories of $\mathcal{D}$.

Proof. First, let's start with a full triangulated subcategory $\mathcal{B}$. Then $\mathcal{B}(S(\mathcal{B}))=$ $\operatorname{Ker}(Q: \mathcal{D} \rightarrow \mathcal{D} / \mathcal{B})$ and hence (2) is the content of Lemma 13.6.9.

Next, suppose that $S$ is multiplicative system in $\mathcal{D}$ compatible with the triangulation on $\mathcal{D}$. Then $\mathcal{B}(S)=\operatorname{Ker}\left(Q: \mathcal{D} \rightarrow S^{-1} \mathcal{D}\right)$. Hence (using Lemma 13.4.8 in the localized category)

$$
\begin{aligned}
S(\mathcal{B}(S)) & =\left\{\begin{array}{c}
f \in \operatorname{Arrows}(\mathcal{D}) \text { such that there exists a distinguished } \\
\text { triangle }(X, Y, Z, f, g, h) \text { of } \mathcal{D} \text { with } Q(Z)=0
\end{array}\right\} \\
& =\{f \in \operatorname{Arrows}(\mathcal{D}) \mid Q(f) \text { is an isomorphism }\} \\
& =\hat{S}=S^{\prime}
\end{aligned}
$$

in the notation of Categories, Lemma 4.26.21. The final statement of that lemma finishes the proof.

05RM Lemma 13.6.11. Let $H: \mathcal{D} \rightarrow \mathcal{A}$ be a homological functor from a triangulated category $\mathcal{D}$ to an abelian category $\mathcal{A}$, see Definition 13.3.5. The subcategory $\operatorname{Ker}(H)$ of $\mathcal{D}$ is a strictly full saturated triangulated subcategory of $\mathcal{D}$ whose corresponding saturated multiplicative system (see Lemma 13.6.10) is the set

$$
S=\left\{f \in \operatorname{Arrows}(\mathcal{D}) \mid H^{i}(f) \text { is an isomorphism for all } i \in \mathbf{Z}\right\} .
$$

The functor $H$ factors through the quotient functor $Q: \mathcal{D} \rightarrow \mathcal{D} / \operatorname{Ker}(H)$.
Proof. The category $\operatorname{Ker}(H)$ is a strictly full saturated triangulated subcategory of $\mathcal{D}$ by Lemma 13.6.3. The set $S$ is a saturated multiplicative system compatible with the triangulated structure by Lemma 13.5.4 Recall that the multiplicative system corresponding to $\operatorname{Ker}(H)$ is the set

$$
\left\{\begin{array}{c}
f \in \operatorname{Arrows}(\mathcal{D}) \text { such that there exists a distinguished triangle } \\
(X, Y, Z, f, g, h) \text { with } H^{i}(Z)=0 \text { for all } i
\end{array}\right\}
$$

By the long exact cohomology sequence, see 13.3.5.1), it is clear that $f$ is an element of this set if and only if $f$ is an element of $S$. Finally, the factorization of $H$ through $Q$ is a consequence of Lemma 13.6.8

It is clear that in the lemma above the factorization of $H$ through $\mathcal{D} / \operatorname{Ker}(H)$ is the universal factorization. Namely, if $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ is an exact functor of triangulated categories and if there exists a homological functor $H^{\prime}: \mathcal{D}^{\prime} \rightarrow \mathcal{A}$ such that $H \cong$ $H^{\prime} \circ F$, then $F$ factors through the quotient functor $Q: \mathcal{D} \rightarrow \mathcal{D} / \operatorname{Ker}(H)$.

### 13.7. Adjoints for exact functors

0A8C Results on adjoint functors between triangulated categories.
0A8D Lemma 13.7.1. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor between triangulated categories. If $F$ has a right adjoint, then it is an exact functor.
Proof. Let $G$ be a right adjoint. Let $X$ be an object of $\mathcal{D}$ and $A$ an object of $\mathcal{D}^{\prime}$. Since $F$ is an exact functor we see that

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{D}}(X, G(A[1]) & =\operatorname{Mor}_{\mathcal{D}^{\prime}}(F(X), A[1]) \\
& =\operatorname{Mor}_{\mathcal{D}^{\prime}}(F(X)[-1], A) \\
& =\operatorname{Mor}_{\mathcal{D}^{\prime}}(F(X[-1]), A) \\
& =\operatorname{Mor}_{\mathcal{D}}(X[-1], G(A)) \\
& =\operatorname{Mor}_{\mathcal{D}}(X, G(A)[1])
\end{aligned}
$$

By Yoneda's lemma (Categories, Lemma 4.3.5 we obtain a canonical isomorphism $G(A)[1]=G(A[1])$. Let $A \rightarrow B \rightarrow C \rightarrow A[1]$ be a distinguished triangle in $\mathcal{D}^{\prime}$. Choose a distinguished triangle

$$
G(A) \rightarrow G(B) \rightarrow X \rightarrow G(A)[1]
$$

in $\mathcal{D}$. Then $F(G(A)) \rightarrow F(G(B)) \rightarrow F(X) \rightarrow F(G(A))[1]$ is a distinguished triangle in $\mathcal{D}^{\prime}$. By TR3 we can choose a morphism of distinguished triangles

Since $G$ is the adjoint the new morphism determines a morphism $X \rightarrow G(C)$ such that the diagram

commutes. Applying the cohomological functor $\operatorname{Hom}_{\mathcal{D}^{\prime}}(W,-)$ for an object $W$ of $\mathcal{D}^{\prime}$ we deduce from the 5 lemma that

$$
\operatorname{Hom}_{\mathcal{D}^{\prime}}(W, X) \rightarrow \operatorname{Hom}_{\mathcal{D}^{\prime}}(W, G(C))
$$

is a bijection and using the Yoneda lemma once more we conclude that $X \rightarrow G(C)$ is an isomorphism. Hence we conclude that $G(A) \rightarrow G(B) \rightarrow G(C) \rightarrow G(A)[1]$ is a distinguished triangle which is what we wanted to show.

09J1 Lemma 13.7.2. Let $\mathcal{D}, \mathcal{D}^{\prime}$ be triangulated categories. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ and $G: \mathcal{D}^{\prime} \rightarrow \mathcal{D}$ be functors. Assume that
(1) $F$ and $G$ are exact functors,
(2) $F$ is fully faithful,
(3) $G$ is a right adjoint to $F$, and
(4) the kernel of $G$ is zero.

Then $F$ is an equivalence of categories.

Proof. Since $F$ is fully faithful the adjunction map id $\rightarrow G \circ F$ is an isomorphism (Categories, Lemma 4.24.3). Let $X$ be an object of $\mathcal{D}^{\prime}$. Choose a distinguished triangle

$$
F(G(X)) \rightarrow X \rightarrow Y \rightarrow F(G(X))[1]
$$

in $\mathcal{D}^{\prime}$. Applying $G$ and using that $G(F(G(X)))=G(X)$ we find a distinguished triangle

$$
G(X) \rightarrow G(X) \rightarrow G(Y) \rightarrow G(X)[1]
$$

Hence $G(Y)=0$. Thus $Y=0$. Thus $F(G(X)) \rightarrow X$ is an isomorphism.

### 13.8. The homotopy category

$05 \mathrm{RN} \quad$ Let $\mathcal{A}$ be an additive category. The homotopy category $K(\mathcal{A})$ of $\mathcal{A}$ is the category of complexes of $\mathcal{A}$ with morphisms given by morphisms of complexes up to homotopy. Here is the formal definition.

013H Definition 13.8.1. Let $\mathcal{A}$ be an additive category.
(1) We set $\operatorname{Comp}(\mathcal{A})=\operatorname{CoCh}(\mathcal{A})$ be the category of (cochain) complexes.
(2) A complex $K^{\bullet}$ is said to be bounded below if $K^{n}=0$ for all $n \ll 0$.
(3) A complex $K^{\bullet}$ is said to be bounded above if $K^{n}=0$ for all $n \gg 0$.
(4) A complex $K^{\bullet}$ is said to be bounded if $K^{n}=0$ for all $|n| \gg 0$.
(5) We let $\operatorname{Comp}^{+}(\mathcal{A}), \operatorname{Comp}^{-}(\mathcal{A})$, resp. $\operatorname{Comp}^{b}(\mathcal{A})$ be the full subcategory of $\operatorname{Comp}(\mathcal{A})$ whose objects are the complexes which are bounded below, bounded above, resp. bounded.
(6) We let $K(\mathcal{A})$ be the category with the same objects as $\operatorname{Comp}(\mathcal{A})$ but as morphisms homotopy classes of maps of complexes (see Homology, Lemma 12.12.7).
(7) We let $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, resp. $K^{b}(\mathcal{A})$ be the full subcategory of $K(\mathcal{A})$ whose objects are bounded below, bounded above, resp. bounded complexes of $\mathcal{A}$.

It will turn out that the categories $K(\mathcal{A}), K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, and $K^{b}(\mathcal{A})$ are triangulated categories. To prove this we first develop some machinery related to cones and split exact sequences.

### 13.9. Cones and termwise split sequences

014 D Let $\mathcal{A}$ be an additive category, and let $K(\mathcal{A})$ denote the category of complexes of $\mathcal{A}$ with morphisms given by morphisms of complexes up to homotopy. Note that the shift functors $[n]$ on complexes, see Homology, Definition 12.14.7, give rise to functors $[n]: K(\mathcal{A}) \rightarrow K(\mathcal{A})$ such that $[n] \circ[m]=[n+m]$ and $[0]=\mathrm{id}$.

014E Definition 13.9.1. Let $\mathcal{A}$ be an additive category. Let $f: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of complexes of $\mathcal{A}$. The cone of $f$ is the complex $C(f)^{\bullet}$ given by $C(f)^{n}=$ $L^{n} \oplus K^{n+1}$ and differential

$$
d_{C(f)}^{n}=\left(\begin{array}{cc}
d_{L}^{n} & f^{n+1} \\
0 & -d_{K}^{n+1}
\end{array}\right)
$$

It comes equipped with canonical morphisms of complexes $i: L^{\bullet} \rightarrow C(f)^{\bullet}$ and $p: C(f)^{\bullet} \rightarrow K^{\bullet}[1]$ induced by the obvious maps $L^{n} \rightarrow C(f)^{n} \rightarrow K^{n+1}$.

In other words $(K, L, C(f), f, i, p)$ forms a triangle:

$$
K^{\bullet} \rightarrow L^{\bullet} \rightarrow C(f)^{\bullet} \rightarrow K^{\bullet}[1]
$$

The formation of this triangle is functorial in the following sense.
014F Lemma 13.9.2. Suppose that

is a diagram of morphisms of complexes which is commutative up to homotopy. Then there exists a morphism $c: C\left(f_{1}\right)^{\bullet} \rightarrow C\left(f_{2}\right)^{\bullet}$ which gives rise to a morphism of triangles $(a, b, c):\left(K_{1}^{\bullet}, L_{1}^{\bullet}, C\left(f_{1}\right)^{\bullet}, f_{1}, i_{1}, p_{1}\right) \rightarrow\left(K_{2}^{\bullet}, L_{2}^{\bullet}, C\left(f_{2}\right)^{\bullet}, f_{2}, i_{2}, p_{2}\right)$ of $K(\mathcal{A})$.

Proof. Let $h^{n}: K_{1}^{n} \rightarrow L_{2}^{n-1}$ be a family of morphisms such that $b \circ f_{1}-f_{2} \circ a=$ $d \circ h+h \circ d$. Define $c^{n}$ by the matrix

$$
c^{n}=\left(\begin{array}{cc}
b^{n} & h^{n+1} \\
0 & a^{n+1}
\end{array}\right): L_{1}^{n} \oplus K_{1}^{n+1} \rightarrow L_{2}^{n} \oplus K_{2}^{n+1}
$$

A matrix computation show that $c$ is a morphism of complexes. It is trivial that $c \circ i_{1}=i_{2} \circ b$, and it is trivial also to check that $p_{2} \circ c=a \circ p_{1}$.

Note that the morphism $c: C\left(f_{1}\right)^{\bullet} \rightarrow C\left(f_{2}\right)^{\bullet}$ constructed in the proof of Lemma 13.9 .2 in general depends on the chosen homotopy $h$ between $f_{2} \circ a$ and $b \circ f_{1}$.

08RI Lemma 13.9.3. Suppose that $f: K^{\bullet} \rightarrow L^{\bullet}$ and $g: L^{\bullet} \rightarrow M^{\bullet}$ are morphisms of complexes such that $g \circ f$ is homotopic to zero. Then $g$ factors through a morphism $C(f)^{\bullet} \rightarrow M^{\bullet}$ of $K(\mathcal{A})$.

Proof. The assumptions say that the diagram

commutes up to homotopy. Since the cone on $0 \rightarrow M^{\bullet}$ is $M^{\bullet}$ the map $C(f)^{\bullet} \rightarrow$ $C\left(0 \rightarrow M^{\bullet}\right)=M^{\bullet}$ of Lemma 13.9 .2 is the desired map.

Note that the morphism $C(f)^{\bullet} \rightarrow M^{\bullet}$ constructed in the proof of Lemma 13.9.3 in general depends on the chosen homotopy.

014G Definition 13.9.4. Let $\mathcal{A}$ be an additive category. A termwise split injection $\alpha: A^{\bullet} \rightarrow B^{\bullet}$ is a morphism of complexes such that each $A^{n} \rightarrow B^{n}$ is isomorphic to the inclusion of a direct summand. A termwise split surjection $\beta: B^{\bullet} \rightarrow C^{\bullet}$ is a morphism of complexes such that each $B^{n} \rightarrow C^{n}$ is isomorphic to the projection onto a direct summand.

014H Lemma 13.9.5. Let $\mathcal{A}$ be an additive category. Let

be a diagram of morphisms of complexes commuting up to homotopy. If $f$ is a split injection, then $b$ is homotopic to a morphism which makes the diagram commute. If $g$ is a split surjection, then $a$ is homotopic to a morphism which makes the diagram commute.

Proof. Let $h^{n}: A^{n} \rightarrow D^{n-1}$ be a collection of morphisms such that $b f-g a=$ $d h+h d$. Suppose that $\pi^{n}: B^{n} \rightarrow A^{n}$ are morphisms splitting the morphisms $f^{n}$. Take $b^{\prime}=b-d h \pi-h \pi d$. Suppose $s^{n}: D^{n} \rightarrow C^{n}$ are morphisms splitting the morphisms $g^{n}: C^{n} \rightarrow D^{n}$. Take $a^{\prime}=a+d s h+s h d$. Computations omitted.

The following lemma can be used to replace a morphism of complexes by a morphism where in each degree the map is the injection of a direct summand.

013N Lemma 13.9.6. Let $\mathcal{A}$ be an additive category. Let $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of complexes of $\mathcal{A}$. There exists a factorization

such that
(1) $\tilde{\alpha}$ is a termwise split injection (see Definition 13.9.4),
(2) there is a map of complexes $s: L^{\bullet} \rightarrow \tilde{L}^{\bullet}$ such that $\pi \circ s=i d_{L} \bullet$ and such that $s \circ \pi$ is homotopic to $i d_{\tilde{L} \bullet} \cdot$
Moreover, if both $K^{\bullet}$ and $L^{\bullet}$ are in $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, or $K^{b}(\mathcal{A})$, then so is $\tilde{L}^{\bullet}$.
Proof. We set

$$
\tilde{L}^{n}=L^{n} \oplus K^{n} \oplus K^{n+1}
$$

and we define

$$
d_{\tilde{L}}^{n}=\left(\begin{array}{ccc}
d_{L}^{n} & 0 & 0 \\
0 & d_{K}^{n} & \operatorname{id}_{K^{n+1}} \\
0 & 0 & -d_{K}^{n+1}
\end{array}\right)
$$

In other words, $\tilde{L}^{\bullet}=L^{\bullet} \oplus C\left(1_{K} \bullet\right)$. Moreover, we set

$$
\tilde{\alpha}=\left(\begin{array}{c}
\alpha \\
\mathrm{id}_{K^{n}} \\
0
\end{array}\right)
$$

which is clearly a split injection. It is also clear that it defines a morphism of complexes. We define

$$
\pi=\left(\begin{array}{lll}
\mathrm{id}_{L^{n}} & 0 & 0
\end{array}\right)
$$

so that clearly $\pi \circ \tilde{\alpha}=\alpha$. We set

$$
s=\left(\begin{array}{c}
\mathrm{id}_{L^{n}} \\
0 \\
0
\end{array}\right)
$$

so that $\pi \circ s=\operatorname{id}_{\tilde{L}} \cdot \bullet$. Finally, let $h^{n}: \tilde{L}^{n} \rightarrow \tilde{L}^{n-1}$ be the map which maps the summand $K^{n}$ of $\tilde{L}^{n}$ via the identity morphism to the summand $K^{n}$ of $\tilde{L}^{n-1}$. Then it is a trivial matter (see computations in remark below) to prove that

$$
\operatorname{id}_{\tilde{L} \bullet}-s \circ \pi=d \circ h+h \circ d
$$

which finishes the proof of the lemma.
013 O Remark 13.9.7. To see the last displayed equality in the proof above we can argue with elements as follows. We have $s \pi\left(l, k, k^{+}\right)=(l, 0,0)$. Hence the morphism of the left hand side maps $\left(l, k, k^{+}\right)$to $\left(0, k, k^{+}\right)$. On the other hand $h\left(l, k, k^{+}\right)=(0,0, k)$ and $d\left(l, k, k^{+}\right)=\left(d l, d k+k^{+},-d k^{+}\right)$. Hence $(d h+h d)\left(l, k, k^{+}\right)=d(0,0, k)+$ $h\left(d l, d k+k^{+},-d k^{+}\right)=(0, k,-d k)+\left(0,0, d k+k^{+}\right)=\left(0, k, k^{+}\right)$as desired.

0642 Lemma 13.9.8. Let $\mathcal{A}$ be an additive category. Let $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of complexes of $\mathcal{A}$. There exists a factorization

such that
(1) $\tilde{\alpha}$ is a termwise split surjection (see Definition 13.9.4),
(2) there is a map of complexes $s: \tilde{K}^{\bullet} \rightarrow K^{\bullet}$ such that $s \circ i=i d_{K} \bullet$ and such that $i \circ s$ is homotopic to $i d_{\tilde{K}} \cdot$.
Moreover, if both $K^{\bullet}$ and $L^{\bullet}$ are in $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, or $K^{b}(\mathcal{A})$, then so is $\tilde{K}^{\bullet}$.
Proof. Dual to Lemma 13.9.6. Take

$$
\tilde{K}^{n}=K^{n} \oplus L^{n-1} \oplus L^{n}
$$

and we define

$$
d_{\tilde{K}}^{n}=\left(\begin{array}{ccc}
d_{K}^{n} & 0 & 0 \\
0 & -d_{L}^{n-1} & \mathrm{id}_{L^{n}} \\
0 & 0 & d_{L}^{n}
\end{array}\right)
$$

in other words $\tilde{K}^{\bullet}=K^{\bullet} \oplus C\left(1_{L \bullet[-1]}\right)$. Moreover, we set

$$
\tilde{\alpha}=\left(\begin{array}{lll}
\alpha & 0 & \operatorname{id}_{L^{n}}
\end{array}\right)
$$

which is clearly a split surjection. It is also clear that it defines a morphism of complexes. We define

$$
i=\left(\begin{array}{c}
\mathrm{id}_{K^{n}} \\
0 \\
0
\end{array}\right)
$$

so that clearly $\tilde{\alpha} \circ i=\alpha$. We set

$$
s=\left(\begin{array}{lll}
\mathrm{id}_{K^{n}} & 0 & 0
\end{array}\right)
$$

so that $s \circ i=\operatorname{id}_{K}$ •. Finally, let $h^{n}: \tilde{K}^{n} \rightarrow \tilde{K}^{n-1}$ be the map which maps the summand $L^{n-1}$ of $\tilde{K}^{n}$ via the identity morphism to the summand $L^{n-1}$ of $\tilde{K}^{n-1}$. Then it is a trivial matter to prove that

$$
\mathrm{id}_{\tilde{K} \bullet}-i \circ s=d \circ h+h \circ d
$$

which finishes the proof of the lemma.

014I Definition 13.9.9. Let $\mathcal{A}$ be an additive category. A termwise split sequence of complexes of $\mathcal{A}$ is a complex of complexes

$$
0 \rightarrow A^{\bullet} \xrightarrow{\alpha} B^{\bullet} \xrightarrow{\beta} C^{\bullet} \rightarrow 0
$$

together with given direct sum decompositions $B^{n}=A^{n} \oplus C^{n}$ compatible with $\alpha^{n}$ and $\beta^{n}$. We often write $s^{n}: C^{n} \rightarrow B^{n}$ and $\pi^{n}: B^{n} \rightarrow A^{n}$ for the maps induced by the direct sum decompositions. According to Homology, Lemma 12.14 .10 we get an associated morphism of complexes

$$
\delta: C^{\bullet} \longrightarrow A^{\bullet}[1]
$$

which in degree $n$ is the map $\pi^{n+1} \circ d_{B}^{n} \circ s^{n}$. In other words $\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right)$ forms a triangle

$$
A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow A^{\bullet}[1]
$$

This will be the triangle associated to the termwise split sequence of complexes.
05SS Lemma 13.9.10. Let $\mathcal{A}$ be an additive category. Let $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ be termwise split exact sequences as in Definition 13.9.9. Let $\left(\pi^{\prime}\right)^{n},\left(s^{\prime}\right)^{n}$ be a second collection of splittings. Denote $\delta^{\prime}: C^{\bullet} \longrightarrow A^{\bullet}[1]$ the morphism associated to this second set of splittings. Then

$$
(1,1,1):\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right) \longrightarrow\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta^{\prime}\right)
$$

is an isomorphism of triangles in $K(\mathcal{A})$.
Proof. The statement simply means that $\delta$ and $\delta^{\prime}$ are homotopic maps of complexes. This is Homology, Lemma 12.14.12.

014J Remark 13.9.11. Let $\mathcal{A}$ be an additive category. Let $0 \rightarrow A_{i}^{\bullet} \rightarrow B_{i}^{\bullet} \rightarrow C_{i}^{\bullet} \rightarrow 0$, $i=1,2$ be termwise split exact sequences. Suppose that $a: A_{1}^{\bullet} \rightarrow A_{2}^{\bullet}, b: B_{1}^{\bullet} \rightarrow B_{2}^{\bullet}$, and $c: C_{1}^{\bullet} \rightarrow C_{2}^{\bullet}$ are morphisms of complexes such that

commutes in $K(\mathcal{A})$. In general, there does not exist a morphism $b^{\prime}: B_{1}^{\bullet} \rightarrow B_{2}^{\bullet}$ which is homotopic to $b$ such that the diagram above commutes in the category of complexes. Namely, consider Examples, Equation 88.54.0.1). If we could replace the middle map there by a homotopic one such that the diagram commutes, then we would have additivity of traces which we do not.

086L Lemma 13.9.12. Let $\mathcal{A}$ be an additive category. Let $0 \rightarrow A_{i}^{\bullet} \rightarrow B_{i}^{\bullet} \rightarrow C_{i}^{\bullet} \rightarrow 0$, $i=1,2,3$ be termwise split exact sequences of complexes. Let $b: B_{1}^{\bullet} \rightarrow B_{2}^{\bullet}$ and $b^{\prime}: B_{2}^{\bullet} \rightarrow B_{3}^{\bullet}$ be morphisms of complexes such that

and

commute in $K(\mathcal{A})$. Then $b^{\prime} \circ b=0$ in $K(\mathcal{A})$.

Proof. By Lemma 13.9 .5 we can replace $b$ and $b^{\prime}$ by homotopic maps such that the right square of the left diagram commutes and the left square of the right diagram commutes. In other words, we have $\operatorname{Im}\left(b^{n}\right) \subset \operatorname{Im}\left(A_{2}^{n} \rightarrow B_{2}^{n}\right)$ and $\operatorname{Ker}\left(\left(b^{\prime}\right)^{n}\right) \supset$ $\operatorname{Im}\left(A_{2}^{n} \rightarrow B_{2}^{n}\right)$. Then $b \circ b^{\prime}=0$ as a map of complexes.
014K Lemma 13.9.13. Let $\mathcal{A}$ be an additive category. Let $f_{1}: K_{1}^{\bullet} \rightarrow L_{1}^{\bullet}$ and $f_{2}: K_{2}^{\bullet \bullet} \rightarrow$ $L_{2}^{*}$ be morphisms of complexes. Let

$$
(a, b, c):\left(K_{1}^{\bullet}, L_{1}^{\bullet}, C\left(f_{1}\right)^{\bullet}, f_{1}, i_{1}, p_{1}\right) \longrightarrow\left(K_{2}^{\bullet}, L_{2}^{\bullet}, C\left(f_{2}\right)^{\bullet}, f_{2}, i_{2}, p_{2}\right)
$$

be any morphism of triangles of $K(\mathcal{A})$. If $a$ and $b$ are homotopy equivalences then so is $c$.

Proof. Let $a^{-1}: K_{2}^{\bullet} \rightarrow K_{1}^{\bullet}$ be a morphism of complexes which is inverse to $a$ in $K(\mathcal{A})$. Let $b^{-1}: L_{2}^{\bullet} \rightarrow L_{1}^{\bullet}$ be a morphism of complexes which is inverse to $b$ in $K(\mathcal{A})$. Let $c^{\prime}: C\left(f_{2}\right)^{\bullet} \rightarrow C\left(f_{1}\right)^{\bullet}$ be the morphism from Lemma 13.9 .2 applied to $f_{1} \circ a^{-1}=b^{-1} \circ f_{2}$. If we can show that $c \circ c^{\prime}$ and $c^{\prime} \circ c$ are isomorphisms in $K(\mathcal{A})$ then we win. Hence it suffices to prove the following: Given a morphism of triangles $(1,1, c):\left(K^{\bullet}, L^{\bullet}, C(f)^{\bullet}, f, i, p\right)$ in $K(\mathcal{A})$ the morphism $c$ is an isomorphism in $K(\mathcal{A})$. By assumption the two squares in the diagram

commute up to homotopy. By construction of $C(f)^{\bullet}$ the rows form termwise split sequences of complexes. Thus we see that $(c-1)^{2}=0$ in $K(\mathcal{A})$ by Lemma 13.9.12 Hence $c$ is an isomorphism in $K(\mathcal{A})$ with inverse $2-c$.

Hence if $a$ and $b$ are homotopy equivalences then the resulting morphism of triangles is an isomorphism of triangles in $K(\mathcal{A})$. It turns out that the collection of triangles of $K(\mathcal{A})$ given by cones and the collection of triangles of $K(\mathcal{A})$ given by termwise split sequences of complexes are the same up to isomorphisms, at least up to sign!

014L Lemma 13.9.14. Let $\mathcal{A}$ be an additive category.
(1) Given a termwise split sequence of complexes $\left(\alpha: A^{\bullet} \rightarrow B^{\bullet}, \beta: B^{\bullet} \rightarrow\right.$ $\left.C^{\bullet}, s^{n}, \pi^{n}\right)$ there exists a homotopy equivalence $C(\alpha)^{\bullet} \rightarrow C^{\bullet}$ such that the diagram

defines an isomorphism of triangles in $K(\mathcal{A})$.
(2) Given a morphism of complexes $f: K^{\bullet} \rightarrow L^{\bullet}$ there exists an isomorphism of triangles

where the upper triangle is the triangle associated to a termwise split exact sequence $K^{\bullet} \rightarrow \tilde{L}^{\bullet} \rightarrow M^{\bullet}$.
Proof. Proof of (1). We have $C(\alpha)^{n}=B^{n} \oplus A^{n+1}$ and we simply define $C(\alpha)^{n} \rightarrow$ $C^{n}$ via the projection onto $B^{n}$ followed by $\beta^{n}$. This defines a morphism of complexes because the compositions $A^{n+1} \rightarrow B^{n+1} \rightarrow C^{n+1}$ are zero. To get a homotopy inverse we take $C^{\bullet} \rightarrow C(\alpha)^{\bullet}$ given by $\left(s^{n},-\delta^{n}\right)$ in degree $n$. This is a morphism of complexes because the morphism $\delta^{n}$ can be characterized as the unique morphism $C^{n} \rightarrow A^{n+1}$ such that $d \circ s^{n}-s^{n+1} \circ d=\alpha \circ \delta^{n}$, see proof of Homology, Lemma 12.14.10. The composition $C^{\bullet} \rightarrow C(f)^{\bullet} \rightarrow C^{\bullet}$ is the identity. The composition $C(f)^{\bullet} \rightarrow C^{\bullet} \rightarrow C(f)^{\bullet}$ is equal to the morphism

$$
\left(\begin{array}{cc}
s^{n} \circ \beta^{n} & 0 \\
-\delta^{n} \circ \beta^{n} & 0
\end{array}\right)
$$

To see that this is homotopic to the identity map use the homotopy $h^{n}: C(\alpha)^{n} \rightarrow$ $C(\alpha)^{n-1}$ given by the matrix

$$
\left(\begin{array}{cc}
0 & 0 \\
\pi^{n} & 0
\end{array}\right): C(\alpha)^{n}=B^{n} \oplus A^{n+1} \rightarrow B^{n-1} \oplus A^{n}=C(\alpha)^{n-1}
$$

It is trivial to verify that

$$
\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)-\binom{s^{n}}{-\delta^{n}}\left(\begin{array}{ll}
\beta^{n} & 0
\end{array}\right)=\left(\begin{array}{cc}
d & \alpha^{n} \\
0 & -d
\end{array}\right)\left(\begin{array}{cc}
0 & 0 \\
\pi^{n} & 0
\end{array}\right)+\left(\begin{array}{cc}
0 & 0 \\
\pi^{n+1} & 0
\end{array}\right)\left(\begin{array}{cc}
d & \alpha^{n+1} \\
0 & -d
\end{array}\right)
$$

To finish the proof of (1) we have to show that the morphisms $-p: C(\alpha)^{\bullet} \rightarrow A^{\bullet}[1]$ (see Definition 13.9.1) and $C(\alpha)^{\bullet} \rightarrow C^{\bullet} \rightarrow A^{\bullet}[1]$ agree up to homotopy. This is clear from the above. Namely, we can use the homotopy inverse $(s,-\delta): C^{\bullet} \rightarrow C(\alpha)^{\bullet}$ and check instead that the two maps $C^{\bullet} \rightarrow A^{\bullet}[1]$ agree. And note that $p \circ(s,-\delta)=-\delta$ as desired.
Proof of (2). We let $\tilde{f}: K^{\bullet} \rightarrow \tilde{L}^{\bullet}, s: L^{\bullet} \rightarrow \tilde{L}^{\bullet}$ and $\pi: L^{\bullet} \rightarrow L^{\bullet}$ be as in Lemma 13.9 .6 By Lemmas 13.9 .2 and 13.9 .13 the triangles $\left(K^{\bullet}, L^{\bullet}, C(f), i, p\right)$ and $\left(K^{\bullet}, \tilde{L}^{\bullet}, C(\tilde{f}), \tilde{i}, \tilde{p}\right)$ are isomorphic. Note that we can compose isomorphisms of triangles. Thus we may replace $L^{\bullet}$ by $\tilde{L}^{\bullet}$ and $f$ by $\tilde{f}$. In other words we may assume that $f$ is a termwise split injection. In this case the result follows from part (1).

014M Lemma 13.9.15. Let $\mathcal{A}$ be an additive category. Let $A_{1}^{\bullet} \rightarrow A_{2}^{\bullet} \rightarrow \ldots \rightarrow A_{n}^{\bullet}$ be a sequence of composable morphisms of complexes. There exists a commutative diagram

such that each morphism $B_{i}^{\bullet} \rightarrow B_{i+1}^{\bullet}$ is a split injection and each $B_{i}^{\bullet} \rightarrow A_{i}^{\bullet}$ is a homotopy equivalence. Moreover, if all $A_{i}^{\bullet}$ are in $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, or $K^{b}(\mathcal{A})$, then so are the $B_{i}^{\bullet}$.

Proof. The case $n=1$ is without content. Lemma 13.9 .6 is the case $n=2$. Suppose we have constructed the diagram except for $B_{n}^{\bullet}$. Apply Lemma 13.9 .6 to the composition $B_{n-1}^{\bullet} \rightarrow A_{n-1}^{\bullet} \rightarrow A_{n}^{\bullet}$. The result is a factorization $B_{n-1}^{\bullet} \rightarrow B_{n}^{\bullet} \rightarrow$ $A_{n}^{\bullet}$ as desired.

014N Lemma 13.9.16. Let $\mathcal{A}$ be an additive category. Let $\left(\alpha: A^{\bullet} \rightarrow B^{\bullet}, \beta: B^{\bullet} \rightarrow\right.$ $\left.C^{\bullet}, s^{n}, \pi^{n}\right)$ be a termwise split sequence of complexes. Let $\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right)$ be the associated triangle. Then the triangle $\left(C^{\bullet}[-1], A^{\bullet}, B^{\bullet}, \delta[-1], \alpha, \beta\right)$ is isomorphic to the triangle $\left(C^{\bullet}[-1], A^{\bullet}, C(\delta[-1])^{\bullet}, \delta[-1], i, p\right)$.

Proof. We write $B^{n}=A^{n} \oplus C^{n}$ and we identify $\alpha^{n}$ and $\beta^{n}$ with the natural inclusion and projection maps. By construction of $\delta$ we have

$$
d_{B}^{n}=\left(\begin{array}{cc}
d_{A}^{n} & \delta^{n} \\
0 & d_{C}^{n}
\end{array}\right)
$$

On the other hand the cone of $\delta[-1]: C^{\bullet}[-1] \rightarrow A^{\bullet}$ is given as $C(\delta[-1])^{n}=A^{n} \oplus C^{n}$ with differential identical with the matrix above! Whence the lemma.

014 O Lemma 13.9.17. Let $\mathcal{A}$ be an additive category. Let $f: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of complexes. The triangle $\left(L^{\bullet}, C(f)^{\bullet}, K^{\bullet}[1], i, p, f[1]\right)$ is the triangle associated to the termwise split sequence

$$
0 \rightarrow L^{\bullet} \rightarrow C(f)^{\bullet} \rightarrow K^{\bullet}[1] \rightarrow 0
$$

coming from the definition of the cone of $f$.
Proof. Immediate from the definitions.

### 13.10. Distinguished triangles in the homotopy category

014P Since we want our boundary maps in long exact sequences of cohomology to be given by the maps in the snake lemma without signs we define distinguished triangles in the homotopy category as follows.

014Q Definition 13.10.1. Let $\mathcal{A}$ be an additive category. A triangle ( $X, Y, Z, f, g, h$ ) of $K(\mathcal{A})$ is called a distinguished triangle of $K(\mathcal{A})$ if it is isomorphic to the triangle associated to a termwise split exact sequence of complexes, see Definition 13.9.9. Same definition for $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, and $K^{b}(\mathcal{A})$.

Note that according to Lemma 13.9 .14 a triangle of the form $\left(K^{\bullet}, L^{\bullet}, C(f)^{\bullet}, f, i,-p\right)$ is a distinguished triangle. This does indeed lead to a triangulated category, see Proposition 13.10.3. Before we can prove the proposition we need one more lemma in order to be able to prove TR4.

014R Lemma 13.10.2. Let $\mathcal{A}$ be an additive category. Suppose that $\alpha: A^{\bullet} \rightarrow B^{\bullet}$ and $\beta: B^{\bullet} \rightarrow C^{\bullet}$ are split injections of complexes. Then there exist distinguished triangles $\left(A^{\bullet}, B^{\bullet}, Q_{1}^{\bullet}, \alpha, p_{1}, d_{1}\right),\left(A^{\bullet}, C^{\bullet}, Q_{2}^{\bullet}, \beta \circ \alpha, p_{2}, d_{2}\right)$ and $\left(B^{\bullet}, C^{\bullet}, Q_{3}^{\bullet}, \beta, p_{3}, d_{3}\right)$ for which TR4 holds.

Proof. Say $\pi_{1}^{n}: B^{n} \rightarrow A^{n}$, and $\pi_{3}^{n}: C^{n} \rightarrow B^{n}$ are the splittings. Then also $A^{\bullet} \rightarrow C^{\bullet}$ is a split injection with splittings $\pi_{2}^{n}=\pi_{1}^{n} \circ \pi_{3}^{n}$. Let us write $Q_{1}^{\bullet}, Q_{2}^{\bullet}$ and $Q_{3}^{\bullet}$ for the "quotient" complexes. In other words, $Q_{1}^{n}=\operatorname{Ker}\left(\pi_{1}^{n}\right), Q_{3}^{n}=\operatorname{Ker}\left(\pi_{3}^{n}\right)$ and $Q_{2}^{n}=\operatorname{Ker}\left(\pi_{2}^{n}\right)$. Note that the kernels exist. Then $B^{n}=A^{n} \oplus Q_{1}^{n}$ and $C_{n}=$ $B^{n} \oplus Q_{3}^{n}$, where we think of $A^{n}$ as a subobject of $B^{n}$ and so on. This implies $C^{n}=A^{n} \oplus Q_{1}^{n} \oplus Q_{3}^{n}$. Note that $\pi_{2}^{n}=\pi_{1}^{n} \circ \pi_{3}^{n}$ is zero on both $Q_{1}^{n}$ and $Q_{3}^{n}$. Hence
$Q_{2}^{n}=Q_{1}^{n} \oplus Q_{3}^{n}$. Consider the commutative diagram

The rows of this diagram are termwise split exact sequences, and hence determine distinguished triangles by definition. Moreover downward arrows in the diagram above are compatible with the chosen splittings and hence define morphisms of triangles

$$
\left(A^{\bullet} \rightarrow B^{\bullet} \rightarrow Q_{1}^{\bullet} \rightarrow A^{\bullet}[1]\right) \longrightarrow\left(A^{\bullet} \rightarrow C^{\bullet} \rightarrow Q_{2}^{\bullet} \rightarrow A^{\bullet}[1]\right)
$$

and

$$
\left(A^{\bullet} \rightarrow C^{\bullet} \rightarrow Q_{2}^{\bullet} \rightarrow A^{\bullet}[1]\right) \longrightarrow\left(B^{\bullet} \rightarrow C^{\bullet} \rightarrow Q_{3}^{\bullet} \rightarrow B^{\bullet}[1]\right)
$$

Note that the splittings $Q_{3}^{n} \rightarrow C^{n}$ of the bottom split sequence in the diagram provides a splitting for the split sequence $0 \rightarrow Q_{1}^{\bullet} \rightarrow Q_{2}^{\bullet} \rightarrow Q_{3}^{\bullet} \rightarrow 0$ upon composing with $C^{n} \rightarrow Q_{2}^{n}$. It follows easily from this that the morphism $\delta: Q_{3}^{\bullet} \rightarrow Q_{1}^{\bullet}[1]$ in the corresponding distinguished triangle

$$
\left(Q_{1}^{\bullet} \rightarrow Q_{2}^{\bullet} \rightarrow Q_{3}^{\bullet} \rightarrow Q_{1}^{\bullet}[1]\right)
$$

is equal to the composition $Q_{3}^{\bullet} \rightarrow B^{\bullet}[1] \rightarrow Q_{1}^{\bullet}[1]$. Hence we get a structure as in the conclusion of axiom TR4.

014S Proposition 13.10.3. Let $\mathcal{A}$ be an additive category. The category $K(\mathcal{A})$ of complexes up to homotopy with its natural translation functors and distinguished triangles as defined above is a triangulated category.

Proof. Proof of TR1. By definition every triangle isomorphic to a distinguished one is distinguished. Also, any triangle ( $A^{\bullet}, A^{\bullet}, 0,1,0,0$ ) is distinguished since $0 \rightarrow A^{\bullet} \rightarrow A^{\bullet} \rightarrow 0 \rightarrow 0$ is a termwise split sequence of complexes. Finally, given any morphism of complexes $f: K^{\bullet} \rightarrow L^{\bullet}$ the triangle $(K, L, C(f), f, i,-p)$ is distinguished by Lemma 13.9.14.
Proof of TR2. Let $(X, Y, Z, f, g, h)$ be a triangle. Assume $(Y, Z, X[1], g, h,-f[1])$ is distinguished. Then there exists a termwise split sequence of complexes $A^{\bullet} \rightarrow$ $B^{\bullet} \rightarrow C^{\bullet}$ such that the associated triangle $\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right)$ is isomorphic to $(Y, Z, X[1], g, h,-f[1])$. Rotating back we see that $(X, Y, Z, f, g, h)$ is isomorphic to $\left(C^{\bullet}[-1], A^{\bullet}, B^{\bullet},-\delta[-1], \alpha, \beta\right)$. It follows from Lemma 13.9.16 that the triangle $\left(C^{\bullet}[-1], A^{\bullet}, B^{\bullet}, \delta[-1], \alpha, \beta\right)$ is isomorphic to $\left(C^{\bullet}[-1], A^{\bullet}, C(\delta[-1])^{\bullet}, \delta[-1], i, p\right)$. Precomposing the previous isomorphism of triangles with -1 on $Y$ it follows that $(X, Y, Z, f, g, h)$ is isomorphic to $\left(C^{\bullet}[-1], A^{\bullet}, C(\delta[-1])^{\bullet}, \delta[-1], i,-p\right)$. Hence it is distinguished by Lemma 13.9.14. On the other hand, suppose that ( $X, Y, Z, f, g, h$ ) is distinguished. By Lemma 13.9.14 this means that it is isomorphic to a triangle of the form $\left(K^{\bullet}, L^{\bullet}, C(f), f, i,-p\right)$ for some morphism of complexes $f$. Then the rotated triangle $(Y, Z, X[1], g, h,-f[1])$ is isomorphic to $\left(L^{\bullet}, C(f), K^{\bullet}[1], i,-p,-f[1]\right)$ which is isomorphic to the triangle $\left(L^{\bullet}, C(f), K^{\bullet}[1], i, p, f[1]\right)$. By Lemma 13.9.17 this triangle is distinguished. Hence $(Y, Z, X[1], g, h,-f[1])$ is distinguished as desired.
Proof of TR3. Let $(X, Y, Z, f, g, h)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)$ be distinguished triangles of $K(\mathcal{A})$ and let $a: X \rightarrow X^{\prime}$ and $b: Y \rightarrow Y^{\prime}$ be morphisms such that $f^{\prime} \circ a=b \circ$
$f$. By Lemma 13.9 .14 we may assume that $(X, Y, Z, f, g, h)=(X, Y, C(f), f, i,-p)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)=\left(X^{\prime}, Y^{\prime}, C\left(f^{\prime}\right), f^{\prime}, i^{\prime},-p^{\prime}\right)$. At this point we simply apply Lemma 13.9 .2 to the commutative diagram given by $f, f^{\prime}, a, b$.
Proof of TR4. At this point we know that $K(\mathcal{A})$ is a pre-triangulated category. Hence we can use Lemma 13.4.13. Let $A^{\bullet} \rightarrow B^{\bullet}$ and $B^{\bullet} \rightarrow C^{\bullet}$ be composable morphisms of $K(\mathcal{A})$. By Lemma 13.9 .15 we may assume that $A^{\bullet} \rightarrow B^{\bullet}$ and $B^{\bullet} \rightarrow$ $C^{\bullet}$ are split injective morphisms. In this case the result follows from Lemma 13.10.2.

05RP Remark 13.10.4. Let $\mathcal{A}$ be an additive category. Exactly the same proof as the proof of Proposition 13.10 .3 shows that the categories $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, and $K^{b}(\mathcal{A})$ are triangulated categories. Namely, the cone of a morphisms between bounded (above, below) is bounded (above, below). But we prove below that these are triangulated subcategories of $K(\mathcal{A})$ which gives another proof.

05RQ Lemma 13.10.5. Let $\mathcal{A}$ be an additive subcategory. The categories $K^{+}(\mathcal{A})$, $K^{-}(\mathcal{A})$, and $K^{b}(\mathcal{A})$ are full triangulated subcategories of $K(\mathcal{A})$.

Proof. Each of the categories mentioned is a full additive subcategory. We use the criterion of Lemma 13.4 .14 to show that they are triangulated subcategories. It is clear that each of the categories $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, and $K^{b}(\mathcal{A})$ is preserved under the shift functors $[1],[-1]$. Finally, suppose that $f: A^{\bullet} \rightarrow B^{\bullet}$ is a morphism in $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, or $K^{b}(\mathcal{A})$. Then $\left(A^{\bullet}, B^{\bullet}, C(f)^{\bullet}, f, i,-p\right)$ is a distinguished triangle of $K(\mathcal{A})$ with $C(f)^{\bullet} \in K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, or $K^{b}(\mathcal{A})$ as is clear from the construction of the cone. Thus the lemma is proved. (Alternatively, $K^{\bullet} \rightarrow L^{\bullet}$ is isomorphic to an termwise split injection of complexes in $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, or $K^{b}(\mathcal{A})$, see Lemma 13.9 .6 and then one can directly take the associated distinguished triangle.)

014X Lemma 13.10.6. Let $\mathcal{A}, \mathcal{B}$ be additive categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor. The induced functors

$$
\begin{aligned}
F: K(\mathcal{A}) & \longrightarrow K(\mathcal{B}) \\
F: K^{+}(\mathcal{A}) & \longrightarrow K^{+}(\mathcal{B}) \\
F: K^{-}(\mathcal{A}) & \longrightarrow K^{-}(\mathcal{B}) \\
F: K^{b}(\mathcal{A}) & \longrightarrow K^{b}(\mathcal{B})
\end{aligned}
$$

are exact functors of triangulated categories.
Proof. Suppose $A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet}$ is a termwise split sequence of complexes of $\mathcal{A}$ with splittings $\left(s^{n}, \pi^{n}\right)$ and associated morphism $\delta: C^{\bullet} \rightarrow A^{\bullet}[1]$, see Definition 13.9.9. Then $F\left(A^{\bullet}\right) \rightarrow F\left(B^{\bullet}\right) \rightarrow F\left(C^{\bullet}\right)$ is a termwise split sequence of complexes with splittings $\left(F\left(s^{n}\right), F\left(\pi^{n}\right)\right)$ and associated morphism $F(\delta): F\left(C^{\bullet}\right) \rightarrow F\left(A^{\bullet}\right)[1]$. Thus $F$ transforms distinguished triangles into distinguished triangles.

### 13.11. Derived categories

05 RR In this section we construct the derived category of an abelian category $\mathcal{A}$ by inverting the quasi-isomorphisms in $K(\mathcal{A})$. Before we do this recall that the functors $H^{i}: \operatorname{Comp}(\mathcal{A}) \rightarrow \mathcal{A}$ factor through $K(\mathcal{A})$, see Homology, Lemma 12.12.11. Moreover, in Homology, Definition 12.14 .8 we have defined identifications $H^{\imath}\left(K^{\bullet}[n]\right)=$ $H^{i+n}\left(K^{\bullet}\right)$. At this point it makes sense to redefine

$$
H^{i}\left(K^{\bullet}\right)=H^{0}\left(K^{\bullet}[i]\right)
$$

in order to avoid confusion and possible sign errors.
05RS Lemma 13.11.1. Let $\mathcal{A}$ be an abelian category. The functor

$$
H^{0}: K(\mathcal{A}) \longrightarrow \mathcal{A}
$$

is homological.
Proof. Because $H^{0}$ is a functor, and by our definition of distinguished triangles it suffices to prove that given a termwise split short exact sequence of complexes $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ the sequence $H^{0}\left(A^{\bullet}\right) \rightarrow H^{0}\left(B^{\bullet}\right) \rightarrow H^{0}\left(C^{\bullet}\right)$ is exact. This follows from Homology, Lemma 12.12.12.

In particular, this lemma implies that a distinguished triangle $(X, Y, Z, f, g, h)$ in $K(\mathcal{A})$ gives rise to a long exact cohomology sequence

05ST

$$
\begin{equation*}
\ldots \longrightarrow H^{i}(X) \xrightarrow{H^{i}(f)} H^{i}(Y) \xrightarrow{H^{i}(g)} H^{i}(Z) \xrightarrow{H^{i}(h)} H^{i+1}(X) \longrightarrow \tag{13.11.1.1}
\end{equation*}
$$

see 13.3.5.1. Moreover, there is a compatibility with the long exact sequence of cohomology associated to a short exact sequence of complexes (insert future reference here). For example, if $\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right)$ is the distinguished triangle associated to a termwise split exact sequence of complexes (see Definition 13.9.9), then the cohomology sequence above agrees with the one defined using the snake lemma, see Homology, Lemma 12.12 .12 and for agreement of sequences, see Homology, Lemma 12.14.11.

Recall that a complex $K^{\bullet}$ is acyclic if $H^{i}\left(K^{\bullet}\right)=0$ for all $i \in \mathbf{Z}$. Moreover, recall that a morphism of complexes $f: K^{\bullet} \rightarrow L^{\bullet}$ is a quasi-isomorphism if and only if $H^{i}(f)$ is an isomorphism for all $i$. See Homology, Definition 12.12.10.
05RT Lemma 13.11.2. Let $\mathcal{A}$ be an abelian category. The full subcategory $\operatorname{Ac}(\mathcal{A})$ of $K(\mathcal{A})$ consisting of acyclic complexes is a strictly full saturated triangulated subcategory of $K(\mathcal{A})$. The corresponding saturated multiplicative system (see Lemma 13.6.10) of $K(\mathcal{A})$ is the set $\operatorname{Qis}(\mathcal{A})$ of quasi-isomorphisms. In particular, the kernel of the localization functor $Q: K(\mathcal{A}) \rightarrow \operatorname{Qis}(\mathcal{A})^{-1} K(\mathcal{A})$ is $A c(\mathcal{A})$ and the functor $H^{0}$ factors through $Q$.

Proof. We know that $H^{0}$ is a homological functor by Lemma 13.11.1. Thus this lemma is a special case of Lemma 13.6.11.

05RU Definition 13.11.3. Let $\mathcal{A}$ be an abelian category. Let $\operatorname{Ac}(\mathcal{A})$ and $\operatorname{Qis}(\mathcal{A})$ be as in Lemma 13.11.2 The derived category of $\mathcal{A}$ is the triangulated category

$$
D(\mathcal{A})=K(\mathcal{A}) / \operatorname{Ac}(\mathcal{A})=\operatorname{Qis}(\mathcal{A})^{-1} K(\mathcal{A})
$$

We denote $H^{0}: D(\mathcal{A}) \rightarrow \mathcal{A}$ the unique functor whose composition with the quotient functor gives back the functor $H^{0}$ defined above. Using Lemma 13.6.4 we introduce the strictly full saturated triangulated subcategories $D^{+}(\mathcal{A}), D^{-}(\mathcal{A}), D^{b}(\mathcal{A})$ whose sets of objects are

$$
\begin{aligned}
& \operatorname{Ob}\left(D^{+}(\mathcal{A})\right)=\left\{X \in \operatorname{Ob}(D(\mathcal{A})) \mid H^{n}(X)=0 \text { for all } n \ll 0\right\} \\
& \operatorname{Ob}\left(D^{-}(\mathcal{A})\right)=\left\{X \in \operatorname{Ob}(D(\mathcal{A})) \mid H^{n}(X)=0 \text { for all } n \gg 0\right\} \\
& \operatorname{Ob}\left(D^{b}(\mathcal{A})\right)=\left\{X \in \operatorname{Ob}(D(\mathcal{A})) \mid H^{n}(X)=0 \text { for all }|n| \gg 0\right\}
\end{aligned}
$$

The category $D^{b}(\mathcal{A})$ is called the bounded derived category of $\mathcal{A}$.

If $K^{\bullet}$ and $L^{\bullet}$ are complexes of $\mathcal{A}$ then we sometimes say " $K^{\bullet}$ is quasi-isomorphic to $L^{\bullet} "$ to indicate that $K^{\bullet}$ and $L^{\bullet}$ are isomorphic objects of $D(\mathcal{A})$.
09PA Remark 13.11.4. In this chapter, we consistently work with "small" abelian categories (as is the convention in the Stacks project). For a "big" abelian category $\mathcal{A}$, it isn't clear that the derived category $D(\mathcal{A})$ exists, because it isn't clear that morphisms in the derived category are sets. In fact, in general they aren't, see Examples, Lemma 88.52.1. However, if $\mathcal{A}$ is a Grothendieck abelian category, and given $K^{\bullet}, L^{\bullet}$ in $K(\mathcal{A})$, then by Injectives, Theorem 19.12 .6 there exists a quasiisomorphism $L^{\bullet} \rightarrow I^{\bullet}$ to a K-injective complex $I^{\bullet}$ and Lemma 13.29.2 shows that

$$
\operatorname{Hom}_{D(\mathcal{A})}\left(K^{\bullet}, L^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)
$$

which is a set. Some examples of Grothendieck abelian categories are the category of modules over a ring, or more generally the category of sheaves of modules on a ringed site.
Each of the variants $D^{+}(\mathcal{A}), D^{-}(\mathcal{A}), D^{b}(\mathcal{A})$ can be constructed as a localization of the corresponding homotopy category. This relies on the following simple lemma.

05RV Lemma 13.11.5. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a complex.
(1) If $H^{n}\left(K^{\bullet}\right)=0$ for all $n \ll 0$, then there exists a quasi-isomorphism $K^{\bullet} \rightarrow L^{\bullet}$ with $L^{\bullet}$ bounded below.
(2) If $H^{n}\left(K^{\bullet}\right)=0$ for all $n \gg 0$, then there exists a quasi-isomorphism $M^{\bullet} \rightarrow K^{\bullet}$ with $M^{\bullet}$ bounded above.
(3) If $H^{n}\left(K^{\bullet}\right)=0$ for all $|n| \gg 0$, then there exists a commutative diagram of morphisms of complexes

where all the arrows are quasi-isomorphisms, $L^{\bullet}$ bounded below, $M^{\bullet}$ bounded above, and $N^{\bullet}$ a bounded complex.
Proof. Pick $a \ll 0 \ll b$ and set $M^{\bullet}=\tau_{\leq a} K^{\bullet}, L^{\bullet}=K^{\bullet} / \tau_{\leq b} K^{\bullet}$, and $N^{\bullet}=L^{\bullet} / M^{\bullet}$. See Homology, Section 12.13 for the truncation functors.

To state the following lemma denote $\mathrm{Ac}^{+}(\mathcal{A}), \mathrm{Ac}^{-}(\mathcal{A})$, resp. $\mathrm{Ac}^{b}(\mathcal{A})$ the intersection of $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, resp. $K^{b}(\mathcal{A})$ with $\operatorname{Ac}(\mathcal{A})$. Denote $\operatorname{Qis}^{+}(\mathcal{A}), \mathrm{Qis}^{-}(\mathcal{A})$, resp. Qis ${ }^{b}(\mathcal{A})$ the intersection of $K^{+}(\mathcal{A}), K^{-}(\mathcal{A})$, resp. $K^{b}(\mathcal{A})$ with $\operatorname{Qis}(\mathcal{A})$.
05RW Lemma 13.11.6. Let $\mathcal{A}$ be an abelian category. The subcategories $A c^{+}(\mathcal{A})$, $A c^{-}(\mathcal{A})$, resp. $A c^{b}(\mathcal{A})$ are strictly full saturated triangulated subcategories of $K^{+}(\mathcal{A})$, $K^{-}(\mathcal{A})$, resp. $K^{b}(\mathcal{A})$. The corresponding saturated multiplicative systems (see Lemma 13.6.10) are the sets $\operatorname{Qis}^{+}(\mathcal{A}), \operatorname{Qis}^{-}(\mathcal{A})$, resp. $\operatorname{Qis}^{b}(\mathcal{A})$.
(1) The kernel of the functor $K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{A})$ is $A c^{+}(\mathcal{A})$ and this induces an equivalence of triangulated categories

$$
K^{+}(\mathcal{A}) / A c^{+}(\mathcal{A})=\operatorname{Qis}^{+}(\mathcal{A})^{-1} K^{+}(\mathcal{A}) \longrightarrow D^{+}(\mathcal{A})
$$

(2) The kernel of the functor $K^{-}(\mathcal{A}) \rightarrow D^{-}(\mathcal{A})$ is $A c^{-}(\mathcal{A})$ and this induces an equivalence of triangulated categories

$$
K^{-}(\mathcal{A}) / A c^{-}(\mathcal{A})=\operatorname{Qis}^{-}(\mathcal{A})^{-1} K^{-}(\mathcal{A}) \longrightarrow D^{-}(\mathcal{A})
$$

(3) The kernel of the functor $K^{b}(\mathcal{A}) \rightarrow D^{b}(\mathcal{A})$ is $A c^{b}(\mathcal{A})$ and this induces an equivalence of triangulated categories

$$
K^{b}(\mathcal{A}) / A c^{b}(\mathcal{A})=\operatorname{Qis}^{b}(\mathcal{A})^{-1} K^{b}(\mathcal{A}) \longrightarrow D^{b}(\mathcal{A})
$$

Proof. The initial statements follow from Lemma 13.6 .11 by considering the restriction of the homological functor $H^{0}$. The statement on kernels in (1), (2), (3) is a consequence of the definitions in each case. Each of the functors is essentially surjective by Lemma 13.11 .5 . To finish the proof we have to show the functors are fully faithful. We first do this for the bounded below version.

Suppose that $K^{\bullet}, L^{\bullet}$ are bounded above complexes. A morphism between these in $D(\mathcal{A})$ is of the form $s^{-1} f$ for a pair $f: K^{\bullet} \rightarrow\left(L^{\prime}\right)^{\bullet}, s: L^{\bullet} \rightarrow\left(L^{\prime}\right)^{\bullet}$ where $s$ is a quasi-isomorphism. This implies that $\left(L^{\prime}\right)^{\bullet}$ has cohomology bounded below. Hence by Lemma 13.11 .5 we can choose a quasi-isomorphism $s^{\prime}:\left(L^{\prime}\right)^{\bullet} \rightarrow\left(L^{\prime \prime}\right)^{\bullet}$ with $\left(L^{\prime \prime}\right)^{\bullet}$ bounded below. Then the pair $\left(s^{\prime} \circ f, s^{\prime} \circ s\right)$ defines a morphism in $\mathrm{Qis}^{+}(\mathcal{A})^{-1} K^{+}(\mathcal{A})$. Hence the functor is "full". Finally, suppose that the pair $f: K^{\bullet} \rightarrow\left(L^{\prime}\right)^{\bullet}, s: L^{\bullet} \rightarrow\left(L^{\prime}\right)^{\bullet}$ defines a morphism in $\mathrm{Qis}^{+}(\mathcal{A})^{-1} K^{+}(\mathcal{A})$ which is zero in $D(\mathcal{A})$. This means that there exists a quasi-isomorphism $s^{\prime}:\left(L^{\prime}\right)^{\bullet} \rightarrow\left(L^{\prime \prime}\right)^{\bullet}$ such that $s^{\prime} \circ f=0$. Using Lemma 13.11 .5 once more we obtain a quasi-isomorphism $s^{\prime \prime}:\left(L^{\prime \prime}\right)^{\bullet} \rightarrow\left(L^{\prime \prime \prime}\right)^{\bullet}$ with $\left(L^{\prime \prime \prime}\right)^{\bullet}$ bounded below. Thus we see that $s^{\prime \prime} \circ s^{\prime} \circ f=0$ which implies that $s^{-1} f$ is zero in $\operatorname{Qis}^{+}(\mathcal{A})^{-1} K^{+}(\mathcal{A})$. This finishes the proof that the functor in (1) is an equivalence.
The proof of (2) is dual to the proof of (1). To prove (3) we may use the result of (2). Hence it suffices to prove that the functor $\operatorname{Qis}^{b}(\mathcal{A})^{-1} K^{b}(\mathcal{A}) \rightarrow \operatorname{Qis}^{-}(\mathcal{A})^{-1} K^{-}(\mathcal{A})$ is fully faithful. The argument given in the previous paragraph applies directly to show this where we consistently work with complexes which are already bounded above.

### 13.12. The canonical delta-functor

014 Z The derived category should be the receptacle for the universal cohomology functor. In order to state the result we use the notion of a $\delta$-functor from an abelian category into a triangulated category, see Definition 13.3.6.

Consider the functor $\operatorname{Comp}(\mathcal{A}) \rightarrow K(\mathcal{A})$. This functor is not a $\delta$-functor in general. The easiest way to see this is to consider a nonsplit short exact sequence $0 \rightarrow$ $A \rightarrow B \rightarrow C \rightarrow 0$ of objects of $\mathcal{A}$. Since $\operatorname{Hom}_{K(\mathcal{A})}(C[0], A[1])=0$ we see that any distinguished triangle arising from this short exact sequence would look like ( $A[0], B[0], C[0], a, b, 0)$. But the existence of such a distinguished triangle in $K(\mathcal{A})$ implies that the extension is split. A contradiction.
It turns out that the functor $\operatorname{Comp}(\mathcal{A}) \rightarrow D(\mathcal{A})$ is a $\delta$-functor. In order to see this we have to define the morphisms $\delta$ associated to a short exact sequence

$$
0 \rightarrow A^{\bullet} \xrightarrow{a} B^{\bullet} \xrightarrow{b} C^{\bullet} \rightarrow 0
$$

of complexes in the abelian category $\mathcal{A}$. Consider the cone $C(a)^{\bullet}$ of the morphism $a$. We have $C(a)^{n}=B^{n} \oplus A^{n+1}$ and we define $q^{n}: C(a)^{n} \rightarrow C^{n}$ via the projection to $B^{n}$ followed by $b^{n}$. Hence a morphism of complexes

$$
q: C(a)^{\bullet} \longrightarrow C^{\bullet}
$$

It is clear that $q \circ i=b$ where $i$ is as in Definition 13.9.1. Note that, as $a^{\bullet}$ is injective in each degree, the kernel of $q$ is identified with the cone of $\operatorname{id}_{A} \bullet$ which is acyclic. Hence we see that $q$ is a quasi-isomorphism. According to Lemma 13.9.14 the triangle

$$
(A, B, C(a), a, i,-p)
$$

is a distinguished triangle in $K(\mathcal{A})$. As the localization functor $K(\mathcal{A}) \rightarrow D(\mathcal{A})$ is exact we see that $(A, B, C(a), a, i,-p)$ is a distinguished triangle in $D(\mathcal{A})$. Since $q$ is a quasi-isomorphism we see that $q$ is an isomorphism in $D(\mathcal{A})$. Hence we deduce that

$$
\left(A, B, C, a, b,-p \circ q^{-1}\right)
$$

is a distinguished triangle of $D(\mathcal{A})$. This suggests the following lemma.
0152 Lemma 13.12.1. Let $\mathcal{A}$ be an abelian category. The functor $\operatorname{Comp}(\mathcal{A}) \rightarrow D(\mathcal{A})$ defined has the natural structure of a $\delta$-functor, with

$$
\delta_{A} \bullet \rightarrow B^{\bullet} \rightarrow C \cdot=-p \circ q^{-1}
$$

with $p$ and $q$ as explained above. The same construction turns the functors $\operatorname{Comp}^{+}(\mathcal{A}) \rightarrow$ $D^{+}(\mathcal{A}), \operatorname{Comp}^{-}(\mathcal{A}) \rightarrow D^{-}(\mathcal{A})$, and $\operatorname{Comp}^{b}(\mathcal{A}) \rightarrow D^{b}(\mathcal{A})$ into $\delta$-functors.

Proof. We have already seen that this choice leads to a distinguished triangle whenever given a short exact sequence of complexes. We have to show that given a commutative diagram

we get the desired commutative diagram of Definition 13.3.6(2). By Lemma 13.9.2 the pair $(f, g)$ induces a canonical morphism $c: C(a)^{\bullet} \rightarrow C\left(a^{\prime}\right)^{\bullet}$. It is a simple computation to show that $q^{\prime} \circ c=h \circ q$ and $f[1] \circ p=p^{\prime} \circ c$. From this the result follows directly.

0153 Lemma 13.12.2. Let $\mathcal{A}$ be an abelian category. Let

be a commutative diagram of morphisms of complexes such that the rows are short exact sequences of complexes, and the vertical arrows are quasi-isomorphisms. The $\delta$-functor of Lemma 13.12.1 above maps the to short exact sequences $0 \rightarrow A^{\bullet} \rightarrow$ $B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ and $0 \rightarrow D^{\bullet} \rightarrow E^{\bullet} \rightarrow F^{\bullet} \rightarrow 0$ to isomorphic distinguished triangles.

Proof. Trivial from the fact that $K(\mathcal{A}) \rightarrow D(\mathcal{A})$ transforms quasi-isomorphisms into isomorphisms and that the associated distinguished triangles are functorial.

0154
Lemma 13.12.3. Let $\mathcal{A}$ be an abelian category. Let

$$
0 \longrightarrow A^{\bullet} \longrightarrow B^{\bullet} \longrightarrow C^{\bullet} \longrightarrow 0
$$

be a short exact sequences of complexes. Assume this short exact sequence is termwise split. Let $\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right)$ be the distinguished triangle of $K(\mathcal{A})$ associated to the sequence. The $\delta$-functor of Lemma 13.12.1 above maps the short exact sequences $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ to a triangle isomorphic to the distinguished triangle

$$
\left(A^{\bullet}, B^{\bullet}, C^{\bullet}, \alpha, \beta, \delta\right)
$$

Proof. Follows from Lemma 13.9.14
08J5 Remark 13.12.4. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a complex of $\mathcal{A}$. Let $a \in \mathbf{Z}$. We claim there is a canonical distinguished triangle

$$
\tau_{\leq a} K^{\bullet} \rightarrow K^{\bullet} \rightarrow \tau_{\geq a+1} K^{\bullet} \rightarrow\left(\tau_{\leq a} K^{\bullet}\right)[1]
$$

in $D(\mathcal{A})$. Here we have used the canonical truncation functors $\tau$ from Homology, Section 12.13 . Namely, we first take the distinguished triangle associated by our $\delta$-functor (Lemma 13.12.1) to the short exact sequence of complexes

$$
0 \rightarrow \tau_{\leq a} K^{\bullet} \rightarrow K^{\bullet} \rightarrow K^{\bullet} / \tau_{\leq a} K^{\bullet} \rightarrow 0
$$

Next, we use that the map $K^{\bullet} \rightarrow \tau_{\geq a+1} K^{\bullet}$ factors through a quasi-isomorphism $K^{\bullet} / \tau_{\leq a} K^{\bullet} \rightarrow \tau_{\geq a+1} K^{\bullet}$ by the description of cohomology groups in Homology, Section 12.13. In a similar way we obtain canonical distinguished triangles

$$
\tau_{\leq a} K^{\bullet} \rightarrow \tau_{\leq a+1} K^{\bullet} \rightarrow H^{a+1}\left(K^{\bullet}\right)[-a-1] \rightarrow\left(\tau_{\leq a} K^{\bullet}\right)[1]
$$

and

$$
H^{a}\left(K^{\bullet}\right)[-a] \rightarrow \tau_{\geq a} K^{\bullet} \rightarrow \tau_{\geq a+1} K^{\bullet} \rightarrow H^{a}\left(K^{\bullet}\right)[-a+1]
$$

08Q2 Lemma 13.12.5. Let $\mathcal{A}$ be an abelian category. Let

$$
K_{0}^{\bullet} \rightarrow K_{1}^{\bullet} \rightarrow \ldots \rightarrow K_{n}^{\bullet}
$$

be maps of complexes such that
(1) $H^{i}\left(K_{0}^{\bullet}\right)=0$ for $i>0$,
(2) $H^{-j}\left(K_{j}^{\bullet}\right) \rightarrow H^{-j}\left(K_{j+1}^{\bullet}\right)$ is zero.

Then the composition $K_{0}^{\bullet} \rightarrow K_{n}^{\bullet}$ factors through $\tau_{\leq-n} K_{n}^{\bullet} \rightarrow K_{n}^{\bullet}$ in $D(\mathcal{A})$.
Proof. The case $n=1$. Since $\tau_{\leq 0} K_{0}^{\bullet}=K_{0}^{\bullet}$ in $D(\mathcal{A})$ we can replace $K_{0}^{\bullet}$ by $\tau_{\leq 0} K_{0}^{\bullet}$ and $K_{1}^{\bullet}$ by $\tau_{\leq 0} K_{1}^{\bullet}$. Consider the distinguished triangle

$$
\tau_{\leq-1} K_{1}^{\bullet} \rightarrow K_{1}^{\bullet} \rightarrow H^{0}\left(K_{1}^{\bullet}\right)[0] \rightarrow\left(\tau_{\leq-1} K_{1}^{\bullet}\right)[1]
$$

(Remark 13.12.4. The composition $K_{0}^{\bullet} \rightarrow K_{1}^{\bullet} \rightarrow H^{0}\left(K_{1}^{\bullet}\right)[0]$ is zero as it is equal to $K_{0}^{\bullet} \rightarrow H^{0}\left(K_{0}^{\bullet}\right)[0] \rightarrow H^{0}\left(K_{1}^{\bullet}\right)[0]$ which is zero by assumption. The fact that $\operatorname{Hom}_{D(\mathcal{A})}\left(K_{0}^{\bullet},-\right)$ is a homological functor (Lemma 13.4.2, allows us to find the desired factorization. For $n=2$ we get a factorization $K_{0}^{\mathbf{0}} \rightarrow \tau_{\leq-1} K_{1}^{\bullet}$ by the case $n=1$ and we can apply the case $n=1$ to the map of complexes $\tau_{\leq-1} K_{1}^{\bullet} \rightarrow \tau_{\leq-1} K_{2}^{\bullet}$ to get a factorization $\tau_{\leq-1} K_{1}^{\bullet} \rightarrow \tau_{\leq-2} K_{2}^{\mathbf{\bullet}}$. The general case is proved in exactly the same manner.
13.13. Triangulated subcategories of the derived category

06UP Let $\mathcal{A}$ be an abelian category. In this section we are going to look for strictly full saturated triangulated subcategories $\mathcal{D}^{\prime} \subset D(\mathcal{A})$ and in the bounded versions.
Here is a simple construction. Let $\mathcal{B} \subset \mathcal{A}$ be a weak Serre subcategory, see Homology, Section 12.9 . We let $D_{\mathcal{B}}(\mathcal{A})$ the full subcategory of $D(\mathcal{A})$ whose objects are

$$
\operatorname{Ob}\left(D_{\mathcal{B}}(\mathcal{A})\right)=\left\{X \in \operatorname{Ob}(D(\mathcal{A})) \mid H^{n}(X) \text { is an object of } \mathcal{B} \text { for all } n\right\}
$$

We also define $D_{\mathcal{B}}^{+}(\mathcal{A})=D^{+}(\mathcal{A}) \cap D_{\mathcal{B}}(\mathcal{A})$ and similarly for the other bounded versions.

06UQ Lemma 13.13.1. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{B} \subset \mathcal{A}$ be a weak Serre subcategory. The category $D_{\mathcal{B}}(\mathcal{A})$ is a strictly full saturated triangulated subcategory of $D(\mathcal{A})$. Similarly for the bounded versions.

Proof. It is clear that $D_{\mathcal{B}}(\mathcal{A})$ is an additive subcategory preserved under the translation functors. If $X \oplus Y$ is in $D_{\mathcal{B}}(\mathcal{A})$, then both $H^{n}(X)$ and $H^{n}(Y)$ are kernels of maps between maps of objects of $\mathcal{B}$ as $H^{n}(X \oplus Y)=H^{n}(X) \oplus H^{n}(Y)$. Hence both $X$ and $Y$ are in $D_{\mathcal{B}}(\mathcal{A})$. By Lemma 13.4.14 it therefore suffices to show that given a distinguished triangle $(X, Y, Z, f, g, h)$ such that $X$ and $Y$ are in $D_{\mathcal{B}}(\mathcal{A})$ then $Z$ is an object of $D_{\mathcal{B}}(\mathcal{A})$. The long exact cohomology sequence 13.11.1.1) and the definition of a weak Serre subcategory (see Homology, Definition 12.9.1) show that $H^{n}(Z)$ is an object of $\mathcal{B}$ for all $n$. Thus $Z$ is an object of $D_{\mathcal{B}}(\mathcal{A})$.

An interesting feature of the situation of the lemma is that the functor $D(\mathcal{B}) \rightarrow$ $D(\mathcal{A})$ factors through a canonical exact functor

06UR (13.13.1.1)

$$
D(\mathcal{B}) \longrightarrow D_{\mathcal{B}}(\mathcal{A})
$$

After all a complex made from objects of $\mathcal{B}$ certainly gives rise to an object of $D_{\mathcal{B}}(\mathcal{A})$ and as distinguished triangles in $D_{\mathcal{B}}(\mathcal{A})$ are exactly the distinguished triangles of $D(\mathcal{A})$ whose vertices are in $D_{\mathcal{B}}(\mathcal{A})$ we see that the functor is exact since $D(\mathcal{B}) \rightarrow$ $D(\mathcal{A})$ is exact. Similarly we obtain functors $D^{+}(\mathcal{B}) \longrightarrow D_{\mathcal{B}}^{+}(\mathcal{A})$ etc for the bounded versions. A key question in many cases is whether the displayed functor is an equivalence.
Now, suppose that $\mathcal{B}$ is a Serre subcategory of $\mathcal{A}$. In this case we have the quotient functor $\mathcal{A} \rightarrow \mathcal{A} / \mathcal{B}$, see Homology, Lemma 12.9.6. In this case $D_{\mathcal{B}}(\mathcal{A})$ is the kernel of the functor $D(\mathcal{A}) \rightarrow D(\mathcal{A} / \mathcal{B})$. Thus we obtain a canonical functor

$$
D(\mathcal{A}) / D_{\mathcal{B}}(\mathcal{A}) \longrightarrow D(\mathcal{A} / \mathcal{B})
$$

by Lemma 13.6.8. Similarly for the bounded versions.
06XL Lemma 13.13.2. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{B} \subset \mathcal{A}$ be a Serre subcategory. Then $D(\mathcal{A}) \rightarrow D(\mathcal{A} / \mathcal{B})$ is essentially surjective.

Proof. We will use the description of the category $\mathcal{A} / \mathcal{B}$ in the proof of Homology, Lemma 12.9.6 Let $\left(X^{\bullet}, d^{\bullet}\right)$ be a complex of $\mathcal{A} / \mathcal{B}$. For each $i$ we have an object $X^{i}$ of $\mathcal{A}$ and $d^{i}=\left(s^{i}, f^{i}\right)$ where $s^{i}: Y^{i} \rightarrow X^{i}$ is a morphism of $\mathcal{A}$ whose kernel and cokernel are in $\mathcal{B}$ and $f^{i}: Y^{i} \rightarrow X^{i+1}$ is an arbitrary morphism of $\mathcal{A}$. Next, consider the complex

$$
\ldots \rightarrow X^{i} \oplus Y^{i} \oplus Y^{i+1} \rightarrow X^{i+1} \oplus Y^{i+1} \oplus Y^{i+2} \rightarrow \ldots
$$

in $\mathcal{A}$ with differential given by

$$
\left(\begin{array}{ccc}
0 & f^{i} & s^{i+1} \\
0 & 0 & -\mathrm{id}_{Y^{i+1}} \\
0 & 0 & 0
\end{array}\right)
$$

This complex becomes quasi-isomorphic to the complex $\left(X^{\bullet}, d^{\bullet}\right)$ in $\mathcal{A} / \mathcal{B}$ by the maps

$$
\left(\operatorname{id}_{X^{i}}, s^{i}, 0\right): X^{i} \oplus Y^{i} \oplus Y^{i+1} \rightarrow X^{i}
$$

Calculation omitted.
06XM Lemma 13.13.3. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{B} \subset \mathcal{A}$ be a Serre subcategory. Suppose that the functor $v: \mathcal{A} \rightarrow \mathcal{A} / \mathcal{B}$ has a left adjoint $u: \mathcal{A} / \mathcal{B} \rightarrow \mathcal{A}$ such that $v u \cong i d$. Then

$$
D(\mathcal{A}) / D_{\mathcal{B}}(\mathcal{A})=D(\mathcal{A} / \mathcal{B})
$$

and similarly for the bounded versions.
Proof. The functor $D(v): D(\mathcal{A}) \rightarrow D(\mathcal{A} / \mathcal{B})$ is essentially surjective by Lemma 13.13 .2 For an object $X$ of $D(\mathcal{A})$ the adjunction mapping $c_{X}: u v X \rightarrow X$ maps to an isomorphism in $D(\mathcal{A} / \mathcal{B})$ because $v u v \cong v$ by the assumption that $v u \cong \mathrm{id}$. Thus in a distinguished triangle ( $u v X, X, Z, c_{X}, g, h$ ) the object $Z$ is an object of $D_{\mathcal{B}}(\mathcal{A})$ as we see by looking at the long exact cohomology sequence. Hence $c_{X}$ is an element of the multiplicative system used to define the quotient category $D(\mathcal{A}) / D_{\mathcal{B}}(\mathcal{A})$. Thus $u v X \cong X$ in $D(\mathcal{A}) / D_{\mathcal{B}}(\mathcal{A})$. For $\left.X, Y \in \operatorname{Ob}(\mathcal{A})\right)$ the map

$$
\operatorname{Hom}_{D(\mathcal{A}) / D_{\mathcal{B}}(\mathcal{A})}(X, Y) \longrightarrow \operatorname{Hom}_{D(\mathcal{A} / \mathcal{B})}(v X, v Y)
$$

is bijective because $u$ gives an inverse (by the remarks above).

### 13.14. Filtered derived categories

$05 R X$ A reference for this section is Ill72, I, Chapter V]. Let $\mathcal{A}$ be an abelian category. In this section we will define the filtered derived category $D F(\mathcal{A})$ of $\mathcal{A}$. In short, we will define it as the derived category of the exact category of objects of $\mathcal{A}$ endowed with a finite filtration. (Thus our construction is a special case of a more general construction of the derived category of an exact category, see for example Büh10, Kel90.) Illusie's filtered derived category is the full subcategory of ours consisting of those objects whose filtration is finite. (In our category the filtration is still finite in each degree, but may not be uniformly bounded.) The rationale for our choice is that it is not harder and it allows us to apply the discussion to the spectral sequences of Lemma 13.21.3, see also Remark 13.21.4.

We will use the notation regarding filtered objects introduced in Homology, Section 12.16 . The category of filtered objects of $\mathcal{A}$ is denoted $\operatorname{Fil}(\mathcal{A})$. All filtrations will be decreasing by fiat.

05RY Definition 13.14.1. Let $\mathcal{A}$ be an abelian category. The category of finite filtered objects of $\mathcal{A}$ is the category of filtered objects $(A, F)$ of $\mathcal{A}$ whose filtration $F$ is finite. We denote it $\operatorname{Fil}^{f}(\mathcal{A})$.
Thus $\operatorname{Fil}^{f}(\mathcal{A})$ is a full subcategory of $\operatorname{Fil}(\mathcal{A})$. For each $p \in \mathbf{Z}$ there is a functor $\operatorname{gr}^{p}: \operatorname{Fil}^{f}(\mathcal{A}) \rightarrow \mathcal{A}$. There is a functor

$$
\operatorname{gr}=\bigoplus_{p \in \mathbf{Z}} \operatorname{gr}^{p}: \operatorname{Fil}^{f}(\mathcal{A}) \rightarrow \operatorname{Gr}(\mathcal{A})
$$

where $\operatorname{Gr}(\mathcal{A})$ is the category of graded objects of $\mathcal{A}$, see Homology, Definition 12.15.1. Finally, there is a functor

$$
(\text { forget } F): \operatorname{Fil}^{f}(\mathcal{A}) \longrightarrow \mathcal{A}
$$

which associates to the filtered object $(A, F)$ the underlying object of $\mathcal{A}$. The category $\operatorname{Fil}^{f}(\mathcal{A})$ is an additive category, but not abelian in general, see Homology, Example 12.3.12.
Because the functors $\mathrm{gr}^{p}$, gr, (forget $F$ ) are additive they induce exact functors of triangulated categories

$$
\operatorname{gr}^{p},(\text { forget } F): K\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \rightarrow K(\mathcal{A}) \quad \text { and } \quad \operatorname{gr}: K\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \rightarrow K(\operatorname{Gr}(\mathcal{A}))
$$

by Lemma 13.10 .6 . By analogy with the case of the homotopy category of an abelian category we make the following definitions.

05RZ Definition 13.14.2. Let $\mathcal{A}$ be an abelian category.
(1) Let $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ be a morphism of $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$. We say that $\alpha$ is a filtered quasi-isomorphism if the morphism $\operatorname{gr}(\alpha)$ is a quasi-isomorphism.
(2) Let $K^{\bullet}$ be an object of $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$. We say that $K^{\bullet}$ is filtered acyclic if the complex $\operatorname{gr}\left(K^{\bullet}\right)$ is acyclic.

Note that $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is a filtered quasi-isomorphism if and only if each $\operatorname{gr}^{p}(\alpha)$ is a quasi-isomorphism. Similarly a complex $K^{\bullet}$ is filtered acyclic if and only if each $\operatorname{gr}^{p}\left(K^{\bullet}\right)$ is acyclic.

Lemma 13.14.3. Let $\mathcal{A}$ be an abelian category.
(1) The functor $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \longrightarrow G r(\mathcal{A}), K^{\bullet} \longmapsto H^{0}\left(g r\left(K^{\bullet}\right)\right)$ is homological.
(2) The functor $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \rightarrow \mathcal{A}, K^{\bullet} \longmapsto H^{0}\left(g^{p}\left(K^{\bullet}\right)\right)$ is homological.
(3) The functor $K\left(\right.$ Fil $\left.^{f}(\mathcal{A})\right) \longrightarrow \mathcal{A}, K^{\bullet} \longmapsto H^{0}\left((\right.$ forget $\left.F) K^{\bullet}\right)$ is homological.

Proof. This follows from the fact that $H^{0}: K(\mathcal{A}) \rightarrow \mathcal{A}$ is homological, see Lemma 13.11.1 and the fact that the functors $\mathrm{gr}, \mathrm{gr}^{p}$, (forget $F$ ) are exact functors of triangulated categories. See Lemma 13.4.18.

05S1 Lemma 13.14.4. Let $\mathcal{A}$ be an abelian category. The full subcategory $F A c(\mathcal{A})$ of $K\left(\right.$ Fil $\left.^{f}(\mathcal{A})\right)$ consisting of filtered acyclic complexes is a strictly full saturated triangulated subcategory of $K\left(F i l^{f}(\mathcal{A})\right)$. The corresponding saturated multiplicative system (see Lemma 13.6.10) of $K\left(F i l^{f}(\mathcal{A})\right)$ is the set $F Q i s(\mathcal{A})$ of filtered quasiisomorphisms. In particular, the kernel of the localization functor

$$
Q: K\left(F i l^{f}(\mathcal{A})\right) \longrightarrow F Q i s(\mathcal{A})^{-1} K\left(F_{i l}^{f}(\mathcal{A})\right)
$$

is $F A c(\mathcal{A})$ and the functor $H^{0} \circ$ gr factors through $Q$.
Proof. We know that $H^{0} \circ$ gr is a homological functor by Lemma 13.14.3. Thus this lemma is a special case of Lemma 13.6.11.

05S2 Definition 13.14.5. Let $\mathcal{A}$ be an abelian category. Let $\operatorname{FAc}(\mathcal{A})$ and $\operatorname{FQis}(\mathcal{A})$ be as in Lemma 13.14.4. The filtered derived category of $\mathcal{A}$ is the triangulated category

$$
D F(\mathcal{A})=K\left(\operatorname{Fil}^{f}(\mathcal{A})\right) / \operatorname{FAc}(\mathcal{A})=\operatorname{FQis}(\mathcal{A})^{-1} K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)
$$

05S3 Lemma 13.14.6. The functors $g^{p}$, $g r$, (forget $F$ ) induce canonical exact functors

$$
g r^{p}, g r,(\text { forget } F): D F(\mathcal{A}) \longrightarrow D(\mathcal{A})
$$

which commute with the localization functors.
Proof. This follows from the universal property of localization, see Lemma 13.5.6, provided we can show that a filtered quasi-isomorphism is turned into a quasiisomorphism by each of the functors $\mathrm{gr}^{p}, \mathrm{gr},($ forget $F$ ). This is true by definition for the first two. For the last one the statement we have to do a little bit of work. Let $f: K^{\bullet} \rightarrow L^{\bullet}$ be a filtered quasi-isomorphism in $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$. Choose a distinguished triangle $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ which contains $f$. Then $M^{\bullet}$ is filtered acyclic, see Lemma 13.14.4. Hence by the corresponding lemma for $K(\mathcal{A})$ it suffices to show that a filtered acyclic complex is an acyclic complex if we forget the filtration. This follows from Homology, Lemma 12.16.15.

05S4 Definition 13.14.7. Let $\mathcal{A}$ be an abelian category. The bounded filtered derived category $D F^{b}(\mathcal{A})$ is the full subcategory of $\operatorname{DF}(\mathcal{A})$ with objects those $X$ such that $\operatorname{gr}(X) \in D^{b}(\mathcal{A})$. Similarly for the bounded below filtered derived category $D F^{+}(\mathcal{A})$ and the bounded above filtered derived category $D F^{-}(\mathcal{A})$.

05S5 Lemma 13.14.8. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet} \in K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$.
(1) If $H^{n}\left(g r\left(K^{\bullet}\right)\right)=0$ for all $n<a$, then there exists a filtered quasiisomorphism $K^{\bullet} \rightarrow L^{\bullet}$ with $L^{n}=0$ for all $n<a$.
(2) If $H^{n}\left(g r\left(K^{\bullet}\right)\right)=0$ for all $n>b$, then there exists a filtered quasiisomorphism $M^{\bullet} \rightarrow K^{\bullet}$ with $M^{n}=0$ for all $n>b$.
(3) If $H^{n}\left(g r\left(K^{\bullet}\right)\right)=0$ for all $|n| \gg 0$, then there exists a commutative diagram of morphisms of complexes

where all the arrows are filtered quasi-isomorphisms, $L^{\bullet}$ bounded below, $M^{\bullet}$ bounded above, and $N^{\bullet}$ a bounded complex.

Proof. Suppose that $H^{n}\left(\operatorname{gr}\left(K^{\bullet}\right)\right)=0$ for all $n<a$. By Homology, Lemma 12.16.15 the sequence

$$
K^{a-1} \xrightarrow{d^{a-2}} K^{a-1} \xrightarrow{d^{a-1}} K^{a}
$$

is an exact sequence of objects of $\mathcal{A}$ and the morphisms $d^{a-2}$ and $d^{a-1}$ are strict. Hence $\operatorname{Coim}\left(d^{a-1}\right)=\operatorname{Im}\left(d^{a-1}\right)$ in $\operatorname{Fil}^{f}(\mathcal{A})$ and the map $\operatorname{gr}\left(\operatorname{Im}\left(d^{a-1}\right)\right) \rightarrow \operatorname{gr}\left(K^{a}\right)$ is injective with image equal to the image of $\operatorname{gr}\left(K^{a-1}\right) \rightarrow \operatorname{gr}\left(K^{a}\right)$, see Homology, Lemma 12.16.13. This means that the map $K^{\bullet} \rightarrow \tau_{\geq a} K^{\bullet}$ into the truncation

$$
\tau_{\geq a} K^{\bullet}=\left(\ldots \rightarrow 0 \rightarrow K^{a} / \operatorname{Im}\left(d^{a-1}\right) \rightarrow K^{a+1} \rightarrow \ldots\right)
$$

is a filtered quasi-isomorphism. This proves (1). The proof of (2) is dual to the proof of (1). Part (3) follows formally from (1) and (2).

To state the following lemma denote $\mathrm{FAc}^{+}(\mathcal{A}), \operatorname{FAc}^{-}(\mathcal{A})$, resp. $\mathrm{FAc}^{b}(\mathcal{A})$ the intersection of $K^{+}\left(\operatorname{Fil}^{f} \mathcal{A}\right), K^{-}\left(\operatorname{Fil}^{f} \mathcal{A}\right)$, resp. $K^{b}\left(\operatorname{Fil}^{f} \mathcal{A}\right)$ with $\operatorname{FAc}(\mathcal{A})$. $\operatorname{Denote}^{\operatorname{FQis}}{ }^{+}(\mathcal{A})$, $\mathrm{FQis}^{-}(\mathcal{A})$, resp. $\mathrm{FQis}^{b}(\mathcal{A})$ the intersection of $K^{+}\left(\mathrm{Fil}^{f} \mathcal{A}\right), K^{-}\left(\mathrm{Fil}^{f} \mathcal{A}\right)$, resp. $K^{b}\left(\mathrm{Fil}^{f} \mathcal{A}\right)$ with $\operatorname{FQis}(\mathcal{A})$.

05S6 Lemma 13.14.9. Let $\mathcal{A}$ be an abelian category. The subcategories $F A c^{+}(\mathcal{A})$, $F A c^{-}(\mathcal{A})$, resp. $F A c^{b}(\mathcal{A})$ are strictly full saturated triangulated subcategories of $K^{+}\left(\right.$Fil $\left.^{f} \mathcal{A}\right), K^{-}\left(\right.$Fil $\left.^{f} \mathcal{A}\right)$, resp. $K^{b}\left(\right.$ Fil $\left.^{f} \mathcal{A}\right)$. The corresponding saturated multiplicative systems (see Lemma 13.6.10) are the sets $\mathrm{FQis}^{+}(\mathcal{A}), \operatorname{FQis}^{-}(\mathcal{A})$, resp. FQis ${ }^{b}(\mathcal{A})$.
(1) The kernel of the functor $K^{+}\left(\right.$Fil $\left.^{f} \mathcal{A}\right) \rightarrow D F^{+}(\mathcal{A})$ is $F A c^{+}(\mathcal{A})$ and this induces an equivalence of triangulated categories

$$
K^{+}\left(F i l^{f} \mathcal{A}\right) / F A c^{+}(\mathcal{A})=F Q i s^{+}(\mathcal{A})^{-1} K^{+}\left(F i l^{f} \mathcal{A}\right) \longrightarrow D F^{+}(\mathcal{A})
$$

(2) The kernel of the functor $K^{-}\left(\right.$Fil $\left.^{f} \mathcal{A}\right) \rightarrow D F^{-}(\mathcal{A})$ is $F A c^{-}(\mathcal{A})$ and this induces an equivalence of triangulated categories

$$
K^{-}\left(\text {Fil }^{f} \mathcal{A}\right) / F A c^{-}(\mathcal{A})=F \text { Qis }^{-}(\mathcal{A})^{-1} K^{-}\left(F_{i l}{ }^{f} \mathcal{A}\right) \longrightarrow D F^{-}(\mathcal{A})
$$

(3) The kernel of the functor $K^{b}\left(\right.$ Fil $\left.^{f} \mathcal{A}\right) \rightarrow D F^{b}(\mathcal{A})$ is $F A c^{b}(\mathcal{A})$ and this induces an equivalence of triangulated categories

$$
K^{b}\left(F i l^{f} \mathcal{A}\right) / F A c^{b}(\mathcal{A})=F Q i s^{b}(\mathcal{A})^{-1} K^{b}\left(F i l^{f} \mathcal{A}\right) \longrightarrow D F^{b}(\mathcal{A})
$$

Proof. This follows from the results above, in particular Lemma 13.14.8, by exactly the same arguments as used in the proof of Lemma 13.11.6.

### 13.15. Derived functors in general

05 S 7 A reference for this section is Deligne's exposé XVII in AGV71. A very general notion of right and left derived functors exists where we have an exact functor between triangulated categories, a multiplicative system in the source category and we want to find the "correct" extension of the exact functor to the localized category.
05S8 Situation 13.15.1. Here $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ is an exact functor of triangulated categories and $S$ is a saturated multiplicative system in $\mathcal{D}$ compatible with the structure of triangulated category on $\mathcal{D}$.
Let $X \in \operatorname{Ob}(\mathcal{D})$. Recall from Categories, Remark 4.26.7 the filtered category $X / S$ of arrows $s: X \rightarrow X^{\prime}$ in $S$ with source $X$. Dually, in Categories, Remark 4.26.15 we defined the cofiltered category $S / X$ of arrows $s: X^{\prime} \rightarrow X$ in $S$ with target $X$.

05S9 Definition 13.15.2. Assumptions and notation as in Situation 13.15.1. Let $X \in$ $\mathrm{Ob}(\mathcal{D})$.
(1) we say the right derived functor $R F$ is defined at $X$ if the ind-object

$$
(X / S) \longrightarrow \mathcal{D}^{\prime}, \quad\left(s: X \rightarrow X^{\prime}\right) \longmapsto F\left(X^{\prime}\right)
$$

is essentially constant ${ }^{4}$, in this case the value $Y$ in $\mathcal{D}^{\prime}$ is called the value of $R F$ at $X$.
(2) we say the left derived functor LF is defined at $X$ if the pro-object

$$
(S / X) \longrightarrow \mathcal{D}^{\prime}, \quad\left(s: X^{\prime} \rightarrow X\right) \longmapsto F\left(X^{\prime}\right)
$$

is essentially constant; in this case the value $Y$ in $\mathcal{D}^{\prime}$ is called the value of $L F$ at $X$.
By abuse of notation we often denote the values simply $R F(X)$ or $L F(X)$.

[^34]It will turn out that the full subcategory of $\mathcal{D}$ consisting of objects where $R F$ is defined is a triangulated subcategory, and $R F$ will define a functor on this subcategory which transforms morphisms of $S$ into isomorphisms.

05SA Lemma 13.15.3. Assumptions and notation as in Situation 13.15.1. Let $f: X \rightarrow$ $Y$ be a morphism of $\mathcal{D}$.
(1) If $R F$ is defined at $X$ and $Y$ then there exists a unique morphism $R F(f)$ : $R F(X) \rightarrow R F(Y)$ between the values such that for any commutative diagram

with $s, s^{\prime} \in S$ the diagram

commutes.
(2) If $L F$ is defined at $X$ and $Y$ then there exists a unique morphism $L F(f)$ : $L F(X) \rightarrow L F(Y)$ between the values such that for any commutative diagram

with $s, s^{\prime}$ in $S$ the diagram

commutes.
Proof. Part (1) holds if we only assume that the colimits

$$
R F(X)=\operatorname{colim}_{s: X \rightarrow X^{\prime}} F\left(X^{\prime}\right) \quad \text { and } \quad R F(Y)=\operatorname{colim}_{s^{\prime}: Y \rightarrow Y^{\prime}} F\left(Y^{\prime}\right)
$$

exist. Namely, to give a morphism $R F(X) \rightarrow R F(Y)$ between the colimits is the same thing as giving for each $s: X \rightarrow X^{\prime}$ in $\mathrm{Ob}(X / S)$ a morphism $F\left(X^{\prime}\right) \rightarrow R F(Y)$ compatible with morphisms in the category $X / S$. To get the morphism we choose a commutative diagram

with $s, s^{\prime}$ in $S$ as is possible by MS2 and we set $F\left(X^{\prime}\right) \rightarrow R F(Y)$ equal to the composition $F\left(X^{\prime}\right) \rightarrow F\left(Y^{\prime}\right) \rightarrow R F(Y)$. To see that this is independent of the choice of the diagram above use MS3. Details omitted. The proof of (2) is dual.
05SB Lemma 13.15.4. Assumptions and notation as in Situation 13.15.1. Let $s: X \rightarrow$ $Y$ be an element of $S$.
(1) $R F$ is defined at $X$ if and only if it is defined at $Y$. In this case the map $R F(s): R F(X) \rightarrow R F(Y)$ between values is an isomorphism.
(2) LF is defined at $X$ if and only if it is defined at $Y$. In this case the map $L F(s): L F(X) \rightarrow L F(Y)$ between values is an isomorphism.
Proof. Omitted.
05SU Lemma 13.15.5. Assumptions and notation as in Situation 13.15.1. Let $X$ be an object of $\mathcal{D}$ and $n \in \mathbf{Z}$.
(1) $R F$ is defined at $X$ if and only if it is defined at $X[n]$. In this case there is a canonical isomorphism $R F(X)[n]=R F(X[n])$ between values.
(2) LF is defined at $X$ if and only if it is defined at $X[n]$. In this case there is a canonical isomorphism $L F(X)[n] \rightarrow L F(X[n])$ between values.

Proof. Omitted.
05SC Lemma 13.15.6. Assumptions and notation as in Situation 13.15.1. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle of $\mathcal{D}$. If $R F$ is defined at two out of three of $X, Y, Z$, then it is defined at the third. Moreover, in this case

$$
(R F(X), R F(Y), R F(Z), R F(f), R F(g), R F(h))
$$

is a distinguished triangle in $\mathcal{D}^{\prime}$. Similarly for $L F$.
Proof. Say $R F$ is defined at $X, Y$ with values $A, B$. Let $R F(f): A \rightarrow B$ be the induced morphism, see Lemma 13.15.3. We may choose a distinguished triangle $(A, B, C, R F(f), b, c)$ in $\mathcal{D}^{\prime}$. We claim that $C$ is a value of $R F$ at $Z$.
To see this pick $s: X \rightarrow X^{\prime}$ in $S$ such that there exists a morphism $\alpha: A \rightarrow F\left(X^{\prime}\right)$ as in Categories, Definition 4.22.1. We may choose a commutative diagram

with $s^{\prime} \in S$ by MS2. Using that $Y / S$ is filtered we can (after replacing $s^{\prime}$ by some $s^{\prime \prime}: Y \rightarrow Y^{\prime \prime}$ in $S$ ) assume that there exists a morphism $\beta: B \rightarrow F\left(Y^{\prime}\right)$ as in Categories, Definition 4.22.1. Picture

It may not be true that the left square commutes, but the outer and right squares commute. The assumption that the ind-object $\left\{F\left(Y^{\prime}\right)\right\}_{s^{\prime}: Y^{\prime} \rightarrow Y}$ is essentially constant means that there exists a $s^{\prime \prime}: Y \rightarrow Y^{\prime \prime}$ in $S$ and a morphism $h: Y^{\prime} \rightarrow Y^{\prime \prime}$ such that $s^{\prime \prime}=h \circ s^{\prime}$ and such that $F(h)$ equal to $F\left(Y^{\prime}\right) \rightarrow B \rightarrow F\left(Y^{\prime}\right) \rightarrow F\left(Y^{\prime \prime}\right)$.

Hence after replacing $Y^{\prime}$ by $Y^{\prime \prime}$ and $\beta$ by $F(h) \circ \beta$ the diagram will commute (by direct computation with arrows).
Using MS6 choose a morphism of triangles

$$
\left(s, s^{\prime}, s^{\prime \prime}\right):(X, Y, Z, f, g, h) \longrightarrow\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)
$$

with $s^{\prime \prime} \in S$. By TR3 choose a morphism of triangles

$$
(\alpha, \beta, \gamma):(A, B, C, R F(f), b, c) \longrightarrow\left(F\left(X^{\prime}\right), F\left(Y^{\prime}\right), F\left(Z^{\prime}\right), F\left(f^{\prime}\right), F\left(g^{\prime}\right), F\left(h^{\prime}\right)\right)
$$

By Lemma 13.15 .4 it suffices to prove that $R F\left(Z^{\prime}\right)$ is defined and has value $C$.
Consider the category $\mathcal{I}$ of Lemma 13.5 .8 of triangles

$$
\mathcal{I}=\left\{\left(t, t^{\prime}, t^{\prime \prime}\right):\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right) \rightarrow\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}, f^{\prime \prime}, g^{\prime \prime}, h^{\prime \prime}\right) \mid\left(t, t^{\prime}, t^{\prime \prime}\right) \in S\right\}
$$

To show that the system $F\left(Z^{\prime \prime}\right)$ is essentially constant over the category $Z^{\prime} / S$ is equivalent to showing that the system of $F\left(Z^{\prime \prime}\right)$ is essentially constant over $\mathcal{I}$ because $\mathcal{I} \rightarrow Z^{\prime} / S$ is cofinal, see Categories, Lemma 4.22 .8 (cofinality is proven in Lemma 13.5 .8 . For any object $W$ in $\mathcal{D}^{\prime}$ we consider the diagram

where the horizontal arrows are given by composing with $(\alpha, \beta, \gamma)$. Since filtered colimits are exact (Algebra, Lemma 10.8.9) the left column is an exact sequence. Thus the 5 lemma (Homology, Lemma 12.5.20) tells us the

$$
\operatorname{colim}_{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}^{\prime}}\left(W, F\left(Z^{\prime \prime}\right)\right) \longrightarrow \operatorname{Mor}_{\mathcal{D}^{\prime}}(W, C)
$$

is bijective. Choose an object $\left(t, t^{\prime}, t^{\prime \prime}\right):\left(X^{\prime}, Y^{\prime}, Z^{\prime}\right) \rightarrow\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$ of $\mathcal{I}$. Applying what we just showed to $W=F\left(Z^{\prime \prime}\right)$ and the element $\operatorname{id}_{F\left(X^{\prime \prime}\right)}$ of the colimit we find a unique morphism $c_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}: F\left(Z^{\prime \prime}\right) \rightarrow C$ such that for some $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right) \rightarrow$ $\left(X^{\prime \prime \prime}, Y^{\prime \prime \prime}, Z^{\prime \prime}\right)$ in $\mathcal{I}$

$$
F\left(Z^{\prime \prime}\right) \xrightarrow{c_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}} C \xrightarrow{\gamma} F\left(Z^{\prime}\right) \rightarrow F\left(Z^{\prime \prime}\right) \rightarrow F\left(Z^{\prime \prime \prime}\right) \quad \text { equals } \quad F\left(Z^{\prime \prime}\right) \rightarrow F\left(Z^{\prime \prime \prime}\right)
$$

The family of morphisms $c_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}$ form an element $c$ of $\lim _{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}^{\prime}}\left(F\left(Z^{\prime \prime}\right), C\right)$ by uniquness (computation omitted). Finally, we show that $\operatorname{colim}_{\mathcal{I}} F\left(Z^{\prime \prime}\right)=C$ via the morphisms $c_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}$ which will finish the proof by Categories, Lemma 4.22.6. Namely, let $W$ be an object of $\mathcal{D}^{\prime}$ and let $d_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}: F\left(Z^{\prime \prime}\right) \rightarrow W$ be a family of maps corresponding to an element of $\lim _{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}^{\prime}}\left(F\left(Z^{\prime \prime}\right), W\right)$. If $d_{\left(X^{\prime}, Y^{\prime}, Z^{\prime}\right)} \circ \gamma=0$, then for every object $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)$ of $\mathcal{I}$ the morphism $d_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}$ is zero by the
existence of $c_{\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right)}$ and the morphism $\left(X^{\prime \prime}, Y^{\prime \prime}, Z^{\prime \prime}\right) \rightarrow\left(X^{\prime \prime \prime}, Y^{\prime \prime \prime}, Z^{\prime \prime}\right)$ in $\mathcal{I}$ satisfying the displayed equality above. Hence the map

$$
\lim _{\mathcal{I}} \operatorname{Mor}_{\mathcal{D}^{\prime}}\left(F\left(Z^{\prime \prime}\right), W\right) \longrightarrow \operatorname{Mor}_{\mathcal{D}^{\prime}}(C, W)
$$

(coming from precomposing by $\gamma$ ) is injective. However, it is also surjective because the element $c$ gives a left inverse. We conclude that $C$ is the colimit by Categories, Remark 4.14.4

05SD Lemma 13.15.7. Assumptions and notation as in Situation 13.15.1. Let $X, Y$ be objects of $\mathcal{D}$.
(1) If $R F$ is defined at $X$ and $Y$, then $R F$ is defined at $X \oplus Y$.
(2) If $\mathcal{D}^{\prime}$ is Karoubian and $R F$ is defined at $X \oplus Y$, then $R F$ is defined at both $X$ and $Y$.
In either case we have $R F(X \oplus Y)=R F(X) \oplus R F(Y)$. Similarly for $L F$.
Proof. If $R F$ is defined at $X$ and $Y$, then the distinguished triangle $X \rightarrow X \oplus$ $Y \rightarrow Y \rightarrow X[1]$ (Lemma 13.4.10) and Lemma 13.15.6 shows that $R F$ is defined at $X \oplus Y$ and that we have have a distinguished triangle $R F(X) \rightarrow R F(X \oplus Y) \rightarrow$ $R F(Y) \rightarrow R F(X)[1]$. Applying Lemma 13.4 .10 to this once more we find that $R F(X \oplus Y)=R F(X) \oplus R F(Y)$. This proves (1) and the final assertion.
Conversely, assume that $R F$ is defined at $X \oplus Y$ and that $\mathcal{D}^{\prime}$ is Karoubian. Since $S$ is a saturated system $S$ is the set of arrows which become invertible under the additive localization functor $Q: \mathcal{D} \rightarrow S^{-1} \mathcal{D}$, see Categories, Lemma 4.26.21. Thus for any $s: X \rightarrow X^{\prime}$ and $s^{\prime}: Y \rightarrow Y^{\prime}$ in $S$ the morphism $s \oplus s^{\prime}: X \oplus Y \rightarrow X^{\prime} \oplus Y^{\prime}$ is an element of $S$. In this way we obtain a functor

$$
X / S \times Y / S \longrightarrow(X \oplus Y) / S
$$

Recall that the categories $X / S, Y / S,(X \oplus Y) / S$ are filtered (Categories, Remark 4.26.7). By Categories, Lemma $4.22 .9 X / S \times Y / S$ is filtered and $\left.F\right|_{X / S}: X / S \rightarrow \mathcal{D}^{\prime}$ (resp. $\left.G\right|_{Y / S}: Y / S \rightarrow \mathcal{D}^{\prime}$ ) is essentially constant if and only if $\left.F\right|_{X / S} \circ \operatorname{pr}_{1}: X / S \times$ $Y / S \rightarrow \mathcal{D}^{\prime}\left(\right.$ resp. $\left.\left.G\right|_{Y / S} \circ \operatorname{pr}_{2}: X / S \times Y / S \rightarrow \mathcal{D}^{\prime}\right)$ is essentially constant. Below we will show that the displayed functor is cofinal, hence by Categories, Lemma 4.22.8. we see that $\left.F\right|_{(X \oplus Y) / S}$ is essentially constant implies that $\left.\left.F\right|_{X / S} \circ \operatorname{pr}_{1} \oplus F\right|_{Y / S} \circ \operatorname{pr}_{2}$ : $X / S \times Y / S \rightarrow \mathcal{D}^{\prime}$ is essentially constant. By Homology, Lemma 12.26.3 (and this is where we use that $\mathcal{D}^{\prime}$ is Karoubian) we see that $\left.\left.F\right|_{X / S} \circ \mathrm{pr}_{1} \oplus F\right|_{Y / S} \circ \mathrm{pr}_{2}$ being essentially constant implies $\left.F\right|_{X / S} \circ \mathrm{pr}_{1}$ and $\left.F\right|_{Y / S} \circ \mathrm{pr}_{2}$ are essentially constant proving that $R F$ is defined at $X$ and $Y$.
Proof that the displayed functor is cofinal. To do this pick any $t: X \oplus Y \rightarrow Z$ in $S$. Using MS2 we can find morphisms $Z \rightarrow X^{\prime}, Z \rightarrow Y^{\prime}$ and $s: X \rightarrow X^{\prime}, s^{\prime}: Y \rightarrow Y^{\prime}$ in $S$ such that

commutes. This proves there is a map $Z \rightarrow X^{\prime} \oplus Y^{\prime}$ in $(X \oplus Y) / S$, i.e., we get part (1) of Categories, Definition 4.17.1. To prove part (2) it suffices to prove that given $t: X \oplus Y \rightarrow Z$ and morphisms $s_{i} \oplus s_{i}^{\prime}: Z \rightarrow X_{i}^{\prime} \oplus Y_{i}^{\prime}, i=1,2$ in $(X \oplus Y) / S$ we can find morphisms $a: X_{1}^{\prime} \rightarrow X^{\prime}, b: X_{2}^{\prime} \rightarrow X^{\prime}, c: Y_{1}^{\prime} \rightarrow Y^{\prime}, d: Y_{2}^{\prime} \rightarrow Y^{\prime}$ in $S$ such that $a \circ s_{1}=b \circ s_{2}$ and $c \circ s_{1}^{\prime}=d \circ s_{2}^{\prime}$. To do this we first choose any
$X^{\prime}$ and $Y^{\prime}$ and maps $a, b, c, d$ in $S$; this is possible as $X / S$ and $Y / S$ are filtered. Then the two maps $a \circ s_{1}, b \circ s_{2}: Z \rightarrow X^{\prime}$ become equal in $S^{-1} \mathcal{D}$. Hence we can find a morphism $X^{\prime} \rightarrow X^{\prime \prime}$ in $S$ equalizing them. Similarly we find $Y^{\prime} \rightarrow Y^{\prime \prime}$ in $S$ equalizing $c \circ s_{1}^{\prime}$ and $d \circ s_{2}^{\prime}$. Replacing $X^{\prime}$ by $X^{\prime \prime}$ and $Y^{\prime}$ by $Y^{\prime \prime}$ we get $a \circ s_{1}=b \circ s_{2}$ and $c \circ s_{1}^{\prime}=d \circ s_{2}^{\prime}$.
The proof of the corresponding statements for $L F$ are dual.
05SE Proposition 13.15.8. Assumptions and notation as in Situation 13.15.1.
(1) The full subcategory $\mathcal{E}$ of $\mathcal{D}$ consisting of objects at which RF is defined is a strictly full triangulated subcategory of $\mathcal{D}$.
(2) We obtain an exact functor $R F: \mathcal{E} \longrightarrow \mathcal{D}^{\prime}$ of triangulated categories.
(3) Elements of $S$ with either source or target in $\mathcal{E}$ are morphisms of $\mathcal{E}$.
(4) The functor $S_{\mathcal{E}}^{-1} \mathcal{E} \rightarrow S^{-1} \mathcal{D}$ is a fully faithful exact functor of triangulated categories.
(5) Any element of $S_{\mathcal{E}}=\operatorname{Arrows}(\mathcal{E}) \cap S$ is mapped to an isomorphism by $R F$.
(6) We obtain an exact functor

$$
R F: S_{\mathcal{E}}^{-1} \mathcal{E} \longrightarrow \mathcal{D}^{\prime}
$$

(7) If $\mathcal{D}^{\prime}$ is Karoubian, then $\mathcal{E}$ is a saturated triangulated subcategory of $\mathcal{D}$. A similar result holds for $L F$.

Proof. Since $S$ is saturated it contains all isomorphisms (see remark following Categories, Definition 4.26.20. Hence (1) follows from Lemmas 13.15.4, 13.15.6, and 13.15.5. We get (2) from Lemmas 13.15.3, 13.15.5 and 13.15.6. We get (3) from Lemma 13.15.4 The fully faithfulness in (4) follows from (3) and the definitions. The fact that $S_{\mathcal{E}}^{-1} \mathcal{E} \rightarrow S^{-1} \mathcal{D}$ is exact follows from the fact that a triangle in $S_{\mathcal{E}}^{-1} \mathcal{E}$ is distinguished if and only if it is isomorphic to the image of a distinguished triangle in $\mathcal{E}$, see proof of Proposition 13.5.5. Part (5) follows from Lemma 13.15.4. The factorization of $R F: \mathcal{E} \rightarrow \mathcal{D}^{\prime}$ through an exact functor $S_{\mathcal{E}}^{-1} \mathcal{E} \rightarrow \mathcal{D}^{\prime}$ follows from Lemma 13.5.6. Part (7) follows from Lemma 13.15.7.

Proposition 13.15 .8 tells us that $R F$ lives on a maximal strictly full triangulated subcategory of $S^{-1} \mathcal{D}$ and is an exact functor on this triangulated category. Picture:

05SV Definition 13.15.9. In Situation 13.15.1. We say $F$ is right deriveable, or that $R F$ everywhere defined if $R F$ is defined at every object of $\mathcal{D}$. We say $F$ is left deriveable, or that $L F$ everywhere defined if $L F$ is defined at every object of $\mathcal{D}$.

In this case we obtain a right (resp. left) derived functor
05SW

$$
\begin{equation*}
R F: S^{-1} \mathcal{D} \longrightarrow \mathcal{D}^{\prime}, \quad\left(\text { resp. } L F: S^{-1} \mathcal{D} \longrightarrow \mathcal{D}^{\prime}\right) \tag{13.15.9.1}
\end{equation*}
$$

see Proposition 13.15.8. In most interesting situations it is not the case that $R F \circ Q$ is equal to $F$. In fact, it might happen that the canonical map $F(X) \rightarrow R F(X)$ is never an isomorphism. In practice this does not happen, because in practice we only know how to prove $F$ is right deriveable by showing that $R F$ can be computed
by evaluating $F$ at judiciously chosen objects of the triangulated category $\mathcal{D}$. This warrants a definition.

05SX Definition 13.15.10. In Situation 13.15.1.
(1) An object $X$ of $\mathcal{D}$ computes $R F$ if $R F$ is defined at $X$ and the canonical map $F(X) \rightarrow R F(X)$ is an isomorphism.
(2) An object $X$ of $\mathcal{D}$ computes $L F$ if $L F$ is defined at $X$ and the canonical map $L F(X) \rightarrow F(X)$ is an isomorphism.
05SY Lemma 13.15.11. Assumptions and notation as in Situation 13.15.1. Let $X$ be an object of $\mathcal{D}$ and $n \in \mathbf{Z}$.
(1) $X$ computes $R F$ if and only if $X[n]$ computes $R F$.
(2) $X$ computes $L F$ if and only if $X[n]$ computes $L F$.

Proof. Omitted.
05SZ Lemma 13.15.12. Assumptions and notation as in Situation 13.15.1. Let ( $X, Y, Z, f, g, h)$ be a distinguished triangle of $\mathcal{D}$. If $X, Y$ compute $R F$ then so does $Z$. Similar for $L F$.

Proof. By Lemma 13.15 .6 we know that $R F$ is defined at $Z$ and that $R F$ applied to the triangle produces a distinguished triangle. Consider the morphism of distinguished triangles

Two out of three maps are isomorphisms, hence so is the third.
05 T 0 Lemma 13.15.13. Assumptions and notation as in Situation 13.15.1. Let $X, Y$ be objects of $\mathcal{D}$. If $X \oplus Y$ computes $R F$, then $X$ and $Y$ compute RF. Similarly for $L F$.

Proof. If $X \oplus Y$ computes $R F$, then $R F(X \oplus Y)=F(X) \oplus F(Y)$. In the proof of Lemma 13.15.7 we have seen that the functor $X / S \times Y / S \rightarrow(X \oplus Y) / S,\left(s, s^{\prime}\right) \mapsto$ $s \oplus s^{\prime}$ is cofinal. We will use this without further mention. Let $s: X \rightarrow X^{\prime}$ be an element of $S$. Then $F(X) \rightarrow F\left(X^{\prime}\right)$ has a section, namely,

$$
F\left(X^{\prime}\right) \rightarrow F\left(X^{\prime} \oplus Y\right) \rightarrow R F\left(X^{\prime} \oplus Y\right)=R F(X \oplus Y)=F(X) \oplus F(Y) \rightarrow F(X)
$$

where we have used Lemma 13.15.4. Hence $F\left(X^{\prime}\right)=F(X) \oplus E$ for some object $E$ of $\mathcal{D}^{\prime}$ such that $E \rightarrow F\left(X^{\prime} \oplus Y\right) \rightarrow R F\left(X^{\prime} \oplus Y\right)=R F(X \oplus Y)$ is zero (Lemma 13.4.11. Because $R F$ is defined at $X^{\prime} \oplus Y$ with value $F(X) \oplus F(Y)$ we can find a morphism $t: X^{\prime} \oplus Y \rightarrow Z$ of $S$ such that $F(t)$ annihilates $E$. We may assume $Z=X^{\prime \prime} \oplus Y^{\prime \prime}$ and $t=t^{\prime} \oplus t^{\prime \prime}$ with $t^{\prime}, t^{\prime \prime} \in S$. Then $F\left(t^{\prime}\right)$ annihilates $E$. It follows that $F$ is essentially constant on $X / S$ with value $F(X)$ as desired.

05T1 Lemma 13.15.14. Assumptions and notation as in Situation 13.15.1.
(1) If for every object $X \in \mathrm{Ob}(\mathcal{D})$ there exists an arrow $s: X \rightarrow X^{\prime}$ in $S$ such that $X^{\prime}$ computes $R F$, then $R F$ is everywhere defined.
(2) If for every object $X \in \operatorname{Ob}(\mathcal{D})$ there exists an arrow $s: X^{\prime} \rightarrow X$ in $S$ such that $X^{\prime}$ computes $L F$, then LF is everywhere defined.

Proof. This is clear from the definitions.
06XN Lemma 13.15.15. Assumptions and notation as in Situation 13.15.1. If there exists a subset $\mathcal{I} \subset \operatorname{Ob}(\mathcal{D})$ such that
(1) for all $X \in \operatorname{Ob}(\mathcal{D})$ there exists $s: X \rightarrow X^{\prime}$ in $S$ with $X^{\prime} \in \mathcal{I}$, and
(2) for every arrow $s: X \rightarrow X^{\prime}$ in $S$ with $X, X^{\prime} \in \mathcal{I}$ the map $F(s): F(X) \rightarrow$ $F\left(X^{\prime}\right)$ is an isomorphism,
then RF is everywhere defined and every $X \in \mathcal{I}$ computes RF. Dually, if there exists a subset $\mathcal{P} \subset \mathrm{Ob}(\mathcal{D})$ such that
(1) for all $X \in \operatorname{Ob}(\mathcal{D})$ there exists $s: X^{\prime} \rightarrow X$ in $S$ with $X^{\prime} \in \mathcal{P}$, and
(2) for every arrow $s: X \rightarrow X^{\prime}$ in $S$ with $X, X^{\prime} \in \mathcal{P}$ the map $F(s): F(X) \rightarrow$ $F\left(X^{\prime}\right)$ is an isomorphism,
then $L F$ is everywhere defined and every $X \in \mathcal{P}$ computes $L F$.
Proof. Let $X$ be an object of $\mathcal{D}$. Assumption (1) implies that the arrows $s: X \rightarrow$ $X^{\prime}$ in $S$ with $X^{\prime} \in \mathcal{I}$ are cofinal in the category $X / S$. Assumption (2) implies that $F$ is constant on this cofinal subcategory. Clearly this implies that $F:(X / S) \rightarrow \mathcal{D}^{\prime}$ is essentially constant with value $F\left(X^{\prime}\right)$ for any $s: X \rightarrow X^{\prime}$ in $S$ with $X^{\prime} \in \mathcal{I}$.
05 T 2 Lemma 13.15.16. Let $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be triangulated categories. Let $S$, resp. $S^{\prime}$ be a saturated multiplicative system in $\mathcal{A}$, resp. $\mathcal{B}$ compatible with the triangulated structure. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ and $G: \mathcal{B} \rightarrow \mathcal{C}$ be exact functors. Denote $F^{\prime}: \mathcal{A} \rightarrow\left(S^{\prime}\right)^{-1} \mathcal{B}$ the composition of $F$ with the localization functor.
(1) If $R F^{\prime}, R G, R(G \circ F)$ are everywhere defined, then there is a canonical transformation of functors $t: R(G \circ F) \longrightarrow R G \circ R F^{\prime}$.
(2) If $L F^{\prime}, L G, L(G \circ F)$ are everywhere defined, then there is a canonical transformation of functors $t: L G \circ L F^{\prime} \rightarrow L(G \circ F)$.

Proof. In this proof we try to be careful. Hence let us think of the derived functors as the functors

$$
R F^{\prime}: S^{-1} \mathcal{A} \rightarrow\left(S^{\prime}\right)^{-1} \mathcal{B}, \quad R(G \circ F): S^{-1} \mathcal{A} \rightarrow \mathcal{C}, \quad R G:\left(S^{\prime}\right)^{-1} \mathcal{B} \rightarrow \mathcal{C}
$$

Let us denote $Q_{A}: \mathcal{A} \rightarrow S^{-1} \mathcal{A}$ and $Q_{B}: \mathcal{B} \rightarrow\left(S^{\prime}\right)^{-1} \mathcal{B}$ the localization functors. Then $F^{\prime}=Q_{B} \circ F$. Note that for every object $Y$ of $\mathcal{B}$ there is a canonical map

$$
G(Y) \longrightarrow R G\left(Q_{B}(Y)\right)
$$

in other words, there is a transformation of functors $t^{\prime}: G \rightarrow R G \circ Q_{B}$. Let $X$ be an object of $\mathcal{A}$. We have

$$
\begin{aligned}
R(G \circ F)\left(Q_{A}(X)\right) & =\operatorname{colim}_{s: X \rightarrow X^{\prime} \in S} G\left(F\left(X^{\prime}\right)\right) \\
& \xrightarrow{t^{\prime}} \operatorname{colim}_{s: X \rightarrow X^{\prime} \in S} R G\left(Q_{B}\left(F\left(X^{\prime}\right)\right)\right) \\
& =\operatorname{colim}_{s: X \rightarrow X^{\prime} \in S} R G\left(F^{\prime}\left(X^{\prime}\right)\right) \\
& =R G\left(\operatorname{colim}_{s: X \rightarrow X^{\prime} \in S} F^{\prime}\left(X^{\prime}\right)\right) \\
& =R G\left(R F^{\prime}(X)\right) .
\end{aligned}
$$

The system $F^{\prime}\left(X^{\prime}\right)$ is essentially constant in the category $\left(S^{\prime}\right)^{-1} \mathcal{B}$. Hence we may pull the colimit inside the functor $R G$ in the third equality of the diagram above, see Categories, Lemma 4.22 .5 and its proof. We omit the proof this this defines a transformation of functors. The case of left derived functors is similar.

### 13.16. Derived functors on derived categories

05 T 3 In practice derived functors come about most often when given an additive functor between abelian categories.

05T4 Situation 13.16.1. Here $F: \mathcal{A} \rightarrow \mathcal{B}$ is an additive functor between abelian categories. This induces exact functors

$$
F: K(\mathcal{A}) \rightarrow K(\mathcal{B}), \quad K^{+}(\mathcal{A}) \rightarrow K^{+}(\mathcal{B}), \quad K^{-}(\mathcal{A}) \rightarrow K^{-}(\mathcal{B})
$$

We also denote $F$ the composition $K(\mathcal{A}) \rightarrow D(\mathcal{B}), K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$, and $K^{-}(\mathcal{A}) \rightarrow$ $D^{-}(\mathcal{B})$ of $F$ with the localization functor $K(\mathcal{B}) \rightarrow D(\mathcal{B})$, etc. This situation leads to four derived functors we will consider in the following.
(1) The right derived functor of $F: K(\mathcal{A}) \rightarrow D(\mathcal{B})$ relative to the multiplicative system $\operatorname{Qis}(\mathcal{A})$.
(2) The right derived functor of $F: K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ relative to the multiplicative system $\mathrm{Qis}^{+}(\mathcal{A})$.
(3) The left derived functor of $F: K(\mathcal{A}) \rightarrow D(\mathcal{B})$ relative to the multiplicative system $\operatorname{Qis}(\mathcal{A})$.
(4) The left derived functor of $F: K^{-}(\mathcal{A}) \rightarrow D^{-}(\mathcal{B})$ relative to the multiplicative system Qis $^{-}(\mathcal{A})$.
Each of these cases is an example of Situation 13.15.1.
Some of the ambiguity that may arise is alleviated by the following.
Lemma 13.16.2. In Situation 13.16.1.
(1) Let $X$ be an object of $K^{+}(\mathcal{A})$. The right derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ is defined at $X$ if and only if the right derived functor of $K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is defined at $X$. Moreover, the values are canonically isomorphic.
(2) Let $X$ be an object of $K^{+}(\mathcal{A})$. Then $X$ computes the right derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ if and only if $X$ computes the right derived functor of $K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$.
(3) Let $X$ be an object of $K^{-}(\mathcal{A})$. The left derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ is defined at $X$ if and only if the left derived functor of $K^{-}(\mathcal{A}) \rightarrow D^{-}(\mathcal{B})$ is defined at $X$. Moreover, the values are canonically isomorphic.
(4) Let $X$ be an object of $K^{-}(\mathcal{A})$. Then $X$ computes the left derived functor of $K(\mathcal{A}) \rightarrow D(\mathcal{B})$ if and only if $X$ computes the left derived functor of $K^{-}(\mathcal{A}) \rightarrow D^{-}(\mathcal{B})$.

Proof. Let $X$ be an object of $K^{+}(\mathcal{A})$. Consider a quasi-isomorphism $s: X \rightarrow X^{\prime}$ in $K(\mathcal{A})$. By Lemma 13.11 .5 there exists quasi-isomorphism $X^{\prime} \rightarrow X^{\prime \prime}$ with $X^{\prime \prime}$ bounded below. Hence we see that $X / \operatorname{Qis}^{+}(\mathcal{A})$ is cofinal in $X / \operatorname{Qis}(\mathcal{A})$. Thus it is clear that (1) holds. Part (2) follows directly from part (1). Parts (3) and (4) are dual to parts (1) and (2).

Given an object $A$ of an abelian category $\mathcal{A}$ we get a complex

$$
A[0]=(\ldots \rightarrow 0 \rightarrow A \rightarrow 0 \rightarrow \ldots)
$$

where $A$ is placed in degree zero. Hence a functor $\mathcal{A} \rightarrow K(\mathcal{A}), A \mapsto A[0]$. Let us temporarily say that a partial functor is one that is defined on a subcategory.
(1) The right derived functors of $F$ are the partial functors $R F$ associated to cases (1) and (2) of Situation 13.16.1.
(2) The left derived functors of $F$ are the partial functors $L F$ associated to cases (3) and (4) of Situation 13.16.1.
(3) An object $A$ of $\mathcal{A}$ is said to be right acyclic for $F$, or acyclic for $R F$ if $A[0]$ computes $R F$.
(4) An object $A$ of $\mathcal{A}$ is said to be left acyclic for $F$, or acyclic for $L F$ if $A[0]$ computes $R F$.

The following few lemmas give some criteria for the existence of enough acyclics.
05 T 6 Lemma 13.16.4. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{I} \subset \operatorname{Ob}(\mathcal{A})$ be a subset containing 0 such that every object of $\mathcal{A}$ is a subobject of an element of $\mathcal{I}$. Let $a \in \mathbf{Z}$.
(1) Given $K^{\bullet}$ with $K^{n}=0$ for $n<a$ there exists a quasi-isomorphism $K^{\bullet} \rightarrow$ $I^{\bullet}$ with $K^{n} \rightarrow I^{n}$ injective and $I^{n} \in \mathcal{I}$ for all $n$ and $I^{n}=0$ for $n<a$,
(2) Given $K^{\bullet}$ with $H^{n}\left(K^{\bullet}\right)=0$ for $n<a$ there exists a quasi-isomorphism $K^{\bullet} \rightarrow I^{\bullet}$ with $I^{n} \in \mathcal{I}$ and $I^{n}=0$ for $n<a$.
Proof. Proof of part (1). Consider the following induction hypothesis $I H_{n}$ : There are $I^{j} \in \mathcal{I}, j \leq n$ almost all zero, maps $d^{j}: I^{j} \rightarrow I^{j+1}$ for $j<n$ and injective maps $\alpha^{j}: K^{j} \rightarrow I^{j}$ for $j \leq n$ such that the diagram

is commutative, such that $d^{j} \circ d^{j-1}=0$ for $j<n$ and such that $\alpha$ induces isomorphisms $H^{j}\left(K^{\bullet}\right) \rightarrow \operatorname{Ker}\left(d^{j}\right) / \operatorname{Im}\left(d^{j-1}\right)$ for $j<n$. Note that this implies
013L

$$
\begin{equation*}
\alpha\left(\operatorname{Im}\left(d_{K}^{n-1}\right)\right) \subset \alpha\left(\operatorname{Ker}\left(d_{K}^{n}\right)\right) \cap \operatorname{Im}\left(d^{n-1}\right) \subset \alpha\left(K^{n}\right) \cap \operatorname{Im}\left(d^{n-1}\right) \tag{13.16.4.1}
\end{equation*}
$$

If these inclusions are not equalities, then choose an injection

$$
I^{n} \oplus K^{n} / \operatorname{Im}\left(d_{K}^{n-1}\right) \longrightarrow I
$$

with $I \in \mathcal{I}$. Denote $\alpha^{\prime}: K^{n} \rightarrow I$ the map obtained by composing $\alpha \oplus 1: K^{n} \rightarrow I^{n} \oplus$ $K^{n} / \operatorname{Im}\left(d_{K}^{n-1}\right)$ with the displayed injection. Denote $d^{\prime}: I^{n-1} \rightarrow I$ the composition $I^{n-1} \rightarrow I^{n} \rightarrow I$ of $d^{n-1}$ by the inclusion of the first summand. Then $\alpha^{\prime}\left(K^{n}\right) \cap$ $\operatorname{Im}\left(d^{\prime}\right)=\alpha^{\prime}\left(\operatorname{Im}\left(d_{K}^{n-1}\right)\right)$ simply because the intersection of $\alpha^{\prime}\left(K^{n}\right)$ with the first summand of $I^{n} \oplus K^{n} / \operatorname{Im}\left(d_{K}^{n-1}\right)$ is equal to $\alpha^{\prime}\left(\operatorname{Im}\left(d_{K}^{n-1}\right)\right)$. Hence, after replacing $I^{n}$ by $I, \alpha$ by $\alpha^{\prime}$ and $d^{n-1}$ by $d^{\prime}$ we may assume that we have equality in Equation 13.16.4.1). Once this is the case consider the solid diagram

The horizontal arrow is injective by fiat and the vertical arrow is injective as we have equality in 13.16.4.1. Hence the push-out $M$ of this diagram contains both $K^{n+1}$ and $I^{n} /\left(\operatorname{Im}\left(d^{n-1}\right)+\alpha\left(\operatorname{Ker}\left(d_{K}^{n}\right)\right)\right)$ as subobjects. Choose an injection $M \rightarrow I^{n+1}$ with $I^{n+1} \in \mathcal{I}$. By construction we get $d^{n}: I^{n} \rightarrow I^{n+1}$ and an injective map
$\alpha^{n+1}: K^{n+1} \rightarrow I^{n+1}$. The equality in Equation 13.16.4.1 and the construction of $d^{n}$ guarantee that $\alpha: H^{n}\left(K^{\bullet}\right) \rightarrow \operatorname{Ker}\left(d^{n}\right) / \operatorname{Im}\left(d^{n-1}\right)$ is an isomorphism. In other words $I H_{n+1}$ holds.
We finish the proof of by the following observations. First we note that $I H_{n}$ is true for $n=a$ since we can just take $I^{j}=0$ for $j<a$ and $K^{a} \rightarrow I^{a}$ an injection of $K^{a}$ into an element of $\mathcal{I}$. Next, we note that in the proof of $I H_{n} \Rightarrow I H_{n+1}$ we only modified the object $I^{n}$, the map $d^{n-1}$ and the map $\alpha^{n}$. Hence we see that proceeding by induction we produce a complex $I^{\bullet}$ with $I^{n}=0$ for $n<a$ consisting of objects from $\mathcal{I}$, and a termwise injective quasi-isomorphism $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ as desired.

Proof of part (2). The assumption implies that the morphism $K^{\bullet} \rightarrow \tau_{\geq a} K^{\bullet}$ (Homology, Section 12.13) is a quasi-isomorphism. Apply part (1) to find $\tau_{\geq a} K^{\bullet} \rightarrow I^{\bullet}$. The composition $K^{\bullet} \rightarrow I^{\bullet}$ is the desired quasi-isomorphism.

05 T 7 Lemma 13.16.5. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{P} \subset \operatorname{Ob}(\mathcal{A})$ be a subset containing 0 such that every object of $\mathcal{A}$ is a quotient of an element of $\mathcal{P}$. Let $a \in \mathbf{Z}$.
(1) Given $K^{\bullet}$ with $K^{n}=0$ for $n>$ a there exists a quasi-isomorphism $P^{\bullet} \rightarrow$ $K^{\bullet}$ with $P^{n} \in \mathcal{P}$ and $P^{n} \rightarrow K^{n}$ surjective for all $n$ and $P^{n}=0$ for $n>a$.
(2) Given $K^{\bullet}$ with $H^{n}\left(K^{\bullet}\right)=0$ for $n>a$ there exists a quasi-isomorphism $P^{\bullet} \rightarrow K^{\bullet}$ with $P^{n} \in \mathcal{P}$ for all $n$ and $P^{n}=0$ for $n>a$.

Proof. This lemma is dual to Lemma 13.16.4
05 T 8 Lemma 13.16.6. In Situation 13.16.1. Let $\mathcal{I} \subset \mathrm{Ob}(\mathcal{A})$ be a subset with the following properties:
(1) every object of $\mathcal{A}$ is a subobject of an element of $\mathcal{I}$,
(2) for any short exact sequence $0 \rightarrow P \rightarrow Q \rightarrow R \rightarrow 0$ of $\mathcal{A}$ with $P, Q \in \mathcal{I}$, then $R \in \mathcal{I}$, and $0 \rightarrow F(P) \rightarrow F(Q) \rightarrow F(R) \rightarrow 0$ is exact.
Then every object of $\mathcal{I}$ is acyclic for $R F$.
Proof. We may add 0 to $\mathcal{I}$ if necessary. Pick $A \in \mathcal{I}$. Let $A[0] \rightarrow K^{\bullet}$ be a quasi-isomorphism with $K^{\bullet}$ bounded below. Then we can find a quasi-isomorphism $K^{\bullet} \rightarrow I^{\bullet}$ with $I^{\bullet}$ bounded below and each $I^{n} \in \mathcal{I}$, see Lemma 13.16.4. Hence we see that these resolutions are cofinal in the category $A[0] /$ Qis $^{+}(\mathcal{A})$. To finish the proof it therefore suffices to show that for any quasi-isomorphism $A[0] \rightarrow I^{\bullet}$ with $I^{\bullet}$ bounded above and $I^{n} \in \mathcal{I}$ we have $F(A)[0] \rightarrow F\left(I^{\bullet}\right)$ is a quasi-isomorphism. To see this suppose that $I^{n}=0$ for $n<n_{0}$. Of course we may assume that $n_{0}<0$. Starting with $n=n_{0}$ we prove inductively that $\operatorname{Im}\left(d^{n-1}\right)=\operatorname{Ker}\left(d^{n}\right)$ and $\operatorname{Im}\left(d^{-1}\right)$ are elements of $\mathcal{I}$ using property (2) and the exact sequences

$$
0 \rightarrow \operatorname{Ker}\left(d^{n}\right) \rightarrow I^{n} \rightarrow \operatorname{Im}\left(d^{n}\right) \rightarrow 0
$$

Moreover, property (2) also guarantees that the complex

$$
0 \rightarrow F\left(I^{n_{0}}\right) \rightarrow F\left(I^{n_{0}+1}\right) \rightarrow \ldots \rightarrow F\left(I^{-1}\right) \rightarrow F\left(\operatorname{Im}\left(d^{-1}\right)\right) \rightarrow 0
$$

is exact. The exact sequence $0 \rightarrow \operatorname{Im}\left(d^{-1}\right) \rightarrow I^{0} \rightarrow I^{0} / \operatorname{Im}\left(d^{-1}\right) \rightarrow 0$ implies that $I^{0} / \operatorname{Im}\left(d^{-1}\right)$ is an element of $\mathcal{I}$. The exact sequence $0 \rightarrow A \rightarrow I^{0} / \operatorname{Im}\left(d^{-1}\right) \rightarrow$ $\operatorname{Im}\left(d^{0}\right) \rightarrow 0$ then implies that $\operatorname{Im}\left(d^{0}\right)=\operatorname{Ker}\left(d^{1}\right)$ is an elements of $\mathcal{I}$ and from then on one continues as before to show that $\operatorname{Im}\left(d^{n-1}\right)=\operatorname{Ker}\left(d^{n}\right)$ is an element of $\mathcal{I}$ for
all $n>0$. Applying $F$ to each of the short exact sequences mentioned above and using (2) we observe that $F(A)[0] \rightarrow F\left(I^{\bullet}\right)$ is an isomorphism as desired.
05 T 9 Lemma 13.16.7. In Situation 13.16.1. Let $\mathcal{P} \subset \operatorname{Ob}(\mathcal{A})$ be a subset with the following properties:
(1) every object of $\mathcal{A}$ is a quotient of an element of $\mathcal{P}$,
(2) for any short exact sequence $0 \rightarrow P \rightarrow Q \rightarrow R \rightarrow 0$ of $\mathcal{A}$ with $Q, R \in \mathcal{P}$, then $P \in \mathcal{P}$, and $0 \rightarrow F(P) \rightarrow F(Q) \rightarrow F(R) \rightarrow 0$ is exact.
Then every object of $\mathcal{P}$ is acyclic for $L F$.
Proof. Dual to the proof of Lemma 13.16 .6

### 13.17. Higher derived functors

05TB The following simple lemma shows that right derived functors "move to the right".
05TC Lemma 13.17.1. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories. Let $K^{\bullet} \in K^{+}(\mathcal{A})$ and $a \in \mathbf{Z}$.
(1) If $H^{i}\left(K^{\bullet}\right)=0$ for all $i<a$ and $R F$ is defined at $K^{\bullet}$, then $H^{i}\left(R F\left(K^{\bullet}\right)\right)=$ 0 for all $i<a$.
(2) If $R F$ is defined at $K^{\bullet}$ and $\tau_{\leq a} K^{\bullet}$, then $H^{i}\left(R F\left(\tau_{\leq a} K^{\bullet}\right)\right)=H^{i}\left(R F\left(K^{\bullet}\right)\right)$ for all $i \leq a$.

Proof. Assume $K^{\bullet}$ satisfies the assumptions of (1). Let $K^{\bullet} \rightarrow L^{\bullet}$ be any quasiisomorphism. Then it is also true that $K^{\bullet} \rightarrow \tau_{\geq a} L^{\bullet}$ is a quasi-isomorphism by our assumption on $K^{\bullet}$. Hence in the category $K^{\bullet} /$ Qis $^{+}(\mathcal{A})$ the quasi-isomorphisms $s: K^{\bullet} \rightarrow L^{\bullet}$ with $L^{n}=0$ for $n<a$ are cofinal. Thus $R F$ is the value of the essentially constant ind-object $F\left(L^{\bullet}\right)$ for these $s$ it follows that $H^{i}\left(R F\left(K^{\bullet}\right)\right)=0$ for $i<0$.

To prove (2) we use the distinguished triangle

$$
\tau_{\leq a} K^{\bullet} \rightarrow K^{\bullet} \rightarrow \tau_{\geq a+1} K^{\bullet} \rightarrow\left(\tau_{\leq a} K^{\bullet}\right)[1]
$$

of Remark 13.12 .4 to conclude via Lemma 13.15 .6 that $R F$ is defined at $\tau_{\geq a+1} K^{\bullet}$ as well and that we have a distinguished triangle

$$
R F\left(\tau_{\leq a} K^{\bullet}\right) \rightarrow R F\left(K^{\bullet}\right) \rightarrow R F\left(\tau_{\geq a+1} K^{\bullet}\right) \rightarrow R F\left(\tau_{\leq a} K^{\bullet}\right)[1]
$$

in $D(\mathcal{B})$. By part (1) we see that $R F\left(\tau_{\geq a+1} K^{\bullet}\right)$ has vanishing cohomology in degrees $<a+1$. The long exact cohomology sequence of this distinguished triangle then shows what we want.

Definition 13.17.2. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories. Assume $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is everywhere defined. Let $i \in \mathbf{Z}$. The ith right derived functor $R^{i} F$ of $F$ is the functor

$$
R^{i} F=H^{i} \circ R F: \mathcal{A} \longrightarrow \mathcal{B}
$$

The following lemma shows that it really does not make a lot of sense to take the right derived functor unless the functor is left exact.

05TD Lemma 13.17.3. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is everywhere defined.
(1) We have $R^{i} F=0$ for $i<0$,
(2) $R^{0} F$ is left exact,
(3) the map $F \rightarrow R^{0} F$ is an isomorphism if and only if $F$ is left exact.

Proof. Let $A$ be an object of $\mathcal{A}$. Let $A[0] \rightarrow K^{\bullet}$ be any quasi-isomorphism. Then it is also true that $A[0] \rightarrow \tau_{\geq 0} K^{\bullet}$ is a quasi-isomorphism. Hence in the category $A[0] / \operatorname{Qis}^{+}(\mathcal{A})$ the quasi-isomorphisms $s: A[0] \rightarrow K^{\bullet}$ with $K^{n}=0$ for $n<0$ are cofinal. Thus it is clear that $H^{i}(R F(A[0]))=0$ for $i<0$. Moreover, for such an $s$ the sequence

$$
0 \rightarrow A \rightarrow K^{0} \rightarrow K^{1}
$$

is exact. Hence if $F$ is left exact, then $0 \rightarrow F(A) \rightarrow F\left(K^{0}\right) \rightarrow F\left(K^{1}\right)$ is exact as well, and we see that $F(A) \rightarrow H^{0}\left(F\left(K^{\bullet}\right)\right)$ is an isomorphism for every $s: A[0] \rightarrow$ $K^{\bullet}$ as above which implies that $H^{0}(R F(A[0]))=F(A)$.

Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence of $\mathcal{A}$. By Lemma 13.12.1 we obtain a distinguished triangle $(A[0], B[0], C[0], a, b, c)$ in $K^{+}(\mathcal{A})$. From the long exact cohomology sequence (and the vanishing for $i<0$ proved above) we deduce that $0 \rightarrow R^{0} F(A) \rightarrow R^{0} F(B) \rightarrow R^{0} F(C)$ is exact. Hence $R^{0} F$ is left exact. Of course this also proves that if $F \rightarrow R^{0} F$ is an isomorphism, then $F$ is left exact.

015C Lemma 13.17.4. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is everywhere defined. Let $A$ be an object of $\mathcal{A}$.
(1) $A$ is right acyclic for $F$ if and only if $F(A) \rightarrow R^{0} F(A)$ is an isomorphism and $R^{i} F(A)=0$ for all $i>0$,
(2) if $F$ is left exact, then $A$ is right acyclic for $F$ if and only if $R^{i} F(A)=0$ for all $i>0$.

Proof. If $A$ is right acyclic for $F$, then $R F(A[0])=F(A)[0]$ and in particular $F(A) \rightarrow R^{0} F(A)$ is an isomorphism and $R^{i} F(A)=0$ for $i \neq 0$. Conversely, if $F(A) \rightarrow R^{0} F(A)$ is an isomorphism and $R^{i} F(A)=0$ for all $i>0$ then $F(A[0]) \rightarrow$ $R F(A[0])$ is a quasi-isomorphism by Lemma 13.17 .3 part (1) and hence $A$ is acyclic. If $F$ is left exact then $F=R^{0} F$, see Lemma 13.17.3.

015D Lemma 13.17.5. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor between abelian categories and assume $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is everywhere defined. Let $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow$ 0 be a short exact sequence of $\mathcal{A}$.
(1) If $A$ and $C$ are right acyclic for $F$ then so is $B$.
(2) If $A$ and $B$ are right acyclic for $F$ then so is $C$.
(3) If $B$ and $C$ are right acyclic for $F$ and $F(B) \rightarrow F(C)$ is surjective then $A$ is right acyclic for $F$.
In each of the three cases

$$
0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow 0
$$

is a short exact sequence of $\mathcal{B}$.
Proof. By Lemma 13.12.1]we obtain a distinguished triangle ( $A[0], B[0], C[0], a, b, c$ ) in $K^{+}(\mathcal{A})$. As $R F$ is an exact functor and since $R^{i} F=0$ for $i<0$ and $R^{0} F=F$ (Lemma 13.17.3) we obtain an exact cohomology sequence

$$
0 \rightarrow F(A) \rightarrow F(B) \rightarrow F(C) \rightarrow R^{1} F(A) \rightarrow \ldots
$$

in the abelian category $\mathcal{B}$. Thus the lemma follows from the characterization of acyclic objects in Lemma 13.17 .4 .

05TE Lemma 13.17.6. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is everywhere defined.
(1) The functors $R^{i} F, i \geq 0$ come equipped with a canonical structure of a $\delta$-functor from $\mathcal{A} \rightarrow \mathcal{B}$, see Homology, Definition 12.11.1.
(2) If every object of $\mathcal{A}$ is a subobject of a right acyclic object for $F$, then $\left\{R^{i} F, \delta\right\}_{i \geq 0}$ is a universal $\delta$-functor, see Homology, Definition 12.11.3.

Proof. The functor $\mathcal{A} \rightarrow \operatorname{Comp}^{+}(\mathcal{A}), A \mapsto A[0]$ is exact. The functor $\operatorname{Comp}^{+}(\mathcal{A}) \rightarrow$ $D^{+}(\mathcal{A})$ is a $\delta$-functor, see Lemma 13.12.1. The functor $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is exact. Finally, the functor $H^{0}: D^{+}(\mathcal{B}) \rightarrow \mathcal{B}$ is a homological functor, see Definition 13.11.3. Hence we get the structure of a $\delta$-functor from Lemma 13.4.20 and Lemma 13.4.19. Part (2) follows from Homology, Lemma 12.11 .4 and the description of acyclics in Lemma 13.17 .4

015E Lemma 13.17.7 (Leray's acyclicity lemma). Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an additive functor between abelian categories and assume $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is everywhere defined. Let $A^{\bullet}$ be a bounded below complex of $F$-acyclic objects. The canonical map

$$
F\left(A^{\bullet}\right) \longrightarrow R F\left(A^{\bullet}\right)
$$

is an isomorphism in $D^{+}(\mathcal{B})$, i.e., $A^{\bullet}$ computes $R F$.
Proof. First we claim the lemma holds for a bounded complex of acyclic objects. Namely, it holds for complexes with at most one nonzero object by definition. Suppose that $A^{\bullet}$ is a complex with $A^{n}=0$ for $n \notin[a, b]$. Using the "stupid" truncations we obtain a termwise split short exact sequence of complexes

$$
0 \rightarrow \sigma_{\geq a+1} A^{\bullet} \rightarrow A^{\bullet} \rightarrow \sigma_{\leq a} A^{\bullet} \rightarrow 0
$$

see Homology, Section 12.13. Thus a distinguished triangle ( $\sigma_{\geq a+1} A^{\bullet}, A^{\bullet}, \sigma_{\leq a} A^{\bullet}$ ). By induction hypothesis the two outer complexes compute $R \bar{F}$. Then the middle one does too by Lemma 13.15 .12 .
Suppose that $A^{\bullet}$ is a bounded below complex of acyclic objects. To show that $F(A) \rightarrow R F(A)$ is an isomorphism in $D^{+}(\mathcal{B})$ it suffices to show that $H^{i}(F(A)) \rightarrow$ $H^{i}(R F(A))$ is an isomorphism for all $i$. Pick $i$. Consider the termwise split short exact sequence of complexes

$$
0 \rightarrow \sigma_{\geq i+2} A^{\bullet} \rightarrow A^{\bullet} \rightarrow \sigma_{\leq i+1} A^{\bullet} \rightarrow 0
$$

Note that this induces a termwise split short exact sequence

$$
0 \rightarrow \sigma_{\geq i+2} F\left(A^{\bullet}\right) \rightarrow F\left(A^{\bullet}\right) \rightarrow \sigma_{\leq i+1} F\left(A^{\bullet}\right) \rightarrow 0
$$

Hence we get distinguished triangles

$$
\begin{gathered}
\left(\sigma_{\geq i+2} A^{\bullet}, A^{\bullet}, \sigma_{\leq i+1} A^{\bullet}\right) \\
\left(\sigma_{\geq i+2} F\left(A^{\bullet}\right), F\left(A^{\bullet}\right), \sigma_{\leq i+1} F\left(A^{\bullet}\right)\right) \\
\left(R F\left(\sigma_{\geq i+2} A^{\bullet}\right), R F\left(A^{\bullet}\right), R F\left(\sigma_{\leq i+1} A^{\bullet}\right)\right)
\end{gathered}
$$

Using the last two we obtain a map of exact sequences

By the results of the first paragraph the map $\beta$ is an isomorphism. By inspection the objects on the upper left and the upper right are zero. Hence to finish the proof it suffices to show that $R^{i} F\left(\sigma_{\geq i+2} A^{\bullet}\right)=0$ and $R^{i+1} F\left(\sigma_{\geq i+2} A^{\bullet}\right)=0$. This follows immediately from Lemma 13.17.1.
(1) If every object of $\mathcal{A}$ injects into an object acyclic for $R F$, then $R F$ is defined on all of $K^{+}(\mathcal{A})$ and we obtain an exact functor

$$
R F: D^{+}(\mathcal{A}) \longrightarrow D^{+}(\mathcal{B})
$$

see 13.15.9.1. Moreover, any bounded below complex $A^{\bullet}$ whose terms are acyclic for $R F$ computes $R F$.
(2) If every object of $\mathcal{A}$ is quotient of an object acyclic for LF, then LF is defined on all of $K^{-}(\mathcal{A})$ and we obtain an exact functor

$$
L F: D^{-}(\mathcal{A}) \longrightarrow D^{-}(\mathcal{B})
$$

see 13.15.9.1). Moreover, any bounded above complex $A^{\bullet}$ whose terms are acyclic for $L F$ computes $L F$.
Proof. Assume every object of $\mathcal{A}$ injects into an object acyclic for $R F$. Let $\mathcal{I}$ be the set of objects acyclic for $R F$. Let $K^{\bullet}$ be a bounded below complex in $\mathcal{A}$. By Lemma 13.16 .4 there exists a quasi-isomorphism $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ with $I^{\bullet}$ bounded below and $I^{n} \in \mathcal{I}$. Hence in order to prove (1) it suffices to show that $F\left(I^{\bullet}\right) \rightarrow F\left(\left(I^{\prime}\right)^{\bullet}\right)$ is a quasi-isomorphism when $s: I^{\bullet} \rightarrow\left(I^{\prime}\right)^{\bullet}$ is a quasi-isomorphism of bounded below complexes of objects from $\mathcal{I}$, see Lemma 13.15.15. Note that the cone $C(s)^{\bullet}$ is an acyclic bounded below complex all of whose terms are in $\mathcal{I}$. Hence it suffices to show: given an acyclic bounded below complex $I^{\bullet}$ all of whose terms are in $\mathcal{I}$ the complex $F\left(I^{\bullet}\right)$ is acyclic.
Say $I^{n}=0$ for $n<n_{0}$. Setting $J^{n}=\operatorname{Im}\left(d^{n}\right)$ we break $I^{\bullet}$ into short exact sequences $0 \rightarrow J^{n} \rightarrow I^{n+1} \rightarrow J^{n+1} \rightarrow 0$ for $n \geq n_{0}$. These sequences induce distinguished triangles $\left(J^{n}, I^{n+1}, J^{n+1}\right)$ in $D^{+}(\mathcal{A})$ by Lemma 13.12.1. For each $k \in \mathbf{Z}$ denote $H_{k}$ the assertion: For all $n \leq k$ the right derived functor $R F$ is defined at $J^{n}$ and $R^{i} F\left(J^{n}\right)=0$ for $i \neq 0$. Then $H_{k}$ holds trivially for $k \leq n_{0}$. If $H_{n}$ holds, then, using Proposition 13.15.8, we see that $R F$ is defined at $J^{n+1}$ and $\left(R F\left(J^{n}\right), R F\left(I^{n+1}\right), R F\left(J^{n+1}\right)\right)$ is a distinguished triangle of $D^{+}(\mathcal{B})$. Thus the long exact cohomology sequence 13.11.1.1 associated to this triangle gives an exact sequence

$$
0 \rightarrow R^{-1} F\left(J^{n+1}\right) \rightarrow R^{0} F\left(J^{n}\right) \rightarrow F\left(I^{n+1}\right) \rightarrow R^{0} F\left(J^{n+1}\right) \rightarrow 0
$$

and gives that $R^{i} F\left(J^{n+1}\right)=0$ for $i \notin\{-1,0\}$. By Lemma 13.17.1 we see that $R^{-1} F\left(J^{n+1}\right)=0$. This proves that $H_{n+1}$ is true hence $H_{k}$ holds for all $k$. We also conclude that

$$
0 \rightarrow R^{0} F\left(J^{n}\right) \rightarrow F\left(I^{n+1}\right) \rightarrow R^{0} F\left(J^{n+1}\right) \rightarrow 0
$$

is short exact for all $n$. This in turn proves that $F\left(I^{\bullet}\right)$ is exact.
The proof in the case of $L F$ is dual.
015F Lemma 13.17.9. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be an exact functor of abelian categories. Then
(1) every object of $\mathcal{A}$ is right acyclic for $F$,
(2) $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{A})$ is everywhere defined,
(3) $R F: D(\mathcal{A}) \rightarrow D(\mathcal{A})$ is everywhere defined,
(4) every complex computes $R F$, in other words, the canonical map $F\left(K^{\bullet}\right) \rightarrow$ $R F\left(K^{\bullet}\right)$ is an isomorphism for all complexes, and
(5) $R^{i} F=0$ for $i \neq 0$.

Proof. This is true because $F$ transforms acyclic complexes into acyclic complexes and quasi-isomorphisms into quasi-isomorphisms. Details omitted.

### 13.18. Injective resolutions

013G In this section we prove some lemmas regarding the existence of injective resolutions in abelian categories having enough injectives.

013 I Definition 13.18.1. Let $\mathcal{A}$ be an abelian category. Let $A \in \operatorname{Ob}(\mathcal{A})$. An injective resolution of $A$ is a complex $I^{\bullet}$ together with a map $A \rightarrow I^{0}$ such that:
(1) We have $I^{n}=0$ for $n<0$.
(2) Each $I^{n}$ is an injective object of $\mathcal{A}$.
(3) The map $A \rightarrow I^{0}$ is an isomorphism onto $\operatorname{Ker}\left(d^{0}\right)$.
(4) We have $H^{i}\left(I^{\bullet}\right)=0$ for $i>0$.

Hence $A[0] \rightarrow I^{\bullet}$ is a quasi-isomorphism. In other words the complex

$$
\ldots \rightarrow 0 \rightarrow A \rightarrow I^{0} \rightarrow I^{1} \rightarrow \ldots
$$

is acyclic. Let $K^{\bullet}$ be a complex in $\mathcal{A}$. An injective resolution of $K^{\bullet}$ is a complex $I^{\bullet}$ together with a map $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ of complexes such that
(1) We have $I^{n}=0$ for $n \ll 0$, i.e., $I^{\bullet}$ is bounded below.
(2) Each $I^{n}$ is an injective object of $\mathcal{A}$.
(3) The map $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ is a quasi-isomorphism.

In other words an injective resolution $K^{\bullet} \rightarrow I^{\bullet}$ gives rise to a diagram

which induces an isomorphism on cohomology objects in each degree. An injective resolution of an object $A$ of $\mathcal{A}$ is almost the same thing as an injective resolution of the complex $A[0]$.

013J Lemma 13.18.2. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a complex of $\mathcal{A}$.
(1) If $K^{\bullet}$ has an injective resolution then $H^{n}\left(K^{\bullet}\right)=0$ for $n \ll 0$.
(2) If $H^{n}\left(K^{\bullet}\right)=0$ for all $n \ll 0$ then there exists a quasi-isomorphism $K^{\bullet} \rightarrow$ $L^{\bullet}$ with $L^{\bullet}$ bounded below.

Proof. Omitted. For the second statement use $L^{\bullet}=\tau_{\geq n} K^{\bullet}$ for some $n \ll 0$. See Homology, Section 12.13 for the definition of the truncation $\tau_{\geq n}$.

013 K Lemma 13.18.3. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives.
(1) Any object of $\mathcal{A}$ has an injective resolution.
(2) If $H^{n}\left(K^{\bullet}\right)=0$ for all $n \ll 0$ then $K^{\bullet}$ has an injective resolution.
(3) If $K^{\bullet}$ is a complex with $K^{n}=0$ for $n<a$, then there exists an injective resolution $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ with $I^{n}=0$ for $n<a$ such that each $\alpha^{n}: K^{n} \rightarrow$ $I^{n}$ is injective.

Proof. Proof of (1). First choose an injection $A \rightarrow I^{0}$ of $A$ into an injective object of $\mathcal{A}$. Next, choose an injection $I_{0} / A \rightarrow I^{1}$ into an injective object of $\mathcal{A}$. Denote $d^{0}$ the induced map $I^{0} \rightarrow I^{1}$. Next, choose an injection $I^{1} / \operatorname{Im}\left(d^{0}\right) \rightarrow I^{2}$ into an injective object of $\mathcal{A}$. Denote $d^{1}$ the induced map $I^{1} \rightarrow I^{2}$. And so on. By Lemma 13.18 .2 part (2) follows from part (3). Part (3) is a special case of Lemma 13.16.4

013R Lemma 13.18.4. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be an acyclic complex. Let $I^{\bullet}$ be bounded below and consisting of injective objects. Any morphism $K^{\bullet} \rightarrow I^{\bullet}$ is homotopic to zero.

Proof. Let $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ be a morphism of complexes. Assume that $\alpha^{j}=0$ for $j<n$. We will show that there exists a morphism $h: K^{n+1} \rightarrow I^{n}$ such that $\alpha^{n}=h \circ d$. Thus $\alpha$ will be homotopic to the morphism of complexes $\beta$ defined by

$$
\beta^{j}=\left\{\begin{array}{ccc}
0 & \text { if } & j \leq n \\
\alpha^{n+1}-d \circ h & \text { if } & j=n+1 \\
\alpha^{j} & \text { if } & j>n+1
\end{array}\right.
$$

This will clearly prove the lemma (by induction). To prove the existence of $h$ note that $\left.\alpha^{n}\right|_{d^{n-1}\left(K^{n-1}\right)}=0$ since $\alpha^{n-1}=0$. Since $K^{\bullet}$ is acyclic we have $d^{n-1}\left(K^{n-1}\right)=$ $\operatorname{Ker}\left(K^{n} \rightarrow K^{n+1}\right)$. Hence we can think of $\alpha^{n}$ as a map into $I^{n}$ defined on the subobject $\operatorname{Im}\left(K^{n} \rightarrow K^{n+1}\right)$ of $K^{n+1}$. By injectivity of the object $I^{n}$ we can extend this to a map $h: K^{n+1} \rightarrow I^{n}$ as desired.

05 TF Remark 13.18.5. Let $\mathcal{A}$ be an abelian category. Using the fact that $K(\mathcal{A})$ is a triangulated category we may use Lemma 13.18 .4 to obtain proofs of some of the lemmas below which are usually proved by chasing through diagrams. Namely, suppose that $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is a quasi-isomorphism of complexes. Then

$$
\left(K^{\bullet}, L^{\bullet}, C(\alpha)^{\bullet}, \alpha, i,-p\right)
$$

is a distinguished triangle in $K(\mathcal{A})$ (Lemma 13.9.14) and $C(f)^{\bullet}$ is an acyclic complex (Lemma 13.11.2). Next, let $I^{\bullet}$ be a bounded below complex of injective objects. Then

$$
\begin{aligned}
& \operatorname{Hom}_{K(\mathcal{A})}\left(C(\alpha)^{\bullet}, I^{\bullet}\right) \longrightarrow \operatorname{Hom}_{K(\mathcal{A})}\left(L^{\bullet}, I^{\bullet}\right) \longrightarrow \operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right) \\
& \operatorname{Hom}_{K(\mathcal{A})}\left(C(\alpha) \bullet[-1], I^{\bullet}\right)
\end{aligned}
$$

is an exact sequence of abelian groups, see Lemma 13.4.2. At this point Lemma 13.18 .4 guarantees that the outer two groups are zero and hence $\operatorname{Hom}_{K(\mathcal{A})}\left(L^{\bullet}, I^{\bullet}\right)=$ $\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)$.

013P Lemma 13.18.6. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

where $I^{\bullet}$ is bounded below and consists of injective objects, and $\alpha$ is a quasiisomorphism.
(1) There exists a map of complexes $\beta$ making the diagram commute up to homotopy.
(2) If $\alpha$ is injective in every degree then we can find a $\beta$ which makes the diagram commute.

Proof. The "correct" proof of part (1) is explained in Remark 13.18.5. We also give a direct proof here.

We first show that (2) implies (1). Namely, let $\tilde{\alpha}: K \rightarrow \tilde{L}^{\bullet}, \pi, s$ be as in Lemma 13.9.6. Since $\tilde{\alpha}$ is injective by (2) there exists a morphism $\tilde{\beta}: \tilde{L}^{\bullet} \rightarrow I^{\bullet}$ such that $\gamma=\beta \circ \tilde{\alpha}$. Set $\beta=\tilde{\beta} \circ s$. Then we have

$$
\beta \circ \alpha=\tilde{\beta} \circ s \circ \pi \circ \tilde{\alpha} \sim \tilde{\beta} \circ \tilde{\alpha}=\gamma
$$

as desired.
Assume that $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is injective. Suppose we have already defined $\beta$ in all degrees $\leq n-1$ compatible with differentials and such that $\gamma^{j}=\beta^{j} \circ \alpha^{j}$ for all $j \leq n-1$. Consider the commutative solid diagram

Thus we see that the dotted arrow is prescribed on the subobjects $\alpha\left(K^{n}\right)$ and $d^{n-1}\left(L^{n-1}\right)$. Moreover, these two arrows agree on $\alpha\left(d^{n-1}\left(K^{n-1}\right)\right)$. Hence if

013Q

$$
\begin{equation*}
\alpha\left(d^{n-1}\left(K^{n-1}\right)\right)=\alpha\left(K^{n}\right) \cap d^{n-1}\left(L^{n-1}\right) \tag{13.18.6.1}
\end{equation*}
$$

then these morphisms glue to a morphism $\alpha\left(K^{n}\right)+d^{n-1}\left(L^{n-1}\right) \rightarrow I^{n}$ and, using the injectivity of $I^{n}$, we can extend this to a morphism from all of $L^{n}$ into $I^{n}$. After this by induction we get the morphism $\beta$ for all $n$ simultaneously (note that we can set $\beta^{n}=0$ for all $n \ll 0$ since $I^{\bullet}$ is bounded below - in this way starting the induction).

It remains to prove the equality 13.18 .6 .1 . The reader is encouraged to argue this for themselves with a suitable diagram chase. Nonetheless here is our argument. Note that the inclusion $\alpha\left(d^{n-1}\left(K^{n-1}\right)\right) \subset \alpha\left(K^{n}\right) \cap d^{n-1}\left(L^{n-1}\right)$ is obvious. Take an object $T$ of $\mathcal{A}$ and a morphism $x: T \rightarrow L^{n}$ whose image is contained in the subobject $\alpha\left(K^{n}\right) \cap d^{n-1}\left(L^{n-1}\right)$. Since $\alpha$ is injective we see that $x=\alpha \circ x^{\prime}$ for some $x^{\prime}: T \rightarrow K^{n}$. Moreover, since $x$ lies in $d^{n-1}\left(L^{n-1}\right)$ we see that $d^{n} \circ x=0$. Hence using injectivity of $\alpha$ again we see that $d^{n} \circ x^{\prime}=0$. Thus $x^{\prime}$ gives a morphism $\left[x^{\prime}\right]: T \rightarrow H^{n}\left(K^{\bullet}\right)$. On the other hand the corresponding map $[x]: T \rightarrow H^{n}\left(L^{\bullet}\right)$ induced by $x$ is zero by assumption. Since $\alpha$ is a quasi-isomorphism we conclude that $\left[x^{\prime}\right]=0$. This of course means exactly that the image of $x^{\prime}$ is contained in $d^{n-1}\left(K^{n-1}\right)$ and we win.

013 Lemma 13.18.7. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

where $I^{\bullet}$ is bounded below and consists of injective objects, and $\alpha$ is a quasiisomorphism. Any two morphisms $\beta_{1}, \beta_{2}$ making the diagram commute up to homotopy are homotopic.

Proof. This follows from Remark 13.18.5. We also give a direct argument here.
Let $\tilde{\alpha}: K \rightarrow \tilde{L}^{\bullet}, \pi, s$ be as in Lemma 13.9.6. If we can show that $\beta_{1} \circ \pi$ is homotopic to $\beta_{2} \circ \pi$, then we deduce that $\beta_{1} \sim \beta_{2}$ because $\pi \circ s$ is the identity. Hence we may assume $\alpha^{n}: K^{n} \rightarrow L^{n}$ is the inclusion of a direct summand for all $n$. Thus we get a short exact sequence of complexes

$$
0 \rightarrow K^{\bullet} \rightarrow L^{\bullet} \rightarrow M^{\bullet} \rightarrow 0
$$

which is termwise split and such that $M^{\bullet}$ is acyclic. We choose splittings $L^{n}=$ $K^{n} \oplus M^{n}$, so we have $\beta_{i}^{n}: K^{n} \oplus M^{n} \rightarrow I^{n}$ and $\gamma^{n}: K^{n} \rightarrow I^{n}$. In this case the condition on $\beta_{i}$ is that there are morphisms $h_{i}^{n}: K^{n} \rightarrow I^{n-1}$ such that

$$
\gamma^{n}-\left.\beta_{i}^{n}\right|_{K^{n}}=d \circ h_{i}^{n}+h_{i}^{n+1} \circ d
$$

Thus we see that

$$
\left.\beta_{1}^{n}\right|_{K^{n}}-\left.\beta_{2}^{n}\right|_{K^{n}}=d \circ\left(h_{1}^{n}-h_{2}^{n}\right)+\left(h_{1}^{n+1}-h_{2}^{n+1}\right) \circ d
$$

Consider the map $h^{n}: K^{n} \oplus M^{n} \rightarrow I^{n-1}$ which equals $h_{1}^{n}-h_{2}^{n}$ on the first summand and zero on the second. Then we see that

$$
\left.\beta_{1}^{n}-\beta_{2}^{n}-\left(d \circ h^{n}+h^{n+1}\right) \circ d\right)
$$

is a morphism of complexes $L^{\bullet} \rightarrow I^{\bullet}$ which is identically zero on the subcomplex $K^{\bullet}$. Hence it factors as $L^{\bullet} \rightarrow M^{\bullet} \rightarrow I^{\bullet}$. Thus the result of the lemma follows from Lemma 13.18.4.

05TG Lemma 13.18.8. Let $\mathcal{A}$ be an abelian category. Let $I^{\bullet}$ be bounded below complex consisting of injective objects. Let $L^{\bullet} \in K(\mathcal{A})$. Then

$$
\operatorname{Mor}_{K(\mathcal{A})}\left(L^{\bullet}, I^{\bullet}\right)=\operatorname{Mor}_{D(\mathcal{A})}\left(L^{\bullet}, I^{\bullet}\right)
$$

Proof. Let $a$ be an element of the right hand side. We may represent $a=\gamma \alpha^{-1}$ where $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is a quasi-isomorphism and $\gamma: K^{\bullet} \rightarrow I^{\bullet}$ is a map of complexes. By Lemma 13.18 .6 we can find a morphism $\beta: L^{\bullet} \rightarrow I^{\bullet}$ such that $\beta \circ \alpha$ is homotopic to $\gamma$. This proves that the map is surjective. Let $b$ be an element of the left hand side which maps to zero in the right hand side. Then $b$ is the homotopy class of a morphism $\beta: L^{\bullet} \rightarrow I^{\bullet}$ such that there exists a quasi-isomorphism $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ with $\beta \circ \alpha$ homotopic to zero. Then Lemma 13.18 .7 shows that $\beta$ is homotopic to zero also, i.e., $b=0$.

013 Lemma 13.18.9. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. For any short exact sequence $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ of $\operatorname{Comp}^{+}(\mathcal{A})$ there exists
a commutative diagram in $\operatorname{Comp}^{+}(\mathcal{A})$

where the vertical arrows are injective resolutions and the rows are short exact sequences of complexes. In fact, given any injective resolution $A^{\bullet} \rightarrow I^{\bullet}$ we may assume $I_{1}^{\bullet}=I^{\bullet}$.

Proof. Step 1. Choose an injective resolution $A^{\bullet} \rightarrow I^{\bullet}$ (see Lemma 13.18.3) or use the given one. Recall that $\operatorname{Comp}^{+}(\mathcal{A})$ is an abelian category, see Homology, Lemma 12.12 .9 . Hence we may form the pushout along the injective map $A^{\bullet} \rightarrow I^{\bullet}$ to get

Note that the lower short exact sequence is termwise split, see Homology, Lemma 12.23 .2 Hence it suffices to prove the lemma when $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ is termwise split.
Step 2. Choose splittings. In other words, write $B^{n}=A^{n} \oplus C^{n}$. Denote $\delta: C^{\bullet} \rightarrow$ $A^{\bullet}[1]$ the morphism as in Homology, Lemma 12.14 .10 . Choose injective resolutions $f_{1}: A^{\bullet} \rightarrow I_{1}^{\bullet}$ and $f_{3}: C^{\bullet} \rightarrow I_{3}^{\bullet}$. (If $A^{\bullet}$ is a complex of injectives, then use $I_{1}^{\bullet}=A^{\bullet}$.) We may assume $f_{3}$ is injective in every degree. By Lemma 13.18 .6 we may find a morphism $\delta^{\prime}: I_{3}^{\bullet} \rightarrow I_{1}^{\bullet}[1]$ such that $\delta^{\prime} \circ f_{3}=f_{1}[1] \circ \delta$ (equality of morphisms of complexes). Set $I_{2}^{n}=I_{1}^{n} \oplus I_{3}^{n}$. Define

$$
d_{I_{2}}^{n}=\left(\begin{array}{cc}
d_{I_{1}}^{n} & \left(\delta^{\prime}\right)^{n} \\
0 & d_{I_{3}}^{n}
\end{array}\right)
$$

and define the maps $B^{n} \rightarrow I_{2}^{n}$ to be given as the sum of the maps $A^{n} \rightarrow I_{1}^{n}$ and $C^{n} \rightarrow I_{3}^{n}$. Everything is clear.

### 13.19. Projective resolutions

0643 This section is dual to Section 13.18 . We give definitions and state results, but we do not reprove the lemmas.

0644 Definition 13.19.1. Let $\mathcal{A}$ be an abelian category. Let $A \in \operatorname{Ob}(\mathcal{A})$. An projective resolution of $A$ is a complex $P^{\bullet}$ together with a map $P^{0} \rightarrow A$ such that:
(1) We have $P^{n}=0$ for $n>0$.
(2) Each $P^{n}$ is an projective object of $\mathcal{A}$.
(3) The map $P^{0} \rightarrow A$ induces an isomorphism $\operatorname{Coker}\left(d^{-1}\right) \rightarrow A$.
(4) We have $H^{i}\left(P^{\bullet}\right)=0$ for $i<0$.

Hence $P^{\bullet} \rightarrow A[0]$ is a quasi-isomorphism. In other words the complex

$$
\ldots \rightarrow P^{-1} \rightarrow P^{0} \rightarrow A \rightarrow 0 \rightarrow \ldots
$$

is acyclic. Let $K^{\bullet}$ be a complex in $\mathcal{A}$. An projective resolution of $K^{\bullet}$ is a complex $P^{\bullet}$ together with a map $\alpha: P^{\bullet} \rightarrow K^{\bullet}$ of complexes such that
(1) We have $P^{n}=0$ for $n \gg 0$, i.e., $P^{\bullet}$ is bounded above.
(2) Each $P^{n}$ is an projective object of $\mathcal{A}$.
(3) The map $\alpha: P^{\bullet} \rightarrow K^{\bullet}$ is a quasi-isomorphism.

0645 Lemma 13.19.2. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a complex of $\mathcal{A}$.
(1) If $K^{\bullet}$ has a projective resolution then $H^{n}\left(K^{\bullet}\right)=0$ for $n \gg 0$.
(2) If $H^{n}\left(K^{\bullet}\right)=0$ for $n \gg 0$ then there exists a quasi-isomorphism $L^{\bullet} \rightarrow K^{\bullet}$ with $L^{\bullet}$ bounded above.

Proof. Dual to Lemma 13.18.2
0646 Lemma 13.19.3. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough projectives.
(1) Any object of $\mathcal{A}$ has a projective resolution.
(2) If $H^{n}\left(K^{\bullet}\right)=0$ for all $n \gg 0$ then $K^{\bullet}$ has a projective resolution.
(3) If $K^{\bullet}$ is a complex with $K^{n}=0$ for $n>a$, then there exists a projective resolution $\alpha: P^{\bullet} \rightarrow K^{\bullet}$ with $P^{n}=0$ for $n>a$ such that each $\alpha^{n}: P^{n} \rightarrow$ $K^{n}$ is surjective.

Proof. Dual to Lemma 13.18 .3
0647 Lemma 13.19.4. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be an acyclic complex. Let $P^{\bullet}$ be bounded above and consisting of projective objects. Any morphism $P^{\bullet} \rightarrow K^{\bullet}$ is homotopic to zero.

Proof. Dual to Lemma 13.18.4
0648 Remark 13.19.5. Let $\mathcal{A}$ be an abelian category. Suppose that $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is a quasi-isomorphism of complexes. Let $P^{\bullet}$ be a bounded above complex of projectives. Then

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}, K^{\bullet}\right) \longrightarrow \operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}, L^{\bullet}\right)
$$

is an isomorphism. This is dual to Remark 13.18.5.
0649 Lemma 13.19.6. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

where $P^{\bullet}$ is bounded above and consists of projective objects, and $\alpha$ is a quasiisomorphism.
(1) There exists a map of complexes $\beta$ making the diagram commute up to homotopy.
(2) If $\alpha$ is surjective in every degree then we can find a $\beta$ which makes the diagram commute.
Proof. Dual to Lemma 13.18 .6
064A Lemma 13.19.7. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

where $P^{\bullet}$ is bounded above and consists of projective objects, and $\alpha$ is a quasiisomorphism. Any two morphisms $\beta_{1}, \beta_{2}$ making the diagram commute up to homotopy are homotopic.

Proof. Dual to Lemma 13.18.7
064B Lemma 13.19.8. Let $\mathcal{A}$ be an abelian category. Let $P^{\bullet}$ be bounded above complex consisting of projective objects. Let $L^{\bullet} \in K(\mathcal{A})$. Then

$$
\operatorname{Mor}_{K(\mathcal{A})}\left(P^{\bullet}, L^{\bullet}\right)=\operatorname{Mor}_{D(\mathcal{A})}\left(P^{\bullet}, L^{\bullet}\right)
$$

Proof. Dual to Lemma 13.18 .8
064C Lemma 13.19.9. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough projectives. For any short exact sequence $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ of $\operatorname{Comp}^{+}(\mathcal{A})$ there exists a commutative diagram in $\operatorname{Comp}^{+}(\mathcal{A})$

where the vertical arrows are projective resolutions and the rows are short exact sequences of complexes. In fact, given any projective resolution $P^{\bullet} \rightarrow C^{\bullet}$ we may assume $P_{3}^{\bullet}=P^{\bullet}$.

Proof. Dual to Lemma 13.18 .9 .
064D Lemma 13.19.10. Let $\mathcal{A}$ be an abelian category. Let $P^{\bullet}, K^{\bullet}$ be complexes. Let $n \in \mathbf{Z}$. Assume that
(1) $P^{\bullet}$ is a bounded complex consisting of projective objects,
(2) $P^{i}=0$ for $i<n$, and
(3) $H^{i}\left(K^{\bullet}\right)=0$ for $i \geq n$.

Then $\operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}, K^{\bullet}\right)=\operatorname{Hom}_{D(\mathcal{A})}\left(P^{\bullet}, K^{\bullet}\right)=0$.
Proof. The first equality follows from Lemma 13.19.8. Note that there is a distinguished triangle

$$
\left(\tau_{\leq n-1} K^{\bullet}, K^{\bullet}, \tau_{\geq n} K^{\bullet}, f, g, h\right)
$$

by Remark 13.12 .4 . Hence, by Lemma 13.4 .2 it suffices to prove $\operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}, \tau_{\leq n-1} K^{\bullet}\right)=$ 0 and $\operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}, \tau_{\geq n} K^{\bullet}\right)=0$. The first vanishing is trivial and the second is Lemma 13.19.4.

064E Lemma 13.19.11. Let $\mathcal{A}$ be an abelian category. Let $\beta: P^{\bullet} \rightarrow L^{\bullet}$ and $\alpha: E^{\bullet} \rightarrow$ $L^{\bullet}$ be maps of complexes. Let $n \in \mathbf{Z}$. Assume
(1) $P^{\bullet}$ is a bounded complex of projectives and $P^{i}=0$ for $i<n$,
(2) $H^{i}(\alpha)$ is an isomorphism for $i>n$ and surjective for $i=n$.

Then there exists a map of complexes $\gamma: P^{\bullet} \rightarrow E^{\bullet}$ such that $\alpha \circ \gamma$ and $\beta$ are homotopic.

Proof. Consider the cone $C^{\bullet}=C(\alpha)^{\bullet}$ with map $i: L^{\bullet} \rightarrow C^{\bullet}$. Note that $i \circ \beta$ is zero by Lemma 13.19.10. Hence we can lift $\beta$ to $E^{\bullet}$ by Lemma 13.4.2.

### 13.20. Right derived functors and injective resolutions

0156 At this point we can use the material above to define the right derived functors of an additive functor between an abelian category having enough injectives and a general abelian category.
05 TH Lemma 13.20.1. Let $\mathcal{A}$ be an abelian category. Let $I \in \operatorname{Ob}(\mathcal{A})$ be an injective object. Let $I^{\bullet}$ be a bounded below complex of injectives in $\mathcal{A}$.
(1) $I^{\bullet}$ computes $R F$ relative to $Q i s^{+}(\mathcal{A})$ for any exact functor $F: K^{+}(\mathcal{A}) \rightarrow$ $\mathcal{D}$ into any triangulated category $\mathcal{D}$.
(2) $I$ is right acyclic for any additive functor $F: \mathcal{A} \rightarrow \mathcal{B}$ into any abelian category $\mathcal{B}$.
Proof. Part (2) is a direct consequences of part (1) and Definition 13.16.3 To prove (1) let $\alpha: I^{\bullet} \rightarrow K^{\bullet}$ be a quasi-isomorphism into a complex. By Lemma 13.18.7 we see that $\alpha$ has a left inverse. Hence the category $I^{\bullet} /$ Qis $^{+}(\mathcal{A})$ is essentially constant with value id : $I^{\bullet} \rightarrow I^{\bullet}$. Thus also the ind-object

$$
I^{\bullet} / \mathrm{Qis}^{+}(\mathcal{A}) \longrightarrow \mathcal{D}, \quad\left(I^{\bullet} \rightarrow K^{\bullet}\right) \longmapsto F\left(K^{\bullet}\right)
$$

is essentially constant with value $F\left(I^{\bullet}\right)$. This proves (1), see Definitions 13.15 .2 and 13.15 .10 .

05 TI Lemma 13.20.2. Let $\mathcal{A}$ be an abelian category with enough injectives.
(1) For any exact functor $F: K^{+}(\mathcal{A}) \rightarrow \mathcal{D}$ into a triangulated category $\mathcal{D}$ the right derived functor

$$
R F: D^{+}(\mathcal{A}) \longrightarrow \mathcal{D}
$$

is everywhere defined.
(2) For any additive functor $F: \mathcal{A} \rightarrow \mathcal{B}$ into an abelian category $\mathcal{B}$ the right derived functor

$$
R F: D^{+}(\mathcal{A}) \longrightarrow D^{+}(\mathcal{B})
$$

is everywhere defined.
Proof. Combine Lemma 13.20 .1 and Proposition 13.17 .8 for the second assertion. To see the first assertion combine Lemma 13.18.3. Lemma 13.20.1, Lemma 13.15.14, and Equation 13.15.9.1.
0159 Lemma 13.20.3. Let $\mathcal{A}$ be an abelian category with enough injectives. Let $F$ : $\mathcal{A} \rightarrow \mathcal{B}$ be an additive functor.
(1) The functor $R F$ is an exact functor $D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$.
(2) The functor $R F$ induces an exact functor $K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$.
(3) The functor $R F$ induces a $\delta$-functor $\operatorname{Comp}^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$.
(4) The functor $R F$ induces a $\delta$-functor $\mathcal{A} \rightarrow D^{+}(\mathcal{B})$.

Proof. This lemma simply reviews some of the results obtained so far. Note that by Lemma $13.20 .2 R F$ is everywhere defined. Here are some references:
(1) The derived functor is exact: This boils down to Lemma 13.15.6.
(2) This is true because $K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{A})$ is exact and compositions of exact functors are exact.
(3) This is true because $\operatorname{Comp}^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{A})$ is a $\delta$-functor, see Lemma 13.12.1
(4) This is true because $\mathcal{A} \rightarrow \operatorname{Comp}^{+}(\mathcal{A})$ is exact and precomposing a $\delta$ functor by an exact functor gives a $\delta$-functor.

015B Lemma 13.20.4. Let $\mathcal{A}$ be an abelian category with enough injectives. Let $F$ : $\mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor.
(1) For any short exact sequence $0 \rightarrow A^{\bullet} \rightarrow B^{\bullet} \rightarrow C^{\bullet} \rightarrow 0$ of complexes in Comp $^{+}(\mathcal{A})$ there is an associated long exact sequence

$$
\ldots \rightarrow H^{i}\left(R F\left(A^{\bullet}\right)\right) \rightarrow H^{i}\left(R F\left(B^{\bullet}\right)\right) \rightarrow H^{i}\left(R F\left(C^{\bullet}\right)\right) \rightarrow H^{i+1}\left(R F\left(A^{\bullet}\right)\right) \rightarrow \ldots
$$

(2) The functors $R^{i} F: \mathcal{A} \rightarrow \mathcal{B}$ are zero for $i<0$. Also $R^{0} F=F: \mathcal{A} \rightarrow \mathcal{B}$.
(3) We have $R^{i} F(I)=0$ for $i>0$ and $I$ injective.
(4) The sequence $\left(R^{i} F, \delta\right)$ forms a universal $\delta$-functor (see Homology, Definition 12.11.3) from $\mathcal{A}$ to $\mathcal{B}$.

Proof. This lemma simply reviews some of the results obtained so far. Note that by Lemma $13.20 .2 R F$ is everywhere defined. Here are some references:
(1) This follows from Lemma 13.20 .3 part (3) combined with the long exact cohomology sequence 13.11 .1 .1 for $D^{+}(\mathcal{B})$.
(2) This is Lemma 13.17 .3
(3) This is the fact that injective objects are acyclic.
(4) This is Lemma 13.17.6.

### 13.21. Cartan-Eilenberg resolutions

015 G This section can be expanded. The material can be generalized and applied in more cases. Resolutions need not use injectives and the method also works in the unbounded case in some situations.
015 H Definition 13.21.1. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}$ be a bounded below complex. A Cartan-Eilenberg resolution of $K^{\bullet}$ is given by a double complex $I^{\bullet}, \bullet$ and a morphism of complexes $\epsilon: K^{\bullet} \rightarrow I^{\bullet, 0}$ with the following properties:
(1) There exists a $i \ll 0$ such that $I^{p, q}=0$ for all $p<i$ and all $q$.
(2) We have $I^{p, q}=0$ if $q<0$.
(3) The complex $I^{p, \bullet}$ is an injective resolution of $K^{p}$.
(4) The complex $\operatorname{Ker}\left(d_{1}^{p, \bullet}\right)$ is an injective resolution of $\operatorname{Ker}\left(d_{K}^{p}\right)$.
(5) The complex $\operatorname{Im}\left(d_{1}^{p, \bullet}\right)$ is an injective resolution of $\operatorname{Im}\left(d_{K}^{p}\right)$.
(6) The complex $H_{I}^{p}\left(I^{\bullet \bullet \bullet}\right)$ is an injective resolution of $H^{p}\left(K^{\bullet}\right)$.

015I Lemma 13.21.2. Let $\mathcal{A}$ be an abelian category with enough injectives. Let $K^{\bullet}$ be a bounded below complex. There exists a Cartan-Eilenberg resolution of $K^{\bullet}$.

Proof. Suppose that $K^{p}=0$ for $p<n$. Decompose $K^{\bullet}$ into short exact sequences as follows: Set $Z^{p}=\operatorname{Ker}\left(d^{p}\right), B^{p}=\operatorname{Im}\left(d^{p-1}\right), H^{p}=Z^{p} / B^{p}$, and consider

$$
\begin{gathered}
0 \rightarrow Z^{n} \rightarrow K^{n} \rightarrow B^{n+1} \rightarrow 0 \\
0 \rightarrow B^{n+1} \rightarrow Z^{n+1} \rightarrow H^{n+1} \rightarrow 0 \\
0 \rightarrow Z^{n+1} \rightarrow K^{n+1} \rightarrow B^{n+2} \rightarrow 0 \\
0 \rightarrow B^{n+2} \rightarrow Z^{n+2} \rightarrow H^{n+2} \rightarrow 0
\end{gathered}
$$

Set $I^{p, q}=0$ for $p<n$. Inductively we choose injective resolutions as follows:
(1) Choose an injective resolution $Z^{n} \rightarrow J_{Z}^{n, \bullet}$.
(2) Using Lemma 13.18 .9 choose injective resolutions $K^{n} \rightarrow I^{n, \bullet}, B^{n+1} \rightarrow$ $J_{B}^{n+1, \bullet}$, and an exact sequence of complexes $0 \rightarrow J_{Z}^{n, \bullet} \rightarrow I^{n, \bullet} \rightarrow J_{B}^{n+1, \bullet} \rightarrow$ 0 compatible with the short exact sequence $0 \rightarrow Z^{n} \rightarrow K^{n} \rightarrow B^{n+1} \rightarrow 0$.
(3) Using Lemma 13.18 .9 choose injective resolutions $Z^{n+1} \rightarrow J_{Z}^{n+1, \bullet}, H^{n+1} \rightarrow$ $J_{H}^{n+1, \bullet}$, and an exact sequence of complexes $0 \rightarrow J_{B}^{n+1, \bullet} \rightarrow J_{Z}^{n+1, \bullet} \rightarrow$ $J_{H}^{n+1, \bullet} \rightarrow 0$ compatible with the short exact sequence $0 \rightarrow B^{n+1} \rightarrow$ $Z^{n+1} \rightarrow H^{n+1} \rightarrow 0$.
(4) Etc.

Taking as maps $d_{1}^{\bullet}: I^{p, \bullet} \rightarrow I^{p+1, \bullet}$ the compositions $I^{p, \bullet} \rightarrow J_{B}^{p+1, \bullet} \rightarrow J_{Z}^{p+1, \bullet} \rightarrow$ $I^{p+1, \bullet}$ everything is clear.

015J Lemma 13.21.3. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor of abelian categories. Let $K^{\bullet}$ be a bounded below complex of $\mathcal{A}$. Let $I^{\bullet \bullet}$ be a Cartan-Eilenberg resolution for $K^{\bullet}$. The spectral sequences $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)_{r \geq 0}$ and $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$ associated to the double complex $F\left(I^{\bullet \bullet \bullet}\right)$ satisfy the relations

$$
{ }^{\prime} E_{1}^{p, q}=R^{q} F\left(K^{p}\right) \quad \text { and } \quad{ }^{\prime \prime} E_{2}^{p, q}=R^{p} F\left(H^{q}\left(K^{\bullet}\right)\right)
$$

Moreover, these spectral sequences are bounded, converge to $H^{*}\left(R F\left(K^{\bullet}\right)\right)$, and the associated induced filtrations on $H^{n}\left(R F\left(K^{\bullet}\right)\right)$ are finite.

Proof. We will use the following remarks without further mention:
(1) As $I^{p, \bullet}$ is an injective resolution of $K^{p}$ we see that $R F$ is defined at $K^{p}[0]$ with value $F\left(I^{p, \bullet}\right)$.
(2) As $H_{I}^{p}\left(I^{\bullet \bullet}\right)$ is an injective resolution of $H^{p}\left(K^{\bullet}\right)$ the derived functor $R F$ is defined at $H^{p}\left(K^{\bullet}\right)[0]$ with value $F\left(H_{I}^{p}\left(I^{\bullet \bullet \bullet}\right)\right)$.
(3) By Homology, Lemma 12.22 .7 the total complex $s I^{\bullet}$ is an injective resolution of $K^{\bullet}$. Hence $R \bar{F}$ is defined at $K^{\bullet}$ with value $F\left(s I^{\bullet}\right)$.
Consider the two spectral sequences associated to the double complex $L^{\bullet \bullet}=$ $F\left(I^{\bullet \bullet}\right)$, see Homology, Lemma 12.22 .4 . These are both bounded, converge to $H^{*}\left(s L^{\bullet}\right)$, and induce finite filtrations on $H^{n}\left(s L^{\bullet}\right)$, see Homology, Lemma 12.22.6. Since $s L^{\bullet}=s\left(F\left(I^{\bullet \bullet \bullet}\right)\right)=F\left(s I^{\bullet}\right)$ computes $H^{n}\left(R F\left(K^{\bullet}\right)\right)$ we find the final assertion of the lemma holds true.
Computation of the first spectral sequence. We have ${ }^{\prime} E_{1}^{p, q}=H^{q}\left(L^{p, \bullet}\right)$ in other words

$$
{ }^{\prime} E_{1}^{p, q}=H^{q}\left(F\left(I^{p, \bullet}\right)\right)=R^{q} F\left(K^{p}\right)
$$

as desired. Observe for later use that the maps ${ }^{\prime} d_{1}^{p, q}:{ }^{\prime} E_{1}^{p, q} \rightarrow{ }^{\prime} E_{1}^{p+1, q}$ are the maps $R^{q} F\left(K^{p}\right) \rightarrow R^{q} F\left(K^{p+1}\right)$ induced by $K^{p} \rightarrow K^{p+1}$ and the fact that $R^{q} F$ is a functor.
Computation of the second spectral sequence. We have " $E_{1}^{p, q}=H^{q}\left(L^{\bullet, p}\right)=$ $H^{q}\left(F\left(I^{\bullet, p}\right)\right)$. Note that the complex $I^{\bullet, p}$ is bounded below, consists of injectives, and moreover each kernel, image, and cohomology group of the differentials is an injective object of $\mathcal{A}$. Hence we can split the differentials, i.e., each differential is a split surjection onto a direct summand. It follows that the same is true after applying $F$. Hence ${ }^{\prime \prime} E_{1}^{p, q}=F\left(H^{q}\left(I^{\bullet, p}\right)\right)=F\left(H_{I}^{q}\left(I^{\bullet, p}\right)\right)$. The differentials on this are $(-1)^{q}$ times $F$ applied to the differential of the complex $H_{I}^{p}\left(I^{\bullet \bullet}\right)$ which is an injective resolution of $H^{p}\left(K^{\bullet}\right)$. Hence the description of the $E_{2}$ terms.

015K Remark 13.21.4. The spectral sequences of Lemma 13.21 .3 are functorial in the complex $K^{\bullet}$. This follows from functoriality properties of Cartan-Eilenberg resolutions. On the other hand, they are both examples of a more general spectral sequence which may be associated to a filtered complex of $\mathcal{A}$. The functoriality will follow from its construction. We will return to this in the section on the filtered derived category, see Remark 13.26.15.

### 13.22. Composition of right derived functors

015L Sometimes we can compute the right derived functor of a composition. Suppose that $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ and $G: \mathcal{B} \rightarrow \mathcal{C}$ be left exact functors. Assume that the right derived functors $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B}), R G:$ $D^{+}(\mathcal{B}) \rightarrow D^{+}(\mathcal{C})$, and $R(G \circ F): D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{C})$ are everywhere defined. Then there exists a canonical transformation

$$
t: R(G \circ F) \longrightarrow R G \circ R F
$$

of functors from $D^{+}(\mathcal{A})$ to $D^{+}(\mathcal{C})$, see Lemma 13.15.16. This transformation need not always be an isomorphism.

015 M Lemma 13.22.1. Let $\mathcal{A}, \mathcal{B}, \mathcal{C}$ be abelian categories. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ and $G: \mathcal{B} \rightarrow \mathcal{C}$ be left exact functors. Assume $\mathcal{A}, \mathcal{B}$ have enough injectives. The following are equivalent
(1) $F(I)$ is right acyclic for $G$ for each injective object $I$ of $\mathcal{A}$, and
(2) the canonical map

$$
t: R(G \circ F) \longrightarrow R G \circ R F
$$

is isomorphism of functors of functors from $D^{+}(\mathcal{A})$ to $D^{+}(\mathcal{C})$.
Proof. If (2) holds, then (1) follows by evaluating the isomorphism $t$ on $R F(I)=$ $F(I)$. Conversely, assume (1) holds. Let $A^{\bullet}$ be a bounded below complex of $\mathcal{A}$. Choose an injective resolution $A^{\bullet} \rightarrow I^{\bullet}$. The map $t$ is given (see proof of Lemma 13.15.16 by the maps

$$
\left.R(G \circ F)\left(A^{\bullet}\right)=(G \circ F)\left(I^{\bullet}\right)=G\left(F\left(I^{\bullet}\right)\right)\right) \rightarrow R G\left(F\left(I^{\bullet}\right)\right)=R G\left(R F\left(A^{\bullet}\right)\right)
$$

where the arrow is an isomorphism by Lemma 13.17.7.
015N Lemma 13.22.2 (Grothendieck spectral sequence). With assumptions as in Lemma 13.22.1 and assuming the equivalent conditions (1) and (2) hold. Let $X$ be an object of $D^{+}(\mathcal{A})$. There exists a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ consisting of bigraded objects $E_{r}$ of $\mathcal{C}$ with $d_{r}$ of bidegree $(r,-r+1)$ and with

$$
E_{2}^{p, q}=R^{p} G\left(R^{q} F(X)\right)
$$

Moreover, this spectral sequence is bounded, converges to $R^{*}(G \circ F)(X)$, and induces a finite filtration on each $R^{n}(G \circ F)(X)$.

Proof. We may represent $X$ by a bounded below complex $A^{\bullet}$. Choose an injective resolution $A^{\bullet} \rightarrow I^{\bullet}$. Choose a Cartan-Eilenberg resolution $F\left(I^{\bullet}\right) \rightarrow I^{\bullet \bullet}$ using Lemma 13.21.2. Apply the second spectral sequence of Lemma 13.21.3.

### 13.23. Resolution functors

013 U Let $\mathcal{A}$ be an abelian category with enough injectives. Denote $\mathcal{I}$ the full additive subcategory of $\mathcal{A}$ whose objects are the injective objects of $\mathcal{A}$. It turns out that $K^{+}(\mathcal{I})$ and $D^{+}(\mathcal{A})$ are equivalent in this case (see Proposition 13.23.1). For many purposes it therefore makes sense to think of $D^{+}(\mathcal{A})$ as the (easier to grok) category $K^{+}(\mathcal{I})$ in this case.

013V Proposition 13.23.1. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Denote $\mathcal{I} \subset \mathcal{A}$ the strictly full additive subcategory whose objects are the injective objects of $\mathcal{A}$. The functor

$$
K^{+}(\mathcal{I}) \longrightarrow D^{+}(\mathcal{A})
$$

is exact, fully faithful and essentially surjective, i.e., an equivalence of triangulated categories.

Proof. It is clear that the functor is exact. It is essentially surjective by Lemma 13.18.3. Fully faithfulness is a consequence of Lemma 13.18.8.

Proposition 13.23.1 implies that we can find resolution functors. It turns out that we can prove resolution functors exist even in some cases where the abelian category $\mathcal{A}$ is a "big" category, i.e., has a class of objects.
013W Definition 13.23.2. Let $\mathcal{A}$ be an abelian category with enough injectives. A resolution functor ${ }^{5}$ for $\mathcal{A}$ is given by the following data:
(1) for all $K^{\bullet} \in \operatorname{Ob}\left(K^{+}(\mathcal{A})\right)$ a bounded below complex of injectives $j\left(K^{\bullet}\right)$, and
(2) for all $K^{\bullet} \in \operatorname{Ob}\left(K^{+}(\mathcal{A})\right)$ a quasi-isomorphism $i_{K} \bullet: K^{\bullet} \rightarrow j\left(K^{\bullet}\right)$.

05TJ Lemma 13.23.3. Let $\mathcal{A}$ be an abelian category with enough injectives. Given a resolution functor $(j, i)$ there is a unique way to turn $j$ into a functor and $i$ into $a$ 2-isomorphism producing a 2-commutative diagram

where $\mathcal{I}$ is the full additive subcategory of $\mathcal{A}$ consisting of injective objects.
Proof. For every morphism $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ of $K^{+}(\mathcal{A})$ there is a unique morphism $j(\alpha): j\left(K^{\bullet}\right) \rightarrow j\left(L^{\bullet}\right)$ in $K^{+}(\mathcal{I})$ such that

is commutative in $K^{+}(\mathcal{A})$. To see this either use Lemmas 13.18 .6 and 13.18 .7 or the equivalent Lemma 13.18 .8 . The uniqueness implies that $j$ is a functor, and the commutativity of the diagram implies that $i$ gives a 2 -morphism which witnesses the 2-commutativity of the diagram of categories in the statement of the lemma.

[^35]013X Lemma 13.23.4. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Then a resolution functor $j$ exists and is unique up to unique isomorphism of functors.
Proof. Consider the set of all objects $K^{\bullet}$ of $K^{+}(\mathcal{A})$. (Recall that by our conventions any category has a set of objects unless mentioned otherwise.) By Lemma 13.18 .3 every object has an injective resolution. By the axiom of choice we can choose for each $K^{\bullet}$ an injective resolution $i_{K} \bullet: K^{\bullet} \rightarrow j\left(K^{\bullet}\right)$.

014W Lemma 13.23.5. Let $\mathcal{A}$ be an abelian category with enough injectives. Any resolution functor $j: K^{+}(\mathcal{A}) \rightarrow K^{+}(\mathcal{I})$ is exact.

Proof. Denote $i_{K^{\bullet}}: K^{\bullet} \rightarrow j\left(K^{\bullet}\right)$ the canonical maps of Definition 13.23.2 First we discuss the existence of the functorial isomorphism $j\left(K^{\bullet}[1]\right) \rightarrow j\left(K^{\bullet}\right)[1]$. Consider the diagram

By Lemmas 13.18 .6 and 13.18 .7 there exists a unique dotted arrow $\xi_{K} \bullet$ in $K^{+}(\mathcal{I})$ making the diagram commute in $K^{+}(\mathcal{A})$. We omit the verification that this gives a functorial isomorphism. (Hint: use Lemma 13.18.7 again.)
Let $\left(K^{\bullet}, L^{\bullet}, M^{\bullet}, f, g, h\right)$ be a distinguished triangle of $K^{+}(\mathcal{A})$. We have to show that $\left(j\left(K^{\bullet}\right), j\left(L^{\bullet}\right), j\left(M^{\bullet}\right), j(f), j(g), \xi_{K} \bullet \circ j(h)\right)$ is a distinguished triangle of $K^{+}(\mathcal{I})$. Note that we have a commutative diagram

in $K^{+}(\mathcal{A})$ whose vertical arrows are the quasi-isomorphisms $i_{K}, i_{L}, i_{M}$. Hence we see that the image of $\left(j\left(K^{\bullet}\right), j\left(L^{\bullet}\right), j\left(M^{\bullet}\right), j(f), j(g), \xi_{K} \bullet \circ j(h)\right)$ in $D^{+}(\mathcal{A})$ is isomorphic to a distinguished triangle and hence a distinguished triangle by TR1. Thus we see from Lemma 13.4 .16 that $\left(j\left(K^{\bullet}\right), j\left(L^{\bullet}\right), j\left(M^{\bullet}\right), j(f), j(g), \xi_{K} \bullet \circ j(h)\right)$ is a distinguished triangle in $K^{+}(\mathcal{I})$.

05TK Lemma 13.23.6. Let $\mathcal{A}$ be an abelian category which has enough injectives. Let $j$ be a resolution functor. Write $Q: K^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{A})$ for the natural functor. Then $j=j^{\prime} \circ Q$ for a unique functor $j^{\prime}: D^{+}(\mathcal{A}) \rightarrow K^{+}(\mathcal{I})$ which is quasi-inverse to the canonical functor $K^{+}(\mathcal{I}) \rightarrow D^{+}(\mathcal{A})$.

Proof. By Lemma $13.11 .6 Q$ is a localization functor. To prove the existence of $j^{\prime}$ it suffices to show that any element of $\mathrm{Qis}^{+}(\mathcal{A})$ is mapped to an isomorphism under the functor $j$, see Lemma 13.5 .6 . This is true by the remarks following Definition 13.23 .2

013Y Remark 13.23.7. Suppose that $\mathcal{A}$ is a "big" abelian category with enough injectives such as the category of abelian groups. In this case we have to be slightly more careful in constructing our resolution functor since we cannot use the axiom of choice with a quantifier ranging over a class. But note that the proof of the
lemma does show that any two localization functors are canonically isomorphic. Namely, given quasi-isomorphisms $i: K^{\bullet} \rightarrow I^{\bullet}$ and $i^{\prime}: K^{\bullet} \rightarrow J^{\bullet}$ of a bounded below complex $K^{\bullet}$ into bounded below complexes of injectives there exists a unique(!) morphism $a: I^{\bullet} \rightarrow J^{\bullet}$ in $K^{+}(\mathcal{I})$ such that $i^{\prime}=i \circ a$ as morphisms in $K^{+}(\mathcal{I})$. Hence the only issue is existence, and we will see how to deal with this in the next section.

### 13.24. Functorial injective embeddings and resolution functors

0140 In this section we redo the construction of a resolution functor $K^{+}(\mathcal{A}) \rightarrow K^{+}(\mathcal{I})$ in case the category $\mathcal{A}$ has functorial injective embeddings. There are two reasons for this: (1) the proof is easier and (2) the construction also works if $\mathcal{A}$ is a "big" abelian category. See Remark 13.24 .3 below.

Let $\mathcal{A}$ be an abelian category. As before denote $\mathcal{I}$ the additive full subcategory of $\mathcal{A}$ consisting of injective objects. Consider the category $\operatorname{InjRes}(\mathcal{A})$ of arrows $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ where $K^{\bullet}$ is a bounded below complex of $\mathcal{A}, I^{\bullet}$ is a bounded below complex of injectives of $\mathcal{A}$ and $\alpha$ is a quasi-isomorphism. In other words, $\alpha$ is an injective resolution and $K^{\bullet}$ is bounded below. There is an obvious functor

$$
s: \operatorname{InjRes}(\mathcal{A}) \longrightarrow \operatorname{Comp}^{+}(\mathcal{A})
$$

defined by $\left(\alpha: K^{\bullet} \rightarrow I^{\bullet}\right) \mapsto K^{\bullet}$. There is also a functor

$$
t: \operatorname{Inj} \operatorname{Res}(\mathcal{A}) \longrightarrow K^{+}(\mathcal{I})
$$

defined by $\left(\alpha: K^{\bullet} \rightarrow I^{\bullet}\right) \mapsto I^{\bullet}$.
0141 Lemma 13.24.1. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has functorial injective embeddings, see Homology, Definition 12.23.5.
(1) There exists a functor inj : $\operatorname{Comp}^{+}(\mathcal{A}) \rightarrow \operatorname{InjRes}(\mathcal{A})$ such that soinj $=i d$.
(2) For any functor inj : $\operatorname{Comp}^{+}(\mathcal{A}) \rightarrow \operatorname{InjRes}(\mathcal{A})$ such that $s \circ$ inj $=$ id we obtain a resolution functor, see Definition 13.23.2.

Proof. Let $A \mapsto(A \rightarrow J(A))$ be a functorial injective embedding, see Homology, Definition 12.23.5. We first note that we may assume $J(0)=0$. Namely, if not then for any object $A$ we have $0 \rightarrow A \rightarrow 0$ which gives a direct sum decomposition $J(A)=J(0) \oplus \operatorname{Ker}(J(A) \rightarrow J(0))$. Note that the functorial morphism $A \rightarrow J(A)$ has to map into the second summand. Hence we can replace our functor by $J^{\prime}(A)=$ $\operatorname{Ker}(J(A) \rightarrow J(0))$ if needed.
Let $K^{\bullet}$ be a bounded below complex of $\mathcal{A}$. Say $K^{p}=0$ if $p<B$. We are going to construct a double complex $I^{\bullet \bullet}$ of injectives, together with a map $\alpha: K^{\bullet} \rightarrow I^{\bullet, 0}$ such that $\alpha$ induces a quasi-isomorphism of $K^{\bullet}$ with the associated total complex of $I^{\bullet \bullet \bullet}$. First we set $I^{p, q}=0$ whenever $q<0$. Next, we set $I^{p, 0}=J\left(K^{p}\right)$ and $\alpha^{p}: K^{p} \rightarrow I^{p, 0}$ the functorial embedding. Since $J$ is a functor we see that $I^{\bullet, 0}$ is a complex and that $\alpha$ is a morphism of complexes. Each $\alpha^{p}$ is injective. And $I^{p, 0}=0$ for $p<B$ because $J(0)=0$. Next, we set $I^{p, 1}=J\left(\operatorname{Coker}\left(K^{p} \rightarrow I^{p, 0}\right)\right)$. Again by functoriality we see that $I^{\bullet, 1}$ is a complex. And again we get that $I^{p, 1}=0$ for $p<B$. It is also clear that $K^{p}$ maps isomorphically onto $\operatorname{Ker}\left(I^{p, 0} \rightarrow I^{p, 1}\right)$. As our third step we take $I^{p, 2}=J\left(\operatorname{Coker}\left(I^{p, 0} \rightarrow I^{p, 1}\right)\right)$. And so on and so forth.
At this point we can apply Homology, Lemma 12.22 .7 to get that the map

$$
\alpha: K^{\bullet} \rightarrow s I^{\bullet}
$$

is a quasi-isomorphism. To prove we get a functor inj it rests to show that the construction above is functorial. This verification is omitted.

Suppose we have a functor inj such that $s \circ i n j=i d$. For every object $K^{\bullet}$ of $\operatorname{Comp}^{+}(\mathcal{A})$ we can write

$$
\operatorname{inj}\left(K^{\bullet}\right)=\left(i_{K} \bullet: K^{\bullet} \rightarrow j\left(K^{\bullet}\right)\right)
$$

This provides us with a resolution functor as in Definition 13.23.2.
05TL Remark 13.24.2. Suppose $i n j$ is a functor such that $s \circ i n j=$ id as in part (2) of Lemma 13.24.1. Write $\operatorname{inj}\left(K^{\bullet}\right)=\left(i_{K^{\bullet}}: K^{\bullet} \rightarrow j\left(K^{\bullet}\right)\right)$ as in the proof of that lemma. Suppose $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is a map of bounded below complexes. Consider the map $\operatorname{inj}(\alpha)$ in the category $\operatorname{Inj} \operatorname{Res}(\mathcal{A})$. It induces a commutative diagram

of morphisms of complexes. Hence, looking at the proof of Lemma 13.23 .3 we see that the functor $j: K^{+}(\mathcal{A}) \rightarrow K^{+}(\mathcal{I})$ is given by the rule

$$
j(\alpha \text { up to homotopy })=\operatorname{inj}(\alpha) \text { up to homotopy } \in \operatorname{Hom}_{K^{+}(\mathcal{I})}\left(j\left(K^{\bullet}\right), j\left(L^{\bullet}\right)\right)
$$

Hence we see that $j$ matches $t \circ i n j$ in this case, i.e., the diagram

is commutative.
0142 Remark 13.24.3. Let $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ be the category of $\mathcal{O}_{X}$-modules on a ringed space $\left(X, \mathcal{O}_{X}\right)$ (or more generally on a ringed site). We will see later that $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ has enough injectives and in fact functorial injective embeddings, see Injectives, Theorem 19.8.4. Note that the proof of Lemma 13.23 .4 does not apply to $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. But the proof of Lemma 13.24 .1 does apply to $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. Thus we obtain

$$
j: K^{+}\left(\operatorname{Mod}\left(\mathcal{O}_{X}\right)\right) \longrightarrow K^{+}(\mathcal{I})
$$

which is a resolution functor where $\mathcal{I}$ is the additive category of injective $\mathcal{O}_{X^{-}}$ modules. This argument also works in the following cases:
(1) The category $\operatorname{Mod}_{R}$ of $R$-modules over a ring $R$.
(2) The category $\operatorname{PMod}(\mathcal{O})$ of presheaves of $\mathcal{O}$-modules on a site endowed with a presheaf of rings.
(3) The category $\operatorname{Mod}(\mathcal{O})$ of sheaves of $\mathcal{O}$-modules on a ringed site.
(4) Add more here as needed.

### 13.25. Right derived functors via resolution functors

05 TM The content of the following lemma is that we can simply define $R F\left(K^{\bullet}\right)=$ $F\left(j\left(K^{\bullet}\right)\right)$ if we are given a resolution functor $j$.
05TN Lemma 13.25.1. Let $\mathcal{A}$ be an abelian category with enough injectives Let $F$ : $\mathcal{A} \rightarrow \mathcal{B}$ be an additive functor into an abelian category. Let $(i, j)$ be a resolution functor, see Definition 13.23.2. The right derived functor RF of $F$ fits into the following 2 -commutative diagram

where $j^{\prime}$ is the functor from Lemma 13.23.6.
Proof. By Lemma 13.20.1 we have $R F\left(K^{\bullet}\right)=F\left(j\left(K^{\bullet}\right)\right)$.
0158 Remark 13.25.2. In the situation of Lemma 13.25.1 we see that we have actually lifted the right derived functor to an exact functor $F \circ j^{\prime}: D^{+}(\mathcal{A}) \rightarrow K^{+}(\mathcal{B})$. It is occasionally useful to use such a factorization.
13.26. Filtered derived category and injective resolutions

015 O Let $\mathcal{A}$ be an abelian category. In this section we will show that if $\mathcal{A}$ has enough injectives, then so does the category $\mathrm{Fil}^{f}(\mathcal{A})$ in some sense. One can use this observation to compute in the filtered derived category of $\mathcal{A}$.
The category $\operatorname{Fil}^{f}(\mathcal{A})$ is an example of an exact category, see Injectives, Remark 19.9.6. A special role is played by the strict morphisms, see Homology, Definition 12.16.3, i.e., the morphisms $f$ such that $\operatorname{Coim}(f)=\operatorname{Im}(f)$. We will say that a complex $A \rightarrow B \rightarrow C$ in $\operatorname{Fil}^{f}(\mathcal{A})$ is exact if the sequence $\operatorname{gr}(A) \rightarrow \operatorname{gr}(B) \rightarrow \operatorname{gr}(C)$ is exact in $\mathcal{A}$. This implies that $A \rightarrow B$ and $B \rightarrow C$ are strict morphisms, see Homology, Lemma 12.16.15
015P Definition 13.26.1. Let $\mathcal{A}$ be an abelian category. We say an object $I$ of $\mathrm{Fil}^{f}(\mathcal{A})$ is filtered injective if each $\operatorname{gr}^{p}(I)$ is an injective object of $\mathcal{A}$.
05TP Lemma 13.26.2. Let $\mathcal{A}$ be an abelian category. An object I of Filf $(\mathcal{A})$ is filtered injective if and only if there exist $a \leq b$, injective objects $I_{n}, a \leq n \leq b$ of $\mathcal{A}$ and an isomorphism $I \cong \bigoplus_{a \leq n \leq b} I_{n}$ such that $F^{p} I=\bigoplus_{n \geq p} I_{n}$.
Proof. Follows from the fact that any injection $J \rightarrow M$ of $\mathcal{A}$ is split if $J$ is an injective object. Details omitted.
05TQ Lemma 13.26.3. Let $\mathcal{A}$ be an abelian category. Any strict monomorphism $u$ : $I \rightarrow A$ of $\operatorname{Fil}^{f}(\mathcal{A})$ where $I$ is a filtered injective object is a split injection.

Proof. Let $p$ be the largest integer such that $F^{p} I \neq 0$. In particular $\operatorname{gr}^{p}(I)=F^{p} I$. Let $I^{\prime}$ be the object of $\operatorname{Fil}^{f}(\mathcal{A})$ whose underlying object of $\mathcal{A}$ is $F^{p} I$ and with filtration given by $F^{n} I^{\prime}=0$ for $n>p$ and $F^{n} I^{\prime}=I^{\prime}=F^{p} I$ for $n \leq p$. Note that $I^{\prime} \rightarrow I$ is a strict monomorphism too. The fact that $u$ is a strict monomorphism implies that $F^{p} I \rightarrow A / F^{p+1}(A)$ is injective, see Homology, Lemma 12.16.13. Choose a
splitting $s: A / F^{p+1} A \rightarrow F^{p} I$ in $\mathcal{A}$. The induced morphism $s^{\prime}: A \rightarrow I^{\prime}$ is a strict morphism of filtered objects splitting the composition $I^{\prime} \rightarrow I \rightarrow A$. Hence we can write $A=I^{\prime} \oplus \operatorname{Ker}\left(s^{\prime}\right)$ and $I=I^{\prime} \oplus \operatorname{Ker}\left(\left.s^{\prime}\right|_{I}\right)$. Note that $\operatorname{Ker}\left(\left.s^{\prime}\right|_{I}\right) \rightarrow \operatorname{ker}\left(s^{\prime}\right)$ is a strict monomorphism and that $\operatorname{Ker}\left(\left.s^{\prime}\right|_{I}\right)$ is a filtered injective object. By induction on the length of the filtration on $I$ the map $\operatorname{Ker}\left(\left.s^{\prime}\right|_{I}\right) \rightarrow \operatorname{ker}\left(s^{\prime}\right)$ is a split injection. Thus we win.

05TR Lemma 13.26.4. Let $\mathcal{A}$ be an abelian category. Let $u: A \rightarrow B$ be a strict monomorphism of $F_{i l}(\mathcal{A})$ and $f: A \rightarrow I$ a morphism from $A$ into a filtered injective object in $\operatorname{Fil}^{f}(\mathcal{A})$. Then there exists a morphism $g: B \rightarrow I$ such that $f=g \circ u$.

Proof. The pushout $f^{\prime}: I \rightarrow I \amalg_{A} B$ of $f$ by $u$ is a strict monomorphism, see Homology, Lemma 12.16.10. Hence the result follows formally from Lemma 13.26.3.

05TS Lemma 13.26.5. Let $\mathcal{A}$ be an abelian category with enough injectives. For any object $A$ of Fil $^{f}(\mathcal{A})$ there exists a strict monomorphism $A \rightarrow I$ where $I$ is a filtered injective object.

Proof. Pick $a \leq b$ such that $\operatorname{gr}^{p}(A)=0$ unless $p \in\{a, a+1, \ldots, b\}$. For each $n \in\{a, a+1, \ldots, b\}$ choose an injection $u_{n}: A / F^{n} A \rightarrow I_{n}$ with $I_{n}$ and injective object. Set $I=\bigoplus_{a \leq n \leq b} I_{p}$ with filtration $F^{p} I=\bigoplus_{n \geq p} I_{n}$ and set $u: A \rightarrow I$ equal to the direct sum of the maps $u_{n}$.

05TT Lemma 13.26.6. Let $\mathcal{A}$ be an abelian category with enough injectives. For any object $A$ of Fil $^{f}(\mathcal{A})$ there exists a filtered quasi-isomorphism $A[0] \rightarrow I^{\bullet}$ where $I^{\bullet}$ is a complex of filtered injective objects with $I^{n}=0$ for $n<0$.

Proof. First choose a strict monomorphism $u_{0}: A \rightarrow I^{0}$ of $A$ into a filtered injective object, see Lemma 13.26.5. Next, choose a strict monomorphism $u_{1}$ : $\operatorname{Coker}\left(u_{0}\right) \rightarrow I^{1}$ into a filtered injective object of $\mathcal{A}$. Denote $d^{0}$ the induced map $I^{0} \rightarrow I^{1}$. Next, choose a strict monomorphism $u_{2}: \operatorname{Coker}\left(u_{1}\right) \rightarrow I^{2}$ into a filtered injective object of $\mathcal{A}$. Denote $d^{1}$ the induced map $I^{1} \rightarrow I^{2}$. And so on. This works because each of the sequences

$$
0 \rightarrow \operatorname{Coker}\left(u_{n}\right) \rightarrow I^{n+1} \rightarrow \operatorname{Coker}\left(u_{n+1}\right) \rightarrow 0
$$

is short exact, i.e., induces a short exact sequence on applying gr. To see this use Homology, Lemma 12.16.13.

05TU Lemma 13.26.7. Let $\mathcal{A}$ be an abelian category with enough injectives. Let $f$ : $A \rightarrow B$ be a morphism of Fil $^{f}(\mathcal{A})$. Given filtered quasi-isomorphisms $A[0] \rightarrow I^{\bullet}$ and $B[0] \rightarrow J^{\bullet}$ where $I^{\bullet}, J^{\bullet}$ are complexes of filtered injective objects with $I^{n}=J^{n}=0$ for $n<0$, then there exists a commutative diagram

Proof. As $A[0] \rightarrow I^{\bullet}$ and $C[0] \rightarrow J^{\bullet}$ are filtered quasi-isomorphisms we conclude that $a: A \rightarrow I^{0}, b: B \rightarrow J^{0}$ and all the morphisms $d_{I}^{n}, d_{J}^{n}$ are strict, see Homology, Lemma 13.14.4. We will inductively construct the maps $f^{n}$ in the following commutative diagram

Because $A \rightarrow I^{0}$ is a strict monomorphism and because $J^{0}$ is filtered injective, we can find a morphism $f^{0}: I^{0} \rightarrow J^{0}$ such that $f^{0} \circ a=b \circ f$, see Lemma 13.26.4. The composition $d_{J}^{0} \circ b \circ f$ is zero, hence $d_{J}^{0} \circ f^{0} \circ a=0$, hence $d_{J}^{0} \circ f^{0}$ factors through a unique morphism

$$
\operatorname{Coker}(a)=\operatorname{Coim}\left(d_{I}^{0}\right)=\operatorname{Im}\left(d_{I}^{0}\right) \longrightarrow J^{1} .
$$

As $\operatorname{Im}\left(d_{I}^{0}\right) \rightarrow I^{1}$ is a strict monomorphism we can extend the displayed arrow to a morphism $f^{1}: I^{1} \rightarrow J^{1}$ by Lemma 13.26.4 again. And so on.

05TV Lemma 13.26.8. Let $\mathcal{A}$ be an abelian category with enough injectives. Let $0 \rightarrow$ $A \rightarrow B \rightarrow C \rightarrow 0$ be a short exact sequence in $F i l^{f}(\mathcal{A})$. Given filtered quasiisomorphisms $A[0] \rightarrow I^{\bullet}$ and $C[0] \rightarrow J^{\bullet}$ where $I^{\bullet}, J^{\bullet}$ are complexes of filtered injective objects with $I^{n}=J^{n}=0$ for $n<0$, then there exists a commutative diagram

where the lower row is a termwise split sequence of complexes.
Proof. As $A[0] \rightarrow I^{\bullet}$ and $C[0] \rightarrow J^{\bullet}$ are filtered quasi-isomorphisms we conclude that $a: A \rightarrow I^{0}, c: C \rightarrow J^{0}$ and all the morphisms $d_{I}^{n}, d_{J}^{n}$ are strict, see Homology, Lemma 13.14.4 We are going to step by step construct the south-east and the south arrows in the following commutative diagram

As $A \rightarrow B$ is a strict monomorphism, we can find a morphism $b: B \rightarrow I^{0}$ such that $b \circ \alpha=a$, see Lemma 13.26.4. As $A$ is the kernel of the strict morphism $I^{0} \rightarrow I^{1}$ and $\beta=\operatorname{Coker}(\alpha)$ we obtain a unique morphism $\bar{b}: C \rightarrow I^{1}$ fitting into the diagram. As $c$ is a strict monomorphism and $I^{1}$ is filtered injective we can find $\delta^{0}: J^{0} \rightarrow I^{1}$, see Lemma 13.26.4 Because $B \rightarrow C$ is a strict epimorphism and because $B \rightarrow I^{0} \rightarrow I^{1} \rightarrow I^{2}$ is zero, we see that $C \rightarrow I^{1} \rightarrow I^{2}$ is zero. Hence $d_{I}^{1} \circ \delta^{0}$ is zero on $C \cong \operatorname{Im}(c)$. Hence $d_{I}^{1} \circ \delta^{0}$ factors through a unique morphism

$$
\operatorname{Coker}(c)=\operatorname{Coim}\left(d_{J}^{0}\right)=\operatorname{Im}\left(d_{J}^{0}\right) \longrightarrow I^{2}
$$

As $I^{2}$ is filtered injective and $\operatorname{Im}\left(d_{J}^{0}\right) \rightarrow J^{1}$ is a strict monomorphism we can extend the displayed morphism to a morphism $\delta^{1}: J^{1} \rightarrow I^{2}$, see Lemma 13.26.4. And so
on. We set $M^{\bullet}=I^{\bullet} \oplus J^{\bullet}$ with differential

$$
d_{M}^{n}=\left(\begin{array}{cc}
d_{I}^{n} & (-1)^{n+1} \delta^{n} \\
0 & d_{J}^{n}
\end{array}\right)
$$

Finally, the map $B[0] \rightarrow M^{\bullet}$ is given by $b \oplus c \circ \beta: M \rightarrow I^{0} \oplus J^{0}$.
05TW Lemma 13.26.9. Let $\mathcal{A}$ be an abelian category with enough injectives. For every $K^{\bullet} \in K^{+}\left(\right.$Fil $\left.^{f}(\mathcal{A})\right)$ there exists a filtered quasi-isomorphism $K^{\bullet} \rightarrow I^{\bullet}$ with $I^{\bullet}$ bounded below, each $I^{n}$ a filtered injective object, and each $K^{n} \rightarrow I^{n}$ a strict monomorphism.

Proof. After replacing $K^{\bullet}$ by a shift (which is harmless for the proof) we may assume that $K^{n}=0$ for $n<0$. Consider the short exact sequences

$$
\begin{aligned}
& 0 \rightarrow \operatorname{Ker}\left(d_{K}^{0}\right) \rightarrow K^{0} \rightarrow \operatorname{Coim}\left(d_{K}^{0}\right) \rightarrow 0 \\
& 0 \rightarrow \operatorname{Ker}\left(d_{K}^{1}\right) \rightarrow K^{1} \rightarrow \operatorname{Coim}\left(d_{K}^{1}\right) \rightarrow 0 \\
& 0 \rightarrow \operatorname{Ker}\left(d_{K}^{2}\right) \rightarrow K^{2} \rightarrow \operatorname{Coim}\left(d_{K}^{2}\right) \rightarrow 0
\end{aligned}
$$

of the exact category $\operatorname{Fil}^{f}(\mathcal{A})$ and the maps $u_{i}: \operatorname{Coim}\left(d_{K}^{i}\right) \rightarrow \operatorname{Ker}\left(d_{K}^{i+1}\right)$. For each $i \geq 0$ we may choose filtered quasi-isomorphisms

$$
\begin{aligned}
\operatorname{Ker}\left(d_{K}^{i}\right)[0] & \rightarrow I_{k e r, i}^{\bullet} \\
\operatorname{Coim}\left(d_{K}^{i}\right)[0] & \rightarrow I_{c o i m, i}^{\bullet}
\end{aligned}
$$

with $I_{\text {ker }, i}^{n}, I_{\text {coim }, i}^{n}$ filtered injective and zero for $n<0$, see Lemma 13.26.6. By Lemma 13.26 .7 we may lift $u_{i}$ to a morphism of complexes $u_{i}^{\bullet}: I_{\text {coim }, i}^{\bullet} \rightarrow I_{k e r, i+1}^{\bullet}$. Finally, for each $i \geq 0$ we may complete the diagrams

with the lower sequence a termwise split exact sequence, see Lemma 13.26.8. For $i \geq 0$ set $d_{i}: I_{i}^{\bullet} \rightarrow I_{i+1}^{\bullet}$ equal to $d_{i}=\alpha_{i+1} \circ u_{i}^{\bullet} \circ \beta_{i}$. Note that $d_{i} \circ d_{i-1}=0$ because $\beta_{i} \circ \alpha_{i}=0$. Hence we have constructed a commutative diagram

Here the vertical arrows are filtered quasi-isomorphisms. The upper row is a complex of complexes and each complex consists of filtered injective objects with no nonzero objects in degree $<0$. Thus we obtain a double complex by setting $I^{a, b}=I_{a}^{b}$ and using

$$
d_{1}^{a, b}: I^{a, b}=I_{a}^{b} \rightarrow I_{a+1}^{b}=I^{a+1, b}
$$

the map $d_{a}^{b}$ and using for

$$
d_{2}^{a, b}: I^{a, b}=I_{a}^{b} \rightarrow I_{a}^{b+1}=I^{a, b+1}
$$

the map $d_{I_{a}}^{b}$. Denote $\operatorname{Tot}\left(I^{\bullet \bullet \bullet}\right)$ the total complex associated to this double complex, see Homology, Definition 12.22 .3 . Observe that the maps $K^{n}[0] \rightarrow I_{n}^{\bullet}$ come from maps $K^{n} \rightarrow I^{n, 0}$ which give rise to a map of complexes

$$
K^{\bullet} \longrightarrow \operatorname{Tot}\left(I^{\bullet \bullet \bullet}\right)
$$

We claim this is a filtered quasi-isomorphism. As $\operatorname{gr}(-)$ is an additive functor, we see that $\operatorname{gr}\left(\operatorname{Tot}\left(I^{\bullet \bullet \bullet}\right)\right)=\operatorname{Tot}\left(\operatorname{gr}\left(I^{\bullet \bullet \bullet}\right)\right)$. Thus we can use Homology, Lemma 12.22 .7 to conclude that $\operatorname{gr}\left(K^{\bullet}\right) \rightarrow \operatorname{gr}\left(\operatorname{Tot}\left(I^{\bullet \bullet}\right)\right)$ is a quasi-isomorphism as desired.

Lemma 13.26.10. Let $\mathcal{A}$ be an abelian category. Let $K^{\bullet}, I^{\bullet} \in K\left(F i l^{f}(\mathcal{A})\right)$. Assume $K^{\bullet}$ is filtered acyclic and $I^{\bullet}$ bounded below and consisting of filtered injective objects. Any morphism $K^{\bullet} \rightarrow I^{\bullet}$ is homotopic to zero: $\operatorname{Hom}_{K\left(F i l^{f}(\mathcal{A})\right)}\left(K^{\bullet}, I^{\bullet}\right)=0$.

Proof. Let $\alpha: K^{\bullet} \rightarrow I^{\bullet}$ be a morphism of complexes. Assume that $\alpha^{j}=0$ for $j<n$. We will show that there exists a morphism $h: K^{n+1} \rightarrow I^{n}$ such that $\alpha^{n}=h \circ d$. Thus $\alpha$ will be homotopic to the morphism of complexes $\beta$ defined by

$$
\beta^{j}=\left\{\begin{array}{ccc}
0 & \text { if } & j \leq n \\
\alpha^{n+1}-d \circ h & \text { if } & j=n+1 \\
\alpha^{j} & \text { if } & j>n+1
\end{array}\right.
$$

This will clearly prove the lemma (by induction). To prove the existence of $h$ note that $\alpha^{n} \circ d_{K}^{n-1}=0$ since $\alpha^{n-1}=0$. Since $K^{\bullet}$ is filtered acyclic we see that $d_{K}^{n-1}$ and $d_{K}^{n}$ are strict and that

$$
0 \rightarrow \operatorname{Im}\left(d_{K}^{n-1}\right) \rightarrow K^{n} \rightarrow \operatorname{Im}\left(d_{K}^{n}\right) \rightarrow 0
$$

is an exact sequence of the exact category $\operatorname{Fil}^{f}(\mathcal{A})$, see Homology, Lemma 12.16.15. Hence we can think of $\alpha^{n}$ as a map into $I^{n}$ defined on $\operatorname{Im}\left(d_{K}^{n}\right)$. Using that $\operatorname{Im}\left(d_{K}^{n}\right) \rightarrow$ $K^{n+1}$ is a strict monomorphism and that $I^{n}$ is filtered injective we may lift this map to a map $h: K^{n+1} \rightarrow I^{n}$ as desired, see Lemma 13.26.4.

05 TY Lemma 13.26.11. Let $\mathcal{A}$ be an abelian category. Let $I^{\bullet} \in K\left(\right.$ Fil $\left.^{f}(\mathcal{A})\right)$ be a bounded below complex consisting of filtered injective objects.
(1) Let $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ in $K\left(\right.$ Fil $\left.^{f}(\mathcal{A})\right)$ be a filtered quasi-isomorphism. Then the map

$$
\operatorname{Hom}_{K\left(F i l^{f}(\mathcal{A})\right)}\left(L^{\bullet}, I^{\bullet}\right) \rightarrow \operatorname{Hom}_{K\left(F i l^{f}(\mathcal{A})\right)}\left(K^{\bullet}, I^{\bullet}\right)
$$

is bijective.
(2) Let $L^{\bullet} \in K(\mathcal{A})$. Then

$$
\operatorname{Hom}_{K\left(F i l^{f}(\mathcal{A})\right)}\left(L^{\bullet}, I^{\bullet}\right)=\operatorname{Hom}_{D F(\mathcal{A})}\left(L^{\bullet}, I^{\bullet}\right)
$$

Proof. Proof of (1). Note that

$$
\left(K^{\bullet}, L^{\bullet}, C(\alpha)^{\bullet}, \alpha, i,-p\right)
$$

is a distinguished triangle in $K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)\left(\right.$ Lemma 13.9.14) and $C(f)^{\bullet}$ is a filtered acyclic complex (Lemma 13.14.4). Then

$$
\begin{aligned}
& \operatorname{Hom}_{K\left(\operatorname{Fil}^{f}(\mathcal{A})\right)}\left(C(\alpha), I^{\bullet}\right) \longrightarrow \operatorname{Hom}_{K\left(\mathrm{Fil}^{f}(\mathcal{A})\right)}\left(L^{\bullet}, I^{\bullet}\right) \longrightarrow \operatorname{Hom}_{K\left(\mathrm{Fil}^{f}(\mathcal{A})\right)}\left(K^{\bullet}, I^{\bullet}\right) \\
& \operatorname{Hom}_{K\left(\mathrm{Fil}^{f}(\mathcal{A})\right)}\left(C(\alpha) \bullet[-1], \Gamma^{\bullet}\right)
\end{aligned}
$$

is an exact sequence of abelian groups, see Lemma 13.4.2. At this point Lemma 13.26 .10 guarantees that the outer two groups are zero and hence $\operatorname{Hom}_{K(\mathcal{A})}\left(L^{\bullet}, I^{\bullet}\right)=$ $\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)$.
Proof of (2). Let $a$ be an element of the right hand side. We may represent $a=\gamma \alpha^{-1}$ where $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ is a filtered quasi-isomorphism and $\gamma: K^{\bullet} \rightarrow I^{\bullet}$ is a map of complexes. By part (1) we can find a morphism $\beta: L^{\bullet} \rightarrow I^{\bullet}$ such that $\beta \circ \alpha$ is homotopic to $\gamma$. This proves that the map is surjective. Let $b$ be an element of the left hand side which maps to zero in the right hand side. Then $b$ is the homotopy class of a morphism $\beta: L^{\bullet} \rightarrow I^{\bullet}$ such that there exists a filtered quasi-isomorphism $\alpha: K^{\bullet} \rightarrow L^{\bullet}$ with $\beta \circ \alpha$ homotopic to zero. Then part (1) shows that $\beta$ is homotopic to zero also, i.e., $b=0$.

015Q Lemma 13.26.12. Let $\mathcal{A}$ be an abelian category with enough injectives. Let $\mathcal{I}^{f} \subset \operatorname{Fil}^{f}(\mathcal{A})$ denote the strictly full additive subcategory whose objects are the filtered injective objects. The canonical functor

$$
K^{+}\left(\mathcal{I}^{f}\right) \longrightarrow D F^{+}(\mathcal{A})
$$

is exact, fully faithful and essentially surjective, i.e., an equivalence of triangulated categories. Furthermore the diagrams

are commutative, where $\mathcal{I} \subset \mathcal{A}$ is the strictly full additive subcategory whose objects are the injective objects.

Proof. The functor $K^{+}\left(\mathcal{I}^{f}\right) \rightarrow D F^{+}(\mathcal{A})$ is essentially surjective by Lemma 13.26.9. It is fully faithful by Lemma 13.26.11. It is an exact functor by our definitions regarding distinguished triangles. The commutativity of the squares is immediate.

015R Remark 13.26.13. We can invert the arrow of the lemma only if $\mathcal{A}$ is a category in our sense, namely if it has a set of objects. However, suppose given a big abelian category $\mathcal{A}$ with enough injectives, such as $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ for example. Then for any given set of objects $\left\{A_{i}\right\}_{i \in I}$ there is an abelian subcategory $\mathcal{A}^{\prime} \subset \mathcal{A}$ containing all of them and having enough injectives, see Sets, Lemma 3.12.1. Thus we may use the lemma above for $\mathcal{A}^{\prime}$. This essentially means that if we use a set worth of diagrams, etc then we will never run into trouble using the lemma.

Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $T: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor. (We cannot use the letter $F$ for the functor since this would conflict too much with our use of the letter $F$ to indicate filtrations.) Note that $T$ induces an additive functor

$$
T: \operatorname{Fil}^{f}(\mathcal{A}) \rightarrow \operatorname{Fil}^{f}(\mathcal{B})
$$

by the rule $T(A, F)=(T(A), F)$ where $F^{p} T(A)=T\left(F^{p} A\right)$ which makes sense as $T$ is left exact. (Warning: It may not be the case that $\operatorname{gr}(T(A))=T(\operatorname{gr}(A))$.) This induces functors of triangulated categories
05TZ

$$
\begin{equation*}
T: K^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \longrightarrow K^{+}\left(\operatorname{Fil}^{f}(\mathcal{B})\right) \tag{13.26.13.1}
\end{equation*}
$$

The filtered right derived functor of $T$ is the right derived functor of Definition 13.15.2 for this exact functor composed with the exact functor $K^{+}\left(\operatorname{Fil}^{f}(\mathcal{B})\right) \rightarrow$ $D F^{+}(\mathcal{B})$ and the multiplicative set $\mathrm{FQis}^{+}(\mathcal{A})$. Assume $\mathcal{A}$ has enough injectives. At this point we can redo the discussion of Section 13.20 to define the filtered right derived functors

$$
\begin{equation*}
R T: D F^{+}(\mathcal{A}) \longrightarrow D F^{+}(\mathcal{B}) \tag{13.26.13.2}
\end{equation*}
$$

of our functor $T$.
However, instead we will proceed as in Section 13.25, and it will turn out that we can define $R T$ even if $T$ is just additive. Namely, we first choose a quasi-inverse $j^{\prime}: D F^{+}(\mathcal{A}) \rightarrow K^{+}\left(\mathcal{I}^{f}\right)$ of the equivalence of Lemma 13.26.12 By Lemma 13.4.16 we see that $j^{\prime}$ is an exact functor of triangulated categories. Next, we note that for a filtered injective object $I$ we have a (noncanonical) decomposition

$$
\begin{equation*}
I \cong \bigoplus_{p \in \mathbf{z}} I_{p}, \quad \text { with } \quad F^{p} I=\bigoplus_{q \geq p} I_{q} \tag{13.26.13.3}
\end{equation*}
$$

by Lemma 13.26 .2 . Hence if $T$ is any additive functor $T: \mathcal{A} \rightarrow \mathcal{B}$ then we get an additive functor

$$
\begin{equation*}
T_{e x t}: \mathcal{I}^{f} \rightarrow \operatorname{Fil}^{f}(\mathcal{B}) \tag{13.26.13.4}
\end{equation*}
$$

by setting $T_{\text {ext }}(I)=\bigoplus T\left(I_{p}\right)$ with $F^{p} T_{e x t}(I)=\bigoplus_{q \geq p} T\left(I_{q}\right)$. Note that we have the property $\operatorname{gr}\left(T_{\text {ext }}(I)\right)=T(\operatorname{gr}(I))$ by construction. Hence we obtain a functor

$$
\begin{equation*}
T_{\text {ext }}: K^{+}\left(\mathcal{I}^{f}\right) \rightarrow K^{+}\left(\operatorname{Fil}^{f}(\mathcal{B})\right) \tag{13.26.13.5}
\end{equation*}
$$

which commutes with gr. Then we define 13.26 .13 .2 by the composition

$$
\begin{equation*}
R T=T_{e x t} \circ j^{\prime} . \tag{13.26.13.6}
\end{equation*}
$$

Since $R T: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ is computed by injective resolutions as well, see Lemmas 13.20.1. the commutation of $T$ with gr, and the commutative diagrams of Lemma 13.26.12 imply that
015U
(13.26.13.7)

$$
\operatorname{gr}^{p} \circ R T \cong R T \circ \mathrm{gr}^{p}
$$

and
$015 \mathrm{~V} \quad($ 13.26.13.8 $) \quad($ forget $F) \circ R T \cong R T \circ($ forget $F)$
as functors $D F^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$.
The filtered derived functor $R T$ 13.26.13.2 induces functors

$$
\begin{gathered}
R T: \operatorname{Fil}^{f}(\mathcal{A}) \rightarrow D F^{+}(\mathcal{B}), \\
R T: \operatorname{Comp}^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right) \rightarrow D F^{+}(\mathcal{B}), \\
R T: K F^{+}(\mathcal{A}) \rightarrow D F^{+}(\mathcal{B}) .
\end{gathered}
$$

Note that since $\operatorname{Fil}^{f}(\mathcal{A})$, and $\operatorname{Comp}^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$ are no longer abelian it does not make sense to say that $R T$ restricts to a $\delta$-functor on them. (This can be repaired by thinking of these categories as exact categories and formulating the notion of a $\delta$-functor from an exact category into a triangulated category.) But it does make sense, and it is true by construction, that $R T$ is an exact functor on the triangulated category $K F^{+}(\mathcal{A})$.

015W Lemma 13.26.14. Let $\mathcal{A}, \mathcal{B}$ be abelian categories. Let $T: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor. Assume $\mathcal{A}$ has enough injectives. Let $\left(K^{\bullet}, F\right)$ be an object of $\operatorname{Comp}^{+}\left(\right.$Fil $\left.^{f}(\mathcal{A})\right)$. There exists a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ consisting of bigraded objects $E_{r}$ of $\mathcal{B}$ and $d_{r}$ of bidegree $(r,-r+1)$ and with

$$
E_{1}^{p, q}=R^{p+q} T\left(g r^{p}\left(K^{\bullet}\right)\right)
$$

Moreover, this spectral sequence is bounded, converges to $R^{*} T\left(K^{\bullet}\right)$, and induces a finite filtration on each $R^{n} T\left(K^{\bullet}\right)$. The construction of this spectral sequence is functorial in the object $K^{\bullet}$ of $\operatorname{Comp}^{+}\left(\right.$Fil $\left.^{f}(\mathcal{A})\right)$ and the terms $\left(E_{r}, d_{r}\right)$ for $r \geq 1$ do not depend on any choices.

Proof. Choose a filtered quasi-isomorphism $K^{\bullet} \rightarrow I^{\bullet}$ with $I^{\bullet}$ a bounded below complex of filtered injective objects, see Lemma 13.26.9. Consider the complex $R T\left(K^{\bullet}\right)=T_{\text {ext }}\left(I^{\bullet}\right)$, see 13.26 .13 .6 . Thus we can consider the spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ associated to this as a filtered complex in $\mathcal{B}$, see Homology, Section 12.21 By Homology, Lemma 12.21 .2 we have $E_{1}^{p, q}=H^{p+q}\left(\operatorname{gr}^{p}\left(T\left(I^{\bullet}\right)\right)\right)$. By Equation (13.26.13.3) we have $E_{1}^{p, q}=H^{p+q}\left(T\left(\mathrm{gr}^{p}\left(I^{\bullet}\right)\right)\right.$ ), and by definition of a filtered injective resolution the map $\mathrm{gr}^{p}\left(K^{\bullet}\right) \rightarrow \mathrm{gr}^{p}\left(I^{\bullet}\right)$ is an injective resolution. Hence $E_{1}^{p, q}=R^{p+q} T\left(\mathrm{gr}^{p}\left(K^{\bullet}\right)\right)$.

On the other hand, each $I^{n}$ has a finite filtration and hence each $T\left(I^{n}\right)$ has a finite filtration. Thus we may apply Homology, Lemma 12.21 .11 to conclude that the spectral sequence is bounded, converges to $H^{n}\left(T\left(I^{\bullet}\right)\right)=R^{n} T\left(K^{\bullet}\right)$ moreover inducing finite filtrations on each of the terms.

Suppose that $K^{\bullet} \rightarrow L^{\bullet}$ is a morphism of $\operatorname{Comp}^{+}\left(\operatorname{Fil}^{f}(\mathcal{A})\right)$. Choose a filtered quasi-isomorphism $L^{\bullet} \rightarrow J^{\bullet}$ with $J^{\bullet}$ a bounded below complex of filtered injective objects, see Lemma 13.26 .9 . By our results above, for example Lemma 13.26.11, there exists a diagram

which commutes up to homotopy. Hence we get a morphism of filtered complexes $T\left(I^{\bullet}\right) \rightarrow T\left(J^{\bullet}\right)$ which gives rise to the morphism of spectral sequences, see Homology, Lemma 12.21.4. The last statement follows from this.

015X Remark 13.26.15. As promised in Remark 13.21 .4 we discuss the connection of the lemma above with the constructions using Cartan-Eilenberg resolutions. Namely, let $T: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor of abelian categories, assume $\mathcal{A}$ has enough injectives, and let $K^{\bullet}$ be a bounded below complex of $\mathcal{A}$. We give an alternative construction of the spectral sequences ' $E$ and " $E$ of Lemma 13.21.3

First spectral sequence. Consider the "stupid" filtration on $K^{\bullet}$ obtained by setting $F^{p}\left(K^{\bullet}\right)=\sigma_{\geq p}\left(K^{\bullet}\right)$, see Homology, Section 12.13. Note that this stupid in the sense that $d\left(\bar{F}^{p}\left(K^{\bullet}\right)\right) \subset F^{p+1}\left(K^{\bullet}\right)$, compare Homology, Lemma 12.21.3. Note that $\operatorname{gr}^{p}\left(K^{\bullet}\right)=K^{p}[-p]$ with this filtration. According to Lemma 13.26 .14 there is a spectral sequence with $E_{1}$ term

$$
E_{1}^{p, q}=R^{p+q} T\left(K^{p}[-p]\right)=R^{q} T\left(K^{p}\right)
$$

as in the spectral sequence ' $E_{r}$. Observe moreover that the differentials $E_{1}^{p, q} \rightarrow$ $E_{1}^{p+1, q}$ agree with the differentials in ' $E_{1}$, see Homology, Lemma 12.21 .3 part (2) and the description of ' $d_{1}$ in the proof of Lemma 13.21 .3 .
Second spectral sequence. Consider the filtration on the complex $K^{\bullet}$ obtained by setting $F^{p}\left(K^{\bullet}\right)=\tau_{\leq-p}\left(K^{\bullet}\right)$, see Homology, Section 12.13. The minus sign is necessary to get a decreasing filtration. Note that $\operatorname{gr}^{p}\left(K^{\bullet}\right)$ is quasi-isomorphic to $H^{-p}\left(K^{\bullet}\right)[p]$ with this filtration. According to Lemma 13.26 .14 there is a spectral sequence with $E_{1}$ term

$$
E_{1}^{p, q}=R^{p+q} T\left(H^{-p}\left(K^{\bullet}\right)[p]\right)=R^{2 p+q} T\left(H^{-p}\left(K^{\bullet}\right)\right)={ }^{\prime \prime} E_{2}^{i, j}
$$

with $i=2 p+q$ and $j=-p$. (This looks unnatural, but note that we could just have well developed the whole theory of filtered complexes using increasing filtrations, with the end result that this then looks natural, but the other one doesn't.) We leave it to the reader to see that the differentials match up.
Actually, given a Cartan-Eilenberg resolution $K^{\bullet} \rightarrow I^{\bullet \bullet \bullet}$ the induced morphism $K^{\bullet} \rightarrow s I^{\bullet}$ into the associated simple complex will be a filtered injective resolution for either filtration using suitable filtrations on $s I^{\bullet}$. This can be used to match up the spectral sequences exactly.

### 13.27. Ext groups

06XP In this section we start describing the Ext groups of objects of an abelian category. First we have the following very general definition.

06XQ Definition 13.27.1. Let $\mathcal{A}$ be an abelian category. Let $i \in \mathbf{Z}$. Let $X, Y$ be objects of $D(\mathcal{A})$. The ith extension group of $X$ by $Y$ is the group

$$
\operatorname{Ext}_{\mathcal{A}}^{i}(X, Y)=\operatorname{Hom}_{D(\mathcal{A})}(X, Y[i])=\operatorname{Hom}_{D(\mathcal{A})}(X[-i], Y) .
$$

If $A, B \in \operatorname{Ob}(\mathcal{A})$ we set $\operatorname{Ext}_{\mathcal{A}}^{i}(A, B)=\operatorname{Ext}_{\mathcal{A}}^{i}(A[0], B[0])$.
Since $\operatorname{Hom}_{D(\mathcal{A})}(X,-)$, resp. $\operatorname{Hom}_{D(\mathcal{A})}(-, Y)$ is a homological, resp. cohomological functor, see Lemma 13.4.2, we see that a distinguished triangle ( $Y, Y^{\prime}, Y^{\prime \prime}$ ), resp. ( $X, X^{\prime}, X^{\prime \prime}$ ) leads to a long exact sequence

$$
\ldots \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i}(X, Y) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i}\left(X, Y^{\prime}\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i}\left(X, Y^{\prime \prime}\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i+1}(X, Y) \rightarrow \ldots
$$

respectively

$$
\ldots \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i}\left(X^{\prime \prime}, Y\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i}\left(X^{\prime}, Y\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i}(X, Y) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{i+1}\left(X^{\prime \prime}, Y\right) \rightarrow \ldots
$$

Note that since $D^{+}(\mathcal{A}), D^{-}(\mathcal{A}), D^{b}(\mathcal{A})$ are full subcategories we may compute the Ext groups by Hom groups in these categories provided $X, Y$ are contained in them.
In case the category $\mathcal{A}$ has enough injectives or enough projectives we can compute the Ext groups using injective or projective resolutions. To avoid confusion, recall that having an injective (resp. projective) resolution implies vanishing of homology in all low (resp. high) degrees, see Lemmas 13.18 .2 and 13.19 .2 .
06XR Lemma 13.27.2. Let $\mathcal{A}$ be an abelian category. Let $X^{\bullet}, Y^{\bullet} \in \operatorname{Ob}(K(\mathcal{A}))$.
(1) Let $Y^{\bullet} \rightarrow I^{\bullet}$ be an injective resolution (Definition 13.18.1). Then

$$
\operatorname{Ext}_{\mathcal{A}}^{i}\left(X^{\bullet}, Y^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{A})}\left(X^{\bullet}, I^{\bullet}[i]\right) .
$$

(2) Let $P^{\bullet} \rightarrow X^{\bullet}$ be a projective resolution (Definition 13.19.1). Then

$$
E x t_{\mathcal{A}}^{i}\left(X^{\bullet}, Y^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{A})}\left(P^{\bullet}[-i], Y^{\bullet}\right)
$$

Proof. Follows immediately from Lemma 13.18 .8 and Lemma 13.19.8.

In the rest of this section we discuss extensions of objects of the abelian category itself. First we observe the following.

06XS Lemma 13.27.3. Let $\mathcal{A}$ be an abelian category.
(1) Let $X, Y$ be objects of $D(\mathcal{A})$. Given $a, b \in \mathbf{Z}$ such that $H^{i}(X)=0$ for $i>a$ and $H^{j}(Y)=0$ for $j<b$, we have $E x t_{\mathcal{A}}^{n}(X, Y)=0$ for $n<b-a$ and

$$
E x t_{\mathcal{A}}^{b-a}(X, Y)=\operatorname{Hom}_{\mathcal{A}}\left(H^{a}(X), H^{b}(Y)\right)
$$

(2) Let $A, B \in \operatorname{Ob}(\mathcal{A})$. For $i<0$ we have $E x t_{\mathcal{A}}^{i}(B, A)=0$. We have $E x t_{\mathcal{A}}^{0}(B, A)=\operatorname{Hom}_{\mathcal{A}}(B, A)$.

Proof. Choose complexes $X^{\bullet}$ and $Y^{\bullet}$ representing $X$ and $Y$. Since $Y^{\bullet} \rightarrow \tau_{\geq b} Y^{\bullet}$ is a quasi-isomorphism, we may assume that $Y^{j}=0$ for $j<b$. Let $L^{\bullet} \rightarrow X^{\bullet}$ be any quasi-isomorphism. Then $\tau_{\leq a} L^{\bullet} \rightarrow X^{\bullet}$ is a quasi-isomorphism. Hence a morphism $X \rightarrow Y[n]$ in $D(\mathcal{A})$ can be represented as $f s^{-1}$ where $s: L^{\bullet} \rightarrow X^{\bullet}$ is a quasi-isomorphism, $f: L^{\bullet} \rightarrow Y^{\bullet}[n]$ a morphism, and $L^{i}=0$ for $i<a$. Note that $f$ maps $L^{i}$ to $Y^{i+n}$. Thus $f=0$ if $n<b-a$ because always either $L^{i}$ or $Y^{i+n}$ is zero. If $n=b-a$, then $f$ corresponds exactly to a morphism $H^{a}(X) \rightarrow H^{b}(Y)$. Part (2) is a special case of (1).

Let $\mathcal{A}$ be an abelian category. Suppose that $0 \rightarrow A \rightarrow A^{\prime} \rightarrow A^{\prime \prime} \rightarrow 0$ is a short exact sequence of objects of $\mathcal{A}$. Then $0 \rightarrow A[0] \rightarrow A^{\prime}[0] \rightarrow A^{\prime \prime}[0] \rightarrow 0$ leads to a distinguished triangle in $D(\mathcal{A})$ (see Lemma 13.12.1) hence a long exact sequence of Ext groups

$$
0 \rightarrow \operatorname{Ext}_{\mathcal{A}}^{0}(B, A) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{0}\left(B, A^{\prime}\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{0}\left(B, A^{\prime \prime}\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{1}(B, A) \rightarrow \ldots
$$

Similarly, given a short exact sequence $0 \rightarrow B \rightarrow B^{\prime} \rightarrow B^{\prime \prime} \rightarrow 0$ we obtain a long exact sequence of Ext groups

$$
0 \rightarrow \operatorname{Ext}_{\mathcal{A}}^{0}\left(B^{\prime \prime}, A\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{0}\left(B^{\prime}, A\right) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{0}(B, A) \rightarrow \operatorname{Ext}_{\mathcal{A}}^{1}\left(B^{\prime \prime}, A\right) \rightarrow \ldots
$$

We may view these Ext groups as an application of the construction of the derived category. It shows one can define Ext groups and construct the long exact sequence of Ext groups without needing the existence of enough injectives or projectives. There is an alternative construction of the Ext groups due to Yoneda which avoids the use of the derived category, see Yon60].
06XT Definition 13.27.4. Let $\mathcal{A}$ be an abelian category. Let $A, B \in \mathrm{Ob}(\mathcal{A})$. A degree $i$ Yoneda extension of $B$ by $A$ is an exact sequence

$$
E: 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow Z_{i-2} \rightarrow \ldots \rightarrow Z_{0} \rightarrow B \rightarrow 0
$$

in $\mathcal{A}$. We say two Yoneda extensions $E$ and $E^{\prime}$ of the same degree are equivalent if there exists a commutative diagram

where the middle row is a Yoneda extension as well.
It is not immediately clear that the equivalence of the definition is an equivalence relation. Although it is instructive to prove this directly this will also follow from Lemma 13.27 .5 below.

Let $\mathcal{A}$ be an abelian category with objects $A, B$. Given a Yoneda extension $E$ : $0 \rightarrow A \rightarrow Z_{i-1} \rightarrow Z_{i-2} \rightarrow \ldots \rightarrow Z_{0} \rightarrow B \rightarrow 0$ we define an associated element $\delta(E) \in \operatorname{Ext}^{i}(B, A)$ as the morphism $\delta(E)=f s^{-1}: B[0] \rightarrow A[i]$ where $s$ is the quasi-isomorphism

$$
\left(\ldots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow \ldots \rightarrow Z_{0} \rightarrow 0 \rightarrow \ldots\right) \longrightarrow B[0]
$$

and $f$ is the morphism of complexes

$$
\left(\ldots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow \ldots \rightarrow Z_{0} \rightarrow 0 \rightarrow \ldots\right) \longrightarrow A[i]
$$

We call $\delta(E)=f s^{-1}$ the class of the Yoneda extension. It turns out that this class characterizes the equivalence class of the Yoneda extension.

06XU Lemma 13.27.5. Let $\mathcal{A}$ be an abelian category with objects $A, B$. Any element in $\operatorname{Ext}_{\mathcal{A}}^{2}(B, A)$ is $\delta(E)$ for some degree $i$ Yoneda extension of $B$ by $A$. Given two Yoneda extensions $E, E^{\prime}$ of the same degree then $E$ is equivalent to $E^{\prime}$ if and only if $\delta(E)=\delta\left(E^{\prime}\right)$.
Proof. Let $\xi: B[0] \rightarrow A[i]$ be an element of $\operatorname{Ext}_{\mathcal{A}}^{i}(B, A)$. We may write $\xi=f s^{-1}$ for some quasi-isomorphism $s: L^{\bullet} \rightarrow B[0]$ and map $f: L^{\bullet} \rightarrow A[i]$. After replacing $L^{\bullet}$ by $\tau_{\leq 0} L^{\bullet}$ we may assume that $L^{i}=0$ for $i>0$. Picture

Then setting $Z_{i-1}=\left(L^{-i+1} \oplus A\right) / L^{-i}$ and $Z_{j}=L^{-j}$ for $j=i-2, \ldots, 0$ we see that we obtain a degree $i$ extension $E$ of $B$ by $A$ whose class $\delta(E)$ equals $\xi$.

It is immediate from the definitions that equivalent Yoneda extensions have the same class. Suppose that $E: 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow Z_{i-2} \rightarrow \ldots \rightarrow Z_{0} \rightarrow B \rightarrow 0$ and $E^{\prime}: 0 \rightarrow A \rightarrow Z_{i-1}^{\prime} \rightarrow Z_{i-2}^{\prime} \rightarrow \ldots \rightarrow Z_{0}^{\prime} \rightarrow B \rightarrow 0$ are Yoneda extensions with the same class. By construction of $D(\mathcal{A})$ as the localization of $K(\mathcal{A})$ at the set of quasi-isomorphisms, this means there exists a complex $L^{\bullet}$ and quasi-isomorphisms

$$
t: L^{\bullet} \rightarrow\left(\ldots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1} \rightarrow \ldots \rightarrow Z_{0} \rightarrow 0 \rightarrow \ldots\right)
$$

and

$$
t^{\prime}: L^{\bullet} \rightarrow\left(\ldots \rightarrow 0 \rightarrow A \rightarrow Z_{i-1}^{\prime} \rightarrow \ldots \rightarrow Z_{0}^{\prime} \rightarrow 0 \rightarrow \ldots\right)
$$

such that $s \circ t=s^{\prime} \circ t^{\prime}$ and $f \circ t=f^{\prime} \circ t^{\prime}$, see Categories, Section 4.26. Let $E^{\prime \prime}$ be the degree $i$ extension of $B$ by $A$ constructed from the pair $L^{\bullet} \rightarrow B[0]$ and $L^{\bullet} \rightarrow A[i]$ in the first paragraph of the proof. Then the reader sees readily that there exists "morphisms" of degree $i$ Yoneda extensions $E^{\prime \prime} \rightarrow E$ and $E^{\prime \prime} \rightarrow E^{\prime}$ as in the definition of equivalent Yoneda extensions (details omitted). This finishes the proof.
06XV Lemma 13.27.6. Let $\mathcal{A}$ be an abelian category. Let $A, B$ be objects of $\mathcal{A}$. Then $\operatorname{Ext}_{\mathcal{A}}^{1}(B, A)$ is the group $\operatorname{Ext}_{\mathcal{A}}(B, A)$ constructed in Homology, Definition 12.6.2.

Proof. This is the case $i=1$ of Lemma 13.27.5.

### 13.28. Unbounded complexes

06XW A reference for the material in this section is Spa88. The following lemma is useful to find "good" left resolutions of unbounded complexes.

06XX Lemma 13.28.1. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{P} \subset \operatorname{Ob}(\mathcal{A})$ be a subset. Assume that every object of $\mathcal{A}$ is a quotient of an element of $\mathcal{P}$. Let $K^{\bullet}$ be a complex. There exists a commutative diagram

in the category of complexes such that
(1) the vertical arrows are quasi-isomorphisms,
(2) $P_{1}^{\bullet}$ is a bounded above complex with terms in $\mathcal{P}$,
(3) the arrows $P_{n}^{\bullet} \rightarrow P_{n+1}^{\bullet}$ are termwise split injections and each cokernel $P_{n+1}^{i} / P_{n}^{i}$ is an element of $\mathcal{P}$.

Proof. By Lemma 13.16 .5 any bounded above complex has a resolution by a bounded above complex whose terms are in $\mathcal{P}$. Thus we obtain the first complex $P_{1}^{\bullet}$. By induction it suffices, given $P_{1}^{\bullet}, \ldots, P_{n}^{\bullet}$ to construct $P_{n+1}^{\bullet}$ and the maps $P_{n}^{\bullet} \rightarrow P_{n+1}^{\bullet}$ and $P_{n}^{\bullet} \rightarrow \tau_{\leq n+1} K^{\bullet}$. Consider the cone $C_{1}^{\bullet}$ of the composition $P_{n}^{\bullet} \rightarrow \tau_{\leq n} K^{\bullet} \rightarrow \tau_{\leq n+1} K^{\bullet}$. This fits into the distinguished triangle

$$
P_{n}^{\bullet} \rightarrow \tau_{\leq n+1} K^{\bullet} \rightarrow C_{1}^{\bullet} \rightarrow P_{n}^{\bullet}[1]
$$

Note that $C_{1}^{\bullet}$ is bounded above, hence we can choose a quasi-isomorphism $Q^{\bullet} \rightarrow C_{1}^{\bullet}$ where $Q^{\bullet}$ is a bounded above complex whose terms are elements of $\mathcal{P}$. Take the cone $C_{2}^{\bullet}$ of the map of complexes $Q^{\bullet} \rightarrow P_{n}^{\bullet}[1]$ to get the distinguished triangle

$$
Q^{\bullet} \rightarrow P_{n}^{\bullet}[1] \rightarrow C_{2}^{\bullet} \rightarrow Q^{\bullet}[1]
$$

By the axioms of triangulated categories we obtain a map of distinguished triangles

in the triangulated category $K(\mathcal{A})$. Set $P_{n+1}^{\bullet}=C_{2}^{\bullet}[-1]$. Note that (3) holds by construction. Choose an actual morphism of complexes $f: P_{n+1}^{\bullet} \rightarrow \tau_{\leq n+1} K^{\bullet}$. The left square of the diagram above commutes up to homotopy, but as $P_{n}^{\bullet} \rightarrow P_{n+1}^{\bullet}$ is a termwise split injection we can lift the homotopy and modify our choice of $f$ to make it commute. Finally, $f$ is a quasi-isomorphism, because both $P_{n}^{\bullet} \rightarrow P_{n}^{\bullet}$ and $Q^{\bullet} \rightarrow C_{1}^{\bullet}$ are.

In some cases we can use the lemma above to show that a left derived functor is everywhere defined.

0794 Proposition 13.28.2. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a right exact functor of abelian categories. Let $\mathcal{P} \subset \operatorname{Ob}(\mathcal{A})$ be a subset. Assume
(1) every object of $\mathcal{A}$ is a quotient of an element of $\mathcal{P}$,
(2) for any bounded above acyclic complex $P^{\bullet}$ of $\mathcal{A}$ with $P^{n} \in \mathcal{P}$ for all $n$ the complex $F\left(P^{\bullet}\right)$ is exact,
(3) $\mathcal{A}$ and $\mathcal{B}$ have colimits of systems over $\mathbf{N}$,
(4) colimits over $\mathbf{N}$ are exact in both $\mathcal{A}$ and $\mathcal{B}$, and
(5) $F$ commutes with colimits over $\mathbf{N}$.

Then LF is defined on all of $D(\mathcal{A})$.
Proof. By (1) and Lemma 13.16 .5 for any bounded above complex $K^{\bullet}$ there exists a quasi-isomorphism $P^{\bullet} \rightarrow K^{\bullet}$ with $P^{\bullet}$ bounded above and $P^{n} \in \mathcal{P}$ for all $n$. Suppose that $s: P^{\bullet} \rightarrow\left(P^{\prime}\right)^{\bullet}$ is a quasi-isomorphism of bounded above complexes consisting of objects of $\mathcal{P}$. Then $F\left(P^{\bullet}\right) \rightarrow F\left(\left(P^{\prime}\right)^{\bullet}\right)$ is a quasi-isomorphism because $F\left(C(s)^{\bullet}\right)$ is acyclic by assumption (2). This already shows that $L F$ is defined on $D^{-}(\mathcal{A})$ and that a bounded above complex consisting of objects of $\mathcal{P}$ computes $L F$, see Lemma 13.15.15.

Next, let $K^{\bullet}$ be an arbitrary complex of $\mathcal{A}$. Choose a diagram

as in Lemma 13.28.1. Note that the map colim $P_{n}^{\bullet} \rightarrow K^{\bullet}$ is a quasi-isomorphism because colimits over $\mathbf{N}$ in $\mathcal{A}$ are exact and $H^{i}\left(P_{n}^{\bullet}\right)=H^{i}\left(K^{\bullet}\right)$ for $n>i$. We claim that

$$
F\left(\operatorname{colim} P_{n}^{\bullet}\right)=\operatorname{colim} F\left(P_{n}^{\bullet}\right)
$$

(termwise colimits) is $L F\left(K^{\bullet}\right)$, i.e., that colim $P_{n}^{\bullet}$ computes $L F$. To see this, by Lemma 13.15 .15 it suffices to prove the following claim. Suppose that

$$
\operatorname{colim} Q_{n}^{\bullet}=Q^{\bullet} \xrightarrow{\alpha} P^{\bullet}=\operatorname{colim} P_{n}^{\bullet}
$$

is a quasi-isomorphism of complexes, such that each $P_{n}^{\bullet}, Q_{n}^{\bullet}$ is a bounded above complex whose terms are in $\mathcal{P}$ and the maps $P_{n}^{\bullet} \rightarrow \tau_{\leq n} P^{\bullet}$ and $Q_{n}^{\bullet} \rightarrow \tau_{\leq n} Q^{\bullet}$ are quasi-isomorphisms. Claim: $F(\alpha)$ is a quasi-isomorphism.

The problem is that we do not assume that $\alpha$ is given as a colimit of maps between the complexes $P_{n}^{\bullet}$ and $Q_{n}^{\bullet}$. However, for each $n$ we know that the solid arrows in
the diagram

are quasi-isomorphisms. Because quasi-isomorphisms form a multiplicative system in $K(\mathcal{A})$ (see Lemma 13.11 .2 we can find a quasi-isomorphism $L^{\bullet} \rightarrow P_{n}^{\bullet}$ and map of complexes $L^{\bullet} \rightarrow Q_{n}^{\bullet}$ such that the diagram above commutes up to homotopy. Then $\tau_{\leq n} L^{\bullet} \rightarrow L^{\bullet}$ is a quasi-isomorphism. Hence (by the first part of the proof) we can find a bounded above complex $R^{\bullet}$ whose terms are in $\mathcal{P}$ and a quasiisomorphism $R^{\bullet} \rightarrow L^{\bullet}$ (as indicated in the diagram). Using the result of the first paragraph of the proof we see that $F\left(R^{\bullet}\right) \rightarrow F\left(P_{n}^{\bullet}\right)$ and $F\left(R^{\bullet}\right) \rightarrow F\left(Q_{n}^{\bullet}\right)$ are quasiisomorphisms. Thus we obtain a isomorphisms $H^{i}\left(F\left(P_{n}^{\bullet}\right)\right) \rightarrow H^{i}\left(F\left(Q_{n}^{\bullet}\right)\right)$ fitting into the commutative diagram

The exact same argument shows that these maps are also compatible as $n$ varies. Since by (4) and (5) we have

$$
H^{i}\left(F\left(P^{\bullet}\right)\right)=H^{i}\left(F\left(\operatorname{colim} P_{n}^{\bullet}\right)\right)=H^{i}\left(\operatorname{colim} F\left(P_{n}^{\bullet}\right)\right)=\operatorname{colim} H^{i}\left(F\left(P_{n}^{\bullet}\right)\right)
$$

and similarly for $Q^{\bullet}$ we conclude that $H^{i}(\alpha): H^{i}\left(F\left(P^{\bullet}\right) \rightarrow H^{i}\left(F\left(Q^{\bullet}\right)\right.\right.$ is an isomorphism and the claim follows.

070F Lemma 13.28.3. Let $\mathcal{A}$ be an abelian category. Let $\mathcal{I} \subset \operatorname{Ob}(\mathcal{A})$ be a subset. Assume that every object of $\mathcal{A}$ is a subobject of an element of $\mathcal{I}$. Let $K^{\bullet}$ be a complex. There exists a commutative diagram

in the category of complexes such that
(1) the vertical arrows are quasi-isomorphisms,
(2) $I_{1}^{\bullet}$ is a bounded below complex with terms in $\mathcal{I}$,
(3) the arrows $I_{n+1}^{\bullet} \rightarrow I_{n}^{\bullet}$ are termwise split surjections and $\operatorname{Ker}\left(I_{n+1}^{i} \rightarrow I_{n}^{i}\right)$ is an element of $\mathcal{I}$.

Proof. This lemma is dual to Lemma 13.28.1
The following lemma is an example of why it is easier to work with unbounded derived categories. Namely, without having the unbounded derived functors, the lemma could not even be stated.

09 T 5 Lemma 13.28.4. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ and $G: \mathcal{B} \rightarrow \mathcal{A}$ be functors such that $F$ is a right adjoint to $G$. If the derived functors $R F: D(\mathcal{A}) \rightarrow D(\mathcal{B})$ and $L G: D(\mathcal{B}) \rightarrow D(\mathcal{A})$ exist, then $R F$ is a right adjoint to $L G$.

Proof. Let $K^{\bullet}$ be a complex of $\mathcal{A}$ and let $M^{\bullet}$ be a complex of $\mathcal{B}$. Since $R F$ is defined at $K^{\bullet}$, we see that the rule which assigns to a quasi-isomorphism $s: K^{\bullet} \rightarrow$ $I^{\bullet}$ the object $F\left(I^{\bullet}\right)$ is essentially constant as an ind-object of $D(\mathcal{B})$ with value $R F\left(K^{\bullet}\right)$. Similarly, the rule which assigns to a quasi-isomorphism $t: P^{\bullet} \rightarrow M^{\bullet}$ the object $G\left(P^{\bullet}\right)$ is essentially constant as a pro-object of $D(\mathcal{A})$ with value $L G\left(M^{\bullet}\right)$. Thus we have

$$
\begin{aligned}
\operatorname{Hom}_{D(\mathcal{B})}\left(M^{\bullet}, R F\left(K^{\bullet}\right)\right) & =\operatorname{colim}_{s: K^{\bullet} \rightarrow I} \operatorname{Hom}_{D(\mathcal{B})}\left(M^{\bullet}, F\left(I^{\bullet}\right)\right) \\
& =\operatorname{colim}_{s: K^{\bullet} \rightarrow I} \operatorname{colim}_{t: P^{\bullet} \rightarrow M^{\bullet}} \operatorname{Hom}_{K(\mathcal{B})}\left(P^{\bullet}, F\left(I^{\bullet}\right)\right) \\
& =\operatorname{colim}_{t: P^{\bullet} \rightarrow M^{\bullet}} \operatorname{colim}_{s: K^{\bullet} \rightarrow I^{\bullet}} \operatorname{Hom}_{K(\mathcal{B})}\left(P^{\bullet}, F\left(I^{\bullet}\right)\right) \\
& =\operatorname{colim}_{t: P^{\bullet} \rightarrow M^{\bullet}} \operatorname{colim}_{s: K^{\bullet} \rightarrow I^{\bullet}} \operatorname{Hom}_{K(\mathcal{A})}\left(G\left(P^{\bullet}\right), I^{\bullet}\right) \\
& =\operatorname{colim}_{s: K^{\bullet} \rightarrow I^{\bullet}} \operatorname{Hom}_{D(\mathcal{A})}\left(G\left(P^{\bullet}\right), K^{\bullet}\right) \\
& =\operatorname{Hom}_{D(\mathcal{A})}\left(L G\left(M^{\bullet}\right), K^{\bullet}\right)
\end{aligned}
$$

The first equality holds by Categories, Lemma 4.22.6. The second equality holds by the definition of morphisms in $D(\mathcal{B})$. The third equality holds by Categories, Lemma 4.14.9. The fourth equality holds because $F$ and $G$ are adjoint. The fifth equality holds by definition of morphism in $D(\mathcal{A})$. The sixth equality holds by Categories, Lemma 4.22.7

### 13.29. K-injective complexes

070G The following types of complexes can be used to compute right derived functors on the unbounded derived category.

070 H Definition 13.29.1. Let $\mathcal{A}$ be an abelian category. A complex $I^{\bullet}$ is $K$-injective if for every acyclic complex $M^{\bullet}$ we have $\operatorname{Hom}_{K(\mathcal{A})}\left(M^{\bullet}, I^{\bullet}\right)=0$.

In the situation of the definition we have in fact $\operatorname{Hom}_{K(\mathcal{A})}\left(M^{\bullet}[i], I^{\bullet}\right)=0$ for all $i$ as the translate of an acyclic complex is acyclic.

070I Lemma 13.29.2. Let $\mathcal{A}$ be an abelian category. Let $I^{\bullet}$ be a complex. The following are equivalent
(1) $I^{\bullet}$ is $K$-injective,
(2) for every quasi-isomorphism $M^{\bullet} \rightarrow N^{\bullet}$ the map

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(N^{\bullet}, I^{\bullet}\right) \rightarrow \operatorname{Hom}_{K(\mathcal{A})}\left(M^{\bullet}, I^{\bullet}\right)
$$

is bijective, and
(3) for every complex $N^{\bullet}$ the map

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(N^{\bullet}, I^{\bullet}\right) \rightarrow \operatorname{Hom}_{D(\mathcal{A})}\left(N^{\bullet}, I^{\bullet}\right)
$$

is an isomorphism.
Proof. Assume (1). Then (2) holds because the functor $\operatorname{Hom}_{K(\mathcal{A})}\left(-, I^{\bullet}\right)$ is cohomological and the cone on a quasi-isomorphism is acyclic.
Assume (2). A morphism $N^{\bullet} \rightarrow I^{\bullet}$ in $D(\mathcal{A})$ is of the form $f s^{-1}: N^{\bullet} \rightarrow I^{\bullet}$ where $s: M^{\bullet} \rightarrow N^{\bullet}$ is a quasi-isomorphism and $f: M^{\bullet} \rightarrow I^{\bullet}$ is a map. By (2) this corresponds to a unique morphism $N^{\bullet} \rightarrow I^{\bullet}$ in $K(\mathcal{A})$, i.e., (3) holds.

Assume (3). If $M^{\bullet}$ is acyclic then $M^{\bullet}$ is isomorphic to the zero complex in $D(\mathcal{A})$ hence $\operatorname{Hom}_{D(\mathcal{A})}\left(N^{\bullet}, I^{\bullet}\right)=0$, whence $\operatorname{Hom}_{K(\mathcal{A})}\left(N^{\bullet}, I^{\bullet}\right)=0$ by (3), i.e., (1) holds.

090X Lemma 13.29.3. Let $\mathcal{A}$ be an abelian category. Let $(K, L, M, f, g, h)$ be a distinguished triangle of $K(\mathcal{A})$. If two out of $K, L, M$ are $K$-injective complexes, then the third is too.

Proof. Follows from the definition, Lemma 13.4 .2 , and the fact that $K(\mathcal{A})$ is a triangulated category (Proposition 13.10.3).

070J Lemma 13.29.4. Let $\mathcal{A}$ be an abelian category. A bounded below complex of injectives is $K$-injective.

Proof. Follows from Lemmas 13.29.2 and 13.18.8.
0BK6 Lemma 13.29.5. Let $\mathcal{A}$ be an abelian category. Let $T$ be a set and for each $t \in T$ let $I_{t}^{\bullet}$ be a K-injective complex. If $I^{n}=\prod_{t} I_{t}^{n}$ exists for all $n$, then $I^{\bullet}$ is a $K$-injective complex. Moreover, $I^{\bullet}$ represents the product of the objects $I_{t}^{\bullet}$ in $D(\mathcal{A})$.

Proof. Let $K^{\bullet}$ be an complex. Then we have

$$
\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)=\prod_{t \in T} \operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I_{t}^{\bullet}\right)
$$

Since taking products is an exact functor on the category of abelian groups we see that if $K^{\bullet}$ is acyclic, then $\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)$ is acyclic because this is true for each of the complexes $\operatorname{Hom}_{K(\mathcal{A})}\left(K^{\bullet}, I_{t}^{\bullet}\right)$. Having said this, we can use Lemma 13.29.2 to conclude that

$$
\operatorname{Hom}_{D(\mathcal{A})}\left(K^{\bullet}, I^{\bullet}\right)=\prod_{t \in T} \operatorname{Hom}_{D(\mathcal{A})}\left(K^{\bullet}, I_{t}^{\bullet}\right)
$$

and indeed $I^{\bullet}$ represents the product in the derived category.
070Y Lemma 13.29.6. Let $\mathcal{A}$ be an abelian category. Let $F: K(\mathcal{A}) \rightarrow \mathcal{D}^{\prime}$ be an exact functor of triangulated categories. Then $R F$ is defined at every complex in $K(\mathcal{A})$ which is quasi-isomorphic to a K-injective complex. In fact, every $K$-injective complex computes $R F$.

Proof. By Lemma 13.15 .4 it suffices to show that $R F$ is defined at a K-injective complex, i.e., it suffices to show a K-injective complex $I^{\bullet}$ computes $R F$. Any quasiisomorphism $I^{\bullet} \rightarrow N^{\bullet}$ is a homotopy equivalence as it has an inverse by Lemma 13.29.2 Thus $I^{\bullet} \rightarrow I^{\bullet}$ is a final object of $I^{\bullet} / \operatorname{Qis}(\mathcal{A})$ and we win.

070K Lemma 13.29.7. Let $\mathcal{A}$ be an abelian category. Assume every complex has a quasi-isomorphism towards a K-injective complex. Then any exact functor $F$ : $K(\mathcal{A}) \rightarrow \mathcal{D}^{\prime}$ of triangulated categories has a right derived functor

$$
R F: D(\mathcal{A}) \longrightarrow \mathcal{D}^{\prime}
$$

and $R F\left(I^{\bullet}\right)=F\left(I^{\bullet}\right)$ for $K$-injective complexes $I^{\bullet}$.
Proof. To see this we apply Lemma 13.15 .15 with $\mathcal{I}$ the collection of K-injective complexes. Since (1) holds by assumption, it suffices to prove that if $I^{\bullet} \rightarrow J^{\bullet}$ is a quasi-isomorphism of K -injective complexes, then $F\left(I^{\bullet}\right) \rightarrow F\left(J^{\bullet}\right)$ is an isomorphism. This is clear because $I^{\bullet} \rightarrow J^{\bullet}$ is a homotopy equivalence, i.e., an isomorphism in $K(\mathcal{A})$, by Lemma 13.29 .2 .

The following lemma can be generalized to limits over bigger ordinals.
070L Lemma 13.29.8. Let $\mathcal{A}$ be an abelian category. Let

$$
\ldots \rightarrow I_{3}^{\bullet} \rightarrow I_{2}^{\bullet} \rightarrow I_{1}^{\bullet}
$$

be an inverse system of $K$-injective complexes. Assume
(1) each $I_{n}^{\bullet}$ is $K$-injective,
(2) each map $I_{n+1}^{m} \rightarrow I_{n}^{m}$ is a split surjection,
(3) the limits $I^{m}=\lim I_{n}^{m}$ exist.

Then the complex $I^{\bullet}$ is $K$-injective.
Proof. We urge the reader to skip the proof of this lemma. Let $M^{\bullet}$ be an acyclic complex. Let us abbreviate $H_{n}(a, b)=\operatorname{Hom}_{\mathcal{A}}\left(M^{a}, I_{n}^{b}\right)$. With this notation $\operatorname{Hom}_{K(\mathcal{A})}\left(M^{\bullet}, I^{\bullet}\right)$ is the cohomology of the complex
$\prod_{m} \lim _{n} H_{n}(m, m-2) \rightarrow \prod_{m} \lim _{n} H_{n}(m, m-1) \rightarrow \prod_{m} \lim _{n} H_{n}(m, m) \rightarrow \prod_{m} \lim _{n} H_{n}(m, m+1)$
in the third spot from the left. We may exchange the order of $\Pi$ and lim and each of the complexes

$$
\prod_{m} H_{n}(m, m-2) \rightarrow \prod_{m} H_{n}(m, m-1) \rightarrow \prod_{m} H_{n}(m, m) \rightarrow \prod_{m} H_{n}(m, m+1)
$$

is exact by assumption (1). By assumption (2) the maps in the systems

$$
\cdots \rightarrow \prod_{m} H_{3}(m, m-2) \rightarrow \prod_{m} H_{2}(m, m-2) \rightarrow \prod_{m} H_{1}(m, m-2)
$$

are surjective. Thus the lemma follows from Homology, Lemma 12.27.4
It appears that a combination of Lemmas $13.28 .3,13.29 .4$, and 13.29 .8 produces "enough K-injectives" for any abelian category with enough injectives and countable products. Actually, this may not work! See Lemma 13.32 .4 for an explanation.

08BJ Lemma 13.29.9. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $u: \mathcal{A} \rightarrow \mathcal{B}$ and $v: \mathcal{B} \rightarrow \mathcal{A}$ be additive functors. Assume
(1) $u$ is right adjoint to $v$, and
(2) $v$ is exact.

Then $u$ transforms $K$-injective complexes into $K$-injective complexes.
Proof. Let $I^{\bullet}$ be a K-injective complex of $\mathcal{A}$. Let $M^{\bullet}$ be a acyclic complex of $\mathcal{B}$. As $v$ is exact we see that $v\left(M^{\bullet}\right)$ is an acyclic complex. By adjointness we get

$$
0=\operatorname{Hom}_{K(\mathcal{A})}\left(v\left(M^{\bullet}\right), I^{\bullet}\right)=\operatorname{Hom}_{K(\mathcal{B})}\left(M^{\bullet}, u\left(I^{\bullet}\right)\right)
$$

hence the lemma follows.

### 13.30. Bounded cohomological dimension

07 K 5 There is another case where the unbounded derived functor exists. Namely, when the functor has bounded cohomological dimension.

07 K 6 Lemma 13.30.1. Let $\mathcal{A}$ be an abelian category. Let $d: \operatorname{Ob}(\mathcal{A}) \rightarrow\{0,1,2, \ldots, \infty\}$ be a function. Assume that
(1) every object of $\mathcal{A}$ is a subobject of an object $A$ with $d(A)=0$,
(2) $d(A \oplus B) \leq \max \{d(A), d(B)\}$ for $A, B \in \mathcal{A}$, and
(3) if $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$ is short exact, then $d(C) \leq \max \{d(A)-1, d(B)\}$. Let $K^{\bullet}$ be a complex such that $n+d\left(K^{n}\right)$ tends to $-\infty$ as $n \rightarrow-\infty$. Then there exists a quasi-isomorphism $K^{\bullet} \rightarrow L^{\bullet}$ with $d\left(L^{n}\right)=0$ for all $n \in \mathbf{Z}$.

Proof. By Lemma 13.16 .4 we can find a quasi-isomorphism $\sigma_{\geq 0} K^{\bullet} \rightarrow M^{\bullet}$ with $M^{n}=0$ for $n<0$ and $d\left(M^{n}\right)=0$ for $n \geq 0$. Then $K^{\bullet}$ is quasi-isomorphic to the complex

$$
\ldots \rightarrow K^{-2} \rightarrow K^{-1} \rightarrow M^{0} \rightarrow M^{1} \rightarrow \ldots
$$

Hence we may assume that $d\left(K^{n}\right)=0$ for $n \gg 0$. Note that the condition $n+$ $d\left(K^{n}\right) \rightarrow-\infty$ as $n \rightarrow-\infty$ is not violated by this replacement.
We are going to improve $K^{\bullet}$ by an (infinite) sequence of elementary replacements. An elementary replacement is the following. Choose an index $n$ such that $d\left(K^{n}\right)>$ 0 . Choose an injection $K^{n} \rightarrow M$ where $d(M)=0$. Set $M^{\prime}=\operatorname{Coker}\left(K^{n} \rightarrow\right.$ $\left.M \oplus K^{n+1}\right)$. Consider the map of complexes

It is clear that $K^{\bullet} \rightarrow\left(K^{\prime}\right)^{\bullet}$ is a quasi-isomorphism. Moreover, it is clear that $d\left(\left(K^{\prime}\right)^{n}\right)=0$ and

$$
d\left(\left(K^{\prime}\right)^{n+1}\right) \leq \max \left\{d\left(K^{n}\right)-1, d\left(M \oplus K^{n+1}\right)\right\} \leq \max \left\{d\left(K^{n}\right)-1, d\left(K^{n+1}\right)\right\}
$$

and the other values are unchanged.
To finish the proof we carefuly choose the order in which to do the elementary replacements so that for every integer $m$ the complex $\sigma_{\geq m} K^{\bullet}$ is changed only a finite number of times. To do this set

$$
\xi\left(K^{\bullet}\right)=\max \left\{n+d\left(K^{n}\right) \mid d\left(K^{n}\right)>0\right\}
$$

and

$$
I=\left\{n \in \mathbf{Z} \mid \xi\left(K_{\bullet}^{\bullet}\right)=n+d\left(K^{n}\right) \wedge d\left(K^{n}\right)>0\right\}
$$

Our assumption that $n+d\left(K^{n}\right)$ tends to $-\infty$ as $n \rightarrow-\infty$ and the fact that $d\left(K^{n}\right)=0$ for $n \gg 0$ implies $\xi\left(K^{\bullet}\right)<+\infty$ and that $I$ is a finite set. It is clear that $\xi\left(\left(K^{\prime}\right)^{\bullet}\right) \leq \xi\left(K^{\bullet}\right)$ for an elementary transformation as above. An elementary transformation changes the complex in degrees $\leq \xi\left(K^{\bullet}\right)+1$. Hence if we can find finite sequence of elementary transformations which decrease $\xi\left(K^{\bullet}\right)$, then we win. However, note that if we do an elementary transformation starting with the smallest element $n \in I$, then we either decrease the size of $I$, or we increase $\min I$. Since every element of $I$ is $\leq \xi\left(K^{\bullet}\right)$ we see that we win after a finite number of steps.

07K7 Lemma 13.30.2. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a left exact functor of abelian categories. If
(1) every object of $\mathcal{A}$ is a subobject of an object which is right acyclic for $F$,
(2) there exists an integer $n$ such that $R^{n} F=0$,
then $R F: D(\mathcal{A}) \rightarrow D(\mathcal{B})$ exists. Any complex consisting of right acyclic objects for $F$ computes $R F$ and any complex is the source of a quasi-isomorphism into such a complex.

Proof. Note that the first condition implies that $R F: D^{+}(\mathcal{A}) \rightarrow D^{+}(\mathcal{B})$ exists, see Proposition 13.17.8. Let $A$ be an object of $\mathcal{A}$. Choose an injection $A \rightarrow A^{\prime}$ with $A^{\prime}$ acyclic. Then we see that $R^{n+1} F(A)=R^{n} F\left(A^{\prime} / A\right)=0$ by the long exact cohomology sequence. Hence we conclude that $R^{n+1} F=0$. Continuing like this using induction we find that $R^{m} F=0$ for all $m \geq n$.
We are going to use Lemma 13.30 .1 with the function $d: \operatorname{Ob}(\mathcal{A}) \rightarrow\{0,1,2, \ldots\}$ given by $d(A)=\max \{0\} \cup\left\{i \mid R^{2} F(A) \neq 0\right\}$. The first assumption of Lemma 13.30 .1 is our assumption (1). The second assumption of Lemma 13.30 .1 follows from the fact that $R F(A \oplus B)=R F(A) \oplus R F(B)$. The third assumption of Lemma 13.30 .1 follows from the long exact cohomology sequence. Hence for every complex $K^{\bullet}$ there exists a quasi-isomorphism $K^{\bullet} \rightarrow L^{\bullet}$ with $L^{n}$ right acyclic for $F$. We claim that if $L^{\bullet} \rightarrow M^{\bullet}$ is a quasi-isomorphism of complexes of right acyclic objects for $F$, then $F\left(L^{\bullet}\right) \rightarrow F\left(M^{\bullet}\right)$ is a quasi-isomorphism. If we prove this claim then we are done by Lemma 13.15 .15 . To prove the claim pick an integer $i \in \mathbf{Z}$. Consider the distinguished triangle

$$
\sigma_{\geq i-n-1} L^{\bullet} \rightarrow \sigma_{\geq i-n-1} M^{\bullet} \rightarrow Q^{\bullet}
$$

i.e., let $Q^{\bullet}$ be the cone of the first map. Note that $Q^{\bullet}$ is bounded below and that $H^{j}\left(Q^{\bullet}\right)$ is zero except possibly for $j=i-n-1$ or $j=i-n-2$. We may apply $R F$ to $Q^{\bullet}$. Using the second spectral sequence of Lemma 13.21 .3 and the assumed vanishing of cohomology (2) we conclude that $R^{j} F\left(Q^{\bullet}\right)$ is zero except possibly for $j \in\{i-n-2, \ldots, i-1\}$. Hence we see that $R F\left(\sigma_{\geq i-n-1} L^{\bullet}\right) \rightarrow R F\left(\sigma_{\geq i-n-1} M^{\bullet}\right)$ induces an isomorphism of cohomology objects in degrees $\geq i$. By Proposition 13.17 .8 we know that $R F\left(\sigma_{\geq i-n-1} L^{\bullet}\right)=\sigma_{\geq i-n-1} F\left(L^{\bullet}\right)$ and $R F\left(\sigma_{\geq i-n-1} M^{\bullet}\right)=$ $\sigma_{\geq i-n-1} F\left(M^{\bullet}\right)$. We conclude that $F\left(L^{\bullet}\right) \rightarrow F\left(M^{\bullet}\right)$ is an isomorphism in degree $i$ as desired.

07K8 Lemma 13.30.3. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a right exact functor of abelian categories. If
(1) every object of $\mathcal{A}$ is a quotient of an object which is left acyclic for $F$,
(2) there exists an integer $n$ such that $L^{n} F=0$,
then $L F: D(\mathcal{A}) \rightarrow D(\mathcal{B})$ exists. Any complex consisting of left acyclic objects for $F$ computes $L F$ and any complex is the target of a quasi-isomorphism into such a complex.

Proof. This is dual to Lemma 13.30 .2 .

### 13.31. Derived colimits

0 A 5 K In a triangulated category there is a notion of derived colimit.
090Z Definition 13.31.1. Let $\mathcal{D}$ be a triangulated category. Let $\left(K_{n}, f_{n}\right)$ be a system of objects of $\mathcal{D}$. We say an object $K$ is a derived colimit, or a homotopy colimit of the system $\left(K_{n}\right)$ if the direct sum $\bigoplus K_{n}$ exists and there is a distinguished triangle

$$
\bigoplus K_{n} \rightarrow \bigoplus K_{n} \rightarrow K \rightarrow \bigoplus K_{n}[1]
$$

where the map $\bigoplus K_{n} \rightarrow \bigoplus K_{n}$ is given by $1-f_{n}$ in degree $n$. If this is the case, then we sometimes indicate this by the notation $K=\operatorname{hocolim} K_{n}$.

By TR3 a derived colimit, if it exists, is unique up to (non-unique) isomorphism. Moreover, by TR1 a derived colimit of $K_{n}$ exists as soon as $\bigoplus K_{n}$ exists. The
derived category $D(A b)$ of the category of abelian groups is an example. More generally we have the following lemma.

0A5L Lemma 13.31.2. Let $\mathcal{A}$ be an abelian category. If $\mathcal{A}$ has exact countable direct sums, then $D(\mathcal{A})$ has countable direct sums. In fact given a collection of complexes $K_{i}^{\bullet}$ indexed by a countable index set I the termwise direct sum $\bigoplus K_{i}^{\bullet}$ is the direct sum of $K_{i}^{\bullet}$ in $D(\mathcal{A})$.

Proof. Let $L^{\bullet}$ be a complex. Suppose given maps $\alpha_{i}: K_{i}^{\bullet} \rightarrow L^{\bullet}$ in $D(\mathcal{A})$. This means there exist quasi-isomorphisms $s_{i}: M_{i}^{\bullet} \rightarrow K_{i}^{\bullet}$ of complexes and maps of complexes $f_{i}: M_{i}^{\bullet} \rightarrow L^{\bullet}$ such that $\alpha_{i}=f_{i} s_{i}^{-1}$. By assumption the map of complexes

$$
s: \bigoplus M_{i}^{\bullet} \longrightarrow \bigoplus K_{i}^{\bullet}
$$

is a quasi-isomorphism. Hence setting $f=\bigoplus f_{i}$ we see that $\alpha=f s^{-1}$ is a map in $D(\mathcal{A})$ whose composition with the coprojection $K_{i}^{\bullet} \rightarrow \bigoplus K_{i}^{\bullet}$ is $\alpha_{i}$. We omit the verification that $\alpha$ is unique.

093W Lemma 13.31.3. Let $\mathcal{A}$ be an abelian category. Assume colimits over $\mathbf{N}$ exist and are exact. Then countable direct sums exists and are exact. Moreover, if $\left(A_{n}, f_{n}\right)$ is a system over $\mathbf{N}$, then there is a short exact sequence

$$
0 \rightarrow \bigoplus A_{n} \rightarrow \bigoplus A_{n} \rightarrow \operatorname{colim} A_{n} \rightarrow 0
$$

where the first map in degree $n$ is given by $1-f_{n}$.
Proof. The first statement follows from $\bigoplus A_{n}=\operatorname{colim}\left(A_{1} \oplus \ldots \oplus A_{n}\right)$. For the second, note that for each $n$ we have the short exact sequence

$$
0 \rightarrow A_{1} \oplus \ldots \oplus A_{n-1} \rightarrow A_{1} \oplus \ldots \oplus A_{n} \rightarrow A_{n} \rightarrow 0
$$

where the first map is given by the maps $1-f_{i}$ and the second map is the sum of the transition maps. Take the colimit to get the sequence of the lemma.

0949 Lemma 13.31.4. Let $\mathcal{A}$ be an abelian category. Let $L_{n}^{\bullet}$ be a system of complexes of $\mathcal{A}$. Assume colimits over $\mathbf{N}$ exist and are exact in $\mathcal{A}$. Then the termwise colimit $L^{\bullet}=\operatorname{colim} L_{n}^{\bullet}$ is a homotopy colimit of the system in $D(\mathcal{A})$.

Proof. We have an exact sequence of complexes

$$
0 \rightarrow \bigoplus L_{n}^{\bullet} \rightarrow \bigoplus L_{n}^{\bullet} \rightarrow L^{\bullet} \rightarrow 0
$$

by Lemma 13.31.3. The direct sums are direct sums in $D(\mathcal{A})$ by Lemma 13.31 .2 , Thus the result follows from the definition of derived colimits in Definition 13.31.1 and the fact that a short exact sequence of complexes gives a distinguished triangle (Lemma 13.12.1.

The following lemma tells us that taking maps out of a compact object (to be defined later) commutes with derived colimits.

094A Lemma 13.31.5. Let $\mathcal{D}$ be a triangulated category with countable direct sums. Let $K \in \mathcal{D}$ be an object such that for every countable set of objects $E_{n} \in \mathcal{D}$ the canonical map

$$
\bigoplus \operatorname{Hom}_{\mathcal{D}}\left(K, E_{n}\right) \longrightarrow \operatorname{Hom}_{\mathcal{D}}\left(K, \bigoplus E_{n}\right)
$$

is a bijection. Then, given any system $L_{n}$ of $\mathcal{D}$ over $\mathbf{N}$ whose derived colimit $L=$ hocolim $L_{n}$ exists we have that

$$
\operatorname{colim}_{\operatorname{Hom}_{\mathcal{D}}}\left(K, L_{n}\right) \longrightarrow \operatorname{Hom}_{\mathcal{D}}(K, L)
$$

is a bijection.
Proof. Consider the defining distinguished triangle

$$
\bigoplus L_{n} \rightarrow \bigoplus L_{n} \rightarrow L \rightarrow \bigoplus L_{n}[1]
$$

Apply the cohomological functor $\operatorname{Hom}_{\mathcal{D}}(K,-)$ (see Lemma 13.4.2). By elementary considerations concerning colimits of abelian groups we get the result.

### 13.32. Derived limits

08 TB In a triangulated category there is a notion of derived limit.
08 TC Definition 13.32.1. Let $\mathcal{D}$ be a triangulated category. Let $\left(K_{n}, f_{n}\right)$ be an inverse system of objects of $\mathcal{D}$. We say an object $K$ is a derived limit, or a homotopy limit of the system $\left(K_{n}\right)$ if the product $\Pi K_{n}$ exists and there is a distinguished triangle

$$
K \rightarrow \prod K_{n} \rightarrow \prod K_{n} \rightarrow K[1]
$$

where the map $\prod K_{n} \rightarrow \prod K_{n}$ is given by $\left(k_{n}\right) \mapsto\left(k_{n}-f_{n+1}\left(k_{n+1}\right)\right)$. If this is the case, then we sometimes indicate this by the notation $K=R \lim K_{n}$.

By TR3 a derived limit, if it exists, is unique up to (non-unique) isomorphism. Moreover, by TR1 a derived $\operatorname{limit} R \lim K_{n}$ exists as soon as $\Pi K_{n}$ exists. The derived category $D(A b)$ of the category of abelian groups is an example. More generally, we have the following lemma.

07KC Lemma 13.32.2. Let $\mathcal{A}$ be an abelian category with exact countable products. Then
(1) $D(\mathcal{A})$ has countable products,
(2) countable products $\prod K_{i}$ in $D(\mathcal{A})$ are obtained by taking termwise products of any complexes representing the $K_{i}$, and
(3) $H^{p}\left(\prod K_{i}\right)=\prod H^{p}\left(K_{i}\right)$.

Proof. Let $K_{i}^{\bullet}$ be a complex representing $K_{i}$ in $D(\mathcal{A})$. Let $L^{\bullet}$ be a complex. Suppose given maps $\alpha_{i}: L^{\bullet} \rightarrow K_{i}^{\bullet}$ in $D(\mathcal{A})$. This means there exist quasi-isomorphisms $s_{i}: K_{i}^{\bullet} \rightarrow M_{i}^{\bullet}$ of complexes and maps of complexes $f_{i}: L^{\bullet} \rightarrow M_{i}^{\bullet}$ such that $\alpha_{i}=s_{i}^{-1} f_{i}$. By assumption the map of complexes

$$
s: \prod K_{i}^{\bullet} \longrightarrow \prod M_{i}^{\bullet}
$$

is a quasi-isomorphism. Hence setting $f=\prod f_{i}$ we see that $\alpha=s^{-1} f$ is a map in $D(\mathcal{A})$ whose composition with the projection $\prod K_{i}^{\bullet} \rightarrow K_{i}^{\bullet}$ is $\alpha_{i}$. We omit the verification that $\alpha$ is unique.

The duals of Lemmas 13.31 .3 13.31.4, and 13.31 .5 should be stated here and proved. However, we do not know any applications of these lemmas for now.

0BK7 Lemma 13.32.3. Let $\mathcal{A}$ be an abelian category with countable products and enough injectives. Let $\left(K_{n}\right)$ be an inverse system of $D^{-}(\mathcal{A})$. Then $R \lim K_{n}$ exists.

Proof. It suffices to show that $\prod K_{n}$ exists in $D(\mathcal{A})$. For every $n$ we can represent $K_{n}$ by a bounded below complex $I_{n}^{\bullet}$ of injectives (Lemma 13.18.3). Then $\prod K_{n}$ is represented by $\Pi I_{n}^{\bullet}$, see Lemma 13.29 .5 .

070M Lemma 13.32.4. Let $\mathcal{A}$ be an abelian category with countable products and enough injectives. Let $K^{\bullet}$ be a complex. Let $I_{n}^{\bullet}$ be the inverse system of bounded below complexes of injectives produced by Lemma 13.28.3. Then $I^{\bullet}=\lim I_{n}^{\bullet}$ exists, is K-injective, and the following are equivalent
(1) the map $K^{\bullet} \rightarrow I^{\bullet}$ is a quasi-isomorphism,
(2) the canonical map $K^{\bullet} \rightarrow R \lim \tau_{\leq-n} K^{\bullet}$ is an isomorphism in $D(\mathcal{A})$.

Proof. The statement of the lemma makes sense as $R \lim \tau_{\geq-n} K^{\bullet}$ exists by Lemma 13.32.3. Each complex $I_{n}^{\bullet}$ is K-injective by Lemma 13.29 .4 . Choose direct sum decompositions $I_{n+1}^{p}=C_{n+1}^{p} \oplus I_{n}^{p}$ for all $n \geq 1$. Set $C_{1}^{p}=I_{1}^{p}$. The complex $I^{\bullet}=\lim I_{n}^{\bullet}$ exists because we can take $I^{p}=\prod_{n \geq 1} C_{n}^{p}$. Fix $p \in \mathbf{Z}$. We claim there is a split short exact sequence

$$
0 \rightarrow I^{p} \rightarrow \prod I_{n}^{p} \rightarrow \prod I_{n}^{p} \rightarrow 0
$$

of objects of $\mathcal{A}$. Here the first map is given by the projection maps $I^{p} \rightarrow I_{n}^{p}$ and the second map by $\left(x_{n}\right) \mapsto\left(x_{n}-f_{n+1}^{p}\left(x_{n+1}\right)\right)$ where $f_{n}^{p}: I_{n}^{p} \rightarrow I_{n-1}^{p}$ are the transition maps. The splitting comes from the map $\prod I_{n}^{p} \rightarrow \prod C_{n}^{p}=I^{p}$. We obtain a termwise split short exact sequence of complexes

$$
0 \rightarrow I^{\bullet} \rightarrow \prod I_{n}^{\bullet} \rightarrow \prod I_{n}^{\bullet} \rightarrow 0
$$

Hence a corresponding distinguished triangle in $K(\mathcal{A})$ and $D(\mathcal{A})$. By Lemma 13.29 .5 the products are K-injective and represent the corresponding products in $D(\mathcal{A})$. It follows that $I^{\bullet}$ represents $R \lim I_{n}^{\bullet}$ (Definition 13.32.1). Moreover, it follows that $I^{\bullet}$ is K-injective by Lemma 13.29 .3 . By the commutative diagram of Lemma 13.28 .3 we obtain a corresponding commutative diagram

in $D(\mathcal{A})$. Since the right vertical arrow is an isomorphism (as derived limits are defined on the level of the derived category and since $\tau_{\geq-n} K^{\bullet} \rightarrow I_{n}^{\bullet}$ is a quasiisomorphism), the lemma follows.

090Y Lemma 13.32.5. Let $\mathcal{A}$ be an abelian category having enough injectives and exact countable products. Then for every complex there is a quasi-isomorphism to a Kinjective complex.

Proof. By Lemma 13.32 .4 it suffices to show that $K \rightarrow R \lim \tau_{\geq-n} K$ is an isomorphism for all $K$ in $\overline{D(\mathcal{A}) \text {. Consider the defining distinguished triangle }}$

$$
R \lim \tau_{\geq-n} K \rightarrow \prod \tau_{\geq-n} K \rightarrow \prod \tau_{\geq-n} K \rightarrow\left(R \lim \tau_{\geq-n} K\right)[1]
$$

By Lemma 13.32 .2 we have

$$
H^{p}\left(\prod \tau_{\geq-n} K\right)=\prod_{p \geq-n} H^{p}(K)
$$

It follows in a straightforward manner from the long exact cohomology sequence of the displayed distinguished triangle that $H^{p}\left(R \lim \tau_{\geq-n} K\right)=H^{p}(K)$.

### 13.33. Generators of triangulated categories

09SI In this section we briefly introduce a few of the different notions of a generator for a triangulated category. Our terminology is taken from BV03 (except that we use "saturated" for what they call "épaisse", see Definition 13.6.1).
Let $\mathcal{D}$ be a triangulated category. Let $E$ be an object of $\mathcal{D}$. Denote $\langle E\rangle_{1}$ the strictly full subcategory of $\mathcal{D}$ consisting of objects in $\mathcal{D}$ isomorphic to direct summands of finite direct sums

$$
\bigoplus_{i=1, \ldots, r} E\left[n_{i}\right]
$$

of shifts of $E$. For $n>1$ let $\langle E\rangle_{n}$ denote the full subcategory of $\mathcal{D}$ consisting of objects of $\mathcal{D}$ isomorphic to direct summands of objects $X$ which fit into a distinguished triangle

$$
A \rightarrow X \rightarrow B \rightarrow A[1]
$$

where $A$ is an object of $\langle E\rangle_{1}$ and $B$ an object of $\langle E\rangle_{n-1}$. Each of the categories $\langle E\rangle_{n}$ is a strictly full additive subcategory of $\mathcal{D}$ preserved under shifts and under taking summands. But, $\langle E\rangle_{n}$ is not necessarily closed under "taking cones", hence not necessarily a triangulated subcategory.
$0 A T G$ Lemma 13.33.1. Let $\mathcal{D}$ be a triangulated category. Let $E$ be an object of $\mathcal{D}$. The subcategory

$$
\langle E\rangle=\bigcup_{n}\langle E\rangle_{n}
$$

is a strictly full, saturated, triangulated subcategory of $\mathcal{D}$ and it is the smallest such subcategory of $\mathcal{D}$ containing the object $E$.

Proof. To prove this it suffices to show: if $A \in\langle E\rangle_{a}$ and $B \in\langle E\rangle_{b}$ and if $A \rightarrow X \rightarrow$ $B \rightarrow A[1]$ is a distinguished triangle, then $X \in\langle E\rangle_{a+b}$. We omit the details.

09SJ Definition 13.33.2. Let $\mathcal{D}$ be a triangulated category. Let $E$ be an object of $\mathcal{D}$.
(1) We say $E$ is a classical generator of $\mathcal{D}$ if the smallest strictly full, saturated, triangulated subcategory of $\mathcal{D}$ containing $E$ is equal to $\mathcal{D}$, in other words, if $\langle E\rangle=\mathcal{D}$.
(2) We say $E$ is a strong generator of $\mathcal{D}$ if $\langle E\rangle_{n}=\mathcal{D}$ for some $n \geq 1$.
(3) We say $E$ is a weak generator or a generator of $\mathcal{D}$ if for any nonzero object $K$ of $\mathcal{D}$ there exists an integer $n$ and a nonzero map $E \rightarrow K[n]$.

This definition can be generalized to the case of a family of objects.
09SK Lemma 13.33.3. Let $\mathcal{D}$ be a triangulated category. Let $E, K$ be objects of $\mathcal{D}$. The following are equivalent
(1) $\operatorname{Hom}(E, K[i])=0$ for all $i \in \mathbf{Z}$,
(2) $\operatorname{Hom}\left(E^{\prime}, K\right)=0$ for all $E^{\prime} \in\langle E\rangle$.

Proof. The implication $(2) \Rightarrow(1)$ is immediate. Conversely, assume (1). Then $\operatorname{Hom}(X, K)=0$ for all $X$ in $\langle E\rangle_{1}$. Arguing by induction on $n$ and using Lemma 13.4.2 we see that $\operatorname{Hom}(X, K)=0$ for all $X$ in $\langle E\rangle_{n}$.

09SL Lemma 13.33.4. Let $\mathcal{D}$ be a triangulated category. Let $E$ be an object of $\mathcal{D}$. If $E$ is a classical generator of $\mathcal{D}$, then $E$ is a generator.

Proof. Assume $E$ is a classical generator. Let $K$ be an object of $\mathcal{D}$ such that $\operatorname{Hom}(E, K[i])=0$ for all $i \in \mathbf{Z}$. By Lemma $13.33 .3 \operatorname{Hom}\left(E^{\prime}, K\right)=0$ for all $E^{\prime}$ in $\langle E\rangle$. However, since $\mathcal{D}=\langle E\rangle$ we conclude that $\mathrm{id}_{K}=0$, i.e., $K=0$.

0 ATH Remark 13.33.5. Let $\mathcal{D}$ be a triangulated category. Let $E$ be an object of $\mathcal{D}$. Let $T$ be a property of objects of $\mathcal{D}$. Suppose that
(1) if $K_{i} \in D(A), i=1, \ldots, r$ with $T\left(K_{i}\right)$ for $i=1, \ldots, r$, then $T\left(\bigoplus K_{i}\right)$,
(2) if $K \rightarrow L \rightarrow M \rightarrow K[1]$ is a distinguished triangle and $T$ holds for two, then $T$ holds for the third object,
(3) if $T(K \oplus L)$ then $T(K)$ and $T(L)$, and
(4) $T(E[n])$ holds for all $n$.

Then $T$ holds for all objects of $\langle E\rangle$.

### 13.34. Compact objects

09SM Here is the definition.
07LS Definition 13.34.1. Let $\mathcal{D}$ be an additive category with arbitrary direct sums. A compact object of $\mathcal{D}$ is an object $K$ such that the map

$$
\bigoplus_{i \in I} \operatorname{Hom}_{\mathcal{D}}\left(K, E_{i}\right) \longrightarrow \operatorname{Hom}_{\mathcal{D}}\left(K, \bigoplus_{i \in I} E_{i}\right)
$$

is bijective for any set $I$ and objects $E_{i} \in \operatorname{Ob}(\mathcal{D})$ parametrized by $i \in I$.
This notion turns out to be very useful in algebraic geometry. It is an intrinsic condition on objects that forces the objects to be, well, compact.

09QH Lemma 13.34.2. Let $\mathcal{D}$ be a (pre-)triangulated category with direct sums. Then the compact objects of $\mathcal{D}$ form the objects of a Karoubian, saturated, strictly full, (pre-)triangulated subcategory $\mathcal{D}_{c}$ of $\mathcal{D}$.
Proof. Let $(X, Y, Z, f, g, h)$ be a distinguished triangle of $\mathcal{D}$ with $X$ and $Y$ compact. Then it follows from Lemma 13.4 .2 and the five lemma (Homology, Lemma 12.5.20) that $Z$ is a compact object too. It is clear that if $X \oplus Y$ is compact, then $X, Y$ are compact objects too. Hence $\mathcal{D}_{c}$ is a saturated triangulated subcategory. Since $\mathcal{D}$ is Karoubian by Lemma 13.4 .12 we conclude that the same is true for $\mathcal{D}_{c}$.

09SN Lemma 13.34.3. Let $\mathcal{D}$ be a triangulated category with direct sums. Let $E_{i}, i \in I$ be a family of compact objects of $\mathcal{D}$ such that $\bigoplus E_{i}$ generates $\mathcal{D}$. Then every object $X$ of $\mathcal{D}$ can be written as

$$
X=\operatorname{hocolim} X_{n}
$$

where $X_{1}$ is a direct sum of shifts of the $E_{i}$ and each transition morphism fits into a distinguished triangle $Y_{n} \rightarrow X_{n} \rightarrow X_{n+1} \rightarrow Y_{n}[1]$ where $Y_{n}$ is a direct sum of shifts of the $E_{i}$.

Proof. Set $X_{1}=\bigoplus_{(i, m, \varphi)} E_{i}[m]$ where the direct sum is over all triples $(i, m, \varphi)$ such that $i \in I, m \in \mathbf{Z}$ and $\varphi: E_{i}[m] \rightarrow X$. Then $X_{1}$ comes equipped with a canonical morphism $X_{1} \rightarrow X$. Given $X_{n} \rightarrow X$ we set $Y_{n}=\bigoplus_{(i, m, \varphi)} E_{i}[m]$ where the direct sum is over all triples $(i, m, \varphi)$ such that $i \in I, m \in \mathbf{Z}$, and $\varphi: E_{i}[m] \rightarrow X_{n}$ is a morphism such that $E_{i}[m] \rightarrow X_{n} \rightarrow X$ is zero. Choose a distinguished triangle $Y_{n} \rightarrow X_{n} \rightarrow X_{n+1} \rightarrow Y_{n}[1]$ and let $X_{n+1} \rightarrow X$ be any morphism such that $X_{n} \rightarrow X_{n+1} \rightarrow X$ is the given one; such a morphism exists by
our choice of $Y_{n}$. We obtain a morphism hocolim $X_{n} \rightarrow X$ by the construction of our maps $X_{n} \rightarrow X$. Choose a distinguished triangle

$$
C \rightarrow \operatorname{hocolim} X_{n} \rightarrow X \rightarrow C[1]
$$

Let $E_{i}[m] \rightarrow C$ be a morphism. Since $E_{i}$ is compact, the composition $E_{i}[m] \rightarrow$ $X \rightarrow \operatorname{hocolim} X_{n}$ factors through $X_{n}$ for some $n$, say by $E_{i}[m] \rightarrow X_{n}$. Then the construction of $Y_{n}$ shows that the composition $E_{i}[m] \rightarrow X_{n} \rightarrow X_{n+1}$ is zero. In other words, the composition $E_{i}[m] \rightarrow C \rightarrow \operatorname{hocolim} X_{n}$ is zero. This means that our morphism $E_{i}[m] \rightarrow C$ comes from a morphism $E_{i}[m] \rightarrow X[-1]$. The construction of $X_{1}$ then shows that such morphism lifts to hocolim $X_{n}$ and we conclude that our morphism $E_{i}[m] \rightarrow C$ is zero. The assumption that $\bigoplus E_{i}$ generates $\mathcal{D}$ implies that $C$ is zero and the proof is done.

09SP Lemma 13.34.4. With assumptions and notation as in Lemma 13.34.3. If C is a compact object and $C \rightarrow X_{n}$ is a morphism, then there is a factorization $C \rightarrow E \rightarrow X_{n}$ where $E$ is an object of $\left\langle E_{i_{1}} \oplus \ldots \oplus E_{i_{t}}\right\rangle$ for some $i_{1}, \ldots, i_{t} \in I$.

Proof. We prove this by induction on $n$. The base case $n=1$ is clear. If $n>1$ consider the composition $C \rightarrow X_{n} \rightarrow Y_{n-1}[1]$. This can be factored through some $E^{\prime}[1] \rightarrow Y_{n-1}[1]$ where $E^{\prime}$ is a finite direct sum of shifts of the $E_{i}$. Let $I^{\prime} \subset I$ be the finite set of indices that occur in this direct sum. Thus we obtain

By induction the morphism $C^{\prime} \rightarrow X_{n-1}$ factors through $E^{\prime \prime} \rightarrow X_{n-1}$ with $E^{\prime \prime}$ an object of $\left\langle\bigoplus_{i \in I^{\prime \prime}} E_{i}\right\rangle$ for some finite subset $I^{\prime \prime} \subset I$. Choose a distinguished triangle

$$
E^{\prime} \rightarrow E^{\prime \prime} \rightarrow E \rightarrow E^{\prime}[1]
$$

then $E$ is an object of $\left\langle\bigoplus_{i \in I^{\prime} \cup I^{\prime \prime}} E_{i}\right\rangle$. By construction and the axioms of a triangulated category we can choose morphisms $C \rightarrow E$ and a morphism $E \rightarrow X_{n}$ fitting into morphisms of triangles $\left(E^{\prime}, C^{\prime}, C\right) \rightarrow\left(E^{\prime}, E^{\prime \prime}, E\right)$ and $\left(E^{\prime}, E^{\prime \prime}, E\right) \rightarrow$ $\left(Y_{n-1}, X_{n-1}, X_{n}\right)$. The composition $C \rightarrow E \rightarrow X_{n}$ may not equal the given morphism $C \rightarrow X_{n}$, but the compositions into $Y_{n-1}$ are equal. Let $C \rightarrow X_{n-1}$ be a morphism that lifts the difference. By induction assumption we can factor this through a morphism $E^{\prime \prime \prime} \rightarrow X_{n-1}$ with $E^{\prime \prime}$ an object of $\left\langle\bigoplus_{i \in I^{\prime \prime \prime}} E_{i}\right\rangle$ for some finite subset $I^{\prime} \subset I$. Thus we see that we get a solution on considering $E \oplus E^{\prime \prime \prime} \rightarrow X_{n}$ because $E \oplus E^{\prime \prime \prime}$ is an object of $\left\langle\bigoplus_{i \in I^{\prime} \cup I^{\prime \prime} \cup I^{\prime \prime \prime}} E_{i}\right\rangle$.
09SQ Definition 13.34.5. Let $\mathcal{D}$ be a triangulated category with arbitrary direct sums. We say $\mathcal{D}$ is compactly generated if there exists a set $E_{i}, i \in I$ of compact objects such that $\bigoplus E_{i}$ generates $\mathcal{D}$.

The following proposition clarifies the relationship between classical generators and weak generators.

09SR Proposition 13.34.6. Let $\mathcal{D}$ be a triangulated category with direct sums. Let $E$ be a compact object of $\mathcal{D}$. The following are equivalent
(1) $E$ is a classical generator for $\mathcal{D}_{c}$ and $\mathcal{D}$ is compactly generated, and
(2) $E$ is a generator for $\mathcal{D}$.

Proof. If $E$ is a classical generator for $\mathcal{D}_{c}$, then $\mathcal{D}_{c}=\langle E\rangle$. It follows formally from the assumption that $\mathcal{D}$ is compactly generated and Lemma 13.33 .3 that $E$ is a generator for $\mathcal{D}$.
The converse is more interesting. Assume that $E$ is a generator for $\mathcal{D}$. Let $X$ be a compact object of $\mathcal{D}$. Apply Lemma 13.34 .3 with $I=\{1\}$ and $E_{1}=E$ to write

$$
X=\operatorname{hocolim} X_{n}
$$

as in the lemma. Since $X$ is compact we find that $X \rightarrow \operatorname{hocolim} X_{n}$ factors through $X_{n}$ for some $n$ (Lemma 13.31.5). Thus $X$ is a direct summand of $X_{n}$. By Lemma 13.34 .4 we see that $X$ is an object of $\langle E\rangle$ and the lemma is proven.

### 13.35. Brown representability

0 A 8 E A reference for the material in this section is Nee96.
0A8F Lemma 13.35.1. Let $\mathcal{D}$ be a triangulated category with direct sums which is compactly generated. Let $H: \mathcal{D} \rightarrow A b$ be a contravariant cohomological functor which transforms direct sums into products. Then $H$ is representable.

Proof. Let $E_{i}, i \in I$ be a set of compact objects such that $\bigoplus_{i \in I} E_{i}$ generates $\mathcal{D}$. We may and do assume that the set of objects $\left\{E_{i}\right\}$ is preserved under shifts. Consider pairs $(i, a)$ where $i \in I$ and $a \in H\left(E_{i}\right)$ and set

$$
X_{1}=\bigoplus_{(i, a)} E_{i}
$$

Since $H\left(X_{1}\right)=\prod_{(i, a)} H\left(E_{i}\right)$ we see that $(a)_{(i, a)}$ defines an element $a_{1} \in H\left(X_{1}\right)$. Set $H_{1}=\operatorname{Hom}_{\mathcal{D}}\left(-, X_{1}\right)$. By Yoneda's lemma (Categories, Lemma 4.3.5) the element $a_{1}$ defines a natural transformation $H_{1} \rightarrow H$.
We are going to inductively construct $X_{n}$ and transformations $a_{n}: H_{n} \rightarrow H$ where $H_{n}=\operatorname{Hom}_{\mathcal{D}}\left(-, X_{n}\right)$. Namely, we apply the procedure above to the functor $\operatorname{Ker}\left(H_{n} \rightarrow H\right)$ to get an object

$$
K_{n+1}=\bigoplus_{(i, k), k \in \operatorname{Ker}\left(H_{n}\left(E_{i}\right) \rightarrow H\left(E_{i}\right)\right)} E_{i}
$$

and a transformation $\operatorname{Hom}_{\mathcal{D}}\left(-, K_{n+1}\right) \rightarrow \operatorname{Ker}\left(H_{n} \rightarrow H\right)$. By Yoneda's lemma the composition $\operatorname{Hom}_{\mathcal{D}}\left(-, K_{n+1}\right) \rightarrow H_{n}$ gives a morphism $K_{n+1} \rightarrow X_{n}$. We choose a distinguished triangle

$$
K_{n+1} \rightarrow X_{n} \rightarrow X_{n+1} \rightarrow K_{n+1}[1]
$$

in $\mathcal{D}$. The element $a_{n} \in H\left(X_{n}\right)$ maps to zero in $H\left(K_{n+1}\right)$ by construction. Since $H$ is cohomological we can lift it to an element $a_{n+1} \in H\left(X_{n+1}\right)$.
We claim that $X=\operatorname{hocolim} X_{n}$ represents $H$. First of all, by our definition of derived colimits and the fact that $H$ transforms direct sums into products, we see that $H(X)=\lim H\left(X_{n}\right)$. Thus $a=\left(a_{n}\right)$ gives an element in $H(X)$ and hence a natural transformation $\operatorname{Hom}_{\mathcal{D}}(-, X) \rightarrow H$ such that

$$
\operatorname{Hom}_{\mathcal{D}}\left(-, X_{1}\right) \rightarrow \operatorname{Hom}_{\mathcal{D}}\left(-, X_{2}\right) \rightarrow \operatorname{Hom}_{\mathcal{D}}\left(-, X_{3}\right) \rightarrow \ldots \rightarrow \operatorname{Hom}_{\mathcal{D}}(-, X) \rightarrow H
$$

commutes. For each $i$ the map $\operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X\right) \rightarrow H\left(E_{i}\right)$ is surjective, by construction of $X_{1}$. On the other hand, by construction of $X_{n} \rightarrow X_{n+1}$ the kernel of $\operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X_{n}\right) \rightarrow H\left(E_{i}\right)$ is killed by the map $\operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X_{n}\right) \rightarrow \operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X_{n+1}\right)$. Since

$$
\operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X\right)=\operatorname{colim} \operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X_{n}\right)
$$

by Lemma 13.31 .5 we see that $\operatorname{Hom}_{\mathcal{D}}\left(E_{i}, X\right) \rightarrow H\left(E_{i}\right)$ is injective.
To finish the proof, consider the subcategory

$$
\mathcal{D}^{\prime}=\left\{Y \in \operatorname{Ob}(\mathcal{D}) \mid \operatorname{Hom}_{\mathcal{D}}(Y[n], X) \rightarrow H(Y[n]) \text { is an isomorphism for all } n\right\}
$$

As $\operatorname{Hom}_{\mathcal{D}}(-, X) \rightarrow H$ is a transformation between cohomological functors, the subcategory $\mathcal{D}^{\prime}$ is a strictly full, saturated, triangulated subcategory of $\mathcal{D}$ (details omitted; see proof of Lemma 13.6.3). Moreover, as both $H$ and $\operatorname{Hom}_{\mathcal{D}}(-, X)$ transform direct sums into products, we see that direct sums of objects of $\mathcal{D}^{\prime}$ are in $\mathcal{D}^{\prime}$. Thus derived colimits of objects of $\mathcal{D}^{\prime}$ are in $\mathcal{D}^{\prime}$. Since $\left\{E_{i}\right\}$ is preserved under shifts, we see that $E_{i}$ is an object of $\mathcal{D}^{\prime}$ for all $i$. It follows from Lemma 13.34 .3 that $\mathcal{D}^{\prime}=\mathcal{D}$ and the proof is complete.

0A8G Proposition 13.35.2. Let $\mathcal{D}$ be a triangulated category with direct sums which is compactly generated. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be an exact functor of triangulated categories which transforms direct sums into direct sums. Then $F$ has an exact right adjoint.

Proof. For an object $Y$ of $\mathcal{D}^{\prime}$ consider the contravariant functor

$$
\mathcal{D} \rightarrow A b, \quad W \mapsto \operatorname{Hom}_{\mathcal{D}^{\prime}}(F(W), Y)
$$

This is a cohomological functor as $F$ is exact and tranforms direct sums into products as $F$ transforms direct sums into direct sums. Thus by Lemma 13.35.1 we find an object $X$ of $\mathcal{D}$ such that $\operatorname{Hom}_{\mathcal{D}}(W, X)=\operatorname{Hom}_{\mathcal{D}^{\prime}}(F(W), Y)$. The existence of the adjoint follows from Categories, Lemma 4.24.2. Exactness follows from Lemma 13.7.1.

## CHAPTER 14

## Simplicial Methods

### 14.1. Introduction

0163 This is a minimal introduction to simplicial methods. We just add here whenever something is needed later on. A general reference to this material is perhaps GJ99. An example of the things you can do is the paper by Quillen on Homotopical Algebra, see Qui67 or the paper on Étale Homotopy by Artin and Mazur, see AM69.

### 14.2. The category of finite ordered sets

0164 The category $\Delta$ is the category with
(1) objects $[0],[1],[2], \ldots$ with $[n]=\{0,1,2, \ldots, n\}$ and
(2) a morphism $[n] \rightarrow[m]$ is a nondecreasing map $\{0,1,2, \ldots, n\} \rightarrow\{0,1,2, \ldots, m\}$ between the corresponding sets.

Here nondecreasing for a map $\varphi:[n] \rightarrow[m]$ means by definition that $\varphi(i) \geq$ $\varphi(j)$ if $i \geq j$. In other words, $\Delta$ is a category equivalent to the "big" category of finite totally ordered sets and nondecreasing maps. There are exactly $n+1$ morphisms $[0] \rightarrow[n]$ and there is exactly 1 morphism $[n] \rightarrow[0]$. There are exactly $(n+1)(n+2) / 2$ morphisms $[1] \rightarrow[n]$ and there are exactly $n+2$ morphisms $[n] \rightarrow[1]$. And so on and so forth.

0165 Definition 14.2.1. For any integer $n \geq 1$, and any $0 \leq j \leq n$ we let $\delta_{j}^{n}:[n-1] \rightarrow$ $[n\rfloor$ denote the injective order preserving map skipping $j$. For any integer $n \geq 0$, and any $0 \leq j \leq n$ we denote $\sigma_{j}^{n}:[n+1] \rightarrow[n]$ the surjective order preserving map with $\left(\sigma_{j}^{n}\right)^{-1}(\{j\})=\{j, j+1\}$.

0166 Lemma 14.2.2. Any morphism in $\Delta$ can be written as a composition of the morphisms $\delta_{j}^{n}$ and $\sigma_{j}^{n}$.

Proof. Let $\varphi:[n] \rightarrow[m]$ be a morphism of $\Delta$. If $j \notin \operatorname{Im}(\varphi)$, then we can write $\varphi$ as $\delta_{j}^{m} \circ \psi$ for some morphism $\psi:[n] \rightarrow[m-1]$. If $\varphi(j)=\varphi(j+1)$ then we can write $\varphi$ as $\psi \circ \sigma_{j}^{n-1}$ for some morphism $\psi:[n-1] \rightarrow[m]$. The result follows because each replacement as above lowers $n+m$ and hence at some point $\varphi$ is both injective and surjective, hence an identity morphism.

0167 Lemma 14.2.3. The morphisms $\delta_{j}^{n}$ and $\sigma_{j}^{n}$ satisfy the following relations.
(1) If $0 \leq i<j \leq n+1$, then $\delta_{j}^{n+1} \circ \delta_{i}^{n}=\delta_{i}^{n+1} \circ \delta_{j-1}^{n}$. In other words the diagram

commutes.
(2) If $0 \leq i<j \leq n-1$, then $\sigma_{j}^{n-1} \circ \delta_{i}^{n}=\delta_{i}^{n-1} \circ \sigma_{j-1}^{n-2}$. In other words the diagram

commutes.
(3) If $0 \leq j \leq n-1$, then $\sigma_{j}^{n-1} \circ \delta_{j}^{n}=i d_{[n-1]}$ and $\sigma_{j}^{n-1} \circ \delta_{j+1}^{n}=i d_{[n-1]}$. In other words the diagram

commutes.
(4) If $0<j+1<i \leq n$, then $\sigma_{j}^{n-1} \circ \delta_{i}^{n}=\delta_{i-1}^{n-1} \circ \sigma_{j}^{n-2}$. In other words the diagram

commutes.
(5) If $0 \leq i \leq j \leq n-1$, then $\sigma_{j}^{n-1} \circ \sigma_{i}^{n}=\sigma_{i}^{n-1} \circ \sigma_{j+1}^{n}$. In other words the diagram

commutes.
Proof. Omitted.
0168 Lemma 14.2.4. The category $\Delta$ is the universal category with objects $[n], n \geq$ 0 and morphisms $\delta_{j}^{n}$ and $\sigma_{j}^{n}$ such that (a) every morphism is a composition of these morphisms, (b) the relations listed in Lemma 14.2.3 are satisfied, and (c) any relation among the morphisms is a consequence of those relations.
Proof. Omitted.

### 14.3. Simplicial objects

0169
016A Definition 14.3.1. Let $\mathcal{C}$ be a category.
(1) A simplicial object $U$ of $\mathcal{C}$ is a contravariant functor $U$ from $\Delta$ to $\mathcal{C}$, in a formula:

$$
U: \Delta^{o p p} \longrightarrow \mathcal{C}
$$

(2) If $\mathcal{C}$ is the category of sets, then we call $U$ a simplicial set.
(3) If $\mathcal{C}$ is the category of abelian groups, then we call $U$ a simplicial abelian group.
(4) A morphism of simplicial objects $U \rightarrow U^{\prime}$ is a transformation of functors.
(5) The category of simplicial objects of $\mathcal{C}$ is denoted $\operatorname{Simp}(\mathcal{C})$.

This means there are objects $U([0]), U([1]), U([2]), \ldots$ and for $\varphi$ any nondecreasing $\operatorname{map} \varphi:[m] \rightarrow[n]$ a morphism $U(\varphi): U([n]) \rightarrow U([m])$, satisfying $U(\varphi \circ \psi)=$ $U(\psi) \circ U(\varphi)$.
In particular there is a unique morphism $U([0]) \rightarrow U([n])$ and there are exactly $n+1$ morphisms $U([n]) \rightarrow U([0])$ corresponding to the $n+1$ maps $[0] \rightarrow[n]$. Obviously we need some more notation to be able to talk intelligently about these simplicial objects. We do this by considering the morphisms we singled out in Section 14.2 above.

016B Lemma 14.3.2. Let $\mathcal{C}$ be a category.
(1) Given a simplicial object $U$ in $\mathcal{C}$ we obtain a sequence of objects $U_{n}=$ $U([n])$ endowed with the morphisms $d_{j}^{n}=U\left(\delta_{j}^{n}\right): U_{n} \rightarrow U_{n-1}$ and $s_{j}^{n}=U\left(\sigma_{j}^{n}\right): U_{n} \rightarrow U_{n+1}$. These morphisms satisfy the opposites of the relations displayed in Lemma 14.2.3.
(2) Conversely, given a sequence of objects $U_{n}$ and morphisms $d_{j}^{n}$, $s_{j}^{n}$ satisfying these relations there exists a unique simplicial object $U$ in $\mathcal{C}$ such that $U_{n}=U([n]), d_{j}^{n}=U\left(\delta_{j}^{n}\right)$, and $s_{j}^{n}=U\left(\sigma_{j}^{n}\right)$.
(3) A morphism between simplicial objects $U$ and $U^{\prime}$ is given by a family of morphisms $U_{n} \rightarrow U_{n}^{\prime}$ commuting with the morphisms $d_{j}^{n}$ and $s_{j}^{n}$.
Proof. This follows from Lemma 14.2.4
016C Remark 14.3.3. By abuse of notation we sometimes write $d_{i}: U_{n} \rightarrow U_{n-1}$ instead of $d_{i}^{n}$, and similarly for $s_{i}: U_{n} \rightarrow U_{n+1}$. The relations among the morphisms $d_{i}^{n}$ and $s_{i}^{n}$ may be expressed as follows:
(1) If $i<j$, then $d_{i} \circ d_{j}=d_{j-1} \circ d_{i}$.
(2) If $i<j$, then $d_{i} \circ s_{j}=s_{j-1} \circ d_{i}$.
(3) We have id $=d_{j} \circ s_{j}=d_{j+1} \circ s_{j}$.
(4) If $i>j+1$, then $d_{i} \circ s_{j}=s_{j} \circ d_{i-1}$.
(5) If $i \leq j$, then $s_{i} \circ s_{j}=s_{j+1} \circ s_{i}$.

This means that whenever the compositions on both the left and the right are defined then the corresponding equality should hold.
We get a unique morphism $s_{0}^{0}=U\left(\sigma_{0}^{0}\right): U_{0} \rightarrow U_{1}$ and two morphisms $d_{0}^{1}=U\left(\delta_{0}^{1}\right)$, and $d_{1}^{1}=U\left(\delta_{1}^{1}\right)$ which are morphisms $U_{1} \rightarrow U_{0}$. There are two morphisms $s_{0}^{1}=$ $U\left(\sigma_{0}^{1}\right), s_{1}^{1}=U\left(\sigma_{1}^{1}\right)$ which are morphisms $U_{1} \rightarrow U_{2}$. Three morphisms $d_{0}^{2}=U\left(\delta_{0}^{2}\right)$, $d_{1}^{2}=U\left(\delta_{1}^{2}\right), d_{2}^{2}=U\left(\delta_{2}^{2}\right)$ which are morphisms $U_{3} \rightarrow U_{2}$. And so on.
Pictorially we think of $U$ as follows:

$$
U_{2} \underset{\rightleftarrows}{\rightleftarrows} U_{1} \rightleftarrows U_{0}
$$

Here the $d$-morphisms are the arrows pointing right and the $s$-morphisms are the arrows pointing left.

016D Example 14.3.4. The simplest example is the constant simplicial object with value $X \in \mathrm{Ob}(\mathcal{C})$. In other words, $U_{n}=X$ and all maps are $\mathrm{id}_{X}$.

016E Example 14.3.5. Suppose that $Y \rightarrow X$ is a morphism of $\mathcal{C}$ such that all the fibred products $Y \times_{X} Y \times_{X} \ldots \times_{X} Y$ exist. Then we set $U_{n}$ equal to the $(n+1)$-fold fibre product, and we let $\varphi:[n] \rightarrow[m]$ correspond to the map (on "coordinates") $\left(y_{0}, \ldots, y_{m}\right) \mapsto\left(y_{\varphi(0)}, \ldots, y_{\varphi(n)}\right)$. In other words, the map $U_{0}=Y \rightarrow U_{1}=Y \times_{X} Y$ is the diagonal map. The two maps $U_{1}=Y \times_{X} Y \rightarrow U_{0}=Y$ are the projection maps.

Geometrically Example 14.3 .5 above is an important example. It tells us that it is a good idea to think of the maps $d_{j}^{n}: U_{n} \rightarrow U_{n-1}$ as projection maps (forgetting the $j$ th component), and to think of the maps $s_{j}^{n}: U_{n} \rightarrow U_{n+1}$ as diagonal maps (repeating the $j$ th coordinate). We will return to this in the sections below.

016F Lemma 14.3.6. Let $\mathcal{C}$ be a category. Let $U$ be a simplicial object of $\mathcal{C}$. Each of the morphisms $s_{i}^{n}: U_{n} \rightarrow U_{n+1}$ has a left inverse. In particular $s_{i}^{n}$ is a monomorphism.
Proof. This is true because $d_{i}^{n+1} \circ s_{i}^{n}=\mathrm{id}_{U_{n}}$.

### 14.4. Simplicial objects as presheaves

016G Another observation is that we may think of a simplicial object of $\mathcal{C}$ as a presheaf with values in $\mathcal{C}$ over $\Delta$. See Sites, Definition 7.2.2. And in fact, if $U, U^{\prime}$ are simplicial objects of $\mathcal{C}$, then we have
016H

$$
\begin{equation*}
\operatorname{Mor}\left(U, U^{\prime}\right)=\operatorname{Mor}_{P S h(\Delta)}\left(U, U^{\prime}\right) \tag{14.4.0.1}
\end{equation*}
$$

Some of the material below could be replaced by the more general constructions in the chapter on sites. However, it seems a clearer picture arises from the arguments specific to simplicial objects.

### 14.5. Cosimplicial objects

016I A cosimplicial object of a category $\mathcal{C}$ could be defined simply as a simplicial object of the opposite category $\mathcal{C}^{\text {opp }}$. This is not really how the human brain works, so we introduce them separately here and point out some simple properties.

016J Definition 14.5.1. Let $\mathcal{C}$ be a category.
(1) A cosimplicial object $U$ of $\mathcal{C}$ is a covariant functor $U$ from $\Delta$ to $\mathcal{C}$, in a formula:

$$
U: \Delta \longrightarrow \mathcal{C}
$$

(2) If $\mathcal{C}$ is the category of sets, then we call $U$ a cosimplicial set.
(3) If $\mathcal{C}$ is the category of abelian groups, then we call $U$ a cosimplicial abelian group.
(4) A morphism of cosimplicial objects $U \rightarrow U^{\prime}$ is a transformation of functors.
(5) The category of cosimplicial objects of $\mathcal{C}$ is denoted $\operatorname{CoSimp}(\mathcal{C})$.

This means there are objects $U([0]), U([1]), U([2]), \ldots$ and for $\varphi$ any nondecreasing $\operatorname{map} \varphi:[m] \rightarrow[n]$ a morphism $U(\varphi): U([m]) \rightarrow U([n])$, satisfying $U(\varphi \circ \psi)=$ $U(\varphi) \circ U(\psi)$.

In particular there is a unique morphism $U([n]) \rightarrow U([0])$ and there are exactly $n+1$ morphisms $U([0]) \rightarrow U([n])$ corresponding to the $n+1$ maps $[0] \rightarrow[n]$. Obviously we need some more notation to be able to talk intelligently about these simplicial objects. We do this by considering the morphisms we singled out in Section 14.2 above.

016K Lemma 14.5.2. Let $\mathcal{C}$ be a category.
(1) Given a cosimplicial object $U$ in $\mathcal{C}$ we obtain a sequence of objects $U_{n}=$ $U([n])$ endowed with the morphisms $\delta_{j}^{n}=U\left(\delta_{j}^{n}\right): U_{n-1} \rightarrow U_{n}$ and $\sigma_{j}^{n}=$ $U\left(\sigma_{j}^{n}\right): U_{n+1} \rightarrow U_{n}$. These morphisms satisfy the relations displayed in Lemma 14.2.3.
(2) Conversely, given a sequence of objects $U_{n}$ and morphisms $\delta_{j}^{n}, \sigma_{j}^{n}$ satisfying these relations there exists a unique cosimplicial object $U$ in $\mathcal{C}$ such that $U_{n}=U([n]), \delta_{j}^{n}=U\left(\delta_{j}^{n}\right)$, and $\sigma_{j}^{n}=U\left(\sigma_{j}^{n}\right)$.
(3) A morphism between cosimplicial objects $U$ and $U^{\prime}$ is given by a family of morphisms $U_{n} \rightarrow U_{n}^{\prime}$ commuting with the morphisms $\delta_{j}^{n}$ and $\sigma_{j}^{n}$.
Proof. This follows from Lemma 14.2.4.
016L Remark 14.5.3. By abuse of notation we sometimes write $\delta_{i}: U_{n-1} \rightarrow U_{n}$ instead of $\delta_{i}^{n}$, and similarly for $\sigma_{i}: U_{n+1} \rightarrow U_{n}$. The relations among the morphisms $\delta_{i}^{n}$ and $\sigma_{i}^{n}$ may be expressed as follows:
(1) If $i<j$, then $\delta_{j} \circ \delta_{i}=\delta_{i} \circ \delta_{j-1}$.
(2) If $i<j$, then $\sigma_{j} \circ \delta_{i}=\delta_{i} \circ \sigma_{j-1}$.
(3) We have id $=\sigma_{j} \circ \delta_{j}=\sigma_{j} \circ \delta_{j+1}$.
(4) If $i>j+1$, then $\sigma_{j} \circ \delta_{i}=\delta_{i-1} \circ \sigma_{j}$.
(5) If $i \leq j$, then $\sigma_{j} \circ \sigma_{i}=\sigma_{i} \circ \sigma_{j+1}$.

This means that whenever the compositions on both the left and the right are defined then the corresponding equality should hold.

We get a unique morphism $\sigma_{0}^{0}=U\left(\sigma_{0}^{0}\right): U_{1} \rightarrow U_{0}$ and two morphisms $\delta_{0}^{1}=U\left(\delta_{0}^{1}\right)$, and $\delta_{1}^{1}=U\left(\delta_{1}^{1}\right)$ which are morphisms $U_{0} \rightarrow U_{1}$. There are two morphisms $\sigma_{0}^{1}=$ $U\left(\sigma_{0}^{1}\right), \sigma_{1}^{1}=U\left(\sigma_{1}^{1}\right)$ which are morphisms $U_{2} \rightarrow U_{1}$. Three morphisms $\delta_{0}^{2}=U\left(\delta_{0}^{2}\right)$, $\delta_{1}^{2}=U\left(\delta_{1}^{2}\right), \delta_{2}^{2}=U\left(\delta_{2}^{2}\right)$ which are morphisms $U_{2} \rightarrow U_{3}$. And so on.
Pictorially we think of $U$ as follows:

$$
U_{0} \longleftrightarrow U_{1} \stackrel{\longleftrightarrow}{\rightleftarrows} U_{2}
$$

Here the $\delta$-morphisms are the arrows pointing right and the $\sigma$-morphisms are the arrows pointing left.

016M Example 14.5.4. The simplest example is the constant cosimplicial object with value $X \in \mathrm{Ob}(\mathcal{C})$. In other words, $U_{n}=X$ and all maps are $\mathrm{id}_{X}$.

016N Example 14.5.5. Suppose that $Y \rightarrow X$ is a morphism of $C$ such that all the pushouts $Y \amalg_{X} Y \amalg_{X} \ldots \amalg_{X} Y$ exist. Then we set $U_{n}$ equal to the $(n+1)$-fold pushout, and we let $\varphi:[n] \rightarrow[m]$ correspond to the map

$$
(y \text { in } i \text { th component }) \mapsto(y \text { in } \varphi(i) \text { th component })
$$

on "coordinates". In other words, the map $U_{1}=Y \amalg_{X} Y \rightarrow U_{0}=Y$ is the identity on each component. The two maps $U_{0}=Y \rightarrow U_{1}=Y \amalg_{X} Y$ are the two natural maps.

0B13 Example 14.5.6. For every $n \geq 0$ we denote $C[n]$ the cosimplicial set

$$
\Delta \longrightarrow \text { Sets, } \quad[k] \longmapsto \operatorname{Mor}_{\Delta}([n],[k])
$$

This example is dual to Example 14.11.2.
016 O Lemma 14.5.7. Let $\mathcal{C}$ be a category. Let $U$ be a cosimplicial object of $\mathcal{C}$. Each of the morphisms $\delta_{i}^{n}: U_{n-1} \rightarrow U_{n}$ has a left inverse. In particular $\delta_{i}^{n}$ is a monomorphism.
Proof. This is true because $\sigma_{i}^{n-1} \circ \delta_{i}^{n}=\mathrm{id}_{U_{n}}$ for $j<n$.

### 14.6. Products of simplicial objects

016P Of course we should define the product of simplicial objects as the product in the category of simplicial objects. This may lead to the potentially confusing situation where the product exists but is not described as below. To avoid this we define the product directly as follows.

016Q Definition 14.6.1. Let $\mathcal{C}$ be a category. Let $U$ and $V$ be simplicial objects of $\mathcal{C}$. Assume the products $U_{n} \times V_{n}$ exist in $\mathcal{C}$. The product of $U$ and $V$ is the simplicial object $U \times V$ defined as follows:
(1) $(U \times V)_{n}=U_{n} \times V_{n}$,
(2) $d_{i}^{n}=\left(d_{i}^{n}, d_{i}^{n}\right)$, and
(3) $s_{i}^{n}=\left(s_{i}^{n}, s_{i}^{n}\right)$.

In other words, $U \times V$ is the product of the presheaves $U$ and $V$ on $\Delta$.

016R Lemma 14.6.2. If $U$ and $V$ are simplicial objects in the category $\mathcal{C}$, and if $U \times V$ exists, then we have

$$
\operatorname{Mor}(W, U \times V)=\operatorname{Mor}(W, U) \times \operatorname{Mor}(W, V)
$$

for any third simplicial object $W$ of $\mathcal{C}$.
Proof. Omitted.

### 14.7. Fibre products of simplicial objects

016S Of course we should define the fibre product of simplicial objects as the fibre product in the category of simplicial objects. This may lead to the potentially confusing situation where the fibre product exists but is not described as below. To avoid this we define the fibre product directly as follows.

016T Definition 14.7.1. Let $\mathcal{C}$ be a category. Let $U, V, W$ be simplicial objects of $\mathcal{C}$. Let $a: V \rightarrow U, b: W \rightarrow U$ be morphisms. Assume the fibre products $V_{n} \times_{U_{n}} W_{n}$ exist in $\mathcal{C}$. The fibre product of $V$ and $W$ over $U$ is the simplicial object $V \times_{U} W$ defined as follows:
(1) $\left(V \times_{U} W\right)_{n}=V_{n} \times_{U_{n}} W_{n}$,
(2) $d_{i}^{n}=\left(d_{i}^{n}, d_{i}^{n}\right)$, and
(3) $s_{i}^{n}=\left(s_{i}^{n}, s_{i}^{n}\right)$.

In other words, $V \times_{U} W$ is the fibre product of the presheaves $V$ and $W$ over the presheaf $U$ on $\Delta$.

016 U Lemma 14.7.2. If $U, V, W$ are simplicial objects in the category $\mathcal{C}$, and if $a: V \rightarrow$ $U, b: W \rightarrow U$ are morphisms and if $V \times_{U} W$ exists, then we have

$$
\operatorname{Mor}\left(T, V \times_{U} W\right)=\operatorname{Mor}(T, V) \times_{\operatorname{Mor}(T, U)} \operatorname{Mor}(T, W)
$$

for any fourth simplicial object $T$ of $\mathcal{C}$.
Proof. Omitted.

### 14.8. Pushouts of simplicial objects

016 V Of course we should define the pushout of simplicial objects as the pushout in the category of simplicial objects. This may lead to the potentially confusing situation where the pushouts exist but are not as described below. To avoid this we define the pushout directly as follows.

016W Definition 14.8.1. Let $\mathcal{C}$ be a category. Let $U, V, W$ be simplicial objects of $\mathcal{C}$. Let $a: U \rightarrow V, b: U \rightarrow W$ be morphisms. Assume the pushouts $V_{n} \amalg_{U_{n}} W_{n}$ exist in $\mathcal{C}$. The pushout of $V$ and $W$ over $U$ is the simplicial object $V \amalg_{U} W$ defined as follows:
(1) $\left(V \amalg_{U} W\right)_{n}=V_{n} \amalg_{U_{n}} W_{n}$,
(2) $d_{i}^{n}=\left(d_{i}^{n}, d_{i}^{n}\right)$, and
(3) $s_{i}^{n}=\left(s_{i}^{n}, s_{i}^{n}\right)$.

In other words, $V \amalg_{U} W$ is the pushout of the presheaves $V$ and $W$ over the presheaf $U$ on $\Delta$.

016X Lemma 14.8.2. If $U, V, W$ are simplicial objects in the category $\mathcal{C}$, and if $a: U \rightarrow$ $V, b: U \rightarrow W$ are morphisms and if $V \amalg_{U} W$ exists, then we have

$$
\operatorname{Mor}\left(V \amalg_{U} W, T\right)=\operatorname{Mor}(V, T) \times_{\operatorname{Mor}(U, T)} \operatorname{Mor}(W, T)
$$

for any fourth simplicial object $T$ of $\mathcal{C}$.
Proof. Omitted.

### 14.9. Products of cosimplicial objects

016 Y Of course we should define the product of cosimplicial objects as the product in the category of cosimplicial objects. This may lead to the potentially confusing situation where the product exists but is not described as below. To avoid this we define the product directly as follows.

016Z Definition 14.9.1. Let $\mathcal{C}$ be a category. Let $U$ and $V$ be cosimplicial objects of $\mathcal{C}$. Assume the products $U_{n} \times V_{n}$ exist in $\mathcal{C}$. The product of $U$ and $V$ is the cosimplicial object $U \times V$ defined as follows:
(1) $(U \times V)_{n}=U_{n} \times V_{n}$,
(2) for any $\varphi:[n] \rightarrow[m]$ the $\operatorname{map}(U \times V)(\varphi): U_{n} \times V_{n} \rightarrow U_{m} \times V_{m}$ is the product $U(\varphi) \times V(\varphi)$.

0170 Lemma 14.9.2. If $U$ and $V$ are cosimplicial objects in the category $\mathcal{C}$, and if $U \times V$ exists, then we have

$$
\operatorname{Mor}(W, U \times V)=\operatorname{Mor}(W, U) \times \operatorname{Mor}(W, V)
$$

for any third cosimplicial object $W$ of $\mathcal{C}$.
Proof. Omitted.

### 14.10. Fibre products of cosimplicial objects

0171 Of course we should define the fibre product of cosimplicial objects as the fibre product in the category of cosimplicial objects. This may lead to the potentially confusing situation where the product exists but is not described as below. To avoid this we define the fibre product directly as follows.

0172 Definition 14.10.1. Let $\mathcal{C}$ be a category. Let $U, V, W$ be cosimplicial objects of $\mathcal{C}$. Let $a: V \rightarrow U$ and $b: W \rightarrow U$ be morphisms. Assume the fibre products $V_{n} \times_{U_{n}} W_{n}$ exist in $\mathcal{C}$. The fibre product of $V$ and $W$ over $U$ is the cosimplicial object $V \times_{U} W$ defined as follows:
(1) $\left(V \times_{U} W\right)_{n}=V_{n} \times_{U_{n}} W_{n}$,
(2) for any $\varphi:[n] \rightarrow[m]$ the $\operatorname{map}\left(V \times_{U} W\right)(\varphi): V_{n} \times_{U_{n}} W_{n} \rightarrow V_{m} \times_{U_{m}} W_{m}$ is the product $V(\varphi) \times_{U(\varphi)} W(\varphi)$.

0173 Lemma 14.10.2. If $U, V, W$ are cosimplicial objects in the category $\mathcal{C}$, and if $a: V \rightarrow U, b: W \rightarrow U$ are morphisms and if $V \times_{U} W$ exists, then we have

$$
\operatorname{Mor}\left(T, V \times_{U} W\right)=\operatorname{Mor}(T, V) \times_{\operatorname{Mor}(T, U)} \operatorname{Mor}(T, W)
$$

for any fourth cosimplicial object $T$ of $\mathcal{C}$.
Proof. Omitted.

### 14.11. Simplicial sets

0174 Let $U$ be a simplicial set. It is a good idea to think of $U_{0}$ as the 0 -simplices, the set $U_{1}$ as the 1-simplices, the set $U_{2}$ as the 2-simplices, and so on.
We think of the maps $s_{j}^{n}: U_{n} \rightarrow U_{n+1}$ as the map that associates to an $n$-simplex $A$ the degenerate $(n+1)$-simplex $B$ whose $(j, j+1)$-edge is collapsed to the vertex $j$ of $A$. We think of the $\operatorname{map} d_{j}^{n}: U_{n} \rightarrow U_{n-1}$ as the map that associates to an $n$-simplex $A$ one of the faces, namely the face that omits the vertex $j$. In this way it become possible to visualize the relations among the maps $s_{j}^{n}$ and $d_{j}^{n}$ geometrically.

0175 Definition 14.11.1. Let $U$ be a simplicial set. We say $x$ is an $n$-simplex of $U$ to signify that $x$ is an element of $U_{n}$. We say that $y$ is the $j$ the face of $x$ to signify that $d_{j}^{n} x=y$. We say that $z$ is the $j$ th degeneracy of $x$ if $z=s_{j}^{n} x$. A simplex is called degenerate if it is the degeneracy of another simplex.

Here are a few fundamental examples.
0176 Example 14.11.2. For every $n \geq 0$ we denote $\Delta[n]$ the simplicial set

$$
\begin{aligned}
\Delta^{o p p} & \longrightarrow \text { Sets } \\
\quad[k] & \longmapsto \operatorname{Mor}_{\Delta}([k],[n])
\end{aligned}
$$

We leave it to the reader to verify the following statements. Every $m$-simplex of $\Delta[n]$ with $m>n$ is degenerate. There is a unique nondegenerate $n$-simplex of $\Delta[n]$, namely id $_{[n]}$.

0177 Lemma 14.11.3. Let $U$ be a simplicial set. Let $n \geq 0$ be an integer. There is a canonical bijection

$$
\operatorname{Mor}(\Delta[n], U) \longrightarrow U_{n}
$$

which maps a morphism $\varphi$ to the value of $\varphi$ on the unique nondegenerate $n$-simplex of $\Delta[n]$.

Proof. Omitted.
0178 Example 14.11.4. Consider the category $\Delta /[n]$ of objects over $[n]$ in $\Delta$, see Categories, Example 4.2.13. There is a functor $p: \Delta /[n] \rightarrow \Delta$. The fibre category of $p$ over [ $k$ ], see Categories, Section 4.34, has as objects the set $\Delta[n]_{k}$ of $k$-simplices in $\Delta[n]$, and as morphisms only identities. For every morphism $\varphi:[k] \rightarrow[l]$ of $\Delta$, and every object $\psi:[l] \rightarrow[n]$ in the fibre category over $[l]$ there is a unique object over $[k]$ with a morphism covering $\varphi$, namely $\psi \circ \varphi:[k] \rightarrow[n]$. Thus $\Delta /[n]$ is fibred in sets over $\Delta$. In other words, we may think of $\Delta /[n]$ as a presheaf of sets over $\Delta$. See also, Categories, Example 4.37.7. And this presheaf of sets agrees with the simplicial set $\Delta[n]$. In particular, from Equation 14.4.0.1) and Lemma 14.11.3 above we get the formula

$$
\operatorname{Mor}_{P S h(\Delta)}(\Delta /[n], U)=U_{n}
$$

for any simplicial set $U$.
0179 Lemma 14.11.5. Let $U, V$ be simplicial sets. Let $a, b \geq 0$ be integers. Assume every $n$-simplex of $U$ is degenerate if $n>a$. Assume every $n$-simplex of $V$ is degenerate if $n>b$. Then every $n$-simplex of $U \times V$ is degenerate if $n>a+b$.

Proof. Suppose $n>a+b$. Let $(u, v) \in(U \times V)_{n}=U_{n} \times V_{n}$. By assumption, there exists a $\alpha:[n] \rightarrow[a]$ and a $u^{\prime} \in U_{a}$ and a $\beta:[n] \rightarrow[b]$ and a $v^{\prime} \in V_{b}$ such that $u=U(\alpha)\left(u^{\prime}\right)$ and $v=V(\beta)\left(v^{\prime}\right)$. Because $n>a+b$, there exists an $0 \leq i \leq a+b$ such that $\alpha(i)=\alpha(i+1)$ and $\beta(i)=\beta(i+1)$. It follows immediately that $(u, v)$ is in the image of $s_{i}^{n-1}$.

### 14.12. Truncated simplicial objects and skeleton functors

017 Z Let $\Delta_{\leq n}$ denote the full subcategory of $\Delta$ with objects [0], [1], [2], $\ldots,[n]$. Let $\mathcal{C}$ be a category.
0180 Definition 14.12.1. An $n$-truncated simplicial object of $\mathcal{C}$ is a contravariant functor from $\Delta_{\leq n}$ to $\mathcal{C}$. A morphism of $n$-truncated simplicial objects is a transformation of functors. We denote the category of $n$-truncated simplicial objects of $\mathcal{C}$ by the symbol $^{\operatorname{Simp}}{ }_{n}(\mathcal{C})$.

Given a simplicial object $U$ of $\mathcal{C}$ the truncation $\operatorname{sk}_{n} U$ is the restriction of $U$ to the subcategory $\Delta_{\leq n}$. This defines a skeleton functor

$$
\operatorname{sk}_{n}: \operatorname{Simp}(\mathcal{C}) \longrightarrow \operatorname{Simp}_{n}(\mathcal{C})
$$

from the category of simplicial objects of $\mathcal{C}$ to the category of $n$-truncated simplicial objects of $\mathcal{C}$. See Remark 14.21 .6 to avoid possible confusion with other functors in the literature.

### 14.13. Products with simplicial sets

017A Let $\mathcal{C}$ be a category. Let $U$ be a simplicial set. Let $V$ be a simplicial object of $\mathcal{C}$. We can consider the covariant functor which associates to a simplicial object $W$ of $\mathcal{C}$ the set (14.13.0.1)

017B

$$
\left\{\left(f_{n, u}: V_{n} \rightarrow W_{n}\right)_{n \geq 0, u \in U_{n}} \text { such that } \begin{array}{rl}
\forall \varphi:[m] & \rightarrow[n] \\
f_{m, U(\varphi)(u)} \circ V(\varphi) & =W(\varphi) \circ f_{n, u}
\end{array}\right\}
$$

If this functor is of the form $\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(Q,-)$ then we can think of $Q$ as the product of $U$ with $V$. Instead of formalizing this in this way we just directly define the product as follows.

017C Definition 14.13.1. Let $\mathcal{C}$ be a category such that the coproduct of any two objects of $\mathcal{C}$ exists. Let $U$ be a simplicial set. Let $V$ be a simplicial object of $\mathcal{C}$. Assume that each $U_{n}$ is finite nonempty. In this case we define the product $U \times V$ of $U$ and $V$ to be the simplicial object of $\mathcal{C}$ whose $n$th term is the object

$$
(U \times V)_{n}=\coprod_{u \in U_{n}} V_{n}
$$

with maps for $\varphi:[m] \rightarrow[n]$ given by the morphism

$$
\coprod_{u \in U_{n}} V_{n} \longrightarrow \coprod_{u^{\prime} \in U_{m}} V_{m}
$$

which maps the component $V_{n}$ corresponding to $u$ to the component $V_{m}$ corresponding to $u^{\prime}=U(\varphi)(u)$ via the morphism $V(\varphi)$. More loosely, if all of the coproducts displayed above exist (without assuming anything about $\mathcal{C}$ ) we will say that the product $U \times V$ exists.

017D Lemma 14.13.2. Let $\mathcal{C}$ be a category such that the coproduct of any two objects of $\mathcal{C}$ exists. Let $U$ be a simplicial set. Let $V$ be a simplicial object of $\mathcal{C}$. Assume that each $U_{n}$ is finite nonempty. The functor $W \mapsto \operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(U \times V, W)$ is canonically isomorphic to the functor which maps $W$ to the set in Equation (14.13.0.1).
Proof. Omitted.
017E Lemma 14.13.3. Let $\mathcal{C}$ be a category such that the coproduct of any two objects of $\mathcal{C}$ exists. Let us temporarily denote FSSets the category of simplicial sets all of whose components are finite nonempty.
(1) The rule $(U, V) \mapsto U \times V$ defines a functor $F \operatorname{SSets} \times \operatorname{Simp}(\mathcal{C}) \rightarrow \operatorname{Simp}(\mathcal{C})$.
(2) For every $U, V$ as above there is a canonical map of simplicial objects

$$
U \times V \longrightarrow V
$$

defined by taking the identity on each component of $(U \times V)_{n}=\coprod_{u} V_{n}$.
Proof. Omitted.
We briefly study a special case of the construction above. Let $\mathcal{C}$ be a category. Let $X$ be an object of $\mathcal{C}$. Let $k \geq 0$ be an integer. If all coproducts $X \amalg \ldots \amalg X$ exist then according to the definition above the product

$$
X \times \Delta[k]
$$

exists, where we think of $X$ as the corresponding constant simplicial object.
017F Lemma 14.13.4. With $X$ and $k$ as above. For any simplicial object $V$ of $\mathcal{C}$ we have the following canonical bijection

$$
\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(X \times \Delta[k], V) \longrightarrow \operatorname{Mor}_{\mathcal{C}}\left(X, V_{k}\right) .
$$

wich maps $\gamma$ to the restriction of the morphism $\gamma_{k}$ to the component corresponding to $i d_{[k]}$. Similarly, for any $n \geq k$, if $W$ is an $n$-truncated simplicial object of $\mathcal{C}$, then we have

$$
\operatorname{Mor}_{\operatorname{Simp}_{n}(\mathcal{C})}\left(s k_{n}(X \times \Delta[k]), W\right)=\operatorname{Mor}_{\mathcal{C}}\left(X, W_{k}\right)
$$

Proof. A morphism $\gamma: X \times \Delta[k] \rightarrow V$ is given by a family of morphisms $\gamma_{\alpha}$ : $X \rightarrow V_{n}$ where $\alpha:[n] \rightarrow[k]$. The morphisms have to satisfy the rules that for all $\varphi:[m] \rightarrow[n]$ the diagrams

commute. Taking $\alpha=\operatorname{id}_{[k]}$, we see that for any $\varphi:[m] \rightarrow[k]$ we have $\gamma_{\varphi}=$ $V(\varphi) \circ \gamma_{\mathrm{id}_{[k]}}$. Thus the morphism $\gamma$ is determined by the value of $\gamma$ on the component corresponding to $\mathrm{id}_{[k]}$. Conversely, given such a morphism $f: X \rightarrow V_{k}$ we easily construct a morphism $\gamma$ by putting $\gamma_{\alpha}=V(\alpha) \circ f$.
The truncated case is similar, and left to the reader.
A particular example of this is the case $k=0$. In this case the formula of the lemma just says that

$$
\operatorname{Mor}_{\mathcal{C}}\left(X, V_{0}\right)=\operatorname{Mor}_{S i m p(\mathcal{C})}(X, V)
$$

where on the right hand side $X$ indicates the constant simplicial object with value $X$. We will use this formula without further mention in the following.

### 14.14. Hom from simplicial sets into cosimplicial objects

$07 \mathrm{~K} 9 \quad$ Let $\mathcal{C}$ be a category. Let $U$ be a simplicial object of $\mathcal{C}$, and let $V$ be a cosimplicial object of $\mathcal{C}$. Then we get a cosimplicial set $\operatorname{Hom}_{\mathcal{C}}(U, V)$ as follows:
(1) we set $\operatorname{Hom}_{\mathcal{C}}(U, V)_{n}=\operatorname{Mor}_{\mathcal{C}}\left(U_{n}, V_{n}\right)$, and
(2) for $\varphi:[m] \rightarrow[n]$ we take the $\operatorname{map} \operatorname{Hom}_{\mathcal{C}}(U, V)_{m} \rightarrow \operatorname{Hom}_{\mathcal{C}}(U, V)_{n}$ given by $f \mapsto V(\varphi) \circ f \circ U(\varphi)$.
This is our motivation for the following definition.
019V Definition 14.14.1. Let $\mathcal{C}$ be a category with finite products. Let $V$ be a cosimplicial object of $\mathcal{C}$. Let $U$ be a simplicial set such that each $U_{n}$ is finite nonempty. We define $\operatorname{Hom}(U, V)$ to be the cosimplicial object of $\mathcal{C}$ defined as follows:
(1) we set $\operatorname{Hom}(U, V)_{n}=\prod_{u \in U_{n}} V_{n}$, in other words the unique object of $\mathcal{C}$ such that its $X$-valued points satisfy

$$
\operatorname{Mor}_{\mathcal{C}}\left(X, \operatorname{Hom}(U, V)_{n}\right)=\operatorname{Map}\left(U_{n}, \operatorname{Mor}_{\mathcal{C}}\left(X, V_{n}\right)\right)
$$

and
(2) for $\varphi:[m] \rightarrow[n]$ we take the map $\operatorname{Hom}(U, V)_{m} \rightarrow \operatorname{Hom}(U, V)_{n}$ given by $f \mapsto V(\varphi) \circ f \circ U(\varphi)$ on $X$-valued points as above.

We leave it to the reader to spell out the definition in terms of maps between products. We also point out that the construction is functorial in both $U$ (contravariantly) and $V$ (covariantly), exactly as in Lemma 14.13 .3 in the case of products of simplicial sets with simplicial objects.

### 14.15. Hom from cosimplicial sets into simplicial objects

0B14 Let $\mathcal{C}$ be a category. Let $U$ be a cosimplicial object of $\mathcal{C}$, and let $V$ be a simplicial object of $\mathcal{C}$. Then we get a simplicial set $\operatorname{Hom}_{\mathcal{C}}(U, V)$ as follows:
(1) we set $\operatorname{Hom}_{\mathcal{C}}(U, V)_{n}=\operatorname{Mor}_{\mathcal{C}}\left(U_{n}, V_{n}\right)$, and
(2) for $\varphi:[m] \rightarrow[n]$ we take the $\operatorname{map} \operatorname{Hom}_{\mathcal{C}}(U, V)_{n} \rightarrow \operatorname{Hom}_{\mathcal{C}}(U, V)_{m}$ given by $f \mapsto V(\varphi) \circ f \circ U(\varphi)$.
This is our motivation for the following definition.
0B15 Definition 14.15.1. Let $\mathcal{C}$ be a category with finite products. Let $V$ be a simplicial object of $\mathcal{C}$. Let $U$ be a cosimplicial set such that each $U_{n}$ is finite nonempty. We define $\operatorname{Hom}(U, V)$ to be the simplicial object of $\mathcal{C}$ defined as follows:
(1) we set $\operatorname{Hom}(U, V)_{n}=\prod_{u \in U_{n}} V_{n}$, in other words the unique object of $\mathcal{C}$ such that its $X$-valued points satisfy

$$
\operatorname{Mor}_{\mathcal{C}}\left(X, \operatorname{Hom}(U, V)_{n}\right)=\operatorname{Map}\left(U_{n}, \operatorname{Mor}_{\mathcal{C}}\left(X, V_{n}\right)\right)
$$

and
(2) for $\varphi:[m] \rightarrow[n]$ we take the map $\operatorname{Hom}(U, V)_{n} \rightarrow \operatorname{Hom}(U, V)_{m}$ given by $f \mapsto V(\varphi) \circ f \circ U(\varphi)$ on $X$-valued points as above.
We leave it to the reader to spell out the definition in terms of maps between products. We also point out that the construction is functorial in both $U$ (contravariantly) and $V$ (covariantly), exactly as in Lemma 14.13 .3 in the case of products of simplicial sets with simplicial objects.

We spell out the construction above in a special case. Let $X$ be an object of a category $\mathcal{C}$. Assume that self products $X \times \ldots \times X$ exist. Let $k$ be an integer. Consider the simplicial object $U$ with terms

$$
U_{n}=\prod_{\alpha \in \operatorname{Mor}([k],[n])} X
$$

and maps given $\varphi:[m] \rightarrow[n]$

$$
U(\varphi): \prod_{\alpha \in \operatorname{Mor}([k],[n])} X \longrightarrow \prod_{\alpha^{\prime} \in \operatorname{Mor}([k],[m])} X, \quad\left(f_{\alpha}\right)_{\alpha} \longmapsto\left(f_{\varphi \circ \alpha^{\prime}}\right)_{\alpha^{\prime}}
$$

In terms of "coordinates", the element $\left(x_{\alpha}\right)_{\alpha}$ is mapped to the element $\left(x_{\varphi \circ \alpha^{\prime}}\right)_{\alpha^{\prime}}$. We claim this object is equal to $\operatorname{Hom}(C[k], X)$ where we think of $X$ as the constant simplicial object $X$ and where $C[k]$ is the cosimplicial set from Example 14.5.6.

017M Lemma 14.15.2. With $X, k$ and $U$ as above.
(1) For any simplicial object $V$ of $\mathcal{C}$ we have the following canonical bijection

$$
\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(V, U) \longrightarrow \operatorname{Mor}_{\mathcal{C}}\left(V_{k}, X\right)
$$

wich maps $\gamma$ to the morphism $\gamma_{k}$ composed with the projection onto the factor corresponding to $i d_{[k]}$.
(2) Similarly, if $W$ is an $k$-truncated simplicial object of $\mathcal{C}$, then we have

$$
\operatorname{Mor}_{S i m p_{k}(\mathcal{C})}\left(W, s k_{k} U\right)=\operatorname{Mor}_{\mathcal{C}}\left(W_{k}, X\right)
$$

(3) The object $U$ constructed above is an incarnation of $\operatorname{Hom}(C[k], X)$ where $C[k]$ is the cosimplicial set from Example 14.5.6.

Proof. We first prove (1). Suppose that $\gamma: V \rightarrow U$ is a morphism. This is given by a family of morphisms $\gamma_{\alpha}: V_{n} \rightarrow X$ for $\alpha:[k] \rightarrow[n]$. The morphisms have to satisfy the rules that for all $\varphi:[m] \rightarrow[n]$ the diagrams

commute for all $\alpha^{\prime}:[k] \rightarrow[m]$. Taking $\alpha^{\prime}=\operatorname{id}_{[k]}$, we see that for any $\varphi:[k] \rightarrow[n]$ we have $\gamma_{\varphi}=\gamma_{\mathrm{id}_{[k]}} \circ V(\varphi)$. Thus the morphism $\gamma$ is determined by the component of $\gamma_{k}$ corresponding to $\mathrm{id}_{[k]}$. Conversely, given such a morphism $f: V_{k} \rightarrow X$ we easily construct a morphism $\gamma$ by putting $\gamma_{\alpha}=f \circ V(\alpha)$.

The truncated case is similar, and left to the reader.
Part (3) is immediate from the construction of $U$ and the fact that $C[k]_{n}=$ $\operatorname{Mor}([k],[n])$ which are the index sets used in the construction of $U_{n}$.

### 14.16. Internal Hom

017 G Let $\mathcal{C}$ be a category with finite nonempty products. Let $U, V$ be simplicial objects $\mathcal{C}$. In some cases the functor

$$
\operatorname{Simp}(\mathcal{C})^{o p p} \longrightarrow S e t s, \quad W \longmapsto \operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(W \times V, U)
$$

is representable. In this case we denote $\mathcal{H o m}(V, U)$ the resulting simplicial object of $\mathcal{C}$, and we say that the internal hom of $V$ into $U$ exists. Moreover, in this case, given $X$ in $\mathcal{C}$, we would have

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{C}}\left(X, \mathcal{H o m}(V, U)_{n}\right) & =\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(X \times \Delta[n], \mathcal{H o m}(V, U)) \\
& =\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(X \times \Delta[n] \times V, U) \\
& =\operatorname{Mor}_{\text {Simp }(\mathcal{C})}(X, \mathcal{H o m}(\Delta[n] \times V, U)) \\
& =\operatorname{Mor}_{\mathcal{C}}\left(X, \mathcal{H o m}(\Delta[n] \times V, U)_{0}\right)
\end{aligned}
$$

provided that $\mathcal{H o m}(\Delta[n] \times V, U)$ exists also. The first and last equalities follow from Lemma 14.13.4.

The lesson we learn from this is that, given $U$ and $V$, if we want to construct the internal hom then we should try to construct the objects

$$
\mathcal{H o m}(\Delta[n] \times V, U)_{0}
$$

because these should be the $n$th term of $\mathcal{H o m}(V, U)$. In the next section we study a construction of simplicial objects " $\operatorname{Hom}(\Delta[n], U)$ ".

### 14.17. Hom from simplicial sets into simplicial objects

017 H Motivated by the discussion on internal hom we define what should be the simplicial object classifying morphisms from a simplicial set into a given simplicial object of the category $\mathcal{C}$.
017I Definition 14.17.1. Let $\mathcal{C}$ be a category such that the coproduct of any two objects exists. Let $U$ be a simplicial set, with $U_{n}$ finite nonempty for all $n \geq 0$. Let $V$ be a simplicial object of $\mathcal{C}$. We denote $\operatorname{Hom}(U, V)$ any simplicial object of $\mathcal{C}$ such that

$$
\operatorname{Mor}_{S i m p}(\mathcal{C})(W, \operatorname{Hom}(U, V))=\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(W \times U, V)
$$

functorially in the simplicial object $W$ of $\mathcal{C}$.
Of course $\operatorname{Hom}(U, V)$ need not exist. Also, by the discussion in Section 14.16 we expect that if it does exist, then $\operatorname{Hom}(U, V)_{n}=\operatorname{Hom}(U \times \Delta[n], V)_{0}$. We do not use the italic notation for these Hom objects since $\operatorname{Hom}(U, V)$ is not an internal hom.

017J Lemma 14.17.2. Assume the category $\mathcal{C}$ has coproducts of any two objects and countable limits. Let $U$ be a simplicial set, with $U_{n}$ finite nonempty for all $n \geq 0$. Let $V$ be a simplicial object of $\mathcal{C}$. Then the functor

$$
\begin{aligned}
\mathcal{C}^{\text {opp }} & \longrightarrow \text { Sets } \\
X & \longmapsto \operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(X \times U, V)
\end{aligned}
$$

is representable.
Proof. A morphism from $X \times U$ into $V$ is given by a collection of morphisms $f_{u}: X \rightarrow V_{n}$ with $n \geq 0$ and $u \in U_{n}$. And such a collection actually defines a morphism if and only if for all $\varphi:[m] \rightarrow[n]$ all the diagrams

commute. Thus it is natural to introduce a category $\mathcal{U}$ and a functor $\mathcal{V}: \mathcal{U}^{o p p} \rightarrow \mathcal{C}$ as follows:
(1) The set of objects of $\mathcal{U}$ is $\coprod_{n \geq 0} U_{n}$,
(2) a morphism from $u^{\prime} \in U_{m}$ to $u \in U_{n}$ is a $\varphi:[m] \rightarrow[n]$ such that $U(\varphi)(u)=u^{\prime}$
(3) for $u \in U_{n}$ we set $\mathcal{V}(u)=V_{n}$, and
(4) for $\varphi:[m] \rightarrow[n]$ such that $U(\varphi)(u)=u^{\prime}$ we set $\mathcal{V}(\varphi)=V(\varphi): V_{n} \rightarrow V_{m}$.

At this point it is clear that our functor is nothing but the functor defining

$$
\lim _{\mathcal{U}^{o p p}} \mathcal{V}
$$

Thus if $\mathcal{C}$ has countable limits then this limit and hence an object representing the functor of the lemma exist.

017K Lemma 14.17.3. Assume the category $\mathcal{C}$ has coproducts of any two objects and finite limits. Let $U$ be a simplicial set, with $U_{n}$ finite nonempty for all $n \geq 0$. Assume that all n-simplices of $U$ are degenerate for all $n \gg 0$. Let $V$ be a simplicial object of $\mathcal{C}$. Then the functor

$$
\begin{aligned}
\mathcal{C}^{\text {opp }} & \longrightarrow \text { Sets } \\
X & \longmapsto \operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(X \times U, V)
\end{aligned}
$$

is representable.
Proof. We have to show that the category $\mathcal{U}$ described in the proof of Lemma 14.17 .2 has a finite subcategory $\mathcal{U}^{\prime}$ such that the limit of $\mathcal{V}$ over $\mathcal{U}^{\prime}$ is the same as the limit of $\mathcal{V}$ over $\mathcal{U}$. We will use Categories, Lemma 4.17.4. For $m>0$ let $\mathcal{U}_{\leq m}$ denote the full subcategory with objects $\coprod_{0 \leq n \leq m} U_{m}$. Let $m_{0}$ be an integer such that every $n$-simplex of the simplicial set $U$ is degenerate if $n>m_{0}$. For any $m \geq m_{0}$ large enough, the subcategory $\mathcal{U}_{\leq m}$ satisfies property (1) of Categories, Definition 4.17.3.

Suppose that $u \in U_{n}$ and $u^{\prime} \in U_{n^{\prime}}$ with $n, n^{\prime} \leq m_{0}$ and suppose that $\varphi:[k] \rightarrow$ $[n], \varphi^{\prime}:[k] \rightarrow\left[n^{\prime}\right]$ are morphisms such that $U(\varphi)(u)=U\left(\varphi^{\prime}\right)\left(u^{\prime}\right)$. A simple combinatorial argument shows that if $k>2 m_{0}$, then there exists an index $0 \leq i \leq$ $2 m_{0}$ such that $\varphi(i)=\varphi(i+1)$ and $\varphi^{\prime}(i)=\varphi^{\prime}(i+1)$. (The pigeon hole principle would tell you this works if $k>m_{0}^{2}$ which is good enough for the argument below anyways.) Hence, if $k>2 m_{0}$, we may write $\varphi=\psi \circ \sigma_{i}^{k-1}$ and $\varphi^{\prime}=\psi^{\prime} \circ \sigma_{i}^{k-1}$ for some $\psi:[k-1] \rightarrow[n]$ and some $\psi^{\prime}:[k-1] \rightarrow\left[n^{\prime}\right]$. Since $s_{i}^{k-1}: U_{k-1} \rightarrow U_{k}$ is injective, see Lemma 14.3.6, we conclude that $U(\psi)(u)=U\left(\psi^{\prime}\right)\left(u^{\prime}\right)$ also. Continuing in this fashion we conclude that given morphisms $u \rightarrow z$ and $u^{\prime} \rightarrow z$ of $\mathcal{U}$ with $u, u^{\prime} \in \mathcal{U}_{\leq m_{0}}$, there exists a commutative diagram

with $a \in \mathcal{U}_{\leq 2 m_{0}}$.

It is easy to deduce from this that the finite subcategory $\mathcal{U}_{\leq 2 m_{0}}$ works. Namely, suppose given $x^{\prime} \in U_{n}$ and $x^{\prime \prime} \in U_{n^{\prime}}$ with $n, n^{\prime} \leq 2 m_{0}$ as well as morphisms $x^{\prime} \rightarrow x$ and $x^{\prime \prime} \rightarrow x$ of $\mathcal{U}$ with the same target. By our choice of $m_{0}$ we can find objects $u, u^{\prime}$ of $\mathcal{U}_{\leq m_{0}}$ and morphisms $u \rightarrow x^{\prime}, u^{\prime} \rightarrow x^{\prime \prime}$. By the above we can find $a \in \mathcal{U}_{\leq 2 m_{0}}$ and morphisms $u \rightarrow a, u^{\prime} \rightarrow a$ such that

is commutative. Turning this diagram 90 degrees clockwise we get the desired diagram as in (2) of Categories, Definition 4.17.3.

017L Lemma 14.17.4. Assume the category $\mathcal{C}$ has coproducts of any two objects and finite limits. Let $U$ be a simplicial set, with $U_{n}$ finite nonempty for all $n \geq 0$. Assume that all n-simplices of $U$ are degenerate for all $n \gg 0$. Let $V$ be a simplicial object of $\mathcal{C}$. Then $\operatorname{Hom}(U, V)$ exists, moreover we have the expected equalities

$$
\operatorname{Hom}(U, V)_{n}=\operatorname{Hom}(U \times \Delta[n], V)_{0}
$$

Proof. We construct this simplicial object as follows. For $n \geq 0$ let $\operatorname{Hom}(U, V)_{n}$ denote the object of $\mathcal{C}$ representing the functor

$$
X \longmapsto \operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(X \times U \times \Delta[n], V)
$$

This exists by Lemma 14.17 .3 because $U \times \Delta[n]$ is a simplicial set with finite sets of simplices and no nondegenerate simplices in high enough degree, see Lemma 14.11.5. For $\varphi:[m] \rightarrow[n]$ we obtain an induced map of simplicial sets $\varphi: \Delta[m] \rightarrow \Delta[n]$. Hence we obtain a morphism $X \times U \times \Delta[m] \rightarrow X \times U \times \Delta[n]$ functorial in $X$, and hence a transformation of functors, which in turn gives

$$
\operatorname{Hom}(U, V)(\varphi): \operatorname{Hom}(U, V)_{n} \longrightarrow \operatorname{Hom}(U, V)_{m}
$$

Clearly this defines a contravariant functor $\operatorname{Hom}(U, V)$ from $\Delta$ into the category $\mathcal{C}$. In other words, we have a simplicial object of $\mathcal{C}$.

We have to show that $\operatorname{Hom}(U, V)$ satisfies the desired universal property

$$
\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(W, \operatorname{Hom}(U, V))=\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(W \times U, V)
$$

To see this, let $f: W \rightarrow \operatorname{Hom}(U, V)$ be given. We want to construct the element $f^{\prime}:$ $W \times U \rightarrow V$ of the right hand side. By construction, each $f_{n}: W_{n} \rightarrow \operatorname{Hom}(U, V)_{n}$ corresponds to a morphism $f_{n}: W_{n} \times U \times \Delta[n] \rightarrow V$. Further, for every morphism $\varphi:[m] \rightarrow[n]$ the diagram

is commutative. For $\psi:[n] \rightarrow[k]$ in $(\Delta[n])_{k}$ we denote $\left(f_{n}\right)_{k, \psi}: W_{n} \times U_{k} \rightarrow V_{k}$ the component of $\left(f_{n}\right)_{k}$ corresponding to the element $\psi$. We define $f_{n}^{\prime}: W_{n} \times U_{n} \rightarrow V_{n}$
as $f_{n}^{\prime}=\left(f_{n}\right)_{n, \text { id }}$, in other words, as the restriction of $\left(f_{n}\right)_{n}: W_{n} \times U_{n} \times(\Delta[n])_{n} \rightarrow V_{n}$ to $W_{n} \times U_{n} \times \mathrm{id}_{[n]}$. To see that the collection $\left(f_{n}^{\prime}\right)$ defines a morphism of simplicial objects, we have to show for any $\varphi:[m] \rightarrow[n]$ that $V(\varphi) \circ f_{n}^{\prime}=f_{m}^{\prime} \circ W(\varphi) \times U(\varphi)$. The commutative diagram above says that $\left(f_{n}\right)_{m, \varphi}: W_{n} \times U_{m} \rightarrow V_{m}$ is equal to $\left(f_{m}\right)_{m, \mathrm{id}} \circ W(\varphi): W_{n} \times U_{m} \rightarrow V_{m}$. But then the fact that $f_{n}$ is a morphism of simplicial objects implies that the diagram

$$
\begin{aligned}
& W_{n} \times U_{n} \times(\Delta[n])_{n} \xrightarrow[\left(f_{n}\right)_{n}]{ } V_{n} \\
& i d \times U(\varphi) \times \varphi \downarrow V(\varphi) \\
& W_{n} \times U_{m} \times(\Delta[n])_{m} \xrightarrow{\left(f_{n}\right)_{m}} V_{m}^{\downarrow}
\end{aligned}
$$

is commutative. And this implies that $\left(f_{n}\right)_{m, \varphi} \circ U(\varphi)$ is equal to $V(\varphi) \circ\left(f_{n}\right)_{n, \text { id }}$. Altogether we obtain $V(\varphi) \circ\left(f_{n}\right)_{n, \text { id }}=\left(f_{n}\right)_{m, \varphi} \circ U(\varphi)=\left(f_{m}\right)_{m, \text { id }} \circ W(\varphi) \circ U(\varphi)=$ $\left(f_{m}\right)_{m, \text { id }} \circ W(\varphi) \times U(\varphi)$ as desired.
On the other hand, given a morphism $f^{\prime}: W \times U \rightarrow V$ we define a morphism $f: W \rightarrow \operatorname{Hom}(U, V)$ as follows. By Lemma 14.13 .4 the morphisms id : $W_{n} \rightarrow W_{n}$ corresponds to a unique morphism $c_{n}: W_{n} \times \Delta[n] \rightarrow W$. Hence we can consider the composition

$$
W_{n} \times \Delta[n] \times U \xrightarrow{c_{n}} W \times U \xrightarrow{f^{\prime}} V .
$$

By construction this corresponds to a unique morphism $f_{n}: W_{n} \rightarrow \operatorname{Hom}(U, V)_{n}$. We leave it to the reader to see that these define a morphism of simplicial sets as desired.
We also leave it to the reader to see that $f \mapsto f^{\prime}$ and $f^{\prime} \mapsto f$ are mutually inverse operations.

017 N Lemma 14.17.5. Assume the category $\mathcal{C}$ has coproducts of any two objects and finite limits. Let $a: U \rightarrow V, b: U \rightarrow W$ be morphisms of simplicial sets. Assume $U_{n}, V_{n}, W_{n}$ finite nonempty for all $n \geq 0$. Assume that all $n$-simplices of $U, V, W$ are degenerate for all $n \gg 0$. Let $T$ be a simplicial object of $\mathcal{C}$. Then

$$
\operatorname{Hom}(V, T) \times_{\operatorname{Hom}(U, T)} \operatorname{Hom}(W, T)=\operatorname{Hom}\left(V \amalg_{U} W, T\right)
$$

In other words, the fibre product on the left hand side is represented by the Hom object on the right hand side.

Proof. By Lemma 14.17.4 all the required Hom objects exist and satisfy the correct functorial properties. Now we can identify the $n$th term on the left hand side as the object representing the functor that associates to $X$ the first set of the following sequence of functorial equalities

$$
\begin{aligned}
& \operatorname{Mor}\left(X \times \Delta[n], \operatorname{Hom}(V, T) \times_{\operatorname{Hom}(U, T)} \operatorname{Hom}(W, T)\right) \\
& =\operatorname{Mor}(X \times \Delta[n], \operatorname{Hom}(V, T)) \times_{\operatorname{Mor}(X \times \Delta[n], \operatorname{Hom}(U, T))} \operatorname{Mor}(X \times \Delta[n], \operatorname{Hom}(W, T)) \\
& =\operatorname{Mor}(X \times \Delta[n] \times V, T) \times_{\operatorname{Mor}(X \times \Delta[n] \times U, T)} \operatorname{Mor}(X \times \Delta[n] \times W, T) \\
& \left.=\operatorname{Mor}\left(X \times \Delta[n] \times\left(V \amalg_{U} W\right), T\right)\right)
\end{aligned}
$$

Here we have used the fact that

$$
(X \times \Delta[n] \times V) \times_{X \times \Delta[n] \times U}(X \times \Delta[n] \times W)=X \times \Delta[n] \times\left(V \amalg_{U} W\right)
$$

which is easy to verify term by term. The result of the lemma follows as the last term in the displayed sequence of equalities corresponds to $\operatorname{Hom}\left(V \amalg_{U} W, T\right)_{n}$.

### 14.18. Splitting simplicial objects

017 O A subobject $N$ of an object $X$ of the category $\mathcal{C}$ is an object $N$ of $\mathcal{C}$ together with a monomorphism $N \rightarrow X$. Of course we say (by abouse of notation) that the subobjects $N, N^{\prime}$ are equal if there exists an isomorphism $N \rightarrow N^{\prime}$ compatible with the morphisms to $X$. The collection of subobjects forms a partially ordered set. (Because of our conventions on categories; not true for category of spaces up to homotopy for example.)

017P Definition 14.18.1. Let $\mathcal{C}$ be a category which admits finite nonempty coproducts. We say a simplicial object $U$ of $\mathcal{C}$ is split if there exist subobjects $N\left(U_{m}\right)$ of $U_{m}, m \geq 0$ with the property that
017Q (14.18.1.1)

$$
\coprod_{\varphi:[n] \rightarrow[m] \text { surjective }} N\left(U_{m}\right) \longrightarrow U_{n}
$$

is an isomorphism for all $n \geq 0$.
If this is the case, then $N\left(U_{0}\right)=U_{0}$. Next, we have $U_{1}=U_{0} \amalg N\left(U_{1}\right)$. Second we have

$$
U_{2}=U_{0} \amalg N\left(U_{1}\right) \amalg N\left(U_{1}\right) \amalg N\left(U_{2}\right) .
$$

It turns out that in many categories $\mathcal{C}$ every simplicial object is split.
017R Lemma 14.18.2. Let $U$ be a simplicial set. Then $U$ has a splitting with $N\left(U_{m}\right)$ equal to the set of nondegenerate m-simplices.
Proof. Let $x \in U_{n}$. Suppose that there are surjections $\varphi:[n] \rightarrow[k]$ and $\psi:$ $[n] \rightarrow[l]$ and nondegenerate simplices $y \in U_{k}, z \in U_{l}$ such that $x=U(\varphi)(y)$ and $x=U(\psi)(z)$. Choose a right inverse $\xi:[l] \rightarrow[n]$ of $\psi$, i.e., $\psi \circ \xi=\mathrm{id}_{[l]}$. Then $z=U(\xi)(x)$. Hence $z=U(\xi)(x)=U(\varphi \circ \xi)(y)$. Since $z$ is nondegenerate we conclude that $\varphi \circ \xi:[l] \rightarrow[k]$ is surjective, and hence $l \geq k$. Similarly $k \geq l$. Hence we see that $\varphi \circ \xi:[l] \rightarrow[k]$ has to be the identity map for any choice of right inverse $\xi$ of $\psi$. This easily implies that $\psi=\varphi$.

Of course it can happen that a map of simplicial sets maps a nondegenerate $n$ simplex to a degenerate $n$-simplex. Thus the splitting of Lemma 14.18 .2 is not functorial. Here is a case where it is functorial.

017S Lemma 14.18.3. Let $f: U \rightarrow V$ be a morphism of simplicial sets. Suppose that (a) the image of every nondegenerate simplex of $U$ is a nondegenerate simplex of $V$ and (b) no two nondegenerate simplices of $U$ are mapped to the same simplex of $V$. Then $f_{n}$ is injective for all $n$. Same holds with "injective" replaced by "surjective" or "bijective".

Proof. Under hypothesis (a) we see that the map $f$ preserves the disjoint union decompositions of the splitting of Lemma 14.18 .2 , in other words that we get commutative diagrams

And then (b) clearly shows that the left vertical arrow is injective (resp. surjective, resp. bijective).

017 T Lemma 14.18.4. Let $U$ be a simplicial set. Let $n \geq 0$ be an integer. The rule

$$
U_{m}^{\prime}=\bigcup_{\varphi:[m] \rightarrow[i], i \leq n} \operatorname{Im}(U(\varphi))
$$

defines a sub simplicial set $U^{\prime} \subset U$ with $U_{i}^{\prime}=U_{i}$ for $i \leq n$. Moreover, all msimplices of $U^{\prime}$ are degenerate for all $m>n$.

Proof. If $x \in U_{m}$ and $x=U(\varphi)(y)$ for some $y \in U_{i}, i \leq n$ and some $\varphi:[m] \rightarrow[i]$ then any image $U(\psi)(x)$ for any $\psi:\left[m^{\prime}\right] \rightarrow[m]$ is equal to $U(\varphi \circ \psi)(y)$ and $\varphi \circ \psi:\left[m^{\prime}\right] \rightarrow[i]$. Hence $U^{\prime}$ is a simplicial set. By construction all simplices in dimension $n+1$ and higher are degenerate.

017 U Lemma 14.18.5. Let $U$ be a simplicial abelian group. Then $U$ has a splitting obtained by taking $N\left(U_{0}\right)=U_{0}$ and for $m \geq 1$ taking

$$
N\left(U_{m}\right)=\bigcap_{i=0}^{m-1} \operatorname{Ker}\left(d_{i}^{m}\right)
$$

Moreover, this splitting is functorial on the category of simplicial abelian groups.
Proof. By induction on $n$ we will show that the choice of $N\left(U_{m}\right)$ in the lemma guarantees that 14.18.1.1 is an isomorphism for $m \leq n$. This is clear for $n=0$. In the rest of this proof we are going to drop the superscripts from the maps $d_{i}$ and $s_{i}$ in order to improve readability. We will also repeatedly use the relations from Remark 14.3.3.

First we make a general remark. For $0 \leq i \leq m$ and $z \in U_{m}$ we have $d_{i}\left(s_{i}(z)\right)=z$. Hence we can write any $x \in U_{m+1}$ uniquely as $x=x^{\prime}+x^{\prime \prime}$ with $d_{i}\left(x^{\prime}\right)=0$ and $x^{\prime \prime} \in \operatorname{Im}\left(s_{i}\right)$ by taking $x^{\prime}=\left(x-s_{i}\left(d_{i}(x)\right)\right)$ and $x^{\prime \prime}=s_{i}\left(d_{i}(x)\right)$. Moreover, the element $z \in U_{m}$ such that $x^{\prime \prime}=s_{i}(z)$ is unique because $s_{i}$ is injective.
Here is a procedure for decomposing any $x \in U_{n+1}$. First, write $x=x_{0}+s_{0}\left(z_{0}\right)$ with $d_{0}\left(x_{0}\right)=0$. Next, write $x_{0}=x_{1}+s_{1}\left(z_{1}\right)$ with $d_{n}\left(x_{1}\right)=0$. Continue like this to get

$$
\begin{aligned}
x & =x_{0}+s_{0}\left(z_{0}\right) \\
x_{0} & =x_{1}+s_{1}\left(z_{1}\right) \\
x_{1} & =x_{2}+s_{2}\left(z_{2}\right), \\
\cdots & \cdots \cdots \\
x_{n-1} & =x_{n}+s_{n}\left(z_{n}\right)
\end{aligned}
$$

where $d_{i}\left(x_{i}\right)=0$ for all $i=n, \ldots, 0$. By our general remark above all of the $x_{i}$ and $z_{i}$ are determined uniquely by $x$. We claim that $x_{i} \in \operatorname{Ker}\left(d_{0}\right) \cap \operatorname{Ker}\left(d_{1}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{i}\right)$ and $z_{i} \in \operatorname{Ker}\left(d_{0}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{i-1}\right)$ for $i=n, \ldots, 0$. Here and in the following an empty intersection of kernels indicates the whole space; i.e., the notation $z_{0} \in$ $\operatorname{Ker}\left(d_{0}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{i-1}\right)$ when $i=0$ means $z_{0} \in U_{n}$ with no restriction.
We prove this by ascending induction on $i$. It is clear for $i=0$ by construction of $x_{0}$ and $z_{0}$. Let us prove it for $0<i \leq n$ assuming the result for $i-1$. First of all we have $d_{i}\left(x_{i}\right)=0$ by construction. So pick a $j$ with $0 \leq j<i$. We have $d_{j}\left(x_{i-1}\right)=0$ by induction. Hence

$$
0=d_{j}\left(x_{i-1}\right)=d_{j}\left(x_{i}\right)+d_{j}\left(s_{i}\left(z_{i}\right)\right)=d_{j}\left(x_{i}\right)+s_{i-1}\left(d_{j}\left(z_{i}\right)\right)
$$

The last equality by the relations of Remark 14.3.3. These relations also imply that $d_{i-1}\left(d_{j}\left(x_{i}\right)\right)=d_{j}\left(d_{i}\left(x_{i}\right)\right)=0$ because $d_{i}\left(x_{i}\right)=0$ by construction. Then the
uniqueness in the general remark above shows the equality $0=x^{\prime}+x^{\prime \prime}=d_{j}\left(x_{i}\right)+$ $s_{i-1}\left(d_{j}\left(z_{i}\right)\right)$ can only hold if both terms are zero. We conclude that $d_{j}\left(x_{i}\right)=0$ and by injectivity of $s_{i-1}$ we also conclude that $d_{j}\left(z_{i}\right)=0$. This proves the claim.
The claim implies we can uniquely write

$$
x=s_{0}\left(z_{0}\right)+s_{1}\left(z_{1}\right)+\ldots+s_{n}\left(z_{n}\right)+x_{0}
$$

with $x_{0} \in N\left(U_{n+1}\right)$ and $z_{i} \in \operatorname{Ker}\left(d_{0}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{i-1}\right)$. We can reformulate this as saying that we have found a direct sum decomposition

$$
U_{n+1}=N\left(U_{n+1}\right) \oplus \bigoplus_{i=0}^{i=n} s_{i}\left(\operatorname{Ker}\left(d_{0}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{i-1}\right)\right)
$$

with the property that

$$
\operatorname{Ker}\left(d_{0}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{j}\right)=N\left(U_{n+1}\right) \oplus \bigoplus_{i=j+1}^{i=n} s_{i}\left(\operatorname{Ker}\left(d_{n}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{i-1}\right)\right)
$$

for $j=0, \ldots, n$. The result follows from this statement as follows. Each of the $z_{i}$ in the expression for $x$ can be written uniquely as

$$
z_{i}=s_{i}\left(z_{i, i}^{\prime}\right)+\ldots+s_{n-1}\left(z_{i, n-1}^{\prime}\right)+z_{i, 0}
$$

with $z_{i, 0} \in N\left(U_{n}\right)$ and $z_{i, j}^{\prime} \in \operatorname{Ker}\left(d_{0}\right) \cap \ldots \cap \operatorname{Ker}\left(d_{j-1}\right)$. The first few steps in the decomposition of $z_{i}$ are zero because $z_{i}$ already is in the kernel of $d_{0}, \ldots, d_{i}$. This in turn uniquely gives

$$
x=x_{0}+s_{0}\left(z_{0,0}\right)+s_{1}\left(z_{1,0}\right)+\ldots+s_{n}\left(z_{n, 0}\right)+\sum_{0 \leq i \leq j \leq n-1} s_{i}\left(s_{j}\left(z_{i, j}^{\prime}\right)\right)
$$

Continuing in this fashion we see that we in the end obtain a decomposition of $x$ as a sum of terms of the form

$$
s_{i_{1}} s_{i_{2}} \ldots s_{i_{k}}(z)
$$

with $0 \leq i_{1} \leq i_{2} \leq \ldots \leq i_{k} \leq n-k+1$ and $z \in N\left(U_{n+1-k}\right)$. This is exactly the required decomposition, because any surjective map $[n+1] \rightarrow[n+1-k]$ can be uniquely expressed in the form

$$
\sigma_{i_{k}}^{n-k} \ldots \sigma_{i_{2}}^{n-1} \sigma_{i_{1}}^{n}
$$

with $0 \leq i_{1} \leq i_{2} \leq \ldots \leq i_{k} \leq n-k+1$.
017 V Lemma 14.18.6. Let $\mathcal{A}$ be an abelian category. Let $U$ be a simplicial object in $\mathcal{A}$. Then $U$ has a splitting obtained by taking $N\left(U_{0}\right)=U_{0}$ and for $m \geq 1$ taking

$$
N\left(U_{m}\right)=\bigcap_{i=0}^{m-1} \operatorname{Ker}\left(d_{i}^{m}\right)
$$

Moreover, this splitting is functorial on the category of simplicial objects of $\mathcal{A}$.
Proof. For any object $A$ of $\mathcal{A}$ we obtain a simplicial abelian group $\operatorname{Mor}_{\mathcal{A}}(A, U)$. Each of these are canonically split by Lemma 14.18.5. Moreover,

$$
N\left(\operatorname{Mor}_{\mathcal{A}}\left(A, U_{m}\right)\right)=\bigcap_{i=0}^{m-1} \operatorname{Ker}\left(d_{i}^{m}\right)=\operatorname{Mor}_{\mathcal{A}}\left(A, N\left(U_{m}\right)\right)
$$

Hence we see that the morphism 14.18.1.1 becomes an isomorphism after applying the functor $\operatorname{Mor}_{\mathcal{A}}(A,-)$ for any object of $\mathcal{A}$. Hence it is an isomorphism by the Yoneda lemma.

017W Lemma 14.18.7. Let $\mathcal{A}$ be an abelian category. Let $f: U \rightarrow V$ be a morphism of simplicial objects of $\mathcal{A}$. If the induced morphisms $N(f)_{i}: N(U)_{i} \rightarrow N(V)_{i}$ are injective for all $i$, then $f_{i}$ is injective for all $i$. Same holds with"injective" replaced with "surjective", or "isomorphism".

Proof. This is clear from Lemma 14.18 .6 and the definition of a splitting.
017X Lemma 14.18.8. Let $\mathcal{A}$ be an abelian category. Let $U$ be a simplicial object in $\mathcal{A}$. Let $N\left(U_{m}\right)$ as in Lemma 14.18.6 above. Then $d_{m}^{m}\left(N\left(U_{m}\right)\right) \subset N\left(U_{m-1}\right)$.

Proof. For $j=0, \ldots, m-2$ we have $d_{j}^{m-1} d_{m}^{m}=d_{m-1}^{m-1} d_{j}^{m}$ by the relations in Remark 14.3.3. The result follows.

017Y Lemma 14.18.9. Let $\mathcal{A}$ be an abelian category. Let $U$ be a simplicial object of $\mathcal{A}$. Let $n \geq 0$ be an integer. The rule

$$
U_{m}^{\prime}=\sum_{\varphi:[m] \rightarrow[i], i \leq n} \operatorname{Im}(U(\varphi))
$$

defines a sub simplicial object $U^{\prime} \subset U$ with $U_{i}^{\prime}=U_{i}$ for $i \leq n$. Moreover, $N\left(U_{m}^{\prime}\right)=$ 0 for all $m>n$.

Proof. Pick $m, i \leq n$ and some $\varphi:[m] \rightarrow[i]$. The image under $U(\psi)$ of $\operatorname{Im}(U(\varphi))$ for any $\psi:\left[m^{\prime}\right] \rightarrow[m]$ is equal to the image of $U(\varphi \circ \psi)$ and $\varphi \circ \psi:\left[m^{\prime}\right] \rightarrow[i]$. Hence $U^{\prime}$ is a simplicial object. Pick $m>n$. We have to show $N\left(U_{m}^{\prime}\right)=0$. By definition of $N\left(U_{m}\right)$ and $N\left(U_{m}^{\prime}\right)$ we have $N\left(U_{m}^{\prime}\right)=U_{m}^{\prime} \cap N\left(U_{m}\right)$ (intersection of subobjects). Since $U$ is split by Lemma 14.18.6, it suffices to show that $U_{m}^{\prime}$ is contained in the sum

$$
\sum_{\varphi:[m] \rightarrow\left[m^{\prime}\right] \text { surjective, } m^{\prime}<m} \operatorname{Im}\left(\left.U(\varphi)\right|_{N\left(U_{m^{\prime}}\right)}\right)
$$

By the splitting each $U_{m^{\prime}}$ is the sum of images of $N\left(U_{m^{\prime \prime}}\right)$ via $U(\psi)$ for surjective $\operatorname{maps} \psi:\left[m^{\prime}\right] \rightarrow\left[m^{\prime \prime}\right]$. Hence the displayed sum above is the same as

$$
\sum_{\varphi:[m] \rightarrow\left[m^{\prime}\right] \text { surjective, } m^{\prime}<m} \operatorname{Im}(U(\varphi))
$$

Clearly $U_{m}^{\prime}$ is contained in this by the simple fact that any $\varphi:[m] \rightarrow[i], i \leq n$ occurring in the definition of $U_{m}^{\prime}$ may be factored as $[m] \rightarrow\left[m^{\prime}\right] \rightarrow[i]$ with $[m] \rightarrow$ [ $m^{\prime}$ ] surjective and $m^{\prime}<m$ as in the last displayed sum above.

### 14.19. Coskeleton functors

0AMA Let $\mathcal{C}$ be a category. The coskeleton functor (if it exists) is a functor

$$
\operatorname{cosk}_{n}: \operatorname{Simp}_{n}(\mathcal{C}) \longrightarrow \operatorname{Simp}(\mathcal{C})
$$

which is right adjoint to the skeleton functor. In a formula

$$
\begin{equation*}
\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}\left(U, \operatorname{cosk}_{n} V\right)=\operatorname{Mor}_{\operatorname{Simp}_{n}(\mathcal{C})}\left(\operatorname{sk}_{n} U, V\right) \tag{14.19.0.1}
\end{equation*}
$$

Given a $n$-truncated simplicial object $V$ we say that $\operatorname{cosk}_{n} V$ exists if there exists a $\operatorname{cosk}_{n} V \in \mathrm{Ob}(\operatorname{Simp}(\mathcal{C}))$ and a morphism $\operatorname{sk}_{n} \operatorname{cosk}_{n} V \rightarrow V$ such that the displayed formula holds, in other words if the functor $U \mapsto \operatorname{Mor}_{\operatorname{Simp}_{n}(\mathcal{C})}\left(\mathrm{sk}_{n} U, V\right)$ is representable. If it exists it is unique up to unique isomorphism by the Yoneda lemma. See Categories, Section 4.3.

0182 Example 14.19.1. Suppose the category $\mathcal{C}$ has finite nonempty self products. A 0 -truncated simplicial object of $\mathcal{C}$ is the same as an object $X$ of $\mathcal{C}$. In this case we claim that $\operatorname{cosk}_{0}(X)$ is the simplicial object $U$ with $U_{n}=X^{n+1}$ the $(n+1)$-fold self product of $X$, and structure of simplicial object as in Example 14.3.5. Namely, a morphism $V \rightarrow U$ where $V$ is a simplicial object is given by morphisms $V_{n} \rightarrow X^{n+1}$, such that all the diagrams

commute. Clearly this means that the map determines and is determined by a unique morphism $V_{0} \rightarrow X$. This proves that formula 14.19.0.1 holds.

Recall the category $\Delta /[n]$, see Example 14.11.4. We let $(\Delta /[n])_{\leq m}$ denote the full subcategory of $\Delta /[n]$ consisting of objects $[k] \rightarrow[n]$ of $\Delta /[n]$ with $k \leq m$. In other words we have the following commutative diagram of categories and functors

Given a $m$-truncated simplicial object $U$ of $\mathcal{C}$ we define a functor

$$
U(n):(\Delta /[n])_{\leq m}^{o p p} \longrightarrow \mathcal{C}
$$

by the rules

$$
\begin{aligned}
([k] \rightarrow[n]) & \longmapsto \\
\psi:\left(\left[k^{\prime}\right] \rightarrow[n]\right) \rightarrow & U_{k} \\
([k] \rightarrow[n]) & \longmapsto
\end{aligned} U^{\prime}(\psi): U_{k} \rightarrow U_{k^{\prime}}
$$

For a given morphism $\varphi:[n] \rightarrow\left[n^{\prime}\right]$ of $\Delta$ we have an associated functor

$$
\bar{\varphi}:(\Delta /[n])_{\leq m} \longrightarrow\left(\Delta /\left[n^{\prime}\right]\right)_{\leq m}
$$

which maps $\alpha:[k] \rightarrow[n]$ to $\varphi \circ \alpha:[k] \rightarrow\left[n^{\prime}\right]$. The composition $U\left(n^{\prime}\right) \circ \bar{\varphi}$ is equal to the functor $U(n)$.
0183 Lemma 14.19.2. If the category $\mathcal{C}$ has finite limits, then $\operatorname{cosk}_{m}$ functors exist for all $m$. Moreover, for any m-truncated simplicial object $U$ the simplicial object $\operatorname{cosk}_{m} U$ is described by the formula

$$
\left(\operatorname{cosk}_{m} U\right)_{n}=\lim _{(\Delta /[n])_{\leq m}^{o p p}} U(n)
$$

and for $\varphi:[n] \rightarrow\left[n^{\prime}\right]$ the map $\operatorname{cosk}_{m} U(\varphi)$ comes from the identification $U\left(n^{\prime}\right) \circ \bar{\varphi}=$ $U(n)$ above via Categories, Lemma 4.14.8.
Proof. During the proof of this lemma we denote $\operatorname{cosk}_{m} U$ the simplicial object with $\left(\operatorname{cosk}_{m} U\right)_{n}$ equal to $\lim _{(\Delta /[n])_{\leq m}^{o p p}} U(n)$. We will conclude at the end of the proof that it does satisfy the required mapping property.
Suppose that $V$ is a simplicial object. A morphism $\gamma: V \rightarrow \operatorname{cosk}_{m} U$ is given by a sequence of morphisms $\gamma_{n}: V_{n} \rightarrow\left(\operatorname{cosk}_{m} U\right)_{n}$. By definition of a limit, this is given
by a collection of morphisms $\gamma(\alpha): V_{n} \rightarrow U_{k}$ where $\alpha$ ranges over all $\alpha:[k] \rightarrow[n]$ with $k \leq m$. These morphisms then also satisfy the rules that

are commutative, given any $0 \leq k, k^{\prime} \leq m, 0 \leq n, n^{\prime}$ and any $\psi:[k] \rightarrow\left[k^{\prime}\right]$, $\varphi:[n] \rightarrow\left[n^{\prime}\right], \alpha:[k] \rightarrow[n]$ and $\alpha^{\prime}:\left[k^{\prime}\right] \rightarrow\left[n^{\prime}\right]$ in $\Delta$ such that $\varphi \circ \alpha=\alpha^{\prime} \circ \psi$. Taking $n=k, \varphi=\alpha^{\prime}$, and $\alpha=\psi=\mathrm{id}_{[k]}$ we deduce that $\gamma\left(\alpha^{\prime}\right)=\gamma\left(\mathrm{id}_{[k]}\right) \circ V\left(\alpha^{\prime}\right)$. In other words, the morphisms $\gamma\left(\mathrm{id}_{[k]}\right), k \leq m$ determine the morphism $\gamma$. And it is easy to see that these morphisms form a morphism $\mathrm{sk}_{m} V \rightarrow U$.
Conversely, given a morphism $\gamma: \mathrm{sk}_{m} V \rightarrow U$, we obtain a family of morphisms $\gamma(\alpha)$ where $\alpha$ ranges over all $\alpha:[k] \rightarrow[n]$ with $k \leq m$ by setting $\gamma(\alpha)=\gamma\left(\operatorname{id}_{[k]}\right) \circ V(\alpha)$. These morphisms satisfy all the displayed commutativity restraints pictured above, and hence give rise to a morphism $V \rightarrow \operatorname{cosk}_{m} U$.

0184 Lemma 14.19.3. Let $\mathcal{C}$ be a category. Let $U$ be an $m$-truncated simplicial object of $\mathcal{C}$. For $n \leq m$ the limit $\lim _{(\Delta /[n])_{\leq m}^{o p p}} U(n)$ exists and is canonically isomorphic to $U_{n}$.
Proof. This is true because the category $(\Delta /[n])_{\leq m}$ has an final object in this case, namely the identity map $[n] \rightarrow[n]$.

0185 Lemma 14.19.4. Let $\mathcal{C}$ be a category with finite limits. Let $U$ be an $n$-truncated simplicial object of $\mathcal{C}$. The morphism $s k_{n} \operatorname{cosk}_{n} U \rightarrow U$ is an isomorphism.

Proof. Combine Lemmas 14.19 .2 and 14.19 .3 .
Let us describe a particular instance of the coskeleton functor in more detail. By abuse of notation we will denote $\mathrm{sk}_{n}$ also the restriction functor $\operatorname{Simp}_{n^{\prime}}(\mathcal{C}) \rightarrow$ $\operatorname{Simp}_{n}(\mathcal{C})$ for any $n^{\prime} \geq n$. We are going to describe a right adjoint of the functor $\mathrm{sk}_{n}$ : $\operatorname{Simp}_{n+1}(\mathcal{C}) \rightarrow \operatorname{Simp}_{n}(\mathcal{C})$. For $n \geq 1,0 \leq i<j \leq n+1$ define $\delta_{i, j}^{n+1}:[n-1] \rightarrow[n+1]$ to be the increasing map omitting $i$ and $j$. Note that $\delta_{i, j}^{n+1}=\delta_{j}^{n+1} \circ \delta_{i}^{n}=\delta_{i}^{n+1} \circ \delta_{j-1}^{n}$, see Lemma 14.2.3. This motivates the following lemma.

0186 Lemma 14.19.5. Let $n$ be an integer $\geq 1$. Let $U$ be a n-truncated simplicial object of $\mathcal{C}$. Consider the contravariant functor from $\mathcal{C}$ to Sets which associates to an object $T$ the set

$$
\left\{\left(f_{0}, \ldots, f_{n+1}\right) \in \operatorname{Mor}_{\mathcal{C}}\left(T, U_{n}\right) \mid d_{j-1}^{n} \circ f_{i}=d_{i}^{n} \circ f_{j} \forall 0 \leq i<j \leq n+1\right\}
$$

If this functor is representable by some object $U_{n+1}$ of $\mathcal{C}$, then

$$
U_{n+1}=\lim _{(\Delta /[n+1])_{\leq n}^{o p p}} U(n)
$$

Proof. The limit, if it exists, represents the functor that associates to an object $T$ the set

$$
\left\{\left(f_{\alpha}\right)_{\alpha:[k] \rightarrow[n+1], k \leq n} \mid f_{\alpha \circ \psi}=U(\psi) \circ f_{\alpha} \forall \psi:\left[k^{\prime}\right] \rightarrow[k], \alpha:[k] \rightarrow[n+1]\right\}
$$

In fact we will show this functor is isomorphic to the one displayed in the lemma. The map in one direction is given by the rule

$$
\left(f_{\alpha}\right)_{\alpha} \longmapsto\left(f_{\delta_{0}^{n+1}}, \ldots, f_{\delta_{n+1}^{n+1}}\right) .
$$

This satisfies the conditions of the lemma because

$$
d_{j-1}^{n} \circ f_{\delta_{i}^{n+1}}=f_{\delta_{i}^{n+1} \circ \delta_{j-1}^{n}}=f_{\delta_{j}^{n+1} \circ \delta_{i}^{n}}=d_{i}^{n} \circ f_{\delta_{j}^{n+1}}
$$

by the relations we recalled above the lemma. To construct a map in the other direction we have to associate to a system $\left(f_{0}, \ldots, f_{n+1}\right)$ as in the displayed formula of the lemma a system of maps $f_{\alpha}$. Let $\alpha:[k] \rightarrow[n+1]$ be given. Since $k \leq n$ the $\operatorname{map} \alpha$ is not surjective. Hence we can write $\alpha=\delta_{i}^{n+1} \circ \psi$ for some $0 \leq i \leq n+1$ and some $\psi:[k] \rightarrow[n]$. We have no choice but to define

$$
f_{\alpha}=U(\psi) \circ f_{i}
$$

Of course we have to check that this is independent of the choice of the pair $(i, \psi)$. First, observe that given $i$ there is a unique $\psi$ which works. Second, suppose that $(j, \phi)$ is another pair. Then $i \neq j$ and we may assume $i<j$. Since both $i, j$ are not in the image of $\alpha$ we may actually write $\alpha=\delta_{i, j}^{n+1} \circ \xi$ and then we see that $\psi=\delta_{j-1}^{n} \circ \xi$ and $\phi=\delta_{i}^{n} \circ \xi$. Thus

$$
\begin{aligned}
U(\psi) \circ f_{i} & =U\left(\delta_{j-1}^{n} \circ \xi\right) \circ f_{i} \\
& =U(\xi) \circ d_{j-1}^{n} \circ f_{i} \\
& =U(\xi) \circ d_{i}^{n} \circ f_{j} \\
& =U\left(\delta_{i}^{n} \circ \xi\right) \circ f_{j} \\
& =U(\phi) \circ f_{j}
\end{aligned}
$$

as desired. We still have to verify that the maps $f_{\alpha}$ so defined satisfy the rules of a system of maps $\left(f_{\alpha}\right)_{\alpha}$. To see this suppose that $\psi:\left[k^{\prime}\right] \rightarrow[k], \alpha:[k] \rightarrow[n+1]$ with $k, k^{\prime} \leq n$. Set $\alpha^{\prime}=\alpha \circ \psi$. Choose $i$ not in the image of $\alpha$. Then clearly $i$ is not in the image of $\alpha^{\prime}$ also. Write $\alpha=\delta_{i}^{n+1} \circ \phi$ (we cannot use the letter $\psi$ here because we've already used it). Then obviously $\alpha^{\prime}=\delta_{i}^{n+1} \circ \phi \circ \psi$. By construction above we then have

$$
U(\psi) \circ f_{\alpha}=U(\psi) \circ U(\phi) \circ f_{i}=U(\phi \circ \psi) \circ f_{i}=f_{\alpha \circ \psi}=f_{\alpha^{\prime}}
$$

as desired. We leave to the reader the pleasant task of verifying that our constructions are mutually inverse bijections, and are functorial in $T$.

0187 Lemma 14.19.6. Let $n$ be an integer $\geq 1$. Let $U$ be a n-truncated simplicial object of $\mathcal{C}$. Consider the contravariant functor from $\mathcal{C}$ to Sets which associates to an object $T$ the set

$$
\left\{\left(f_{0}, \ldots, f_{n+1}\right) \in \operatorname{Mor}_{\mathcal{C}}\left(T, U_{n}\right) \mid d_{j-1}^{n} \circ f_{i}=d_{i}^{n} \circ f_{j} \forall 0 \leq i<j \leq n+1\right\}
$$

If this functor is representable by some object $U_{n+1}$ of $\mathcal{C}$, then there exists an $(n+1)$ truncated simplicial object $\tilde{U}$, with $s k_{n} \tilde{U}=U$ and $\tilde{U}_{n+1}=U_{n+1}$ such that the following adjointness holds

$$
\operatorname{Mor}_{\operatorname{Simp}_{n+1}(\mathcal{C})}(V, \tilde{U})=\operatorname{Mor}_{\operatorname{Simp}_{n}(\mathcal{C})}\left(s k_{n} V, U\right)
$$

Proof. By Lemma 14.19.3 there are identifications

$$
U_{i}=\lim _{(\Delta /[i])_{\leq n}^{o p p}} U(i)
$$

for $0 \leq i \leq n$. By Lemma 14.19 .5 we have

$$
U_{n+1}=\lim _{(\Delta /[n+1])_{\leq n}^{o p p}} U(n) .
$$

Thus we may define for any $\varphi:[i] \rightarrow[j]$ with $i, j \leq n+1$ the corresponding map $\tilde{U}(\varphi): \tilde{U}_{j} \rightarrow \tilde{U}_{i}$ exactly as in Lemma 14.19.2 This defines an $(n+1)$-truncated simplicial object $\tilde{U}$ with $\operatorname{sk}_{n} \tilde{U}=U$.

To see the adjointness we argue as follows. Given any element $\gamma: \operatorname{sk}_{n} V \rightarrow U$ of the right hand side of the formula consider the morphisms $f_{i}=\gamma_{n} \circ d_{i}^{n+1}$ : $V_{n+1} \rightarrow V_{n} \rightarrow U_{n}$. These clearly satisfy the relations $d_{j-1}^{n} \circ f_{i}=d_{i}^{n} \circ f_{j}$ and hence define a unique morphism $V_{n+1} \rightarrow U_{n+1}$ by our choice of $U_{n+1}$. Conversely, given a morphism $\gamma^{\prime}: V \rightarrow \tilde{U}$ of the left hand side we can simply restrict to $\Delta_{\leq n}$ to get an element of the right hand side. We leave it to the reader to show these are mutually inverse constructions.

0188 Remark 14.19.7. Let $U$, and $U_{n+1}$ be as in Lemma 14.19.6. On $T$-valued points we can easily describe the face and degeneracy maps of $U$. Explicitly, the maps $d_{i}^{n+1}: U_{n+1} \rightarrow U_{n}$ are given by

$$
\left(f_{0}, \ldots, f_{n+1}\right) \longmapsto f_{i}
$$

And the maps $s_{j}^{n}: U_{n} \rightarrow U_{n+1}$ are given by

$$
\begin{aligned}
f \longmapsto & \left(s_{j-1}^{n-1} \circ d_{0}^{n-1} \circ f,\right. \\
& s_{j-1}^{n-1} \circ d_{1}^{n-1} \circ f \\
& \cdots \\
& s_{j-1}^{n-1} \circ d_{j-1}^{n-1} \circ f \\
& f, \\
& f, \\
& s_{j}^{n-1} \circ d_{j+1}^{n-1} \circ f \\
& s_{j}^{n-1} \circ d_{j+2}^{n-1} \circ f \\
& \cdots \\
& \left.s_{j}^{n-1} \circ d_{n}^{n-1} \circ f\right)
\end{aligned}
$$

where we leave it to the reader to verify that the RHS is an element of the displayed set of Lemma 14.19.6. For $n=0$ there is one map, namely $f \mapsto(f, f)$. For $n=1$ there are two maps, namely $f \mapsto\left(f, f, s_{0} d_{1} f\right)$ and $f \mapsto\left(s_{0} d_{0} f, f, f\right)$. For $n=2$ there are three maps, namely $f \mapsto\left(f, f, s_{0} d_{1} f, s_{0} d_{2} f\right), f \mapsto\left(s_{0} d_{0} f, f, f, s_{1} d_{2} f\right)$, and $f \mapsto\left(s_{1} d_{0} f, s_{1} d_{1} f, f, f\right)$. And so on and so forth.

0189 Remark 14.19.8. The construction of Lemma 14.19 .6 above in the case of simplicial sets is the following. Given an $n$-truncated simplicial set $U$, we make a canonical $(n+1)$-truncated simplicial set $\tilde{U}$ as follows. We add a set of $(n+1)$ simplices $U_{n+1}$ by the formula of the lemma. Namely, an element of $U_{n+1}$ is a numbered collection of $\left(f_{0}, \ldots, f_{n+1}\right)$ of $n$-simplices, with the property that they glue as they would in a $(n+1)$-simplex. In other words, the $i$ th face of $f_{j}$ is the $(j-1)$ st face of $f_{i}$ for $i<j$. Geometrically it is obvious how to define the face and degeneracy maps for $\tilde{U}$. If $V$ is an $(n+1)$-truncated simplicial set, then its $(n+1)$-simplices give rise to compatible collections of $n$-simplices $\left(f_{0}, \ldots, f_{n+1}\right)$ with $f_{i} \in V_{n}$. Hence there is a natural map $\operatorname{Mor}\left(\operatorname{sk}_{n} V, U\right) \rightarrow \operatorname{Mor}(V, \tilde{U})$ which is inverse to the canonical restriction mapping the other way.

Also, it is enough to do the combinatorics of the construction in the case of truncated simplicial sets. Namely, for any object $T$ of the category $\mathcal{C}$, and any $n$ truncated simplicial object $U$ of $\mathcal{C}$ we can consider the $n$-truncated simplicial set $\operatorname{Mor}(T, U)$. We may apply the construction to this, and take its set of $(n+1)$ simplices, and require this to be representable. This is a good way to think about the result of Lemma 14.19.6

018A Remark 14.19.9. Inductive construction of coskeleta. Suppose that $\mathcal{C}$ is a category with finite limits. Suppose that $U$ is an $m$-truncated simplicial object in $\mathcal{C}$. Then we can inductively construct $n$-truncated objects $U^{n}$ as follows:
(1) To start, set $U^{m}=U$.
(2) Given $U^{n}$ for $n \geq m$ set $U^{n+1}=\tilde{U}^{n}$, where $\tilde{U}^{n}$ is constructed from $U^{n}$ as in Lemma 14.19.6.
Since the construction of Lemma 14.19 .6 has the property that it leaves the $n$ skeleton of $U^{n}$ unchanged, we can then define $\operatorname{cosk}_{m} U$ to be the simplicial object with $\left(\operatorname{cosk}_{m} U\right)_{n}=U_{n}^{n}=U_{n}^{n+1}=\ldots$. And it follows formally from Lemma 14.19.6 that $U^{n}$ satisfies the formula

$$
\operatorname{Mor}_{\operatorname{Simp}_{n}(\mathcal{C})}\left(V, U^{n}\right)=\operatorname{Mor}_{\operatorname{Simp}_{m}(\mathcal{C})}\left(\operatorname{sk}_{m} V, U\right)
$$

for all $n \geq m$. It also then follows formally from this that

$$
\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}\left(V, \operatorname{cosk}_{m} U\right)=\operatorname{Mor}_{\operatorname{Simp}_{m}(\mathcal{C})}\left(\mathrm{sk}_{m} V, U\right)
$$

with $\operatorname{cosk}_{m} U$ chosen as above.
018B Lemma 14.19.10. Let $\mathcal{C}$ be a category which has finite limits.
(1) For every $n$ the functor $s k_{n}: \operatorname{Simp}(\mathcal{C}) \rightarrow \operatorname{Simp}_{n}(\mathcal{C})$ has a right adjoint $\operatorname{cosk}_{n}$.
(2) For every $n^{\prime} \geq n$ the functor $s k_{n}: \operatorname{Simp}_{n^{\prime}}(\mathcal{C}) \rightarrow \operatorname{Simp}_{n}(\mathcal{C})$ has a right adjoint, namely $s k_{n^{\prime}} \operatorname{cosk}_{n}$.
(3) For every $m \geq n \geq 0$ and every $n$-truncated simplicial object $U$ of $\mathcal{C}$ we have $\operatorname{cosk}_{m} s k_{m} \operatorname{cosk}_{n} U=\operatorname{cosk}_{n} U$.
(4) If $U$ is a simplicial object of $\mathcal{C}$ such that the canonical map $U \rightarrow \operatorname{cosk}_{n} s k_{n} U$ is an isomorphism for some $n \geq 0$, then the canonical map $U \rightarrow \operatorname{cosk}_{m} s k_{m} U$ is an isomorphism for all $m \geq n$.

Proof. The existence in (1) follows from Lemma 14.19 .2 above. Parts (2) and (3) follow from the discussion in Remark 14.19.9. After this (4) is obvious.

09VS Remark 14.19.11. We do not need all finite limits in order to be able to define the coskeleton functors. Here are some remarks
(1) We have seen in Examples 14.19.1 that if $\mathcal{C}$ has products of pairs of objects then $\operatorname{cosk}_{0}$ exists.
(2) For $k>0$ the functor $\operatorname{cosk}_{k}$ exists if $\mathcal{C}$ has finite connected limits.

This is clear from the inductive procedure of constructing coskeleta (Remarks 14.19 .8 and 14.19 .9 but it also follows from the fact that the categories $(\Delta /[n])_{\leq k}$ for $k \geq 1$ and $n \geq k+1$ used in Lemma 14.19.2 are connected. Observe that we do not need the categories for $n \leq k$ by Lemma 14.19 .3 or Lemma 14.19.4. (As $k$ gets higher the categories $(\Delta /[n])_{\leq k}$ for $k \geq 1$ and $n \geq k+1$ are more and more connected in a topological sense.)

018C Lemma 14.19.12. Let $U, V$ be $n$-truncated simplicial objects of a category $\mathcal{C}$. Then

$$
\operatorname{cosk}_{n}(U \times V)=\operatorname{cosk}_{n} U \times \operatorname{cosk}_{n} V
$$

whenever the left and right hand sides exist.
Proof. Let $W$ be a simplicial object. We have

$$
\begin{aligned}
\operatorname{Mor}\left(W, \operatorname{cosk}_{n}(U \times V)\right) & =\operatorname{Mor}\left(\operatorname{sk}_{n} W, U \times V\right) \\
& =\operatorname{Mor}\left(\operatorname{sk}_{n} W, U\right) \times \operatorname{Mor}\left(\operatorname{sk}_{n} W, V\right) \\
& =\operatorname{Mor}\left(W, \operatorname{cosk}_{n} U\right) \times \operatorname{Mor}\left(W, \operatorname{cosk}_{n} V\right) \\
& =\operatorname{Mor}\left(W, \operatorname{cosk}_{n} U \times \operatorname{cosk}_{n} V\right)
\end{aligned}
$$

The lemma follows.
018D Lemma 14.19.13. Assume $\mathcal{C}$ has fibre products. Let $U, V, W$ be $n$-truncated simplicial objects of the category $\mathcal{C}$. Then

$$
\operatorname{cosk}_{n}\left(V \times_{U} W\right)=\operatorname{cosk}_{n} U \times_{\operatorname{cosk}_{n} U} \operatorname{cosk}_{n} V
$$

whenever the left and right hand side exist.
Proof. Omitted, but very similar to the proof of Lemma 14.19 .12 above.
08NJ Lemma 14.19.14. Let $\mathcal{C}$ be a category with finite limits. Let $X \in \operatorname{Ob}(\mathcal{C})$. The functor $\mathcal{C} / X \rightarrow \mathcal{C}$ commutes with the coskeleton functors $\operatorname{cosk}_{k}$ for $k \geq 1$.

Proof. The statement means that if $U$ is a simplicial object of $\mathcal{C} / X$ which we can think of as a simplicial object of $\mathcal{C}$ with a morphism towards the constant simplicial object $X$, then $\operatorname{cosk}_{k} U$ computed in $\mathcal{C} / X$ is the same as computed in $\mathcal{C}$. This follows for example from Categories, Lemma 4.16 .2 because the categories $(\Delta /[n])_{\leq k}$ for $k \geq 1$ and $n \geq k+1$ used in Lemma 14.19.2 are connected. Observe that we do not need the categories for $n \leq k$ by Lemma 14.19.3 or Lemma 14.19.4.

018E Lemma 14.19.15. The canonical map $\Delta[n] \rightarrow \operatorname{cosk}_{1} s k_{1} \Delta[n]$ is an isomorphism.
Proof. Consider a simplicial set $U$ and a morphism $f: U \rightarrow \Delta[n]$. This is a rule that associates to each $u \in U_{i}$ a map $f_{u}:[i] \rightarrow[n]$ in $\Delta$. Furthermore, these maps should have the property that $f_{u} \circ \varphi=f_{U(\varphi)(u)}$ for any $\varphi:[j] \rightarrow[i]$. Denote $\epsilon_{j}^{i}:[0] \rightarrow[i]$ the map which maps 0 to $j$. Denote $F: U_{0} \rightarrow[n]$ the map $u \mapsto f_{u}(0)$. Then we see that

$$
f_{u}(j)=F\left(\epsilon_{j}^{i}(u)\right)
$$

for all $0 \leq j \leq i$ and $u \in U_{i}$. In particular, if we know the function $F$ then we know the maps $f_{u}$ for all $u \in U_{i}$ all $i$. Conversely, given a map $F: U_{0} \rightarrow[n]$, we can set for any $i$, and any $u \in U_{i}$ and any $0 \leq j \leq i$

$$
f_{u}(j)=F\left(\epsilon_{j}^{i}(u)\right)
$$

This does not in general define a morphism $f$ of simplicial sets as above. Namely, the condition is that all the maps $f_{u}$ are nondecreasing. This clearly is equivalent to the condition that $F\left(\epsilon_{j}^{i}(u)\right) \leq F\left(\epsilon_{j^{\prime}}^{i}(u)\right)$ whenever $0 \leq j \leq j^{\prime} \leq i$ and $u \in U_{i}$. But in this case the morphisms

$$
\epsilon_{j}^{i}, \epsilon_{j^{\prime}}^{i}:[0] \rightarrow[i]
$$

both factor through the map $\epsilon_{j, j^{\prime}}^{i}:[1] \rightarrow[i]$ defined by the rules $0 \mapsto j, 1 \mapsto j^{\prime}$. In other words, it is enough to check the inequalities for $i=1$ and $u \in X_{1}$. In other words, we have

$$
\operatorname{Mor}(U, \Delta[n])=\operatorname{Mor}\left(\mathrm{sk}_{1} U, \mathrm{sk}_{1} \Delta[n]\right)
$$

as desired.

### 14.20. Augmentations

018G Definition 14.20.1. Let $\mathcal{C}$ be a category. Let $U$ be a simplicial object of $\mathcal{C}$. An augmentation $\epsilon: U \rightarrow X$ of $U$ towards an object $X$ of $\mathcal{C}$ is a morphism from $U$ into the constant simplicial object $X$.

018 H Lemma 14.20.2. Let $\mathcal{C}$ be a category. Let $X \in \mathrm{Ob}(\mathcal{C})$. Let $U$ be a simplicial object of $\mathcal{C}$. To give an augmentation of $U$ towards $X$ is the same as giving a morphism $\epsilon_{0}: U_{0} \rightarrow X$ such that $\epsilon_{0} \circ d_{0}^{1}=\epsilon_{0} \circ d_{1}^{1}$.

Proof. Given a morphism $\epsilon: U \rightarrow X$ we certainly obtain an $\epsilon_{0}$ as in the lemma. Conversely, given $\epsilon_{0}$ as in the lemma, define $\epsilon_{n}: U_{n} \rightarrow X$ by choosing any morphism $\alpha:[0] \rightarrow[n]$ and taking $\epsilon_{n}=\epsilon_{0} \circ U(\alpha)$. Namely, if $\beta:[0] \rightarrow[n]$ is another choice, then there exists a morphism $\gamma:[1] \rightarrow[n]$ such that $\alpha$ and $\beta$ both factor as $[0] \rightarrow[1] \rightarrow[n]$. Hence the condition on $\epsilon_{0}$ shows that $\epsilon_{n}$ is well defined. Then it is easy to show that $\left(\epsilon_{n}\right): U \rightarrow X$ is a morphism of simplicial objects.

018I Lemma 14.20.3. Let $\mathcal{C}$ be a category with fibred products. Let $f: Y \rightarrow X$ be $a$ morphism of $\mathcal{C}$. Let $U$ be the simplicial object of $\mathcal{C}$ whose $n$th term is the $(n+1)$ fold fibred product $Y \times_{X} Y \times_{X} \ldots \times_{X} Y$. See Example 14.3.5. For any simplicial object $V$ of $\mathcal{C}$ we have

$$
\begin{aligned}
\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}(V, U) & =\operatorname{Mor}_{\operatorname{Simp}}^{1}(\mathcal{C}) \\
& \left(s k_{1} V, s k_{1} U\right) \\
& =\left\{g_{0}: V_{0} \rightarrow Y \mid f \circ g_{0} \circ d_{0}^{1}=f \circ g_{0} \circ d_{1}^{1}\right\}
\end{aligned}
$$

In particular we have $U=\operatorname{cosk}_{1} s k_{1} U$.
Proof. Suppose that $g: \mathrm{sk}_{1} V \rightarrow \mathrm{sk}_{1} U$ is a morphism of 1-truncated simplicial objects. Then the diagram

is commutative, which proves that the relation shown in the lemma holds. We have to show that, conversely, given a morphism $g_{0}$ satisfying the relation $f \circ g_{0} \circ d_{0}^{1}=$ $f \circ g_{0} \circ d_{1}^{1}$ we get a unique morphism of simplicial objects $g: V \rightarrow U$. This is done as follows. For any $n \geq 1$ let $g_{n, i}=g_{0} \circ V([0] \rightarrow[n], 0 \mapsto i): V_{n} \rightarrow Y$. The equality
above implies that $f \circ g_{n, i}=f \circ g_{n, i+1}$ because of the commutative diagram

Hence we get $\left(g_{n, 0}, \ldots, g_{n, n}\right): V_{n} \rightarrow Y \times_{X} \ldots \times_{X} Y=U_{n}$. We leave it to the reader to see that this is a morphism of simplicial objects. The last assertion of the lemma is equivalent to the first equality in the displayed formula of the lemma.

018J Remark 14.20.4. Let $\mathcal{C}$ be a category with fibre products. Let $V$ be a simplicial object. Let $\epsilon: V \rightarrow X$ be an augmentation. Let $U$ be the simplicial object whose $n$th term is the $(n+1)$ st fibred product of $V_{0}$ over $X$. By a simple combination of Lemmas 14.20 .2 and 14.20 .3 we obtain a canonical morphism $V \rightarrow U$.

### 14.21. Left adjoints to the skeleton functors

018 K In this section we construct a left adjoint $i_{m!}$ of the skeleton functor $\mathrm{sk}_{m}$ in certain cases. The adjointness formula is

$$
\operatorname{Mor}_{\operatorname{Simp}_{m}(\mathcal{C})}\left(U, \operatorname{sk}_{m} V\right)=\operatorname{Mor}_{\operatorname{Simp}(\mathcal{C})}\left(i_{m!} U, V\right)
$$

It turns out that this left adjoint exists when the category $\mathcal{C}$ has finite colimits.
We use a similar construction as in Section 14.12 Recall the category $[n] / \Delta$ of objects under $[n]$, see Categories, Example 4.2.14. Its objects are morphisms $\alpha$ : $[n] \rightarrow[k]$ and its morphisms are commutative triangles. We let $([n] / \Delta)_{\leq m}$ denote the full subcategory of $[n] / \Delta$ consisting of objects $[n] \rightarrow[k]$ with $k \leq m$. Given a $m$-truncated simplicial object $U$ of $\mathcal{C}$ we define a functor

$$
U(n):([n] / \Delta)_{\leq m}^{o p p} \longrightarrow \mathcal{C}
$$

by the rules

$$
\begin{aligned}
([n] \rightarrow[k]) & \longmapsto \\
\psi:\left([n] \rightarrow\left[k^{\prime}\right]\right) \rightarrow & ([n] \rightarrow[k])
\end{aligned} \begin{aligned}
& k \\
& \\
& \left([\psi): U_{k} \rightarrow U_{k^{\prime}}\right.
\end{aligned}
$$

For a given morphism $\varphi:[n] \rightarrow\left[n^{\prime}\right]$ of $\Delta$ we have an associated functor

$$
\underline{\varphi}:\left(\left[n^{\prime}\right] / \Delta\right)_{\leq m} \longrightarrow([n] / \Delta)_{\leq m}
$$

which maps $\alpha:\left[n^{\prime}\right] \rightarrow[k]$ to $\varphi \circ \alpha:[n] \rightarrow[k]$. The composition $U(n) \circ \underline{\varphi}$ is equal to the functor $U\left(n^{\prime}\right)$.

018L Lemma 14.21.1. Let $\mathcal{C}$ be a category which has finite colimits. The functors $i_{m}$ ! exist for all $m$. Let $U$ be an m-truncated simplicial object of $\mathcal{C}$. The simplicial object $i_{m!} U$ is described by the formula

$$
\left(i_{m!} U\right)_{n}=\operatorname{colim}_{([n] / \Delta)_{\substack{o p p}}^{o p} U(n)}
$$

and for $\varphi:[n] \rightarrow\left[n^{\prime}\right]$ the map $i_{m!} U(\varphi)$ comes from the identification $U(n) \circ \underline{\varphi}=$ $U\left(n^{\prime}\right)$ above via Categories, Lemma 4.14.7.

Proof. In this proof we denote $i_{m!} U$ the simplicial object whose $n$th term is given by the displayed formula of the lemma. We will show it satisfies the adjointness property.
Let $V$ be a simplicial object of $\mathcal{C}$. Let $\gamma: U \rightarrow \mathrm{sk}_{m} V$ be given. A morphism

$$
\operatorname{colim}_{([n] / \Delta)_{\leq m}^{o p p}} U(n) \rightarrow T
$$

is given by a compatible system of morphisms $f_{\alpha}: U_{k} \rightarrow T$ where $\alpha:[n] \rightarrow[k]$ with $k \leq m$. Certainly, we have such a system of morphisms by taking the compositions

$$
U_{k} \xrightarrow{\gamma_{k}} V_{k} \xrightarrow{V(\alpha)} V_{n} .
$$

Hence we get an induced morphism $\left(i_{m!} U\right)_{n} \rightarrow V_{n}$. We leave it to the reader to see that these form a morphism of simplicial objects $\gamma^{\prime}: i_{m!} U \rightarrow V$.
Conversely, given a morphism $\gamma^{\prime}: i_{m!} U \rightarrow V$ we obtain a morphism $\gamma: U \rightarrow \mathrm{sk}_{m} V$ by setting $\gamma_{i}: U_{i} \rightarrow V_{i}$ equal to the composition

$$
U_{i} \xrightarrow{\operatorname{id}_{[i]}} \operatorname{colim}_{([i] / \Delta)_{\leq m}^{o p p}} U(i) \xrightarrow{\gamma_{i}^{\prime}} V_{i}
$$

for $0 \leq i \leq n$. We leave it to the reader to see that this is the inverse of the construction above.

018M Lemma 14.21.2. Let $\mathcal{C}$ be a category. Let $U$ be an m-truncated simplicial object of $\mathcal{C}$. For any $n \leq m$ the colimit

$$
\operatorname{colim}_{([n] / \Delta)_{\leq m}^{o p p}} U(n)
$$

exists and is equal to $U_{n}$.
Proof. This is so because the category $([n] / \Delta)_{\leq m}$ has an initial object, namely id : $[n] \rightarrow[n]$.

018N Lemma 14.21.3. Let $\mathcal{C}$ be a category which has finite colimits. Let $U$ be an m-truncated simplicial object of $\mathcal{C}$. The map $U \rightarrow s k_{m} i_{m!} U$ is an isomorphism.
Proof. Combine Lemmas 14.21.1 and 14.21 .2 .
018 O Lemma 14.21.4. If $U$ is an $m$-truncated simplicial set and $n>m$ then all $n$ simplices of $i_{m!} U$ are degenerate.
Proof. This can be seen from the construction of $i_{m!} U$ in Lemma 14.21.1, but we can also argue directly as follows. Write $V=i_{m!} U$. Let $V^{\prime} \subset V$ be the simplicial subset with $V_{i}^{\prime}=V_{i}$ for $i \leq m$ and all $i$ simplices degenerate for $i>m$, see Lemma 14.18.4 By the adjunction formula, since $\mathrm{sk}_{m} V^{\prime}=U$, there is an inverse to the injection $V^{\prime} \rightarrow V$. Hence $V^{\prime}=V$.

018P Lemma 14.21.5. Let $U$ be a simplicial set. Let $n \geq 0$ be an integer. The morphism $i_{n!} s k_{n} U \rightarrow U$ identifies $i_{n!} s k_{n} U$ with the simplicial set $U^{\prime} \subset U$ defined in Lemma 14.18.4.

Proof. By Lemma 14.21 .4 the only nondegenerate simplices of $i_{n!} \mathrm{sk}_{n} U$ are in degrees $\leq n$. The map $i_{n!} \mathrm{sk}_{n} U \rightarrow U$ is an isomorphism in degrees $\leq n$. Combined we conclude that the map $i_{n!} \mathrm{sk}_{n} U \rightarrow U$ maps nondegenerate simplices to nondegenerate simplices and no two nondegenerate simplices have the same image. Hence Lemma 14.18 .3 applies. Thus $i_{n!} \mathrm{sk}_{n} U \rightarrow U$ is injective. The result follows easily from this.

018Q Remark 14.21.6. In some texts the composite functor

$$
\operatorname{Simp}(\mathcal{C}) \xrightarrow{\mathrm{sk}_{m}} \operatorname{Simp}_{m}(\mathcal{C}) \xrightarrow{i_{m!}} \operatorname{Simp}(\mathcal{C})
$$

is denoted $\mathrm{sk}_{m}$. This makes sense for simplicial sets, because then Lemma 14.21 .5 says that $i_{m!} \mathrm{sk}_{m} V$ is just the sub simplicial set of $V$ consisting of all $i$-simplices of $V, i \leq m$ and their degeneracies. In those texts it is also customary to denote the composition

$$
\operatorname{Simp}(\mathcal{C}) \xrightarrow{\mathrm{sk}_{m}} \operatorname{Simp}_{m}(\mathcal{C}) \xrightarrow{\text { cosk }_{m}} \operatorname{Simp}(\mathcal{C})
$$

by $\operatorname{cosk}_{m}$.
018R Lemma 14.21.7. Let $U \subset V$ be simplicial sets. Suppose $n \geq 0$ and $x \in V_{n}$, $x \notin U_{n}$ are such that
(1) $V_{i}=U_{i}$ for $i<n$,
(2) $V_{n}=U_{n} \cup\{x\}$,
(3) any $z \in V_{j}, z \notin U_{j}$ for $j>n$ is degenerate.

Let $\Delta[n] \rightarrow V$ be the unique morphism mapping the nondegenerate $n$-simplex of $\Delta[n]$ to $x$. In this case the diagram

is a pushout diagram.
Proof. Let us denote $\partial \Delta[n]=i_{(n-1)!} \mathrm{sk}_{n-1} \Delta[n]$ for convenience. There is a natural $\operatorname{map} U \amalg_{\partial \Delta[n]} \Delta[n] \rightarrow V$. We have to show that it is bijective in degree $j$ for all $j$. This is clear for $j \leq n$. Let $j>n$. The third condition means that any $z \in V_{j}, z \notin U_{j}$ is a degenerate simplex, say $z=s_{i}^{j-1}\left(z^{\prime}\right)$. Of course $z^{\prime} \notin U_{j-1}$. By induction it follows that $z^{\prime}$ is a degeneracy of $x$. Thus we conclude that all $j$-simplices of $V$ are either in $U$ or degeneracies of $x$. This implies that the map $U \amalg_{\partial \Delta[n]} \Delta[n] \rightarrow V$ is surjective. Note that a nondegenerate simplex of $U \amalg_{\partial \Delta[n]} \Delta[n]$ is either the image of a nondegenerate simplex of $U$, or the image of the (unique) nondegenerate $n$-simplex of $\Delta[n]$. Since clearly $x$ is nondegenerate we deduce that $U \amalg_{\partial \Delta[n]} \Delta[n] \rightarrow V$ maps nondegenerate simplices to nondegenerate simplices and is injective on nondegenerate simplices. Hence it is injective, by Lemma 14.18.3
018S Lemma 14.21.8. Let $U \subset V$ be simplicial sets, with $U_{n}, V_{n}$ finite nonempty for all $n$. Assume that $U$ and $V$ have finitely many nondegenerate simplices. Then there exists a sequence of sub simplicial sets

$$
U=W^{0} \subset W^{1} \subset W^{2} \subset \ldots W^{r}=V
$$

such that Lemma 14.21.7 applies to each of the inclusions $W^{i} \subset W^{i+1}$.
Proof. Let $n$ be the smallest integer such that $V$ has a nondegenerate simplex that does not belong to $U$. Let $x \in V_{n}, x \notin U_{n}$ be such a nondegenerate simplex. Let $W \subset V$ be the set of elements which are either in $U$, or are a (repeated) degeneracy of $x$ (in other words, are of the form $V(\varphi)(x)$ with $\varphi:[m] \rightarrow[n]$ surjective). It is easy to see that $W$ is a simplicial set. The inclusion $U \subset W$ satisfies the conditions of Lemma 14.21.7. Moreover the number of nondegenerate simplices of $V$ which are
not contained in $W$ is exactly one less than the number of nondegenerate simplices of $V$ which are not contained in $U$. Hence we win by induction on this number.

018 T Lemma 14.21.9. Let $\mathcal{A}$ be an abelian category Let $U$ be an $m$-truncated simplicial object of $\mathcal{A}$. For $n>m$ we have $N\left(i_{m!} U\right)_{n}=0$.
Proof. Write $V=i_{m!} U$. Let $V^{\prime} \subset V$ be the simplicial subobject of $V$ with $V_{i}^{\prime}=V_{i}$ for $i \leq m$ and $N\left(V_{i}^{\prime}\right)=0$ for $i>m$, see Lemma 14.18.9. By the adjunction formula, since $\mathrm{sk}_{m} V^{\prime}=U$, there is an inverse to the injection $V^{\prime} \rightarrow V$. Hence $V^{\prime}=V$.

018 U Lemma 14.21.10. Let $\mathcal{A}$ be an abelian category. Let $U$ be a simplicial object of $\mathcal{A}$. Let $n \geq 0$ be an integer. The morphism $i_{n!} s k_{n} U \rightarrow U$ identifies $i_{n!} s k_{n} U$ with the simplicial subobject $U^{\prime} \subset U$ defined in Lemma 14.18.9.

Proof. By Lemma 14.21 .9 we have $N\left(i_{n!} \operatorname{sk}_{n} U\right)_{i}=0$ for $i>n$. The map $i_{n!} \mathrm{sk}_{n} U \rightarrow$ $U$ is an isomorphism in degrees $\leq n$, see Lemma 14.21 .3 . Combined we conclude that the map $i_{n!} \mathrm{sk}_{n} U \rightarrow U$ induces injective maps $N\left(i_{n!} \mathrm{sk}_{n} U\right)_{i} \rightarrow N(U)_{i}$ for all $i$. Hence Lemma 14.18 .7 applies. Thus $i_{n!} \mathrm{sk}_{n} U \rightarrow U$ is injective. The result follows easily from this.

Here is another way to think about the coskeleton functor using the material above.
018V Lemma 14.21.11. Let $\mathcal{C}$ be a category with finite coproducts and finite limits. Let $V$ be a simplicial object of $\mathcal{C}$. In this case

$$
\left(\cos _{n} s k_{n} V\right)_{n+1}=\operatorname{Hom}\left(i_{n!} s k_{n} \Delta[n+1], V\right)_{0}
$$

Proof. By Lemma 14.13 .4 the object on the left represents the functor which assigns to $X$ the first set of the following equalities

$$
\begin{aligned}
\operatorname{Mor}\left(X \times \Delta[n+1], \operatorname{cosk}_{n} \mathrm{sk}_{n} V\right) & =\operatorname{Mor}\left(X \times \operatorname{sk}_{n} \Delta[n+1], \mathrm{sk}_{n} V\right) \\
& =\operatorname{Mor}\left(X \times i_{n!}!\mathrm{sk}_{n} \Delta[n+1], V\right)
\end{aligned}
$$

The object on the right in the formula of the lemma is represented by the functor which assigns to $X$ the last set in the sequence of equalities. This proves the result.

In the sequence of equalities we have used that $\mathrm{sk}_{n}(X \times \Delta[n+1])=X \times \operatorname{sk}_{n} \Delta[n+1]$ and that $i_{n!}\left(X \times \operatorname{sk}_{n} \Delta[n+1]\right)=X \times i_{n!} \operatorname{sk}_{n} \Delta[n+1]$. The first equality is obvious. For any (possibly truncated) simplicial object $W$ of $\mathcal{C}$ and any object $X$ of $\mathcal{C}$ denote temporarily $\operatorname{Mor}_{\mathcal{C}}(X, W)$ the (possibly truncated) simplicial set $[n] \mapsto \operatorname{Mor}_{\mathcal{C}}\left(X, W_{n}\right)$. From the definitions it follows that $\operatorname{Mor}(U \times X, W)=\operatorname{Mor}\left(U, \operatorname{Mor}_{\mathcal{C}}(X, W)\right)$ for any (possibly truncated) simplicial set $U$. Hence

$$
\begin{aligned}
\operatorname{Mor}\left(X \times i_{n!} \mathrm{Sk}_{n} \Delta[n+1], W\right) & =\operatorname{Mor}\left(i_{n!} \operatorname{sk}_{n} \Delta[n+1], \operatorname{Mor}_{\mathcal{C}}(X, W)\right) \\
& =\operatorname{Mor}\left(\operatorname{sk}_{n} \Delta[n+1], \operatorname{sk}_{n} \operatorname{Mor}_{\mathcal{C}}(X, W)\right) \\
& =\operatorname{Mor}\left(X \times \operatorname{sk}_{n} \Delta[n+1], \operatorname{sk}_{n} W\right) \\
& =\operatorname{Mor}\left(i_{n!}\left(X \times \operatorname{sk}_{n} \Delta[n+1]\right), W\right)
\end{aligned}
$$

This proves the second equality used, and ends the proof of the lemma.

### 14.22. Simplicial objects in abelian categories

018 Y Recall that an abelian category is defined in Homology, Section 12.5.
018 Z Lemma 14.22.1. Let $\mathcal{A}$ be an abelian category.
(1) The categories $\operatorname{Simp}(\mathcal{A})$ and $\operatorname{CoSimp}(\mathcal{A})$ are abelian.
(2) A morphism of (co) simplicial objects $f: A \rightarrow B$ is injective if and only if each $f_{n}: A_{n} \rightarrow B_{n}$ is injective.
(3) A morphism of (co) simplicial objects $f: A \rightarrow B$ is surjective if and only if each $f_{n}: A_{n} \rightarrow B_{n}$ is surjective.
(4) A sequence of (co) simplicial objects

$$
A \xrightarrow{f} B \xrightarrow{g} C
$$

is exact at $B$ if and only if each sequence

$$
A_{i} \xrightarrow{f_{i}} B_{i} \xrightarrow{g_{i}} C_{i}
$$

is exact at $B_{i}$.
Proof. Pre-additivity is easy. A final object is given by $U_{n}=0$ in all degrees. Existence of direct products we saw in Lemmas 14.6 .2 and 14.9 .2 . Kernels and cokernels are obtained by taking termwise kernels and cokernels.

For an object $A$ of $\mathcal{A}$ and an integer $k$ consider the $k$-truncated simplicial object $U$ with
(1) $U_{i}=0$ for $i<k$,
(2) $U_{k}=A$,
(3) all morphisms $U(\varphi)$ equal to zero, except $U\left(\operatorname{id}_{[k]}\right)=\operatorname{id}_{A}$.

Since $\mathcal{A}$ has both finite limits and finite colimits we see that both $\operatorname{cosk}_{k} U$ and $i_{k!} U$ exist. We will describe both of these and the canonical map $i_{k!} U \rightarrow \operatorname{cosk}_{k} U$.

0190 Lemma 14.22.2. With $A, k$ and $U$ as above, so $U_{i}=0, i<k$ and $U_{k}=A$.
(1) Given a $k$-truncated simplicial object $V$ we have

$$
\operatorname{Mor}(U, V)=\left\{f: A \rightarrow V_{k} \mid d_{i}^{k} \circ f=0, i=0, \ldots, k\right\}
$$

and

$$
\operatorname{Mor}(V, U)=\left\{f: V_{k} \rightarrow A \mid f \circ s_{i}^{k-1}=0, i=0, \ldots, k-1\right\}
$$

(2) The object $i_{k!} U$ has $n$th term equal to $\bigoplus_{\alpha} A$ where $\alpha$ runs over all surjective morphisms $\alpha:[n] \rightarrow[k]$.
(3) For any $\varphi:[m] \rightarrow[n]$ the map $i_{k!} U(\varphi)$ is described as the mapping $\bigoplus_{\alpha} A \rightarrow \bigoplus_{\alpha^{\prime}} A$ which maps to component corresponding to $\alpha:[n] \rightarrow[k]$ to zero if $\alpha \circ \varphi$ is not surjective and by the identity to the component corresponding to $\alpha \circ \varphi$ if it is surjective.
(4) The object $\operatorname{cosk}_{k} U$ has nth term equal to $\bigoplus_{\beta} A$, where $\beta$ runs over all injective morphisms $\beta:[k] \rightarrow[n]$.
(5) For any $\varphi:[m] \rightarrow[n]$ the map $\operatorname{cosk}_{k} U(\varphi)$ is described as the mapping $\bigoplus_{\beta} A \rightarrow \bigoplus_{\beta}$ A which maps to component corresponding to $\beta:[k] \rightarrow[n]$ to zero if $\beta$ does not factor through $\varphi$ and by the identity to each of the components corresponding to $\beta^{\prime}$ such that $\beta=\varphi \circ \beta^{\prime}$ if it does.
(6) The canonical map $c: i_{k!} U \rightarrow \operatorname{cosk}_{k} U$ in degree $n$ has $(\alpha, \beta)$ coefficient $A \rightarrow A$ equal to zero if $\alpha \circ \beta$ is not the identity and equal to $i d_{A}$ if it is.
(7) The canonical map $c: i_{k!} U \rightarrow \operatorname{cosk}_{k} U$ is injective.

Proof. The proof of (1) is left to the reader.
Let us take the rules of (2) and (3) as the definition of a simplicial object, call it $\tilde{U}$. We will show that it is an incarnation of $i_{k!} U$. This will prove (2), (3) at the
same time. We have to show that given a morphism $f: U \rightarrow \operatorname{sk}_{k} V$ there exists a unique morphism $\tilde{f}: \tilde{U} \rightarrow V$ which recovers $f$ upon taking the $k$-skeleton. From (1) we see that $f$ corresponds with a morphism $f_{k}: A \rightarrow V_{k}$ which maps into the kernel of $d_{i}^{k}$ for all $i$. For any surjective $\alpha:[n] \rightarrow[k]$ we set $\tilde{f}_{\alpha}: A \rightarrow V_{n}$ equal to the composition $\tilde{f}_{\alpha}=V(\alpha) \circ f_{k}: A \rightarrow V_{n}$. We define $\tilde{f}_{n}: \tilde{U}_{n} \rightarrow V_{n}$ as the sum of the $\tilde{f}_{\alpha}$ over $\alpha:[n] \rightarrow[k]$ surjective. Such a collection of $\tilde{f}_{\alpha}$ defines a morphism of simplicial objects if and only if for any $\varphi:[m] \rightarrow[n]$ the diagram

is commutative. Choosing $\varphi=\alpha$ shows our choice of $\tilde{f}_{\alpha}$ is uniquely determined by $f_{k}$. The commutativity in general may be checked for each summand of the left upper corner separately. It is clear for the summands corresponding to $\alpha$ where $\alpha \circ \varphi$ is surjective, because those get mapped by $\mathrm{id}_{A}$ to the summand with $\alpha^{\prime}=\alpha \circ \varphi$, and we have $\tilde{f}_{\alpha^{\prime}}=V\left(\alpha^{\prime}\right) \circ f_{k}=V(\alpha \circ \varphi) \circ f_{k}=V(\varphi) \circ \tilde{f}_{\alpha}$. For those where $\alpha \circ \varphi$ is not surjective, we have to show that $V(\varphi) \circ \tilde{f}_{\alpha}=0$. By definition this is equal to $V(\varphi) \circ V(\alpha) \circ f_{k}=V(\alpha \circ \varphi) \circ f_{k}$. Since $\alpha \circ \varphi$ is not surjective we can write it as $\delta_{i}^{k} \circ \psi$, and we deduce that $V(\varphi) \circ V(\alpha) \circ f_{k}=V(\psi) \circ d_{i}^{k} \circ f_{k}=0$ see above.

Let us take the rules of (4) and (5) as the definition of a simplicial object, call it $\tilde{U}$. We will show that it is an incarnation of $\operatorname{cosk}_{k} U$. This will prove (4), (5) at the same time. The argument is completely dual to the proof of (2), (3) above, but we give it anyway. We have to show that given a morphism $f: \operatorname{sk}_{k} V \rightarrow U$ there exists a unique morphism $\tilde{f}: V \rightarrow \tilde{U}$ which recovers $f$ upon taking the $k$-skeleton. From (1) we see that $f$ corresponds with a morphism $f_{k}: V_{k} \rightarrow A$ which is zero on the image of $s_{i}^{k-1}$ for all $i$. For any injective $\beta:[k] \rightarrow[n]$ we set $\tilde{f}_{\beta}: V_{n} \rightarrow A$ equal to the composition $\tilde{f}_{\beta}=f_{k} \circ V(\beta): V_{n} \rightarrow A$. We define $\tilde{f}_{n}: V_{n} \rightarrow \tilde{U}_{n}$ as the sum of the $\tilde{f}_{\beta}$ over $\beta:[k] \rightarrow[n]$ injective. Such a collection of $\tilde{f}_{\beta}$ defines a morphism of simplicial objects if and only if for any $\varphi:[m] \rightarrow[n]$ the diagram

is commutative. Choosing $\varphi=\beta$ shows our choice of $\tilde{f}_{\beta}$ is uniquely determined by $f_{k}$. The commutativity in general may be checked for each summand of the right lower corner separately. It is clear for the summands corresponding to $\beta^{\prime}$ where $\varphi \circ \beta^{\prime}$ is injective, because these summands get mapped into by exactly the summand with $\beta=\varphi \circ \beta^{\prime}$ and we have in that case $\tilde{f}_{\beta^{\prime}} \circ V(\varphi)=f_{k} \circ V\left(\beta^{\prime}\right) \circ V(\varphi)=f_{k} \circ V(\beta)=\tilde{f}_{\beta}$. For those where $\varphi \circ \beta^{\prime}$ is not injective, we have to show that $\tilde{f}_{\beta^{\prime}} \circ V(\varphi)=0$. By definition this is equal to $f_{k} \circ V\left(\beta^{\prime}\right) \circ V(\varphi)=f_{k} \circ V\left(\varphi \circ \beta^{\prime}\right)$. Since $\varphi \circ \beta^{\prime}$ is not injective we can write it as $\psi \circ \sigma_{i}^{k-1}$, and we deduce that $f_{k} \circ V\left(\beta^{\prime}\right) \circ V(\varphi)=f_{k} \circ s_{i}^{k-1} \circ V(\psi)=0$ see above.

The composition $i_{k!} U \rightarrow \operatorname{cosk}_{k} U$ is the unique map of simplicial objects which is the identity on $A=U_{k}=\left(i_{k!} U\right)_{k}=\left(\operatorname{cosk}_{k} U\right)_{k}$. Hence it suffices to check that the proposed rule defines a morphism of simplicial objects. To see this we have to show that for any $\varphi:[m] \rightarrow[n]$ the diagram

is commutative. Now we can think of this in terms of matrices filled with only 0 's and 1's as follows: The matrix of (3) has a nonzero $\left(\alpha^{\prime}, \alpha\right)$ entry if and only if $\alpha^{\prime}=\alpha \circ \varphi$. Likewise the matrix of (5) has a nonzero $\left(\beta^{\prime}, \beta\right)$ entry if and only if $\beta=\varphi \circ \beta^{\prime}$. The upper matrix of (6) has a nonzero $(\alpha, \beta)$ entry if and only if $\alpha \circ \beta=\operatorname{id}_{[k]}$. Similarly for the lower matrix of (6). The commutativity of the diagram then comes down to computing the $\left(\alpha, \beta^{\prime}\right)$ entry for both compositions and seeing they are equal. This comes down to the following equality

$$
\#\left\{\beta \mid \beta=\varphi \circ \beta^{\prime} \wedge \alpha \circ \beta=\operatorname{id}_{[k]}\right\}=\#\left\{\alpha^{\prime} \mid \alpha^{\prime}=\alpha \circ \varphi \wedge \alpha^{\prime} \circ \beta^{\prime}=\operatorname{id}_{[k]}\right\}
$$

whose proof may safely be left to the reader.
Finally, we prove (7). This follows directly from Lemmas 14.18.7, 14.19.4, 14.21.3 and 14.21 .9 .

0191 Definition 14.22.3. Let $\mathcal{A}$ be an abelian category. Let $A$ be an object of $\mathcal{A}$ and let $k$ be an integer $\geq 0$. The Eilenberg-Maclane object $K(A, k)$ is given by the object $K(A, k)=i_{k!} U$ which is described in Lemma 14.22 .2 above.

0192 Lemma 14.22.4. Let $\mathcal{A}$ be an abelian category. Let $A$ be an object of $\mathcal{A}$ and let $k$ be an integer $\geq 0$. Consider the simplicial object $E$ defined by the following rules
(1) $E_{n}=\bigoplus_{\alpha} A$, where the sum is over $\alpha:[n] \rightarrow[k+1]$ whose image is either $[k]$ or $[k+1]$.
(2) Given $\varphi:[m] \rightarrow[n]$ the map $E_{n} \rightarrow E_{m}$ maps the summand corresponding to $\alpha$ via $^{2} d_{A}$ to the summand corresponding to $\alpha \circ \varphi$, provided $\operatorname{Im}(\alpha \circ \varphi)$ is equal to $[k]$ or $[k+1]$.
Then there exists a short exact sequence

$$
0 \rightarrow K(A, k) \rightarrow E \rightarrow K(A, k+1) \rightarrow 0
$$

which is term by term split exact.
Proof. The maps $K(A, k)_{n} \rightarrow E_{n}$ resp. $E_{n} \rightarrow K(A, k+1)_{n}$ are given by the inclusion of direct sums, resp. projection of direct sums which is obvious from the inclusions of index sets. It is clear that these are maps of simplicial objects.

0193 Lemma 14.22.5. Let $\mathcal{A}$ be an abelian category. For any simplicial object $V$ of $\mathcal{A}$ we have

$$
V=\operatorname{colim}_{n} i_{n!} s k_{n} V
$$

where all the transition maps are injections.
Proof. This is true simply because each $V_{m}$ is equal to $\left(i_{n!} \mathrm{sk}_{n} V\right)_{m}$ as soon as $n \geq m$. See also Lemma 14.21 .10 for the transition maps.

### 14.23. Simplicial objects and chain complexes

0194 Let $\mathcal{A}$ be an abelian category. See Homology, Section 12.12 for conventions and notation regarding chain complexes. Let $U$ be a simplicial object of $\mathcal{A}$. The associated chain complex $s(U)$ of $U$, sometimes called the Moore complex, is the chain complex

$$
\ldots \rightarrow U_{2} \rightarrow U_{1} \rightarrow U_{0} \rightarrow 0 \rightarrow 0 \rightarrow \ldots
$$

with boundary maps $d_{n}: U_{n} \rightarrow U_{n-1}$ given by the formula

$$
d_{n}=\sum_{i=0}^{n}(-1)^{i} d_{i}^{n}
$$

This is a complex because, by the relations listed in Remark 14.3.3, we have

$$
\begin{aligned}
d_{n} \circ d_{n+1} & =\left(\sum_{i=0}^{n}(-1)^{i} d_{i}^{n}\right) \circ\left(\sum_{j=0}^{n+1}(-1)^{j} d_{j}^{n+1}\right) \\
& =\sum_{0 \leq i<j \leq n+1}(-1)^{i+j} d_{j-1}^{n} \circ d_{i}^{n+1}+\sum_{n \geq i \geq j \geq 0}(-1)^{i+j} d_{i}^{n} \circ d_{j}^{n+1} \\
& =0
\end{aligned}
$$

The signs cancel! We denote the associated chain complex $s(U)$. Clearly, the construction is functorial and hence defines a functor

$$
s: \operatorname{Simp}(\mathcal{A}) \longrightarrow \mathrm{Ch}_{\geq 0}(\mathcal{A})
$$

Thus we have the confusing but correct formula $s(U)_{n}=U_{n}$.
0195 Lemma 14.23.1. The functor $s$ is exact.
Proof. Clear from Lemma 14.22.1.
0196 Lemma 14.23.2. Let $\mathcal{A}$ be an abelian category. Let $A$ be an object of $\mathcal{A}$ and let $k$ be an integer. Let $E$ be the object described in Lemma 14.22.4. Then the complex $s(E)$ is acyclic.

Proof. For a morphism $\alpha:[n] \rightarrow[k+1]$ we define $\alpha^{\prime}:[n+1] \rightarrow[k+1]$ to be the map such that $\left.\alpha^{\prime}\right|_{[n]}=\alpha$ and $\alpha^{\prime}(n+1)=k+1$. Note that if the image of $\alpha$ is $[k]$ or $[k+1]$, then the image of $\alpha^{\prime}$ is $[k+1]$. Consider the family of maps $h_{n}: E_{n} \rightarrow E_{n+1}$ which maps the summand corresponding to $\alpha$ to the summand corresponding to $\alpha^{\prime}$ via the identity on $A$. Let us compute $d_{n+1} \circ h_{n}-h_{n-1} \circ d_{n}$. We will first do this in case the category $\mathcal{A}$ is the category of abelian groups. Let us use the notation $x_{\alpha}$ to indicate the element $x \in A$ in the summand of $E_{n}$ corresponding to the map $\alpha$ occurring in the index set. Let us also adopt the convention that $x_{\alpha}$ designates the zero element of $E_{n}$ whenever $\operatorname{Im}(\alpha)$ is not $[k]$ or $[k+1]$. With these conventions we see that

$$
d_{n+1}\left(h_{n}\left(x_{\alpha}\right)\right)=\sum_{i=0}^{n+1}(-1)^{i} x_{\alpha^{\prime} \circ \delta_{i}^{n+1}}
$$

and

$$
h_{n-1}\left(d_{n}\left(x_{\alpha}\right)\right)=\sum_{i=0}^{n}(-1)^{i} x_{\left(\alpha \circ \delta_{i}^{n}\right)^{\prime}}
$$

It is easy to see that $\alpha^{\prime} \circ \delta_{i}^{n+1}=\left(\alpha \circ \delta_{i}^{n}\right)^{\prime}$ for $i=0, \ldots, n$. It is also easy to see that $\alpha^{\prime} \circ \delta_{n+1}^{n+1}=\alpha$. Thus we see that

$$
\left(d_{n+1} \circ h_{n}-h_{n-1} \circ d_{n}\right)\left(x_{\alpha}\right)=(-1)^{n+1} x_{\alpha}
$$

These identities continue to hold if $\mathcal{A}$ is any abelian category because they hold in the simplicial abelian group $[n] \mapsto \operatorname{Hom}\left(A, E_{n}\right)$; details left to the reader. We conclude that the identity map on $E$ is homotopic to zero, with homotopy given by
the system of maps $h_{n}^{\prime}=(-1)^{n+1} h_{n}: E_{n} \rightarrow E_{n+1}$. Hence we see that $E$ is acyclic, for example by Homology, Lemma 12.12 .5 .

0197 Lemma 14.23.3. Let $\mathcal{A}$ be an abelian category. Let $A$ be an object of $\mathcal{A}$ and let $k$ be an integer. We have $H_{i}(s(K(A, k)))=A$ if $i=k$ and 0 else.

Proof. First, let us prove this if $k=0$. In this case we have $K(A, 0)_{n}=A$ for all $n$. Furthermore, all the maps in this simplicial abelian group are $\mathrm{id}_{A}$, in other words $K(A, 0)$ is the constant simplicial object with value $A$. The boundary maps $d_{n}=\sum_{i=0}^{n}(-1)^{i} \operatorname{id}_{A}=0$ if $n$ odd and $=\mathrm{id}_{A}$ if $n$ is even. Thus $s(K(A, 0))$ looks like this

$$
\ldots \rightarrow A \xrightarrow{0} A \xrightarrow{1} A \xrightarrow{0} A \rightarrow 0
$$

and the result is clear.
Next, we prove the result for all $k$ by induction. Given the result for $k$ consider the short exact sequence

$$
0 \rightarrow K(A, k) \rightarrow E \rightarrow K(A, k+1) \rightarrow 0
$$

from Lemma 14.22.4. By Lemma 14.22.1 the associated sequence of chain complexes is exact. By Lemma 14.23 .2 we see that $s(E)$ is acyclic. Hence the result for $k+1$ follows from the long exact sequence of homology, see Homology, Lemma 12.12 .6

There is a second chain complex we can associate to a simplicial object of $\mathcal{A}$. Recall that by Lemma 14.18 .6 any simplicial object $U$ of $\mathcal{A}$ is canonically split with $N\left(U_{m}\right)=\bigcap_{i=0}^{m-1} \operatorname{Ker}\left(d_{i}^{m}\right)$. We define the normalized chain complex $N(U)$ to be the chain complex

$$
\ldots \rightarrow N\left(U_{2}\right) \rightarrow N\left(U_{1}\right) \rightarrow N\left(U_{0}\right) \rightarrow 0 \rightarrow 0 \rightarrow \ldots
$$

with boundary map $d_{n}: N\left(U_{n}\right) \rightarrow N\left(U_{n-1}\right)$ given by the restriction of $(-1)^{n} d_{n}^{n}$ to the direct summand $N\left(U_{n}\right)$ of $U_{n}$. Note that Lemma 14.18 .8 implies that $d_{n}^{n}\left(N\left(U_{n}\right)\right) \subset N\left(U_{n-1}\right)$. It is a complex because $d_{n}^{n} \circ d_{n+1}^{n+1}=d_{n}^{n} \circ d_{n}^{n+1}$ and $d_{n}^{n+1}$ is zero on $N\left(U_{n+1}\right)$ by definition. Thus we obtain a second functor

$$
N: \operatorname{Simp}(\mathcal{A}) \longrightarrow \mathrm{Ch}_{\geq 0}(\mathcal{A})
$$

Here is the reason for the sign in the differential.
0198 Lemma 14.23.4. Let $\mathcal{A}$ be an abelian category. Let $U$ be a simplicial object of $\mathcal{A}$. The canonical map $N\left(U_{n}\right) \rightarrow U_{n}$ gives rise to a morphism of complexes $N(U) \rightarrow s(U)$.

Proof. This is clear because the differential on $s(U)_{n}=U_{n}$ is $\sum(-1)^{i} d_{i}^{n}$ and the maps $d_{i}^{n}, i<n$ are zero on $N\left(U_{n}\right)$, whereas the restriction of $(-1)^{n} d_{n}^{n}$ is the boundary map of $N(U)$ by definition.

0199 Lemma 14.23.5. Let $\mathcal{A}$ be an abelian category. Let $A$ be an object of $\mathcal{A}$ and let $k$ be an integer. We have $N(K(A, k))_{i}=A$ if $i=k$ and 0 else.

Proof. It is clear that $N(K(A, k))_{i}=0$ when $i<k$ because $K(A, k)_{i}=0$ in that case. It is clear that $N(K(A, k))_{k}=A$ since $K(A, k)_{k-1}=0$ and $K(A, k)_{k}=A$. For $i>k$ we have $N(K(A, k))_{i}=0$ by Lemma 14.21 .9 and the definition of $K(A, k)$, see Definition 14.22.3

019A Lemma 14.23.6. Let $\mathcal{A}$ be an abelian category. Let $U$ be a simplicial object of $\mathcal{A}$. The canonical morphism of chain complexes $N(U) \rightarrow s(U)$ is split. In fact,

$$
s(U)=N(U) \oplus A(U)
$$

for some complex $A(U)$. The construction $U \mapsto A(U)$ is functorial.
Proof. Define $A(U)_{n}$ to be the image of

$$
\bigoplus_{\varphi:[n] \rightarrow[m] \text { surjective, } m<n} N\left(U_{m}\right) \xrightarrow{\oplus U(\varphi)} U_{n}
$$

which is a subobject of $U_{n}$ complementary to $N\left(U_{n}\right)$ according to Lemma 14.18.6 and Definition 14.18.1. We show that $A(U)$ is a subcomplex. Pick a surjective map $\varphi:[n] \rightarrow[m]$ with $m<n$ and consider the composition

$$
N\left(U_{m}\right) \xrightarrow{U(\varphi)} U_{n} \xrightarrow{d_{n}} U_{n-1}
$$

This composition is the sum of the maps

$$
N\left(U_{m}\right) \xrightarrow{U\left(\varphi \circ \delta_{i}^{n}\right)} U_{n-1}
$$

with $\operatorname{sign}(-1)^{i}, i=0, \ldots, n$.
First we will prove by ascending induction on $m, 0 \leq m<n-1$ that all the maps $U\left(\varphi \circ \delta_{i}^{n}\right) \operatorname{map} N\left(U_{m}\right)$ into $A(U)_{n-1}$. (The case $m=n-1$ is treated below.) Whenever the map $\varphi \circ \delta_{i}^{n}:[n-1] \rightarrow[m]$ is surjective then the image of $N\left(U_{m}\right)$ under $U\left(\varphi \circ \delta_{i}^{n}\right)$ is contained in $A(U)_{n-1}$ by definition. If $\varphi \circ \delta_{i}^{n}:[n-1] \rightarrow[m]$ is not surjective, set $j=\varphi(i)$ and observe that $i$ is the unique index whose image under $\varphi$ is $j$. We may write $\varphi \circ \delta_{i}^{n}=\delta_{j}^{m} \circ \psi \circ \delta_{i}^{n}$ for some $\psi:[n-1] \rightarrow[m-1]$. Hence $U\left(\varphi \circ \delta_{i}^{n}\right)=U\left(\psi \circ \delta_{i}^{n}\right) \circ d_{j}^{m}$ which is zero on $N\left(U_{m}\right)$ unless $j=m$. If $j=m$, then $d_{m}^{m}\left(N\left(U_{m}\right)\right) \subset N\left(U_{m-1}\right)$ and hence $U\left(\varphi \circ \delta_{i}^{n}\right)\left(N\left(U_{m}\right)\right) \subset U\left(\psi \circ \delta_{i}^{n}\right)\left(N\left(U_{m-1}\right)\right)$ and we win by induction hypothesis.

To finish proving that $A(U)$ is a subcomplex we still have to deal with the composition

$$
N\left(U_{m}\right) \xrightarrow{U(\varphi)} U_{n} \xrightarrow{d_{n}} U_{n-1}
$$

in case $m=n-1$. In this case $\varphi=\sigma_{j}^{n-1}$ for some $0 \leq j \leq n-1$ and $U(\varphi)=s_{j}^{n-1}$. Thus the composition is given by the sum

$$
\sum(-1)^{i} d_{i}^{n} \circ s_{j}^{n-1}
$$

Recall from Remark 14.3 .3 that $d_{j}^{n} \circ s_{j}^{n-1}=d_{j+1}^{n} \circ s_{j}^{n-1}=$ id and these drop out because the corresponding terms have opposite signs. The map $d_{n}^{n} \circ s_{j}^{n-1}$, if $j<n-1$, is equal to $s_{j}^{n-2} \circ d_{n-1}^{n-1}$. Since $d_{n-1}^{n-1} \operatorname{maps} N\left(U_{n-1}\right)$ into $N\left(U_{n-2}\right)$, we see that the image $d_{n}^{n}\left(s_{j}^{n-1}\left(N\left(U_{n-1}\right)\right)\right.$ is contained in $s_{j}^{n-2}\left(N\left(U_{n-2}\right)\right)$ which is contained in $A\left(U_{n-1}\right)$ by definition. For all other combinations of $(i, j)$ we have either $d_{i}^{n} \circ s_{j}^{n-1}=s_{j-1}^{n-2} \circ d_{i}^{n-1}($ if $i<j)$, or $d_{i}^{n} \circ s_{j}^{n-1}=s_{j}^{n-2} \circ d_{i-1}^{n-1}($ if $n>i>j+1)$ and in these cases the map is zero because of the definition of $N\left(U_{n-1}\right)$.

019B Lemma 14.23.7. The functor $N$ is exact.
Proof. By Lemma 14.23 .1 and the functorial decomposition of Lemma 14.23.6.

019C Lemma 14.23.8. Let $\mathcal{A}$ be an abelian category. Let $V$ be a simplicial object of $\mathcal{A}$. The canonical morphism of chain complexes $N(V) \rightarrow s(V)$ is a quasi-isomorphism. In other words, the complex $A(V)$ of Lemma 14.23 .6 is acyclic.

Proof. Note that the result holds for $K(A, k)$ for any object $A$ and any $k \geq 0$, by Lemmas 14.23 .3 and 14.23 .5 . Consider the hypothesis $I H_{n, m}$ : for all $V$ such that $V_{j}=0$ for $j \leq m$ and all $i \leq n$ the map $N(V) \rightarrow s(V)$ induces an isomorphism $H_{i}(N(V)) \rightarrow H_{i}(s(V))$.
To start of the induction, note that $I H_{n, n}$ is trivially true, because in that case $N(V)_{n}=0$ and $s(V)_{n}=0$.

Assume $I H_{n, m}$, with $m \leq n$. Pick a simplicial object $V$ such that $V_{j}=0$ for $j<m$. By Lemma 14.22 .2 and Definition 14.22 .3 we have $K\left(V_{m}, m\right)=i_{m!} \mathrm{sk}_{m} V$. By Lemma 14.21 .10 the natural morphism

$$
K\left(V_{m}, m\right)=i_{m!} \mathrm{sk}_{m} V \rightarrow V
$$

is injective. Thus we get a short exact sequence

$$
0 \rightarrow K\left(V_{m}, m\right) \rightarrow V \rightarrow W \rightarrow 0
$$

for some $W$ with $W_{i}=0$ for $i=0, \ldots, m$. This short exact sequence induces a morphism of short exact sequence of associated complexes

see Lemmas 14.23.1 and 14.23.7. Hence we deduce the result for $V$ from the result on the ends.

### 14.24. Dold-Kan

019D
019E Lemma 14.24.1. Let $\mathcal{A}$ be an abelian category. The functor $N$ is faithful, and reflects isomorphisms, injections and surjections.

Proof. The faithfulness is immediate from the canonical splitting of Lemma 14.18 .6 The statement on reflecting injections, surjections, and isomorphisms follows from Lemma 14.18.7.

019F Lemma 14.24.2. Let $\mathcal{A}$ and $\mathcal{B}$ be abelian categories. Let $N: \mathcal{A} \rightarrow \mathcal{B}$, and $S: \mathcal{B} \rightarrow \mathcal{A}$ be functors. Suppose that
(1) the functors $S$ and $N$ are exact,
(2) there is an isomorphism $g: N \circ S \rightarrow i d_{\mathcal{B}}$ to the identity functor of $\mathcal{B}$,
(3) $N$ is faithful, and
(4) $S$ is essentially surjective.

Then $S$ and $N$ are quasi-inverse equivalences of categories.
Proof. It suffices to construct a functorial isomorphism $S(N(A)) \cong A$. To do this choose $B$ and an isomorphism $f: A \rightarrow S(B)$. Consider the map

$$
f^{-1} \circ g_{S(B)} \circ S(N(f)): S(N(A)) \rightarrow S(N(S(B))) \rightarrow S(B) \rightarrow A
$$

It is easy to show this does not depend on the choice of $f, B$ and gives the desired isomorphism $S \circ N \rightarrow \operatorname{id}_{\mathcal{A}}$.

019G Theorem 14.24.3. Let $\mathcal{A}$ be an abelian category. The functor $N$ induces an equivalence of categories

$$
N: \operatorname{Simp}(\mathcal{A}) \longrightarrow C h_{\geq 0}(\mathcal{A})
$$

Proof. We will describe a functor in the reverse direction inspired by the construction of Lemma 14.22 .4 (except that we throw in a sign to get the boundaries right). Let $A \bullet$ be a chain complex with boundary maps $d_{A, n}: A_{n} \rightarrow A_{n-1}$. For each $n \geq 0$ denote

$$
I_{n}=\{\alpha:[n] \rightarrow\{0,1,2, \ldots\} \mid \operatorname{Im}(\alpha)=[k] \text { for some } k\} .
$$

For $\alpha \in I_{n}$ we denote $k(\alpha)$ the unique integer such that $\operatorname{Im}(\alpha)=[k]$. We define a simplicial object $S\left(A_{\bullet}\right)$ as follows:
(1) $S\left(A_{\bullet}\right)_{n}=\bigoplus_{\alpha \in I_{n}} A_{k(\alpha)}$, which we will write as $\bigoplus_{\alpha \in I_{n}} A_{k(\alpha)} \cdot \alpha$ to suggest thinking of " $\alpha$ " as a basis vector for the summand corresponding to it,
(2) given $\varphi:[m] \rightarrow[n]$ we define $S\left(A_{\bullet}\right)(\varphi)$ by its restriction to the direct summand $A_{k(\alpha)} \cdot \alpha$ of $S\left(A_{\bullet}\right)_{n}$ as follows
(a) $\alpha \circ \varphi \notin I_{m}$ then we set it equal to zero,
(b) $\alpha \circ \varphi \in I_{m}$ but $k(\alpha \circ \varphi)$ not equal to either $k(\alpha)$ or $k(\alpha)-1$ then we set it equal to zero as well,
(c) if $\alpha \circ \varphi \in I_{m}$ and $k(\alpha \circ \varphi)=k(\alpha)$ then we use the identity map to the summand $A_{k(\alpha \circ \varphi)} \cdot(\alpha \circ \varphi)$ of $S\left(A_{\bullet}\right)_{m}$, and
(d) if $\alpha \circ \varphi \in I_{m}$ and $k(\alpha \circ \varphi)=k(\alpha)-1$ then we use $(-1)^{k(\alpha)} d_{A, k(\alpha)}$ to the summand $A_{k(\alpha \circ \varphi)} \cdot(\alpha \circ \varphi)$ of $S\left(A_{\bullet}\right)_{m}$.
It is an exercise (FIXME) to show that this is a simplicial complex; one has to use in particular that the compositions $d_{A, k} \circ d_{A, k-1}$ are all zero.

Having verified this, the correct way to proceed with the proof would be to prove directly that $N$ and $S$ are quasi-inverse functors (FIXME). Instead we prove this by an indirect method using Eilenberg-Maclane objects and truncations. It is clear that $A_{\bullet} \mapsto S\left(A_{\bullet}\right)$ is an exact functor from chain complexes to simplicial objects. If $A_{i}=0$ for $i=0, \ldots, n$ then $S\left(A_{\bullet}\right)_{i}=0$ for $i=0, \ldots, n$. The objects $K(A, k)$, see Definition 14.22 .3 , are equal to $S(A[-k])$ where $A[-k]$ is the chain complex with $A$ in degree $k$ and zero elsewhere.

Moreover, for each integer $k$ we get a sub simplicial object $S_{\leq k}\left(A_{\bullet}\right)$ by considering only those $\alpha$ with $k(\alpha) \leq k$. In fact this is nothing but $S\left(\sigma_{\leq k} A_{\bullet}\right)$, where $\sigma_{\leq k} A_{\bullet}$ is the "stupid" truncation of $A \bullet$ at $k$ (which simply replaces $A_{i}$ by 0 for $i>k$ ). Also, by Lemma 14.21 .10 we see that it is equal to $i_{k!} \mathrm{sk}_{k} S\left(A_{\bullet}\right)$. Clearly, the quotient $S_{\leq k}\left(A_{\bullet}\right) / S_{\leq k-1}\left(A_{\bullet}\right)=K\left(A_{k}, k\right)$ and the quotient $S\left(A_{\bullet}\right) / S_{\leq k}\left(A_{\bullet}\right)=S\left(A / \sigma_{\leq k} A_{\bullet}\right)$ is a simplicial object whose $i$ th term is zero for $i=0, \ldots, k$. Since $S_{\leq k-1}\left(A_{\bullet}\right)$ is filtered with subquotients $K\left(A_{i}, i\right), i<k$ we see that $N\left(S_{\leq k-1}\left(A_{\bullet}\right)\right)_{k}=0$ by exactness of the functor $N$, see Lemma 14.23 .7 . All in all we conclude that the maps

$$
N\left(S\left(A_{\bullet}\right)\right)_{k} \leftarrow N\left(S_{\leq k}\left(A_{\bullet}\right)\right)_{k} \rightarrow N\left(S\left(A_{k}[-k]\right)\right)=N\left(K\left(A_{k}, k\right)\right)_{k}=A_{k}
$$

are functorial isomorphisms.

It is actually easy to identify the map $A_{k} \rightarrow N\left(S\left(A_{\bullet}\right)\right)_{k}$. Note that there is a unique map $A_{k} \rightarrow S\left(A_{\bullet}\right)_{k}$ corresponding to the summand $\alpha=\operatorname{id}_{[k]}$. Note that $\operatorname{Im}\left(\operatorname{id}_{[k]} \circ \delta_{i}^{k}\right)$ has cardinality $k-1$ but does not have image $[k-1]$ unless $i=k$. Hence $d_{i}^{k}$ kills the summand $A_{k} \cdot \operatorname{id}_{[k]}$ for $i=0, \ldots, k-1$. From the abstract computation of $N\left(S\left(A_{\bullet}\right)\right)_{k}$ above we conclude that the summand $A_{k} \cdot \mathrm{id}_{[k]}$ is equal to $N\left(S\left(A_{\bullet}\right)\right)_{k}$.

In order to show that $N \circ S$ is the identity functor on $\mathrm{Ch}_{\geq 0}(\mathcal{A})$, the last thing we have to verify is that we recover the map $d_{A, k+1}: A_{k+1} \rightarrow A_{k}$ as the differential on the complex $N\left(S\left(A_{\bullet}\right)\right)$ as follows

$$
A_{k+1}=N\left(S\left(A_{\bullet}\right)\right)_{k+1} \rightarrow N\left(S\left(A_{\bullet}\right)\right)_{k}=A_{k}
$$

By definition the map $N\left(S\left(A_{\bullet}\right)\right)_{k+1} \rightarrow N\left(S\left(A_{\bullet}\right)\right)_{k}$ corresponds to the restriction of $(-1)^{k+1} d_{k+1}^{k+1}$ to $N\left(S\left(A_{\bullet}\right)\right)$ which is the summand $A_{k+1} \cdot \mathrm{id}_{[k+1]}$. And by the definition of $S\left(A_{\bullet}\right)$ above the map $d_{k+1}^{k+1}$ maps $A_{k+1} \cdot \operatorname{id}_{[k+1]}$ into $A_{k} \cdot \mathrm{id}_{[k]}$ by $(-1)^{k+1} d_{A, k+1}$. The signs cancel and hence the desired equality.

We know that $N$ is faithful, see Lemma 14.24.1. If we can show that $S$ is essentially surjective, then it will follow that $N$ is an equivalence, see Homology, Lemma 14.24.2 Note that if $A_{\bullet}$ is a chain complex then $S\left(A_{\bullet}\right)=\operatorname{colim}_{n} S_{\leq n}\left(A_{\bullet}\right)=$ $\operatorname{colim}_{n} S\left(\sigma_{\leq n} A_{\bullet}\right)=\operatorname{colim}_{n} i_{n!} \mathrm{sk}_{n} S\left(A_{\bullet}\right)$ by construction of $S$. By Lemma 14.22 .5 it suffices to show that $i_{n!} V$ is in the essential image for any $n$-truncated simplicial object $V$. By induction on $n$ it suffices to show that any extension

$$
0 \rightarrow S\left(A_{\bullet}\right) \rightarrow V \rightarrow K(A, n) \rightarrow 0
$$

where $A_{i}=0$ for $i \geq n$ is in the essential image of $S$. By Homology, Lemma 12.7.2 we have abelian group homomorphisms

$$
\operatorname{Ext}_{\operatorname{Simp}(\mathcal{A})}(K(A, n), S(A \bullet)) \underset{S}{\stackrel{N}{<}} \operatorname{Ext}_{\mathrm{Ch}_{\geq 0}(\mathcal{A})}\left(A[-n], A_{\bullet}\right)
$$

between ext groups (see Homology, Definition 12.6.2). We want to show that $S$ is surjective. We know that $N \circ S=$ id. Hence it suffices to show that $\operatorname{Ker}(N)=0$. Clearly an extension

of $A$ • by $A[-n]$ in $\operatorname{Ch}(\mathcal{A})$ is zero if and only if the map $A \rightarrow A_{n-1}$ is zero. Thus we have to show that any extension

$$
0 \rightarrow S\left(A_{\bullet}\right) \rightarrow V \rightarrow K(A, n) \rightarrow 0
$$

such that $A=N(V)_{n} \rightarrow N(V)_{n-1}$ is zero is split. By Lemma 14.22 .2 we have

$$
\operatorname{Mor}(K(A, n), V)=\left\{f: A \rightarrow \bigcap_{i=0}^{n} \operatorname{Ker}\left(d_{i}^{n}: V_{n} \rightarrow V_{n-1}\right)\right\}
$$

and if $A=N(V)_{n} \rightarrow N(V)_{n-1}$ is zero, then the intersection occurring in the formula above is equal to $A$. Let $i: K(A, n) \rightarrow V$ be the morphism corresponding to $\mathrm{id}_{A}$ on the right hand side of the displayed formula. Clearly this is a section to the map $V \rightarrow K(A, n)$ and the extension is split as desired.

### 14.25. Dold-Kan for cosimplicial objects

019 H Let $\mathcal{A}$ be an abelian category. According to Homology, Lemma 12.5.2 also $\mathcal{A}^{\text {opp }}$ is abelian. It follows formally from the definitions that

$$
\operatorname{CoSimp}(\mathcal{A})=\operatorname{Simp}\left(\mathcal{A}^{o p p}\right)^{o p p}
$$

Thus Dold-Kan (Theorem 14.24.3) implies that $\operatorname{CoSimp}(\mathcal{A})$ is equivalent to the category $\mathrm{Ch}_{\geq 0}\left(\mathcal{A}^{\text {opp }}\right)^{o p p}$. And it follows formally from the definitions that

$$
\mathrm{CoCh}_{\geq 0}(\mathcal{A})=\mathrm{Ch}_{\geq 0}\left(\mathcal{A}^{o p p}\right)^{o p p}
$$

Putting these arrows together we obtain an equivalence

$$
Q: \operatorname{CoSimp}(\mathcal{A}) \longrightarrow \mathrm{CoCh}_{\geq 0}(\mathcal{A})
$$

In this section we describe $Q$.
First we define the cochain complex $s(U)$ associated to a cosimplicial object $U$. It is the cochain complex with terms zero in negative degrees, and $s(U)^{n}=U_{n}$ for $n \geq 0$. As differentials we use the maps $d^{n}: s(U)^{n} \rightarrow s(U)^{n+1}$ defined by $d^{n}=\sum_{i=0}^{n+1}(-1)^{i} \delta_{i}^{n+1}$. In other words the complex $s(U)$ looks like

$$
0 \longrightarrow U_{0} \xrightarrow{\delta_{0}^{1}-\delta_{1}^{1}} U_{1} \xrightarrow{\delta_{0}^{2}-\delta_{1}^{2}+\delta_{2}^{2}} U_{2} \longrightarrow \ldots
$$

This is sometimes also called the Moore complex associated to $U$.
On the other hand, given a cosimplicial object $U$ of $\mathcal{A}$ set $Q(U)^{0}=U_{0}$ and

$$
Q(U)^{n}=\operatorname{Coker}\left(\bigoplus_{i=0}^{n-1} U_{n-1} \xrightarrow{\delta_{i}^{n}} U_{n}\right)
$$

The differential $d^{n}: Q(U)^{n} \rightarrow Q(U)^{n+1}$ is induced by $(-1)^{n+1} \delta_{n+1}^{n+1}$, i.e., by fitting the morphism $(-1)^{n+1} \delta_{n+1}^{n+1}$ into a commutative diagram

We leave it to the reader to show that this diagram makes sense, i.e., that the image of $\delta_{i}^{n}$ maps into the kernel of the right vertical arrow for $i=0, \ldots, n-1$. (This is dual to Lemma 14.18.8.) Thus our cochain complex $Q(U)$ looks like this

$$
0 \rightarrow Q(U)^{0} \rightarrow Q(U)^{1} \rightarrow Q(U)^{2} \rightarrow \ldots
$$

This is called the normalized cochain complex associated to $U$. The dual to the Dold-Kan Theorem 14.24 .3 is the following.

019 Lemma 14.25.1. Let $\mathcal{A}$ be an abelian category.
(1) The functor $s: \operatorname{CoSimp}(\mathcal{A}) \rightarrow \operatorname{CoCh}_{\geq 0}(\mathcal{A})$ is exact.
(2) The maps $s(U)^{n} \rightarrow Q(U)^{n}$ define a morphism of cochain complexes.
(3) There exists a functorial direct sum decomposition $s(U)=A(U) \oplus Q(U)$ in $C o C h_{\geq 0}(\mathcal{A})$.
(4) The functor $Q$ is exact.
(5) The morphism of complexes $s(U) \rightarrow Q(U)$ is a quasi-isomorphism.
(6) The functor $U \mapsto Q(U)^{\bullet}$ defines an equivalence of categories $\operatorname{CoSimp}(\mathcal{A}) \rightarrow$ $C o C h_{\geq 0}(\mathcal{A})$.
Proof. Omitted. But the results are the exact dual statements to Lemmas 14.23.1, $14.23 .4,14.23 .6,14.23 .7,14.23 .8$, and Theorem 14.24 .3 .

### 14.26. Homotopies

019J Consider the simplicial sets $\Delta[0]$ and $\Delta[1]$. Recall that there are two morphisms

$$
e_{0}, e_{1}: \Delta[0] \longrightarrow \Delta[1]
$$

coming from the morphisms $[0] \rightarrow[1]$ mapping 0 to an element of $[1]=\{0,1\}$. Recall also that each set $\Delta[1]_{k}$ is finite. Hence, if the category $\mathcal{C}$ has finite coproducts, then we can form the product

$$
U \times \Delta[1]
$$

for any simplicial object $U$ of $\mathcal{C}$, see Definition 14.13.1. Note that $\Delta[0]$ has the property that $\Delta[0]_{k}=\{*\}$ is a singleton for all $k \geq 0$. Hence $U \times \Delta[0]=U$. Thus $e_{0}, e_{1}$ above gives rise to morphisms

$$
e_{0}, e_{1}: U \rightarrow U \times \Delta[1]
$$

019K Definition 14.26.1. Let $\mathcal{C}$ be a category having finite coproducts. Suppose that $U$ and $V$ are two simplicial objects of $\mathcal{C}$. Let $a, b: U \rightarrow V$ be two morphisms.
(1) We say a morphism

$$
h: U \times \Delta[1] \longrightarrow V
$$

is a homotopy connecting a to $b$ if $a=h \circ e_{0}$ and $b=h \circ e_{1}$.
(2) We say morphisms $a$ and $b$ are homotopic if there exists a homotopy connecting $a$ to $b$ or a homotopy connecting $b$ to $a$.

Warning: Being homotopic is not an equivalence relation on the set of all morphisms from $U$ to $V$ ! The relation "there exists a homotopy from $a$ to $b$ " is not symmetric.
It turns out we can define homotopies between pairs of maps of simplicial objects in any category. To do this you just work out what it means to have the morphisms $h_{n}:(U \times \Delta[1])_{n} \rightarrow V_{n}$ in terms of the mapping property of coproducts.

Let $\mathcal{C}$ be a category with finite coproducts. Let $U, V$ be simplicial objects of $\mathcal{C}$. Let $a, b: U \rightarrow V$ be morphisms. Further, suppose that $h: U \times \Delta[1] \rightarrow V$ is a homotopy connecting $a$ to $b$. For every $n \geq 0$ let us write

$$
\Delta[1]_{n}=\left\{\alpha_{0}^{n}, \ldots, \alpha_{n+1}^{n}\right\}
$$

where $\alpha_{i}^{n}:[n] \rightarrow[1]$ is the map such that

$$
\alpha_{i}^{n}(j)=\left\{\begin{array}{lll}
0 & \text { if } & j<i \\
1 & \text { if } & j \geq i
\end{array}\right.
$$

Thus

$$
h_{n}:(U \times \Delta[1])_{n}=\coprod U_{n} \cdot \alpha_{i}^{n} \longrightarrow V_{n}
$$

has a component $h_{n, i}: U_{n} \rightarrow V_{n}$ which is the restriction to the summand corresponding to $\alpha_{i}^{n}$ for all $i=0, \ldots, n+1$.
019L Lemma 14.26.2. In the situation above, we have the following relations:
(1) We have $h_{n, 0}=b_{n}$ and $h_{n, n+1}=a_{n}$.
(2) We have $d_{j}^{n} \circ h_{n, i}=h_{n-1, i-1} \circ d_{j}^{n}$ for $i>j$.
(3) We have $d_{j}^{n} \circ h_{n, i}=h_{n-1, i} \circ d_{j}^{n}$ for $i \leq j$.
(4) We have $s_{j}^{n} \circ h_{n, i}=h_{n+1, i+1} \circ s_{j}^{n}$ for $i>j$.
(5) We have $s_{j}^{n} \circ h_{n, i}=h_{n+1, i} \circ s_{j}^{n}$ for $i \leq j$.

Conversely, given a system of maps $h_{n, i}$ satisfying the properties listed above, then these define a morphisms $h$ which is a homotopy between $a$ and $b$.

Proof. Omitted. You can prove the last statement using the fact, see Lemma 14.2.4 that to give a morphism of simplicial objects is the same as giving a sequence of morphisms $h_{n}$ commuting with all $d_{j}^{n}$ and $s_{j}^{n}$.
07KA Example 14.26.3. Suppose in the situation above $a=b$. Then there is a trivial homotopy between $a$ and $b$, namely the one with $h_{n, i}=a_{n}=b_{n}$.
019M Remark 14.26.4. Let $\mathcal{C}$ be any category (no assumptions whatsoever). We say that a pair of morphisms $a, b: U \rightarrow V$ of simplicial objects are homotopic if there exist morphisms ${ }^{1} h_{n, i}: U_{n} \rightarrow V_{n}$, for $n \geq 0, i=0, \ldots, n+1$ satisfying the relations of Lemma 14.26 .2 (potentially with the roles of $a$ and $b$ switched). This is a "better" definition, because it applies to any category. Also it has the following property: if $F: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ is any functor then $a$ homotopic to $b$ implies trivially that $F(a)$ is homotopic to $F(b)$. Since the lemma says that the newer notion is the same as the old one in case finite coproduct exist, we deduce in particular that functors preserve the old notion whenever both categories have finite coproducts.
08RJ Remark 14.26.5. Let $\mathcal{C}$ be any category. Suppose two morphisms $a, a^{\prime}: U \rightarrow V$ of simplicial objects are homotopic. Then for any morphism $b: V \rightarrow W$ the two maps $b \circ a, b \circ a^{\prime}: U \rightarrow W$ are homotopic. Similarly, for any morphism $c: X \rightarrow U$ the two maps $a \circ c, a^{\prime} \circ c: X \rightarrow V$ are homotopic. In fact the maps $b \circ a \circ c, b \circ a^{\prime} \circ c: X \rightarrow W$ are homotopic. Namely, if the maps $h_{n, i}: U \rightarrow U$ define a homotopy between $a$ and $a^{\prime}$ then the maps $b \circ h_{n, i} \circ c$ define a homotopy between $b \circ a \circ c$ and $b \circ a^{\prime} \circ c$.
019N Definition 14.26.6. Let $U$ and $V$ be two simplicial objects of a category $\mathcal{C}$. We say a morphism $a: U \rightarrow V$ is a homotopy equivalence if there exists a morphism $b: V \rightarrow U$ such that $a \circ b$ is homotopic to $\mathrm{id}_{V}$ and $b \circ a$ is homotopic to $\mathrm{id}_{U}$. If there exists such a morphism between $U$ and $V$, then we say that $U$ and $V$ are homotopy equivalen ${ }^{2}$
08Q3 Example 14.26.7. The simplicial set $\Delta[m]$ is homotopy equivalent to $\Delta[0]$. Namely, there is a unique morphism $f: \Delta[m] \rightarrow \Delta[0]$ and we take $g: \Delta[0] \rightarrow \Delta[m]$ to be given by the inclusion of the last 0 -simplex of $\Delta[m]$. We have $f \circ g=\mathrm{id}$ and we will give a homotopy $h: \Delta[m] \times \Delta[1] \rightarrow \Delta[m]$ between $\operatorname{id}_{\Delta[m]}$ and $g \circ f$. Namely $h$ given by the maps

$$
\operatorname{Mor}_{\Delta}([n],[m]) \times \operatorname{Mor}_{\Delta}([n],[1]) \rightarrow \operatorname{Mor}_{\Delta}([n],[m])
$$

[^36]which send $(\varphi, \alpha)$ to
\[

k \mapsto\left\{$$
\begin{array}{cll}
\varphi(k) & \text { if } & \alpha(k)=0 \\
m & \text { if } & \alpha(k)=1
\end{array}
$$\right.
\]

Note that this only works because we took $g$ to be the inclusion of the last 0 -simplex. If we took $g$ to be the inclusion of the first 0 -simplex we could find a homotopy from $g \circ f$ to $\mathrm{id}_{\Delta[m]}$. This is an illustration of the asymmetry inherent in homotopies in the category of simplicial sets.
The following lemma says that $U \times \Delta[1]$ is homotopy equivalent to $U$.
0190 Lemma 14.26.8. Let $\mathcal{C}$ be a category with finite coproducts. Let $U$ be a simplicial object of $\mathcal{C}$. Consider the maps $e_{1}, e_{0}: U \rightarrow U \times \Delta[1]$, and $\pi: U \times \Delta[1] \rightarrow U$, see Lemma 14.13.3.
(1) We have $\pi \circ e_{1}=\pi \circ e_{0}=i d_{U}$, and
(2) The morphisms $i d_{U \times \Delta[1]}$, and $e_{0} \circ \pi$ are homotopic.
(3) The morphisms $i d_{U \times \Delta[1]}$, and $e_{1} \circ \pi$ are homotopic.

Proof. The first assertion is trivial. For the second, consider the map of simplicial sets $\Delta[1] \times \Delta[1] \longrightarrow \Delta[1]$ which in degree $n$ assigns to a pair $\left(\beta_{1}, \beta_{2}\right), \beta_{i}:[n] \rightarrow[1]$ the morphism $\beta:[n] \rightarrow[1]$ defined by the rule

$$
\beta(i)=\max \left\{\beta_{1}(i), \beta_{2}(i)\right\}
$$

It is a morphism of simplicial sets, because the action $\Delta[1](\varphi): \Delta[1]_{n} \rightarrow \Delta[1]_{m}$ of $\varphi:[m] \rightarrow[n]$ is by precomposing. Clearly, using notation from Section 14.26 , we have $\beta=\beta_{1}$ if $\beta_{2}=\alpha_{0}^{n}$ and $\beta=\alpha_{n+1}^{n}$ if $\beta_{2}=\alpha_{n+1}^{n}$. This implies easily that the induced morphism

$$
U \times \Delta[1] \times \Delta[1] \longrightarrow U \times \Delta[1]
$$

of Lemma 14.13 .3 is a homotopy between $\mathrm{id}_{U \times \Delta[1]}$ and $e_{0} \circ \pi$. Similarly for $e_{1} \circ \pi$ (use minimum instead of maximum).
019P Lemma 14.26.9. Let $f: Y \rightarrow X$ be a morphism of a category $\mathcal{C}$ with fibre products. Assume $f$ has a section s. Consider the simplicial object $U$ constructed in Example 14.3 .5 starting with $f$. The morphism $U \rightarrow U$ which in each degree is the self map $(s \circ f)^{n+1}$ of $Y \times_{X} \ldots \times_{X} Y$ given by $s \circ f$ on each factor is homotopic to the identity on $U$. In particular, $U$ is homotopy equivalent to the constant simplicial object $X$.

Proof. Set $g^{0}=\operatorname{id}_{Y}$ and $g^{1}=s \circ f$. We use the morphisms

$$
\begin{aligned}
Y \times_{X} \ldots \times_{X} Y \times \operatorname{Mor}([n],[1]) & \rightarrow Y \times_{X} \ldots \times_{X} Y \\
\left(y_{0}, \ldots, y_{n}\right) \times \alpha & \mapsto\left(g^{\alpha(0)}\left(y_{0}\right), \ldots, g^{\alpha(n)}\left(y_{n}\right)\right)
\end{aligned}
$$

where we use the functor of points point of view to define the maps. Another way to say this is to say that $h_{n, 0}=\mathrm{id}, h_{n, n+1}=(s \circ f)^{n+1}$ and $h_{n, i}=\mathrm{id}_{Y}^{i+1} \times(s \circ f)^{n+1-i}$. We leave it to the reader to show that these satisfy the relations of Lemma 14.26 .2 , Hence they define the desired homotopy. See also Remark 14.26 .4 which shows that we do not need to assume anything else on the category $\mathcal{C}$.

08Q4 Lemma 14.26.10. Let $\mathcal{C}$ be a category.
(1) If $a_{t}, b_{t}: X_{t} \rightarrow Y_{t}, t \in T$ are homotopic morphisms between simplicial objects of $\mathcal{C}$, then $\prod a_{t}, \prod b_{t}: \prod X_{t} \rightarrow \prod Y_{t}$ are homotopic morphisms between simplicial objects of $\mathcal{C}$, provided $\prod X_{t}$ and $\prod Y_{t}$ exist in $\operatorname{Simp}(\mathcal{C})$.
(2) If $\left(X_{t}, Y_{t}\right), t \in T$ are homotopy equivalent pairs of simplicial objects of $\mathcal{C}$, then $\Pi X_{t}$ and $\Pi Y_{t}$ are homotopy equivalent pairs of simplicial objects of $\mathcal{C}$, provided $\Pi X_{t}$ and $\Pi Y_{t}$ exist in $\operatorname{Simp}(\mathcal{C})$.
Proof. If $h_{t}=\left(h_{t, n, i}\right)$ are homotopies connecting $a_{t}$ and $b_{t}$ (see Remark 14.26.4), then $h=\left(\prod_{t} h_{t, n, i}\right)$ is a homotopy connecting $\prod a_{t}$ and $\prod b_{t}$. This proves (1). Part (2) follows from part (1) and the definitions.

### 14.27. Homotopies in abelian categories

019 Q Let $\mathcal{A}$ be an abelian category. Let $U, V$ be simplicial objects of $\mathcal{A}$. Let $a, b: U \rightarrow V$ be morphisms. Further, suppose that $h: U \times \Delta[1] \rightarrow V$ is a homotopy connecting $a$ and $b$. Consider the two morphisms of chain complexes $s(a), s(b): s(U) \longrightarrow s(V)$. Using the notation introduced above Lemma 14.26 .2 we define

$$
s(h)_{n}: U_{n} \longrightarrow V_{n+1}
$$

by the formula

$$
s(h)_{n}=\sum_{i=0}^{n}(-1)^{i+1} h_{n+1, i+1} \circ s_{i}^{n}
$$

Let us compute $d_{n+1} \circ s(h)_{n}+s(h)_{n-1} \circ d_{n}$. We first compute

$$
\begin{aligned}
d_{n+1} \circ s(h)_{n}= & \sum_{j=0}^{n+1} \sum_{i=0}^{n}(-1)^{j+i+1} d_{j}^{n+1} \circ h_{n+1, i+1} \circ s_{i}^{n} \\
= & \sum_{1 \leq i+1 \leq j \leq n+1}(-1)^{j+i+1} h_{n, i+1} \circ d_{j}^{n+1} \circ s_{i}^{n} \\
& +\sum_{n \geq i \geq j \geq 0}(-1)^{i+j+1} h_{n, i} \circ d_{j}^{n+1} \circ s_{i}^{n} \\
= & \sum_{1 \leq i+1<j \leq n+1}(-1)^{j+i+1} h_{n, i+1} \circ s_{i}^{n-1} \circ d_{j-1}^{n} \\
& +\sum_{1 \leq i+1=j \leq n+1}(-1)^{j+i+1} h_{n, i+1} \\
& +\sum_{n \geq i=j \geq 0}(-1)^{i+j+1} h_{n, i} \\
& +\sum_{n \geq i>j \geq 0}(-1)^{i+j+1} h_{n, i} \circ s_{i-1}^{n-1} \circ d_{j}^{n}
\end{aligned}
$$

We leave it to the reader to see that the first and the last of the four sums cancel exactly against all the terms of

$$
s(h)_{n-1} \circ d_{n}=\sum_{i=0}^{n-1} \sum_{j=0}^{n}(-1)^{i+1+j} h_{n, i+1} \circ s_{i}^{n-1} \circ d_{j}^{n} .
$$

Hence we obtain

$$
\begin{aligned}
d_{n+1} \circ s(h)_{n}+s(h)_{n-1} \circ d_{n} & =\sum_{j=1}^{n+1}(-1)^{2 j} h_{n, j}+\sum_{i=0}^{n}(-1)^{2 i+1} h_{n, i} \\
& =h_{n, n+1}-h_{n, 0} \\
& =a_{n}-b_{n}
\end{aligned}
$$

Thus we've proved part of the following lemma.
019S Lemma 14.27.1. Let $\mathcal{A}$ be an abelian category. Let $a, b: U \rightarrow V$ be morphisms of simplicial objects of $\mathcal{A}$. If $a, b$ are homotopic, then $s(a), s(b): s(U) \rightarrow s(V)$, and $N(a), N(b): N(U) \rightarrow N(V)$ are homotopic maps of chain complexes.

Proof. The part about $s(a)$ and $s(b)$ is clear from the calculation above the lemma. On the other hand, if follows from Lemma 14.23 .6 that $N(a), N(b)$ are compositions

$$
N(U) \rightarrow s(U) \rightarrow s(V) \rightarrow N(V)
$$

where we use $s(a), s(b)$ in the middle. Hence the assertion follows from Homology, Lemma 12.12 .1

019 T Lemma 14.27.2. Let $\mathcal{A}$ be an abelian category. Let $a: U \rightarrow V$ be a morphism of simplicial objects of $\mathcal{A}$. If $a$ is a homotopy equivalence, then $s(a): s(U) \rightarrow s(V)$, and $N(a): N(U) \rightarrow N(V)$ are homotopy equivalences of chain complexes.

Proof. Omitted. See Lemma 14.27.1 above.

### 14.28. Homotopies and cosimplicial objects

019 U Let $\mathcal{C}$ be a category with finite products. Let $V$ be a cosimplicial object and consider $\operatorname{Hom}(\Delta[1], V)$, see Section 14.14 . The morphisms $e_{0}, e_{1}: \Delta[0] \rightarrow \Delta[1]$ produce two morphisms $e_{0}, e_{1}: \operatorname{Hom}(\Delta[1], V) \rightarrow V$.

019W Definition 14.28.1. Let $\mathcal{C}$ be a category having finite products. Suppose that $U$ and $V$ are two cosimplicial objects of $\mathcal{C}$. We say morphisms $a, b: U \rightarrow V$ are homotopic if there exists a morphism

$$
h: U \longrightarrow \operatorname{Hom}(\Delta[1], V)
$$

such that $a=e_{0} \circ h$ and $b=e_{1} \circ h$. In this case $h$ is called a homotopy connecting $a$ and $b$.

This is really exactly the same as the notion we introduced for simplicial objects earlier. In particular, recall that $\Delta[1]_{n}$ is a finite set, and that

$$
h_{n}=\left(h_{n, \alpha}\right): U \longrightarrow \prod_{\alpha \in \Delta[1]_{n}} V_{n}
$$

is given by a collection of maps $h_{n, \alpha}: U_{n} \rightarrow V_{n}$ parametrized by elements of $\Delta[1]_{n}=\operatorname{Mor}_{\Delta}([n],[1])$. As in Lemma 14.26 .2 these morphisms satisfy some relations. Namely, for every $f:[n] \rightarrow[m]$ in $\Delta$ we should have

07KB

$$
\begin{equation*}
h_{m, \alpha} \circ U(f)=V(f) \circ h_{n, \alpha \circ f} \tag{14.28.1.1}
\end{equation*}
$$

The condition that $a=e_{0} \circ h$ means that $a_{n}=h_{n, 0:[n] \rightarrow[1]}$ where $0:[n] \rightarrow[1]$ is the constant map with value zero. Similarly, we should have $b_{n}=h_{n, 1:[n] \rightarrow[1]}$. In particular we deduce once more that the notion of homotopy can be formulated between cosimplicial objects of any category, i.e., existence of products is not necessary. Here is a precise formulation of why this is dual to the notion of a homotopy between morphisms of simplicial objects.

019X Lemma 14.28.2. Let $\mathcal{C}$ be a category having finite products. Suppose that $U$ and $V$ are two cosimplicial objects of $\mathcal{C}$. Let $a, b: U \rightarrow V$ be morphisms of cosimplicial objects. Recall that $U, V$ correspond to simplicial objects $U^{\prime}$, $V^{\prime}$ of $\mathcal{C}^{\text {opp }}$. Moreover $a, b$ correspond to morphisms $a^{\prime}, b^{\prime}: V^{\prime} \rightarrow U^{\prime}$. The following are equivalent
(1) The morphisms $a, b: U \rightarrow V$ of cosimplicial objects are homotopic.
(2) The morphisms $a^{\prime}, b^{\prime}: V^{\prime} \rightarrow U^{\prime}$ of simplicial objects of $\mathcal{C}^{\text {opp }}$ are homotopic.

Proof. If $\mathcal{C}$ has finite products, then $\mathcal{C}^{o p p}$ has finite coproducts. And the contravariant functor $(-)^{\prime}: \mathcal{C} \rightarrow \mathcal{C}^{o p p}$ transforms products into coproducts. Then it is immediate from the definitions that $(\operatorname{Hom}(\Delta[1], V))^{\prime}=V^{\prime} \times \Delta[1]$. And so on and so forth.

019Y Lemma 14.28.3. Let $\mathcal{C}, \mathcal{C}^{\prime}, \mathcal{D}, \mathcal{D}^{\prime}$ be categories such that $\mathcal{C}, \mathcal{C}^{\prime}$ have finite products, and $\mathcal{D}, \mathcal{D}^{\prime}$ have finite coproducts.
(1) Let $a, b: U \rightarrow V$ be morphisms of simplicial objects of $\mathcal{D}$. Let $F: \mathcal{D} \rightarrow \mathcal{D}^{\prime}$ be a covariant functor. If $a$ and $b$ are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(U) \rightarrow F(V)$ of simplicial objects.
(2) Let $a, b: U \rightarrow V$ be morphisms of cosimplicial objects of $\mathcal{C}$. Let $F: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ be a covariant functor. If $a$ and $b$ are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(U) \rightarrow F(V)$ of cosimplicial objects.
(3) Let $a, b: U \rightarrow V$ be morphisms of simplicial objects of $\mathcal{D}$. Let $F: \mathcal{D} \rightarrow \mathcal{C}$ be a contravariant functor. If $a$ and $b$ are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(V) \rightarrow F(U)$ of cosimplicial objects.
(4) Let $a, b: U \rightarrow V$ be morphisms of cosimplicial objects of $\mathcal{C}$. Let $F: \mathcal{C} \rightarrow \mathcal{D}$ be a contravariant functor. If $a$ and $b$ are homotopic, then $F(a), F(b)$ are homotopic morphisms $F(V) \rightarrow F(U)$ of simplicial objects.

Proof. By Lemma 14.28 .2 above, we can turn $F$ into a covariant functor between a pair of categories which have finite coproducts, and we have to show that the functor preserves homotopic pairs of maps. It is explained in Remark 14.26 .4 how this is the case. Even if the functor does not commute with coproducts!

019Z Lemma 14.28.4. Let $f: Y \rightarrow X$ be a morphism of a category $\mathcal{C}$ with pushouts. Assume $f$ has a section s. Consider the cosimplicial object $U$ constructed in Example 14.5 .5 starting with $f$. The morphism $U \rightarrow U$ which in each degree is the self map of $Y \amalg_{X} \ldots \amalg_{X} Y$ given by $s \circ f$ on each factor is homotopic to the identity on $U$. In particular, $U$ is homotopy equivalent to the constant cosimplicial object $X$.

Proof. The dual statement which is Lemma 14.26.9. Hence this lemma follows on applying Lemma 14.28 .2 .

01A0 Lemma 14.28.5. Let $\mathcal{A}$ be an abelian category. Let $a, b: U \rightarrow V$ be morphisms of cosimplicial objects of $\mathcal{A}$. If $a, b$ are homotopic, then $s(a), s(b): s(U) \rightarrow s(V)$, and $Q(a), Q(b): Q(U) \rightarrow Q(V)$ are homotopic maps of cochain complexes.

Proof. Let $(-)^{\prime}: \mathcal{A} \rightarrow \mathcal{A}^{o p p}$ be the contravariant functor $A \mapsto A$. By Lemma 14.28 .4 the maps $a^{\prime}$ and $b^{\prime}$ are homotopic. By Lemma 14.27 .1 we see that $s\left(a^{\prime}\right)$ and $s\left(b^{\prime}\right)$ are homotopic maps of chain complexes. Since $s\left(a^{\prime}\right)=(s(a))^{\prime}$ and $s\left(b^{\prime}\right)=$ $(s(b))^{\prime}$ we conclude that also $s(a)$ and $s(b)$ are homotopic by applying the additive contravariant functor $(-)^{\prime \prime}: \mathcal{A}^{o p p} \rightarrow \mathcal{A}$. The result for the $Q$-complexes follows from the direct sum decomposition of Lemma 14.25 .1 for example.

### 14.29. More homotopies in abelian categories

01A1 Let $\mathcal{A}$ be an abelian category. In this section we show that a homotopy between morphisms in $\mathrm{Ch}_{\geq 0}(\mathcal{A})$ always comes from a morphism $U \times \Delta[1] \rightarrow V$ in the category of simplicial objects. In some sense this will provide a converse to Lemma 14.27.1. We first develop some material on homotopies between morphisms of chain complexes.

01A2 Lemma 14.29.1. Let $\mathcal{A}$ be an abelian category. Let $A$ be a chain complex. Consider the covariant functor

$$
B \longmapsto\{(a, b, h) \mid a, b: A \rightarrow B \text { and } h \text { a homotopy between } a, b\}
$$

There exists a chain complex $\diamond A$ such that $\operatorname{Mor}_{C h(\mathcal{A})}(\diamond A,-)$ is isomorphic to the displayed functor. The construction $A \mapsto \diamond A$ is functorial.

Proof. We set $\diamond A_{n}=A_{n} \oplus A_{n} \oplus A_{n-1}$, and we define $d_{\diamond A, n}$ by the matrix

$$
d_{\diamond A, n}=\left(\begin{array}{ccc}
d_{A, n} & 0 & \operatorname{id}_{A_{n-1}} \\
0 & d_{A, n} & -\mathrm{id}_{A_{n-1}} \\
0 & 0 & -d_{A, n-1}
\end{array}\right): A_{n} \oplus A_{n} \oplus A_{n-1} \rightarrow A_{n-1} \oplus A_{n-1} \oplus A_{n-2}
$$

If $\mathcal{A}$ is the category of abelian groups, and $(x, y, z) \in A_{n} \oplus A_{n} \oplus A_{n-1}$ then $d_{\diamond A, n}(x, y, z)=\left(d_{n}(x)+z, d_{n}(y)-z,-d_{n-1}(z)\right)$. It is easy to verify that $d^{2}=0$. Clearly, there are two maps $\diamond a, \diamond b: A \rightarrow \diamond A$ (first summand and second summand), and a map $\diamond A \rightarrow A[-1]$ which give a short exact sequence

$$
0 \rightarrow A \oplus A \rightarrow \diamond A \rightarrow A[-1] \rightarrow 0
$$

which is termwise split. Moreover, there is a sequence of maps $\diamond h_{n}: A_{n} \rightarrow \diamond A_{n+1}$, namely the identity from $A_{n}$ to the summand $A_{n}$ of $\diamond A_{n+1}$, such that $\diamond h$ is a homotopy between $\diamond a$ and $\diamond b$.

We conclude that any morphism $f: \diamond A \rightarrow B$ gives rise to a triple $(a, b, h)$ by setting $a=f \circ \diamond a, b=f \circ \diamond b$ and $h_{n}=f_{n+1} \circ \diamond h_{n}$. Conversely, given a triple $(a, b, h)$ we get a morphism $f: \diamond A \rightarrow B$ by taking

$$
f_{n}=\left(a_{n}, b_{n}, h_{n-1}\right)
$$

To see that this is a morphism of chain complexes you have to do a calculation. We only do this in case $\mathcal{A}$ is the category of abelian groups: Say $(x, y, z) \in \diamond A_{n}=$ $A_{n} \oplus A_{n} \oplus A_{n-1}$. Then

$$
\begin{aligned}
f_{n-1}\left(d_{n}(x, y, z)\right) & =f_{n-1}\left(d_{n}(x)+z, d_{n}(y)-z,-d_{n-1}(z)\right) \\
& =a_{n}\left(d_{n}(x)\right)+a_{n}(z)+b_{n}\left(d_{n}(y)\right)-b_{n}(z)-h_{n-2}\left(d_{n-1}(z)\right)
\end{aligned}
$$

and

$$
\begin{aligned}
d_{n}\left(f_{n}(x, y, z)\right. & =d_{n}\left(a_{n}(x)+b_{n}(y)+h_{n-1}(z)\right) \\
& =d_{n}\left(a_{n}(x)\right)+d_{n}\left(b_{n}(y)\right)+d_{n}\left(h_{n-1}(z)\right)
\end{aligned}
$$

which are the same by definition of a homotopy.
Note that the extension

$$
0 \rightarrow A \oplus A \rightarrow \diamond A \rightarrow A[-1] \rightarrow 0
$$

comes with sections of the morphisms $\diamond A_{n} \rightarrow A[-1]_{n}$ with the property that the associated morphism $\delta: A[-1] \rightarrow(A \oplus A)[-1]$, see Homology, Lemma 12.14.4 equals the morphism $(1,-1): A[-1] \rightarrow A[-1] \oplus A[-1]$.
01A3 Lemma 14.29.2. Let $\mathcal{A}$ be an abelian category. Let

$$
0 \rightarrow A \oplus A \rightarrow B \rightarrow C \rightarrow 0
$$

be a short exact sequence of chain complexes of $\mathcal{A}$. Suppose given in addition morphisms $s_{n}: C_{n} \rightarrow B_{n}$ splitting the associated short exact sequence in degree n. Let $\delta(s): C \rightarrow(A \oplus A)[-1]=A[-1] \oplus A[-1]$ be the associated morphism of
complexes, see Homology, Lemma 12.14.4. If $\delta(s)$ factors through the morphism $(1,-1): A[-1] \rightarrow A[-1] \oplus A[-1]$, then there is a unique morphism $B \rightarrow \diamond A$ fitting into a commutative diagram

where the vertical maps are compatible with the splittings $s_{n}$ and the splittings of $\diamond A_{n} \rightarrow A[-1]_{n}$ as well.

Proof. Denote $\left(p_{n}, q_{n}\right): B_{n} \rightarrow A_{n} \oplus A_{n}$ the morphism $\pi_{n}$ of Homology, Lemma 12.14.4. Also write $(a, b): A \oplus A \rightarrow B$, and $r: B \rightarrow C$ for the maps in the short exact sequence. Write the factorization of $\delta(s)$ as $\delta(s)=(1,-1) \circ f$. This means that $p_{n-1} \circ d_{B, n} \circ s_{n}=f_{n}$, and $q_{n-1} \circ d_{B, n} \circ s_{n}=-f_{n}$, and Set $B_{n} \rightarrow \diamond A_{n}=$ $A_{n} \oplus A_{n} \oplus A_{n-1}$ equal to ( $p_{n}, q_{n}, f_{n} \circ r_{n}$ ).

Now we have to check that this actually defines a morphism of complexes. We will only do this in the case of abelian groups. Pick $x \in B_{n}$. Then $x=a_{n}\left(x_{1}\right)+b_{n}\left(x_{2}\right)+$ $s_{n}\left(x_{3}\right)$ and it suffices to show that our definition commutes with differential for each term separately. For the term $a_{n}\left(x_{1}\right)$ we have $\left(p_{n}, q_{n}, f_{n} \circ r_{n}\right)\left(a_{n}\left(x_{1}\right)\right)=\left(x_{1}, 0,0\right)$ and the result is obvious. Similarly for the term $b_{n}\left(x_{2}\right)$. For the term $s_{n}\left(x_{3}\right)$ we have

$$
\begin{aligned}
\left(p_{n}, q_{n}, f_{n} \circ r_{n}\right)\left(d_{n}\left(s_{n}\left(x_{3}\right)\right)\right)= & \left(p_{n}, q_{n}, f_{n} \circ r_{n}\right)( \\
& \left.a_{n}\left(f_{n}\left(x_{3}\right)\right)-b_{n}\left(f_{n}\left(x_{3}\right)\right)+s_{n}\left(d_{n}\left(x_{3}\right)\right)\right) \\
= & \left(f_{n}\left(x_{3}\right),-f_{n}\left(x_{3}\right), f_{n}\left(d_{n}\left(x_{3}\right)\right)\right)
\end{aligned}
$$

by definition of $f_{n}$. And

$$
\begin{aligned}
d_{n}\left(p_{n}, q_{n}, f_{n} \circ r_{n}\right)\left(s_{n}\left(x_{3}\right)\right) & =d_{n}\left(0,0, f_{n}\left(x_{3}\right)\right) \\
& =\left(f_{n}\left(x_{3}\right),-f_{n}\left(x_{3}\right), d_{A[-1], n}\left(f_{n}\left(x_{3}\right)\right)\right)
\end{aligned}
$$

The result follows as $f$ is a morphism of complexes.
01A4 Lemma 14.29.3. Let $\mathcal{A}$ be an abelian category. Let $U, V$ be simplicial objects of $\mathcal{A}$. Let $a, b: U \rightarrow V$ be a pair of morphisms. Assume the corresponding maps of chain complexes $N(a), N(b): N(U) \rightarrow N(V)$ are homotopic by a homotopy $\left\{N_{n}: N(U)_{n} \rightarrow N(V)_{n+1}\right\}$. Then $a, b$ are homotopic in the sense of Definition 14.26.1. Moreover, one can choose the homotopy $h: U \times \Delta[1] \rightarrow V$ such that $N_{n}=N(h)_{n}$ where $N(h)$ is the homotopy coming from $h$ as in Section 14.27.
Proof. Let $(\diamond N(U), \diamond a, \diamond b, \diamond h)$ be as in Lemma 14.29 .1 and its proof. By that lemma there exists a morphism $\diamond N(U) \rightarrow N(V)$ representing the triple $\left(N(a), N(b),\left\{N_{n}\right\}\right)$. We will show there exists a morphism $\psi: N(U \times \Delta[1]) \rightarrow \diamond N(U)$ such that $\diamond a=\psi \circ N\left(e_{0}\right)$, and $\diamond b=\psi \circ N\left(e_{1}\right)$. Moreover, we will show that the homotopy between $N\left(e_{0}\right), N\left(e_{1}\right): N(U) \rightarrow N(U \times \Delta[1])$ coming from 14.27.0.1) and Lemma 14.27 .1 with $h=\operatorname{id}_{U \times \Delta[1]}$ is mapped via $\psi$ to the canonical homotopy $\diamond h$ between the two maps $\diamond a, \diamond b: N(U) \rightarrow \diamond N(U)$. Certainly this will imply the lemma.
Note that $N: \operatorname{Simp}(\mathcal{A}) \rightarrow \mathrm{Ch}_{\geq 0}(\mathcal{A})$ as a functor is a direct summand of the functor $N: \operatorname{Simp}(\mathcal{A}) \rightarrow \mathrm{Ch}_{\geq 0}(\overline{\mathcal{A}})$. Also, the functor $\diamond$ is compatible with direct
sums. Thus it suffices instead to construct a morphism $\Psi: s(U \times \Delta[1]) \rightarrow \diamond s(U)$ with the corresponding properties. This is what we do below.
By Definition 14.26.1 the morphisms $e_{0}: U \rightarrow U \times \Delta[1]$ and $e_{1}: U \rightarrow U \times \Delta[1]$ are homotopic with homotopy $\mathrm{id}_{U \times \Delta[1]}$. By Lemma 14.27 .1 we get an explicit homotopy $\left\{h_{n}: s(U)_{n} \rightarrow s(U \times \Delta[1])_{n+1}\right\}$ between the morphisms of chain complexes $s\left(e_{0}\right):$ $s(U) \rightarrow s(U \times \Delta[1])$ and $s\left(e_{1}\right): s(U) \rightarrow s(U \times \Delta[1])$. By Lemma 14.29 .2 above we get a corresponding morphism

$$
\Phi: \diamond s(U) \rightarrow s(U \times \Delta[1])
$$

According to the construction, $\Phi_{n}$ restricted to the summand $s(U)[-1]_{n}=s(U)_{n-1}$ of $\diamond s(U)_{n}$ is equal to $h_{n-1}$. And

$$
h_{n-1}=\sum_{i=0}^{n-1}(-1)^{i+1} s_{i}^{n} \cdot \alpha_{i+1}^{n}: U_{n-1} \rightarrow \bigoplus_{j} U_{n} \cdot \alpha_{j}^{n}
$$

with obvious notation.
On the other hand, the morphisms $e_{i}: U \rightarrow U \times \Delta[1]$ induce a morphism $\left(e_{0}, e_{1}\right)$ : $U \oplus U \rightarrow U \times \Delta[1]$. Denote $W$ the cokernel. Note that, if we write $(U \times \Delta[1])_{n}=$ $\bigoplus_{\alpha:[n] \rightarrow[1]} U_{n} \cdot \alpha$, then we may identify $W_{n}=\bigoplus_{i=1}^{n} U_{n} \cdot \alpha_{i}^{n}$ with $\alpha_{i}^{n}$ as in Section 14.26 . We have a commutative diagram

This implies we have a similar commutative diagram after applying the functor $s$. Next, we choose the splittings $\sigma_{n}: s(W)_{n} \rightarrow s(U \times \Delta[1])_{n}$ by mapping the summand $U_{n} \cdot \alpha_{i}^{n} \subset W_{n}$ via $(-1,1)$ to the summands $U_{n} \cdot \alpha_{0}^{n} \oplus U_{n} \cdot \alpha_{i}^{n} \subset(U \times \Delta[1])_{n}$. Note that $s(\pi)_{n} \circ \sigma_{n}=0$. It follows that $(1,1) \circ \delta(\sigma)_{n}=0$. Hence $\delta(\sigma)$ factors as in Lemma 14.29.2. By that lemma we obtain a canonical morphism $\Psi: s(U \times \Delta[1]) \rightarrow \diamond s(U)$.

To compute $\Psi$ we first compute the morphism $\delta(\sigma): s(W) \rightarrow s(U)[-1] \oplus s(U)[-1]$. According to Homology, Lemma 12.14.4 and its proof, to do this we have compute

$$
d_{s(U \times \delta[1]), n} \circ \sigma_{n}-\sigma_{n-1} \circ d_{s(W), n}
$$

and write it as a morphism into $U_{n-1} \cdot \alpha_{0}^{n-1} \oplus U_{n-1} \cdot \alpha_{n}^{n-1}$. We only do this in case $\mathcal{A}$ is the category of abelian groups. We use the short hand notation $x_{\alpha}$ for $x \in U_{n}$ to denote the element $x$ in the summand $U_{n} \cdot \alpha$ of $(U \times \Delta[1])_{n}$. Recall that

$$
d_{s(U \times \delta[1]), n}=\sum_{i=0}^{n}(-1)^{i} d_{i}^{n}
$$

where $d_{i}^{n}$ maps the summand $U_{n} \cdot \alpha$ to the summand $U_{n-1} \cdot\left(\alpha \circ \delta_{i}^{n}\right)$ via the morphism $d_{i}^{n}$ of the simplicial object $U$. In terms of the notation above this means

$$
d_{s(U \times \delta[1]), n}\left(x_{\alpha}\right)=\sum_{i=0}^{n}(-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha \circ \delta_{i}^{n}}
$$

Starting with $x_{\alpha} \in W_{n}$, in other words $\alpha=\alpha_{j}^{n}$ for some $j \in\{1, \ldots, n\}$, we see that $\sigma_{n}\left(x_{\alpha}\right)=x_{\alpha}-x_{\alpha_{0}^{n}}$ and hence

$$
\left(d_{s(U \times \delta[1]), n} \circ \sigma_{n}\right)\left(x_{\alpha}\right)=\sum_{i=0}^{n}(-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha \circ \delta_{i}^{n}}-\sum_{i=0}^{n}(-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha_{0}^{n} \circ \delta_{i}^{n}}
$$

To compute $d_{s(W), n}\left(x_{\alpha}\right)$, we have to omit all terms where $\alpha \circ \delta_{i}^{n}=\alpha_{0}^{n-1}, \alpha_{n}^{n-1}$. Hence we get

$$
\begin{gathered}
\left(\sigma_{n-1} \circ d_{s(W), n}\right)\left(x_{\alpha}\right)= \\
\sum_{i=0, \ldots, n \text { and } \alpha \circ \delta_{i}^{n} \neq \alpha_{0}^{n-1} \text { or } \alpha_{n}^{n-1}\left((-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha \circ \delta_{i}^{n}}-(-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha_{0}^{n-1}}\right)}
\end{gathered}
$$

Clearly the difference of the two terms is the sum

$$
\sum_{i=0, \ldots, n \text { and } \alpha \circ \delta_{i}^{n}=\alpha_{0}^{n-1} \text { or } \alpha_{n}^{n-1}}\left((-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha \circ \delta_{i}^{n}}-(-1)^{i}\left(d_{i}^{n}(x)\right)_{\alpha_{0}^{n-1}}\right)
$$

Of course, if $\alpha \circ \delta_{i}^{n}=\alpha_{0}^{n-1}$ then the term drops out. Recall that $\alpha=\alpha_{j}^{n}$ for some $j \in\{1, \ldots, n\}$. The only way $\alpha_{j}^{n} \circ \delta_{i}^{n}=\alpha_{n}^{n-1}$ is if $j=n$ and $i=n$. Thus we actually get 0 unless $j=n$ and in that case we get $(-1)^{n}\left(d_{n}^{n}(x)\right)_{\alpha_{n}^{n-1}}-(-1)^{n}\left(d_{n}^{n}(x)\right)_{\alpha_{0}^{n-1}}$. In other words, we conclude the morphism

$$
\delta(\sigma)_{n}: W_{n} \rightarrow(s(U)[-1] \oplus s(U)[-1])_{n}=U_{n-1} \oplus U_{n-1}
$$

is zero on all summands except $U_{n} \cdot \alpha_{n}^{n}$ and on that summand it is equal to $\left((-1)^{n} d_{n}^{n},-(-1)^{n} d_{n}^{n}\right)$. (Namely, the first summand of the two corresponds to the factor with $\alpha_{n}^{n-1}$ because that is the map $[n-1] \rightarrow[1]$ which maps everybody to 0 , and hence corresponds to $e_{0}$.)

We obtain a canonical diagram

We claim that $\Phi \circ \Psi$ is the identity. To see this it is enough to prove that the composition of $\Phi$ and $\delta(\sigma)$ as a map $s(U)[-1] \rightarrow s(W) \rightarrow s(U)[-1] \oplus s(U)[-1]$ is the identity in the first factor and minus identity in the second. By the computations above it is $\left((-1)^{n} d_{0}^{n},-(-1)^{n} d_{0}^{n}\right) \circ(-1)^{n} s_{n}^{n}=(1,-1)$ as desired.

### 14.30. Trivial Kan fibrations

08 NK Recall that for $n \geq 0$ the simplicial set $\Delta[n]$ is given by the rule $[k] \mapsto \operatorname{Mor}_{\Delta}([k],[n])$, see Example 14.11.2. Recall that $\Delta[n]$ has a unique nondegenerate $n$-simplex and all nondegenerate simplices are faces of this $n$-simplex. In fact, the nondegenerate simplices of $\Delta[n]$ correspond exactly to injective morphisms $[k] \rightarrow[n]$, which we may identify with subsets of $[n]$. Moreover, recall that $\operatorname{Mor}(\Delta[n], X)=X_{n}$ for any simplicial set $X$ (Lemma 14.11.3). We set

$$
\partial \Delta[n]=i_{(n-1)!} \mathrm{sk}_{n-1} \Delta[n]
$$

and we call it the boundary of $\Delta[n]$. From Lemma 14.21.5 we see that $\partial \Delta[n] \subset \Delta[n]$ is the simplicial subset having the same nondegenerate simplices in degrees $\leq n-1$ but not containing the nondegenerate $n$-simplex.

08NL Definition 14.30.1. A map $X \rightarrow Y$ of simplicial sets is called a trivial Kan fibration if $X_{0} \rightarrow Y_{0}$ is surjective and for all $n \geq 1$ and any commutative solid diagram

a dotted arrow exists making the diagram commute.
A trivial Kan fibration satisfies a very general lifting property.
08NM Lemma 14.30.2. Let $f: X \rightarrow Y$ be a trivial Kan fibration of simplicial sets. For any solid commutative diagram

of simplicial sets with $Z \rightarrow W$ (termwise) injective a dotted arrow exists making the diagram commute.

Proof. Suppose that $Z \neq W$. Let $n$ be the smallest integer such that $Z_{n} \neq W_{n}$. Let $x \in W_{n}, x \notin Z_{n}$. Denote $Z^{\prime} \subset W$ the simplicial subset containing $Z, x$, and all degeneracies of $x$. Let $\varphi: \Delta[n] \rightarrow Z^{\prime}$ be the morphism corresponding to $x$ (Lemma 14.11.3). Then $\left.\varphi\right|_{\partial \Delta[n]}$ maps into $Z$ as all the nondegenerate simplices of $\partial \Delta[n]$ end up in $Z$. By assumption we can extend $\left.b \circ \varphi\right|_{\partial \Delta[n]}$ to $\beta: \Delta[n] \rightarrow X$. By Lemma 14.21 .7 the simplicial set $Z^{\prime}$ is the pushout of $\Delta[n]$ and $Z$ along $\partial \Delta[n]$. Hence $b$ and $\beta$ define a morphism $b^{\prime}: Z^{\prime} \rightarrow X$. In other words, we have extended the morphism $b$ to a bigger simplicial subset of $Z$.
The proof is finished by an application of Zorn's lemma (omitted).
08NN Lemma 14.30.3. Let $f: X \rightarrow Y$ be a trivial Kan fibration of simplicial sets. Let $Y^{\prime} \rightarrow Y$ be a morphism of simplicial sets. Then $X \times_{Y} Y^{\prime} \rightarrow Y^{\prime}$ is a trivial Kan fibration.
Proof. This follows immediately from the functorial properties of the fibre product (Lemma 14.7.2) and the definitions.
08NP Lemma 14.30.4. The composition of two trivial Kan fibrations is a trivial Kan fibration.

Proof. Omitted.
08 NQ Lemma 14.30.5. Let $\ldots \rightarrow U^{2} \rightarrow U^{1} \rightarrow U^{0}$ be a sequence of trivial Kan fibrations. Let $U=\lim U^{t}$ defined by taking $U_{n}=\lim U_{n}^{t}$. Then $U \rightarrow U^{0}$ is a trivial Kan fibration.

Proof. Omitted. Hint: use that for a countable sequence of surjections of sets the inverse limit is nonempty.

08NR Lemma 14.30.6. Let $X_{i} \rightarrow Y_{i}$ be a set of trivial Kan fibrations. Then $\prod X_{i} \rightarrow$ $\prod Y_{i}$ is a trivial Kan fibration.

Proof. Omitted.
08Q5 Lemma 14.30.7. A filtered colimit of trivial Kan fibrations is a trivial Kan fibration.

Proof. Omitted. Hint: See description of filtered colimits of sets in Categories, Section 4.19

08NS Lemma 14.30.8. Let $f: X \rightarrow Y$ be a trivial Kan fibration of simplicial sets. Then $f$ is a homotopy equivalence.

Proof. By Lemma 14.30 .2 we can choose an right inverse $g: Y \rightarrow X$ to $f$. Consider the diagram

Here the top horizontal arrow is given by $\operatorname{id}_{X}$ and $g \circ f$ where we use that $(\partial \Delta[1] \times$ $X)_{n}=X_{n} \amalg X_{n}$ for all $n \geq 0$. The bottom horizontal arrow is given by the map $\Delta[1] \rightarrow \Delta[0]$ and $f: X \rightarrow Y$. The diagram commutes as $f \circ g \circ f=f$. By Lemma 14.30 .2 we can fill in the dotted arrow and we win.

### 14.31. Kan fibrations

08 NT Let $n, k$ be integers with $0 \leq k \leq n$ and $1 \leq n$. Let $\sigma_{0}, \ldots, \sigma_{n}$ be the $n+1$ faces of the unique nondegenerate $n$-simplex $\sigma$ of $\Delta[n]$, i.e., $\sigma_{i}=d_{i} \sigma$. We let

$$
\Lambda_{k}[n] \subset \Delta[n]
$$

be the $k$ th horn of the $n$-simplex $\Delta[n]$. It is the simplicial subset of $\Delta[n]$ generated by $\sigma_{0}, \ldots, \hat{\sigma}_{k}, \ldots, \sigma_{n}$. In other words, the image of the displayed inclusion contains all the nondegenerate simplices of $\Delta[n]$ except for $\sigma$ and $\sigma_{k}$.
08NU Definition 14.31.1. A map $X \rightarrow Y$ of simplicial sets is called a Kan fibration if for all $k, n$ with $1 \leq n, 0 \leq k \leq n$ and any commutative solid diagram

a dotted arrow exists making the diagram commute. A Kan complex is a simplicial set $X$ such that $X \rightarrow *$ is a Kan fibration, where $*$ is the constant simplicial set on a singleton.
Note that $\Lambda_{k}[n]$ is always nonempty. This a morphism from the empty simplicial set to any simplicial set is always a Kan fibration. It follows from Lemma 14.30.2 that a trivial Kan fibration is a Kan fibration.

08NV Lemma 14.31.2. Let $f: X \rightarrow Y$ be a Kan fibration of simplicial sets. Let $Y^{\prime} \rightarrow Y$ be a morphism of simplicial sets. Then $X \times_{Y} Y^{\prime} \rightarrow Y^{\prime}$ is a Kan fibration.

Proof. This follows immediately from the functorial properties of the fibre product (Lemma 14.7.2) and the definitions.

08NW Lemma 14.31.3. The composition of two Kan fibrations is a Kan fibration.
Proof. Omitted.
08NX Lemma 14.31.4. Let $\ldots \rightarrow U^{2} \rightarrow U^{1} \rightarrow U^{0}$ be a sequence of Kan fibrations. Let $U=\lim U^{t}$ defined by taking $U_{n}=\lim U_{n}^{t}$. Then $U \rightarrow U^{0}$ is a Kan fibration.

Proof. Omitted. Hint: use that for a countable sequence of surjections of sets the inverse limit is nonempty.

08NY Lemma 14.31.5. Let $X_{i} \rightarrow Y_{i}$ be a set of Kan fibrations. Then $\prod X_{i} \rightarrow \prod Y_{i}$ is a Kan fibration.

Proof. Omitted.
The following lemma is due to J.C. Moore, see Moo55.
08NZ Lemma 14.31.6. Let $X$ be a simplicial group. Then $X$ is a Kan complex.
Proof. The following proof is basically just a translation into English of the proof in the reference mentioned above. Using the terminology as explained in the introduction to this section, suppose $f: \Lambda_{k}[n] \rightarrow X$ is a morphism from a horn. Set $x_{i}=f\left(\sigma_{i}\right) \in X_{n-1}$ for $i=0, \ldots, \hat{k}, \ldots, n$. This means that for $i<j$ we have $d_{i} x_{j}=d_{j-1} x_{i}$ whenever $i, j \neq k$. We have to find an $x \in X_{n}$ such that $x_{i}=d_{i} x$ for $i=0, \ldots, \hat{k}, \ldots, n$.
We first prove there exists a $u \in X_{n}$ such that $d_{i} u=x_{i}$ for $i<k$. This is trivial for $k=0$. If $k>0$, one defines by induction an element $u^{r} \in X_{n}$ such that $d_{i} u^{r}=x_{i}$ for $0 \leq i \leq r$. Start with $u^{0}=s_{0} x_{0}$. If $r<k-1$, we set

$$
y^{r}=s_{r+1}\left(\left(d_{r+1} u^{r}\right)^{-1} x_{r+1}\right), \quad u^{r+1}=u^{r} y^{r} .
$$

An easy calculation shows that $d_{i} y^{r}=1$ (unit element of the group $X_{n-1}$ ) for $i \leq r$ and $d_{r+1} y^{r}=\left(d_{r+1} u^{r}\right)^{-1} x_{r+1}$. It follows that $d_{i} u^{r+1}=x_{i}$ for $i \leq r+1$. Finally, take $u=u^{k-1}$ to get $u$ as promised.
Next we prove, by induction on the integer $r, 0 \leq r \leq n-k$, there exists a $x^{r} \in X_{n}$ such that

$$
d_{i} x^{r}=x_{i} \quad \text { for } i<k \text { and } i>n-r .
$$

Start with $x^{0}=u$ for $r=0$. Having defined $x^{r}$ for $r \leq n-k-1$ we set

$$
z^{r}=s_{n-r-1}\left(\left(d_{n-r} x^{r}\right)^{-1} x_{n-r}\right), \quad x^{r+1}=x^{r} z^{r}
$$

A simple calculation, using the given relations, shows that $d_{i} z^{r}=1$ for $i<k$ and $i>n-r$ and that $d_{n-r}\left(z^{r}\right)=\left(d_{n-r} x^{r}\right)^{-1} x_{n-r}$. It follows that $d_{i} x^{r+1}=x_{i}$ for $i<k$ and $i>n-r-1$. Finally, we take $x=x^{n-k}$ which finishes the proof.

08P0 Lemma 14.31.7. Let $f: X \rightarrow Y$ be a homomorphism of simplicial abelian groups which is termwise surjective. Then $f$ is a Kan fibration of simplicial sets.

Proof. Consider a commutative solid diagram

as in Definition 14.31.1. The map $a$ corresponds to $x_{0}, \ldots, \hat{x}_{k}, \ldots, x_{n} \in X_{n-1}$ satisfying $d_{i} x_{j}=d_{j-1} x_{i}$ for $i<j, i, j \neq k$. The map $b$ corresponds to an element $y \in Y_{n}$ such that $d_{i} y=f\left(x_{i}\right)$ for $i \neq k$. Our task is to produce an $x \in X_{n}$ such that $d_{i} x=x_{i}$ for $i \neq k$ and $f(x)=y$.
Since $f$ is termwise surjective we can find $x \in X_{n}$ with $f(x)=y$. Replace $y$ by $0=y-f(x)$ and $x_{i}$ by $x_{i}-d_{i} x$ for $i \neq k$. Then we see that we may assume $y=0$. In particular $f\left(x_{i}\right)=0$. In other words, we can replace $X$ by $\operatorname{Ker}(f) \subset X$ and $Y$ by 0 . In this case the statement become Lemma 14.31 .6

08P1 Lemma 14.31.8. Let $f: X \rightarrow Y$ be a homomorphism of simplicial abelian groups which is termwise surjective and induces a quasi-isomorphism on associated chain complexes. Then $f$ is a trivial Kan fibration of simplicial sets.

Proof. Consider a commutative solid diagram

as in Definition 14.30.1 The map $a$ corresponds to $x_{0}, \ldots, x_{n} \in X_{n-1}$ satisfying $d_{i} x_{j}=d_{j-1} x_{i}$ for $i<j$. The map $b$ corresponds to an element $y \in Y_{n}$ such that $d_{i} y=f\left(x_{i}\right)$. Our task is to produce an $x \in X_{n}$ such that $d_{i} x=x_{i}$ and $f(x)=y$.

Since $f$ is termwise surjective we can find $x \in X_{n}$ with $f(x)=y$. Replace $y$ by $0=y-f(x)$ and $x_{i}$ by $x_{i}-d_{i} x$. Then we see that we may assume $y=0$. In particular $f\left(x_{i}\right)=0$. In other words, we can replace $X$ by $\operatorname{Ker}(f) \subset X$ and $Y$ by 0 . This works, because by Homology, Lemma 12.12 .6 the homology of the chain complex associated to $\operatorname{Ker}(f)$ is zero and hence $\operatorname{Ker}(f) \rightarrow 0$ induces a quasi-isomorphism on associated chain complexes.
Since $X$ is a Kan complex (Lemma 14.31.6) we can find $x \in X_{n}$ with $d_{i} x=x_{i}$ for $i=0, \ldots, n-1$. After replacing $x_{i}$ by $x_{i}-d_{i} x$ for $i=0, \ldots, n$ we may assume that $x_{0}=x_{1}=\ldots=x_{n-1}=0$. In this case we see that $d_{i} x_{n}=0$ for $i=0, \ldots, n-1$. Thus $x_{n} \in N(X)_{n-1}$ and lies in the kernel of the differential $N(X)_{n-1} \rightarrow N(X)_{n-2}$. Here $N(X)$ is the normalized chain complex associated to $X$, see Section 14.23 . Since $N(X)$ is quasi-isomorphic to $s(X)$ (Lemma 14.23.8) and thus acyclic we find $x \in N\left(X_{n}\right)$ whose differential is $x_{n}$. This $x$ answers the question posed by the lemma and we are done.

08P2 Lemma 14.31.9. Let $f: X \rightarrow Y$ be a map of simplicial abelian groups. If $f$ is termwise surjectiv $\xi^{3}$ and a homotopy equivalence of simplicial sets, then $f$ induces a quasi-isomorphism of associated chain complexes.

Proof. By assumption there exists a map $g: Y \rightarrow X$ of simplicial sets, a homotopy $h: X \times \Delta[1] \rightarrow X$ between $g \circ f$ and $^{2}{ }_{X}$, and a homotopy $h^{\prime}: Y \times \Delta[1] \rightarrow Y$ between $f \circ g$ and $\operatorname{id}_{Y}$. During this proof we will write $H_{n}(X)=H_{n}(s(X))=H_{n}(N(X))$, see Section 14.23 .

[^37]Note that $H_{0}(X)$ is the cokernel of the difference map $d_{1}-d_{0}: X_{1} \rightarrow X_{0}$. Observe that $x \in X_{0}$ corresponds to a morphism $\Delta[0] \rightarrow X$. Composing $h$ with the induced map $\Delta[0] \times \Delta[1] \rightarrow X \times \Delta[1]$ we see that $x$ and $g(f(x))$ are equal to $d_{0} x^{\prime}$ and $d_{1} x^{\prime}$ for some $x^{\prime} \in X_{1}$. Similarly for $y \in Y_{0}$. We conclude that $f$ defines a bijection $H_{0}(X) \rightarrow H_{0}(Y)$.
Let $n \geq 1$. Consider the simplicial set $S$ which is the pushout of

Concretely, we take

$$
S_{k}=\{\varphi:[k] \rightarrow[n] \mid \varphi \text { is surjective }\} \amalg\{*\} .
$$

Denote $E=\mathbf{Z}[S]$ the free abelian group on $S$. The inclusion $\Delta[0] \rightarrow S$ coming from $* \in S_{0}$ determines an injection $K(\mathbf{Z}, 0) \rightarrow E$ whose cokernel is the object $K(\mathbf{Z}, n)$, i.e., we have a short exact sequence

$$
0 \rightarrow K(\mathbf{Z}, 0) \rightarrow E \rightarrow K(\mathbf{Z}, n) \rightarrow 0
$$

See Definition 14.22 .3 and the description of the Eilenberg-Maclane objects in Lemma 14.22.2 Note that the extension above is split, for example because the element $\xi=\left[\mathrm{id}_{[n]}\right]-[*] \in E_{n}$ satisfies $d_{i} \xi=0$ and maps to the "generator" of $K(\mathbf{Z}, n)$. We have

$$
\operatorname{Mor}_{S i m p(S e t s)}(S, X)=\operatorname{Mor}_{\operatorname{Simp}(A b)}(E, X)=X_{0} \times \bigcap_{i=0, \ldots, n} \operatorname{Ker}\left(d_{i}: X_{n} \rightarrow X_{n-1}\right)
$$

This uses the choice of our splitting above and the description of morphisms out of Eilenberg-Maclane objects given in Lemma 14.22.2. Note that we can think of $\bigcap_{i=0, \ldots, n} \operatorname{Ker}\left(d_{i}: X_{n} \rightarrow X_{n-1}\right)$ as the cycles in degree $n$ in the normalized chain complex associated to $X$, see Section 14.23. If two maps $a, b: S \rightarrow X$ are homotopic (as maps of simplicial sets), then the corresponding maps $a^{\prime}, b^{\prime}: E \rightarrow X$ are homotopic as maps of simplicial abelian groups (because taking the free abelian group on is a functor). Thus if $a$, resp. $b$ correspond to $\left(a_{0}, a_{n}\right)$, resp. $\left(b_{0}, b_{n}\right)$ in the formula above, then $a_{0}$ and $b_{0}$ define the same element of $H_{0}(X)$ and $a_{n}$ and $b_{n}$ define the same class in $H_{n}(X)$. See Lemma 14.27.1.
We come the final arguments of the proof. An element $y$ of $H_{n}(Y)$ can be represented by an element $y_{n}$ in $\bigcap_{i=0, \ldots, n} \operatorname{Ker}\left(d_{i}: Y_{n} \rightarrow Y_{n-1}\right)$. Let $a: S \rightarrow Y$ be the map of simplicial sets corresponding to $\left(0, y_{n}\right)$. Then $b=g \circ a$ corresponds to some $\left(b_{0}, b_{n}\right)$ as above for $X$. Using the homotopy $h^{\prime}$ we see $\left(f\left(b_{0}\right), f\left(b_{n}\right)\right)$ and $\left(0, y_{n}\right)$ come from homotopic maps $S \rightarrow Y$ and hence $y_{n}$ and $f\left(b_{n}\right)$ define the same element of $H_{n}(Y)$. Clearly this shows that $H_{n}(f)$ is surjective. Conversely, suppose $x_{n}$ in $\bigcap_{i=0, \ldots, n} \operatorname{Ker}\left(d_{i}: X_{n} \rightarrow X_{n-1}\right)$ and $f\left(x_{n}\right)=d\left(y^{\prime}\right)$ with $y^{\prime} \in N\left(Y_{n+1}\right)$. Since $f$ is termwise surjective so is the induced map $f: N\left(X_{n+1}\right) \rightarrow N\left(Y_{n+1}\right)$ (see Lemma 14.23.6). Thus we can pick $x^{\prime} \in N\left(X_{n+1}\right)$ mapping to $y^{\prime}$. After replacing $x_{n}$ by $x_{n}-d\left(x^{\prime}\right)$ we reach the point where $f\left(x_{n}\right)=0$. This means that the morphism $a: S \rightarrow X$ corresponding to $\left(0, x_{n}\right)$ has the property that $f \circ a$ is the constant morphism with value 0 in $Y$. Hence $g \circ f \circ a$ is also a constant morphism, i.e., corresponds to a pair $\left(b_{0}, 0\right)$. Since as before $x_{n}$ and 0 represent the same element of $H_{n}(X)$ we conclude.

### 14.32. A homotopy equivalence

01A5 Suppose that $A, B$ are sets, and that $f: A \rightarrow B$ is a map. Consider the associated map of simplicial sets

See Example 14.19.1. The case $n=0$ of the following lemma says that this map of simplicial sets is a trivial Kan fibration if $f$ is surjective.

01A6 Lemma 14.32.1. Let $f: V \rightarrow U$ be a morphism of simplicial sets. Let $n \geq 0$ be an integer. Assume
(1) The map $f_{i}: V_{i} \rightarrow U_{i}$ is a bijection for $i<n$.
(2) The map $f_{n}: V_{n} \rightarrow U_{n}$ is a surjection.
(3) The canonical morphism $U \rightarrow \operatorname{cosk}_{n} s k_{n} U$ is an isomorphism.
(4) The canonical morphism $V \rightarrow \operatorname{cosk}_{n} s k_{n} V$ is an isomorphism.

Then $f$ is a trivial Kan fibration.
Proof. Consider a solid diagram

as in Definition 14.30.1. Let $x \in U_{k}$ be the $k$-simplex corresponding to the lower horizontal arrow. If $k \leq n$ then the dotted arrow is the one corresponding to a lift $y \in V_{k}$ of $x$; the diagram will commute as the other nondegenerate simplices of $\Delta[k]$ are in degrees $<k$ where $f$ is an isomorphism. If $k>n$, then by conditions (3) and (4) we have (using adjointness of skeleton and coskeleton functors)

$$
\operatorname{Mor}(\Delta[k], U)=\operatorname{Mor}\left(\operatorname{sk}_{n} \Delta[k], \operatorname{sk}_{n} U\right)=\operatorname{Mor}\left(\mathrm{sk}_{n} \partial \Delta[k], \operatorname{sk}_{n} U\right)=\operatorname{Mor}(\partial \Delta[k], U)
$$

and similarly for $V$ because $\operatorname{sk}_{n} \Delta[k]=\operatorname{sk}_{n} \partial \Delta[k]$ for $k>n$. Thus we obtain a unique dotted arrow fitting into the diagram in this case also.

Let $A, B$ be sets. Let $f^{0}, f^{1}: A \rightarrow B$ be maps of sets. Consider the induced maps $f^{0}, f^{1}: \operatorname{cosk}_{0}(A) \rightarrow \operatorname{cosk}_{0}(B)$ abusively denoted by the same symbols. The following lemma for $n=0$ says that $f^{0}$ is homotopic to $f^{1}$. In fact, the homotopy is given by the map $h: \operatorname{cosk}_{0}(A) \times \Delta[1] \rightarrow \operatorname{cosk}_{0}(A)$ with components

$$
\begin{aligned}
h_{m}: A \times \ldots \times A \times \operatorname{Mor}_{\Delta}([m],[1]) & \longrightarrow A \times \ldots \times A, \\
\left(a_{0}, \ldots, a_{m}, \alpha\right) & \longmapsto\left(f^{\alpha(0)}\left(a_{0}\right), \ldots, f^{\alpha(m)}\left(a_{m}\right)\right)
\end{aligned}
$$

To check that this works, note that for a map $\varphi:[k] \rightarrow[m]$ the induced maps are $\left(a_{0}, \ldots, a_{m}\right) \mapsto\left(a_{\varphi(0)}, \ldots, a_{\varphi(k)}\right)$ and $\alpha \mapsto \alpha \circ \varphi$. Thus $h=\left(h_{m}\right)_{m \geq 0}$ is clearly a map of simplicial sets as desired.
01A9 Lemma 14.32.2. Let $f^{0}, f^{1}: V \rightarrow U$ be maps of a simplicial sets. Let $n \geq 0$ be an integer. Assume
(1) The maps $f_{i}^{j}: V_{i} \rightarrow U_{i}, j=0,1$ are equal for $i<n$.
(2) The canonical morphism $U \rightarrow \operatorname{cosk}_{n} s k_{n} U$ is an isomorphism.
(3) The canonical morphism $V \rightarrow \operatorname{cosk}_{n} s k_{n} V$ is an isomorphism.

Then $f^{0}$ is homotopic to $f^{1}$.
First proof. Let $W$ be the $n$-truncated simplicial set with $W_{i}=U_{i}$ for $i<n$ and $W_{n}=U_{n} / \sim$ where $\sim$ is the equivalence relation generated by $f^{0}(y) \sim f^{1}(y)$ for $y \in V_{n}$. This makes sense as the morphisms $U(\varphi): U_{n} \rightarrow U_{i}$ corresponding to $\varphi:[i] \rightarrow[n]$ for $i<n$ factor through the quotient map $U_{n} \rightarrow W_{n}$ because $f^{0}$ and $f^{1}$ are morphisms of simplicial sets and equal in degrees $<n$. Next, we upgrade $W$ to a simplicial set by taking $\operatorname{cosk}_{n} W$. By Lemma 14.32 .1 the morphism $g: U \rightarrow W$ is a trivial Kan fibration. Observe that $g \circ f^{0}=g \circ f^{1}$ by construction and denote this morphism $f: V \rightarrow W$. Consider the diagram

By Lemma 14.30 .2 the dotted arrow exists and the proof is done.
Second proof. We have to construct a morphism of simplicial sets $h: V \times \Delta[1] \rightarrow$ $U$ which recovers $f^{i}$ on composing with $e_{i}$. The case $n=0$ was dealt with above the lemma. Thus we may assume that $n \geq 1$. The map $\Delta[1] \rightarrow \operatorname{cosk}_{1} \operatorname{sk}_{1} \Delta[1]$ is an isomorphism, see Lemma 14.19 .15 Thus we see that $\Delta[1] \rightarrow \operatorname{cosk}_{n} \mathrm{sk}_{n} \Delta[1]$ is an isomorphism as $n \geq 1$, see Lemma 14.19.10. And hence $V \times \Delta[1] \rightarrow \operatorname{cosk}_{n} \operatorname{sk}_{n}(V \times$ $\Delta[1])$ is an isomorphism too, see Lemma 14.19.12. In other words, in order to construct the homotopy it suffices to construct a suitable morphism of $n$-truncated simplicial sets $h: \mathrm{sk}_{n} V \times \mathrm{sk}_{n} \Delta[1] \rightarrow \mathrm{sk}_{n} U$.
For $k=0, \ldots, n-1$ we define $h_{k}$ by the formula $h_{k}(v, \alpha)=f^{0}(v)=f^{1}(v)$. The map $h_{n}: V_{n} \times \operatorname{Mor}_{\Delta}([k],[1]) \rightarrow U_{n}$ is defined as follows. Pick $v \in V_{n}$ and $\alpha:[n] \rightarrow[1]:$
(1) If $\operatorname{Im}(\alpha)=\{0\}$, then we set $h_{n}(v, \alpha)=f^{0}(v)$.
(2) If $\operatorname{Im}(\alpha)=\{0,1\}$, then we set $h_{n}(v, \alpha)=f^{0}(v)$.
(3) If $\operatorname{Im}(\alpha)=\{1\}$, then we set $h_{n}(v, \alpha)=f^{1}(v)$.

Let $\varphi:[k] \rightarrow[l]$ be a morphism of $\Delta_{\leq n}$. We will show that the diagram

commutes. Pick $v \in V_{l}$ and $\alpha:[l] \rightarrow[1]$. The commutativity means that

$$
h_{k}(V(\varphi)(v), \alpha \circ \varphi)=U(\varphi)\left(h_{l}(v, \alpha)\right)
$$

In almost every case this holds because $h_{k}(V(\varphi)(v), \alpha \circ \varphi)=f^{0}(V(\varphi)(v))$ and $U(\varphi)\left(h_{l}(v, \alpha)\right)=U(\varphi)\left(f^{0}(v)\right)$, combined with the fact that $f^{0}$ is a morphism of simplicial sets. The only cases where this does not hold is when either $(\mathrm{A}) \operatorname{Im}(\alpha)=$ $\{1\}$ and $l=n$ or $(\mathrm{B}) \operatorname{Im}(\alpha \circ \varphi)=\{1\}$ and $k=n$. Observe moreover that necessarily $f^{0}(v)=f^{1}(v)$ for any degenerate $n$-simplex of $V$. Thus we can narrow the cases
above down even further to the cases $(\mathrm{A}) \operatorname{Im}(\alpha)=\{1\}, l=n$ and $v$ nondegenerate, and $(\mathrm{B}) \operatorname{Im}(\alpha \circ \varphi)=\{1\}, k=n$ and $V(\varphi)(v)$ nondegenerate.
In case (A), we see that also $\operatorname{Im}(\alpha \circ \varphi)=\{1\}$. Hence we see that not only $h_{l}(v, \alpha)=$ $f^{1}(v)$ but also $h_{k}(V(\varphi)(v), \alpha \circ \varphi)=f^{1}(V(\varphi)(v))$. Thus we see that the relation holds because $f^{1}$ is a morphism of simplicial sets.
In case (B) we conclude that $l=k=n$ and $\varphi$ is bijective, since otherwise $V(\varphi)(v)$ is degenerate. Thus $\varphi=\mathrm{id}_{[n]}$, which is a trivial case.

01 AB Lemma 14.32.3. Let $A, B$ be sets, and that $f: A \rightarrow B$ is a map. Consider the simplicial set $U$ with $n$-simplices

$$
A \times_{B} A \times_{B} \ldots \times_{B} A(n+1 \text { factors })
$$

see Example 14.3.5. If $f$ is surjective, the morphism $U \rightarrow B$ where $B$ indicates the constant simplicial set with value $B$ is a trivial Kan fibration.

Proof. Observe that $U$ fits into a cartesian square

Since the right vertical arrow is a trivial Kan fibration by Lemma 14.32.1. so is the left by Lemma 14.30 .3

### 14.33. Standard resolutions

08N8 Some of the material in this section can be found in God73, Appendix 1] and [Ill72, I 1.5].
08N9 Situation 14.33.1. Let $\mathcal{A}, \mathcal{S}$ be categories and let $i: \mathcal{A} \rightarrow \mathcal{S}$ be a functor with a left adjoint $F: \mathcal{S} \rightarrow \mathcal{A}$.

In this very general situation we will construct a simplicial object $X$ in the category of functors from $\mathcal{A}$ to $\mathcal{A}$. Please keep the following example in mind while we do this.

08NA Example 14.33.2. As an example of the above we can take $i:$ Rings $\rightarrow$ Sets to be the forgetful functor and $F:$ Sets $\rightarrow$ Rings to be the functor that associates to a set $E$ the polynomial algebra $\mathbf{Z}[E]$ on $E$ over $\mathbf{Z}$. The simplicial object $X$ when evaluated on an ring $A$ will give the simplicial ring

$$
\mathbf{Z}[\mathbf{Z}[\mathbf{Z}[A]]] \underset{ }{\rightleftarrows} \mathbf{Z}[\mathbf{Z}[A]] \underset{ }{\rightleftarrows} \mathbf{Z}[A]
$$

which comes with an augmentation towards $A$. We will also show this augmentation is a homotopy equivalence.

For the general construction we will use the horizontal composition as defined in Categories, Section4.27. The definition of the adjunction morphisms $k: F \circ i \rightarrow \mathrm{id}_{\mathcal{A}}$ and $t: \mathrm{id}_{\mathcal{S}} \rightarrow i \circ F$ in Categories, Section 4.24 shows that the compositions

08NB

$$
\begin{equation*}
i \xrightarrow{t \star 1_{i}} i \circ F \circ i \xrightarrow{1_{i} \star k} i \quad \text { and } \quad F \xrightarrow{1_{F} \star t} F \circ i \circ F \xrightarrow{k \star 1_{F}} F \tag{14.33.2.1}
\end{equation*}
$$

are the identity morphisms. Here to define the morphism $t \star 1$ we silently identify $i$ with $\operatorname{id}_{\mathcal{S}} \circ i$ and 1 stands for $\operatorname{id}_{i}: i \rightarrow i$. We will use this notation and these relations repeatedly in what follows. For $n \geq 0$ we set

$$
X_{n}=(F \circ i)^{\circ(n+1)}=F \circ i \circ F \circ \ldots \circ i \circ F
$$

In other words, $X_{n}$ is the $(n+1)$-fold composition of $F \circ i$ with itself. We also set $X_{-1}=\operatorname{id}_{\mathcal{A}}$. We have $X_{n+m+1}=X_{n} \circ X_{m}$ for all $n, m \geq-1$. We will endow this sequence of functors with the structure of a $\operatorname{simplicial}$ object of $\operatorname{Fun}(\mathcal{A}, \mathcal{A})$ by constructing the morphisms of functors

$$
d_{j}^{n}: X_{n} \rightarrow X_{n-1}, \quad s_{j}^{n}: X_{n} \rightarrow X_{n+1}
$$

satisfying the relations displayed in Lemma 14.2 .3 . Namely, we set

$$
d_{j}^{n}=1_{X_{j-1}} \star k \star 1_{X_{n-j-1}} \quad \text { and } \quad s_{j}^{n}=1_{X_{j-1} \circ F} \star t \star 1_{i \circ X_{n-j-1}}
$$

Finally, write $\epsilon_{0}=k: X_{0} \rightarrow X_{-1}$.
09CB Example 14.33.3. In Example 14.33 .2 we have $X_{n}(A)=\mathbf{Z}[\mathbf{Z}[\ldots[A] \ldots]]$ with $n+1$ brackets. We describe the maps constructed above using a typical element $\xi=\sum n_{i}\left[n_{i j}\left[a_{i j}\right]\right]$ of $X_{1}(A)$. The maps $d_{0}, d_{1}: \mathbf{Z}[\mathbf{Z}[A]] \rightarrow \mathbf{Z}[A]$ are given by

$$
d_{0}(\xi)=\sum n_{i} n_{i j}\left[a_{i j}\right] \quad \text { and } \quad d_{1}(\xi)=\sum n_{i}\left[n_{i j} a_{i j}\right]
$$

The maps $s_{0}, s_{1}: \mathbf{Z}[\mathbf{Z}[A]] \rightarrow \mathbf{Z}[\mathbf{Z}[\mathbf{Z}[A]]]$ are given by

$$
s_{0}(\xi)=\sum n_{i}\left[\left[n_{i j}\left[a_{i j}\right]\right]\right] \quad \text { and } \quad s_{1}(\xi)=\sum n_{i}\left[n_{i j}\left[\left[a_{i j}\right]\right]\right] .
$$

08NC Lemma 14.33.4. In Situation 14.33 .1 the system $X=\left(X_{n}, d_{j}^{n}, s_{j}^{n}\right)$ is a simplicial object of $\operatorname{Fun}(\mathcal{A}, \mathcal{A})$ and $\epsilon_{0}$ defines an augmentation $\epsilon$ from $X$ to the constant simplicial object with value $X_{-1}=i d_{\mathcal{A}}$.

Proof. Suppose that we have shown that $X$ is a simplicial object. Then to prove that $\epsilon_{0}=k$ defines an augmentation we have to check that $\epsilon_{0} \circ d_{0}^{1}=\epsilon_{0} \circ d_{1}^{1}$ as morphisms $X_{1} \rightarrow X_{-1}$, see Lemma 14.20 .2 . In other words, we have to check that the diagram

is commutative. More precisely we should write this as the equality

$$
\left(k \star 1_{\mathrm{id}_{\mathcal{A}}}\right) \circ\left(1_{F \circ i} \star k\right)=\left(1_{\mathrm{id}_{\mathcal{A}}} \star k\right) \circ\left(k \star 1_{F \circ i}\right)
$$

as morphisms $(F \circ i) \circ(F \circ i) \rightarrow \operatorname{id}_{\mathcal{A}} \circ \mathrm{id}_{\mathcal{A}}$. Applying the general property of Categories, Lemma 4.27.2 both sides expand to $k \star k$ when equality holds.

To prove that $X$ is a simplicial object we have to check (see Remark 14.3.3):
(1) If $i<j$, then $d_{i} \circ d_{j}=d_{j-1} \circ d_{i}$.
(2) If $i<j$, then $d_{i} \circ s_{j}=s_{j-1} \circ d_{i}$.
(3) We have id $=d_{j} \circ s_{j}=d_{j+1} \circ s_{j}$.
(4) If $i>j+1$, then $d_{i} \circ s_{j}=s_{j} \circ d_{i-1}$.
(5) If $i \leq j$, then $s_{i} \circ s_{j}=s_{j+1} \circ s_{i}$.

Relation (1) is proved in exactly the same manner as the proof of the equality $\epsilon_{0} \circ d_{0}^{1}=\epsilon_{0} \circ d_{1}^{1}$ above.
The simplest case of equality (5) is the commutativity of the diagram

which holds because both compositions expand to the morphism $1_{F} \star t \star t \star 1_{i}$ from $F \circ \mathrm{id}_{\mathcal{A}} \circ \mathrm{id}_{\mathcal{A}} \circ i$ to $F \circ(i \circ F) \circ(i \circ F) \circ i$. All other cases of (5) are proved in the same manner.

The simplest case of equalities (2) and (4) is the commutativity of the diagram

which again holds because both compositions expand to give $1_{F} \star k \star 1_{i} \star t$ as maps from $F \circ(i \circ F) \circ i \circ \operatorname{id}_{\mathcal{A}}$ to $F \circ \operatorname{id}_{\mathcal{A}} \circ i \circ(F \circ i)$. All other cases of (2) and (4) are proved in the same manner.

The relations (3) are the only nontrivial ones and these are consequences of the fact that the compositions in 14.33 .2 .1 are the identity. For example, the simplest case of (3) states that the compositions

go around the diagram either way evaluate out to the identity. Going around the top the composition evaluates to $1_{F} \star\left(\left(k \star 1_{i}\right) \circ\left(1_{i} \star t\right)\right)$ which is the identity by what was said above. The other cases of (3) are proved in the same manner.

Before reading the proof of the following lemma, we strongly urge the reader to look at the example discussed in Example 14.33 .6 in order to understand the purpose of the lemma.

08ND
Lemma 14.33.5. In Situation 14.33.1 the maps

$$
1_{i} \star \epsilon: i \circ X \rightarrow i, \quad \text { and } \quad \epsilon \star 1_{F}: X \circ F \rightarrow F
$$

are homotopy equivalences.
Proof. Denote $\epsilon_{n}: X_{n} \rightarrow X_{-1}$ the components of the augmentation morphism. We observe that $\epsilon_{n}=k^{\star(n+1)}$, the $(n+1)$-fold $\star$-composition of $k$. Recall that $t: \operatorname{id}_{\mathcal{S}} \rightarrow i \circ F$ is the adjunction map. We have the morphisms

$$
t^{\star(n+1)} \star 1_{i}: i \longrightarrow i \circ(F \circ i)^{\circ(n+1)}=i \circ X_{n}
$$

which are right inverse to $1_{i} \star \epsilon_{n}$ and the morphisms

$$
1_{F} \star t^{\star(n+1)}: F \longrightarrow(F \circ i)^{\circ(n+1)} \circ F=X_{n} \circ F
$$

which are right inverse to $\epsilon_{n} \star 1_{F}$. These morphisms determine morphisms of simplicial objects $b: i \rightarrow i \circ X$ and $c: F \rightarrow X \circ F$ (proof omitted). To finish it suffices to construct a homotopy between the morphisms $1, b \circ\left(1_{i} \star \epsilon\right): i \circ X \rightarrow i \circ X$ and between the two morphisms $1, c \circ\left(\epsilon \star 1_{F}\right): X \circ F \rightarrow X \circ F$.
To show the morphisms $b \circ\left(1_{i} \star \epsilon\right), 1: i \circ X \rightarrow i \circ X$ are homotopic we have to construct morphisms

$$
h_{n, j}: i \circ X_{n} \rightarrow i \circ X_{n}
$$

for $n \geq 0$ and $0 \leq j \leq n+1$ satisfying the relations described in Lemma 14.26.2, See also Remark 14.26.4. We are forced to set $h_{n, 0}=1$ and

$$
h_{n, n+1}=b_{n} \circ\left(1_{i} \star \epsilon_{n}\right)=\left(t^{\star(n+1)} \star 1_{i}\right) \circ\left(1_{i} \star k^{\star(n+1)}\right)
$$

Thus a logical choice is

$$
h_{n, j}=\left(t^{\star(j)} \star 1\right) \circ\left(1_{i} \star k^{\star(j)} \star 1\right)
$$

Here and in the rest of the proof we drop the subscript from 1 if it is clear by knowing the source and the target of the morphism what this subscript should be. Writing

$$
i \circ X_{n}=i \circ F \circ i \circ \ldots \circ F \circ i
$$

we can think of the morphism $h_{n, j}$ as collapsing the first $j$ pairs $(F \circ i)$ to $\mathrm{id}_{\mathcal{S}}$ using $k^{\star(j)}$, then adding a $\operatorname{id}_{\mathcal{S}}$ in front and expanding this to $j$ pairs $(i \circ F)$ using $t^{\star(j)}$. We have to prove
(1) We have $d_{m}^{n} \circ h_{n, j}=h_{n-1, j-1} \circ d_{m}^{n}$ for $j>m$.
(2) We have $d_{m}^{n} \circ h_{n, j}=h_{n-1, j} \circ d_{m}^{n}$ for $j \leq m$.
(3) We have $s_{m}^{n} \circ h_{n, j}=h_{n+1, j+1} \circ s_{m}^{n}$ for $j>m$.
(4) We have $s_{m}^{n} \circ h_{n, j}=h_{n+1, j} \circ s_{m}^{n}$ for $j \leq m$.

Recall that $d_{m}^{n}$ is given by applying $k$ to the $(m+1)$ st pair $(F \circ i)$ in the functor $X_{n}=(F \circ i)^{\circ(n+1)}$. Thus it is clear that (2) holds (because $k$ does $\star$-commute with $k$, but not with $t$ ). Similarly, $s_{m}^{n}$ is given by applying $1_{F} \star t \star i_{i}$ to the ( $m+1$ ) st pair $(F \circ i)$ in $X_{n}=(F \circ i)^{\circ(n+1)}$. Thus it is clear that (4) holds. In the two remaining cases one uses the fact that the compositions in 14.33.2.1) are the identity causes the drop in the index $j$. Some details omitted.

To show the morphisms $1, c \circ\left(\epsilon \star 1_{F}\right): X \circ F \rightarrow X \circ F$ are homotopic we have to construct morphisms

$$
h_{n, j}: X_{n} \circ F \longrightarrow X_{n} \circ F
$$

for $n \geq 0$ and $0 \leq j \leq n+1$ satisfying the relations described in Lemma 14.26.2, See also Remark 14.26.4. We are forced to set $h_{n, 0}=1$ and

$$
h_{n, n+1}=c_{n} \circ\left(\epsilon_{n} \star 1_{F}\right)=\left(1_{F} \star t^{\star(n+1)}\right) \circ\left(k^{\star(n+1)} \star 1_{F}\right)
$$

Thus a logical choice is

$$
h_{n, j}=\left(1_{F} \star t^{\star(j)} \star 1\right) \circ\left(k^{\star(j)} \star 1\right)
$$

Here and in the rest of the proof we drop the subscript from 1 if it is clear by knowing the source and the target of the morphism what this subscript should be. Writing

$$
X_{n} \circ F=F \circ i \circ F \circ \ldots \circ i \circ F
$$

we can think of the morphism $h_{n, j}$ as collapsing the first $j$ pairs $(F \circ i)$ to id $\mathcal{S}$ using $k^{\star(j)}$, then inserting a $\operatorname{id}_{\mathcal{S}}$ just after the first $F$ and expanding this to $j$ pairs $(i \circ F)$ using $t^{\star(j)}$. We have to prove
(1) We have $d_{m}^{n} \circ h_{n, j}=h_{n-1, j-1} \circ d_{m}^{n}$ for $j>m$.
(2) We have $d_{m}^{n} \circ h_{n, j}=h_{n-1, j} \circ d_{m}^{n}$ for $j \leq m$.
(3) We have $s_{m}^{n} \circ h_{n, j}=h_{n+1, j+1} \circ s_{m}^{n}$ for $j>m$.
(4) We have $s_{m}^{n} \circ h_{n, j}=h_{n+1, j} \circ s_{m}^{n}$ for $j \leq m$.

Recall that $d_{m}^{n}$ is given by applying $k$ to the $(m+1)$ st pair $(F \circ i)$ in the functor $X_{n}=(F \circ i)^{\circ(n+1)}$. Thus it is clear that (2) holds (because $k$ does $\star$-commute with $k$, but not with $t$ ). Similarly, $s_{m}^{n}$ is given by applying $1_{F} \star t \star i_{i}$ to the ( $m+1$ )st pair $(F \circ i)$ in $X_{n}=(F \circ i)^{\circ(n+1)}$. Thus it is clear that (4) holds. In the two remaining cases one uses the fact that the compositions in 14.33.2.1) are the identity causes the drop in the index $j$. Some details omitted.
08NE Example 14.33.6. Going back to the example discussed in Example 14.33 .2 our Lemma 14.33 .5 signifies that for any ring $A$ the map of simplicial rings

is a homotopy equivalence on underlying simplicial sets. Moreover, the inverse map constructed in Lemma 14.33 .5 is in degree $n$ given by

$$
a \longmapsto[\ldots[a] \ldots]
$$

with obvious notation. In the other direction the lemma tells us that for every set $E$ there is a homotopy equivalence

of rings. The inverse map constructed in the lemma is in degree $n$ given by the ring map

$$
\sum m_{e_{1}, \ldots, e_{p}}\left[e_{1}\right]\left[e_{2}\right] \ldots\left[e_{p}\right] \longmapsto \sum m_{e_{1}, \ldots, e_{p}}\left[\ldots\left[e_{1}\right] \ldots\right]\left[\ldots\left[e_{2}\right] \ldots\right] \ldots\left[\ldots\left[e_{p}\right] \ldots\right]
$$

(with obvious notation).

## CHAPTER 15

## More on Algebra

05E3

### 15.1. Introduction

05 E 4 In this chapter we prove some results in commutative algebra which are less elementary than those in the first chapter on commutative algebra, see Algebra, Section 10.1. A reference is Mat70a.

### 15.2. Advice for the reader

0910 More than in the chapter on commutative algebra, each of the sections in this chapter stands on its own. Starting with Section 15.47 we freely use the (unbounded) derived category of modules over rings and all the machinery that comes with it.

### 15.3. Stably free modules

0BC2 Here is what seems to be the generally accepted definition.
0BC3 Definition 15.3.1. Let $R$ be a ring.
(1) Two modules $M, N$ over $R$ are said to be stably isomorphic if there exist $n, m \geq 0$ such that $M \oplus R^{\oplus m} \cong N \oplus R^{\oplus m}$ as $R$-modules.
(2) A module $M$ is stably free if it is stably isomorphic to a free module.

Observe that a stably free module is projective.
0BC4 Lemma 15.3.2. Let $R$ be a ring. Let $0 \rightarrow P^{\prime} \rightarrow P \rightarrow P^{\prime \prime} \rightarrow 0$ be a short exact sequence of finite projective $R$-modules. If 2 out of 3 of these modules are stably free, then so is the third.

Proof. Since the modules are projective, the sequence is split. Thus we can choose an isomorphism $P=P^{\prime} \oplus P^{\prime \prime}$. If $P^{\prime} \oplus R^{\oplus n}$ and $P^{\prime \prime} \oplus R^{\oplus m}$ are free, then we see that $P \oplus R^{\oplus n+m}$ is free. Suppose that $P^{\prime}$ and $P$ are stably free, say $P \oplus R^{\oplus n}$ is free and $P^{\prime} \oplus R^{\oplus m}$ is free. Then

$$
P^{\prime \prime} \oplus\left(P^{\prime} \oplus R^{\oplus m}\right) \oplus R^{\oplus n}=\left(P^{\prime \prime} \oplus P^{\prime}\right) \oplus R^{\oplus m} \oplus R^{\oplus n}=\left(P \oplus R^{\oplus n}\right) \oplus R^{\oplus m}
$$

is free. Thus $P^{\prime \prime}$ is stably free. By symmetry we get the last of the three cases.
0BC5 Lemma 15.3.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Assume that every element of $1+I$ is a unit (in other words $I$ is contained in the radical of $R$ ). For every finite stably free $R / I$-module $E$ there exists a finite stably free $R$-module $M$ such that $M / I M \cong E$.

Proof. Choose a $n$ and $m$ and an isomorphism $E \oplus(R / I)^{\oplus n} \cong(R / I)^{\oplus m}$. Choose $R$-linear maps $\varphi: R^{\oplus m} \rightarrow R^{\oplus n}$ and $\psi: R^{\oplus n} \rightarrow R^{\oplus m}$ lifting the projection $(R / I)^{\oplus m} \rightarrow(R / I)^{\oplus n}$ and injection $(R / I)^{\oplus n} \rightarrow(R / I)^{\oplus m}$. Then $\varphi \circ \psi: R^{\oplus n} \rightarrow R^{\oplus n}$ reduces to the identity modulo $I$. Thus the determinant of this map is invertible by our assumption on $I$. Hence $P=\operatorname{Ker}(\varphi)$ is stably free and lifts $E$.

The lift of the previous lemma is unique up to isomorphism by the following lemma.
0BC6 Lemma 15.3.4. Let $R$ be a ring. Let $I \subset R$ be an ideal. Assume that every element of $1+I$ is a unit. If $P$ and $P^{\prime}$ are finite projective $R$-modules such that $P / I P \cong P^{\prime} / I P^{\prime}$, then $P \cong P^{\prime}$.

Proof. Fix an isomorphism $P / I P \cong P^{\prime} / I P^{\prime}$. Since $P$ is projectve we can choose a lift $\varphi: P \rightarrow P^{\prime}$ of the map $P \rightarrow P / I P \rightarrow P^{\prime} / I P^{\prime}$. Simiarly we choose a lift $\psi: P^{\prime} \rightarrow P$ of the map $P^{\prime} \rightarrow P^{\prime} / I P^{\prime} \rightarrow P / I P$. Then $\psi \circ \varphi: P \rightarrow P$ is a map whose reduction modulo $I$ is the identity. By Nakayama's lemma (Algebra, Lemma 10.19.1 this implies that $\psi \circ \varphi$ is surjective. Hence it is an isomorphism (Algebra, Lemma 10.15.4. Similarly for $\varphi \circ \psi$. This $P \cong P^{\prime}$.

### 15.4. A comment on the Artin-Rees property

07VD Some of this material is taken from CdJ02. A general discussion with additional references can be found in [EH05, Section 1].

Let $A$ be a Noetherian ring and let $I \subset A$ be an ideal. Given a homomorphism $f: M \rightarrow N$ of finite $A$-modules there exists a $c \geq 0$ such that

$$
f(M) \cap I^{n} N \subset f\left(I^{n-c} M\right)
$$

for all $n \geq c$, see Algebra, Lemma 10.50.3. In this situation we will say $c$ works for $f$ in the Artin-Rees lemma.

07 VE Lemma 15.4.1. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal contained in the Jacobson radical of A. Let

$$
S: L \xrightarrow{f} M \xrightarrow{g} N \quad \text { and } \quad S^{\prime}: L \xrightarrow{f^{\prime}} M \xrightarrow{g^{\prime}} N
$$

be two complexes of finite A-modules as shown. Assume that
(1) $c$ works in the Artin-Rees lemma for $f$ and $g$,
(2) the complex $S$ is exact, and
(3) $f^{\prime}=f \bmod I^{c+1} M$ and $g^{\prime}=g \bmod I^{c+1} N$.

Then c works in the Artin-Rees lemma for $g^{\prime}$ and the complex $S^{\prime}$ is exact.
Proof. We first show that $g^{\prime}(L) \cap I^{n} M \subset g^{\prime}\left(I^{n-c} L\right)$ for $n \geq c$. Let $a$ be an element of $M$ such that $g^{\prime}(a) \in I^{n} N$. We want to adjust $a$ by an element of $f^{\prime}(L)$, i.e, without changing $g^{\prime}(a)$, so that $a \in I^{n-c} M$. Assume that $a \in I^{r} M$, where $r<n-c$. Then

$$
g(a)=g^{\prime}(a)+\left(g-g^{\prime}\right)(a) \in I^{n} N+I^{r+c+1} N=I^{r+c+1} N .
$$

By Artin-Rees for $g$ we have $g(a) \in g\left(I^{r+1} M\right)$. Say $g(a)=g\left(a_{1}\right)$ with $a_{1} \in I^{r+1} M$. Since the sequence $S$ is exact, $a-a_{1} \in f(L)$. Accordingly, we write $a=f(b)+a_{1}$ for some $b \in L$. Then $f(b)=a-a_{1} \in I^{r} M$. Artin-Rees for $f$ shows that if $r \geq c$, we may replace $b$ by an element of $I^{r-c} L$. Then in all cases, $a=f^{\prime}(b)+a_{2}$, where $a_{2}=\left(f-f^{\prime}\right)(b)+a_{1} \in I^{r+1} M$. (Namely, either $c \geq r$ and $\left(f-f^{\prime}\right)(b) \in I^{r+1} M$
by assumption, or $c<r$ and $b \in I^{r-c}$, whence again $\left(f-f^{\prime}\right)(b) \in I^{c+1} I^{r-c} M=$ $I^{r+1} M$.) So we can adjust $a$ by the element $f^{\prime}(b) \in f^{\prime}(L)$ to increase $r$ by 1.

In fact, the argument above shows that $\left(g^{\prime}\right)^{-1}\left(I^{n} M\right) \subset f^{\prime}(L)+I^{n-c} M$ for all $n \geq c$. Hence $S^{\prime}$ is exact because

$$
\left(g^{\prime}\right)^{-1}(0)=\left(g^{\prime}\right)^{-1}\left(\bigcap I^{n} N\right) \subset \bigcap f^{\prime}(L)+I^{n-c} M=f^{\prime}(L)
$$

as $I \subset \operatorname{rad}(A)$, see Algebra, Lemma 10.50 .5 .
Given an ideal $I \subset A$ of a ring $A$ and an $A$-module $M$ we set

$$
\operatorname{Gr}_{I}(M)=\bigoplus I^{n} M / I^{n+1} M
$$

We think of this as a graded $\operatorname{Gr}_{I}(A)$-module.
07 VF Lemma 15.4.2. Assumptions as in Lemma 15.4.1. Let $Q=\operatorname{Coker}(g)$ and $Q^{\prime}=$ Coker $\left(g^{\prime}\right)$. Then $G r_{I}(Q) \cong G r_{I}\left(Q^{\prime}\right)$ as graded $G r_{I}(A)$-modules.

Proof. In degree $n$ we have $\operatorname{Gr}_{I}(Q)_{n}=I^{n} N /\left(I^{n+1} N+g(M) \cap I^{n} N\right)$ and similarly for $Q^{\prime}$. We claim that

$$
g(M) \cap I^{n} N \subset I^{n+1} N+g^{\prime}(M) \cap I^{n} N
$$

By symmetry (the proof of the claim will only use that $c$ works for $g$ which also holds for $g^{\prime}$ by the lemma) this will imply that

$$
I^{n+1} N+g(M) \cap I^{n} N=I^{n+1} N+g^{\prime}(M) \cap I^{n} N
$$

whence $\operatorname{Gr}_{I}(Q)_{n}$ and $\operatorname{Gr}_{I}\left(Q^{\prime}\right)_{n}$ agree as subquotients of $N$, implying the lemma. Observe that the claim is clear for $n \leq c$ as $f=f^{\prime} \bmod I^{c+1} N$. If $n>c$, then suppose $b \in g(M) \cap I^{n} N$. Write $b=g(a)$ for $a \in I^{n-c} M$. Set $b^{\prime}=g^{\prime}(a)$. We have $b-b^{\prime}=\left(g-g^{\prime}\right)(a) \in I^{n+1} N$ as desired.

07VG Lemma 15.4.3. Let $A \rightarrow B$ be a flat map of Noetherian rings. Let $I \subset A$ be an ideal. Let $f: M \rightarrow N$ be a homomorphism of finite $A$-modules. Assume that $c$ works for $f$ in the Artin-Rees lemma. Then c works for $f \otimes 1: M \otimes_{A} B \rightarrow N \otimes_{A} B$ in the Artin-Rees lemma for the ideal IB.

Proof. Note that

$$
(f \otimes 1)(M) \cap I^{n} N \otimes_{A} B=(f \otimes 1)\left((f \otimes 1)^{-1}\left(I^{n} N \otimes_{A} B\right)\right)
$$

On the other hand,

$$
\begin{aligned}
(f \otimes 1)^{-1}\left(I^{n} N \otimes_{A} B\right) & =\operatorname{Ker}\left(M \otimes_{A} B \rightarrow N \otimes_{A} B /\left(I^{n} N \otimes_{A} B\right)\right) \\
& =\operatorname{Ker}\left(M \otimes_{A} B \rightarrow\left(N / I^{n} N\right) \otimes_{A} B\right)
\end{aligned}
$$

As $A \rightarrow B$ is flat taking kernels and cokernels commutes with tensoring with $B$, whence this is equal to $f^{-1}\left(I^{n} N\right) \otimes_{A} B$. By assumption $f^{-1}\left(I^{n} N\right)$ is contained in $\operatorname{Ker}(f)+I^{n-c} M$. Thus the lemma holds.

### 15.5. Fibre products of rings

08 KG Fibre products of rings have to do with pushouts of schemes. Some cases of pushouts of schemes are discussed in More on Morphisms, Section 36.11.

00IT Lemma 15.5.1. Let $R$ be a ring. Let $A \rightarrow B$ and $C \rightarrow B$ be $R$-algebra maps. Assume
(1) $R$ is Noetherian,
(2) $A, B, C$ are of finite type over $R$,
(3) $A \rightarrow B$ is surjective, and
(4) $B$ is finite over $C$.

Then $A \times{ }_{B} C$ is of finite type over $R$.
Proof. Set $D=A \times{ }_{B} C$. There is a commutative diagram

with exact rows. Choose $y_{1}, \ldots, y_{n} \in B$ which are generators for $B$ as a $C$-module. Choose $x_{i} \in A$ mapping to $y_{i}$. Then $1, x_{1}, \ldots, x_{n}$ are generators for $A$ as a $D$ module. The map $D \rightarrow A \times C$ is injective, and the ring $A \times C$ is finite as a $D$-module (because it is the direct sum of the finite $D$-modules $A$ and $C$ ). Hence the lemma follows from the Artin-Tate lemma (Algebra, Lemma 10.50.7).

08NI Lemma 15.5.2. Let $R$ be a Noetherian ring. Let $I$ be a finite set. Suppose given a cartesian diagram

with $\psi_{i}$ and $\varphi_{i}$ surjective, and $Q, A_{i}, B_{i}$ of finite type over $R$. Then $P$ is of finite type over $R$.

Proof. Follows from Lemma 15.5 .1 and induction on the size of $I$. Namely, let $I=I^{\prime} \amalg\left\{i_{0}\right\}$. Let $P^{\prime}$ be the ring defined by the diagram of the lemma using $I^{\prime}$. Then $P^{\prime}$ is of finite type by the lemma. Finally, $P$ sits in a fibre product diagram

to which the lemma applies.
01Z8 Lemma 15.5.3. Suppose given a cartesian diagram of rings

i.e., $B^{\prime}=B \times{ }_{R} R^{\prime}$. If $h \in B^{\prime}$ corresponds to $g \in B$ and $f \in R^{\prime}$ such that $s(g)=t(f)$, then the diagram

is cartesian too.
Proof. Note that $B^{\prime}=\left\{\left(b, r^{\prime}\right) \in B \times R^{\prime} \mid s(b)=t\left(r^{\prime}\right)\right\}$. So $h=(g, f) \in B^{\prime}$. First we show that $\left(B^{\prime}\right)_{h}$ maps injectively into $B_{g} \times\left(R^{\prime}\right)_{f}$. Namely, suppose that $(x, y) / h^{n}$ maps to zero. This means that $g^{N} x=0$ for some $N$ and $f^{M} y$ is zero for some $M$. Thus $h^{\max (N, M)}(x, y)=0$ in $B^{\prime}$ and hence $(x, y) / h^{n}=0$ in $B_{h}^{\prime}$. Next, suppose that $x / g^{n}$ and $y / f^{m}$ are elements which map to the same element of $R_{s(g)}$. This means that $s(g)^{N}\left(t(f)^{m} s(x)-s(g)^{n} t(y)\right)=0$ in $R^{\prime}$ for some $N \gg 0$. We can rewrite this as $s\left(g^{m+N} x\right)=t\left(f^{n+N} y\right)$. Hence we see that the pair $\left(x / g^{n}, y / f^{m}\right)$ is the image of the element $\left(g^{m+N} x, f^{n+N} y\right) / h^{n+m+N}$ of $\left(B^{\prime}\right)_{h}$.

08 KH Situation 15.5.4. In the following we will consider ring maps

$$
B \longrightarrow A<A^{\prime}
$$

where we assume $A^{\prime} \rightarrow A$ is surjective with kernel $I$. In this situation we set $B^{\prime}=B \times{ }_{A} A^{\prime}$ to obtain a cartesian square

0B7J Lemma 15.5.5. In Situation 15.5.4 we have

$$
\operatorname{Spec}\left(B^{\prime}\right)=\operatorname{Spec}(B) \amalg_{\operatorname{Spec}(A)} \operatorname{Spec}\left(A^{\prime}\right)
$$

as topological spaces.
Proof. Since $B^{\prime}=B \times{ }_{A} A^{\prime}$ we obtain a commutative square of spectra, which induces a continuous map

$$
\text { can }: \operatorname{Spec}(B) \amalg_{\mathrm{Spec}(A)} \operatorname{Spec}\left(A^{\prime}\right) \longrightarrow \operatorname{Spec}\left(B^{\prime}\right)
$$

as the source is a pushout in the category of topological spaces (which exists by Topology, Section 5.28.
To show the map can is surjective, let $\mathfrak{q}^{\prime} \subset B^{\prime}$ be a prime ideal. If $\mathfrak{q}^{\prime} \cap I=0$ (here and below we take the liberty of considering $I$ as an ideal of $B^{\prime}$ as well as an ideal of $A$ ), then $\mathfrak{q}^{\prime}$ corresponds to a prime ideal of $B$ and is in the image. If not, then pick $h \in I \cap \mathfrak{q}^{\prime}$. In this case $B_{h}=A_{h}=0$ and the ring map $B_{h}^{\prime} \rightarrow A_{h}^{\prime}$ is an isomorphism, see Lemma 15.5.3. Thus we see that $\mathfrak{q}^{\prime}$ corresponds to a unique prime ideal $\mathfrak{p}^{\prime} \subset A^{\prime}$ which meets $I$.

Since $B^{\prime} \rightarrow B$ is surjective, we see that can is injective on the summand $\operatorname{Spec}(B)$. We have seen above that $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}\left(B^{\prime}\right)$ is injective on the complement of $V(I) \subset \operatorname{Spec}\left(A^{\prime}\right)$. Since $V(I) \subset \operatorname{Spec}\left(A^{\prime}\right)$ is eactly the image of $\operatorname{Spec}(A) \rightarrow$ $\operatorname{Spec}\left(A^{\prime}\right)$ a trivial set theoretic argument shows that can is injective.

To finish the proof we have to show that can is open. To do this, observe that an open of the pushout is of the form $V \amalg U^{\prime}$ where $V \subset \operatorname{Spec}(B)$ and $U^{\prime} \subset \operatorname{Spec}\left(A^{\prime}\right)$ are opens whose inverse images in $\operatorname{Spec}(A)$ agree. Let $v \in V$. We can find a $g \in B$ such that $v \in D(g) \subset V$. Let $f \in A$ be the image. Pick $f^{\prime} \in A^{\prime}$ mapping to $f$. Then $D\left(f^{\prime}\right) \cap U^{\prime} \cap V(I)=D\left(f^{\prime}\right) \cap V(I)$. Hence $V(I) \cap D\left(f^{\prime}\right)$ and $D\left(f^{\prime}\right) \cap\left(U^{\prime}\right)^{c}$ are disjoint closed subsets of $D\left(f^{\prime}\right)=\operatorname{Spec}\left(A_{f^{\prime}}^{\prime}\right)$. Write $\left(U^{\prime}\right)^{c}=V(J)$ for some ideal $J \subset A^{\prime}$. Since $A_{f^{\prime}}^{\prime} \rightarrow_{f^{\prime}}^{\prime} / I A_{f^{\prime}}^{\prime} \times A_{f^{\prime}}^{\prime} / J^{\prime} A_{f^{\prime}}^{\prime}$ is surjective by the disjointness just shown, we can find an $a^{\prime \prime} \in A_{f^{\prime}}^{\prime}$ mapping to 1 in $A_{f^{\prime}}^{\prime} / I A_{f^{\prime}}^{\prime}$, and mapping to zero in $A_{f^{\prime}}^{\prime} / J^{\prime} A_{f^{\prime}}^{\prime}$. Clearing denominators, we find an element $a^{\prime} \in J$ mapping to $f^{n}$ in $A$. Then $D\left(a^{\prime} f^{\prime}\right) \subset U^{\prime}$. Let $h^{\prime}=\left(g^{n}, a^{\prime} f^{\prime}\right) \in B^{\prime}$. Since $B_{h^{\prime}}^{\prime}=B_{g^{n}} \times_{A_{f} n} A_{a^{\prime} f^{\prime}}^{\prime}$ by a previously cited lemma, we see that $D(h)$ pulls back to an open neighbourhood of $v$ in the pushouti, i.e., the image of $V \amalg U$ contains an open neighbourhood of the image of $v$. We omit the (easier) proof that the same thing is true for $u^{\prime} \in U^{\prime}$ with $u^{\prime} \notin V(I)$.

In Situation 15.5 .4 we'd like to understand $B^{\prime}$-modules in terms of modules over $A^{\prime}, A$, and $B$. In order to do this we consider the functor (where the fibre product of categories as constructed in Categories, Example 4.30.3)
$08 \mathrm{KI} \quad(15.5 .5 .1) \quad \operatorname{Mod}_{B^{\prime}} \longrightarrow \operatorname{Mod}_{B} \times_{\operatorname{Mod}_{A}} \operatorname{Mod}_{A^{\prime}}, \quad L^{\prime} \longmapsto\left(L^{\prime} \otimes_{B^{\prime}} B, L^{\prime} \otimes_{B^{\prime}} A^{\prime}\right.$, can $)$
where can is the canonical identification $L^{\prime} \otimes_{B^{\prime}} B \otimes_{B} A=L^{\prime} \otimes_{B^{\prime}} A^{\prime} \otimes_{A^{\prime}} A$. In the following we will write $\left(N, M^{\prime}, \varphi\right)$ for an object of the right hand side, i.e., $N$ is a $B$-module, $M^{\prime}$ is an $A^{\prime}$-module and $\varphi: N \otimes_{B} A \rightarrow M^{\prime} \otimes_{A^{\prime}} A$ is an isomorphism. However, it is often more convenient think of $\varphi$ as a $B$-linear map $\varphi: N \rightarrow M^{\prime} / I M^{\prime}$ which induces an isomorphism $N \otimes_{B} A \rightarrow M^{\prime} \otimes_{A^{\prime}} A=M^{\prime} / I M^{\prime}$.
07RU Lemma 15.5.6. In Situation 15.5.4 the functor 15.5.5.1) has a right adjoint, namely the functor

$$
F:\left(N, M^{\prime}, \varphi\right) \longmapsto N \times_{\varphi, M} M^{\prime}
$$

where $M=M^{\prime} / I M^{\prime}$. Moreover, the composition of $F$ with 15.5.5.1) is the identity functor on $\operatorname{Mod}_{B} \times_{\text {Mod }_{A}} \operatorname{Mod}_{A^{\prime}}$. In other words, setting $N^{\prime}=N \times_{\varphi}, M M^{\prime}$ we have $N^{\prime} \otimes_{B^{\prime}} B=N$ and $N^{\prime} \otimes_{B^{\prime}} A^{\prime}=M^{\prime}$.

Proof. The adjointness statement is that for a $B^{\prime}$-module $L^{\prime}$ and a triple $\left(N, M^{\prime}, \varphi\right)$ we have
$\operatorname{Hom}_{B^{\prime}}\left(L^{\prime}, N \times_{\varphi, M} M^{\prime}\right)=\operatorname{Hom}_{B}\left(L^{\prime} \otimes_{B^{\prime}} B, N\right) \times_{\operatorname{Hom}_{A}\left(L^{\prime} \otimes_{B^{\prime}} A, M\right)} \operatorname{Hom}_{A^{\prime}}\left(L^{\prime} \otimes_{B^{\prime}} A^{\prime}, M^{\prime}\right)$
This follows from Algebra, Lemma 10.13 .3 and the fact that an element of the left hand side is given by a pair of $B^{\prime}$-linear maps $L^{\prime} \rightarrow N$ and $L^{\prime} \rightarrow M^{\prime}$ agreeing as maps to $M$. To prove the final assertion, recall that $B^{\prime}=B \times{ }_{A} A^{\prime}$ and $N^{\prime}=$ $N \times{ }_{\varphi, M} M^{\prime}$ and extend these equalities to

and

where $I, J, K, L$ are the kernels of the horizontal maps of the original diagrams. We present the proof as a sequence of observations:
(1) $K=I M^{\prime}$ (see statement lemma),
(2) $B^{\prime} \rightarrow B$ is surjective with kernel $J$ and $J \rightarrow I$ is bijective,
(3) $N^{\prime} \rightarrow N$ is surjective with kernel $L$ and $L \rightarrow K$ is bijective,
(4) $J N^{\prime} \subset L$,
(5) $\operatorname{Im}(N \rightarrow M)$ generates $M$ as an $A$-module (because $N \otimes_{B} A=M$ ),
(6) $\operatorname{Im}\left(N^{\prime} \rightarrow M^{\prime}\right)$ generates $M^{\prime}$ as an $A^{\prime}$-module (because it holds modulo $K$ and $L$ maps isomorphically to $K$ ),
(7) $J N^{\prime}=L$ (because $L \cong K=I M^{\prime}$ is generated by images of elements $x n^{\prime}$ with $x \in I$ and $n^{\prime} \in N^{\prime}$ by the previous statement),
(8) $N^{\prime} \otimes_{B^{\prime}} B=N$ (because $N=N^{\prime} / L, B=B^{\prime} / J$, and the previous statement),
(9) there is a map $\gamma: N^{\prime} \otimes_{B^{\prime}} A^{\prime} \rightarrow M^{\prime}$,
(10) $\gamma$ is surjective (see above),
(11) the kernel of the composition $N^{\prime} \otimes_{B^{\prime}} A^{\prime} \rightarrow M^{\prime} \rightarrow M$ is generated by elements $l \otimes 1$ and $n^{\prime} \otimes x$ with $l \in K, n^{\prime} \in N^{\prime}, x \in I$ (because $M=N \otimes_{B} A$ by assumption and because $N^{\prime} \rightarrow N$ and $A^{\prime} \rightarrow A$ are surjective with kernels $L$ and $I$ ),
(12) any element of $N^{\prime} \otimes_{B^{\prime}} A^{\prime}$ in the submodule generated by the elements $l \otimes 1$ and $n^{\prime} \otimes x$ with $l \in L, n^{\prime} \in N^{\prime}, x \in I$ can be written as $l \otimes 1$ for some $l \in L$ (because $J$ maps isomorphically to $I$ we see that $n^{\prime} \otimes x=n^{\prime} x \otimes 1$ in $N^{\prime} \otimes_{B^{\prime}} A^{\prime}$; similarly $x n^{\prime} \otimes a^{\prime}=n^{\prime} \otimes x a^{\prime}=n^{\prime}\left(x a^{\prime}\right) \otimes 1$ in $N^{\prime} \otimes_{B^{\prime}} A^{\prime}$ when $n^{\prime} \in N^{\prime}, x \in J$ and $a^{\prime} \in A^{\prime}$; since we have seen that $J N^{\prime}=L$ this proves the assertion),
(13) the kernel of $\gamma$ is zero (because by (10) and (11) any element of the kernel is of the form $l \otimes 1$ with $l \in L$ which is mapped to $l \in K \subset M^{\prime}$ by $\gamma$ ).
This finishes the proof.
08IG Lemma 15.5.7. In the situation of Lemma 15.5.6 for a $B^{\prime}$-module $L^{\prime}$ the adjunction map

$$
L^{\prime} \longrightarrow\left(L^{\prime} \otimes_{B^{\prime}} B\right) \times_{\left(L^{\prime} \otimes_{B^{\prime}} A\right)}\left(L^{\prime} \otimes_{B^{\prime}} A^{\prime}\right)
$$

is surjective but in general not injective.
Proof. As in the proof of Lemma 15.5 .6 let $J \subset B^{\prime}$ be the kernel of the map $B^{\prime} \rightarrow B$. Then $L^{\prime} \otimes_{B^{\prime}} B=L^{\prime} / J L^{\prime}$. Hence to prove surjectivity it suffices to show that elements of the form $(0, z)$ of the fibre product are in the image of the map of the lemma. The kernel of the map $L^{\prime} \otimes_{B^{\prime}} A^{\prime} \rightarrow L^{\prime} \otimes_{B^{\prime}} A$ is the image of $L^{\prime} \otimes_{B^{\prime}} I \rightarrow L^{\prime} \otimes_{B^{\prime}} A^{\prime}$. Since the map $J \rightarrow I$ induced by $B^{\prime} \rightarrow A^{\prime}$ is an isomorphism the composition

$$
L^{\prime} \otimes_{B^{\prime}} J \rightarrow L^{\prime} \rightarrow\left(L^{\prime} \otimes_{B^{\prime}} B\right) \times_{\left(L^{\prime} \otimes_{B^{\prime}} A\right)}\left(L^{\prime} \otimes_{B^{\prime}} A^{\prime}\right)
$$

induces a surjection of $L^{\prime} \otimes_{B^{\prime}} J$ onto the set of elements of the form $(0, z)$. To see the map is not injective in general we present a simple example. Namely, take a field $k$, set $B^{\prime}=k[x, y] /(x y), A=B^{\prime} /(x), B=B^{\prime} /(y), A=B^{\prime} /(x, y)$ and $L^{\prime}=B^{\prime} /(x-y)$. In that case the class of $x$ in $L^{\prime}$ is nonzero but is mapped to zero under the displayed arrow.

08KJ Lemma 15.5.8. In Situation 15.5 .4 let $\left(N_{1}, M_{1}^{\prime}, \varphi_{1}\right) \rightarrow\left(N_{2}, M_{2}^{\prime}, \varphi_{2}\right)$ be a morphism of $\operatorname{Mod}_{B} \times_{\text {Mod }_{A}} \operatorname{Mod}_{A^{\prime}}$ with $N_{1} \rightarrow N_{2}$ and $M_{1}^{\prime} \rightarrow M_{2}^{\prime}$ surjective. Then

$$
N_{1} \times_{M_{1}} M_{1}^{\prime} \rightarrow N_{2} \times_{M_{2}} M_{2}^{\prime}
$$

where $M_{1}=M_{1}^{\prime} / I M_{1}^{\prime}$ and $M_{2}=M_{2}^{\prime} / I M_{2}^{\prime}$ is surjective.

Proof. Pick $\left(x_{2}, y_{2}\right) \in N_{2} \times_{M_{2}} M_{2}^{\prime}$. Choose $x_{1} \in N_{1}$ mapping to $x_{2}$. Since $M_{1}^{\prime} \rightarrow$ $M_{1}$ is surjective we can find $y_{1} \in M_{1}^{\prime}$ mapping to $\varphi_{1}\left(x_{1}\right)$. Then $\left(x_{1}, y_{1}\right)$ maps to $\left(x_{2}, y_{2}^{\prime}\right)$ in $N_{2} \times_{M_{2}} M_{2}^{\prime}$. Thus it suffices to show that elements of the form ( $0, y_{2}$ ) are in the image of the map. Here we see that $y_{2} \in I M_{2}^{\prime}$. Write $y_{2}=\sum t_{i} y_{2, i}$ with $t_{i} \in I$. Choose $y_{1, i} \in M_{1}^{\prime}$ mapping to $y_{2, i}$. Then $y_{1}=\sum t_{i} y_{1, i} \in I M_{1}^{\prime}$ and the element $\left(0, y_{1}\right)$ does the job.

08 KK Situation 15.5.9. Let $A, A^{\prime}, B, B^{\prime}, I$ be as in Situation 15.5.4. Let $B^{\prime} \rightarrow D^{\prime}$ be a ring map. Set $D=D^{\prime} \otimes_{B^{\prime}} B, C^{\prime}=D^{\prime} \otimes_{B^{\prime}} A^{\prime}$, and $C=D^{\prime} \otimes_{B^{\prime}} A$. This leads to a big commutative diagram

of rings. Observe that we do not assume that the map $D^{\prime} \rightarrow D \times{ }_{C} C^{\prime}$ is an isomorphism. In this situation we have the functor

08KL
(15.5.9.1) $\operatorname{Mod}_{D^{\prime}} \longrightarrow \operatorname{Mod}_{D} \times_{\operatorname{Mod}_{C}} \operatorname{Mod}_{C^{\prime}}, \quad L^{\prime} \longmapsto\left(L^{\prime} \otimes_{D^{\prime}} D, L^{\prime} \otimes_{D^{\prime}} C^{\prime}\right.$, can $)$
analogous to 15.5.5.1). Note that $L^{\prime} \otimes_{D^{\prime}} D=L \otimes_{D^{\prime}}\left(D^{\prime} \otimes_{B^{\prime}} B\right)=L \otimes_{B^{\prime}} B$ and similarly $L^{\prime} \otimes_{D^{\prime}} C^{\prime}=L \otimes_{D^{\prime}}\left(D^{\prime} \otimes_{B^{\prime}} A^{\prime}\right)=L \otimes_{B^{\prime}} A^{\prime}$ hence the diagram

is commutative. In the following we will write $\left(N, M^{\prime}, \varphi\right)$ for an object of $\operatorname{Mod}_{D} \times{ }_{\operatorname{Mod}}$ $\operatorname{Mod}_{C^{\prime}}$, i.e., $N$ is a $D$-module, $M^{\prime}$ is an $C^{\prime}$-module and $\varphi: N \otimes_{B} A \rightarrow M^{\prime} \otimes_{A^{\prime}} A$ is an isomorphism of $C$-modules. However, it is often more convenient think of $\varphi$ as a $D$-linear map $\varphi: N \rightarrow M^{\prime} / I M^{\prime}$ which induces an isomorphism $N \otimes_{B} A \rightarrow$ $M^{\prime} \otimes_{A^{\prime}} A=M^{\prime} / I M^{\prime}$.

08KM Lemma 15.5.10. In Situation 15.5.9 the functor 15.5.9.1) has a right adjoint, namely the functor

$$
F:\left(N, M^{\prime}, \varphi\right) \longmapsto N \times_{\varphi, M} M^{\prime}
$$

where $M=M^{\prime} / I M^{\prime}$. Moreover, the composition of $F$ with 15.5.9.1) is the identity functor on $\operatorname{Mod}_{D} \times$ Mod $_{C} \operatorname{Mod}_{C^{\prime}}$. In other words, setting $N^{\prime}=N \times_{\varphi, M} M^{\prime}$ we have $N^{\prime} \otimes_{D^{\prime}} D=N$ and $N^{\prime} \otimes_{D^{\prime}} C^{\prime}=M^{\prime}$.
Proof. The adjointness statement is that for a $D^{\prime}$-module $L^{\prime}$ and a triple $\left(N, M^{\prime}, \varphi\right)$ we have
$\operatorname{Hom}_{D^{\prime}}\left(L^{\prime}, N \times{ }_{\varphi, M} M^{\prime}\right)=\operatorname{Hom}_{D}\left(L^{\prime} \otimes_{D^{\prime}} D, N\right) \times_{\operatorname{Hom}_{C}\left(L^{\prime} \otimes_{D^{\prime}} C, M\right)} \operatorname{Hom}_{C^{\prime}}\left(L^{\prime} \otimes_{D^{\prime}} C^{\prime}, M^{\prime}\right)$

This follows from Algebra, Lemma 10.13 .3 and the fact that an element of the left hand side is given by a pair of $D^{\prime}$-linear maps $L^{\prime} \rightarrow N$ and $L^{\prime} \rightarrow M^{\prime}$ agreeing as maps to $M$. The final assertion follows from the corresponding assertion of Lemma 15.5.6.

08KN Lemma 15.5.11. In Situation 15.5.9 the map $J D^{\prime} \rightarrow I C^{\prime}$ is surjective where $J=\operatorname{Ker}\left(B^{\prime} \rightarrow B\right)$.
Proof. Since $C^{\prime}=D^{\prime} \otimes_{B^{\prime}} A^{\prime}$ we have that $I C^{\prime}$ is the image of $D^{\prime} \otimes_{B^{\prime}} I=C^{\prime} \otimes_{A^{\prime}} I \rightarrow$ $C^{\prime}$. As the ring map $B^{\prime} \rightarrow A^{\prime}$ induces an isomorphism $J \rightarrow I$ the lemma follows.

08 IH Lemma 15.5.12. Let $A, A^{\prime}, B, B^{\prime}, C, C^{\prime}, D, D^{\prime}, I, M^{\prime}, M, N, \varphi$ be as in Lemma 15.5.10. If $N$ finite over $D$ and $M^{\prime}$ finite over $C^{\prime}$, then $N^{\prime}=N \times_{M} M^{\prime}$ is finite over $D^{\prime}$.

Proof. We will use the results of Lemma 15.5 .10 without further mention. Choose generators $x_{1}, \ldots, x_{r}$ of $N$ over $B$ and generators $y_{1}, \ldots, y_{s}$ of $M^{\prime}$ over $A^{\prime}$. Using that $N=N^{\prime} \otimes_{D^{\prime}} D$ and $D^{\prime} \rightarrow D$ is surjective we can find $u_{1}, \ldots, u_{r} \in N^{\prime}$ mapping to $x_{1}, \ldots, x_{r}$ in $N$. Using that $M^{\prime}=N^{\prime} \otimes_{D^{\prime}} C^{\prime}$ we can find $v_{1}, \ldots, v_{t} \in N^{\prime}$ such that $y_{i}=\sum v_{j} \otimes c_{i j}^{\prime}$ for some $c_{i j}^{\prime} \in C^{\prime}$. In particular we see that the images $\bar{v}_{j}$ of the $v_{j}$ generate $M^{\prime}$ over $C^{\prime}$. We claim that $u_{1}, \ldots, u_{r}, v_{1}, \ldots, v_{t}$ generate $N^{\prime}$ as a $D^{\prime}$-module. Namely, pick $\xi \in N^{\prime}$. We first choose $d_{1}^{\prime}, \ldots, d_{r}^{\prime} \in D^{\prime}$ such that $\xi$ and $\sum d_{i}^{\prime} u_{i}$ map to the same element of $N$. This is possible because $D^{\prime} \rightarrow D$ is surjective and $x_{1}, \ldots, x_{r}$ generate $N$. The difference $\xi-\sum d_{i}^{\prime} u_{i}$ is of the form $(0, \theta)$ for some $\theta$ in $I M^{\prime}$. Say $\theta$ is $\sum t_{j} \bar{v}_{j}$ with $t_{j} \in I C^{\prime}$. By Lemma 15.5 .11 we can choose $s_{j} \in J D^{\prime}$ mapping to $t_{j}$. Because $N^{\prime}=N \times_{M} M^{\prime}$ it follows that $\xi=\sum b_{i}^{\prime} u_{i}+\sum s_{j} v_{j}$ as desired.

07 RW Lemma 15.5.13. With $A, A^{\prime}, B, B^{\prime}, C, C^{\prime}, D, D^{\prime}, I$ as in Situation 15.5.9.
(1) Let $\left(N, M^{\prime}, \varphi\right)$ be an object of $\operatorname{Mod}_{D} \times{ }_{M o d_{C}} \operatorname{Mod}_{C^{\prime}}$. If $M^{\prime}$ is flat over $A^{\prime}$ and $N$ is flat over $B$, then $N^{\prime}=N \times_{M} M^{\prime}$ is flat over $B^{\prime}$.
(2) If $L^{\prime}$ is a $D^{\prime}$-module flat over $B^{\prime}$, then $L^{\prime}=\left(L \otimes_{D^{\prime}} D\right) \times\left(L \otimes_{D^{\prime}} C\right)\left(L \otimes_{D^{\prime}} C^{\prime}\right)$.
(3) The category of $D^{\prime}$-modules flat over $B^{\prime}$ is equivalent to the categories of objects $\left(N, M^{\prime}, \varphi\right)$ of $\operatorname{Mod}_{D} \times{ }_{M_{o d}} \operatorname{Mod}_{C^{\prime}}$ with $N$ flat over $B$ and $M^{\prime}$ flat over $A^{\prime}$.

Proof. Proof of (1). Let $J \subset B^{\prime}$ be an ideal. We have to show that $J \otimes_{B^{\prime}} N^{\prime} \rightarrow N^{\prime}$ is injective, see Algebra, Lemma 10.38.5. We know that

$$
J /(J \cap I) \otimes_{B^{\prime}} N^{\prime}=J /(J \cap I) \otimes_{B} N \rightarrow N
$$

is injective as $N$ is flat over $B$. As $J \cap I \rightarrow J \rightarrow J /(J \cap I) \rightarrow 0$ is exact, we conclude that it suffices to show that $(J \cap I) \otimes_{B^{\prime}} N^{\prime} \rightarrow N^{\prime}$ is injective. Thus we may assume that $J \subset I$; in particular we can think of $J$ as an $A^{\prime}$-module and an ideal of $A^{\prime}$ and

$$
J \otimes_{B^{\prime}} N^{\prime}=J \otimes_{A^{\prime}} A^{\prime} \otimes_{B^{\prime}} N^{\prime}=J \otimes_{A^{\prime}} M^{\prime}
$$

which maps injectively into $M^{\prime}$ by our assumption that $M^{\prime}$ is flat over $A^{\prime}$. We conclude that $J \otimes_{B^{\prime}} N^{\prime} \rightarrow N^{\prime} \rightarrow M^{\prime}$ is injective and hence the first map is injective as desired.

Proof of (2). This follows by tensoring the short exact sequence $0 \rightarrow B^{\prime} \rightarrow B \oplus A^{\prime} \rightarrow$ $A \rightarrow 0$ with $L^{\prime}$ over $B^{\prime}$ and using that $L^{\prime} \otimes_{D^{\prime}} D=L^{\prime} \otimes_{B^{\prime}} B, L^{\prime} \otimes_{D^{\prime}} C^{\prime}=L^{\prime} \otimes_{B^{\prime}} A^{\prime}$, and $L^{\prime} \otimes_{D^{\prime}} C=L^{\prime} \otimes_{B^{\prime}} A$, see discussion in Situation 15.5 .9 .

Proof of (3). Immediate consequence of (1) and (2).
08 KP Lemma 15.5.14. Let $A, A^{\prime}, B, B^{\prime}, C, C^{\prime}, D, D^{\prime}, I, M^{\prime}, M, N, \varphi$ be as in Lemma 15.5.10. If
(1) $N$ is finitely presented over $D$ and flat over $B$,
(2) $M^{\prime}$ finitely presented over $C^{\prime}$ and flat over $A^{\prime}$, and
(3) the ring map $B^{\prime} \rightarrow D^{\prime}$ factors as $B^{\prime} \rightarrow D^{\prime \prime} \rightarrow D^{\prime \prime}$ with $B^{\prime} \rightarrow D^{\prime \prime}$ flat and $D^{\prime \prime} \rightarrow D^{\prime}$ of finite presentation,
then $N^{\prime}=N \times_{M} M^{\prime}$ is finitely presented over $D^{\prime}$.
Proof. Choose a surjection $D^{\prime \prime \prime}=D^{\prime \prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow D^{\prime}$ with finitely generated kernel $J$. By Algebra, Lemma 10.35 .21 it suffices to show that $N^{\prime}$ is finitely presented as a $D^{\prime \prime \prime}$-module. Moreover, $D^{\prime \prime \prime} \otimes_{B^{\prime}} B \rightarrow D^{\prime} \otimes_{B^{\prime}} B=D$ and $D^{\prime \prime \prime} \otimes_{B^{\prime}} A^{\prime} \rightarrow$ $D^{\prime} \otimes_{B^{\prime}} A^{\prime}=C^{\prime}$ are surjections whose kernels are generated by the image of $J$, hence $N$ is a finitely presented $D^{\prime \prime \prime} \otimes_{B^{\prime}} B$-module and $M^{\prime}$ is a finitely presented $D^{\prime \prime \prime} \otimes_{B^{\prime}} A^{\prime}$-module by Algebra, Lemma 10.35 .21 again. Thus we may replace $D^{\prime}$ by $D^{\prime \prime \prime}$ and $D$ by $D^{\prime \prime \prime} \otimes_{B^{\prime}} B$, etc. Since $D^{\prime \prime \prime}$ is flat over $B^{\prime}$, it follows that we may assume that $B^{\prime} \rightarrow D^{\prime}$ is flat.
Assume $B^{\prime} \rightarrow D^{\prime}$ is flat. By Lemma 15.5 .12 the module $N^{\prime}$ is finite over $D^{\prime}$. Choose a surjection $\left(D^{\prime}\right)^{\oplus n} \rightarrow N^{\prime}$ with kernel $K^{\prime}$. By base change we obtain maps $D^{\oplus n} \rightarrow N,\left(C^{\prime}\right)^{\oplus n} \rightarrow M^{\prime}$, and $C^{\oplus n} \rightarrow M$ with kernels $K_{D}, K_{C^{\prime}}$, and $K_{C}$. There is a canonical map

$$
K^{\prime} \longrightarrow K_{D} \times_{K_{C}} K_{C^{\prime}}
$$

On the other hand, since $N^{\prime}=N \times_{M} M^{\prime}$ and $D^{\prime}=D \times_{C} C^{\prime}$ (by Lemma 15.5.13) there is also a canonical map $K_{D} \times_{K_{C}} K_{C^{\prime}} \rightarrow K^{\prime}$ inverse to the displayed arrow. Hence the displayed map is an isomorphism. By Algebra, Lemma 10.5.3 the modules $K_{D}$ and $K_{C^{\prime}}$ are finite. We conclude from Lemma 15.5 .12 that $K^{\prime}$ is a finite $D^{\prime}$-module provided that $K_{D} \rightarrow K_{C}$ and $K_{C^{\prime}} \rightarrow K_{C}$ induce isomorphisms $K_{D} \otimes_{B} A=K_{C}=K_{C^{\prime}} \otimes_{A^{\prime}} A$. This is true because the flatness assumptions implies the sequences

$$
0 \rightarrow K_{D} \rightarrow D^{\oplus n} \rightarrow N \rightarrow 0 \quad \text { and } \quad 0 \rightarrow K_{C^{\prime}} \rightarrow\left(C^{\prime}\right)^{\oplus n} \rightarrow M^{\prime} \rightarrow 0
$$

stay exact upon tensoring, see Algebra, Lemma 10.38.12
08 KQ Lemma 15.5.15. Let $A, A^{\prime}, B, B^{\prime}, I$ be as in Situation 15.5.4. Let $\left(D, C^{\prime}, \varphi\right)$ be a system consisting of an $B$-algebra $D$, a $A^{\prime}$-algebra $C^{\prime \prime}$ and an isomorphism $D \otimes_{B} A \rightarrow C^{\prime} / I C=C$. Set $D^{\prime}=D \times_{C} C^{\prime}$ (as in Lemma 15.5.6). Then
(1) $B^{\prime} \rightarrow D^{\prime}$ is finite type if and only if $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are finite type,
(2) $B^{\prime} \rightarrow D^{\prime}$ is flat if and only if $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are flat,
(3) $B^{\prime} \rightarrow D^{\prime}$ is flat and of finite presentation if and only if $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are flat and of finite presentation,
(4) $B^{\prime} \rightarrow D^{\prime}$ is smooth if and only if $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are smooth,
(5) $B^{\prime} \rightarrow D^{\prime}$ is étale if and only if $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are étale.

Moreover, if $D^{\prime}$ is a flat $B^{\prime}$-algebra, then $D^{\prime} \rightarrow\left(D^{\prime} \otimes_{B^{\prime}} B\right) \times_{\left(D^{\prime} \otimes_{B^{\prime}} A\right)}\left(D^{\prime} \otimes_{B^{\prime}} A^{\prime}\right)$ is an isomorphism. In this way the category of flat $B^{\prime}$-algebras is equivalent to the categories of systems $\left(D, C^{\prime}, \varphi\right)$ as above with $D$ flat over $B$ and $C^{\prime}$ flat over $A^{\prime}$.
Proof. The implication " $\Rightarrow$ " follows from Algebra, Lemmas 10.13.2, 10.38.7, 10.135.4, and 10.141 .3 because we have $D^{\prime} \otimes_{B^{\prime}} B=D$ and $D^{\prime} \otimes_{B^{\prime}} A^{\prime}=C^{\prime}$ by Lemma 15.5.6. Thus it suffices to prove the implications in the other direction.

Ad (1). Assume $D$ of finite type over $B$ and $C^{\prime}$ of finite type over $A^{\prime}$. We will use the results of Lemma 15.5 .6 without further mention. Choose generators $x_{1}, \ldots, x_{r}$ of $D$ over $B$ and generators $y_{1}, \ldots, y_{s}$ of $C^{\prime}$ over $A^{\prime}$. Using that $N=N^{\prime} \otimes_{B^{\prime}} B$ and $B^{\prime} \rightarrow B$ is surjective we can find $u_{1}, \ldots, u_{r} \in D^{\prime}$ mapping to $x_{1}, \ldots, x_{r}$ in $D$. Using that $C^{\prime}=D^{\prime} \otimes_{B^{\prime}} A^{\prime}$ we can find $v_{1}, \ldots, v_{t} \in D^{\prime}$ such that $y_{i}=\sum v_{j} \otimes a_{i j}^{\prime}$ for some $a_{i j}^{\prime} \in A^{\prime}$. In particular, the images of $v_{j}$ in $C^{\prime}$ generate $C^{\prime}$ as an $A^{\prime}$-algebra. Set $N=r+t$ and consider the cube of rings

Observe that the back square is cartesian as well. Consider the ring map

$$
B^{\prime}\left[x_{1}, \ldots, x_{N}\right] \rightarrow D^{\prime}, \quad x_{i} \mapsto u_{i} \quad \text { and } \quad x_{r+j} \mapsto v_{j}
$$

Then we see that the induced maps $B\left[x_{1}, \ldots, x_{N}\right] \rightarrow D$ and $A^{\prime}\left[x_{1}, \ldots, x_{N}\right] \rightarrow$ $C^{\prime}$ are surjective, in particular finite. We conclude from Lemma 15.5 .12 that $B^{\prime}\left[x_{1}, \ldots, x_{N}\right] \rightarrow D^{\prime}$ is finite, which implies that $D^{\prime}$ is of finite type over $B^{\prime}$ for example by Algebra, Lemma 10.6.2.

Ad (2). The implication " $\Leftarrow "$ follows from Lemma 15.5.13. Moreover, the final statement follows from the final statement of Lemma 15.5.13.
$\operatorname{Ad}$ (3). Assume $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are flat and of finite presentation. The flatness of $B^{\prime} \rightarrow D^{\prime}$ we've seen in (2). We know $B^{\prime} \rightarrow D^{\prime}$ is of finite type by (1). Choose a surjection $B^{\prime}\left[x_{1}, \ldots, x_{N}\right] \rightarrow D^{\prime}$. By Algebra, Lemma 10.6 .3 the ring $D$ is of finite presentation as a $B\left[x_{1}, \ldots, x_{N}\right]$-module and the ring $C^{\prime}$ is of finite presentation as a $A^{\prime}\left[x_{1}, \ldots, x_{N}\right]$-module. By Lemma 15.5 .14 we see that $D^{\prime}$ is of finite presentation as a $B^{\prime}\left[x_{1}, \ldots, x_{N}\right]$-module, i.e., $B^{\prime} \rightarrow D^{\prime}$ is of finite presentation.

Ad (4). Assume $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ smooth. By (3) we see that $B^{\prime} \rightarrow D^{\prime}$ is flat and of finite presentation. By Algebra, Lemma 10.135 .16 it suffices to check that $D^{\prime} \otimes_{B^{\prime}} k$ is smooth for any field $k$ over $B^{\prime}$. If the composition $J \rightarrow B^{\prime} \rightarrow k$ is zero, then $B^{\prime} \rightarrow k$ factors as $B^{\prime} \rightarrow B \rightarrow k$ and we see that

$$
D^{\prime} \otimes_{B^{\prime}} k=D^{\prime} \otimes_{B^{\prime}} B \otimes_{B} k=D \otimes_{B} k
$$

is smooth as $B \rightarrow D$ is smooth. If the composition $J \rightarrow B^{\prime} \rightarrow k$ is nonzero, then there exists an $h \in J$ which does not map to zero in $k$. Then $B^{\prime} \rightarrow k$ factors as $B^{\prime} \rightarrow B_{h}^{\prime} \rightarrow k$. Observe that $h$ maps to zero in $B$, hence $B_{h}=0$. Thus by Lemma 15.5 .3 we have $B_{h}^{\prime}=A_{h}^{\prime}$ and we get

$$
D^{\prime} \otimes_{B^{\prime}} k=D^{\prime} \otimes_{B^{\prime}} B_{h}^{\prime} \otimes_{B_{h}^{\prime}} k=C_{h}^{\prime} \otimes_{A_{h}^{\prime}} k
$$

is smooth as $A^{\prime} \rightarrow C^{\prime}$ is smooth.

Ad (5). Assume $B \rightarrow D$ and $A^{\prime} \rightarrow C^{\prime}$ are étale. By (4) we see that $B^{\prime} \rightarrow D^{\prime}$ is smooth. As we can read off whether or not a smooth map is étale from the dimension of fibres we see that (5) holds (argue as in the proof of (4) to identify fibres - some details omitted).

08KR Remark 15.5.16. In Situation 15.5.9. Assume $B^{\prime} \rightarrow D^{\prime}$ is of finite presentation and suppose we are given a $D^{\prime}$-module $L^{\prime}$. We claim there is a bijective correspondence between
(1) surjections of $D^{\prime}$-modules $L^{\prime} \rightarrow Q^{\prime}$ with $Q^{\prime}$ of finite presentation over $D^{\prime}$ and flat over $B^{\prime}$, and
(2) pairs of surjections of modules $\left(L^{\prime} \otimes_{D^{\prime}} D \rightarrow Q_{1}, L^{\prime} \otimes_{D^{\prime}} C^{\prime} \rightarrow Q_{2}\right)$ with
(a) $Q_{1}$ of finite presentation over $D$ and flat over $B$,
(b) $Q_{2}$ of finite presentation over $C^{\prime}$ and flat over $A^{\prime}$,
(c) $Q_{1} \otimes_{D} C=Q_{2} \otimes_{C^{\prime}} C$ as quotients of $L^{\prime} \otimes_{D^{\prime}} C$.

The correspondence between these is given by $Q \mapsto\left(Q_{1}, Q_{2}\right)$ with $Q_{1}=Q \otimes_{D^{\prime}} D$ and $Q_{2}=Q \otimes_{D^{\prime}} C^{\prime}$. And for the converse we use $Q=Q_{1} \times_{Q_{12}} Q_{2}$ where $Q_{12}$ the common quotient $Q_{1} \otimes_{D} C=Q_{2} \otimes_{C^{\prime}} C$ of $L^{\prime} \otimes_{D^{\prime}} C$. As quotient map we use

$$
L^{\prime} \longrightarrow\left(L^{\prime} \otimes_{D^{\prime}} D\right) \times_{\left(L^{\prime} \otimes_{D^{\prime}} C\right)}\left(L^{\prime} \otimes_{D^{\prime}} C^{\prime}\right) \longrightarrow Q_{1} \times_{Q_{12}} Q_{2}=Q
$$

where the first arrow is surjective by Lemma 15.5 .7 and the second by Lemma 15.5.8. The claim follows by Lemmas 15.5 .13 and 15.5 .14 .

### 15.6. Fitting ideals

07Z6 The fitting ideals of a finite module are the ideals determined by the construction of Lemma 15.6.2.

07Z7 Lemma 15.6.1. Let $R$ be a ring. Let $A$ be an $n \times m$ matrix with coefficients in $R$. Let $I_{r}(A)$ be the ideal generated by the $r \times r$-minors of $A$ with the convention that $I_{0}(A)=R$ and $I_{r}(A)=0$ if $r>\min (n, m)$. Then
(1) $I_{0}(A) \supset I_{1}(A) \supset I_{2}(A) \ldots$,
(2) if $B$ is an $\left(n+n^{\prime}\right) \times m$ matrix, and $A$ is the first $n$ rows of $B$, then $I_{r+n^{\prime}}(B) \subset I_{r}(A)$,
(3) if $C$ is an $n \times n$ matrix then $I_{r}(C A) \subset I_{r}(A)$.
(4) If $A$ is a block matrix

$$
\left(\begin{array}{cc}
A_{1} & 0 \\
0 & A_{2}
\end{array}\right)
$$

then $I_{r}(A)=\sum_{r_{1}+r_{2}=r} I_{r_{1}}\left(A_{1}\right) I_{r_{2}}\left(A_{2}\right)$.
(5) Add more here.

Proof. Omitted. (Hint: Use that a determinant can be computed by expanding along a column or a row.)

Lemma 15.6.2. Let $R$ be a ring. Let $M$ be a finite $R$-module. Choose a presentation

$$
\bigoplus_{j \in J} R \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0
$$

of $M$. Let $A=\left(a_{i j}\right)_{i=1, \ldots, n, j \in J}$ be the matrix of the map $\bigoplus_{j \in J} R \rightarrow R^{\oplus n}$. The ideal Fit ${ }_{k}(M)$ generated by the $(n-k) \times(n-k)$ minors of $A$ is independent of the choice of the presentation.

Proof. Let $K \subset R^{\oplus n}$ be the kernel of the surjection $R^{\oplus n} \rightarrow M$. Pick $z_{1}, \ldots, z_{n-k} \in$ $K$ and write $z_{j}=\left(z_{1 j}, \ldots, z_{n j}\right)$. Another description of the ideal $\operatorname{Fit}_{k}(M)$ is that it is the ideal generated by the $(n-k) \times(n-k)$ minors of all the matrices $\left(z_{i j}\right)$ we obtain in this way.
Suppose we change the surjection into the surjection $R^{\oplus n+n^{\prime}} \rightarrow M$ with kernel $K^{\prime}$ where we use the original map on the first $n$ standard basis elements of $R^{\oplus n+n^{\prime}}$ and 0 on the last $n^{\prime}$ basis vectors. Then the corresponding ideals are the same. Namely, if $z_{1}, \ldots, z_{n-k} \in K$ as above, let $z_{j}^{\prime}=\left(z_{1 j}, \ldots, z_{n j}, 0, \ldots, 0\right) \in K^{\prime}$ for $j=1, \ldots, n-k$ and $z_{n+j^{\prime}}^{\prime}=(0, \ldots, 0,1,0, \ldots, 0) \in K^{\prime}$. Then we see that the ideal of $(n-k) \times(n-k)$ minors of $\left(z_{i j}\right)$ agrees with the ideal of $\left(n+n^{\prime}-k\right) \times\left(n+n^{\prime}-k\right)$ minors of $\left(z_{i j}^{\prime}\right)$. This gives one of the inclusions. Conversely, given $z_{1}^{\prime}, \ldots, z_{n+n^{\prime}-k}^{\prime}$ in $K^{\prime}$ we can project these to $R^{\oplus n}$ to get $z_{1}, \ldots, z_{n+n^{\prime}-k}$ in $K$. By Lemma 15.6.1 we see that the ideal generated by the $\left(n+n^{\prime}-k\right) \times\left(n+n^{\prime}-k\right)$ minors of $\left(z_{i j}^{\prime}\right)$ is contained in the ideal generated by the $(n-k) \times(n-k)$ minors of $\left(z_{i j}\right)$. This gives the other inclusion.
Let $R^{\oplus m} \rightarrow M$ be another surjection with kernel $L$. By the previous paragraph we may assume $m=n$. By Algebra, Lemma 10.5 .2 we can choose a map $R^{\oplus n} \rightarrow R^{\oplus m}$ commuting with the surjections to $M$. Let $C=\left(c_{l i}\right)$ be the matrix of this map (it is a square matrix as $n=m$ ). Then given $z_{1}, \ldots, z_{n-k} \in K$ as above we get $C z_{1}, \ldots, C z_{n-k} \in L$. By Lemma 15.6.1 we get one of the inclusions. By symmetry we get the other.

07Z9 Definition 15.6.3. Let $R$ be a ring. Let $M$ be a finite $R$-module. Let $k \geq 0$. The $k$ th fitting ideal of $M$ is the ideal $\operatorname{Fit}_{k}(M)$ constructed in Lemma 15.6.2. Set $\operatorname{Fit}_{-1}(M)=0$.
Since the fitting ideals are the ideals of minors of a big matrix (numbered in reverse ordering from the ordering in Lemma 15.6.1 we see that

$$
0=\operatorname{Fit}_{-1}(M) \subset \operatorname{Fit}_{0}(M) \subset \operatorname{Fit}_{1}(M) \subset \ldots \subset \operatorname{Fit}_{t}(M)=R
$$

for some $t \gg 0$. Here are some basic properties of fitting ideals.
Lemma 15.6.4. Let $R$ be a ring. Let $M$ be a finite $R$-module.
(1) If $M$ can be generated by $n$ elements, then $\operatorname{Fit}_{n}(M)=R$.
(2) Given a second finite $R$-module $M^{\prime}$ we have

$$
\operatorname{Fit}_{k}\left(M \oplus M^{\prime}\right)=\sum_{k+k^{\prime}=l} \operatorname{Fit}_{k}(M) \operatorname{Fit}_{k^{\prime}}\left(M^{\prime}\right)
$$

(3) If $R \rightarrow R^{\prime}$ is a ring map, then Fit $\left(M \otimes_{R} R^{\prime}\right)$ is the ideal of $R^{\prime}$ generated by the image of Fit $_{k}(M)$.
(4) If $M$ is an $R$-module of finite presentation, then Fit $_{k}(M)$ is a finitely generated ideal.
(5) If $M \rightarrow M^{\prime}$ is a surjection, then $\operatorname{Fit}_{k}(M) \subset \operatorname{Fit}_{k}\left(M^{\prime}\right)$.
(6) Add more here.

Proof. Part (1) follows from the fact that $I_{0}(A)=R$ in Lemma 15.6.1 part (2) follows form the corresponding statement in Lemma 15.6.1. Part (3) follows from the fact that $\otimes_{R} R^{\prime}$ is right exact, so the base change of a presentation of $M$ is a presentation of $M \otimes_{R} R^{\prime}$. Proof of (4). Let $R^{\oplus m} \xrightarrow{A} R^{\oplus n} \rightarrow M \rightarrow 0$ be a presentation. Then $\operatorname{Fit}_{k}(M)$ is the ideal generated by the $n-k \times n-k$ minors of the matrix $A$. Part (5) is immediate from the definition.

07ZB Example 15.6.5. Let $R$ be a ring. The fitting ideals of the finite free module $M=R^{\oplus n}$ are are $\operatorname{Fit}_{k}(M)=0$ for $k<n$ and $\operatorname{Fit}_{k}(M)=R$ for $k \geq n$.
07ZC Lemma 15.6.6. Let $R$ be a ring. Let $M$ be a finite $R$-module. Let $k \geq 0$. Let $\mathfrak{p}$ be a prime ideal with Fit $_{k}(M) \not \subset \mathfrak{p}$. Then there exists an $f \in R, f \notin \mathfrak{p}$ such that $M_{f}$ can be generated by $k$ elements over $R_{f}$.
Proof. By Nakayama's lemma (Algebra, Lemma 10.19.1) we see that $M_{f}$ can be generated by $k$ elements over $R_{f}$ for some $f \in R, f \notin \mathfrak{p}$ if $M \otimes_{R} \kappa(\mathfrak{p})$ can be generated by $k$ elements. This reduces the problem to the case where $R$ is a field and $\mathfrak{p}=(0)$. In this case the result follows from Example 15.6.5.

07ZD Lemma 15.6.7. Let $R$ be a ring. Let $M$ be a finite $R$-module. Let $r \geq 0$. The following are equivalent
(1) $M$ is finite locally free of rank r (Algebra, Definition 10.77.1),
(2) $\operatorname{Fit}_{r-1}(M)=0$ and Fit $(M)=R$, and
(3) $\operatorname{Fit}_{k}(M)=0$ for $k<r$ and $\operatorname{Fit}_{k}(M)=R$ for $k \geq r$.

Proof. It is immediate that (2) is equivalent to (3) because the fitting ideals form an increasing sequence of ideals. Since the formation of $\operatorname{Fit}_{k}(M)$ commutes with base change (Lemma 15.6.4) we see that (1) implies (2) by Example 15.6.5 and glueing results (Algebra, Section 10.23). Conversely, assume (2). By Lemma 15.6.6 we may assume that $M$ is generated by $r$ elements. Thus a presentation $\bigoplus_{j \in J} R \rightarrow$ $R^{\oplus r} \rightarrow M \rightarrow 0$. But now the assumption that $\operatorname{Fit}_{r-1}(M)=0$ implies that all entries of the matrix of the map $\bigoplus_{j \in J} R \rightarrow R^{\oplus r}$ are zero. Thus $M$ is free.

080Z Lemma 15.6.8. Let $R$ be a local ring. Let $M$ be a finite $R$-module. Let $k \geq 0$. Assume that Fit $_{k}(M)=(f)$ for some $f \in R$. Let $M^{\prime}$ be the quotient of $M$ by $\{x \in M \mid f x=0\}$. Then $M^{\prime}$ can be generated by $k$ elements.

Proof. Choose generators $x_{1}, \ldots, x_{n} \in M$ corresponding to the surjection $R^{\oplus n} \rightarrow$ $M$. Since $R$ is local if a set of elements $E \subset(f)$ generates $(f)$, then some $e \in E$ generates $(f)$, see Algebra, Lemma 10.19.1. Hence we may pick $z_{1}, \ldots, z_{n-k}$ in the kernel of $R^{\oplus n} \rightarrow M$ such that some $(n-k) \times(n-k)$ minor of the $n \times(n-k)$ matrix $A=\left(z_{i j}\right)$ generates $(f)$. After renumbering the $x_{i}$ we may assume the first minor $\operatorname{det}\left(z_{i j}\right)_{1 \leq i, j \leq n-k}$ generates $(f)$, i.e., $\operatorname{det}\left(z_{i j}\right)_{1 \leq i, j \leq n-k}=u f$ for some unit $u \in R$. Every other minor is a multiple of $f$. By Algebra, Lemma 10.14 .5 there exists a $n-k \times n-k$ matrix $B$ such that

$$
A B=f\binom{u 1_{n-k \times n-k}}{C}
$$

for some matrix $C$ with coefficients in $R$. This implies that for every $i \leq n-k$ the element $y_{i}=u x_{i}+\sum_{j} c_{j i} x_{j}$ is annihilated by $f$. Since $M / \sum R y_{i}$ is generated by the images of $x_{n-k+1}, \ldots, x_{n}$ we win.

### 15.7. Lifting

07 LW In this section we collection some lemmas concerning lifting statements of the following kind: If $A$ is a ring and $I \subset A$ is an ideal, and $\bar{\xi}$ is some kind of structure over $A / I$, then we can lift $\bar{\xi}$ to a similar kind of structure $\xi$ over $A$ or over some étale extension of $A$. Here are some types of structure for which we have already proved some results:
(1) idempotents, see Algebra, Lemmas 10.31.5 and 10.31 .6 .
(2) projective modules, see Algebra, Lemma 10.76.4,
(3) finite stably free modules, see Lemma 15.3 .3 ,
(4) basis elements, see Algebra, Lemmas 10.100.1 and 10.100.3,
(5) ring maps, i.e., proving certain algebras are formally smooth, see Algebra, Lemma 10.136.4 Proposition 10.136.13, and Lemma 10.136.16,
(6) syntomic ring maps, see Algebra, Lemma 10.134.18,
(7) smooth ring maps, see Algebra, Lemma 10.135.19,
(8) étale ring maps, see Algebra, Lemma 10.141.11,
(9) factoring polynomials, see Algebra, Lemma 10.141.20, and
(10) Algebra, Section 10.148 discusses henselian local rings.

The interested reader will find more results of this nature in Smoothing Ring Maps, Section 16.4 in particular Smoothing Ring Maps, Proposition 16.4.2.
Let $A$ be a ring and let $I \subset A$ be an ideal. Let $\bar{\xi}$ be some kind of structure over $A / I$. In the following lemmas we look for étale ring maps $A \rightarrow A^{\prime}$ which induce isomorphisms $A / I \rightarrow A^{\prime} / I A^{\prime}$ and objects $\xi^{\prime}$ over $A^{\prime}$ lifting $\bar{\xi}$. A general remark is that given étale ring maps $A \rightarrow A^{\prime} \rightarrow A^{\prime \prime}$ such that $A / I \cong A^{\prime} / I A^{\prime}$ and $A^{\prime} / I A^{\prime} \cong A^{\prime \prime} / I A^{\prime \prime}$ the composition $A \rightarrow A^{\prime \prime}$ is also étale (Algebra, Lemma 10.141 .3 and also satisfies $A / I \cong A^{\prime \prime} / I A^{\prime \prime}$. We will frequently use this in the following lemmas without further mention. Here is a trivial example of the type of result we are looking for.

07LX Lemma 15.7.1. Let $A$ be a ring, let $I \subset A$ be an ideal, let $\bar{u} \in A / I$ be an invertible element. There exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and an invertible element $u^{\prime} \in A^{\prime}$ lifting $\bar{u}$.
Proof. Choose any lift $f \in A$ of $\bar{u}$ and set $A^{\prime}=A_{f}$ and $u$ the image of $f$ in $A^{\prime}$.
07 LY Lemma 15.7.2. Let $A$ be a ring, let $I \subset A$ be an ideal, let $\bar{e} \in A / I$ be an idempotent. There exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and an idempotent $e^{\prime} \in A^{\prime}$ lifting $\bar{e}$.
Proof. Choose any lift $x \in A$ of $\bar{e}$. Set

$$
A^{\prime}=A[t] /\left(t^{2}-t\right)\left[\frac{1}{t-1+x}\right]
$$

The ring map $A \rightarrow A^{\prime}$ is étale because $(2 t-1) \mathrm{d} t=0$ and $(2 t-1)(2 t-1)=1$ which is invertible. We have $A^{\prime} / I A^{\prime}=A / I[t] /\left(t^{2}-t\right)\left[\frac{1}{t-1+\bar{e}}\right] \cong A / I$ the last map sending $t$ to $\bar{e}$ which works as $\bar{e}$ is a root of $t^{2}-t$. This also shows that setting $e^{\prime}$ equal to the class of $t$ in $A^{\prime}$ works.

07LZ Lemma 15.7.3. Let $A$ be a ring, let $I \subset A$ be an ideal. Let $\operatorname{Spec}(A / I)=\coprod_{j \in J} \bar{U}_{j}$ be a finite disjoint open covering. Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and a finite disjoint open covering $\operatorname{Spec}\left(A^{\prime}\right)=\coprod_{j \in J} U_{j}^{\prime}$ lifting the given covering.
Proof. This follows from Lemma 15.7 .2 and the fact that open and closed subsets of Spectra correspond to idempotents, see Algebra, Lemma 10.20.3.
07M0 Lemma 15.7.4. Let $A \rightarrow B$ be a ring map and $J \subset B$ an ideal. If $A \rightarrow B$ is étale at every prime of $V(J)$, then there exists a $g \in B$ mapping to an invertible element of $B / J$ such that $A^{\prime}=B_{g}$ is étale over $A$.

Proof. The set of points of $\operatorname{Spec}(B)$ where $A \rightarrow B$ is not étale is a closed subset of $\operatorname{Spec}(B)$, see Algebra, Definition 10.141.1. Write this as $V\left(J^{\prime}\right)$ for some ideal $J^{\prime} \subset B$. Then $V\left(J^{\prime}\right) \cap V(J)=\emptyset$ hence $J+J^{\prime}=B$ by Algebra, Lemma 10.16.2. Write $1=f+g$ with $f \in J$ and $g \in J^{\prime}$. Then $g$ works.

Next we have three lemmas saying we can lift factorizations of polynomials.
0 ALH Lemma 15.7.5. Let $A$ be a ring, let $I \subset A$ be an ideal. Let $f \in A[x]$ be a monic polynomial. Let $\bar{f}=\bar{g} \bar{h}$ be a factorization of $f$ in $A / I[x]$ such that $\bar{g}$ and $\bar{h}$ are monic and generate the unit ideal in $A / I[x]$. Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and a factorization $f=g^{\prime} h^{\prime}$ in $A^{\prime}[x]$ with $g^{\prime}, h^{\prime}$ monic lifting the given factorization over $A / I$.

Proof. We will deduce this from results on the universal factorization proved ealier; however, we encourage the reader to find their own proof not using this trick. Say $\operatorname{deg}(\bar{g})=n$ and $\operatorname{deg}(\bar{h})=m$ so that $\operatorname{deg}(f)=n+m$. Write $f=x^{n+m}+\sum \alpha_{i} x^{n+m-i}$ for some $\alpha_{1}, \ldots, \alpha_{n+m} \in A$. Consider the ring map

$$
R=\mathbf{Z}\left[a_{1}, \ldots, a_{n+m}\right] \longrightarrow S=\mathbf{Z}\left[b_{1}, \ldots, b_{n}, c_{1}, \ldots, c_{m}\right]
$$

of Algebra, Example 10.141 .13 Let $R \rightarrow A$ be the ring map which sends $a_{i}$ to $\alpha_{i}$. Set

$$
B=A \otimes_{R} S
$$

By construction the image $f_{B}$ of $f$ in $B[x]$ factors, say $f_{B}=g_{B} h_{B}$ with $g_{B}=$ $x^{n}+\sum\left(1 \otimes b_{i}\right) x^{n-i}$ and similarly for $h_{B}$. Write $\bar{g}=x^{n}+\sum \bar{\beta}_{i} x^{n-i}$ and $\bar{h}=$ $x^{m}+\sum \bar{\gamma}_{i} x^{m-i}$. The $A$-algebra map

$$
B \longrightarrow A / I, \quad 1 \otimes b_{i} \mapsto \bar{\beta}_{i}, \quad 1 \otimes c_{i} \mapsto \bar{\gamma}_{i}
$$

maps $g_{B}$ and $h_{B}$ to $\bar{g}$ and $\bar{h}$ in $A / I[x]$. The displayed map is surjective; denote $J \subset B$ its kernel. From the discussion in Algebra, Example 10.141 .13 it is clear that $A \rightarrow B$ is etale at all points of $V(J) \subset \operatorname{Spec}(B)$. Choose $g \in B$ as in Lemma 15.7.4 and consider the $A$-algebra $B_{g}$. Since $g$ maps to a unit in $B / J=A / I$ we obtain also a map $B_{g} / I B_{g} \rightarrow A / I$ of $A / I$-algebras. Since $A / I \rightarrow B_{g} / I B_{g}$ is étale, also $B_{g} / I B_{g} \rightarrow A / I$ is étale (Algebra, Lemma 10.141.9). Hence there exists an idempotent $e \in B_{g} / I B_{g}$ such that $A / I=\left(B_{g} / I B_{g}\right)_{e}$ (Algebra, Lemma 10.141.10). Choose a lift $h \in B_{g}$ of $e$. Then $A \rightarrow A^{\prime}=\left(B_{g}\right)_{h}$ with factorization given by the image of the factorization $f_{B}=g_{B} h_{B}$ in $A^{\prime}$ is a solution to the problem posed by the lemma.

The assumption on the leading coefficient in the following lemma will be removed in Lemma 15.7.7.

07M1 Lemma 15.7.6. Let $A$ be a ring, let $I \subset A$ be an ideal. Let $f \in A[x]$ be a monic polynomial. Let $\bar{f}=\bar{g} \bar{h}$ be a factorization of $f$ in $A / I[x]$ and assume
(1) the leading coefficient of $\bar{g}$ is an invertible element of $A / I$, and
(2) $\bar{g}, \bar{h}$ generate the unit ideal in $A / I[x]$.

Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow$ $A^{\prime} / I A^{\prime}$ and a factorization $f=g^{\prime} h^{\prime}$ in $A^{\prime}[x]$ lifting the given factorization over $A / I$.

Proof. Applying Lemma 15.7.1 we may assume that the leading coefficient of $\bar{g}$ is the reduction of an invertible element $u \in A$. Then we may replace $\bar{g}$ by $\bar{u}^{-1} \bar{g}$ and $\bar{h}$ by $\bar{u} \bar{h}$. Thus we may assume that $\bar{g}$ is monic. Since $f$ is monic we conclude that $\bar{h}$ is monic too. In this case the result follows from Lemma 15.7.5.

07M2 Lemma 15.7.7. Let $A$ be a ring, let $I \subset A$ be an ideal. Let $f \in A[x]$ be a monic polynomial. Let $\bar{f}=\bar{g} \bar{h}$ be a factorization of $f$ in $A / I[x]$ and assume that $\bar{g}, \bar{h}$ generate the unit ideal in $A / I[x]$. Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and a factorization $f=g^{\prime} h^{\prime}$ in $A^{\prime}[x]$ lifting the given factorization over $A / I$.
$\underline{\text { Proof. Say }} f=x^{d}+a_{1} x^{d-1}+\ldots+a_{d}$ has degree $d$. Write $\bar{g}=\sum \bar{b}_{j} x^{j}$ and $\bar{h}=\sum \bar{c}_{j} x^{j}$. Then we see that $1=\sum \bar{b}_{j} \bar{c}_{d-j}$. It follows that $\operatorname{Spec}(A / I)$ is covered by the standard opens $D\left(\bar{b}_{j} \bar{c}_{d-j}\right)$. However, each point $\mathfrak{p}$ of $\operatorname{Spec}(A / I)$ is contained in at most one of these as by looking at the induced factorization of $f$ over the field $\kappa(\mathfrak{p})$ we see that $\operatorname{deg}(\bar{g} \bmod \mathfrak{p})+\operatorname{deg}(\bar{h} \bmod \mathfrak{p})=d$. Hence our open covering is a disjoint open covering. Applying Lemma 15.7 .3 (and replacing $A$ by $A^{\prime}$ ) we see that we may assume there is a corresponding disjoint open covering of $\operatorname{Spec}(A)$. This disjoint open covering corresponds to a product decomposition of $A$, see Algebra, Lemma 10.22.3. It follows that

$$
A=A_{0} \times \ldots \times A_{d}, \quad I=I_{0} \times \ldots \times I_{d}
$$

where the image of $\bar{g}$, resp. $\bar{h}$ in $A_{j} / I_{j}$ has degree $j$, resp. $d-j$ with invertible leading coefficient. Clearly, it suffices to prove the result for each factor $A_{j}$ separatedly. Hence the lemma follows from Lemma 15.7.6.
07M3 Lemma 15.7.8. Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal of $R$ and let $J \subset S$ be an ideal of $S$. If the closure of the image of $V(J)$ in $\operatorname{Spec}(R)$ is disjoint from $V(I)$, then there exists an element $f \in R$ which maps to 1 in $R / I$ and to an element of $J$ in $S$.

Proof. Let $I^{\prime} \subset R$ be an ideal such that $V\left(I^{\prime}\right)$ is the closure of the image of $V(J)$. Then $V(I) \cap V\left(I^{\prime}\right)=\emptyset$ by assumption and hence $I+I^{\prime}=R$ by Algebra, Lemma 10.16.2. Write $1=g+f$ with $g \in I$ and $f \in I^{\prime}$. We have $V\left(f^{\prime}\right) \supset V(J)$ where $f^{\prime}$ is the image of $f$ in $S$. Hence $\left(f^{\prime}\right)^{n} \in J$ for some $n$, see Algebra, Lemma 10.16.2, Replacing $f$ by $f^{n}$ we win.

07M4 Lemma 15.7.9. Let $A$ be a ring, let $I \subset A$ be an ideal. Let $A \rightarrow B$ be an integral ring map. Let $\bar{e} \in B / I B$ be an idempotent. Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and an idempotent $e^{\prime} \in B \otimes_{A} A^{\prime}$ lifting $\bar{e}$.

Proof. Choose an element $y \in B$ lifting $\bar{e}$. Then $z=y^{2}-y$ is an element of $I B$. By Algebra, Lemma 10.37 .4 there exist a monic polynomial $g(x)=x^{d}+\sum a_{j} x^{j}$ of degree $d$ with $a_{j} \in I$ such that $g(z)=0$ in $B$. Hence $f(x)=g\left(x^{2}-x\right) \in A[x]$ is a monic polynomial such that $f(x) \equiv x^{d}(x-1)^{d} \bmod I$ and such that $f(y)=0$ in $B$. By Lemma 15.7 .6 we can find an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and such that $f=g h$ in $A[x]$ with $g(x)=x^{d} \bmod I A^{\prime}$ and $h(x)=(x-1)^{d} \bmod I A^{\prime}$. After replacing $A$ by $A^{\prime}$ we may assume that the factorization is defined over $A$. In that case we see that $b_{1}=g(y) \in B$ is a lift of $\bar{e}^{d}=\bar{e}$ and $b_{2}=h(y) \in B$ is a lift of $(\bar{e}-1)^{d}=(-1)^{d}(1-\bar{e})^{d}=(-1)^{d}(1-\bar{e})$
and moreover $b_{1} b_{2}=0$. Thus $\left(b_{1}, b_{2}\right) B / I B=B / I B$ and $V\left(b_{1}, b_{2}\right) \subset \operatorname{Spec}(B)$ is disjoint from $V(I B)$. Since $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is closed (see Algebra, Lemmas 10.35 .20 and 10.40 .6 we can find an $a \in A$ which maps to an invertible element of $A / I$ whose image in $B$ lies in $\left(b_{1}, b_{2}\right)$, see Lemma 15.7.8. After replacing $A$ by the localization $A_{a}$ we get that $\left(b_{1}, b_{2}\right)=B$. Then $\operatorname{Spec}(B)=D\left(b_{1}\right) \amalg D\left(b_{2}\right)$; disjoint union because $b_{1} b_{2}=0$. Let $e \in B$ be the idempotent corresponding to the open and closed subset $D\left(b_{1}\right)$, see Algebra, Lemma 10.20.3. Since $b_{1}$ is a lift of $\bar{e}$ and $b_{2}$ is a lift of $\pm(1-\bar{e})$ we conclude that $e$ is a lift of $\bar{e}$ by the uniqueness statement in Algebra, Lemma 10.20.3.

07M5 Lemma 15.7.10. Let $A$ be a ring, let $I \subset A$ be an ideal. Let $\bar{P}$ be finite projective $A / I$-module. Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and a finite projective $A^{\prime}$-module $P^{\prime}$ lifting $\bar{P}$.
Proof. We can choose an integer $n$ and a direct sum decomposition $(A / I)^{\oplus n}=$ $\bar{P} \oplus \bar{K}$ for some $R / I$-module $\bar{K}$. Choose a lift $\varphi: A^{\oplus n} \rightarrow A^{\oplus n}$ of the projector $\bar{p}$ associated to the direct summand $\bar{P}$. Let $f \in A[x]$ be the characteristic polynomial of $\varphi$. Set $B=A[x] /(f)$. By Cayley-Hamilton (Algebra, Lemma 10.15.1) there is a map $B \rightarrow \operatorname{End}_{A}\left(A^{\oplus n}\right)$ mapping $x$ to $\varphi$. For every prime $\mathfrak{p} \supset I$ the image of $f$ in $\kappa(\mathfrak{p})$ is $(x-1)^{r} x^{n-r}$ where $r$ is the dimension of $\bar{P} \otimes_{A / I} \kappa(\mathfrak{p})$. Hence $(x-1)^{n} x^{n}$ maps to zero in $B \otimes_{A} \kappa(\mathfrak{p})$ for all $\mathfrak{p} \supset I$. Hence the image of $(x-1)^{n} x^{n}$ in $B$ is contained in

$$
\bigcup_{\mathfrak{p} \supset I} \mathfrak{p} B=\left(\bigcup_{\mathfrak{p} \supset I} \mathfrak{p}\right) B=\sqrt{I} B
$$

the first equality because $B$ is a free $A$-module and the second by Algebra, Lemma 10.16.2. Thus $(x-1)^{N} x^{N}$ is contained in $I B$ for some $N$. It follows that $x^{N}+(1-$ $x)^{N}$ is a unit in $B / I B$ and that

$$
\bar{e}=\text { image of } \frac{x^{N}}{x^{N}+(1-x)^{N}} \text { in } B / I B
$$

is an idempotent as both assertions hold in $\mathbf{Z}[x] /\left(x^{n}(x-1)^{N}\right)$. The image of $\bar{e}$ in $\operatorname{End}_{A / I}\left((A / I)^{\oplus n}\right)$ is

$$
\frac{\bar{p}^{N}}{\bar{p}^{N}+(1-\bar{p})^{N}}=\bar{p}
$$

as $\bar{p}$ is an idempotent. After replacing $A$ by an étale extension $A^{\prime}$ as in the lemma, we may assume there exists an idempotent $e \in B$ which maps to $\bar{e}$ in $B / I B$, see Lemma 15.7.9. Then the image of $e$ under the map

$$
B=A[x] /(f) \longrightarrow \operatorname{End}_{A}\left(A^{\oplus n}\right)
$$

is an idempotent element $p$ which lifts $\bar{p}$. Setting $P=\operatorname{Im}(p)$ we win.
07EV Lemma 15.7.11. Let $A$ be a ring. Let $0 \rightarrow K \rightarrow A^{\oplus m} \rightarrow M \rightarrow 0$ be a sequence of $A$-modules. Consider the $A$-algebra $C=\operatorname{Sym}_{A}^{*}(M)$ with its presentation $\alpha$ : $A\left[y_{1}, \ldots, y_{m}\right] \rightarrow C$ coming from the surjection $A^{\oplus m} \rightarrow M$. Then

$$
N L(\alpha)=\left(K \otimes_{A} C \rightarrow \bigoplus_{j=1, \ldots, m} C d y_{j}\right)
$$

(see Algebra, Section 10.132) in particular $\Omega_{C / A}=M \otimes_{A} C$.

Proof. Let $J=\operatorname{Ker}(\alpha)$. The lemma asserts that $J / J^{2} \cong K \otimes_{A} C$. Note that $\alpha$ is a homomorphism of graded algebras. We will prove that in degree $d$ we have $\left(J / J^{2}\right)_{d}=K \otimes_{A} C_{d-1}$. Note that
$J_{d}=\operatorname{Ker}\left(\operatorname{Sym}_{A}^{d}\left(A^{\oplus m}\right) \rightarrow \operatorname{Sym}_{A}^{d}(M)\right)=\operatorname{Im}\left(K \otimes_{A} \operatorname{Sym}_{A}^{d-1}\left(A^{\oplus m}\right) \rightarrow \operatorname{Sym}_{A}^{d}\left(A^{\oplus m}\right)\right)$, see Algebra, Lemma 10.12.2. It follows that $\left(J^{2}\right)_{d}=\sum_{a+b=d} J_{a} \cdot J_{b}$ is the image of

$$
K \otimes_{A} K \otimes_{A} \operatorname{Sym}_{A}^{d-2}\left(A^{\otimes m}\right) \rightarrow \operatorname{Sym}_{A}^{d}\left(A^{\oplus m}\right)
$$

The cokernel of the map $K \otimes_{A} \operatorname{Sym}_{A}^{d-2}\left(A^{\otimes m}\right) \rightarrow \operatorname{Sym}_{A}^{d-1}\left(A^{\oplus m}\right)$ is $\operatorname{Sym}_{A}^{d-1}(M)$ by the lemma referenced above. Hence it is clear that $\left(J / J^{2}\right)_{d}=J_{d} /\left(J^{2}\right)_{d}$ is equal to

$$
\begin{aligned}
\operatorname{Coker}\left(K \otimes_{A} K \otimes_{A} \operatorname{Sym}_{A}^{d-2}\left(A^{\otimes m}\right) \rightarrow K \otimes_{A} \operatorname{Sym}_{A}^{d-1}\left(A^{\otimes m}\right)\right) & =K \otimes_{A} \operatorname{Sym}_{A}^{d-1}(M) \\
& =K \otimes_{A} C_{d-1}
\end{aligned}
$$

as desired.
07M6 Lemma 15.7.12. Let $A$ be a ring. Let $M$ be an $A$-module. Then $C=\operatorname{Sym}_{A}^{*}(M)$ is smooth over $A$ if and only if $M$ is a finite projective $A$-module.

Proof. Let $\sigma: C \rightarrow A$ be the projection onto the degree 0 part of $C$. Then $J=\operatorname{Ker}(\sigma)$ is the part of degree $>0$ and we see that $J / J^{2}=M$ as an $A$-module. Hence if $A \rightarrow C$ is smooth then $M$ is a finite projective $A$-module by Algebra, Lemma 10.137.4
Conversely, assume that $M$ is finite projective and choose a surjection $A^{\oplus n} \rightarrow M$ with kernel $K$. Of course the sequence $0 \rightarrow K \rightarrow A^{\oplus n} \rightarrow M \rightarrow 0$ is split as $M$ is projective. In particular we see that $K$ is a finite $A$-module and hence $C$ is of finite presentation over $A$ as $C$ is a quotient of $A\left[x_{1}, \ldots, x_{n}\right]$ by the ideal generated by $K \subset \bigoplus A x_{i}$. The computation of Lemma 15.7 .11 shows that $N L_{C / A}$ is homotopy equivalent to $(K \rightarrow M) \otimes_{A} C$. Hence $N L_{C / A}$ is quasi-isomorphic to $C \otimes_{A} M$ placed in degree 0 which means that $C$ is smooth over $A$ by Algebra, Definition 10.135.1.

07M7 Lemma 15.7.13. Let $A$ be a ring, let $I \subset A$ be an ideal. Consider a commutative diagram

where $B$ is a smooth $A$-algebra. Then there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and an $A$-algebra map $B \rightarrow A^{\prime}$ lifting the ring map $B \rightarrow A / I$.

Proof. Let $J \subset B$ be the kernel of $B \rightarrow A / I$ so that $B / J=A / I$. By Algebra, Lemma 10.137.3 the sequence

$$
0 \rightarrow I / I^{2} \rightarrow J / J^{2} \rightarrow \Omega_{B / A} \otimes_{B} B / J \rightarrow 0
$$

is split exact. Thus $\bar{P}=J /\left(J^{2}+I B\right)=\Omega_{B / A} \otimes_{B} B / J$ is a finite projective $A / I$ module. Choose an integer $n$ and a direct sum decomposition $A / I^{\oplus n}=\bar{P} \oplus \bar{K}$. By Lemma 15.7.10 we can find an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ and a finite projective $A$-module $K$ which lifts $\bar{K}$. We may and do replace $A$ by $A^{\prime}$. Set $B^{\prime}=B \otimes_{A} \operatorname{Sym}_{A}^{*}(K)$. Since $A \rightarrow \operatorname{Sym}_{A}^{*}(K)$ is smooth
by Lemma 15.7 .12 we see that $B \rightarrow B^{\prime}$ is smooth which in turn implies that $A \rightarrow B^{\prime}$ is smooth (see Algebra, Lemmas 10.135.4 and 10.135.13). Moreover the section $\operatorname{Sym}_{A}^{*}(K) \rightarrow A$ determines a section $B^{\prime} \rightarrow B$ and we let $B^{\prime} \rightarrow A / I$ be the composition $B^{\prime} \rightarrow B \rightarrow A / I$. Let $J^{\prime} \subset B^{\prime}$ be the kernel of $B^{\prime} \rightarrow A / I$. We have $J B^{\prime} \subset J^{\prime}$ and $B \otimes_{A} K \subset J^{\prime}$. These maps combine to give an isomorphism

$$
(A / I)^{\oplus n} \cong J / J^{2} \oplus \bar{K} \longrightarrow J^{\prime} /\left(\left(J^{\prime}\right)^{2}+I B^{\prime}\right)
$$

Thus, after replacing $B$ by $B^{\prime}$ we may assume that $J /\left(J^{2}+I B\right)=\Omega_{B / A} \otimes_{B} B / J$ is a free $A / I$-module of rank $n$.

In this case, choose $f_{1}, \ldots, f_{n} \in J$ which map to a basis of $J /\left(J^{2}+I B\right)$. Consider the finitely presented $A$-algebra $C=B /\left(f_{1}, \ldots, f_{n}\right)$. Note that we have an exact sequence

$$
0 \rightarrow H_{1}\left(L_{C / A}\right) \rightarrow\left(f_{1}, \ldots, f_{n}\right) /\left(f_{1}, \ldots, f_{n}\right)^{2} \rightarrow \Omega_{B / A} \otimes_{B} C \rightarrow \Omega_{C / A} \rightarrow 0
$$

see Algebra, Lemma 10.132 .4 (note that $H_{1}\left(L_{B / A}\right)=0$ and that $\Omega_{B / A}$ is finite projective, in particular flat so the Tor group vanishes). For any prime $\mathfrak{q} \supset J$ of $B$ the module $\Omega_{B / A, \mathfrak{q}}$ is free of rank $n$ because $\Omega_{B / A}$ is finite projective and because $\Omega_{B / A} \otimes_{B} B / J$ is free of rank $n$. By our choice of $f_{1}, \ldots, f_{n}$ the map

$$
\left(\left(f_{1}, \ldots, f_{n}\right) /\left(f_{1}, \ldots, f_{n}\right)^{2}\right)_{\mathfrak{q}} \rightarrow \Omega_{B / A, \mathfrak{q}}
$$

is surjective modulo $I$. Hence we see that this map of modules over the local ring $C_{\mathfrak{q}}$ has to be an isomorphism. Thus $H_{1}\left(L_{C / A}\right)_{\mathfrak{q}}=0$ and $\Omega_{C / A, \mathfrak{q}}=0$. By Algebra, Lemma 10.135 .12 we see that $A \rightarrow C$ is smooth at the prime $\overline{\mathfrak{q}}$ of $C$ corresponding to $\mathfrak{q}$. Since $\Omega_{C / A, \mathfrak{q}}=0$ it is actually étale at $\overline{\mathfrak{q}}$. Thus $A \rightarrow C$ is étale at all primes of $C$ containing $J C$. By Lemma 15.7 .4 we can find an $f \in C$ mapping to an invertible element of $C / J C$ such that $A \rightarrow C_{f}$ is étale. By our choice of $f$ it is still true that $C_{f} / J C_{f}=A / I$. The map $C_{f} / I C_{f} \rightarrow A / I$ is surjective and étale by Algebra, Lemma 10.141.9. Hence $A / I$ is isomorphic to the localization of $C_{f} / I C_{f}$ at some element $g \in C$, see Algebra, Lemma 10.141.10. Set $A^{\prime}=C_{f g}$ to conclude the proof.

### 15.8. Henselian pairs

09XD Some of the results of Section 15.7 may be viewed as results about henselian pairs. In this section a pair is a pair $(A, I)$ where $A$ is a ring and $I \subset A$ is an ideal. A morphism of pairs $(A, I) \rightarrow(B, J)$ is a ring map $\varphi: A \rightarrow B$ with $\varphi(I) \subset J$. As in Section 15.7 given an object $\xi$ over $A$ we denote $\bar{\xi}$ the "base change" of $\xi$ to an object over $A / I$ (provided this makes sense).

09XE Definition 15.8.1. A henselian pair is a pair $(A, I)$ satisfying
(1) $I$ is contained in the Jacobson radical of $A$, and
(2) for any monic polynomial $f \in A[T]$ and factorization $\bar{f}=g_{0} h_{0}$ with $g_{0}, h_{0} \in A / I[T]$ monic generating the unit ideal in $A / I[T]$, there exists a factorization $f=g h$ in $A[T]$ with $g, h$ monic and $g_{0}=\bar{g}$ and $h_{0}=\bar{h}$.

Observe that if $A$ is a local ring and $I=\mathfrak{m}$ is the maximal ideal, then $(A, I)$ is a henselian pair if and only if $A$ is a henselian local ring, see Algebra, Lemma 10.148 .3 . In Lemma 15.8 .7 we give a number of equivalent characterizations of henselian pairs (and we will add more as time goes on).

0ALI Lemma 15.8.2. Let $(A, I)$ be a pair with I locally nilpotent. Then the functor $B \mapsto B / I B$ induces an equivalence between the category of étale algebras over $A$ and the category of étale algebras over $A / I$. Moreover, the pair is henselian.
Proof. Essential surjectivity holds by Algebra, Lemma 10.141.11. If $B, B^{\prime}$ are étale over $A$ and $B / I B \rightarrow B^{\prime} / I B^{\prime}$ is a morphism of $A / I$-algebras, then we can lift this by Algebra, Lemma 10.136.16. Finally, suppose that $f, g: B \rightarrow B^{\prime}$ are two $A$-algebra maps with $f \bmod I=g \bmod I$. Choose an idempotent $e \in B \otimes_{A} B$ generating the kernel of the multiplication map $B \otimes_{A} B \rightarrow B$, see Algebra, Lemmas 10.147 .4 and 10.147 .3 (to see that étale is unramified). Then $(f \otimes g)(e) \in I B$. Since $I B$ is locally nilpotent (Algebra, Lemma 10.31.2) this implies $(f \otimes g)(e)=0$ by Algebra, Lemma 10.31.5. Thus $f=g$.

It is clear that $I$ is contained in the radical of $A$. Let $f \in A[T]$ be a monic polynomial and let $\bar{f}=g_{0} h_{0}$ be a factorization of $\bar{f}=f \bmod I$ with $g_{0}, h_{0} \in A / I[T]$ monic generating the unit ideal in $A / I[T]$. By Lemma 15.7 .5 there exists an étale ring map $A \rightarrow A^{\prime}$ which induces an isomorphism $A / I \rightarrow A^{\prime} / I A^{\prime}$ such that the factorization lifts to a factorization into monic polynomials over $A^{\prime}$. By the above we have $A=A^{\prime}$ and the factorization is over $A$.

0ALJ Lemma 15.8.3. Let $(A, I)$ be a pair. If $A$ is I-adically complete, then the pair is henselian.

Proof. By Algebra, Lemma 10.95 .6 the ideal $I$ is contained in the radical of $A$. Let $f \in A[T]$ be a monic polynomial and let $\bar{f}=g_{0} h_{0}$ be a factorization of $\bar{f}=f \bmod I$ with $g_{0}, h_{0} \in A / I[T]$ monic generating the unit ideal in $A / I[T]$. By Lemma 15.8.2 we can succesively lift this factorization to $f \bmod I^{n}=g_{n} h_{n}$ with $g_{n}, h_{n}$ monic in $A / I^{n}[T]$ for all $n \geq 1$. As $A=\lim A / I^{n}$ this finishes the proof.

09XF Lemma 15.8.4. Let $(A, I)$ be a pair. If I is contained in the Jacobson radical of $A$, then the map from idempotents of $A$ to idempotents of $A / I$ is injective.

Proof. An idempotent of a local ring is either 0 or 1 . Thus an idempotent is determined by the set of maximal ideals where it vanishes, by Algebra, Lemma 10.23.1.

09XG Lemma 15.8.5. Let $(A, I)$ be a pair. Let $A \rightarrow B$ be an integral ring map such that $B / I B=C_{1} \times C_{2}$ as $A / I$-algebra with $A / I \rightarrow C_{1}$ injective. Any element $b \in B$ mapping to $(0,1)$ in $B / I B$ is the zero of a monic polynomial $f \in A[T]$ with $f \bmod I=g T^{n}$ and $g(0)$ a unit in $A / I$.

Proof. Let $b \in B$ map to $(0,1)$ in $C_{1} \times C_{2}$. Let $J \subset A[T]$ be the kernel of the $\operatorname{map} A[T] \rightarrow B, T \mapsto b$. Since $B$ is integral over $A$, it is integral over $A[T]$. Hence the image of $\operatorname{Spec}(B)$ in $\operatorname{Spec}(A[T])$ is closed by Algebra, Lemmas 10.40.6 and 10.35 .20 . Hence this image is equal to $V(J)=\operatorname{Spec}(A[T] / J)$ by Algebra, Lemma 10.29.5. Intersecting with the inverse image of $V(I)$ our choice of $b$ shows we have $V(J+I A[T]) \subset V\left(T^{2}-T\right)$. Hence there exists an $n \geq 1$ and $g \in J$ with $g \bmod I A[T]=\left(T^{2}-T\right)^{n}$. On the other hand, as $A \rightarrow B$ is integral there exists a monic polynomial $h \in J$. Note that $h(0) \bmod I$ maps to zero under the composition $A[T] \rightarrow B \rightarrow B / I B \rightarrow C_{1}$. Since $A / I \rightarrow C_{1}$ is injective we conclude $h \bmod I A[T]=h_{0} T$ for some $h_{0} \in A / I[T]$. Set

$$
f=g+h^{m}
$$

for $m>n$. If $m$ is large enough, this is a monic polynomial and

$$
f \bmod I A[T]=\left(T^{2}-T\right)^{n}+h_{0}^{m} T^{m}=T^{n}\left((T-1)^{n}+h_{0}^{m} T^{m-n}\right)
$$

and hence the desired conclusion.
09XH Lemma 15.8.6. Let $(A, I)$ be a pair. Let $A \rightarrow B$ be a finite type ring map such that $B / I B=C_{1} \times C_{2}$ with $A / I \rightarrow C_{1}$ finite. Let $B^{\prime}$ be the integral closure of $A$ in $B$. Then we can write $B^{\prime} / I B^{\prime}=C_{1} \times C_{2}^{\prime}$ such that the map $B^{\prime} / I B^{\prime} \rightarrow B / I B$ preserves product decompositions and there exists a $g \in B^{\prime}$ mapping to $(1,0)$ in $C_{1} \times C_{2}^{\prime}$ with $B_{g}^{\prime} \rightarrow B_{g}$ an isomorphism.
Proof. Observe that $A \rightarrow B$ is quasi-finite at every prime of the closed subset $T=\operatorname{Spec}\left(C_{1}\right) \subset \operatorname{Spec}(B)$ (this follows by looking at fibre rings, see Algebra, Definition 10.121.3. Consider the diagram of topological spaces

By Algebra, Theorem 10.122 .13 for every $\mathfrak{p} \in T$ there is a $h_{\mathfrak{p}} \in B^{\prime}, h_{\mathfrak{p}} \notin \mathfrak{p}$ such that $B_{h}^{\prime} \rightarrow B_{h}$ is an isomorphism. The union $U=\bigcup D\left(h_{\mathfrak{p}}\right)$ gives an open $U \subset \operatorname{Spec}\left(B^{\prime}\right)$ such that $\phi^{-1}(U) \rightarrow U$ is a homeomorphism and $T \subset \phi^{-1}(U)$. Since $T$ is open in $\psi^{-1}(V(I))$ we conclude that $\phi(T)$ is open in $U \cap\left(\psi^{\prime}\right)^{-1}(V(I))$. Thus $\phi(T)$ is open in $\left(\psi^{\prime}\right)^{-1}(V(I))$. On the other hand, since $C_{1}$ is finite over $A / I$ it is finite over $B^{\prime}$. Hence $\phi(T)$ is a closed subset of $\operatorname{Spec}\left(B^{\prime}\right)$ by Algebra, Lemmas 10.40 .6 and 10.35.20. We conclude that $\operatorname{Spec}\left(B^{\prime} / I B^{\prime}\right) \supset \phi(T)$ is open and closed. By Algebra, Lemma 10.22 .3 we get a corresponding product decomposition $B^{\prime} / I B^{\prime}=C_{1}^{\prime} \times C_{2}^{\prime}$. The map $B^{\prime} / I B^{\prime} \rightarrow B / I B$ maps $C_{1}^{\prime}$ into $C_{1}$ and $C_{2}^{\prime}$ into $C_{2}$ as one sees by looking at what happens on spectra (hint: the inverse image of $\phi(T)$ is exactly $T$; some details omitted). Pick a $g \in B^{\prime}$ mapping to $(1,0)$ in $C_{1}^{\prime} \times C_{2}^{\prime}$ such that $D(g) \subset U$; this is possible $\operatorname{because} \operatorname{Spec}\left(C_{1}^{\prime}\right)$ and $\operatorname{Spec}\left(C_{2}^{\prime}\right)$ are disjoint and closed in $\operatorname{Spec}\left(B^{\prime}\right)$ and $\operatorname{Spec}\left(C_{1}^{\prime}\right)$ is contained in $U$. Then $B_{g}^{\prime} \rightarrow B_{g}$ defines a homeomorphism on spectra and an isomorphism on local rings (by our choice of $U$ above). Hence it is an isomorphism, as follows for example from Algebra, Lemma 10.23.1. Finally, it follows that $C_{1}^{\prime}=C_{1}$ and the proof is complete.

09XI Lemma 15.8.7. Let $(A, I)$ be a pair. The following are equivalent
(1) $(A, I)$ is a henselian pair,
(2) given an étale ring map $A \rightarrow A^{\prime}$ and an $A$-algebra map $\sigma: A^{\prime} \rightarrow A / I$, there exists an $A$-algebra map $A^{\prime} \rightarrow A$ lifting $\sigma$,
(3) for any finite $A$-algebra $B$ the map $B \rightarrow B / I B$ induces a bijection on idempotents, and
(4) for any integral $A$-algebra $B$ the map $B \rightarrow B / I B$ induces a bijection on idempotents.

Proof. Assume (2) holds. Then $I$ is contained in the Jacobson radical of $A$, since otherwise there would be a nonunit $f \in A$ not contained in $I$ and the map $A \rightarrow A_{f}$ would contradict (2). Hence $I B \subset B$ is contained in the Jacobson radical of $B$ for $B$ integral over $A$ because $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is closed by Algebra, Lemmas 10.40.6 and 10.35 .20 . Thus the map from idempotents of $B$ to idempotents of $B / I B$ is
injective by Lemma 15.8.4. On the other hand, since (2) holds, every idempotent of $B$ lifts to an idempotent of $B / I B$ by by Lemma 15.7 .9 . In this way we see that (2) implies (4).

The implication $(4) \Rightarrow(3)$ is trivial.
Assume (3). Let $\mathfrak{m}$ be a maximal ideal and consider the finite map $A \rightarrow B=$ $A /(I \cap \mathfrak{m})$. The condition that $B \rightarrow B / I B$ induces a bijection on idempotents implies that $I \subset \mathfrak{m}$ (if not, then $B=A / I \times A / \mathfrak{m}$ and $B / I B=A / I$ ). Thus we see that $I$ is contained in the Jacobson radical of $A$. Let $f \in A[T]$ be monic and suppose given a factorization $\bar{f}=g_{0} h_{0}$ with $g_{0}, h_{0} \in A / I[T]$ monic. Set $B=A[T] /(f)$. Let $\bar{e}$ be the nontrivial idempotent of $B / I B$ corresponding to the decomposition

$$
B / I B=A / I[T] /\left(g_{0}\right) \times A[T] /\left(h_{0}\right)
$$

of $A$-algebras. Let $e \in B$ be an idempotent lifting $\bar{e}$ which exists as we assumed (3). This gives a product decomposition

$$
B=e B \times(1-e) B
$$

Note that $B$ is free of rank $\operatorname{deg}(f)$ as an $A$-module. Hence $e B$ and $(1-e) B$ are finite locally free $A$-modules. However, since $e B$ and $(1-e) B$ have constant rank $\operatorname{deg}\left(g_{0}\right)$ and $\operatorname{deg}\left(h_{0}\right)$ over $A / I$ we find that the same is true over $\operatorname{Spec}(A)$. We conclude that

$$
f=\operatorname{det}_{A}(T: B \rightarrow B)=\operatorname{det}_{A}(T: e B \rightarrow e B) \operatorname{det}_{A}(T:(1-e) B \rightarrow(1-e) B)
$$

is a factorization into monic polynomials reducing to the given factorization modulo $I$. Thus (3) implies (1).

Assume (1). Let $A \rightarrow A^{\prime}$ be an étale ring map and let $\sigma: A^{\prime} \rightarrow A / I$ be an $A$-algebra map. This implies that $A^{\prime} / I A^{\prime}=A / I \times C$ for some ring $C$. Let $A^{\prime \prime} \subset A^{\prime}$ be the integral closure of $A$ in $A^{\prime}$. By Lemma 15.8 .6 we can write $A^{\prime \prime} / I A^{\prime \prime}=A / I \times C^{\prime}$ such that $A^{\prime \prime} / I A^{\prime \prime} \rightarrow A^{\prime} / I A^{\prime}$ maps $A / I$ isomorphically to $A^{\prime} / I A^{\prime}$ and $C^{\prime}$ to $C$ and such that there exists a $a \in A^{\prime \prime}$ mapping to $(1,0)$ in $A / I \times C^{\prime}$ such that $A_{a}^{\prime \prime} \cong A_{a}^{\prime}$. By Lemma 15.8 .5 we see that $a$ satisfies a monic polynomial $f \in A[T]$ whose reduction modulo $I$ factors as $\bar{f}=g_{0} T^{n}$ where $T, g_{0}$ generate the unit ideal in $A / I[T]$. Thus by assumption we can factor $f$ as $f=g h$ where $g$ is a monic lift of $g_{0}$ and $h$ is a monic lift of $T^{n}$. Because $I$ is contained in the Jacobson radical of $A$, we find that $g$ and $h$ generate the unit ideal in $A[T]$ (details omitted; hint: use that $A[T] /(g, h)$ is finite over $A)$. Thus $A[T] /(f)=A[T] /(h) \times A[T] /(g)$ and we find a corresponding product decomposition $A^{\prime \prime}=A_{1}^{\prime \prime} \times A_{2}^{\prime \prime}$. By construction we have $A_{1}^{\prime \prime} / I A_{1}^{\prime \prime}=A / I$ and $A_{2}^{\prime \prime} / I A_{2}^{\prime \prime}=C^{\prime}$. Since $A_{1}^{\prime \prime}$ is integral over $A$ and $I$ is contained in the Jacobson radical of $A$ we see that $a$ maps to an invertible element of $A_{1}^{\prime \prime}$. Hence $A_{a}^{\prime \prime}=A_{1}^{\prime \prime} \times\left(A_{2}^{\prime \prime}\right)_{a}$. It follows that $A \rightarrow A_{1}^{\prime \prime}$ is integral as well as étale, hence finite locally free. However, $A_{1}^{\prime \prime} / I A_{1}^{\prime \prime}=A / I$ thus $A_{1}^{\prime \prime}$ has rank 1 as an $A$-module along $V(I)$. Since $I$ is contained in the Jacobson radical of $A$ we conclude that $A_{1}^{\prime \prime}$ has rank 1 everywhere and it follows that $A \rightarrow A_{1}^{\prime \prime}$ is an isomorphism. Thus $A^{\prime} \rightarrow A_{a}^{\prime} \cong A_{a}^{\prime \prime} \rightarrow\left(A_{1}^{\prime \prime}\right)_{a}=A_{1}^{\prime \prime}=A$ is the desired lift of $\sigma$. In this way we see that (1) implies (2).

09XJ Lemma 15.8.8. Let $A$ be a ring. Let $I, J \subset A$ be ideals with $V(I)=V(J)$. Then $(A, I)$ is henselian if and only if $(A, J)$ is henselian.

Proof. For any integral ring map $A \rightarrow B$ we see that $V(I B)=V(J B)$. Hence idempotents of $B / I B$ and $B / J B$ are in bijective correspondence (Algebra, Lemma 10.20.3. It follows that $B \rightarrow B / I B$ induces a bijection on sets of idempotents if and only if $B \rightarrow B / J B$ induces a bijection on sets of idempotents. Thus we conclude by Lemma 15.8.7.

09XK Lemma 15.8.9. Let $(A, I)$ be a henselian pair and let $A \rightarrow B$ be an integral ring map. Then $(B, I B)$ is a henselian pair.

Proof. Immediate from the fourth characterization of henselian pairs in Lemma 15.8 .7 and the fact that the composition of integral ring maps is integral.

0ATD Lemma 15.8.10. Let $J$ be a set and let $\left\{\left(A_{j}, I_{j}\right)\right\}_{j \in J}$ be a collection of pairs. Then $\left(\prod_{j \in J} A_{j}, \prod_{j \in J} I_{j}\right)$ is Henselian if and only if so is each $\left(A_{j}, I_{j}\right)$.

Proof. For every $j \in J$, the projection $\prod_{j \in J} A_{j} \rightarrow A_{j}$ is an integral ring map, so Lemma 15.8 .9 proves that each $\left(A_{j}, I_{j}\right)$ is Henselian if $\left(\prod_{j \in J} A_{j}, \prod_{j \in J} I_{j}\right)$ is Henselian.

Conversely, suppose that each $\left(A_{j}, I_{j}\right)$ is a Henselian pair. Then every $1+x$ with $x \in \prod_{j \in J} I_{j}$ is a unit in $\prod_{j \in J} A_{j}$ because it is so componentwise by Algebra, Lemma 10.18 .1 and Definition 15.8.1. Thus, by Algebra, Lemma 10.18.1 again, $\prod_{j \in J} I_{j}$ is contained in the Jacobson radical of $\prod_{j \in J} A_{j}$. Continuing to work componentwise, it likewise follows that for every monic $f \in\left(\prod_{j \in J} A_{j}\right)[T]$ and every factorization $\bar{f}=g_{0} h_{0}$ with monic $g_{0}, h_{0} \in\left(\prod_{j \in J} A_{j} / \prod_{j \in J} I_{j}\right)[T]=\left(\prod_{j \in J} A_{j} / I_{j}\right)[T]$ that generate the unit ideal in $\left(\prod_{j \in J} A_{j} / \prod_{j \in J} I_{j}\right)[T]$, there exists a factorization $f=g h$ in $\left(\prod_{j \in J} A_{j}\right)[T]$ with $g, h$ monic and reducing to $g_{0}, h_{0}$. In conclusion, according to Definition 15.8.1 $\left(\prod_{j \in J} A_{j}, \prod_{j \in J} I_{j}\right)$ is a Henselian pair.
09Y6 Lemma 15.8.11. Let $(A, I)$ be a henselian pair. Let $\mathfrak{p} \subset A$ be a prime ideal. Then $V(\mathfrak{p}+I)$ is connected.

Proof. By Lemma 15.8 .9 we see that $(A / \mathfrak{p}, I+\mathfrak{p} / \mathfrak{p})$ is a henselian pair. Thus it suffices to prove: If $(A, I)$ is a henselian pair and $A$ is a domain, then $\operatorname{Spec}(A / I)=$ $V(I)$ is connected. If not, then $A / I$ has a nontrivial idempotent, whence by Lemma 15.8.7 $A$ has a nontrivial idempotent. This is a contradiction.

09ZL Lemma 15.8.12. Let $(A, I)$ be a henselian pair. The functor $B \rightarrow B / I B$ determines an equivalence between finite étale $A$-algebras and finite étale $A / I$-algebras.

Proof. Let $B, B^{\prime}$ be two $A$-algebras finite étale over $A$. Then $B^{\prime} \rightarrow B^{\prime \prime}=B \otimes_{A} B^{\prime}$ is finite étale as well (Algebra, Lemmas 10.141.3 and 10.35.11). Now we have 1-to-1 correspondences between
(1) $A$-algebra maps $B \rightarrow B^{\prime}$,
(2) sections of $B^{\prime} \rightarrow B^{\prime \prime}$, and
(3) idempotents $e$ of $B^{\prime \prime}$ such that $B^{\prime} \rightarrow B^{\prime \prime} \rightarrow e B^{\prime \prime}$ is an isomorphism.

The bijection between (2) and (3) sends $\sigma: B^{\prime \prime} \rightarrow B^{\prime}$ to $e$ such that ( $1-e$ ) is the idempotent that generates the kernel of $\sigma$ which exists by Algebra, Lemmas 10.141 .9 and 10.141 .10 . There is a similar correspondence between $A / I$ algebra maps $B / I B \rightarrow B^{\prime} / I B^{\prime}$ and idempotents $\bar{e}$ of $B^{\prime \prime} / I B^{\prime \prime}$ such that $B^{\prime} / I B^{\prime} \rightarrow$ $B^{\prime \prime} / I B^{\prime \prime} \rightarrow \bar{e}\left(B^{\prime \prime} / I B^{\prime \prime}\right)$ is an isomorphism. However every idempotent $\bar{e}$ of $B^{\prime \prime} / I B^{\prime \prime}$ lifts uniquely to an idempotent $e$ of $B^{\prime \prime}$ (Lemma 15.8.7). Moreover, if $B^{\prime \prime} / I B^{\prime \prime} \rightarrow$
$\bar{e}\left(B^{\prime \prime} / I B^{\prime \prime}\right)$ is an isomorphism, then $B^{\prime} \rightarrow e B^{\prime \prime}$ is an isomorphism too by Nakayama's lemma (Algebra, Lemma 10.19.1). In this way we see that the functor is fully faithful.

Essential surjectivity. Let $A / I \rightarrow C$ be a finite étale map. By Algebra, Lemma 10.141.11 there exists an étale map $A \rightarrow B$ such that $B / I B \cong C$. Let $B^{\prime}$ be the integral closure of $A$ in $B$. By Lemma 15.8 .6 we have $B^{\prime} / I B^{\prime}=C \times C^{\prime}$ for some ring $C^{\prime}$ and $B_{g}^{\prime} \cong B_{g}$ for some $g \in B^{\prime}$ mapping to $(1,0) \in C \times C^{\prime}$. Since idempotents lift (Lemma 15.8.7) we get $B^{\prime}=B_{1}^{\prime} \times B_{2}^{\prime}$ with $C=B_{1}^{\prime} / I B_{1}^{\prime}$ and $C^{\prime}=B_{2}^{\prime} / I B_{2}^{\prime}$. The image of $g$ in $B_{1}^{\prime}$ is invertible and $\left(B_{2}^{\prime}\right)_{g}=0$ because $I B^{\prime}$ is contained in the Jacobson radical of $B^{\prime}$ (for example because $\left(B^{\prime}, I B^{\prime}\right)$ is a henselian pair by Lemma 15.8.9. We conclude that $B_{1}^{\prime}=B_{g}$ is finite étale over $A$ and the proof is done.

0A02 Lemma 15.8.13. The inclusion functor

$$
\text { category of henselian pairs } \longrightarrow \text { category of pairs }
$$

has a left adjoint $(A, I) \mapsto\left(A^{h}, I^{h}\right)$.
Proof. Let $(A, I)$ be a pair. Consider the category $\mathcal{C}$ consisting of étale ring maps $A \rightarrow B$ such that $A / I \rightarrow B / I B$ is an isomorphism. We will show that the category $\mathcal{C}$ is directed and that $A^{h}=\operatorname{colim}_{B \in \mathcal{C}} B$ with ideal $I^{h}=I A^{h}$ gives the desired adjoint.
We first prove that $\mathcal{C}$ is directed (Categories, Definition 4.19.1). It is nonempty because id : $A \rightarrow A$ is an object. If $B$ and $B^{\prime}$ are two objects of $\mathcal{C}$, then $B^{\prime \prime}=$ $B \otimes_{A} B^{\prime}$ is an object of $\mathcal{C}$ (use Algebra, Lemma 10.141.3) and there are morphisms $B \rightarrow B^{\prime \prime}$ and $B^{\prime} \rightarrow B^{\prime \prime}$. Suppose that $f, g: B \rightarrow B^{\prime}$ are two maps between objects of $\mathcal{C}$. Then a coequalizer is $B^{\prime} \otimes_{f, B, g} B^{\prime}$ which is étale over $A$ by Algebra, Lemmas 10.141 .3 and 10.141.9. Thus the category $\mathcal{C}$ is directed.

Since $B / I B=A / I$ for all objects $B$ of $\mathcal{C}$ we see that $A^{h} / I^{h}=A^{h} / I A^{h}=$ $\operatorname{colim} B / I B=\operatorname{colim} A / I=A / I$.
Next, we show that $A^{h}=\operatorname{colim}_{B \in \mathcal{C}} B$ with $I^{h}=I A^{h}$ is a henselian pair. To do this we will verify condition (2) of Lemma 15.8.7. Namely, suppose given an étale ring map $A^{h} \rightarrow A^{\prime}$ and and $A^{h}$-algebra map $\sigma: A^{\prime} \rightarrow A^{h} / I^{h}$. Then there exists a $B \in \mathcal{C}$ and an étale ring map $B \rightarrow B^{\prime}$ such that $A^{\prime}=B^{\prime} \otimes_{B} A^{h}$. See Algebra, Lemma 10.141.3. Since $A^{h} / I^{h}=A / I B$, the map $\sigma$ induces an $A$-algebra map $s: B^{\prime} \rightarrow A / I$. Then $B^{\prime} / I B^{\prime}=A / I \times C$ as $A / I$-algebra, where $C$ is the kernel of the map $B^{\prime} / I B^{\prime} \rightarrow A / I$ induced by $s$. Let $g \in B^{\prime}$ map to $(1,0) \in A / I \times C$. Then $B \rightarrow B_{g}^{\prime}$ is étale and $A / I \rightarrow B_{g}^{\prime} / I B_{g}^{\prime}$ is an isomorphism, i.e., $B_{g}^{\prime}$ is an object of $\mathcal{C}$. Thus we obtain a canonical map $B_{g}^{\prime} \rightarrow A^{h}$ such that

and

commute. This induces a map $A^{\prime}=B^{\prime} \otimes_{B} A^{h} \rightarrow A^{h}$ compatible with $\sigma$ as desired. Let $(A, I) \rightarrow\left(A^{\prime}, I^{\prime}\right)$ be a morphism of pairs with $\left(A^{\prime}, I^{\prime}\right)$ henselian. We will show there is a unique factorization $A \rightarrow A^{h} \rightarrow A^{\prime}$ which will finish the proof. Namely, for each $A \rightarrow B$ in $\mathcal{C}$ the ring map $A^{\prime} \rightarrow B^{\prime}=A^{\prime} \otimes_{A} B$ is étale and induces an
isomorphism $A^{\prime} / I^{\prime} \rightarrow B^{\prime} / I^{\prime} B^{\prime}$. Hence there is a section $\sigma_{B}: B^{\prime} \rightarrow A^{\prime}$ by Lemma 15.8.7. Given a morphism $B_{1} \rightarrow B_{2}$ in $\mathcal{C}$ we claim the diagram

commutes. This follows once we prove that for every $B$ in $\mathcal{C}$ the section $\sigma_{B}$ is the unique $A^{\prime}$-algebra map $B^{\prime} \rightarrow A^{\prime}$. We have $B^{\prime} \otimes_{A^{\prime}} B^{\prime}=B^{\prime} \times R$ for some ring $R$, see Algebra, Lemma 10.147.4. In our case $R / I^{\prime} R=0$ as $B^{\prime} / I^{\prime} B^{\prime}=A^{\prime} / I^{\prime}$. Thus given two $A^{\prime}$-algebra maps $\sigma_{B}, \sigma_{B}^{\prime}: B^{\prime} \rightarrow A^{\prime}$ then $e=\left(\sigma_{B} \otimes \sigma_{B}^{\prime}\right)(0,1) \in A^{\prime}$ is an idempotent contained in $I^{\prime}$. We conclude that $e=0$ by Lemma 15.8.4. Hence $\sigma_{B}=\sigma_{B}^{\prime}$ as desired. Using the commutativity we obtain

$$
A^{h}=\operatorname{colim}_{B \in \mathcal{C}} B \rightarrow \operatorname{colim}_{B \in \mathcal{C}} A^{\prime} \otimes_{A} B \xrightarrow{\operatorname{colim} \sigma_{B}} A^{\prime}
$$

as desired. The uniqueness of the maps $\sigma_{B}$ also guarantees that this map is unique. Hence $(A, I) \mapsto\left(A^{h}, I^{h}\right)$ is the desired adjoint.

0 L 03 Lemma 15.8.14. The functor of Lemma 15.8 .13 associates to a local ring $(A, \mathfrak{m})$ its henselization.

Proof. First proof: in the proof of Algebra, Lemma 10.148 .16 it is shown that the henselization of $A$ is given by the the colimit used to construct $A^{h}$ in Lemma 15.8.13. Second proof: Both the henselization $S$ and the ring $A^{h}$ of Lemma 15.8.13 are filtered colimits of étale $A$-algebras, henselian, and have residue fields equal to $\kappa(\mathfrak{m})$. Hence they are canonically isomorphic by Algebra, Lemma 10.148.15.
0AGU Lemma 15.8.15. Let $(A, I)$ be a pair. Let $\left(A^{h}, I^{h}\right)$ be as in Lemma 15.8.13. Then $A \rightarrow A^{h}$ is flat, $I^{h}=I A^{h}$ and $A / I^{n} \rightarrow A^{h} / I^{n} A^{h}$ is an isomorphism for all $n$.
Proof. In the proof of Lemma 15.8 .13 we have seen that $A^{h}$ is a filtered colimit of étale $A$-algebras $B$ such that $A / I \rightarrow B / I B$ is an isomorphism and we have seen that $I^{h}=I A^{h}$. As an étale ring map is flat (Algebra, Lemma 10.141.3) we conclude that $A \rightarrow A^{h}$ is flat by Algebra, Lemma 10.38.3. Since each $A \rightarrow B$ is flat we find that the maps $A / I^{n} \rightarrow B / I^{n} B$ are isomorphisms as well (for example by Algebra, Lemma 10.100.3). Taking the colimit we find that $A / I^{n}=A^{h} / I^{n} A^{h}$ as desired.

0AGV Lemma 15.8.16. Let $(A, I)$ be a pair with $A$ Noetherian. Let $\left(A^{h}, I^{h}\right)$ be as in Lemma 15.8.13. Then the map of I-adic completions

$$
A^{\wedge} \rightarrow\left(A^{h}\right)^{\wedge}
$$

is an isomorphism. Moreover, $A^{h}$ is Noetherian, the maps $A \rightarrow A^{h} \rightarrow A^{\wedge}$ are flat, and $A^{h} \rightarrow A^{\wedge}$ is faithfully flat.

Proof. The first statement is an immediate consequence of Lemma 15.8.15 and in fact holds without assuming $A$ is Noetherian. In the proof of Lemma 15.8.13 we have seen that $A^{h}$ is a filtered colimit of étale $A$-algebras $B$ such that $A / I \rightarrow B / I B$ is an isomorphism. For each such $A \rightarrow B$ the induced map $A^{\wedge} \rightarrow B^{\wedge}$ is an isomorphism (see proof of Lemma 15.8.15). By Algebra, Lemma 10.96.2 the ring map $B \rightarrow A^{\wedge}=B^{\wedge}=\left(A^{h}\right)^{\wedge}$ is flat for each $B$. Thus $A^{h} \rightarrow A^{\wedge}=\left(A^{h}\right)^{\wedge}$ is flat by Algebra, Lemma 10.38.6. Since $I^{h}=I A^{h}$ is contained in the radical ideal of $A^{h}$ and since $A^{h} \rightarrow A^{\wedge}$ induces an isomorphism $A^{h} / I^{h} \rightarrow A / I$ we see that $A^{h} \rightarrow A^{\wedge}$
is faithfully flat by Algebra, Lemma 10.38.15. By Algebra, Lemma 10.96.6 the ring $A^{\wedge}$ is Noetherian. Hence we conclude that $A^{h}$ is Noetherian by Algebra, Lemma 10.156.1.

0A04 Lemma 15.8.17. Let $(A, I)=\operatorname{colim}\left(A_{i}, I_{i}\right)$ be a colimit of pairs. The functor of Lemma 15.8.13 gives $A^{h}=\operatorname{colim} A_{i}^{h}$ and $I^{h}=\operatorname{colim} I_{i}^{h}$.
Proof. This is true for any left adjoint, see Categories, Lemma 4.24.4.

### 15.9. Auto-associated rings

05GL Some of this material is in Laz69.
05GM Definition 15.9.1. A ring $R$ is said to be auto-associated if $R$ is local and its maximal ideal $\mathfrak{m}$ is weakly associated to $R$.
05GN Lemma 15.9.2. An auto-associated ring $R$ has the following property: $(P)$ Every proper finitely generated ideal $I \subset R$ has a nonzero annihilator.
Proof. By assumption there exists a nonzero element $x \in R$ such that for every $f \in \mathfrak{m}$ we have $f^{n} x=0$. Say $I=\left(f_{1}, \ldots, f_{r}\right)$. Then $x$ is in the kernel of $R \rightarrow \bigoplus R_{f_{i}}$. Hence we see that there exists a nonzero $y \in R$ such that $f_{i} y=0$ for all $i$, see Algebra, Lemma 10.22.4. As $y \in \operatorname{Ann}_{R}(I)$ we win.

05GP Lemma 15.9.3. Let $R$ be a ring having property ( $P$ ) of Lemma 15.9.2. Let $u: N \rightarrow M$ be a homomorphism of projective $R$-modules. Then $u$ is universally injective if and only if $u$ is injective.

Proof. Assume $u$ is injective. Our goal is to show $u$ is universally injective. First we choose a module $Q$ such that $N \oplus Q$ is free. On considering the map $N \oplus Q \rightarrow M \oplus Q$ we see that it suffices to prove the lemma in case $N$ is free. In this case $N$ is a directed colimit of finite free $R$-modules. Thus we reduce to the case that $N$ is a finite free $R$-module, say $N=R^{\oplus n}$. We prove the lemma by induction on $n$. The case $n=0$ is trivial.

Let $u: R^{\oplus n} \rightarrow M$ be an injective module map with $M$ projective. Choose an $R$-module $Q$ such that $M \oplus Q$ is free. After replacing $u$ by the composition $R^{\oplus n} \rightarrow M \rightarrow M \oplus Q$ we see that we may assume that $M$ is free. Then we can find a direct summand $R^{\oplus m} \subset M$ such that $u\left(R^{\oplus n}\right) \subset R^{\oplus m}$. Hence we may assume that $M=R^{\oplus m}$. In this case $u$ is given by a matrix $A=\left(a_{i j}\right)$ so that $u\left(x_{1}, \ldots, x_{n}\right)=\left(\sum x_{i} a_{i 1}, \ldots, \sum x_{i} a_{i m}\right)$. As $u$ is injective, in particular $u(x, 0, \ldots, 0)=\left(x a_{11}, x a_{12}, \ldots, x a_{1 m}\right) \neq 0$ if $x \neq 0$, and as $R$ has property ( P ) we see that $a_{11} R+a_{12} R+\ldots+a_{1 m} R=R$. Hence see that $R\left(a_{11}, \ldots, a_{1 m}\right) \subset R^{\oplus m}$ is a direct summand of $R^{\oplus m}$, in particular $R^{\oplus m} / R\left(a_{11}, \ldots, a_{1 m}\right)$ is a projective $R$-module. We get a commutative diagram

with split exact rows. Thus the right vertical arrow is injective and we may apply the induction hypothesis to conclude that the right vertical arrow is universally injective. It follows that the middle vertical arrow is universally injective.

05GQ Lemma 15.9.4. Let $R$ be a ring. The following are equivalent
(1) $R$ has property $(P)$ of Lemma 15.9.2.
(2) any injective map of projective $R$-modules is universally injective,
(3) if $u: N \rightarrow M$ is injective and $N, M$ are finite projective $R$-modules then $\operatorname{Coker}(u)$ is a finite projective $R$-module,
(4) if $N \subset M$ and $N, M$ are finite projective as $R$-modules, then $N$ is a direct summand of $M$, and
(5) any injective map $R \rightarrow R^{\oplus n}$ is a split injection.

Proof. The implication $(1) \Rightarrow(2)$ is Lemma 15.9.3. It is clear that (3) and (4) are equivalent. We have $(2) \Rightarrow(3)$, (4) by Algebra, Lemma 10.81.4. Part (5) is a special case of (4). Assume (5). Let $I=\left(a_{1}, \ldots, a_{n}\right)$ be a proper finitely generated ideal of $R$. As $I \neq R$ we see that $R \rightarrow R^{\oplus n}, x \mapsto\left(x a_{1}, \ldots, x a_{n}\right)$ is not a split injection. Hence it has a nonzero kernel and we conclude that $\operatorname{Ann}_{R}(I) \neq 0$. Thus (1) holds.

05GR Example 15.9.5. If the equivalent conditions of Lemma 15.9.4 hold, then it is not always the case that every injective map of free $R$-modules is a split injection. For example suppose that $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right] /\left(x_{i}^{2}\right)$. This is an auto-associated ring. Consider the map of free $R$-modules

$$
u: \bigoplus_{i \geq 1} R e_{i} \longrightarrow \bigoplus_{i \geq 1} R f_{i}, \quad e_{i} \longmapsto f_{i}-x_{i} f_{i+1}
$$

For any integer $n$ the restriction of $u$ to $\bigoplus_{i=1, \ldots, n} R e_{i}$ is injective as the images $u\left(e_{1}\right), \ldots, u\left(e_{n}\right)$ are $R$-linearly independent. Hence $u$ is injective and hence universally injective by the lemma. Since $u \otimes \mathrm{id}_{k}$ is bijective we see that if $u$ were a split injection then $u$ would be surjective. But $u$ is not surjective because the inverse image of $f_{1}$ would be the element

$$
\sum_{i \geq 0} x_{1} \ldots x_{i} e_{i+1}=e_{1}+x_{1} e_{2}+x_{1} x_{2} e_{3}+\ldots
$$

which is not an element of the direct sum. A side remark is that $\operatorname{Coker}(u)$ is a flat (because $u$ is universally injective), countably generated $R$-module which is not projective (as $u$ is not split), hence not Mittag-Leffler (see Algebra, Lemma 10.92.1).

### 15.10. Flattening stratification

0521 Let $R \rightarrow S$ be a ring map and let $N$ be an $S$-module. For any $R$-algebra $R^{\prime}$ we can consider the base changes $S^{\prime}=S \otimes_{R} R^{\prime}$ and $M^{\prime}=M \otimes_{R} R^{\prime}$. We say $R \rightarrow R^{\prime}$ flattens $M$ if the module $M^{\prime}$ is flat over $R^{\prime}$. We would like to understand the structure of the collection of ring maps $R \rightarrow R^{\prime}$ which flatten $M$. In particular we would like to know if there exists a universal flattening $R \rightarrow R_{\text {univ }}$ of $M$, i.e., a ring map $R \rightarrow R_{\text {univ }}$ which flattens $M$ and has the property that any ring map $R \rightarrow R^{\prime}$ which flattens $M$ factors through $R \rightarrow R_{\text {univ }}$. It turns out that such a universal solution usually does not exist.

We will discuss universal flattenings and flattening stratifications in a scheme theoretic setting $\mathcal{F} / X / S$ in More on Flatness, Section 37.21. If the universal flattening $R \rightarrow R_{\text {univ }}$ exists then the morphism of $\operatorname{schemes} \operatorname{Spec}\left(R_{\text {univ }}\right) \rightarrow \operatorname{Spec}(R)$ is the universal flattening of the quasi-coherent module $\widetilde{M}$ on $\operatorname{Spec}(S)$.

In this and the next few sections we prove some basic algebra facts related to this. The most basic result is perhaps the following.

0522 Lemma 15.10.1. Let $R$ be a ring. Let $M$ be an $R$-module. Let $I_{1}$, $I_{2}$ be ideals of $R$. If $M / I_{1} M$ is flat over $R / I_{1}$ and $M / I_{2} M$ is flat over $R / I_{2}$, then $M /\left(I_{1} \cap I_{2}\right) M$ is flat over $R /\left(I_{1} \cap I_{2}\right)$.

Proof. By replacing $R$ with $R /\left(I_{1} \cap I_{2}\right)$ and $M$ by $M /\left(I_{1} \cap I_{2}\right) M$ we may assume that $I_{1} \cap I_{2}=0$. Let $J \subset R$ be an ideal. To prove that $M$ is flat over $R$ we have to show that $J \otimes_{R} M \rightarrow M$ is injective, see Algebra, Lemma 10.38.5. By flatness of $M / I_{1} M$ over $R / I_{1}$ the map

$$
J /\left(J \cap I_{1}\right) \otimes_{R} M=\left(J+I_{1}\right) / I_{1} \otimes_{R / I_{1}} M / I_{1} M \longrightarrow M / I_{1} M
$$

is injective. As $0 \rightarrow\left(J \cap I_{1}\right) \rightarrow J \rightarrow J /\left(J \cap I_{1}\right) \rightarrow 0$ is exact we obtain a diagram

hence it suffices to show that $\left(J \cap I_{1}\right) \otimes_{R} M \rightarrow M$ is injective. Since $I_{1} \cap I_{2}=$ 0 the ideal $J \cap I_{1}$ maps isomorphically to an ideal $J^{\prime} \subset R / I_{2}$ and we see that $\left(J \cap I_{1}\right) \otimes_{R} M=J^{\prime} \otimes_{R / I_{2}} M / I_{2} M$. By flatness of $M / I_{2} M$ over $R / I_{2}$ the map $J^{\prime} \otimes_{R / I_{2}} M / I_{2} M \rightarrow M / I_{2} M$ is injective, which clearly implies that $\left(J \cap I_{1}\right) \otimes_{R} M \rightarrow$ $M$ is injective.

### 15.11. Flattening over an Artinian ring

05LJ A universal flattening exists when the base ring is an Artinian local ring. It exists for an arbitrary module. Hence, as we will see later, a flatting stratification exists when the base scheme is the spectrum of an Artinian local ring.

0524 Lemma 15.11.1. Let $R$ be an Artinian ring. Let $M$ be an $R$-module. Then there exists a smallest ideal $I \subset R$ such that $M / I M$ is flat over $R / I$.

Proof. This follows directly from Lemma 15.10.1 and the Artinian property.

This ideal has the following universal property.
0525 Lemma 15.11.2. Let $R$ be an Artinian ring. Let $M$ be an $R$-module. Let $I \subset R$ be the smallest ideal $I \subset R$ such that $M / I M$ is flat over $R / I$. Then $I$ has the following universal property: For every ring map $\varphi: R \rightarrow R^{\prime}$ we have

$$
R^{\prime} \otimes_{R} M \text { is flat over } R^{\prime} \Leftrightarrow \text { we have } \varphi(I)=0 \text {. }
$$

Proof. Note that $I$ exists by Lemma 15.11.1. The implication $\Rightarrow$ follows from Algebra, Lemma 10.38.7. Let $\varphi: R \rightarrow \overline{R^{\prime}}$ be such that $M \otimes_{R} R^{\prime}$ is flat over $R^{\prime}$. Let $J=\operatorname{Ker}(\varphi)$. By Algebra, Lemma 10.100.7 and as $R^{\prime} \otimes_{R} M=R^{\prime} \otimes_{R / J} M / J M$ is flat over $R^{\prime}$ we conclude that $M / J M$ is flat over $R / J$. Hence $I \subset J$ as desired.

### 15.12. Flattening over a closed subset of the base

05LK Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let $M$ be an $S$-module. In the following we will consider the following condition
052W (15.12.0.1)

$$
\forall \mathfrak{q} \in V(I S) \subset \operatorname{Spec}(S): M_{\mathfrak{q}} \text { is flat over } R
$$

Geometrically, this means that $M$ is flat over $R$ along the inverse image of $V(I)$ in $\operatorname{Spec}(S)$. If $R$ and $S$ are Noetherian rings and $M$ is a finite $S$-module, then 15.12.0.1 is equivalent to the condition that $M / I^{n} M$ is flat over $R / I^{n}$ for all $n \geq 1$, see Algebra, Lemma 10.98.11.
052X Lemma 15.12.1. Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let $M$ be an $S$-module. Let $R \rightarrow R^{\prime}$ be a ring map and $I R^{\prime} \subset I^{\prime} \subset R^{\prime}$ an ideal. If 15.12.0.1) holds for $(R \rightarrow S, I, M)$, then (15.12.0.1) holds for $\left(R^{\prime} \rightarrow S \otimes_{R} R^{\prime}, I^{\prime}, M \otimes_{R} R^{\prime}\right)$.

Proof. Assume (15.12.0.1) holds for $(R \rightarrow S, I \subset R, M)$. Let $I^{\prime}\left(S \otimes_{R} R^{\prime}\right) \subset \mathfrak{q}^{\prime}$ be a prime of $S \otimes_{R} R^{\prime}$. Let $\mathfrak{q} \subset S$ be the corresponding prime of $S$. Then $I S \subset \mathfrak{q}$. Note that $\left(M \otimes_{R} R^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is a localization of the base change $M_{\mathfrak{q}} \otimes_{R} R^{\prime}$. Hence $\left(M \otimes_{R} R^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is flat over $R^{\prime}$ as a localization of a flat module, see Algebra, Lemmas 10.38 .7 and 10.38.19.

05LL Lemma 15.12.2. Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let $M$ be an $S$-module. Let $R \rightarrow R^{\prime}$ be a ring map and $I R^{\prime} \subset I^{\prime} \subset R^{\prime}$ an ideal such that
(1) the map $V\left(I^{\prime}\right) \rightarrow V(I)$ induced by $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow \operatorname{Spec}(R)$ is surjective, and
(2) $R_{\mathfrak{p}^{\prime}}^{\prime}$ is flat over $R$ for all primes $\mathfrak{p}^{\prime} \in V\left(I^{\prime}\right)$.

If 15.12.0.1) holds for $\left(R^{\prime} \rightarrow S \otimes_{R} R^{\prime}, I^{\prime}, M \otimes_{R} R^{\prime}\right)$, then 15.12.0.1) holds for $(R \rightarrow S, I, M)$.

Proof. Assume 15.12 .0 .1 holds for $\left(R^{\prime} \rightarrow S \otimes_{R} R^{\prime}, I R^{\prime}, M \otimes_{R} R^{\prime}\right)$. Pick a prime $I S \subset \mathfrak{q} \subset S$. Let $\bar{I} \subset \mathfrak{p} \subset R$ be the corresponding prime of $R$. By assumption there exists a prime $\mathfrak{p}^{\prime} \in V\left(I^{\prime}\right)$ of $R^{\prime}$ lying over $\mathfrak{p}$ and $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}^{\prime}}^{\prime}$ is flat. Choose a prime $\overline{\mathfrak{q}}^{\prime} \subset \kappa(\mathfrak{q}) \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{p}^{\prime}\right)$ which corresponds to a prime $\mathfrak{q}^{\prime} \subset S \otimes_{R} R^{\prime}$ which lies over $\mathfrak{q}$ and over $\mathfrak{p}^{\prime}$. Note that $\left(S \otimes_{R} R^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is a localization of $S_{\mathfrak{q}} \otimes_{R_{\mathfrak{p}}} R_{\mathfrak{p}^{\prime}}^{\prime}$. By assumption the module $\left(M \otimes_{R} R^{\prime}\right)_{\mathfrak{q}^{\prime}}$ is flat over $R_{\mathfrak{p}^{\prime}}^{\prime}$. Hence Algebra, Lemma 10.99.1 implies that $M_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ which is what we wanted to prove.

05LM Lemma 15.12.3. Let $R \rightarrow S$ be a ring map of finite presentation. Let $M$ be an $S$-module of finite presentation. Let $R^{\prime}=\operatorname{colim}_{\lambda \in \Lambda} R_{\lambda}$ be a directed colimit of $R$-algebras. Let $I_{\lambda} \subset R_{\lambda}$ be ideals such that $I_{\lambda} R_{\mu} \subset I_{\mu}$ for all $\mu \geq \lambda$ and set $I^{\prime}=\operatorname{colim}_{\lambda} I_{\lambda}$. If 15.12.0.1) holds for $\left(R^{\prime} \rightarrow S \otimes_{R} R^{\prime}, I^{\prime}, M \otimes_{R} R^{\prime}\right)$, then there exists a $\lambda \in \Lambda$ such that (15.12.0.1) holds for $\left(R_{\lambda} \rightarrow S \otimes_{R} R_{\lambda}, I_{\lambda}, M \otimes_{R} R_{\lambda}\right)$.
Proof. We are going to write $S_{\lambda}=S \otimes_{R} R_{\lambda}, S^{\prime}=S \otimes_{R} R^{\prime}, M_{\lambda}=M \otimes_{R} R_{\lambda}$, and $M^{\prime}=M \otimes_{R} R^{\prime}$. The base change $S^{\prime}$ is of finite presentation over $R^{\prime}$ and $M^{\prime}$ is of finite presentation over $S^{\prime}$ and similarly for the versions with subscript $\lambda$, see Algebra, Lemma 10.13.2. By Algebra, Theorem 10.128.4 the set

$$
U^{\prime}=\left\{\mathfrak{q}^{\prime} \in \operatorname{Spec}\left(S^{\prime}\right) \mid M_{\mathfrak{q}^{\prime}}^{\prime} \text { is flat over } R^{\prime}\right\}
$$

is open in $\operatorname{Spec}\left(S^{\prime}\right)$. Note that $V\left(I^{\prime} S^{\prime}\right)$ is a quasi-compact space which is contained in $U^{\prime}$ by assumption. Hence there exist finitely many $g_{j}^{\prime} \in S^{\prime}, j=1, \ldots, m$ such that $D\left(g_{j}^{\prime}\right) \subset U^{\prime}$ and such that $V\left(I^{\prime} S^{\prime}\right) \subset \bigcup D\left(g_{j}^{\prime}\right)$. Note that in particular $\left(M^{\prime}\right)_{g_{j}^{\prime}}$ is a flat module over $R^{\prime}$.

We are going to pick increasingly large elements $\lambda \in \Lambda$. First we pick it large enough so that we can find $g_{j, \lambda} \in S_{\lambda}$ mapping to $g_{j}^{\prime}$. The inclusion $V\left(I^{\prime} S^{\prime}\right) \subset \bigcup D\left(g_{j}^{\prime}\right)$ means that $I^{\prime} S^{\prime}+\left(g_{1}^{\prime}, \ldots, g_{m}^{\prime}\right)=S^{\prime}$ which can be expressed as $1=\sum z_{s} h_{s}+\sum f_{j} g_{j}^{\prime}$ for some $z_{s} \in I^{\prime}, h_{s}, f_{j} \in S^{\prime}$. After increasing $\lambda$ we may assume such an equation holds in $S_{\lambda}$. Hence we may assume that $V\left(I_{\lambda} S_{\lambda}\right) \subset \bigcup D\left(g_{j, \lambda}\right)$. By Algebra, Lemma 10.160.1 we see that for some sufficiently large $\lambda$ the modules $\left(M_{\lambda}\right)_{g_{j, \lambda}}$ are flat over $R_{\lambda}$. In particular the module $M_{\lambda}$ is flat over $R_{\lambda}$ at all the primes lying over the ideal $I_{\lambda}$.

### 15.13. Flattening over a closed subsets of source and base

05 LN In this section we slightly generalize the discussion in Section 15.12 . We strongly suggest the reader first read and understand that section.

05LP Situation 15.13.1. Let $R \rightarrow S$ be a ring map. Let $J \subset S$ be an ideal. Let $M$ be an $S$-module.

In this situation, given an $R$-algebra $R^{\prime}$ and an ideal $I^{\prime} \subset R^{\prime}$ we set $S^{\prime}=S \otimes_{R} R^{\prime}$ and $M^{\prime}=M \otimes_{R} R^{\prime}$. We will consider the condition
$05 \mathrm{LQ} \quad(15.13 .1 .1) \quad \forall \mathfrak{q}^{\prime} \in V\left(I^{\prime} S^{\prime}+J S^{\prime}\right) \subset \operatorname{Spec}\left(S^{\prime}\right): M_{\mathfrak{q}^{\prime}}^{\prime}$ is flat over $R^{\prime}$.
Geometrically, this means that $M^{\prime}$ is flat over $R^{\prime}$ along the intersection of the inverse image of $V\left(I^{\prime}\right)$ with the inverse image of $V(J)$. Since $(R \rightarrow S, J, M)$ are fixed, condition 15.13.1.1 only depends on the pair $\left(R^{\prime}, I^{\prime}\right)$ where $R^{\prime}$ is viewed as an $R$-algebra.
05LR Lemma 15.13.2. In Situation 15.13 .1 let $R^{\prime} \rightarrow R^{\prime \prime}$ be an $R$-algebra map. Let $I^{\prime} \subset R^{\prime}$ and $I^{\prime} R^{\prime \prime} \subset I^{\prime \prime} \subset R^{\prime \prime}$ be ideals. If 15.13.1.1) holds for $\left(R^{\prime}, I^{\prime}\right)$, then 15.13.1.1) holds for $\left(R^{\prime \prime}, I^{\prime \prime}\right)$.

Proof. Assume 15.13.1.1) holds for $\left(R^{\prime}, I^{\prime}\right)$. Let $I^{\prime \prime} S^{\prime \prime}+J S^{\prime \prime} \subset \mathfrak{q}^{\prime \prime}$ be a prime of $S^{\prime \prime}$. Let $\mathfrak{q}^{\prime} \subset S^{\prime}$ be the corresponding prime of $S^{\prime}$. Then both $I^{\prime} S^{\prime} \subset \mathfrak{q}^{\prime}$ and $J S^{\prime} \subset \mathfrak{q}^{\prime}$ because the corresponding conditions hold for $\mathfrak{q}^{\prime \prime}$. Note that $\left(M^{\prime \prime}\right)_{\mathfrak{q}^{\prime \prime}}$ is a localization of the base change $M_{\mathfrak{q}^{\prime}}^{\prime} \otimes_{R} R^{\prime \prime}$. Hence $\left(M^{\prime \prime}\right)_{\mathfrak{q}^{\prime \prime}}$ is flat over $R^{\prime \prime}$ as a localization of a flat module, see Algebra, Lemmas 10.38 .7 and 10.38 .19 .

05LS Lemma 15.13.3. In Situation 15.13 .1 let $R^{\prime} \rightarrow R^{\prime \prime}$ be an $R$-algebra map. Let $I^{\prime} \subset R^{\prime}$ and $I^{\prime} R^{\prime \prime} \subset I^{\prime \prime} \subset R^{\prime \prime}$ be ideals. Assume
(1) the map $V\left(I^{\prime \prime}\right) \rightarrow V\left(I^{\prime}\right)$ induced by $\operatorname{Spec}\left(R^{\prime \prime}\right) \rightarrow \operatorname{Spec}\left(R^{\prime}\right)$ is surjective, and
(2) $R_{\mathfrak{p}^{\prime \prime}}^{\prime \prime}$ is flat over $R^{\prime}$ for all primes $\mathfrak{p}^{\prime \prime} \in V\left(I^{\prime \prime}\right)$. If (15.13.1.1) holds for $\left(R^{\prime \prime}, I^{\prime \prime}\right)$, then 15.13.1.1) holds for $\left(R^{\prime}, I^{\prime}\right)$.
Proof. Assume 15.13.1.1 holds for $\left(R^{\prime \prime}, I^{\prime \prime}\right)$. Pick a prime $I^{\prime} S^{\prime}+J S^{\prime} \subset \mathfrak{q}^{\prime} \subset S^{\prime}$. Let $I^{\prime} \subset \mathfrak{p}^{\prime} \subset R^{\prime}$ be the corresponding prime of $R^{\prime}$. By assumption there exists a prime $\mathfrak{p}^{\prime \prime} \in V\left(I^{\prime \prime}\right)$ of $R^{\prime \prime}$ lying over $\mathfrak{p}^{\prime}$ and $R_{\mathfrak{p}^{\prime}}^{\prime} \rightarrow R_{\mathfrak{p}^{\prime \prime}}^{\prime \prime}$ is flat. Choose a prime $\overline{\mathfrak{q}}^{\prime \prime} \subset \kappa\left(\mathfrak{q}^{\prime}\right) \otimes_{\kappa\left(\mathfrak{p}^{\prime}\right)} \kappa\left(\mathfrak{p}^{\prime \prime}\right)$. This corresponds to a prime $\mathfrak{q}^{\prime \prime} \subset S^{\prime \prime}=S^{\prime} \otimes_{R^{\prime}} R^{\prime \prime}$ which lies over $\mathfrak{q}^{\prime}$ and over $\mathfrak{p}^{\prime \prime}$. In particular we see that $I^{\prime \prime} S^{\prime \prime} \subset \mathfrak{q}^{\prime \prime}$ and that $J S^{\prime \prime} \subset \mathfrak{q}^{\prime \prime}$. Note that $\left(S^{\prime} \otimes_{R^{\prime}} R^{\prime \prime}\right)_{\mathfrak{q}^{\prime \prime}}$ is a localization of $S_{\mathfrak{q}^{\prime}}^{\prime} \otimes_{R_{\mathfrak{p}^{\prime}}^{\prime}} R_{\mathfrak{p}^{\prime \prime}}^{\prime \prime}$. By assumption the module $\left(M^{\prime} \otimes_{R^{\prime}} R^{\prime \prime}\right)_{\mathfrak{q}^{\prime \prime}}$ is flat over $R_{\mathfrak{p}^{\prime \prime}}^{\prime \prime}$. Hence Algebra, Lemma 10.99 .1 implies that $M_{\mathfrak{q}^{\prime}}^{\prime}$ is flat over $R_{\mathfrak{p}^{\prime}}^{\prime}$ which is what we wanted to prove.

05LT Lemma 15.13.4. In Situation 15.13 .1 assume $R \rightarrow S$ is essentially of finite presentation and $M$ is an $S$-module of finite presentation. Let $R^{\prime}=\operatorname{colim}_{\lambda \in \Lambda} R_{\lambda}$ be a directed colimit of $R$-algebras. Let $I_{\lambda} \subset R_{\lambda}$ be ideals such that $I_{\lambda} R_{\mu} \subset I_{\mu}$ for all $\mu \geq \lambda$ and set $I^{\prime}=\operatorname{colim}_{\lambda} I_{\lambda}$. If (15.13.1.1) holds for $\left(R^{\prime}, I^{\prime}\right)$, then there exists $a \lambda \in \Lambda$ such that (15.13.1.1) holds for $\left(R_{\lambda}, I_{\lambda}\right)$.
Proof. We first prove the lemma in case $R \rightarrow S$ is of finite presentation and then we explain what needs to be changed in the general case. We are going to write $S_{\lambda}=S \otimes_{R} R_{\lambda}, S^{\prime}=S \otimes_{R} R^{\prime}, M_{\lambda}=M \otimes_{R} R_{\lambda}$, and $M^{\prime}=M \otimes_{R} R^{\prime}$. The base change $S^{\prime}$ is of finite presentation over $R^{\prime}$ and $M^{\prime}$ is of finite presentation over $S^{\prime}$ and similarly for the versions with subscript $\lambda$, see Algebra, Lemma 10.13.2. By Algebra, Theorem 10.128.4 the set

$$
U^{\prime}=\left\{\mathfrak{q}^{\prime} \in \operatorname{Spec}\left(S^{\prime}\right) \mid M_{\mathfrak{q}^{\prime}}^{\prime} \text { is flat over } R^{\prime}\right\}
$$

is open in $\operatorname{Spec}\left(S^{\prime}\right)$. Note that $V\left(I^{\prime} S^{\prime}+J S^{\prime}\right)$ is a quasi-compact space which is contained in $U^{\prime}$ by assumption. Hence there exist finitely many $g_{j}^{\prime} \in S^{\prime}, j=$ $1, \ldots, m$ such that $D\left(g_{j}^{\prime}\right) \subset U^{\prime}$ and such that $V\left(I^{\prime} S^{\prime}+J S^{\prime}\right) \subset \bigcup D\left(g_{j}^{\prime}\right)$. Note that in particular $\left(M^{\prime}\right)_{g_{j}^{\prime}}$ is a flat module over $R^{\prime}$.
We are going to pick increasingly large elements $\lambda \in \Lambda$. First we pick it large enough so that we can find $g_{j, \lambda} \in S_{\lambda}$ mapping to $g_{j}^{\prime}$. The inclusion $V\left(I^{\prime} S^{\prime}+J S^{\prime}\right) \subset \bigcup D\left(g_{j}^{\prime}\right)$ means that $I^{\prime} S^{\prime}+J S^{\prime}+\left(g_{1}^{\prime}, \ldots, g_{m}^{\prime}\right)=S^{\prime}$ which can be expressed as

$$
1=\sum y_{t} k_{t}+\sum z_{s} h_{s}+\sum f_{j} g_{j}^{\prime}
$$

for some $z_{s} \in I^{\prime}, y_{t} \in J, k_{t}, h_{s}, f_{j} \in S^{\prime}$. After increasing $\lambda$ we may assume such an equation holds in $S_{\lambda}$. Hence we may assume that $V\left(I_{\lambda} S_{\lambda}+J S_{\lambda}\right) \subset \bigcup D\left(g_{j, \lambda}\right)$. By Algebra, Lemma 10.160.1 we see that for some sufficiently large $\lambda$ the modules $\left(M_{\lambda}\right)_{g_{j, \lambda}}$ are flat over $R_{\lambda}$. In particular the module $M_{\lambda}$ is flat over $R_{\lambda}$ at all the primes corresponding to points of $V\left(I_{\lambda} S_{\lambda}+J S_{\lambda}\right)$.
In the case that $S$ is essentially of finite presentation, we can write $S=\Sigma^{-1} C$ where $R \rightarrow C$ is of finite presentation and $\Sigma \subset C$ is a multiplicative subset. We can also write $M=\Sigma^{-1} N$ for some finitely presented $C$-module $N$, see Algebra, Lemma 10.125.3. At this point we introduce $C_{\lambda}, C^{\prime}, N_{\lambda}, N^{\prime}$. Then in the discussion above we obtain an open $U^{\prime} \subset \operatorname{Spec}\left(C^{\prime}\right)$ over which $N^{\prime}$ is flat over $R^{\prime}$. The assumption that 15.13 .1 .1$)$ is true means that $V\left(I^{\prime} S^{\prime}+J S^{\prime}\right)$ maps into $U^{\prime}$, because for a prime $\mathfrak{q}^{\prime} \subset S^{\prime}$, corresponding to a prime $\mathfrak{r}^{\prime} \subset C^{\prime}$ we have $M_{\mathfrak{q}^{\prime}}^{\prime}=N_{\mathfrak{r}^{\prime}}^{\prime}$. Thus we can find $g_{j}^{\prime} \in C^{\prime}$ such that $\bigcup D\left(g_{j}^{\prime}\right)$ contains the image of $V\left(I^{\prime} S^{\prime}+J S^{\prime}\right)$. The rest of the proof is exactly the same as before.

05LU Lemma 15.13.5. In Situation 15.13.1. Let $I \subset R$ be an ideal. Assume
(1) $R$ is a Noetherian ring,
(2) $S$ is a Noetherian ring,
(3) $M$ is a finite $S$-module, and
(4) for each $n \geq 1$ and any prime $\mathfrak{q} \in V(J+I S)$ the module $\left(M / I^{n} M\right)_{\mathfrak{q}}$ is flat over $R / I^{n}$.
Then 15.13.1.1) holds for $(R, I)$, i.e., for every prime $\mathfrak{q} \in V(J+I S)$ the localization $M_{\mathfrak{q}}$ is flat over $R$.

Proof. Let $\mathfrak{q} \in V(J+I S)$. Then Algebra, Lemma 10.98 .11 applied to $R \rightarrow S_{\mathfrak{q}}$ and $M_{\mathfrak{q}}$ implies that $M_{\mathfrak{q}}$ is flat over $R$.

### 15.14. Flattening over a Noetherian complete local ring

05LV The following three lemmas give a completely algebraic proof of the existence of the "local" flattening stratification when the base is a complete local Noetherian ring $R$ and the given module is finite over a finite type $R$-algebra $S$.

0526 Lemma 15.14.1. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume
(1) $(R, \mathfrak{m})$ is a complete local Noetherian ring,
(2) $S$ is a Noetherian ring, and
(3) $M$ is finite over $S$.

Then there exists an ideal $I \subset \mathfrak{m}$ such that
(1) $(M / I M)_{\mathfrak{q}}$ is flat over $R / I$ for all primes $\mathfrak{q}$ of $S / I S$ lying over $\mathfrak{m}$, and
(2) if $J \subset R$ is an ideal such that $(M / J M)_{\mathfrak{q}}$ is flat over $R / J$ for all primes $\mathfrak{q}$ lying over $\mathfrak{m}$, then $I \subset J$.
In other words, $\frac{I}{R}$ is the smallest ideal of $R$ such that 15.12.0.1) holds for $(\bar{R} \rightarrow$ $\bar{S}, \overline{\mathfrak{m}}, \bar{M})$ where $\bar{R}=R / I, \bar{S}=S / I S, \overline{\mathfrak{m}}=\mathfrak{m} / I$ and $\bar{M}=M / I M$.

Proof. Let $J \subset R$ be an ideal. Apply Algebra, Lemma 10.98 .11 to the module $M / J M$ over the ring $R / J$. Then we see that $(M / J M)_{\mathfrak{q}}$ is flat over $R / J$ for all primes $\mathfrak{q}$ of $S / J S$ if and only if $M /\left(J+\mathfrak{m}^{n}\right) M$ is flat over $R /\left(J+\mathfrak{m}^{n}\right)$ for all $n \geq 1$. We will use this remark below.

For every $n \geq 1$ the local ring $R / \mathfrak{m}^{n}$ is Artinian. Hence, by Lemma 15.11.1 there exists a smallest ideal $I_{n} \supset \mathfrak{m}^{n}$ such that $M / I_{n} M$ is flat over $R / I_{n}$. It is clear that $I_{n+1}+\mathfrak{m}^{n}$ is contains $I_{n}$ and applying Lemma 15.10 .1 we see that $I_{n}=I_{n+1}+\mathfrak{m}^{n}$. Since $R=\lim _{n} R / \mathfrak{m}^{n}$ we see that $I=\lim _{n} I_{n} / \mathfrak{m}^{n}$ is an ideal in $R$ such that $I_{n}=I+\mathfrak{m}^{n}$ for all $n \geq 1$. By the initial remarks of the proof we see that $I$ verifies (1) and (2). Some details omitted.

0527 Lemma 15.14.2. With notation $R \rightarrow S, M$, and $I$ and assumptions as in Lemma 15.14.1. Consider a local homomorphism of local rings $\varphi:(R, \mathfrak{m}) \rightarrow\left(R^{\prime}, \mathfrak{m}^{\prime}\right)$ such that $R^{\prime}$ is Noetherian. Then the following are equivalent
(1) condition 15.12.0.1) holds for $\left(R^{\prime} \rightarrow S \otimes_{R} R^{\prime}, \mathfrak{m}^{\prime}, M \otimes_{R} R^{\prime}\right)$, and
(2) $\varphi(I)=0$.

Proof. The implication $(2) \Rightarrow(1)$ follows from Lemma 15.12.1. Let $\varphi: R \rightarrow R^{\prime}$ be as in the lemma satisfying (1). We have to show that $\varphi(I)=0$. This is equivalent to the condition that $\varphi(I) R^{\prime}=0$. By Artin-Rees in the Noetherian local ring $R^{\prime}$ (see Algebra, Lemma 10.50.4) this is equivalent to the condition that $\varphi(I) R^{\prime}+\left(\mathfrak{m}^{\prime}\right)^{n}=\left(\mathfrak{m}^{\prime}\right)^{n}$ for all $n>0$. Hence this is equivalent to the condition that the composition $\varphi_{n}: R \rightarrow R^{\prime} \rightarrow R^{\prime} /\left(\mathfrak{m}^{\prime}\right)^{n}$ annihilates $I$ for each $n$. Now assumption (1) for $\varphi$ implies assumption (1) for $\varphi_{n}$ by Lemma 15.12.1. This reduces us to the case where $R^{\prime}$ is Artinian local.

Assume $R^{\prime}$ Artinian. Let $J=\operatorname{Ker}(\varphi)$. We have to show that $I \subset J$. By the construction of $I$ in Lemma 15.14.1 it suffices to show that $(M / J M)_{\mathfrak{q}}$ is flat over $R / J$ for every prime $\mathfrak{q}$ of $S / J S$ lying over $\mathfrak{m}$. As $R^{\prime}$ is Artinian, condition (1) signifies that $M \otimes_{R} R^{\prime}$ is flat over $R^{\prime}$. As $R^{\prime}$ is Artinian and $R / J \rightarrow R^{\prime}$ is a local injective ring map, it follows that $R / J$ is Artinian too. Hence the flatness of $M \otimes_{R} R^{\prime}=M / J M \otimes_{R / J} R^{\prime}$ over $R^{\prime}$ implies that $M / J M$ is flat over $R / J$ by Algebra, Lemma 10.100.7. This concludes the proof.

0528 Lemma 15.14.3. With notation $R \rightarrow S, M$, and $I$ and assumptions as in Lemma 15.14.1. In addition assume that $R \rightarrow S$ is of finite type. Then for any local homomorphism of local rings $\varphi:(R, \mathfrak{m}) \rightarrow\left(R^{\prime}, \mathfrak{m}^{\prime}\right)$ the following are equivalent
(1) condition 15.12.0.1) holds for $\left(R^{\prime} \rightarrow S \otimes_{R} R^{\prime}, \mathfrak{m}^{\prime}, M \otimes_{R} R^{\prime}\right)$, and
(2) $\varphi(I)=0$.

Proof. The implication $(2) \Rightarrow(1)$ follows from Lemma 15.12.1. Let $\varphi: R \rightarrow R^{\prime}$ be as in the lemma satisfying (1). As $R$ is Noetherian we see that $R \rightarrow S$ is of finite presentation and $M$ is an $S$-module of finite presentation. Write $R^{\prime}=\operatorname{colim}_{\lambda} R_{\lambda}$ as a directed colimit of local $R$-subalgebras $R_{\lambda} \subset R^{\prime}$, with maximal ideals $\mathfrak{m}_{\lambda}=R_{\lambda} \cap \mathfrak{m}^{\prime}$ such that each $R_{\lambda}$ is essentially of finite type over $R$. By Lemma 15.12 .3 we see that condition 15.12 .0 .1 holds for $\left(R_{\lambda} \rightarrow S \otimes_{R} R_{\lambda}, \mathfrak{m}_{\lambda}, M \otimes_{R} R_{\lambda}\right)$ for some $\lambda$. Hence Lemma 15.14 .2 applies to the ring map $R \rightarrow R_{\lambda}$ and we see that $I$ maps to zero in $R_{\lambda}$, a fortiori it maps to zero in $R^{\prime}$.

### 15.15. Descent flatness along integral maps

052 Y First a few simple lemmas.
052 Z Lemma 15.15.1. Let $R$ be a ring. Let $P(T)$ be a monic polynomial with coefficients in $R$. If there exists an $\alpha \in R$ such that $P(\alpha)=0$, then $P(T)=(T-\alpha) Q(T)$ for some monic polynomial $Q(T) \in R[T]$.
Proof. By induction on the degree of $P$. If $\operatorname{deg}(P)=1$, then $P(T)=T-\alpha$ and the result is true. If $\operatorname{deg}(P)>1$, then we can write $P(T)=(T-\alpha) Q(T)+r$ for some polynomial $Q \in R[T]$ of $\operatorname{degree}<\operatorname{deg}(P)$ and some $r \in R$ by long division. By assumption $0=P(\alpha)=(\alpha-\alpha) Q(\alpha)+r=r$ and we conclude that $r=0$ as desired.

0530 Lemma 15.15.2. Let $R$ be a ring. Let $P(T)$ be a monic polynomial with coefficients in $R$. There exists a finite free ring map $R \rightarrow R^{\prime}$ such that $P(T)=$ $(T-\alpha) Q(T)$ for some $\alpha \in R^{\prime}$ and some monic polynomial $Q(T) \in R^{\prime}[T]$.

Proof. Write $P(T)=T^{d}+a_{1} T^{d-1}+\ldots+a_{0}$. Set $R^{\prime}=R[x] /\left(x^{d}+a_{1} x^{d-1}+\ldots+a_{0}\right)$. Set $\alpha$ equal to the congruence class of $x$. Then it is clear that $P(\alpha)=0$. Thus we win by Lemma 15.15 .1

0531 Lemma 15.15.3. Let $R \rightarrow S$ be a finite ring map. There exists a finite free ring extension $R \subset R^{\prime}$ such that $S \otimes_{R} R^{\prime}$ is a quotient of a ring of the form

$$
R^{\prime}\left[T_{1}, \ldots, T_{n}\right] /\left(P_{1}\left(T_{1}\right), \ldots, P_{n}\left(T_{n}\right)\right)
$$

with $P_{i}(T)=\prod_{j=1, \ldots, d_{i}}\left(T-\alpha_{i j}\right)$ for some $\alpha_{i j} \in R^{\prime}$.
Proof. Let $x_{1}, \ldots, x_{n} \in S$ be generators of $S$ over $R$. For each $i$ we can choose a monic polynomial $P_{i}(T) \in R[T]$ such that $P\left(x_{i}\right)=0$ in $S$, see Algebra, Lemma 10.35.3. Say $\operatorname{deg}\left(P_{i}\right)=d_{i}$. By Lemma 15.15 .2 (applied $\sum d_{i}$ times) there exists a finite free ring extension $R \subset R^{\prime}$ such that each $P_{i}$ splits completely:

$$
P_{i}(T)=\prod_{j=1, \ldots, d_{i}}\left(T-\alpha_{i j}\right)
$$

for certain $\alpha_{i k} \in R^{\prime}$. Let $R^{\prime}\left[T_{1}, \ldots, T_{n}\right] \rightarrow S \otimes_{R} R^{\prime}$ be the $R^{\prime}$-algebra map which maps $T_{i}$ to $x_{i} \otimes 1$. As this maps $P_{i}\left(T_{i}\right)$ to zero, this induces the desired surjection.

0532 Lemma 15.15.4. Let $R$ be a ring. Let $S=R\left[T_{1}, \ldots, T_{n}\right] / J$. Assume $J$ contains elements of the form $P_{i}\left(T_{i}\right)$ with $P_{i}(T)=\prod_{j=1, \ldots, d_{i}}\left(T-\alpha_{i j}\right)$ for some $\alpha_{i j} \in R$. For $\underline{k}=\left(k_{1}, \ldots, k_{n}\right)$ with $1 \leq k_{i} \leq d_{i}$ consider the ring map

$$
\Phi_{\underline{k}}: R\left[T_{1}, \ldots, T_{n}\right] \rightarrow R, \quad T_{i} \longmapsto \alpha_{i k_{i}}
$$

Set $J_{\underline{k}}=\Phi_{\underline{k}}(J)$. Then the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is equal to $V\left(\cap J_{\underline{k}}\right)$.
Proof. This lemma proves itself. Hint: $V\left(\bigcap J_{\underline{k}}\right)=\bigcup V\left(J_{\underline{k}}\right)$.
The following result is due to Ferrand, see Fer69.
0533 Lemma 15.15.5. Let $R \rightarrow S$ be a finite injective homomorphism of Noetherian rings. Let $M$ be an $R$-module. If $M \otimes_{R} S$ is a flat $S$-module, then $M$ is a flat $R$-module.

Proof. Let $M$ be an $R$-module such that $M \otimes_{R} S$ is flat over $S$. By Algebra, Lemma 10.38 .8 in order to prove that $M$ is flat we may replace $R$ by any faithfully flat ring extension. By Lemma 15.15 .3 we can find a finite locally free ring extension $R \subset R^{\prime}$ such that $S^{\prime}=S \otimes_{R} R^{\prime}=R^{\prime}\left[T_{1}, \ldots, T_{n}\right] / J$ for some ideal $J \subset R^{\prime}\left[T_{1}, \ldots, T_{n}\right]$ which contains the elements of the form $P_{i}\left(T_{i}\right)$ with $P_{i}(T)=\prod_{j=1, \ldots, d_{i}}\left(T-\alpha_{i j}\right)$ for some $\alpha_{i j} \in R^{\prime}$. Note that $R^{\prime}$ is Noetherian and that $R^{\prime} \subset S^{\prime}$ is a finite extension of rings. Hence we may replace $R$ by $R^{\prime}$ and assume that $S$ has a presentation as in Lemma 15.15.4. Note that $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective, see Algebra, Lemma 10.35.15. Thus, using Lemma 15.15.4 we conclude that $I=\bigcap J_{\underline{k}}$ is an ideal such that $V(I)=\operatorname{Spec}(R)$. This means that $I \subset \sqrt{(0)}$, and since $R$ is Noetherian that $I$ is nilpotent. The maps $\Phi_{k}$ induce commutative diagrams

from which we conclude that $M / J_{\underline{k}} M$ is flat over $R / J_{\underline{k}}$. By Lemma 15.10 .1 we see that $M / I M$ is flat over $R / I$. Finally, applying Algebra, Lemma 10.100 .5 we conclude that $M$ is flat over $R$.

0534 Lemma 15.15.6. Let $R \rightarrow S$ be an injective integral ring map. Let $M$ be a finitely presented module over $R\left[x_{1}, \ldots, x_{n}\right]$. If $M \otimes_{R} S$ is flat over $S$, then $M$ is flat over $R$.

Proof. Choose a presentation

$$
R\left[x_{1}, \ldots, x_{n}\right]^{\oplus t} \rightarrow R\left[x_{1}, \ldots, x_{n}\right]^{\oplus r} \rightarrow M \rightarrow 0 .
$$

Let's say that the first map is given by the $r \times t$-matrix $T=\left(f_{i j}\right)$ with $f_{i j} \in$ $R\left[x_{1}, \ldots, x_{n}\right]$. Write $f_{i j}=\sum f_{i j, I} x^{I}$ with $f_{i j, I} \in R$ (multi-index notation). Consider diagrams

where $R_{\lambda}$ is a finitely generated $\mathbf{Z}$-subalgebra of $R$ containing all $f_{i j, I}$ and $S_{\lambda}$ is a finite $R_{\lambda}$-subalgebra of $S$. Let $M_{\lambda}$ be the finite $R_{\lambda}\left[x_{1}, \ldots, x_{n}\right]$-module defined by
a presentation as above, using the same matrix $T$ but now viewed as a matrix over $R_{\lambda}\left[x_{1}, \ldots, x_{n}\right]$. Note that $S$ is the directed colimit of the $S_{\lambda}$ (details omitted). By Algebra, Lemma 10.160.1 we see that for some $\lambda$ the module $M_{\lambda} \otimes_{R_{\lambda}} S_{\lambda}$ is flat over $S_{\lambda}$. By Lemma 15.15.5 we conclude that $M_{\lambda}$ is flat over $R_{\lambda}$. Since $M=M_{\lambda} \otimes_{R_{\lambda}} R$ we win by Algebra, Lemma 10.38.7.

### 15.16. Torsion free modules

0549 In this section we discuss torsion free modules and the relationship with flatness (especially over dimension 1 rings).

0536 Definition 15.16.1. Let $R$ be a domain. Let $M$ be an $R$-module.
(1) We say an element $x \in M$ is torsion if there exists a nonzero $f \in R$ such that $f x=0$.
(2) We say $M$ is torsion free if the only torsion element of $M$ is 0 .

Let $R$ be a domain and let $S=R \backslash\{0\}$ be the multiplicative set of nonzero elements of $R$. Then an $R$-module $M$ is torsion free if and only if $M \rightarrow S^{-1} M$ is injective. In other words, if and only if the map $M \rightarrow M \otimes_{R} K$ is injective where $K=S^{-1} R$ is the fraction field of $R$.

0537 Lemma 15.16.2. Let $R$ be a domain. Let $M$ be an $R$-module. The set of torsion elements of $M$ forms a submodule $M_{\text {tors }} \subset M$. The quotient module $M / M_{\text {tors }}$ is torsion free.

Proof. Omitted.
0AUR Lemma 15.16.3. Let $R$ be a domain. Let $M$ be a torsion free $R$-module. For any multiplicative set $S \subset R$ the module $S^{-1} M$ is a torsion free $S^{-1} R$-module.

Proof. Omitted.
0AXM Lemma 15.16.4. Let $R \rightarrow R^{\prime}$ be a flat homomorphism of domains. If $M$ is $a$ torsion free $R$-module, then $M \otimes_{R} R^{\prime}$ is a torsion free $R^{\prime}$-module.

Proof. If $M$ is torsion free, then $M \subset M \otimes_{R} K$ is injective where $K$ is the fraction field of $R$. Since $R^{\prime}$ is flat over $R$ we see that $M \otimes_{R} R^{\prime} \rightarrow\left(M \otimes_{R} K\right) \otimes_{R} R^{\prime}$ is injective. Since $M \otimes_{R} K$ is isomorphic to a direct sum of copies of $K$, it suffices to see that $K \otimes_{R} R^{\prime}$ is torsion free. This is true because it is a localization of $R^{\prime}$.

0AUS Lemma 15.16.5. Let $R$ be a domain. Let $0 \rightarrow M \rightarrow M^{\prime} \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of $R$-modules. If $M$ and $M^{\prime \prime}$ are torsion free, then $M^{\prime}$ is torsion free.

Proof. Omitted.
0AUT Lemma 15.16.6. Let $R$ be a domain. Let $M$ be an $R$-module. Then $M$ is torsion free if and only if $M_{\mathfrak{m}}$ is a torsion free $R_{\mathfrak{m}}$-module for all maximal ideals $\mathfrak{m}$ of $R$.

Proof. Omitted. Hint: Use Lemma 15.16 .3 and Algebra, Lemma 10.23.1
0AUU Lemma 15.16.7. Let $R$ be a domain. Let $M$ be a finite $R$-module. Then $M$ is torsion free if and only if $M$ is a submodule of a finite free module.

Proof. If $M$ is a submodule of $R^{\oplus n}$, then $M$ is torsion free. For the converse, assume $M$ is torsion free. Let $K$ be the fraction field of $R$. Then $M \otimes_{R} K$ is a finite dimensional $K$-vector space. Choose a basis $e_{1}, \ldots, e_{r}$ for this vector spce. Let $x_{1}, \ldots, x_{n}$ be generators of $M$. Write $x_{i}=\sum\left(a_{i j} / b_{i j}\right) e_{j}$ for some $a_{i j}, b_{i j} \in R$ with $b_{i j} \neq 0$. Set $b=\prod_{i, j} b_{i j}$. Since $M$ is torsion free the map $M \rightarrow M \otimes_{R} K$ is injective and the image is contained in $R^{\oplus r}=R e_{1} / b \oplus \ldots \oplus R e_{r} / b$.

0AUV Lemma 15.16.8. Let $R$ be a Noetherian domain. Let $M$ be a nonzero finite $R$-module. The following are equivalent
(1) $M$ is torsion free,
(2) $M$ is a submodule of a finite free module,
(3) (0) is the only associated prime of $M$,
(4) (0) is in the support of $M$ and $M$ has property $\left(S_{1}\right)$, and
(5) (0) is in the support of $M$ and $M$ has no embedded associated prime.

Proof. We have seen the equivalence of (1) and (2) in Lemma 15.16.7. We have seen the equivalence of (4) and (5) in Algebra, Lemma 10.149.2 The equivalence between (3) and (5) is immediate from the definition. A localization of a torsion free module is torsion free (Lemma 15.16.3), hence it is clear that a $M$ has no associated primes different from (0). Thus (1) implies (5). Conversely, assume (5). If $M$ has torsion, then there exists an embedding $R / I \subset M$ for some nonzero ideal $I$ of $R$. Hence $M$ has an associated prime different from (0) (see Algebra, Lemmas 10.62 .3 and 10.62 .7 ). This is an embedded associated prime which contradicts the assumption.

0538 Lemma 15.16.9. Let $R$ be a domain. Any flat $R$-module is torsion free.
Proof. If $x \in R$ is nonzero, then $x: R \rightarrow R$ is injective, and hence if $M$ is flat over $R$, then $x: M \rightarrow M$ is injective. Thus if $M$ is flat over $R$, then $M$ is torsion free.

0539 Lemma 15.16.10. Let $A$ be a valuation ring. An $A$-module $M$ is flat over $A$ if and only if $M$ is torsion free.

Proof. The implication "flat $\Rightarrow$ torsion free" is Lemma 15.16.9. For the converse, assume $M$ is torsion free. By the equational criterion of flatness (see Algebra, Lemma 10.38.11 we have to show that every relation in $M$ is trivial. To do this assume that $\sum_{i=1, \ldots, n} a_{i} x_{i}=0$ with $x_{i} \in M$ and $f_{i} \in A$. After renumbering we may assume that $v\left(a_{1}\right) \leq v\left(a_{i}\right)$ for all $i$. Hence we can write $a_{i}=a_{i}^{\prime} a_{1}$ for some $a_{i}^{\prime} \in A$. Note that $a_{1}^{\prime}=1$. As $A$ is torsion free we see that $x_{1}=-\sum_{i \geq 2} a_{i}^{\prime} x_{i}$. Thus, if we choose $y_{i}=x_{i}, i=2, \ldots, n$ then

$$
x_{1}=\sum_{j \geq 2}-a_{j}^{\prime} y_{j}, \quad x_{i}=y_{i},(i \geq 2) \quad 0=a_{1} \cdot\left(-a_{j}^{\prime}\right)+a_{j} \cdot 1(j \geq 2)
$$

shows that the relation was trivial (to be explicit the elements $a_{i j}$ are defined by setting $a_{1 j}=-a_{j}^{\prime}$ and $a_{i j}=\delta_{i j}$ for $\left.i, j \geq 2\right)$.

0AUW Lemma 15.16.11. Let $A$ be a Dedekind domain (for example a PID or a discrete valuation ring).
(1) An A-module is flat if and only if it is torsion free.
(2) A finite torsion free $A$-module is finite locally free.
(3) A finite torsion free $A$-module is finite free if $A$ is a PID or a discrete valuation ring.

Proof. Proof of (1). Since a PID is a Dedekind domain (Algebra, Lemma 10.119.13), it suffices to prove this for Dedekind domains. By Lemma 15.16 .6 and Algebra, Lemma 10.38 .19 it suffices to check the statement over $A_{\mathfrak{m}}$ for $\mathfrak{m} \subset A$ maximal. Since $A_{\mathfrak{m}}$ is a discrete valuation ring (Algebra, Lemma 10.119.15) we win by Lemma 15.16.10.

Proof of (2). Follows from Algebra, Lemma 10.77 .2 and (1).
Proof of (3). If $A$ is a discrete valuation ring this follows from (2) and the definitions. Let $A$ be a PID and let $M$ be a finite torsion free module. By Lemma 15.16.7 we see that $M \subset A^{\oplus n}$ for some $n$. We argue that $M$ is free by induction on $M$. The case $n=1$ expresses exactly the fact that $A$ is a PID. If $n>1$ let $M^{\prime} \subset R^{\oplus n-1}$ be the image of the projection onto the last $n-1$ summands of $R^{\oplus n}$. Then we obtain a short exact sequence $0 \rightarrow I \rightarrow M \rightarrow M^{\prime} \rightarrow 0$ where $I$ is the intersection of $M$ with the first summand $R$ of $R^{\oplus n}$. By induction we see that $M$ is an extension of finite free $R$-modules, whence finite free.

0AUX Lemma 15.16.12. Let $R$ be a domain. Let $M, N$ be $R$-modules. If $N$ is torsion free, so is $\operatorname{Hom}_{R}(M, N)$.

Proof. Choose a surjection $\bigoplus_{i \in I} R \rightarrow M . \operatorname{Then} \operatorname{Hom}_{R}(M, N) \subset \prod_{i \in I} N$.

### 15.17. Reflexive modules

0AUY Here is our definition.
0AUZ Definition 15.17.1. Let $R$ be a domain. We say an $R$-module $M$ is reflexive if the natural map

$$
j: M \longrightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right)
$$

which sends $m \in M$ to the map sending $\varphi \in \operatorname{Hom}_{R}(M, R)$ to $\varphi(m) \in R$ is an isomorphism.

We can make this definition for more general rings, but already the definition above has drawbacks. It would be wise to restrict to Noetherian domains and finite torsion free modules and (perhaps) impose some regularity conditions on $R$ (e.g., $R$ is normal).

0AV0 Lemma 15.17.2. Let $R$ be a domain and let $M$ be an $R$-module.
(1) If $M$ is reflexive, then $M$ is torsion free.
(2) If $M$ is finite, then $j: M \rightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right)$ is injective if and only if $M$ is torsion free

Proof. Follows immediately from Lemmas 15.16 .12 and 15.16 .7 .
0B36 Lemma 15.17.3. Let $R$ be a discrete valuation ring and let $M$ be a finite $R$ module. Then the map $j: M \rightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right)$ is surjective.

Proof. Let $M_{\text {tors }} \subset M$ be the torsion submodule. Then we have $\operatorname{Hom}_{R}(M, R)=$ $\operatorname{Hom}_{R}\left(M / M_{\text {tors }}, R\right)$ (holds over any domain). Hence we may assume that $M$ is torsion free. Then $M$ is free by Lemma 15.16 .11 and the lemma is clear.

0AV1 Lemma 15.17.4. Let $R$ be a Noetherian domain. Let $M$ be a finite $R$-module. Then $M$ is reflexive if and only if $M_{\mathfrak{m}}$ is a reflexive $R_{\mathfrak{m}}$-module for all maximal ideals $\mathfrak{m}$ of $R$.

Proof. Omitted. Hint: Use Algebra, Lemmas 10.23.1 and 10.10.2.
0AV2 Lemma 15.17.5. Let $R$ be a Noetherian domain. Let $M$ be a finite $R$-module. The following are equivalent
(1) $M$ is reflexive,
(2) there exists a short exact sequence $0 \rightarrow M \rightarrow F \rightarrow N \rightarrow 0$ with $F$ finite free and $N$ torsion free.
Proof. We will use without further mention that $\operatorname{Hom}_{R}\left(N, N^{\prime}\right)$ is a finite $R$-module for any finite $R$-modules $N$ and $N^{\prime}$, see Algebra, Lemma 10.70.9 Given an exact sequence $0 \rightarrow M \rightarrow F \rightarrow N \rightarrow 0$ as in (2) we take duals to get an exact sequence

$$
\operatorname{Hom}_{R}(M, R) \leftarrow \operatorname{Hom}_{R}(F, R) \leftarrow \operatorname{Hom}_{R}(N, R) \leftarrow 0
$$

Dualizing again we obtain a commutative diagram

We do not know the top row is exact. But we do know the middle arrow is an isomorphism as $F$ is finite free and hence reflexive. Moreover, if $S=R \backslash\{0\}$, then inverting $S$ commutes with taking $\operatorname{Hom}_{R}$ for finite $R$-modules, see Algebra, Lemma 10.10.2. Since $S^{-1} M$ and $S^{-1} N$ are finite free over the fraction field $K=S^{-1} R$ of $R$, we find that the vertical maps are isomorphisms after inverting $S$. Since $\operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right)$ is torsion free (Lemma 15.16.12), it follows in particular that the left top horizontal arrow is injective. Since $N$ is torsion free the right vertical arrow is injective (Lemma 15.17 .2 ). Now a diagram chase shows that $M$ is reflexive.
Assume $M$ is reflexive. Choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow \operatorname{Hom}_{R}(M, R) \rightarrow 0$. Dualizing and using reflivity we get an exact sequence

$$
0 \rightarrow \operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right) \rightarrow R^{\oplus n} \rightarrow N \rightarrow 0
$$

with $N=\operatorname{Im}\left(R^{\oplus n} \rightarrow R^{\oplus m}\right)$ a torsion free module.
0AV3 Lemma 15.17.6. Let $R$ be a Noetherian domain. Let $M$ be a finite $R$-module. Let $N$ be a reflexive $R$-module. Then $\operatorname{Hom}_{R}(M, N)$ is reflexive.
Proof. Choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. Then we obtain

$$
0 \rightarrow \operatorname{Hom}_{R}(M, N) \rightarrow N^{\oplus n} \rightarrow N^{\prime} \rightarrow 0
$$

with $N^{\prime}=\operatorname{Im}\left(N^{\oplus n} \rightarrow N^{\oplus m}\right)$ torsion free. Choose a sequence $0 \rightarrow N \rightarrow F \rightarrow$ $N^{\prime \prime} \rightarrow 0$ with $N^{\prime \prime}$ torsion free as in Lemma 15.17.5. We obtain an injective map $\delta: \operatorname{Hom}_{R}(M, N) \rightarrow F^{\oplus n}$. A snake lemma argument shows there is a short exact sequence

$$
0 \rightarrow N^{\prime} \rightarrow \operatorname{Coker}(\delta) \rightarrow\left(N^{\prime \prime}\right)^{\oplus n} \rightarrow 0
$$

Thus $\operatorname{Coker}(\delta)$ is an extension of torsion free modules, hence torsion free (Lemma 15.16.5).

0AV4 Definition 15.17.7. Let $R$ be a Noetherian domain. Let $M$ be a finite $R$-module. The module $M^{* *}=\operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right)$ is called the reflexive hull of $M$.
This makes sense because the reflexive hull is reflexive by Lemma 15.17.6. The assignment $M \mapsto M^{* *}$ is a functor. If $\varphi: M \rightarrow N$ is an $R$-module map into a reflexive $R$-module $N$, then $\varphi$ factors $M \rightarrow M^{* *} \rightarrow N$ through the reflexive hull of $M$. Another way to say this is that taking the reflexive hull is the left adjoint to the inclusion functor

$$
\text { finite reflexive modules } \subset \text { finite modules }
$$

over a Noetherian domain $R$.
0AV5 Lemma 15.17.8. Let $R$ be a Noetherian local ring. Let $M, N$ be finite $R$-modules.
(1) If $N$ has depth $\geq 1$, then $\operatorname{Hom}_{R}(M, N)$ has depth $\geq 1$.
(2) If $N$ has depth $\geq 2$, then $\operatorname{Hom}_{R}(M, N)$ has depth $\geq 2$.

Proof. Choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. Dualizing we get an exact sequence

$$
0 \rightarrow \operatorname{Hom}_{R}(M, N) \rightarrow N^{\oplus n} \rightarrow N^{\prime} \rightarrow 0
$$

with $N^{\prime}=\operatorname{Im}\left(N^{\oplus n} \rightarrow N^{\oplus m}\right)$. A submodule of a module with depth $\geq 1$ has depth $\geq 1$; this follows immediately from the definition. Thus part (1) is clear. For (2) note that here the assumption and the previous remark implies $N^{\prime}$ has depth $\geq 1$. The module $N^{\oplus n}$ has depth $\geq 2$. From Algebra, Lemma 10.71.6 we conclude $\operatorname{Hom}_{R}(M, N)$ has depth $\geq 2$.

0AV6 Lemma 15.17.9. Let $R$ be a Noetherian ring. Let $M, N$ be finite $R$-modules.
(1) If $N$ has property $\left(S_{1}\right)$, then $\operatorname{Hom}_{R}(M, N)$ has property $\left(S_{1}\right)$.
(2) If $N$ has property $\left(S_{2}\right)$, then $\operatorname{Hom}_{R}(M, N)$ has property $\left(S_{2}\right)$.
(3) If $R$ is a domain, $N$ is torsion free and $\left(S_{2}\right)$, then $\operatorname{Hom}_{R}(M, N)$ is torsion free and has property $\left(S_{2}\right)$.

Proof. Since localizing at primes commutes with taking $\operatorname{Hom}_{R}$ for finite $R$-modules (Algebra, Lemma 10.70.9) parts (1) and (2) follow immediately from Lemma 15.17.8. Part (3) follows from (2) and Lemma 15.16.12.
0AV7 Lemma 15.17.10. Let $R$ be a Noetherian ring. Let $\varphi: M \rightarrow N$ be a map of $R$-modules. Assume that for every prime $\mathfrak{p}$ of $R$ at least one of the following happens
(1) $M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}$ is injective, or
(2) $\mathfrak{p} \notin A s s(M)$.

Then $\varphi$ is injective.
Proof. Let $\mathfrak{p}$ be an associated prime of $\operatorname{Ker}(\varphi)$. Then there exists an element $x \in M_{\mathfrak{p}}$ which is in the kernel of $M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}$ and is annihilated by $\mathfrak{p} R_{\mathfrak{p}}$ (Algebra, Lemma 10.62.15. This is impossible in all three cases. Hence $\operatorname{Ass}(\operatorname{Ker}(\varphi))=\emptyset$ and we conclude $\operatorname{Ker}(\varphi)=0$ by Algebra, Lemma 10.62.7.
0AV8 Lemma 15.17.11. Let $R$ be a Noetherian ring. Let $\varphi: M \rightarrow N$ be a map of $R$ modules. Assume $M$ is finite and that for every prime $\mathfrak{p}$ of $R$ one of the following happens
(1) $M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}$ is an isomorphism, or
(2) $\operatorname{depth}\left(M_{\mathfrak{p}}\right) \geq 2$ and $\mathfrak{p} \notin \operatorname{Ass}(N)$.

Then $\varphi$ is an isomorphism.
Proof. By Lemma 15.17 .10 we see that $\varphi$ is injective. Let $N^{\prime} \subset N$ be an finitely generated $R$-module containing the image of $M$. Then $\operatorname{Ass}\left(N_{\mathfrak{p}}\right)=\emptyset$ implies $\operatorname{Ass}\left(N_{\mathfrak{p}}^{\prime}\right)=\emptyset$. Hence the assumptions of the lemma hold for $M \rightarrow N^{\prime}$. In order to prove that $\varphi$ is an isomorphism, it suffices to prove the same thing for every such $N^{\prime} \subset N$. Thus we may assume $N$ is a finite $R$-module. In this case, $\mathfrak{p} \notin \operatorname{Ass}(N) \Rightarrow \operatorname{depth}\left(N_{\mathfrak{p}}\right) \geq 1$, see Algebra, Lemma 10.62.18. Consider the short exact sequence

$$
0 \rightarrow M \rightarrow N \rightarrow Q \rightarrow 0
$$

defining $Q$. Looking at the conditions we see that either $Q_{\mathfrak{p}}=0$ in case (1) or $\operatorname{depth}\left(Q_{\mathfrak{p}}\right) \geq 1$ in case (2) by Algebra, Lemma 10.71.6. This implies that $Q$ does not have any associated primes, hence $Q=0$ by Algebra, Lemma 10.62.7.

0AV9 Lemma 15.17.12. Let $R$ be a Noetherian domain. Let $\varphi: M \rightarrow N$ be a map of $R$-modules. Assume $M$ is finite, $N$ is torsion free, and that for every prime $\mathfrak{p}$ of $R$ one of the following happens
(1) $M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}$ is an isomorphism, or
(2) $\operatorname{depth}\left(M_{\mathfrak{p}}\right) \geq 2$.

Then $\varphi$ is an isomorphism.
Proof. This is a special case of Lemma 15.17 .11 .
0AVA Lemma 15.17.13. Let $R$ be a Noetherian domain. Let $M$ be a finite $R$-module. The following are equivalent
(1) $M$ is reflexive,
(2) for every prime $\mathfrak{p}$ of $R$ one of the following happens
(a) $M_{\mathfrak{p}}$ is a reflexive $R_{\mathfrak{p}}$-module, or
(b) $\operatorname{depth}\left(R_{\mathfrak{p}}\right) \geq 2$ and $\operatorname{depth}\left(M_{\mathfrak{p}}\right) \geq 2$.

Proof. If (1) is true, then (2) holds by Lemmas 15.17.4 and 15.17.8. Conversely, assume (2) is true. Set $N=\operatorname{Hom}_{R}\left(\operatorname{Hom}_{R}(M, R), R\right)$ so that

$$
N_{\mathfrak{p}}=\operatorname{Hom}_{R_{\mathfrak{p}}}\left(\operatorname{Hom}_{R_{\mathfrak{p}}}\left(M_{\mathfrak{p}}, R_{\mathfrak{p}}\right), R_{\mathfrak{p}}\right)
$$

(Algebra, Lemma 10.10 .2 ) for every prime $\mathfrak{p}$ of $R$. We apply Lemma 15.17 .12 to the $\operatorname{map} j: M \rightarrow N$. This is allowed because $M$ is finite, $N$ is torsion free by Lemma 15.16.12, in case (2)(a) the map $M_{\mathfrak{p}} \rightarrow N_{\mathfrak{p}}$ is an isomorphism, and in case (2)(b) we have $\operatorname{depth}\left(M_{\mathfrak{p}}\right) \geq 2$.

0AVB Lemma 15.17.14. Let $R$ be a Noetherian normal domain with fraction field $K$. Let $M$ be a finite $R$-module. The following are equivalent
(1) $M$ is reflexive,
(2) $M$ is torsion free and has property $\left(S_{2}\right)$,
(3) $M$ is torsion free and $M=\bigcap_{\text {height }(\mathfrak{p})=1} M_{\mathfrak{p}}$ where the intersection happens in $M \otimes_{R} K$.

Proof. By Algebra, Lemma 10.149.4 we see that $R$ satisfies $\left(R_{1}\right)$ and $\left(S_{2}\right)$. Observe that in all three cases $M$ is a torsion free module (Lemma 15.17.2). Let $\mathfrak{p}$ be a prime of height 1 , hence $R_{\mathfrak{p}}$ is a discrete valuation ring by $\left(R_{1}\right)$. By Lemma 15.16.11 we see that $M_{\mathfrak{p}}$ is finite free, in particular reflexive. The same is true for $M_{(0)}$. Since $R$ is normal, we have $\operatorname{depth}\left(R_{\mathfrak{p}}\right) \geq 2$ for every prime of heigth $\geq 2$ by $\left(S_{2}\right)$ for $R$. Thus Lemma 15.17 .13 applies to show the equivalence of (1) and (2).

Assume the equivalent conditions (1) and (2) hold and let $M^{\prime}=\bigcap_{\operatorname{height}(\mathfrak{p})=1} M_{\mathfrak{p}}$. Then $M^{\prime}$ is torsion free, $M \subset M^{\prime}$ and $M_{\mathfrak{p}}=M_{\mathfrak{p}}^{\prime}$ for every prime of height 1. Since we've seen $M$ has depth $\geq 2$ at primes of height $>1$, we see that $M \rightarrow M^{\prime}$ is an isomorphism by Lemma 15.17 .12 ,
Assume (3). The map $M \rightarrow M^{* *}$ induces an isomorphism at all the primes $\mathfrak{p}$ of height 1 , because $M_{\mathfrak{p}}$ is finite free as we've seen above. Thus the condition $M=\bigcap_{\text {height }(\mathfrak{p})=1} M_{\mathfrak{p}}$ implies that $M=M^{* *}$ and we win.

0AVC Lemma 15.17.15. Let $R$ be a Noetherian normal domain. Let $M$ be a finite $R$-module. Then the reflexive hull of $M$ is the intersection

$$
M^{* *}=\bigcap_{\text {height }(\mathfrak{p})=1} M_{\mathfrak{p}} /\left(M_{\mathfrak{p}}\right)_{\text {tors }}=\bigcap_{\text {height }(\mathfrak{p})=1}\left(M / M_{\text {tors }}\right)_{\mathfrak{p}}
$$

taken in $M \otimes_{R} K$.
Proof. Let $\mathfrak{p}$ be a prime of height 1. The kernel of $M_{\mathfrak{p}} \rightarrow M \otimes_{R} K$ is the torsion submodule $\left(M_{\mathfrak{p}}\right)_{\text {tors }}$ of $M_{\mathfrak{p}}$. Moreover, we have $\left(M / M_{\text {tors }}\right)_{\mathfrak{p}}=M_{\mathfrak{p}} /\left(M_{\mathfrak{p}}\right)_{\text {tors }}$ and this is a finite free module over the discrete valuation ring $R_{\mathfrak{p}}$ (Lemma 15.16.11). Then $M_{\mathfrak{p}} /\left(M_{\mathfrak{p}}\right)_{\text {tors }} \rightarrow\left(M_{\mathfrak{p}}\right)^{* *}=\left(M^{* *}\right)_{\mathfrak{p}}$ is an isomorphism, hence the lemma is a consequence of Lemma 15.17.14.

0BM4 Lemma 15.17.16. Let $A$ be a Noetherian normal domain with fraction field $K$. Let $L$ be a finite extension of $K$. If the integral closure $B$ of $A$ in $L$ is finite over $A$, then $B$ is reflexive as an $A$-module.

Proof. It suffices to show that $B=\bigcap B_{\mathfrak{p}}$ where the intersection is over height 1 primes $\mathfrak{p} \subset A$, see Lemma 15.17.14. Let $b \in \bigcap B_{\mathfrak{p}}$. Let $x^{d}+a_{1} x^{d-1}+\ldots+a_{d}$ be the minimal polynomial of $b$ over $K$. We want to show $a_{i} \in A$. By Algebra, Lemma 10.37 .6 we see that $a_{i} \in A_{\mathfrak{p}}$ for all $i$ and all hieght one primes $\mathfrak{p}$. Hence we get what we want from Algebra, Lemma 10.149 .6 (or the lemma already cited as $A$ is a reflexive module over itself).

### 15.18. Content ideals

0AS9 The definition may not be what you expect.
0ASA Definition 15.18.1. Let $A$ be a ring. Let $M$ be a flat $A$-module. Let $x \in M$. If the set of ideals $I$ in $A$ such that $x \in I M$ has a smallest element, we call it the content ideal of $x$.
Note that since $M$ is flat over $A$, for a pair of ideals $I, I^{\prime}$ of $A$ we have $I M \cap I^{\prime} M=$ $\left(I \cap I^{\prime}\right) M$ as can be seen by tensoring the exact sequence $0 \rightarrow I \cap I^{\prime} \rightarrow I \oplus I^{\prime} \rightarrow$ $I+I^{\prime} \rightarrow 0$ by $M$.

0ASB Lemma 15.18.2. Let $A$ be a ring. Let $M$ be a flat $A$-module. Let $x \in M$. The content ideal of $x$, if it exists, is finitely generated.

Proof. Say $x \in I M$. Then we can write $x=\sum_{i=1, \ldots, n} f_{i} x_{i}$ with $f_{i} \in I$ and $x_{i} \in M$. Hence $x \in I^{\prime} M$ with $I^{\prime}=\left(f_{1}, \ldots, f_{n}\right)$.

0ASC Lemma 15.18.3. Let $(A, \mathfrak{m})$ be a local ring. Let $u: M \rightarrow N$ be a map of flat $A$-modules such that $\bar{u}: M / \mathfrak{m} M \rightarrow N / \mathfrak{m} N$ is injective. If $x \in M$ has content ideal $I$, then $u(x)$ has content ideal I as well.

Proof. It is clear that $u(x) \in I N$. If $u(x) \in I^{\prime} N$, then $u(x) \in\left(I^{\prime} \cap I\right) N$, see discussion following Definition 15.18.1. Hence it suffices to show: if $x \in I^{\prime} N$ and $I^{\prime} \subset I, I^{\prime} \neq I$, then $u(x) \notin I^{\prime} N$. Since $I / I^{\prime}$ is a nonzero finite $A$-module (Lemma 15.18 .2 there is a nonzero map $\chi: I / I^{\prime} \rightarrow A / \mathfrak{m}$ of $A$-modules by Nakayama's lemma (Algebra, Lemma 10.19.1). Since $I$ is the content ideal of $x$ we see that $x \notin I^{\prime \prime} M$ where $I^{\prime \prime}=\operatorname{Ker}(\chi)$. Hence $x$ is not in the kernel of the map

$$
I M=I \otimes_{A} M \xrightarrow{\chi \otimes 1} A / \mathfrak{m} \otimes M \cong M / \mathfrak{m} M
$$

Applying our hypothesis on $\bar{u}$ we conclude that $u(x)$ does not map to zero under the map

$$
I N=I \otimes_{A} N \xrightarrow{\chi \otimes 1} A / \mathfrak{m} \otimes N \cong N / \mathfrak{m} N
$$

and we conclude.
0ASD Lemma 15.18.4. Let $A$ be a ring. Let $M$ be a flat Mittag-Leffler module. Then every element of $M$ has a content ideal.

Proof. This is a special case of Algebra, Lemma 10.90.2.

### 15.19. Flatness and finiteness conditions

054A In this section we discuss some implications of the type "flat + finite type $\Rightarrow$ finite presentation". We will revisit this result in the chapter on flatness, see More on Flatness, Section 37.1. A first result of this type was proved in Algebra, Lemma 10.107.6.

053A Lemma 15.19.1. Let $R$ be a ring. Let $S=R\left[x_{1}, \ldots, x_{n}\right]$ be a polynomial ring over $R$. Let $M$ be an $S$-module. Assume
(1) there exist finitely many primes $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{m}$ of $R$ such that the map $R \rightarrow$ $\prod R_{\mathfrak{p}_{j}}$ is injective,
(2) $M$ is a finite $S$-module,
(3) $M$ flat over $R$, and
(4) for every prime $\mathfrak{p}$ of $R$ the module $M_{\mathfrak{p}}$ is of finite presentation over $S_{\mathfrak{p}}$.

Then $M$ is of finite presentation over $S$.
Proof. Choose a presentation

$$
0 \rightarrow K \rightarrow S^{\oplus r} \rightarrow M \rightarrow 0
$$

of $M$ as an $S$-module. Let $\mathfrak{q}$ be a prime ideal of $S$ lying over a prime $\mathfrak{p}$ of $R$. By assumption there exist finitely many elements $k_{1}, \ldots, k_{t} \in K$ such that if we set $K^{\prime}=\sum S k_{j} \subset K$ then $K_{\mathfrak{p}}^{\prime}=K_{\mathfrak{p}}$ and $K_{\mathfrak{p}_{j}}^{\prime}=K_{\mathfrak{p}_{j}}$ for $j=1, \ldots, m$. Setting $M^{\prime}=S^{\oplus r} / K^{\prime}$ we deduce that in particular $M_{\mathfrak{q}}^{\prime}=M_{\mathfrak{q}}$. By openness of flatness, see Algebra, Theorem 10.128.4 we conclude that there exists a $g \in S, g \notin \mathfrak{q}$ such that $M_{g}^{\prime}$ is flat over $R$. Thus $M_{g}^{\prime} \rightarrow M_{g}$ is a surjective map of flat $R$-modules. Consider the commutative diagram

The bottom arrow is an isomorphism by choice of $k_{1}, \ldots, k_{t}$. The left vertical arrow is an injective map as $R \rightarrow \prod R_{\mathfrak{p}_{j}}$ is injective and $M_{g}^{\prime}$ is flat over $R$. Hence the top horizontal arrow is injective, hence an isomorphism. This proves that $M_{g}$ is of finite presentation over $S_{g}$. We conclude by applying Algebra, Lemma 10.23.2.
053B Lemma 15.19.2. Let $R \rightarrow S$ be a ring homomorphism. Assume
(1) there exist finitely many primes $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{m}$ of $R$ such that the map $R \rightarrow$ $\prod R_{\mathfrak{p}_{j}}$ is injective,
(2) $R \rightarrow S$ is of finite type,
(3) $S$ flat over $R$, and
(4) for every prime $\mathfrak{p}$ of $R$ the ring $S_{\mathfrak{p}}$ is of finite presentation over $R_{\mathfrak{p}}$.

Then $S$ is of finite presentation over $R$.
Proof. By assumption $S$ is a quotient of a polynomial ring over $R$. Thus the result follows directly from Lemma 15.19.1.
053C Lemma 15.19.3. Let $R$ be a ring. Let $S=R\left[x_{1}, \ldots, x_{n}\right]$ be a graded polynomial algebra over $R$, i.e., $\operatorname{deg}\left(x_{i}\right)>0$ but not necessarily equal to 1 . Let $M$ be a graded $S$-module. Assume
(1) $R$ is a local ring,
(2) $M$ is a finite $S$-module, and
(3) $M$ is flat over $R$.

Then $M$ is finitely presented as an $S$-module.
Proof. Let $M=\bigoplus M_{d}$ be the grading on $M$. Pick homogeneous generators $m_{1}, \ldots, m_{r} \in M$ of $M$. Say $\operatorname{deg}\left(m_{i}\right)=d_{i} \in \mathbf{Z}$. This gives us a presentation

$$
0 \rightarrow K \rightarrow \bigoplus_{i=1, \ldots, r} S\left(-d_{i}\right) \rightarrow M \rightarrow 0
$$

which in each degree $d$ leads to the short exact sequence

$$
0 \rightarrow K_{d} \rightarrow \bigoplus_{i=1, \ldots, r} S_{d-d_{i}} \rightarrow M_{d} \rightarrow 0
$$

By assumption each $M_{d}$ is a finite flat $R$-module. By Algebra, Lemma 10.77.4 this implies each $M_{d}$ is a finite free $R$-module. Hence we see each $K_{d}$ is a finite $R$-module. Also each $K_{d}$ is flat over $R$ by Algebra, Lemma 10.38.13. Hence we conclude that each $K_{d}$ is finite free by Algebra, Lemma 10.77.4 again.
Let $\mathfrak{m}$ be the maximal ideal of $R$. By the flatness of $M$ over $R$ the short exact sequences above remain short exact after tensoring with $\kappa=\kappa(\mathfrak{m})$. As the ring $S \otimes_{R} \kappa$ is Noetherian we see that there exist homogeneous elements $k_{1}, \ldots, k_{t} \in K$ such that the images $\bar{k}_{j}$ generate $K \otimes_{R} \kappa$ over $S \otimes_{R} \kappa$. Say $\operatorname{deg}\left(k_{j}\right)=e_{j}$. Thus for any $d$ the map

$$
\bigoplus_{j=1, \ldots, t} S_{d-e_{j}} \longrightarrow K_{d}
$$

becomes surjective after tensoring with $\kappa$. By Nakayama's lemma (Algebra, Lemma 10.19.1 this implies the map is surjective over $R$. Hence $K$ is generated by $k_{1}, \ldots, k_{t}$ over $S$ and we win.

053D Lemma 15.19.4. Let $R$ be a ring. Let $S=\bigoplus_{n \geq 0} S_{n}$ be a graded $R$-algebra. Let $M=\bigoplus_{d \in \mathbf{Z}} M_{d}$ be a graded $S$-module. Assume $S$ is finitely generated as an $R$-algebra, assume $S_{0}$ is a finite $R$-algebra, and assume there exist finitely many primes $\mathfrak{p}_{j}, i=1, \ldots, m$ such that $R \rightarrow \prod R_{\mathfrak{p}_{j}}$ is injective.
(1) If $S$ is flat over $R$, then $S$ is a finitely presented $R$-algebra.
(2) If $M$ is flat as an $R$-module and finite as an $S$-module, then $M$ is finitely presented as an $S$-module.
Proof. As $S$ is finitely generated as an $R$-algebra, it is finitely generated as an $S_{0}$ algebra, say by homogeneous elements $t_{1}, \ldots, t_{n} \in S$ of degrees $d_{1}, \ldots, d_{n}>0$. Set $P=R\left[x_{1}, \ldots, x_{n}\right]$ with $\operatorname{deg}\left(x_{i}\right)=d_{i}$. The ring map $P \rightarrow S, x_{i} \rightarrow t_{i}$ is finite as $S_{0}$ is a finite $R$-module. To prove (1) it suffices to prove that $S$ is a finitely presented $P$-module. To prove (2) it suffices to prove that $M$ is a finitely presented $P$-module. Thus it suffices to prove that if $S=P$ is a graded polynomial ring and $M$ is a finite $S$-module flat over $R$, then $M$ is finitely presented as an $S$-module. By Lemma 15.19 .3 we see $M_{\mathfrak{p}}$ is a finitely presented $S_{\mathfrak{p}}$-module for every prime $\mathfrak{p}$ of $R$. Thus the result follows from Lemma 15.19.1.

05GS Remark 15.19.5. Let $R$ be a ring. When does $R$ satisfy the condition mentioned in Lemmas 15.19.1, 15.19.2, and 15.19.4. This holds if
(1) $R$ is local,
(2) $R$ is Noetherian,
(3) $R$ is a domain,
(4) $R$ is a reduced ring with finitely many minimal primes, or
(5) $R$ has finitely many weakly associated primes, see Algebra, Lemma 10.65.16

Thus these lemmas hold in all cases listed above.
The following lemma will be improved on in More on Flatness, Proposition 37.13.9,
053E Lemma 15.19.6. Let $A$ be a valuation ring. Let $A \rightarrow B$ be a ring map of finite type. Let $M$ be a finite $B$-module.
(1) If $B$ is flat over $A$, then $B$ is a finitely presented $A$-algebra.
(2) If $M$ is flat as an $A$-module, then $M$ is finitely presented as a $B$-module.

Proof. We are going to use that an $A$-module is flat if and only if it is torsion free, see Lemma 15.16.10. By Algebra, Lemma 10.56 .10 we can find a graded $A$-algebra $S$ with $S_{0}=A$ and generated by finitely many elements in degree 1 , an element $f \in S_{1}$ and a finite graded $S$-module $N$ such that $B \cong S_{(f)}$ and $M \cong N_{(f)}$. If $M$ is torsion free, then we can take $N$ torsion free by replacing it by $N / N_{\text {tors }}$, see Lemma 15.16.2. Similarly, if $B$ is torsion free, then we can take $S$ torsion free by replacing it by $S / S_{\text {tors }}$. Hence in case (1), we may apply Lemma 15.19 .4 to see that $S$ is a finitely presented $A$-algebra, which implies that $B=S_{(f)}$ is a finitely presented $A$-algebra. To see (2) we may first replace $S$ by a graded polynomial ring, and then we may apply Lemma 15.19 .3 to conclude.

### 15.20. Blowing up and flatness

0535 In this section we begin our discussion of results of the form: "After a blow up the strict transform becomes flat". More results of this type may be found in More on Flatness, Section 37.28 .
053 H Definition 15.20.1. Let $R$ be a domain. Let $M$ be an $R$-module. Let $R \subset R^{\prime}$ be an extension of domains. The strict transform of $M$ along $R \rightarrow R^{1}$ is the torsion free $R^{\prime}$-module

$$
M^{\prime}=\left(M \otimes_{R} R^{\prime}\right) /\left(M \otimes_{R} R^{\prime}\right)_{t o r s}
$$

[^38]The following is a very weak version of flattening by blowing up, but it is already sometimes a useful result.
053I Lemma 15.20.2. Let $(R, \mathfrak{m})$ be a local domain with fraction field $K$. Let $S$ be $a$ finite type $R$-algebra. Let $M$ be a finite $S$-module. For every valuation ring $A \subset K$ dominating $R$ there exists an ideal $I \subset \mathfrak{m}$ and a nonzero element $a \in I$ such that
(1) $I$ is finitely generated,
(2) A has center on $R\left[\frac{I}{a}\right]$,
(3) the fibre ring of $R \rightarrow R\left[\frac{I}{a}\right]$ at $\mathfrak{m}$ is not zero, and
(4) the strict transform $S_{I, a}$ of $S$ along $R \rightarrow R\left[\frac{I}{a}\right]$ is flat and of finite presentation over $R$, and the strict transform $M_{I, a}$ of $M$ along $R \rightarrow R\left[\frac{I}{a}\right]$ is flat over $R$ and finitely presented over $S_{I, a}$.
Proof. Note that the assertion makes sense as $R\left[\frac{I}{a}\right]$ is a domain, and $R \rightarrow R\left[\frac{I}{a}\right]$ is injective, see Algebra, Lemmas 10.69 .7 and 10.69 .8 . Before we start the proof of the Lemma, note that there is no loss in generality assuming that $S=R\left[x_{1}, \ldots, x_{n}\right]$ is a polynomial ring over $R$. We also fix a presentation

$$
0 \rightarrow K \rightarrow S^{\oplus r} \rightarrow M \rightarrow 0
$$

Let $M_{A}$ be the strict transform of $M$ along $R \rightarrow A$. It is a finite module over $S_{A}=A\left[x_{1}, \ldots, x_{n}\right]$. By Lemma 15.16 .10 we see that $M_{A}$ is flat over $A$. By Lemma 15.19 .6 we see that $M_{A}$ is finitely presented. Hence there exist finitely many elements $k_{1}, \ldots, k_{t} \in S_{A}^{\oplus r}$ which generate the kernel of the presentation $S_{A}^{\oplus r} \rightarrow M_{A}$ as an $S_{A}$-module. For any choice of $a \in I \subset \mathfrak{m}$ satisfying (1), (2), and (3) we denote $M_{I, a}$ the strict transform of $M$ along $R \rightarrow R\left[\frac{I}{a}\right]$. It is a finite module over $S_{I, a}=R\left[\frac{I}{a}\right]\left[x_{1}, \ldots, x_{n}\right]$. By Algebra, Lemma 10.69 .10 we have $A=\operatorname{colim}_{I, a} R\left[\frac{I}{a}\right]$. This implies that $S_{A}=\operatorname{colim} S_{I, a}$ and $M_{A}=\operatorname{colim}_{I, a} M_{I, a}$. Thus we may choose $a \in I \subset R$ such that $k_{1}, \ldots, k_{t}$ are elements of $S_{I, a}^{\oplus r}$ and map to zero in $M_{I, a}$. For any such pair $(I, a)$ we set

$$
M_{I, a}^{\prime}=S_{I, a}^{\oplus r} / \sum S_{I, a} k_{j}
$$

Since $M_{A}=S_{A}^{\oplus r} / \sum S_{A} k_{j}$ we see that also $M_{A}=\operatorname{colim}_{I, a} M_{I, a}^{\prime}$. At this point we may apply Algebra, Lemma 10.160 .1 (3) to conclude that $M_{I, a}^{\prime}$ is flat for some pair $(I, a)$. (This lemma does not apply a priori to the system $M_{I, a}$ as the transition maps may not satisfy the assumptions of the lemma.) Since flatness implies torsion free ( Lemma 15.16.9, we also conclude that $M_{I, a}^{\prime}=M_{I, a}$ for such a pair and we win.

0BBJ Lemma 15.20.3. Let $R$ be a ring. Let $M$ be a finite $R$-module. Let $f \in R$ be an element such that $M_{f}$ is finite locally free of rank $r$. Then there exists a finitely generated ideal $I \subset R$ with $V(f)=V(I)$ such that for all $a \in I$ with $R^{\prime}=R\left[\frac{I}{a}\right]$ the strict transform

$$
M^{\prime}=\left(M \otimes_{R} R^{\prime}\right) / \text { a-power torsion }
$$

is finite locally free of rank $r$.
Proof. Choose a surjection $R^{\oplus n} \rightarrow M$. Choose a finite submodule $K \subset \operatorname{Ker}\left(R^{\oplus n} \rightarrow\right.$ $M)$ such that $R^{\oplus n} / K \rightarrow M$ becomes an isomorphism after inverting $f$. Set $M_{1}=S^{\oplus n} / K$ and suppose we can prove the lemma for $M_{1}$. Say $I \subset R$ is the corresponding ideal. Then for $a \in I$ the map

$$
M_{1}^{\prime}=\left(M_{1} \otimes_{R} R^{\prime}\right) / a \text {-power torsion } \longrightarrow M^{\prime}=\left(M \otimes_{R} R^{\prime}\right) / a \text {-power torsion }
$$

is surjective. It is also an isomorphism after inverting $a$ in $R^{\prime}$ as $R_{a}^{\prime}=R_{f}$, see Algebra, Lemma 10.69 .4 . But $a$ is a nonzerodivisor on $M_{1}^{\prime}$, whence the displayed map is an isomorphism. Thus it suffices to prove the lemma in case $M$ is a finitely presented $R$-module.
Assume $M$ is a finitely presented $R$-module. Then $J=\operatorname{Fit}_{r}(M) \subset S$ is a finitely generated ideal. We claim that $I=f J$ works.
We first check that $V(f)=V(I)$. The inclusion $V(f) \subset V(I)$ is clear. Conversely, if $f \notin \mathfrak{p}$, then $\mathfrak{p}$ is not an element of $V(J)$ by Lemma 15.6.4. Thus $\mathfrak{p} \notin V(f J)=V(I)$.
Let $a \in I$ and set $R^{\prime}=R\left[\frac{I}{a}\right]$. We may write $a=f b$ for some $b \in J$. By Algebra, Lemmas 10.69 .2 and 10.69 .5 we see that $J R^{\prime}=b R^{\prime}$ and $b$ is a nonzerodivisor in $R^{\prime}$. Let $\mathfrak{p}^{\prime} \subset R^{\prime}=R\left[\frac{I}{a}\right]$ be a prime ideal. Then $J R_{\mathfrak{p}^{\prime}}^{\prime}$ is generated by $b$. It follows from Lemma 15.6 .8 that $M_{\mathfrak{p}^{\prime}}^{\prime}$ can be generated by $r$ elements. Since $M^{\prime}$ is finite, there exist $m_{1}, \ldots, m_{r} \in M^{\prime}$ and $g \in R^{\prime}, g \notin \mathfrak{p}^{\prime}$ such that the corresponding map $\left(R^{\prime}\right)^{\oplus r} \rightarrow M^{\prime}$ becomes surjective after inverting $g$.
Finally, consider the ideal $J^{\prime}=\operatorname{Fit}_{k-1}\left(M^{\prime}\right)$. Note that $J^{\prime} R_{g}^{\prime}$ is generated by the coefficients of relations between $m_{1}, \ldots, m_{r}$ (compatibility of fitting ideal with base change). Thus it suffices to show that $J^{\prime}=0$, see Lemma 15.6.7. Since $R_{a}^{\prime}=R_{f}$ (Algebra, Lemma 10.69.4) and $M_{a}^{\prime}=M_{f}$ is free of rank $r$ we see that $J_{a}^{\prime}=0$. Since $a$ is a nonzerodivisor in $R^{\prime}$ we conclude that $J^{\prime}=0$ and we win.

### 15.21. Completion and flatness

06 LD In this section we discuss when the completion of a "big" flat module is flat.
05BC Lemma 15.21.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $A$ be a set. Assume $R$ is Noetherian and complete with respect to $I$. There is a canonical map

$$
\left(\bigoplus_{\alpha \in A} R\right)^{\wedge} \longrightarrow \prod_{\alpha \in A} R
$$

from the I-adic completion of the direct sum into the product which is universally injective.

Proof. By definition an element $x$ of the left hand side is $x=\left(x_{n}\right)$ where $x_{n}=$ $\left(x_{n, \alpha}\right) \in \bigoplus_{\alpha \in A} R / I^{n}$ such that $x_{n, \alpha}=x_{n+1, \alpha} \bmod I^{n}$. As $R=R^{\wedge}$ we see that for any $\alpha$ there exists a $y_{\alpha} \in R$ such that $x_{n, \alpha}=y_{\alpha} \bmod I^{n}$. Note that for each $n$ there are only finitely many $\alpha$ such that the elements $x_{n, \alpha}$ are nonzero. Conversely, given $\left(y_{\alpha}\right) \in \prod_{\alpha} R$ such that for each $n$ there are only finitely many $\alpha$ such that $y_{\alpha} \bmod I^{n}$ is nonzero, then this defines an element of the left hand side. Hence we can think of an element of the left hand side as infinite "convergent sums" $\sum_{\alpha} y_{\alpha}$ with $y_{\alpha} \in R$ such that for each $n$ there are only finitely many $y_{\alpha}$ which are nonzero modulo $I^{n}$. The displayed map maps this element to the element to $\left(y_{\alpha}\right)$ in the product. In particular the map is injective.
Let $Q$ be a finite $R$-module. We have to show that the map

$$
Q \otimes_{R}\left(\bigoplus_{\alpha \in A} R\right)^{\wedge} \longrightarrow Q \otimes_{R}\left(\prod_{\alpha \in A} R\right)
$$

is injective, see Algebra, Theorem 10.81.3. Choose a presentation $R^{\oplus k} \rightarrow R^{\oplus m} \rightarrow$ $Q \rightarrow 0$ and denote $q_{1}, \ldots, q_{m} \in Q$ the corresponding generators for $Q$. By ArtinRees (Algebra, Lemma 10.50.2) there exists a constant $c$ such that $\operatorname{Im}\left(R^{\oplus k} \rightarrow\right.$
$\left.R^{\oplus m}\right) \cap\left(I^{N}\right)^{\oplus m} \subset \operatorname{Im}\left(\left(I^{N-c}\right)^{\oplus k} \rightarrow R^{\oplus m}\right)$. Let us contemplate the diagram

with exact rows. Pick an element $\sum_{j} \sum_{\alpha} y_{j, \alpha}$ of $\bigoplus_{j=1, \ldots, m}\left(\bigoplus_{\alpha \in A} R\right)^{\wedge}$. If this element maps to zero in the module $Q \otimes_{R}\left(\prod_{\alpha \in A} R\right)$, then we see in particular that $\sum_{j} q_{j} \otimes y_{j, \alpha}=0$ in $Q$ for each $\alpha$. Thus we can find an element $\left(z_{1, \alpha}, \ldots, z_{k, \alpha}\right) \in$ $\bigoplus_{l=1, \ldots, k} R$ which maps to $\left(y_{1, \alpha}, \ldots, y_{m, \alpha}\right) \in \bigoplus_{j=1, \ldots, m} R$. Moreover, if $y_{j, \alpha} \in I^{N_{\alpha}}$ for $j=1, \ldots, m$, then we may assume that $z_{l, \alpha} \in I^{N_{\alpha}-c}$ for $l=1, \ldots, k$. Hence the sum $\sum_{l} \sum_{\alpha} z_{l, \alpha}$ is "convergent" and defines an element of $\bigoplus_{l=1, \ldots, k}\left(\bigoplus_{\alpha \in A} R\right)^{\wedge}$ which maps to the element $\sum_{j} \sum_{\alpha} y_{j, \alpha}$ we started out with. Thus the right vertical arrow is injective and we win.

The following lemma can also be deduced from Lemma 15.21.4 below.
06LE Lemma 15.21.2. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $A$ be a set. Assume $R$ is Noetherian. The completion $\left(\bigoplus_{\alpha \in A} R\right)^{\wedge}$ is a flat $R$-module.
Proof. Denote $R^{\wedge}$ the completion of $R$ with respect to $I$. As $R \rightarrow R^{\wedge}$ is flat by Algebra, Lemma 10.96 .2 it suffices to prove that $\left(\bigoplus_{\alpha \in A} R\right)^{\wedge}$ is a flat $R^{\wedge}$-module (use Algebra, Lemma 10.38.4). Since

$$
\left(\bigoplus_{\alpha \in A} R\right)^{\wedge}=\left(\bigoplus_{\alpha \in A} R^{\wedge}\right)^{\wedge}
$$

we may replace $R$ by $R^{\wedge}$ and assume that $R$ is complete with respect to $I$ (see Algebra, Lemma 10.96.4). In this case Lemma 15.21 .1 tells us the map $\left(\bigoplus_{\alpha \in A} R\right)^{\wedge} \rightarrow$ $\prod_{\alpha \in A} R$ is universally injective. Thus, by Algebra, Lemma 10.81 .7 it suffices to show that $\prod_{\alpha \in A} R$ is flat. By Algebra, Proposition 10.89 .5 (and Algebra, Lemma 10.89.4 we see that $\prod_{\alpha \in A} R$ is flat.

0911 Lemma 15.21.3. Let $A$ be a Noetherian ring. Let $I$ be an ideal of $A$. Let $M$ be $a$ finite A-module. For every $p>0$ there exists a $c>0$ such that $\operatorname{Tor}_{p}^{A}\left(M, A / I^{n+c}\right) \rightarrow$ $\operatorname{Tor}_{p}^{A}\left(M, A / I^{n}\right)$ is zero.
Proof. Proof for $p=1$. Choose a short exact sequence $0 \rightarrow K \rightarrow R^{\oplus t} \rightarrow M \rightarrow 0$. Then $\operatorname{Tor}_{1}^{A}\left(M, A / I^{n}\right)=K \cap\left(I^{n}\right)^{\oplus t} / I^{n} K$. By Artin-Rees (Algebra, Lemma 10.50.2) there is a constant $c \geq 0$ such that $K \cap\left(I^{n+c}\right)^{\oplus t} \subset I^{n} K$. Thus the result for $p=1$. For $p>1$ we have $\operatorname{Tor}_{p}^{A}\left(M, A / I^{n}\right)=\operatorname{Tor}_{p-1}^{A}\left(K, A / I^{n}\right)$. Thus the lemma follows by induction.

0912 Lemma 15.21.4. Let $A$ be a Noetherian ring. Let $I$ be an ideal of $A$. Let $\left(M_{n}\right)$ be an inverse system of $A$-modules such that
(1) $M_{n}$ is a flat $A / I^{n}$-module,
(2) $M_{n+1} \rightarrow M_{n}$ is surjective.

Then $M=\lim M_{n}$ is a flat A-module and $Q \otimes_{A} M=\lim Q \otimes_{A} M_{n}$ for every finite A-module $Q$.

Proof. We first show that $Q \otimes_{A} M=\lim Q \otimes_{A} M_{n}$ for every finite $A$-module $Q$. Choose a resolution $F_{2} \rightarrow F_{1} \rightarrow F_{0} \rightarrow Q \rightarrow 0$ by finite free $A$-modules $F_{i}$. Then

$$
F_{2} \otimes_{A} M_{n} \rightarrow F_{1} \otimes_{A} M_{n} \rightarrow F_{0} \otimes_{A} M_{n}
$$

is a chain complex whose homology in degree 0 is $Q \otimes_{A} M_{n}$ and whose homology in degree 1 is

$$
\operatorname{Tor}_{1}^{A}\left(Q, M_{n}\right)=\operatorname{Tor}_{1}^{A}\left(Q, A / I^{n}\right) \otimes_{A / I^{n}} M_{n}
$$

as $M_{n}$ is flat over $A / I^{n}$. By Lemma 15.21 .3 we see that this system is essentially constant (with value 0). It follows from Homology, Lemma 12.27 .7 that $\lim Q \otimes_{A}$ $A / I^{n}=\operatorname{Coker}\left(\lim F_{1} \otimes_{A} M_{n} \rightarrow \lim F_{0} \otimes_{A} M_{n}\right)$. Since $F_{i}$ is finite free this equals $\operatorname{Coker}\left(F_{1} \otimes_{A} M \rightarrow F_{0} \otimes_{A} M\right)=Q \otimes_{A} M$.

Next, let $Q \rightarrow Q^{\prime}$ be an injective map of finite $A$-modules. We have to show that $Q \otimes_{A} M \rightarrow Q^{\prime} \otimes_{A} M$ is injective (Algebra, Lemma 10.38.5). By the above we see

$$
\operatorname{Ker}\left(Q \otimes_{A} M \rightarrow Q^{\prime} \otimes_{A} M\right)=\operatorname{Ker}\left(\lim Q \otimes_{A} M_{n} \rightarrow \lim Q^{\prime} \otimes_{A} M_{n}\right)
$$

For each $n$ we have an exact sequence

$$
\operatorname{Tor}_{1}^{A}\left(Q^{\prime}, M_{n}\right) \rightarrow \operatorname{Tor}_{1}^{A}\left(Q^{\prime \prime}, M_{n}\right) \rightarrow Q \otimes_{A} M_{n} \rightarrow Q^{\prime} \otimes_{A} M_{n}
$$
