## Contents

Chapter 1. Introduction ..... 58
1.1. Overview ..... 58
1.2. Attribution ..... 58
1.3. Other chapters ..... 59
Chapter 2. Conventions ..... 61
2.1. Comments ..... 61
2.2. Set theory ..... 61
2.3. Categories ..... 61
2.4. Algebra ..... 61
2.5. Notation ..... 61
2.6. Other chapters ..... 61
Chapter 3. Set Theory ..... 63
3.1. Introduction ..... 63
3.2. Everything is a set ..... 63
3.3. Classes ..... 63
3.4. Ordinals ..... 64
3.5. The hierarchy of sets ..... 64
3.6. Cardinality ..... 64
3.7. Cofinality ..... 65
3.8. Reflection principle ..... 65
3.9. Constructing categories of schemes ..... 66
3.10. Sets with group action ..... 71
3.11. Coverings of a site ..... 72
3.12. Abelian categories and injectives ..... 74
3.13. Other chapters ..... 74
Chapter 4. Categories ..... 76
4.1. Introduction ..... 76
4.2. Definitions ..... 76
4.3. Opposite Categories and the Yoneda Lemma ..... 80
4.4. Products of pairs ..... 81
4.5. Coproducts of pairs ..... 82
4.6. Fibre products ..... 82
4.7. Examples of fibre products ..... 84
4.8. Fibre products and representability ..... 84
4.9. Pushouts ..... 85
4.10. Equalizers ..... 86
4.11. Coequalizers ..... 86
4.12. Initial and final objects ..... 87
4.13. Monomorphisms and Epimorphisms ..... 87
4.14. Limits and colimits ..... 87
4.15. Limits and colimits in the category of sets ..... 90
4.16. Connected limits ..... 90
4.17. Cofinal and initial categories ..... 91
4.18. Finite limits and colimits ..... 93
4.19. Filtered colimits ..... 95
4.20. Cofiltered limits ..... 99
4.21. Limits and colimits over partially ordered sets ..... 99
4.22. Essentially constant systems ..... 102
4.23. Exact functors ..... 105
4.24. Adjoint functors ..... 105
4.25. A criterion for representability ..... 107
4.26. Localization in categories ..... 109
4.27. Formal properties ..... 121
4.28. 2-categories ..... 123
4.29. $(2,1)$-categories ..... 125
4.30. 2-fibre products ..... 126
4.31. Categories over categories ..... 132
4.32. Fibred categories ..... 133
4.33. Inertia ..... 139
4.34. Categories fibred in groupoids ..... 141
4.35. Presheaves of categories ..... 148
4.36. Presheaves of groupoids ..... 149
4.37. Categories fibred in sets ..... 151
4.38. Categories fibred in setoids ..... 152
4.39. Representable categories fibred in groupoids ..... 155
4.40. Representable 1-morphisms ..... 156
4.41. Other chapters ..... 159
Chapter 5. Topology ..... 161
5.1. Introduction ..... 161
5.2. Basic notions ..... 161
5.3. Hausdorff spaces ..... 162
5.4. Bases ..... 162
5.5. Submersive maps ..... 163
5.6. Connected components ..... 164
5.7. Irreducible components ..... 166
5.8. Noetherian topological spaces ..... 170
5.9. Krull dimension ..... 171
5.10. Codimension and catenary spaces ..... 172
5.11. Quasi-compact spaces and maps ..... 173
5.12. Locally quasi-compact spaces ..... 177
5.13. Limits of spaces ..... 179
5.14. Constructible sets ..... 181
5.15. Constructible sets and Noetherian spaces ..... 184
5.16. Characterizing proper maps ..... 185
5.17. Jacobson spaces ..... 188
5.18. Specialization ..... 190
5.19. Dimension functions ..... 192
5.20. Nowhere dense sets ..... 194
5.21. Profinite spaces ..... 195
5.22. Spectral spaces ..... 196
5.23. Limits of spectral spaces ..... 201
5.24. Stone-Cech compactification ..... 205
5.25. Extremally disconnected spaces ..... 206
5.26. Miscellany ..... 208
5.27. Partitions and stratifications ..... 209
5.28. Colimits of spaces ..... 210
5.29. Topological groups, rings, modules ..... 211
5.30. Other chapters ..... 214
Chapter 6. Sheaves on Spaces ..... 216
6.1. Introduction ..... 216
6.2. Basic notions ..... 216
6.3. Presheaves ..... 216
6.4. Abelian presheaves ..... 217
6.5. Presheaves of algebraic structures ..... 218
6.6. Presheaves of modules ..... 219
6.7. Sheaves ..... 220
6.8. Abelian sheaves ..... 222
6.9. Sheaves of algebraic structures ..... 222
6.10. Sheaves of modules ..... 224
6.11. Stalks ..... 224
6.12. Stalks of abelian presheaves ..... 225
6.13. Stalks of presheaves of algebraic structures ..... 226
6.14. Stalks of presheaves of modules ..... 226
6.15. Algebraic structures ..... 227
6.16. Exactness and points ..... 228
6.17. Sheafification ..... 229
6.18. Sheafification of abelian presheaves ..... 231
6.19. Sheafification of presheaves of algebraic structures ..... 232
6.20. Sheafification of presheaves of modules ..... 233
6.21. Continuous maps and sheaves ..... 234
6.22. Continuous maps and abelian sheaves ..... 238
6.23. Continuous maps and sheaves of algebraic structures ..... 239
6.24. Continuous maps and sheaves of modules ..... 241
6.25. Ringed spaces ..... 244
6.26. Morphisms of ringed spaces and modules ..... 244
6.27. Skyscraper sheaves and stalks ..... 246
6.28. Limits and colimits of presheaves ..... 247
6.29. Limits and colimits of sheaves ..... 247
6.30. Bases and sheaves ..... 250
6.31. Open immersions and (pre)sheaves ..... 257
6.32. Closed immersions and (pre)sheaves ..... 262
6.33. Glueing sheaves ..... 263
6.34. Other chapters ..... 265
Chapter 7. Sites and Sheaves ..... 267
7.1. Introduction ..... 267
7.2. Presheaves ..... 267
7.3. Injective and surjective maps of presheaves ..... 268
7.4. Limits and colimits of presheaves ..... 269
7.5. Functoriality of categories of presheaves ..... 269
7.6. Sites ..... 272
7.7. Sheaves ..... 273
7.8. Families of morphisms with fixed target ..... 275
7.9. The example of G-sets ..... 278
7.10. Sheafification ..... 280
7.11. Quasi-compact objects and colimits ..... 285
7.12. Injective and surjective maps of sheaves ..... 288
7.13. Representable sheaves ..... 289
7.14. Continuous functors ..... 290
7.15. Morphisms of sites ..... 292
7.16. Topoi ..... 293
7.17. G-sets and morphisms ..... 295
7.18. More functoriality of presheaves ..... 296
7.19. Cocontinuous functors ..... 298
7.20. Cocontinuous functors and morphisms of topoi ..... 300
7.21. Cocontinuous functors which have a right adjoint ..... 304
7.22. Cocontinuous functors which have a left adjoint ..... 304
7.23. Existence of lower shriek ..... 305
7.24. Localization ..... 306
7.25. Glueing sheaves ..... 309
7.26. More localization ..... 310
7.27. Localization and morphisms ..... 312
7.28. Morphisms of topoi ..... 315
7.29. Localization of topoi ..... 321
7.30. Localization and morphisms of topoi ..... 323
7.31. Points ..... 325
7.32. Constructing points ..... 329
7.33. Points and morphisms of topoi ..... 331
7.34. Localization and points ..... 333
7.35. 2-morphisms of topoi ..... 335
7.36. Morphisms between points ..... 336
7.37. Sites with enough points ..... 336
7.38. Criterion for existence of points ..... 338
7.39. Weakly contractible objects ..... 340
7.40. Exactness properties of pushforward ..... 341
7.41. Almost cocontinuous functors ..... 345
7.42. Subtopoi ..... 347
7.43. Sheaves of algebraic structures ..... 349
7.44. Pullback maps ..... 352
7.45. Topologies ..... 353
7.46. The topology defined by a site ..... 356
7.47. Sheafification in a topology ..... 358
7.48. Topologies and sheaves ..... 361
7.49. Topologies and continuous functors ..... 362
7.50. Points and topologies ..... 362
7.51. Other chapters ..... 362
Chapter 8. Stacks ..... 364
8.1. Introduction ..... 364
8.2. Presheaves of morphisms associated to fibred categories ..... 364
8.3. Descent data in fibred categories ..... 366
8.4. Stacks ..... 368
8.5. Stacks in groupoids ..... 372
8.6. Stacks in setoids ..... 373
8.7. The inertia stack ..... 375
8.8. Stackification of fibred categories ..... 376
8.9. Stackification of categories fibred in groupoids ..... 380
8.10. Inherited topologies ..... 381
8.11. Gerbes ..... 383
8.12. Functoriality for stacks ..... 386
8.13. Stacks and localization ..... 394
8.14. Other chapters ..... 395
Chapter 9. Fields ..... 397
9.1. Introduction ..... 397
9.2. Basic definitions ..... 397
9.3. Examples of fields ..... 397
9.4. Vector spaces ..... 398
9.5. The characteristic of a field ..... 399
9.6. Field extensions ..... 399
9.7. Finite extensions ..... 401
9.8. Algebraic extensions ..... 403
9.9. Minimal polynomials ..... 405
9.10. Algebraic closure ..... 406
9.11. Relatively prime polynomials ..... 408
9.12. Separable extensions ..... 408
9.13. Purely inseparable extensions ..... 411
9.14. Normal extensions ..... 414
9.15. Splitting fields ..... 416
9.16. Roots of unity ..... 417
9.17. Finite fields ..... 418
9.18. Primitive elements ..... 418
9.19. Trace and norm ..... 419
9.20. Galois theory ..... 422
9.21. Infinite Galois theory ..... 424
9.22 . The complex numbers ..... 426
9.23. Kummer extensions ..... 426
9.24. Artin-Schreier extensions ..... 427
9.25. Transcendence ..... 427
9.26. Linearly disjoint extensions ..... 429
9.27 . Review ..... 430
9.28. Other chapters ..... 431
Chapter 10. Commutative Algebra ..... 433
10.1. Introduction ..... 433
10.2. Conventions ..... 433
10.3. Basic notions ..... 433
10.4. Snake lemma ..... 435
10.5. Finite modules and finitely presented modules ..... 436
10.6. Ring maps of finite type and of finite presentation ..... 438
10.7. Finite ring maps ..... 439
10.8. Colimits ..... 439
10.9. Localization ..... 443
10.10. Internal Hom ..... 448
10.11. Tensor products ..... 449
10.12. Tensor algebra ..... 453
10.13. Base change ..... 455
10.14. Miscellany ..... 456
10.15. Cayley-Hamilton ..... 458
10.16. The spectrum of a ring ..... 460
10.17. Local rings ..... 464
10.18. The Jacobson radical of a ring ..... 465
10.19. Nakayama's lemma ..... 466
10.20. Open and closed subsets of spectra ..... 467
10.21. Connected components of spectra ..... 468
10.22. Glueing functions ..... 469
10.23. More glueing results ..... 472
10.24. Zerodivisors and total rings of fractions ..... 475
10.25. Irreducible components of spectra ..... 476
10.26. Examples of spectra of rings ..... 477
10.27. A meta-observation about prime ideals ..... 480
10.28. Images of ring maps of finite presentation ..... 483
10.29. More on images ..... 486
10.30. Noetherian rings ..... 488
10.31. Locally nilpotent ideals ..... 490
10.32. Curiosity ..... 491
10.33. Hilbert Nullstellensatz ..... 492
10.34. Jacobson rings ..... 493
10.35. Finite and integral ring extensions ..... 501
10.36. Normal rings ..... 505
10.37. Going down for integral over normal ..... 509
10.38. Flat modules and flat ring maps ..... 510
10.39. Supports and annihilators ..... 517
10.40. Going up and going down ..... 519
10.41. Separable extensions ..... 522
10.42. Geometrically reduced algebras ..... 524
10.43. Separable extensions, continued ..... 526
10.44. Perfect fields ..... 527
10.45. Universal homeomorphisms ..... 528
10.46. Geometrically irreducible algebras ..... 533

10.151. Constructing flat ring maps ..... 828
10.152. The Cohen structure theorem ..... 829
10.153. Japanese rings ..... 832
10.154. Nagata rings ..... 837
10.155. Ascending properties ..... 844
10.156. Descending properties ..... 847
10.157. Geometrically normal algebras ..... 849
10.158. Geometrically regular algebras ..... 850
10.159. Geometrically Cohen-Macaulay algebras ..... 852
10.160. Colimits and maps of finite presentation, II ..... 853
10.161. Other chapters ..... 856
Chapter 11. Brauer groups ..... 859
11.1. Introduction ..... 859
11.2. Noncommutative algebras ..... 859
11.3. Wedderburn's theorem ..... 859
11.4. Lemmas on algebras ..... 860
11.5. The Brauer group of a field ..... 862
11.6. Skolem-Noether ..... 863
11.7. The centralizer theorem ..... 864
11.8. Splitting fields ..... 865
11.9. Other chapters ..... 866
Chapter 12. Homological Algebra ..... 869
12.1. Introduction ..... 869
12.2. Basic notions ..... 869
12.3. Preadditive and additive categories ..... 869
12.4. Karoubian categories ..... 872
12.5. Abelian categories ..... 873
12.6. Extensions ..... 879
12.7. Additive functors ..... 881
12.8. Localization ..... 883
12.9. Serre subcategories ..... 885
12.10. K-groups ..... 888
12.11. Cohomological delta-functors ..... 890
12.12. Complexes ..... 892
12.13. Truncation of complexes ..... 896
12.14. Homotopy and the shift functor ..... 898
12.15. Graded objects ..... 901
12.16. Filtrations ..... 902
12.17. Spectral sequences ..... 908
12.18. Spectral sequences: exact couples ..... 909
12.19. Spectral sequences: differential objects ..... 911
12.20. Spectral sequences: filtered differential objects ..... 913
12.21. Spectral sequences: filtered complexes ..... 916
12.22. Spectral sequences: double complexes ..... 922
12.23. Injectives ..... 926
12.24. Projectives ..... 927
12.25. Injectives and adjoint functors ..... 928
12.26. Essentially constant systems ..... 930
12.27. Inverse systems ..... 931
12.28. Exactness of products ..... 935
12.29. Other chapters ..... 935
Chapter 13. Derived Categories ..... 937
13.1. Introduction ..... 937
13.2. Triangulated categories ..... 937
13.3. The definition of a triangulated category ..... 937
13.4. Elementary results on triangulated categories ..... 940
13.5. Localization of triangulated categories ..... 947
13.6. Quotients of triangulated categories ..... 953
13.7. Adjoints for exact functors ..... 959
13.8. The homotopy category ..... 960
13.9. Cones and termwise split sequences ..... 960
13.10. Distinguished triangles in the homotopy category ..... 967
13.11. Derived categories ..... 969
13.12. The canonical delta-functor ..... 972
13.13. Triangulated subcategories of the derived category ..... 975
13.14. Filtered derived categories ..... 976
13.15. Derived functors in general ..... 979
13.16. Derived functors on derived categories ..... 987
13.17. Higher derived functors ..... 990
13.18. Injective resolutions ..... 994
13.19. Projective resolutions ..... 998
13.20. Right derived functors and injective resolutions ..... 1001
13.21. Cartan-Eilenberg resolutions ..... 1002
13.22. Composition of right derived functors ..... 1004
13.23. Resolution functors ..... 1005
13.24. Functorial injective embeddings and resolution functors ..... 1007
13.25. Right derived functors via resolution functors ..... 1009
13.26. Filtered derived category and injective resolutions ..... 1009
13.27. Ext groups ..... 1017
13.28. Unbounded complexes ..... 1020
13.29. K-injective complexes ..... 1023
13.30. Bounded cohomological dimension ..... 1025
13.31. Derived colimits ..... 1027
13.32. Derived limits ..... 1029
13.33. Generators of triangulated categories ..... 1031
13.34. Compact objects ..... 1032
13.35. Brown representability ..... 1034
13.36. Other chapters ..... 1035
Chapter 14. Simplicial Methods ..... 1037
14.1. Introduction ..... 1037
14.2. The category of finite ordered sets ..... 1037
14.3. Simplicial objects ..... 1039
14.4. Simplicial objects as presheaves ..... 1040
14.5. Cosimplicial objects ..... 1041
14.6. Products of simplicial objects ..... 1042
14.7. Fibre products of simplicial objects ..... 1043
14.8. Pushouts of simplicial objects ..... 1043
14.9. Products of cosimplicial objects ..... 1044
14.10. Fibre products of cosimplicial objects ..... 1044
14.11. Simplicial sets ..... 1045
14.12. Truncated simplicial objects and skeleton functors ..... 1046
14.13. Products with simplicial sets ..... 1046
14.14. Hom from simplicial sets into cosimplicial objects ..... 1048
14.15. Hom from cosimplicial sets into simplicial objects ..... 1048
14.16. Internal Hom ..... 1049
14.17. Hom from simplicial sets into simplicial objects ..... 1050
14.18. Splitting simplicial objects ..... 1054
14.19. Coskeleton functors ..... 1057
14.20. Augmentations ..... 1064
14.21. Left adjoints to the skeleton functors ..... 1065
14.22. Simplicial objects in abelian categories ..... 1068
14.23. Simplicial objects and chain complexes ..... 1072
14.24. Dold-Kan ..... 1075
14.25. Dold-Kan for cosimplicial objects ..... 1078
14.26. Homotopies ..... 1079
14.27. Homotopies in abelian categories ..... 1082
14.28. Homotopies and cosimplicial objects ..... 1083
14.29. More homotopies in abelian categories ..... 1084
14.30. Trivial Kan fibrations ..... 1088
14.31. Kan fibrations ..... 1090
14.32. A homotopy equivalence ..... 1094
14.33. Standard resolutions ..... 1096
14.34. Other chapters ..... 1100
Chapter 15. More on Algebra ..... 1102
15.1. Introduction ..... 1102
15.2. Advice for the reader ..... 1102
15.3. Stably free modules ..... 1102
15.4. A comment on the Artin-Rees property ..... 1103
15.5. Fibre products of rings ..... 1105
15.6. Fitting ideals ..... 1113
15.7. Lifting ..... 1115
15.8. Henselian pairs ..... 1121
15.9. Auto-associated rings ..... 1128
15.10. Flattening stratification ..... 1129

| 15.11 | Flattening over an Artinian ring | 1130 |
| :---: | :---: | :---: |
| 15.12 | Flattening over a closed subset of the base | 1131 |
| 15.13 | Flattening over a closed subsets of source and base | 1132 |
| 15.14 | Flattening over a Noetherian complete local ring | 1134 |
| 15.15 | Descent flatness along integral maps | 1135 |
| 15.16 | Torsion free modules | 1137 |
| 15.17 | Reflexive modules | 1139 |
| 15.18 | Content ideals | 1143 |
| 15.19 | Flatness and finiteness conditions | 1144 |
| 15.20 | Blowing up and flatness | 1146 |
| 15.21 | Completion and flatness | 1148 |
| 15.22 | The Koszul complex | 1150 |
| 15.23 | Koszul regular sequences | 1154 |
| 15.24 | Regular ideals | 1160 |
| 15.25 | Local complete intersection maps | 1162 |
| 15.26 | Cartier's equality and geometric regularity | 1164 |
| 15.27 | Geometric regularity | 1165 |
| 15.28 | Topological rings and modules | 1167 |
| 15.29 | Formally smooth maps of topological rings | 1169 |
| 15.30 | Some results on power series rings | 1174 |
| 15.31 | Geometric regularity and formal smoothness | 1176 |
| 15.32 | Regular ring maps | 1181 |
| 15.33 | Ascending properties along regular ring maps | 1182 |
| 15.34 | Permanence of properties under completion | 1183 |
| 15.35 | Permanence of properties under étale maps | 1184 |
| 15.36 | Permanence of properties under henselization | 1185 |
| 15.37 | Field extensions, revisited | 1188 |
| 15.38 | The singular locus | 1191 |
| 15.39 | Regularity and derivations | 1192 |
| 15.40 | Formal smoothness and regularity | 1194 |
| 15.41 | G-rings | 1196 |
| 15.42 | Properties of formal fibres | 1202 |
| 15.43 | Excellent rings | 1206 |
| 15.44 | Abelian categories of modules | 1208 |
| 15.45 | Injective abelian groups | 1208 |
| 15.46 | Injective modules | 1209 |
| 15.47 | Derived categories of modules | 1211 |
| 15.48 | Computing Tor | 1212 |
| 15.49 | Derived tensor product | 1213 |
| 15.50 | Derived change of rings | 1216 |
| 15.51 | Tor independence | 1218 |
| 15.52 | Spectral sequences for Tor | 1219 |
| 15.53 | Products and Tor | 1220 |
| 15.54 | Pseudo-coherent modules | 1222 |
| 15.55 | Tor dimension | 1229 |
| 15.56 | Spectral sequences for Ext | 1233 |
| 15.57 | Projective dimension | 1233 |
| 15.58 | Injective dimension | 1235 |

15.59. Hom complexes ..... 1237
15.60. Derived hom ..... 1240
15.61. Perfect complexes ..... 1242
15.62. Lifting complexes ..... 1246
15.63. Splitting complexes ..... 1249
15.64. Characterizing perfect complexes ..... 1254
15.65. Relatively finitely presented modules ..... 1258
15.66. Relatively pseudo-coherent modules ..... 1261
15.67. Pseudo-coherent and perfect ring maps ..... 1266
15.68. Rlim of abelian groups and modules ..... 1267
15.69. Torsion modules ..... 1275
15.70. Formal glueing of module categories ..... 1277
15.71. The Beauville-Laszlo theorem ..... 1285
15.72. Derived Completion ..... 1293
15.73. Derived completion for a principal ideal ..... 1300
15.74. Derived completion for Noetherian rings ..... 1302
15.75. Taking limits of complexes ..... 1304
15.76. Some evaluation maps ..... 1305
15.77. Miscellany ..... 1307
15.78. Weakly étale ring maps ..... 1310
15.79. Local irreducibility ..... 1316
15.80. Group actions and integral closure ..... 1319
15.81. Ramification theory ..... 1322
15.82. Eliminating ramification ..... 1327
15.83. Picard groups of rings ..... 1346
15.84. Extensions of valuation rings ..... 1349
15.85. Structure of modules over a PID ..... 1352
15.86. Other chapters ..... 1355
Chapter 16. Smoothing Ring Maps ..... 1357
16.1. Introduction ..... 1357
16.2. Colimits ..... 1358
16.3. Singular ideals ..... 1359
16.4. Presentations of algebras ..... 1361
16.5. Intermezzo: Néron desingularization ..... 1366
16.6. The lifting problem ..... 1369
16.7. The lifting lemma ..... 1372
16.8. The desingularization lemma ..... 1374
16.9. Warmup: reduction to a base field ..... 1377
16.10. Local tricks ..... 1378
16.11. Separable residue fields ..... 1380
16.12. Inseparable residue fields ..... 1382
16.13. The main theorem ..... 1388
16.14. The approximation property for G-rings ..... 1388
16.15. Approximation for henselian pairs ..... 1390
16.16. Other chapters ..... 1391
Chapter 17. Sheaves of Modules ..... 1393
17.1. Introduction ..... 1393
17.2. Pathology ..... 1393
17.3. The abelian category of sheaves of modules ..... 1393
17.4. Sections of sheaves of modules ..... 1396
17.5. Supports of modules and sections ..... 1397
17.6. Closed immersions and abelian sheaves ..... 1398
17.7. A canonical exact sequence ..... 1399
17.8. Modules locally generated by sections ..... 1399
17.9. Modules of finite type ..... 1400
17.10. Quasi-coherent modules ..... 1401
17.11. Modules of finite presentation ..... 1405
17.12. Coherent modules ..... 1407
17.13. Closed immersions of ringed spaces ..... 1409
17.14. Locally free sheaves ..... 1411
17.15. Tensor product ..... 1412
17.16. Flat modules ..... 1414
17.17. Flat morphisms of ringed spaces ..... 1416
17.18. Symmetric and exterior powers ..... 1417
17.19. Internal Hom ..... 1419
17.20. Koszul complexes ..... 1420
17.21. Invertible modules ..... 1420
17.22. Rank and determinant ..... 1424
17.23. Localizing sheaves of rings ..... 1425
17.24. Modules of differentials ..... 1426
17.25. The naive cotangent complex ..... 1430
17.26. Other chapters ..... 1432
Chapter 18. Modules on Sites ..... 1434
18.1. Introduction ..... 1434
18.2. Abelian presheaves ..... 1434
18.3. Abelian sheaves ..... 1435
18.4. Free abelian presheaves ..... 1436
18.5. Free abelian sheaves ..... 1437
18.6. Ringed sites ..... 1438
18.7. Ringed topoi ..... 1438
18.8. 2-morphisms of ringed topoi ..... 1439
18.9. Presheaves of modules ..... 1440
18.10. Sheaves of modules ..... 1441
18.11. Sheafification of presheaves of modules ..... 1441
18.12. Morphisms of topoi and sheaves of modules ..... 1443
18.13. Morphisms of ringed topoi and modules ..... 1444
18.14. The abelian category of sheaves of modules ..... 1445
18.15. Exactness of pushforward ..... 1447
18.16. Exactness of lower shriek ..... 1448
18.17. Global types of modules ..... 1450
18.18. Intrinsic properties of modules ..... 1451
18.19. Localization of ringed sites ..... 1452
18.20. Localization of morphisms of ringed sites ..... 1454
18.21. Localization of ringed topoi ..... 1455
18.22. Localization of morphisms of ringed topoi ..... 1457
18.23. Local types of modules ..... 1459
18.24. Basic results on local types of modules ..... 1462
18.25. Closed immersions of ringed topoi ..... 1463
18.26. Tensor product ..... 1464
18.27. Internal Hom ..... 1465
18.28. Flat modules ..... 1467
18.29. Towards constructible modules ..... 1471
18.30. Flat morphisms ..... 1475
18.31. Invertible modules ..... 1475
18.32. Modules of differentials ..... 1477
18.33. Finite order differential operators ..... 1481
18.34. The naive cotangent complex ..... 1483
18.35. Stalks of modules ..... 1485
18.36. Skyscraper sheaves ..... 1487
18.37. Localization and points ..... 1488
18.38. Pullbacks of flat modules ..... 1488
18.39. Locally ringed topoi ..... 1489
18.40. Lower shriek for modules ..... 1495
18.41. Constant sheaves ..... 1496
18.42. Locally constant sheaves ..... 1497
18.43. Other chapters ..... 1500
Chapter 19. Injectives ..... 1502
19.1. Introduction ..... 1502
19.2. Baer's argument for modules ..... 1502
19.3. G-modules ..... 1506
19.4. Abelian sheaves on a space ..... 1507
19.5. Sheaves of modules on a ringed space ..... 1507
19.6. Abelian presheaves on a category ..... 1508
19.7. Abelian Sheaves on a site ..... 1509
19.8. Modules on a ringed site ..... 1511
19.9. Embedding abelian categories ..... 1512
19.10. Grothendieck's AB conditions ..... 1514
19.11. Injectives in Grothendieck categories ..... 1515
19.12. K-injectives in Grothendieck categories ..... 1517
19.13. Additional remarks on Grothendieck abelian categories ..... 1520
19.14. Other chapters ..... 1524
Chapter 20. Cohomology of Sheaves ..... 1526
20.1. Introduction ..... 1526
20.2. Topics ..... 1526
20.3. Cohomology of sheaves ..... 1526
20.4. Derived functors ..... 1527
20.5. First cohomology and torsors ..... 1528
20.6. First cohomology and extensions ..... 1529
20.7. First cohomology and invertible sheaves ..... 1529
20.8. Locality of cohomology ..... 1530
20.9. Mayer-Vietoris ..... 1532
20.10. The Cech complex and Čech cohomology ..... 1533
20.11. Cech cohomology as a functor on presheaves ..... 1534
20.12. Cech cohomology and cohomology ..... 1538
20.13. Flasque sheaves ..... 1542
20.14. The Leray spectral sequence ..... 1544
20.15. Functoriality of cohomology ..... 1546
20.16. Refinements and Cech cohomology ..... 1547
20.17. Cohomology on Hausdorff quasi-compact spaces ..... 1549
20.18. The base change map ..... 1551
20.19. Proper base change in topology ..... 1552
20.20. Cohomology and colimits ..... 1553
20.21. Vanishing on Noetherian topological spaces ..... 1555
20.22. Cohomology with support in a closed ..... 1558
20.23. Cohomology on spectral spaces ..... 1560
20.24. The alternating Cech complex ..... 1562
20.25. Alternative view of the Cech complex ..... 1565
20.26. Cech cohomology of complexes ..... 1567
20.27. Flat resolutions ..... 1575
20.28. Derived pullback ..... 1578
20.29. Cohomology of unbounded complexes ..... 1579
20.30. Unbounded Mayer-Vietoris ..... 1582
20.31. Derived limits ..... 1586
20.32. Producing K-injective resolutions ..... 1588
20.33. Cech cohomology of unbounded complexes ..... 1590
20.34. Hom complexes ..... 1591
20.35. Internal hom in the derived category ..... 1593
20.36. Ext sheaves ..... 1596
20.37. Global derived hom ..... 1597
20.38. Strictly perfect complexes ..... 1597
20.39. Pseudo-coherent modules ..... 1600
20.40. Tor dimension ..... 1603
20.41. Perfect complexes ..... 1605
20.42. Compact objects ..... 1608
20.43. Projection formula ..... 1608
20.44. Other chapters ..... 1610
Chapter 21. Cohomology on Sites ..... 1612
21.1. Introduction ..... 1612
21.2. Topics ..... 1612
21.3. Cohomology of sheaves ..... 1612
21.4. Derived functors ..... 1613
21.5. First cohomology and torsors ..... 1614
21.6. First cohomology and extensions ..... 1615
21.7. First cohomology and invertible sheaves ..... 1616
21.8. Locality of cohomology ..... 1617
21.9. The Cech complex and Cech cohomology ..... 1619
21.10. Cech cohomology as a functor on presheaves ..... 1620
21.11. Cech cohomology and cohomology ..... 1624
21.12. Cohomology of modules ..... 1627
21.13. Limp sheaves ..... 1629
21.14. The Leray spectral sequence ..... 1631
21.15. The base change map ..... 1632
21.16. Cohomology and colimits ..... 1633
21.17. Flat resolutions ..... 1635
21.18. Derived pullback ..... 1638
21.19. Cohomology of unbounded complexes ..... 1640
21.20. Some properties of K-injective complexes ..... 1641
21.21. Derived and homotopy limits ..... 1642
21.22. Producing K-injective resolutions ..... 1646
21.23. Cohomology on Hausdorff and locally quasi-compact spaces ..... 1649
21.24. Spectral sequences for Ext ..... 1653
21.25. Hom complexes ..... 1653
21.26. Internal hom in the derived category ..... 1655
21.27. Global derived hom ..... 1658
21.28. Derived lower shriek ..... 1659
21.29. Derived lower shriek for fibred categories ..... 1661
21.30. Homology on a category ..... 1664
21.31. Calculating derived lower shriek ..... 1669
21.32. Simplicial modules ..... 1671
21.33. Cohomology on a category ..... 1673
21.34. Strictly perfect complexes ..... 1674
21.35. Pseudo-coherent modules ..... 1678
21.36. Tor dimension ..... 1681
21.37. Perfect complexes ..... 1683
21.38. Projection formula ..... 1686
21.39. Weakly contractible objects ..... 1686
21.40. Compact objects ..... 1688
21.41. Complexes with locally constant cohomology sheaves ..... 1690
21.42. Other chapters ..... 1692
Chapter 22. Differential Graded Algebra ..... 1694
22.1. Introduction ..... 1694
22.2. Conventions ..... 1694
22.3. Differential graded algebras ..... 1694
22.4. Differential graded modules ..... 1695
22.5. The homotopy category ..... 1697
22.6. Cones ..... 1698
22.7. Admissible short exact sequences ..... 1698
22.8. Distinguished triangles ..... 1700
22.9. Cones and distinguished triangles ..... 1701
22.10. The homotopy category is triangulated ..... 1703
22.11. Projective modules over algebras ..... 1705
22.12. Injective modules over algebras ..... 1706
22.13. P-resolutions ..... 1709
22.14. I-resolutions ..... 1711
22.15. The derived category ..... 1713
22.16. The canonical delta-functor ..... 1715
22.17. Linear categories ..... 1716
22.18. Graded categories ..... 1716
22.19. Differential graded categories ..... 1718
22.20. Obtaining triangulated categories ..... 1722
22.21. Derived Hom ..... 1733
22.22. Variant of derived Hom ..... 1734
22.23. Tensor product ..... 1735
22.24. Derived tensor product ..... 1736
22.25. Variant of derived tensor product ..... 1739
22.26. Characterizing compact objects ..... 1741
22.27. Equivalences of derived categories ..... 1745
22.28. Other chapters ..... 1749
Chapter 23. Divided Power Algebra ..... 1751
23.1. Introduction ..... 1751
23.2. Divided powers ..... 1751
23.3. Divided power rings ..... 1754
23.4. Extending divided powers ..... 1756
23.5. Divided power polynomial algebras ..... 1758
23.6. Tate resolutions ..... 1760
23.7. Application to complete intersections ..... 1765
23.8. Local complete intersection rings ..... 1767
23.9. Local complete intersection maps ..... 1771
23.10. Other chapters ..... 1774
Chapter 24. Hypercoverings ..... 1776
24.1. Introduction ..... 1776
24.2. Hypercoverings ..... 1776
24.3. Acyclicity ..... 1780
24.4. Cech cohomology and hypercoverings ..... 1783
24.5. Hypercoverings a la Verdier ..... 1785
24.6. Covering hypercoverings ..... 1787
24.7. Adding simplices ..... 1790
24.8. Homotopies ..... 1791
24.9. Cohomology and hypercoverings ..... 1793
24.10. Hypercoverings of spaces ..... 1797
24.11. Hypercoverings and weakly contractible objects ..... 1799
24.12. Other chapters ..... 1800
Chapter 25. Schemes ..... 1802
25.1. Introduction ..... 1802
25.2. Locally ringed spaces ..... 1802
25.3. Open immersions of locally ringed spaces ..... 1803
25.4. Closed immersions of locally ringed spaces ..... 1805
25.5. Affine schemes ..... 1806
25.6. The category of affine schemes ..... 1809
25.7. Quasi-coherent sheaves on affines ..... 1812
25.8. Closed subspaces of affine schemes ..... 1816
25.9. Schemes ..... 1816
25.10. Immersions of schemes ..... 1817
25.11. Zariski topology of schemes ..... 1818
25.12. Reduced schemes ..... 1820
25.13. Points of schemes ..... 1821
25.14. Glueing schemes ..... 1823
25.15. A representability criterion ..... 1826
25.16. Existence of fibre products of schemes ..... 1828
25.17. Fibre products of schemes ..... 1830
25.18. Base change in algebraic geometry ..... 1832
25.19. Quasi-compact morphisms ..... 1834
25.20. Valuative criterion for universal closedness ..... 1836
25.21. Separation axioms ..... 1838
25.22. Valuative criterion of separatedness ..... 1843
25.23. Monomorphisms ..... 1844
25.24. Functoriality for quasi-coherent modules ..... 1845
25.25. Other chapters ..... 1847
Chapter 26. Constructions of Schemes ..... 1849
26.1. Introduction ..... 1849
26.2. Relative glueing ..... 1849
26.3. Relative spectrum via glueing ..... 1852
26.4. Relative spectrum as a functor ..... 1853
26.5. Affine n-space ..... 1855
26.6. Vector bundles ..... 1856
26.7. Cones ..... 1857
26.8. Proj of a graded ring ..... 1857
26.9. Quasi-coherent sheaves on Proj ..... 1863
26.10. Invertible sheaves on Proj ..... 1865
26.11. Functoriality of Proj ..... 1868
26.12. Morphisms into Proj ..... 1871
26.13. Projective space ..... 1875
26.14. Invertible sheaves and morphisms into Proj ..... 1879
26.15. Relative Proj via glueing ..... 1880
26.16. Relative Proj as a functor ..... 1882
26.17. Quasi-coherent sheaves on relative Proj ..... 1887
26.18. Functoriality of relative Proj ..... 1889
26.19. Invertible sheaves and morphisms into relative Proj ..... 1890
26.20. Twisting by invertible sheaves and relative Proj ..... 1891
26.21. Projective bundles ..... 1892
26.22. Grassmannians ..... 1894
26.23. Other chapters ..... 1896
Chapter 27. Properties of Schemes ..... 1898
27.1. Introduction ..... 1898
27.2. Constructible sets ..... 1898
27.3. Integral, irreducible, and reduced schemes ..... 1899
27.4. Types of schemes defined by properties of rings ..... 1900
27.5. Noetherian schemes ..... 1901
27.6. Jacobson schemes ..... 1903
27.7. Normal schemes ..... 1904
27.8. Cohen-Macaulay schemes ..... 1906
27.9. Regular schemes ..... 1906
27.10. Dimension ..... 1907
27.11. Catenary schemes ..... 1908
27.12. Serre's conditions ..... 1909
27.13. Japanese and Nagata schemes ..... 1910
27.14. The singular locus ..... 1912
27.15. Local irreducibility ..... 1912
27.16. Characterizing modules of finite type and finite presentation ..... 1913
27.17. Sections over principal opens ..... 1914
27.18. Quasi-affine schemes ..... 1916
27.19. Flat modules ..... 1917
27.20. Locally free modules ..... 1918
27.21. Locally projective modules ..... 1918
27.22. Extending quasi-coherent sheaves ..... 1919
27.23. Gabber's result ..... 1925
27.24. Sections with support in a closed subset ..... 1928
27.25. Sections of quasi-coherent sheaves ..... 1930
27.26. Ample invertible sheaves ..... 1933
27.27. Affine and quasi-affine schemes ..... 1938
27.28. Quasi-coherent sheaves and ample invertible sheaves ..... 1938
27.29. Finding suitable affine opens ..... 1940
27.30. Other chapters ..... 1942
Chapter 28. Morphisms of Schemes ..... 1944
28.1. Introduction ..... 1944
28.2. Closed immersions ..... 1944
28.3. Immersions ..... 1945
28.4. Closed immersions and quasi-coherent sheaves ..... 1947
28.5. Supports of modules ..... 1948
28.6. Scheme theoretic image ..... 1950
28.7. Scheme theoretic closure and density ..... 1951
28.8. Dominant morphisms ..... 1953
28.9. Rational maps ..... 1955
28.10. Surjective morphisms ..... 1958
28.11. Radicial and universally injective morphisms ..... 1959
28.12. Affine morphisms ..... 1960
28.13. Quasi-affine morphisms ..... 1963
28.14. Types of morphisms defined by properties of ring maps ..... 1965
28.15. Morphisms of finite type ..... 1967
28.16. Points of finite type and Jacobson schemes ..... 1969
28.17. Universally catenary schemes ..... 1971
28.18. Nagata schemes, reprise ..... 1973
28.19. The singular locus, reprise ..... 1973
28.20. Quasi-finite morphisms ..... 1974
28.21. Morphisms of finite presentation ..... 1979
28.22. Constructible sets ..... 1982
28.23. Open morphisms ..... 1983
28.24. Submersive morphisms ..... 1984
28.25. Flat morphisms ..... 1984
28.26. Flat closed immersions ..... 1987
28.27. Generic flatness ..... 1988
28.28. Morphisms and dimensions of fibres ..... 1990
28.29. Morphisms of given relative dimension ..... 1992
28.30. The dimension formula ..... 1993
28.31. Syntomic morphisms ..... 1996
28.32. Conormal sheaf of an immersion ..... 2000
28.33. Sheaf of differentials of a morphism ..... 2002
28.34. Smooth morphisms ..... 2007
28.35. Unramified morphisms ..... 2013
28.36. Étale morphisms ..... 2017
28.37. Relatively ample sheaves ..... 2022
28.38. Very ample sheaves ..... 2025
28.39. Ample and very ample sheaves relative to finite type morphisms ..... 2027
28.40. Quasi-projective morphisms ..... 2031
28.41. Proper morphisms ..... 2032
28.42. Projective morphisms ..... 2037
28.43. Integral and finite morphisms ..... 2041
28.44. Universal homeomorphisms ..... 2044
28.45. Finite locally free morphisms ..... 2045
28.46. Birational morphisms ..... 2047
28.47. Generically finite morphisms ..... 2049
28.48. Relative normalization ..... 2053
28.49. Normalization ..... 2058
28.50. Zariski's Main Theorem (algebraic version) ..... 2060
28.51. Universally bounded fibres ..... 2062
28.52. Other chapters ..... 2065
Chapter 29. Cohomology of Schemes ..... 2067
29.1. Introduction ..... 2067
29.2. Cech cohomology of quasi-coherent sheaves ..... 2067
29.3. Vanishing of cohomology ..... 2069
29.4. Quasi-coherence of higher direct images ..... 2071
29.5. Cohomology and base change, I ..... 2074
29.6. Colimits and higher direct images ..... 2076
29.7. Cohomology and base change, II ..... 2076
29.8. Cohomology of projective space ..... 2079
29.9. Coherent sheaves on locally Noetherian schemes ..... 2084
29.10. Coherent sheaves on Noetherian schemes ..... 2087
29.11. Depth ..... 2089
29.12. Devissage of coherent sheaves ..... 2090
29.13. Finite morphisms and affines ..... 2095
29.14. Coherent sheaves on Proj ..... 2096
29.15. Higher direct images along projective morphisms ..... 2101
29.16. Ample invertible sheaves and cohomology ..... 2103
29.17. Chow's Lemma ..... 2106
29.18. Higher direct images of coherent sheaves ..... 2108
29.19. The theorem on formal functions ..... 2110
29.20. Applications of the theorem on formal functions ..... 2115
29.21. Cohomology and base change, III ..... 2116
29.22. Grothendieck's existence theorem, I ..... 2117
29.23. Grothendieck's existence theorem, III ..... 2120
29.24. Grothendieck's algebraization theorem ..... 2126
29.25. Other chapters ..... 2129
Chapter 30. Divisors ..... 2131
30.1. Introduction ..... 2131
30.2. Associated points ..... 2131
30.3. Morphisms and associated points ..... 2133
30.4. Embedded points ..... 2134
30.5. Weakly associated points ..... 2135
30.6. Morphisms and weakly associated points ..... 2137
30.7. Relative assassin ..... 2138
30.8. Relative weak assassin ..... 2139
30.9. Torsion free modules ..... 2139
30.10. Reflexive modules ..... 2141
30.11. Effective Cartier divisors ..... 2143
30.12. Effective Cartier divisors on Noetherian schemes ..... 2147
30.13. Complements of affine opens ..... 2150
30.14. Norms ..... 2152
30.15. Relative effective Cartier divisors ..... 2156
30.16. The normal cone of an immersion ..... 2160
30.17. Regular ideal sheaves ..... 2162
30.18. Regular immersions ..... 2165
30.19. Relative regular immersions ..... 2168
30.20. Meromorphic functions and sections ..... 2174
30.21. Weil divisors ..... 2180
30.22. The Weil divisor class associated to an invertible module ..... 2181
30.23. More on invertible modules ..... 2184
30.24. Relative Proj ..... 2186
30.25. Closed subschemes of relative proj ..... 2188
30.26. Blowing up ..... 2191
30.27. Strict transform ..... 2195
30.28. Admissible blowups ..... 2199
30.29. Modifications ..... 2200
30.30. Other chapters ..... 2201
Chapter 31. Limits of Schemes ..... 2203
31.1. Introduction ..... 2203
31.2. Directed limits of schemes with affine transition maps ..... 2203
31.3. Descending properties ..... 2204
31.4. Absolute Noetherian Approximation ..... 2211
31.5. Limits and morphisms of finite presentation ..... 2214
31.6. Relative approximation ..... 2215
31.7. Descending properties of morphisms ..... 2217
31.8. Finite type closed in finite presentation ..... 2219
31.9. Descending relative objects ..... 2221
31.10. Characterizing affine schemes ..... 2224
31.11. Variants of Chow's Lemma ..... 2226
31.12. Applications of Chow's lemma ..... 2228
31.13. Universally closed morphisms ..... 2233
31.14. Limits and dimensions of fibres ..... 2236
31.15. Application to modifications ..... 2237
31.16. Other chapters ..... 2239
Chapter 32. Varieties ..... 2241
32.1. Introduction ..... 2241
32.2. Notation ..... 2241
32.3. Varieties ..... 2241
32.4. Geometrically reduced schemes ..... 2242
32.5. Geometrically connected schemes ..... 2245
32.6. Geometrically irreducible schemes ..... 2251
32.7. Geometrically integral schemes ..... 2255
32.8. Geometrically normal schemes ..... 2256
32.9. Change of fields and locally Noetherian schemes ..... 2257
32.10. Geometrically regular schemes ..... 2258
32.11. Change of fields and the Cohen-Macaulay property ..... 2261
32.12. Change of fields and the Jacobson property ..... 2261
32.13. Change of fields and ample invertible sheaves ..... 2261
32.14. Tangent spaces ..... 2263
32.15. Generically finite morphisms ..... 2266
32.16. Dimension of fibres ..... 2267
32.17. Algebraic schemes ..... 2269
32.18. Global generation ..... 2272
32.19. Closures of products ..... 2273
32.20. Schemes smooth over fields ..... 2274
32.21. Types of varieties ..... 2276
32.22. Groups of invertible functions ..... 2277
32.23. Künneth formula ..... 2279
32.24. Picard groups of varieties ..... 2282
32.25. Uniqueness of base field ..... 2282
32.26. Euler characteristics ..... 2284
32.27. Projective space ..... 2286
32.28. Coherent sheaves on projective space ..... 2286
32.29. Glueing dimension one rings ..... 2292
32.30. One dimensional Noetherian schemes ..... 2296
32.31. Finding affine opens ..... 2301
32.32. Curves ..... 2304
32.33. Degrees on curves ..... 2305
32.34. Numerical intersections ..... 2311
32.35. Other chapters ..... 2316
Chapter 33. Topologies on Schemes ..... 2318
33.1. Introduction ..... 2318
33.2. The general procedure ..... 2318
33.3. The Zariski topology ..... 2319
33.4. The étale topology ..... 2324

|  | source | 2399 |

34.26. Properties of morphisms local in the smooth topology on the source 400
34.27. Properties of morphisms local in the étale topology on the source 2400
34.28. Properties of morphisms étale local on source-and-target ..... 2401
34.29. Properties of morphisms of germs local on source-and-target ..... 2406
34.30. Descent data for schemes over schemes ..... 2409
34.31. Fully faithfulness of the pullback functors ..... 2413
34.32. Descending types of morphisms ..... 2418
34.33. Descending affine morphisms ..... 2419
34.34. Descending quasi-affine morphisms ..... 2420
34.35. Descent data in terms of sheaves ..... 2421
34.36. Other chapters ..... 2422
Chapter 35. Derived Categories of Schemes ..... 2424
35.1. Introduction ..... 2424
35.2. Conventions ..... 2424
35.3. Derived category of quasi-coherent modules ..... 2424
35.4. Total direct image ..... 2428
35.5. Affine morphisms ..... 2429
35.6. Derived category of coherent modules ..... 2430
35.7. The coherator ..... 2431
35.8. The coherator for Noetherian schemes ..... 2434
35.9. Koszul complexes ..... 2435
35.10. Pseudo-coherent and perfect complexes ..... 2438
35.11. Descent finiteness properties of complexes ..... 2441
35.12. Lifting complexes ..... 2443
35.13. Approximation by perfect complexes ..... 2448
35.14. Generating derived categories ..... 2451
35.15. An example generator ..... 2453
35.16. Compact and perfect objects ..... 2455
35.17. Derived categories as module categories ..... 2456
35.18. Cohomology and base change, IV ..... 2459
35.19. Producing perfect complexes ..... 2463
35.20. Cohomology, Ext groups, and base change ..... 2463
35.21. Limits and derived categories ..... 2466
35.22. Cohomology and base change, V ..... 2467
35.23. Perfect complexes ..... 2469
35.24. Applications ..... 2471
35.25 . Theorem of the cube ..... 2472
35.26. Formal functions for a principal ideal ..... 2476
35.27. Other chapters ..... 2478
Chapter 36. More on Morphisms ..... 2480
36.1. Introduction ..... 2480
36.2. Thickenings ..... 2480
36.3. First order infinitesimal neighbourhood ..... 2485
36.4. Formally unramified morphisms ..... 2486
36.5. Universal first order thickenings ..... 2488
36.6. Formally étale morphisms ..... 2494
36.7. Infinitesimal deformations of maps ..... 2497
36.8. Infinitesimal deformations of schemes ..... 2500
36.9. Formally smooth morphisms ..... 2504
36.10. Smoothness over a Noetherian base ..... 2508
36.11. Pushouts in the category of schemes ..... 2510
36.12. Openness of the flat locus ..... 2514
36.13. Critère de platitude par fibres ..... 2515
36.14. Normalization revisited ..... 2518
36.15. Normal morphisms ..... 2519
36.16. Regular morphisms ..... 2520
36.17. Cohen-Macaulay morphisms ..... 2521
36.18. Slicing Cohen-Macaulay morphisms ..... 2524
36.19. Generic fibres ..... 2527
36.20. Relative assassins ..... 2532
36.21. Reduced fibres ..... 2534
36.22. Irreducible components of fibres ..... 2536
36.23. Connected components of fibres ..... 2541
36.24. Connected components meeting a section ..... 2545
36.25. Dimension of fibres ..... 2547
36.26. Limit arguments ..... 2548
36.27. Étale neighbourhoods ..... 2551
36.28. Slicing smooth morphisms ..... 2553
36.29. Finite free locally dominates étale ..... 2557
36.30. Etale localization of quasi-finite morphisms ..... 2558
36.31. Zariski's Main Theorem ..... 2561
36.32. Application to morphisms with connected fibres ..... 2569
36.33. Application to the structure of finite type morphisms ..... 2571
36.34. Application to the fppf topology ..... 2574
36.35. Quasi-projective schemes ..... 2575
36.36. Projective schemes ..... 2576
36.37. Closed points in fibres ..... 2577
36.38. Stein factorization ..... 2583
36.39. Descending separated locally quasi-finite morphisms ..... 2586
36.40. Relative finite presentation ..... 2587
36.41. Relative pseudo-coherence ..... 2589
36.42. Pseudo-coherent morphisms ..... 2596
36.43. Perfect morphisms ..... 2600
36.44. Local complete intersection morphisms ..... 2603
36.45. Exact sequences of differentials and conormal sheaves ..... 2610
36.46. Weakly étale morphisms ..... 2610
36.47. Reduced fibre theorem ..... 2614
36.48. Ind-quasi-affine morphisms ..... 2617
36.49. Relative morphisms ..... 2618
36.50. Other chapters ..... 2620
Chapter 37. More on Flatness ..... 2622
37.1. Introduction ..... 2622
37.2. Lemmas on étale localization ..... 2622
37.3. The local structure of a finite type module ..... 2624
37.4. One step dévissage ..... 2628
37.5. Complete dévissage ..... 2632
37.6. Translation into algebra ..... 2637
37.7. Localization and universally injective maps ..... 2639
37.8. Completion and Mittag-Leffler modules ..... 2641
37.9. Projective modules ..... 2642
37.10. Flat finite type modules, Part I ..... 2644
37.11. Extending properties from an open ..... 2650
37.12. Flat finitely presented modules ..... 2652
37.13. Flat finite type modules, Part II ..... 2658
37.14. Examples of relatively pure modules ..... 2662
37.15. Impurities ..... 2664
37.16. Relatively pure modules ..... 2667
37.17. Examples of relatively pure sheaves ..... 2669
37.18. A criterion for purity ..... 2670
37.19. How purity is used ..... 2674
37.20. Flattening functors ..... 2677
37.21. Flattening stratifications ..... 2682
37.22. Flattening stratification over an Artinian ring ..... 2685
37.23. Flattening a map ..... 2685
37.24. Flattening in the local case ..... 2687
37.25. Variants of a lemma ..... 2689
37.26. Flat finite type modules, Part III ..... 2695
37.27. Universal flattening ..... 2696
37.28. Blowing up and flatness ..... 2700
37.29. Applications ..... 2705
37.30. Other chapters ..... 2707
Chapter 38. Groupoid Schemes ..... 2709
38.1. Introduction ..... 2709
38.2. Notation ..... 2709
38.3. Equivalence relations ..... 2709
38.4. Group schemes ..... 2711
38.5. Examples of group schemes ..... 2712
38.6. Properties of group schemes ..... 2714
38.7. Properties of group schemes over a field ..... 2715
38.8. Properties of algebraic group schemes ..... 2720
38.9. Abelian varieties ..... 2724
38.10. Actions of group schemes ..... 2727
38.11. Principal homogeneous spaces ..... 2728
38.12. Equivariant quasi-coherent sheaves ..... 2730
38.13. Groupoids ..... 2730
38.14. Quasi-coherent sheaves on groupoids ..... 2732
38.15. Colimits of quasi-coherent modules ..... 2734
38.16. Groupoids and group schemes ..... 2738
38.17. The stabilizer group scheme ..... 2739
38.18. Restricting groupoids ..... 2740
38.19. Invariant subschemes ..... 2741
38.20. Quotient sheaves ..... 2742
38.21. Descent in terms of groupoids ..... 2746
38.22. Separation conditions ..... 2747
38.23. Finite flat groupoids, affine case ..... 2748
38.24. Finite flat groupoids ..... 2753
38.25. Other chapters ..... 2754
Chapter 39. More on Groupoid Schemes ..... 2756
39.1. Introduction ..... 2756
39.2. Notation ..... 2756
39.3. Useful diagrams ..... 2756
39.4. Sheaf of differentials ..... 2757
39.5. Properties of groupoids ..... 2757
39.6. Comparing fibres ..... 2760
39.7. Cohen-Macaulay presentations ..... 2761
39.8. Restricting groupoids ..... 2762
39.9. Properties of groupoids on fields ..... 2764
39.10. Morphisms of groupoids on fields ..... 2770
39.11. Slicing groupoids ..... 2773
39.12. Etale localization of groupoids ..... 2777
39.13. Finite groupoids ..... 2780
39.14. Descending ind-quasi-affine morphisms ..... 2785
39.15. Other chapters ..... 2788
Chapter 40. Étale Morphisms of Schemes ..... 2790
40.1. Introduction ..... 2790
40.2. Conventions ..... 2790
40.3. Unramified morphisms ..... 2790
40.4. Three other characterizations of unramified morphisms ..... 2792
40.5. The functorial characterization of unramified morphisms ..... 2794
40.6. Topological properties of unramified morphisms ..... 2795
40.7. Universally injective, unramified morphisms ..... 2796
40.8. Examples of unramified morphisms ..... 2798
40.9. Flat morphisms ..... 2798
40.10. Topological properties of flat morphisms ..... 2800
40.11. Étale morphisms ..... 2800
40.12. The structure theorem ..... 2803
40.13. Étale and smooth morphisms ..... 2804
40.14. Topological properties of étale morphisms ..... 2804
40.15. Topological invariance of the étale topology ..... 2805
40.16. The functorial characterization ..... 2806
40.17. Etale local structure of unramified morphisms ..... 2807
40.18. Etale local structure of étale morphisms ..... 2808
40.19. Permanence properties ..... 2809
40.20. Other chapters ..... 2810
Chapter 41. Chow Homology and Chern Classes ..... 2812
41.1. Introduction ..... 2812
41.2. Determinants of finite length modules ..... 2813
41.3. Periodic complexes and Herbrand quotients ..... 2820
41.4. Periodic complexes and determinants ..... 2821
41.5. Symbols ..... 2828
41.6. Lengths and determinants ..... 2832
41.7. Application to tame symbol ..... 2837
41.8. Setup ..... 2838
41.9. Cycles ..... 2839
41.10. Cycle associated to a closed subscheme ..... 2840
41.11. Cycle associated to a coherent sheaf ..... 2840
41.12. Preparation for proper pushforward ..... 2841
41.13. Proper pushforward ..... 2842
41.14. Preparation for flat pullback ..... 2844
41.15. Flat pullback ..... 2845
41.16. Push and pull ..... 2847
41.17. Preparation for principal divisors ..... 2848
41.18. Principal divisors ..... 2848
41.19. Principal divisors and pushforward ..... 2849
41.20. Rational equivalence ..... 2852
41.21. Rational equivalence and push and pull ..... 2853
41.22. Rational equivalence and the projective line ..... 2856
41.23. The divisor associated to an invertible sheaf ..... 2858
41.24. Intersecting with an invertible sheaf ..... 2859
41.25. Intersecting with an invertible sheaf and push and pull ..... 2861
41.26. The key formula ..... 2863
41.27. Intersecting with an invertible sheaf and rational equivalence ..... 2865
41.28. Intersecting with effective Cartier divisors ..... 2866
41.29. Gysin homomorphisms ..... 2869
41.30. Relative effective Cartier divisors ..... 2871
41.31. Affine bundles ..... 2872
41.32. Bivariant intersection theory ..... 2873
41.33. Projective space bundle formula ..... 2875
41.34. The Chern classes of a vector bundle ..... 2878
41.35. Intersecting with chern classes ..... 2879
41.36. Polynomial relations among chern classes ..... 2883
41.37. Additivity of chern classes ..... 2884
41.38. The splitting principle ..... 2886
41.39. Chern classes and tensor product ..... 2887
41.40. Todd classes ..... 2888
41.41. Degrees of zero cycles ..... 2888
41.42. Grothendieck-Riemann-Roch ..... 2890
41.43. Appendix ..... 2890
41.44. Other chapters ..... 2907
Chapter 42. Intersection Theory ..... 2909
42.1. Introduction ..... 2909
42.2. Conventions ..... 2910
42.3. Cycles ..... 2910
42.4. Cycle associated to closed subscheme ..... 2910
42.5. Cycle associated to a coherent sheaf ..... 2911
42.6. Proper pushforward ..... 2911
42.7. Flat pullback ..... 2911
42.8. Rational Equivalence ..... 2912
42.9. Rational equivalence and rational functions ..... 2913
42.10. Proper pushforward and rational equivalence ..... 2913
42.11. Flat pullback and rational equivalence ..... 2914
42.12. The short exact sequence for an open ..... 2914
42.13. Proper intersections ..... 2914
42.14. Intersection multiplicities using Tor formula ..... 2916
42.15. Algebraic multiplicities ..... 2918
42.16. Computing intersection multiplicities ..... 2921
42.17. Intersection product using Tor formula ..... 2923
42.18. Exterior product ..... 2924
42.19. Reduction to the diagonal ..... 2925
42.20. Associativity of intersections ..... 2928
42.21. Flat pullback and intersection products ..... 2929
42.22. Projection formula for flat proper morphisms ..... 2930
42.23. Projections ..... 2931
42.24. Moving Lemma ..... 2935
42.25. Intersection products and rational equivalence ..... 2937
42.26. Chow rings ..... 2940
42.27. Pullback for a general morphism ..... 2941
42.28. Pullback of cycles ..... 2942
42.29. Other chapters ..... 2942
Chapter 43. Picard Schemes of Curves ..... 2944
43.1. Introduction ..... 2944
43.2. Hilbert scheme of points ..... 2944
43.3. Moduli of divisors on smooth curves ..... 2948
43.4. The Picard functor ..... 2951
43.5. A representability criterion ..... 2953
43.6. The Picard scheme of a curve ..... 2953
43.7. Other chapters ..... 2957
Chapter 44. Adequate Modules ..... 2959
44.1. Introduction ..... 2959
44.2. Conventions ..... 2959
44.3. Adequate functors ..... 2960
44.4. Higher exts of adequate functors ..... 2967
44.5. Adequate modules ..... 2973
44.6. Parasitic adequate modules ..... 2978
44.7. Derived categories of adequate modules, I ..... 2979
44.8. Pure extensions ..... 2982
44.9. Higher exts of quasi-coherent sheaves on the big site ..... 2985
44.10. Derived categories of adequate modules, II ..... 2986
44.11. Other chapters ..... 2987
Chapter 45. Dualizing Complexes ..... 2989
45.1. Introduction ..... 2989
45.2. Essential surjections and injections ..... 2989
45.3. Injective modules ..... 2990
45.4. Projective covers ..... 2993
45.5. Injective hulls ..... 2993
45.6. Duality over Artinian local rings ..... 2995
45.7. Injective hull of the residue field ..... 2996
45.8. Deriving torsion ..... 2998
45.9. Local cohomology ..... 3000
45.10. Local cohomology for Noetherian rings ..... 3004
45.11. Depth ..... 3006
45.12. Torsion versus complete modules ..... 3007
45.13. Formally catenary rings ..... 3009
45.14. Finiteness of local cohomology, I ..... 3011
45.15. Finiteness of pushforwards, I ..... 3013
45.16. Trivial duality for a ring map ..... 3017
45.17. Dualizing complexes ..... 3018
45.18. Dualizing complexes over local rings ..... 3022
45.19. The dimension function of a dualizing complex ..... 3025
45.20. The local duality theorem ..... 3026
45.21. Dualizing complexes on schemes ..... 3028
45.22. Right adjoint of pushforward ..... 3030
45.23. Right adjoint of pushforward and base change ..... 3034
45.24. Right adjoint of pushforward and trace maps ..... 3040
45.25. Right adjoint of pushforward and pullback ..... 3043
45.26. Right adjoint of pushforward for closed immersions ..... 3045
45.27. Right adjoint of pushforward for finite morphisms ..... 3047
45.28. Right adjoint of pushforward for perfect proper morphisms ..... 3049
45.29. Right adjoint of pushforward for effective Cartier divisors ..... 3051
45.30. Right adjoint of pushforward in examples ..... 3052
45.31. Compactifications ..... 3056
45.32. Upper shriek functors ..... 3059
45.33. Properties of upper shriek functors ..... 3064
45.34. A duality theory ..... 3067
45.35. Glueing dualizing complexes ..... 3068
45.36. Dualizing modules ..... 3073
45.37. Cohen-Macaulay schemes ..... 3076
45.38. Gorenstein schemes ..... 3077
45.39. Formal fibres ..... 3079
45.40. Finiteness of local cohomology, II ..... 3081
45.41. Finiteness of pushforwards, II ..... 3085
45.42. Other chapters ..... 3086
Chapter 46. Algebraic Curves ..... 3088
46.1. Introduction ..... 3088
46.2. Riemann-Roch and duality ..... 3088
46.3. Some vanishing results ..... 3091
46.4. Other chapters ..... 3092
Chapter 47. Resolution of Surfaces ..... 3095
47.1. Introduction ..... 3095
47.2. A trace map in positive characteristic ..... 3096
47.3. Quadratic transformations ..... 3099
47.4. Dominating by quadratic transformations ..... 3102
47.5. Dominating by normalized blowups ..... 3104
47.6. Modifying over local rings ..... 3106
47.7. Vanishing ..... 3107
47.8. Boundedness ..... 3110
47.9. Rational singularities ..... 3118
47.10. Formal arcs ..... 3121
47.11. Base change to the completion ..... 3123
47.12. Rational double points ..... 3126
47.13. Implied properties ..... 3131
47.14. Resolution ..... 3133
47.15. Embedded resolution ..... 3136
47.16. Other chapters ..... 3140

| 49.14. Cohomology | 3187 |
| 49.15. The fpqc topology | 3188 |
| 49.16. Faithfully flat descent | 3190 |
| 49.17. Quasi-coherent sheaves | 3192 |
| 49.18. Cech cohomology | 3193 |
| 49.19. The Cech-to-cohomology spectral sequence | 3196 |
| 49.20. Big and small sites of schemes | 3197 |
| 49.21. The étale topos | 3199 |
| 49.22. Cohomology of quasi-coherent sheaves | 3200 |
| 49.23. Examples of sheaves | 3202 |
| 49.24. Picard groups | 3203 |
| 49.25. The étale site | 3203 |
| 49.26. Étale morphisms | 3203 |
| 49.27. Etale coverings | 3205 |
| 49.28. Kummer theory | 3206 |
| 49.29. Neighborhoods, stalks and points | 3209 |
| 49.30. Points in other topologies | 3215 |

Chapter 48. Fundamental Groups of Schemes ..... 3142
88.1. Introduction3142
48.3. Galois categories ..... 48.5. Fundamental groups3154
proper scheme3159
48.8. Fundamental groups of normal schemes ..... 3163
48.9. Finite étale covers of punctured spectra, I3170
48.11. Purity of branch locus ..... 3172
8.13. Purity in cocal3176
48.14. Ramification theory3177
48.16. Other chapters ..... 3177
Chapter 49. Étale Cohomology ..... 31793179
49.3. Prologue ..... 3179
49.4.3181
49.6. A computation ..... 3181
4.7. Nontorsion coellicients3183
49.9. Presheaves ..... 3183
49.10. Sites3185
49.12. The example of G-sets ..... 3185
9.13. Sheafication3187
49.15. The fpqc topology3190
49.17. Quasi-coherent sheaves ..... 3192
Cech conomology3196
49.20. Big and small sites of schemes ..... 3199
49.22. Cohonalogy of3200
49.23. Examples of sheaves ..... 3202
9.24. Picard group3203
49.26. Etale morphisms ..... 320349.28. Kummer theory3206
29.29. Neighborhoods, stalks and points3215

| 49.31 | Supports of abelian sheaves | 3217 |
| :---: | :---: | :---: |
| 49.32 | Henselian rings | 3218 |
| 49.33 | Stalks of the structure sheaf | 3220 |
| 49.34 | Functoriality of small étale topos | 3221 |
| 49.35 | Direct images | 3222 |
| 49.36 | Inverse image | 3223 |
| 49.37 | Functoriality of big topoi | 3224 |
| 49.38 | Functoriality and sheaves of modules | 3225 |
| 49.39 | Comparing big and small topoi | 3226 |
| 49.40 | Comparing topologies | 3227 |
| 49.41 | Recovering morphisms | 3228 |
| 49.42 | Push and pull | 3234 |
| 49.43 | Property (A) | 3234 |
| 49.44 | Property (B) | 3236 |
| 49.45 | Property (C) | 3238 |
| 49.46 | Topological invariance of the small étale site | 3240 |
| 49.47 | Closed immersions and pushforward | 3242 |
| 49.48 | Integral universally injective morphisms | 3244 |
| 49.49 | Big sites and pushforward | 3244 |
| 49.50 | Exactness of big lower shriek | 3245 |
| 49.51 | Étale cohomology | 3247 |
| 49.52 | Colimits | 3248 |
| 49.53 | Stalks of higher direct images | 3250 |
| 49.54 | The Leray spectral sequence | 3250 |
| 49.55 | Vanishing of finite higher direct images | 3251 |
| 49.56 | Galois action on stalks | 3253 |
| 49.57 | Group cohomology | 3256 |
| 49.58 | Cohomology of a point | 3257 |
| 49.59 | Cohomology of curves | 3258 |
| 49.60 | Brauer groups | 3258 |
| 49.61 | The Brauer group of a scheme | 3260 |
| 49.62 | Galois cohomology | 3261 |
| 49.63 | Higher vanishing for the multiplicative group | 3263 |
| 49.64 | The Artin-Schreier sequence | 3264 |
| 49.65 | Picard groups of curves | 3267 |
| 49.66 | Extension by zero | 3270 |
| 49.67 | Locally constant sheaves | 3271 |
| 49.68 | Constructible sheaves | 3273 |
| 49.69 | Auxiliary lemmas on morphisms | 3277 |
| 49.70 | More on constructible sheaves | 3278 |
| 49.71 | Constructible sheaves on Noetherian schemes | 3283 |
| 49.72 | Cohomology with support in a closed subscheme | 3287 |
| 49.73 | Affine analog of proper base change | 3289 |
| 49.74 | Cohomology of torsion sheaves on curves | 3294 |
| 49.75 | First cohomology of proper schemes | 3299 |
| 49.76 | The proper base change theorem | 3301 |
| 49.77 | Applications of proper base change | 3306 |
| 49.78 | The trace formula | 3307 |

49.79. Frobenii ..... 3307
49.80. Traces ..... 3310
49.81. Why derived categories? ..... 3311
49.82. Derived categories ..... 3312
49.83. Filtered derived category ..... 3313
49.84. Filtered derived functors ..... 3313
49.85. Application of filtered complexes ..... 3314
49.86. Perfectness ..... 3315
49.87. Filtrations and perfect complexes ..... 3316
49.88. Characterizing perfect objects ..... 3316
49.89. Complexes with constructible cohomology ..... 3317
49.90. Cohomology of nice complexes ..... 3320
49.91. Lefschetz numbers ..... 3321
49.92. Preliminaries and sorites ..... 3324
49.93. Proof of the trace formula ..... 3327
49.94. Applications ..... 3330
49.95. On l-adic sheaves ..... 3330
49.96. L-functions ..... 3331
49.97. Cohomological interpretation ..... 3332
49.98. List of things which we should add above ..... 3335
49.99. Examples of L-functions ..... 3335
49.100. Constant sheaves ..... 3335
49.101. The Legendre family ..... 3337
49.102. Exponential sums ..... 3338
49.103. Trace formula in terms of fundamental groups ..... 3339
49.104. Fundamental groups ..... 3339
49.105. Profinite groups, cohomology and homology ..... 3341
49.106. Cohomology of curves, revisited ..... 3342
49.107. Abstract trace formula ..... 3344
49.108. Automorphic forms and sheaves ..... 3345
49.109. Counting points ..... 3348
49.110. Precise form of Chebotarev ..... 3348
49.111. How many primes decompose completely? ..... 3349
49.112. How many points are there really? ..... 3350
49.113. Other chapters ..... 3351
Chapter 50. Crystalline Cohomology ..... 3353
50.1. Introduction ..... 3353
50.2. Divided power envelope ..... 3353
50.3. Some explicit divided power thickenings ..... 3357
50.4. Compatibility ..... 3359
50.5. Affine crystalline site ..... 3360
50.6. Module of differentials ..... 3362
50.7. Divided power schemes ..... 3368
50.8. The big crystalline site ..... 3370
50.9. The crystalline site ..... 3373
50.10. Sheaves on the crystalline site ..... 3375
50.11. Crystals in modules ..... 3376
50.12. Sheaf of differentials ..... 3377

| 50.13. Two universal thickenings | 3379 |
| :---: | :---: |
| 50.14. The de Rham complex | 3381 |
| 50.15. Connections | 3381 |
| 50.16. Cosimplicial algebra | 3382 |
| 50.17. Crystals in quasi-coherent modules | 3384 |
| 50.18. General remarks on cohomology | 3388 |
| 50.19. Cosimplicial preparations | 3390 |
| 50.20. Divided power Poincaré lemma | 3392 |
| 50.21. Cohomology in the affine case | 3393 |
| 50.22. Two counter examples | 3396 |
| 50.23. Applications | 3398 |
| 50.24. Some further results | 3399 |
| 50.25. Pulling back along purely inseparable maps | 3405 |
| 50.26. Frobenius action on crystalline cohomology | 3410 |
| 50.27. Other chapters | 3412 |
| Chapter 51. Pro-étale Cohomology | 3414 |
| 51.1. Introduction | 3414 |
| 51.2. Some topology | 3414 |
| 51.3. Local isomorphisms | 3417 |

65.28. Separation conditions ..... 4064
65.29. Other chapters ..... 4065
Chapter 66. More on Groupoids in Spaces ..... 4067
66.1. Introduction ..... 4067
66.2. Notation ..... 4067
66.3. Useful diagrams ..... 4067
66.4. Properties of groupoids ..... 4068
66.5. Comparing fibres ..... 4069
66.6. Restricting groupoids ..... 4069
66.7. Properties of groups over fields and groupoids on fields ..... 4070
66.8. Group algebraic spaces over fields ..... 4073
66.9. No rational curves on groups ..... 4075
66.10. The finite part of a morphism ..... 4076
66.11. Finite collections of arrows ..... 4083
66.12 . The finite part of a groupoid ..... 4084
66.13. Etale localization of groupoid schemes ..... 4086
66.14. Other chapters ..... 4089
Chapter 67. Bootstrap ..... 4091
67.1. Introduction ..... 4091
67.2. Conventions ..... 4091
67.3. Morphisms representable by algebraic spaces ..... 4091
67.4. Properties of maps of presheaves representable by algebraic spaces ..... 4094
67.5. Bootstrapping the diagonal ..... 4096
67.6. Bootstrap ..... 4098
67.7. Finding opens ..... 4099
67.8. Slicing equivalence relations ..... 4101
67.9. Quotient by a subgroupoid ..... 4102
67.10. Final bootstrap ..... 4104
67.11. Applications ..... 4106
67.12. Algebraic spaces in the étale topology ..... 4110
67.13. Other chapters ..... 4112
Chapter 68. Quotients of Groupoids ..... 4114
68.1. Introduction ..... 4114
68.2. Conventions and notation ..... 4114
68.3. Invariant morphisms ..... 4114
68.4. Categorical quotients ..... 4115
68.5. Quotients as orbit spaces ..... 4117
68.6. Coarse quotients ..... 4125
68.7. Topological properties ..... 4126
68.8. Invariant functions ..... 4126
68.9. Good quotients ..... 4127
68.10. Geometric quotients ..... 4127
68.11. Other chapters ..... 4127
Chapter 69. Simplicial Spaces ..... 4130
69.1. Introduction ..... 4130
69.2. Simplicial topological spaces ..... 4130
69.3. Simplicial sites and topoi ..... 4134
69.4. Simplicial semi-representable objects ..... 4138
69.5. Hypercovering in a site ..... 4140
69.6. Proper hypercoverings in topology ..... 4141
69.7. Simplicial schemes ..... 4143
69.8. Descent in terms of simplicial schemes ..... 4143
69.9. Quasi-coherent modules on simplicial schemes ..... 4145
69.10. Groupoids and simplicial schemes ..... 4147
69.11. Descent data give equivalence relations ..... 4149
69.12. An example case ..... 4150
69.13. Other chapters ..... 4150
Chapter 70. Formal Algebraic Spaces ..... 4153
70.1. Introduction ..... 4153
70.2. Formal schemes à la EGA ..... 4153
70.3. Conventions and notation ..... 4159
70.4. Topological rings and modules ..... 4160
70.5. Affine formal algebraic spaces ..... 4164
70.6. Countably indexed affine formal algebraic spaces ..... 4169
70.7. Formal algebraic spaces ..... 4170
70.8. Colimits of algebraic spaces along thickenings ..... 4173
70.9. Completion along a closed subset ..... 4175
70.10. Fibre products ..... 4178
70.11. Separation axioms for formal algebraic spaces ..... 4178
70.12. Quasi-compact formal algebraic spaces ..... 4180
70.13. Quasi-compact and quasi-separated formal algebraic spaces ..... 4181
70.14. Morphisms representable by algebraic spaces ..... 4183
70.15. Types of formal algebraic spaces ..... 4187
70.16. Morphisms and continuous ring maps ..... 4191
70.17. Adic morphisms ..... 4195
70.18. Morphisms of finite type ..... 4196
70.19. Monomorphisms ..... 4198
70.20. Closed immersions ..... 4199

| 88.6. | Noncomplete completion | 4726 |
| 88.7 . | Noncomplete quotient | 4727 |
| 88.8. | Completion is not exact | 4728 |
| 88.9. | The category of complete modules is not abelian | 4729 |
| 88.10. | The category of derived complete modules | 4729 |
| 88.11. | Nonflat completions | 4730 |
| 88.12. | Nonabelian category of quasi-coherent modules | 4732 |
| 88.13 . | Regular sequences and base change | 4733 |
| 88.14 . | A Noetherian ring of infinite dimension | 4734 |
| 88.15. | Local rings with nonreduced completion | 4734 |
| 88.16. | A non catenary Noetherian local ring | 4735 |
| 88.17. | Existence of bad local Noetherian rings | 4737 |
| 88.18. | Non-quasi-affine variety with quasi-affine normalization | 4738 |
| 88.19. | A locally closed subscheme which is not open in closed | 4739 |
| 88.20 . | Nonexistence of suitable opens | 4739 |
| 88.21. | Nonexistence of quasi-compact dense open subscheme | 4740 |
| 88.22 . | Affines over algebraic spaces | 4741 |
| 88.23. | Pushforward of quasi-coherent modules | 4741 |
| 88.24. | A nonfinite module with finite free rank 1 stalks | 4742 |
| 88.25. | A finite flat module which is not projective | 4742 |
| 88.26 . | A projective module which is not locally free | 4743 |
| 88.27. | Zero dimensional local ring with nonzero flat ideal | 4745 |
| 88.28. | An epimorphism of zero-dimensional rings which is not surjective | 4745 |
| 88.29. | Finite type, not finitely presented, flat at prime | 4746 |
| 88.30 . | Finite type, flat and not of finite presentation | 4747 |
| 88.31. | Topology of a finite type ring map | 4748 |
| 88.32 . | Pure not universally pure | 4748 |
| 88.33 . | A formally smooth non-flat ring map | 4749 |
| 88.34. | A formally étale non-flat ring map | 4750 |
| 88.35 . | A formally étale ring map with nontrivial cotangent complex | 4751 |
| 88.36. | Ideals generated by sets of idempotents and localization | 4751 |
| 88.37. | A ring map which identifies local rings which is not ind-étale | 4752 |
| 88.38. | Non flasque quasi-coherent sheaf associated to injective module | 4752 |
| 88.39. | A non-separated flat group scheme | 4753 |
| 88.40 . | A non-flat group scheme with flat identity component | 4753 |
| 88.41. | A non-separated group algebraic space over a field | 4754 |
| 88.42 . | Specializations between points in fibre étale morphism | 4754 |
| 88.43. | A torsor which is not an fppf torsor | 4755 |
| 88.44 . | Stack with quasi-compact flat covering which is not algebraic | 4756 |
| 88.45. | Limit preserving on objects, not limit preserving | 4757 |
| 88.46 . | A non-algebraic classifying stack | 4757 |
| 88.47. | Sheaf with quasi-compact flat covering which is not algebraic | 4758 |
| 88.48. | Sheaves and specializations | 4759 |
| 88.49. | Sheaves and constructible functions | 4760 |
| 88.50 . | The lisse-étale site is not functorial | 4761 |

## CHAPTER 1

## Introduction

0000

### 1.1. Overview

0001 Besides the book by Laumon and Moret-Bailly, see LMB00, and the work (in progress) by Fulton et al, we think there is a place for an open source textbook on algebraic stacks and the algebraic geometry that is needed to define them. The Stacks Project attempts to do this by building the foundations starting with commutative algebra and proceeding via the theory of schemes and algebraic spaces to a comprehensive foundation for the theory of algebraic stacks.

We expect this material to be read online as a key feature are the hyperlinks giving quick access to internal references spread over many different pages. If you use an embedded pdf or dvi viewer in your browser, the cross file links should work.
This project is a collaborative effort and we encourage you to help out. Please email any typos or errors you find while reading or any suggestions, additional material, or examples you have to stacks.project@gmail.com. You can download a tarball containing all source files, extract, run make, and use a dvi or pdf viewer locally. Please feel free to edit the LaTeX files and email your improvements.

### 1.2. Attribution

06 LB The scope of this work is such that it is a daunting task to attribute correctly and succinctly all of those mathematicians whose work has led to the development of the theory we try to explain here. We hope eventually to generate enough community interest to find contributors willing to write sections with historical remarks for each and every chapter.

Those who contributed to this work are listed on the title page of the book version of this work and online. Here we would like to name a selection of major contributions:
(1) Jarod Alper wrote Guide to Literature
(2) Bhargav Bhatt wrote the initial version of Étale Morphisms of Schemes
(3) Bhargav Bhatt wrote the initial version of More on Algebra, Section 15.70
(4) Kiran Kedlaya contributed the initial writeup of Descent, Section 34.4
(5) The initial versions of
(a) Algebra, Section 10.27 ,
(b) Injectives, Section 19.2, and
(c) the chapter Fields
are from The CRing Project, courtesy of Akhil Mathew et al.
(6) Alex Perry wrote the material on projective modules, Mittag-Leffler modules, including the proof of Algebra, Theorem 10.94 .5
(7) Alex Perry wrote Formal Deformation Theory,
(8) Thibaut Pugin, Zachary Maddock and Min Lee took course notes which formed the basis for Etale Cohomology.
(9) David Rydh has contributed many helpful comments, pointed out several mistakes, helped out in an essential way with the material on residual gerbes, and was the originator for the material in More on Groupoids in Spaces, Sections 66.10 and 66.13.
(10) Burt Totaro contributed Examples, Sections 88.55, 88.56, and Properties of Stacks, Section 82.12,
(11) The material in the chapter Pro-étale Cohomology is taken from a paper by Bhargav Bhatt and Peter Scholze.
(12) Bhargav Bhatt contributed Examples, Sections 88.60 and 88.63 .
(13) Ofer Gabber found mistakes, contributed corrections and he contributed Formal Spaces, Lemma 70.9.5, the material in More on Groupoids, Section 39.14 the main result of Properties of Spaces, Section 53.16, and the proof of More on Flatness, Proposition 37.25.13.
(14) János Kollár contributed Algebra, Lemma 10.118 .2 and Dualizing Complexes, Proposition 45.15 .7
(15) Kiran Kedlaya wrote the initial version of More on Algebra, Section 15.71 .
(16) Matthew Emerton, Toby Gee, and Brandon Levin contributed some results on thickenings, in particular More on Morphisms of Stacks, Lemmas 87.3.6, 87.3.7, and 87.3.8.

## CHAPTER 2

## Conventions

0002

### 2.1. Comments

0003 The philosophy behind the conventions used in writing these documents is to choose those conventions that work.

### 2.2. Set theory

0004 We use Zermelo-Fraenkel set theory with the axiom of choice. See Kun83. We do not use universes (different from SGA4). We do not stress set-theoretic issues, but we make sure everything is correct (of course) and so we do not ignore them either.

### 2.3. Categories

0005 A category $\mathcal{C}$ consists of a set of objects and, for each pair of objects, a set of morphisms between them. In other words, it is what is called a "small" category in other texts. We will use "big" categories (categories whose objects form a proper class) as well, but only those that are listed in Categories, Remark 4.2.2

### 2.4. Algebra

0006 In these notes a ring is a commutative ring with a 1 . Hence the category of rings has an initial object $\mathbf{Z}$ and a final object $\{0\}$ (this is the unique ring where $1=0$ ). Modules are assumed unitary. See [Eis95].

### 2.5. Notation

055X The natural integers are elements of $\mathbf{N}=\{1,2,3, \ldots\}$. The integers are elements of $\mathbf{Z}=\{\ldots,-2,-1,0,1,2, \ldots\}$. The field of rational numbers is denoted $\mathbf{Q}$. The field of real numbers is denoted $\mathbf{R}$. The field of complex numbers is denoted $\mathbf{C}$.

## CHAPTER 3

## Set Theory

### 3.1. Introduction

0008 We need some set theory every now and then. We use Zermelo-Fraenkel set theory with the axiom of choice (ZFC) as described in Kun83 and Jec02.

### 3.2. Everything is a set

0009 Most mathematicians think of set theory as providing the basic foundations for mathematics. So how does this really work? For example, how do we translate the sentence " $X$ is a scheme" into set theory? Well, we just unravel the definitions: A scheme is a locally ringed space such that every point has an open neighbourhood which is an affine scheme. A locally ringed space is a ringed space such that every stalk of the structure sheaf is a local ring. A ringed space is a pair $\left(X, \mathcal{O}_{X}\right)$ consisting of a topological space $X$ and a sheaf of rings $\mathcal{O}_{X}$ on it. A topological space is a pair $(X, \tau)$ consisting of a set $X$ and a set of subsets $\tau \subset \mathcal{P}(X)$ satisfying the axioms of a topology. And so on and so forth.

So how, given a set $S$ would we recognize whether it is a scheme? The first thing we look for is whether the set $S$ is an ordered pair. This is defined (see Jec02, page 7) as saying that $S$ has the form $(a, b):=\{\{a\},\{a, b\}\}$ for some sets $a, b$. If this is the case, then we would take a look to see whether $a$ is an ordered pair $(c, d)$. If so we would check whether $d \subset \mathcal{P}(c)$, and if so whether $d$ forms the collection of sets for a topology on the set $c$. And so on and so forth.

So even though it would take a considerable amount of work to write a complete formula $\phi_{\text {scheme }}(x)$ with one free variable $x$ in set theory that expresses the notion " $x$ is a scheme", it is possible to do so. The same thing should be true for any mathematical object.

### 3.3. Classes

000A Informally we use the notion of a class. Given a formula $\phi\left(x, p_{1}, \ldots, p_{n}\right)$, we call

$$
C=\left\{x: \phi\left(x, p_{1}, \ldots, p_{n}\right)\right\}
$$

a class. A class is easier to manipulate than the formula that defines it, but it is not strictly speaking a mathematical object. For example, if $R$ is a ring, then we may consider the class of all $R$-modules (since after all we may translate the sentence " $M$ is an $R$-module" into a formula in set theory, which then defines a class). A proper class is a class which is not a set.

In this way we may consider the category of $R$-modules, which is a "big" categoryin other words, it has a proper class of objects. Similarly, we may consider the "big" category of schemes, the "big" category of rings, etc.

### 3.4. Ordinals

05N1 A set $T$ is transitive if $x \in T$ implies $x \subset T$. A set $\alpha$ is an ordinal if it is transitive and well-ordered by $\in$. In this case, we define $\alpha+1=\alpha \cup\{\alpha\}$, which is another ordinal called the successor of $\alpha$. An ordinal $\alpha$ is called a successor ordinal if there exists an ordinal $\beta$ such that $\alpha=\beta+1$. The smallest ordinal is $\emptyset$ which is also denoted 0 . If $\alpha$ is not 0 , and not a successor ordinal, then $\alpha$ is called a limit ordinal and we have

$$
\alpha=\bigcup_{\gamma \in \alpha} \gamma
$$

The first limit ordinal is $\omega$ and it is also the first infinite ordinal. The first uncountable ordinal $\omega_{1}$ is the set of all countable ordinals. The collection of all ordinals is a proper class. It is well-ordered by $\in$ in the following sense: any nonempty set (or even class) of ordinals has a least element. Given a set $A$ of ordinals, we define the supremum of $A$ to be $\sup _{\alpha \in A} \alpha=\bigcup_{\alpha \in A} \alpha$. It is the least ordinal bigger or equal to all $\alpha \in A$. Given any well-ordered set $(S, \geq)$, there is a unique ordinal $\alpha$ such that $(S, \geq) \cong(\alpha, \in)$; this is called the order type of the well-ordered set.

### 3.5. The hierarchy of sets

000B We define, by transfinite induction, $V_{0}=\emptyset, V_{\alpha+1}=P\left(V_{\alpha}\right)$ (power set), and for a limit ordinal $\alpha$,

$$
V_{\alpha}=\bigcup_{\beta<\alpha} V_{\beta}
$$

Note that each $V_{\alpha}$ is a transitive set.
000C Lemma 3.5.1. Every set is an element of $V_{\alpha}$ for some ordinal $\alpha$.
Proof. See [Jec02, Lemma 6.3].
In Kun83, Chapter III] it is explained that this lemma is equivalent to the axiom of foundation. The rank of a set $S$ is the least ordinal $\alpha$ such that $S \in V_{\alpha}$. By a partial universe we shall mean a suitably large set of the form $V_{\alpha}$ which will be clear from the context.

### 3.6. Cardinality

000D The cardinality of a set $A$ is the least ordinal $\alpha$ such that there exists a bijection between $A$ and $\alpha$. We sometimes use the notation $\alpha=|A|$ to indicate this. We say an ordinal $\alpha$ is a cardinal if and only if it occurs as the cardinality of some set $A$-in other words, if $\alpha=|A|$. We use the greek letters $\kappa, \lambda$ for cardinals. The first infinite cardinal is $\omega$, and in this context it is denoted $\aleph_{0}$. A set is countable if its cardinality is $\leq \aleph_{0}$. If $\alpha$ is an ordinal, then we denote $\alpha^{+}$the least cardinal $>\alpha$. You can use this to define $\aleph_{1}=\aleph_{0}^{+}, \aleph_{2}=\aleph_{1}^{+}$, etc, and in fact you can define $\aleph_{\alpha}$ for any ordinal $\alpha$ by transfinite induction. We note the equality $\aleph_{1}=\omega_{1}$.

The addition of cardinals $\kappa, \lambda$ is denoted $\kappa \oplus \lambda$; it is the cardinality of $\kappa \amalg \lambda$. The multiplication of cardinals $\kappa, \lambda$ is denoted $\kappa \otimes \lambda$; it is the cardinality of $\kappa \times \lambda$. It is uninteresting since if $\kappa$ and $\lambda$ are infinite cardinals, then $\kappa \otimes \lambda=\max (\kappa, \lambda)$. The exponentiation of cardinals $\kappa, \lambda$ is denoted $\kappa^{\lambda}$; it is the cardinality of the set
of (set) maps from $\lambda$ to $\kappa$. Given any set $K$ of cardinals, the supremum of $K$ is $\sup _{\kappa \in K} \kappa=\bigcup_{\kappa \in K} \kappa$, which is also a cardinal.

### 3.7. Cofinality

000 E A cofinal subset $S$ of a partially ordered set $T$ is a subset $S \subset T$ such that $\forall t \in$ $T \exists s \in S(t \leq s)$. Note that a subset of a well-ordered set is a well-ordered set (with induced ordering). Given an ordinal $\alpha$, the cofinality $\operatorname{cf}(\alpha)$ of $\alpha$ is the least ordinal $\beta$ which occurs as the order type of some cofinal subset of $\alpha$. The cofinality of an ordinal is always a cardinal (this is clear from the definition). Hence alternatively we can define the cofinality of $\alpha$ as the least cardinality of a cofinal subset of $\alpha$.
05N2 Lemma 3.7.1. Suppose that $T=\operatorname{colim}_{\alpha<\beta} T_{\alpha}$ is a colimit of sets indexed by ordinals less than a given ordinal $\beta$. Suppose that $\varphi: S \rightarrow T$ is a map of sets. Then $\varphi$ lifts to a map into $T_{\alpha}$ for some $\alpha<\beta$ provided that $\beta$ is not a limit of ordinals indexed by $S$, in other words, if $\beta$ is an ordinal with $c f(\beta)>|S|$.
Proof. For each element $s \in S$ pick a $\alpha_{s}<\beta$ and an element $t_{s} \in T_{\alpha_{s}}$ which maps to $\varphi(s)$ in $T$. By assumption $\alpha=\sup _{s \in S} \alpha_{s}$ is strictly smaller than $\beta$. Hence the $\operatorname{map} \varphi_{\alpha}: S \rightarrow T_{\alpha}$ which assigns to $s$ the image of $t_{s}$ in $T_{\alpha}$ is a solution.

The following is essentially Grothendieck's argument for the existence of ordinals with arbitrarily large cofinality which he used to prove the existence of enough injectives in certain abelian categories, see Gro57.
05N3 Proposition 3.7.2. Let $\kappa$ be a cardinal. Then there exists an ordinal whose cofinality is bigger than $\kappa$.

Proof. If $\kappa$ is finite, then $\omega=\operatorname{cf}(\omega)$ works. Let us thus assume that $\kappa$ is infinite. Consider the smallest ordinal $\alpha$ whose cardinality is strictly greater than $\kappa$. We claim that $\operatorname{cf}(\alpha)>\kappa$. Note that $\alpha$ is a limit ordinal, since if $\alpha=\beta+1$, then $|\alpha|=|\beta|$ (because $\alpha$ and $\beta$ are infinite) and this contradicts the minimality of $\alpha$. (Of course $\alpha$ is also a cardinal, but we do not need this.) To get a contradiction suppose $S \subset \alpha$ is a cofinal subset with $|S| \leq \kappa$. For $\beta \in S$, i.e., $\beta<\alpha$, we have $|\beta| \leq \kappa$ by minimality of $\alpha$. As $\alpha$ is a limit ordinal and $S$ cofinal in $\alpha$ we obtain $\alpha=\bigcup_{\beta \in S} \beta$. Hence $|\alpha| \leq|S| \otimes \kappa \leq \kappa \otimes \kappa \leq \kappa$ which is a contradiction with our choice of $\alpha$.

### 3.8. Reflection principle

000 F Some of this material is in the chapter of Kun83 called "Easy consistency proofs".
Let $\phi\left(x_{1}, \ldots, x_{n}\right)$ be a formula of set theory. Let us use the convention that this notation implies that all the free variables in $\phi$ occur among $x_{1}, \ldots, x_{n}$. Let $M$ be a set. The formula $\phi^{M}\left(x_{1}, \ldots, x_{n}\right)$ is the formula obtained from $\phi\left(x_{1}, \ldots, x_{n}\right)$ by replacing all the $\forall x$ and $\exists x$ by $\forall x \in M$ and $\exists x \in M$, respectively. So the formula $\phi\left(x_{1}, x_{2}\right)=\exists x\left(x \in x_{1} \wedge x \in x_{2}\right)$ is turned into $\phi^{M}\left(x_{1}, x_{2}\right)=\exists x \in M\left(x \in x_{1} \wedge x \in\right.$ $x_{2}$ ). The formula $\phi^{M}$ is called the relativization of $\phi$ to $M$.
000G Theorem 3.8.1. Suppose given $\phi_{1}\left(x_{1}, \ldots, x_{n}\right), \ldots, \phi_{m}\left(x_{1}, \ldots, x_{n}\right)$ a finite collection of formulas of set theory. Let $M_{0}$ be a set. There exists a set $M$ such that $M_{0} \subset M$ and $\forall x_{1}, \ldots, x_{n} \in M$, we have

$$
\forall i=1, \ldots, m, \phi_{i}^{M}\left(x_{1}, \ldots, x_{n}\right) \Leftrightarrow \forall i=1, \ldots, m, \phi_{i}\left(x_{1}, \ldots, x_{n}\right)
$$

In fact we may take $M=V_{\alpha}$ for some limit ordinal $\alpha$.

Proof. See [Jec02, Theorem 12.14] or Kun83, Theorem 7.4].
We view this theorem as saying the following: Given any $x_{1}, \ldots, x_{n} \in M$ the formulas hold with the bound variables ranging through all sets if and only if they hold for the bound variables ranging through elements of $V_{\alpha}$. This theorem is a meta-theorem because it deals with the formulas of set theory directly. It actually says that given the finite list of formulas $\phi_{1}, \ldots, \phi_{m}$ with at most free variables $x_{1}, \ldots, x_{n}$ the sentence

$$
\begin{gathered}
\forall M_{0} \exists M, M_{0} \subset M \forall x_{1}, \ldots, x_{n} \in M \\
\phi_{1}\left(x_{1}, \ldots, x_{n}\right) \wedge \ldots \wedge \phi_{m}\left(x_{1}, \ldots, x_{n}\right) \leftrightarrow \phi_{1}^{M}\left(x_{1}, \ldots, x_{n}\right) \wedge \ldots \wedge \phi_{m}^{M}\left(x_{1}, \ldots, x_{n}\right)
\end{gathered}
$$

is provable in ZFC. In other words, whenever we actually write down a finite list of formulas $\phi_{i}$, we get a theorem.

It is somewhat hard to use this theorem in "ordinary mathematics" since the meaning of the formulas $\phi_{i}^{M}\left(x_{1}, \ldots, x_{n}\right)$ is not so clear! Instead, we will use the idea of the proof of the reflection principle to prove the existence results we need directly.

### 3.9. Constructing categories of schemes

000 H We will discuss how to apply this to produce, given an initial set of schemes, a "small" category of schemes closed under a list of natural operations. Before we do so, we introduce the size of a scheme. Given a scheme $S$ we define

$$
\operatorname{size}(S)=\max \left(\aleph_{0}, \kappa_{1}, \kappa_{2}\right)
$$

where we define the cardinal numbers $\kappa_{1}$ and $\kappa_{2}$ as follows:
(1) We let $\kappa_{1}$ be the cardinality of the set of affine opens of $S$.
(2) We let $\kappa_{2}$ be the supremum of all the cardinalities of all $\Gamma\left(U, \mathcal{O}_{S}\right)$ for all $U \subset S$ affine open.

000I Lemma 3.9.1. For every cardinal $\kappa$, there exists a set $A$ such that every element of $A$ is a scheme and such that for every scheme $S$ with size $(S) \leq \kappa$, there is an element $X \in A$ such that $X \cong S$ (isomorphism of schemes).

Proof. Omitted. Hint: think about how any scheme is isomorphic to a scheme obtained by glueing affines.

We denote Bound the function which to each cardinal $\kappa$ associates
046U

$$
\begin{equation*}
\operatorname{Bound}(\kappa)=\max \left\{\kappa^{\aleph_{0}}, \kappa^{+}\right\} \tag{3.9.1.1}
\end{equation*}
$$

We could make this function grow much more rapidly, e.g., we could set $\operatorname{Bound}(\kappa)=$ $\kappa^{\kappa}$, and the result below would still hold. For any ordinal $\alpha$, we denote $S c h_{\alpha}$ the full subcategory of category of schemes whose objects are elements of $V_{\alpha}$. Here is the result we are going to prove.

000J Lemma 3.9.2. With notations size, Bound and $S c h_{\alpha}$ as above. Let $S_{0}$ be a set of schemes. There exists a limit ordinal $\alpha$ with the following properties:
$000 \mathrm{~K} \quad$ (1) We have $S_{0} \subset V_{\alpha}$; in other words, $S_{0} \subset \mathrm{Ob}\left(S c h_{\alpha}\right)$.
000L
(2) For any $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ and any scheme $T$ with size $(T) \leq \operatorname{Bound}(\operatorname{size}(S))$, there exists a scheme $S^{\prime} \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ such that $T \cong S^{\prime}$.
(3) For any countabl $\oint^{1}$ diagram category $\mathcal{I}$ and any functor $F: \mathcal{I} \rightarrow$ Sch $_{\alpha}$, the limit $\lim _{\mathcal{I}} F$ exists in $S_{\alpha}$ if and only if it exists in Sch and moreover, in this case, the natural morphism between them is an isomorphism.
000N
(4) For any countable diagram category $\mathcal{I}$ and any functor $F: \mathcal{I} \rightarrow S c h_{\alpha}$, the colimit $\operatorname{colim}_{\mathcal{I}} F$ exists in $S c h_{\alpha}$ if and only if it exists in $S c h$ and moreover, in this case, the natural morphism between them is an isomorphism.
Proof. We define, by transfinite induction, a function $f$ which associates to every ordinal an ordinal as follows. Let $f(0)=0$. Given $f(\alpha)$, we define $f(\alpha+1)$ to be the least ordinal $\beta$ such that the following hold:
(1) We have $\alpha+1 \leq \beta$ and $f(\alpha) \leq \beta$.
(2) For any $S \in \operatorname{Ob}\left(S c h_{f(\alpha)}\right)$ and any scheme $T$ with size $(T) \leq \operatorname{Bound}(\operatorname{size}(S))$, there exists a scheme $S^{\prime} \in \mathrm{Ob}\left(S c h_{\beta}\right)$ such that $T \cong S^{\prime}$.
(3) For any countable diagram category $\mathcal{I}$ and any functor $F: \mathcal{I} \rightarrow S c h_{f(\alpha)}$, if the limit $\lim _{\mathcal{I}} F$ or the colimit $\operatorname{colim}_{\mathcal{I}} F$ exists in $S c h$, then it is isomorphic to a scheme in $S c h_{\beta}$.
To see $\beta$ exists, we argue as follows. Since $\mathrm{Ob}\left(S c h_{f(\alpha)}\right)$ is a set, we see that $\kappa=\sup _{S \in \mathrm{Ob}\left(S c h_{f(\alpha)}\right)}$ Bound $(\operatorname{size}(S))$ exists and is a cardinal. Let $A$ be a set of schemes obtained starting with $\kappa$ as in Lemma 3.9.1. There is a set CountCat of countable categories such that any countable category is isomorphic to an element of CountCat. Hence in (3) above we may assume that $\mathcal{I}$ is an element in CountCat. This means that the pairs $(\mathcal{I}, F)$ in (3) range over a set. Thus, there exists a set $B$ whose elements are schemes such that for every $(\mathcal{I}, F)$ as in (3), if the limit or colimit exists, then it is isomorphic to an element in $B$. Hence, if we pick any $\beta$ such that $A \cup B \subset V_{\beta}$ and $\beta>\max \{\alpha+1, f(\alpha)\}$, then (1)-(3) hold. Since every nonempty collection of ordinals has a least element, we see that $f(\alpha+1)$ is well defined. Finally, if $\alpha$ is a limit ordinal, then we set $f(\alpha)=\sup _{\alpha^{\prime}<\alpha} f\left(\alpha^{\prime}\right)$.
Pick $\beta_{0}$ such that $S_{0} \subset V_{\beta_{0}}$. By construction $f(\beta) \geq \beta$ and we see that also $S_{0} \subset V_{f\left(\beta_{0}\right)}$. Moreover, as $f$ is nondecreasing, we see $S_{0} \subset V_{f(\beta)}$ is true for any $\beta \geq \beta_{0}$. Next, choose any ordinal $\beta_{1}>\beta_{0}$ with cofinality $\operatorname{cf}\left(\beta_{1}\right)>\omega=\aleph_{0}$. This is possible since the cofinality of ordinals gets arbitrarily large, see Proposition 3.7.2. We claim that $\alpha=f\left(\beta_{1}\right)$ is a solution to the problem posed in the lemma.

The first property of the lemma holds by our choice of $\beta_{1}>\beta_{0}$ above.
Since $\beta_{1}$ is a limit ordinal (as its cofinality is infinite), we get $f\left(\beta_{1}\right)=\sup _{\beta<\beta_{1}} f(\beta)$. Hence $\left\{f(\beta) \mid \beta<\beta_{1}\right\} \subset f\left(\beta_{1}\right)$ is a cofinal subset. Hence we see that

$$
V_{\alpha}=V_{f\left(\beta_{1}\right)}=\bigcup_{\beta<\beta_{1}} V_{f(\beta)} .
$$

Now, let $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$. We define $\beta(S)$ to be the least ordinal $\beta$ such that $S \in$ $\mathrm{Ob}\left(S c h_{f(\beta)}\right)$. By the above we see that always $\beta(S)<\beta_{1}$. Since $\mathrm{Ob}\left(S c h_{f(\beta+1)}\right) \subset$ $\mathrm{Ob}\left(S c h_{\alpha}\right)$, we see by construction of $f$ above that the second property of the lemma is satisfied.

Suppose that $\left\{S_{1}, S_{2}, \ldots\right\} \subset \mathrm{Ob}\left(S c h_{\alpha}\right)$ is a countable collection. Consider the function $\omega \rightarrow \beta_{1}, n \mapsto \beta\left(S_{n}\right)$. Since the cofinality of $\beta_{1}$ is $>\omega$, the image of this function cannot be a cofinal subset. Hence there exists a $\beta<\beta_{1}$ such that $\left\{S_{1}, S_{2}, \ldots\right\} \subset \mathrm{Ob}\left(S c h_{f(\beta)}\right)$. It follows that any functor $F: \mathcal{I} \rightarrow S c h_{\alpha}$ factors

[^0]through one of the subcategories $S c h_{f(\beta)}$. Thus, if there exists a scheme $X$ that is the colimit or limit of the diagram $F$, then, by construction of $f$, we see $X$ is isomorphic to an object of $S c h_{f(\beta+1)}$ which is a subcategory of $S c h_{\alpha}$. This proves the last two assertions of the lemma.

000 Remark 3.9.3. The lemma above can also be proved using the reflection principle. However, one has to be careful. Namely, suppose the sentence $\phi_{\text {scheme }}(X)$ expresses the property " $X$ is a scheme", then what does the formula $\phi_{\text {scheme }}^{V_{\alpha}}(X)$ mean? It is true that the reflection principle says we can find $\alpha$ such that for all $X \in V_{\alpha}$ we have $\phi_{\text {scheme }}(X) \leftrightarrow \phi_{\text {scheme }}^{V_{\alpha}}(X)$ but this is entirely useless. It is only by combining two such statements that something interesting happens. For example suppose $\phi_{\text {red }}(X, Y)$ expresses the property " $X, Y$ are schemes, and $Y$ is the reduction of $X "$ (see Schemes, Definition 25.12.5). Suppose we apply the reflection principle to the pair of formulas $\phi_{1}(X, Y)=\phi_{\text {red }}(X, Y), \phi_{2}(X)=\exists Y, \phi_{1}(X, Y)$. Then it is easy to see that any $\alpha$ produced by the reflection principle has the property that given $X \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ the reduction of $X$ is also an object of $S c h_{\alpha}$ (left as an exercise).

000P Lemma 3.9.4. Let $S$ be an affine scheme. Let $R=\Gamma\left(S, \mathcal{O}_{S}\right)$. Then the size of $S$ is equal to $\max \left\{\aleph_{0},|R|\right\}$.

Proof. There are at most $\max \left\{|R|, \aleph_{0}\right\}$ affine opens of $\operatorname{Spec}(R)$. This is clear since any affine open $U \subset \operatorname{Spec}(R)$ is a finite union of principal opens $D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ and hence the number of affine opens is at $\operatorname{most}^{\sup }{ }_{n}|R|^{n}=\max \left\{|R|, \aleph_{0}\right\}$, see Kun83, Ch. I, 10.13]. On the other hand, we see that $\Gamma(U, \mathcal{O}) \subset R_{f_{1}} \times \ldots \times R_{f_{n}}$ and hence $|\Gamma(U, \mathcal{O})| \leq \max \left\{\aleph_{0},\left|R_{f_{1}}\right|, \ldots,\left|R_{f_{n}}\right|\right\}$. Thus it suffices to prove that $\left|R_{f}\right| \leq \max \left\{\aleph_{0},|R|\right\}$ which is omitted.

000Q Lemma 3.9.5. Let $S$ be a scheme. Let $S=\bigcup_{i \in I} S_{i}$ be an open covering. Then $\operatorname{size}(S) \leq \max \left\{|I|, \sup _{i}\left\{\operatorname{size}\left(S_{i}\right)\right\}\right\}$.

Proof. Let $U \subset S$ be any affine open. Since $U$ is quasi-compact there exist finitely many elements $i_{1}, \ldots, i_{n} \in I$ and affine opens $U_{i} \subset U \cap S_{i}$ such that $U=U_{1} \cup U_{2} \cup$ $\ldots \cup U_{n}$. Thus

$$
\left|\Gamma\left(U, \mathcal{O}_{U}\right)\right| \leq\left|\Gamma\left(U_{1}, \mathcal{O}\right)\right| \otimes \ldots \otimes\left|\Gamma\left(U_{n}, \mathcal{O}\right)\right| \leq \sup _{i}\left\{\operatorname{size}\left(S_{i}\right)\right\}
$$

Moreover, it shows that the set of affine opens of $S$ has cardinality less than or equal to the cardinality of the set

$$
\coprod_{n \in \omega} \coprod_{i_{1}, \ldots, i_{n} \in I}\left\{\text { affine opens of } S_{i_{1}}\right\} \times \ldots \times\left\{\text { affine opens of } S_{i_{n}}\right\}
$$

Each of the sets inside the disjoint union has cardinality at $\operatorname{most}_{\sup }^{i}$ $\left\{\operatorname{size}\left(S_{i}\right)\right\}$. The index set has cardinality at most max $\left\{|I|, \aleph_{0}\right\}$, see Kun83, Ch. I, 10.13]. Hence by [Jec02, Lemma 5.8] the cardinality of the coproduct is at most $\max \left\{\aleph_{0},|I|\right\} \otimes$ $\sup _{i}\left\{\operatorname{size}\left(S_{i}\right)\right\}$. The lemma follows.

04 T Lemma 3.9.6. Let $f: X \rightarrow S, g: Y \rightarrow S$ be morphisms of schemes. Then we have $\operatorname{size}\left(X \times_{S} Y\right) \leq \max \{\operatorname{size}(X)$, size $(Y)\}$.
Proof. Let $S=\bigcup_{k \in K} S_{k}$ be an affine open covering. Let $X=\bigcup_{i \in I} U_{i}, Y=$ $\bigcup_{j \in J} V_{j}$ be affine open coverings with $I, J$ of cardinality $\leq \operatorname{size}(X)$, $\operatorname{size}(Y)$. For each $i \in I$ there exists a finite set $K_{i}$ of $k \in K$ such that $f\left(U_{i}\right) \subset \bigcup_{k \in K_{i}} S_{k}$. For each $j \in J$ there exists a finite set $K_{j}$ of $k \in K$ such that $g\left(V_{j}\right) \subset \bigcup_{k \in K_{j}} S_{k}$. Hence
$f(X), g(Y)$ are contained in $S^{\prime}=\bigcup_{k \in K^{\prime}} S_{k}$ with $K^{\prime}=\bigcup_{i \in I} K_{i} \cup \bigcup_{j \in J} K_{j}$. Note that the cardinality of $K^{\prime}$ is at most $\max \left\{\aleph_{0},|I|,|J|\right\}$. Applying Lemma 3.9.5 we see that it suffices to prove that $\left.\operatorname{size}\left(f^{-1}\left(S_{k}\right) \times{ }_{S_{k}} g^{-1}\left(S_{k}\right)\right) \leq \max \{\operatorname{size}(X), \operatorname{size}(Y))\right\}$ for $k \in K^{\prime}$. In other words, we may assume that $S$ is affine.
Assume $S$ affine. Let $X=\bigcup_{i \in I} U_{i}, Y=\bigcup_{j \in J} V_{j}$ be affine open coverings with $I$, $J$ of cardinality $\leq \operatorname{size}(X)$, size $(Y)$. Again by Lemma 3.9.5 it suffices to prove the lemma for the products $U_{i} \times_{S} V_{j}$. By Lemma 3.9.4 we see that it suffices to show that

$$
\left|A \otimes_{C} B\right| \leq \max \left\{\aleph_{0},|A|,|B|\right\}
$$

We omit the proof of this inequality.
04 T 7 Lemma 3.9.7. Let $S$ be a scheme. Let $f: X \rightarrow S$ be locally of finite type with $X$ quasi-compact. Then size $(X) \leq \operatorname{size}(S)$.

Proof. We can find a finite affine open covering $X=\bigcup_{i=1, \ldots n} U_{i}$ such that each $U_{i}$ maps into an affine open $S_{i}$ of $S$. Thus by Lemma 3.9.5 we reduce to the case where both $S$ and $X$ are affine. In this case by Lemma 3.9.4 we see that it suffices to show

$$
\left|A\left[x_{1}, \ldots, x_{n}\right]\right| \leq \max \left\{\aleph_{0},|A|\right\}
$$

We omit the proof of this inequality.
In Algebra, Lemma 10.106 .13 we will show that if $A \rightarrow B$ is an epimorphism of rings, then $|B| \leq \max \left(|A|, \aleph_{0}\right)$. The analogue for schemes is the following lemma.
04VA Lemma 3.9.8. Let $f: X \rightarrow Y$ be a monomorphism of schemes. If at least one of the following properties holds, then size $(X) \leq \operatorname{size}(Y)$ :
(1) $f$ is quasi-compact,
(2) $f$ is locally of finite presentation,
(3) add more here as needed.

But the bound does not hold for monomorphisms which are locally of finite type.
Proof. Let $Y=\bigcup_{j \in J} V_{j}$ be an affine open covering of $Y$ with $|J| \leq \operatorname{size}(Y)$. By Lemma 3.9 .5 it suffices to bound the size of the inverse image of $V_{j}$ in $X$. Hence we reduce to the case that $Y$ is affine, say $Y=\operatorname{Spec}(B)$. For any affine open $\operatorname{Spec}(A) \subset X$ we have $|A| \leq \max \left(|B|, \aleph_{0}\right)=\operatorname{size}(Y)$, see remark above and Lemma 3.9.4. Thus it suffices to show that $X$ has at most size $(Y)$ affine opens. This is clear if $X$ is quasi-compact, whence case (1) holds. In case (2) the number of isomorphism classes of $B$-algebras $A$ that can occur is bounded by $\operatorname{size}(B)$, because each $A$ is of finite type over $B$, hence isomorphic to an algebra $B\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ for some $n, m$, and $f_{j} \in B\left[x_{1}, \ldots, x_{n}\right]$. However, as $X \rightarrow Y$ is a monomorphism, there is a unique morphism $\operatorname{Spec}(A) \rightarrow X$ over $Y=\operatorname{Spec}(B)$ if there is one, hence the number of affine opens of $X$ is bounded by the number of these isomorphism classes.

To prove the final statement of the lemma consider the ring $B=\prod_{n \in \mathbf{N}} \mathbf{F}_{2}$ and set $Y=\operatorname{Spec}(B)$. For every ultrafilter $\mathcal{U}$ on $\mathbf{N}$ we obtain a maximal ideal $\mathfrak{m}_{\mathcal{U}}$ with residue field $\mathbf{F}_{2}$; the map $B \rightarrow \mathbf{F}_{2}$ sends the element $\left(x_{n}\right)$ to $\lim _{\mathcal{U}} x_{n}$. Details omitted. The morphism of schemes $X=\coprod_{\mathcal{U}} \operatorname{Spec}\left(\mathbf{F}_{2}\right) \rightarrow Y$ is a monomorphism as all the points are distinct. However the cardinality of the set of affine open subschemes of $X$ is equal to the cardinality of the set of ultrafilters on $\mathbf{N}$ which is $2^{2^{\aleph_{0}}}$. We conclude as $|B|=2^{\aleph_{0}}<2^{2^{\aleph_{0}}}$.

000R Lemma 3.9.9. Let $\alpha$ be an ordinal as in Lemma 3.9.2 above. The category $S c h_{\alpha}$ satisfies the following properties:
(1) If $X, Y, S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$, then for any morphisms $f: X \rightarrow S, g: Y \rightarrow S$ the fibre product $X \times_{S} Y$ in $S c h_{\alpha}$ exists and is a fibre product in the category of schemes.
(2) Given any at most countable collection $S_{1}, S_{2}, \ldots$ of elements of $\mathrm{Ob}\left(S c h_{\alpha}\right)$, the coproduct $\coprod_{i} S_{i}$ exists in $\mathrm{Ob}\left(S c h_{\alpha}\right)$ and is a coproduct in the category of schemes.
(3) For any $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ and any open immersion $U \rightarrow S$, there exists a $V \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ with $V \cong U$.
(4) For any $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ and any closed immersion $T \rightarrow S$, there exists a $S^{\prime} \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ with $S^{\prime} \cong T$.
(5) For any $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ and any finite type morphism $T \rightarrow S$, there exists a $S^{\prime} \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ with $S^{\prime} \cong T$.
(6) Suppose $S$ is a scheme which has an open covering $S=\bigcup_{i \in I} S_{i}$ such that there exists a $T \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ with (a) size $\left(S_{i}\right) \leq \operatorname{size}(T)^{\aleph_{0}}$ for all $i \in I$, and (b) $|I| \leq \operatorname{size}(T)^{\aleph_{0}}$. Then $S$ is isomorphic to an object of $S c h_{\alpha}$.
(7) For any $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ and any morphism $f: T \rightarrow S$ locally of finite type such that $T$ can be covered by at most size $(S)^{\aleph_{0}}$ open affines, there exists a $S^{\prime} \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ with $S^{\prime} \cong T$. For example this holds if $T$ can be covered by at most $|\mathbf{R}|=2^{\aleph_{0}}=\aleph_{0}^{\aleph_{0}}$ open affines.
(8) For any $S \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ and any monomorphism $T \rightarrow S$ which is either locally of finite presentation or quasi-compact, there exists a $S^{\prime} \in \mathrm{Ob}\left(S c h_{\alpha}\right)$ with $S^{\prime} \cong T$.
(9) Suppose that $T \in \mathrm{Ob}\left(S_{\text {sch }}^{\alpha}\right)$ is affine. Write $R=\Gamma\left(T, \mathcal{O}_{T}\right)$. Then any of the following schemes is isomorphic to a scheme in $S c h_{\alpha}$ :
(a) For any ideal $I \subset R$ with completion $R^{*}=\lim _{n} R / I^{n}$, the scheme $\operatorname{Spec}\left(R^{*}\right)$.
(b) For any finite type $R$-algebra $R^{\prime}$, the scheme $\operatorname{Spec}\left(R^{\prime}\right)$.
(c) For any localization $S^{-1} R$, the scheme $\operatorname{Spec}\left(S^{-1} R\right)$.
(d) For any prime $\mathfrak{p} \subset R$, the scheme $\operatorname{Spec}(\overline{\kappa(\mathfrak{p})})$.
(e) For any subring $R^{\prime} \subset R$, the scheme $\operatorname{Spec}\left(R^{\prime}\right)$.
(f) Any scheme of finite type over a ring of cardinality at most $|R|^{\aleph_{0}}$.
(g) And so on.

Proof. Statements (1) and (2) follow directly from the definitions. Statement (3) follows as the size of an open subscheme $U$ of $S$ is clearly smaller than or equal to the size of $S$. Statement (4) follows from (5). Statement (5) follows from (7). Statement (6) follows as the size of $S$ is $\leq \max \left\{|I|, \sup _{i} \operatorname{size}\left(S_{i}\right)\right\} \leq \operatorname{size}(T)^{\aleph_{0}}$ by Lemma 3.9.5. Statement (7) follows from (6). Namely, for any affine open $V \subset T$ we have $\operatorname{size}(V) \leq \operatorname{size}(S)$ by Lemma 3.9.7. Thus, we see that (6) applies in the situation of (7). Part (8) follows from Lemma 3.9.8.

Statement (9) is translated, via Lemma 3.9.4, into an upper bound on the cardinality of the rings $R^{*}, S^{-1} R, \overline{\kappa(\mathfrak{p})}, R^{\prime}$, etc. Perhaps the most interesting one is the $\operatorname{ring} R^{*}$. As a set, it is the image of a surjective map $R^{\mathbf{N}} \rightarrow R^{*}$. Since $\left|R^{\mathbf{N}}\right|=|R|^{\aleph_{0}}$, we see that it works by our choice of $\operatorname{Bound}(\kappa)$ being at least $\kappa^{\aleph_{0}}$. Phew! (The cardinality of the algebraic closure of a field is the same as the cardinality of the field, or it is $\aleph_{0}$. )

000S Remark 3.9.10. Let $R$ be a ring. Suppose we consider the ring $\prod_{\mathfrak{p} \in \operatorname{Spec}(R)} \kappa(\mathfrak{p})$. The cardinality of this ring is bounded by $|R|^{2^{|R|}}$, but is not bounded by $|R|^{\aleph_{0}}$ in general. For example if $R=\mathbf{C}[x]$ it is not bounded by $|R|^{\aleph_{0}}$ and if $R=\prod_{n \in \mathbf{N}} \mathbf{F}_{2}$ it is not bounded by $|R|^{|R|}$. Thus the "And so on" of Lemma 3.9.9 above should be taken with a grain of salt. Of course, if it ever becomes necessary to consider these rings in arguments pertaining to fppf/étale cohomology, then we can change the function Bound above into the function $\kappa \mapsto \kappa^{2^{\kappa}}$.

In the following lemma we use the notion of an fpqc covering which is introduced in Topologies, Section 33.8 .

0AHK Lemma 3.9.11. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume there exists an fpqc covering $\left\{g_{j}: Y_{j} \rightarrow Y\right\}_{j \in J}$ such that $g_{j}$ factors through $f$. Then $\operatorname{size}(Y) \leq \operatorname{size}(X)$.

Proof. Let $V \subset Y$ be an affine open. By definition there exist $n \geq 0$ and $a$ : $\{1, \ldots, n\} \rightarrow J$ and affine opens $V_{i} \subset Y_{a(i)}$ such that $V=g_{a(1)}\left(V_{1}\right) \cup \ldots \cup g_{a(n)}\left(V_{n}\right)$. Denote $h_{j}: Y_{j} \rightarrow X$ a morphism such that $f \circ h_{j}=g_{j}$. Then $h_{a(1)}\left(V_{1}\right) \cup \ldots \cup$ $h_{a(n)}\left(V_{n}\right)$ is a quasi-compact subset of $f^{-1}(V)$. Hence we can find a quasi-compact open $W \subset f^{-1}(V)$ which contains $h_{a(i)}\left(V_{i}\right)$ for $i=1, \ldots, n$. In particular $V=$ $f(W)$.
On the one hand this shows that the cardinality of the set of affine opens of $Y$ is at most the cardinality of the set $S$ of quasi-compact opens of $X$. Since every quasi-compact open of $X$ is a finite union of affines, we see that the cardinality of this set is at most $\sup |S|^{n}=\max \left(\aleph_{0},|S|\right)$. On the other hand, we have $\mathcal{O}_{Y}(V) \subset$ $\prod_{i=1, \ldots, n} \mathcal{O}_{Y_{a(i)}}\left(V_{i}\right)$ because $\left\{V_{i} \rightarrow V\right\}$ is an fpqc covering. Hence $\mathcal{O}_{Y}(V) \subset \mathcal{O}_{X}(W)$ because $V_{i} \rightarrow V$ factors through $W$. Again since $W$ has a finite covering by affine opens of $X$ we conclude that $\left|\mathcal{O}_{Y}(V)\right|$ is bounded by the size of $X$. The lemma now follows from the definition of the size of a scheme.

In the following lemma we use the notion of an fppf covering which is introduced in Topologies, Section 33.7.

0AHL Lemma 3.9.12. Let $\left\{f_{i}: X_{i} \rightarrow X\right\}_{i \in I}$ be an fppf covering of a scheme. There exists an fppf covering $\left\{W_{j} \rightarrow X\right\}_{j \in J}$ which is a refinement of $\left\{X_{i} \rightarrow X\right\}_{i \in I}$ such that size $\left(\amalg W_{j}\right) \leq \operatorname{size}(X)$.

Proof. Choose an affine open covering $X=\bigcup_{a \in A} U_{a}$ with $|A| \leq \operatorname{size}(X)$. For each $a$ we can choose a finite subset $I_{a} \subset I$ and for $i \in I_{a}$ a quasi-compact open $W_{a, i} \subset X_{i}$ such that $U_{a}=\bigcup_{i \in I_{a}} f_{i}\left(W_{a, i}\right)$. Then $\operatorname{size}\left(W_{a, i}\right) \leq \operatorname{size}(X)$ by Lemma 3.9.7. We conclude that size $\left(\coprod_{a} \coprod_{i \in I_{a}} W_{i, a}\right) \leq \operatorname{size}(X)$ by Lemma 3.9.5.

### 3.10. Sets with group action

000 T Let $G$ be a group. We denote $G$-Sets the "big" category of $G$-sets. For any ordinal $\alpha$, we denote $G$-Sets $s_{\alpha}$ the full subcategory of $G$-Sets whose objects are in $V_{\alpha}$. As a notion for size of a $G$-set we take $\operatorname{size}(S)=\max \left\{\aleph_{0},|G|,|S|\right\}$ (where $|G|$ and $|S|$ are the cardinality of the underlying sets). As above we use the function $\operatorname{Bound}(\kappa)=\kappa^{\aleph_{0}}$.
000U Lemma 3.10.1. With notations $G$, $G$-Sets ${ }_{\alpha}$, size, and Bound as above. Let $S_{0}$ be a set of $G$-sets. There exists a limit ordinal $\alpha$ with the following properties:
(1) We have $S_{0} \cup\left\{{ }_{G} G\right\} \subset \mathrm{Ob}\left(G-\right.$ Sets $\left._{\alpha}\right)$.
(2) For any $S \in \mathrm{Ob}\left(G\right.$-Sets $\alpha_{\alpha}$ ) and any $G$-set $T$ with size $(T) \leq \operatorname{Bound}(\operatorname{size}(S))$, there exists a $S^{\prime} \in \mathrm{Ob}\left(G-\right.$ Sets $\left._{\alpha}\right)$ that is isomorphic to $T$.
(3) For any countable diagram category $\mathcal{I}$ and any functor $F: \mathcal{I} \rightarrow G$-Sets ${ }_{\alpha}$, the limit $\lim _{\mathcal{I}} F$ and colimit $\operatorname{colim}_{\mathcal{I}} F$ exist in $G$-Sets $\alpha_{\alpha}$ and are the same as in G-Sets.

Proof. Omitted. Similar to but easier than the proof of Lemma 3.9.2 above.
000V Lemma 3.10.2. Let $\alpha$ be an ordinal as in Lemma 3.10.1 above. The category $G$-Sets $\alpha_{\alpha}$ satisfies the following properties:
(1) The $G$-set ${ }_{G} G$ is an object of $G$-Sets ${ }_{\alpha}$.
(2) (Co)Products, fibre products, and pushouts exist in $G$-Sets $\alpha_{\alpha}$ and are the same as their counterparts in G-Sets.
(3) Given an object $U$ of $G$-Sets ${ }_{\alpha}$, any $G$-stable subset $O \subset U$ is isomorphic to an object of $G$-Sets ${ }_{\alpha}$.

Proof. Omitted.

### 3.11. Coverings of a site

000 W Suppose that $\mathcal{C}$ is a category (as in Categories, Definition 4.2.1) and that $\operatorname{Cov}(\mathcal{C})$ is a proper class of coverings satisfying properties (1), (2), and (3) of Sites, Definition 7.6.2. We list them here:
(1) If $V \rightarrow U$ is an isomorphism, then $\{V \rightarrow U\} \in \operatorname{Cov}(\mathcal{C})$.
(2) If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ and for each $i$ we have $\left\{V_{i j} \rightarrow U_{i}\right\}_{j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})$, then $\left\{V_{i j} \rightarrow U\right\}_{i \in I, j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})$.
(3) If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ and $V \rightarrow U$ is a morphism of $\mathcal{C}$, then $U_{i} \times_{U} V$ exists for all $i$ and $\left\{U_{i} \times_{U} V \rightarrow V\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$.
For an ordinal $\alpha$, we set $\operatorname{Cov}(\mathcal{C})_{\alpha}=\operatorname{Cov}(\mathcal{C}) \cap V_{\alpha}$. Given an ordinal $\alpha$ and a cardinal $\kappa$, we set $\operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$ equal to the set of elements $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\alpha}$ such that $|I| \leq \kappa$.
We recall the following notion, see Sites, Definition 7.8.2. Two families of morphisms, $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ and $\left\{\psi_{j}: W_{j} \rightarrow U\right\}_{j \in J}$, with the same target of $\mathcal{C}$ are called combinatorially equivalent if there exist maps $\alpha: I \rightarrow J$ and $\beta: J \rightarrow I$ such that $\varphi_{i}=\psi_{\alpha(i)}$ and $\psi_{j}=\varphi_{\beta(j)}$. This defines an equivalence relation on families of morphisms having a fixed target.

000X Lemma 3.11.1. With notations as above. Let $\operatorname{Cov}_{0} \subset \operatorname{Cov}(\mathcal{C})$ be a set contained in $\operatorname{Cov}(\mathcal{C})$. There exist a cardinal $\kappa$ and a limit ordinal $\alpha$ with the following properties:
(1) We have $\operatorname{Cov}_{0} \subset \operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$.
(2) The set of coverings $\operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$ satisfies (1), (2), and (3) of Sites, Definition 7.6.2 (see above). In other words $\left(\mathcal{C}, \operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}\right)$ is a site.
(3) Every covering in $\operatorname{Cov}(\mathcal{C})$ is combinatorially equivalent to a covering in $\operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$.

Proof. To prove this, we first consider the set $\mathcal{S}$ of all sets of morphisms of $\mathcal{C}$ with fixed target. In other words, an element of $\mathcal{S}$ is a subset $T$ of $\operatorname{Arrows}(\mathcal{C})$ such that all elements of $T$ have the same target. Given a family $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ of morphisms with fixed target, we define $\operatorname{Supp}(\mathcal{U})=\{\varphi \in \operatorname{Arrows}(\mathcal{C}) \mid \exists i \in I, \varphi=$ $\left.\varphi_{i}\right\}$. Note that two families $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ and $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ are
combinatorially equivalent if and only if $\operatorname{Supp}(\mathcal{U})=\operatorname{Supp}(\mathcal{V})$. Next, we define $\mathcal{S}_{\tau} \subset \mathcal{S}$ to be the subset $\mathcal{S}_{\tau}=\{T \in \mathcal{S} \mid \exists \mathcal{U} \in \operatorname{Cov}(\mathcal{C}) T=\operatorname{Supp}(\mathcal{U})\}$. For every element $T \in \mathcal{S}_{\tau}$, set $\beta(T)$ to equal the least ordinal $\beta$ such that there exists a $\mathcal{U} \in \operatorname{Cov}(\mathcal{C})_{\beta}$ such that $T=\operatorname{Supp}(\mathcal{U})$. Finally, set $\beta_{0}=\sup _{T \in S_{\tau}} \beta(T)$. At this point it follows that every $\mathcal{U} \in \operatorname{Cov}(\mathcal{C})$ is combinatorially equivalent to some element of $\operatorname{Cov}(\mathcal{C})_{\beta_{0}}$.
Let $\kappa$ be the maximum of $\aleph_{0}$, the cardinality $|\operatorname{Arrows}(\mathcal{C})|$,

$$
\sup _{\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\beta_{0}}}|I|, \quad \text { and } \quad \sup _{\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}_{0}}|I| .
$$

Since $\kappa$ is an infinite cardinal, we have $\kappa \otimes \kappa=\kappa$. Note that obviously $\operatorname{Cov}(\mathcal{C})_{\beta_{0}}=$ $\operatorname{Cov}(\mathcal{C})_{\kappa, \beta_{0}}$.

We define, by transfinite induction, a function $f$ which associates to every ordinal an ordinal as follows. Let $f(0)=0$. Given $f(\alpha)$, we define $f(\alpha+1)$ to be the least ordinal $\beta$ such that the following hold:
(1) We have $\alpha+1 \leq \beta$ and $f(\alpha) \leq \beta$.
(2) If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$ and for each $i$ we have $\left\{W_{i j} \rightarrow U_{i}\right\}_{j \in J_{i}} \in$ $\operatorname{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$, then $\left\{W_{i j} \rightarrow U\right\}_{i \in I, j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})_{\kappa, \beta}$.
(3) If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$ and $W \rightarrow U$ is a morphism of $\mathcal{C}$, then $\left\{U_{i} \times_{U} W \rightarrow W\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\kappa, \beta}$.
To see $\beta$ exists we note that clearly the collection of all coverings $\left\{W_{i j} \rightarrow U\right\}$ and $\left\{U_{i} \times_{U} W \rightarrow W\right\}$ that occur in (2) and (3) form a set. Hence there is some ordinal $\beta$ such that $V_{\beta}$ contains all of these coverings. Moreover, the index set of the covering $\left\{W_{i j} \rightarrow U\right\}$ has cardinality $\sum_{i \in I}\left|J_{i}\right| \leq \kappa \otimes \kappa=\kappa$, and hence these coverings are contained in $\operatorname{Cov}(\mathcal{C})_{\kappa, \beta}$. Since every nonempty collection of ordinals has a least element we see that $f(\alpha+1)$ is well defined. Finally, if $\alpha$ is a limit ordinal, then we set $f(\alpha)=\sup _{\alpha^{\prime}<\alpha} f\left(\alpha^{\prime}\right)$.
Pick an ordinal $\beta_{1}$ such that $\operatorname{Arrows}(\mathcal{C}) \subset V_{\beta_{1}}, \operatorname{Cov}_{0} \subset V_{\beta_{0}}$, and $\beta_{1} \geq \beta_{0}$. By construction $f\left(\beta_{1}\right) \geq \beta_{1}$ and we see that the same properties hold for $V_{f\left(\beta_{1}\right)}$. Moreover, as $f$ is nondecreasing this remains true for any $\beta \geq \beta_{1}$. Next, choose any ordinal $\beta_{2}>\beta_{1}$ with cofinality $\operatorname{cf}\left(\beta_{2}\right)>\kappa$. This is possible since the cofinality of ordinals gets arbitrarily large, see Proposition 3.7.2. We claim that the pair $\kappa, \alpha=f\left(\beta_{2}\right)$ is a solution to the problem posed in the lemma.

The first and third property of the lemma holds by our choices of $\kappa, \beta_{2}>\beta_{1}>\beta_{0}$ above.

Since $\beta_{2}$ is a limit ordinal (as its cofinality is infinite) we get $f\left(\beta_{2}\right)=\sup _{\beta<\beta_{2}} f(\beta)$. Hence $\left\{f(\beta) \mid \beta<\beta_{2}\right\} \subset f\left(\beta_{2}\right)$ is a cofinal subset. Hence we see that

$$
V_{\alpha}=V_{f\left(\beta_{2}\right)}=\bigcup_{\beta<\beta_{2}} V_{f(\beta)}
$$

Now, let $\mathcal{U} \in \operatorname{Cov}_{\kappa, \alpha}$. We define $\beta(\mathcal{U})$ to be the least ordinal $\beta$ such that $\mathcal{U} \in$ $\operatorname{Cov}_{\kappa, f(\beta)}$. By the above we see that always $\beta(\mathcal{U})<\beta_{2}$.

We have to show properties (1), (2), and (3) defining a site hold for the pair $\left(\mathcal{C}, \operatorname{Cov}_{\kappa, \alpha}\right)$. The first holds because by our choice of $\beta_{2}$ all arrows of $\mathcal{C}$ are contained in $V_{f\left(\beta_{2}\right)}$. For the third, we use that given a covering $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$ we have $\beta(\mathcal{U})<\beta_{2}$ and hence any base change of $\mathcal{U}$ is by construction of $f$ contained in $\operatorname{Cov}(\mathcal{C})_{\kappa, f(\beta+1)}$ and hence in $\operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$.

Finally, for the second condition, suppose that $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$ and for each $i$ we have $\mathcal{W}_{i}=\left\{W_{i j} \rightarrow U_{i}\right\}_{j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})_{\kappa, f(\alpha)}$. Consider the function $I \rightarrow \beta_{2}, i \mapsto \beta\left(\mathcal{W}_{i}\right)$. Since the cofinality of $\beta_{2}$ is $>\kappa \geq|I|$ the image of this function cannot be a cofinal subset. Hence there exists a $\beta<\beta_{1}$ such that $\mathcal{W}_{i} \in \operatorname{Cov}_{\kappa, f(\beta)}$ for all $i \in I$. It follows that the covering $\left\{W_{i j} \rightarrow U\right\}_{i \in I, j \in J_{i}}$ is an element of $\operatorname{Cov}(\mathcal{C})_{\kappa, f(\beta+1)} \subset \operatorname{Cov}(\mathcal{C})_{\kappa, \alpha}$ as desired.
000 Y Remark 3.11.2. It is likely the case that, for some limit ordinal $\alpha$, the set of coverings $\operatorname{Cov}(\mathcal{C})_{\alpha}$ satisfies the conditions of the lemma. This is after all what an application of the reflection principle would appear to give (modulo caveats as described at the end of Section 3.8 and in Remark 3.9.3.

### 3.12. Abelian categories and injectives

000 Z The following lemma applies to the category of modules over a sheaf of rings on a site.

0010 Lemma 3.12.1. Suppose given a big category $\mathcal{A}$ (see Categories, Remark 4.2.2). Assume $\mathcal{A}$ is abelian and has enough injectives. See Homology, Definitions 12.5.1 and 12.23.4. Then for any given set of objects $\left\{A_{s}\right\}_{s \in S}$ of $\mathcal{A}$, there is an abelian subcategory $\mathcal{A}^{\prime} \subset \mathcal{A}$ with the following properties:
(1) $\operatorname{Ob}\left(\mathcal{A}^{\prime}\right)$ is a set,
(2) $\operatorname{Ob}\left(\mathcal{A}^{\prime}\right)$ contains $A_{s}$ for each $s \in S$,
(3) $\mathcal{A}^{\prime}$ has enough injectives, and
(4) an object of $\mathcal{A}^{\prime}$ is injective if and only if it is an injective object of $\mathcal{A}$.

Proof. Omitted.

## CHAPTER 4

## Categories

### 4.1. Introduction

0012 Categories were first introduced in EM45. The category of categories (which is a proper class) is a 2-category. Similarly, the category of stacks forms a 2-category. If you already know about categories, but not about 2-categories you should read Section 4.27 as an introduction to the formal definitions later on.

### 4.2. Definitions

0013 We recall the definitions, partly to fix notation.
0014 Definition 4.2.1. A category $\mathcal{C}$ consists of the following data:
(1) A set of objects $\operatorname{Ob}(\mathcal{C})$.
(2) For each pair $x, y \in \operatorname{Ob}(\mathcal{C})$ a set of morphisms $\operatorname{Mor}_{\mathcal{C}}(x, y)$.
(3) For each triple $x, y, z \in \operatorname{Ob}(\mathcal{C})$ a composition map $\operatorname{Mor}_{\mathcal{C}}(y, z) \times \operatorname{Mor}_{\mathcal{C}}(x, y) \rightarrow$ Mor $_{\mathcal{C}}(x, z)$, denoted $(\phi, \psi) \mapsto \phi \circ \psi$.
These data are to satisfy the following rules:
(1) For every element $x \in \operatorname{Ob}(\mathcal{C})$ there exists a morphism $\operatorname{id}_{x} \in \operatorname{Mor}_{\mathcal{C}}(x, x)$ such that $\operatorname{id}_{x} \circ \phi=\phi$ and $\psi \circ \operatorname{id}_{x}=\psi$ whenever these compositions make sense.
(2) Composition is associative, i.e., $(\phi \circ \psi) \circ \chi=\phi \circ(\psi \circ \chi)$ whenever these compositions make sense.

It is customary to require all the morphism sets $\operatorname{Mor}_{\mathcal{C}}(x, y)$ to be disjoint. In this way a morphism $\phi: x \rightarrow y$ has a unique source $x$ and a unique target $y$. This is not strictly necessary, although care has to be taken in formulating condition (2) above if it is not the case. It is convenient and we will often assume this is the case. In this case we say that $\phi$ and $\psi$ are composable if the source of $\phi$ is equal to the target of $\psi$, in which case $\phi \circ \psi$ is defined. An equivalent definition would be to define a category as a quintuple ( Ob , Arrows, $s, t, \circ$ ) consisting of a set of objects, a set of morphisms (arrows), source, target and composition subject to a long list of axioms. We will occasionally use this point of view.

0015 Remark 4.2.2. Big categories. In some texts a category is allowed to have a proper class of objects. We will allow this as well in these notes but only in the following list of cases (to be updated as we go along). In particular, when we say: "Let $\mathcal{C}$ be a category" then it is understood that $\operatorname{Ob}(\mathcal{C})$ is a set.
(1) The category Sets of sets.
(2) The category $A b$ of abelian groups.
(3) The category Groups of groups.
(4) Given a group $G$ the category $G$-Sets of sets with a left $G$-action.
(5) Given a ring $R$ the category $\operatorname{Mod}_{R}$ of $R$-modules.
(6) Given a field $k$ the category of vector spaces over $k$.
(7) The category of rings.
(8) The category of schemes.
(9) The category Top of topological spaces.
(10) Given a topological space $X$ the category $\operatorname{PSh}(X)$ of presheaves of sets over $X$.
(11) Given a topological space $X$ the category $\operatorname{Sh}(X)$ of sheaves of sets over $X$.
(12) Given a topological space $X$ the category $\operatorname{PAb}(X)$ of presheaves of abelian groups over $X$.
(13) Given a topological space $X$ the category $A b(X)$ of sheaves of abelian groups over $X$.
(14) Given a small category $\mathcal{C}$ the category of functors from $\mathcal{C}$ to Sets.
(15) Given a category $\mathcal{C}$ the category of presheaves of sets over $\mathcal{C}$.
(16) Given a site $\mathcal{C}$ the category of sheaves of sets over $\mathcal{C}$.

One of the reason to enumerate these here is to try and avoid working with something like the "collection" of "big" categories which would be like working with the collection of all classes which I think definitively is a meta-mathematical object.

0016 Remark 4.2.3. It follows directly from the definition that any two identity morphisms of an object $x$ of $\mathcal{A}$ are the same. Thus we may and will speak of the identity morphism $\mathrm{id}_{x}$ of $x$.

0017 Definition 4.2.4. A morphism $\phi: x \rightarrow y$ is an isomorphism of the category $\mathcal{C}$ if there exists a morphism $\psi: y \rightarrow x$ such that $\phi \circ \psi=\mathrm{id}_{y}$ and $\psi \circ \phi=\mathrm{id}_{x}$.

An isomorphism $\phi$ is also sometimes called an invertible morphism, and the morphism $\psi$ of the definition is called the inverse and denoted $\phi^{-1}$. It is unique if it exists. Note that given an object $x$ of a category $\mathcal{A}$ the set of invertible elements $\operatorname{Aut}_{\mathcal{A}}(x)$ of $\operatorname{Mor}_{\mathcal{A}}(x, x)$ forms a group under composition. This group is called the automorphism group of $x$ in $\mathcal{A}$.

0018 Definition 4.2.5. A groupoid is a category where every morphism is an isomorphism.

0019 Example 4.2.6. A group $G$ gives rise to a groupoid with a single object $x$ and morphisms $\operatorname{Mor}(x, x)=G$, with the composition rule given by the group law in $G$. Every groupoid with a single object is of this form.

001A Example 4.2.7. A set $C$ gives rise to a groupoid $\mathcal{C}$ defined as follows: As objects we take $\operatorname{Ob}(\mathcal{C}):=C$ and for morphisms we take $\operatorname{Mor}(x, y)$ empty if $x \neq y$ and equal to $\left\{\mathrm{id}_{x}\right\}$ if $x=y$.

001B Definition 4.2.8. A functor $F: \mathcal{A} \rightarrow \mathcal{B}$ between two categories $\mathcal{A}, \mathcal{B}$ is given by the following data:
(1) $\mathrm{A} \operatorname{map} F: \operatorname{Ob}(\mathcal{A}) \rightarrow \mathrm{Ob}(\mathcal{B})$.
(2) For every $x, y \in \operatorname{Ob}(\mathcal{A})$ a map $F: \operatorname{Mor}_{\mathcal{A}}(x, y) \rightarrow \operatorname{Mor}_{\mathcal{B}}(F(x), F(y))$, denoted $\phi \mapsto F(\phi)$.

These data should be compatible with composition and identity morphisms in the following manner: $F(\phi \circ \psi)=F(\phi) \circ F(\psi)$ for a composable pair $(\phi, \psi)$ of morphisms of $\mathcal{A}$ and $F\left(\mathrm{id}_{x}\right)=\operatorname{id}_{F(x)}$.
Note that every category $\mathcal{A}$ has an identity functor $\mathrm{id}_{\mathcal{A}}$. In addition, given a functor $G: \mathcal{B} \rightarrow \mathcal{C}$ and a functor $F: \mathcal{A} \rightarrow \mathcal{B}$ there is a composition functor $G \circ F: \mathcal{A} \rightarrow \mathcal{C}$ defined in an obvious manner.

001C Definition 4.2.9. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a functor.
(1) We say $F$ is faithful if for any objects $x, y$ of $\operatorname{Ob}(\mathcal{A})$ the map

$$
F: \operatorname{Mor}_{\mathcal{A}}(x, y) \rightarrow \operatorname{Mor}_{\mathcal{B}}(F(x), F(y))
$$

is injective.
(2) If these maps are all bijective then $F$ is called fully faithful.
(3) The functor $F$ is called essentially surjective if for any object $y \in \operatorname{Ob}(\mathcal{B})$ there exists an object $x \in \operatorname{Ob}(\mathcal{A})$ such that $F(x)$ is isomorphic to $y$ in $\mathcal{B}$.

001D Definition 4.2.10. A subcategory of a category $\mathcal{B}$ is a category $\mathcal{A}$ whose objects and arrows form subsets of the objects and arrows of $\mathcal{B}$ and such that source, target and composition in $\mathcal{A}$ agree with those of $\mathcal{B}$. We say $\mathcal{A}$ is a full subcategory of $\mathcal{B}$ if $\operatorname{Mor}_{\mathcal{A}}(x, y)=\operatorname{Mor}_{\mathcal{B}}(x, y)$ for all $x, y \in \operatorname{Ob}(\mathcal{A})$. We say $\mathcal{A}$ is a strictly full subcategory of $\mathcal{B}$ if it is a full subcategory and given $x \in \operatorname{Ob}(\mathcal{A})$ any object of $\mathcal{B}$ which is isomorphic to $x$ is also in $\mathcal{A}$.

If $\mathcal{A} \subset \mathcal{B}$ is a subcategory then the identity map is a functor from $\mathcal{A}$ to $\mathcal{B}$. Furthermore a subcategory $\mathcal{A} \subset \mathcal{B}$ is full if and only if the inclusion functor is fully faithful. Note that given a category $\mathcal{B}$ the set of full subcategories of $\mathcal{B}$ is the same as the set of subsets of $\operatorname{Ob}(\mathcal{B})$.

001E Remark 4.2.11. Suppose that $\mathcal{A}$ is a category. A functor $F$ from $\mathcal{A}$ to $\operatorname{Sets}$ is a mathematical object (i.e., it is a set not a class or a formula of set theory, see Sets, Section 3.2 even though the category of sets is "big". Namely, the range of $F$ on objects will be a set $F(\operatorname{Ob}(\mathcal{A}))$ and then we may think of $F$ as a functor between $\mathcal{A}$ and the full subcategory of the category of sets whose objects are elements of $F(\mathrm{Ob}(\mathcal{A}))$.

001F Example 4.2.12. A homomorphism $p: G \rightarrow H$ of groups gives rise to a functor between the associated groupoids in Example 4.2.6. It is faithful (resp. fully faithful) if and only if $p$ is injective (resp. an isomorphism).

001G Example 4.2.13. Given a category $\mathcal{C}$ and an object $X \in \operatorname{Ob}(\mathcal{C})$ we define the category of objects over $X$, denoted $\mathcal{C} / X$ as follows. The objects of $\mathcal{C} / X$ are morphisms $Y \rightarrow X$ for some $Y \in \mathrm{Ob}(\mathcal{C})$. Morphisms between objects $Y \rightarrow X$ and $Y^{\prime} \rightarrow X$ are morphisms $Y \rightarrow Y^{\prime}$ in $\mathcal{C}$ that make the obvious diagram commute. Note that there is a functor $p_{X}: \mathcal{C} / X \rightarrow \mathcal{C}$ which simply forgets the morphism. Moreover given a morphism $f: X^{\prime} \rightarrow X$ in $\mathcal{C}$ there is an induced functor $F: \mathcal{C} / X^{\prime} \rightarrow \mathcal{C} / X$ obtained by composition with $f$, and $p_{X} \circ F=p_{X^{\prime}}$.
001H Example 4.2.14. Given a category $\mathcal{C}$ and an object $X \in \mathrm{Ob}(\mathcal{C})$ we define the category of objects under $X$, denoted $X / \mathcal{C}$ as follows. The objects of $X / \mathcal{C}$ are morphisms $X \rightarrow Y$ for some $Y \in \operatorname{Ob}(\mathcal{C})$. Morphisms between objects $X \rightarrow Y$ and $X \rightarrow Y^{\prime}$ are morphisms $Y \rightarrow Y^{\prime}$ in $\mathcal{C}$ that make the obvious diagram commute. Note that there is a functor $p_{X}: X / \mathcal{C} \rightarrow \mathcal{C}$ which simply forgets the morphism.

Moreover given a morphism $f: X^{\prime} \rightarrow X$ in $\mathcal{C}$ there is an induced functor $F: X / \mathcal{C} \rightarrow$ $X^{\prime} / \mathcal{C}$ obtained by composition with $f$, and $p_{X^{\prime}} \circ F=p_{X}$.
001 D Definition 4.2.15. Let $F, G: \mathcal{A} \rightarrow \mathcal{B}$ be functors. A natural transformation, or a morphism of functors $t: F \rightarrow G$, is a collection $\left\{t_{x}\right\}_{x \in \mathrm{Ob}(\mathcal{A})}$ such that
(1) $t_{x}: F(x) \rightarrow G(x)$ is a morphism in the category $\mathcal{B}$, and
(2) for every morphism $\phi: x \rightarrow y$ of $\mathcal{A}$ the following diagram is commutative

Sometimes we use the diagram

$$
\mathcal{A}{\underset{G}{\Downarrow_{G}}}_{\frac{F}{\Downarrow_{t}}} \mathcal{B}
$$

to indicate that $t$ is a morphism from $F$ to $G$.
Note that every functor $F$ comes with the identity transformation $\mathrm{id}_{F}: F \rightarrow F$. In addition, given a morphism of functors $t: F \rightarrow G$ and a morphism of functors $s: E \rightarrow F$ then the composition $t \circ s$ is defined by the rule

$$
(t \circ s)_{x}=t_{x} \circ s_{x}: E(x) \rightarrow G(x)
$$

for $x \in \operatorname{Ob}(\mathcal{A})$. It is easy to verify that this is indeed a morphism of functors from $E$ to $G$. In this way, given categories $\mathcal{A}$ and $\mathcal{B}$ we obtain a new category, namely the category of functors between $\mathcal{A}$ and $\mathcal{B}$.

02C2 Remark 4.2.16. This is one instance where the same thing does not hold if $\mathcal{A}$ is a "big" category. For example consider functors Sets $\rightarrow$ Sets. As we have currently defined it such a functor is a class and not a set. In other words, it is given by a formula in set theory (with some variables equal to specified sets)! It is not a good idea to try to consider all possible formulae of set theory as part of the definition of a mathematical object. The same problem presents itself when considering sheaves on the category of schemes for example. We will come back to this point later.

001J Definition 4.2.17. An equivalence of categories $F: \mathcal{A} \rightarrow \mathcal{B}$ is a functor such that there exists a functor $G: \mathcal{B} \rightarrow \mathcal{A}$ such that the compositions $F \circ G$ and $G \circ F$ are isomorphic to the identity functors $\mathrm{id}_{\mathcal{B}}$, respectively $\mathrm{id}_{\mathcal{A}}$. In this case we say that $G$ is a quasi-inverse to $F$.

05SG Lemma 4.2.18. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a fully faithful functor. Suppose for every $X \in \operatorname{Ob}(\mathcal{B})$ given an object $j(X)$ of $\mathcal{A}$ and an isomorphism $i_{X}: X \rightarrow F(j(X))$. Then there is a unique functor $j: \mathcal{B} \rightarrow \mathcal{A}$ such that $j$ extends the rule on objects, and the isomorphisms $i_{X}$ define an isomorphism of functors $i d_{\mathcal{B}} \rightarrow F \circ j$. Moreover, $j$ and $F$ are quasi-inverse equivalences of categories.

Proof. This lemma proves itself.
02C3 Lemma 4.2.19. A functor is an equivalence of categories if and only if it is both fully faithful and essentially surjective.

Proof. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be essentially surjective and fully faithful. As by convention all categories are small and as $F$ is essentially surjective we can, using the axiom of choice, choose for every $X \in \mathrm{Ob}(\mathcal{B})$ an object $j(X)$ of $\mathcal{A}$ and an isomorphism $i_{X}: X \rightarrow F(j(X))$. Then we apply Lemma 4.2.18 using that $F$ is fully faithful.

001 K Definition 4.2.20. Let $\mathcal{A}, \mathcal{B}$ be categories. We define the product category $\mathcal{A} \times \mathcal{B}$ to be the category with objects $\operatorname{Ob}(\mathcal{A} \times \mathcal{B})=\operatorname{Ob}(\mathcal{A}) \times \operatorname{Ob}(\mathcal{B})$ and

$$
\operatorname{Mor}_{\mathcal{A} \times \mathcal{B}}\left((x, y),\left(x^{\prime}, y^{\prime}\right)\right):=\operatorname{Mor}_{\mathcal{A}}\left(x, x^{\prime}\right) \times \operatorname{Mor}_{\mathcal{B}}\left(y, y^{\prime}\right)
$$

Composition is defined componentwise.

### 4.3. Opposite Categories and the Yoneda Lemma

001L
001 M Definition 4.3.1. Given a category $\mathcal{C}$ the opposite category $\mathcal{C}^{o p p}$ is the category with the same objects as $\mathcal{C}$ but all morphisms reversed.

In other words $\operatorname{Mor}_{\mathcal{C}}{ }^{\text {opp }}(x, y)=\operatorname{Mor}_{\mathcal{C}}(y, x)$. Composition in $\mathcal{C}^{\text {opp }}$ is the same as in $\mathcal{C}$ except backwards: if $\phi: y \rightarrow z$ and $\psi: x \rightarrow y$ are morphisms in $\mathcal{C}^{o p p}$, in other words arrows $z \rightarrow y$ and $y \rightarrow x$ in $\mathcal{C}$, then $\phi \circ^{o p p} \psi$ is the morphism $x \rightarrow z$ of $\mathcal{C}^{\text {opp }}$ which corresponds to the composition $z \rightarrow y \rightarrow x$ in $\mathcal{C}$.

001 N Definition 4.3.2. Let $\mathcal{C}, \mathcal{S}$ be categories. A contravariant functor $F$ from $\mathcal{C}$ to $\mathcal{S}$ is a functor $\mathcal{C}^{o p p} \rightarrow \mathcal{S}$.

Concretely, a contravariant functor $F$ is given by a map $F: \mathrm{Ob}(\mathcal{C}) \rightarrow \mathrm{Ob}(\mathcal{S})$ and for every morphism $\psi: x \rightarrow y$ in $\mathcal{C}$ a morphism $F(\psi): F(y) \rightarrow F(x)$. These should satisfy the property that, given another morphism $\phi: y \rightarrow z$, we have $F(\phi \circ \psi)=F(\psi) \circ F(\phi)$ as morphisms $F(z) \rightarrow F(x)$. (Note the reverse of order.)
02X6 Definition 4.3.3. Let $\mathcal{C}$ be a category.
(1) A presheaf of sets on $\mathcal{C}$ or simply a presheaf is a contravariant functor $F$ from $\mathcal{C}$ to Sets.
(2) The category of presheaves is denoted $\operatorname{PSh}(\mathcal{C})$.

Of course the category of presheaves is a proper class.
001 O Example 4.3.4. Functor of points. For any $U \in \mathrm{Ob}(\mathcal{C})$ there is a contravariant functor

$$
\begin{array}{rlcc}
h_{U}: & \mathcal{C} & \longrightarrow & \text { Sets } \\
& X & \longmapsto & \operatorname{Mor}_{\mathcal{C}}(X, U)
\end{array}
$$

which takes an object $X$ to the set $\operatorname{Mor}_{\mathcal{C}}(X, U)$. In other words $h_{U}$ is a presheaf. Given a morphism $f: X \rightarrow Y$ the corresponding map $h_{U}(f): \operatorname{Mor}_{\mathcal{C}}(Y, U) \rightarrow$ $\operatorname{Mor}_{\mathcal{C}}(X, U)$ takes $\phi$ to $\phi \circ f$. We will always denote this presheaf $h_{U}: \mathcal{C}^{\text {opp }} \rightarrow$ Sets. It is called the representable presheaf associated to $U$. If $\mathcal{C}$ is the category of schemes this functor is sometimes referred to as the functor of points of $U$.

Note that given a morphism $\phi: U \rightarrow V$ in $\mathcal{C}$ we get a corresponding natural transformation of functors $h(\phi): h_{U} \rightarrow h_{V}$ defined simply by composing with the morphism $U \rightarrow V$. It is trivial to see that this turns composition of morphisms in $\mathcal{C}$ into composition of transformations of functors. In other words we get a functor

$$
h: \mathcal{C} \longrightarrow \operatorname{Fun}\left(\mathcal{C}^{o p p}, S e t s\right)=\operatorname{PSh}(\mathcal{C})
$$

Note that the target is a "big" category, see Remark 4.2.2. On the other hand, $h$ is an actual mathematical object (i.e. a set), compare Remark 4.2.11.

001P Lemma 4.3.5 (Yoneda lemma). Let $U, V \in \mathrm{Ob}(\mathcal{C})$. Given any morphism of functors $s: h_{U} \rightarrow h_{V}$ there is a unique morphism $\phi: U \rightarrow V$ such that $h(\phi)=s$. In other words the functor $h$ is fully faithful. More generally, given any contravariant functor $F$ and any object $U$ of $\mathcal{C}$ we have a natural bijection

$$
\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, F\right) \longrightarrow F(U), \quad s \longmapsto s_{U}\left(i d_{U}\right)
$$

Proof. For the first statement, just take $\phi=s_{U}\left(\operatorname{id}_{U}\right) \in \operatorname{Mor}_{\mathcal{C}}(U, V)$. For the second statement, given $\xi \in F(U)$ define $s$ by $s_{V}: h_{U}(V) \rightarrow F(V)$ by sending the element $f: V \rightarrow U$ of $h_{V}(U)=\operatorname{Mor}_{\mathcal{C}}(V, U)$ to $F(f)(\xi)$.

001Q Definition 4.3.6. A contravariant functor $F: \mathcal{C} \rightarrow$ Sets is said to be representable if it is isomorphic to the functor of points $h_{U}$ for some object $U$ of $\mathcal{C}$.

Let $\mathcal{C}$ be a category and let $F: \mathcal{C}^{\text {opp }} \rightarrow$ Sets be a representable functor. Choose an object $U$ of $\mathcal{C}$ and an isomorphism $s: h_{U} \rightarrow F$. The Yoneda lemma guarantees that the pair $(U, s)$ is unique up to unique isomorphism. The object $U$ is called an object representing $F$. By the Yoneda lemma the transformation $s$ corresponds to a unique element $\xi \in F(U)$. This element is called the universal object. It has the property that for $V \in \operatorname{Ob}(\mathcal{C})$ the map

$$
\operatorname{Mor}_{\mathcal{C}}(V, U) \longrightarrow F(V), \quad(f: V \rightarrow U) \longmapsto F(f)(\xi)
$$

is a bijection. Thus $\xi$ is universal in the sens that every element of $F(V)$ is equal to the image of $\xi$ via $F(f)$ for a unique morphism $f: V \rightarrow U$ in $\mathcal{C}$.

### 4.4. Products of pairs

001R
001 S Definition 4.4.1. Let $x, y \in \mathrm{Ob}(\mathcal{C})$. A product of $x$ and $y$ is an object $x \times y \in$ $\mathrm{Ob}(\mathcal{C})$ together with morphisms $p \in \operatorname{Mor}_{\mathcal{C}}(x \times y, x)$ and $q \in \operatorname{Mor}_{\mathcal{C}}(x \times y, y)$ such that the following universal property holds: for any $w \in \mathrm{Ob}(\mathcal{C})$ and morphisms $\alpha \in \operatorname{Mor}_{\mathcal{C}}(w, x)$ and $\beta \in \operatorname{Mor}_{\mathcal{C}}(w, y)$ there is a unique $\gamma \in \operatorname{Mor}_{\mathcal{C}}(w, x \times y)$ making the diagram

commute.
If a product exists it is unique up to unique isomorphism. This follows from the Yoneda lemma as the definition requires $x \times y$ to be an object of $\mathcal{C}$ such that

$$
h_{x \times y}(w)=h_{x}(w) \times h_{y}(w)
$$

functorially in $w$. In other words the product $x \times y$ is an object representing the functor $w \mapsto h_{x}(w) \times h_{y}(w)$.

001T Definition 4.4.2. We say the category $\mathcal{C}$ has products of pairs of objects if a product $x \times y$ exists for any $x, y \in \mathrm{Ob}(\mathcal{C})$.

We use this terminology to distinguish this notion from the notion of "having products" or "having finite products" which usually means something else (in particular it always implies there exists a final object).

### 4.5. Coproducts of pairs

04AN
04 AO Definition 4.5.1. Let $x, y \in \mathrm{Ob}(\mathcal{C})$. A coproduct, or amalgamated sum of $x$ and $y$ is an object $x \amalg y \in \operatorname{Ob}(\mathcal{C})$ together with morphisms $i \in \operatorname{Mor}_{\mathcal{C}}(x, x \amalg y)$ and $j \in \operatorname{Mor}_{\mathcal{C}}(y, x \amalg y)$ such that the following universal property holds: for any $w \in \operatorname{Ob}(\mathcal{C})$ and morphisms $\alpha \in \operatorname{Mor}_{\mathcal{C}}(x, w)$ and $\beta \in \operatorname{Mor}_{\mathcal{C}}(y, w)$ there is a unique $\gamma \in \operatorname{Mor}_{\mathcal{C}}(x \amalg y, w)$ making the diagram

commute.
If a coproduct exists it is unique up to unique isomorphism. This follows from the Yoneda lemma (applied to the opposite category) as the definition requires $x \amalg y$ to be an object of $\mathcal{C}$ such that

$$
\operatorname{Mor}_{\mathcal{C}}(x \amalg y, w)=\operatorname{Mor}_{\mathcal{C}}(x, w) \times \operatorname{Mor}_{\mathcal{C}}(y, w)
$$

functorially in $w$.
04AP Definition 4.5.2. We say the category $\mathcal{C}$ has coproducts of pairs of objects if a coproduct $x \amalg y$ exists for any $x, y \in \operatorname{Ob}(\mathcal{C})$.

We use this terminology to distinguish this notion from the notion of "having coproducts" or "having finite coproducts" which usually means something else (in particular it always implies there exists an initial object in $\mathcal{C}$ ).

### 4.6. Fibre products

001U
001V Definition 4.6.1. Let $x, y, z \in \operatorname{Ob}(\mathcal{C}), f \in \operatorname{Mor}_{\mathcal{C}}(x, y)$ and $g \in \operatorname{Mor}_{\mathcal{C}}(z, y)$. A fibre product of $f$ and $g$ is an object $x \times_{y} z \in \operatorname{Ob}(\mathcal{C})$ together with morphisms $p \in \operatorname{Mor}_{\mathcal{C}}\left(x \times_{y} z, x\right)$ and $q \in \operatorname{Mor}_{\mathcal{C}}\left(x \times_{y} z, z\right)$ making the diagram

commute, and such that the following universal property holds: for any $w \in \operatorname{Ob}(\mathcal{C})$ and morphisms $\alpha \in \operatorname{Mor}_{\mathcal{C}}(w, x)$ and $\beta \in \operatorname{Mor}_{\mathcal{C}}(w, z)$ with $f \circ \alpha=g \circ \beta$ there is a unique $\gamma \in \operatorname{Mor}_{\mathcal{C}}\left(w, x \times_{y} z\right)$ making the diagram

commute.
If a fibre product exists it is unique up to unique isomorphism. This follows from the Yoneda lemma as the definition requires $x \times_{y} z$ to be an object of $\mathcal{C}$ such that

$$
h_{x \times_{y} z}(w)=h_{x}(w) \times_{h_{y}(w)} h_{z}(w)
$$

functorially in $w$. In other words the fibre product $x \times_{y} z$ is an object representing the functor $w \mapsto h_{x}(w) \times_{h_{y}(w)} h_{z}(w)$.

08N0 Definition 4.6.2. We say a commutative diagram

in a category is cartesian if $w$ and the morphisms $w \rightarrow x$ and $w \rightarrow z$ form a fibre product of the morphisms $x \rightarrow y$ and $z \rightarrow y$.

001W Definition 4.6.3. We say the category $\mathcal{C}$ has fibre products if the fibre product exists for any $f \in \operatorname{Mor}_{\mathcal{C}}(x, y)$ and $g \in \operatorname{Mor}_{\mathcal{C}}(z, y)$.

001X Definition 4.6.4. A morphism $f: x \rightarrow y$ of a category $\mathcal{C}$ is said to be representable if for every morphism $z \rightarrow y$ in $\mathcal{C}$ the fibre product $x \times_{y} z$ exists.

001Y Lemma 4.6.5. Let $\mathcal{C}$ be a category. Let $f: x \rightarrow y$, and $g: y \rightarrow z$ be representable. Then $g \circ f: x \rightarrow z$ is representable.

Proof. Omitted.
$001 Z$ Lemma 4.6.6. Let $\mathcal{C}$ be a category. Let $f: x \rightarrow y$ be representable. Let $y^{\prime} \rightarrow y$ be a morphism of $\mathcal{C}$. Then the morphism $x^{\prime}:=x \times_{y} y^{\prime} \rightarrow y^{\prime}$ is representable also.

Proof. Let $z \rightarrow y^{\prime}$ be a morphism. The fibre product $x^{\prime} \times{ }_{y^{\prime}} z$ is supposed to represent the functor

$$
\begin{aligned}
w & \mapsto h_{x^{\prime}}(w) \times_{h_{y^{\prime}}(w)} h_{z}(w) \\
& =\left(h_{x}(w) \times_{h_{y}(w)} h_{y^{\prime}}(w)\right) \times_{h_{y^{\prime}}(w)} h_{z}(w) \\
& =h_{x}(w) \times_{h_{y}(w)} h_{z}(w)
\end{aligned}
$$

which is representable by assumption.

### 4.7. Examples of fibre products

0020 In this section we list examples of fibre products and we describe them.
As a really trivial first example we observe that the category of sets has fibred products and hence every morphism is representable. Namely, if $f: X \rightarrow Y$ and $g: Z \rightarrow Y$ are maps of sets then we define $X \times_{Y} Z$ as the subset of $X \times Z$ consisting of pairs $(x, z)$ such that $f(x)=g(z)$. The morphisms $p: X \times_{Y} Z \rightarrow X$ and $q: X \times_{U} Z \rightarrow Z$ are the projection maps $(x, z) \mapsto x$, and $(x, z) \mapsto z$. Finally, if $\alpha: W \rightarrow X$ and $\beta: W \rightarrow Z$ are morphisms such that $f \circ \alpha=g \circ \beta$ then the map $W \rightarrow X \times Z, w \mapsto(\alpha(w), \beta(w))$ obviously ends up in $X \times_{Y} Z$ as desired.

In many categories whose objects are sets endowed with certain types of algebraic structures the fibre product of the underlying sets also provides the fibre product in the category. For example, suppose that $X, Y$ and $Z$ above are groups and that $f, g$ are homomorphisms of groups. Then the set-theoretic fibre product $X \times_{Y} Z$ inherits the structure of a group, simply by defining the product of two pairs by the formula $(x, z) \cdot\left(x^{\prime}, z^{\prime}\right)=\left(x x^{\prime}, z z^{\prime}\right)$. Here we list those categories for which a similar reasoning works.
(1) The category Groups of groups.
(2) The category $G$-Sets of sets endowed with a left $G$-action for some fixed group $G$.
(3) The category of rings.
(4) The category of $R$-modules given a ring $R$.

### 4.8. Fibre products and representability

0021 In this section we work out fibre products in the category of contravariant functors from a category to the category of sets. This will later be superseded during the discussion of sites, presheaves, sheaves. Of some interest is the notion of a "representable morphism" between such functors.

0022 Lemma 4.8.1. Let $\mathcal{C}$ be a category. Let $F, G, H: \mathcal{C}^{\text {opp }} \rightarrow$ Sets be functors. Let $a: F \rightarrow G$ and $b: H \rightarrow G$ be transformations of functors. Then the fibre product $F \times_{a, G, b} H$ in the category $F u n\left(\mathcal{C}^{\text {opp }}\right.$, Sets) exists and is given by the formula

$$
\left(F \times_{a, G, b} H\right)(X)=F(X) \times_{a_{X}, G(X), b_{X}} H(X)
$$

for any object $X$ of $\mathcal{C}$.
Proof. Omitted.
As a special case suppose we have a morphism $a: F \rightarrow G$, an object $U \in \mathrm{Ob}(\mathcal{C})$ and an element $\xi \in G(U)$. According to the Yoneda Lemma 4.3.5 this gives a transformation $\xi: h_{U} \rightarrow G$. The fibre product in this case is described by the rule

$$
\left(h_{U} \times_{\xi, G, a} F\right)(X)=\left\{\left(f, \xi^{\prime}\right) \mid f: X \rightarrow U, \xi^{\prime} \in F(X), G(f)(\xi)=a_{X}\left(\xi^{\prime}\right)\right\}
$$

If $F, G$ are also representable, then this is the functor representing the fibre product, if it exists, see Section 4.6 The analogy with Definition 4.6 .4 prompts us to define a notion of representable transformations.

0023 Definition 4.8.2. Let $\mathcal{C}$ be a category. Let $F, G: \mathcal{C}^{o p p} \rightarrow$ Sets be functors. We say a morphism $a: F \rightarrow G$ is representable, or that $F$ is relatively representable over $G$, if for every $U \in \mathrm{Ob}(\mathcal{C})$ and any $\xi \in G(U)$ the functor $h_{U} \times_{G} F$ is representable.

03KC Lemma 4.8.3. Let $\mathcal{C}$ be a category. Let $a: F \rightarrow G$ be a morphism of contravariant functors from $\mathcal{C}$ to Sets. If a is representable, and $G$ is a representable functor, then $F$ is representable.

Proof. Omitted.

0024 Lemma 4.8.4. Let $\mathcal{C}$ be a category. Let $F: \mathcal{C}^{\text {opp }} \rightarrow$ Sets be a functor. Assume $\mathcal{C}$ has products of pairs of objects and fibre products. The following are equivalent:
(1) The diagonal $F \rightarrow F \times F$ is representable.
(2) For every $U$ in $\mathcal{C}$, and any $\xi \in F(U)$ the map $\xi: h_{U} \rightarrow F$ is representable.

Proof. Suppose the diagonal is representable, and let $U, \xi$ be given. Consider any $V \in \operatorname{Ob}(\mathcal{C})$ and any $\xi^{\prime} \in F(V)$. Note that $h_{U} \times h_{V}=h_{U \times V}$ is representable. Hence the fibre product of the maps $\left(\xi, \xi^{\prime}\right): h_{U} \times h_{V} \rightarrow F \times F$ and $F \rightarrow F \times F$ is representable by assumption. This means there exists $W \in \mathrm{Ob}(\mathcal{C})$, morphisms $W \rightarrow U, W \rightarrow V$ and $h_{W} \rightarrow F$ such that

is cartesian. We leave it to the reader to see that this implies that $h_{W}=h_{U} \times{ }_{F} h_{V}$ as desired.

Assume (2) holds. Consider any $V \in \operatorname{Ob}(\mathcal{C})$ and any $\left(\xi, \xi^{\prime}\right) \in(F \times F)(V)$. We have to show that $h_{V} \times{ }_{F \times F} F$ is representable. What we know is that $h_{V} \times \xi, F, \xi^{\prime} h_{V}$ is representable, say by $W$ in $\mathcal{C}$ with corresponding morphisms $a, a^{\prime}: W \rightarrow V$ (such that $\left.\xi \circ a=\xi^{\prime} \circ a^{\prime}\right)$. Consider $W^{\prime}=W \times_{\left(a, a^{\prime}\right), V \times V} V$. It is formal to show that $W^{\prime}$ represents $h_{V} \times{ }_{F \times F} F$ because

$$
h_{W^{\prime}}=h_{W} \times_{h_{V} \times h_{V}} h_{V}=\left(h_{V} \times_{\xi, F, \xi^{\prime}} h_{V}\right) \times_{h_{V} \times h_{V}} h_{V}=F \times_{F \times F} h_{V}
$$

### 4.9. Pushouts

0025 The dual notion to fibre products is that of pushouts.
0026 Definition 4.9.1. Let $x, y, z \in \operatorname{Ob}(\mathcal{C}), f \in \operatorname{Mor}_{\mathcal{C}}(y, x)$ and $g \in \operatorname{Mor}_{\mathcal{C}}(y, z)$. A pushout of $f$ and $g$ is an object $x \amalg_{y} z \in \operatorname{Ob}(\mathcal{C})$ together with morphisms $p \in$ $\operatorname{Mor}_{\mathcal{C}}\left(x, x \amalg_{y} z\right)$ and $q \in \operatorname{Mor}_{\mathcal{C}}\left(z, x \amalg_{y} z\right)$ making the diagram

commute, and such that the following universal property holds: For any $w \in \mathrm{Ob}(\mathcal{C})$ and morphisms $\alpha \in \operatorname{Mor}_{\mathcal{C}}(x, w)$ and $\beta \in \operatorname{Mor}_{\mathcal{C}}(z, w)$ with $\alpha \circ f=\beta \circ g$ there is a
unique $\gamma \in \operatorname{Mor}_{\mathcal{C}}\left(x \amalg_{y} z, w\right)$ making the diagram

commute.
It is possible and straightforward to prove the uniqueness of the triple ( $x \amalg_{y} z, p, q$ ) up to unique isomorphism (if it exists) by direct arguments. Another possibility is to think of the pushout as the fibre product in the opposite category, thereby getting this uniqueness for free from the discussion in Section 4.6 .
08N1 Definition 4.9.2. We say a commutative diagram

in a category is cocartesian if $w$ and the morphisms $x \rightarrow w$ and $z \rightarrow w$ form a pushout of the morphisms $y \rightarrow x$ and $y \rightarrow z$.

### 4.10. Equalizers

0027
0028 Definition 4.10.1. Suppose that $X, Y$ are objects of a category $\mathcal{C}$ and that $a, b: X \rightarrow Y$ are morphisms. We say a morphism $e: Z \rightarrow X$ is an equalizer for the pair $(a, b)$ if $a \circ e=b \circ e$ and if $(Z, e)$ satisfies the following universal property: For every morphism $t: W \rightarrow X$ in $\mathcal{C}$ such that $a \circ t=b \circ t$ there exists a unique morphism $s: W \rightarrow Z$ such that $t=e \circ s$.

As in the case of the fibre product above, equalizers when they exist are unique up to unique isomorphism. There is a straightforward generalization of this definition to the case where we have more than 2 morphisms.

### 4.11. Coequalizers

0029
002A Definition 4.11.1. Suppose that $X, Y$ are objects of a category $\mathcal{C}$ and that $a, b: X \rightarrow Y$ are morphisms. We say a morphism $c: Y \rightarrow Z$ is a coequalizer for the pair $(a, b)$ if $c \circ a=c \circ b$ and if $(Z, c)$ satisfies the following universal property: For every morphism $t: Y \rightarrow W$ in $\mathcal{C}$ such that $t \circ a=t \circ b$ there exists a unique morphism $s: Z \rightarrow W$ such that $t=s \circ c$.

As in the case of the pushouts above, coequalizers when they exist are unique up to unique isomorphism, and this follows from the uniqueness of equalizers upon considering the opposite category. There is a straightforward generalization of this definition to the case where we have more than 2 morphisms.

### 4.12. Initial and final objects

002B
002C Definition 4.12.1. Let $\mathcal{C}$ be a category.
(1) An object $x$ of the category $\mathcal{C}$ is called an initial object if for every object $y$ of $\mathcal{C}$ there is exactly one morphism $x \rightarrow y$.
(2) An object $x$ of the category $\mathcal{C}$ is called a final object if for every object $y$ of $\mathcal{C}$ there is exactly one morphism $y \rightarrow x$.
In the category of sets the empty set $\emptyset$ is an initial object, and in fact the only initial object. Also, any singleton, i.e., a set with one element, is a final object (so it is not unique).

### 4.13. Monomorphisms and Epimorphisms

003A
003B Definition 4.13.1. Let $\mathcal{C}$ be a category and let $f: X \rightarrow Y$ be a morphism of $\mathcal{C}$.
(1) We say that $f$ is a monomorphism if for every object $W$ and every pair of morphisms $a, b: W \rightarrow X$ such that $f \circ a=f \circ b$ we have $a=b$.
(2) We say that $f$ is an epimorphism if for every object $W$ and every pair of morphisms $a, b: Y \rightarrow W$ such that $a \circ f=b \circ f$ we have $a=b$.
003C Example 4.13.2. In the category of sets the monomorphisms correspond to injective maps and the epimorphisms correspond to surjective maps.

08LR Lemma 4.13.3. Let $\mathcal{C}$ be a category, and let $f: X \rightarrow Y$ be a morphism of $\mathcal{C}$. Then
(1) $f$ is a monomorphism if and only if $X$ is the fibre product $X \times_{Y} X$, and
(2) $f$ is an epimorphism if and only if $Y$ is the pushout $Y \amalg_{X} Y$.

Proof. Omitted.

### 4.14. Limits and colimits

002 D Let $\mathcal{C}$ be a category. A diagram in $\mathcal{C}$ is simply a functor $M: \mathcal{I} \rightarrow \mathcal{C}$. We say that $\mathcal{I}$ is the index category or that $M$ is an $\mathcal{I}$-diagram. We will use the notation $M_{i}$ to denote the image of the object $i$ of $\mathcal{I}$. Hence for $\phi: i \rightarrow i^{\prime}$ a morphism in $\mathcal{I}$ we have $M(\phi): M_{i} \rightarrow M_{i^{\prime}}$.
002E Definition 4.14.1. A limit of the $\mathcal{I}$-diagram $M$ in the category $\mathcal{C}$ is given by an object $\lim _{\mathcal{I}} M$ in $\mathcal{C}$ together with morphisms $p_{i}: \lim _{\mathcal{I}} M \rightarrow M_{i}$ such that
(1) for $\phi: i \rightarrow i^{\prime}$ a morphism in $\mathcal{I}$ we have $p_{i^{\prime}}=M(\phi) \circ p_{i}$, and
(2) for any object $W$ in $\mathcal{C}$ and any family of morphisms $q_{i}: W \rightarrow M_{i}$ (indexed by $i \in \mathcal{I}$ ) such that for all $\phi: i \rightarrow i^{\prime}$ in $\mathcal{I}$ we have $q_{i^{\prime}}=M(\phi) \circ q_{i}$ there exists a unique morphism $q: W \rightarrow \lim _{\mathcal{I}} M$ such that $q_{i}=p_{i} \circ q$ for every object $i$ of $\mathcal{I}$.

Limits $\left(\lim _{\mathcal{I}} M,\left(p_{i}\right)_{i \in \mathrm{Ob}(\mathcal{I})}\right)$ are (if they exist) unique up to unique isomorphism by the uniqueness requirement in the definition. Products of pairs, fibred products, and equalizers are examples of limits. The limit over the empty diagram is a final object of $\mathcal{C}$. In the category of sets all limits exist. The dual notion is that of colimits.

002F Definition 4.14.2. A colimit of the $\mathcal{I}$-diagram $M$ in the category $\mathcal{C}$ is given by an object $\operatorname{colim}_{\mathcal{I}} M$ in $\mathcal{C}$ together with morphisms $s_{i}: M_{i} \rightarrow \operatorname{colim}_{\mathcal{I}} M$ such that
(1) for $\phi: i \rightarrow i^{\prime}$ a morphism in $\mathcal{I}$ we have $s_{i}=s_{i^{\prime}} \circ M(\phi)$, and
(2) for any object $W$ in $\mathcal{C}$ and any family of morphisms $t_{i}: M_{i} \rightarrow W$ (indexed by $i \in \mathcal{I}$ ) such that for all $\phi: i \rightarrow i^{\prime}$ in $\mathcal{I}$ we have $t_{i}=t_{i^{\prime}} \circ M(\phi)$ there exists a unique morphism $t: \operatorname{colim}_{\mathcal{I}} M \rightarrow W$ such that $t_{i}=t \circ s_{i}$ for every object $i$ of $\mathcal{I}$.
Colimits ( $\left.\operatorname{colim}_{\mathcal{I}} M,\left(s_{i}\right)_{i \in \mathrm{Ob}(\mathcal{I})}\right)$ are (if they exist) unique up to unique isomorphism by the uniqueness requirement in the definition. Coproducts of pairs, pushouts, and coequalizers are examples of colimits. The colimit over an empty diagram is an initial object of $\mathcal{C}$. In the category of sets all colimits exist.

002G Remark 4.14.3. The index category of a (co)limit will never be allowed to have a proper class of objects. In this project it means that it cannot be one of the categories listed in Remark 4.2.2

002H Remark 4.14.4. We often write $\lim _{i} M_{i}, \operatorname{colim}_{i} M_{i}, \lim _{i \in \mathcal{I}} M_{i}$, or $\operatorname{colim}_{i \in \mathcal{I}} M_{i}$ instead of the versions indexed by $\mathcal{I}$. Using this notation, and using the description of limits and colimits of sets in Section 4.15 below, we can say the following. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram.
(1) The object $\lim _{i} M_{i}$ if it exists satisfies the following property

$$
\operatorname{Mor}_{\mathcal{C}}\left(W, \lim _{i} M_{i}\right)=\lim _{i} \operatorname{Mor}_{\mathcal{C}}\left(W, M_{i}\right)
$$

where the limit on the right takes place in the category of sets.
(2) The object colim $i_{i} M_{i}$ if it exists satisfies the following property

$$
\operatorname{Mor}_{\mathcal{C}}\left(\operatorname{colim}_{i} M_{i}, W\right)=\lim _{i \in \mathcal{I}^{\text {opp }}} \operatorname{Mor}_{\mathcal{C}}\left(M_{i}, W\right)
$$

where on the right we have the limit over the opposite category with value in the category of sets.
By the Yoneda lemma (and its dual) this formula completely determines the limit, respectively the colimit.

As an application of the notions of limits and colimits we define products and coproducts.
002I Definition 4.14.5. Suppose that $I$ is a set, and suppose given for every $i \in I$ an object $M_{i}$ of the category $\mathcal{C}$. A product $\prod_{i \in I} M_{i}$ is by definition $\lim _{\mathcal{I}} M$ (if it exists) where $\mathcal{I}$ is the category having only identities as morphisms and having the elements of $I$ as objects.

An important special case is where $I=\emptyset$ in which case the product is a final object of the category. The morphisms $p_{i}: \prod M_{i} \rightarrow M_{i}$ are called the projection morphisms.

002J Definition 4.14.6. Suppose that $I$ is a set, and suppose given for every $i \in I$ an object $M_{i}$ of the category $\mathcal{C}$. A coproduct $\coprod_{i \in I} M_{i}$ is by definition colim $\mathcal{I}_{\mathcal{I}} M$ (if it exists) where $\mathcal{I}$ is the category having only identities as morphisms and having the elements of $I$ as objects.

An important special case is where $I=\emptyset$ in which case the coproduct is an initial object of the category. Note that the coproduct comes equipped with morphisms $M_{i} \rightarrow \amalg M_{i}$. These are sometimes called the coprojections.

002 K Lemma 4.14.7. Suppose that $M: \mathcal{I} \rightarrow \mathcal{C}$, and $N: \mathcal{J} \rightarrow \mathcal{C}$ are diagrams whose colimits exist. Suppose $H: \mathcal{I} \rightarrow \mathcal{J}$ is a functor, and suppose $t: M \rightarrow N \circ H$ is a transformation of functors. Then there is a unique morphism

$$
\theta: \operatorname{colim}_{\mathcal{I}} M \longrightarrow \operatorname{colim}_{\mathcal{J}} N
$$

such that all the diagrams

commute.
Proof. Omitted.

002L Lemma 4.14.8. Suppose that $M: \mathcal{I} \rightarrow \mathcal{C}$, and $N: \mathcal{J} \rightarrow \mathcal{C}$ are diagrams whose limits exist. Suppose $H: \mathcal{I} \rightarrow \mathcal{J}$ is a functor, and suppose $t: N \circ H \rightarrow M$ is a transformation of functors. Then there is a unique morphism

$$
\theta: \lim _{\mathcal{J}} N \longrightarrow \lim _{\mathcal{I}} M
$$

such that all the diagrams

commute.
Proof. Omitted.
002M Lemma 4.14.9. Let $\mathcal{I}$, $\mathcal{J}$ be index categories. Let $M: \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{C}$ be a functor. We have

$$
\operatorname{colim}_{i} \operatorname{colim}_{j} M_{i, j}=\operatorname{colim}_{i, j} M_{i, j}=\operatorname{colim}_{j} \operatorname{colim}_{i} M_{i, j}
$$

provided all the indicated colimits exist. Similar for limits.
Proof. Omitted.
002N Lemma 4.14.10. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram. Write $I=\mathrm{Ob}(\mathcal{I})$ and $A=$ Arrow(I). Denote $s, t: A \rightarrow I$ the source and target maps. Suppose that $\prod_{i \in I} M_{i}$ and $\prod_{a \in A} M_{t(a)}$ exist. Suppose that the equalizer of

$$
\prod_{i \in I} M_{i} \xrightarrow[\psi]{\phi} \prod_{a \in A} M_{t(a)}
$$

exists, where the morphisms are determined by their components as follows: $p_{a} \circ \psi=$ $M(a) \circ p_{s(a)}$ and $p_{a} \circ \phi=p_{t(a)}$. Then this equalizer is the limit of the diagram.

Proof. Omitted.

002P Lemma 4.14.11. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram. Write $I=\operatorname{Ob}(\mathcal{I})$ and $A=$ $\operatorname{Arrow}(\mathcal{I})$. Denote $s, t: A \rightarrow I$ the source and target maps. Suppose that $\coprod_{i \in I} M_{i}$ and $\coprod_{a \in A} M_{s(a)}$ exist. Suppose that the coequalizer of

$$
\coprod_{a \in A} M_{s(a)} \xrightarrow[\psi]{\stackrel{\phi}{\longrightarrow}} \coprod_{i \in I} M_{i}
$$

exists, where the morphisms are determined by their components as follows: The component $M_{s(a)}$ maps via $\psi$ to the component $M_{t(a)}$ via the morphism a. The component $M_{s(a)}$ maps via $\phi$ to the component $M_{s(a)}$ by the identity morphism. Then this coequalizer is the colimit of the diagram.

Proof. Omitted.

### 4.15. Limits and colimits in the category of sets

002 U Not only do limits and colimits exist in Sets but they are also easy to describe. Namely, let $M: \mathcal{I} \rightarrow$ Sets, $i \mapsto M_{i}$ be a diagram of sets. Denote $I=\operatorname{Ob}(\mathcal{I})$. The limit is described as

$$
\lim _{\mathcal{I}} M=\left\{\left(m_{i}\right)_{i \in I} \in \prod_{i \in I} M_{i} \mid \forall \phi: i \rightarrow i^{\prime} \text { in } \mathcal{I}, M(\phi)\left(m_{i}\right)=m_{i^{\prime}}\right\}
$$

So we think of an element of the limit as a compatible system of elements of all the sets $M_{i}$.

On the other hand, the colimit is

$$
\operatorname{colim}_{\mathcal{I}} M=\left(\coprod_{i \in I} M_{i}\right) / \sim
$$

where the equivalence relation $\sim$ is the equivalence relation generated by setting $m_{i} \sim m_{i^{\prime}}$ if $m_{i} \in M_{i}, m_{i^{\prime}} \in M_{i^{\prime}}$ and $M(\phi)\left(m_{i}\right)=m_{i^{\prime}}$ for some $\phi: i \rightarrow i^{\prime}$. In other words, $m_{i} \in M_{i}$ and $m_{i^{\prime}} \in M_{i^{\prime}}$ are equivalent if there is a chain of morphisms in $\mathcal{I}$

and elements $m_{i_{j}} \in M_{i_{j}}$ mapping to each other under the maps $M_{i_{2 k-1}} \rightarrow M_{i_{2 k-2}}$ and $M_{i_{2 k-1}} \rightarrow M_{i_{2 k}}$ induced from the maps in $\mathcal{I}$ above.

This is not a very pleasant type of object to work with. But if the diagram is filtered then it is much easier to describe. We will explain this in Section 4.19 .

### 4.16. Connected limits

04 AQ A (co)limit is called connected if its index category is connected.
002 S Definition 4.16.1. We say that a category $\mathcal{I}$ is connected if the equivalence relation generated by $x \sim y \Leftrightarrow \operatorname{Mor}_{\mathcal{I}}(x, y) \neq \emptyset$ has exactly one equivalence class.

Here we follow the convention of Topology, Definition 5.6.1 that connected spaces are nonempty. The following in some vague sense characterizes connected limits.

002T Lemma 4.16.2. Let $\mathcal{C}$ be a category. Let $X$ be an object of $\mathcal{C}$. Let $M: \mathcal{I} \rightarrow \mathcal{C} / X$ be a diagram in the category of objects over $X$. If the index category $\mathcal{I}$ is connected and the limit of $M$ exists in $\mathcal{C} / X$, then the limit of the composition $\mathcal{I} \rightarrow \mathcal{C} / X \rightarrow \mathcal{C}$ exists and is the same.

Proof. Let $M \rightarrow X$ be an object representing the limit in $\mathcal{C} / X$. Consider the functor

$$
W \longmapsto \lim _{i} \operatorname{Mor}_{\mathcal{C}}\left(W, M_{i}\right) .
$$

Let $\left(\varphi_{i}\right)$ be an element of the set on the right. Since each $M_{i}$ comes equipped with a morphism $s_{i}: M_{i} \rightarrow X$ we get morphisms $f_{i}=s_{i} \circ \varphi_{i}: W \rightarrow X$. But as $\mathcal{I}$ is connected we see that all $f_{i}$ are equal. Since $\mathcal{I}$ is nonempty there is at least one $f_{i}$. Hence this common value $W \rightarrow X$ defines the structure of an object of $W$ in $\mathcal{C} / X$ and $\left(\varphi_{i}\right)$ defines is an element of $\lim _{i} \operatorname{Mor}_{\mathcal{C} / X}\left(W, M_{i}\right)$. Thus we obtain a unique morphism $\phi: W \rightarrow M$ such that $\varphi_{i}$ is the composition of $\phi$ with $M \rightarrow M_{i}$ as desired.

04AR Lemma 4.16.3. Let $\mathcal{C}$ be a category. Let $X$ be an object of $\mathcal{C}$. Let $M: \mathcal{I} \rightarrow$ $X / \mathcal{C}$ be a diagram in the category of objects under $X$. If the index category $\mathcal{I}$ is connected and the colimit of $M$ exists in $X / \mathcal{C}$, then the colimit of the composition $\mathcal{I} \rightarrow X / \mathcal{C} \rightarrow \mathcal{C}$ exists and is the same.

Proof. Omitted. Hint: This lemma is dual to Lemma 4.16.2.

### 4.17. Cofinal and initial categories

09WN In the literature sometimes the word "final" is used instead of cofinal in the following definition.

04E6 Definition 4.17.1. Let $H: \mathcal{I} \rightarrow \mathcal{J}$ be a functor between categories. We say $\mathcal{I}$ is cofinal in $\mathcal{J}$ or that $H$ is cofinal if
(1) for all $y \in \operatorname{Ob}(\mathcal{J})$ there exists a $x \in \operatorname{Ob}(\mathcal{I})$ and a morphism $y \rightarrow H(x)$, and
(2) given $y \in \operatorname{Ob}(\mathcal{J}), x, x^{\prime} \in \mathrm{Ob}(\mathcal{I})$ and morphisms $y \rightarrow H(x)$ and $y \rightarrow H\left(x^{\prime}\right)$ there exists a sequence of morphisms

$$
x=x_{0} \leftarrow x_{1} \rightarrow x_{2} \leftarrow x_{3} \rightarrow \ldots \rightarrow x_{2 n}=x^{\prime}
$$

in $\mathcal{I}$ and morphisms $y \rightarrow H\left(x_{i}\right)$ in $\mathcal{J}$ such that the diagrams

commute for $k=0, \ldots, n-1$.
04E7 Lemma 4.17.2. Let $H: \mathcal{I} \rightarrow \mathcal{J}$ be a functor of categories. Assume $\mathcal{I}$ is cofinal in $\mathcal{J}$. Then for every diagram $M: \mathcal{J} \rightarrow \mathcal{C}$ we have a canonical isomorphism

$$
\operatorname{colim}_{\mathcal{I}} M \circ H=\operatorname{colim}_{\mathcal{J}} M
$$

if either side exists.
Proof. Omitted.

09WP Definition 4.17.3. Let $H: \mathcal{I} \rightarrow \mathcal{J}$ be a functor between categories. We say $\mathcal{I}$ is initial in $\mathcal{J}$ or that $H$ is initial if
(1) for all $y \in \mathrm{Ob}(\mathcal{J})$ there exists a $x \in \mathrm{Ob}(\mathcal{I})$ and a morphism $H(x) \rightarrow y$,
(2) for any $y \in \operatorname{Ob}(\mathcal{J}), x, x^{\prime} \in \mathrm{Ob}(\mathcal{I})$ and morphisms $H(x) \rightarrow y, H\left(x^{\prime}\right) \rightarrow y$ in $\mathcal{J}$ there exists a sequence of morphisms

$$
x=x_{0} \leftarrow x_{1} \rightarrow x_{2} \leftarrow x_{3} \rightarrow \ldots \rightarrow x_{2 n}=x^{\prime}
$$

in $\mathcal{I}$ and morphisms $H\left(x_{i}\right) \rightarrow y$ in $\mathcal{J}$ such that the diagrams

commute for $k=0, \ldots, n-1$.
This is just the dual notion to "cofinal" functors.
002R Lemma 4.17.4. Let $H: \mathcal{I} \rightarrow \mathcal{J}$ be a functor of categories. Assume $\mathcal{I}$ is initial in $\mathcal{J}$. Then for every diagram $M: \mathcal{J} \rightarrow \mathcal{C}$ we have a canonical isomorphism

$$
\lim _{\mathcal{I}} M \circ H=\lim _{\mathcal{J}} M
$$

if either side exists.
Proof. Omitted.
05US Lemma 4.17.5. Let $F: \mathcal{I} \rightarrow \mathcal{I}^{\prime}$ be a functor. Assume
(1) the fibre categories (see Definition 4.31.2) of $\mathcal{I}$ over $\mathcal{I}^{\prime}$ are all connected, and
(2) for every morphism $\alpha^{\prime}: x^{\prime} \rightarrow y^{\prime}$ in $\mathcal{I}^{\prime}$ there exist a morphism $\alpha: x \rightarrow y$ in $\mathcal{I}$ such that $F(\alpha)=\alpha^{\prime}$.
Then for every diagram $M: \mathcal{I}^{\prime} \rightarrow \mathcal{C}$ the colimit $\operatorname{colim}_{\mathcal{I}} M \circ F$ exists if and only if $\operatorname{colim}_{\mathcal{I}^{\prime}} M$ exists and if so these colimits agree.

Proof. One can prove this by showing that $\mathcal{I}$ is cofinal in $\mathcal{I}^{\prime}$ and applying Lemma 4.17.2. But we can also prove it directly as follows. It suffices to show that for any object $T$ of $\mathcal{C}$ we have

$$
\lim _{\mathcal{I}^{\text {opp }}} \operatorname{Mor}_{\mathcal{C}}\left(M_{F(i)}, T\right)=\lim _{\left(\mathcal{I}^{\prime}\right) \text { opp }} \operatorname{Mor}_{\mathcal{C}}\left(M_{i^{\prime}}, T\right)
$$

If $\left(g_{i^{\prime}}\right)_{i^{\prime} \in \mathrm{Ob}\left(\mathcal{I}^{\prime}\right)}$ is an element of the right hand side, then setting $f_{i}=g_{F(i)}$ we obtain an element $\left(f_{i}\right)_{i \in \mathrm{Ob}(\mathcal{I})}$ of the left hand side. Conversely, let $\left(f_{i}\right)_{i \in \mathrm{Ob}(\mathcal{I})}$ be an element of the left hand side. Note that on each (connected) fibre category $\mathcal{I}_{i^{\prime}}$ the functor $M \circ F$ is constant with value $M_{i^{\prime}}$. Hence the morphisms $f_{i}$ for $i \in \mathrm{Ob}(\mathcal{I})$ with $F(i)=i^{\prime}$ are all the same and determine a well defined morphism $g_{i^{\prime}}: M_{i^{\prime}} \rightarrow T$. By assumption (2) the collection $\left(g_{i^{\prime}}\right)_{i^{\prime} \in \mathrm{Ob}\left(\mathcal{I}^{\prime}\right)}$ defines an element of the right hand side.

0A2B Lemma 4.17.6. Let $\mathcal{I}$ and $\mathcal{J}$ be a categories and denote $p: \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{J}$ the projection. If $\mathcal{I}$ is connected, then for a diagram $M: \mathcal{J} \rightarrow \mathcal{C}$ the colimit $\operatorname{colim}_{\mathcal{J}} M$ exists if and only if $\operatorname{colim}_{\mathcal{I} \times \mathcal{J}} M \circ p$ exists and if so these colimits are equal.

Proof. This is a special case of Lemma 4.17 .5

### 4.18. Finite limits and colimits

04AS A finite (co)limit is a (co)limit whose diagram category is finite, i.e., the diagram category has finitely many objects and finitely many morphisms. A (co)limit is called nonempty if the index category is nonempty. A (co)limit is called connected if the index category is connected, see Definition 4.16.1. It turns out that there are "enough" finite diagram categories.

05XU Lemma 4.18.1. Let $\mathcal{I}$ be a category with
(1) $\mathrm{Ob}(\mathcal{I})$ is finite, and
(2) there exist finitely many morphisms $f_{1}, \ldots, f_{m} \in \operatorname{Arrows}(\mathcal{I})$ such that every morphism of $\mathcal{I}$ is a composition $f_{j_{1}} \circ f_{j_{2}} \circ \ldots \circ f_{j_{k}}$.
Then there exists a functor $F: \mathcal{J} \rightarrow \mathcal{I}$ such that
(a) $\mathcal{J}$ is a finite category, and
(b) for any diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ the (co)limit of $M$ over $\mathcal{I}$ exists if and only if the (co)limit of $M \circ F$ over $\mathcal{J}$ exists and in this case the (co)limits are canonically isomorphic.
Moreover, $\mathcal{J}$ is connected (resp. nonempty) if and only if $\mathcal{I}$ is so.
Proof. Say $\operatorname{Ob}(\mathcal{I})=\left\{x_{1}, \ldots, x_{n}\right\}$. Denote $s, t:\{1, \ldots, m\} \rightarrow\{1, \ldots, n\}$ the functions such that $f_{j}: x_{s(j)} \rightarrow x_{t(j)}$. We set $\operatorname{Ob}(\mathcal{J})=\left\{y_{1}, \ldots, y_{n}, z_{1}, \ldots, z_{n}\right\}$ Besides the identity morphisms we introduce morphisms $g_{j}: y_{s(j)} \rightarrow z_{t(j)}, j=$ $1, \ldots, m$ and morphisms $h_{i}: y_{i} \rightarrow z_{i}, i=1, \ldots, n$. Since all of the nonidentity morphisms in $\mathcal{J}$ go from a $y$ to a $z$ there are no compositions to define and no associativities to check. Set $F\left(y_{i}\right)=F\left(z_{i}\right)=x_{i}$. Set $F\left(g_{j}\right)=f_{j}$ and $F\left(h_{i}\right)=\mathrm{id}_{x_{i}}$. It is clear that $F$ is a functor. It is clear that $\mathcal{J}$ is finite. It is clear that $\mathcal{J}$ is connected, resp. nonempty if and only if $\mathcal{I}$ is so.
Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram. Consider an object $W$ of $\mathcal{C}$ and morphisms $q_{i}$ : $W \rightarrow M\left(x_{i}\right)$ as in Definition 4.14.1. Then by taking $q_{i}: W \rightarrow M\left(F\left(y_{i}\right)\right)=$ $M\left(F\left(z_{i}\right)\right)=M\left(x_{i}\right)$ we obtain a family of maps as in Definition 4.14.1 for the diagram $M \circ F$. Conversely, suppose we are given maps $q y_{i}: W \rightarrow M\left(F\left(y_{i}\right)\right)$ and $q z_{i}: W \rightarrow M\left(F\left(z_{i}\right)\right)$ as in Definition 4.14.1 for the diagram $M \circ F$. Since

$$
M\left(F\left(h_{i}\right)\right)=\mathrm{id}: M\left(F\left(y_{i}\right)\right)=M\left(x_{i}\right) \longrightarrow M\left(x_{i}\right)=M\left(F\left(z_{i}\right)\right)
$$

we conclude that $q y_{i}=q z_{i}$ for all $i$. Set $q_{i}$ equal to this common value. The compatibility of $q_{s(j)}=q y_{s(j)}$ and $q_{t(j)}=q z_{t(j)}$ with the morphism $M\left(f_{j}\right)$ guarantees that the family $q_{i}$ is compatible with all morphisms in $\mathcal{I}$ as by assumption every such morphism is a composition of the morphisms $f_{j}$. Thus we have found a canonical bijection

$$
\lim _{B \in \operatorname{Ob}(\mathcal{J})} \operatorname{Mor}_{\mathcal{C}}(W, M(F(B)))=\lim _{A \in \mathrm{Ob}(\mathcal{I})} \operatorname{Mor}_{\mathcal{C}}(W, M(A))
$$

which implies the statement on limits in the lemma. The statement on colimits is proved in the same way (proof omitted).

04AT Lemma 4.18.2. Let $\mathcal{C}$ be a category. The following are equivalent:
(1) Connected finite limits exist in $\mathcal{C}$.
(2) Equalizers and fibre products exist in $\mathcal{C}$.

Proof. Since equalizers and fibre products are finite connected limits we see that (1) implies (2). For the converse, let $\mathcal{I}$ be a finite connected diagram category. Let
$F: \mathcal{J} \rightarrow \mathcal{I}$ be the functor of diagram categories constructed in the proof of Lemma 4.18.1. Then we see that we may replace $\mathcal{I}$ by $\mathcal{J}$. The result is that we may assume that $\operatorname{Ob}(\mathcal{I})=\left\{x_{1}, \ldots, x_{n}\right\} \amalg\left\{y_{1}, \ldots, y_{m}\right\}$ with $n, m \geq 1$ such that all nonidentity morphisms in $\mathcal{I}$ are morphisms $f: x_{i} \rightarrow y_{j}$ for some $i$ and $j$.
Suppose that $n>1$. Since $\mathcal{I}$ is connected there exist indices $i_{1}, i_{2}$ and $j_{0}$ and morphisms $a: x_{i_{1}} \rightarrow y_{j_{0}}$ and $b: x_{i_{2}} \rightarrow y_{j_{0}}$. Consider the category

$$
\mathcal{I}^{\prime}=\{x\} \amalg\left\{x_{1}, \ldots, \hat{x}_{i_{1}}, \ldots, \hat{x}_{i_{2}}, \ldots x_{n}\right\} \amalg\left\{y_{1}, \ldots, y_{m}\right\}
$$

with

$$
\operatorname{Mor}_{\mathcal{I}^{\prime}}\left(x, y_{j}\right)=\operatorname{Mor}_{\mathcal{I}}\left(x_{i_{1}}, y_{j}\right) \amalg \operatorname{Mor}_{\mathcal{I}}\left(x_{i_{2}}, y_{j}\right)
$$

and all other morphism sets the same as in $\mathcal{I}$. For any functor $M: \mathcal{I} \rightarrow \mathcal{C}$ we can construct a functor $M^{\prime}: \mathcal{I}^{\prime} \rightarrow \mathcal{C}$ by setting

$$
M^{\prime}(x)=M\left(x_{i_{1}}\right) \times_{M(a), M\left(y_{j}\right), M(b)} M\left(x_{i_{2}}\right)
$$

and for a morphism $f^{\prime}: x \rightarrow y_{j}$ corresponding to, say, $f: x_{i_{1}} \rightarrow y_{j}$ we set $M^{\prime}(f)=M(f) \circ \mathrm{pr}_{1}$. Then the functor $M$ has a limit if and only if the functor $M^{\prime}$ has a limit (proof omitted). Hence by induction we reduce to the case $n=1$.
If $n=1$, then the limit of any $M: \mathcal{I} \rightarrow \mathcal{C}$ is the successive equalizer of pairs of maps $x_{1} \rightarrow y_{j}$ hence exists by assumption.

04AU Lemma 4.18.3. Let $\mathcal{C}$ be a category. The following are equivalent:
(1) Nonempty finite limits exist in $\mathcal{C}$.
(2) Products of pairs and equalizers exist in $\mathcal{C}$.
(3) Products of pairs and fibre products exist in $\mathcal{C}$.

Proof. Since products of pairs, fibre products, and equalizers are limits with nonempty index categories we see that (1) implies both (2) and (3). Assume (2). Then finite nonempty products and equalizers exist. Hence by Lemma 4.14 .10 we see that finite nonempty limits exist, i.e., (1) holds. Assume (3). If $a, b: A \rightarrow B$ are morphisms of $\mathcal{C}$, then the equalizer of $a, b$ is

$$
\left(A \times_{a, B, b} A\right) \times \times_{\left(p r_{1}, p r_{2}\right), A \times A, \Delta} A .
$$

Thus (3) implies (2), and the lemma is proved.
002 O Lemma 4.18.4. Let $\mathcal{C}$ be a category. The following are equivalent:
(1) Finite limits exist in $\mathcal{C}$.
(2) Finite products and equalizers exist.
(3) The category has a final object and fibred products exist.

Proof. Since products of pairs, fibre products, equalizers, and final objects are limits over finite index categories we see that (1) implies both (2) and (3). By Lemma 4.14.10 above we see that (2) implies (1). Assume (3). Note that the product $A \times B$ is the fibre product over the final object. If $a, b: A \rightarrow B$ are morphisms of $\mathcal{C}$, then the equalizer of $a, b$ is

$$
\left(A \times_{a, B, b} A\right) \times\left(p r_{1}, p r_{2}\right), A \times A, \Delta A .
$$

Thus (3) implies (2) and the lemma is proved.
04AV Lemma 4.18.5. Let $\mathcal{C}$ be a category. The following are equivalent:
(1) Connected finite colimits exist in $\mathcal{C}$.
(2) Coequalizers and pushouts exist in $\mathcal{C}$.

Proof. Omitted. Hint: This is dual to Lemma 4.18.2,
04AW Lemma 4.18.6. Let $\mathcal{C}$ be a category. The following are equivalent:
(1) Nonempty finite colimits exist in $\mathcal{C}$.
(2) Coproducts of pairs and coequalizers exist in $\mathcal{C}$.
(3) Coproducts of pairs and pushouts exist in $\mathcal{C}$.

Proof. Omitted. Hint: This is the dual of Lemma 4.18 .3
002Q Lemma 4.18.7. Let $\mathcal{C}$ be a category. The following are equivalent:
(1) Finite colimits exist in $\mathcal{C}$,
(2) Finite coproducts and coequalizers exist in $\mathcal{C}$, and
(3) The category has an initial object and pushouts exist.

Proof. Omitted. Hint: This is dual to Lemma 4.18.4.

### 4.19. Filtered colimits

04AX Colimits are easier to compute or describe when they are over a filtered diagram. Here is the definition.

002V Definition 4.19.1. We say that a diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ is directed, or filtered if the following conditions hold:
(1) the category $\mathcal{I}$ has at least one object,
(2) for every pair of objects $x, y$ of $\mathcal{I}$ there exists an object $z$ and morphisms $x \rightarrow z, y \rightarrow z$, and
(3) for every pair of objects $x, y$ of $\mathcal{I}$ and every pair of morphisms $a, b: x \rightarrow y$ of $\mathcal{I}$ there exists a morphism $c: y \rightarrow z$ of $\mathcal{I}$ such that $M(c \circ a)=M(c \circ b)$ as morphisms in $\mathcal{C}$.

We say that an index category $\mathcal{I}$ is directed, or filtered if id : $\mathcal{I} \rightarrow \mathcal{I}$ is filtered (in other words you erase the $M$ in part (3) above.)

We observe that any diagram with filtered index category is filtered, and this is how filtered colimits usually come about. In fact, if $M: \mathcal{I} \rightarrow \mathcal{C}$ is a filtered diagram, then we can factor $M$ as $\mathcal{I} \rightarrow \mathcal{I}^{\prime} \rightarrow \mathcal{C}$ where $\mathcal{I}^{\prime}$ is a filtered index category ${ }^{11}$ such that $\operatorname{colim}_{\mathcal{I}} M$ exists if and only if colim $\mathcal{I}^{\prime} M^{\prime}$ exists in which case the colimits are canonically isomorphic.

Suppose that $M: \mathcal{I} \rightarrow$ Sets is a filtered diagram. In this case we may describe the equivalence relation in the formula

$$
\operatorname{colim}_{\mathcal{I}} M=\left(\coprod_{i \in I} M_{i}\right) / \sim
$$

simply as follows

$$
m_{i} \sim m_{i^{\prime}} \Leftrightarrow \exists i^{\prime \prime}, \phi: i \rightarrow i^{\prime \prime}, \phi^{\prime}: i^{\prime} \rightarrow i^{\prime \prime}, M(\phi)\left(m_{i}\right)=M\left(\phi^{\prime}\right)\left(m_{i^{\prime}}\right)
$$

In other words, two elements are equal in the colimit if and only if they "eventually become equal".

[^1]002W Lemma 4.19.2. Let $\mathcal{I}$ and $\mathcal{J}$ be index categories. Assume that $\mathcal{I}$ is filtered and $\mathcal{J}$ is finite. Let $M: \mathcal{I} \times \mathcal{J} \rightarrow$ Sets, $(i, j) \mapsto M_{i, j}$ be a diagram of diagrams of sets. In this case

$$
\operatorname{colim}_{i} \lim _{j} M_{i, j}=\lim _{j} \operatorname{colim}_{i} M_{i, j}
$$

In particular, colimits over $\mathcal{I}$ commute with finite products, fibre products, and equalizers of sets.
Proof. Omitted. In fact, it is a fun exercise to prove that a category is filtered if and only if colimits over the category commute with finite limits (into the category of sets).

We give a counter example to the lemma in the case where $\mathcal{J}$ is infinite. Namely, let $\mathcal{I}$ consist of $\mathbf{N}=\{1,2,3, \ldots\}$ with a unique morphism $i \rightarrow i^{\prime}$ whenever $i \leq i^{\prime}$. Let $\mathcal{J}$ consist of the discrete category $\mathbf{N}=\{1,2,3, \ldots\}$ (only morphisms are identities). Let $M_{i, j}=\{1,2, \ldots, i\}$ with obvious inclusion maps $M_{i, j} \rightarrow M_{i^{\prime}, j}$ when $i \leq i^{\prime}$. In this case $\operatorname{colim}_{i} M_{i, j}=\mathbf{N}$ and hence

$$
\lim _{j} \operatorname{colim}_{i} M_{i, j}=\prod_{j} \mathbf{N}=\mathbf{N}^{\mathbf{N}}
$$

On the other hand $\lim _{j} M_{i, j}=\prod_{j} M_{i, j}$ and hence

$$
\operatorname{colim}_{i} \lim _{j} M_{i, j}=\bigcup_{i}\{1,2, \ldots, i\}^{\mathbf{N}}
$$

which is smaller than the other limit.
It turns out we sometimes need a more finegrained control over the possible conditions one can impose on index categories. Thus we add some lemmas on the possible things one can require.

09WQ Lemma 4.19.3. Let $\mathcal{I}$ be an index category, i.e., a category. Assume that for every pair of objects $x, y$ of $\mathcal{I}$ there exists an object $z$ and morphisms $x \rightarrow z$ and $y \rightarrow z$. Then colimits of diagrams of sets over $\mathcal{I}$ commute with finite nonempty products.

Proof. Let $M$ and $N$ be diagrams of sets over $\mathcal{I}$. To prove the lemma we have to show that the canonical map

$$
\operatorname{colim}\left(M_{i} \times N_{i}\right) \longrightarrow \operatorname{colim} M_{i} \times \operatorname{colim} N_{i}
$$

is an isomorphism. If $\mathcal{I}$ is empty, then this is true because the colimit of sets over the empty category is the empty set. If $\mathcal{I}$ is nonempty, then we construct a map colim $M_{i} \times \operatorname{colim} N_{i} \rightarrow \operatorname{colim}\left(M_{i} \times N_{i}\right)$ as follows. Suppose that $m \in M_{i}$ and $n \in N_{j}$ give rise to elements $s$ and $t$ of the respective colimits. By assumption we can find $a: i \rightarrow k$ and $b: j \rightarrow k$ in $\mathcal{I}$. Then $(M(a)(m), N(b)(n))$ is an element of $M_{k} \times N_{k}$ and we map $(s, t)$ to the corresponding element of colim $M_{i} \times N_{i}$. We omit the verification that this map is well defined and that it is an inverse of the map displayed above.

09WR Lemma 4.19.4. Let $\mathcal{I}$ be an index category, i.e., a category. Assume that for every pair of objects $x, y$ of $\mathcal{I}$ there exists an object $z$ and morphisms $x \rightarrow z$ and $y \rightarrow z$. Let $M: \mathcal{I} \rightarrow A b$ be a diagram of abelian groups over $\mathcal{I}$. Then the set underlying $\operatorname{colim}_{i} M_{i}$ is the colimit of $M$ viewed as a diagram of sets over $\mathcal{I}$.

Proof. In this proof all colimits are taken in the category of sets. By Lemma 4.19.3 we have colim $M_{i} \times \operatorname{colim} M_{i}=\operatorname{colim}\left(M_{i} \times M_{i}\right)$ hence we can use the maps $+: M_{i} \times M_{i} \rightarrow M_{i}$ to define an addition map on $\operatorname{colim} M_{i}$. A straightforward argument, which we omit, shows that the set $\operatorname{colim} M_{i}$ with this addition is the colimit in the category of abelian groups.

09WS Lemma 4.19.5. Let $\mathcal{I}$ be an index category, i.e., a category. Assume that for every solid diagram

in $\mathcal{I}$ there exists an object $w$ and dotted arrows making the diagram commute. Then $\mathcal{I}$ is a (possibly empty) disjoint union of categories satisfying the condition above and the condition of Lemma 4.19.3.

Proof. If $\mathcal{I}$ is the empty category, then the lemma is true. Otherwise, we define a relation on objects of $\mathcal{I}$ by saying that $x \sim y$ if there exists a $z$ and morphisms $x \rightarrow z$ and $y \rightarrow z$. This is an equivalence relation by the assumption of the lemma. Hence $\operatorname{Ob}(\mathcal{I})$ is a disjoint union of equivalence classes. Let $\mathcal{I}_{j}$ be the full subcategories corresponding to these equivalence classes. Then $\mathcal{I}=\coprod \mathcal{I}_{j}$ as desired.

09WT Lemma 4.19.6. Let $\mathcal{I}$ be an index category, i.e., a category. Assume that for every solid diagram

in $\mathcal{I}$ there exists an object $w$ and dotted arrows making the diagram commute. Then an injective morphism $M \rightarrow N$ of diagrams of sets (resp. abelian groups) over $\mathcal{I}$ gives rise to an injective map colim $M_{i} \rightarrow \operatorname{colim} N_{i}$ of sets (resp. abelian groups).

Proof. We first show that it suffices to prove the lemma for the case of a diagram of sets. Namely, by Lemma 4.19 .5 we can write $\mathcal{I}=\coprod \mathcal{I}_{j}$ where each $\mathcal{I}_{j}$ satisfies the condition of the lemma as well as the condition of Lemma 4.19.3. Thus, if $M$ is a diagram of abelian groups over $\mathcal{I}$, then

$$
\operatorname{colim}_{\mathcal{I}} M=\left.\bigoplus_{j} \operatorname{colim}_{\mathcal{I}_{j}} M\right|_{\mathcal{I}_{j}}
$$

It follows that it suffices to prove the result for the categories $\mathcal{I}_{j}$. Howeover, colimits of abelian groups over these categories are computed by the colimits of the underlying sets (Lemma 4.19.4) hence we reduce to the case of an injective map of diagrams of sets.

Here we say that $M \rightarrow N$ is injective if all the maps $M_{i} \rightarrow N_{i}$ are injective. In fact, we will identify $M_{i}$ with the image of $M_{i} \rightarrow N_{i}$, i.e., we will think of $M_{i}$ as a subset of $N_{i}$. We will use the description of the colimits given in Section 4.15 without further mention. Let $s, s^{\prime} \in \operatorname{colim} M_{i}$ map to the same element of colim $N_{i}$. Say $s$ comes from an element $m$ of $M_{i}$ and $s^{\prime}$ comes from an element $m^{\prime}$ of $M_{i^{\prime}}$.

Then we can find a sequence $i=i_{0}, i_{1}, \ldots, i_{n}=i^{\prime}$ of objects of $\mathcal{I}$ and morphisms

and elements $n_{i_{j}} \in N_{i_{j}}$ mapping to each other under the maps $N_{i_{2 k-1}} \rightarrow N_{i_{2 k-2}}$ and $N_{i_{2 k-1}} \rightarrow N_{i_{2 k}}$ induced from the maps in $\mathcal{I}$ above with $n_{i_{0}}=m$ and $n_{i_{2 n}}=m^{\prime}$. We will prove by induction on $n$ that this implies $s=s^{\prime}$. The base case $n=0$ is trivial. Assume $n \geq 1$. Using the assumption on $\mathcal{I}$ we find a commutative diagram

We conclude that $m$ and $n_{i_{2}}$ map to the same element of $N_{w}$ because both are the image of the element $n_{i_{1}}$. In particular, this element is an element $m^{\prime \prime} \in M_{w}$ which gives rise to the same element as $s$ in colim $M_{i}$. Then we find the chain

and the elements $n_{i_{j}}$ for $j \geq 3$ which has a smaller length than the chain we started with. This proves the induction step and the proof of the lemma is complete.

Lemma 4.19.7. Let $\mathcal{I}$ be an index category, i.e., a category. Assume
(1) for every pair of morphisms $a: w \rightarrow x$ and $b: w \rightarrow y$ in $\mathcal{I}$ there exists an object $z$ and morphisms $c: x \rightarrow z$ and $d: y \rightarrow z$ such that $c \circ a=d \circ b$, and
(2) for every pair of morphisms $a, b: x \rightarrow y$ there exists a morphism $c: y \rightarrow z$ such that $c \circ a=c \circ b$.

Then $\mathcal{I}$ is a (possibly empty) union of disjoint filtered index categories $\mathcal{I}_{j}$.
Proof. If $\mathcal{I}$ is the empty category, then the lemma is true. Otherwise, we define a relation on objects of $\mathcal{I}$ by saying that $x \sim y$ if there exists a $z$ and morphisms $x \rightarrow z$ and $y \rightarrow z$. This is an equivalence relation by the first assumption of the lemma. Hence $\operatorname{Ob}(\mathcal{I})$ is a disjoint union of equivalence classes. Let $\mathcal{I}_{j}$ be the full subcategories corresponding to these equivalence classes. The rest is clear from the definitions.

002Y Lemma 4.19.8. Let $\mathcal{I}$ be an index category satisfying the hypotheses of Lemma 4.19.7 above. Then colimits over $\mathcal{I}$ commute with fibre products and equalizers in sets (and more generally with finite connected limits).

Proof. By Lemma 4.19.7 we may write $\mathcal{I}=\coprod \mathcal{I}_{j}$ with each $\mathcal{I}_{j}$ filtered. By Lemma 4.19.2 we see that colimits of $\mathcal{I}_{j}$ commute with equalizers and fibred products. Thus it suffices to show that equalizers and fibre products commute with coproducts in the category of sets (including empty coproducts). In other words, given a set $J$ and sets $A_{j}, B_{j}, C_{j}$ and set maps $A_{j} \rightarrow B_{j}, C_{j} \rightarrow B_{j}$ for $j \in J$ we have to show that

$$
\left.\left(\coprod_{j \in J} A_{j}\right) \times \coprod_{j \in J} B_{j}\right)\left(\coprod_{j \in J} C_{j}\right)=\coprod_{j \in J} A_{j} \times_{B_{j}} C_{j}
$$

and given $a_{j}, a_{j}^{\prime}: A_{j} \rightarrow B_{j}$ that

$$
\operatorname{Equalizer}\left(\coprod_{j \in J} a_{j}, \coprod_{j \in J} a_{j}^{\prime}\right)=\coprod_{j \in J} \operatorname{Equalizer}\left(a_{j}, a_{j}^{\prime}\right)
$$

This is true even if $J=\emptyset$. Details omitted.

### 4.20. Cofiltered limits

04 AY Limits are easier to compute or describe when they are over a cofiltered diagram. Here is the definition.

04AZ Definition 4.20.1. We say that a diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ is codirected or cofiltered if the following conditions hold:
(1) the category $\mathcal{I}$ has at least one object,
(2) for every pair of objects $x, y$ of $\mathcal{I}$ there exists an object $z$ and morphisms $z \rightarrow x, z \rightarrow y$, and
(3) for every pair of objects $x, y$ of $\mathcal{I}$ and every pair of morphisms $a, b: x \rightarrow y$ of $\mathcal{I}$ there exists a morphism $c: w \rightarrow x$ of $\mathcal{I}$ such that $M(a \circ c)=M(b \circ c)$ as morphisms in $\mathcal{C}$.
We say that an index category $\mathcal{I}$ is codirected, or cofiltered if id : $\mathcal{I} \rightarrow \mathcal{I}$ is cofiltered (in other words you erase the $M$ in part (3) above.)
We observe that any diagram with cofiltered index category is cofiltered, and this is how this situation usually occurs.
As an example of why cofiltered limits of sets are "easier" than general ones, we mention the fact that a cofiltered diagram of finite nonempty sets has nonempty limit (Lemma 4.21.5). This result does not hold for a general limit of finite nonempty sets.

### 4.21. Limits and colimits over partially ordered sets

002 Z A special case of diagrams is given by systems over partially ordered sets.
0030 Definition 4.21.1. Let $(I, \geq)$ be a partially ordered set. Let $\mathcal{C}$ be a category.
(1) A system over $I$ in $\mathcal{C}$, sometimes called a inductive system over $I$ in $\mathcal{C}$ is given by objects $M_{i}$ of $\mathcal{C}$ and for every $i \leq i^{\prime}$ a morphism $f_{i i^{\prime}}: M_{i} \rightarrow M_{i^{\prime}}$ such that $f_{i i}=\mathrm{id}$ and such that $f_{i i^{\prime \prime}}=f_{i^{\prime} i^{\prime \prime}} \circ f_{i i^{\prime}}$ whenever $i \leq i^{\prime} \leq i^{\prime \prime}$.
(2) An inverse system over $I$ in $\mathcal{C}$, sometimes called a projective system over $I$ in $\mathcal{C}$ is given by objects $M_{i}$ of $\mathcal{C}$ and for every $i \geq i^{\prime}$ a morphism $f_{i i^{\prime}}: M_{i} \rightarrow M_{i^{\prime}}$ such that $f_{i i}=\mathrm{id}$ and such that $f_{i i^{\prime \prime}}=f_{i^{\prime} i^{\prime \prime}} \circ f_{i i^{\prime}}$ whenever $i \geq i^{\prime} \geq i^{\prime \prime}$. (Note reversal of inequalities.)
We will say $\left(M_{i}, f_{i i^{\prime}}\right)$ is a (inverse) system over $I$ to denote this. The maps $f_{i i^{\prime}}$ are sometimes called the transition maps.

In other words a system over $I$ is just a diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ where $\mathcal{I}$ is the category with objects $I$ and a unique arrow $i \rightarrow i^{\prime}$ if and only $i \leq i^{\prime}$. And an inverse system is a diagram $M: \mathcal{I}^{o p p} \rightarrow \mathcal{C}$. From this point of view we could take (co)limits of any (inverse) system over $I$. However, it is customary to take only colimits of systems over $I$ and only limits of inverse systems over $I$. More precisely: Given a system $\left(M_{i}, f_{i i^{\prime}}\right)$ over $I$ the colimit of the system $\left(M_{i}, f_{i i^{\prime}}\right)$ is defined as

$$
\operatorname{colim}_{i \in I} M_{i}=\operatorname{colim}_{\mathcal{I}} M
$$

i.e., as the colimit of the corresponding diagram. Given a inverse system $\left(M_{i}, f_{i i^{\prime}}\right)$ over $I$ the limit of the inverse system $\left(M_{i}, f_{i i^{\prime}}\right)$ is defined as

$$
\lim _{i \in I} M_{i}=\lim _{\mathcal{I}^{o p p}} M
$$

i.e., as the limit of the corresponding diagram.

0031 Definition 4.21.2. With notation as above. We say the system (resp. inverse system) $\left(M_{i}, f_{i i^{\prime}}\right)$ is a directed system (resp. directed inverse system) if the partially ordered set $I$ is directed: $I$ is nonempty and for all $i_{1}, i_{2} \in I$ there exists $i \in I$ such that $i_{1} \leq i$ and $i_{2} \leq i$.

In this case the colimit is sometimes (unfortunately) called the "direct limit". We will not use this last terminology. It turns out that diagrams over a filtered category are no more general than directed systems in the following sense.

0032 Lemma 4.21.3. Let $\mathcal{I}$ be a filtered index category. There exists a directed partially ordered set $(I, \geq)$ and a system $\left(x_{i}, \varphi_{i i^{\prime}}\right)$ over $I$ in $\mathcal{I}$ with the following properties:
(1) For every category $\mathcal{C}$ and every diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ with values in $\mathcal{C}$, denote $\left(M\left(x_{i}\right), M\left(\varphi_{i i^{\prime}}\right)\right)$ the corresponding system over I. If $\operatorname{colim}_{i \in I} M\left(x_{i}\right)$ exists then so does $\operatorname{colim}_{\mathcal{I}} M$ and the transformation

$$
\theta: \operatorname{colim}_{i \in I} M\left(x_{i}\right) \longrightarrow \operatorname{colim}_{\mathcal{I}} M
$$

of Lemma 4.14.7 is an isomorphism.
(2) For every category $\mathcal{C}$ and every diagram $M: \mathcal{I}^{\text {opp }} \rightarrow \mathcal{C}$ in $\mathcal{C}$, denote $\left(M\left(x_{i}\right), M\left(\varphi_{i i^{\prime}}\right)\right)$ the corresponding inverse system over I. If $\lim _{i \in I} M\left(x_{i}\right)$ exists then so does $\lim _{\mathcal{I}} M$ and the transformation

$$
\theta: \lim _{\mathcal{I}^{\text {opp }}} M \longrightarrow \lim _{i \in I} M\left(x_{i}\right)
$$

of Lemma 4.14.8 is an isomorphism.
Proof. As mentioned in the beginning of the section, we may view partially ordered sets as categories and systems as functors. Throughout the proof, we will freely shift between these two points of view. We prove the first statement by constructing a category $\mathcal{I}_{0}$, corresponding to a directed set, and a cofinal functor $M_{0}: \mathcal{I}_{0} \rightarrow \mathcal{I}$. Then, by Lemma 4.17.2, the colimit of a diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ coincides with the colimit of the diagram $M \circ M_{0} \mid \mathcal{I}_{0} \rightarrow \mathcal{C}$, from which the statement follows. The second statement is dual to the first and may be proved by interpreting a limit in $\mathcal{C}$ as a colimit in $\mathcal{C}^{o p p}$. We omit the details.

A category $\mathcal{F}$ is called finitely generated if there exists a finite set $F$ of arrows in $\mathcal{F}$, such that each arrow in $\mathcal{F}$ may be obtained by composing arrows from $F$. In particular, this implies that $\mathcal{F}$ has finitely many objects. We start the proof by reducing to the case when $\mathcal{I}$ has the property that every finitely generated
subcategory of $\mathcal{I}$ may be extended to a finitely generated subcategory with a unique final object.
Let $\omega$ denote the directed set of finite ordinals, which we view as a filtered category. It is easy to verify that the product category $\mathcal{I} \times \omega$ is also filtered, and the projection $\Pi: \mathcal{I} \times \omega \rightarrow \mathcal{I}$ is cofinal.

Now let $\mathcal{F}$ be any finitely generated subcategory of $\mathcal{I} \times \omega$. By using the axioms of a filtered category and a simple induction argument on a finite set of generators of $\mathcal{F}$, we may construct a cocone $\left(\left\{f_{i}\right\}, i_{\infty}\right)$ in $\mathcal{I}$ for the diagram $\mathcal{F} \rightarrow \mathcal{I}$. That is, a morphism $f_{i}: i \rightarrow i_{\infty}$ for every object $i$ in $\mathcal{F}$ such that for each arrow $f: i \rightarrow i^{\prime}$ in $\mathcal{F}$ we have $f_{i}=f \circ f_{i^{\prime}}$. We can also choose $i_{\infty}$ such that there are no arrows from $i_{\infty}$ to an object in $\mathcal{F}$. This is possible since we may always post-compose the arrows $f_{i}$ with an arrow which is the identity on the $\mathcal{I}$-component and strictly increasing on the $\omega$-component. Now let $\mathcal{F}^{+}$denote the category consisting of all objects and arrows in $\mathcal{F}$ together with the object $i_{\infty}$, the identity arrow $\operatorname{id}_{i_{\infty}}$ and the arrows $f_{i}$. Since there are no arrows from $i_{\infty}$ in $\mathcal{F}^{+}$to any object of $\mathcal{F}$, the arrow set in $\mathcal{F}^{+}$is closed under composition, so $\mathcal{F}^{+}$is indeed a category. By construction, it is a finitely generated subcategory of $\mathcal{I}$ which has $i_{\infty}$ as unique final object. Since, by Lemma 4.17.2, the colimit of any diagram $M: \mathcal{I} \rightarrow \mathcal{C}$ coincides with the colimit of $M \circ \Pi$, this gives the desired reduction.

The set of all finitely generated subcategories of $\mathcal{I}$ with a unique final object is naturally ordered by inclusion. We take $\mathcal{I}_{0}$ to be the category corresponding to this set. We also have a functor $M_{0}: \mathcal{I}_{0} \rightarrow \mathcal{I}$, which takes an arrow $\mathcal{F} \subset \mathcal{F}^{\prime}$ in $\mathcal{I}_{0}$ to the unique map from the final object of $\mathcal{F}$ to the final object of $\mathcal{F}^{\prime}$. Given any two finitely generated subcategories of $\mathcal{I}$, the category generated by these two categories is also finitely generated. By our assumption on $\mathcal{I}$, it is also contained in a finitely generated subcategory of $\mathcal{I}$ with a unique final object. This shows that $\mathcal{I}_{0}$ is directed.

Finally, we verify that $M_{0}$ is cofinal. Since any object of $\mathcal{I}$ is the final object in the subcategory consisting of only that object and its identity arrow, the functor $M_{0}$ is surjective on objects. In particular, Condition (1) of Definition 4.17.1 is satisfied. Given an object $i$ of $\mathcal{I}, \mathcal{F}_{1}, \mathcal{F}_{2}$ in $\mathcal{I}_{0}$ and maps $\varphi_{1}: i \rightarrow M_{0}\left(\mathcal{F}_{1}\right)$ and $\varphi_{2}: i \rightarrow M_{0}\left(\mathcal{F}_{2}\right)$ in $\mathcal{I}$, we can take $\mathcal{F}_{12}$ to be a finitely generated category with a unique final object containing $\mathcal{F}_{1}, \mathcal{F}_{2}$ and the morphisms $\varphi_{1}, \varphi_{2}$. The resulting diagram commutes

since it lives in the category $\mathcal{F}_{12}$ and $M_{0}\left(\mathcal{F}_{12}\right)$ is final in this category. Hence also Condition (2) is satisfied, which concludes the proof.

09P8 Remark 4.21.4. Note that a finite directed set $(I, \geq)$ always has a greatest object $i_{\infty}$. Hence any colimit of a system $\left(M_{i}, f_{i i^{\prime}}\right)$ over such a set is trivial in the sense
that the colimit equals $M_{i_{\infty}}$. In contrast, a colimit indexed by a finite filtered category need not be trival. For instance, let $\mathcal{I}$ be the category with a single object $i$ and a single non-trivial morphism $e$ satisfying $e=e \circ e$. The colimit of a diagram $M: \mathcal{I} \rightarrow$ Sets is the image of the idempotent $M(e)$. This illustrates that something like the trick of passing to $\mathcal{I} \times \omega$ in the proof of Lemma 4.21 .3 is essential.

086J Lemma 4.21.5. If $S: \mathcal{I} \rightarrow$ Sets is a cofiltered diagram of sets and all the $S_{i}$ are finite nonempty, then $\lim _{i} S_{i}$ is nonempty. In other words, the limit of a directed inverse system of finite nonempty sets is nonempty.

Proof. The two statements are equivalent by Lemma 4.21.3. Let $I$ be a directed partially ordered set and let $\left(S_{i}\right)_{i \in I}$ be an inverse system of finite nonempty sets over $I$. Let us say that a subsystem $T$ is a family $T=\left(T_{i}\right)_{i \in I}$ of nonempty subsets $T_{i} \subset S_{i}$ such that $T_{i^{\prime}}$ is mapped into $T_{i}$ by the transition map $S_{i^{\prime}} \rightarrow S_{i}$ for all $i^{\prime} \geq i$. Denote $\mathcal{T}$ the set of subsystems. We order $\mathcal{T}$ by inclusion. Suppose $T_{\alpha}$, $\alpha \in A$ is a totally ordered family of elements of $\mathcal{T}$. Say $T_{\alpha}=\left(T_{\alpha, i}\right)_{i \in I}$. Then we can find a lower bound $T=\left(T_{i}\right)_{i \in I}$ by setting $T_{i}=\bigcap_{\alpha \in A} T_{\alpha, i}$ which is manifestly a finite nonempty subset of $S_{i}$ as all the $T_{\alpha, i}$ are nonempty and as the $T_{\alpha}$ form a totally ordered family. Thus we may apply Zorn's lemma to see that $\mathcal{T}$ has minimal elements.

Let's analyze what a minimal element $T \in \mathcal{T}$ looks like. First observe that the maps $T_{i^{\prime}} \rightarrow T_{i}$ are all surjective. Namely, as $I$ is a directed partially ordered set and $T_{i}$ is finite, the intersection $T_{i}^{\prime}=\bigcap_{i^{\prime} \geq i} \operatorname{Im}\left(T_{i^{\prime}} \rightarrow T_{i}\right)$ is nonempty. Thus $T^{\prime}=\left(T_{i}^{\prime}\right)$ is a subsystem contained in $T$ and by minimality $T^{\prime}=T$. Finally, we claim that $T_{i}$ is a singleton for each $i$. Namely, if $x \in T_{i}$, then we can define $T_{i^{\prime}}^{\prime}=\left(T_{i^{\prime}} \rightarrow T_{i}\right)^{-1}(\{x\})$ for $i^{\prime} \geq i$ and $T_{j}^{\prime}=T_{j}$ if $j \nsupseteq i$. This is another subsystem as we’ve seen above that the transition maps of the subsystem $T$ are surjective. By minimality we see that $T=T^{\prime}$ which indeed implies that $T_{i}$ is a singleton. This holds for every $i \in I$, hence we see that $T_{i}=\left\{x_{i}\right\}$ for some $x_{i} \in S_{i}$ with $x_{i^{\prime}} \mapsto x_{i}$ under the map $S_{i^{\prime}} \rightarrow S_{i}$ for every $i^{\prime} \geq i$. In other words, $\left(x_{i}\right) \in \lim S_{i}$ and the lemma is proved.

### 4.22. Essentially constant systems

05 PT Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram in a category $\mathcal{C}$. Assume the index category $\mathcal{I}$ is filtered. In this case there are three successively stronger notions which pick out an object $X$ of $\mathcal{C}$. The first is just

$$
X=\operatorname{colim}_{i \in \mathcal{I}} M_{i} .
$$

Then $X$ comes equipped with the coprojections $M_{i} \rightarrow X$. A stronger condition would be to require that $X$ is the colimit and that there exists an $i \in \mathcal{I}$ and a morphism $X \rightarrow M_{i}$ such that the composition $X \rightarrow M_{i} \rightarrow X$ is $\mathrm{id}_{X}$. A stronger condition is the following.

05PU Definition 4.22.1. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram in a category $\mathcal{C}$.
(1) Assume the index category $\mathcal{I}$ is filtered. We say $M$ is essentially constant with value $X$ if $X=\operatorname{colim}_{i} M_{i}$ and there exists an $i \in \mathcal{I}$ and a morphism $X \rightarrow M_{i}$ such that
(a) $X \rightarrow M_{i} \rightarrow X$ is $\operatorname{id}_{X}$, and
(b) for all $j$ there exist $k$ and morphisms $i \rightarrow k$ and $j \rightarrow k$ such that the morphism $M_{j} \rightarrow M_{k}$ equals the composition $M_{j} \rightarrow X \rightarrow M_{i} \rightarrow M_{k}$.
(2) Assume the index category $\mathcal{I}$ is cofiltered. We say $M$ is essentially constant with value $X$ if $X=\lim _{i} M_{i}$ and there exists an $i \in \mathcal{I}$ and a morphism $M_{i} \rightarrow X$ such that
(a) $X \rightarrow M_{i} \rightarrow X$ is $\operatorname{id}_{X}$, and
(b) for all $j$ there exist $k$ and morphisms $k \rightarrow i$ and $k \rightarrow j$ such that the morphism $M_{k} \rightarrow M_{j}$ equals the composition $M_{k} \rightarrow M_{i} \rightarrow X \rightarrow M_{j}$.
Which of the two versions is meant will be clear from context. If there is any confusion we will distinguish between these by saying that the first version means $M$ is essentially constant as an ind-object, and in the second case we will say it is essentially constant as a pro-object. This terminology is further explained in Remarks 4.22 .3 and 4.22 .4 In fact we will often use the terminology "essentially constant system" which formally speaking is only defined for systems over directed partially ordered sets.

05PV Definition 4.22.2. Let $\mathcal{C}$ be a category. A directed system $\left(M_{i}, f_{i i^{\prime}}\right)$ is an essentially constant system if $M$ viewed as a functor $I \rightarrow \mathcal{C}$ defines an essentially constant diagram. A directed inverse system $\left(M_{i}, f_{i i^{\prime}}\right)$ is an essentially constant inverse system if $M$ viewed as a functor $I^{o p p} \rightarrow \mathcal{C}$ defines an essentially constant inverse diagram.
If $\left(M_{i}, f_{i i^{\prime}}\right)$ is an essentially constant system and the morphisms $f_{i i^{\prime}}$ are monomorphisms, then for all $i \leq i^{\prime}$ sufficiently large the morphisms $f_{i i^{\prime}}$ are isomorphisms. In general this need not be the case however. An example is the system

$$
\mathbf{Z}^{2} \rightarrow \mathbf{Z}^{2} \rightarrow \mathbf{Z}^{2} \rightarrow \ldots
$$

with maps given by $(a, b) \mapsto(a+b, 0)$. This system is essentially constant with value $\mathbf{Z}$. A non-example is to let $M=\bigoplus_{n \geq 0} \mathbf{Z}$ and to let $S: M \rightarrow M$ be the shift operator $\left(a_{0}, a_{1}, \ldots\right) \mapsto\left(a_{1}, a_{2}, \ldots\right)$. In this case the system $M \rightarrow M \rightarrow M \rightarrow \ldots$ with transition maps $S$ has colimit 0 and the composition $0 \rightarrow M \rightarrow 0$ is the identity, but the system is not essentially constant.

05PW Remark 4.22.3. Let $\mathcal{C}$ be a category. There exists a big category Ind- $\mathcal{C}$ of indobjects of $\mathcal{C}$. Namely, if $F: \mathcal{I} \rightarrow \mathcal{C}$ and $G: \mathcal{J} \rightarrow \mathcal{C}$ are filtered diagrams in $\mathcal{C}$, then we can define

$$
\operatorname{Mor}_{\operatorname{Ind}-\mathcal{C}}(F, G)=\lim _{i} \operatorname{colim}_{j} \operatorname{Mor}_{\mathcal{C}}(F(i), G(j))
$$

There is a canonical functor $\mathcal{C} \rightarrow$ Ind- $\mathcal{C}$ which maps $X$ to the constant system on $X$. This is a fully faithful embedding. In this language one sees that a diagram $F$ is essentially constant if and only $F$ is isomorphic to a constant system. If we ever need this material, then we will formulate this into a lemma and prove it here.

05PX Remark 4.22.4. Let $\mathcal{C}$ be a category. There exists a big category Pro-C of proobjects of $\mathcal{C}$. Namely, if $F: \mathcal{I} \rightarrow \mathcal{C}$ and $G: \mathcal{J} \rightarrow \mathcal{C}$ are cofiltered diagrams in $\mathcal{C}$, then we can define

$$
\operatorname{Mor}_{\operatorname{Pro-C}}(F, G)=\lim _{j} \operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}(F(i), G(j))
$$

There is a canonical functor $\mathcal{C} \rightarrow$ Pro- $\mathcal{C}$ which maps $X$ to the constant system on $X$. This is a fully faithful embedding. In this language one sees that a diagram $F$ is essentially constant if and only $F$ is isomorphic to a constant system. If we ever need this material, then we will formulate this into a lemma and prove it here.

05SH Lemma 4.22.5. Let $\mathcal{C}$ be a category. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram with filtered (resp. cofiltered) index category $\mathcal{I}$. Let $F: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. If $M$ is essentially constant as an ind-object (resp. pro-object), then so is $F \circ M: \mathcal{I} \rightarrow \mathcal{D}$.

Proof. If $X$ is a value for $M$, then it follows immediately from the definition that $F(X)$ is a value for $F \circ M$.

05PY Lemma 4.22.6. Let $\mathcal{C}$ be a category. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram with filtered index category $\mathcal{I}$. The following are equivalent
(1) $M$ is an essentially constant ind-object, and
(2) $X=\operatorname{colim}_{i} M_{i}$ exists and for any $W$ in $\mathcal{C}$ the map

$$
\operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(W, M_{i}\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(W, X)
$$

is bijective.
Proof. Assume (2) holds. Then $\operatorname{id}_{X} \in \operatorname{Mor}_{\mathcal{C}}(X, X)$ comes from a morphism $X \rightarrow$ $M_{i}$ for some $i$, i.e., $X \rightarrow M_{i} \rightarrow X$ is the identity. Then both maps

$$
\operatorname{Mor}_{\mathcal{C}}(W, X) \longrightarrow \operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(W, M_{i}\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(W, X)
$$

are bijective for all $W$ where the first one is induced by the morphism $X \rightarrow M_{i}$ we found above, and the composition is the identity. This means that the composition

$$
\operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(W, M_{i}\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(W, X) \longrightarrow \operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(W, M_{i}\right)
$$

is the identity too. Setting $W=M_{j}$ and starting with $\operatorname{id}_{M_{j}}$ in the colimit, we see that $M_{j} \rightarrow X \rightarrow M_{i} \rightarrow M_{k}$ is equal to $M_{j} \rightarrow M_{k}$ for some $k$ large enough. This proves (1) holds. The proof of $(1) \Rightarrow(2)$ is omitted.

05PZ Lemma 4.22.7. Let $\mathcal{C}$ be a category. Let $M: \mathcal{I} \rightarrow \mathcal{C}$ be a diagram with cofiltered index category $\mathcal{I}$. The following are equivalent
(1) $M$ is an essentially constant pro-object, and
(2) $X=\lim _{i} M_{i}$ exists and for any $W$ in $\mathcal{C}$ the map

$$
\operatorname{colim}_{i \in \mathcal{I}^{\circ p p}} \operatorname{Mor}_{\mathcal{C}}\left(M_{i}, W\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, W)
$$

is bijective.
Proof. Assume (2) holds. Then $\operatorname{id}_{X} \in \operatorname{Mor}_{\mathcal{C}}(X, X)$ comes from a morphism $M_{i} \rightarrow$ $X$ for some $i$, i.e., $X \rightarrow M_{i} \rightarrow X$ is the identity. Then both maps

$$
\operatorname{Mor}_{\mathcal{C}}(X, W) \longrightarrow \operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(M_{i}, W\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, W)
$$

are bijective for all $W$ where the first one is induced by the morphism $M_{i} \rightarrow X$ we found above, and the composition is the identity. This means that the composition

$$
\operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(M_{i}, W\right) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, W) \longrightarrow \operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(M_{i}, W\right)
$$

is the identity too. Setting $W=M_{j}$ and starting with $\operatorname{id}_{M_{j}}$ in the colimit, we see that $M_{k} \rightarrow M_{i} \rightarrow X \rightarrow M_{j}$ is equal to $M_{k} \rightarrow M_{j}$ for some $k$ large enough. This proves (1) holds. The proof of $(1) \Rightarrow(2)$ is omitted.

0A1S Lemma 4.22.8. Let $\mathcal{C}$ be a category. Let $H: \mathcal{I} \rightarrow \mathcal{J}$ be a functor of filtered index categories. If $H$ is cofinal, then any diagram $M: \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant if and only if $M \circ H$ is essentially constant.

Proof. This follows formally from Lemmas 4.22.6 and 4.17.2.

0A2C Lemma 4.22.9. Let $\mathcal{I}$ and $\mathcal{J}$ be filtered categories and denote $p: \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{J}$ the projection. Then $\mathcal{I} \times \mathcal{J}$ is filtered and a diagram $M: \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant if and only if $M \circ p: \mathcal{I} \times \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant.

Proof. We omit the verification that $\mathcal{I} \times \mathcal{J}$ is filtered. The equivalence follows from Lemma 4.22.8 because $p$ is cofinal (verification omitted).

0A1T Lemma 4.22.10. Let $\mathcal{C}$ be a category. Let $H: \mathcal{I} \rightarrow \mathcal{J}$ be a functor of cofiltered index categories. If $H$ is initial, then any diagram $M: \mathcal{J} \rightarrow \mathcal{C}$ is essentially constant if and only if $M \circ H$ is essentially constant.

Proof. This follows formally from Lemmas 4.22.7, 4.17.4, 4.17.2, and the fact that if $\mathcal{I}$ is initial in $\mathcal{J}$, then $\mathcal{I}^{\text {opp }}$ is cofinal in $\mathcal{J}^{\text {opp }}$.

### 4.23. Exact functors

0033
0034 Definition 4.23.1. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a functor.
(1) Suppose all finite limits exist in $\mathcal{A}$. We say $F$ is left exact if it commutes with all finite limits.
(2) Suppose all finite colimits exist in $\mathcal{A}$. We say $F$ is right exact if it commutes with all finite colimits.
(3) We say $F$ is exact if it is both left and right exact.

0035 Lemma 4.23.2. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ be a functor. Suppose all finite limits exist in $\mathcal{A}$, see Lemma 4.18.4. The following are equivalent:
(1) $F$ is left exact,
(2) $F$ commutes with finite products and equalizers, and
(3) $F$ transforms a final object of $\mathcal{A}$ into a final object of $\mathcal{B}$, and commutes with fibre products.

Proof. Lemma 4.14 .10 shows that (2) implies (1). Suppose (3) holds. The fibre product over the final object is the product. If $a, b: A \rightarrow B$ are morphisms of $\mathcal{A}$, then the equalizer of $a, b$ is

$$
\left(A \times_{a, B, b} A\right) \times\left(p r_{1}, p r_{2}\right), A \times A, \Delta A .
$$

Thus (3) implies (2). Finally (1) implies (3) because the empty limit is a final object, and fibre products are limits.

### 4.24. Adjoint functors

0036
0037
Definition 4.24.1. Let $\mathcal{C}, \mathcal{D}$ be categories. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ and $v: \mathcal{D} \rightarrow \mathcal{C}$ be functors. We say that $u$ is a left adjoint of $v$, or that $v$ is a right adjoint to $u$ if there are bijections

$$
\operatorname{Mor}_{\mathcal{D}}(u(X), Y) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(X, v(Y))
$$

functorial in $X \in \operatorname{Ob}(\mathcal{C})$, and $Y \in \operatorname{Ob}(\mathcal{D})$.

In other words, this means that there is a given isomorphism of functors $\mathcal{C}^{\text {opp }} \times \mathcal{D} \rightarrow$ Sets from $\operatorname{Mor}_{\mathcal{D}}(u(-),-)$ to $\operatorname{Mor}_{\mathcal{C}}(-, v(-))$. For any object $X$ of $\mathcal{C}$ we obtain a morphism $X \rightarrow v(u(X))$ corresponding to $\operatorname{id}_{u(X)}$. Similarly, for any object $Y$ of $\mathcal{D}$ we obtain a morphism $u(v(Y)) \rightarrow Y$ corresponding to $\mathrm{id}_{v(Y)}$. These maps are called the adjunction maps. The adjunction maps are functorial in $X$ and $Y$, hence we obtain morphisms of functors

$$
\operatorname{id}_{\mathcal{C}} \rightarrow v \circ u \quad \text { (unit) } \quad \text { and } \quad u \circ v \rightarrow \operatorname{id}_{\mathcal{D}} \quad \text { (counit). }
$$

Moreover, if $\alpha: u(X) \rightarrow Y$ and $\beta: X \rightarrow v(Y)$ are morphisms, then the following are equivalent
(1) $\alpha$ and $\beta$ correspond to each other via the bijection of the definition,
(2) $\beta$ is the composition $X \rightarrow v(u(X)) \xrightarrow{v(\alpha)} v(Y)$, and
(3) $\alpha$ is the composition $u(X) \xrightarrow{u(\beta)} u(v(Y)) \rightarrow Y$.

In this way one can reformulate the notion of adjoint functors in terms of adjunction maps.

0A8B Lemma 4.24.2. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. If for each $y \in \operatorname{Ob}(\mathcal{D})$ the functor $x \mapsto \operatorname{Mor}_{\mathcal{D}}(u(x), y)$ is representable, then $u$ has a right adjoint.

Proof. For each $y$ choose an object $v(y)$ and an isomorphism $\operatorname{Mor}_{\mathcal{C}}(-, v(y)) \rightarrow$ Mor $_{\mathcal{D}}(u(-), y)$ of functors. By Yoneda's lemma (Lemma 4.3.5) for any morphism $g: y \rightarrow y^{\prime}$ the transformation of functors

$$
\operatorname{Mor}_{\mathcal{C}}(-, v(y)) \rightarrow \operatorname{Mor}_{\mathcal{D}}(u(-), y) \rightarrow \operatorname{Mor}_{\mathcal{D}}\left(u(-), y^{\prime}\right) \rightarrow \operatorname{Mor}_{\mathcal{C}}\left(-, v\left(y^{\prime}\right)\right)
$$

corresponds to a unique morphism $v(g): v(y) \rightarrow v\left(y^{\prime}\right)$. We omit the verification that $v$ is a functor and that it is right adjoint to $u$.

07RB Lemma 4.24.3. Let $u$ be a left adjoint to $v$ as in Definition 4.24.1. Then
(1) $u$ is fully faithful $\Leftrightarrow i d \cong v \circ u$.
(2) $v$ is fully faithful $\Leftrightarrow u \circ v \cong i d$.

Proof. Assume $u$ is fully faithful. We have to show the adjunction map $X \rightarrow$ $v(u(X))$ is an isomorphism. Let $X^{\prime} \rightarrow v(u(X))$ be any morphism. By adjointness this corresponds to a morphism $u\left(X^{\prime}\right) \rightarrow u(X)$. By fully faithfulness of $u$ this corresponds to a morphism $X^{\prime} \rightarrow X$. Thus we see that $X \rightarrow v(u(X))$ defines a bijection $\operatorname{Mor}\left(X^{\prime}, X\right) \rightarrow \operatorname{Mor}\left(X^{\prime}, v(u(X))\right)$. Hence it is an isomorphism. Conversely, if id $\cong v \circ u$ then $u$ has to be fully faithful, as $v$ defines an inverse on morphism sets.

Part (2) is dual to part (1).
0038 Lemma 4.24.4. Let $u$ be a left adjoint to $v$ as in Definition 4.24.1.
(1) Suppose that $M: \mathcal{I} \rightarrow \mathcal{C}$ is a diagram, and suppose that $\operatorname{colim}_{\mathcal{I}} M$ exists in $\mathcal{C}$. Then $u\left(\operatorname{colim}_{\mathcal{I}} M\right)=\operatorname{colim}_{\mathcal{I}} u \circ M$. In other words, $u$ commutes with (representable) colimits.
(2) Suppose that $M: \mathcal{I} \rightarrow \mathcal{D}$ is a diagram, and suppose that $\lim _{\mathcal{I}} M$ exists in $\mathcal{D}$. Then $v\left(\lim _{\mathcal{I}} M\right)=\lim _{\mathcal{I}} v \circ M$. In other words $v$ commutes with representable limits.

Proof. A morphism from a colimit into an object is the same as a compatible system of morphisms from the constituents of the limit into the object, see Remark 4.14.4 So

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{D}}\left(u\left(\operatorname{colim}_{i \in \mathcal{I}} M_{i}\right), Y\right) & =\operatorname{Mor}_{\mathcal{C}}\left(\operatorname{colim}_{i \in \mathcal{I}} M_{i}, v(Y)\right) \\
& =\lim _{i \in \mathcal{I}^{\text {opp }}} \operatorname{Mor}_{\mathcal{C}}\left(M_{i}, v(Y)\right) \\
& =\lim _{i \in \mathcal{I}^{\text {opp }}} \operatorname{Mor}_{\mathcal{D}}\left(u\left(M_{i}\right), Y\right)
\end{aligned}
$$

proves that $u\left(\operatorname{colim}_{i \in \mathcal{I}} M_{i}\right)$ is the colimit we are looking for. A similar argument works for the other statement.

0039 Lemma 4.24.5. Let $u$ be a left adjoint of $v$ as in Definition 4.24.1.
(1) If $\mathcal{C}$ has finite colimits, then $u$ is right exact.
(2) If $\mathcal{D}$ has finite limits, then $v$ is left exact.

Proof. Obvious from the definitions and Lemma 4.24.4
0B65 Lemma 4.24.6. Let $u_{1}, u_{2}: \mathcal{C} \rightarrow \mathcal{D}$ be functors with right adjoints $v_{1}, v_{2}: \mathcal{D} \rightarrow$ $\mathcal{C}$. Let $\beta: u_{2} \rightarrow u_{1}$ be a transformation of functors. Let $\beta^{\vee}: v_{1} \rightarrow v_{2}$ be the corresponding transformation of adjoint functors. Then

is commutative where the unlabeled arrows are the counit transformations.
Proof. This is true because $\beta_{D}^{\vee}: v_{1} D \rightarrow v_{2} D$ is the unique morphism such that the induced maps $\operatorname{Mor}\left(C, v_{1} D\right) \rightarrow \operatorname{Mor}\left(C, v_{2} D\right)$ is the map $\operatorname{Mor}\left(u_{1} C, D\right) \rightarrow$ $\operatorname{Mor}\left(u_{2} C, D\right)$ induced by $\beta_{C}: u_{2} C \rightarrow u_{1} C$. Namely, this means the map

$$
\operatorname{Mor}\left(u_{1} v_{1} D, D^{\prime}\right) \rightarrow \operatorname{Mor}\left(u_{2} v_{1} D, D^{\prime}\right)
$$

induced by $\beta_{v_{1} D}$ is the same as the map

$$
\operatorname{Mor}\left(v_{1} D, v_{1} D^{\prime}\right) \rightarrow \operatorname{Mor}\left(v_{1} D, v_{2} D^{\prime}\right)
$$

induced by $\beta_{D^{\prime}}^{\vee}$. Taking $D^{\prime}=D$ we find that the counit $u_{1} v_{1} D \rightarrow D$ precomposed by $\beta_{v_{1} D}$ corresponds to $\beta_{D}^{\vee}$ under adjunction. This exactly means that the diagram commutes when evaluated on $D$.

### 4.25. A criterion for representability

OAHM The following lemma is often useful to prove the existence of universal objects in big categories, please see the discussion in Remark 4.25.2.

0AHN Lemma 4.25.1. Let $\mathcal{C}$ be a big2 ${ }^{2}$ category which has limits. Let $F: \mathcal{C} \rightarrow$ Sets be $a$ functor. Assume that
(1) $F$ commutes with limits,
(2) there exists a family $\left\{x_{i}\right\}_{i \in I}$ of objects of $\mathcal{C}$ and for each $i \in I$ an element $f_{i} \in F\left(x_{i}\right)$ such that for $y \in \operatorname{Ob}(\mathcal{C})$ and $g \in F(y)$ there exists an $i$ and $a$ morphism $\varphi: x_{i} \rightarrow y$ with $F(\varphi)\left(f_{i}\right)=g$.

[^2]Then $F$ is representable, i.e., there exists an object $x$ of $\mathcal{C}$ such that

$$
F(y)=\operatorname{Mor}_{\mathcal{C}}(x, y)
$$

functorially in $y$.
Proof. Let $\mathcal{I}$ be the category whose objects are the pairs $\left(x_{i}, f_{i}\right)$ and whose morphisms $\left(x_{i}, f_{i}\right) \rightarrow\left(x_{i^{\prime}}, f_{i^{\prime}}\right)$ are maps $\varphi: x_{i} \rightarrow x_{i^{\prime}}$ in $\mathcal{C}$ such that $F(\varphi)\left(f_{i}\right)=f_{i^{\prime}}$. Set

$$
x=\lim _{\left(x_{i}, f_{i}\right) \in \mathcal{I}} x_{i}
$$

(this will not be the $x$ we are looking for, see below). The limit exists by assumption. As $F$ commutes with limits we have

$$
F(x)=\lim _{\left(x_{i}, f_{i}\right) \in \mathcal{I}} F\left(x_{i}\right) .
$$

Hence there is a universal element $f \in F(x)$ which maps to $f_{i} \in F\left(x_{i}\right)$ under $F$ applied to the projection map $x \rightarrow x_{i}$. Using $f$ we obtain a transformation of functors

$$
\xi: \operatorname{Mor}_{\mathcal{C}}(x,-) \longrightarrow F(-)
$$

see Section 4.3. Let $y$ be an arbitrary object of $\mathcal{C}$ and let $g \in F(y)$. Choose $x_{i} \rightarrow y$ such that $f_{i}$ maps to $g$ which is possible by assumption. Then $F$ applied to the maps

$$
x \longrightarrow x_{i} \longrightarrow y
$$

(the first being the projection map of the limit defining $x$ ) sends $f$ to $g$. Hence the transformation $\xi$ is surjective.

In order to find the object representing $F$ we let $e: x^{\prime} \rightarrow x$ be the equalizer of all self maps $\varphi: x \rightarrow x$ with $F(\varphi)(f)=f$. Since $F$ commutes with limits, it commutes with equalizers, and we see there exists an $f^{\prime} \in F\left(x^{\prime}\right)$ mapping to $f$ in $F(x)$. Since $\xi$ is surjective and since $f^{\prime}$ maps to $f$ we see that also $\xi^{\prime}: \operatorname{Mor}_{\mathcal{C}}\left(x^{\prime},-\right) \rightarrow F(-)$ is surjective. Finally, suppose that $a, b: x^{\prime} \rightarrow y$ are two maps such that $F(a)(f)=$ $F(b)(f)$. We have to show $a=b$. Consider the equalizer $e^{\prime}: x^{\prime \prime} \rightarrow x^{\prime}$. Again we find $f^{\prime \prime} \in F\left(x^{\prime \prime}\right)$ mapping to $f^{\prime}$. Choose a map $\psi: x \rightarrow x^{\prime \prime}$ such that $F(\psi)(f)=f^{\prime \prime}$. Then we see that $e \circ e^{\prime} \circ \psi: x \rightarrow x$ is a morphism with $F\left(e \circ e^{\prime} \circ \psi\right)(f)=f$. Hence $e \circ e^{\prime} \circ \psi \circ e=e$. This means that $e: x^{\prime} \rightarrow x$ factors through $e^{\prime} \circ e: x^{\prime \prime} \rightarrow x$ and since $e$ and $e^{\prime}$ are monomorphisms this implies $x^{\prime \prime}=x^{\prime}$, i.e., $a=b$ as desired.

0AHP Remark 4.25.2. The lemma above is often used to construct the free something on something. For example the free abelian group on a set, the free group on a set, etc. The idea, say in the case of the free group on a set $E$ is to consider the functor

$$
F: \text { Groups } \rightarrow \text { Sets, } \quad G \longmapsto \operatorname{Map}(E, G)
$$

This functor commutes with limits. As our family of objects we can take a family $E \rightarrow G_{i}$ consisting of groups $G_{i}$ of cardinality at most $\max \left(\aleph_{0},|E|\right)$ and set maps $E \rightarrow G_{i}$ such that every isomorphism class of such a structure occurs at least once. Namely, if $E \rightarrow G$ is a map from $E$ to a group $G$, then the subgroup $G^{\prime}$ generated by the image has cardinality at most $\max \left(\aleph_{0},|E|\right)$. The lemma tells us the functor is representable, hence there exists a group $F_{E}$ such that $\operatorname{Mor}_{G r o u p s}\left(F_{E}, G\right)=$ $\operatorname{Map}(E, G)$. In particular, the identity morphism of $F_{E}$ corresponds to a map $E \rightarrow F_{E}$ and one can show that $F_{E}$ is generated by the image without imposing any relations.

Another typical application is that we can use the lemma to construct colimits once it is known that limits exist. We illustrate it using the category of topological spaces which has limits by Topology, Lemma 5.13.1. Namely, suppose that $\mathcal{I} \rightarrow$ Top, $i \mapsto X_{i}$ is a functor. Then we can consider

$$
F: \text { Top } \longrightarrow \text { Sets, } \quad Y \longmapsto \lim _{\mathcal{I}} \operatorname{Mor}_{T o p}\left(X_{i}, Y\right)
$$

This functor commutes with limits. Moreover, given any topological space $Y$ and an element $\left(\varphi_{i}: X_{i} \rightarrow Y\right)$ of $F(Y)$, there is a subspace $Y^{\prime} \subset Y$ of cardinality at most $\left|\amalg X_{i}\right|$ such that the morphisms $\varphi_{i}$ map into $Y^{\prime}$. Namely, we can take the induced topology on the union of the images of the $\varphi_{i}$. Thus it is clear that the hypotheses of the lemma are satisfied and we find a topological space $X$ representing the functor $F$, which precisely means that $X$ is the colimit of the diagram $i \mapsto X_{i}$.

0AHQ Theorem 4.25.3 (Adjoint functor theorem). Let $G: \mathcal{C} \rightarrow \mathcal{D}$ be a functor of big categories. Assume $\mathcal{C}$ has limits, $G$ commutes with them, and for every object $y$ of $\mathcal{D}$ there exists a set of pairs $\left(x_{i}, f_{i}\right)_{i \in I}$ with $x_{i} \in \operatorname{Ob}(\mathcal{C}), f_{i} \in \operatorname{Mor}_{\mathcal{D}}\left(y, G\left(x_{i}\right)\right)$ such that for any pair $(x, f)$ with $x \in \operatorname{Ob}(\mathcal{C}), f \in \operatorname{Mor}_{\mathcal{C}}(y, G(x))$ there is an $i$ and a morphism $h: x_{i} \rightarrow x$ such that $f=G(h) \circ f_{i}$. Then $G$ has a left adjoint $F$.

Proof. The assumptions imply that for every object $y$ of $\mathcal{D}$ the functor $x \mapsto$ Mor $_{\mathcal{D}}(y, G(x))$ satisfies the assumptions of Lemma 4.25.1. Thus it is representable by an object, let's call it $F(y)$. An application of Yoneda's lemma (Lemma 4.3.5) turns the rule $y \mapsto F(y)$ into a functor which by construction is an adjoint to $G$. We omit the details.

### 4.26. Localization in categories

04 VB The basic idea of this section is given a category $\mathcal{C}$ and a set of arrows $S$ to construct a functor $F: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$ such that all elements of $S$ become invertible in $S^{-1} \mathcal{C}$ and such that $F$ is universal among all functors with this property. References for this section are GZ67, Chapter I, Section 2] and [Ver96, Chapter II, Section 2].

04VC Definition 4.26.1. Let $\mathcal{C}$ be a category. A set of arrows $S$ of $\mathcal{C}$ is called a left multiplicative system if it has the following properties:

LMS1 The identity of every object of $\mathcal{C}$ is in $S$ and the composition of two composable elements of $S$ is in $S$.
LMS2 Every solid diagram

with $t \in S$ can be completed to a commutative dotted square with $s \in S$.
LMS3 For every pair of morphisms $f, g: X \rightarrow Y$ and $t \in S$ with target $X$ such that $f \circ t=g \circ t$ there exists a $s \in S$ with source $Y$ such that $s \circ f=s \circ g$.
A set of arrows $S$ of $\mathcal{C}$ is called a right multiplicative system if it has the following properties:

RMS1 The identity of every object of $\mathcal{C}$ is in $S$ and the composition of two composable elements of $S$ is in $S$.

RMS2 Every solid diagram

with $s \in S$ can be completed to a commutative dotted square with $t \in S$.
RMS3 For every pair of morphisms $f, g: X \rightarrow Y$ and $s \in S$ with source $Y$ such that $s \circ f=s \circ g$ there exists a $t \in S$ with target $X$ such that $f \circ t=g \circ t$.
A set of arrows $S$ of $\mathcal{C}$ is called a multiplicative system if it is both a left multiplicative system and a right multiplicative system. In other words, this means that MS1, MS2, MS3 hold, where MS1 = LMS1 + RMS1, MS2 = LMS2 + RMS2, and MS3 $=\mathrm{LMS} 3+\mathrm{RMS} 3$. (That said, of course LMS1 $=$ RMS1 $=$ MS1.)

These conditions are useful to construct the categories $S^{-1} \mathcal{C}$ as follows.
Left calculus of fractions. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system. We define a new category $S^{-1} \mathcal{C}$ as follows (we verify this works in the proof of Lemma 4.26.2):
(1) We set $\operatorname{Ob}\left(S^{-1} \mathcal{C}\right)=\operatorname{Ob}(\mathcal{C})$.
(2) Morphisms $X \rightarrow Y$ of $S^{-1} \mathcal{C}$ are given by pairs $\left(f: X \rightarrow Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)$ with $s \in S$ up to equivalence. (The equivalence is defined below. Think of the equivalence class of a pair $(f, s)$ as $s^{-1} f: X \rightarrow Y$.)
(3) Two pairs $\left(f_{1}: X \rightarrow Y_{1}, s_{1}: Y \rightarrow Y_{1}\right)$ and $\left(f_{2}: X \rightarrow Y_{2}, s_{2}: Y \rightarrow Y_{2}\right)$ are said to be equivalent if there exists a third pair $\left(f_{3}: X \rightarrow Y_{3}, s_{3}\right.$ : $\left.Y \rightarrow Y_{3}\right)$ and morphisms $u: Y_{1} \rightarrow Y_{3}$ and $v: Y_{2} \rightarrow Y_{3}$ of $\mathcal{C}$ fitting into the commutative diagram

(4) The composition of the equivalence classes of the pairs $\left(f: X \rightarrow Y^{\prime}, s\right.$ : $\left.Y \rightarrow Y^{\prime}\right)$ and $\left(g: Y \rightarrow Z^{\prime}, t: Z \rightarrow Z^{\prime}\right)$ is defined as the equivalence class of a pair ( $h \circ f: X \rightarrow Z^{\prime \prime}, u \circ t: Z \rightarrow Z^{\prime \prime}$ ) where $h$ and $u \in S$ are chosen to fit into a commutative diagram

which exists by assumption.
(5) The identity morphism $X \rightarrow X$ in $S^{-1} \mathcal{C}$ is the equivalence class of the pair (id: $X \rightarrow X$, id : $X \rightarrow X$ ).

04VD Lemma 4.26.2. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system.
(1) The relation on pairs defined above is an equivalence relation.
(2) The composition rule given above is well defined on equivalence classes.
(3) Composition is associative (and the identity morphisms satisfy the identity axioms), and hence $S^{-1} \mathcal{C}$ is a category.

Proof. Proof of (1). Let us say two pairs $p_{1}=\left(f_{1}: X \rightarrow Y_{1}, s_{1}: Y \rightarrow Y_{1}\right)$ and $p_{2}=\left(f_{2}: X \rightarrow Y_{2}, s_{2}: Y \rightarrow Y_{2}\right)$ are elementary equivalent if there exists a morphism $a: Y_{1} \rightarrow Y_{2}$ of $\mathcal{C}$ such that $a \circ f_{1}=f_{2}$ and $a \circ s_{1}=s_{2}$. Diagram:

Let us denote this property by saying $p_{1} E p_{2}$. Note that $p E p$ and $a E b, b E c \Rightarrow a E c$. (Despite its name, $E$ is not an equivalence relation.) Part (1) claims that the relation $p \sim p^{\prime} \Leftrightarrow \exists q: p E q \wedge p^{\prime} E q$ (where $q$ is supposed to be a pair satisfying the same conditions as $p$ and $p^{\prime}$ ) is an equivalence relation. A simple formal argument, using the properties of $E$ above, shows that it suffices to prove $p_{3} E p_{1}, p_{3} E p_{2} \Rightarrow$ $p_{1} \sim p_{2}$. Thus suppose that we are given a commutative diagram

with $s_{i} \in S$. First we apply LMS2 to get a commutative diagram

with $a_{24} \in S$. Then, we have

$$
a_{14} \circ a_{31} \circ s_{3}=a_{14} \circ s_{1}=a_{24} \circ s_{2}=a_{24} \circ a_{32} \circ s_{3}
$$

Hence, by LMS3, there exists a morphism $s_{44}: Y_{4} \rightarrow Y_{4}^{\prime}$ such that $s_{44} \in S$ and $s_{44} \circ a_{14} \circ a_{31}=s_{44} \circ a_{24} \circ a_{32}$. Hence, after replacing $Y_{4}, a_{14}$ and $a_{24}$ by $Y_{4}^{\prime}, s_{44} \circ a_{14}$ and $s_{44} \circ a_{24}$, we may assume that $a_{14} \circ a_{31}=a_{24} \circ a_{32}$ (and we still have $a_{24} \in S$ and $a_{14} \circ s_{1}=a_{24} \circ s_{2}$ ). Set

$$
f_{4}=a_{14} \circ f_{1}=a_{14} \circ a_{31} \circ f_{3}=a_{24} \circ a_{32} \circ f_{3}=a_{24} \circ f_{2}
$$

and $s_{4}=a_{14} \circ s_{1}=a_{24} \circ s_{2}$. Then, the diagram

commutes, and we have $s_{4} \in S$ (by LMS1). Thus, $p_{1} E p_{4}$, where $p_{4}=\left(f_{4}, s_{4}\right)$. Similarly, $p_{2} E p_{4}$. Combining these, we find $p_{1} \sim p_{2}$.

Proof of (2). Let $p=\left(f: X \rightarrow Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)$ and $q=\left(g: Y \rightarrow Z^{\prime}, t: Z \rightarrow Z^{\prime}\right)$ be pairs as in the definition of composition above. To compose we choose a diagram

with $u_{2} \in S$. We first show that the equivalence class of the pair $r_{2}=\left(h_{2} \circ f: X \rightarrow\right.$ $\left.Z_{2}, u_{2} \circ t: Z \rightarrow Z_{2}\right)$ is independent of the choice of $\left(Z_{2}, h_{2}, u_{2}\right)$. Namely, suppose that $\left(Z_{3}, h_{3}, u_{3}\right)$ is another choice with corresponding composition $r_{3}=\left(h_{3} \circ f:\right.$ $\left.X \rightarrow Z_{3}, u_{3} \circ t: Z \rightarrow Z_{3}\right)$. Then by LMS2 we can choose a diagram

with $u_{34} \in S$. We have $h_{2} \circ s=u_{2} \circ g$ and similarly $h_{3} \circ s=u_{3} \circ g$. Now,

$$
u_{34} \circ h_{3} \circ s=u_{34} \circ u_{3} \circ g=h_{24} \circ u_{2} \circ g=h_{24} \circ h_{2} \circ s
$$

Hence, LMS3 shows that there exists a $Z_{4}^{\prime}$ and an $s_{44}: Z_{4} \rightarrow Z_{4}^{\prime}$ such that $s_{44} \circ$ $u_{34} \circ h_{3}=s_{44} \circ h_{24} \circ h_{2}$. Replacing $Z_{4}, h_{24}$ and $u_{34}$ by $Z_{4}^{\prime}, s_{44} \circ h_{24}$ and $s_{44} \circ u_{34}$, we may assume that $u_{34} \circ h_{3}=h_{24} \circ h_{2}$. Meanwhile, the relations $u_{34} \circ u_{3}=h_{24} \circ u_{2}$ and $u_{34} \in S$ continue to hold. We can now set $h_{4}=u_{34} \circ h_{3}=h_{24} \circ h_{2}$ and $u_{4}=u_{34} \circ u_{3}=h_{24} \circ u_{2}$. Then, we have a commutative diagram

Hence we obtain a pair $r_{4}=\left(h_{4} \circ f: X \rightarrow Z_{4}, u_{4} \circ t: Z \rightarrow Z_{4}\right)$ and the above diagram shows that we have $r_{2} E r_{4}$ and $r_{3} E r_{4}$, whence $r_{2} \sim r_{3}$, as desired. Thus it now makes sense to define $p \circ q$ as the equivalence class of all possible pairs $r$ obtained as above.

To finish the proof of (2) we have to show that given pairs $p_{1}, p_{2}, q$ such that $p_{1} E p_{2}$ then $p_{1} \circ q=p_{2} \circ q$ and $q \circ p_{1}=q \circ p_{2}$ whenever the compositions make sense. To do this, write $p_{1}=\left(f_{1}: X \rightarrow Y_{1}, s_{1}: Y \rightarrow Y_{1}\right)$ and $p_{2}=\left(f_{2}: X \rightarrow Y_{2}, s_{2}: Y \rightarrow Y_{2}\right)$ and let $a: Y_{1} \rightarrow Y_{2}$ be a morphism of $\mathcal{C}$ such that $f_{2}=a \circ f_{1}$ and $s_{2}=a \circ s_{1}$. First assume that $q=\left(g: Y \rightarrow Z^{\prime}, t: Z \rightarrow Z^{\prime}\right)$. In this case choose a commutative diagram as the one on the left

(with $u \in S$ ), which implies the diagram on the right is commutative as well. Using these diagrams we see that both compositions $q \circ p_{1}$ and $q \circ p_{2}$ are the equivalence class of $\left(h \circ a \circ f_{1}: X \rightarrow Z^{\prime \prime}, u \circ t: Z \rightarrow Z^{\prime \prime}\right)$. Thus $q \circ p_{1}=q \circ p_{2}$. The proof of the other case, in which we have to show $p_{1} \circ q=p_{2} \circ q$, is omitted. (It is similar to the case we did.)
Proof of (3). We have to prove associativity of composition. Consider a solid diagram

(whose vertical arrows belong to $S$ ) which gives rise to three composable pairs. Using LMS2 we can choose the dotted arrows making the squares commutative and such that the vertical arrows are in $S$. Then it is clear that the composition of the three pairs is the equivalence class of the pair ( $W \rightarrow Z^{\prime \prime \prime}, Z \rightarrow Z^{\prime \prime \prime}$ ) gotten by composing the horizontal arrows on the bottom row and the vertical arrows on the right column.
We leave it to the reader to check the identity axioms.
0BM1 Remark 4.26.3. The motivation for the construction of $S^{-1} \mathcal{C}$ is to "force" the morphisms in $S$ to be invertible by artificially creating inverses to them (at the cost of some existing morphisms possibly becoming identified with each other). This is similar to the localization of a commutative ring at a multiplicative subset, and more generally to the localization of a noncommutative ring at a right denominator set. This is more than just a similarity: The construction of $S^{-1} \mathcal{C}$ (or, more precisely, its version for additive categories $\mathcal{C}$ ) actually generalizes the latter type of localization. Namely, a noncommutative ring can be viewed as an additive category with a single object (the morphisms being the elements of the ring); a multiplicative subset of this ring then becomes a set $S$ of morphisms satisfying LMS1 (aka RMS1). Then, the conditions RMS2 and RMS3 for this category and this subset $S$ translate into the two conditions ("right permutable" and "right reversible") of a right denominator set (and similarly for LMS and left denominator sets), and $S^{-1} \mathcal{C}$ (with a properly defined additive structure) is the one-object category corresponding to the localization of the ring.
0BM2 Definition 4.26.4. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system of morphisms of $\mathcal{C}$. Given any morphism $f: X \rightarrow Y^{\prime}$ in $\mathcal{C}$ and any morphism $s: Y \rightarrow Y^{\prime}$ in $S$, we denote by $s^{-1} f$ the equivalence class of the pair $(f: X \rightarrow$ $\left.Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)$. This is a morphism from $X$ to $Y$ in $S^{-1} \mathcal{C}$.

This notation is suggestive, and the things it suggests are true: Given any morphism $f: X \rightarrow Y^{\prime}$ in $\mathcal{C}$ and any two morphisms $s: Y \rightarrow Y^{\prime}$ and $t: Y^{\prime} \rightarrow Y^{\prime \prime}$ in $S$, we have $(t \circ s)^{-1}(t \circ f)=s^{-1} f$. Also, for any $f: X \rightarrow Y^{\prime}$ and $g: Y^{\prime} \rightarrow Z^{\prime}$ in $\mathcal{C}$
and all $s: Z \rightarrow Z^{\prime}$ in $S$, we have $s^{-1}(g \circ f)=\left(s^{-1} g\right) \circ\left(\operatorname{id}_{Y^{\prime}}^{-1} f\right)$. Finally, for any $f: X \rightarrow Y^{\prime}$ in $\mathcal{C}$, all $s: Y \rightarrow Y^{\prime}$ in $S$, and $t: Z \rightarrow Y$ in $S$, we have $(s \circ t)^{-1} f=\left(t^{-1} \mathrm{id}_{Y}\right) \circ\left(s^{-1} f\right)$. This is all clear from the definition. We can "write any finite collection of morphisms with the same target as fractions with common denominator".

04VE Lemma 4.26.5. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system of morphisms of $\mathcal{C}$. Given any finite collection $g_{i}: X_{i} \rightarrow Y$ of morphisms of $S^{-1} \mathcal{C}$ (indexed by $i$, we can find an element $s: Y \rightarrow Y^{\prime}$ of $S$ and a family of morphisms $f_{i}: X_{i} \rightarrow Y^{\prime}$ of $\mathcal{C}$ such that each $g_{i}$ is the equivalence class of the pair $\left(f_{i}: X_{i} \rightarrow Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)$.

Proof. For each $i$ choose a representative $\left(X_{i} \rightarrow Y_{i}, s_{i}: Y \rightarrow Y_{i}\right)$ of $g_{i}$. The lemma follows if we can find a morphism $s: Y \rightarrow Y^{\prime}$ in $S$ such that for each $i$ there is a morphism $a_{i}: Y_{i} \rightarrow Y^{\prime}$ with $a_{i} \circ s_{i}=s$. If we have two indices $i=1,2$, then we can do this by completing the square

with $t_{2} \in S$ as is possible by Definition 4.26.1. Then $s=t_{2} \circ s_{2} \in S$ works. If we have $n>2$ morphisms, then we use the above trick to reduce to the case of $n-1$ morphisms, and we win by induction.

There is an easy characterization of equality of morphisms if they have the same denominator.

04VF Lemma 4.26.6. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system of morphisms of $\mathcal{C}$. Let $A, B: X \rightarrow Y$ be morphisms of $S^{-1} \mathcal{C}$ which are the equivalence classes of $\left(f: X \rightarrow Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)$ and $\left(g: X \rightarrow Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)$. Then $A=B$ if and only if there exists a morphism $a: Y^{\prime} \rightarrow Y^{\prime \prime}$ with $a \circ s \in S$ and such that $a \circ f=a \circ g$.

Proof. The equality of $A$ and $B$ means that there exists a commutative diagram

with $t \in S$. In particular $u \circ s=v \circ s$. Hence by LMS3 there exists a $s^{\prime}: Z \rightarrow Y^{\prime \prime}$ in $S$ such that $s^{\prime} \circ u=s^{\prime} \circ v$. Setting $a$ equal to this common value does the job.

05Q0 Remark 4.26.7. Let $\mathcal{C}$ be a category. Let $S$ be a left multiplicative system. Given an object $Y$ of $\mathcal{C}$ we denote $Y / S$ the category whose objects are $s: Y \rightarrow Y^{\prime}$ with
$s \in S$ and whose morphisms are commutative diagrams

where $a: Y^{\prime} \rightarrow Y^{\prime \prime}$ is arbitrary. We claim that the category $Y / S$ is filtered (see Definition 4.19.1. Namely, LMS1 implies that $\operatorname{id}_{Y}: Y \rightarrow Y$ is in $Y / S$; hence $Y / S$ is nonempty. LMS2 implies that given $s_{1}: Y \rightarrow Y_{1}$ and $s_{2}: Y \rightarrow Y_{2}$ we can find a diagram

with $t \in S$. Hence $s_{1}: Y \rightarrow Y_{1}$ and $s_{2}: Y \rightarrow Y_{2}$ both have maps to $t \circ s_{2}: Y \rightarrow Y_{3}$ in $Y / S$. Finally, given two morphisms $a, b$ from $s_{1}: Y \rightarrow Y_{1}$ to $s_{2}: Y \rightarrow Y_{2}$ in $Y / S$ we see that $a \circ s_{1}=b \circ s_{1}$; hence by LMS3 there exists a $t: Y_{2} \rightarrow Y_{3}$ in $S$ such that $t \circ a=t \circ b$. Now the combined results of Lemmas 4.26.5 and 4.26.6 tell us that

05Q1 (4.26.7.1) $\quad \operatorname{Mor}_{S^{-1} \mathcal{C}}(X, Y)=\operatorname{colim}_{\left(s: Y \rightarrow Y^{\prime}\right) \in Y / S} \operatorname{Mor}_{\mathcal{C}}\left(X, Y^{\prime}\right)$

This formula expressing morphism sets in $S^{-1} \mathcal{C}$ as a filtered colimit of morphism sets in $\mathcal{C}$ is occasionally useful.

04VG Lemma 4.26.8. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system of morphisms of $\mathcal{C}$.
(1) The rules $X \mapsto X$ and $(f: X \rightarrow Y) \mapsto\left(f: X \rightarrow Y, i d_{Y}: Y \rightarrow Y\right)$ define a functor $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$.
(2) For any $s \in S$ the morphism $Q(s)$ is an isomorphism in $S^{-1} \mathcal{C}$.
(3) If $G: \mathcal{C} \rightarrow \mathcal{D}$ is any functor such that $G(s)$ is invertible for every $s \in S$, then there exists a unique functor $H: S^{-1} \mathcal{C} \rightarrow \mathcal{D}$ such that $H \circ Q=G$.

Proof. Parts (1) and (2) are clear. (In (2), the inverse of $Q(s)$ is the equivalence class of the pair $\left(\mathrm{id}_{Y}, s\right)$.) To see (3) just set $H(X)=G(X)$ and set $H((f: X \rightarrow$ $\left.\left.Y^{\prime}, s: Y \rightarrow Y^{\prime}\right)\right)=G(s)^{-1} \circ G(f)$. Details omitted.

05Q2 Lemma 4.26.9. Let $\mathcal{C}$ be a category and let $S$ be a left multiplicative system of morphisms of $\mathcal{C}$. The localization functor $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$ commutes with finite colimits.

Proof. Let $\mathcal{I}$ be a finite category and let $\mathcal{I} \rightarrow \mathcal{C}, i \mapsto X_{i}$ be a functor whose colimit exists. Then using 4.26.7.1 , the fact that $Y / S$ is filtered, and Lemma 4.19.2 we have

$$
\begin{aligned}
\operatorname{Mor}_{S^{-1} \mathcal{C}}\left(Q\left(\operatorname{colim} X_{i}\right), Q(Y)\right) & =\operatorname{colim}_{\left(s: Y \rightarrow Y^{\prime}\right) \in Y / S} \operatorname{Mor}_{\mathcal{C}}\left(\operatorname{colim}_{i}, Y^{\prime}\right) \\
& =\operatorname{colim}_{\left(s: Y \rightarrow Y^{\prime}\right) \in Y / S} \lim _{i} \operatorname{Mor}_{\mathcal{C}}\left(X_{i}, Y^{\prime}\right) \\
& =\lim _{i} \operatorname{colim}_{\left(s: Y \rightarrow Y^{\prime}\right) \in Y / S} \operatorname{Mor}_{\mathcal{C}}\left(X_{i}, Y^{\prime}\right) \\
& =\lim _{i} \operatorname{Mor}_{S^{-1} \mathcal{C}}\left(Q\left(X_{i}\right), Q(Y)\right)
\end{aligned}
$$

and hence $Q\left(\operatorname{colim} X_{i}\right)$ is the colimit of the functor $i \mapsto Q\left(X_{i}\right)$ as desired.

05Q3 Lemma 4.26.10. Let $\mathcal{C}$ be a category. Let $S$ be a left multiplicative system. If $f: X \rightarrow Y, f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ are two morphisms of $\mathcal{C}$ and if

is a commutative diagram in $S^{-1} \mathcal{C}$, then there exists a morphism $f^{\prime \prime}: X^{\prime \prime} \rightarrow Y^{\prime \prime}$ in $\mathcal{C}$ and a commutative diagram

in $\mathcal{C}$ with $s, t \in S$ and $a=s^{-1} g, b=t^{-1} h$.
Proof. We choose maps and objects in the following way: First write $a=s^{-1} g$ for some $s: X^{\prime} \rightarrow X^{\prime \prime}$ in $S$ and $g: X \rightarrow X^{\prime \prime}$. By LMS2 we can find $t: Y^{\prime} \rightarrow Y^{\prime \prime}$ in $S$ and $f^{\prime \prime}: X^{\prime \prime} \rightarrow Y^{\prime \prime}$ such that

commutes. Now in this diagram we are going to repeatedly change our choice of

$$
X^{\prime \prime} \xrightarrow{f^{\prime \prime}} Y^{\prime \prime} \stackrel{t}{\leftarrow} Y^{\prime}
$$

by postcomposing both $t$ and $f^{\prime \prime}$ by a morphism $d: Y^{\prime \prime} \rightarrow Y^{\prime \prime \prime}$ with the property that $d \circ t \in S$. According to Remark 4.26.7 we may after such a replacement assume that there exists a morphism $h: Y \rightarrow Y^{\prime \prime}$ such that $b=t^{-1} h^{3}$. At this point we have everything as in the lemma except that we don't know that the left square of the diagram commutes. But the definition of composition in $S^{-1} \mathcal{C}$ shows that $b \circ Q(f)$ is the equivalence class of the pair ( $h \circ f: X \rightarrow Y^{\prime \prime}, t: Y^{\prime} \rightarrow Y^{\prime \prime}$ ) (since $b$ is the equivalence class of the pair $\left(g: X \rightarrow X^{\prime \prime}, s: X^{\prime} \rightarrow X^{\prime \prime}\right)$, while $Q(f)$ is the equivalence class of the pair $(f: X \rightarrow Y$, id :Y $\rightarrow Y)$ ), while $Q\left(f^{\prime}\right) \circ a$ is the equivalence class of the pair ( $f^{\prime \prime} \circ g: X \rightarrow Y^{\prime \prime}, t: Y^{\prime} \rightarrow Y^{\prime \prime}$ ) (since $a$ is the equivalence class of the pair $\left(h: Y \rightarrow Y^{\prime \prime}, t: Y^{\prime} \rightarrow Y^{\prime \prime}\right)$, while $Q\left(f^{\prime}\right)$ is the equivalence class of the pair $\left(f^{\prime}: X^{\prime} \rightarrow Y^{\prime}\right.$, id : $\left.Y^{\prime} \rightarrow Y^{\prime}\right)$ ). Since we know that $b \circ Q(f)=Q\left(f^{\prime}\right) \circ a$, we thus conclude that the equivalence classes of the pairs $\left(h \circ f: X \rightarrow Y^{\prime \prime}, t: Y^{\prime} \rightarrow Y^{\prime \prime}\right)$ and $\left(f^{\prime \prime} \circ g: X \rightarrow Y^{\prime \prime}, t: Y^{\prime} \rightarrow Y^{\prime \prime}\right)$ are equal. Hence using Lemma 4.26.6 we can find a morphism $d: Y^{\prime \prime} \rightarrow Y^{\prime \prime \prime}$ such that $d \circ t \in S$ and $d \circ h \circ f=d \circ f^{\prime \prime} \circ g$. Hence we make one more replacement of the kind described above and we win.

[^3]Right calculus of fractions. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system. We define a new category $S^{-1} \mathcal{C}$ as follows (we verify this works in the proof of Lemma 4.26.11):
(1) We set $\mathrm{Ob}\left(S^{-1} \mathcal{C}\right)=\mathrm{Ob}(\mathcal{C})$.
(2) Morphisms $X \rightarrow Y$ of $S^{-1} \mathcal{C}$ are given by pairs $\left(f: X^{\prime} \rightarrow Y, s: X^{\prime} \rightarrow X\right)$ with $s \in S$ up to equivalence. (The equivalence is defined below. Think of the equivalence class of a pair $(f, s)$ as $f s^{-1}: X \rightarrow Y$.)
(3) Two pairs $\left(f_{1}: X_{1} \rightarrow Y, s_{1}: X_{1} \rightarrow X\right)$ and $\left(f_{2}: X_{2} \rightarrow Y, s_{2}: X_{2} \rightarrow X\right)$ are said to be equivalent if there exists a third pair $\left(f_{3}: X_{3} \rightarrow Y, s_{3}:\right.$ $\left.X_{3} \rightarrow X\right)$ and morphisms $u: X_{3} \rightarrow X_{1}$ and $v: X_{3} \rightarrow X_{2}$ of $\mathcal{C}$ fitting into the commutative diagram

(4) The composition of the equivalence classes of the pairs $\left(f: X^{\prime} \rightarrow Y, s:\right.$ $\left.X^{\prime} \rightarrow X\right)$ and $\left(g: Y^{\prime} \rightarrow Z, t: Y^{\prime} \rightarrow Y\right)$ is defined as the equivalence class of a pair $\left(g \circ h: X^{\prime \prime} \rightarrow Z, s \circ u: X^{\prime \prime} \rightarrow X\right)$ where $h$ and $u \in S$ are chosen to fit into a commutative diagram

which exists by assumption.
(5) The identity morphism $X \rightarrow X$ in $S^{-1} \mathcal{C}$ is the equivalence class of the pair (id : $X \rightarrow X$, id : $X \rightarrow X$ ).

04VH Lemma 4.26.11. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system.
(1) The relation on pairs defined above is an equivalence relation.
(2) The composition rule given above is well defined on equivalence classes.
(3) Composition is associative (and the identity morphisms satisfy the identity axioms), and hence $S^{-1} \mathcal{C}$ is a category.
Proof. This lemma is dual to Lemma 4.26.2. It follows formally from that lemma by replacing $\mathcal{C}$ by its opposite category in which $S$ is a left multiplicative system.

0BM3 Definition 4.26.12. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system of morphisms of $\mathcal{C}$. Given any morphism $f: X^{\prime} \rightarrow Y$ in $\mathcal{C}$ and any morphism $s: X^{\prime} \rightarrow X$ in $S$, we denote by $f s^{-1}$ the equivalence class of the pair $\left(f: X^{\prime} \rightarrow\right.$ $\left.Y, s: X^{\prime} \rightarrow X\right)$. This is a morphism from $X$ to $Y$ in $S^{-1} \mathcal{C}$.

Identities similar (actually, dual) to the ones in Definition 4.26 .4 hold. We can "write any finite collection of morphisms with the same source as fractions with common denominator".

04VI Lemma 4.26.13. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system of morphisms of $\mathcal{C}$. Given any finite collection $g_{i}: X \rightarrow Y_{i}$ of morphisms of $S^{-1} \mathcal{C}$ (indexed by $i$ ), we can find an element $s: X^{\prime} \rightarrow X$ of $S$ and a family of morphisms $f_{i}: X^{\prime} \rightarrow Y_{i}$ of $\mathcal{C}$ such that $g_{i}$ is the equivalence class of the pair $\left(f_{i}: X^{\prime} \rightarrow Y_{i}, s: X^{\prime} \rightarrow X\right)$.
Proof. This lemma is the dual of Lemma 4.26 .5 and follows formally from that lemma by replacing all categories in sight by their opposites.

There is an easy characterization of equality of morphisms if they have the same denominator.

04VJ Lemma 4.26.14. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system of morphisms of $\mathcal{C}$. Let $A, B: X \rightarrow Y$ be morphisms of $S^{-1} \mathcal{C}$ which are the equivalence classes of $\left(f: X^{\prime} \rightarrow Y, s: X^{\prime} \rightarrow X\right)$ and $\left(g: X^{\prime} \rightarrow Y, s: X^{\prime} \rightarrow X\right)$. Then $A=B$ if and only if there exists a morphism $a: X^{\prime \prime} \rightarrow X^{\prime}$ with $s \circ a \in S$ and such that $f \circ a=g \circ a$.

Proof. This is dual to Lemma 4.26.6.
05Q4 Remark 4.26.15. Let $\mathcal{C}$ be a category. Let $S$ be a right multiplicative system. Given an object $X$ of $\mathcal{C}$ we denote $S / X$ the category whose objects are $s: X^{\prime} \rightarrow X$ with $s \in S$ and whose morphisms are commutative diagrams

where $a: X^{\prime} \rightarrow X^{\prime \prime}$ is arbitrary. The category $S / X$ is cofiltered (see Definition 4.20.1). (This is dual to the corresponding statement in Remark 4.26.7.) Now the combined results of Lemmas 4.26.13 and 4.26.14 tell us that
05Q5 (4.26.15.1) $\quad \operatorname{Mor}_{S^{-1} \mathcal{C}}(X, Y)=\operatorname{colim}_{\left(s: X^{\prime} \rightarrow X\right) \in(S / X)^{\text {opp }}} \operatorname{Mor}_{\mathcal{C}}\left(X^{\prime}, Y\right)$
This formula expressing morphisms in $S^{-1} \mathcal{C}$ as a filtered colimit of morphisms in $\mathcal{C}$ is occasionally useful.

04VK Lemma 4.26.16. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system of morphisms of $\mathcal{C}$.
(1) The rules $X \mapsto X$ and $(f: X \rightarrow Y) \mapsto\left(f: X \rightarrow Y, i d_{X}: X \rightarrow X\right)$ define a functor $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$.
(2) For any $s \in S$ the morphism $Q(s)$ is an isomorphism in $S^{-1} \mathcal{C}$.
(3) If $G: \mathcal{C} \rightarrow \mathcal{D}$ is any functor such that $G(s)$ is invertible for every $s \in S$, then there exists a unique functor $H: S^{-1} \mathcal{C} \rightarrow \mathcal{D}$ such that $H \circ Q=G$.

Proof. This lemma is the dual of Lemma 4.26 .8 and follows formally from that lemma by replacing all categories in sight by their opposites.

05Q6 Lemma 4.26.17. Let $\mathcal{C}$ be a category and let $S$ be a right multiplicative system of morphisms of $\mathcal{C}$. The localization functor $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$ commutes with finite limits.

Proof. This is dual to Lemma 4.26.9,

05Q7 Lemma 4.26.18. Let $\mathcal{C}$ be a category. Let $S$ be a right multiplicative system. If $f: X \rightarrow Y, f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ are two morphisms of $\mathcal{C}$ and if

is a commutative diagram in $S^{-1} \mathcal{C}$, then there exists a morphism $f^{\prime \prime}: X^{\prime \prime} \rightarrow Y^{\prime \prime}$ in $\mathcal{C}$ and a commutative diagram

in $\mathcal{C}$ with $s, t \in S$ and $a=g s^{-1}, b=h t^{-1}$.
Proof. This lemma is dual to Lemma 4.26 .10 but we can also prove it directly as follows. We choose maps and objects in the following way: First write $b=h t^{-1}$ for some $t: Y^{\prime \prime} \rightarrow Y$ in $S$ and $h: Y^{\prime \prime} \rightarrow Y^{\prime}$. By RMS2 we can find $s: X^{\prime \prime} \rightarrow X$ in $S$ and $f^{\prime \prime}: X^{\prime \prime} \rightarrow Y^{\prime \prime}$ such that

commutes. Now in this diagram we are going to repeatedly change our choice of

$$
X \stackrel{s}{\leftarrow} X^{\prime \prime} \xrightarrow{f^{\prime \prime}} Y^{\prime \prime}
$$

by precomposing both $s$ and $f^{\prime \prime}$ by a morphism $d: X^{\prime \prime \prime} \rightarrow X^{\prime \prime}$ with the property that $s \circ d \in S$. According to Remark 4.26 .15 we may after such a replacement assume that there exists a morphism $g: X^{\prime \prime} \rightarrow X^{\prime}$ such that $a=g s^{-1}$. At this point we have everything as in the lemma except that we don't know that the right square of the diagram commutes. However, we do know that $Q\left(f^{\prime} g\right)=Q\left(h f^{\prime \prime}\right)$ in $S^{-1} \mathcal{D}$ because the left square commutes, the outer square commutes in $S^{-1} \mathcal{D}$ by assumption, and because $Q(s), Q(t)$ are isomorphisms. Hence using Lemma 4.26.14 we can find a morphism $d: X^{\prime \prime \prime} \rightarrow X^{\prime \prime}$ in $S(!)$ such that $f^{\prime} g d=h f^{\prime \prime} d$. Hence we make one more replacement of the kind described above and we win.

Multiplicative systems and two sided calculus of fractions. If $S$ is a multiplicative system then left and right calculus of fractions give canonically isomorphic categories.

04VL Lemma 4.26.19. Let $\mathcal{C}$ be a category and let $S$ be a multiplicative system. The category of left fractions and the category of right fractions $S^{-1} \mathcal{C}$ are canonically isomorphic.

Proof. Denote $\mathcal{C}_{\text {left }}, \mathcal{C}_{\text {right }}$ the two categories of fractions. By the universal properties of Lemmas 4.26 .8 and 4.26 .16 we obtain functors $\mathcal{C}_{\text {left }} \rightarrow \mathcal{C}_{\text {right }}$ and $\mathcal{C}_{\text {right }} \rightarrow \mathcal{C}_{\text {left }}$. By the uniqueness of these functors they are each others inverse.

05Q8 Definition 4.26.20. Let $\mathcal{C}$ be a category and let $S$ be a multiplicative system. We say $S$ is saturated if, in addition to MS1, MS2, MS3 we also have

MS4 Given three composable morphisms $f, g, h$, if $f g, g h \in S$, then $g \in S$.
Note that a saturated multiplicative system contains all isomorphisms. Moreover, if $f, g, h$ are composable morphisms in a category and $f g, g h$ are isomorphisms, then $g$ is an isomorphism (because then $g$ has both a left and a right inverse, hence is invertible).

05Q9 Lemma 4.26.21. Let $\mathcal{C}$ be a category and let $S$ be a multiplicative system. Denote $Q: \mathcal{C} \rightarrow S^{-1} \mathcal{C}$ the localization functor. The set

$$
\hat{S}=\{f \in \operatorname{Arrows}(\mathcal{C}) \mid Q(f) \text { is an isomorphism }\}
$$

is equal to

$$
S^{\prime}=\{f \in \operatorname{Arrows}(\mathcal{C}) \mid \text { there exist } g, h \text { such that } g f, f h \in S\}
$$

and is the smallest saturated multiplicative system containing $S$. In particular, if $S$ is saturated, then $\hat{S}=S$.

Proof. It is clear that $S \subset S^{\prime} \subset \hat{S}$ because elements of $S^{\prime}$ map to morphisms in $S^{-1} \mathcal{C}$ which have both left and right inverses. Note that $S^{\prime}$ satisfies MS4, and that $\hat{S}$ satisfies MS1. Next, we prove that $S^{\prime}=\hat{S}$.

Let $f \in \hat{S}$. Let $s^{-1} g=h t^{-1}$ be the inverse morphism in $S^{-1} \mathcal{C}$. (We may use both left fractions and right fractions to describe morphisms in $S^{-1} \mathcal{C}$, see Lemma 4.26.19.) The relation $\mathrm{id}_{X}=s^{-1} g f$ in $S^{-1} \mathcal{C}$ means there exists a commutative diagram

for some morphisms $f^{\prime}, u, v$ and $s^{\prime} \in S$. Hence $u g f=s^{\prime} \in S$. Similarly, using that $\operatorname{id}_{Y}=f h t^{-1}$ one proves that $f h w \in S$ for some $w$. We conclude that $f \in S^{\prime}$. Thus $S^{\prime}=\hat{S}$. Provided we prove that $S^{\prime}=\hat{S}$ is a multiplicative system it is now clear that this implies that $S^{\prime}=\hat{S}$ is the smallest saturated system containing $S$.

Our remarks above take care of MS1 and MS4, so to finish the proof of the lemma we have to show that LMS2, RMS2, LMS3, RMS3 hold for $\hat{S}$. Let us check that LMS2 holds for $\hat{S}$. Suppose we have a solid diagram

with $t \in \hat{S}$. Pick a morphism $a: Z \rightarrow Z^{\prime}$ such that $a t \in S$. Then we can use LMS2 for $S$ to find a commutative diagram

and setting $f=f^{\prime} \circ a$ we win. The proof of RMS2 is dual to this. Finally, suppose given a pair of morphisms $f, g: X \rightarrow Y$ and $t \in \hat{S}$ with target $X$ such that $f t=g t$. Then we pick a morphism $b$ such that $t b \in S$. Then $f t b=g t b$ which implies by LMS3 for $S$ that there exists an $s \in S$ with source $Y$ such that $s f=s g$ as desired. The proof of RMS3 is dual to this.

### 4.27. Formal properties

003 D In this section we discuss some formal properties of the 2-category of categories. This will lead us to the definition of a (strict) 2-category later.
Let us denote $\mathrm{Ob}(C a t)$ the class of all categories. For every pair of categories $\mathcal{A}, \mathcal{B} \in \operatorname{Ob}(C a t)$ we have the "small" category of functors Fun $(\mathcal{A}, \mathcal{B})$. Composition of transformation of functors such as

composes to

is called vertical composition. We will use the usual symbol o for this. Next, we will define horizontal composition. In order to do this we explain a bit more of the structure at hand.

Namely for every triple of categories $\mathcal{A}, \mathcal{B}$, and $\mathcal{C}$ there is a composition law

$$
\circ: \operatorname{Ob}(\operatorname{Fun}(\mathcal{B}, \mathcal{C})) \times \operatorname{Ob}(\operatorname{Fun}(\mathcal{A}, \mathcal{B})) \longrightarrow \operatorname{Ob}(\operatorname{Fun}(\mathcal{A}, \mathcal{C}))
$$

coming from composition of functors. This composition law is associative, and identity functors act as units. In other words - forgetting about transformations of functors - we see that Cat forms a category. How does this structure interact with the morphisms between functors?

Well, given $t: F \rightarrow F^{\prime}$ a transformation of functors $F, F^{\prime}: \mathcal{A} \rightarrow \mathcal{B}$ and a functor $G: \mathcal{B} \rightarrow \mathcal{C}$ we can define a transformation of functors $G \circ F \rightarrow G \circ F^{\prime}$. We will denote this transformation ${ }_{G} t$. It is given by the formula $\left({ }_{G} t\right)_{x}=G\left(t_{x}\right)$ : $G(F(x)) \rightarrow G\left(F^{\prime}(x)\right)$ for all $x \in \mathcal{A}$. In this way composition with $G$ becomes a functor

$$
\operatorname{Fun}(\mathcal{A}, \mathcal{B}) \longrightarrow \operatorname{Fun}(\mathcal{A}, \mathcal{C})
$$

To see this you just have to check that ${ }_{G}\left(\operatorname{id}_{F}\right)=\operatorname{id}_{G \circ F}$ and that ${ }_{G}\left(t_{1} \circ t_{2}\right)={ }_{G} t_{1} \circ{ }_{G} t_{2}$. Of course we also have that $\mathrm{id}_{\mathcal{A}} t=t$.

Similarly, given $s: G \rightarrow G^{\prime}$ a transformation of functors $G, G^{\prime}: \mathcal{B} \rightarrow \mathcal{C}$ and $F: \mathcal{A} \rightarrow \mathcal{B}$ a functor we can define $s_{F}$ to be the transformation of functors $G \circ F \rightarrow$ $G^{\prime} \circ F$ given by $\left(s_{F}\right)_{x}=s_{F(x)}: G(F(x)) \rightarrow G^{\prime}(F(x))$ for all $x \in \mathcal{A}$. In this way composition with $F$ becomes a functor

$$
\operatorname{Fun}(\mathcal{B}, \mathcal{C}) \longrightarrow \operatorname{Fun}(\mathcal{A}, \mathcal{C})
$$

To see this you just have to check that $\left(\operatorname{id}_{G}\right)_{F}=\operatorname{id}_{G \circ F}$ and that $\left(s_{1} \circ s_{2}\right)_{F}=$ $s_{1, F} \circ s_{2, F}$. Of course we also have that $s_{\mathrm{id}_{\mathcal{B}}}=s$.

These constructions satisfy the additional properties

$$
G_{1}\left(G_{2} t\right)=G_{1} \circ G_{2} t,\left(s_{F_{1}}\right)_{F_{2}}=s_{F_{1} \circ F_{2}}, \text { and }_{H}\left(s_{F}\right)=(H s)_{F}
$$

whenever these make sense. Finally, given functors $F, F^{\prime}: \mathcal{A} \rightarrow \mathcal{B}$, and $G, G^{\prime}$ : $\mathcal{B} \rightarrow \mathcal{C}$ and transformations $t: F \rightarrow F^{\prime}$, and $s: G \rightarrow G^{\prime}$ the following diagram is commutative

in other words ${ }_{G^{\prime}} t \circ s_{F}=s_{F^{\prime}} \circ{ }_{G} t$. To prove this we just consider what happens on any object $x \in \operatorname{Ob}(\mathcal{A})$ :

which is commutative because $s$ is a transformation of functors. This compatibility relation allows us to define horizontal composition.

003E Definition 4.27.1. Given a diagram as in the left hand side of:

we define the horizontal composition $s \star t$ to be the transformation of functors $G^{\prime} t \circ s_{F}=s_{F^{\prime}} \circ{ }_{G} t$.

Now we see that we may recover our previously constructed transformations ${ }_{G} t$ and $s_{F}$ as ${ }_{G} t=\operatorname{id}_{G} \star t$ and $s_{F}=s \star \operatorname{id}_{F}$. Furthermore, all of the rules we found above are consequences of the properties stated in the lemma that follows.

003F Lemma 4.27.2. The horizontal and vertical compositions have the following properties
(1) $\circ$ and $\star$ are associative,
(2) the identity transformations $i d_{F}$ are units for $\circ$,
(3) the identity transformations of the identity functors $i d_{i d_{\mathcal{A}}}$ are units for $\star$ and $\circ$, and
(4) given a diagram

we have $\left(s^{\prime} \circ s\right) \star\left(t^{\prime} \circ t\right)=\left(s^{\prime} \star t^{\prime}\right) \circ(s \star t)$.
Proof. The last statement turns using our previous notation into the following equation

$$
s_{F^{\prime \prime}}^{\prime} \circ{ }_{G^{\prime}} t^{\prime} \circ s_{F^{\prime}} \circ{ }_{G} t=\left(s^{\prime} \circ s\right)_{F^{\prime \prime}} \circ{ }_{G}\left(t^{\prime} \circ t\right)
$$

According to our result above applied to the middle composition we may rewrite the left hand side as $s_{F^{\prime \prime}}^{\prime} \circ s_{F^{\prime \prime}} \circ{ }_{G} t^{\prime} \circ{ }_{G} t$ which is easily shown to be equal to the right hand side.
Another way of formulating condition (4) of the lemma is that composition of functors and horizontal composition of transformation of functors gives rise to a functor

$$
(\circ, \star): \operatorname{Fun}(\mathcal{B}, \mathcal{C}) \times \operatorname{Fun}(\mathcal{A}, \mathcal{B}) \longrightarrow \operatorname{Fun}(\mathcal{A}, \mathcal{C})
$$

whose source is the product category, see Definition 4.2 .20 .

### 4.28. 2-categories

003G We will give a definition of (strict) 2-categories as they appear in the setting of stacks. Before you read this take a look at Section 4.27 and Example 4.29.2. Basically, you take this example and you write out all the rules satisfied by the objects, 1 -morphisms and 2 -morphisms in that example.

003H Definition 4.28.1. A (strict) 2-category $\mathcal{C}$ consists of the following data
(1) A set of objects $\mathrm{Ob}(\mathcal{C})$.
(2) For each pair $x, y \in \operatorname{Ob}(\mathcal{C})$ a category $\operatorname{Mor}_{\mathcal{C}}(x, y)$. The objects of $\operatorname{Mor}_{\mathcal{C}}(x, y)$ will be called 1-morphisms and denoted $F: x \rightarrow y$. The morphisms between these 1-morphisms will be called 2-morphisms and denoted $t: F^{\prime} \rightarrow$ $F$. The composition of 2 -morphisms in $\operatorname{Mor}_{\mathcal{C}}(x, y)$ will be called vertical composition and will be denoted $t \circ t^{\prime}$ for $t: F^{\prime} \rightarrow F$ and $t^{\prime}: F^{\prime \prime} \rightarrow F^{\prime}$.
(3) For each triple $x, y, z \in \operatorname{Ob}(\mathcal{C})$ a functor

$$
(\circ, \star): \operatorname{Mor}_{\mathcal{C}}(y, z) \times \operatorname{Mor}_{\mathcal{C}}(x, y) \longrightarrow \operatorname{Mor}_{\mathcal{C}}(x, z)
$$

The image of the pair of 1-morphisms $(F, G)$ on the left hand side will be called the composition of $F$ and $G$, and denoted $F \circ G$. The image of the pair of 2-morphisms $(t, s)$ will be called the horizontal composition and denoted $t \star s$.
These data are to satisfy the following rules:
(1) The set of objects together with the set of 1-morphisms endowed with composition of 1-morphisms forms a category.
(2) Horizontal composition of 2 -morphisms is associative.
(3) The identity 2-morphism $\operatorname{id}_{\operatorname{id}_{x}}$ of the identity 1-morphism $\mathrm{id}_{x}$ is a unit for horizontal composition.

This is obviously not a very pleasant type of object to work with. On the other hand, there are lots of examples where it is quite clear how you work with it. The only example we have so far is that of the 2-category whose objects are a given collection of categories, 1-morphisms are functors between these categories, and 2morphisms are natural transformations of functors, see Section 4.27. As far as this text is concerned all 2-categories will be sub 2-categories of this example. Here is what it means to be a sub 2-category.

02X7 Definition 4.28.2. Let $\mathcal{C}$ be a 2-category. A sub 2 -category $\mathcal{C}^{\prime}$ of $\mathcal{C}$, is given by a subset $\mathrm{Ob}\left(\mathcal{C}^{\prime}\right)$ of $\mathrm{Ob}(\mathcal{C})$ and sub categories $\operatorname{Mor}_{\mathcal{C}^{\prime}}(x, y)$ of the categories $\operatorname{Mor}_{\mathcal{C}}(x, y)$ for all $x, y \in \operatorname{Ob}\left(\mathcal{C}^{\prime}\right)$ such that these, together with the operations o (composition 1morphisms), ○ (vertical composition 2-morphisms), and $\star$ (horizontal composition) form a 2-category.

003J Remark 4.28.3. Big 2-categories. In many texts a 2-category is allowed to have a class of objects (but hopefully a "class of classes" is not allowed). We will allow these "big" 2-categories as well, but only in the following list of cases (to be updated as we go along):
(1) The 2-category of categories Cat.
(2) The (2,1)-category of categories Cat.
(3) The 2-category of groupoids Groupoids.
(4) The $(2,1)$-category of groupoids Groupoids.
(5) The 2-category of fibred categories over a fixed category.
(6) The $(2,1)$-category of fibred categories over a fixed category.

See Definition 4.29.1. Note that in each case the class of objects of the 2-category $\mathcal{C}$ is a proper class, but for all objects $x, y \in \operatorname{Ob}(C)$ the category $\operatorname{Mor}_{\mathcal{C}}(x, y)$ is "small" (according to our conventions).

The notion of equivalence of categories that we defined in Section 4.2 extends to the more general setting of 2 -categories as follows.

003L Definition 4.28.4. Two objects $x, y$ of a 2-category are equivalent if there exist 1-morphisms $F: x \rightarrow y$ and $G: y \rightarrow x$ such that $F \circ G$ is 2 -isomorphic to id ${ }_{y}$ and $G \circ F$ is 2-isomorphic to $\operatorname{id}_{x}$.

Sometimes we need to say what it means to have a functor from a category into a 2-category.

003N Definition 4.28.5. Let $\mathcal{A}$ be a category and let $\mathcal{C}$ be a 2-category.
(1) A functor from an ordinary category into a 2-category will ignore the 2-morphisms unless mentioned otherwise. In other words, it will be a "usual" functor into the category formed out of 2-category by forgetting all the 2-morphisms.
(2) A weak functor, or a pseudo functor $\varphi$ from $\mathcal{A}$ into the 2-category $\mathcal{C}$ is given by the following data
(a) a map $\varphi: \operatorname{Ob}(\mathcal{A}) \rightarrow \mathrm{Ob}(\mathcal{C})$,
(b) for every pair $x, y \in \operatorname{Ob}(\mathcal{A})$, and every morphism $f: x \rightarrow y$ a 1morphism $\varphi(f): \varphi(x) \rightarrow \varphi(y)$,
(c) for every $x \in \operatorname{Ob}(A)$ a 2-morphism $\alpha_{x}: \mathrm{id}_{\varphi(x)} \rightarrow \varphi\left(\mathrm{id}_{x}\right)$, and
(d) for every pair of composable morphisms $f: x \rightarrow y, g: y \rightarrow z$ of $\mathcal{A}$ a 2-morphism $\alpha_{g, f}: \varphi(g \circ f) \rightarrow \varphi(g) \circ \varphi(f)$.

These data are subject to the following conditions:
(a) the 2-morphisms $\alpha_{x}$ and $\alpha_{g, f}$ are all isomorphisms,
(b) for any morphism $f: x \rightarrow y$ in $\mathcal{A}$ we have $\alpha_{\operatorname{id}_{y}, f}=\alpha_{y} \star \operatorname{id}_{\varphi(f)}$ :

$$
\varphi(x) \xrightarrow[\varphi(f)]{\stackrel{\varphi(f)}{\downarrow \operatorname{lid}_{\varphi(f)}}} \varphi(y) \xrightarrow[\varphi\left(\operatorname{id}_{y}\right)]{\downarrow \alpha_{y}} \varphi(y)=\varphi(x) \underset{\varphi\left(\operatorname{id}_{y}\right) \circ \varphi(f)}{\downarrow \alpha_{\mathrm{id}_{y}, f}} \varphi(y)
$$

(c) for any morphism $f: x \rightarrow y$ in $\mathcal{A}$ we have $\alpha_{f, \mathrm{id}_{x}}=\operatorname{id}_{\varphi(f)} \star \alpha_{x}$,
(d) for any triple of composable morphisms $f: w \rightarrow x, g: x \rightarrow y$, and $h: y \rightarrow z$ of $\mathcal{A}$ we have

$$
\left(\operatorname{id}_{\varphi(h)} \star \alpha_{g, f}\right) \circ \alpha_{h, g \circ f}=\left(\alpha_{h, g} \star \operatorname{id}_{\varphi(f)}\right) \circ \alpha_{h \circ g, f}
$$

in other words the following diagram with objects 1-morphisms and arrows 2-morphisms commutes

Again this is not a very workable notion, but it does sometimes come up. There is a theorem that says that any pseudo-functor is isomorphic to a functor. Finally, there are the notions of functor between 2-categories, and pseudo functor between 2 -categories. This last notion leads us into 3 -category territory. We would like to avoid having to define this at almost any cost!

### 4.29. (2, 1)-categories

02X8 Some 2-categories have the property that all 2-morphisms are isomorphisms. These will play an important role in the following, and they are easier to work with.

003I Definition 4.29.1. A (strict) $(2,1)$-category is a 2-category in which all 2-morphisms are isomorphisms.

003 K Example 4.29.2. The 2-category Cat, see Remark 4.28.3. can be turned into a $(2,1)$-category by only allowing isomorphisms of functors as 2 -morphisms.

In fact, more generally any 2 -category $\mathcal{C}$ produces a $(2,1)$-category by considering the sub 2 -category $\mathcal{C}^{\prime}$ with the same objects and 1 -morphisms but whose 2 morphisms are the invertible 2 -morphisms of $\mathcal{C}$. In this situation we will say "let $\mathcal{C}^{\prime}$ be the $(2,1)$-category associated to $\mathcal{C}$ " or similar. For example, the $(2,1)$-category of groupoids means the 2-category whose objects are groupoids, whose 1-morphisms are functors and whose 2-morphisms are isomorphisms of functors. Except that this is a bad example as a transformation between functors between groupoids is automatically an isomorphism!

003M Remark 4.29.3. Thus there are variants of the construction of Example 4.29 .2 above where we look at the 2-category of groupoids, or categories fibred in groupoids over a fixed category, or stacks. And so on.

### 4.30. 2-fibre products

003 O In this section we introduce 2-fibre products. Suppose that $\mathcal{C}$ is a 2-category. We say that a diagram

2-commutes if the two 1-morphisms $w \rightarrow y \rightarrow z$ and $w \rightarrow x \rightarrow z$ are 2-isomorphic. In a 2-category it is more natural to ask for 2-commutativity of diagrams than for actually commuting diagrams. (Indeed, some may say that we should not work with strict 2-categories at all, and in a "weak" 2-category the notion of a commutative diagram of 1-morphisms does not even make sense.) Correspondingly the notion of a fibre product has to be adjusted.

Let $\mathcal{C}$ be a 2-category. Let $x, y, z \in \operatorname{Ob}(\mathcal{C})$ and $f \in \operatorname{Mor}_{\mathcal{C}}(x, z)$ and $g \in \operatorname{Mor}_{\mathcal{C}}(y, z)$. In order to define the 2 -fibre product of $f$ and $g$ we are going to look at 2commutative diagrams

Now in the case of categories, the fibre product is a final object in the category of such diagrams. Correspondingly a 2 -fibre product is a final object in a 2 -category (see definition below). The 2-category of 2-commutative diagrams is the 2-category defined as follows:
(1) Objects are quadruples $(w, a, b, \phi)$ as above where $\phi$ is an invertible 2morphism $\phi: f \circ a \rightarrow g \circ b$,
(2) 1-morphisms from $\left(w^{\prime}, a^{\prime}, b^{\prime}, \phi^{\prime}\right)$ to $(w, a, b, \phi)$ are given by $\left(k: w^{\prime} \rightarrow w, \alpha\right.$ : $\left.a^{\prime} \rightarrow a \circ k, \beta: b^{\prime} \rightarrow b \circ k\right)$ such that

is commutative,
(3) given a second 1-morphism $\left(k^{\prime}, \alpha^{\prime}, \beta^{\prime}\right):\left(w^{\prime \prime}, a^{\prime \prime}, b^{\prime \prime}, \phi^{\prime \prime}\right) \rightarrow\left(w^{\prime}, \alpha^{\prime}, \beta^{\prime}, \phi^{\prime}\right)$ the composition of 1 -morphisms is given by the rule

$$
(k, \alpha, \beta) \circ\left(k^{\prime}, \alpha^{\prime}, \beta^{\prime}\right)=\left(k \circ k^{\prime},\left(\alpha \star \operatorname{id}_{k^{\prime}}\right) \circ \alpha^{\prime},\left(\beta \star \operatorname{id}_{k^{\prime}}\right) \circ \beta^{\prime}\right)
$$

(4) a 2 -morphism between 1 -morphisms $\left(k_{i}, \alpha_{i}, \beta_{i}\right), i=1,2$ with the same source and target is given by a 2 -morphism $\delta: k_{1} \rightarrow k_{2}$ such that

commute,
(5) vertical composition of 2-morphisms is given by vertical composition of the morphisms $\delta$ in $\mathcal{C}$, and
(6) horizontal composition of the diagram

$$
\left(w^{\prime \prime}, a^{\prime \prime}, b^{\prime \prime}, \phi^{\prime \prime}\right) \xrightarrow[\left(k_{2}^{\prime}, \alpha_{2}^{\prime}, \beta_{2}^{\prime}\right)]{\Downarrow \delta^{\prime}}\left(w^{\prime}, a^{\prime}, b^{\prime}, \phi^{\prime}\right) \xrightarrow[\left(k_{2}, \alpha_{2}, \beta_{2}\right)]{\Downarrow{ }^{\left(k_{1}^{\prime}, \alpha_{1}^{\prime}, \beta_{1}^{\prime}\right)}} \stackrel{\left(k_{1}, \alpha_{1}, \beta_{1}\right)}{\Downarrow}(w, a, b, \phi)
$$

is given by the diagram

$$
\left(w^{\prime \prime}, a^{\prime \prime}, b^{\prime \prime}, \phi^{\prime \prime}\right) \xrightarrow{\left(k_{1} \circ k_{1}^{\prime},\left(\alpha_{1} \star \mathrm{id}_{k_{1}^{\prime}}\right) \circ \alpha_{1}^{\prime},\left(\beta_{1} \star \mathrm{id}_{k_{1}^{\prime}}\right) \circ \beta_{1}^{\prime}\right)} \underset{\left(k_{2} \circ k_{2}^{\prime},\left(\alpha_{2} \star \mathrm{id}_{k_{2}^{\prime}}\right) \circ \alpha_{2}^{\prime},\left(\beta_{2} \star \mathrm{id}_{k_{2}^{\prime}}\right) \circ \beta_{2}^{\prime}\right)}{ }(w, a, b, \phi)
$$

Note that if $\mathcal{C}$ is actually a $(2,1)$-category, the morphisms $\alpha$ and $\beta$ in (2) above are automatically also isomorphisms ${ }^{4}$. In addition the 2 -category of 2 -commutative diagrams is also a $(2,1)$-category if $\mathcal{C}$ is a $(2,1)$-category.
003P Definition 4.30.1. A final object of a $(2,1)$-category $\mathcal{C}$ is an object $x$ such that
(1) for every $y \in \operatorname{Ob}(\mathcal{C})$ there is a morphism $y \rightarrow x$, and
(2) every two morphisms $y \rightarrow x$ are isomorphic by a unique 2-morphism.

Likely, in the more general case of 2-categories there are different flavours of final objects. We do not want to get into this and hence we only define 2 -fibre products in the $(2,1)$-case.
003 Q Definition 4.30.2. Let $\mathcal{C}$ be a (2,1)-category. Let $x, y, z \in \operatorname{Ob}(\mathcal{C})$ and $f \in$ $\operatorname{Mor}_{\mathcal{C}}(x, z)$ and $g \in \operatorname{Mor}_{\mathcal{C}}(y, z)$. A 2-fibre product of $f$ and $g$ is a final object in the category of 2 -commutative diagrams described above. If a 2 -fibre product exists we will denote it $x \times_{z} y \in \operatorname{Ob}(\mathcal{C})$, and denote the required morphisms $p \in$ $\operatorname{Mor}_{\mathcal{C}}\left(x \times_{z} y, x\right)$ and $q \in \operatorname{Mor}_{\mathcal{C}}\left(x \times_{z} y, y\right)$ making the diagram

2-commute and we will denote the given invertible 2 -morphism exhibiting this by $\psi: f \circ p \rightarrow g \circ q$.
Thus the following universal property holds: for any $w \in \operatorname{Ob}(\mathcal{C})$ and morphisms $a \in \operatorname{Mor}_{\mathcal{C}}(w, x)$ and $b \in \operatorname{Mor}_{\mathcal{C}}(w, y)$ with a given 2-isomorphism $\phi: f \circ a \rightarrow g \circ b$ there is a $\gamma \in \operatorname{Mor}_{\mathcal{C}}\left(w, x \times_{z} y\right)$ making the diagram

[^4]2-commute such that for suitable choices of $a \rightarrow p \circ \gamma$ and $b \rightarrow q \circ \gamma$ the diagram

commutes. Moreover $\gamma$ is unique up to isomorphism. Of course the exact properties are finer than this. All of the cases of 2 -fibre products that we will need later on come from the following example of 2-fibre products in the 2-category of categories.

003R Example 4.30.3. Let $\mathcal{A}, \mathcal{B}$, and $\mathcal{C}$ be categories. Let $F: \mathcal{A} \rightarrow \mathcal{C}$ and $G: \mathcal{B} \rightarrow \mathcal{C}$ be functors. We define a category $\mathcal{A} \times \mathcal{C} \mathcal{B}$ as follows:
(1) an object of $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is a triple $(A, B, f)$, where $A \in \operatorname{Ob}(\mathcal{A}), B \in \operatorname{Ob}(\mathcal{B})$, and $f: F(A) \rightarrow G(B)$ is an isomorphism in $\mathcal{C}$,
(2) a morphism $(A, B, f) \rightarrow\left(A^{\prime}, B^{\prime}, f^{\prime}\right)$ is given by a pair $(a, b)$, where $a$ : $A \rightarrow A^{\prime}$ is a morphism in $\mathcal{A}$, and $b: B \rightarrow B^{\prime}$ is a morphism in $\mathcal{B}$ such that the diagram

is commutative.
Moreover, we define functors $p: \mathcal{A} \times_{\mathcal{C}} \mathcal{B} \rightarrow \mathcal{A}$ and $q: \mathcal{A} \times_{\mathcal{C}} \mathcal{B} \rightarrow \mathcal{B}$ by setting

$$
p(A, B, f)=A, \quad q(A, B, f)=B
$$

in other words, these are the forgetful functors. We define a transformation of functors $\psi: F \circ p \rightarrow G \circ q$. On the object $\xi=(A, B, f)$ it is given by $\psi_{\xi}=f:$ $F(p(\xi))=F(A) \rightarrow G(B)=G(q(\xi))$.

02X9 Lemma 4.30.4. In the $(2,1)$-category of categories 2 -fibre products exist and are given by the construction of Example 4.30.3.
Proof. Let us check the universal property: let $\mathcal{W}$ be a category, let $a: \mathcal{W} \rightarrow \mathcal{A}$ and $b: \mathcal{W} \rightarrow \mathcal{B}$ be functors, and let $t: F \circ a \rightarrow G \circ b$ be an isomorphism of functors.
Consider the functor $\gamma: \mathcal{W} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ given by $W \mapsto\left(a(W), b(W), t_{W}\right)$. (Check this is a functor omitted.) Moreover, consider $\alpha: a \rightarrow p \circ \gamma$ and $\beta: b \rightarrow q \circ \gamma$ obtained from the identities $p \circ \gamma=a$ and $q \circ \gamma=b$. Then it is clear that $(\gamma, \alpha, \beta)$ is a morphism from $(W, a, b, t)$ to $\left(\mathcal{A} \times_{\mathcal{C}} \mathcal{B}, p, q, \psi\right)$.
Let $\left(k, \alpha^{\prime}, \beta^{\prime}\right):(W, a, b, t) \rightarrow\left(\mathcal{A} \times_{\mathcal{C}} \mathcal{B}, p, q, \psi\right)$ be a second such morphism. For an object $W$ of $\mathcal{W}$ let us write $k(W)=\left(a_{k}(W), b_{k}(W), t_{k, W}\right)$. Hence $p(k(W))=a_{k}(W)$ and so on. The map $\alpha^{\prime}$ corresponds to functorial maps $\alpha^{\prime}: a(W) \rightarrow a_{k}(W)$. Since we are working in the $(2,1)$-category of categories, in fact each of the maps $a(W) \rightarrow a_{k}(W)$ is an isomorphism. We can use these (and their counterparts $\left.b(W) \rightarrow b_{k}(W)\right)$ to get isomorphisms

$$
\delta_{W}: \gamma(W)=\left(a(W), b(W), t_{W}\right) \longrightarrow\left(a_{k}(W), b_{k}(W), t_{k, W}\right)=k(W) .
$$

It is straightforward to show that $\delta$ defines a 2 -isomorphism between $\gamma$ and $k$ in the 2-category of 2-commutative diagrams as desired.

06RL Remark 4.30.5. Let $\mathcal{A}, \mathcal{B}$, and $\mathcal{C}$ be categories. Let $F: \mathcal{A} \rightarrow \mathcal{C}$ and $G: \mathcal{B} \rightarrow \mathcal{C}$ be functors. Another, slightly more symmetrical, construction of a 2 -fibre product $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is as follows. An object is a quintuple $(A, B, C, a, b)$ where $A, B, C$ are objects of $\mathcal{A}, \mathcal{B}, \mathcal{C}$ and where $a: F(A) \rightarrow C$ and $b: G(B) \rightarrow C$ are isomorphisms. A morphism $(A, B, C, a, b) \rightarrow\left(A^{\prime}, B^{\prime}, C^{\prime}, a^{\prime}, b^{\prime}\right)$ is given by a triple of morphisms $A \rightarrow A^{\prime}, B \rightarrow B^{\prime}, C \rightarrow C^{\prime}$ compatible with the morphisms $a, b, a^{\prime}, b^{\prime}$. We can prove directly that this leads to a 2-fibre product. However, it is easier to observe that the functor $(A, B, C, a, b) \mapsto\left(A, B, b^{-1} \circ a\right)$ gives an equivalence from the category of quintuples to the category constructed in Example 4.30.3.

02XA Lemma 4.30.6. Let

be a 2-commutative diagram of categories. A choice of isomorphisms $\alpha: G \circ K \rightarrow$ $M \circ I$ and $\beta: M \circ H \rightarrow F \circ L$ determines a morphism

$$
\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \longrightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}
$$

of 2-fibre products associated to this situation.
Proof. Just use the functor

$$
(X, Y, \phi) \longmapsto\left(L(X), K(Y), \alpha_{Y}^{-1} \circ M(\phi) \circ \beta_{X}^{-1}\right)
$$

on objects and

$$
(a, b) \longmapsto(L(a), K(b))
$$

on morphisms.
02XB Lemma 4.30.7. Assumptions as in Lemma 4.30.6.
(1) If $K$ and $L$ are faithful then the morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is faithful.
(2) If $K$ and $L$ are fully faithful and $M$ is faithful then the morphism $\mathcal{X} \times \mathcal{Z}$ $\mathcal{Y} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is fully faithful.
(3) If $K$ and $L$ are equivalences and $M$ is fully faithful then the morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \rightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is an equivalence.
Proof. Let $(X, Y, \phi)$ and $\left(X^{\prime}, Y^{\prime}, \phi^{\prime}\right)$ be objects of $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y}$. Set $Z=H(X)$ and identify it with $I(Y)$ via $\phi$. Also, identify $M(Z)$ with $F(L(X))$ via $\alpha_{X}$ and identify $M(Z)$ with $G(K(Y))$ via $\beta_{Y}$. Similarly for $Z^{\prime}=H\left(X^{\prime}\right)$ and $M\left(Z^{\prime}\right)$. The map on morphisms is the map

Hence parts (1) and (2) follow. Moreover, if $K$ and $L$ are equivalences and $M$ is fully faithful, then any object $(A, B, \phi)$ is in the essential image for the following reasons: Pick $X, Y$ such that $L(X) \cong A$ and $K(Y) \cong B$. Then the fully faithfulness
of $M$ guarantees that we can find an isomorphism $H(X) \cong I(Y)$. Some details omitted.

02XC Lemma 4.30.8. Let

be a diagram of categories and functors. Then there is a canonical isomorphism

$$
\left(\mathcal{A} \times_{\mathcal{B}} \mathcal{C}\right) \times_{\mathcal{D}} \mathcal{E} \cong \mathcal{A} \times_{\mathcal{B}}\left(\mathcal{C} \times_{\mathcal{D}} \mathcal{E}\right)
$$

of categories.
Proof. Just use the functor

$$
((A, C, \phi), E, \psi) \longmapsto(A,(C, E, \psi), \phi)
$$

if you know what I mean.
Henceforth we do not write the parentheses when dealing with fibred products of more than 2 categories.

04S7 Lemma 4.30.9. Let

be a commutative diagram of categories and functors. Then there is a canonical functor

$$
p r_{02}: \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{D}} \mathcal{E} \longrightarrow \mathcal{A} \times_{\mathcal{F}} \mathcal{E}
$$

of categories.
Proof. If we write $\mathcal{A} \times{ }_{\mathcal{B}} \mathcal{C} \times{ }_{\mathcal{D}} \mathcal{E}$ as $\left(\mathcal{A} \times{ }_{\mathcal{B}} \mathcal{C}\right) \times{ }_{\mathcal{D}} \mathcal{E}$ then we can just use the functor

$$
((A, C, \phi), E, \psi) \longmapsto(A, E, G(\psi) \circ F(\phi))
$$

if you know what I mean.
02XD Lemma 4.30.10. Let

$$
\mathcal{A} \rightarrow \mathcal{B} \leftarrow \mathcal{C} \leftarrow \mathcal{D}
$$

be a diagram of categories and functors. Then there is a canonical isomorphism

$$
\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times \mathcal{C} \mathcal{D} \cong \mathcal{A} \times_{\mathcal{B}} \mathcal{D}
$$

of categories.
Proof. Omitted.
We claim that this means you can work with these 2 -fibre products just like with ordinary fibre products. Here are some further lemmas that actually come up later.

02XE Lemma 4.30.11. Let

be a 2 -fibre product of categories. Then there is a canonical isomorphism $\mathcal{C}_{3} \cong$ $\mathcal{C}_{1} \times{ }_{G_{1}, \mathcal{S}, G_{2}} \mathcal{C}_{2}$.
Proof. We may assume that $\mathcal{C}_{3}$ is the category $\left(\mathcal{C}_{1} \times \mathcal{C}_{2}\right) \times{ }_{\mathcal{S}} \times \mathcal{S} \mathcal{S}$ constructed in Example 4.30.3. Hence an object is a triple $\left(\left(X_{1}, X_{2}\right), S, \phi\right)$ where $\phi=\left(\phi_{1}, \phi_{2}\right)$ : $\left(G_{1}\left(X_{1}\right), G_{2}\left(X_{2}\right)\right) \rightarrow(S, S)$ is an isomorphism. Thus we can associate to this the triple $\left(X_{1}, X_{2}, \phi_{2}^{-1} \circ \phi_{1}\right)$. Conversely, if $\left(X_{1}, X_{2}, \psi\right)$ is an object of $\mathcal{C}_{1} \times{ }_{G_{1}, \mathcal{S}, G_{2}} \mathcal{C}_{2}$, then we can associate to this the triple $\left(\left(X_{1}, X_{2}\right), G_{2}\left(X_{2}\right),\left(\psi, \mathrm{id}_{G_{2}\left(X_{2}\right)}\right)\right)$. We claim these constructions given mutually inverse functors. We omit describing how to deal with morphisms and showing they are mutually inverse.
02XF Lemma 4.30.12. Let

be a 2-fibre product of categories. Then there is a canonical isomorphism

$$
\mathcal{C}^{\prime} \cong\left(\mathcal{C} \times_{G_{1}, \mathcal{S}, G_{2}} \mathcal{C}\right) \times \times_{(p, q), \mathcal{C} \times \mathcal{C}, \Delta} \mathcal{C}
$$

Proof. An object of the right hand side is given by $\left(\left(C_{1}, C_{2}, \phi\right), C_{3}, \psi\right)$ where $\phi$ : $G_{1}\left(C_{1}\right) \rightarrow G_{2}\left(C_{2}\right)$ is an isomorphism and $\psi=\left(\psi_{1}, \psi_{2}\right):\left(C_{1}, C_{2}\right) \rightarrow\left(C_{3}, C_{3}\right)$ is an isomorphism. Hence we can associate to this the triple $\left(C_{3}, G_{1}\left(C_{1}\right),\left(G_{1}\left(\psi_{1}^{-1}\right), \phi^{-1} \circ\right.\right.$ $\left.G_{2}\left(\psi_{2}^{-1}\right)\right)$ ) which is an object of $\mathcal{C}^{\prime}$. Details omitted.

04 Z 1 Lemma 4.30.13. Let $\mathcal{A} \rightarrow \mathcal{C}, \mathcal{B} \rightarrow \mathcal{C}$ and $\mathcal{C} \rightarrow \mathcal{D}$ be functors between categories. Then the diagram

is a 2-fibre product diagram.
Proof. Omitted.
04YR Lemma 4.30.14. Let

be a 2-fibre product of categories. Then the diagram

4.31. CATEGORIES OVER CATEGORIES
is 2-cartesian.
Proof. This is a purely 2-category theoretic statement, valid in any (2,1)-category with 2-fibre products. Explicitly, it follows from the following chain of equivalences:

$$
\begin{aligned}
\mathcal{X} \times_{(\mathcal{X} \times \mathcal{Y} \mathcal{X})}(\mathcal{U} \times \mathcal{V} \mathcal{U}) & =\mathcal{X} \times_{(\mathcal{X} \times \mathcal{Y} \mathcal{X})}\left((\mathcal{X} \times \mathcal{Y} \mathcal{V}) \times_{\mathcal{V}}(\mathcal{X} \times \mathcal{Y} \mathcal{V})\right) \\
& =\mathcal{X} \times_{(\mathcal{X} \times \mathcal{Y} \mathcal{X})}(\mathcal{X} \times \mathcal{Y} \mathcal{X} \times \mathcal{Y} \mathcal{V}) \\
& =\mathcal{X} \times_{\mathcal{Y}} \mathcal{V}=\mathcal{U}
\end{aligned}
$$

see Lemmas 4.30 .8 and 4.30.10.

### 4.31. Categories over categories

02 XG In this section we have a functor $p: \mathcal{S} \rightarrow \mathcal{C}$. We think of $\mathcal{S}$ as being on top and of $\mathcal{C}$ as being at the bottom. To make sure that everybody knows what we are talking about we define the 2 -category of categories over $\mathcal{C}$.

003 Y Definition 4.31.1. Let $\mathcal{C}$ be a category. The 2 -category of categories over $\mathcal{C}$ is the 2-category defined as follows:
(1) Its objects will be functors $p: \mathcal{S} \rightarrow \mathcal{C}$.
(2) Its 1 -morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$.
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\operatorname{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.
In this situation we will denote

$$
\operatorname{Mor}_{C a t / \mathcal{C}}\left(\mathcal{S}, \mathcal{S}^{\prime}\right)
$$

the category of 1-morphisms between $(\mathcal{S}, p)$ and $\left(\mathcal{S}^{\prime}, p^{\prime}\right)$
In this 2-category we define horizontal and vertical composition exactly as is done for Cat in Section 4.27. The axioms of a 2-category are satisfied for the same reason that the hold in Cat. To see this one can also use that the axioms hold in Cat and verify things such as "vertical composition of 2 -morphisms over $\mathcal{C}$ gives another 2-morphism over $\mathcal{C}$ ". This is clear.
Analogously to the fibre of a map of spaces, we have the notion of a fibre category, and some notions of lifting associated to this situation.

02XH Definition 4.31.2. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$.
(1) The fibre category over an object $U \in \operatorname{Ob}(\mathcal{C})$ is the category $\mathcal{S}_{U}$ with objects

$$
\operatorname{Ob}\left(\mathcal{S}_{U}\right)=\{x \in \mathrm{Ob}(\mathcal{S}): p(x)=U\}
$$

and morphisms

$$
\operatorname{Mor}_{\mathcal{S}_{U}}(x, y)=\left\{\phi \in \operatorname{Mor}_{\mathcal{S}}(x, y): p(\phi)=\operatorname{id}_{U}\right\}
$$

(2) A lift of an object $U \in \operatorname{Ob}(\mathcal{C})$ is an object $x \in \operatorname{Ob}(\mathcal{S})$ such that $p(x)=U$, i.e., $x \in \mathrm{Ob}\left(\mathcal{S}_{U}\right)$. We will also sometime say that $x$ lies over $U$.
(3) Similarly, a lift of a morphism $f: V \rightarrow U$ in $\mathcal{C}$ is a morphism $\phi: y \rightarrow x$ in $\mathcal{S}$ such that $p(\phi)=f$. We sometimes say that $\phi$ lies over $f$.

There are some observations we could make here. For example if $F:(\mathcal{S}, p) \rightarrow$ $\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ is a 1-morphism of categories over $\mathcal{C}$, then $F$ induces functors of fibre categories $F: \mathcal{S}_{U} \rightarrow \mathcal{S}_{U}^{\prime}$. Similarly for 2 -morphisms.

Here is the obligatory lemma describing the 2 -fibre product in the $(2,1)$-category of categories over $\mathcal{C}$.

0040 Lemma 4.31.3. Let $\mathcal{C}$ be a category. The $(2,1)$-category of categories over $\mathcal{C}$ has 2-fibre products. Suppose that $F: \mathcal{X} \rightarrow \mathcal{S}$ and $G: \mathcal{Y} \rightarrow \mathcal{S}$ are morphisms of categories over $\mathcal{C}$. An explicit 2-fibre product $\mathcal{X} \times \mathcal{S} \mathcal{Y}$ is given by the following description
(1) an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is a quadruple $(U, x, y, f)$, where $U \in \operatorname{Ob}(\mathcal{C}), x \in$ $\operatorname{Ob}\left(\mathcal{X}_{U}\right), y \in \operatorname{Ob}\left(\mathcal{Y}_{U}\right)$, and $f: F(x) \rightarrow G(y)$ is an isomorphism in $\mathcal{S}_{U}$,
(2) a morphism $(U, x, y, f) \rightarrow\left(U^{\prime}, x^{\prime}, y^{\prime}, f^{\prime}\right)$ is given by a pair $(a, b)$, where $a: x \rightarrow x^{\prime}$ is a morphism in $\mathcal{X}$, and $b: y \rightarrow y^{\prime}$ is a morphism in $\mathcal{Y}$ such that
(a) $a$ and $b$ induce the same morphism $U \rightarrow U^{\prime}$, and
(b) the diagram

is commutative.
The functors $p: \mathcal{X} \times{ }_{\mathcal{S}} \mathcal{Y} \rightarrow \mathcal{X}$ and $q: \mathcal{X} \times{ }_{\mathcal{S}} \mathcal{Y} \rightarrow \mathcal{Y}$ are the forgetful functors in this case. The transformation $\psi: F \circ p \rightarrow G \circ q$ is given on the object $\xi=(U, x, y, f)$ by $\psi_{\xi}=f: F(p(\xi))=F(x) \rightarrow G(y)=G(q(\xi))$.

Proof. Let us check the universal property: let $p_{\mathcal{W}}: \mathcal{W} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$, let $X: \mathcal{W} \rightarrow \mathcal{X}$ and $Y: \mathcal{W} \rightarrow \mathcal{Y}$ be functors over $\mathcal{C}$, and let $t: F \circ X \rightarrow G \circ Y$ be an isomorphism of functors over $\mathcal{C}$. The desired functor $\gamma: \mathcal{W} \rightarrow \mathcal{X} \times \mathcal{S} \mathcal{Y}$ is given by $W \mapsto\left(p_{\mathcal{W}}(W), X(W), Y(W), t_{W}\right)$. Details omitted; compare with Lemma 4.30 .4 .

02XI Lemma 4.31.4. Let $\mathcal{C}$ be a category. Let $f: \mathcal{X} \rightarrow \mathcal{S}$ and $g: \mathcal{Y} \rightarrow \mathcal{S}$ be morphisms of categories over $\mathcal{C}$. For any object $U$ of $\mathcal{C}$ we have the following identity of fibre categories

$$
(\mathcal{X} \times \mathcal{S} \mathcal{Y})_{U}=\mathcal{X}_{U} \times_{\mathcal{S}_{U}} \mathcal{Y}_{U}
$$

Proof. Omitted.

### 4.32. Fibred categories

02XJ A very brief discussion of fibred categories is warranted.
Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$. Given an object $x \in \mathcal{S}$ with $p(x)=U$, and given a morphism $f: V \rightarrow U$, we can try to take some kind of "fibre product $V \times_{U} x$ " (or a base change of $x$ via $V \rightarrow U$ ). Namely, a morphism from an object $z \in \mathcal{S}$ into " $V \times_{U} x$ " should be given by a pair $(\varphi, g)$, where $\varphi: z \rightarrow x, g: p(z) \rightarrow V$
such that $p(\varphi)=f \circ g$. Pictorially:

If such a morphism $V \times_{U} x \rightarrow x$ exists then it is called a strongly cartesian morphism.

02XK Definition 4.32.1. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$. A strongly cartesian morphism, or more precisely a strongly $\mathcal{C}$-cartesian morphism is a morphism $\varphi: y \rightarrow x$ of $\mathcal{S}$ such that for every $z \in \operatorname{Ob}(\mathcal{S})$ the map

$$
\operatorname{Mor}_{\mathcal{S}}(z, y) \longrightarrow \operatorname{Mor}_{\mathcal{S}}(z, x) \times_{\operatorname{Mor}_{\mathcal{C}}(p(z), p(x))} \operatorname{Mor}_{\mathcal{C}}(p(z), p(y)),
$$

given by $\psi \longmapsto(\varphi \circ \psi, p(\psi))$ is bijective.
Note that by the Yoneda Lemma 4.3.5 given $x \in \operatorname{Ob}(\mathcal{S})$ lying over $U \in \mathrm{Ob}(\mathcal{C})$ and the morphism $f: V \rightarrow U$ of $\mathcal{C}$, if there is a strongly cartesian morphism $\varphi: y \rightarrow x$ with $p(\varphi)=f$, then $(y, \varphi)$ is unique up to unique isomorphism. This is clear from the definition above, as the functor

$$
z \longmapsto \operatorname{Mor}_{\mathcal{S}}(z, x) \times_{\operatorname{Mor}(p(z), U)} \operatorname{Mor}_{\mathcal{C}}(p(z), V)
$$

only depends on the data $(x, U, f: V \rightarrow U)$. Hence we will sometimes use $V \times_{U} x \rightarrow$ $x$ or $f^{*} x \rightarrow x$ to denote a strongly cartesian morphism which is a lift of $f$.

02XL Lemma 4.32.2. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$.
(1) The composition of two strongly cartesian morphisms is strongly cartesian.
(2) Any isomorphism of $\mathcal{S}$ is strongly cartesian.
(3) Any strongly cartesian morphism $\varphi$ such that $p(\varphi)$ is an isomorphism, is an isomorphism.

Proof. Proof of (1). Let $\varphi: y \rightarrow x$ and $\psi: z \rightarrow y$ be strongly cartesian. Let $t$ be an arbitrary object of $\mathcal{S}$. Then we have

```
\(\operatorname{Mor}_{\mathcal{S}}(t, z)\)
\(=\operatorname{Mor}_{\mathcal{S}}(t, y) \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(y))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(z))\)
\(=\operatorname{Mor}_{\mathcal{S}}(t, x) \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(x))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(y)) \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(y))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(z))\)
\(=\operatorname{Mor}_{\mathcal{S}}(t, x) \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(x))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(z))\)
```

hence $z \rightarrow x$ is strongly cartesian.
Proof of (2). Let $y \rightarrow x$ be an isomorphism. Then $p(y) \rightarrow p(x)$ is an isomorphism too. Hence $\operatorname{Mor}_{\mathcal{C}}(p(z), p(y)) \rightarrow \operatorname{Mor}_{\mathcal{C}}(p(z), p(x))$ is a bijection. Hence $\operatorname{Mor}_{\mathcal{S}}(z, x) \times_{\operatorname{Mor}_{\mathcal{C}}(p(z), p(x))} \operatorname{Mor}_{\mathcal{C}}(p(z), p(y))$ is bijective to $\operatorname{Mor}_{\mathcal{S}}(z, x)$. Hence the displayed map of Definition 4.32.1 is a bijection as $y \rightarrow x$ is an isomorphism, and we conclude that $y \rightarrow x$ is strongly cartesian.
Proof of (3). Assume $\varphi: y \rightarrow x$ is strongly cartesian with $p(\varphi): p(y) \rightarrow p(x)$ an isomorphism. Applying the definition with $z=x$ shows that $\left(\mathrm{id}_{x}, p(\varphi)^{-1}\right)$ comes from a unique morphism $\chi: x \rightarrow y$. We omit the verification that $\chi$ is the inverse of $\varphi$.

09WU Lemma 4.32.3. Let $F: \mathcal{A} \rightarrow \mathcal{B}$ and $G: \mathcal{B} \rightarrow \mathcal{C}$ be composable functors between categories. Let $x \rightarrow y$ be a morphism of $\mathcal{A}$. If $x \rightarrow y$ is strongly $\mathcal{B}$-cartesian and $F(x) \rightarrow F(y)$ is strongly $\mathcal{C}$-cartesian, then $x \rightarrow y$ is strongly $\mathcal{C}$-cartesian.

Proof. This follows directly from the definition.

06N4 Lemma 4.32.4. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$. Let $x \rightarrow y$ and $z \rightarrow y$ be morphisms of $\mathcal{S}$. Assume
(1) $x \rightarrow y$ is strongly cartesian,
(2) $p(x) \times_{p(y)} p(z)$ exists, and
(3) there exists a strongly cartesian morphism $a: w \rightarrow z$ in $\mathcal{S}$ with $p(w)=$ $p(x) \times_{p(y)} p(z)$ and $p(a)=p r_{2}: p(x) \times_{p(y)} p(z) \rightarrow p(z)$.
Then the fibre product $x \times_{y} z$ exists and is isomorphic to $w$.
Proof. Since $x \rightarrow y$ is strongly cartesian there exists a unique morphism $b: w \rightarrow x$ such that $p(b)=\mathrm{pr}_{1}$. To see that $w$ is the fibre product we compute

$$
\begin{aligned}
& \operatorname{Mor}_{\mathcal{S}}(t, w) \\
& =\operatorname{Mor}_{\mathcal{S}}(t, z) \times \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(z))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(w)) \\
& =\operatorname{Mor}_{\mathcal{S}}(t, z) \times \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(z))}\left(\operatorname{Mor}_{\mathcal{C}}(p(t), p(x)) \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(y))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(z))\right) \\
& =\operatorname{Mor}_{\mathcal{S}}(t, z) \times \operatorname{Mor}_{\mathcal{C}}(p(t), p(y)) \\
& =\operatorname{Mor}_{\mathcal{C}}(p(t), p(x)) \\
& =\operatorname{Mor}_{\mathcal{S}}(t, z) \times \times_{\operatorname{Mor}_{\mathcal{S}}(t, y)} \operatorname{Mor}_{\mathcal{S}}(t, y) \times_{\operatorname{Mor}_{\mathcal{C}}(p(t), p(y))} \operatorname{Mor}_{\mathcal{C}}(p(t), p(x)) \\
& \operatorname{Mor}_{\mathcal{S}}(t, x)
\end{aligned}
$$

as desired. The first equality holds because $a: w \rightarrow z$ is strongly cartesian and the last equality holds because $x \rightarrow y$ is strongly cartesian.

02XM Definition 4.32.5. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$. We say $\mathcal{S}$ is a fibred category over $\mathcal{C}$ if given any $x \in \operatorname{Ob}(\mathcal{S})$ lying over $U \in \mathrm{Ob}(\mathcal{C})$ and any morphism $f: V \rightarrow U$ of $\mathcal{C}$, there exists a strongly cartesian morphism $f^{*} x \rightarrow x$ lying over $f$.

Assume $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category. For every $f: V \rightarrow U$ and $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$ as in the definition we may choose a strongly cartesian morphism $f^{*} x \rightarrow x$ lying over $f$. By the axiom of choice we may choose $f^{*} x \rightarrow x$ for all $f: V \rightarrow U=p(x)$ simultaneously. We claim that for every morphism $\phi: x \rightarrow x^{\prime}$ in $\mathcal{S}_{U}$ and $f: V \rightarrow U$ there is a unique morphism $f^{*} \phi: f^{*} x \rightarrow f^{*} x^{\prime}$ in $\mathcal{S}_{V}$ such that

commutes. Namely, the arrow exists and is unique because $f^{*} x^{\prime} \rightarrow x^{\prime}$ is strongly cartesian. The uniqueness of this arrow guarantees that $f^{*}$ (now also defined on morphisms) is a functor $f^{*}: \mathcal{S}_{U} \rightarrow \mathcal{S}_{V}$.

02XN Definition 4.32.6. Assume $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category.
(1) A choice of pullback $5^{5}$ for $p: \mathcal{S} \rightarrow \mathcal{C}$ is given by a choice of a strongly cartesian morphism $f^{*} x \rightarrow x$ lying over $f$ for any morphism $f: V \rightarrow U$ of $\mathcal{C}$ and any $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$.
(2) Given a choice of pullbacks, for any morphism $f: V \rightarrow U$ of $\mathcal{C}$ the functor $f^{*}: \mathcal{S}_{U} \rightarrow \mathcal{S}_{V}$ described above is called a pullback functor (associated to the choices $f^{*} x \rightarrow x$ made above).

Of course we may always assume our choice of pullbacks has the property that $\mathrm{id}_{U}^{*} x=x$, although in practice this is a useless property without imposing further assumptions on the pullbacks.

02XO Lemma 4.32.7. Assume $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category. Assume given a choice of pullbacks for $p: \mathcal{S} \rightarrow \mathcal{C}$.
(1) For any pair of composable morphisms $f: V \rightarrow U, g: W \rightarrow V$ there is a unique isomorphism

$$
\alpha_{g, f}:(f \circ g)^{*} \longrightarrow g^{*} \circ f^{*}
$$

as functors $\mathcal{S}_{U} \rightarrow \mathcal{S}_{W}$ such that for every $y \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$ the following diagram commutes

(2) If $f=i d_{U}$, then there is a canonical isomorphism $\alpha_{U}:$ id $\rightarrow\left(i d_{U}\right)^{*}$ as functors $\mathcal{S}_{U} \rightarrow \mathcal{S}_{U}$.
(3) The quadruple $\left(U \mapsto \mathcal{S}_{U}, f \mapsto f^{*}, \alpha_{g, f}, \alpha_{U}\right)$ defines a pseudo functor from $\mathcal{C}^{\text {opp }}$ to the $(2,1)$-category of categories, see Definition 4.28.5.

Proof. In fact, it is clear that the commutative diagram of part (1) uniquely determines the morphism $\left(\alpha_{g, f}\right)_{y}$ in the fibre category $\mathcal{S}_{W}$. It is an isomorphism since both the morphism $(f \circ g)^{*} y \rightarrow y$ and the composition $g^{*} f^{*} y \rightarrow f^{*} y \rightarrow y$ are strongly cartesian morphisms lifting $f \circ g$ (see discussion following Definition 4.32 .1 and Lemma 4.32.2). In the same way, since $\operatorname{id}_{x}: x \rightarrow x$ is clearly strongly cartesian over $\operatorname{id}_{U}$ (with $U=p(x)$ ) we see that there exists an isomorphism $\left(\alpha_{U}\right)_{x}: x \rightarrow\left(\mathrm{id}_{U}\right)^{*} x$. (Of course we could have assumed beforehand that $f^{*} x=x$ whenever $f$ is an identity morphism, but it is better for the sake of generality not to assume this.) We omit the verification that $\alpha_{g, f}$ and $\alpha_{U}$ so obtained are transformations of functors. We also omit the verification of (3).

042 G Lemma 4.32.8. Let $\mathcal{C}$ be a category. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_{1}$ and $\mathcal{S}_{2}$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_{1}$ is fibred over $\mathcal{C}$ if and only if $\mathcal{S}_{2}$ is fibred over $\mathcal{C}$.
Proof. Denote $p_{i}: \mathcal{S}_{i} \rightarrow \mathcal{C}$ the given functors. Let $F: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}, G: \mathcal{S}_{2} \rightarrow \mathcal{S}_{1}$ be functors over $\mathcal{C}$, and let $i: F \circ G \rightarrow \operatorname{id}_{\mathcal{S}_{2}}, j: G \circ F \rightarrow \operatorname{id}_{\mathcal{S}_{1}}$ be isomorphisms of functors over $\mathcal{C}$. We claim that in this case $F$ maps strongly cartesian morphisms to

[^5]strongly cartesian morphisms. Namely, suppose that $\varphi: y \rightarrow x$ is strongly cartesian in $\mathcal{S}_{1}$. Set $f: V \rightarrow U$ equal to $p_{1}(\varphi)$. Suppose that $z^{\prime} \in \operatorname{Ob}\left(\mathcal{S}_{2}\right)$, with $W=p_{2}\left(z^{\prime}\right)$, and we are given $g: W \rightarrow V$ and $\psi^{\prime}: z^{\prime} \rightarrow F(x)$ such that $p_{2}\left(\psi^{\prime}\right)=f \circ g$. Then
$$
\psi=j \circ G\left(\psi^{\prime}\right): G\left(z^{\prime}\right) \rightarrow G(F(x)) \rightarrow x
$$
is a morphism in $\mathcal{S}_{1}$ with $p_{1}(\psi)=f \circ g$. Hence by assumption there exists a unique morphism $\xi: G\left(z^{\prime}\right) \rightarrow y$ lying over $g$ such that $\psi=\varphi \circ \xi$. This in turn gives a morphism
$$
\xi^{\prime}=F(\xi) \circ i^{-1}: z^{\prime} \rightarrow F\left(G\left(z^{\prime}\right)\right) \rightarrow F(y)
$$
lying over $g$ with $\psi^{\prime}=F(\varphi) \circ \xi^{\prime}$. We omit the verification that $\xi^{\prime}$ is unique.
The conclusion from Lemma 4.32 .8 is that equivalences map strongly cartesian morphisms to strongly cartesian morphisms. But this may not be the case for an arbitrary functor between fibred categories over $\mathcal{C}$. Hence we define the 2 -category of fibred categories as follows.

02XP Definition 4.32.9. Let $\mathcal{C}$ be a category. The 2-category of fibred categories over $\mathcal{C}$ is the sub 2-category of the 2-category of categories over $\mathcal{C}$ (see Definition 4.31.1) defined as follows:
(1) Its objects will be fibred categories $p: \mathcal{S} \rightarrow \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$ and such that $G$ maps strongly cartesian morphisms to strongly cartesian morphisms.
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\operatorname{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.
In this situation we will denote

$$
\operatorname{Mor}_{F i b / \mathcal{C}}\left(\mathcal{S}, \mathcal{S}^{\prime}\right)
$$

the category of 1-morphisms between $(\mathcal{S}, p)$ and $\left(\mathcal{S}^{\prime}, p^{\prime}\right)$
Note the condition on 1-morphisms. Note also that this is a true 2-category and not a $(2,1)$-category. Hence when taking 2-fibre products we first pass to the associated (2,1)-category.
02XQ Lemma 4.32.10. Let $\mathcal{C}$ be a category. The $(2,1)$-category of fibred categories over $\mathcal{C}$ has 2-fibre products, and they are described as in Lemma 4.31.3.
Proof. Basically what one has to show here is that given $F: \mathcal{X} \rightarrow \mathcal{S}$ and $G: \mathcal{Y} \rightarrow \mathcal{S}$ morphisms of fibred categories over $\mathcal{C}$, then the category $\mathcal{X} \times \mathcal{S}$ Y described in Lemma 4.31 .3 is fibred. Let us show that $\mathcal{X} \times \mathcal{S} \mathcal{Y}$ has plenty of strongly cartesian morphisms. Namely, suppose we have $(U, x, y, \phi)$ an object of $\mathcal{X} \times{ }_{\mathcal{S}} \mathcal{Y}$. And suppose $f: V \rightarrow U$ is a morphism in $\mathcal{C}$. Choose strongly cartesian morphisms $a: f^{*} x \rightarrow x$ in $\mathcal{X}$ lying over $f$ and $b: f^{*} y \rightarrow y$ in $\mathcal{Y}$ lying over $f$. By assumption $F(a)$ and $G(b)$ are strongly cartesian. Since $\phi: F(x) \rightarrow G(y)$ is an isomorphism, by the uniqueness of strongly cartesian morphisms we find a unique isomorphism $f^{*} \phi$ : $F\left(f^{*} x\right) \rightarrow G\left(f^{*} y\right)$ such that $G(b) \circ f^{*} \phi=\phi \circ F(a)$. In other words $(G(a), G(b))$ : $\left(V, f^{*} x, f^{*} y, f^{*} \phi\right) \rightarrow(U, x, y, \phi)$ is a morphism in $\mathcal{X} \times \mathcal{S} \mathcal{Y}$. We omit the verification that this is a strongly cartesian morphism (and that these are in fact the only strongly cartesian morphisms).
02XR Lemma 4.32.11. Let $\mathcal{C}$ be a category. Let $U \in \operatorname{Ob}(\mathcal{C})$. If $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category and $p$ factors through $p^{\prime}: \mathcal{S} \rightarrow \mathcal{C} / U$ then $p^{\prime}: \mathcal{S} \rightarrow \mathcal{C} / U$ is a fibred category.

Proof. Suppose that $\varphi: x^{\prime} \rightarrow x$ is strongly cartesian with respect to $p$. We claim that $\varphi$ is strongly cartesian with respect to $p^{\prime}$ also. Set $g=p^{\prime}(\varphi)$, so that $g: V^{\prime} / U \rightarrow V / U$ for some morphisms $f: V \rightarrow U$ and $f^{\prime}: V^{\prime} \rightarrow U$. Let $z \in \mathrm{Ob}(\mathcal{S})$. Set $p^{\prime}(z)=(W \rightarrow U)$. To show that $\varphi$ is strongly cartesian for $p^{\prime}$ we have to show

$$
\operatorname{Mor}_{\mathcal{S}}\left(z, x^{\prime}\right) \longrightarrow \operatorname{Mor}_{\mathcal{S}}(z, x) \times_{\operatorname{Mor}_{\mathcal{C} / U}(W / U, V / U)} \operatorname{Mor}_{\mathcal{C} / U}\left(W / U, V^{\prime} / U\right)
$$

given by $\psi^{\prime} \longmapsto\left(\varphi \circ \psi^{\prime}, p^{\prime}\left(\psi^{\prime}\right)\right)$ is bijective. Suppose given an element $(\psi, h)$ of the right hand side, then in particular $g \circ h=p(\psi)$, and by the condition that $\varphi$ is strongly cartesian we get a unique morphism $\psi^{\prime}: z \rightarrow x^{\prime}$ with $\psi=\varphi \circ \psi^{\prime}$ and $p\left(\psi^{\prime}\right)=h$. OK, and now $p^{\prime}\left(\psi^{\prime}\right): W / U \rightarrow V / U$ is a morphism whose corresponding map $W \rightarrow V$ is $h$, hence equal to $h$ as a morphism in $\mathcal{C} / U$. Thus $\psi^{\prime}$ is a unique morphism $z \rightarrow x^{\prime}$ which maps to the given pair $(\psi, h)$. This proves the claim.
Finally, suppose given $g: V^{\prime} / U \rightarrow V / U$ and $x$ with $p^{\prime}(x)=V / U$. Since $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category we see there exists a strongly cartesian morphism $\varphi: x^{\prime} \rightarrow x$ with $p(\varphi)=g$. By the same argument as above it follows that $p^{\prime}(\varphi)=g: V^{\prime} / U \rightarrow V / U$. And as seen above the morphism $\varphi$ is strongly cartesian. Thus the conditions of Definition 4.32.5 are satisfied and we win.

09WV Lemma 4.32.12. Let $\mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C}$ be functors between categories. If $\mathcal{A}$ is fibred over $\mathcal{B}$ and $\mathcal{B}$ is fibred over $\mathcal{C}$, then $\mathcal{A}$ is fibred over $\mathcal{C}$.

Proof. This follows from the definitions and Lemma 4.32.3.
06N5 Lemma 4.32.13. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $x \rightarrow y$ and $z \rightarrow y$ be morphisms of $\mathcal{S}$ with $x \rightarrow y$ strongly cartesian. If $p(x) \times_{p(y)} p(z)$ exists, then $x \times_{y} z$ exists, $p\left(x \times_{y} z\right)=p(x) \times_{p(y)} p(z)$, and $x \times_{y} z \rightarrow z$ is strongly cartesian.

Proof. Pick a strongly cartesian morphism $\mathrm{pr}_{2}^{*} z \rightarrow z$ lying over $\mathrm{pr}_{2}: p(x) \times_{p(y)}$ $p(z) \rightarrow p(z)$. Then $\operatorname{pr}_{2}^{*} z=x \times_{y} z$ by Lemma 4.32.4.

08NF Lemma 4.32.14. Let $\mathcal{C}$ be a category. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of fibred categories over $\mathcal{C}$. There exist 1-morphisms of fibred categories over $\mathcal{C}$

such that $F=v \circ u$ and such that
(1) $u: \mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is fully faithful,
(2) $w$ is left adjoint to $u$, and
(3) $v: \mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a fibred category.

Proof. Denote $p: \mathcal{X} \rightarrow \mathcal{C}$ and $q: \mathcal{Y} \rightarrow \mathcal{C}$ the structure functors. We construct $\mathcal{X}^{\prime}$ explicitly as follows. An object of $\mathcal{X}^{\prime}$ is a quadruple $(U, x, y, f)$ where $x \in$ $\mathrm{Ob}\left(\mathcal{X}_{U}\right), y \in \mathrm{Ob}\left(\mathcal{Y}_{U}\right)$ and $f: y \rightarrow F(x)$ is a morphism in $\mathcal{Y}_{U}$. A morphism $(a, b):(U, x, y, f) \rightarrow\left(U^{\prime}, x^{\prime}, y^{\prime}, f^{\prime}\right)$ is given by $a: x \rightarrow x^{\prime}$ and $b: y \rightarrow y^{\prime}$ with $p(a)=q(b): U \rightarrow U^{\prime}$ and such that $f^{\prime} \circ b=F(a) \circ f$.

Let us make a choice of pullbacks for both $p$ and $q$ and let us use the same notation to indicate them. Let $(U, x, y, f)$ be an object and let $h: V \rightarrow U$ be a morphism. Consider the morphism $c:\left(V, h^{*} x, h^{*} y, h^{*} f\right) \rightarrow(U, x, y, f)$ coming from the given strongly cartesian maps $h^{*} x \rightarrow x$ and $h^{*} y \rightarrow y$. We claim $c$ is strongly cartesian in $\mathcal{X}^{\prime}$ over $\mathcal{C}$. Namely, suppose we are given an object $\left(W, x^{\prime}, y^{\prime}, f^{\prime}\right)$ of $\mathcal{X}^{\prime}$, a morphism $(a, b):\left(W, x^{\prime}, y^{\prime}, f^{\prime}\right) \rightarrow(U, x, y, f)$ lying over $W \rightarrow U$, and a factorization $W \rightarrow$
$V \rightarrow U$ of $W \rightarrow U$ through $h$. As $h^{*} x \rightarrow x$ and $h^{*} y \rightarrow y$ are strongly cartesian we obtain morphisms $a^{\prime}: x^{\prime} \rightarrow h^{*} x$ and $b^{\prime}: y^{\prime} \rightarrow h^{*} y$ lying over the given morphism $W \rightarrow V$. Consider the diagram

The outer rectangle and the right square commute. Since $F$ is a 1-morphism of fibred categories the morphism $F\left(h^{*} x\right) \rightarrow F(x)$ is strongly cartesian. Hence the left square commutes by the universal property of strongly cartesian morphisms. This proves that $\mathcal{X}^{\prime}$ is fibred over $\mathcal{C}$.
The functor $u: \mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is given by $x \mapsto(p(x), x, F(x)$, id). This is fully faithful. The functor $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is given by $(U, x, y, f) \mapsto y$. The functor $w: \mathcal{X}^{\prime} \rightarrow \mathcal{X}$ is given by $(U, x, y, f) \mapsto x$. Each of these functors is a 1-morphism of fibred categories over $\mathcal{C}$ by our description of strongly cartesian morphisms of $\mathcal{X}^{\prime}$ over $\mathcal{C}$. Adjointness of $w$ and $u$ means that

$$
\operatorname{Mor}_{\mathcal{X}}\left(x, x^{\prime}\right)=\operatorname{Mor}_{\mathcal{X}^{\prime}}\left((U, x, y, f),\left(p\left(x^{\prime}\right), x^{\prime}, F\left(x^{\prime}\right), \mathrm{id}\right)\right),
$$

which follows immediately from the definitions.
Finally, we have to show that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a fibred category. Let $c: y^{\prime} \rightarrow y$ be a morphism in $\mathcal{Y}$ and let $(U, x, y, f)$ be an object of $\mathcal{X}^{\prime}$ lying over $y$. Set $V=q\left(y^{\prime}\right)$ and let $h=q(c): V \rightarrow U$. Let $a: h^{*} x \rightarrow x$ and $b: h^{*} y \rightarrow y$ be the strongly cartesian morphisms covering $h$. Since $F$ is a 1-morphism of fibred categories we may identify $h^{*} F(x)=F\left(h^{*} x\right)$ with strongly cartesian morphism $F(a): F\left(h^{*} x\right) \rightarrow F(x)$. By the universal property of $b: h^{*} y \rightarrow y$ there is a morphism $c^{\prime}: y^{\prime} \rightarrow h^{*} y$ in $\mathcal{Y}_{V}$ such that $c=b \circ c^{\prime}$. We claim that

$$
(a, c):\left(V, h^{*} x, y^{\prime}, h^{*} f \circ c^{\prime}\right) \longrightarrow(U, x, y, f)
$$

is strongly cartesian in $\mathcal{X}^{\prime}$ over $\mathcal{Y}$. To see this let $\left(W, x_{1}, y_{1}, f_{1}\right)$ be an object of $\mathcal{X}^{\prime}$, let $\left(a_{1}, b_{1}\right):\left(W, x_{1}, y_{1}, f_{1}\right) \rightarrow(U, x, y, f)$ be a morphism and let $b_{1}=c \circ b_{1}^{\prime}$ for some morphism $b_{1}^{\prime}: y_{1} \rightarrow y^{\prime}$. Then

$$
\left(a_{1}^{\prime}, b_{1}^{\prime}\right):\left(W, x_{1}, y_{1}, f_{1}\right) \longrightarrow\left(V, h^{*} x, y^{\prime}, h^{*} f \circ c^{\prime}\right)
$$

(where $a_{1}^{\prime}: x_{1} \rightarrow h^{*} x$ is the unique morphism lying over the given morphism $q\left(b_{1}^{\prime}\right): W \rightarrow V$ such that $\left.a_{1}=a \circ a_{1}^{\prime}\right)$ is the desired morphism.

### 4.33. Inertia

04 Z 2 Given fibred categories $p: \mathcal{S} \rightarrow \mathcal{C}$ and $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ over a category $\mathcal{C}$ and a 1-morphism $F: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ we have the diagonal morphism

$$
\Delta=\Delta_{\mathcal{S} / \mathcal{S}^{\prime}}: \mathcal{S} \longrightarrow \mathcal{S} \times_{\mathcal{S}^{\prime}} \mathcal{S}
$$

in the $(2,1)$-category of fibred categories over $\mathcal{C}$.
034H Lemma 4.33.1. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be fibred categories. Let $F: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be a 1-morphism of fibred categories over $\mathcal{C}$. Consider the category $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}}$ over $\mathcal{C}$ whose
(1) objects are pairs $(x, \alpha)$ where $x \in \operatorname{Ob}(\mathcal{S})$ and $\alpha: x \rightarrow x$ is an automorphism with $F(\alpha)=i d$,
(2) morphisms $(x, \alpha) \rightarrow(y, \beta)$ are given by morphisms $\phi: x \rightarrow y$ such that

commutes, and
(3) the functor $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \rightarrow \mathcal{C}$ is given by $(x, \alpha) \mapsto p(x)$.

Then
(1)
there is an equivalence

$$
\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \longrightarrow \mathcal{S} \times_{\Delta,\left(\mathcal{S} \times{ }_{\mathcal{S}^{\prime}} \mathcal{S}\right), \Delta} \mathcal{S}
$$

in the $(2,1)$-category of categories over $\mathcal{C}$, and
(2) $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}}$ is a fibred category over $\mathcal{C}$.

Proof. Note that (2) follows from (1) by Lemmas 4.32.10 and 4.32.8. Thus it suffices to prove (1). We will use without further mention the construction of the 2 -fibre product from Lemma 4.32.10. In particular an object of $\mathcal{S} \times \times_{\Delta,\left(\mathcal{S} \times{ }_{\mathcal{S}^{\prime}} \mathcal{S}\right), \Delta} \mathcal{S}$ is a triple $(x, y,(\iota, \kappa))$ where $x$ and $y$ are objects of $\mathcal{S}$, and $(\iota, \kappa):\left(x, x, \operatorname{id}_{F(x)}\right) \rightarrow$ $\left(y, y, \operatorname{id}_{F(y)}\right)$ is an isomorphism in $\mathcal{S} \times \mathcal{S}^{\prime} \mathcal{S}$. This just means that $\iota, \kappa: x \rightarrow y$ are isomorphisms and that $F(\iota)=F(\kappa)$. Consider the functor

$$
I_{\mathcal{S} / \mathcal{S}^{\prime}} \longrightarrow \mathcal{S} \times_{\Delta,\left(\mathcal{S} \times{ }_{\mathcal{S}^{\prime}} \mathcal{S}\right), \Delta} \mathcal{S}
$$

which to an object $(x, \alpha)$ of the left hand side assigns the object $\left(x, x,\left(\alpha, \mathrm{id}_{x}\right)\right)$ of the right hand side and to a morphism $\phi$ of the left hand side assigns the morphism $(\phi, \phi)$ of the right hand side. We claim that a quasi-inverse to that morphism is given by the functor

$$
\mathcal{S} \times_{\Delta,\left(\mathcal{S} \times{ }_{\mathcal{S}^{\prime}} \mathcal{S}\right), \Delta} \mathcal{S} \longrightarrow I_{\mathcal{S} / \mathcal{S}^{\prime}}
$$

which to an object $(x, y,(\iota, \kappa))$ of the left hand side assigns the object $\left(x, \kappa^{-1} \circ \iota\right)$ of the right hand side and to a morphism $\left(\phi, \phi^{\prime}\right):(x, y,(\iota, \kappa)) \rightarrow(z, w,(\lambda, \mu))$ of the left hand side assigns the morphism $\phi$. Indeed, the endo-functor of $I_{\mathcal{S} / \mathcal{S}^{\prime}}$ induced by composing the two functors above is the identity on the nose, and the endofunctor induced on $\mathcal{S} \times{ }_{\Delta,\left(\mathcal{S} \times{ }_{\mathcal{S}^{\prime}} \mathcal{S}\right), \Delta} \mathcal{S}$ is isomorphic to the identity via the natural isomorphism

$$
\left(\mathrm{id}_{x}, \kappa\right):\left(x, x,\left(\kappa^{-1} \circ \iota, \mathrm{id}_{x}\right)\right) \longrightarrow(x, y,(\iota, \kappa))
$$

Some details omitted.
034I Definition 4.33.2. Let $\mathcal{C}$ be a category.
(1) Let $F: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be a 1-morphism of fibred categories over $\mathcal{C}$. The relative inertia of $\mathcal{S}$ over $\mathcal{S}^{\prime}$ is the fibred category $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \rightarrow \mathcal{C}$ of Lemma 4.33.1.
(2) By the inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$ we mean $\mathcal{I}_{\mathcal{S}}=\mathcal{I}_{\mathcal{S} / \mathcal{C}}$.

Note that there are canonical 1-morphisms

$$
\begin{equation*}
\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \longrightarrow \mathcal{S} \quad \text { and } \quad \mathcal{I}_{\mathcal{S}} \longrightarrow \mathcal{S} \tag{4.33.2.1}
\end{equation*}
$$

of fibred categories over $\mathcal{C}$. In terms of the description of Lemma4.33.1 these simply map the object $(x, \alpha)$ to the object $x$ and the morphism $\phi:(x, \alpha) \rightarrow(y, \beta)$ to the morphism $\phi: x \rightarrow y$. There is also a neutral section
04Z3 (4.33.2.2)

$$
e: \mathcal{S} \rightarrow \mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \quad \text { and } \quad e: \mathcal{S} \rightarrow \mathcal{I}_{\mathcal{S}}
$$

defined by the rules $x \mapsto\left(x, \mathrm{id}_{x}\right)$ and $(\phi: x \rightarrow y) \mapsto \phi$. This is a right inverse to 4.33.2.1). Given a 2 -commutative square

there is a functoriality map
$04 \mathrm{Z4}$ (4.33.2.3)

$$
\mathcal{I}_{\mathcal{S}_{1} / \mathcal{S}_{1}^{\prime}} \longrightarrow \mathcal{I}_{\mathcal{S}_{2} / \mathcal{S}_{2}^{\prime}} \quad \text { and } \quad \mathcal{I}_{\mathcal{S}_{1}} \longrightarrow \mathcal{I}_{\mathcal{S}_{2}}
$$

defined by the rules $(x, \alpha) \mapsto(G(x), G(\alpha))$ and $\phi \mapsto G(\phi)$. In particular there is always a comparison map
04Z5 (4.33.2.4)

$$
\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \longrightarrow \mathcal{I}_{\mathcal{S}}
$$

and all the maps above are compatible with this.
04Z6 Lemma 4.33.3. Let $F: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be a 1-morphism of categories fibred over a category $\mathcal{C}$. Then the diagram

is a 2-fibre product.
Proof. Omitted.

### 4.34. Categories fibred in groupoids

003 S In this section we explain how to think about categories in groupoids and we see how they are basically the same as functors with values in the $(2,1)$-category of groupoids.

003 T Definition 4.34.1. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a functor. We say that $\mathcal{S}$ is fibred in groupoids over $\mathcal{C}$ if the following two conditions hold:
(1) For every morphism $f: V \rightarrow U$ in $\mathcal{C}$ and every lift $x$ of $U$ there is a lift $\phi: y \rightarrow x$ of $f$ with target $x$.
(2) For every pair of morphisms $\phi: y \rightarrow x$ and $\psi: z \rightarrow x$ and any morphism $f: p(z) \rightarrow p(y)$ such that $p(\phi) \circ f=p(\psi)$ there exists a unique lift $\chi: z \rightarrow y$ of $f$ such that $\phi \circ \chi=\psi$.
Condition (2) phrased differently says that applying the functor $p$ gives a bijection between the sets of dotted arrows in the following commutative diagram below:

Another way to think about the second condition is the following. Suppose that $g: W \rightarrow V$ and $f: V \rightarrow U$ are morphisms in $\mathcal{C}$. Let $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. By the first condition we can lift $f$ to $\phi: y \rightarrow x$ and then we can lift $g$ to $\psi: z \rightarrow y$. Instead of
doing this two step process we can directly lift $g \circ f$ to $\gamma: z^{\prime} \rightarrow x$. This gives the solid arrows in the diagram

03WP (4.34.1.1)

where the squiggly arrows represent not morphisms but the functor $p$. Applying the second condition to the arrows $\phi \circ \psi, \gamma$ and $\mathrm{id}_{W}$ we conclude that there is a unique morphism $\chi: z \rightarrow z^{\prime}$ in $\mathcal{S}_{W}$ such that $\gamma \circ \chi=\phi \circ \psi$. Similarly there is a unique morphism $z^{\prime} \rightarrow z$. The uniqueness implies that the morphisms $z^{\prime} \rightarrow z$ and $z \rightarrow z^{\prime}$ are mutually inverse, in other words isomorphisms.

It should be clear from this discussion that a category fibred in groupoids is very closely related to a fibred category. Here is the result.

003 V Lemma 4.34.2. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a functor. The following are equivalent
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in groupoids, and
(2) all fibre categories are groupoids and $\mathcal{S}$ is a fibred category over $\mathcal{C}$.

Moreover, in this case every morphism of $\mathcal{S}$ is strongly cartesian. In addition, given $f^{*} x \rightarrow x$ lying over $f$ for all $f: V \rightarrow U=p(x)$ the data $\left(U \mapsto \mathcal{S}_{U}, f \mapsto f^{*}, \alpha_{f, g}, \alpha_{U}\right)$ constructed in Lemma 4.32.7 defines a pseudo functor from $\mathcal{C}^{\text {opp }}$ in to the $(2,1)$ category of groupoids.

Proof. Assume $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids. To show all fibre categories $\mathcal{S}_{U}$ for $U \in \operatorname{Ob}(\mathcal{C})$ are groupoids, we must exhibit for every $f: y \rightarrow x$ in $\mathcal{S}_{U}$ an inverse morphism. The diagram on the left (in $\mathcal{S}_{U}$ ) is mapped by $p$ to the diagram on the right:

Since only i $d_{U}$ makes the diagram on the right commute, there is a unique $g: x \rightarrow y$ making the diagram on the left commute, so $f g=\mathrm{id}_{x}$. By a similar argument there is a unique $h: y \rightarrow x$ so that $g h=\operatorname{id}_{y}$. Then $f g h=f: y \rightarrow x$. We have $f g=\operatorname{id}_{x}$, so $h=f$. Condition (2) of Definition 4.34.1 says exactly that every morphism of $\mathcal{S}$ is strongly cartesian. Hence condition (1) of Definition 4.34.1 implies that $\mathcal{S}$ is a fibred category over $\mathcal{C}$.

Conversely, assume all fibre categories are groupoids and $\mathcal{S}$ is a fibred category over $\mathcal{C}$. We have to check conditions (1) and (2) of Definition 4.34.1. The first condition follows trivially. Let $\phi: y \rightarrow x, \psi: z \rightarrow x$ and $f: p(z) \rightarrow p(y)$ such that $p(\phi) \circ f=p(\psi)$ be as in condition (2) of Definition 4.34.1. Write $U=p(x)$, $V=p(y), W=p(z), p(\phi)=g: V \rightarrow U, p(\psi)=h: W \rightarrow U$. Choose a strongly cartesian $g^{*} x \rightarrow x$ lying over $g$. Then we get a morphism $i: y \rightarrow g^{*} x$ in $\mathcal{S}_{V}$, which is therefore an isomorphism. We also get a morphism $j: z \rightarrow g^{*} x$ corresponding to
the pair $(\psi, f)$ as $g^{*} x \rightarrow x$ is strongly cartesian. Then one checks that $\chi=i^{-1} \circ j$ is a solution.

We have seen in the proof of $(1) \Rightarrow(2)$ that every morphism of $\mathcal{S}$ is strongly cartesian. The final statement follows directly from Lemma 4.32.7

03WQ Lemma 4.34.3. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $\mathcal{S}^{\prime}$ be the subcategory of $\mathcal{S}$ defined as follows
(1) $\operatorname{Ob}\left(\mathcal{S}^{\prime}\right)=\operatorname{Ob}(\mathcal{S})$, and
(2) for $x, y \in \operatorname{Ob}\left(\mathcal{S}^{\prime}\right)$ the set of morphisms between $x$ and $y$ in $\mathcal{S}^{\prime}$ is the set of of strongly cartesian morphisms between $x$ and $y$ in $\mathcal{S}$.

Let $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be the restriction of $p$ to $\mathcal{S}^{\prime}$. Then $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ is fibred in groupoids.
Proof. Note that the construction makes sense since by Lemma 4.32.2 the identity morphism of any object of $\mathcal{S}$ is strongly cartesian, and the composition of strongly cartesian morphisms is strongly cartesian. The first lifting property of Definition 4.34 .1 follows from the condition that in a fibred category given any morphism $f: V \rightarrow U$ and $x$ lying over $U$ there exists a strongly cartesian morphism $\varphi: y \rightarrow x$ lying over $f$. Let us check the second lifting property of Definition 4.34.1 for the category $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ over $\mathcal{C}$. To do this we argue as in the discussion following Definition 4.34.1. Thus in Diagram4.34.1.1 the morphisms $\phi, \psi$ and $\gamma$ are strongly cartesian morphisms of $\mathcal{S}$. Hence $\gamma$ and $\phi \circ \psi$ are strongly cartesian morphisms of $\mathcal{S}$ lying over the same arrow of $\mathcal{C}$ and having the same target in $\mathcal{S}$. By the discussion following Definition 4.32 .1 this means these two arrows are isomorphic as desired (here we use also that any isomorphism in $\mathcal{S}$ is strongly cartesian, by Lemma 4.32.2 again).

003 U Example 4.34.4. A homomorphism of groups $p: G \rightarrow H$ gives rise to a functor $p: \mathcal{S} \rightarrow \mathcal{C}$ as in Example 4.2.12. This functor $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids if and only if $p$ is surjective. The fibre category $\mathcal{S}_{U}$ over the (unique) object $U \in \operatorname{Ob}(\mathcal{C})$ is the category associated to the kernel of $p$ as in Example 4.2.6.

Given $p: \mathcal{S} \rightarrow \mathcal{C}$, we can ask: if the fibre category $\mathcal{S}_{U}$ is a groupoid for all $U \in$ $\operatorname{Ob}(\mathcal{C})$, must $\mathcal{S}$ be fibred in groupoids over $\mathcal{C}$ ? We can see the answer is no as follows. Start with a category fibred in groupoids $p: \mathcal{S} \rightarrow \mathcal{C}$. Altering the morphisms in $\mathcal{S}$ which do not map to the identity morphism on some object does not alter the categories $\mathcal{S}_{U}$. Hence we can violate the existence and uniqueness conditions on lifts. One example is the functor from Example 4.34 .4 when $G \rightarrow H$ is not surjective. Here is another example.

02C4 Example 4.34.5. Let $\operatorname{Ob}(\mathcal{C})=\{A, B, T\}$ and $\operatorname{Mor}_{\mathcal{C}}(A, B)=\{f\}, \operatorname{Mor}_{\mathcal{C}}(B, T)=$ $\{g\}, \operatorname{Mor}_{\mathcal{C}}(A, T)=\{h\}=\{g f\}$, plus the identity morphism for each object. See the diagram below for a picture of this category. Now let $\operatorname{Ob}(\mathcal{S})=\left\{A^{\prime}, B^{\prime}, T^{\prime}\right\}$ and $\operatorname{Mor}_{\mathcal{S}}\left(A^{\prime}, B^{\prime}\right)=\emptyset, \operatorname{Mor}_{\mathcal{S}}\left(B^{\prime}, T^{\prime}\right)=\left\{g^{\prime}\right\}, \operatorname{Mor}_{\mathcal{S}}\left(A^{\prime}, T^{\prime}\right)=\left\{h^{\prime}\right\}$, plus the identity morphisms. The functor $p: \mathcal{S} \rightarrow \mathcal{C}$ is obvious. Then for every $U \in \operatorname{Ob}(\mathcal{C}), \mathcal{S}_{U}$ is the category with one object and the identity morphism on that object, so a groupoid, but the morphism $f: A \rightarrow B$ cannot be lifted. Similarly, if we declare $\operatorname{Mor}_{\mathcal{S}}\left(A^{\prime}, B^{\prime}\right)=\left\{f_{1}^{\prime}, f_{2}^{\prime}\right\}$ and $\operatorname{Mor}_{\mathcal{S}}\left(A^{\prime}, T^{\prime}\right)=\left\{h^{\prime}\right\}=\left\{g^{\prime} f_{1}^{\prime}\right\}=\left\{g^{\prime} f_{2}^{\prime}\right\}$, then the fibre
categories are the same and $f: A \rightarrow B$ in the diagram below has two lifts.

Later we would like to make assertions such as "any category fibred in groupoids over $\mathcal{C}$ is equivalent to a split one", or "any category fibred in groupoids whose fibre categories are setlike is equivalent to a category fibred in sets". The notion of equivalence depends on the 2-category we are working with.
02XS Definition 4.34.6. Let $\mathcal{C}$ be a category. The 2 -category of categories fibred in groupoids over $\mathcal{C}$ is the sub 2-category of the 2-category of fibred categories over $\mathcal{C}$ (see Definition 4.32.9) defined as follows:
(1) Its objects will be categories $p: \mathcal{S} \rightarrow \mathcal{C}$ fibred in groupoids.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$ (since every morphism is strongly cartesian $G$ automatically preserves them).
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\operatorname{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.
Note that every 2 -morphism is automatically an isomorphism! Hence this is actually a (2,1)-category and not just a 2-category. Here is the obligatory lemma on 2-fibre products.
0041 Lemma 4.34.7. Let $\mathcal{C}$ be a category. The 2-category of categories fibred in groupoids over $\mathcal{C}$ has 2-fibre products, and they are described as in Lemma 4.31.3.
Proof. By Lemma 4.32 .10 the fibre product as described in Lemma 4.31 .3 is a fibred category. Hence it suffices to prove that the fibre categories are groupoids, see Lemma 4.34.2. By Lemma 4.31.4 it is enough to show that the 2 -fibre product of groupoids is a groupoid, which is clear (from the construction in Lemma 4.30.4 for example).

003 Z Lemma 4.34.8. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be categories fibred in groupoids, and suppose that $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ is a functor over $\mathcal{C}$.
(1) Then $G$ is faithful (resp. fully faithful, resp. an equivalence) if and only if for each $U \in \mathrm{Ob}(\mathcal{C})$ the induced functor $G_{U}: \mathcal{S}_{U} \rightarrow \mathcal{S}_{U}^{\prime}$ is faithful (resp. fully faithful, resp. an equivalence).
(2) If $G$ is an equivalence, then $G$ is an equivalence in the 2-category of categories fibred in groupoids over $\mathcal{C}$.
Proof. Let $x, y$ be objects of $\mathcal{S}$ lying over the same object $U$. Consider the commutative diagram

From this diagram it is clear that if $G$ is faithful (resp. fully faithful) then so is each $G_{U}$.

Suppose $G$ is an equivalence. For every object $x^{\prime}$ of $\mathcal{S}^{\prime}$ there exists an object $x$ of $\mathcal{S}$ such that $G(x)$ is isomorphic to $x^{\prime}$. Suppose that $x^{\prime}$ lies over $U^{\prime}$ and $x$ lies over $U$. Then there is an isomorphism $f: U^{\prime} \rightarrow U$ in $\mathcal{C}$, namely, $p^{\prime}$ applied to the isomorphism $x^{\prime} \rightarrow G(x)$. By the axioms of a category fibred in groupoids there exists an arrow $f^{*} x \rightarrow x$ of $\mathcal{S}$ lying over $f$. Hence there exists an isomorphism $\alpha: x^{\prime} \rightarrow G\left(f^{*} x\right)$ such that $p^{\prime}(\alpha)=\operatorname{id}_{U^{\prime}}$ (this time by the axioms for $\left.\mathcal{S}^{\prime}\right)$. All in all we conclude that for every object $x^{\prime}$ of $\mathcal{S}^{\prime}$ we can choose a pair ( $o_{x^{\prime}}, \alpha_{x^{\prime}}$ ) consisting of an object $o_{x^{\prime}}$ of $\mathcal{S}$ and an isomorphism $\alpha_{x^{\prime}}: x^{\prime} \rightarrow G\left(o_{x^{\prime}}\right)$ with $p^{\prime}\left(\alpha_{x^{\prime}}\right)=\operatorname{id}_{p^{\prime}\left(x^{\prime}\right)}$. From this point on we proceed as usual (see proof of Lemma 4.2.19) to produce an inverse functor $F: \mathcal{S}^{\prime} \rightarrow \mathcal{S}$, by taking $x^{\prime} \mapsto o_{x^{\prime}}$ and $\varphi^{\prime}: x^{\prime} \rightarrow y^{\prime}$ to the unique arrow $\varphi_{\varphi^{\prime}}: o_{x^{\prime}} \rightarrow o_{y^{\prime}}$ with $\alpha_{y^{\prime}}^{-1} \circ G\left(\varphi_{\varphi^{\prime}}\right) \circ \alpha_{x^{\prime}}=\varphi^{\prime}$. With these choices $F$ is a functor over $\mathcal{C}$. We omit the verification that $G \circ F$ and $F \circ G$ are 2-isomorphic to the respective identity functors (in the 2-category of categories fibred in groupoids over $\mathcal{C}$ ).

Suppose that $G_{U}$ is faithful (resp. fully faithful) for all $U \in \mathrm{Ob}(\mathcal{C})$. To show that $G$ is faithful (resp. fully faithful) we have to show for any objects $x, y \in \operatorname{Ob}(\mathcal{S})$ that $G$ induces an injection (resp. bijection) between $\operatorname{Mor}_{\mathcal{S}}(x, y)$ and $\operatorname{Mor}_{\mathcal{S}^{\prime}}(G(x), G(y))$. Set $U=p(x)$ and $V=p(y)$. It suffices to prove that $G$ induces an injection (resp. bijection) between morphism $x \rightarrow y$ lying over $f$ to morphisms $G(x) \rightarrow G(y)$ lying over $f$ for any morphism $f: U \rightarrow V$. Now fix $f: U \rightarrow V$. Denote $f^{*} y \rightarrow y$ a pullback. Then also $G\left(f^{*} y\right) \rightarrow G(y)$ is a pullback. The set of morphisms from $x$ to $y$ lying over $f$ is bijective to the set of morphisms between $x$ and $f^{*} y$ lying over $\mathrm{id}_{U}$. (By the second axiom of a category fibred in groupoids.) Similarly the set of morphisms from $G(x)$ to $G(y)$ lying over $f$ is bijective to the set of morphisms between $G(x)$ and $G\left(f^{*} y\right)$ lying over $\mathrm{id}_{U}$. Hence the fact that $G_{U}$ is faithful (resp. fully faithful) gives the desired result.

Finally suppose for all $G_{U}$ is an equivalence for all $U$, so it is fully faithful and essentially surjective. We have seen this implies $G$ is fully faithful, and thus to prove it is an equivalence we have to prove that it is essentially surjective. This is clear, for if $z^{\prime} \in \operatorname{Ob}\left(\mathcal{S}^{\prime}\right)$ then $z^{\prime} \in \operatorname{Ob}\left(\mathcal{S}_{U}^{\prime}\right)$ where $U=p^{\prime}\left(z^{\prime}\right)$. Since $G_{U}$ is essentially surjective we know that $z^{\prime}$ is isomorphic, in $\mathcal{S}_{U}^{\prime}$, to an object of the form $G_{U}(z)$ for some $z \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. But morphisms in $\mathcal{S}_{U}^{\prime}$ are morphisms in $\mathcal{S}^{\prime}$ and hence $z^{\prime}$ is isomorphic to $G(z)$ in $\mathcal{S}^{\prime}$.

04 Z 7 Lemma 4.34.9. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be categories fibred in groupoids. Let $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be a functor over $\mathcal{C}$. Then $G$ is fully faithful if and only if the diagonal

$$
\Delta_{G}: \mathcal{S} \longrightarrow \mathcal{S} \times_{G, \mathcal{S}^{\prime}, G} \mathcal{S}
$$

is an equivalence.
Proof. By Lemma 4.34 .8 it suffices to look at fibre categories over an object $U$ of $\mathcal{C}$. An object of the right hand side is a triple $\left(x, x^{\prime}, \alpha\right)$ where $\alpha: G(x) \rightarrow G\left(x^{\prime}\right)$ is a morphism in $\mathcal{S}_{U}^{\prime}$. The functor $\Delta_{G}$ maps the object $x$ of $\mathcal{S}_{U}$ to the triple $\left(x, x, \operatorname{id}_{G(x)}\right)$. Note that $\left(x, x^{\prime}, \alpha\right)$ is in the essential image of $\Delta_{G}$ if and only if $\alpha=G(\beta)$ for some morphism $\beta: x \rightarrow x^{\prime}$ in $\mathcal{S}_{U}$ (details omitted). Hence in order for $\Delta_{G}$ to be an equivalence, every $\alpha$ has to be the image of a morphism $\beta: x \rightarrow x^{\prime}$, and also every two distinct morphisms $\beta, \beta^{\prime}: x \rightarrow x^{\prime}$ have to give distinct morphisms $G(\beta), G\left(\beta^{\prime}\right)$. This proves the lemma.

03YT Lemma 4.34.10. Let $\mathcal{C}$ be a category. Let $\mathcal{S}_{i}, i=1,2,3,4$ be categories fibred in groupoids over $\mathcal{C}$. Suppose that $\varphi: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ and $\psi: \mathcal{S}_{3} \rightarrow \mathcal{S}_{4}$ are equivalences over $\mathcal{C}$. Then

$$
\operatorname{Mor}_{C a t / \mathcal{C}}\left(\mathcal{S}_{2}, \mathcal{S}_{3}\right) \longrightarrow \operatorname{Mor}_{C a t / \mathcal{C}}\left(\mathcal{S}_{1}, \mathcal{S}_{4}\right), \quad \alpha \longmapsto \psi \circ \alpha \circ \varphi
$$

is an equivalence of categories.
Proof. This is a generality and holds in any 2-category.
042 L Lemma 4.34.11. Let $\mathcal{C}$ be a category. If $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids, then so is the inertia fibred category $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{C}$.

Proof. Clear from the construction in Lemma 4.33.1 or by using (from the same lemma) that $I_{\mathcal{S}} \rightarrow \mathcal{S} \times_{\Delta, \mathcal{S} \times{ }_{\mathcal{C}} \mathcal{S}, \Delta} \mathcal{S}$ is an equivalence and appealing to Lemma 4.34 .7 .

02XT Lemma 4.34.12. Let $\mathcal{C}$ be a category. Let $U \in \operatorname{Ob}(\mathcal{C})$. If $p: \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in groupoids and $p$ factors through $p^{\prime}: \mathcal{S} \rightarrow \mathcal{C} / U$ then $p^{\prime}: \mathcal{S} \rightarrow \mathcal{C} / U$ is fibred in groupoids.

Proof. We have already seen in Lemma 4.32.11 that $p^{\prime}$ is a fibred category. Hence it suffices to prove the fibre categories are groupoids, see Lemma 4.34.2. For $V \in$ $\mathrm{Ob}(\mathcal{C})$ we have

$$
\mathcal{S}_{V}=\coprod_{f: V \rightarrow U} \mathcal{S}_{(f: V \rightarrow U)}
$$

where the left hand side is the fibre category of $p$ and the right hand side is the disjoint union of the fibre categories of $p^{\prime}$. Hence the result.

09WW Lemma 4.34.13. Let $\mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C}$ be functors between categories. If $\mathcal{A}$ is fibred in groupoids over $\mathcal{B}$ and $\mathcal{B}$ is fibred in groupoids over $\mathcal{C}$, then $\mathcal{A}$ is fibred in groupoids over $\mathcal{C}$.

Proof. One can prove this directly from the definition. However, we will argue using the criterion of Lemma 4.34.2, By Lemma 4.32 .12 we see that $\mathcal{A}$ is fibred over $\mathcal{C}$. To finish the proof we show that the fibre category $\mathcal{A}_{U}$ is a groupoid for $U$ in $\mathcal{C}$. Namely, if $x \rightarrow y$ is a morphism of $\mathcal{A}_{U}$, then its image in $\mathcal{B}$ is an isomorphism as $\mathcal{B}_{U}$ is a groupoid. But then $x \rightarrow y$ is an isomorphism, for example by Lemma 4.32 .2 and the fact that every morphism of $\mathcal{A}$ is strongly $\mathcal{B}$-cartesian (see Lemma 4.34.2).

06N6 Lemma 4.34.14. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. Let $x \rightarrow y$ and $z \rightarrow y$ be morphisms of $\mathcal{S}$. If $p(x) \times_{p(y)} p(z)$ exists, then $x \times_{y} z$ exists and $p\left(x \times_{y} z\right)=p(x) \times_{p(y)} p(z)$.

Proof. Follows from Lemma 4.32 .13
06N7 Lemma 4.34.15. Let $\mathcal{C}$ be a category. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $\mathcal{C}$. There exists a factorization $\mathcal{X} \rightarrow \mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ by 1-morphisms of categories fibred in groupoids over $\mathcal{C}$ such that $\mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is an equivalence over $\mathcal{C}$ and such that $\mathcal{X}^{\prime}$ is a category fibred in groupoids over $\mathcal{Y}$.

Proof. Denote $p: \mathcal{X} \rightarrow \mathcal{C}$ and $q: \mathcal{Y} \rightarrow \mathcal{C}$ the structure functors. We construct $\mathcal{X}^{\prime}$ explicitly as follows. An object of $\mathcal{X}^{\prime}$ is a quadruple $(U, x, y, f)$ where $x \in$ $\mathrm{Ob}\left(\mathcal{X}_{U}\right), y \in \mathrm{Ob}\left(\mathcal{Y}_{U}\right)$ and $f: F(x) \rightarrow y$ is an isomorphism in $\mathcal{Y}_{U}$. A morphism $(a, b):(U, x, y, f) \rightarrow\left(U^{\prime}, x^{\prime}, y^{\prime}, f^{\prime}\right)$ is given by $a: x \rightarrow x^{\prime}$ and $b: y \rightarrow y^{\prime}$ with
$p(a)=q(b)$ and such that $f^{\prime} \circ F(a)=b \circ f$. In other words $\mathcal{X}^{\prime}=\mathcal{X} \times_{F, \mathcal{Y}, \text { id }} \mathcal{Y}$ with the construction of the 2-fibre product from Lemma 4.31.3. By Lemma 4.34.7 we see that $\mathcal{X}^{\prime}$ is a category fibred in groupoids over $\mathcal{C}$ and that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a morphism of categories over $\mathcal{C}$. As functor $\mathcal{X} \rightarrow \mathcal{X}^{\prime}$ we take $x \mapsto\left(p(x), x, F(x), \operatorname{id}_{F(x)}\right)$ on objects and $\left(a: x \rightarrow x^{\prime}\right) \mapsto(a, F(a))$ on morphisms. It is clear that the composition $\mathcal{X} \rightarrow \mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ equals $F$. We omit the verification that $\mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is an equivalence of fibred categories over $\mathcal{C}$.

Finally, we have to show that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a category fibred in groupoids. Let $b: y^{\prime} \rightarrow y$ be a morphism in $\mathcal{Y}$ and let $(U, x, y, f)$ be an object of $\mathcal{X}^{\prime}$ lying over $y$. Because $\mathcal{X}$ is fibred in groupoids over $\mathcal{C}$ we can find a morphism $a: x^{\prime} \rightarrow x$ lying over $U^{\prime}=q\left(y^{\prime}\right) \rightarrow q(y)=U$. Since $\mathcal{Y}$ is fibred in groupoids over $\mathcal{C}$ and since both $F\left(x^{\prime}\right) \rightarrow F(x)$ and $y^{\prime} \rightarrow y$ lie over the same morphism $U^{\prime} \rightarrow U$ we can find $f^{\prime}: F\left(x^{\prime}\right) \rightarrow y^{\prime}$ lying over $\operatorname{id}_{U^{\prime}}$ such that $f \circ F(a)=b \circ f^{\prime}$. Hence we obtain $(a, b):\left(U^{\prime}, x^{\prime}, y^{\prime}, f^{\prime}\right) \rightarrow(U, x, y, f)$. This verifies the first condition (1) of Definition 4.34.1. To see (2) let $(a, b):\left(U^{\prime}, x^{\prime}, y^{\prime}, f^{\prime}\right) \rightarrow(U, x, y, f)$ and $\left(a^{\prime}, b^{\prime}\right):\left(U^{\prime \prime}, x^{\prime \prime}, y^{\prime \prime}, f^{\prime \prime}\right) \rightarrow(U, x, y, f)$ be morphisms of $\mathcal{X}^{\prime}$ and let $b^{\prime \prime}: y^{\prime} \rightarrow y^{\prime \prime}$ be a morphism of $\mathcal{Y}$ such that $b^{\prime} \circ b^{\prime \prime}=b$. We have to show that there exists a unique morphism $a^{\prime \prime}: x^{\prime} \rightarrow x^{\prime \prime}$ such that $f^{\prime \prime} \circ F\left(a^{\prime \prime}\right)=b^{\prime \prime} \circ f^{\prime}$ and such that $\left(a^{\prime}, b^{\prime}\right) \circ\left(a^{\prime \prime}, b^{\prime \prime}\right)=(a, b)$. Because $\mathcal{X}$ is fibred in groupoids we know there exists a unique morphism $a^{\prime \prime}: x^{\prime} \rightarrow x^{\prime \prime}$ such that $a^{\prime} \circ a^{\prime \prime}=a$ and $p\left(a^{\prime \prime}\right)=q\left(b^{\prime \prime}\right)$. Because $\mathcal{Y}$ is fibred in groupoids we see that $F\left(a^{\prime \prime}\right)$ is the unique morphism $F\left(x^{\prime}\right) \rightarrow F\left(x^{\prime \prime}\right)$ such that $F\left(a^{\prime}\right) \circ F\left(a^{\prime \prime}\right)=F(a)$ and $q\left(F\left(a^{\prime \prime}\right)\right)=q\left(b^{\prime \prime}\right)$. The relation $f^{\prime \prime} \circ F\left(a^{\prime \prime}\right)=b^{\prime \prime} \circ f^{\prime}$ follows from this and the given relations $f \circ F(a)=b \circ f^{\prime}$ and $f \circ F\left(a^{\prime}\right)=b^{\prime} \circ f^{\prime \prime}$.
06N8 Lemma 4.34.16. Let $\mathcal{C}$ be a category. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $\mathcal{C}$. Assume we have a 2 -commutative diagram

where $a$ and $b$ are equivalences of categories over $\mathcal{C}$ and $f$ and $g$ are categories fibred in groupoids. Then there exists an equivalence $h: \mathcal{X}^{\prime \prime} \rightarrow \mathcal{X}^{\prime}$ of categories over $\mathcal{Y}$ such that $h \circ b$ is 2-isomorphic to $a$ as 1 -morphisms of categories over $\mathcal{C}$. If the diagram above actually commutes, then we can arrange it so that $h \circ b$ is 2-isomorphic to a as 1-morphisms of categories over $\mathcal{Y}$.

Proof. We will show that both $\mathcal{X}^{\prime}$ and $\mathcal{X}^{\prime \prime}$ over $\mathcal{Y}$ are equivalent to the category fibred in groupoids $\mathcal{X} \times_{F, \mathcal{Y}, \text { id }} \mathcal{Y}$ over $\mathcal{Y}$, see proof of Lemma 4.34.15. Choose a quasi-inverse $b^{-1}: \mathcal{X}^{\prime \prime} \rightarrow \mathcal{X}$ in the 2-category of categories over $\mathcal{C}$. Since the right triangle of the diagram is 2 -commutative we see that

is 2-commutative. Hence we obtain a 1-morphism $c: \mathcal{X}^{\prime \prime} \rightarrow \mathcal{X} \times{ }_{F, \mathcal{Y}, \mathrm{id}} \mathcal{Y}$ by the universal property of the 2-fibre product. Moreover $c$ is a morphism of categories over $\mathcal{Y}$ (!) and an equivalence (by the assumption that $b$ is an equivalence, see

Lemma 4.30.7. Hence $c$ is an equivalence in the 2-category of categories fibred in groupoids over $\mathcal{Y}$ by Lemma 4.34.8.
We still have to construct a 2-isomorphism between $c \circ b$ and the functor $d: \mathcal{X} \rightarrow$ $\mathcal{X} \times_{F, \mathcal{Y}, \mathrm{id}} \mathcal{Y}, x \mapsto\left(p(x), x, F(x), \operatorname{id}_{F(x)}\right)$ constructed in the proof of Lemma 4.34.15. Let $\alpha: F \rightarrow g \circ b$ and $\beta: b^{-1} \circ b \rightarrow$ id be 2-isomorphisms between 1-morphisms of categories over $\mathcal{C}$. Note that $c \circ b$ is given by the rule

$$
x \mapsto\left(p(x), b^{-1}(b(x)), g(b(x)), \alpha_{x} \circ F\left(\beta_{x}\right)\right)
$$

on objects. Then we see that

$$
\left(\beta_{x}, \alpha_{x}\right):\left(p(x), x, F(x), \mathrm{id}_{F(x)}\right) \longrightarrow\left(p(x), b^{-1}(b(x)), g(b(x)), \alpha_{x} \circ F\left(\beta_{x}\right)\right)
$$

is a functorial isomorphism which gives our 2-morphism $d \rightarrow b \circ c$. Finally, if the diagram commutes then $\alpha_{x}$ is the identity for all $x$ and we see that this 2-morphism is a 2 -morphism in the 2-category of categories over $\mathcal{Y}$.

### 4.35. Presheaves of categories

02 XU In this section we compare the notion of fibred categories with the closely related notion of a "presheaf of categories". The basic construction is explained in the following example.
02XV Example 4.35.1. Let $\mathcal{C}$ be a category. Suppose that $F: \mathcal{C}^{o p p} \rightarrow C a t$ is a functor to the 2-category of categories, see Definition 4.28.5. For $f: V \rightarrow U$ in $\mathcal{C}$ we will suggestively write $F(f)=f^{*}$ for the functor from $F(U)$ to $F(V)$. From this we can construct a fibred category $\mathcal{S}_{F}$ over $\mathcal{C}$ as follows. Define

$$
\operatorname{Ob}\left(\mathcal{S}_{F}\right)=\{(U, x) \mid U \in \operatorname{Ob}(\mathcal{C}), x \in \operatorname{Ob}(F(U))\}
$$

For $(U, x),(V, y) \in \operatorname{Ob}\left(\mathcal{S}_{F}\right)$ we define

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{S}_{F}}((V, y),(U, x)) & =\left\{(f, \phi) \mid f \in \operatorname{Mor}_{\mathcal{C}}(V, U), \phi \in \operatorname{Mor}_{F(V)}\left(y, f^{*} x\right)\right\} \\
& =\coprod_{f \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \operatorname{Mor}_{F(V)}\left(y, f^{*} x\right)
\end{aligned}
$$

In order to define composition we use that $g^{*} \circ f^{*}=(f \circ g)^{*}$ for a pair of composable morphisms of $\mathcal{C}$ (by definition of a functor into a 2-category). Namely, we define the composition of $\psi: z \rightarrow g^{*} y$ and $\phi: y \rightarrow f^{*} x$ to be $g^{*}(\phi) \circ \psi$. The functor $p_{F}: \mathcal{S}_{F} \rightarrow \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. Let us check that this is indeed a fibred category. Given $f: V \rightarrow U$ in $\mathcal{C}$ and $(U, x)$ a lift of $U$, then we claim $\left(f, \operatorname{id}_{f^{*} x}\right):\left(V, f^{*} x\right) \rightarrow(U, x)$ is a strongly cartesian lift of $f$. We have to show a $h$ in the diagram on the left determines $(h, \nu)$ on the right:

Just take $\nu=\psi$ which works because $f \circ h=g$ and hence $g^{*} x=h^{*} f^{*} x$. Moreover, this is the only lift making the diagram (on the right) commute.
02XW Definition 4.35.2. Let $\mathcal{C}$ be a category. Suppose that $F: \mathcal{C}^{o p p} \rightarrow C a t$ is a functor to the 2-category of categories. We will write $p_{F}: \mathcal{S}_{F} \rightarrow \mathcal{C}$ for the fibred category constructed in Example 4.35.1. A split fibred category is a fibred category isomorphic (!) over $\mathcal{C}$ to one of these categories $\mathcal{S}_{F}$.

02XX Lemma 4.35.3. Let $\mathcal{C}$ be a category. Let $\mathcal{S}$ be a fibred category over $\mathcal{C}$. Then $\mathcal{S}$ is split if and only if for some choice of pullbacks (see Definition 4.32.6) the pullback functors $(f \circ g)^{*}$ and $g^{*} \circ f^{*}$ are equal.

Proof. This is immediate from the definitions.
004A Lemma 4.35.4. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. There exists a contravariant functor $F: \mathcal{C} \rightarrow$ Cat such that $\mathcal{S}$ is equivalent to $\mathcal{S}_{F}$ in the 2-category of fibred categories over $\mathcal{C}$. In other words, every fibred category is equivalent to a split one.

Proof. Let us make a choice of pullbacks (see Definition 4.32.6). By Lemma 4.32.7 we get pullback functors $f^{*}$ for every morphism $f$ of $\mathcal{C}$.

We construct a new category $\mathcal{S}^{\prime}$ as follows. The objects of $\mathcal{S}^{\prime}$ are pairs $(x, f)$ consisting of a morphism $f: V \rightarrow U$ of $\mathcal{C}$ and an object $x$ of $\mathcal{S}$ over $U$, i.e., $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. The functor $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ will map the pair $(x, f)$ to the source of the morphism $f$, in other words $p^{\prime}(x, f: V \rightarrow U)=V$. A morphism $\varphi:\left(x_{1}, f_{1}\right.$ : $\left.V_{1} \rightarrow U_{1}\right) \rightarrow\left(x_{2}, f_{2}: V_{2} \rightarrow U_{2}\right)$ is given by a pair $(\varphi, g)$ consisting of a morphism $g: V_{1} \rightarrow V_{2}$ and a morphism $\varphi: f_{1}^{*} x_{1} \rightarrow f_{2}^{*} x_{2}$ with $p(\varphi)=g$. It is no problem to define the composition law: $(\varphi, g) \circ(\psi, h)=(\varphi \circ \psi, g \circ h)$ for any pair of composable morphisms. There is a natural functor $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ which simply maps $x$ over $U$ to the pair $\left(x, \mathrm{id}_{U}\right)$.

At this point we need to check that $p^{\prime}$ makes $\mathcal{S}^{\prime}$ into a fibred category over $\mathcal{C}$, and we need to check that $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ is an equivalence of categories over $\mathcal{C}$ which maps strongly cartesian morphisms to strongly cartesian morphisms. We omit the verifications.

Finally, we can define pullback functors on $\mathcal{S}^{\prime}$ by setting $g^{*}(x, f)=(x, f \circ g)$ on objects if $g: V^{\prime} \rightarrow V$ and $f: V \rightarrow U$. On morphisms $\left(\varphi, \mathrm{id}_{V}\right):\left(x_{1}, f_{1}\right) \rightarrow\left(x_{2}, f_{2}\right)$ between morphisms in $\mathcal{S}_{V}^{\prime}$ we set $g^{*}\left(\varphi, \mathrm{id}_{V}\right)=\left(g^{*} \varphi, \mathrm{id}_{V^{\prime}}\right)$ where we use the unique identifications $g^{*} f_{i}^{*} x_{i}=\left(f_{i} \circ g\right)^{*} x_{i}$ from Lemma 4.32.7 to think of $g^{*} \varphi$ as a morphism from $\left(f_{1} \circ g\right)^{*} x_{1}$ to $\left(f_{2} \circ g\right)^{*} x_{2}$. Clearly, these pullback functors $g^{*}$ have the property that $g_{1}^{*} \circ g_{2}^{*}=\left(g_{2} \circ g_{1}\right)^{*}$, in other words $\mathcal{S}^{\prime}$ is split as desired.

### 4.36. Presheaves of groupoids

0048 In this section we compare the notion of categories fibred in groupoids with the closely related notion of a "presheaf of groupoids". The basic construction is explained in the following example.

0049 Example 4.36.1. This example is the analogue of Example 4.35.1. for "presheaves of groupoids" instead of "presheaves of categories". The output will be a category fibred in groupoids instead of a fibred category. Suppose that $F: \mathcal{C}^{\text {opp }} \rightarrow$ Groupoids is a functor to the category of groupoids, see Definition 4.28.5. For $f: V \rightarrow U$ in $\mathcal{C}$ we will suggestively write $F(f)=f^{*}$ for the functor from $F(U)$ to $F(V)$. We construct a category $\mathcal{S}_{F}$ fibred in groupoids over $\mathcal{C}$ as follows. Define

$$
\mathrm{Ob}\left(\mathcal{S}_{F}\right)=\{(U, x) \mid U \in \mathrm{Ob}(\mathcal{C}), x \in \mathrm{Ob}(F(U))\}
$$

For $(U, x),(V, y) \in \operatorname{Ob}\left(\mathcal{S}_{F}\right)$ we define

$$
\begin{aligned}
\operatorname{Mor}_{\mathcal{S}_{F}}((V, y),(U, x)) & =\left\{(f, \phi) \mid f \in \operatorname{Mor}_{\mathcal{C}}(V, U), \phi \in \operatorname{Mor}_{F(V)}\left(y, f^{*} x\right)\right\} \\
& =\coprod_{f \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \operatorname{Mor}_{F(V)}\left(y, f^{*} x\right)
\end{aligned}
$$

In order to define composition we use that $g^{*} \circ f^{*}=(f \circ g)^{*}$ for a pair of composable morphisms of $\mathcal{C}$ (by definition of a functor into a 2-category). Namely, we define the composition of $\psi: z \rightarrow g^{*} y$ and $\phi: y \rightarrow f^{*} x$ to be $g^{*}(\phi) \circ \psi$. The functor $p_{F}: \mathcal{S}_{F} \rightarrow \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. The condition that $F(U)$ is a groupoid for every $U$ guarantees that $\mathcal{S}_{F}$ is fibred in groupoids over $\mathcal{C}$, as we have already seen in Example 4.35.1 that $\mathcal{S}_{F}$ is a fibred category, see Lemma 4.34.2. But we can also prove conditions (1), (2) of Definition 4.34.1 directly as follows: (1) Lifts of morphisms exist since given $f: V \rightarrow U$ in $\mathcal{C}$ and $(U, x)$ an object of $\mathcal{S}_{F}$ over $U$, then $\left(f, \operatorname{id}_{f^{*} x}\right):\left(V, f^{*} x\right) \rightarrow(U, x)$ is a lift of $f$. (2) Suppose given solid diagrams as follows

Then for the dotted arrows we have $\nu=\left(h^{*} \phi\right)^{-1} \circ \psi$ so given $h$ there exists a $\nu$ which is unique by uniqueness of inverses.

04TL Definition 4.36.2. Let $\mathcal{C}$ be a category. Suppose that $F: \mathcal{C}^{\text {opp }} \rightarrow$ Groupoids is a functor to the 2-category of groupoids. We will write $p_{F}: \mathcal{S}_{F} \rightarrow \mathcal{C}$ for the category fibred in groupoids constructed in Example 4.36.1. A split category fibred in groupoids is a category fibred in groupoids isomorphic (!) over $\mathcal{C}$ to one of these categories $\mathcal{S}_{F}$.

02XY Lemma 4.36.3. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. There exists a contravariant functor $F: \mathcal{C} \rightarrow$ Groupoids such that $\mathcal{S}$ is equivalent to $\mathcal{S}_{F}$ over $\mathcal{C}$. In other words, every category fibred in groupoids is equivalent to a split one.

Proof. Make a choice of pullbacks (see Definition 4.32.6). By Lemmas 4.32.7 and 4.34 .2 we get pullback functors $f^{*}$ for every morphism $f$ of $\mathcal{C}$.

We construct a new category $\mathcal{S}^{\prime}$ as follows. The objects of $\mathcal{S}^{\prime}$ are pairs $(x, f)$ consisting of a morphism $f: V \rightarrow U$ of $\mathcal{C}$ and an object $x$ of $\mathcal{S}$ over $U$, i.e., $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. The functor $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ will map the pair $(x, f)$ to the source of the morphism $f$, in other words $p^{\prime}(x, f: V \rightarrow U)=V$. A morphism $\varphi:\left(x_{1}, f_{1}\right.$ : $\left.V_{1} \rightarrow U_{1}\right) \rightarrow\left(x_{2}, f_{2}: V_{2} \rightarrow U_{2}\right)$ is given by a pair $(\varphi, g)$ consisting of a morphism $g: V_{1} \rightarrow V_{2}$ and a morphism $\varphi: f_{1}^{*} x_{1} \rightarrow f_{2}^{*} x_{2}$ with $p(\varphi)=g$. It is no problem to define the composition law: $(\varphi, g) \circ(\psi, h)=(\varphi \circ \psi, g \circ h)$ for any pair of composable morphisms. There is a natural functor $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ which simply maps $x$ over $U$ to the pair $\left(x, \mathrm{id}_{U}\right)$.
At this point we need to check that $p^{\prime}$ makes $\mathcal{S}^{\prime}$ into a category fibred in groupoids over $\mathcal{C}$, and we need to check that $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ is an equivalence of categories over $\mathcal{C}$. We omit the verifications.

Finally, we can define pullback functors on $\mathcal{S}^{\prime}$ by setting $g^{*}(x, f)=(x, f \circ g)$ on objects if $g: V^{\prime} \rightarrow V$ and $f: V \rightarrow U$. On morphisms $\left(\varphi, \mathrm{id}_{V}\right):\left(x_{1}, f_{1}\right) \rightarrow\left(x_{2}, f_{2}\right)$ between morphisms in $\mathcal{S}_{V}^{\prime}$ we set $g^{*}\left(\varphi, \mathrm{id}_{V}\right)=\left(g^{*} \varphi, \mathrm{id}_{V^{\prime}}\right)$ where we use the unique identifications $g^{*} f_{i}^{*} x_{i}=\left(f_{i} \circ g\right)^{*} x_{i}$ from Lemma4.34.2 to think of $g^{*} \varphi$ as a morphism from $\left(f_{1} \circ g\right)^{*} x_{1}$ to $\left(f_{2} \circ g\right)^{*} x_{2}$. Clearly, these pullback functors $g^{*}$ have the property that $g_{1}^{*} \circ g_{2}^{*}=\left(g_{2} \circ g_{1}\right)^{*}$, in other words $\mathcal{S}^{\prime}$ is split as desired.

We will see an alternative proof of this lemma in Section 4.40

### 4.37. Categories fibred in sets

02Y0 Definition 4.37.1. A category is called discrete if the only morphisms are the identity morphisms.

A discrete category has only one interesting piece of information: its set of objects. Thus we sometime confuse discrete categories with sets.
0043 Definition 4.37.2. Let $\mathcal{C}$ be a category. A category fibred in sets, or a category fibred in discrete categories is a category fibred in groupoids all of whose fibre categories are discrete.
We want to clarify the relationship between categories fibred in sets and presheaves (see Definition 4.3.3). To do this it makes sense to first make the following definition.

04S8 Definition 4.37.3. Let $\mathcal{C}$ be a category. The 2 -category of categories fibred in sets over $\mathcal{C}$ is the sub 2-category of the category of categories fibred in groupoids over $\mathcal{C}$ (see Definition 4.34.6) defined as follows:
(1) Its objects will be categories $p: \mathcal{S} \rightarrow \mathcal{C}$ fibred in sets.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$ (since every morphism is strongly cartesian $G$ automatically preserves them).
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\operatorname{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism. Hence this 2-category is actually a $(2,1)$-category. Here is the obligatory lemma on the existence of 2 -fibre products.
0047 Lemma 4.37.4. Let $\mathcal{C}$ be a category. The 2-category of categories fibred in sets over C has 2-fibre products. More precisely, the 2-fibre product described in Lemma 4.31 .3 returns a category fibred in sets if one starts out with such.

Proof. Omitted.
04TM Example 4.37.5. This example is the analogue of Examples 4.35.1 and 4.36.1 for presheaves instead of "presheaves of categories". The output will be a category fibred in sets instead of a fibred category. Suppose that $F: \mathcal{C}^{\text {opp }} \rightarrow$ Sets is a presheaf. For $f: V \rightarrow U$ in $\mathcal{C}$ we will suggestively write $F(f)=f^{*}: F(U) \rightarrow F(V)$. We construct a category $\mathcal{S}_{F}$ fibred in sets over $\mathcal{C}$ as follows. Define

$$
\mathrm{Ob}\left(\mathcal{S}_{F}\right)=\{(U, x) \mid U \in \mathrm{Ob}(\mathcal{C}), x \in \mathrm{Ob}(F(U))\}
$$

For $(U, x),(V, y) \in \operatorname{Ob}\left(\mathcal{S}_{F}\right)$ we define

$$
\operatorname{Mor}_{\mathcal{S}_{F}}((V, y),(U, x))=\left\{f \in \operatorname{Mor}_{\mathcal{C}}(V, U) \mid f^{*} x=y\right\}
$$

Composition is inherited from composition in $\mathcal{C}$ which works as $g^{*} \circ f^{*}=(f \circ g)^{*}$ for a pair of composable morphisms of $\mathcal{C}$. The functor $p_{F}: \mathcal{S}_{F} \rightarrow \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. As every fibre category $\mathcal{S}_{F, U}$ is discrete with underlying set $F(U)$ and we have already see in Example 4.36.1 that $\mathcal{S}_{F}$ is a category fibred in groupoids, we conclude that $\mathcal{S}_{F}$ is fibred in sets.

02Y2 Lemma 4.37.6. Let $\mathcal{C}$ be a category. The only 2 -morphisms between categories fibred in sets are identities. In other words, the 2-category of categories fibred in sets is a category. Moreover, there is an equivalence of categories

$$
\left\{\begin{array}{c}
\text { the category of presheaves } \\
\text { of sets over } \mathcal{C}
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { the category of categories } \\
\text { fibred in sets over } \mathcal{C}
\end{array}\right\}
$$

The functor from left to right is the construction $F \rightarrow \mathcal{S}_{F}$ discussed in Example 4.37.5. The functor from right to left assigns to $p: \mathcal{S} \rightarrow \mathcal{C}$ the presheaf of objects $U \mapsto \mathrm{Ob}\left(\mathcal{S}_{U}\right)$.

Proof. The first assertion is clear, as the only morphisms in the fibre categories are identities.
Suppose that $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in sets. Let $f: V \rightarrow U$ be a morphism in $\mathcal{C}$ and let $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. Then there is exactly one choice for the object $f^{*} x$. Thus we see that $(f \circ g)^{*} x=g^{*}\left(f^{*} x\right)$ for $f, g$ as in Lemma 4.34.2. It follows that we may think of the assignments $U \mapsto \operatorname{Ob}\left(\mathcal{S}_{U}\right)$ and $f \mapsto f^{*}$ as a presheaf on $\mathcal{C}$.
Here is an important example of a category fibred in sets.
0044 Example 4.37.7. Let $\mathcal{C}$ be a category. Let $X \in \mathrm{Ob}(\mathcal{C})$. Consider the representable presheaf $h_{X}=\operatorname{Mor}_{\mathcal{C}}(-, X)$ (see Example 4.3.4). On the other hand, consider the category $p: \mathcal{C} / X \rightarrow \mathcal{C}$ from Example 4.2.13. The fibre category $(\mathcal{C} / X)_{U}$ has as objects morphisms $h: U \rightarrow X$, and only identities as morphisms. Hence we see that under the correspondence of Lemma 4.37 .6 we have

$$
h_{X} \longleftrightarrow \mathcal{C} / X
$$

In other words, the category $\mathcal{C} / X$ is canonically equivalent to the category $\mathcal{S}_{h_{X}}$ associated to $h_{X}$ in Example 4.37.5.

For this reason it is tempting to define a "representable" object in the 2-category of categories fibred in groupoids to be a category fibred in sets whose associated presheaf is representable. However, this is would not be a good definition for use since we prefer to have a notion which is invariant under equivalences. To make this precise we study exactly which categories fibred in groupoids are equivalent to categories fibred in sets.

### 4.38. Categories fibred in setoids

04S9
02XZ Definition 4.38.1. Let us call a category a setoid ${ }^{6}$ if it is a groupoid where every object has exactly one automorphism: the identity.

If $C$ is a set with an equivalence relation $\sim$, then we can make a setoid $\mathcal{C}$ as follows: $\operatorname{Ob}(\mathcal{C})=C$ and $\operatorname{Mor}_{\mathcal{C}}(x, y)=\emptyset$ unless $x \sim y$ in which case we set $\operatorname{Mor}_{\mathcal{C}}(x, y)=\{1\}$. Transitivity of $\sim$ means that we can compose morphisms. Conversely any setoid category defines an equivalence relation on its objects (isomorphism) such that you recover the category (up to unique isomorphism - not equivalence) from the procedure just described.
Discrete categories are setoids. For any setoid $\mathcal{C}$ there is a canonical procedure to make a discrete category equivalent to it, namely one replaces $\mathrm{Ob}(\mathcal{C})$ by the set of

[^6]isomorphism classes (and adds identity morphisms). In terms of sets endowed with an equivalence relation this corresponds to taking the quotient by the equivalence relation.

04SA Definition 4.38.2. Let $\mathcal{C}$ be a category. A category fibred in setoids is a category fibred in groupoids all of whose fibre categories are setoids.

Below we will clarify the relationship between categories fibred in setoids and categories fibred in sets.

02Y1 Definition 4.38.3. Let $\mathcal{C}$ be a category. The 2 -category of categories fibred in setoids over $\mathcal{C}$ is the sub 2-category of the category of categories fibred in groupoids over $\mathcal{C}$ (see Definition 4.34.6) defined as follows:
(1) Its objects will be categories $p: \mathcal{S} \rightarrow \mathcal{C}$ fibred in setoids.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$ (since every morphism is strongly cartesian $G$ automatically preserves them).
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\mathrm{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism. Hence this 2-category is actually a $(2,1)$-category.
Here is the obligatory lemma on the existence of 2-fibre products.
04SB Lemma 4.38.4. Let $\mathcal{C}$ be a category. The 2-category of categories fibred in setoids over C has 2-fibre products. More precisely, the 2-fibre product described in Lemma 4.31.3 returns a category fibred in setoids if one starts out with such.

Proof. Omitted.
0045 Lemma 4.38.5. Let $\mathcal{C}$ be a category. Let $\mathcal{S}$ be a category over $\mathcal{C}$.
(1) If $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ is an equivalence over $\mathcal{C}$ with $\mathcal{S}^{\prime}$ fibred in sets over $\mathcal{C}$, then
(a) $\mathcal{S}$ is fibred in setoids over $\mathcal{C}$, and
(b) for each $U \in \mathrm{Ob}(\mathcal{C})$ the map $\mathrm{Ob}\left(\mathcal{S}_{U}\right) \rightarrow \mathrm{Ob}\left(\mathcal{S}_{U}^{\prime}\right)$ identifies the target as the set of isomorphism classes of the source.
(2) If $p: \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in setoids, then there exists a category fibred in sets $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ and an equivalence can $: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ over $\mathcal{C}$.

Proof. Let us prove (2). An object of the category $\mathcal{S}^{\prime}$ will be a pair $(U, \xi)$, where $U \in \operatorname{Ob}(\mathcal{C})$ and $\xi$ is an isomorphism class of objects of $\mathcal{S}_{U}$. A morphism $(U, \xi) \rightarrow$ $(V, \psi)$ is given by a morphism $x \rightarrow y$, where $x \in \xi$ and $y \in \psi$. Here we identify two morphisms $x \rightarrow y$ and $x^{\prime} \rightarrow y^{\prime}$ if they induce the same morphism $U \rightarrow V$, and if for some choices of isomorphisms $x \rightarrow x^{\prime}$ in $\mathcal{S}_{U}$ and $y \rightarrow y^{\prime}$ in $\mathcal{S}_{V}$ the compositions $x \rightarrow x^{\prime} \rightarrow y^{\prime}$ and $x \rightarrow y \rightarrow y^{\prime}$ agree. By construction there are surjective maps on objects and morphisms from $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$. We define composition of morphisms in $\mathcal{S}^{\prime}$ to be the unique law that turns $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ into a functor. Some details omitted.

Thus categories fibred in setoids are exactly the categories fibred in groupoids which are equivalent to categories fibred in sets. Moreover, an equivalence of categories fibred in sets is an isomorphism by Lemma 4.37.6.

04SC Lemma 4.38.6. Let $\mathcal{C}$ be a category. The construction of Lemma 4.38.5 part (2) gives a functor

$$
F:\left\{\begin{array}{c}
\text { the 2-category of categories } \\
\text { fibred in setoids over } \mathcal{C}
\end{array}\right\} \rightarrow\left\{\begin{array}{c}
\text { the category of categories } \\
\text { fibred in sets over } \mathcal{C}
\end{array}\right\}
$$

(see Definition 4.28.5). This functor is an equivalence in the following sense:
(1) for any two 1-morphisms $f, g: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ with $F(f)=F(g)$ there exists a unique 2-isomorphism $f \rightarrow g$,
(2) for any morphism $h: F\left(\mathcal{S}_{1}\right) \rightarrow F\left(\mathcal{S}_{2}\right)$ there exists a 1-morphism $f: \mathcal{S}_{1} \rightarrow$ $\mathcal{S}_{2}$ with $F(f)=h$, and
(3) any category fibred in sets $\mathcal{S}$ is equal to $F(\mathcal{S})$.

In particular, defining $F_{i} \in \operatorname{PSh}(\mathcal{C})$ by the rule $F_{i}(U)=\mathrm{Ob}\left(\mathcal{S}_{i, U}\right) / \cong$, we have

$$
\operatorname{Mor}_{C a t / \mathcal{C}}\left(\mathcal{S}_{1}, \mathcal{S}_{2}\right) / 2 \text {-isomorphism }=\operatorname{Mor}_{P S h(\mathcal{C})}\left(F_{1}, F_{2}\right)
$$

More precisely, given any map $\phi: F_{1} \rightarrow F_{2}$ there exists a 1-morphism $f: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ which induces $\phi$ on isomorphism classes of objects and which is unique up to unique 2-isomorphism.

Proof. By Lemma 4.37 .6 the target of $F$ is a category hence the assertion makes sense. The construction of Lemma 4.38.5 part (2) assigns to $\mathcal{S}$ the category fibred in sets whose value over $U$ is the set of isomorphism classes in $\mathcal{S}_{U}$. Hence it is clear that it defines a functor as indicated. Let $f, g: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ with $F(f)=F(g)$ be as in (1). For each object $U$ of $\mathcal{C}$ and each object $x$ of $\mathcal{S}_{1, U}$ we see that $f(x) \cong$ $g(x)$ by assumption. As $\mathcal{S}_{2}$ is fibred in setoids there exists a unique isomorphism $t_{x}: f(x) \rightarrow g(x)$ in $\mathcal{S}_{2, U}$. Clearly the rule $x \mapsto t_{x}$ gives the desired 2-isomorphism $f \rightarrow g$. We omit the proofs of (2) and (3). To see the final assertion use Lemma 4.37 .6 to see that the right hand side is equal to $\operatorname{Mor}_{C a t / \mathcal{C}}\left(F\left(\mathcal{S}_{1}\right), F\left(\mathcal{S}_{2}\right)\right)$ and apply (1) and (2) above.

Here is another characterization of categories fibred in setoids among all categories fibred in groupoids.

042J Lemma 4.38.7. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. The following are equivalent:
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is a category fibred in setoids, and
(2) the canonical 1-morphism $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S}$, see 4.33.2.1), is an equivalence (of categories over $\mathcal{C})$.

Proof. Assume (2). The category $\mathcal{I}_{\mathcal{S}}$ has objects $(x, \alpha)$ where $x \in \mathcal{S}$, say with $p(x)=U$, and $\alpha: x \rightarrow x$ is a morphism in $\mathcal{S}_{U}$. Hence if $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S}$ is an equivalence over $\mathcal{C}$ then every pair of objects $(x, \alpha),\left(x, \alpha^{\prime}\right)$ are isomorphic in the fibre category of $\mathcal{I}_{\mathcal{S}}$ over $U$. Looking at the definition of morphisms in $\mathcal{I}_{\mathcal{S}}$ we conclude that $\alpha$, $\alpha^{\prime}$ are conjugate in the group of automorphisms of $x$. Hence taking $\alpha^{\prime}=\mathrm{id}_{x}$ we conclude that every automorphism of $x$ is equal to the identity. Since $\mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids this implies that $\mathcal{S} \rightarrow \mathcal{C}$ is fibred in setoids. We omit the proof of $(1) \Rightarrow(2)$.

04SD Lemma 4.38.8. Let $\mathcal{C}$ be a category. The construction of Lemma 4.38.6 which associates to a category fibred in setoids a presheaf is compatible with products, in the sense that the presheaf associated to a 2 -fibre product $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ is the fibre product of the presheaves associated to $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$.

Proof. Let $U \in \mathrm{Ob}(\mathcal{C})$. The lemma just says that

$$
\mathrm{Ob}\left((\mathcal{X} \times \mathcal{Y} \mathcal{Z})_{U}\right) / \cong \text { equals } \mathrm{Ob}\left(\mathcal{X}_{U}\right) / \cong \times_{\mathrm{Ob}\left(\mathcal{Y}_{U}\right)} \cong \mathrm{Ob}\left(\mathcal{Z}_{U}\right) / \cong
$$

the proof of which we omit. (But note that this would not be true in general if the category $\mathcal{Y}_{U}$ is not a setoid.)

### 4.39. Representable categories fibred in groupoids

04 SE Here is our definition of a representable category fibred in groupoids. As promised this is invariant under equivalences.

0046 Definition 4.39.1. Let $\mathcal{C}$ be a category. A category fibred in groupoids $p: \mathcal{S} \rightarrow \mathcal{C}$ is called representable if there exists an object $X$ of $\mathcal{C}$ and an equivalence $j: \mathcal{S} \rightarrow$ $\mathcal{C} / X$ (in the 2-category of groupoids over $\mathcal{C}$ ).

The usual abuse of notation is to say that $X$ represents $\mathcal{S}$ and not mention the equivalence $j$. We spell out what this entails.

02Y3 Lemma 4.39.2. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids.
(1) $\mathcal{S}$ is representable if and only if the following conditions are satisfied:
(a) $\mathcal{S}$ is fibred in setoids, and
(b) the presheaf $U \mapsto \operatorname{Ob}\left(\mathcal{S}_{U}\right) / \cong$ is representable.
(2) If $\mathcal{S}$ is representable the pair $(X, j)$, where $j$ is the equivalence $j: \mathcal{S} \rightarrow$ $\mathcal{C} / X$, is uniquely determined up to isomorphism.

Proof. The first assertion follows immediately from Lemma 4.38.5. For the second, suppose that $j^{\prime}: \mathcal{S} \rightarrow \mathcal{C} / X^{\prime}$ is a second such pair. Choose a 1 -morphism $t^{\prime}:$ $\mathcal{C} / X^{\prime} \rightarrow \mathcal{S}$ such that $j^{\prime} \circ t^{\prime} \cong \operatorname{id}_{\mathcal{C} / X^{\prime}}$ and $t^{\prime} \circ j^{\prime} \cong \operatorname{id}_{\mathcal{S}}$. Then $j \circ t^{\prime}: \mathcal{C} / X^{\prime} \rightarrow \mathcal{C} / X$ is an equivalence. Hence it is an isomorphism, see Lemma 4.37.6. Hence by the Yoneda Lemma 4.3.5 (via Example 4.37.7for example) it is given by an isomorphism $X^{\prime} \rightarrow X$.

04SF Lemma 4.39.3. Let $\mathcal{C}$ be a category. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Assume that $\mathcal{X}, \mathcal{Y}$ are representable by objects $X, Y$ of $\mathcal{C}$. Then

$$
\operatorname{Mor}_{C a t / \mathcal{C}}(\mathcal{X}, \mathcal{Y}) / 2 \text {-isomorphism }=\operatorname{Mor}_{\mathcal{C}}(X, Y)
$$

More precisely, given $\phi: X \rightarrow Y$ there exists a 1-morphism $f: \mathcal{X} \rightarrow \mathcal{Y}$ which induces $\phi$ on isomorphism classes of objects and which is unique up to unique 2isomorphism.

Proof. By Example 4.37 .7 we have $\mathcal{C} / X=\mathcal{S}_{h_{X}}$ and $\mathcal{C} / Y=\mathcal{S}_{h_{Y}}$. By Lemma 4.38 .6 we have

$$
\operatorname{Mor}_{C a t / \mathcal{C}}(\mathcal{X}, \mathcal{Y}) / 2 \text {-isomorphism }=\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{X}, h_{Y}\right)
$$

By the Yoneda Lemma 4.3.5 we have $\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{X}, h_{Y}\right)=\operatorname{Mor}_{\mathcal{C}}(X, Y)$.

### 4.40. Representable 1-morphisms

02Y4 Let $\mathcal{C}$ be a category. In this section we explain what it means for a 1-morphism between categories fibred in groupoids over $\mathcal{C}$ to be representable. Note that the 2 -category of categories fibred in groupoids over $\mathcal{C}$ is a "full" sub 2-category of the 2 -category of categories over $\mathcal{C}$ (see Definition 4.34.6). Hence if $\mathcal{S}, \mathcal{S}^{\prime}$ are fibred in groupoids over $\mathcal{C}$ then

$$
\operatorname{Mor}_{C a t / \mathcal{C}}\left(\mathcal{S}, \mathcal{S}^{\prime}\right)
$$

denotes the category of 1-morphisms in this 2-category (see Definition 4.31.1). These are all groupoids, see remarks following Definition 4.34.6. Here is the 2category analogue of the Yoneda lemma.
004B Lemma 4.40.1 (2-Yoneda lemma). Let $\mathcal{S} \rightarrow \mathcal{C}$ be fibred in groupoids. Let $U \in$ $\mathrm{Ob}(\mathcal{C})$. The functor

$$
\text { Mor }_{C a t / \mathcal{C}}(\mathcal{C} / U, \mathcal{S}) \longrightarrow \mathcal{S}_{U}
$$

given by $G \mapsto G\left(i d_{U}\right)$ is an equivalence.
Proof. Make a choice of pullbacks for $\mathcal{S}$ (see Definition 4.32.6). We define a functor

$$
\mathcal{S}_{U} \longrightarrow \operatorname{Mor}_{C a t / \mathcal{C}}(\mathcal{C} / U, \mathcal{S})
$$

as follows. Given $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$ the associated functor is
(1) on objects: $(f: V \rightarrow U) \mapsto f^{*} x$, and
(2) on morphisms: the arrow $\left(g: V^{\prime} / U \rightarrow V / U\right)$ maps to the composition

$$
(f \circ g)^{*} x \xrightarrow{\left(\alpha_{g, f}\right)_{x}} g^{*} f^{*} x \rightarrow f^{*} x
$$

where $\alpha_{g, f}$ is as in Lemma 4.34.2.
We omit the verification that this is an inverse to the functor of the lemma.
076J Remark 4.40.2. We can use the 2-Yoneda lemma to give an alternative proof of Lemma 4.36.3. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. We define a contravariant functor $F$ from $\mathcal{C}$ to the category of groupoids as follows: for $U \in$ $\mathrm{Ob}(\mathcal{C})$ let

$$
F(U)=\operatorname{Mor}_{C a t / \mathcal{C}}(\mathcal{C} / U, \mathcal{S})
$$

If $f: U \rightarrow V$ the induced functor $\mathcal{C} / U \rightarrow \mathcal{C} / V$ induces the morphism $F(f)$ : $F(V) \rightarrow F(U)$. Clearly $F$ is a functor. Let $\mathcal{S}^{\prime}$ be the associated category fibred in groupoids from Example 4.36.1. There is an obvious functor $G: \mathcal{S}^{\prime} \rightarrow \mathcal{S}$ over $\mathcal{C}$ given by taking the pair $(U, x)$, where $U \in \mathrm{Ob}(\mathcal{C})$ and $x \in F(U)$, to $x\left(\mathrm{id}_{U}\right) \in \mathcal{S}$. Now Lemma 4.40.1 implies that for each $U$,

$$
G_{U}: \mathcal{S}_{U}^{\prime}=F(U)=\operatorname{Mor}_{C a t / \mathcal{C}}(\mathcal{C} / U, \mathcal{S}) \rightarrow \mathcal{S}_{U}
$$

is an equivalence, and thus $G$ is an equivalence between $\mathcal{S}$ and $\mathcal{S}^{\prime}$ by Lemma 4.34.8.
Let $\mathcal{C}$ be a category. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $U \in \operatorname{Ob}(\mathcal{C})$. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ and $G: \mathcal{C} / U \rightarrow \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $\mathcal{C}$. We want to describe the 2 -fibre product

Let $y=G\left(\mathrm{id}_{U}\right) \in \mathcal{Y}_{U}$. Make a choice of pullbacks for $\mathcal{Y}$ (see Definition 4.32.6). Then $G$ is isomorphic to the functor $(f: V \rightarrow U) \mapsto f^{*} y$, see Lemma 4.40.1 and its proof. We may think of an object of $(\mathcal{C} / U) \times \mathcal{Y} \mathcal{X}$ as a quadruple $(V, f: V \rightarrow U, x, \phi)$, see Lemma 4.31.3 Using the description of $G$ above we may think of $\phi$ as an isomorphism $\phi: f^{*} y \rightarrow F(x)$ in $\mathcal{Y}_{V}$.

02Y5 Lemma 4.40.3. In the situation above the fibre category of $(\mathcal{C} / U) \times \mathcal{Y} \mathcal{X}$ over an object $f: V \rightarrow U$ of $\mathcal{C} / U$ is the category described as follows:
(1) objects are pairs $(x, \phi)$, where $x \in \mathrm{Ob}\left(\mathcal{X}_{V}\right)$, and $\phi: f^{*} y \rightarrow F(x)$ is a morphism in $\mathcal{Y}_{V}$,
(2) the set of morphisms between $(x, \phi)$ and $\left(x^{\prime}, \phi^{\prime}\right)$ is the set of morphisms $\psi: x \rightarrow x^{\prime}$ in $\mathcal{X}_{V}$ such that $F(\psi)=\phi^{\prime} \circ \phi^{-1}$.

Proof. See discussion above.
02Y6 Lemma 4.40.4. Let $\mathcal{C}$ be a category. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. Let $G: \mathcal{C} / U \rightarrow \mathcal{Y}$ be a 1-morphism. Then

$$
(\mathcal{C} / U) \times \mathcal{Y} \mathcal{X} \longrightarrow \mathcal{C} / U
$$

is a category fibred in groupoids.
Proof. We have already seen in Lemma 4.34.7 that the composition

$$
(\mathcal{C} / U) \times \mathcal{Y} \mathcal{X} \longrightarrow \mathcal{C} / U \longrightarrow \mathcal{C}
$$

is a category fibred in groupoids. Then the lemma follows from Lemma 4.34.12,
02Y7 Definition 4.40.5. Let $\mathcal{C}$ be a category. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism. We say $F$ is representable, or that $\mathcal{X}$ is relatively representable over $\mathcal{Y}$, if for every $U \in \operatorname{Ob}(\mathcal{C})$ and any $G: \mathcal{C} / U \rightarrow \mathcal{Y}$ the category fibred in groupoids

$$
(\mathcal{C} / U) \times \mathcal{Y} \mathcal{X} \longrightarrow \mathcal{C} / U
$$

is representable.
02 Y 8 Lemma 4.40.6. Let $\mathcal{C}$ be a category. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. If $F$ is representable then every one of the functors

$$
F_{U}: \mathcal{X}_{U} \longrightarrow \mathcal{Y}_{U}
$$

between fibre categories is faithful.
Proof. Clear from the description of fibre categories in Lemma 4.40 .3 and the characterization of representable fibred categories in Lemma 4.39.2.

02Y9 Lemma 4.40.7. Let $\mathcal{C}$ be a category. Let $\mathcal{X}, \mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism. Make a choice of pullbacks for $\mathcal{Y}$. Assume
(1) each functor $F_{U}: \mathcal{X}_{U} \longrightarrow \mathcal{Y}_{U}$ between fibre categories is faithful, and
(2) for each $U$ and each $y \in \mathcal{Y}_{U}$ the presheaf

$$
(f: V \rightarrow U) \longmapsto\left\{(x, \phi) \mid x \in \mathcal{X}_{V}, \phi: f^{*} y \rightarrow F(x)\right\} / \cong
$$ is a representable presheaf on $\mathcal{C} / U$.

Then $F$ is representable.

Proof. Clear from the description of fibre categories in Lemma 4.40 .3 and the characterization of representable fibred categories in Lemma 4.39.2.
Before we state the next lemma we point out that the 2-category of categories fibred in groupoids is a $(2,1)$-category, and hence we know what it means to say that it has a final object (see Definition 4.30.1). And it has a final object namely id : $\mathcal{C} \rightarrow \mathcal{C}$. Thus we define 2-products of categories fibred in groupoids over $\mathcal{C}$ as the 2 -fibred products

$$
\mathcal{X} \times \mathcal{Y}:=\mathcal{X} \times_{\mathcal{C}} \mathcal{Y}
$$

With this definition in place the following lemma makes sense.
02YA Lemma 4.40.8. Let $\mathcal{C}$ be a category. Let $\mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids. Assume $\mathcal{C}$ has products of pairs of objects and fibre products. The following are equivalent:
(1) The diagonal $\mathcal{S} \rightarrow \mathcal{S} \times \mathcal{S}$ is representable.
(2) For every $U$ in $\mathcal{C}$, any $G: \mathcal{C} / U \rightarrow \mathcal{S}$ is representable.

Proof. Suppose the diagonal is representable, and let $U, G$ be given. Consider any $V \in \operatorname{Ob}(\mathcal{C})$ and any $G^{\prime}: \mathcal{C} / V \rightarrow \mathcal{S}$. Note that $\mathcal{C} / U \times \mathcal{C} / V=\mathcal{C} / U \times V$ is representable. Hence the fibre product

is representable by assumption. This means there exists $W \rightarrow U \times V$ in $\mathcal{C}$, such that

is cartesian. This implies that $\mathcal{C} / W \cong \mathcal{C} / U \times{ }_{\mathcal{S}} \mathcal{C} / V$ (see Lemma 4.30.11) as desired. Assume (2) holds. Consider any $V \in \mathrm{Ob}(\mathcal{C})$ and any $\left(G, G^{\prime}\right): \mathcal{C} / V \rightarrow \mathcal{S} \times \mathcal{S}$. We have to show that $\mathcal{C} / V \times{ }_{\mathcal{S} \times \mathcal{S}} \mathcal{S}$ is representable. What we know is that $\mathcal{C} / V \times{ }_{G, \mathcal{S}, G^{\prime}}$ $\mathcal{C} / V$ is representable, say by $a: W \rightarrow V$ in $\mathcal{C} / V$. The equivalence

$$
\mathcal{C} / W \rightarrow \mathcal{C} / V \times_{G, \mathcal{S}, G^{\prime}} \mathcal{C} / V
$$

followed by the second projection to $\mathcal{C} / V$ gives a second morphism $a^{\prime}: W \rightarrow V$. Consider $W^{\prime}=W \times_{\left(a, a^{\prime}\right), V \times V} V$. There exists an equivalence

$$
\mathcal{C} / W^{\prime} \cong \mathcal{C} / V \times_{\mathcal{S} \times \mathcal{S}} \mathcal{S}
$$

namely

$$
\begin{aligned}
& \mathcal{C} / W^{\prime} \cong \mathcal{C} / W \times_{(\mathcal{C} / V \times \mathcal{C} / V)} \mathcal{C} / V \\
& \cong\left(\mathcal{C} / V \times_{\left(G, \mathcal{S}, G^{\prime}\right)} \mathcal{C} / V\right) \times(\mathcal{C} / V \times \mathcal{C} / V) \\
& \cong \mathcal{C} / V \\
&(\mathcal{S} \times \mathcal{S}) \\
& \mathcal{S}
\end{aligned}
$$

(for the last isomorphism see Lemma 4.30.12) which proves the lemma.

## CHAPTER 5

## Topology

004C

### 5.1. Introduction

Basic topology will be explained in this document. A reference is Eng77.

### 5.2. Basic notions

004E
lowing is a list of basic notions in topology. Some of these notions are discussed in more detail in the text that follows and some are defined in the list, but others are considered basic and will not be defined. If you are not familiar with most of the italicized concepts, then we suggest looking at an introductory text on topology before continuing.

004F
004G
0B12
004H
08ZA
004I
(1) $X$ is a topological space,
(2) $x \in X$ is a point,
(3) $E \subset X$ is a locally closed subset,
(4) $x \in X$ is a closed point,
(5) $E \subset X$ is a dense subset,
(6) $f: X_{1} \rightarrow X_{2}$ is continuous,
(7) an extended real function $f: X \rightarrow \mathbf{R} \cup\{\infty,-\infty\}$ is upper semi-continuous if $\{x \in X \mid f(x)<a\}$ is open for all $a \in \mathbf{R}$,
(8) an extended real function $f: X \rightarrow \mathbf{R} \cup\{\infty,-\infty\}$ is lower semi-continuous if $\{x \in X \mid f(x)>a\}$ is open for all $a \in \mathbf{R}$,
(9) a continuous map of spaces $f: X \rightarrow Y$ is open if $f(U)$ is open in $Y$ for $U \subset X$ open,
(10) a continuous map of spaces $f: X \rightarrow Y$ is closed if $f(Z)$ is closed in $Y$ for $Z \subset X$ closed,
(11) a neighbourhood of $x \in X$ is any subset $E \subset X$ which contains an open subset that contains $x$,
(12) the induced topology on a subset $E \subset X$,
(13) $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ is an open covering of $U$ (note: we allow any $U_{i}$ to be empty and we even allow, in case $U$ is empty, the empty set for $I$ ),
(14) the open covering $\mathcal{V}$ is a refinement of the open covering $\mathcal{U}$ (if $\mathcal{V}: V=$ $\bigcup_{j \in J} V_{j}$ and $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ this means each $V_{j}$ is completely contained in one of the $U_{i}$ ),
(15) $\left\{E_{i}\right\}_{i \in I}$ is a fundamental system of neighbourhoods of $x$ in $X$,
(16) a topological space $X$ is called Hausdorff or separated if and only if for every distinct pair of points $x, y \in X$ there exist disjoint opens $U, V \subset X$ such that $x \in U, y \in V$,

08ZB (17) the product of two topological spaces,
08ZC (18) the fibre product $X \times_{Y} Z$ of a pair of continuous maps $f: X \rightarrow Y$ and $g: Z \rightarrow Y$
0B30 (19) the discrete topology and the indiscrete topology on a set,
(20) etc.

### 5.3. Hausdorff spaces

08ZD The category of topological spaces has finite products.
08ZE Lemma 5.3.1. Let $X$ be a topological space. The following are equivalent:
(1) $X$ is Hausdorff,
(2) the diagonal $\Delta(X) \subset X \times X$ is closed.

Proof. Omitted.
08ZF Lemma 5.3.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If $Y$ is Hausdorff, then the graph of $f$ is closed in $X \times Y$.
Proof. The graph is the inverse image of the diagonal under the map $X \times Y \rightarrow$ $Y \times Y$. Thus the lemma follows from Lemma 5.3.1.

08ZG Lemma 5.3.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $s: Y \rightarrow X$ be a continuous map such that $f \circ s=i d_{Y}$. If $X$ is Hausdorff, then $s(Y)$ is closed.

Proof. This follows from Lemma 5.3.1 as $s(Y)=\{x \in X \mid x=s(f(x))\}$.
08ZH Lemma 5.3.4. Let $X \rightarrow Z$ and $Y \rightarrow Z$ be continuous maps of topological spaces. If $Z$ is Hausdorff, then $X \times_{Z} Y$ is closed in $X \times Y$.

Proof. This follows from Lemma 5.3.1 as $X \times_{Z} Y$ is the inverse image of $\Delta(Z)$ under $X \times Y \rightarrow Z \times Z$.

### 5.4. Bases

004 O Basic material on bases for topological spaces.
004P Definition 5.4.1. Let $X$ be a topological space. A collection of subsets $\mathcal{B}$ of $X$ is called a base for the topology on $X$ or a basis for the topology on $X$ if the following conditions hold:
(1) Every element $B \in \mathcal{B}$ is open in $X$.
(2) For every open $U \subset X$ and every $x \in U$, there exists an element $B \in \mathcal{B}$ such that $x \in B \subset U$.

Let $X$ be a set and let $\mathcal{B}$ be a collection of subsets. Assume that $X=\bigcup_{B \in \mathcal{B}} B$ and that given $x \in B_{1} \cap B_{2}$ with $B_{1}, B_{2} \in \mathcal{B}$ there is a $B_{3} \in \mathcal{B}$ with $x \in B_{3} \subset B_{1} \cap B_{2}$. Then there is a unique topology on $X$ such that $\mathcal{B}$ is a basis for this topology. This remark is sometimes used to define a topology.
004Q Lemma 5.4.2. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{U}: U=\bigcup_{i} U_{i}$ be an open covering of $U \subset X$. There exists an open covering $U=\bigcup V_{j}$ which is a refinement of $\mathcal{U}$ such that each $V_{j}$ is an element of the basis $\mathcal{B}$.

Proof. Omitted.

08ZI Definition 5.4.3. Let $X$ be a topological space. A collection of subsets $\mathcal{B}$ of $X$ is called a subbase for the topology on $X$ or a subbasis for the topology on $X$ if the finite intersections of elements of $\mathcal{B}$ form a basis for the topology on $X$.
In particular every element of $\mathcal{B}$ is open.
08ZJ Lemma 5.4.4. Let $X$ be a set. Given any collection $\mathcal{B}$ of subsets of $X$ there is a unique topology on $X$ such that $\mathcal{B}$ is a subbase for this topology.
Proof. Omitted.

### 5.5. Submersive maps

0405 If $X$ is a topological space and $E \subset X$ is a subset, then we usually endow $E$ with the induced topology.
09R8 Lemma 5.5.1. Let $X$ be a topological space. Let $Y$ be a set and let $f: Y \rightarrow X$ be an injective map of sets. The induced topology on $Y$ is the topology characterized by each of the following statements:
(1) it is the weakest topology on $Y$ such that $f$ is continuous,
(2) the open subsets of $Y$ are $f^{-1}(U)$ for $U \subset X$ open,
(3) the closed subsets of $Y$ are the sets $f^{-1}(Z)$ for $Z \subset X$ closed.

Proof. Omitted.
Dually, if $X$ is a topological space and $X \rightarrow Y$ is a surjection of sets, then $Y$ can be endowed with the quotient topology.

08ZK Lemma 5.5.2. Let $X$ be a topological space. Let $Y$ be a set and let $f: X \rightarrow Y$ be a surjective map of sets. The quotient topology on $Y$ is the topology characterized by each of the following statements:
(1) it is the strongest topology on $Y$ such that $f$ is continuous,
(2) a subset $V$ of $Y$ is open if and only if $f^{-1}(V)$ is open,
(3) a subset $Z$ of $Y$ is closed if and only if $f^{-1}(Z)$ is closed.

Proof. Omitted.
Let $f: X \rightarrow Y$ be a continuous map of topological spaces. In this case we obtain a factorization $X \rightarrow f(X) \rightarrow Y$ of maps of sets. We can endow $f(X)$ with the quotient topology coming from the surjection $X \rightarrow f(X)$ or with the induced topology coming from the injection $f(X) \rightarrow Y$. The map

$$
(f(X), \text { quotient topology }) \longrightarrow(f(X), \text { induced topology })
$$

is continuous.
0406 Definition 5.5.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces.
(1) We say $f$ is a strict map of topological spaces if the induced topology and the quotient topology on $f(X)$ agree (see discussion above).
(2) We say $f$ is submersiv $\oint^{\dagger}$ if $f$ is surjective and strict.

Thus a continuous map $f: X \rightarrow Y$ is submersive if $f$ is a surjection and for any $T \subset Y$ we have $T$ is open or closed if and only if $f^{-1}(T)$ is so. In other words, $Y$ has the quotient topology relative to the surjection $X \rightarrow Y$.

[^7]02YB Lemma 5.5.4. Let $f: X \rightarrow Y$ be surjective, open, continuous map of topological spaces. Let $T \subset Y$ be a subset. Then
(1) $f^{-1}(\bar{T})=\overline{f^{-1}(T)}$,
(2) $T \subset Y$ is closed if and only $f^{-1}(T)$ is closed,
(3) $T \subset Y$ is open if and only $f^{-1}(T)$ is open, and
(4) $T \subset Y$ is locally closed if and only $f^{-1}(T)$ is locally closed.

In particular we see that $f$ is submersive.
Proof. It is clear that $\overline{f^{-1}(T)} \subset f^{-1}(\bar{T})$. If $x \in X$, and $x \notin \overline{f^{-1}(T)}$, then there exists an open neighbourhood $x \in U \subset X$ with $U \cap f^{-1}(T)=\emptyset$. Since $f$ is open we see that $f(U)$ is an open neighbourhood of $f(x)$ not meeting $T$. Hence $x \notin f^{-1}(\bar{T})$. This proves (1). Part (2) is an easy consequence of (1). Part (3) is obvious from the fact that $f$ is open and surjective. For (4), if $f^{-1}(T)$ is locally closed, then $f^{-1}(T) \subset \overline{f^{-1}(T)}=f^{-1}(\bar{T})$ is open, and hence by (3) applied to the map $f^{-1}(\bar{T}) \rightarrow \bar{T}$ we see that $T$ is open in $\bar{T}$, i.e., $T$ is locally closed.

0AAU Lemma 5.5.5. Let $f: X \rightarrow Y$ be surjective, closed, continuous map of topological spaces. Let $T \subset Y$ be a subset. Then
(1) $\bar{T}=f\left(\overline{f^{-1}(T)}\right)$,
(2) $T \subset Y$ is closed if and only $f^{-1}(T)$ is closed,
(3) $T \subset Y$ is open if and only $f^{-1}(T)$ is open, and
(4) $T \subset Y$ is locally closed if and only $f^{-1}(T)$ is locally closed.

In particular we see that $f$ is submersive.
Proof. It is clear that $\overline{f^{-1}(T)} \subset f^{-1}(\bar{T})$. Then $T \subset f\left(\overline{f^{-1}(T)}\right) \subset \bar{T}$ is a closed subset, hence we get (1). Part (2) is obvious from the fact that $f$ is closed and surjective. Part (3) follows from (2) applied to the complement of $T$. For (4), if $f^{-1}(T)$ is locally closed, then $f^{-1}(T) \subset \overline{f^{-1}(T)}$ is open. Since the map $\overline{f^{-1}(T)} \rightarrow \bar{T}$ is surjective by (1) we can apply part (3) to the map $\overline{f^{-1}(T)} \rightarrow \bar{T}$ induced by $f$ to conclude that $T$ is open in $\bar{T}$, i.e., $T$ is locally closed.

### 5.6. Connected components

004R
004S Definition 5.6.1. Let $X$ be a topological space.
(1) We say $X$ is connected if $X$ is not empty and whenever $X=T_{1} \amalg T_{2}$ with $T_{i} \subset X$ open and closed, then either $T_{1}=\emptyset$ or $T_{2}=\emptyset$.
(2) We say $T \subset X$ is a connected component of $X$ if $T$ is a maximal connected subset of $X$.

The empty space is not connected.
0376 Lemma 5.6.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If $E \subset X$ is a connected subset, then $f(E) \subset Y$ is connected as well.
Proof. Omitted.
004 L Lemma 5.6.3. Let $X$ be a topological space.
(1) If $T \subset X$ is connected, then so is its closure.
(2) Any connected component of $X$ is closed (but not necessarily open).
(3) Every connected subset of $X$ is contained in a connected component of $X$.
(4) Every point of $X$ is contained in a connected component, in other words, $X$ is the union of its connected components.
Proof. Let $\bar{T}$ be the closure of the connected subset $T$. Suppose $\bar{T}=T_{1} \amalg T_{2}$ with $T_{i} \subset \bar{T}$ open and closed. Then $T=\left(T \cap T_{1}\right) \amalg\left(T \cap T_{2}\right)$. Hence $T$ equals one of the two, say $T=T_{1} \cap T$. Thus clearly $\bar{T} \subset T_{1}$ as desired.
Pick a point $x \in X$. Consider the set $A$ of connected subsets $x \in T_{\alpha} \subset X$. Note that $A$ is nonempty since $\{x\} \in A$. There is a partial ordering on $A$ coming from inclusion: $\alpha \leq \alpha^{\prime} \Leftrightarrow T_{\alpha} \subset T_{\alpha^{\prime}}$. Choose a maximal totally ordered subset $A^{\prime} \subset A$, and let $T=\bigcup_{\alpha \in A^{\prime}} T_{\alpha}$. We claim that $T$ is connected. Namely, suppose that $T=T_{1} \amalg T_{2}$ is a disjoint union of two open and closed subsets of $T$. For each $\alpha \in A^{\prime}$ we have either $T_{\alpha} \subset T_{1}$ or $T_{\alpha} \subset T_{2}$, by connectedness of $T_{\alpha}$. Suppose that for some $\alpha_{0} \in A^{\prime}$ we have $T_{\alpha_{0}} \not \subset T_{1}$ (say, if not we're done anyway). Then, since $A^{\prime}$ is totally ordered we see immediately that $T_{\alpha} \subset T_{2}$ for all $\alpha \in A^{\prime}$. Hence $T=T_{2}$.
To get an example where connected components are not open, just take an infinite product $\prod_{n \in \mathbf{N}}\{0,1\}$ with the product topology. Its connected components are singletons, which are not open.

0377 Lemma 5.6.4. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume that
(1) all fibres of $f$ are connected, and
(2) a set $T \subset Y$ is closed if and only if $f^{-1}(T)$ is closed.

Then $f$ induces a bijection between the sets of connected components of $X$ and $Y$.
Proof. Let $T \subset Y$ be a connected component. Note that $T$ is closed, see Lemma 5.6.3. The lemma follows if we show that $f^{-1}(T)$ is connected because any connected subset of $X$ maps into a connected component of $Y$ by Lemma 5.6.2. Suppose that $f^{-1}(T)=Z_{1} \amalg Z_{2}$ with $Z_{1}, Z_{2}$ closed. For any $t \in T$ we see that $f^{-1}(\{t\})=Z_{1} \cap f^{-1}(\{t\}) \amalg Z_{2} \cap f^{-1}(\{t\})$. By (1) we see $f^{-1}(\{t\})$ is connected we conclude that either $f^{-1}(\{t\}) \subset Z_{1}$ or $f^{-1}(\{t\}) \subset Z_{2}$. In other words $T=T_{1} \amalg T_{2}$ with $f^{-1}\left(T_{i}\right)=Z_{i}$. By (2) we conclude that $T_{i}$ is closed in $Y$. Hence either $T_{1}=\emptyset$ or $T_{2}=\emptyset$ as desired.

0378 Lemma 5.6.5. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume that (a) $f$ is open, (b) all fibres of $f$ are connected. Then $f$ induces a bijection between the sets of connected components of $X$ and $Y$.

Proof. This is a special case of Lemma 5.6.4.
07VB Lemma 5.6.6. Let $f: X \rightarrow Y$ be a continuous map of nonempty topological spaces. Assume that (a) $Y$ is connected, (b) $f$ is open and closed, and (c) there is a point $y \in Y$ such that the fiber $f^{-1}(y)$ is a finite set. Then $X$ has at most $\left|f^{-1}(y)\right|$ connected components. Hence any connected component $T$ of $X$ is open and closed, and $p(T)$ is a nonempty open and closed subset of $Y$, which is therefore equal to $Y$.

Proof. If the topological space $X$ has at least $N$ connected components for some $N \in \mathbf{N}$, we find by induction a decomposition $X=X_{1} \amalg \ldots \amalg X_{N}$ of $X$ as a disjoint union of $N$ nonempty open and closed subsets $X_{1}, \ldots, X_{N}$ of $X$. As $f$ is open and closed, each $f\left(X_{i}\right)$ is a nonempty open and closed subset of $Y$ and is hence equal to $Y$. In particular the intersection $X_{i} \cap f^{-1}(y)$ is nonempty for each $1 \leq i \leq N$. Hence $f^{-1}(y)$ has at least $N$ elements.

04MC Definition 5.6.7. A topological space is totally disconnected if the connected components are all singletons.

A discrete space is totally disconnected. A totally disconnected space need not be discrete, for example $\mathbf{Q} \subset \mathbf{R}$ is totally disconnected but not discrete.

08ZL Lemma 5.6.8. Let $X$ be a topological space. Let $\pi_{0}(X)$ be the set of connected components of $X$. Let $X \rightarrow \pi_{0}(X)$ be the map which sends $x \in X$ to the connected component of $X$ passing through $x$. Endow $\pi_{0}(X)$ with the quotient topology. Then $\pi_{0}(X)$ is a totally disconnected space and any continuous map $X \rightarrow Y$ from $X$ to a totally disconnected space $Y$ factors through $\pi_{0}(X)$.

Proof. By Lemma 5.6.4 the connected components of $\pi_{0}(X)$ are the singletons. We omit the proof of the second statement.

04MD Definition 5.6.9. A topological space $X$ is called locally connected if every point $x \in X$ has a fundamental system of connected neighbourhoods.

04ME Lemma 5.6.10. Let $X$ be a topological space. If $X$ is locally connected, then
(1) any open subset of $X$ is locally connected, and
(2) the connected components of $X$ are open.

So also the connected components of open subsets of $X$ are open. In particular, every point has a fundamental system of open connected neighbourhoods.

Proof. Omitted.

### 5.7. Irreducible components

004 U
004V Definition 5.7.1. Let $X$ be a topological space.
(1) We say $X$ is irreducible, if $X$ is not empty, and whenever $X=Z_{1} \cup Z_{2}$ with $Z_{i}$ closed, we have $X=Z_{1}$ or $X=Z_{2}$.
(2) We say $Z \subset X$ is an irreducible component of $X$ if $Z$ is a maximal irreducible subset of $X$.

An irreducible space is obviously connected.
0379 Lemma 5.7.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If $E \subset X$ is an irreducible subset, then $f(E) \subset Y$ is irreducible as well.

Proof. Suppose $f(E)$ is the union of $Z_{1} \cap f(E)$ and $Z_{2} \cap f(E)$, for two distinct closed subsets $Z_{1}$ and $Z_{2}$ of $Y$; this is equal to the intersection $\left(Z_{1} \cup Z_{2}\right) \cap f(E)$, so $f(E)$ is then contained in the union $Z_{1} \cup Z_{2}$. For the irreducibility of $f(E)$ it suffices to show that it is contained in either $Z_{1}$ or $Z_{2}$. The relation $f(E) \subset Z_{1} \cup Z_{2}$ shows that $f^{-1}(f(E)) \subset f^{-1}\left(Z_{1} \cup Z_{2}\right)$; as the right-hand side is clearly equal to $f^{-1}\left(Z_{1}\right) \cup f^{-1}\left(Z_{2}\right)$ and since $E \subset f^{-1}(f(E))$, it follows that $E \subset f^{-1}\left(Z_{1}\right) \cup f^{-1}\left(Z_{2}\right)$, from which one concludes by the irreducibility of $E$ that $E \subset f^{-1}\left(Z_{1}\right)$ or $E \subset$ $f^{-1}\left(Z_{2}\right)$. Hence one sees that either $f(E) \subset f\left(f^{-1}\left(Z_{1}\right)\right) \subset Z_{1}$ or $f(E) \subset Z_{2}$.

004W Lemma 5.7.3. Let $X$ be a topological space.
(1) If $T \subset X$ is irreducible so is its closure in $X$.
(2) Any irreducible component of $X$ is closed.
(3) Any irreducible subset of $X$ is contained in an irreducible component of $X$.
(4) Every point of $X$ is contained in some irreducible component of $X$, in other words, $X$ is the union of its irreducible components.
Proof. Let $\bar{T}$ be the closure of the irreducible subset $T$. If $\bar{T}=Z_{1} \cup Z_{2}$ with $Z_{i} \subset \bar{T}$ closed, then $T=\left(T \cap Z_{1}\right) \cup\left(T \cap Z_{2}\right)$ and hence $T$ equals one of the two, say $T=Z_{1} \cap T$. Thus clearly $\bar{T} \subset Z_{1}$. This proves (1). Part (2) follows immediately from (1) and the definition of irreducible components.

Let $T \subset X$ be irreducible. Consider the set $A$ of irreducible subsets $T \subset T_{\alpha} \subset X$. Note that $A$ is nonempty since $T \in A$. There is a partial ordering on $A$ coming from inclusion: $\alpha \leq \alpha^{\prime} \Leftrightarrow T_{\alpha} \subset T_{\alpha^{\prime}}$. Choose a maximal totally ordered subset $A^{\prime} \subset A$, and let $T^{\prime}=\bigcup_{\alpha \in A^{\prime}} T_{\alpha}$. We claim that $T^{\prime}$ is irreducible. Namely, suppose that $T^{\prime}=Z_{1} \cup Z_{2}$ is a union of two closed subsets of $T$. For each $\alpha \in A^{\prime}$ we have either $T_{\alpha} \subset Z_{1}$ or $T_{\alpha} \subset Z_{2}$, by irreducibility of $T_{\alpha}$. Suppose that for some $\alpha_{0} \in A^{\prime}$ we have $T_{\alpha_{0}} \not \subset Z_{1}$ (say, if not we're done anyway). Then, since $A^{\prime}$ is totally ordered we see immediately that $T_{\alpha} \subset Z_{2}$ for all $\alpha \in A^{\prime}$. Hence $T^{\prime}=Z_{2}$. This proves (3). Part (4) is an immediate consequence of (3) as a singleton space is irreducible.

A singleton is irreducible. Thus if $x \in X$ is a point then the closure $\overline{\{x\}}$ is an irreducible closed subset of $X$.

004X Definition 5.7.4. Let $X$ be a topological space.
(1) Let $Z \subset X$ be an irreducible closed subset. A generic point of $Z$ is a point $\xi \in Z$ such that $Z=\overline{\{\xi\}}$.
(2) The space $X$ is called Kolmogorov, if for every $x, x^{\prime} \in X, x \neq x^{\prime}$ there exists a closed subset of $X$ which contains exactly one of the two points.
(3) The space $X$ is called quasi-sober if every irreducible closed subset has a generic point.
(4) The space $X$ is called sober if every irreducible closed subset has a unique generic point.

A topological space $X$ is Kolmogorov, quasi-sober or sober, resp., if and only if the map $x \mapsto \overline{\{x\}}$ from $X$ to the set of irreducible closed subsets of $X$ is injective, surjective or bijective, resp. Hence we see that a topological space is sober if and only if it is quasi-sober and Kolmogorov.

0B31 Lemma 5.7.5. Let $X$ be a topological space and let $Y \subset X$.
(1) If $X$ is Kolmogorov then so is $Y$.
(2) Suppose $Y$ is locally closed in $X$. If $X$ is quasi-sober then so is $Y$.
(3) Suppose $Y$ is locally closed in $X$. If $X$ is sober then so is $Y$.

Proof. Proof of (1). Suppose $X$ is Kolmogorov. Let $x, y \in X$ with $x \neq y$. Then $\overline{\overline{\{x\}} \cap Y}=\overline{\{x\}} \neq \overline{\{y\}}=\overline{\overline{\{y\}} \cap Y}$. Hence $\overline{\{x\}} \cap Y \neq \overline{\{y\}} \cap Y$. This shows that $Y$ is Kolmogorov.

Proof of (2). Suppose $X$ is quasi-sober. It suffices to consider the cases $Y$ is closed and $Y$ is open. First, suppose $Y$ is closed. Let $Z$ be an irreducible closed subset of $Y$. Then $Z$ is an irreducible closed subset of $X$. Hence there exists $x \in Y$ with $\overline{\{x\}}=Y$. It follows $\overline{\{x\}} \cap Y=Y$. This shows $Y$ is quasi-sober. Second, suppose $Y$ is open. Let $Z$ be an irreducible closed subset of $Y$. Then $\bar{Z}$ is an irreducible
closed subset of $X$. Hence there exists $x \in Z$ with $\overline{\{x\}}=\bar{Z}$. If $x \notin Y$ we get the contradiction $Z=Z \cap Y \subset \bar{Z} \cap Y=\overline{\{x\}} \cap Y=\emptyset$. Therefore $x \in Y$. It follows $Z=\bar{Z} \cap Y=\overline{\{x\}} \cap Y$. This shows $Y$ is quasi-sober.
Proof of (3). Immediately from (1) and (2).
06N9 Lemma 5.7.6. Let $X$ be a topological space and let $\left(X_{i}\right)_{i \in I}$ be a covering of $X$.
(1) Suppose $X_{i}$ is locally closed in $X$ for every $i \in I$. Then, $X$ is Kolmogorov if and only if $X_{i}$ is Kolmogorov for every $i \in I$.
(2) Suppose $X_{i}$ is open in $X$ for every $i \in I$. Then, $X$ is quasi-sober if and only if $X_{i}$ is quasi-sober for every $i \in I$.
(3) Suppose $X_{i}$ is open in $X$ for every $i \in I$. Then, $X$ is sober if and only if $X_{i}$ is sober for every $i \in I$.
Proof. Proof of (1). If $X$ is Kolmogorov then so is $X_{i}$ for every $i \in I$ by Lemma 5.7.5. Suppose $X_{i}$ is Kolmogorov for every $i \in I$. Let $x, y \in X$ with $\overline{\{x\}}=\overline{\{y\}}$. There exists $i \in I$ with $x \in X_{i}$. There exists an open subset $U \subset X$ such that $X_{i}$ is a closed subset of $U$. If $y \notin U$ we get the contradiction $x \in \overline{\{x\}} \cap U=\overline{\{y\}} \cap U=\emptyset$. Hence $y \in U$. It follows $y \in \overline{\{y\}} \cap U=\overline{\{x\}} \cap U \subset X_{i}$. This shows $y \in X_{i}$. It follows $\overline{\{x\}} \cap X_{i}=\overline{\{y\}} \cap X_{i}$. Since $X_{i}$ is Kolmogorov we get $x=y$. This shows $X$ is Kolmogorov.
Proof of (2). If $X$ is quasi-sober then so is $X_{i}$ for every $i \in I$ by Lemma 5.7.5. Suppose $X_{i}$ is quasi-sober for every $i \in I$. Let $Y$ be an irreducible closed subset of $X$. As $Y \neq \emptyset$ there exists $i \in I$ with $X_{i} \cap Y \neq \emptyset$. As $X_{i}$ is open in $X$ it follows $X_{i} \cap Y$ is non-empty and open in $Y$, hence irreducible and dense in $Y$. Thus $X_{i} \cap Y$ is an irreducible closed subset of $X_{i}$. As $X_{i}$ is quasi-sober there exists $x \in X_{i} \cap Y$ with $X_{i} \cap Y=\overline{\{x\}} \cap X_{i} \subset \overline{\{x\}}$. Since $X_{i} \cap Y$ is dense in $Y$ and $Y$ is closed in $X$ it follows $Y=\overline{X_{i} \cap Y} \cap Y \subset \overline{X_{i} \cap Y} \subset \overline{\{x\}} \subset Y$. Therefore $Y=\overline{\{x\}}$. This shows $X$ is quasi-sober.

Proof of (3). Immediately from (1) and (2).
0B32 Example 5.7.7. Let $X$ be an indiscrete space of cardinality at least 2 . Then $X$ is quasi-sober but not Kolmogorov. Moreover, the family of its singletons is a covering of $X$ by discrete and hence Kolmogorov spaces.
0B33 Example 5.7.8. Let $Y$ be an infinite set, furnished with the topology whose closed sets are $Y$ and the finite subsets of $Y$. Then $Y$ is Kolmogorov but not quasi-sober. However, the family of its singletons (which are its irreducible components) is a covering by discrete and hence sober spaces.
0B34 Example 5.7.9. Let $X$ and $Y$ be as in Example 5.7.7 and Example 5.7.8. Then, $X \amalg Y$ is neither Kolmogorov nor quasi-sober.

0B35 Example 5.7.10. Let $Z$ be an infinite set and let $z \in Z$. We furnish $Z$ with the topology whose closed sets are $Z$ and the finite subsets of $Z \backslash\{z\}$. Then $Z$ is sober but its subspace $Z \backslash\{z\}$ is not quasi-sober.

004 Y Example 5.7.11. Recall that a topological space $X$ is Hausdorff iff for every distinct pair of points $x, y \in X$ there exist disjoint opens $U, V \subset X$ such that $x \in U, y \in V$. In this case $X$ is irreducible if and only if $X$ is a singleton. Similarly, any subset of $X$ is irreducible if and only if it is a singleton. Hence a Hausdorff space is sober.

004Z Lemma 5.7.12. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume that (a) $Y$ is irreducible, (b) $f$ is open, and (c) there exists a dense collection of points $y \in Y$ such that $f^{-1}(y)$ is irreducible. Then $X$ is irreducible.

Proof. Suppose $X=Z_{1} \cup Z_{2}$ with $Z_{i}$ closed. Consider the open sets $U_{1}=Z_{1} \backslash Z_{2}=$ $X \backslash Z_{2}$ and $U_{2}=Z_{2} \backslash Z_{1}=X \backslash Z_{1}$. To get a contradiction assume that $U_{1}$ and $U_{2}$ are both nonempty. By (b) we see that $f\left(U_{i}\right)$ is open. By (a) we have $Y$ irreducible and hence $f\left(U_{1}\right) \cap f\left(U_{2}\right) \neq \emptyset$. By (c) there is a point $y$ which corresponds to a point of this intersection such that the fibre $X_{y}=f^{-1}(y)$ is irreducible. Then $X_{y} \cap U_{1}$ and $X_{y} \cap U_{2}$ are nonempty disjoint open subsets of $X_{y}$ which is a contradiction.

037A Lemma 5.7.13. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume that (a) $f$ is open, and (b) for every $y \in Y$ the fibre $f^{-1}(y)$ is irreducible. Then $f$ induces a bijection between irreducible components.
Proof. We point out that assumption (b) implies that $f$ is surjective (see Definition 5.7.1. Let $T \subset Y$ be an irreducible component. Note that $T$ is closed, see Lemma 5.7.3. The lemma follows if we show that $f^{-1}(T)$ is irreducible because any irreducible subset of $X$ maps into an irreducible component of $Y$ by Lemma 5.7.2. Note that $f^{-1}(T) \rightarrow T$ satisfies the assumptions of Lemma 5.7.12. Hence we win.

The construction of the following lemma is sometimes called the "soberification".
0A2N Lemma 5.7.14. Let $X$ be a topological space. There is a canonical continuous map

$$
c: X \longrightarrow X^{\prime}
$$

from $X$ to a sober topological space $X^{\prime}$ which is universal among continuous maps from $X$ to sober topological spaces. Moreover, the assignment $U^{\prime} \mapsto c^{-1}\left(U^{\prime}\right)$ is a bijection between opens of $X^{\prime}$ and $X$ which commutes with finite intersections and arbitrary unions. The image $c(X)$ is a Kolmogorov topological space and the map $c: X \rightarrow c(X)$ is universal for maps of $X$ into Kolmogorov spaces.

Proof. Let $X^{\prime}$ be the set of irreducible closed subsets of $X$ and let

$$
c: X \rightarrow X^{\prime}, \quad x \mapsto \overline{\{x\}}
$$

For $U \subset X$ open, let $U^{\prime} \subset X^{\prime}$ denote the set of irreducible closed subsets of $X$ which meet $U$. Then $c^{-1}\left(U^{\prime}\right)=U$. In particular, if $U_{1} \neq U_{2}$ are open in $X$, then $U_{1}^{\prime} \neq U_{2}^{\prime}$. Hence $c$ induces a bijection between the subsets of $X^{\prime}$ of the form $U^{\prime}$ and the opens of $X$.

Let $U_{1}, U_{2}$ be open in $X$. Suppose that $Z \in U_{1}^{\prime}$ and $Z \in U_{2}^{\prime}$. Then $Z \cap U_{1}$ and $Z \cap U_{2}$ are nonempty open subsets of the irreducible space $Z$ and hence $Z \cap U_{1} \cap U_{2}$ is nonempty. Thus $\left(U_{1} \cap U_{2}\right)^{\prime}=U_{1}^{\prime} \cap U_{2}^{\prime}$. The rule $U \mapsto U^{\prime}$ is also compatible with arbitrary unions (details omitted). Thus it is clear that the collection of $U^{\prime}$ form a topology on $X^{\prime}$ and that we have a bijection as stated in the lemma.

Next we show that $X^{\prime}$ is sober. Let $T \subset X^{\prime}$ be an irreducible closed subset. Let $U \subset X$ be the open such that $X^{\prime} \backslash T=U^{\prime}$. Then $Z=X \backslash U$ is irreducible because of the properties of the bijection of the lemma. We claim that $Z \in T$ is the unique generic point. Namely, any open of the form $V^{\prime} \subset X^{\prime}$ which does not contain $Z$ must come from an open $V \subset X$ which misses $Z$, i.e., is contained in $U$.

Finally, we check the universal property. Let $f: X \rightarrow Y$ be a continuous map to a sober topological space. Then we let $f^{\prime}: X^{\prime} \rightarrow Y$ be the map which sends the irreducible closed $Z \subset X$ to the unique generic point of $\overline{f(Z)}$. It follows immediately that $f^{\prime} \circ c=f$ as maps of sets, and the properties of $c$ imply that $f^{\prime}$ is continuous. We omit the verification that the continuous map $f^{\prime}$ is unique. We also omit the proof of the statements on Kolmogorov spaces.

### 5.8. Noetherian topological spaces

0050
0051 Definition 5.8.1. A topological space is called Noetherian if the descending chain condition holds for closed subsets of $X$. A topological space is called locally Noetherian if every point has a neighbourhood which is Noetherian.

Lemma 5.8.2. Let $X$ be a Noetherian topological space.
(1) Any subset of $X$ with the induced topology is Noetherian.
(2) The space $X$ has finitely many irreducible components.
(3) Each irreducible component of $X$ contains a nonempty open of $X$.

Proof. Let $T \subset X$ be a subset of $X$. Let $T_{1} \supset T_{2} \supset \ldots$ be a descending chain of closed subsets of $T$. Write $T_{i}=T \cap Z_{i}$ with $Z_{i} \subset X$ closed. Consider the descending chain of closed subsets $Z_{1} \supset Z_{1} \cap Z_{2} \supset Z_{1} \cap Z_{2} \cap Z_{3} \ldots$ This stabilizes by assumption and hence the original sequence of $T_{i}$ stabilizes. Thus $T$ is Noetherian.
Let $A$ be the set of closed subsets of $X$ which do not have finitely many irreducible components. Assume that $A$ is not empty to arrive at a contradiction. The set $A$ is partially ordered by inclusion: $\alpha \leq \alpha^{\prime} \Leftrightarrow Z_{\alpha} \subset Z_{\alpha^{\prime}}$. By the descending chain condition we may find a smallest element of $A$, say $Z$. As $Z$ is not a finite union of irreducible components, it is not irreducible. Hence we can write $Z=Z^{\prime} \cup Z^{\prime \prime}$ and both are strictly smaller closed subsets. By construction $Z^{\prime}=\bigcup Z_{i}^{\prime}$ and $Z^{\prime \prime}=\bigcup Z_{j}^{\prime \prime}$ are finite unions of their irreducible components. Hence $Z=\bigcup Z_{i}^{\prime} \cup \bigcup Z_{j}^{\prime \prime}$ is a finite union of irreducible closed subsets. After removing redundant members of this expression, this will be the decomposition of $Z$ into its irreducible components, a contradiction.
Let $Z \subset X$ be an irreducible component of $X$. Let $Z_{1}, \ldots, Z_{n}$ be the other irreducible components of $X$. Consider $U=Z \backslash\left(Z_{1} \cup \ldots \cup Z_{n}\right)$. This is not empty since otherwise the irreducible space $Z$ would be contained in one of the other $Z_{i}$. Because $X=Z \cup Z_{1} \cup \ldots Z_{n}$ (see Lemma5.7.3), also $U=X \backslash\left(Z_{1} \cup \ldots \cup Z_{n}\right)$ and hence open in $X$. Thus $Z$ contains a nonempty open of $X$.

04 Z 8 Lemma 5.8.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces.
(1) If $X$ is Noetherian, then $f(X)$ is Noetherian.
(2) If $X$ is locally Noetherian and $f$ open, then $f(X)$ is locally Noetherian.

Proof. In case (1), suppose that $Z_{1} \supset Z_{2} \supset Z_{3} \supset \ldots$ is a descending chain of closed subsets of $f(X)$ (as usual with the induced topology as a subset of $Y$ ). Then $f^{-1}\left(Z_{1}\right) \supset f^{-1}\left(Z_{2}\right) \supset f^{-1}\left(Z_{3}\right) \supset \ldots$ is a descending chain of closed subsets of $X$. Hence this chain stabilizes. Since $f\left(f^{-1}\left(Z_{i}\right)\right)=Z_{i}$ we conclude that $Z_{1} \supset Z_{2} \supset$ $Z_{3} \supset \ldots$ stabilizes also. In case (2), let $y \in f(X)$. Choose $x \in X$ with $f(x)=y$. By assumption there exists a neighbourhood $E \subset X$ of $x$ which is Noetherian. Then $f(E) \subset f(X)$ is a neighbourhood which is Noetherian by part (1).

0053 Lemma 5.8.4. Let $X$ be a topological space. Let $X_{i} \subset X, i=1, \ldots, n$ be a finite collection of subsets. If each $X_{i}$ is Noetherian (with the induced topology), then $\bigcup_{i=1, \ldots, n} X_{i}$ is Noetherian (with the induced topology).

Proof. Omitted.
02HZ Example 5.8.5. Any nonempty, Kolmogorov Noetherian topological space has a closed point (combine Lemmas 5.11.8 and 5.11.13). Let $X=\{1,2,3, \ldots\}$. Define a topology on $X$ with opens $\emptyset,\{1,2, \ldots, n\}, n \geq 1$ and $X$. Thus $X$ is a locally Noetherian topological space, without any closed points. This space cannot be the underlying topological space of a locally Noetherian scheme, see Properties, Lemma 27.5.9.

04MF Lemma 5.8.6. Let $X$ be a locally Noetherian topological space. Then $X$ is locally connected.

Proof. Let $x \in X$. Let $E$ be a neighbourhood of $x$. We have to find a connected neighbourhood of $x$ contained in $E$. By assumption there exists a neighbourhood $E^{\prime}$ of $x$ which is Noetherian. Then $E \cap E^{\prime}$ is Noetherian, see Lemma 5.8.2. Let $E \cap E^{\prime}=Y_{1} \cup \ldots \cup Y_{n}$ be the decomposition into irreducible components, see Lemma 5.8.2. Let $E^{\prime \prime}=\bigcup_{x \in Y_{i}} Y_{i}$. This is a connected subset of $E \cap E^{\prime}$ containing $x$. It contains the open $E \cap E^{\prime} \backslash\left(\bigcup_{x \notin Y_{i}} Y_{i}\right)$ of $E \cap E^{\prime}$ and hence it is a neighbourhood of $x$ in $X$. This proves the lemma.

### 5.9. Krull dimension

0054
0055 Definition 5.9.1. Let $X$ be a topological space.
(1) A chain of irreducible closed subsets of $X$ is a sequence $Z_{0} \subset Z_{1} \subset \ldots \subset$ $Z_{n} \subset X$ with $Z_{i}$ closed irreducible and $Z_{i} \neq Z_{i+1}$ for $i=0, \ldots, n-1$.
(2) The length of a chain $Z_{0} \subset Z_{1} \subset \ldots \subset Z_{n} \subset X$ of irreducible closed subsets of $X$ is the integer $n$.
(3) The dimension or more precisely the Krull dimension $\operatorname{dim}(X)$ of $X$ is the element of $\{-\infty, 0,1,2,3, \ldots, \infty\}$ defined by the formula: $\operatorname{dim}(X)=\sup \{$ lengths of chains of irreducible closed subsets $\}$

Thus $\operatorname{dim}(X)=-\infty$ if and only if $X$ is the empty space.
(4) Let $x \in X$. The Krull dimension of $X$ at $x$ is defined as

$$
\operatorname{dim}_{x}(X)=\min \{\operatorname{dim}(U), x \in U \subset X \text { open }\}
$$

the minimum of $\operatorname{dim}(U)$ where $U$ runs over the open neighbourhoods of $x$ in $X$.

Note that if $U^{\prime} \subset U \subset X$ are open then $\operatorname{dim}\left(U^{\prime}\right) \leq \operatorname{dim}(U)$. Hence if $\operatorname{dim}_{x}(X)=$ $d$ then $x$ has a fundamental system of open neighbourhoods $U$ with $\operatorname{dim}(U)=$ $\operatorname{dim}_{x}(X)$.

0B7I Lemma 5.9.2. Let $X$ be a topological space. Then $\operatorname{dim}(X)=\sup \operatorname{dim}_{x}(X)$ where the supremum runs over the points $x$ of $X$.

Proof. It is clear that $\operatorname{dim}(X) \geq \operatorname{dim}_{x}(X)$ for all $x \in X$ (see discussion following Definition 5.9.1. Thus an inequality in one direction. For the converse, let $n \geq 0$ and suppose that $\operatorname{dim}(X) \geq n$. Then we can find a chain of irreducible closed subsets $Z_{0} \subset Z_{1} \subset \ldots \subset \bar{Z}_{n} \subset X$. Pick $x \in Z_{0}$. Then we see that every open neighbourhood $U$ of $x$ has a chain of irreducible closed subsets $Z_{0} \cap U \subset Z_{1} \cap U \subset$ $\ldots Z_{n} \cap U \subset U$. In this way we see that $\operatorname{dim}_{x}(X) \geq n$ which proves the other inequality.

Example 5.9.3. The Krull dimension of the usual Euclidean space $\mathbf{R}^{n}$ is 0 .
0057 Example 5.9.4. Let $X=\{s, \eta\}$ with open sets given by $\{\emptyset,\{\eta\},\{s, \eta\}\}$. In this case a maximal chain of irreducible closed subsets is $\{s\} \subset\{s, \eta\}$. Hence $\operatorname{dim}(X)=1$. It is easy to generalize this example to get a $(n+1)$-element topological space of Krull dimension $n$.

0058 Definition 5.9.5. Let $X$ be a topological space. We say that $X$ is equidimensional if every irreducible component of $X$ has the same dimension.

### 5.10. Codimension and catenary spaces

02IO We only define the codimension of irreducible closed subsets.
02I3 Definition 5.10.1. Let $X$ be a topological space. Let $Y \subset X$ be an irreducible closed subset. The codimension of $Y$ in $X$ is the supremum of the lengths $e$ of chains

$$
Y=Y_{0} \subset Y_{1} \subset \ldots \subset Y_{e} \subset X
$$

of irreducible closed subsets in $X$ starting with $Y$. We will denote this $\operatorname{codim}(Y, X)$.
The codimension is an element of $\{0,1,2, \ldots\} \cup\{\infty\}$. If $\operatorname{codim}(Y, X)<\infty$, then every chain can be extended to a maximal chain (but these do not all have to have the same length).
02I4 Lemma 5.10.2. Let $X$ be a topological space. Let $Y \subset X$ be an irreducible closed subset. Let $U \subset X$ be an open subset such that $Y \cap U$ is nonempty. Then

$$
\operatorname{codim}(Y, X)=\operatorname{codim}(Y \cap U, U)
$$

Proof. The rule $T \mapsto \bar{T}$ defines a bijective inclusion preserving map between the closed irreducible subsets of $U$ and the closed irreducible subsets of $X$ which meet $U$. Using this the lemma easily follows. Details omitted.

02I5 Example 5.10.3. Let $X=[0,1]$ be the unit interval with the following topology: The sets $[0,1],(1-1 / n, 1]$ for $n \in \mathbf{N}$, and $\emptyset$ are open. So the closed sets are $\emptyset,\{0\}$, [ $0,1-1 / n]$ for $n>1$ and $[0,1]$. This is clearly a Noetherian topological space. But the irreducible closed subset $Y=\{0\}$ has infinite codimension $\operatorname{codim}(Y, X)=\infty$. To see this we just remark that all the closed sets $[0,1-1 / n]$ are irreducible.
02I1 Definition 5.10.4. Let $X$ be a topological space. We say $X$ is catenary if for every pair of irreducible closed subsets $T \subset T^{\prime}$ we have $\operatorname{codim}\left(T, T^{\prime}\right)<\infty$ and every maximal chain of irreducible closed subsets

$$
T=T_{0} \subset T_{1} \subset \ldots \subset T_{e}=T^{\prime}
$$

has the same length (equal to the codimension).
02I2 Lemma 5.10.5. Let $X$ be a topological space. The following are equivalent:
(1) $X$ is catenary,
(2) $X$ has an open covering by catenary spaces.

Moreover, in this case any locally closed subspace of $X$ is catenary.
Proof. Suppose that $X$ is catenary and that $U \subset X$ is an open subset. The rule $T \mapsto \bar{T}$ defines a bijective inclusion preserving map between the closed irreducible subsets of $U$ and the closed irreducible subsets of $X$ which meet $U$. Using this the lemma easily follows. Details omitted.

02I6 Lemma 5.10.6. Let $X$ be a topological space. The following are equivalent:
(1) $X$ is catenary, and
(2) for every pair of irreducible closed subsets $Y \subset Y^{\prime}$ we have $\operatorname{codim}\left(Y, Y^{\prime}\right)<$ $\infty$ and for every triple $Y \subset Y^{\prime} \subset Y^{\prime \prime}$ of irreducible closed subsets we have

$$
\operatorname{codim}\left(Y, Y^{\prime \prime}\right)=\operatorname{codim}\left(Y, Y^{\prime}\right)+\operatorname{codim}\left(Y^{\prime}, Y^{\prime \prime}\right)
$$

Proof. Omitted.

### 5.11. Quasi-compact spaces and maps

0059 The phrase "compact" will be reserved for Hausdorff topological spaces. And many spaces occurring in algebraic geometry are not Hausdorff.

005A Definition 5.11.1. Quasi-compactness.
(1) We say that a topological space $X$ is quasi-compact if every open covering of $X$ has a finite refinement.
(2) We say that a continuous map $f: X \rightarrow Y$ is quasi-compact if the inverse image $f^{-1}(V)$ of every quasi-compact open $V \subset Y$ is quasi-compact.
(3) We say a subset $Z \subset X$ is retrocompact if the inclusion map $Z \rightarrow X$ is quasi-compact.

In many texts on topology a space is called compact if it is quasi-compact and Hausdorff; and in other texts the Hausdorff condition is omitted. To avoid confusion in algebraic geometry we use the term quasi-compact. Note that the notion of quasi-compactness of a map is very different from the notion of a "proper map" in topology, since there one requires the inverse image of any (quasi-) compact subset of the target to be (quasi-)compact, whereas in the definition above we only consider quasi-compact open sets.

005B Lemma 5.11.2. A composition of quasi-compact maps is quasi-compact.
Proof. This is immediate from the definition.
005C Lemma 5.11.3. A closed subset of a quasi-compact topological space is quasicompact.

Proof. Let $E \subset X$ be a closed subset of the quasi-compact space $X$. Let $E=\bigcup V_{j}$ be an open covering. Choose $U_{j} \subset X$ open such that $V_{j}=E \cap U_{j}$. Then $X=$ $(X \backslash E) \cup \bigcup U_{j}$ is an open covering of $X$. Hence $X=(X \backslash E) \cup U_{j_{1}} \cup \ldots \cup U_{j_{n}}$ for some $n$ and indices $j_{i}$. Thus $E=V_{j_{1}} \cup \ldots \cup V_{j_{n}}$ as desired.

08YB Lemma 5.11.4. Let $X$ be a Hausdorff topological space.
(1) If $E \subset X$ is quasi-compact, then it is closed.
5.11. QUASI-COMPACT SPACES AND MAPS
(2) If $E_{1}, E_{2} \subset X$ are disjoint quasi-compact subsets then there exists opens $E_{i} \subset U_{i}$ with $U_{1} \cap U_{2}=\emptyset$.

Proof. Proof of (1). Let $x \in X, x \notin E$. For every $e \in E$ we can find disjoint opens $V_{e}$ and $U_{e}$ with $e \in V_{e}$ and $x \in U_{e}$. Since $E \subset \bigcup V_{e}$ we can find finitely many $e_{1}, \ldots, e_{n}$ such that $E \subset V_{e_{1}} \cup \ldots \cup V_{e_{n}}$. Then $U=U_{e_{1}} \cap \ldots \cap U_{e_{n}}$ is an open neighbourhood of $x$ which avoids $V_{e_{1}} \cup \ldots \cup V_{e_{n}}$. In particular it avoids $E$. Thus $E$ is closed.

Proof of (2). In the proof of (1) we have seen that given $x \in E_{1}$ we can find an open neighbourhood $x \in U_{x}$ and an open $E_{2} \subset V_{x}$ such that $U_{x} \cap V_{x}=\emptyset$. Because $E_{1}$ is quasi-compact we can find a finite number $x_{i} \in E_{1}$ such that $E_{1} \subset U=$ $U_{x_{1}} \cup \ldots \cup U_{x_{n}}$. We take $V=V_{x_{1}} \cap \ldots \cap V_{x_{n}}$ to finish the proof.
08 YC Lemma 5.11.5. Let $X$ be a quasi-compact Hausdorff space. Let $E \subset X$. The following are equivalent: (a) $E$ is closed in $X$, (b) $E$ is quasi-compact.

Proof. The implication $(\mathrm{a}) \Rightarrow(\mathrm{b})$ is Lemma 5.11.3. The implication $(\mathrm{b}) \Rightarrow(\mathrm{a})$ is Lemma 5.11.4

The following is really a reformulation of the quasi-compact property.
005D Lemma 5.11.6. Let $X$ be a quasi-compact topological space. If $\left\{Z_{\alpha}\right\}_{\alpha \in A}$ is a collection of closed subsets such that the intersection of each finite subcollection is nonempty, then $\bigcap_{\alpha \in A} Z_{\alpha}$ is nonempty.
Proof. Omitted.
04Z9 Lemma 5.11.7. Let $f: X \rightarrow Y$ be a continuous map of topological spaces.
(1) If $X$ is quasi-compact, then $f(X)$ is quasi-compact.
(2) If $f$ is quasi-compact, then $f(X)$ is retrocompact.

Proof. If $f(X)=\bigcup V_{i}$ is an open covering, then $X=\bigcup f^{-1}\left(V_{i}\right)$ is an open covering. Hence if $X$ is quasi-compact then $X=f^{-1}\left(V_{i_{1}}\right) \cup \ldots \cup f^{-1}\left(V_{i_{n}}\right)$ for some $i_{1}, \ldots, i_{n} \in I$ and hence $f(X)=V_{i_{1}} \cup \ldots \cup V_{i_{n}}$. This proves (1). Assume $f$ is quasi-compact, and let $V \subset Y$ be quasi-compact open. Then $f^{-1}(V)$ is quasicompact, hence by (1) we see that $f\left(f^{-1}(V)\right)=f(X) \cap V$ is quasi-compact. Hence $f(X)$ is retrocompact.

005E Lemma 5.11.8. Let $X$ be a topological space. Assume that
(1) $X$ is nonempty,
(2) $X$ is quasi-compact, and
(3) $X$ is Kolmogorov.

Then $X$ has a closed point.
Proof. Consider the set

$$
\mathcal{T}=\{Z \subset X \mid Z=\overline{\{x\}} \text { for some } x \in X\}
$$

of all closures of singletons in $X$. It is nonempty since $X$ is nonempty. Make $\mathcal{T}$ into a partially ordered set using the relation of inclusion. Suppose $Z_{\alpha}, \alpha \in A$ is a totally ordered subset of $\mathcal{T}$. By Lemma 5.11.6 we see that $\bigcap_{\alpha \in A} Z_{\alpha} \neq \emptyset$. Hence there exists some $x \in \bigcap_{\alpha \in A} Z_{\alpha}$ and we see that $Z=\overline{\{x\}} \in \mathcal{T}$ is a lower bound for the family. By Zorn's lemma there exists a minimal element $Z \in \mathcal{T}$. As $X$ is Kolmogorov we conclude that $Z=\{x\}$ for some $x$ and $x \in X$ is a closed point.

08ZM Lemma 5.11.9. Let $X$ be a quasi-compact Kolmogorov space. Then the set $X_{0}$ of closed points of $X$ is quasi-compact.
Proof. Let $X_{0}=\bigcup U_{i, 0}$ be an open covering. Write $U_{i, 0}=X_{0} \cap U_{i}$ for some open $U_{i} \subset X$. Consider the complement $Z$ of $\bigcup U_{i}$. This is a closed subset of $X$, hence quasi-compact (Lemma 5.11.3) and Kolmogorov. By Lemma 5.11.8 if $Z$ is nonempty it would have a closed point which contradicts the fact that $X_{0} \subset \cup U_{i}$. Hence $Z=\emptyset$ and $X=\bigcup U_{i}$. Since $X$ is quasi-compact this covering has a finite subcover and we conclude.

005F Lemma 5.11.10. Let $X$ be a topological space. Assume
(1) $X$ is quasi-compact,
(2) $X$ has a basis for the topology consisting of quasi-compact opens, and
(3) the intersection of two quasi-compact opens is quasi-compact.

For any $x \in X$ the connected component of $X$ containing $x$ is the intersection of all open and closed subsets of $X$ containing $x$.
Proof. Let $T$ be the connected component containing $x$. Let $S=\bigcap_{\alpha \in A} Z_{\alpha}$ be the intersection of all open and closed subsets $Z_{\alpha}$ of $X$ containing $x$. Note that $S$ is closed in $X$. Note that any finite intersection of $Z_{\alpha}$ 's is a $Z_{\alpha}$. Because $T$ is connected and $x \in T$ we have $T \subset S$. It suffices to show that $S$ is connected. If not, then there exists a disjoint union decomposition $S=B \amalg C$ with $B$ and $C$ open and closed in $S$. In particular, $B$ and $C$ are closed in $X$, and so quasi-compact by Lemma 5.11.3 and assumption (1). By assumption (2) there exist quasi-compact opens $U, V \subset X$ with $B=S \cap U$ and $C=S \cap V$ (details omitted). Then $U \cap V \cap S=\emptyset$. Hence $\bigcap_{\alpha} U \cap V \cap Z_{\alpha}=\emptyset$. By assumption (3) the intersection $U \cap V$ is quasi-compact. By Lemma 5.11 .6 for some $\alpha^{\prime} \in A$ we have $U \cap V \cap Z_{\alpha^{\prime}}=\emptyset$. Since $X \backslash(U \cup V)$ is disjoint from $S$ and closed in $X$ hence quasi-compact, we can use the same lemma to see that $Z_{\alpha^{\prime \prime}} \subset U \cup V$ for some $\alpha^{\prime \prime} \in A$. Then $Z_{\alpha}=Z_{\alpha^{\prime}} \cap Z_{\alpha^{\prime \prime}}$ is contained in $U \cup V$ and disjoint from $U \cap V$. Hence $Z_{\alpha}=U \cap Z_{\alpha} \amalg V \cap Z_{\alpha}$ is a decomposition into two open pieces, hence $U \cap Z_{\alpha}$ and $V \cap Z_{\alpha}$ are open and closed in $X$. Thus, if $x \in B$ say, then we see that $S \subset U \cap Z_{\alpha}$ and we conclude that $C=\emptyset$.
08ZN Lemma 5.11.11. Let $X$ be a topological space. Assume $X$ is quasi-compact and Hausdorff. For any $x \in X$ the connected component of $X$ containing $x$ is the intersection of all open and closed subsets of $X$ containing $x$.

Proof. Let $T$ be the connected component containing $x$. Let $S=\bigcap_{\alpha \in A} Z_{\alpha}$ be the intersection of all open and closed subsets $Z_{\alpha}$ of $X$ containing $x$. Note that $S$ is closed in $X$. Note that any finite intersection of $Z_{\alpha}$ 's is a $Z_{\alpha}$. Because $T$ is connected and $x \in T$ we have $T \subset S$. It suffices to show that $S$ is connected. If not, then there exists a disjoint union decomposition $S=B \amalg C$ with $B$ and $C$ open and closed in $S$. In particular, $B$ and $C$ are closed in $X$, and so quasi-compact by Lemma 5.11.3. By Lemma 5.11.4 there exist disjoint opens $U, V \subset X$ with $B \subset U$ and $C \subset V$. Then $X \backslash U \cup V$ is closed in $X$ hence quasi-compact (Lemma 5.11.3). It follows that $(X \backslash U \cup V) \cap Z_{\alpha}=\emptyset$ for some $\alpha$ by Lemma 5.11.6. In other words, $Z_{\alpha} \subset U \cup V$. Thus $Z_{\alpha}=Z_{\alpha} \cap V \amalg Z_{\alpha} \cap U$ is a decomposition into two open pieces, hence $U \cap Z_{\alpha}$ and $V \cap Z_{\alpha}$ are open and closed in $X$. Thus, if $x \in B$ say, then we see that $S \subset U \cap Z_{\alpha}$ and we conclude that $C=\emptyset$.

04PL Lemma 5.11.12. Let $X$ be a topological space. Assume
(1) $X$ is quasi-compact,
(2) $X$ has a basis for the topology consisting of quasi-compact opens, and
(3) the intersection of two quasi-compact opens is quasi-compact.

For a subset $T \subset X$ the following are equivalent:
(a) $T$ is an intersection of open and closed subsets of $X$, and
(b) $T$ is closed in $X$ and is a union of connected components of $X$.

Proof. It is clear that (a) implies (b). Assume (b). Let $x \in X, x \notin T$. Let $x \in C \subset X$ be the connected component of $X$ containing $x$. By Lemma 5.11.10 we see that $C=\bigcap V_{\alpha}$ is the intersection of all open and closed subsets $V_{\alpha}$ of $X$ which contain $C$. In particular, any pairwise intersection $V_{\alpha} \cap V_{\beta}$ occurs as a $V_{\alpha}$. As $T$ is a union of connected components of $X$ we see that $C \cap T=\emptyset$. Hence $T \cap \cap V_{\alpha}=\emptyset$. Since $T$ is quasi-compact as a closed subset of a quasi-compact space (see Lemma 5.11.3) we deduce that $T \cap V_{\alpha}=\emptyset$ for some $\alpha$, see Lemma 5.11.6. For this $\alpha$ we see that $U_{\alpha}=X \backslash V_{\alpha}$ is an open and closed subset of $X$ which contains $T$ and not $x$. The lemma follows.

04ZA Lemma 5.11.13. Let $X$ be a Noetherian topological space.
(1) The space $X$ is quasi-compact.
(2) Any subset of $X$ is retrocompact.

Proof. Suppose $X=\bigcup U_{i}$ is an open covering of $X$ indexed by the set $I$ which does not have a refinement by a finite open covering. Choose $i_{1}, i_{2}, \ldots$ elements of $I$ inductively in the following way: Choose $i_{n+1}$ such that $U_{i_{n+1}}$ is not contained in $U_{i_{1}} \cup \ldots \cup U_{i_{n}}$. Thus we see that $X \supset\left(X \backslash U_{i_{1}}\right) \supset\left(X \backslash U_{i_{1}} \cup U_{i_{2}}\right) \supset \ldots$ is a strictly decreasing infinite sequence of closed subsets. This contradicts the fact that $X$ is Noetherian. This proves the first assertion. The second assertion is now clear since every subset of $X$ is Noetherian by Lemma 5.8.2.

04ZB Lemma 5.11.14. A quasi-compact locally Noetherian space is Noetherian.
Proof. The conditions imply immediately that $X$ has a finite covering by Noetherian subsets, and hence is Noetherian by Lemma 5.8.4.

08ZP Lemma 5.11.15 (Alexander subbase theorem). Let $X$ be a topological space. Let $\mathcal{B}$ be a subbase for $X$. If every covering of $X$ by elements of $\mathcal{B}$ has a finite refinement, then $X$ is quasi-compact.

Proof. Assume there is an open covering of $X$ which does not have a finite refinement. Using Zorn's lemma we can choose a maximal open covering $X=\bigcup_{i \in I} U_{i}$ which does not have a finite refinement (details omitted). In other words, if $U \subset X$ is any open which does not occur as one of the $U_{i}$, then the covering $X=U \cup \bigcup_{i \in I} U_{i}$ does have a finite refinement. Let $I^{\prime} \subset I$ be the set of indices such that $U_{i} \in \mathcal{B}$. Then $\bigcup_{i \in I^{\prime}} U_{i} \neq X$, since otherwise we would get a finite refinement covering $X$ by our assumption on $\mathcal{B}$. Pick $x \in X, x \notin \bigcup_{i \in I^{\prime}} U_{i}$. Pick $i \in I$ with $x \in U_{i}$. Pick $V_{1}, \ldots, V_{n} \in \mathcal{B}$ such that $x \in V_{1} \cap \ldots \cap V_{n} \subset U_{i}$. This is possible as $\mathcal{B}$ is a subbasis for $X$. Note that $V_{j}$ does not occur as a $U_{i}$. By maximality of the chosen covering we see that for each $j$ there exist $i_{j, 1}, \ldots, i_{j, n_{j}} \in I$ such that $X=V_{j} \cup U_{i_{j, 1}} \cup \ldots \cup U_{i_{j, n_{j}}}$. Since $V_{1} \cap \ldots \cap V_{n} \subset U_{i}$ we conclude that $X=U_{i} \cup \bigcup U_{i_{j, l}}$ a contradiction.

### 5.12. Locally quasi-compact spaces

08ZQ Recall that a neighbourhood of a point need not be open.
0068 Definition 5.12.1. A topological space $X$ is called locally quasi-compac ${ }^{2}$ if every point has a fundamental system of quasi-compact neighbourhoods.

The term locally compact space in the literature often refers to a space as in the following lemma.

08ZR Lemma 5.12.2. A Hausdorff space is locally quasi-compact if and only if every point has a quasi-compact neighbourhood.
Proof. Let $X$ be a Hausdorff space. Let $x \in X$ and let $x \in E \subset X$ be a quasicompact neighbourhood. Then $E$ is closed by Lemma 5.11.4. Suppose that $x \in$ $U \subset X$ is an open neighbourhood of $x$. Then $Z=E \backslash U$ is a closed subset of $E$ not containing $x$. Hence we can find a pair of disjoint open subsets $W, V \subset E$ of $E$ such that $x \in V$ and $Z \subset W$, see Lemma 5.11.4. It follows that $\bar{V} \subset E$ is a closed neighbourhood of $x$ contained in $E \cap U$. Also $\bar{V}$ is quasi-compact as a closed subset of $E$ (Lemma 5.11.3). In this way we obtain a fundamental system of quasi-compact neighbourhoods of $x$.

09UV Lemma 5.12.3. Let $X$ be a Hausdorff and quasi-compact space. Let $X=\bigcup_{i \in I} U_{i}$ be an open covering. Then there exists an open covering $X=\bigcup_{i \in I} V_{i}$ such that $\overline{V_{i}} \subset U_{i}$ for all $i$.

Proof. Let $x \in X$. Choose an $i(x) \in I$ such that $x \in U_{i(x)}$. Since $X \backslash U_{i(x)}$ and $\{x\}$ are disjoint closed subsets of $X$, by Lemmas 5.11 .3 and 5.11.4 there exists an open neighbourhood $U_{x}$ of $x$ whose closure is disjoint from $X \backslash U_{i(x)}$. Thus $\overline{U_{x}} \subset U_{i(x)}$. Since $X$ is quasi-compact, there is a finite list of points $x_{1}, \ldots, x_{m}$ such that $X=U_{x_{1}} \cup \ldots \cup U_{x_{m}}$. Setting $V_{i}=\bigcup_{i=i\left(x_{j}\right)} U_{x_{j}}$ the proof is finished.

09UW Lemma 5.12.4. Let $X$ be a Hausdorff and quasi-compact space. Let $X=\bigcup_{i \in I} U_{i}$ be an open covering. Suppose given an integer $p \geq 0$ and for every $(p+1)$-tuple $i_{0}, \ldots, i_{p}$ of $I$ an open covering $U_{i_{0}} \cap \ldots \cap U_{i_{p}}=\bigcup W_{i_{0} \ldots i_{p}, k}$. Then there exists an open covering $X=\bigcup_{j \in J} V_{j}$ and a map $\alpha: J \rightarrow I$ such that $\overline{V_{j}} \subset U_{\alpha(j)}$ and such that each $V_{j_{0}} \cap \ldots \cap V_{j_{p}}$ is contained in $W_{\alpha\left(j_{0}\right) \ldots \alpha\left(j_{p}\right), k}$ for some $k$.
Proof. Since $X$ is quasi-compact, there is a reduction to the case where $I$ is finite (details omitted). We prove the result for $I$ finite by induction on $p$. The base case $p=0$ is immediate by taking a covering as in Lemma 5.12.3 refining the open covering $X=\bigcup W_{i_{0}, k}$.
Induction step. Assume the lemma proven for $p-1$. For all $p$-tuples $i_{0}^{\prime}, \ldots, i_{p-1}^{\prime}$ of $I$ let $U_{i_{0}^{\prime}} \cap \ldots \cap U_{i_{p-1}^{\prime}}=\bigcup W_{i_{0}^{\prime} \ldots i_{p-1}^{\prime}, k}$ be a common refinement of the coverings $U_{i_{0}} \cap \ldots \cap U_{i_{p}}=\bigcup W_{i_{0} \ldots i_{p}, k}$ for those $(p+1)$-tuples such that $\left\{i_{0}^{\prime}, \ldots, i_{p-1}^{\prime}\right\}=$ $\left\{i_{0}, \ldots, i_{p}\right\}$ (equality of sets). (There are finitely many of these as $I$ is finite.) By induction there exists a solution for these opens, say $X=\bigcup V_{j}$ and $\alpha: J \rightarrow I$. At this point the covering $X=\bigcup_{j \in J} V_{j}$ and $\alpha$ satisfy $\overline{V_{j}} \subset U_{\alpha(j)}$ and each $V_{j_{0}} \cap \ldots \cap V_{j_{p}}$

[^8]is contained in $W_{\alpha\left(j_{0}\right) \ldots \alpha\left(j_{p}\right), k}$ for some $k$ if there is a repetition in $\alpha\left(j_{0}\right), \ldots, \alpha\left(j_{p}\right)$. Of course, we may and do assume that $J$ is finite.
Fix $i_{0}, \ldots, i_{p} \in I$ pairwise distinct. Consider $(p+1)$-tuples $j_{0}, \ldots, j_{p} \in J$ with $i_{0}=\alpha\left(j_{0}\right), \ldots, i_{p}=\alpha\left(j_{p}\right)$ such that $V_{j_{0}} \cap \ldots \cap V_{j_{p}}$ is not contained in $W_{\alpha\left(j_{0}\right) \ldots \alpha\left(j_{p}\right), k}$ for any $k$. Let $N$ be the number of such $(p+1)$-tuples. We will show how to decrease $N$. Since
$$
\overline{V_{j_{0}}} \cap \ldots \cap \overline{V_{j_{p}}} \subset U_{i_{0}} \cap \ldots \cap U_{i_{p}}=\bigcup W_{i_{0} \ldots i_{p}, k}
$$
we find a finite set $K=\left\{k_{1}, \ldots, k_{t}\right\}$ such that the LHS is contained in $\bigcup_{k \in K} W_{i_{0} \ldots i_{p}, k}$. Then we consider the open covering
$$
V_{j_{0}}=\left(V_{j_{0}} \backslash\left(\overline{V_{j_{1}}} \cap \ldots \cap \overline{V_{j_{p}}}\right)\right) \cup\left(\bigcup_{k \in K} V_{j_{0}} \cap W_{i_{0} \ldots i_{p}, k}\right)
$$

The first open on the RHS intersects $V_{j_{1}} \cap \ldots \cap V_{j_{p}}$ in the empty set and the other opens $V_{j_{0}, k}$ of the RHS satisfy $V_{j_{0}, k} \cap V_{j_{1}} \ldots \cap V_{j_{p}} \subset W_{\alpha\left(j_{0}\right) \ldots \alpha\left(j_{p}\right), k}$. Set $J^{\prime}=J \amalg K$. For $j \in J$ set $V_{j}^{\prime}=V_{j}$ if $j \neq j_{0}$ and set $V_{j_{0}}^{\prime}=V_{j_{0}} \backslash\left(\overline{V_{j_{1}}} \cap \ldots \cap \overline{V_{j_{p}}}\right)$. For $k \in K$ set $V_{k}^{\prime}=V_{j_{0}, k}$. Finally, the map $\alpha^{\prime}: J^{\prime} \rightarrow I$ is given by $\alpha$ on $J$ and maps every element of $K$ to $i_{0}$. A simple check shows that $N$ has decreased by one under this replacement. Repeating this procedure $N$ times we arrive at the situation where $N=0$.

To finish the proof we argue by induction on the number $M$ of $(p+1)$-tuples $i_{0}, \ldots, i_{p} \in I$ with pairwise distinct entries for which there exists a $(p+1)$-tuple $j_{0}, \ldots, j_{p} \in J$ with $i_{0}=\alpha\left(j_{0}\right), \ldots, i_{p}=\alpha\left(j_{p}\right)$ such that $V_{j_{0}} \cap \ldots \cap V_{j_{p}}$ is not contained in $W_{\alpha\left(j_{0}\right) \ldots \alpha\left(j_{p}\right), k}$ for any $k$. To do this, we claim that the operation performed in the previous paragraph does not increase $M$. This follows formally from the fact that the map $\alpha^{\prime}: J^{\prime} \rightarrow I$ factors through a map $\beta: J^{\prime} \rightarrow J$ such that $V_{j^{\prime}}^{\prime} \subset V_{\beta\left(j^{\prime}\right)}$.
09UX Lemma 5.12.5. Let $X$ be a Hausdorff and locally quasi-compact space. Let $Z \subset X$ be a quasi-compact (hence closed) subset. Suppose given an integer $p \geq 0$, a set $I$, for every $i \in I$ an open $U_{i} \subset X$, and for every $(p+1)$-tuple $i_{0}, \ldots, i_{p}$ of $I$ an open $W_{i_{0} \ldots i_{p}} \subset U_{i_{0}} \cap \ldots \cap U_{i_{p}}$ such that
(1) $Z \subset \bigcup U_{i}$, and
(2) for every $i_{0}, \ldots, i_{p}$ we have $W_{i_{0} \ldots i_{p}} \cap Z=U_{i_{0}} \cap \ldots \cap U_{i_{p}} \cap Z$.

Then there exist opens $V_{i}$ of $X$ such that we have $Z \subset \bigcup V_{i}$, for all $i$ we have $\overline{V_{i}} \subset U_{i}$, and we have $V_{i_{0}} \cap \ldots \cap V_{i_{p}} \subset W_{i_{0} \ldots i_{p}}$ for all $(p+1)$-tuples $i_{0}, \ldots, i_{p}$.

Proof. Since $Z$ is quasi-compact, there is a reduction to the case where $I$ is finite (details omitted). Because $X$ is locally quasi-compact and $Z$ is quasi-compact, we can find a neighbourhood $Z \subset E$ which is quasi-compact, i.e., $E$ is quasi-compact and contains an open neighbourhood of $Z$ in $X$. If we prove the result after replacing $X$ by $E$, then the result follows. Hence we may assume $X$ is quasi-compact.
We prove the result in case $I$ is finite and $X$ is quasi-compact by induction on $p$. The base case is $p=0$. In this case we have $X=(X \backslash Z) \cup \bigcup W_{i}$. By Lemma 5.12 .3 we can find a covering $X=V \cup \bigcup V_{i}$ by opens $V_{i} \subset W_{i}$ and $V \subset X \backslash Z$ with $\overline{V_{i}} \subset W_{i}$ for all $i$. Then we see that we obtain a solution of the problem posed by the lemma.
Induction step. Assume the lemma proven for $p-1$. Set $W_{j_{0} \ldots j_{p-1}}$ equal to the intersection of all $W_{i_{0} \ldots i_{p}}$ with $\left\{j_{0}, \ldots, j_{p-1}\right\}=\left\{i_{0}, \ldots, i_{p}\right\}$ (equality of sets). By
induction there exists a solution for these opens, say $V_{i} \subset U_{i}$. It follows from our choice of $W_{j_{0} \ldots j_{p-1}}$ that we have $V_{i_{0}} \cap \ldots \cap V_{i_{p}} \subset W_{i_{0} \ldots i_{p}}$ for all $(p+1)$-tuples $i_{0}, \ldots, i_{p}$ where $i_{a}=i_{b}$ for some $0 \leq a<b \leq p$. Thus we only need to modify our choice of $V_{i}$ if $V_{i_{0}} \cap \ldots \cap V_{i_{p}} \not \subset W_{i_{0} \ldots i_{p}}$ for some ( $p+1$ )-tuple $i_{0}, \ldots, i_{p}$ with pairwise distinct elements. In this case we have

$$
T=\overline{V_{i_{0}} \cap \ldots \cap V_{i_{p}} \backslash W_{i_{0} \ldots i_{p}}} \subset \overline{V_{i_{0}}} \cap \ldots \cap \overline{V_{i_{p}}} \backslash W_{i_{0} \ldots i_{p}}
$$

is a closed subset of $X$ contained in $U_{i_{0}} \cap \ldots \cap U_{i_{p}}$ not meeting $Z$. Hence we can replace $V_{i_{0}}$ by $V_{i_{0}} \backslash T$ to "fix" the problem. After repeating this finitely many times for each of the problem tuples, the lemma is proven.

### 5.13. Limits of spaces

08ZS The category of topological spaces has products. Namely, if $I$ is a set and for $i \in I$ we are given a topological space $X_{i}$ then we endow $\prod_{i \in I} X_{i}$ with the product topology. As a basis for the topology we use sets of the form $\prod U_{i}$ where $U_{i} \subset X_{i}$ is open and $U_{i}=X_{i}$ for almost all $i$.

The category of topological spaces has equalizers. Namely, if $a, b: X \rightarrow Y$ are morphisms of topological spaces, then the equalizer of $a$ and $b$ is the subset $\{x \in$ $X \mid a(x)=b(x)\} \subset X$ endowed with the induced topology.

08ZT Lemma 5.13.1. The category of topological spaces has limits and the forgetful functor to sets commutes with them.

Proof. This follows from the discussion above and Categories, Lemma 4.14.10. It follows from the description above that the forgetful functor commutes with limits. Another way to see this is to use Categories, Lemma 4.24.4 and use that the forgetful functor has a left adjoint, namely the functor which assigns to a set the corresponding discrete topological space.

0A2P Lemma 5.13.2. Let $\mathcal{I}$ be a cofiltered category. Let $i \mapsto X_{i}$ be a diagram of topological spaces over $\mathcal{I}$. Let $X=\lim X_{i}$ be the limit with projection maps $f_{i}$ : $X \rightarrow X_{i}$.
(1) Any open of $X$ is of the form $\bigcup_{j \in J} f_{j}^{-1}\left(U_{j}\right)$ for some subset $J \subset I$ and opens $U_{j} \subset X_{j}$.
(2) Any quasi-compact open of $X$ is of the form $f_{i}^{-1}\left(U_{i}\right)$ for some $i$ and some $U_{i} \subset X_{i}$ open.

Proof. The construction of the limit given above shows that $X \subset \Pi X_{i}$ with the induced topology. A basis for the topology of $\Pi X_{i}$ are the opens $\prod U_{i}$ where $U_{i} \subset X_{i}$ is open and $U_{i}=X_{i}$ for almost all $i$. Say $i_{1}, \ldots, i_{n} \in \operatorname{Ob}(\mathcal{I})$ are the objects such that $U_{i_{j}} \neq X_{i_{j}}$. Then

$$
X \cap \prod U_{i}=f_{i_{1}}^{-1}\left(U_{i_{1}}\right) \cap \ldots \cap f_{i_{n}}^{-1}\left(U_{i_{n}}\right)
$$

For a general limit of topological spaces these form a basis for the topology on $X$. However, if $\mathcal{I}$ is cofiltered as in the statement of the lemma, then we can pick a $j \in \mathrm{Ob}(\mathcal{I})$ and morphisms $j \rightarrow i_{l}, l=1, \ldots, n$. Let

$$
U_{j}=\left(X_{j} \rightarrow X_{i_{1}}\right)^{-1}\left(U_{i_{1}}\right) \cap \ldots \cap\left(X_{j} \rightarrow X_{i_{n}}\right)^{-1}\left(U_{i_{n}}\right)
$$

Then it is clear that $X \cap \prod U_{i}=f_{j}^{-1}\left(U_{j}\right)$. Thus for any open $W$ of $X$ there is a set $A$ and a map $\alpha: A \rightarrow \mathrm{Ob}(\mathcal{I})$ and opens $U_{a} \subset X_{\alpha(a)}$ such that $W=\bigcup f_{\alpha(a)}^{-1}\left(U_{a}\right)$.

Set $J=\operatorname{Im}(\alpha)$ and for $j \in J$ set $U_{j}=\bigcup_{\alpha(a)=j} U_{a}$ to see that $W=\bigcup_{j \in J} f_{j}^{-1}\left(U_{j}\right)$. This proves (1).

To see (2) suppose that $\bigcup_{j \in J} f_{j}^{-1}\left(U_{j}\right)$ is quasi-compact. Then it is equal to $f_{j_{1}}^{-1}\left(U_{j_{1}}\right) \cup \ldots \cup f_{j_{m}}^{-1}\left(U_{j_{m}}\right)$ for some $j_{1}, \ldots, j_{m} \in J$. Since $\mathcal{I}$ is cofiltered, we can pick a $i \in \mathrm{Ob}(\mathcal{I})$ and morphisms $i \rightarrow j_{l}, l=1, \ldots, m$. Let

$$
U_{i}=\left(X_{i} \rightarrow X_{j_{1}}\right)^{-1}\left(U_{j_{1}}\right) \cup \ldots \cup\left(X_{i} \rightarrow X_{j_{m}}\right)^{-1}\left(U_{j_{m}}\right)
$$

Then our open equals $f_{i}^{-1}\left(U_{i}\right)$ as desired.
0A2Q Lemma 5.13.3. Let $\mathcal{I}$ be a cofiltered category. Let $i \mapsto X_{i}$ be a diagram of topological spaces over $\mathcal{I}$. Let $X$ be a topological space such that
(1) $X=\lim X_{i}$ as a set (denote $f_{i}$ the projection maps),
(2) the sets $f_{i}^{-1}\left(U_{i}\right)$ for $i \in \mathrm{Ob}(\mathcal{I})$ and $U_{i} \subset X_{i}$ open form a basis for the topology of $X$.
Then $X$ is the limit of the $X_{i}$ as a topological space.
Proof. Follows from the description of the limit topology in Lemma 5.13.2,
08ZU Theorem 5.13.4 (Tychonov). A product of quasi-compact spaces is quasi-compact.
Proof. Let $I$ be a set and for $i \in I$ let $X_{i}$ be a quasi-compact topological space. Set $X=\prod X_{i}$. Let $\mathcal{B}$ be the set of subsets of $X$ of the form $U_{i} \times \prod_{i^{\prime} \in I, i^{\prime} \neq i} X_{i^{\prime}}$ where $U_{i} \subset X_{i}$ is open. By construction this family is a subbasis for the topology on $X$. By Lemma 5.11 .15 it suffices to show that any covering $X=\bigcup_{j \in J} B_{j}$ by elements $B_{j}$ of $\mathcal{B}$ has a finite refinement. We can decompose $J=\coprod J_{i}$ so that if $j \in J_{i}$, then $B_{j}=U_{j} \times \prod_{i^{\prime} \neq i} X_{i^{\prime}}$ with $U_{j} \subset X_{i}$ open. If $X_{i}=\bigcup_{j \in J_{i}} U_{j}$, then there is a finite refinement and we conclude that $X=\bigcup_{j \in J} B_{j}$ has a finite refinement. If this is not the case, then for every $i$ we can choose an point $x_{i} \in X_{i}$ which is not in $\bigcup_{j \in J_{i}} U_{j}$. But then the point $x=\left(x_{i}\right)_{i \in I}$ is an element of $X$ not contained in $\bigcup_{j \in J} B_{j}$, a contradiction.

The following lemma does not hold if one drops the assumption that the spaces $X_{i}$ are Hausdorff, see Examples, Section 88.4

08ZV Lemma 5.13.5. Let $\mathcal{I}$ be a category and let $i \mapsto X_{i}$ be a diagram over $\mathcal{I}$ in the category of topological spaces. If each $X_{i}$ is quasi-compact and Hausdorff, then $\lim X_{i}$ is quasi-compact.

Proof. Recall that $\lim X_{i}$ is a subspace of $\Pi X_{i}$. By Theorem 5.13.4 this product is quasi-compact. Hence it suffices to show that $\lim X_{i}$ is a closed subspace of $\Pi X_{i}$ (Lemma 5.11.3). If $\varphi: j \rightarrow k$ is a morphism of $\mathcal{I}$, then let $\Gamma_{\varphi} \subset X_{j} \times X_{k}$ denote the graph of the corresponding continuous map $X_{j} \rightarrow X_{k}$. By Lemma 5.3.2 this graph is closed. It is clear that $\lim X_{i}$ is the intersection of the closed subsets

$$
\Gamma_{\varphi} \times \prod_{l \neq j, k} X_{l} \subset \prod X_{i}
$$

Thus the result follows.
The following lemma generalizes Categories, Lemma 4.21.5 and partially generalizes Lemma 5.11.6.

0A2R Lemma 5.13.6. Let $\mathcal{I}$ be a cofiltered category and let $i \mapsto X_{i}$ be a diagram over $\mathcal{I}$ in the category of topological spaces. If each $X_{i}$ is quasi-compact, Hausdorff, and nonempty, then $\lim X_{i}$ is nonempty.
Proof. In the proof of Lemma 5.13.5 we have seen that $X=\lim X_{i}$ is the intersection of the closed subsets

$$
Z_{\varphi}=\Gamma_{\varphi} \times \prod_{l \neq j, k} X_{l}
$$

inside the quasi-compact space $\prod X_{i}$ where $\varphi: j \rightarrow k$ is a morphism of $\mathcal{I}$ and $\Gamma_{\varphi} \subset X_{j} \times X_{k}$ is the graph of the corresponding morphism $X_{j} \rightarrow X_{k}$. Hence by Lemma 5.11.6 it suffices to show any finite intersection of these subsets is nonempty. Assume $\varphi_{t}: j_{t} \rightarrow k_{t}, t=1, \ldots, n$ is a finite collection of morphisms of $\mathcal{I}$. Since $\mathcal{I}$ is cofiltered, we can pick an object $j$ and a morphism $\psi_{t}: j \rightarrow j_{t}$ for each $t$. For each pair $t, t^{\prime}$ such that either (a) $j_{t}=j_{t^{\prime}}$, or (b) $j_{t}=k_{t^{\prime}}$, or (c) $k_{t}=k_{t^{\prime}}$ we obtain two morphisms $j \rightarrow l$ with $l=j_{t}$ in case (a), (b) or $l=k_{t}$ in case (c). Because $\mathcal{I}$ is cofiltered and since there are finitely many pairs $\left(t, t^{\prime}\right)$ we may choose a map $j^{\prime} \rightarrow j$ which equalizes these two morphisms for all such pairs $\left(t, t^{\prime}\right)$. Pick an element $x \in X_{j^{\prime}}$ and for each $t$ let $x_{j_{t}}$, resp. $x_{k_{t}}$ be the image of $x$ under the morphism $X_{j^{\prime}} \rightarrow X_{j} \rightarrow X_{j_{t}}$, resp. $X_{j^{\prime}} \rightarrow X_{j} \rightarrow X_{j_{t}} \rightarrow X_{k_{t}}$. For any index $l \in \operatorname{Ob}(\mathcal{I})$ which is not equal to $j_{t}$ or $k_{t}$ for some $t$ we pick an arbitrary element $x_{l} \in X_{l}$ (using the axiom of choice). Then $\left(x_{i}\right)_{i \in \operatorname{Ob}(\mathcal{I})}$ is in the intersection

$$
Z_{\varphi_{1}} \cap \ldots \cap Z_{\varphi_{n}}
$$

by construction and the proof is complete.

### 5.14. Constructible sets

04ZC
005G Definition 5.14.1. Let $X$ be a topological space. Let $E \subset X$ be a subset of $X$.
(1) We say $E$ is constructibl $]^{3}$ in $X$ if $E$ is a finite union of subsets of the form $U \cap V^{c}$ where $U, V \subset X$ are open and retrocompact in $X$.
(2) We say $E$ is locally constructible in $X$ if there exists an open covering $X=\bigcup V_{i}$ such that each $E \cap V_{i}$ is constructible in $V_{i}$.
005 H Lemma 5.14.2. The collection of constructible sets is closed under finite intersections, finite unions and complements.
Proof. Note that if $U_{1}, U_{2}$ are open and retrocompact in $X$ then so is $U_{1} \cup U_{2}$ because the union of two quasi-compact subsets of $X$ is quasi-compact. It is also true that $U_{1} \cap U_{2}$ is retrocompact. Namely, suppose $U \subset X$ is quasi-compact open, then $U_{2} \cap U$ is quasi-compact because $U_{2}$ is retrocompact in $X$, and then we conclude $U_{1} \cap\left(U_{2} \cap U\right)$ is quasi-compact because $U_{1}$ is retrocompact in $X$. From this it is formal to show that the complement of a constructible set is constructible, that finite unions of constructibles are constructible, and that finite intersections of constructibles are constructible.

005I Lemma 5.14.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If the inverse image of every retrocompact open subset of $Y$ is retrocompact in $X$, then inverse images of constructible sets are constructible.

[^9]Proof. This is true because $f^{-1}\left(U \cap V^{c}\right)=f^{-1}(U) \cap f^{-1}(V)^{c}$, combined with the definition of constructible sets.

005J Lemma 5.14.4. Let $U \subset X$ be open. For a constructible set $E \subset X$ the intersection $E \cap U$ is constructible in $U$.

Proof. Suppose that $V \subset X$ is retrocompact open in $X$. It suffices to show that $V \cap U$ is retrocompact in $U$ by Lemma 5.14.3. To show this let $W \subset U$ be open and quasi-compact. Then $W$ is open and quasi-compact in $X$. Hence $V \cap W=V \cap U \cap W$ is quasi-compact as $V$ is retrocompact in $X$.

09YD Lemma 5.14.5. Let $U \subset X$ be a retrocompact open. Let $E \subset U$. If $E$ is constructible in $U$, then $E$ is constructible in $X$.

Proof. Suppose that $V, W \subset U$ are retrocompact open in $U$. Then $V, W$ are retrocompact open in $X$ (Lemma 5.11.2). Hence $V \cap(U \backslash W)=V \cap(X \backslash W)$ is constructible in $X$. We conclude since every constructible subset of $U$ is a finite union of subsets of the form $V \cap(U \backslash W)$.

053W Lemma 5.14.6. Let $X$ be a topological space. Let $E \subset X$ be a subset. Let $X=V_{1} \cup \ldots \cup V_{m}$ be a finite covering by retrocompact opens. Then $E$ is constructible in $X$ if and only if $E \cap V_{j}$ is constructible in $V_{j}$ for each $j=1, \ldots, m$.

Proof. If $E$ is constructible in $X$, then by Lemma 5.14.4 we see that $E \cap V_{j}$ is constructible in $V_{j}$ for all $j$. Conversely, suppose that $E \cap V_{j}$ is constructible in $V_{j}$ for each $j=1, \ldots, m$. Then $E=\bigcup E \cap V_{j}$ is a finite union of constructible sets by Lemma 5.14.5 and hence constructible.

09YE Lemma 5.14.7. Let $X$ be a topological space. Let $Z \subset X$ be a closed subset such that $X \backslash Z$ is quasi-compact. Then for a constructible set $E \subset X$ the intersection $E \cap Z$ is constructible in $Z$.

Proof. Suppose that $V \subset X$ is retrocompact open in $X$. It suffices to show that $V \cap Z$ is retrocompact in $Z$ by Lemma 5.14.3. To show this let $W \subset Z$ be open and quasi-compact. The subset $W^{\prime}=W \cup(X \backslash Z)$ is quasi-compact, open, and $W=Z \cap W^{\prime}$. Hence $V \cap Z \cap W=V \cap Z \cap W^{\prime}$ is a closed subset of the quasi-compact open $V \cap W^{\prime}$ as $V$ is retrocompact in $X$. Thus $V \cap Z \cap W$ is quasi-compact by Lemma 5.11.3.

09YF Lemma 5.14.8. Let $X$ be a topological space. Let $T \subset X$ be a subset. Suppose
(1) $T$ is retrocompact in $X$,
(2) quasi-compact opens form a basis for the topology on $X$.

Then for a constructible set $E \subset X$ the intersection $E \cap T$ is constructible in $T$.
Proof. Suppose that $V \subset X$ is retrocompact open in $X$. It suffices to show that $V \cap T$ is retrocompact in $T$ by Lemma 5.14.3. To show this let $W \subset T$ be open and quasi-compact. By assumption (2) we can find a quasi-compact open $W^{\prime} \subset X$ such that $W=T \cap W^{\prime}$ (details omitted). Hence $V \cap T \cap W=V \cap T \cap W^{\prime}$ is the intersection of $T$ with the quasi-compact open $V \cap W^{\prime}$ as $V$ is retrocompact in $X$. Thus $V \cap T \cap W$ is quasi-compact.

09YG Lemma 5.14.9. Let $Z \subset X$ be a closed subset whose complement is retrocompact open. Let $E \subset Z$. If $E$ is constructible in $Z$, then $E$ is constructible in $X$.
$\underset{\sim}{\text { Proof. Suppose that }} V \subset Z$ is retrocompact open in $Z$. Consider the open subset $\tilde{V}=V \cup(X \backslash Z)$ of $X$. Let $W \subset X$ be quasi-compact open. Then

$$
W \cap \tilde{V}=(V \cap W) \cup((X \backslash Z) \cap W)
$$

The first part is quasi-compact as $V \cap W=V \cap(Z \cap W)$ and $(Z \cap W)$ is quasicompact open in $Z$ (Lemma 5.11.3) and $V$ is retrocompact in $Z$. The second part is quasi-compact as $(X \backslash Z)$ is retrocompact in $X$. In this way we see that $\tilde{V}$ is retrocompact in $X$. Thus if $V_{1}, V_{2} \subset Z$ are retrocompact open, then

$$
V_{1} \cap\left(Z \backslash V_{2}\right)=\tilde{V}_{1} \cap\left(X \backslash \tilde{V}_{2}\right)
$$

is constructible in $X$. We conclude since every constructible subset of $Z$ is a finite union of subsets of the form $V_{1} \cap\left(Z \backslash V_{2}\right)$.

09YH Lemma 5.14.10. Let $X$ be a topological space. Every constructible subset of $X$ is retrocompact.
Proof. Let $E=\bigcup_{i=1, \ldots, n} U_{i} \cap V_{i}^{c}$ with $U_{i}, V_{i}$ retrocompact open in $X$. Let $W \subset X$ be quasi-compact open. Then $E \cap W=\bigcup_{i=1, \ldots, n} U_{i} \cap V_{i}^{c} \cap W$. Thus it suffices to show that $U \cap V^{c} \cap W$ is quasi-compact if $U, V$ are retrocompact open and $W$ is quasi-compact open. This is true because $U \cap V^{c} \cap W$ is a closed subset of the quasi-compact $U \cap W$ so Lemma 5.11.3 applies.

Question: Does the following lemma also hold if we assume $X$ is a quasi-compact topological space? Compare with Lemma 5.14.7.

09YI Lemma 5.14.11. Let $X$ be a topological space. Assume $X$ has a basis consisting of quasi-compact opens. For $E, E^{\prime}$ constructible in $X$, the intersection $E \cap E^{\prime}$ is constructible in $E$.

Proof. Combine Lemmas 5.14.8 and 5.14.10.
09YJ Lemma 5.14.12. Let $X$ be a topological space. Assume $X$ has a basis consisting of quasi-compact opens. Let $E$ be constructible in $X$ and $F \subset E$ constructible in $E$. Then $F$ is constructible in $X$.

Proof. Observe that any retrocompact subset $T$ of $X$ has a basis for the induced topology consisting of quasi-compact opens. In particular this holds for any constructible subset (Lemma 5.14.10). Write $E=E_{1} \cup \ldots \cup E_{n}$ with $E_{i}=U_{i} \cap V_{i}^{c}$ where $U_{i}, V_{i} \subset X$ are retrocompact open. Note that $E_{i}=E \cap E_{i}$ is constructible in $E$ by Lemma 5.14.11. Hence $F \cap E_{i}$ is constructible in $E_{i}$ by Lemma 5.14.11. Thus it suffices to prove the lemma in case $E=U \cap V^{c}$ where $U, V \subset X$ are retrocompact open. In this case the inclusion $E \subset X$ is a composition

$$
E=U \cap V^{c} \rightarrow U \rightarrow X
$$

Then we can apply Lemma 5.14 .9 to the first inclusion and Lemma 5.14 .5 to the second.

09YK Lemma 5.14.13. Let $X$ be a topological space which has a basis for the topology consisting of quasi-compact opens. Let $E \subset X$ be a subset. Let $X=E_{1} \cup \ldots \cup E_{m}$ be a finite covering by constructible subsets. Then $E$ is constructible in $X$ if and only if $E \cap E_{j}$ is constructible in $E_{j}$ for each $j=1, \ldots, m$.
Proof. Combine Lemmas 5.14.11 and 5.14.12.

005 K Lemma 5.14.14. Let $X$ be a topological space. Suppose that $Z \subset X$ is irreducible. Let $E \subset X$ be a finite union of locally closed subsets (e.g. $E$ is constructible). The following are equivalent
(1) The intersection $E \cap Z$ contains an open dense subset of $Z$.
(2) The intersection $E \cap Z$ is dense in $Z$.

If $Z$ has a generic point $\xi$, then this is also equivalent to
(3) We have $\xi \in E$.

Proof. Write $E=\bigcup U_{i} \cap Z_{i}$ as the finite union of intersections of open sets $U_{i}$ and closed sets $Z_{i}$. Suppose that $E \cap Z$ is dense in $Z$. Note that the closure of $E \cap Z$ is the union of the closures of the intersections $U_{i} \cap Z_{i} \cap Z$. As $Z$ is irreducible we conclude that the closure of $U_{i} \cap Z_{i} \cap Z$ is $Z$ for some $i$. Fix such an $i$. It follows that $Z \subset Z_{i}$ since otherwise the closed subset $Z \cap Z_{i}$ of $Z$ would not be dense in $Z$. Then $U_{i} \cap Z_{i} \cap Z=U_{i} \cap Z$ is an open nonempty subset of $Z$. Because $Z$ is irreducible, it is open dense. Hence $E \cap Z$ contains an open dense subset of $Z$. The converse is obvious.
Suppose that $\xi \in Z$ is a generic point. Of course if $(1) \Leftrightarrow(2)$ holds, then $\xi \in E$. Conversely, if $\xi \in E$, then $\xi \in U_{i} \cap Z_{i}$ for some $i=i_{0}$. Clearly this implies $Z \subset Z_{i_{0}}$ and hence $U_{i_{0}} \cap Z_{i_{0}} \cap Z=U_{i_{0}} \cap Z$ is an open not empty subset of $Z$. We conclude as before.

### 5.15. Constructible sets and Noetherian spaces

053X
005L Lemma 5.15.1. Let $X$ be a Noetherian topological space. The constructible sets in $X$ are precisely the finite unions of locally closed subsets of $X$.
Proof. This follows immediately from Lemma 5.11.13.
053Y Lemma 5.15.2. Let $f: X \rightarrow Y$ be a continuous map of Noetherian topological spaces. If $E \subset Y$ is constructible in $Y$, then $f^{-1}(E)$ is constructible in $X$.
Proof. Follows immediately from Lemma 5.15.1 and the definition of a continuous map.

053Z Lemma 5.15.3. Let $X$ be a Noetherian topological space. Let $E \subset X$ be a subset. The following are equivalent:
(1) $E$ is constructible in $X$, and
(2) for every irreducible closed $Z \subset X$ the intersection $E \cap Z$ either contains a nonempty open of $Z$ or is not dense in $Z$.

Proof. Assume $E$ is constructible and $Z \subset X$ irreducible closed. Then $E \cap Z$ is constructible in $Z$ by Lemma 5.15.2. Hence $E \cap Z$ is a finite union of nonempty locally closed subsets $T_{i}$ of $Z$. Clearly if none of the $T_{i}$ is open in $Z$, then $E \cap Z$ is not dense in $Z$. In this way we see that (1) implies (2).
Conversely, assume (2) holds. Consider the set $\mathcal{S}$ of closed subsets $Y$ of $X$ such that $E \cap Y$ is not constructible in $Y$. If $\mathcal{S} \neq \emptyset$, then it has a smallest element $Y$ as $X$ is Noetherian. Let $Y=Y_{1} \cup \ldots \cup Y_{r}$ be the decomposition of $Y$ into its irreducible components, see Lemma5.8.2. If $r>1$, then each $Y_{i} \cap E$ is constructible in $Y_{i}$ and hence a finite union of locally closed subsets of $Y_{i}$. Thus $E \cap Y$ is a finite union of
locally closed subsets of $Y$ too and we conclude that $E \cap Y$ is constructible in $Y$ by Lemma 5.15.1. This is a contradiction and so $r=1$. If $r=1$, then $Y$ is irreducible, and by assumption (2) we see that $E \cap Y$ either (a) contains an open $V$ of $Y$ or (b) is not dense in $Y$. In case (a) we see, by minimality of $Y$, that $E \cap(Y \backslash V)$ is a finite union of locally closed subsets of $Y \backslash V$. Thus $E \cap Y$ is a finite union of locally closed subsets of $Y$ and is constructible by Lemma 5.15.1. This is a contradiction and so we must be in case (b). In case (b) we see that $E \cap Y=E \cap Y^{\prime}$ for some proper closed subset $Y^{\prime} \subset Y$. By minimality of $Y$ we see that $E \cap Y^{\prime}$ is a finite union of locally closed subsets of $Y^{\prime}$ and we see that $E \cap Y^{\prime}=E \cap Y$ is a finite union of locally closed subsets of $Y$ and is constructible by Lemma 5.15.1. This contradiction finishes the proof of the lemma.

0540 Lemma 5.15.4. Let $X$ be a Noetherian topological space. Let $x \in X$. Let $E \subset X$ be constructible in $X$. The following are equivalent:
(1) $E$ is a neighbourhood of $x$, and
(2) for every irreducible closed subset $Y$ of $X$ which contains $x$ the intersection $E \cap Y$ is dense in $Y$.

Proof. It is clear that (1) implies (2). Assume (2). Consider the set $\mathcal{S}$ of closed subsets $Y$ of $X$ containing $x$ such that $E \cap Y$ is not a neighbourhood of $x$ in $Y$. If $\mathcal{S} \neq \emptyset$, then it has a minimal element $Y$ as $X$ is Noetherian. Suppose $Y=Y_{1} \cup Y_{2}$ with two smaller nonempty closed subsets $Y_{1}, Y_{2}$. If $x \in Y_{i}$ for $i=1,2$, then $Y_{i} \cap E$ is a neighbourhood of $x$ in $Y_{i}$ and we conclude $Y \cap E$ is a neighbourhood of $x$ in $Y$ which is a contradiction. If $x \in Y_{1}$ but $x \notin Y_{2}$ (say), then $Y_{1} \cap E$ is a neighbourhood of $x$ in $Y_{1}$ and hence also in $Y$, which is a contradiction as well. We conclude that $Y$ is irreducible closed. By assumption (2) we see that $E \cap Y$ is dense in $Y$. Thus $E \cap Y$ contains an open $V$ of $Y$, see Lemma 5.15.3. If $x \in V$ then $E \cap Y$ is a neighbourhood of $x$ in $Y$ which is a contradiction. If $x \notin V$, then $Y^{\prime}=Y \backslash V$ is a proper closed subset of $Y$ containing $x$. By minimality of $Y$ we see that $E \cap Y^{\prime}$ contains an open neighbourhood $V^{\prime} \subset Y^{\prime}$ of $x$ in $Y^{\prime}$. But then $V^{\prime} \cup V$ is an open neighbourhood of $x$ in $Y$ contained in $E$, a contradiction. This contradiction finishes the proof of the lemma.

0541 Lemma 5.15.5. Let $X$ be a Noetherian topological space. Let $E \subset X$ be a subset. The following are equivalent:
(1) $E$ is open in $X$, and
(2) for every irreducible closed subset $Y$ of $X$ the intersection $E \cap Y$ is either empty or contains a nonempty open of $Y$.

Proof. This follows formally from Lemmas 5.15.3 and 5.15.4

### 5.16. Characterizing proper maps

005 M We include a section discussing the notion of a proper map in usual topology. It turns out that in topology, the notion of being proper is the same as the notion of being universally closed, in the sense that any base change is a closed morphism (not just taking products with spaces). The reason for doing this is that in algebraic geometry we use this notion of universal closedness as the basis for our definition of properness.

005N Lemma 5.16.1 (Tube lemma). Let $X$ and $Y$ be topological spaces. Let $A \subset X$ and $B \subset Y$ be quasi-compact subsets. Let $A \times B \subset W \subset X \times Y$ with $W$ open in $X \times Y$. Then there exists opens $A \subset U \subset X$ and $B \subset V \subset Y$ such that $U \times V \subset W$.
Proof. For every $a \in A$ and $b \in B$ there exist opens $U_{(a, b)}$ of $X$ and $V_{(a, b)}$ of $Y$ such that $(a, b) \in U_{(a, b)} \times V_{(a, b)} \subset W$. Fix $b$ and we see there exist a finite number $a_{1}, \ldots, a_{n}$ such that $A \subset U_{\left(a_{1}, b\right)} \cup \ldots \cup U_{\left(a_{n}, b\right)}$. Hence

$$
A \times\{b\} \subset\left(U_{\left(a_{1}, b\right)} \cup \ldots \cup U_{\left(a_{n}, b\right)}\right) \times\left(V_{\left(a_{1}, b\right)} \cap \ldots \cap V_{\left(a_{n}, b\right)}\right) \subset W
$$

Thus for every $b \in B$ there exists opens $U_{b} \subset X$ and $V_{b} \subset Y$ such that $A \times\{b\} \subset$ $U_{b} \times V_{b} \subset W$. As above there exist a finite number $b_{1}, \ldots, b_{m}$ such that $B \subset$ $V_{b_{1}} \cup \ldots \cup V_{b_{m}}$. Then we win because $A \times B \subset\left(U_{b_{1}} \cap \ldots \cap U_{b_{m}}\right) \times\left(V_{b_{1}} \cup \ldots \cup V_{b_{m}}\right)$.

The notation in the following definition may be slightly different from what you are used to.
005 O Definition 5.16.2. Let $f: X \rightarrow Y$ be a continuous map between topological spaces.
(1) We say that the map $f$ is closed iff the image of every closed subset is closed.
(2) We say that the map $f$ is proper ${ }^{[4}$ iff the map $Z \times X \rightarrow Z \times Y$ is closed for any topological space $Z$.
(3) We say that the map $f$ is quasi-proper iff the inverse image $f^{-1}(V)$ of every quasi-compact subset $V \subset Y$ is quasi-compact.
(4) We say that $f$ is universally closed iff the map $f^{\prime}: Z \times_{Y} X \rightarrow Z$ is closed for any map $g: Z \rightarrow Y$.

The following lemma is useful later.
005P Lemma 5.16.3. A topological space $X$ is quasi-compact if and only if the projection map $Z \times X \rightarrow Z$ is closed for any topological space $Z$.
Proof. (See also remark below.) If $X$ is not quasi-compact, there exists an open covering $X=\bigcup_{i \in I} U_{i}$ such that no finite number of $U_{i}$ cover $X$. Let $Z$ be the subset of the power set $\mathcal{P}(I)$ of $I$ consisting of $I$ and all nonempty finite subsets of $I$. Define a topology on $Z$ with as a basis for the topology the following sets:
(1) All subsets of $Z \backslash\{I\}$.
(2) For every finite subset $K$ of $I$ the set $\left.U_{K}:=\{J \subset I \mid J \in Z, K \subset J\}\right)$. It is left to the reader to verify this is the basis for a topology. Consider the subset of $Z \times X$ defined by the formula

$$
\left.M=\left\{(J, x) \mid J \in Z, x \in \bigcap_{i \in J} U_{i}^{c}\right)\right\}
$$

If $(J, x) \notin M$, then $x \in U_{i}$ for some $i \in J$. Hence $U_{\{i\}} \times U_{i} \subset Z \times X$ is an open subset containing $(J, x)$ and not intersecting $M$. Hence $M$ is closed. The projection of $M$ to $Z$ is $Z-\{I\}$ which is not closed. Hence $Z \times X \rightarrow Z$ is not closed.
Assume $X$ is quasi-compact. Let $Z$ be a topological space. Let $M \subset Z \times X$ be closed. Let $z \in Z$ be a point which is not in $\operatorname{pr}_{1}(M)$. By the Tube Lemma 5.16.1 there exists an open $U \subset Z$ such that $U \times X$ is contained in the complement of $M$. Hence $\operatorname{pr}_{1}(M)$ is closed.

[^10]Combination of
Bou71, I, p. 75, Lemme 1] and
Bou71, I, p. 76, Corrolaire 1].

005Q Remark 5.16.4. Lemma 5.16 .3 is a combination of Bou71, I, p. 75, Lemme 1] and [Bou71, I, p. 76, Corrolaire 1].

005R Theorem 5.16.5. Let $f: X \rightarrow Y$ be a continuous map between topological spaces. The following conditions are equivalent:
(1) The map $f$ is quasi-proper and closed.
(2) The map $f$ is proper.
(3) The map $f$ is universally closed.
(4) The map $f$ is closed and $f^{-1}(y)$ is quasi-compact for any $y \in Y$.

Proof. (See also the remark below.) If the map $f$ satisfies (1), it automatically satisfies (4) because any single point is quasi-compact.

Assume map $f$ satisfies (4). We will prove it is universally closed, i.e., (3) holds. Let $g: Z \rightarrow Y$ be a continuous map of topological spaces and consider the diagram

During the proof we will use that $Z \times_{Y} X \rightarrow Z \times X$ is a homeomorphism onto its image, i.e., that we may identify $Z \times_{Y} X$ with the corresponding subset of $Z \times X$ with the induced topology. The image of $f^{\prime}: Z \times_{Y} X \rightarrow Z$ is $\operatorname{Im}\left(f^{\prime}\right)=\{z: g(z) \in f(X)\}$. Because $f(X)$ is closed, we see that $\operatorname{Im}\left(f^{\prime}\right)$ is a closed subspace of $Z$. Consider a closed subset $P \subset Z \times_{Y} X$. Let $z \in Z, z \notin f^{\prime}(P)$. If $z \notin \operatorname{Im}\left(f^{\prime}\right)$, then $Z \backslash \operatorname{Im}\left(f^{\prime}\right)$ is an open neighbourhood which avoids $f^{\prime}(P)$. If $z$ is in $\operatorname{Im}\left(f^{\prime}\right)$ then $\left(f^{\prime}\right)^{-1}\{z\}=$ $\{z\} \times f^{-1}\{g(z)\}$ and $f^{-1}\{g(z)\}$ is quasi-compact by assumption. Because $P$ is a closed subset of $Z \times_{Y} X$, we have a closed $P^{\prime}$ of $Z \times X$ such that $P=P^{\prime} \cap Z \times_{Y} X$. Since $\left(f^{\prime}\right)^{-1}\{z\}$ is a subset of $P^{c}=P^{\prime c} \cup\left(Z \times_{Y} X\right)^{c}$, and since $\left(f^{\prime}\right)^{-1}\{z\}$ is disjoint from $\left(Z \times_{Y} X\right)^{c}$ we see that $\left(f^{\prime}\right)^{-1}\{z\}$ is contained in $P^{\prime c}$. We may apply the Tube Lemma 5.16.1 to $\left(f^{\prime}\right)^{-1}\{z\}=\{z\} \times f^{-1}\{g(z)\} \subset\left(P^{\prime}\right)^{c} \subset Z \times X$. This gives $V \times U$ containing $\left(f^{\prime}\right)^{-1}\{z\}$ where $U$ and $V$ are open sets in $X$ and $Z$ respectively and $V \times U$ has empty intersection with $P^{\prime}$. Then the set $V \cap g^{-1}\left(Y-f\left(U^{c}\right)\right)$ is open in $Z$ since $f$ is closed, contains $z$, and has empty intersection with the image of $P$. Thus $f^{\prime}(P)$ is closed. In other words, the map $f$ is universally closed.

The implication $(3) \Rightarrow(2)$ is trivial. Namely, given any topological space $Z$ consider the projection morphism $g: Z \times Y \rightarrow Y$. Then it is easy to see that $f^{\prime}$ is the map $Z \times X \rightarrow Z \times Y$, in other words that $(Z \times Y) \times_{Y} X=Z \times X$. (This identification is a purely categorical property having nothing to do with topological spaces per se.)

Assume $f$ satisfies (2). We will prove it satisfies (1). Note that $f$ is closed as $f$ can be identified with the map $\{p t\} \times X \rightarrow\{p t\} \times Y$ which is assumed closed. Choose any quasi-compact subset $K \subset Y$. Let $Z$ be any topological space. Because $Z \times X \rightarrow Z \times Y$ is closed we see the map $Z \times f^{-1}(K) \rightarrow Z \times K$ is closed (if $T$ is closed in $Z \times f^{-1}(K)$, write $T=Z \times f^{-1}(K) \cap T^{\prime}$ for some closed $\left.T^{\prime} \subset Z \times X\right)$. Because $K$ is quasi-compact, $K \times Z \rightarrow Z$ is closed by Lemma 5.16.3. Hence the composition $Z \times f^{-1}(K) \rightarrow Z \times K \rightarrow Z$ is closed and therefore $f^{-1}(K)$ must be quasi-compact by Lemma 5.16.3 again.

005S Remark 5.16.6. Here are some references to the literature. In Bou71, I, p. 75, Theorem 1] you can find: $(2) \Leftrightarrow(4)$. In Bou71, I, p. 77, Proposition 6] you can find: $(2) \Rightarrow(1)$. Of course, trivially we have $(1) \Rightarrow(4)$. Thus (1), (2) and (4) are equivalent. Fan Zhou claimed and proved that (3) and (4) are equivalent; let me know if you find a reference in the literature.

08YD Lemma 5.16.7. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If $X$ is quasi-compact and $Y$ is Hausdorff, then $f$ is proper.
Proof. Since every point of $Y$ is closed, we see from Lemma 5.11.3 that the closed subset $f^{-1}(y)$ of $X$ is quasi-compact for all $y \in Y$. Thus, by Theorem 5.16.5 it suffices to show that $f$ is closed. If $E \subset X$ is closed, then it is quasi-compact (Lemma 5.11.3), hence $f(E) \subset Y$ is quasi-compact (Lemma 5.11.7), hence $f(E)$ is closed in $Y$ (Lemma 5.11.4).

08YE Lemma 5.16.8. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If $f$ is bijective, $X$ is quasi-compact, and $Y$ is Hausdorff, then $f$ is a homeomorphism.
Proof. This follows immediately from Lemma 5.16 .7 which tells us that $f$ is closed, i.e., $f^{-1}$ is continuous.

### 5.17. Jacobson spaces

005 U Definition 5.17.1. Let $X$ be a topological space. Let $X_{0}$ be the set of closed points of $X$. We say that $X$ is Jacobson if every closed subset $Z \subset X$ is the closure of $Z \cap X_{0}$.

Note that a topological space $X$ is Jacobson if and only if every nonempty locally closed subset of $X$ has a point closed in $X$.
Let $X$ be a Jacobson space and let $X_{0}$ be the set of closed points of $X$ with the induced topology. Clearly, the definition implies that the morphism $X_{0} \rightarrow X$ induces a bijection between the closed subsets of $X_{0}$ and the closed subsets of $X$. Thus many properties of $X$ are inherited by $X_{0}$. For example, the Krull dimensions of $X$ and $X_{0}$ are the same.
005 V Lemma 5.17.2. Let $X$ be a topological space. Let $X_{0}$ be the set of closed points of $X$. Suppose that for every point $x \in X$ the intersection $X_{0} \cap \overline{\{x\}}$ is dense in $\overline{\{x\}}$. Then $X$ is Jacobson.
Proof. Let $Z$ be closed subset of $X$ and $U$ be and open subset of $X$ such that $U \cap Z$ is nonempty. Then for $x \in U \cap Z$ we have that $\overline{\{x\}} \cap U$ is a nonempty subset of $Z \cap U$, and by hypothesis it contains a point closed in $X$ as required.

02I7 Lemma 5.17.3. Let $X$ be a Kolmogorov topological space with a basis of quasicompact open sets. If $X$ is not Jacobson, then there exists a non-closed point $x \in X$ such that $\{x\}$ is locally closed.

Proof. As $X$ is not Jacobson there exists a closed set $Z$ and an open set $U$ in $X$ such that $Z \cap U$ is nonempty and does not contain points closed in $X$. As $X$ has a basis of quasi-compact open sets we may replace $U$ by an open quasi-compact neighborhood of a point in $Z \cap U$ and so we may assume that $U$ is quasi-compact open. By Lemma 5.11.8, there exists a point $x \in Z \cap U$ closed in $Z \cap U$, and so $\{x\}$ is locally closed but not closed in $X$.

005W Lemma 5.17.4. Let $X$ be a topological space. Let $X=\bigcup U_{i}$ be an open covering. Then $X$ is Jacobson if and only if each $U_{i}$ is Jacobson. Moreover, in this case $X_{0}=\bigcup U_{i, 0}$.

Proof. Let $X$ be a topological space. Let $X_{0}$ be the set of closed points of $X$. Let $U_{i, 0}$ be the set of closed points of $U_{i}$. Then $X_{0} \cap U_{i} \subset U_{i, 0}$ but equality may not hold in general.

First, assume that each $U_{i}$ is Jacobson. We claim that in this case $X_{0} \cap U_{i}=U_{i, 0}$. Namely, suppose that $x \in U_{i, 0}$, i.e., $x$ is closed in $U_{i}$. Let $\overline{\{x\}}$ be the closure in $X$. Consider $\overline{\{x\}} \cap U_{j}$. If $x \notin U_{j}$, then $\overline{\{x\}} \cap U_{j}=\emptyset$. If $x \in U_{j}$, then $U_{i} \cap U_{j} \subset U_{j}$ is an open subset of $U_{j}$ containing $x$. Let $T^{\prime}=U_{j} \backslash U_{i} \cap U_{j}$ and $T=\{x\} \amalg T^{\prime}$. Then $T, T^{\prime}$ are closed subsets of $U_{j}$ and $T$ contains $x$. As $U_{j}$ is Jacobson we see that the closed points of $U_{j}$ are dense in $T$. Because $T=\{x\} \amalg T^{\prime}$ this can only be the case if $x$ is closed in $U_{j}$. Hence $\overline{\{x\}} \cap U_{j}=\{x\}$. We conclude that $\overline{\{x\}}=\{x\}$ as desired.

Let $Z \subset X$ be a closed subset (still assuming each $U_{i}$ is Jacobson). Since now we know that $X_{0} \cap Z \cap U_{i}=U_{i, 0} \cap Z$ are dense in $Z \cap U_{i}$ it follows immediately that $X_{0} \cap Z$ is dense in $Z$.

Conversely, assume that $X$ is Jacobson. Let $Z \subset U_{i}$ be closed. Then $X_{0} \cap \bar{Z}$ is dense in $\bar{Z}$. Hence also $X_{0} \cap Z$ is dense in $Z$, because $\bar{Z} \backslash Z$ is closed. As $X_{0} \cap U_{i} \subset U_{i, 0}$ we see that $U_{i, 0} \cap Z$ is dense in $Z$. Thus $U_{i}$ is Jacobson as desired.

005X Lemma 5.17.5. Let $X$ be Jacobson. The following types of subsets $T \subset X$ are Jacobson:
(1) Open subspaces.
(2) Closed subspaces.
(3) Locally closed subspaces.
(4) Unions of locally closed subspaces.
(5) Constructible sets.
(6) Any subset $T \subset X$ which locally on $X$ is a union of locally closed subsets.

In each of these cases closed points of $T$ are closed in $X$.
Proof. Let $X_{0}$ be the set of closed points of $X$. For any subset $T \subset X$ we let $(*)$ denote the property:
(*) Every nonempty locally closed subset of $T$ has a point closed in $X$.
Note that always $X_{0} \cap T \subset T_{0}$. Hence property (*) implies that $T$ is Jacobson. In addition it clearly implies that every closed point of $T$ is closed in $X$.

Suppose that $T=\bigcup_{i} T_{i}$ with $T_{i}$ locally closed in $X$. Take $A \subset T$ a locally closed nonempty subset in $T$, then there exists a $T_{i}$ such that $A \cap T_{i}$ is nonempty, it is locally closed in $T_{i}$ and so in $X$. As $X$ is Jacobson $A$ has a point closed in $X$.

07JU Lemma 5.17.6. A finite Jacobson space is discrete.
Proof. If $X$ is finite Jacobson, $X_{0} \subset X$ the subset of closed points, then, on the one hand, $\overline{X_{0}}=X$. On the other hand, $X$, and hence $X_{0}$ is finite, so $X_{0}=$ $\left\{x_{1}, \ldots, x_{n}\right\}=\bigcup_{i=1, \ldots, n}\left\{x_{i}\right\}$ is a finite union of closed sets, hence closed, so $X=$ $\overline{X_{0}}=X_{0}$. Every point is closed, and by finiteness, every point is open.

005Z Lemma 5.17.7. Suppose $X$ is a Jacobson topological space. Let $X_{0}$ be the set of closed points of $X$. There is a bijective, inclusion preserving correspondence
$\{$ finite unions loc. closed subsets of $X\} \leftrightarrow\left\{\right.$ finite unions loc. closed subsets of $\left.X_{0}\right\}$ given by $E \mapsto E \cap X_{0}$. This correspondence preserves the subsets of locally closed, of open and of closed subsets.

Proof. We just prove that the correspondence $E \mapsto E \cap X_{0}$ is injective. Indeed if $E \neq E^{\prime}$ then without loss of generality $E \backslash E^{\prime}$ is nonempty, and it is a finite union of locally closed sets (details omitted). As $X$ is Jacobson, we see that $\left(E \backslash E^{\prime}\right) \cap X_{0}=$ $E \cap X_{0} \backslash E^{\prime} \cap X_{0}$ is not empty.

005Y Lemma 5.17.8. Suppose $X$ is a Jacobson topological space. Let $X_{0}$ be the set of closed points of $X$. There is a bijective, inclusion preserving correspondence

$$
\{\text { constructible subsets of } X\} \leftrightarrow\left\{\text { constructible subsets of } X_{0}\right\}
$$

given by $E \mapsto E \cap X_{0}$. This correspondence preserves the subset of retrocompact open subsets, as well as complements of these.

Proof. From Lemma 5.17.7 above, we just have to see that if $U$ is open in $X$ then $U \cap X_{0}$ is retrocompact in $X_{0}$ if and only if $U$ is retrocompact in $X$. This follows if we prove that for $U$ open in $X$ then $U \cap X_{0}$ is quasi-compact if and only if $U$ is quasi-compact. From Lemma 5.17 .5 it follows that we may replace $X$ by $U$ and assume that $U=X$. Finally notice that any collection of opens $\mathcal{U}$ of $X$ cover $X$ if and only if they cover $X_{0}$, using the Jacobson property of $X$ in the closed $X \backslash \cup \mathcal{U}$ to find a point in $X_{0}$ if it were nonempty.

### 5.18. Specialization

0060
0061 Definition 5.18.1. Let $X$ be a topological space.
(1) If $x, x^{\prime} \in X$ then we say $x$ is a specialization of $x^{\prime}$, or $x^{\prime}$ is a generalization of $x$ if $x \in \overline{\left\{x^{\prime}\right\}}$. Notation: $x^{\prime} \rightsquigarrow x$.
(2) A subset $T \subset X$ is stable under specialization if for all $x^{\prime} \in T$ and every specialization $x^{\prime} \rightsquigarrow x$ we have $x \in T$.
(3) A subset $T \subset X$ is stable under generalization if for all $x \in T$ and every generalization $x^{\prime} \rightsquigarrow x$ we have $x^{\prime} \in T$.

0062 Lemma 5.18.2. Let $X$ be a topological space.
(1) Any closed subset of $X$ is stable under specialization.
(2) Any open subset of $X$ is stable under generalization.
(3) A subset $T \subset X$ is stable under specialization if and only if the complement $T^{c}$ is stable under generalization.

Proof. Omitted.
0063 Definition 5.18.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces.
(1) We say that specializations lift along $f$ or that $f$ is specializing if given $y^{\prime} \rightsquigarrow y$ in $Y$ and any $x^{\prime} \in X$ with $f\left(x^{\prime}\right)=y^{\prime}$ there exists a specialization $x^{\prime} \rightsquigarrow x$ of $x^{\prime}$ in $X$ such that $f(x)=y$.
(2) We say that generalizations lift along $f$ or that $f$ is generalizing if given $y^{\prime} \rightsquigarrow y$ in $Y$ and any $x \in X$ with $f(x)=y$ there exists a generalization $x^{\prime} \rightsquigarrow x$ of $x$ in $X$ such that $f\left(x^{\prime}\right)=y^{\prime}$.

0064 Lemma 5.18.4. Suppose $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are continuous maps of topological spaces. If specializations lift along both $f$ and $g$ then specializations lift along $g \circ f$. Similarly for "generalizations lift along".
Proof. Omitted.
0065 Lemma 5.18.5. Let $f: X \rightarrow Y$ be a continuous map of topological spaces.
(1) If specializations lift along $f$, and if $T \subset X$ is stable under specialization, then $f(T) \subset Y$ is stable under specialization.
(2) If generalizations lift along $f$, and if $T \subset X$ is stable under generalization, then $f(T) \subset Y$ is stable under generalization.
Proof. Omitted.
0066 Lemma 5.18.6. Let $f: X \rightarrow Y$ be a continuous map of topological spaces.
(1) If $f$ is closed then specializations lift along $f$.
(2) If $f$ is open, $X$ is a Noetherian topological space, each irreducible closed subset of $X$ has a generic point, and $Y$ is Kolmogorov then generalizations lift along $f$.

Proof. Assume $f$ is closed. Let $y^{\prime} \rightsquigarrow y$ in $Y$ and any $x^{\prime} \in X$ with $f\left(x^{\prime}\right)=y^{\prime}$ be given. Consider the closed subset $T=\overline{\left\{x^{\prime}\right\}}$ of $X$. Then $f(T) \subset Y$ is a closed subset, and $y^{\prime} \in f(T)$. Hence also $y \in f(T)$. Hence $y=f(x)$ with $x \in T$, i.e., $x^{\prime} \rightsquigarrow x$.
Assume $f$ is open, $X$ Noetherian, every irreducible closed subset of $X$ has a generic point, and $Y$ is Kolmogorov. Let $y^{\prime} \rightsquigarrow y$ in $Y$ and any $x \in X$ with $f(x)=y$ be given. Consider $T=f^{-1}\left(\left\{y^{\prime}\right\}\right) \subset X$. Take an open neighbourhood $x \in U \subset X$ of $x$. Then $f(U) \subset Y$ is open and $y \in f(U)$. Hence also $y^{\prime} \in f(U)$. In other words, $T \cap U \neq \emptyset$. This proves that $x \in \bar{T}$. Since $X$ is Noetherian, $T$ is Noetherian (Lemma 5.8.2). Hence it has a decomposition $T=T_{1} \cup \ldots \cup T_{n}$ into irreducible components. Then correspondingly $\bar{T}=\overline{T_{1}} \cup \ldots \cup \overline{T_{n}}$. By the above $x \in \overline{T_{i}}$ for some $i$. By assumption there exists a generic point $x^{\prime} \in \overline{T_{i}}$, and we see that $x^{\prime} \rightsquigarrow x$. As $x^{\prime} \in \bar{T}$ we see that $f\left(x^{\prime}\right) \in \overline{\left\{y^{\prime}\right\}}$. Note that $f\left(\overline{T_{i}}\right)=f\left(\overline{\left\{x^{\prime}\right\}}\right) \subset \overline{\left\{f\left(x^{\prime}\right)\right\}}$. If $f\left(x^{\prime}\right) \neq y^{\prime}$, then since $Y$ is Kolmogorov $f\left(x^{\prime}\right)$ is not a generic point of the irreducible closed subset $\overline{\left\{y^{\prime}\right\}}$ and the inclusion $\overline{\left\{f\left(x^{\prime}\right)\right\}} \subset \overline{\left\{y^{\prime}\right\}}$ is strict, i.e., $y^{\prime} \notin f\left(\overline{T_{i}}\right)$. This contradicts the fact that $f\left(T_{i}\right)=\left\{y^{\prime}\right\}$. Hence $f\left(x^{\prime}\right)=y^{\prime}$ and we win.

06NA Lemma 5.18.7. Suppose that $s, t: R \rightarrow U$ and $\pi: U \rightarrow X$ are continuous maps of topological spaces such that
(1) $\pi$ is open,
(2) $U$ is sober,
(3) $s, t$ have finite fibres,
(4) generalizations lift along $s, t$,
(5) $(t, s)(R) \subset U \times U$ is an equivalence relation on $U$ and $X$ is the quotient of $U$ by this equivalence relation (as a set).
Then $X$ is Kolmogorov.

Proof. Properties (3) and (5) imply that a point $x$ corresponds to an finite equivalence class $\left\{u_{1}, \ldots, u_{n}\right\} \subset U$ of the equivalence relation. Suppose that $x^{\prime} \in X$ is a second point corresponding to the equivalence class $\left\{u_{1}^{\prime}, \ldots, u_{m}^{\prime}\right\} \subset U$. Suppose that $u_{i} \rightsquigarrow u_{j}^{\prime}$ for some $i, j$. Then for any $r^{\prime} \in R$ with $s\left(r^{\prime}\right)=u_{j}^{\prime}$ by (4) we can find $r \rightsquigarrow r^{\prime}$ with $s(r)=u_{i}$. Hence $t(r) \rightsquigarrow t\left(r^{\prime}\right)$. Since $\left\{u_{1}^{\prime}, \ldots, u_{m}^{\prime}\right\}=t\left(s^{-1}\left(\left\{u_{j}^{\prime}\right\}\right)\right)$ we conclude that every element of $\left\{u_{1}^{\prime}, \ldots, u_{m}^{\prime}\right\}$ is the specialization of an element of $\left\{u_{1}, \ldots, u_{n}\right\}$. Thus $\overline{\left\{u_{1}\right\}} \cup \ldots \cup \overline{\left\{u_{n}\right\}}$ is a union of equivalence classes, hence of the form $\pi^{-1}(Z)$ for some subset $Z \subset X$. By (1) we see that $Z$ is closed in $X$ and in fact $Z=\overline{\{x\}}$ because $\pi\left(\overline{\left\{u_{i}\right\}}\right) \subset \overline{\{x\}}$ for each $i$. In other words, $x \rightsquigarrow x^{\prime}$ if and only if some lift of $x$ in $U$ specializes to some lift of $x^{\prime}$ in $U$, if and only if every lift of $x^{\prime}$ in $U$ is a specialization of some lift of $x$ in $U$.
Suppose that both $x \rightsquigarrow x^{\prime}$ and $x^{\prime} \rightsquigarrow x$. Say $x$ corresponds to $\left\{u_{1}, \ldots, u_{n}\right\}$ and $x^{\prime}$ corresponds to $\left\{u_{1}^{\prime}, \ldots, u_{m}^{\prime}\right\}$ as above. Then, by the results of the preceding paragraph, we can find a sequence

$$
\ldots \rightsquigarrow u_{j_{3}}^{\prime} \rightsquigarrow u_{i_{3}} \rightsquigarrow u_{j_{2}}^{\prime} \rightsquigarrow u_{i_{2}} \rightsquigarrow u_{j_{1}}^{\prime} \rightsquigarrow u_{i_{1}}
$$

which must repeat, hence by (2) we conclude that $\left\{u_{1}, \ldots, u_{n}\right\}=\left\{u_{1}^{\prime}, \ldots, u_{m}^{\prime}\right\}$, i.e., $x=x^{\prime}$. Thus $X$ is Kolmogorov.

02JF Lemma 5.18.8. Let $f: X \rightarrow Y$ be a morphism of topological spaces. Suppose that $Y$ is a sober topological space, and $f$ is surjective. If either specializations or generalizations lift along $f$, then $\operatorname{dim}(X) \geq \operatorname{dim}(Y)$.
Proof. Assume specializations lift along $f$. Let $Z_{0} \subset Z_{1} \subset \ldots Z_{e} \subset Y$ be a chain of irreducible closed subsets of $X$. Let $\xi_{e} \in X$ be a point mapping to the generic point of $Z_{e}$. By assumption there exists a specialization $\xi_{e} \rightsquigarrow \xi_{e-1}$ in $X$ such that $\xi_{e-1}$ maps to the generic point of $Z_{e-1}$. Continuing in this manner we find a sequence of specializations

$$
\xi_{e} \rightsquigarrow \xi_{e-1} \rightsquigarrow \ldots \rightsquigarrow \xi_{0}
$$

with $\xi_{i}$ mapping to the generic point of $Z_{i}$. This clearly implies the sequence of irreducible closed subsets

$$
\overline{\left\{\xi_{0}\right\}} \subset \overline{\left\{\xi_{1}\right\}} \subset \ldots \overline{\left\{\xi_{e}\right\}}
$$

is a chain of length $e$ in $X$. The case when generalizations lift along $f$ is similar.
0542 Lemma 5.18.9. Let $X$ be a Noetherian sober topological space. Let $E \subset X$ be a subset of $X$.
(1) If $E$ is constructible and stable under specialization, then $E$ is closed.
(2) If $E$ is constructible and stable under generalization, then $E$ is open.

Proof. Let $E$ be constructible and stable under generalization. Let $Y \subset X$ be an irreducible closed subset with generic point $\xi \in Y$. If $E \cap Y$ is nonempty, then it contains $\xi$ (by stability under generalization) and hence is dense in $Y$, hence it contains a nonempty open of $Y$, see Lemma 5.15.3. Thus $E$ is open by Lemma 5.15.5. This proves (2). To prove (1) apply (2) to the complement of $E$ in $X$.

### 5.19. Dimension functions

02 I8 It scarcely makes sense to consider dimension functions unless the space considered is sober (Definition 5.7.4). Thus the definition below can be improved by considering the sober topological space associated to $X$. Since the underlying topological space of a scheme is sober we do not bother with this improvement.

02I9 Definition 5.19.1. Let $X$ be a topological space.
(1) Let $x, y \in X, x \neq y$. Suppose $x \rightsquigarrow y$, that is $y$ is a specialization of $x$. We say $y$ is an immediate specialization of $x$ if there is no $z \in X \backslash\{x, y\}$ with $x \rightsquigarrow z$ and $z \rightsquigarrow y$.
(2) A map $\delta: X \rightarrow \mathbf{Z}$ is called a dimension function ${ }^{5}$ if
(a) whenever $x \rightsquigarrow y$ and $x \neq y$ we have $\delta(x)>\delta(y)$, and
(b) for every immediate specialization $x \rightsquigarrow y$ in $X$ we have $\delta(x)=\delta(y)+$ 1.

It is clear that if $\delta$ is a dimension function, then so is $\delta+t$ for any $t \in \mathbf{Z}$. Here is a fun lemma.
02IA Lemma 5.19.2. Let $X$ be a topological space. If $X$ is sober and has a dimension function, then $X$ is catenary. Moreover, for any $x \rightsquigarrow y$ we have

$$
\delta(x)-\delta(y)=\operatorname{codim}(\overline{\{y\}}, \overline{\{x\}})
$$

Proof. Suppose $Y \subset Y^{\prime} \subset X$ are irreducible closed subsets. Let $\xi \in Y, \xi^{\prime} \in$ $Y^{\prime}$ be their generic points. Then we see immediately from the definitions that $\operatorname{codim}\left(Y, Y^{\prime}\right) \leq \delta(\xi)-\delta\left(\xi^{\prime}\right)<\infty$. In fact the first inequality is an equality. Namely, suppose

$$
Y=Y_{0} \subset Y_{1} \subset \ldots \subset Y_{e}=Y^{\prime}
$$

is any maximal chain of irreducible closed subsets. Let $\xi_{i} \in Y_{i}$ denote the generic point. Then we see that $\xi_{i} \rightsquigarrow \xi_{i+1}$ is an immediate specialization. Hence we see that $e=\delta(\xi)-\delta\left(\xi^{\prime}\right)$ as desired. This also proves the last statement of the lemma.
02IB Lemma 5.19.3. Let $X$ be a topological space. Let $\delta$, $\delta^{\prime}$ be two dimension functions on $X$. If $X$ is locally Noetherian and sober then $\delta-\delta^{\prime}$ is locally constant on $X$.
Proof. Let $x \in X$ be a point. We will show that $\delta-\delta^{\prime}$ is constant in a neighbourhood of $x$. We may replace $X$ by an open neighbourhood of $x$ in $X$ which is Noetherian. Hence we may assume $X$ is Noetherian and sober. Let $Z_{1}, \ldots, Z_{r}$ be the irreducible components of $X$ passing through $x$. (There are finitely many as $X$ is Noetherian, see Lemma 5.8.2 ) Let $\xi_{i} \in Z_{i}$ be the generic point. Note $Z_{1} \cup \ldots \cup Z_{r}$ is a neighbourhood of $x$ in $X$ (not necessarily closed). We claim that $\delta-\delta^{\prime}$ is constant on $Z_{1} \cup \ldots \cup Z_{r}$. Namely, if $y \in Z_{i}$, then

$$
\delta(x)-\delta(y)=\delta(x)-\delta\left(\xi_{i}\right)+\delta\left(\xi_{i}\right)-\delta(y)=-\operatorname{codim}\left(\overline{\{x\}}, Z_{i}\right)+\operatorname{codim}\left(\overline{\{y\}}, Z_{i}\right)
$$

by Lemma 5.19.2. Similarly for $\delta^{\prime}$. Whence the result.
02IC Lemma 5.19.4. Let $X$ be locally Noetherian, sober and catenary. Then any point has an open neighbourhood $U \subset X$ which has a dimension function.
Proof. We will use repeatedly that an open subspace of a catenary space is catenary, see Lemma 5.10 .5 and that a Noetherian topological space has finitely many irreducible components, see Lemma 5.8.2. In the proof of Lemma 5.19.3 we saw how to construct such a function. Namely, we first replace $X$ by a Noetherian open neighbourhood of $x$. Next, we let $Z_{1}, \ldots, Z_{r} \subset X$ be the irreducible components of $X$. Let

$$
Z_{i} \cap Z_{j}=\bigcup Z_{i j k}
$$

[^11]be the decomposition into irreducible components. We replace $X$ by
$$
X \backslash\left(\bigcup_{x \notin Z_{i}} Z_{i} \cup \bigcup_{x \notin Z_{i j k}} Z_{i j k}\right)
$$
so that we may assume $x \in Z_{i}$ for all $i$ and $x \in Z_{i j k}$ for all $i, j, k$. For $y \in X$ choose any $i$ such that $y \in Z_{i}$ and set
$$
\delta(y)=-\operatorname{codim}\left(\overline{\{x\}}, Z_{i}\right)+\operatorname{codim}\left(\overline{\{y\}}, Z_{i}\right)
$$

We claim this is a dimension function. First we show that it is well defined, i.e., independent of the choice of $i$. Namely, suppose that $y \in Z_{i j k}$ for some $i, j, k$. Then we have (using Lemma 5.10.6)

$$
\begin{aligned}
\delta(y) & =-\operatorname{codim}\left(\overline{\{x\}}, Z_{i}\right)+\operatorname{codim}\left(\overline{\{y\}}, Z_{i}\right) \\
& =-\operatorname{codim}\left(\overline{\{x\}}, Z_{i j k}\right)-\operatorname{codim}\left(Z_{i j k}, Z_{i}\right)+\operatorname{codim}\left(\overline{\{y\}}, Z_{i j k}\right)+\operatorname{codim}\left(Z_{i j k}, Z_{i}\right) \\
& =-\operatorname{codim}\left(\overline{\{x\}}, Z_{i j k}\right)+\operatorname{codim}\left(\overline{\{y\}}, Z_{i j k}\right)
\end{aligned}
$$

which is symmetric in $i$ and $j$. We omit the proof that it is a dimension function.
02ID Remark 5.19.5. Combining Lemmas 5.19.3 and 5.19.4 we see that on a catenary, locally Noetherian, sober topological space the obstruction to having a dimension function is an element of $H^{1}(X, \mathbf{Z})$.

### 5.20. Nowhere dense sets

Definition 5.20.1. Let $X$ be a topological space.
(1) Given a subset $T \subset X$ the interior of $T$ is the largest open subset of $X$ contained in $T$.
(2) A subset $T \subset X$ is called nowhere dense if the closure of $T$ has empty interior.

03HO Lemma 5.20.2. Let $X$ be a topological space. The union of a finite number of nowhere dense sets is a nowhere dense set.

Proof. Omitted.
03J0 Lemma 5.20.3. Let $X$ be a topological space. Let $U \subset X$ be an open. Let $T \subset U$ be a subset. If $T$ is nowhere dense in $U$, then $T$ is nowhere dense in $X$.
Proof. Assume $T$ is nowhere dense in $U$. Suppose that $x \in X$ is an interior point of the closure $\bar{T}$ of $T$ in $X$. Say $x \in V \subset \bar{T}$ with $V \subset X$ open in $X$. Note that $\bar{T} \cap U$ is the closure of $T$ in $U$. Hence the interior of $\bar{T} \cap U$ being empty implies $V \cap U=\emptyset$. Thus $x$ cannot be in the closure of $U$, a fortiori cannot be in the closure of $T$, a contradiction.

03HP Lemma 5.20.4. Let $X$ be a topological space. Let $X=\bigcup U_{i}$ be an open covering. Let $T \subset X$ be a subset. If $T \cap U_{i}$ is nowhere dense in $U_{i}$ for all $i$, then $T$ is nowhere dense in $X$.
Proof. Omitted. (Hint: closure commutes with intersecting with opens.)
03 HQ Lemma 5.20.5. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $T \subset X$ be a subset. If $f$ is a homeomorphism of $X$ onto a closed subset of $Y$ and $T$ is nowhere dense in $X$, then also $f(T)$ is nowhere dense in $Y$.

Proof. Omitted.
03HR Lemma 5.20.6. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $T \subset Y$ be a subset. If $f$ is open and $T$ is a closed nowhere dense subset of $Y$, then also $f^{-1}(T)$ is a closed nowhere dense subset of $X$. If $f$ is surjective and open, then $T$ is closed nowhere dense if and only if $f^{-1}(T)$ is closed nowhere dense.
Proof. Omitted. (Hint: In the first case the interior of $f^{-1}(T)$ maps into the interior of $T$, and in the second case the interior of $f^{-1}(T)$ maps onto the interior of $T$.)

### 5.21. Profinite spaces

08ZW Here is the definition.
08ZX Definition 5.21.1. A topological space is profinite if it is homeomorphic to a limit of a diagram of finite discrete spaces.

This is not the most convenient characterization of a profinite space.
08ZY Lemma 5.21.2. Let $X$ be a topological space. The following are equivalent
(1) $X$ is a profinite space, and
(2) $X$ is Hausdorff, quasi-compact, and totally disconnected.

If this is true, then $X$ is a cofiltered limit of finite discrete spaces.
Proof. Assume (1). Choose a diagram $i \mapsto X_{i}$ of finite discrete spaces such that $X=\lim X_{i}$. As each $X_{i}$ is Hausdorff and quasi-compact we find that $X$ is quasicompact by Lemma 5.13.5. If $x, x^{\prime} \in X$ are distinct points, then $x$ and $x^{\prime}$ map to distinct points in some $X_{i}$. Hence $x$ and $x^{\prime}$ have disjoint open neighbourhoods, i.e., $X$ is Hausdorff. In exactly the same way we see that $X$ is totally disconnected.

Assume (2). Let $\mathcal{I}$ be the set of finite disjoint union decompositions $X=\coprod_{i \in I} U_{i}$ with $U_{i}$ open (and closed). For each $I \in \mathcal{I}$ there is a continuous map $X \rightarrow I$ sending a point of $U_{i}$ to $i$. We define a partial ordering: $I \leq I^{\prime}$ for $I, I^{\prime} \in \mathcal{I}$ if and only if the covering corresponding to $I^{\prime}$ refines the covering corresponding to $I$. In this case we obtain a canonical map $I^{\prime} \rightarrow I$. In other words we obtain an inverse system of finite discrete spaces over $\mathcal{I}$. The maps $X \rightarrow I$ fit together and we obtain a continuous map

$$
X \longrightarrow \lim _{I \in \mathcal{I}} I
$$

We claim this map is a homeomorphism, which finishes the proof. (The final assertion follows too as the partially ordered set $\mathcal{I}$ is directed: given two disjoint union decompositions of $X$ we can find a third refining either.) Namely, the map is injective as $X$ is totally disconnected and hence $\{x\}$ is the intersection of all open and closed subsets of $X$ containing $x$ (Lemma 5.11.11) and the map is surjective by Lemma 5.11.6. By Lemma 5.16.8 the map is a homeomorphism.

08ZZ Lemma 5.21.3. Let $X$ be a profinite space. Every open covering of $X$ has a refinement by a finite covering $X=\coprod U_{i}$ with $U_{i}$ open and closed.
Proof. Write $X=\lim X_{i}$ as a limit of an inverse system of finite discrete spaces over a directed partially ordered set $I$ (Lemma 5.21.2). Denote $f_{i}: X \rightarrow X_{i}$ the projection. For every point $x=\left(x_{i}\right) \in X$ a fundamental system of open
neighbourhoods is the collection $f_{i}^{-1}\left(\left\{x_{i}\right\}\right)$. Thus, as $X$ is quasi-compact, we may assume we have an open covering

$$
X=f_{i_{1}}^{-1}\left(\left\{x_{i_{1}}\right\}\right) \cup \ldots \cup f_{i_{n}}^{-1}\left(\left\{x_{i_{n}}\right\}\right)
$$

Choose $i \in I$ with $i \geq i_{j}$ for $j=1, \ldots, n$ (this is possible as $I$ is a directed partially ordered set). Then we see that the covering

$$
X=\coprod_{t \in X_{i}} f_{i}^{-1}(\{t\})
$$

refines the given covering and is of the desired form.
0900 Lemma 5.21.4. Let $X$ be a topological space. If $X$ is quasi-compact and every connected component of $X$ is the intersection of the open and closed subsets containing it, then $\pi_{0}(X)$ is a profinite space.

Proof. We will use Lemma 5.21 .2 to prove this. Since $\pi_{0}(X)$ is the image of a quasi-compact space it is quasi-compact (Lemma 5.11 .7 ). It is totally disconnected by construction (Lemma 5.6.8). Let $C, D \subset X$ be distinct connected components of $X$. Write $C=\bigcap U_{\alpha}$ as the intersection of the open and closed subsets of $X$ containing $C$. Any finite intersection of $U_{\alpha}$ 's is another. Since $\bigcap U_{\alpha} \cap D=\emptyset$ we conclude that $U_{\alpha} \cap D=\emptyset$ for some $\alpha$ (use Lemmas 5.6.3, 5.11.3 and 5.11.6 Since $U_{\alpha}$ is open and closed, it is the union of the connected components it contains, i.e., $U_{\alpha}$ is the inverse image of some open and closed subset $V_{\alpha} \subset \pi_{0}(X)$. This proves that the points corresponding to $C$ and $D$ are contained in disjoint open subsets, i.e., $\pi_{0}(X)$ is Hausdorff.

### 5.22. Spectral spaces

08YF The material in this section is taken from Hoc69 and Hoc67. In his thesis Hochster proves (among other things) that the spectral spaces are exactly the topological spaces that occur as the spectrum of a ring.

08YG Definition 5.22.1. A topological space $X$ is called spectral if it is sober, quasicompact, the intersection of two quasi-compact opens is quasi-compact, and the collection of quasi-compact opens forms a basis for the topology. A continuous map $f: X \rightarrow Y$ of spectral spaces is called spectral if the inverse image of a quasi-compact open is quasi-compact.

In other words a continuous map of spectral spaces is spectral if and only if it is quasi-compact (Definition 5.11.1).

Let $X$ be a spectral space. The constructible topology on $X$ is the topology which has as a subbase of opens the sets $U$ and $U^{c}$ where $U$ is a quasi-compact open of $X$. Note that since $X$ is spectral an open $U \subset X$ is retrocompact if and only if $U$ is quasi-compact. Hence the constructible topology can also be characterized as the coarsest topology such that every constructible subset of $X$ is both open and closed. Since the collection of quasi-compact opens is a basis for the topology on $X$ we see that the constructible topology is stronger than the given topology on $X$.

0901 Lemma 5.22.2. Let $X$ be a spectral space. The constructible topology is Hausdorff and quasi-compact.

Proof. Since the collection of all quasi-compact opens forms a basis for the topology on $X$ and $X$ is sober, it is clear that $X$ is Hausdorff in the constructible topology.

Let $\mathcal{B}$ be the collection of subsets $B \subset X$ with $B$ either quasi-compact open or closed with quasi-compact complement. If $B \in \mathcal{B}$ then $B^{c} \in \mathcal{B}$. It suffices to show every covering $X=\bigcup_{i \in I} B_{i}$ with $B_{i} \in \mathcal{B}$ has a finite refinement, see Lemma 5.11.15. Taking complements we see that we have to show that any family $\left\{B_{i}\right\}_{i \in I}$ of elements of $\mathcal{B}$ such that $B_{i_{1}} \cap \ldots \cap B_{i_{n}} \neq \emptyset$ for all $n$ and all $i_{1}, \ldots, i_{n} \in I$ has a common point of intersection. We may and do assume $B_{i} \neq B_{i^{\prime}}$ for $i \neq i^{\prime}$.

To get a contradiction assume $\left\{B_{i}\right\}_{i \in I}$ is a family of elements of $\mathcal{B}$ having the finite intersection property but empty intersection. An application of Zorn's lemma shows that we may assume our family is maximal (details omitted). Let $I^{\prime} \subset I$ be those indices such that $B_{i}$ is closed and set $Z=\bigcap_{i \in I^{\prime}} B_{i}$. This is a closed subset of $X$. If $Z$ is reducible, then we can write $Z=Z^{\prime} \cup Z^{\prime \prime}$ as a union of two closed subsets, neither equal to $Z$. This means in particular that we can find a quasi-compact open $U^{\prime} \subset X$ meeting $Z^{\prime}$ but not $Z^{\prime \prime}$. Similarly, we can find a quasi-compact open $U^{\prime \prime} \subset X$ meeting $Z^{\prime \prime}$ but not $Z^{\prime}$. Set $B^{\prime}=X \backslash U^{\prime}$ and $B^{\prime \prime}=X \backslash U^{\prime \prime}$. Note that $Z^{\prime \prime} \subset B^{\prime}$ and $Z^{\prime} \subset B^{\prime \prime}$. If there exist a finite number of indices $i_{1}, \ldots, i_{n} \in I$ such that $B^{\prime} \cap B_{i_{1}} \cap \ldots \cap B_{i_{n}}=\emptyset$ as well as a finite number of indices $j_{1}, \ldots, j_{m} \in I$ such that $B^{\prime \prime} \cap B_{j_{1}} \cap \ldots \cap B_{j_{m}}=\emptyset$ then we find that $Z \cap B_{i_{1}} \cap \ldots \cap B_{i_{n}} \cap B_{j_{1}} \cap \ldots \cap B_{j_{m}}=\emptyset$. However, the set $B_{i_{1}} \cap \ldots \cap B_{i_{n}} \cap B_{j_{1}} \cap \ldots \cap B_{j_{m}}$ is quasi-compact hence we would find a finite number of indices $i_{1}^{\prime}, \ldots, i_{l}^{\prime} \in I^{\prime}$ with $B_{i_{1}} \cap \ldots \cap B_{i_{n}} \cap B_{j_{1}} \cap \ldots \cap B_{j_{m}} \cap B_{i_{1}^{\prime}} \cap \ldots \cap B_{i_{l}^{\prime}}=\emptyset$, a contradiction. Thus we see that we may add either $B^{\prime}$ or $B^{\prime \prime}$ to the given family contradicting maximality. We conclude that $Z$ is irreducible. However, this leads to a contradiction as well, as now every nonempty (by the same argument as above) open $Z \cap B_{i}$ for $i \in I \backslash I^{\prime}$ contains the unique generic point of $Z$. This contradiction proves the lemma.

0A2S Lemma 5.22.3. Let $f: X \rightarrow Y$ be a spectral map of spectral spaces. Then
(1) $f$ is continuous in the constructible topology,
(2) the fibres of $f$ are quasi-compact, and
(3) the image is closed in the constructible topology.

Proof. Let $X^{\prime}$ and $Y^{\prime}$ denote $X$ and $Y$ endowed with the constructible topology which are quasi-compact Hausdorff spaces by Lemma5.22.2. Part (1) says $X^{\prime} \rightarrow Y^{\prime}$ is continuous and follows immediately from the definitions. Part (3) follows as $f\left(X^{\prime}\right)$ is a quasi-compact subset of the Hausdorff space $Y^{\prime}$, see Lemma 5.11.4. We have a commutative diagram

of continuous maps of topological spaces. Since $Y^{\prime}$ is Hausdorff we see that the fibres $X_{y}^{\prime}$ are closed in $X^{\prime}$. As $X^{\prime}$ is quasi-compact we see that $X_{y}^{\prime}$ is quasi-compact (Lemma 5.11.3). As $X_{y}^{\prime} \rightarrow X_{y}$ is a surjective continuous map we conclude that $X_{y}$ is quasi-compact (Lemma 5.11.7).

0902 Lemma 5.22.4. Let $X$ be a spectral space. Let $E \subset X$ be closed in the constructible topology (for example constructible or closed). Then $E$ with the induced topology is a spectral space.

Proof. Let $Z \subset E$ be a closed irreducible subset. Let $\eta$ be the generic point of the closure $\bar{Z}$ of $Z$ in $X$. To prove that $E$ is sober, we show that $\eta \in E$. If not, then since $E$ is closed in the constructible topology, there exists a constructible subset $F \subset X$ such that $\eta \in F$ and $F \cap E=\emptyset$. By Lemma 5.14.14 this implies $F \cap \bar{Z}$ contains a nonempty open subset of $\bar{Z}$. But this is impossible as $\bar{Z}$ is the closure of $Z$ and $Z \cap F=\emptyset$.

Since $E$ is closed in the constructible topology, it is quasi-compact in the constructible topology (Lemmas 5.11.3 and 5.22.2). Hence a fortiori it is quasi-compact in the topology coming from $X$. If $U \subset X$ is a quasi-compact open, then $E \cap U$ is closed in the constructible topology, hence quasi-compact (as seen above). It follows that the quasi-compact open subsets of $E$ are the intersections $E \cap U$ with $U$ quasi-compact open in $X$. These form a basis for the topology. Finally, given two $U, U^{\prime} \subset X$ quasi-compact opens, the intersection $(E \cap U) \cap\left(E \cap U^{\prime}\right)=E \cap\left(U \cap U^{\prime}\right)$ and $U \cap U^{\prime}$ is quasi-compact as $X$ is spectral. This finishes the proof.

0903 Lemma 5.22.5. Let $X$ be a spectral space. Let $E \subset X$ be a subset closed in the constructible topology (for example constructible).
(1) If $x \in \bar{E}$, then $x$ is the specialization of a point of $E$.
(2) If $E$ is stable under specialization, then $E$ is closed.
(3) If $E^{\prime} \subset X$ is open in the constructible topology (for example constructible) and stable under generalization, then $E^{\prime}$ is open.

Proof. Proof of (1). Let $x \in \bar{E}$. Let $\left\{U_{i}\right\}$ be the set of quasi-compact open neighbourhoods of $x$. A finite intersection of the $U_{i}$ is another one. The intersection $U_{i} \cap E$ is nonempty for all $i$. Since the subsets $U_{i} \cap E$ are closed in the constructible topology we see that $\bigcap\left(U_{i} \cap E\right)$ is nonempty by Lemma 5.22.2 and Lemma 5.11.6. Since $X$ is a sober space and $\left\{U_{i}\right\}$ is a fundamental system of open neighbourhoods of $x$, we see that $\bigcap U_{i}$ is the set of generalizations of $x$. Thus $x$ is a specialization of a point of $E$.
Part (2) is immediate from (1).
Proof of (3). Assume $E^{\prime}$ is as in (3). The complement of $E^{\prime}$ is closed in the constructible topology (Lemma 5.14.2) and closed under specialization (Lemma 5.18 .2 . Hence the complement is closed by (2), i.e., $E^{\prime}$ is open.

0904 Lemma 5.22.6. Let $X$ be a spectral space. Let $x, y \in X$. Then either there exists a third point specializing to both $x$ and $y$, or there exist disjoint open neighbourhoods containing $x$ and $y$.

Proof. Let $\left\{U_{i}\right\}$ be the set of quasi-compact open neighbourhoods of $x$. A finite intersection of the $U_{i}$ is another one. Let $\left\{V_{j}\right\}$ be the set of quasi-compact open neighbourhoods of $y$. A finite intersection of the $V_{j}$ is another one. If $U_{i} \cap V_{j}$ is empty for some $i, j$ we are done. If not, then the intersection $U_{i} \cap V_{j}$ is nonempty for all $i$ and $j$. The sets $U_{i} \cap V_{j}$ are closed in the constructible topology on $X$. By Lemma 5.22 .2 we see that $\bigcap\left(U_{i} \cap V_{j}\right)$ is nonempty (Lemma 5.11.6. Since $X$ is a sober space and $\left\{U_{i}\right\}$ is a fundamental system of open neighbourhoods of $x$, we see that $\bigcap U_{i}$ is the set of generalizations of $x$. Similarly, $\bigcap V_{j}$ is the set of
generalizations of $y$. Thus any element of $\bigcap\left(U_{i} \cap V_{j}\right)$ specializes to both $x$ and $y$.

0905 Lemma 5.22.7. Let $X$ be a spectral space. The following are equivalent:
(1) $X$ is profinite,
(2) $X$ is Hausdorff,
(3) $X$ is totally disconnected,
(4) every quasi-compact open is closed,
(5) there are no nontrivial specializations between points,
(6) every point of $X$ is closed,
(7) every point of $X$ is the generic point of an irreducible component of $X$,
(8) add more here.

Proof. Lemma 5.21 .2 shows the implication $(1) \Rightarrow$ (3). Irreducible components are closed, so if $X$ is totally disconnected, then every point is closed. So (3) implies (6). The equivalence of (6) and (5) is immediate, and (6) $\Leftrightarrow(7)$ holds because $X$ is sober. Assume (5). Then all constructible subsets of $X$ are closed (Lemma 5.22 .5 ), in particular all quasi-compact opens are closed. So (5) implies (4). Since $X$ is sober, for any two points there is a quasi-compact open containing exactly one of them, hence (4) implies (2). It remains to prove (2) implies (1). Suppose $X$ is Hausdorff. Every quasi-compact open is also closed (Lemma 5.11.4). This implies $X$ is totally disconnected. Hence it is profinite, by Lemma 5.21.2
0906 Lemma 5.22.8. If $X$ is a spectral space, then $\pi_{0}(X)$ is a profinite space.
Proof. Combine Lemmas 5.11.10 and 5.21.4
0907 Lemma 5.22.9. The product of two spectral spaces is spectral.
Proof. Let $X, Y$ be spectral spaces. Denote $p: X \times Y \rightarrow X$ and $q: X \times Y \rightarrow Y$ the projections. Let $Z \subset X \times Y$ be a closed irreducible subset. Then $p(Z) \subset X$ is irreducible and $q(Z) \subset Y$ is irreducible. Let $x \in X$ be the generic point of the closure of $p(X)$ and let $y \in Y$ be the generic point of the closure of $q(Y)$. If $(x, y) \notin Z$, then there exist opens $x \in U \subset X, y \in V \subset Y$ such that $Z \cap U \times V=\emptyset$. Hence $Z$ is contained in $(X \backslash U) \times Y \cup X \times(Y \backslash V)$. Since $Z$ is irreducible, we see that either $Z \subset(X \backslash U) \times Y$ or $Z \subset X \times(Y \backslash V)$. In the first case $p(Z) \subset(X \backslash U)$ and in the second case $q(Z) \subset(Y \backslash V)$. Both cases are absurd as $x$ is in the closure of $p(Z)$ and $y$ is in the closure of $q(Z)$. Thus we conclude that $(x, y) \in Z$, which means that $(x, y)$ is the generic point for $Z$.
A basis of the topology of $X \times Y$ are the opens of the form $U \times V$ with $U \subset X$ and $V \subset Y$ quasi-compact open (here we use that $X$ and $Y$ are spectral). Then $U \times V$ is quasi-compact as the product of quasi-compact spaces is quasi-compact. Moreover, any quasi-compact open of $X \times Y$ is a finite union of such quasi-compact rectangles $U \times V$. It follows that the intersection of two such is again quasi-compact (since $X$ and $Y$ are spectral). This concludes the proof.
09XU Lemma 5.22.10. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. If
(1) $X$ and $Y$ are spectral,
(2) $f$ is spectral and bijective, and
(3) generalizations (resp. specializations) lift along $f$.

Then $f$ is a homeomorphism.

Proof. Since $f$ is spectral it defines a continuous map between $X$ and $Y$ in the constructible topology. By Lemmas 5.22 .2 and 5.16 .8 it follows that $X \rightarrow Y$ is a homeomorphism in the constructible topology. Let $U \subset X$ be quasi-compact open. Then $f(U)$ is constructible in $Y$. Let $y \in Y$ specialize to a point in $f(U)$. By the last assumption we see that $f^{-1}(y)$ specializes to a point of $U$. Hence $f^{-1}(y) \in U$. Thus $y \in f(U)$. It follows that $f(U)$ is open, see Lemma 5.22.5. Whence $f$ is a homeomorphism. To prove the lemma in case specializations lift along $f$ one shows instead that $f(Z)$ is closed if $X \backslash Z$ is a quasi-compact open of $X$.

09XV Lemma 5.22.11. The inverse limit of a directed inverse system of finite sober topological spaces is a spectral topological space.

Proof. Let $I$ be a directed partially ordered set. Let $X_{i}$ be an inverse system of finite sober spaces over $I$. Let $X=\lim X_{i}$ which exists by Lemma 5.13.1. As a set $X=\lim X_{i}$. Denote $p_{i}: X \rightarrow X_{i}$ the projection. Because $I$ is directed we may apply Lemma 5.13.2. A basis for the topology is given by the opens $p_{i}^{-1}\left(U_{i}\right)$ for $U_{i} \subset X_{i}$ open. Since an open covering of $p_{i}^{-1}\left(U_{i}\right)$ is in particular an open covering in the profinite topology, we conclude that $p_{i}^{-1}\left(U_{i}\right)$ is quasi-compact. Given $U_{i} \subset X_{i}$ and $U_{j} \subset X_{j}$, then $p_{i}^{-1}\left(U_{i}\right) \cap p_{j}^{-1}\left(U_{j}\right)=p_{k}^{-1}\left(U_{k}\right)$ for some $k \geq i, j$ and open $U_{k} \subset X_{k}$. Finally, if $Z \subset X$ is irreducible and closed, then $p_{i}(Z) \subset X_{i}$ is irreducible and therefore has a unique generic point $\xi_{i}$ (because $X_{i}$ is a finite sober topological space). Then $\xi=\lim \xi_{i}$ is a generic point of $Z$ (it is a point of $Z$ as $Z$ is closed). This finishes the proof.

09XW Lemma 5.22.12. Let $W$ be the topological space with two points, one closed, the other not. A topological space is spectral if and only if it is homeomorphic to a subspace of a product of copies of $W$ which is closed in the constructible topology.

Proof. Write $W=\{0,1\}$ where 0 is a specialization of 1 but not vice versa. Let $I$ be a set. The space $\prod_{i \in I} W$ is spectral by Lemma 5.22.11. Thus we see that a subspace of $\prod_{i \in I} W$ closed in the constructible topology is a spectral space by Lemma 5.22.4

For the converse, let $X$ be a spectral space. Let $U \subset X$ be a quasi-compact open. Consider the continuous map

$$
f_{U}: X \longrightarrow W
$$

which maps every point in $U$ to 1 and every point in $X \backslash U$ to 0 . Taking the product of these maps we obtain a continuous map

$$
f=\prod f_{U}: X \longrightarrow \prod_{U} W
$$

By construction the map $f: X \rightarrow Y$ is spectral. By Lemma 5.22 .3 the image of $f$ is closed in the constructible topology. If $x^{\prime}, x \in X$ are distinct, then since $X$ is sober either $x^{\prime}$ is not a specialization of $x$ or conversely. In either case (as the quasicompact opens form a basis for the topology of $X$ ) there exists a quasi-compact open $U \subset X$ such that $f_{U}\left(x^{\prime}\right) \neq f_{U}(x)$. Thus $f$ is injective. Let $Y=f(X)$ endowed with the induced topology. Let $y^{\prime} \rightsquigarrow y$ be a specialization in $Y$ and say $f\left(x^{\prime}\right)=y^{\prime}$ and $f(x)=y$. Arguing as above we see that $x^{\prime} \rightsquigarrow x$, since otherwise there is a $U$ such that $x \in U$ and $x^{\prime} \notin U$, which would imply $f_{U}\left(x^{\prime}\right) \nleftarrow \rightarrow f_{U}(x)$. We conclude that $f: X \rightarrow Y$ is a homeomorphism by Lemma 5.22 .10

09XX Lemma 5.22.13. A topological space is spectral if and only if it is a directed inverse limit of finite sober topological spaces.
Proof. One direction is given by Lemma 5.22.11. For the converse, assume $X$ is spectral. Then we may assume $X \subset \prod_{i \in I} W$ is a subset closed in the constructible topology where $W=\{0,1\}$ as in Lemma 5.22.12. We can write

$$
\prod_{i \in I} W=\lim _{J \subset I \text { finite }} \prod_{j \in J} W
$$

as a cofiltered limit. For each $J$, let $X_{J} \subset \prod_{j \in J} W$ be the image of $X$. Then we see that $X=\lim X_{J}$ as sets because $X$ is closed in the product with the constructible topology (detail omitted). A formal argument (omitted) on limits shows that $X=\lim X_{J}$ as topological spaces.

0A2T Lemma 5.22.14. Let $X$ be a topological space and let $c: X \rightarrow X^{\prime}$ be the universal map from $X$ to a sober topological space, see Lemma 5.7.14.
(1) If $X$ is quasi-compact, so is $X^{\prime}$.
(2) If $X$ is quasi-compact, has a basis of quasi-compact opens, and the intersection of two quasi-compact opens is quasi-compact, then $X^{\prime}$ is spectral.
(3) If $X$ is Noetherian, then $X^{\prime}$ is a Noetherian spectral space.

Proof. Let $U \subset X$ be open and let $U^{\prime} \subset X^{\prime}$ be the corresponding open, i.e., the open such that $c^{-1}\left(U^{\prime}\right)=U$. Then $U$ is quasi-compact if and only if $U^{\prime}$ is quasicompact, as pulling back by $c$ is a bijection between the opens of $X$ and $X^{\prime}$ which commutes with unions. This in particular proves (1).
Proof of (2). It follows from the above that $X^{\prime}$ has a basis of quasi-compact opens. Since $c^{-1}$ also commutes with intersections of pairs of opens, we see that the intersection of two quasi-compact opens $X^{\prime}$ is quasi-compact. Finally, $X^{\prime}$ is quasicompact by (1) and sober by construction. Hence $X^{\prime}$ is spectral.
Proof of (3). It is immediate that $X^{\prime}$ is Noetherian as this is defined in terms of the acc for open subsets which holds for $X$. We have already seen in (2) that $X^{\prime}$ is spectral.

### 5.23. Limits of spectral spaces

0A2U Lemma 5.22 .13 tells us that every spectral space is a cofiltered limit of finite sober spaces. Every finite sober space is a spectral space and every continuous map of finite sober spaces is a spectral map of spectral spaces. In this section we prove some lemmas concerning limits of systems of spectral topological spaces along spectral maps.

0A2V Lemma 5.23.1. Let $\mathcal{I}$ be a category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral.
(1) Given subsets $Z_{i} \subset X_{i}$ closed in the constructible topology with $f_{a}\left(Z_{j}\right) \subset$ $Z_{i}$ for all $a: j \rightarrow i$ in $\mathcal{I}$, then $\lim Z_{i}$ is quasi-compact.
(2) The space $X=\lim X_{i}$ is quasi-compact.

Proof. The limit $Z=\lim Z_{i}$ exists by Lemma 5.13.1. Denote $X_{i}^{\prime}$ the space $X_{i}$ endowed with the constructible topology and $Z_{i}^{\prime}$ the corresponding subspace of $X_{i}^{\prime}$. Let $a: j \rightarrow i$ in $\mathcal{I}$ be a morphism. As $f_{a}$ is spectral it defines a continuous map $f_{a}: X_{j}^{\prime} \rightarrow X_{i}^{\prime}$. Thus $\left.f_{a}\right|_{Z_{j}}: Z_{j}^{\prime} \rightarrow Z_{i}^{\prime}$ is a continuous map of quasi-compact Hausdorff spaces (by Lemmas 5.22.2 and 5.11.3). Thus $Z^{\prime}=\lim Z_{i}$ is quasi-compact
by Lemma 5.13.5. The maps $Z_{i}^{\prime} \rightarrow Z_{i}$ are continuous, hence $Z^{\prime} \rightarrow Z$ is continuous and a bijection on underlying sets. Hence $Z$ is quasi-compact as the image of the surjective continuous map $Z^{\prime} \rightarrow Z$ (Lemma 5.11.7).
0A2W Lemma 5.23.2. Let $\mathcal{I}$ be a cofiltered category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral.
(1) Given nonempty subsets $Z_{i} \subset X_{i}$ closed in the constructible topology with $f_{a}\left(Z_{j}\right) \subset Z_{i}$ for all $a: j \rightarrow i$ in $\mathcal{I}$, then $\lim Z_{i}$ is nonempty.
(2) If each $X_{i}$ is nonempty, then $X=\lim X_{i}$ is nonempty.

Proof. Denote $X_{i}^{\prime}$ the space $X_{i}$ endowed with the constructible topology and $Z_{i}^{\prime}$ the corresponding subspace of $X_{i}^{\prime}$. Let $a: j \rightarrow i$ in $\mathcal{I}$ be a morphism. As $f_{a}$ is spectral it defines a continuous map $f_{a}: X_{j}^{\prime} \rightarrow X_{i}^{\prime}$. Thus $\left.f_{a}\right|_{Z_{j}}: Z_{j}^{\prime} \rightarrow Z_{i}^{\prime}$ is a continuous map of quasi-compact Hausdorff spaces (by Lemmas 5.22.2 and 5.11.3). By Lemma 5.13 .6 the space $\lim Z_{i}^{\prime}$ is nonempty. Since $\lim Z_{i}^{\prime}=\lim Z_{i}$ as sets we conclude.

0A2X Lemma 5.23.3. Let $\mathcal{I}$ be a cofiltered category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral. Let $X=\lim X_{i}$ with projections $p_{i}: X \rightarrow X_{i}$. Let $i \in \operatorname{Ob}(\mathcal{I})$ and let $E, F \subset X_{i}$ be subsets with $E$ closed in the constructible topology and $F$ open in the constructible topology. Then $p_{i}^{-1}(E) \subset p_{i}^{-1}(F)$ if and only if there is a morphism $a: j \rightarrow i$ in $\mathcal{I}$ such that $f_{a}^{-1}(E) \subset f_{a}^{-1}(F)$.
Proof. Observe that

$$
p_{i}^{-1}(E) \backslash p_{i}^{-1}(F)=\lim _{a: j \rightarrow i} f_{a}^{-1}(E) \backslash f_{a}^{-1}(F)
$$

Since $f_{a}$ is a spectral map, it is continuous in the constructible topology hence the set $f_{a}^{-1}(E) \backslash f_{a}^{-1}(F)$ is closed in the constructible topology. Hence Lemma 5.23.2 applies to show that the LHS is nonempty if and only if each of the spaces of the RHS is nonempty.
0A2Y Lemma 5.23.4. Let $\mathcal{I}$ be a cofiltered category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral. Let $X=\lim X_{i}$ with projections $p_{i}: X \rightarrow X_{i}$. Let $E \subset X$ be a constructible subset. Then there exists an $i \in \operatorname{Ob}(\mathcal{I})$ and a constructible subset $E_{i} \subset X_{i}$ such that $p_{i}^{-1}\left(E_{i}\right)=E$. If $E$ is open, resp. closed, we may choose $E_{i}$ open, resp. closed.
Proof. Assume $E$ is a quasi-compact open of $X$. By Lemma 5.13 .2 we can write $E=p_{i}^{-1}\left(U_{i}\right)$ for some $i$ and some open $U_{i} \subset X_{i}$. Write $U_{i}=\bigcup U_{i, \alpha}$ as a union of quasi-compact opens. As $E$ is quasi-compact we can find $\alpha_{1}, \ldots, \alpha_{n}$ such that $E=p_{i}^{-1}\left(U_{i, \alpha_{1}} \cup \ldots \cup U_{i, \alpha_{n}}\right)$. Hence $E_{i}=U_{i, \alpha_{1}} \cup \ldots \cup U_{i, \alpha_{n}}$ works.
Assume $E$ is a constructible closed subset. Then $E^{c}$ is quasi-compact open. So $E^{c}=p_{i}^{-1}\left(F_{i}\right)$ for some $i$ and quasi-compact open $F_{i} \subset X_{i}$ by the result of the previous paragraph. Then $E=p_{i}^{-1}\left(F_{i}^{c}\right)$ as desired.
If $E$ is general we can write $E=\bigcup_{l=1, \ldots, n} U_{l} \cap Z_{l}$ with $U_{l}$ constructible open and $Z_{l}$ constructible closed. By the result of the previous paragraphs we may write $U_{l}=$ $p_{i_{l}}^{-1}\left(U_{l, i_{l}}\right)$ and $Z_{l}=p_{j_{l}}^{-1}\left(Z_{l, j_{l}}\right)$ with $U_{l, i_{l}} \subset X_{i_{l}}$ constructible open and $Z_{l, j_{l}} \subset X_{j_{l}}$ constructible closed. As $\mathcal{I}$ is cofiltered we may choose an object $k$ of $\mathcal{I}$ and morphism $a_{l}: k \rightarrow i_{l}$ and $b_{l}: k \rightarrow j_{l}$. Then taking $E_{k}=\bigcup_{l=1, \ldots, n} f_{a_{l}}^{-1}\left(U_{l, i_{l}}\right) \cap f_{b_{l}}^{-1}\left(Z_{l, j_{l}}\right)$ we obtain a constructible subset of $X_{k}$ whose inverse image in $X$ is $E$.

0A2Z Lemma 5.23.5. Let $\mathcal{I}$ be a cofiltered index category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral. Then the inverse limit $X=\lim X_{i}$ is a spectral topological space and the projection maps $p_{i}: X \rightarrow X_{i}$ are spectral.

Proof. The limit $X=\lim X_{i}$ exists (Lemma 5.13.1) and is quasi-compact by Lemma 5.23.1.

Denote $p_{i}: X \rightarrow X_{i}$ the projection. Because $\mathcal{I}$ is cofiltered we can apply Lemma 5.13.2 Hence a basis for the topology on $X$ is given by the opens $p_{i}^{-1}\left(U_{i}\right)$ for $U_{i} \subset X_{i}$ open. Since a basis for the topology of $X_{i}$ is given by the quasi-compact open, we conclude that a basis for the topology on $X$ is given by $p_{i}^{-1}\left(U_{i}\right)$ with $U_{i} \subset X_{i}$ quasi-compact open. A formal argument shows that

$$
p_{i}^{-1}\left(U_{i}\right)=\lim _{a: j \rightarrow i} f_{a}^{-1}\left(U_{i}\right)
$$

as topological spaces. Since each $f_{a}$ is spectral the sets $f_{a}^{-1}\left(U_{i}\right)$ are closed in the constructible topology of $X_{j}$ and hence $p_{i}^{-1}\left(U_{i}\right)$ is quasi-compact by Lemma 5.23.1. Thus $X$ has a basis for the topology consisting of quasi-compact opens.

Any quasi-compact open $U$ of $X$ is of the form $U=p_{i}^{-1}\left(U_{i}\right)$ for some $i$ and some quasi-compact open $U_{i} \subset X_{i}$ (see Lemma 5.23.4). Given $U_{i} \subset X_{i}$ and $U_{j} \subset X_{j}$ quasi-compact open, then $p_{i}^{-1}\left(U_{i}\right) \cap p_{j}^{-1}\left(U_{j}\right)=p_{k}^{-1}\left(U_{k}\right)$ for some $k$ and quasicompact open $U_{k} \subset X_{k}$. Namely, choose $k$ and morphisms $k \rightarrow i$ and $k \rightarrow j$ and let $U_{k}$ be the intersection of the pullbacks of $U_{i}$ and $U_{j}$ to $X_{k}$. Thus we see that the intersection of two quasi-compact opens of $X$ is quasi-compact open.

Finally, let $Z \subset X$ be irreducible and closed. Then $p_{i}(Z) \subset X_{i}$ is irreducible and therefore $Z_{i}=\overline{p_{i}(Z)}$ has a unique generic point $\xi_{i}$ (because $X_{i}$ is a spectral space). Then $f_{a}\left(\xi_{j}\right)=\xi_{i}$ for $a: j \rightarrow i$ in $\mathcal{I}$ because $\overline{f_{a}\left(Z_{j}\right)}=Z_{i}$. Hence $\xi=\lim \xi_{i}$ is a point of $X$. Claim: $\xi \in Z$. Namely, if not we can find a quasi-compact open containing $\xi$ disjoint from $Z$. This would be of the form $p_{i}^{-1}\left(U_{i}\right)$ for some $i$ and quasi-compact open $U_{i} \subset X_{i}$. Then $\xi_{i} \in U_{i}$ but $p_{i}(Z) \cap U_{i}=\emptyset$ which contradicts $\xi_{i} \in \overline{p_{i}(Z)}$. So $\xi \in Z$ and hence $\overline{\{\xi\}} \subset Z$. Conversely, every $z \in Z$ is in the closure of $\xi$. Namely, given a quasi-compact open neighbourhood $U$ of $z$ we write $U=p_{i}^{-1}\left(U_{i}\right)$ for some $i$ and quasi-compact open $U_{i} \subset X_{i}$. We see that $p_{i}(z) \in U_{i}$ hence $\xi_{i} \in U_{i}$ hence $\xi \in U$. Thus $\xi$ is the generic point of $Z$. This finishes the proof.

0A30 Lemma 5.23.6. Let $\mathcal{I}$ be a cofiltered index category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral. Set $X=\lim X_{i}$ and denote $p_{i}: X \rightarrow X_{i}$ the projection.
(1) Given any quasi-compact open $U \subset X$ there exists an $i \in \operatorname{Ob}(\mathcal{I})$ and a quasi-compact open $U_{i} \subset X_{i}$ such that $p_{i}^{-1}\left(U_{i}\right)=U$.
(2) Given $U_{i} \subset X_{i}$ and $U_{j} \subset X_{j}$ quasi-compact opens such that $p_{i}^{-1}\left(U_{i}\right) \subset$ $p_{j}^{-1}\left(U_{j}\right)$ there exist $k \in \mathrm{Ob}(\mathcal{I})$ and morphisms $a: k \rightarrow i$ and $b: k \rightarrow j$ such that $f_{a}^{-1}\left(U_{i}\right) \subset f_{b}^{-1}\left(U_{j}\right)$.
(3) If $U_{i}, U_{1, i}, \ldots, U_{n, i} \subset X_{i}$ are quasi-compact opens and $p_{i}^{-1}\left(U_{i}\right)=p_{i}^{-1}\left(U_{1, i}\right) \cup$ $\ldots \cup p_{i}^{-1}\left(U_{n, i}\right)$ then $f_{a}^{-1}\left(U_{i}\right)=f_{a}^{-1}\left(U_{1, i}\right) \cup \ldots \cup f_{a}^{-1}\left(U_{n, i}\right)$ for some morphism $a: j \rightarrow i$ in $\mathcal{I}$.
(4) Same statement as in (3) but for intersections.

Proof. Part (1) is a special case of Lemma 5.23.4. Part (2) is a special case of Lemma 5.23.3 as quasi-compact opens are both open and closed in the constructible topology. Parts (3) and (4) follow formally from (1) and (2) and the fact that taking inverse images of subsets commutes with taking unions and intersections.

0A31 Lemma 5.23.7. Let $W$ be a subset of a spectral space $X$. The following are equivalent:
(1) $W$ is an intersection of constructible sets and closed under generalizations,
(2) $W$ is quasi-compact and closed under generalizations,
(3) there exists a quasi-compact subset $E \subset X$ such that $W$ is the set of points specializing to $E$,
(4) $W$ is an intersection of quasi-compact open subsets,

0 (5) there exists a nonempty set I and quasi-compact opens $U_{i} \subset X, i \in I$ such that $W=\bigcap U_{i}$ and for all $i, j \in I$ there exists a $k \in I$ with $U_{k} \subset U_{i} \cap U_{j}$.
In this case we have (a) $W$ is a spectral space, (b) $W=\lim U_{i}$ as topological spaces, and (c) for any open $U$ containing $W$ there exists an $i$ with $U_{i} \subset U$.

Proof. Let $E \subset X$ satisfy (1). Then $E$ is closed in the constructible topology, hence quasi-compact in the constructible topology (by Lemmas 5.22 .2 and 5.11.3), hence quasi-compact in the topology of $X$ (because opens in $X$ are open in the constructible topology). Thus (2) holds.

It is clear that (2) implies (3) by taking $E=W$.
Let $X$ be a spectral space and let $E \subset W$ be as in (3). Since every point of $W$ specializes to a point of $E$ we see that an open of $W$ which contains $E$ is equal to $W$. Hence since $E$ is quasi-compact, so is $W$. If $x \in X, x \notin W$, then $Z=\overline{\{x\}}$ is disjoint from $W$. Since $W$ is quasi-compact we can find a quasi-compact open $U$ with $W \subset U$ and $U \cap Z=\emptyset$. We conclude that (4) holds.

If $W=\bigcap_{j \in J} U_{j}$ then setting $I$ equal to the set of finite subsets of $J$ and $U_{i}=$ $U_{j_{1}} \cap \ldots \cap U_{j_{r}}$ for $i=\left\{j_{1}, \ldots, j_{r}\right\}$ shows that (4) implies (5). It is immediate that (5) implies (1).

Let $I$ and $U_{i}$ be as in (5). Since $W=\bigcap U_{i}$ we have $W=\lim U_{i}$ by the universal property of limits. Then $W$ is a spectral space by Lemma 5.23.5. Let $U \subset X$ be an open neighbourhood of $W$. Then $E_{i}=U_{i} \cap(X \backslash U)$ is a family of constructible subsets of the spectral space $Z=X \backslash U$ with empty intersection. Using that the spectral topology on $Z$ is quasi-compact (Lemma 5.22.2) we conclude from Lemma 5.11.6 that $E_{i}=\emptyset$ for some $i$.

0AP0 Lemma 5.23.8. Let $X$ be a spectral space. Let $E \subset X$ be a constructible subset. Let $W \subset X$ be the set of points of $X$ which specialize to a point of $E$. Then $W \backslash E$ is a spectral space. If $W=\bigcap U_{i}$ with $U_{i}$ as in Lemma 5.23.7 (5) then $W \backslash E=\lim \left(U_{i} \backslash E\right)$.

Proof. Since $E$ is constructible, it is quasi-compact and hence Lemma 5.23 .7 applies to $W$. If $E$ is constructible, then $E$ is constructible in $U_{i}$ for all $i \in I$. Hence $U_{i} \backslash E$ is spectral by Lemma 5.22.4. Since $W \backslash E=\bigcap\left(U_{i} \backslash E\right)$ we have $W \backslash E=\lim U_{i} \backslash E$ by the universal property of limits. Then $W \backslash E$ is a spectral space by Lemma 5.23.5.

### 5.24. Stone-Čech compactification

0908 The Stone-Čech compactification of a topological space $X$ is a map $X \rightarrow \beta(X)$ from $X$ to a Hausdorff quasi-compact space $\beta(X)$ which is universal for such maps. We prove this exists by a standard argument using the following simple lemma.

0909 Lemma 5.24.1. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume that $f(X)$ is dense in $Y$ and that $Y$ is Hausdorff. Then the cardinality of $Y$ is at most the cardinality of $P(P(X))$ where $P$ is the power set operation.

Proof. Let $S=f(X) \subset Y$. Let $\mathcal{D}$ be the set of all closed domains of $Y$, i.e., subsets $D \subset Y$ which equal the closure of its interior. Note that the closure of an open subset of $Y$ is a closed domain. For $y \in Y$ consider the set

$$
I_{y}=\{T \subset S \mid \text { there exists } D \in \mathcal{D} \text { with } T=S \cap D \text { and } y \in D\}
$$

Since $S$ is dense in $Y$ for every closed domain $D$ we see that $S \cap D$ is dense in $D$. Hence, if $D \cap S=D^{\prime} \cap S$ for $D, D^{\prime} \in \mathcal{D}$, then $D=D^{\prime}$. Thus $I_{y}=I_{y^{\prime}}$ implies that $y=y^{\prime}$ because the Hausdorff condition assures us that we can find a closed domain containing $y$ but not $y^{\prime}$. The result follows.

Let $X$ be a topological space. By Lemma 5.24.1, there is a set $I$ of isomorphism classes of continuous maps $f: X \rightarrow Y$ which have dense image and where $Y$ is Hausdorff and quasi-compact. For $i \in I$ choose a representative $f_{i}: X \rightarrow Y_{i}$. Consider the map

$$
\prod f_{i}: X \longrightarrow \prod_{i \in I} Y_{i}
$$

and denote $\beta(X)$ the closure of the image. Since each $Y_{i}$ is Hausdorff, so is $\beta(X)$. Since each $Y_{i}$ is quasi-compact, so is $\beta(X)$ (use Theorem 5.13.4 and Lemma 5.11.3).

Let us show the canonical map $X \rightarrow \beta(X)$ satisfies the universal property with respect to maps to Hausdorff, quasi-compact spaces. Namely, let $f: X \rightarrow Y$ be such a morphism. Let $Z \subset Y$ be the closure of $f(X)$. Then $X \rightarrow Z$ is isomorphic to one of the maps $f_{i}: X \rightarrow Y_{i}$, say $f_{i_{0}}: X \rightarrow Y_{i_{0}}$. Thus $f$ factors as $X \rightarrow \beta(X) \rightarrow$ $\prod Y_{i} \rightarrow Y_{i_{0}} \cong Z \rightarrow Y$ as desired.

090A Lemma 5.24.2. Let $X$ be a Hausdorff, locally quasi-compact space. There exists a map $X \rightarrow X^{*}$ which identifies $X$ as an open subspace of a quasi-compact Hausdorff space $X^{*}$ such that $X^{*} \backslash X$ is a singleton (one point compactification). In particular, the map $X \rightarrow \beta(X)$ identifies $X$ with an open subspace of $\beta(X)$.

Proof. Set $X^{*}=X \amalg\{\infty\}$. We declare a subset $V$ of $X^{*}$ to be open if either $V \subset X$ is open in $X$, or $\infty \in V$ and $U=V \cap X$ is an open of $X$ such that $X \backslash U$ is quasi-compact. We omit the verification that this defines a topology. It is clear that $X \rightarrow X^{*}$ identifies $X$ with an open subspace of $X$.

Since $X$ is locally quasi-compact, every point $x \in X$ has a quasi-compact neighbourhood $x \in E \subset X$. Then $E$ is closed (Lemma 5.11.3) and $V=(X \backslash E) \amalg\{\infty\}$ is an open neighbourhood of $\infty$ disjoint from the interior of $E$. Thus $X^{*}$ is Hausdorff.
Let $X^{*}=\bigcup V_{i}$ be an open covering. Then for some $i$, say $i_{0}$, we have $\infty \in V_{i_{0}}$. By construction $Z=X^{*} \backslash V_{i_{0}}$ is quasi-compact. Hence the covering $Z \subset \bigcup_{i \neq i_{0}} Z \cap V_{i}$ has a finite refinement which implies that the given covering of $X^{*}$ has a finite refinement. Thus $X^{*}$ is quasi-compact.

The map $X \rightarrow X^{*}$ factors as $X \rightarrow \beta(X) \rightarrow X^{*}$ by the universal property of the Stone-Čech compactification. Let $\varphi: \beta(X) \rightarrow X^{*}$ be this factorization. Then $X \rightarrow \varphi^{-1}(X)$ is a section to $\varphi^{-1}(X) \rightarrow X$ hence has closed image (Lemma 5.3.3). Since the image of $X \rightarrow \beta(X)$ is dense we conclude that $X=\varphi^{-1}(X)$.

### 5.25. Extremally disconnected spaces

08 YH The material in this section is taken from Gle58 (with a slight modification as in Rai59). In Gleason's paper it is shown that in the category of quasi-compact Hausdorff spaces, the "projective objects" are exactly the extremally disconnected spaces.

08YI Definition 5.25.1. A topological space $X$ is called extremally disconnected if the closure of every open subset of $X$ is open.

If $X$ is Hausdorff and extremally disconnected, then $X$ is totally disconnected (this isn't true in general). If $X$ is quasi-compact, Hausdorff, and extremally disconnected, then $X$ is profinite by Lemma 5.21 .2 , but the converse does not holds in general. Namely, Gleason shows that in an extremally disconnected Hausdorff space $X$ a convergent sequence $x_{1}, x_{2}, x_{3}, \ldots$ is eventually constant. Hence for example the $p$-adic integers $\mathbf{Z}_{p}=\lim \mathbf{Z} / p^{n} \mathbf{Z}$ is a profinite space which is not extremally disconnected.

08YJ Lemma 5.25.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume $f$ is surjective and $f(E) \neq Y$ for all proper closed subsets $E \subset X$. Then for $U \subset X$ open the subset $f(U)$ is contained in the closure of $Y \backslash f(X \backslash U)$.

Proof. Pick $y \in f(U)$ and let $V \subset Y$ be any open neighbourhood of $y$. We will show that $V$ intersects $Y \backslash f(X \backslash U)$. Note that $W=U \cap f^{-1}(V)$ is a nonempty open subset of $X$, hence $f(X \backslash W) \neq Y$. Take $y^{\prime} \in Y, y^{\prime} \notin f(X \backslash W)$. It is elementary to show that $y^{\prime} \in V$ and $y^{\prime} \in Y \backslash f(X \backslash U)$.

08 YK Lemma 5.25.3. Let $X$ be an extremally disconnected space. If $U, V \subset X$ are disjoint open subsets, then $\bar{U}$ and $\bar{V}$ are disjoint too.

Proof. By assumption $\bar{U}$ is open, hence $V \cap \bar{U}$ is open and disjoint from $U$, hence empty because $\bar{U}$ is the intersection of all the closed subsets of $X$ containing $U$. This means the open $\bar{V} \cap \bar{U}$ avoids $V$ hence is empty by the same argument.
08YL Lemma 5.25.4. Let $f: X \rightarrow Y$ be a continuous map of Hausdorff quasi-compact topological spaces. If $Y$ is extremally disconnected, $f$ is surjective, and $f(Z) \neq Y$ for every proper closed subset $Z$ of $X$, then $f$ is a homeomorphism.

Proof. By Lemma 5.16.8 it suffices to show that $f$ is injective. Suppose that $x, x^{\prime} \in$ $X$ are distinct points with $y=f(x)=f\left(x^{\prime}\right)$. Choose disjoint open neighbourhoods $U, U^{\prime} \subset X$ of $x, x^{\prime}$. Observe that $f$ is closed (Lemma 5.16.7) hence $T=f(X \backslash U)$ and $T^{\prime}=f\left(X \backslash U^{\prime}\right)$ are closed in $Y$. Since $X$ is the union of $X \backslash U$ and $X \backslash U^{\prime}$ we see that $Y=T \cup T^{\prime}$. By Lemma 5.25.2 we see that $y$ is contained in the closure of $Y \backslash T$ and the closure of $Y \backslash T^{\prime}$. On the other hand, by Lemma 5.25.3, this intersection is empty. In this way we obtain the desired contradiction.

08YM Lemma 5.25.5. Let $f: X \rightarrow Y$ be a continuous surjective map of Hausdorff quasi-compact topological spaces. There exists a quasi-compact subset $E \subset X$ such that $f(E)=Y$ but $f\left(E^{\prime}\right) \neq Y$ for all proper closed subsets $E^{\prime} \subset E$.

Proof. We will use without further mention that the quasi-compact subsets of $X$ are exactly the closed subsets (Lemma 5.11.5). Consider the collection $\mathcal{E}$ of all quasi-compact subsets $E \subset X$ with $f(E)=Y$ ordered by inclusion. We will use Zorn's lemma to show that $\mathcal{E}$ has a minimal element. To do this it suffices to show that given a totally ordered family $E_{\lambda}$ of elements of $\mathcal{E}$ the intersection $\bigcap E_{\lambda}$ is an element of $\mathcal{E}$. It is quasi-compact as it is closed. For every $y \in Y$ the sets $E_{\lambda} \cap f^{-1}(\{y\})$ are nonempty and closed, hence the intersection $\bigcap E_{\lambda} \cap f^{-1}(\{y\})=$ $\bigcap\left(E_{\lambda} \cap f^{-1}(\{y\})\right)$ is nonempty by Lemma 5.11.6. This finishes the proof.
08YN Proposition 5.25.6. Let $X$ be a Hausdorff, quasi-compact topological space. The following are equivalent
(1) $X$ is extremally disconnected,
(2) for any surjective continuous map $f: Y \rightarrow X$ with $Y$ Hausdorff quasicompact there exists a continuous section, and
(3) for any solid commutative diagram

of continuous maps of quasi-compact Hausdorff spaces with $Y \rightarrow Z$ surjective, there is a dotted arrow in the category of topological spaces making the diagram commute.

Proof. It is clear that (3) implies (2). On the other hand, if (2) holds and $X \rightarrow Z$ and $Y \rightarrow Z$ are as in (3), then (2) assures there is a section to the projection $X \times{ }_{Z} Y \rightarrow X$ which implies a suitable dotted arrow exists (details omitted). Thus (3) is equivalent to (2).

Assume $X$ is extremally disconnected and let $f: Y \rightarrow X$ be as in (2). By Lemma 5.25 .5 there exists a quasi-compact subset $E \subset Y$ such that $f(E)=X$ but $f\left(E^{\prime}\right) \neq$ $X$ for all proper closed subsets $E^{\prime} \subset E$. By Lemma 5.25 .4 we find that $\left.f\right|_{E}: E \rightarrow X$ is a homeomorphism, the inverse of which gives the desired section.
Assume (2). Let $U \subset X$ be open with complement $Z$. Consider the continuous surjection $f: \bar{U} \amalg Z \rightarrow X$. Let $\sigma$ be a section. Then $\bar{U}=\sigma^{-1}(\bar{U})$ is open. Thus $X$ is extremally disconnected.

090B Lemma 5.25.7. Let $f: X \rightarrow X$ be a continuous selfmap of a Hausdorff topological space. If $f$ is not $i d_{X}$, then there exists a proper closed subset $E \subset X$ such that $X=E \cup f(E)$.

Proof. Pick $p \in X$ with $f(p) \neq p$. Choose disjoint open neighbourhoods $p \in U$, $f(p) \in V$ and set $E=X \backslash U \cap f^{-1}(V)$.

090C Example 5.25.8. We can use Proposition 5.25 .6 to see that the Stone-Čech compactification $\beta(X)$ of a discrete space $X$ is extremally disconnected. Namely, let $f: Y \rightarrow \beta(X)$ be a continuous surjection where $Y$ is quasi-compact and Hausdorff. Then we can lift the map $X \rightarrow \beta(X)$ to a continuous (!) map $X \rightarrow Y$ as $X$ is discrete. By the universal property of the Stone-Čech compactification we see that we obtain a factorization $X \rightarrow \beta(X) \rightarrow Y$. Since $\beta(X) \rightarrow Y \rightarrow \beta(X)$ equals the identity on the dense subset $X$ we conclude that we get a section. In
particular, we conclude that the Stone-Čech compactification of a discrete space is totally disconnected, whence profinite (see discussion following Definition 5.25.1 and Lemma 5.21.2).
Using the supply of extremally disconnected spaces given by Example 5.25 .8 we can prove that every quasi-compact Hausdorff space has a "projective cover" in the category of quasi-compact Hausdorff spaces.

090D Lemma 5.25.9. Let $X$ be a quasi-compact Hausdorff space. There exists a continuous surjection $X^{\prime} \rightarrow X$ with $X^{\prime}$ quasi-compact, Hausdorff, and extremally disconnected. If we require that every proper closed subset of $X^{\prime}$ does not map onto $X$, then $X^{\prime}$ is unique up to isomorphism.

Proof. Let $Y=X$ but endowed with the discrete topology. Let $X^{\prime}=\beta(Y)$. The continuous map $Y \rightarrow X$ factors as $Y \rightarrow X^{\prime} \rightarrow X$. This proves the first statement of the lemma by Example 5.25 .8 .
By Lemma 5.25 .5 we can find a quasi-compact subset $E \subset X^{\prime}$ such that no proper closed subset of $E$ surjects onto $X$. Because $X^{\prime}$ is extremally disconnected there exists a continuous map $f: X^{\prime} \rightarrow E$ over $X$ (Proposition 5.25.6). Composing $f$ with the map $E \rightarrow X^{\prime}$ gives a continuous selfmap $\left.f\right|_{E}: E \rightarrow E$. This map has to be $\mathrm{id}_{E}$ as otherwise Lemma 5.25 .7 shows that $E$ isn't minimal. Thus the $\mathrm{id}_{E}$ factors through the extremally disconnected space $X^{\prime}$. A formal, categorical argument (using the characterization of Proposition 5.25.6) shows that $E$ is extremally disconnected.
To prove uniqueness, suppose we have a second $X^{\prime \prime} \rightarrow X$ minimal cover. By the lifting property proven in Proposition 5.25 .6 we can find a continuous map $g: X^{\prime} \rightarrow X^{\prime \prime}$ over $X$. Observe that $g$ is a closed map (Lemma 5.16.7). Hence $g\left(X^{\prime}\right) \subset X^{\prime \prime}$ is a closed subset surjecting onto $X$ and we conclude $g\left(X^{\prime}\right)=X^{\prime \prime}$ by minimality of $X^{\prime \prime}$. On the other hand, if $E \subset X^{\prime}$ is a proper closed subset, then $g(E) \neq X^{\prime \prime}$ as $E$ does not map onto $X$ by minimality of $X^{\prime}$. By Lemma 5.25.4 we see that $g$ is an isomorphism.

090E Remark 5.25.10. Let $X$ be a quasi-compact Hausdorff space. Let $\kappa$ be an infinite cardinal bigger or equal than the cardinality of $X$. Then the cardinality of the minimal quasi-compact, Hausdorff, extremally disconnected cover $X^{\prime} \rightarrow X$ (Lemma 5.25.9) is at most $2^{2^{\kappa}}$. Namely, choose a subset $S \subset X^{\prime}$ mapping bijectively to $X$. By minimality of $X^{\prime}$ the set $S$ is dense in $X^{\prime}$. Thus $\left|X^{\prime}\right| \leq 2^{2^{\kappa}}$ by Lemma 5.24.1.

### 5.26. Miscellany

0067 The following lemma applies to the underlying topological space associated to a quasi-separated scheme.

0069 Lemma 5.26.1. Let $X$ be a topological space which
(1) has a basis of the topology consisting of quasi-compact opens, and
(2) has the property that the intersection of any two quasi-compact opens is quasi-compact.
Then
(1) $X$ is locally quasi-compact,
(2) a quasi-compact open $U \subset X$ is retrocompact,
(3) any quasi-compact open $U \subset X$ has a cofinal system of open coverings $\mathcal{U}: U=\bigcup_{j \in J} U_{j}$ with $J$ finite and all $U_{j}$ and $U_{j} \cap U_{j^{\prime}}$ quasi-compact,
(4) add more here.

Proof. Omitted.
06RM Definition 5.26.2. Let $X$ be a topological space. We say $x \in X$ is an isolated point of $X$ if $\{x\}$ is open in $X$.

### 5.27. Partitions and stratifications

09XY Stratifications can be defined in many different ways. We welcome comments on the choice of definitions in this section.

09XZ Definition 5.27.1. Let $X$ be a topological space. A partition of $X$ is a decomposition $X=\coprod X_{i}$ into locally closed subsets $X_{i}$. The $X_{i}$ are called the parts of the partition. Given two partitions of $X$ we say one refines the other if the parts of one are unions of parts of the other.

Any topological space $X$ has a partition into connected components. If $X$ has finitely many irreducible components $Z_{1}, \ldots, Z_{r}$, then there is a partition with parts $X_{I}=\bigcap_{i \in I} Z_{i} \backslash\left(\bigcup_{i \notin I} Z_{i}\right)$ whose indices are subsets $I \subset\{1, \ldots, r\}$ which refines the partition into connected components.

09 Y 0 Definition 5.27.2. Let $X$ be a topological space. A good stratification of $X$ is a partition $X=\coprod X_{i}$ such that for all $i, j \in I$ we have

$$
X_{i} \cap \overline{X_{j}} \neq \emptyset \Rightarrow X_{i} \subset \overline{X_{j}}
$$

Given a good stratification $X=\coprod_{i \in I} X_{i}$ we obtain a partial ordering on $I$ by setting $i \leq j$ if and only if $X_{i} \subset \overline{X_{j}}$. Then we see that

$$
\overline{X_{j}}=\bigcup_{i \leq j} X_{i}
$$

However, what often happens in algebraic geometry is that one just has that the left hand side is a subset of the right hand side in the last displayed formula. This leads to the following definition.

09Y1 Definition 5.27.3. Let $X$ be a topological space. A stratification of $X$ is given by a partition $X=\coprod_{i \in I} X_{i}$ and a partial ordering on $I$ such that for each $j \in I$ we have

$$
\overline{X_{j}} \subset \bigcup_{i \leq j} X_{i}
$$

The parts $X_{i}$ are called the strata of the stratification.
We often impose additional conditions on the stratification. For example, stratifications are particularly nice if they are locally finite, which means that every point has a neighbourhood which meets only finitely many strata. Moreo generally we introduce the following definition.

0BDS Definition 5.27.4. Let $X$ be a topological space. Let $I$ be a set and for $i \in I$ let $E_{i} \subset X$ be a subset. We say the collection $\left\{E_{i}\right\}_{i \in I}$ is locally finite if for all $x \in X$ there exists an open neighbourhood $U$ of $x$ such that $\left\{i \in I \mid E_{i} \cap U \neq \emptyset\right\}$ is finite.

09Y2 Remark 5.27.5. Given a locally finite stratification $X=\coprod X_{i}$ of a topological space $X$, we obtain a family of closed subsets $Z_{i}=\bigcup_{j \leq i} X_{j}$ of $X$ indexed by $I$ such that

$$
Z_{i} \cap Z_{j}=\bigcup_{k \leq i, j} Z_{k}
$$

Conversely, given closed subsets $Z_{i} \subset X$ indexed by a partially ordered set $I$ such that $X=\bigcup Z_{i}$, such that every point has a neighbourhood meeting only finitely many $Z_{i}$, and such that the displayed formula holds, then we obtain a locally finite stratification of $X$ by setting $X_{i}=Z_{i} \backslash \bigcup_{j<i} Z_{j}$.

09Y3 Lemma 5.27.6. Let $X$ be a topological space. Let $X=\coprod X_{i}$ be a finite partition of $X$. Then there exists a finite stratification of $X$ refining it.

Proof. Let $T_{i}=\overline{X_{i}}$ and $\Delta_{i}=T_{i} \backslash X_{i}$. Let $S$ be the set of all intersections of $T_{i}$ and $\Delta_{i}$. (For example $T_{1} \cap T_{2} \cap \Delta_{4}$ is an element of $S$.) Then $S=\left\{Z_{s}\right\}$ is a finite collection of closed subsets of $X$ such that $Z_{s} \cap Z_{s^{\prime}} \in S$ for all $s, s^{\prime} \in S$. Define a partial ordering on $S$ by inclusion. Then set $Y_{s}=Z_{s} \backslash \bigcup_{s^{\prime}<s} Z_{s^{\prime}}$ to get the desired stratification.

09Y4 Lemma 5.27.7. Let $X$ be a topological space. Suppose $X=T_{1} \cup \ldots \cup T_{n}$ is written as a union of constructible subsets. There exists a finite stratification $X=\coprod X_{i}$ with each $X_{i}$ constructible such that each $T_{k}$ is a union of strata.

Proof. By definition of constructible subsets, we can write each $T_{i}$ as a finite union of $U \cap V^{c}$ with $U, V \subset X$ retrocompact open. Hence we may assume that $T_{i}=$ $U_{i} \cap V_{i}^{c}$ with $U_{i}, V_{i} \subset X$ retrocompact open. Let $S$ be the finite set of closed subsets of $X$ consisting of $\emptyset, X, U_{i}^{c}, V_{i}^{c}$ and finite intersections of these. Write $S=\left\{Z_{s}\right\}$. If $s \in S$, then $Z_{s}$ is constructible (Lemma 5.14.2). Moreover, $Z_{s} \cap Z_{s^{\prime}} \in S$ for all $s, s^{\prime} \in S$. Define a partial ordering on $S$ by inclusion. Then set $Y_{s}=Z_{s} \backslash \bigcup_{s^{\prime}<s} Z_{s^{\prime}}$ to get the desired stratification.

09Y5 Lemma 5.27.8. Let $X$ be a Noetherian topological space. Any finite partition of $X$ can be refined by a finite good stratification.

Proof. Let $X=\coprod X_{i}$ be a finite partition of $X$. Let $Z$ be an irreducible component of $X$. Since $X=\bigcup \overline{X_{i}}$ with finite index set, there is an $i$ such that $Z \subset \overline{X_{i}}$. Since $X_{i}$ is locally closed this implies that $Z \cap X_{i}$ contains an open of $Z$. Thus $Z \cap X_{i}$ contains an open $U$ of $X$ (Lemma 5.8.2). Write $X_{i}=U \amalg X_{i}^{1} \amalg X_{i}^{2}$ with $X_{i}^{1}=\left(X_{i} \backslash U\right) \cap \bar{U}$ and $X_{i}^{2}=\left(X_{i} \backslash U\right) \cap \bar{U}^{c}$. For $i^{\prime} \neq i$ we set $X_{i^{\prime}}^{1}=X_{i^{\prime}} \cap \bar{U}$ and $X_{i^{\prime}}^{2}=X_{i^{\prime}} \cap \bar{U}^{c}$. Then

$$
X \backslash U=\coprod X_{l}^{k}
$$

is a partition such that $\bar{U} \backslash U=\bigcup X_{l}^{1}$. Note that $X \backslash U$ is closed and strictly smaller than $X$. By Noetherian induction we can refine this partition by a finite good stratification $X \backslash U=\coprod_{\alpha \in A} T_{\alpha}$. Then $X=U \amalg \coprod_{\alpha \in A} T_{\alpha}$ is a finite good stratification of $X$ refining the partition we started with.

### 5.28. Colimits of spaces

0B1W The category of topological spaces has coproducts. Namely, if $I$ is a set and for $i \in I$ we are given a topological space $X_{i}$ then we endow the set $\coprod_{i \in I} X_{i}$ with the coproduct topology. As a basis for this topology we use sets of the form $U_{i}$ where $U_{i} \subset X_{i}$ is open.

The category of topological spaces has coequalizers. Namely, if $a, b: X \rightarrow Y$ are morphisms of topological spaces, then the equalizer of $a$ and $b$ is the coequalizer $Y / \sim$ in the category of sets endowed with the quotient topology (Section 5.5).
0B1X Lemma 5.28.1. The category of topological spaces has colimits and the forgetful functor to sets commutes with them.

Proof. This follows from the discussion above and Categories, Lemma 4.14.11 Another proof of existence of colimits is sketched in Categories, Remark 4.25.2, It follows from the above that the forgetful functor commutes with colimits. Another way to see this is to use Categories, Lemma 4.24 .4 and use that the forgetful functor has a right adjoint, namely the functor which assigns to a set the corresponding chaotic (or indiscrete) topological space.

### 5.29. Topological groups, rings, modules

0B1Y This is just a short section with definitions and elementary properties.
0B1Z Definition 5.29.1. A topological group is a group $G$ endowed with a topology such that multiplication $G \times G \rightarrow G,(x, y) \mapsto x y$ and inverse $G \rightarrow G, x \mapsto x^{-1}$ are continuous. A homomorphism of topological groups is a homomorphism of groups which is continuous.

If $G$ is a topological group and $H \subset G$ is a subgroup, then $H$ with the induced topology is a topological group. If $G$ is a topological group and $G \rightarrow H$ is a surjection of groups, then $H$ endowed with the quotient topology is a topological group.
0 BMC Example 5.29.2. Let $E$ be a set. We can endow the set of self maps $\operatorname{Map}(E, E)$ with the compact open topology, i.e., the topology such that given $f: E \rightarrow E$ a fundamental system of neighbourhoods of $f$ is given by the sets $U_{S}(f)=\left\{f^{\prime}\right.$ : $\left.E \rightarrow E\left|f^{\prime}\right|_{S}=\left.f\right|_{S}\right\}$ where $S \subset E$ is finite. With this topology the action of $\operatorname{Map}(E, E) \times E \rightarrow E$ and the composition $\operatorname{Map}(E, E) \times \operatorname{Map}(E, E) \rightarrow \operatorname{Map}(E, E)$ are continuous. Finally, if $\operatorname{Aut}(E) \subset \operatorname{Map}(E, E)$ is the subset of invertible maps, then the inverse $i: \operatorname{Aut}(E) \rightarrow \operatorname{Aut}(E), f \mapsto f^{-1}$ is continuous too. Namely, say $S \subset E$ is finite, then $i^{-1}\left(U_{S}\left(f^{-1}\right)\right)=U_{f^{-1}(S)}(f)$. Hence $\operatorname{Aut}(E)$ is a topological group as in Definition 5.29.1.

0B20 Lemma 5.29.3. The category of topological groups has limits and limits commute with the forgetful functors to (a) the category of topological spaces and (b) the category of groups.

Proof. It is enough to prove the existence and commutation for products and equalizers, see Categories, Lemma 4.14.10. Let $G_{i}, i \in I$ be a collection of topological groups. Take the usual product $G=\prod G_{i}$ with the product topology. Since $G \times G=\prod\left(G_{i} \times G_{i}\right)$ as a topological space (because products commutes with products in any category), we see that multiplication on $G$ is continuous. Similarly for the inverse map. Let $a, b: G \rightarrow H$ be two homomorphisms of topological groups. Then as the equalizer we can simply take the equalizer of $a$ and $b$ as maps of topological spaces, which is the same thing as the equalizer as maps of groups endowed with the induced topology.

0BR1 Lemma 5.29.4. Let $G$ be a topological group. The following are equivalent
(1) $G$ as a topological space is profinite,
(2) $G$ is a limit of a diagram of finite discrete topological groups,
(3) $G$ is a cofiltered limit of finite discrete topological groups.

Proof. We have the corresponding result for topological spaces, see Lemma 5.21.2, Combined with Lemma 5.29.3 we see that it suffices to prove that (1) implies (3).
We first prove that every neighbourhood $E$ of the neutral element $e$ contains an open subgroup. Namely, since $G$ is the cofiltered limit of finite discrete topological spaces (Lemma 5.21.2), we can choose a continuous map $f: G \rightarrow T$ to a finite discrete space $T$ such that $f^{-1}(f(\{e\})) \subset E$. Consider

$$
H=\left\{g \in G \mid f\left(g g^{\prime}\right)=f\left(g^{\prime}\right) \text { for all } g^{\prime} \in G\right\}
$$

This is a subgroup of $G$ and contained in $E$. Thus it suffices to show that $H$ is open. Pick $t \in T$ and set $W=f^{-1}(\{t\})$. Observe that $W \subset G$ is open and closed, in particular quasi-compact. For each $w \in W$ there exist open neighbourhoods $e \in U_{w} \subset G$ and $w \in U_{w}^{\prime} \subset W$ such that $U_{w} U_{w}^{\prime} \subset W$. By quasi-compactness we can find $w_{1}, \ldots, w_{n}$ such that $W=\bigcup U_{w_{i}}^{\prime}$. Then $U_{t}=U_{w_{1}} \cap \ldots \cap U_{w_{n}}$ is an open neighbourhood of $e$ such that $f(g w)=t$ for all $w \in W$. Since $T$ is finite we see that $\bigcap_{t \in T} U_{t} \subset H$ is an open neighourhood of $e$. Since $H \subset G$ is a subgroup it follows that $H$ is open.

Suppose that $H \subset G$ is an open subgroup. Since $G$ is quasi-compact we see that the index of $H$ in $G$ is finite. Say $G=H g_{1} \cup \ldots \cup H g_{n}$. Then $N=\bigcap_{i=1, \ldots, n} g_{i} H g_{i}^{-1}$ is an open normal subgroup contained in $H$. Since $N$ also has finite index we see that $G \rightarrow G / N$ is a surjection to a finite discrete topological group.
Consider the map

$$
G \longrightarrow \lim _{N \subset G} \text { open and normal } G / N
$$

We claim that this map is an isomorphism of topological groups. This finishes the proof of the lemma as the limit on the right is cofiltered (the intersection of two open normal subgroups is open and normal). The map is continuous as each $G \rightarrow G / N$ is continuous. The map is injective as $G$ is Hausdorf and every neighbourhood of $e$ contains an $N$ by the arguments above. The map is surjective by Lemma 5.11.6. By Lemma 5.16.8 the map is a homeomorphism.

0BR2 Definition 5.29.5. A topological group is called a profinite group if it satisfies the equivalent conditions of Lemma 5.29 .4
If $G_{1} \rightarrow G_{2} \rightarrow G_{3} \rightarrow \ldots$ is a system of topological groups then the colimit $G=$ $\operatorname{colim} G_{n}$ as a topological group (Lemma 5.29.6) is in general different from the colimit as a topological space (Lemma 5.28.1) even though these have the same underlying set. See Examples, Section 88.65 .

0B21 Lemma 5.29.6. The category of topological groups has colimits and colimits commute with the forgetful functor to the category of groups.
Proof. We will use the argument of Categories, Remark 4.25 .2 to prove existence of colimits. Namely, suppose that $\mathcal{I} \rightarrow T o p, i \mapsto G_{i}$ is a functor into the category Top Group of topological groups. Then we can consider

$$
F: \text { TopGroup } \longrightarrow \text { Sets, } \quad H \longmapsto \lim _{\mathcal{I}} \operatorname{Mor}_{\text {Top Group }}\left(G_{i}, H\right)
$$

This functor commutes with limits. Moreover, given any topological group $H$ and an element $\left(\varphi_{i}: G_{i} \rightarrow H\right)$ of $F(H)$, there is a subgroup $H^{\prime} \subset H$ of cardinality
at most $\left|\amalg G_{i}\right|$ (coproduct in the category of groups, i.e., the free product on the $G_{i}$ ) such that the morphisms $\varphi_{i}$ map into $H^{\prime}$. Namely, we can take the induced topology on the subgroup generated by the images of the $\varphi_{i}$. Thus it is clear that the hypotheses of Categories, Lemma 4.25.1 are satisfied and we find a topological group $G$ representing the functor $F$, which precisely means that $G$ is the colimit of the diagram $i \mapsto G_{i}$.

To see the statement on commutation with the forgetful functor to groups we will use Categories, Lemma 4.24.4. Indeed, the forgetful functor has a right adjoint, namely the functor which assigns to a group the corresponding chaotic (or indiscrete) topological group.

0B22 Definition 5.29.7. A topological ring is a ring $R$ endowed with a topology such that addition $R \times R \rightarrow R,(x, y) \mapsto x+y$ and multiplication $R \times R \rightarrow R,(x, y) \mapsto x y$ are continuous. A homomorphism of topological rings is a homomorphism of rings which is continuous.

In the Stacks project rings are commutative with 1 . If $R$ is a topological ring, then $(R,+)$ is a topological group since $x \mapsto-x$ is continuous. If $R$ is a topological ring and $R^{\prime} \subset R$ is a subring, then $R^{\prime}$ with the induced topology is a topological ring. If $R$ is a topological ring and $R \rightarrow R^{\prime}$ is a surjection of rings, then $R^{\prime}$ endowed with the quotient topology is a topological ring.

0B23 Lemma 5.29.8. The category of topological rings has limits and limits commute with the forgetful functors to (a) the category of topological spaces and (b) the category of rings.

Proof. It is enough to prove the existence and commutation for products and equalizers, see Categories, Lemma 4.14.10. Let $R_{i}, i \in I$ be a collection of topological rings. Take the usual product $R=\prod R_{i}$ with the product topology. Since $R \times R=\prod\left(R_{i} \times R_{i}\right)$ as a topological space (because products commutes with products in any category), we see that addition and multiplication on $R$ are continuous. Let $a, b: R \rightarrow R^{\prime}$ be two homomorphisms of topological rings. Then as the equalizer we can simply take the equalizer of $a$ and $b$ as maps of topological spaces, which is the same thing as the equalizer as maps of rings endowed with the induced topology.

0B24 Lemma 5.29.9. The category of topological rings has colimits and colimits commute with the forgetful functor to the category of rings.

Proof. The exact same argument as used in the proof of Lemma 5.29.6 shows existence of colimits. To see the statement on commutation with the forgetful functor to rings we will use Categories, Lemma 4.24.4. Indeed, the forgetful functor has a right adjoint, namely the functor which assigns to a ring the corresponding chaotic (or indiscrete) topological ring.

0B25 Definition 5.29.10. Let $R$ be a topological ring. A topological module is an $R$ module $M$ endowed with a topology such that addition $M \times M \rightarrow M$ and scalar multiplication $R \times M \rightarrow M$ are continuous. A homomorphism of topological modules is a homomorphism of modules which is continuous.

If $R$ is a topological ring and $M$ is a topological module, then $(M,+)$ is a topological group since $x \mapsto-x$ is continuous. If $R$ is a topological ring, $M$ is a topological
module and $M^{\prime} \subset M$ is a submodule, then $M^{\prime}$ with the induced topology is a topological module. If $R$ is a topological ring, $M$ is a topological module, and $M \rightarrow M^{\prime}$ is a surjection of modules, then $M^{\prime}$ endowed with the quotient topology is a topological module.

0B26 Lemma 5.29.11. Let $R$ be a topological ring. The category of topological modules over $R$ has limits and limits commute with the forgetful functors to (a) the category of topological spaces and (b) the category of $R$-modules.

Proof. It is enough to prove the existence and commutation for products and equalizers, see Categories, Lemma 4.14.10. Let $M_{i}, i \in I$ be a collection of topological modules over $R$. Take the usual product $M=\prod M_{i}$ with the product topology. Since $M \times M=\Pi\left(M_{i} \times M_{i}\right)$ as a topological space (because products commutes with products in any category), we see that addition on $M$ is continuous. Similarly for multiplication $R \times M \rightarrow M$. Let $a, b: M \rightarrow M^{\prime}$ be two homomorphisms of topological modules over $R$. Then as the equalizer we can simply take the equalizer of $a$ and $b$ as maps of topological spaces, which is the same thing as the equalizer as maps of modules endowed with the induced topology.

0B27 Lemma 5.29.12. Let $R$ be a topological ring. The category of topological modules over $R$ has colimits and colimits commute with the forgetful functor to the category of modules over $R$.

Proof. The exact same argument as used in the proof of Lemma 5.29.6 shows existence of colimits. To see the statement on commutation with the forgetful functor to $R$-modules we will use Categories, Lemma 4.24.4. Indeed, the forgetful functor has a right adjoint, namely the functor which assigns to a module the corresponding chaotic (or indiscrete) topological module.

## CHAPTER 6

## Sheaves on Spaces

## 006A

### 6.1. Introduction

006B Basic properties of sheaves on topological spaces will be explained in this document. A reference is God73.
This will be superseded by the discussion of sheaves over sites later in the documents. But perhaps it makes sense to briefly define some of the notions here.

### 6.2. Basic notions

006C The following is a list of basic notions in topology.
(1) Let $X$ be a topological space. The phrase: "Let $U=\bigcup_{i \in I} U_{i}$ be an open covering" means the following: $I$ is a set and for each $i \in I$ we are given an open subset $U_{i} \subset X$ such that $U$ is the union of the $U_{i}$. It is allowed to have $I=\emptyset$ in which case there are no $U_{i}$ and $U=\emptyset$. It is also allowed, in case $I \neq \emptyset$ to have any or all of the $U_{i}$ be empty.
(2) etc, etc.

### 6.3. Presheaves

006D
006E Definition 6.3.1. Let $X$ be a topological space.
(1) A presheaf $\mathcal{F}$ of sets on $X$ is a rule which assigns to each open $U \subset X$ a set $\mathcal{F}(U)$ and to each inclusion $V \subset U$ a map $\rho_{V}^{U}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ such that $\rho_{U}^{U}=\operatorname{id}_{\mathcal{F}(U)}$ and whenever $W \subset V \subset U$ we have $\rho_{W}^{U}=\rho_{W}^{V} \circ \rho_{V}^{U}$.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on $X$ is a rule which assigns to each open $U \subset X$ a map of sets $\varphi: \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ compatible with restriction maps, i.e., whenever $V \subset U \subset X$ are open the diagram

commutes.
(3) The category of presheaves of sets on $X$ will be denoted $\operatorname{PSh}(X)$.

The elements of the set $\mathcal{F}(U)$ are called the sections of $\mathcal{F}$ over $U$. For every $V \subset U$ the $\operatorname{map} \rho_{V}^{U}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is called the restriction map. We will use the notation $\left.s\right|_{V}:=\rho_{V}^{U}(s)$ if $s \in \mathcal{F}(U)$. This notation is consistent with the notion of restriction
of functions from topology because if $W \subset V \subset U$ and $s$ is a section of $\mathcal{F}$ over $U$ then $\left.s\right|_{W}=\left.\left(\left.s\right|_{V}\right)\right|_{W}$ by the property of the restriction maps expressed in the definition above.

Another notation that is often used is to indicate sections over an open $U$ by the symbol $\Gamma(U,-)$ or by $H^{0}(U,-)$. In other words, the following equalities are tautological

$$
\Gamma(U, \mathcal{F})=\mathcal{F}(U)=H^{0}(U, \mathcal{F})
$$

In this chapter we will not use this notation, but in others we will.
006F Definition 6.3.2. Let $X$ be a topological space. Let $A$ be a set. The constant presheaf with value $A$ is the presheaf that assigns the set $A$ to every open $U \subset X$, and such that all restriction mappings are $\mathrm{id}_{A}$.

### 6.4. Abelian presheaves

006 G In this section we briefly point out some features of the category of presheaves that allow one to define presheaves of abelian groups.

006H Example 6.4.1. Let $X$ be a topological space $X$. Consider a rule $\mathcal{F}$ that associates to every open subset a singleton set. Since every set has a unique map into a singleton set, there exist unique restriction maps $\rho_{V}^{U}$. The resulting structure is a presheaf of sets. It is a final object in the category of presheaves of sets, by the property of singleton sets mentioned above. Hence it is also unique up to unique isomorphism. We will sometimes write $*$ for this presheaf.

006I Lemma 6.4.2. Let $X$ be a topological space. The category of presheaves of sets on $X$ has products (see Categories, Definition 4.14.5). Moreover, the set of sections of the product $\mathcal{F} \times \mathcal{G}$ over an open $U$ is the product of the sets of sections of $\mathcal{F}$ and $\mathcal{G}$ over $U$.

Proof. Namely, suppose $\mathcal{F}$ and $\mathcal{G}$ are presheaves of sets on the topological space $X$. Consider the rule $U \mapsto \mathcal{F}(U) \times \mathcal{G}(U)$, denoted $\mathcal{F} \times \mathcal{G}$. If $V \subset U \subset X$ are open then define the restriction mapping

$$
(\mathcal{F} \times \mathcal{G})(U) \longrightarrow(\mathcal{F} \times \mathcal{G})(V)
$$

by mapping $(s, t) \mapsto\left(\left.s\right|_{V},\left.t\right|_{V}\right)$. Then it is immediately clear that $\mathcal{F} \times \mathcal{G}$ is a presheaf. Also, there are projection maps $p: \mathcal{F} \times \mathcal{G} \rightarrow \mathcal{F}$ and $q: \mathcal{F} \times \mathcal{G} \rightarrow \mathcal{G}$. We leave it to the reader to show that for any third presheaf $\mathcal{H}$ we have $\operatorname{Mor}(\mathcal{H}, \mathcal{F} \times \mathcal{G})=$ $\operatorname{Mor}(\mathcal{H}, \mathcal{F}) \times \operatorname{Mor}(\mathcal{H}, \mathcal{G})$.

Recall that if $(A,+: A \times A \rightarrow A,-: A \rightarrow A, 0 \in A)$ is an abelian group, then the zero and the negation maps are uniquely determined by the addition law. In other words, it makes sense to say "let $(A,+)$ be an abelian group".

006J Lemma 6.4.3. Let $X$ be a topological space. Let $\mathcal{F}$ be a presheaf of sets. Consider the following types of structure on $\mathcal{F}$ :
(1) For every open $U$ the structure of an abelian group on $\mathcal{F}(U)$ such that all restriction maps are abelian group homomorphisms.
(2) A map of presheaves $+: \mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$, a map of presheaves $-: \mathcal{F} \rightarrow \mathcal{F}$ and a map $0: * \rightarrow \mathcal{F}$ (see Example 6.4.1) satisfying all the axioms of,,+- 0 in a usual abelian group.
(3) A map of presheaves $+: \mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$, a map of presheaves $-: \mathcal{F} \rightarrow \mathcal{F}$ and a map $0: * \rightarrow \mathcal{F}$ such that for each open $U \subset X$ the quadruple $(\mathcal{F}(U),+,-, 0)$ is an abelian group,
(4) A map of presheaves $+: \mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ such that for every open $U \subset X$ the map $+: \mathcal{F}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ defines the structure of an abelian group. There are natural bijections between the collections of types of data (1) - (4) above.

Proof. Omitted.
The lemma says that to give an abelian group object $\mathcal{F}$ in the category of presheaves is the same as giving a presheaf of sets $\mathcal{F}$ such that all the sets $\mathcal{F}(U)$ are endowed with the structure of an abelian group and such that all the restriction mappings are group homomorphisms. For most algebra structures we will take this approach to (pre)sheaves of such objects, i.e., we will define a (pre)sheaf of such objects to be a (pre)sheaf $\mathcal{F}$ of sets all of whose sets of sections $\mathcal{F}(U)$ are endowed with this structure compatibly with the restriction mappings.

006 K Definition 6.4.4. Let $X$ be a topological space.
(1) A presheaf of abelian groups on $X$ or an abelian presheaf over $X$ is a presheaf of sets $\mathcal{F}$ such that for each open $U \subset X$ the set $\mathcal{F}(U)$ is endowed with the structure of an abelian group, and such that all restriction maps $\rho_{V}^{U}$ are homomorphisms of abelian groups, see Lemma 6.4.3 above.
(2) A morphism of abelian presheaves over $X \varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets which induces a homomorphism of abelian groups $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ for every open $U \subset X$.
(3) The category of presheaves of abelian groups on $X$ is denoted $\operatorname{PAb}(X)$.

006L Example 6.4.5. Let $X$ be a topological space. For each $x \in X$ suppose given an abelian group $M_{x}$. For $U \subset X$ open we set

$$
\mathcal{F}(U)=\bigoplus_{x \in U} M_{x}
$$

We denote a typical element in this abelian group by $\sum_{i=1}^{n} m_{x_{i}}$, where $x_{i} \in U$ and $m_{x_{i}} \in M_{x_{i}}$. (Of course we may always choose our representation such that $x_{1}, \ldots, x_{n}$ are pairwise distinct.) We define for $V \subset U \subset X$ open a restriction mapping $\mathcal{F}(U) \rightarrow \mathcal{F}(V)$ by mapping an element $s=\sum_{i=1}^{n} m_{x_{i}}$ to the element $\left.s\right|_{V}=\sum_{x_{i} \in V} m_{x_{i}}$. We leave it to the reader to verify that this is a presheaf of abelian groups.

### 6.5. Presheaves of algebraic structures

006 M Let us clarify the definition of presheaves of algebraic structures. Suppose that $\mathcal{C}$ is a category and that $F: \mathcal{C} \rightarrow$ Sets is a faithful functor. Typically $F$ is a "forgetful" functor. For an object $M \in \operatorname{Ob}(\mathcal{C})$ we often call $F(M)$ the underlying set of the object $M$. If $M \rightarrow M^{\prime}$ is a morphism in $\mathcal{C}$ we call $F(M) \rightarrow F\left(M^{\prime}\right)$ the underlying map of sets. In fact, we will often not distinguish between an object and its underlying set, and similarly for morphisms. So we will say a map of sets $F(M) \rightarrow F\left(M^{\prime}\right)$ is a morphism of algebraic structures, if it is equal to $F(f)$ for some morphism $f: M \rightarrow M^{\prime}$ in $\mathcal{C}$.
In analogy with Definition 6.4.4 above a "presheaf of objects of $\mathcal{C}$ " could be defined by the following data:
(1) a presheaf of sets $\mathcal{F}$, and
(2) for every open $U \subset X$ a choice of an object $A(U) \in \operatorname{Ob}(\mathcal{C})$
subject to the following conditions (using the phraseology above)
(1) for every open $U \subset X$ the set $\mathcal{F}(U)$ is the underlying set of $A(U)$, and
(2) for every $V \subset U \subset X$ open the map of sets $\rho_{V}^{U}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is a morphism of algebraic structures.
In other words, for every $V \subset U$ open in $X$ the restriction mappings $\rho_{V}^{U}$ is the image $F\left(\alpha_{V}^{U}\right)$ for some unique morphism $\alpha_{V}^{U}: A(U) \rightarrow A(V)$ in the category $\mathcal{C}$. The uniqueness is forced by the condition that $F$ is faithful; it also implies that $\alpha_{W}^{U}=\alpha_{W}^{V} \circ \alpha_{V}^{U}$ whenever $W \subset V \subset U$ are open in $X$. The system $\left(A(-), \alpha_{V}^{U}\right)$ is what we will define as a presheaf with values in $\mathcal{C}$ on $X$, compare Sites, Definition 7.2.2. We recover our presheaf of sets $\left(\mathcal{F}, \rho_{V}^{U}\right)$ via the rules $\mathcal{F}(U)=F(A(U))$ and $\rho_{V}^{U}=F\left(\alpha_{V}^{U}\right)$.
006N Definition 6.5.1. Let $X$ be a topological space. Let $\mathcal{C}$ be a category.
(1) A presheaf $\mathcal{F}$ on $X$ with values in $\mathcal{C}$ is given by a rule which assigns to every open $U \subset X$ an object $\mathcal{F}(U)$ of $\mathcal{C}$ and to each inclusion $V \subset U$ a morphism $\rho_{V}^{U}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ in $\mathcal{C}$ such that whenever $W \subset V \subset U$ we have $\rho_{W}^{U}=\rho_{W}^{V} \circ \rho_{V}^{U}$.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with value in $\mathcal{C}$ is given by a morphism $\varphi: \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ in $\mathcal{C}$ compatible with restriction morphisms.
006 Definition 6.5.2. Let $X$ be a topological space. Let $\mathcal{C}$ be a category. Let $F$ : $\mathcal{C} \rightarrow$ Sets be a faithful functor. Let $\mathcal{F}$ be a presheaf on $X$ with values in $\mathcal{C}$. The presheaf of sets $U \mapsto F(\mathcal{F}(U))$ is called the underlying presheaf of sets of $\mathcal{F}$.
It is customary to use the same letter $\mathcal{F}$ to denote the underlying presheaf of sets, and this makes sense according to our discussion preceding Definition 6.5.1. In particular, the phrase "let $s \in \mathcal{F}(U)$ " or "let $s$ be a section of $\mathcal{F}$ over $U$ " signifies that $s \in F(\mathcal{F}(U))$.
This notation and these definitions apply in particular to: Presheaves of (not necessarily abelian) groups, rings, modules over a fixed ring, vector spaces over a fixed field, etc and morphisms between these.

### 6.6. Presheaves of modules

006 P Suppose that $\mathcal{O}$ is a presheaf of rings on $X$. We would like to define the notion of a presheaf of $\mathcal{O}$-modules over $X$. In analogy with Definition 6.4.4 we are tempted to define this as a sheaf of sets $\mathcal{F}$ such that for every open $U \subset X$ the set $\mathcal{F}(U)$ is endowed with the structure of an $\mathcal{O}(U)$-module compatible with restriction mappings (of $\mathcal{F}$ and $\mathcal{O}$ ). However, it is customary (and equivalent) to define it as in the following definition.
006Q Definition 6.6.1. Let $X$ be a topological space, and let $\mathcal{O}$ be a presheaf of rings on $X$.
(1) A presheaf of $\mathcal{O}$-modules is given by an abelian presheaf $\mathcal{F}$ together with a map of presheaves of sets

$$
\mathcal{O} \times \mathcal{F} \longrightarrow \mathcal{F}
$$

such that for every open $U \subset X$ the $\operatorname{map} \mathcal{O}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ defines the structure of an $\mathcal{O}(U)$-module structure on the abelian group $\mathcal{F}(U)$.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of $\mathcal{O}$-modules is a morphism of abelian presheaves $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ such that the diagram

commutes.
(3) The set of $\mathcal{O}$-module morphisms as above is denoted $\operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$.
(4) The category of presheaves of $\mathcal{O}$-modules is denoted $\operatorname{PMod}(\mathcal{O})$.

Suppose that $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ is a morphism of presheaves of rings on $X$. In this case, if $\mathcal{F}$ is a presheaf of $\mathcal{O}_{2}$-modules then we can think of $\mathcal{F}$ as a presheaf of $\mathcal{O}_{1}$-modules by using the composition

$$
\mathcal{O}_{1} \times \mathcal{F} \rightarrow \mathcal{O}_{2} \times \mathcal{F} \rightarrow \mathcal{F}
$$

We sometimes denote this by $\mathcal{F}_{\mathcal{O}_{1}}$ to indicate the restriction of rings. We call this the restriction of $\mathcal{F}$. We obtain the restriction functor

$$
\operatorname{PMod}\left(\mathcal{O}_{2}\right) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{1}\right)
$$

On the other hand, given a presheaf of $\mathcal{O}_{1}$-modules $\mathcal{G}$ we can construct a presheaf of $\mathcal{O}_{2}$-modules $\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}$ by the rule

$$
\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}\right)(U)=\mathcal{O}_{2}(U) \otimes_{\mathcal{O}_{1}(U)} \mathcal{G}(U)
$$

The index $p$ stands for "presheaf" and not "point". This presheaf is called the tensor product presheaf. We obtain the change of rings functor

$$
\operatorname{PMod}\left(\mathcal{O}_{1}\right) \longrightarrow \operatorname{PMod}\left(\mathcal{O}_{2}\right)
$$

006R Lemma 6.6.2. With $X, \mathcal{O}_{1}, \mathcal{O}_{2}, \mathcal{F}$ and $\mathcal{G}$ as above there exists a canonical bijection

$$
\operatorname{Hom}_{\mathcal{O}_{1}}\left(\mathcal{G}, \mathcal{F}_{\mathcal{O}_{1}}\right)=\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)
$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from the fact that for a ring map $A \rightarrow B$ the restriction functor and the change of ring functor are adjoint to each other.

### 6.7. Sheaves

006 S In this section we explain the sheaf condition.
006 T Definition 6.7.1. Let $X$ be a topological space.
(1) A sheaf $\mathcal{F}$ of sets on $X$ is a presheaf of sets which satisfies the following additional property: Given any open covering $U=\bigcup_{i \in I} U_{i}$ and any collection of sections $s_{i} \in \mathcal{F}\left(U_{i}\right), i \in I$ such that $\forall i, j \in I$

$$
\left.s_{i}\right|_{U_{i} \cap U_{j}}=\left.s_{j}\right|_{U_{i} \cap U_{j}}
$$

there exists a unique section $s \in \mathcal{F}(U)$ such that $s_{i}=\left.s\right|_{U_{i}}$ for all $i \in I$.
(2) A morphism of sheaves of sets is simply a morphism of presheaves of sets.
(3) The category of sheaves of sets on $X$ is denoted $\operatorname{Sh}(X)$.

006U Remark 6.7.2. There is always a bit of confusion as to whether it is necessary to say something about the set of sections of a sheaf over the empty set $\emptyset \subset X$. It is necessary, and we already did if you read the definition right. Namely, note that the empty set is covered by the empty open covering, and hence the "collection of section $s_{i}$ " from the definition above actually form an element of the empty product which is the final object of the category the sheaf has values in. In other words, if you read the definition right you automatically deduce that $\mathcal{F}(\emptyset)=$ a final object, which in the case of a sheaf of sets is a singleton. If you do not like this argument, then you can just require that $\mathcal{F}(\emptyset)=\{*\}$.

In particular, this condition will then ensure that if $U, V \subset X$ are open and disjoint then

$$
\mathcal{F}(U \cup V)=\mathcal{F}(U) \times \mathcal{F}(V)
$$

(Because the fibre product over a final object is a product.)
006 V Example 6.7.3. Let $X, Y$ be topological spaces. Consider the rule $\mathcal{F}$ wich associates to the open $U \subset X$ the set

$$
\mathcal{F}(U)=\{f: U \rightarrow Y \mid f \text { is continuous }\}
$$

with the obvious restriction mappings. We claim that $\mathcal{F}$ is a sheaf. To see this suppose that $U=\bigcup_{i \in I} U_{i}$ is an open covering, and $f_{i} \in \mathcal{F}\left(U_{i}\right), i \in I$ with $\left.f_{i}\right|_{U_{i} \cap U_{j}}=$ $\left.f_{j}\right|_{U_{i} \cap U_{j}}$ for all $i, j \in I$. In this case define $f: U \rightarrow Y$ by setting $f(u)$ equal to the value of $f_{i}(u)$ for any $i \in I$ such that $u \in U_{i}$. This is well defined by assumption. Moreover, $f: U \rightarrow Y$ is a map such that its restriction to $U_{i}$ agrees with the continuous map $U_{i}$. Hence clearly $f$ is continuous!

We can use the result of the example to define constant sheaves. Namely, suppose that $A$ is a set. Endow $A$ with the discrete topology. Let $U \subset X$ be an open subset. Then we have

$$
\{f: U \rightarrow A \mid f \text { continuous }\}=\{f: U \rightarrow A \mid f \text { locally constant }\}
$$

Thus the rule which assigns to an open all locally constant maps into $A$ is a sheaf.
006W Definition 6.7.4. Let $X$ be a topological space. Let $A$ be a set. The constant sheaf with value $A$ denoted $\underline{A}$, or $\underline{A}_{X}$ is the sheaf that assigns to an open $U \subset X$ the set of all locally constant maps $U \rightarrow A$ with restriction mappings given by restrictions of functions.

006X Example 6.7.5. Let $X$ be a topological space. Let $\left(A_{x}\right)_{x \in X}$ be a family of sets $A_{x}$ indexed by points $x \in X$. We are going to construct a sheaf of sets $\Pi$ from this data. For $U \subset X$ open set

$$
\Pi(U)=\prod_{x \in U} A_{x}
$$

For $V \subset U \subset X$ open define a restriction mapping by the following rule: An element $s=\left(a_{x}\right)_{x \in U} \in \Pi(U)$ restricts to $\left.s\right|_{V}=\left(a_{x}\right)_{x \in V}$. It is obvious that this defines a presheaf of sets. We claim this is a sheaf. Namely, let $U=\bigcup U_{i}$ be an open covering. Suppose that $s_{i} \in \Pi\left(U_{i}\right)$ are such that $s_{i}$ and $s_{j}$ agree over $U_{i} \cap U_{j}$. Write $s_{i}=\left(a_{i, x}\right)_{x \in U_{i}}$. The compatibility condition implies that $a_{i, x}=a_{j, x}$ in the set $A_{x}$ whenever $x \in U_{i} \cap U_{j}$. Hence there exists a unique element $s=\left(a_{x}\right)_{x \in U}$ in $\Pi(U)=\prod_{x \in U} A_{x}$ with the property that $a_{x}=a_{i, x}$ whenever $x \in U_{i}$ for some $i$. Of course this element $s$ has the property that $\left.s\right|_{U_{i}}=s_{i}$ for all $i$.

006Y Example 6.7.6. Let $X$ be a topological space. Suppose for each $x \in X$ we are given an abelian group $M_{x}$. Consider the presheaf $\mathcal{F}: U \mapsto \bigoplus_{x \in U} M_{x}$ defined in Example 6.4.5. This is not a sheaf in general. For example, if $X$ is an infinite set with the discrete topology, then the sheaf condition would imply that $\mathcal{F}(X)=$ $\prod_{x \in X} \mathcal{F}(\{x\})$ but by definition we have $\mathcal{F}(X)=\bigoplus_{x \in X} M_{x}=\bigoplus_{x \in X} \mathcal{F}(\{x\})$. And an infinite direct sum is in general different from an infinite direct product.

However, if $X$ is a topological space such that every open of $X$ is quasi-compact, then $\mathcal{F}$ is a sheaf. This is left as an exercise to the reader.

### 6.8. Abelian sheaves

Definition 6.8.1. Let $X$ be a topological space.
(1) An abelian sheaf on $X$ or sheaf of abelian groups on $X$ is an abelian presheaf on $X$ such that the underlying presheaf of sets is a sheaf.
(2) The category of sheaves of abelian groups is denoted $A b(X)$.

Let $X$ be a topological space. In the case of an abelian presheaf $\mathcal{F}$ the sheaf condition with regards to an open covering $U=\bigcup U_{i}$ is often expressed by saying that the complex of abelian groups

$$
0 \rightarrow \mathcal{F}(U) \rightarrow \prod_{i} \mathcal{F}\left(U_{i}\right) \rightarrow \prod_{\left(i_{0}, i_{1}\right)} \mathcal{F}\left(U_{i_{0}} \cap U_{i_{1}}\right)
$$

is exact. The first map is the usual one, whereas the second maps the element $\left(s_{i}\right)_{i \in I}$ to the element

$$
\left(\left.s_{i_{0}}\right|_{U_{i_{0}} \cap U_{i_{1}}}-\left.s_{i_{1}}\right|_{U_{i_{0}} \cap U_{i_{1}}}\right)_{\left(i_{0}, i_{1}\right)} \in \prod_{\left(i_{0}, i_{1}\right)} \mathcal{F}\left(U_{i_{0}} \cap U_{i_{1}}\right)
$$

### 6.9. Sheaves of algebraic structures

0071 Let us clarify the definition of sheaves of certain types of structures. First, let us reformulate the sheaf condition. Namely, suppose that $\mathcal{F}$ is a presheaf of sets on the topological space $X$. The sheaf condition can be reformulated as follows. Let $U=\bigcup_{i \in I} U_{i}$ be an open covering. Consider the diagram

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \longrightarrow \prod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}\left(U_{i_{0}} \cap U_{i_{1}}\right)
$$

Here the left map is defined by the rule $\left.s \mapsto \prod_{i \in I} s\right|_{U_{i}}$. The two maps on the right are the maps

$$
\left.\prod_{i} s_{i} \mapsto \prod_{\left(i_{0}, i_{1}\right)} s_{i_{0}}\right|_{U_{i_{0}} \cap U_{i_{1}}} \text { resp. }\left.\prod_{i} s_{i} \mapsto \prod_{\left(i_{0}, i_{1}\right)} s_{i_{1} \mid}\right|_{U_{i_{0}} \cap U_{i_{1}}}
$$

The sheaf condition exactly says that the left arrow is the equalizer of the right two. This generalizes immediately to the case of presheaves with values in a category as long as the category has products.

0072 Definition 6.9.1. Let $X$ be a topological space. Let $\mathcal{C}$ be a category with products. A presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $X$ is a sheaf if for every open covering the diagram

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \longrightarrow \prod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}\left(U_{i_{0}} \cap U_{i_{1}}\right)
$$

is an equalizer diagram in the category $\mathcal{C}$.

Suppose that $\mathcal{C}$ is a category and that $F: \mathcal{C} \rightarrow$ Sets is a faithful functor. A good example to keep in mind is the case where $\mathcal{C}$ is the category of abelian groups and $F$ is the forgetful functor. Consider a presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $X$. We would like to reformulate the condition above in terms of the underlying presheaf of sets (Definition 6.5.2). Note that the underlying presheaf of sets is a sheaf of sets if and only if all the diagrams

$$
F(\mathcal{F}(U)) \longrightarrow \prod_{i \in I} F\left(\mathcal{F}\left(U_{i}\right)\right) \longrightarrow \prod_{\left(i_{0}, i_{1}\right) \in I \times I} F\left(\mathcal{F}\left(U_{i_{0}} \cap U_{i_{1}}\right)\right)
$$

of sets - after applying the forgetful functor $F$ - are equalizer diagrams! Thus we would like $\mathcal{C}$ to have products and equalizers and we would like $F$ to commute with them. This is equivalent to the condition that $\mathcal{C}$ has limits and that $F$ commutes with them, see Categories, Lemma 4.14.10. But this is not yet good enough (see Example 6.9.4); we also need $F$ to reflect isomorphisms. This property means that given a morphism $f: A \rightarrow A^{\prime}$ in $\mathcal{C}$, then $f$ is an isomorphism if (and only if) $F(f)$ is a bijection.

0073 Lemma 6.9.2. Suppose the category $\mathcal{C}$ and the functor $F: \mathcal{C} \rightarrow$ Sets have the following properties:
(1) $F$ is faithful,
(2) $\mathcal{C}$ has limits and $F$ commutes with them, and
(3) the functor $F$ reflects isomorphisms.

Let $X$ be a topological space. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{C}$. Then $\mathcal{F}$ is a sheaf if and only if the underlying presheaf of sets is a sheaf.

Proof. Assume that $\mathcal{F}$ is a sheaf. Then $\mathcal{F}(U)$ is the equalizer of the diagram above and by assumption we see $F(\mathcal{F}(U))$ is the equalizer of the corresponding diagram of sets. Hence $F(\mathcal{F})$ is a sheaf of sets.

Assume that $F(\mathcal{F})$ is a sheaf. Let $E \in \mathrm{Ob}(\mathcal{C})$ be the equalizer of the two parallel arrows in Definition 6.9.1 We get a canonical morphism $\mathcal{F}(U) \rightarrow E$, simply because $\mathcal{F}$ is a presheaf. By assumption, the induced map $F(\mathcal{F}(U)) \rightarrow F(E)$ is an isomorphism, because $F(E)$ is the equalizer of the corresponding diagram of sets. Hence we see $\mathcal{F}(U) \rightarrow E$ is an isomorphism by condition (3) of the lemma.

The lemma in particular applies to sheaves of groups, rings, algebras over a fixed ring, modules over a fixed ring, vector spaces over a fixed field, etc. In other words, these are presheaves of groups, rings, modules over a fixed ring, vector spaces over a fixed field, etc such that the underlying presheaf of sets is a sheaf.

0074 Example 6.9.3. Let $X$ be a topological space. For each open $U \subset X$ consider the R-algebra $\mathcal{C}^{0}(U)=\{f: U \rightarrow \mathbf{R} \mid f$ is continuous $\}$. There are obvious restriction mappings that turn this into a presheaf of $\mathbf{R}$-algebras over $X$. By Example 6.7.3 it is a sheaf of sets. Hence by the Lemma 6.9 .2 it is a sheaf of $\mathbf{R}$-algebras over $X$.

0075 Example 6.9.4. Consider the category of topological spaces Top. There is a natural faithful functor Top $\rightarrow$ Sets which commutes with products and equalizers. But it does not reflect isomorphisms. And, in fact it turns out that the analogue of Lemma 6.9 .2 is wrong. Namely, suppose $X=\mathbf{N}$ with the discrete topology. Let $A_{i}$, for $i \in \mathbf{N}$ be a discrete topological space. For any subset $U \subset \mathbf{N}$ define $\mathcal{F}(U)=$ $\prod_{i \in U} A_{i}$ with the discrete topology. Then this is a presheaf of topological spaces whose underlying presheaf of sets is a sheaf, see Example 6.7.5. However, if each $A_{i}$
has at least two elements, then this is not a sheaf of topological spaces according to Definition 6.9.1. The reader may check that putting the product topology on each $\mathcal{F}(U)=\prod_{i \in U} A_{i}$ does lead to a sheaf of topological spaces over $X$.

### 6.10. Sheaves of modules

0076
Definition 6.10.1. Let $X$ be a topological space. Let $\mathcal{O}$ be a sheaf of rings on $X$.
(1) A sheaf of $\mathcal{O}$-modules is a presheaf of $\mathcal{O}$-modules $\mathcal{F}$, see Definition 6.6.1. such that the underlying presheaf of abelian groups $\mathcal{F}$ is a sheaf.
(2) A morphism of sheaves of $\mathcal{O}$-modules is a morphism of presheaves of $\mathcal{O}$ modules.
(3) Given sheaves of $\mathcal{O}$-modules $\mathcal{F}$ and $\mathcal{G}$ we $\operatorname{denote} \operatorname{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ the set of morphism of sheaves of $\mathcal{O}$-modules.
(4) The category of sheaves of $\mathcal{O}$-modules is denoted $\operatorname{Mod}(\mathcal{O})$.

This definition kind of makes sense even if $\mathcal{O}$ is just a presheaf of rings, although we do not know any examples where this is useful, and we will avoid using the terminology "sheaves of $\mathcal{O}$-modules" in case $\mathcal{O}$ is not a sheaf of rings.

### 6.11. Stalks

0078
Let $X$ be a topological space. Let $x \in X$ be a point. Let $\mathcal{F}$ be a presheaf of sets on $X$. The stalk of $\mathcal{F}$ at $x$ is the set

$$
\mathcal{F}_{x}=\operatorname{colim}_{x \in U} \mathcal{F}(U)
$$

where the colimit is over the set of open neighbourhoods $U$ of $x$ in $X$. The set of open neighbourhoods is (partially) ordered by (reverse) inclusion: We say $U \geq$ $U^{\prime} \Leftrightarrow U \subset U^{\prime}$. The transition maps in the system are given by the restriction maps of $\mathcal{F}$. See Categories, Section 4.21 for notation and terminology regarding (co)limits over systems. Note that the colimit is a directed colimit. Thus it is easy to describe $\mathcal{F}_{x}$. Namely,

$$
\mathcal{F}_{x}=\{(U, s) \mid x \in U, s \in \mathcal{F}(U)\} / \sim
$$

with equivalence relation given by $(U, s) \sim\left(U^{\prime}, s^{\prime}\right)$ if and only if there exists an open $U^{\prime \prime} \subset U \cap U^{\prime}$ with $x \in U^{\prime \prime}$ and $\left.s\right|_{U^{\prime \prime}}=\left.s^{\prime}\right|_{U^{\prime \prime}}$. By abuse of notation we will often denote $(U, s), s_{x}$, or even $s$ the corresponding element in $\mathcal{F}_{x}$. Also we will say $s=s^{\prime}$ in $\mathcal{F}_{x}$ for two local sections of $\mathcal{F}$ defined in an open neighbourhood of $x$ to denote that they have the same image in $\mathcal{F}_{x}$.

An obvious consequence of this definition is that for any open $U \subset X$ there is a canonical map

$$
\mathcal{F}(U) \longrightarrow \prod_{x \in U} \mathcal{F}_{x}
$$

defined by $s \mapsto \prod_{x \in U}(U, s)$. Think about it!
0079 Lemma 6.11.1. Let $\mathcal{F}$ be a sheaf of sets on the topological space $X$. For every open $U \subset X$ the map

$$
\mathcal{F}(U) \longrightarrow \prod_{x \in U} \mathcal{F}_{x}
$$

is injective.

Proof. Suppose that $s, s^{\prime} \in \mathcal{F}(U)$ map to the same element in every stalk $\mathcal{F}_{x}$ for all $x \in U$. This means that for every $x \in U$, there exists an open $V^{x} \subset U, x \in V^{x}$ such that $\left.s\right|_{V^{x}}=\left.s^{\prime}\right|_{V^{x}}$. But then $U=\bigcup_{x \in U} V^{x}$ is an open covering. Thus by the uniqueness in the sheaf condition we see that $s=s^{\prime}$.
007A Definition 6.11.2. Let $X$ be a topological space. A presheaf of sets $\mathcal{F}$ on $X$ is separated if for every open $U \subset X$ the map $\mathcal{F}(U) \rightarrow \prod_{x \in U} \mathcal{F}_{x}$ is injective.
Another observation is that the construction of the stalk $\mathcal{F}_{x}$ is functorial in the presheaf $\mathcal{F}$. In other words, it gives a functor

$$
\operatorname{PSh}(X) \longrightarrow \text { Sets, } \mathcal{F} \longmapsto \mathcal{F}_{x} .
$$

This functor is called the stalk functor. Namely, if $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves, then we define $\varphi_{x}: \mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ by the rule $(U, s) \mapsto(U, \varphi(s))$. To see that this works we have to check that if $(U, s)=\left(U^{\prime}, s^{\prime}\right)$ in $\mathcal{F}_{x}$ then also $(U, \varphi(s))=\left(U^{\prime}, \varphi\left(s^{\prime}\right)\right)$ in $\mathcal{G}_{x}$. This is clear since $\varphi$ is compatible with the restriction mappings.
007B Example 6.11.3. Let $X$ be a topological space. Let $A$ be a set. Denote temporarily $A_{p}$ the constant presheaf with value $A$ ( $p$ for presheaf - not for point). There is a canonical map of presheaves $A_{p} \rightarrow \underline{A}$ into the constant sheaf with value $A$. For every point we have canonical bijections $A=\left(A_{p}\right)_{x}=\underline{A}_{x}$, where the second map is induced by functoriality from the map $A_{p} \rightarrow \underline{A}$.
007C Example 6.11.4. Suppose $X=\mathbf{R}^{n}$ with the Euclidean topology. Consider the presheaf of $\mathcal{C}^{\infty}$ functions on $X$, denoted $\mathcal{C}_{\mathbf{R}^{n}}^{\infty}$. In other words, $\mathcal{C}_{\mathbf{R}^{n}}^{\infty}(U)$ is the set of $\mathcal{C}^{\infty}$-functions $f: U \rightarrow \mathbf{R}$. As in Example 6.7.3 it is easy to show that this is a sheaf. In fact it is a sheaf of $\mathbf{R}$-vector spaces.
Next, let $x \in X=\mathbf{R}^{n}$ be a point. How do we think of an element in the stalk $\mathcal{C}_{\mathbf{R}^{n}, x}^{\infty}$ ? Such an element is given by a $\mathcal{C}^{\infty}$-function $f$ whose domain contains $x$. And a pair of such functions $f, g$ determine the same element of the stalk if they agree in a neighbourhood of $x$. In other words, an element if $\mathcal{C}_{\mathbf{R}^{n}, x}^{\infty}$ is the same thing as what is sometimes called a germ of a $\mathcal{C}^{\infty}$-function at $x$.
007D Example 6.11.5. Let $X$ be a topological space. Let $A_{x}$ be a set for each $x \in X$. Consider the sheaf $\mathcal{F}: U \mapsto \prod_{x \in U} A_{x}$ of Example 6.7.5. We would just like to point out here that the stalk $\mathcal{F}_{x}$ of $\mathcal{F}$ at $x$ is in general not equal to the set $A_{x}$. Of course there is a map $\mathcal{F}_{x} \rightarrow A_{x}$, but that is in general the best you can say. For example, suppose $x=\lim x_{n}$ with $x_{n} \neq x_{m}$ for all $n \neq m$ and suppose that $A_{y}=\{0,1\}$ for all $y \in X$. Then $\mathcal{F}_{x}$ maps onto the (infinite) set of tails of sequences of 0 s and 1s. Namely, every open neighbourhood of $x$ contains almost all of the $x_{n}$. On the other hand, if every neighbourhood of $x$ contains a point $y$ such that $A_{y}=\emptyset$, then $\mathcal{F}_{x}=\emptyset$.

### 6.12. Stalks of abelian presheaves

007 E We first deal with the case of abelian groups as a model for the general case.
007F Lemma 6.12.1. Let $X$ be a topological space. Let $\mathcal{F}$ be a presheaf of abelian groups on $X$. There exists a unique structure of an abelian group on $\mathcal{F}_{x}$ such that for every $U \subset X$ open, $x \in U$ the map $\mathcal{F}(U) \rightarrow \mathcal{F}_{x}$ is a group homomorphism. Moreover,

$$
\mathcal{F}_{x}=\operatorname{colim}_{x \in U} \mathcal{F}(U)
$$

holds in the category of abelian groups.
Proof. We define addition of a pair of elements $(U, s)$ and $(V, t)$ as the pair $(U \cap$ $\left.V,\left.s\right|_{U \cap V}+\left.t\right|_{U \cap V}\right)$. The rest is easy to check.
What is crucial in the proof above is that the partially ordered set of open neighbourhoods is a directed system (compare Categories, Definition 4.21.2). Namely, the coproduct of two abelian groups $A, B$ is the direct sum $A \oplus B$, whereas the coproduct in the category of sets is the disjoint union $A \amalg B$, showing that colimits in the category of abelian groups do not agree with colimits in the category of sets in general.

### 6.13. Stalks of presheaves of algebraic structures

007G The proof of Lemma 6.12.1 will work for any type of algebraic structure such that directed colimits commute with the forgetful functor.
007 H Lemma 6.13.1. Let $\mathcal{C}$ be a category. Let $F: \mathcal{C} \rightarrow$ Sets be a functor. Assume that (1) $F$ is faithful, and
(2) directed colimits exist in $\mathcal{C}$ and $F$ commutes with them.

Let $X$ be a topological space. Let $x \in X$. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{C}$. Then

$$
\mathcal{F}_{x}=\operatorname{colim}_{x \in U} \mathcal{F}(U)
$$

exists in $\mathcal{C}$. Its underlying set is equal to the stalk of the underlying presheaf of sets of $\mathcal{F}$. Furthermore, the construction $\mathcal{F} \mapsto \mathcal{F}_{x}$ is a functor from the category of presheaves with values in $\mathcal{C}$ to $\mathcal{C}$.
Proof. Omitted.
By the very definition, all the morphisms $\mathcal{F}(U) \rightarrow \mathcal{F}_{x}$ are morphisms in the category $\mathcal{C}$ which (after applying the forgetful functor $F$ ) turn into the corresponding maps for the underlying sheaf of sets. As usual we will not distinguish between the morphism in $\mathcal{C}$ and the underlying map of sets, which is permitted since $F$ is faithful.

This lemma applies in particular to: Presheaves of (not necessarily abelian) groups, rings, modules over a fixed ring, vector spaces over a fixed field.

### 6.14. Stalks of presheaves of modules

007I
007J Lemma 6.14.1. Let $X$ be a topological space. Let $\mathcal{O}$ be a presheaf of rings on $X$. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. Let $x \in X$. The canonical map $\mathcal{O}_{x} \times \mathcal{F}_{x} \rightarrow \mathcal{F}_{x}$ coming from the multiplication map $\mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ defines a $\mathcal{O}_{x}$-module structure on the abelian group $\mathcal{F}_{x}$.
Proof. Omitted.
007K Lemma 6.14.2. Let $X$ be a topological space. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a morphism of presheaves of rings on $X$. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. Let $x \in X$. We have

$$
\mathcal{F}_{x} \otimes_{\mathcal{O}_{x}} \mathcal{O}_{x}^{\prime}=\left(\mathcal{F} \otimes_{p, \mathcal{O}} \mathcal{O}^{\prime}\right)_{x}
$$

as $\mathcal{O}_{x}^{\prime}$-modules.
Proof. Omitted.

### 6.15. Algebraic structures

007 L In this section we mildly formalize the notions we have encountered in the sections above.

007 M Definition 6.15.1. A type of algebraic structure is given by a category $\mathcal{C}$ and a functor $F: \mathcal{C} \rightarrow$ Sets with the following properties
(1) $F$ is faithful,
(2) $\mathcal{C}$ has limits and $F$ commutes with limits,
(3) $\mathcal{C}$ has filtered colimits and $F$ commutes with them, and
(4) $F$ reflects isomorphisms.

We make this definition to point out the properties we will use in a number of arguments below. But we will not actually study this notion in any great detail, since we are prohibited from studying "big" categories by convention, except for those listed in Categories, Remark 4.2.2. Among those the following have the required properties.

007 N Lemma 6.15.2. The following categories, endowed with the obvious forgetful functor, define types of algebraic structures:
(1) The category of pointed sets.
(2) The category of abelian groups.
(3) The category of groups.
(4) The category of monoids.
(5) The category of rings.
(6) The category of $R$-modules for a fixed ring $R$.
(7) The category of Lie algebras over a fixed field.

Proof. Omitted.
From now on we will think of a (pre)sheaf of algebraic structures and their stalks, in terms of the underlying (pre)sheaf of sets. This is allowable by Lemmas 6.9.2 and 6.13.1.

In the rest of this section we point out some results on algebraic structures that will be useful in the future.

007O Lemma 6.15.3. Let $(\mathcal{C}, F)$ be a type of algebraic structure.
(1) $\mathcal{C}$ has a final object 0 and $F(0)=\{*\}$.
(2) $\mathcal{C}$ has products and $F\left(\prod A_{i}\right)=\prod F\left(A_{i}\right)$.
(3) $\mathcal{C}$ has fibre products and $F\left(A \times_{B} C\right)=F(A) \times{ }_{F(B)} F(C)$.
(4) $\mathcal{C}$ has equalizers, and if $E \rightarrow A$ is the equalizer of $a, b: A \rightarrow B$, then $F(E) \rightarrow F(A)$ is the equalizer of $F(a), F(b): F(A) \rightarrow F(B)$.
(5) $A \rightarrow B$ is a monomorphism if and only if $F(A) \rightarrow F(B)$ is injective.
(6) if $F(a): F(A) \rightarrow F(B)$ is surjective, then $a$ is an epimorphism.
(7) given $A_{1} \rightarrow A_{2} \rightarrow A_{3} \rightarrow \ldots$, then colim $A_{i}$ exists and $F\left(\operatorname{colim} A_{i}\right)=$ colim $F\left(A_{i}\right)$, and more generally for any filtered colimit.

Proof. Omitted. The only interesting statement is (5) which follows because $A \rightarrow$ $B$ is a monomorphism if and only if $A \rightarrow A \times_{B} A$ is an isomorphism, and then applying the fact that $F$ reflects isomorphisms.

007P Lemma 6.15.4. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Suppose that $A, B, C \in$ $\mathrm{Ob}(\mathcal{C})$. Let $f: A \rightarrow B$ and $g: C \rightarrow B$ be morphisms of $\mathcal{C}$. If $F(g)$ is injective, and $\operatorname{Im}(F(f)) \subset \operatorname{Im}(F(g))$, then $f$ factors as $f=g \circ t$ for some morphism $t: A \rightarrow C$.

Proof. Consider $A \times{ }_{B} C$. The assumptions imply that $F\left(A \times_{B} C\right)=F(A) \times{ }_{F(B)}$ $F(C)=F(A)$. Hence $A=A \times_{B} C$ because $F$ reflects isomorphisms. The result follows.

007Q Example 6.15.5. The lemma will be applied often to the following situation. Suppose that we have a diagram

in $\mathcal{C}$. Suppose $C \rightarrow D$ is injective on underlying sets, and suppose that the composition $A \rightarrow B \rightarrow D$ has image on underlying sets in the image of $C \rightarrow D$. Then we get a commutative diagram

in $\mathcal{C}$.
007R Example 6.15.6. Let $F: \mathcal{C} \rightarrow$ Sets be a type of algebraic structures. Let $X$ be a topological space. Suppose that for every $x \in X$ we are given an object $A_{x} \in \operatorname{ob}(\mathcal{C})$. Consider the presheaf $\Pi$ with values in $\mathcal{C}$ on $X$ defined by the rule $\Pi(U)=\prod_{x \in U} A_{x}$ (with obvious restriction mappings). Note that the associated presheaf of sets $U \mapsto F(\Pi(U))=\prod_{x \in U} F\left(A_{x}\right)$ is a sheaf by Example 6.7.5. Hence $\Pi$ is a sheaf of algebraic structures of type $(\mathcal{C}, F)$. This gives many examples of sheaves of abelian groups, groups, rings, etc.

### 6.16. Exactness and points

007S In any category we have the notion of epimorphism, monomorphism, isomorphism, etc.

007T Lemma 6.16.1. Let $X$ be a topological space. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a morphism of sheaves of sets on $X$.
(1) The map $\varphi$ is a monomorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_{x}: \mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is injective.
(2) The map $\varphi$ is an epimorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_{x}: \mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is surjective.
(3) The map $\varphi$ is an isomorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_{x}: \mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is bijective.

Proof. Omitted.
It follows that in the category of sheaves of sets the notions epimorphism and monomorphism can be described as follows.

Definition 6.16.2. Let $X$ be a topological space.
(1) A presheaf $\mathcal{F}$ is called a subpresheaf of a presheaf $\mathcal{G}$ if $\mathcal{F}(U) \subset \mathcal{G}(U)$ for all open $U \subset X$ such that the restriction maps of $\mathcal{G}$ induce the restriction maps of $\mathcal{F}$. If $\mathcal{F}$ and $\mathcal{G}$ are sheaves, then $\mathcal{F}$ is called a subsheaf of $\mathcal{G}$. We sometimes indicate this by the notation $\mathcal{F} \subset \mathcal{G}$.
(2) A morphism of presheaves of sets $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ on $X$ is called injective if and only if $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is injective for all $U$ open in $X$.
(3) A morphism of presheaves of sets $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ on $X$ is called surjective if and only if $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is surjective for all $U$ open in $X$.
(4) A morphism of sheaves of sets $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ on $X$ is called injective if and only if $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is injective for all $U$ open in $X$.
(5) A morphism of sheaves of sets $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ on $X$ is called surjective if and only if for every open $U$ of $X$ and every section $s$ of $\mathcal{G}(U)$ there exists an open covering $U=\bigcup U_{i}$ such that $\left.s\right|_{U_{i}}$ is in the image of $\mathcal{F}\left(U_{i}\right) \rightarrow \mathcal{G}(U)$ for all $i$.

007V Lemma 6.16.3. Let $X$ be a topological space.
(1) Epimorphisms (resp. monomorphisms) in the category of presheaves are exactly the surjective (resp. injective) maps of presheaves.
(2) Epimorphisms (resp. monomorphisms) in the category of sheaves are exactly the surjective (resp. injective) maps of sheaves, and are exactly those maps with are surjective (resp. injective) on all the stalks.
(3) The sheafification of a surjective (resp. injective) morphism of presheaves of sets is surjective (resp. injective).
Proof. Omitted.
007W Lemma 6.16.4. let $X$ be a topological space. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Suppose that $\mathcal{F}, \mathcal{G}$ are sheaves on $X$ with values in $\mathcal{C}$. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of the underlying sheaves of sets. If for all points $x \in X$ the map $\mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is a morphism of algebraic structures, then $\varphi$ is a morphism of sheaves of algebraic structures.

Proof. Let $U$ be an open subset of $X$. Consider the diagram of (underlying) sets

By assumption, and previous results, all but the left vertical arrow are morphisms of algebraic structures. In addition the bottom horizontal arrow is injective, see Lemma 6.11.1. Hence we conclude by Lemma 6.15.4, see also Example 6.15.5

Short exact sequences of abelian sheaves, etc will be discussed in the chapter on sheaves of modules. See Modules, Section 17.3 .

### 6.17. Sheafification

007X In this section we explain how to get the sheafification of a presheaf on a topological space. We will use stalks to describe the sheafification in this case. This is different from the general procedure described in Sites, Section 7.10, and perhaps somewhat easier to understand.

The basic construction is the following. Let $\mathcal{F}$ be a presheaf of sets $\mathcal{F}$ on a topological space $X$. For every open $U \subset X$ we define

$$
\mathcal{F}^{\#}(U)=\left\{\left(s_{u}\right) \in \prod_{u \in U} \mathcal{F}_{u} \text { such that }(*)\right\}
$$

where $(*)$ is the property:
$(*)$ For every $u \in U$, there exists an open neighbourhood $u \in V \subset U$, and a section $\sigma \in \mathcal{F}(V)$ such that for all $v \in V$ we have $s_{v}=(V, \sigma)$ in $\mathcal{F}_{v}$.
Note that $(*)$ is a condition for each $u \in U$, and that given $u \in U$ the truth of this condition depends only on the values $s_{v}$ for $v$ in any open neighbourhood of $u$. Thus it is clear that, if $V \subset U \subset X$ are open, the projection maps

$$
\prod_{u \in U} \mathcal{F}_{u} \longrightarrow \prod_{v \in V} \mathcal{F}_{v}
$$

maps elements of $\mathcal{F}^{\#}(U)$ into $\mathcal{F}^{\#}(V)$. In other words, we get the structure of a presheaf of sets on $\mathcal{F}^{\#}$.
Furthermore, the map $\mathcal{F}(U) \rightarrow \prod_{u \in U} \mathcal{F}_{u}$ described in Section 6.11 clearly has image in $\mathcal{F}^{\#}(U)$. In addition, if $V \subset U \subset X$ are open then we have the following commutative diagram

where the vertical maps are induced from the restriction mappings. Thus we see that there is a canonical morphism of presheaves $\mathcal{F} \rightarrow \mathcal{F}^{\#}$.
In Example 6.7 .5 we saw that the rule $\Pi(\mathcal{F}): U \mapsto \prod_{u \in U} \mathcal{F}_{u}$ is a sheaf, with obvious restriction mappings. And by construction $\mathcal{F} \#$ is a subpresheaf of this. In other words, we have morphisms of presheaves

$$
\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \Pi(\mathcal{F})
$$

In addition the rule that associates to $\mathcal{F}$ the sequence above is clearly functorial in the presheaf $\mathcal{F}$. This notation will be used in the proofs of the lemmas below.
007Y Lemma 6.17.1. The presheaf $\mathcal{F}^{\#}$ is a sheaf.
Proof. It is probably better for the reader to find their own explanation of this than to read the proof here. In fact the lemma is true for the same reason as why the presheaf of continuous function is a sheaf, see Example 6.7.3 (and this analogy can be made precise using the "espace étale"").
Anyway, let $U=\bigcup U_{i}$ be an open covering. Suppose that $s_{i}=\left(s_{i, u}\right)_{u \in U_{i}} \in \mathcal{F}^{\#}\left(U_{i}\right)$ such that $s_{i}$ and $s_{j}$ agree over $U_{i} \cap U_{j}$. Because $\Pi(\mathcal{F})$ is a sheaf, we find an element $s=\left(s_{u}\right)_{u \in U}$ in $\prod_{u \in U} \mathcal{F}_{u}$ restricting to $s_{i}$ on $U_{i}$. We have to check property (*). Pick $u \in U$. Then $u \in U_{i}$ for some $i$. Hence by $(*)$ for $s_{i}$, there exists a $V$ open, $u \in V \subset U_{i}$ and a $\sigma \in \mathcal{F}(V)$ such that $s_{i, v}=(V, \sigma)$ in $\mathcal{F}_{v}$ for all $v \in V$. Since $s_{i, v}=s_{v}$ we get $(*)$ for $s$.

007Z Lemma 6.17.2. Let $X$ be a topological space. Let $\mathcal{F}$ be a presheaf of sets on $X$. Let $x \in X$. Then $\mathcal{F}_{x}=\mathcal{F}_{x}^{\#}$.

Proof. The map $\mathcal{F}_{x} \rightarrow \mathcal{F}_{x}^{\#}$ is injective, since already the map $\mathcal{F}_{x} \rightarrow \Pi(\mathcal{F})_{x}$ is injective. Namely, there is a canonical map $\Pi(\mathcal{F})_{x} \rightarrow \mathcal{F}_{x}$ which is a left inverse to the map $\mathcal{F}_{x} \rightarrow \Pi(\mathcal{F})_{x}$, see Example 6.11.5. To show that it is surjective, suppose that $\bar{s} \in \mathcal{F}_{x}^{\#}$. We can find an open neighbourhood $U$ of $x$ such that $\bar{s}$ is the equivalence class of $(U, s)$ with $s \in \mathcal{F}^{\#}(U)$. By definition, this means there exists an open neighbourhood $V \subset U$ of $x$ and a section $\sigma \in \mathcal{F}(V)$ such that $\left.s\right|_{V}$ is the image of $\sigma$ in $\Pi(\mathcal{F})(V)$. Clearly the class of $(V, \sigma)$ defines an element of $\mathcal{F}_{x}$ mapping to $\bar{s}$.

0080 Lemma 6.17.3. Let $\mathcal{F}$ be a presheaf of sets on $X$. Any map $\mathcal{F} \rightarrow \mathcal{G}$ into a sheaf of sets factors uniquely as $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{G}$.

Proof. Clearly, there is a commutative diagram

So it suffices to prove that $\mathcal{G}=\mathcal{G}^{\#}$. To see this it suffices to prove, for every point $x \in X$ the $\operatorname{map} \mathcal{G}_{x} \rightarrow \mathcal{G}_{x}^{\#}$ is bijective, by Lemma 6.16.1. And this is Lemma 6.17.2 above.

This lemma really says that there is an adjoint pair of functors: $i: \operatorname{Sh}(X) \rightarrow \operatorname{PSh}(X)$ (inclusion) and \#: PSh $(X) \rightarrow \operatorname{Sh}(X)$ (sheafification). The formula is that

$$
\operatorname{Mor}_{P S h(X)}(\mathcal{F}, i(\mathcal{G}))=\operatorname{Mor}_{S h(X)}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

which says that sheafification is a left adjoint of the inclusion functor. See Categories, Section 4.24
0081 Example 6.17.4. See Example 6.11 .3 for notation. The map $A_{p} \rightarrow \underline{A}$ induces a map $A_{p}^{\#} \rightarrow \underline{A}$. It is easy to see that this is an isomorphism. In words: The sheafification of the constant presheaf with value $A$ is the constant sheaf with value A.

0082 Lemma 6.17.5. Let $X$ be a topological space. A presheaf $\mathcal{F}$ is separated (see Definition 6.11.2) if and only if the canonical map $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ is injective.

Proof. This is clear from the construction of $\mathcal{F} \#$ in this section.

### 6.18. Sheafification of abelian presheaves

0083 The following strange looking lemma is likely unnecessary, but very convenient to deal with sheafification of presheaves of algebraic structures.

0084 Lemma 6.18.1. Let $X$ be a topological space. Let $\mathcal{F}$ be a presheaf of sets on $X$. Let $U \subset X$ be open. There is a canonical fibre product diagram

where the maps are the following:
(1) The left vertical map has components $\mathcal{F}^{\#}(U) \rightarrow \mathcal{F}_{x}^{\#}=\mathcal{F}_{x}$ where the equality is Lemma 6.17.2.
(2) The top horizontal map comes from the map of presheaves $\mathcal{F} \rightarrow \Pi(\mathcal{F})$ described in Section 6.17.
(3) The right vertical map has obvious component maps $\Pi(\mathcal{F})(U) \rightarrow \Pi(\mathcal{F})_{x}$.
(4) The bottom horizontal map has components $\mathcal{F}_{x} \rightarrow \Pi(\mathcal{F})_{x}$ which come from the map of presheaves $\mathcal{F} \rightarrow \Pi(\mathcal{F})$ described in Section 6.17.

Proof. It is clear that the diagram commutes. We have to show it is a fibre product diagram. The bottom horizontal arrow is injective since all the maps $\mathcal{F}_{x} \rightarrow \Pi(\mathcal{F})_{x}$ are injective (see beginning proof of Lemma 6.17.2). A section $s \in \Pi(\mathcal{F})(U)$ is in $\mathcal{F}^{\#}$ if and only if $(*)$ holds. But $(*)$ says that around every point the section $s$ comes from a section of $\mathcal{F}$. By definition of the stalk functors, this is equivalent to saying that the value of $s$ in every stalk $\Pi(\mathcal{F})_{x}$ comes from an element of the stalk $\mathcal{F}_{x}$. Hence the lemma.

0085 Lemma 6.18.2. Let $X$ be a topological space. Let $\mathcal{F}$ be an abelian presheaf on $X$. Then there exists a unique structure of abelian sheaf on $\mathcal{F}^{\#}$ such that $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ is a morphism of abelian presheaves. Moreover, the following adjointness property holds

$$
\operatorname{Mor}_{P A b(X)}(\mathcal{F}, i(\mathcal{G}))=\operatorname{Mor}_{A b(X)}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

Proof. Recall the sheaf of sets $\Pi(\mathcal{F})$ defined in Section 6.17. All the stalks $\mathcal{F}_{x}$ are abelian groups, see Lemma 6.12.1. Hence $\Pi(\mathcal{F})$ is a sheaf of abelian groups by Example 6.15.6. Also, it is clear that the map $\mathcal{F} \rightarrow \Pi(\mathcal{F})$ is a morphism of abelian presheaves. If we show that condition $(*)$ of Section 6.17 defines a subgroup of $\Pi(\mathcal{F})(U)$ for all open subsets $U \subset X$, then $\mathcal{F}^{\#}$ canonically inherits the structure of abelian sheaf. This is quite easy to do by hand, and we leave it to the reader to find a good simple argument. The argument we use here, which generalizes to presheaves of algebraic structures is the following: Lemma 6.18.1 show that $\mathcal{F}^{\#}(U)$ is the fibre product of a diagram of abelian groups. Thus $\mathcal{F}^{\#}$ is an abelian subgroup as desired.

Note that at this point $\mathcal{F}_{x}^{\#}$ is an abelian group by Lemma 6.12.1 and that $\mathcal{F}_{x} \rightarrow \mathcal{F}_{x}^{\#}$ is a bijection (Lemma 6.17.2) and a homomorphism of abelian groups. Hence $\mathcal{F}_{x} \rightarrow \mathcal{F}_{x}^{\#}$ is an isomorphism of abelian groups. This will be used below without further mention.

To prove the adjointness property we use the adjointness property of sheafification of presheaves of sets. For example if $\psi: \mathcal{F} \rightarrow i(\mathcal{G})$ is morphism of presheaves then we obtain a morphism of sheaves $\psi^{\prime}: \mathcal{F}^{\#} \rightarrow \mathcal{G}$. What we have to do is to check that this is a morphism of abelian sheaves. We may do this for example by noting that it is true on stalks, by Lemma 6.17.2, and then using Lemma 6.16.4 above.

### 6.19. Sheafification of presheaves of algebraic structures

0086
0087 Lemma 6.19.1. Let $X$ be a topological space. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{C}$ on $X$. Then there exists a sheaf $\mathcal{F}^{\#}$ with values in $\mathcal{C}$ and a morphism $\mathcal{F} \rightarrow \mathcal{F} \#$ of presheaves with values in $\mathcal{C}$ with the following properties:
(1) The map $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ identifies the underlying sheaf of sets of $\mathcal{F}^{\#}$ with the sheafification of the underlying presheaf of sets of $\mathcal{F}$.
(2) For any morphism $\mathcal{F} \rightarrow \mathcal{G}$, where $\mathcal{G}$ is a sheaf with values in $\mathcal{C}$ there exists a unique factorization $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{G}$.
Proof. The proof is the same as the proof of Lemma 6.18.2, with repeated application of Lemma 6.15.4 (see also Example 6.15.5). The main idea however, is to define $\mathcal{F}^{\#}(U)$ as the fibre product in $\mathcal{C}$ of the diagram

compare Lemma 6.18.1.

### 6.20. Sheafification of presheaves of modules

0088
0089 Lemma 6.20.1. Let $X$ be a topological space. Let $\mathcal{O}$ be a presheaf of rings on $X$. Let $\mathcal{F}$ be a presheaf $\mathcal{O}$-modules. Let $\mathcal{O}^{\#}$ be the sheafification of $\mathcal{O}$. Let $\mathcal{F}^{\#}$ be the sheafification of $\mathcal{F}$ as a presheaf of abelian groups. There exists a map of sheaves of sets

$$
\mathcal{O}^{\#} \times \mathcal{F}^{\#} \longrightarrow \mathcal{F}^{\#}
$$

which makes the diagram

commute and which makes $\mathcal{F}^{\#}$ into a sheaf of $\mathcal{O}^{\#}$-modules. In addition, if $\mathcal{G}$ is a sheaf of $\mathcal{O}^{\#}$-modules, then any morphism of presheaves of $\mathcal{O}$-modules $\mathcal{F} \rightarrow \mathcal{G}$ (into the restriction of $\mathcal{G}$ to a $\mathcal{O}$-module) factors uniquely as $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{G}$ where $\mathcal{F}^{\#} \rightarrow \mathcal{G}$ is a morphism of $\mathcal{O}^{\#}$-modules.

Proof. Omitted.
This actually means that the functor $i: \operatorname{Mod}\left(\mathcal{O}^{\#}\right) \rightarrow \operatorname{PMod}(\mathcal{O})$ (combining restriction and including sheaves into presheaves) and the sheafification functor of the lemma $\#: \operatorname{PMod}(\mathcal{O}) \rightarrow \operatorname{Mod}\left(\mathcal{O}^{\#}\right)$ are adjoint. In a formula

$$
\operatorname{Mor}_{P M o d(\mathcal{O})}(\mathcal{F}, i \mathcal{G})=\operatorname{Mor}_{M o d(\mathcal{O} \#)}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

Let $X$ be a topological space. Let $\mathcal{O}_{1} \rightarrow \mathcal{O}_{2}$ be a morphism of sheaves of rings on $X$. In Section 6.6 we defined a restriction functor and a change of rings functor on presheaves of modules associated to this situation.
If $\mathcal{F}$ is a sheaf of $\mathcal{O}_{2}$-modules then the restriction $\mathcal{F}_{\mathcal{O}_{1}}$ of $\mathcal{F}$ is clearly a sheaf of $\mathcal{O}_{1}$-modules. We obtain the restriction functor

$$
\operatorname{Mod}\left(\mathcal{O}_{2}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{1}\right)
$$

On the other hand, given a sheaf of $\mathcal{O}_{1}$-modules $\mathcal{G}$ the presheaf of $\mathcal{O}_{2}$-modules $\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}$ is in general not a sheaf. Hence we define the tensor product sheaf $\mathcal{O}_{2} \otimes \mathcal{O}_{1} \mathcal{G}$ by the formula

$$
\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}=\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}\right)^{\#}
$$

as the sheafification of our construction for presheaves. We obtain the change of rings functor

$$
\operatorname{Mod}\left(\mathcal{O}_{1}\right) \longrightarrow \operatorname{Mod}\left(\mathcal{O}_{2}\right)
$$

008A Lemma 6.20.2. With $X, \mathcal{O}_{1}, \mathcal{O}_{2}, \mathcal{F}$ and $\mathcal{G}$ as above there exists a canonical bijection

$$
\operatorname{Hom}_{\mathcal{O}_{1}}\left(\mathcal{G}, \mathcal{F}_{\mathcal{O}_{1}}\right)=\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)
$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from Lemma 6.6 .2 and the fact that $\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{\mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)=$ $\operatorname{Hom}_{\mathcal{O}_{2}}\left(\mathcal{O}_{2} \otimes_{p, \mathcal{O}_{1}} \mathcal{G}, \mathcal{F}\right)$ because $\mathcal{F}$ is a sheaf.

008B Lemma 6.20.3. Let $X$ be a topological space. Let $\mathcal{O} \rightarrow \mathcal{O}^{\prime}$ be a morphism of sheaves of rings on $X$. Let $\mathcal{F}$ be a sheaf $\mathcal{O}$-modules. Let $x \in X$. We have

$$
\mathcal{F}_{x} \otimes_{\mathcal{O}_{x}} \mathcal{O}_{x}^{\prime}=\left(\mathcal{F} \otimes_{\mathcal{O}} \mathcal{O}^{\prime}\right)_{x}
$$

as $\mathcal{O}_{x}^{\prime}$-modules.
Proof. Follows directly from Lemma 6.14 .2 and the fact that taking stalks commutes with sheafification.

### 6.21. Continuous maps and sheaves

008C Let $f: X \rightarrow Y$ be a continuous map of topological spaces. We will define the pushforward and pullback functors for presheaves and sheaves.
Let $\mathcal{F}$ be a presheaf of sets on $X$. We define the pushforward of $\mathcal{F}$ by the rule

$$
f_{*} \mathcal{F}(V)=\mathcal{F}\left(f^{-1}(V)\right)
$$

for any open $V \subset Y$. Given $V_{1} \subset V_{2} \subset Y$ open the restriction map is given by the commutativity of the diagram

It is clear that this defines a presheaf of sets. The construction is clearly functorial in the presheaf $\mathcal{F}$ and hence we obtain a functor

$$
f_{*}: P S h(X) \longrightarrow P S h(Y) .
$$

008D Lemma 6.21.1. Let $f: X \rightarrow Y$ be a continuous map. Let $\mathcal{F}$ be a sheaf of sets on $X$. Then $f_{*} \mathcal{F}$ is a sheaf on $Y$.

Proof. This immediately follows from the fact that if $V=\bigcup V_{j}$ is an open covering in $Y$, then $f^{-1}(V)=\bigcup f^{-1}\left(V_{j}\right)$ is an open covering in $X$.

As a consequence we obtain a functor

$$
f_{*}: S h(X) \longrightarrow S h(Y)
$$

This is compatible with composition in the following strong sense.
008E Lemma 6.21.2. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be continuous maps of topological spaces. The functors $(g \circ f)_{*}$ and $g_{*} \circ f_{*}$ are equal (on both presheaves and sheaves of sets).

Proof. This is because $(g \circ f)_{*} \mathcal{F}(W)=\mathcal{F}\left((g \circ f)^{-1} W\right)$ and $\left(g_{*} \circ f_{*}\right) \mathcal{F}(W)=$ $\mathcal{F}\left(f^{-1} g^{-1} W\right)$ and $(g \circ f)^{-1} W=f^{-1} g^{-1} W$.

Let $\mathcal{G}$ be a presheaf of sets on $Y$. The pullback presheaf $f_{p} \mathcal{G}$ of a given presheaf $\mathcal{G}$ is defined as the left adjoint of the pushforward $f_{*}$ on presheaves. In other words it should be a presheaf $f_{p} \mathcal{G}$ on $X$ such that

$$
\operatorname{Mor}_{P S h(X)}\left(f_{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P S h(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

By the Yoneda lemma this determines the pullback uniquely. It turns out that it actually exists.

008F Lemma 6.21.3. Let $f: X \rightarrow Y$ be a continuous map. There exists a functor $f_{p}: \operatorname{PSh}(Y) \rightarrow P S h(X)$ which is left adjoint to $f_{*}$. For a presheaf $\mathcal{G}$ it is determined by the rule

$$
f_{p} \mathcal{G}(U)=\operatorname{colim}_{f(U) \subset V} \mathcal{G}(V)
$$

where the colimit is over the collection of open neighbourhoods $V$ of $f(U)$ in $Y$. The colimits are over directed partially ordered sets. (The restriction mappings of $f_{p} \mathcal{G}$ are explained in the proof.)
Proof. The colimit is over the partially ordered set consisting of open subset $V \subset Y$ which contain $f(U)$ with ordering by reverse inclusion. This is a directed partially ordered set, since if $V, V^{\prime}$ are in it then so is $V \cap V^{\prime}$. Furthermore, if $U_{1} \subset U_{2}$, then every open neighbourhood of $f\left(U_{2}\right)$ is an open neighbourhood of $f\left(U_{1}\right)$. Hence the system defining $f_{p} \mathcal{G}\left(U_{2}\right)$ is a subsystem of the one defining $f_{p} \mathcal{G}\left(U_{1}\right)$ and we obtain a restriction map (for example by applying the generalities in Categories, Lemma 4.14.7).

Note that the construction of the colimit is clearly functorial in $\mathcal{G}$, and similarly for the restriction mappings. Hence we have defined $f_{p}$ as a functor.

A small useful remark is that there exists a canonical map $\mathcal{G}(U) \rightarrow f_{p} \mathcal{G}\left(f^{-1}(U)\right)$, because the system of open neighbourhoods of $f\left(f^{-1}(U)\right)$ contains the element $U$. This is compatible with restriction mappings. In other words, there is a canonical $\operatorname{map} i_{\mathcal{G}}: \mathcal{G} \rightarrow f_{*} f_{p} \mathcal{G}$.
Let $\mathcal{F}$ be a presheaf of sets on $X$. Suppose that $\psi: f_{p} \mathcal{G} \rightarrow \mathcal{F}$ is a map of presheaves of sets. The corresponding map $\mathcal{G} \rightarrow f_{*} \mathcal{F}$ is the $\operatorname{map} f_{*} \psi \circ i_{\mathcal{G}}: \mathcal{G} \rightarrow f_{*} f_{p} \mathcal{G} \rightarrow f_{*} \mathcal{F}$.
Another small useful remark is that there exists a canonical map $c_{\mathcal{F}}: f_{p} f_{*} \mathcal{F} \rightarrow \mathcal{F}$. Namely, let $U \subset X$ open. For every open neighbourhood $V \supset f(U)$ in $Y$ there exists a map $f_{*} \mathcal{F}(V)=\mathcal{F}\left(f^{-1}(V)\right) \rightarrow \mathcal{F}(U)$, namely the restriction map on $\mathcal{F}$. And this is compatible with the restriction mappings between values of $\mathcal{F}$ on $f^{-1}$ of varying opens containing $f(U)$. Thus we obtain a canonical map $f_{p} f_{*} \mathcal{F}(U) \rightarrow \mathcal{F}(U)$. Another trivial verification shows that these maps are compatible with restriction maps and define a map $c_{\mathcal{F}}$ of presheaves of sets.

Suppose that $\varphi: \mathcal{G} \rightarrow f_{*} \mathcal{F}$ is a map of presheaves of sets. Consider $f_{p} \varphi: f_{p} \mathcal{G} \rightarrow$ $f_{p} f_{*} \mathcal{F}$. Postcomposing with $c_{\mathcal{F}}$ gives the desired map $c_{\mathcal{F}} \circ f_{p} \varphi: f_{p} \mathcal{G} \rightarrow \mathcal{F}$. We omit the verification that this construction is inverse to the construction in the other direction given above.

008G Lemma 6.21.4. Let $f: X \rightarrow Y$ be a continuous map. Let $x \in X$. Let $\mathcal{G}$ be $a$ presheaf of sets on $Y$. There is a canonical bijection of stalks $\left(f_{p} \mathcal{G}\right)_{x}=\mathcal{G}_{f(x)}$.
Proof. This you can see as follows

$$
\begin{aligned}
\left(f_{p} \mathcal{G}\right)_{x} & =\operatorname{colim}_{x \in U} f_{p} \mathcal{G}(U) \\
& =\operatorname{colim}_{x \in U} \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\
& =\operatorname{colim}_{f(x) \in V} \mathcal{G}(V) \\
& =\mathcal{G}_{f(x)}
\end{aligned}
$$

Here we have used Categories, Lemma 4.14.9, and the fact that any $V$ open in $Y$ containing $f(x)$ occurs in the third description above. Details omitted.

Let $\mathcal{G}$ be a sheaf of sets on $Y$. The pullback sheaf $f^{-1} \mathcal{G}$ is defined by the formula

$$
f^{-1} \mathcal{G}=\left(f_{p} \mathcal{G}\right)^{\#}
$$

Sheafification is a left adjoint to the inclusion of sheaves in presheaves, and $f_{p}$ is a left adjoint to $f_{*}$ on presheaves. As a formal consequence we obtain that $f^{-1}$ is a left adjoint of pushforward on sheaves. In other words,

$$
\operatorname{Mor}_{S h(X)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{S h(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

The formal argument is given in the setting of abelian sheaves in the next section.
008H Lemma 6.21.5. Let $x \in X$. Let $\mathcal{G}$ be a sheaf of sets on $Y$. There is a canonical bijection of stalks $\left(f^{-1} \mathcal{G}\right)_{x}=\mathcal{G}_{f(x)}$.
Proof. This is a combination of Lemmas 6.17.2 and 6.21.4
008 L Lemma 6.21.6. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be continuous maps of topological spaces. The functors $(g \circ f)^{-1}$ and $f^{-1} \circ g^{-1}$ are canonically isomorphic. Similarly $(g \circ f)_{p} \cong f_{p} \circ g_{p}$ on presheaves.
Proof. To see this use that adjoint functors are unique up to unique isomorphism, and Lemma 6.21.2.

008J Definition 6.21.7. Let $f: X \rightarrow Y$ be a continuous map. Let $\mathcal{F}$ be a sheaf of sets on $X$ and let $\mathcal{G}$ be a sheaf of sets on $Y$. An $f$-map $\xi: \mathcal{G} \rightarrow \mathcal{F}$ is a collection of maps $\xi_{V}: \mathcal{G}(V) \rightarrow \mathcal{F}\left(f^{-1}(V)\right)$ indexed by open subsets $V \subset Y$ such that

commutes for all $V^{\prime} \subset V \subset Y$ open.
008K Lemma 6.21.8. Let $f: X \rightarrow Y$ be a continuous map. Let $\mathcal{F}$ be a sheaf of sets on $X$ and let $\mathcal{G}$ be a sheaf of sets on $Y$. There are canonical bijections between the following three sets:
(1) The set of maps $\mathcal{G} \rightarrow f_{*} \mathcal{F}$.
(2) The set of maps $f^{-1} \mathcal{G} \rightarrow \mathcal{F}$.
(3) The set of $f$-maps $\xi: \mathcal{G} \rightarrow \mathcal{F}$.

Proof. We leave the easy verification to the reader.
It is sometimes convenient to think about $f$-maps instead of maps between sheaves either on $X$ or on $Y$. We define composition of $f$-maps as follows.

008L Definition 6.21.9. Suppose that $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are continuous maps of topological spaces. Suppose that $\mathcal{F}$ is a sheaf on $X, \mathcal{G}$ is a sheaf on $Y$, and $\mathcal{H}$ is a sheaf on $Z$. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be an $f$-map. Let $\psi: \mathcal{H} \rightarrow \mathcal{G}$ be an $g$-map. The composition of $\varphi$ and $\psi$ is the $(g \circ f)-\operatorname{map} \varphi \circ \psi$ defined by the commutativity of the diagrams

We leave it to the reader to verify that this works. Another way to think about this is to think of $\varphi \circ \psi$ as the composition

$$
\mathcal{H} \xrightarrow{\psi} g_{*} \mathcal{G} \xrightarrow{g_{*} \varphi} g_{*} f_{*} \mathcal{F}=(g \circ f)_{*} \mathcal{F}
$$

Now, doesn't it seem that thinking about $f$-maps is somehow easier?
Finally, given a continuous map $f: X \rightarrow Y$, and an $f$-map $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ there is a natural map on stalks

$$
\varphi_{x}: \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_{x}
$$

for all $x \in X$. The image of a representative $(V, s)$ of an element in $\mathcal{G}_{f(x)}$ is mapped to the element in $\mathcal{F}_{x}$ with representative $\left(f^{-1} V, \varphi_{V}(s)\right)$. We leave it to the reader to see that this is well defined. Another way to state it is that it is the unique map such that all diagrams

(for $x \in V \subset Y$ open) commute.
008M Lemma 6.21.10. Suppose that $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ are continuous maps of topological spaces. Suppose that $\mathcal{F}$ is a sheaf on $X, \mathcal{G}$ is a sheaf on $Y$, and $\mathcal{H}$ is a sheaf on $Z$. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be an f-map. Let $\psi: \mathcal{H} \rightarrow \mathcal{G}$ be an g-map. Let $x \in X$ be a point. The map on stalks $(\varphi \circ \psi)_{x}: \mathcal{H}_{g(f(x))} \rightarrow \mathcal{F}_{x}$ is the composition

$$
\mathcal{H}_{g(f(x))} \xrightarrow{\psi_{f(x)}} \mathcal{G}_{f(x)} \xrightarrow{\varphi_{x}} \mathcal{F}_{x}
$$

Proof. Immediate from Definition 6.21 .9 and the definition of the map on stalks above.

### 6.22. Continuous maps and abelian sheaves

008 N Let $f: X \rightarrow Y$ be a continuous map. We claim there are functors

$$
\begin{aligned}
& f_{*}: P A b(X) \longrightarrow \\
& P A b(Y) \\
& f_{*}: A b(X) \longrightarrow A b(Y) \\
& f_{p}: P A b(Y) \longrightarrow \\
& f^{-1}: A b(Y) \longrightarrow A b(X) \\
&
\end{aligned}
$$

with similar properties to their counterparts in Section 6.21 To see this we argue in the following way.

Each of the functors will be constructed in the same way as the corresponding functor in Section 6.21. This works because all the colimits in that section are directed colimits (but we will work through it below).

First off, given an abelian presheaf $\mathcal{F}$ on $X$ and an abelian presheaf $\mathcal{G}$ on $Y$ we define

$$
\begin{aligned}
f_{*} \mathcal{F}(V) & =\mathcal{F}\left(f^{-1}(V)\right) \\
f_{p} \mathcal{G}(U) & =\operatorname{colim}_{f(U) \subset V} \mathcal{G}(V)
\end{aligned}
$$

as abelian groups. The restriction mappings are the same as the restriction mappings for presheaves of sets (and they are all homomorphisms of abelian groups).

The assignments $\mathcal{F} \mapsto f_{*} \mathcal{F}$ and $\mathcal{G} \rightarrow f_{p} \mathcal{G}$ are functors on the categories of presheaves of abelian groups. This is clear, as (for example) a map of abelian presheaves $\mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ gives rise to a map of directed systems $\left\{\mathcal{G}_{1}(V)\right\}_{f(U) \subset V} \rightarrow\left\{\mathcal{G}_{2}(V)\right\}_{f(U) \subset V}$ all of whose maps are homomorphisms and hence gives rise to a homomorphism of abelian groups $f_{p} \mathcal{G}_{1}(U) \rightarrow f_{p} \mathcal{G}_{2}(U)$.

The functors $f_{*}$ and $f_{p}$ are adjoint on the category of presheaves of abelian groups, i.e., we have

$$
\operatorname{Mor}_{P A b(X)}\left(f_{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P A b(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

To prove this, note that the $\operatorname{map} i_{\mathcal{G}}: \mathcal{G} \rightarrow f_{*} f_{p} \mathcal{G}$ from the proof of Lemma 6.21 .3 is a map of abelian presheaves. Hence if $\psi: f_{p} \mathcal{G} \rightarrow \mathcal{F}$ is a map of abelian presheaves, then the corresponding map $\mathcal{G} \rightarrow f_{*} \mathcal{F}$ is the map $f_{*} \psi \circ i_{\mathcal{G}}: \mathcal{G} \rightarrow f_{*} f_{p} \mathcal{G} \rightarrow f_{*} \mathcal{F}$ is also a map of abelian presheaves. For the other direction we point out that the map $c_{\mathcal{F}}: f_{p} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ from the proof of Lemma 6.21 .3 is a map of abelian presheaves as well (since it is made out of restriction mappings of $\mathcal{F}$ which are all homomorphisms). Hence given a map of abelian presheaves $\varphi: \mathcal{G} \rightarrow f_{*} \mathcal{F}$ the map $c_{\mathcal{F}} \circ f_{p} \varphi: f_{p} \mathcal{G} \rightarrow \mathcal{F}$ is a map of abelian presheaves as well. Since these constructions $\psi \mapsto f_{*} \psi$ and $\varphi \mapsto c_{\mathcal{F}} \circ f_{p} \varphi$ are inverse to each other as constructions on maps of presheaves of sets we see they are also inverse to each other on maps of abelian presheaves.

If $\mathcal{F}$ is an abelian sheaf on $Y$, then $f_{*} \mathcal{F}$ is an abelian sheaf on $X$. This is true because of the definition of an abelian sheaf and because this is true for sheaves of sets, see Lemma 6.21.1. This defines the functor $f_{*}$ on the category of abelian sheaves.

We define $f^{-1} \mathcal{G}=\left(f_{p} \mathcal{G}\right)^{\#}$ as before. Adjointness of $f_{*}$ and $f^{-1}$ follows formally as in the case of presheaves of sets. Here is the argument:

$$
\begin{aligned}
\operatorname{Mor}_{A b(X)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{P A b(X)}\left(f_{p} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{P A b(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right) \\
& =\operatorname{Mor}_{A b(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

008 O Lemma 6.22.1. Let $f: X \rightarrow Y$ be a continuous map.
(1) Let $\mathcal{G}$ be an abelian presheaf on $Y$. Let $x \in X$. The bijection $\mathcal{G}_{f(x)} \rightarrow$ $\left(f_{p} \mathcal{G}\right)_{x}$ of Lemma 6.21.4 is an isomorphism of abelian groups.
(2) Let $\mathcal{G}$ be an abelian sheaf on $Y$. Let $x \in X$. The bijection $\mathcal{G}_{f(x)} \rightarrow\left(f^{-1} \mathcal{G}\right)_{x}$ of Lemma 6.21.5 is an isomorphism of abelian groups.

Proof. Omitted.

Given a continuous map $f: X \rightarrow Y$ and sheaves of abelian groups $\mathcal{F}$ on $X, \mathcal{G}$ on $Y$, the notion of an $f$-map $\mathcal{G} \rightarrow \mathcal{F}$ of sheaves of abelian groups makes sense. We can just define it exactly as in Definition 6.21 .7 (replacing maps of sets with homomorphisms of abelian groups) or we can simply say that it is the same as a map of abelian sheaves $\mathcal{G} \rightarrow f_{*} \mathcal{F}$. We will use this notion freely in the following. The group of $f$-maps between $\mathcal{G}$ and $\mathcal{F}$ will be in canonical bijection with the groups $\operatorname{Mor}_{A b(X)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)$ and $\operatorname{Mor}_{A b(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)$.

Composition of $f$-maps is defined in exactly the same manner as in the case of $f$ maps of sheaves of sets. In addition, given an $f$-map $\mathcal{G} \rightarrow \mathcal{F}$ as above, the induced maps on stalks

$$
\varphi_{x}: \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_{x}
$$

are abelian group homomorphisms.

### 6.23. Continuous maps and sheaves of algebraic structures

008 P Let $(\mathcal{C}, F)$ be a type of algebraic structure. For a topological space $X$ let us introduce the notation:
(1) $\operatorname{PSh}(X, \mathcal{C})$ will be the category of presheaves with values in $\mathcal{C}$.
(2) $\operatorname{Sh}(X, \mathcal{C})$ will be the category of sheaves with values in $\mathcal{C}$.

Let $f: X \rightarrow Y$ be a continuous map of topological spaces. The same arguments as in the previous section show there are functors

$$
\begin{aligned}
f_{*}: \operatorname{PSh}(X, \mathcal{C}) & \longrightarrow \operatorname{PSh}(Y, \mathcal{C}) \\
f_{*}: \operatorname{Sh}(X, \mathcal{C}) & \longrightarrow \operatorname{Sh}(Y, \mathcal{C}) \\
f_{p}: \operatorname{PSh}(Y, \mathcal{C}) & \longrightarrow \operatorname{PSh}(X, \mathcal{C}) \\
f^{-1}: \operatorname{Sh}(Y, \mathcal{C}) & \longrightarrow \operatorname{Sh}(X, \mathcal{C})
\end{aligned}
$$

constructed in the same manner and with the same properties as the functors constructed for abelian (pre)sheaves. In particular there are commutative diagrams

The main formulas to keep in mind are the following

$$
\begin{aligned}
f_{*} \mathcal{F}(V) & =\mathcal{F}\left(f^{-1}(V)\right) \\
f_{p} \mathcal{G}(U) & =\operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\
f^{-1} \mathcal{G} & =\left(f_{p} \mathcal{G}\right)^{\#} \\
\left(f_{p} \mathcal{G}\right)_{x} & =\mathcal{G}_{f(x)} \\
\left(f^{-1} \mathcal{G}\right)_{x} & =\mathcal{G}_{f(x)}
\end{aligned}
$$

Each of these formulas has the property that they hold in the category $\mathcal{C}$ and that upon taking underlying sets we get the corresponding formula for presheaves of sets. In addition we have the adjointness properties

$$
\begin{aligned}
\operatorname{Mor}_{P S h(X, \mathcal{C})}\left(f_{p} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{P S h(Y, \mathcal{C})}\left(\mathcal{G}, f_{*} \mathcal{F}\right) \\
\operatorname{Mor}_{S h(X, \mathcal{C})}\left(f^{-1} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{S h(Y, \mathcal{C})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

To prove these, the main step is to construct the maps

$$
i_{\mathcal{G}}: \mathcal{G} \longrightarrow f_{*} f_{p} \mathcal{G}
$$

and

$$
c_{\mathcal{F}}: f_{p} f_{*} \mathcal{F} \longrightarrow \mathcal{F}
$$

which occur in the proof of Lemma 6.21 .3 as morphisms of presheaves with values in $\mathcal{C}$. This may be safely left to the reader since the constructions are exactly the same as in the case of presheaves of sets.
Given a continuous map $f: X \rightarrow Y$ and sheaves of algebraic structures $\mathcal{F}$ on $X$, $\mathcal{G}$ on $Y$, the notion of an $f$-map $\mathcal{G} \rightarrow \mathcal{F}$ of sheaves of algebraic structures makes sense. We can just define it exactly as in Definition 6.21.7 (replacing maps of sets with morphisms in $\mathcal{C}$ ) or we can simply say that it is the same as a map of sheaves of algebraic structures $\mathcal{G} \rightarrow f_{*} \mathcal{F}$. We will use this notion freely in the following. The set of $f$-maps between $\mathcal{G}$ and $\mathcal{F}$ will be in canonical bijection with the sets $\operatorname{Mor}_{S h(X, \mathcal{C})}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)$ and $\operatorname{Mor}_{S h(Y, \mathcal{C})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)$.
Composition of $f$-maps is defined in exactly the same manner as in the case of $f$ maps of sheaves of sets. In addition, given an $f$-map $\mathcal{G} \rightarrow \mathcal{F}$ as above, the induced maps on stalks

$$
\varphi_{x}: \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_{x}
$$

are homomorphisms of algebraic structures.
008Q Lemma 6.23.1. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Suppose given sheaves of algebraic structures $\mathcal{F}$ on $X, \mathcal{G}$ on $Y$. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be an $f$-map of underlying sheaves of sets. If for every $V \subset Y$ open the map of sets $\varphi_{V}: \mathcal{G}(V) \rightarrow \mathcal{F}\left(f^{-1} V\right)$ is the effect of a morphism in $\mathcal{C}$ on underlying sets, then $\varphi$ comes from a unique $f$-morphism between sheaves of algebraic structures.

Proof. Omitted.

### 6.24. Continuous maps and sheaves of modules

008 R The case of sheaves of modules is more complicated. The reason is that the natural setting for defining the pullback and pushforward functors, is the setting of ringed spaces, which we will define below. First we state a few obvious lemmas.

008S Lemma 6.24.1. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on $X$. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. There is a natural map of underlying presheaves of sets

$$
f_{*} \mathcal{O} \times f_{*} \mathcal{F} \longrightarrow f_{*} \mathcal{F}
$$

which turns $f_{*} \mathcal{F}$ into a presheaf of $f_{*} \mathcal{O}$-modules. This construction is functorial in $\mathcal{F}$.

Proof. Let $V \subset Y$ is open. We define the map of the lemma to be the map

$$
f_{*} \mathcal{O}(V) \times f_{*} \mathcal{F}(V)=\mathcal{O}\left(f^{-1} V\right) \times \mathcal{F}\left(f^{-1} V\right) \rightarrow \mathcal{F}\left(f^{-1} V\right)=f_{*} \mathcal{F}(V)
$$

Here the arrow in the middle is the multiplication map on $X$. We leave it to the reader to see this is compatible with restriction mappings and defines a structure of $f_{*} \mathcal{O}$-module on $f_{*} \mathcal{F}$.

008T Lemma 6.24.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on $Y$. Let $\mathcal{G}$ be a presheaf of $\mathcal{O}$-modules. There is a natural map of underlying presheaves of sets

$$
f_{p} \mathcal{O} \times f_{p} \mathcal{G} \longrightarrow f_{p} \mathcal{G}
$$

which turns $f_{p} \mathcal{G}$ into a presheaf of $f_{p} \mathcal{O}$-modules. This construction is functorial in $\mathcal{G}$.

Proof. Let $U \subset X$ is open. We define the map of the lemma to be the map

$$
\begin{aligned}
f_{p} \mathcal{O}(U) \times f_{p} \mathcal{G}(U) & =\operatorname{colim}_{f(U) \subset V} \mathcal{O}(V) \times \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\
& =\operatorname{colim}_{f(U) \subset V}(\mathcal{O}(V) \times \mathcal{G}(V)) \\
& \rightarrow \operatorname{colim}_{f(U) \subset V} \mathcal{G}(V) \\
& =f_{p} \mathcal{G}(U) .
\end{aligned}
$$

Here the arrow in the middle is the multiplication map on $Y$. The second equality holds because directed colimits commute with finite limits, see Categories, Lemma 4.19.2. We leave it to the reader to see this is compatible with restriction mappings and defines a structure of $f_{p} \mathcal{O}$-module on $f_{p} \mathcal{G}$.

Let $f: X \rightarrow Y$ be a continuous map. Let $\mathcal{O}_{X}$ be a presheaf of rings on $X$ and let $\mathcal{O}_{Y}$ be a presheaf of rings on $Y$. So at the moment we have defined functors

$$
\begin{aligned}
& f_{*}: \operatorname{PMod}\left(\mathcal{O}_{X}\right) \quad \longrightarrow \quad \operatorname{PMod}\left(f_{*} \mathcal{O}_{X}\right) \\
& f_{p}: \operatorname{PMod}\left(\mathcal{O}_{Y}\right) \quad \longrightarrow \quad \operatorname{PMod}\left(f_{p} \mathcal{O}_{Y}\right)
\end{aligned}
$$

These satisfy some compatibilities as follows.
008 U Lemma 6.24.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on $Y$. Let $\mathcal{G}$ be a presheaf of $\mathcal{O}$-modules. Let $\mathcal{F}$ be a presheaf of $f_{p} \mathcal{O}$-modules. Then

$$
\operatorname{Mor}_{P M o d\left(f_{p} \mathcal{O}\right)}\left(f_{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P M o d(\mathcal{O})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

Here we use Lemmas 6.24.2 and 6.24.1, and we think of $f_{*} \mathcal{F}$ as an $\mathcal{O}$-module via the map $i_{\mathcal{O}}: \mathcal{O} \rightarrow f_{*} f_{p} \mathcal{O}$ (defined first in the proof of Lemma 6.21.3).

Proof. Note that we have

$$
\operatorname{Mor}_{P A b(X)}\left(f_{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P A b(Y)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

according to Section 6.22 . So what we have to prove is that under this correspondence, the subsets of module maps correspond. In addition, the correspondence is determined by the rule

$$
\left(\psi: f_{p} \mathcal{G} \rightarrow \mathcal{F}\right) \longmapsto\left(f_{*} \psi \circ i_{\mathcal{G}}: \mathcal{G} \rightarrow f_{*} \mathcal{F}\right)
$$

and in the other direction by the rule

$$
\left(\varphi: \mathcal{G} \rightarrow f_{*} \mathcal{F}\right) \longmapsto\left(c_{\mathcal{F}} \circ f_{p} \varphi: f_{p} \mathcal{G} \rightarrow \mathcal{F}\right)
$$

where $i_{\mathcal{G}}$ and $c_{\mathcal{F}}$ are as in Section 6.22. Hence, using the functoriality of $f_{*}$ and $f_{p}$ we see that it suffices to check that the maps $i_{\mathcal{G}}: \mathcal{G} \rightarrow f_{*} f_{p} \mathcal{G}$ and $c_{\mathcal{F}}: f_{p} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ are compatible with module structures, which we leave to the reader.

008 V Lemma 6.24.4. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on $X$.Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. Let $\mathcal{G}$ be a presheaf of $f_{*} \mathcal{O}$-modules. Then

$$
\operatorname{Mor}_{P M o d(\mathcal{O})}\left(\mathcal{O} \otimes_{p, f_{p} f_{*} \mathcal{O}} f_{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P M o d\left(f_{*} \mathcal{O}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

Here we use Lemmas 6.24.2 and 6.24.1, and we use the map $c_{\mathcal{O}}: f_{p} f_{*} \mathcal{O} \rightarrow \mathcal{O}$ in the definition of the tensor product.

Proof. This follows from the equalities

$$
\begin{aligned}
\operatorname{Mor}_{P M o d(\mathcal{O})}\left(\mathcal{O} \otimes_{p, f_{p} f_{*} \mathcal{O}} f_{p} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{P \operatorname{Mod}\left(f_{p} f_{*} \mathcal{O}\right)}\left(f_{p} \mathcal{G}, \mathcal{F}_{f_{p} f_{*} \mathcal{O}}\right) \\
& =\operatorname{Mor}_{P \operatorname{Mod}\left(f_{*} \mathcal{O}\right)}\left(\mathcal{G}, f_{*}\left(\mathcal{F}_{f_{p} f_{*} \mathcal{O}}\right)\right) \\
& =\operatorname{Mor}_{P \operatorname{Mod}\left(f_{*} \mathcal{O}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

The first equality is Lemma6.6.2. The second equality is Lemma6.24.3. The third equality is given by the equality $f_{*}\left(\mathcal{F}_{f_{p} f_{*} \mathcal{O}}\right)=f_{*} \mathcal{F}$ of abelian sheaves which is $f_{*} \mathcal{O}$-linear. Namely, $\mathrm{id}_{f_{*} \mathcal{O}}$ corresponds to $c_{\mathcal{O}}$ under the adjunction described in the proof of Lemma 6.21.3 and thus $\mathrm{id}_{f_{*} \mathcal{O}}=f_{*} c_{\mathcal{O}} \circ i_{f_{*} \mathcal{O}}$.

008W Lemma 6.24.5. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on $X$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. The pushforward $f_{*} \mathcal{F}$, as defined in Lemma 6.24.1 is a sheaf of $f_{*} \mathcal{O}$-modules.

Proof. Obvious from the definition and Lemma 6.21.1.

008X Lemma 6.24.6. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on $Y$. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules. There is a natural map of underlying presheaves of sets

$$
f^{-1} \mathcal{O} \times f^{-1} \mathcal{G} \longrightarrow f^{-1} \mathcal{G}
$$

which turns $f^{-1} \mathcal{G}$ into a sheaf of $f^{-1} \mathcal{O}$-modules.
Proof. Recall that $f^{-1}$ is defined as the composition of the functor $f_{p}$ and sheafification. Thus the lemma is a combination of Lemma 6.24.2 and Lemma 6.20.1.

Let $f: X \rightarrow Y$ be a continuous map. Let $\mathcal{O}_{X}$ be a sheaf of rings on $X$ and let $\mathcal{O}_{Y}$ be a sheaf of rings on $Y$. So now we have defined functors

$$
\begin{aligned}
& f_{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Mod}\left(f_{*} \mathcal{O}_{X}\right) \\
& f^{-1}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \longrightarrow \\
& \operatorname{Mod}\left(f^{-1} \mathcal{O}_{Y}\right)
\end{aligned}
$$

These satisfy some compatibilities as follows.
008Y Lemma 6.24.7. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on $Y$. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules. Let $\mathcal{F}$ be a sheaf of $f^{-1} \mathcal{O}$-modules. Then

$$
\operatorname{Mor}_{M o d\left(f^{-1} \mathcal{O}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{\operatorname{Mod}(\mathcal{O})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

Here we use Lemmas 6.24.6 and 6.24.5, and we think of $f_{*} \mathcal{F}$ as an $\mathcal{O}$-module by restriction via $\mathcal{O} \rightarrow f_{*} f^{-1} \mathcal{O}$.

Proof. Argue by the equalities

$$
\begin{aligned}
\operatorname{Mor}_{M o d\left(f^{-1} \mathcal{O}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{M o d\left(f_{p} \mathcal{O}\right)}\left(f_{p} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{M o d(\mathcal{O})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

where the second is Lemmas 6.24.3 and the first is by Lemma 6.20.1.
008Z Lemma 6.24.8. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on $X$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Let $\mathcal{G}$ be a sheaf of $f_{*} \mathcal{O}$-modules. Then

$$
\operatorname{Mor}_{M o d(\mathcal{O})}\left(\mathcal{O} \otimes_{f^{-1} f_{*} \mathcal{O}} f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{M o d\left(f_{*} \mathcal{O}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

Here we use Lemmas 6.24.6 and 6.24.5, and we use the canonical map $f^{-1} f_{*} \mathcal{O} \rightarrow \mathcal{O}$ in the definition of the tensor product.

Proof. This follows from the equalities

$$
\begin{aligned}
\operatorname{Mor}_{M o d(\mathcal{O})}\left(\mathcal{O} \otimes_{f^{-1} f_{*} \mathcal{O}} f^{-1} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{\operatorname{Mod}\left(f^{-1} f_{*} \mathcal{O}\right)}\left(f^{-1} \mathcal{G}, \mathcal{F}_{f^{-1} f_{*} \mathcal{O}}\right) \\
& =\operatorname{Mor}_{\operatorname{Mod}\left(f_{*} \mathcal{O}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

which are a combination of Lemma 6.20.2 and 6.24.7.
Let $f: X \rightarrow Y$ be a continuous map. Let $\mathcal{O}_{X}$ be a (pre)sheaf of rings on $X$ and let $\mathcal{O}_{Y}$ be a (pre)sheaf of rings on $Y$. So at the moment we have defined functors

$$
\begin{aligned}
f_{*}: \operatorname{PMod}\left(\mathcal{O}_{X}\right) & \longrightarrow \operatorname{PMod}\left(f_{*} \mathcal{O}_{X}\right) \\
f_{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) & \longrightarrow \operatorname{Mod}\left(f_{*} \mathcal{O}_{X}\right) \\
f_{p}: \operatorname{PMod}\left(\mathcal{O}_{Y}\right) & \longrightarrow \operatorname{PMod}\left(f_{p} \mathcal{O}_{Y}\right) \\
f^{-1}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) & \longrightarrow \operatorname{Mod}\left(f^{-1} \mathcal{O}_{Y}\right)
\end{aligned}
$$

Clearly, usually the pair of functors $\left(f_{*}, f^{-1}\right)$ on sheaves of modules are not adjoint, because their target categories do not match. Namely, as we saw above, it works only if by some miracle the sheaves of rings $\mathcal{O}_{X}, \mathcal{O}_{Y}$ satisfy the relations $\mathcal{O}_{X}=$ $f^{-1} \mathcal{O}_{Y}$ and $\mathcal{O}_{Y}=f_{*} \mathcal{O}_{X}$. This is almost never true in practice. We interrupt the discussion to define the correct notion of morphism for which a suitable adjoint pair of functors on sheaves of modules exists.

### 6.25. Ringed spaces

Let $X$ be a topological space and let $\mathcal{O}_{X}$ be a sheaf of rings on $X$. We are supposed to think of the sheaf of rings $\mathcal{O}_{X}$ as a sheaf of functions on $X$. And if $f: X \rightarrow Y$ is a "suitable" map, then by composition a function on $Y$ turns into a function on $X$. Thus there should be a natural $f$-map from $\mathcal{O}_{Y}$ to $\mathcal{O}_{X}$ See Definition 6.21.7, and the remarks in previous sections for terminology. For a precise example, see Example 6.25 .2 below. Here is the relevant abstract definition.

0091 Definition 6.25.1. A ringed space is a pair $\left(X, \mathcal{O}_{X}\right)$ consisting of a topological space $X$ and a sheaf of rings $\mathcal{O}_{X}$ on $X$. A morphism of ringed spaces $\left(X, \mathcal{O}_{X}\right) \rightarrow$ $\left(Y, \mathcal{O}_{Y}\right)$ is a pair consisting of a continuous map $f: X \rightarrow Y$ and an $f$-map of sheaves of rings $f^{\sharp}: \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$.

0092 Example 6.25.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Consider the sheaves of continuous real valued functions $\mathcal{C}_{X}^{0}$ on $X$ and $\mathcal{C}_{Y}^{0}$ on $Y$, see Example 6.9.3. We claim that there is a natural $f$-map $f^{\sharp}: \mathcal{C}_{Y}^{0} \rightarrow \mathcal{C}_{X}^{0}$ associated to $f$. Namely, we simply define it by the rule

$$
\begin{aligned}
\mathcal{C}_{Y}^{0}(V) & \longrightarrow \mathcal{C}_{X}^{0}\left(f^{-1} V\right) \\
h & \longmapsto h \circ f
\end{aligned}
$$

Strictly speaking we should write $f^{\sharp}(h)=\left.h \circ f\right|_{f^{-1}(V)}$. It is clear that this is a family of maps as in Definition 6.21 .7 and compatible with the $\mathbf{R}$-algebra structures. Hence it is an $f$-map of sheaves of $\mathbf{R}$-algebras, see Lemma 6.23.1.

Of course there are lots of other situations where there is a canonical morphism of ringed spaces associated to a geometrical type of morphism. For example, if $M, N$ are $\mathcal{C}^{\infty}$-manifolds and $f: M \rightarrow N$ is a infinitely differentiable map, then $f$ induces a canonical morphism of ringed spaces $\left(M, \mathcal{C}_{M}^{\infty}\right) \rightarrow\left(N, \mathcal{C}_{N}^{\infty}\right)$. The construction (which is identical to the above) is left to the reader.

It may not be completely obvious how to compose morphisms of ringed spaces hence we spell it out here.

0093 Definition 6.25.3. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ and $\left(g, g^{\sharp}\right):\left(Y, \mathcal{O}_{Y}\right) \rightarrow$ $\left(Z, \mathcal{O}_{Z}\right)$ be morphisms of ringed spaces. Then we define the composition of morphisms of ringed spaces by the rule

$$
\left(g, g^{\sharp}\right) \circ\left(f, f^{\sharp}\right)=\left(g \circ f, f^{\sharp} \circ g^{\sharp}\right) .
$$

Here we use composition of $f$-maps defined in Definition 6.21 .9 .

### 6.26. Morphisms of ringed spaces and modules

0094 We have now introduced enough notation so that we are able to define the pullback and pushforward of modules along a morphism of ringed spaces.

0095 Definition 6.26.1. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces.
(1) Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. We define the pushforward of $\mathcal{F}$ as the sheaf of $\mathcal{O}_{Y}$-modules which as a sheaf of abelian groups equals $f_{*} \mathcal{F}$ and with module structure given by the restriction via $f^{\sharp}: \mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$ of the module structure given in Lemma 6.24.5.
(2) Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{Y}$-modules. We define the pullback $f^{*} \mathcal{G}$ to be the sheaf of $\mathcal{O}_{X}$-modules defined by the formula

$$
f^{*} \mathcal{G}=\mathcal{O}_{X} \otimes_{f^{-1}} \mathcal{O}_{Y} f^{-1} \mathcal{G}
$$

where the ring map $f^{-1} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$ is the map corresponding to $f^{\sharp}$, and where the module structure is given by Lemma 6.24.6.

Thus we have defined functors

$$
\begin{array}{lll}
f_{*}: \operatorname{Mod}\left(\mathcal{O}_{X}\right) & \longrightarrow & \operatorname{Mod}\left(\mathcal{O}_{Y}\right) \\
f^{*}: \operatorname{Mod}\left(\mathcal{O}_{Y}\right) & \longrightarrow & \operatorname{Mod}\left(\mathcal{O}_{X}\right)
\end{array}
$$

The final result on these functors is that they are indeed adjoint as expected.
0096 Lemma 6.26.2. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{Y}$-modules. There is a canonical bijection

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(f^{*} \mathcal{G}, \mathcal{F}\right)=\operatorname{Hom}_{\mathcal{O}_{Y}}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

In other words: the functor $f^{*}$ is the left adjoint to $f_{*}$.
Proof. This follows from the work we did before:

$$
\begin{aligned}
\operatorname{Hom}_{\mathcal{O}_{X}}\left(f^{*} \mathcal{G}, \mathcal{F}\right) & =\operatorname{Mor}_{M o d\left(\mathcal{O}_{X}\right)}\left(\mathcal{O}_{X} \otimes_{f^{-1}} \mathcal{O}_{Y} f^{-1} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{M o d(f-1} \mathcal{O}_{Y}\left(f^{-1} \mathcal{G}, \mathcal{F}_{f^{-1}} \mathcal{O}_{Y}\right) \\
& =\operatorname{Hom}_{\mathcal{O}_{Y}}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
\end{aligned}
$$

Here we use Lemmas 6.20.2 and 6.24.7,
0097 Lemma 6.26.3. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of ringed spaces. The functors $(g \circ f)_{*}$ and $g_{*} \circ f_{*}$ are equal. There is a canonical isomorphism of functors $(g \circ f)^{*} \cong f^{*} \circ g^{*}$.

Proof. The result on pushforwards is a consequence of Lemma 6.21.2 and our definitions. The result on pullbacks follows from this by the same argument as in the proof of Lemma 6.21.6.

Given a morphism of ringed spaces $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$, and a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$, a sheaf of $\mathcal{O}_{Y}$-modules $\mathcal{G}$ on $Y$, the notion of an $f$-map $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ of sheaves of modules makes sense. We can just define it as an $f$-map $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ of abelian sheaves such that for all open $V \subset Y$ the map

$$
\mathcal{G}(V) \longrightarrow \mathcal{F}\left(f^{-1} V\right)
$$

is an $\mathcal{O}_{Y}(V)$-module map. Here we think of $\mathcal{F}\left(f^{-1} V\right)$ as an $\mathcal{O}_{Y}(V)$-module via the map $f_{V}^{\sharp}: \mathcal{O}_{Y}(V) \rightarrow \mathcal{O}_{X}\left(f^{-1} V\right)$. The set of $f$-maps between $\mathcal{G}$ and $\mathcal{F}$ will be in canonical bijection with the sets $\operatorname{Mor}_{M o d\left(\mathcal{O}_{X}\right)}\left(f^{*} \mathcal{G}, \mathcal{F}\right)$ and $\operatorname{Mor}_{\operatorname{Mod}\left(\mathcal{O}_{Y}\right)}\left(\mathcal{G}, f_{*} \mathcal{F}\right)$. See above.

Composition of $f$-maps is defined in exactly the same manner as in the case of $f$-maps of sheaves of sets. In addition, given an $f$-map $\mathcal{G} \rightarrow \mathcal{F}$ as above, and $x \in X$ the induced map on stalks

$$
\varphi_{x}: \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_{x}
$$

is an $\mathcal{O}_{Y, f(x)}$-module map where the $\mathcal{O}_{Y, f(x)}$-module structure on $\mathcal{F}_{x}$ comes from the $\mathcal{O}_{X, x}$-module structure via the map $f_{x}^{\sharp}: \mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$. Here is a related lemma.
0098 Lemma 6.26.4. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{Y}$-modules. Let $x \in X$. Then

$$
\left(f^{*} \mathcal{G}\right)_{x}=\mathcal{G}_{f(x)} \otimes_{\mathcal{O}_{Y, f(x)}} \mathcal{O}_{X, x}
$$

as $\mathcal{O}_{X, x}$-modules where the tensor product on the right uses $f_{x}^{\sharp}: \mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$.
Proof. This follows from Lemma 6.20.3 and the identification of the stalks of pullback sheaves at $x$ with the corresponding stalks at $f(x)$. See the formulae in Section 6.23 for example.

### 6.27. Skyscraper sheaves and stalks

0099
Definition 6.27.1. Let $X$ be a topological space.
(1) Let $x \in X$ be a point. Denote $i_{x}:\{x\} \rightarrow X$ the inclusion map. Let $A$ be a set and think of $A$ as a sheaf on the one point space $\{x\}$. We call $i_{x, *} A$ the skyscraper sheaf at $x$ with value $A$.
(2) If in (1) above $A$ is an abelian group then we think of $i_{x, *} A$ as a sheaf of abelian groups on $X$.
(3) If in (1) above $A$ is an algebraic structure then we think of $i_{x, *} A$ as a sheaf of algebraic structures.
(4) If $\left(X, \mathcal{O}_{X}\right)$ is a ringed space, then we think of $i_{x}:\{x\} \rightarrow X$ as a morphism of ringed spaces $\left(\{x\}, \mathcal{O}_{X, x}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ and if $A$ is a $\mathcal{O}_{X, x}$-module, then we think of $i_{x, *} A$ as a sheaf of $\mathcal{O}_{X}$-modules.
(5) We say a sheaf of sets $\mathcal{F}$ is a skyscraper sheaf if there exists an point $x$ of $X$ and a set $A$ such that $\mathcal{F} \cong i_{x, *} A$.
(6) We say a sheaf of abelian groups $\mathcal{F}$ is a skyscraper sheaf if there exists an point $x$ of $X$ and an abelian group $A$ such that $\mathcal{F} \cong i_{x, *} A$ as sheaves of abelian groups.
(7) We say a sheaf of algebraic structures $\mathcal{F}$ is a skyscraper sheaf if there exists an point $x$ of $X$ and an algebraic structure $A$ such that $\mathcal{F} \cong i_{x, *} A$ as sheaves of algebraic structures.
(8) If $\left(X, \mathcal{O}_{X}\right)$ is a ringed space and $\mathcal{F}$ is a sheaf of $\mathcal{O}_{X}$-modules, then we say $\mathcal{F}$ is a skyscraper sheaf if there exists a point $x \in X$ and a $\mathcal{O}_{X, x}$-module $A$ such that $\mathcal{F} \cong i_{x, *} A$ as sheaves of $\mathcal{O}_{X}$-modules.
009B Lemma 6.27.2. Let $X$ be a topological space, $x \in X$ a point, and $A$ a set. For any point $x^{\prime} \in X$ the stalk of the skyscraper sheaf at $x$ with value $A$ at $x^{\prime}$ is

$$
\left(i_{x, *} A\right)_{x^{\prime}}=\left\{\begin{array}{cll}
A & \text { if } & x^{\prime} \in \overline{\{x\}} \\
\{*\} & \text { if } & x^{\prime} \notin \overline{\{x\}}
\end{array}\right.
$$

A similar description holds for the case of abelian groups, algebraic structures and sheaves of modules.

Proof. Omitted.
009C Lemma 6.27.3. Let $X$ be a topological space, and let $x \in X$ a point. The functors $\mathcal{F} \mapsto \mathcal{F}_{x}$ and $A \mapsto i_{x, *} A$ are adjoint. In a formula

$$
\operatorname{Mor}_{S e t s}\left(\mathcal{F}_{x}, A\right)=\operatorname{Mor}_{S h(X)}\left(\mathcal{F}, i_{x, *} A\right)
$$

A similar statement holds for the case of abelian groups, algebraic structures. In the case of sheaves of modules we have

$$
\operatorname{Hom}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}, A\right)=\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, i_{x, *} A\right)
$$

Proof. Omitted. Hint: The stalk functor can be seen as the pullback functor for the morphism $i_{x}:\{x\} \rightarrow X$. Then the adjointness follows from adjointness of $i_{x}^{-1}$ and $i_{x, *}$ (resp. $i_{x}^{*}$ and $i_{x, *}$ in the case of sheaves of modules).

### 6.28. Limits and colimits of presheaves

009 D Let $X$ be a topological space. Let $\mathcal{I} \rightarrow P S h(X), i \mapsto \mathcal{F}_{i}$ be a diagram.
(1) Both $\lim _{i} \mathcal{F}_{i}$ and $\operatorname{colim}_{i} \mathcal{F}_{i}$ exist.
(2) For any open $U \subset X$ we have

$$
\left(\lim _{i} \mathcal{F}_{i}\right)(U)=\lim _{i} \mathcal{F}_{i}(U)
$$

and

$$
\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)(U)=\operatorname{colim}_{i} \mathcal{F}_{i}(U)
$$

(3) Let $x \in X$ be a point. In general the stalk of $\lim _{i} \mathcal{F}_{i}$ at $x$ is not equal to the limit of the stalks. But if the diagram category is finite then it is the case. In other words, the stalk functor is left exact (see Categories, Definition 4.23.1).
(4) Let $x \in X$. We always have

$$
\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)_{x}=\operatorname{colim}_{i} \mathcal{F}_{i, x}
$$

The proofs are all easy.

### 6.29. Limits and colimits of sheaves

009 E Let $X$ be a topological space. Let $\mathcal{I} \rightarrow S h(X), i \mapsto \mathcal{F}_{i}$ be a diagram.
(1) Both $\lim _{i} \mathcal{F}_{i}$ and $\operatorname{colim}_{i} \mathcal{F}_{i}$ exist.
(2) The inclusion functor $i: S h(X) \rightarrow \operatorname{PSh}(X)$ commutes with limits. In other words, we may compute the limit in the category of sheaves as the limit in the category of presheaves. In particular, for any open $U \subset X$ we have

$$
\left(\lim _{i} \mathcal{F}_{i}\right)(U)=\lim _{i} \mathcal{F}_{i}(U)
$$

(3) The inclusion functor $i: \operatorname{Sh}(X) \rightarrow \operatorname{PSh}(X)$ does not commute with colimits in general (not even with finite colimits - think surjections). The colimit is computed as the sheafification of the colimit in the category of presheaves:

$$
\operatorname{colim}_{i} \mathcal{F}_{i}=\left(U \mapsto \operatorname{colim}_{i} \mathcal{F}_{i}(U)\right)^{\#}
$$

(4) Let $x \in X$ be a point. In general the stalk of $\lim _{i} \mathcal{F}_{i}$ at $x$ is not equal to the limit of the stalks. But if the diagram category is finite then it is the case. In other words, the stalk functor is left exact.
(5) Let $x \in X$. We always have

$$
\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)_{x}=\operatorname{colim}_{i} \mathcal{F}_{i, x}
$$

(6) The sheafification functor $\#: \operatorname{PSh}(X) \rightarrow \operatorname{Sh}(X)$ commutes with all colimits, and with finite limits. But it does not commute with all limits.
The proofs are all easy. Here is an example of what is true for directed colimits of sheaves.

009F Lemma 6.29.1. Let $X$ be a topological space. Let $I$ be a directed partially ordered set. Let $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ be a system of sheaves of sets over I, see Categories, Section 4.21. Let $U \subset X$ be an open subset. Consider the canonical map

$$
\Psi: \operatorname{colim}_{i} \mathcal{F}_{i}(U) \longrightarrow\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)(U)
$$

(1) If all the transition maps are injective then $\Psi$ is injective for any open $U$.
(2) If $U$ is quasi-compact, then $\Psi$ is injective.
(3) If $U$ is quasi-compact and all the transition maps are injective then $\Psi$ is an isomorphism.
(4) If $U$ has a cofinal system of open coverings $\mathcal{U}: U=\bigcup_{j \in J} U_{j}$ with $J$ finite and $U_{j} \cap U_{j^{\prime}}$ quasi-compact for all $j, j^{\prime} \in J$, then $\Psi$ is bijective.
Proof. Assume all the transition maps are injective. In this case the presheaf $\mathcal{F}^{\prime}: V \mapsto \operatorname{colim}_{i} \mathcal{F}_{i}(V)$ is separated (see Definition 6.11.2). By the discussion above we have $\left(\mathcal{F}^{\prime}\right)^{\#}=\operatorname{colim}_{i} \mathcal{F}_{i}$. By Lemma 6.17.5 we see that $\mathcal{F}^{\prime} \rightarrow\left(\mathcal{F}^{\prime}\right)^{\#}$ is injective. This proves (1).
Assume $U$ is quasi-compact. Suppose that $s \in \mathcal{F}_{i}(U)$ and $s^{\prime} \in \mathcal{F}_{i^{\prime}}(U)$ give rise to elements on the left hand side which have the same image under $\Psi$. Since $U$ is quasi-compact this means there exists a finite open covering $U=\bigcup_{j=1, \ldots, m} U_{j}$ and for each $j$ an index $i_{j} \in I, i_{j} \geq i, i_{j} \geq i^{\prime}$ such that $\varphi_{i i_{j}}(s)=\varphi_{i^{\prime} i_{j}}\left(s^{\prime}\right)$. Let $i^{\prime \prime} \in I$ be $\geq$ than all of the $i_{j}$. We conclude that $\varphi_{i i^{\prime \prime}}(s)$ and $\varphi_{i^{\prime} i^{\prime \prime}}(s)$ agree on the opens $U_{j}$ for all $j$ and hence that $\varphi_{i i^{\prime \prime}}(s)=\varphi_{i^{\prime} i^{\prime \prime}}(s)$. This proves (2).
Assume $U$ is quasi-compact and all transition maps injective. Let $s$ be an element of the target of $\Psi$. Since $U$ is quasi-compact there exists a finite open covering $U=\bigcup_{j=1, \ldots, m} U_{j}$, for each $j$ an index $i_{j} \in I$ and $s_{j} \in \mathcal{F}_{i_{j}}\left(U_{j}\right)$ such that $\left.s\right|_{U_{j}}$ comes from $s_{j}$ for all $j$. Pick $i \in I$ which is $\geq$ than all of the $i_{j}$. By (1) the sections $\varphi_{i_{j} i}\left(s_{j}\right)$ agree over the overlaps $U_{j} \cap U_{j^{\prime}}$. Hence they glue to a section $s^{\prime} \in \mathcal{F}_{i}(U)$ which maps to $s$ under $\Psi$. This proves (3).

Assume the hypothesis of (4). Let $s$ be an element of the target of $\Psi$. By assumption there exists a finite open covering $U=\bigcup_{j=1, \ldots, m} U_{j}$, with $U_{j} \cap U_{j^{\prime}}$ quasi-compact for all $j, j^{\prime} \in J$ and for each $j$ an index $i_{j} \in I$ and $s_{j} \in \mathcal{F}_{i_{j}}\left(U_{j}\right)$ such that $\left.s\right|_{U_{j}}$ is the image of $s_{j}$ for all $j$. Since $U_{j} \cap U_{j^{\prime}}$ is quasi-compact we can apply (2) and we see that there exists an $i_{j j^{\prime}} \in I, i_{j j^{\prime}} \geq i_{j}, i_{j j^{\prime}} \geq i_{j^{\prime}}$ such that $\varphi_{i_{j} i_{j j^{\prime}}}\left(s_{j}\right)$ and $\varphi_{i_{j^{\prime}} i_{j j^{\prime}}}\left(s_{j^{\prime}}\right)$ agree over $U_{j} \cap U_{j^{\prime}}$. Choose an index $i \in I$ wich is bigger or equal than all the $i_{j j^{\prime}}$. Then we see that the sections $\varphi_{i_{j} i}\left(s_{j}\right)$ of $\mathcal{F}_{i}$ glue to a section of $\mathcal{F}_{i}$ over $U$. This section is mapped to the element $s$ as desired.
009G Example 6.29.2. Let $X=\left\{s_{1}, s_{2}, \xi_{1}, \xi_{2}, \xi_{3}, \ldots\right\}$ as a set. Declare a subset $U \subset X$ to be open if $s_{1} \in U$ or $s_{2} \in U$ implies $U$ contains all of the $\xi_{i}$. Let $U_{n}=$ $\left\{\xi_{n}, \xi_{n+1}, \ldots\right\}$, and let $j_{n}: U_{n} \rightarrow X$ be the inclusion map. Set $\mathcal{F}_{n}=j_{n, *} \underline{\mathbf{Z}}$. There are transition maps $\mathcal{F}_{n} \rightarrow \mathcal{F}_{n+1}$. Let $\mathcal{F}=\operatorname{colim} \mathcal{F}_{n}$. Note that $\mathcal{F}_{n, \xi_{m}}=0$ if $m<n$
because $\left\{\xi_{m}\right\}$ is an open subset of $X$ which misses $U_{n}$. Hence we see that $\mathcal{F}_{\xi_{n}}=0$ for all $n$. On the other hand the stalk $\mathcal{F}_{s_{i}}, i=1,2$ is the colimit

$$
M=\operatorname{colim}_{n} \prod_{m \geq n} \mathbf{Z}
$$

which is not zero. We conclude that the sheaf $\mathcal{F}$ is the direct sum of the skyscraper sheaves with value $M$ at the closed points $s_{1}$ and $s_{2}$. Hence $\Gamma(X, \mathcal{F})=M \oplus M$. On the other hand, the reader can verify that $\operatorname{colim}_{n} \Gamma\left(X, \mathcal{F}_{n}\right)=M$. Hence some condition is necessary in part (4) of Lemma 6.29.1 above.

There is a version of the previous lemma dealing with sheaves on a diagram of spectral spaces. To state it we introduce some notation. Let $\mathcal{I}$ be a cofiltered index category. Let $i \mapsto X_{i}$ be a diagram of spectral spaces over $\mathcal{I}$ such that for $a: j \rightarrow i$ in $\mathcal{I}$ the corresponding map $f_{a}: X_{j} \rightarrow X_{i}$ is spectral. Set $X=\lim X_{i}$ and denote $p_{i}: X \rightarrow X_{i}$ the projection.

0 A 32 Lemma 6.29.3. In the situation described above, let $i \in \operatorname{Ob}(\mathcal{I})$ and let $\mathcal{G}$ be a sheaf on $X_{i}$. For $U_{i} \subset X_{i}$ quasi-compact open we have

$$
p_{i}^{-1} \mathcal{G}\left(p_{i}^{-1}\left(U_{i}\right)\right)=\operatorname{colim}_{a: j \rightarrow i} f_{a}^{-1} \mathcal{G}\left(f_{a}^{-1}\left(U_{i}\right)\right)
$$

Proof. Let us prove the canonical map $\operatorname{colim}_{a: j \rightarrow i} f_{a}^{-1} \mathcal{G}\left(f_{a}^{-1}\left(U_{i}\right)\right) \rightarrow p_{i}^{-1} \mathcal{G}\left(p_{i}^{-1}\left(U_{i}\right)\right)$ is injective. Let $s, s^{\prime}$ be sections of $f_{a}^{-1} \mathcal{G}$ over $f_{a}^{-1}\left(U_{i}\right)$ for some $a: j \rightarrow i$. For $b: k \rightarrow j$ let $Z_{k} \subset f_{a \circ b}^{-1}\left(U_{i}\right)$ be the closed subset of points $x$ such that the image of $s$ and $s^{\prime}$ in the stalk $\left(f_{a \circ b}^{-1} \mathcal{G}\right)_{x}$ are different. If $Z_{k}$ is nonempty for all $b: k \rightarrow j$, then by Topology, Lemma 5.23 .2 we see that $\lim _{b: k \rightarrow j} Z_{k}$ is nonempty too. Then for $x \in \lim _{b: k \rightarrow j} Z_{k} \subset X$ (observe that $\mathcal{I} / j \rightarrow \mathcal{I}$ is initial) we see that the image of $s$ and $s^{\prime}$ in the stalk of $p_{i}^{-1} \mathcal{G}$ at $x$ are different too since $\left(p_{i}^{-1} \mathcal{G}\right)_{x}=\left(f_{b \circ a}^{-1} \mathcal{G}\right)_{p_{k}(x)}$ for all $b: k \rightarrow j$ as above. Thus if the images of $s$ and $s^{\prime}$ in $p_{i}^{-1} \mathcal{G}\left(p_{i}^{-1}\left(U_{i}\right)\right)$ are the same, then $Z_{k}$ is empty for some $b: k \rightarrow j$. This proves injectivity.

Surjectivity. Let $s$ be a section of $p_{i}^{-1} \mathcal{G}$ over $p_{i}^{-1}\left(U_{i}\right)$. By Topology, Lemma 5.23.5 the set $p_{i}^{-1}\left(U_{i}\right)$ is a quasi-compact open of the spectral space $X$. By construction of the pullback sheaf, we can find an open covering $p_{i}^{-1}\left(U_{i}\right)=\bigcup_{l \in L} W_{l}$, opens $V_{l, i} \subset X_{i}$, sections $s_{l, i} \in \mathcal{G}\left(V_{l, i}\right)$ such that $p_{i}\left(W_{l}\right) \subset V_{l, i}$ and $\left.p_{i}^{-1} s_{l, i}\right|_{W_{l}}=\left.s\right|_{W_{l}}$. Because $X$ and $X_{i}$ are spectral and $p_{i}^{-1}\left(U_{i}\right)$ is quasi-compact open, we may assume $L$ is finite and $W_{l}$ and $V_{l, i}$ quasi-compact open for all $l$. Then we can apply Topology, Lemma 5.23.6 to find $a: j \rightarrow i$ and open covering $f_{a}^{-1}\left(U_{i}\right)=\bigcup_{l \in L} W_{l, j}$ by quasicompact opens whose pullback to $X$ is the covering $p_{i}^{-1}\left(U_{i}\right)=\bigcup_{l \in L} W_{l}$ and such that moreover $W_{l, j} \subset f_{a}^{-1}\left(V_{l, i}\right)$. Write $s_{l, j}$ the restriction of the pullback of $s_{l, i}$ by $f_{a}$ to $W_{l, j}$. Then we see that $s_{l, j}$ and $s_{l^{\prime}, j}$ restrict to elements of $\left(f_{a}^{-1} \mathcal{G}\right)\left(W_{l, j} \cap W_{l^{\prime}, j}\right)$ which pullback to the same element $\left(p_{i}^{-1} \mathcal{G}\right)\left(W_{l} \cap W_{l^{\prime}}\right)$, namely, the restriction of $s$. Hence by injectivity, we can find $b: k \rightarrow j$ such that the sections $f_{b}^{-1} s_{l, j}$ glue to a section over $f_{a \circ b}^{-1}\left(U_{i}\right)$ as desired.

Next, in addition to the cofiltered system $X_{i}$ of spectral spaces, assume given
(1) a sheaf $\mathcal{F}_{i}$ on $X_{i}$ for all $i \in \operatorname{Ob}(\mathcal{I})$,
(2) for $a: j \rightarrow i$ an $f_{a}$-map $\varphi_{a}: \mathcal{F}_{i} \rightarrow \mathcal{F}_{j}$
such that $\varphi_{c}=\varphi_{b} \circ \varphi_{a}$ whenever $c=a \circ b$. Set $\mathcal{F}=\operatorname{colim} p_{i}^{-1} \mathcal{F}_{i}$ on $X$.

0 A 33 Lemma 6.29.4. In the situation described above, let $i \in \operatorname{Ob}(\mathcal{I})$ and let $U_{i} \subset X_{i}$ be a quasi-compact open. Then

$$
\operatorname{colim}_{a: j \rightarrow i} \mathcal{F}_{j}\left(f_{a}^{-1}\left(U_{i}\right)\right)=\mathcal{F}\left(p_{i}^{-1}\left(U_{i}\right)\right)
$$

Proof. Recall that $p_{i}^{-1}\left(U_{i}\right)$ is a quasi-compact open of the spectral space $X$, see Topology, Lemma 5.23.5. Hence Lemma 6.29.1 applies and we have

$$
\mathcal{F}\left(p_{i}^{-1}\left(U_{i}\right)\right)=\operatorname{colim}_{a: j \rightarrow i} p_{j}^{-1} \mathcal{F}_{j}\left(p_{i}^{-1}\left(U_{i}\right)\right)
$$

A formal argument shows that

$$
\operatorname{colim}_{a: j \rightarrow i} \mathcal{F}_{j}\left(f_{a}^{-1}\left(U_{i}\right)\right)=\operatorname{colim}_{a: j \rightarrow i} \operatorname{colim}_{b: k \rightarrow j} f_{b}^{-1} \mathcal{F}_{j}\left(f_{a \circ b}^{-1}\left(U_{i}\right)\right)
$$

Thus it suffices to show that

$$
p_{j}^{-1} \mathcal{F}_{j}\left(p_{i}^{-1}\left(U_{i}\right)\right)=\operatorname{colim}_{b: k \rightarrow j} f_{b}^{-1} \mathcal{F}_{j}\left(f_{a \circ b}^{-1}\left(U_{i}\right)\right)
$$

This is Lemma 6.29.3 applied to $\mathcal{F}_{j}$ and the quasi-compact open $f_{a}^{-1}\left(U_{i}\right)$.

### 6.30. Bases and sheaves

009 H Sometimes there exists a basis for the topology consisting of opens that are easier to work with than general opens. For convenience we give here some definitions and simple lemmas in order to facilitate working with (pre)sheaves in such a situation.

009I Definition 6.30.1. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$.
(1) A presheaf $\mathcal{F}$ of sets on $\mathcal{B}$ is a rule which assigns to each $U \in \mathcal{B}$ a set $\mathcal{F}(U)$ and to each inclusion $V \subset U$ of elements of $\mathcal{B}$ a map $\rho_{V}^{U}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ such that whenever $W \subset V \subset U$ in $\mathcal{B}$ we have $\rho_{W}^{U}=\rho_{W}^{V} \circ \rho_{V}^{U}$.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of sets on $\mathcal{B}$ is a rule which assigns to each element $U \in \mathcal{B}$ a map of sets $\varphi: \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ compatible with restriction maps.

As in the case of usual presheaves we use the terminology of sections, restrictions of sections, etc. In particular, we may define the stalk of $\mathcal{F}$ at a point $x \in X$ by the colimit

$$
\mathcal{F}_{x}=\operatorname{colim}_{U \in \mathcal{B}, x \in U} \mathcal{F}(U) .
$$

As in the case of the stalk of a presheaf on $X$ this limit is directed. The reason is that the collection of $U \in \mathcal{B}, x \in U$ is a fundamental system of open neighbourhoods of $x$.

It is easy to make examples to show that the notion of a presheaf on $X$ is very different from the notion of a presheaf on a basis for the topology on $X$. This does not happen in the case of sheaves. A much more useful notion therefore, is the following.

009J Definition 6.30.2. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$.
(1) A sheaf $\mathcal{F}$ of sets on $\mathcal{B}$ is a presheaf of sets on $\mathcal{B}$ which satisfies the following additional property: Given any $U \in \mathcal{B}$, and any covering $U=$ $\bigcup_{i \in I} U_{i}$ with $U_{i} \in \mathcal{B}$, and any coverings $U_{i} \cap U_{j}=\bigcup_{k \in I_{i j}} U_{i j k}$ with $U_{i j k} \in$ $\mathcal{B}$ the sheaf condition holds:
(**) For any collection of sections $s_{i} \in \mathcal{F}\left(U_{i}\right), i \in I$ such that $\forall i, j \in I$, $\forall k \in I_{i j}$

$$
\left.s_{i}\right|_{U_{i j k}}=\left.s_{j}\right|_{U_{i j k}}
$$

there exists a unique section $s \in \mathcal{F}(U)$ such that $s_{i}=\left.s\right|_{U_{i}}$ for all $i \in I$.
(2) A morphism of sheaves of sets on $\mathcal{B}$ is simply a morphism of presheaves of sets.

First we explain that it suffices to check the sheaf condition $(* *)$ on a cofinal system of coverings. In the situation of the definition, suppose $U \in \mathcal{B}$. Let us temporarily denote $\operatorname{Cov}_{\mathcal{B}}(U)$ the set of all coverings of $U$ by elements of $\mathcal{B}$. Note that $\operatorname{Cov}_{\mathcal{B}}(U)$ is partially ordered by refinement. A subset $C \subset \operatorname{Cov}_{\mathcal{B}}(U)$ is a cofinal system, if for every $\mathcal{U} \in \operatorname{Cov}_{\mathcal{B}}(U)$ there exists a covering $\mathcal{V} \in C$ which refines $\mathcal{U}$.

009K Lemma 6.30.3. With notation as above. For each $U \in \mathcal{B}$, let $C(U) \subset \operatorname{Cov}_{\mathcal{B}}(U)$ be a cofinal system. For each $U \in \mathcal{B}$, and each $\mathcal{U}: U=\bigcup U_{i}$ in $C(U)$, let coverings $\mathcal{U}_{i j}: U_{i} \cap U_{j}=\bigcup U_{i j k}, U_{i j k} \in \mathcal{B}$ be given. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{B}$. The following are equivalent
(1) The presheaf $\mathcal{F}$ is a sheaf on $\mathcal{B}$.
(2) For every $U \in \mathcal{B}$ and every covering $\mathcal{U}: U=\bigcup U_{i}$ in $C(U)$ the sheaf condition $(* *)$ holds (for the given coverings $\mathcal{U}_{i j}$ ).

Proof. We have to show that (2) implies (1). Suppose that $U \in \mathcal{B}$, and that $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ is an arbitrary covering by elements of $\mathcal{B}$. Because the system $C(U)$ is cofinal we can find an element $\mathcal{V}: U=\bigcup_{j \in J} V_{j}$ in $C(U)$ which refines $\mathcal{U}$. This means there exists a map $\alpha: J \rightarrow I$ such that $V_{j} \subset U_{\alpha(i)}$.
Note that if $s, s^{\prime} \in \mathcal{F}(U)$ are sections such that $\left.s\right|_{U_{i}}=\left.s^{\prime}\right|_{U_{i}}$, then

$$
\left.s\right|_{V_{j}}=\left.\left(\left.s\right|_{\left.U_{\alpha(j)}\right)}\right)\right|_{V_{j}}=\left.\left(\left.s^{\prime}\right|_{U_{\alpha(j)}}\right)\right|_{V_{j}}=\left.s^{\prime}\right|_{V_{j}}
$$

for all $j$. Hence by the uniqueness in ( $* *$ ) for the covering $\mathcal{V}$ we conclude that $s=s^{\prime}$. Thus we have proved the uniqueness part of $(* *)$ for our arbitrary covering $\mathcal{U}$.

Suppose furthermore that $U_{i} \cap U_{i^{\prime}}=\bigcup_{k \in I_{i i^{\prime}}} U_{i i^{\prime} k}$ are arbitrary coverings by $U_{i i^{\prime} k} \in$ $\mathcal{B}$. Let us try to prove the existence part of $(* *)$ for the system $\left(\mathcal{U}, \mathcal{U}_{i j}\right)$. Thus let $s_{i} \in \mathcal{F}\left(U_{i}\right)$ and suppose we have

$$
\left.s_{i}\right|_{U_{i j k}}=\left.s_{i^{\prime}}\right|_{U_{i i^{\prime} k}}
$$

for all $i, i^{\prime}, k$. Set $t_{j}=\left.s_{\alpha(i)}\right|_{V_{j}}$, where $\mathcal{V}$ and $\alpha$ are as above.
There is one small kink in the argument here. Namely, let $\mathcal{V}_{j j^{\prime}}: V_{j} \cap V_{j^{\prime}}=$ $\bigcup_{l \in J_{j j^{\prime}}} V_{j j^{\prime} l}$ be the covering given to us by the statement of the lemma. It is not a priori clear that

$$
\left.t_{j}\right|_{V_{j j^{\prime} l}}=\left.t_{j^{\prime}}\right|_{V_{j j^{\prime} l} l}
$$

for all $j, j^{\prime}, l$. To see this, note that we do have

$$
\left.t_{j}\right|_{W}=\left.t_{j^{\prime}}\right|_{W} \text { for all } W \in \mathcal{B}, W \subset V_{j j^{\prime} l} \cap U_{\alpha(j) \alpha\left(j^{\prime}\right) k}
$$

for all $k \in I_{\alpha(j) \alpha\left(j^{\prime}\right)}$, by our assumption on the family of elements $s_{i}$. And since $V_{j} \cap V_{j^{\prime}} \subset U_{\alpha(j)} \cap U_{\alpha\left(j^{\prime}\right)}$ we see that $\left.t_{j}\right|_{V_{j j^{\prime} l}}$ and $\left.t_{j^{\prime}}\right|_{V_{j j^{\prime} l}}$ agree on the members of a covering of $V_{j j^{\prime} l}$ by elements of $\mathcal{B}$. Hence by the uniqueness part proved above we
finally deduce the desired equality of $t_{j} \mid V_{j j^{\prime} l}$ and $\left.t_{j^{\prime}}\right|_{V_{j j^{\prime} l}}$. Then we get the existence of an element $t \in \mathcal{F}(U)$ by property $(* *)$ for $\left(\mathcal{V}, \mathcal{V}_{j j^{\prime}}\right)$.
Again there is a small snag. We know that $t$ restricts to $t_{j}$ on $V_{j}$ but we do not yet know that $t$ restricts to $s_{i}$ on $U_{i}$. To conclude this note that the sets $U_{i} \cap V_{j}, j \in J$ cover $U_{i}$. Hence also the sets $U_{i \alpha(j) k} \cap V_{j}, j \in J, k \in I_{i \alpha(j)}$ cover $U_{i}$. We leave it to the reader to see that $t$ and $s_{i}$ restrict to the same section of $\mathcal{F}$ on any $W \in \mathcal{B}$ which is contained in one of the open sets $U_{i \alpha(j) k} \cap V_{j}, j \in J, k \in I_{i \alpha(j)}$. Hence by the uniqueness part seen above we win.

009L Lemma 6.30.4. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Assume that for every pair $U, U^{\prime} \in \mathcal{B}$ we have $U \cap U^{\prime} \in \mathcal{B}$. For each $U \in \mathcal{B}$, let $C(U) \subset \operatorname{Cov}_{\mathcal{B}}(U)$ be a cofinal system. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{B}$. The following are equivalent
(1) The presheaf $\mathcal{F}$ is a sheaf on $\mathcal{B}$.
(2) For every $U \in \mathcal{B}$ and every covering $\mathcal{U}: U=\bigcup U_{i}$ in $C(U)$ and for every family of sections $s_{i} \in \mathcal{F}\left(U_{i}\right)$ such that $\left.s_{i}\right|_{U_{i} \cap U_{j}}=\left.s_{j}\right|_{U_{i} \cap U_{j}}$ there exists a unique section $s \in \mathcal{F}(U)$ which restricts to $s_{i}$ on $U_{i}$.

Proof. This is a reformulation of Lemma 6.30.3 above in the special case where the coverings $\mathcal{U}_{i j}$ each consist of a single element. But also this case is much easier and is an easy exercise to do directly.

009M Lemma 6.30.5. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $U \in \mathcal{B}$. Let $\mathcal{F}$ be a sheaf of sets on $\mathcal{B}$. The map

$$
\mathcal{F}(U) \rightarrow \prod_{x \in U} \mathcal{F}_{x}
$$

identifies $\mathcal{F}(U)$ with the elements $\left(s_{x}\right)_{x \in U}$ with the property
(*) For any $x \in U$ there exists a $V \in \mathcal{B}, x \in V$ and a section $\sigma \in \mathcal{F}(V)$ such that for all $y \in V$ we have $s_{y}=(V, \sigma)$ in $\mathcal{F}_{y}$.

Proof. First note that the map $\mathcal{F}(U) \rightarrow \prod_{x \in U} \mathcal{F}_{x}$ is injective by the uniqueness in the sheaf condition of Definition 6.30.2, Let $\left(s_{x}\right)$ be any element on the right hand side which satisfies $(*)$. Clearly this means we can find a covering $U=\bigcup U_{i}$, $U_{i} \in \mathcal{B}$ such that $\left(s_{x}\right)_{x \in U_{i}}$ comes from certain $\sigma_{i} \in \mathcal{F}\left(U_{i}\right)$. For every $y \in U_{i} \cap U_{j}$ the sections $\sigma_{i}$ and $\sigma_{j}$ agree in the stalk $\mathcal{F}_{y}$. Hence there exists an element $V_{i j y} \in \mathcal{B}$, $y \in V_{i j y}$ such that $\left.\sigma_{i}\right|_{V_{i j y}}=\left.\sigma_{j}\right|_{V_{i j y}}$. Thus the sheaf condition ( $* *$ ) of Definition 6.30 .2 applies to the system of $\sigma_{i}$ and we obtain a section $s \in \mathcal{F}(U)$ with the desired property.

Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. There is a natural restriction functor from the category of sheaves of sets on $X$ to the category of sheaves of sets on $\mathcal{B}$. It turns out that this is an equivalence of categories. In down to earth terms this means the following.

009N Lemma 6.30.6. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{F}$ be a sheaf of sets on $\mathcal{B}$. There exists a unique sheaf of sets $\mathcal{F}^{\text {ext }}$ on $X$ such that $\mathcal{F}^{\text {ext }}(U)=\mathcal{F}(U)$ for all $U \in \mathcal{B}$ compatibly with the restriction mappings.
Proof. We first construct a presheaf $\mathcal{F}^{e x t}$ with the desired property. Namely, for an arbitrary open $U \subset X$ we define $\mathcal{F}^{e x t}(U)$ as the set of elements $\left(s_{x}\right)_{x \in U}$ such that $(*)$ of Lemma 6.30 .5 holds. It is clear that there are restriction mappings that turn
$\mathcal{F}^{e x t}$ into a presheaf of sets. Also, by Lemma 6.30.5 we see that $\mathcal{F}(U)=\mathcal{F}^{e x t}(U)$ whenever $U$ is an element of the basis $\mathcal{B}$. To see $\mathcal{F}^{e x t}$ is a sheaf one may argue as in the proof of Lemma 6.17.1.

Note that we have

$$
\mathcal{F}_{x}=\mathcal{F}_{x}^{e x t}
$$

in the situation of the lemma. This is so because the collection of elements of $\mathcal{B}$ containing $x$ forms a fundamental system of open neighbourhoods of $x$.
0090 Lemma 6.30.7. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Denote $\operatorname{Sh}(\mathcal{B})$ the category of sheaves on $\mathcal{B}$. There is an equivalence of categories

$$
\operatorname{Sh}(X) \longrightarrow \operatorname{Sh}(\mathcal{B})
$$

which assigns to a sheaf on $X$ its restriction to the members of $\mathcal{B}$.
Proof. The inverse functor in given in Lemma 6.30.6 above. Checking the obvious functorialities is left to the reader.

This ends the discussion of sheaves of sets on a basis $\mathcal{B}$. Let $(\mathcal{C}, F)$ be a type of algebraic structure. At the end of this section we would like to point out that the constructions above work for sheaves with values in $\mathcal{C}$. Let us briefly define the relevant notions.

009P Definition 6.30.8. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $(\mathcal{C}, F)$ be a type of algebraic structure.
(1) A presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$ is a rule which assigns to each $U \in \mathcal{B}$ an object $\mathcal{F}(U)$ of $\mathcal{C}$ and to each inclusion $V \subset U$ of elements of $\mathcal{B}$ a morphism $\rho_{V}^{U}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ in $\mathcal{C}$ such that whenever $W \subset V \subset U$ in $\mathcal{B}$ we have $\rho_{W}^{U}=\rho_{W}^{V} \circ \rho_{V}^{U}$.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves with values in $\mathcal{C}$ on $\mathcal{B}$ is a rule which assigns to each element $U \in \mathcal{B}$ a morphism of algebraic structures $\varphi: \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ compatible with restriction maps.
(3) Given a presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$ we say that $U \mapsto F(\mathcal{F}(U))$ is the underlying presheaf of sets.
(4) A sheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$ is a presheaf with values in $\mathcal{C}$ on $\mathcal{B}$ whose underlying presheaf of sets is a sheaf.

At this point we can define the stalk at $x \in X$ of a presheaf with values in $\mathcal{C}$ on $\mathcal{B}$ as the directed colimit

$$
\mathcal{F}_{x}=\operatorname{colim}_{U \in \mathcal{B}, x \in U} \mathcal{F}(U)
$$

It exists as an object of $\mathcal{C}$ because of our assumptions on $\mathcal{C}$. Also, we see that the underlying set of $\mathcal{F}_{x}$ is the stalk of the underlying presheaf of sets on $\mathcal{B}$.
Note that Lemmas 6.30.3, 6.30.4 and 6.30.5 refer to the sheaf property which we have defined in terms of the associated presheaf of sets. Hence they generalize without change to the notion of a presheaf with values in $\mathcal{C}$. The analogue of Lemma 6.30.6 need some care. Here it is.
009Q Lemma 6.30.9. Let $X$ be a topological space. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on $\mathcal{B}$. There exists a unique sheaf $\mathcal{F}^{\text {ext }}$ with values in $\mathcal{C}$ on $X$ such that $\mathcal{F}^{e x t}(U)=\mathcal{F}(U)$ for all $U \in \mathcal{B}$ compatibly with the restriction mappings.

Proof. By the conditions imposed on the pair $(\mathcal{C}, F)$ it suffices to come up with a presheaf $\mathcal{F}^{e x t}$ which does the correct thing on the level of underlying presheaves of sets. Thus our first task is to construct a suitable object $\mathcal{F}^{e x t}(U)$ for all open $U \subset X$. We could do this by imitating Lemma 6.18.1 in the setting of presheaves on $\mathcal{B}$. However, a slightly different method (but basically equivalent) is the following: Define it as the directed colimit

$$
\mathcal{F}^{e x t}(U):=\operatorname{colim}_{\mathcal{U}} F I B(\mathcal{U})
$$

over all coverings $\mathcal{U}: U=\bigcup_{i \in I} U_{i}$ by $U_{i} \in \mathcal{B}$ of the fibre product

By the usual arguments, see Lemma 6.15 .4 and Example 6.15 .5 it suffices to show that this construction on underlying sets is the same as the definition using $(* *)$ above. Details left to the reader.

Note that we have

$$
\mathcal{F}_{x}=\mathcal{F}_{x}^{e x t}
$$

as objects in $\mathcal{C}$ in the situation of the lemma. This is so because the collection of elements of $\mathcal{B}$ containing $x$ forms a fundamental system of open neighbourhoods of $x$.

009R Lemma 6.30.10. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Denote $\operatorname{Sh}(\mathcal{B}, \mathcal{C})$ the category of sheaves with values in $\mathcal{C}$ on $\mathcal{B}$. There is an equivalence of categories

$$
\operatorname{Sh}(X, \mathcal{C}) \longrightarrow \operatorname{Sh}(\mathcal{B}, \mathcal{C})
$$

which assigns to a sheaf on $X$ its restriction to the members of $\mathcal{B}$.
Proof. The inverse functor in given in Lemma 6.30.9 above. Checking the obvious functorialities is left to the reader.

Finally we come to the case of (pre)sheaves of modules on a basis. We will use the easy fact that the category of presheaves of sets on a basis has products and that they are described by taking products of values on elements of the bases.

009S Definition 6.30.11. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{B}$.
(1) A presheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{B}$ is a presheaf of abelian groups on $\mathcal{B}$ together with a morphism of presheaves of sets $\mathcal{O} \times \mathcal{F} \rightarrow \mathcal{F}$ such that for all $U \in \mathcal{B}$ the map $\mathcal{O}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U)$ turns the group $\mathcal{F}(U)$ into an $\mathcal{O}(U)$-module.
(2) A morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ of presheaves of $\mathcal{O}$-modules on $\mathcal{B}$ is a morphism of abelian presheaves on $\mathcal{B}$ which induces an $\mathcal{O}(U)$-module homomorphism $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ for every $U \in \mathcal{B}$.
(3) Suppose that $\mathcal{O}$ is a sheaf of rings on $\mathcal{B}$. A sheaf $\mathcal{F}$ of $\mathcal{O}$-modules on $\mathcal{B}$ is a presheaf of $\mathcal{O}$-modules on $\mathcal{B}$ whose underlying presheaf of abelian groups is a sheaf.

We can define the stalk at $x \in X$ of a presheaf of $\mathcal{O}$-modules on $\mathcal{B}$ as the directed colimit

$$
\mathcal{F}_{x}=\operatorname{colim}_{U \in \mathcal{B}, x \in U} \mathcal{F}(U)
$$

It is a $\mathcal{O}_{x}$-module.
Note that Lemmas 6.30.3, 6.30 .4 and 6.30 .5 refer to the sheaf property which we have defined in terms of the associated presheaf of sets. Hence they generalize without change to the notion of a presheaf of $\mathcal{O}$-modules. The analogue of Lemma 6.30 .6 is as follows.

009T Lemma 6.30.12. Let $X$ be a topological space. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{B}$. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on $\mathcal{B}$. Let $\mathcal{O}^{\text {ext }}$ be the sheaf of rings on $X$ extending $\mathcal{O}$ and let $\mathcal{F}^{\text {ext }}$ be the abelian sheaf on $X$ extending $\mathcal{F}$, see Lemma 6.30.9. There exists a canonical map

$$
\mathcal{O}^{e x t} \times \mathcal{F}^{e x t} \longrightarrow \mathcal{F}^{e x t}
$$

which agrees with the given map over elements of $\mathcal{B}$ and which endows $\mathcal{F}^{\text {ext }}$ with the structure of an $\mathcal{O}^{\text {ext }}$-module.
Proof. It suffices to construct the multiplication map on the level of presheaves of sets. Perhaps the easiest way to see this is to prove directly that if $\left(f_{x}\right)_{x \in U}, f_{x} \in \mathcal{O}_{x}$ and $\left(m_{x}\right)_{x \in U}, m_{x} \in \mathcal{F}_{x}$ satisfy $(*)$, then the element $\left(f_{x} m_{x}\right)_{x \in U}$ also satisfies $(*)$. Then we get the desired result, because in the proof of Lemma 6.30 .6 we construct the extension in terms of families of elements of stalks satisfying (*).

Note that we have

$$
\mathcal{F}_{x}=\mathcal{F}_{x}^{e x t}
$$

as $\mathcal{O}_{x}$-modules in the situation of the lemma. This is so because the collection of elements of $\mathcal{B}$ containing $x$ forms a fundamental system of open neighbourhoods of $x$, or simply because it is true on the underlying sets.
009U Lemma 6.30.13. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology on $X$. Let $\mathcal{O}$ be a sheaf of rings on $X$. Denote $\operatorname{Mod}\left(\left.\mathcal{O}\right|_{\mathcal{B}}\right)$ the category of sheaves of $\left.\mathcal{O}\right|_{\mathcal{B}}$-modules on $\mathcal{B}$. There is an equivalence of categories

$$
\operatorname{Mod}(\mathcal{O}) \longrightarrow \operatorname{Mod}\left(\left.\mathcal{O}\right|_{\mathcal{B}}\right)
$$

which assigns to a sheaf of $\mathcal{O}$-modules on $X$ its restriction to the members of $\mathcal{B}$.
Proof. The inverse functor in given in Lemma 6.30.12 above. Checking the obvious functorialities is left to the reader.

Finally, we address the question of the relationship of this with continuous maps. This is now very easy thanks to the work above. First we do the case where there is a basis on the target given.
009V Lemma 6.30.14. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $(\mathcal{C}, F)$ be a type of algebraic structures. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on $X$. Let $\mathcal{G}$ be a sheaf with values in $\mathcal{C}$ on $Y$. Let $\mathcal{B}$ be a basis for the topology on $Y$. Suppose given for every $V \in \mathcal{B}$ a morphism

$$
\varphi_{V}: \mathcal{G}(V) \longrightarrow \mathcal{F}\left(f^{-1} V\right)
$$

of $\mathcal{C}$ compatible with restriction mappings. Then there is a unique f-map (see Definition 6.21.7 and discussion of $f$-maps in Section6.23) $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ recovering $\varphi_{V}$ for $V \in \mathcal{B}$.

Proof. This is trivial because the collection of maps amounts to a morphism between the restrictions of $\mathcal{G}$ and $f_{*} \mathcal{F}$ to $\mathcal{B}$. By Lemma 6.30 .10 this is the same as giving a morphism from $\mathcal{G}$ to $f_{*} \mathcal{F}$, which by Lemma 6.21 .8 is the same as an $f$-map. See also Lemma 6.23.1 and the discussion preceding it for how to deal with the case of sheaves of algebraic structures.

Here is the analogue for ringed spaces.
009 W Lemma 6.30.15. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{Y}$-modules. Let $\mathcal{B}$ be a basis for the topology on $Y$. Suppose given for every $V \in \mathcal{B}$ a $\mathcal{O}_{Y}(V)$-module map

$$
\varphi_{V}: \mathcal{G}(V) \longrightarrow \mathcal{F}\left(f^{-1} V\right)
$$

(where $\mathcal{F}\left(f^{-1} V\right)$ has a module structure using $f_{V}^{\sharp}: \mathcal{O}_{Y}(V) \rightarrow \mathcal{O}_{X}\left(f^{-1} V\right)$ ) compatible with restriction mappings. Then there is a unique $f$-map (see discussion of $f$-maps in Section 6.26) $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ recovering $\varphi_{V}$ for $V \in \mathcal{B}$.

Proof. Same as the proof of the corresponding lemma for sheaves of algebraic structures above.

009X Lemma 6.30.16. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Let $(\mathcal{C}, F)$ be a type of algebraic structures. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on $X$. Let $\mathcal{G}$ be a sheaf with values in $\mathcal{C}$ on $Y$. Let $\mathcal{B}_{Y}$ be a basis for the topology on $Y$. Let $\mathcal{B}_{X}$ be a basis for the topology on $X$. Suppose given for every $V \in \mathcal{B}_{Y}$, and $U \in \mathcal{B}_{X}$ such that $f(U) \subset V$ a morphism

$$
\varphi_{V}^{U}: \mathcal{G}(V) \longrightarrow \mathcal{F}(U)
$$

of $\mathcal{C}$ compatible with restriction mappings. Then there is a unique $f$-map (see Definition 6.21.7 and the discussion of $f$-maps in Section 6.23) $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ recovering $\varphi_{V}^{U}$ as the composition

$$
\mathcal{G}(V) \xrightarrow{\varphi_{V}} \mathcal{F}\left(f^{-1}(V)\right) \xrightarrow{\text { restr. }} \mathcal{F}(U)
$$

for every pair $(U, V)$ as above.
Proof. Let us first proves this for sheaves of sets. Fix $V \subset Y$ open. Pick $s \in \mathcal{G}(V)$. We are going to construct an element $\varphi_{V}(s) \in \mathcal{F}\left(f^{-1} V\right)$. We can define a value $\varphi(s)_{x}$ in the stalk $\mathcal{F}_{x}$ for every $x \in f^{-1} V$ by picking a $U \in \mathcal{B}_{X}$ with $x \in U \subset f^{-1} V$ and setting $\varphi(s)_{x}$ equal to the equivalence class of $\left(U, \varphi_{V}^{U}(s)\right)$ in the stalk. Clearly, the family $\left(\varphi(s)_{x}\right)_{x \in f^{-1} V}$ satisfies condition $(*)$ because the maps $\varphi_{V}^{U}$ for varying $U$ are compatible with restrictions in the sheaf $\mathcal{F}$. Thus, by the proof of Lemma 6.30.6 we see that $\left(\varphi(s)_{x}\right)_{x \in f^{-1} V}$ corresponds to a unique element $\varphi_{V}(s)$ of $\mathcal{F}\left(f^{-1} V\right)$. Thus we have defined a set $\operatorname{map} \varphi_{V}: \mathcal{G}(V) \rightarrow \mathcal{F}\left(f^{-1} V\right)$. The compatibility between $\varphi_{V}$ and $\varphi_{V}^{U}$ follows from Lemma 6.30.5
We leave it to the reader to show that the construction of $\varphi_{V}$ is compatible with restriction mappings as we vary $v \in \mathcal{B}_{Y}$. Thus we may apply Lemma 6.30.14 above to "glue" them to the desired $f$-map.
Finally, we note that the map of sheaves of sets so constructed satisfies the property that the map on stalks

$$
\mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_{x}
$$

is the colimit of the system of maps $\varphi_{V}^{U}$ as $V \in \mathcal{B}_{Y}$ varies over those elements that contain $f(x)$ and $U \in \mathcal{B}_{X}$ varies over those elements that contain $x$. In particular,
if $\mathcal{G}$ and $\mathcal{F}$ are the underlying sheaves of sets of sheaves of algebraic structures, then we see that the maps on stalks is a morphism of algebraic structures. Hence we conclude that the associated map of sheaves of underlying sets $f^{-1} \mathcal{G} \rightarrow \mathcal{F}$ satisfies the assumptions of Lemma 6.23.1. We conclude that $f^{-1} \mathcal{G} \rightarrow \mathcal{F}$ is a morphism of sheaves with values in $\mathcal{C}$. And by adjointness this means that $\varphi$ is an $f$-map of sheaves of algebraic structures.

009Y Lemma 6.30.17. Let $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_{Y}$-modules. Let $\mathcal{B}_{Y}$ be a basis for the topology on $Y$. Let $\mathcal{B}_{X}$ be a basis for the topology on $X$. Suppose given for every $V \in \mathcal{B}_{Y}$, and $U \in \mathcal{B}_{X}$ such that $f(U) \subset V$ a $\mathcal{O}_{Y}(V)$-module map

$$
\varphi_{V}^{U}: \mathcal{G}(V) \longrightarrow \mathcal{F}(U)
$$

compatible with restriction mappings. Here the $\mathcal{O}_{Y}(V)$-module structure on $\mathcal{F}(U)$ comes from the $\mathcal{O}_{X}(U)$-module structure via the map $f_{V}^{\sharp}: \mathcal{O}_{Y}(V) \rightarrow \mathcal{O}_{X}\left(f^{-1} V\right) \rightarrow$ $\mathcal{O}_{X}(U)$. Then there is a unique $f$-map of sheaves of modules (see Definition 6.21.7 and the discussion of $f$-maps in Section 6.26) $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ recovering $\varphi_{V}^{U}$ as the composition

$$
\mathcal{G}(V) \xrightarrow{\varphi_{V}} \mathcal{F}\left(f^{-1}(V)\right) \xrightarrow{\text { restrc. }} \mathcal{F}(U)
$$

for every pair $(U, V)$ as above.
Proof. Similar to the above and omitted.

### 6.31. Open immersions and (pre)sheaves

009 Z Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset $U$ into $X$. In Section 6.21 we have defined functors $j_{*}$ and $j^{-1}$ such that $j_{*}$ is right adjoint to $j^{-1}$. It turns out that for an open immersion there is a left adjoint for $j^{-1}$, which we will denote $j$ !. First we point out that $j^{-1}$ has a particularly simple description in the case of an open immersion.

00A0 Lemma 6.31.1. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset $U$ into $X$.
(1) Let $\mathcal{G}$ be a presheaf of sets on $X$. The presheaf $j_{p} \mathcal{G}$ (see Section 6.21) is given by the rule $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open.
(2) Let $\mathcal{G}$ be a sheaf of sets on $X$. The sheaf $j^{-1} \mathcal{G}$ is given by the rule $V \mapsto$ $\mathcal{G}(V)$ for $V \subset U$ open.
(3) For any point $u \in U$ and any sheaf $\mathcal{G}$ on $X$ we have a canonical identification of stalks

$$
j^{-1} \mathcal{G}_{u}=\left(\left.\mathcal{G}\right|_{U}\right)_{u}=\mathcal{G}_{u}
$$

(4) On the category of presheaves of $U$ we have $j_{p} j_{*}=i d$.
(5) On the category of sheaves of $U$ we have $j^{-1} j_{*}=i d$.

The same description holds for (pre)sheaves of abelian groups, (pre)sheaves of algebraic structures, and (pre)sheaves of modules.

Proof. The colimit in the definition of $j_{p} \mathcal{G}(V)$ is over collection of all $W \subset X$ open such that $V \subset W$ ordered by reverse inclusion. Hence this has a largest element, namely $V$. This proves (1). And (2) follows because the assignment $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open is clearly a sheaf if $\mathcal{G}$ is a sheaf. Assertion (3) follows from (2) since the collection of open neighbourhoods of $u$ which are contained in $U$ is cofinal in
the collection of all open neighbourhoods of $u$ in $X$. Parts (4) and (5) follow by computing $j^{-1} j_{*} \mathcal{F}(V)=j_{*} \mathcal{F}(V)=\mathcal{F}(V)$.

The exact same arguments work for (pre)sheaves of abelian groups and (pre)sheaves of algebraic structures.

00A1 Definition 6.31.2. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset.
(1) Let $\mathcal{G}$ be a presheaf of sets, abelian groups or algebraic structures on $X$. The presheaf $j_{p} \mathcal{G}$ described in Lemma 6.31.1 is called the restriction of $\mathcal{G}$ to $U$ and denoted $\left.\mathcal{G}\right|_{U}$.
(2) Let $\mathcal{G}$ be a sheaf of sets on $X$, abelian groups or algebraic structures on $X$. The sheaf $j^{-1} \mathcal{G}$ is called the restriction of $\mathcal{G}$ to $U$ and denoted $\left.\mathcal{G}\right|_{U}$.
(3) If $(X, \mathcal{O})$ is a ringed space, then the pair $\left(U,\left.\mathcal{O}\right|_{U}\right)$ is called the open subspace of $(X, \mathcal{O})$ associated to $U$.
(4) If $\mathcal{G}$ is a presheaf of $\mathcal{O}$-modules then $\left.\mathcal{G}\right|_{U}$ together with the multiplication $\left.\operatorname{map} \mathcal{O}\right|_{U} \times\left.\left.\mathcal{G}\right|_{U} \rightarrow \mathcal{G}\right|_{U}$ (see Lemma 6.24.6) is called the restriction of $\mathcal{G}$ to $U$.

We leave a definition of the restriction of presheaves of modules to the reader. Ok , so in this section we will discuss a left adjoint to the restriction functor. Here is the definition in the case of (pre)sheaves of sets.

00A2 Definition 6.31.3. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset.
(1) Let $\mathcal{F}$ be a presheaf of sets on $U$. We define the extension of $\mathcal{F}$ by the empty set $j_{p!} \mathcal{F}$ to be the presheaf of sets on $X$ defined by the rule

$$
j_{p!} \mathcal{F}(V)=\left\{\begin{array}{ccc}
\emptyset & \text { if } & V \not \subset U \\
\mathcal{F}(V) & \text { if } & V \subset U
\end{array}\right.
$$

with obvious restriction mappings.
(2) Let $\mathcal{F}$ be a sheaf of sets on $U$. We define the extension of $\mathcal{F}$ by the empty set $j!\mathcal{F}$ to be the sheafification of the presheaf $j_{p!} \mathcal{F}$.
00A3 Lemma 6.31.4. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset.
(1) The functor $j_{p!}$ is a left adjoint to the restriction functor $j_{p}$ (see Lemma 6.31.1).
(2) The functor $j_{!}$is a left adjoint to restriction, in a formula

$$
\operatorname{Mor}_{S h(X)}(j!\mathcal{F}, \mathcal{G})=\operatorname{Mor}_{S h(U)}\left(\mathcal{F}, j^{-1} \mathcal{G}\right)=\operatorname{Mor}_{S h(U)}\left(\mathcal{F},\left.\mathcal{G}\right|_{U}\right)
$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(3) Let $\mathcal{F}$ be a sheaf of sets on $U$. The stalks of the sheaf $j!\mathcal{F}$ are described as follows

$$
j_{!} \mathcal{F}_{x}=\left\{\begin{array}{cll}
\emptyset & \text { if } & x \notin U \\
\mathcal{F}_{x} & \text { if } & x \in U
\end{array}\right.
$$

(4) On the category of presheaves of $U$ we have $j_{p} j_{p!}=i d$.
(5) On the category of sheaves of $U$ we have $j^{-1} j_{!}=i d$.

Proof. To map $j_{p!} \mathcal{F}$ into $\mathcal{G}$ it is enough to map $\mathcal{F}(V) \rightarrow \mathcal{G}(V)$ whenever $V \subset U$ compatibly with restriction mappings. And by Lemma 6.31.1 the same description holds for maps $\left.\mathcal{F} \rightarrow \mathcal{G}\right|_{U}$. The adjointness of $j$ ! and restriction follows from this and the properties of sheafification. The identification of stalks is obvious from the definition of the extension by the empty set and the definition of a stalk. Statements (4) and (5) follow by computing the value of the sheaf on any open of $U$.

Note that if $\mathcal{F}$ is a sheaf of abelian groups on $U$, then in general $j_{!} \mathcal{F}$ as defined above, is not a sheaf of abelian groups, for example because some of its stalks are empty (hence not abelian groups for sure). Thus we need to modify the definition of $j$ ! depending on the type of sheaves we consider. The reason for choosing the empty set in the definition of the extension by the empty set, is that it is the initial object in the category of sets. Thus in the case of abelian groups we use 0 (and more generally for sheaves with values in any abelian category).

00A4 Definition 6.31.5. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset.
(1) Let $\mathcal{F}$ be an abelian presheaf on $U$. We define the extension $j_{p!} \mathcal{F}$ of $\mathcal{F}$ by 0 to be the abelian presheaf on $X$ defined by the rule

$$
j_{p!} \mathcal{F}(V)=\left\{\begin{array}{ccc}
0 & \text { if } & V \not \subset U \\
\mathcal{F}(V) & \text { if } & V \subset U
\end{array}\right.
$$

with obvious restriction mappings.
(2) Let $\mathcal{F}$ be an abelian sheaf on $U$. We define the extension $j!\mathcal{F}$ of $\mathcal{F}$ by 0 to be the sheafification of the abelian presheaf $j_{p!} \mathcal{F}$.
(3) Let $\mathcal{C}$ be a category having an initial object $e$. Let $\mathcal{F}$ be a presheaf on $U$ with values in $\mathcal{C}$. We define the extension $j_{p!} \mathcal{F}$ of $\mathcal{F}$ by $e$ to be the presheaf on $X$ with values in $\mathcal{C}$ defined by the rule

$$
j_{p!} \mathcal{F}(V)=\left\{\begin{array}{cll}
e & \text { if } & V \not \subset U \\
\mathcal{F}(V) & \text { if } & V \subset U
\end{array}\right.
$$

with obvious restriction mappings.
(4) Let $(\mathcal{C}, F)$ be a type of algebraic structure such that $\mathcal{C}$ has an initial object $e$. Let $\mathcal{F}$ be a sheaf of algebraic structures on $U$ (of the give type). We define the extension $j!\mathcal{F}$ of $\mathcal{F}$ by $e$ to be the sheafification of the presheaf $j_{p!} \mathcal{F}$ defined above.
(5) Let $\mathcal{O}$ be a presheaf of rings on $X$. Let $\mathcal{F}$ be a presheaf of $\left.\mathcal{O}\right|_{U}$-modules. In this case we define the extension by 0 to be the presheaf of $\mathcal{O}$-modules which is equal to $j_{p!} \mathcal{F}$ as an abelian presheaf endowed with the multiplication $\operatorname{map} \mathcal{O} \times j_{p!} \mathcal{F} \rightarrow j_{p!} \mathcal{F}$.
(6) Let $\mathcal{O}$ be a sheaf of rings on $X$. Let $\mathcal{F}$ be a sheaf of $\left.\mathcal{O}\right|_{U}$-modules. In this case we define the extension by 0 to be the $\mathcal{O}$-module which is equal to $j!\mathcal{F}$ as an abelian sheaf endowed with the multiplication map $\mathcal{O} \times j!\mathcal{F} \rightarrow j_{!} \mathcal{F}$.

It is true that one can define $j$ ! in the setting of sheaves of algebraic structures (see below). However, it depends on the type of algebraic structures involved what the resulting object is. For example, if $\mathcal{O}$ is a sheaf of rings on $U$, then $j_{!, \text {,rings }} \mathcal{O} \neq$ $j_{!, a b e l i a n} \mathcal{O}$ since the initial object in the category of rings is $\mathbf{Z}$ and the initial object in the category of abelian groups is 0 . In particular the functor $j$ ! does not commute with taking underlying sheaves of sets, in contrast to what we have seen so far! We
separate out the case of (pre)sheaves of abelian groups, (pre)sheaves of algebraic structures and (pre)sheaves of modules as usual.
00A5 Lemma 6.31.6. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset. Consider the functors of restriction and extension by 0 for abelian (pre)sheaves.
(1) The functor $j_{p!}$ is a left adjoint to the restriction functor $j_{p}$ (see Lemma 6.31.1).
(2) The functor $j$ ! is a left adjoint to restriction, in a formula

$$
\operatorname{Mor}_{A b(X)}(j!\mathcal{F}, \mathcal{G})=\operatorname{Mor}_{A b(U)}\left(\mathcal{F}, j^{-1} \mathcal{G}\right)=\operatorname{Mor}_{A b(U)}\left(\mathcal{F},\left.\mathcal{G}\right|_{U}\right)
$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(3) Let $\mathcal{F}$ be an abelian sheaf on $U$. The stalks of the sheaf $j!\mathcal{F}$ are described as follows

$$
j!\mathcal{F}_{x}=\left\{\begin{array}{cll}
0 & \text { if } & x \notin U \\
\mathcal{F}_{x} & \text { if } & x \in U
\end{array}\right.
$$

(4) On the category of abelian presheaves of $U$ we have $j_{p} j_{p!}=i d$.
(5) On the category of abelian sheaves of $U$ we have $j^{-1} j_{!}=i d$.

Proof. Omitted.
00A6 Lemma 6.31.7. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset. Let $(\mathcal{C}, F)$ be a type of algebraic structure such that $\mathcal{C}$ has an initial object $e$. Consider the functors of restriction and extension by e for (pre)sheaves of algebraic structure defined above.
(1) The functor $j_{p!}$ is a left adjoint to the restriction functor $j_{p}$ (see Lemma 6.31.1).
(2) The functor $j_{!}$is a left adjoint to restriction, in a formula $\operatorname{Mor}_{S h(X, \mathcal{C})}(j!\mathcal{F}, \mathcal{G})=\operatorname{Mor}_{S h(U, \mathcal{C})}\left(\mathcal{F}, j^{-1} \mathcal{G}\right)=\operatorname{Mor}_{S h(U, \mathcal{C})}\left(\mathcal{F},\left.\mathcal{G}\right|_{U}\right)$
bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(3) Let $\mathcal{F}$ be a sheaf on $U$. The stalks of the sheaf $j!\mathcal{F}$ are described as follows

$$
j!\mathcal{F}_{x}=\left\{\begin{array}{cll}
e & \text { if } & x \notin U \\
\mathcal{F}_{x} & \text { if } & x \in U
\end{array}\right.
$$

(4) On the category of presheaves of algebraic structures on $U$ we have $j_{p} j_{p!}=$ $i d$.
(5) On the category of sheaves of algebraic structures on $U$ we have $j^{-1} j_{!}=i d$.

Proof. Omitted.
00A7 Lemma 6.31.8. Let $(X, \mathcal{O})$ be a ringed space. Let $j:\left(U,\left.\mathcal{O}\right|_{U}\right) \rightarrow(X, \mathcal{O})$ be an open subspace. Consider the functors of restriction and extension by 0 for (pre)sheaves of modules defined above.
(1) The functor $j_{p!}$ is a left adjoint to restriction, in a formula

$$
\operatorname{Mor}_{P M o d(\mathcal{O})}\left(j_{p!} \mathcal{F}, \mathcal{G}\right)=\operatorname{Mor}_{P M o d\left(\left.\mathcal{O}\right|_{U}\right)}\left(\mathcal{F},\left.\mathcal{G}\right|_{U}\right)
$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(2) The functor $j$ ! is a left adjoint to restriction, in a formula

$$
\operatorname{Mor}_{M o d(\mathcal{O})}(j!\mathcal{F}, \mathcal{G})=\operatorname{Mor}_{M o d\left(\left.\mathcal{O}\right|_{U}\right)}\left(\mathcal{F},\left.\mathcal{G}\right|_{U}\right)
$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(3) Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules on $U$. The stalks of the sheaf $j!\mathcal{F}$ are described as follows

$$
j!\mathcal{F}_{x}=\left\{\begin{array}{cll}
0 & \text { if } & x \notin U \\
\mathcal{F}_{x} & \text { if } & x \in U
\end{array}\right.
$$

(4) On the category of sheaves of $\left.\mathcal{O}\right|_{U}$-modules on $U$ we have $j^{-1} j$ ! $=i d$.

Proof. Omitted.
Note that by the lemmas above, both the functors $j_{*}$ and $j_{!}$are fully faithful embeddings of the category of sheaves on $U$ into the category of sheaves on $X$. It is only true for the functor $j$ ! that one can easily describe the essential image of this functor.
00A8 Lemma 6.31.9. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset. The functor

$$
j_{!}: \operatorname{Sh}(U) \longrightarrow \operatorname{Sh}(X)
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=\emptyset$ for all $x \in X \backslash U$.
Proof. Fully faithfulness follows formally from $j^{-1} j!=i d$. We have seen that any sheaf in the image of the functor has the property on the stalks mentioned in the lemma. Conversely, suppose that $\mathcal{G}$ has the indicated property. Then it is easy to check that

$$
j!j^{-1} \mathcal{G} \rightarrow \mathcal{G}
$$

is an isomorphism on all stalks and hence an isomorphism.
00A9 Lemma 6.31.10. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset. The functor

$$
j_{!}: A b(U) \longrightarrow A b(X)
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=0$ for all $x \in X \backslash U$.

Proof. Omitted.
00AA Lemma 6.31.11. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subset. Let $(\mathcal{C}, F)$ be a type of algebraic structure such that $\mathcal{C}$ has an initial object e. The functor

$$
j_{!}: \operatorname{Sh}(U, \mathcal{C}) \longrightarrow \operatorname{Sh}(X, \mathcal{C})
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=e$ for all $x \in X \backslash U$.

Proof. Omitted.
00 AB Lemma 6.31.12. Let $(X, \mathcal{O})$ be a ringed space. Let $j:\left(U,\left.\mathcal{O}\right|_{U}\right) \rightarrow(X, \mathcal{O})$ be an open subspace. The functor

$$
j_{!}: \operatorname{Mod}\left(\left.\mathcal{O}\right|_{U}\right) \longrightarrow \operatorname{Mod}(\mathcal{O})
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=0$ for all $x \in X \backslash U$.

Proof. Omitted.

00AC Remark 6.31.13. Let $j: U \rightarrow X$ be an open immersion of topological spaces as above. Let $x \in X, x \notin U$. Let $\mathcal{F}$ be a sheaf of sets on $U$. Then $\mathcal{F}_{x}=\emptyset$ by Lemma 6.31.4. Hence $j_{!}$does not transform a final object of $S h(U)$ into a final object of $\operatorname{Sh}(X)$ unless $U=X$. According to our conventions in Categories, Section 4.23 this means that the functor $j_{\text {! }}$ is not left exact as a functor between the categories of sheaves of sets. It will be shown later that $j$ ! on abelian sheaves is exact, see Modules, Lemma 17.3.4.

### 6.32. Closed immersions and (pre)sheaves

$00 \mathrm{AD} \quad$ Let $X$ be a topological space. Let $i: Z \rightarrow X$ be the inclusion of a closed subset $Z$ into $X$. In Section 6.21 we have defined functors $i_{*}$ and $i^{-1}$ such that $i_{*}$ is right adjoint to $i^{-1}$.

00AE Lemma 6.32.1. Let $X$ be a topological space. Let $i: Z \rightarrow X$ be the inclusion of a closed subset $Z$ into $X$. Let $\mathcal{F}$ be a sheaf of sets on $Z$. The stalks of $i_{*} \mathcal{F}$ are described as follows

$$
i_{*} \mathcal{F}_{x}=\left\{\begin{array}{lll}
\{*\} & \text { if } & x \notin Z \\
\mathcal{F}_{x} & \text { if } & x \in Z
\end{array}\right.
$$

where $\{*\}$ denotes a singleton set. Moreover, $i^{-1} i_{*}=i d$ on the category of sheaves of sets on $Z$. Moreover, the same holds for abelian sheaves on $Z$, resp. sheaves of algebraic structures on $Z$ where $\{*\}$ has to be replaced by 0 , resp. a final object of the category of algebraic structures.

Proof. If $x \notin Z$, then there exist arbitrarily small open neighbourhoods $U$ of $x$ which do not meet $Z$. Because $\mathcal{F}$ is a sheaf we have $\mathcal{F}\left(i^{-1}(U)\right)=\{*\}$ for any such $U$, see Remark 6.7.2. This proves the first case. The second case comes from the fact that for $z \in Z$ any open neighbourhood of $z$ is of the form $Z \cap U$ for some open $U$ of $X$. For the statement that $i^{-1} i_{*}=$ id consider the canonical map $i^{-1} i_{*} \mathcal{F} \rightarrow \mathcal{F}$. This is an isomorphism on stalks (see above) and hence an isomorphism.

For sheaves of abelian groups, and sheaves of algebraic structures you argue in the same manner.

00AF Lemma 6.32.2. Let $X$ be a topological space. Let $i: Z \rightarrow X$ be the inclusion of a closed subset. The functor

$$
i_{*}: \operatorname{Sh}(Z) \longrightarrow \operatorname{Sh}(X)
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=\{*\}$ for all $x \in X \backslash Z$.
Proof. Fully faithfulness follows formally from $i^{-1} i_{*}=\mathrm{id}$. We have seen that any sheaf in the image of the functor has the property on the stalks mentioned in the lemma. Conversely, suppose that $\mathcal{G}$ has the indicated property. Then it is easy to check that

$$
\mathcal{G} \rightarrow i_{*} i^{-1} \mathcal{G}
$$

is an isomorphism on all stalks and hence an isomorphism.
00AG Lemma 6.32.3. Let $X$ be a topological space. Let $i: Z \rightarrow X$ be the inclusion of a closed subset. The functor

$$
i_{*}: A b(Z) \longrightarrow A b(X)
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=0$ for all $x \in X \backslash Z$.

Proof. Omitted.
00AH Lemma 6.32.4. Let $X$ be a topological space. Let $i: Z \rightarrow X$ be the inclusion of a closed subset. Let $(\mathcal{C}, F)$ be a type of algebraic structure with final object 0 . The functor

$$
i_{*}: \operatorname{Sh}(Z, \mathcal{C}) \longrightarrow \operatorname{Sh}(X, \mathcal{C})
$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_{x}=0$ for all $x \in X \backslash Z$.

Proof. Omitted.
00AI Remark 6.32.5. Let $i: Z \rightarrow X$ be a closed immersion of topological spaces as above. Let $x \in X, x \notin Z$. Let $\mathcal{F}$ be a sheaf of sets on $Z$. Then $\left(i_{*} \mathcal{F}\right)_{x}=$ $\{*\}$ by Lemma 6.32.1. Hence if $\mathcal{F}=* \amalg *$, where $*$ is the singleton sheaf, then $i_{*} \mathcal{F}_{x}=\{*\} \neq i_{*}(*)_{x} \amalg i_{*}(*)_{x}$ because the latter is a two point set. According to our conventions in Categories, Section 4.23 this means that the functor $i_{*}$ is not right exact as a functor between the categories of sheaves of sets. In particular, it cannot have a right adjoint, see Categories, Lemma 4.24.5.
On the other hand, we will see later (see Modules, Lemma 17.6.3) that $i_{*}$ on abelian sheaves is exact, and does have a right adjoint, namely the functor that associates to an abelian sheaf on $X$ the sheaf of sections supported in $Z$.
00AJ Remark 6.32.6. We have not discussed the relationship between closed immersions and ringed spaces. This is because the notion of a closed immersion of ringed spaces is best discussed in the setting of quasi-coherent sheaves, see Modules, Section 17.13 .

### 6.33. Glueing sheaves

$00 A K$ In this section we glue sheaves defined on the members of a covering of $X$. We first deal with maps.

04TN Lemma 6.33.1. Let $X$ be a topological space. Let $X=\bigcup U_{i}$ be an open covering. Let $\mathcal{F}, \mathcal{G}$ be sheaves of sets on $X$. Given a collection

$$
\varphi_{i}:\left.\left.\mathcal{F}\right|_{U_{i}} \longrightarrow \mathcal{G}\right|_{U_{i}}
$$

of maps of sheaves such that for all $i, j \in I$ the maps $\varphi_{i}, \varphi_{j}$ restrict to the same map $\left.\left.\mathcal{F}\right|_{U_{i} \cap U_{j}} \rightarrow \mathcal{G}\right|_{U_{i} \cap U_{j}}$ then there exists a unique map of sheaves

$$
\varphi: \mathcal{F} \longrightarrow \mathcal{G}
$$

whose restriction to each $U_{i}$ agrees with $\varphi_{i}$.
Proof. Omitted.
The previous lemma implies that given two sheaves $\mathcal{F}, \mathcal{G}$ on the topological space $X$ the rule

$$
U \longmapsto \operatorname{Mor}_{S h(U)}\left(\left.\mathcal{F}\right|_{U},\left.\mathcal{G}\right|_{U}\right)
$$

defines a sheaf. This is a kind of internal hom sheaf. It is seldom used in the setting of sheaves of sets, and more usually in the setting of sheaves of modules, see Modules, Section 17.19 .

Let $X$ be a topological space. Let $X=\bigcup_{i \in I} U_{i}$ be an open covering. For each $i \in I$ let $\mathcal{F}_{i}$ be a sheaf of sets on $U_{i}$. For each pair $i, j \in I$, let

$$
\varphi_{i j}:\left.\left.\mathcal{F}_{i}\right|_{U_{i} \cap U_{j}} \longrightarrow \mathcal{F}_{j}\right|_{U_{i} \cap U_{j}}
$$

be an isomorphism of sheaves of sets. Assume in addition that for every triple of indices $i, j, k \in I$ the following diagram is commutative

We will call such a collection of data $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ a glueing data for sheaves of sets with respect to the covering $X=\bigcup U_{i}$.
00AL Lemma 6.33.2. Let $X$ be a topological space. Let $X=\bigcup_{i \in I} U_{i}$ be an open covering. Given any glueing data $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for sheaves of sets with respect to the covering $X=\bigcup U_{i}$ there exists a sheaf of sets $\mathcal{F}$ on $X$ together with isomorphisms

$$
\varphi_{i}:\left.\mathcal{F}\right|_{U_{i}} \rightarrow \mathcal{F}_{i}
$$

such that the diagrams

are commutative.
Proof. Actually we can write a formula for the set of sections of $\mathcal{F}$ over an open $W \subset X$. Namely, we define

$$
\mathcal{F}(W)=\left\{\left(s_{i}\right)_{i \in I}\left|s_{i} \in \mathcal{F}_{i}\left(W \cap U_{i}\right), \varphi_{i j}\left(\left.s_{i}\right|_{W \cap U_{i} \cap U_{j}}\right)=s_{j}\right|_{W \cap U_{i} \cap U_{j}}\right\} .
$$

Restriction mappings for $W^{\prime} \subset W$ are defined by the restricting each of the $s_{i}$ to $W^{\prime} \cap U_{i}$. The sheaf condition for $\mathcal{F}$ follows immediately from the sheaf condition for each of the $\mathcal{F}_{i}$.
We still have to prove that $\left.\mathcal{F}\right|_{U_{i}}$ maps isomorphically to $\mathcal{F}_{i}$. Let $W \subset U_{i}$. In this case the condition in the definition of $\mathcal{F}(W)$ implies that $s_{j}=\varphi_{i j}\left(\left.s_{i}\right|_{W \cap U_{j}}\right)$. And the commutativity of the diagrams in the definition of a glueing data assures that we may start with any section $s \in \mathcal{F}_{i}(W)$ and obtain a compatible collection by setting $s_{i}=s$ and $s_{j}=\varphi_{i j}\left(\left.s_{i}\right|_{W \cap U_{j}}\right)$. Thus the lemma follows.

00AM Lemma 6.33.3. Let $X$ be a topological space. Let $X=\bigcup U_{i}$ be an open covering. Let $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ be a glueing data of sheaves of abelian groups, resp. sheaves of algebraic structures, resp. sheaves of $\mathcal{O}$-modules for some sheaf of rings $\mathcal{O}$ on $X$. Then the construction in the proof of Lemma 6.33.2 above leads to a sheaf of abelian groups, resp. sheaf of algebraic structures, resp. sheaf of $\mathcal{O}$-modules.

Proof. This is true because in the construction the set of sections $\mathcal{F}(W)$ over an open $W$ is given as the equalizer of the maps

$$
\prod_{i \in I} \mathcal{F}_{i}\left(W \cap U_{i}\right) \longrightarrow \prod_{i, j \in I} \mathcal{F}_{i}\left(W \cap U_{i} \cap U_{j}\right)
$$

And in each of the cases envisioned this equalizer gives an object in the relevant category whose underlying set is the object considered in the cited lemma.
00AN Lemma 6.33.4. Let $X$ be a topological space. Let $X=\bigcup_{i \in I} U_{i}$ be an open covering. The functor which associates to a sheaf of sets $\mathcal{F}$ the following collection of glueing data

$$
\left(\left.\mathcal{F}\right|_{U_{i}},\left.\left.\left(\left.\mathcal{F}\right|_{U_{i}}\right)\right|_{U_{i} \cap U_{j}} \rightarrow\left(\left.\mathcal{F}\right|_{U_{j}}\right)\right|_{U_{i} \cap U_{j}}\right)
$$

with respect to the covering $X=\bigcup U_{i}$ defines an equivalence of categories between Sh $(X)$ and the category of glueing data. A similar statement holds for abelian sheaves, resp. sheaves of algebraic structures, resp. sheaves of $\mathcal{O}$-modules.

Proof. The functor is fully faithful by Lemma 6.33.1 and essentially surjective (via an explicitly given quasi-inverse functor) by Lemma 6.33.2.

This lemma means that if the sheaf $\mathcal{F}$ was constructed from the glueing data $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ and if $\mathcal{G}$ is a sheaf on $X$, then a morphism $f: \mathcal{F} \rightarrow \mathcal{G}$ is given by a collection of morphisms of sheaves

$$
f_{i}:\left.\mathcal{F}_{i} \longrightarrow \mathcal{G}\right|_{U_{i}}
$$

compatible with the glueing maps $\varphi_{i j}$. Similarly, to give a morphism of sheaves $g: \mathcal{G} \rightarrow \mathcal{F}$ is the same as giving a collection of morphisms of sheaves

$$
g_{i}:\left.\mathcal{G}\right|_{U_{i}} \longrightarrow \mathcal{F}_{i}
$$

compatible with the glueing maps $\varphi_{i j}$.

## CHAPTER 7

## Sites and Sheaves

00UZ

### 7.1. Introduction

00V0 The notion of a site was introduced by Grothendieck to be able to study sheaves in the étale topology of schemes. The basic reference for this notion is perhaps AGV71. Our notion of a site differs from that in AGV71; what we call a site is called a category endowed with a pretopology in AGV71, Exposé II, Définition 1.3]. The reason we do this is that in algebraic geometry it is often convenient to work with a given class of coverings, for example when defining when a property of schemes is local in a given topology, see Descent, Section 34.11. Our exposition will closely follow Art62. We will not use universes.

### 7.2. Presheaves

00 V 1 Let $\mathcal{C}$ be a category. A presheaf of sets is a contravariant functor $\mathcal{F}$ from $\mathcal{C}$ to Sets (see Categories, Remark 4.2.11). So for every object $U$ of $\mathcal{C}$ we have a set $\mathcal{F}(U)$. The elements of this set are called the sections of $\mathcal{F}$ over $U$. For every morphism $f: V \rightarrow U$ the map $\mathcal{F}(f): \mathcal{F}(U) \rightarrow \mathcal{F}(V)$ is called the restriction map and is often denoted $f^{*}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$. Another way of expressing this is to say that $f^{*}(s)$ is the pullback of $s$ via $f$. Functoriality means that $g^{*} f^{*}(s)=(f \circ g)^{*}(s)$. Sometimes we use the notation $\left.s\right|_{V}:=f^{*}(s)$. This notation is consistent with the notion of restriction of functions from topology because if $W \rightarrow V \rightarrow U$ are morphisms in $\mathcal{C}$ and $s$ is a section of $\mathcal{F}$ over $U$ then $\left.s\right|_{W}=\left.\left(\left.s\right|_{V}\right)\right|_{W}$ by the functorial nature of $\mathcal{F}$. Of course we have to be careful since it may very well happen that there is more than one morphism $V \rightarrow U$ and it is certainly not going to be the case that the corresponding pullback maps are equal.

00V2 Definition 7.2.1. A presheaf of sets on $\mathcal{C}$ is a contravariant functor from $\mathcal{C}$ to Sets. Morphisms of presheaves are transformations of functors. The category of presheaves of sets is denoted $\operatorname{PSh}(\mathcal{C})$.

Note that for any object $U$ of $\mathcal{C}$ the functor of points $h_{U}$, see Categories, Example 4.3 .4 is a presheaf. These are called the representable presheaves. These presheaves have the pleasing property that for any presheaf $\mathcal{F}$ we have
090F (7.2.1.1)

$$
\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)=\mathcal{F}(U)
$$

This is the Yoneda lemma (Categories, Lemma 4.3.5.
Similarly, we can define the notion of a presheaf of abelian groups, rings, etc. More generally we may define a presheaf with values in a category.

00 V 3 Definition 7.2.2. Let $\mathcal{C}, \mathcal{A}$ be categories. A presheaf $\mathcal{F}$ on $\mathcal{C}$ with values in $\mathcal{A}$ is a contravariant functor from $\mathcal{C}$ to $\mathcal{A}$, i.e., $\mathcal{F}: \mathcal{C}^{\text {opp }} \rightarrow \mathcal{A}$. A morphism of presheaves $\mathcal{F} \rightarrow \mathcal{G}$ on $\mathcal{C}$ with values in $\mathcal{A}$ is a transformation of functors from $\mathcal{F}$ to $\mathcal{G}$.

These form the objects and morphisms of the category of presheaves on $\mathcal{C}$ with values in $\mathcal{A}$.

00V4 Remark 7.2.3. As already pointed out we may consider the category of presheaves with values in any of the "big" categories listed in Categories, Remark 4.2.2. These will be "big" categories as well and they will be listed in the above mentioned remark as we go along.

### 7.3. Injective and surjective maps of presheaves

00V5
00V6 Definition 7.3.1. Let $\mathcal{C}$ be a category, and let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of presheaves of sets.
(1) We say that $\varphi$ is injective if for every object $U$ of $\mathcal{C}$ the map $\varphi_{U}: \mathcal{F}(U) \rightarrow$ $\mathcal{G}(U)$ is injective.
(2) We say that $\varphi$ is surjective if for every object $U$ of $\mathcal{C}$ the map $\varphi_{U}: \mathcal{F}(U) \rightarrow$ $\mathcal{G}(U)$ is surjective.
00V7 Lemma 7.3.2. The injective (resp. surjective) maps defined above are exactly the monomorphisms (resp. epimorphisms) of $\operatorname{PSh}(\mathcal{C})$. A map is an isomorphism if and only if it is both injective and surjective.

Proof. We shall show that $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is injective if and only if it is a monomorphism of $\operatorname{PSh}(\mathcal{C})$. Indeed, the "only if" direction is straightforward, so let us show the "if" direction. Assume that $\varphi$ is a monomorphism. Let $U \in \operatorname{Ob}(\mathcal{C})$; we need to show that $\varphi_{U}$ is injective. So let $a, b \in \mathcal{F}(U)$ be such that $\varphi_{U}(a)=\varphi_{U}(b)$; we need to check that $a=b$. Under the isomorphism (7.2.1.1), the elements $a$ and $b$ of
 ilarly, under the analogous isomorphism $\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{G}\right)=\mathcal{G}(U)$, the two equal elements $\varphi_{U}(a)$ and $\varphi_{U}(b)$ of $\mathcal{G}(U)$ correspond to the two natural transformations $\varphi \circ a^{\prime}, \varphi \circ b^{\prime} \in \operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{G}\right)$, which therefore must also be equal. So $\varphi \circ a^{\prime}=\varphi \circ b^{\prime}$, and thus $a^{\prime}=b^{\prime}$ (since $\varphi$ is monic), whence $a=b$. This finishes (1).

We shall show that $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is surjective if and only if it is an epimorphism of $\operatorname{PSh}(\mathcal{C})$. Indeed, the "only if" direction is straightforward, so let us show the "if" direction. Assume that $\varphi$ is an epimorphism.
For any two morphisms $f: A \rightarrow B$ and $g: A \rightarrow C$ in the category Sets, we let $\operatorname{inl}_{f, g}$ and $\operatorname{inr}_{f, g}$ denote the two canonical maps from $B$ and $C$ to $B \coprod_{A} C$. (Here, the pushout is evaluated in Sets.)
Now, we define a presheaf $\mathcal{H}$ of sets on $\mathcal{C}$ by setting $\mathcal{H}(U)=\mathcal{G}(U) \coprod_{\mathcal{F}(U)} \mathcal{G}(U)$ (where the pushout is evaluated in Sets and induced by the map $\varphi_{U}: \mathcal{F}(U) \rightarrow \mathcal{G}(U)$ ) for every $U \in \operatorname{Ob}(\mathcal{C})$; its action on morphisms is defined in the obvious way (by the functoriality of pushout). Then, there are two natural transformations $i_{1}: \mathcal{G} \rightarrow \mathcal{H}$ and $i_{2}: \mathcal{G} \rightarrow \mathcal{H}$ whose components at an object $U \in \mathrm{Ob}(\mathcal{C})$ are given by the maps $\operatorname{inl}_{\varphi_{U}, \varphi_{U}}$ and $\operatorname{inr}_{\varphi_{U}, \varphi_{U}}$, respectively. The definition of a pushout shows that $i_{1} \circ \varphi=i_{2} \circ \varphi$, whence $i_{1}=i_{2}$ (since $\varphi$ is an epimorphism). Thus, for every $U \in \operatorname{Ob}(\mathcal{C})$, we have $\operatorname{inl}_{\varphi_{U}, \varphi_{U}}=\operatorname{inr}_{\varphi_{U}, \varphi_{U}}$. Thus, $\varphi_{U}$ must be surjective (since a
simple combinatorial argument shows that if $f: A \rightarrow B$ is a morphism in Sets, then $\operatorname{inl}_{f, f}=\operatorname{inr}_{f, f}$ if and only if $f$ is surjective). In other words, $\varphi$ is surjective, and (2) is proven.
We shall show that $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is both injective and surjective if and only if is an isomorphism of $\operatorname{PSh}(\mathcal{C})$. This time, the "if" direction is straightforward. To prove the "only if" direction, it suffices to observe that if $\varphi$ is both injective and surjective, then $\varphi_{U}$ is an invertible map for every $U \in \operatorname{Ob}(\mathcal{C})$, and the inverses of these maps for all $U$ can be combined to a natural transformation $\mathcal{G} \rightarrow \mathcal{F}$ which is an inverse to $\varphi$.

00V8 Definition 7.3.3. We say $\mathcal{F}$ is a subpresheaf of $\mathcal{G}$ if for every object $U \in \operatorname{Ob}(\mathcal{C})$ the set $\mathcal{F}(U)$ is a subset of $\mathcal{G}(U)$, compatibly with the restriction mappings.

In other words, the inclusion maps $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ glue together to give an (injective) morphism of presheaves $\mathcal{F} \rightarrow \mathcal{G}$.

00V9 Lemma 7.3.4. Let $\mathcal{C}$ be a category. Suppose that $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets on $\mathcal{C}$. There exists a unique subpresheaf $\mathcal{G}^{\prime} \subset \mathcal{G}$ such that $\varphi$ factors as $\mathcal{F} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G}$ and such that the first map is surjective.

Proof. To prove existence, just set $\mathcal{G}^{\prime}(U)=\varphi_{U}(\mathcal{F}(U))$ for every $U \in \mathrm{Ob}(C)$ (and inherit the action on morphisms from $\mathcal{G})$, and prove that this defines a subpresheaf of $\mathcal{G}$ and that $\varphi$ factors as $\mathcal{F} \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{G}$ with the first map being surjective. Uniqueness is straightforward.
00VA Definition 7.3.5. Notation as in Lemma 7.3.4. We say that $\mathcal{G}^{\prime}$ is the image of $\varphi$.

### 7.4. Limits and colimits of presheaves

00 VB Let $\mathcal{C}$ be a category. Limits and colimits exist in the category $\operatorname{PSh}(\mathcal{C})$. In addition, for any $U \in \operatorname{ob}(\mathcal{C})$ the functor

$$
\operatorname{PSh}(\mathcal{C}) \longrightarrow \text { Sets, } \quad \mathcal{F} \longmapsto \mathcal{F}(U)
$$

commutes with limits and colimits. Perhaps the easiest way to prove these statements is the following. Given a diagram $\mathcal{F}: \mathcal{I} \rightarrow \operatorname{PSh}(\mathcal{C})$ define presheaves

$$
\mathcal{F}_{\lim }: U \longmapsto \lim _{i \in \mathcal{I}} \mathcal{F}_{i}(U) \text { and } \mathcal{F}_{\text {colim }}: U \longmapsto \operatorname{colim}_{i \in \mathcal{I}} \mathcal{F}_{i}(U)
$$

There are clearly projection maps $\mathcal{F}_{\lim } \rightarrow \mathcal{F}_{i}$ and canonical maps $\mathcal{F}_{i} \rightarrow \mathcal{F}_{\text {colim }}$. These maps satisfy the requirements of the maps of a limit (reps. colimit) of Categories, Definition 4.14 .1 (resp. Categories, Definition 4.14 .2 ). Indeed, they clearly form a cone, resp. a cocone, over $\mathcal{F}$. Furthermore, if $\left(\mathcal{G}, q_{i}: \mathcal{G} \rightarrow \mathcal{F}_{i}\right)$ is another system (as in the definition of a limit), then we get for every $U$ a system of maps $\mathcal{G}(U) \rightarrow \mathcal{F}_{i}(U)$ with suitable functoriality requirements. And thus a unique map $\mathcal{G}(U) \rightarrow \mathcal{F}_{\text {lim }}(U)$. It is easy to verify these are compatible as we vary $U$ and arise from the desired map $\mathcal{G} \rightarrow \mathcal{F}_{\text {lim }}$. A similar argument works in the case of the colimit.

### 7.5. Functoriality of categories of presheaves

00 VC Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. In this case we denote

$$
u^{p}: \operatorname{PSh}(\mathcal{D}) \longrightarrow \operatorname{PSh}(\mathcal{C})
$$

the functor that associates to $\mathcal{G}$ on $\mathcal{D}$ the presheaf $u^{p} \mathcal{G}=\mathcal{G} \circ u$. Note that by the previous section this functor commutes with all limits.
For $V \in \operatorname{ob}(\mathcal{D})$ let $\mathcal{I}_{V}^{u}$ denote the category with
053L

$$
\begin{array}{cl}
\operatorname{Ob}\left(\mathcal{I}_{V}^{u}\right) & =\{(U, \phi) \mid U \in \operatorname{Ob}(\mathcal{C}), \phi: V \rightarrow u(U)\} \\
\operatorname{Mor}_{\mathcal{I}_{V}^{u}}\left((U, \phi),\left(U^{\prime}, \phi^{\prime}\right)\right) & =\left\{f: U \rightarrow U^{\prime} \text { in } \mathcal{C} \mid u(f) \circ \phi=\phi^{\prime}\right\} \tag{7.5.0.1}
\end{array}
$$

We sometimes drop the subscript ${ }^{u}$ from the notation and we simply write $\mathcal{I}_{V}$. We will use these categories to define a left adjoint to the functor $u^{p}$. Before we do so we prove a few technical lemmas.

00X4 Lemma 7.5.1. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Suppose that $\mathcal{C}$ has fibre products and equalizers, and that $u$ commutes with them. Then the categories $\left(\mathcal{I}_{V}\right)^{\text {opp }}$ satisfy the hypotheses of Categories, Lemma 4.19.7.
Proof. There are two conditions to check.
First, suppose we are given three objects $\phi: V \rightarrow u(U), \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right)$, and $\phi^{\prime \prime}: V \rightarrow u\left(U^{\prime \prime}\right)$ and morphisms $a: U^{\prime} \rightarrow U, b: U^{\prime \prime} \rightarrow U$ such that $u(a) \circ \phi^{\prime}=\phi$ and $u(b) \circ \phi^{\prime \prime}=\phi$. We have to show there exists another object $\phi^{\prime \prime \prime}: V \rightarrow u\left(U^{\prime \prime \prime}\right)$ and morphisms $c: U^{\prime \prime \prime} \rightarrow U^{\prime}$ and $d: U^{\prime \prime \prime} \rightarrow U^{\prime \prime}$ such that $u(c) \circ \phi^{\prime \prime \prime}=\phi^{\prime}, u(d) \circ \phi^{\prime \prime \prime}=\phi^{\prime \prime}$ and $a \circ c=b \circ d$. We take $U^{\prime \prime \prime}=U^{\prime} \times_{U} U^{\prime \prime}$ with $c$ and $d$ the projection morphisms. This works as $u$ commutes with fibre products; we omit the verification.
Second, suppose we are given two objects $\phi: V \rightarrow u(U)$ and $\phi^{\prime}: V \rightarrow u\left(U^{\prime}\right)$ and morphisms $a, b:(U, \phi) \rightarrow\left(U^{\prime}, \phi^{\prime}\right)$. We have to find a morphism $c:\left(U^{\prime \prime}, \phi^{\prime \prime}\right) \rightarrow$ $(U, \phi)$ which equalizes $a$ and $b$. Let $c: U^{\prime \prime} \rightarrow U$ be the equalizer of $a$ and $b$ in the category $\mathcal{C}$. As $u$ commutes with equalizers and since $u(a) \circ \phi=u(b) \circ \phi=\phi^{\prime}$ we obtain a morphism $\phi^{\prime \prime}: V \rightarrow u\left(U^{\prime \prime}\right)$.

00X3 Lemma 7.5.2. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Assume
(1) the category $\mathcal{C}$ has a final object $X$ and $u(X)$ is a final object of $\mathcal{D}$, and
(2) the category $\mathcal{C}$ has fibre products and $u$ commutes with them.

Then the index categories $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ are filtered (see Categories, Definition 4.19.1).
Proof. The assumptions imply that the assumptions of Lemma 7.5.1 are satisfied (see the discussion in Categories, Section 4.18). By Categories, Lemma 4.19.7 we see that $\mathcal{I}_{V}$ is a (possibly empty) disjoint union of directed categories. Hence it suffices to show that $\mathcal{I}_{V}$ is connected.
First, we show that $\mathcal{I}_{V}$ is nonempty. Namely, let $X$ be the final object of $\mathcal{C}$, which exists by assumption. Let $V \rightarrow u(X)$ be the morphism coming from the fact that $u(X)$ is final in $\mathcal{D}$ by assumption. This gives an object of $\mathcal{I}_{V}$.

Second, we show that $\mathcal{I}_{V}$ is connected. Let $\phi_{1}: V \rightarrow u\left(U_{1}\right)$ and $\phi_{2}: V \rightarrow u\left(U_{2}\right)$ be in $\operatorname{Ob}\left(\mathcal{I}_{V}\right)$. By assumption $U_{1} \times U_{2}$ exists and $u\left(U_{1} \times U_{2}\right)=u\left(U_{1}\right) \times u\left(U_{2}\right)$. Consider the morphism $\phi: V \rightarrow u\left(U_{1} \times U_{2}\right)$ corresponding to $\left(\phi_{1}, \phi_{2}\right)$ by the universal property of products. Clearly the object $\phi: V \rightarrow u\left(U_{1} \times U_{2}\right)$ maps to both $\phi_{1}: V \rightarrow u\left(U_{1}\right)$ and $\phi_{2}: V \rightarrow u\left(U_{2}\right)$.

Given $g: V^{\prime} \rightarrow V$ in $\mathcal{D}$ we get a functor $\bar{g}: \mathcal{I}_{V} \rightarrow \mathcal{I}_{V^{\prime}}$ by setting $\bar{g}(U, \phi)=(U, \phi \circ g)$ on objects. Given a presheaf $\mathcal{F}$ on $\mathcal{C}$ we obtain a functor

$$
\mathcal{F}_{V}: \mathcal{I}_{V}^{o p p} \longrightarrow \text { Sets, } \quad(U, \phi) \longmapsto \mathcal{F}(U)
$$

In other words, $\mathcal{F}_{V}$ is a presheaf of sets on $\mathcal{I}_{V}$. Note that we have $\mathcal{F}_{V^{\prime}} \circ \bar{g}=\mathcal{F}_{V}$. We define

$$
u_{p} \mathcal{F}(V):=\operatorname{colim}_{\mathcal{I}_{V}^{o p p}} \mathcal{F}_{V}
$$

As a colimit we obtain for each $(U, \phi) \in \operatorname{Ob}\left(\mathcal{I}_{V}\right)$ a canonical map $\mathcal{F}(U) \xrightarrow{c(\phi)}$ $u_{p} \mathcal{F}(V)$. For $g: V^{\prime} \rightarrow V$ as above there is a canonical restriction map $g^{*}$ : $u_{p} \mathcal{F}(V) \rightarrow u_{p} \mathcal{F}\left(V^{\prime}\right)$ compatible with $\mathcal{F}_{V^{\prime}} \circ \bar{g}=\mathcal{F}_{V}$ by Categories, Lemma 4.14.7. It is the unique map so that for all $(U, \phi) \in \operatorname{Ob}\left(\mathcal{I}_{V}\right)$ the diagram

commutes. The uniqueness of these maps implies that we obtain a presheaf. This presheaf will be denoted $u_{p} \mathcal{F}$.
00VD Lemma 7.5.3. There is a canonical map $\mathcal{F}(U) \rightarrow u_{p} \mathcal{F}(u(U))$, which is compatible with restriction maps (on $\mathcal{F}$ and on $u_{p} \mathcal{F}$ ).

Proof. This is just the map $c\left(\mathrm{id}_{u(U)}\right)$ introduced above.
Note that any map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ gives rise to compatible systems of maps between functors $\mathcal{F}_{Y} \rightarrow \mathcal{F}_{Y}^{\prime}$, and hence to a map of presheaves $u_{p} \mathcal{F} \rightarrow u_{p} \mathcal{F}^{\prime}$. In other words, we have defined a functor

$$
u_{p}: \operatorname{PSh}(\mathcal{C}) \longrightarrow \operatorname{PSh}(\mathcal{D})
$$

00VE Lemma 7.5.4. The functor $u_{p}$ is a left adjoint to the functor $u^{p}$. In other words the formula

$$
\operatorname{Mor}_{P S h(\mathcal{C})}\left(\mathcal{F}, u^{p} \mathcal{G}\right)=\operatorname{Mor}_{P S h(\mathcal{D})}\left(u_{p} \mathcal{F}, \mathcal{G}\right)
$$

holds bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
Proof. Let $\mathcal{G}$ be a presheaf on $\mathcal{D}$ and let $\mathcal{F}$ be a presheaf on $\mathcal{C}$. We will show that the displayed formula holds by constructing maps either way. We will leave it to the reader to verify they are each others inverse.
Given a map $\alpha: u_{p} \mathcal{F} \rightarrow \mathcal{G}$ we get $u^{p} \alpha: u^{p} u_{p} \mathcal{F} \rightarrow u^{p} \mathcal{G}$. Lemma 7.5.3 says that there is a $\operatorname{map} \mathcal{F} \rightarrow u^{p} u_{p} \mathcal{F}$. The composition of the two gives the desired map. (The good thing about this construction is that it is clearly functorial in everything in sight.)
Conversely, given a map $\beta: \mathcal{F} \rightarrow u^{p} \mathcal{G}$ we get a map $u_{p} \beta: u_{p} \mathcal{F} \rightarrow u_{p} u^{p} \mathcal{G}$. We claim that the functor $u^{p} \mathcal{G}_{Y}$ on $\mathcal{I}_{Y}$ has a canonical map to the constant functor with value $\mathcal{G}(Y)$. Namely, for every object $(X, \phi)$ of $\mathcal{I}_{Y}$, the value of $u^{p} \mathcal{G}_{Y}$ on this object is $\mathcal{G}(u(X))$ which maps to $\mathcal{G}(Y)$ by $\mathcal{G}(\phi)=\phi^{*}$. This is a transformation of functors because $\mathcal{G}$ is a functor itself. This leads to a map $u_{p} u^{p} \mathcal{G}(Y) \rightarrow \mathcal{G}(Y)$. Another trivial verification shows that this is functorial in $Y$ leading to a map of presheaves $u_{p} u^{p} \mathcal{G} \rightarrow \mathcal{G}$. The composition $u_{p} \mathcal{F} \rightarrow u_{p} u^{p} \mathcal{G} \rightarrow \mathcal{G}$ is the desired map.
00VF Remark 7.5.5. Suppose that $\mathcal{A}$ is a category such that any diagram $\mathcal{I}_{Y} \rightarrow \mathcal{A}$ has a colimit in $\mathcal{A}$. In this case it is clear that there are functors $u^{p}$ and $u_{p}$, defined in exactly the same way as above, on the categories of presheaves with values in $\mathcal{A}$. Moreover, the adjointness of the pair $u^{p}$ and $u_{p}$ continues to hold in this setting.

04D2 Lemma 7.5.6. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. For any object $U$ of $\mathcal{C}$ we have $u_{p} h_{U}=h_{u(U)}$.

Proof. By adjointness of $u_{p}$ and $u^{p}$ we have

$$
\operatorname{Mor}_{P S h(\mathcal{D})}\left(u_{p} h_{U}, \mathcal{G}\right)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, u^{p} \mathcal{G}\right)=u^{p} \mathcal{G}(U)=\mathcal{G}(u(U))
$$

and hence by Yoneda's lemma we see that $u_{p} h_{U}=h_{u(U)}$ as presheaves.

### 7.6. Sites

00 VG Our notion of a site uses the following type of structures.
0396 Definition 7.6.1. Let $\mathcal{C}$ be a category, see Conventions, Section 2.3 A family of morphisms with fixed target in $\mathcal{C}$ is given by an object $U \in \operatorname{Ob}(\mathcal{C})$, a set $I$ and for each $i \in I$ a morphism $U_{i} \rightarrow U$ of $\mathcal{C}$ with target $U$. We use the notation $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ to indicate this.

It can happen that the set $I$ is empty! This notation is meant to suggest an open covering as in topology.

00VH Definition 7.6.2. A sit $\oint^{1}$ is given by a category $\mathcal{C}$ and a set $\operatorname{Cov}(\mathcal{C})$ of families of morphisms with fixed target $\left\{U_{i} \rightarrow U\right\}_{i \in I}$, called coverings of $\mathcal{C}$, satisfying the following axioms
(1) If $V \rightarrow U$ is an isomorphism then $\{V \rightarrow U\} \in \operatorname{Cov}(\mathcal{C})$.
(2) If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ and for each $i$ we have $\left\{V_{i j} \rightarrow U_{i}\right\}_{j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})$, then $\left\{V_{i j} \rightarrow U\right\}_{i \in I, j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})$.
(3) If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ and $V \rightarrow U$ is a morphism of $\mathcal{C}$ then $U_{i} \times_{U} V$ exists for all $i$ and $\left\{U_{i} \times_{U} V \rightarrow V\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$.

00VI Remark 7.6.3. (On set theoretic issues - skip on a first reading.) The main reason for introducing sites is to study the category of sheaves on a site, because it is the generalization of the category of sheaves on a topological space that has been so important in algebraic geometry. In order to avoid thinking about things like "classes of classes" and so on, we will not allow sites to be "big" categories, in contrast to what we do for categories and 2-categories.

Suppose that $\mathcal{C}$ is a category and that $\operatorname{Cov}(\mathcal{C})$ is a proper class of coverings satisfying $(1),(2)$ and (3) above. We will not allow this as a site either, mainly because we are going to take limits over coverings. However, there are several natural ways to replace $\operatorname{Cov}(\mathcal{C})$ by a set of coverings or a slightly different structure that give rise to the same category of sheaves. For example:
(1) In Sets, Section 3.11 we show how to pick a suitable set of coverings that gives the same category of sheaves.
(2) Another thing we can do is to take the associated topology (see Definition 7.46.2). The resulting topology on $\mathcal{C}$ has the same category of sheaves. Two topologies have the same categories of sheaves if and only if they are equal, see Theorem 7.48.2. A topology on a category is given by a choice of sieves on objects. The collection of all possible sieves and even all possible topologies on $\mathcal{C}$ is a set.

[^12](3) We could also slightly modify the notion of a site, see Remark 7.46.4 below, and end up with a canonical set of coverings which is contained in the powerset of the set of arrows of $\mathcal{C}$.
Each of these solutions has some minor drawback. For the first, one has to check that constructions later on do not depend on the choice of the set of coverings. For the second, one has to learn about topologies and redo many of the arguments for sites. For the third, see the last sentence of Remark 7.46.4.
Our approach will be to work with sites as in Definition 7.6 .2 above. Given a category $\mathcal{C}$ with a proper class of coverings as above, we will replace this by a set of coverings producing a site using Sets, Lemma 3.11.1. It is shown in Lemma 7.8.6 below that the resulting category of sheaves (the topos) is independent of this choice. We leave it to the reader to use one of the other two strategies to deal with these issues if he/she so desires.

00VJ Example 7.6.4. Let $X$ be a topological space. Let $X_{Z a r}$ be the category whose objects consist of all the open sets $U$ in $X$ and whose morphisms are just the inclusion maps. That is, there is at most one morphism between any two objects in $X_{Z a r}$. Now define $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}\left(X_{Z a r}\right)$ if and only if $\bigcup U_{i}=U$. Conditions (1) and (2) above are clear, and (3) is also clear once we realize that in $X_{\text {Zar }}$ we have $U \times V=U \cap V$. Note that in particular the empty set has to be an element of $X_{Z a r}$ since otherwise this would not work in general. Furthermore, it is equally important, as we will see later, to allow the empty covering of the empty set as a covering! We turn $X_{Z a r}$ into a site by choosing a suitable set of coverings $\operatorname{Cov}\left(X_{Z a r}\right)_{\kappa, \alpha}$ as in Sets, Lemma 3.11.1. Presheaves and sheaves (as defined below) on the site $X_{Z a r}$ agree exactly with the usual notion of a presheaves and sheaves on a topological space, as defined in Sheaves, Section 6.1 .

00VK Example 7.6.5. Let $G$ be a group. Consider the category $G$-Sets whose objects are sets $X$ with a left $G$-action, with $G$-equivariant maps as the morphisms. An important example is ${ }_{G} G$ which is the $G$-set whose underlying set is $G$ and action given by left multiplication. This category has fiber products, see Categories, Section 4.7. We declare $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ to be a covering if $\bigcup_{i \in I} \varphi_{i}\left(U_{i}\right)=U$. This gives a class of coverings on $G$-Sets which is easily see to satisfy conditions (1), (2), and (3) of Definition 7.6.2. The result is not a site since both the collection of objects of the underlying category and the collection of coverings form a proper class. We first replace by $G$-Sets by a full subcategory $G$-Sets $\alpha_{\alpha}$ as in Sets, Lemma 3.10.1. After this the site $\left(G-\right.$ Sets $\left._{\alpha}, \operatorname{Cov}_{\kappa, \alpha^{\prime}}\left(G-\operatorname{Sets}_{\alpha}\right)\right)$ gotten by suitably restricting the collection of coverings as in Sets, Lemma 3.11.1 will be denoted $\mathcal{T}_{G}$.
As a special case, if the group $G$ is countable, then we can let $\mathcal{T}_{G}$ be the category of countable $G$-sets and coverings those jointly surjective families of morphisms $\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ such that $I$ is countable.
07GE Example 7.6.6. Let $\mathcal{C}$ be a category. There is a canonical way to turn this into a site where $\left\{\operatorname{id}_{U}: U \rightarrow U\right\}$ are the coverings. Sheaves on this site are the presheaves on $\mathcal{C}$. This corresponding topology is called the chaotic or indiscrete topology.

### 7.7. Sheaves

00 VL Let $\mathcal{C}$ be a site. Before we introduce the notion of a sheaf with values in a category we explain what it means for a presheaf of sets to be a sheaf. Let $\mathcal{F}$ be a presheaf
of sets on $\mathcal{C}$ and let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be an element of $\operatorname{Cov}(\mathcal{C})$. By assumption all the fibre products $U_{i} \times_{U} U_{j}$ exist in $\mathcal{C}$. There are two natural maps

$$
\prod_{i \in I} \mathcal{F}\left(U_{i}\right) \xrightarrow[\operatorname{pr}_{1}^{*}]{\stackrel{\mathrm{pr}_{0}^{*}}{\longrightarrow}} \prod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}\left(U_{i_{0}} \times_{U} U_{i_{1}}\right)
$$

which we will denote $\mathrm{pr}_{i}^{*}, i=0,1$ as indicated in the displayed equation. Namely, an element of the left hand side corresponds to a family $\left(s_{i}\right)_{i \in I}$, where each $s_{i}$ is a section of $\mathcal{F}$ over $U_{i}$. For each pair $\left(i_{0}, i_{1}\right) \in I \times I$ we have the projection morphisms

$$
\operatorname{pr}_{i_{0}}^{\left(i_{0}, i_{1}\right)}: U_{i_{0}} \times_{U} U_{i_{1}} \longrightarrow U_{i_{0}} \text { and } \operatorname{pr}_{i_{1}}^{\left(i_{0}, i_{1}\right)}: U_{i_{0}} \times_{U} U_{i_{1}} \longrightarrow U_{i_{1}}
$$

Thus we may pull back either the section $s_{i_{0}}$ via the first of these maps or the section $s_{i_{1}}$ via the second. Explicitly the maps we referred to above are

$$
\operatorname{pr}_{0}^{*}:\left(s_{i}\right)_{i \in I} \longmapsto\left(\operatorname{pr}_{i_{0}}^{\left(i_{0}, i_{1}\right), *}\left(s_{i_{0}}\right)\right)_{\left(i_{0}, i_{1}\right) \in I \times I}
$$

and

$$
\operatorname{pr}_{1}^{*}:\left(s_{i}\right)_{i \in I} \longmapsto\left(\operatorname{pr}_{i_{1}}^{\left(i_{0}, i_{1}\right), *}\left(s_{i_{1}}\right)\right)_{\left(i_{0}, i_{1}\right) \in I \times I}
$$

Finally consider the natural map

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right), \quad s \longmapsto\left(\left.s\right|_{U_{i}}\right)_{i \in I}
$$

where we have used the notation $\left.s\right|_{U_{i}}$ to indicate the pullback of $s$ via the map $U_{i} \rightarrow U$. It is clear from the functorial nature of $\mathcal{F}$ and the commutativity of the fibre product diagrams that $\operatorname{pr}_{0}^{*}\left(\left(\left.s\right|_{U_{i}}\right)_{i \in I}\right)=\operatorname{pr}_{1}^{*}\left(\left(\left.s\right|_{U_{i}}\right)_{i \in I}\right)$.
00VM Definition 7.7.1. Let $\mathcal{C}$ be a site, and let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. We say $\mathcal{F}$ is a sheaf if for every covering $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ the diagram

00 VN

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \xrightarrow[\operatorname{pr}_{1}^{*}]{\stackrel{\mathrm{pr}_{0}^{*}}{\longrightarrow}} \prod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}\left(U_{i_{0}} \times_{U} U_{i_{1}}\right)
$$

represents the first arrow as the equalizer of $\mathrm{pr}_{0}^{*}$ and $\mathrm{pr}_{1}^{*}$.
Loosely speaking this means that given sections $s_{i} \in \mathcal{F}\left(U_{i}\right)$ such that

$$
\left.s_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}
$$

in $\mathcal{F}\left(U_{i} \times_{U} U_{j}\right)$ for all pairs $(i, j) \in I \times I$ then there exists a unique $s \in \mathcal{F}(U)$ such that $s_{i}=\left.s\right|_{U_{i}}$.
04B3 Remark 7.7.2. If the covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is the empty family (this means that $I=\emptyset$ ), then the sheaf condition signifies that $\mathcal{F}(U)=\{*\}$ is a singleton set. This is because in 7.7 .1 .1 the second and third sets are empty products in the category of sets, which are final objects in the category of sets, hence singletons.
00VO Example 7.7.3. Let $X$ be a topological space. Let $X_{Z a r}$ be the site constructed in Example 7.6.4. The notion of a sheaf on $X_{Z a r}$ coincides with the notion of a sheaf on $X$ introduced in Sheaves, Definition 6.7.1.

00VP Example 7.7.4. Let $X$ be a topological space. Let us consider the site $X_{Z a r}^{\prime}$ which is the same as the site $X_{Z a r}$ of Example 7.6.4 except that we disallow the empty covering of the empty set. In other words, we do allow the covering $\{\emptyset \rightarrow \emptyset\}$ but we do not allow the covering whose index set is empty. It is easy to show that
this still defines a site. However, we claim that the sheaves on $X_{Z a r}^{\prime}$ are different from the sheaves on $X_{Z a r}$. For example, as an extreme case consider the situation where $X=\{p\}$ is a singleton. Then the objects of $X_{Z a r}^{\prime}$ are $\emptyset, X$ and every covering if $\emptyset$ can be refined by $\{\emptyset \rightarrow \emptyset\}$ and every covering of $X$ by $\{X \rightarrow X\}$. Clearly, a sheaf on this is given by any choice of a set $\mathcal{F}(\emptyset)$ and any choice of a set $\mathcal{F}(X)$, together with any restriction map $\mathcal{F}(X) \rightarrow \mathcal{F}(\emptyset)$. Thus sheaves on $X_{\text {Zar }}^{\prime}$ are the same as usual sheaves on the two point space $\{\eta, p\}$ with open sets $\{\emptyset,\{\eta\},\{p, \eta\}\}$. In general sheaves on $X_{Z a r}^{\prime}$ are the same as sheaves on the space $X \amalg\{\eta\}$, with opens given by the empty set and any set of the form $U \cup\{\eta\}$ for $U \subset X$ open.

00VQ Definition 7.7.5. The category $\operatorname{Sh}(\mathcal{C})$ of sheaves of sets is the full subcategory of the category $\operatorname{PSh}(\mathcal{C})$ whose objects are the sheaves of sets.

Let $\mathcal{A}$ be a category. If products indexed by $I$, and $I \times I$ exist in $\mathcal{A}$ for any $I$ that occurs as an index set for covering families then Definition 7.7.1 above makes sense, and defines a notion of a sheaf on $\mathcal{C}$ with values in $\mathcal{A}$. Note that the diagram in $\mathcal{A}$

$$
\mathcal{F}(U) \longrightarrow \prod_{i \in I} \mathcal{F}\left(U_{i}\right) \xrightarrow[\operatorname{pr}_{1}^{*}]{\stackrel{\mathrm{pr}_{0}^{*}}{\longrightarrow}} \prod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}\left(U_{i_{0}} \times_{U} U_{i_{1}}\right)
$$

is an equalizer diagram if and only if for every object $X$ of $\mathcal{A}$ the diagram of sets

$$
\operatorname{Mor}_{\mathcal{A}}(X, \mathcal{F}(U)) \longrightarrow \prod \operatorname{Mor}_{\mathcal{A}}\left(X, \mathcal{F}\left(U_{i}\right)\right) \xrightarrow[\operatorname{pr}_{1}^{*}]{\stackrel{\mathrm{pr}_{0}^{*}}{\longrightarrow}} \Pi \operatorname{Mor}_{\mathcal{A}}\left(X, \mathcal{F}\left(U_{i_{0}} \times_{U} U_{i_{1}}\right)\right)
$$

is an equalizer diagram.
Suppose $\mathcal{A}$ is arbitrary. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{A}$. Choose any object $X \in \operatorname{Ob}(\mathcal{A})$. Then we get a presheaf of sets $\mathcal{F}_{X}$ defined by the rule

$$
\mathcal{F}_{X}(U)=\operatorname{Mor}_{\mathcal{A}}(X, \mathcal{F}(U))
$$

From the above it follows that a good definition is obtained by requiring all the presheaves $\mathcal{F}_{X}$ to be sheaves of sets.
00VR Definition 7.7.6. Let $\mathcal{C}$ be a site, let $\mathcal{A}$ be a category and let $\mathcal{F}$ be a presheaf on $\mathcal{C}$ with values in $\mathcal{A}$. We say that $\mathcal{F}$ is a sheaf if for all objects $X$ of $\mathcal{A}$ the presheaf of sets $\mathcal{F}_{X}$ (defined above) is a sheaf.

### 7.8. Families of morphisms with fixed target

00 VS This section is meant to introduce some notions regarding families of morphisms with the same target.
00VT Definition 7.8.1. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms of $\mathcal{C}$ with fixed target. Let $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be another.
(1) A morphism of families of maps with fixed target of $\mathcal{C}$ from $\mathcal{U}$ to $\mathcal{V}$, or simply a morphism from $\mathcal{U}$ to $\mathcal{V}$ is given by a morphism $U \rightarrow V$, a map of sets $\alpha: I \rightarrow J$ and for each $i \in I$ a morphism $U_{i} \rightarrow V_{\alpha(i)}$ such that the diagram

is commutative.
(2) In the special case that $U=V$ and $U \rightarrow V$ is the identity we call $\mathcal{U}$ a refinement of the family $\mathcal{V}$.

A trivial but important remark is that if $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ is the empty family of maps, i.e., if $J=\emptyset$, then no family $\mathcal{U}=\left\{U_{i} \rightarrow V\right\}_{j \in I}$ with $I \neq \emptyset$ can refine $\mathcal{V}$ !
00VU Definition 7.8.2. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$, and $\mathcal{V}=\left\{\psi_{j}\right.$ : $\left.V_{j} \rightarrow U\right\}_{j \in J}$ be two families of morphisms with fixed target.
(1) We say $\mathcal{U}$ and $\mathcal{V}$ are combinatorially equivalent if there exist maps $\alpha: I \rightarrow$ $J$ and $\beta: J \rightarrow I$ such that $\varphi_{i}=\psi_{\alpha(i)}$ and $\psi_{j}=\varphi_{\beta(j)}$.
(2) We say $\mathcal{U}$ and $\mathcal{V}$ are tautologically equivalent if there exist maps $\alpha: I \rightarrow J$ and $\beta: J \rightarrow I$ and for all $i \in I$ and $j \in J$ commutative diagrams

with isomorphisms as horizontal arrows.
00VV Lemma 7.8.3. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$, and $\mathcal{V}=\left\{\psi_{j}\right.$ : $\left.V_{j} \rightarrow U\right\}_{j \in J}$ be two families of morphisms with the same fixed target.
(1) If $\mathcal{U}$ and $\mathcal{V}$ are combinatorially equivalent then they are tautologically equivalent.
(2) If $\mathcal{U}$ and $\mathcal{V}$ are tautologically equivalent then $\mathcal{U}$ is a refinement of $\mathcal{V}$ and $\mathcal{V}$ is a refinement of $\mathcal{U}$.
(3) The relation "being combinatorially equivalent" is an equivalence relation on all families of morphisms with fixed target.
(4) The relation "being tautologically equivalent" is an equivalence relation on all families of morphisms with fixed target.
(5) The relation ' $\mathcal{U}$ refines $\mathcal{V}$ and $\mathcal{V}$ refines $\mathcal{U}$ " is an equivalence relation on all families of morphisms with fixed target.

Proof. Omitted.
In the following lemma, given a category $\mathcal{C}$, a presheaf $\mathcal{F}$ on $\mathcal{C}$, a family $\mathcal{U}=\left\{U_{i} \rightarrow\right.$ $U\}_{i \in I}$ such that all fibre products $U_{i} \times{ }_{U} U_{i^{\prime}}$ exist, we say that the sheaf condition for $\mathcal{F}$ with respect to $\mathcal{U}$ holds if the diagram 7.7.1.1 is an equalizer diagram.

00VW Lemma 7.8.4. Let $\mathcal{C}$ be a category. Let $\mathcal{U}=\left\{\varphi_{i}: U_{i} \rightarrow U\right\}_{i \in I}$, and $\mathcal{V}=\left\{\psi_{j}\right.$ : $\left.V_{j} \rightarrow U\right\}_{j \in J}$ be two families of morphisms with the same fixed target. Assume that the fibre products $U_{i} \times_{U} U_{i^{\prime}}$ and $V_{j} \times_{U} V_{j^{\prime}}$ exist. If $\mathcal{U}$ and $\mathcal{V}$ are tautologically equivalent, then for any presheaf $\mathcal{F}$ on $\mathcal{C}$ the sheaf condition for $\mathcal{F}$ with respect to $\mathcal{U}$ is equivalent to the sheaf condition for $\mathcal{F}$ with respect to $\mathcal{V}$.

Proof. First, note that if $\varphi: A \rightarrow B$ is an isomorphism in the category $\mathcal{C}$, then $\varphi^{*}: \mathcal{F}(B) \rightarrow \mathcal{F}(A)$ is an isomorphism. Let $\beta: J \rightarrow I$ be a map and let $\psi_{j}: V_{j} \rightarrow$ $U_{\beta(j)}$ be isomorphisms over $U$ which are assumed to exist by hypothesis. Let us show that the sheaf condition for $\mathcal{V}$ implies the sheaf condition for $\mathcal{U}$. Suppose given sections $s_{i} \in \mathcal{F}\left(U_{i}\right)$ such that

$$
\left.s_{i}\right|_{U_{i} \times{ }_{U} U_{i^{\prime}}}=\left.s_{i^{\prime}}\right|_{U_{i} \times U U_{i^{\prime}}}
$$

in $\mathcal{F}\left(U_{i} \times_{U} U_{i^{\prime}}\right)$ for all pairs $\left(i, i^{\prime}\right) \in I \times I$. Then we can define $s_{j}=\psi_{j}^{*} s_{\beta(j)}$. For any pair $\left(j, j^{\prime}\right) \in J \times J^{\prime}$ the morphism $\psi_{j} \times_{\mathrm{id}_{U}} \psi_{j^{\prime}}: V_{j} \times{ }_{U} V_{j^{\prime}} \rightarrow U_{\beta(j)} \times{ }_{U} U_{\beta\left(j^{\prime}\right)}$ is an isomorphism as well. Hence by transport of structure we see that

$$
\left.s_{j}\right|_{V_{j} \times} V_{j^{\prime}}=\left.s_{j^{\prime}}\right|_{V_{j} \times} \times_{U} V_{j^{\prime}}
$$

as well. The sheaf condition w.r.t. $\mathcal{V}$ implies there exists a unique $s$ such that $\left.s\right|_{V_{j}}=s_{j}$ for all $j \in J$. By the first remark of the proof this implies that $\left.s\right|_{U_{i}}=s_{i}$ for all $i \in \operatorname{Im}(\beta)$ as well. Suppose that $i \in I, i \notin \operatorname{Im}(\beta)$. For such an $i$ we have isomorphisms $U_{i} \rightarrow V_{\alpha(i)} \rightarrow U_{\beta(\alpha(i))}$ over $U$. This gives a morphism $U_{i} \rightarrow$ $U_{i} \times_{U} U_{\beta(\alpha(i))}$ which is a section of the projection. Because $s_{i}$ and $s_{\beta(\alpha(i))}$ restrict to the same element on the fibre product we conclude that $s_{\beta(\alpha(i))}$ pulls back to $s_{i}$ via $U_{i} \rightarrow U_{\beta(\alpha(i))}$. Thus we see that also $s_{i}=\left.s\right|_{U_{i}}$ as desired.

00VX Lemma 7.8.5. Let $\mathcal{C}$ be a category. Let $\operatorname{Cov}_{i}, i=1,2$ be two sets of families of morphisms with fixed target which each define the structure of a site on $\mathcal{C}$.
(1) If every $\mathcal{U} \in \operatorname{Cov}_{1}$ is tautologically equivalent to some $\mathcal{V} \in \operatorname{Cov}_{2}$, then $\operatorname{Sh}\left(\mathcal{C}, \operatorname{Cov}_{2}\right) \subset \operatorname{Sh}\left(\mathcal{C}, \operatorname{Cov}_{1}\right)$. If also, every $\mathcal{U} \in \operatorname{Cov}_{2}$ is tautologically equivalent to some $\mathcal{V} \in \operatorname{Cov}_{1}$ then the category of sheaves are equal.
(2) Suppose that for each $\mathcal{U} \in \operatorname{Cov}_{1}$ there exists a $\mathcal{V} \in \operatorname{Cov}_{2}$ such that $\mathcal{V}$ refines $\mathcal{U}$. In this case $\operatorname{Sh}\left(\mathcal{C}, \mathrm{Cov}_{2}\right) \subset \operatorname{Sh}\left(\mathcal{C}, \operatorname{Cov}_{1}\right)$. If also for every $\mathcal{U} \in \mathrm{Cov}_{2}$ there exists a $\mathcal{V} \in \operatorname{Cov}_{1}$ such that $\mathcal{V}$ refines $\mathcal{U}$, then the categories of sheaves are equal.

Proof. Part (1) follows directly from Lemma 7.8 .4 and the definitions.
We advise the reader to skip the proof of (2) on a first reading. Let $\mathcal{F}$ be a sheaf of sets for the site $\left(\mathcal{C}, \operatorname{Cov}_{2}\right)$. Let $\mathcal{U} \in \operatorname{Cov}_{1}$, say $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$. Choose a refinement $\mathcal{V} \in \operatorname{Cov}_{2}$ of $\mathcal{U}$, say $\mathcal{V}=\left\{V_{j} \rightarrow U\right\}_{j \in J}$ and refinement given by $\alpha: J \rightarrow I$ and $f_{j}: V_{j} \rightarrow U_{\alpha(j)}$.
First let $s, s^{\prime} \in \mathcal{F}(U)$. If for all $i \in I$ we have $\left.s\right|_{U_{i}}=\left.s^{\prime}\right|_{U_{i}}$, then we also have $\left.s\right|_{V_{j}}=\left.s^{\prime}\right|_{V_{j}}$ for all $j \in J$. This implies that $s=s^{\prime}$ by the sheaf condition for $\mathcal{F}$ with respect to $\mathrm{Cov}_{2}$. Hence we see that the unicity in the sheaf condition for $\mathcal{F}$ and the site $\left(\mathcal{C}, \operatorname{Cov}_{1}\right)$ holds.

Next, suppose given $s_{i} \in \mathcal{F}\left(U_{i}\right)$ such that $\left.s_{i}\right|_{U_{i} \times_{U} U_{i^{\prime}}}=\left.s_{i^{\prime}}\right|_{U_{i} \times_{U} U_{i^{\prime}}}$ for all $i, i^{\prime} \in I$. Set $s_{j}=f_{j}^{*}\left(s_{\alpha(j)}\right) \in \mathcal{F}\left(V_{j}\right)$. Since the morphisms $f_{j}$ are morphisms over $U$ we obtain induced morphisms $f_{j j^{\prime}}: V_{j} \times_{U} V_{j^{\prime}} \rightarrow U_{\alpha(i)} \times{ }_{U} U_{\alpha\left(i^{\prime}\right)}$ compatible with the $f_{j}, f_{j^{\prime}}$ via the projection maps. It follows that

$$
\left.s_{j}\right|_{V_{j} \times} \times_{U} V_{j^{\prime}}=f_{j j^{\prime}}^{*}\left(\left.s_{\alpha(j)}\right|_{U_{\alpha(j)} \times{ }_{U} U_{\alpha\left(j^{\prime}\right)}}\right)=f_{j j^{\prime}}^{*}\left(\left.s_{\alpha\left(j^{\prime}\right)}\right|_{U_{\alpha(j)} \times{ }_{U} U_{\alpha\left(j^{\prime}\right)}}\right)=\left.s_{j^{\prime}}\right|_{V_{j} \times_{U} V_{j^{\prime}}}
$$

for all $j, j^{\prime} \in J$. Hence, by the sheaf condition for $\mathcal{F}$ with respect to $\mathrm{Cov}_{2}$, we get a section $s \in \mathcal{F}(U)$ which restricts to $s_{j}$ on each $V_{j}$. We are done if we show $s$ restricts to $s_{i_{0}}$ on $U_{i_{0}}$ for any $i_{0} \in I$. For each $i_{0} \in I$ the family $\mathcal{U}^{\prime}=\left\{U_{i} \times_{U} U_{i_{0}} \rightarrow U_{i_{0}}\right\}_{i \in I}$ is an element of $\operatorname{Cov}_{1}$ by the axioms of a site. Also, the family $\mathcal{V}^{\prime}=\left\{V_{j} \times_{U} U_{i_{0}} \rightarrow\right.$ $\left.U_{i_{0}}\right\}_{j \in J}$ is an element of $\operatorname{Cov}_{2}$. Then $\mathcal{V}^{\prime}$ refines $\mathcal{U}^{\prime}$ via $\alpha: J \rightarrow I$ and the maps $f_{j}^{\prime}=f_{j} \times \mathrm{id}_{U_{i_{0}}}$. The element $s_{i_{0}}$ restricts to $\left.s_{i}\right|_{U_{i} \times_{U} U_{i_{0}}}$ on the members of the covering $\mathcal{U}^{\prime}$ and hence via $\left(f_{j}^{\prime}\right)^{*}$ to the elements $\left.s_{j}\right|_{V_{j} \times_{U} U_{i_{0}}}$ on the members of the covering $\mathcal{V}^{\prime}$. By construction of $s$ this is the same as the family of restrictions of $\left.s\right|_{U_{i_{0}}}$ to the members of the covering $\mathcal{V}^{\prime}$. Hence by the sheaf condition for $\mathcal{F}$ with respect to $\mathrm{Cov}_{2}$ we see that $\left.s\right|_{U_{i_{0}}}=s_{i_{0}}$ as desired.

00 VY Lemma 7.8.6. Let $\mathcal{C}$ be a category. Let $\operatorname{Cov}(\mathcal{C})$ be a proper class of coverings satisfying conditions (1), (2) and (3) of Definition 7.6.2. Let $\operatorname{Cov}_{1}, \operatorname{Cov}_{2} \subset \operatorname{Cov}(\mathcal{C})$ be two subsets of $\operatorname{Cov}(\mathcal{C})$ which endow $\mathcal{C}$ with the structure of a site. If every covering $\mathcal{U} \in \operatorname{Cov}(\mathcal{C})$ is combinatorially equivalent to a covering in $\operatorname{Cov}_{1}$ and combinatorially equivalent to a covering in $\mathrm{Cov}_{2}$, then $\operatorname{Sh}\left(\mathcal{C}, \operatorname{Cov}_{1}\right)=\operatorname{Sh}\left(\mathcal{C}, \operatorname{Cov}_{2}\right)$.

Proof. This is clear from Lemmas 7.8.5 and 7.8.3 above as the hypothesis implies that every covering $\mathcal{U} \in \operatorname{Cov}_{1} \subset \operatorname{Cov}(\mathcal{C})$ is combinatorially equivalent to an element of $\mathrm{Cov}_{2}$, and similarly with the roles of $\mathrm{Cov}_{1}$ and $\mathrm{Cov}_{2}$ reversed.

### 7.9. The example of G-sets

00 VZ As an example, consider the site $\mathcal{T}_{G}$ of Example 7.6.5. We will describe the category of sheaves on $\mathcal{T}_{G}$. The answer will turn out to be independent of the choices made in defining $\mathcal{T}_{G}$. In fact, during the proof we will need only the following properties of the site $\mathcal{T}_{G}$ :
(a) $\mathcal{T}_{G}$ is a full subcategory of $G$-Sets,
(b) $\mathcal{T}_{G}$ contains the $G$-set ${ }_{G} G$,
(c) $\mathcal{T}_{G}$ has fibre products and they are the same as in $G$-Sets,
(d) given $U \in \mathrm{Ob}\left(\mathcal{T}_{G}\right)$ and a $G$-invariant subset $O \subset U$, there exists an object of $\mathcal{T}_{G}$ isomorphic to $O$, and
(e) any surjective family of maps $\left\{U_{i} \rightarrow U\right\}_{i \in I}$, with $U, U_{i} \in \operatorname{Ob}\left(\mathcal{T}_{G}\right)$ is combinatorially equivalent to a covering of $\mathcal{T}_{G}$.
These properties hold by Sets, Lemmas 3.10.2 and 3.11.1.
Remark that the map

$$
\operatorname{Hom}_{G}\left({ }_{G} G,{ }_{G} G\right) \longrightarrow G^{o p p}, \varphi \longmapsto \varphi(1)
$$

is an isomorphism of groups. The inverse map sends $g \in G$ to the map $R_{g}: s \mapsto s g$ (i.e. right multiplication). Note that $R_{g_{1} g_{2}}=R_{g_{2}} \circ R_{g_{1}}$ so the opposite is necessary.

This implies that for every presheaf $\mathcal{F}$ on $\mathcal{T}_{G}$ the value $\mathcal{F}\left({ }_{G} G\right)$ inherits the structure of a $G$-set as follows: $g \cdot s$ for $g \in G$ and $s \in \mathcal{F}\left({ }_{G} G\right)$ defined by $\mathcal{F}\left(R_{g}\right)(s)$. This is a left action because

$$
\left(g_{1} g_{2}\right) \cdot s=\mathcal{F}\left(R_{g_{1} g_{2}}\right)(s)=\mathcal{F}\left(R_{g_{2}} \circ R_{g_{1}}\right)(s)=\mathcal{F}\left(R_{g_{1}}\right)\left(\mathcal{F}\left(R_{g_{2}}\right)(s)\right)=g_{1} \cdot\left(g_{2} \cdot s\right)
$$

Here we've used that $\mathcal{F}$ is contravariant. Note that if $\mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets on $\mathcal{T}_{G}$ then we get a map $\mathcal{F}\left({ }_{G} G\right) \rightarrow \mathcal{G}\left({ }_{G} G\right)$ which is compatible with the $G$-actions we have just defined. All in all we have constructed a functor

$$
\operatorname{PSh}\left(\mathcal{T}_{G}\right) \longrightarrow G \text {-Sets, } \quad \mathcal{F} \longmapsto \mathcal{F}\left({ }_{G} G\right) .
$$

We leave it to the reader to verify that this construction has the pleasing property that the representable presheaf $h_{U}$ is mapped to something canonically isomorphic to $U$. In a formula $h_{U}\left({ }_{G} G\right)=\operatorname{Hom}_{G}\left({ }_{G} G, U\right) \cong U$.
Suppose that $S$ is a $G$-set. We define a presheaf $\mathcal{F}_{S}$ by the formuld ${ }^{2}$

$$
\mathcal{F}_{S}(U)=\operatorname{Mor}_{G-S e t s}(U, S)
$$

[^13]This is clearly a presheaf. On the other hand, suppose that $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering in $\mathcal{T}_{G}$. This implies that $\coprod_{i} U_{i} \rightarrow U$ is surjective. Thus it is clear that the map

$$
\mathcal{F}_{S}(U)=\operatorname{Mor}_{G-S e t s}(U, S) \longrightarrow \prod \mathcal{F}_{S}\left(U_{i}\right)=\prod \operatorname{Mor}_{G-S e t s}\left(U_{i}, S\right)
$$

is injective. And, given a family of $G$-equivariant maps $s_{i}: U_{i} \rightarrow S$, such that all the diagrams

commute, there is a unique $G$-equivariant map $s: U \rightarrow S$ such that $s_{i}$ is the composition $U_{i} \rightarrow U \rightarrow S$. Namely, we just define $s(u)=s_{i}\left(u_{i}\right)$ where $i \in I$ is any index such that there exists some $u_{i} \in U_{i}$ mapping to $u$ under the map $U_{i} \rightarrow U$. The commutativity of the diagrams above implies exactly that this construction is well defined. All in all we have constructed a functor

$$
G \text {-Sets } \longrightarrow S h\left(\mathcal{T}_{G}\right), \quad S \longmapsto \mathcal{F}_{S}
$$

We now have the following diagram of categories and functors

It is immediate from the definitions that $\mathcal{F}_{S}\left({ }_{G} G\right)=\operatorname{Mor}_{G}\left({ }_{G} G, S\right)=S$, the last equality by evaluation at 1 . This almost proves the following.
00W0 Proposition 7.9.1. The functors $\mathcal{F} \mapsto \mathcal{F}\left({ }_{G} G\right)$ and $S \mapsto \mathcal{F}_{S}$ define quasi-inverse equivalences between $\operatorname{Sh}\left(\mathcal{T}_{G}\right)$ and $G$-Sets.

Proof. We have already seen that composing the functors one way around is isomorphic to the identity functor. In the other direction, for any sheaf $\mathcal{H}$ there is a natural map of sheaves

$$
\text { can }: \mathcal{H} \longrightarrow \mathcal{F}_{\mathcal{H}\left({ }_{G} G\right)}
$$

Namely, for any object $U$ of $\mathcal{T}_{G}$ we let $\operatorname{can}_{U}$ be the map

$$
\begin{array}{ccc}
\mathcal{H}(U) & \longrightarrow & \mathcal{F}_{\mathcal{H}\left({ }_{G} G\right)}(U)=\operatorname{Mor}_{G}\left(U, \mathcal{H}\left({ }_{G} G\right)\right) \\
s & \longmapsto & \left(u \mapsto \alpha_{u}^{*} s\right)
\end{array}
$$

Here $\alpha_{u}:{ }_{G} G \rightarrow U$ is the map $\alpha_{u}(g)=g u$ and $\alpha_{u}^{*}: \mathcal{H}(U) \rightarrow \mathcal{H}\left({ }_{G} G\right)$ is the pullback map. A trivial but confusing verification shows that this is indeed a map of presheaves. We have to show that can is an isomorphism. We do this by showing $c a n_{U}$ is an isomorphism for all $U \in \operatorname{ob}\left(\mathcal{T}_{G}\right)$. We leave the (important but easy) case that $U={ }_{G} G$ to the reader. A general object $U$ of $\mathcal{T}_{G}$ is a disjoint union of $G$ orbits: $U=\coprod_{i \in I} O_{i}$. The family of maps $\left\{O_{i} \rightarrow U\right\}_{i \in I}$ is tautologically equivalent to a covering in $\mathcal{T}_{G}$ (by the properties of $\mathcal{T}_{G}$ listed at the beginning of this section). Hence by Lemma 7.8 .4 the sheaf $\mathcal{H}$ satisfies the sheaf property with respect to $\left\{O_{i} \rightarrow U\right\}_{i \in I}$. The sheaf property for this covering implies $\mathcal{H}(U)=\prod_{i} \mathcal{H}\left(O_{i}\right)$. Hence it suffices to show that $\mathrm{can}_{U}$ is an isomorphism when $U$ consists of a single $G$-orbit. Let $u \in U$ and let $H \subset G$ be its stabilizer. Clearly, $\operatorname{Mor}_{G}\left(U, \mathcal{H}\left({ }_{G} G\right)\right)=$
$\mathcal{H}\left({ }_{G} G\right)^{H}$ equals the subset of $H$-invariant elements. On the other hand consider the covering $\left\{{ }_{G} G \rightarrow U\right\}$ given by $g \mapsto g u$ (again it is just combinatorially equivalent to some covering of $\mathcal{T}_{G}$, and again this doesn't matter). Note that the fibre product $\left({ }_{G} G\right) \times{ }_{U}\left({ }_{G} G\right)$ is equal to $\{(g, g h), g \in G, h \in H\} \cong \prod_{h \in H} G$. Hence the sheaf property for this covering reads as

$$
\mathcal{H}(U) \longrightarrow \mathcal{H}\left({ }_{G} G\right) \xrightarrow[\mathrm{pr}_{1}^{*}]{\stackrel{\mathrm{pr}_{0}^{*}}{\longrightarrow}} \prod_{h \in H} \mathcal{H}\left({ }_{G} G\right) .
$$

The two maps pr ${ }_{i}^{*}$ into the factor $\mathcal{H}\left({ }_{G} G\right)$ differ by multiplication by $h$. Now the result follows from this and the fact that can is an isomorphism for $U={ }_{G} G$.

### 7.10. Sheafification

00W1 In order to define the sheafification we study the zeroth Cech cohomology group of a covering and its functoriality properties.
Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$, and let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. Let us use the notation $\mathcal{F}(\mathcal{U})$ to indicate the equalizer

$$
H^{0}(\mathcal{U}, \mathcal{F})=\left\{\left(s_{i}\right)_{i \in I} \in \prod_{i} \mathcal{F}\left(U_{i}\right)\left|s_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.s_{j}\right|_{U_{i} \times_{U} U_{j}} \forall i, j \in I\right\}
$$

As we will see later, this is the zeroth Cech cohomology of $\mathcal{F}$ over $U$ with respect to the covering $\mathcal{U}$. A small remark is that we can define $H^{0}(\mathcal{U}, \mathcal{F})$ as soon as all the morphisms $U_{i} \rightarrow U$ are representable, i.e., $\mathcal{U}$ need not be a covering of the site. There is a canonical map $\mathcal{F}(U) \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$. It is clear that a morphism of coverings $\mathcal{U} \rightarrow \mathcal{V}$ induces commutative diagrams

This in turn produces a map $H^{0}(\mathcal{V}, \mathcal{F}) \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$, compatible with the map $\mathcal{F}(V) \rightarrow \mathcal{F}(U)$.
By construction, a presheaf $\mathcal{F}$ is a sheaf if and only if for every covering $\mathcal{U}$ of $\mathcal{C}$ the natural map $\mathcal{F}(U) \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$ is bijective. We will use this notion to prove the following simple lemma about limits of sheaves.

00W2 Lemma 7.10.1. Let $\mathcal{F}: \mathcal{I} \rightarrow S h(\mathcal{C})$ be a diagram. Then $\lim _{\mathcal{I}} \mathcal{F}$ exists and is equal to the limit in the category of presheaves.

Proof. Let $\lim _{i} \mathcal{F}_{i}$ be the limit as a presheaf. We will show that this is a sheaf and then it will trivially follow that it is a limit in the category of sheaves. To prove the sheaf property, let $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be a covering. Let $\left(s_{j}\right)_{j \in J}$ be an element of $H^{0}\left(\mathcal{V}, \lim _{i} \mathcal{F}_{i}\right)$. Using the projection maps we get elements $\left(s_{j, i}\right)_{j \in J}$ in $H^{0}\left(\mathcal{V}, \mathcal{F}_{i}\right)$. By the sheaf property for $\mathcal{F}_{i}$ we see that there is a unique $s_{i} \in \mathcal{F}_{i}(V)$ such that $s_{j, i}=\left.s_{i}\right|_{V_{j}}$. Let $\phi: i \rightarrow i^{\prime}$ be a morphism of the index category. We would like to show that $\mathcal{F}(\phi): \mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ maps $s_{i}$ to $s_{i^{\prime}}$. We know this is true for the sections
$s_{i, j}$ and $s_{i^{\prime}, j}$ for all $j$ and hence by the sheaf property for $\mathcal{F}_{i^{\prime}}$ this is true. At this point we have an element $s=\left(s_{i}\right)_{i \in \operatorname{Ob}(\mathcal{I})}$ of $\left(\lim _{i} \mathcal{F}_{i}\right)(V)$. We leave it to the reader to see this element has the required property that $s_{j}=\left.s\right|_{V_{j}}$.

00W3 Example 7.10.2. A particular example is the limit over the empty diagram. This gives the final object in the category of (pre)sheaves. It is the sheaf that associates to each object $U$ of $\mathcal{C}$ a singleton set, with unique restriction mappings. We often denote this sheaf by $*$.

Let $\mathcal{J}_{U}$ be the category of all coverings of $U$. In other words, the objects of $\mathcal{J}_{U}$ are the coverings of $U$ in $\mathcal{C}$, and the morphisms are the refinements. By our conventions on sites this is indeed a category, i.e., the collection of objects and morphisms forms a set. Note that $\operatorname{Ob}\left(\mathcal{J}_{U}\right)$ is not empty since $\left\{\mathrm{id}_{U}\right\}$ is an object of it. According to the remarks above the construction $\mathcal{U} \mapsto H^{0}(\mathcal{U}, \mathcal{F})$ is a contravariant functor on $\mathcal{J}_{U}$. We define

$$
\mathcal{F}^{+}(U)=\operatorname{colim}_{\mathcal{J}_{U}^{o p p}} H^{0}(\mathcal{U}, \mathcal{F})
$$

See Categories, Section 4.14 for a discussion of limits and colimits. We point out that later we will see that $\mathcal{F}^{+}(U)$ is the zeroth Cech cohomology of $\mathcal{F}$ over $U$.

Before we say more about the structure of the colimit, we turn the collection of sets $\mathcal{F}^{+}(U), U \in \operatorname{Ob}(\mathcal{C})$ into a presheaf. Namely, let $V \rightarrow U$ be a morphism of $\mathcal{C}$. By the axioms of a site there is a functor ${ }^{3}$

$$
\mathcal{J}_{U} \longrightarrow \mathcal{J}_{V}, \quad\left\{U_{i} \rightarrow U\right\} \longmapsto\left\{U_{i} \times_{U} V \rightarrow V\right\}
$$

Note that the projection maps furnish a functorial morphism of coverings $\left\{U_{i} \times{ }_{U}\right.$ $V \rightarrow V\} \rightarrow\left\{U_{i} \rightarrow U\right\}$ and hence, by the construction above, a functorial map of sets $H^{0}\left(\left\{U_{i} \rightarrow U\right\}, \mathcal{F}\right) \rightarrow H^{0}\left(\left\{U_{i} \times_{U} V \rightarrow V\right\}, \mathcal{F}\right)$. In other words, there is a transformation of functors from $H^{0}(-, \mathcal{F}): \mathcal{J}_{U} \rightarrow$ Sets to the composition $\mathcal{J}_{U} \rightarrow \mathcal{J}_{V} \xrightarrow{H^{0}(-, \mathcal{F})}$ Sets. Hence by generalities of colimits we obtain a canonical map $\mathcal{F}^{+}(U) \rightarrow \mathcal{F}^{+}(V)$. In terms of the description of the set $\mathcal{F}^{+}(U)$ above, it just takes the element associated with $s=\left(s_{i}\right) \in H^{0}\left(\left\{U_{i} \rightarrow U\right\}, \mathcal{F}\right)$ to the element associated with $\left(\left.s_{i}\right|_{V \times_{U} U_{i}}\right) \in H^{0}\left(\left\{U_{i} \times_{U} V \rightarrow V\right\}, \mathcal{F}\right)$.

00W4 Lemma 7.10.3. The constructions above define a presheaf $\mathcal{F}^{+}$together with a canonical map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^{+}$.
Proof. All we have to do is to show that given morphisms $W \rightarrow V \rightarrow U$ the composition $\mathcal{F}^{+}(U) \rightarrow \mathcal{F}^{+}(V) \rightarrow \mathcal{F}^{+}(W)$ equals the map $\mathcal{F}^{+}(U) \rightarrow \mathcal{F}^{+}(W)$. This can be shown directly by verifying that, given a covering $\left\{U_{i} \rightarrow U\right\}$ and $s=\left(s_{i}\right) \in H^{0}\left(\left\{U_{i} \rightarrow U\right\}, \mathcal{F}\right)$, we have canonically $W \times_{U} U_{i} \cong W \times_{V}\left(V \times_{U} U_{i}\right)$, and $\left.s_{i}\right|_{W \times{ }_{U} U_{i}}$ corresponds to $\left.\left(\left.s_{i}\right|_{V \times_{U} U_{i}}\right)\right|_{W \times{ }_{V}\left(V \times_{U} U_{i}\right)}$ via this isomorphism.

More indirectly, the result of Lemma 7.10 .6 shows that we may pullback an element $s$ as above via any morphism from any covering of $W$ to $\left\{U_{i} \rightarrow U\right\}$ and we will always end up with the same element in $\mathcal{F}^{+}(W)$.

00W5 Lemma 7.10.4. The association $\mathcal{F} \mapsto\left(\mathcal{F} \rightarrow \mathcal{F}^{+}\right)$is a functor.

[^14]Proof. Instead of proving this we state exactly what needs to be proven. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a map of presheaves. Prove the commutativity of:

The next two lemmas imply that the colimits above are colimits over a directed partially ordered set.

00W6 Lemma 7.10.5. Given a pair of coverings $\left\{U_{i} \rightarrow U\right\}$ and $\left\{V_{j} \rightarrow U\right\}$ of a given object $U$ of the site $\mathcal{C}$, there exists a covering which is a common refinement.

Proof. Since $\mathcal{C}$ is a site we have that for every $i$ the family $\left\{V_{j} \times_{U} U_{i} \rightarrow U_{i}\right\}_{j}$ is a covering. And, then another axiom implies that $\left\{V_{j} \times_{U} U_{i} \rightarrow U\right\}_{i, j}$ is a covering of $U$. Clearly this covering refines both given coverings.

00W7 Lemma 7.10.6. Any two morphisms $f, g: \mathcal{U} \rightarrow \mathcal{V}$ of coverings inducing the same morphism $U \rightarrow V$ induce the same map $H^{0}(\mathcal{V}, \mathcal{F}) \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$.

Proof. Let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ and $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$. The morphism $f$ consists of a map $U \rightarrow V$, a map $\alpha: I \rightarrow J$ and maps $f_{i}: U_{i} \rightarrow V_{\alpha(i)}$. Likewise, $g$ determines a map $\beta: I \rightarrow J$ and maps $g_{i}: U_{i} \rightarrow V_{\beta(i)}$. As $f$ and $g$ induce the same map $U \rightarrow V$, the diagram

is commutative for every $i \in I$. Hence $f$ and $g$ factor through the fibre product

Now let $s=\left(s_{j}\right)_{j} \in H^{0}(\mathcal{V}, \mathcal{F})$. Then for all $i \in I$ :

$$
\left(f^{*} s\right)_{i}=f_{i}^{*}\left(s_{\alpha(i)}\right)=\varphi^{*} \operatorname{pr}_{1}^{*}\left(s_{\alpha(i)}\right)=\varphi^{*} \operatorname{pr}_{2}^{*}\left(s_{\beta(i)}\right)=g_{i}^{*}\left(s_{\beta(i)}\right)=\left(g^{*} s\right)_{i}
$$

where the middle equality is given by the definition of $H^{0}(\mathcal{V}, \mathcal{F})$. This shows that the maps $H^{0}(\mathcal{V}, \mathcal{F}) \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$ induced by $f$ and $g$ are equal.

00W8 Remark 7.10.7. In particular this lemma shows that if $\mathcal{U}$ is a refinement of $\mathcal{V}$, and if $\mathcal{V}$ is a refinement of $\mathcal{U}$, then there is a canonical identification $H^{0}(\mathcal{U}, \mathcal{F})=$ $H^{0}(\mathcal{V}, \mathcal{F})$.

From these two lemmas, and the fact that $\mathcal{J}_{U}$ is nonempty, it follows that the diagram $H^{0}(-, \mathcal{F}): \mathcal{J}_{U}^{\text {opp }} \rightarrow$ Sets is filtered, see Categories, Definition 4.19.1. Hence, by Categories, Section 4.19 the colimit $\mathcal{F}^{+}(U)$ may be described in the following straightforward manner. Namely, every element in the set $\mathcal{F}^{+}(U)$ arises from an element $s \in H^{0}(\mathcal{U}, \mathcal{F})$ for some covering $\mathcal{U}$ of $U$. Given a second element $s^{\prime} \in H^{0}\left(\mathcal{U}^{\prime}, \mathcal{F}\right)$ then $s$ and $s^{\prime}$ determine the same element of the colimit if and only if there exists a covering $\mathcal{V}$ of $U$ and refinements $f: \mathcal{V} \rightarrow \mathcal{U}$ and $f^{\prime}: \mathcal{V} \rightarrow \mathcal{U}^{\prime}$ such that $f^{*} s=\left(f^{\prime}\right)^{*} s^{\prime}$ in $H^{0}(\mathcal{V}, \mathcal{F})$. Since the trivial covering $\left\{\operatorname{id}_{U}\right\}$ is an object of $\mathcal{J}_{U}$ we get a canonical map $\mathcal{F}(U) \rightarrow \mathcal{F}^{+}(U)$.

00W9 Lemma 7.10.8. The map $\theta: \mathcal{F} \rightarrow \mathcal{F}^{+}$has the following property: For every object $U$ of $\mathcal{C}$ and every section $s \in \mathcal{F}^{+}(U)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.s\right|_{U_{i}}$ is in the image of $\theta: \mathcal{F}\left(U_{i}\right) \rightarrow \mathcal{F}^{+}\left(U_{i}\right)$.

Proof. Namely, let $\left\{U_{i} \rightarrow U\right\}$ be a covering such that $s$ arises from the element $\left(s_{i}\right) \in H^{0}\left(\left\{U_{i} \rightarrow U\right\}, \mathcal{F}\right)$. According to Lemma 7.10.6 we may consider the covering $\left\{U_{i} \rightarrow U_{i}\right\}$ and the (obvious) morphism of coverings $\left\{U_{i} \rightarrow U_{i}\right\} \rightarrow\left\{U_{i} \rightarrow U\right\}$ to compute the pullback of $s$ to an element of $\mathcal{F}^{+}\left(U_{i}\right)$. And indeed, using this covering we get exactly $\theta\left(s_{i}\right)$ for the restriction of $s$ to $U_{i}$.

00WA Definition 7.10.9. We say that a presheaf of sets $\mathcal{F}$ on a site $\mathcal{C}$ is separated if, for all coverings of $\left\{U_{i} \rightarrow U\right\}$, the map $\mathcal{F}(U) \rightarrow \prod \mathcal{F}\left(U_{i}\right)$ is injective.

00WB Theorem 7.10.10. With $\mathcal{F}$ as above
00WC (1) The presheaf $\mathcal{F}^{+}$is separated.
(2) If $\mathcal{F}$ is separated, then $\mathcal{F}^{+}$is a sheaf and the map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^{+}$ is injective.
00WE
(3) If $\mathcal{F}$ is a sheaf, then $\mathcal{F} \rightarrow \mathcal{F}^{+}$is an isomorphism.

00WF
(4) The presheaf $\mathcal{F}^{++}$is always a sheaf.

Proof. Proof of (1). Suppose that $s, s^{\prime} \in \mathcal{F}^{+}(U)$ and suppose that there exists some covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.s\right|_{U_{i}}=\left.s^{\prime}\right|_{U_{i}}$ for all $i$. We now have three coverings of $U$ : the covering $\left\{U_{i} \rightarrow U\right\}$ above, a covering $\mathcal{U}$ for $s$ as in Lemma 7.10.8, and a similar covering $\mathcal{U}^{\prime}$ for $s^{\prime}$. By Lemma 7.10.5, we can find a common refinement, say $\left\{W_{j} \rightarrow U\right\}$. This means we have $s_{j}, s_{j}^{\prime} \in \mathcal{F}\left(W_{j}\right)$ such that $\left.s\right|_{W_{j}}=$ $\theta\left(s_{j}\right)$, similarly for $\left.s^{\prime}\right|_{W_{j}}$, and such that $\theta\left(s_{j}\right)=\theta\left(s_{j}^{\prime}\right)$. This last equality means that there exists some covering $\left\{W_{j k} \rightarrow W_{j}\right\}$ such that $\left.s_{j}\right|_{W_{j k}}=\left.s_{j}^{\prime}\right|_{W_{j k}}$. Then since $\left\{W_{j k} \rightarrow U\right\}$ is a covering we see that $s, s^{\prime}$ map to the same element of $H^{0}\left(\left\{W_{j k} \rightarrow U\right\}, \mathcal{F}\right)$ as desired.

Proof of (2). It is clear that $\mathcal{F} \rightarrow \mathcal{F}^{+}$is injective because all the maps $\mathcal{F}(U) \rightarrow$ $H^{0}(\mathcal{U}, \mathcal{F})$ are injective. It is also clear that, if $\mathcal{U} \rightarrow \mathcal{U}^{\prime}$ is a refinement, then $H^{0}\left(\mathcal{U}^{\prime}, \mathcal{F}\right) \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$ is injective. Now, suppose that $\left\{U_{i} \rightarrow U\right\}$ is a covering, and let $\left(s_{i}\right)$ be a family of elements of $\mathcal{F}^{+}\left(U_{i}\right)$ satisfying the sheaf condition $\left.s_{i}\right|_{U_{i} \times{ }_{U} U_{j}}=$ $\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}$ for all $i, j \in I$. Choose coverings (as in Lemma 7.10.8) $\left\{U_{i j} \rightarrow U_{i}\right\}$ such that $\left.s_{i}\right|_{U_{i j}}$ is the image of the (unique) element $s_{i j} \in \mathcal{F}\left(U_{i j}\right)$. The sheaf condition implies that $s_{i j}$ and $s_{i^{\prime} j^{\prime}}$ agree over $U_{i j} \times{ }_{U} U_{i^{\prime} j^{\prime}}$ because it maps to $U_{i} \times{ }_{U} U_{i^{\prime}}$ and we
have the equality there. Hence $\left(s_{i j}\right) \in H^{0}\left(\left\{U_{i j} \rightarrow U\right\}, \mathcal{F}\right)$ gives rise to an element $s \in \mathcal{F}^{+}(U)$. We leave it to the reader to verify that $\left.s\right|_{U_{i}}=s_{i}$.
Proof of (3). This is immediate from the definitions because the sheaf property says exactly that every $\operatorname{map} \mathcal{F} \rightarrow H^{0}(\mathcal{U}, \mathcal{F})$ is bijective (for every covering $\mathcal{U}$ of $U$ ).

Statement (4) is now obvious.
00WG Definition 7.10.11. Let $\mathcal{C}$ be a site and let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. The sheaf $\mathcal{F}^{\#}:=\mathcal{F}^{++}$together with the canonical map $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ is called the sheaf associated to $\mathcal{F}$.

00WH Proposition 7.10.12. The canonical map $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ has the following universal property: For any map $\mathcal{F} \rightarrow \mathcal{G}$, where $\mathcal{G}$ is a sheaf of sets, there is a unique map $\mathcal{F}^{\#} \rightarrow \mathcal{G}$ such that $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{G}$ equals the given map.

Proof. By Lemma 7.10 .4 we get a commutative diagram

and by Theorem 7.10 .10 the lower horizontal maps are isomorphisms. The uniqueness follows from Lemma 7.10 .8 which says that every section of $\mathcal{F}^{\#}$ locally comes from sections of $\mathcal{F}$.

It is clear from this result that the functor $\mathcal{F} \mapsto\left(\mathcal{F} \rightarrow \mathcal{F}^{\#}\right)$ is unique up to unique isomorphism of functors. Actually, let us temporarily denote $i: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{PSh}(\mathcal{C})$ the functor of inclusion. The result above actually says that

$$
\operatorname{Mor}_{P S h(\mathcal{C})}(\mathcal{F}, i(\mathcal{G}))=\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}^{\#}, \mathcal{G}\right)
$$

In other words, the functor of sheafification is the left adjoint to the inclusion functor $i$. We finish this section with a couple of lemmas.

00WI Lemma 7.10.13. Let $\mathcal{F}: \mathcal{I} \rightarrow \operatorname{Sh}(\mathcal{C})$ be a diagram. Then $\operatorname{colim}_{\mathcal{I}} \mathcal{F}$ exists and is the sheafification of the colimit in the category of presheaves.

Proof. Since the sheafification functor is a left adjoint it commutes with all colimits, see Categories, Lemma 4.24.4. Hence, since $\operatorname{PSh}(\mathcal{C})$ has colimits, we deduce that $S h(\mathcal{C})$ has colimits (which are the sheafifications of the colimits in presheaves).

00WJ Lemma 7.10.14. The functor $\operatorname{PSh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{C}), \mathcal{F} \mapsto \mathcal{F}^{\#}$ is exact.
Proof. Since it is a left adjoint it is right exact, see Categories, Lemma 4.24.5. On the other hand, by Lemmas 7.10.5 and Lemma 7.10 .6 the colimits in the construction of $\mathcal{F}^{+}$are really over the directed partially ordered set $\operatorname{Ob}\left(\mathcal{J}_{U}\right)$ where $\mathcal{U} \geq \mathcal{U}^{\prime}$ if and only if $\mathcal{U}$ is a refinement of $\mathcal{U}^{\prime}$. Hence by Categories, Lemma 4.19.2 we see that $\mathcal{F} \rightarrow \mathcal{F}^{+}$commutes with finite limits (as a functor from presheaves to presheaves). Then we conclude using Lemma 7.10.1.
00 WK Lemma 7.10.15. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. Denote $\theta^{2}: \mathcal{F} \rightarrow \mathcal{F}^{\#}$ the canonical map of $\mathcal{F}$ into its sheafification. Let $U$ be an object of $\mathcal{C}$. Let $s \in \mathcal{F}^{\#}(U)$. There exists a covering $\left\{U_{i} \rightarrow U\right\}$ and sections $s_{i} \in \mathcal{F}\left(U_{i}\right)$ such that
(1) $\left.s\right|_{U_{i}}=\theta^{2}\left(s_{i}\right)$, and
(2) for every $i, j$ there exists a covering $\left\{U_{i j k} \rightarrow U_{i} \times_{U} U_{j}\right\}$ of $\mathcal{C}$ such that the pullback of $s_{i}$ and $s_{j}$ to each $U_{i j k}$ agree.
Conversely, given any covering $\left\{U_{i} \rightarrow U\right\}$, elements $s_{i} \in \mathcal{F}\left(U_{i}\right)$ such that (2) holds, then there exists a unique section $s \in \mathcal{F} \#(U)$ such that (1) holds.

Proof. Omitted.

### 7.11. Quasi-compact objects and colimits

090G To be able to use the same language as in the case of topological spaces we introduce the following terminology.

090H Definition 7.11.1. Let $\mathcal{C}$ be a site. An object $U$ of $\mathcal{C}$ is quasi-compact if every covering of $U$ in $\mathcal{C}$ can be refined by a finite covering.
The following lemma is the analogue of Sheaves, Lemma 6.29.1 for sites.
0738 Lemma 7.11.2. Let $\mathcal{C}$ be a site. Let $\mathcal{I} \rightarrow \operatorname{Sh}(\mathcal{C}), i \mapsto \mathcal{F}_{i}$ be a filtered diagram of sheaves of sets. Let $U \in \mathrm{Ob}(\mathcal{C})$. Consider the canonical map

$$
\Psi: \operatorname{colim}_{i} \mathcal{F}_{i}(U) \longrightarrow\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)(U)
$$

With the terminology introduced above:
(1) If all the transition maps are injective then $\Psi$ is injective for any $U$.
(2) If $U$ is quasi-compact, then $\Psi$ is injective.
(3) If $U$ is quasi-compact and all the transition maps are injective then $\Psi$ is an isomorphism.
(4) If $U$ has a cofinal system of coverings $\left\{U_{j} \rightarrow U\right\}_{j \in J}$ with $J$ finite and $U_{j} \times_{U} U_{j^{\prime}}$ quasi-compact for all $j, j^{\prime} \in J$, then $\Psi$ is bijective.

Proof. Assume all the transition maps are injective. In this case the presheaf $\mathcal{F}^{\prime}: V \mapsto \operatorname{colim}_{i} \mathcal{F}_{i}(V)$ is separated (see Definition 7.10.9. By Lemma 7.10 .13 we have $\left(\mathcal{F}^{\prime}\right)^{\#}=\operatorname{colim}_{i} \mathcal{F}_{i}$. By Theorem 7.10.10 we see that $\mathcal{F}^{\prime} \rightarrow\left(\mathcal{F}^{\prime}\right)^{\#}$ is injective. This proves (1).
Assume $U$ is quasi-compact. Suppose that $s \in \mathcal{F}_{i}(U)$ and $s^{\prime} \in \mathcal{F}_{i^{\prime}}(U)$ give rise to elements on the left hand side which have the same image under $\Psi$. Since $U$ is quasi-compact this means there exists a finite covering $\left\{U_{j} \rightarrow U\right\}_{j=1, \ldots, m}$ and for each $j$ an index $i_{j} \in I, i_{j} \geq i, i_{j} \geq i^{\prime}$ such that $\varphi_{i i_{j}}(s)=\varphi_{i^{\prime} i_{j}}\left(s^{\prime}\right)$. Let $i^{\prime \prime} \in I$ be $\geq$ than all of the $i_{j}$. We conclude that $\varphi_{i i^{\prime \prime}}(s)$ and $\varphi_{i^{\prime} i^{\prime \prime}}(s)$ agree on $U_{j}$ for all $j$ and hence that $\varphi_{i i^{\prime \prime}}(s)=\varphi_{i^{\prime} i^{\prime \prime}}(s)$. This proves (2).
Assume $U$ is quasi-compact and all transition maps injective. Let $s$ be an element of the target of $\Psi$. Since $U$ is quasi-compact there exists a finite covering $\left\{U_{j} \rightarrow\right.$ $U\}_{j=1, \ldots, m}$, for each $j$ an index $i_{j} \in I$ and $s_{j} \in \mathcal{F}_{i_{j}}\left(U_{j}\right)$ such that $\left.s\right|_{U_{j}}$ comes from $s_{j}$ for all $j$. Pick $i \in I$ which is $\geq$ than all of the $i_{j}$. By (1) the sections $\varphi_{i_{j} i}\left(s_{j}\right)$ agree over $U_{j} \times_{U} U_{j^{\prime}}$. Hence they glue to a section $s^{\prime} \in \mathcal{F}_{i}(U)$ which maps to $s$ under $\Psi$. This proves (3).
Assume the hypothesis of (4). Let $s$ be an element of the target of $\Psi$. By assumption there exists a finite covering $\left\{U_{j} \rightarrow U\right\}_{j=1, \ldots, m} U_{j}$, with $U_{j} \times_{U} U_{j^{\prime}}$ quasi-compact for all $j, j^{\prime} \in J$ and for each $j$ an index $i_{j} \in I$ and $s_{j} \in \mathcal{F}_{i_{j}}\left(U_{j}\right)$ such that $\left.s\right|_{U_{j}}$ is the image of $s_{j}$ for all $j$. Since $U_{j} \times_{U} U_{j^{\prime}}$ is quasi-compact we can apply (2) and we see that there exists an $i_{j j^{\prime}} \in I, i_{j j^{\prime}} \geq i_{j}, i_{j j^{\prime}} \geq i_{j^{\prime}}$ such that $\varphi_{i_{j} i_{j j^{\prime}}}\left(s_{j}\right)$ and
$\varphi_{i_{j^{\prime}} i_{j j^{\prime}}}\left(s_{j^{\prime}}\right)$ agree over $U_{j} \times_{U} U_{j^{\prime}}$. Choose an index $i \in I$ wich is bigger or equal than all the $i_{j j^{\prime}}$. Then we see that the sections $\varphi_{i_{j} i}\left(s_{j}\right)$ of $\mathcal{F}_{i}$ glue to a section of $\mathcal{F}_{i}$ over $U$. This section is mapped to the element $s$ as desired.

We need an analogue of the above result in the case that the site is the limit of an inverse system of sites. For simplicity we only explain the construction in case the index sets of coverings are finite.

## 0A34 <br> Situation 7.11.3. Here we are given

(1) a cofiltered index category $\mathcal{I}$,
(2) for $i \in \operatorname{Ob}(\mathcal{I})$ a site $\mathcal{C}_{i}$ such that every covering in $\mathcal{C}_{i}$ has a finite index set,
(3) for a morphism $a: i \rightarrow j$ in $\mathcal{I}$ a morphism of sites $f_{a}: \mathcal{C}_{i} \rightarrow \mathcal{C}_{j}$ given by a continuous functor $u_{a}: \mathcal{C}_{j} \rightarrow \mathcal{C}_{i}$,
such that $f_{a} \circ f_{b}=f_{c}$ whenever $c=a \circ b$ in $\mathcal{I}$.
09YL Lemma 7.11.4. In Situation 7.11.3 we can construct a site $(\mathcal{C}, \operatorname{Cov}(\mathcal{C}))$ as follows
(1) as a category $\mathcal{C}=\operatorname{colim} \mathcal{C}_{i}$, and
(2) $\operatorname{Cov}(\mathcal{C})$ is the union of the images of $\operatorname{Cov}\left(\mathcal{C}_{i}\right)$ by $u_{i}: \mathcal{C}_{i} \rightarrow \mathcal{C}$.

Proof. Our definition of composition of morphisms of sites implies that $u_{b} \circ u_{a}=u_{c}$ whenever $c=a \circ b$ in $\mathcal{I}$. The formula $\mathcal{C}=\operatorname{colim} \mathcal{C}_{i}$ means that $\operatorname{Ob}(\mathcal{C})=\operatorname{colim} \operatorname{Ob}\left(\mathcal{C}_{i}\right)$ and $\operatorname{Arrows}(\mathcal{C})=\operatorname{colim} \operatorname{Arrows}\left(\mathcal{C}_{i}\right)$. Then source, target, and composition are inherited from the source, target, and composition on $\operatorname{Arrows}\left(\mathcal{C}_{i}\right)$. In this way we obtain a category. Denote $u_{i}: \mathcal{C}_{i} \rightarrow \mathcal{C}$ the obvious functor. Remark that given any finite diagram in $\mathcal{C}$ there exists an $i$ such that this diagram is the image of a diagram in $\mathcal{C}_{i}$.

Let $\left\{U^{t} \rightarrow U\right\}$ be a covering of $\mathcal{C}$. We first prove that if $V \rightarrow U$ is a morphism of $\mathcal{C}$, then $U^{t} \times_{U} V$ exists. By our remark above and our definition of coverings, we can find an $i$, a covering $\left\{U_{i}^{t} \rightarrow U_{i}\right\}$ of $\mathcal{C}_{i}$ and a morphism $V_{i} \rightarrow U_{i}$ whose image by $u_{i}$ is the given data. We claim that $U^{t} \times_{U} V$ is the image of $U_{i}^{t} \times_{U_{i}} V_{i}$ by $u_{i}$. Namely, for every $a: j \rightarrow i$ in $\mathcal{I}$ the functor $u_{a}$ is continuous, hence $u_{a}\left(U_{i}^{t} \times_{U_{i}} V_{i}\right)=u_{a}\left(U_{i}^{t}\right) \times_{u_{a}\left(U_{i}\right)} u_{a}\left(V_{i}\right)$. In particular we can replace $i$ by $j$, if we so desire. Thus, if $W$ is another object of $\mathcal{C}$, then we may assume $W=u_{i}\left(W_{i}\right)$ and we see that

$$
\begin{aligned}
& \operatorname{Mor}_{\mathcal{C}}\left(W, u_{i}\left(U_{i}^{t} \times_{U_{i}} V_{i}\right)\right) \\
& =\operatorname{colim}_{a: j \rightarrow i} \operatorname{Mor}_{\mathcal{C}_{j}}\left(u_{a}\left(W_{i}\right), u_{a}\left(U_{i}^{t} \times_{U_{i}} V_{i}\right)\right) \\
& =\operatorname{colim}_{a: j \rightarrow i} \operatorname{Mor}_{\mathcal{C}_{j}}\left(u_{a}\left(W_{i}\right), u_{a}\left(U_{i}^{t}\right)\right) \times_{\operatorname{Mor}_{\mathcal{C}_{j}}\left(u_{a}\left(W_{i}\right), u_{a}\left(U_{i}\right)\right)} \operatorname{Mor}_{\mathcal{C}_{j}}\left(u_{a}\left(W_{i}\right), u_{a}\left(V_{i}\right)\right) \\
& =\operatorname{Mor}_{\mathcal{C}}\left(W, U^{t}\right) \times_{\operatorname{Mor}_{\mathcal{C}}(W, U)} \operatorname{Mor}_{\mathcal{C}}(W, V)
\end{aligned}
$$

as filtered colimits commute with finite limits (Categories, Lemma 4.19.2). It also follows that $\left\{U^{t} \times_{U} V \rightarrow V\right\}$ is a covering in $\mathcal{C}$. In this way we see that axiom (3) of Definition 7.6 .2 holds.
To verify axiom (2) of Definition 7.6 .2 let $\left\{U^{t} \rightarrow U\right\}_{t \in T}$ be a covering of $\mathcal{C}$ and for each $t$ let $\left\{U^{t s} \rightarrow U^{t}\right\}$ be a covering of $\mathcal{C}$. Then we can find an $i$ and a covering $\left\{U_{i}^{t} \rightarrow U_{i}\right\}_{t \in T}$ of $\mathcal{C}_{i}$ whose image by $u_{i}$ is $\left\{U^{t} \rightarrow U\right\}$. Since $T$ is finite we may choose an $a: j \rightarrow i$ in $\mathcal{I}$ and coverings $\left\{U_{j}^{t s} \rightarrow u_{a}\left(U_{i}^{t}\right)\right\}$ of $\mathcal{C}_{j}$ whose image by $u_{j}$
7.11. QUASI-COMPACT OBJECTS AND COLIMITS
gives $\left\{U^{t s} \rightarrow U^{t}\right\}$. Then we conclude that $\left\{U^{t s} \rightarrow U\right\}$ is a covering of $\mathcal{C}$ by an application of axiom (2) to the site $\mathcal{C}_{j}$.
We omit the proof of axiom (1) of Definition 7.6.2
0A35 Lemma 7.11.5. In Situation 7.11.3 let $u_{i}: \mathcal{C}_{i} \rightarrow \mathcal{C}$ be as constructed in Lemma 7.11.4. Then $u_{i}$ defines a morphism of sites $f_{i}: \mathcal{C} \rightarrow \mathcal{C}_{i}$. For $U_{i} \in \operatorname{Ob}\left(\mathcal{C}_{i}\right)$ and sheaf $\mathcal{F}$ on $\mathcal{C}_{i}$ we have

09YM (7.11.5.1)

$$
f_{i}^{-1} \mathcal{F}\left(u_{i}\left(U_{i}\right)\right)=\operatorname{colim}_{a: j \rightarrow i} f_{a}^{-1} \mathcal{F}\left(u_{a}\left(U_{i}\right)\right)
$$

Proof. It is immediate from the arguments in the proof of Lemma 7.11 .4 that the functors $u_{i}$ are continuous. To finish the proof we have to show that $f_{i}^{-1}:=u_{i, s}$ is an exact functor $S h\left(\mathcal{C}_{i}\right) \rightarrow S h(\mathcal{C})$. In fact it suffices to show that $f_{i}^{-1}$ is left exact, because it is right exact as a left adjoint (Categories, Lemma 4.24.5). We first prove 7.11.5.1 and then we decuce exactness.

For an arbitrary object $V$ of $\mathcal{C}$ we can pick a $a: j \rightarrow i$ and an object $V_{j} \in \mathrm{Ob}(\mathcal{C})$ with $V=u_{j}\left(V_{j}\right)$. Then we can set

$$
\mathcal{G}(V)=\operatorname{colim}_{b: k \rightarrow j} f_{a \circ b}^{-1} \mathcal{F}\left(u_{b}\left(V_{j}\right)\right)
$$

The value $\mathcal{G}(V)$ of the colimit is independent of the choice of $b: j \rightarrow i$ and of the object $V_{j}$ with $u_{j}\left(V_{j}\right)=V$; we omit the verification. Moreover, if $\alpha: V \rightarrow V^{\prime}$ is a morphism of $\mathcal{C}$, then we can choose $b: j \rightarrow i$ and a morphism $\alpha_{j}: V_{j} \rightarrow V_{j}^{\prime}$ with $u_{j}\left(\alpha_{j}\right)=\alpha$. This induces a map $\mathcal{G}\left(V^{\prime}\right) \rightarrow \mathcal{G}(V)$ by using the restrictions along the morphisms $u_{b}\left(\alpha_{j}\right): u_{b}\left(V_{j}\right) \rightarrow u_{b}\left(V_{j}^{\prime}\right)$. A check shows that $\mathcal{G}$ is a presheaf (omitted). In fact, $\mathcal{G}$ satisfies the sheaf condition. Namely, any covering $\mathcal{U}=\left\{U^{t} \rightarrow U\right\}$ in $\mathcal{C}$ comes from a finite level. Say $\mathcal{U}_{j}=\left\{U_{j}^{t} \rightarrow U_{j}\right\}$ is mapped to $\mathcal{U}$ by $u_{j}$ for some $a: j \rightarrow i$ in $\mathcal{I}$. Then we have

$$
H^{0}(\mathcal{U}, \mathcal{G})=\operatorname{colim}_{b: k \rightarrow j} H^{0}\left(u_{b}\left(\mathcal{U}_{j}\right), f_{b \circ a}^{-1} \mathcal{F}\right)=\operatorname{colim}_{b: k \rightarrow j} f_{b \circ a}^{-1} \mathcal{F}\left(u_{b}\left(U_{j}\right)\right)=\mathcal{G}(U)
$$

as desired. The first equality holds because filtered colimits commute with finite limits (Categories, Lemma 4.19.2). By construction $\mathcal{G}(U)$ is given by the right hand side of 7.11 .5 .1 . Hence 7.11.5.1 is true if we can show that $\mathcal{G}$ is equal to $f_{i}^{-1} \mathcal{F}$.
In this paragraph we check that $\mathcal{G}$ is canonically isomorphic to $f_{i}^{-1} \mathcal{F}$. We strongly encourage the reader to skip this paragraph. To check this we have to show there is a bijection $\operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{G}, \mathcal{H})=\operatorname{Mor}_{S h\left(\mathcal{C}_{i}\right)}\left(\mathcal{F}, f_{i, *} \mathcal{H}\right)$ functorial in the sheaf $\mathcal{H}$ on $\mathcal{C}$ where $f_{i, *}=u_{i}^{p}$. A map $\mathcal{G} \rightarrow \mathcal{H}$ is the same thing as a compatible system of maps

$$
\varphi_{a, b, V_{j}}: f_{a \circ b}^{-1} \mathcal{F}\left(u_{b}\left(V_{j}\right)\right) \longrightarrow \mathcal{H}\left(u_{j}\left(V_{j}\right)\right)
$$

for all $a: j \rightarrow i, b: k \rightarrow j$ and $V_{j} \in \operatorname{Ob}\left(\mathcal{C}_{j}\right)$. The compatibilities force the maps $\varphi_{a, b, V_{j}}$ to be equal to $\varphi_{a \circ b, \text { id }, u_{b}\left(V_{j}\right)}$. Given $a: j \rightarrow i$, the family of maps $\varphi_{a, \text { id }, V_{j}}$ corresponds to a map of sheaves $\varphi_{a}: f_{a}^{-1} \mathcal{F} \rightarrow f_{j, *} \mathcal{H}$. The compatibilities between the $\varphi_{a, \mathrm{id}, u_{a}\left(V_{i}\right)}$ and the $\varphi_{\mathrm{id}, \mathrm{id}, V_{i}}$ implies that $\varphi_{a}$ is the adjoint of the map $\varphi_{i d}$ via

$$
\operatorname{Mor}_{S h\left(\mathcal{C}_{j}\right)}\left(f_{a}^{-1} \mathcal{F}, f_{j, *} \mathcal{H}\right)=\operatorname{Mor}_{S h\left(\mathcal{C}_{i}\right)}\left(\mathcal{F}, f_{a, *} f_{j, *} \mathcal{H}\right)=\operatorname{Mor}_{S h\left(\mathcal{C}_{i}\right)}\left(\mathcal{F}, f_{i, *} \mathcal{H}\right)
$$

Thus finally we see that the whole system of maps $\varphi_{a, b, V_{j}}$ is determined by the $\operatorname{map} \varphi_{i d}: \mathcal{F} \rightarrow f_{i, *} \mathcal{H}$. Conversely, given such a map $\psi: \mathcal{F} \rightarrow f_{i, *} \mathcal{H}$ we can read the argument just given backwards to construct the family of maps $\varphi_{a, b, V_{j}}$. This finishes the proof that $\mathcal{G}=f_{i}^{-1} \mathcal{F}$.

Assume 7.11.5.1 holds. Then the functor $\mathcal{F} \mapsto f_{i}^{-1} \mathcal{F}(U)$ commutes with finite limits because finite limits of sheaves are computed in the category of presheaves (Lemma 7.10.1, the functors $f_{a}^{-1}$ commutes with finite limits, and filtered colimits commute with finite limits. To see that $\mathcal{F} \mapsto f_{i}^{-1} \mathcal{F}(V)$ commutes with finite limits for a general object $V$ of $\mathcal{C}$, we can use the same argument using the formula for $f_{i}^{-1} \mathcal{F}(V)=\mathcal{G}(V)$ given above. Thus $f_{i}^{-1}$ is left exact and the proof of the lemma is complete.

09YN Lemma 7.11.6. In Situation 7.11.3 assume given
(1) a sheaf $\mathcal{F}_{i}$ on $\mathcal{C}_{i}$ for all $i \in \operatorname{Ob}(\mathcal{I})$,
(2) for $a: j \rightarrow i$ a map $\varphi_{a}: f_{a}^{-1} \mathcal{F}_{i} \rightarrow \mathcal{F}_{j}$ of sheaves on $\mathcal{C}_{j}$
such that $\varphi_{c}=\varphi_{b} \circ f_{b}^{-1} \varphi_{a}$ whenever $c=a \circ b$. Set $\mathcal{F}=\operatorname{colim} f_{i}^{-1} \mathcal{F}_{i}$ on the site $\mathcal{C}$ of Lemma 7.11.4. Let $i \in \operatorname{Ob}(\mathcal{I})$ and $X_{i} \in \operatorname{Ob}\left(\mathcal{C}_{i}\right)$. Then

$$
\operatorname{colim}_{a: j \rightarrow i} \mathcal{F}_{j}\left(u_{a}\left(X_{i}\right)\right)=\mathcal{F}\left(u_{i}\left(X_{i}\right)\right)
$$

Proof. A formal argument shows that

$$
\operatorname{colim}_{a: j \rightarrow i} \mathcal{F}_{i}\left(u_{a}\left(X_{i}\right)\right)=\operatorname{colim}_{a: j \rightarrow i} \operatorname{colim}_{b: k \rightarrow j} f_{b}^{-1} \mathcal{F}_{j}\left(u_{a \circ b}\left(X_{i}\right)\right)
$$

By 7.11 .5 .1 ) we see that the inner colimit is equal to $f_{j}^{-1} \mathcal{F}_{j}\left(u_{i}\left(X_{i}\right)\right)$ hence we conclude by Lemma 7.11.2.

### 7.12. Injective and surjective maps of sheaves

00WL
00WM Definition 7.12.1. Let $\mathcal{C}$ be a site, and let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of sheaves of sets.
(1) We say that $\varphi$ is injective if for every object $U$ of $\mathcal{C}$ the map $\varphi: \mathcal{F}(U) \rightarrow$ $\mathcal{G}(U)$ is injective.
(2) We say that $\varphi$ is surjective if for every object $U$ of $\mathcal{C}$ and every section $s \in \mathcal{G}(U)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that for all $i$ the restriction $\left.s\right|_{U_{i}}$ is in the image of $\varphi: \mathcal{F}\left(U_{i}\right) \rightarrow \mathcal{G}\left(U_{i}\right)$.

00WN Lemma 7.12.2. The injective (resp. surjective) maps defined above are exactly the monomorphisms (resp. epimorphisms) of the category $\operatorname{Sh}(\mathcal{C})$. A map of sheaves is an isomorphism if and only if it is both injective and surjective.

Proof. Omitted.
086K Lemma 7.12.3. Let $\mathcal{C}$ be a site. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a surjection of sheaves of sets. Then the diagram

$$
\mathcal{F} \times_{\mathcal{G}} \mathcal{F} \longrightarrow \mathcal{F} \longrightarrow \mathcal{G}
$$

represents $\mathcal{G}$ as a coequalizer.
Proof. Let $\mathcal{H}$ be a sheaf of sets and let $\varphi: \mathcal{F} \rightarrow \mathcal{H}$ be a map of sheaves equalizing the two maps $\mathcal{F} \times{ }_{\mathcal{G}} \mathcal{F} \rightarrow \mathcal{F}$. Let $\mathcal{G}^{\prime} \subset \mathcal{G}$ be the presheaf image of the map $\mathcal{F} \rightarrow \mathcal{G}$. As the product $\mathcal{F} \times{ }_{\mathcal{G}} \mathcal{F}$ may be computed in the category of presheaves we see that it is equal to the presheaf product $\mathcal{F} \times{ }_{\mathcal{G}^{\prime}} \mathcal{F}$. Hence $\varphi$ induces a unique map of presheaves $\psi^{\prime}: \mathcal{G}^{\prime} \rightarrow \mathcal{H}$. Since $\mathcal{G}$ is the sheafification of $\mathcal{G}^{\prime}$ by Lemma 7.12 .2 we conclude that $\psi^{\prime}$ extends uniquely to a map of sheaves $\psi: \mathcal{G} \rightarrow \mathcal{H}$. We omit the verification that $\varphi$ is equal to the composition of $\psi$ and the given map.

### 7.13. Representable sheaves

00 WO Let $\mathcal{C}$ be a category. The canonical topology is the finest topology such that all representable presheaves are sheaves (it is formally defined in Definition 7.45.12 but we will not need this). This topology is not always the topology associated to the structure of a site on $\mathcal{C}$. We will give a collection of coverings that generates this topology in case $\mathcal{C}$ has fibered products. First we give the following general definition.

00WP Definition 7.13.1. Let $\mathcal{C}$ be a category. We say that a family $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is an effective epimorphism if all the morphisms $U_{i} \rightarrow U$ are representable (see Categories, Definition 4.6.4), and for any $X \in \operatorname{Ob}(\mathcal{C})$ the sequence

$$
\operatorname{Mor}_{\mathcal{C}}(U, X) \longrightarrow \prod_{i \in I} \operatorname{Mor}_{\mathcal{C}}\left(U_{i}, X\right) \longrightarrow \prod_{(i, j) \in I^{2}} \operatorname{Mor}_{\mathcal{C}}\left(U_{i} \times_{U} U_{j}, X\right)
$$

is an equalizer diagram. We say that a family $\left\{U_{i} \rightarrow U\right\}$ is a universal effective epimorphism if for any morphism $V \rightarrow U$ the base change $\left\{U_{i} \times_{U} V \rightarrow V\right\}$ is an effective epimorphism.
The class of families which are universal effective epimorphisms satisfies the axioms of Definition 7.6.2. If $\mathcal{C}$ has fibre products, then the associated topology is the canonical topology. (In this case, to get a site argue as in Sets, Lemma 3.11.1.)

Conversely, suppose that $\mathcal{C}$ is a site such that all representable presheaves are sheaves. Then clearly, all coverings are universal effective epimorphisms. Thus the following definition is the "correct" one in the setting of sites.
00WQ Definition 7.13.2. We say that the topology on a site $\mathcal{C}$ is weaker than the canonical topology, or that the topology is subcanonical if all the coverings of $\mathcal{C}$ are universal effective epimorphisms.

A representable sheaf is a representable presheaf which is also a sheaf. Since it is perhaps better to avoid this terminology when the topology is not subcanonical, we only define it formally in that case.
00WR Definition 7.13.3. Let $\mathcal{C}$ be a site whose topology is subcanonical. The Yoneda embedding $h$ (see Categories, Section 4.3) presents $\mathcal{C}$ as a full subcategory of the category of sheaves of $\mathcal{C}$. In this case we call sheaves of the form $h_{U}$ with $U \in$ $\mathrm{Ob}(\mathcal{C})$ representable sheaves on $\mathcal{C}$. Notation: Sometimes, the representable sheaf $h_{U}$ associated to $U$ is denoted $\underline{U}$.
Note that we have in the situation of the definition

$$
\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)=\mathcal{F}(U)
$$

for every sheaf $\mathcal{F}$, since it holds for presheaves, see 7.2.1.1. In general the presheaves $h_{U}$ are not sheaves and to get a sheaf you have to sheafify them. In this case we still have

090I

$$
\begin{equation*}
\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}^{\#}, \mathcal{F}\right)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)=\mathcal{F}(U) \tag{7.13.3.1}
\end{equation*}
$$

for every sheaf $\mathcal{F}$. Namely, the first equality holds by the adjointness property of $\#$ and the second is 7.2.1.1).
00WT Lemma 7.13.4. Let $\mathcal{C}$ be a site. If $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering of the site $\mathcal{C}$, then the morphism of presheaves of sets

$$
\coprod_{i \in I} h_{U_{i}} \rightarrow h_{U}
$$

becomes surjective after sheafification.
Proof. By Lemma 7.12 .2 above we have to show that $\coprod_{i \in I} h_{U_{i}}^{\#} \rightarrow h_{U}^{\#}$ is an epimorphism. Let $\mathcal{F}$ be a sheaf of sets. A morphism $h_{U}^{\#} \rightarrow \mathcal{F}$ corresponds to a section $s \in \mathcal{F}(U)$. Hence the injectivity of $\operatorname{Mor}\left(h_{U}^{\#}, \mathcal{F}\right) \rightarrow \prod_{i} \operatorname{Mor}\left(h_{U_{i}}^{\#}, \mathcal{F}\right)$ follows directly from the sheaf property of $\mathcal{F}$.

The next lemma says, in the case the topology is weaker than the canonical topology, that every sheaf is made up out of representable sheaves in a way.
00WS Lemma 7.13.5. Let $\mathcal{C}$ be a site. Let $E \subset \mathrm{Ob}(\mathcal{C})$ be a subset such that every object of $\mathcal{C}$ has a covering by elements of $E$. Let $\mathcal{F}$ be a sheaf of sets. There exists a diagram of sheaves of sets

$$
\mathcal{F}_{1} \longrightarrow \mathcal{F}_{0} \longrightarrow \mathcal{F}
$$

which represents $\mathcal{F}$ as a coequalizer, such that $\mathcal{F}_{i}, i=0,1$ are coproducts of sheaves of the form $h_{U}^{\#}$ with $U \in E$.
Proof. First we show there is an epimorphism $\mathcal{F}_{0} \rightarrow \mathcal{F}$ of the desired type. Namely, just take

$$
\mathcal{F}_{0}=\coprod_{U \in E, s \in \mathcal{F}(U)}\left(h_{U}\right)^{\#} \longrightarrow \mathcal{F}
$$

Here the arrow restricted to the component corresponding to $(U, s)$ maps the element $\operatorname{id}_{U} \in h_{U}^{\#}(U)$ to the section $s \in \mathcal{F}(U)$. This is an epimorphism according to Lemma 7.12 .2 and our condition on $E$. To construct $\mathcal{F}_{1}$ first set $\mathcal{G}=\mathcal{F}_{0} \times{ }_{\mathcal{F}} \mathcal{F}_{0}$ and then construct an epimorphism $\mathcal{F}_{1} \rightarrow \mathcal{G}$ as above. See Lemma 7.12.3.

### 7.14. Continuous functors

00WU
00WV Definition 7.14.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A functor $u: \mathcal{C} \rightarrow \mathcal{D}$ is called continuous if for every $\left\{V_{i} \rightarrow V\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ we have the following
(1) $\left\{u\left(V_{i}\right) \rightarrow u(V)\right\}_{i \in I}$ is in $\operatorname{Cov}(\mathcal{D})$, and
(2) for any morphism $T \rightarrow V$ in $\mathcal{C}$ the morphism $u\left(T \times{ }_{V} V_{i}\right) \rightarrow u(T) \times{ }_{u(V)}$ $u\left(V_{i}\right)$ is an isomorphism.
Recall that given a functor $u$ as above, and a presheaf of sets $\mathcal{F}$ on $\mathcal{D}$ we have defined $u^{p} \mathcal{F}$ to be simply the presheaf $\mathcal{F} \circ u$, in other words

$$
u^{p} \mathcal{F}(V)=\mathcal{F}(u(V))
$$

for every object $V$ of $\mathcal{C}$.
00WW Lemma 7.14.2. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor. If $\mathcal{F}$ is a sheaf on $\mathcal{D}$ then $u^{p} \mathcal{F}$ is a sheaf as well.

Proof. Let $\left\{V_{i} \rightarrow V\right\}$ be a covering. By assumption $\left\{u\left(V_{i}\right) \rightarrow u(V)\right\}$ is a covering in $\mathcal{D}$ and $u\left(V_{i} \times_{V} V_{j}\right)=u\left(V_{i}\right) \times{ }_{u(V)} u\left(V_{j}\right)$. Hence the sheaf condition for $u^{p} \mathcal{F}$ and the covering $\left\{V_{i} \rightarrow V\right.$ \} is precisely the same as the sheaf condition for $\mathcal{F}$ and the covering $\left\{u\left(V_{i}\right) \rightarrow u(V)\right\}$.

In order to avoid confusion we sometimes denote

$$
u^{s}: \operatorname{Sh}(\mathcal{D}) \longrightarrow S h(\mathcal{C})
$$

the functor $u^{p}$ restricted to the subcategory of sheaves of sets.

00WX Lemma 7.14.3. In the situation of Lemma 7.14.2. The functor $u_{s}: \mathcal{G} \mapsto\left(u_{p} \mathcal{G}\right)^{\#}$ is a left adjoint to $u^{s}$.

Proof. Follows directly from Lemma 7.5.4 and Proposition 7.10.12,

Here is a technical lemma.
00WY Lemma 7.14.4. In the situation of Lemma 7.14.2. For any presheaf $\mathcal{G}$ on $\mathcal{C}$ we have $\left(u_{p} \mathcal{G}\right)^{\#}=\left(u_{p}\left(\mathcal{G}^{\#}\right)\right)^{\#}$.

Proof. For any sheaf $\mathcal{F}$ on $\mathcal{D}$ we have

$$
\begin{aligned}
\operatorname{Mor}_{S h(\mathcal{D})}\left(u_{s}\left(\mathcal{G}^{\#}\right), \mathcal{F}\right) & =\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{G}^{\#}, u^{s} \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{C})}\left(\mathcal{G}^{\#}, u^{p} \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{C})}\left(\mathcal{G}, u^{p} \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{D})}\left(u_{p} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{D})}\left(\left(u_{p} \mathcal{G}\right)^{\#}, \mathcal{F}\right)
\end{aligned}
$$

and the result follows from the Yoneda lemma.

04D3 Lemma 7.14.5. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor between sites. For any object $U$ of $\mathcal{C}$ we have $u_{s} h_{U}^{\#}=h_{u(U)}^{\#}$.

Proof. Follows from Lemmas 7.5.6 and 7.14.4

00WZ Remark 7.14.6. (Skip on first reading.) Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let us use the definition of tautologically equivalent families of maps, see Definition 7.8.2 to (slightly) weaken the conditions defining continuity. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Let us call $u$ quasi-continuous if for every $\mathcal{V}=\left\{V_{i} \rightarrow V\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ we have the following
(1') the family of maps $\left\{u\left(V_{i}\right) \rightarrow u(V)\right\}_{i \in I}$ is tautologically equivalent to an element of $\operatorname{Cov}(\mathcal{D})$, and
(2) for any morphism $T \rightarrow V$ in $\mathcal{C}$ the morphism $u\left(T \times{ }_{V} V_{i}\right) \rightarrow u(T) \times{ }_{u(V)}$ $u\left(V_{i}\right)$ is an isomorphism.
We are going to see that Lemmas 7.14.2 and 7.14.3 hold in case $u$ is quasi-continuous as well.

We first remark that the morphisms $u\left(V_{i}\right) \rightarrow u(V)$ are representable, since they are isomorphic to representable morphisms (by the first condition). In particular, the family $u(\mathcal{V})=\left\{u\left(V_{i}\right) \rightarrow u(V)\right\}_{i \in I}$ gives rise to a zeroth Cech cohomology group $H^{0}(u(\mathcal{V}), \mathcal{F})$ for any presheaf $\mathcal{F}$ on $\mathcal{D}$. Let $\mathcal{U}=\left\{U_{j} \rightarrow u(V)\right\}_{j \in J}$ be an element of $\operatorname{Cov}(\mathcal{D})$ tautologically equivalent to $\left\{u\left(V_{i}\right) \rightarrow u(V)\right\}_{i \in I}$. Note that $u(\mathcal{V})$ is a refinement of $\mathcal{U}$ and vice versa. Hence by Remark 7.10.7 we see that $H^{0}(u(\mathcal{V}), \mathcal{F})=$ $H^{0}(\mathcal{U}, \mathcal{F})$. In particular, if $\mathcal{F}$ is a sheaf, then $\mathcal{F}(u(V))=H^{0}(u(\mathcal{V}), \mathcal{F})$ because of the sheaf property expressed in terms of zeroth Cech cohomology groups. We conclude that $u^{p} \mathcal{F}$ is a sheaf if $\mathcal{F}$ is a sheaf, since $H^{0}\left(\mathcal{V}, u^{p} \mathcal{F}\right)=H^{0}(u(\mathcal{V}), \mathcal{F})$ which we just observed is equal to $\mathcal{F}(u(V))=u^{p} \mathcal{F}(V)$. Thus Lemma 7.14.2 holds. Lemma 7.14.3 follows immediately.

### 7.15. Morphisms of sites

## 00X0

00X1 Definition 7.15.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A morphism of sites $f: \mathcal{D} \rightarrow \mathcal{C}$ is given by a continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$ such that the functor $u_{s}$ is exact.

Notice how the functor $u$ goes in the direction opposite the morphism $f$. If $f \leftrightarrow u$ is a morphism of sites then we use the notation $f^{-1}=u_{s}$ and $f_{*}=u^{s}$. The functor $f^{-1}$ is called the pullback functor and the functor $f_{*}$ is called the pushforward functor. As in topology we have the following adjointness property

$$
\operatorname{Mor}_{S h(\mathcal{D})}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

The motivation for this definition comes from the following example.
00X2 Example 7.15.2. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Recall that we have sites $X_{Z a r}$ and $Y_{Z a r}$, see Example 7.6.4. Consider the functor $u: Y_{Z a r} \rightarrow X_{Z a r}, V \mapsto f^{-1}(V)$. This functor is clearly continuous because inverse images of open coverings are open coverings. (Actually, this depends on how you chose sets of coverings for $X_{Z a r}$ and $Y_{Z a r}$. But in any case the functor is quasicontinuous, see Remark 7.14.6.) It is easy to verify that the functor $u^{s}$ equals the usual pushforward functor $f_{*}$ from topology. Hence, since $u_{s}$ is an adjoint and since the usual topological pullback functor $f^{-1}$ is an adjoint as well, we get a canonical isomorphism $f^{-1} \cong u_{s}$. Since $f^{-1}$ is exact we deduce that $u_{s}$ is exact. Hence $u$ defines a morphism of sites $f: X_{Z a r} \rightarrow Y_{Z a r}$, which we may denote $f$ as well since we've already seen the functors $u_{s}, u^{s}$ agree with their usual notions anyway.

03CB Lemma 7.15.3. Let $\mathcal{C}_{i}, i=1,2,3$ be sites. Let $u: \mathcal{C}_{2} \rightarrow \mathcal{C}_{1}$ and $v: \mathcal{C}_{3} \rightarrow \mathcal{C}_{2}$ be continuous functors which induce morphisms of sites. Then the functor $u \circ v: \mathcal{C}_{3} \rightarrow$ $\mathcal{C}_{1}$ is continuous and defines a morphism of sites $\mathcal{C}_{1} \rightarrow \mathcal{C}_{3}$.

Proof. It is immediate from the definitions that $u \circ v$ is a continuous functor. In addition, we clearly have $(u \circ v)^{p}=v^{p} \circ u^{p}$, and hence $(u \circ v)^{s}=v^{s} \circ u^{s}$. Hence functors $(u \circ v)_{s}$ and $u_{s} \circ v_{s}$ are both left adjoints of $(u \circ v)^{s}$. Therefore $(u \circ v)_{s} \cong u_{s} \circ v_{s}$ and we conclude that $(u \circ v)_{s}$ is exact as a composition of exact functors.
03CC Definition 7.15.4. Let $\mathcal{C}_{i}, i=1,2,3$ be sites. Let $f: \mathcal{C}_{1} \rightarrow \mathcal{C}_{2}$ and $g: \mathcal{C}_{2} \rightarrow \mathcal{C}_{3}$ be morphisms of sites given by continuous functors $u: \mathcal{C}_{2} \rightarrow \mathcal{C}_{1}$ and $v: \mathcal{C}_{3} \rightarrow \mathcal{C}_{2}$. The composition $g \circ f$ is the morphism of sites corresponding to the functor $u \circ v$.

In this situation we have $(g \circ f)_{*}=g_{*} \circ f_{*}$ and $(g \circ f)^{-1}=f^{-1} \circ g^{-1}$ (see proof of Lemma 7.15.3.
00X5 Lemma 7.15.5. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be continuous. Assume all the categories $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ of Section 7.5 are filtered. Then $u$ defines a morphism of sites $\mathcal{D} \rightarrow \mathcal{C}$, in other words $u_{s}$ is exact.

Proof. Since $u_{s}$ is the left adjoint of $u^{s}$ we see that $u_{s}$ is right exact, see Categories, Lemma 4.24.5 Hence it suffices to show that $u_{s}$ is left exact. In other words we have to show that $u_{s}$ commutes with finite limits. Because the categories $\mathcal{I}_{Y}^{\text {opp }}$ are filtered we see that $u_{p}$ commutes with finite limits, see Categories, Lemma 4.19 .2 (this also uses the description of limits in PSh, see Section 7.4). And since sheafification commutes with finite limits as well (Lemma 7.10.14) we conclude because $u_{s}=\# \circ u_{p}$.

00X6 Proposition 7.15.6. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be continuous. Assume furthermore the following:
(1) the category $\mathcal{C}$ has a final object $X$ and $u(X)$ is a final object of $\mathcal{D}$, and
(2) the category $\mathcal{C}$ has fibre products and $u$ commutes with them.

Then $u$ defines a morphism of sites $\mathcal{D} \rightarrow \mathcal{C}$, in other words $u_{s}$ is exact.
Proof. This follows from Lemmas 7.5 .2 and 7.15 .5 .
00X7 Remark 7.15.7. The conditions of Proposition 7.15 .6 above are equivalent to saying that $u$ is left exact, i.e., commutes with finite limits. See Categories, Lemmas 4.18 .4 and 4.23.2. It seems more natural to phrase it in terms of final objects and fibre products since this seems to have more geometric meaning in the examples.

Lemma 7.18 .4 will provide another way to prove a continuous functor gives rise to a morphism of sites.

00X8 Remark 7.15.8. (Skip on first reading.) Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Analogously to Definition 7.15.1 we say that a quasi-morphism of sites $f: \mathcal{D} \rightarrow \mathcal{C}$ is given by a quasi-continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$ (see Remark 7.14.6) such that $u_{s}$ is exact. The analogue of Proposition 7.15 .6 in this setting is obtained by replacing the word "continuous" by the word "quasi-continuous", and replacing the word "morphism" by "quasi-morphism". The proof is literally the same.

In Definition 7.15.1 the condition that $u_{s}$ be exact cannot be omitted. For example, the conclusion of the following lemma need not hold if one only assumes that $u$ is continuous.

08H2 Lemma 7.15.9. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by the functor $u: \mathcal{C} \rightarrow \mathcal{D}$. Given any object $V$ of $\mathcal{D}$ there exists a covering $\left\{V_{j} \rightarrow V\right\}$ such that for every $j$ there exists a morphism $V_{j} \rightarrow u\left(U_{j}\right)$ for some object $U_{j}$ of $\mathcal{C}$.

Proof. Since $f^{-1}=u_{s}$ is exact we have $f^{-1} *=*$ where $*$ denotes the final object of the category of sheaves (Example 7.10.2). Since $f^{-1} *=u_{s} *$ is the sheafification of $u_{p} *$ we see there exists a covering $\left\{V_{j} \rightarrow V\right\}$ such that $\left(u_{p} *\right)\left(V_{j}\right)$ is nonempty. Since $\left(u_{p} *\right)\left(V_{j}\right)$ is a colimit over the category $\mathcal{I}_{V_{j}}^{u}$ whose objects are morphisms $V_{j} \rightarrow u(U)$ the lemma follows.

### 7.16. Topoi

00X9 Here is a definition of a topos which is suitable for our purposes. Namely, a topos is the category of sheaves on a site. In order to specify a topos you just specify the site. The real difference between a topos and a site lies in the definition of morphisms. Namely, it turns out that there are lots of morphisms of topoi which do not come from morphisms of the underlying sites.

00XA Definition 7.16.1 (Topoi). A topos is the category $\operatorname{Sh}(\mathcal{C})$ of sheaves on a site $\mathcal{C}$.
(1) Let $\mathcal{C}, \mathcal{D}$ be sites. A morphism of topoi $f$ from $\operatorname{Sh}(\mathcal{D})$ to $\operatorname{Sh}(\mathcal{C})$ is given by a pair of functors $f_{*}: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ and $f^{-1}: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ such that (a) we have

$$
\operatorname{Mor}_{S h(\mathcal{D})}\left(f^{-1} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{G}, f_{*} \mathcal{F}\right)
$$

bifunctorially, and
(b) the functor $f^{-1}$ commutes with finite limits, i.e., is left exact.
(2) Let $\mathcal{C}, \mathcal{D}, \mathcal{E}$ be sites. Given morphisms of topoi $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ and $g: \operatorname{Sh}(\mathcal{E}) \rightarrow \operatorname{Sh}(\mathcal{D})$ the composition $f \circ g$ is the morphism of topoi defined by the functors $(f \circ g)_{*}=f_{*} \circ g_{*}$ and $(f \circ g)^{-1}=g^{-1} \circ f^{-1}$.
Suppose that $\alpha: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ is an equivalence of (possibly "big") categories. If $\mathcal{S}_{1}$, $\mathcal{S}_{2}$ are topoi, then setting $f_{*}=\alpha$ and $f^{-1}$ equal to a quasi-inverse of $\alpha$ gives a morphism $f: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ of topoi. Moreover this morphism is an equivalence in the 2 -category of topoi (see Section 7.35). Thus it makes sense to say " $\mathcal{S}$ is a topos" if $\mathcal{S}$ is equivalent to the category of sheaves on a site (and not necessarily equal to the category of sheaves on a site). We will occasionally use this abuse of notation.

Two examples of topoi. The empty topos is topos of sheaves on the site $\mathcal{C}$, where $\mathcal{C}$ has a single object $\emptyset$ and a single morphism $\mathrm{id}_{\emptyset}$ and a single covering, namely the empty covering of $\emptyset$. We will sometimes write $\emptyset$ for this site. This is a site and every sheaf on $\mathcal{C}$ assigns a singleton to $\emptyset$. Thus $S h(\emptyset)$ is equivalent to the category having a single object and a single morphism. The punctual topos is the topos of sheaves on the site $\mathcal{C}$ which has a single object $p t$ and one morphism $\mathrm{id}_{p t}$ and whose only covering is the covering $\left\{\operatorname{id}_{p t}\right\}$. We will simply write $p t$ for this site. It is clear that the category of sheaves $=$ the category of presheaves $=$ the category of sets. In a formula $S h(p t)=$ Sets.
Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $f: S h(\mathcal{D}) \rightarrow S h(\mathcal{C})$ be a morphism of topoi. Note that $f_{*}$ commutes with all limits and that $f^{-1}$ commutes with all colimits, see Categories, Lemma 4.24.4. In particular, the condition on $f^{-1}$ in the definition above guarantees that $f^{-1}$ is exact. Morphisms of topoi are often constructed using either Lemma 7.20 .1 or the following lemma.

00XC Lemma 7.16.2. Given a morphism of sites $f: \mathcal{D} \rightarrow \mathcal{C}$ corresponding to the functor $u: \mathcal{C} \rightarrow \mathcal{D}$ the pair of functors $\left(f^{-1}=u_{s}, f_{*}=u^{s}\right)$ is a morphism of topoi.

Proof. This is obvious from Definition 7.15.1.
00XD Remark 7.16.3. There are many sites that give rise to the topos $S h(p t)$. A useful example is the following. Suppose that $S$ is a set (of sets) which contains at least one nonempty element. Let $\mathcal{S}$ be the category whose objects are elements of $S$ and whose morphisms are arbitrary set maps. Assume that $\mathcal{S}$ has fibre products. For example this will be the case if $S=\mathcal{P}$ (infinite set) is the power set of any infinite set (exercise in set theory). Make $\mathcal{S}$ into a site by declaring surjective families of maps to be coverings (and choose a suitable sufficiently large set of covering families as in Sets, Section 3.11. We claim that $\operatorname{Sh}(\mathcal{S})$ is equivalent to the category of sets.
We first prove this in case $S$ contains $e \in S$ which is a singleton. In this case, there is an equivalence of topoi $i: S h(p t) \rightarrow S h(\mathcal{S})$ given by the functors

05UW

$$
i^{-1} \mathcal{F}=\mathcal{F}(e), \quad i_{*} E=\left(U \mapsto \operatorname{Mor}_{S e t s}(U, E)\right)
$$

Namely, suppose that $\mathcal{F}$ is a sheaf on $\mathcal{S}$. For any $U \in \operatorname{Ob}(\mathcal{S})=S$ we can find a covering $\left\{\varphi_{u}: e \rightarrow U\right\}_{u \in U}$, where $\varphi_{u}$ maps the unique element of $e$ to $u \in$ $U$. The sheaf condition implies in this case that $\mathcal{F}(U)=\prod_{u \in U} \mathcal{F}(e)$. In other words $\mathcal{F}(U)=\operatorname{Mor}_{S e t s}(U, \mathcal{F}(e))$. Moreover, this rule is compatible with restriction mappings. Hence the functor

$$
i_{*}: \operatorname{Sets}=\operatorname{Sh}(p t) \longrightarrow \operatorname{Sh}(\mathcal{S}), \quad E \longmapsto\left(U \mapsto \operatorname{Mor}_{\text {Sets }}(U, E)\right)
$$

is an equivalence of categories, and its inverse is the functor $i^{-1}$ given above.

If $\mathcal{S}$ does not contain a singleton, then the functor $i_{*}$ as defined above still makes sense. To show that it is still an equivalence in this case, choose any nonempty $\tilde{e} \in S$ and a $\operatorname{map} \varphi: \tilde{e} \rightarrow \tilde{e}$ whose image is a singleton. For any sheaf $\mathcal{F}$ set

$$
\mathcal{F}(e):=\operatorname{Im}(\mathcal{F}(\varphi): \mathcal{F}(\tilde{e}) \longrightarrow \mathcal{F}(\tilde{e}))
$$

and show that this is a quasi-inverse to $i_{*}$. Details omitted.
00XB Remark 7.16.4. (Set theoretical issues related to morphisms of topoi. Skip on a first reading.) A morphism of topoi as defined above is not a set but a class. In other words it is given by a mathematical formula rather than a mathematical object. Although we may contemplate the collection of all morphisms between two given topoi, it is not a good idea to introduce it as a mathematical object. On the other hand, suppose $\mathcal{C}$ and $\mathcal{D}$ are given sites. Consider a functor $\Phi: \mathcal{C} \rightarrow \operatorname{Sh}(\mathcal{D})$. Such a thing is a set, in other words, it is a mathematical object. We may, in succession, ask the following questions on $\Phi$.
(1) Is it true, given a sheaf $\mathcal{F}$ on $\mathcal{D}$, that the rule $U \mapsto \operatorname{Mor}_{S h(\mathcal{D})}(\Phi(U), \mathcal{F})$ defines a sheaf on $\mathcal{C}$ ? If so, this defines a functor $\Phi_{*}: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$.
(2) Is it true that $\Phi_{*}$ has a left adjoint? If so, write $\Phi^{-1}$ for this left adjoint.
(3) Is it true that $\Phi^{-1}$ is exact?

If the last question still has the answer "yes", then we obtain a morphism of topoi $\left(\Phi_{*}, \Phi^{-1}\right)$. Moreover, given any morphism of topoi $\left(f_{*}, f^{-1}\right)$ we may set $\Phi(U)=$ $f^{-1}\left(h_{U}^{\#}\right)$ and obtain a functor $\Phi$ as above with $f_{*} \cong \Phi_{*}$ and $f^{-1} \cong \Phi^{-1}$ (compatible with adjoint property). The upshot is that by working with the collection of $\Phi$ instead of morphisms of topoi, we (a) replaced the notion of a morphism of topoi by a mathematical object, and (b) the collection of $\Phi$ forms a class (and not a collection of classes). Of course, more can be said, for example one can work out more precisely the significance of conditions (2) and (3) above; we do this in the case of points of topoi in Section 7.31 .

00XE Remark 7.16.5. (Skip on first reading.) Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A quasi-morphism of sites $f: \mathcal{D} \rightarrow \mathcal{C}$ (see Remark 7.15.8) gives rise to a morphism of topoi $f$ from $S h(\mathcal{D})$ to $S h(\mathcal{C})$ exactly as in Lemma 7.16.2.

### 7.17. G-sets and morphisms

04D4 Let $\varphi: G \rightarrow H$ be a homomorphism of groups. Choose (suitable) sites $\mathcal{T}_{G}$ and $\mathcal{T}_{H}$ as in Example 7.6.5 and Section 7.9. Let $u: \mathcal{T}_{H} \rightarrow \mathcal{T}_{G}$ be the functor which assigns to a $H$-set $U$ the $G$-set $U_{\varphi}$ which has the same underlying set but $G$ action defined by $g \cdot u=\varphi(g) u$. It is clear that $u$ commutes with finite limits and is continuous ${ }^{4}$ Applying Proposition 7.15 .6 and Lemma 7.16 .2 we obtain a morphism of topoi

$$
f: S h\left(\mathcal{T}_{G}\right) \longrightarrow S h\left(\mathcal{T}_{H}\right)
$$

associated with $\varphi$. Using Proposition 7.9.1 we see that we get a pair of adjoint functors

$$
f_{*}: G \text {-Sets } \longrightarrow H \text {-Sets }, \quad f^{-1}: H \text {-Sets } \longrightarrow G \text {-Sets } .
$$

Let's work out what are these functors in this case.

[^15]We first work out a formula for $f_{*}$. Recall that given a $G$-set $S$ the corresponding sheaf $\mathcal{F}_{S}$ on $\mathcal{T}_{G}$ is given by the rule $\mathcal{F}_{S}(U)=\operatorname{Mor}_{G}(U, S)$. And on the other hand, given a sheaf $\mathcal{G}$ on $\mathcal{T}_{H}$ the corresponding $H$-set is given by the rule $\mathcal{G}\left({ }_{H} H\right)$. Hence we see that

$$
f_{*} S=\operatorname{Mor}_{G-S e t s}\left(\left({ }_{H} H\right)_{\varphi}, S\right) .
$$

If we work this out a little bit more then we get

$$
f_{*} S=\{a: H \rightarrow S \mid a(g h)=g a(h)\}
$$

with left $H$-action given by $(h \cdot a)\left(h^{\prime}\right)=a\left(h^{\prime} h\right)$ for any element $a \in f_{*} S$.
Next, we explicitly compute $f^{-1}$. Note that since the topology on $\mathcal{T}_{G}$ and $\mathcal{T}_{H}$ is subcanonical, all representable presheaves are sheaves. Moreover, given an object $V$ of $\mathcal{T}_{H}$ we see that $f^{-1} h_{V}$ is equal to $h_{u(V)}$ (see Lemma 7.14.5). Hence we see that $f^{-1} S=S_{\varphi}$ for representable sheaves. Since every sheaf on $\mathcal{T}_{H}$ is a coproduct of representable sheaves we conclude that this is true in general. Hence we see that for any $H$-set $T$ we have

$$
f^{-1} T=T_{\varphi}
$$

The adjunction between $f^{-1}$ and $f_{*}$ is evidenced by the formula

$$
\operatorname{Mor}_{G-S e t s}\left(T_{\varphi}, S\right)=\operatorname{Mor}_{H-S e t s}\left(T, f_{*} S\right)
$$

with $f_{*} S$ as above. This can be proved directly. Moreover, it is then clear that $\left(f^{-1}, f_{*}\right)$ form an adjoint pair and that $f^{-1}$ is exact. So alternatively to the above the morphism of topoi $f: G$-Sets $\rightarrow H$-Sets can be defined directly in this manner.

### 7.18. More functoriality of presheaves

00XF In this section we revisit the material of Section 7.5. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Recall that

$$
u^{p}: \operatorname{PSh}(\mathcal{D}) \longrightarrow \operatorname{PSh}(\mathcal{C})
$$

is the functor that associates to $\mathcal{G}$ on $\mathcal{D}$ the presheaf $u^{p} \mathcal{G}=\mathcal{G} \circ u$. It turns out that this functor not only has a left adjoint (namely $u_{p}$ ) but also a right adjoint.

Namely, for any $V \in \operatorname{Ob}(\mathcal{D})$ we define a category ${ }_{V} \mathcal{I}={ }_{V}^{u} \mathcal{I}$. Its objects are pairs $(U, \psi: u(U) \rightarrow V)$. Note that the arrow is in the opposite direction from the arrow we used in defining the category $\mathcal{I}_{V}^{u}$ in Section 7.5 A morphism $(U, \psi) \rightarrow\left(U^{\prime}, \psi^{\prime}\right)$ is given by a morphism $\alpha: U \rightarrow U^{\prime}$ such that $\psi=\psi^{\prime} \circ u(\alpha)$. In addition, given any presheaf of sets $\mathcal{F}$ on $\mathcal{C}$ we introduce the functor ${ }_{V} \mathcal{F}:{ }_{V} \mathcal{I}^{\text {opp }} \rightarrow$ Sets, which is defined by the rule ${ }_{V} \mathcal{F}(U, \psi)=\mathcal{F}(U)$. We define

$$
{ }_{p} u(\mathcal{F})(V):=\lim _{V \mathcal{I}^{o p p}} V \mathcal{F}
$$

As a limit there are projection maps $c(\psi):{ }_{p} u(\mathcal{F})(V) \rightarrow \mathcal{F}(U)$ for every object $(U, \psi)$ of ${ }_{V} \mathcal{I}$. In fact,

$$
{ }_{p} u(\mathcal{F})(V)=\left\{\begin{array}{c}
\text { collections } s_{(U, \psi)} \in \mathcal{F}(U) \\
\forall \beta:\left(U_{1}, \psi_{1}\right) \rightarrow\left(U_{2}, \psi_{2}\right) \text { in }_{V} \mathcal{I} \\
\text { we have } \beta^{*} s_{\left(U_{2}, \psi_{2}\right)}=s_{\left(U_{1}, \psi_{1}\right)}
\end{array}\right\}
$$

where the correspondence is given by $s \mapsto s_{(U, \psi)}=c(\psi)(s)$. We leave it to the reader to define the restriction mappings ${ }_{p} u(\mathcal{F})(V) \rightarrow{ }_{p} u(\mathcal{F})\left(V^{\prime}\right)$ associated to any morphism $V^{\prime} \rightarrow V$ of $\mathcal{D}$. The resulting presheaf will be denoted ${ }_{p} u \mathcal{F}$.

00XG Lemma 7.18.1. There is a canonical map ${ }_{p} u \mathcal{F}(u(U)) \rightarrow \mathcal{F}(U)$, which is compatible with restriction maps.

Proof. This is just the projection map $c\left(\mathrm{id}_{u(U)}\right)$ above.
Note that any map of presheaves $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ gives rise to compatible systems of maps between functors ${ }_{V} \mathcal{F} \rightarrow{ }_{V} \mathcal{F}^{\prime}$, and hence to a map of presheaves ${ }_{p} u \mathcal{F} \rightarrow{ }_{p} u \mathcal{F}^{\prime}$. In other words, we have defined a functor

$$
{ }_{p} u: \operatorname{PSh}(\mathcal{C}) \longrightarrow P \operatorname{Sh}(\mathcal{D})
$$

00XH Lemma 7.18.2. The functor ${ }_{p} u$ is a right adjoint to the functor $u^{p}$. In other words the formula

$$
\operatorname{Mor}_{P S h(\mathcal{C})}\left(u^{p} \mathcal{G}, \mathcal{F}\right)=\operatorname{Mor}_{P S h(\mathcal{D})}\left(\mathcal{G},{ }_{p} u \mathcal{F}\right)
$$

holds bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
Proof. This is proved in exactly the same way as the proof of Lemma 7.5.4. We note that the map $u^{p}{ }_{p} u \mathcal{F} \rightarrow \mathcal{F}$ from Lemma 7.18 .1 is the map that is used to go from the right to the left.

Alternately, think of a presheaf of sets $\mathcal{F}$ on $\mathcal{C}$ as a presheaf $\mathcal{F}^{\prime}$ on $\mathcal{C}^{\text {opp }}$ with values in Sets ${ }^{o p p}$, and similarly on $\mathcal{D}$. Check that $\left({ }_{p} u \mathcal{F}\right)^{\prime}=u_{p}\left(\mathcal{F}^{\prime}\right)$, and that $\left(u^{p} \mathcal{G}\right)^{\prime}=u^{p}\left(\mathcal{G}^{\prime}\right)$. By Remark 7.5.5 we have the adjointness of $u_{p}$ and $u^{p}$ for presheaves with values in Sets ${ }^{\text {opp }}$. The result then follows formally from this.

Thus given a functor $u: \mathcal{C} \rightarrow \mathcal{D}$ of categories we obtain a sequence of functors

$$
u_{p}, u^{p},{ }_{p} u
$$

between categories of presheaves where in each consequtive pair the first is left adjoint to the second.

09VQ Lemma 7.18.3. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ and $v: \mathcal{D} \rightarrow \mathcal{C}$ be functors of categories. Assume that $v$ is right adjoint to $u$. Then we have
(1) $u^{p} h_{V}=h_{v(V)}$ for any $V$ in $\mathcal{D}$,
(2) the category $\mathcal{I}_{U}^{v}$ has an initial object,
(3) the category ${ }_{V}^{u} \mathcal{I}$ has a final object,
(4) ${ }_{p} u=v^{p}$, and
(5) $u^{p}=v_{p}$.

Proof. Proof of (1). Let $V$ be an object of $\mathcal{D}$. We have $u^{p} h_{V}=h_{v(V)}$ because $u^{p} h_{V}(U)=\operatorname{Mor}_{\mathcal{D}}(u(U), V)=\operatorname{Mor}_{\mathcal{C}}(U, v(V))$ by assumption.

Proof of (2). Let $U$ be an object of $\mathcal{C}$. Let $\eta: U \rightarrow v(u(U))$ be the map adjoint to the map id : $u(U) \rightarrow u(U)$. Then we claim $(u(U), \eta)$ is an initial object of $\mathcal{I}_{U}^{v}$. Namely, given an object $(V, \phi: U \rightarrow v(V))$ of $\mathcal{I}_{U}^{v}$ the morphism $\phi$ is adjoint to a map $\psi: u(U) \rightarrow V$ which then defines a morphism $(u(U), \eta) \rightarrow(V, \phi)$.

Proof of (3). Let $V$ be an object of $\mathcal{D}$. Let $\xi: u(v(V)) \rightarrow V$ be the map adjoint to the map id : $v(V) \rightarrow v(V)$. Then we calim $(v(V), \xi)$ is a final object of ${ }_{V}^{u} \mathcal{I}$. Namely, given an object $(U, \psi: u(U) \rightarrow V)$ of ${ }_{V}^{u} \mathcal{I}$ the morphism $\psi$ is adjoint to a $\operatorname{map} \phi: U \rightarrow v(V)$ which then defines a morphism $(U, \psi) \rightarrow(v(V), \xi)$.

Hence for any presheaf $\mathcal{F}$ on $\mathcal{C}$ we have

$$
\begin{aligned}
v^{p} \mathcal{F}(V) & =\mathcal{F}(v(V)) \\
& =\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{v(V)}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{C})}\left(u^{p} h_{V}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{D})}\left(h_{V},{ }_{p} u \mathcal{F}\right) \\
& ={ }_{p} u \mathcal{F}(V)
\end{aligned}
$$

which proves part (2). Part (3) follows by the uniqueness of adjoint functors.
09VR Lemma 7.18.4. A continuous functor of sites which has a continuous left adjoint defines a morphism of sites.

Proof. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor of sites. Let $w: \mathcal{D} \rightarrow \mathcal{C}$ be a continuous left adjoint. Then $u_{p}=w^{p}$ by Lemma 7.18.3. Hence $u_{s}=w^{s}$ has a left adjoint, namely $w_{s}$ (Lemma 7.14.3). Thus $u_{s}$ has both a right and a left adjoint, whence is exact (Categories, Lemma 4.24.5).

### 7.19. Cocontinuous functors

00XI There is another way to construct morphisms of topoi. This involves using cocontinuous functors between sites defined as follows.
00XJ Definition 7.19.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. The functor $u$ is called cocontinuous if for every $U \in \operatorname{Ob}(\mathcal{C})$ and every covering $\left\{V_{j} \rightarrow\right.$ $u(U)\}_{j \in J}$ of $\mathcal{D}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ such that the family of maps $\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}_{i \in I}$ refines the covering $\left\{V_{j} \rightarrow u(U)\right\}_{j \in J}$.
Note that $\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}_{i \in I}$ is in general not a covering of the site $\mathcal{D}$.
00XK Lemma 7.19.2. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be cocontinuous. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Then ${ }_{p} u \mathcal{F}$ is a sheaf on $\mathcal{D}$, which we will denote ${ }_{s} u \mathcal{F}$.

Proof. Let $\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be a covering of the site $\mathcal{D}$. We have to show that

$$
{ }_{p} u \mathcal{F}(V) \longrightarrow \prod_{p} u \mathcal{F}\left(V_{j}\right) \longrightarrow \prod_{p} u \mathcal{F}\left(V_{j} \times_{V} V_{j^{\prime}}\right)
$$

is an equalizer diagram. Since ${ }_{p} u$ is right adjoint to $u^{p}$ we have

$$
{ }_{p} u \mathcal{F}(V)=\operatorname{Mor}_{P S h(\mathcal{D})}\left(h_{V},{ }_{p} u \mathcal{F}\right)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(u^{p} h_{V}, \mathcal{F}\right)=\operatorname{Mor}_{S h(\mathcal{C})}\left(\left(u^{p} h_{V}\right)^{\#}, \mathcal{F}\right)
$$

Hence it suffices to show that
07 GF

$$
\begin{equation*}
\amalg u^{p} h_{V_{j} \times_{V} V_{j^{\prime}}} \longrightarrow \amalg u^{p} h_{V_{j}} \longrightarrow u^{p} h_{V} \tag{7.19.2.1}
\end{equation*}
$$

becomes a coequalizer diagram after sheafification. (Recall that a coproduct in the category of sheaves is the sheafification of the coproduct in the category of presheaves, see Lemma 7.10.13.)
We first show that the second arrow of 7 7.19.2.1 becomes surjective after sheafification. To do this we use Lemma 7.12.2, Thus it suffices to show a section $s$ of $u^{p} h_{V}$ over $U$ lifts to a section of $\amalg u^{p} h_{V_{j}}$ on the members of a covering of $U$. Note that $s$ is a morphism $s: u(U) \rightarrow V$. Then $\left\{V_{j} \times_{V, s} u(U) \rightarrow u(U)\right\}$ is a covering of $\mathcal{D}$. Hence, as $u$ is cocontinuous, there is a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}$ refines $\left\{V_{j} \times_{V, s} u(U) \rightarrow u(U)\right\}$. This means that each restriction $\left.s\right|_{U_{i}}: u\left(U_{i}\right) \rightarrow V$ factors through a morphism $s_{i}: u\left(U_{i}\right) \rightarrow V_{j}$ for some $j$, i.e., $\left.s\right|_{U_{i}}$ is in the image of $u^{p} h_{V_{j}}\left(U_{i}\right) \rightarrow u^{p} h_{V}\left(U_{i}\right)$ as desired.

Let $s, s^{\prime} \in\left(\coprod u^{p} h_{V_{j}}\right)^{\#}(U)$ map to the same element of $\left(u^{p} h_{V}\right)^{\#}(U)$. To finish the proof of the lemma we show that after replacing $U$ by the members of a covering that $s, s^{\prime}$ are the image of the same section of $\amalg u^{p} h_{V_{j} \times{ }_{V} V_{j^{\prime}}}$ by the two maps of 7.19.2.1. We may first replace $U$ by the members of a covering and assume that $s \in u^{p} h_{V_{j}}(U)$ and $s^{\prime} \in u^{p} h_{V_{j^{\prime}}}(U)$. A second such replacement guarantees that $s$ and $s^{\prime}$ have the same image in $u^{p} h_{V}(U)$ instead of in the sheafification. Hence $s: u(U) \rightarrow V_{j}$ and $s^{\prime}: u(U) \rightarrow V_{j^{\prime}}$ are morphisms of $\mathcal{D}$ such that

is commutative. Thus we obtain $t=\left(s, s^{\prime}\right): u(U) \rightarrow V_{j} \times_{V} V_{j^{\prime}}$, i.e., a section $t \in u^{p} h_{V_{j} \times_{V} V_{j^{\prime}}}(U)$ which maps to $s, s^{\prime}$ as desired.

00XL Lemma 7.19.3. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be cocontinuous. The functor $\operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C}), \mathcal{G} \mapsto\left(u^{p} \mathcal{G}\right)^{\#}$ is a left adjoint to the functor ${ }_{s} u$ introduced in Lemma 7.19.2 above. Moreover, it is exact.

Proof. Let us prove the adjointness property as follows

$$
\begin{aligned}
\operatorname{Mor}_{S h(\mathcal{C})}\left(\left(u^{p} \mathcal{G}\right)^{\#}, \mathcal{F}\right) & =\operatorname{Mor}_{P S h(\mathcal{C})}\left(u^{p} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{D})}\left(\mathcal{G},{ }_{p} u \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{D})}\left(\mathcal{G},{ }_{s} u \mathcal{F}\right)
\end{aligned}
$$

Thus it is a left adjoint and hence right exact, see Categories, Lemma 4.24 .5 . We have seen that sheafification is left exact, see Lemma 7.10.14. Moreover, the inclusion $i: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{PSh}(\mathcal{D})$ is left exact by Lemma 7.10.1. Finally, the functor $u^{p}$ is left exact because it is a right adjoint (namely to $u_{p}$ ). Thus the functor is the composition \# $\circ u^{p} \circ i$ of left exact functors, hence left exact.

We finish this section with a technical lemma.
00XM Lemma 7.19.4. In the situation of Lemma 7.19.3. For any presheaf $\mathcal{G}$ on $\mathcal{D}$ we have $\left(u^{p} \mathcal{G}\right)^{\#}=\left(u^{p}\left(\mathcal{G}^{\#}\right)\right)^{\#}$.

Proof. For any sheaf $\mathcal{F}$ on $\mathcal{C}$ we have

$$
\begin{aligned}
\operatorname{Mor}_{S h(\mathcal{C})}\left(\left(u^{p}\left(\mathcal{G}^{\#}\right)\right)^{\#}, \mathcal{F}\right) & =\operatorname{Mor}_{S h(\mathcal{D})}\left(\mathcal{G}^{\#},{ }_{s} u \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{D})}\left(\mathcal{G}^{\#},{ }_{p} u \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{D})}\left(\mathcal{G},{ }_{p} u \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{C})}\left(u^{p} \mathcal{G}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(\left(u^{p} \mathcal{G}\right)^{\#}, \mathcal{F}\right)
\end{aligned}
$$

and the result follows from the Yoneda lemma.
09W7 Remark 7.19.5. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Given morphisms $g: u(U) \rightarrow V$ and $f: W \rightarrow V$ in $\mathcal{D}$ we can define consider the functor

$$
\mathcal{C}^{o p p} \longrightarrow \text { Sets, } \quad T \longmapsto \operatorname{Mor}_{\mathcal{C}}(T, U) \times_{\operatorname{Mor}_{\mathcal{D}}(u(T), V)} \operatorname{Mor}_{\mathcal{D}}(u(T), W)
$$

If this functor is representable, denote $U \times_{g, V, f} W$ the corresponding object of $\mathcal{C}$. Assume that $\mathcal{C}$ and $\mathcal{D}$ are sites. Consider the property $P$ : for every covering $\left\{f_{j}: V_{j} \rightarrow V\right\}$ of $\mathcal{D}$ and any morphism $g: u(U) \rightarrow V$ we have
(1) $U \times_{g, V, f_{i}} V_{i}$ exists for all $i$, and
(2) $\left\{U \times_{g, V, f_{i}} V_{i} \rightarrow U\right\}$ is a covering of $\mathcal{C}$.

Please note the similarity with the definition of continuous functors. If $u$ has $P$ then $u$ is cocontinuous (details omitted). Many of the cocontinuous functors we will encounter satisfy $P$.

### 7.20. Cocontinuous functors and morphisms of topoi

00 XN It is clear from the above that a cocontinuous functor $u$ gives a morphism of topoi in the same direction as $u$. Thus this is in the opposite direction from the morphism of topoi associated (under certain conditions) to a continuous $u$ as in Definition 7.15.1, Proposition 7.15.6, and Lemma 7.16.2.

00 XO Lemma 7.20.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be cocontinuous. The functors $g_{*}={ }_{s} u$ and $g^{-1}=\left(u^{p}\right)^{\#}$ define a morphism of topoi $g$ from $\operatorname{Sh}(\mathcal{C})$ to $\operatorname{Sh}(\mathcal{D})$.
Proof. This is exactly the content of Lemma 7.19.3.
03L5 Lemma 7.20.2. Let $u: \mathcal{C} \rightarrow \mathcal{D}$, and $v: \mathcal{D} \rightarrow \mathcal{E}$ be cocontinuous functors. Then $v \circ u$ is cocontinuous and we have $h=g \circ f$ where $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$, resp. $g: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{E})$, resp. $h: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{E})$ is the morphism of topoi associated to $u$, resp. $v$, resp. $v \circ u$.

Proof. Let $U \in \operatorname{Ob}(\mathcal{C})$. Let $\left\{E_{i} \rightarrow v(u(U))\right\}$ be a covering of $U$ in $\mathcal{E}$. By assumption there exists a covering $\left\{D_{j} \rightarrow u(U)\right\}$ in $\mathcal{D}$ such that $\left\{v\left(D_{j}\right) \rightarrow v(u(U))\right\}$ refines $\left\{E_{i} \rightarrow v(u(U))\right\}$. Also by assumption there exists a covering $\left\{C_{l} \rightarrow U\right\}$ in $\mathcal{C}$ such that $\left\{u\left(C_{l}\right) \rightarrow u(U)\right\}$ refines $\left\{D_{j} \rightarrow u(U)\right\}$. Then it is true that $\left\{v\left(u\left(C_{l}\right)\right) \rightarrow v(u(U))\right\}$ refines the covering $\left\{E_{i} \rightarrow v(u(U))\right\}$. This proves that $v \circ u$ is cocontinuous. To prove the last assertion it suffices to show that ${ }_{s} v \circ{ }_{s} u={ }_{s}(v \circ u)$. It suffices to prove that ${ }_{p} v \circ_{p} u={ }_{p}(v \circ u)$, see Lemma 7.19.2. Since ${ }_{p} u$, resp. ${ }_{p} v$, resp. $p(v \circ u)$ is right adjoint to $u^{p}$, resp. $v^{p}$, resp. $(v \circ u)^{p}$ it suffices to prove that $u^{p} \circ v^{p}=(v \circ u)^{p}$. And this is direct from the definitions.

00XP Example 7.20.3. Let $X$ be a topological space. Let $j: U \rightarrow X$ be the inclusion of an open subspace. Recall that we have sites $X_{Z a r}$ and $U_{Z a r}$, see Example 7.6.4. Recall that we have the functor $u: X_{Z a r} \rightarrow U_{Z a r}$ associated to $j$ which is continuous and gives rise to a morphism of sites $U_{Z a r} \rightarrow X_{Z a r}$, see Example 7.15.2. This also gives a morphism of topoi $\left(j_{*}, j^{-1}\right)$. Next, consider the functor $v: U_{Z a r} \rightarrow X_{Z a r}$, $V \mapsto v(V)=V$ (just the same open but now thought of as an object of $X_{Z a r}$ ). This functor is cocontinuous. Namely, if $v(V)=\bigcup_{j \in J} W_{j}$ is an open covering in $X$, then each $W_{j}$ must be a subset of $U$ and hence is of the form $v\left(V_{j}\right)$, and trivially $V=\bigcup_{j \in J} V_{j}$ is an open covering in $U$. We conclude by Lemma 7.20.1 above that there is a morphism of topoi associated to $v$

$$
\operatorname{Sh}(U) \longrightarrow \operatorname{Sh}(X)
$$

given by ${ }_{s} v$ and $\left(v^{p}\right)^{\#}$. We claim that actually $\left(v^{p}\right)^{\#}=j^{-1}$ and that ${ }_{s} v=j_{*}$, in other words, that this is the same morphism of topoi as the one given above. Perhaps the easiest way to see this is to realize that for any sheaf $\mathcal{G}$ on $X$ we have
$v^{p} \mathcal{G}(V)=\mathcal{G}(V)$ which according to Sheaves, Lemma 6.31.1 is a description of $j^{-1} \mathcal{G}$ (and hence sheafification is superfluous in this case). The equality of ${ }_{s} v$ and $j_{*}$ follows by uniqueness of adjoint functors (but may also be computed directly).
00XQ Example 7.20.4. This example is a slight generalization of Example 7.20.3. Let $f: X \rightarrow Y$ be a continuous map of topological spaces. Assume that $f$ is open. Recall that we have sites $X_{Z a r}$ and $Y_{Z a r}$, see Example 7.6.4. Recall that we have the functor $u: Y_{Z a r} \rightarrow X_{Z a r}$ associated to $f$ which is continuous and gives rise to a morphism of sites $X_{Z a r} \rightarrow Y_{Z a r}$, see Example 7.15.2. This also gives a morphism of topoi $\left(f_{*}, f^{-1}\right)$. Next, consider the functor $v: X_{Z a r} \rightarrow Y_{Z a r}, U \mapsto v(U)=f(U)$. This functor is cocontinuous. Namely, if $f(U)=\bigcup_{j \in J} V_{j}$ is an open covering in $Y$, then setting $U_{j}=f^{-1}\left(V_{j}\right) \cap U$ we get an open covering $U=\bigcup U_{j}$ such that $f(U)=\bigcup f\left(U_{j}\right)$ is a refinement of $f(U)=\bigcup V_{j}$. We conclude by Lemma 7.20.1 above that there is a morphism of topoi associated to $v$

$$
\operatorname{Sh}(X) \longrightarrow \operatorname{Sh}(Y)
$$

given by ${ }_{s} v$ and $\left(v^{p}\right)^{\#}$. We claim that actually $\left(v^{p}\right)^{\#}=f^{-1}$ and that ${ }_{s} v=f_{*}$, in other words, that this is the same morphism of topoi as the one given above. For any sheaf $\mathcal{G}$ on $Y$ we have $v^{p} \mathcal{G}(U)=\mathcal{G}(f(U))$. On the other hand, we may compute $u_{p} \mathcal{G}(U)=\operatorname{colim}_{f(U) \subset V} \mathcal{G}(V)=\mathcal{G}(f(U))$ because clearly $\left(f(U), U \subset f^{-1}(f(U))\right)$ is an initial object of the category $\mathcal{I}_{U}^{u}$ of Section 7.5. Hence $u_{p}=v^{p}$ and we conclude $f^{-1}=u_{s}=\left(v^{p}\right)^{\#}$. The equality of ${ }_{s} v$ and $f_{*}$ follows by uniqueness of adjoint functors (but may also be computed directly).

In the first Example 7.20 .3 the functor $v$ is also continuous. But in the second Example 7.20 .4 it is generally not continuous because condition (2) of Definition 7.14.1 may fail. Hence the following lemma applies to the first example, but not to the second.

00XR Lemma 7.20.5. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(a) $u$ is cocontinuous, and
(b) $u$ is continuous.

Let $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be the associated morphism of topoi. Then
(1) sheafification in the formula $g^{-1}=\left(u^{p}\right)^{\#}$ is unnecessary, in other words $g^{-1}(\mathcal{G})(U)=\mathcal{G}(u(U))$,
(2) $g^{-1}$ has a left adjoint $g_{!}=\left(u_{p}\right)^{\#}$, and
(3) $g^{-1}$ commutes with arbitrary limits and colimits.

Proof. By Lemma 7.14 .2 for any sheaf $\mathcal{G}$ on $\mathcal{D}$ the presheaf $u^{p} \mathcal{G}$ is a sheaf on $\mathcal{C}$. And then we see the adjointness by the following string of equalities

$$
\begin{aligned}
\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}, g^{-1} \mathcal{G}\right) & =\operatorname{Mor}_{P S h(\mathcal{C})}\left(\mathcal{F}, u^{p} \mathcal{G}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{D})}\left(u_{p} \mathcal{F}, \mathcal{G}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{D})}\left(g_{!} \mathcal{F}, \mathcal{G}\right)
\end{aligned}
$$

The statement on limits and colimits follows from the discussion in Categories, Section 4.24

In the situation of Lemma 7.20 .5 above we see that we have a sequence of adjoint functors

$$
g_{!}, g^{-1}, g_{*}
$$

The functor $g_{!}$is not exact in general, because it does not transform a final object of $\operatorname{Sh}(\mathcal{C})$ into a final object of $S h(\mathcal{D})$ in general. See Sheaves, Remark 6.31.13. On the other hand, in the topological setting of Example 7.20 .3 the functor $j_{!}$is exact on abelian sheaves, see Modules, Lemma 17.3.4 The following lemma gives the generalization to the case of sites.

00XS Lemma 7.20.6. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(a) $u$ is cocontinuous,
(b) $u$ is continuous, and
(c) fibre products and equalizers exist in $\mathcal{C}$ and $u$ commutes with them.

In this case the functor $g$ ! above commutes with fibre products and equalizers (and more generally with finite connected limits).
Proof. Assume (a), (b), and (c). We have $g_{!}=\left(u_{p}\right)^{\#}$. Recall (Lemma 7.10.1) that limits of sheaves are equal to the corresponding limits as presheaves. And sheafification commutes with finite limits (Lemma 7.10.14). Thus it suffices to show that $u_{p}$ commutes with fibre products and equalizers. To do this it suffices that colimits over the categories $\left(\mathcal{I}_{V}^{u}\right)^{\text {opp }}$ of Section 7.5 commute with fibre products and equalizers. This follows from Lemma 7.5.1 and Categories, Lemma 4.19.8.

The following lemma deals with a case that is even more like the morphism associated to an open immersion of topological spaces.

00XT Lemma 7.20.7. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(a) $u$ is cocontinuous,
(b) $u$ is continuous, and
(c) $u$ is fully faithful.

For $g!, g^{-1}, g_{*}$ as above the canonical maps $\mathcal{F} \rightarrow g^{-1} g_{!} \mathcal{F}$ and $g^{-1} g_{*} \mathcal{F} \rightarrow \mathcal{F}$ are isomorphisms for all sheaves $\mathcal{F}$ on $\mathcal{C}$.

Proof. Let $X$ be an object of $\mathcal{C}$. In Lemmas 7.19 .2 and 7.20 .5 we have seen that sheafification is not necessary for the functors $g^{-1}=\left(u^{p}\right)^{\#}$ and $g_{*}=\left({ }_{p} u\right)^{\#}$. We may compute $\left(g^{-1} g_{*} \mathcal{F}\right)(X)=g_{*} \mathcal{F}(u(X))=\lim \mathcal{F}(Y)$. Here the limit is over the category of pairs $(Y, u(Y) \rightarrow u(X))$ where the morphisms $u(Y) \rightarrow u(X)$ are not required to be of the form $u(\alpha)$ with $\alpha$ a morphism of $\mathcal{C}$. By assumption (c) we see that they automatically come from morphisms of $\mathcal{C}$ and we deduce that the limit is the value on $\left(X, u\left(\mathrm{id}_{X}\right)\right)$, i.e., $\mathcal{F}(X)$. This proves that $g^{-1} g_{*} \mathcal{F}=\mathcal{F}$.
On the other hand, $\left(g^{-1} g!\mathcal{F}\right)(X)=g_{!} \mathcal{F}(u(X))=\left(u_{p} \mathcal{F}\right)^{\#}(u(X))$, and $u_{p} \mathcal{F}(u(X))=$ $\operatorname{colim} \mathcal{F}(Y)$. Here the colimit is over the category of pairs $(Y, u(X) \rightarrow u(Y))$ where the morphisms $u(X) \rightarrow u(Y)$ are not required to be of the form $u(\alpha)$ with $\alpha$ a morphism of $\mathcal{C}$. By assumption (c) we see that they automatically come from morphisms of $\mathcal{C}$ and we deduce that the colimit is the value on $\left(X, u\left(\mathrm{id}_{X}\right)\right)$, i.e., $\mathcal{F}(X)$. Thus for every $X \in \operatorname{Ob}(\mathcal{C})$ we have $u_{p} \mathcal{F}(u(X))=\mathcal{F}(X)$. Since $u$ is cocontinuous and continuous any covering of $u(X)$ in $\mathcal{D}$ can be refined by a covering (!) $\left\{u\left(X_{i}\right) \rightarrow u(X)\right\}$ of $\mathcal{D}$ where $\left\{X_{i} \rightarrow X\right\}$ is a covering in $\mathcal{C}$. This implies that $\left(u_{p} \mathcal{F}\right)^{+}(u(X))=\mathcal{F}(X)$ also, since in the colimit defining the value of $\left(u_{p} \mathcal{F}\right)^{+}$on $u(X)$ we may restrict to the cofinal system of coverings $\left\{u\left(X_{i}\right) \rightarrow u(X)\right\}$ as above. Hence we see that $\left(u_{p} \mathcal{F}\right)^{+}(u(X))=\mathcal{F}(X)$ for all objects $X$ of $\mathcal{C}$ as well. Repeating this argument one more time gives the equality $\left(u_{p} \mathcal{F}\right)^{\#}(u(X))=\mathcal{F}(X)$ for all objects $X$ of $\mathcal{C}$. This produces the desired equality $g^{-1} g!\mathcal{F}=\mathcal{F}$.

Finally, here is a case that does not have any corresponding topological example. We will use this lemma to see what happens when we enlarge a "partial universe" of schemes keeping the same topology. In the situation of the lemma, the morphism of topoi $g: S h(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ identifies $S h(\mathcal{C})$ as a subtopos of $S h(\mathcal{D})$ (Section 7.42 ) and moreover, the given embedding has a retraction.

00XU Lemma 7.20.8. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(a) $u$ is cocontinuous,
(b) $u$ is continuous,
(c) $u$ is fully faithful,
(d) fibre products exist in $\mathcal{C}$ and $u$ commutes with them, and
(e) there exist final objects $e_{\mathcal{C}} \in \operatorname{Ob}(\mathcal{C})$, $e_{\mathcal{D}} \in \operatorname{Ob}(\mathcal{D})$ such that $u\left(e_{\mathcal{C}}\right)=e_{\mathcal{D}}$.

Let $g_{!}, g^{-1}, g_{*}$ be as above. Then, $u$ defines a morphism of sites $f: \mathcal{D} \rightarrow \mathcal{C}$ with $f_{*}=g^{-1}, f^{-1}=g_{!}$. The composition

$$
S h(\mathcal{C}) \xrightarrow{g} \operatorname{Sh}(\mathcal{D}) \xrightarrow{f} \operatorname{Sh}(\mathcal{C})
$$

is isomorphic to the identity morphism of the topos $\operatorname{Sh}(\mathcal{C})$. Moreover, the functor $f^{-1}$ is fully faithful.

Proof. By assumption the functor $u$ satisfies the hypotheses of Proposition 7.15.6. Hence $u$ defines a morphism of sites and hence a morphism of topoi $f$ as in Lemma 7.16.2. The formulas $f_{*}=g^{-1}$ and $f^{-1}=g$ ! are clear from the lemma cited and Lemma 7.20.5. We have $f_{*} \circ g_{*}=g^{-1} \circ g_{*} \cong \mathrm{id}$, and $g^{-1} \circ f^{-1}=g^{-1} \circ g_{!} \cong \mathrm{id}$ by Lemma 7.20.7

We still have to show that $f^{-1}$ is fully faithful. Let $\mathcal{F}, \mathcal{G} \in \operatorname{Ob}(\operatorname{Sh}(\mathcal{C}))$. We have to show that the map

$$
\operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{F}, \mathcal{G}) \longrightarrow \operatorname{Mor}_{S h(\mathcal{D})}\left(f^{-1} \mathcal{F}, f^{-1} \mathcal{G}\right)
$$

is bijective. But the right hand side is equal to

$$
\begin{aligned}
\operatorname{Mor}_{S h(\mathcal{D})}\left(f^{-1} \mathcal{F}, f^{-1} \mathcal{G}\right) & =\operatorname{Mor}_{S h(\mathcal{C})}\left(f_{*} f^{-1} \mathcal{F}, \mathcal{G}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(g^{-1} f^{-1} \mathcal{F}, \mathcal{G}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{F}, \mathcal{G})
\end{aligned}
$$

(the first equality by adjunction) which proves what we want.
00XV Example 7.20.9. Let $X$ be a topological space. Let $i: Z \rightarrow X$ be the inclusion of a subset (with induced topology). Consider the functor $u: X_{Z a r} \rightarrow Z_{Z a r}$, $U \mapsto u(U)=Z \cap U$. At first glance it may appear that this functor is cocontinuous as well. After all, since $Z$ has the induced topology, shouldn't any covering of $U \cap Z$ it come from a covering of $U$ in $X$ ? Not so! Namely, what if $U \cap Z=\emptyset$ ? In that case, the empty covering is a covering of $U \cap Z$, and the empty covering can only be refined by the empty covering. Thus we conclude that $u$ cocontinuous $\Rightarrow$ every nonempty open $U$ of $X$ has nonempty intersection with $Z$. But this is not sufficient. For example, if $X=\mathbf{R}$ the real number line with the usual topology, and $Z=\mathbf{R} \backslash\{0\}$, then there is an open covering of $Z$, namely $Z=\{x<0\} \cup \bigcup_{n}\{1 / n<x\}$ which cannot be refined by the restriction of any open covering of $X$.

### 7.21. Cocontinuous functors which have a right adjoint

00XW It may happen that a cocontinuous functor $u$ has a right adjoint $v$. In this case it is often the case that $v$ is continuous, and if so, then it defines a morphism of topoi (which is the same as the one defined by $u$ ).
00XX Lemma 7.21.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$, and $v: \mathcal{D} \rightarrow \mathcal{C}$ be functors. Assume that $u$ is cocontinuous, and that $v$ is a right adjoint to $u$. Let $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be the morphism of topoi associated to u, see Lemma 7.20.1. Then $g_{*} \mathcal{F}$ is equal to the presheaf $v^{p} \mathcal{F}$, in other words, $\left(g_{*} \mathcal{F}\right)(V)=\mathcal{F}(v(V))$.
Proof. We have $u^{p} h_{V}=h_{v(V)}$ by Lemma 7.18.3. By Lemma 7.19.4 this implies that $g^{-1}\left(h_{V}^{\#}\right)=\left(u^{p} h_{V}^{\#}\right)^{\#}=\left(u^{p} h_{V}\right)^{\#}=h_{v(V)}^{\#}$. Hence for any sheaf $\mathcal{F}$ on $\mathcal{C}$ we have

$$
\begin{aligned}
\left(g_{*} \mathcal{F}\right)(V) & =\operatorname{Mor}_{S h(\mathcal{D})}\left(h_{V}^{\#}, g_{*} \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(g^{-1}\left(h_{V}^{\#}\right), \mathcal{F}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{v(V)}^{\#}, \mathcal{F}\right) \\
& =\mathcal{F}(v(V))
\end{aligned}
$$

which proves the lemma.
In the situation of Lemma 7.21.1 we see that $v^{p}$ transforms sheaves into sheaves. Hence we can define $v^{s}=v^{p}$ restricted to sheaves. Just as in Lemma 7.14.3 we see that $v_{s}: \mathcal{G} \mapsto\left(v_{p} \mathcal{G}\right)^{\#}$ is a left adjoint to $v^{s}$. On the other hand, we have $v^{s}=g_{*}$ and $g^{-1}$ is a left adjoint of $g_{*}$ as well. We conclude that $g^{-1}=v_{s}$ is exact.
00XY Lemma 7.21.2. In the situation of Lemma 7.21.1. We have $g_{*}=v^{s}=v^{p}$ and $g^{-1}=v_{s}=\left(v_{p}\right)^{\#}$. If $v$ is continuous then $v$ defines a morphism of sites $f$ from $\mathcal{C}$ to $\mathcal{D}$ whose associated morphism of topoi is equal to the morphism $g$ associated to the cocontinuous functor $u$. In other words, a continuous functor which has a cocontinuous left adjoint defines a morphism of sites.

Proof. Clear from the discussion above the lemma and Definitions 7.15.1 and Lemma 7.16.2

### 7.22. Cocontinuous functors which have a left adjoint

08 NG It may happen that a cocontinuous functor $u$ has a left adjoint $w$.
08 NH Lemma 7.22.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be the morphism of topoi associated to a continuous and cocontinuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$, see Lemmas 7.20 .1 and 7.20.5.
(1) If $w: \mathcal{D} \rightarrow \mathcal{C}$ is a left adjoint to $u$, then
(a) $g_{!} \mathcal{F}$ is the sheaf associated to the presheaf $w^{p} \mathcal{F}$, and
(b) $g_{!}$is exact.
(2) if $w$ is a continuous left adjoint, then $g_{!}$has a left adjoint.
(3) If $w$ is a cocontinuous left adjoint, then $g_{!}=h^{-1}$ and $g^{-1}=h_{*}$ where $h: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ is the morphism of topoi associated to $w$.

Proof. Recall that $g_{!} \mathcal{F}$ is the sheafification of $u_{p} \mathcal{F}$. Hence (1)(a) follows from the fact that $u_{p}=w^{p}$ by Lemma 7.18.3.
To see (1)(b) note that $g_{\text {! }}$ commutes with all colimits as $g_{!}$is a left adjoint (Categories, Lemma 4.24.4. Let $i \mapsto \mathcal{F}_{i}$ be a finite diagram in $\operatorname{Sh}(\mathcal{C})$. Then $\lim \mathcal{F}_{i}$ is
computed in the category of presheaves (Lemma 7.10.1). Since $w^{p}$ is a right adjoint (Lemma 7.5.4) we see that $w^{p} \lim \mathcal{F}_{i}=\lim w^{p} \mathcal{F}_{i}$. Since sheafification is exact (Lemma 7.10.14) we conclude by (1)(a).
Assume $w$ is continuous. Then $g!=\left(w^{p}\right)^{\#}=w^{s}$ but sheafification isn't necessary and one has the left adjoint $w_{s}$, see Lemmas 7.14.2 and 7.14.3.

Assume $w$ is cocontinuous. The equality $g_{!}=h^{-1}$ follows from (1)(a) and the definitions. The equality $g^{-1}=h_{*}$ follows from the equality $g_{!}=h^{-1}$ and uniqueness of adjoint functor. Alternatively one can deduce it from Lemma 7.21.1.

### 7.23. Existence of lower shriek

09YW In this section we discuss some cases of morphisms of topoi $f$ for which $f^{-1}$ has a left adjoint $f_{!}$.

09YX Lemma 7.23.1. Let $\mathcal{C}, \mathcal{D}$ be two sites. Let $f: S h(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Let $E \subset \mathrm{Ob}(\mathcal{D})$ be a subset such that
(1) for $V \in E$ there exists a sheaf $\mathcal{G}$ on $\mathcal{C}$ such that $f^{-1} \mathcal{F}(V)=\operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{G}, \mathcal{F})$ functorially for $\mathcal{F}$ in $\operatorname{Sh}(\mathcal{C})$,
(2) every object of $\mathcal{D}$ has a covering by objects of $E$.

Then $f^{-1}$ has a left adjoint $f_{!}$.
Proof. By the Yoneda lemma (Categories, Lemma 4.3.5) the sheaf $\mathcal{G}_{V}$ corresponding to $V \in E$ is defined up to unique isomorphism by the formula $f^{-1} \mathcal{F}(V)=$ $\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{G}_{V}, \mathcal{F}\right)$. Recall that $f^{-1} \mathcal{F}(V)=\operatorname{Mor}_{S h(\mathcal{D})}\left(h_{V}^{\#}, f^{-1} \mathcal{F}\right)$. Denote $i_{V}: h_{V}^{\#} \rightarrow$ $f^{-1} \mathcal{G}_{V}$ the map corresponding to id in $\operatorname{Mor}\left(\mathcal{G}_{V}, \mathcal{G}_{V}\right)$. Functoriality in (1) implies that the bijection is given by

$$
\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{G}_{V}, \mathcal{F}\right) \rightarrow \operatorname{Mor}_{S h(\mathcal{D})}\left(h_{V}^{\#}, f^{-1} \mathcal{F}\right), \quad \varphi \mapsto f^{-1} \varphi \circ i_{V}
$$

For any $V_{1}, V_{2} \in E$ there is a canonical map

$$
\operatorname{Mor}_{S h(\mathcal{D})}\left(h_{V_{2}}^{\#}, h_{V_{1}}^{\#}\right) \rightarrow \operatorname{Hom}_{S h(\mathcal{C})}\left(\mathcal{G}_{V_{2}}, \mathcal{G}_{V_{1}}\right), \quad \varphi \mapsto f_{!}(\varphi)
$$

which is characterized by $f^{-1}\left(f_{!}(\varphi)\right) \circ i_{V_{2}}=i_{V_{1}} \circ \varphi$. Note that $\varphi \mapsto f_{!}(\varphi)$ is compatible with composition; this can be seen directly from the characterization. Hence $h_{V}^{\#} \mapsto \mathcal{G}_{V}$ and $\varphi \mapsto f!\varphi$ is a functor from the full subcategory of $\operatorname{Sh}(\mathcal{D})$ whose objects are the $h_{V}^{\#}$.
Let $J$ be a set and let $J \rightarrow E, j \mapsto V_{j}$ be a map. Then we have a functorial bijection

$$
\operatorname{Mor}_{S h(\mathcal{C})}\left(\coprod \mathcal{G}_{V_{j}}, \mathcal{F}\right) \longrightarrow \operatorname{Mor}_{S h(\mathcal{D})}\left(\coprod h_{V_{j}}^{\#}, f^{-1} \mathcal{F}\right)
$$

using the product of the bijections above. Hence we can extend the functor $f_{!}$to the full subcategory of $S h(\mathcal{D})$ whose objects are coproducts of $h_{V}^{\#}$ with $V \in E$.
Given an arbitrary sheaf $\mathcal{H}$ on $\mathcal{D}$ we choose an coequalizer diagram

$$
\mathcal{H}_{1} \longrightarrow \mathcal{H}_{0} \longrightarrow \mathcal{H}
$$

where $\mathcal{H}_{i}=\coprod h_{V_{i, j}}^{\#}$ is a coproduct with $V_{i, j} \in E$. This is possible by assumption (2), see Lemma 7.13 .5 (for those worried about set theoretical issues, note that the construction given in Lemma 7.13 .5 is canonical). Define $f_{!}(\mathcal{H})$ to be the sheaf on $\mathcal{C}$ which makes

$$
f_{!} \mathcal{H}_{1} \longrightarrow f_{!} \mathcal{H}_{0} \longrightarrow f_{!} \mathcal{H}
$$

Then

$$
\begin{aligned}
\operatorname{Mor}\left(f_{!} \mathcal{H}, \mathcal{F}\right) & =\operatorname{Equalizer}\left(\operatorname{Mor}\left(f_{!} \mathcal{H}_{0}, \mathcal{F}\right) \longrightarrow \operatorname{Mor}\left(f_{!} \mathcal{H}_{1}, \mathcal{F}\right)\right) \\
& =\operatorname{Equalizer}\left(\operatorname{Mor}\left(\mathcal{H}_{0}, f^{-1} \mathcal{F}\right) \longrightarrow \operatorname{Mor}\left(\mathcal{H}_{1}, f^{-1} \mathcal{F}\right)\right) \\
& =\operatorname{Hom}\left(\mathcal{H}, f^{-1} \mathcal{F}\right)
\end{aligned}
$$

Hence we see that we can extend $f_{!}$to the whole category of sheaves on $\mathcal{D}$.

### 7.24. Localization

00 XZ Let $\mathcal{C}$ be a site. Let $U \in \operatorname{Ob}(\mathcal{C})$. See Categories, Example 4.2.13 for the definition of the category $\mathcal{C} / U$ of objects over $U$. We turn $\mathcal{C} / U$ into a site by declaring a family of morphisms $\left\{V_{j} \rightarrow V\right\}$ of objects over $U$ to be a covering of $\mathcal{C} / U$ if and only if it is a covering in $\mathcal{C}$. Consider the forgetful functor

$$
j_{U}: \mathcal{C} / U \longrightarrow \mathcal{C}
$$

This is clearly cocontinuous and continuous. Hence by the results of the previous sections we obtain a morphism of topoi

$$
j_{U}: S h(\mathcal{C} / U) \longrightarrow S h(\mathcal{C})
$$

given by $j_{U}^{-1}$ and $j_{U *}$, as well as a functor $j_{U!}$.
00 Y 0 Definition 7.24.1. Let $\mathcal{C}$ be a site. Let $U \in \mathrm{Ob}(\mathcal{C})$.
(1) The site $\mathcal{C} / U$ is called the localization of the site $\mathcal{C}$ at the object $U$.
(2) The morphism of topoi $j_{U}: S h(\mathcal{C} / U) \rightarrow S h(\mathcal{C})$ is called the localization morphism.
(3) The functor $j_{U *}$ is called the direct image functor.
(4) For a sheaf $\mathcal{F}$ on $\mathcal{C}$ the sheaf $j_{U}^{-1} \mathcal{F}$ is called the restriction of $\mathcal{F}$ to $\mathcal{C} / U$.
(5) For a sheaf $\mathcal{G}$ on $\mathcal{C} / U$ the sheaf $j_{U!} \mathcal{G}$ is called the extension of $\mathcal{G}$ by the empty set.
The restriction $j_{U}^{-1} \mathcal{F}$ is the sheaf defined by the rule $j_{U}^{-1} \mathcal{F}(X / U)=\mathcal{F}(X)$ as expected. The extension by the empty set also has a very easy description in this case; here it is.

03CD Lemma 7.24.2. Let $\mathcal{C}$ be a site. Let $U \in \operatorname{Ob}(\mathcal{C})$. Let $\mathcal{G}$ be a presheaf on $\mathcal{C} / U$. Then $j_{U!}\left(\mathcal{G}^{\#}\right)$ is the sheaf associated to the presheaf

$$
V \longmapsto \coprod_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \stackrel{\varphi}{\longrightarrow} U)
$$

with obvious restriction mappings.
Proof. By Lemma 7.20.5 we have $j_{U!}\left(\mathcal{G}^{\#}\right)=\left(\left(j_{U}\right)_{p} \mathcal{G}^{\#}\right)^{\#}$. By Lemma 7.14.4 this is equal to $\left(\left(j_{U}\right)_{p} \mathcal{G}\right)^{\#}$. Hence it suffices to prove that $\left(j_{U}\right)_{p}$ is given by the formula above for any presheaf $\mathcal{G}$ on $\mathcal{C} / U$. OK, and by the definition in Section 7.5 we have

$$
\left(j_{U}\right)_{p} \mathcal{G}(V)=\operatorname{colim}_{(W / U, V \rightarrow W)} \mathcal{G}(W)
$$

Now it is clear that the category of pairs $(W / U, V \rightarrow W)$ has an object $O_{\varphi}=(\varphi$ : $V \rightarrow U$, id : $V \rightarrow V$ ) for every $\varphi: V \rightarrow U$, and moreover for any object there is a unique morphism from one of the $O_{\varphi}$ into it. The result follows.
03 HU Lemma 7.24.3. Let $\mathcal{C}$ be a site. Let $U \in \mathrm{Ob}(\mathcal{C})$. Let $X / U$ be an object of $\mathcal{C} / U$. Then we have $j_{U!}\left(h_{X / U}^{\#}\right)=h_{X}^{\#}$.

Proof. Denote $p: X \rightarrow U$ the structure morphism of $X$. By Lemma 7.24 .2 we see $j_{U!}\left(h_{X / U}^{\#}\right)$ is the sheaf associated to the presheaf

$$
V \longmapsto \coprod_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)}\{\psi: V \rightarrow X \mid p \circ \psi=\varphi\}
$$

This is clearly the same thing as $\operatorname{Mor}_{\mathcal{C}}(V, X)$. Hence the lemma follows.
We have $j_{U!}(*)=h_{U}^{\#}$ by either of the two lemmas above. Hence for every sheaf $\mathcal{G}$ over $\mathcal{C} / U$ there is a canonical map of sheaves $j_{U} \mathcal{G} \rightarrow h_{U}^{\#}$. This characterizes sheaves in the essential image of $j_{U!}$.
00Y1 Lemma 7.24.4. Let $\mathcal{C}$ be a site. Let $U \in \operatorname{Ob}(\mathcal{C})$. The functor $j_{U!}$ gives an equivalence of categories

$$
\operatorname{Sh}(\mathcal{C} / U) \longrightarrow \operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}
$$

Proof. We explain how to get a functor from $\operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}$ to $\operatorname{Sh}(\mathcal{C} / U)$. Suppose that $\varphi: \mathcal{F} \rightarrow h_{U}^{\#}$ is given. For any object $a: X \rightarrow U$ of $\mathcal{C} / U$ we consider the set $\mathcal{F}_{\varphi}(X \rightarrow U)$ of elements $s \in \mathcal{F}(X)$ which under $\varphi$ map to the image of $a \in \operatorname{Mor}_{\mathcal{C}}(X, U)=h_{U}(X)$ in $h_{U}^{\#}(X)$. It is easy to see that $(X \rightarrow U) \mapsto \mathcal{F}_{\varphi}(X \rightarrow U)$ is a sheaf on $\mathcal{C} / U$. The verification that $(\mathcal{F}, \varphi) \mapsto \mathcal{F}_{\varphi}$ is an inverse to the functor $j_{U!}$ is omitted.

The lemma says the functor $j_{U!}$ is the composition

$$
\operatorname{Sh}(\mathcal{C} / U) \rightarrow \operatorname{Sh}(\mathcal{C}) / h_{U}^{\#} \rightarrow \operatorname{Sh}(\mathcal{C})
$$

where the first arrow is an equivalence.
04BB Lemma 7.24.5. Let $\mathcal{C}$ be a site. Let $U \in \mathrm{Ob}(\mathcal{C})$. The functor $j_{U}$ ! commutes with with fibre products and equalizers (and more generally finite connected limits). In particular, if $\mathcal{F} \subset \mathcal{F}^{\prime}$ in $\operatorname{Sh}(\mathcal{C} / U)$, then $j_{U!} \mathcal{F} \subset j_{U!} \mathcal{F}^{\prime}$.

Proof. This follows from the fact that an isomorphism of categories commutes with all limits and the functor $S h(\mathcal{C}) / h_{U}^{\#} \rightarrow S h(\mathcal{C})$ commutes with fibre products and equalizers. Alternatively, one can prove this directly using the description of $j_{U!}$ in Lemma 7.24 .2 using that sheafification is exact. (Also, in case $\mathcal{C}$ has fibre products and equalizers, the result follows from Lemma 7.20.6.)

03EE Lemma 7.24.6. Let $\mathcal{C}$ be a site. Let $U \in \operatorname{Ob}(\mathcal{C})$. For any sheaf $\mathcal{F}$ on $\mathcal{C}$ we have $j_{U!} j_{U}^{-1} \mathcal{F}=\mathcal{F} \times h_{U}^{\#}$.
Proof. This is clear from the description of $j_{U!}$ in Lemma 7.24.2.
03 EH Lemma 7.24.7. Let $\mathcal{C}$ be a site. Let $f: V \rightarrow U$ be a morphism of $\mathcal{C}$. Then there exists a commutative diagram

of cocontinuous functors. Here $j: \mathcal{C} / V \rightarrow \mathcal{C} / U,(a: W \rightarrow V) \mapsto(f \circ a: W \rightarrow U)$ is identified with the functor $j_{V / U}:(\mathcal{C} / U) /(V / U) \rightarrow \mathcal{C} / U$ via the identification $(\mathcal{C} / U) /(V / U)=\mathcal{C} / V$. Moreover we have $j_{V!}=j_{U!} \circ j_{!}, j_{V}^{-1}=j^{-1} \circ j_{U}^{-1}$, and $j_{V *}=j_{U *} \circ j_{*}$.

Proof. The commutativity of the diagram is immediate. The agreement of $j$ with $j_{V / U}$ follows from the definitions. By Lemma 7.20 .2 we see that the following diagram of morphisms of topoi

04IK

is commutative. This proves that $j_{V}^{-1}=j^{-1} \circ j_{U}^{-1}$ and $j_{V *}=j_{U *} \circ j_{*}$. The equality $j_{V!}=j_{U!} \circ j_{!}$follows formally from adjointness properties.

04IL Lemma 7.24.8. Notation $\mathcal{C}, f: V \rightarrow U, j_{U}, j_{V}$, and $j$ as in Lemma 7.24.7. Via the identifications $\operatorname{Sh}(\mathcal{C} / V)=\operatorname{Sh}(\mathcal{C}) / h_{V}^{\#}$ and $\operatorname{Sh}(\mathcal{C} / U)=\operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}$ of Lemma 7.24.4 the functor $j^{-1}$ has the following description

$$
j^{-1}\left(\mathcal{H} \xrightarrow{\varphi} h_{U}^{\#}\right)=\left(\mathcal{H} \times_{\varphi, h_{U}^{\#}, f} h_{V}^{\#} \rightarrow h_{V}^{\#}\right) .
$$

Proof. Suppose that $\varphi: \mathcal{H} \rightarrow h_{U}^{\#}$ is an object of $\operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}$. By the proof of Lemma 7.24 .4 this corresponds to the sheaf $\mathcal{H}_{\varphi}$ on $\mathcal{C} / U$ defined by the rule

$$
(a: W \rightarrow U) \longmapsto\{s \in \mathcal{H}(W) \mid \varphi(s)=a\}
$$

on $\mathcal{C} / U$. The pullback $j^{-1} \mathcal{H}_{\varphi}$ to $\mathcal{C} / V$ is given by the rule

$$
(a: W \rightarrow V) \longmapsto\{s \in \mathcal{H}(W) \mid \varphi(s)=f \circ a\}
$$

by the description of $j^{-1}=j_{U / V}^{-1}$ as the restriction of $\mathcal{H}_{\varphi}$ to $\mathcal{C} / V$. On the other hand, applying the rule to the object

$$
\mathcal{H}^{\prime}=\mathcal{H} \times_{\varphi, h_{U}^{\#}, f} h_{V}^{\#} \longrightarrow h_{V}^{\#}
$$

of $S h(\mathcal{C}) / h_{V}^{\#}$ we get $\mathcal{H}_{\varphi^{\prime}}^{\prime}$ given by

$$
\begin{aligned}
(a: W \rightarrow V) \longmapsto & \left\{s^{\prime} \in \mathcal{H}^{\prime}(W) \mid \varphi^{\prime}\left(s^{\prime}\right)=a\right\} \\
& =\left\{\left(s, a^{\prime}\right) \in \mathcal{H}(W) \times h_{V}^{\#}(W) \mid a^{\prime}=a \text { and } \varphi(s)=f \circ a^{\prime}\right\}
\end{aligned}
$$

which is exactly the same rule as the one describing $j^{-1} \mathcal{H}_{\varphi}$ above.
0494 Remark 7.24.9. Localization and presheaves. Let $\mathcal{C}$ be a category. Let $U$ be an object of $\mathcal{C}$. Strictly speaking the functors $j_{U}^{-1}, j_{U *}$ and $j_{U}$ ! have not been defined for presheaves. But of course, we can think of a presheaf as a sheaf for the chaotic topology on $\mathcal{C}$ (see Example 7.6.6). Hence we also obtain a functor

$$
j_{U}^{-1}: \operatorname{PSh}(\mathcal{C}) \longrightarrow \operatorname{PSh}(\mathcal{C} / U)
$$

and functors

$$
j_{U *}, j_{U!}: P S h(\mathcal{C} / U) \longrightarrow \operatorname{PSh}(\mathcal{C})
$$

which are right, left adjoint to $j_{U}^{-1}$. By Lemma 7.24 .2 we see that $j_{U!} \mathcal{G}$ is the presheaf

$$
V \longmapsto \coprod_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)
$$

In addition the functor $j_{U!}$ commutes with fibre products and equalizers.

09W8 Remark 7.24.10. Let $\mathcal{C}$ be a site. Let $U \rightarrow V$ be a morphism of $\mathcal{C}$. The cocontinuous functors $\mathcal{C} / U \rightarrow \mathcal{C}$ and $j: \mathcal{C} / U \rightarrow \mathcal{C} / V$ (Lemma 7.24.7) satisfy property $P$ of Remark 7.19.5. For example, if we have objects $(X / U),(W / V)$, a morphism $g: j(X / U) \rightarrow(W / V)$, and a covering $\left\{f_{i}:\left(W_{i} / V\right) \rightarrow(W / V)\right\}$ then $\left(X \times_{W} W_{i} / U\right)$ is an avatar of $(X / U) \times{ }_{g,(W / V), f_{i}}\left(W_{i} / V\right)$ and the family $\left\{\left(X \times{ }_{W} W_{i} / U\right) \rightarrow(X / U)\right\}$ is a covering of $\mathcal{C} / U$.

### 7.25. Glueing sheaves

04TP This section is the analogue of Sheaves, Section 6.33
04 TQ Lemma 7.25.1. Let $\mathcal{C}$ be a site. Let $\left\{U_{i} \rightarrow U\right\}$ be a covering of $\mathcal{C}$. Let $\mathcal{F}, \mathcal{G}$ be sheaves on $\mathcal{C}$. Given a collection

$$
\varphi_{i}:\left.\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}} \longrightarrow \mathcal{G}\right|_{\mathcal{C} / U_{i}}
$$

of maps of sheaves such that for all $i, j \in I$ the maps $\varphi_{i}, \varphi_{j}$ restrict to the same map $\left.\left.\mathcal{F}\right|_{\mathcal{C} / U_{i} \times_{U} U_{j}} \rightarrow \mathcal{G}\right|_{\mathcal{C} / U_{i} \times_{U} U_{j}}$ then there exists a unique map of sheaves

$$
\varphi:\left.\left.\mathcal{F}\right|_{\mathcal{C} / U} \longrightarrow \mathcal{G}\right|_{\mathcal{C} / U}
$$

whose restriction to each $\mathcal{C} / U_{i}$ agrees with $\varphi_{i}$.
Proof. Omitted. Note that the restrictions are always those of Lemma 7.24.7.
The previous lemma implies that given two sheaves $\mathcal{F}, \mathcal{G}$ on a site $\mathcal{C}$ the rule

$$
U \longmapsto \operatorname{Mor}_{S h(\mathcal{C} / U)}\left(\left.\mathcal{F}\right|_{\mathcal{C} / U},\left.\mathcal{G}\right|_{\mathcal{C} / U}\right)
$$

defines a sheaf. This is a kind of internal hom sheaf. It is seldom used in the setting of sheaves of sets, and more usually in the setting of sheaves of modules, see Modules on Sites, Section 18.27 .

Let $\mathcal{C}$ be a site. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. For each $i \in I$ let $\mathcal{F}_{i}$ be a sheaf of sets on $\mathcal{C} / U_{i}$. For each pair $i, j \in I$, let

$$
\varphi_{i j}:\left.\left.\mathcal{F}_{i}\right|_{\mathcal{C} / U_{i} \times{ }_{U} U_{j}} \longrightarrow \mathcal{F}_{j}\right|_{\mathcal{C} / U_{i} \times{ }_{U} U_{j}}
$$

be an isomorphism of sheaves of sets. Assume in addition that for every triple of indices $i, j, k \in I$ the following diagram is commutative

We will call such a collection of data $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ a glueing data for sheaves of sets with respect to the covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$.

04TR Lemma 7.25.2. Let $\mathcal{C}$ be a site. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. Given any glueing data $\left(\mathcal{F}_{i}, \varphi_{i j}\right)$ for sheaves of sets with respect to the covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ there exists a sheaf of sets $\mathcal{F}$ on $\mathcal{C} / U$ together with isomorphisms

$$
\varphi_{i}:\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}} \rightarrow \mathcal{F}_{i}
$$

such that the diagrams

are commutative.
Proof. Let us describe how to construct the sheaf $\mathcal{F}$ on $\mathcal{C} / U$. Let $a: V \rightarrow U$ be an object of $\mathcal{C} / U$. Then

$$
\mathcal{F}(V / U)=\left\{\left(s_{i}\right)_{i \in I} \in \prod_{i \in I} \mathcal{F}_{i}\left(U_{i} \times_{U} V / U_{i}\right)\left|\varphi_{i j}\left(\left.s_{i}\right|_{U_{i} \times_{U} U_{j} \times_{U} V}\right)=s_{j}\right|_{U_{i} \times_{U} U_{j} \times_{U} V}\right\}
$$

We omit the construction of the restriction mappings. We omit the verification that this is a sheaf. We omit the construction of the isomorphisms $\varphi_{i}$, and we omit proving the commutativity of the diagrams of the lemma.

Let $\mathcal{C}$ be a site. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. Let $\mathcal{F}$ be a sheaf on $\mathcal{C} / U$. Associated to $\mathcal{F}$ we have its canonical glueing data given by the restrictions $\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}$ and the canonical isomorphisms

$$
\left.\left(\left.\mathcal{F}\right|_{\mathcal{C} / U_{i}}\right)\right|_{\mathcal{C} / U_{i} \times_{U} U_{j}}=\left.\left(\left.\mathcal{F}\right|_{\mathcal{C} / U_{j}}\right)\right|_{\mathcal{C} / U_{i} \times_{U} U_{j}}
$$

coming from the fact that the composition of the functors $\mathcal{C} / U_{i} \times_{U} U_{j} \rightarrow \mathcal{C} / U_{i} \rightarrow$ $\mathcal{C} / U$ and $\mathcal{C} / U_{i} \times_{U} U_{j} \rightarrow \mathcal{C} / U_{j} \rightarrow \mathcal{C} / U$ are equal.

04 TS Lemma 7.25.3. Let $\mathcal{C}$ be a site. Let $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of $\mathcal{C}$. The category $\operatorname{Sh}(\mathcal{C} / U)$ is equivalent to the category of glueing data via the functor that associates to $\mathcal{F}$ on $\mathcal{C} / U$ the canonical glueing data.
Proof. In Lemma 7.25.1 we saw that the functor is fully faithful, and in Lemma 7.25 .2 we proved that it is essentially surjective (by explicitly constructing a quasiinverse functor).

### 7.26. More localization

04IM In this section we prove a few lemmas on localization where we impose some additional hypotheses on the site on or the object we are localizing at.
03HT Lemma 7.26.1. Let $\mathcal{C}$ be a site. Let $U \in \mathrm{Ob}(\mathcal{C})$. If the topology on $\mathcal{C}$ is subcanonical, see Definition 7.13.2, and if $\mathcal{G}$ is a sheaf on $\mathcal{C} / U$, then

$$
j_{U!}(\mathcal{G})(V)=\coprod_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}(V \xrightarrow{\varphi} U)
$$

in other words sheafification is not necessary in Lemma 7.24.2.
Proof. Let $\mathcal{V}=\left\{V_{i} \rightarrow V\right\}_{i \in I}$ be a covering of $V$ in the site $\mathcal{C}$. We are going to check the sheaf condition for the presheaf $\mathcal{H}$ of Lemma 7.24 .2 directly. Let $\left(s_{i}, \varphi_{i}\right)_{i \in I} \in$ $\prod_{i} \mathcal{H}\left(V_{i}\right)$, This means $\varphi_{i}: V_{i} \rightarrow U$ is a morphism in $\mathcal{C}$, and $s_{i} \in \mathcal{G}\left(V_{i} \xrightarrow{\varphi_{i}} U\right)$. The restriction of the pair $\left(s_{i}, \varphi_{i}\right)$ to $V_{i} \times_{V} V_{j}$ is the pair $\left(\left.s_{i}\right|_{V_{i} \times_{V} V_{j} / U}, \operatorname{pr}_{1} \circ \varphi_{i}\right)$, and likewise the restriction of the pair $\left(s_{j}, \varphi_{j}\right)$ to $V_{i} \times_{V} V_{j}$ is the pair $\left(\left.s_{j}\right|_{V_{i} \times_{V} V_{j} / U}, \mathrm{pr}_{2} \circ\right.$ $\varphi_{j}$ ). Hence, if the family $\left(s_{i}, \varphi_{i}\right)$ lies in $\check{H}^{0}(\mathcal{V}, \mathcal{H})$, then we see that $\operatorname{pr}_{1} \circ \varphi_{i}=$ $\operatorname{pr}_{2} \circ \varphi_{j}$. The condition that the topology on $\mathcal{C}$ is weaker than the canonical topology then implies that there exists a unique morphism $\varphi: V \rightarrow U$ such that $\varphi_{i}$ is the
composition of $V_{i} \rightarrow V$ with $\varphi$. At this point the sheaf condition for $\mathcal{G}$ guarantees that the sections $s_{i}$ glue to a unique section $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$. Hence $(s, \varphi) \in \mathcal{H}(V)$ as desired.

03CE Lemma 7.26.2. Let $\mathcal{C}$ be a site. Let $U \in \mathrm{Ob}(\mathcal{C})$. Assume $\mathcal{C}$ has products of pairs of objects. Then
(1) the functor $j_{U}$ has a continuous right adjoint, namely the functor $v(X)=$ $X \times U / U$,
(2) the functor $v$ defines a morphism of sites $\mathcal{C} / U \rightarrow \mathcal{C}$ whose associated morphism of topoi equals $j_{U}: S h(\mathcal{C} / U) \rightarrow \operatorname{Sh}(\mathcal{C})$, and
(3) we have $j_{U *} \mathcal{F}(X)=\mathcal{F}(X \times U / U)$.

Proof. The functor $v$ being right adjoint to $j_{U}$ means that given $Y / U$ and $X$ we have

$$
\operatorname{Mor}_{\mathcal{C}}(Y, X)=\operatorname{Mor}_{\mathcal{C} / U}(Y / U, X \times U / U)
$$

which is clear. To check that $v$ is continuous let $\left\{X_{i} \rightarrow X\right\}$ be a covering of $\mathcal{C}$. By the third axiom of a site (Definition 7.6.2) we see that

$$
\left\{X_{i} \times_{X}(X \times U) \rightarrow X \times_{X}(X \times U)\right\}=\left\{X_{i} \times U \rightarrow X \times U\right\}
$$

is a covering of $\mathcal{C}$ also. Hence $v$ is continuous. The other statements of the lemma follow from Lemmas 7.21.1 and 7.21.2.

09W9 Lemma 7.26.3. Let $\mathcal{C}$ be a site. Let $U \rightarrow V$ be a morphism of $\mathcal{C}$. Assume $\mathcal{C}$ has fibre products. Let $j$ be as in Lemma 7.24.7. Then
(1) the functor $j: \mathcal{C} / U \rightarrow \mathcal{C} / V$ has a continuous right adjoint, namely the functor $v:(X / V) \mapsto\left(X \times_{V} U / U\right)$,
(2) the functor $v$ defines a morphism of sites $\mathcal{C} / U \rightarrow \mathcal{C} / V$ whose associated morphism of topoi equals $j$, and
(3) we have $j_{*} \mathcal{F}(X / U)=\mathcal{F}\left(X \times_{V} U / U\right)$.

Proof. Follows from Lemma 7.26 .2 since $j$ may be viewed as a localization functor by Lemma 7.24.7.

A fundamental property of an open immersion is that the restriction of the pushforward and the restriction of the extension by the empty set produces back the original sheaf. This is not always true for the functors associated to $j_{U}$ above. It is true when $U$ is a "subobject of the final object".
$00 Y 2$ Lemma 7.26.4. Let $\mathcal{C}$ be a site. Let $U \in \operatorname{Ob}(\mathcal{C})$. Assume that every $X$ in $\mathcal{C}$ has at most one morphism to $U$. Let $\mathcal{F}$ be a sheaf on $\mathcal{C} / U$. The canonical maps $\mathcal{F} \rightarrow j_{U}^{-1} j_{U!} \mathcal{F}$ and $j_{U}^{-1} j_{U *} \mathcal{F} \rightarrow \mathcal{F}$ are isomorphisms.

Proof. If $\mathcal{C}$ has fibre products, then this is a special case of Lemma 7.20.7. In general we have the following direct proof.
Let $X / U$ be an object over $U$. In Lemmas 7.19 .2 and 7.20 .5 we have seen that sheafification is not necessary for the functors $j_{U}^{-1}=\left(u^{p}\right)^{\#}$ and $j_{U *}=\left({ }_{p} u\right)^{\#}$. We may compute $\left(j_{U}^{-1} j_{U *} \mathcal{F}\right)(X / U)=j_{U *} \mathcal{F}(X)=\lim \mathcal{F}(Y / U)$. Here the limit is over the category of pairs $(Y / U, Y \rightarrow X)$ where the morphisms $Y \rightarrow X$ are not required to be over $U$. By our assumption however we see that they are automatically morphisms over $U$ and we deduce that the limit is the value on $\operatorname{id}_{X}$, i.e., $\mathcal{F}(X / U)$. This proves that $j_{U}^{-1} j_{U *} \mathcal{F}=\mathcal{F}$.

On the other hand, $\left(j_{U}^{-1} j_{U!} \mathcal{F}\right)(X / U)=j_{U!} \mathcal{F}(X)=\left(u_{p} \mathcal{F}\right)^{\#}(X)$, and $u_{p} \mathcal{F}(X)=$ colim $\mathcal{F}(Y / U)$. Here the colimit is over the category of pairs $(Y / U, X \rightarrow Y)$ where the morphisms $X \rightarrow Y$ are not required to be over $U$. By our assumption however we see that they are automatically morphisms over $U$ and we deduce that the colimit is the value on $\operatorname{id}_{X}$, i.e., $\mathcal{F}(X / U)$. This shows that the sheafification is not necessary (since any object over $X$ is automatically in a unique way an object over $U)$ and the result follows.

### 7.27. Localization and morphisms

04 I 8 The following lemma is important in order to understand relation between localization and morphisms of sites and topoi.

03CF Lemma 7.27.1. Let $f: \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites corresponding to the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \operatorname{Ob}(\mathcal{D})$ and set $U=u(V)$. Then the functor $u^{\prime}: \mathcal{D} / V \rightarrow \mathcal{C} / U, V^{\prime} / V \mapsto u\left(V^{\prime}\right) / U$ determines a morphism of sites $f^{\prime}:$ $\mathcal{C} / U \rightarrow \mathcal{D} / V$. The morphism $f^{\prime}$ fits into a commutative diagram of topoi

Using the identifications $\operatorname{Sh}(\mathcal{C} / U)=\operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}$ and $\operatorname{Sh}(\mathcal{D} / V)=\operatorname{Sh}(\mathcal{D}) / h_{V}^{\#}$ of Lemma 7.24.4 the functor $\left(f^{\prime}\right)^{-1}$ is described by the rule

$$
\left(f^{\prime}\right)^{-1}\left(\mathcal{H} \xrightarrow{\varphi} h_{V}^{\#}\right)=\left(f^{-1} \mathcal{H} \xrightarrow{f^{-1} \varphi} h_{U}^{\#}\right) .
$$

Finally, we have $f_{*}^{\prime} j_{U}^{-1}=j_{V}^{-1} f_{*}$.
Proof. It is clear that $u^{\prime}$ is continuous, and hence we get functors $f_{*}^{\prime}=\left(u^{\prime}\right)^{s}=\left(u^{\prime}\right)^{p}$ (see Sections 7.5 and 7.14) and an adjoint $\left(f^{\prime}\right)^{-1}=\left(u^{\prime}\right)_{s}=\left(\left(u^{\prime}\right)_{p}\right)^{\#}$. The assertion $f_{*}^{\prime} j_{U}^{-1}=j_{V}^{-1} f_{*}$ follows as

$$
\left(j_{V}^{-1} f_{*} \mathcal{F}\right)\left(V^{\prime} / V\right)=f_{*} \mathcal{F}\left(V^{\prime}\right)=\mathcal{F}\left(u\left(V^{\prime}\right)\right)=\left(j_{U}^{-1} \mathcal{F}\right)\left(u\left(V^{\prime}\right) / U\right)=\left(f_{*}^{\prime} j_{U}^{-1} \mathcal{F}\right)\left(V^{\prime} / V\right)
$$

which holds even for presheaves. What isn't clear a priori is that $\left(f^{\prime}\right)^{-1}$ is exact, that the diagram commutes, and that the description of $\left(f^{\prime}\right)^{-1}$ holds.

Let $\mathcal{H}$ be a sheaf on $\mathcal{D} / V$. Let us compute $j_{U!}\left(f^{\prime}\right)^{-1} \mathcal{H}$. We have

$$
\begin{aligned}
j_{U!}\left(f^{\prime}\right)^{-1} \mathcal{H}= & \left(\left(j_{U}\right)_{p}\left(u_{p}^{\prime} \mathcal{H}\right)^{\#}\right)^{\#} \\
= & \left(\left(j_{U}\right)_{p} u_{p}^{\prime} \mathcal{H}\right)^{\#} \\
= & \left(u_{p}\left(j_{V}\right)_{p} \mathcal{H}\right)^{\#} \\
& =f^{-1} j_{V!} \mathcal{H}
\end{aligned}
$$

The first equality by unwinding the definitions. The second equality by Lemma 7.14.4. The third equality because $u \circ j_{V}=j_{U} \circ u^{\prime}$. The fourth equality by Lemma 7.14.4 again. All of the equalities above are isomorphisms of functors, and hence we may interpret this as saying that the following diagram of categories and functors
is commutative

The middle arrow makes sense as $f^{-1} h_{V}^{\#}=\left(h_{u(V)}\right)^{\#}=h_{U}^{\#}$, see Lemma 7.14.5. In particular this proves the description of $\left(f^{\prime}\right)^{-1}$ given in the statement of the lemma. Since by Lemma 7.24 .4 the left horizontal arrows are equivalences and since $f^{-1}$ is exact by assumption we conclude that $\left(f^{\prime}\right)^{-1}=u_{s}^{\prime}$ is exact. Namely, because it is a left adjoint it is already right exact (Categories, Lemma 4.24.4). Hence we only need to show that it transforms a final object into a final object and commutes with fibre products (Categories, Lemma 4.23.2). Both are clear for the induced functor $f^{-1}: S h(\mathcal{D}) / h_{V}^{\#} \rightarrow S h(\mathcal{C}) / h_{U}^{\#}$. This proves that $f^{\prime}$ is a morphism of sites.
We still have to verify that $\left(f^{\prime}\right)^{-1} j_{V}^{-1}=j_{U}^{-1} f^{-1}$. To see this use the formula above and the description in Lemma 7.24.6. Namely, combined these give, for any sheaf $\mathcal{G}$ on $\mathcal{D}$, that

$$
j_{U!}\left(f^{\prime}\right)^{-1} j_{V}^{-1} \mathcal{G}=f^{-1} j_{V!} j_{V}^{-1} \mathcal{G}=f^{-1}\left(\mathcal{G} \times h_{V}^{\#}\right)=f^{-1} \mathcal{G} \times h_{U}^{\#}=j_{U!} j_{U}^{-1} f^{-1} \mathcal{G}
$$

Since the functor $j_{U!}$ induces an equivalence $S h(\mathcal{C} / U) \rightarrow S h(\mathcal{C}) / h_{U}^{\#}$ we conclude.
The following lemma is a special case of the more general Lemma 7.27.1 above.
03 EF Lemma 7.27.2. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{D} \rightarrow \mathcal{C}$ be a functor. Let $V \in \operatorname{Ob}(\mathcal{D})$. Set $U=u(V)$. Assume that
(1) $\mathcal{C}$ and $\mathcal{D}$ have all finite limits,
(2) $u$ is continuous, and
(3) u commutes with finite limits.

There exists a commutative diagram of morphisms of sites

where the right vertical arrow corresponds to $u$, the left vertical arrow corresponds to the functor $u^{\prime}: \mathcal{D} / V \rightarrow \mathcal{C} / U, V^{\prime} / V \mapsto u\left(V^{\prime}\right) / u(V)$ and the horizontal arrows correspond to the functors $\mathcal{C} \rightarrow \mathcal{C} / U, X \mapsto X \times U$ and $\mathcal{D} \rightarrow \mathcal{D} / V, Y \mapsto Y \times V$ as in Lemma 7.26.2. Moreover, the associated diagram of morphisms of topoi is equal to the diagram of Lemma 7.27.1. In particular we have $f_{*}^{\prime} j_{U}^{-1}=j_{V}^{-1} f_{*}$.

Proof. Note that $u$ satisfies the assumptions of Proposition 7.15 .6 and hence induces a morphism of sites $f: \mathcal{C} \rightarrow \mathcal{D}$ by that proposition. It is clear that $u$ induces a functor $u^{\prime}$ as indicated. It is clear that this functor also satisfies the assumptions of Proposition 7.15.6. Hence we get a morphism of sites $f^{\prime}: \mathcal{C} / U \rightarrow \mathcal{D} / V$. The diagram commutes by our definition of composition of morphisms of sites (see Definition 7.15.4) and because

$$
u(Y \times V)=u(Y) \times u(V)=u(Y) \times U
$$

which shows that the diagram of categories and functors opposite to the diagram of the lemma commutes.

At this point we can localize a site, we know how to relocalize, and we can localize a morphism of sites at an object of the site downstairs. If we combine these then we get the following kind of diagram.

04IN Lemma 7.27.3. Let $f: \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites corresponding to the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V \in \operatorname{Ob}(\mathcal{D}), U \in \operatorname{Ob}(\mathcal{C})$ and $c: U \rightarrow u(V) a$ morphism of $\mathcal{C}$. There exists a commutative diagram of topoi

We have $f_{c}=f^{\prime} \circ j_{U / u(V)}$ where $f^{\prime}: \operatorname{Sh}(\mathcal{C} / u(V)) \rightarrow \operatorname{Sh}(\mathcal{D} / V)$ is as in Lemma 7.27 .1 and $j_{U / u(V)}: S h(\mathcal{C} / U) \rightarrow S h(\mathcal{C} / u(V))$ is as in Lemma 7.24.7. Using the identifications $\operatorname{Sh}(\mathcal{C} / U)=\operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}$ and $\operatorname{Sh}(\mathcal{D} / V)=\operatorname{Sh}(\mathcal{D}) / h_{V}^{\#}$ of Lemma 7.24.4 the functor $\left(f_{c}\right)^{-1}$ is described by the rule

$$
\left(f_{c}\right)^{-1}\left(\mathcal{H} \xrightarrow{\varphi} h_{V}^{\#}\right)=\left(f^{-1} \mathcal{H} \times_{f^{-1} \varphi, h_{u(V)}^{\#}, c} h_{U}^{\#} \rightarrow h_{U}^{\#}\right) .
$$

Finally, given any morphisms $b: V^{\prime} \rightarrow V, a: U^{\prime} \rightarrow U$ and $c^{\prime}: U^{\prime} \rightarrow u\left(V^{\prime}\right)$ such that

commutes, then the diagram

commutes.
Proof. This lemma proves itself, and is more a collection of things we know at this stage of the development of theory. For example the commutativity of the first square follows from the commutativity of Diagram $\sqrt[7.24 .7 .1]{ }$ and the commutativity of the diagram in Lemma 7.27.1. The description of $f_{c}^{-1}$ follows on combining Lemma 7.24 .8 with Lemma 7.27.1. The commutativity of the last square then follows from the equality

$$
f^{-1} \mathcal{H} \times_{h_{u(V)}^{\#}, c}^{\#} h_{U}^{\#} \times_{h_{U}^{\#}} h_{U^{\prime}}^{\#}=f^{-1}\left(\mathcal{H} \times_{h_{V}^{\#}} h_{V^{\prime}}^{\#}\right) \times_{h_{u\left(V^{\prime}\right), c^{\prime}}^{\#}} h_{U^{\prime}}^{\#}
$$

which is formal using that $f^{-1} h_{V}^{\#}=h_{u(V)}^{\#}$ and $f^{-1} h_{V^{\prime}}^{\#}=h_{u\left(V^{\prime}\right)}^{\#}$, see Lemma 7.14.5.

In the following lemma we find another kind of functoriality of localization, in case the morphism of topoi comes from a cocontinuous functor. This is a kind of diagram which is different from the diagram in Lemma 7.27.1, and in particular, in general the equality $f_{*}^{\prime} j_{U}^{-1}=j_{V}^{-1} f_{*}$ seen in Lemma 7.27.1 does not hold in the situation of the following lemma.

03EG Lemma 7.27.4. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a cocontinuous functor. Let $U$ be an object of $\mathcal{C}$, and set $V=u(U)$. We have a commutative diagram

where the left vertical arrow is $u^{\prime}: \mathcal{C} / U \rightarrow \mathcal{D} / V, U^{\prime} / U \mapsto V^{\prime} / V$. Then $u^{\prime}$ is cocontinuous also and we get a commutative diagram of topoi

where $f$ (resp. $f^{\prime}$ ) corresponds to $u$ (resp. $u^{\prime}$ ).
Proof. The commutativity of the first diagram is clear. It implies the commutativity of the second diagram provided we show that $u^{\prime}$ is cocontinuous.

Let $U^{\prime} / U$ be an object of $\mathcal{C} / U$. Let $\left\{V_{j} / V \rightarrow u\left(U^{\prime}\right) / V\right\}_{j \in J}$ be a covering of $u\left(U^{\prime}\right) / V$ in $\mathcal{D} / V$. Since $u$ is cocontinuous there exists a covering $\left\{U_{i}^{\prime} \rightarrow U^{\prime}\right\}_{i \in I}$ such that the family $\left\{u\left(U_{i}^{\prime}\right) \rightarrow u\left(U^{\prime}\right)\right\}$ refines the covering $\left\{V_{j} \rightarrow u\left(U^{\prime}\right)\right\}$ in $\mathcal{D}$. In other words, there exists a map of index sets $\alpha: I \rightarrow J$ and morphisms $\phi_{i}: u\left(U_{i}^{\prime}\right) \rightarrow V_{\alpha(i)}$ over $U^{\prime}$. Think of $U_{i}^{\prime}$ as an object over $U$ via the composition $U_{i}^{\prime} \rightarrow U^{\prime} \rightarrow U$. Then $\left\{U_{i}^{\prime} / U \rightarrow U^{\prime} / U\right\}$ is a covering of $\mathcal{C} / U$ such that $\left\{u\left(U_{i}^{\prime}\right) / V \rightarrow u\left(U^{\prime}\right) / V\right\}$ refines $\left\{V_{j} / V \rightarrow u\left(U^{\prime}\right) / V\right\}$ (use the same $\alpha$ and the same maps $\phi_{i}$ ). Hence $u^{\prime}: \mathcal{C} / U \rightarrow$ $\mathcal{D} / V$ is cocontinuous.

### 7.28. Morphisms of topoi

039 Z In this section we show that any morphism of topoi is equivalent to a morphism of topoi which comes from a morphism of sites. Please compare with AGV71, Exposé IV, Proposition 4.9.4].

03A0 Lemma 7.28.1. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that
(1) $u$ is cocontinuous,
(2) $u$ is continuous,
(3) given $a, b: U^{\prime} \rightarrow U$ in $\mathcal{C}$ such that $u(a)=u(b)$, then there exists a covering $\left\{f_{i}: U_{i}^{\prime} \rightarrow U^{\prime}\right\}$ in $\mathcal{C}$ such that $a \circ f_{i}=b \circ f_{i}$,
(4) given $U^{\prime}, U \in \mathrm{Ob}(\mathcal{C})$ and a morphism $c: u\left(U^{\prime}\right) \rightarrow u(U)$ in $\mathcal{D}$ there exists a covering $\left\{f_{i}: U_{i}^{\prime} \rightarrow U^{\prime}\right\}$ in $\mathcal{C}$ and morphisms $c_{i}: U_{i}^{\prime} \rightarrow U$ such that $u\left(c_{i}\right)=c \circ u\left(f_{i}\right)$, and
(5) given $V \in \operatorname{Ob}(\mathcal{D})$ there exists a covering of $V$ in $\mathcal{D}$ of the form $\left\{u\left(U_{i}\right) \rightarrow\right.$ $V\}_{i \in I}$.

Then the morphism of topoi

$$
g: S h(\mathcal{C}) \longrightarrow S h(\mathcal{D})
$$

associated to the cocontinuous functor $u$ by Lemma 7.20.1 is an equivalence.
Proof. Assume $u$ satisfies properties (1) - (5). We will show that the adjunction mappings

$$
\mathcal{G} \longrightarrow g_{*} g^{-1} \mathcal{G} \quad \text { and } \quad g^{-1} g_{*} \mathcal{F} \longrightarrow \mathcal{F}
$$

are isomorphisms.
Note that Lemma 7.20.5 applies and we have $g^{-1} \mathcal{G}(U)=\mathcal{G}(u(U))$ for any sheaf $\mathcal{G}$ on $\mathcal{D}$. Next, let $\mathcal{F}$ be a sheaf on $\mathcal{C}$, and let $V$ be an object of $\mathcal{D}$. By definition we have $g_{*} \mathcal{F}(V)=\lim _{u(U) \rightarrow V} \mathcal{F}(U)$. Hence

$$
g^{-1} g_{*} \mathcal{F}(U)=\lim _{U^{\prime}, u\left(U^{\prime}\right) \rightarrow u(U)} \mathcal{F}\left(U^{\prime}\right)
$$

where the morphisms $\psi: u\left(U^{\prime}\right) \rightarrow u(U)$ need not be of the form $u(\alpha)$. The category of such pairs $\left(U^{\prime}, \psi\right)$ has a final object, namely ( $U$, id), which gives rise to the map from the limit into $\mathcal{F}(U)$. Let $\left(s_{\left(U^{\prime}, \psi\right)}\right)$ be an element of the limit. We want to show that $s_{\left(U^{\prime}, \psi\right)}$ is uniquely determined by the value $s_{(U, \text { id })} \in \mathcal{F}(U)$. By property (4) given any $\left(U^{\prime}, \psi\right)$ there exists a covering $\left\{U_{i}^{\prime} \rightarrow U^{\prime}\right\}$ such that the compositions $u\left(U_{i}^{\prime}\right) \rightarrow u\left(U^{\prime}\right) \rightarrow u(U)$ are of the form $u\left(c_{i}\right)$ for some $c_{i}: U_{i}^{\prime} \rightarrow U$ in $\mathcal{C}$. Hence

$$
\left.s_{\left(U^{\prime}, \psi\right)}\right|_{U_{i}^{\prime}}=c_{i}^{*}\left(s_{(U, \mathrm{id})}\right)
$$

Since $\mathcal{F}$ is a sheaf it follows that indeed $s_{\left(U^{\prime}, \psi\right)}$ is determined by $s_{(U, i d)}$. This proves uniqueness. For existence, assume given any $s \in \mathcal{F}(U), \psi: u\left(U^{\prime}\right) \rightarrow u(U)$, $\left\{f_{i}: U_{i}^{\prime} \rightarrow U^{\prime}\right\}$ and $c_{i}: U_{i}^{\prime} \rightarrow U$ such that $\psi \circ u\left(f_{i}\right)=u\left(c_{i}\right)$ as above. We claim there exists a (unique) element $s_{\left(U^{\prime}, \psi\right)} \in \mathcal{F}\left(U^{\prime}\right)$ such that

$$
\left.s_{\left(U^{\prime}, \psi\right)}\right|_{U_{i}^{\prime}}=c_{i}^{*}(s)
$$

Namely, a priori it is not clear the elements $\left.c_{i}^{*}(s)\right|_{U_{i}^{\prime} \times_{U^{\prime} U_{j}^{\prime}}}$ and $\left.c_{j}^{*}(s)\right|_{U_{i}^{\prime} \times{ }_{U^{\prime}} U_{j}^{\prime}}$ agree, since the diagram

need not commute. But condition (3) of the lemma guarantees that there exist coverings $\left\{f_{i j k}: U_{i j k}^{\prime} \rightarrow U_{i}^{\prime} \times_{U^{\prime}} U_{j}^{\prime}\right\}_{k \in K_{i j}}$ such that $c_{i} \circ \operatorname{pr}_{1} \circ f_{i j k}=c_{j} \circ \operatorname{pr}_{2} \circ f_{i j k}$. Hence

$$
f_{i j k}^{*}\left(\left.c_{i}^{*} s\right|_{U_{i}^{\prime} \times{ }_{U} U_{j}^{\prime}}\right)=f_{i j k}^{*}\left(\left.c_{j}^{*} s\right|_{U_{i}^{\prime} \times_{U^{\prime}} U_{j}^{\prime}}\right)
$$

Hence $\left.c_{i}^{*}(s)\right|_{U_{i}^{\prime} \times{ }_{U^{\prime}} U_{j}^{\prime}}=\left.c_{j}^{*}(s)\right|_{U_{i}^{\prime} \times{ }_{U}{ }^{\prime} U_{j}^{\prime}}$ by the sheaf condition for $\mathcal{F}$ and hence the existence of $s_{\left(U^{\prime}, \psi\right)}$ also by the sheaf condition for $\mathcal{F}$. The uniqueness guarantees that the collection $\left(s_{\left(U^{\prime}, \psi\right)}\right)$ so obtained is an element of the limit with $s_{(U, \psi)}=s$. This proves that $g^{-1} g_{*} \mathcal{F} \rightarrow \mathcal{F}$ is an isomorphism.
Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$. Let $V$ be an object of $\mathcal{D}$. Then we see that

$$
g_{*} g^{-1} \mathcal{G}(V)=\lim _{U, \psi: u(U) \rightarrow V} \mathcal{G}(u(U))
$$

By the preceding paragraph we see that the value of the sheaf $g_{*} g^{-1} \mathcal{G}$ on an object $V$ of the form $V=u(U)$ is equal to $\mathcal{G}(u(U))$. (Formally, this holds because we have $g^{-1} g_{*} g^{-1} \cong g^{-1}$, and the description of $g^{-1}$ given at the beginning of the
proof; informally just by comparing limits here and above.) Hence the adjunction mapping $\mathcal{G} \rightarrow g_{*} g^{-1} \mathcal{G}$ has the property that it is a bijection on sections over any object of the form $u(U)$. Since by axiom (5) there exists a covering of $V$ by objects of the form $u(U)$ we see easily that the adjunction map is an isomorphism.

It will be convenient to give cocontinuous functors as in Lemma 7.28.1 a name.
03CG Definition 7.28.2. Let $\mathcal{C}, \mathcal{D}$ be sites. A special cocontinuous functor $u$ from $\mathcal{C}$ to $\mathcal{D}$ is a cocontinuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$ satisfying the assumptions and conclusions of Lemma 7.28.1.

03 CH Lemma 7.28.3. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a special cocontinuous functor. For every object $U$ of $\mathcal{C}$ we have a commutative diagram

as in Lemma 7.27.4. The left vertical arrow is a special cocontinuous functor. Hence in the commutative diagram of topoi

the vertical arrows are equivalences.
Proof. We have seen the existence and commutativity of the diagrams in Lemma 7.27.4. We have to check hypotheses (1) - (5) of Lemma 7.28.1 for the induced functor $u: \mathcal{C} / U \rightarrow \mathcal{D} / u(U)$. This is completely mechanical.

Property (1). This is Lemma 7.27.4
Property (2). Let $\left\{U_{i}^{\prime} / U \rightarrow U^{\prime} / U\right\}_{i \in I}$ be a covering of $U^{\prime} / U$ in $\mathcal{C} / U$. Because $u$ is continuous we see that $\left\{u\left(U_{i}^{\prime}\right) / u(U) \rightarrow u\left(U^{\prime}\right) / u(U)\right\}_{i \in I}$ is a covering of $u\left(U^{\prime}\right) / u(U)$ in $\mathcal{D} / u(U)$. Hence (2) holds for $u: \mathcal{C} / U \rightarrow \mathcal{D} / u(U)$.
Property (3). Let $a, b: U^{\prime \prime} / U \rightarrow U^{\prime} / U$ in $\mathcal{C} / U$ be morphisms such that $u(a)=u(b)$ in $\mathcal{D} / u(U)$. Because $u$ satisfies (3) we see there exists a covering $\left\{f_{i}: U_{i}^{\prime \prime} \rightarrow U^{\prime \prime}\right\}$ in $\mathcal{C}$ such that $a \circ f_{i}=b \circ f_{i}$. This gives a covering $\left\{f_{i}: U_{i}^{\prime \prime} / U \rightarrow U^{\prime \prime} / U\right\}$ in $\mathcal{C} / U$ such that $a \circ f_{i}=b \circ f_{i}$. Hence (3) holds for $u: \mathcal{C} / U \rightarrow \mathcal{D} / u(U)$.

Property (4). Let $U^{\prime \prime} / U, U^{\prime} / U \in \mathrm{Ob}(\mathcal{C} / U)$ and a morphism $c: u\left(U^{\prime \prime}\right) / u(U) \rightarrow$ $u\left(U^{\prime}\right) / u(U)$ in $\mathcal{D} / u(U)$ be given. Because $u$ satisfies property (4) there exists a covering $\left\{f_{i}: U_{i}^{\prime \prime} \rightarrow U^{\prime \prime}\right\}$ in $\mathcal{C}$ and morphisms $c_{i}: U_{i}^{\prime \prime} \rightarrow U^{\prime}$ such that $u\left(c_{i}\right)=$ $c \circ u\left(f_{i}\right)$. We think of $U_{i}^{\prime \prime}$ as an object over $U$ via the composition $U_{i}^{\prime \prime} \rightarrow U^{\prime \prime} \rightarrow U$. It may not be true that $c_{i}$ is a morphism over $U$ ! But since $u\left(c_{i}\right)$ is a morphism over $u(U)$ we may apply property (3) for $u$ and find coverings $\left\{f_{i k}: U_{i k}^{\prime \prime} \rightarrow U_{i}^{\prime \prime}\right\}$ such that $c_{i k}=c_{i} \circ f_{i k}: U_{i k}^{\prime \prime} \rightarrow U^{\prime}$ are morphisms over $U$. Hence $\left\{f_{i} \circ f_{i k}: U_{i k}^{\prime \prime} / U \rightarrow\right.$ $\left.U^{\prime \prime} / U\right\}$ is a covering in $\mathcal{C} / U$ such that $u\left(c_{i k}\right)=c \circ u\left(f_{i k}\right)$. Hence (4) holds for $u: \mathcal{C} / U \rightarrow \mathcal{D} / u(U)$.

Property (5). Let $h: V \rightarrow u(U)$ be an object of $\mathcal{D} / u(U)$. Because $u$ satisfies property (5) there exists a covering $\left\{c_{i}: u\left(U_{i}\right) \rightarrow V\right\}$ in $\mathcal{D}$. By property (4) we can find coverings $\left\{f_{i j}: U_{i j} \rightarrow U_{i}\right\}$ and morphisms $c_{i j}: U_{i j} \rightarrow U$ such that $u\left(c_{i j}\right)=h \circ c_{i} \circ u\left(f_{i j}\right)$. Hence $\left\{u\left(U_{i j}\right) / u(U) \rightarrow V / u(U)\right\}$ is a covering in $\mathcal{D} / u(U)$ of the desired shape and we conclude that (5) holds for $u: \mathcal{C} / U \rightarrow \mathcal{D} / u(U)$.

03A1 Lemma 7.28.4. Let $\mathcal{C}$ be a site. Let $\mathcal{C}^{\prime} \subset \operatorname{Sh}(\mathcal{C})$ be a full subcategory (with a set of objects) such that
(1) $h_{U}^{\#} \in \mathrm{Ob}\left(\mathcal{C}^{\prime}\right)$ for all $U \in \mathrm{Ob}(\mathcal{C})$, and
(2) $\mathcal{C}^{\prime}$ is preserved under fibre products in $\operatorname{Sh}(\mathcal{C})$.

Declare a covering of $\mathcal{C}^{\prime}$ to be any family $\left\{\mathcal{F}_{i} \rightarrow \mathcal{F}\right\}_{i \in I}$ of maps such that $\coprod_{i \in I} \mathcal{F}_{i} \rightarrow$ $\mathcal{F}$ is a surjective map of sheaves. Then
(1) $\mathcal{C}^{\prime}$ is a site (after choosing a set of coverings, see Sets, Lemma 3.11.1),
(2) representable presheaves on $\mathcal{C}^{\prime}$ are sheaves (i.e., the topology on $\mathcal{C}^{\prime}$ is subcanonical, see Definition 7.13.2),
(3) the functor $v: \mathcal{C} \rightarrow \mathcal{C}^{\prime}, U \mapsto h_{U}^{\#}$ is a special cocontinuous functor, hence induces an equivalence $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$,
(4) for any $\mathcal{F} \in \operatorname{Ob}\left(\mathcal{C}^{\prime}\right)$ we have $g^{-1} h_{\mathcal{F}}=\mathcal{F}$, and
(5) for any $U \in \mathrm{Ob}(\mathcal{C})$ we have $g_{*} h_{U}^{\#}=h_{v(U)}=h_{h_{U}^{\#}}$.

Proof. Warning: Some of the statements above may look be a bit confusing at first; this is because objects of $\mathcal{C}^{\prime}$ can also be viewed as sheaves on $\mathcal{C}$ ! We omit the proof that the coverings of $\mathcal{C}^{\prime}$ as described in the lemma satisfy the conditions of Definition 7.6.2,

Suppose that $\left\{\mathcal{F}_{i} \rightarrow \mathcal{F}\right\}$ is a surjective family of morphisms of sheaves. Let $\mathcal{G}$ be another sheaf. Part (2) of the lemma says that the equalizer of

$$
\operatorname{Mor}_{S h(\mathcal{C})}\left(\coprod_{i \in I} \mathcal{F}_{i}, \mathcal{G}\right) \longrightarrow \operatorname{Mor}_{S h(\mathcal{C})}\left(\coprod_{\left(i_{0}, i_{1}\right) \in I \times I} \mathcal{F}_{i_{0}} \times \mathcal{F}_{\mathcal{F}} \mathcal{F}_{i_{1}}, \mathcal{G}\right)
$$

is $\operatorname{Mor}_{S h(\mathcal{C})}(\mathcal{F}, \mathcal{G})$. This is clear (for example use Lemma 7.12.3).
To prove (3) we have to check conditions (1) - (5) of Lemma 7.28.1. The fact that $v$ is cocontinuous is equivalent to the description of surjective maps of sheaves in Lemma 7.12.2. The functor $v$ is continuous because $U \mapsto h_{U}^{\#}$ commutes with fibre products, and transforms coverings into coverings (see Lemma 7.10.14, and Lemma 7.13.4). Properties (3), (4) of Lemma 7.28.1 are statements about morphisms $f$ : $h_{U^{\prime}}^{\#} \rightarrow h_{U}^{\#}$. Such a morphism is the same thing as an element of $h_{U}^{\#}\left(U^{\prime}\right)$. Hence (3) and (4) are immediate from the construction of the sheafification. Property (5) of Lemma 7.28.1 is Lemma 7.13.5. Denote $g: S h(\mathcal{C}) \rightarrow S h\left(\mathcal{C}^{\prime}\right)$ the equivalence of topoi associated with $v$ by Lemma 7.28.1.

Let $\mathcal{F}$ be as in part (4) of the lemma. For any $U \in \operatorname{Ob}(\mathcal{C})$ we have

$$
g^{-1} h_{\mathcal{F}}(U)=h_{\mathcal{F}}(v(U))=\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}^{\#}, \mathcal{F}\right)=\mathcal{F}(U)
$$

The first equality by Lemma 7.20.5. Thus part (4) holds.

Let $\mathcal{F} \in \mathrm{Ob}\left(\mathcal{C}^{\prime}\right)$. Let $U \in \operatorname{Ob}(\mathcal{C})$. Then

$$
\begin{aligned}
g_{*} h_{U}^{\#}(\mathcal{F}) & =\operatorname{Mor}_{S h\left(\mathcal{C}^{\prime}\right)}\left(h_{\mathcal{F}}, g_{*} h_{U}^{\#}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(g^{-1} h_{\mathcal{F}}, h_{U}^{\#}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}, h_{U}^{\#}\right) \\
& =\operatorname{Mor}_{\mathcal{C}^{\prime}}\left(\mathcal{F}, h_{U}^{\#}\right)
\end{aligned}
$$

as desired (where the third equality was shown above).
Using this we can massage any topos to live over a site having all finite limits.
03CI Lemma 7.28.5. Let $\operatorname{Sh}(\mathcal{C})$ be a topos. Let $\left\{\mathcal{F}_{i}\right\}_{i \in I}$ be a set of sheaves on $\mathcal{C}$. There exists an equivalence of topoi $g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)$ induced by a special cocontinuous functor $u: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ of sites such that
(1) $\mathcal{C}^{\prime}$ has a subcanonical topology,
(2) a family $\left\{V_{j} \rightarrow V\right\}$ of morphisms of $\mathcal{C}^{\prime}$ is (combinatorially equivalent to) a covering of $\mathcal{C}^{\prime}$ if and only if $\coprod h_{V_{j}} \rightarrow h_{V}$ is surjective,
(3) $\mathcal{C}^{\prime}$ has fibre products and a final object (i.e., $\mathcal{C}^{\prime}$ has all finite limits),
(4) every subsheaf of a representable sheaf on $\mathcal{C}^{\prime}$ is representable, and
(5) each $g_{*} \mathcal{F}_{i}$ is a representable sheaf.

Proof. Consider the full subcategory $\mathcal{C}_{1} \subset \operatorname{Sh}(\mathcal{C})$ consisting of all $h_{U}^{\#}$ for all $U \in$ $\mathrm{Ob}(\mathcal{C})$, the given sheaves $\mathcal{F}_{i}$ and the final sheaf $*$ (see Example 7.10.2). We are going to inductively define full subcategories

$$
\mathcal{C}_{1} \subset \mathcal{C}_{2} \subset \mathcal{C}_{2} \subset \ldots \subset \operatorname{Sh}(\mathcal{C})
$$

Namely, given $\mathcal{C}_{n}$ let $\mathcal{C}_{n+1}$ be the full subcategory consisting of all fibre products and subsheaves of objects of $\mathcal{C}_{n}$. (Note that $\mathcal{C}_{n+1}$ has a set of objects.) Set $\mathcal{C}^{\prime}=\bigcup_{n \geq 1} \mathcal{C}_{n}$. A covering in $\mathcal{C}^{\prime}$ is any family $\left\{\mathcal{G}_{j} \rightarrow \mathcal{G}\right\}_{j \in J}$ of morphisms of objects of $\mathcal{C}^{\prime}$ such that $\coprod \mathcal{G}_{j} \rightarrow \mathcal{G}$ is surjective as a map of sheaves on $\mathcal{C}$. The functor $v: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ is given by $U \mapsto h_{U}^{\#}$. Apply Lemma 7.28.4.
Here is the goal of the current section.
03A2 Lemma 7.28.6. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Then there exists a site $\mathcal{C}^{\prime}$ and a diagram of functors

$$
\mathcal{C} \longrightarrow \mathcal{C}^{\prime} \leftarrow_{u} \mathcal{D}
$$

such that
(1) the functor $v$ is a special cocontinuous functor,
(2) the functor $u$ commutes with fibre products, is continuous and defines a morphism of sites $\mathcal{C}^{\prime} \rightarrow \mathcal{D}$, and
(3) the morphism of topoi $f$ agrees with the composition of morphisms of topoi

$$
\operatorname{Sh}(\mathcal{C}) \longrightarrow S h\left(\mathcal{C}^{\prime}\right) \longrightarrow S h(\mathcal{D})
$$

where the first arrow comes from $v$ via Lemma 7.28.1 and the second arrow from u via Lemma 7.16.2.
Proof. Consider the full subcategory $\mathcal{C}_{1} \subset \operatorname{Sh}(\mathcal{C})$ consisting of all $h_{U}^{\#}$ and all $f^{-1} h_{V}^{\#}$ for all $U \in \operatorname{Ob}(\mathcal{C})$ and all $V \in \operatorname{Ob}(\mathcal{D})$. Let $\mathcal{C}_{n+1}$ be a full subcategory consisting of all fibre products of objects of $\mathcal{C}_{n}$. Set $\mathcal{C}^{\prime}=\bigcup_{n \geq 1} \mathcal{C}_{n}$. A covering in $\mathcal{C}^{\prime}$ is any

This statement is closely related to

Proposition 4.9.4.
Exposé IV]. In order to get the whole result, one should also use AGV71,
Remarque 4.7.4, Exposé IV].
family $\left\{\mathcal{F}_{i} \rightarrow \mathcal{F}\right\}_{i \in I}$ such that $\coprod_{i \in I} \mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective as a map of sheaves on $\mathcal{C}$. The functor $v: \mathcal{C} \rightarrow \mathcal{C}^{\prime}$ is given by $U \mapsto h_{U}^{\#}$. The functor $u: \mathcal{D} \rightarrow \mathcal{C}^{\prime}$ is given by $V \mapsto f^{-1} h_{V}^{\#}$.

Part (1) follows from Lemma 7.28.4.
Proof of (2) and (3) of the lemma. The functor $u$ commutes with fibre products as both $V \mapsto h_{V}^{\#}$ and $f^{-1}$ do. Moreover, since $f^{-1}$ is exact and commutes with arbitrary colimits we see that it transforms a covering into a surjective family of morphisms of sheaves. Hence $u$ is continuous. To see that it defines a morphism of sites we still have to see that $u_{s}$ is exact. In order to do this we will show that $g^{-1} \circ u_{s}=f^{-1}$. Namely, then since $g^{-1}$ is an equivalence and $f^{-1}$ is exact we will conclude. Because $g^{-1}$ is adjoint to $g_{*}$, and $u_{s}$ is adjoint to $u^{s}$, and $f^{-1}$ is adjoint to $f_{*}$ it also suffices to prove that $u^{s} \circ g_{*}=f_{*}$. Let $U$ be an object of $\mathcal{C}$ and let $V$ be an object of $\mathcal{D}$. Then

$$
\begin{aligned}
\left(u^{s} g_{*} h_{U}^{\#}\right)(V) & =g_{*} h_{U}^{\#}\left(f^{-1} h_{V}^{\#}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{C})}\left(f^{-1} h_{V}^{\#}, h_{U}^{\#}\right) \\
& =\operatorname{Mor}_{S h(\mathcal{D})}\left(h_{V}^{\#}, f_{*} h_{U}^{\#}\right) \\
& =f_{*} h_{U}^{\#}(V)
\end{aligned}
$$

The first equality because $u^{s}=u^{p}$. The second equality by Lemma 7.28.4 (5). The third equality by adjointness of $f_{*}$ and $f^{-1}$ and the final equality by properties of sheafification and the Yoneda lemma. We omit the verification that these identities are functorial in $U$ and $V$. Hence we see that we have $u^{s} \circ g_{*}=f_{*}$ for sheaves of the form $h_{U}^{\#}$. This implies that $u^{s} \circ g_{*}=f_{*}$ and we win (some details omitted).

03CJ Remark 7.28.7. Notation and assumptions as in Lemma 7.28.6. If the site $\mathcal{D}$ has a final object and fibre products then the functor $u: \mathcal{D} \rightarrow \mathcal{C}^{\prime}$ satisfies all the assumptions of Proposition 7.15.6. Namely, in addition to the properties mentioned in the lemma $u$ also transforms the final object of $\mathcal{D}$ into the final object of $\mathcal{C}^{\prime}$. This is clear from the construction of $u$. Hence, if we first apply Lemmas 7.28 .5 to $\mathcal{D}$ and then Lemma $\sqrt{7.28 .6}$ to the resulting morphism of topoi $\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{D}^{\prime}\right)$ we obtain the following statement: Any morphism of topoi $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ fits into a commutative diagram

where the following properties hold:
(1) the morphisms $e$ and $g$ are equivalences given by special cocontinuous functors $\mathcal{C} \rightarrow \mathcal{C}^{\prime}$ and $\mathcal{D} \rightarrow \mathcal{D}^{\prime}$,
(2) the sites $\mathcal{C}^{\prime}$ and $\mathcal{D}^{\prime}$ have fibre products, final objects and have subcanonical topologies,
(3) the morphism $f^{\prime}: \mathcal{C}^{\prime} \rightarrow \mathcal{D}^{\prime}$ comes from a morphism of sites corresponding to a functor $u: \mathcal{D}^{\prime} \rightarrow \mathcal{C}^{\prime}$ to which Proposition 7.15.6 applies, and
(4) given any set of sheaves $\mathcal{F}_{i}$ (resp. $\mathcal{G}_{j}$ ) on $\mathcal{C}$ (resp. $\mathcal{D}$ ) we may assume each of these is a representable sheaf on $\mathcal{C}^{\prime}$ (resp. $\mathcal{D}^{\prime}$ ).

It is often useful to replace $\mathcal{C}$ and $\mathcal{D}$ by $\mathcal{C}^{\prime}$ and $\mathcal{D}^{\prime}$.
03CK Remark 7.28.8. Notation and assumptions as in Lemma 7.28.6. Suppose that in addition the original morphism of topoi $S h(\mathcal{C}) \rightarrow S h(\mathcal{D})$ is an equivalence. Then the construction in the proof of Lemma 7.28.6 gives two functors

$$
\mathcal{C} \rightarrow \mathcal{C}^{\prime} \leftarrow \mathcal{D}
$$

which are both special cocontinuous functors. Hence in this case we can actually factor the morphism of topoi as a composition

$$
\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}\left(\mathcal{C}^{\prime}\right)=\operatorname{Sh}\left(\mathcal{D}^{\prime}\right) \leftarrow \operatorname{Sh}(\mathcal{D})
$$

as in Remark 7.28.7, but with the middle morphism an identity.

### 7.29. Localization of topoi

04GY We repeat some of the material on localization to the apparently more general case of topoi. In reality this is not more general since we may always enlarge the underlying sites to assume that we are localizing at objects of the site.

04GZ Lemma 7.29.1. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Then the category $\operatorname{Sh}(\mathcal{C}) / \mathcal{F}$ is a topos. There is a canonical morphism of topoi

$$
j_{\mathcal{F}}: S h(\mathcal{C}) / \mathcal{F} \longrightarrow S h(\mathcal{C})
$$

which is a localization as in Section 7.24 such that
(1) the functor $j_{\mathcal{F}}^{-1}$ is the functor $\mathcal{H} \mapsto \mathcal{H} \times \mathcal{F} / \mathcal{F}$, and
(2) the functor $j_{\mathcal{F}}$ is the forgetful functor $\mathcal{G} / \mathcal{F} \mapsto \mathcal{G}$.

Proof. Apply Lemma 7.28.5. This means we may assume $\mathcal{C}$ is a site with subcanonical topology, and $\mathcal{F}=h_{U}=h_{U}^{\#}$ for some $U \in \mathrm{Ob}(\mathcal{C})$. Hence the material of Section 7.24 applies. In particular, there is an equivalence $S h(\mathcal{C} / U)=S h(\mathcal{C}) / h_{U}^{\#}$ such that the composition

$$
\operatorname{Sh}(\mathcal{C} / U) \rightarrow \operatorname{Sh}(\mathcal{C}) / h_{U}^{\#} \rightarrow \operatorname{Sh}(\mathcal{C})
$$

is equal to $j_{U}$, see Lemma 7.24.4. Denote $a: \operatorname{Sh}(\mathcal{C}) / h_{U}^{\#} \rightarrow \operatorname{Sh}(\mathcal{C} / U)$ the inverse functor, so $j_{\mathcal{F}!}=j_{U!} \circ a, j_{\mathcal{F}}{ }^{1}=a^{-1} \circ j_{U}^{-1}$, and $j_{\mathcal{F}, *}=j_{U, *} \circ a$. The description of $j_{\mathcal{F} \text { ! }}$ follows from the above. The description of $j_{\mathcal{F}}^{-1}$ follows from Lemma 7.24.6.

04H0 Remark 7.29.2. In the situation of Lemma 7.29.1 we can also describe the functor $j_{\mathcal{F}, *}$. It is the functor which associates to $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ the sheaf

$$
U \longmapsto\left\{\alpha:\left.\left.\mathcal{F}\right|_{U} \rightarrow \mathcal{G}\right|_{U} \text { such that } \alpha \text { is a right inverse to }\left.\varphi\right|_{U}\right\}
$$

In order to prove that this works the introduction of $\mathcal{H o m}$-sheaves is desirable, hence we postpone this to a later time.

0791 Lemma 7.29.3. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Let $\mathcal{C} / \mathcal{F}$ be the category of pairs $(U, s)$ where $U \in \operatorname{Ob}(\mathcal{C})$ and $s \in \mathcal{F}(U)$. Let a covering in $\mathcal{C} / \mathcal{F}$ be a family $\left\{\left(U_{i}, s_{i}\right) \rightarrow(U, s)\right\}$ such that $\left\{U_{i} \rightarrow U\right\}$ is a covering of $\mathcal{C}$. Then $j: \mathcal{C} / \mathcal{F} \rightarrow \mathcal{C}$ is a continuous and cocontinuous functor of sites which induces a morphism of topoi $j: \operatorname{Sh}(\mathcal{C} / \mathcal{F}) \rightarrow \operatorname{Sh}(\mathcal{C})$. In fact, there is an equivalence $\operatorname{Sh}(\mathcal{C} / \mathcal{F})=\operatorname{Sh}(\mathcal{C}) / \mathcal{F}$ which turns $j$ into $j_{\mathcal{F}}$.

Proof. We omit the verification that $\mathcal{C} / \mathcal{F}$ is a site and that $j$ is continuous and cocontinuous. By Lemma 7.20 .5 there exists a morphism of topoi $j$ as indicated, with $j^{-1} \mathcal{G}(U, s)=\mathcal{G}(U)$, and there is a left adjoint $j$ ! to $j^{-1}$. A morphism $\varphi: * \rightarrow$ $j^{-1} \mathcal{G}$ on $\mathcal{C} / \mathcal{F}$ is the same thing as a rule which assigns to every pair $(U, s)$ a section $\varphi(s) \in \mathcal{G}(U)$ compatible with restriction maps. Hence this is the same thing as a morphism $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ over $\mathcal{C}$. We conclude that $j_{!} *=\mathcal{F}$. In particular, for every $\mathcal{H} \in \operatorname{Sh}(\mathcal{C} / \mathcal{F})$ there is a canonical map

$$
j!\mathcal{H} \rightarrow j!*=\mathcal{F}
$$

i.e., we obtain a functor $j_{1}^{\prime}: \operatorname{Sh}(\mathcal{C} / \mathcal{F}) \rightarrow \operatorname{Sh}(\mathcal{C}) / \mathcal{F}$. An inverse to this functor is the rule which assigns to an object $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ of $S h(\mathcal{C}) / \mathcal{F}$ the sheaf

$$
a(\mathcal{G} / \mathcal{F}):(U, s) \longmapsto\{t \in \mathcal{G}(U) \mid \varphi(t)=s\}
$$

We omit the verification that $a(\mathcal{G} / \mathcal{F})$ is a sheaf and that $a$ is inverse to $j_{!}^{\prime}$.
04IP Definition 7.29.4. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$.
(1) The topos $S h(\mathcal{C}) / \mathcal{F}$ is called the localization of the topos $\operatorname{Sh}(\mathcal{C})$ at $\mathcal{F}$.
(2) The morphism of topoi $j_{\mathcal{F}}: S h(\mathcal{C}) / \mathcal{F} \rightarrow S h(\mathcal{C})$ of Lemma 7.29.1 is called the localization morphism.

We are going to show that whenever the sheaf $\mathcal{F}$ is equal to $h_{U}^{\#}$ for some object $U$ of the site, then the localization of the topos is equal to the category of sheaves on the localization of the site at $U$. Moreover, we are going to check that any functorialities are compatible with this identification.

04IQ Lemma 7.29.5. Let $\mathcal{C}$ be a site. Let $\mathcal{F}=h_{U}^{\#}$ for some object $U$ of $\mathcal{C}$. Then $j_{\mathcal{F}}: \operatorname{Sh}(\mathcal{C}) / \mathcal{F} \rightarrow \operatorname{Sh}(\mathcal{C})$ constructed in Lemma 7.29.1 agrees with the morphism of topoi $j_{U}: S h(\mathcal{C} / U) \rightarrow S h(\mathcal{C})$ constructed in Section 7.24 via the identification $S h(\mathcal{C} / U)=S h(\mathcal{C}) / h_{U}^{\#}$ of Lemma 7.24.4

Proof. We have seen in Lemma 7.24 .4 that the composition $\operatorname{Sh}(\mathcal{C} / U) \rightarrow S h(\mathcal{C}) / h_{U}^{\#} \rightarrow$ $S h(\mathcal{C})$ is $j_{U!}$. The functor $\operatorname{Sh}(\mathcal{C}) / h_{U}^{\#} \rightarrow \operatorname{Sh}(\mathcal{C})$ is $j_{\mathcal{F}!}$ by Lemma 7.29.1. Hence $j_{\mathcal{F}!}=j_{U!}$ via the identification. So $j_{\mathcal{F}}^{-1}=j_{U}^{-1}$ (by adjointness) and so $j_{\mathcal{F}, *}=j_{U, *}$ (by adjointness again).

04IR Lemma 7.29.6. Let $\mathcal{C}$ be a site. If $s: \mathcal{G} \rightarrow \mathcal{F}$ is a morphism of sheaves on $\mathcal{C}$ then there exists a natural commutative diagram of morphisms of topoi

where $j=j_{\mathcal{G} / \mathcal{F}}$ is the localization of the topos $\operatorname{Sh}(\mathcal{C}) / \mathcal{F}$ at the object $\mathcal{G} / \mathcal{F}$. In particular we have

$$
j^{-1}(\mathcal{H} \rightarrow \mathcal{F})=\left(\mathcal{H} \times_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}\right)
$$

and

$$
j_{!}(\mathcal{E} \xrightarrow{e} \mathcal{F})=(\mathcal{E} \xrightarrow{\text { soe }} \mathcal{G}) .
$$

Proof. The description of $j^{-1}$ and $j$ ! comes from the description of those functors in Lemma 7.29.1. The equality of functors $j_{\mathcal{G}!}=j_{\mathcal{F}!} \circ j$ is clear from the description of these functors (as forgetful functors). By adjointness we also obtain the equalities $j_{\mathcal{G}}^{-1}=j^{-1} \circ j_{\mathcal{F}}^{-1}$, and $j_{\mathcal{G}, *}=j_{\mathcal{F}, *} \circ j_{*}$.

04IS Lemma 7.29.7. Assume $\mathcal{C}$ and $s: \mathcal{G} \rightarrow \mathcal{F}$ are as in Lemma 7.29.6. If $\mathcal{G}=h_{V}^{\#}$ and $\mathcal{F}=h_{U}^{\#}$ and $s: \mathcal{G} \rightarrow \mathcal{F}$ comes from a morphism $V \rightarrow U$ of $\mathcal{C}$ then the diagram in Lemma 7.29.6 is identified with diagram 7.24.7.1) via the identifications $S h(\mathcal{C} / V)=S h(\mathcal{C}) / h_{V}^{\#}$ and $\operatorname{Sh}(\mathcal{C} / U)=S h(\mathcal{C}) / h_{U}^{\#}$ of Lemma 7.24.4.
Proof. This is true because the descriptions of $j^{-1}$ agree. See Lemma 7.24 .8 and Lemma 7.29.6.

### 7.30. Localization and morphisms of topoi

04IT This section is the analogue of Section 7.27 for morphisms of topoi.
04H1 Lemma 7.30.1. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{G}$ be a sheaf on $\mathcal{D}$. Set $\mathcal{F}=f^{-1} \mathcal{G}$. Then there exists a commutative diagram of topoi

The morphism $f^{\prime}$ is characterized by the property that

$$
\left(f^{\prime}\right)^{-1}(\mathcal{H} \xrightarrow{\varphi} \mathcal{G})=\left(f^{-1} \mathcal{H} \xrightarrow{f^{-1} \varphi} \mathcal{F}\right)
$$

and we have $f_{*}^{\prime} j_{\mathcal{F}}^{-1}=j_{\mathcal{G}}^{-1} f_{*}$.
Proof. Since the statement is about topoi and does not refer to the underlying sites we may change sites at will. Hence by the discussion in Remark 7.28 .7 we may assume that $f$ is given by a continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$ satisfying the assumptions of Proposition 7.15 .6 between sites having all finite limits and subcanonical topologies, and such that $\mathcal{G}=h_{V}$ for some object $V$ of $\mathcal{D}$. Then $\mathcal{F}=f^{-1} h_{V}=h_{u(V)}$ by Lemma 7.14.5. By Lemma 7.27.1 we obtain a commutative diagram of morphisms of topoi

and we have $f_{*}^{\prime} j_{U}^{-1}=j_{V}^{-1} f_{*}$. By Lemma 7.29 .5 we may identify $j_{\mathcal{F}}$ and $j_{U}$ and $j_{\mathcal{G}}$ and $j_{V}$. The description of $\left(f^{\prime}\right)^{-1}$ is given in Lemma 7.27.1.

04IU Lemma 7.30.2. Let $f: \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites given by the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V$ be an object of $\mathcal{D}$. Set $U=u(V)$. Set $\mathcal{G}=h_{V}^{\#}$, and $\mathcal{F}=h_{U}^{\#}=f^{-1} h_{V}^{\#}$ (see Lemma 7.14.5). Then the diagram of morphisms of topoi of Lemma 7.30.1 agrees with the diagram of morphisms of topoi of Lemma 7.27.1 via the identifications $j_{\mathcal{F}}=j_{U}$ and $j_{\mathcal{G}}=j_{V}$ of Lemma 7.29.5.

Proof. This is not a complete triviality as the choice of morphism of sites giving rise to $f$ made in the proof of Lemma 7.30.1 may be different from the morphisms of sites given to us in the lemma. But in both cases the functor $\left(f^{\prime}\right)^{-1}$ is described by the same rule. Hence they agree and the associated morphism of topoi is the same. Some details omitted.

04IV Lemma 7.30.3. Let $f: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Let $\mathcal{G} \in \operatorname{Sh}(\mathcal{D})$, $\mathcal{F} \in \operatorname{Sh}(\mathcal{C})$ and $s: \mathcal{F} \rightarrow f^{-1} \mathcal{G}$ a morphism of sheaves. There exists a commutative diagram of topoi

We have $f_{s}=f^{\prime} \circ j_{\mathcal{F} / f^{-1} \mathcal{G}}$ where $f^{\prime}: \operatorname{Sh}(\mathcal{C}) / f^{-1} \mathcal{G} \rightarrow \operatorname{Sh}(\mathcal{D}) / \mathcal{F}$ is as in Lemma 7.30 .1 and $j_{\mathcal{F} / f^{-1} \mathcal{G}}: \operatorname{Sh}(\mathcal{C}) / \mathcal{F} \rightarrow \operatorname{Sh}(\mathcal{C}) / f^{-1} \mathcal{G}$ is as in Lemma 7.29.6. The functor $\left(f_{s}\right)^{-1}$ is described by the rule

$$
\left(f_{s}\right)^{-1}(\mathcal{H} \xrightarrow{\varphi} \mathcal{G})=\left(f^{-1} \mathcal{H} \times{ }_{f^{-1} \varphi, f^{-1} \mathcal{G}, s} \mathcal{F} \rightarrow \mathcal{F}\right)
$$

Finally, given any morphisms $b: \mathcal{G}^{\prime} \rightarrow \mathcal{G}, a: \mathcal{F}^{\prime} \rightarrow \mathcal{F}$ and $s^{\prime}: \mathcal{F}^{\prime} \rightarrow f^{-1} \mathcal{G}^{\prime}$ such that

commutes, then the diagram

commutes.
Proof. The commutativity of the first square follows from the commutativity of the diagram in Lemma 7.29 .6 and the commutativity of the diagram in Lemma 7.30.1. The description of $f_{s}^{-1}$ follows on combining the descriptions of $\left(f^{\prime}\right)^{-1}$ in Lemma 7.30 .1 with the description of $\left(j_{\mathcal{F} / f^{-1} \mathcal{G}}\right)^{-1}$ in Lemma 7.29.6. The commutativity of the last square then follows from the equality

$$
f^{-1} \mathcal{H} \times_{f^{-1} \mathcal{G}, s} \mathcal{F} \times{ }_{\mathcal{F}} \mathcal{F}^{\prime}=f^{-1}\left(\mathcal{H} \times \mathcal{G} \mathcal{G}^{\prime}\right) \times_{f^{-1} \mathcal{G}^{\prime}, s^{\prime}} \mathcal{F}^{\prime}
$$

which is formal.
04IW Lemma 7.30.4. Let $f: \mathcal{C} \rightarrow \mathcal{D}$ be a morphism of sites given by the continuous functor $u: \mathcal{D} \rightarrow \mathcal{C}$. Let $V$ be an object of $\mathcal{D}$. Let $c: U \rightarrow u(V)$ be a morphism. Set $\mathcal{G}=h_{V}^{\#}$ and $\mathcal{F}=h_{U}^{\#}=f^{-1} h_{V}^{\#}$. Let $s: \mathcal{F} \rightarrow f^{-1} \mathcal{G}$ be the map induced by $c$. Then the diagram of morphisms of topoi of Lemma 7.27 .3 agrees with the diagram of morphisms of topoi of Lemma 7.30.3 via the identifications $j_{\mathcal{F}}=j_{U}$ and $j_{\mathcal{G}}=j_{V}$ of Lemma 7.29.5.

Proof. This follows on combining Lemmas 7.29.7 and 7.30.2.

### 7.31. Points

## 00Y3

00Y4 Definition 7.31.1. Let $\mathcal{C}$ be a site. A point of the topos $\operatorname{Sh}(\mathcal{C})$ is a morphism of topoi $p$ from $S h(p t)$ to $\operatorname{Sh}(\mathcal{C})$.

We will define a point of a site in terms of a functor $u: \mathcal{C} \rightarrow$ Sets. It will turn out later that $u$ will define a morphism of sites which gives rise to a point of the topos associated to $\mathcal{C}$, see Lemma 7.31.8.

Let $\mathcal{C}$ be a site. Let $p=u$ be a functor $u: \mathcal{C} \rightarrow$ Sets. This curious language is introduced because it seems funny to talk about neighbourhoods of functors; so we think of a "point" $p$ as a geometric thing which is given by a categorical datum, namely the functor $u$. The fact that $p$ is actually equal to $u$ does not matter. A neighbourhood of $p$ is a pair $(U, x)$ with $U \in \mathrm{Ob}(\mathcal{C})$ and $x \in u(U)$. A morphism of neighbourhoods $(V, y) \rightarrow(U, x)$ is given by a morphism $\alpha: V \rightarrow U$ of $\mathcal{C}$ such that $u(\alpha)(y)=x$. Note that the category of neighbourhoods isn't a "big" category.
We define the stalk of a presheaf $\mathcal{F}$ at $p$ as
04EH

$$
\mathcal{F}_{p}=\operatorname{colim}_{\{(U, x)\}^{\circ p p}} \mathcal{F}(U) .
$$

The colimit is over the opposite of the category of neighbourhoods of $p$. In other words, an element of $\mathcal{F}_{p}$ is given by a triple ( $U, x, s$ ), where $(U, x)$ is a neighbourhood of $p$ and $s \in \mathcal{F}(U)$. Equality of triples is the equivalence relation generated by $(U, x, s) \sim\left(V, y, \alpha^{*} s\right)$ when $\alpha$ is as above.
Note that if $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is a morphism of presheaves of sets, then we get a canonical map of stalks $\varphi_{p}: \mathcal{F}_{p} \rightarrow \mathcal{G}_{p}$. Thus we obtain a stalk functor

$$
\operatorname{PSh}(\mathcal{C}) \longrightarrow \text { Sets, } \quad \mathcal{F} \longmapsto \mathcal{F}_{p}
$$

We have defined the stalk functor using any functor $p=u: \mathcal{C} \rightarrow$ Sets. No conditions are necessary for the definition to work ${ }^{5}$. On the other hand, it is probably better not to use this notion unless $p$ actually is a point (see definition below), since in general the stalk functor does not have good properties.
$00 Y 5$ Definition 7.31.2. Let $\mathcal{C}$ be a site. A point $p$ of the site $\mathcal{C}$ is given by a functor $u: \mathcal{C} \rightarrow$ Sets such that
(1) For every covering $\left\{U_{i} \rightarrow U\right\}$ of $\mathcal{C}$ the map $\coprod u\left(U_{i}\right) \rightarrow u(U)$ is surjective.
(2) For every covering $\left\{U_{i} \rightarrow U\right\}$ of $\mathcal{C}$ and every morphism $V \rightarrow U$ the maps $u\left(U_{i} \times_{U} V\right) \rightarrow u\left(U_{i}\right) \times_{u(U)} u(V)$ are bijective.
(3) The stalk functor $\operatorname{Sh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \mapsto \mathcal{F}_{p}$ is left exact.

The conditions should be familiar since they are modeled after those of Definitions 7.14.1 and 7.15.1. Note that (3) implies that $*_{p}=\{*\}$, see Example 7.10.2. Hence $u(U) \neq \emptyset$ for at least some $U$ (because the empty colimit produces the empty set). We will show below (Lemma 7.31.7) that this does give rise to a point of the topos $S h(\mathcal{C})$. Before we do so, we prove some lemmas for general functors $u$.

00Y6 Lemma 7.31.3. Let $\mathcal{C}$ be a site. Let $p=u: \mathcal{C} \rightarrow$ Sets be a functor. There are functorial isomorphisms $\left(h_{U}\right)_{p}=u(U)$ for $U \in \mathrm{Ob}(\mathcal{C})$.

[^16]Proof. An element of $\left(h_{U}\right)_{p}$ is given by a triple $(V, y, f)$, where $V \in \mathrm{Ob}(\mathcal{C}), y \in$ $u(V)$ and $f \in h_{U}(V)=\operatorname{Mor}_{\mathcal{C}}(V, U)$. Two such $(V, y, f),\left(V^{\prime}, y^{\prime}, f^{\prime}\right)$ determine the same object if there exists a morphism $\phi: V \rightarrow V^{\prime}$ such that $u(\phi)(y)=y^{\prime}$ and $f^{\prime} \circ \phi=f$, and in general you have to take chains of identities like this to get the correct equivalence relation. In any case, every $(V, y, f)$ is equivalent to the element $\left(U, u(f)(y), \operatorname{id}_{U}\right)$. If $\phi$ exists as above, then the triples $(V, y, f),\left(V^{\prime}, y^{\prime}, f^{\prime}\right)$ determine the same triple $\left(U, u(f)(y), \mathrm{id}_{U}\right)=\left(U, u\left(f^{\prime}\right)\left(y^{\prime}\right), \mathrm{id}_{U}\right)$. This proves that the map $u(U) \rightarrow\left(h_{U}\right)_{p}, x \mapsto$ class of $\left(U, x, \mathrm{id}_{U}\right)$ is bijective.

Let $\mathcal{C}$ be a site. Let $p=u: \mathcal{C} \rightarrow$ Sets be a functor. In analogy with the constructions in Section 7.5 given a set $E$ we define a presheaf $u^{p} E$ by the rule

04EI

$$
\begin{equation*}
U \longmapsto u^{p} E(U)=\operatorname{Mor}_{S e t s}(u(U), E)=\operatorname{Map}(u(U), E) . \tag{7.31.3.1}
\end{equation*}
$$

This defines a functor $u^{p}: \operatorname{Sets} \rightarrow P S h(\mathcal{C}), E \mapsto u^{p} E$.
00Y7 Lemma 7.31.4. For any functor $u: \mathcal{C} \rightarrow$ Sets. The functor $u^{p}$ is a right adjoint to the stalk functor on presheaves.

Proof. Let $\mathcal{F}$ be a presheaf on $\mathcal{C}$. Let $E$ be a set. A morphism $\mathcal{F} \rightarrow u^{p} E$ is given by a compatible system of maps $\mathcal{F}(U) \rightarrow \operatorname{Map}(u(U), E)$, i.e., a compatible system of maps $\mathcal{F}(U) \times u(U) \rightarrow E$. And by definition of $\mathcal{F}_{p}$ a map $\mathcal{F}_{p} \rightarrow E$ is given by a rule associating with each triple $(U, x, \sigma)$ an element in $E$ such that equivalent triples map to the same element, see discussion surrounding Equation (7.31.1.1). This also means a compatible system of maps $\mathcal{F}(U) \times u(U) \rightarrow E$.

In analogy with Section 7.14 we have the following lemma.
$00 Y 8$ Lemma 7.31.5. Let $\mathcal{C}$ be a site. Let $p=u: \mathcal{C} \rightarrow$ Sets be a functor. Suppose that for every covering $\left\{U_{i} \rightarrow U\right\}$ of $\mathcal{C}$
(1) the $\operatorname{map} \coprod u\left(U_{i}\right) \rightarrow u(U)$ is surjective, and
(2) the maps $u\left(U_{i} \times_{U} U_{j}\right) \rightarrow u\left(U_{i}\right) \times{ }_{u(U)} u\left(U_{j}\right)$ are surjective.

Then we have
(1) the presheaf $u^{p} E$ is a sheaf for all sets $E$, denote it $u^{s} E$,
(2) the stalk functor $\operatorname{Sh}(\mathcal{C}) \rightarrow$ Sets and the functor $u^{s}: \operatorname{Sets} \rightarrow \operatorname{Sh}(\mathcal{C})$ are adjoint, and
(3) we have $\mathcal{F}_{p}=\mathcal{F}_{p}^{\#}$ for every presheaf of sets $\mathcal{F}$.

Proof. The first assertion is immediate from the definition of a sheaf, assumptions (1) and (2), and the definition of $u^{p} E$. The second is a restatement of the adjointness of $u^{p}$ and the stalk functor (but now restricted to sheaves). The third assertion follows as, for any set $E$, we have

$$
\operatorname{Map}\left(\mathcal{F}_{p}, E\right)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(\mathcal{F}, u^{p} E\right)=\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}^{\#}, u^{s} E\right)=\operatorname{Map}\left(\mathcal{F}_{p}^{\#}, E\right)
$$

by the adjointness property of sheafification.
In particular Lemma 7.31 .5 holds when $p=u$ is a point. In this case we think of the sheaf $u^{s} E$ as the "skyscraper" sheaf with value $E$ at $p$.
00Y9 Definition 7.31.6. Let $p$ be a point of the site $\mathcal{C}$ given by the functor $u$. For a set $E$ we define $p_{*} E=u^{s} E$ the sheaf described in Lemma 7.31 .5 above. We sometimes call this a skyscraper sheaf.

In particular we have the following adjointness property of skyscraper sheaves and stalks:

$$
\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}, p_{*} E\right)=\operatorname{Map}\left(\mathcal{F}_{p}, E\right)
$$

This motivates the notation $p^{-1} \mathcal{F}=\mathcal{F}_{p}$ which we will sometimes use.
00YA Lemma 7.31.7. Let $\mathcal{C}$ be a site.
(1) Let $p$ be a point of the site $\mathcal{C}$. Then the pair of functors $\left(p_{*}, p^{-1}\right)$ introduced above define a morphism of topoi $\operatorname{Sh}(p t) \rightarrow \operatorname{Sh}(\mathcal{C})$.
(2) Let $p=\left(p_{*}, p^{-1}\right)$ be a point of the topos $\operatorname{Sh}(\mathcal{C})$. Then the functor $u: U \mapsto$ $p^{-1}\left(h_{U}^{\#}\right)$ gives rise to a point $p^{\prime}$ of the site $\mathcal{C}$ whose associated morphism of topoi $\left(p_{*}^{\prime},\left(p^{\prime}\right)^{-1}\right)$ is equal to $p$.

Proof. Proof of (1). By the above the functors $p_{*}$ and $p^{-1}$ are adjoint. The functor $p^{-1}$ is required to be exact by Definition 7.31.2. Hence the conditions imposed in Definition 7.16.1 are all satisfied and we see that (1) holds.
Proof of (2). Let $\left\{U_{i} \rightarrow U\right\}$ be a covering of $\mathcal{C}$. Then $\amalg\left(h_{U_{i}}\right)^{\#} \rightarrow h_{U}^{\#}$ is surjective, see Lemma 7.13.4 Since $p^{-1}$ is exact (by definition of a morphism of topoi) we conclude that $\amalg u\left(U_{i}\right) \rightarrow u(U)$ is surjective. This proves part (1) of Definition 7.31.2. Sheafification is exact, see Lemma 7.10.14 Hence if $U \times_{V} W$ exists in $\mathcal{C}$, then

$$
h_{U \times}{ }_{V}{ }_{W}=h_{U}^{\#} \times_{h_{V}^{\#}} h_{W}^{\#}
$$

and we see that $u\left(U \times_{V} W\right)=u(U) \times_{u(V)} u(W)$ since $p^{-1}$ is exact. This proves part (2) of Definition 7.31.2. Let $p^{\prime}=u$, and let $\mathcal{F}_{p^{\prime}}$ be the stalk functor defined by Equation 7.31.1.1 using $u$. There is a canonical comparison map $c: \mathcal{F}_{p^{\prime}} \rightarrow \mathcal{F}_{p}=$ $p^{-1} \mathcal{F}$. Namely, given a triple $(U, x, \sigma)$ representing an element $\xi$ of $\mathcal{F}_{p^{\prime}}$ we think of $\sigma$ as a map $\sigma: h_{U}^{\#} \rightarrow \mathcal{F}$ and we can set $c(\xi)=p^{-1}(\sigma)(x)$ since $x \in u(U)=p^{-1}\left(h_{U}^{\#}\right)$. By Lemma 7.31 .3 we see that $\left(h_{U}\right)_{p^{\prime}}=u(U)$. Since conditions (1) and (2) of Definition 7.31.2 hold for $p^{\prime}$ we also have $\left(h_{U}^{\#}\right)_{p^{\prime}}=\left(h_{U}\right)_{p^{\prime}}$ by Lemma 7.31.5. Hence we have

$$
\left(h_{U}^{\#}\right)_{p^{\prime}}=\left(h_{U}\right)_{p^{\prime}}=u(U)=p^{-1}\left(h_{U}^{\#}\right)
$$

We claim this bijection equals the comparison map $c:\left(h_{U}^{\#}\right)_{p^{\prime}} \rightarrow p^{-1}\left(h_{U}^{\#}\right)$ (verification omitted). Any sheaf on $\mathcal{C}$ is a coequalizer of maps of coproducts of sheaves of the form $h_{U}^{\#}$, see Lemma 7.13.5. The stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p^{\prime}}$ and the functor $p^{-1}$ commute with arbitrary colimits (as they are both left adjoints). We conclude $c$ is an isomorphism for every sheaf $\mathcal{F}$. Thus the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{p^{\prime}}$ is isomorphic to $p^{-1}$ and we in particular see that it is exact. This proves condition (3) of Definition 7.31 .2 holds and $p^{\prime}$ is a point. The final assertion has already been shown above, since we saw that $p^{-1}=\left(p^{\prime}\right)^{-1}$.

Actually a point always corresponds to a morphism of sites as we show in the following lemma.

04EL Lemma 7.31.8. Let $\mathcal{C}$ be a site. Let $p$ be a point of $\mathcal{C}$ given by $u: \mathcal{C} \rightarrow$ Sets. Let $S_{0}$ be an infinite set such that $u(U) \subset S_{0}$ for all $U \in \mathrm{Ob}(\mathcal{C})$. Let $\mathcal{S}$ be the site constructed out of the powerset $S=\mathcal{P}\left(S_{0}\right)$ in Remark 7.16.3. Then
(1) there is an equivalence $i: \operatorname{Sh}(p t) \rightarrow \operatorname{Sh}(\mathcal{S})$,
(2) the functor $u: \mathcal{C} \rightarrow \mathcal{S}$ induces a morphism of sites $f: \mathcal{S} \rightarrow \mathcal{C}$, and
(3) the composition

$$
\operatorname{Sh}(p t) \rightarrow \operatorname{Sh}(\mathcal{S}) \rightarrow \operatorname{Sh}(\mathcal{C})
$$

is the morphism of topoi $\left(p_{*}, p^{-1}\right)$ of Lemma 7.31.7.
Proof. Part (1) we saw in Remark 7.16.3. Moreover, recall that the equivalence associates to the set $E$ the sheaf $i_{*} E$ on $\mathcal{S}$ defined by the rule $V \mapsto \operatorname{Mor}_{\text {Sets }}(V, E)$. Part (2) is clear from the definition of a point of $\mathcal{C}$ (Definition 7.31.2) and the definition of a morphism of sites (Definition 7.15.1). Finally, consider $f_{*} i_{*} E$. By construction we have

$$
f_{*} i_{*} E(U)=i_{*} E(u(U))=\operatorname{Mor}_{S e t s}(u(U), E)
$$

which is equal to $p_{*} E(U)$, see Equation 7.31.3.1). This proves (3).
Contrary to what happens in the topological case it is not always true that the stalk of the skyscraper sheaf with value $E$ is $E$. Here is what is true in general.

05UX Lemma 7.31.9. Let $\mathcal{C}$ be a site. Let $p: \operatorname{Sh}(p t) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a point of the topos associated to $\mathcal{C}$. For any set $E$ there are canonical maps

$$
E \longrightarrow\left(p_{*} E\right)_{p} \longrightarrow E
$$

whose composition is $i d_{E}$.
Proof. There is always an adjunction map $\left(p_{*} E\right)_{p}=p^{-1} p_{*} E \rightarrow E$. This map is an isomorphism when $E=\{*\}$ because $p_{*}$ and $p^{-1}$ are both left exact, hence transform the final object into the final object. Hence given $e \in E$ we can consider the map $i_{e}:\{*\} \rightarrow E$ which gives

whence the map $E \rightarrow\left(p_{*} E\right)_{p}=p^{-1} p_{*} E$ as desired.
05UY Lemma 7.31.10. Let $\mathcal{C}$ be a site. Let $p: \operatorname{Sh}(p t) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a point of the topos associated to $\mathcal{C}$. The functor $p_{*}:$ Sets $\rightarrow \operatorname{Sh}(\mathcal{C})$ has the following properties: It commutes with arbitrary limits, it is left exact, it is faithful, it transforms surjections into surjections, it commutes with coequalizers, it reflects injections, it reflects surjections, and it reflects isomorphisms.

Proof. Because $p_{*}$ is a right adjoint it commutes with arbitrary limits and it is left exact. The fact that $p^{-1} p_{*} E \rightarrow E$ is a canonically split surjection implies that $p_{*}$ is faithful, reflects injections, reflects surjections, and reflects isomorphisms. By Lemma 7.31 .7 we may assume that $p$ comes from a point $u: \mathcal{C} \rightarrow$ Sets of the underlying site $\mathcal{C}$. In this case the sheaf $p_{*} E$ is given by

$$
p_{*} E(U)=\operatorname{Mor}_{S e t s}(u(U), E)
$$

see Equation 7.31.3.1 and Definition 7.31.6. It follows immediately from this formula that $p_{*}$ transforms surjections into surjections and coequalizers into coequalizers.

### 7.32. Constructing points

05 UZ In this section we give criteria for when a functor from a site to the category of sets defines a point of that site.
00YB Lemma 7.32.1. Let $\mathcal{C}$ be a site. Assume that $\mathcal{C}$ has a final object $X$ and fibred products. Let $p=u: \mathcal{C} \rightarrow$ Sets be a functor such that
(1) $u(X)$ is a singleton set, and
(2) for every pair of morphisms $U \rightarrow W$ and $V \rightarrow W$ with the same target the map $u\left(U \times_{W} V\right) \rightarrow u(U) \times_{u(W)} u(V)$ is bijective.
Then the opposite of the category of neighbourhoods of $p$ is filtered. Moreover, the stalk functor $\operatorname{Sh}(\mathcal{C}) \rightarrow$ Sets, $\mathcal{F} \rightarrow \mathcal{F}_{p}$ commutes with finite limits.
Proof. This is analogous to the proof of Lemma 7.5 .2 above. The assumptions on $\mathcal{C}$ imply that $\mathcal{C}$ has finite limits. See Categories, Lemma 4.18.4. Assumption (1) implies that the category of neighbourhoods is nonempty. Suppose $(U, x)$ and $(V, y)$ are neighbourhoods. Then $u(U \times V)=u\left(U \times_{X} V\right)=u(U) \times_{u(X)} u(V)=$ $u(U) \times u(V)$ by (2). Hence there exists a neighbourhood $\left(U \times_{X} V, z\right)$ mapping to both $(U, x)$ and $(V, y)$. Let $a, b:(V, y) \rightarrow(U, x)$ be two morphisms in the category of neighbourhoods. Let $W$ be the equalizer of $a, b: V \rightarrow U$. As in the proof of Categories, Lemma 4.18.4 we may write $W$ in terms of fibre products:

$$
W=\left(V \times_{a, U, b} V\right) \times \times_{\left(p r_{1}, p r_{2}\right), V \times V, \Delta} V
$$

The bijectivity in (2) guarantees there exists an element $z \in u(W)$ which maps to $((y, y), y)$. Then $(W, z) \rightarrow(V, y)$ equalizes $a, b$ as desired.
Let $\mathcal{I} \rightarrow S h(\mathcal{C}), i \mapsto \mathcal{F}_{i}$ be a finite diagram of sheaves. We have to show that the stalk of the limit of this system agrees with the limit of the stalks. Let $\mathcal{F}$ be the limit of the system as a presheaf. According to Lemma 7.10.1 this is a sheaf and it is the limit in the category of sheaves. Hence we have to show that $\mathcal{F}_{p}=\lim _{\mathcal{I}} \mathcal{F}_{i, p}$. Recall also that $\mathcal{F}$ has a simple description, see Section 7.4. Thus we have to show that

$$
\lim _{i} \operatorname{colim}_{\{(U, x)\}^{o p p}} \mathcal{F}_{i}(U)=\operatorname{colim}_{\{(U, x)\}^{\circ p p}} \lim _{i} \mathcal{F}_{i}(U)
$$

This holds, by Categories, Lemma 4.19.2, because we just showed the opposite of the category of neighbourhoods is filtered.
$00 Y C$ Proposition 7.32.2. Let $\mathcal{C}$ be a site. Assume that finite limits exist in $\mathcal{C}$. (I.e., $\mathcal{C}$ has fibre products, and a final object.) A point $p$ of such a site $\mathcal{C}$ is given by $a$ functor $u: \mathcal{C} \rightarrow$ Sets such that
(1) $u$ commutes with finite limits, and
(2) if $\left\{U_{i} \rightarrow U\right\}$ is a covering, then $\coprod_{i} u\left(U_{i}\right) \rightarrow u(U)$ is surjective.

Proof. Suppose first that $p$ is a point (Definition 7.31.2) given by a functor $u$. Condition (2) is satisfied directly from the definition of a point. By Lemma 7.31.3 we have $\left(h_{U}\right)_{p}=u(U)$. By Lemma 7.31.5 we have $\left(h_{U}^{\#}\right)_{p}=\left(h_{U}\right)_{p}$. Thus we see that $u$ is equal to the composition of functors

$$
\mathcal{C} \xrightarrow{h} \operatorname{PSh}(\mathcal{C}) \xrightarrow{\#} \operatorname{Sh}(\mathcal{C}) \xrightarrow{()_{p}} \text { Sets }
$$

Each of these functors is left exact, and hence we see $u$ satisfies (1).
Conversely, suppose that $u$ satisfies (1) and (2). In this case we immediately see that $u$ satisfies the first two conditions of Definition 7.31.2. And its stalk functor
is exact, because it is a left adjoint by Lemma 7.31 .5 and it commutes with finite limits by Lemma 7.32.1.

00YD Remark 7.32.3. In fact, let $\mathcal{C}$ be a site. Assume $\mathcal{C}$ has a final object $X$ and fibre products. Let $p=u: \mathcal{C} \rightarrow$ Sets be a functor such that
(1) $u(X)=\{*\}$ a singleton, and
(2) for every pair of morphisms $U \rightarrow W$ and $V \rightarrow W$ with the same target the map $u\left(U \times_{W} V\right) \rightarrow u(U) \times_{u(W)} u(V)$ is surjective.
(3) for every covering $\left\{U_{i} \rightarrow U\right\}$ the map $\coprod u\left(U_{i}\right) \rightarrow u(U)$ is surjective.

Then, in general, $p$ is not a point of $\mathcal{C}$. An example is the category $\mathcal{C}$ with two objects $\{U, X\}$ and exactly one non-identity arrow, namely $U \rightarrow X$. We endow $\mathcal{C}$ with the trivial topology, i.e., the only coverings are $\{U \rightarrow U\}$ and $\{X \rightarrow X\}$. A sheaf $\mathcal{F}$ is the same thing as a presheaf and consists of a triple $(A, B, A \rightarrow B)$ : namely $A=\mathcal{F}(X), B=\mathcal{F}(U)$ and $A \rightarrow B$ is the restriction mapping corresponding to $U \rightarrow X$. Note that $U \times_{X} U=U$ so fibre products exist. Consider the functor $u=p$ with $u(X)=\{*\}$ and $u(U)=\left\{*_{1}, *_{2}\right\}$. This satisfies (1), (2), and (3), but the corresponding stalk functor 7.31.1.1 is the functor

$$
(A, B, A \rightarrow B) \longmapsto B \amalg_{A} B
$$

which isn't exact. Namely, consider $(\emptyset,\{1\}, \emptyset \rightarrow\{1\}) \rightarrow(\{1\},\{1\},\{1\} \rightarrow\{1\})$ which is an injective map of sheaves, but is transformed into the noninjective map of sets

$$
\{1\} \amalg\{1\} \longrightarrow\{1\} \amalg_{\{1\}}\{1\}
$$

by the stalk functor.
00YE Example 7.32.4. Let $X$ be a topological space. Let $X_{Z a r}$ be the site of Example 7.6.4. Let $x \in X$ be a point. Consider the functor

$$
u: X_{Z a r} \longrightarrow \text { Sets, } \quad U \mapsto\left\{\begin{array}{ccc}
\emptyset & \text { if } & x \notin U \\
\{*\} & \text { if } & x \in U
\end{array}\right.
$$

This functor commutes with product and fibred products, and turns coverings into surjective families of maps. Hence we obtain a point $p$ of the site $X_{Z a r}$. It is immediately verified that the stalk functor agrees with the stalk at $x$ defined in Sheaves, Section 6.11.

04EJ Example 7.32.5. Let $X$ be a topological space. What are the points of the topos $S h(X)$ ? To see this, let $X_{Z a r}$ be the site of Example 7.6.4. By Lemma 7.31.7 a point of $\operatorname{Sh}(X)$ corresponds to a point of this site. Let $p$ be a point of the site $X_{Z a r}$ given by the functor $u: X_{Z a r} \rightarrow$ Sets. We are going to use the characterization of such a $u$ in Proposition 7.32.2. This implies immediately that $u(\emptyset)=\emptyset$ and $u(U \cap V)=u(U) \times u(V)$. In particular we have $u(U)=u(U) \times u(U)$ via the diagonal map which implies that $u(U)$ is either a singleton or empty. Moreover, if $U=\bigcup U_{i}$ is an open covering then

$$
u(U)=\emptyset \Rightarrow \forall i, u\left(U_{i}\right)=\emptyset \quad \text { and } \quad u(U) \neq \emptyset \Rightarrow \exists i, u\left(U_{i}\right) \neq \emptyset
$$

We conclude that there is a unique largest open $W \subset X$ with $u(W)=\emptyset$, namely the union of all the opens $U$ with $u(U)=\emptyset$. Let $Z=X \backslash W$. If $Z=Z_{1} \cup Z_{2}$ with $Z_{i} \subset Z$ closed, then $W=\left(X \backslash Z_{1}\right) \cap\left(X \backslash Z_{2}\right)$ so $\emptyset=u(W)=u\left(X \backslash Z_{1}\right) \times u\left(X \backslash Z_{2}\right)$ and we conclude that $u\left(X \backslash Z_{1}\right)=\emptyset$ or that $u\left(X \backslash Z_{2}\right)=\emptyset$. This means that
$X \backslash Z_{1}=W$ or that $X \backslash Z_{2}=W$. In other words, $Z$ is irreducible. Now we see that $u$ is described by the rule

$$
u: X_{Z a r} \longrightarrow S e t s, \quad U \mapsto\left\{\begin{array}{ccc}
\emptyset & \text { if } & Z \cap U=\emptyset \\
\{*\} & \text { if } & Z \cap U \neq \emptyset
\end{array}\right.
$$

Note that for any irreducible closed $Z \subset X$ this functor satisfies assumptions (1), (2) of Proposition 7.32 .2 and hence defines a point. In other words we see that points of the site $X_{Z a r}$ are in one-to-one correspondence with irreducible closed subsets of $X$. In particular, if $X$ is a sober topological space, then points of $X_{\text {Zar }}$ and points of $X$ are in one to one correspondence, see Example 7.32.4.

00YF Example 7.32.6. Consider the site $\mathcal{T}_{G}$ described in Example 7.6.5 and Section 7.9. The forgetful functor $u: \mathcal{T}_{G} \rightarrow$ Sets commutes with products and fibred products and turns coverings into surjective families. Hence it defines a point of $\mathcal{T}_{G}$. We identify $\operatorname{Sh}\left(\mathcal{T}_{G}\right)$ and $G$-Sets. The stalk functor

$$
p^{-1}: \operatorname{Sh}\left(\mathcal{T}_{G}\right)=G \text {-Sets } \longrightarrow \text { Sets }
$$

is the forgetful functor. The pushforward $p_{*}$ is the functor

$$
\text { Sets } \longrightarrow S h\left(\mathcal{T}_{G}\right)=G \text {-Sets }
$$

which maps a set $S$ to the $G$-set $\operatorname{Map}(G, S)$ with action $g \cdot \psi=\psi \circ R_{g}$ where $R_{g}$ is right multiplication. In particular we have $p^{-1} p_{*} S=\operatorname{Map}(G, S)$ as a set and the maps $S \rightarrow \operatorname{Map}(G, S) \rightarrow S$ of Lemma 7.31 .9 are the obvious ones.

08RH Example 7.32.7. Let $\mathcal{C}$ be a category endowed with the chaotic topology (Example 7.6.6). For every object $U_{0}$ of $\mathcal{C}$ the functor $u: U \mapsto \operatorname{Mor}_{\mathcal{C}}\left(U_{0}, U\right)$ defines a point $p$ of $\mathcal{C}$. Namely, conditions (1) and (2) of Definition 7.31 .2 are immediate as the only coverings are given by identity maps. Condition (2) holds because $\mathcal{F}_{p}=\mathcal{F}\left(U_{0}\right)$ and since the topology is discrete taking sections over $U_{0}$ is an exact functor.

### 7.33. Points and morphisms of topoi

05 V 0 In this section we make a few remarks about points and morphisms of topoi.
05V1 Lemma 7.33.1. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$. Let $p$ be a point of $\mathcal{D}$ given by the functor $v: \mathcal{D} \rightarrow$ Sets, see Definition 7.31.2. Then the functor $v \circ u: \mathcal{C} \rightarrow$ Sets defines a point $q$ of $\mathcal{C}$ and moreover there is a canonical identification

$$
\left(f^{-1} \mathcal{F}\right)_{p}=\mathcal{F}_{q}
$$

for any sheaf $\mathcal{F}$ on $\mathcal{C}$.
First proof Lemma 7.33.1. Note that since $u$ is continuous and since $v$ defines a point, it is immediate that $v \circ u$ satisfies conditions (1) and (2) of Definition 7.31.2 Let us prove the displayed equality. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Then

$$
\mathcal{F}_{q}=\operatorname{colim}_{(U, x)} \mathcal{F}(U)
$$

where the colimit is over objects $U$ in $\mathcal{C}$ and elements $x \in v(u(U))$. Similarly, we have

$$
\begin{aligned}
\left(f^{-1} \mathcal{F}\right)_{p} & =\left(u_{p} \mathcal{F}\right)_{p} \\
& =\operatorname{colim}_{(V, x)} \operatorname{colim}_{U, \phi: V \rightarrow u(U)} \mathcal{F}(U) \\
& =\operatorname{colim}_{(V, x, U, \phi: V \rightarrow u(U))} \mathcal{F}(U) \\
& =\operatorname{colim}_{(U, x)} \mathcal{F}(U) \\
& =\mathcal{F}_{q}
\end{aligned}
$$

Explanation: The first equality holds because $f^{-1} \mathcal{F}=\left(u_{p} \mathcal{F}\right)^{\#}$ and because $\mathcal{G}_{p}=$ $\mathcal{G}_{p}^{\#}$ for any presheaf $\mathcal{G}$, see Lemma 7.31.5. The second equality holds by the definition of $u_{p}$. In the third equality we simply combine colimits. To see the fourth equality we apply Categories, Lemma 4.17.5 to the functor $F$ of diagram categories defined by the rule $F((V, x, U, \phi: V \rightarrow u(U)))=(U, v(\phi)(x))$. The lemma applies, because $F$ has a right inverse, namely $(U, x) \mapsto(u(U), x, U$, id $: u(U) \rightarrow u(U))$ and because there is always a morphism

$$
(V, x, U, \phi: V \rightarrow u(U)) \longrightarrow(u(U), v(\phi)(x), U, \text { id }: u(U) \rightarrow u(U))
$$

in the fibre category over $(U, x)$ which shows the fibre categories are connected. The fifth equality is clear. Hence now we see that $q$ also satisfies condition (3) of Definition 7.31 .2 because it is a composition of exact functors. This finishes the proof.

Second proof Lemma 7.33.1. By Lemma 7.31 .8 we may factor $\left(p_{*}, p^{-1}\right)$ as

$$
S h(p t) \xrightarrow{i} S h(\mathcal{S}) \xrightarrow{h} S h(\mathcal{D})
$$

where the second morphism of topoi comes from a morphism of sites $h: \mathcal{S} \rightarrow \mathcal{D}$ induced by the functor $v: \mathcal{D} \rightarrow \mathcal{S}$ (which makes sense as $\mathcal{S} \subset$ Sets is a full subcategory containing every object in the image of $v$ ). By Lemma 7.15 .3 the composition $v \circ u: \mathcal{C} \rightarrow \mathcal{S}$ defines a morphism of sites $g: \mathcal{S} \rightarrow \mathcal{C}$. In particular, the functor $v \circ u: \mathcal{C} \rightarrow \mathcal{S}$ is continuous which by the definition of the coverings in $\mathcal{S}$, see Remark 7.16.3, means that $v \circ u$ satisfies conditions (1) and (2) of Definition 7.31.2. On the other hand, we see that

$$
g_{*} i_{*} E(U)=i_{*} E\left(v(u(U))=\operatorname{Mor}_{S e t s}(v(u(U)), E)\right.
$$

by the construction of $i$ in Remark 7.16.3. Note that this is the same as the formula for which is equal to $(v \circ u)^{p} E$, see Equation 7.31.3.1). By Lemma 7.31.5 the functor $g_{*} i_{*}=(v \circ u)^{p}=(v \circ u)^{s}$ is right adjoint to the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{q}$. Hence we see that the stalk functor $q^{-1}$ is canonically isomorphic to $i^{-1} \circ g^{-1}$. Hence it is exact and we conclude that $q$ is a point. Finally, as we have $g=f \circ h$ by construction we see that $q^{-1}=i^{-1} \circ h^{-1} \circ f^{-1}=p^{-1} \circ f^{-1}$, i.e., we have the displayed formula of the lemma.

05V2 Lemma 7.33.2. Let $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Let $p: \operatorname{Sh}(p t) \rightarrow$ $\operatorname{Sh}(\mathcal{D})$ be a point. Then $q=f \circ p$ is a point of the topos $\operatorname{Sh}(\mathcal{C})$ and we have a canonical identification

$$
\left(f^{-1} \mathcal{F}\right)_{p}=\mathcal{F}_{q}
$$

for any sheaf $\mathcal{F}$ on $\mathcal{C}$.

Proof. This is immediate from the definitions and the fact that we can compose morphisms of topoi.

### 7.34. Localization and points

04EK In this section we show that points of a localization $\mathcal{C} / U$ are constructed in a simple manner from the points of $\mathcal{C}$.

04H2 Lemma 7.34.1. Let $\mathcal{C}$ be a site. Let $p$ be a point of $\mathcal{C}$ given by $u: \mathcal{C} \rightarrow$ Sets. Let $U$ be an object of $\mathcal{C}$ and let $x \in u(U)$. The functor

$$
v: \mathcal{C} / U \longrightarrow \text { Sets, } \quad(\varphi: V \rightarrow U) \longmapsto\{y \in u(V) \mid u(\varphi)(y)=x\}
$$

defines a point $q$ of the site $\mathcal{C} / U$ such that the diagram

commutes. In other words $\mathcal{F}_{p}=\left(j_{U}^{-1} \mathcal{F}\right)_{q}$ for any sheaf on $\mathcal{C}$.
Proof. Choose $S$ and $\mathcal{S}$ as in Lemma 7.31.8. We may identify $\operatorname{Sh}(p t)=\operatorname{Sh}(\mathcal{S})$ as in that lemma, and we may write $p=f: \operatorname{Sh}(\mathcal{S}) \rightarrow \operatorname{Sh}(\mathcal{C})$ for the morphism of topoi induced by $u$. By Lemma 7.27.1 we get a commutative diagram of topoi

where $p^{\prime}$ is given by the functor $u^{\prime}: \mathcal{C} / U \rightarrow \mathcal{S} / u(U), V / U \mapsto u(V) / u(U)$. Consider the functor $j_{x}: \mathcal{S} \cong \mathcal{S} / x$ obtained by assigning to a set $E$ the set $E$ endowed with the constant map $E \rightarrow u(U)$ with value $x$. Then $j_{x}$ is a fully faithful cocontinuous functor which has a continuous right adjoint $v_{x}:(\psi: E \rightarrow u(U)) \mapsto \psi^{-1}(\{x\})$. Note that $j_{u(U)} \circ j_{x}=\operatorname{id}_{\mathcal{S}}$, and $v_{x} \circ u^{\prime}=v$. These observations imply that we have the following commutative diagram of topoi

Namely:
(1) The morphism $a: S h(\mathcal{S}) \rightarrow S h(\mathcal{S} / u(U))$ is the morphism of topoi associated to the cocontinuous functor $j_{x}$, which equals the morphism associated to the continuous functor $v_{x}$, see Lemma 7.20.1 and Section 7.21.
(2) The composition $p \circ j_{u(U)} \circ a=p$ since $j_{u(U)} \circ j_{x}=\mathrm{id} \mathcal{S}_{\mathcal{S}}$.
(3) The composition $p^{\prime} \circ a$ gives a morphism of topoi. Moreover, it is the morphism of topoi associated to the continuous functor $v_{x} \circ u^{\prime}=v$. Hence $v$ does indeed define a point $q$ of $\mathcal{C} / U$ which fits into the diagram above by construction.
This ends the proof of the lemma.
04H3 Lemma 7.34.2. Let $\mathcal{C}, p, u, U$ be as in Lemma 7.34.1. The construction of Lemma 7.34.1 gives a one to one correspondence between points $q$ of $\mathcal{C} / U$ lying over $p$ and elements $x$ of $u(U)$.
Proof. Let $q$ be a point of $\mathcal{C} / U$ given by the functor $v: \mathcal{C} / U \rightarrow$ Sets such that $j_{U} \circ q=p$ as morphisms of topoi. Recall that $u(V)=p^{-1}\left(h_{V}^{\#}\right)$ for any object $V$ of $\mathcal{C}$, see Lemma 7.31.7. Similarly $v(V / U)=q^{-1}\left(h_{V / U}^{\#}\right)$ for any object $V / U$ of $\mathcal{C} / U$. Consider the following two diagrams

The right hand diagram is the sheafification of the diagram of presheaves on $\mathcal{C} / U$ which maps $W / U$ to the left hand diagram of sets. (There is a small technical point to make here, namely, that we have $\left(j_{U}^{-1} h_{V}\right)^{\#}=j_{U}^{-1}\left(h_{V}^{\#}\right)$ and similarly for $h_{U}$, see Lemma 7.19 .4 ) Note that the left hand diagram of sets is cartesian. Since sheafification is exact (Lemma 7.10.14) we conclude that the right hand diagram is cartesian.

Apply the exact functor $q^{-1}$ to the right hand diagram to get a cartesian diagram

of sets. Here we have used that $q^{-1} \circ j^{-1}=p^{-1}$. Since $U / U$ is a final object of $\mathcal{C} / U$ we see that $v(U / U)$ is a singleton. Hence the image of $v(U / U)$ in $u(U)$ is an element $x$, and the top horizontal map gives a bijection $v(V / U) \rightarrow\{y \in u(V) \mid y \mapsto$ $x$ in $u(U)\}$ as desired.

04H4 Lemma 7.34.3. Let $\mathcal{C}$ be a site. Let $p$ be a point of $\mathcal{C}$ given by $u: \mathcal{C} \rightarrow$ Sets. Let $U$ be an object of $\mathcal{C}$. For any sheaf $\mathcal{G}$ on $\mathcal{C} / U$ we have

$$
\left(j_{U!} \mathcal{G}\right)_{p}=\coprod_{q} \mathcal{G}_{q}
$$

where the coproduct is over the points $q$ of $\mathcal{C} / U$ associated to elements $x \in u(U)$ as in Lemma 7.34.1.

Proof. We use the description of $j_{U} \mathcal{G}$ as the sheaf associated to the presheaf $V \mapsto \coprod_{\varphi \in \operatorname{Mor}_{\mathcal{C}}(V, U)} \mathcal{G}\left(V /{ }_{\varphi} U\right)$ of Lemma 7.24 .2 Also, the stalk of $j_{U!} \mathcal{G}$ at $p$ is equal to the stalk of this presheaf, see Lemma 7.31.5. Hence we see that

$$
\left(j_{U!\mathcal{G}}\right)_{p}=\operatorname{colim}_{(V, y)} \coprod_{\varphi: V \rightarrow U} \mathcal{G}\left(V /{ }_{\varphi} U\right)
$$

To each element $(V, y, \varphi, s)$ of this colimit, we can assign $x=u(\varphi)(y) \in u(U)$. Hence we obtain

$$
\left(j_{U} \mathcal{G}\right)_{p}=\coprod_{x \in u(U)} \operatorname{colim}_{(\varphi: V \rightarrow U, y), u(\varphi)(y)=x} \mathcal{G}\left(V /{ }_{\varphi} U\right)
$$

This is equal to the expression of the lemma by our construction of the points $q$.
04H5 Remark 7.34.4. Warning: The result of Lemma 7.34 .3 has no analogue for $j_{U, *}$.

### 7.35. 2-morphisms of topoi

04 I 9 This is a brief section concerning the notion of a 2-morphism of topoi.
04IA Definition 7.35.1. Let $f, g: \operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be two morphisms of topoi. A 2-morphism from $f$ to $g$ is given by a transformation of functors $t: f_{*} \rightarrow g_{*}$.

Pictorially we sometimes represent $t$ as follows:

Note that since $f^{-1}$ is adjoint to $f_{*}$ and $g^{-1}$ is adjoint to $g_{*}$ we see that $t$ induces also a transformation of functors $t: g^{-1} \rightarrow f^{-1}$ (usually denoted by the same symbol) uniquely characterized by the condition that the diagram

commutes. Because of set theoretic difficulties (see Remark 7.16.4) we do not obtain a 2-category of topoi. But we can still define horizontal and vertical composition and show that the axioms of a strict 2-category listed in Categories, Section 4.28 hold. Namely, vertical composition of 2-morphisms is clear (just compose transformations of functors), composition of 1-morphisms has been defined in Definition 7.16.1 and horizontal composition of

$$
S h(\mathcal{C}) \xrightarrow[g^{\Downarrow}]{\stackrel{f}{\Downarrow t}} \operatorname{Sh}(\mathcal{D}) \xrightarrow[g^{\prime}]{\stackrel{f^{\prime}}{\Downarrow s}} \ln (\mathcal{E})
$$

is defined by the transformation of functors $s \star t$ introduced in Categories, Definition 4.27.1. Explicitly, $s \star t$ is given by

$$
f_{*}^{\prime} f_{*} \mathcal{F} \xrightarrow{f_{*}^{\prime} t} f_{*}^{\prime} g_{*} \mathcal{F} \xrightarrow{s} g_{*}^{\prime} g_{*} \mathcal{F} \quad \text { or } \quad f_{*}^{\prime} f_{*} \mathcal{F} \xrightarrow{s} g_{*}^{\prime} f_{*} \mathcal{F} \xrightarrow{g_{*}^{\prime} t} g_{*}^{\prime} g_{*} \mathcal{F}
$$

(these maps are equal). Since these definitions agree with the ones in Categories, Section 4.27 it follows from Categories, Lemma 4.27 .2 that the axioms of a strict 2-category hold with these definitions.

### 7.36. Morphisms between points

00 YG
00YH Lemma 7.36.1. Let $\mathcal{C}$ be a site. Let $u, u^{\prime}: \mathcal{C} \rightarrow$ Sets be two functors, and let $t$ : $u^{\prime} \rightarrow u$ be a transformation of functors. Then we obtain a canonical transformation of stalk functors $t_{\text {stalk }}: \mathcal{F}_{p^{\prime}} \rightarrow \mathcal{F}_{p}$ which agrees with $t$ via the identifications of Lemma 7.31.3.
Proof. Omitted.
00YI Definition 7.36.2. Let $\mathcal{C}$ be a site. Let $p, p^{\prime}$ be points of $\mathcal{C}$ given by functors $u, u^{\prime}: \mathcal{C} \rightarrow$ Sets. A morphism $f: p \rightarrow p^{\prime}$ is given by a transformation of functors

$$
f_{u}: u^{\prime} \rightarrow u
$$

Note how the transformation of functors goes the other way. This makes sense, as we will see later, by thinking of the morphism $f$ as a kind of 2 -arrow pictorially as follows:

$$
\text { Sets }=\operatorname{Sh}(p t) \xrightarrow[p^{\prime}]{\Downarrow f} \operatorname{sh}(\mathcal{C})
$$

Namely, we will see later that $f_{u}$ induces a canonical transformation of functors $p_{*} \rightarrow p_{*}^{\prime}$ between the skyscraper sheaf constructions.

This is a fairly important notion, and deserves a more complete treatment here. List of desiderata
(1) Describe the automorphisms of the point of $\mathcal{T}_{G}$ described in Example 7.32 .6
(2) Describe $\operatorname{Mor}\left(p, p^{\prime}\right)$ in terms of $\operatorname{Mor}\left(p_{*}, p_{*}^{\prime}\right)$.
(3) Specialization of points in topological spaces. Show that if $x^{\prime} \in \overline{\{x\}}$ in the topological space $X$, then there is a morphism $p \rightarrow p^{\prime}$, where $p$ (resp. $\left.p^{\prime}\right)$ is the point of $X_{Z a r}$ associated to $x\left(\right.$ resp. $\left.x^{\prime}\right)$.

### 7.37. Sites with enough points

00YJ
00YK Definition 7.37.1. Let $\mathcal{C}$ be a site.
(1) A family of points $\left\{p_{i}\right\}_{i \in I}$ is called conservative if for every map of sheaves $\phi: \mathcal{F} \rightarrow \mathcal{G}$ which is an isomorphism on all the fibres $\mathcal{F}_{p_{i}} \rightarrow \mathcal{G}_{p_{i}}$ is an isomorphism.
(2) We say that $\mathcal{C}$ has enough points if there exists a conservative family of points.

It turns out that you can then check "exactness" at the stalks.
00YL Lemma 7.37.2. Let $\mathcal{C}$ be a site and let $\left\{p_{i}\right\}_{i \in I}$ be a conservative family of points. Then
(1) Given any map of sheaves $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ we have $\forall i, \varphi_{p_{i}}$ injective implies $\varphi$ injective.
(2) Given any map of sheaves $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ we have $\forall i, \varphi_{p_{i}}$ surjective implies $\varphi$ surjective.
(3) Given any pair of maps of sheaves $\varphi_{1}, \varphi_{2}: \mathcal{F} \rightarrow \mathcal{G}$ we have $\forall i, \varphi_{1, p_{i}}=\varphi_{2, p_{i}}$ implies $\varphi_{1}=\varphi_{2}$.
(4) Given a finite diagram $\mathcal{G}: \mathcal{J} \rightarrow S h(\mathcal{C})$, a sheaf $\mathcal{F}$ and morphisms $q_{j}$ : $\mathcal{F} \rightarrow \mathcal{G}_{j}$ then $\left(\mathcal{F}, q_{j}\right)$ is a limit of the diagram if and only if for each $i$ the stalk $\left(\mathcal{F}_{p_{i}},\left(q_{j}\right)_{p_{i}}\right)$ is one.
(5) Given a finite diagram $\mathcal{F}: \mathcal{J} \rightarrow \operatorname{Sh}(\mathcal{C})$, a sheaf $\mathcal{G}$ and morphisms $e_{j}$ : $\mathcal{F}_{j} \rightarrow \mathcal{G}$ then $\left(\mathcal{G}, e_{j}\right)$ is a colimit of the diagram if and only if for each $i$ the stalk $\left(\mathcal{G}_{p_{i}},\left(e_{j}\right)_{p_{i}}\right)$ is one.

Proof. We will use over and over again that all the stalk functors commute with any finite limits and colimits and hence with products, fibred products, etc. We will also use that injective maps are the monomorphisms and the surjective maps are the epimorphisms. A map of sheaves $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is injective if and only if $\mathcal{F} \rightarrow \mathcal{F} \times{ }_{\mathcal{G}} \mathcal{F}$ is an isomorphism. Hence (1). Similarly, $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ is surjective if and only if $\mathcal{G} \amalg_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism. Hence (2). The maps $a, b: \mathcal{F} \rightarrow \mathcal{G}$ are equal if and only if $\mathcal{F} \times a, \mathcal{G}, b \boldsymbol{\mathcal { F }} \rightarrow \mathcal{F} \times \mathcal{F}$ is an isomorphism. Hence (3). The assertions (4) and (5) follow immediately from the definitions and the remarks at the start of this proof.

00YM Lemma 7.37.3. Let $\mathcal{C}$ be a site and let $\left\{\left(p_{i}, u_{i}\right)\right\}_{i \in I}$ be a family of points. The family is conservative if and only if for every sheaf $\mathcal{F}$ and every $U \in \mathrm{Ob}(\mathcal{C})$ and every pair of distinct sections $s, s^{\prime} \in \mathcal{F}(U), s \neq s^{\prime}$ there exists an $i$ and $x \in u_{i}(U)$ such that the triples $(U, x, s)$ and $\left(U, x, s^{\prime}\right)$ define distinct elements of $\mathcal{F}_{p_{i}}$.

Proof. Suppose that the family is conservative and that $\mathcal{F}, U$, and $s, s^{\prime}$ are as in the lemma. The sections $s, s^{\prime}$ define maps $a, a^{\prime}:\left(h_{U}\right)^{\#} \rightarrow \mathcal{F}$ which are distinct. Hence, by Lemma 7.37 .2 there is an $i$ such that $a_{p_{i}} \neq a_{p_{i}}^{\prime}$. Recall that $\left(h_{U}\right)_{p_{i}}^{\#}=$ $u_{i}(U)$, by Lemmas 7.31.3 and 7.31.5. Hence there exists an $x \in u_{i}(U)$ such that $a_{p_{i}}(x) \neq a_{p_{i}}^{\prime}(x)$ in $\mathcal{F}_{p_{i}}$. Unwinding the definitions you see that $(U, x, s)$ and $\left(U, x, s^{\prime}\right)$ are as in the statement of the lemma.

To prove the converse, assume the condition on the existence of points of the lemma. Let $\phi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of sheaves which is an isomorphism at all the stalks. We have to show that $\phi$ is both injective and surjective, see Lemma 7.12.2. Injectivity is an immediate consequence of the assumption. To show surjectivity we have to show that $\mathcal{G} \amalg_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism (Categories, Lemma 4.13.3). Since this map is clearly surjective, it suffices to check injectivity which follows as $\mathcal{G} \amalg_{\mathcal{F}} \mathcal{G} \rightarrow \mathcal{G}$ is injective on all stalks by assumption.

In the following lemma the points $q_{i, x}$ are exactly all the points of $\mathcal{C} / U$ lying over the point $p_{i}$ according to Lemma 7.34 .2 .

04H6 Lemma 7.37.4. Let $\mathcal{C}$ be a site. Let $U$ be an object of $\mathcal{C}$. let $\left\{\left(p_{i}, u_{i}\right)\right\}_{i \in I}$ be a family of points of $\mathcal{C}$. For $x \in u_{i}(U)$ let $q_{i, x}$ be the point of $\mathcal{C} / U$ constructed in Lemma 7.34.1. If $\left\{p_{i}\right\}$ is a conservative family of points, then $\left\{q_{i, x}\right\}_{i \in I, x \in u_{i}(U)}$ is a conservative family of points of $\mathcal{C} / U$. In particular, if $\mathcal{C}$ has enough points, then so does every localization $\mathcal{C} / U$.

Proof. We know that $j_{U!}$ induces an equivalence $j_{U!}: \operatorname{Sh}(\mathcal{C} / U) \rightarrow \operatorname{Sh}(\mathcal{C}) / h_{U}^{\#}$, see Lemma 7.24 .4 Moreover, we know that $\left(j_{U!} \mathcal{G}\right)_{p_{i}}=\coprod_{x} \mathcal{G}_{q_{i, x}}$, see Lemma 7.34.3. Hence the result follows formally.

The following lemma tells us we can check the existence of points locally on the site.

06UL Lemma 7.37.5. Let $\mathcal{C}$ be a site. Let $\left\{U_{i}\right\}_{i \in I}$ be a family of objects of $\mathcal{C}$. Assume
(1) $\coprod h_{U_{i}}^{\#} \rightarrow *$ is a surjective map of sheaves, and
(2) each localization $\mathcal{C} / U_{i}$ has enough points.

Then $\mathcal{C}$ has enough points.
Proof. For each $i \in I$ let $\left\{p_{j}\right\}_{j \in J_{i}}$ be a conservative family of points of $\mathcal{C} / U_{i}$. For $j \in J_{i}$ denote $q_{j}: S h(p t) \rightarrow S h(\mathcal{C})$ the composition of $p_{j}$ with the localization morphism $\operatorname{Sh}\left(\mathcal{C} / U_{i}\right) \rightarrow \operatorname{Sh}(\mathcal{C})$. Then $q_{j}$ is a point, see Lemma 7.33.2. We claim that the family of points $\left\{q_{j}\right\}_{j \in \amalg J_{i}}$ is conservative. Namely, let $\mathcal{F} \rightarrow \mathcal{G}$ be a map of sheaves on $\mathcal{C}$ such that $\mathcal{F}_{q_{j}} \rightarrow \mathcal{G}_{q_{j}}$ is an isomorphism for all $j \in \amalg J_{i}$. Let $W$ be an object of $\mathcal{C}$. By assumption (1) there exists a covering $\left\{W_{a} \rightarrow W\right\}$ and morphisms $W_{a} \rightarrow U_{i(a)}$. Since $\left(\left.\mathcal{F}\right|_{\mathcal{C} / U_{i(a)}}\right)_{p_{j}}=\mathcal{F}_{q_{j}}$ and $\left(\left.\mathcal{G}\right|_{\mathcal{C} / U_{i(a)}}\right)_{p_{j}}=\mathcal{G}_{q_{j}}$ by Lemma 7.33 .2 we see that $\left.\left.\mathcal{F}\right|_{U_{i(a)}} \rightarrow \mathcal{G}\right|_{U_{i(a)}}$ is an isomorphism since the family of points $\left\{p_{j}\right\}_{j \in J_{i(a)}}$ is conservative. Hence $\mathcal{F}\left(W_{a}\right) \rightarrow \mathcal{G}\left(W_{a}\right)$ is bijective for each a. Similarly $\mathcal{F}\left(W_{a} \times_{W} W_{b}\right) \rightarrow \mathcal{G}\left(W_{a} \times_{W} W_{b}\right)$ is bijective for each $a, b$. By the sheaf condition this shows that $\mathcal{F}(W) \rightarrow \mathcal{G}(W)$ is bijective, i.e., $\mathcal{F} \rightarrow \mathcal{G}$ is an isomorphism.

### 7.38. Criterion for existence of points

$00 Y \mathrm{~N}$ This section corresponds to Deligne's appendix to AGV71, Exposé VI]. In fact it is almost literally the same.

Let $\mathcal{C}$ be a site. Suppose that $(I, \geq)$ is a directed partially ordered set, and that $\left(U_{i}, f_{i i^{\prime}}\right)$ is an inverse system over $I$, see Categories, Definition 4.21.1. Given the data $\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)$ we define

$$
u: \mathcal{C} \longrightarrow \text { Sets }, \quad u(V)=\operatorname{colim}_{i} \operatorname{Mor}_{\mathcal{C}}\left(U_{i}, V\right)
$$

Let $\mathcal{F} \mapsto \mathcal{F}_{p}$ be the stalk functor associated to $u$ as in Section 7.31. It is direct from the definition that actually

$$
\mathcal{F}_{p}=\operatorname{colim}_{i} \mathcal{F}\left(U_{i}\right)
$$

in this special case. Note that $u$ commutes with all finite limits (I mean those that are representable in $\mathcal{C}$ ) because each of the functors $V \mapsto \operatorname{Mor}_{\mathcal{C}}\left(U_{i}, V\right)$ do, see Categories, Lemma 4.19.2.
We say that a system $\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)$ is a refinement of $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$ if $J \subset I$, the ordering on $J$ induced from that of $I$ and $V_{j}=U_{j}, g_{j j^{\prime}}=f_{j j^{\prime}}$ (in words, the inverse system over $J$ is induced by that over $I$ ). Let $u$ be the functor associated to $\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)$ and let $u^{\prime}$ be the functor associated to $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$. This induces a transformation of functors

$$
u^{\prime} \longrightarrow u
$$

simply because the colimits for $u^{\prime}$ are over a subsystem of the systems in the colimits for $u$. In particular we get an associated transformation of stalk functors $\mathcal{F}_{p^{\prime}} \rightarrow \mathcal{F}_{p}$, see Lemma 7.36.1

00 YO Lemma 7.38.1. Let $\mathcal{C}$ be a site. Let $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$ be a system as above with associated pair of functors $\left(u^{\prime}, p^{\prime}\right)$. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Let $s, s^{\prime} \in \mathcal{F}_{p^{\prime}}$ be distinct elements. Let $\left\{W_{k} \rightarrow W\right\}$ be a finite covering of $\mathcal{C}$. Let $f \in u^{\prime}(W)$. There exists a refinement $\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)$ of $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$ such that $s, s^{\prime}$ map to distinct elements of $\mathcal{F}_{p}$ and that the image of $f$ in $u(W)$ is in the image of one of the $u\left(W_{k}\right)$.
Proof. There exists a $j_{0} \in J$ such that $f$ is defined by $f^{\prime}: V_{j_{0}} \rightarrow W$. For $j \geq j_{0}$ we set $V_{j, k}=V_{j} \times{ }_{f^{\prime} \circ f_{j j_{0}}, W} W_{k}$. Then $\left\{V_{j, k} \rightarrow V_{j}\right\}$ is a finite covering in the site $\mathcal{C}$. Hence $\mathcal{F}\left(V_{j}\right) \subset \prod_{k} \mathcal{F}\left(V_{j, k}\right)$. By Categories, Lemma 4.19.2 once again we see that

$$
\mathcal{F}_{p^{\prime}}=\operatorname{colim}_{j} \mathcal{F}\left(V_{j}\right) \longrightarrow \prod_{k} \operatorname{colim}_{j} \mathcal{F}\left(V_{j, k}\right)
$$

is injective. Hence there exists a $k$ such that $s$ and $s^{\prime}$ have distinct image in $\operatorname{colim}_{j} \mathcal{F}\left(V_{j, k}\right)$. Let $J_{0}=\left\{j \in J, j \geq j_{0}\right\}$ and $I=J \amalg J_{0}$. We order $I$ so that no element of the second summand is smaller than any element of the first, but otherwise using the ordering on $J$. If $j \in I$ is in the first summand then we use $V_{j}$ and if $j \in I$ is in the second summand then we use $V_{j, k}$. We omit the definition of the transition maps of the inverse system. By the above it follows that $s, s^{\prime}$ have distinct image in $\mathcal{F}_{p}$. Moreover, the restriction of $f^{\prime}$ to $V_{j, k}$ factors through $W_{k}$ by construction.

00YP Lemma 7.38.2. Let $\mathcal{C}$ be a site. Let $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$ be a system as above with associated pair of functors $\left(u^{\prime}, p^{\prime}\right)$. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Let $s, s^{\prime} \in \mathcal{F}_{p^{\prime}}$ be distinct elements. There exists a refinement $\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)$ of $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$ such that $s, s^{\prime}$ map to distinct elements of $\mathcal{F}_{p}$ and such that for every finite covering $\left\{W_{k} \rightarrow W\right\}$ of the site $\mathcal{C}$, and any $f \in u^{\prime}(W)$ the image of $f$ in $u(W)$ is in the image of one of the $u\left(W_{k}\right)$.
Proof. Let $E$ be the set of pairs $\left(\left\{W_{k} \rightarrow W\right\}, f \in u^{\prime}(W)\right)$. Consider pairs $\left(E^{\prime} \subset\right.$ $\left.E,\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)\right)$ such that
(1) $\left(I, \geq, U_{i}, g_{i i^{\prime}}\right)$ is a refinement of $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$,
(2) $s, s^{\prime}$ map to distinct elements of $\mathcal{F}_{p}$, and
(3) for every pair $\left(\left\{W_{k} \rightarrow W\right\}, f \in u^{\prime}(W)\right) \in E^{\prime}$ we have that the image of $f$ in $u(W)$ is in the image of one of the $u\left(W_{k}\right)$.
We order such pairs by inclusion in the first factor and by refinement in the second. Denote $\mathcal{S}$ the class of all pairs $\left(E^{\prime} \subset E,\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)\right)$ as above. We claim that the hypothesis of Zorn's lemma holds for $\mathcal{S}$. Namely, suppose that $\left(E_{a}^{\prime},\left(I_{a}, \geq\right.\right.$ $\left.\left., U_{i}, f_{i i^{\prime}}\right)\right)_{a \in A}$ is a totally ordered subset of $\mathcal{S}$. Then we can define $E^{\prime}=\bigcup_{a \in A} E_{a}^{\prime}$ and we can set $I=\bigcup_{a \in A} I_{a}$. We claim that the corresponding pair $\left(E^{\prime},\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)\right)$ is an element of $\mathcal{S}$. Conditions (1) and (3) are clear. For condition (2) you note that

$$
u=\operatorname{colim}_{a \in A} u_{a} \text { and correspondingly } \mathcal{F}_{p}=\operatorname{colim}_{a \in A} \mathcal{F}_{p_{a}}
$$

The distinctness of the images of $s, s^{\prime}$ in this stalk follows from the description of a directed colimit of sets, see Categories, Section 4.19 . We will simply write $\left(E^{\prime},(I, \ldots)\right)=\bigcup_{a \in A}\left(E_{a}^{\prime},\left(I_{a}, \ldots\right)\right)$ in this situation.
OK, so Zorn's Lemma would apply if $\mathcal{S}$ was a set, and this would, combined with Lemma 7.38.1 above easily prove the lemma. It doesn't since $\mathcal{S}$ is a class. In order to circumvent this we choose a well ordering on $E$. For $e \in E$ set $E_{e}^{\prime}=\left\{e^{\prime} \in E \mid\right.$ $\left.e^{\prime} \leq e\right\}$. By transfinite induction we construct pairs $\left(E_{e}^{\prime},\left(I_{e}, \ldots\right)\right) \in \mathcal{S}$ such that $e_{1} \leq e_{2} \Rightarrow\left(E_{e_{1}}^{\prime},\left(I_{e_{1}}, \ldots\right)\right) \leq\left(E_{e_{2}}^{\prime},\left(I_{e_{2}}, \ldots\right)\right)$. Let $e \in E$, say $e=\left(\left\{W_{k} \rightarrow W\right\}, f \in\right.$
$\left.u^{\prime}(W)\right)$. If $e$ has a predecessor $e-1$, then we let $\left(I_{e}, \ldots\right)$ be a refinement of $\left(I_{e-1}, \ldots\right)$ as in Lemma 7.38.1 with respect to the system $e=\left(\left\{W_{k} \rightarrow W\right\}, f \in u^{\prime}(W)\right)$. If $e$ does not have a predecessor, then we let $\left(I_{e}, \ldots\right)$ be a refinement of $\bigcup_{e^{\prime}<e}\left(I_{e^{\prime}}, \ldots\right)$ with respect to the system $e=\left(\left\{W_{k} \rightarrow W\right\}, f \in u^{\prime}(W)\right)$. Finally, the union $\bigcup_{e \in E} I_{e}$ will be a solution to the problem posed in the lemma.

00 YQ Proposition 7.38.3. Let $\mathcal{C}$ be a site. Assume that
(1) finite limits exist in $\mathcal{C}$, and
(2) every covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ has a refinement by a finite covering of $\mathcal{C}$.

Then $\mathcal{C}$ has enough points.
Proof. We have to show that given any sheaf $\mathcal{F}$ on $\mathcal{C}$, any $U \in \operatorname{Ob}(\mathcal{C})$, and any distinct sections $s, s^{\prime} \in \mathcal{F}(U)$, there exists a point $p$ such that $s, s^{\prime}$ have distinct image in $\mathcal{F}_{p}$. See Lemma 7.37.3. Consider the system $\left(J, \geq, V_{j}, g_{j j^{\prime}}\right)$ with $J=\{1\}$, $V_{1}=U, g_{11}=\mathrm{id}_{U}$. Apply Lemma 7.38.2. By the result of that lemma we get a $\operatorname{system}\left(I, \geq, U_{i}, f_{i i^{\prime}}\right)$ refining our system such that $s_{p} \neq s_{p}^{\prime}$ and such that moreover for every finite covering $\left\{W_{k} \rightarrow W\right\}$ of the site $\mathcal{C}$ the map $\coprod_{k} u\left(W_{k}\right) \rightarrow u(W)$ is surjective. Since every covering of $\mathcal{C}$ can be refined by a finite covering we conclude that $\coprod_{k} u\left(W_{k}\right) \rightarrow u(W)$ is surjective for any covering $\left\{W_{k} \rightarrow W\right\}$ of the site $\mathcal{C}$. This implies that $u=p$ is a point, see Proposition 7.32 .2 (and the discussion at the beginning of this section which guarantees that $u$ commutes with finite limits).

### 7.39. Weakly contractible objects

090 J A weakly contractible object of a site is one that satisfies the equivalent conditions of the following lemma.

090K Lemma 7.39.1. Let $\mathcal{C}$ be a site. Let $U$ be an object of $\mathcal{C}$. The following conditions are equivalent
(1) For every covering $\left\{U_{i} \rightarrow U\right\}$ there exists a map of sheaves $h_{U}^{\#} \rightarrow \coprod h_{U_{i}}^{\#}$ right inverse to the sheafification of $\coprod h_{U_{i}} \rightarrow h_{U}$.
(2) For every surjection of sheaves of sets $\mathcal{F} \rightarrow \mathcal{G}$ the map $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ is surjective.

Proof. Assume (1) and let $\mathcal{F} \rightarrow \mathcal{G}$ be a surjective map of sheaves of sets. For $s \in \mathcal{G}(U)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ and $t_{i} \in \mathcal{F}\left(U_{i}\right)$ mapping to $\left.s\right|_{U_{i}}$, see Definition 7.12.1. Think of $t_{i}$ as a map $t_{i}: h_{U_{i}}^{\#} \rightarrow \mathcal{F}$ via 7.13.3.1. Then precomposing $\coprod t_{i}: \coprod h_{U_{i}}^{\#} \rightarrow \mathcal{F}$ with the map $h_{U}^{\#} \rightarrow \coprod h_{U_{i}}^{\#}$ we get from (1) we obtain a section $t \in \mathcal{F}(U)$ mapping to $s$. Thus (2) holds.
Assume (2) holds. Let $\left\{U_{i} \rightarrow U\right\}$ be a covering. Then $\coprod h_{U_{i}}^{\#} \rightarrow h_{U}^{\#}$ is surjective (Lemma 7.13.4). Hence by (2) there exists a section $s$ of $\coprod h_{U_{i}}^{\#}$ mapping to the section $\operatorname{id}_{U}$ of $h_{U}^{\#}$. This section corresponds to a map $h_{U}^{\#} \rightarrow \coprod h_{U_{i}}^{\#}$ which is right inverse to the sheafification of $\coprod h_{U_{i}} \rightarrow h_{U}$ which proves (1).

090L Definition 7.39.2. Let $\mathcal{C}$ be a site.
(1) We say an object $U$ of $\mathcal{C}$ is weakly contractible if the equivalent conditions of Lemma 7.39.1 hold.
(2) We say a site has enough weakly contractible objects if every object $U$ of $\mathcal{C}$ has a covering $\left\{U_{i} \rightarrow U\right\}$ with $U_{i}$ weakly contractible for all $i$.
(3) More generally, if $P$ is a property of objects of $\mathcal{C}$ we say that $\mathcal{C}$ has enough $P$ objects if every object $U$ of $\mathcal{C}$ has a covering $\left\{U_{i} \rightarrow U\right\}$ such that $U_{i}$ has $P$ for all $i$.

The small étale site of $\mathbf{A}_{\mathbf{C}}^{1}$ does not have any weakly contractible objects. On the other hand, the small pro-étale site of any scheme has enough contractible objects.

### 7.40. Exactness properties of pushforward

04D5 Let $f$ be a morphism of topoi. The functor $f_{*}$ in general is only left exact. There are many additional conditions one can impose on this functor to single out particular classes of morphisms of topoi. We collect them here and note some of the logical dependencies. Some parts of the following lemma are purely category theoretical (i.e., they do not depend on having a morphism of topoi, just having a pair of adjoint functors is enough).

04D6 Lemma 7.40.1. Let $f: S h(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{D})$ be a morphism of topoi. Consider the following properties (on sheaves of sets):
(1) $f_{*}$ is faithful,
(2) $f_{*}$ is fully faithful,
(3) $f^{-1} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ is surjective for all $\mathcal{F}$ in $\operatorname{Sh}(\mathcal{C})$,
(4) $f_{*}$ transforms surjections into surjections,
(5) $f_{*}$ commutes with coequalizers,
(6) $f_{*}$ commutes with pushouts,
(7) $f^{-1} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ is an isomorphism for all $\mathcal{F}$ in $\operatorname{Sh}(\mathcal{C})$,
(8) $f_{*}$ reflects injections,
(9) $f_{*}$ reflects surjections,
(10) $f_{*}$ reflects bijections, and
(11) for any surjection $\mathcal{F} \rightarrow f^{-1} \mathcal{G}$ there exists a surjection $\mathcal{G}^{\prime} \rightarrow \mathcal{G}$ such that $f^{-1} \mathcal{G}^{\prime} \rightarrow f^{-1} \mathcal{G}$ factors through $\mathcal{F} \rightarrow f^{-1} \mathcal{G}$.
Then we have the following implications
(a) (2) $\Rightarrow$ (1),
(b) (3) $\Rightarrow$ (1),
(c) $(7) \Rightarrow(1),(2),(3),(8),(9),(10)$.
(d) $(3) \Leftrightarrow(9)$,
(e) (6) $\Rightarrow$ (4) and (5) $\Rightarrow$ (4),
(f) (4) $\Leftrightarrow$ (11),
(g) (9) $\Rightarrow$ (8), (10), and
(h) (2) $\Leftrightarrow$ (7).

Picture
(6)

$(9) \Longrightarrow(8)$

$(3) \Longrightarrow(1)$

Proof. Proof of (a): This is immediate from the definitions.
Proof of (b). Suppose that $a, b: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ are maps of sheaves on $\mathcal{C}$. If $f_{*} a=f_{*} b$, then $f^{-1} f_{*} a=f^{-1} f_{*} b$. Consider the commutative diagram

If the bottom two arrows are equal and the vertical arrows are surjective then the top two arrows are equal. Hence (b) follows.

Proof of (c). Suppose that $a: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is a map of sheaves on $\mathcal{C}$. Consider the commutative diagram

If (7) holds, then the vertical arrows are isomorphisms. Hence if $f_{*} a$ is injective (resp. surjective, resp. bijective) then the bottom arrow is injective (resp. surjective, resp. bijective) and hence the top arrow is injective (resp. surjective, resp. bijective). Thus we see that (7) implies (8), (9), (10). It is clear that (7) implies (3). The implications $(7) \Rightarrow(2)$, (1) follow from (a) and (h) which we will see below.
Proof of (d). Assume (3). Suppose that $a: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is a map of sheaves on $\mathcal{C}$ such that $f_{*} a$ is surjective. As $f^{-1}$ is exact this implies that $f^{-1} f_{*} a: f^{-1} f_{*} \mathcal{F} \rightarrow$ $f^{-1} f_{*} \mathcal{F}^{\prime}$ is surjective. Combined with (3) this implies that $a$ is surjective. This means that (9) holds. Assume (9). Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. We have to show that the map $f^{-1} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ is surjective. It suffices to show that $f_{*} f^{-1} f_{*} \mathcal{F} \rightarrow f_{*} \mathcal{F}$ is surjective. And this is true because there is a canonical map $f_{*} \mathcal{F} \rightarrow f_{*} f^{-1} f_{*} \mathcal{F}$ which is a one-sided inverse.

Proof of (e). We use Categories, Lemma 4.13.3 without further mention. If $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is surjective then $\mathcal{F}^{\prime} \amalg_{\mathcal{F}} \mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime}$ is an isomorphism. Hence (6) implies that

$$
f_{*} \mathcal{F}^{\prime} \amalg_{f_{*} \mathcal{F}} f_{*} \mathcal{F}^{\prime}=f_{*}\left(\mathcal{F}^{\prime} \amalg_{\mathcal{F}} \mathcal{F}^{\prime}\right) \longrightarrow f_{*} \mathcal{F}^{\prime}
$$

is an isomorphism also. And this in turn implies that $f_{*} \mathcal{F} \rightarrow f_{*} \mathcal{F}^{\prime}$ is surjective. Hence we see that (6) implies (4). If $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is surjective then $\mathcal{F}^{\prime}$ is the coequalizer of the two projections $\mathcal{F} \times \mathcal{F}^{\prime} \mathcal{F} \rightarrow \mathcal{F}$ by Lemma 7.12.3. Hence if (5) holds, then $f_{*} \mathcal{F}^{\prime}$ is the coequalizer of the two projections

$$
f_{*}\left(\mathcal{F} \times_{\mathcal{F}^{\prime}} \mathcal{F}\right)=f_{*} \mathcal{F} \times f_{*} \mathcal{F}^{\prime} f_{*} \mathcal{F} \longrightarrow f_{*} \mathcal{F}
$$

which clearly means that $f_{*} \mathcal{F} \rightarrow f_{*} \mathcal{F}^{\prime}$ is surjective. Hence (5) implies (4) as well. Proof of (f). Assume (4). Let $\mathcal{F} \rightarrow f^{-1} \mathcal{G}$ be a surjective map of sheaves on $\mathcal{C}$. By (4) we see that $f_{*} \mathcal{F} \rightarrow f_{*} f^{-1} \mathcal{G}$ is surjective. Let $\mathcal{G}^{\prime}$ be the fibre product

so that $\mathcal{G}^{\prime} \rightarrow \mathcal{G}$ is surjective also. Consider the commutative diagram

and we see the required result. Conversely, assume (11). Let $a: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ be surjective map of sheaves on $\mathcal{C}$. Consider the fibre product diagram

Because the lower horizontal arrow is surjective and by (11) we can find a surjection $\gamma: \mathcal{G}^{\prime} \rightarrow f_{*} \mathcal{F}^{\prime}$ such that $f^{-1} \gamma$ factors through $\mathcal{F}^{\prime \prime} \rightarrow f^{-1} f_{*} \mathcal{F}^{\prime}$ :

Pushing this down using $f_{*}$ we get a commutative diagram

which proves that (4) holds.
Proof of (g). Assume (9). We use Categories, Lemma 4.13.3 without further mention. Let $a: \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ be a map of sheaves on $\mathcal{C}$ such that $f_{*} a$ is injective. This means that $f_{*} \mathcal{F} \rightarrow f_{*} \mathcal{F} \times f_{*} \mathcal{F}^{\prime} f_{*} \mathcal{F}=f_{*}\left(\mathcal{F} \times_{\mathcal{F}^{\prime}} \mathcal{F}\right)$ is an isomorphism. Thus by (9) we see that $\mathcal{F} \rightarrow \mathcal{F} \times \mathcal{F}^{\prime} \mathcal{F}$ is surjective, i.e., an isomorphism. Thus $a$ is injective, i.e., (8) holds. Since (10) is trivially equivalent to $(8)+(9)$ we are done with (g). Proof of (h). This is Categories, Lemma 4.24.3.

Here is a condition on a morphism of sites which guarantees that the functor $f_{*}$ transforms surjective maps into surjective maps.
04D7 Lemma 7.40.2. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites associated to the continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$. Assume that for any object $U$ of $\mathcal{C}$ and any covering $\left\{V_{j} \rightarrow\right.$ $u(U)\}$ in $\mathcal{D}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ such that the map of sheaves

$$
\coprod h_{u\left(U_{i}\right)}^{\#} \rightarrow h_{u(U)}^{\#}
$$

factors through the map of sheaves

$$
\coprod h_{V_{j}}^{\#} \rightarrow h_{u(U)}^{\#}
$$

Then $f_{*}$ transforms surjective maps of sheaves into surjective maps of sheaves.
Proof. Let $a: \mathcal{F} \rightarrow \mathcal{G}$ be a surjective map of sheaves on $\mathcal{D}$. Let $U$ be an object of $\mathcal{C}$ and let $s \in f_{*} \mathcal{G}(U)=\mathcal{G}(u(U))$. By assumption there exists a covering $\left\{V_{j} \rightarrow u(U)\right\}$ and sections $s_{j} \in \mathcal{F}\left(V_{j}\right)$ with $a\left(s_{j}\right)=\left.s\right|_{V_{j}}$. Now we may think of the sections $s, s_{j}$ and $a$ as giving a commutative diagram of maps of sheaves

By assumption there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that we can enlarge the commutative diagram above as follows

Because $\mathcal{F}$ is a sheaf the map from the left lower corner to the right upper corner corresponds to a family of sections $s_{i} \in \mathcal{F}\left(u\left(U_{i}\right)\right)$, i.e., sections $s_{i} \in f_{*} \mathcal{F}\left(U_{i}\right)$. The commutativity of the diagram implies that $a\left(s_{i}\right)$ is equal to the restriction of $s$ to $U_{i}$. In other words we have shown that $f_{*} a$ is a surjective map of sheaves.

04D8 Example 7.40.3. Assume $f: \mathcal{D} \rightarrow \mathcal{C}$ satisfies the assumptions of Lemma 7.40.2 Then it is in general not the case that $f_{*}$ commutes with coequalizers or pushouts. Namely, suppose that $f$ is the morphism of sites associated to the morphism of topological spaces $X=\{1,2\} \rightarrow Y=\{*\}$ (see Example 7.15.2), where $Y$ is a singleton space, and $X=\{1,2\}$ is a discrete space with two points. A sheaf $\mathcal{F}$ on $X$ is given by a pair $\left(A_{1}, A_{2}\right)$ of sets. Then $f_{*} \mathcal{F}$ corresponds to the set $A_{1} \times A_{2}$. Hence if $a=\left(a_{1}, a_{2}\right), b=\left(b_{1}, b_{2}\right):\left(A_{1}, A_{2}\right) \rightarrow\left(B_{1}, B_{2}\right)$ are maps of sheaves on $X$, then the coequalizer of $a, b$ is $\left(C_{1}, C_{2}\right)$ where $C_{i}$ is the coequalizer of $a_{i}, b_{i}$, and the coequalizer of $f_{*} a, f_{*} b$ is the coequalizer of

$$
a_{1} \times a_{2}, b_{1} \times b_{2}: A_{1} \times A_{2} \longrightarrow B_{1} \times B_{2}
$$

which is in general different from $C_{1} \times C_{2}$. Namely, if $A_{2}=\emptyset$ then $A_{1} \times A_{2}=\emptyset$, and hence the coequalizer of the displayed arrows is $B_{1} \times B_{2}$, but in general $C_{1} \neq B_{1}$. A similar example works for pushouts.

The following lemma gives a criterion for when a morphism of sites has a functor $f_{*}$ which reflects injections and surjections. Note that this also implies that $f_{*}$ is faithful and that the map $f^{-1} f_{*} \mathcal{F} \rightarrow \mathcal{F}$ is always surjective.
04D9 Lemma 7.40.4. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by the functor $u: \mathcal{C} \rightarrow \mathcal{D}$. Assume that for every object $V$ of $\mathcal{D}$ there exist objects $U_{i}$ of $\mathcal{C}$ and morphisms $u\left(U_{i}\right) \rightarrow V$ such that $\left\{u\left(U_{i}\right) \rightarrow V\right\}$ is a covering of $\mathcal{D}$. In this case the functor $f_{*}: S h(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ reflects injections and surjections.

Proof. Let $\alpha: \mathcal{F} \rightarrow \mathcal{G}$ be maps of sheaves on $\mathcal{D}$. By assumption for every object $V$ of $\mathcal{D}$ we get $\mathcal{F}(V) \subset \prod \mathcal{F}\left(u\left(U_{i}\right)\right)=\prod f_{*} \mathcal{F}\left(U_{i}\right)$ by the sheaf condition for some $U_{i} \in \operatorname{Ob}(\mathcal{C})$ and similarly for $\mathcal{G}$. Hence it is clear that if $f_{*} \alpha$ is injective, then $\alpha$ is injective. In other words $f_{*}$ reflects injections.
Suppose that $f_{*} \alpha$ is surjective. Then for $V, U_{i}, u\left(U_{i}\right) \rightarrow V$ as above and a section $s \in \mathcal{G}(V)$, there exist coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ such that $\left.s\right|_{u\left(U_{i j}\right)}$ is in the image of $\mathcal{F}\left(u\left(U_{i j}\right)\right)$. Since $\left\{u\left(U_{i j}\right) \rightarrow V\right\}$ is a covering (as $u$ is continuous and by the axioms of a site) we conclude that $s$ is locally in the image. Thus $\alpha$ is surjective. In other words $f_{*}$ reflects surjections.

08LS Example 7.40.5. We construct a morphism $f: \mathcal{D} \rightarrow \mathcal{C}$ satisfying the assumptions of Lemma 7.40.4. Namely, let $\varphi: G \rightarrow H$ be a morphism of finite groups. Consider the sites $\mathcal{D}=\mathcal{T}_{G}$ and $\mathcal{C}=\mathcal{T}_{H}$ of countable $G$-sets and $H$-sets and coverings countable families of jointly surjective maps (Example 7.6.5. Let $u: \mathcal{T}_{H} \rightarrow \mathcal{T}_{G}$ be the functor described in Section 7.17 and $f: \mathcal{T}_{G} \rightarrow \mathcal{T}_{H}$ the corresponding morphism of sites. If $\varphi$ is injective, then every countable $G$-set is, as a $G$-set, the quotient of a countable $H$-set (this fails if $\varphi$ isn't injective). Thus $f$ satisfies the hypothesis of Lemma 7.40.4. If the sheaf $\mathcal{F}$ on $\mathcal{T}_{G}$ corresponds to the $G$-set $S$, then the canonical map

$$
f^{-1} f_{*} \mathcal{F} \longrightarrow \mathcal{F}
$$

corresponds to the map

$$
\operatorname{Map}_{G}(H, S) \longrightarrow S, \quad a \longmapsto a\left(1_{H}\right)
$$

If $\varphi$ is injective but not surjective, then this map is surjective (as it should according to Lemma 7.40.4 but not injective in general (for example take $G=\{1\}$, $H=\{1, \sigma\}$, and $S=\{1,2\}$ ). Moreover, the functor $f_{*}$ does not commute with coequalizers or pushouts (for $G=\{1\}$ and $H=\{1, \sigma\}$ ).

### 7.41. Almost cocontinuous functors

04B4 Let $\mathcal{C}$ be a site. The category $P S h(\mathcal{C})$ has an initial object, namely the presheaf which assigns the empty set to each object of $\mathcal{C}$. Let us denote this presheaf by $\emptyset$. It follows from the properties of sheafification that the sheafification $\emptyset^{\#}$ of $\emptyset$ is an initial object of the category $\operatorname{Sh}(\mathcal{C})$ of sheaves on $\mathcal{C}$.

04B5 Definition 7.41.1. Let $\mathcal{C}$ be a site. We say an object $U$ of $\mathcal{C}$ is sheaf theoretically empty if $\emptyset^{\#} \rightarrow h_{U}^{\#}$ is an isomorphism of sheaves.
The following lemma makes this notion more explicit.
04B6 Lemma 7.41.2. Let $\mathcal{C}$ be a site. Let $U$ be an object of $\mathcal{C}$. The following are equivalent:
(1) $U$ is sheaf theoretically empty,
(2) $\mathcal{F}(U)$ is a singleton for each sheaf $\mathcal{F}$,
(3) $\emptyset^{\#}(U)$ is a singleton,
(4) $\emptyset \#(U)$ is nonempty, and
(5) the empty family is a covering of $U$ in $\mathcal{C}$.

Moreover, if $U$ is sheaf theoretically empty, then for any morphism $U^{\prime} \rightarrow U$ of $\mathcal{C}$ the object $U^{\prime}$ is sheaf theoretically empty.

Proof. For any sheaf $\mathcal{F}$ we have $\mathcal{F}(U)=\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}^{\#}, \mathcal{F}\right)$. Hence, we see that (1) and (2) are equivalent. It is clear that (2) implies (3) implies (4). If every covering of $U$ is given by a nonempty family, then $\emptyset^{+}(U)$ is empty by definition of the plus construction. Note that $\emptyset^{+}=\emptyset^{\#}$ as $\emptyset$ is a separated presheaf, see Theorem 7.10.10 Thus we see that (4) implies (5). If (5) holds, then $\mathcal{F}(U)$ is a singleton for every sheaf $\mathcal{F}$ by the sheaf condition for $\mathcal{F}$, see Remark 7.7.2. Thus (5) implies (2) and $(1)-(5)$ are equivalent. The final assertion of the lemma follows from Axiom (3) of Definition 7.6.2 applied the empty covering of $U$.

04B7 Definition 7.41.3. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. We say $u$ is almost cocontinuous if for every object $U$ of $\mathcal{C}$ and every covering $\left\{V_{j} \rightarrow u(U)\right\}_{j \in J}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ in $\mathcal{C}$ such that for each $i$ in $I$ we have at least one of the following two conditions
(1) $u\left(U_{i}\right)$ is sheaf theoretically empty, or
(2) the morphism $u\left(U_{i}\right) \rightarrow u(U)$ factors through $V_{j}$ for some $j \in J$.

The motivation for this definition comes from a closed immersion $i: Z \rightarrow X$ of topological spaces. As discussed in Example 7.20 .9 the continuous functor $X_{Z a r} \rightarrow$ $Z_{Z a r}, U \mapsto Z \cap U$ is not cocontinuous. But it is almost cocontinuous in the sense defined above. We know that $i_{*}$ while not exact on sheaves of sets, is exact on sheaves of abelian groups, see Sheaves, Remark 6.32.5. And this holds in general for continuous and almost cocontinuous functors.

04B8 Lemma 7.41.4. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that $u$ is continuous and almost cocontinuous. Let $\mathcal{G}$ be a presheaf on $\mathcal{D}$ such that $\mathcal{G}(V)$ is a singleton whenever $V$ is sheaf theoretically empty. Then $\left(u^{p} \mathcal{G}\right)^{\#}=u^{p}\left(\mathcal{G}^{\#}\right)$.

Proof. Let $U \in \operatorname{Ob}(\mathcal{C})$. We have to show that $\left(u^{p} \mathcal{G}\right)^{\#}(U)=u^{p}\left(\mathcal{G}^{\#}\right)(U)$. It suffices to show that $\left(u^{p} \mathcal{G}\right)^{+}(U)=u^{p}\left(\mathcal{G}^{+}\right)(U)$ since $\mathcal{G}^{+}$is another presheaf for which the assumption of the lemma holds. We have

$$
u^{p}\left(\mathcal{G}^{+}\right)(U)=\mathcal{G}^{+}(u(U))=\operatorname{colim}_{\mathcal{V}} \check{H}^{0}(\mathcal{V}, \mathcal{G})
$$

where the colimit is over the coverings $\mathcal{V}$ of $u(U)$ in $\mathcal{D}$. On the other hand, we see that

$$
u^{p}(\mathcal{G})^{+}(U)=\operatorname{colim}_{\mathcal{U}} \check{H}^{0}(u(\mathcal{U}), \mathcal{G})
$$

where the colimit is over the category of coverings $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $U$ in $\mathcal{C}$ and $u(\mathcal{U})=\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}_{i \in I}$. The condition that $u$ is continuous means that each $u(\mathcal{U})$ is a covering. Write $I=I_{1} \amalg I_{2}$, where

$$
I_{2}=\left\{i \in I \mid u\left(U_{i}\right) \text { is sheaf theoretically empty }\right\}
$$

Then $u(\mathcal{U})^{\prime}=\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}_{i \in I_{1}}$ is still a covering of because each of the other pieces can be covered by the empty family and hence can be dropped by Axiom (2) of Definition 7.6.2 Moreover, $\check{H}^{0}(u(\mathcal{U}), \mathcal{G})=\check{H}^{0}\left(u(\mathcal{U})^{\prime}, \mathcal{G}\right)$ by our assumption on $\mathcal{G}$. Finally, the condition that $u$ is almost cocontinuous implies that for every covering $\mathcal{V}$ of $u(U)$ there exists a covering $\mathcal{U}$ of $U$ such that $u(\mathcal{U})^{\prime}$ refines $\mathcal{V}$. It follows that the two colimits displayed above have the same value as desired.

04B9 Lemma 7.41.5. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Assume that $u$ is continuous and almost cocontinuous. Then $u^{s}=u^{p}: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ commutes with pushouts and coequalizers (and more generally finite connected colimits).

Proof. Let $\mathcal{I}$ be a finite connected index category. Let $\mathcal{I} \rightarrow S h(\mathcal{D}), i \mapsto \mathcal{G}_{i}$ by a diagram. We know that the colimit of this diagram is the sheafification of the colimit in the category of presheaves, see Lemma 7.10.13. Denote colim ${ }^{\text {Psh }}$ the colimit in the category of presheaves. Since $\mathcal{I}$ is finite and connected we see that $\operatorname{colim}_{i}^{P s h} \mathcal{G}_{i}$ is a presheaf satisfying the assumptions of Lemma 7.41.4 (because a finite connected colimit of singleton sets is a singleton). Hence that lemma gives

$$
\begin{aligned}
u^{s}\left(\operatorname{colim}_{i} \mathcal{G}_{i}\right) & =u^{s}\left(\left(\operatorname{colim}_{i}^{P s h} \mathcal{G}_{i}\right)^{\#}\right) \\
& =\left(u^{p}\left(\operatorname{colim}_{i}^{P s h} \mathcal{G}_{i}\right)\right)^{\#} \\
& =\left(\operatorname{colim}_{i}^{P S h} u^{p}\left(\mathcal{G}_{i}\right)\right)^{\#} \\
& =\operatorname{colim}_{i} u^{s}\left(\mathcal{G}_{i}\right)
\end{aligned}
$$

as desired.
04BA Lemma 7.41.6. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites associated to the continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$. If $u$ is almost cocontinuous then $f_{*}$ commutes with pushouts and coequalizers (and more generally finite connected colimits).

Proof. This is a special case of Lemma 7.41.5

### 7.42. Subtopoi

08LT Here is the definition.
08LU Definition 7.42.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A morphism of topoi $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ is called an embedding if $f_{*}$ is fully faithful.

According to Lemma 7.40.1 this is equivalent to asking the adjunction map $f^{-1} f_{*} \mathcal{F} \rightarrow$ $\mathcal{F}$ to be an isomorphism for every sheaf $\mathcal{F}$ on $\mathcal{D}$.

08LV Definition 7.42.2. Let $\mathcal{C}$ be a site. A strictly full subcategory $E \subset \operatorname{Sh}(\mathcal{C})$ is a subtopos if there exists an embedding of topoi $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ such that $E$ is equal to the essential image of the functor $f_{*}$.

The subtopoi constructed in the following lemma will be dubbed "open" in the definition later on.

08LW Lemma 7.42.3. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. The following are equivalent
(1) $\mathcal{F}$ is a subobject of the final object of $\operatorname{Sh}(\mathcal{C})$, and
(2) the topos $\operatorname{Sh}(\mathcal{C}) / \mathcal{F}$ is a subtopos of $\operatorname{Sh}(\mathcal{C})$.

Proof. We have seen in Lemma 7.29 .1 that $S h(\mathcal{C}) / \mathcal{F}$ is a topos. In fact, we recall the proof. First we apply Lemma 7.28 .5 to see that we may assume $\mathcal{C}$ is a site with a subcanonical topology, fibre products, a final object $X$, and an object $U$ with $\mathcal{F}=h_{U}$. The proof of Lemma 7.29.1 shows that the morphism of topoi $j_{\mathcal{F}}: \operatorname{Sh}(\mathcal{C}) / \mathcal{F} \rightarrow S h(\mathcal{C})$ is equal (modulo certain identifications) to the localization morphism $j_{U}: S h(\mathcal{C} / U) \rightarrow S h(\mathcal{C})$.
Assume (2). This means that $j_{U}^{-1} j_{U, *} \mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism for all sheaves $\mathcal{G}$ on $\mathcal{C} / U$. For any object $Z / U$ of $\mathcal{C} / U$ we have

$$
\left(j_{U, *} h_{Z / U}\right)(U)=\operatorname{Mor}_{\mathcal{C} / U}\left(U \times_{X} U / U, Z / U\right)
$$

by Lemma 7.26.2. Setting $\mathcal{G}=h_{Z / U}$ in the equality above we obtain

$$
\operatorname{Mor}_{\mathcal{C} / U}\left(U \times_{X} U / U, Z / U\right)=\operatorname{Mor}_{\mathcal{C} / U}(U, Z / U)
$$

for all $Z / U$. By Yoneda's lemma (Categories, Lemma 4.3.5) this implies $U \times_{X} U=$ $U$. By Categories, Lemma 4.13.3 $U \rightarrow X$ is a monomorphism, in other words (1) holds.

Assume (1). Then $j_{U}^{-1} j_{U, *}=$ id by Lemma 7.26.4.
08LX Definition 7.42.4. Let $\mathcal{C}$ be a site. A strictly full subcategory $E \subset \operatorname{Sh}(\mathcal{C})$ is an open subtopos if there exists a subsheaf $\mathcal{F}$ of the final object of $\operatorname{Sh}(\mathcal{C})$ such that $E$ is the subtopos $S h(\mathcal{C}) / \mathcal{F}$ described in Lemma 7.42 .3

This means there is a bijection between the collection of open subtopoi of $\operatorname{Sh}(\mathcal{C})$ and the set of subobjects of the final object of $\operatorname{Sh}(\mathcal{C})$. Given an open subtopos there is a "closed" complement.

08LY Lemma 7.42.5. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a subsheaf of the final object $*$ of $\operatorname{Sh}(\mathcal{C})$. The full subcategory of sheaves $\mathcal{G}$ such that $\mathcal{F} \times \mathcal{G} \rightarrow \mathcal{F}$ is an isomorphism is a subtopos of $\operatorname{Sh}(\mathcal{C})$.

Proof. We apply Lemma 7.28 .5 to see that we may assume $\mathcal{C}$ is a site with the properties listed in that lemma. In particular $\mathcal{C}$ has a final object $X$ (so that * $=h_{X}$ ) and an object $U$ with $\mathcal{F}=h_{U}$.

Let $\mathcal{D}=\mathcal{C}$ as a category but a covering is a family $\left\{V_{j} \rightarrow V\right\}$ of morphisms such that $\left\{V_{i} \rightarrow V\right\} \cup\left\{U \times_{X} V \rightarrow V\right\}$ is a covering. By our choice of $\mathcal{C}$ this means exactly that

$$
h_{U \times_{X} V} \amalg \coprod h_{V_{i}} \longrightarrow h_{V}
$$

is surjective. We claim that $\mathcal{D}$ is a site, i.e., the coverings satisfy the conditions (1), (2), (3) of Definition 7.6.2 Condition (1) holds. For condition (2) suppose that $\left\{V_{i} \rightarrow V\right\}$ and $\left\{V_{i j} \rightarrow V_{i}\right\}$ are coverings of $\mathcal{D}$. Then the composition

$$
\coprod\left(h_{U \times_{X} V_{i}} \amalg \coprod h_{V_{i j}}\right) \longrightarrow h_{U \times_{X} V} \amalg \coprod h_{V_{i}} \longrightarrow h_{V}
$$

is surjective. Since each of the morphisms $U \times_{X} V_{i} \rightarrow V$ factors through $U \times_{X} V$ we see that

$$
h_{U \times_{X} V} \amalg \coprod h_{V_{i j}} \longrightarrow h_{V}
$$

is surjective, i.e., $\left\{V_{i j} \rightarrow V\right\}$ is a covering of $V$ in $\mathcal{D}$. Condition (3) follows similarly as a base change of a surjective map of sheaves is surjective.

Note that the (identity) functor $u: \mathcal{C} \rightarrow \mathcal{D}$ is continuous and commutes with fibre products and final objects. Hence we obtain a morphism $f: \mathcal{D} \rightarrow \mathcal{C}$ of sites (Proposition 7.15.6). Observe that $f_{*}$ is the identity functor on underlying presheaves, hence fully faithful. To finish the proof we have to show that the essential image of $f_{*}$ is the full subcategory $E \subset \operatorname{Sh}(\mathcal{C})$ singled out in the lemma. To do this, note that $\mathcal{G} \in \operatorname{Ob}(S h(\mathcal{C}))$ is in $E$ if and only if $\mathcal{G}\left(U \times_{X} V\right)$ is a singleton for all objects $V$ of $\mathcal{C}$. Thus such a sheaf satisfies the sheaf property for all coverings of $\mathcal{D}$ (argument omitted). Conversely, if $\mathcal{G}$ satisfies the sheaf property for all coverings of $\mathcal{D}$, then $\mathcal{G}\left(U \times_{X} V\right)$ is a singleton, as in $\mathcal{D}$ the object $U \times_{X} V$ is covered by the empty covering.

08LZ Definition 7.42.6. Let $\mathcal{C}$ be a site. A strictly full subcategory $E \subset S h(\mathcal{C})$ is an closed subtopos if there exists a subsheaf $\mathcal{F}$ of the final object of $\operatorname{Sh}(\mathcal{C})$ such that $E$ is the subtopos described in Lemma 7.42.5.
All right, and now we can define what it means to have a closed immersion and an open immersion of topoi.
08M0 Definition 7.42.7. Let $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi.
(1) We say $f$ is an open immersion if $f$ is an embedding and the essential image of $f_{*}$ is an open subtopos.
(2) We say $f$ is a closed immersion if $f$ is an embedding and the essential image of $f_{*}$ is a closed subtopos.
08M1 Lemma 7.42.8. Let $i: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a closed immersion of topoi. Then $i_{*}$ is fully faithful, transforms surjections into surjections, commutes with coequalizers, commutes with pushouts, reflects injections, reflects surjections, and reflects bijections.

Proof. Let $\mathcal{F}$ be a subsheaf of the final object $*$ of $S h(\mathcal{C})$ and let $E \subset S h(\mathcal{C})$ be the full subcategory consisting of those $\mathcal{G}$ such that $\mathcal{F} \times \mathcal{G} \rightarrow \mathcal{F}$ is an isomorphism. By Lemma 7.42 .5 the functor $i_{*}$ is isomorphic to the inclusion functor $\iota: E \rightarrow \operatorname{Sh}(\mathcal{C})$.
Let $j_{\mathcal{F}}: S h(\mathcal{C}) / \mathcal{F} \rightarrow S h(\mathcal{C})$ be the localization functor (Lemma 7.29.1). Note that $E$ can also be described as the collection of sheaves $\mathcal{G}$ such that $j_{\mathcal{F}}^{-1} \mathcal{G}=*$.
Let $a, b: \mathcal{G}_{1} \rightarrow \mathcal{G}_{2}$ be two morphism of $E$. To prove $\iota$ commutes with coequalizers it suffices to show that the coequalizer of $a, b$ in $\operatorname{Sh}(\mathcal{C})$ lies in $E$. This is clear because the coequalizer of two morphisms $* \rightarrow *$ is $*$ and because $j_{\mathcal{F}}^{-1}$ is exact. Similarly for pushouts.

Thus $i_{*}$ satisfies properties (5), (6), and (7) of Lemma 7.40.1 and hence the morphism $i$ satisfies all properties mentioned in that lemma, in particular the ones mentioned in this lemma.

### 7.43. Sheaves of algebraic structures

00YR In Sheaves, Section 6.15 we introduced a type of algebraic structure to be a pair $(\mathcal{A}, s)$, where $\mathcal{A}$ is a category, and $s: \mathcal{A} \rightarrow$ Sets is a functor such that
(1) $s$ is faithful,
(2) $\mathcal{A}$ has limits and $s$ commutes with limits,
(3) $\mathcal{A}$ has filtered colimits and $s$ commutes with them, and
(4) $s$ reflects isomorphisms.

For such a type of algebraic structure we saw that a presheaf $\mathcal{F}$ with values in $\mathcal{A}$ on a space $X$ is a sheaf if and only if the associated presheaf of sets is a sheaf. Moreover, we worked out the notion of stalk, and given a continuous map $f: X \rightarrow Y$ we defined adjoint functors pushforward and pullback on sheaves of algebraic structures which agrees with pushforward and pullback on the underlying sheaves of sets. In addition extending a sheaf of algebraic structures from a basis to all opens of a space, works as expected.
Part of this material still works in the setting of sites and sheaves. Let $(\mathcal{A}, s)$ be a type of algebraic structure. Let $\mathcal{C}$ be a site. Let us denote $\operatorname{PSh}(\mathcal{C}, \mathcal{A}), \operatorname{resp} . \operatorname{Sh}(\mathcal{C}, \mathcal{A})$ the category of presheaves, resp. sheaves with values in $\mathcal{A}$ on $\mathcal{C}$.
( $\alpha$ ) A presheaf with values in $\mathcal{A}$ is a sheaf if and only if its underlying presheaf of sets is a sheaf. See the proof of Sheaves, Lemma 6.9.2.
( $\beta$ ) Given a presheaf $\mathcal{F}$ with values in $\mathcal{A}$ the presheaf $\mathcal{F}^{\#}=\left(\mathcal{F}^{+}\right)^{+}$is a sheaf. This is true since the colimits in the sheafification process are filtered, and even colimits over directed partially ordered sets (see Section 7.10 especially the proof of Lemma $\sqrt{7.10 .14}$ ) and since $s$ commutes with filtered colimits.
$(\gamma)$ We get the following commutative diagram

( $\delta$ ) We have $\mathcal{F}=\mathcal{F} \#$ if and only if $\mathcal{F}$ is a sheaf of algebraic structures.
$(\epsilon)$ The functor $\#$ is adjoint to the inclusion functor:

$$
\operatorname{Mor}_{P S h(\mathcal{C}, \mathcal{A})}(\mathcal{G}, \mathcal{F})=\operatorname{Mor}_{S h(\mathcal{C}, \mathcal{A})}\left(\mathcal{G}^{\#}, \mathcal{F}\right)
$$

The proof is the same as the proof of Proposition 7.10.12.
$(\zeta)$ The functor $\mathcal{F} \mapsto \mathcal{F} \#$ is left exact. The proof is the same as the proof of Lemma 7.10 .14 .

00YS Definition 7.43.1. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a functor $u: \mathcal{C} \rightarrow \mathcal{D}$. We define the pushforward functor for presheaves of algebraic structures by the rule $u^{p} \mathcal{F}(U)=\mathcal{F}(u U)$, and for sheaves of algebraic structures by the same rule, namely $f_{*} \mathcal{F}(U)=\mathcal{F}(u U)$.

The problem comes with trying the define the pullback. The reason is that the colimits defining the functor $u_{p}$ in Section 7.5 may not be filtered. Thus the axioms above are not enough in general to define the pullback of a (pre)sheaf of algebraic structures. Nonetheless, in almost all cases the following lemma is sufficient to define pushforward, and pullback of (pre)sheaves of algebraic structures.

00YT Lemma 7.43.2. Suppose the functor $u: \mathcal{C} \rightarrow \mathcal{D}$ satisfies the hypotheses of Proposition 7.15.6, and hence gives rise to a morphism of sites $f: \mathcal{D} \rightarrow \mathcal{C}$. In this case the pullback functor $f^{-1}$ (resp. $u_{p}$ ) and the pushforward functor $f_{*}$ (resp. $u^{p}$ ) extend to an adjoint pair of functors on the categories of sheaves (resp. presheaves) of algebraic structures. Moreover, these functors commute with taking the underlying sheaf (resp. presheaf) of sets.

Proof. We have defined $f_{*}=u^{p}$ above. In the course of the proof of Proposition 7.15 .6 we saw that all the colimits used to define $u_{p}$ are filtered under the assumptions of the proposition. Hence we conclude from the definition of a type of algebraic structure that we may define $u_{p}$ by exactly the same colimits as a functor on presheaves of algebraic structures. Adjointness of $u_{p}$ and $u^{p}$ is proved in exactly the same way as the proof of Lemma 7.5.4. The discussion of sheafification of presheaves of algebraic structures above then implies that we may define $f^{-1}(\mathcal{F})=\left(u_{p} \mathcal{F}\right)^{\#}$.

We briefly discuss a method for dealing with pullback and pushforward for a general morphism of sites, and more generally for any morphism of topoi.
7.43. SHEAVES OF ALGEBRAIC STRUCTURES

Let $\mathcal{C}$ be a site. In the case $\mathcal{A}=A b$, we may think of an abelian (pre)sheaf on $\mathcal{C}$ as a quadruple $(\mathcal{F},+, 0, i)$. Here the data are
(D1) $\mathcal{F}$ is a sheaf of sets,
(D2) $+: \mathcal{F} \times \mathcal{F} \rightarrow \mathcal{F}$ is a morphism of sheaves of sets,
(D3) $0: * \rightarrow \mathcal{F}$ is a morphism from the singleton sheaf (see Example 7.10.2 to $\mathcal{F}$, and
(D4) $i: \mathcal{F} \rightarrow \mathcal{F}$ is a morphism of sheaves of sets.
These data have to satisfy the following axioms

$$
\begin{aligned}
& \text { (A1) }+ \text { is associative and commutative, } \\
& \text { (A2) } 0 \text { is a unit for }+ \text {, and } \\
& \text { (A3) }+\circ(1, i)=0 \circ(\mathcal{F} \rightarrow *)
\end{aligned}
$$

Compare Sheaves, Lemma 6.4.3. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites. Note that since $f^{-1}$ is exact we have $f^{-1} *=*$ and $f^{-1}(\mathcal{F} \times \mathcal{F})=f^{-1} \mathcal{F} \times f^{-1} \mathcal{F}$. Thus we can define $f^{-1} \mathcal{F}$ simply as the quadruple $\left(f^{-1} \mathcal{F}, f^{-1}+, f^{-1} 0, f^{-1} i\right)$. The axioms are going to be preserved because $f^{-1}$ is a functor which commutes with finite limits. Finally it is not hard to check that $f_{*}$ and $f^{-1}$ are adjoint as usual.
In AGV71 this method is used. They introduce something called an "espèce the structure algébrique <<définie par limites projectives finie»". For such an espèce you can use the method described above to define a pair of adjoint functors $f^{-1}$ and $f_{*}$ as above. This clearly works for most algebraic structures that one encounters in practice. Instead of formalizing this construction we simply list those algebraic structures for which this method works (to be verified case by case). In fact, this method works for any morphism of topoi.

00 YV Proposition 7.43.3. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $f=\left(f^{-1}, f_{*}\right)$ be a morphism of topoi from $\operatorname{Sh}(\mathcal{D}) \rightarrow S h(\mathcal{C})$. The method introduced above gives rise to an adjoint pair of functors $\left(f^{-1}, f_{*}\right)$ on sheaves of algebraic structures compatible with taking the underlying sheaves of sets for the following types of algebraic structures:
(1) pointed sets,
(2) abelian groups,
(3) groups,
(4) monoids,
(5) rings,
(6) modules over a fixed ring, and
(7) lie algebras over a fixed field.

Moreover, in each of these cases the results above labeled ( $\alpha$ ), ( $\beta$ ), ( $\gamma$ ), ( $\delta$ ), ( $\epsilon$ ), and ( $\zeta$ ) hold.

Proof. The final statement of the proposition holds simply since each of the listed categories, endowed with the obvious forgetful functor, is indeed a type of algebraic structure in the sense explained at the beginning of this section. See Sheaves, Lemma 6.15.2

Proof of (2). We think of a sheaf of abelian groups as a quadruple $(\mathcal{F},+, 0, i)$ as explained in the discussion preceding the proposition. If $(\mathcal{F},+, 0, i)$ lives on $\mathcal{C}$, then its pullback is defined as $\left(f^{-1} \mathcal{F}, f^{-1}+, f^{-1} 0, f^{-1} i\right)$. If $(\mathcal{G},+, 0, i)$ lives on $\mathcal{D}$, then its pushforward is defined as $\left(f_{*} \mathcal{G}, f_{*}+, f_{*} 0, f_{*} i\right)$. This works because $f_{*}(\mathcal{G} \times \mathcal{G})=f_{*} \mathcal{G} \times f_{*} \mathcal{G}$. Adjointness follows from adjointness of the set based
functors, since

$$
\operatorname{Mor}_{A b(\mathcal{C})}\left(\left(\mathcal{F}_{1},+, 0, i\right),\left(\mathcal{F}_{2},+, 0, i\right)\right)=\left\{\begin{array}{c}
\varphi \in \operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{F}_{1}, \mathcal{F}_{2}\right) \\
\varphi \text { is compatible with }+, 0, i
\end{array}\right\}
$$

Details left to the reader.
This method also works for sheaves of rings by thinking of a sheaf of rings (with unit) as a sixtuple $(\mathcal{O},+, 0, i, \cdot, 1)$ satisfying a list of axioms that you can find in any elementary algebra book.
A sheaf of pointed sets is a pair $(\mathcal{F}, p)$, where $\mathcal{F}$ is a sheaf of sets, and $p: * \rightarrow \mathcal{F}$ is a map of sheaves of sets.

A sheaf of groups is given by a quadruple $(\mathcal{F}, \cdot, 1, i)$ with suitable axioms.
A sheaf of monoids is given by a pair $(\mathcal{F}, \cdot)$ with suitable axiom.
Let $R$ be a ring. An sheaf of $R$-modules is given by a quintuple $\left(\mathcal{F},+, 0, i,\left\{\lambda_{r}\right\}_{r \in R}\right)$, where the quadruple $(\mathcal{F},+, 0, i)$ is a sheaf of abelian groups as above, and $\lambda_{r}: \mathcal{F} \rightarrow$ $\mathcal{F}$ is a family of morphisms of sheaves of sets such that $\lambda_{r} \circ 0=0, \lambda_{r} \circ+=+\circ\left(\lambda_{r}, \lambda_{r}\right)$, $\lambda_{r+r^{\prime}}=+\circ \lambda_{r} \times \lambda_{r^{\prime}} \circ(\mathrm{id}, \mathrm{id}), \lambda_{r r^{\prime}}=\lambda_{r} \circ \lambda_{r^{\prime}}, \lambda_{1}=\mathrm{id}, \lambda_{0}=0 \circ(\mathcal{F} \rightarrow *)$.

We will discuss the category of sheaves of modules over a sheaf of rings in Modules on Sites, Section 18.10 .

00YU Remark 7.43.4. Let $\mathcal{C}, \mathcal{D}$ be sites. Let $u: \mathcal{D} \rightarrow \mathcal{C}$ be a continuous functor which gives rise to a morphism of sites $\mathcal{C} \rightarrow \mathcal{D}$. Note that even in the case of abelian groups we have not defined a pullback functor for presheaves of abelian groups. Since all colimits are representable in the category of abelian groups, we certainly may define a functor $u_{p}^{a b}$ on abelian presheaves by the same colimits as we have used to define $u_{p}$ on presheaves of sets. It will also be the case that $u_{p}^{a b}$ is adjoint to $u^{p}$ on the categories of abelian presheaves. However, it will not always be the case that $u_{p}^{a b}$ agrees with $u_{p}$ on the underlying presheaves of sets.

### 7.44. Pullback maps

06 UM It sometimes happens that a site $\mathcal{C}$ does not have a final object. In this case we define the global section functor as follows.

06UN Definition 7.44.1. The global sections of a presheaf of sets $\mathcal{F}$ over a site $\mathcal{C}$ is the set

$$
\Gamma(\mathcal{C}, \mathcal{F})=\operatorname{Mor}_{P S h(\mathcal{C})}(*, \mathcal{F})
$$

where $*$ is the final object in the category of presheaves on $\mathcal{C}$, i.e., the presheaf which associates to every object a singleton.

Of course the same definition applies to sheaves as well. Here is one way to compute global sections.

0792 Lemma 7.44.2. Let $\mathcal{C}$ be a site. Let $a, b: V \rightarrow U$ be objects of $\mathcal{C}$ such that

$$
h_{V}^{\#} \longrightarrow h_{U}^{\#} \longrightarrow *
$$

is a coequalizer in $\operatorname{Sh}(\mathcal{C})$. Then $\Gamma(\mathcal{C}, \mathcal{F})$ is the equalizer of $a^{*}, b^{*}: \mathcal{F}(U) \rightarrow \mathcal{F}(V)$.
Proof. Since $\operatorname{Mor}_{S h(\mathcal{C})}\left(h_{U}^{\#}, \mathcal{F}\right)=\mathcal{F}(U)$ this is clear from the definitions.

Now, let $f: \operatorname{Sh}(\mathcal{D}) \rightarrow \operatorname{Sh}(\mathcal{C})$ be a morphism of topoi. Then for any sheaf $\mathcal{F}$ on $\mathcal{C}$ there is a pullback map

$$
f^{-1}: \Gamma(\mathcal{C}, \mathcal{F}) \longrightarrow \Gamma\left(\mathcal{D}, f^{-1} \mathcal{F}\right)
$$

Namely, as $f^{-1}$ is exact it transforms $*$ into $*$. We can generalize this a bit by considering a pair of sheaves $\mathcal{F}, \mathcal{G}$ on $\mathcal{C}, \mathcal{D}$ together with a map $f^{-1} \mathcal{F} \rightarrow \mathcal{G}$. Then we compose to get a map

$$
\Gamma(\mathcal{C}, \mathcal{F}) \longrightarrow \Gamma(\mathcal{D}, \mathcal{G})
$$

A slightly more general construction which occurs frequently in nature is the following. Suppose that we have a commutative diagram of morphisms of topoi

Next, suppose that we have a sheaf $\mathcal{F}$ on $\mathcal{C}$. Then there is a pullback map

$$
f^{-1}: g_{*} \mathcal{F} \longrightarrow h_{*} f^{-1} \mathcal{F}
$$

Namely, it is just the map coming from the identification $h_{*} f^{-1} \mathcal{F}=g_{*} f_{*} f^{-1} \mathcal{F}$ together with the canonical map $\mathcal{F} \rightarrow f_{*} f^{-1} \mathcal{F}$ pushed down to $\mathcal{B}$. Again, if we have a pair of sheaves $\mathcal{F}, \mathcal{G}$ on $\mathcal{C}, \mathcal{D}$ together with a map $f^{-1} \mathcal{F} \rightarrow \mathcal{G}$, then we compose to get a map

$$
g_{*} \mathcal{F} \longrightarrow h_{*} \mathcal{G}
$$

Restricting to sections over an object of $\mathcal{B}$ one recovers the pullback map on global sections in many cases, see (insert future reference here). A seemingly more general situation is where we have a commutative diagram of topoi

and a sheaf $\mathcal{G}$ on $\mathcal{C}$. Then there is a map $e^{-1} g_{*} \mathcal{G} \rightarrow h_{*} f^{-1} \mathcal{G}$. Namely, this map is adjoint to a map $g_{*} \mathcal{G} \rightarrow e_{*} h_{*} f^{-1} \mathcal{G}=(e \circ h)_{*} f^{-1} \mathcal{G}$ which is the pullback map just described.

### 7.45. Topologies

00YW In this section we define what a topology on a category is as defined in AGV71. One can develop all of the machinery of sheaves and topoi in this language. A modern exposition of this material can be found in KS06. However, the case of most interest for algebraic geometry is the topology defined by a site on its underlying category. Thus we strongly suggest the first time reader skip this section and all other sections of this chapter!

00YX Definition 7.45.1. Let $\mathcal{C}$ be a category. Let $U \in \mathrm{Ob}(\mathcal{C})$. A sieve $S$ on $U$ is a subpresheaf $S \subset h_{U}$.

In other words, a sieve on $U$ picks out for each object $T \in \mathrm{Ob}(\mathcal{C})$ a subset $S(T)$ of the set of all morphisms $T \rightarrow U$. In fact, the only condition on the collection of subsets $S(T) \subset h_{U}(T)=\operatorname{Mor}_{\mathcal{C}}(T, U)$ is the following rule
$00 Y Y$

$$
\left.\begin{array}{c}
(\alpha: T \rightarrow U) \in S(T)  \tag{7.45.1.1}\\
g: T^{\prime} \rightarrow T
\end{array}\right\} \Rightarrow\left(\alpha \circ g: T^{\prime} \rightarrow U\right) \in S\left(T^{\prime}\right)
$$

A good mental picture to keep in mind is to think of the map $S \rightarrow h_{U}$ as a "morphism from $S$ to $U$ ".
$00 Y Z$ Lemma 7.45.2. Let $\mathcal{C}$ be a category. Let $U \in \operatorname{Ob}(\mathcal{C})$.
(1) The collection of sieves on $U$ is a set.
(2) Inclusion defines a partial ordering on this set.
(3) Unions and intersections of sieves are sieves.

00Z0 (4) Given a family of morphisms $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ of $\mathcal{C}$ with target $U$ there exists a unique smallest sieve $S$ on $U$ such that each $U_{i} \rightarrow U$ belongs to $S\left(U_{i}\right)$.
(5) The sieve $S=h_{U}$ is the maximal sieve.
(6) The empty subpresheaf is the minimal sieve.

Proof. By our definition of subpresheaf, the collection of all subpresheaves of a presheaf $\mathcal{F}$ is a subset of $\prod_{U \in \mathrm{Ob}(\mathcal{C})} \mathcal{P}(\mathcal{F}(U))$. And this is a set. (Here $\mathcal{P}(A)$ denotes the powerset of $A$.) Hence the collection of sieves on $U$ is a set.
The partial ordering is defined by: $S \leq S^{\prime}$ if and only if $S(T) \subset S^{\prime}(T)$ for all $T \rightarrow U$. Notation: $S \subset S^{\prime}$.
Given a collection of sieves $S_{i}, i \in I$ on $U$ we can define $\bigcup S_{i}$ as the sieve with values $\left(\bigcup S_{i}\right)(T)=\bigcup S_{i}(T)$ for all $T \in \mathrm{Ob}(\mathcal{C})$. We define the intersection $\bigcap S_{i}$ in the same way.

Given $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ as in the statement, consider the morphisms of presheaves $h_{U_{i}} \rightarrow h_{U}$. We simply define $S$ as the union of the images (Definition 7.3.5) of these maps of presheaves.
The last two statements of the lemma are obvious.
00Z1 Definition 7.45.3. Let $\mathcal{C}$ be a category. Given a family of morphisms $\left\{f_{i}: U_{i} \rightarrow\right.$ $U\}_{i \in I}$ of $\mathcal{C}$ with target $U$ we say the sieve $S$ on $U$ described in Lemma 7.45 .2 part (4) is the sieve on $U$ generated by the morphisms $f_{i}$.

00Z2 Definition 7.45.4. Let $\mathcal{C}$ be a category. Let $f: V \rightarrow U$ be a morphism of $\mathcal{C}$. Let $S \subset h_{U}$ be a sieve. We define the pullback of $S$ by $f$ to be the sieve $S \times{ }_{U} V$ of $V$ defined by the rule

$$
(\alpha: T \rightarrow V) \in\left(S \times_{U} V\right)(T) \Leftrightarrow(f \circ \alpha: T \rightarrow U) \in S(T)
$$

We leave it to the reader to see that this is indeed a sieve (hint: use Equation 7.45.1.1). We also sometimes call $S \times_{U} V$ the base change of $S$ by $f: V \rightarrow U$.

00Z3 Lemma 7.45.5. Let $\mathcal{C}$ be a category. Let $U \in \operatorname{Ob}(\mathcal{C})$. Let $S$ be a sieve on $U$. If $f: V \rightarrow U$ is in $S$, then $S \times_{U} V=h_{V}$ is maximal.

Proof. Trivial from the definitions.
00Z4 Definition 7.45.6. Let $\mathcal{C}$ be a category. A topology on $\mathcal{C}$ is given by a rule which assigns to every $U \in \mathrm{Ob}(\mathcal{C})$ a subset $J(U)$ of the set of all sieves on $U$ satisfying the following conditions
(1) For every morphism $f: V \rightarrow U$ in $\mathcal{C}$, and every element $S \in J(U)$ the pullback $S \times_{U} V$ is an element of $J(V)$.
(2) If $S$ and $S^{\prime}$ are sieves on $U \in \mathrm{Ob}(\mathcal{C})$, if $S \in J(U)$, and if for all $f \in S(V)$ the pullback $S^{\prime} \times_{U} V$ belongs to $J(V)$, then $S^{\prime}$ belongs to $J(U)$.
(3) For every $U \in \operatorname{Ob}(\mathcal{C})$ the maximal sieve $S=h_{U}$ belongs to $J(U)$.

In this case, the sieves belonging to $J(U)$ are called the covering sieves.
00 Z 5 Lemma 7.45.7. Let $\mathcal{C}$ be a category. Let $J$ be a topology on $\mathcal{C}$. Let $U \in \mathrm{Ob}(\mathcal{C})$.
(1) Finite intersections of elements of $J(U)$ are in $J(U)$.
(2) If $S \in J(U)$ and $S^{\prime} \supset S$, then $S^{\prime} \in J(U)$.

Proof. Let $S, S^{\prime} \in J(U)$. Consider $S^{\prime \prime}=S \cap S^{\prime}$. For every $V \rightarrow U$ in $S(U)$ we have

$$
S^{\prime} \times_{U} V=S^{\prime \prime} \times_{U} V
$$

simply because $V \rightarrow U$ already is in $S$. Hence by the second axiom of the definition we see that $S^{\prime \prime} \in J(U)$.

Let $S \in J(U)$ and $S^{\prime} \supset S$. For every $V \rightarrow U$ in $S(U)$ we have $S^{\prime} \times_{U} V=h_{V}$ by Lemma 7.45.5. Thus $S^{\prime} \times{ }_{U} V \in J(V)$ by the third axiom. Hence $S^{\prime} \in J(U)$ by the second axiom.

00 Z6 Definition 7.45.8. Let $\mathcal{C}$ be a category. Let $J, J^{\prime}$ be two topologies on $\mathcal{C}$. We say that $J$ is finer than $J^{\prime}$ if and only if for every object $U$ of $\mathcal{C}$ we have $J^{\prime}(U) \subset J(U)$.

In other words, any covering sieve of $J^{\prime}$ is a covering sieve of $J$. There exists a finest topology on $\mathcal{C}$, namely that topology where any sieve is a covering sieve. This is called the discrete topology of $\mathcal{C}$. There also exists a coarsest topology. Namely, the topology where $J(U)=\left\{h_{U}\right\}$ for all objects $U$. This is called the chaotic or indiscrete topology.

00Z7 Lemma 7.45.9. Let $\mathcal{C}$ be a category. Let $\left\{J_{i}\right\}_{i \in I}$ be a set of topologies.
(1) The rule $J(U)=\bigcap J_{i}(U)$ defines a topology on $\mathcal{C}$.
(2) There is a coarsest topology finer than all of the topologies $J_{i}$.

Proof. The first part is direct from the definitions. The second follows by taking the intersection of all topologies finer than all of the $J_{i}$.

At this point we can define without any motivation what a sheaf is.
00Z8 Definition 7.45.10. Let $\mathcal{C}$ be a category endowed with a topology $J$. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. We say that $\mathcal{F}$ is a sheaf on $\mathcal{C}$ if for every $U \in \operatorname{Ob}(\mathcal{C})$ and for every covering sieve $S$ of $U$ the canonical map

$$
\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right) \longrightarrow \operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})
$$

is bijective.
Recall that the left hand side of the displayed formula equals $\mathcal{F}(U)$. In other words, $\mathcal{F}$ is a sheaf if and only if a section of $\mathcal{F}$ over $U$ is the same thing as a compatible collection of sections $s_{T, \alpha} \in \mathcal{F}(T)$ parametrized by $(\alpha: T \rightarrow U) \in S(T)$, and this for every covering sieve $S$ on $U$.
$00 \mathrm{Z9}$ Lemma 7.45.11. Let $\mathcal{C}$ be a category. Let $\left\{\mathcal{F}_{i}\right\}_{i \in I}$ be a collection of presheaves of sets on $\mathcal{C}$. For each $U \in \mathrm{Ob}(\mathcal{C})$ denote $J(U)$ the set of sieves $S$ with the following property: For every morphism $V \rightarrow U$, the maps

$$
\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{V}, \mathcal{F}_{i}\right) \longrightarrow \operatorname{Mor}_{P S h(\mathcal{C})}\left(S \times_{U} V, \mathcal{F}_{i}\right)
$$

are bijective for all $i \in I$. Then $J$ defines a topology on $\mathcal{C}$. This topology is the finest topology in which all of the $\mathcal{F}_{i}$ are sheaves.

Proof. If we show that $J$ is a topology, then the last statement of the lemma immediately follows. The first and second axioms of a topology are immediately verified. Thus, assume that we have an object $U$, and sieves $S, S^{\prime}$ of $U$ such that $S \in J(U)$, and for all $V \rightarrow U$ in $S(V)$ we have $S^{\prime} \times_{U} V \in J(V)$. We have to show that $S^{\prime} \in J(U)$. In other words, we have to show that for any $f: W \rightarrow U$, the maps

$$
\mathcal{F}_{i}(W)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{W}, \mathcal{F}_{i}\right) \longrightarrow \operatorname{Mor}_{P S h(\mathcal{C})}\left(S^{\prime} \times_{U} W, \mathcal{F}_{i}\right)
$$

are bijective for all $i \in I$. Pick an element $i \in I$ and pick an element $\varphi \in$ $\operatorname{Mor}_{P S h(\mathcal{C})}\left(S^{\prime} \times_{U} W, \mathcal{F}_{i}\right)$. We will construct a section $s \in \mathcal{F}_{i}(W)$ mapping to $\varphi$.
Suppose $\alpha: V \rightarrow W$ is an element of $S \times_{U} W$. According to the definition of pullbacks we see that the composition $f \circ \alpha: V \rightarrow W \rightarrow U$ is in $S$. Hence $S^{\prime} \times_{U} V$ is in $J(W)$ by assumption on the pair of sieves $S, S^{\prime}$. Now we have a commutative diagram of presheaves

The restriction of $\varphi$ to $S^{\prime} \times_{U} V$ corresponds to an element $s_{V, \alpha} \in \mathcal{F}_{i}(V)$. This we see from the definition of $J$, and because $S^{\prime} \times_{U} V$ is in $J(W)$. We leave it to the reader to check that the rule $(V, \alpha) \mapsto s_{V, \alpha}$ defines an element $\psi \in \operatorname{Mor}_{P S h(\mathcal{C})}\left(S \times_{U} W, \mathcal{F}_{i}\right)$. Since $S \in J(U)$ we see immediately from the definition of $J$ that $\psi$ corresponds to an element $s$ of $\mathcal{F}_{i}(W)$.
We leave it to the reader to verify that the construction $\varphi \mapsto s$ is inverse to the natural map displayed above.

00ZA Definition 7.45.12. Let $\mathcal{C}$ be a category. The finest topology on $\mathcal{C}$ such that all representable presheaves are sheaves, see Lemma 7.45.11, is called the canonical topology of $\mathcal{C}$.

### 7.46. The topology defined by a site

00ZB Suppose that $\mathcal{C}$ is a category, and suppose that $\operatorname{Cov}_{1}(\mathcal{C})$ and $\operatorname{Cov}_{2}(\mathcal{C})$ are sets of coverings that define the structure of a site on $\mathcal{C}$. In this situation it can happen that the categories of sheaves (of sets) for $\operatorname{Cov}_{1}(\mathcal{C})$ and $\operatorname{Cov}_{2}(\mathcal{C})$ are the same, see for example Lemma 7.8.5.

It turns out that the category of sheaves on $\mathcal{C}$ with respect to some topogy $J$ determines and is determined by the topology $J$. This is a nontrivial statement which we will address later, see Theorem 7.48.2.
Accepting this for the moment it makes sense to study the topology determined by a site.

00ZC Lemma 7.46.1. Let $\mathcal{C}$ be a site with coverings $\operatorname{Cov}(\mathcal{C})$. For every object $U$ of $\mathcal{C}$, let $J(U)$ denote the set of sieves $S$ on $U$ with the following property: there exists a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ so that the sieve $S^{\prime}$ generated by the $f_{i}$ (see Definition 7.45.3) is contained in $S$.
(1) This $J$ is a topology on $\mathcal{C}$.
(2) A presheaf $\mathcal{F}$ is a sheaf for this topology (see Definition 7.45.10) if and only if it is a sheaf on the site (see Definition 7.7.1).

Proof. To prove the first assertion we just note that axioms (1), (2) and (3) of the definition of a site (Definition 7.6.2) directly imply the axioms (3), (2) and (1) of the definition of a topology (Definition 7.45.6). As an example we prove $J$ has property (2). Namely, let $U$ be an object of $\mathcal{C}$, let $S, S^{\prime}$ be sieves on $U$ such that $S \in J(U)$, and such that for every $V \rightarrow U$ in $S(V)$ we have $S^{\prime} \times_{U} V \in J(V)$. By definition of $J(U)$ we can find a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ of the site such that $S$ the image of $h_{U_{i}} \rightarrow h_{U}$ is contained in $S$. Since each $S^{\prime} \times_{U} U_{i}$ is in $J\left(U_{i}\right)$ we see that there are coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ of the site such that $h_{U_{i j}} \rightarrow h_{U_{i}}$ is contained in $S^{\prime} \times_{U} U_{i}$. By definition of the base change this means that $h_{U_{i j}} \rightarrow h_{U}$ is contained in the subpresheaf $S^{\prime} \subset h_{U}$. By axiom (2) for sites we see that $\left\{U_{i j} \rightarrow U\right\}$ is a covering of $U$ and we conclude that $S^{\prime} \in J(U)$ by definition of $J$.

Let $\mathcal{F}$ be a presheaf. Suppose that $\mathcal{F}$ is a sheaf in the topology $J$. We will show that $\mathcal{F}$ is a sheaf on the site as well. Let $\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of the site. Let $s_{i} \in \mathcal{F}\left(U_{i}\right)$ be a family of sections such that $\left.s_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}$ for all $i, j$. We have to show that there exists a unique section $s \in \mathcal{F}(U)$ restricting back to the $s_{i}$ on the $U_{i}$. Let $S \subset h_{U}$ be the sieve generated by the $f_{i}$. Note that $S \in J(U)$ by definition. In stead of constructing $s$, by the sheaf condition in the topology, it suffices to construct an element

$$
\varphi \in \operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})
$$

Take $\alpha \in S(T)$ for some object $T \in \mathcal{U}$. This means exactly that $\alpha: T \rightarrow U$ is a morphism which factors through $f_{i}$ for some $i \in I$ (and maybe more than 1 ). Pick such an index $i$ and a factorization $\alpha=f_{i} \circ \alpha_{i}$. Define $\varphi(\alpha)=\alpha_{i}^{*} s_{i}$. If $i^{\prime}$, $\alpha=f_{i} \circ \alpha_{i^{\prime}}^{\prime}$ is a second choice, then $\alpha_{i}^{*} s_{i}=\left(\alpha_{i^{\prime}}^{\prime}\right)^{*} s_{i^{\prime}}$ exactly because of our condition $\left.s_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}$ for all $i, j$. Thus $\varphi(\alpha)$ is well defined. We leave it to the reader to verify that $\varphi$, which in turn determines $s$ is correct in the sense that $s$ restricts back to $s_{i}$.

Let $\mathcal{F}$ be a presheaf. Suppose that $\mathcal{F}$ is a sheaf on the site $(\mathcal{C}, \operatorname{Cov}(\mathcal{C}))$. We will show that $\mathcal{F}$ is a sheaf for the topology $J$ as well. Let $U$ be an object of $\mathcal{C}$. Let $S$ be a covering sieve on $U$ with respect to the topology $J$. Let

$$
\varphi \in \operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})
$$

We have to show there is a unique element in $\mathcal{F}(U)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)$ which restricts back to $\varphi$. By definition there exists a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ such that $f_{i}: U_{i} \in U$ belongs to $S\left(U_{i}\right)$. Hence we can set $s_{i}=\varphi\left(f_{i}\right) \in \mathcal{F}\left(U_{i}\right)$. Then it is a pleasant exercise to see that $\left.s_{i}\right|_{U_{i} \times_{U} U_{j}}=\left.s_{j}\right|_{U_{i} \times_{U} U_{j}}$ for all $i, j$. Thus we obtain the desired section $s$ by the sheaf condition for $\mathcal{F}$ on the site $(\mathcal{C}, \operatorname{Cov}(\mathcal{C}))$. Details left to the reader.

00ZD Definition 7.46.2. Let $\mathcal{C}$ be a site with coverings $\operatorname{Cov}(\mathcal{C})$. The topology associated to $\mathcal{C}$ is the topology $J$ constructed in Lemma 7.46.1 above.

Let $\mathcal{C}$ be a category. Let $\operatorname{Cov}_{1}(\mathcal{C})$ and $\operatorname{Cov}_{2}(\mathcal{C})$ be two coverings defining the structure of a site on $\mathcal{C}$. It may very well happen that the topologies defined by these are the same. If this happens then we say $\operatorname{Cov}_{1}(\mathcal{C})$ and $\operatorname{Cov}_{2}(\mathcal{C})$ define the same topology on $\mathcal{C}$. And if this happens then the categories of sheaves are the same, by Lemma 7.46.1

It is usually the case that we only care about the topology defined by a collection of coverings, and we view the possibility of choosing different sets of coverings as a tool to study the topology.

00ZE Remark 7.46.3. Enlarging the class of coverings. Clearly, if $\operatorname{Cov}(\mathcal{C})$ defines the structure of a site on $\mathcal{C}$ then we may add to $\mathcal{C}$ any set of families of morphisms with fixed target tautologically equivalent (see Definition 7.8.2) to elements of $\operatorname{Cov}(\mathcal{C})$ without changing the topology.

00ZF Remark 7.46.4. Shrinking the class of coverings. Let $\mathcal{C}$ be a site. Consider the power set $\mathcal{S}=P(\operatorname{Arrow}(\mathcal{C}))$ (power set) of the set of morphisms, i.e., the set of all sets of morphisms. Let $\mathcal{S}_{\tau} \subset \mathcal{S}$ be the subset consisting of those $T \in \mathcal{S}$ such that (a) all $\varphi \in T$ have the same target, (b) the collection $\{\varphi\}_{\varphi \in T}$ is tautologically equivalent (see Definition 7.8.2) to some covering in $\operatorname{Cov}(\mathcal{C})$. Clearly, considering the elements of $\mathcal{S}_{\tau}$ as the coverings, we do not get exactly the notion of a site as defined in Definition 7.6.2. The structure $\left(\mathcal{C}, \mathcal{S}_{\tau}\right)$ we get satisfies slightly modified conditions. The modified conditions are:
$\left(0^{\prime}\right) \operatorname{Cov}(\mathcal{C}) \subset P(\operatorname{Arrow}(\mathcal{C}))$,
(1') If $V \rightarrow U$ is an isomorphism then $\{V \rightarrow U\} \in \operatorname{Cov}(\mathcal{C})$.
(2') If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ and for each $i$ we have $\left\{V_{i j} \rightarrow U_{i}\right\}_{j \in J_{i}} \in$ $\operatorname{Cov}(\mathcal{C})$, then $\left\{V_{i j} \rightarrow U\right\}_{i \in I, j \in J_{i}}$ is tautologically equivalent to an element of $\operatorname{Cov}(\mathcal{C})$.
(3') If $\left\{U_{i} \rightarrow U\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ and $V \rightarrow U$ is a morphism of $\mathcal{C}$ then $U_{i} \times_{U} V$ exists for all $i$ and $\left\{U_{i} \times_{U} V \rightarrow V\right\}_{i \in I}$ is tautologically equivalent to an element of $\operatorname{Cov}(\mathcal{C})$.
And it is easy to verify that, given a structure satisfying ( $0^{\prime}$ ) - ( $3^{\prime}$ ) above, then after suitably enlarging $\operatorname{Cov}(\mathcal{C})$ (compare Sets, Section 3.11) we get a site. Obviously there is little difference between this notion and the actual notion of a site, at least from the point of view of the topology. There are two benefits: because of condition $\left(0^{\prime}\right)$ above the coverings automatically form a set, and because of $\left(0^{\prime}\right)$ the totality of all structures of this type forms a set as well. The price you pay for this is that you have to keep writing "tautologically equivalent" everywhere.

### 7.47. Sheafification in a topology

00ZG In this section we explain the analogue of the sheafification construction in a topology.

Let $\mathcal{C}$ be a category. Let $J$ be a topology on $\mathcal{C}$. Let $\mathcal{F}$ be a presheaf of sets. For every $U \in \mathrm{Ob}(\mathcal{C})$ we define

$$
L \mathcal{F}(U)=\operatorname{colim}_{S \in J(U)^{o p p}} \operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})
$$

as a colimit. Here we think of $J(U)$ as a partially ordered set, ordered by inclusion, see Lemma 7.45.2. The transition maps in the system are defined as follows. If
$S \subset S^{\prime}$ are in $J(U)$, then $S \rightarrow S^{\prime}$ is a morphism of presheaves. Hence there is a natural restriction mapping

$$
\operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F}) \longrightarrow \operatorname{Mor}_{P S h(\mathcal{C})}\left(S^{\prime}, \mathcal{F}\right)
$$

Thus we see that $S \mapsto \operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})$ is a directed system as in Categories, Definition 4.21.1 provided we reverse the ordering on $J(U)$ (which is what the superscript ${ }^{o p p}$ is supposed to indicate). In particular, since $h_{U} \in J(U)$ there is a canonical map

$$
\ell: \mathcal{F}(U) \longrightarrow L \mathcal{F}(U)
$$

coming from the identification $\mathcal{F}(U)=\operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U}, \mathcal{F}\right)$. In addition, the colimit defining $L \mathcal{F}(U)$ is directed since for any pair of covering sieves $S, S^{\prime}$ on $U$ the sieve $S \cap S^{\prime}$ is a covering sieve too, see Lemma 7.45.2.
Let $f: V \rightarrow U$ be a morphism in $\mathcal{C}$. Let $S \in J(U)$. There is a commutative diagram

We can use the left vertical map to get canonical restriction maps

$$
\operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F}) \rightarrow \operatorname{Mor}_{P S h(\mathcal{C})}\left(S \times_{U} V, \mathcal{F}\right)
$$

Base change $S \mapsto S \times_{U} V$ induces an order preserving map $J(U) \rightarrow J(V)$. And the restriction maps define a transformation of functors as in Categories, Lemma categories-lemma-functorial-colimit. Hence we get a natural restriction map

$$
L \mathcal{F}(U) \longrightarrow L \mathcal{F}(V)
$$

00ZH Lemma 7.47.1. In the situation above.
(1) The assignment $U \mapsto L \mathcal{F}(U)$ combined with the restriction mappings defined above is a presheaf.
(2) The maps $\ell$ glue to give a morphism of presheaves $\ell: \mathcal{F} \rightarrow L \mathcal{F}$.
(3) The rule $\mathcal{F} \mapsto(\mathcal{F} \xrightarrow{\ell} L \mathcal{F})$ is a functor.
(4) If $\mathcal{F}$ is a subpresheaf of $\mathcal{G}$, then $L \mathcal{F}$ is a subpresheaf of $L \mathcal{G}$.
(5) The map $\ell: \mathcal{F} \rightarrow L \mathcal{F}$ has the following property: For every section $s \in L \mathcal{F}(U)$ there exists a covering sieve $S$ on $U$ and an element $\varphi \in$ $\operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})$ such that $\ell(\varphi)$ equals the restriction of $s$ to $S$.
Proof. Omitted.
00ZI Definition 7.47.2. Let $\mathcal{C}$ be a category. Let $J$ be a topology on $\mathcal{C}$. We say that a presheaf of sets $\mathcal{F}$ is separated if for every object $U$ and every covering sieve $S$ on $U$ the canonical map $\mathcal{F}(U) \rightarrow \operatorname{Mor}_{P S h(\mathcal{C})}(S, \mathcal{F})$ is injective.

00ZJ Theorem 7.47.3. Let $\mathcal{C}$ be a category. Let $J$ be a topology on $\mathcal{C}$. Let $\mathcal{F}$ be $a$ presheaf of sets.
(1) The presheaf $L \mathcal{F}$ is separated.
(2) If $\mathcal{F}$ is separated, then $L \mathcal{F}$ is a sheaf and the map of presheaves $\mathcal{F} \rightarrow L \mathcal{F}$ is injective.
(3) If $\mathcal{F}$ is a sheaf, then $\mathcal{F} \rightarrow L \mathcal{F}$ is an isomorphism.
(4) The presheaf $L L \mathcal{F}$ is always a sheaf.

Proof. Part (3) is trivial from the definition of $L$ and the definition of a sheaf (Definition 7.45.10). Part (4) follows formally from the others.
We sketch the proof of (1). Suppose $S$ is a covering sieve of the object $U$. Suppose that $\varphi_{i} \in L \mathcal{F}(U), i=1,2$ map to the same element in $\operatorname{Mor}_{P S h(\mathcal{C})}(S, L \mathcal{F})$. We may find a single covering sieve $S^{\prime}$ on $U$ such that both $\varphi_{i}$ are represented by elements $\varphi_{i} \in \operatorname{Mor}_{P S h(\mathcal{C})}\left(S^{\prime}, \mathcal{F}\right)$. We may assume that $S^{\prime}=S$ by replacing both $S$ and $S^{\prime}$ by $S^{\prime} \cap S$ which is also a covering sieve, see Lemma 7.45.2. Suppose $V \in \operatorname{Ob}(\mathcal{C})$, and $\alpha: V \rightarrow U$ in $S(V)$. Then we have $S \times_{U} V=h_{V}$, see Lemma 7.45.5. Thus the restrictions of $\varphi_{i}$ via $V \rightarrow U$ correspond to sections $s_{i, V, \alpha}$ of $\mathcal{F}$ over $V$. The assumption is that there exist a covering sieve $S_{V, \alpha}$ of $V$ such that $s_{i, V, \alpha}$ restrict to the same element of $\operatorname{Mor}_{P S h(\mathcal{C})}\left(S_{V, \alpha}, \mathcal{F}\right)$. Consider the sieve $S^{\prime \prime}$ on $U$ defined by the rule

$$
\begin{aligned}
(f: T \rightarrow U) \in S^{\prime \prime}(T) \Leftrightarrow & \exists V, \alpha: V \rightarrow U, \alpha \in S(V), \\
& \exists g: T \rightarrow V, g \in S_{V, \alpha}(T), \\
& f=\alpha \circ g
\end{aligned}
$$

By axiom (2) of a topology we see that $S^{\prime \prime}$ is a covering sieve on $U$. By construction we see that $\varphi_{1}$ and $\varphi_{2}$ restrict to the same element of $\operatorname{Mor}_{P S h(\mathcal{C})}\left(S^{\prime \prime}, L \mathcal{F}\right)$ as desired.
We sketch the proof of (2). Assume that $\mathcal{F}$ is a separated presheaf of sets on $\mathcal{C}$ with respect to the topology $J$. Let $S$ be a covering sieve of the object $U$ of $\mathcal{C}$. Suppose that $\varphi \in \operatorname{Mor}_{\mathcal{C}}(S, L \mathcal{F})$. We have to find an element $s \in L \mathcal{F}(U)$ restricting to $\varphi$. Suppose $V \in \operatorname{Ob}(\mathcal{C})$, and $\alpha: V \rightarrow U$ in $S(V)$. The value $\varphi(\alpha) \in L \mathcal{F}(V)$ is given by a covering sieve $S_{V, \alpha}$ of $V$ and a morphism of presheaves $\varphi_{V, \alpha}: S_{V, \alpha} \rightarrow \mathcal{F}$. As in the proof above, define a covering sieve $S^{\prime \prime}$ on $U$ by Equation 7.47.3.1). We define

$$
\varphi^{\prime \prime}: S^{\prime \prime} \longrightarrow \mathcal{F}
$$

by the following simple rule: For every $f: T \rightarrow U, f \in S^{\prime \prime}(T)$ choose $V, \alpha, g$ as in Equation 7.47.3.1). Then set

$$
\varphi^{\prime \prime}(f)=\varphi_{V, \alpha}(g)
$$

We claim this is independent of the choice of $V, \alpha, g$. Consider a second such choice $V^{\prime}, \alpha^{\prime}, g^{\prime}$. The restrictions of $\varphi_{V, \alpha}$ and $\varphi_{V^{\prime}, \alpha^{\prime}}$ to the intersection of the following covering sieves on $T$

$$
\left(S_{V, \alpha} \times_{V, g} T\right) \cap\left(S_{V^{\prime}, \alpha^{\prime}} \times \times_{V^{\prime}, g^{\prime}} T\right)
$$

agree. Namely, these restrictions both correspond to the restriction of $\varphi$ to $T$ (via $f)$ and the desired equality follows because $\mathcal{F}$ is separated. Denote the common restriction $\psi$. The independence of choice follows because $\varphi_{V, \alpha}(g)=\psi\left(\mathrm{id}_{T}\right)=$ $\varphi_{V^{\prime}, \alpha^{\prime}}\left(g^{\prime}\right)$. OK, so now $\varphi^{\prime \prime}$ gives an element $s \in L \mathcal{F}(U)$. We leave it to the reader to check that $s$ restricts to $\varphi$.

00ZL Definition 7.47.4. Let $\mathcal{C}$ be a category endowed with a topology $J$. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. The sheaf $\mathcal{F}^{\#}:=L L \mathcal{F}$ together with the canonical map $\mathcal{F} \rightarrow \mathcal{F} \#$ is called the sheaf associated to $\mathcal{F}$.

00ZM Proposition 7.47.5. Let $\mathcal{C}$ be a category endowed with a topology. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. The canonical map $\mathcal{F} \rightarrow \mathcal{F}^{\#}$ has the following universal property: For any map $\mathcal{F} \rightarrow \mathcal{G}$, where $\mathcal{G}$ is a sheaf of sets, there is a unique map $\mathcal{F}^{\#} \rightarrow \mathcal{G}$ such that $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{G}$ equals the given map.

Proof. Same as the proof of Proposition 7.10 .12 .

### 7.48. Topologies and sheaves

00ZN
00ZO Lemma 7.48.1. Let $\mathcal{C}$ be a category endowed with a topology J. Let $U$ be an object of $\mathcal{C}$. Let $S$ be a sieve on $U$. The following are equivalent
(1) The sieve $S$ is a covering sieve.
(2) The sheafification $S^{\#} \rightarrow h_{U}^{\#}$ of the map $S \rightarrow h_{U}$ is an isomorphism.

Proof. First we make a couple of general remarks. We will use that $S^{\#}=L L S$, and $h_{U}^{\#}=L L h_{U}$. In particular, by Lemma 7.47.1, we see that $S^{\#} \rightarrow h_{U}^{\#}$ is injective. Note that $\operatorname{id}_{U} \in h_{U}(U)$. Hence it gives rise to sections of $L h_{U}$ and $h_{U}^{\#}=L L h_{U}$ over $U$ which we will also denote $\mathrm{id}_{U}$.
Suppose $S$ is a covering sieve. It clearly suffices to find a morphism $h_{U} \rightarrow S^{\#}$ such that the composition $h_{U} \rightarrow h_{U}^{\#}$ is the canonical map. To find such a map it suffices to find a section $s \in S^{\#}(U)$ wich restricts to $\mathrm{id}_{U}$. But since $S$ is a covering sieve, the element $\operatorname{id}_{S} \in \operatorname{Mor}_{P S h(\mathcal{C})}(S, S)$ gives rise to a section of $L S$ over $U$ which restricts to $\mathrm{id}_{U}$ in $L h_{U}$. Hence we win.
Suppose that $S^{\#} \rightarrow h_{U}^{\#}$ is an isomorphism. Let $1 \in S^{\#}(U)$ be the element corresponding to $\operatorname{id}_{U}$ in $h_{U}^{\#}(U)$. Because $S^{\#}=L L S$ there exists a covering sieve $S^{\prime}$ on $U$ such that 1 comes from a

$$
\varphi \in \operatorname{Mor}_{P S h(\mathcal{C})}\left(S^{\prime}, L S\right)
$$

This in turn means that for every $\alpha: V \rightarrow U, \alpha \in S^{\prime}(V)$ there exists a covering sieve $S_{V, \alpha}$ on $V$ such that $\varphi\left(\mathrm{id}_{V}\right)$ corresponds to a morphism of presheaves $S_{V, \alpha} \rightarrow S$. In other words $S_{V, \alpha}$ is contained in $S \times_{U} V$. By the second axiom of a topology we see that $S$ is a covering sieve.

00ZP Theorem 7.48.2. Let $\mathcal{C}$ be a category. Let $J, J^{\prime}$ be topologies on $\mathcal{C}$. The following are equivalent
(1) $J=J^{\prime}$,
(2) sheaves for the topology $J$ are the same as sheaves for the topology $J^{\prime}$.

Proof. It is a tautology that if $J=J^{\prime}$ then the notions of sheaves are the same. Conversely, Lemma 7.48.1 characterizes covering sieves in terms of the sheafification functor. But the sheafification functor $\operatorname{PSh}(\mathcal{C}) \rightarrow \operatorname{Sh}(\mathcal{C}, J)$ is the right adjoint of the inclusion functor $\operatorname{Sh}(\mathcal{C}, J) \rightarrow P S h(\mathcal{C})$. Hence if the subcategories $\operatorname{Sh}(\mathcal{C}, J)$ and $S h\left(\mathcal{C}, J^{\prime}\right)$ are the same, then the sheafification functors are the same and hence the collections of covering sieves are the same.
00ZQ Lemma 7.48.3. Assumption and notation as in Theorem 7.48.2. Then $J \subset J^{\prime}$ if and only if every sheaf for the topology $J^{\prime}$ is a sheaf for the topology $J$.

Proof. One direction is clear. For the other direction suppose that $S h\left(\mathcal{C}, J^{\prime}\right) \subset$ $S h(\mathcal{C}, J)$. By formal nonsense this implies that if $\mathcal{F}$ is a presheaf of sets, and $\mathcal{F} \rightarrow \mathcal{F}^{\#}$, resp. $\mathcal{F} \rightarrow \mathcal{F}^{\#, \prime}$ is the sheafification wrt $J$, resp. $J^{\prime}$ then there is a canonical map $\mathcal{F}^{\#} \rightarrow \mathcal{F}^{\#, \prime}$ such that $\mathcal{F} \rightarrow \mathcal{F}^{\#} \rightarrow \mathcal{F}^{\#, \prime}$ equals the canonical map $\mathcal{F} \rightarrow \mathcal{F}^{\#, \prime}$. Of course, $\mathcal{F}^{\#} \rightarrow \mathcal{F}^{\#, \prime}$ identifies the second sheaf as the sheafification
of the first with respect to the topology $J^{\prime}$. Apply this to the map $S \rightarrow h_{U}$ of Lemma 7.48.1. We get a commutative diagram

And clearly, if $S$ is a covering sieve for the topology $J$ then the middle vertical map is an isomorphism (by the lemma) and we conclude that the right vertical map is an isomorphism as it is the sheafification of the one in the middle wrt $J^{\prime}$. By the lemma again we conclude that $S$ is a covering sieve for $J^{\prime}$ as well.

### 7.49. Topologies and continuous functors

00ZR Explain how a continuous functor gives an adjoint pair of functors on sheaves.

### 7.50. Points and topologies

00ZS Recall from Section 7.31 that given a functor $p=u: \mathcal{C} \rightarrow$ Sets we can define a stalk functor

$$
\operatorname{PSh}(\mathcal{C}) \longrightarrow \text { Sets, } \mathcal{F} \longmapsto \mathcal{F}_{p}
$$

00ZT Definition 7.50.1. Let $\mathcal{C}$ be a category. Let $J$ be a topology on $\mathcal{C}$. A point $p$ of the topology is given by a functor $u: \mathcal{C} \rightarrow$ Sets such that
(1) For every covering sieve $S$ on $U$ the map $S_{p} \rightarrow\left(h_{U}\right)_{p}$ is surjective.
(2) The stalk functor $\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sets}, \mathcal{F} \rightarrow \mathcal{F}_{p}$ is exact.

## CHAPTER 8

## Stacks

### 8.1. Introduction

In this very short chapter we introduce stacks, and stacks in groupoids. See DM69, and Vis04.

### 8.2. Presheaves of morphisms associated to fibred categories

02Z9 Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, see Categories, Section 4.32 Suppose that $x, y \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$ are objects in the fibre category over $U$. We are going to define a functor

$$
\operatorname{Mor}(x, y):(\mathcal{C} / U)^{o p p} \longrightarrow \text { Sets. }
$$

In other words this will be a presheaf on $\mathcal{C} / U$, see Sites, Definition 7.2.2. Make a choice of pullbacks as in Categories, Definition 4.32.6. Then, for $f: V \rightarrow U$ we set

$$
\operatorname{Mor}(x, y)(f: V \rightarrow U)=\operatorname{Mor}_{\mathcal{S}_{V}}\left(f^{*} x, f^{*} y\right)
$$

Let $f^{\prime}: V^{\prime} \rightarrow U$ be a second object of $\mathcal{C} / U$. We also have to define the restriction map corresponding to a morphism $g: V^{\prime} / U \rightarrow V / U$ in $\mathcal{C} / U$, in other words $g$ : $V^{\prime} \rightarrow V$ and $f^{\prime}=f \circ g$. This will be a map

$$
\operatorname{Mor}_{\mathcal{S}_{V}}\left(f^{*} x, f^{*} y\right) \longrightarrow \operatorname{Mor}_{\mathcal{S}_{V^{\prime}}}\left(f^{\prime *} x, f^{\prime *} y\right),\left.\quad \phi \longmapsto \phi\right|_{V^{\prime}}
$$

This map will basically be $g^{*}$, except that this transforms an element $\phi$ of the left hand side into an element $g^{*} \phi$ of $\operatorname{Mor}_{\mathcal{S}_{V^{\prime}}}\left(g^{*} f^{*} x, g^{*} f^{*} y\right)$. At this point we use the transformation $\alpha_{g, f}$ of Categories, Lemma 4.32.7. In a formula, the restriction map is described by

$$
\left.\phi\right|_{V^{\prime}}=\left(\alpha_{g, f}\right)_{y}^{-1} \circ g^{*} \phi \circ\left(\alpha_{g, f}\right)_{x} .
$$

Of course, nobody thinks of this restriction map in this way. We will only do this once in order to verify the following lemma.

026A Lemma 8.2.1. This actually does give a presheaf.
Proof. Let $g: V^{\prime} / U \rightarrow V / U$ be as above and similarly $g^{\prime}: V^{\prime \prime} / U \rightarrow V^{\prime} / U$ be morphisms in $\mathcal{C} / U$. So $f^{\prime}=f \circ g$ and $f^{\prime \prime}=f^{\prime} \circ g^{\prime}=f \circ g \circ g^{\prime}$. Let $\phi \in$ $\operatorname{Mor}_{\mathcal{S}_{V}}\left(f^{*} x, f^{*} y\right)$. Then we have

$$
\begin{aligned}
& \left(\alpha_{g \circ g^{\prime}, f}\right)_{y}^{-1} \circ\left(g \circ g^{\prime}\right)^{*} \phi \circ\left(\alpha_{g \circ g^{\prime}, f}\right)_{x} \\
= & \left(\alpha_{g \circ g^{\prime}, f}\right)_{y}^{-1} \circ\left(\alpha_{g^{\prime}, g}\right)_{f^{*} y}^{-1} \circ\left(g^{\prime}\right)^{*} g^{*} \phi \circ\left(\alpha_{g^{\prime}, g}\right)_{f^{*} x} \circ\left(\alpha_{g \circ g^{\prime}, f}\right)_{x} \\
= & \left(\alpha_{g^{\prime}, f^{\prime}}\right)_{y}^{-1} \circ\left(g^{\prime}\right)^{*}\left(\alpha_{g, f}\right)_{y}^{-1} \circ\left(g^{\prime}\right)^{*} g^{*} \phi \circ\left(g^{\prime}\right)^{*}\left(\alpha_{g, f}\right)_{x} \circ\left(\alpha_{g^{\prime}, f^{\prime}}\right)_{x} \\
= & \left(\alpha_{g^{\prime}, f^{\prime}}\right)_{y}^{-1} \circ\left(g^{\prime}\right)^{*}\left(\left(\alpha_{g, f}\right)_{y}^{-1} \circ g^{*} \phi \circ\left(\alpha_{g, f}\right)_{x}\right) \circ\left(\alpha_{g^{\prime}, f^{\prime}}\right)_{x}
\end{aligned}
$$

which is what we want, namely $\left.\phi\right|_{V^{\prime \prime}}=\left.\left(\left.\phi\right|_{V^{\prime}}\right)\right|_{V^{\prime \prime}}$. The first equality holds because $\alpha_{g^{\prime}, g}$ is a transformation of functors, and hence

commutes. The second equality holds because of property (d) of a pseudo functor since $f^{\prime}=f \circ g$ (see Categories, Definition 4.28.5). The last equality follows from the fact that $\left(g^{\prime}\right)^{*}$ is a functor.

From now on we often omit mentioning the transformations $\alpha_{g, f}$ and we simply identify the functors $g^{*} \circ f^{*}$ and $(f \circ g)^{*}$. In particular, given $g: V^{\prime} / U \rightarrow V / U$ the restriction mappings for the presheaf $\operatorname{Mor}(x, y)$ will sometimes be denoted $\phi \mapsto g^{*} \phi$. We formalize the construction in a definition.
02ZB Definition 8.2.2. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, see Categories, Section 4.32. Given an object $U$ of $\mathcal{C}$ and objects $x, y$ of the fibre category, the presheaf of morphisms from $x$ to $y$ is the presheaf

$$
(f: V \rightarrow U) \longmapsto \operatorname{Mor}_{\mathcal{S}_{V}}\left(f^{*} x, f^{*} y\right)
$$

described above. It is denoted $\operatorname{Mor}(x, y)$. The subpresheaf $\operatorname{Isom}(x, y)$ whose values over $V$ is the set of isomorphisms $f^{*} x \rightarrow f^{*} y$ in the fibre category $\mathcal{S}_{V}$ is called the presheaf of isomorphisms from $x$ to $y$.
If $\mathcal{S}$ is fibred in groupoids then of course $\operatorname{Isom}(x, y)=\operatorname{Mor}(x, y)$, and it is customary to use the Isom notation.

042V Lemma 8.2.3. Let $F: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ be a 1-morphism of fibred categories over the category $\mathcal{C}$. Let $U \in \operatorname{Ob}(\mathcal{C})$ and $x, y \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. Then $F$ defines a canonical morphism of presheaves

$$
\operatorname{Mor}_{\mathcal{S}_{1}}(x, y) \longrightarrow \operatorname{Mor}_{\mathcal{S}_{2}}(F(x), F(y))
$$

on $\mathcal{C} / U$.
Proof. By Categories, Definition 4.32 .9 the functor $F$ maps strongly cartesian morphisms to strongly cartesian morphisms. Hence if $f: V \rightarrow U$ is a morphism in $\mathcal{C}$, then there are canonical isomorphisms $\alpha_{V}: f^{*} F(x) \rightarrow F\left(f^{*} x\right), \beta_{V}: f^{*} F(y) \rightarrow$ $F\left(f^{*} y\right)$ such that $f^{*} F(x) \rightarrow F\left(f^{*} x\right) \rightarrow F(x)$ is the canonical morphism $f^{*} F(x) \rightarrow$ $F(x)$, and similarly for $\beta_{V}$. Thus we may define

by $\phi \mapsto \beta_{V}^{-1} \circ F(\phi) \circ \alpha_{V}$. We omit the verification that this is compatible with the restriction mappings.

02ZA Remark 8.2.4. Suppose that $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids. In this case we can prove Lemma 8.2.1 using Categories, Lemma 4.35.4 which says that $\mathcal{S} \rightarrow \mathcal{C}$ is equivalent to the category associated to a contravariant functor $F: \mathcal{C} \rightarrow$ Groupoids.

In the case of the fibred category associated to $F$ we have $g^{*} \circ f^{*}=(f \circ g)^{*}$ on the nose and there is no need to use the maps $\alpha_{g, f}$. In this case the lemma is (even more) trivial. Of course then one uses that the $\operatorname{Mor}(x, y)$ presheaf is unchanged when passing to an equivalent fibred category which follows from Lemma 8.2.3.
04SI Lemma 8.2.5. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, see Categories, Section 4.32. Let $U \in \operatorname{Ob}(\mathcal{C})$ and let $x, y \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$. Denote $x, y$ : $\mathcal{C} / U \rightarrow \mathcal{S}$ also the corresponding 1-morphisms, see Categories, Lemma 4.40.1. Then
(1) the 2 -fibre product $\mathcal{S} \times_{\mathcal{S} \times \mathcal{S},(x, y)} \mathcal{C} / U$ is fibred in setoids over $\mathcal{C} / U$, and
(2) $\operatorname{Isom}(x, y)$ is the presheaf of sets corresponding to this category fibred in setoids, see Categories, Lemma 4.38.6.

Proof. Omitted. Hint: Objects of the 2-fibre product are ( $a: V \rightarrow U, z, a: V \rightarrow$ $U,(\alpha, \beta))$ where $\alpha: z \rightarrow a^{*} x$ and $\beta: z \rightarrow a^{*} y$ are isomorphisms in $\mathcal{S}_{V}$. Thus the relationship with $\operatorname{Isom}(x, y)$ comes by assigning to such an object the isomorphism $\beta \circ \alpha^{-1}$.

### 8.3. Descent data in fibred categories

02ZC In this section we define the notion of a descent datum in the abstract setting of a fibred category. Before we do so we point out that this is completely analogous to descent data for quasi-coherent sheaves (Descent, Section 34.2) and descent data for schemes over schemes (Descent, Section 34.30).

We will use the convention where the projection maps $\mathrm{pr}_{i}: X \times \ldots \times X \rightarrow X$ are labeled starting with $i=0$. Hence we have $\mathrm{pr}_{0}, \mathrm{pr}_{1}: X \times X \rightarrow X, \mathrm{pr}_{0}, \mathrm{pr}_{1}, \mathrm{pr}_{2}$ : $X \times X \times X \rightarrow X$, etc.
026B Definition 8.3.1. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Make a choice of pullbacks as in Categories, Definition 4.32.6. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms of $\mathcal{C}$. Assume all the fibre products $U_{i} \times{ }_{U} U_{j}$, and $U_{i} \times_{U} U_{j} \times_{U} U_{k}$ exist.
(1) A descent datum $\left(X_{i}, \varphi_{i j}\right)$ in $\mathcal{S}$ relative to the family $\left\{f_{i}: U_{i} \rightarrow U\right\}$ is given by an object $X_{i}$ of $\mathcal{S}_{U_{i}}$ for each $i \in I$, an isomorphism $\varphi_{i j}: \operatorname{pr}_{0}^{*} X_{i} \rightarrow \operatorname{pr}_{1}^{*} X_{j}$ in $\mathcal{S}_{U_{i} \times U_{U} U_{j}}$ for each pair $(i, j) \in I^{2}$ such that for every triple of indices $(i, j, k) \in I^{3}$ the diagram

in the category $\mathcal{S}_{U_{i} \times{ }_{U} U_{j} \times{ }_{U} U_{k}}$ commutes. This is called the cocycle condition.
(2) A morphism $\psi:\left(X_{i}, \varphi_{i j}\right) \rightarrow\left(X_{i}^{\prime}, \varphi_{i j}^{\prime}\right)$ of descent data is given by a family $\psi=\left(\psi_{i}\right)_{i \in I}$ of morphisms $\psi_{i}: X_{i} \rightarrow X_{i}^{\prime}$ in $\mathcal{S}_{U_{i}}$ such that all the diagrams

in the categories $\mathcal{S}_{U_{i} \times_{U} U_{j}}$ commute.
(3) The category of descent data relative to $\mathcal{U}$ is denoted $D D(\mathcal{U})$.

The fibre products $U_{i} \times_{U} U_{j}$ and $U_{i} \times_{U} U_{j} \times_{U} U_{k}$ will exist if each of the morphisms $f_{i}: U_{i} \rightarrow U$ is representable, see Categories, Definition 4.6.4. Recall that in a site one of the conditions for a covering $\left\{U_{i} \rightarrow U\right\}$ is that each of the morphisms is representable, see Sites, Definition 7.6 .2 part (3). In fact the main interest in the definition above is where $\mathcal{C}$ is a site and $\left\{U_{i} \rightarrow U\right\}$ is a covering of $\mathcal{C}$. However, a descent datum is just an abstract gadget that can be defined as above. This is useful: for example, given a fibred category over $\mathcal{C}$ one can look at the collection of families with respect to which descent data are effective, and try to use these as the family of coverings for a site.

026C Remarks 8.3.2. Two remarks on Definition 8.3.1 are in order. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$, and $\left(X_{i}, \varphi_{i j}\right)$ be as in Definition 8.3.1.
(1) There is a diagonal morphism $\Delta: U_{i} \rightarrow U_{i} \times_{U} U_{i}$. We can pull back $\varphi_{i i}$ via this morphism to get an automorphism $\Delta^{*} \varphi_{i i} \in \operatorname{Aut}_{U_{i}}\left(x_{i}\right)$. On pulling back the cocycle condition for the triple $(i, i, i)$ by $\Delta_{123}: U_{i} \rightarrow$ $U_{i} \times_{U} U_{i} \times_{U} U_{i}$ we deduce that $\Delta^{*} \varphi_{i i} \circ \Delta^{*} \varphi_{i i}=\Delta^{*} \varphi_{i i}$; thus $\Delta^{*} \varphi_{i i}=\operatorname{id}_{x_{i}}$.
(2) There is a morphism $\Delta_{13}: U_{i} \times_{U} U_{j} \rightarrow U_{i} \times_{U} U_{j} \times_{U} U_{i}$ and we can pull back the cocycle condition for the triple $(i, j, i)$ to get the identity $\left(\sigma^{*} \varphi_{j i}\right) \circ \varphi_{i j}=\operatorname{id}_{\mathrm{pr}_{0}^{*} x_{i}}$, where $\sigma: U_{i} \times_{U} U_{j} \rightarrow U_{j} \times_{U} U_{i}$ is the switching morphism.

02ZD Lemma 8.3.3. (Pullback of descent data.) Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Make a choice pullbacks as in Categories, Definition 4.32.6. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$, and $\mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}$ be a families of morphisms of $\mathcal{C}$ with fixed target. Assume all the fibre products $U_{i} \times_{U} U_{i^{\prime}}, U_{i} \times_{U} U_{i^{\prime}} \times \times_{U} U_{i^{\prime \prime}}, V_{j} \times V V_{j^{\prime}}$, and $V_{j} \times_{V} V_{j^{\prime}} \times_{V} V_{j^{\prime \prime}}$ exist. Let $\alpha: I \rightarrow J, h: U \rightarrow V$ and $g_{i}: U_{i} \rightarrow V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 7.8.1.
(1) Let $\left(Y_{j}, \varphi_{j j^{\prime}}\right)$ be a descent datum relative to the family $\left\{V_{j} \rightarrow V\right\}$. The system

$$
\left(g_{i}^{*} Y_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right)
$$

is a descent datum relative to $\mathcal{U}$.
(2) This construction defines a functor between descent data relative to $\mathcal{V}$ and descent data relative to $\mathcal{U}$.
(3) Given a second $\alpha^{\prime}: I \rightarrow J, h^{\prime}: U \rightarrow V$ and $g_{i}^{\prime}: U_{i} \rightarrow V_{\alpha^{\prime}(i)}$ morphism of families of maps with fixed target, then if $h=h^{\prime}$ the two resulting functors between descent data are canonically isomorphic.

Proof. Omitted.
02ZE Definition 8.3.4. With $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}_{i \in I}, \mathcal{V}=\left\{V_{j} \rightarrow V\right\}_{j \in J}, \alpha: I \rightarrow J$, $h: U \rightarrow V$, and $g_{i}: U_{i} \rightarrow V_{\alpha(i)}$ as in Lemma 8.3.3 the functor

$$
\left(Y_{j}, \varphi_{j j^{\prime}}\right) \longmapsto\left(g_{i}^{*} Y_{\alpha(i)},\left(g_{i} \times g_{i^{\prime}}\right)^{*} \varphi_{\alpha(i) \alpha\left(i^{\prime}\right)}\right)
$$

constructed in that lemma is called the pullback functor on descent data.
Given $h: U \rightarrow V$, if there exists a morphism $\tilde{h}: \mathcal{U} \rightarrow \mathcal{V}$ covering $h$ then $\tilde{h}^{*}$ is independent of the choice of $\tilde{h}$ as we saw in Lemma 8.3.3. Hence we will sometimes simply write $h^{*}$ to indicate the pullback functor.

026 E Definition 8.3.5. Let $\mathcal{C}$ be a category. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Make a choice of pullbacks as in Categories, Definition 4.32.6. Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a family of morphisms with target $U$. Assume all the fibre products $U_{i} \times_{U} U_{j}$ and $U_{i} \times_{U} U_{j} \times_{U} U_{k}$ exist.
(1) Given an object $X$ of $\mathcal{S}_{U}$ the trivial descent datum is the descent datum $\left(X, \mathrm{id}_{X}\right)$ with respect to the family $\left\{\mathrm{id}_{U}: U \rightarrow U\right\}$.
(2) Given an object $X$ of $\mathcal{S}_{U}$ we have a canonical descent datum on the family of objects $f_{i}^{*} X$ by pulling back the trivial descent datum $\left(X, \mathrm{id}_{X}\right)$ via the obvious map $\left\{f_{i}: U_{i} \rightarrow U\right\} \rightarrow\left\{\operatorname{id}_{U}: U \rightarrow U\right\}$. We denote this descent datum $\left(f_{i}^{*} X\right.$, can $)$.
(3) A descent datum $\left(X_{i}, \varphi_{i j}\right)$ relative to $\left\{f_{i}: U_{i} \rightarrow U\right\}$ is called effective if there exists an object $X$ of $\mathcal{S}_{U}$ such that $\left(X_{i}, \varphi_{i j}\right)$ is isomorphic to ( $\left.f_{i}^{*} X, c a n\right)$.

Note that the rule that associates to $X \in \mathcal{S}_{U}$ its canonical descent datum relative to $\mathcal{U}$ defines a functor

$$
\mathcal{S}_{U} \longrightarrow D D(\mathcal{U})
$$

A descent datum is effective if and only if it is in the essential image of this functor. Let us make explicit the canonical descent datum as follows.

026D Lemma 8.3.6. In the situation of Definition 8.3.5 part (2) the maps can ${ }_{i j}$ : $p r_{0}^{*} f_{i}^{*} X \rightarrow p r_{1}^{*} f_{j}^{*} X$ are equal to $\left(\alpha_{p r_{1}, f_{j}}\right)_{X} \circ\left(\alpha_{p r_{0}, f_{i}}\right)_{X}^{-1}$ where $\alpha$., is as in Categories, Lemma 4.32.7 and where we use the equality $f_{i} \circ p r_{0}=f_{j} \circ p r_{1}$ as maps $U_{i} \times{ }_{U} U_{j} \rightarrow$ $U$.

Proof. Omitted.

### 8.4. Stacks

0268 Here is the definition of a stack. It mixes the notion of a fibred category with the notion of descent.

026F Definition 8.4.1. Let $\mathcal{C}$ be a site. A stack over $\mathcal{C}$ is a category $p: \mathcal{S} \rightarrow \mathcal{C}$ over $\mathcal{C}$ which satisfies the following conditions:
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category, see Categories, Definition 4.32 .5
(2) for any $U \in \operatorname{Ob}(\mathcal{C})$ and any $x, y \in \mathcal{S}_{U}$ the presheaf $\operatorname{Mor}(x, y)$ (see Definition 8.2.2) is a sheaf on the site $\mathcal{C} / U$, and
(3) for any covering $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ of the site $\mathcal{C}$, any descent datum in $\mathcal{S}$ relative to $\mathcal{U}$ is effective.

We find the formulation above the most convenient way to think about a stack. Namely, given a category over $\mathcal{C}$ in order to verify that it is a stack you proceed to check properties $(1),(2)$ and (3) in that order. Certainly properties (2) and (3) do not make sense if the category isn't fibred. Without (2) we cannot prove that the descent in (3) is unique up to unique isomorphism and functorial.

The following lemma provides an alternative definition.
02ZF Lemma 8.4.2. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category over $\mathcal{C}$. The following are equivalent
(1) $\mathcal{S}$ is a stack over $\mathcal{C}$, and
(2) for any covering $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ of the site $\mathcal{C}$ the functor

$$
\mathcal{S}_{U} \longrightarrow D D(\mathcal{U})
$$

which associates to an object its canonical descent datum is an equivalence.
Proof. Omitted.
04TU Lemma 8.4.3. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a stack over the site $\mathcal{C}$. Let $\mathcal{S}^{\prime}$ be a subcategory of $\mathcal{S}$. Assume
(1) if $\varphi: y \rightarrow x$ is a strongly cartesian morphism of $\mathcal{S}$ and $x$ is an object of $\mathcal{S}^{\prime}$, then $y$ is isomorphic to an object of $\mathcal{S}^{\prime}$,
(2) $\mathcal{S}^{\prime}$ is a full subcategory of $\mathcal{S}$, and
(3) if $\left\{f_{i}: U_{i} \rightarrow U\right\}$ is a covering of $\mathcal{C}$, and $x$ an object of $\mathcal{S}$ over $U$ such that $f_{i}^{*} x$ is isomorphic to an object of $\mathcal{S}^{\prime}$ for each $i$, then $x$ is isomorphic to an object of $\mathcal{S}^{\prime}$.
Then $\mathcal{S}^{\prime} \rightarrow \mathcal{C}$ is a stack.
Proof. Omitted. Hints: The first condition guarantees that $\mathcal{S}^{\prime}$ is a fibred category. The second condition guarantees that the Isom-presheaves of $\mathcal{S}^{\prime}$ are sheaves (as they are identical to their counter parts in $\mathcal{S}$ ). The third condition guarantees that the descent condition holds in $\mathcal{S}^{\prime}$ as we can first descend in $\mathcal{S}$ and then (3) implies the resulting object is isomorphic to an object of $\mathcal{S}^{\prime}$.

042W Lemma 8.4.4. Let $\mathcal{C}$ be a site. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_{1}$ and $\mathcal{S}_{2}$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_{1}$ is a stack over $\mathcal{C}$ if and only if $\mathcal{S}_{2}$ is a stack over $\mathcal{C}$.

Proof. Let $F: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}, G: \mathcal{S}_{2} \rightarrow \mathcal{S}_{1}$ be functors over $\mathcal{C}$, and let $i: F \circ G \rightarrow \operatorname{id}_{\mathcal{S}_{2}}$, $j: G \circ F \rightarrow \mathrm{id}_{\mathcal{S}_{1}}$ be isomorphisms of functors over $\mathcal{C}$. By Categories, Lemma4.32.8 we see that $\mathcal{S}_{1}$ is fibred if and only if $\mathcal{S}_{2}$ is fibred over $\mathcal{C}$. Hence we may assume that both $\mathcal{S}_{1}$ and $\mathcal{S}_{2}$ are fibred. Moreover, the proof of Categories, Lemma 4.32 .8 shows that $F$ and $G$ map strongly cartesian morphisms to strongly cartesian morphisms, i.e., $F$ and $G$ are 1-morphisms of fibred categories over $\mathcal{C}$. This means that given $U \in \operatorname{Ob}(\mathcal{C})$, and $x, y \in \mathcal{S}_{1, U}$ then the presheaves

$$
\operatorname{Mor}_{\mathcal{S}_{1}}(x, y), \operatorname{Mor}_{\mathcal{S}_{1}}(F(x), F(y)):(\mathcal{C} / U)^{o p p} \longrightarrow \text { Sets. }
$$

are identified, see Lemma 8.2.3. Hence the first is a sheaf if and only if the second is a sheaf. Finally, we have to show that if every descent datum in $\mathcal{S}_{1}$ is effective, then so is every descent datum in $\mathcal{S}_{2}$. To do this, let $\left(X_{i}, \varphi_{i i^{\prime}}\right)$ be a descent datum in $\mathcal{S}_{2}$ relative the covering $\left\{U_{i} \rightarrow U\right\}$ of the site $\mathcal{C}$. Then $\left(G\left(X_{i}\right), G\left(\varphi_{i i^{\prime}}\right)\right)$ is a descent datum in $\mathcal{S}_{1}$ relative the covering $\left\{U_{i} \rightarrow U\right\}$. Let $X$ be an object of $\mathcal{S}_{1, U}$ such that the descent datum $\left(f_{i}^{*} X\right.$, can $)$ is isomorphic to $\left(G\left(X_{i}\right), G\left(\varphi_{i i^{\prime}}\right)\right)$. Then $F(X)$ is an object of $\mathcal{S}_{2, U}$ such that the descent datum $\left(f_{i}^{*} F(X)\right.$, can $)$ is isomorphic to $\left(F\left(G\left(X_{i}\right)\right), F\left(G\left(\varphi_{i i^{\prime}}\right)\right)\right)$ which in turn is isomorphic to the original descent datum ( $X_{i}, \varphi_{i i^{\prime}}$ ) using $i$.

The 2-category of stacks over $\mathcal{C}$ is defined as follows.
02ZG Definition 8.4.5. Let $\mathcal{C}$ be a site. The 2 -category of stacks over $\mathcal{C}$ is the sub 2-category of the 2-category of fibred categories over $\mathcal{C}$ (see Categories, Definition 4.32.9) defined as follows:
(1) Its objects will be stacks $p: \mathcal{S} \rightarrow \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$ and such that $G$ maps strongly cartesian morphisms to strongly cartesian morphisms.
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\operatorname{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.
026G Lemma 8.4.6. Let $\mathcal{C}$ be a site. The $(2,1)$-category of stacks over $\mathcal{C}$ has 2-fibre products, and they are described as in Categories, Lemma 4.31.3.
Proof. Let $f: \mathcal{X} \rightarrow \mathcal{S}$ and $g: \mathcal{Y} \rightarrow \mathcal{S}$ be 1-morphisms of stacks over $\mathcal{C}$ as defined above. The category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ described in Categories, Lemma 4.31.3 is a fibred category according to Categories, Lemma 4.32 .10 . (This is where we use that $f$ and $g$ preserve strongly cartesian morphisms.) It remains to show that the morphism presheaves are sheaves and that descent relative to coverings of $\mathcal{C}$ is effective.

Recall that an object of $\mathcal{X} \times \mathcal{S} \mathcal{Y}$ is given by a quadruple $(U, x, y, \phi)$. It lies over the object $U$ of $\mathcal{C}$. Next, let $\left(U, x^{\prime}, y^{\prime}, \phi^{\prime}\right)$ be second object lying over $U$. Recall that $\phi: f(x) \rightarrow g(y)$, and $\phi^{\prime}: f\left(x^{\prime}\right) \rightarrow g\left(y^{\prime}\right)$ are isomorphisms in the category $\mathcal{S}_{U}$. Let us use these isomorphisms to identify $z=f(x)=g(y)$ and $z^{\prime}=f\left(x^{\prime}\right)=g\left(y^{\prime}\right)$. With this identifications it is clear that

$$
\operatorname{Mor}\left((U, x, y, \phi),\left(U, x^{\prime}, y^{\prime}, \phi^{\prime}\right)\right)=\operatorname{Mor}\left(x, x^{\prime}\right) \times_{\operatorname{Mor}\left(z, z^{\prime}\right)} \operatorname{Mor}\left(y, y^{\prime}\right)
$$

as presheaves. However, as the fibred product in the category of presheaves preserves sheaves (Sites, Lemma 7.10.1) we see that this is a sheaf.
Let $\mathcal{U}=\left\{f_{i}: U_{i} \rightarrow U\right\}_{i \in I}$ be a covering of the site $\mathcal{C}$. Let $\left(X_{i}, \chi_{i j}\right)$ be a descent datum in $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ relative to $\mathcal{U}$. Write $X_{i}=\left(U_{i}, x_{i}, y_{i}, \phi_{i}\right)$ as above. Write $\chi_{i j}=$ $\left(\varphi_{i j}, \psi_{i j}\right)$ as in the definition of the category $\mathcal{X} \times \mathcal{S} \mathcal{Y}$ (see Categories, Lemma 4.31.3). It is clear that $\left(x_{i}, \varphi_{i j}\right)$ is a descent datum in $\mathcal{X}$ and that $\left(y_{i}, \psi_{i j}\right)$ is a descent datum in $\mathcal{Y}$. Since $\mathcal{X}$ and $\mathcal{Y}$ are stacks these descent data are effective. Thus we get $x \in \operatorname{Ob}\left(\mathcal{X}_{U}\right)$, and $y \in \operatorname{Ob}\left(\mathcal{Y}_{U}\right)$ with $x_{i}=\left.x\right|_{U_{i}}$, and $y_{i}=\left.y\right|_{U_{i}}$ compatibly with descent data. Set $z=f(x)$ and $z^{\prime}=g(y)$ which are both objects of $\mathcal{S}_{U}$. The morphisms $\phi_{i}$ are elements of $\operatorname{Isom}\left(z, z^{\prime}\right)\left(U_{i}\right)$ with the property that $\left.\phi_{i}\right|_{U_{i} \times{ }_{U} U_{j}}=$ $\left.\phi_{j}\right|_{U_{i} \times{ }_{U} U_{j}}$. Hence by the sheaf property of $\operatorname{Isom}\left(z, z^{\prime}\right)$ we obtain an isomorphism $\phi: z=f(x) \rightarrow z^{\prime}=g(y)$. We omit the verification that the canonical descent datum associated to the object $(U, x, y, \phi)$ of $\left(\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}\right)_{U}$ is isomorphic to the descent datum we started with.

04WQ Lemma 8.4.7. Let $\mathcal{C}$ be a site. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be stacks over $\mathcal{C}$. Let $F: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ be a 1-morphism. Then the following are equivalent
(1) $F$ is fully faithful,
(2) for every $U \in \operatorname{Ob}(\mathcal{C})$ and for every $x, y \in \operatorname{Ob}\left(\mathcal{S}_{1, U}\right)$ the map

$$
F: \operatorname{Mor}_{\mathcal{S}_{1}}(x, y) \longrightarrow \operatorname{Mor}_{\mathcal{S}_{2}}(F(x), F(y))
$$

is an isomorphism of sheaves on $\mathcal{C} / U$.
Proof. Assume (1). For $U, x, y$ as in (2) the displayed map $F$ evaluates to the $\operatorname{map} F: \operatorname{Mor}_{\mathcal{S}_{1, V}}\left(\left.x\right|_{V},\left.y\right|_{V}\right) \rightarrow \operatorname{Mor}_{\mathcal{S}_{2, V}}\left(F\left(\left.x\right|_{V}\right), F\left(\left.y\right|_{V}\right)\right)$ on an object $V$ of $\mathcal{C}$ lying over $U$. Now, since $F$ is fully faithful, the corresponding map $\operatorname{Mor}_{\mathcal{S}_{1}}\left(\left.x\right|_{V},\left.y\right|_{V}\right) \rightarrow$ $\operatorname{Mor}_{\mathcal{S}_{2}}\left(F\left(\left.x\right|_{V}\right), F\left(\left.y\right|_{V}\right)\right)$ is a bijection. Morphisms in the fibre category $\mathcal{S}_{1, V}$ are exactly those morphisms between $\left.x\right|_{V}$ and $\left.y\right|_{V}$ in $\mathcal{S}_{1}$ lying over id ${ }_{V}$. Similarly, morphisms in the fibre category $\mathcal{S}_{2, V}$ are exactly those morphisms between $F\left(\left.x\right|_{V}\right)$
and $F\left(\left.y\right|_{V}\right)$ in $\mathcal{S}_{2}$ lying over $\mathrm{id}_{V}$. Thus we find that $F$ induces a bijection between these also. Hence (2) holds.

Assume (2). Suppose given objects $U, V$ of $\mathcal{C}$ and $x \in \operatorname{Ob}\left(\mathcal{S}_{1, U}\right)$ and $y \in \operatorname{Ob}\left(\mathcal{S}_{1, V}\right)$. To show that $F$ is fully faithful, it suffices to prove it induces a bijection on morphisms lying over a fixed $f: U \rightarrow V$. Choose a strongly Cartesian $f^{*} y \rightarrow y$ in $\mathcal{S}_{1}$ lying above $f$. This results in a bijection between the set of morphisms $x \rightarrow y$ in $\mathcal{S}_{1}$ lying over $f$ and $\operatorname{Mor}_{\mathcal{S}_{1, U}}\left(x, f^{*} y\right)$. Since $F$ preserves strongly Cartesian morphisms as a 1 -morphism in the 2-category of stacks over $\mathcal{C}$, we also get a bijection between the set of morphisms $F(x) \rightarrow F(y)$ in $\mathcal{S}_{2}$ lying over $f$ and $\operatorname{Mor}_{\mathcal{S}_{2, U}}\left(F(x), F\left(f^{*} y\right)\right)$. Since $F$ induces a bijection $\operatorname{Mor}_{\mathcal{S}_{1, U}}\left(x, f^{*} y\right) \rightarrow \operatorname{Mor}_{\mathcal{S}_{2, U}}\left(F(x), F\left(f^{*} y\right)\right)$ we conclude (1) holds.

046N Lemma 8.4.8. Let $\mathcal{C}$ be a site. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be stacks over $\mathcal{C}$. Let $F: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}$ be a 1-morphism which is fully faithful. Then the following are equivalent
(1) $F$ is an equivalence,
(2) for every $U \in \mathrm{Ob}(\mathcal{C})$ and for every $x \in \operatorname{Ob}\left(\mathcal{S}_{2, U}\right)$ there exists a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ such that $f_{i}^{*} x$ is in the essential image of the functor $F: \mathcal{S}_{1, U_{i}} \rightarrow \mathcal{S}_{2, U_{i}}$.
Proof. The implication $(1) \Rightarrow(2)$ is immediate. To see that (2) implies (1) we have to show that every $x$ as in (2) is in the essential image of the functor $F$. To do this choose a covering as in $(2), x_{i} \in \operatorname{Ob}\left(\mathcal{S}_{1, U_{i}}\right)$, and isomorphisms $\varphi_{i}: F\left(x_{i}\right) \rightarrow f_{i}^{*} x$. Then we get a descent datum for $\mathcal{S}_{1}$ relative to $\left\{f_{i}: U_{i} \rightarrow U\right\}$ by taking

$$
\varphi_{i j}:\left.\left.x_{i}\right|_{U_{i} \times_{U} U_{j}} \longrightarrow x_{j}\right|_{U_{i} \times_{U} U_{j}}
$$

the arrow such that $F\left(\varphi_{i j}\right)=\varphi_{j}^{-1} \circ \varphi_{i}$. This descent datum is effective by the axioms of a stack, and hence we obtain an object $x_{1}$ of $\mathcal{S}_{1}$ over $U$. We omit the verification that $F\left(x_{1}\right)$ is isomorphic to $x$ over $U$.

03ZZ Remark 8.4.9. (Cutting down a "big" stack to get a stack.) Let $\mathcal{C}$ be a site. Suppose that $p: \mathcal{S} \rightarrow \mathcal{C}$ is functor from a "big" category to $\mathcal{C}$, i.e., suppose that the collection of objects of $\mathcal{S}$ forms a proper class. Finally, suppose that $p: \mathcal{S} \rightarrow \mathcal{C}$ satisfies conditions (1), (2), (3) of Definition 8.4.1. In general there is no way to replace $p: \mathcal{S} \rightarrow \mathcal{C}$ by a equivalent category such that we obtain a stack. The reason is that it can happen that a fibre categories $\mathcal{S}_{U}$ may have a proper class of isomorphism classes of objects. On the other hand, suppose that
(4) for every $U \in \mathrm{Ob}(\mathcal{C})$ there exists a set $S_{U} \subset \mathrm{Ob}\left(\mathcal{S}_{U}\right)$ such that every object of $\mathcal{S}_{U}$ is isomorphic in $\mathcal{S}_{U}$ to an element of $S_{U}$.
In this case we can find a full subcategory $\mathcal{S}_{\text {small }}$ of $\mathcal{S}$ such that, setting $p_{\text {small }}=$ $\left.p\right|_{\mathcal{S}_{\text {small }}}$, we have
(a) the functor $p_{\text {small }}: \mathcal{S}_{\text {small }} \rightarrow \mathcal{C}$ defines a stack, and
(b) the inclusion $\mathcal{S}_{\text {small }} \rightarrow \mathcal{S}$ is fully faithful and essentially surjective.
(Hint: For every $U \in \operatorname{Ob}(\mathcal{C})$ let $\alpha(U)$ denote the smallest ordinal such that $\mathrm{Ob}\left(\mathcal{S}_{U}\right) \cap V_{\alpha(U)}$ surjects onto the set of isomorphism classes of $\mathcal{S}_{U}$, and set $\alpha=$ $\sup _{U \in \operatorname{Ob}(\mathcal{C})} \alpha(U)$. Then take $\operatorname{Ob}\left(\mathcal{S}_{\text {small }}\right)=\operatorname{Ob}(\mathcal{S}) \cap V_{\alpha}$. For notation used see Sets, Section 3.5.)

### 8.5. Stacks in groupoids

02ZH Among stacks those which are fibred in groupoids are somewhat easier to comprehend. We redefine them as follows.

02ZI Definition 8.5.1. A stack in groupoids over a site $\mathcal{C}$ is a category $p: \mathcal{S} \rightarrow \mathcal{C}$ over $\mathcal{C}$ such that
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids over $\mathcal{C}$ (see Categories, Definition 4.34.1),
(2) for all $U \in \mathrm{Ob}(\mathcal{C})$, for all $x, y \in \mathrm{Ob}\left(\mathcal{S}_{U}\right)$ the presheaf $\operatorname{Isom}(x, y)$ is a sheaf on the site $\mathcal{C} / U$, and
(3) for all coverings $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$, all descent data $\left(x_{i}, \phi_{i j}\right)$ for $\mathcal{U}$ are effective.

Usually the hardest part to check is the third condition. Here is the lemma comparing this with the notion of a stack.

02ZJ Lemma 8.5.2. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$. The following are equivalent
(1) $\mathcal{S}$ is a stack in groupoids over $\mathcal{C}$,
(2) $\mathcal{S}$ is a stack over $\mathcal{C}$ and all fibre categories are groupoids, and
(3) $\mathcal{S}$ is fibred in groupoids over $\mathcal{C}$ and is a stack over $\mathcal{C}$.

Proof. Omitted, but see Categories, Lemma 4.34.2.
03YI Lemma 8.5.3. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a stack. Let $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be the category fibred in groupoids associated to $\mathcal{S}$ constructed in Categories, Lemma 4.34.3. Then $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ is a stack in groupoids.

Proof. Recall that the morphisms in $\mathcal{S}^{\prime}$ are exactly the strongly cartesian morphisms of $\mathcal{S}$, and that any isomorphism of $\mathcal{S}$ is such a morphism. Hence descent data in $\mathcal{S}^{\prime}$ are exactly the same thing as descent data in $\mathcal{S}$. Now apply Lemma 8.4.2 Some details omitted.

042X Lemma 8.5.4. Let $\mathcal{C}$ be a site. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_{1}$ and $\mathcal{S}_{2}$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_{1}$ is a stack in groupoids over $\mathcal{C}$ if and only if $\mathcal{S}_{2}$ is a stack in groupoids over $\mathcal{C}$.

Proof. Follows by combining Lemmas 8.5.2 and 8.4.4.
The 2-category of stacks in groupoids over $\mathcal{C}$ is defined as follows.
02ZK Definition 8.5.5. Let $\mathcal{C}$ be a site. The 2 -category of stacks in groupoids over $\mathcal{C}$ is the sub 2-category of the 2-category of stacks over $\mathcal{C}$ (see Definition 8.4.5) defined as follows:
(1) Its objects will be stacks in groupoids $p: \mathcal{S} \rightarrow \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$. (Since every morphism is strongly cartesian every functor preserves them.)
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\mathrm{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.
Note that any 2-morphism is automatically an isomorphism, so that in fact the 2 -category of stacks in groupoids over $\mathcal{C}$ is a (strict) (2,1)-category.

02ZL Lemma 8.5.6. Let $\mathcal{C}$ be a category. The 2 -category of stacks in groupoids over $\mathcal{C}$ has 2-fibre products, and they are described as in Categories, Lemma 4.31.3.
Proof. This is clear from Categories, Lemma 4.34.7 and Lemmas 8.5.2 and 8.4.6.

### 8.6. Stacks in setoids

042Y This is just a brief section saying that a stack in sets is the same thing as a sheaf of sets. Please consult Categories, Section 4.38 for notation.

042 Z Definition 8.6.1. Let $\mathcal{C}$ be a site.
(1) A stack in setoids over $\mathcal{C}$ is a stack over $\mathcal{C}$ all of whose fibre categories are setoids.
(2) A stack in sets, or a stack in discrete categories is a stack over $\mathcal{C}$ all of whose fibre categories are discrete.

From the discussion in Section 8.5 this is the same thing as a stack in groupoids whose fibre categories are setoids (resp. discrete). Moreover, it is also the same thing as a category fibred in setoids (resp. sets) which is a stack.

0430 Lemma 8.6.2. Let $\mathcal{C}$ be a site. Under the equivalence

$$
\left\{\begin{array}{c}
\text { the category of presheaves } \\
\text { of sets over } \mathcal{C}
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { the category of categories } \\
\text { fibred in sets over } \mathcal{C}
\end{array}\right\}
$$

of Categories, Lemma 4.37.6 the stacks in sets correspond precisely to the sheaves.
Proof. Omitted. Hint: Show that effectivity of descent corresponds exactly to the sheaf condition.

0432 Lemma 8.6.3. Let $\mathcal{C}$ be a site. Let $\mathcal{S}$ be a category fibred in setoids over $\mathcal{C}$. Then $\mathcal{S}$ is a stack in setoids if and only if the unique equivalent category $\mathcal{S}^{\prime}$ fibred in sets (see Categories, Lemma 4.38.5) is a stack in sets. In other words, if and only if the presheaf

$$
U \longmapsto \mathrm{Ob}\left(\mathcal{S}_{U}\right) / \cong
$$

is a sheaf.
Proof. Omitted.
0431 Lemma 8.6.4. Let $\mathcal{C}$ be a site. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_{1}$ and $\mathcal{S}_{2}$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_{1}$ is a stack in setoids over $\mathcal{C}$ if and only if $\mathcal{S}_{2}$ is a stack in setoids over $\mathcal{C}$.

Proof. By Categories, Lemma 4.38.5 we see that a category $\mathcal{S}$ over $\mathcal{C}$ is fibred in setoids over $\mathcal{C}$ if and only if it is equivalent over $\mathcal{C}$ to a category fibred in sets. Hence we see that $\mathcal{S}_{1}$ is fibred in setoids over $\mathcal{C}$ if and only if $\mathcal{S}_{2}$ is fibred in setoids over $\mathcal{C}$. Hence now the lemma follows from Lemma 8.6.3,

The 2-category of stacks in setoids over $\mathcal{C}$ is defined as follows.
0433 Definition 8.6.5. Let $\mathcal{C}$ be a site. The 2 -category of stacks in setoids over $\mathcal{C}$ is the sub 2-category of the 2-category of stacks over $\mathcal{C}$ (see Definition 8.4.5) defined as follows:
(1) Its objects will be stacks in setoids $p: \mathcal{S} \rightarrow \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be functors $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ such that $p^{\prime} \circ G=p$. (Since every morphism is strongly cartesian every functor preserves them.)
(3) Its 2-morphisms $t: G \rightarrow H$ for $G, H:(\mathcal{S}, p) \rightarrow\left(\mathcal{S}^{\prime}, p^{\prime}\right)$ will be morphisms of functors such that $p^{\prime}\left(t_{x}\right)=\mathrm{id}_{p(x)}$ for all $x \in \operatorname{Ob}(\mathcal{S})$.
Note that any 2-morphism is automatically an isomorphism, so that in fact the 2 -category of stacks in setoids over $\mathcal{C}$ is a (strict) $(2,1)$-category.

0434 Lemma 8.6.6. Let $\mathcal{C}$ be a site. The 2-category of stacks in setoids over $\mathcal{C}$ has 2-fibre products, and they are described as in Categories, Lemma 4.31.3.

Proof. This is clear from Categories, Lemmas 4.34.7 and 4.38.4 and Lemmas 8.5.2 and 8.4.6.

05UI Lemma 8.6.7. Let $\mathcal{C}$ be a site. Let $\mathcal{S}, \mathcal{T}$ be stacks in groupoids over $\mathcal{C}$ and let $\mathcal{R}$ be a stack in setoids over $\mathcal{C}$. Let $f: \mathcal{T} \rightarrow \mathcal{S}$ and $g: \mathcal{R} \rightarrow \mathcal{S}$ be 1-morphisms. If $f$ is faithful, then the 2 -fibre product

$$
\mathcal{T} \times_{f, \mathcal{S}, g} \mathcal{R}
$$

is a stack in setoids over $\mathcal{C}$.
Proof. Immediate from the explicit description of the 2-fibre product in Categories, Lemma 4.31.3.

05UJ Lemma 8.6.8. Let $\mathcal{C}$ be a site. Let $\mathcal{S}$ be a stack in groupoids over $\mathcal{C}$ and let $\mathcal{S}_{i}$, $i=1,2$ be stacks in setoids over $\mathcal{C}$. Let $f_{i}: \mathcal{S}_{i} \rightarrow \mathcal{S}$ be 1-morphisms. Then the 2-fibre product

$$
\mathcal{S}_{1} \times_{f_{1}, \mathcal{S}, f_{2}} \mathcal{S}_{2}
$$

is a stack in setoids over $\mathcal{C}$.
Proof. This is a special case of Lemma 8.6.7 as $f_{2}$ is faithful.
06DV Lemma 8.6.9. Let $\mathcal{C}$ be a site. Let

be a 2-cartesian diagram of stacks in groupoids over $\mathcal{C}$. Assume
(1) for every $U \in \operatorname{Ob}(\mathcal{C})$ and $x \in \operatorname{Ob}\left(\left(\mathcal{S}_{1}\right)_{U}\right)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.x\right|_{U_{i}}$ is in the essential image of $F:\left(\mathcal{S}_{2}\right)_{U_{i}} \rightarrow\left(\mathcal{S}_{1}\right)_{U_{i}}$, and
(2) $G^{\prime}$ is faithful,
then $G$ is faithful.
Proof. We may assume that $\mathcal{T}_{2}$ is the category $\mathcal{S}_{2} \times{ }_{\mathcal{S}_{1}} \mathcal{T}_{1}$ described in Categories, Lemma 4.31.3. By Categories, Lemma 4.34 .8 the faithfulness of $G, G^{\prime}$ can be checked on fibre categories. Suppose that $y, y^{\prime}$ are objects of $\mathcal{T}_{1}$ over the object $U$ of $\mathcal{C}$. Let $\alpha, \beta: y \rightarrow y^{\prime}$ be morphisms of $\left(\mathcal{T}_{1}\right)_{U}$ such that $G(\alpha)=G(\beta)$. Our object is to show that $\alpha=\beta$. Considering instead $\gamma=\alpha^{-1} \circ \beta$ we see that $G(\gamma)=\operatorname{id}_{G(y)}$ and we have to show that $\gamma=\mathrm{id}_{y}$. By assumption we can find a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.G(y)\right|_{U_{i}}$ is in the essential image of $F:\left(\mathcal{S}_{2}\right)_{U_{i}} \rightarrow\left(\mathcal{S}_{1}\right)_{U_{i}}$. Since it suffices to show that $\left.\gamma\right|_{U_{i}}=\mathrm{id}$ for each $i$, we may therefore assume that we
have $f: F(x) \rightarrow G(y)$ for some object $x$ of $\mathcal{S}_{2}$ over $U$ and morphisms $f$ of $\left(\mathcal{S}_{1}\right)_{U}$. In this case we get a morphism

$$
(1, \gamma):(U, x, y, f) \longrightarrow(U, x, y, f)
$$

in the fibre category of $\mathcal{S}_{2} \times \mathcal{S}_{1} \mathcal{T}_{1}$ over $U$ whose image under $G^{\prime}$ in $\mathcal{S}_{1}$ is $\operatorname{id}_{x}$. As $G^{\prime}$ is faithful we conclude that $\gamma=\mathrm{id}_{y}$ and we win.

05W9 Lemma 8.6.10. Let $\mathcal{C}$ be a site. Let

be a 2-cartesian diagram of stacks in groupoids over $\mathcal{C}$. If
(1) $F: \mathcal{S}_{2} \rightarrow \mathcal{S}_{1}$ is fully faithful,
(2) for every $U \in \operatorname{Ob}(\mathcal{C})$ and $x \in \operatorname{Ob}\left(\left(\mathcal{S}_{1}\right)_{U}\right)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.x\right|_{U_{i}}$ is in the essential image of $F:\left(\mathcal{S}_{2}\right)_{U_{i}} \rightarrow\left(\mathcal{S}_{1}\right)_{U_{i}}$, and
(3) $\mathcal{T}_{2}$ is a stack in setoids.
then $\mathcal{T}_{1}$ is a stack in setoids.
Proof. We may assume that $\mathcal{T}_{2}$ is the category $\mathcal{S}_{2} \times{ }_{\mathcal{S}_{1}} \mathcal{T}_{1}$ described in Categories, Lemma 4.31.3. Pick $U \in \operatorname{Ob}(\mathcal{C})$ and $y \in \operatorname{Ob}\left(\left(\mathcal{T}_{1}\right)_{U}\right)$. We have to show that the sheaf $A u t(y)$ on $\mathcal{C} / U$ is trivial. To to this we may replace $U$ by the members of a covering of $U$. Hence by assumption (2) we may assume that there exists an object $x \in \operatorname{Ob}\left(\left(\mathcal{S}_{2}\right)_{U}\right)$ and an isomorphism $f: F(x) \rightarrow G(y)$. Then $y^{\prime}=(U, x, y, f)$ is an object of $\mathcal{T}_{2}$ over $U$ which is mapped to $y$ under the projection $\mathcal{T}_{2} \rightarrow \mathcal{T}_{1}$. Because $F$ is fully faithful by (1) the map $A u t\left(y^{\prime}\right) \rightarrow A u t(y)$ is surjective, use the explicit description of morphisms in $\mathcal{T}_{2}$ in Categories, Lemma 4.31.3. Since by (3) the sheaf $\operatorname{Aut}\left(y^{\prime}\right)$ is trivial we get the result of the lemma.

### 8.7. The inertia stack

036X Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be fibred categories over the category $\mathcal{C}$. Let $F: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be a 1-morphism of fibred categories over $\mathcal{C}$. Recall that we have defined in Categories, Definition 4.33 .2 an relative inertia fibred category $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}} \rightarrow \mathcal{C}$ as the category whose objects are pairs $(x, \alpha)$ where $x \in \operatorname{Ob}(\mathcal{S})$ and $\alpha: x \rightarrow x$ with $F(\alpha)=\operatorname{id}_{F(x)}$. There is also an absolute version, namely the inertia $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$. These inertia categories are actually stacks over $\mathcal{C}$ provided that $\mathcal{S}$ and $\mathcal{S}^{\prime}$ are stacks.

036Y Lemma 8.7.1. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ be stacks over the site $\mathcal{C}$. Let $F: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be a 1-morphism of stacks over $\mathcal{C}$.
(1) The inertia $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}}$ and $\mathcal{I}_{\mathcal{S}}$ are stacks over $\mathcal{C}$.
(2) If $\mathcal{S}, \mathcal{S}^{\prime}$ are stacks in groupoids over $\mathcal{S}$, then so are $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}}$ and $\mathcal{I}_{\mathcal{S}}$.
(3) If $\mathcal{S}, \mathcal{S}^{\prime}$ are stacks in setoids over $\mathcal{S}$, then so are $\mathcal{I}_{\mathcal{S} / \mathcal{S}^{\prime}}$ and $\mathcal{I}_{\mathcal{S}}$.

Proof. The first three assertions follow from Lemmas 8.4.6, 8.5.6, and 8.6.6 and the equivalence in Categories, Lemma 4.33.1 part (1).

04ZM Lemma 8.7.2. Let $\mathcal{C}$ be a site. If $\mathcal{S}$ is a stack in groupoids, then the canonical 1-morphism $\mathcal{I}_{\mathcal{S}} \rightarrow \mathcal{S}$ is an equivalence if and only if $\mathcal{S}$ is a stack in setoids.

Proof. Follows directly from Categories, Lemma 4.38.7.

### 8.8. Stackification of fibred categories

02ZM Here is the result.
02ZN Lemma 8.8.1. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category over $\mathcal{C}$. There exists a stack $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ and a 1-morphism $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ of fibred categories over $\mathcal{C}$ (see Categories, Definition 4.32.9) such that
(1) for every $U \in \mathrm{Ob}(\mathcal{C})$, and any $x, y \in \mathrm{Ob}\left(\mathcal{S}_{U}\right)$ the map

$$
\operatorname{Mor}(x, y) \longrightarrow \operatorname{Mor}(G(x), G(y))
$$

induced by $G$ identifies the right hand side with the sheafification of the left hand side, and
(2) for every $U \in \mathrm{Ob}(\mathcal{C})$, and any $x^{\prime} \in \mathrm{Ob}\left(\mathcal{S}_{U}^{\prime}\right)$ there exists a covering $\left\{U_{i} \rightarrow\right.$ $U\}_{i \in I}$ such that for every $i \in I$ the object $\left.x^{\prime}\right|_{U_{i}}$ is in the essential image of the functor $G: \mathcal{S}_{U} \rightarrow \mathcal{S}_{U}^{\prime}$.
Moreover the stack $\mathcal{S}^{\prime}$ is determined up to unique 2-isomorphism by these conditions.

Proof by naive method. In this proof method we proceed in stages:
First, given $x$ lying over $U$ and any object $y$ of $\mathcal{S}$, we say that two morphisms $a, b: x \rightarrow y$ of $\mathcal{S}$ lying over the same arrow of $\mathcal{C}$ are locally equal if there exists a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ of $\mathcal{C}$ such that the compositions

$$
f_{i}^{*} x \rightarrow x \xrightarrow{a} y, \quad f_{i}^{*} x \rightarrow x \xrightarrow{b} y
$$

are equal. This gives an equivalence relation $\sim$ on arrows of $\mathcal{S}$. If $b \sim b^{\prime}$ then $a \circ b \circ c \sim a \circ b^{\prime} \circ c$ (verification omitted). Hence we can quotient out by this equivalence relation to obtain a new category $\mathcal{S}^{1}$ over $\mathcal{C}$ together with a morphism $G^{1}: \mathcal{S} \rightarrow \mathcal{S}^{1}$.
One checks that $G^{1}$ preserves strongly cartesian morphisms and that $\mathcal{S}^{1}$ is a fibred category over $\mathcal{C}$. Checks omitted. Thus we reduce to the case where locally equal morphisms are equal.
Next, we add morphisms as follows. Given $x$ lying over $U$ and any object $y$ of lying over $V$ a locally defined morphism from $x$ to $y$ is given by
(1) a morphism $f: U \rightarrow V$,
(2) a covering $\left\{f_{i}: U_{i} \rightarrow U\right\}$ of $U$, and
(3) morphisms $a_{i}: f_{i}^{*} x \rightarrow y$ with $p\left(a_{i}\right)=f \circ f_{i}$
with the property that the compositions

$$
\left(f_{i} \times f_{j}\right)^{*} x \rightarrow f_{i}^{*} x \xrightarrow{a_{i}} y, \quad\left(f_{i} \times f_{j}\right)^{*} x \rightarrow f_{j}^{*} x \xrightarrow{a_{j}} y
$$

are equal. Note that a usual morphism $a: x \rightarrow y$ gives a locally defined morphism $\left(p(a): U \rightarrow V,\left\{\operatorname{id}_{U}\right\}, a\right)$. We say two locally defined morphisms $\left(f,\left\{f_{i}: U_{i} \rightarrow\right.\right.$ $\left.U\}, a_{i}\right)$ and $\left(g,\left\{g_{j}: U_{j}^{\prime} \rightarrow U\right\}, b_{j}\right)$ are equal if $f=g$ and the compositions

$$
\left(f_{i} \times g_{j}\right)^{*} x \rightarrow f_{i}^{*} x \xrightarrow{a_{i}} y, \quad\left(f_{i} \times g_{j}\right)^{*} x \rightarrow g_{j}^{*} x \xrightarrow{b_{j}} y
$$

are equal (this is the right condition since we are in the situation where locally equal morphisms are equal). To compose locally defined morphisms $\left(f,\left\{f_{i}: U_{i} \rightarrow\right.\right.$
$\left.U\}, a_{i}\right)$ from $x$ to $y$ and $\left(g,\left\{g_{j}: V_{j} \rightarrow V\right\}, b_{j}\right)$ from $y$ to $z$ lying over $W$, just take $g \circ f: U \rightarrow W$, the covering $\left\{U_{i} \times_{V} V_{j} \rightarrow U\right\}$, and as maps the compositions

$$
\left.\left.x\right|_{U_{i} \times_{V} V_{j}} \xrightarrow{\operatorname{pr}_{0}^{*} a_{i}} y\right|_{V_{j}} \xrightarrow{b_{j}} z
$$

We omit the verification that this is a locally defined morphism.
One checks that $\mathcal{S}^{2}$ with the same objects as $\mathcal{S}$ and with locally defined morphisms as morphisms is a category over $\mathcal{C}$, that there is a functor $G^{2}: \mathcal{S} \rightarrow \mathcal{S}^{2}$ over $\mathcal{C}$, that this functor preserves strongly cartesian objects, and that $\mathcal{S}^{2}$ is a fibred category over $\mathcal{C}$. Checks omitted. This reduces one to the case where the morphism presheaves of $\mathcal{S}$ are all sheaves, by checking that the effect of using locally defined morphisms is to take the sheafification of the (separated) morphisms presheaves.

Finally, in the case where the morphism presheaves are all sheaves we have to add objects in order to make sure descent conditions are effective in the end result. The simplest way to do this is to consider the category $\mathcal{S}^{\prime}$ whose objects are pairs $(\mathcal{U}, \xi)$ where $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ is a covering of $\mathcal{C}$ and $\xi=\left(X_{i}, \varphi_{i i^{\prime}}\right)$ is a descent datum relative $\mathcal{U}$. Suppose given two such data $(\mathcal{U}, \xi)=\left(\left\{f_{i}: U_{i} \rightarrow U\right\}, x_{i}, \varphi_{i i^{\prime}}\right)$ and $(\mathcal{V}, \eta)=\left(\left\{g_{j}: V_{j} \rightarrow V\right\}, y_{j}, \psi_{j j^{\prime}}\right)$. We define

$$
\operatorname{Mor}_{\mathcal{S}^{\prime}}((\mathcal{U}, \xi),(\mathcal{V}, \eta))
$$

as the set of $\left(f, a_{i j}\right)$, where $f: U \rightarrow V$ and

$$
a_{i j}:\left.x_{i}\right|_{U_{i} \times{ }_{V} V_{j}} \longrightarrow y_{j}
$$

are morphisms of $\mathcal{S}$ lying over $U_{i} \times_{V} V_{j} \rightarrow V_{j}$. These have to satisfy the following condition: for any $i, i^{\prime} \in I$ and $j, j^{\prime} \in J$ set $W=\left(U_{i} \times_{U} U_{i^{\prime}}\right) \times_{V}\left(V_{j} \times_{V} V_{j^{\prime}}\right)$. Then

$$
\begin{gathered}
\left.\left.x_{i}\right|_{W} \xrightarrow[\left.a_{i j}\right|_{W}]{ } y_{j}\right|_{W} \\
\left.\varphi_{i i^{\prime}}\right|_{W}\left|\stackrel{\left.\psi_{j j^{\prime}}\right|_{W}}{\downarrow} \stackrel{a_{i^{\prime} j^{\prime} \mid W}}{ } y_{j^{\prime}}\right|_{W} \\
\left.x_{i^{\prime}}\right|_{W}
\end{gathered}
$$

commutes. At this point you have to verify the following things:
(1) there is a well defined composition on morphisms as above,
(2) this turns $\mathcal{S}^{\prime}$ into a category over $\mathcal{C}$,
(3) there is a functor $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ over $\mathcal{C}$,
(4) for $x, y$ objects of $\mathcal{S}$ we have $\operatorname{Mor}_{\mathcal{S}}(x, y)=\operatorname{Mor}_{\mathcal{S}^{\prime}}(G(x), G(y))$,
(5) any object of $\mathcal{S}^{\prime}$ locally comes from an object of $\mathcal{S}$, i.e., part (2) of the lemma holds,
(6) $G$ preserves strongly cartesian morphisms,
(7) $\mathcal{S}^{\prime}$ is a fibred category over $\mathcal{C}$, and
(8) $\mathcal{S}^{\prime}$ is a stack over $\mathcal{C}$.

This is all not hard but there is a lot of it. Details omitted.
Less naive proof. Here is a less naive proof. By Categories, Lemma 4.35 .4 there exists an equivalence of fibred categories $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ where $\mathcal{S}^{\prime}$ is a split fibred category, i.e., one in which the pullback functors compose on the nose. Obviously the lemma for $\mathcal{S}^{\prime}$ implies the lemma for $\mathcal{S}$. Hence we may think of $\mathcal{S}$ as a presheaf in categories.

Consider the 2-category Cat temporarily as a category by forgetting about 2morphisms. Let us think of a category as a quintuple (Ob, Arrows, $s, t, \circ$ ) as in Categories, Section 4.2. Consider the forgetful functor

$$
\text { forget : Cat } \rightarrow \text { Sets, } \quad(\mathrm{Ob}, \text { Arrows, } s, t, \circ) \mapsto \mathrm{Ob} \amalg \text { Arrows. }
$$

Then forget is faithful, Cat has limits and forget commutes with them, Cat has directed colimits and forget commutes with them, and forget reflects isomorphisms. Hence, according to the first part of Sites, Section 7.43 we can sheafify presheaves with values in $C a t$, and the result commutes with forget. Applying this to $\mathcal{S}$ we obtain a sheafification $\mathcal{S}^{\#}$ which has a sheaf of objects and a sheaf of morphisms both of which are the sheafifications of the corresponding presheaves for $\mathcal{S}$. In this case it is quite easy to see that the map $\mathcal{S} \rightarrow \mathcal{S}^{\#}$ has the properties (1) and (2) of the lemma.

However, the category $\mathcal{S}^{\#}$ may not yet be a stack since, although the presheaf of objects is a sheaf, the descent condition may not yet be satisfied. To remedy this we have to add more objects. But the argument above does reduce us to the case where $\mathcal{S}=\mathcal{S}_{F}$ for some sheaf(!) $F: \mathcal{C}^{o p p} \rightarrow C a t$ of categories. In this case consider the functor $F^{\prime}: \mathcal{C}^{o p p} \rightarrow$ Cat defined by
(1) The set $\operatorname{Ob}\left(F^{\prime}(U)\right)$ is the set of pairs $(\mathcal{U}, \xi)$ where $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ is a covering of $U$ and $\xi=\left(x_{i}, \varphi_{i i^{\prime}}\right)$ is a descent datum relative to $\mathcal{U}$.
(2) A morphism in $F^{\prime}(U)$ from $(\mathcal{U}, \xi)$ to $(\mathcal{V}, \eta)$ is an element of

$$
\operatorname{colim}_{\operatorname{Mor}_{D D(\mathcal{W})}}\left(a^{*} \xi, b^{*} \eta\right)
$$

where the colimit is over all common refinements $a: \mathcal{W} \rightarrow \mathcal{U}, b: \mathcal{W} \rightarrow \mathcal{V}$. This colimit is filtered (verification omitted). Hence composition of morphisms in $F(U)$ is defined by finding a common refinement and composing in $D D(\mathcal{W})$.
(3) Given $h: V \rightarrow U$ and an object $(\mathcal{U}, \xi)$ of $F^{\prime}(U)$ we set $F^{\prime}(h)(\mathcal{U}, \xi)$ equal to $\left(V \times_{U} \mathcal{U}, \operatorname{pr}_{1}^{*} \xi\right)$. More precisely, if $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ and $\xi=\left(x_{i}, \varphi_{i i^{\prime}}\right)$, then $V \times_{U} \mathcal{U}=\left\{V \times_{U} U_{i} \rightarrow V\right\}$ which comes with a canonical morphism $\operatorname{pr}_{1}: V \times_{U} \mathcal{U} \rightarrow \mathcal{U}$ and $\operatorname{pr}_{1}^{*} \xi$ is the pullback of $\xi$ with respect to this morphism (see Definition 8.3.4).
(4) Given $h: V \rightarrow U$, objects $(\mathcal{U}, \xi)$ and $(\mathcal{V}, \eta)$ and a morphism between them, represented by $a: \mathcal{W} \rightarrow \mathcal{U}, b: \mathcal{W} \rightarrow \mathcal{V}$, and $\alpha: a^{*} \xi \rightarrow b^{*} \eta$, then $F^{\prime}(h)(\alpha)$ is represented by $a^{\prime}: V \times_{U} \mathcal{W} \rightarrow V \times_{U} \mathcal{U}, b^{\prime}: V \times_{U} \mathcal{W} \rightarrow V \times_{U} \mathcal{V}$, and the pullback $\alpha^{\prime}$ of the morphism $\alpha$ via the map $V \times_{U} \mathcal{W} \rightarrow \mathcal{W}$. This works since pullbacks in $\mathcal{S}_{F}$ commute on the nose.
There is a map $F \rightarrow F^{\prime}$ given by associating to an object $x$ of $F(U)$ the object $(\{U \rightarrow U\},(x$, triv $))$ of $F^{\prime}(U)$. At this point you have to check that the corresponding functor $\mathcal{S}_{F} \rightarrow \mathcal{S}_{F^{\prime}}$ has properties (1) and (2) of the lemma, and finally that $\mathcal{S}_{F^{\prime}}$ is a stack. Details omitted.

0435 Lemma 8.8.2. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category over $\mathcal{C}$. Let $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ and $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ the stack and 1-morphism constructed in Lemma 8.8.1. This construction has the following universal property: Given a stack $q: \mathcal{X} \rightarrow \mathcal{C}$ and a 1-morphism $F: \mathcal{S} \rightarrow \mathcal{X}$ of fibred categories over $\mathcal{C}$ there exists a 1-morphism
$H: \mathcal{S}^{\prime} \rightarrow \mathcal{X}$ such that the diagram

is 2-commutative.
Proof. Omitted. Hint: Suppose that $x^{\prime} \in \operatorname{Ob}\left(\mathcal{S}_{U}^{\prime}\right)$. By the result of Lemma 8.8.1 there exists a covering $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ such that $\left.x^{\prime}\right|_{U_{i}}=G\left(x_{i}\right)$ for some $x_{i} \in$ $\operatorname{Ob}\left(\mathcal{S}_{U_{i}}\right)$. Moreover, there exist coverings $\left\{U_{i j k} \rightarrow U_{i} \times_{U} U_{j}\right\}$ and isomorphisms $\alpha_{i j k}:\left.\left.x_{i}\right|_{U_{i j k}} \rightarrow x_{j}\right|_{U_{i j k}}$ with $G\left(\alpha_{i j k}\right)=\operatorname{id}_{x^{\prime} \mid U_{i j k}}$. Set $y_{i}=F\left(x_{i}\right)$. Then you can check that

$$
F\left(\alpha_{i j k}\right):\left.\left.y_{i}\right|_{U_{i j k}} \rightarrow y_{j}\right|_{U_{i j k}}
$$

agree on overlaps and therefore (as $\mathcal{X}$ is a stack) define a morphism $\beta_{i j}:\left.y_{i}\right|_{U_{i} \times_{U} U_{j}} \rightarrow$ $\left.y_{j}\right|_{U_{i} \times_{U} U_{j}}$. Next, you check that the $\beta_{i j}$ define a descent datum. Since $\mathcal{X}$ is a stack these descent data are effective and we find an object $y$ of $\mathcal{X}_{U}$ agreeing with $G\left(x_{i}\right)$ over $U_{i}$. The hint is to set $H\left(x^{\prime}\right)=y$.
04W9 Lemma 8.8.3. Notation and assumptions as in Lemma 8.8.2. There is a canonical equivalence of categories

$$
\operatorname{Mor}_{\text {Fib/C }}(\mathcal{S}, \mathcal{X})=\operatorname{Mor}_{\text {Stacks } / \mathcal{C}}\left(\mathcal{S}^{\prime}, \mathcal{X}\right)
$$

given by the constructions in the proof of the aforementioned lemma.
Proof. Omitted.
04Y1 Lemma 8.8.4. Let $\mathcal{C}$ be a site. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Z} \rightarrow \mathcal{Y}$ be morphisms of fibred categories over $\mathcal{C}$. In this case the stackification of the 2 -fibre product is the 2-fibre product of the stackifications.

Proof. Let us denote $\mathcal{X}^{\prime}, \mathcal{Y}^{\prime}, \mathcal{Z}^{\prime}$ the stackifications and $\mathcal{W}$ the stackification of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$. By construction of 2-fibre products there is a canonical 1-morphism $\mathcal{X} \times \mathcal{Y}^{\mathcal{Z}} \rightarrow \mathcal{X}^{\prime} \times \mathcal{Y}^{\prime} \mathcal{Z}^{\prime}$. As the second 2-fibre product is a stack (see Lemma 8.4.6) this 1-morphism induces a 1-morphism $h: \mathcal{W} \rightarrow \mathcal{X}^{\prime} \times \mathcal{Y}^{\prime} \mathcal{Z}^{\prime}$ by the universal property of stackification, see Lemma 8.8.2. Now $h$ is a morphism of stacks, and we may check that it is an equivalence using Lemmas 8.4.7 and 8.4.8.
Thus we first prove that $h$ induces isomorphisms of Mor-sheaves. Let $\xi, \xi^{\prime}$ be objects of $\mathcal{W}$ over $U \in \operatorname{Ob}(\mathcal{C})$. We want to show that

$$
h: \operatorname{Mor}\left(\xi, \xi^{\prime}\right) \longrightarrow \operatorname{Mor}\left(h(\xi), h\left(\xi^{\prime}\right)\right)
$$

is an isomorphism. To do this we may work locally on $U$ (see Sites, Section 7.25). Hence by construction of $\mathcal{W}$ (see Lemma 8.8.1) we may assume that $\xi, \xi^{\prime}$ actually come from objects $(x, y, \alpha)$ and $\left(x^{\prime}, y^{\prime}, \alpha^{\prime}\right)$ of $\mathcal{X} \times \mathcal{Y} \mathcal{Z}$ over $U$. By the same lemma once more we see that in this case $\operatorname{Mor}\left(\xi, \xi^{\prime}\right)$ is the sheafification of

$$
V / U \longmapsto \operatorname{Mor}_{\mathcal{X}_{V}}\left(\left.x\right|_{V},\left.x^{\prime}\right|_{V}\right) \times_{\operatorname{Mor}_{\mathcal{Z}_{V}}\left(\left.f(x)\right|_{V},\left.f\left(x^{\prime}\right)\right|_{V}\right)} \operatorname{Mor}_{\mathcal{Y}_{V}}\left(\left.y\right|_{V},\left.y^{\prime}\right|_{V}\right)
$$

and that $\operatorname{Mor}\left(h(\xi), h\left(\xi^{\prime}\right)\right)$ is equal to the fibre product

$$
\operatorname{Mor}\left(i(x), i\left(x^{\prime}\right)\right) \times_{\operatorname{Mor}\left(k(f(x)), k\left(f\left(x^{\prime}\right)\right)\right.} \operatorname{Mor}\left(j(x), j\left(x^{\prime}\right)\right)
$$

where $i: \mathcal{X} \rightarrow \mathcal{X}^{\prime}, j: \mathcal{Y} \rightarrow \mathcal{Y}^{\prime}$, and $k: \mathcal{Z} \rightarrow \mathcal{Z}^{\prime}$ are the canonical functors. Thus the first displayed map of this paragraph is an isomorphism as sheafification is exact
(and hence the sheafification of a fibre product of presheaves is the fibre product of the sheafifications).
Finally, we have to check that any object of $\mathcal{X}^{\prime} \times \mathcal{Y}^{\prime} \mathcal{Z}^{\prime}$ over $U$ is locally on $U$ in the essential image of $h$. Write such an object as a triple $\left(x^{\prime}, y^{\prime}, \alpha\right)$. Then $x^{\prime}$ locally comes from an object of $\mathcal{X}, y^{\prime}$ locally comes from an object of $\mathcal{Y}$, and having made suitable replacements for $x^{\prime}, y^{\prime}$ the morphism $\alpha$ of $\mathcal{Z}_{U}^{\prime}$ locally comes from a morphism of $\mathcal{Z}$. In other words, we have shown that any object of $\mathcal{X}^{\prime} \times \mathcal{Y}^{\prime} \mathcal{Z}^{\prime}$ over $U$ is locally on $U$ in the essential image of $\mathcal{X} \times \mathcal{Y} \mathcal{Z} \rightarrow \mathcal{X}^{\prime} \times \mathcal{Y}^{\prime} \mathcal{Z}^{\prime}$, hence a fortiori it is locally in the essential image of $h$.

06NS Lemma 8.8.5. Let $\mathcal{C}$ be a site. Let $\mathcal{X}$ be a fibred category over $\mathcal{C}$. The stackification of the inertia fibred category $\mathcal{I}_{\mathcal{X}}$ is inertia of the stackification of $\mathcal{X}$.

Proof. This follows from the fact that stackification is compatible with 2 -fibre products by Lemma 8.8 .4 and the fact that there is a formula for the inertia in terms of 2-fibre products of categories over $\mathcal{C}$, see Categories, Lemma 4.33.1.

### 8.9. Stackification of categories fibred in groupoids

02 ZO Here is the result.
02ZP Lemma 8.9.1. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids over $\mathcal{C}$. There exists a stack in groupoids $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ and a 1-morphism $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ of categories fibred in groupoids over $\mathcal{C}$ (see Categories, Definition 4.34.6) such that
(1) for every $U \in \mathrm{Ob}(\mathcal{C})$, and any $x, y \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$ the map

$$
\operatorname{Mor}(x, y) \longrightarrow \operatorname{Mor}(G(x), G(y))
$$

induced by $G$ identifies the right hand side with the sheafification of the left hand side, and
(2) for every $U \in \mathrm{Ob}(\mathcal{C})$, and any $x^{\prime} \in \mathrm{Ob}\left(\mathcal{S}_{U}^{\prime}\right)$ there exists a covering $\left\{U_{i} \rightarrow\right.$ $U\}_{i \in I}$ such that for every $i \in I$ the object $\left.x^{\prime}\right|_{U_{i}}$ is in the essential image of the functor $G: \mathcal{S}_{U_{i}} \rightarrow \mathcal{S}_{U_{i}}^{\prime}$.
Moreover the stack in groupoids $\mathcal{S}^{\prime}$ is determined up to unique 2-isomorphism by these conditions.

Proof. Apply Lemma 8.8.1. The result will be a stack in groupoids by applying Lemma 8.5.2.

0436 Lemma 8.9.2. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category fibred in groupoids over $\mathcal{C}$. Let $p^{\prime}: \mathcal{S}^{\prime} \rightarrow \mathcal{C}$ and $G: \mathcal{S} \rightarrow \mathcal{S}^{\prime}$ the stack in groupoids and 1-morphism constructed in Lemma 8.9.1. This construction has the following universal property: Given a stack in groupoids $q: \mathcal{X} \rightarrow \mathcal{C}$ and a 1-morphism $F: \mathcal{S} \rightarrow \mathcal{X}$ of categories over $\mathcal{C}$ there exists a 1-morphism $H: \mathcal{S}^{\prime} \rightarrow \mathcal{X}$ such that the diagram

is 2-commutative.
Proof. This is a special case of Lemma 8.8.2.

04Y2 Lemma 8.9.3. Let $\mathcal{C}$ be a site. Let $f: \mathcal{X} \rightarrow \mathcal{Y}$ and $g: \mathcal{Y} \rightarrow \mathcal{Z}$ be morphisms categories fibred in groupoids over $\mathcal{C}$. In this case the stackification of the 2-fibre product is the 2-fibre product of the stackifications.

Proof. This is a special case of Lemma 8.8.4.

### 8.10. Inherited topologies

06 NT It turns out that a fibred category over a site inherits a canonical topology from the underlying site.

06 NU Lemma 8.10.1. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. Let $\operatorname{Cov}(\mathcal{S})$ be the set of families $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ of morphisms in $\mathcal{S}$ with fixed target such that (a) each $x_{i} \rightarrow x$ is strongly cartesian, and (b) $\left\{p\left(x_{i}\right) \rightarrow p(x)\right\}_{i \in I}$ is a covering of $\mathcal{C}$. Then $(\mathcal{S}, \operatorname{Cov}(\mathcal{S}))$ is a site.

Proof. We have to check the three conditions of Sites, Definition 7.6.2,
(1) If $x \rightarrow y$ is an isomorphism of $\mathcal{S}$, then it is strongly cartesian by Categories, Lemma 4.32 .2 and $p(x) \rightarrow p(y)$ is an isomorphism of $\mathcal{C}$. Thus $\{p(x) \rightarrow$ $p(y)\}$ is a covering of $\mathcal{C}$ whence $\{x \rightarrow y\} \in \operatorname{Cov}(\mathcal{S})$.
(2) If $\left\{x_{i} \rightarrow x\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{S})$ and for each $i$ we have $\left\{y_{i j} \rightarrow x_{i}\right\}_{j \in J_{i}} \in \operatorname{Cov}(\mathcal{S})$, then each composition $p\left(y_{i j}\right) \rightarrow p(x)$ is strongly cartesian by Categories, Lemma 4.32.2 and $\left\{p\left(y_{i j}\right) \rightarrow p(x)\right\}_{i \in I, j \in J_{i}} \in \operatorname{Cov}(\mathcal{C})$. Hence also $\left\{y_{i j} \rightarrow\right.$ $x\}_{i \in I, j \in J_{i}} \in \operatorname{Cov}(\mathcal{S})$.
(3) Suppose $\left\{x_{i} \rightarrow x\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{S})$ and $y \rightarrow x$ is a morphism of $\mathcal{S}$. As $\left\{p\left(x_{i}\right) \rightarrow p(x)\right\}$ is a covering of $\mathcal{C}$ we see that $p\left(x_{i}\right) \times_{p(x)} p(y)$ exists. Hence Categories, Lemma 4.32.13implies that $x_{i} \times_{x} y$ exists, that $p\left(x_{i} \times_{x} y\right)=$ $p\left(x_{i}\right) \times_{p(x)} p(y)$, and that $x_{i} \times_{x} y \rightarrow y$ is strongly cartesian. Since also $\left\{p\left(x_{i}\right) \times_{p(x)} p(y) \rightarrow p(y)\right\}_{i \in I} \in \operatorname{Cov}(\mathcal{C})$ we conclude that $\left\{x_{i} \times_{x} y \rightarrow\right.$ $y\}_{i \in I} \in \operatorname{Cov}(\mathcal{S})$
This finishes the proof.
Note that if $p: \mathcal{S} \rightarrow \mathcal{C}$ is fibred in groupoids, then the coverings of the site $\mathcal{S}$ in Lemma 8.10.1 are characterized by

$$
\left\{x_{i} \rightarrow x\right\} \in \operatorname{Cov}(\mathcal{S}) \Leftrightarrow\left\{p\left(x_{i}\right) \rightarrow p(x)\right\} \in \operatorname{Cov}(\mathcal{C})
$$

because every morphism of $\mathcal{S}$ is strongly cartesian.
06NV Definition 8.10.2. Let $\mathcal{C}$ be a site. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a fibred category. We say $(\mathcal{S}, \operatorname{Cov}(\mathcal{S}))$ as in Lemma 8.10.1 is the structure of site on $\mathcal{S}$ inherited from $\mathcal{C}$. We sometimes indicate this by saying that $\mathcal{S}$ is endowed with the topology inherited from $\mathcal{C}$.

In particular we obtain a topos of sheaves $S h(\mathcal{S})$ in this situation. It turns out that this topos is functorial with respect to 1-morphisms of fibred categories.

06NW Lemma 8.10.3. Let $\mathcal{C}$ be a site. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of fibred categories over $\mathcal{C}$. Then $F$ is a continuous and cocontinuous functor between the structure of sites inherited from $\mathcal{C}$. Hence $F$ induces a morphism of topoi $f: \operatorname{Sh}(\mathcal{X}) \rightarrow \operatorname{Sh}(\mathcal{Y})$ with $f_{*}={ }_{s} F={ }_{p} F$ and $f^{-1}=F^{s}=F^{p}$. In particular $f^{-1}(\mathcal{G})(x)=\mathcal{G}(F(x))$ for a sheaf $\mathcal{G}$ on $\mathcal{Y}$ and object $x$ of $\mathcal{X}$.

Proof. We first prove that $F$ is continuous. Let $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ be a covering of $\mathcal{X}$. By Categories, Definition 4.32.9 the functor $F$ transforms strongly cartesian morphisms into strongly cartesian morphisms, hence $\left\{F\left(x_{i}\right) \rightarrow F(x)\right\}_{i \in I}$ is a covering of $\mathcal{Y}$. This proves part (1) of Sites, Definition 7.14.1. Moreover, let $x^{\prime} \rightarrow x$ be a morphism of $\mathcal{X}$. By Categories, Lemma 4.32 .13 the fibre product $x_{i} \times{ }_{x} x^{\prime}$ exists and $x_{i} \times{ }_{x} x^{\prime} \rightarrow$ $x^{\prime}$ is strongly cartesian. Hence $F\left(x_{i} \times_{x} x^{\prime}\right) \rightarrow F\left(x^{\prime}\right)$ is strongly cartesian. By Categories, Lemma 4.32.13 applied to $\mathcal{Y}$ this means that $F\left(x_{i} \times_{x} x^{\prime}\right)=F\left(x_{i}\right) \times_{F(x)}$ $F\left(x^{\prime}\right)$. This proves part (2) of Sites, Definition 7.14.1 and we conclude that $F$ is continuous.

Next we prove that $F$ is cocontinuous. Let $x \in \operatorname{Ob}(\mathcal{X})$ and let $\left\{y_{i} \rightarrow F(x)\right\}_{i \in I}$ be a covering in $\mathcal{Y}$. Denote $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ the corresponding covering of $\mathcal{C}$. For each $i$ choose a strongly cartesian morphism $x_{i} \rightarrow x$ in $\mathcal{X}$ lying over $U_{i} \rightarrow U$. Then $F\left(x_{i}\right) \rightarrow F(x)$ and $y_{i} \rightarrow F(x)$ are both a strongly cartesian morphisms in $\mathcal{Y}$ lying over $U_{i} \rightarrow U$. Hence there exists a unique isomorphism $F\left(x_{i}\right) \rightarrow y_{i}$ in $\mathcal{Y}_{U_{i}}$ compatible with the maps to $F(x)$. Thus $\left\{x_{i} \rightarrow x\right\}_{i \in I}$ is a covering of $\mathcal{X}$ such that $\left\{F\left(x_{i}\right) \rightarrow F(x)\right\}_{i \in I}$ is isomorphic to $\left\{y_{i} \rightarrow F(x)\right\}_{i \in I}$. Hence $F$ is cocontinuous, see Sites, Definition 7.19.1.

The final assertion follows from the first two, see Sites, Lemmas 7.20.1, 7.19.2, and 7.20 .5

06NX Lemma 8.10.4. Let $\mathcal{C}$ be a site. Let $p: \mathcal{X} \rightarrow \mathcal{C}$ and $q: \mathcal{Y} \rightarrow \mathcal{C}$ be stacks in groupoids. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories over $\mathcal{C}$. If $F$ turns $\mathcal{X}$ into a category fibred in groupoids over $\mathcal{Y}$, then $\mathcal{X}$ is a stack in groupoids over $\mathcal{Y}$ (with topology inherited from $\mathcal{C}$ ).

Proof. Let us prove descent for objects. Let $\left\{y_{i} \rightarrow y\right\}$ be a covering of $\mathcal{Y}$. Let $\left(x_{i}, \varphi_{i j}\right)$ be a descent datum in $\mathcal{X}$ with respect to this covering. Then $\left(x_{i}, \varphi_{i j}\right)$ is also a descent datum with respect to the covering $\left\{q\left(y_{i}\right) \rightarrow q(y)\right\}$ of $\mathcal{C}$. As $\mathcal{X}$ is a stack in groupoids we obtain an object $x$ over $q(y)$ and isomorphisms $\psi_{i}:\left.x\right|_{q\left(y_{i}\right)} \rightarrow x_{i}$ over $q\left(y_{i}\right)$ compatible with the $\varphi_{i j}$, i.e., such that

$$
\varphi_{i j}=\left.\left.\psi_{j}\right|_{q\left(y_{i}\right) \times_{q(y)} q\left(y_{j}\right)} \circ \psi_{i}^{-1}\right|_{q\left(y_{i}\right) \times_{q(y)} q\left(y_{j}\right)}
$$

Consider the sheaf $I=\operatorname{Isom}_{\mathcal{Y}}(F(x), y)$ on $\mathcal{C} / p(x)$. Note that $s_{i}=F\left(\psi_{i}\right) \in I\left(q\left(x_{i}\right)\right)$ because $F\left(x_{i}\right)=y_{i}$. Because $F\left(\varphi_{i j}\right)=$ id (as we started with a descent datum over $\left.\left\{y_{i} \rightarrow y\right\}\right)$ the displayed formula shows that $\left.s_{i}\right|_{q\left(y_{i}\right) \times_{q(y)} q\left(y_{j}\right)}=\left.s_{j}\right|_{q\left(y_{i}\right) \times_{q(y)} q\left(y_{j}\right)}$. Hence the local sections $s_{i}$ glue to $s: F(x) \rightarrow y$. As $F$ is fibred in groupoids we see that $x$ is isomorphic to an object $x^{\prime}$ with $F\left(x^{\prime}\right)=y$. We omit the verification that $x^{\prime}$ in the fibre category of $\mathcal{X}$ over $y$ is a solution to the problem of descent posed by the descent datum $\left(x_{i}, \varphi_{i j}\right)$. We also omit the proof of the sheaf property of the Isom-presheaves of $\mathcal{X} / \mathcal{Y}$.

09WX Lemma 8.10.5. Let $\mathcal{C}$ be a site. Let $p: \mathcal{X} \rightarrow \mathcal{C}$ be a stack. Endow $\mathcal{X}$ with the topology inherited from $\mathcal{C}$ and let $q: \mathcal{Y} \rightarrow \mathcal{X}$ be a stack. Then $\mathcal{Y}$ is a stack over $\mathcal{C}$. If $p$ and $q$ define stacks in groupoids, then $\mathcal{Y}$ is a stack in groupoids over $\mathcal{C}$.

Proof. We check the three conditions in Definition 8.4.1 to prove that $\mathcal{Y}$ is a stack over $\mathcal{C}$. By Categories, Lemma 4.32 .12 we find that $\mathcal{Y}$ is a fibred category over $\mathcal{C}$. Thus condition (1) holds.

Let $U$ be an object of $\mathcal{C}$ and let $y_{1}, y_{2}$ be objects of $\mathcal{Y}$ over $U$. Denote $x_{i}=q\left(y_{i}\right)$ in $\mathcal{X}$. Consider the map of presheaves

$$
q: \operatorname{Mor}_{\mathcal{Y} / \mathcal{C}}\left(y_{1}, y_{2}\right) \longrightarrow \operatorname{Mor}_{\mathcal{X} / \mathcal{C}}\left(x_{1}, x_{2}\right)
$$

on $\mathcal{C} / U$, see Lemma 8.2.3. Let $\left\{U_{i} \rightarrow U\right\}$ be a covering and let $\varphi_{i}$ be a section of the presheaf on the left over $U_{i}$ such that $\varphi_{i}$ and $\varphi_{j}$ restrict to the same section over $U_{i} \times_{U} U_{j}$. We have to find a morphism $\varphi: x_{1} \rightarrow x_{2}$ restricting to $\varphi_{i}$. Note that $q\left(\varphi_{i}\right)=\left.\psi\right|_{U_{i}}$ for some morphism $\psi: x_{1} \rightarrow x_{2}$ over $U$ because the second presheaf is a sheaf (by assumption). Let $y_{12} \rightarrow y_{2}$ be the stronly $\mathcal{X}$-cartesian morphism of $\mathcal{Y}$ lying over $\psi$. Then $\varphi_{i}$ corresponds to a morphism $\varphi_{i}^{\prime}:\left.\left.y_{1}\right|_{U_{i}} \rightarrow y_{12}\right|_{U_{i}}$ over $\left.x_{1}\right|_{U_{i}}$. In other words, $\varphi_{i}^{\prime}$ now define local sections of the presheaf

$$
\operatorname{Mor}_{\mathcal{Y} / \mathcal{X}}\left(y_{1}, y_{12}\right)
$$

over the members of the covering $\left\{\left.x_{1}\right|_{U_{i}} \rightarrow x_{1}\right\}$. By assumption these glue to a unique morphism $y_{1} \rightarrow y_{12}$ which composed with the given morphism $y_{12} \rightarrow y_{2}$ produces the desired morphism $y_{1} \rightarrow y_{2}$.
Finally, we show that descent data are effective. Let $\left\{f_{i}: U_{i} \rightarrow U\right\}$ be a covering of $\mathcal{C}$ and let $\left(y_{i}, \varphi_{i j}\right)$ be a descent datum relative to this covering (Definition 8.3.1). Setting $x_{i}=q\left(y_{i}\right)$ and $\psi_{i j}=q\left(\varphi_{i j}\right)$ we obtain a descent datum $\left(x_{i}, \psi_{i j}\right)$ for the covering in $\mathcal{X}$. By assumption on $\mathcal{X}$ we may assume $x_{i}=\left.x\right|_{U_{i}}$ and the $\psi_{i j}$ equal to the canonical descent datum (Definition 8.3.5. In this case $\left\{\left.x\right|_{U_{i}} \rightarrow x\right\}$ is a covering and we can view $\left(y_{i}, \varphi_{i j}\right)$ as a descent datum relative to this covering. By our assumption that $\mathcal{Y}$ is a stack over $\mathcal{C}$ we see that it is effective which finishes the proof of condition (3).
The final assertion follows because $\mathcal{Y}$ is a stack over $\mathcal{C}$ and is fibred in groupoids by Categories, Lemma 4.34.13.

### 8.11. Gerbes

06 NY Gerbes are a special kind of stacks in groupoids.
06NZ Definition 8.11.1. A gerbe over a site $\mathcal{C}$ is a category $p: \mathcal{S} \rightarrow \mathcal{C}$ over $\mathcal{C}$ such that
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is a stack in groupoids over $\mathcal{C}$ (see Definition 8.5.1),
(2) for $U \in \operatorname{Ob}(\mathcal{C})$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ such that $\mathcal{S}_{U_{i}}$ is nonempty, and
(3) for $U \in \operatorname{Ob}(\mathcal{C})$ and $x, y \in \mathrm{Ob}\left(\mathcal{S}_{U}\right)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ such that $\left.\left.x\right|_{U_{i}} \cong y\right|_{U_{i}}$ in $\mathcal{S}_{U_{i}}$.
In other words, a gerbe is a stack in groupoids such that any two objects are locally isomorphic and such that objects exist locally.

06P0 Lemma 8.11.2. Let $\mathcal{C}$ be a site. Let $\mathcal{S}_{1}, \mathcal{S}_{2}$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_{1}$ and $\mathcal{S}_{2}$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_{1}$ is a gerbe over $\mathcal{C}$ if and only if $\mathcal{S}_{2}$ is a gerbe over $\mathcal{C}$.

Proof. Assume $\mathcal{S}_{1}$ is a gerbe over $\mathcal{C}$. By Lemma 8.5.4 we see $\mathcal{S}_{2}$ is a stack in groupoids over $\mathcal{C}$. Let $F: \mathcal{S}_{1} \rightarrow \mathcal{S}_{2}, G: \mathcal{S}_{2} \rightarrow \mathcal{S}_{1}$ be equivalences of categories over $\mathcal{C}$. Given $U \in \operatorname{Ob}(\mathcal{C})$ we see that there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left(\mathcal{S}_{1}\right)_{U_{i}}$ is nonempty. Applying $F$ we see that $\left(\mathcal{S}_{2}\right)_{U_{i}}$ is nonempty. Given $U \in \operatorname{Ob}(\mathcal{C})$ and $x, y \in \operatorname{Ob}\left(\left(\mathcal{S}_{2}\right)_{U}\right)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ such that $\left.\left.G(x)\right|_{U_{i}} \cong G(y)\right|_{U_{i}}$ in $\left(\mathcal{S}_{1}\right)_{U_{i}}$. By Categories, Lemma 4.34.8 this implies $\left.\left.x\right|_{U_{i}} \cong y\right|_{U_{i}}$ in $\left(\mathcal{S}_{2}\right)_{U_{i}}$.

We want to generalize the definition of gerbes a bit. Namely, let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1 -morphism of stacks in groupoids over a site $\mathcal{C}$. We want to say what it means for $\mathcal{X}$ to be a gerbe over $\mathcal{Y}$. By Section 8.10 the category $\mathcal{Y}$ inherits the structure of a site from $\mathcal{C}$. A naive guess is: Just require that $\mathcal{X} \rightarrow \mathcal{Y}$ is a gerbe in the sense above. Except the notion so obtained is not invariants under replacing $\mathcal{X}$ by an equivalent stack in groupoids over $\mathcal{C}$; this is even the case for the property of being fibred in groupoids over $\mathcal{Y}$. However, it turns out that we can replace $\mathcal{X}$ by an equivalent stack in groupoids over $\mathcal{Y}$ which is fibred in groupoids over $\mathcal{Y}$, and then the property of being a gerbe over $\mathcal{Y}$ is independent of this choice. Here is the precise formulation.

06P1 Lemma 8.11.3. Let $\mathcal{C}$ be a site. Let $p: \mathcal{X} \rightarrow \mathcal{C}$ and $q: \mathcal{Y} \rightarrow \mathcal{C}$ be stacks in groupoids. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories over $\mathcal{C}$. The following are equivalent
(1) For some (equivalently any) factorization $F=F^{\prime} \circ a$ where $a: \mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is an equivalence of categories over $\mathcal{C}$ and $F^{\prime}$ is fibred in groupoids, the map $F^{\prime}: \mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a gerbe (with the topology on $\mathcal{Y}$ inherited from $\mathcal{C}$ ).
(2) The following two conditions are satisfied
(a) for $y \in \mathrm{Ob}(\mathcal{Y})$ lying over $U \in \mathrm{Ob}(\mathcal{C})$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ and objects $x_{i}$ of $\mathcal{X}$ over $U_{i}$ such that $\left.F\left(x_{i}\right) \cong y\right|_{U_{i}}$ in $\mathcal{Y}_{U_{i}}$, and
(b) for $U \in \mathrm{Ob}(\mathcal{C}), x, x^{\prime} \in \mathrm{Ob}\left(\mathcal{X}_{U}\right)$, and $b: F(x) \rightarrow F\left(x^{\prime}\right)$ in $\mathcal{Y}_{U}$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ and morphisms $a_{i}:\left.\left.x\right|_{U_{i}} \rightarrow x^{\prime}\right|_{U_{i}}$ in $\mathcal{X}_{U_{i}}$ with $F\left(a_{i}\right)=\left.b\right|_{U_{i}}$.

Proof. By Categories, Lemma 4.34.15 there exists a factorization $F=F^{\prime} \circ a$ where $a: \mathcal{X} \rightarrow \mathcal{X}^{\prime}$ is an equivalence of categories over $\mathcal{C}$ and $F^{\prime}$ is fibred in groupoids. By Categories, Lemma 4.34.16 given any two such factorizations $F=F^{\prime} \circ a=F^{\prime \prime} \circ b$ we have that $\mathcal{X}^{\prime}$ is equivalent to $\mathcal{X}^{\prime \prime}$ as categories over $\mathcal{Y}$. Hence Lemma 8.11.2 guarantees that the condition (1) is independent of the choice of the factorization. Moreover, this means that we may assume $\mathcal{X}^{\prime}=\mathcal{X} \times_{F, \mathcal{Y}, \text { id }} \mathcal{Y}$ as in the proof of Categories, Lemma 4.34.15

Let us prove that (a) and (b) imply that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a gerbe. First of all, by Lemma 8.10 .4 we see that $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}$ is a stack in groupoids. Next, let $y$ be an object of $\mathcal{Y}$ lying over $U \in \operatorname{Ob}(\mathcal{C})$. By (a) we can find a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ and objects $x_{i}$ of $\mathcal{X}$ over $U_{i}$ and isomorphisms $f_{i}:\left.F\left(x_{i}\right) \rightarrow y\right|_{U_{i}}$ in $\mathcal{Y}_{U_{i}}$. Then ( $U_{i}, x_{i},\left.y\right|_{U_{i}}, f_{i}$ ) are objects of $\mathcal{X}_{U_{i}}^{\prime}$, i.e., the second condition of Definition 8.11.1 holds. Finally, let $(U, x, y, f)$ and ( $U, x^{\prime}, y, f^{\prime}$ ) be objects of $\mathcal{X}^{\prime}$ lying over the same object $y \in \operatorname{Ob}(\mathcal{Y})$. Set $b=\left(f^{\prime}\right)^{-1} \circ f$. By condition (b) we can find a covering $\left\{U_{i} \rightarrow U\right\}$ and isomorphisms $a_{i}:\left.\left.x\right|_{U_{i}} \rightarrow x^{\prime}\right|_{U_{i}}$ in $\mathcal{X}_{U_{i}}$ with $F\left(a_{i}\right)=\left.b\right|_{U_{i}}$. Then

$$
\left(a_{i}, \mathrm{id}\right):\left.\left.(U, x, y, f)\right|_{U_{i}} \rightarrow\left(U, x^{\prime}, y, f^{\prime}\right)\right|_{U_{i}}
$$

is a morphism in $\mathcal{X}_{U_{i}}^{\prime}$ as desired. This proves that (2) implies (1).
To prove that (1) implies (2) one reads the arguments in the preceding paragraph backwards. Details omitted.

06P2 Definition 8.11.4. Let $\mathcal{C}$ be a site. Let $\mathcal{X}$ and $\mathcal{Y}$ be stacks in groupoids over $\mathcal{C}$. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ be a 1-morphism of categories over $\mathcal{C}$. We say $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ if the equivalent conditions of Lemma 8.11 .3 are satisfied.

This definition does not conflict with Definition 8.11.1 when $\mathcal{Y}=\mathcal{C}$ because in this case we may take $\mathcal{X}^{\prime}=\mathcal{X}$ in part (1) of Lemma8.11.3. Note that conditions (2)(a) and $(2)(\mathrm{b})$ of Lemma 8.11 .3 are quite close in spirit to conditions (2) and (3) of Definition 8.11.1. Namely, (2)(a) says that the map of presheaves of isomorphism classes of objects becomes a surjection after sheafification. Moreover, (2)(b) says that

$$
\operatorname{Isom}_{\mathcal{X}}\left(x, x^{\prime}\right) \longrightarrow \operatorname{Isom}_{\mathcal{Y}}\left(F(x), F\left(x^{\prime}\right)\right)
$$

is a surjection of sheaves on $\mathcal{C} / U$ for any $U$ and $x, x^{\prime} \in \operatorname{Ob}\left(\mathcal{X}_{U}\right)$.
06P3 Lemma 8.11.5. Let $\mathcal{C}$ be a site. Let

be a 2-fibre product of stacks in groupoids over $\mathcal{C}$. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, then $\mathcal{X}^{\prime}$ is a gerbe over $\mathcal{Y}^{\prime}$.

Proof. By the uniqueness property of a 2 -fibre product may assume that $\mathcal{X}^{\prime}=$ $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$ as in Categories, Lemma 4.31.3. Let us prove properties (2)(a) and (2)(b) of Lemma 8.11 .3 for $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X} \rightarrow \mathcal{Y}^{\prime}$.
Let $y^{\prime}$ be an object of $\mathcal{Y}^{\prime}$ lying over the object $U$ of $\mathcal{C}$. By assumption there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of $U$ and objects $x_{i} \in \mathcal{X}_{U_{i}}$ with isomorphisms $\alpha_{i}:\left.G\left(y^{\prime}\right)\right|_{U_{i}} \rightarrow$ $F\left(x_{i}\right)$. Then $\left(U_{i},\left.y^{\prime}\right|_{U_{i}}, x_{i}, \alpha_{i}\right)$ is an object of $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$ over $U_{i}$ whose image in $\mathcal{Y}^{\prime}$ is $\left.y^{\prime}\right|_{U_{i}}$. Thus (2)(a) holds.

Let $U \in \operatorname{Ob}(\mathcal{C})$, let $x_{1}^{\prime}, x_{2}^{\prime}$ be objects of $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$ over $U$, and let $b^{\prime}: F^{\prime}\left(x_{1}^{\prime}\right) \rightarrow F^{\prime}\left(x_{2}^{\prime}\right)$ be a morphism in $\mathcal{Y}_{U}^{\prime}$. Write $x_{i}^{\prime}=\left(U, y_{i}^{\prime}, x_{i}, \alpha_{i}\right)$. Note that $F^{\prime}\left(x_{i}^{\prime}\right)=x_{i}$ and $G^{\prime}\left(x_{i}^{\prime}\right)=y_{i}^{\prime}$. By assumption there exists a covering $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ and morphisms $a_{i}:\left.\left.x_{1}\right|_{U_{i}} \rightarrow x_{2}\right|_{U_{i}}$ in $\mathcal{X}_{U_{i}}$ with $F\left(a_{i}\right)=\left.G\left(b^{\prime}\right)\right|_{U_{i}}$. Then $\left(\left.b^{\prime}\right|_{U_{i}}, a_{i}\right)$ is a morphism $\left.\left.x_{1}^{\prime}\right|_{U_{i}} \rightarrow x_{2}^{\prime}\right|_{U_{i}}$ as required in (2)(b).

06R3 Lemma 8.11.6. Let $\mathcal{C}$ be a site. Let $F: \mathcal{X} \rightarrow \mathcal{Y}$ and $G: \mathcal{Y} \rightarrow \mathcal{Z}$ be 1-morphisms of stacks in groupoids over $\mathcal{C}$. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ and $\mathcal{Y}$ is a gerbe over $\mathcal{Z}$, then $\mathcal{X}$ is a gerbe over $\mathcal{Z}$.
Proof. Let us prove properties (2)(a) and (2)(b) of Lemma 8.11.3 for $\mathcal{X} \rightarrow \mathcal{Z}$.
Let $z$ be an object of $\mathcal{Z}$ lying over the object $U$ of $\mathcal{C}$. By assumption on $G$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of $U$ and objects $y_{i} \in \mathcal{Y}_{U_{i}}$ such that $\left.G\left(y_{i}\right) \cong z\right|_{U_{i}}$. By assumption on $F$ there exist coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ and objects $x_{i j} \in \mathcal{X}_{U_{i j}}$ such that $\left.F\left(x_{i j}\right) \cong y_{i}\right|_{U_{i j}}$. Then $\left\{U_{i j} \rightarrow U\right\}$ is a covering of $\mathcal{C}$ and $\left.(G \circ F)\left(x_{i j}\right) \cong z\right|_{U_{i j}}$. Thus (2) (a) holds.

Let $U \in \operatorname{Ob}(\mathcal{C})$, let $x_{1}, x_{2}$ be objects of $\mathcal{X}$ over $U$, and let $c:(G \circ F)\left(x_{1}\right) \rightarrow(G \circ$ $F)\left(x_{2}\right)$ be a morphism in $\mathcal{Z}_{U}$. By assumption on $G$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of $U$ and morphisms $b_{i}:\left.\left.F\left(x_{1}\right)\right|_{U_{i}} \rightarrow F\left(x_{2}\right)\right|_{U_{i}}$ in $\mathcal{Y}_{U_{i}}$ such that $G\left(b_{i}\right)=\left.c\right|_{U_{i}}$. By assumption on $F$ there exist coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ and morphisms $a_{i j}:\left.x_{1}\right|_{U_{i j}} \rightarrow$ $\left.x_{2}\right|_{U_{i j}}$ in $\mathcal{X}_{U_{i j}}$ such that $F\left(a_{i j}\right)=\left.b_{i}\right|_{U_{i j}}$. Then $\left\{U_{i j} \rightarrow U\right\}$ is a covering of $\mathcal{C}$ and $(G \circ F)\left(a_{i j}\right)=\left.c\right|_{U_{i j}}$ as required in (2)(b).

06P4 Lemma 8.11.7. Let $\mathcal{C}$ be a site. Let

be a 2-cartesian diagram of stacks in groupoids over $\mathcal{C}$. If for every $U \in \mathrm{Ob}(\mathcal{C})$ and $x \in \operatorname{Ob}\left(\mathcal{Y}_{U}\right)$ there exists a covering $\left\{U_{i} \rightarrow U\right\}$ such that $\left.x\right|_{U_{i}}$ is in the essential image of $G: \mathcal{Y}_{U_{i}}^{\prime} \rightarrow \mathcal{Y}_{U_{i}}$ and $\mathcal{X}^{\prime}$ is a gerbe over $\mathcal{Y}^{\prime}$, then $\mathcal{X}$ is a gerbe over $\mathcal{Y}$.
Proof. By the uniqueness property of a 2-fibre product may assume that $\mathcal{X}^{\prime}=$ $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$ as in Categories, Lemma 4.31.3. Let us prove properties (2)(a) and (2)(b) of Lemma 8.11 .3 for $\mathcal{X} \rightarrow \mathcal{Y}$.

Let $y$ be an object of $\mathcal{Y}$ lying over the object $U$ of $\mathcal{C}$. By assumption there exists a covering $\left\{U_{i} \rightarrow U\right\}$ of $U$ and objects $y_{i}^{\prime} \in \mathcal{Y}_{U_{i}}^{\prime}$ with $\left.G\left(y_{i}^{\prime}\right) \cong y\right|_{U_{i}}$. By (2)(a) for $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ there exist coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ and objects $x_{i j}^{\prime}$ of $\mathcal{X}^{\prime}$ over $U_{i j}$ with $F^{\prime}\left(x_{i j}^{\prime}\right)$ isomorphic to the restriction of $y_{i}^{\prime}$ to $U_{i j}$. Then $\left\{U_{i j} \rightarrow U\right\}$ is a covering of $\mathcal{C}$ and $G^{\prime}\left(x_{i j}^{\prime}\right)$ are objects of $\mathcal{X}$ over $U_{i j}$ whose images in $\mathcal{Y}$ are isomorphic to the restrictions $\left.y\right|_{U_{i j}}$. This proves (2)(a) for $\mathcal{X} \rightarrow \mathcal{Y}$.
Let $U \in \operatorname{Ob}(\mathcal{C})$, let $x_{1}, x_{2}$ be objects of $\mathcal{X}$ over $U$, and let $b: F\left(x_{1}\right) \rightarrow F\left(x_{2}\right)$ be a morphism in $\mathcal{Y}_{U}$. By assumption we may choose a covering $\left\{U_{i} \rightarrow U\right\}$ and objects $y_{i}^{\prime}$ of $\mathcal{Y}^{\prime}$ over $U_{i}$ such that there exist isomorphisms $\alpha_{i}:\left.G\left(y_{i}^{\prime}\right) \rightarrow F\left(x_{1}\right)\right|_{U_{i}}$. Then we get objects

$$
x_{1 i}^{\prime}=\left(U_{i}, y_{i}^{\prime},\left.x_{1}\right|_{U_{i}}, \alpha_{i}\right) \quad \text { and } \quad x_{2 i}^{\prime}=\left(U_{i}, y_{i}^{\prime},\left.x_{2}\right|_{U_{i}},\left.b\right|_{U_{i}} \circ \alpha_{i}\right)
$$

of $\mathcal{X}^{\prime}$ over $U_{i}$. The identity morphism on $y_{i}^{\prime}$ is a morphism $F^{\prime}\left(x_{1 i}^{\prime}\right) \rightarrow F^{\prime}\left(x_{2 i}^{\prime}\right)$. By $(2)(\mathrm{b})$ for $\mathcal{X}^{\prime} \rightarrow \mathcal{Y}^{\prime}$ there exist coverings $\left\{U_{i j} \rightarrow U_{i}\right\}$ and morphisms $a_{i j}^{\prime}:\left.x_{1 i}^{\prime}\right|_{U_{i j}} \rightarrow$ $\left.x_{2 i}^{\prime}\right|_{U_{i j}}$ such that $F^{\prime}\left(a_{i j}^{\prime}\right)=\left.\mathrm{id}_{y_{i}^{\prime}}\right|_{U_{i j}}$. Unwinding the definition of morphisms in $\mathcal{Y}^{\prime} \times \mathcal{Y} \mathcal{X}$ we see that $G^{\prime}\left(a_{i j}^{\prime}\right):\left.\left.x_{1}\right|_{U_{i j}} \rightarrow x_{2}\right|_{U_{i j}}$ are the morphisms we're looking for, i.e., (2)(b) holds for $\mathcal{X} \rightarrow \mathcal{Y}$.

### 8.12. Functoriality for stacks

04WA In this section we study what happens if we want to change the base site of a stack. This section can be skipped on a first reading.

Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Let $p: \mathcal{S} \rightarrow \mathcal{D}$ be a category over $\mathcal{D}$. In this situation we denote $u^{p} \mathcal{S}$ the category over $\mathcal{C}$ defined as follows
(1) An object of $u^{p} \mathcal{S}$ is a pair $(U, y)$ consisting of an object $U$ of $\mathcal{C}$ and an object $y$ of $\mathcal{S}_{u(U)}$.
(2) A morphism $(a, \beta):(U, y) \rightarrow\left(U^{\prime}, y^{\prime}\right)$ is given by a morphism $a: U \rightarrow U^{\prime}$ of $\mathcal{C}$ and a morphism $\beta: y \rightarrow y^{\prime}$ of $\mathcal{S}$ such that $p(\beta)=u(a)$.
Note that with these definitions the fibre category of $u^{p} \mathcal{S}$ over $U$ is equal to the fibre category of $\mathcal{S}$ over $u(U)$.

04WB Lemma 8.12.1. In the situation above, if $\mathcal{S}$ is a fibred category over $\mathcal{D}$ then $u^{p} \mathcal{S}$ is a fibred category over $\mathcal{C}$.

Proof. Please take a look at the discussion surrounding Categories, Definitions 4.32 .1 and 4.32 .5 before reading this proof. Let $(a, \beta):(U, y) \rightarrow\left(U^{\prime}, y^{\prime}\right)$ be a morphism of $u^{p} \mathcal{S}$. We claim that $(a, \beta)$ is strongly cartesian if and only if $\beta$ is strongly cartesian. First, assume $\beta$ is strongly cartesian. Consider any second morphism $\left(a_{1}, \beta_{1}\right):\left(U_{1}, y_{1}\right) \rightarrow\left(U^{\prime}, y^{\prime}\right)$ of $u^{p} \mathcal{S}$. Then
$\operatorname{Mor}_{u^{p} \mathcal{S}}\left(\left(U_{1}, y_{1}\right),(U, y)\right)$
$=\operatorname{Mor}_{\mathcal{C}}\left(U_{1}, U\right) \times_{\operatorname{Mor}_{\mathcal{D}}\left(u\left(U_{1}\right), u(U)\right)} \operatorname{Mor}_{\mathcal{S}}\left(y_{1}, y\right)$
$=\operatorname{Mor}_{\mathcal{C}}\left(U_{1}, U\right) \times_{\operatorname{Mor}_{\mathcal{D}}\left(u\left(U_{1}\right), u(U)\right)} \operatorname{Mor}_{\mathcal{S}}\left(y_{1}, y^{\prime}\right) \times_{\operatorname{Mor}_{\mathcal{D}}\left(u\left(U_{1}\right), u\left(U^{\prime}\right)\right)} \operatorname{Mor}_{\mathcal{D}}\left(u\left(U_{1}\right), u(U)\right)$
$=\operatorname{Mor}_{\mathcal{S}}\left(y_{1}, y^{\prime}\right) \times_{\operatorname{Mor}_{\mathcal{D}}\left(u\left(U_{1}\right), u\left(U^{\prime}\right)\right)} \operatorname{Mor}_{\mathcal{C}}\left(U_{1}, U\right)$
$=\operatorname{Mor}_{u^{p} \mathcal{S}}\left(\left(U_{1}, y_{1}\right),\left(U^{\prime}, y^{\prime}\right)\right) \times_{\operatorname{Mor}_{\mathcal{C}}\left(U_{1}, U^{\prime}\right)} \operatorname{Mor}_{\mathcal{C}}\left(U_{1}, U\right)$
the second equality as $\beta$ is strongly cartesian. Hence we see that indeed $(a, \beta)$ is strongly cartesian. Conversely, suppose that $(a, \beta)$ is strongly cartesian. Choose a strongly cartesian morphism $\beta^{\prime}: y^{\prime \prime} \rightarrow y^{\prime}$ in $\mathcal{S}$ with $p\left(\beta^{\prime}\right)=u(a)$. Then bot $(a, \beta):(U, y) \rightarrow\left(U, y^{\prime}\right)$ and $\left(a, \beta^{\prime}\right):\left(U, y^{\prime \prime}\right) \rightarrow(U, y)$ are strongly cartesian and lift $a$. Hence, by the uniqueness of strongly cartesian morphisms (see discussion in Categories, Section 4.32 there exists an isomorphism $\iota: y \rightarrow y^{\prime \prime}$ in $\mathcal{S}_{u(U)}$ such that $\beta=\beta^{\prime} \circ \iota$, which implies that $\beta$ is strongly cartesian in $\mathcal{S}$ by Categories, Lemma 4.32 .2 .

Finally, we have to show that given $\left(U^{\prime}, y^{\prime}\right)$ and $U \rightarrow U^{\prime}$ we can find a strongly cartesian morphism $(U, y) \rightarrow\left(U^{\prime}, y^{\prime}\right)$ in $u^{p} \mathcal{S}$ lifting the morphism $U \rightarrow U^{\prime}$. This follows from the above as by assumption we can find a strongly cartesian morphism $y \rightarrow y^{\prime}$ lifting the morphism $u(U) \rightarrow u\left(U^{\prime}\right)$.

04WC Lemma 8.12.2. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor of sites. Let $p: \mathcal{S} \rightarrow \mathcal{D}$ be a stack over $\mathcal{D}$. Then $u^{p} \mathcal{S}$ is a stack over $\mathcal{C}$.

Proof. We have seen in Lemma 8.12.1 that $u^{p} \mathcal{S}$ is a fibred category over $\mathcal{C}$. Moreover, in the proof of that lemma we have seen that a morphism $(a, \beta)$ of $u^{p} \mathcal{S}$ is strongly cartesian if and only $\beta$ is strongly cartesian in $\mathcal{S}$. Hence, given a morphism $a: U \rightarrow U^{\prime}$ of $\mathcal{C}$, not only do we have the equalities $\left(u^{p} \mathcal{S}\right)_{U}=\mathcal{S}_{U}$ and $\left(u^{p} \mathcal{S}\right)_{U^{\prime}}=\mathcal{S}_{U^{\prime}}$, but via these equalities the pullback functors agree; in a formula $a^{*}\left(U^{\prime}, y^{\prime}\right)=\left(U, u(a)^{*} y^{\prime}\right)$.
Having said this, let $\mathcal{U}=\left\{U_{i} \rightarrow U\right\}$ be a covering of $\mathcal{C}$. As $u$ is continuous we see that $\mathcal{V}=\left\{u\left(U_{i}\right) \rightarrow u(U)\right\}$ is a covering of $\mathcal{D}$, and that $u\left(U_{i} \times_{U} U_{j}\right)=$ $u\left(U_{i}\right) \times_{u(U)} u\left(U_{j}\right)$ and similarly for the triple fibre products $U_{i} \times_{U} U_{j} \times_{U} U_{k}$. As we have the identifications of fibre categories and pullbacks we see that descend data relative to $\mathcal{U}$ are identical to descend data relative to $\mathcal{V}$. Since by assumption we have effective descent in $\mathcal{S}$ we conclude the same holds for $u^{p} \mathcal{S}$.

04WD Lemma 8.12.3. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a continuous functor of sites. Let $p: \mathcal{S} \rightarrow \mathcal{D}$ be a stack in groupoids over $\mathcal{D}$. Then $u^{p} \mathcal{S}$ is a stack in groupoids over $\mathcal{C}$.

Proof. This follows immediately from Lemma 8.12 .2 and the fact that all fibre categories are groupoids.

04WE Definition 8.12.4. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by the continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$. Let $\mathcal{S}$ be a fibred category over $\mathcal{D}$. In this setting we write $f_{*} \mathcal{S}$
for the fibred category $u^{p} \mathcal{S}$ defined above. We say that $f_{*} \mathcal{S}$ is the pushforward of $\mathcal{S}$ along $f$.

By the results above we know that $f_{*} \mathcal{S}$ is a stack (in groupoids) if $\mathcal{S}$ is a stack (in groupoids). It is harder to define the pullback of a stack (and we'll need additional assumptions for our particular construction - feel free to write up and submit a more general construction). We do this in several steps.
Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor between categories. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ be a category over $\mathcal{C}$. In this setting we define a category $u_{p p} \mathcal{S}$ as follows:
(1) An object of $u_{p p} \mathcal{S}$ is a triple $(U, \phi: V \rightarrow u(U), x)$ where $U \in \mathrm{Ob}(\mathcal{C})$, the $\operatorname{map} \phi: V \rightarrow u(U)$ is a morphism in $\mathcal{D}$, and $x \in \operatorname{Ob}\left(\mathcal{S}_{U}\right)$.
(2) A morphism

$$
\left(U_{1}, \phi_{1}: V_{1} \rightarrow u\left(U_{1}\right), x_{1}\right) \longrightarrow\left(U_{2}, \phi_{2}: V_{2} \rightarrow u\left(U_{2}\right), x_{2}\right)
$$

of $u_{p p} \mathcal{S}$ is given by a $(a, b, \alpha)$ where $a: U_{1} \rightarrow U_{2}$ is a morphism of $\mathcal{C}$, $b: V_{1} \rightarrow V_{2}$ is a morphism of $\mathcal{D}$, and $\alpha: x_{1} \rightarrow x_{2}$ is morphism of $\mathcal{S}$, such that $p(\alpha)=a$ and the diagram

commutes in $\mathcal{D}$.
We think of $u_{p p} \mathcal{S}$ as a category over $\mathcal{D}$ via

$$
p_{p p}: u_{p p} \mathcal{S} \longrightarrow \mathcal{D}, \quad(U, \phi: V \rightarrow u(U), x) \longmapsto V
$$

The fibre category of $u_{p p} \mathcal{S}$ over an object $V$ of $\mathcal{D}$ does not have a simple description.
04WF Lemma 8.12.5. In the situation above assume
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category,
(2) $\mathcal{C}$ has nonempty finite limits, and
(3) $u: \mathcal{C} \rightarrow \mathcal{D}$ commutes with nonempty finite limits.

Consider the set $R \subset \operatorname{Arrows}\left(u_{p p} \mathcal{S}\right)$ of morphisms of the form

$$
\left(a, i d_{V}, \alpha\right):\left(U^{\prime}, \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right) \longrightarrow(U, \phi: V \rightarrow u(U), x)
$$

with $\alpha$ strongly cartesian. Then $R$ is a right multiplicative system.
Proof. According to Categories, Definition 4.26.1 we have to check RMS1, RMS2, RMS3. Condition RMS1 holds as a composition of strongly cartesian morphisms is strongly cartesian, see Categories, Lemma 4.32.2.
To check RMS2 suppose we have a morphism

$$
(a, b, \alpha):\left(U_{1}, \phi_{1}: V_{1} \rightarrow u\left(U_{1}\right), x_{1}\right) \longrightarrow(U, \phi: V \rightarrow u(U), x)
$$

of $u_{p p} \mathcal{S}$ and a morphism

$$
\left(c, \mathrm{id}_{V}, \gamma\right):\left(U^{\prime}, \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right) \longrightarrow(U, \phi: V \rightarrow u(U), x)
$$

with $\gamma$ strongly cartesian from $R$. In this situation set $U_{1}^{\prime}=U_{1} \times_{U} U^{\prime}$, and denote $a^{\prime}: U_{1}^{\prime} \rightarrow U^{\prime}$ and $c^{\prime}: U_{1}^{\prime} \rightarrow U_{1}$ the projections. As $u\left(U_{1}^{\prime}\right)=u\left(U_{1}\right) \times_{u(U)} u\left(U^{\prime}\right)$ we see that $\phi_{1}^{\prime}=\left(\phi_{1}, \phi^{\prime}\right): V_{1} \rightarrow u\left(U_{1}^{\prime}\right)$ is a morphism in $\mathcal{D}$. Let $\gamma_{1}: x_{1}^{\prime} \rightarrow x_{1}$ be a strongly cartesian morphism of $\mathcal{S}$ with $p\left(\gamma_{1}\right)=\phi_{1}^{\prime}$ (which exists because $\mathcal{S}$ is a
fibred category over $\mathcal{C})$. Then as $\gamma: x^{\prime} \rightarrow x$ is strongly cartesian there exists a unique morphism $\alpha^{\prime}: x_{1}^{\prime} \rightarrow x^{\prime}$ with $p\left(\alpha^{\prime}\right)=a^{\prime}$. At this point we see that

$$
\left(a^{\prime}, b, \alpha^{\prime}\right):\left(U_{1}, \phi_{1}: V_{1} \rightarrow u\left(U_{1}^{\prime}\right), x_{1}^{\prime}\right) \longrightarrow\left(U, \phi: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right)
$$

is a morphism and that

$$
\left(c^{\prime}, \operatorname{id}_{V_{1}}, \gamma_{1}\right):\left(U_{1}^{\prime}, \phi_{1}^{\prime}: V_{1} \rightarrow u\left(U_{1}^{\prime}\right), x_{1}^{\prime}\right) \longrightarrow\left(U_{1}, \phi: V_{1} \rightarrow u\left(U_{1}\right), x_{1}\right)
$$

is an element of $R$ which form a solution of the existence problem posed by RMS2.
Finally, suppose that

$$
(a, b, \alpha),\left(a^{\prime}, b^{\prime}, \alpha^{\prime}\right):\left(U_{1}, \phi_{1}: V_{1} \rightarrow u\left(U_{1}\right), x_{1}\right) \longrightarrow(U, \phi: V \rightarrow u(U), x)
$$

are two morphisms of $u_{p p} \mathcal{S}$ and suppose that

$$
\left(c, \operatorname{id}_{V}, \gamma\right):(U, \phi: V \rightarrow u(U), x) \longrightarrow\left(U^{\prime}, \phi: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right)
$$

is an element of $R$ which equalizes the morphisms $(a, b, \alpha)$ and ( $a^{\prime}, b^{\prime}, \alpha^{\prime}$ ). This implies in particular that $b=b^{\prime}$. Let $d: U_{2} \rightarrow U_{1}$ be the equalizer of $a, a^{\prime}$ which exists (see Categories, Lemma 4.18.3). Moreover, $u(d): u\left(U_{2}\right) \rightarrow u\left(U_{1}\right)$ is the equalizer of $u(a), u\left(a^{\prime}\right)$ hence ( as $b=b^{\prime}$ ) there is a morphism $\phi_{2}: V_{1} \rightarrow u\left(U_{2}\right)$ such that $\phi_{1}=u(d) \circ \phi_{1}$. Let $\delta: x_{2} \rightarrow x_{1}$ be a strongly cartesian morphism of $\mathcal{S}$ with $p(\delta)=u(d)$. Now we claim that $\alpha \circ \delta=\alpha^{\prime} \circ \delta$. This is true because $\gamma$ is strongly cartesian, $\gamma \circ \alpha \circ \delta=\gamma \circ \alpha^{\prime} \circ \delta$, and $p(\alpha \circ \delta)=p\left(\alpha^{\prime} \circ \delta\right)$. Hence the arrow

$$
\left(d, \mathrm{id}_{V_{1}}, \delta\right):\left(U_{2}, \phi_{2}: V_{1} \rightarrow u\left(U_{2}\right), x_{2}\right) \longrightarrow\left(U_{1}, \phi_{1}: V_{1} \rightarrow u\left(U_{1}\right), x_{1}\right)
$$

is an element of $R$ and equalizes $(a, b, \alpha)$ and $\left(a^{\prime}, b^{\prime}, \alpha^{\prime}\right)$. Hence $R$ satisfies RMS3 as well.

04WG Lemma 8.12.6. With notation and assumptions as in Lemma 8.12.5. Set $u_{p} \mathcal{S}=$ $R^{-1} u_{p p} \mathcal{S}$, see Categories, Section 4.26. Then $u_{p} \mathcal{S}$ is a fibred category over $\mathcal{D}$.

Proof. We use the description of $u_{p} \mathcal{S}$ given just above Categories, Lemma 4.26.11. Note that the functor $p_{p p}: u_{p p} \mathcal{S} \rightarrow \mathcal{D}$ transforms every element of $R$ to an identity morphism. Hence by Categories, Lemma 4.26 .16 we obtain a canonical functor $p_{p}: u_{p} \mathcal{S} \rightarrow \mathcal{D}$ extending the given functor. This is how we think of $u_{p} \mathcal{S}$ as a category over $\mathcal{D}$.
First we want to characterize the $\mathcal{D}$-strongly cartesian morphisms in $u_{p} \mathcal{S}$. A morphism $f: X \rightarrow Y$ of $u_{p} \mathcal{S}$ is the equivalence class of a pair $\left(f^{\prime}: X^{\prime} \rightarrow Y, r: X^{\prime} \rightarrow X\right)$ with $r \in R$. In fact, in $u_{p} \mathcal{S}$ we have $f=\left(f^{\prime}, 1\right) \circ(r, 1)^{-1}$ with obvious notation. Note that an isomorphism is always strongly cartesian, as are compositions of strongly cartesian morphisms, see Categories, Lemma 4.32.2. Hence $f$ is strongly cartesian if and only if $\left(f^{\prime}, 1\right)$ is so. Thus the following claim completely characterizes strongly cartesian morphisms. Claim: A morphism

$$
(a, b, \alpha): X_{1}=\left(U_{1}, \phi_{1}: V_{1} \rightarrow u\left(U_{1}\right), x_{1}\right) \longrightarrow\left(U_{2}, \phi_{2}: V_{2} \rightarrow u\left(U_{2}\right), x_{2}\right)=X_{2}
$$

of $u_{p p} \mathcal{S}$ has image $f=((a, b, \alpha), 1)$ strongly cartesian in $u_{p} \mathcal{S}$ if and only if $\alpha$ is a strongly cartesian morphism of $\mathcal{S}$.

Assume $\alpha$ strongly cartesian. Let $X=(U, \phi: V \rightarrow u(U), x)$ be another object, and let $f_{2}: X \rightarrow X_{2}$ be a morphism of $u_{p} \mathcal{S}$ such that $p_{p}\left(f_{2}\right)=b \circ b_{1}$ for some $b_{1}: U \rightarrow U_{1}$. To show that $f$ is strongly cartesian we have to show that there exists a unique morphism $f_{1}: X \rightarrow X_{1}$ in $u_{p} \mathcal{S}$ such that $p_{p}\left(f_{1}\right)=b_{1}$ and $f_{2}=f \circ f_{1}$ in $u_{p} \mathcal{S}$. Write $f_{2}=\left(f_{2}^{\prime}: X^{\prime} \rightarrow X_{2}, r: X^{\prime} \rightarrow X\right)$. Again we can write $f_{2}=\left(f_{2}^{\prime}, 1\right) \circ(r, 1)^{-1}$
in $u_{p} \mathcal{S}$. Since $(r, 1)$ is an isomorphism whose image in $\mathcal{D}$ is an identity we see that finding a morphism $f_{1}: X \rightarrow X_{1}$ with the required properties is the same thing as finding a morphism $f_{1}^{\prime}: X^{\prime} \rightarrow X_{1}$ in $u_{p} \mathcal{S}$ with $p\left(f_{1}^{\prime}\right)=b_{1}$ and $f_{2}^{\prime}=f \circ f_{1}^{\prime}$. Hence we may assume that $f_{2}$ is of the form $f_{2}=\left(\left(a_{2}, b_{2}, \alpha_{2}\right), 1\right)$ with $b_{2}=b \circ b_{1}$. Here is a picture

$$
\begin{aligned}
&\left(U_{1}, V_{1}\right.\left.\rightarrow u\left(U_{1}\right), x_{1}\right) \\
& \downarrow^{(a, b, \alpha)} \\
& \downarrow \\
&\left(a_{2}, b_{2}, \alpha_{2}\right) \\
& \longrightarrow
\end{aligned}\left(U_{2}, V_{2} \rightarrow u\left(U_{2}\right), x_{2}\right)
$$

Now it is clear how to construct the morphism $f_{1}$. Namely, set $U^{\prime}=U \times_{U_{2}} U_{1}$ with projections $c: U^{\prime} \rightarrow U$ and $a_{1}: U^{\prime} \rightarrow U_{1}$. Pick a strongly cartesian morphism $\gamma$ : $x^{\prime} \rightarrow x$ lifting the morphism $c$. Since $b_{2}=b \circ b_{1}$, and since $u\left(U^{\prime}\right)=u(U) \times_{u\left(U_{2}\right)} u\left(U_{1}\right)$ we see that $\phi^{\prime}=\left(\phi, \phi_{1} \circ b_{1}\right): V \rightarrow u\left(U^{\prime}\right)$. Since $\alpha$ is strongly cartesian, and $a \circ a_{1}=a_{2} \circ c=p\left(\alpha_{2} \circ \gamma\right)$ there exists a morphism $\alpha_{1}: x^{\prime} \rightarrow x_{1}$ lifting $a_{1}$ such that $\alpha \circ \alpha_{1}=\alpha_{2} \circ \gamma$. Set $X^{\prime}=\left(U^{\prime}, \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right)$. Thus we see that

$$
f_{1}=\left(\left(a_{1}, b_{1}, \alpha_{1}\right): X^{\prime} \rightarrow X_{1},\left(c, \mathrm{id}_{V}, \gamma\right): X^{\prime} \rightarrow X\right): X \longrightarrow X_{1}
$$

works, in fact the diagram

is commutative by construction. This proves existence.
Next we prove uniqueness, still in the special case $f=((a, b, \alpha), 1)$ and $f_{2}=$ $\left(\left(a_{2}, b_{2}, \alpha_{2}\right), 1\right)$. We strongly advise the reader to skip this part. Suppose that $g_{1}, g_{1}^{\prime}: X \rightarrow X_{1}$ are two morphisms of $u_{p} \mathcal{S}$ such that $p_{p}\left(g_{1}\right)=p_{p}\left(g_{1}^{\prime}\right)=b_{1}$ and $f_{2}=f \circ g_{1}=f \circ g_{1}^{\prime}$. Our goal is to show that $g_{1}=g_{1}^{\prime}$. By Categories, Lemma4.26.13 we may represent $g_{1}$ and $g_{1}^{\prime}$ as the equivalence classes of $\left(f_{1}: X^{\prime} \rightarrow X_{1}, r: X^{\prime} \rightarrow X\right)$ and $\left(f_{1}^{\prime}: X^{\prime} \rightarrow X_{1}, r: X^{\prime} \rightarrow X\right)$ for some $r \in R$. By Categories, Lemma 4.26.14 we see that $f_{2}=f \circ g_{1}=f \circ g_{1}^{\prime}$ means that there exists a morphism $r^{\prime}: X^{\prime \prime} \rightarrow X^{\prime}$ in $u_{p p} \mathcal{S}$ such that $r^{\prime} \circ r \in R$ and

$$
(a, b, \alpha) \circ f_{1} \circ r^{\prime}=(a, b, \alpha) \circ f_{1}^{\prime} \circ r^{\prime}=\left(a_{2}, b_{2}, \alpha_{2}\right) \circ r^{\prime}
$$

in $u_{p p} \mathcal{S}$. Note that now $g_{1}$ is represented by $\left(f_{1} \circ r^{\prime}, r \circ r^{\prime}\right)$ and similarly for $g_{1}^{\prime}$. Hence we may assume that

$$
(a, b, \alpha) \circ f_{1}=(a, b, \alpha) \circ f_{1}^{\prime}=\left(a_{2}, b_{2}, \alpha_{2}\right)
$$

Write $r=\left(c, \mathrm{id}_{V}, \gamma\right):\left(U^{\prime}, \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right), f_{1}=\left(a_{1}, b_{1}, \alpha_{1}\right)$, and $f_{1}^{\prime}=$ $\left(a_{1}^{\prime}, b_{1}, \alpha_{1}^{\prime}\right)$. Here we have used the condition that $p_{p}\left(g_{1}\right)=p_{p}\left(g_{1}^{\prime}\right)$. The equalities above are now equivalent to $a \circ a_{1}=a \circ a_{1}^{\prime}=a_{2} \circ c$ and $\alpha \circ \alpha_{1}=\alpha \circ \alpha_{1}^{\prime}=\alpha_{2} \circ \gamma$. It need not be the case that $a_{1}=a_{1}^{\prime}$ in this situation. Thus we have to precompose by one more morphism from $R$. Namely, let $U^{\prime \prime}=\operatorname{Eq}\left(a_{1}, a_{1}^{\prime}\right)$ be the equalizer of $a_{1}$ and $a_{1}^{\prime}$ which is a subobject of $U^{\prime}$. Denote $c^{\prime}: U^{\prime \prime} \rightarrow U^{\prime}$ the canonical monomorphism. Because of the relations among the morphisms above we see that $V \rightarrow u\left(U^{\prime}\right)$ maps into $u\left(U^{\prime \prime}\right)=u\left(\operatorname{Eq}\left(a_{1}, a_{1}^{\prime}\right)\right)=\operatorname{Eq}\left(u\left(a_{1}\right), u\left(a_{1}^{\prime}\right)\right)$. Hence we get a new object $\left(U^{\prime \prime}, \phi^{\prime \prime}: V \rightarrow u\left(U^{\prime \prime}\right), x^{\prime \prime}\right)$, where $\gamma^{\prime}: x^{\prime \prime} \rightarrow x^{\prime}$ is a strongly cartesian
morphism lifting $\gamma$. Then we see that we may precompose $f_{1}$ and $f_{1}^{\prime}$ with the element $\left(c^{\prime}, \operatorname{id}_{V}, \gamma^{\prime}\right)$ of $R$. After doing this, i.e., replacing $\left(U^{\prime}, \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right)$ with $\left(U^{\prime \prime}, \phi^{\prime \prime}: V \rightarrow u\left(U^{\prime \prime}\right), x^{\prime \prime}\right)$, we get back to the previous situation where in addition we now have that $a_{1}=a_{1}^{\prime}$. In this case it follows formally from the fact that $\alpha$ is strongly cartesian (!) that $\alpha_{1}=\alpha_{1}^{\prime}$. This shows that $g_{1}=g_{1}^{\prime}$ as desired.
We omit the proof of the fact that for any strongly cartesian morphism of $u_{p} \mathcal{S}$ of the form $((a, b, \alpha), 1)$ the morphism $\alpha$ is strongly cartesian in $\mathcal{S}$. (We do not need the characterization of strongly cartesian morphisms in the rest of the proof, although we do use it later in this section.)
Let $(U, \phi: V \rightarrow u(U), x)$ be an object of $u_{p} \mathcal{S}$. Let $b: V^{\prime} \rightarrow V$ be a morphism of $\mathcal{D}$. Then the morphism

$$
\left(\mathrm{id}_{U}, b, \mathrm{id}_{x}\right):\left(U, \phi \circ b: V^{\prime} \rightarrow u(U), x\right) \longrightarrow(U, \phi: V \rightarrow u(U), x)
$$

is strongly cartesian by the result of the preceding paragraphs and we win.
04WH Lemma 8.12.7. With notation and assumptions as in Lemma 8.12.6. If $\mathcal{S}$ is fibred in groupoids, then $u_{p} \mathcal{S}$ is fibred in groupoids.

Proof. By Lemma 8.12.6 we know that $u_{p} \mathcal{S}$ is a fibred category. Let $f: X \rightarrow Y$ be a morphism of $u_{p} \mathcal{S}$ with $p_{p}(f)=\operatorname{id}_{V}$. We are done if we can show that $f$ is invertible, see Categories, Lemma 4.34.2. Write $f$ as the equivalence class of a pair $((a, b, \alpha), r)$ with $r \in R$. Then $p_{p}(r)=\mathrm{id}_{V}$, hence $p_{p p}((a, b, \alpha))=\mathrm{id}_{V}$. Hence $b=\mathrm{id}_{V}$. But any morphism of $\mathcal{S}$ is strongly cartesian, see Categories, Lemma 4.34.2 hence we see that $(a, b, \alpha) \in R$ is invertible in $u_{p} \mathcal{S}$ as desired.

04WI Lemma 8.12.8. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $q: \mathcal{T} \rightarrow \mathcal{D}$ be categories over $\mathcal{C}$ and $\mathcal{D}$. Assume that
(1) $p: \mathcal{S} \rightarrow \mathcal{C}$ is a fibred category,
(2) $q: \mathcal{T} \rightarrow \mathcal{D}$ is a fibred category,
(3) $\mathcal{C}$ has nonempty finite limits, and
(4) $u: \mathcal{C} \rightarrow \mathcal{D}$ commutes with nonempty finite limits.

Then we have a canonical equivalence of categories

$$
\operatorname{Mor}_{F i b / \mathcal{C}}\left(\mathcal{S}, u^{p} \mathcal{T}\right)=\operatorname{Mor}_{F i b / \mathcal{D}}\left(u_{p} \mathcal{S}, \mathcal{T}\right)
$$

of morphism categories.
Proof. In this proof we use the notation $x / U$ to denote an object $x$ of $\mathcal{S}$ which lies over $U$ in $\mathcal{C}$. Similarly $y / V$ denotes an object $y$ of $\mathcal{T}$ which lies over $V$ in $\mathcal{D}$. In the same vein $\alpha / a: x / U \rightarrow x^{\prime} / U^{\prime}$ denotes the morphism $\alpha: x \rightarrow x^{\prime}$ with image $a: U \rightarrow U^{\prime}$ in $\mathcal{C}$.

Let $G: u_{p} \mathcal{S} \rightarrow \mathcal{T}$ be a 1-morphism of fibred categories over $\mathcal{D}$. Denote $G^{\prime}: u_{p p} \mathcal{S} \rightarrow$ $\mathcal{T}$ the composition of $G$ with the canonical (localization) functor $u_{p p} \mathcal{S} \rightarrow u_{p} \mathcal{S}$. Then consider the functor $H: \mathcal{S} \rightarrow u^{p} \mathcal{T}$ given by

$$
H(x / U)=\left(U, G^{\prime}\left(U, \mathrm{id}_{u(U)}: u(U) \rightarrow u(U), x\right)\right)
$$

on objects and by

$$
H\left((\alpha, a): x / U \rightarrow x^{\prime} / U^{\prime}\right)=G^{\prime}(a, u(a), \alpha)
$$

on morphisms. Since $G$ transforms strongly cartesian morphisms into strongly cartesian morphisms, we see that if $\alpha$ is strongly cartesian, then $H(\alpha)$ is strongly
cartesian. Namely, we've seen in the proof of Lemma 8.12 .6 that in this case the map $(a, u(a), \alpha)$ becomes strongly cartesian in $u_{p} \mathcal{S}$. Clearly this construction is functorial in $G$ and we obtain a functor

$$
A: \operatorname{Mor}_{F i b / \mathcal{D}}\left(u_{p} \mathcal{S}, \mathcal{T}\right) \longrightarrow \operatorname{Mor}_{F i b / \mathcal{C}}\left(\mathcal{S}, u^{p} \mathcal{T}\right)
$$

Conversely, let $H: \mathcal{S} \rightarrow u^{p} \mathcal{T}$ be a 1-morphism of fibred categories. Recall that an object of $u^{p} \mathcal{T}$ is a pair $(U, y)$ with $y \in \operatorname{Ob}\left(\mathcal{T}_{u(U)}\right)$. We denote pr: $u^{p} \mathcal{T} \rightarrow \mathcal{T}$ the functor $(U, y) \mapsto y$. In this case we define a functor $G^{\prime}: u_{p p} \mathcal{S} \rightarrow \mathcal{T}$ by the rules

$$
G^{\prime}(U, \phi: V \rightarrow u(U), x)=\phi^{*} \operatorname{pr}(H(x))
$$

on objects and we let

$$
G^{\prime}\left((a, b, \alpha):(U, \phi: V \rightarrow u(U), x) \rightarrow\left(U^{\prime}, \phi^{\prime}: V^{\prime} \rightarrow u\left(U^{\prime}\right), x^{\prime}\right)\right)=\beta
$$

be the unique morphism $\beta: \phi^{*} \operatorname{pr}(H(x)) \rightarrow\left(\phi^{\prime}\right)^{*} \operatorname{pr}\left(H\left(x^{\prime}\right)\right)$ such that $q(\beta)=b$ and the diagram

Such a morphism exists and is unique because $\mathcal{T}$ is a fibred category.
We check that $G^{\prime}(r)$ is an isomorphism if $r \in R$. Namely, if

$$
\left(a, \mathrm{id}_{V}, \alpha\right):\left(U^{\prime}, \phi^{\prime}: V \rightarrow u\left(U^{\prime}\right), x^{\prime}\right) \longrightarrow(U, \phi: V \rightarrow u(U), x)
$$

with $\alpha$ strongly cartesian is an element of the right multiplicative system $R$ of Lemma 8.12 .5 then $H(\alpha)$ is strongly cartesian, and $\operatorname{pr}(H(\alpha))$ is strongly cartesian, see proof of Lemma 8.12.1. Hence in this case the morphism $\beta$ has $q(\beta)=\operatorname{id}_{V}$ and is strongly cartesian. Hence $\beta$ is an isomorphism by Categories, Lemma 4.32.2. Thus by Categories, Lemma 4.26 .16 we obtain a canonical extension $G: u_{p} \mathcal{S} \rightarrow \mathcal{T}$.

Next, let us prove that $G$ transforms strongly cartesian morphisms into strongly cartesian morphisms. Suppose that $f: X \rightarrow Y$ is a strongly cartesian. By the characterization of strongly cartesian morphisms in $u_{p} \mathcal{S}$ we can write $f$ as $((a, b, \alpha)$ : $X^{\prime} \rightarrow Y, r: X^{\prime} \rightarrow Y$ ) where $r \in R$ and $\alpha$ strongly cartesian in $\mathcal{S}$. By the above it suffices to show that $G^{\prime}(a, b \alpha)$ is strongly cartesian. As before the condition that $\alpha$ is strongly cartesian implies that $\operatorname{pr}(H(a, \alpha)): \operatorname{pr}(H(x)) \rightarrow \operatorname{pr}\left(H\left(x^{\prime}\right)\right)$ is strongly cartesian in $\mathcal{T}$. Since in the commutative square above now all arrows except possibly $\beta$ is strongly cartesian it follows that also $\beta$ is strongly cartesian as desired. Clearly the construction $H \mapsto G$ is functorial in $H$ and we obtain a functor

$$
B: \operatorname{Mor}_{F i b / \mathcal{C}}\left(\mathcal{S}, u^{p} \mathcal{T}\right) \longrightarrow \operatorname{Mor}_{F i b / \mathcal{D}}\left(u_{p} \mathcal{S}, \mathcal{T}\right)
$$

To finish the proof of the lemma we have to show that the functors $A$ and $B$ are mutually quasi-inverse. We omit the verifications.

04WJ Definition 8.12.9. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$ satisfying the hypotheses and conclusions of Sites, Proposition 7.15.6. Let $\mathcal{S}$ be a stack over $\mathcal{C}$. In this setting we write $f^{-1} \mathcal{S}$ for the stackification of the fibred category $u_{p} \mathcal{S}$ over $\mathcal{D}$ constructed above. We say that $f^{-1} \mathcal{S}$ is the pullback of $\mathcal{S}$ along $f$.

Of course, if $\mathcal{S}$ is a stack in groupoids, then $f^{-1} \mathcal{S}$ is a stack in groupoids by Lemmas 8.9 .1 and 8.12.7

04WK Lemma 8.12.10. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$ satisfying the hypotheses and conclusions of Sites, Proposition 7.15.6. Let $p: \mathcal{S} \rightarrow \mathcal{C}$ and $q: \mathcal{T} \rightarrow \mathcal{D}$ be stacks. Then we have a canonical equivalence of categories

$$
\operatorname{Mor}_{\text {Stacks } / \mathcal{C}}\left(\mathcal{S}, f_{*} \mathcal{T}\right)=\operatorname{Mor}_{\text {Stacks } / \mathcal{D}}\left(f^{-1} \mathcal{S}, \mathcal{T}\right)
$$

of morphism categories.
Proof. For $i=1,2$ an $i$-morphism of stacks is the same thing as a $i$-morphism of fibred categories, see Definition 8.4.5. By Lemma 8.12.8 we have already

$$
\operatorname{Mor}_{F i b / \mathcal{C}}\left(\mathcal{S}, u^{p} \mathcal{T}\right)=\operatorname{Mor}_{F i b / \mathcal{D}}\left(u_{p} \mathcal{S}, \mathcal{T}\right)
$$

Hence the result follows from Lemma 8.8.3 as $u^{p} \mathcal{T}=f_{*} \mathcal{T}$ and $f^{-1} \mathcal{S}$ is the stackification of $u_{p} \mathcal{S}$.

04WR Lemma 8.12.11. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be a morphism of sites given by a continuous functor $u: \mathcal{C} \rightarrow \mathcal{D}$ satisfying the hypotheses and conclusions of Sites, Proposition 7.15.6. Let $\mathcal{S} \rightarrow \mathcal{C}$ be a fibred category, and let $\mathcal{S} \rightarrow \mathcal{S}^{\prime}$ be the stackification of $\mathcal{S}$. Then $f^{-1} \mathcal{S}^{\prime}$ is the stackification of $u_{p} \mathcal{S}$.
Proof. Omitted. Hint: This is the analogue of Sites, Lemma 7.14.4.
The following lemma tells us that the 2-category of stacks over $S c h_{f p p f}$ is a "full 2-sub category" of the 2-category of stacks over $S c h_{f p p f}^{\prime}$ provided that $S c h_{f p p f}^{\prime}$ contains $S c h_{f p p f}$ (see Topologies, Section 33.10).
04 WS Lemma 8.12.12. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u: \mathcal{C} \rightarrow \mathcal{D}$ be a functor satisfying the assumptions of Sites, Lemma 7.20.8. Let $f: \mathcal{D} \rightarrow \mathcal{C}$ be the corresponding morphism of sites. Then
(1) for every stack $p: \mathcal{S} \rightarrow \mathcal{C}$ the canonical functor $\mathcal{S} \rightarrow f_{*} f^{-1} \mathcal{S}$ is an equivalence of stacks,
(2) given stacks $\mathcal{S}, \mathcal{S}^{\prime}$ over $\mathcal{C}$ the construction $f^{-1}$ induces an equivalence

$$
\operatorname{Mor}_{\text {Stacks } / \mathcal{C}}\left(\mathcal{S}, \mathcal{S}^{\prime}\right) \longrightarrow \operatorname{Mor}_{\text {Stacks } / \mathcal{D}}\left(f^{-1} \mathcal{S}, f^{-1} \mathcal{S}^{\prime}\right)
$$

of morphism categories.
Proof. Note that by Lemma 8.12.10 we have an equivalence of categories

$$
\operatorname{Mor}_{S t a c k s / \mathcal{D}}\left(f^{-1} \mathcal{S}, f^{-1} \mathcal{S}^{\prime}\right)=\operatorname{Mor}_{\text {Stacks } / \mathcal{C}}\left(\mathcal{S}, f_{*} f^{-1} \mathcal{S}^{\prime}\right)
$$

Hence (2) follows from (1).
To prove (1) we are going to use Lemma 8.4.8. This lemma tells us that we have to show that can : $\mathcal{S} \rightarrow f_{*} f^{-1} \mathcal{S}$ is fully faithful and that all objects of $f_{*} f^{-1} \mathcal{S}$ are locally in the essential image.

We quickly describe the functor can, see proof of Lemma 8.12.8. To do this we introduce the functor $c^{\prime \prime}: \mathcal{S} \rightarrow u_{p p} \mathcal{S}$ defined by $c^{\prime \prime}(x / U)=(U$, id : $u(U) \rightarrow u(U), x)$, and $c^{\prime \prime}(\alpha / a)=(a, u(a), \alpha)$. We set $c^{\prime}: \mathcal{S} \rightarrow u_{p} \mathcal{S}$ equal to the composition of $c^{\prime \prime}$ and the canonical functor $u_{p p} \mathcal{S} \rightarrow u_{p} \mathcal{S}$. We set $c: \mathcal{S} \rightarrow f^{-1} \mathcal{S}$ equal to the composition of $c^{\prime}$ and the canonical functor $u_{p} \mathcal{S} \rightarrow f^{-1} \mathcal{S}$. Then can: $\mathcal{S} \rightarrow f_{*} f^{-1} \mathcal{S}$ is the functor which to $x / U$ associates the pair $(U, c(x))$ and to $\alpha / a$ the morphism $(a, c(\alpha))$.

Fully faithfulness. To prove this we are going to use Lemma 8.4.7. Let $U \in \mathrm{Ob}(\mathcal{C})$. Let $x, y \in \mathcal{S}_{U}$. First off, as $u$ is fully faithful, we have

$$
\operatorname{Mor}_{\left(f_{*} f^{-1} \mathcal{S}\right)_{U}}(\operatorname{can}(x), \operatorname{can}(y))=\operatorname{Mor}_{\left(f^{-1} \mathcal{S}\right)_{u(U)}}(c(x), c(y))
$$

directly from the definition of $f_{*}$. Similar holds after pulling back to any $U^{\prime} / U$. Because $f^{-1} \mathcal{S}$ is the stackification of $u_{p} \mathcal{S}$, and since $u$ is continuous and cocontinuous the presheaf

$$
U^{\prime} / U \longmapsto \operatorname{Mor}_{\left(f^{-1} \mathcal{S}\right)_{u\left(U^{\prime}\right)}}\left(c\left(\left.x\right|_{U^{\prime}}\right), c\left(\left.y\right|_{U^{\prime}}\right)\right)
$$

is the sheafification of the presheaf

$$
U^{\prime} / U \longmapsto \operatorname{Mor}_{\left(u_{p} \mathcal{S}\right)_{u\left(U^{\prime}\right)}}\left(c^{\prime}\left(\left.x\right|_{U^{\prime}}\right), c^{\prime}\left(\left.y\right|_{U^{\prime}}\right)\right)
$$

Hence to finish the proof of fully faithfulness it suffices to show that for any $U$ and $x, y$ the map

$$
\operatorname{Mor}_{\mathcal{S}_{U}}(x, y) \longrightarrow \operatorname{Mor}_{\left(u_{p} \mathcal{S}\right)_{U}}\left(c^{\prime}(x), c^{\prime}(y)\right)
$$

is bijective. A morphism $f: x \rightarrow y$ in $u_{p} \mathcal{S}$ over $u(U)$ is given by an equivalence class of diagrams

$$
\begin{aligned}
& \left(U^{\prime}, \phi: u(U) \rightarrow u\left(U^{\prime}\right), x^{\prime}\right) \underset{(a, b, \alpha)}{\longrightarrow}(U, \text { id }: u(U) \rightarrow u(U), y) \\
& \quad\left(c, \mathrm{id}_{u(U)}, \gamma\right) \downarrow \\
& (U, \mathrm{id}: u(U) \rightarrow u(U), x)
\end{aligned}
$$

with $\gamma$ strongly cartesian and $b=\mathrm{id}_{u(U)}$. But since $u$ is fully faithful we can write $\phi=u\left(c^{\prime}\right)$ for some morphism $c^{\prime}: U \rightarrow U^{\prime}$ and then we see that $a \circ c^{\prime}=\mathrm{id}_{U}$ and $c \circ c^{\prime}=\operatorname{id}_{U^{\prime}}$. Because $\gamma$ is strongly cartesian we can find a morphism $\gamma^{\prime}: x \rightarrow x^{\prime}$ lifting $c^{\prime}$ such that $\gamma \circ \gamma^{\prime}=\operatorname{id}_{x}$. By definition of the equivalence classes defining morphisms in $u_{p} \mathcal{S}$ it follows that the morphism

$$
(U, \text { id }: u(U) \rightarrow u(U), x) \xrightarrow[\left(\mathrm{id}, \mathrm{id}, \alpha \circ \gamma^{\prime}\right)]{ }(U, \mathrm{id}: u(U) \rightarrow u(U), y)
$$

of $u_{p p} \mathcal{S}$ induces the morphism $f$ in $u_{p} \mathcal{S}$. This proves that the map is surjective. We omit the proof that it is injective.

Finally, we have to show that any object of $f_{*} f^{-1} \mathcal{S}$ locally comes from an object of $\mathcal{S}$. This is clear from the constructions (details omitted).

### 8.13. Stacks and localization

04 WT Let $\mathcal{C}$ be a site. Let $U$ be an object of $\mathcal{C}$. We want to understand stacks over $\mathcal{C} / U$ as stacks over $\mathcal{C}$ together with a morphism towards $U$. The following lemma is the reason why this is easier to do when the presheaf $h_{U}$ is a sheaf.

04WU Lemma 8.13.1. Let $\mathcal{C}$ be a site. Let $U \in \operatorname{Ob}(\mathcal{C})$. Then $j_{U}: \mathcal{C} / U \rightarrow \mathcal{C}$ is a stack over $\mathcal{C}$ if and only if $h_{U}$ is a sheaf.

Proof. Combine Lemma 8.6.3 with Categories, Example 4.37 .7
Assume that $\mathcal{C}$ is a site, and $U$ is an object of $\mathcal{C}$ whose associated representable presheaf is a sheaf. We denote $j: \mathcal{C} / U \rightarrow \mathcal{C}$ the localization functor.
Construction A. Let $p: \mathcal{S} \rightarrow \mathcal{C} / U$ be a stack over the site $\mathcal{C} / U$. We define a stack $j!p: j_{!} \mathcal{S} \rightarrow \mathcal{C}$ as follows:
(1) As a category $j!\mathcal{S}=\mathcal{S}$, and
(2) the functor $j!p: j!\mathcal{S} \rightarrow \mathcal{C}$ is just the composition $j \circ p$.

We omit the verification that this is a stack (hint: Use that $h_{U}$ is a sheaf to glue morphisms to $U$ ). There is a canonical functor

$$
j!\mathcal{S} \longrightarrow \mathcal{C} / U
$$

namely the functor $p$ which is a 1 -morphism of stacks over $\mathcal{C}$.
Construction B. Let $q: \mathcal{T} \rightarrow \mathcal{C}$ be a stack over $\mathcal{C}$ which is endowed with a morphism of stacks $p: \mathcal{T} \rightarrow \mathcal{C} / U$ over $\mathcal{C}$. In this case it is automatically the case that $p: \mathcal{T} \rightarrow \mathcal{C} / U$ is a stack over $\mathcal{C} / U$.

04WV Lemma 8.13.2. Assume that $\mathcal{C}$ is a site, and $U$ is an object of $\mathcal{C}$ whose associated representable presheaf is a sheaf. Constructions $A$ and $B$ above define mutually inverse (!) functors of 2-categories

$$
\left\{\begin{array}{c}
\text { 2-category of } \\
\text { stacks over } \mathcal{C} / U
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { 2-category of pairs }(\mathcal{T}, p) \text { consisting } \\
\text { of a stack } \mathcal{T} \text { over } \mathcal{C} \text { and a morphism } \\
p: \mathcal{T} \rightarrow \mathcal{C} / U \text { of stacks over } \mathcal{C}
\end{array}\right\}
$$

Proof. This is clear.

## CHAPTER 9

## Fields

09FA

### 9.1. Introduction

09 FB In this chapter, we shall discuss the theory of fields. Recall that a field is a ring in which all nonzero elements are invertible. Equivalently, the only two ideals of a field are (0) and (1) since any nonzero element is a unit. Consequently fields will be the simplest cases of much of the theory developed later.

The theory of field extensions has a different feel from standard commutative algebra since, for instance, any morphism of fields is injective. Nonetheless, it turns out that questions involving rings can often be reduced to questions about fields. For instance, any domain can be embedded in a field (its quotient field), and any local ring (that is, a ring with a unique maximal ideal; we have not defined this term yet) has associated to it its residue field (that is, its quotient by the maximal ideal). A knowledge of field extensions will thus be useful.

### 9.2. Basic definitions

09FC Because we have placed this chapter before the chapter discussing commutative algebra we need to introduce some of the basic definitions here before we discuss these in greater detail in the algebra chapters.
09FD Definition 9.2.1. An field is a nonzero ring where every nonzero element is invertible. Given a field a subfield is a subring that is itself a field.

For a field $k$, we write $k^{*}$ for the subset $k \backslash\{0\}$. This generalizes the usual notation $R^{*}$ that refers to the group of invertible elements in a ring $R$.

09FE Definition 9.2.2. A domain or an integral domain is a nonzero ring where 0 is the only zerodivisor.

### 9.3. Examples of fields

09 FF To get started, let us begin by providing several examples of fields. The reader should recall that if $R$ is a ring and $I \subset R$ an ideal, then $R / I$ is a field precisely when $I$ is a maximal ideal.

09FG Example 9.3.1 (Rational numbers). The rational numbers form a field. It is called the field of rational numbers and denoted $\mathbf{Q}$.

09FH Example 9.3.2 (Prime fields). If $p$ is a prime number, then $\mathbf{Z} /(p)$ is a field, denoted $\mathbf{F}_{p}$. Indeed, $(p)$ is a maximal ideal in $\mathbf{Z}$. Thus, fields may be finite: $\mathbf{F}_{p}$ contains $p$ elements.

09FI Example 9.3.3. In a principal ideal domain, an ideal generated by an irreducible element is maximal. Now, if $k$ is a field, then the polynomial ring $k[x]$ is a principal ideal domain. It follows that if $P \in k[x]$ is an irreducible polynomial (that is, a nonconstant polynomial that does not admit a factorization into terms of smaller degrees), then $k[x] /(P)$ is a field. It contains a copy of $k$ in a natural way. This is a very general way of constructing fields. For instance, the complex numbers $\mathbf{C}$ can be constructed as $\mathbf{R}[x] /\left(x^{2}+1\right)$.

09FJ Example 9.3.4 (Quotient fields). Recall that, given a domain $A$, there is an imbedding $A \rightarrow K(A)$ into a field $K(A)$ constructed from $A$ in exactly the same manner that $\mathbf{Q}$ is constructed from $\mathbf{Z}$. Formally the elements of $K(A)$ are (equivalence classes of) fractions $a / b, a, b \in A, b \neq 0$. As usual $a / b=a^{\prime} / b^{\prime}$ if and only if $a b^{\prime}=b a^{\prime}$. This is called the quotient field or field of fractions or the fraction field of $A$. The quotient field has the following universal property: given an injective ring $\operatorname{map} \varphi: A \rightarrow K$ to a field $K$, there is a unique map $\psi: K(A) \rightarrow K$ making

commute. Indeed, it is clear how to define such a map: we set $\psi(a / b)=\varphi(a) \varphi(b)^{-1}$ where injectivity of $\varphi$ assures that $\varphi(b) \neq 0$ if $b \neq 0$.

09FK Example 9.3.5 (Field of rational functions). If $k$ is a field, then we can consider the field $k(x)$ of rational functions over $k$. This is the quotient field of the polynomial ring $k[x]$. In other words, it is the set of quotients $F / G$ for $F, G \in k[x], G \neq 0$ with the obvious equivalence relation.

09FL Example 9.3.6. Let $X$ be a Riemann surface. Let $\mathbf{C}(X)$ denote the set of meromorphic functions on $X$. Then $\mathbf{C}(X)$ is a ring under multiplication and addition of functions. It turns out that in fact $\mathbf{C}(X)$ is a field. Namely, if a nonzero function $f(z)$ is meromorphic, so is $1 / f(z)$. For example, let $S^{2}$ be the Riemann sphere; then we know from complex analysis that the ring of meromorphic functions $\mathbf{C}\left(S^{2}\right)$ is the field of rational functions $\mathbf{C}(z)$.

### 9.4. Vector spaces

$09 F M$ One reason fields are so nice is that the theory of modules over fields (i.e. vector spaces), is very simple.

09FN Lemma 9.4.1. If $k$ is a field, then every $k$-module is free.
Proof. Indeed, by linear algebra we know that a $k$-module (i.e. vector space) $V$ has a basis $\mathcal{B} \subset V$, which defines an isomorphism from the free vector space on $\mathcal{B}$ to $V$.

09FP Lemma 9.4.2. Every exact sequence of modules over a field splits.
Proof. This follows from Lemma 9.4.1 as every vector space is a projective module.

This is another reason why much of the theory in future chapters will not say very much about fields, since modules behave in such a simple manner. Note
that Lemma 9.4 .2 is a statement about the category of $k$-modules (for $k$ a field), because the notion of exactness is inherently arrow-theoretic, i.e., makes use of purely categorical notions, and can in fact be phrased within a so-called abelian category.
Henceforth, since the study of modules over a field is linear algebra, and since the ideal theory of fields is not very interesting, we shall study what this chapter is really about: extensions of fields.

### 9.5. The characteristic of a field

09 FQ In the category of rings, there is an initial object $\mathbf{Z}$ : any ring $R$ has a map from $\mathbf{Z}$ into it in precisely one way. For fields, there is no such initial object. Nonetheless, there is a family of objects such that every field can be mapped into in exactly one way by exactly one of them, and in no way by the others.

Let $F$ be a field. Think of $F$ as a ring to get a ring map $f: \mathbf{Z} \rightarrow F$. The image of this ring map is a domain (as a subring of a field) hence the kernel of $f$ is a prime ideal in $\mathbf{Z}$. Hence the kernel of $f$ is either ( 0 ) or $(p)$ for some prime number $p$.
In the first case we see that $f$ is injective, and in this case we think of $\mathbf{Z}$ as a subring of $F$. Moreover, since every nonzero element of $F$ is invertible we see that it makes sense to talk about $p / q \in F$ for $p, q \in \mathbf{Z}$ with $q \neq 0$. Hence in this case we may and we do think of $\mathbf{Q}$ as a subring of $F$. One can easily see that this is the smallest subfield of $F$ in this case.
In the second case, i.e., when $\operatorname{Ker}(f)=(p)$ we see that $\mathbf{Z} /(p)=\mathbf{F}_{p}$ is a subring of $F$. Clearly it is the smallest subfield of $F$.
Arguing in this way we see that every field contains a smallest subfield which is either $\mathbf{Q}$ or finite equal to $\mathbf{F}_{p}$ for some prime number $p$.

09FR Definition 9.5.1. The characteristic of a field $F$ is 0 if $\mathbf{Z} \subset F$, or is a prime $p$ if $p=0$ in $F$. The prime subfield of $F$ is the smallest subfield of $F$ which is either $\mathbf{Q} \subset F$ if the characteristic is zero, or $\mathbf{F}_{p} \subset F$ if the characteristic is $p>0$.

It is easy to see that if $E \subset F$ is a subfield, then the characteristic of $E$ is the same as the characteristic of $F$.

09FS Example 9.5.2. The characteristic of $\mathbf{F}_{p}$ is $p$, and that of $\mathbf{Q}$ is 0 .

### 9.6. Field extensions

09FT In general, though, we are interested not so much in fields by themselves but in field extensions. This is perhaps analogous to studying not rings but algebras over a fixed ring. The nice thing for fields is that the notion of a "field over another field" just recovers the notion of a field extension, by the next result.

09FU Lemma 9.6.1. If $F$ is a field and $R$ is a nonzero ring, then any ring homomorphism $\varphi: F \rightarrow R$ is injective.
Proof. Indeed, let $a \in \operatorname{Ker}(\varphi)$ be a nonzero element. Then we have $\varphi(1)=$ $\varphi\left(a^{-1} a\right)=\varphi\left(a^{-1}\right) \varphi(a)=0$. Thus $1=\varphi(1)=0$ and $R$ is the zero ring.

09FV Definition 9.6.2. If $F$ is a field contained in a field $E$, then $E$ is said to be a field extension of $F$. We shall write $E / F$ to indicate that $E$ is an extension of $F$.

So if $F, F^{\prime}$ are fields, and $F \rightarrow F^{\prime}$ is any ring-homomorphism, we see by Lemma 9.6.1 that it is injective, and $F^{\prime}$ can be regarded as an extension of $F$, by a slight abuse of language. Alternatively, a field extension of $F$ is just an $F$-algebra that happens to be a field. This is completely different than the situation for general rings, since a ring homomorphism is not necessarily injective.
Let $k$ be a field. There is a category of field extensions of $k$. An object of this category is an extension $E / k$, that is a (necessarily injective) morphism of fields

$$
k \rightarrow E
$$

while a morphism between extensions $E / k$ and $E^{\prime} / k$ is a $k$-algebra morphism $E \rightarrow$ $E^{\prime}$; alternatively, it is a commutative diagram

The set of morphisms from $E \rightarrow E^{\prime}$ in the category of extensions of $k$ will be denoted by $\operatorname{Mor}_{k}\left(E, E^{\prime}\right)$.
09FW Definition 9.6.3. A tower of fields $E_{n} / E_{n-1} / \ldots / E_{0}$ consists of a sequence of extensions of fields $E_{n} / E_{n-1}, E_{n-1} / E_{n-2}, \ldots, E_{1} / E_{0}$.
Let us give a few examples of field extensions.
09FX Example 9.6.4. Let $k$ be a field, and $P \in k[x]$ an irreducible polynomial. We have seen that $k[x] /(P)$ is a field (Example 9.3.3). Since it is also a $k$-algebra in the obvious way, it is an extension of $k$.
09FY Example 9.6.5. If $X$ is a Riemann surface, then the field of meromorphic functions $\mathbf{C}(X)$ (Example 9.3.6) is an extension field of $\mathbf{C}$, because any element of $\mathbf{C}$ induces a meromorphic - indeed, holomorphic - constant function on $X$.
Let $F / k$ be a field extension. Let $S \subset F$ be any subset. Then there is a smallest subextension of $F$ (that is, a subfield of $F$ containing $k$ ) that contains $S$. To see this, consider the family of subfields of $F$ containing $S$ and $k$, and take their intersection; one checks that this is a field. By a standard argument one shows, in fact, that this is the set of elements of $F$ that can be obtained via a finite number of elementary algebraic operations (addition, multiplication, subtraction, and division) involving elements of $k$ and $S$.
09FZ Definition 9.6.6. Let $k$ be a field. If $F / k$ is an extension of fields and $S \subset F$, we write $k(S)$ for the smallest subfield of $F$ containing $k$ and $S$. We will say that $S$ generates the field extension $k(S) / k$. If $S=\{\alpha\}$ is a singleton, then we write $k(\alpha)$ instead of $k(\{\alpha\})$. We say $F / k$ is a finitely generated field extension if there exists a finite subset $S \subset F$ with $F=k(S)$.
For instance, $\mathbf{C}$ is generated by $i$ over $\mathbf{R}$.
09G0 Exercise 9.6.7. Show that $\mathbf{C}$ does not have a countable set of generators over $\mathbf{Q}$. Let us now classify extensions generated by one element.
09G1 Lemma 9.6.8 (Classification of simple extensions). If a field extension $F / k$ is generated by one element, then it is $k$-isomorphic either to the rational function field $k(t) / k$ or to one of the extensions $k[t] /(P)$ for $P \in k[t]$ irreducible.

We will see that many of the most important cases of field extensions are generated by one element, so this is actually useful.

Proof. Let $\alpha \in F$ be such that $F=k(\alpha)$; by assumption, such an $\alpha$ exists. There is a morphism of rings

$$
k[t] \rightarrow F
$$

sending the indeterminate $t$ to $\alpha$. The image is a domain, so the kernel is a prime ideal. Thus, it is either $(0)$ or $(P)$ for $P \in k[t]$ irreducible.

If the kernel is $(P)$ for $P \in k[t]$ irreducible, then the map factors through $k[t] /(P)$, and induces a morphism of fields $k[t] /(P) \rightarrow F$. Since the image contains $\alpha$, we see easily that the map is surjective, hence an isomorphism. In this case, $k[t] /(P) \simeq F$.
If the kernel is trivial, then we have an injection $k[t] \rightarrow F$. One may thus define a morphism of the quotient field $k(t)$ into $F$; given a quotient $R(t) / Q(t)$ with $R(t), Q(t) \in k[t]$, we map this to $R(\alpha) / Q(\alpha)$. The hypothesis that $k[t] \rightarrow F$ is injective implies that $Q(\alpha) \neq 0$ unless $Q$ is the zero polynomial. The quotient field of $k[t]$ is the rational function field $k(t)$, so we get a morphism $k(t) \rightarrow F$ whose image contains $\alpha$. It is thus surjective, hence an isomorphism.

### 9.7. Finite extensions

09G2 If $F / E$ is a field extension, then evidently $F$ is also a vector space over $E$ (the scalar action is just multiplication in $F$ ).

09G3 Definition 9.7.1. Let $F / E$ be an extension of fields. The dimension of $F$ considered as an $E$-vector space is called the degree of the extension and is denoted $[F: E]$. If $[F: E]<\infty$ then $F$ is said to be a finite extension of $E$.

09G4 Example 9.7.2. The field $\mathbf{C}$ is a two dimensional vector space over $\mathbf{R}$ with basis $1, i$. Thus $\mathbf{C}$ is a finite extension of $\mathbf{R}$ of degree 2 .

09G5 Lemma 9.7.3. Let $K / E / F$ be a tower of algebraic field extensions. If $K$ is finite over $F$, then $K$ is finite over $E$.

Proof. Direct from the definition.
Let us now consider the degree in the most important special example, that given by Lemma 9.6.8, in the next two examples.

09G6 Example 9.7.4 (Degree of a rational function field). If $k$ is any field, then the rational function field $k(t)$ is not a finite extension. For example the elements $\left\{t^{n}, n \in \mathbf{Z}\right\}$ are linearly independent over $k$.

In fact, if $k$ is uncountable, then $k(t)$ is uncountably dimensional as a $k$-vector space. To show this, we claim that the family of elements $\{1 /(t-\alpha), \alpha \in k\} \subset k(t)$ is linearly independent over $k$. A nontrivial relation between them would lead to a contradiction: for instance, if one works over $\mathbf{C}$, then this follows because $\frac{1}{t-\alpha}$, when considered as a meromorphic function on $\mathbf{C}$, has a pole at $\alpha$ and nowhere else. Consequently any sum $\sum c_{i} \frac{1}{t-\alpha_{i}}$ for the $c_{i} \in k^{*}$, and $\alpha_{i} \in k$ distinct, would have poles at each of the $\alpha_{i}$. In particular, it could not be zero.

Amusingly, this leads to a quick proof of the Hilbert Nullstellensatz over the complex numbers. For a slightly more general result, see Algebra, Theorem 10.34.11.

09G7 Example 9.7.5 (Degree of a simple algebraic extension). Consider a monogenic field extension $E / k$ of the form discussed in Example 9.6.4 In other words, $E=$ $k[t] /(P)$ for $P \in k[t]$ an irreducible polynomial. Then the degree $[E: k]$ is just the degree $d=\operatorname{deg}(P)$ of the polynomial $P$. Indeed, say
09G8 (9.7.5.1) $P=a_{d} t^{d}+a_{1} t^{d-1}+\ldots+a_{0}$.
with $a_{d} \neq 0$. Then the images of $1, t, \ldots, t^{d-1}$ in $k[t] /(P)$ are linearly independent over $k$, because any relation involving them would have degree strictly smaller than that of $P$, and $P$ is the element of smallest degree in the ideal $(P)$.
Conversely, the set $S=\left\{1, t, \ldots, t^{d-1}\right\}$ (or more properly their images) spans $k[t] /(P)$ as a vector space. Indeed, we have by 9.7.5.1 that $a_{d} t^{d}$ lies in the span of $S$. Since $a_{d}$ is invertible, we see that $t^{d}$ is in the span of $S$. Similarly, the relation $t P(t)=0$ shows that the image of $t^{d+1}$ lies in the span of $\left\{1, t, \ldots, t^{d}\right\}-$ by what was just shown, thus in the span of $S$. Working upward inductively, we find that the image of $t^{n}$ for $n \geq d$ lies in the span of $S$.

This confirms the observation that $[\mathbf{C}: \mathbf{R}]=2$, for instance. More generally, if $k$ is a field, and $\alpha \in k$ is not a square, then the irreducible polynomial $x^{2}-\alpha \in k[x]$ allows one to construct an extension $k[x] /\left(x^{2}-\alpha\right)$ of degree two. We shall write this as $k(\sqrt{\alpha})$. Such extensions will be called quadratic, for obvious reasons.
The basic fact about the degree is that it is multiplicative in towers.
09G9 Lemma 9.7.6 (Multiplicativity). Suppose given a tower of fields $F / E / k$. Then

$$
[F: k]=[F: E][E: k]
$$

Proof. Let $\alpha_{1}, \ldots, \alpha_{n} \in F$ be an $E$-basis for $F$. Let $\beta_{1}, \ldots, \beta_{m} \in E$ be a $k$-basis for $E$. Then the claim is that the set of products $\left\{\alpha_{i} \beta_{j}, 1 \leq i \leq n, 1 \leq j \leq m\right\}$ is a $k$-basis for $F$. Indeed, let us check first that they span $F$ over $k$.
By assumption, the $\left\{\alpha_{i}\right\}$ span $F$ over $E$. So if $f \in F$, there are $a_{i} \in E$ with

$$
f=\sum_{i} a_{i} \alpha_{i}
$$

and, for each $i$, we can write $a_{i}=\sum b_{i j} \beta_{j}$ for some $b_{i j} \in k$. Putting these together, we find

$$
f=\sum_{i, j} b_{i j} \alpha_{i} \beta_{j}
$$

proving that the $\left\{\alpha_{i} \beta_{j}\right\}$ span $F$ over $k$.
Suppose now that there existed a nontrivial relation

$$
\sum_{i, j} c_{i j} \alpha_{i} \beta_{j}=0
$$

for the $c_{i j} \in k$. In that case, we would have

$$
\sum_{i} \alpha_{i}\left(\sum_{j} c_{i j} \beta_{j}\right)=0
$$

and the inner terms lie in $E$ as the $\beta_{j}$ do. Now $E$-linear independence of the $\left\{\alpha_{i}\right\}$ shows that the inner sums are all zero. Then $k$-linear independence of the $\left\{\beta_{j}\right\}$ shows that the $c_{i j}$ all vanish.

We sidetrack to a slightly tangential definition.
09GA Definition 9.7.7. A field $K$ is said to be a number field if it has characteristic 0 and the extension $\mathbf{Q} \subset K$ is finite.

Number fields are the basic objects in algebraic number theory. We shall see later that, for the analog of the integers $\mathbf{Z}$ in a number field, something kind of like unique factorization still holds (though strict unique factorization generally does not!).

### 9.8. Algebraic extensions

09 GB An important class of extensions are those where every element generates a finite extension.

09GC Definition 9.8.1. Consider a field extension $F / E$. An element $\alpha \in F$ is said to be algebraic over $E$ if $\alpha$ is the root of some nonzero polynomial with coefficients in $E$. If all elements of $F$ are algebraic then $F$ is said to be an algebraic extension of $E$.

By Lemma 9.6.8, the subextension $E(\alpha)$ is isomorphic either to the rational function field $E(t)$ or to a quotient ring $E[t] /(P)$ for $P \in E[t]$ an irreducible polynomial. In the latter case, $\alpha$ is algebraic over $E$ (in fact, the proof of Lemma 9.6.8 shows that we can pick $P$ such that $\alpha$ is a root of $P$ ); in the former case, it is not.

09GD Example 9.8.2. The field $\mathbf{C}$ is algebraic over $\mathbf{R}$. Namely, if $\alpha=a+i b$ in $\mathbf{C}$, then $\alpha^{2}-2 a \alpha+a^{2}+b^{2}=0$ is a polynomial equation for $\alpha$ over $\mathbf{R}$.

09GE Example 9.8.3. Let $X$ be a compact Riemann surface, and let $f \in \mathbf{C}(X)-\mathbf{C}$ any nonconstant meromorphic function on $X$ (see Example 9.3.6). Then it is known that $\mathbf{C}(X)$ is algebraic over the subextension $\mathbf{C}(f)$ generated by $f$. We shall not prove this.

09GF Lemma 9.8.4. Let $K / E / F$ be a tower of field extensions.
(1) If $\alpha \in K$ is algebraic over $F$, then $\alpha$ is algebraic over $E$.
(2) if $K$ is algebraic over $F$, then $K$ is algebraic over $E$.

Proof. This is immediate from the definitions.
We now show that there is a deep connection between finiteness and being algebraic.
09GG Lemma 9.8.5. A finite extension is algebraic. In fact, an extension $E / k$ is algebraic if and only if every subextension $k(\alpha) / k$ generated by some $\alpha \in E$ is finite.

In general, it is very false that an algebraic extension is finite.
Proof. Let $E / k$ be finite, say of degree $n$. Choose $\alpha \in E$. Then the elements $\left\{1, \alpha, \ldots, \alpha^{n}\right\}$ are linearly dependent over $E$, or we would necessarily have $[E$ : $k]>n$. A relation of linear dependence now gives the desired polynomial that $\alpha$ must satisfy.

For the last assertion, note that a monogenic extension $k(\alpha) / k$ is finite if and only $\alpha$ is algebraic over $k$, by Examples 9.7.4 and 9.7.5. So if $E / k$ is algebraic, then each $k(\alpha) / k, \alpha \in E$, is a finite extension, and conversely.

We can extract a lemma of the last proof (really of Examples 9.7.4 and 9.7.5): a monogenic extension is finite if and only if it is algebraic. We shall use this observation in the next result.

09GH Lemma 9.8.6. Let $k$ be a field, and let $\alpha_{1}, \alpha_{2}, \ldots, \alpha_{n}$ be elements of some extension field such that each $\alpha_{i}$ is algebraic over $k$. Then the extension $k\left(\alpha_{1}, \ldots, \alpha_{n}\right) / k$ is finite. That is, a finitely generated algebraic extension is finite.
Proof. Indeed, each extension $k\left(\alpha_{1}, \ldots, \alpha_{i+1}\right) / k\left(\alpha_{1}, \ldots, \alpha_{i}\right)$ is generated by one element and algebraic, hence finite. By multiplicativity of degree (Lemma 9.7.6) we obtain the result.

The set of complex numbers that are algebraic over $\mathbf{Q}$ are simply called the algebraic numbers. For instance, $\sqrt{2}$ is algebraic, $i$ is algebraic, but $\pi$ is not. It is a basic fact that the algebraic numbers form a field, although it is not obvious how to prove this from the definition that a number is algebraic precisely when it satisfies a nonzero polynomial equation with rational coefficients (e.g. by polynomial equations).
09GI Lemma 9.8.7. Let $E / k$ be a field extension. Then the elements of $E$ algebraic over $k$ form a subextension of $E / k$.

Proof. Let $\alpha, \beta \in E$ be algebraic over $k$. Then $k(\alpha, \beta) / k$ is a finite extension by Lemma 9.8.6. It follows that $k(\alpha+\beta) \subset k(\alpha, \beta)$ is a finite extension, which implies that $\alpha+\beta$ is algebraic by Lemma 9.8.5. Similarly for the difference, product and quotient of $\alpha$ and $\beta$.

Many nice properties of field extensions, like those of rings, will have the property that they will be preserved by towers and composita.

09GJ Lemma 9.8.8. Let $E / k$ and $F / E$ be algebraic extensions of fields. Then $F / k$ is an algebraic extension of fields.

Proof. Choose $\alpha \in F$. Then $\alpha$ is algebraic over $E$. The key observation is that $\alpha$ is algebraic over a finitely generated subextension of $k$. That is, there is a finite set $S \subset E$ such that $\alpha$ is algebraic over $k(S)$ : this is clear because being algebraic means that a certain polynomial in $E[x]$ that $\alpha$ satisfies exists, and as $S$ we can take the coefficients of this polynomial. It follows that $\alpha$ is algebraic over $k(S)$. In particular, the extension $k(S, \alpha) / k(S)$ is finite. Since $S$ is a finite set, and $k(S) / k$ is algebraic, Lemma 9.8 .6 shows that $k(S) / k$ is finite. Using multiplicativity (Lemma 9.7.6) we find that $k(S, \alpha) / k$ is finite, so $\alpha$ is algebraic over $k$.

The method of proof in the previous argument - that being algebraic over $E$ was a property that descended to a finitely generated subextension of $E$ - is an idea that recurs throughout algebra. It often allows one to reduce general commutative algebra questions to the Noetherian case for example.

09GK Lemma 9.8.9. Let $E / F$ be an algebraic extension of fields. Then the cardinality $|E|$ of $E$ is at most $\max \left(\aleph_{0},|F|\right)$.
Proof. Let $S$ be the set of nonconstant polynomials with coefficients in $F$. For every $P \in S$ the set of roots $r(P, E)=\{\alpha \in E \mid P(\alpha)=0\}$ is finite (details omitted). Moreover, the fact that $E$ is algebraic over $F$ implies that $E=\bigcup_{P \in S} r(P, E)$. It is clear that $S$ has cardinality bounded by $\max \left(\aleph_{0},|F|\right)$ because the cardinality of a finite product of copies of $F$ has cardinality at $\operatorname{most} \max \left(\aleph_{0},|F|\right)$. Thus so does $E$.

0BID Lemma 9.8.10. Let $E / F$ be a finite or more generally an algebraic extension of fields. Any subring $F \subset R \subset E$ is a field.

Proof. Let $\alpha \in R$ be nonzero. Then $1, \alpha, \alpha^{2}, \ldots$ are contained in $R$. By Lemma 9.8.5 we find a nontrivial relation $a_{0}+a_{1} \alpha+\ldots+a_{d} \alpha^{d}=0$. We may assume $a_{0} \neq 0$ because if not we can divide the relation by $\alpha$ to decrease $d$. Then we see that

$$
a_{0}=\alpha\left(-a_{1}-\ldots-a_{d} \alpha^{d-1}\right)
$$

which proves that the inverse of $\alpha$ is the element $a_{0}^{-1}\left(-a_{1}-\ldots-a_{d} \alpha^{d-1}\right)$ of $R$.
0BMD Lemma 9.8.11. Let $E / F$ an algebraic extension of fields. Any $F$-algebra map $f: E \rightarrow E$ is an automorphism.

Proof. If $E / F$ is finite, then $f: E \rightarrow E$ is an $F$-linear injective map (Lemma 9.6.1 of finite dimensional vector spaces, and hence bijective. In general we still see that $f$ is injective. Let $\alpha \in E$ and let $P \in F[x]$ be a polynomial such that $P(\alpha)=0$. Let $E^{\prime} \subset E$ be the subfield of $E$ generated by the roots $\alpha=\alpha_{1}, \ldots, \alpha_{n}$ of $P$ in $E$. Then $E^{\prime}$ is finite over $F$ by Lemma 9.8.6. Since $f$ preserves the set of roots, we find that $\left.f\right|_{E^{\prime}}: E^{\prime} \rightarrow E^{\prime}$. Hence $\left.f\right|_{E^{\prime}}$ is an isomorphism by the first part of the proof and we conclude that $\alpha$ is in the image of $f$.

### 9.9. Minimal polynomials

09 GL Let $E / k$ be a field extension, and let $\alpha \in E$ be algebraic over $k$. Then $\alpha$ satisfies a (nontrivial) polynomial equation in $k[x]$. Consider the set of polynomials $P \in$ $k[x]$ such that $P(\alpha)=0$; by hypothesis, this set does not just contain the zero polynomial. It is easy to see that this set is an ideal. Indeed, it is the kernel of the map

$$
k[x] \rightarrow E, \quad x \mapsto \alpha
$$

Since $k[x]$ is a PID, there is a generator $P \in k[x]$ of this ideal. If we assume $P$ monic, without loss of generality, then $P$ is uniquely determined.

09GM Definition 9.9.1. The polynomial $P$ above is called the minimal polynomial of $\alpha$ over $k$.

The minimal polynomial has the following characterization: it is the monic polynomial, of smallest degree, that annihilates $\alpha$. Any nonconstant multiple of $P$ will have larger degree, and only multiples of $P$ can annihilate $\alpha$. This explains the name minimal.

Clearly the minimal polynomial is irreducible. This is equivalent to the assertion that the ideal in $k[x]$ consisting of polynomials annihilating $\alpha$ is prime. This follows from the fact that the map $k[x] \rightarrow E, x \mapsto \alpha$ is a map into a domain (even a field), so the kernel is a prime ideal.

09GN Lemma 9.9.2. The degree of the minimal polynomial is $[k(\alpha): k]$.
Proof. This is just a restatement of the argument in Lemma 9.6.8 the observation is that if $P$ is the minimal polynomial of $\alpha$, then the map

$$
k[x] /(P) \rightarrow k(\alpha), \quad x \mapsto \alpha
$$

is an isomorphism as in the aforementioned proof, and we have counted the degree of such an extension (see Example 9.7.5).

So the observation of the above proof is that if $\alpha \in E$ is algebraic, then $k(\alpha) \subset E$ is isomorphic to $k[x] /(P)$.

### 9.10. Algebraic closure

09GP The "fundamental theorem of algebra" states that $\mathbf{C}$ is algebraically closed. A beautiful proof of this result uses Liouville's theorem in complex analysis, we shall give another proof (see Lemma 9.22.1).
09GQ Definition 9.10.1. A field $F$ is said to be algebraically closed if every algebraic extension $E / F$ is trivial, i.e., $E=F$.

This may not be the definition in every text. Here is the lemma comparing it with the other one.

09GR Lemma 9.10.2. Let $F$ be a field. The following are equivalent
(1) $F$ is algebraically closed,
(2) every irreducible polynomial over $F$ is linear,
(3) every nonconstant polynomial over $F$ has a root,
(4) every nonconstant polynomial over $F$ is a product of linear factors.

Proof. If $F$ is algebraically closed, then every irreducible polynomial is linear. Namely, if there exists an irreducible polynomial of degree $>1$, then this generates a nontrivial finite (hence algebraic) field extension, see Example 9.7.5. Thus (1) implies (2). If every irreducible polynomial is linear, then every irreducible polynomial has a root, whence every nonconstant polynomial has a root. Thus (2) implies (3).

Assume every nonconstant polynomial has a root. Let $P \in F[x]$ be nonconstant. If $P(\alpha)=0$ with $\alpha \in F$, then we see that $P=(x-\alpha) Q$ for some $Q \in F[x]$ (by division with remainder). Thus we can argue by induction on the degree that any nonconstant polynomial can be written as a product $c \prod\left(x-\alpha_{i}\right)$.
Finally, suppose that every nonconstant polynomial over $F$ is a product of linear factors. Let $E / F$ be an algebraic extension. Then all the simple subextensions $F(\alpha) / F$ of $E$ are necessarily trivial (because the only irreducible polynomials are linear by assumption). Thus $E=F$. We see that (4) implies (1) and we are done.

Now we want to define a "universal" algebraic extension of a field. Actually, we should be careful: the algebraic closure is not a universal object. That is, the algebraic closure is not unique up to unique isomorphism: it is only unique up to isomorphism. But still, it will be very handy, if not functorial.

09GS Definition 9.10.3. Let $F$ be a field. We say $F$ is algebraically closed if every algebraic extension $E / F$ is trivial, i.e., $E=F$. An algebraic closure of $F$ is a field $\bar{F}$ containing $F$ such that:
(1) $\bar{F}$ is algebraic over $F$.
(2) $\bar{F}$ is algebraically closed.

If $F$ is algebraically closed, then $F$ is its own algebraic closure. We now prove the basic existence result.

09GT Theorem 9.10.4. Every field has an algebraic closure.
The proof will mostly be a red herring to the rest of the chapter. However, we will want to know that it is possible to embed a field inside an algebraically closed field, and we will often assume it done.

Proof. Let $F$ be a field. By Lemma 9.8 .9 the cardinality of an algebraic extension of $F$ is bounded by $\max \left(\aleph_{0},|F|\right)$. Choose a set $S$ containing $F$ with $|S|>\max \left(\aleph_{0},|F|\right)$. Let's consider triples $\left(E, \sigma_{E}, \mu_{E}\right)$ where
(1) $E$ is a set with $F \subset E \subset S$, and
(2) $\sigma_{E}: E \times E \rightarrow E$ and $\mu_{E}: E \times E \rightarrow E$ are maps of sets such that $\left(E, \sigma_{E}, \mu_{E}\right)$ defines the structure of a field extension of $F$ (in particular $\sigma_{E}(a, b)=a+{ }_{F} b$ for $a, b \in F$ and similarly for $\left.\mu_{E}\right)$, and
(3) $F \subset E$ is an algebraic field extension.

The collection of all triples $\left(E, \sigma_{E}, \mu_{E}\right)$ forms a set $I$. For $i \in I$ we will denote $E_{i}=\left(E_{i}, \sigma_{i}, \mu_{i}\right)$ the corresponding field extension to $F$. We define a partial ordering on $I$ by declaring $i \leq i^{\prime}$ if and only if $E_{i} \subset E_{i^{\prime}}$ (this makes sense as $E_{i}$ and $E_{i^{\prime}}$ are subsets of the same set $S$ ) and we have $\sigma_{i}=\left.\sigma_{i^{\prime}}\right|_{E_{i} \times E_{i}}$ and $\mu_{i}=\left.\mu_{i^{\prime}}\right|_{E_{i} \times E_{i}}$, in other words, $E_{i^{\prime}}$ is a field extension of $E_{i}$.

Let $T \subset I$ be a totally ordered subset. Then it is clear that $E_{T}=\bigcup_{i \in T} E_{i}$ with induced maps $\sigma_{T}=\bigcup \sigma_{i}$ and $\mu_{T}=\bigcup \mu_{i}$ is another element of $I$. In other words every totally order subset of $I$ has a upper bound in $I$. By Zorn's lemma there exists a maximal element $\left(E, \sigma_{E}, \mu_{E}\right)$ in $I$. We claim that $E$ is an algebraic closure. Since by definition of $I$ the extension $E / F$ is algebraic, it suffices to show that $E$ is algebraically closed.
To see this we argue by contradiction. Namely, suppose that $E$ is not algebraically closed. Then there exists an irreducible polynomial $P$ over $E$ of degree $>1$, see Lemma 9.10 .2 . By Lemma 9.8 .5 we obtain a nontrivial finite extension $E^{\prime}=E[x] /(P)$. Observe that $E^{\prime} / F$ is algebraic by Lemma 9.8.8. Thus the cardinality of $E^{\prime}$ is $\leq \max \left(\aleph_{0},|F|\right)$. By elementary set theory we can extend the given injection $E \subset S$ to an injection $E^{\prime} \rightarrow S$. In other words, we may think of $E^{\prime}$ as an element of our set $I$ contradicting the maximality of $E$. This contradiction completes the proof.

09GU Lemma 9.10.5. Let $F$ be a field. Let $\bar{F}$ be an algebraic closure of $F$. Let $M / F$ be an algebraic extension. Then there is a morphism of $F$-extensions $M \rightarrow \bar{F}$.

Proof. Consider the set $I$ of pairs $(E, \varphi)$ where $F \subset E \subset M$ is a subextension and $\varphi: E \rightarrow \bar{F}$ is a morphism of $F$-extensions. We partially order the set $I$ by declaring $(E, \varphi) \leq\left(E^{\prime}, \varphi^{\prime}\right)$ if and only if $E \subset E^{\prime}$ and $\left.\varphi^{\prime}\right|_{E}=\varphi$. If $T=\left\{\left(E_{t}, \varphi_{t}\right)\right\} \subset I$ is a totally ordered subset, then $\bigcup \varphi_{t}: \bigcup E_{t} \rightarrow \bar{F}$ is an element of $I$. Thus every totally ordered subset of $I$ has an upper bound. By Zorn's lemma there exists a maximal element $(E, \varphi)$ in $I$. We claim that $E=M$, which will finish the proof. If not, then pick $\alpha \in M, \alpha \notin E$. The $\alpha$ is algebraic over $E$, see Lemma 9.8.4. Let $P$ be the minimal polynomial of $\alpha$ over $E$. Let $P^{\varphi}$ be the image of $P$ by $\varphi$ in $\bar{F}[x]$. Since $\bar{F}$ is algebraically closed there is a root $\beta$ of $P^{\varphi}$ in $\bar{F}$. Then we can extend $\varphi$ to $\varphi^{\prime}: E(\alpha)=E[x] /(P) \rightarrow \bar{F}$ by mapping $x$ to $\beta$. This contradicts the maximality of $(E, \varphi)$ as desired.

09GV Lemma 9.10.6. Any two algebraic closures of a field are isomorphic.
Proof. Let $F$ be a field. If $M$ and $\bar{F}$ are algebraic closures of $F$, then there exists a morphism of $F$-extensions $\varphi: M \rightarrow \bar{F}$ by Lemma 9.10.5. Now the image $\varphi(M)$ is algebraically closed. On the other hand, the extension $\varphi(M) \subset \bar{F}$ is algebraic by Lemma 9.8.4 Thus $\varphi(M)=\bar{F}$.

### 9.11. Relatively prime polynomials

09GW Let $K$ be an algebraically closed field. Then the ring $K[x]$ has a very simple ideal structure as we saw in Lemma 9.10.2. In particular, every polynomial $P \in K[x]$ can be written as

$$
P=c\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{n}\right)
$$

where $c$ is the constant term and the $\alpha_{1}, \ldots, \alpha_{n} \in k$ are the roots of $P$ (counted with multiplicity). Clearly, the only irreducible polynomials in $K[x]$ are the linear polynomials $c(x-\alpha), c, \alpha \in K$ (and $c \neq 0)$.
09GX Definition 9.11.1. If $k$ is any field, we say that two polynomials in $k[x]$ are relatively prime if they generate the unit ideal in $k[x]$.

Continuing the discussion above, if $K$ is an algebraically closed field, two polynomials in $K[x]$ are relatively prime if and only if they have no common roots. This follows because the maximal ideals of $K[x]$ are of the form $(x-\alpha), \alpha \in K$. So if $F, G \in K[x]$ have no common root, then $(F, G)$ cannot be contained in any $(x-\alpha)$ (as then they would have a common root at $\alpha$ ).
If $k$ is not algebraically closed, then this still gives information about when two polynomials in $k[x]$ generate the unit ideal.
09GY Lemma 9.11.2. Two polynomials in $k[x]$ are relatively prime precisely when they have no common roots in an algebraic closure $\bar{k}$ of $k$.

Proof. The claim is that any two polynomials $P, Q$ generate (1) in $k[x]$ if and only if they generate (1) in $\bar{k}[x]$. This is a piece of linear algebra: a system of linear equations with coefficients in $k$ has a solution if and only if it has a solution in any extension of $k$. Consequently, we can reduce to the case of an algebraically closed field, in which case the result is clear from what we have already proved.

### 9.12. Separable extensions

09GZ In characteristic $p$ something funny happens with irreducible polynomials over fields. We explain this in the following lemma.
09H0 Lemma 9.12.1. Let $F$ be a field. Let $P \in F[x]$ be an irreducible polynomial over $F$. Let $P^{\prime}=d P / d x$ be the derivative of $P$ with respect to $x$. Then one of the following two cases happens
(1) $P$ and $P^{\prime}$ are relatively prime, or
(2) $P^{\prime}$ is the zero polynomial.

Then second case can only happen if $F$ has characteristic $p>0$. In this case $P(x)=Q\left(x^{q}\right)$ where $q=p^{f}$ is a power of $p$ and $Q \in F[x]$ is an irreducible polynomial such that $Q$ and $Q^{\prime}$ are relatively prime.
Proof. Note that $P^{\prime}$ has degree $<\operatorname{deg}(P)$. Hence if $P$ and $P^{\prime}$ are not relatively prime, then $\left(P, P^{\prime}\right)=(R)$ where $R$ is a polynomial of degree $<\operatorname{deg}(P)$ contradicting the irreducibility of $P$. This proves we have the dichotomy between (1) and (2).
Assume we are in case (2) and $P=a_{d} x^{d}+\ldots+a_{0}$. Then $P^{\prime}=d a_{d} x^{d-1}+\ldots+a_{1}$. In characteristic 0 we see that this forces $a_{d}, \ldots, a_{1}=0$ which would mean $P$ is constant a contradiction. Thus we conclude that the characteristic $p$ is positive. In this case the condition $P^{\prime}=0$ forces $a_{i}=0$ whenever $p \Lambda i$. In other words, $P(x)=P_{1}\left(x^{p}\right)$ for some nonconstant polynomial $P_{1}$. Clearly, $P_{1}$ is irreducible as
well. By induction on the degree we see that $P_{1}(x)=Q\left(x^{q}\right)$ as in the statement of the lemma, hence $P(x)=Q\left(x^{p q}\right)$ and the lemma is proved.
09H1 Definition 9.12.2. Let $F$ be a field. Let $K / F$ be an extension of fields.
(1) We say an irreducible polynomial $P$ over $F$ is separable if it is relatively prime to its derivative.
(2) Given $\alpha \in K$ algebraic over $F$ we say $\alpha$ is separable over $F$ if its minimal polynomial is separable over $F$.
(3) If $K$ is an algebraic extension of $F$, we say $K$ is separabl $\ell^{1}$ over $F$ if every element of $K$ is separable over $F$.

By Lemma 9.12.1 in characteristic 0 every irreducible polynomial is separable, every algebraic element in an extension is separable, and every algebraic extension is separable.
09 H 2 Lemma 9.12.3. Let $K / E / F$ be a tower of algebraic field extensions.
(1) If $\alpha \in K$ is separable over $F$, then $\alpha$ is separable over $E$.
(2) if $K$ is separable over $F$, then $K$ is separable over $E$.

Proof. We will use Lemma 9.12 .1 without further mention. Let $P$ be the minimal polynomial of $\alpha$ over $F$. Let $Q$ be the minimal polynomial of $\alpha$ over $E$. Then $Q$ divides $P$ in the polynomial ring $E[x]$, say $P=Q R$. Then $P^{\prime}=Q^{\prime} R+Q R^{\prime}$. Thus if $Q^{\prime}=0$, then $Q$ divides $P$ and $P^{\prime}$ hence $P^{\prime}=0$ by the lemma. This proves (1). Part (2) follows immediately from (1) and the definitions.

09H3 Lemma 9.12.4. Let $F$ be a field. An irreducible polynomial $P$ over $F$ is separable if and only if $P$ has pairwise distinct roots in an algebraic closure of $F$.
Proof. Suppose that $\alpha \in F$ is a root of both $P$ and $P^{\prime}$. Then $P=(x-\alpha) Q$ for some polynomial $Q$. Taking derivatives we obtain $P^{\prime}=Q+(x-\alpha) Q^{\prime}$. Thus $\alpha$ is a root of $Q$. Hence we see that if $P$ and $P^{\prime}$ have a common root, then $P$ does not have pairwise distinct roots. Conversely, if $P$ has a repeated root, i.e., $(x-\alpha)^{2}$ divides $P$, then $\alpha$ is a root of both $P$ and $P^{\prime}$. Combined with Lemma 9.11 .2 this proves the lemma.

09H4 Lemma 9.12.5. Let $F$ be a field and let $\bar{F}$ be an algebraic closure of $F$. Let $p>0$ be the characteristic of $F$. Let $P$ be a polynomial over $F$. Then the set of roots of $P$ and $P\left(x^{p}\right)$ in $\bar{F}$ have the same cardinality (not counting multiplicity).
Proof. Clearly, $\alpha$ is a root of $P\left(x^{p}\right)$ if and only if $\alpha^{p}$ is a root of $P$. In other words, the roots of $P\left(x^{p}\right)$ are the roots of $x^{p}-\beta$, where $\beta$ is a root of $P$. Thus it suffices to show that the map $\bar{F} \rightarrow \bar{F}, \alpha \mapsto \alpha^{p}$ is bijective. It is surjective, as $\bar{F}$ is algebraically closed which means that every element has a $p$ th root. It is injective because $\alpha^{p}=\beta^{p}$ implies $(\alpha-\beta)^{p}=0$ because the characteristic is $p$. And of course in a field $x^{p}=0$ implies $x=0$.

Let $F$ be a field and let $P$ be an irreducible polynomial over $F$. Then we know that $P=Q\left(x^{q}\right)$ for some separable irreducible polynomial $Q$ (Lemma 9.12.1) where $q$ is a power of the characteristic $p$ (and if the characteristic is zero, then $q=1 \|^{2}$ and $Q=P$ ). By Lemma 9.12 .5 the number of roots of $P$ and $Q$ in any algebraic closure of $F$ is the same. By Lemma 9.12 .4 this number is equal to the degree of $Q$.

[^17]09H5 Definition 9.12.6. Let $F$ be a field. Let $P$ be an irreducible polynomial over $F$. The separable degree of $P$ is the cardinality of the set of roots of $P$ in any algebraic closure of $F$ (see discussion above). Notation $\operatorname{deg}_{s}(P)$.
The separable degree of $P$ always divides the degree and the quotient is a power of the characteristic. If the characteristic is zero, then $\operatorname{deg}_{s}(P)=\operatorname{deg}(P)$.
09H6 Situation 9.12.7. Here $F$ be a field and $K / F$ is a finite extension generated by elements $\alpha_{1}, \ldots, \alpha_{n} \in K$. We set $K_{0}=F$ and

$$
K_{i}=F\left(\alpha_{1}, \ldots, \alpha_{i}\right)
$$

to obtain a tower of finite extensions $K=K_{r} / K_{r-1} / \ldots / K_{0}=F$. Denote $P_{i}$ the minimal polynomial of $\alpha_{i}$ over $K_{i-1}$. Finally, we fix an algebraic closure $\bar{F}$ of $F$.

Let $F, K, \alpha_{i}$, and $\bar{F}$ be as in Situation 9.12.7. Suppose that $\varphi: K \rightarrow \bar{F}$ is a morphism of extensions of $F$. Then we obtain maps $\varphi_{i}: K_{i} \rightarrow \bar{F}$. In particular, we can take the image of $P_{i} \in K_{i-1}[x]$ by $\varphi_{i-1}$ to get a polynomial $P_{i}^{\varphi} \in \bar{F}[x]$.
09H7 Lemma 9.12.8. In Situation 9.12.7 the correspondence

$$
\operatorname{Mor}_{F}(K, \bar{F}) \longrightarrow\left\{\left(\beta_{1}, \ldots, \beta_{n}\right) \text { as below }\right\}, \quad \varphi \longmapsto\left(\varphi\left(\alpha_{1}\right), \ldots, \varphi\left(\alpha_{n}\right)\right)
$$

is a bijection. Here the right hand side is the set of $n$-tuples $\left(\beta_{1}, \ldots, \beta_{n}\right)$ of elements of $\bar{F}$ such that $\beta_{i}$ is a root of $P_{i}^{\varphi}$.

Proof. Let $\left(\beta_{1}, \ldots, \beta_{n}\right)$ be an element of the right hand side. We construct a map of fields corresponding to it by induction. Namely, we set $\varphi_{0}: K_{0} \rightarrow \bar{F}$ equal to the given map $K_{0}=F \subset \bar{F}$. Having constructed $\varphi_{i-1}: K_{i-1} \rightarrow \bar{F}$ we observe that $K_{i}=K_{i-1}[x] /\left(P_{i}\right)$. Hence we can set $\varphi_{i}$ equal to the unique map $K_{i} \rightarrow \bar{F}$ inducing $\varphi_{i-1}$ on $K_{i-1}$ and mapping $x$ to $\beta_{i}$. This works precisely as $\beta_{i}$ is a root of $P_{i}^{\varphi}$. Uniqueness implies that the two constructions are mutually inverse.

09H8 Lemma 9.12.9. In Situation 9.12 .7 we have $\left|\operatorname{Mor}_{F}(K, \bar{F})\right|=\prod_{i=1}^{n} \operatorname{deg}_{s}\left(P_{i}\right)$.
Proof. This follows immediately from Lemma 9.12.8. Observe that a key ingredient we are tacitly using here is the well-definedness of the separable degree of an irreducible polynomial which was observed just prior to Definition 9.12.6.

We now use the result above to characterize separable field extensions.
09H9 Lemma 9.12.10. Assumptions and notation as in Situation 9.12.7. If each $P_{i}$ is separable, i.e., each $\alpha_{i}$ is separable over $K_{i-1}$, then

$$
\left|\operatorname{Mor}_{F}(K, \bar{F})\right|=[K: F]
$$

and the field extension $K / F$ is separable. If one of the $\alpha_{i}$ is not separable over $K_{i-1}$, then $\left|\operatorname{Mor}_{F}(K, \bar{F})\right|<[K: F]$.
Proof. If $\alpha_{i}$ is separable over $K_{i-1}$ then $\operatorname{deg}_{s}\left(P_{i}\right)=\operatorname{deg}\left(P_{i}\right)=\left[K_{i}: K_{i-1}\right]$ (last equality by Lemma 9.9.2). By multiplicativity (Lemma 9.7.6) we have

$$
[K: F]=\prod\left[K_{i}: K_{i-1}\right]=\prod \operatorname{deg}\left(P_{i}\right)=\prod \operatorname{deg}_{s}\left(P_{i}\right)=\left|\operatorname{Mor}_{F}(K, \bar{F})\right|
$$

where the last equality is Lemma 9.12 .9 . By the exact same argument we get the strict inequality $\left|\operatorname{Mor}_{F}(K, \bar{F})\right|<[\bar{K}: F]$ if one of the $\alpha_{i}$ is not separable over $K_{i-1}$.
Finally, assume again that each $\alpha_{i}$ is separable over $K_{i-1}$. Let $\gamma=\gamma_{1} \in K$ be arbitrary. Then we can find additional elements $\gamma_{2}, \ldots, \gamma_{m}$ such that $K=$
$F\left(\gamma_{1}, \ldots, \gamma_{m}\right)$ (for example we could take $\left.\gamma_{2}=\alpha_{1}, \ldots, \gamma_{n+1}=\alpha_{n}\right)$. Then we see by the last part of the lemma (already proven above) that if $\gamma$ is not separable over $F$ we would have the strict inequality $\left|\operatorname{Mor}_{F}(K, \bar{F})\right|<[K: F]$ contradicting the very first part of the lemma (already prove above as well).

09HA Lemma 9.12.11. Let $K / F$ be a finite extension of fields. Let $\bar{F}$ be an algebraic closure of $F$. Then we have

$$
\left|\operatorname{Mor}_{F}(K, \bar{F})\right| \leq[K: F]
$$

with equality if and only if $K$ is separable over $F$.
Proof. This is a corollary of Lemma 9.12.10. Namely, since $K / F$ is finite we can find finitely many elements $\alpha_{1}, \ldots, \alpha_{n} \in K$ generating $K$ over $F$ (for example we can choose the $\alpha_{i}$ to be a basis of $K$ over $\left.F\right)$. If $K / F$ is separable, then each $\alpha_{i}$ is separable over $F\left(\alpha_{1}, \ldots, \alpha_{i-1}\right)$ by Lemma 9.12 .3 and we get equality by Lemma 9.12 .10 . On the other hand, if we have equality, then no matter how we choose $\alpha_{1}, \ldots, \alpha_{n}$ we get that $\alpha_{1}$ is separable over $F$ by Lemma 9.12 .10 . Since we can start the sequence with an arbitrary element of $K$ it follows that $K$ is separable over $F$.

09HB Lemma 9.12.12. Let $E / k$ and $F / E$ be separable algebraic extensions of fields. Then $F / k$ is a separable extension of fields.

Proof. Choose $\alpha \in F$. Then $\alpha$ is separable algebraic over $E$. Let $P=x^{d}+$ $\sum_{i<d} a_{i} x^{i}$ be the minimal polynomial of $\alpha$ over $E$. Each $a_{i}$ is separable algebraic over $k$. Consider the tower of fields

$$
k \subset k\left(a_{0}\right) \subset k\left(a_{0}, a_{1}\right) \subset \ldots \subset k\left(a_{0}, \ldots, a_{d-1}\right) \subset k\left(a_{0}, \ldots, a_{d-1}, \alpha\right)
$$

Because $a_{i}$ is separable algebraic over $k$ it is separable algebraic over $k\left(a_{0}, \ldots, a_{i-1}\right)$ by Lemma 9.12 .3 . Finally, $\alpha$ is separable algebraic over $k\left(a_{0}, \ldots, a_{d-1}\right)$ because it is a root of $P$ which is irreducible (as it is irreducible over the possibly bigger field $E)$ and separable (as it is separable over $E$ ). Thus $k\left(a_{0}, \ldots, a_{d-1}, \alpha\right.$ ) is separable over $k$ by Lemma 9.12 .10 and we conclude that $\alpha$ is separable over $k$ as desired.

09HC Lemma 9.12.13. Let $E / k$ be a field extension. Then the elements of $E$ separable over $k$ form a subextension of $E / k$.

Proof. Let $\alpha, \beta \in E$ be separable over $k$. Then $\beta$ is separable over $k(\alpha)$ by Lemma 9.12 .3 . Thus we can apply Lemma 9.12 .12 to $k(\alpha, \beta)$ to see that $k(\alpha, \beta)$ is separable over $k$.

### 9.13. Purely inseparable extensions

09HD Purely inseparable extensions are the opposite of the separable extensions defined in the previous section. These extensions only show up in positive characteristic.

09HE Definition 9.13.1. Let $F$ be a field of characteristic $p>0$. Let $K / F$ be an extension.
(1) An element $\alpha \in K$ is purely inseparable over $F$ if there exists a power $q$ of $p$ such that $\alpha^{q} \in F$.
(2) The extension $K / F$ is said to be purely inseparable if and only if every element of $K$ is purely inseparable over $F$.

Observe that a purely inseparable extension is necessarily algebraic. Let $F$ be a field of characteristic $p>0$. An example of a purely inseparable extension is gotten by adjoining the $p$ th root of an element $t \in F$ which does not yet have one. Namely, the lemma below shows that $P=x^{p}-t$ is irreducible, and hence

$$
K=F[x] /(P)=F\left[t^{1 / p}\right]
$$

is a field. And $K$ is purely inseparable over $F$ because every element

$$
a_{0}+a_{1} t^{1 / p}+\ldots+a_{p-1} t^{p-1 / p}, a_{i} \in F
$$

has $p$ th power equal to

$$
\left(a_{0}+a_{1} t^{1 / p}+\ldots+a_{p-1} t^{p-1 / p}\right)^{p}=a_{0}^{p}+a_{1}^{p} t+\ldots+a_{p-1}^{p} t^{p-1} \in F
$$

This situation occurs for the field $\mathbf{F}_{p}(t)$ of rational functions over $\mathbf{F}_{p}$.
09HF Lemma 9.13.2. Let $p$ be a prime number. Let $F$ be a field of characteristic $p$. Let $t \in F$ be an element which does not have a pth root in $F$. Then the polynomial $x^{p}-t$ is irreducible over $F$.

Proof. To see this, suppose that we have a factorization $x^{p}-t=f g$. Taking derivatives we get $f^{\prime} g+f g^{\prime}=0$. Note that neither $f^{\prime}=0$ nor $g^{\prime}=0$ as the degrees of $f$ and $g$ are smaller than $p$. Moreover, $\operatorname{deg}\left(f^{\prime}\right)<\operatorname{deg}(f)$ and $\operatorname{deg}\left(g^{\prime}\right)<\operatorname{deg}(g)$. We conclude that $f$ and $g$ have a factor in common. Thus if $x^{p}-t$ is reducible, then it is of the form $x^{p}-t=c f^{n}$ for some irreducible $f, c \in F^{*}$, and $n>1$. Since $p$ is a prime number this implies $n=p$ and $f$ linear, which would imply $x^{p}-t$ has a root in $F$. Contradiction.

We will see that taking $p$ th roots is a very important operation in characteristic $p$.
09HG Lemma 9.13.3. Let $E / k$ and $F / E$ be purely inseparable extensions of fields. Then $F / k$ is a purely inseparable extension of fields.

Proof. Say the characteristic of $k$ is $p$. Choose $\alpha \in F$. Then $\alpha^{q} \in E$ for some p-power $q$. Whereupon $\left(\alpha^{q}\right)^{q^{\prime}} \in k$ for some $p$-power $q^{\prime}$. Hence $\alpha^{q q^{\prime}} \in k$.

09HH Lemma 9.13.4. Let $E / k$ be a field extension. Then the elements of $E$ purelyinseparable over $k$ form a subextension of $E / k$.

Proof. Let $p$ be the characteristic of $k$. Let $\alpha, \beta \in E$ be purely inseparable over $k$. Say $\alpha^{q} \in k$ and $\beta^{q^{\prime}} \in k$ for some $p$-powers $q, q^{\prime}$. If $q^{\prime \prime}$ is a $p$-power, then $(\alpha+\beta)^{q^{\prime \prime}}=\alpha^{q^{\prime \prime}}+\beta^{q^{\prime \prime}}$. Hence if $q^{\prime \prime} \geq q, q^{\prime}$, then we conclude that $\alpha+\beta$ is purely inseparable over $k$. Similarly for the difference, product and quotient of $\alpha$ and $\beta$.

09HI Lemma 9.13.5. Let $E / F$ be a finite purely inseparable field extension of characteristic $p>0$. Then there exists a sequence of elements $\alpha_{1}, \ldots, \alpha_{n} \in E$ such that we obtain a tower of fields

$$
E=F\left(\alpha_{1}, \ldots, \alpha_{n}\right) \supset F\left(\alpha_{1}, \ldots, \alpha_{n-1}\right) \supset \ldots \supset F\left(\alpha_{1}\right) \supset F
$$

such that each intermediate extension is of degree $p$ and comes from adjoining a pth root. Namely, $\alpha_{i}^{p} \in F\left(\alpha_{1}, \ldots, \alpha_{i-1}\right)$ is an element which does not have a pth root in $F\left(\alpha_{1}, \ldots, \alpha_{i-1}\right)$ for $i=1, \ldots, n$.

Proof. By induction on the degree of $E / F$. If the degree of the extension is 1 then the result is clear (with $n=0$ ). If not, then choose $\alpha \in E, \alpha \notin F$. Say $\alpha^{p^{r}} \in F$ for some $r>0$. Pick $r$ minimal and replace $\alpha$ by $\alpha^{p^{r-1}}$. Then $\alpha \notin F$, but $\alpha^{p} \in F$. Then $t=\alpha^{p}$ is not a $p$ th power in $F$ (because that would imply $\alpha \in F$, see Lemma 9.12 .5 or its proof). Thus $F \subset F(\alpha)$ is a subextension of degree $p$ (Lemma 9.13.2). By induction we find $\alpha_{1}, \ldots, \alpha_{n} \in E$ generating $E / F(\alpha)$ satisfying the conclusions of the lemma. The sequence $\alpha, \alpha_{1}, \ldots, \alpha_{n}$ does the job for the extension $E / F$.

030K Lemma 9.13.6. Let $E / F$ be an algebraic field extension. There exists a unique subextension $F \subset E_{\text {sep }} \subset E$ such that $E_{\text {sep }} / F$ is separable and $E / E_{\text {sep }}$ is purely inseparable.

Proof. If the characteristic is zero we set $E_{s e p}=E$. Assume the characteristic if $p>0$. Let $E_{\text {sep }}$ be the set of elements of $E$ which are separable over $F$. This is a subextension by Lemma 9.12 .13 and of course $E_{\text {sep }}$ is separable over $F$. Given an $\alpha$ in $E$ there exists a $p$-power $q$ such that $\alpha^{q}$ is separable over $F$. Namely, $q$ is that power of $p$ such that the minimal polynomial of $\alpha$ is of the form $P\left(x^{q}\right)$ with $P$ separable algebraic, see Lemma 9.12.1. Hence $E / E_{\text {sep }}$ is purely inseparable. Uniqueness is clear.

030L Definition 9.13.7. Let $E / F$ be an algebraic field extension. Let $E_{\text {sep }}$ be the subextension found in Lemma 9.13.6.
(1) The integer $\left[E_{\text {sep }}: F\right]$ is called the separable degree of the extension. Notation $[E: F]_{s}$.
(2) The integer $\left[E: E_{\text {sep }}\right]$ is called the inseparable degree, or the degree of inseparability of the extension. Notation $[E: F]_{i}$.

Of course in characteristic 0 we have $[E: F]=[E: F]_{s}$ and $[E: F]_{i}=1$. By multipliciativity (Lemma 9.7.6) we have

$$
[E: F]=[E: F]_{s}[E: F]_{i}
$$

even in case some of these degrees are infinite. In fact, the separable degree and the inseparable degree are multiplicative too (see Lemma 9.13.9).

09HJ Lemma 9.13.8. Let $K / F$ be a finite extension. Let $\bar{F}$ be an algebraic closure of $F$. Then $[K: F]_{s}=\left|\operatorname{Mor}_{F}(K, \bar{F})\right|$.

Proof. We first prove this when $K / F$ is purely inseparable. Namely, we claim that in this case there is a unique map $K \rightarrow \bar{F}$. This can be seen by choosing a sequence of elements $\alpha_{1}, \ldots, \alpha_{n} \in K$ as in Lemma 9.13.5. The irreducible polynmial of $\alpha_{i}$ over $F\left(\alpha_{1}, \ldots, \alpha_{i-1}\right)$ is $x^{p}-\alpha_{i}^{p}$. Applying Lemma 9.12 .9 we see that $\left|\operatorname{Mor}_{F}(K, \bar{F})\right|=1$. On the other hand, $[K: F]_{s}=1$ in this case hence the equality holds.

Let's return to a general finite extension $K / F$. In this case choose $F \subset K_{s} \subset K$ as in Lemma 9.13.6. By Lemma 9.12.11 we have $\left|\operatorname{Mor}_{F}\left(K_{s}, \bar{F}\right)\right|=\left[K_{s}: F\right]=$ $[K: F]_{s}$. On the other hand, every field map $\sigma^{\prime}: K_{s} \rightarrow \bar{F}$ extends to a unique field map $\sigma: K \rightarrow \bar{F}$ by the result of the previous paragraph. In other words $\left|\operatorname{Mor}_{F}(K, \bar{F})\right|=\left|\operatorname{Mor}_{F}\left(K_{s}, \bar{F}\right)\right|$ and the proof is done.

09HK Lemma 9.13.9 (Multiplicativity). Suppose given a tower of algebraic field extensions $K / E / F$. Then

$$
[K: F]_{s}=[K: E]_{s}[E: F]_{s} \quad \text { and } \quad[K: F]_{i}=[K: E]_{i}[E: F]_{i}
$$

Proof. We first prove this in case $K$ is finite over $F$. Since we have multiplicativity for the usual degree (by Lemma 9.7.6) it suffices to prove one of the two formulas. By Lemma 9.13 .8 we have $[K: F]_{s}=\left|\operatorname{Mor}_{F}(K, \bar{F})\right|$. By the same lemma, given any $\sigma \in \operatorname{Mor}_{F}(E, \bar{F})$ the number of extensions of $\sigma$ to a map $\tau: K \rightarrow \bar{F}$ is $[K: E]_{s}$. Namely, via $E \cong \sigma(E) \subset \bar{F}$ we can view $\bar{F}$ as an algebraic closure of $E$. Combined with the fact that there are $[E: F]_{s}=\left|\operatorname{Mor}_{F}(E, \bar{F})\right|$ choices for $\sigma$ we obtain the result.

If the extensions are infinite one can write $K$ as the union of all finite subextension $F \subset K^{\prime} \subset K$. For each $K^{\prime}$ we set $E^{\prime}=E \cap K^{\prime}$. Then we have the formulas of the lemma for $K^{\prime} / E^{\prime} / F$ by the first paragraph. Since $[K: F]_{s}=\sup \left\{\left[K^{\prime}: F\right]_{s}\right\}$ and similarly for the other degrees (some details omitted) we obtain the result in general.

### 9.14. Normal extensions

09HL Let $P \in F[x]$ be a nonconstant polynomial over a field $F$. We say $P$ splits completely into linear factors over $F$ or splits completely over $F$ if there exist $c \in F^{*}, n \geq 1$, $\alpha_{1}, \ldots, \alpha_{n} \in F$ such that

$$
P=c\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{n}\right)
$$

in $F[x]$. Normal extensions are defined as follows.
09HM Definition 9.14.1. Let $E / F$ be an algebraic field extension. We say $E$ is normal over $F$ if for all $\alpha \in E$ the minimal polynomial $P$ of $\alpha$ over $F$ splits completely into linear factors over $E$.

As in the case of separable extensions, it takes a bit of work to establish the basic properties of this notion.

09HN Lemma 9.14.2. Let $K / E / F$ be a tower of algebraic field extensions. If $K$ is normal over $F$, then $K$ is normal over $E$.

Proof. Let $\alpha \in K$. Let $P$ be the minimal polynomial of $\alpha$ over $F$. Let $Q$ be the minimal polynomial of $\alpha$ over $E$. Then $Q$ divides $P$ in the polynomial ring $E[x]$, say $P=Q R$. Hence, if $P$ splits completely over $K$, then so does $Q$.

09HP Lemma 9.14.3. Let $F$ be a field. Let $M / F$ be an algebraic extension. Let $F \subset$ $E_{i} \subset M, i \in I$ be subextensions with $E_{i} / F$ normal. Then $\bigcap E_{i}$ is normal over $F$.

Proof. Direct from the definitions.
09HQ Lemma 9.14.4. Let $E / F$ be an algebraic extension of fields. Let $\bar{F}$ be an algebraic closure of $F$. The following are equivalent
(1) $E$ is normal over $F$, and
(2) for every pair $\sigma, \sigma^{\prime} \in \operatorname{Mor}_{F}(E, \bar{F})$ we have $\sigma(E)=\sigma^{\prime}(E)$.

Proof. Let $\mathcal{P}$ be the set of all minimal polynomials over $F$ of all elements of $E$. Set

$$
T=\{\beta \in \bar{F} \mid P(\beta)=0 \text { for some } P \in \mathcal{P}\}
$$

It is clear that if $E$ is normal over $F$, then $\sigma(E)=T$ for all $\sigma \in \operatorname{Mor}_{F}(E, \bar{F})$. Thus we see that (1) implies (2).
Conversely, assume (2). Pick $\beta \in T$. We can find a corresponding $\alpha \in E$ whose minimal polynomial $P \in \mathcal{P}$ annihilates $\beta$. Because $F(\alpha)=F[x] /(P)$ we can find an element $\sigma_{0} \in \operatorname{Mor}_{F}(F(\alpha), \bar{F})$ mapping $\alpha$ to $\beta$. By Lemma 9.10.5 we can extend $\sigma_{0}$ to a $\sigma \in \operatorname{Mor}_{F}(E, \bar{F})$. Whence we see that $\beta$ is in the common image of all embeddings $\sigma: E \rightarrow \bar{F}$. It follows that $\sigma(E)=T$ for any $\sigma$. Fix a $\sigma$. Now let $P \in \mathcal{P}$. Then we can write

$$
P=\left(x-\beta_{1}\right) \ldots\left(x-\beta_{n}\right)
$$

for some $n$ and $\beta_{i} \in \bar{F}$ by Lemma 9.10.2. Observe that $\beta_{i} \in T$. Thus $\beta_{i}=\sigma\left(\alpha_{i}\right)$ for some $\alpha_{i} \in E$. Thus $P=\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{n}\right)$ splits completely over $E$. This finishes the proof.

0BR3 Lemma 9.14.5. Let $E / F$ be an algebraic extension of fields. If $E$ is generated by $\alpha_{i} \in E, i \in I$ over $F$ and if for each $i$ the minimal polynomial of $\alpha_{i}$ over $F$ splits completely in $E$, then $E / F$ is normal.

Proof. Let $P_{i}$ be the minimal polynomial of $\alpha_{i}$ over $F$. Let $\alpha_{i}=\alpha_{i, 1}, \alpha_{i, 2}, \ldots, \alpha_{i, d_{i}}$ be the roots of $P_{i}$ over $E$. Given two embeddings $\sigma, \sigma^{\prime}: E \rightarrow \bar{F}$ over $F$ we see that

$$
\left\{\sigma\left(\alpha_{i, 1}\right), \ldots, \sigma\left(\alpha_{i, d_{i}}\right)\right\}=\left\{\sigma^{\prime}\left(\alpha_{i, 1}\right), \ldots, \sigma^{\prime}\left(\alpha_{i, d_{i}}\right)\right\}
$$

because both sides are equal to the set of roots of $P_{i}$ in $\bar{F}$. The elements $\alpha_{i, j}$ generate $E$ over $F$ and we find that $\sigma(E)=\sigma^{\prime}(E)$. Hence $E / F$ is normal by Lemma 9.14.4

0BME Lemma 9.14.6. Let $L / M / K$ be a tower of algebraic extensions.
(1) If $M / K$ is normal, then any automorphism $\tau$ of $L / K$ induces an automorphism $\left.\tau\right|_{M}: M \rightarrow M$.
(2) If $L / K$ is normal, then $K$-algebra map $\sigma: M \rightarrow L$ extends to an automorphism of $L$.

Proof. Choose an algebraic closure $\bar{L}$ of $L$ (Theorem 9.10.4).
Let $\tau$ be as in (1). Then $\tau(M)=M$ as subfields of $\bar{L}$ by Lemma 9.14.4 and hence $\left.\tau\right|_{M}: M \rightarrow M$ is an automorphism.

Let $\sigma: M \rightarrow L$ be as in (2). By Lemma 9.10.5 we can extend $\sigma$ to a map $\tau: L \rightarrow \bar{L}$, i.e., such that

is commutative. By Lemma 9.14 .4 we see that $\tau(L)=L$. Hence $\tau: L \rightarrow L$ is an automorphism which extends $\sigma$.

09HR Definition 9.14.7. Let $E / F$ be an extension of fields. Then $\operatorname{Aut}(E / F)$ or $\operatorname{Aut}_{F}(E)$ denotes the automorphism group of $E$ as an object of the category of $F$-extensions. Elements of $\operatorname{Aut}(E / F)$ are called automorphisms of $E$ over $F$ or automorphisms of $E / F$.
Here is a characterization of normal extensions in terms of automorphisms.
09HS Lemma 9.14.8. Let $E / F$ be a finite extension. We have

$$
|A u t(E / F)| \leq[E: F]_{s}
$$

with equality if and only if $E$ is normal over $F$.
Proof. Choose an algebraic closure $\bar{F}$ of $F$. Recall that $[E: F]=\left|\operatorname{Mor}_{F}(E, \bar{F})\right|$. Pick an element $\sigma_{0} \in \operatorname{Mor}_{F}(E, \bar{F})$. Then the map

$$
\operatorname{Aut}(E / F) \longrightarrow \operatorname{Mor}_{F}(E, \bar{F}), \quad \tau \longmapsto \sigma_{0} \circ \tau
$$

is injective. Thus the inequality. If equality holds, then every $\sigma \in \operatorname{Mor}_{F}(E, \bar{F})$ is gotten by precomposing $\sigma_{0}$ by an automorphism. Hence $\sigma(E)=\sigma_{0}(E)$. Thus $E$ is normal over $F$ by Lemma 9.14.4.
Conversely, assume that $E / F$ is normal. Then by Lemma 9.14.4 we have $\sigma(E)=$ $\sigma_{0}(E)$ for all $\sigma \in \operatorname{Mor}_{F}(E, \bar{F})$. Thus we get an automorphism of $E$ over $F$ by setting $\tau=\sigma_{0}^{-1} \circ \sigma$. Whence the map displayed above is surjective.

0BR4 Lemma 9.14.9. Let $L / K$ be an algebraic normal extension of fields. Let $E / K$ be an extension of fields. Then either there is no $K$-embedding from $L$ to $E$ or there is one $\tau: L \rightarrow E$ and every other one is of the form $\tau \circ \sigma$ where $\sigma \in \operatorname{Aut}(L / K)$.

Proof. Given $\tau$ replace $L$ by $\tau(L) \subset E$ and apply Lemma 9.14.6.

### 9.15. Splitting fields

09HT The following lemma is a useful tool for constructing normal field extensions.
09HU Lemma 9.15.1. Let $F$ be a field. Let $P \in F[x]$ be a nonconstant polynomial. There exists a smallest field extension $E / F$ such that $P$ splits completely over $E$. Moreover, the field extension $E / F$ is normal and unique up to (nonunique) isomorphism.
Proof. Choose an algebraic closure $\bar{F}$. Then we can write $P=c\left(x-\beta_{1}\right) \ldots\left(x-\beta_{n}\right)$ in $\bar{F}[x]$, see Lemma 9.10.2. Note that $c \in F^{*}$. Set $E=F\left(\beta_{1}, \ldots, \beta_{n}\right)$. Then it is clear that $E$ is minimal with the requirement that $P$ splits completely over $E$.

Next, let $E^{\prime}$ be another minimal field extension of $F$ such that $P$ splits completely over $E^{\prime}$. Write $P=c\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{n}\right)$ with $c \in F$ and $\alpha_{i} \in E^{\prime}$. Again it follows from minimality that $E^{\prime}=F\left(\alpha_{1}, \ldots, \alpha_{n}\right)$. Moreover, if we pick any $\sigma: E^{\prime} \rightarrow \bar{F}$ (Lemma 9.10.5 then we immediately see that $\sigma\left(\alpha_{i}\right)=\beta_{\tau(i)}$ for some permutation $\tau:\{1, \ldots, n\} \rightarrow\{1, \ldots, n\}$. Thus $\sigma\left(E^{\prime}\right)=E$. This implies that $E^{\prime}$ is a normal extension of $F$ by Lemma 9.14 .4 and that $E \cong E^{\prime}$ as extensions of $F$ thereby finishing the proof.

09HV Definition 9.15.2. Let $F$ be a field. Let $P \in F[x]$ be a nonconstant polynomial. The field extension $E / F$ constructed in Lemma 9.15 .1 is called the splitting field of $P$ over $F$.

09DT Lemma 9.15.3. Let $E / F$ be a finite extension of fields. There exists a unique smallest finite extension $K / E$ such that $K$ is normal over $F$.

Proof. Choose generators $\alpha_{1}, \ldots, \alpha_{n}$ of $E$ over $F$. Let $P_{1}, \ldots, P_{n}$ be the minimal polynomials of $\alpha_{1}, \ldots, \alpha_{n}$ over $F$. Set $P=P_{1} \ldots P_{n}$. Observe that $\left(x-\alpha_{1}\right) \ldots(x-$ $\alpha_{n}$ ) divides $P$, since each $\left(x-\alpha_{i}\right)$ divides $P_{i}$. Say $P=\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{n}\right) Q$. Let $K / E$ be the splitting field of $P$ over $E$. We claim that $K$ is the splitting field of $P$ over $F$ as well (which implies that $K$ is normal over $F$ ). This is clear because $K / E$ is generated by the roots of $Q$ over $E$ and $E$ is generated by the roots of $\left(x-\alpha_{1}\right) \ldots\left(x-\alpha_{n}\right)$ over $F$, hence $K$ is generated by the roots of $P$ over $F$.

Uniqueness. Suppose that $K^{\prime} / E$ is a second smallest extension such that $K^{\prime} / F$ is normal. Choose an algebraic closure $\bar{F}$ and an embedding $\sigma_{0}: E \rightarrow \bar{F}$. By Lemma 9.10 .5 we can extend $\sigma_{0}$ to $\sigma: K \rightarrow \bar{F}$ and $\sigma^{\prime}: K^{\prime} \rightarrow \bar{F}$. By Lemma 9.14 .3 we see that $\sigma(K) \cap \sigma^{\prime}\left(K^{\prime}\right)$ is normal over $F$. By minimality we conclude that $\sigma(K)=\sigma\left(K^{\prime}\right)$. Thus $\sigma \circ\left(\sigma^{\prime}\right)^{-1}: K^{\prime} \rightarrow K$ gives an isomorphism of extensions of $E$.

0BMF Definition 9.15.4. Let $E / F$ be a finite extension of fields. The field extension $K / E$ constructed in Lemma 9.15 .3 is called the normal closure $E$ over $F$.

One can construct the normal closure inside any given normal extension.
0BMG Lemma 9.15.5. Let $L / K$ be an algebraic normal extension.
(1) If $L / M / K$ is a subextension with $M / K$ finite, then there exists a tower $L / M^{\prime} / M / K$ with $M^{\prime} / K$ finite and normal.
(2) If $L / M^{\prime} / M / K$ is a tower with $M / K$ normal and $M^{\prime} / M$ finite, then there exists a tower $L / M^{\prime \prime} / M^{\prime} / M / K$ with $M^{\prime \prime} / M$ finite and $M^{\prime \prime} / K$ normal.

Proof. Proof of (1). Let $M^{\prime}$ be the smallest subextension of $L / K$ containing $M$ which is normal over $K$. By Lemma 9.15 .3 this is the normal closure of $M / K$ and is finite over $K$.

Proof of (2). Let $\alpha_{1}, \ldots, \alpha_{n} \in M^{\prime}$ generate $M^{\prime}$ over $M$. Let $P_{1}, \ldots, P_{n}$ be the minimal polynomials of $\alpha_{1}, \ldots, \alpha_{n}$ over $K$. Let $\alpha_{i, j}$ be the roots of $P_{i}$ in $L$. Let $M^{\prime \prime}=M\left(\alpha_{i, j}\right)$. It follows from Lemma 9.14 .5 (applied with the set of generators $\left.M \cup\left\{\alpha_{i, j}\right\}\right)$ that $M^{\prime \prime}$ is normal over $K$.

### 9.16. Roots of unity

09HW Let $F$ be a field. For an integer $n \geq 1$ we set

$$
\mu_{n}(F)=\left\{\zeta \in F \mid \zeta^{n}=1\right\}
$$

This is called the group of nth roots of unity or nth roots of 1 . It is an abelian group under multiplication with neutral element given by 1. Observe that in a field the number of roots of a polynomial of degree $d$ is always at most $d$. Hence we see that $\left|\mu_{n}(F)\right| \leq n$ as it is defined by a polynomial equation of degree $n$. Of course every element of $\mu_{n}(F)$ has order dividing $n$. Moreover, the subgroups

$$
\mu_{d}(F) \subset \mu_{n}(F), \quad d \mid n
$$

each have at most $d$ elements. This implies that $\mu_{n}(F)$ is cyclic.

09HX Lemma 9.16.1. Let $A$ be an abelian group of exponent dividing $n$ such that $\{x \in$ $A \mid d x=0\}$ has cardinality at most $d$ for all $d \mid n$. Then $A$ is cyclic of order dividing $n$.

Proof. The conditions imply that $|A| \leq n$, in particular $A$ is finite. The structure of finite abelian groups shows that $A=\mathbf{Z} / e_{1} \mathbf{Z} \oplus \ldots \oplus \mathbf{Z} / e_{r} \mathbf{Z}$ for some integers $1<e_{1}\left|e_{2}\right| \ldots \mid e_{r}$. This would imply that $\left\{x \in A \mid e_{1} x=0\right\}$ has cardinality $e_{1}^{r}$. Hence $r=1$.

Applying this to the field $\mathbf{F}_{p}$ we obtain the celebrated result that the group ( $\left.\mathbf{Z} / p \mathbf{Z}\right)^{*}$ is a cyclic group. More about this in the section on finite fields.

One more observation is often useful: If $F$ has characteristic $p>0$, then $\mu_{p^{n}}(F)=$ $\{1\}$. This is true because raising to the $p$ th power is an injective map on fields of characteristic $p$ as we have seen in the proof of Lemma 9.12.5. (Of course, it also follows from the statement of that lemma itself.)

### 9.17. Finite fields

09 HY Let $F$ be a finite field. It is clear that $F$ has positive characteristic as we cannot have an injection $\mathbf{Q} \rightarrow F$. Say the characteristic of $F$ is $p$. The extension $\mathbf{F}_{p} \subset F$ is finite. Hence we see that $F$ has $q=p^{f}$ elements for some $f \geq 1$.

Let us think about the group of units $F^{*}$. This is a finite abelian group, so it has some exponent $e$. Then $F^{*}=\mu_{e}(F)$ and we see from the discussion in Section 9.16 that $F^{*}$ is a cyclic group of order $q-1$. (A posteriori it follows that $e=q-1$ as well.) In particular, if $\alpha \in F^{*}$ is a generator then it clearly is true that

$$
F=\mathbf{F}_{p}(\alpha)
$$

In other words, the extension $F / \mathbf{F}_{p}$ is generated by a single element. Of course, the same thing is true for any extension of finite fields $E / F$ (because $E$ is already generated by a single element over the prime field).

### 9.18. Primitive elements

09 HZ Let $E / F$ be a finite extension of fields. An element $\alpha \in E$ is called a primitive element of $E$ over $F$ if $E=F(\alpha)$.

030N Lemma 9.18.1 (Primitive element). Let $E / F$ be a finite extension of fields. The following are equivalent
(1) there exists a primitive element for $E$ over $F$, and
(2) there are finitely many subextensions $E / K / F$.

Moreover, (1) and (2) hold if $E / F$ is separable.
Proof. Let $\alpha \in E$ be a primitive element. Let $P$ be the minimal polynomial of $\alpha$ over $F$. Let $E \subset M$ be a splitting field for $P$ over $E$, so that $P(x)=$ $(x-\alpha)\left(x-\alpha_{2}\right) \ldots\left(x-\alpha_{n}\right)$ over $M$. For ease of notation we set $\alpha_{1}=\alpha$. Next, let $E / K / F$ be a subextension. Let $Q$ be the minimal polynomial of $\alpha$ over $K$. Observe that $\operatorname{deg}(Q)=[E: K]$. Writing $Q=x^{d}+\sum_{i<d} a_{i} x^{i}$ we claim that $K$ is equal to $L=F\left(a_{0}, \ldots, a_{d-1}\right)$. Indeed $\alpha$ has degree $d$ over $L$ and $L \subset K$. Hence $[E: L]=[E: K]$ and it follows that $[K: L]=1$, i.e., $K=L$. Thus it suffices to show there are at most finitely many possibilities for the polynomial $Q$. This is clear because we have a factorization $P=Q R$ in $K[x]$ in particular in $E[x]$. Since
we have unique factorization in $E[x]$ there are at most finitely many monic factors of $P$ in $E[x]$.
If $F$ is a finite field (equivalently $E$ is a finite field), then $E / F$ has a primitive element by the discussion in Section 9.17. Next, assume $F$ is infinite and there are at most finitely many proper subfields $E / K / F$. List them, say $K_{1}, \ldots, K_{N}$. Then each $K_{i} \subset E$ is a proper sub $F$-vector space. As $F$ is infinite we can find a vector $\alpha \in E$ with $\alpha \notin K_{i}$ for all $i$ (a finite union of proper subvector spaces is never a subvector space; details omitted). Then $\alpha$ is a primitive element for $E$ over $F$.
Having established the equivalence of (1) and (2) we now turn to the final statement of the lemma. Choose an algebraic closure $\bar{F}$ of $F$. Enumerate the elements $\sigma_{1}, \ldots, \sigma_{n} \in \operatorname{Mor}_{F}(E, \bar{F})$. Since $E / F$ is separable we have $n=[E: F]$ by Lemma 9.12.11. Note that if $i \neq j$, then

$$
V_{i j}=\operatorname{Ker}\left(\sigma_{i}-\sigma_{j}: E \longrightarrow \bar{F}\right)
$$

is not equal to $E$. Hence arguing as in the preceding paragraph we can find $\alpha \in E$ with $\alpha \notin V_{i j}$ for all $i \neq j$. It follows that $\left|\operatorname{Mor}_{F}(F(\alpha), \bar{F})\right| \geq n$. On the other hand $[F(\alpha): F] \leq[E: F]$. Hence equality by Lemma 9.12 .11 and we conclude that $E=F(\alpha)$.

### 9.19. Trace and norm

0BIE Let $L / K$ be a finite extension of fields. By Lemma 9.4.1 we can choose an isomorphism $L \cong K^{\oplus n}$ of $K$-modules. Of course $n=[L: K]$ is the degree of the field extension. Using this isomorphism we get for a $K$-algebra map
$L \longrightarrow \operatorname{Mat}(n \times n, K), \quad \alpha \longmapsto$ matrix of multiplication by $\alpha$
Thus given $\alpha \in L$ we can take the trace and the determinant of the corresponding matrix. Of course these quantities are independent of the choice of the basis chosen above. More canonically, simply thinking of $L$ as a finite dimensional $K$-vector space we have $\operatorname{Trace}_{K}(\alpha: L \rightarrow L)$ and the determinant $\operatorname{Det}_{K}(\alpha: L \rightarrow L)$.
0BIF Definition 9.19.1. Let $L / K$ be a finite extension of fields. For $\alpha \in L$ we define the trace $\operatorname{Trace}_{L / K}(\alpha)=\operatorname{Trace}_{K}(\alpha: L \rightarrow L)$ and the norm $\operatorname{Norm}_{L / K}(\alpha)=\operatorname{Det}_{K}(\alpha$ : $L \rightarrow L)$.

It is clear from the definition that $\operatorname{Trace}_{L / K}$ is $K$-linear and satisfies $\operatorname{Trace}_{L / K}(\alpha)=$ $[L: K] \alpha$ for $\alpha \in L$. Similarly $\operatorname{Norm}_{L / K}$ is multiplicative and $\operatorname{Norm}_{L / K}(\alpha)=\alpha^{[L: K]}$ for $\alpha \in K$. This is a special case of the more general construction discussed in Exercises, Exercises 89.15.6 and 89.15.7.

0BIG Lemma 9.19.2. Let $L / K$ be a finite extension of fields. Let $\alpha \in L$ and let $P$ be the minimal polynomial of $\alpha$ over $K$. Then the characteristic polynomial of the $K$-linear map $\alpha: L \rightarrow L$ is equal to $P^{e}$ with $e \operatorname{deg}(P)=[L: K]$.

Proof. Choose a basis $\beta_{1}, \ldots, \beta_{e}$ of $L$ over $K(\alpha)$. Then $e$ satisfies $e \operatorname{deg}(P)=$ $[L: K]$ by Lemmas 9.9 .2 and 9.7 .6 . Then we see that $L=\bigoplus K(\alpha) \beta_{i}$ is a direct sum decomposition into $\alpha$-invariant subspaces hence the characteristic polynomial of $\alpha: L \rightarrow L$ is equal to the characteristic polynommial of $\alpha: K(\alpha) \rightarrow K(\alpha)$ to the power $e$.
To finish the proof we may assume that $L=K(\alpha)$. In this case by Cayley-Hamilton we see that $\alpha$ is a root of the characteristic polynomial. And since the characteristic
polynomial has the same degree as the minimal polynomial, we find that equality holds.

0BIH Lemma 9.19.3. Let $L / K$ be a finite extension of fields. Let $\alpha \in L$ and let $P=x^{d}+a_{1} x^{d-1}+\ldots+a_{d}$ be the minimal polynomial of $\alpha$ over $K$. Then

$$
\operatorname{Norm}_{L / K}(\alpha)=(-1)^{[L: K]} a_{d}^{e} \quad \text { and } \quad \operatorname{Trace}_{L / K}(\alpha)=-e a_{1}
$$

where ed $=[L: K]$.
Proof. Follows immediately from Lemma 9.19 .2 and the definitions.
0BII Lemma 9.19.4. Let $L / K$ be a finite extension of fields. Let $V$ be a finite dimensional vector space over $L$. Let $\varphi: V \rightarrow V$ be an L-linear map. Then

$$
\operatorname{Trace}_{K}(\varphi: V \rightarrow V)=\operatorname{Trace}_{K / L}\left(\operatorname{Trace}_{L}(\varphi: V \rightarrow V)\right)
$$

and

$$
\operatorname{Det}_{K}(\varphi: V \rightarrow V)=\operatorname{Norm}_{K / L}\left(\operatorname{Det}_{L}(\varphi: V \rightarrow V)\right)
$$

Proof. Choose an isomorphism $V=L^{\oplus n}$ so that $\varphi$ corresponds to an $n \times n$ matrix. In the case of traces, both sides of the formula are additive in $\varphi$. Hence we can assume that $\varphi$ corresponds to the matrix with exactly one nonzero entry in the $(i, j)$ spot. In this case a direct computation shows both sides are equal.

In the case of norms both sides are zero if $\varphi$ has a nonzero kernel. Hence we may assume $\varphi$ corresponds to an element of $\mathrm{GL}_{n}(L)$. Both sides of the formula are multiplicative in $\varphi$. Since every element of $\mathrm{GL}_{n}(L)$ is a product of elementary matrices we may assume that $\varphi$ either looks like

$$
E_{12}(\lambda)=\left(\begin{array}{ccc}
1 & \lambda & \ldots \\
0 & 1 & \ldots \\
\ldots & \ldots & \ldots
\end{array}\right) \quad \text { or } \quad E_{1}(a)=\left(\begin{array}{ccc}
a & 0 & \ldots \\
0 & 1 & \ldots \\
\ldots & \ldots & \ldots
\end{array}\right)
$$

(because we may also permute the basis elements if we like). In both cases the fomula is easy to verify by direct computation.

0BIJ Lemma 9.19.5. Let $M / L / K$ be a tower of finite extensions of fields. Then

$$
\operatorname{Trace}_{M / K}=\operatorname{Trace}_{L / K} \circ \operatorname{Trace}_{M / L} \quad \text { and } \quad \operatorname{Norm}_{M / K}=\operatorname{Norm}_{L / K} \circ \operatorname{Norm}_{M / L}
$$

Proof. Think of $M$ as a vector space over $L$ and apply Lemma 9.19.4.
The trace pairing is defined using the trace.
0BIK Definition 9.19.6. Let $L / K$ be a finite extension of fields. The trace pairing for $L / K$ is the symmetric $K$-bilinear form

$$
Q_{L / K}: L \times L \longrightarrow K, \quad(\alpha, \beta) \longmapsto \operatorname{Trace}_{L / K}(\alpha \beta)
$$

It turns out that a finite extension of fields is separable if and only if the trace pairing is nondegenerate.
0BIL Lemma 9.19.7. Let $L / K$ be a finite extension of fields. The following are equivalent:
(1) $L / K$ is separable, and
(2) the trace pairing $Q_{L / K}$ is nondegenerate.

Proof. Observe that the trace pairing is nondegenerate if and only if $\operatorname{Trace}_{L / K}$ is identically zero.
Suppose that $K$ has characteristic $p$ and $L=K(\alpha)$ with $\alpha \notin K$ and $\alpha^{p} \in K$. Then $\operatorname{Trace}_{L / K}(1)=p=0$. For $i=1, \ldots, p-1$ we see that $x^{p}-\alpha^{p i}$ is the minimal polynomial for $\alpha^{i}$ over $K$ and we find $\operatorname{Trace}_{L / K}\left(\alpha^{i}\right)=0$ by Lemma 9.19.3. Hence for this kind of purely inseparable degree $p$ extension we see that Trace ${ }_{L / K}$ is identically zero.
Assume that $L / K$ is not separable. Then there exists a subfield $L / K^{\prime} / K$ such that $L / K^{\prime}$ is a purely inseparable degree $p$ extension as in the previous paragraph, see Lemmas 9.13 .6 and 9.13 .5 Hence by Lemma 9.19 .5 we see that $\operatorname{Trace}_{L / K}$ is identically zero.
Assume on the other hand that $\operatorname{Trace}_{L / K}$ is not identically zero. Let $L / K^{\prime} / K$ be a maximal subfield separable over $K$. Then by Lemma 9.19 .5 we see that $\operatorname{Trace}_{L / K^{\prime}}$ is not identically zero. Then we pick $\alpha \in L$ such that $\operatorname{Trace}_{L / K^{\prime}}(\alpha) \neq 0$. Then by Lemma 9.19 .3 we see that $\alpha$ is separable over $K^{\prime}$. If $\alpha \notin K$ then $K^{\prime}$ is not maximal. If $\alpha \in K^{\prime}$ then Lemma 9.19 .3 shows that the characteristic of $K$ does not divide [ $L: K^{\prime}$ ] which implies that $L / K^{\prime}$ is separable (as the inseparable degree of $L / K^{\prime}$ is forced to be 1, see Definition 9.13.7) and hence trivial.

Let $K$ be a field and let $Q: V \times V \rightarrow K$ be a bilinear form on a finite dimensional vector space over $K$. Say $\operatorname{dim}_{K}(V)=n$. Then $Q$ defines a linear map $Q: V \rightarrow V^{*}$, $v \mapsto Q(v,-)$ where $V^{*}=\operatorname{Hom}_{K}(V, K)$ is the dual vector space. Hence a linear map

$$
\operatorname{Det}(Q): \wedge^{n}(V) \longrightarrow \wedge^{n}(V)^{*}
$$

If we pick a basis element $\omega \in \wedge^{n}(V)$, then we can write $\operatorname{Det}(Q)(\omega)=\lambda \omega^{\wedge}$, where $\omega^{\wedge}$ is the dual basis element in $\wedge^{n}(V)^{*}$. If we change our choice of $\omega$ into $c \omega$ for some $c \in K^{*}$, then $\omega^{\wedge}$ changes into $c^{-1} \omega^{\wedge}$ and therefore $\lambda$ changes into $c^{2} \lambda$. Thus the class of $\lambda$ in $K /\left(K^{*}\right)^{2}$ is well defined and is called the discriminant of $Q$. Unwinding the definitions we see that

$$
\lambda=\operatorname{det}\left(Q\left(v_{i}, v_{j}\right)_{1 \leq i, j \leq n}\right)
$$

if $\left\{v_{1}, \ldots, v_{n}\right\}$ is a basis for $V$ over $K$. Observe that the discriminant is nonzero if and only if $Q$ is nondegenerate.

0BIM Definition 9.19.8. Let $L / K$ be a finite extension of fields. The discriminant of $L / K$ is the discriminant of the trace pairing $Q_{L / K}$.
By the discussion above and Lemma 9.19.7 we see that the discriminant is nonzero if and only if $L / K$ is separable. For $a \in K$ we often say "the discriminant is $a$ " when it would be more correct to say the discriminant is the class of $a$ in $K /\left(K^{*}\right)^{2}$.
0BIN Exercise 9.19.9. Let $L / K$ be an extension of degree 2. Show that exactly one of the following happens
(1) the discriminant is 0 , the characteristic of $K$ is 2 , and $L / K$ is purely inseparable obtained by taking a square root of an element of $K$,
(2) the disriminant is 1 , the characteristic of $K$ is 2 , and $L / K$ is separable of degree 2 ,
(3) the discriminant is not a square, the characteristic of $K$ is not 2 , and $L$ is obtained from $K$ by taking the square root of the discriminant.

### 9.20. Galois theory

09DU Here is the definition.
09I0 Definition 9.20.1. A field extension $E / F$ is called Galois if it is algebraic, separable, and normal.
It turns out that a finite extension is Galois if and only if it has the "correct" number of automorphisms.

0911 Lemma 9.20.2. Let $E / F$ be a finite extension of fields. Then $E$ is Galois over $F$ if and only if $|A u t(E / F)|=[E: F]$.

Proof. Assume $|\operatorname{Aut}(E / F)|=[E: F]$. By Lemma 9.14 .8 this implies that $E / F$ is separable and normal, hence Galois. Conversely, if $E / F$ is separable then $[E$ : $F]=[E: F]_{s}$ and if $E / F$ is in addition normal, then Lemma 9.14 .8 implies that $|\operatorname{Aut}(E / F)|=[E: F]$.
Motivated by the lemma above we introduce the Galois group as follows.
09DV Definition 9.20.3. If $E / F$ is a Galois extension, then the group $\operatorname{Aut}(E / F)$ is called the Galois group and it is denoted $\operatorname{Gal}(E / F)$.

If $L / K$ is an infinite Galois extension, then one should think of the Galois group as a topological group. We will return to this in Section 9.21 ,
09I2 Lemma 9.20.4. Let $K / E / F$ be a tower of algebraic field extensions. If $K$ is Galois over $F$, then $K$ is Galois over $E$.
Proof. Combine Lemmas 9.14 .2 and 9.12 .3
Let $G$ be a group acting on a field $K$ (by field automorphisms). We will often use the notation

$$
K^{G}=\{x \in K \mid \sigma(x)=x \forall \sigma \in G\}
$$

and we will call this the fixed field for the action of $G$ on $K$.
09I3 Lemma 9.20.5. Let $K$ be a field. Let $G$ be a finite group acting faithfully on $K$. Then the extension $K / K^{G}$ is Galois, we have $\left[K: K^{G}\right]=|G|$, and the Galois group of the extension is $G$.

Proof. Given $\alpha \in K$ consider the orbit $G \cdot \alpha \subset K$ of $\alpha$ under the group action. Consider the polynomial

$$
P=\prod_{\beta \in G \cdot \alpha}(x-\beta) \in K[x]
$$

The key to the whole lemma is that this polynomial is invariant under the action of $G$ and hence has coefficients in $K^{G}$. Namely, for $\tau \in G$ we have

$$
P^{\sigma}=\prod_{\beta \in G \cdot \alpha}(x-\tau(\beta))=\prod_{\beta \in G \cdot \alpha}(x-\beta)=P
$$

because the map $\beta \mapsto \tau(\beta)$ is a permutation of the orbit $G \cdot \alpha$. Thus $P \in K^{G}[x]$. Since also $P(\alpha)=0$ as $\alpha$ is an element of its orbit we conclude that the extension $K / K^{G}$ is algebraic. Moreover, the minimal polynomial $Q$ of $\alpha$ over $K^{G}$ divides the polynomial $P$ just constructed. Hence $Q$ is separable (by Lemma 9.12.4 for example) and we conclude that $K / K^{G}$ is separable. Thus $K / K^{G}$ is Galois. To finish the proof it suffices to show that $\left[K: K^{G}\right]=|G|$ since then $G$ will be the Galois group by Lemma 9.20.2.

Pick finitely many elements $\alpha_{i} \in K, i=1, \ldots, n$ such that $\sigma\left(\alpha_{i}\right)=\alpha_{i}$ for $i=$ $1, \ldots, n$ implies $\sigma$ is the neutral element of $G$. Set

$$
L=K^{G}\left(\left\{\sigma\left(\alpha_{i}\right) ; 1 \leq i \leq n, \sigma \in G\right\}\right) \subset K
$$

and observe that the action of $G$ on $K$ induces an action of $G$ on $L$. We will show that $L$ has degree $|G|$ over $K^{G}$. This will finish the proof, since if $L \subset K$ is proper, then we can add an element $\alpha \in K, \alpha \notin L$ to our list of elements $\alpha_{1}, \ldots, \alpha_{n}$ without increasing $L$ which is absurd. This reduces us to the case that $K / K^{G}$ is finite which is treated in the next paragraph.

Assume $K / K^{G}$ is finite. By Lemma 9.18.1 we can find $\alpha \in K$ such that $K=K^{G}(\alpha)$. By the construction in the first paragraph of this proof we see that $\alpha$ has degree at most $|G|$ over $K$. However, the degree cannot be less than $|G|$ as $G$ acts faithfully on $K^{G}(\alpha)=L$ by construction and the inequality of Lemma 9.14.8.

09DW Theorem 9.20.6 (Fundamental theorem of Galois theory). Let $L / K$ be a finite Galois extension with Galois group $G$. Then we have $K=L^{G}$ and the map
$\{$ subgroups of $G\} \longrightarrow\{$ subextensions $K \subset M \subset L\}, \quad H \longmapsto L^{H}$
is a bijection whose inverse maps $M$ to $G a l(L / M)$. The normal subgroups $H$ of $G$ correspond exactly to those subextensions $M$ with $M / K$ Galois.

Proof. By Lemma 9.20 .4 given a subextension $L / M / K$ the extension $L / M$ is Galois. Of course $L / M$ is also finite (Lemma 9.7.3). Thus $|\operatorname{Gal}(L / M)|=[L: M]$ by Lemma 9.20.2. Conversely, if $H \subset G$ is a finite subgroup, then $\left[L: L^{H}\right]=|H|$ by Lemma 9.20.5. It follows formally from these two observations that we obtain a bijective correspondence as in the theorem.

If $H \subset G$ is normal, then $L^{H}$ is fixed by the action of $G$ and we obtain a canonical $\operatorname{map} G / H \rightarrow \operatorname{Aut}\left(L^{H} / K\right)$. This map has to be injective as $\operatorname{Gal}\left(L / L^{H}\right)=H$. Hence $|G / H|=\left[L^{H}: K\right]$ and $L^{H}$ is Galois by Lemma 9.20.2.

Conversely, assume that $K \subset M \subset L$ with $M / K$ Galois. By Lemma 9.14.6 we see that every element $\tau \in \operatorname{Gal}(L / K)$ induces an element $\left.\tau\right|_{M} \in \operatorname{Gal}(M / K)$. This induces a homomorphism of Galois groups $\operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(M / K)$ whose kernel is $H$. Thus $H$ is a normal subgroup.

0BMH Lemma 9.20.7. Let $L / M / K$ be a tower of fields. Assume $L / K$ and $M / K$ are finite Galois. Then we obtain a short exact sequence

$$
1 \rightarrow \operatorname{Gal}(L / M) \rightarrow \operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(M / K) \rightarrow 1
$$

of finite groups.
Proof. Namely, by Lemma 9.14 .6 we see that every element $\tau \in \operatorname{Gal}(L / K)$ induces an element $\left.\tau\right|_{M} \in \operatorname{Gal}(M / K)$ which gives us the homomorphism on the right. The map on the left identifies the left group with the kernel of the right arrow. The sequence is exact because the sizes of the groups work out correctly by multiplicativity of degrees in towers of finite extensions (Lemma 9.7.6). One can also use Lemma 9.14 .6 directly to see that the map on the right is surjective.

### 9.21. Infinite Galois theory

0BMI The Galois group comes with a canonical topology.
0BMJ Lemma 9.21.1. Let $E / F$ be a Galois extension. There is a canonical topology on Gal $(E / F)$ such that
(1) $\operatorname{Gal}(E / F)$ is a profinite topological group,
(2) the action $\operatorname{Gal}(E / F) \times E \rightarrow E$ is continuous when $E$ is given the discrete topology.

Proof. Throughout this proof we think of $E$ as a discrete topological space. Recall that the set of invertible self maps $\operatorname{Aut}(E)$ endowed with the compact open topology forms a topological group, see Topology, Example 5.29.2. Let us use the injection

$$
\operatorname{Gal}(E / F) \subset \operatorname{Aut}(E)
$$

to endow $\operatorname{Gal}(E / F)$ with the induced structure of a topological group (see Topology, Section 5.29). By construction the action $\operatorname{Gal}(E / F) \times E \rightarrow E$ is continuous.

To show that $\operatorname{Gal}(E / F)$ is profinite we argue as follows (our argument is nonstandard; the usual proof goes by writing $E$ as the union of all finite Galois subextensions and proving that $\operatorname{Gal}(E / F)$ is the inverse limit of the corresponding finite Galois groups). By Topology, Lemma 5.29.4 it suffices to show that the underlying topological space of $\operatorname{Gal}(E / F)$ is profinite. For any subset $S \subset E$ consider the set

$$
G(S)=\left\{f:\left.S \rightarrow E\right|^{f(\alpha) \text { is a root of the minimal polynomial }} \begin{array}{c}
\text { of } \alpha \text { over } F \text { for all } \alpha \in S
\end{array}\right\}
$$

Since a polynomial has only a finite number of roots we see that $G(S)$ is finite for all $S \subset E$ finite. If $S \subset S^{\prime}$ then restriction gives a map $G\left(S^{\prime}\right) \rightarrow G(S)$. Also, observe that if $\alpha \in S \cap F$ and $f \in G(S)$, then $f(\alpha)=\alpha$ because the minimal polynomial is linear in this case. Consider the profinite topological space

$$
G=\lim _{S \subset E \text { finite }} G(S)
$$

Consider the canonical map

$$
c: \operatorname{Gal}(E / F) \longrightarrow G, \quad \sigma \longmapsto\left(\left.\sigma\right|_{S}: S \rightarrow E\right)_{S}
$$

This is injective and unwinding the definitions the reader sees the topology on $\operatorname{Gal}(E / F)$ as defined above is the induced topology from $G$. An element $\left(f_{S}\right) \in G$ is in the image of $c$ exactly if (A) $f_{S}(\alpha)+f_{S}(\beta)=f_{S}(\alpha+\beta)$ and $(\mathrm{M}) f_{S}(\alpha) f_{S}(\beta)=$ $f_{S}(\alpha \beta)$ whenever this makes sense (i.e., $\alpha, \beta, \alpha+\beta, \alpha \beta \in S$ ). Namely, this means $\lim f_{S}: E \rightarrow E$ will be an $F$-algebra map and hence an automorphism by Lemma 9.8.11. The conditions (A) and (M) for a given triple ( $S, \alpha, \beta$ ) define a closed subset of $G$ and hence $\operatorname{Gal}(E / F)$ is homeomorphic to a closed subset of a profinite space and therefore profinite itself.

0BMK Lemma 9.21.2. Let $L / M / K$ be a tower of fields. Assume both $L / K$ and $M / K$ are Galois. Then there is a canonical surjective continuous homomorphism $c$ : $\operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(M / K)$.

Proof. By Lemma 9.14 .6 given $\tau: L \rightarrow L$ in $\operatorname{Gal}(L / K)$ the restriction $\left.\tau\right|_{M}: M \rightarrow$ $M$ is an element of $\operatorname{Gal}(M / K)$. This defines the homomorphism. We omit the proof of continuity. Lemma 9.14.6 also shows that the map is surjective.

0BML Theorem 9.21.3 (Fundamental theorem of infinite Galois theory). Let $L / K$ be a Galois extension. Let $G=G a l(L / K)$ be the Galois group viewed as a profinite topoological group (Lemma 9.21.1). Then we have $K=L^{G}$ and the map

$$
\{\text { closed subgroups of } G\} \longrightarrow\{\text { subextensions } K \subset M \subset L\}, \quad H \longmapsto L^{H}
$$

is a bijection whose inverse maps $M$ to $G a l(L / M)$. The finite subextensions $M$ correspond exactly to the open subgroups $H \subset G$. The normal closed subgroups $H$ of $G$ correspond exactly to subextensions $M$ Galois over $K$.

Proof. We will use the result of finite Galois theory (Theorem 9.20.6 without further mention. Let $S \subset L$ be a finite subset. There exists a tower $L / E / K$ such that $K(S) \subset E$ and such that $E / K$ is finite Galois, see Lemma 9.15.5. In other words, we see that $L / K$ is the union of its finite Galois subextensions. For such an $E$, by Lemma 9.21 .2 the map $\operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(E / K)$ is surjective and continuous, i.e., the kernel is open because the topology on $\operatorname{Gal}(E / K)$ is discrete. In particular we see that no element of $M \backslash K$ is fixed by $\operatorname{Gal}(L / K)$ as $E^{\operatorname{Gal}(E / K)}=K$. This proves that $L^{G}=K$.
Lemma 9.20 .4 given a subextension $L / M / K$ the extension $L / M$ is Galois. It is immediate from the definition of the topology on $G$ that the subgroup $\operatorname{Gal}(L / M)$ is closed. By the above applied to $L / M$ we see that $L^{\operatorname{Gal}(L / M)}=M$
Conversely, let $H \subset G$ be a closed subgroup. We claim that $H=\operatorname{Gal}\left(L / L^{H}\right)$. The inclusion $H \subset \operatorname{Gal}\left(L / L^{H}\right)$ is clear. Suppose that $g \in \operatorname{Gal}\left(L / L^{H}\right)$. Let $S \subset L$ be a finite subset. We will show that the open neighbourhood $U_{S}(g)=\left\{g^{\prime} \in G \mid\right.$ $\left.g^{\prime}(s)=g(s)\right\}$ of $g$ meets $H$. This implies that $g \in H$ because $H$ is closed. Let $L / E / K$ be a finite Galois subextension containing $K(S)$ as in the first paragraph of the proof and consider the homomorphism $c: \operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(E / K)$. Then $L^{H} \cap E=E^{c(H)}$. Since $g$ fixes $L^{H}$ it fixes $E^{c(H)}$ and hence $c(g) \in c(H)$ by finite Galois theory. Pick $h \in H$ with $c(h)=c(g)$. Then $h \in U_{S}(g)$ as desired.
At this point we have established the correspondence between closed subgroups and subextensions.
Assume $H \subset G$ is open. Arguing as above we find that $H$ containes $\operatorname{Gal}(E / K)$ for some large enough finite Galois subextension $E$ and we find that $L^{H}$ is contained in $E$ whence finite over $K$. Conversely, if $M$ is a finite subextension, then $M$ is generated by a finite subset $S$ and the corresponding subgroup is the open subset $U_{S}(e)$ where $e \in G$ is the neutral element.

Assume that $K \subset M \subset L$ with $M / K$ Galois. By Lemma 9.21 .2 there is a surjective continuous homomorphism of Galois groups $\operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(M / K)$ whose kernel is $\operatorname{Gal}(L / M)$. Thus $\operatorname{Gal}(L / M)$ is a normal closed subgroup.
Finally, assume $N \subset G$ is normal and closed. For any $L / E / K$ as in the first paragraph of the proof, the image $c(N) \subset \operatorname{Gal}(E / K)$ is a normal subgroup. Hence $L^{N}=\bigcup E^{c(N)}$ is a union of Galois extensions of $K$ (by finite Galois theory) whence Galois over $K$.

0BMM Lemma 9.21.4. Let $L / M / K$ be a tower of fields. Assume $L / K$ and $M / K$ are Galois. Then we obtain a short exact sequence

$$
1 \rightarrow \operatorname{Gal}(L / M) \rightarrow \operatorname{Gal}(L / K) \rightarrow \operatorname{Gal}(M / K) \rightarrow 1
$$

of profinite topological groups.

Proof. This is a reformulation of Lemma 9.21.2.

### 9.22. The complex numbers

09I4 The fundamental theorem of algebra states that the field of complex numbers is an algebraically closed field. In this section we discuss this briefly.

The first remark we'd like to make is that you need to use a little bit of input from calculus in order to prove this. We will use the intuitively clear fact that every odd degree polynomial over the reals has a real root. Namely, let $P(x)=$ $a_{2 k+1} x^{2 k+1}+\ldots+a_{0} \in \mathbf{R}[x]$ for some $k \geq 0$ and $a_{2 k+1} \neq 0$. We may and do assume $a_{2 k+1}>0$. Then for $x \in \mathbf{R}$ very large (positive) we see that $P(x)>0$ as the term $a_{2 k+1} x^{2 k+1}$ dominates all the other terms. Similarly, if $x \ll 0$, then $P(x)<0$ by the same reason (and this is where we use that the degree is odd). Hence by the intermediate value theorem there is an $x \in \mathbf{R}$ with $P(x)=0$.

A conclusion we can draw from the above is that $\mathbf{R}$ has no nontrivial odd degree field extensions, as elements of such extensions would have odd degree minimal polynomials.
Next, let $K / \mathbf{R}$ be a finite Galois extension with Galois group $G$. Let $P \subset G$ be a 2-sylow subgroup. Then $K^{P} / \mathbf{R}$ is an odd degree extension, hence by the above $K^{P}=K$, which in turn implies $G=P$. (All of these arguments rely on Galois theory of course.) Thus $G$ is a 2 -group. If $G$ is nontrivial, then we see that $\mathbf{C} \subset K$ as $\mathbf{C}$ is (up to isomorphism) the only degree degree 2 extension of $\mathbf{R}$. If $G$ has more than 2 elements we would obtain a quadratic extension of $\mathbf{C}$. This is absurd as every complex number has a square root.

The conclusion: C is algebraically closed. Namely, if not then we'd get a nontrivial finite extension $\mathbf{C} \subset K$ which we could assume normal (hence Galois) over $\mathbf{R}$ by Lemma 9.15.3. But we've seen above that then $K=\mathbf{C}$.

0915 Lemma 9.22.1 (Fundamental theorem of algebra). The field $\mathbf{C}$ is algebraically closed.

Proof. See discussion above.

### 9.23. Kummer extensions

0916 Let $K$ be a field. Let $n \geq 2$ be an integer such that $K$ contains a primitive $n$th root of 1 . Let $a \in K$. Let $L$ be an extension of $K$ obtained by adjoining a root $b$ of the equation $x^{n}=a$. Then $L / K$ is Galois. If $G=\operatorname{Gal}(L / K)$ is the Galois group, then the map

$$
G \longrightarrow \mu_{n}(K), \quad \sigma \longmapsto \sigma(b) / b
$$

is an injective homomorphism of groups. In particular, $G$ is cyclic of order dividing $n$ as a subgroup of the cyclic group $\mu_{n}(K)$. Kummer theory gives a converse.

09DX Lemma 9.23.1 (Kummer extensions). Let $K \subset L$ be a Galois extension of fields whose Galois group is $\mathbf{Z} / n \mathbf{Z}$. Assume moreover that the characteristic of $K$ is prime to $n$ and that $K$ contains a primitive nth root of 1 . Then $L=K[z]$ with $z^{n} \in K$.

Proof. Omitted.

### 9.24. Artin-Schreier extensions

0917 Let $K$ be a field of characteristic $p>0$. Let $a \in K$. Let $L$ be an extension of $K$ obtained by adjoining a root $b$ of the equation $x^{p}-x=a$. Then $L / K$ is Galois. If $G=\operatorname{Gal}(L / K)$ is the Galois group, then the map

$$
G \longrightarrow \mathbf{Z} / p \mathbf{Z}, \quad \sigma \longmapsto \sigma(b)-b
$$

is an injective homomorphism of groups. In particular, $G$ is cyclic of order dividing $p$ as a subgroup of $\mathbf{Z} / p \mathbf{Z}$. The theory of Artin-Schreier extensions gives a converse.

09DY Lemma 9.24.1 (Artin-Schreier extensions). Let $K \subset L$ be a Galois extension of fields of characteristic $p>0$ with Galois group $\mathbf{Z} / p \mathbf{Z}$. Then $L=K[z]$ with $z^{p}-z \in K$.

Proof. Omitted.

### 9.25. Transcendence

030D We recall the standard definitions.
030E Definition 9.25.1. Let $k \subset K$ be a field extension.
(1) A collection of elements $\left\{x_{i}\right\}_{i \in I}$ of $K$ is called algebraically independent over $k$ if the map

$$
k\left[X_{i} ; i \in I\right] \longrightarrow K
$$

which maps $X_{i}$ to $x_{i}$ is injective.
(2) The field of fractions of a polynomial ring $k\left[x_{i} ; i \in I\right]$ is denoted $k\left(x_{i} ; i \in\right.$ I).
(3) A purely transcendental extension of $k$ is any field extension $k \subset K$ isomorphic to the field of fractions of a polynomial ring over $k$.
(4) A transcendence basis of $K / k$ is a collection of elements $\left\{x_{i}\right\}_{i \in I}$ which are algebraically independent over $k$ and such that the extension $k\left(x_{i} ; i \in\right.$ $I) \subset K$ is algebraic.

0918 Example 9.25.2. The field $\mathbf{Q}(\pi)$ is purely transcendental because $\pi$ isn't the root of a nonzero polynomial with rational coefficients. In particular, $\mathbf{Q}(\pi) \cong \mathbf{Q}(x)$.

030F Lemma 9.25.3. Let $E / F$ be a field extension. A transcendence basis of $E$ over $F$ exists. Any two transcendence bases have the same cardinality.

Proof. Let $A$ be an algebraically independent subset of $E$. Let $G$ be a subset of $E$ containing $A$ that generates $E / F$. We claim we can find a transcendence basis $B$ such that $A \subset B \subset G$. To prove this consider the collection of algebraically independent subsets $\mathcal{B}$ whose members are subsets of $G$ that contain $A$. Define a partial ordering on $\mathcal{B}$ using inclusion. Then $\mathcal{B}$ contains at least one element $A$. The union of the elements of a totally ordered subset $T$ of $\mathcal{B}$ is an algebraically independent subset of $E$ over $F$ since any algebraic dependence relation would have occurred in one of the elements of $T$ (since polynomials only involve finitely many variables). The union also contains $A$ and is contained in $G$. By Zorn's lemma, there is a maximal element $B \in \mathcal{B}$. Now we claim $E$ is algebraic over $F(B)$. This is because if it wasn't then there would be an element $f \in G$ transcendental over $F(B)$ since $E(G)=F$. Then $B \cup\{f\}$ wold be algebraically independent contradicting the maximality of $B$. Thus $B$ is our transcendence basis.

Let $B$ and $B^{\prime}$ be two transcendence bases. Without loss of generality, we can assume that $\left|B^{\prime}\right| \leq|B|$. Now we divide the proof into two cases: the first case is that $B$ is an infinite set. Then for each $\alpha \in B^{\prime}$, there is a finite set $B_{\alpha}$ such that $\alpha$ is algebraic over $E\left(B_{\alpha}\right)$ since any algebraic dependence relation only uses finitely many indeterminates. Then we define $B^{*}=\bigcup_{\alpha \in B^{\prime}} B_{\alpha}$. By construction, $B^{*} \subset B$, but we claim that in fact the two sets are equal. To see this, suppose that they are not equal, say there is an element $\beta \in B \backslash B^{*}$. We know $\beta$ is algebraic over $E\left(B^{\prime}\right)$ which is algebraic over $E\left(B^{*}\right)$. Therefore $\beta$ is algebraic over $E\left(B^{*}\right)$, a contradiction. So $|B| \leq\left|\bigcup_{\alpha \in B^{\prime}} B_{\alpha}\right|$. Now if $B^{\prime}$ is finite, then so is $B$ so we can assume $B^{\prime}$ is infinite; this means

$$
|B| \leq\left|\bigcup_{\alpha \in B^{\prime}} B_{\alpha}\right|=\left|B^{\prime}\right|
$$

because each $B_{\alpha}$ is finite and $B^{\prime}$ is infinite. Therefore in the infinite case, $|B|=\left|B^{\prime}\right|$.
Now we need to look at the case where $B$ is finite. In this case, $B^{\prime}$ is also finite, so suppose $B=\left\{\alpha_{1}, \ldots, \alpha_{n}\right\}$ and $B^{\prime}=\left\{\beta_{1}, \ldots, \beta_{m}\right\}$ with $m \leq n$. We perform induction on $m$ : if $m=0$ then $E / F$ is algebraic so $B=\emptyset$ so $n=0$. If $m>0$, there is an irreducible polynomial $f \in E\left[x, y_{1}, \ldots, y_{n}\right]$ such that $f\left(\beta_{1}, \alpha_{1}, \ldots, \alpha_{n}\right)=0$ and such that $x$ occurs in $f$. Since $\beta_{1}$ is not algebraic over $F, f$ must involve some $y_{i}$ so without loss of generality, assume $f$ uses $y_{1}$. Let $B^{*}=\left\{\beta_{1}, \alpha_{2}, \ldots, \alpha_{n}\right\}$. We claim that $B^{*}$ is a basis for $E / F$. To prove this claim, we see that we have a tower of algebraic extensions

$$
E / F\left(B^{*}, \alpha_{1}\right) / F\left(B^{*}\right)
$$

since $\alpha_{1}$ is algebraic over $F\left(B^{*}\right)$. Now we claim that $B^{*}$ (counting multiplicity of elements) is algebraically independent over $E$ because if it weren't, then there would be an irreducible $g \in E\left[x, y_{2}, \ldots, y_{n}\right]$ such that $g\left(\beta_{1}, \alpha_{2}, \ldots, \alpha_{n}\right)=0$ which must involve $x$ making $\beta_{1}$ algebraic over $E\left(\alpha_{2}, \ldots, \alpha_{n}\right)$ which would make $\alpha_{1}$ algebraic over $E\left(\alpha_{2}, \ldots, \alpha_{n}\right)$ which is impossible. So this means that $\left\{\alpha_{2}, \ldots, \alpha_{n}\right\}$ and $\left\{\beta_{2}, \ldots, \beta_{m}\right\}$ are bases for $E$ over $F\left(\beta_{1}\right)$ which means by induction, $m=n$.

030G Definition 9.25.4. Let $k \subset K$ be a field extension. The transcendence degree of $K$ over $k$ is the cardinality of a transcendence basis of $K$ over $k$. It is denoted $\operatorname{trdeg}_{k}(K)$.
030H Lemma 9.25.5. Let $k \subset K \subset L$ be field extensions. Then

$$
\operatorname{trdeg}_{k}(L)=\operatorname{trdeg}_{K}(L)+\operatorname{trdeg}_{k}(K)
$$

Proof. Choose a transcendence basis $A \subset K$ of $K$ over $k$. Choose a transcendence basis $B \subset L$ of $L$ over $K$. Then it is straightforward to see that $A \cup B$ is a transcendence basis of $L$ over $k$.

0919 Example 9.25.6. Consider the field extension $\mathbf{Q}(e, \pi)$ formed by adjoining the numbers $e$ and $\pi$. This field extension has transcendence degree at least 1 since both $e$ and $\pi$ are transcendental over the rationals. However, this field extension might have transcendence degree 2 if $e$ and $\pi$ are algebraically independent. Whether or not this is true is unknown and whence the problem of determining $\operatorname{trdeg}(\mathbf{Q}(e, \pi))$ is open.

09IA Example 9.25.7. Let $F$ be a field and $E=F(t)$. Then $\{t\}$ is a transcendence basis since $E=F(t)$. However, $\left\{t^{2}\right\}$ is also a transcendence basis since $F(t) / F\left(t^{2}\right)$ is algebraic. This illustrates that while we can always decompose an extension $E / F$
into an algebraic extension $E / F^{\prime}$ and a purely transcendental extension $F^{\prime} / F$, this decomposition is not unique and depends on choice of transcendence basis.

09IB Example 9.25.8. Let $X$ be a compact Riemann surface. Then the function field $\mathbf{C}(X)$ (see Example 9.3.6) has transcendence degree one over $\mathbf{C}$. In fact, any finitely generated extension of $\mathbf{C}$ of transcendence degree one arises from a Riemann surface. There is even an equivalence of categories between the category of compact Riemann surfaces and (non-constant) holomorphic maps and the opposite of the category of finitely generated extensions of $\mathbf{C}$ of transcendence degree 1 and morphisms of C-algebras. See [For91].

There is an algebraic version of the above statement as well. Given an (irreducible) algebraic curve in projective space over an algebraically closed field $k$ (e.g. the complex numbers), one can consider its "field of rational functions": basically, functions that look like quotients of polynomials, where the denominator does not identically vanish on the curve. There is a similar anti-equivalence of categories (insert future reference here) between smooth projective curves and non-constant morphisms of curves and finitely generated extensions of $k$ of transcendence degree one. See Har77.

037 I Definition 9.25.9. Let $k \subset K$ be a field extension.
(1) The algebraic closure of $k$ in $K$ is the subfield $k^{\prime}$ of $K$ consisting of elements of $K$ which are algebraic over $k$.
(2) We say $k$ is algebraically closed in $K$ if every element of $K$ which is algebraic over $k$ is contained in $k$.

037J Lemma 9.25.10. Let $k \subset K$ be a finitely generated field extension. The algebraic closure of $k$ in $K$ is finite over $k$.

Proof. Let $x_{1}, \ldots, x_{r} \in K$ be a transcendence basis for $K$ over $k$. Then $n=$ $\left[K: k\left(x_{1}, \ldots, x_{r}\right)\right]<\infty$. Suppose that $k \subset k^{\prime} \subset K$ with $k^{\prime} / k$ finite. In this case $\left[k^{\prime}\left(x_{1}, \ldots, x_{r}\right): k\left(x_{1}, \ldots, x_{r}\right)\right]=\left[k^{\prime}: k\right]<\infty$. Hence

$$
\left[k^{\prime}: k\right]=\left[k^{\prime}\left(x_{1}, \ldots, x_{r}\right): k\left(x_{1}, \ldots, x_{r}\right)\right]<\left[K: k\left(x_{1}, \ldots, x_{r}\right)\right]=n .
$$

In other words, the degrees of finite subextensions are bounded and the lemma follows.

### 9.26. Linearly disjoint extensions

09IC Let $k$ be a field, $K$ and $L$ field extensions of $k$. Suppose also that $K$ and $L$ are embedded in some larger field $\Omega$.

09ID Definition 9.26.1. Consider a diagram

09IE

of field extensions. The compositum of $K$ and $L$ in $\Omega$ written $K L$ is the smallest subfield of $\Omega$ containing both $L$ and $K$.

It is clear that $K L$ is generated by the set $K \cup L$ over $k$, generated by the set $K$ over $L$, and generated by the set $L$ over $K$.
Warning: The (isomorphism class of the) composition depends on the choice of the embeddings of $K$ and $L$ into $\Omega$. For example consider the number fields $K=$ $\mathbf{Q}\left(2^{1 / 8}\right) \subset \mathbf{R}$ and $L=\mathbf{Q}\left(2^{1 / 12}\right) \subset \mathbf{R}$. The compositum inside $\mathbf{R}$ is the field $\mathbf{Q}\left(2^{1 / 24}\right)$ of degree 24 over $\mathbf{Q}$. However, if we embed $K=\mathbf{Q}[x] /\left(x^{8}-2\right)$ into $\mathbf{C}$ by mapping $x$ to $2^{1 / 8} e^{2 \pi i / 8}$, then the compositum $\mathbf{Q}\left(2^{1 / 12}, 2^{1 / 8} e^{2 \pi i / 8}\right)$ contains $i=e^{2 \pi i / 4}$ and has degree 48 over $\mathbf{Q}$ (we omit showing the degree is 48 , but the existence of $i$ certainly proves the two composita are not isomorphic).

09IF Definition 9.26.2. Consider a diagram of fields as in 9.26.1.1. We say that $K$ and $L$ are linearly disjoint over $k$ in $\Omega$ if the map

$$
K \otimes_{k} L \longrightarrow K L, \quad \sum x_{i} \otimes y_{i} \longmapsto \sum x_{i} y_{i}
$$

is injective.
The following lemma does not seem to fit anywhere else.
030M Lemma 9.26.3. Let $E / F$ be a normal algebraic field extension. There exist subextensions $E / E_{\text {sep }} / F$ and $E / E_{\text {insep }} / F$ such that
(1) $F \subset E_{\text {sep }}$ is Galois and $E_{\text {sep }} \subset E$ is purely inseparable,
(2) $F \subset E_{\text {insep }}$ is purely inseparable and $E_{\text {insep }} \subset E$ is Galois,
(3) $E=E_{\text {sep }} \otimes_{F} E_{\text {insep }}$.

Proof. We found the subfield $E_{\text {sep }}$ in Lemma 9.13.6. We set $E_{\text {insep }}=E^{\operatorname{Aut}(E / F)}$. Details omitted.

### 9.27. Review

037 H In this section we give a quick review of what has transpired above.
Let $k \subset K$ be a field extension. Let $\alpha \in K$. Then we have the following possibilities:
(1) The element $\alpha$ is transcendental over $k$.
(2) The element $\alpha$ is algebraic over $k$. Denote $P(T) \in k[T]$ its minimal polynomial. This is a monic polynomial $P(T)=T^{d}+a_{1} T^{d-1}+\ldots+a_{d}$ with coefficients in $k$. It is irreducible and $P(\alpha)=0$. These properties uniquely determine $P$, and the integer $d$ is called the degree of $\alpha$ over $k$. There are two subcases:
(a) The polynomial $\mathrm{d} P / \mathrm{d} T$ is not identically zero. This is equivalent to the condition that $P(T)=\prod_{i=1, \ldots, d}\left(T-\alpha_{i}\right)$ for pairwise distinct elements $\alpha_{1}, \ldots, \alpha_{d}$ in the algebraic closure of $k$. In this case we say that $\alpha$ is separable over $k$.
(b) The $\mathrm{d} P / \mathrm{d} T$ is identically zero. In this case the characteristic $p$ of $k$ is $>0$, and $P$ is actually a polynomial in $T^{p}$. Clearly there exists a largest power $q=p^{e}$ such that $P$ is a polynomial in $T^{q}$. Then the element $\alpha^{q}$ is separable over $k$.
030J Definition 9.27.1. Algebraic field extensions.
(1) A field extension $k \subset K$ is called algebraic if every element of $K$ is algebraic over $k$.
(2) An algebraic extension $k \subset k^{\prime}$ is called separable if every $\alpha \in k^{\prime}$ is separable over $k$.
(3) An algebraic extension $k \subset k^{\prime}$ is called purely inseparable if the characteristic of $k$ is $p>0$ and for every element $\alpha \in k^{\prime}$ there exists a power $q$ of $p$ such that $\alpha^{q} \in k$.
(4) An algebraic extension $k \subset k^{\prime}$ is called normal if for every $\alpha \in k^{\prime}$ the minimal polynomial $P(T) \in k[T]$ of $\alpha$ over $k$ splits completely into linear factors over $k^{\prime}$.
(5) An algebraic extension $k \subset k^{\prime}$ is called Galois if it is separable and normal.

The following lemma does not seem to fit anywhere else.
031V Lemma 9.27.2. Let $K$ be a field of characteristic $p>0$. Let $K \subset L$ be a separable algebraic extension. Let $\alpha \in L$.
(1) If the coefficients of the minimal polynomial of $\alpha$ over $K$ are pth powers in $K$ then $\alpha$ is a pth power in $L$.
(2) More generally, if $P \in K[T]$ is a polynomial such that (a) $\alpha$ is a root of $P$, (b) $P$ has pairwise distinct roots in an algebraic closure, and (c) all coefficients of $P$ are pth powers, then $\alpha$ is a pth power in L.

Proof. It follows from the definitions that (2) implies (1). Assume $P$ is as in (2). Write $P(T)=\sum_{i=0}^{d} a_{i} T^{d-i}$ and $a_{i}=b_{i}^{p}$. The polynomial $Q(T)=\sum_{i=0}^{d} b_{i} T^{d-i}$ has distinct roots in an algebraic closure as well, because the roots of $Q$ are the $p$ th roots of the roots of $P$. If $\alpha$ is not a $p$ th power, then $T^{p}-\alpha$ is an irreducible polynomial over $L$ (Lemma 9.13.2. Moreover $Q$ and $T^{p}-\alpha$ have a root in common in an algebraic closure $\bar{L}$. Thus $Q$ and $T^{p}-\alpha$ are not relatively prime, which implies $T^{p}-\alpha \mid Q$ in $L[T]$. This contradicts the fact that the roots of $Q$ are pairwise distinct.

## CHAPTER 10

## Commutative Algebra

### 10.1. Introduction

00 AP Basic commutative algebra will be explained in this document. A reference is Mat70a.

### 10.2. Conventions

00 AQ A ring is commutative with 1 . The zero ring is a ring. In fact it is the only ring that does not have a prime ideal. The Kronecker symbol $\delta_{i j}$ will be used. If $R \rightarrow S$ is a ring map and $\mathfrak{q}$ a prime of $S$, then we use the notation " $\mathfrak{p}=R \cap \mathfrak{q}$ " to indicate the prime which is the inverse image of $\mathfrak{q}$ under $R \rightarrow S$ even if $R$ is not a subring of $S$ and even if $R \rightarrow S$ is not injective.

### 10.3. Basic notions

00AR The following is a list of basic notions in commutative algebra. Some of these notions are discussed in more detail in the text that follows and some are defind in the list, but others are considered basic and will not be defined. If you are not familiar with most of the italicized concepts, then we suggest looking at an introductory text on algebra before continuing.
$00 \mathrm{AS} \quad$ (1) $R$ is a ring,

00AT
00AU
00AV
00AW
00AX
00AY
00AZ

00B0

00B1
00B2
00B3
00B4
00B5
00B6
00B7
(2) $x \in R$ is nilpotent,
(3) $x \in R$ is a zerodivisor,
(4) $x \in R$ is a unit,
(5) $e \in R$ is an idempotent,
(6) an idempotent $e \in R$ is called trivial if $e=1$ or $e=0$,
(7) $\varphi: R_{1} \rightarrow R_{2}$ is a ring homomorphism,
(8) $\varphi: R_{1} \rightarrow R_{2}$ is of finite presentation, or $R_{2}$ is a finitely presented $R_{1}$ algebra, see Definition 10.6.1,
(9) $\varphi: R_{1} \rightarrow R_{2}$ is of finite type, or $R_{2}$ is a finite type $R_{1}$-algebra, see Definition 10.6.1
(10) $\varphi: R_{1} \rightarrow R_{2}$ is finite, or $R_{2}$ is a finite $R_{1}$-algebra,
(11) $R$ is a (integral) domain,
(12) $R$ is reduced,
(13) $R$ is Noetherian,
(14) $R$ is a principal ideal domain or a PID,
(15) $R$ is a Euclidean domain,
(16) $R$ is a unique factorization domain or a $U F D$,

00B8 (17) $R$ is a discrete valuation ring or a $d v r$,
00B9 (18) $K$ is a field,
00BA (19) $K \subset L$ is a field extension,
00BB (20) $K \subset L$ is an algebraic field extension,
00BC (21) $\left\{t_{i}\right\}_{i \in I}$ is a transcendence basis for $L$ over $K$,
00BD (22) the transcendence degree $\operatorname{trdeg}(L / K)$ of $L$ over $K$,
00BE (23) the field $k$ is algebraically closed,
00BF $\quad(24)$ if $K \subset L$ is algebraic, and $K \subset k$ an extension with $k$ algebraically closed, then there exists a map ring map $L \rightarrow k$ extending the map on $K$,
00BG (25) $I \subset R$ is an ideal,
00BH (26) $I \subset R$ is radical,
00BI
(27) if $I$ is an ideal then we have its radical $\sqrt{I}$,
(28) $I \subset R$ is nilpotent means that $I^{n}=0$ for some $n \in \mathbf{N}$,
(29) $I \subset R$ is locally nilpotent means that every element of $I$ is nilpotent,
(30) $\mathfrak{p} \subset R$ is a prime ideal,
(31) if $\mathfrak{p} \subset R$ is prime and if $I, J \subset R$ are ideal, and if $I J \subset \mathfrak{p}$, then $I \subset \mathfrak{p}$ or $J \subset \mathfrak{p}$.
$00 \mathrm{BM} \quad$ (32) $\mathfrak{m} \subset R$ is a maximal ideal,
00BN (33) any nonzero ring has a maximal ideal,
00BO (34) the Jacobson radical of $R$ is $\operatorname{rad}(R)=\bigcap_{\mathfrak{m} \subset R} \mathfrak{m}$ the intersection of all the maximal ideals of $R$,
00BP
(35) the ideal $(T)$ generated by a subset $T \subset R$,

00BQ
00BR
00BS
(36) the quotient ring $R / I$,
(37) an ideal $I$ in the ring $R$ is prime if and only if $R / I$ is a domain,
(38) an ideal $I$ in the ring $R$ is maximal if and only if the $\operatorname{ring} R / I$ is a field,

00BT
(39) if $\varphi: R_{1} \rightarrow R_{2}$ is a ring homomorphism, and if $I \subset R_{2}$ is an ideal, then $\varphi^{-1}(I)$ is an ideal of $R_{1}$,
00 BU
(40) if $\varphi: R_{1} \rightarrow R_{2}$ is a ring homomorphism, and if $I \subset R_{1}$ is an ideal, then $\varphi(I) \cdot R_{2}$ (sometimes denoted $I \cdot R_{2}$, or $I R_{2}$ ) is the ideal of $R_{2}$ generated by $\varphi(I)$,
00BV

00BW
055Y
00BX
00BY
00BZ
(41) if $\varphi: R_{1} \rightarrow R_{2}$ is a ring homomorphism, and if $\mathfrak{p} \subset R_{2}$ is a prime ideal, then $\varphi^{-1}(\mathfrak{p})$ is a prime ideal of $R_{1}$,
(42) $M$ is an $R$-module,
(43) for $m \in M$ the annihilator $I=\{f \in R \mid f m=0\}$ of $m$ in $R$,
(44) $N \subset M$ is an $R$-submodule,
(45) $M$ is an Noetherian $R$-module,
(46) $M$ is a finite $R$-module,

00C0 (47) $M$ is a finitely generated $R$-module,
00 C 1
(48) $M$ is a finitely presented $R$-module,

00C2
0516
(50) if $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is a short exact sequence of $R$-modules and $K$, $M$ are free, then $L$ is free,
00C3 (51) if $N \subset M \subset L$ are $R$-modules, then $L / M=(L / N) /(M / N)$,
00C4 (52) $S$ is a multiplicative subset of $R$,
00C5
(53) the localization $R \rightarrow S^{-1} R$ of $R$,

00C6 (54) if $R$ is a ring and $S$ is a multiplicative subset of $R$ then $S^{-1} R$ is the zero ring if and only if $S$ contains 0 ,
$00 \mathrm{C} 7 \quad(55)$ if $R$ is a ring and if the multiplicative subset $S$ consists completely of nonzerodivisors, then $R \rightarrow S^{-1} R$ is injective,
(56) if $\varphi: R_{1} \rightarrow R_{2}$ is a ring homomorphism, and $S$ is a multiplicative subsets of $R_{1}$, then $\varphi(S)$ is a multiplicative subset of $R_{2}$,
00 C 8
(57) if $S, S^{\prime}$ are multiplicative subsets of $R$, and if $S S^{\prime}$ denotes the set of products $S S^{\prime}=\left\{r \in R \mid \exists s \in S, \exists s^{\prime} \in S^{\prime}, r=s s^{\prime}\right\}$ then $S S^{\prime}$ is a multiplicative subset of $R$,
00C9
(58) if $S, S^{\prime}$ are multiplicative subsets of $R$, and if $\bar{S}$ denotes the image of $S$ in $\left(S^{\prime}\right)^{-1} R$, then $\left(S S^{\prime}\right)^{-1} R=\bar{S}^{-1}\left(\left(S^{\prime}\right)^{-1} R\right)$,
00 CA
(59) the localization $S^{-1} M$ of the $R$-module $M$,

00 CB
00 CC
(60) the functor $M \mapsto S^{-1} M$ preserves injective maps, surjective maps, and exactness,
(61) if $S, S^{\prime}$ are multiplicative subsets of $R$, and if $M$ is an $R$-module, then $\left(S S^{\prime}\right)^{-1} M=S^{-1}\left(\left(S^{\prime}\right)^{-1} M\right)$,
00 CD
(62) if $R$ is a ring, $I$ and ideal of $R$ and $S$ a multiplicative subset of $R$, then $S^{-1} I$ is an ideal of $S^{-1} R$, and we have $S^{-1} R / S^{-1} I=\bar{S}^{-1}(R / I)$, where $\bar{S}$ is the image of $S$ in $R / I$,
00CE
(63) if $R$ is a ring, and $S$ a multiplicative subset of $R$, then any ideal $I^{\prime}$ of $S^{-1} R$ is of the form $S^{-1} I$, where one can take $I$ to be the inverse image of $I^{\prime}$ in $R$,
00 CF
(64) if $R$ is a ring, $M$ an $R$-module, and $S$ a multiplicative subset of $R$, then any submodule $N^{\prime}$ of $S^{-1} M$ is of the form $S^{-1} N$ for some submodule $N \subset M$, where one can take $N$ to be the inverse image of $N^{\prime}$ in $M$,
00 CG
(65) if $S=\left\{1, f, f^{2}, \ldots\right\}$ then $R_{f}=S^{-1} R$ and $M_{f}=S^{-1} M$,
(66) if $S=R \backslash \mathfrak{p}=\{x \in R \mid x \notin \mathfrak{p}\}$ for some prime ideal $\mathfrak{p}$, then it is customary to denote $R_{\mathfrak{p}}=S^{-1} R$ and $M_{\mathfrak{p}}=S^{-1} M$
00 CI
(67) a local ring is a ring with exactly one maximal ideal,

03C0
(68) a semi-local ring is a ring with finitely many maximal ideals,

00CJ
(69) if $\mathfrak{p}$ is a prime in $R$, then $R_{\mathfrak{p}}$ is a local ring with maximal ideal $\mathfrak{p} R_{\mathfrak{p}}$,
$00 \mathrm{CK} \quad(70)$ the residue field, denoted $\kappa(\mathfrak{p})$, of the prime $\mathfrak{p}$ in the ring $R$ is the quotient $R_{\mathfrak{p}} / \mathfrak{p} R_{\mathfrak{p}}=(R \backslash \mathfrak{p})^{-1} R / \mathfrak{p}$,
$00 \mathrm{CL} \quad(71)$ given $R$ and $M_{1}, M_{2}$ the tensor product $M_{1} \otimes_{R} M_{2}$,
(72) etc.

### 10.4. Snake lemma

07JV The snake lemma and its variants are discussed in the setting of abelian categories in Homology, Section 12.5 .

07JW Lemma 10.4.1. Suppose given a commutative diagram

CE56, III, Lemma 3.3]
of abelian groups with exact rows, then there is a canonical exact sequence

$$
\operatorname{Ker}(\alpha) \rightarrow \operatorname{Ker}(\beta) \rightarrow \operatorname{Ker}(\gamma) \rightarrow \operatorname{Coker}(\alpha) \rightarrow \operatorname{Coker}(\beta) \rightarrow \operatorname{Coker}(\gamma)
$$

Moreover, if $X \rightarrow Y$ is injective, then the first map is injective, and if $V \rightarrow W$ is surjective, then the last map is surjective.

Proof. The map $\partial: \operatorname{Ker}(\gamma) \rightarrow \operatorname{Coker}(\alpha)$ is defined as follows. Take $z \in \operatorname{Ker}(\gamma)$. Choose $y \in Y$ mapping to $z$. Then $\beta(y) \in V$ maps to zero in $W$. Hence $\beta(y)$ is the image of some $u \in U$. Set $\partial z=\bar{u}$ the class of $u$ in the cokernel of $\alpha$. Proof of exactness is omitted.

### 10.5. Finite modules and finitely presented modules

0517 Just some basic notation and lemmas.
0518 Definition 10.5.1. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) We say $M$ is a finite $R$-module, or a finitely generated $R$-module if there exist $n \in \mathbf{N}$ and $x_{1}, \ldots, x_{n} \in M$ such that every element of $M$ is a $R$-linear combination of the $x_{i}$. Equivalently, this means there exists a surjection $R^{\oplus n} \rightarrow M$ for some $n \in \mathbf{N}$.
(2) We say $M$ is a finitely presented $R$-module or an $R$-module of finite presentation if there exist integers $n, m \in \mathbf{N}$ and an exact sequence

$$
R^{\oplus m} \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0
$$

Informally, $M$ is a finitely presented $R$-module if and only if it is finitely generated and the module of relations among these generators is finitely generated as well. A choice of an exact sequence as in the definition is called a presentation of $M$.
07JX Lemma 10.5.2. Let $R$ be a ring. Let $\alpha: R^{\oplus n} \rightarrow M$ and $\beta: N \rightarrow M$ be module maps. If $\operatorname{Im}(\alpha) \subset \operatorname{Im}(\beta)$, then there exists an $R$-module map $\gamma: R^{\oplus n} \rightarrow N$ such that $\alpha=\beta \circ \gamma$.
Proof. Let $e_{i}=(0, \ldots, 0,1,0, \ldots, 0)$ be the $i$ th basis vector of $R^{\oplus n}$. Let $x_{i} \in N$ be an element with $\alpha\left(e_{i}\right)=\beta\left(x_{i}\right)$ which exists by assumption. Set $\gamma\left(a_{1}, \ldots, a_{n}\right)=$ $\sum a_{i} x_{i}$. By construction $\alpha=\beta \circ \gamma$.

0519 Lemma 10.5.3. Let $R$ be a ring. Let

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

be a short exact sequence of $R$-modules.
(1) If $M_{1}$ and $M_{3}$ are finite $R$-modules, then $M_{2}$ is a finite $R$-module.
(2) If $M_{1}$ and $M_{3}$ are finitely presented $R$-modules, then $M_{2}$ is a finitely presented $R$-module.
(3) If $M_{2}$ is a finite $R$-module, then $M_{3}$ is a finite $R$-module.
(4) If $M_{2}$ is a finitely presented $R$-module and $M_{1}$ is a finite $R$-module, then $M_{3}$ is a finitely presented $R$-module.
(5) If $M_{3}$ is a finitely presented $R$-module and $M_{2}$ is a finite $R$-module, then $M_{1}$ is a finite $R$-module.

Proof. Proof of (1). If $x_{1}, \ldots, x_{n}$ are generators of $M_{1}$ and $y_{1}, \ldots, y_{m} \in M_{2}$ are elements whose images in $M_{3}$ are generators of $M_{3}$, then $x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}$ generate $M_{2}$.

Part (3) is immediate from the definition.
Proof of (5). Assume $M_{3}$ is finitely presented and $M_{2}$ finite. Choose a presentation

$$
R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M_{3} \rightarrow 0
$$

By Lemma 10.5 .2 there exists a map $R^{\oplus n} \rightarrow M_{2}$ such that the solid diagram

commutes. This produces the dotted arrow. By the snake lemma (Lemma 10.4.1) we see that we get an isomorphism

$$
\operatorname{Coker}\left(R^{\oplus m} \rightarrow M_{1}\right) \cong \operatorname{Coker}\left(R^{\oplus n} \rightarrow M_{2}\right)
$$

In particular we conclude that $\operatorname{Coker}\left(R^{\oplus m} \rightarrow M_{1}\right)$ is a finite $R$-module. Since $\operatorname{Im}\left(R^{\oplus m} \rightarrow M_{1}\right)$ is finite by (3), we see that $M_{1}$ is finite by part (1).
Proof of (4). Assume $M_{2}$ is finitely presented and $M_{1}$ is finite. Choose a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M_{2} \rightarrow 0$. Choose a surjection $R^{\oplus k} \rightarrow M_{1}$. By Lemma 10.5.2 there exists a factorization $R^{\oplus k} \rightarrow R^{\oplus n} \rightarrow M_{2}$ of the composition $R^{\oplus k} \rightarrow M_{1} \rightarrow M_{2}$. Then $R^{\oplus k+m} \rightarrow R^{\oplus n} \rightarrow M_{3} \rightarrow 0$ is a presentation.

Proof of (2). Assume that $M_{1}$ and $M_{3}$ are finitely presented. The argument in the proof of part (1) produces a commutative diagram

with surjective vertical arrows. By the snake lemma we obtain a short exact sequence

$$
0 \rightarrow \operatorname{Ker}\left(R^{\oplus n} \rightarrow M_{1}\right) \rightarrow \operatorname{Ker}\left(R^{\oplus n+m} \rightarrow M_{2}\right) \rightarrow \operatorname{Ker}\left(R^{\oplus m} \rightarrow M_{3}\right) \rightarrow 0
$$

By part (5) we see that the outer two modules are finite. Hence the middle one is finite too. By (4) we see that $M_{2}$ is of finite presentation.
00KZ Lemma 10.5.4. Let $R$ be a ring, and let $M$ be a finite $R$-module. There exists a filtration by $R$-submodules

$$
0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M
$$

such that each quotient $M_{i} / M_{i-1}$ is isomorphic to $R / I_{i}$ for some ideal $I_{i}$ of $R$.
Proof. By induction on the number of generators of $M$. Let $x_{1}, \ldots, x_{r} \in M$ be a minimal number of generators. Let $M^{\prime}=R x_{1} \subset M$. Then $M / M^{\prime}$ has $r-1$ generators and the induction hypothesis applies. And clearly $M^{\prime} \cong R / I_{1}$ with $I_{1}=\left\{f \in R \mid f x_{1}=0\right\}$.
0560 Lemma 10.5.5. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. If $M$ is finite as an $R$-module, then $M$ is finite as an $S$-module.

Proof. In fact, any $R$-generating set of $M$ is also an $S$-generating set of $M$, since the $R$-module structure is induced by the image of $R$ in $S$.
10.6. Ring maps of finite type and of finite presentation

00F2
00F3 Definition 10.6.1. Let $R \rightarrow S$ be a ring map.
(1) We say $R \rightarrow S$ is of finite type, or that $S$ is a finite type $R$-algebra if there exists an $n \in \mathbf{N}$ and an surjection of $R$-algebras $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$.
(2) We say $R \rightarrow S$ is of finite presentation if there exist integers $n, m \in \mathbf{N}$ and polynomials $f_{1}, \ldots, f_{m} \in R\left[x_{1}, \ldots, x_{n}\right]$ and an isomorphism of $R$-algebras $R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right) \cong S$.
Informally, $R \rightarrow S$ is of finite presentation if and only if $S$ is finitely generated as an $R$-algebra and the ideal of relations among the generators is finitely generated. A choice of a surjection $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ as in the definition is sometimes called a presentation of $S$.

00F4 Lemma 10.6.2. The notions finite type and finite presentation have the following permanence properties.
(1) A composition of ring maps of finite type is of finite type.
(2) A composition of ring maps of finite presentation is of finite presentation.
(3) Given $R \rightarrow S^{\prime} \rightarrow S$ with $R \rightarrow S$ of finite type, then $S^{\prime} \rightarrow S$ is of finite type.
(4) Given $R \rightarrow S^{\prime} \rightarrow S$, with $R \rightarrow S$ of finite presentation, and $R \rightarrow S^{\prime}$ of finite type, then $S^{\prime} \rightarrow S$ is of finite presentation.

Proof. We only prove the last assertion. Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ and $S^{\prime}=R\left[y_{1}, \ldots, y_{a}\right] / I$. Say that the class $\bar{y}_{i}$ of $y_{i} \operatorname{maps}$ to $h_{i} \bmod \left(f_{1}, \ldots, f_{m}\right)$ in $S$. Then it is clear that $S=S^{\prime}\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}, h_{1}-\bar{y}_{1}, \ldots, h_{a}-\bar{y}_{a}\right)$.
00R2 Lemma 10.6.3. Let $R \rightarrow S$ be a ring map of finite presentation. For any surjection $\alpha: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ the kernel of $\alpha$ is a finitely generated ideal in $R\left[x_{1}, \ldots, x_{n}\right]$.
Proof. Write $S=R\left[y_{1}, \ldots, y_{m}\right] /\left(f_{1}, \ldots, f_{k}\right)$. Choose $g_{i} \in R\left[y_{1}, \ldots, y_{m}\right]$ which are lifts of $\alpha\left(x_{i}\right)$. Then we see that $S=R\left[x_{i}, y_{j}\right] /\left(f_{j}, x_{i}-g_{i}\right)$. Choose $h_{j} \in$ $R\left[x_{1}, \ldots, x_{n}\right]$ such that $\alpha\left(h_{j}\right)$ corresponds to $y_{j} \bmod \left(f_{1}, \ldots, f_{k}\right)$. Consider the map $\psi: R\left[x_{i}, y_{j}\right] \rightarrow R\left[x_{i}\right], x_{i} \mapsto x_{i}, y_{j} \mapsto h_{j}$. Then the kernel of $\alpha$ is the image of $\left(f_{j}, x_{i}-g_{i}\right)$ under $\psi$ and we win.

0561 Lemma 10.6.4. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Assume $R \rightarrow S$ is of finite type and $M$ is finitely presented as an $R$-module. Then $M$ is finitely presented as an $S$-module.

Proof. This is similar to the proof of part (4) of Lemma 10.6.2. We may assume $S=R\left[x_{1}, \ldots, x_{n}\right] / J$. Choose $y_{1}, \ldots, y_{m} \in M$ which generate $M$ as an $R$-module and choose relations $\sum a_{i j} y_{j}=0, i=1, \ldots, t$ which generate the kernel of $R^{\oplus m} \rightarrow$ $M$. For any $i=1, \ldots, n$ and $j=1, \ldots, m$ write

$$
x_{i} y_{j}=\sum a_{i j k} y_{k}
$$

for some $a_{i j k} \in R$. Consider the $S$-module $N$ generated by $y_{1}, \ldots, y_{m}$ subject to the relations $\sum a_{i j} y_{j}=0, i=1, \ldots, t$ and $x_{i} y_{j}=\sum a_{i j k} y_{k}, i=1, \ldots, n$ and $j=1, \ldots, m$. Then $N$ has a presentation

$$
S^{\oplus n m+t} \longrightarrow S^{\oplus m} \longrightarrow N \longrightarrow 0
$$

By construction there is a surjective $\operatorname{map} \varphi: N \rightarrow M$. To finish the proof we show $\varphi$ is injective. Suppose $z=\sum b_{j} y_{j} \in N$ for some $b_{j} \in S$. We may think of $b_{j}$ as a polynomial in $x_{1}, \ldots, x_{n}$ with coefficients in $R$. By applying the relations of the form $x_{i} y_{j}=\sum a_{i j k} y_{k}$ we can inductively lower the degree of the polynomials. Hence we see that $z=\sum c_{j} y_{j}$ for some $c_{j} \in R$. Hence if $\varphi(z)=0$ then the vector $\left(c_{1}, \ldots, c_{m}\right)$ is an $R$-linear combination of the vectors $\left(a_{i 1}, \ldots, a_{i m}\right)$ and we conclude that $z=0$ as desired.

### 10.7. Finite ring maps

0562
0563 Definition 10.7.1. Let $\varphi: R \rightarrow S$ be a ring map. We say $\varphi: R \rightarrow S$ is finite if $S$ is finite as an $R$-module.

00GJ Lemma 10.7.2. Let $R \rightarrow S$ be a finite ring map. Let $M$ be an $S$-module. Then $M$ is finite as an $R$-module if and only if $M$ is finite as an $S$-module.

Proof. One of the implications follows from Lemma 10.5.5. To see the other assume that $M$ is finite as an $S$-module. Pick $x_{1}, \ldots, x_{n} \in S$ which generate $S$ as an $R$ module. Pick $y_{1}, \ldots, y_{m} \in M$ which generate $M$ as an $S$-module. Then $x_{i} y_{j}$ generate $M$ as an $R$-module.

00GL Lemma 10.7.3. Suppose that $R \rightarrow S$ and $S \rightarrow T$ are finite ring maps. Then $R \rightarrow T$ is finite.

Proof. If $t_{i}$ generate $T$ as an $S$-module and $s_{j}$ generate $S$ as an $R$-module, then $t_{i} s_{j}$ generate $T$ as an $R$-module. (Also follows from Lemma 10.7.2.)

For more information on finite ring maps, please see Section 10.35 .

### 10.8. Colimits

07 N 7 Some of the material in this section overlaps with the general discussion on colimits in Categories, Sections 4.14-4.21.

00D3 Definition 10.8.1. A partially ordered set is a set $I$ together with a relation $\leq$ which is transitive (if $i \leq j$ and $j \leq k$ then $i \leq k$ ) and reflexive ( $i \leq i$ for all $i \in I$ ). A directed set $(I, \leq)$ is a partially ordered set $(I, \leq)$ such that $I$ is not empty and such that $\forall i, j \in I$, there exists $k \in I$ with $i \leq k, j \leq k$.

It is customary to drop the $\leq$ from the notation when talking about a partially ordered set (that is, one speaks of the partially ordered set $I$ rather than of the partially ordered set $(I, \leq))$. This is the same as the notion defined in Categories, Section 4.21

The notion "partially ordered set" is commonly abbreviated as "poset".
00D4 Definition 10.8.2. Let $(I, \leq)$ be a partially ordered set. A system $\left(M_{i}, \mu_{i j}\right)$ of $R$-modules over $I$ consists of a family of $R$-modules $\left\{M_{i}\right\}_{i \in I}$ indexed by $I$ and a family of $R$-module maps $\left\{\mu_{i j}: M_{i} \rightarrow M_{j}\right\}_{i \leq j}$ such that for all $i \leq j \leq k$

$$
\mu_{i i}=\operatorname{id}_{M_{i}} \quad \mu_{i k}=\mu_{j k} \circ \mu_{i j}
$$

We say $\left(M_{i}, \mu_{i j}\right)$ is a directed system if $I$ is a directed set.

This is the same as the notion defined in Categories, Definition 4.21.1 and Section 4.21 We refer to Categories, Definition 4.14 .2 for the definition of a colimit of a diagram/system in any category.
00D5 Lemma 10.8.3. Let $\left(M_{i}, \mu_{i j}\right)$ be a system of $R$-modules over the partially ordered set $I$. The colimit of the system $\left(M_{i}, \mu_{i j}\right)$ is the quotient $R$-module $\left(\bigoplus_{i \in I} M_{i}\right) / Q$ where $Q$ is the $R$-submodule generated by all elements

$$
\iota_{i}\left(x_{i}\right)-\iota_{j}\left(\mu_{i j}\left(x_{i}\right)\right)
$$

where $\iota_{i}: M_{i} \rightarrow \bigoplus_{i \in I} M_{i}$ is the natural inclusion. We denote the colimit $M=$ $\operatorname{colim}_{i} M_{i}$. We denote $\pi: \bigoplus_{i \in I} M_{i} \rightarrow M$ the projection map and $\phi_{i}=\pi \circ \iota_{i}: M_{i} \rightarrow$ $M$.

Proof. This lemma is a special case of Categories, Lemma 4.14 .11 but we will also prove it directly in this case. Namely, note that $\phi_{i}=\phi_{j} \circ \mu_{i j}$ in the above construction. To show the pair $\left(M, \phi_{i}\right)$ is the colimit we have to show it satisfies the universal property: for any other such pair $\left(Y, \psi_{i}\right)$ with $\psi_{i}: M_{i} \rightarrow Y, \psi_{i}=\psi_{j} \circ \mu_{i j}$, there is a unique $R$-module homomorphism $g: M \rightarrow Y$ such that the following diagram commutes:

And this is clear because we can define $g$ by taking the map $\psi_{i}$ on the summand $M_{i}$ in the direct sum $\bigoplus M_{i}$.

00D6 Lemma 10.8.4. Let $\left(M_{i}, \mu_{i j}\right)$ be a system of $R$-modules over the partially ordered set I. Assume that I is directed. The colimit of the system $\left(M_{i}, \mu_{i j}\right)$ is canonically isomorphic to the module $M$ defined as follows:
(1) as a set let

$$
M=\left(\coprod_{i \in I} M_{i}\right) / \sim
$$

where for $m \in M_{i}$ and $m^{\prime} \in M_{i^{\prime}}$ we have

$$
m \sim m^{\prime} \Leftrightarrow \mu_{i j}(m)=\mu_{i^{\prime} j}\left(m^{\prime}\right) \text { for some } j \geq i, i^{\prime}
$$

(2) as an abelian group for $m \in M_{i}$ and $m^{\prime} \in M_{i^{\prime}}$ we define the sum of the classes of $m$ and $m^{\prime}$ in $M$ to be the class of $\mu_{i j}(m)+\mu_{i^{\prime} j}\left(m^{\prime}\right)$ where $j \in I$ is any index with $i \leq j$ and $i^{\prime} \leq j$, and
(3) as an $R$-module define for $m \in M_{i}$ and $x \in R$ the product of $x$ and the class of $m$ in $M$ to be the class of $x m$ in $M$.
The canonical maps $\phi_{i}: M_{i} \rightarrow M$ are induced by the canonical maps $M_{i} \rightarrow$ $\coprod_{i \in I} M_{i}$.
Proof. Omitted. Compare with Categories, Section 4.19.
00D7 Lemma 10.8.5. Let $\left(M_{i}, \mu_{i j}\right)$ be a directed system. Let $M=\operatorname{colim} M_{i}$ with $\mu_{i}: M_{i} \rightarrow M$. Then, $\mu_{i}\left(x_{i}\right)=0$ for $x_{i} \in M_{i}$ if and only if there exists $j \geq i$ such that $\mu_{i j}\left(x_{i}\right)=0$.

Proof. This is clear from the description of the directed colimit in Lemma 10.8.4

00D8 Example 10.8.6. Consider the partially ordered set $I=\{a, b, c\}$ with $a<b$ and $a<c$ and no other strict inequalities. A system $\left(M_{a}, M_{b}, M_{c}, \mu_{a b}, \mu_{a c}\right)$ over $I$ consists of three $R$-modules $M_{a}, M_{b}, M_{c}$ and two $R$-module homomorphisms $\mu_{a b}$ : $M_{a} \rightarrow M_{b}$ and $\mu_{a c}: M_{a} \rightarrow M_{c}$. The colimit of the system is just

$$
M:=\operatorname{colim}_{i \in I} M_{i}=\operatorname{Coker}\left(M_{a} \rightarrow M_{b} \oplus M_{c}\right)
$$

where the map is $\mu_{a b} \oplus-\mu_{a c}$. Thus the kernel of the canonical map $M_{a} \rightarrow M$ is $\operatorname{Ker}\left(\mu_{a b}\right)+\operatorname{Ker}\left(\mu_{a c}\right)$. And the kernel of the canonical map $M_{b} \rightarrow M$ is the image of $\operatorname{Ker}\left(\mu_{a c}\right)$ under the map $\mu_{a b}$. Hence clearly the result of Lemma 10.8.5 is false for general systems.
00D9 Definition 10.8.7. Let $\left(M_{i}, \mu_{i j}\right),\left(N_{i}, \nu_{i j}\right)$ be systems of $R$-modules over the same partially ordered set $I$. A homomorphism of systems $\Phi$ from $\left(M_{i}, \mu_{i j}\right)$ to $\left(N_{i}, \nu_{i j}\right)$ is by definition a family of $R$-module homomorphisms $\phi_{i}: M_{i} \rightarrow N_{i}$ such that $\phi_{j} \circ \mu_{i j}=\nu_{i j} \circ \phi_{i}$ for all $i \leq j$.

This is the same notion as a transformation of functors between the associated diagrams $M: I \rightarrow \operatorname{Mod}_{R}$ and $N: I \rightarrow \operatorname{Mod}_{R}$, in the language of categories. The following lemma is a special case of Categories, Lemma 4.14.7.

00DA Lemma 10.8.8. Let $\left(M_{i}, \mu_{i j}\right),\left(N_{i}, \nu_{i j}\right)$ be systems of $R$-modules over the same partially ordered set. A morphism of systems $\Phi=\left(\phi_{i}\right)$ from $\left(M_{i}, \mu_{i j}\right)$ to $\left(N_{i}, \nu_{i j}\right)$ induces a unique homomorphism

$$
\operatorname{colim} \phi_{i}: \operatorname{colim} M_{i} \longrightarrow \operatorname{colim} N_{i}
$$

such that

commutes for all $i \in I$.
Proof. Write $M=\operatorname{colim} M_{i}$ and $N=\operatorname{colim} N_{i}$ and $\phi=\operatorname{colim} \phi_{i}$ (as yet to be constructed). We will use the explicit description of $M$ and $N$ in Lemma 10.8.3 without further mention. The condition of the lemma is equivalent to the condition that

commutes. Hence it is clear that if $\phi$ exists, then it is unique. To see that $\phi$ exists, it suffices to show that the kernel of the upper horizontal arrow is mapped by $\bigoplus \phi_{i}$ to the kernel of the lower horizontal arrow. To see this, let $j \leq k$ and $x_{j} \in M_{j}$. Then

$$
\left(\bigoplus \phi_{i}\right)\left(x_{j}-\mu_{j k}\left(x_{j}\right)\right)=\phi_{j}\left(x_{j}\right)-\phi_{k}\left(\mu_{j k}\left(x_{j}\right)\right)=\phi_{j}\left(x_{j}\right)-\nu_{j k}\left(\phi_{j}\left(x_{j}\right)\right)
$$

which is in the kernel of the lower horizontal arrow as required.

00DB Lemma 10.8.9. Let $I$ be a directed partially ordered set. Let $\left(L_{i}, \lambda_{i j}\right),\left(M_{i}, \mu_{i j}\right)$, and $\left(N_{i}, \nu_{i j}\right)$ be systems of $R$-modules over $I$. Let $\varphi_{i}: L_{i} \rightarrow M_{i}$ and $\psi_{i}: M_{i} \rightarrow N_{i}$ be morphisms of systems over $I$. Assume that for all $i \in I$ the sequence of $R$ modules

$$
L_{i} \xrightarrow{\varphi_{i}} M_{i} \xrightarrow{\psi_{i}} N_{i}
$$

is a complex with homology $H_{i}$. Then the $R$-modules $H_{i}$ form a system over $I$, the sequence of $R$-modules

$$
\operatorname{colim}_{i} L_{i} \xrightarrow{\varphi} \operatorname{colim}_{i} M_{i} \xrightarrow{\psi} \operatorname{colim}_{i} N_{i}
$$

is a complex as well, and denoting $H$ its homology we have

$$
H=\operatorname{colim}_{i} H_{i} .
$$

Proof. It is clear that $\operatorname{colim}_{i} L_{i} \xrightarrow{\varphi} \operatorname{colim}_{i} M_{i} \xrightarrow{\psi} \operatorname{colim}_{i} N_{i}$ is a complex. For each $i \in I$, there is a canonical $R$-module morphism $H_{i} \rightarrow H$ (sending each $[m] \in H_{i}=\operatorname{Ker}\left(\psi_{i}\right) / \operatorname{Im}\left(\varphi_{i}\right)$ to the residue class in $H=\operatorname{Ker}(\psi) / \operatorname{Im}(\varphi)$ of the image of $m$ in $\operatorname{colim}_{i} M_{i}$ ). These give rise to a morphism $\operatorname{colim}_{i} H_{i} \rightarrow H$. It remains to show that this morphism is surjective and injective.

We are going to repeatedly use the description of colimits over $I$ as in Lemma 10.8.4 without further mention. Let $h \in H$. Since $H=\operatorname{Ker}(\psi) / \operatorname{Im}(\varphi)$ we see that $h$ is the class mod $\operatorname{Im}(\varphi)$ of an element $[m]$ in $\operatorname{Ker}(\psi) \subset \operatorname{colim}_{i} M_{i}$. Choose an $i$ such that $[m]$ comes from an element $m \in M_{i}$. Choose a $j \geq i$ such that $\nu_{i j}\left(\psi_{i}(m)\right)=0$ which is possible since $[m] \in \operatorname{Ker}(\psi)$. After replacing $i$ by $j$ and $m$ by $\mu_{i j}(m)$ we see that we may assume $m \in \operatorname{Ker}\left(\psi_{i}\right)$. This shows that the map colim ${ }_{i} H_{i} \rightarrow H$ is surjective.

Suppose that $h_{i} \in H_{i}$ has image zero on $H$. Since $H_{i}=\operatorname{Ker}\left(\psi_{i}\right) / \operatorname{Im}\left(\varphi_{i}\right)$ we may represent $h_{i}$ by an element $m \in \operatorname{Ker}\left(\psi_{i}\right) \subset M_{i}$. The assumption on the vanishing of $h_{i}$ in $H$ means that the class of $m$ in $\operatorname{colim}_{i} M_{i}$ lies in the image of $\varphi$. Hence there exists a $j \geq i$ and an $l \in L_{j}$ such that $\varphi_{j}(l)=\mu_{i j}(m)$. Clearly this shows that the image of $h_{i}$ in $H_{j}$ is zero. This proves the injectivity of $\operatorname{colim}_{i} H_{i} \rightarrow H$.

00DC Example 10.8.10. Taking colimits is not exact in general. Consider the partially ordered set $I=\{a, b, c\}$ with $a<b$ and $a<c$ and no other strict inequalities, as in Example 10.8.6. Consider the map of systems $(0, \mathbf{Z}, \mathbf{Z}, 0,0) \rightarrow(\mathbf{Z}, \mathbf{Z}, \mathbf{Z}, 1,1)$. From the description of the colimit in Example 10.8.6 we see that the associated map of colimits is not injective, even though the map of systems is injective on each object. Hence the result of Lemma 10.8.9 is false for general systems.

04B0 Lemma 10.8.11. Let $\mathcal{I}$ be an index category satisfying the assumptions of Categories, Lemma 4.19.7. Then taking colimits of diagrams of abelian groups over $\mathcal{I}$ is exact (i.e., the analogue of Lemma 10.8 .9 holds in this situation).

Proof. By Categories, Lemma 4.19.7 we may write $\mathcal{I}=\coprod_{j \in J} \mathcal{I}_{j}$ with each $\mathcal{I}_{j}$ a filtered category, and $J$ possibly empty. By Categories, Lemma 4.21 .3 taking colimits over the index categories $\mathcal{I}_{j}$ is the same as taking the colimit over some directed partially ordered set. Hence Lemma 10.8 .9 applies to these colimits. This reduces the problem to showing that coproducts in the category of $R$-modules over
the set $J$ are exact. In other words, exact sequences $L_{j} \rightarrow M_{j} \rightarrow N_{j}$ of $R$ modules we have to show that

$$
\bigoplus_{j \in J} L_{j} \longrightarrow \bigoplus_{j \in J} M_{j} \longrightarrow \bigoplus_{j \in J} N_{j}
$$

is exact. This can be verified by hand, and holds even if $J$ is empty.
For purposes of reference, we define what it means to have a relation between elements of a module.

07N8 Definition 10.8.12. Let $R$ be a ring. Let $M$ be an $R$-module. Let $n \geq 0$ and $x_{i} \in M$ for $i=1, \ldots, n$. A relation between $x_{1}, \ldots, x_{n}$ in $M$ is a sequence of elements $f_{1}, \ldots, f_{n} \in R$ such that $\sum_{i=1, \ldots, n} f_{i} x_{i}=0$.

00HA Lemma 10.8.13. Let $R$ be a ring and let $M$ be an $R$-module. Then $M$ is the colimit of a directed system $\left(M_{i}, \mu_{i j}\right)$ of $R$-modules with all $M_{i}$ finitely presented $R$-modules.

Proof. Consider any finite subset $S \subset M$ and any finite collection of relations $E$ among the elements of $S$. So each $s \in S$ corresponds to $x_{s} \in M$ and each $e \in E$ consists of a vector of elements $f_{e, s} \in R$ such that $\sum f_{e, s} x_{s}=0$. Let $M_{S, E}$ be the cokernel of the map

$$
R^{\# E} \longrightarrow R^{\# S}, \quad\left(g_{e}\right)_{e \in E} \longmapsto\left(\sum g_{e} f_{e, s}\right)_{s \in S}
$$

There are canonical maps $M_{S, E} \rightarrow M$. If $S \subset S^{\prime}$ and if the elements of $E$ correspond, via this map, to relations in $E^{\prime}$, then there is an obvious map $M_{S, E} \rightarrow M_{S^{\prime}, E^{\prime}}$ commuting with the maps to $M$. Let $I$ be the set of pairs $(S, E)$ with ordering by inclusion as above. It is clear that the colimit of this directed system is $M$.

### 10.9. Localization

00CM
00CN Definition 10.9.1. Let $R$ be a ring, $S$ a subset of $R$. We say $S$ is a multiplicative subset of $R$ is $1 \in S$ and $S$ is closed under multiplication, i.e., $s, s^{\prime} \in S \Rightarrow s s^{\prime} \in S$.
Given a ring $A$ and a multiplicative subset $S$, we define a relation on $A \times S$ as follows:

$$
(x, s) \sim(y, t) \Leftrightarrow \exists u \in S \text { such that }(x t-y s) u=0
$$

It is easily checked that this is an equivalence relation. Let $x / s$ (or $\frac{x}{s}$ ) be the equivalence class of $(x, s)$ and $S^{-1} A$ be the set of all equivalence classes. Define addition and multiplication in $S^{-1} A$ as follows:

$$
x / s+y / t=(x t+y s) / s t, \quad x / s \cdot y / t=x y / s t
$$

One can check that $S^{-1} A$ becomes a ring under these operations.
00 CO Definition 10.9.2. This ring is called the localization of $A$ with respect to $S$.
We have a natural ring map from $A$ to its localization $S^{-1} A$,

$$
A \longrightarrow S^{-1} A, \quad x \longmapsto x / 1
$$

which is sometimes called the localization map. In general the localization map is not injective, unless $S$ contains no zerodivisors. For, if $x / 1=0$, then there is a $u \in S$ such that $x u=0$ in $A$ and hence $x=0$ since there are no zerodivisors in $S$. The localization of a ring has the following universal property.

00CP Proposition 10.9.3. Let $f: A \rightarrow B$ be a ring map that sends every element in $S$ to a unit of $B$. Then there is a unique homomorphism $g: S^{-1} A \rightarrow B$ such that the following diagram commutes.

Proof. Existence. We define a map $g$ as follows. For $x / s \in S^{-1} A$, let $g(x / s)=$ $f(x) f(s)^{-1} \in B$. It is easily checked from the definition that this is a well-defined ring map. And it is also clear that this makes the diagram commutative.

Uniqueness. We now show that if $g^{\prime}: S^{-1} A \rightarrow B$ satisfies $g^{\prime}(x / 1)=f(x)$, then $g=g^{\prime}$. Hence $f(s)=g^{\prime}(s / 1)$ for $s \in S$ by the commutativity of the diagram. But then $g^{\prime}(1 / s) f(s)=1$ in $B$, which implies that $g^{\prime}(1 / s)=f(s)^{-1}$ and hence $g^{\prime}(x / s)=g^{\prime}(x / 1) g^{\prime}(1 / s)=f(x) f(s)^{-1}=g(x / s)$.

00 CQ Lemma 10.9.4. The localization $S^{-1} A$ is the zero ring if and only if $0 \in S$.
Proof. If $0 \in S$, any pair $(a, s) \sim(0,1)$ by definition. If $0 \notin S$, then clearly $1 / 1 \neq 0 / 1$ in $S^{-1} A$.

07JY Lemma 10.9.5. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset. The category of $S^{-1} R$-modules is equivalent to the category of $R$-modules $N$ with the property that every $s \in S$ acts as an automorphism on $N$.

Proof. The functor which defines the equivalence associates to an $S^{-1} R$-module $M$ the same module but now viewed as an $R$-module via the localization map $R \rightarrow S^{-1} R$. Conversely, if $N$ is an $R$-module, such that every $s \in S$ acts via an automorphism $s_{N}$, then we can think of $N$ as an $S^{-1} R$-module by letting $x / s$ act via $x_{N} \circ s_{N}^{-1}$. We omit the verification that these two functors are quasi-inverse to each other.

The notion of localization of a ring can be generalized to the localization of a module. Let $A$ be a ring, $S$ a multiplicative subset of $A$ and $M$ an $A$-module. We define a relation on $M \times S$ as follows

$$
(m, s) \sim(n, t) \Leftrightarrow \exists u \in S \text { such that }(m t-n s) u=0
$$

This is clearly an equivalence relation. Denote by $m / s$ (or $\frac{m}{s}$ ) be the equivalence class of $(m, s)$ and $S^{-1} M$ be the set of all equivalence classes. Define the addition and scalar multiplication as follows

$$
m / s+n / t=(m t+n s) / s t, \quad m / s \cdot n / t=m n / s t
$$

It is clear that this makes $S^{-1} M$ an $S^{-1} A$ module.
07JZ Definition 10.9.6. The $S^{-1} A$-module $S^{-1} M$ is called the localization of $M$ at $S$.
Note that there is an $A$-module map $M \rightarrow S^{-1} M, m \mapsto m / 1$ which is sometimes called the localization map. It satisfies the following universal property.

07K0 Lemma 10.9.7. Let $R$ be a ring. Let $S \subset R$ a multiplicative subset. Let $M, N$ be $R$-modules. Assume all the elements of $S$ act as automorphisms on $N$. Then the canonical map

$$
\operatorname{Hom}_{R}\left(S^{-1} M, N\right) \longrightarrow \operatorname{Hom}_{R}(M, N)
$$

induced by the localization map, is an isomorphism.
Proof. It is clear that the map is well-defined and R-linear. Injectivity: Let $\alpha \in$ $\operatorname{Hom}_{R}\left(S^{-1} M, N\right)$ and take an arbitrary element $m / s \in S^{-1} M$. Then, since $s$. $\alpha(m / s)=\alpha(m / 1)$, we have $\alpha(m / s)=s^{-1}(\alpha(m / 1))$, so $\alpha$ is completely determined by what it does on the image of $M$ in $S^{-1} M$. Surjectivity: Let $\beta: M \rightarrow N$ be a given R-linear map. We need to show that it can be "extended" to $S^{-1} M$. Define a map of sets

$$
M \times S \rightarrow N, \quad(m, s) \mapsto s^{-1}(m)
$$

Clearly, this map respects the equivalence relation from above, so it descends to a well-defined map $\alpha: S^{-1} M \rightarrow N$. It remains to show that this map is $R$-linear, so take $r, r^{\prime} \in R$ as well as $s, s^{\prime} \in S$ and $m, m^{\prime} \in M$. Then

$$
\begin{aligned}
\alpha\left(r \cdot m / s+r^{\prime} \cdot m^{\prime} / s^{\prime}\right) & =\alpha\left(\left(r \cdot s \prime \cdot m+r \prime \cdot s \cdot m^{\prime}\right) /\left(s s^{\prime}\right)\right) \\
& =\left(s s^{\prime}\right)^{-1}\left(\beta\left(r \cdot s \prime \cdot m+r \prime \cdot s \cdot m^{\prime}\right)\right. \\
& =\left(s s^{\prime}\right)^{-1}\left(r \cdot s^{\prime} \beta(m)+r^{\prime} \cdot s \beta\left(m^{\prime}\right)\right. \\
& =r \alpha(m / s)+r^{\prime} \alpha\left(m^{\prime} / s^{\prime}\right)
\end{aligned}
$$

and we win.
02C5 Example 10.9.8. Let $A$ be a ring and let $M$ be an $A$-module. Here are some important examples of localizations.
(1) Given $\mathfrak{p}$ a prime ideal of $A$ consider $S=A \backslash \mathfrak{p}$. It is immediately checked that $S$ is a multiplicative set. In this case we denote $A_{\mathfrak{p}}$ and $M_{\mathfrak{p}}$ the localization of $A$ and $M$ with respect to $S$ respectively. These are called the localization of $A$, resp. $M$ at $\mathfrak{p}$.
(2) Let $f \in A$. Consider $S=\left\{1, f, f^{2}, \ldots\right\}$. This is clearly a multiplicative subset of $A$. In this case we denote $A_{f}\left(\right.$ resp. $\left.M_{f}\right)$ the localization $S^{-1} A$ (resp. $S^{-1} M$ ). This is called the localization of $A$, resp. $M$ with respect to $f$. Note that $A_{f}=0$ if and only if $f$ is nilpotent in $A$.
(3) Let $S=\{f \in A \mid f$ is not a zerodivisor in $A\}$. This is a multiplicative subset of $A$. In this case the ring $Q(A)=S^{-1} A$ is called either the total quotient ring, or the total ring of fractions of $A$.
00CR Lemma 10.9.9. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset. Let $M$ be an $R$-module. Then

$$
S^{-1} M=\operatorname{colim}_{f \in S} M_{f}
$$

where the partial ordering on $S$ is given by $f \geq f^{\prime} \Leftrightarrow f=f^{\prime} f^{\prime \prime}$ for some $f^{\prime \prime} \in R$ in which case the $\operatorname{map} M_{f^{\prime}} \rightarrow M_{f}$ is given by $m /\left(f^{\prime}\right)^{e} \mapsto m\left(f^{\prime \prime}\right)^{e} / f^{e}$.

Proof. Omitted. Hint: Use the universal property of Lemma 10.9.7.
In the following paragraph, let $A$ denote a ring, and $M, N$ denote modules over $A$.
If $S$ and $S^{\prime}$ are multiplicative sets of $A$, then it is clear that

$$
S S^{\prime}=\left\{s s^{\prime}: s \in S, s^{\prime} \in S^{\prime}\right\}
$$

is also a multiplicative set of $A$. Then the following holds.

02C6 Proposition 10.9.10. Let $\bar{S}$ be the image of $S$ in $S^{\prime-1} A$, then $\left(S S^{\prime}\right)^{-1} A$ is isomorphic to $\bar{S}^{-1}\left(S^{\prime-1} A\right)$.

Proof. The map sending $x \in A$ to $x / 1 \in\left(S S^{\prime-1}\right) A$ induces a map sending $x / s \in$ $S^{\prime-1} A$ to $x / s \in\left(S S^{\prime-1}\right) A$, by universal property. The image of the elements in $\bar{S}$ are invertible in $\left(S S^{\prime-1}\right) A$. By the universal property we get a map $f: \bar{S}^{-1}\left(S^{\prime-1} A\right) \rightarrow$ $\left(S S^{\prime-1}\right) A$ which maps $\left(x / t^{\prime}\right) /\left(s / s^{\prime}\right)$ to $\left(x / t^{\prime}\right) \cdot\left(s / s^{\prime}\right)^{-1}$.
On the other hand, the map from $A$ to $\bar{S}^{-1}\left(S^{\prime-1} A\right)$ sending $x \in A$ to $(x / 1) /(1 / 1)$ also induces a map $g:\left(S S^{\prime-1}\right) A \rightarrow \bar{S}^{-1}\left(S^{\prime-1} A\right)$ which sends $x / s s^{\prime}$ to $\left(x / s^{\prime}\right) /(s / 1)$, by the universal property again. It is immediately checked that $f$ and $g$ are inverse to each other, hence they are both isomorphisms.

For the module $M$ we have
02C7 Proposition 10.9.11. View $S^{\prime-1} M$ as an $A$-module, then $S^{-1}\left(S^{\prime-1} M\right)$ is isomorphic to $\left(S S^{\prime}\right)^{-1} M$.

Proof. Note that given a $A$-module M , we have not proved any universal property for $S^{-1} M$. Hence we cannot reason as in the preceding proof; we have to construct the isomorphism explicitly.

We define the maps as follows
$f: S^{-1}\left(S^{\prime-1} M\right) \longrightarrow\left(S S^{\prime}\right)^{-1} M, \quad \frac{x / s^{\prime}}{s} \mapsto x / s s^{\prime}$
$g:\left(S S^{\prime}\right)^{-1} M \longrightarrow S^{-1}\left(S^{\prime-1} M\right), \quad x / t \mapsto \frac{x / s^{\prime}}{s}$ for some $s \in S, s^{\prime} \in S^{\prime}$, and $t=s s^{\prime}$
We have to check that these homomorphisms are well-defined, that is, independent the choice of the fraction. This is easily checked and it is also straightforward to show that they are inverse to each other.

If $u: M \rightarrow N$ is an $A$ homomorphism, then the localization indeed induces a well-defined $S^{-1} A$ homomorphism $S^{-1} u: S^{-1} M \rightarrow S^{-1} N$ which sends $x / s$ to $u(x) / s$. It is immediately checked that this construction is functorial, so that $S^{-1}$ is actually a functor from the category of $A$-modules to the category of $S^{-1} A$ modules. Moreover this functor is exact, as we show in the following proposition.

00CS Proposition 10.9.12. Let $L \xrightarrow{u} M \xrightarrow{v} N$ is an exact sequence of $R$-modules. Then $S^{-1} L \rightarrow S^{-1} M \rightarrow S^{-1} N$ is also exact.

Proof. First it is clear that $S^{-1} L \rightarrow S^{-1} M \rightarrow S^{-1} N$ is a complex since localization is a functor. Next suppose that $x / s$ maps to zero in $S^{-1} N$ for some $x / s \in S^{-1} M$. Then by definition there is a $t \in S$ such that $v(x t)=v(x) t=0$ in $M$, which means $x t \in \operatorname{Ker}(v)$. By the exactness of $L \rightarrow M \rightarrow N$ we have $x t=u(y)$ for some $y$ in $L$. Then $x / s$ is the image of $y / s t$. This proves the exactness.

02C8 Lemma 10.9.13. Localization respects quotients, i.e. if $N$ is a submodule of $M$, then $S^{-1}(M / N) \simeq\left(S^{-1} M\right) /\left(S^{-1} N\right)$.

Proof. From the exact sequence

$$
0 \longrightarrow N \longrightarrow M \longrightarrow M / N \longrightarrow 0
$$

we have

$$
0 \longrightarrow S^{-1} N \longrightarrow S^{-1} M \longrightarrow S^{-1}(M / N) \longrightarrow 0
$$

The corollary then follows.

If, in the preceding Corollary, we take $N=I$ and $M=A$ for an ideal $I$ of $A$, we see that $S^{-1} A / S^{-1} I \simeq S^{-1}(A / I)$ as $A$-modules. The next proposition shows that they are isomorphic as rings.

00CT Proposition 10.9.14. Let $I$ be an ideal of $A, S$ a multiplicative set of $A$. Then $S^{-1} I$ is an ideal of $S^{-1} A$ and $\bar{S}^{-1}(A / I)$ is isomorphic to $S^{-1} A / S^{-1} I$, where $\bar{S}$ is the image of $S$ in $A / I$.

Proof. The fact that $S^{-1} I$ is an ideal is clear since $I$ itself is an ideal. Define

$$
f: S^{-1} A \longrightarrow \bar{S}^{-1}(A / I), \quad x / s \mapsto \bar{x} / \bar{s}
$$

where $\bar{x}$ and $\bar{s}$ are the images of $x$ and $s$ in $A / I$. We shall keep similar notations in this proof. This map is well-defined by the universal property of $S^{-1} A$, and $S^{-1} I$ is contained in the kernel of it, therefore it induces a map

$$
\bar{f}: S^{-1} A / S^{-1} I \longrightarrow \bar{S}^{-1}(A / I), \quad \overline{x / s} \mapsto \bar{x} / \bar{s}
$$

On the other hand, the map $A \rightarrow S^{-1} A / S^{-1} I$ sending $x$ to $\overline{x / 1}$ induces a map $A / I \rightarrow S^{-1} A / S^{-1} I$ sending $\bar{x}$ to $\overline{x / 1}$. The image of $\bar{S}$ is invertible in $S^{-1} A / S^{-1} I$, thus induces a map

$$
g: \bar{S}^{-1}(A / I) \longrightarrow S^{-1} A / S^{-1} I, \quad \frac{\bar{x}}{\bar{s}} \mapsto \overline{x / s}
$$

by the universal property. It is then clear that $\bar{f}$ and $g$ are inverse to each other, hence are both isomorphisms.

We now consider how submodules behave in localization.
00CU Lemma 10.9.15. Any submodule $N^{\prime}$ of $S^{-1} M$ is of the form $S^{-1} N$ for some $N \subset M$. Indeed one can take $N$ to be the inverse image of $N^{\prime}$ in $M$.

Proof. Let $N$ be the inverse image of $N^{\prime}$ in $M$. Then one can see that $S^{-1} N \supset N^{\prime}$. To show they are equal, take $x / s$ in $S^{-1} N$, where $s \in S$ and $x \in N$. This yields that $x / 1 \in N^{\prime}$. Since $N^{\prime}$ is an $S^{-1} R$-submodule we have $x / s=x / 1 \cdot 1 / s \in N^{\prime}$. This finishes the proof.

Taking $M=A$ and $N=I$ an ideal of $A$, we have the following corollary, which can be viewed as a converse of the first part of Proposition 10.9.14.

02C9 Lemma 10.9.16. Each ideal $I^{\prime}$ of $S^{-1} A$ takes the form $S^{-1} I$, where one can take $I$ to be the inverse image of $I^{\prime}$ in $A$.

Proof. Immediate from Lemma 10.9 .15

### 10.10. Internal Hom

0581 If $R$ is a ring, and $M, N$ are $R$-modules, then

$$
\operatorname{Hom}_{R}(M, N)=\{\varphi: M \rightarrow N\}
$$

is the set of $R$-linear maps from $M$ to $N$. This set comes with the structure of an abelian group by setting $(\varphi+\psi)(m)=\varphi(m)+\psi(m)$, as usual. In fact, $\operatorname{Hom}_{R}(M, N)$ is also an $R$-module via the rule $(x \varphi)(m)=x \varphi(m)=\varphi(x m)$.
Given maps $a: M \rightarrow M^{\prime}$ and $b: N \rightarrow N^{\prime}$ of $R$-modules, we can pre-compose and post-compose homomorphisms by $a$ and $b$. This leads to the following commutative diagram

In fact, the maps in this diagram are $R$-module maps. Thus $\operatorname{Hom}_{R}$ defines an additive functor

$$
\operatorname{Mod}_{R}^{o p p} \times \operatorname{Mod}_{R} \longrightarrow \operatorname{Mod}_{R}, \quad(M, N) \longmapsto \operatorname{Hom}_{R}(M, N)
$$

0582 Lemma 10.10.1. Exactness and $\operatorname{Hom}_{R}$. Let $R$ be a ring.
(1) Let $M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0$ be a complex of $R$-modules. Then $M_{1} \rightarrow M_{2} \rightarrow$ $M_{3} \rightarrow 0$ is exact if and only if $0 \rightarrow \operatorname{Hom}_{R}\left(M_{3}, N\right) \rightarrow \operatorname{Hom}_{R}\left(M_{2}, N\right) \rightarrow$ $\operatorname{Hom}_{R}\left(M_{1}, N\right)$ is exact for all $R$-modules $N$.
(2) Let $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3}$ be a complex of $R$-modules. Then $0 \rightarrow M_{1} \rightarrow$ $M_{2} \rightarrow M_{3}$ is exact if and only if $0 \rightarrow \operatorname{Hom}_{R}\left(N, M_{1}\right) \rightarrow \operatorname{Hom}_{R}\left(N, M_{2}\right) \rightarrow$ $\operatorname{Hom}_{R}\left(N, M_{3}\right)$ is exact for all $R$-modules $N$.

Proof. Omitted.
0583 Lemma 10.10.2. Let $R$ be a ring. Let $M$ be a finitely presented $R$-module. Let $N$ be an $R$-module.
(1) For $f \in R$ we have $\operatorname{Hom}_{R}(M, N)_{f}=\operatorname{Hom}_{R_{f}}\left(M_{f}, N_{f}\right)=\operatorname{Hom}_{R}\left(M_{f}, N_{f}\right)$,
(2) for a multiplicative subset $S$ of $R$ we have
$S^{-1} \operatorname{Hom}_{R}(M, N)=\operatorname{Hom}_{S^{-1} R}\left(S^{-1} M, S^{-1} N\right)=\operatorname{Hom}_{R}\left(S^{-1} M, S^{-1} N\right)$.
Proof. Part (1) is a special case of part (2). The second equality in (2) follows from Lemma 10.9.7. Choose a presentation

$$
\bigoplus_{j=1, \ldots, m} R \longrightarrow \bigoplus_{i=1, \ldots, n} R \rightarrow M \rightarrow 0
$$

By Lemma 10.10 .1 this gives an exact sequence

$$
0 \rightarrow \operatorname{Hom}_{R}(M, N) \rightarrow \bigoplus_{i=1, \ldots, n} N \longrightarrow \bigoplus_{j=1, \ldots, m} N
$$

Inverting $S$ and using Proposition 10.9 .12 we get an exact sequence

$$
0 \rightarrow S^{-1} \operatorname{Hom}_{R}(M, N) \rightarrow \bigoplus_{i=1, \ldots, n} S^{-1} N \longrightarrow \bigoplus_{j=1, \ldots, m} S^{-1} N
$$

and the result follows since $S^{-1} M$ sits in an exact sequence

$$
\bigoplus_{j=1, \ldots, m} S^{-1} R \longrightarrow \bigoplus_{i=1, \ldots, n} S^{-1} R \rightarrow S^{-1} M \rightarrow 0
$$

which induces (by Lemma 10.10.1) the exact sequence

$$
0 \rightarrow \operatorname{Hom}_{S^{-1} R}\left(S^{-1} M, S^{-1} N\right) \rightarrow \bigoplus_{i=1, \ldots, n} S^{-1} N \longrightarrow \bigoplus_{j=1, \ldots, m} S^{-1} N
$$

which is the same as the one above.

### 10.11. Tensor products

00 CV
00CW Definition 10.11.1. Let $R$ be a ring, $M, N, P$ be three $R$-modules. A mapping $f: M \times N \rightarrow P$ (where $M \times N$ is viewed only as Cartesian product of two $R$ modules) is said to be $R$-bilinear if for each $x \in M$ the mapping $y \mapsto f(x, y)$ of $N$ into $P$ is $R$-linear, and for each $y \in N$ the mapping $x \mapsto f(x, y)$ is also $R$-linear.

00CX Lemma 10.11.2. Let $M, N$ be $R$-modules. Then there exists a pair $(T, g)$ where $T$ is an $R$-module, and $g: M \times N \rightarrow T$ an $R$-bilinear mapping, with the following universal property: For any $R$-module $P$ and any $R$-bilinear mapping $f: M \times N \rightarrow$ $P$, there exists a unique $R$-linear mapping $\tilde{f}: T \rightarrow P$ such that $f=\tilde{f} \circ g$. In other words, the following diagram commutes:

Moreover, if $(T, g)$ and $\left(T^{\prime}, g^{\prime}\right)$ are two pairs with this property, then there exists a unique isomorphism $j: T \rightarrow T^{\prime}$ such that $j \circ g=g^{\prime}$.

The $R$-module $T$ which satisfies the above universal property is called the tensor product of $R$-modules $M$ and $N$, denoted as $M \otimes_{R} N$.

Proof. We first prove the existence of such $R$-module $T$. Let $M, N$ be $R$-modules. Let $T$ be the quotient module $P / Q$, where $P$ is the free $R$-module $R^{(M \times N)}$ and $Q$ is the $R$-module generated by all elements of the following types: $(x \in M, y \in N)$

$$
\begin{array}{r}
\left(x+x^{\prime}, y\right)-(x, y)-\left(x^{\prime}, y\right), \\
\left(x, y+y^{\prime}\right)-(x, y)-\left(x, y^{\prime}\right), \\
(a x, y)-a(x, y), \\
(x, a y)-a(x, y)
\end{array}
$$

Let $\pi: M \times N \rightarrow T$ denote the natural map. This map is $R$-bilinear, as implied by the above relations when we check the bilinearity conditions. Denote the image $\pi(x, y)=x \otimes y$, then these elements generate $T$. Now let $f: M \times N \rightarrow P$ be an $R$-bilinear map, then we can define $f^{\prime}: T \rightarrow P$ by extending the mapping $f^{\prime}(x \otimes y)=f(x, y)$. Clearly $f=f^{\prime} \circ \pi$. Moreover, $f^{\prime}$ is uniquely determined by the value on the generating sets $\{x \otimes y: x \in M, y \in N\}$. Suppose there is another pair $\left(T^{\prime}, g^{\prime}\right)$ satisfying the same properties. Then there is a unique $j: T \rightarrow T^{\prime}$ and also $j^{\prime}: T^{\prime} \rightarrow T$ such that $g^{\prime}=j \circ g, g=j^{\prime} \circ g^{\prime}$. But then both the maps $\left(j \circ j^{\prime}\right) \circ g$ and $g$ satisfies the universal properties, so by uniqueness they are equal, and hence $j^{\prime} \circ j$ is identity on $T$. Similarly $\left(j^{\prime} \circ j\right) \circ g^{\prime}=g^{\prime}$ and $j \circ j^{\prime}$ is identity on $T^{\prime}$. So $j$ is an isomorphism.

00CY Lemma 10.11.3. Let $M, N, P$ be $R$-modules, then the bilinear maps

$$
\begin{aligned}
(x, y) & \mapsto y \otimes x \\
(x+y, z) & \mapsto x \otimes z+y \otimes z \\
(r, x) & \mapsto r x
\end{aligned}
$$

induce unique isomorphisms

$$
\begin{aligned}
M \otimes_{R} N & \rightarrow N \otimes_{R} M, \\
(M \oplus N) \otimes_{R} P & \rightarrow\left(M \otimes_{R} P\right) \oplus\left(N \otimes_{R} P\right), \\
R \otimes_{R} M & \rightarrow M
\end{aligned}
$$

Proof. Omitted.
We may generalize the tensor product of two $R$-modules to finitely many $R$-modules, and set up a correspondence between the multi-tensor product with multilinear mappings. Using almost the same construction one can prove that:
00 CZ Lemma 10.11.4. Let $M_{1}, \ldots, M_{r}$ be $R$-modules. Then there exists a pair $(T, g)$ consisting of an $R$-module $T$ and an $R$-multilinear mapping $g: M_{1} \times \ldots \times M_{r} \rightarrow T$ with the universal property: For any $R$-multilinear mapping $f: M_{1} \times \ldots \times M_{r} \rightarrow P$ there exists a unique $R$-module homomorphism $f^{\prime}: T \rightarrow P$ such that $f^{\prime} \circ g=f$. Such a module $T$ is unique up to unique isomorphism. We denote it $M_{1} \otimes_{R} \ldots \otimes_{R} M_{r}$ and we denote the universal multilinear $\operatorname{map}\left(m_{1}, \ldots, m_{r}\right) \mapsto m_{1} \otimes \ldots \otimes m_{r}$.

Proof. Omitted.
00D0
Lemma 10.11.5. The homomorphisms

$$
\left(M \otimes_{R} N\right) \otimes_{R} P \rightarrow M \otimes_{R} N \otimes_{R} P \rightarrow M \otimes_{R}\left(N \otimes_{R} P\right)
$$

such that $f((x \otimes y) \otimes z)=x \otimes y \otimes z$ and $g(x \otimes y \otimes z)=x \otimes(y \otimes z), x \in M, y \in N, z \in P$ are well-defined and are isomorphisms.

Proof. We shall prove $f$ is well-defined and is an isomorphism, and this proof carries analogously to $g$. Fix any $z \in P$, then the mapping $(x, y) \mapsto x \otimes y \otimes$ $z, x \in M, y \in N$, is $R$-bilinear in $x$ and $y$, and hence induces homomorphism $f_{z}: M \otimes N \rightarrow M \otimes N \otimes P$ which sends $f_{z}(x \otimes y)=x \otimes y \otimes z$. Then consider $(M \otimes N) \times P \rightarrow M \otimes N \otimes P$ given by $(w, z) \mapsto f_{z}(w)$. The map is $R$-bilinear and thus induces $f:\left(M \otimes_{R} N\right) \otimes_{R} P \rightarrow M \otimes_{R} N \otimes_{R} P$ and $f((x \otimes y) \otimes z)=x \otimes y \otimes z$. To construct the inverse, we note that the map $\pi: M \times N \times P \rightarrow(M \otimes N) \otimes P$ is $R$-trilinear. Therefore, it induces an $R$-linear map $h: M \otimes N \otimes P \rightarrow(M \otimes N) \otimes P$ which agrees with the universal property. Here we see that $h(x \otimes y \otimes z)=(x \otimes y) \otimes z$. From the explicit expression of $f$ and $h, f \circ h$ and $h \circ f$ are identity maps of $M \otimes N \otimes P$ and $(M \otimes N) \otimes P$ respectively, hence $f$ is our desired isomorphism.

Doing induction we see that this extends to multi-tensor products. Combined with Lemma 10.11 .3 we see that the tensor product operation on the category of $R$ modules is associative, commutative and distributive.

00D1 Definition 10.11.6. An abelian group $N$ is called an $(A, B)$-bimodule if it is both an $A$-module and a $B$-module, and the actions $A \rightarrow \operatorname{End}(M)$ and $B \rightarrow \operatorname{End}(M)$ are compatible in the sense that $(a x) b=a(x b)$ for all $a \in A, b \in B, x \in N$. Usually we denote it as ${ }_{A} N_{B}$.

00D2 Lemma 10.11.7. For $A$-module $M, B$-module $P$ and $(A, B)$-bimodule $N$, the modules $\left(M \otimes_{A} N\right) \otimes_{B} P$ and $M \otimes_{A}\left(N \otimes_{B} P\right)$ can both be given $(A, B)$-bimodule structure, and moreover

$$
\left(M \otimes_{A} N\right) \otimes_{B} P \cong M \otimes_{A}\left(N \otimes_{B} P\right)
$$

Proof. A priori $M \otimes_{A} N$ is an $A$-module, but we can give it a $B$-module structure by letting

$$
(x \otimes y) b=x \otimes y b, \quad x \in M, y \in N, b \in B
$$

Thus $M \otimes_{A} N$ becomes an $(A, B)$-bimodule. Similarly for $N \otimes_{B} P$, and thus for $\left(M \otimes_{A} N\right) \otimes_{B} P$ and $M \otimes_{A}\left(N \otimes_{B} P\right)$. By Lemma 10.11.5, these two modules are isomorphic as both as $A$-module and $B$-module via the same mapping.

00DE Lemma 10.11.8. For any three $R$-modules $M, N, P$,

$$
\operatorname{Hom}_{R}\left(M \otimes_{R} N, P\right) \cong \operatorname{Hom}_{R}\left(M, \operatorname{Hom}_{R}(N, P)\right)
$$

Proof. An $R$-linear map $\hat{f} \in \operatorname{Hom}_{R}\left(M \otimes_{R} N, P\right)$ corresponds to an $R$-bilinear map $f: M \times N \rightarrow P$. For each $x \in M$ the mapping $y \mapsto f(x, y)$ is $R$-linear by the universal property. Thus $f$ corresponds to a map $\phi_{f}: M \rightarrow \operatorname{Hom}_{R}(N, P)$. This map is $R$-linear since

$$
\phi_{f}(a x+y)(z)=f(a x+y, z)=a f(x, z)+f(y, z)=\left(a \phi_{f}(x)+\phi_{f}(y)\right)(z)
$$

for all $a \in R, x \in M, y \in M$ and $z \in N$. Conversely, any $f \in \operatorname{Hom}_{R}\left(M, \operatorname{Hom}_{R}(N, P)\right)$ defines an $R$-bilinear map $M \times N \rightarrow P$, namely $(x, y) \mapsto f(x)(y)$. So this is a natural one-to-one correspondence between the two modules $\operatorname{Hom}_{R}\left(M \otimes_{R} N, P\right)$ and $\operatorname{Hom}_{R}\left(M, \operatorname{Hom}_{R}(N, P)\right)$.

00DD Lemma 10.11.9 (Tensor products commute with colimits). Let $\left(M_{i}, \mu_{i j}\right)$ be a system over the partially ordered set $I$. Let $N$ be an $R$-module. Then

$$
\operatorname{colim}\left(M_{i} \otimes N\right) \cong\left(\operatorname{colim} M_{i}\right) \otimes N
$$

Moreover, the isomorphism is induced by the homomorphisms $\mu_{i} \otimes 1: M_{i} \otimes N \rightarrow$ $M \otimes N$ where $M=\operatorname{colim}_{i} M_{i}$ with natural maps $\mu_{i}: M_{i} \rightarrow M$.

Proof. First proof. The functor $M^{\prime} \mapsto M^{\prime} \otimes_{R} N$ is left adjoint to the functor $N^{\prime} \mapsto \operatorname{Hom}_{R}\left(N, N^{\prime}\right)$ by Lemma 10.11.8. Thus $M^{\prime} \mapsto M^{\prime} \otimes_{R} N$ commutes with all colimits, see Categories, Lemma 4.24.4.

Second direct proof. Let $P=\operatorname{colim}\left(M_{i} \otimes N\right), M=\operatorname{colim} M_{i}$. Then for all $i \leq j$, the following diagram commutes:

By Lemma 10.8.8, these maps induce a unique homomorphism $\psi: P \rightarrow M \otimes N$, with $\lambda_{i}: M_{i} \otimes N \rightarrow P$ given by $\lambda_{i}=\pi \circ\left(\iota_{i} \otimes 1\right)$.
To construct the inverse map, for each $i \in I$, there is the canonical $R$-bilinear mapping $g_{i}: M_{i} \times N \rightarrow M_{i} \otimes N$. This induces a unique mapping $\widehat{\phi}: M \times N \rightarrow P$
such that $\widehat{\phi} \circ\left(\mu_{i} \times 1\right)=\lambda_{i} \circ g_{i}$. It is $R$-bilinear. Thus it induces an $R$-linear mapping $\phi: M \otimes N \rightarrow P$. From the commutative diagram below:

we see that $\psi \circ \widehat{\phi}=g$, the canonical $R$-bilinear mapping $g: M \times N \rightarrow M \otimes N$. So $\psi \circ \phi$ is identity on $M \otimes N$. From the right-hand square and triangle, $\phi \circ \psi$ is also identity on $P$.

00DF Lemma 10.11.10. Let

$$
M_{1} \xrightarrow{f} M_{2} \xrightarrow{g} M_{3} \rightarrow 0
$$

be an exact sequence of $R$-modules and homomorphisms, and let $N$ be any $R$ module. Then the sequence

00DG

$$
\begin{equation*}
M_{1} \otimes N \xrightarrow{f \otimes 1} M_{2} \otimes N \xrightarrow{g \otimes 1} M_{3} \otimes N \rightarrow 0 \tag{10.11.10.1}
\end{equation*}
$$

is exact. In other words, the functor $-\otimes_{R} N$ is right exact, in the sense that tensoring each term in the original right exact sequence preserves the exactness.

Proof. We apply the functor $\operatorname{Hom}(-, \operatorname{Hom}(N, P))$ to the first exact sequence. We obtain

$$
0 \rightarrow \operatorname{Hom}\left(M_{3}, \operatorname{Hom}(N, P)\right) \rightarrow \operatorname{Hom}\left(M_{2}, \operatorname{Hom}(N, P)\right) \rightarrow \operatorname{Hom}\left(M_{1}, \operatorname{Hom}(N, P)\right)
$$

By Lemma 10.11.8, we have

$$
0 \rightarrow \operatorname{Hom}\left(M_{3} \otimes N, P\right) \rightarrow \operatorname{Hom}\left(M_{2} \otimes N, P\right) \rightarrow \operatorname{Hom}\left(M_{1} \otimes N, P\right)
$$

Using the pullback property again, we arrive at the desired exact sequence.
00DH Remark 10.11.11. However, tensor product does NOT preserve exact sequences in general. In other words, if $M_{1} \rightarrow M_{2} \rightarrow M_{3}$ is exact, then it is not necessarily true that $M_{1} \otimes N \rightarrow M_{2} \otimes N \rightarrow M_{3} \otimes N$ is exact for arbitrary $R$-module $N$.

00DI Example 10.11.12. Consider the injective map 2: $\mathbf{Z} \rightarrow \mathbf{Z}$ viewed as a map of $\mathbf{Z}$-modules. Let $N=\mathbf{Z} / 2$. Then the induced map $\mathbf{Z} \otimes \mathbf{Z} / 2 \rightarrow \mathbf{Z} \otimes \mathbf{Z} / 2$ is NOT injective. This is because for $x \otimes y \in \mathbf{Z} \otimes \mathbf{Z} / 2$,

$$
(2 \otimes 1)(x \otimes y)=2 x \otimes y=x \otimes 2 y=x \otimes 0=0
$$

Therefore the induced map is the zero map while $\mathbf{Z} \otimes N \neq 0$.
00DJ Remark 10.11.13. For $R$-modules $N$, if the functor $-\otimes_{R} N$ is exact, i.e. tensoring with $N$ preserves all exact sequences, then $N$ is said to be flat $R$-module. We will discuss this later in Section 10.38 .

05BS Lemma 10.11.14. Let $R$ be a ring. Let $M$ and $N$ be $R$-modules.
(1) If $N$ and $M$ are finite, then so is $M \otimes_{R} N$.
(2) If $N$ and $M$ are finitely presented, then so is $M \otimes_{R} N$.

Proof. Suppose $M$ is finite. Then choose a presentation $0 \rightarrow K \rightarrow R^{\otimes n} \rightarrow M \rightarrow 0$. This gives an exact sequence $K \otimes_{R} N \rightarrow N^{\oplus n} \rightarrow M \otimes_{R} N \rightarrow 0$ by Lemma 10.11.10. We conclude that if $N$ is finite too then $M \otimes_{R} N$ is a quotient of a finite module, hence finite, see Lemma 10.5 .3 . Similarly, if both $N$ and $M$ are finitely presented, then we see that $K$ is finite and that $M \otimes_{R} N$ is a quotient of the finitely presented module $N^{\oplus n}$ by a finite module, namely $K \otimes_{R} N$, and hence finitely presented, see Lemma 10.5.3.

00DK Lemma 10.11.15. Let $M$ be an $R$-module. Then the $S^{-1} R$-modules $S^{-1} M$ and $S^{-1} R \otimes_{R} M$ are canonically isomorphic, and the canonical isomorphism $f$ : $S^{-1} R \otimes_{R} M \rightarrow S^{-1} M$ is given by

$$
f((a / s) \otimes m)=a m / s, \forall a \in R, m \in M, s \in S
$$

Proof. Obviously, the map $f^{\prime}: S^{-1} R \times M \rightarrow S^{-1} M$ given by $f((a / s, m))=a m / s$ is bilinear, and thus by the universal property, this map induces a unique $S^{-1} R$ module homomorphism $f: S^{-1} R \otimes_{R} M \rightarrow S^{-1} M$ as in the statement of the lemma. Actually every element in $S^{-1} M$ is of the form $m / s, m \in M, s \in S$ and every element in $S^{-1} R \otimes_{R} M$ is of the form $1 / s \otimes m$. To see the latter fact, write an element in $S^{-1} R \otimes_{R} M$ as

$$
\sum_{k} \frac{a_{k}}{s_{k}} \otimes m_{k}=\sum_{k} \frac{a_{k} t_{k}}{s} \otimes m_{k}=\frac{1}{s} \otimes \sum_{k} a_{k} t_{k} m_{k}=\frac{1}{s} \otimes m
$$

Where $m=\sum_{k} a_{k} t_{k} m_{k}$. Then it is obvious that $f$ is surjective, and if $f\left(\frac{1}{s} \otimes m\right)=$ $m / s=0$ then there exists $t^{\prime} \in S$ with $t m=0$ in $M$. Then we have

$$
\frac{1}{s} \otimes m=\frac{1}{s t} \otimes t m=\frac{1}{s t} \otimes 0=0
$$

Therefore $f$ is injective.
00DL Lemma 10.11.16. Let $M, N$ be $R$-modules, then there is a canonical $S^{-1} R$ module isomorphism $f: S^{-1} M \otimes_{S^{-1} R} S^{-1} N \rightarrow S^{-1}\left(M \otimes_{R} N\right)$, given by

$$
f((m / s) \otimes(n / t))=(m \otimes n) / s t
$$

Proof. We may use Lemma 10.11 .7 and Lemma 10.11 .15 repeatedly to see that these two $S^{-1} R$-modules are isomorphic, noting that $S^{-1} R$ is an $\left(R, S^{-1} R\right)$-bimodule:

$$
\begin{aligned}
S^{-1}\left(M \otimes_{R} N\right) & \cong S^{-1} R \otimes_{R}\left(M \otimes_{R} N\right) \\
& \cong S^{-1} M \otimes_{R} N \\
& \cong\left(S^{-1} M \otimes_{S^{-1} R} S^{-1} R\right) \otimes_{R} N \\
& \cong S^{-1} M \otimes_{S^{-1} R}\left(S^{-1} R \otimes_{R} N\right) \\
& \cong S^{-1} M \otimes_{S^{-1} R} S^{-1} N
\end{aligned}
$$

This isomorphism is easily seen to be the one stated in the lemma.

### 10.12. Tensor algebra

00 DM Let $R$ be a ring. Let $M$ be an $R$-module. We define the tensor algebra of $M$ over $R$ to be the noncommutative $R$-algebra

$$
\mathrm{T}(M)=\mathrm{T}_{R}(M)=\bigoplus_{n \geq 0} \mathrm{~T}^{n}(M)
$$

with $\mathrm{T}^{0}(M)=R, \mathrm{~T}^{1}(M)=M, \mathrm{~T}^{2}(M)=M \otimes_{R} M, \mathrm{~T}^{3}(M)=M \otimes_{R} M \otimes_{R} M$, and so on. Multiplication is defined by the rule that on pure tensors we have
$\left(x_{1} \otimes x_{2} \otimes \ldots \otimes x_{n}\right) \cdot\left(y_{1} \otimes y_{2} \otimes \ldots \otimes y_{m}\right)=x_{1} \otimes x_{2} \otimes \ldots \otimes x_{n} \otimes y_{1} \otimes y_{2} \otimes \ldots \otimes y_{m}$ and we extend this by linearity.
We define the exterior algebra $\wedge(M)$ of $M$ over $R$ to be the quotient of $\mathrm{T}(M)$ by the two sided ideal generated by the elements $x \otimes x \in \mathrm{~T}^{2}(M)$. The image of a pure tensor $x_{1} \otimes \ldots \otimes x_{n}$ in $\wedge^{n}(M)$ is denoted $x_{1} \wedge \ldots \wedge x_{n}$. These elements generate $\wedge^{n}(M)$, they are $R$-linear in each $x_{i}$ and they are zero when two of the $x_{i}$ are equal (i.e., they are alternating as functions of $x_{1}, x_{2}, \ldots, x_{n}$ ). The multiplication on $\wedge(M)$ is graded commutative, i.e., every $x \in M$ and $y \in M$ satisfy $x \wedge y=-y \wedge x$.
An example of this is when $M=R x_{1} \oplus \ldots \oplus R x_{n}$ is a finite free module. In this case $\wedge(M)$ is free over $R$ with basis the elements

$$
x_{i_{1}} \wedge \ldots \wedge x_{i_{r}}
$$

with $0 \leq r \leq n$ and $1 \leq i_{1}<i_{2}<\ldots<i_{r} \leq n$.
We define the symmetric algebra $\operatorname{Sym}(M)$ of $M$ over $R$ to be the quotient of $\mathrm{T}(M)$ by the two sided ideal generated by the elements $x \otimes y-y \otimes x \in \mathrm{~T}^{2}(M)$. The image of a pure tensor $x_{1} \otimes \ldots \otimes x_{n}$ in $\operatorname{Sym}^{n}(M)$ is denoted just $x_{1} \ldots x_{n}$. These elements generate $\operatorname{Sym}^{n}(M)$, these are $R$-linear in each $x_{i}$ and $x_{1} \ldots x_{n}=x_{1}^{\prime} \ldots x_{n}^{\prime}$ if the sequence of elements $x_{1}, \ldots, x_{n}$ is a permutation of the sequence $x_{1}^{\prime}, \ldots, x_{n}^{\prime}$. Thus we see that $\operatorname{Sym}(M)$ is commutative.
An example of this is when $M=R x_{1} \oplus \ldots \oplus R x_{n}$ is a finite free module. In this case $\operatorname{Sym}(M)=R\left[x_{1}, \ldots, x_{n}\right]$ is a polynomial algebra.
00DN Lemma 10.12.1. Let $R$ be a ring. Let $M$ be an $R$-module. If $M$ is a free $R$ module, so is each symmetric and exterior power.
Proof. Omitted, but see above for the finite free case.
00DO Lemma 10.12.2. Let $R$ be a ring. Let $M_{2} \rightarrow M_{1} \rightarrow M \rightarrow 0$ be an exact sequence of $R$-modules. There are exact sequences

$$
M_{2} \otimes_{R} \operatorname{Sym}^{n-1}\left(M_{1}\right) \rightarrow \operatorname{Sym}^{n}\left(M_{1}\right) \rightarrow \operatorname{Sym}^{n}(M) \rightarrow 0
$$

and similarly

$$
M_{2} \otimes_{R} \wedge^{n-1}\left(M_{1}\right) \rightarrow \wedge^{n}\left(M_{1}\right) \rightarrow \wedge^{n}(M) \rightarrow 0
$$

Proof. Omitted.
00DP Lemma 10.12.3. Let $R$ be a ring. Let $M$ be an $R$-module. Let $x_{i}, i \in I$ be a given system of generators of $M$ as an $R$-module. Let $n \geq 2$. There exists a canonical exact sequence

$$
\bigoplus_{1 \leq j_{1}<j_{2} \leq n} \bigoplus_{i_{1}, i_{2} \in I} T^{n-2}(M) \oplus \bigoplus_{1 \leq j_{1}<j_{2} \leq n} \bigoplus_{i \in I} T^{n-2}(M) \rightarrow T^{n}(M) \rightarrow \wedge^{n}(M) \rightarrow 0
$$

where the pure tensor $m_{1} \otimes \ldots \otimes m_{n-2}$ in the first summand maps to

$$
\begin{gathered}
\underbrace{m_{1} \otimes \ldots \otimes x_{i_{1}} \otimes \ldots \otimes x_{i_{2}} \otimes \ldots \otimes m_{n-2}}_{\text {with } x_{i_{1}} \text { and } x_{i_{2}} \text { occupying slots } j_{1} \text { and } j_{2} \text { in the tensor }} \\
+\quad \underbrace{m_{1} \otimes \ldots \otimes x_{i_{2}} \otimes \ldots \otimes x_{i_{1}} \otimes \ldots \otimes m_{n-2}}_{\text {with } x_{i_{2}} \text { and } x_{i_{1}} \text { occupying slots } j_{1} \text { and } j_{2} \text { in the tensor }}
\end{gathered}
$$

and $m_{1} \otimes \ldots \otimes m_{n-2}$ in the second summand maps to

$$
\underbrace{m_{1} \otimes \ldots \otimes x_{i} \otimes \ldots \otimes x_{i} \otimes \ldots \otimes m_{n-2}}_{i \text { ith } x_{i} \text { and } x_{i} \text { occupying slots } j_{1} \text { and } j_{2} \text { in the tensor }}
$$

There is also a canonical exact sequence

$$
\bigoplus_{1 \leq j_{1}<j_{2} \leq n} \bigoplus_{i_{1}, i_{2} \in I} T^{n-2}(M) \rightarrow T^{n}(M) \rightarrow \operatorname{Sym}^{n}(M) \rightarrow 0
$$

where the pure tensor $m_{1} \otimes \ldots \otimes m_{n-2}$ maps to

$$
\begin{gathered}
\underbrace{m_{1} \otimes \ldots \otimes x_{i_{1}} \otimes \ldots \otimes x_{i_{2}} \otimes \ldots \otimes m_{n-2}}_{\text {with } x_{i_{1}} \text { and } x_{i_{2}} \text { occupying slots } j_{1} \text { and } j_{2} \text { in the tensor }} \\
-\quad \underbrace{m_{1} \otimes \ldots \otimes x_{i_{2}} \otimes \ldots \otimes x_{i_{1}} \otimes \ldots \otimes m_{n-2}}_{\text {with } x_{i_{2}} \text { and } x_{i_{1}} \text { occupying slots } j_{1} \text { and } j_{2} \text { in the tensor }}
\end{gathered}
$$

Proof. Omitted.
00DQ Lemma 10.12.4. Let $R$ be a ring. Let $M_{i}$ be a directed system of $R$-modules. Then $\operatorname{colim}_{i} T(M)=T\left(\operatorname{colim}_{i} M_{i}\right)$ and similarly for the symmetric and exterior algebras.

Proof. Omitted.

### 10.13. Base change

05G3 We formally introduce base change in algebra as follows.
05G4 Definition 10.13.1. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Let $R \rightarrow R^{\prime}$ be any ring map. The base change of $\varphi$ by $R \rightarrow R^{\prime}$ is the ring map $R^{\prime} \rightarrow S \otimes_{R} R^{\prime}$. In this situation we often write $S^{\prime}=S \otimes_{R} R^{\prime}$. The base change of the $S$-module $M$ is the $S^{\prime}$-module $M \otimes_{R} R^{\prime}$.

If $S=R\left[x_{i}\right] /\left(f_{j}\right)$ for some collection of variables $x_{i}, i \in I$ and some collection of polynomials $f_{j} \in R\left[x_{i}\right], j \in J$, then $S \otimes_{R} R^{\prime}=R^{\prime}\left[x_{i}\right] /\left(f_{j}^{\prime}\right)$, where $f_{j}^{\prime} \in R^{\prime}\left[x_{i}\right]$ is the image of $f_{j}$ under the map $R\left[x_{i}\right] \rightarrow R^{\prime}\left[x_{i}\right]$ induced by $R \rightarrow R^{\prime}$. This simple remark is the key to understanding base change.

05G5 Lemma 10.13.2. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Let $R \rightarrow R^{\prime}$ be a ring map and let $S^{\prime}=S \otimes_{R} R^{\prime}$ and $M^{\prime}=M \otimes_{R} R^{\prime}$ be the base changes.
(1) If $M$ is a finite $S$-module, then the base change $M^{\prime}$ is a finite $S^{\prime}$-module.
(2) If $M$ is an $S$-module finite presentation, then the base change $M^{\prime}$ is an $S^{\prime}$-module of finite presentation.
(3) If $R \rightarrow S$ is of finite type, then the base change $R^{\prime} \rightarrow S^{\prime}$ is of finite type.
(4) If $R \rightarrow S$ is of finite presentation, then the base change $R^{\prime} \rightarrow S^{\prime}$ is of finite presentation.
Proof. Proof of (1). Take a surjective, $R$-linear map $R^{\oplus n} \rightarrow M \rightarrow 0$. By Lemma 10.11 .3 and 10.11 .10 the result after tensoring with $R^{\prime}$ is a surjection $R^{\prime \oplus n} \rightarrow$ $M^{\prime} \rightarrow 0$, so $M^{\prime}$ is a finitely generated $R^{\prime}$-module. Proof of (2). Take a presentation $R^{\oplus m} \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$. By Lemma 10.11 .3 and 10.11 .10 the result after tensoring with $R^{\prime}$ gives a finite presentation $R^{\prime \oplus m} \rightarrow R^{\prime \oplus n} \rightarrow M^{\prime} \rightarrow 0$, of the $R^{\prime}$-module $M^{\prime}$. Proof of (3). This follows by the remark preceding the lemma as we can take $I$ to
be finite by assumption. Proof of (4). This follows by the remark preceding the lemma as we can take $I$ and $J$ to be finite by assumption.

Let $\varphi: R \rightarrow S$ be a ring map. Given a $S$-module $N$ we obtain an $R$-module $N_{R}$ by the rule $r \cdot n=\varphi(r) n$. This is sometimes called the restriction of $N$ to $R$.
05DQ Lemma 10.13.3. Let $R \rightarrow S$ be a ring map. The functors $\operatorname{Mod}_{S} \rightarrow \operatorname{Mod}_{R}$, $N \mapsto N_{R}$ (restriction) and $\operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{S}, M \mapsto M \otimes_{R} S$ (base change) are adjoint functors. In a formula

$$
\operatorname{Hom}_{R}\left(M, N_{R}\right)=\operatorname{Hom}_{S}\left(M \otimes_{R} S, N\right)
$$

Proof. If $\alpha: M \rightarrow N_{R}$ is an $R$-module map, then we define $\alpha^{\prime}: M \otimes_{R} S \rightarrow N$ by the rule $\alpha^{\prime}(m \otimes s)=s \alpha(m)$. If $\beta: M \otimes_{R} S \rightarrow N$ is an $S$-module map, we define $\beta^{\prime}: M \rightarrow N_{R}$ by the rule $\beta^{\prime}(m)=\beta(m \otimes 1)$. We omit the verification that these constructions are mutually inverse.
The lemma above tells us that restriction has a left adjoint, namely base change. It also has a right adjoint.

08YP Lemma 10.13.4. Let $R \rightarrow S$ be a ring map. The functors $\operatorname{Mod}_{S} \rightarrow \operatorname{Mod}_{R}$, $N \mapsto N_{R}$ (restriction) and $\operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{S}, M \mapsto \operatorname{Hom}_{R}(S, M)$ are adjoint functors. In a formula

$$
\operatorname{Hom}_{R}\left(N_{R}, M\right)=\operatorname{Hom}_{S}\left(N, \operatorname{Hom}_{R}(S, M)\right)
$$

Proof. If $\alpha: N_{R} \rightarrow M$ is an $R$-module map, then we define $\alpha^{\prime}: N \rightarrow \operatorname{Hom}_{R}(S, M)$ by the rule $\alpha^{\prime}(n)=(s \mapsto \alpha(s n))$. If $\beta: N \rightarrow \operatorname{Hom}_{R}(S, M)$ is an $S$-module map, we define $\beta^{\prime}: N_{R} \rightarrow M$ by the rule $\beta^{\prime}(n)=\beta(n)(1)$. We omit the verification that these constructions are mutually inverse.

08YQ Lemma 10.13.5. Let $R \rightarrow S$ be a ring map. Given $S$-modules $M, N$ and an $R$-module $P$ we have

$$
\operatorname{Hom}_{R}\left(M \otimes_{S} N, P\right)=\operatorname{Hom}_{S}\left(M, \operatorname{Hom}_{R}(N, P)\right)
$$

Proof. This can be proved directly, but it is also a consequence of Lemmas 10.13.4 and 10.11.8. Namely, we have

$$
\begin{aligned}
\operatorname{Hom}_{R}\left(M \otimes_{S} N, P\right) & =\operatorname{Hom}_{S}\left(M \otimes_{S} N, \operatorname{Hom}_{R}(S, P)\right) \\
& =\operatorname{Hom}_{S}\left(M, \operatorname{Hom}_{S}\left(N, \operatorname{Hom}_{R}(S, P)\right)\right) \\
& =\operatorname{Hom}_{S}\left(M, \operatorname{Hom}_{R}(N, P)\right)
\end{aligned}
$$

as desired.

### 10.14. Miscellany

00 DR The proofs in this section should not refer to any results except those from the section on basic notions, Section 10.3 .

07 K 1 Lemma 10.14.1. Let $R$ be a ring, $I$ and $J$ two ideals and $\mathfrak{p}$ a prime ideal containing the product IJ. Then $\mathfrak{p}$ contains $I$ or $J$.

Proof. Assume the contrary and take $x \in I \backslash \mathfrak{p}$ and $y \in J \backslash \mathfrak{p}$. Their product is an element of $I J \subset \mathfrak{p}$, which contradicts the assumption that $\mathfrak{p}$ was prime.

00DS Lemma 10.14.2 (Prime avoidance). Let $R$ be a ring. Let $I_{i} \subset R, i=1, \ldots, r$, and $J \subset R$ be ideals. Assume
(1) $J \not \subset I_{i}$ for $i=1, \ldots, r$, and
(2) all but two of $I_{i}$ are prime ideals.

Then there exists an $x \in J, x \notin I_{i}$ for all $i$.
Proof. The result is true for $r=1$. If $r=2$, then let $x, y \in J$ with $x \notin I_{1}$ and $y \notin I_{2}$. We are done unless $x \in I_{2}$ and $y \in I_{1}$. Then the element $x+y$ cannot be in $I_{1}$ (since that would mean $x+y-y \in I_{1}$ ) and it also cannot be in $I_{2}$.
For $r \geq 3$, assume the result holds for $r-1$. After renumbering we may assume that $I_{r}$ is prime. We may also assume there are no inclusions among the $I_{i}$. Pick $x \in J, x \notin I_{i}$ for all $i=1, \ldots, r-1$. If $x \notin I_{r}$ we are done. So assume $x \in I_{r}$. If $J I_{1} \ldots I_{r-1} \subset I_{r}$ then $J \subset I_{r}$ (by Lemma 10.14.1) a contradiction. Pick $y \in$ $J I_{1} \ldots I_{r-1}, y \notin I_{r}$. Then $x+y$ works.

00DT Lemma 10.14.3 (Chinese remainder). Let $R$ be a ring.
(1) If $I_{1}, \ldots, I_{r}$ are ideals such that $I_{a}+I_{b}=R$ when $a \neq b$, then $I_{1} \cap \ldots \cap I_{r}=$ $I_{1} I_{2} \ldots I_{r}$ and $R /\left(I_{1} I_{2} \ldots I_{r}\right) \cong R / I_{1} \times \ldots \times R / I_{r}$.
(2) If $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{r}$ are pairwise distinct maximal ideals then $\mathfrak{m}_{a}+\mathfrak{m}_{b}=R$ for $a \neq b$ and the above applies.

Proof. Let us first prove $I_{1} \cap \ldots \cap I_{r}=I_{1} \ldots I_{r}$ as this will also imply the injectivity of the induced ring homomorphism $R /\left(I_{1} \ldots I_{r}\right) \rightarrow R / I_{1} \times \ldots \times R / I_{r}$. The inclusion $I_{1} \cap \ldots \cap I_{r} \supset I_{1} \ldots I_{r}$ is always fulfilled since ideals are closed under multiplication with arbitrary ring elements. To prove the other inclusion, we claim that the ideals

$$
I_{1} \ldots \hat{I}_{i} \ldots I_{r}, \quad i=1, \ldots, r
$$

generate the ring $R$. We prove this by induction on $r$. It holds when $r=2$. If $r>2$, then we see that $R$ is the sum of the ideals $I_{1} \ldots \hat{I}_{i} \ldots I_{r-1}, i=1, \ldots, r-1$. Hence $I_{r}$ is the sum of the ideals $I_{1} \ldots \hat{I}_{i} \ldots I_{r}, i=1, \ldots, r-1$. Applying the same argument with the reverse ordering on the ideals we see that $I_{1}$ is the sum of the ideals $I_{1} \ldots \hat{I}_{i} \ldots I_{r}, i=2, \ldots, r$. Since $R=I_{1}+I_{r}$ by assumption we see that $R$ is the sum of the ideals displayed above. Therefore we can find elements $a_{i} \in I_{1} \ldots \hat{I}_{i} \ldots I_{r}$ such that their sum is one. Multiplying this equation by an element of $I_{1} \cap \ldots \cap I_{r}$ gives the other inclusion. It remains to show that the canonical map $R /\left(I_{1} \ldots I_{r}\right) \rightarrow R / I_{1} \times \ldots \times R / I_{r}$ is surjective. For this, consider its action on the equation $1=\sum_{i=1}^{r} a_{i}$ we derived above. On the one hand, a ring morphism sends 1 to 1 and on the other hand, the image of any $a_{i}$ is zero in $R / I_{j}$ for $j \neq i$. Therefore, the image of $a_{i}$ in $R / I_{i}$ is the identity. So given any element $\left(\overline{b_{1}}, \ldots, \overline{b_{r}}\right) \in R / I_{1} \times \ldots \times R / I_{r}$, the element $\sum_{i=1}^{r} a_{i} \cdot b_{i}$ is an inverse image in $R$. To see (2), by the very definition of being distinct maximal ideals, we have $\mathfrak{m}_{a}+\mathfrak{m}_{b}=$ $R$ for $a \neq b$ and so the above applies.

07DQ Lemma 10.14.4. Let $R$ be a ring. Let $n \geq m$. Let $A$ be an $n \times m$ matrix with coefficients in $R$. Let $J \subset R$ be the ideal generated by the $m \times m$ minors of $A$.
(1) For any $f \in J$ there exists a $m \times n$ matrix $B$ such that $B A=f 1_{m \times m}$.
(2) If $f \in R$ and $B A=f 1_{m \times m}$ for some $m \times m$ matrix $B$, then $f^{m} \in J$.

Proof. For $I \subset\{1, \ldots, n\}$ with $|I|=m$, we denote by $E_{I}$ the $m \times n$ matrix of the projection

$$
R^{\oplus n}=\bigoplus_{i \in\{1, \ldots, n\}} R \longrightarrow \bigoplus_{i \in I} R
$$

and set $A_{I}=E_{I} A$, i.e., $A_{I}$ is the $m \times m$ matrix whose rows are the rows of $A$ with indices in $I$. Let $B_{I}$ be the adjugate (transpose of cofactor) matrix to $A_{I}$, i.e., such that $A_{I} B_{I}=B_{I} A_{I}=\operatorname{det}\left(A_{I}\right) 1_{m \times m}$. The $m \times m$ minors of $A$ are the determinants $\operatorname{det} A_{I}$ for all the $I \subset\{1, \ldots, n\}$ with $|I|=m$. If $f \in J$ then we can write $f=\sum c_{I} \operatorname{det}\left(A_{I}\right)$ for some $c_{I} \in R$. Set $B=\sum c_{I} B_{I} E_{I}$ to see that (1) holds.
If $f 1_{m \times m}=B A$ then by the Cauchy-Binet formula we have $f^{m}=\sum b_{I} \operatorname{det}\left(A_{I}\right)$ where $b_{I}$ is the determinant of the $m \times m$ matrix whose columns are the columns of $B$ with indices in $I$.

080R Lemma 10.14.5. Let $R$ be a ring. Let $n \geq m$. Let $A=\left(a_{i j}\right)$ be an $n \times m$ matrix with coefficients in $R$, written in block form as

$$
A=\binom{A_{1}}{A_{2}}
$$

where $A_{1}$ has size $m \times m$. Let $B$ be the adjugate (transpose of cofactor) matrix to $A_{1}$. Then

$$
A B=\binom{f 1_{m \times m}}{C}
$$

where $f=\operatorname{det}\left(A_{1}\right)$ and $c_{i j}$ is (up to sign) the determinant of the $m \times m$ minor of A corresponding to the rows $1, \ldots, \hat{j}, \ldots, m, i$.

Proof. Since the adjugate has the property $A_{1} B=B A_{1}=f$ the first block of the expression for $A B$ is correct. Note that

$$
c_{i j}=\sum_{k} a_{i k} b_{k j}=\sum(-1)^{j+k} a_{i k} \operatorname{det}\left(A_{1}^{j k}\right)
$$

where $A_{1}^{i j}$ means $A_{1}$ with the $j$ th row and $k$ th column removed. This last expression is the row expansion of the determinant of the matrix in the statement of the lemma.

### 10.15. Cayley-Hamilton

05G6
00DX Lemma 10.15.1. Let $R$ be a ring. Let $A=\left(a_{i j}\right)$ be an $n \times n$ matrix with coefficients in $R$. Let $P(x) \in R[x]$ be the characteristic polynomial of $A$ (defined as $\left.\operatorname{det}\left(x i d_{n \times n}-A\right)\right)$. Then $P(A)=0$ in $\operatorname{Mat}(n \times n, R)$.

Proof. We reduce the question to the well-known Cayley-Hamilton theorem from linear algebra in several steps:
(1) If $\phi: S \rightarrow R$ is a ring morphism and $b_{i j}$ are inverse images of the $a_{i j}$ under this map, then it suffices to show the statement for $S$ and $\left(b_{i j}\right)$ since $\phi$ is a ring morphism.
(2) If $\psi: R \hookrightarrow S$ is an injective ring morphism, it clearly suffices to show the result for $S$ and the $a_{i j}$ considered as elements of $S$.
(3) Thus we may first reduce to the case $R=\mathbf{Z}\left[X_{i j}\right], a_{i j}=X_{i j}$ of a polynomial ring and then further to the case $R=\mathbf{Q}\left(X_{i j}\right)$ where we may finally apply Cayley-Hamilton.

05BT Lemma 10.15.2. Let $R$ be a ring. Let $M$ be a finite $R$-module. Let $\varphi: M \rightarrow M$ be an endomorphism. Then there exists a monic polynomial $P \in R[T]$ such that $P(\varphi)=0$ as an endomorphism of $M$.
Proof. Choose a surjective $R$-module map $R^{\oplus n} \rightarrow M$, given by $\left(a_{1}, \ldots, a_{n}\right) \mapsto$ $\sum a_{i} x_{i}$ for some generators $x_{i} \in M$. Choose $\left(a_{i 1}, \ldots, a_{i n}\right) \in R^{\oplus n}$ such that $\varphi\left(x_{i}\right)=$ $\sum a_{i j} x_{j}$. In other words the diagram

is commutative where $A=\left(a_{i j}\right)$. By Lemma 10.15 .1 there exists a monic polynomial $P$ such that $P(A)=0$. Then it follows that $P(\varphi)=0$.

05G7 Lemma 10.15.3. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $M$ be a finite $R$-module. Let $\varphi: M \rightarrow M$ be an endomorphism such that $\varphi(M) \subset I M$. Then there exists a monic polynomial $P=t^{n}+a_{1} t^{n-1}+\ldots+a_{n} \in R[T]$ such that $a_{j} \in I^{j}$ and $P(\varphi)=0$ as an endomorphism of $M$.

Proof. Choose a surjective $R$-module map $R^{\oplus n} \rightarrow M$, given by $\left(a_{1}, \ldots, a_{n}\right) \mapsto$ $\sum a_{i} x_{i}$ for some generators $x_{i} \in M$. Choose $\left(a_{i 1}, \ldots, a_{i n}\right) \in I^{\oplus n}$ such that $\varphi\left(x_{i}\right)=$ $\sum a_{i j} x_{j}$. In other words the diagram

is commutative where $A=\left(a_{i j}\right)$. By Lemma 10.15.1 the polynomial $P(t)=$ $\operatorname{det}\left(t \mathrm{id}_{n \times n}-A\right)$ has all the desired properties.
As a fun example application we prove the following surprising lemma.
05G8 Lemma 10.15.4. Let $R$ be a ring. Let $M$ be a finite $R$-module. Let $\varphi: M \rightarrow M$ be a surjective $R$-module map. Then $\varphi$ is an isomorphism.
First proof. Write $R^{\prime}=R[x]$ and think of $M$ as a finite $R^{\prime}$-module with $x$ acting via $\varphi$. Set $I=(x) \subset R^{\prime}$. By our assumption that $\varphi$ is surjective we have $I M=M$. Hence we may apply Lemma 10.15 .3 to $M$ as an $R^{\prime}$-module, the ideal $I$ and the endomorphism $\operatorname{id}_{M}$. We conclude that $\left(1+a_{1}+\ldots+a_{n}\right) \operatorname{id}_{M}=0$ with $a_{j} \in I$. Write $a_{j}=b_{j}(x) x$ for some $b_{j}(x) \in R[x]$. Translating back into $\varphi$ we see that $\mathrm{id}_{M}=-\left(\sum_{j=1, \ldots, n} b_{j}(\varphi)\right) \varphi$, and hence $\varphi$ is invertible.
Second proof. We perform induction on the number of generators of $M$ over $R$. If $M$ is generated by one element, then $M \cong R / I$ for some ideal $I \subset R$. In this case we may replace $R$ by $R / I$ so that $M=R$. In this case $\varphi: R \rightarrow R$ is given by multiplication on $M$ by an element $r \in R$. The surjectivity of $\varphi$ forces $r$ invertible, since $\varphi$ must hit 1 , which implies that $\varphi$ is invertible.
Now assume that we have proven the lemma in the case of modules generated by $n-1$ elements, and are examining a module $M$ generated by $n$ elements. Let $A$ mean the ring $R[t]$, and regard the module $M$ as an $A$-module by letting $t$ act via $\varphi$; since $M$ is finite over $R$, it is finite over $R[t]$ as well, and since we're
trying to prove $\varphi$ injective, a set-theoretic property, we might as well prove the endomorphism $t: M \rightarrow M$ over $A$ injective. We have reduced our problem to the case our endomorphism is multiplication by an element of the ground ring. Let $M^{\prime} \subset M$ denote the sub- $A$-module generated by the first $n-1$ of the generators of $M$, and consider the diagram

where the restriction of $\varphi$ to $M^{\prime}$ and the map induced by $\varphi$ on the quotient $M / M^{\prime}$ are well-defined since $\varphi$ is multiplication by an element in the base, and $M^{\prime}$ and $M / M^{\prime}$ are $A$-modules in their own right. By the case $n=1$ the map $M / M^{\prime} \rightarrow$ $M / M^{\prime}$ is an isomorphism. A diagram chase implies that $\left.\varphi\right|_{M^{\prime}}$ is surjective hence by induction $\left.\varphi\right|_{M^{\prime}}$ is an isomorphism. This forces the middle column to be an isomorphism by the snake lemma.

### 10.16. The spectrum of a ring

00 DY We arbitrarily decide that the spectrum of a ring as a topological space is part of the algebra chapter, whereas an affine scheme is part of the chapter on schemes.

00DZ Definition 10.16.1. Let $R$ be a ring.
(1) The spectrum of $R$ is the set of prime ideals of $R$. It is usually denoted $\operatorname{Spec}(R)$.
(2) Given a subset $T \subset R$ we let $V(T) \subset \operatorname{Spec}(R)$ be the set of primes containing $T$, i.e., $V(T)=\{\mathfrak{p} \in \operatorname{Spec}(R) \mid \forall f \in T, f \in \mathfrak{p}\}$.
(3) Given an element $f \in R$ we let $D(f) \subset \operatorname{Spec}(R)$ be the set of primes not containing $f$.

00E0 Lemma 10.16.2. Let $R$ be a ring.
(1) The spectrum of a ring $R$ is empty if and only if $R$ is the zero ring.
(2) Every nonzero ring has a maximal ideal.
(3) Every nonzero ring has a minimal prime ideal.
(4) Given an ideal $I \subset R$ and a prime ideal $I \subset \mathfrak{p}$ there exists a prime $I \subset \mathfrak{q} \subset \mathfrak{p}$ such that $\mathfrak{q}$ is minimal over $I$.
(5) If $T \subset R$, and if $(T)$ is the ideal generated by $T$ in $R$, then $V((T))=V(T)$.
(6) If $I$ is an ideal and $\sqrt{I}$ is its radical, see basic notion 27), then $V(I)=$ $V(\sqrt{I})$.
(7) Given an ideal I of $R$ we have $\sqrt{I}=\bigcap_{I \subset \mathfrak{p}} \mathfrak{p}$.
(8) If $I$ is an ideal then $V(I)=\emptyset$ if and only if $I$ is the unit ideal.
(9) If $I, J$ are ideals of $R$ then $V(I) \cup V(J)=V(I \cap J)$.
(10) If $\left(I_{a}\right)_{a \in A}$ is a set of ideals of $R$ then $\cap_{a \in A} V\left(I_{a}\right)=V\left(\cup_{a \in A} I_{a}\right)$.
(11) If $f \in R$, then $D(f) \amalg V(f)=\operatorname{Spec}(R)$.
(12) If $f \in R$ then $D(f)=\emptyset$ if and only if $f$ is nilpotent.
(13) If $f=u f^{\prime}$ for some unit $u \in R$, then $D(f)=D\left(f^{\prime}\right)$.
(14) If $I \subset R$ is an ideal, and $\mathfrak{p}$ is a prime of $R$ with $\mathfrak{p} \notin V(I)$, then there exists an $f \in R$ such that $\mathfrak{p} \in D(f)$, and $D(f) \cap V(I)=\emptyset$.
(15) If $f, g \in R$, then $D(f g)=D(f) \cap D(g)$.
(16) If $f_{i} \in R$ for $i \in I$, then $\bigcup_{i \in I} D\left(f_{i}\right)$ is the complement of $V\left(\left\{f_{i}\right\}_{i \in I}\right)$ in $\operatorname{Spec}(R)$.
(17) If $f \in R$ and $D(f)=\operatorname{Spec}(R)$, then $f$ is a unit.

Proof. We address each part in the corresponding item below.
(1) This is a direct consequence of (2) or (3).
(2) Let $\mathfrak{A}$ be the set of all proper ideals of $R$. This set is ordered by inclusion and is non-empty, since $(0) \in \mathfrak{A}$ is a proper ideal. Let $A$ be a totally ordered subset of $R . \bigcup_{I \in A} I$ is in fact an ideal. Since $1 \notin I$ for all $I \in A$, the union does not contain 1 and thus is proper. Hence $\bigcup_{I \in A} I$ is in $\mathfrak{A}$ and is an upper bound for the set $A$. Thus by Zorn's lemma $\mathfrak{A}$ has a maximal element, which is the sought-after maximal ideal.
(3) Since $R$ is nonzero, it contains a maximal ideal which is a prime ideal. Thus the set $\mathfrak{A}$ of all prime ideals of $R$ is nonempty. $\mathfrak{A}$ is ordered by reverse-inclusion. Let $A$ be a totally ordered subset of $\mathfrak{A}$. It's pretty clear that $J=\bigcap_{I \in A} I$ is in fact an ideal. Not so clear, however, is that it is prime. Let $x y \in J$. Then $x y \in I$ for all $I \in A$. Now let $B=\{I \in A \mid y \in I\}$. Let $K=\bigcap_{I \in B} I$. Since $A$ is totally ordered, either $K=J$ (and we're done, since then $y \in J)$ or $K \supset J$ and for all $I \in A$ such that $I$ is properly contained in $K$, we have $y \notin I$. But that means that for all those $I, x \in I$, since they are prime. Hence $x \in J$. In either case, $J$ is prime as desired. Hence by Zorn's lemma we get a maximal element which in this case is a minimal prime ideal.
(4) This is the same exact argument as (3) except you only consider prime ideals contained in $\mathfrak{p}$ and containing $I$.
(5) $(T)$ is the smallest ideal containing $T$. Hence if $T \subset I$, some ideal, then $(T) \subset I$ as well. Hence if $I \in V(T)$, then $I \in V((T))$ as well. The other inclusion is obvious.
(6) Since $I \subset \sqrt{I}, V(\sqrt{I}) \subset V(I)$. Now let $\mathfrak{p} \in V(I)$. Let $x \in \sqrt{I}$. Then $x^{n} \in I$ for some $n$. Hence $x^{n} \in \mathfrak{p}$. But since $\mathfrak{p}$ is prime, a boring induction argument gets you that $x \in \mathfrak{p}$. Hence $\sqrt{I} \subset \mathfrak{p}$ and $\mathfrak{p} \in V(\sqrt{I})$.
(7) Let $f \in R \backslash \sqrt{I}$. Then $f^{n} \notin I$ for all $n$. Hence $S=\left\{1, f, f^{2}, \ldots\right\}$ is a multiplicative subset, not containing 0 . Take a prime ideal $\overline{\mathfrak{p}} \subset S^{-1} R$ containing $S^{-1} I$. Then the pull-back $\mathfrak{p}$ in $R$ of $\overline{\mathfrak{p}}$ is a prime ideal containing $I$ that does not intersect $S$. This shows that $\bigcap_{I \subset \mathfrak{p}} \mathfrak{p} \subset \sqrt{I}$. Now if $a \in \sqrt{I}$, then $a^{n} \in I$ for some $n$. Hence if $I \subset \mathfrak{p}$, then $a^{n} \in \mathfrak{p}$. But since $\mathfrak{p}$ is prime, we have $a \in \mathfrak{p}$. Thus the equality is shown.
(8) $I$ is not the unit ideal if and only if $I$ is contained in some maximal ideal (to see this, apply (2) to the ring $R / I$ ) which is therefore prime.
(9) If $\mathfrak{p} \in V(I) \cup V(J)$, then $I \subset \mathfrak{p}$ or $J \subset \mathfrak{p}$ which means that $I \cap J \subset \mathfrak{p}$. Now if $I \cap J \subset \mathfrak{p}$, then $I J \subset \mathfrak{p}$ and hence either $I$ of $J$ is in $\mathfrak{p}$, since $\mathfrak{p}$ is prime.
(10) $\mathfrak{p} \in \bigcap_{a \in A} V\left(I_{a}\right) \Leftrightarrow I_{a} \subset \mathfrak{p}, \forall a \in A \Leftrightarrow \mathfrak{p} \in V\left(\cup_{a \in A} I_{a}\right)$
(11) If $\mathfrak{p}$ is a prime ideal and $f \in R$, then either $f \in \mathfrak{p}$ or $f \notin \mathfrak{p}$ (strictly) which is what the disjoint union says.
(12) If $a \in R$ is nilpotent, then $a^{n}=0$ for some $n$. Hence $a^{n} \in \mathfrak{p}$ for any prime ideal. Thus $a \in \mathfrak{p}$ as can be shown by induction and $D(f)=\emptyset$. Now, as shown in (7), if $a \in R$ is not nilpotent, then there is a prime ideal that does not contain it.
(13) $f \in \mathfrak{p} \Leftrightarrow u f \in \mathfrak{p}$, since $u$ is invertible.
(14) If $\mathfrak{p} \notin V(I)$, then $\exists f \in I \backslash \mathfrak{p}$. Then $f \notin \mathfrak{p}$ so $\mathfrak{p} \in D(f)$. Also if $\mathfrak{q} \in D(f)$, then $f \notin \mathfrak{q}$ and thus $I$ is not contained in $\mathfrak{q}$. Thus $D(f) \cap V(I)=\emptyset$.
(15) If $f g \in \mathfrak{p}$, then $f \in \mathfrak{p}$ or $g \in \mathfrak{p}$. Hence if $f \notin \mathfrak{p}$ and $g \notin \mathfrak{p}$, then $f g \notin \mathfrak{p}$. Since $\mathfrak{p}$ is an ideal, if $f g \notin \mathfrak{p}$, then $f \notin \mathfrak{p}$ and $g \notin \mathfrak{p}$.
(16) $\mathfrak{p} \in \bigcup_{i \in I} D\left(f_{i}\right) \Leftrightarrow \exists i \in I, f_{i} \notin \mathfrak{p} \Leftrightarrow \mathfrak{p} \in \operatorname{Spec}(R) \backslash V\left(\left\{f_{i}\right\}_{i \in I}\right)$
(17) If $D(f)=\operatorname{Spec}(R)$, then $V(f)=\emptyset$ and hence $f R=R$, so $f$ is a unit.

The lemma implies that the subsets $V(T)$ from Definition 10.16.1 form the closed subsets of a topology on $\operatorname{Spec}(R)$. And it also shows that the sets $D(f)$ are open and form a basis for this topology.

00E1 Definition 10.16.3. Let $R$ be a ring. The topology on $\operatorname{Spec}(R)$ whose closed sets are the sets $V(T)$ is called the Zariski topology. The open subsets $D(f)$ are called the standard opens of $\operatorname{Spec}(R)$.
It should be clear from context whether we consider $\operatorname{Spec}(R)$ just as a set or as a topological space.

00E2 Lemma 10.16.4. Suppose that $\varphi: R \rightarrow R^{\prime}$ is a ring homomorphism. The induced map

$$
\operatorname{Spec}(\varphi): \operatorname{Spec}\left(R^{\prime}\right) \longrightarrow \operatorname{Spec}(R), \quad \mathfrak{p}^{\prime} \longmapsto \varphi^{-1}\left(\mathfrak{p}^{\prime}\right)
$$

is continuous for the Zariski topologies. In fact, for any element $f \in R$ we have $\operatorname{Spec}(\varphi)^{-1}(D(f))=D(\varphi(f))$.

Proof. It is basic notion 41) that $\mathfrak{p}:=\varphi^{-1}\left(\mathfrak{p}^{\prime}\right)$ is indeed a prime ideal of $R$. The last assertion of the lemma follows directly from the definitions, and implies the first.

If $\varphi^{\prime}: R^{\prime} \rightarrow R^{\prime \prime}$ is a second ring homomorphism then the composition

$$
\operatorname{Spec}\left(R^{\prime \prime}\right) \longrightarrow \operatorname{Spec}\left(R^{\prime}\right) \longrightarrow \operatorname{Spec}(R)
$$

equals $\operatorname{Spec}\left(\varphi^{\prime} \circ \varphi\right)$. In other words, $\operatorname{Spec}$ is a contravariant functor from the category of rings to the category of topological spaces.

00E3 Lemma 10.16.5. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset. The map $R \rightarrow S^{-1} R$ induces via the functoriality of Spec a homeomorphism

$$
\operatorname{Spec}\left(S^{-1} R\right) \longrightarrow\{\mathfrak{p} \in \operatorname{Spec}(R) \mid S \cap \mathfrak{p}=\emptyset\}
$$

where the topology on the right hand side is that induced from the Zariski topology on $\operatorname{Spec}(R)$. The inverse map is given by $\mathfrak{p} \mapsto S^{-1} \mathfrak{p}$.
Proof. Denote the right hand side of the arrow of the lemma by $D$. Choose a prime $\mathfrak{p}^{\prime} \subset S^{-1} R$ and let $\mathfrak{p}$ the inverse image of $\mathfrak{p}^{\prime}$ in $R$. Since $\mathfrak{p}^{\prime}$ does not contain 1 we see that $\mathfrak{p}$ does not contain any element of $S$. Hence $\mathfrak{p} \in D$ and we see that the image is contained in $D$. Let $\mathfrak{p} \in D$. By assumption the image $\bar{S}$ does not contain 0. By basic notion 54 $\bar{S}^{-1}(R / \mathfrak{p})$ is not the zero ring. By basic notion 62) we see $S^{-1} R / S^{-1} \mathfrak{p}=\bar{S}^{-1}(R / \mathfrak{p})$ is a domain, and hence $S^{-1} \mathfrak{p}$ is a prime. The equality of rings also shows that the inverse image of $S^{-1} \mathfrak{p}$ in $R$ is equal to $\mathfrak{p}$, because $R / \mathfrak{p} \rightarrow \bar{S}^{-1}(R / \mathfrak{p})$ is injective by basic notion 55 . This proves that the map $\operatorname{Spec}\left(S^{-1} R\right) \rightarrow \operatorname{Spec}(R)$ is bijective onto $D$ with inverse as given. It is continuous by Lemma 10.16.4. Finally, let $D(g) \subset \operatorname{Spec}\left(S^{-1} R\right)$ be a standard open.

Write $g=h / s$ for some $h \in R$ and $s \in S$. Since $g$ and $h / 1$ differ by a unit we have $D(g)=D(h / 1)$ in $\operatorname{Spec}\left(S^{-1} R\right)$. Hence by Lemma 10.16.4 and the bijectivity above the image of $D(g)=D(h / 1)$ is $D \cap D(h)$. This proves the map is open as well.

00 E 4 Lemma 10.16.6. Let $R$ be a ring. Let $f \in R$. The map $R \rightarrow R_{f}$ induces via the functoriality of Spec a homeomorphism

$$
\operatorname{Spec}\left(R_{f}\right) \longrightarrow D(f) \subset \operatorname{Spec}(R)
$$

The inverse is given by $\mathfrak{p} \mapsto \mathfrak{p} \cdot R_{f}$.
Proof. This is a special case of Lemma 10.16.5.
It is not the case that every "affine open" of a spectrum is a standard open. See Example 10.26.4.

00E5 Lemma 10.16.7. Let $R$ be a ring. Let $I \subset R$ be an ideal. The map $R \rightarrow R / I$ induces via the functoriality of Spec a homeomorphism

$$
\operatorname{Spec}(R / I) \longrightarrow V(I) \subset \operatorname{Spec}(R)
$$

The inverse is given by $\mathfrak{p} \mapsto \mathfrak{p} / I$.
Proof. It is immediate that the image is contained in $V(I)$. On the other hand, if $\mathfrak{p} \in V(I)$ then $\mathfrak{p} \supset I$ and we may consider the ideal $\mathfrak{p} / I \subset R / I$. Using basic notion (51) we see that $(R / I) /(\mathfrak{p} / I)=R / \mathfrak{p}$ is a domain and hence $\mathfrak{p} / I$ is a prime ideal. From this it is immediately clear that the image of $D(f+I)$ is $D(f) \cap V(I)$, and hence the map is a homeomorphism.

00E6 Remark 10.16.8. A fundamental commutative diagram associated to $\varphi: R \rightarrow S$, $\mathfrak{q} \subset S$ and $\mathfrak{p}=\varphi^{-1}(\mathfrak{q})$ is the following

In this diagram the arrows in the outer left and outer right columns are identical. The horizontal maps induce on the associated spectra always a homeomorphism onto the image. The lower two rows of the diagram make sense without assuming $\mathfrak{q}$ exists. The lower squares induce fibre squares of topological spaces. This diagram shows that $\mathfrak{p}$ is in the image of the map on Spec if and only if $S \otimes_{R} \kappa(\mathfrak{p})$ is not the zero ring.

00E7 Lemma 10.16.9. Let $\varphi: R \rightarrow S$ be a ring map. Let $\mathfrak{p}$ be a prime of $R$. The following are equivalent
(1) $\mathfrak{p}$ is in the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$,
(2) $S \otimes_{R} \kappa(\mathfrak{p}) \neq 0$,
(3) $S_{\mathfrak{p}} / \mathfrak{p} S_{\mathfrak{p}} \neq 0$,
(4) $(S / \mathfrak{p} S)_{\mathfrak{p}} \neq 0$, and
(5) $\mathfrak{p}=\varphi^{-1}(\mathfrak{p} S)$.

Proof. We have already seen the equivalence of the first two in Remark 10.16.8. The others are just reformulations of this.
00E8 Lemma 10.16.10. Let $R$ be a ring. The space $\operatorname{Spec}(R)$ is quasi-compact.
Proof. It suffices to prove that any covering of $\operatorname{Spec}(R)$ by standard opens can be refined by a finite covering. Thus suppose that $\operatorname{Spec}(R)=\cup D\left(f_{i}\right)$ for a set of elements $\left\{f_{i}\right\}_{i \in I}$ of $R$. This means that $\cap V\left(f_{i}\right)=\emptyset$. According to Lemma 10.16.2 this means that $V\left(\left\{f_{i}\right\}\right)=\emptyset$. According to the same lemma this means that the ideal generated by the $f_{i}$ is the unit ideal of $R$. This means that we can write 1 as a finite sum: $1=\sum_{i \in J} r_{i} f_{i}$ with $J \subset I$ finite. And then it follows that $\operatorname{Spec}(R)=\cup_{i \in J} D\left(f_{i}\right)$.

04PM Lemma 10.16.11. Let $R$ be a ring. The topology on $X=\operatorname{Spec}(R)$ has the following properties:
(1) $X$ is quasi-compact,
(2) $X$ has a basis for the topology consisting of quasi-compact opens, and
(3) the intersection of any two quasi-compact opens is quasi-compact.

Proof. The spectrum of a ring is quasi-compact, see Lemma 10.16.10. It has a basis for the topology consisting of the standard opens $D(f)=\operatorname{Spec}\left(R_{f}\right)$ (Lemma 10.16.6 which are quasi-compact by the first remark. The intersection of two standard opens is quasi-compact as $D(f) \cap D(g)=D(f g)$. Given any two quasicompact opens $U, V \subset X$ we may write $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ and $V=D\left(g_{1}\right) \cup$ $\ldots \cup D\left(g_{m}\right)$. Then $U \cap V=\bigcup D\left(f_{i} g_{j}\right)$ which is quasi-compact.

### 10.17. Local rings

07BH Local rings are the bread and butter of algebraic geometry.
07BI Definition 10.17.1. A local ring is a ring with exactly one maximal ideal. The maximal ideal is often denoted $\mathfrak{m}_{R}$ in this case. We often say "let $(R, \mathfrak{m}, \kappa)$ be a local ring" to indicate that $R$ is local, $\mathfrak{m}$ is its unique maximal ideal and $\kappa=R / \mathfrak{m}$ is its residue field. A local homomorphism of local rings is a ring map $\varphi: R \rightarrow S$ such that $R$ and $S$ are local rings and such that $\varphi\left(\mathfrak{m}_{R}\right) \subset \mathfrak{m}_{S}$. If it is given that $R$ and $S$ are local rings, then the phrase "local ring $\operatorname{map} \varphi: R \rightarrow S$ " means that $\varphi$ is a local homomorphism of local rings.

A field is a local ring. Any ring map between fields is a local homomorphism of local rings.

00E9 Lemma 10.17.2. Let $R$ be a ring. The following are equivalent:
(1) $R$ is a local ring,
(2) $\operatorname{Spec}(R)$ has exactly one closed point,
(3) $R$ has a maximal ideal $\mathfrak{m}$ and every element of $R \backslash \mathfrak{m}$ is a unit, and
(4) $R$ is not the zero ring and for every $x \in R$ either $x$ or $1-x$ is invertible or both.

Proof. Let $R$ be a ring, and $\mathfrak{m}$ a maximal ideal. If $x \in R \backslash \mathfrak{m}$, and $x$ is not a unit then there is a maximal ideal $\mathfrak{m}^{\prime}$ containing $x$. Hence $R$ has at least two maximal ideals. Conversely, if $\mathfrak{m}^{\prime}$ is another maximal ideal, then choose $x \in \mathfrak{m}^{\prime}$, $x \notin \mathfrak{m}$. Clearly $x$ is not a unit. This proves the equivalence of (1) and (3). The equivalence (1) and (2) is tautological. If $R$ is local then (4) holds since $x$ is either
in $\mathfrak{m}$ or not. If (4) holds, and $\mathfrak{m}, \mathfrak{m}^{\prime}$ are distinct maximal ideals then we may choose $x \in R$ such that $x \bmod \mathfrak{m}^{\prime}=0$ and $x \bmod \mathfrak{m}=1$ by the Chinese remainder theorem (Lemma 10.14.3). This element $x$ is not invertible and neither is $1-x$ which is a contradiction. Thus (4) and (1) are equivalent.
The localization $R_{\mathfrak{p}}$ of a ring $R$ at a prime $\mathfrak{p}$ is a local ring with maximal ideal $\mathfrak{p} R_{\mathfrak{p}}$. Namely, the quotient $R_{\mathfrak{p}} / \mathfrak{p} R_{\mathfrak{p}}$ is the fraction field of the domain $R / \mathfrak{p}$ and every element of $R_{\mathfrak{p}}$ which is not contained in $\mathfrak{p} R_{\mathfrak{p}}$ is invertible.

07BJ Lemma 10.17.3. Let $\varphi: R \rightarrow S$ be a ring map. Assume $R$ and $S$ are local rings. The following are equivalent:
(1) $\varphi$ is a local ring map,
(2) $\varphi\left(\mathfrak{m}_{R}\right) \subset \mathfrak{m}_{S}$, and
(3) $\varphi^{-1}\left(\mathfrak{m}_{S}\right)=\mathfrak{m}_{R}$.
(4) For any $x \in R$, if $\varphi(x)$ is invertible in $S$, then $x$ is invertible in $R$.

Proof. Conditions (1) and (2) are equivalent by definition. If (3) holds then (2) holds. Conversely, if (2) holds, then $\varphi^{-1}\left(\mathfrak{m}_{S}\right)$ is a prime ideal containing the maximal ideal $\mathfrak{m}_{R}$, hence $\varphi^{-1}\left(\mathfrak{m}_{S}\right)=\mathfrak{m}_{R}$. Finally, (4) is the contrapositive of (2) by Lemma 10.17.2.
Let $\varphi: R \rightarrow S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime and set $\mathfrak{p}=\varphi^{-1}(\mathfrak{q})$. Then the induced ring map $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is a local ring map.

### 10.18. The Jacobson radical of a ring

0AMD We recall that the Jacobson radical $\operatorname{rad}(R)$ of a ring $R$ is the intersection of all maximal ideals of $R$. If $R$ is local then $\operatorname{rad}(R)$ is the maximal ideal of $R$.
0AME Lemma 10.18.1. Let $R$ be a ring and let $I \subset R$ be an ideal. The following are equivalent
(1) $I \subset \operatorname{rad}(R)$, and
(2) every element of $1+I$ is a unit in $R$.

In this case every element of $R$ which maps to a unit of $R / I$ is a unit.
Proof. If $f \in \operatorname{rad}(R)$, then $f \in \mathfrak{m}$ for all maximal ideals $\mathfrak{m}$ of $R$. Hence $1+f \notin \mathfrak{m}$ for all maximal ideals $\mathfrak{m}$ of $R$. Thus the closed subset $V(1+f)$ of $\operatorname{Spec}(R)$ is empty. This implies that $1+f$ is a unit, see Lemma 10.16.2
Conversely, assume that $1+f$ is a unit for all $f \in I$. If $\mathfrak{m}$ is a maximal ideal and $I \not \subset \mathfrak{m}$, then $I+\mathfrak{m}=R$. Hence $1=f+g$ for some $g \in \mathfrak{m}$ and $f \in I$. Then $g=1+(-f)$ is not a unit, contradiction.
For the final statement let $f \in R$ map to a unit in $R / I$. Then we can find $g \in R$ mapping to the multiplicative inverse of $f \bmod I$. Then $f g=1 \bmod I$. Hence $f g$ is a unit of $R$ by (2) which implies that $f$ is a unit.

0B7C Lemma 10.18.2. Let $\varphi: R \rightarrow S$ be a ring map such that the induced map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective. Then an element $x \in R$ is a unit if and only if $\varphi(x) \in S$ is a unit.

Proof. If $x$ is a unit, then so is $\varphi(x)$. Conversely, if $\varphi(x)$ is a unit, then $\varphi(x) \notin \mathfrak{q}$ for all $\mathfrak{q} \in \operatorname{Spec}(S)$. Hence $x \notin \varphi^{-1}(\mathfrak{q})=\operatorname{Spec}(\varphi)(\mathfrak{q})$ for all $\mathfrak{q} \in \operatorname{Spec}(S)$. Since $\operatorname{Spec}(\varphi)$ is surjective we conclude that $x$ is a unit by part (17) of Lemma 10.16.2

### 10.19. Nakayama's lemma

07RC We quote from Mat70a: "This simple but important lemma is due to T. Nakayama, G. Azumaya and W. Krull. Priority is obscure, and although it is usually called the Lemma of Nakayama, late Prof. Nakayama did not like the name."

00DV Lemma 10.19.1 (Nakayama's lemma). Let $R$ be a ring, let $M$ be an $R$-module, and let $I \subset R$ be an ideal.
00DW (1) If $I M=M$ and $M$ is finite, then there exists a $f \in 1+I$ such that $f M=0$.
(2) If $I M=M, M$ is finite, and $I \subset \operatorname{rad}(R)$, then $M=0$.
(3) If $N, N^{\prime} \subset M, M=N+I N^{\prime}$, and $N^{\prime}$ is finite, then there exists a $f \in 1+I$ such that $M_{f}=N_{f}$.
(4) If $N, N^{\prime} \subset M, M=N+I N^{\prime}, N^{\prime}$ is finite, and $I \subset \operatorname{rad}(R)$, then $M=N$.
(5) If $N \rightarrow M$ is a module map, $N / I N \rightarrow M / I M$ is surjective, and $M$ is finite, then there exists a $f \in 1+I$ such that $N_{f} \rightarrow M_{f}$ is surjective.
(6) If $N \rightarrow M$ is a module map, $N / I N \rightarrow M / I M$ is surjective, $M$ is finite, and $I \subset \operatorname{rad}(R)$, then $N \rightarrow M$ is surjective.
(7) If $x_{1}, \ldots, x_{n} \in M$ generate $M / I M$ and $M$ is finite, then there exists an $f \in 1+I$ such that $x_{1}, \ldots, x_{n}$ generate $M_{f}$ over $R_{f}$.
(8) If $x_{1}, \ldots, x_{n} \in M$ generate $M / I M, M$ is finite, and $I \subset \operatorname{rad}(R)$, then $M$ is generated by $x_{1}, \ldots, x_{n}$.
(9) If $I M=M, I$ is nilpotent, then $M=0$.
(10) If $N, N^{\prime} \subset M, M=N+I N^{\prime}$, and $I$ is nilpotent then $M=N$.
(11) If $N \rightarrow M$ is a module map, $I$ is nilpotent, and $N / I N \rightarrow M / I M$ is surjective, then $N \rightarrow M$ is surjective.
(12) If $\left\{x_{\alpha}\right\}_{\alpha \in A}$ is a set of elements of $M$ which generate $M / I M$ and $I$ is nilpotent, then $M$ is generated by the $x_{\alpha}$.

Proof. Proof of (1). Choose generators $y_{1}, \ldots, y_{m}$ of $M$ over $R$. For each $i$ we can write $y_{i}=\sum z_{i j} y_{j}$ with $z_{i j} \in I$ (since $\left.M=I M\right)$. In other words $\sum_{j}\left(\delta_{i j}-z_{i j}\right) y_{j}=$ 0 . Let $f$ be the determinant of the $m \times m$ matrix $A=\left(\delta_{i j}-z_{i j}\right)$. Note that $f \in 1+I$ (since the matrix $A$ is entrywise congruent to the $m \times m$ identity matrix modulo $I$ ). By Lemma 10.14.4 (1), there exists an $m \times m$ matrix $B$ such that $B A=f 1_{m \times m}$. Writing out we see that $\sum_{i} b_{h i} a_{i j}=f \delta_{h j}$ for all $h$ and $j$; hence, $\sum_{i, j} b_{h i} a_{i j} y_{j}=\sum_{j} f \delta_{h j} y_{j}=f y_{h}$ for every $h$. In other words, $0=f y_{h}$ for every $h$ (since each $i$ satisfies $\sum_{j} a_{i j} y_{j}=0$ ). This implies that $f$ annihilates $M$.

By Lemma 10.16 .2 an element of $1+\operatorname{rad}(R)$ is invertible element of $R$. Hence we see that (1) implies (2). We obtain (3) by applying (1) to $M / N$ which is finite as $N^{\prime}$ is finite. We obtain (4) by applying (2) to $M / N$ which is finite as $N^{\prime}$ is finite. We obtain (5) by applying (3) to $M$ and the submodules $\operatorname{Im}(N \rightarrow M)$ and $M$. We obtain (6) by applying (4) to $M$ and the submodules $\operatorname{Im}(N \rightarrow M)$ and $M$. We obtain (7) by applying (5) to the map $R^{\oplus n} \rightarrow M,\left(a_{1}, \ldots, a_{n}\right) \mapsto a_{1} x_{1}+\ldots+a_{n} x_{n}$. We obtain (8) by applying (6) to the map $R^{\oplus n} \rightarrow M,\left(a_{1}, \ldots, a_{n}\right) \mapsto a_{1} x_{1}+\ldots+$ $a_{n} x_{n}$.

Part (9) holds because if $M=I M$ then $M=I^{n} M$ for all $n \geq 0$ and $I$ being nilpotent means $I^{n}=0$ for some $n \gg 0$. Parts (10), (11), and (12) follow from (9) by the arguments used above.

Mat70a 1.M
Lemma (NAK) page 11]

### 10.20. Open and closed subsets of spectra

04 PN It turns out that open and closed subsets of a spectrum correspond to idempotents of the ring.

00EC Lemma 10.20.1. Let $R$ be a ring. Let $e \in R$ be an idempotent. In this case

$$
\operatorname{Spec}(R)=D(e) \amalg D(1-e) .
$$

Proof. Note that an idempotent $e$ of a domain is either 1 or 0 . Hence we see that

$$
\begin{aligned}
D(e) & =\{\mathfrak{p} \in \operatorname{Spec}(R) \mid e \notin \mathfrak{p}\} \\
& =\{\mathfrak{p} \in \operatorname{Spec}(R) \mid e \neq 0 \text { in } \kappa(\mathfrak{p})\} \\
& =\{\mathfrak{p} \in \operatorname{Spec}(R) \mid e=1 \text { in } \kappa(\mathfrak{p})\}
\end{aligned}
$$

Similarly we have

$$
\begin{aligned}
D(1-e) & =\{\mathfrak{p} \in \operatorname{Spec}(R) \mid 1-e \notin \mathfrak{p}\} \\
& =\{\mathfrak{p} \in \operatorname{Spec}(R) \mid e \neq 1 \text { in } \kappa(\mathfrak{p})\} \\
& =\{\mathfrak{p} \in \operatorname{Spec}(R) \mid e=0 \text { in } \kappa(\mathfrak{p})\}
\end{aligned}
$$

Since the image of $e$ in any residue field is either 1 or 0 we deduce that $D(e)$ and $D(1-e)$ cover all of $\operatorname{Spec}(R)$.

00ED Lemma 10.20.2. Let $R_{1}$ and $R_{2}$ be rings. Let $R=R_{1} \times R_{2}$. The maps $R \rightarrow R_{1}$, $(x, y) \mapsto x$ and $R \rightarrow R_{2},(x, y) \mapsto y$ induce continuous maps $\operatorname{Spec}\left(R_{1}\right) \rightarrow \operatorname{Spec}(R)$ and $\operatorname{Spec}\left(R_{2}\right) \rightarrow \operatorname{Spec}(R)$. The induced map

$$
\operatorname{Spec}\left(R_{1}\right) \amalg \operatorname{Spec}\left(R_{2}\right) \longrightarrow \operatorname{Spec}(R)
$$

is a homeomorphism. In other words, the spectrum of $R=R_{1} \times R_{2}$ is the disjoint union of the spectrum of $R_{1}$ and the spectrum of $R_{2}$.

Proof. Write $1=e_{1}+e_{2}$ with $e_{1}=(1,0)$ and $e_{2}=(0,1)$. Note that $e_{1}$ and $e_{2}=1-e_{1}$ are idempotents. We leave it to the reader to show that $R_{1}=R_{e_{1}}$ is the localization of $R$ at $e_{1}$. Similarly for $e_{2}$. Thus the statement of the lemma follows from Lemma 10.20 .1 combined with Lemma 10.16.6.

We reprove the following lemma later after introducing a glueing lemma for functions. See Section 10.22

00 EE Lemma 10.20.3. Let $R$ be a ring. For each $U \subset \operatorname{Spec}(R)$ which is open and closed there exists a unique idempotent $e \in R$ such that $U=D(e)$. This induces a 1-1 correspondence between open and closed subsets $U \subset \operatorname{Spec}(R)$ and idempotents $e \in R$.

First proof of Lemma $\mathbf{1 0 . 2 0 . 3}$, Let $U \subset \operatorname{Spec}(R)$ be open and closed. Since $U$ is closed it is quasi-compact by Lemma 10.16 .10 , and similarly for its complement. Write $U=\bigcup_{i=1}^{n} D\left(f_{i}\right)$ as a finite union of standard opens. Similarly, write $\operatorname{Spec}(R) \backslash$ $U=\bigcup_{j=1}^{m} D\left(g_{j}\right)$ as a finite union of standard opens. Since $\emptyset=D\left(f_{i}\right) \cap D\left(g_{j}\right)=$ $D\left(f_{i} g_{j}\right)$ we see that $f_{i} g_{j}$ is nilpotent by Lemma 10.16.2 Let $I=\left(f_{1}, \ldots, f_{n}\right) \subset R$ and let $J=\left(g_{1}, \ldots, g_{m}\right) \subset R$. Note that $V(J)$ equals $U$, that $V(I)$ equals the complement of $U$, so $\operatorname{Spec}(R)=V(I) \amalg V(J)$. By the remark on nilpotency above, we see that $(I J)^{N}=(0)$ for some sufficiently large integer $N$. Since $\bigcup D\left(f_{i}\right) \cup$ $\bigcup D\left(g_{j}\right)=\operatorname{Spec}(R)$ we see that $I+J=R$, see Lemma 10.16 .2 By raising this equation to the $2 N$ th power we conclude that $I^{N}+J^{N}=R$. Write $1=x+y$ with
$x \in I^{N}$ and $y \in J^{N}$. Then $1=(x+y)^{2}=x^{2}+y^{2}$ because $I^{N} J^{N}=(0)$. Then $z=x-x^{2} \in I^{N} \cap J^{N}$. Thus $z x=0$ and $z^{2}=0$. Hence $(x-z)-(x-z)^{2}=$ $x-x^{2}-z=0$. In other words, $e=x-z$ is an idempotent contained in $I^{N} \subset I$, and the idempotent $e^{\prime}=1-e=y+z$ is contained in $J^{N} \subset J$. This shows that the idempotent $e$ maps to 1 in every residue field $\kappa(\mathfrak{p})$ for $\mathfrak{p} \in V(J)$ and that $e$ maps to 0 in $\kappa(\mathfrak{p})$ for every $\mathfrak{p} \in V(I)$.
To see uniqueness suppose that $e_{1}, e_{2}$ are distinct idempotents in $R$. We have to show there exists a prime $\mathfrak{p}$ such that $e_{1} \in \mathfrak{p}$ and $e_{2} \notin \mathfrak{p}$, or conversely. Write $e_{i}^{\prime}=1-e_{i}$. If $e_{1} \neq e_{2}$, then $0 \neq e_{1}-e_{2}=e_{1}\left(e_{2}+e_{2}^{\prime}\right)-\left(e_{1}+e_{1}^{\prime}\right) e_{2}=e_{1} e_{2}^{\prime}-e_{1}^{\prime} e_{2}$. Hence either the idempotent $e_{1} e_{2}^{\prime} \neq 0$ or $e_{1}^{\prime} e_{2} \neq 0$. An idempotent is not nilpotent, and hence we find a prime $\mathfrak{p}$ such that either $e_{1} e_{2}^{\prime} \notin \mathfrak{p}$ or $e_{1}^{\prime} e_{2} \notin \mathfrak{p}$, by Lemma 10.16.2. It is easy to see this gives the desired prime.

00 EF Lemma 10.20.4. Let $R$ be a nonzero ring. Then $\operatorname{Spec}(R)$ is connected if and only if $R$ has no nontrivial idempotents.

Proof. Obvious from Lemma 10.20 .3
00 EH Lemma 10.20.5. Let $R$ be a ring. Let $I$ be a finitely generated ideal. Assume that $I=I^{2}$. Then $V(I)$ is open and closed in $\operatorname{Spec}(R)$, and $R / I \cong R_{e}$ for some idempotent $e \in R$.
Proof. By Nakayama's Lemma 10.19.1 there exists an element $f=1+i, i \in I$ in $R$ such that $f I=0$. It follows that $V(I)=D(f)$ by a simple argument. Also, $0=f i=i+i^{2}$, and hence $f^{2}=1+i+i+i^{2}=1+i=f$, so $f$ is an idempotent. Consider the canonical map $R \rightarrow R_{f}$. It is surjective since $x / f^{n}=x / f=x f / f^{2}=$ $x f / f=x / 1$ in $R_{f}$. Any element of $I$ is in the kernel since $f I=0$. If $x \mapsto 0$ in $R_{f}$, then $f^{n} x=0$ for some $n>0$ and hence $(1+i) x=0$ hence $x \in I$.

### 10.21. Connected components of spectra

00 EB Connected components of spectra are not as easy to understand as one may think at first. This is because we are used to the topology of locally connected spaces, but the spectrum of a ring is in general not locally connected.

04PP Lemma 10.21.1. Let $R$ be a ring. Let $T \subset \operatorname{Spec}(R)$ be a subset of the spectrum. The following are equivalent
(1) $T$ is closed and is a union of connected components of $\operatorname{Spec}(R)$,
(2) $T$ is an intersection of open and closed subsets of $\operatorname{Spec}(R)$, and
(3) $T=V(I)$ where $I \subset R$ is an ideal generated by idempotents.

Moreover, the ideal in (3) if it exists is unique.
Proof. By Lemma 10.16 .11 and Topology, Lemma 5.11 .12 we see that (1) and (2) are equivalent. Assume (2) and write $T=\bigcap U_{\alpha}$ with $U_{\alpha} \subset \operatorname{Spec}(R)$ open and closed. Then $U_{\alpha}=D\left(e_{\alpha}\right)$ for some idempotent $e_{\alpha} \in R$ by Lemma 10.20.3. Then setting $I=\left(1-e_{\alpha}\right)$ we see that $T=V(I)$, i.e., (3) holds. Finally, assume (3). Write $T=V(I)$ and $I=\left(e_{\alpha}\right)$ for some collection of idempotents $e_{\alpha}$. Then it is clear that $T=\bigcap V\left(e_{\alpha}\right)=\bigcap D\left(1-e_{\alpha}\right)$.
Suppose that $I$ is an ideal generated by idempotents. Let $e \in R$ be an idempotent such that $V(I) \subset V(e)$. Then by Lemma 10.16 .2 we see that $e^{n} \in I$ for some $n \geq 1$. As $e$ is an idempotent this means that $e \in I$. Hence we see that $I$ is generated
by exactly those idempotents $e$ such that $T \subset V(e)$. In other words, the ideal $I$ is completely determined by the closed subset $T$ which proves uniqueness.

00 EG Lemma 10.21.2. Let $R$ be a ring. A connected component of $\operatorname{Spec}(R)$ is of the form $V(I)$, where $I$ is an ideal generated by idempotents such that every idempotent of $R$ either maps to 0 or 1 in $R / I$.

Proof. Let $\mathfrak{p}$ be a prime of $R$. By Lemma 10.16.11 we have see that the hypotheses of Topology, Lemma 5.11 .10 are satisfied for the topological space $\operatorname{Spec}(R)$. Hence the connected component of $\mathfrak{p}$ in $\operatorname{Spec}(R)$ is the intersection of open and closed subsets of $\operatorname{Spec}(R)$ containing $\mathfrak{p}$. Hence it equals $V(I)$ where $I$ is generated by the idempotents $e \in R$ such that $e$ maps to 0 in $\kappa(\mathfrak{p})$, see Lemma 10.20.3. Any idempotent $e$ which is not in this collection clearly maps to 1 in $R / I$.

### 10.22. Glueing functions

00 EI In this section we show that given an open covering

$$
\operatorname{Spec}(R)=\bigcup_{i=1}^{n} D\left(f_{i}\right)
$$

by standard opens, and given an element $h_{i} \in R_{f_{i}}$ for each $i$ such that $h_{i}=h_{j}$ as elements of $R_{f_{i} f_{j}}$ then there exists a unique $h \in R$ such that the image of $h$ in $R_{f_{i}}$ is $h_{i}$. This result can be interpreted in two ways:
(1) The rule $D(f) \mapsto R_{f}$ is a sheaf of rings on the standard opens, see Sheaves, Section 6.30
(2) If we think of elements of $R_{f}$ as the "algebraic" or "regular" functions on $D(f)$, then these glue as would continuous, resp. differentiable functions on a topological, resp. differentiable manifold.
At the end of this section we use this result to reprove the lemma describing open and closed subsets in terms of idempotents.

00EJ Lemma 10.22.1. Let $R$ be a ring, and let $f_{1}, f_{2}, \ldots f_{n} \in R$ generate the unit ideal in $R$. Then the following sequence is exact:

$$
0 \longrightarrow R \longrightarrow \bigoplus_{i} R_{f_{i}} \longrightarrow \bigoplus_{i, j} R_{f_{i} f_{j}}
$$

where the maps $\alpha: R \longrightarrow \bigoplus_{i} R_{f_{i}}$ and $\beta: \bigoplus_{i} R_{f_{i}} \longrightarrow \bigoplus_{i, j} R_{f_{i} f_{j}}$ are defined as

$$
\alpha(x)=\left(\frac{x}{1}, \ldots, \frac{x}{1}\right) \text { and } \beta\left(\frac{x_{1}}{f_{1}^{r_{1}}}, \ldots, \frac{x_{n}}{f_{n}^{r_{n}}}\right)=\left(\frac{x_{i}}{f_{i}^{r_{i}}}-\frac{x_{j}}{f_{j}^{r_{j}}} \text { in } R_{f_{i} f_{j}}\right)
$$

Proof. We first show that $\alpha$ is injective, and then that the image of $\alpha$ equals the kernel of $\beta$. Assume there exists $x \in R$ such that $\alpha(x)=(0, \ldots, 0)$. Then $\frac{x}{1}=0$ in $R_{f_{i}}$ for all $i$. This means, for all $i$, there exists a number $n_{i}$ such that

$$
f_{i}^{n_{i}} x=0
$$

Since the $f_{i}$ generate $R$, we can pick $a_{i}$ so

$$
1=\sum_{i=1}^{n} a_{i} f_{i}
$$

Then for all $M \geq \sum n_{i}$, we have

$$
1^{M}=\left(\sum a_{i} f_{i}\right)^{M}=\sum\binom{M}{u_{1}, \ldots, u_{n}} a_{1}^{u_{1}} a_{2}^{u_{2}} \cdots a_{n}^{u_{n}} f_{1}^{u_{1}} f_{2}^{u_{2}} \cdots f_{n}^{u_{n}}
$$

where each term has a factor of at least $f_{i}^{n_{i}}$ for some $i$. Therefore,

$$
x=1 x=1^{M} x=\left(\sum a_{i} f_{i}\right)^{M} x=0 .
$$

Thus, if $\alpha(x)=0, x=0$ and $\alpha$ is injective. We check that the image of $\alpha$ equals the kernel of $\beta$. First, note that for $x \in R$,

$$
\beta(\alpha(x))=\beta\left(\frac{x}{1}, \ldots, \frac{x}{1}\right)=\left(\frac{x}{1}-\frac{x}{1} \text { in } R_{f_{i} f_{j}}\right)=0 .
$$

Therefore, the image of $\alpha$ is in the kernel of $\beta$, and it remains only to verify that if

$$
\beta\left(\frac{x_{1}}{f_{1}^{r_{1}}}, \ldots, \frac{x_{n}}{f_{n}^{r_{n}}}\right)=0
$$

then there exists $x \in R$ so that for all $i$,

$$
\frac{x}{1}=\frac{x_{i}}{f_{i}^{r_{i}}}
$$

Assume we have $x_{1}, \ldots, x_{n}$ such that

$$
\beta\left(\frac{x_{1}}{f_{1}^{r_{1}}}, \ldots, \frac{x_{n}}{f_{n}^{r_{n}}}\right)=0 .
$$

Then, for all pairs $i, j$, there exists an $n_{i j}$ such that

$$
f_{i}^{n_{i j}} f_{j}^{n_{i j}}\left(f_{j}^{r_{j}} x_{i}-f_{i}^{r_{i}} x_{j}\right)=0
$$

Choosing $N$ so $N \geq n_{i j}$ for all $i, j$, we see that

$$
f_{i}^{N} f_{j}^{N}\left(f_{j}^{r_{j}} x_{i}-f_{i}^{r_{i}} x_{j}\right)=0
$$

Define elements $\widetilde{x}_{i}$ and $\widetilde{f}_{i}$ of $R$ as follows:

$$
\widetilde{f}_{i}=f_{i}^{N+r_{i}}, \quad \widetilde{x_{i}}=f_{i}^{N} x_{i} .
$$

Notice that

$$
\frac{\widetilde{x}_{i}}{\widetilde{f}_{i}}=\frac{x_{i}}{f_{i}^{r_{i}}} .
$$

Also, we can use this to rewrite the above equation $f_{i}^{N} f_{j}^{N}\left(f_{j}^{r_{j}} x_{i}-f_{i}^{r_{i}} x_{j}\right)=0$ to get the following equality, for all $i, j$,

$$
\tilde{f}_{j} \widetilde{x}_{i}=\tilde{f}_{i} \widetilde{x}_{j}
$$

Since $f_{1}, \ldots, f_{n}$ generate $R$, we clearly have that $\widetilde{f}_{1}, \ldots, \widetilde{f_{n}}$ also generate $R$. Therefore, there exist $a_{1}, \ldots, a_{n}$ in $R$ so that

$$
1=\sum_{i=1}^{n} a_{i} \widetilde{f}_{i}
$$

Therefore, we finally conclude that for all $i$,

$$
\frac{x_{i}}{f_{i}^{r_{i}}}=\frac{\widetilde{x_{i}}}{\widetilde{f}_{i}}=\sum_{j=1}^{n} \frac{a_{j} \widetilde{f}_{j} \widetilde{x}_{i}}{\widetilde{f}_{i}}=\sum_{j=1}^{n} \frac{a_{j} \widetilde{f}_{i} \widetilde{x}_{j}}{\widetilde{f}_{i}}=\frac{\sum_{j=1}^{n} a_{j} \widetilde{x}_{j}}{1}
$$

Thus, we have

$$
\alpha\left(\sum_{j=1}^{n} a_{j} \widetilde{x_{j}}\right)=\left(\frac{x_{1}}{f_{1}^{r_{1}}}, \ldots, \frac{x_{n}}{f_{n}^{r_{n}}}\right)
$$

as required. There the sequence is exact.

00EK Lemma 10.22.2. Let $R$ be a ring. Let $f_{1}, \ldots, f_{n}$ be elements of $R$ generating the unit ideal. Let $M$ be an $R$-module. The sequence

$$
0 \rightarrow M \stackrel{\alpha}{\rightarrow} \bigoplus_{i=1}^{n} M_{f_{i}} \stackrel{\beta}{\rightarrow} \bigoplus_{i, j=1}^{n} M_{f_{i} f_{j}}
$$

is exact, where $\alpha(m)=(m / 1, \ldots, m / 1)$ and $\beta\left(m_{1} / f_{1}^{e_{1}}, \ldots, m_{n} / f_{n}^{e_{n}}\right)=\left(m_{i} / f_{i}^{e_{i}}-\right.$ $\left.m_{j} / f_{j}^{e_{j}}\right)_{(i, j)}$.

Proof. The same as the proof of Lemma 10.22 .1 .
Second proof of Lemma 10.20.3. Having assured ourselves (Lemma 10.22.1) that for generators $f_{1}, \ldots, f_{n}$ for the unit ideal of a ring $R$ the sequence

$$
0 \rightarrow R \rightarrow \bigoplus_{i=1}^{n} R_{f_{i}} \rightarrow \bigoplus_{i, j} R_{f_{i} f_{j}}
$$

is exact, we now provide an alternate proof of the surjectivity of the map from idempotents $e$ of $R$ to open and closed subsets of $\operatorname{Spec}(R)$ presented in Lemma 10.20.3. Let $U \subset \operatorname{Spec}(R)$ be open and closed, and $W$ be its complement. We can write $U$ and $V$ as unions of standard opens such that $U=\bigcup_{i=1}^{n} D\left(f_{i}\right)$ and $W=$ $\bigcup_{j=1}^{m} D\left(g_{j}\right)$. Since $\operatorname{Spec}(R)=\bigcup D\left(f_{i}\right) \cup \bigcup D\left(g_{j}\right)$, we observe that the collection $\left\{f_{i} ; g_{j}\right\}$ must generate the unit ideal in $R$ by Lemma 10.16.2 So the following sequence is exact.
(10.22.2.1)
$00 \mathrm{EL} \quad 0 \rightarrow R \xrightarrow{\alpha} \bigoplus_{i=1}^{n} R_{f_{i}} \oplus \bigoplus_{j=1}^{m} R_{g_{j}} \rightarrow \bigoplus_{i_{1}, i_{2}} R_{f_{i_{1} f_{i_{2}}}} \oplus \bigoplus_{i, j} R_{f_{i} g_{j}} \oplus \bigoplus_{j_{1}, j_{2}} R_{g_{j_{1}} g_{j_{2}}}$ However, notice that for any pair $i, j, D\left(f_{i}\right) \cap D\left(g_{j}\right)=\emptyset$ since $D\left(f_{i}\right) \subset U$ and $\left.D\left(g_{j}\right) \subset W\right)$. From part (15) of Lemma 10.16 .2 we recall that $D\left(f_{i} g_{j}\right)=D\left(f_{i}\right) \cap$ $D\left(g_{j}\right)=\emptyset$. Therefore by Lemma $10.16 .5 \operatorname{Spec}\left(R_{f_{i} g_{j}}\right)=D\left(f_{i} g_{j}\right)=\emptyset$, implying that $R_{f_{i} g_{j}}$ is the zero ring for each pair $i, j$ by part (3) of Lemma 10.16 .2 . Consider the element $(1, \ldots, 1,0, \ldots, 0) \in \bigoplus_{i=1}^{n} R_{f_{i}} \oplus \bigoplus_{j=1}^{m} R_{g_{j}}$ whose coordinates are 1 in each $R_{f_{i}}$ and 0 in each $R_{g_{j}}$. This is sent to 0 under the map

$$
\beta: \bigoplus_{i=1}^{n} R_{f_{i}} \oplus \bigoplus_{j=1}^{m} R_{g_{j}} \rightarrow \bigoplus_{i_{1}, i_{2}} R_{f_{i_{1}} f_{i_{2}}} \oplus \bigoplus_{j_{1}, j_{2}} R_{g_{j_{1}} g_{j_{2}}}
$$

so by the exactness of the sequence 10.22 .2 .1 , there must be some element of $R$ whose image under $\alpha$ is $(1, \ldots, 1,0, \ldots, 0)$. Call it $e$. We see that $\alpha\left(e^{2}\right)=\alpha(e)^{2}=$ $(1, \ldots, 1,0, \ldots, 0)=\alpha(e)$. Since $\alpha$ is injective, $e=e^{2}$ in $R$ and $e$ is an idempotent of $R$. We claim that $U=D(e)$. Notice that for arbitrary $j$, the map $R \rightarrow R_{g_{j}}$ maps $e$ to 0 . Therefore there must be some positive integer $k_{j}$ such that $g_{j}^{k_{j}}(e-0)=0$ in $R$. Multiplying by $e$ as necessary, we see that $\left(g_{j} e\right)^{k_{j}}=0$, so $g_{j} e$ is nilpotent in $R$. By Lemma 10.16.2 $D\left(g_{j}\right) \cap D(e)=D\left(g_{j} e\right)=\emptyset$. So since $V=\bigcup D\left(g_{j}\right), D(e) \cap V=\emptyset$ and $D(e) \subset U$. Furthermore, for arbitrary $i$, the map $R \rightarrow R_{f_{i}}$ maps $e$ to 1 , so there must be some $l_{i}$ such that $f_{i}^{l_{i}}(e-1)=0$ in $R$. Hence $f_{i}^{l_{i}} e=f_{i}^{l_{i}}$. Suppose $\mathfrak{p} \in \operatorname{Spec}(R)$ contains $e$, then $\mathfrak{p}$ contains $f_{i}^{l_{i}} e=f_{i}^{l_{i}}$, and since $\mathfrak{p}$ is prime, $f_{i} \in \mathfrak{p}$. So $V(e) \subset V\left(f_{i}\right)$, implying that $D\left(f_{i}\right) \subset D(e)$. Therefore $U=\bigcup D\left(f_{i}\right) \subset D(e)$, and $U=D(e)$. Therefore any open and closed subset of $\operatorname{Spec}(R)$ is the standard open of an idempotent as desired.

The following we have already seen above, but we state it explicitly here for convenience.

00 EM Lemma 10.22.3. Let $R$ be a ring. If $\operatorname{Spec}(R)=U \amalg V$ with both $U$ and $V$ open then $R \cong R_{1} \times R_{2}$ with $U \cong \operatorname{Spec}\left(R_{1}\right)$ and $V \cong \operatorname{Spec}\left(R_{2}\right)$ via the maps in Lemma 10.20.2. Moreover, both $R_{1}$ and $R_{2}$ are localizations as well as quotients of the ring $R$.

Proof. By Lemma 10.20 .3 we have $U=D(e)$ and $V=D(1-e)$ for some idempotent $e$. By Lemma 10.22 .1 we see that $R \cong R_{e} \times R_{1-e}$ (since clearly $R_{e(1-e)}=0$ so the glueing condition is trivial; of course it is trivial to prove the product decomposition directly in this case). The lemma follows.

0565 Lemma 10.22.4. Let $R$ be a ring. Let $f_{1}, \ldots, f_{n} \in R$. Let $M$ be an $R$-module. Then $M \rightarrow \bigoplus M_{f_{i}}$ is injective if and only if

$$
M \longrightarrow \bigoplus_{i=1, \ldots, n} M, \quad m \longmapsto\left(f_{1} m, \ldots, f_{n} m\right)
$$

is injective.
Proof. The map $M \rightarrow \bigoplus M_{f_{i}}$ is injective if and only if for all $m \in M$ and $e_{1}, \ldots, e_{n} \geq 1$ such that $f_{i}^{e_{i}} m=0, i=1, \ldots, n$ we have $m=0$. This clearly implies the displayed map is injective. Conversely, suppose the displayed map is injective and $m \in M$ and $e_{1}, \ldots, e_{n} \geq 1$ are such that $f_{i}^{e_{i}} m=0, i=1, \ldots, n$. If $e_{i}=1$ for all $i$, then we immediately conclude that $m=0$ from the injectivity of the displayed map. Next, we prove this holds for any such data by induction on $e=\sum e_{i}$. The base case is $e=n$, and we have just dealt with this. If some $e_{i}>1$, then set $m^{\prime}=f_{i} m$. By induction we see that $m^{\prime}=0$. Hence we see that $f_{i} m=0$, i.e., we may take $e_{i}=1$ which decreases $e$ and we win.

### 10.23. More glueing results

00 EN In this section we put a number of standard results of the form: if something is true for all members of a standard open covering then it is true. In fact, it often suffices to check things on the level of local rings as in the following lemma.
00 HN Lemma 10.23.1. Let $R$ be a ring.
(1) For an element $x$ of an $R$-module $M$ the following are equivalent
(a) $x=0$,
(b) $x$ maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \in \operatorname{Spec}(R)$,
(c) $x$ maps to zero in $M_{\mathfrak{m}}$ for all maximal ideals $\mathfrak{m}$ of $R$.

In other words, the map $M \rightarrow \prod_{\mathfrak{m}} M_{\mathfrak{m}}$ is injective.
(2) Given an $R$-module $M$ the following are equivalent
(a) $M$ is zero,
(b) $M_{\mathfrak{p}}$ is zero for all $\mathfrak{p} \in \operatorname{Spec}(R)$,
(c) $M_{\mathfrak{m}}$ is zero for all maximal ideals $\mathfrak{m}$ of $R$.
(3) Given a complex $M_{1} \rightarrow M_{2} \rightarrow M_{3}$ of $R$-modules the following are equivalent
(a) $M_{1} \rightarrow M_{2} \rightarrow M_{3}$ is exact,
(b) for every prime $\mathfrak{p}$ of $R$ the localization $M_{1, \mathfrak{p}} \rightarrow M_{2, \mathfrak{p}} \rightarrow M_{3, \mathfrak{p}}$ is exact,
(c) for every maximal ideal $\mathfrak{m}$ of $R$ the localization $M_{1, \mathfrak{m}} \rightarrow M_{2, \mathfrak{m}} \rightarrow$ $M_{3, \mathfrak{m}}$ is exact.
(4) Given a map $f: M \rightarrow M^{\prime}$ of $R$-modules the following are equivalent
(a) $f$ is injective,
(b) $f_{\mathfrak{p}}: M_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}^{\prime}$ is injective for all primes $\mathfrak{p}$ of $R$,
(c) $f_{\mathfrak{m}}: M_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}^{\prime}$ is injective for all maximal ideals $\mathfrak{m}$ of $R$.
(5) Given a map $f: M \rightarrow M^{\prime}$ of $R$-modules the following are equivalent
(a) $f$ is surjective,
(b) $f_{\mathfrak{p}}: M_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}^{\prime}$ is surjective for all primes $\mathfrak{p}$ of $R$,
(c) $f_{\mathfrak{m}}: M_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}^{\prime}$ is surjective for all maximal ideals $\mathfrak{m}$ of $R$.
(6) Given a map $f: M \rightarrow M^{\prime}$ of $R$-modules the following are equivalent
(a) $f$ is bijective,
(b) $f_{\mathfrak{p}}: M_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}^{\prime}$ is bijective for all primes $\mathfrak{p}$ of $R$,
(c) $f_{\mathfrak{m}}: M_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}^{\prime}$ is bijective for all maximal ideals $\mathfrak{m}$ of $R$.

Proof. Let $x \in M$ as in (1). Let $I=\{f \in R \mid f x=0\}$. It is easy to see that $I$ is an ideal (it is the annihilator of $x$ ). Condition (1)(c) means that for all maximal ideals $\mathfrak{m}$ there exists an $f \in R \backslash \mathfrak{m}$ such that $f x=0$. In other words, $V(I)$ does not contain a closed point. By Lemma 10.16 .2 we see $I$ is the unit ideal. Hence $x$ is zero, i.e., (1)(a) holds. This proves (1).
Part (2) follows by applying (1) to all elements of $M$ simultaneously.
Proof of (3). Let $H$ be the homology of the sequence, i.e., $H=\operatorname{Ker}\left(M_{2} \rightarrow\right.$ $\left.M_{3}\right) / \operatorname{Im}\left(M_{1} \rightarrow M_{2}\right)$. By Proposition 10.9 .12 we have that $H_{\mathfrak{p}}$ is the homology of the sequence $M_{1, \mathfrak{p}} \rightarrow M_{2, \mathfrak{p}} \rightarrow M_{3, \mathfrak{p}}$. Hence (3) is a consequence of (2).
Parts (4) and (5) are special cases of (3). Part (6) follows formally on combining (4) and (5).

00 EO Lemma 10.23.2. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S$ be an $R$-algebra. Suppose that $f_{1}, \ldots, f_{n}$ is a finite list of elements of $R$ such that $\bigcup D\left(f_{i}\right)=\operatorname{Spec}(R)$ in other words $\left(f_{1}, \ldots, f_{n}\right)=R$.
(1) If each $M_{f_{i}}=0$ then $M=0$.
(2) If each $M_{f_{i}}$ is a finite $R_{f_{i}}$-module, then $M$ is a finite $R$-module.
(3) If each $M_{f_{i}}$ is a finitely presented $R_{f_{i}}$-module, then $M$ is a finitely presented $R$-module.
(4) Let $M \rightarrow N$ be a map of $R$-modules. If $M_{f_{i}} \rightarrow N_{f_{i}}$ is an isomorphism for each $i$ then $M \rightarrow N$ is an isomorphism.
(5) Let $0 \rightarrow M^{\prime \prime} \rightarrow M \rightarrow M^{\prime} \rightarrow 0$ be a complex of $R$-module. If $0 \rightarrow M_{f_{i}}^{\prime \prime} \rightarrow$ $M_{f_{i}} \rightarrow M_{f_{i}}^{\prime} \rightarrow 0$ is exact for each $i$, then $0 \rightarrow M^{\prime \prime} \rightarrow M \rightarrow M^{\prime} \rightarrow 0$ is exact.
(6) If each $R_{f_{i}}$ is Noetherian, then $R$ is Noetherian.
(7) If each $S_{f_{i}}$ is a finite type $R$-algebra, so is $S$.
(8) If each $S_{f_{i}}$ is of finite presentation over $R$, so is $S$.

Proof. We prove each of the parts in turn.
(1) By Proposition 10.9 .10 this implies $M_{\mathfrak{p}}=0$ for all $\mathfrak{p} \in \operatorname{Spec}(R)$, so we conclude by Lemma 10.23.1.
(2) For each $i$ take a finite generating set $X_{i}$ of $M_{f_{i}}$. Without loss of generality, we may assume that the elements of $X_{i}$ are in the image of the localization $\operatorname{map} M \rightarrow M_{f_{i}}$, so we take a finite set $Y_{i}$ of preimages of the elements of $X_{i}$ in $M$. Let $Y$ be the union of these sets. This is still a finite set. Consider the obvious $R$-linear map $R^{Y} \rightarrow M$ sending the basis element $e_{y}$ to $y$. By assumption this map is surjective after localizing at an arbitrary prime ideal $\mathfrak{p}$ of $R$, so it surjective by Lemma 10.23 .1 and $M$ is finitely generated.
(3) By (2) we have a short exact sequence

$$
0 \rightarrow K \rightarrow R^{n} \rightarrow M \rightarrow 0
$$

Since localization is an exact functor and $M_{f_{i}}$ is finitely presented we see that $K_{f_{i}}$ is finitely generated for all $1 \leq i \leq n$ by Lemma 10.5.3. By (2) this implies that $K$ is a finite $R$-module and therefore $M$ is finitely presented.
(4) By Proposition 10.9 .10 the assumption implies that the induced morphism on localizations at all prime ideals is an isomorphism, so we conclude by Lemma 10.23.1.
(5) By Proposition 10.9 .10 the assumption implies that the induced sequence of localizations at all prime ideals is short exact, so we conclude by Lemma 10.23 .1
(6) We will show that every ideal of $R$ has a finite generating set: For this, let $I \subset R$ be an arbitrary ideal. By Proposition 10.9 .12 each $I_{f_{i}} \subset R_{f_{i}}$ is an ideal. These are all finitely generated by assumption, so we conclude by (2).
(7) For each $i$ take a finite generating set $X_{i}$ of $S_{f_{i}}$. Without loss of generality, we may assume that the elements of $X_{i}$ are in the image of the localization map $S \rightarrow S_{f_{i}}$, so we take a finite set $Y_{i}$ of preimages of the elements of $X_{i}$ in $S$. Let $Y$ be the union of these sets. This is still a finite set. Consider the algebra homomorphism $R\left[X_{y}\right]_{y \in Y} \rightarrow S$ induced by $Y$. Since it is an algebra homomorphism, the image $T$ is an $R$-submodule of the $R$-module $S$, so we can consider the quotient module $S / T$. By assumption, this is zero if we localize at the $f_{i}$, so it is zero by (1) and therefore $S$ is an $R$-algebra of finite type.
(8) By the previous item, there exists a surjective $R$-algebra homomorphism $R\left[X_{1}, \ldots, X_{n}\right] \rightarrow S$. Let $K$ be the kernel of this map. This is an ideal in $R\left[X_{1}, . . X_{n}\right]$, finitely generated in each localization at $f_{i}$. Since the $f_{i}$ generate the unit ideal in $R$, they also generate the unit ideal in $R\left[X_{1}, \ldots, X_{n}\right]$, so an application of (2) finishes the proof.

00EP Lemma 10.23.3. Let $R \rightarrow S$ be a ring map. Suppose that $g_{1}, \ldots, g_{m}$ is a finite list of elements of $S$ such that $\bigcup D\left(g_{j}\right)=\operatorname{Spec}(S)$ in other words $\left(g_{1}, \ldots, g_{m}\right)=S$.
(1) If each $S_{g_{i}}$ is of finite type over $R$, then $S$ is of finite type over $R$.
(2) If each $S_{g_{i}}$ is of finite presentation over $R$, then $S$ is of finite presentation over $R$.

Proof. Omitted.
The following lemma is better stated and proved in the more general context of flat descent. However, it makes sense to state it here since it fits well with the above.

00EQ Lemma 10.23.4. Let $R$ be a ring. Let $f_{1}, \ldots, f_{n} \in R$ be elements which generate the unit ideal in $R$. Suppose we are given the following data:
(1) For each $i$ an $R_{f_{i}}$-module $M_{i}$.
(2) For each pair $i, j$ an $R_{f_{i} f_{j}}$-module isomorphism $\psi_{i j}:\left(M_{i}\right)_{f_{j}} \rightarrow\left(M_{j}\right)_{f_{i}}$.
which satisfy the "cocycle condition" that all the diagrams

commute (for all triples $i, j, k$ ). Given this data define

$$
M=\operatorname{Ker}\left(\bigoplus_{1 \leq i \leq n} M_{i} \longrightarrow \bigoplus_{1 \leq i, j \leq n}\left(M_{i}\right)_{f_{i}}\right)
$$

where $\left(m_{1}, \ldots, m_{n}\right)$ maps to the element whose $(i, j)$ th entry is $m_{i} / 1-\psi_{j i}\left(m_{j} / 1\right)$. Then the natural map $M \rightarrow M_{i}$ identifies $M_{i}$ with $M_{f_{i}}$. Moreover $\psi_{i j}(m / 1)=m / 1$ for all $m \in M$ (with obvious notation).

Proof. Omitted.

### 10.24. Zerodivisors and total rings of fractions

02LV The local ring at a minimal prime has the following properties.
00 EU Lemma 10.24.1. Let $\mathfrak{p}$ be a minimal prime of a ring R. Every element of the maximal ideal of $R_{\mathfrak{p}}$ is nilpotent. If $R$ is reduced then $R_{\mathfrak{p}}$ is a field.
Proof. If some element $x$ of $\mathfrak{p} R_{\mathfrak{p}}$ is not nilpotent, then $D(x) \neq \emptyset$, see Lemma 10.16 .2 . This contradicts the minimality of $\mathfrak{p}$. If $R$ is reduced, then $\mathfrak{p} R_{\mathfrak{p}}=0$ and hence it is a field.

00EW Lemma 10.24.2. Let $R$ be a reduced ring. Then
(1) $R$ is a subring of a product of fields,
(2) $R \rightarrow \prod_{\mathfrak{p} \text { minimal }} R_{\mathfrak{p}}$ is an embedding into a product of fields,
(3) $\bigcup_{\mathfrak{p} \text { minimal }} \mathfrak{p}$ is the set of zerodivisors of $R$.

Proof. By Lemma 10.24 .1 each of the rings $R_{\mathfrak{p}}$ is a field. In particular, the kernel of the ring map $R \rightarrow R_{\mathfrak{p}}$ is $\mathfrak{p}$. By Lemma 10.16 .2 we have $\bigcap_{\mathfrak{p}} \mathfrak{p}=(0)$. Hence (2) and (1) are true. If $x y=0$ and $y \neq 0$, then $y \notin \mathfrak{p}$ for some minimal prime $\mathfrak{p}$. Hence $x \in \mathfrak{p}$. Thus every zerodivisor of $R$ is contained in $\bigcup_{\mathfrak{p} \text { minimal }} \mathfrak{p}$. Conversely, suppose that $x \in \mathfrak{p}$ for some minimal prime $\mathfrak{p}$. Then $x$ maps to zero in $R_{\mathfrak{p}}$, hence there exists $y \in R, y \notin \mathfrak{p}$ such that $x y=0$. In other words, $x$ is a zerodivisor. This finishes the proof of (3) and the lemma.

The total ring of fractions $Q(R)$ of a ring $R$ was introduced in Example 10.9.8
02LW Lemma 10.24.3. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset consisting of nonzerodivisors. Then $Q(R) \cong Q\left(S^{-1} R\right)$. In particular $Q(R) \cong Q(Q(R))$.
Proof. If $x \in S^{-1} R$ is a nonzerodivisor, and $x=r / f$ for some $r \in R, f \in S$, then $r$ is a nonzerodivisor in $R$. Whence the lemma.

We can apply glueing results to prove something about total rings of fractions $Q(R)$ which we introduced in Example 10.9.8.

02LX Lemma 10.24.4. Let $R$ be a ring. Assume that $R$ has finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$, and that $\mathfrak{q}_{1} \cup \ldots \cup \mathfrak{q}_{t}$ is the set of zerodivisors of $R$. Then the total ring of fractions $Q(R)$ is equal to $R_{\mathfrak{q}_{1}} \times \ldots \times R_{\mathfrak{q}_{t}}$.

Proof. There are natural maps $Q(R) \rightarrow R_{\mathfrak{q}_{i}}$ since any nonzerodivisor is contained in $R \backslash \mathfrak{q}_{i}$. Hence a natural map $Q(R) \rightarrow R_{\mathfrak{q}_{1}} \times \ldots \times R_{\mathfrak{q}_{t}}$. For any nonminimal prime $\mathfrak{p} \subset R$ we see that $\mathfrak{p} \not \subset \mathfrak{q}_{1} \cup \ldots \cup \mathfrak{q}_{t}$ by Lemma 10.14.2. Hence $\operatorname{Spec}(Q(R))=$ $\left\{\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$ (as subsets of $\operatorname{Spec}(R)$, see Lemma 10.16.5). Therefore $\operatorname{Spec}(Q(R))$ is a finite discrete set and it follows that $Q(R)=A_{1} \times \ldots \times A_{t}$ with $\operatorname{Spec}\left(A_{i}\right)=\left\{q_{i}\right\}$, see Lemma 10.22.3. Moreover $A_{i}$ is a local ring, which is a localization of $R$. Hence $A_{i} \cong R_{\mathfrak{q}_{i}}$.

### 10.25. Irreducible components of spectra

00 ER We show that irreducible components of the spectrum of a ring correspond to the minimal primes in the ring.

00ES Lemma 10.25.1. Let $R$ be a ring.
(1) For a prime $\mathfrak{p} \subset R$ the closure of $\{\mathfrak{p}\}$ in the Zariski topology is $V(\mathfrak{p})$. In a formula $\overline{\{\mathfrak{p}\}}=V(\mathfrak{p})$.
(2) The irreducible closed subsets of $\operatorname{Spec}(R)$ are exactly the subsets $V(\mathfrak{p})$, with $\mathfrak{p} \subset R$ a prime.
(3) The irreducible components (see Topology, Definition 5.7.1) of $\operatorname{Spec}(R)$ are exactly the subsets $V(\mathfrak{p})$, with $\mathfrak{p} \subset R$ a minimal prime.

Proof. Note that if $\mathfrak{p} \in V(I)$, then $I \subset \mathfrak{p}$. Hence, clearly $\overline{\{\mathfrak{p}\}}=V(\mathfrak{p})$. In particular $V(\mathfrak{p})$ is the closure of a singleton and hence irreducible. The second assertion implies the third. To show the second, let $V(I) \subset \operatorname{Spec}(R)$ with $I$ a radical ideal. If $I$ is not prime, then choose $a, b \in R, a, b \notin I$ with $a b \in I$. In this case $V(I, a) \cup V(I, b)=$ $V(I)$, but neither $V(I, b)=V(I)$ nor $V(I, a)=V(I)$, by Lemma 10.16.2. Hence $V(I)$ is not irreducible.

In other words, this lemma shows that every irreducible closed subset of $\operatorname{Spec}(R)$ is of the form $V(\mathfrak{p})$ for some prime $\mathfrak{p}$. Since $V(\mathfrak{p})=\overline{\{\mathfrak{p}\}}$ we see that each irreducible closed subset has a unique generic point, see Topology, Definition 5.7.4. In particular, $\operatorname{Spec}(R)$ is a sober topological space. We record this fact in the following lemma.

090M Lemma 10.25.2. The spectrum of a ring is a spectral space, see Topology, Definition 5.22.1.

Proof. Formally this follows from Lemma 10.25 .1 and Lemma 10.16.11. See also discussion above.

00 ET Lemma 10.25.3. Let $R$ be a ring. Let $\mathfrak{p} \subset R$ be a prime.
(1) the set of irreducible closed subsets of $\operatorname{Spec}(R)$ passing through $\mathfrak{p}$ is in one-to-one correspondence with primes $\mathfrak{q} \subset R_{\mathfrak{p}}$.
(2) The set of irreducible components of $\operatorname{Spec}(R)$ passing through $\mathfrak{p}$ is in one-to-one correspondence with minimal primes $\mathfrak{q} \subset R_{\mathfrak{p}}$.

Proof. Follows from Lemma 10.25 .1 and the description of $\operatorname{Spec}\left(R_{\mathfrak{p}}\right)$ in Lemma 10.16 .5 which shows that $\operatorname{Spec}\left(R_{\mathfrak{p}}\right)$ corresponds to primes $\mathfrak{q}$ in $R$ with $\mathfrak{q} \subset \mathfrak{p}$.

00 EV Lemma 10.25.4. Let $R$ be a ring. Let $\mathfrak{p}$ be a minimal prime of $R$. Let $W \subset$ $\operatorname{Spec}(R)$ be a quasi-compact open not containing the point $\mathfrak{p}$. Then there exists an $f \in R, f \notin \mathfrak{p}$ such that $D(f) \cap W=\emptyset$.

Proof. Since $W$ is quasi-compact we may write it as a finite union of standard affine opens $D\left(g_{i}\right), i=1, \ldots, n$. Since $\mathfrak{p} \notin W$ we have $g_{i} \in \mathfrak{p}$ for all $i$. By Lemma 10.24.1 each $g_{i}$ is nilpotent in $R_{\mathfrak{p}}$. Hence we can find an $f \in R, f \notin \mathfrak{p}$ such that for all $i$ we have $f g_{i}^{n_{i}}=0$ for some $n_{i}>0$. Then $D(f)$ works.

04MG Lemma 10.25.5. Let $R$ be a ring. Let $X=\operatorname{Spec}(R)$ as a topological space. The following are equivalent
(1) $X$ is profinite,
(2) $X$ is Hausdorff,
(3) $X$ is totally disconnected.
(4) every quasi-compact open of $X$ is closed,
(5) there are no nontrivial inclusions between its prime ideals,
(6) every prime ideal is a maximal ideal,
(7) every prime ideal is minimal,
(8) every standard open $D(f) \subset X$ is closed, and
(9) add more here.

Proof. First proof. It is clear that (5), (6), and (7) are equivalent. It is clear that (4) and (8) are equivalent as every quasi-compact open is a finite union of standard opens. The implication $(7) \Rightarrow(4)$ follows from Lemma 10.25.4. Assume (4) holds. Let $\mathfrak{p}, \mathfrak{p}^{\prime}$ be distinct primes of $R$. Choose an $f \in \mathfrak{p}^{\prime}, f \notin \mathfrak{p}$ (if needed switch $\mathfrak{p}$ with $\left.\mathfrak{p}^{\prime}\right)$. Then $\mathfrak{p}^{\prime} \notin D(f)$ and $\mathfrak{p} \in D(f)$. By (4) the open $D(f)$ is also closed. Hence $\mathfrak{p}$ and $\mathfrak{p}^{\prime}$ are in disjoint open neighbourhoods whose union is $X$. Thus $X$ is Hausdorff and totally disconnected. Thus $(4) \Rightarrow(2)$ and (3). If (3) holds then there cannot be any specializations between points of $\operatorname{Spec}(R)$ and we see that $(5)$ holds. If $X$ is Hausdorff then every point is closed, so (2) implies (6). Thus (2), (3), (4), (5), (6), (7) and (8) are equivalent. Any profinite space is Hausdorff, so (1) implies (2). If $X$ satisfies (2) and (3), then $X$ (being quasi-compact by Lemma 10.16.10) is profinite by Topology, Lemma 5.21.2.

Second proof. Besides the equivalence of (4) and (8) this follows from Lemma 10.25 .2 and purely topological facts, see Topology, Lemma 5.22.7.

### 10.26. Examples of spectra of rings

00EX In this section we put some examples of spectra.
00 EY Example 10.26.1. In this example we describe $X=\operatorname{Spec}\left(\mathbf{Z}[x] /\left(x^{2}-4\right)\right)$. Let $\mathfrak{p}$ be an arbitrary prime in $X$. Let $\phi: \mathbf{Z} \rightarrow \mathbf{Z}[x] /\left(x^{2}-4\right)$ be the natural ring map. Then, $\phi^{-1}(\mathfrak{p})$ is a prime in $\mathbf{Z}$. If $\phi^{-1}(\mathfrak{p})=(2)$, then since $\mathfrak{p}$ contains 2 , it corresponds to a prime ideal in $\mathbf{Z}[x] /\left(x^{2}-4,2\right) \cong(\mathbf{Z} / 2 \mathbf{Z})[x] /\left(x^{2}\right)$ via the map $\mathbf{Z}[x] /\left(x^{2}-4\right) \rightarrow$ $\mathbf{Z}[x] /\left(x^{2}-4,2\right)$. Any prime in $(\mathbf{Z} / 2 \mathbf{Z})[x] /\left(x^{2}\right)$ corresponds to a prime in $(\mathbf{Z} / 2 \mathbf{Z})[x]$ containing $\left(x^{2}\right)$. Such primes will then contain $x$. Since $(\mathbf{Z} / 2 \mathbf{Z}) \cong(\mathbf{Z} / 2 \mathbf{Z})[x] /(x)$ is a field, $(x)$ is a maximal ideal. Since any prime contains $(x)$ and $(x)$ is maximal, the ring contains only one prime $(x)$. Thus, in this case, $\mathfrak{p}=(2, x)$. Now, if $\phi^{-1}(\mathfrak{p})=(q)$ for $q>2$, then since $\mathfrak{p}$ contains $q$, it corresponds to a prime ideal in $\mathbf{Z}[x] /\left(x^{2}-4, q\right) \cong(\mathbf{Z} / q \mathbf{Z})[x] /\left(x^{2}-4\right)$ via the map $\mathbf{Z}[x] /\left(x^{2}-4\right) \rightarrow \mathbf{Z}[x] /\left(x^{2}-4, q\right)$. Any prime in $(\mathbf{Z} / q \mathbf{Z})[x] /\left(x^{2}-4\right)$ corresponds to a prime in $(\mathbf{Z} / q \mathbf{Z})[x]$ containing $\left(x^{2}-4\right)=(x-2)(x+2)$. Hence, these primes must contain either $x-2$ or $x+2$. Since $(\mathbf{Z} / q \mathbf{Z})[x]$ is a PID, all nonzero primes are maximal, and so there are precisely 2 primes in $(\mathbf{Z} / q \mathbf{Z})[x]$ containing $(x-2)(x+2)$, namely $(x-2)$ and $(x+2)$. In
conclusion, there exist two primes $(q, x-2)$ and $(q, x+2)$ since $2 \neq-2 \in \mathbf{Z} /(q)$. Finally, we treat the case where $\phi^{-1}(\mathfrak{p})=(0)$. Notice that $\mathfrak{p}$ corresponds to a prime ideal in $\mathbf{Z}[x]$ that contains $\left(x^{2}-4\right)=(x-2)(x+2)$. Hence, $\mathfrak{p}$ contains either $(x-2)$ or $(x+2)$. Hence, $\mathfrak{p}$ corresponds to a prime in $\mathbf{Z}[x] /(x-2)$ or one in $\mathbf{Z}[x] /(x+2)$ that intersects $\mathbf{Z}$ only at 0 , by assumption. Since $\mathbf{Z}[x] /(x-2) \cong \mathbf{Z}$ and $\mathbf{Z}[x] /(x+2) \cong \mathbf{Z}$, this means that $\mathfrak{p}$ must correspond to 0 in one of these rings. Thus, $\mathfrak{p}=(x-2)$ or $\mathfrak{p}=(x+2)$ in the original ring.

00EZ Example 10.26.2. In this example we describe $X=\operatorname{Spec}(\mathbf{Z}[x])$. Fix $\mathfrak{p} \in X$. Let $\phi: \mathbf{Z} \rightarrow \mathbf{Z}[x]$ and notice that $\phi^{-1}(\mathfrak{p}) \in \operatorname{Spec}(\mathbf{Z})$. If $\phi^{-1}(\mathfrak{p})=(q)$ for $q$ a prime number $q>0$, then $\mathfrak{p}$ corresponds to a prime in $(\mathbf{Z} /(q))[x]$, which must be generated by a polynomial that is irreducible in $(\mathbf{Z} /(q))[x]$. If we choose a representative of this polynomial with minimal degree, then it will also be irreducible in $\mathbf{Z}[x]$. Hence, in this case $\mathfrak{p}=\left(q, f_{q}\right)$ where $f_{q}$ is an irreducible polynomial in $\mathbf{Z}[x]$ that is irreducible when viewed in $(\mathbf{Z} /(q)[x])$. Now, assume that $\phi^{-1}(\mathfrak{p})=(0)$. In this case, $\mathfrak{p}$ must be generated by nonconstant polynomials which, since $\mathfrak{p}$ is prime, may be assumed to be irreducible in $\mathbf{Z}[x]$. By Gauss' lemma, these polynomials are also irreducible in $\mathbf{Q}[x]$. Since $\mathbf{Q}[x]$ is a Euclidean domain, if there are at least two distinct irreducibles $f, g$ generating $\mathfrak{p}$, then $1=a f+b g$ for $a, b \in \mathbf{Q}[x]$. Multiplying through by a common denominator, we see that $m=\bar{a} f+\bar{b} g$ for $\bar{a}, \bar{b} \in \mathbf{Z}[x]$ and nonzero $m \in \mathbf{Z}$. This is a contradiction. Hence, $\mathfrak{p}$ is generated by one irreducible polynomial in $\mathbf{Z}[x]$.

00F0 Example 10.26.3. In this example we describe $X=\operatorname{Spec}(k[x, y])$ when $k$ is an arbitrary field. Clearly (0) is prime, and any principal ideal generated by an irreducible polynomial will also be a prime since $k[x, y]$ is a unique factorization domain. Now assume $\mathfrak{p}$ is an element of $X$ that is not principal. Since $k[x, y]$ is a Noetherian UFD, the prime ideal $\mathfrak{p}$ can be generated by a finite number of irreducible polynomials $\left(f_{1}, \ldots, f_{n}\right)$. Now, I claim that if $f, g$ are irreducible polynomials in $k[x, y]$ that are not associates, then $(f, g) \cap k[x] \neq 0$. To do this, it is enough to show that $f$ and $g$ are relatively prime when viewed in $k(x)[y]$. In this case, $k(x)[y]$ is a Euclidean domain, so by applying the Euclidean algorithm and clearing denominators, we obtain $p=a f+b g$ for $p, a, b \in k[x]$. Thus, assume this is not the case, that is, that some nonunit $h \in k(x)[y]$ divides both $f$ and $g$. Then, by Gauss's lemma, for some $a, b \in k(x)$ we have $a h \mid f$ and $b h \mid g$ for $a h, b h \in k[x]$ since $f . f .(k[x])=k(x)$. By irreducibility, $a h=f$ and $b h=g$ (since $h \notin k(x))$. So, back in $k(x)[y], f, g$ are associates, as $\frac{a}{b} g=f$. Since $k(x)=f . f .(k[x])$, we can write $g=\frac{r}{s} f$ for elements $r, s \in k[x]$ sharing no common factors. This implies that $s g=r f$ in $k[x, y]$ and so $s$ must divide $f$ since $k[x, y]$ is a UFD. Hence, $s=1$ or $s=f$. If $s=f$, then $r=g$, implying $f, g \in k[x]$ and thus must be units in $k(x)$ and relatively prime in $k(x)[y]$, contradicting our hypothesis. If $s=1$, then $g=r f$, another contradiction. Thus, we must have $f, g$ relatively prime in $k(x)[y]$, a Euclidean domain. Thus, we have reduced to the case $\mathfrak{p}$ contains some irreducible polynomial $p \in k[x] \subset k[x, y]$. By the above, $\mathfrak{p}$ corresponds to a prime in the ring $k[x, y] /(p)=k(\alpha)[y]$, where $\alpha$ is an element algebraic over $k$ with minimum polynomial $p$. This is a PID, and so any prime ideal corresponds to (0) or an irreducible polynomial in $k(\alpha)[y]$. Thus, $\mathfrak{p}$ is of the form $(p)$ or $(p, f)$ where $f$ is a polynomial in $k[x, y]$ that is irreducible in the quotient $k[x, y] /(p)$.

00F1 Example 10.26.4. Consider the ring

$$
R=\{f \in \mathbf{Q}[z] \text { with } f(0)=f(1)\} .
$$

Consider the map

$$
\varphi: \mathbf{Q}[A, B] \rightarrow R
$$

defined by $\varphi(A)=z^{2}-z$ and $\varphi(B)=z^{3}-z^{2}$. It is easily checked that $\left(A^{3}-B^{2}+\right.$ $A B) \subset \operatorname{Ker}(\varphi)$ and that $A^{3}-B^{2}+A B$ is irreducible. Assume that $\varphi$ is surjective; then since $R$ is an integral domain (it is a subring of an integral domain), $\operatorname{Ker}(\phi)$ must be a prime ideal of $\mathbf{Q}[A, B]$. The prime ideals which contain $\left(A^{3}-B^{2}+A B\right)$ are $\left(A^{3}-B^{2}+A B\right)$ itself and any maximal ideal $(f, g)$ with $f, g \in \mathbf{Q}[A, B]$ such that $f$ is irreducible mod $g$. But $R$ is not a field, so the kernel must be $\left(A^{3}-B^{2}+A B\right)$; hence $\varphi$ gives an isomorphism $R \rightarrow \mathbf{Q}[A, B] /\left(A^{3}-B^{2}+A B\right)$.

To see that $\varphi$ is surjective, we must express any $f \in R$ as a $\mathbf{Q}$-coefficient polynomial in $A(z)=z^{2}-z$ and $B(z)=z^{3}-z^{2}$. Note the relation $z A(z)=B(z)$. Let $a=f(0)=f(1)$. Then $z(z-1)$ must divide $f(z)-a$, so we can write $f(z)=$ $z(z-1) g(z)+a=A(z) g(z)+a$. If $\operatorname{deg}(g)<2$, then $h(z)=c_{1} z+c_{0}$ and $f(z)=$ $A(z)\left(c_{1} z+c_{0}\right)+a=c_{1} B(z)+c_{0} A(z)+a$, so we are done. If $\operatorname{deg}(g) \geq 2$, then by the polynomial division algorithm, we can write $g(z)=A(z) h(z)+b_{1} z+b_{0}$ $(\operatorname{deg}(h) \leq \operatorname{deg}(g)-2)$, so $f(z)=A(z)^{2} h(z)+b_{1} B(z)+b_{0} A(z)$. Applying division to $h(z)$ and iterating, we obtain an expression for $f(z)$ as a polynomial in $A(z)$ and $B(z)$; hence $\varphi$ is surjective.

Now let $a \in \mathbf{Q}, a \neq 0, \frac{1}{2}, 1$ and consider

$$
R_{a}=\left\{f \in \mathbf{Q}\left[z, \frac{1}{z-a}\right] \text { with } f(0)=f(1)\right\}
$$

This is a finitely generated $\mathbf{Q}$-algebra as well: it is easy to check that the functions $z^{2}-z, z^{3}-z$, and $\frac{a^{2}-a}{z-a}+z$ generate $R_{a}$ as an $\mathbf{Q}$-algebra. We have the following inclusions:

$$
R \subset R_{a} \subset \mathbf{Q}\left[z, \frac{1}{z-a}\right], \quad R \subset \mathbf{Q}[z] \subset \mathbf{Q}\left[z, \frac{1}{z-a}\right]
$$

Recall (Lemma 10.16 .5 ) that for a ring T and a multiplicative subset $S \subset T$, the ring map $T \rightarrow S^{-1} T$ induces a map on spectra $\operatorname{Spec}\left(S^{-1} T\right) \rightarrow \operatorname{Spec}(T)$ which is a homeomorphism onto the subset

$$
\{\mathfrak{p} \in \operatorname{Spec}(T) \mid S \cap \mathfrak{p}=\emptyset\} \subset \operatorname{Spec}(T)
$$

When $S=\left\{1, f, f^{2}, \ldots\right\}$ for some $f \in T$, this is the open set $D(f) \subset T$. We now verify a corresponding property for the ring map $R \rightarrow R_{a}$ : we will show that the map $\theta: \operatorname{Spec}\left(R_{a}\right) \rightarrow \operatorname{Spec}(R)$ induced by inclusion $R \subset R_{a}$ is a homeomorphism onto an open subset of $\operatorname{Spec}(R)$ by verifying that $\theta$ is an injective local homeomorphism. We do so with respect to an open cover of $\operatorname{Spec}\left(R_{a}\right)$ by two distinguished opens, as we now describe. For any $r \in \mathbf{Q}$, let $\mathrm{ev}_{r}: R \rightarrow \mathbf{Q}$ be the homomorphism given by evaluation at $r$. Note that for $r=0$ and $r=1-a$, this can be extended to a homomorphism $\mathrm{ev}_{r}^{\prime}: R_{a} \rightarrow \mathbf{Q}$ (the latter because $\frac{1}{z-a}$ is well-defined at $z=1-a$, since $a \neq \frac{1}{2}$ ). However, $\mathrm{ev}_{a}$ does not extend to $R_{a}$. Write $\mathfrak{m}_{r}=\operatorname{Ker}\left(\mathrm{ev}_{r}\right)$. We have

$$
\begin{gathered}
\mathfrak{m}_{0}=\left(z^{2}-z, z^{3}-z\right), \\
\mathfrak{m}_{a}=\left((z-1+a)(z-a),\left(z^{2}-1+a\right)(z-a)\right), \text { and } \\
\mathfrak{m}_{1-a}=\left((z-1+a)(z-a),(z-1+a)\left(z^{2}-a\right)\right) .
\end{gathered}
$$

To verify this, note that the right-hand sides are clearly contained in the left-hand sides. Then check that the right-hand sides are maximal ideals by writing the generators in terms of $A$ and $B$, and viewing $R$ as $\mathbf{Q}[A, B] /\left(A^{3}-B^{2}+A B\right)$. Note that $\mathfrak{m}_{a}$ is not in the image of $\theta$ : we have

$$
\left(z^{2}-z\right)^{2}(z-a)\left(\frac{a^{2}-a}{z-a}+z\right)=\left(z^{2}-z\right)^{2}\left(a^{2}-a\right)+\left(z^{2}-z\right)^{2}(z-a) z
$$

The left hand side is in $\mathfrak{m}_{a} R_{a}$ because $\left(z^{2}-z\right)(z-a)$ is in $\mathfrak{m}_{a}$ and because $\left(z^{2}-\right.$ $z)\left(\frac{a^{2}-a}{z-a}+z\right)$ is in $R_{a}$. Similarly the element $\left(z^{2}-z\right)^{2}(z-a) z$ is in $\mathfrak{m}_{a} R_{a}$ because $\left(z^{2}-z\right)$ is in $R_{a}$ and $\left(z^{2}-z\right)(z-a)$ is in $\mathfrak{m}_{a}$. As $a \notin\{0,1\}$ we conclude that $\left(z^{2}-z\right)^{2} \in \mathfrak{m}_{a} R_{a}$. Hence no ideal $I$ of $R_{a}$ can satisfy $I \cap R=\mathfrak{m}_{a}$, as such an $I$ would have to contain $\left(z^{2}-z\right)^{2}$, which is in $R$ but not in $\mathfrak{m}_{a}$. The distinguished open set $D((z-1+a)(z-a)) \subset \operatorname{Spec}(R)$ is equal to the complement of the closed set $\left\{\mathfrak{m}_{a}, \mathfrak{m}_{1-a}\right\}$. Then check that $R_{(z-1+a)(z-a)}=\left(R_{a}\right)_{(z-1+a)(z-a)}$; calling this localized ring $R^{\prime}$, then, it follows that the map $R \rightarrow R^{\prime}$ factors as $R \rightarrow$ $R_{a} \rightarrow R^{\prime}$. By Lemma 10.16 .5 then, these maps express $\operatorname{Spec}\left(R^{\prime}\right) \subset \operatorname{Spec}\left(R_{a}\right)$ and $\operatorname{Spec}\left(R^{\prime}\right) \subset \operatorname{Spec}(R)$ as open subsets; hence $\theta: \operatorname{Spec}\left(R_{a}\right) \rightarrow \operatorname{Spec}(R)$, when restricted to $D((z-1+a)(z-a))$, is a homeomorphism onto an open subset. Similarly, $\theta$ restricted to $D\left(\left(z^{2}+z+2 a-2\right)(z-a)\right) \subset \operatorname{Spec}\left(R_{a}\right)$ is a homeomorphism onto the open subset $D\left(\left(z^{2}+z+2 a-2\right)(z-a)\right) \subset \operatorname{Spec}(R)$. Depending on whether $z^{2}+z+2 a-2$ is irreducible or not over $\mathbf{Q}$, this former distinguished open set has complement equal to one or two closed points along with the closed point $\mathfrak{m}_{a}$. Furthermore, the ideal in $R_{a}$ generated by the elements $\left(z^{2}+z+2 a-a\right)(z-a)$ and $(z-1+a)(z-a)$ is all of $R_{a}$, so these two distinguished open sets cover $\operatorname{Spec}\left(R_{a}\right)$. Hence in order to show that $\theta$ is a homeomorphism onto $\operatorname{Spec}(R)-\left\{\mathfrak{m}_{a}\right\}$, it suffices to show that these one or two points can never equal $\mathfrak{m}_{1-a}$. And this is indeed the case, since $1-a$ is a root of $z^{2}+z+2 a-2$ if and only of $a=0$ or $a=1$, both of which do not occur.

Despite this homeomorphism which mimics the behavior of a localization at an element of $R$, while $\mathbf{Q}\left[z, \frac{1}{z-a}\right]$ is the localization of $\mathbf{Q}[z]$ at the maximal ideal $(z-a)$, the ring $R_{a}$ is not a localization of $R$ : Any localization $S^{-1} R$ results in more units than the original ring $R$. The units of $R$ are $\mathbf{Q}^{\times}$, the units of $\mathbf{Q}$. In fact, it is easy to see that the units of $R_{a}$ are $\mathbf{Q}^{*}$. Namely, the units of $\mathbf{Q}\left[z, \frac{1}{z-a}\right]$ are $c(z-a)^{n}$ for $c \in \mathbf{Q}^{*}$ and $n \in \mathbf{Z}$ and it is clear that these are in $R_{a}$ only if $n=0$. Hence $R_{a}$ has no more units than $R$ does, and thus cannot be a localization of $R$.

We used the fact that $a \neq 0,1$ to ensure that $\frac{1}{z-a}$ makes sense at $z=0,1$. We used the fact that $a \neq 1 / 2$ in a few places: (1) In order to be able to talk about the kernel of $\mathrm{ev}_{1-a}$ on $R_{a}$, which ensures that $\mathfrak{m}_{1-a}$ is a point of $R_{a}$ (i.e., that $R_{a}$ is missing just one point of $R$ ). (2) At the end in order to conclude that $(z-a)^{k+\ell}$ can only be in $R$ for $k=\ell=0$; indeed, if $a=1 / 2$, then this is in $R$ as long as $k+\ell$ is even. Hence there would indeed be more units in $R_{a}$ than in $R$, and $R_{a}$ could possibly be a localization of $R$.

### 10.27. A meta-observation about prime ideals

05 K 7 This section is taken from the CRing project. Let $R$ be a ring and let $S \subset R$ be a multiplicative subset. A consequence of Lemma 10.16 .5 is that an ideal $I \subset R$ maximal with respect to the property of not intersecting $S$ is prime. The reason
is that $I=R \cap \mathfrak{m}$ for some maximal ideal $\mathfrak{m}$ of the ring $S^{-1} R$. It turns out that for many properties of ideals, the maximal ones are prime. A general method of seeing this was developed in LR08. In this section, we digress to explain this phenomenon.
Let $R$ be a ring. If $I$ is an ideal of $R$ and $a \in R$, we define

$$
(I: a)=\{x \in R \mid x a \in I\}
$$

More generally, if $J \subset R$ is an ideal, we define

$$
(I: J)=\{x \in R \mid x J \subset I\}
$$

05K8 Lemma 10.27.1. Let $R$ be a ring. For a principal ideal $J \subset R$, and for any ideal $I \subset J$ we have $I=J(I: J)$.

Proof. Say $J=(a)$. Then $(I: J)=(I: a)$. Since $I \subset J$ we see that any $y \in I$ is of the form $y=x a$ for some $x \in(I: a)$. Hence $I \subset J(I: J)$. Conversely, if $x \in(I: a)$, then $x J=(x a) \subset I$, which proves the other inclusion.

Let $\mathcal{F}$ be a collection of ideals of $R$. We are interested in conditions that will guarantee that the maximal elements in the complement of $\mathcal{F}$ are prime.

05K9 Definition 10.27.2. Let $R$ be a ring. Let $\mathcal{F}$ be a set of ideals of $R$. We say $\mathcal{F}$ is an Oka family if $R \in \mathcal{F}$ and whenever $I \subset R$ is an ideal and $(I: a),(I, a) \in \mathcal{F}$ for some $a \in R$, then $I \in \mathcal{F}$.

Let us give some examples of Oka families. The first example is the basic example discussed in the introduction to this section.

05KA Example 10.27.3. Let $R$ be a ring and let $S$ be a multiplicative subset of $R$. We claim that $\mathcal{F}=\{I \subset R \mid I \cap S \neq \emptyset\}$ is an Oka family. Namely, suppose that $(I: a),(I, a) \in \mathcal{F}$ for some $a \in R$. Then pick $s \in(I, a) \cap S$ and $s^{\prime} \in(I: a) \cap S$. Then $s s^{\prime} \in I \cap S$ and hence $I \in \mathcal{F}$. Thus $\mathcal{F}$ is an Oka family.

05KB Example 10.27.4. Let $R$ be a ring, $I \subset R$ an ideal, and $a \in R$. If ( $I: a)$ is generated by $a_{1}, \ldots, a_{n}$ and $(I, a)$ is generated by $a, b_{1}, \ldots, b_{m}$ with $b_{1}, \ldots, b_{m} \in I$, then $I$ is generated by $a a_{1}, \ldots, a a_{n}, b_{1}, \ldots, b_{m}$. To see this, note that if $x \in I$, then $x \in(I, a)$ is a linear combination of $a, b_{1}, \ldots, b_{m}$, but the coefficient of $a$ must lie in $(I: a)$. As a result, we deduce that the family of finitely generated ideals is an Oka family.

05 KC Example 10.27.5. Let us show that the family of principal ideals of a ring $R$ is an Oka family. Indeed, suppose $I \subset R$ is an ideal, $a \in R$, and $(I, a)$ and $(I: a)$ are principal. Note that $(I: a)=(I:(I, a))$. Setting $J=(I, a)$, we find that $J$ is principal and $(I: J)$ is too. By Lemma 10.27.1 we have $I=J(I: J)$. Thus we find in our situation that since $J=(I, a)$ and $(I: J)$ are principal, $I$ is principal.

05KD Example 10.27.6. Let $R$ be a ring. Let $\kappa$ be an infinite cardinal. The family of ideals which can be generated by at most $\kappa$ elements is an Oka family. The argument is analogous to the argument in Example 10.27.4 and is omitted.

05KE Proposition 10.27.7. If $\mathcal{F}$ is an Oka family of ideals, then any maximal element of the complement of $\mathcal{F}$ is prime.

Proof. Suppose $I \notin \mathcal{F}$ is maximal with respect to not being in $\mathcal{F}$ but $I$ is not prime. Note that $I \neq R$ because $R \in \mathcal{F}$. Since $I$ is not prime we can find $a, b \in R-I$ with $a b \in I$. It follows that $(I, a) \neq I$ and $(I: a)$ contains $b \notin I$ so also $(I: a) \neq I$. Thus $(I: a),(I, a)$ both strictly contain $I$, so they must belong to $\mathcal{F}$. By the Oka condition, we have $I \in \mathcal{F}$, a contradiction.

At this point we are able to turn most of the examples above into a lemma about prime ideals in a ring.

05KF Lemma 10.27.8. Let $R$ be a ring. Let $S$ be a multiplicative subset of $R$. An ideal $I \subset R$ which is maximal with respect to the property that $I \cap S=\emptyset$ is prime.

Proof. This is the example discussed in the introduction to this section. For an alternative proof, combine Example 10.27 .3 with Proposition 10.27.7.

05KG Lemma 10.27.9. Let $R$ be a ring.
(1) An ideal $I \subset R$ maximal with respect to not being finitely generated is prime.
(2) If every prime ideal of $R$ is finitely generated, then every ideal of $R$ is finitely generated ${ }^{11}$.
Proof. The first assertion is an immediate consequence of Example 10.27.4 and Proposition 10.27.7. For the second, suppose that there exists an ideal $I \subset R$ which is not finitely generated. The union of a totally ordered chain $\left\{I_{\alpha}\right\}$ of ideals that are not finitely generated is not finitely generated; indeed, if $I=\bigcup I_{\alpha}$ were generated by $a_{1}, \ldots, a_{n}$, then all the generators would belong to some $I_{\alpha}$ and would consequently generate it. By Zorn's lemma, there is an ideal maximal with respect to being not finitely generated. By the first part this ideal is prime.

05KH Lemma 10.27.10. Let $R$ be a ring.
(1) An ideal $I \subset R$ maximal with respect to not being principal is prime.
(2) If every prime ideal of $R$ is principal, then every ideal of $R$ is principal.

Proof. The first part follows from Example 10.27 .5 and Proposition 10.27.7. For the second, suppose that there exists an ideal $I \subset R$ which is not principal. The union of a totally ordered chain $\left\{I_{\alpha}\right\}$ of ideals that not principal is not principal; indeed, if $I=\bigcup I_{\alpha}$ were generated by $a$, then $a$ would belong to some $I_{\alpha}$ and $a$ would generate it. By Zorn's lemma, there is an ideal maximal with respect to not being principal. This ideal is necessarily prime by the first part.

05KI Lemma 10.27.11. Let $R$ be a ring.
(1) An ideal maximal among the ideals which do not contain a nonzerodivisor is prime.
(2) If every nonzero prime ideal in $R$ contains a nonzerodivisor, then $R$ is a domain.

Proof. Consider the set $S$ of nonzerodivisors. It is a multiplicative subset of $R$. Hence any ideal maximal with respect to not intersecting $S$ is prime, see Lemma 10.27.8. Thus, if every nonzero prime ideal contains a nonzerodivisor, then (0) is prime, i.e., $R$ is a domain.

[^18]05KJ Remark 10.27.12. Let $R$ be a ring. Let $\kappa$ be an infinite cardinal. By applying Example 10.27.6 and Proposition 10.27 .7 we see that any ideal maximal with respect to the property of not being generated by $\kappa$ elements is prime. This result is not so useful because there exists a ring for which every prime ideal of $R$ can be generated by $\aleph_{0}$ elements, but some ideal cannot. Namely, let $k$ be a field, let $T$ be a set whose cardinality is greater than $\aleph_{0}$ and let

$$
R=k\left[\left\{x_{n}\right\}_{n \geq 1},\left\{z_{t, n}\right\}_{t \in T, n \geq 0}\right] /\left(x_{n}^{2}, z_{t, n}^{2}, x_{n} z_{t, n}-z_{t, n-1}\right)
$$

This is a local ring with unique prime ideal $\mathfrak{m}=\left(x_{n}\right)$. But the ideal $\left(z_{t, n}\right)$ cannot be generated by countably many elements.

### 10.28. Images of ring maps of finite presentation

00F5 In this section we prove some results on the topology of maps $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ induced by ring maps $R \rightarrow S$, mainly Chevalley's Theorem. In order to do this we will use the notions of constructible sets, quasi-compact sets, retrocompact sets, and so on which are defined in Topology, Section 5.11.

00F6 Lemma 10.28.1. Let $U \subset \operatorname{Spec}(R)$ be open. The following are equivalent:
(1) $U$ is retrocompact in $\operatorname{Spec}(R)$,
(2) $U$ is quasi-compact,
(3) $U$ is a finite union of standard opens, and
(4) there exists a finitely generated ideal $I \subset R$ such that $X \backslash V(I)=U$.

Proof. We have $(1) \Rightarrow(2)$ because $\operatorname{Spec}(R)$ is quasi-compact, see Lemma 10.16.10 We have $(2) \Rightarrow(3)$ because standard opens form a basis for the topology. Proof of $(3) \Rightarrow(1)$. Let $U=\bigcup_{i=1 \ldots n} D\left(f_{i}\right)$. To show that $U$ is retrocompact in $\operatorname{Spec}(R)$ it suffices to show that $U \cap V$ is quasi-compact for any quasi-compact open $V$ of $\operatorname{Spec}(R)$. Write $V=\bigcup_{j=1 \ldots m} D\left(g_{j}\right)$ which is possible by $(2) \Rightarrow(3)$. Each standard open is homeomorphic to the spectrum of a ring and hence quasi-compact, see Lemmas 10.16 .6 and 10.16 .10 . Thus $U \cap V=\left(\bigcup_{i=1 \ldots n} D\left(f_{i}\right)\right) \cap\left(\bigcup_{j=1 \ldots m} D\left(g_{j}\right)\right)=$ $\bigcup_{i, j} D\left(f_{i} g_{j}\right)$ is a finite union of quasi-compact opens hence quasi-compact. To finish the proof note that (4) is equivalent to (3) by Lemma 10.16.2.

00F7 Lemma 10.28.2. Let $\varphi: R \rightarrow S$ be a ring map. The induced continuous map $f: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is quasi-compact. For any constructible set $E \subset \operatorname{Spec}(R)$ the inverse image $f^{-1}(E)$ is constructible in $\operatorname{Spec}(S)$.

Proof. We first show that the inverse image of any quasi-compact open $U \subset$ $\operatorname{Spec}(R)$ is quasi-compact. By Lemma 10.28 .1 we may write $U$ as a finite open of standard opens. Thus by Lemma 10.16 .4 we see that $f^{-1}(U)$ is a finite union of standard opens. Hence $f^{-1}(U)$ is quasi-compact by Lemma 10.28.1 again. The second assertion now follows from Topology, Lemma 5.14.3.

00F8 Lemma 10.28.3. Let $R$ be a ring and let $T \subset \operatorname{Spec}(R)$ be constructible. Then there exists a ring map $R \rightarrow S$ of finite presentation such that $T$ is the image of $\operatorname{Spec}(S)$ in $\operatorname{Spec}(R)$.
Proof. Let $T \subset \operatorname{Spec}(R)$ be constructible. The spectrum of a finite product of rings is the disjoint union of the spectra, see Lemma 10.20.2. Hence if $T=T_{1} \cup T_{2}$ and the result holds for $T_{1}$ and $T_{2}$, then the result holds for $T$. In particular we may assume that $T=U \cap V^{c}$, where $U, V \subset \operatorname{Spec}(R)$ are retrocompact open. By Lemma
10.28.1 we may write $T=\left(\bigcup D\left(f_{i}\right)\right) \cap\left(\bigcup D\left(g_{j}\right)\right)^{c}=\bigcup\left(D\left(f_{i}\right) \cap V\left(g_{1}, \ldots, g_{m}\right)\right)$. In fact we may assume that $T=D(f) \cap V\left(g_{1}, \ldots, g_{m}\right)$ (by the argument on unions above). In this case $T$ is the image of the map $R \rightarrow\left(R /\left(g_{1}, \ldots, g_{m}\right)\right)_{f}$, see Lemmas 10.16 .6 and 10.16 .7 .

00F9 Lemma 10.28.4. Let $R$ be a ring. Let $f$ be an element of $R$. Let $S=R_{f}$. Then the image of a constructible subset of $\operatorname{Spec}(S)$ is constructible in $\operatorname{Spec}(R)$.

Proof. We repeatedly use Lemma 10.28 .1 without mention. Let $U, V$ be quasicompact open in $\operatorname{Spec}(S)$. We will show that the image of $U \cap V^{c}$ is constructible. Under the identification $\operatorname{Spec}(S)=D(f)$ of Lemma 10.16 .6 the sets $U, V$ correspond to quasi-compact opens $U^{\prime}, V^{\prime}$ of $\operatorname{Spec}(R)$. Hence it suffices to show that $U^{\prime} \cap\left(V^{\prime}\right)^{c}$ is constructible in $\operatorname{Spec}(R)$ which is clear.
00FA Lemma 10.28.5. Let $R$ be a ring. Let $I$ be a finitely generated ideal of $R$. Let $S=R / I$. Then the image of a constructible of $\operatorname{Spec}(S)$ is constructible in $\operatorname{Spec}(R)$.
Proof. If $I=\left(f_{1}, \ldots, f_{m}\right)$, then we see that $V(I)$ is the complement of $\bigcup D\left(f_{i}\right)$, see Lemma 10.16.2. Hence it is constructible, by Lemma 10.28.1. Denote the map $R \rightarrow S$ by $f \mapsto \bar{f}$. We have to show that if $\bar{U}, \bar{V}$ are retrocompact opens of $\operatorname{Spec}(S)$, then the image of $\bar{U} \cap \bar{V}^{c}$ in $\operatorname{Spec}(R)$ is constructible. By Lemma 10.28.1 we may write $\bar{U}=\bigcup D\left(\overline{g_{i}}\right)$. Setting $U=\bigcup D\left(g_{i}\right)$ we see $\bar{U}$ has image $U \cap V(I)$ which is constructible in $\operatorname{Spec}(R)$. Similarly the image of $\bar{V}$ equals $V \cap V(I)$ for some retrocompact open $V$ of $\operatorname{Spec}(R)$. Hence the image of $\bar{U} \cap \bar{V}^{c}$ equals $U \cap V(I) \cap V^{c}$ as desired.

00FB Lemma 10.28.6. Let $R$ be a ring. The map $\operatorname{Spec}(R[x]) \rightarrow \operatorname{Spec}(R)$ is open, and the image of any standard open is a quasi-compact open.

Proof. It suffices to show that the image of a standard open $D(f), f \in R[x]$ is quasi-compact open. The image of $D(f)$ is the image of $\operatorname{Spec}\left(R[x]_{f}\right) \rightarrow \operatorname{Spec}(R)$. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $\bar{f}$ be the image of $f$ in $\kappa(\mathfrak{p})[x]$. Recall, see Lemma 10.16.9. that $\mathfrak{p}$ is in the image if and only if $R[x]_{f} \otimes_{R} \kappa(\mathfrak{p})=\kappa(\mathfrak{p})[x]_{\bar{f}}$ is not the zero ring. This is exactly the condition that $f$ does not map to zero in $\kappa(\mathfrak{p})[x]$, in other words, that some coefficient of $f$ is not in $\mathfrak{p}$. Hence we see: if $f=a_{d} x^{d}+\ldots a_{0}$, then the image of $D(f)$ is $D\left(a_{d}\right) \cup \ldots \cup D\left(a_{0}\right)$.
We prove a property of characteristic polynomials which will be used below.
00FC Lemma 10.28.7. Let $R \rightarrow A$ be a ring homomorphism. Assume $A \cong R^{\oplus n}$ as an $R$-module. Let $f \in A$. The multiplication map $m_{f}: A \rightarrow A$ is $R$-linear and hence has a characteristic polynomial $P(T)=T^{n}+r_{n-1} T^{n-1}+\ldots+r_{0} \in R[T]$. For any prime $\mathfrak{p} \in \operatorname{Spec}(R)$, $f$ acts nilpotently on $A \otimes_{R} \kappa(\mathfrak{p})$ if and only if $\mathfrak{p} \in$ $V\left(r_{0}, \ldots, r_{n-1}\right)$.

Proof. This follows quite easily once we prove that the characteristic polynomial $\bar{P}(T) \in \kappa(\mathfrak{p})[T]$ of the multiplication map $m_{\bar{f}}: A \otimes_{R} \kappa(\mathfrak{p}) \rightarrow A \otimes_{R} \kappa(\mathfrak{p})$ which multiplies elements of $A \otimes_{R} \kappa(\mathfrak{p})$ by $\bar{f}$, the image of $f$ viewed in $\kappa(\mathfrak{p})$, is just the image of $P(T)$ in $\kappa(\mathfrak{p})[T]$. Let $\left(a_{i j}\right)$ be the matrix of the map $m_{f}$ with entries in $R$, using a basis $e_{1}, \ldots, e_{n}$ of $A$ as an $R$-module. Then, $A \otimes_{R} \kappa(\mathfrak{p}) \cong\left(R \otimes_{R} \kappa(\mathfrak{p})\right)^{\oplus n}=\kappa(\mathfrak{p})^{n}$, which is an $n$-dimensional vector space over $\kappa(\mathfrak{p})$ with basis $e_{1} \otimes 1, \ldots, e_{n} \otimes 1$. The image $\bar{f}=f \otimes 1$, and so the multiplication map $m_{\bar{f}}$ has matrix $\left(a_{i j} \otimes 1\right)$. Thus, the characteristic polynomial is precisely the image of $P(T)$.

From linear algebra, we know that a linear transformation acts nilpotently on an $n$ dimensional vector space if and only if the characteristic polynomial is $T^{n}$ (since the characteristic polynomial divides some power of the minimal polynomial). Hence, $f$ acts nilpotently on $A \otimes_{R} \kappa(\mathfrak{p})$ if and only if $\bar{P}(T)=T^{n}$. This occurs if and only if $r_{i} \in \mathfrak{p}$ for all $0 \leq i \leq n-1$, that is when $\mathfrak{p} \in V\left(r_{0}, \ldots, r_{n-1}\right)$.

00FD Lemma 10.28.8. Let $R$ be a ring. Let $f, g \in R[x]$ be polynomials. Assume the leading coefficient of $g$ is a unit of $R$. There exists elements $r_{i} \in R, i=1 \ldots, n$ such that the image of $D(f) \cap V(g)$ in $\operatorname{Spec}(R)$ is $\bigcup_{i=1, \ldots, n} D\left(r_{i}\right)$.
Proof. Write $g=u x^{d}+a_{d-1} x^{d-1}+\ldots+a_{0}$, where $d$ is the degree of $g$, and hence $u \in R^{*}$. Consider the ring $A=R[x] /(g)$. It is, as an $R$-module, finite free with basis the images of $1, x, \ldots, x^{d-1}$. Consider multiplication by (the image of) $f$ on $A$. This is an $R$-module map. Hence we can let $P(T) \in R[T]$ be the characteristic polynomial of this map. Write $P(T)=T^{d}+r_{d-1} T^{d-1}+\ldots+r_{0}$. We claim that $r_{0}, \ldots, r_{d-1}$ have the desired property. We will use below the property of characteristic polynomials that

$$
\mathfrak{p} \in V\left(r_{0}, \ldots, r_{d-1}\right) \Leftrightarrow \text { multiplication by } f \text { is nilpotent on } A \otimes_{R} \kappa(\mathfrak{p})
$$

This was proved in Lemma 10.28.7.
Suppose $\mathfrak{q} \in D(f) \cap V(g)$, and let $\mathfrak{p}=\mathfrak{q} \cap R$. Then there is a nonzero map $A \otimes_{R} \kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{q})$ which is compatible with multiplication by $f$. And $f$ acts as a unit on $\kappa(\mathfrak{q})$. Thus we conclude $\mathfrak{p} \notin V\left(r_{0}, \ldots, r_{d-1}\right)$.

On the other hand, suppose that $r_{i} \notin \mathfrak{p}$ for some prime $\mathfrak{p}$ of $R$ and some $0 \leq i \leq d-1$. Then multiplication by $f$ is not nilpotent on the algebra $A \otimes_{R} \kappa(\mathfrak{p})$. Hence there exists a maximal ideal $\overline{\mathfrak{q}} \subset A \otimes_{R} \kappa(\mathfrak{p})$ not containing the image of $f$. The inverse image of $\overline{\mathfrak{q}}$ in $R[x]$ is an element of $D(f) \cap V(g)$ mapping to $\mathfrak{p}$.

00FE Theorem 10.28.9 (Chevalley's Theorem). Suppose that $R \rightarrow S$ is of finite presentation. The image of a constructible subset of $\operatorname{Spec}(S)$ in $\operatorname{Spec}(R)$ is constructible.
Proof. Write $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. We may factor $R \rightarrow S$ as $R \rightarrow$ $R\left[x_{1}\right] \rightarrow R\left[x_{1}, x_{2}\right] \rightarrow \ldots \rightarrow R\left[x_{1}, \ldots, x_{n-1}\right] \rightarrow S$. Hence we may assume that $S=R[x] /\left(f_{1}, \ldots, f_{m}\right)$. In this case we factor the map as $R \rightarrow R[x] \rightarrow S$, and by Lemma 10.28 .5 we reduce to the case $S=R[x]$. By Lemma 10.28.1 suffices to show that if $T=\left(\bigcup_{i=1 \ldots n} D\left(f_{i}\right)\right) \cap V\left(g_{1}, \ldots, g_{m}\right)$ for $f_{i}, g_{j} \in R[x]$ then the image in $\operatorname{Spec}(R)$ is constructible. Since finite unions of constructible sets are constructible, it suffices to deal with the case $n=1$, i.e., when $T=D(f) \cap V\left(g_{1}, \ldots, g_{m}\right)$.
Note that if $c \in R$, then we have

$$
\left.\operatorname{Spec}(R)=V(c) \amalg D(c)=\operatorname{Spec}(R /(c)) \amalg \operatorname{Spec}\left(R_{c}\right)\right),
$$

and correspondingly $\left.\operatorname{Spec}(R[x])=V(c) \amalg D(c)=\operatorname{Spec}(R /(c)[x]) \amalg \operatorname{Spec}\left(R_{c}[x]\right)\right)$. The intersection of $T=D(f) \cap V\left(g_{1}, \ldots, g_{m}\right)$ with each part still has the same shape, with $f, g_{i}$ replaced by their images in $R /(c)[x]$, respectively $R_{c}[x]$. Note that the image of $T$ in $\operatorname{Spec}(R)$ is the union of the image of $T \cap V(c)$ and $T \cap D(c)$. Using Lemmas 10.28 .4 and 10.28 .5 it suffices to prove the images of both parts are constructible in $\operatorname{Spec}(R /(c))$, respectively $\operatorname{Spec}\left(R_{c}\right)$.
Let us assume we have $T=D(f) \cap V\left(g_{1}, \ldots, g_{m}\right)$ as above, with $\operatorname{deg}\left(g_{1}\right) \leq$ $\operatorname{deg}\left(g_{2}\right) \leq \ldots \leq \operatorname{deg}\left(g_{m}\right)$. We are going to use descending induction on $m$, and
on the degrees of the $g_{i}$. Let $d=\operatorname{deg}\left(g_{1}\right)$, i.e., $g_{1}=c x^{d_{1}}+$ l.o.t with $c \in R$ not zero. Cutting $R$ up into the pieces $R /(c)$ and $R_{c}$ we either lower the degree of $g_{1}$ (and this is covered by induction) or we reduce to the case where $c$ is invertible. If $c$ is invertible, and $m>1$, then write $g_{2}=c^{\prime} x^{d_{2}}+$ l.o.t. In this case consider $g_{2}^{\prime}=g_{2}-\left(c^{\prime} / c\right) x^{d_{2}-d_{1}} g_{1}$. Since the ideals $\left(g_{1}, g_{2}, \ldots, g_{m}\right)$ and $\left(g_{1}, g_{2}^{\prime}, g_{3}, \ldots, g_{m}\right)$ are equal we see that $T=D(f) \cap V\left(g_{1}, g_{2}^{\prime}, g_{3} \ldots, g_{m}\right)$. But here the degree of $g_{2}^{\prime}$ is strictly less than the degree of $g_{2}$ and hence this case is covered by induction.

The bases case for the induction above are the cases (a) $T=D(f) \cap V(g)$ where the leading coefficient of $g$ is invertible, and (b) $T=D(f)$. These two cases are dealt with in Lemmas 10.28 .8 and 10.28 .6 .

### 10.29. More on images

00 FF In this section we collect a few additional lemmas concerning the image on Spec for ring maps. See also Section 10.40 for example.

00FG Lemma 10.29.1. Let $R \subset S$ be an inclusion of domains. Assume that $R \rightarrow S$ is of finite type. There exists a nonzero $f \in R$, and a nonzero $g \in S$ such that $R_{f} \rightarrow S_{f g}$ is of finite presentation.

Proof. By induction on the number of generators of $S$ over $R$.
Suppose that $S$ is generated by a single element over $R$. Then $S=R[x] / \mathfrak{q}$ for some prime ideal $\mathfrak{q} \subset R[x]$. If $\mathfrak{q}=(0)$ there is nothing to prove. If $\mathfrak{q} \neq(0)$, then let $g \in \mathfrak{q}$ be an element with minimal degree in $x$. Since $K[x]=f . f .(R)[x]$ is a PID we see that $g$ is irreducible over $K$ and that $f . f .(S)=K[x] /(g)$. Write $g=a_{d} x^{d}+\ldots+a_{0}$ with $a_{i} \in R$ and $a_{d} \neq 0$. After inverting $a_{d}$ in $R$ we may assume that $g$ is monic. Hence we see that $R \rightarrow R[x] /(g) \rightarrow S$ with the last map surjective. But $R[x] /(g)=R \oplus R x \oplus \ldots \oplus R x^{d-1}$ maps injectively into $f . f .(S)=K[x] /(g)=$ $K \oplus K x \oplus \ldots \oplus K x^{d-1}$. Thus $S \cong R[x] /(g)$ is finitely presented.

Suppose that $S$ is generated by $n>1$ elements over $R$. Say $x_{1}, \ldots, x_{n} \in S$ generate $S$. Denote $S^{\prime} \subset S$ the subring generated by $x_{1}, \ldots, x_{n-1}$. By induction hypothesis we see that there exist $f \in R$ and $g \in S^{\prime}$ nonzero such that $R_{f} \rightarrow S_{f g}^{\prime}$ is of finite presentation. Next we apply the induction hypothesis to $S_{f g}^{\prime} \rightarrow S_{f g}$ to see that there exist $f^{\prime} \in S_{f g}^{\prime}$ and $g^{\prime} \in S_{f g}$ such that $S_{f g f^{\prime}}^{\prime} \rightarrow S_{f g f^{\prime} g^{\prime}}$ is of finite presentation. We leave it to the reader to conclude.

00FH Lemma 10.29.2. Let $R \rightarrow S$ be a finite type ring map. Denote $X=\operatorname{Spec}(R)$ and $Y=\operatorname{Spec}(S)$. Write $f: Y \rightarrow X$ the induced map of spectra. Let $E \subset Y=\operatorname{Spec}(S)$ be a constructible set. If a point $\xi \in X$ is in $f(E)$, then $\overline{\{\xi\}} \cap f(E)$ contains an open dense subset of $\overline{\{\xi\}}$.

Proof. Let $\xi \in X$ be a point of $f(E)$. Choose a point $\eta \in E$ mapping to $\xi$. Let $\mathfrak{p} \subset R$ be the prime corresponding to $\xi$ and let $\mathfrak{q} \subset S$ be the prime corresponding to $\eta$. Consider the diagram

By Lemma 10.28 .2 the set $E \cap Y^{\prime}$ is constructible in $Y^{\prime}$. It follows that we may replace $X$ by $X^{\prime}$ and $Y$ by $Y^{\prime}$. Hence we may assume that $R \subset S$ is an inclusion of domains, $\xi$ is the generic point of $X$, and $\eta$ is the generic point of $Y$. By Lemma 10.29.1 combined with Chevalley's theorem (Theorem 10.28.9 we see that there exist dense opens $U \subset X, V \subset Y$ such that $f(V) \subset U$ and such that $f: V \rightarrow U$ maps constructible sets to constructible sets. Note that $E \cap V$ is constructible in $V$, see Topology, Lemma 5.14.4 Hence $f(E \cap V)$ is constructible in $U$ and contains $\xi$. By Topology, Lemma 5.14.14 we see that $f(E \cap V)$ contains a dense open $U^{\prime} \subset U$.

At the end of this section we present a few more results on images of maps on Spectra that have nothing to do with constructible sets.

00FI Lemma 10.29.3. Let $\varphi: R \rightarrow S$ be a ring map. The following are equivalent:
(1) The map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective.
(2) For any radical ideal $I \subset R$ the inverse image of $I S$ in $R$ is equal to $I$.
(3) For every prime $\mathfrak{p}$ of $R$ the inverse image of $\mathfrak{p} S$ in $R$ is $\mathfrak{p}$.

In this case the same is true after any base change: Given a ring map $R \rightarrow R^{\prime}$ the ring map $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ has the equivalent properties (1), (2), (3) also.
Proof. The implication $(2) \Rightarrow(3)$ is immediate. If $I \subset R$ is a radical ideal, then Lemma 10.16 .2 guarantees that $I=\bigcap_{I \subset \mathfrak{p}} \mathfrak{p}$. Hence $(3) \Rightarrow(2)$. By Lemma 10.16 .9 we have $\mathfrak{p}=\varphi^{-1}(\mathfrak{p} S)$ if and only if $\mathfrak{p}$ is in the image. Hence (1) $\Leftrightarrow$ (3). Thus (1), (2), and (3) are equivalent.

Assume (1) holds. Let $R \rightarrow R^{\prime}$ be a ring map. Let $\mathfrak{p}^{\prime} \subset R^{\prime}$ be a prime ideal lying over the prime $\mathfrak{p}$ of $R$. To see that $\mathfrak{p}^{\prime}$ is in the image of $\operatorname{Spec}\left(R^{\prime} \otimes_{R} S\right) \rightarrow \operatorname{Spec}\left(R^{\prime}\right)$ we have to show that $\left(R^{\prime} \otimes_{R} S\right) \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)$ is not zero, see Lemma 10.16.9. But we have

$$
\left(R^{\prime} \otimes_{R} S\right) \otimes_{R^{\prime}} \kappa\left(\mathfrak{p}^{\prime}\right)=S \otimes_{R} \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa\left(\mathfrak{p}^{\prime}\right)
$$

which is not zero as $S \otimes_{R} \kappa(\mathfrak{p})$ is not zero by assumption and $\kappa(\mathfrak{p}) \rightarrow \kappa\left(\mathfrak{p}^{\prime}\right)$ is an extension of fields.

00FJ Lemma 10.29.4. Let $R$ be a domain. Let $\varphi: R \rightarrow S$ be a ring map. The following are equivalent:
(1) The ring map $R \rightarrow S$ is injective.
(2) The image $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ contains a dense set of points.
(3) There exists a prime ideal $\mathfrak{q} \subset S$ whose inverse image in $R$ is (0).

Proof. Let $K$ be the field of fractions of the domain $R$. Assume that $R \rightarrow S$ is injective. Since localization is exact we see that $K \rightarrow S \otimes_{R} K$ is injective. Hence there is a prime mapping to (0) by Lemma 10.16 .9 .

Note that (0) is dense in $\operatorname{Spec}(R)$, so that the last condition implies the second.
Suppose the second condition holds. Let $f \in R, f \neq 0$. As $R$ is a domain we see that $V(f)$ is a proper closed subset of $R$. By assumption there exists a prime $\mathfrak{q}$ of $S$ such that $\varphi(f) \notin \mathfrak{q}$. Hence $\varphi(f) \neq 0$. Hence $R \rightarrow S$ is injective.

00FK Lemma 10.29.5. Let $R \subset S$ be an injective ring map. Then $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ hits all the minimal primes of $\operatorname{Spec}(R)$.

Proof. Let $\mathfrak{p} \subset R$ be a minimal prime. In this case $R_{\mathfrak{p}}$ has a unique prime ideal. Hence it suffices to show that $S_{\mathfrak{p}}$ is not zero. And this follows from the fact that localization is exact, see Proposition 10.9.12.

00FL Lemma 10.29.6. Let $R \rightarrow S$ be a ring map. The following are equivalent:
(1) The kernel of $R \rightarrow S$ consists of nilpotent elements.
(2) The minimal primes of $R$ are in the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$.
(3) The image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is dense in $\operatorname{Spec}(R)$.

Proof. Let $I=\operatorname{Ker}(R \rightarrow S)$. Note that $\sqrt{(0)}=\bigcap_{\mathfrak{q} \subset S} \mathfrak{q}$, see Lemma 10.16.2, Hence $\sqrt{I}=\bigcap_{\mathfrak{q} \subset S} R \cap \mathfrak{q}$. Thus $V(I)=V(\sqrt{I})$ is the closure of the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$. This shows that (1) is equivalent to (3). It is clear that (2) implies (3). Finally, assume (1). We may replace $R$ by $R / I$ and $S$ by $S / I S$ without affecting the topology of the spectra and the map. Hence the implication $(1) \Rightarrow$ (2) follows from Lemma 10.29.5.

### 10.30. Noetherian rings

00 FM A ring $R$ is Noetherian if any ideal of $R$ is finitely generated. This is clearly equivalent to the ascending chain condition for ideals of $R$. By Lemma 10.27 .9 it suffices to check that every prime ideal of $R$ is finitely generated.

00FN Lemma 10.30.1. Any finitely generated ring over a Noetherian ring is Noetherian. Any localization of a Noetherian ring is Noetherian.

Proof. The statement on localizations follows from the fact that any ideal $J \subset$ $S^{-1} R$ is of the form $I \cdot S^{-1} R$. Any quotient $R / I$ of a Noetherian ring $R$ is Noetherian because any ideal $\bar{J} \subset R / I$ is of the form $J / I$ for some ideal $I \subset J \subset R$. Thus it suffices to show that if $R$ is Noetherian so is $R[X]$. Suppose $J_{1} \subset J_{2} \subset \ldots$ is an ascending chain of ideals in $R[X]$. Consider the ideals $I_{i, d}$ defined as the ideal of elements of $R$ which occur as leading coefficients of degree $d$ polynomials in $J_{i}$. Clearly $I_{i, d} \subset I_{i^{\prime}, d^{\prime}}$ whenever $i \leq i^{\prime}$ and $d \leq d^{\prime}$. By the ascending chain condition in $R$ there are at most finitely many distinct ideals among all of the $I_{i, d}$. (Hint: Any infinite set of elements of $\mathbf{N} \times \mathbf{N}$ contains an increasing infinite sequence.) Take $i_{0}$ so large that $I_{i, d}=I_{i_{0}, d}$ for all $i \geq i_{0}$ and all $d$. Suppose $f \in J_{i}$ for some $i \geq i_{0}$. By induction on the degree $d=\operatorname{deg}(f)$ we show that $f \in J_{i_{0}}$. Namely, there exists a $g \in J_{i_{0}}$ whose degree is $d$ and which has the same leading coefficient as $f$. By induction $f-g \in J_{i_{0}}$ and we win.

0306 Lemma 10.30.2. If $R$ is a Noetherian ring, then so is the formal power series $\left.\operatorname{ring} R\left[\mid x_{1}, \ldots, x_{n}\right]\right]$.
Proof. Since $R\left[\left[x_{1}, \ldots, x_{n+1}\right]\right] \cong R\left[\left[x_{1}, \ldots, x_{n}\right]\right]\left[\left[x_{n+1}\right]\right]$ it suffices to prove the statement that $R[[x]]$ is Noetherian if $R$ is Noetherian. Let $I \subset R[[x]]$ be a ideal. We have to show that $I$ is a finitely generated ideal. For each integer $d$ denote $I_{d}=\left\{a \in R \mid a x^{d}+\right.$ h.o.t. $\left.\in I\right\}$. Then we see that $I_{0} \subset I_{1} \subset \ldots$ stabilizes as $R$ is Noetherian. Choose $d_{0}$ such that $I_{d_{0}}=I_{d_{0}+1}=\ldots$. For each $d \leq d_{0}$ choose elements $f_{d, j} \in I \cap\left(x^{d}\right), j=1, \ldots, n_{d}$ such that if we write $f_{d, j}=a_{d, j} x^{d}+$ h.o.t then $I_{d}=\left(a_{d, j}\right)$. Denote $I^{\prime}=\left(\left\{f_{d, j}\right\}_{d=0, \ldots, d_{0}, j=1, \ldots, n_{d}}\right)$. Then it is clear that $I^{\prime} \subset I$. Pick $f \in I$. First we may choose $c_{d, i} \in R$ such that

$$
f-\sum c_{d, i} f_{d, i} \in\left(x^{d_{0}+1}\right) \cap I
$$

Next, we can choose $c_{i, 1} \in R, i=1, \ldots, n_{d_{0}}$ such that

$$
f-\sum c_{d, i} f_{d, i}-\sum c_{i, 1} x f_{d_{0}, i} \in\left(x^{d_{0}+2}\right) \cap I
$$

Next, we can choose $c_{i, 2} \in R, i=1, \ldots, n_{d_{0}}$ such that

$$
f-\sum c_{d, i} f_{d, i}-\sum c_{i, 1} x f_{d_{0}, i}-\sum c_{i, 2} x^{2} f_{d_{0}, i} \in\left(x^{d_{0}+3}\right) \cap I
$$

And so on. In the end we see that

$$
f=\sum c_{d, i} f_{d, i}+\sum_{i}\left(\sum_{e} c_{i, e} x^{e}\right) f_{d_{0}, i}
$$

is contained in $I^{\prime}$ as desired.
The following lemma, although easy, is useful because finite type $\mathbf{Z}$-algebras come up quite often in a technique called "absolute Noetherian reduction".

00FO Lemma 10.30.3. Any finite type algebra over a field is Noetherian. Any finite type algebra over $\mathbf{Z}$ is Noetherian.

Proof. This is immediate from Lemma 10.30.1 and the fact that fields are Noetherian rings and that $\mathbf{Z}$ is Noetherian ring (because it is a principal ideal domain).

00FP Lemma 10.30.4. Let $R$ be a Noetherian ring.
(1) Any finite $R$-module is of finite presentation.
(2) Any finite type $R$-algebra is of finite presentation over $R$.

Proof. Let $M$ be a finite $R$-module. By Lemma 10.5 .4 we can find a finite filtration of $M$ whose successive quotients are of the form $R / I$. Since any ideal is finitely generated, each of the quotients $R / I$ is finitely presented. Hence $M$ is finitely presented by Lemma 10.5 .3 . This proves (1). To see (2) note that any ideal of $R\left[x_{1}, \ldots, x_{n}\right]$ is finitely generated by Lemma 10.30.1.
00FQ Lemma 10.30.5. If $R$ is a Noetherian ring then $\operatorname{Spec}(R)$ is a Noetherian topological space, see Topology, Definition 5.8.1.

Proof. This is because any closed subset of $\operatorname{Spec}(R)$ is uniquely of the form $V(I)$ with $I$ a radical ideal, see Lemma 10.16 .2 . And this correspondence is inclusion reversing. Thus the result follows from the definitions.

00FR Lemma 10.30.6. If $R$ is a Noetherian ring then $\operatorname{Spec}(R)$ has finitely many irreducible components. In other words $R$ has finitely many minimal primes.

Proof. By Lemma 10.30 .5 and Topology, Lemma 5.8 .2 we see there are finitely many irreducible components. By Lemma 10.25 .1 these correspond to minimal primes of $R$.

045I Lemma 10.30.7. Let $k$ be a field and let $R$ be a Noetherian $k$-algebra. If $k \subset K$ is a finitely generated field extension then $K \otimes_{k} R$ is Noetherian.

Proof. Since $K / k$ is a finitely generated field extension, there exists a finitely generated $k$-algebra $B \subset K$ such that $K$ is the fraction field of $B$. In other words, $K=S^{-1} B$ with $S=B \backslash\{0\}$. Then $K \otimes_{k} R=S^{-1}\left(B \otimes_{k} R\right)$. Since $B \otimes_{k} R$ is a finite type $R$-algebra (Lemma 10.13.2) it follows that $S^{-1}\left(B \otimes_{k} R\right)$ is Noetherian by Lemma 10.30.1.

Here is fun lemma that is sometimes useful.

06RN Lemma 10.30.8. Any surjective endomorphism of a Noetherian ring is an isomorphism.

Proof. If $f: R \rightarrow R$ were such an endomorphism but not injective, then

$$
\operatorname{Ker}(f) \subset \operatorname{Ker}(f \circ f) \subset \operatorname{Ker}(f \circ f \circ f) \subset \ldots
$$

would be a strictly increasing chain of ideals.

### 10.31. Locally nilpotent ideals

0AMF Here is the definition.
00IL Definition 10.31.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. We say $I$ is locally nilpotent if for every $x \in I$ there exists an $n \in \mathbf{N}$ such that $x^{n}=0$. We say $I$ is nilpotent if there exists an $n \in \mathbf{N}$ such that $I^{n}=0$.

0544 Lemma 10.31.2. Let $R \rightarrow R^{\prime}$ be a ring map and let $I \subset R$ be a locally nilpotent ideal. Then $I R^{\prime}$ is a locally nilpotent ideal of $R^{\prime}$.

Proof. This follows from the fact that if $x, y \in R^{\prime}$ are nilpotent, then $x+y$ is nilpotent too. Namely, if $x^{n}=0$ and $y^{m}=0$, then $(x+y)^{n+m-1}=0$.

0AMG Lemma 10.31.3. Let $R$ be a ring and let $I \subset R$ be a locally nilpotent ideal. An element $x$ of $R$ is a unit if and only if the image of $x$ in $R / I$ is a unit.

Proof. If $x$ is a unit in $R$, then its image is clearly a unit in $R / I$. It remains to prove the converse. Assume the image of $y \in R$ in $R / I$ is the inverse of the image of $x$. Then $x y=1-z$ for some $z \in I$. Then every $k \geq 1$ satisfies

$$
(1-z)(1+z)\left(1+z^{2}\right)\left(1+z^{4}\right) \ldots\left(1+z^{2^{k-1}}\right)=1-z^{2^{k}}
$$

(as follows by induction over $k$ ). But the right hand side is is equal to 1 for sufficiently large $k$ (since $z$ lies in the locally nilpotent ideal $I$ ). Thus $1-z$ is invertible in $R$, and therefore so is $x$ (as $x y=1-z$ ).

00IM Lemma 10.31.4. Let $R$ be a Noetherian ring. Let $I, J$ be ideals of $R$. Suppose $J \subset \sqrt{I}$. Then $J^{n} \subset I$ for some $n$. In particular, in a Noetherian ring the notions of "locally nilpotent ideal" and "nilpotent ideal" coincide.
Proof. Say $J=\left(f_{1}, \ldots, f_{s}\right)$. By assumption $f_{i}^{d_{i}} \in I$. Take $n=d_{1}+d_{2}+\ldots+$ $d_{s}+1$.

00J9 Lemma 10.31.5. Let $R$ be a ring. Let $I \subset R$ be a locally nilpotent ideal. Then $R \rightarrow R / I$ induces a bijection on idempotents.

First proof of Lemma 10.31 .5 . As $I$ is locally nilpotent it is contained in every prime ideal. Hence $\operatorname{Spec}(R / I)=V(I)=\operatorname{Spec}(R)$. Hence the lemma follows from Lemma 10.20 .3 .

Second proof of Lemma 10.31.5. Suppose $\bar{e} \in R / I$ is an idempotent. We have to lift $\bar{e}$ to an idempotent of $R$.
First, choose any lift $f \in R$ of $\bar{e}$, and set $x=f^{2}-f$. Then, $x \in I$, so $x$ is nilpotent (since $I$ is locally nilpotent). Let now $J$ be the ideal of $R$ generated by $x$. Then, $J$ is nilpotent (not just locally nilpotent), since it is generated by the nilpotent $x$.

Now, assume that we have found a lift $e \in R$ of $\bar{e}$ such that $e^{2}-e \in J^{k}$ for some $k \geq 1$. Let $e^{\prime}=e-(2 e-1)\left(e^{2}-e\right)=3 e^{2}-2 e^{3}$, which is another lift of $\bar{e}$ (since the idempotency of $\bar{e}$ yields $\left.e^{2}-e \in I\right)$. Then

$$
\left(e^{\prime}\right)^{2}-e^{\prime}=\left(4 e^{2}-4 e-3\right)\left(e^{2}-e\right)^{2} \in J^{2 k}
$$

by a simple computation.
We thus have started with a lift $e$ of $\bar{e}$ such that $e^{2}-e \in J^{k}$, and obtained a lift $e^{\prime}$ of $\bar{e}$ such that $\left(e^{\prime}\right)^{2}-e^{\prime} \in J^{2 k}$. This way we can successively improve the approximation (starting with $e=f$, which fits the bill for $k=1$ ). Eventually, we reach a stage where $J^{k}=0$, and at that stage we have a lift $e$ of $\bar{e}$ such that $e^{2}-e \in J^{k}=0$, that is, this $e$ is idempotent.

We thus have seen that if $\bar{e} \in R / I$ is any idempotent, then there exists a lift of $\bar{e}$ which is an idempotent of $R$. It remains to prove that this lift is unique. Indeed, let $e_{1}$ and $e_{2}$ be two such lifts. We need to show that $e_{1}=e_{2}$.

By definition of $e_{1}$ and $e_{2}$, we have $e_{1} \equiv e_{2} \bmod I$, and both $e_{1}$ and $e_{2}$ are idempotent. From $e_{1} \equiv e_{2} \bmod I$, we see that $e_{1}-e_{2} \in I$, so that $e_{1}-e_{2}$ is nilpotent (since $I$ is locally nilpotent). A straightforward computation (using the idempotency of $e_{1}$ and $e_{2}$ ) reveals that $\left(e_{1}-e_{2}\right)^{3}=e_{1}-e_{2}$. Using this and induction, we obtain $\left(e_{1}-e_{2}\right)^{k}=e_{1}-e_{2}$ for any positive integer $k$. Since all high enough $k$ satisfy $\left(e_{1}-e_{2}\right)^{k}=0$ (since $e_{1}-e_{2}$ is nilpotent), this shows $e_{1}-e_{2}=0$, so that $e_{1}=e_{2}$, which completes our proof.

05BU Lemma 10.31.6. Let $A$ be a possibly noncommutative algebra. Let $e \in A$ be an element such that $x=e^{2}-e$ is nilpotent. Then there exists an idempotent of the form $e^{\prime}=e+x\left(\sum a_{i, j} e^{i} x^{j}\right) \in A$ with $a_{i, j} \in \mathbf{Z}$.

Proof. Consider the ring $R_{n}=\mathbf{Z}[e] /\left(\left(e^{2}-e\right)^{n}\right)$. It is clear that if we can prove the result for each $R_{n}$ then the lemma follows. In $R_{n}$ consider the ideal $I=\left(e^{2}-e\right)$ and apply Lemma 10.31 .5

### 10.32. Curiosity

02JG Lemma 10.22 .3 explains what happens if $V(I)$ is open for some ideal $I \subset R$. But what if $\operatorname{Spec}\left(S^{-1} R\right)$ is closed in $\operatorname{Spec}(R)$ ? The next two lemmas give a partial answer. For more information see Section 10.107,

02JH Lemma 10.32.1. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset. Assume the image of the map $\operatorname{Spec}\left(S^{-1} R\right) \rightarrow \operatorname{Spec}(R)$ is closed. Then $S^{-1} R \cong R / I$ for some ideal $I \subset R$.

Proof. Let $I=\operatorname{Ker}\left(R \rightarrow S^{-1} R\right)$ so that $V(I)$ contains the image. Say the image is the closed subset $V\left(I^{\prime}\right) \subset \operatorname{Spec}(R)$ for some ideal $I^{\prime} \subset R$. So $V\left(I^{\prime}\right) \subset V(I)$. For $f \in I^{\prime}$ we see that $f / 1 \in S^{-1} R$ is contained in every prime ideal. Hence $f^{n}$ maps to zero in $S^{-1} R$ for some $n \geq 1$ (Lemma 10.16.2). Hence $V\left(I^{\prime}\right)=V(I)$. Then this implies every $g \in S$ is invertible $\bmod I$. Hence we get ring maps $R / I \rightarrow S^{-1} R$ and $S^{-1} R \rightarrow R / I$. The first map is injective by choice of $I$. The second is the map $S^{-1} R \rightarrow S^{-1}(R / I)=R / I$ which has kernel $S^{-1} I$ because localization is exact. Since $S^{-1} I=0$ we see also the second map is injective. Hence $S^{-1} R \cong R / I$.

02JI
Lemma 10.32.2. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset. Assume the image of the map $\operatorname{Spec}\left(S^{-1} R\right) \rightarrow \operatorname{Spec}(R)$ is closed. If $R$ is Noetherian, or $\operatorname{Spec}(R)$ is a Noetherian topological space, or $S$ is finitely generated as a monoid, then $R \cong S^{-1} R \times R^{\prime}$ for some ring $R^{\prime}$.
Proof. By Lemma 10.32 .1 we have $S^{-1} R \cong R / I$ for some ideal $I \subset R$. By Lemma 10.22 .3 it suffices to show that $V(I)$ is open. If $R$ is Noetherian then $\operatorname{Spec}(R)$ is a Noetherian topological space, see Lemma 10.30 .5 . If $\operatorname{Spec}(R)$ is a Noetherian topological space, then the complement $\operatorname{Spec}(R) \backslash V(I)$ is quasi-compact, see Topology, Lemma 5.11.13. Hence there exist finitely many $f_{1}, \ldots, f_{n} \in I$ such that $V(I)=V\left(f_{1}, \ldots, f_{n}\right)$. Since each $f_{i}$ maps to zero in $S^{-1} R$ there exists a $g \in S$ such that $g f_{i}=0$ for $i=1, \ldots, n$. Hence $D(g)=V(I)$ as desired. In case $S$ is finitely generated as a monoid, say $S$ is generated by $g_{1}, \ldots, g_{m}$, then $S^{-1} R \cong R_{g_{1} \ldots g_{m}}$ and we conclude that $V(I)=D\left(g_{1} \ldots g_{m}\right)$.

### 10.33. Hilbert Nullstellensatz

Theorem 10.33.1 (Hilbert Nullstellensatz). Let $k$ be a field.
00FW
00FX
(1) For any maximal ideal $\mathfrak{m} \subset k\left[x_{1}, \ldots, x_{n}\right]$ the field extension $k \subset \kappa(\mathfrak{m})$ is finite.
(2) Any radical ideal $I \subset k\left[x_{1}, \ldots, x_{n}\right]$ is the intersection of maximal ideals containing it.
The same is true in any finite type $k$-algebra.
Proof. It is enough to prove part (1) of the theorem for the case of a polynomial algebra $k\left[x_{1}, \ldots, x_{n}\right]$, because any finitely generated $k$-algebra is a quotient of such a polynomial algebra. We prove this by induction on $n$. The case $n=0$ is clear. Suppose that $\mathfrak{m}$ is a maximal ideal in $k\left[x_{1}, \ldots, x_{n}\right]$. Let $\mathfrak{p} \subset k\left[x_{n}\right]$ be the intersection of $\mathfrak{m}$ with $k\left[x_{n}\right]$.
If $\mathfrak{p} \neq(0)$, then $\mathfrak{p}$ is maximal and generated by an irreducible monic polynomial $P$ (because of the Euclidean algorithm in $k\left[x_{n}\right]$ ). Then $k^{\prime}=k\left[x_{n}\right] / \mathfrak{p}$ is a finite field extension of $k$ and contained in $\kappa(\mathfrak{m})$. In this case we get a surjection

$$
k^{\prime}\left[x_{1}, \ldots, x_{n-1}\right] \rightarrow k^{\prime}\left[x_{1}, \ldots, x_{n}\right]=k^{\prime} \otimes_{k} k\left[x_{1}, \ldots, x_{n}\right] \longrightarrow \kappa(\mathfrak{m})
$$

and hence we see that $\kappa(\mathfrak{m})$ is a finite extension of $k^{\prime}$ by induction hypothesis. Thus $\kappa(\mathfrak{m})$ is finite over $k$ as well.
If $\mathfrak{p}=(0)$ we consider the ring extension $k\left[x_{n}\right] \subset k\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{m}$. This is a finitely generated ring extension, hence of finite presentation by Lemmas 10.30 .3 and 10.30 .4 . Thus the image of $\operatorname{Spec}\left(k\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{m}\right)$ in $\operatorname{Spec}\left(k\left[x_{n}\right]\right)$ is constructible by Theorem 10.28.9. Since the image contains (0) we conclude that it contains a standard open $D(f)$ for some $f \in k\left[x_{n}\right]$ nonzero. Since clearly $D(f)$ is infinite we get a contradiction with the assumption that $k\left[x_{1}, \ldots, x_{n}\right] / \mathfrak{m}$ is a field (and hence has a spectrum consisting of one point).
To prove part (2) let $I \subset R$ be radical, with $R$ of finite type over $k$. Let $f \in R$, $f \notin I$. Pick a maximal ideal $\mathfrak{m}^{\prime}$ in the nonzero ring $R_{f} / I R_{f}=(R / I)_{f}$. Let $\mathfrak{m} \subset R$ be the inverse image of $\mathfrak{m}^{\prime}$ in $R$. We see that $I \subset \mathfrak{m}$ and $f \notin \mathfrak{m}$. If we show that $\mathfrak{m}$ is a maximal ideal of $R$, then we are done. We clearly have

$$
k \subset R / \mathfrak{m} \subset \kappa\left(\mathfrak{m}^{\prime}\right)
$$

By part (1) the field extension $k \subset \kappa\left(\mathfrak{m}^{\prime}\right)$ is finite. Hence $R / \mathfrak{m}$ is a field by Fields, Lemma 9.8.10. Thus $\mathfrak{m}$ is maximal and the proof is complete.
00FY Lemma 10.33.2. Let $R$ be a ring. Let $K$ be a field. If $R \subset K$ and $K$ is of finite type over $R$, then there exists a $f \in R$ such that $R_{f}$ is a field, and $R_{f} \subset K$ is a finite field extension.

Proof. By Lemma 10.29 .2 there exist a nonempty open $U \subset \operatorname{Spec}(R)$ contained in the image $\{(0)\}$ of $\operatorname{Spec}(K) \rightarrow \operatorname{Spec}(R)$. Choose $f \in R, f \neq 0$ such that $D(f) \subset U$, i.e., $D(f)=\{(0)\}$. Then $R_{f}$ is a domain whose spectrum has exactly one point and $R_{f}$ is a field. Then $K$ is a finitely generated algebra over the field $R_{f}$ and hence a finite field extension of $R_{f}$ by the Hilbert Nullstellensatz (Theorem 10.33.1).

### 10.34. Jacobson rings

00 FZ Let $R$ be a ring. The closed points of $\operatorname{Spec}(R)$ are the maximal ideals of $R$. Often rings which occur naturally in algebraic geometry have lots of maximal ideals. For example finite type algebras over a field or over $\mathbf{Z}$. We will show that these are examples of Jacobson rings.

00G0 Definition 10.34.1. Let $R$ be a ring. We say that $R$ is a Jacobson ring if every radical ideal $I$ is the intersection of the maximal ideals containing it.
00G1 Lemma 10.34.2. Any algebra of finite type over a field is Jacobson.
Proof. This follows from Theorem 10.33 .1 and Definition 10.34.1
00G2 Lemma 10.34.3. Let $R$ be a ring. If every prime ideal of $R$ is the intersection of the maximal ideals containing it, then $R$ is Jacobson.

Proof. This is immediately clear from the fact that every radical ideal $I \subset R$ is the intersection of the primes containing it. See Lemma 10.16.2.
00G3 Lemma 10.34.4. A ring $R$ is Jacobson if and only if $\operatorname{Spec}(R)$ is Jacobson, see Topology, Definition 5.17.1.

Proof. Suppose $R$ is Jacobson. Let $Z \subset \operatorname{Spec}(R)$ be a closed subset. We have to show that the set of closed points in $Z$ is dense in $Z$. Let $U \subset \operatorname{Spec}(R)$ be an open such that $U \cap Z$ is nonempty. We have to show $Z \cap U$ contains a closed point of $\operatorname{Spec}(R)$. We may assume $U=D(f)$ as standard opens form a basis for the topology on $\operatorname{Spec}(R)$. According to Lemma 10.16 .2 we may assume that $Z=V(I)$, where $I$ is a radical ideal. We see also that $f \notin I$. By assumption, there exists a maximal ideal $\mathfrak{m} \subset R$ such that $I \subset \mathfrak{m}$ but $f \notin \mathfrak{m}$. Hence $\mathfrak{m} \in D(f) \cap V(I)=U \cap Z$ as desired.
Conversely, suppose that $\operatorname{Spec}(R)$ is Jacobson. Let $I \subset R$ be a radical ideal. Let $J=\cap_{I \subset \mathfrak{m}} \mathfrak{m}$ be the intersection of the maximal ideals containing $I$. Clearly $J$ is radical, $V(J) \subset V(I)$, and $V(J)$ is the smallest closed subset of $V(I)$ containing all the closed points of $V(I)$. By assumption we see that $V(J)=V(I)$. But Lemma 10.16 .2 shows there is a bijection between Zariski closed sets and radical ideals, hence $I=J$ as desired.

034J Lemma 10.34.5. Let $R$ be a ring. If $R$ is not Jacobson there exist a prime $\mathfrak{p} \subset R$, an element $f \in R$ such that the following hold
(1) $\mathfrak{p}$ is not a maximal ideal,
(2) $f \notin \mathfrak{p}$,
(3) $V(\mathfrak{p}) \cap D(f)=\{\mathfrak{p}\}$, and
(4) $(R / \mathfrak{p})_{f}$ is a field.

On the other hand, if $R$ is Jacobson, then for any pair $(\mathfrak{p}, f)$ such that (1) and (2) hold the set $V(\mathfrak{p}) \cap D(f)$ is infinite.

Proof. Assume $R$ is not Jacobson. By Lemma 10.34 .4 this means there exists an closed subset $T \subset \operatorname{Spec}(R)$ whose set $T_{0} \subset T$ of closed points is not dense in $T$. Choose an $f \in R$ such that $T_{0} \subset V(f)$ but $T \not \subset V(f)$. Note that $T \cap D(f)$ is homeomorphic to $\operatorname{Spec}\left((R / I)_{f}\right)$ if $T=V(I)$, see Lemmas 10.16 .7 and 10.16.6. As any ring has a maximal ideal (Lemma 10.16.2) we can choose a closed point $t$ of space $T \cap D(f)$. Then $t$ corresponds to a prime ideal $\mathfrak{p} \subset R$ which is not maximal (as $t \notin T_{0}$ ). Thus (1) holds. By construction $f \notin \mathfrak{p}$, hence (2). As $t$ is a closed point of $T \cap D(f)$ we see that $V(\mathfrak{p}) \cap D(f)=\{\mathfrak{p}\}$, i.e., (3) holds. Hence we conclude that $(R / \mathfrak{p})_{f}$ is a domain whose spectrum has one point, hence (4) holds (for example combine Lemmas 10.17 .2 and 10.24.1.

Conversely, suppose that $R$ is Jacobson and $(\mathfrak{p}, f)$ satisfy (1) and (2). If $V(\mathfrak{p}) \cap$ $V(f)=\left\{\mathfrak{p}, \mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$ then $\mathfrak{p} \neq \mathfrak{q}_{i}$ implies there exists an element $g \in R$ such that $g \notin \mathfrak{p}$ but $g \in \mathfrak{q}_{i}$ for all $i$. Hence $V(\mathfrak{p}) \cap D(f g)=\{\mathfrak{p}\}$ which is impossible since each locally closed subset of $\operatorname{Spec}(R)$ contains at least one closed point as $\operatorname{Spec}(R)$ is a Jacobson topological space.

00G4 Lemma 10.34.6. The ring $\mathbf{Z}$ is a Jacobson ring. More generally, let $R$ be a ring such that
(1) $R$ is a domain,
(2) $R$ is Noetherian,
(3) any nonzero prime ideal is a maximal ideal, and
(4) $R$ has infinitely many maximal ideals.

Then $R$ is a Jacobson ring.
Proof. Let $R$ satisfy (1), (2), (3) and (4). The statement means that (0) = $\bigcap_{\mathfrak{m} \subset R} \mathfrak{m}$. Since $R$ has infinitely many maximal ideals it suffices to show that any nonzero $x \in R$ is contained in at most finitely many maximal ideals, in other words that $V(x)$ is finite. By Lemma 10.16 .7 we see that $V(x)$ is homeomorphic to $\operatorname{Spec}(R / x R)$. By assumption (3) every prime of $R / x R$ is minimal and hence corresponds to an irreducible component of $\operatorname{Spec}(R)$ (Lemma 10.25.1). As $R / x R$ is Noetherian, the topological space $\operatorname{Spec}(R / x R)$ is Noetherian (Lemma 10.30.5) and has finitely many irreducible components (Topology, Lemma 5.8.2. Thus $V(x)$ is finite as desired.

02CC Example 10.34.7. Let $A$ be an infinite set. For each $\alpha \in A$, let $k_{\alpha}$ be a field. We claim that $R=\prod_{\alpha \in A} k_{\alpha}$ is Jacobson. First, note that any element $f \in R$ has the form $f=u e$, with $u \in R$ a unit and $e \in R$ an idempotent (left to the reader). Hence $D(f)=D(e)$, and $R_{f}=R_{e}=R /(1-e)$ is a quotient of $R$. Actually, any ring with this property is Jacobson. Namely, say $\mathfrak{p} \subset R$ is a prime ideal and $f \in R$, $f \notin \mathfrak{p}$. We have to find a maximal ideal $\mathfrak{m}$ of $R$ such that $\mathfrak{p} \subset \mathfrak{m}$ and $f \notin \mathfrak{m}$. Because $R_{f}$ is a quotient of $R$ we see that any maximal ideal of $R_{f}$ corresponds to a maximal ideal of $R$ not containing $f$. Hence the result follows by choosing a maximal ideal of $R_{f}$ containing $\mathfrak{p} R_{f}$.

00G5 Example 10.34.8. A domain $R$ with finitely many maximal ideals $\mathfrak{m}_{i}, i=1, \ldots, n$ is not a Jacobson ring, except when it is a field. Namely, in this case (0) is not the intersection of the maximal ideals $(0) \neq \mathfrak{m}_{1} \cap \mathfrak{m}_{2} \cap \ldots \cap \mathfrak{m}_{n} \supset \mathfrak{m}_{1} \cdot \mathfrak{m}_{2} \cdot \ldots \cdot \mathfrak{m}_{n} \neq 0$. In particular a discrete valuation ring, or any local ring with at least two prime ideals is not a Jacobson ring.

00GA Lemma 10.34.9. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{m} \subset R$ be a maximal ideal. Let $\mathfrak{q} \subset S$ be a prime ideal lying over $\mathfrak{m}$ such that $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{q})$ is an algebraic field extension. Then $\mathfrak{q}$ is a maximal ideal of $S$.

Proof. Consider the diagram

We see that $\kappa(\mathfrak{m}) \subset S / \mathfrak{q} \subset \kappa(\mathfrak{q})$. Because the field extension $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{q})$ is algebraic, any ring between $\kappa(\mathfrak{m})$ and $\kappa(\mathfrak{q})$ is a field (Fields, Lemma 9.8.10). Thus $S / \mathfrak{q}$ is a field, and a posteriori equal to $\kappa(\mathfrak{q})$.

00FT Lemma 10.34.10. Suppose that $k$ is a field and suppose that $V$ is a nonzero vector space over $k$. Assume the dimension of $V$ (which is a cardinal number) is smaller than the cardinality of $k$. Then for any linear operator $T: V \rightarrow V$ there exists some monic polynomial $P(t) \in k[t]$ such that $P(T)$ is not invertible.

Proof. If not then $V$ inherits the structure of a vector space over the field $k(t)$. But the dimension of $k(t)$ over $k$ is at least the cardinality of $k$ for example due to the fact that the elements $\frac{1}{t-\lambda}$ are $k$-linearly independent.

Here is another version of Hilbert's Nullstellensatz.
00FU Theorem 10.34.11. Let $k$ be a field. Let $S$ be a $k$-algebra generated over $k$ by the elements $\left\{x_{i}\right\}_{i \in I}$. Assume the cardinality of $I$ is smaller than the cardinality of $k$. Then
(1) for all maximal ideals $\mathfrak{m} \subset S$ the field extension $k \subset \kappa(\mathfrak{m})$ is algebraic, and
(2) $S$ is a Jacobson ring.

Proof. If $I$ is finite then the result follows from the Hilbert Nullstellensatz, Theorem 10.33.1. In the rest of the proof we assume $I$ is infinite. It suffices to prove the result for $\mathfrak{m} \subset k\left[\left\{x_{i}\right\}_{i \in I}\right]$ maximal in the polynomial ring on variables $x_{i}$, since $S$ is a quotient of this. As $I$ is infinite the set of monomials $x_{i_{1}}^{e_{1}} \ldots x_{i_{r}}^{e_{r}}, i_{1}, \ldots, i_{r} \in I$ and $e_{1}, \ldots, e_{r} \geq 0$ has cardinality at most equal to the cardinality of $I$. Because the cardinality of $I \times \ldots \times I$ is the cardinality of $I$, and also the cardinality of $\bigcup_{n \geq 0} I^{n}$ has the same cardinality. (If $I$ is finite, then this is not true and in that case this proof only works if $k$ is uncountable.)
To arrive at a contradiction pick $T \in \kappa(\mathfrak{m})$ transcendental over $k$. Note that the $k$-linear map $T: \kappa(\mathfrak{m}) \rightarrow \kappa(\mathfrak{m})$ given by multiplication by $T$ has the property that $P(T)$ is invertible for all monic polynomials $P(t) \in k[t]$. Also, $\kappa(\mathfrak{m})$ has dimension at most the cardinality of $I$ over $k$ since it is a quotient of the vector space $k\left[\left\{x_{i}\right\}_{i \in I}\right]$
over $k$ (whose dimension is $\# I$ as we saw above). This is impossible by Lemma 10.34.10.

To show that $S$ is Jacobson we argue as follows. If not then there exists a prime $\mathfrak{q} \subset S$ and an element $f \in S, f \notin \mathfrak{q}$ such that $\mathfrak{q}$ is not maximal and $(S / \mathfrak{q})_{f}$ is a field, see Lemma 10.34.5. But note that $(S / \mathfrak{q})_{f}$ is generated by at most $\# I+1$ elements. Hence the field extension $k \subset(R / \mathfrak{q})_{f}$ is algebraic (by the first part of the proof). This implies that $\kappa(\mathfrak{q})$ is an algebraic extension of $k$ hence $\mathfrak{q}$ is maximal by Lemma 10.34.9. This contradiction finishes the proof.

046 V Lemma 10.34.12. Let $k$ be a field. Let $S$ be a $k$-algebra. For any field extension $k \subset K$ whose cardinality is larger than the cardinality of $S$ we have
(1) for every maximal ideal $\mathfrak{m}$ of $S_{K}$ the field $\kappa(\mathfrak{m})$ is algebraic over $K$, and
(2) $S_{K}$ is a Jacobson ring.

Proof. Choose $k \subset K$ such that the cardinality of $K$ is greater than the cardinality of $S$. Since the elements of $S$ generate the $K$-algebra $S_{K}$ we see that Theorem 10.34.11 applies.

02CB Example 10.34.13. The trick in the proof of Theorem 10.34 .11 really does not work if $k$ is a countable field and $I$ is countable too. Let $k$ be a countable field. Let $x$ be a variable, and let $k(x)$ be the field of rational functions in $x$. Consider the polynomial algebra $R=k\left[x,\left\{x_{f}\right\}_{f \in k[x]-\{0\}}\right]$. Let $I=\left(\left\{f x_{f}-1\right\}_{f \in k[x]-\{0\}}\right)$. Note that $I$ is a proper ideal in $R$. Choose a maximal ideal $I \subset \mathfrak{m}$. Then $k \subset R / \mathfrak{m}$ is isomorphic to $k(x)$, and is not algebraic over $k$.

00G6 Lemma 10.34.14. Let $R$ be a Jacobson ring. Let $f \in R$. The ring $R_{f}$ is Jacobson and maximal ideals of $R_{f}$ correspond to maximal ideals of $R$ not containing $f$.

Proof. By Topology, Lemma 5.17.5 we see that $D(f)=\operatorname{Spec}\left(R_{f}\right)$ is Jacobson and that closed points of $D(f)$ correspond to closed points in $\operatorname{Spec}(R)$ which happen to lie in $D(f)$. Thus $R_{f}$ is Jacobson by Lemma 10.34.4.
00G7 Example 10.34.15. Here is a simple example that shows Lemma 10.34 .14 to be false if $R$ is not Jacobson. Consider the ring $R=\mathbf{Z}_{(2)}$, i.e., the localization of $\mathbf{Z}$ at the prime (2). The localization of $R$ at the element 2 is isomorphic to $\mathbf{Q}$, in a formula: $R_{2} \cong \mathbf{Q}$. Clearly the map $R \rightarrow R_{2}$ maps the closed point of $\operatorname{Spec}(\mathbf{Q})$ to the generic point of $\operatorname{Spec}(R)$.

00G8 Example 10.34.16. Here is a simple example that shows Lemma 10.34 .14 is false if $R$ is Jacobson but we localize at infinitely many elements. Namely, let $R=\mathbf{Z}$ and consider the localization $(R \backslash\{0\})^{-1} R \cong \mathbf{Q}$ of $R$ at the set of all nonzero elements. Clearly the map $\mathbf{Z} \rightarrow \mathbf{Q}$ maps the closed point of $\operatorname{Spec}(\mathbf{Q})$ to the generic point of $\operatorname{Spec}(\mathbf{Z})$.
00G9 Lemma 10.34.17. Let $R$ be a Jacobson ring. Let $I \subset R$ be an ideal. The ring $R / I$ is Jacobson and maximal ideals of $R / I$ correspond to maximal ideals of $R$ containing $I$.

Proof. The proof is the same as the proof of Lemma 10.34.14.
00GB Proposition 10.34.18. Let $R$ be a Jacobson ring. Let $R \rightarrow S$ be a ring map of finite type. Then
(1) The ring $S$ is Jacobson.
(2) The map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ transforms closed points to closed points.
(3) For $\mathfrak{m}^{\prime} \subset S$ maximal lying over $\mathfrak{m} \subset R$ the field extension $\kappa(\mathfrak{m}) \subset \kappa\left(\mathfrak{m}^{\prime}\right)$ is finite.

Proof. Let $A \rightarrow B \rightarrow C$ be finite type ring maps. Suppose $\operatorname{Spec}(C) \rightarrow \operatorname{Spec}(B)$ and $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ map closed points to closed points, and induce finite residue field extensions on residue fields at closed points. Then so does $\operatorname{Spec}(C) \rightarrow$ $\operatorname{Spec}(A)$. Thus it is clear that if we factor $R \rightarrow S$ as $R \rightarrow S^{\prime} \rightarrow S$ for some finite type $R$-algebra $S^{\prime}$, then it suffices to prove the lemma for $R \rightarrow S^{\prime}$ and then $S^{\prime} \rightarrow S$. Writing $S=R\left[x_{1}, \ldots, x_{n}\right] / I$ we see that it suffices to prove the lemma in the cases $S=R[x]$ and $S=R / I$. The case $S=R / I$ is Lemma 10.34.17.

The case $S=R[x]$. Take an irreducible closed subset $Z \subset \operatorname{Spec}(R[x])$. In other words $Z=V(\mathfrak{q})$ for some prime $\mathfrak{q} \subset R[x]$. Set $\mathfrak{p}=\mathfrak{q} \cap R$. Let $U \subset \operatorname{Spec}(R[x])$ be open such that $U \cap Z \neq \emptyset$. We have to find a closed point in $U \cap Z$. In fact, we will find
(*) a closed point $y$ of $U \cap Z$ which maps to a closed point $x$ of $\operatorname{Spec}(R)$ such that additionally $\kappa(x) \subset \kappa(y)$ is finite.
To do this we may assume $U=D(f)$ for some $f \in R[x]$. In this case $U \cap V(\mathfrak{q}) \neq \emptyset$ means $f \notin \mathfrak{q}$. Consider the diagram

It suffices to solve the problem on the right hand side of this diagram. Thus we see we may assume $R$ is Jacobson, a domain and $\mathfrak{p}=(0)$.

In case $\mathfrak{q}=(0)$, write $f=a_{d} x^{d}+\ldots+a_{0}$. We see that not all $a_{i}$ are zero. Take any maximal ideal $\mathfrak{m}$ of $R$ such that $a_{i} \notin \mathfrak{m}$ for some $i$ (here we use $R$ is Jacobson). Next, choose a maximal ideal $\overline{\mathfrak{m}}^{\prime} \subset(R / \mathfrak{m})[x]$ not containing the image of $f$ (possible because $\kappa(\mathfrak{m})[x]$ is Jacobson). Then the inverse image $\mathfrak{m}^{\prime} \subset R[x]$ defines a closed point of $U \cap Z$ and maps to $\mathfrak{m}$. Also, by construction $\kappa(\mathfrak{m}) \subset \kappa\left(\mathfrak{m}^{\prime}\right)$ is finite. Thus we have shown $(*)$ in this case.

In case $\mathfrak{q} \neq(0)$, let $K$ be the fraction field of $R$. Write $\mathfrak{q} K[x]=(g)$ for some irreducible $g \in K[x]$. Clearing denominators, we may assume that $g \in R[x]$, and hence in $\mathfrak{q}$. Write $g=b_{e} x^{e}+\ldots+b_{0}, b_{i} \in R$ with $b_{e} \neq 0$. The maps $R \rightarrow R_{b_{e}}$ and $R[x] \rightarrow R[x]_{b_{e}}$ satisfies the conclusion of the lemma, by Lemma 10.34.14 and moreover induce isomorphisms on residue fields. Hence, in order to prove (*), we may replace $R$ by $R_{b_{e}}$ and assume that $g$ is monic. In this case we see that $R[x] / \mathfrak{q}$ is a quotient of the finite free $R$-module $R[x] /(g)=R \oplus R x \oplus \ldots \oplus R x^{e-1}$. But on the other hand we have $R[x] /(g) \subset K[x] /(g)=K[x] / \mathfrak{q} K[x]$. Hence $\mathfrak{q}=(g)$, and $Z=V(\mathfrak{q})=V(g)$. At this point, by Lemma 10.28 .8 the image of $D(f) \cap V(g)$ in $\operatorname{Spec}(R)$ is $D\left(r_{1}\right) \cup \ldots \cup D\left(r_{d}\right)$ for some $r_{i} \in R$ (of course it is nonempty). Take any maximal ideal $\mathfrak{m} \subset R$ in this image (possible because $R$ is Jacobson) and take any prime $\mathfrak{m}^{\prime} \subset R[x]$ corresponding to a point of $D(f) \cap V(g)$ lying over $\mathfrak{m}$. Note that the residue field extension $\kappa(\mathfrak{m}) \subset \kappa\left(\mathfrak{m}^{\prime}\right)$ is finite (because $g \in \mathfrak{m}^{\prime}$ ). By Lemma 10.34 .9 we see that $\mathfrak{m}^{\prime}$ is a closed point. This proves $(*)$ in this case.

At this point we are done. Namely, $(*)$ implies that $\operatorname{Spec}(R[x])$ is Jacobson (via Lemma 10.34.4. Also, if $Z$ is a singleton closed set, then $(*)$ implies that $Z=\left\{\mathfrak{m}^{\prime}\right\}$ with $\mathfrak{m}^{\prime}$ lying over a maximal ideal $\mathfrak{m} \subset R$ such that $\kappa(\mathfrak{m}) \subset \kappa\left(\mathfrak{m}^{\prime}\right)$ is finite.

00GC Lemma 10.34.19. Any finite type algebra over $\mathbf{Z}$ is Jacobson.
Proof. Combine Lemma 10.34 .6 and Proposition 10.34 .18 .
00GD Lemma 10.34.20. Let $R \rightarrow S$ be a finite type ring map of Jacobson rings. Denote $X=\operatorname{Spec}(R)$ and $Y=\operatorname{Spec}(S)$. Write $f: Y \rightarrow X$ the induced map of spectra. Let $E \subset Y=\operatorname{Spec}(S)$ be a constructible set. Denote with a subscript ${ }_{0}$ the set of closed points of a topological space.
(1) We have $f(E)_{0}=f\left(E_{0}\right)=X_{0} \cap f(E)$.
(2) A point $\xi \in X$ is in $f(E)$ if and only if $\overline{\{\xi\}} \cap f\left(E_{0}\right)$ is dense in $\overline{\{\xi\}}$.

Proof. We have a commutative diagram of continuous maps

Suppose $x \in f(E)$ is closed in $f(E)$. Then $f^{-1}(\{x\}) \cap E$ is nonempty and closed in $E$. Applying Topology, Lemma 5.17.5 to both inclusions

$$
f^{-1}(\{x\}) \cap E \subset E \subset Y
$$

we find there exists a point $y \in f^{-1}(\{x\}) \cap E$ which is closed in $Y$. In other words, there exists $y \in Y_{0}$ and $y \in E_{0}$ mapping to $x$. Hence $x \in f\left(E_{0}\right)$. This proves that $f(E)_{0} \subset f\left(E_{0}\right)$. Proposition 10.34 .18 implies that $f\left(E_{0}\right) \subset X_{0} \cap f(E)$. The inclusion $X_{0} \cap f(E) \subset f(E)_{0}$ is trivial. This proves the first assertion.

Suppose that $\xi \in f(E)$. According to Lemma 10.29 .2 the set $f(E) \cap \overline{\{\xi\}}$ contains a dense open subset of $\overline{\{\xi\}}$. Since $X$ is Jacobson we conclude that $f(E) \cap \overline{\{\xi\}}$ contains a dense set of closed points, see Topology, Lemma 5.17.5. We conclude by part (1) of the lemma.

On the other hand, suppose that $\overline{\{\xi\}} \cap f\left(E_{0}\right)$ is dense in $\overline{\{\xi\}}$. By Lemma 10.28 .3 there exists a ring map $S \rightarrow S^{\prime}$ of finite presentation such that $E$ is the image of $Y^{\prime}:=\operatorname{Spec}\left(S^{\prime}\right) \rightarrow Y$. Then $E_{0}$ is the image of $Y_{0}^{\prime}$ by the first part of the lemma applied to the ring map $S \rightarrow S^{\prime}$. Thus we may assume that $E=Y$ by replacing $S$ by $S^{\prime}$. Suppose $\xi$ corresponds to $\mathfrak{p} \subset R$. Consider the diagram

This diagram and the density of $f\left(Y_{0}\right) \cap V(\mathfrak{p})$ in $V(\mathfrak{p})$ shows that the morphism $R / \mathfrak{p} \rightarrow S / \mathfrak{p} S$ satisfies condition (2) of Lemma 10.29.4. Hence we conclude there exists a prime $\overline{\mathfrak{q}} \subset S / \mathfrak{p} S$ mapping to (0). In other words the inverse image $\mathfrak{q}$ of $\overline{\mathfrak{q}}$ in $S$ maps to $\mathfrak{p}$ as desired.

The conclusion of the lemma above is that we can read off the image of $f$ from the set of closed points of the image. This is a little nicer in case the map is of finite presentation because then we know that images of a constructible is constructible. Before we state it we introduce some notation. Denote Constr$(X)$ the set of constructible Let $R \rightarrow S$ be a ring map. Denote $X=\operatorname{Spec}(R)$ and $Y=\operatorname{Spec}(S)$. Write $f: Y \rightarrow X$ the induced map of spectra. Denote with a subscript ${ }_{0}$ the set of closed points of a topological space.

00GE Lemma 10.34.21. With notation as above. Assume that $R$ is a Noetherian Jacobson ring. Further assume $R \rightarrow S$ is of finite type. There is a commutative diagram

where the horizontal arrows are the bijections from Topology, Lemma 5.17.8.
Proof. Since $R \rightarrow S$ is of finite type, it is of finite presentation, see Lemma 10.30.4, Thus the image of a constructible set in $X$ is constructible in $Y$ by Chevalley's theorem (Theorem 10.28.9). Combined with Lemma 10.34 .20 the lemma follows.

To illustrate the use of Jacobson rings, we give the following two examples.
00GF Example 10.34.22. Let $k$ be a field. The space $\operatorname{Spec}(k[x, y] /(x y))$ has two irreducible components: namely the $x$-axis and the $y$-axis. As a generalization, let

$$
R=k\left[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}\right] / \mathfrak{a}
$$

where $\mathfrak{a}$ is the ideal in $k\left[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}\right]$ generated by the entries of the $2 \times 2$ product matrix

$$
\left(\begin{array}{ll}
x_{11} & x_{12} \\
x_{21} & x_{22}
\end{array}\right)\left(\begin{array}{ll}
y_{11} & y_{12} \\
y_{21} & y_{22}
\end{array}\right)
$$

In this example we will describe $\operatorname{Spec}(R)$.
To prove the statement about $\operatorname{Spec}(k[x, y] /(x y))$ we argue as follows. If $\mathfrak{p} \subset k[x, y]$ is any ideal containing $x y$, then either $x$ or $y$ would be contained in $\mathfrak{p}$. Hence the minimal such prime ideals are just $(x)$ and $(y)$. In case $k$ is algebraically closed, the max-Spec of these components can then be visualized as the point sets of $y$ and $x$-axis.
For the generalization, note that we may identify the closed points of the spectrum of $\left.k\left[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}\right]\right)$ with the space of matrices

$$
\left\{(X, Y) \in \operatorname{Mat}(2, k) \times \operatorname{Mat}(2, k) \left\lvert\, X=\left(\begin{array}{ll}
x_{11} & x_{12} \\
x_{21} & x_{22}
\end{array}\right)\right., Y=\left(\begin{array}{ll}
y_{11} & y_{12} \\
y_{21} & y_{22}
\end{array}\right)\right\}
$$

at least if $k$ is algebraically closed. Now define a group action of $\mathrm{GL}(2, k) \times$ $\mathrm{GL}(2, k) \times \mathrm{GL}(2, k)$ on the space of matrices $\{(X, Y)\}$ by

$$
\left(g_{1}, g_{2}, g_{3}\right) \times(X, Y) \mapsto\left(\left(g_{1} X g_{2}^{-1}, g_{2} Y g_{3}^{-1}\right)\right)
$$

Here, also observe that the algebraic set

$$
\mathrm{GL}(2, k) \times \mathrm{GL}(2, k) \times \mathrm{GL}(2, k) \subset \operatorname{Mat}(2, k) \times \operatorname{Mat}(2, k) \times \operatorname{Mat}(2, k)
$$

is irreducible since it is the max spectrum of the domain
$k\left[x_{11}, x_{12}, \ldots, z_{21}, z_{22},\left(x_{11} x_{22}-x_{12} x_{21}\right)^{-1},\left(y_{11} y_{22}-y_{12} y_{21}\right)^{-1},\left(z_{11} z_{22}-z_{12} z_{21}\right)^{-1}\right]$.
Since the image of irreducible an algebraic set is still irreducible, it suffices to classify the orbits of the set $\{(X, Y) \in \operatorname{Mat}(2, k) \times \operatorname{Mat}(2, k) \mid X Y=0\}$ and take their closures. From standard linear algebra, we are reduced to the following three cases:
(1) $\exists\left(g_{1}, g_{2}\right)$ such that $g_{1} X g_{2}^{-1}=I_{2 \times 2}$. Then $Y$ is necessarily 0 , which as an algebraic set is invariant under the group action. It follows that this orbit is contained in the irreducible algebraic set defined by the prime ideal $\left(y_{11}, y_{12}, y_{21}, y_{22}\right)$. Taking the closure, we see that $\left(y_{11}, y_{12}, y_{21}, y_{22}\right)$ is actually a component.
(2) $\exists\left(g_{1}, g_{2}\right)$ such that

$$
g_{1} X g_{2}^{-1}=\left(\begin{array}{ll}
1 & 0 \\
0 & 0
\end{array}\right)
$$

This case occurs if and only if $X$ is a rank 1 matrix, and furthermore, $Y$ is killed by such an $X$ if and only if

$$
\begin{array}{ll}
x_{11} y_{11}+x_{12} y_{21}=0 ; & x_{11} y_{12}+x_{12} y_{22}=0 \\
x_{21} y_{11}+x_{22} y_{21}=0 ; & x_{21} y_{12}+x_{22} y_{22}=0
\end{array}
$$

Fix a rank $1 X$, such non zero $Y^{\prime}$ 's satisfying the above equations form an irreducible algebraic set for the following reason $(Y=0$ is contained the previous case): $0=g_{1} X g_{2}^{-1} g_{2} Y$ implies that

$$
g_{2} Y=\left(\begin{array}{cc}
0 & 0 \\
y_{21}^{\prime} & y_{22}^{\prime}
\end{array}\right) .
$$

With a further GL( $2, k)$-action on the right by $g_{3}, g_{2} Y$ can be brought into

$$
g_{2} Y g_{3}^{-1}=\left(\begin{array}{ll}
0 & 0 \\
0 & 1
\end{array}\right)
$$

and thus such $Y$ 's form an irreducible algebraic set isomorphic to the image of GL $(2, k)$ under this action. Finally, notice that the "rank 1 " condition for $X$ 's forms an open dense subset of the irreducible algebraic set $\operatorname{det} X=x_{11} x_{22}-x_{12} x_{21}=0$. It now follows that all the five equations define an irreducible component $\left(x_{11} y_{11}+x_{12} y_{21}, x_{11} y_{12}+x_{12} y_{22}, x_{21} y_{11}+\right.$ $\left.x_{22} y_{21}, x_{21} y_{12}+x_{22} y_{22}, x_{11} x_{22}-x_{12} x_{21}\right)$ in the open subset of the space of pairs of nonzero matrices. It can be shown that the pair of equations $\operatorname{det} X=0, \operatorname{det} Y=0$ cuts $\operatorname{Spec}(R)$ in an irreducible component with the above locus an open dense subset.
(3) $\exists\left(g_{1}, g_{2}\right)$ such that $g_{1} X g_{2}^{-1}=0$, or equivalently, $X=0$. Then $Y$ can be arbitrary and this component is thus defined by $\left(x_{11}, x_{12}, x_{21}, x_{22}\right)$.
00GG Example 10.34.23. For another example, consider $R=k\left[\left\{t_{i j}\right\}_{i, j=1}^{n}\right] / \mathfrak{a}$, where $\mathfrak{a}$ is the ideal generated by the entries of the product matrix $T^{2}-T, T=\left(t_{i j}\right)$. From linear algebra, we know that under the $G L(n, k)$-action defined by $g, T \mapsto g T g^{-1}, T$ is classified by the its rank and each $T$ is conjugate to some $\operatorname{diag}(1, \ldots, 1,0, \ldots, 0)$, which has $r 1$ 's and $n-r 0$ 's. Thus each orbit of $\operatorname{such} \operatorname{diag}(1, \ldots, 1,0, \ldots, 0)$ under the group action forms an irreducible component and every idempotent matrix is contained in one such orbit. Next we will show that any two different orbits
are necessarily disjoint. For this purpose we only need to cook up polynomial functions that take different values on different orbits. In characteristic 0 cases, such a function can be taken to be $f\left(t_{i j}\right)=\operatorname{trace}(T)=\sum_{i=1}^{n} t_{i i}$. In positive characteristic cases, things are slightly more tricky since we might have $\operatorname{trace}(T)=0$ even if $T \neq 0$. For instance, char $=3$

$$
\operatorname{trace}\left(\begin{array}{ccc}
1 & & \\
& 1 & \\
& & 1
\end{array}\right)=3=0
$$

Anyway, these components can be separated using other functions. For instance, in the characteristic 3 case, $\operatorname{tr}\left(\wedge^{3} T\right)$ takes value 1 on the components corresponding to $\operatorname{diag}(1,1,1)$ and 0 on other components.

### 10.35. Finite and integral ring extensions

00 GH Trivial lemmas concerning finite and integral ring maps. We recall the definition.
00GI Definition 10.35.1. Let $\varphi: R \rightarrow S$ be a ring map.
(1) An element $s \in S$ is integral over $R$ if there exists a monic polynomial $P(x) \in R[x]$ such that $P^{\varphi}(s)=0$, where $P^{\varphi}(x) \in S[x]$ is the image of $P$ under $\varphi: R[x] \rightarrow S[x]$.
(2) The ring map $\varphi$ is integral if every $s \in S$ is integral over $R$.

052I Lemma 10.35.2. Let $\varphi: R \rightarrow S$ be a ring map. Let $y \in S$. If there exists a finite $R$-submodule $M$ of $S$ such that $1 \in M$ and $y M \subset M$, then $y$ is integral over $R$.
Proof. Let $x_{1}=1 \in M$ and $x_{i} \in M, i=2, \ldots, n$ be a finite set of elements generating $M$ as an $R$-module. Write $y x_{i}=\sum \varphi\left(a_{i j}\right) x_{j}$ for some $a_{i j} \in R$. Let $P(T) \in R[T]$ be the characteristic polynomial of the $n \times n$ matrix $A=\left(a_{i j}\right)$. By Lemma 10.15 .1 we see $P(A)=0$. By construction the map $\pi: R^{n} \rightarrow M$, $\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum \varphi\left(a_{i}\right) x_{i}$ commutes with $A: R^{n} \rightarrow R^{n}$ and multiplication by $y$. In a formula $\pi(A v)=y \pi(v)$. Thus $P(y)=P(y) \cdot 1=P(y) \cdot x_{1}=P(y) \cdot \pi((1,0, \ldots, 0))=$ $\pi(P(A)(1,0, \ldots, 0))=0$.

00GK Lemma 10.35.3. A finite ring extension is integral.
Proof. Let $R \rightarrow S$ be finite. Let $y \in S$. Apply Lemma 10.35 .2 to $M=S$ to see that $y$ is integral over $R$.
00GM Lemma 10.35.4. Let $\varphi: R \rightarrow S$ be a ring map. Let $s_{1}, \ldots, s_{n}$ be a finite set of elements of $S$. In this case $s_{i}$ is integral over $R$ for all $i=1, \ldots, n$ if and only if there exists an $R$-subalgebra $S^{\prime} \subset S$ finite over $R$ containing all of the $s_{i}$.

Proof. If each $s_{i}$ is integral, then the subalgebra generated by $\varphi(R)$ and the $s_{i}$ is finite over $R$. Namely, if $s_{i}$ satisfies a monic equation of degree $d_{i}$ over $R$, then this subalgebra is generated as an $R$-module by the elements $s_{1}^{e_{1}} \ldots s_{n}^{e_{n}}$ with $0 \leq e_{i} \leq d_{i}-1$. Conversely, suppose given a finite $R$-subalgebra $S^{\prime}$ containing all the $s_{i}$. Then all of the $s_{i}$ are integral by Lemma 10.35 .3 .
02JJ Lemma 10.35.5. Let $R \rightarrow S$ be a ring map. The following are equivalent
(1) $R \rightarrow S$ is finite,
(2) $R \rightarrow S$ is integral and of finite type, and
(3) there exist $x_{1}, \ldots, x_{n} \in S$ which generate $S$ as an algebra over $R$ such that each $x_{i}$ is integral over $R$.

Proof. Clear from Lemma 10.35 .4 .
00GN Lemma 10.35.6. Suppose that $R \rightarrow S$ and $S \rightarrow T$ are integral ring maps. Then $R \rightarrow T$ is integral.

Proof. Let $t \in T$. Let $P(x) \in S[x]$ be a monic polynomial such that $P(t)=0$. Apply Lemma 10.35 .4 to the finite set of coefficients of $P$. Hence $t$ is integral over some subalgebra $S^{\prime} \subset S$ finite over $R$. Apply Lemma 10.35.4 again to find a subalgebra $T^{\prime} \subset T$ finite over $S^{\prime}$ and containing $t$. Lemma 10.7.3 applied to $R \rightarrow S^{\prime} \rightarrow T^{\prime}$ shows that $T^{\prime}$ is finite over $R$. The integrality of $t$ over $R$ now follows from Lemma 10.35 .3 .

00GO Lemma 10.35.7. Let $R \rightarrow S$ be a ring homomorphism. The set

$$
S^{\prime}=\{s \in S \mid s \text { is integral over } R\}
$$

is an $R$-subalgebra of $S$.
Proof. This is clear from Lemmas 10.35 .4 and 10.35 .3
00GP Definition 10.35.8. Let $R \rightarrow S$ be a ring map. The ring $S^{\prime} \subset S$ of elements integral over $R$, see Lemma 10.35.7, is called the integral closure of $R$ in $S$. If $R \subset S$ we say that $R$ is integrally closed in $S$ if $R=S^{\prime}$.

In particular, we see that $R \rightarrow S$ is integral if and only if the integral closure of $R$ in $S$ is all of $S$.

0307 Lemma 10.35.9. Integral closure commutes with localization: If $A \rightarrow B$ is a ring map, and $S \subset A$ is a multiplicative subset, then the integral closure of $S^{-1} A$ in $S^{-1} B$ is $S^{-1} B^{\prime}$, where $B^{\prime} \subset B$ is the integral closure of $A$ in $B$.
Proof. Since localization is exact we see that $S^{-1} B^{\prime} \subset S^{-1} B$. Suppose $x \in B^{\prime}$ and $f \in S$. Then $x^{d}+\sum_{i=1, \ldots, d} a_{i} x^{d-i}=0$ in $B$ for some $a_{i} \in A$. Hence also

$$
(x / f)^{d}+\sum_{i=1, \ldots, d} a_{i} / f^{i}(x / f)^{d-i}=0
$$

in $S^{-1} B$. In this way we see that $S^{-1} B^{\prime}$ is contained in the integral closure of $S^{-1} A$ in $S^{-1} B$. Conversely, suppose that $x / f \in S^{-1} B$ is integral over $S^{-1} A$. Then we have

$$
(x / f)^{d}+\sum_{i=1, \ldots, d}\left(a_{i} / f_{i}\right)(x / f)^{d-i}=0
$$

in $S^{-1} B$ for some $a_{i} \in A$ and $f_{i} \in S$. This means that

$$
\left(f^{\prime} f_{1} \ldots f_{d} x\right)^{d}+\sum_{i=1, \ldots, d} f^{i}\left(f^{\prime}\right)^{i} f_{1}^{i} \ldots f_{i}^{i-1} \ldots f_{d}^{i} a_{i}\left(f^{\prime} f_{1} \ldots f_{d} x\right)^{d-i}=0
$$

for a suitable $f^{\prime} \in S$. Hence $f^{\prime} f_{1} \ldots f_{d} x \in B^{\prime}$ and thus $x / f \in S^{-1} B^{\prime}$ as desired.
034K Lemma 10.35.10. Let $\varphi: R \rightarrow S$ be a ring map. Let $x \in S$. The following are equivalent:
(1) $x$ is integral over $R$, and
(2) for every prime ideal $\mathfrak{p} \subset R$ the element $x \in S_{\mathfrak{p}}$ is integral over $R_{\mathfrak{p}}$.

Proof. It is clear that (1) implies (2). Assume (2). Consider the $R$-algebra $S^{\prime} \subset S$ generated by $\varphi(R)$ and $x$. Let $\mathfrak{p}$ be a prime ideal of $R$. Then we know that $x^{d}+\sum_{i=1, \ldots, d} \varphi\left(a_{i}\right) x^{d-i}=0$ in $S_{\mathfrak{p}}$ for some $a_{i} \in R_{\mathfrak{p}}$. Hence we see, by looking at which denominators occur, that for some $f \in R, f \notin \mathfrak{p}$ we have $a_{i} \in R_{f}$ and
$x^{d}+\sum_{i=1, \ldots, d} \varphi\left(a_{i}\right) x^{d-i}=0$ in $S_{f}$. This implies that $S_{f}^{\prime}$ is finite over $R_{f}$. Since $\mathfrak{p}$ was arbitrary and $\operatorname{Spec}(R)$ is quasi-compact (Lemma 10.16.10 we can find finitely many elements $f_{1}, \ldots, f_{n} \in R$ which generate the unit ideal of $R$ such that $S_{f_{i}}^{\prime}$ is finite over $R_{f_{i}}$. Hence we conclude from Lemma 10.23 .2 that $S^{\prime}$ is finite over $R$. Hence $x$ is integral over $R$ by Lemma 10.35.4.
02JK Lemma 10.35.11. Let $R \rightarrow S$ and $R \rightarrow R^{\prime}$ be ring maps. Set $S^{\prime}=R^{\prime} \otimes_{R} S$.
(1) If $R \rightarrow S$ is integral so is $R^{\prime} \rightarrow S^{\prime}$.
(2) If $R \rightarrow S$ is finite so is $R^{\prime} \rightarrow S^{\prime}$.

Proof. We prove (1). Let $s_{i} \in S$ be generators for $S$ over $R$. Each of these satisfies a monic polynomial equation $P_{i}$ over $R$. Hence the elements $1 \otimes s_{i} \in S^{\prime}$ generate $S^{\prime}$ over $R^{\prime}$ and satisfy the corresponding polynomial $P_{i}^{\prime}$ over $R^{\prime}$. Since these elements generate $S^{\prime}$ over $R^{\prime}$ we see that $S^{\prime}$ is integral over $R^{\prime}$. Proof of (2) omitted.
02JL Lemma 10.35.12. Let $R \rightarrow S$ be a ring map. Let $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal.
(1) If each $R_{f_{i}} \rightarrow S_{f_{i}}$ is integral, so is $R \rightarrow S$.
(2) If each $R_{f_{i}} \rightarrow S_{f_{i}}$ is finite, so is $R \rightarrow S$.

Proof. Proof of (1). Let $s \in S$. Consider the ideal $I \subset R[x]$ of polynomials $P$ such that $P(s)=0$. Let $J \subset R$ denote the ideal (!) of leading coefficients of elements of $I$. By assumption and clearing denominators we see that $f_{i}^{n_{i}} \in J$ for all $i$ and certain $n_{i} \geq 0$. Hence $J$ contains 1 and we see $s$ is integral over $R$. Proof of (2) omitted.

02JM Lemma 10.35.13. Let $A \rightarrow B \rightarrow C$ be ring maps.
(1) If $A \rightarrow C$ is integral so is $B \rightarrow C$.
(2) If $A \rightarrow C$ is finite so is $B \rightarrow C$.

Proof. Omitted.
0308 Lemma 10.35.14. Let $A \rightarrow B \rightarrow C$ be ring maps. Let $B^{\prime}$ be the integral closure of $A$ in $B$, let $C^{\prime}$ be the integral closure of $B^{\prime}$ in $C$. Then $C^{\prime}$ is the integral closure of $A$ in $C$.

Proof. Omitted.
00GQ Lemma 10.35.15. Suppose that $R \rightarrow S$ is an integral ring extension with $R \subset S$. Then $\varphi: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective.

Proof. Let $\mathfrak{p} \subset R$ be a prime ideal. We have to show $\mathfrak{p} S_{\mathfrak{p}} \neq S_{\mathfrak{p}}$, see Lemma 10.16.9. The localization $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{p}}$ is injective (as localization is exact) and integral by Lemma 10.35 .9 or 10.35 .11 . Hence we may replace $R, S$ by $R_{\mathfrak{p}}, S_{\mathfrak{p}}$ and we may assume $R$ is local with maximal ideal $\mathfrak{m}$ and it suffices to show that $\mathfrak{m} S \neq S$. Suppose $1=\sum f_{i} s_{i}$ with $f_{i} \in \mathfrak{m}$ and $s_{i} \in S$ in order to get a contradiction. Let $R \subset S^{\prime} \subset S$ be such that $R \rightarrow S^{\prime}$ is finite and $s_{i} \in S^{\prime}$, see Lemma 10.35.4. The equation $1=\sum f_{i} s_{i}$ implies that the finite $R$-module $S^{\prime}$ satisfies $S^{\prime}=\mathfrak{m} S^{\prime}$. Hence by Nakayama's Lemma 10.19.1 we see $S^{\prime}=0$. Contradiction.

00GR Lemma 10.35.16. Let $R$ be a ring. Let $K$ be a field. If $R \subset K$ and $K$ is integral over $R$, then $R$ is a field and $K$ is an algebraic extension. If $R \subset K$ and $K$ is finite over $R$, then $R$ is a field and $K$ is a finite algebraic extension.

Proof. Assume that $R \subset K$ is integral. By Lemma 10.35 .15 we see that $\operatorname{Spec}(R)$ has 1 point. Since clearly $R$ is a domain we see that $R=R_{(0)}$ is a field (Lemma 10.24.1. The other assertions are immediate from this.

00GS Lemma 10.35.17. Let $k$ be a field. Let $S$ be a $k$-algebra over $k$.
(1) If $S$ is a domain and finite dimensional over $k$, then $S$ is a field.
(2) If $S$ is integral over $k$ and a domain, then $S$ is a field.
(3) If $S$ is integral over $k$ then every prime of $S$ is a maximal ideal (see Lemma 10.25.5 for more consequences).

Proof. The statement on primes follows from the statement "integral + domain $\Rightarrow$ field". Let $S$ integral over $k$ and assume $S$ is a domain, Take $s \in S$. By Lemma 10.35 .4 we may find a finite dimensional $k$-subalgebra $k \subset S^{\prime} \subset S$ containing $s$. Hence $S$ is a field if we can prove the first statement. Assume $S$ finite dimensional over $k$ and a domain. Pick $s \in S$. Since $S$ is a domain the multiplication map $s: S \rightarrow S$ is surjective by dimension reasons. Hence there exists an element $s_{1} \in S$ such that $s s_{1}=1$. So $S$ is a field.

00GT Lemma 10.35.18. Suppose $R \rightarrow S$ is integral. Let $\mathfrak{q}, \mathfrak{q}^{\prime} \in \operatorname{Spec}(S)$ be distinct primes having the same image in $\operatorname{Spec}(R)$. Then neither $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ nor $\mathfrak{q}^{\prime} \subset \mathfrak{q}$.

Proof. Let $\mathfrak{p} \subset R$ be the image. By Remark 10.16 .8 the primes $\mathfrak{q}, \mathfrak{q}^{\prime}$ correspond to ideals in $S \otimes_{R} \kappa(\mathfrak{p})$. Thus the lemma follows from Lemma 10.35.17.

05DR Lemma 10.35.19. Suppose $R \rightarrow S$ is finite. Then the fibres of $\operatorname{Spec}(S) \rightarrow$ $\operatorname{Spec}(R)$ are finite.

Proof. By the discussion in Remark 10.16 .8 the fibres are the spectra of the rings $S \otimes_{R} \kappa(\mathfrak{p})$. As $R \rightarrow S$ is finite, these fibre rings are finite over $\kappa(\mathfrak{p})$ hence Noetherian by Lemma 10.30.1. By Lemma 10.35 .18 every prime of $S \otimes_{R} \kappa(\mathfrak{p})$ is a minimal prime. Hence by Lemma 10.30 .6 there are at most finitely many.

00GU Lemma 10.35.20. Let $R \rightarrow S$ be a ring map such that $S$ is integral over $R$. Let $\mathfrak{p} \subset \mathfrak{p}^{\prime} \subset R$ be primes. Let $\mathfrak{q}$ be a prime of $S$ mapping to $\mathfrak{p}$. Then there exists a prime $\mathfrak{q}^{\prime}$ with $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ mapping to $\mathfrak{p}^{\prime}$.

Proof. We may replace $R$ by $R / \mathfrak{p}$ and $S$ by $S / \mathfrak{q}$. This reduces us to the situation of having an integral extension of domains $R \subset S$ and a prime $\mathfrak{p}^{\prime} \subset R$. By Lemma 10.35 .15 we win.

The property expressed in the lemma above is called the "going up property" for the ring map $R \rightarrow S$, see Definition 10.40 .1 .
0564 Lemma 10.35.21. Let $R \rightarrow S$ be a finite and finitely presented ring map. Let $M$ be an $S$-module. Then $M$ is finitely presented as an $R$-module if and only if $M$ is finitely presented as an $S$-module.
Proof. One of the implications follows from Lemma 10.6.4. To see the other assume that $M$ is finitely presented as an $S$-module. Pick a presentation

$$
S^{\oplus m} \longrightarrow S^{\oplus n} \longrightarrow M \longrightarrow 0
$$

As $S$ is finite as an $R$-module, the kernel of $S^{\oplus n} \rightarrow M$ is a finite $R$-module. Thus from Lemma 10.5 .3 we see that it suffices to prove that $S$ is finitely presented as an $R$-module.

Pick $y_{1}, \ldots, y_{n} \in S$ such that $y_{1}, \ldots, y_{n}$ generate $S$ as an $R$-module. By Lemma 10.35 .2 each $y_{i}$ is integral over $R$. Choose mononic polynomials $P_{i}(x) \in R[x]$ with $P_{i}\left(y_{i}\right)=0$. Consider the ring

$$
S^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] /\left(P_{1}\left(x_{1}\right), \ldots, P_{n}\left(x_{n}\right)\right)
$$

Then we see that $S$ is of finite presentation as an $S^{\prime}$-algebra by Lemma 10.6.2. Since $S^{\prime} \rightarrow S$ is surjective we see that $S$ is of finite presentation as an $S^{\prime}$-module (use Lemma 10.6.3). Hence, arguing as in the first paragraph, it suffices to show that $S^{\prime}$ is of finite presentation as an $R$-module. To see this we write $R \rightarrow S^{\prime}$ as the composition

$$
R \rightarrow R\left[x_{1}\right] /\left(P_{1}\left(x_{1}\right)\right) \rightarrow R\left[x_{1}, x_{2}\right] /\left(P_{1}\left(x_{1}\right), P_{2}\left(x_{2}\right)\right) \rightarrow \ldots \rightarrow S^{\prime}
$$

of ring maps of the form $R^{\prime} \rightarrow R^{\prime}[x] /\left(x^{d}+a_{1} x^{d-1}+\ldots+a_{d}\right)$. Again arguing as in the first paragraph of the proof it is enough to show that the $i$ th ring in this sequence is of finite presentation as a module over the $(i-1)$ st one. This is true because $R^{\prime}[x] /\left(x^{d}+a_{1} x^{d-1}+\ldots+a_{d}\right)$ is free as a module over $R^{\prime}$ with basis $1, x, \ldots, x^{d-1}$.

052J Lemma 10.35.22. Let $R$ be a ring. Let $x, y \in R$ be nonzerodivisors. Let $R[x / y] \subset$ $R_{x y}$ be the $R$-subalgebra generated by $x / y$, and similarly for the subalgebras $R[y / x]$ and $R[x / y, y / x]$. If $R$ is integrally closed in $R_{x}$ or $R_{y}$, then the sequence

$$
0 \rightarrow R \xrightarrow{(-1,1)} R[x / y] \oplus R[y / x] \xrightarrow{(1,1)} R[x / y, y / x] \rightarrow 0
$$

is a short exact sequence of $R$-modules.
Proof. Since $x / y \cdot y / x=1$ it is clear that the map $R[x / y] \oplus R[y / x] \rightarrow R[x / y, y / x]$ is surjective. Let $\alpha \in R[x / y] \cap R[y / x]$. To show exactness in the middle we have to prove that $\alpha \in R$. By assumption we may write

$$
\alpha=a_{0}+a_{1} x / y+\ldots+a_{n}(x / y)^{n}=b_{0}+b_{1} y / x+\ldots+b_{m}(y / x)^{m}
$$

for some $n, m \geq 0$ and $a_{i}, b_{j} \in R$. Pick some $N>\max (n, m)$. Consider the finite $R$-submodule $M$ of $R_{x y}$ generated by the elements

$$
(x / y)^{N},(x / y)^{N-1}, \ldots, x / y, 1, y / x, \ldots,(y / x)^{N-1},(y / x)^{N}
$$

We claim that $\alpha M \subset M$. Namely, it is clear that $(x / y)^{i}\left(b_{0}+b_{1} y / x+\ldots+\right.$ $\left.b_{m}(y / x)^{m}\right) \in M$ for $0 \leq i \leq N$ and that $(y / x)^{i}\left(a_{0}+a_{1} x / y+\ldots+a_{n}(x / y)^{n}\right) \in M$ for $0 \leq i \leq N$. Hence $\alpha$ is integral over $R$ by Lemma 10.35.2. Note that $\alpha \in R_{x}$, so if $R$ is integrally closed in $R_{x}$ then $\alpha \in R$ as desired.

### 10.36. Normal rings

037B We first introduce the notion of a normal domain, and then we introduce the (very general) notion of a normal ring.

0309 Definition 10.36.1. A domain $R$ is called normal if it is integrally closed in its field of fractions.

034L Lemma 10.36.2. Let $R \rightarrow S$ be a ring map. If $S$ is a normal domain, then the integral closure of $R$ in $S$ is a normal domain.

Proof. Omitted.
The following notion is occasionally useful when studying normality.

00GW Definition 10.36.3. Let $R$ be a domain.
(1) An element $g$ of the fraction field of $R$ is called almost integral over $R$ if there exists an element $r \in R, r \neq 0$ such that $r g^{n} \in R$ for all $n \geq 0$.
(2) The domain $R$ is called completely normal if every almost integral element of the fraction field of $R$ is contained in $R$.

The following lemma shows that a Noetherian domain is normal if and only if it is completely normal.

00GX Lemma 10.36.4. Let $R$ be a domain with fraction field $K$. If $u, v \in K$ are almost integral over $R$, then so are $u+v$ and uv. Any element $g \in K$ which is integral over $R$ is almost integral over $R$. If $R$ is Noetherian then the converse holds as well.

Proof. If $r u^{n} \in R$ for all $n \geq 0$ and $v^{n} r^{\prime} \in R$ for all $n \geq 0$, then $(u v)^{n} r r^{\prime}$ and $(u+v)^{n} r r^{\prime}$ are in $R$ for all $n \geq 0$. Hence the first assertion. Suppose $g \in K$ is integral over $R$. In this case there exists an $d>0$ such that the ring $R[g]$ is generated by $1, g, \ldots, g^{d}$ as an $R$-module. Let $r \in R$ be a common denominator of the elements $1, g, \ldots, g^{d} \in K$. It is follows that $r R[g] \subset R$, and hence $g$ is almost integral over $R$.

Suppose $R$ is Noetherian and $g \in K$ is almost integral over $R$. Let $r \in R, r \neq 0$ be as in the definition. Then $R[g] \subset \frac{1}{r} R$ as an $R$-module. Since $R$ is Noetherian this implies that $R[g]$ is finite over $R$. Hence $g$ is integral over $R$, see Lemma 10.35.3.

00GY Lemma 10.36.5. Any localization of a normal domain is normal.
Proof. Let $R$ be a normal domain, and let $S \subset R$ be a multiplicative subset. Suppose $g$ is an element of the fraction field of $R$ which is integral over $S^{-1} R$. Let $P=x^{d}+\sum_{j<d} a_{j} x^{j}$ be a polynomial with $a_{i} \in S^{-1} R$ such that $P(g)=0$. Choose $s \in S$ such that $s a_{i} \in R$ for all $i$. Then $s g$ satisfies the monic polynomial $x^{d}+\sum_{j<d} s^{d-j} a_{j} x^{j}$ which has coefficients $s^{d-j} a_{j}$ in $R$. Hence $s g \in R$ because $R$ is normal. Hence $g \in S^{-1} R$.

00GZ Lemma 10.36.6. A principal ideal domain is normal.
Proof. Let $R$ be a principal ideal domain. Let $g=a / b$ be an element of the fraction field of $R$ integral over $R$. Because $R$ is a principal ideal domain we may divide out a common factor of $a$ and $b$ and assume $(a, b)=R$. In this case, any equation $(a / b)^{n}+r_{n-1}(a / b)^{n-1}+\ldots+r_{0}=0$ with $r_{i} \in R$ would imply $a^{n} \in(b)$. This contradicts $(a, b)=R$ unless $b$ is a unit in $R$.

00H0 Lemma 10.36.7. Let $R$ be a domain with fraction field $K$. Suppose $f=\sum \alpha_{i} x^{i}$ is an element of $K[x]$.
(1) If $f$ is integral over $R[x]$ then all $\alpha_{i}$ are integral over $R$, and
(2) If $f$ is almost integral over $R[x]$ then all $\alpha_{i}$ are almost integral over $R$.

Proof. We first prove the second statement. Write $f=\alpha_{0}+\alpha_{1} x+\ldots+\alpha_{r} x^{r}$ with $\alpha_{r} \neq 0$. By assumption there exists $h=b_{0}+b_{1} x+\ldots+b_{s} x^{s} \in R[x], b_{s} \neq 0$ such that $f^{n} h \in R[x]$ for all $n \geq 0$. This implies that $b_{s} \alpha_{r}^{n} \in R$ for all $n \geq 0$. Hence $\alpha_{r}$ is almost integral over $R$. Since the set of almost integral elements form a subring (Lemma 10.36.4 we deduce that $f-\alpha_{r} x^{r}=\alpha_{0}+\alpha_{1} x+\ldots+\alpha_{r-1} x^{r-1}$ is almost integral over $R[x]$. By induction on $r$ we win.

In order to prove the first statement we will use absolute Noetherian reduction. Namely, write $\alpha_{i}=a_{i} / b_{i}$ and let $P(t)=t^{d}+\sum_{j<d} f_{j} t^{j}$ be a polynomial with coefficients $f_{j} \in R[x]$ such that $P(f)=0$. Let $f_{j}=\sum f_{j i} x^{i}$. Consider the subring $R_{0} \subset R$ generated by the finite list of elements $a_{i}, b_{i}, f_{j i}$ of $R$. It is a domain; let $K_{0}$ be its field of fractions. Since $R_{0}$ is a finite type $\mathbf{Z}$-algebra it is Noetherian, see Lemma 10.30.3. It is still the case that $f \in K_{0}[x]$ is integral over $R_{0}[x]$, because all the identities in $R$ among the elements $a_{i}, b_{i}, f_{j i}$ also hold in $R_{0}$. By Lemma 10.36 .4 the element $f$ is almost integral over $R_{0}[x]$. By the second statement of the lemma, the elements $\alpha_{i}$ are almost integral over $R_{0}$. And since $R_{0}$ is Noetherian, they are integral over $R_{0}$, see Lemma 10.36.4. Of course, then they are integral over $R$.

030A Lemma 10.36.8. Let $R$ be a normal domain. Then $R[x]$ is a normal domain.
Proof. The result is true if $R$ is a field $K$ because $K[x]$ is a euclidean domain and hence a principal ideal domain and hence normal by Lemma 10.36.6. Let $g$ be an element of the fraction field of $R[x]$ which is integral over $R[x]$. Because $g$ is integral over $K[x]$ where $K$ is the fraction field of $R$ we may write $g=\alpha_{d} x^{d}+\alpha_{d-1} x^{d-1}+$ $\ldots+\alpha_{0}$ with $\alpha_{i} \in K$. By Lemma 10.36.7 the elements $\alpha_{i}$ are integral over $R$ and hence are in $R$.

0BI0 Lemma 10.36.9. Let $R$ be a Noetherian normal domain. Then $R[[x]]$ is a Noetherian normal domain.

Proof. The power series ring is Noetherian by Lemma 10.30.2. Let $f, g \in R[[x]]$ be nonzero elements such that $w=f / g$ is integral over $R[[x]]$. Let $K$ be the fraction field of $R$. Since the ring of Laurent series $K((x))=K[[x]][1 / x]$ is a field, we can write $w=a_{n} x^{n}+a_{n+1} x^{n+1}+\ldots$ ) for some $n \in \mathbf{Z}, a_{i} \in K$, and $a_{n} \neq 0$. By Lemma 10.36 .4 we see there exists a nonzero element $h=b_{m} x^{m}+b_{m+1} x^{m+1}+\ldots$ in $R[[x]]$ with $b_{m} \neq 0$ such that $w^{e} h \in R[[x]]$ for all $e \geq 1$. We conclude that $n \geq 0$ and that $b_{m} a_{n}^{e} \in R$ for all $e \geq 1$. Since $R$ is Noetherian this implies that $a_{n} \in R$ by the same lemma. Now, if $a_{n}, a_{n+1}, \ldots, a_{N-1} \in R$, then we can apply the same argument to $w-a_{n} x^{n}-\ldots-a_{N-1} x^{N-1}=a_{N} x^{N}+\ldots$. In this way we see that all $a_{i} \in R$ and the lemma is proved.

030B Lemma 10.36.10. Let $R$ be a domain. The following are equivalent:
(1) The domain $R$ is a normal domain,
(2) for every prime $\mathfrak{p} \subset R$ the local ring $R_{\mathfrak{p}}$ is a normal domain, and
(3) for every maximal ideal $\mathfrak{m}$ the ring $R_{\mathfrak{m}}$ is a normal domain.

Proof. This follows easily from the fact that for any domain $R$ we have

$$
R=\bigcap_{\mathfrak{m}} R_{\mathfrak{m}}
$$

inside the fraction field of $R$. Namely, if $g$ is an element of the right hand side then the ideal $I=\{x \in R \mid x g \in R\}$ is not contained in any maximal ideal $\mathfrak{m}$, whence $I=R$.

Lemma 10.36 .10 shows that the following definition is compatible with Definition 10.36.1. (It is the definition from EGA - see [DG67, IV, 5.13 .5 and 0, 4.1.4].)

00GV Definition 10.36.11. A ring $R$ is called normal if for every prime $\mathfrak{p} \subset R$ the localization $R_{\mathfrak{p}}$ is a normal domain (see Definition 10.36.1).

Note that a normal ring is a reduced ring, as $R$ is a subring of the product of its localizations at all primes (see for example Lemma 10.23.1).

034M Lemma 10.36.12. A normal ring is integrally closed in its total ring of fractions.
Proof. Let $R$ be a normal ring. Let $x \in Q(R)$ be an element of the total ring of fractions of $R$ integral over $R$. Set $I=\{f \in R, f x \in R\}$. Let $\mathfrak{p} \subset R$ be a prime. As $R \subset R_{\mathfrak{p}}$ is flat we see that $R_{\mathfrak{p}} \subset Q(R) \otimes R_{\mathfrak{p}}$. As $R_{\mathfrak{p}}$ is a normal domain we see that $x \otimes 1$ is an element of $R_{\mathfrak{p}}$. Hence we can find $a, f \in R, f \notin \mathfrak{p}$ such that $x \otimes 1=a \otimes 1 / f$. This means that $f x-a$ maps to zero in $Q(R) \otimes_{R} R_{\mathfrak{p}}=Q(R)_{\mathfrak{p}}$, which in turn means that there exists an $f^{\prime} \in R, f^{\prime} \notin \mathfrak{p}$ such that $f^{\prime} f x=f^{\prime} a$ in $R$. In other words, $f f^{\prime} \in I$. Thus $I$ is an ideal which isn't contained in any of the prime ideals of $R$, i.e., $I=R$ and $x \in R$.

037C Lemma 10.36.13. A localization of a normal ring is a normal ring.
Proof. Omitted.
00H1 Lemma 10.36.14. Let $R$ be a normal ring. Then $R[x]$ is a normal ring.
Proof. Let $\mathfrak{q}$ be a prime of $R[x]$. Set $\mathfrak{p}=R \cap \mathfrak{q}$. Then we see that $R_{\mathfrak{p}}[x]$ is a normal domain by Lemma 10.36.8. Hence $(R[x])_{\mathfrak{q}}$ is a normal domain by Lemma 10.36.5.

030C Lemma 10.36.15. Let $R$ be a ring. Assume $R$ is reduced and has finitely many minimal primes. Then the following are equivalent:
(1) $R$ is a normal ring,
(2) $R$ is integrally closed in its total ring of fractions, and
(3) $R$ is a finite product of normal domains.

Proof. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ be the minimal primes of $R$. By Lemmas 10.24 .2 and 10.24 .4 we have $Q(R)=R_{\mathfrak{q}_{1}} \times \ldots \times R_{\mathfrak{q}_{t}}$, and by Lemma 10.24.1 each factor is a field. Denote $e_{i}=(0, \ldots, 0,1,0, \ldots, 0)$ the $i$ th idempotent of $Q(R)$.
If $R$ is integrally closed in $Q(R)$, then it contains in particular the idempotents $e_{i}$, and we see that $R$ is a product of $t$ domains (see Sections 10.21 and 10.22. Hence it is clear that $R$ is a finite product of normal domains.
If $R$ is normal, then it is clear that $e_{i} \in R_{\mathfrak{p}}$ for every prime ideal $\mathfrak{p}$ of $R$. Hence we see that $R$ contains the elements $e_{i}$ (see proof of Lemma 10.36.10). We conclude that $R$ is a product of $t$ domains as before. Each of these $t$ domains is normal by Lemma 10.36 .10 and the assumption that $R$ is a normal ring. Hence it follows that $R$ is a finite product of normal domains.

We omit the verification that (3) implies (1) and (2).
037D Lemma 10.36.16. Let $\left(R_{i}, \varphi_{i i^{\prime}}\right)$ be a directed system (Categories, Definition 10.8.2) of rings. If each $R_{i}$ is a normal ring so is $R=\operatorname{colim}_{i} R_{i}$.

Proof. Let $\mathfrak{p} \subset R$ be a prime ideal. Set $\mathfrak{p}_{i}=R_{i} \cap \mathfrak{p}$ (usual abuse of notation). Then we see that $R_{\mathfrak{p}}=\operatorname{colim}_{i}\left(R_{i}\right)_{\mathfrak{p}_{i}}$. Since each $\left(R_{i}\right)_{\mathfrak{p}_{i}}$ is a normal domain we reduce to proving the statement of the lemma for normal domains. If $a, b \in R$ and $a / b$ satisfies a monic polynomial $P(T) \in R[T]$, then we can find a (sufficiently large) $i \in I$ such that $a, b, P$ all come from objects $a_{i}, b_{i}, P_{i}$ over $R_{i}$. Since $R_{i}$ is normal we see $a_{i} / b_{i} \in R_{i}$ and hence also $a / b \in R$.

### 10.37. Going down for integral over normal

037E We first play around a little bit with the notion of elements integral over an ideal, and then we prove the theorem referred to in the section title.

00H2 Definition 10.37.1. Let $\varphi: R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. We say an element $g \in S$ is integral over $I$ if there exists a monic polynomial $P=x^{d}+\sum_{j<d} a_{j} x^{j}$ with coefficients $a_{j} \in I^{d-j}$ such that $P^{\varphi}(g)=0$ in $S$.
This is mostly used when $\varphi=\operatorname{id}_{R}: R \rightarrow R$. In this case the set $I^{\prime}$ of elements integral over $I$ is called the integral closure of $I$. We will see that $I^{\prime}$ is an ideal of $R$ (and of course $I \subset I^{\prime}$ ).

00H3 Lemma 10.37.2. Let $\varphi: R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. Let $A=\sum I^{n} t^{n} \subset R[t]$ be the subring of the polynomial ring generated by $R \oplus I t \subset R[t]$. An element $s \in S$ is integral over $I$ if and only if the element st $\in S[t]$ is integral over $A$.

Proof. Suppose st is integral over $A$. Let $P=x^{d}+\sum_{j<d} a_{j} x^{j}$ be a monic polynomial with coefficients in $A$ such that $P^{\varphi}(s t)=0$. Let $a_{j}^{\prime} \in A$ be the degree $d-j$ part of $a_{i}$, in other words $a_{j}^{\prime}=a_{j}^{\prime \prime} t^{d-j}$ with $a_{j}^{\prime \prime} \in I^{d-j}$. For degree reasons we still have $(s t)^{d}+\sum_{j<d} \varphi\left(a_{j}^{\prime \prime}\right) t^{d-j}(s t)^{j}=0$. Hence we see that $s$ is integral over $I$.

Suppose that $s$ is integral over $I$. Say $P=x^{d}+\sum_{j<d} a_{j} x^{j}$ with $a_{j} \in I^{d-j}$. The we immediately find a polynomial $Q=x^{d}+\sum_{j<d}\left(a_{j} t^{d-j}\right) x^{j}$ with coefficients in $A$ which proves that st is integral over $A$.

00H4 Lemma 10.37.3. Let $\varphi: R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal. The set of elements of $S$ which are integral over I form a $R$-submodule of $S$. Furthermore, if $s \in S$ is integral over $R$, and $s^{\prime}$ is integral over $I$, then $s s^{\prime}$ is integral over $I$.

Proof. Closure under addition is clear from the characterization of Lemma 10.37 .2 , Any element $s \in S$ which is integral over $R$ corresponds to the degree 0 element $s$ of $S[x]$ which is integral over $A$ (because $R \subset A$ ). Hence we see that multiplication by $s$ on $S[x]$ preserves the property of being integral over $A$, by Lemma 10.35.7.

00H5 Lemma 10.37.4. Suppose $\varphi: R \rightarrow S$ is integral. Suppose $I \subset R$ is an ideal. Then every element of $I S$ is integral over $I$.

Proof. Immediate from Lemma 10.37 .3 .
00H6 Lemma 10.37.5. Let $R$ be a domain with field of fractions $K$. Let $n, m \in \mathbf{N}$ and $a_{0}, \ldots, a_{n-1}, b_{0}, \ldots, b_{m-1} \in R$. If the polynomial $x^{n}+a_{n-1} x^{n-1}+\ldots+a_{0}$ divides the polynomial $x^{m}+b_{m-1} x^{m-1}+\ldots+b_{0}$ in $K[x]$ then
(1) $a_{0}, \ldots, a_{n-1}$ are integral over the subring of $R$ generated by $b_{0}, \ldots, b_{m-1}$, and
(2) each $a_{i}$ lies in $\sqrt{\left(b_{0}, \ldots, b_{m}\right)}$.

Proof. Let $K \supset R$ be the fraction field of $R$. Let $L \supset K$ be a field extension such that we can write $x^{m}+b_{m-1} x^{m-1}+\ldots+b_{0}=\prod_{i=1}^{m}\left(x-\beta_{i}\right)$ with $\beta_{i} \in L$. Each $\beta_{i}$ is integral over the subring generated by $b_{0}, \ldots, b_{m-1}$. Since each $a_{i}$ is a homogeneous polynomial in $\beta_{1}, \ldots, \beta_{m}$ we deduce the same for the $a_{i}$.

Choose $c_{0}, \ldots, c_{m-n-1} \in K$ such that

$$
\begin{gathered}
x^{m}+b_{m-1} x^{m-1}+\ldots+b_{0}= \\
\left(x^{n}+a_{n-1} x^{n-1}+\ldots+a_{0}\right)\left(x^{m-n}+c_{m-n-1} x^{m-n-1}+\ldots+c_{0}\right)
\end{gathered}
$$

By the first part we see that the elements $c_{i}$ are integral over $R$. Let $R^{\prime}$ be the sub $R$-algebra of $K$ generated by $c_{0}, \ldots, c_{m-n-1}$. By Lemmas 10.35 .15 and 10.29 .3 we see that $R \cap \sqrt{\left(b_{0}, \ldots, b_{m}\right) R^{\prime}}=\sqrt{\left(b_{0}, \ldots, b_{m}\right)}$. Thus we may replace $R$ by $R^{\prime}$ and assume $c_{i} \in R$. Dividing out the radical $\sqrt{\left(b_{0}, \ldots, b_{m}\right)}$ we get a reduced ring $\bar{R}$. We have to show that the images $\overline{a_{i}} \in \bar{R}$ are zero. And in $\bar{R}[x]$ we have the relation

$$
\begin{gathered}
x^{m}=x^{m}+\overline{b_{m-1}} x^{m-1}+\ldots+\overline{b_{0}}= \\
\left(x^{n}+\overline{a_{n-1}} x^{n-1}+\ldots+\overline{a_{0}}\right)\left(x^{m-n}+\overline{c_{m-n-1}} x^{m-n-1}+\ldots+\overline{c_{0}}\right)
\end{gathered}
$$

It is easy to see that this implies $\overline{a_{i}}=0$ for all $i$. For example one can see this by localizing at all the minimal primes, see Lemma 10.24 .2 .

00H7 Lemma 10.37.6. Let $R \subset S$ be an inclusion of domains. Assume $R$ is normal. Let $g \in S$ be integral over $R$. Then the minimal polynomial of $g$ has coefficients in $R$.

Proof. Let $P=x^{m}+b_{m-1} x^{m-1}+\ldots+b_{0}$ be a polynomial with coefficients in $R$ such that $P(g)=0$. Let $Q=x^{n}+a_{n-1} x^{n-1}+\ldots+a_{0}$ be the minimal polynomial for $g$ over the fraction field $K$ of $R$. Then $Q$ divides $P$ in $K[x]$. By Lemma 10.37.5 we see the $a_{i}$ are integral over $R$. Since $R$ is normal this means they are in $R$.

00H8 Proposition 10.37.7. Let $R \subset S$ be an inclusion of domains. Assume $R$ is normal and $S$ integral over $R$. Let $\mathfrak{p} \subset \mathfrak{p}^{\prime} \subset R$ be primes. Let $\mathfrak{q}^{\prime}$ be a prime of $S$ with $\mathfrak{p}^{\prime}=R \cap \mathfrak{q}^{\prime}$. Then there exists a prime $\mathfrak{q}$ with $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ such that $\mathfrak{p}=R \cap \mathfrak{q}$. In other words: the going down property holds for $R \rightarrow S$, see Definition 10.40.1.

Proof. Let $\mathfrak{p}, \mathfrak{p}^{\prime}$ and $\mathfrak{q}^{\prime}$ be as in the statement. We have to show there is a prime $\mathfrak{q}$, $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ such that $R \cap \mathfrak{q}=\mathfrak{p}$. This is the same as finding a prime of $S_{\mathfrak{q}^{\prime}}$ mapping to $\mathfrak{p}$. According to Lemma 10.16 .9 we have to show that $\mathfrak{p} S_{\mathfrak{q}^{\prime}} \cap R=\mathfrak{p}$. Pick $z \in \mathfrak{p} S_{\mathfrak{q}^{\prime}} \cap R$. We may write $z=y / g$ with $y \in \mathfrak{p} S$ and $g \in S, g \notin \mathfrak{q}^{\prime}$. Written differently we have $z g=y$.
By Lemma 10.37.4 there exists a monic polynomial $P=x^{m}+b_{m-1} x^{m-1}+\ldots+b_{0}$ with $b_{i} \in \mathfrak{p}$ such that $P(y)=0$.
By Lemma 10.37 .6 the minimal polynomial of $g$ over $K$ has coefficients in $R$. Write it as $Q=x^{n}+a_{n-1} x^{n-1}+\ldots+a_{0}$. Note that not all $a_{i}, i=n-1, \ldots, 0$ are in $\mathfrak{p}$ since that would imply $g^{n}=\sum_{j<n} a_{j} g^{j} \in \mathfrak{p} S \subset \mathfrak{p}^{\prime} S \subset \mathfrak{q}^{\prime}$ which is a contradiction.
Since $y=z g$ we see immediately from the above that $Q^{\prime}=x^{n}+z a_{n-1} x^{n-1}+$ $\ldots+z^{n} a_{0}$ is the minimal polynomial for $y$. Hence $Q^{\prime}$ divides $P$ and by Lemma 10.37.5 we see that $z^{j} a_{n-j} \in \sqrt{\left(b_{0}, \ldots, b_{m-1}\right)} \subset \mathfrak{p}, j=1, \ldots, n$. Because not all $a_{i}, i=n-1, \ldots, 0$ are in $\mathfrak{p}$ we conclude $z \in \mathfrak{p}$ as desired.

### 10.38. Flat modules and flat ring maps

00H9 One often used result is that if $M=\operatorname{colim}_{i \in \mathcal{I}} M_{i}$ is a colimit of $R$-modules and if $N$ is an $R$-module then

$$
M \otimes N=\operatorname{colim}_{i \in \mathcal{I}} M_{i} \otimes_{R} N
$$

see Lemma 10.11 .9 . This property is usually expressed by saying that $\otimes$ commutes with colimits. Another often used result is that if $0 \rightarrow N_{1} \rightarrow N_{2} \rightarrow N_{3} \rightarrow 0$ is an exact sequence and if $M$ is any $R$-module, then

$$
M \otimes_{R} N_{1} \rightarrow M \otimes_{R} N_{2} \rightarrow M \otimes_{R} N_{3} \rightarrow 0
$$

is still exact, see Lemma 10.11.10. Both of these properties tell us that the functor $N \mapsto M \otimes_{R} N$ is right exact. See Categories, Section 4.23 and Homology, Section 12.7. An $R$-module $M$ is flat if $N \mapsto N \otimes_{R} M$ is also left exact, i.e., if it is exact. Here is the precise definition.
00HB Definition 10.38.1. Let $R$ be a ring.
(1) An $R$-module $M$ is called flat if whenever $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ is an exact sequence of $R$-modules the sequence $M \otimes_{R} N_{1} \rightarrow M \otimes_{R} N_{2} \rightarrow M \otimes_{R} N_{3}$ is exact as well.
(2) An $R$-module $M$ is called faithfully flat if the complex of $R$-modules $N_{1} \rightarrow$ $N_{2} \rightarrow N_{3}$ is exact if and only if the sequence $M \otimes_{R} N_{1} \rightarrow M \otimes_{R} N_{2} \rightarrow$ $M \otimes_{R} N_{3}$ is exact.
(3) A ring map $R \rightarrow S$ is called flat if $S$ is flat as an $R$-module.
(4) A ring map $R \rightarrow S$ is called faithfully flat if $S$ is faithfully flat as an $R$-module.

Here is an example of how you can use the flatness condition.
0BBY Lemma 10.38.2. Let $R$ be a ring. Let $I, J \subset R$ be ideals. Let $M$ be a flat $R$-module. Then $I M \cap J M=(I \cap J) M$.
Proof. Consider the exact sequence $0 \rightarrow I \cap J \rightarrow R \rightarrow R / I \oplus R / J$. Tensoring with the flat module $M$ we obtain an exact sequence

$$
0 \rightarrow(I \cap J) \otimes_{R} M \rightarrow M \rightarrow M / I M \oplus M / J M
$$

Since the kernel of $M \rightarrow M / I M \oplus M / J M$ is equal to $I M \cap J M$ we conclude.
05UT Lemma 10.38.3. Let $R$ be a ring. Let $\left\{M_{i}, \varphi_{i i^{\prime}}\right\}$ be a directed system of flat $R$-modules. Then $\operatorname{colim}_{i} M_{i}$ is a flat $R$-module.

Proof. This follows as $\otimes$ commutes with colimits and because directed colimits are exact, see Lemma 10.8.9.
00 HC Lemma 10.38.4. A composition of (faithfully) flat ring maps is (faithfully) flat. If $R \rightarrow R^{\prime}$ is (faithfully) flat, and $M^{\prime}$ is a (faithfully) flat $R^{\prime}$-module, then $M^{\prime}$ is a (faithfully) flat $R$-module.
Proof. The first statement of the lemma is a particular case of the second, so it is clearly enough to prove the latter. Let $R \rightarrow R^{\prime}$ be a flat ring map, and $M^{\prime}$ a flat $R^{\prime}$ module. We need to prove that $M^{\prime}$ is a flat $R$-module. Let $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ be an exact complex of $R$-modules. Then, the complex $R^{\prime} \otimes_{R} N_{1} \rightarrow R^{\prime} \otimes_{R} N_{2} \rightarrow R^{\prime} \otimes_{R} N_{3}$ is exact (since $R^{\prime}$ is flat as an $R$-module), and so the complex $M^{\prime} \otimes_{R^{\prime}}\left(R^{\prime} \otimes_{R} N_{1}\right) \rightarrow$ $M^{\prime} \otimes_{R^{\prime}}\left(R^{\prime} \otimes_{R} N_{2}\right) \rightarrow M^{\prime} \otimes_{R^{\prime}}\left(R^{\prime} \otimes_{R} N_{3}\right)$ is exact (since $M^{\prime}$ is a flat $R^{\prime}$-module). Since $M^{\prime} \otimes_{R^{\prime}}\left(R^{\prime} \otimes_{R} N\right) \cong\left(M^{\prime} \otimes_{R^{\prime}} R^{\prime}\right) \otimes_{R} N \cong M^{\prime} \otimes_{R} N$ for any $R$-module $N$ functorially (by Lemmas 10.11 .7 and 10.11 .3 ), this complex is isomorphic to the complex $M^{\prime} \otimes_{R} N_{1} \rightarrow M^{\prime} \otimes_{R} N_{2} \rightarrow M^{\prime} \otimes_{R} N_{3}$, which is therefore also exact. This shows that $M^{\prime}$ is a flat $R$-module. Tracing this argument backwards, we can show that if $R \rightarrow R^{\prime}$ is faithfully flat, and if $M^{\prime}$ is faithfully flat as an $R^{\prime}$-module, then $M^{\prime}$ is faithfully flat as an $R$-module.

00HD Lemma 10.38.5. Let $M$ be an $R$-module. The following are equivalent:
(1) $M$ is flat over $R$.
(2) for every injection of $R$-modules $N \subset N^{\prime}$ the map $N \otimes_{R} M \rightarrow N^{\prime} \otimes_{R} M$ is injective.
(3) for every ideal $I \subset R$ the map $I \otimes_{R} M \rightarrow R \otimes_{R} M=M$ is injective.

00 HH
(4) for every finitely generated ideal $I \subset R$ the map $I \otimes_{R} M \rightarrow R \otimes_{R} M=M$ is injective.

Proof. The implications (1) implies (2) implies (3) implies (4) are all trivial. Thus we prove (4) implies (1). Suppose that $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ is exact. Let $K=$ $\operatorname{Ker}\left(N_{2} \rightarrow N_{3}\right)$ and $Q=\operatorname{Im}\left(N_{2} \rightarrow N_{3}\right)$. Then we get maps

$$
N_{1} \otimes_{R} M \rightarrow K \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow Q \otimes_{R} M \rightarrow N_{3} \otimes_{R} M
$$

Observe that the first and third arrows are surjective. Thus if we show that the second and fourth arrows are injective, then we are don ${ }^{2}$. Hence it suffices to show that $-\otimes_{R} M$ transforms injective $R$-module maps into injective $R$-module maps.

Assume $K \rightarrow N$ is an injective $R$-module map and let $x \in \operatorname{Ker}\left(K \otimes_{R} M \rightarrow N \otimes_{R} M\right)$. We have to show that $x$ is zero. The $R$-module $K$ is the union of its finite $R$ submodules; hence, $K \otimes_{R} M$ is the colimit of $R$-modules of the form $K_{i} \otimes_{R} M$ where $K_{i}$ runs over all finite $R$-submodules of $K$ (because tensor product commutes with colimits). Thus, for some $i$ our $x$ comes from an element $x_{i} \in K_{i} \otimes_{R} M$. Thus we may assume that $K$ is a finite $R$-module. Assume this. We regard the injection $K \rightarrow N$ as an inclusion, so that $K \subset N$.

The $R$-module $N$ is the union of its finite $R$-submodules that contain $K$. Hence, $N \otimes_{R} M$ is the colimit of $R$-modules of the form $N_{i} \otimes_{R} M$ where $N_{i}$ runs over all finite $R$-submodules of $N$ that contain $K$ (again since tensor product commutes with colimits). Notice that this is a colimit over a directed system (since the sum of two finite submodules of $N$ is again finite). Hence, (by Lemma 10.8.5 the element $x \in K \otimes_{R} M$ maps to zero in at least one of these $R$-modules $N_{i} \otimes_{R} M$ (since $x$ maps to zero in $N \otimes_{R} M$ ). Thus we may assume $N$ is a finite $R$-module.
Assume $N$ is a finite $R$-module. Write $N=R^{\oplus n} / L$ and $K=L^{\prime} / L$ for some $L \subset L^{\prime} \subset R^{\oplus n}$. For any $R$-submodule $G \subset R^{\oplus n}$, we have a canonical map $G \otimes_{R}$ $M \rightarrow M^{\oplus n}$ obtained by composing $G \otimes_{R} M \rightarrow R^{n} \otimes_{R} M=M^{\oplus n}$. It suffices to prove that $L \otimes_{R} M \rightarrow M^{\oplus n}$ and $L^{\prime} \otimes_{R} M \rightarrow M^{\oplus n}$ are injective. Namely, if so, then we see that $K \otimes_{R} M=L^{\prime} \otimes_{R} M / L \otimes_{R} M \rightarrow M^{\oplus n} / L \otimes_{R} M$ is injective tod ${ }^{3}$.

Thus it suffices to show that $L \otimes_{R} M \rightarrow M^{\oplus n}$ is injective when $L \subset R^{\oplus n}$ is an $R$-submodule. We do this by induction on $n$. The base case $n=1$ we handle below.

[^19]For the induction step assume $n>1$ and set $L^{\prime}=L \cap R \oplus 0^{\oplus n-1}$. Then $L^{\prime \prime}=L / L^{\prime}$ is a submodule of $R^{\oplus n-1}$. We obtain a diagram

By induction hypothesis and the base case the left and right vertical arrows are injective. The rows are exact. It follows that the middle vertical arrow is injective too.

The base case of the induction above is when $L \subset R$ is an ideal. In other words, we have to show that $I \otimes_{R} M \rightarrow M$ is injective for any ideal $I$ of $R$. We know this is true when $I$ is finitely generated. However, $I=\bigcup I_{\alpha}$ is the union of the finitely generated ideals $I_{\alpha}$ contained in it. In other words, $I=\operatorname{colim} I_{\alpha}$. Since $\otimes$ commutes with colimits we see that $I \otimes_{R} M=\operatorname{colim} I_{\alpha} \otimes_{R} M$ and since all the morphisms $I_{\alpha} \otimes_{R} M \rightarrow M$ are injective by assumption, the same is true for $I \otimes_{R} M \rightarrow M$.

05UU Lemma 10.38.6. Let $\left\{R_{i}, \varphi_{i i^{\prime}}\right\}$ be a system of rings over the directed partially ordered set $I$. Let $R=\operatorname{colim}_{i} R_{i}$. Let $M$ be an $R$-module such that $M$ is flat as an $R_{i}$-module for all $i$. Then $M$ is flat as an $R$-module.

Proof. Let $\mathfrak{a} \subset R$ be a finitely generated ideal. By Lemma 10.38 .5 it suffices to show that $\mathfrak{a} \otimes_{R} M \rightarrow M$ is injective. We can find an $i \in I$ and a finitely generated ideal $\mathfrak{a}^{\prime} \subset R_{i}$ such that $\mathfrak{a}=\mathfrak{a}^{\prime} R$. Then $\mathfrak{a}=\operatorname{colim}_{i^{\prime} \geq i} \mathfrak{a}^{\prime} R_{i^{\prime}}$. Hence the map $\mathfrak{a} \otimes_{R} M \rightarrow M$ is the colimit of the maps

$$
\mathfrak{a}^{\prime} R_{i^{\prime}} \otimes_{R_{i^{\prime}}} M \longrightarrow M
$$

which are all injective by assumption. Since $\otimes$ commutes with colimits and since colimits over $I$ are exact by Lemma 10.8 .9 we win.

00HI Lemma 10.38.7. Suppose that $M$ is flat over $R$, and that $R \rightarrow R^{\prime}$ is a ring map. Then $M \otimes_{R} R^{\prime}$ is flat over $R^{\prime}$.

Proof. For any $R^{\prime}$-module $N$ we have a canonical isomorphism $N \otimes_{R^{\prime}}\left(R^{\prime} \otimes_{R} M\right)=$ $N \otimes_{R} M$. Hence the exactness of $-\otimes_{R^{\prime}}\left(R^{\prime} \otimes_{R} M\right)$ follows from the exactness of $-\otimes_{R} M$.

00HJ Lemma 10.38.8. Let $R \rightarrow R^{\prime}$ be a faithfully flat ring map. Let $M$ be a module over $R$, and set $M^{\prime}=R^{\prime} \otimes_{R} M$. Then $M$ is flat over $R$ if and only if $M^{\prime}$ is flat over $R^{\prime}$.

Proof. By Lemma 10.38.7 we see that if $M$ is flat then $M^{\prime}$ is flat. For the converse, suppose that $M^{\prime}$ is flat. Let $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ be an exact sequence of $R$-modules. We want to show that $N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M$ is exact. We know that $N_{1} \otimes_{R} R^{\prime} \rightarrow N_{2} \otimes_{R} R^{\prime} \rightarrow N_{3} \otimes_{R} R^{\prime}$ is exact, because $R \rightarrow R^{\prime}$ is flat. Flatness of $M^{\prime}$ implies that $N_{1} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} M^{\prime} \rightarrow N_{2} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} M^{\prime} \rightarrow N_{3} \otimes_{R} R^{\prime} \otimes_{R^{\prime}} M^{\prime}$ is exact. We may write this as $N_{1} \otimes_{R} M \otimes_{R} R^{\prime} \rightarrow N_{2} \otimes_{R} M \otimes_{R} R^{\prime} \rightarrow N_{3} \otimes_{R} M \otimes_{R} R^{\prime}$. Finally, faithful flatness implies that $N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M$ is exact.

0584 Lemma 10.38.9. Let $R$ be a ring. Let $S \rightarrow S^{\prime}$ be a faithfully flat map of $R$ algebras. Let $M$ be a module over $S$, and set $M^{\prime}=S^{\prime} \otimes_{S} M$. Then $M$ is flat over $R$ if and only if $M^{\prime}$ is flat over $R$.

Proof. Let $N \rightarrow N^{\prime}$ be an injection of $R$-modules. By the faithful flatness of $S \rightarrow S^{\prime}$ we have

$$
\operatorname{Ker}\left(N \otimes_{R} M \rightarrow N^{\prime} \otimes_{R} M\right) \otimes_{S} S^{\prime}=\operatorname{Ker}\left(N \otimes_{R} M^{\prime} \rightarrow N^{\prime} \otimes_{R} M^{\prime}\right)
$$

Hence the equivalence of the lemma follows from the second characterization of flatness in Lemma 10.38.5.

039V Lemma 10.38.10. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. If $M$ is flat as an $R$-module and faithfully flat as an $S$-module, then $R \rightarrow S$ is flat.

Proof. Let $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ be an exact sequence of $R$-modules. By assumption $N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M$ is exact. We may write this as

$$
N_{1} \otimes_{R} S \otimes_{S} M \rightarrow N_{2} \otimes_{R} S \otimes_{S} M \rightarrow N_{3} \otimes_{R} S \otimes_{S} M
$$

By faithful flatness of $M$ over $S$ we conclude that $N_{1} \otimes_{R} S \rightarrow N_{2} \otimes_{R} S \rightarrow N_{3} \otimes_{R} S$ is exact. Hence $R \rightarrow S$ is flat.

Let $R$ be a ring. Let $M$ be an $R$-module. Let $\sum f_{i} x_{i}=0$ be a relation in $M$. We say the relation $\sum f_{i} x_{i}$ is trivial if there exist an integer $m \geq 0$, elements $y_{j} \in M$, $j=1, \ldots, m$, and elements $a_{i j} \in R, i=1, \ldots, n, j=1, \ldots, m$ such that

$$
x_{i}=\sum_{j} a_{i j} y_{j}, \forall i, \quad \text { and } \quad 0=\sum_{i} f_{i} a_{i j}, \forall j
$$

00HK Lemma 10.38.11 (Equational criterion of flatness). A module $M$ over $R$ is flat if and only if every relation in $M$ is trivial.

Proof. Assume $M$ is flat and let $\sum f_{i} x_{i}=0$ be a relation in $M$. Let $I=$ $\left(f_{1}, \ldots, f_{n}\right)$, and let $K=\operatorname{Ker}\left(R^{n} \rightarrow I,\left(a_{1}, \ldots, a_{n}\right) \mapsto \sum_{i} a_{i} f_{i}\right)$. So we have the short exact sequence $0 \rightarrow K \rightarrow R^{n} \rightarrow I \rightarrow 0$. Then $\sum f_{i} \otimes x_{i}$ is an element of $I \otimes_{R} M$ which maps to zero in $R \otimes_{R} M=M$. By flatness $\sum f_{i} \otimes x_{i}$ is zero in $I \otimes_{R} M$. Thus there exists an element of $K \otimes_{R} M$ mapping to $\sum e_{i} \otimes x_{i} \in R^{n} \otimes_{R} M$. Write this element as $\sum k_{j} \otimes y_{j}$ and then write the image of $k_{j}$ in $R^{n}$ as $\sum a_{i j} e_{i}$ to get the result.
Assume every relation is trivial, let $I$ be a finitely generated ideal, and let $x=$ $\sum f_{i} \otimes x_{i}$ be an element of $I \otimes_{R} M$ mapping to zero in $R \otimes_{R} M=M$. This just means exactly that $\sum f_{i} x_{i}$ is a relation in $M$. And the fact that it is trivial implies easily that $x$ is zero, because

$$
x=\sum f_{i} \otimes x_{i}=\sum f_{i} \otimes\left(\sum a_{i j} y_{j}\right)=\sum\left(\sum f_{i} a_{i j}\right) \otimes y_{j}=0
$$

00HL Lemma 10.38.12. Suppose that $R$ is a ring, $0 \rightarrow M^{\prime \prime} \rightarrow M^{\prime} \rightarrow M \rightarrow 0$ a short exact sequence, and $N$ an $R$-module. If $M$ is flat then $N \otimes_{R} M^{\prime \prime} \rightarrow N \otimes_{R} M^{\prime}$ is injective, i.e., the sequence

$$
0 \rightarrow N \otimes_{R} M^{\prime \prime} \rightarrow N \otimes_{R} M^{\prime} \rightarrow N \otimes_{R} M \rightarrow 0
$$

is a short exact sequence.

Proof. Let $R^{(I)} \rightarrow N$ be a surjection from a free module onto $N$ with kernel $K$. The result follows from the snake lemma applied to the following diagram
with exact rows and columns. The middle row is exact because tensoring with the free module $R^{(I)}$ is exact.

00HM Lemma 10.38.13. Suppose that $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ is a short exact sequence of $R$-modules. If $M^{\prime}$ and $M^{\prime \prime}$ are flat so is $M$. If $M$ and $M^{\prime \prime}$ are flat so is $M^{\prime}$.

Proof. We will use the criterion that a module $N$ is flat if for every ideal $I \subset R$ the map $N \otimes_{R} I \rightarrow N$ is injective, see Lemma 10.38.5. Consider an ideal $I \subset R$. Consider the diagram

$$
\begin{array}{cccccccc}
0 & \rightarrow & M^{\prime} & \rightarrow & M & \rightarrow & M^{\prime \prime} & \rightarrow \\
\uparrow & & \uparrow & & \\
& M^{\prime} \otimes_{R} I & \rightarrow & M \otimes_{R} I & \rightarrow & M^{\prime \prime} \otimes_{R} I & \rightarrow & 0
\end{array}
$$

with exact rows. This immediately proves the first assertion. The second follows because if $M^{\prime \prime}$ is flat then the lower left horizontal arrow is injective by Lemma 10.38.12.

00 HO Lemma 10.38.14. Let $R$ be a ring. Let $M$ be an $R$-module. The following are equivalent
(1) $M$ is faithfully flat, and
(2) $M$ is flat and for all $R$-module homomorphisms $\alpha: N \rightarrow N^{\prime}$ we have $\alpha=0$ if and only if $\alpha \otimes i d_{M}=0$.

Proof. If $M$ is faithfully flat, then $0 \rightarrow \operatorname{Ker}(\alpha) \rightarrow N \rightarrow 0$ is exact if and only if the same holds after tensoring with $M$. This proves (1) implies (2). For the other, assume (2). Let $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ be a complex, and assume the complex $N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M$ is exact. Take $x \in \operatorname{Ker}\left(N_{2} \rightarrow N_{3}\right)$, and consider the map $\alpha: R \rightarrow N_{2} / \operatorname{Im}\left(N_{1}\right), r \mapsto r x+\operatorname{Im}\left(N_{1}\right)$. By the exactness of the complex $-\otimes_{R} M$ we see that $\alpha \otimes \mathrm{id}_{M}$ is zero. By assumption we get that $\alpha$ is zero. Hence $x$ is in the image of $N_{1} \rightarrow N_{2}$.

00HP Lemma 10.38.15. Let $M$ be a flat $R$-module. The following are equivalent:
(1) $M$ is faithfully flat,
(2) for all $\mathfrak{p} \in \operatorname{Spec}(R)$ the tensor product $M \otimes_{R} \kappa(\mathfrak{p})$ is nonzero, and
(3) for all maximal ideals $\mathfrak{m}$ of $R$ the tensor product $M \otimes_{R} \kappa(\mathfrak{m})=M / \mathfrak{m} M$ is nonzero.

Proof. Assume $M$ faithfully flat. Since $R \rightarrow \kappa(\mathfrak{p})$ is not zero we deduce that $M \rightarrow M \otimes_{R} \kappa(\mathfrak{p})$ is not zero, see Lemma 10.38.14

Conversely assume that $M$ is flat and that $M / \mathfrak{m} M$ is never zero. Suppose that $N_{1} \rightarrow N_{2} \rightarrow N_{3}$ is a complex and suppose that $N_{1} \otimes_{R} M \rightarrow N_{2} \otimes_{R} M \rightarrow N_{3} \otimes_{R} M$ is exact. Let $H$ be the cohomology of the complex, so $H=\operatorname{Ker}\left(N_{2} \rightarrow N_{3}\right) / \operatorname{Im}\left(N_{1} \rightarrow\right.$ $N_{2}$ ). By flatness we see that $H \otimes_{R} M=0$. Take $x \in H$ and let $I=\{f \in R \mid f x=0\}$ be its annihilator. Since $R / I \subset H$ we get $M / I M \subset H \otimes_{R} M=0$ by flatness of $M$. If $I \neq R$ we may choose a maximal ideal $I \subset \mathfrak{m} \subset R$. This immediately gives a contradiction.

00 HQ Lemma 10.38.16. Let $R \rightarrow S$ be a flat ring map. The following are equivalent:
(1) $R \rightarrow S$ is faithfully flat,
(2) the induced map on Spec is surjective, and
(3) any closed point $x \in \operatorname{Spec}(R)$ is in the image of the map $\operatorname{Spec}(S) \rightarrow$ $\operatorname{Spec}(R)$.

Proof. This follows quickly from Lemma 10.38.15 because we saw in Remark 10.16 .8 that $\mathfrak{p}$ is in the image if and only if the ring $S \otimes_{R} \kappa(\mathfrak{p})$ is nonzero.

00HR Lemma 10.38.17. A flat local ring homomorphism of local rings is faithfully flat.
Proof. Immediate from Lemma 10.38 .16 .
00HS Lemma 10.38.18. Let $R \rightarrow S$ be flat. Let $\mathfrak{p} \subset \mathfrak{p}^{\prime}$ be primes of $R$. Let $\mathfrak{q}^{\prime} \subset S$ be a prime of $S$ mapping to $\mathfrak{p}^{\prime}$. Then there exists a prime $\mathfrak{q} \subset \mathfrak{q}^{\prime}$ mapping to $\mathfrak{p}$.

Proof. Namely, consider the flat local ring map $R_{\mathfrak{p}^{\prime}} \rightarrow S_{\mathfrak{q}^{\prime}}$. By Lemma 10.38.17 this is faithfully flat. By Lemma 10.38 .16 there is a prime mapping to $\mathfrak{p} R_{\mathfrak{p}^{\prime}}$. The inverse image of this prime in $S$ does the job.

The property of $R \rightarrow S$ described in the lemma is called the "going down property". See Definition 10.40.1. We finish with some remarks on flatness and localization.

00HT Lemma 10.38.19. Let $R$ be a ring. Let $S \subset R$ be a multiplicative subset.
(1) The localization $S^{-1} R$ is a flat $R$-algebra.
(2) If $M$ is a $S^{-1} R$-module, then $M$ is a flat $R$-module if and only if $M$ is a flat $S^{-1} R$-module.
(3) Suppose $M$ is an $R$-module. Then $M$ is a flat $R$-module if and only if $M_{\mathfrak{p}}$ is a flat $R_{\mathfrak{p}}$-module for all primes $\mathfrak{p}$ of $R$.
(4) Suppose $M$ is an $R$-module. Then $M$ is a flat $R$-module if and only if $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{m}}$-module for all maximal ideals $\mathfrak{m}$ of $R$.
(5) Suppose $R \rightarrow A$ is a ring map, $M$ is an $A$-module, and $g_{1}, \ldots, g_{m} \in A$ are elements generating the unit ideal of $A$. Then $M$ is flat over $R$ if and only if each localization $M_{g_{i}}$ is flat over $R$.
(6) Suppose $R \rightarrow A$ is a ring map, and $M$ is an $A$-module. Then $M$ is a flat $R$-module if and only if the localization $M_{\mathfrak{q}}$ is a flat $R_{\mathfrak{p}}$-module (with $\mathfrak{p}$ the prime of $R$ lying under $\mathfrak{q}$ ) for all primes $\mathfrak{q}$ of $A$.
(7) Suppose $R \rightarrow A$ is a ring map, and $M$ is an $A$-module. Then $M$ is a flat $R$-module if and only if the localization $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{p}}$-module (with $\mathfrak{p}=R \cap \mathfrak{m}$ ) for all maximal ideals $\mathfrak{m}$ of $A$.

Proof. Let us prove the last statement of the lemma. In the proof we will use repeatedly that localization is exact and commutes with tensor product, see Sections 10.9 and 10.11 .

Suppose $R \rightarrow A$ is a ring map, and $M$ is an $A$-module. Assume that $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{p}}$-module for all maximal ideals $\mathfrak{m}$ of $A$ (with $\mathfrak{p}=R \cap \mathfrak{m}$ ). Let $I \subset R$ be an ideal. We have to show the map $I \otimes_{R} M \rightarrow M$ is injective. We can think of this as a map of $A$-modules. By assumption the localization $\left(I \otimes_{R} M\right)_{\mathfrak{m}} \rightarrow M_{\mathfrak{m}}$ is injective because $\left(I \otimes_{R} M\right)_{\mathfrak{m}}=I_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} M_{\mathfrak{m}}$. Hence the kernel of $I \otimes_{R} M \rightarrow M$ is zero by Lemma 10.23.1. Hence $M$ is flat over $R$.

Conversely, assume $M$ is flat over $R$. Pick a prime $\mathfrak{q}$ of $A$ lying over the prime $\mathfrak{p}$ of $R$. Suppose that $I \subset R_{\mathfrak{p}}$ is an ideal. We have to show that $I \otimes_{R_{\mathfrak{p}}} M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}$ is injective. We can write $I=J_{\mathfrak{p}}$ for some ideal $J \subset R$. Then the map $I \otimes_{R_{\mathfrak{p}}} M_{\mathfrak{q}} \rightarrow M_{\mathfrak{q}}$ is just the localization (at $\mathfrak{q}$ ) of the map $J \otimes_{R} M \rightarrow M$ which is injective. Since localization is exact we see that $M_{\mathfrak{q}}$ is a flat $R_{\mathfrak{p}}$-module.
This proves (7) and (6). The other statements follow in a straightforward way from the last statement (proofs omitted).

090N Lemma 10.38.20. Let $R$ be a ring. Let $\left\{S_{i}, \varphi_{i i^{\prime}}\right\}$ be a directed system of faithfully flat $R$-algebras. Then $S=\operatorname{colim}_{i} S_{i}$ is a faithfully flat $R$-algebra.

Proof. By Lemma 10.38 .3 we see that $S$ is flat. Let $\mathfrak{m} \subset R$ be a maximal ideal. By Lemma 10.38 .16 none of the rings $S_{i} / \mathfrak{m} S_{i}$ is zero. Hence $S / \mathfrak{m} S=\operatorname{colim} S_{i} / \mathfrak{m} S_{i}$ is nonzero either as 1 is not equal to zero. Thus the image of $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ contains $\mathfrak{m}$ and we see that $R \rightarrow S$ is faithfully flat by Lemma 10.38 .16

### 10.39. Supports and annihilators

080 S Some very basic definitions and lemmas.
00L1 Definition 10.39.1. Let $R$ be a ring and let $M$ be an $R$-module. The support of $M$ is the set

$$
\operatorname{Supp}(M)=\left\{\mathfrak{p} \in \operatorname{Spec}(R) \mid M_{\mathfrak{p}} \neq 0\right\}
$$

0585 Lemma 10.39.2. Let $R$ be a ring. Let $M$ be an $R$-module. Then

$$
M=(0) \Leftrightarrow \operatorname{Supp}(M)=\emptyset
$$

Proof. Actually, Lemma 10.23 .1 even shows that $\operatorname{Supp}(M)$ always contains a maximal ideal if $M$ is not zero.

07 T 7 Definition 10.39.3. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) Given an element $m \in M$ the annihilator of $m$ is the ideal

$$
\operatorname{Ann}_{R}(m)=\operatorname{Ann}(m)=\{f \in R \mid f m=0\}
$$

(2) The annihilator of $M$ is the ideal

$$
\operatorname{Ann}_{R}(M)=\operatorname{Ann}(M)=\{f \in R \mid f m=0 \forall m \in M\}
$$

07 T 8 Lemma 10.39.4. Let $R \rightarrow S$ be a flat ring map. Let $M$ be an $R$-module and $m \in M$. Then $A n n_{R}(m) S=A n n_{S}(m \otimes 1)$. If $M$ is a finite $R$-module, then $A n n_{R}(M) S=A n n_{S}\left(M \otimes_{R} S\right)$.

Proof. Set $I=\operatorname{Ann}_{R}(m)$. By definition there is an exact sequence $0 \rightarrow I \rightarrow$ $R \rightarrow M$ where the map $R \rightarrow M$ sends $f$ to $f m$. Using flatness we obtain an exact sequence $0 \rightarrow I \otimes_{R} S \rightarrow S \rightarrow M \otimes_{R} S$ which proves the first assertion. If $m_{1}, \ldots, m_{n}$ is a set of generators of $M$ then $\operatorname{Ann}_{R}(M)=\bigcap \operatorname{Ann}_{R}\left(m_{i}\right)$. Similarly $\operatorname{Ann}_{S}\left(M \otimes_{R} S\right)=\bigcap \operatorname{Ann}_{S}\left(m_{i} \otimes 1\right)$. Set $I_{i}=\operatorname{Ann}_{R}\left(m_{i}\right)$. Then it suffices to show that $\bigcap_{i=1, \ldots, n}\left(I_{i} S\right)=\left(\bigcap_{i=1, \ldots, n} I_{i}\right) S$. This is Lemma 10.38.2.

00L2 Lemma 10.39.5. Let $R$ be a ring and let $M$ be an $R$-module. If $M$ is finite, then Supp $(M)$ is closed. More precisely, if $I=\operatorname{Ann}(M)$ is the annihilator of $M$, then $V(I)=\operatorname{Supp}(M)$.

Proof. We will show that $V(I)=\operatorname{Supp}(M)$.
Suppose $\mathfrak{p} \in \operatorname{Supp}(M)$. Then $M_{\mathfrak{p}} \neq 0$. Hence by Nakayama's Lemma 10.19.1 we have $M \otimes_{R} \kappa(\mathfrak{p}) \neq 0$. Hence $I \subset \mathfrak{p}$.

Conversely, suppose that $\mathfrak{p} \notin \operatorname{Supp}(M)$. Then $M_{\mathfrak{p}}=0$. Let $x_{1}, \ldots, x_{r} \in M$ be generators. By Lemma 10.9 .9 there exists an $f \in R, f \notin \mathfrak{p}$ such that $x_{i} / 1=0$ in $M_{f}$. Hence $f^{n_{i}} x_{i}=0$ for some $n_{i} \geq 1$. Hence $f^{n} M=0$ for $n=\max \left\{n_{i}\right\}$ as desired.

07Z5 Lemma 10.39.6. Let $R$ be a ring, let $M$ be an $R$-module, and let $x \in M$. Then $\mathfrak{p} \in V(\operatorname{Ann}(m))$ if and only if $x$ does not map to zero in $M_{\mathfrak{p}}$.

Proof. We may replace $M$ by $R m \subset M$. Then (1) $\operatorname{Ann}(m)=\operatorname{Ann}(M)$ and (2) $x$ does not map to zero in $M_{\mathfrak{p}}$ if and only if $\mathfrak{p} \in \operatorname{Supp}(M)$. The result now follows from Lemma 10.39 .5

051B Lemma 10.39.7. Let $R$ be a ring and let $M$ be an $R$-module. If $M$ is a finitely presented $R$-module, then $\operatorname{Supp}(M)$ is a closed subset of $\operatorname{Spec}(R)$ whose complement is quasi-compact.

Proof. Choose a presentation

$$
R^{\oplus m} \longrightarrow R^{\oplus n} \longrightarrow M \rightarrow 0
$$

Let $A \in \operatorname{Mat}(n \times m, R)$ be the matrix of the first map. By Nakayama's Lemma 10.19.1 we see that

$$
M_{\mathfrak{p}} \neq 0 \Leftrightarrow M \otimes \kappa(\mathfrak{p}) \neq 0 \Leftrightarrow \operatorname{rank}(A \bmod \mathfrak{p})<n
$$

Hence, if $I$ is the ideal of $R$ generated by the $n \times n$ minors of $A$, then $\operatorname{Supp}(M)=$ $V(I)$. Since $I$ is finitely generated, say $I=\left(f_{1}, \ldots, f_{t}\right)$, we see that $\operatorname{Spec}(R) \backslash V(I)$ is a finite union of the standard opens $D\left(f_{i}\right)$, hence quasi-compact.

00L3 Lemma 10.39.8. Let $R$ be a ring and let $M$ be an $R$-module.
(1) If $M$ is finite then the support of $M / I M$ is $\operatorname{Supp}(M) \cap V(I)$.
(2) If $N \subset M$, then $\operatorname{Supp}(N) \subset \operatorname{Supp}(M)$.
(3) If $Q$ is a quotient module of $M$ then $\operatorname{Supp}(Q) \subset \operatorname{Supp}(M)$.
(4) If $0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0$ is a short exact sequence then $\operatorname{Supp}(M)=$ $\operatorname{Supp}(Q) \cup \operatorname{Supp}(N)$.

Proof. The functors $M \mapsto M_{\mathfrak{p}}$ are exact. This immediately implies all but the first assertion. For the first assertion we need to show that $M_{\mathfrak{p}} \neq 0$ and $I \subset \mathfrak{p}$ implies $(M / I M)_{\mathfrak{p}}=M_{\mathfrak{p}} / I M_{\mathfrak{p}} \neq 0$. This follows from Nakayama's Lemma 10.19.1.

### 10.40. Going up and going down

$00 H U$ Suppose $\mathfrak{p}, \mathfrak{p}^{\prime}$ are primes of the ring $R$. Let $X=\operatorname{Spec}(R)$ with the Zariski topology. Denote $x \in X$ the point corresponding to $\mathfrak{p}$ and $x^{\prime} \in X$ the point corresponding to $\mathfrak{p}^{\prime}$. Then we have:

$$
x^{\prime} \rightsquigarrow x \Leftrightarrow \mathfrak{p}^{\prime} \subset \mathfrak{p} .
$$

In words: $x$ is a specialization of $x^{\prime}$ if and only if $\mathfrak{p}^{\prime} \subset \mathfrak{p}$. See Topology, Section 5.18 for terminology and notation.

00HV Definition 10.40.1. Let $\varphi: R \rightarrow S$ be a ring map.
(1) We say a $\varphi: R \rightarrow S$ satisfies going up if given primes $\mathfrak{p} \subset \mathfrak{p}^{\prime}$ in $R$ and a prime $\mathfrak{q}$ in $S$ lying over $\mathfrak{p}$ there exists a prime $\mathfrak{q}^{\prime}$ of $S$ such that (a) $\mathfrak{q} \subset \mathfrak{q}^{\prime}$, and (b) $\mathfrak{q}^{\prime}$ lies over $\mathfrak{p}^{\prime}$.
(2) We say a $\varphi: R \rightarrow S$ satisfies going down if given primes $\mathfrak{p} \subset \mathfrak{p}^{\prime}$ in $R$ and a prime $\mathfrak{q}^{\prime}$ in $S$ lying over $\mathfrak{p}^{\prime}$ there exists a prime $\mathfrak{q}$ of $S$ such that (a) $\mathfrak{q} \subset \mathfrak{q}^{\prime}$, and (b) $\mathfrak{q}$ lies over $\mathfrak{p}$.

So far we have see the following cases of this:
(1) An integral ring map satisfies going up, see Lemma 10.35.20.
(2) As a special case finite ring maps satisfy going up.
(3) As a special case quotient maps $R \rightarrow R / I$ satisfy going up.
(4) A flat ring map satisfies going down, see Lemma 10.38 .18
(5) As a special case any localization satisfies going down.
(6) An extension $R \subset S$ of domains, with $R$ normal and $S$ integral over $R$ satisfies going down, see Proposition 10.37.7.
Here is another case where going down holds.
0407 Lemma 10.40.2. Let $R \rightarrow S$ be a ring map. If the induced map $\varphi: \operatorname{Spec}(S) \rightarrow$ $\operatorname{Spec}(R)$ is open, then $R \rightarrow S$ satisfies going down.

Proof. Suppose that $\mathfrak{p} \subset \mathfrak{p}^{\prime} \subset R$ and $\mathfrak{q}^{\prime} \subset S$ lies over $\mathfrak{p}^{\prime}$. As $\varphi$ is open, for every $g \in S, g \notin \mathfrak{q}^{\prime}$ we see that $\mathfrak{p}$ is in the image of $D(g) \subset \operatorname{Spec}(S)$. In other words $S_{g} \otimes_{R} \kappa(\mathfrak{p})$ is not zero. Since $S_{\mathfrak{q}^{\prime}}$ is the directed colimit of these $S_{g}$ this implies that $S_{\mathfrak{q}^{\prime}} \otimes_{R} \kappa(\mathfrak{p})$ is not zero, see Lemmas 10.9 .9 and 10.11 .9 . Hence $\mathfrak{p}$ is in the image of $\operatorname{Spec}\left(S_{\mathfrak{q}^{\prime}}\right) \rightarrow \operatorname{Spec}(R)$ as desired.

00HW Lemma 10.40.3. Let $R \rightarrow S$ be a ring map.
(1) $R \rightarrow S$ satisfies going down if and only if generalizations lift along the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$, see Topology, Definition 5.18.3.
(2) $R \rightarrow S$ satisfies going up if and only if specializations lift along the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$, see Topology, Definition 5.18.3.
Proof. Omitted.
00HX Lemma 10.40.4. Suppose $R \rightarrow S$ and $S \rightarrow T$ are ring maps satisfying going down. Then so does $R \rightarrow T$. Similarly for going up.

Proof. According to Lemma 10.40.3 this follows from Topology, Lemma 5.18.4
00 HY Lemma 10.40.5. Let $R \rightarrow S$ be a ring map. Let $T \subset \operatorname{Spec}(R)$ be the image of $\operatorname{Spec}(S)$. If $T$ is stable under specialization, then $T$ is closed.

Proof. We give two proofs.
First proof. Let $\mathfrak{p} \subset R$ be a prime ideal such that the corresponding point of $\operatorname{Spec}(R)$ is in the closure of $T$. This means that for ever $f \in R, f \notin \mathfrak{p}$ we have $D(f) \cap T \neq \emptyset$. Note that $D(f) \cap T$ is the image of $\operatorname{Spec}\left(S_{f}\right)$ in $\operatorname{Spec}(R)$. Hence we conclude that $S_{f} \neq 0$. In other words, $1 \neq 0$ in the ring $S_{f}$. Since $S_{\mathfrak{p}}$ is the directed limit of the rings $S_{f}$ we conclude that $1 \neq 0$ in $S_{\mathfrak{p}}$. In other words, $S_{\mathfrak{p}} \neq 0$ and considering the image of $\operatorname{Spec}\left(S_{\mathfrak{p}}\right) \rightarrow \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ we see there exists a $\mathfrak{p}^{\prime} \in T$ with $\mathfrak{p}^{\prime} \subset \mathfrak{p}$. As we assumed $T$ closed under specialization we conclude $\mathfrak{p}$ is a point of $T$ as desired.
Second proof. Let $I=\operatorname{Ker}(R \rightarrow S)$. We may replace $R$ by $R / I$. In this case the ring map $R \rightarrow S$ is injective. By Lemma 10.29 .5 all the minimal primes of $R$ are contained in the image $T$. Hence if $T$ is stable under specialization then it contains all primes.

00HZ Lemma 10.40.6. Let $R \rightarrow S$ be a ring map. The following are equivalent:
(1) Going up holds for $R \rightarrow S$, and
(2) the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is closed.

Proof. It is a general fact that specializations lift along a closed map of topological spaces, see Topology, Lemma 5.18.6. Hence the second condition implies the first.
Assume that going up holds for $R \rightarrow S$. Let $V(I) \subset \operatorname{Spec}(S)$ be a closed set. We want to show that the image of $V(I)$ in $\operatorname{Spec}(R)$ is closed. The ring map $S \rightarrow S / I$ obviously satisfies going up. Hence $R \rightarrow S \rightarrow S / I$ satisfies going up, by Lemma 10.40.4. Replacing $S$ by $S / I$ it suffices to show the image $T$ of $\operatorname{Spec}(S)$ in $\operatorname{Spec}(R)$ is closed. By Topology, Lemmas 5.18 .2 and 5.18 .5 this image is stable under specialization. Thus the result follows from Lemma 10.40 .5 .

00 I 0 Lemma 10.40.7. Let $R$ be a ring. Let $E \subset \operatorname{Spec}(R)$ be a constructible subset.
(1) If $E$ is stable under specialization, then $E$ is closed.
(2) If $E$ is stable under generalization, then $E$ is open.

Proof. First proof. The first assertion follows from Lemma 10.40 .5 combined with Lemma 10.28.3. The second follows because the complement of a constructible set is constructible (see Topology, Lemma 5.14.2), the first part of the lemma and Topology, Lemma 5.18.2.

Second proof. Since $\operatorname{Spec}(R)$ is a spectral space by Lemma 10.25 .2 this is a special case of Topology, Lemma 5.22.5.

0011 Proposition 10.40.8. Let $R \rightarrow S$ be flat and of finite presentation. Then $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is open. More generally this holds for any ring map $R \rightarrow S$ of finite presentation which satisfies going down.

Proof. Assume that $R \rightarrow S$ has finite presentation and satisfies going down. It suffices to prove that the image of a standard open $D(f)$ is open. Since $S \rightarrow S_{f}$ satisfies going down as well, we see that $R \rightarrow S_{f}$ satisfies going down. Thus after replacing $S$ by $S_{f}$ we see it suffices to prove the image is open. By Chevalley's theorem (Theorem 10.28 .9 ) the image is a constructible set $E$. And $E$ is stable under generalization because $R \rightarrow S$ satisfies going down, see Topology, Lemmas 5.18 .2 and 5.18.5 Hence $E$ is open by Lemma 10.40.7.

037F Lemma 10.40.9. Let $k$ be a field, and let $R, S$ be $k$-algebras. Let $S^{\prime} \subset S$ be a sub $k$-algebra, and let $f \in S^{\prime} \otimes_{k} R$. In the commutative diagram

the images of the diagonal arrows are the same.
Proof. Let $\mathfrak{p} \subset R$ be in the image of the south-west arrow. This means (Lemma 10.16.9 that

$$
\left(S^{\prime} \otimes_{k} R\right)_{f} \otimes_{R} \kappa(\mathfrak{p})=\left(S^{\prime} \otimes_{k} \kappa(\mathfrak{p})\right)_{f}
$$

is not the zero ring, i.e., $S^{\prime} \otimes_{k} \kappa(\mathfrak{p})$ is not the zero ring and the image of $f$ in it is not nilpotent. The ring map $S^{\prime} \otimes_{k} \kappa(\mathfrak{p}) \rightarrow S \otimes_{k} \kappa(\mathfrak{p})$ is injective. Hence also $S \otimes_{k} \kappa(\mathfrak{p})$ is not the zero ring and the image of $f$ in it is not nilpotent. Hence $\left(S \otimes_{k} R\right)_{f} \otimes_{R} \kappa(\mathfrak{p})$ is not the zero ring. Thus (Lemma 10.16 .9 we see that $\mathfrak{p}$ is in the image of the south-east arrow as desired.

037G Lemma 10.40.10. Let $k$ be a field. Let $R$ and $S$ be $k$-algebras. The map $\operatorname{Spec}\left(S \otimes_{k}\right.$ $R) \rightarrow \operatorname{Spec}(R)$ is open.

Proof. Let $f \in R \otimes_{k} S$. It suffices to prove that the image of the standard open $D(f)$ is open. Let $S^{\prime} \subset S$ be a finite type $k$-subalgebra such that $f \in S^{\prime} \otimes_{k} R$. The map $R \rightarrow S^{\prime} \otimes_{k} R$ is flat and of finite presentation, hence the image $U$ of $\operatorname{Spec}\left(\left(S^{\prime} \otimes_{k} R\right)_{f}\right) \rightarrow \operatorname{Spec}(R)$ is open by Proposition 10.40.8. By Lemma 10.40.9 this is also the image of $D(f)$ and we win.

Here is a tricky lemma that is sometimes useful.
00EA Lemma 10.40.11. Let $R \rightarrow S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume that
(1) there exists a unique prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$, and
(2) either
(a) going up holds for $R \rightarrow S$, or
(b) going down holds for $R \rightarrow S$ and there is at most one prime of $S$ above every prime of $R$.
Then $S_{\mathfrak{p}}=S_{\mathfrak{q}}$.
Proof. Consider any prime $\mathfrak{q}^{\prime} \subset S$ which corresponds to a point of $\operatorname{Spec}\left(S_{\mathfrak{p}}\right)$. This means that $\mathfrak{p}^{\prime}=R \cap \mathfrak{q}^{\prime}$ is contained in $\mathfrak{p}$. Here is a picture

Assume (1) and (2)(a). By going up there exists a prime $\mathfrak{q}^{\prime \prime} \subset S$ with $\mathfrak{q}^{\prime} \subset \mathfrak{q}^{\prime \prime}$ and $\mathfrak{q}^{\prime \prime}$ lying over $\mathfrak{p}$. By the uniqueness of $\mathfrak{q}$ we conclude that $\mathfrak{q}^{\prime \prime}=\mathfrak{q}$. In other words $\mathfrak{q}^{\prime}$ defines a point of $\operatorname{Spec}\left(S_{\mathfrak{q}}\right)$.

Assume (1) and (2)(b). By going down there exists a prime $\mathfrak{q}^{\prime \prime} \subset \mathfrak{q}$ lying over $\mathfrak{p}^{\prime}$. By the uniqueness of primes lying over $\mathfrak{p}^{\prime}$ we see that $\mathfrak{q}^{\prime}=\mathfrak{q}^{\prime \prime}$. In other words $\mathfrak{q}^{\prime}$ defines a point of $\operatorname{Spec}\left(S_{\mathfrak{q}}\right)$.
In both cases we conclude that the map $\operatorname{Spec}\left(S_{\mathfrak{q}}\right) \rightarrow \operatorname{Spec}\left(S_{\mathfrak{p}}\right)$ is bijective. Clearly this means all the elements of $S-\mathfrak{q}$ are all invertible in $S_{\mathfrak{p}}$, in other words $S_{\mathfrak{p}}=$ $S_{\text {q }}$.

The following lemma is a generalization of going down for flat ring maps.
080T Lemma 10.40.12. Let $R \rightarrow S$ be a ring map. Let $N$ be a finite $S$-module flat over $R$. Endow $\operatorname{Supp}(N) \subset \operatorname{Spec}(S)$ with the induced topology. Then generalizations lift along $\operatorname{Supp}(N) \rightarrow \operatorname{Spec}(R)$.
Proof. The meaning of the statement is as follows. Let $\mathfrak{p} \subset \mathfrak{p}^{\prime} \subset R$ be primes. Let $\mathfrak{q}^{\prime} \subset S$ be a prime $\mathfrak{q}^{\prime} \in \operatorname{Supp}(N)$ Then there exists a prime $\mathfrak{q} \subset \mathfrak{q}^{\prime}, \mathfrak{q} \in \operatorname{Supp}(N)$ lying over $\mathfrak{p}$. As $N$ is flat over $R$ we see that $N_{\mathfrak{q}^{\prime}}$ is flat over $R_{\mathfrak{p}^{\prime}}$, see Lemma 10.38.19. As $N_{\mathfrak{q}^{\prime}}$ is finite over $S_{\mathfrak{q}^{\prime}}$ and not zero since $\mathfrak{q}^{\prime} \in \operatorname{Supp}(N)$ we see that $N_{\mathfrak{q}^{\prime}} \otimes_{S_{\mathfrak{q}^{\prime}}} \kappa\left(\mathfrak{q}^{\prime}\right)$ is nonzero by Nakayama's Lemma 10.19.1. Thus $N_{\mathfrak{q}^{\prime}} \otimes_{R_{\mathfrak{p}^{\prime}}} \kappa\left(\mathfrak{p}^{\prime}\right)$ is also not zero. We conclude from Lemma 10.38 .15 that $N_{\mathfrak{q}^{\prime}} \otimes_{R_{\mathfrak{p}^{\prime}}} \kappa(\mathfrak{p})$ is nonzero. Let $J \subset S_{\mathfrak{q}^{\prime}} \otimes_{R_{\mathfrak{p}^{\prime}}} \kappa(\mathfrak{p})$ be the annihilator of the finite nonzero module $N_{\mathfrak{q}^{\prime}} \otimes_{R_{\mathfrak{p}^{\prime}}} \kappa(\mathfrak{p})$. Since $J$ is a proper ideal we can choose a prime $\mathfrak{q} \subset S$ which corresponds to a prime of $S_{\mathfrak{q}^{\prime}} \otimes_{R_{\mathfrak{p}^{\prime}}} \kappa(\mathfrak{p}) / J$. This prime is in the support of $N$, lies over $\mathfrak{p}$, and is contained in $\mathfrak{q}^{\prime}$ as desired.

### 10.41. Separable extensions

030 I In this section we talk about separability for nonalgebraic field extensions. This is closely related to the concept of geometrically reduced algebras, see Definition 10.42 .1

030 D Definition 10.41.1. Let $k \subset K$ be a field extension.
(1) We say $K$ is separably generated over $k$ if there exists a transcendence basis $\left\{x_{i} ; i \in I\right\}$ of $K / k$ such that the extension $k\left(x_{i} ; i \in I\right) \subset K$ is a separable algebraic extension.
(2) We say $K$ is separable over $k$ if for every subextension $k \subset K^{\prime} \subset K$ with $K^{\prime}$ finitely generated over $k$, the extension $k \subset K^{\prime}$ is separably generated.

With this awkward definition it is not clear that a separably generated field extension is itself separable. It will turn out that this is the case, see Lemma 10.43.2.
030P Lemma 10.41.2. Let $k \subset K$ be a separable field extension. For any subextension $k \subset K^{\prime} \subset K$ the field extension $k \subset K^{\prime}$ is separable.
Proof. This is direct from the definition.
030Q Lemma 10.41.3. Let $k \subset K$ be a separably generated, and finitely generated field extension. Set $r=\operatorname{trdeg}_{k}(K)$. Then there exist elements $x_{1}, \ldots, x_{r+1}$ of $K$ such that
(1) $x_{1}, \ldots, x_{r}$ is a transcendence basis of $K$ over $k$,
(2) $K=k\left(x_{1}, \ldots, x_{r+1}\right)$, and
(3) $x_{r+1}$ is separable over $k\left(x_{1}, \ldots, x_{r}\right)$.

Proof. Combine the definition with Fields, Lemma 9.18.1.

04KM Lemma 10.41.4. Let $k \subset K$ be a finitely generated field extension. There exists a diagram

where $k \subset k^{\prime}, K \subset K^{\prime}$ are finite purely inseparable field extensions such that $k^{\prime} \subset K^{\prime}$ is a separably generated field extension.

Proof. This lemma is only interesting when the characteristic of $k$ is $p>0$. Choose $x_{1}, \ldots, x_{r}$ a transcendence basis of $K$ over $k$. As $K$ is finitely generated over $k$ the extension $k\left(x_{1}, \ldots, x_{r}\right) \subset K$ is finite. Let $k\left(x_{1}, \ldots, x_{r}\right) \subset K_{\text {sep }} \subset K$ be the subextension found in Fields, Lemma 9.13.6. If $K=K_{\text {sep }}$ then we are done. We will use induction on $d=\left[K: K_{\text {sep }}\right]$.

Assume that $d>1$. Choose a $\beta \in K$ with $\alpha=\beta^{p} \in K_{\text {sep }}$ and $\beta \notin K_{\text {sep }}$. Let $P=T^{d}+a_{1} T^{d-1}+\ldots+a_{d}$ be the minimal polynomial of $\alpha$ over $k\left(x_{1}, \ldots, x_{r}\right)$. Let $k \subset k^{\prime}$ be a finite purely inseparable extension obtained by adjoining $p$ th roots such that each $a_{i}$ is a $p$ th power in $k^{\prime}\left(x_{1}^{1 / p}, \ldots, x_{r}^{1 / p}\right)$. Such an extension exists; details omitted. Let $L$ be a field fitting into the diagram

We may and do assume $L$ is the compositum of $K$ and $k^{\prime}\left(x_{1}^{1 / p}, \ldots, x_{r}^{1 / p}\right)$. Let $k^{\prime}\left(x_{1}^{1 / p}, \ldots, x_{r}^{1 / p}\right) \subset L_{\text {sep }} \subset L$ be the subextension found in Fields, Lemma 9.13.6. Then $L_{\text {sep }}$ is the compositum of $K_{\text {sep }}$ and $k^{\prime}\left(x_{1}^{1 / p}, \ldots, x_{r}^{1 / p}\right)$. The element $\alpha \in$ $L_{\text {sep }}$ is a zero of the polynomial $P$ all of whose coefficients are $p$ th powers in $k^{\prime}\left(x_{1}^{1 / p}, \ldots, x_{r}^{1 / p}\right)$ and whose roots are pairwise distinct. By Fields, Lemma 9.27.2 we see that $\alpha=\left(\alpha^{\prime}\right)^{p}$ for some $\alpha^{\prime} \in L_{\text {sep }}$. Clearly, this means that $\beta$ maps to $\alpha^{\prime} \in L_{\text {sep }}$. In other words, we get the tower of fields

Thus this construction leads to a new situation with $\left[L: L_{\text {sep }}\right]<\left[K: K_{\text {sep }}\right]$. By induction we can find $k^{\prime} \subset k^{\prime \prime}$ and $L \subset L^{\prime}$ as in the lemma for the extension $k^{\prime} \subset L$. Then the extensions $k \subset k^{\prime \prime}$ and $K \subset L^{\prime}$ work for the extension $k \subset K$. This proves the lemma.

### 10.42. Geometrically reduced algebras

05DS The main result on geometrically reduced algebras is Lemma 10.43.3. We suggest the reader skip to the lemma after reading the definition.

030S Definition 10.42.1. Let $k$ be a field. Let $S$ be a $k$-algebra. We say $S$ is geometrically reduced over $k$ if for every field extension $k \subset K$ the $K$-algebra $K \otimes_{k} S$ is reduced.

Let $k$ be a field and let $S$ be a reduced $k$ algebra. To check that $S$ is geometrically reduced it will suffice to check that $\bar{k} \otimes_{k} S$ is reduced (where $\bar{k}$ denotes the algebraic closure of $k$ ). In fact it is enough to check this for finite purely inseparable field extensions $k \subset k^{\prime}$. See Lemma 10.43.3.

030T Lemma 10.42.2. Elementary properties of geometrically reduced algebras. Let $k$ be a field. Let $S$ be a $k$-algebra.
(1) If $S$ is geometrically reduced over $k$ so is every $k$-subalgebra.
(2) If all finitely generated $k$-subalgebras of $S$ are geometrically reduced, then $S$ is geometrically reduced.
(3) A directed colimit of geometrically reduced $k$-algebras is geometrically reduced.
(4) If $S$ is geometrically reduced over $k$, then any localization of $S$ is geometrically reduced over $k$.

Proof. Omitted. The second and third property follow from the fact that tensor product commutes with colimits.

04KN Lemma 10.42.3. Let $k$ be a field. If $R$ is geometrically reduced over $k$, and $S \subset R$ is a multiplicative subset, then the localization $S^{-1} R$ is geometrically reduced over $k$. If $R$ is geometrically reduced over $k$, then $R[x]$ is geometrically reduced over $k$.
Proof. Omitted. Hints: A localization of a reduced ring is reduced, and localization commutes with tensor products.

In the proofs of the following lemmas we will repeatedly use the following observation: Suppose that $R^{\prime} \subset R$ and $S^{\prime} \subset S$ are inclusions of $k$-algebras. Then the map $R^{\prime} \otimes_{k} S^{\prime} \rightarrow R \otimes_{k} S$ is injective.

0013 Lemma 10.42.4. Let $k$ be a field. Let $R, S$ be $k$-algebras.
(1) If $R \otimes_{k} S$ is nonreduced, then there exist finitely generated subalgebras $R^{\prime} \subset R, S^{\prime} \subset S$ such that $R^{\prime} \otimes_{k} S^{\prime}$ is not reduced.
(2) If $R \otimes_{k} S$ contains a nonzero zerodivisor, then there exist finitely generated subalgebras $R^{\prime} \subset R, S^{\prime} \subset S$ such that $R^{\prime} \otimes_{k} S^{\prime}$ contains a nonzero zerodivisor.
(3) If $R \otimes_{k} S$ contains a nontrivial idempotent, then there exist finitely generated subalgebras $R^{\prime} \subset R, S^{\prime} \subset S$ such that $R^{\prime} \otimes_{k} S^{\prime}$ contains a nontrivial idempotent.

Proof. Suppose $z \in R \otimes_{k} S$ is nilpotent. We may write $z=\sum_{i=1, \ldots, n} x_{i} \otimes y_{i}$. Thus we may take $R^{\prime}$ the $k$-subalgebra generated by the $x_{i}$ and $S^{\prime}$ the $k$-subalgebra generated by the $y_{i}$. The second and third statements are proved in the same way.

034N Lemma 10.42.5. Let $k$ be a field. Let $S$ be a geometrically reduced $k$-algebra. Let $R$ be any reduced $k$-algebra. Then $R \otimes_{k} S$ is reduced.

Proof. By Lemma 10.42 .4 we may assume that $R$ is of finite type over $k$. Then $R$, as a reduced Noetherian ring, embeds into a finite product of fields (see Lemmas 10.24.4 10.30 .6 and 10.24 .1 . Hence we may assume $R$ is a finite product of fields. In this case it follows from Definition 10.42 .1 that $R \otimes_{k} S$ is reduced.

030U Lemma 10.42.6. Let $k$ be a field. Let $S$ be a reduced $k$-algebra. Let $k \subset K$ be either a separable field extension, or a separably generated field extension. Then $K \otimes_{k} S$ is reduced.

Proof. Assume $k \subset K$ is separable. By Lemma 10.42 .4 we may assume that $S$ is of finite type over $k$ and $K$ is finitely generated over $k$. Then $S$ embeds into a finite product of fields, namely its total ring of fractions (see Lemmas 10.24.1 and 10.24.4). Hence we may actually assume that $S$ is a domain. We choose $x_{1}, \ldots, x_{r+1} \in K$ as in Lemma 10.41.3 Let $P \in k\left(x_{1}, \ldots, x_{r}\right)[T]$ be the minimal polynomial of $x_{r+1}$. It is a separable polynomial. It is easy to see that $k\left[x_{1}, \ldots, x_{r}\right] \otimes_{k} S=S\left[x_{1}, \ldots, x_{r}\right]$ is a domain. This implies $k\left(x_{1}, \ldots, x_{r}\right) \otimes_{k} S$ is a domain as it is a localization of $S\left[x_{1}, \ldots, x_{r}\right]$. The ring extension $k\left(x_{1}, \ldots, x_{r}\right) \otimes_{k} S \subset K \otimes_{k} S$ is generated by a single element $x_{r+1}$ with a single equation, namely $P$. Hence $K \otimes_{k} S$ embeds into $f . f .\left(k\left(x_{1}, \ldots, x_{n}\right) \otimes_{k} S\right)[T] /(P)$. Since $P$ is separable this is a finite product of fields and we win.

At this point we do not yet know that a separably generated field extension is separable, so we have to prove the lemma in this case also. To do this suppose that $\left\{x_{i}\right\}_{i \in I}$ is a separating transcendence basis for $K$ over $k$. For any finite set of elements $\lambda_{j} \in K$ there exists a finite subset $T \subset I$ such that $k\left(\left\{x_{i}\right\}_{i \in T}\right) \subset$ $k\left(\left\{x_{i}\right\}_{i \in T} \cup\left\{\lambda_{j}\right\}\right)$ is finite separable. Hence we see that $K$ is a directed colimit of finitely generated and separably generated extensions of $k$. Thus the argument of the preceding paragraph applies to this case as well.

07K2 Lemma 10.42.7. Let $k$ be a field and let $S$ be a $k$-algebra. Assume that $S$ is reduced and that $S_{\mathfrak{p}}$ is geometrically reduced for every minimal prime $\mathfrak{p}$ of $S$. Then $S$ is geometrically reduced.

Proof. Since $S$ is reduced the map $S \rightarrow \prod_{\mathfrak{p} \text { minimal }} S_{\mathfrak{p}}$ is injective, see Lemma 10.24.2. If $k \subset K$ is a field extension, then the maps

$$
S \otimes_{k} K \rightarrow\left(\prod S_{\mathfrak{p}}\right) \otimes_{k} K \rightarrow \prod S_{\mathfrak{p}} \otimes_{k} K
$$

are injective: the first as $k \rightarrow K$ is flat and the second by inspection because $K$ is a free $k$-module. As $S_{\mathfrak{p}}$ is geometrically reduced the ring on the right is reduced. Thus we see that $S \otimes_{k} K$ is reduced as a subring of a reduced ring.

### 10.43. Separable extensions, continued

05DT In this section we continue the discussion started in Section 10.41. Let $p$ be a prime number and let $k$ be a field of characteristic $p$. In this case we write $k^{1 / p}$ for the extension of $k$ gotten by adjoining $p$ th roots of all the elements of $k$ to $k$. (In other words it is the subfield of an algebraic closure of $k$ generated by the $p$ th roots of elements of $k$.)

030W Lemma 10.43.1. Let $k$ be a field of characteristic $p>0$. Let $k \subset K$ be a field extension. The following are equivalent:
(1) $K$ is separable over $k$,
(2) the ring $K \otimes_{k} k^{1 / p}$ is reduced, and
(3) $K$ is geometrically reduced over $k$.

Proof. The implication $(1) \Rightarrow(3)$ follows from Lemma 10.42.6. The implication $(3) \Rightarrow(2)$ is immediate.
Assume (2). Let $k \subset L \subset K$ be a subextension such that $L$ is a finitely generated field extension of $k$. We have to show that we can find a separating transcendence basis of $L$. The assumption implies that $L \otimes_{k} k^{1 / p}$ is reduced. Let $x_{1}, \ldots, x_{r}$ be a transcendence basis of $L$ over $k$ such that the degree of inseparability of the finite extension $k\left(x_{1}, \ldots, x_{r}\right) \subset L$ is minimal. If $L$ is separable over $k\left(x_{1}, \ldots, x_{r}\right)$ then we win. Assume this is not the case to get a contradiction. Then there exists an element $\alpha \in L$ which is not separable over $k\left(x_{1}, \ldots, x_{r}\right)$. Let $P(T) \in k\left(x_{1}, \ldots, x_{r}\right)[T]$ be the minimal polynomial of $\alpha$ over $k\left(x_{1}, \ldots, x_{r}\right)$. After replacing $\alpha$ by $f \alpha$ for some nonzero $f \in k\left[x_{1}, \ldots, x_{r}\right]$ we may and do assume that $P$ lies in $k\left[x_{1}, \ldots, x_{r}, T\right]$. Because $\alpha$ is not separable $P$ is a polynomial in $T^{p}$, see Fields, Lemma 9.12.1. Let $d p$ be the degree of $P$ as a polynomial in $T$. Since $P$ is the minimal polynomial of $\alpha$ the monomials

$$
x_{1}^{e_{1}} \ldots x_{r}^{e_{r}} \alpha^{e}
$$

for $e<d p$ are linearly independent over $k$ in $L$. We claim that the element $\partial P / \partial x_{i} \in$ $k\left[x_{1}, \ldots, x_{r}, T\right]$ is not zero for at least one $i$. Namely, if this was not the case, then $P$ is actually a polynomial in $x_{1}^{p}, \ldots, x_{r}^{p}, T^{p}$. In that case we can consider $P^{1 / p} \in$ $k^{1 / p}\left[x_{1}, \ldots, x_{r}, T\right]$. This would map to $P^{1 / p}\left(x_{1}, \ldots, x_{r}, \alpha\right)$ which is a nilpotent element of $k^{1 / p} \otimes_{k} L$ and hence zero. On the other hand, $P^{1 / p}\left(x_{1}, \ldots, x_{r}, \alpha\right)$ is a $k^{1 / p}$-linear combination the monomials listed above, hence nonzero in $k^{1 / p} \otimes_{k} L$. This is a contradiction which proves our claim.

Thus, after renumbering, we may assume that $\partial P / \partial x_{1}$ is not zero. As $P$ is an irreducible polynomial in $T$ over $k\left(x_{1}, \ldots, x_{r}\right)$ it is irreducible as a polynomial in $x_{1}, \ldots, x_{r}, T$, hence by Gauss's lemma it is irreducible as a polynomial in $x_{1}$ over $k\left(x_{2}, \ldots, x_{r}, T\right)$. Since the transcendence degree of $L$ is $r$ we see that $x_{2}, \ldots, x_{r}, \alpha$ are algebraically independent. Hence $P\left(X, x_{2}, \ldots, x_{r}, \alpha\right) \in k\left(x_{2}, \ldots, x_{r}, \alpha\right)[X]$ is irreducible. It follows that $x_{1}$ is separably algebraic over $k\left(x_{2}, \ldots, x_{r}, \alpha\right)$. This means that the degree of inseparability of the finite extension $k\left(x_{2}, \ldots, x_{r}, \alpha\right) \subset L$ is less than the degree of inseparability of the finite extension $k\left(x_{1}, \ldots, x_{r}\right) \subset L$, which is a contradiction.

030X Lemma 10.43.2. A separably generated field extension is separable.
Proof. Combine Lemma 10.42 .6 with Lemma 10.43 .1 .

In the following lemma we will use the notion of the perfect closure which is defined in Definition 10.44.5.

030V Lemma 10.43.3. Let $k$ be a field. Let $S$ be a $k$-algebra. The following are equivalent:
(1) $k^{\prime} \otimes_{k} S$ is reduced for every finite purely inseparable extension $k^{\prime}$ of $k$,
(2) $k^{1 / p} \otimes_{k} S$ is reduced,
(3) $k^{\text {perf }} \otimes_{k} S$ is reduced, where $k^{\text {perf }}$ is the perfect closure of $k$,
(4) $\bar{k} \otimes_{k} S$ is reduced, where $\bar{k}$ is the algebraic closure of $k$, and
(5) $S$ is geometrically reduced over $k$.

Proof. Note that any finite purely inseparable extension $k \subset k^{\prime}$ embeds in $k^{\text {perf }}$. Moreover, $k^{1 / p}$ embeds into $k^{\text {perf }}$ which embeds into $\bar{k}$. Thus it is clear that (5) $\Rightarrow$ $(4) \Rightarrow(3) \Rightarrow(2)$ and that $(3) \Rightarrow(1)$.

We prove that $(1) \Rightarrow(5)$. Assume $k^{\prime} \otimes_{k} S$ is reduced for every finite purely inseparable extension $k^{\prime}$ of $k$. Let $k \subset K$ be an extension of fields. We have to show that $K \otimes_{k} S$ is reduced. By Lemma 10.42 .4 we reduce to the case where $k \subset K$ is a finitely generated field extension. Choose a diagram

as in Lemma 10.41 .4 . By assumption $k^{\prime} \otimes_{k} S$ is reduced. By Lemma 10.42 .6 it follows that $K^{\prime} \otimes_{k} S$ is reduced. Hence we conclude that $K \otimes_{k} S$ is reduced as desired.

Finally we prove that $(2) \Rightarrow(5)$. Assume $k^{1 / p} \otimes_{k} S$ is reduced. Then $S$ is reduced. Moreover, for each localization $S_{\mathfrak{p}}$ at a minimal prime $\mathfrak{p}$, the ring $k^{1 / p} \otimes_{k} S_{\mathfrak{p}}$ is a localization of $k^{1 / p} \otimes_{k} S$ hence is reduced. But $S_{\mathfrak{p}}$ is a field by Lemma 10.24.1 hence $S_{\mathfrak{p}}$ is geometrically reduced by Lemma 10.43.1. It follows from Lemma 10.42.7 that $S$ is geometrically reduced.

### 10.44. Perfect fields

05DU Here is the definition.
030Y Definition 10.44.1. Let $k$ be a field. We say $k$ is perfect if every field extension of $k$ is separable over $k$.

030Z Lemma 10.44.2. A field $k$ is perfect if and only if it is a field of characteristic 0 or a field of characteristic $p>0$ such that every element has a pth root.

Proof. The characteristic zero case is clear. Assume the characteristic of $k$ is $p>0$. If $k$ is perfect, then all the field extensions where we adjoin a $p$ th root of an element of $k$ have to be trivial, hence every element of $k$ has a $p$ th root. Conversely if every element has a $p$ th root, then $k=k^{1 / p}$ and every field extension of $k$ is separable by Lemma 10.43.1.

030R Lemma 10.44.3. Let $k \subset K$ be a finitely generated field extension. There exists a diagram

where $k \subset k^{\prime}, K \subset K^{\prime}$ are finite purely inseparable field extensions such that $k^{\prime} \subset K^{\prime}$ is a separable field extension. In this situation we can assume that $K^{\prime}=k^{\prime} K$ is the compositum, and also that $K^{\prime}=\left(k^{\prime} \otimes_{k} K\right)_{\text {red }}$.

Proof. By Lemma 10.41 .4 we can find such a diagram with $k^{\prime} \subset K^{\prime}$ separably generated. By Lemma 10.43 .2 this implies that $K^{\prime}$ is separable over $k^{\prime}$. The compositum $k^{\prime} K$ is a subextension of $k^{\prime} \subset K^{\prime}$ and hence $k^{\prime} \subset k^{\prime} K$ is separable by Lemma 10.41 .2 . The ring $\left(k^{\prime} \otimes_{k} K\right)_{\text {red }}$ is a domain as for some $n \gg 0$ the map $x \mapsto x^{p^{\prime \prime}}$ maps it into $K$. Hence it is a field by Lemma 10.35.17. Thus $\left(k^{\prime} \otimes_{k} K\right)_{\text {red }} \rightarrow K^{\prime}$ maps it isomorphically onto $k^{\prime} K$.

046W Lemma 10.44.4. For every field $k$ there exists a purely inseparable extension $k \subset k^{\prime}$ such that $k^{\prime}$ is perfect. The field extension $k \subset k^{\prime}$ is unique up to unique isomorphism.
Proof. If the characteristic of $k$ is zero, then $k^{\prime}=k$ is the unique choice. Assume the characteristic of $k$ is $p>0$. For every $n>0$ there exists a unique algebraic extension $k \subset k^{1 / p^{n}}$ such that (a) every element $\lambda \in k$ has a $p^{n}$ th root in $k^{1 / p^{n}}$ and (b) for every element $\mu \in k^{1 / p^{n}}$ we have $\mu^{p^{n}} \in k$. Namely, consider the ring $\operatorname{map} k \rightarrow k^{1 / p^{n}}=k, x \mapsto x^{p^{n}}$. This is injective and satisfies (a) and (b). It is clear that $k^{1 / p^{n}} \subset k^{1 / p^{n+1}}$ as extensions of $k$ via the map $y \mapsto y^{p}$. Then we can take $k^{\prime}=\bigcup k^{1 / p^{n}}$. Some details omitted.

046X Definition 10.44.5. Let $k$ be a field. The field extension $k \subset k^{\prime}$ of Lemma 10.44 .4 is called the perfect closure of $k$. Notation $k \subset k^{\text {perf }}$.
Note that if $k \subset k^{\prime}$ is any algebraic purely inseparable extension, then $k^{\prime} \subset k^{p e r f}$. Namely, $\left(k^{\prime}\right)^{\text {perf }}$ is isomorphic to $k^{\text {perf }}$ by the uniqueness of Lemma 10.44.4.
0014 Lemma 10.44.6. Let $k$ be a perfect field. Any reduced $k$ algebra is geometrically reduced over $k$. Let $R, S$ be k-algebras. Assume both $R$ and $S$ are reduced. Then the $k$-algebra $R \otimes_{k} S$ is reduced.

Proof. The first statement follows from Lemma 10.43.3. For the second statement use the first statement and Lemma 10.42.5.

### 10.45. Universal homeomorphisms

0BR5 Let $k \subset k^{\prime}$ be an algebraic purely inseparable field extension. Then for any $k$ algebra $R$ the ring map $R \rightarrow k^{\prime} \otimes_{k} R$ induces a homeomorphism of spectra. The reason for this is the slightly more general Lemma 10.45 .6 below.

0BR6 Lemma 10.45.1. Let $\varphi: R \rightarrow S$ be a surjective map with locally nilpotent kernel. Then $\varphi$ induces a homeomorphism of spectra and isomorphisms on residue fields. For any ring map $R \rightarrow R^{\prime}$ the ring map $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ is surjective with locally nilpotent kernel.

Proof. By Lemma 10.16 .7 the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is a homeomorphism onto the closed subset $V(\operatorname{Ker}(\varphi))$. Of course $V(\operatorname{Ker}(\varphi))=\operatorname{Spec}(R)$ because every prime ideal of $R$ contains every nilpotent element of $R$. This also implies the statement on residue fields. By right exactness of tensor product we see that $\operatorname{Ker}(\varphi) R^{\prime}$ is the kernel of the surjective map $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$. Hence the final statement by Lemma 10.31 .2

0BR7 Lemma 10.45.2. Let $k \subset k^{\prime}$ be a field extension. The following are equivalent
(1) for each $x \in k^{\prime}$ there exists an $n>0$ such that $x^{n} \in k$, and

Alp14, Lemma 3.1.6]
(2) $k^{\prime}=k$, or $k^{\prime} / k$ is a purely inseparable extension of fields, or $k$ and $k^{\prime}$ have characteristic $p>0$ and are algebraic extensions of $\mathbf{F}_{p}$.
Proof. Observe that each of the possibilities listed in (2) satisfies (1). Thus we assume $k^{\prime} / k$ satisfies (1) and we prove that we are in one of the cases of (2). Discarding the case $k=k^{\prime}$ we may assume $k^{\prime} \neq k$. It is clear that $k^{\prime} / k$ is algebraic. Hence we may assume that $k^{\prime} / k$ is a nontrivial finite extension. Let $k \subset k_{\text {sep }}^{\prime} \subset k^{\prime}$ be the separable subextension found in Fields, Lemma 9.13.6. We have to show that $k=k_{\text {sep }}^{\prime}$ or that $k$ is an algebraic over $\mathbf{F}_{p}$. Thus we may assume that $k^{\prime} / k$ is a nontrivial finite separable extension and we have to show $k$ is algebraic over $\mathbf{F}_{p}$.
Pick $x \in k^{\prime}, x \notin k$. Pick $n, m>0$ such that $x^{n} \in k$ and $(x+1)^{m} \in k$. Let $\bar{k}$ be an algebraic closure of $k$. We can choose embeddings $\sigma, \tau: k^{\prime} \rightarrow \bar{k}$ with $\sigma(x) \neq \tau(x)$. This follows from the discussion in Fields, Section 9.12 (more precisely, after replacing $k^{\prime}$ by the $k$-extension generated by $x$ it follows from Fields, Lemma 9.12.8. Then we see that $\sigma(x)=\zeta \tau(x)$ for some $n$th root of unity $\zeta$ in $\bar{k}$. Similarly, we see that $\sigma(x+1)=\zeta^{\prime} \tau(x+1)$ for some $m$ th root of unity $\zeta^{\prime} \in \bar{k}$. Since $\sigma(x+1) \neq \tau(x+1)$ we see $\zeta^{\prime} \neq 1$. Then

$$
\zeta^{\prime}(\tau(x)+1)=\zeta^{\prime} \tau(x+1)=\sigma(x+1)=\sigma(x)+1=\zeta \tau(x)+1
$$

implies that

$$
\tau(x)\left(\zeta^{\prime}-\zeta\right)=1-\zeta^{\prime}
$$

hence $\zeta^{\prime} \neq \zeta$ and

$$
\tau(x)=\left(1-\zeta^{\prime}\right) /\left(\zeta^{\prime}-\zeta\right)
$$

Hence every element of $k^{\prime}$ which is not in $k$ is algebraic over the prime subfield. Since $k^{\prime}$ is generated over the prime subfield by the elements of $k^{\prime}$ which are not in $k$, we conclude that $k^{\prime}$ (and hence $k$ ) is algebraic over the prime subfield.

Finally, if the characteristic of $k$ is 0 , the above leads to a contradiction as follows (we encourage the reader to find their own proof). For every rational number $y$ we similarly get a root of unity $\zeta_{y}$ such that $\sigma(x+y)=\zeta_{y} \tau(x+y)$. Then we find

$$
\zeta \tau(x)+y=\zeta_{y}(\tau(x)+y)
$$

and by our formula for $\tau(x)$ above we conclude $\zeta_{y} \in \mathbf{Q}\left(\zeta, \zeta^{\prime}\right)$. Since the number field $\mathbf{Q}\left(\zeta_{,}^{\prime} \zeta^{\prime}\right)$ contains only a finite number of roots of unity we find two distinct rational numbers $y, y^{\prime}$ with $\zeta_{y}=\zeta_{y^{\prime}}$. Then we conclude that

$$
y-y^{\prime}=\sigma(x+y)-\sigma\left(x+y^{\prime}\right)=\zeta_{y}(\tau(x+y))-\zeta_{y^{\prime}} \tau\left(x+y^{\prime}\right)=\zeta_{y}\left(y-y^{\prime}\right)
$$

which implies $\zeta_{y}=1$ a contradiction.
0BR8 Lemma 10.45.3. Let $\varphi: R \rightarrow S$ be a ring map. If
(1) for any $x \in S$ there exists $n>0$ such that $x^{n}$ is in the image of $\varphi$, and
(2) $\operatorname{Ker}(\varphi)$ is locally nilpotent,
then $\varphi$ induces a homeomorphism on spectra and induces residue field extensions satisfying the equivalent conditions of Lemma 10.45.2.

Proof. Assume (1) and (2). Let $\mathfrak{q}, \mathfrak{q}^{\prime}$ be primes of $S$ lying over the same prime ideal $\mathfrak{p}$ of $R$. Suppose $x \in S$ with $x \in \mathfrak{q}, x \notin \mathfrak{q}^{\prime}$. Then $x^{n} \in \mathfrak{q}$ and $x^{n} \notin \mathfrak{q}^{\prime}$ for all $n>0$. If $x^{n}=\varphi(y)$ with $y \in R$ for some $n>0$ then

$$
x^{n} \in \mathfrak{q} \Rightarrow y \in \mathfrak{p} \Rightarrow x^{n} \in \mathfrak{q}^{\prime}
$$

which is a contradiction. Hence there does not exist an $x$ as above and we conclude that $\mathfrak{q}=\mathfrak{q}^{\prime}$, i.e., the map on spectra is injective. By assumption (2) the kernel $I=\operatorname{Ker}(\varphi)$ is contained in every prime, hence $\operatorname{Spec}(R)=\operatorname{Spec}(R / I)$ as topological spaces. As the induced map $R / I \rightarrow S$ is integral by assumption (1) Lemma 10.35 .15 shows that $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R / I)$ is surjective. Combining the above we see that $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is bijective. If $x \in S$ is arbitrary, and we pick $y \in R$ such that $\varphi(y)=x^{n}$ for some $n>0$, then we see that the open $D(x) \subset \operatorname{Spec}(S)$ corresponds to the open $D(y) \subset \operatorname{Spec}(R)$ via the bijection above. Hence we see that the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is a homeomorphism.

To see the statement on residue fields, let $\mathfrak{q} \subset S$ be a prime lying over a prime ideal $\mathfrak{p} \subset R$. Let $x \in \kappa(\mathfrak{q})$. If we think of $\kappa(\mathfrak{q})$ as the residue field of the local ring $S_{\mathfrak{q}}$, then we see that $x$ is the image of some $y / z \in S_{\mathfrak{q}}$ with $y \in S, z \in S, z \notin \mathfrak{q}$. Choose $n, m>0$ such that $y^{n}, z^{m}$ are in the image of $\varphi$. Then $x^{n m}$ is the residue of $(y / z)^{n m}=\left(y^{n}\right)^{m} /\left(z^{m}\right)^{n}$ which is in the image of $R_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$. Hence $x^{n m}$ is in the image of $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{q})$.
0545 Lemma 10.45.4. Let $p$ be a prime number. Let $n, m>0$ be two integers. There exists an integer a such that $(x+y)^{p^{a}}, p^{a}(x+y) \in \mathbf{Z}\left[x^{p^{n}}, p^{n} x, y^{p^{m}}, p^{m} y\right]$.
Proof. This is clear for $p^{a}(x+y)$ as soon as $a \geq n, m$. In fact, pick $a \gg n, m$. Write

$$
(x+y)^{p^{a}}=\sum_{i, j \geq 0, i+j=p^{a}}\binom{p^{a}}{i, j} x^{i} y^{j}
$$

For every $i, j \geq 0$ with $i+j=p^{a}$ write $i=q p^{n}+r$ with $r \in\left\{0, \ldots, p^{n}-1\right\}$ and $j=$ $q^{\prime} p^{m}+r^{\prime}$ with $r^{\prime} \in\left\{0, \ldots, p^{m}-1\right\}$. The condition $(x+y)^{p^{a}} \in \mathbf{Z}\left[x^{p^{n}}, p^{n} x, y^{p^{m}}, p^{m} y\right]$ holds if

$$
p^{n r+m r^{\prime}} \text { divides }\binom{p^{a}}{i, j}
$$

If $r=r^{\prime}=0$ then the divisibility holds. If $r \neq 0$, then we write

$$
\binom{p^{a}}{i, j}=\frac{p^{a}}{i}\binom{p^{a}-1}{i-1, j}
$$

Since $r \neq 0$ the rational number $p^{a} / i$ has $p$-adic valuation at least $a-(n-1)$ (because $i$ is not divisible by $p^{n}$ ). Thus $\binom{p^{a}}{i, j}$ is divisible by $p^{a-n+1}$ in this case. Similarly, we see that if $r^{\prime} \neq 0$, then $\binom{p^{a}}{i, j}$ is divisible by $p^{a-m+1}$. Picking $a=n p^{n}+m p^{m}+n+m$ will work.
0BR9 Lemma 10.45.5. Let $k \subset k^{\prime}$ be a field extension. Let $p$ be a prime number. The following are equivalent
(1) $k^{\prime}$ is generated as a field extension of $k$ by elements $x$ such that there exists an $n>0$ with $x^{p^{n}} \in k$ and $p^{n} x \in k$, and
(2) $k=k^{\prime}$ or the characteristic of $k$ and $k^{\prime}$ is $p$ and $k^{\prime} / k$ is purely inseparable.

Proof. Let $x \in k^{\prime}$. If there exists an $n>0$ with $x^{p^{n}} \in k$ and $p^{n} x \in k$ and if the characteristic is not $p$, then $x \in k$. If the characteristic is $p$, then we find $x^{p^{n}} \in k$ and hence $x$ is purely inseparable over $k$.

0BRA Lemma 10.45.6. Let $\varphi: R \rightarrow S$ be a ring map. Let $p$ be a prime number. Assume
(a) $S$ is generated as an $R$-algebra by elements $x$ such that there exists an $n>0$ with $x^{p^{n}} \in \varphi(R)$ and $p^{n} x \in \varphi(R)$, and
(b) $\operatorname{Ker}(\varphi)$ is locally nilpotent,

Then $\varphi$ induces a homeomorphism of spectra and induces residue field extensions satisfying the equivalent conditions of Lemma 10.45.5. For any ring map $R \rightarrow R^{\prime}$ the ring map $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ also satisfies (a) and (b).

Proof. Assume (a) and (b). Note that (b) is equivalent to condition (2) of Lemma 10.45.3. Let $T \subset S$ be the set of elements $x \in S$ such that there exists an integer $n>0$ such that $x^{p^{n}}, p^{n} x \in \varphi(R)$. We claim that $T=S$. This will prove that condition (1) of Lemma 10.45 .3 holds and hence $\varphi$ induces a homeomorphism on spectra. By assumption (a) it suffices to show that $T \subset S$ is an $R$-sub algebra. If $x \in T$ and $y \in R$, then it is clear that $y x \in T$. Suppose $x, y \in T$ and $n, m>0$ such that $x^{p^{n}}, y^{p^{m}}, p^{n} x, p^{m} y \in \varphi(R)$. Then $(x y)^{p^{n+m}}, p^{n+m} x y \in \varphi(R)$ hence $x y \in T$. We have $x+y \in T$ by Lemma 10.45 .4 and the claim is proved.

Since $\varphi$ induces a homeomorphism on spectra, it is in particular surjective on spectra which is a property preserved under any base change, see Lemma 10.29.3. Therefore for any $R \rightarrow R^{\prime}$ the kernel of the ring map $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$ consists of nilpotent elements, see Lemma 10.29 .6 , in other words (b) holds for $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$. It is clear that (a) is preserved under base change. Finally, the condition on residue fields follows from (a) as generators for $S$ as an $R$-algebra map to generators for the residue field extensions.

0BRB Lemma 10.45.7. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ induces an injective map of spectra,
(2) $\varphi$ induces purely inseparable residue field extensions.

Then for any ring map $R \rightarrow R^{\prime}$ properties (1) and (2) are true for $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$.
Proof. Set $S^{\prime}=R^{\prime} \otimes_{R} S$ so that we have a commutative diagram of continuous maps of spectra of rings

Let $\mathfrak{p}^{\prime} \subset R^{\prime}$ be a prime ideal lying over $\mathfrak{p} \subset R$. If there is no prime ideal of $S$ lying over $\mathfrak{p}$, then there is no prime ideal of $S^{\prime}$ lying over $\mathfrak{p}^{\prime}$. Otherwise, by Remark 10.16 .8 there is a unique prime ideal $\mathfrak{r}$ of $F=S \otimes_{R} \kappa(\mathfrak{p})$ whose residue field is purely inseparable over $\kappa(\mathfrak{p})$. Consider the ring maps

$$
\kappa(\mathfrak{p}) \rightarrow F \rightarrow \kappa(\mathfrak{r})
$$

By Lemma 10.24 .1 the ideal $\mathfrak{r} \subset F$ is locally nilpotent, hence we may apply Lemma 10.45 .1 to the ring map $F \rightarrow \kappa(\mathfrak{r})$. We may apply Lemma 10.45 .6 to the ring map $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{r})$. Hence the composition and the second arrow in the maps

$$
\kappa\left(\mathfrak{p}^{\prime}\right) \rightarrow \kappa\left(\mathfrak{p}^{\prime}\right) \otimes_{\kappa(\mathfrak{p})} F \rightarrow \kappa\left(\mathfrak{p}^{\prime}\right) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{r})
$$

induces bijections on spectra and purely inseparable residue field extensions. This implies the same thing for the first map. Since

$$
\kappa\left(\mathfrak{p}^{\prime}\right) \otimes_{\kappa(\mathfrak{p})} F=\kappa\left(\mathfrak{p}^{\prime}\right) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}) \otimes_{R} S=\kappa\left(\mathfrak{p}^{\prime}\right) \otimes_{R} S=\kappa\left(\mathfrak{p}^{\prime}\right) \otimes_{R^{\prime}} R^{\prime} \otimes_{R} S
$$

we conclude by the discussion in Remark 10.16.8.
0BRC Lemma 10.45.8. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is integral,
(2) $\varphi$ induces an injective map of spectra,
(3) $\varphi$ induces purely inseparable residue field extensions.

Then $\varphi$ induces a homeomorphism from $\operatorname{Spec}(S)$ onto a closed subset of $\operatorname{Spec}(R)$ and for any ring map $R \rightarrow R^{\prime}$ properties (1), (2), (3) are true for $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$.

Proof. The map on spectra is closed by Lemmas 10.40 .6 and 10.35 .20 The properties are preserved under base change by Lemmas 10.45.7 and 10.35.11.

0BRD Lemma 10.45.9. Let $\varphi: R \rightarrow S$ be a ring map. Assume
(1) $\varphi$ is integral,
(2) $\varphi$ induces an bijective map of spectra,
(3) $\varphi$ induces purely inseparable residue field extensions.

Then $\varphi$ induces a homeomorphism on spectra and for any ring map $R \rightarrow R^{\prime}$ properties (1), (2), (3) are true for $R^{\prime} \rightarrow R^{\prime} \otimes_{R} S$.

Proof. Follows from Lemmas 10.45 .8 and 10.29 .3 .
09EF Lemma 10.45.10. Let $\varphi: R \rightarrow S$ be a ring map such that
(1) the kernel of $\varphi$ is locally nilpotent, and
(2) $S$ is generated as an $R$-algebra by elements $x$ such that there exist $n>0$ and a polynomial $P(T) \in R[T]$ whose image in $S[T]$ is $(T-s)^{n}$.
Then $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is a homeomorphism and $R \rightarrow S$ induces purely inseparable extensions of residue fields. Moreover, conditions (1) and (2) remain true on arbitrary base change.

Proof. We may replace $R$ by $R / \operatorname{Ker}(\varphi)$, see Lemma 10.45.1. Assumption (2) implies $S$ is generated over $R$ by elements which are integral over $R$. Hence $R \subset S$ is integral (Lemma 10.35.7). In $\operatorname{particular} \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is surjective and closed (Lemmas 10.35.15 10.40.6, and 10.35.20.
Let $x \in S$ be one of the generators in (2), i.e., there exists an $n>0$ be such that $(T-x)^{n} \in R[T]$. Let $\mathfrak{p} \subset R$ be a prime. The $\kappa(\mathfrak{p}) \otimes_{R} S$ ring is nonzero by the above and Lemma 10.16.9. If the characteristic of $\kappa(\mathfrak{p})$ is zero then we see that $n x \in R$ implies $1 \otimes x$ is in the image of $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{p}) \otimes_{R} S$. Hence $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{p}) \otimes_{R} S$ is an isomorphism. If the characteristic of $\kappa(\mathfrak{p})$ is $p>0$, then write $n=p^{k} m$ with $m$ prime to $p$. In $\kappa(\mathfrak{p}) \otimes_{R} S[T]$ we have

$$
(T-1 \otimes x)^{n}=\left((T-1 \otimes x)^{p^{k}}\right)^{m}=\left(T^{p^{k}}-1 \otimes x^{p^{k}}\right)^{m}
$$

and we see that $m x^{p^{k}} \in R$. This implies that $1 \otimes x^{p^{k}}$ is in the image of $\kappa(\mathfrak{p}) \rightarrow$ $\kappa(\mathfrak{p}) \otimes_{R} S$. Hence Lemma 10.45 .6 applies to $\kappa(\mathfrak{p}) \rightarrow \kappa(\mathfrak{p}) \otimes_{R} S$. In both cases we conclude that $\kappa(\mathfrak{p}) \otimes_{R} S$ has a unique prime ideal with residue field purely inseparable over $\kappa(\mathfrak{p})$. By Remark 10.16 .8 we conclude that $\varphi$ is bijective on spectra.

The statement on base change is immediate.

### 10.46. Geometrically irreducible algebras

00I2 An algebra $S$ over a field $k$ is geometrically irreducible if the algebra $S \otimes_{k} k^{\prime}$ has a unique minimal prime for every field extension $k^{\prime} / k$. In this section we develop a bit of theory relevant to this notion.

00 I 6 Lemma 10.46.1. Let $R \rightarrow S$ be a ring map. Assume
(a) $\operatorname{Spec}(R)$ is irreducible,
(b) $R \rightarrow S$ is flat,
(c) $R \rightarrow S$ is of finite presentation,
(d) the fibre rings $S \otimes_{R} \kappa(\mathfrak{p})$ have irreducible spectra for a dense collection of primes $\mathfrak{p}$ of $R$.
Then $\operatorname{Spec}(S)$ is irreducible. This is true more generally with (b) + (c) replaced by "the map $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is open".

Proof. The assumptions (b) and (c) imply that the map on spectra is open, see Proposition 10.40.8. Hence the lemma follows from Topology, Lemma 5.7.12,

00I7 Lemma 10.46.2. Let $k$ be a separably algebraically closed field. Let $R, S$ be $k$-algebras. If $R, S$ have a unique minimal prime, so does $R \otimes_{k} S$.

Proof. Let $k \subset \bar{k}$ be a perfect closure, see Definition 10.44.5. By assumption $\bar{k}$ is algebraically closed. The ring maps $R \rightarrow R \otimes_{k} \bar{k}$ and $S \rightarrow S \otimes_{k} \bar{k}$ and $R \otimes_{k} S \rightarrow\left(R \otimes_{k} S\right) \otimes_{k} \bar{k}=\left(R \otimes_{k} \bar{k}\right) \otimes_{\bar{k}}\left(S \otimes_{k} \bar{k}\right)$ satisfy the assumptions of Lemma 10.45.6. Hence we may assume $k$ is algebraically closed.

We may replace $R$ and $S$ by their reductions. Hence we may assume that $R$ and $S$ are domains. By Lemma 10.44 .6 we see that $R \otimes_{k} S$ is reduced. Hence its spectrum is reducible if and only if it contains a nonzero zerodivisor. By Lemma 10.42 .4 we reduce to the case where $R$ and $S$ are domains of finite type over $k$ algebraically closed.

Note that the ring map $R \rightarrow R \otimes_{k} S$ is of finite presentation and flat. Moreover, for every maximal ideal $\mathfrak{m}$ of $R$ we have $\left(R \otimes_{k} S\right) \otimes_{R} R / \mathfrak{m} \cong S$ because $k \cong R / \mathfrak{m}$ by the Hilbert Nullstellensatz Theorem 10.33.1. Moreover, the set of maximal ideals is dense in the spectrum of $R$ since $\operatorname{Spec}(R)$ is Jacobson, see Lemma 10.34.2. Hence we see that Lemma 10.46 .1 applies to the ring map $R \rightarrow R \otimes_{k} S$ and we conclude that the spectrum of $R \otimes_{k} S$ is irreducible as desired.

037K Lemma 10.46.3. Let $k$ be a field. Let $R$ be a $k$-algebra. The following are equivalent
(1) for every field extension $k \subset k^{\prime}$ the spectrum of $R \otimes_{k} k^{\prime}$ is irreducible, and
(2) for every finite separable field extension $k \subset k^{\prime}$ the spectrum of $R \otimes_{k} k^{\prime}$ is irreducible.

Proof. Let $k \subset k^{\text {perf }}$ be a perfect closure of $k$, see Definition 10.44.5. By Lemma 10.45.6 we may replace $R$ by $\left(R \otimes_{k} k^{\text {perf }}\right)_{\text {reduction }}$ and $k$ by $k^{\text {perf }}$ (some details omitted). Hence we may assume that $R$ is geometrically reduced over $k$.
Assume $R$ is geometrically reduced over $k$. For any extension of fields $k \subset k^{\prime}$ we see irreducibility of the spectrum of $R \otimes_{k} k^{\prime}$ is equivalent to $R \otimes_{k} k^{\prime}$ being a domain. Assume (2). Let $k \subset \bar{k}$ be a separable algebraic closure of $k$. Using Lemma 10.42.4 we see that (2) is equivalent to $R \otimes_{k} \bar{k}$ being a domain. For any field extension $k \subset k^{\prime}$, there exists a field extension $\bar{k} \subset \bar{k}^{\prime}$ with $k^{\prime} \subset \bar{k}^{\prime}$. By Lemma 10.46.2 we see that $R \otimes_{k} \bar{k}^{\prime}$ is a domain. If $R \otimes_{k} k^{\prime}$ is not a domain, then also $R \otimes_{k} \bar{k}^{\prime}$ is not a domain, contradiction.

037L Definition 10.46.4. Let $k$ be a field. Let $S$ be a $k$-algebra. We say $S$ is geometrically irreducible over $k$ if for every field extension $k \subset k^{\prime}$ the spectrum of $S \otimes_{k} k^{\prime}$ is irreducible

By Lemma 10.46 .3 it suffices to check this for finite separable field extensions $k \subset k^{\prime}$.
037M Lemma 10.46.5. Let $k$ be a field. Let $R$ be a $k$-algebra. If $k$ is separably algebraically closed then $R$ is geometrically irreducible over $k$ if and only if the spectrum of $R$ is irreducible.

Proof. Immediate from the remark following Definition 10.46.4.
037N Lemma 10.46.6. Let $k$ be a field. Let $S$ be a $k$-algebra.
(1) If $S$ is geometrically irreducible over $k$ so is every $k$-subalgebra.
(2) If all finitely generated $k$-subalgebras of $S$ are geometrically irreducible, then $S$ is geometrically irreducible.
(3) A directed colimit of geometrically irreducible $k$-algebras is geometrically irreducible.

Proof. Let $S^{\prime} \subset S$ be a subalgebra. Then for any extension $k \subset k^{\prime}$ the ring map $S^{\prime} \otimes_{k} k^{\prime} \rightarrow S \otimes_{k} k^{\prime}$ is injective also. Hence (1) follows from Lemma 10.29 .5 (and the fact that the image of an irreducible space under a continuous map is irreducible). The second and third property follow from the fact that tensor product commutes with colimits.

037 O Lemma 10.46.7. Let $k$ be a field. Let $S$ be a geometrically irreducible $k$-algebra. Let $R$ be any $k$-algebra. The map

$$
\operatorname{Spec}\left(R \otimes_{k} S\right) \longrightarrow \operatorname{Spec}(R)
$$

induces a bijection on irreducible components.
Proof. Recall that irreducible components correspond to minimal primes (Lemma 10.25.1. As $R \rightarrow R \otimes_{k} S$ is flat we see by going down (Lemma 10.38.18) that any minimal prime of $R \otimes_{k} S$ lies over a minimal prime of $R$. Conversely, if $\mathfrak{p} \subset R$ is a (minimal) prime then

$$
R \otimes_{k} S / \mathfrak{p}\left(R \otimes_{k} S\right)=(R / \mathfrak{p}) \otimes_{k} S \subset f . f .(R / \mathfrak{p}) \otimes_{k} S
$$

by flatness of $R \rightarrow R \otimes_{k} S$. The ring $f . f .(R / \mathfrak{p}) \otimes_{k} S$ has irreducible spectrum by assumption. It follows that $R \otimes_{k} S / \mathfrak{p}\left(R \otimes_{k} S\right)$ has a single minimal prime (Lemma

[^20]10.29 .5 . In other words, the inverse image of the irreducible set $V(\mathfrak{p})$ is irreducible. Hence the lemma follows.

Let us make some remarks on the notion of geometrically irreducible field extensions.

037P Lemma 10.46.8. Let $k \subset K$ be a field extension. If $k$ is algebraically closed in $K$, then $K$ is geometrically irreducible over $k$.

Proof. Let $k \subset k^{\prime}$ be a finite separable extension, say generated by $\alpha \in k^{\prime}$ over $k$ (see Fields, Lemma 9.18.1). Let $P=T^{d}+a_{1} T^{d-1}+\ldots+a_{d} \in k[T]$ be the minimal polynomial of $\alpha$. Then $K \otimes_{k} k^{\prime} \cong K[T] /(P)$. The only way the spectrum of $K[T] /(P)$ can be reducible is if $P$ is reducible in $K[T]$. Say $P=P_{1} P_{2}$ is a nontrivial factorization of $P$ into monic polynomials. Let $b_{1}, \ldots, b_{t} \in K$ be the coefficients of $P_{1}$. Then we see that $b_{i}$ is algebraic over $k$ by Lemma 10.37.5. Hence the lemma follows.

037Q Lemma 10.46.9. Let $k \subset K$ be a field extension. Consider the subextension $k \subset k^{\prime} \subset K$ such that $k \subset k^{\prime}$ is separable algebraic and $k^{\prime} \subset K$ maximal with this property. Then $K$ is geometrically irreducible over $k^{\prime}$. If $K / k$ is a finitely generated field extension, then $\left[k^{\prime}: k\right]<\infty$.

Proof. Let $k^{\prime \prime} \subset K$ be the algebraic closure of $k$ in $K$. By Lemma 10.46 .8 we see that $K$ is geometrically irreducible over $k^{\prime \prime}$. Since $k^{\prime} \subset k^{\prime \prime}$ is purely inseparable (Fields, Lemma 9.13.6) we see from Lemma 10.45 .6 that the extension $k^{\prime} \subset K$ is also geometrically irreducible. If $k \subset K$ is finitely generated, then $k^{\prime}$ is finite over $k$ by Fields, Lemma 9.25.10.

04KP Lemma 10.46.10. Let $k \subset K$ be an extension of fields. Let $k \subset \bar{k}$ be a separable algebraic closure. Then $G a l(\bar{k} / k)$ acts transitively on the primes of $\bar{k} \otimes_{k} K$.

Proof. Let $k \subset k^{\prime} \subset K$ be the subextension found in Lemma 10.46.9. Note that as $k \subset \bar{k}$ is integral all the prime ideals of $\bar{k} \otimes_{k} K$ and $\bar{k} \otimes_{k} k^{\prime}$ are maximal, see Lemma 10.35.18. By Lemma 10.46.7 the map

$$
\operatorname{Spec}\left(\bar{k} \otimes_{k} K\right) \rightarrow \operatorname{Spec}\left(\bar{k} \otimes_{k} k^{\prime}\right)
$$

is bijective because (1) all primes are minimal primes, (1) $\bar{k} \otimes_{k} K=\left(\bar{k} \otimes_{k} k^{\prime}\right) \otimes_{k^{\prime}} K$, and (3) $K$ is geometrically irreducible over $k^{\prime}$. Hence it suffices to prove the lemma for the action of $\operatorname{Gal}(\bar{k} / k)$ on the primes of $\bar{k} \otimes_{k} k^{\prime}$.

As every prime of $\bar{k} \otimes_{k} k^{\prime}$ is maximal, the residue fields are isomorphic to $\bar{k}$. Hence the prime ideals of $\bar{k} \otimes_{k} k^{\prime}$ correspond one to one to elements of $\operatorname{Hom}_{k}\left(k^{\prime}, \bar{k}\right)$ with $\sigma \in \operatorname{Hom}_{k}\left(k^{\prime}, \bar{k}\right)$ corresponding to the kernel $\mathfrak{p}_{\sigma}$ of $1 \otimes \sigma: \bar{k} \otimes_{k} k^{\prime} \rightarrow \bar{k}$. In particular $\operatorname{Gal}(\bar{k} / k)$ acts transitively on this set as desired.

### 10.47. Geometrically connected algebras

05DV
Lemma 10.47.1. Let $k$ be a separably algebraically closed field. Let $R, S$ be $k$-algebras. If $\operatorname{Spec}(R)$, and $\operatorname{Spec}(S)$ are connected, then so is $\operatorname{Spec}\left(R \otimes_{k} S\right)$.

Proof. Recall that $\operatorname{Spec}(R)$ is connected if and only if $R$ has no nontrivial idempotents, see Lemma 10.20 .4 Hence, by Lemma 10.42 .4 we may assume $R$ and $S$ are of finite type over $k$. In this case $R$ and $S$ are Noetherian, and have finitely many minimal primes, see Lemma 10.30 .6 Thus we may argue by induction on $n+m$ where $n$, resp. $m$ is the number of irreducible components of $\operatorname{Spec}(R)$, resp. $\operatorname{Spec}(S)$. Of course the case where either $n$ or $m$ is zero is trivial. If $n=m=1$, i.e., $\operatorname{Spec}(R)$ and $\operatorname{Spec}(S)$ both have one irreducible component, then the result holds by Lemma 10.46 .2 . Suppose that $n>1$. Let $\mathfrak{p} \subset R$ be a minimal prime corresponding to the irreducible closed subset $T \subset \operatorname{Spec}(R)$. Let $I \subset R$ be such that $T^{\prime}=V(I) \subset \operatorname{Spec}(R)$ is the closure of the complement of $T$. Note that this means that $T^{\prime}=\operatorname{Spec}(R / I)$ (Lemma 10.16 .7 ) has $n-1$ irreducible components. Then $T \cup T^{\prime}=\operatorname{Spec}(R)$, and $T \cap T^{\prime}=V(\mathfrak{p}+I)=\operatorname{Spec}(R /(\mathfrak{p}+I))$ is not empty as $\operatorname{Spec}(R)$ is assumed connected. The inverse image of $T$ in $\operatorname{Spec}\left(R \otimes_{k} S\right)$ is $\operatorname{Spec}\left(R / \mathfrak{p} \otimes_{k} S\right)$, and the inverse of $T^{\prime}$ in $\operatorname{Spec}\left(R \otimes_{k} S\right)$ is $\operatorname{Spec}\left(R / I \otimes_{k} S\right)$. By induction these are both connected. The inverse image of $T \cap T^{\prime}$ is $\operatorname{Spec}\left(R /(\mathfrak{p}+I) \otimes_{k} S\right)$ which is nonempty. Hence $\operatorname{Spec}\left(R \otimes_{k} S\right)$ is connected.
037S Lemma 10.47.2. Let $k$ be a field. Let $R$ be a $k$-algebra. The following are equivalent
(1) for every field extension $k \subset k^{\prime}$ the spectrum of $R \otimes_{k} k^{\prime}$ is connected, and
(2) for every finite separable field extension $k \subset k^{\prime}$ the spectrum of $R \otimes_{k} k^{\prime}$ is connected.
Proof. For any extension of fields $k \subset k^{\prime}$ the connectivity of the spectrum of $R \otimes_{k} k^{\prime}$ is equivalent to $R \otimes_{k} k^{\prime}$ having no nontrivial idempotents, see Lemma 10.20.4 Assume (2). Let $k \subset \bar{k}$ be a separable algebraic closure of $k$. Using Lemma 10.42 .4 we see that (2) is equivalent to $R \otimes_{k} \bar{k}$ having no nontrivial idempotents. For any field extension $k \subset k^{\prime}$, there exists a field extension $\bar{k} \subset \bar{k}^{\prime}$ with $k^{\prime} \subset \bar{k}^{\prime}$. By Lemma 10.47.1 we see that $R \otimes_{k} \bar{k}^{\prime}$ has no nontrivial idempotents. If $R \otimes_{k} k^{\prime}$ has a nontrivial idempotent, then also $R \otimes_{k} \bar{k}^{\prime}$, contradiction.

037T Definition 10.47.3. Let $k$ be a field. Let $S$ be a $k$-algebra. We say $S$ is geometrically connected over $k$ if for every field extension $k \subset k^{\prime}$ the spectrum of $S \otimes_{k} k^{\prime}$ is connected.
By Lemma 10.47 .2 it suffices to check this for finite separable field extensions $k \subset k^{\prime}$.
037U Lemma 10.47.4. Let $k$ be a field. Let $R$ be a $k$-algebra. If $k$ is separably algebraically closed then $R$ is geometrically connected over $k$ if and only if the spectrum of $R$ is connected.
Proof. Immediate from the remark following Definition 10.47.3.
037 V Lemma 10.47.5. Let $k$ be a field. Let $S$ be a $k$-algebra.
(1) If $S$ is geometrically connected over $k$ so is every $k$-subalgebra.
(2) If all finitely generated $k$-subalgebras of $S$ are geometrically connected, then $S$ is geometrically connected.
(3) A directed colimit of geometrically connected $k$-algebras is geometrically connected.
Proof. This follows from the characterization of connectedness in terms of the nonexistence of nontrivial idempotents. The second and third property follow from the fact that tensor product commutes with colimits.

The following lemma will be superseded by the more general Varieties, Lemma 32.5 .4

037W Lemma 10.47.6. Let $k$ be a field. Let $S$ be a geometrically connected $k$-algebra. Let $R$ be any $k$-algebra. The map

$$
R \longrightarrow R \otimes_{k} S
$$

induces a bijection on idempotents, and the map

$$
\operatorname{Spec}\left(R \otimes_{k} S\right) \longrightarrow \operatorname{Spec}(R)
$$

induces a bijection on connected components.
Proof. The second assertion follows from the first combined with Lemma 10.21 .2 , By Lemmas 10.47 .5 and 10.42 .4 we may assume that $R$ and $S$ are of finite type over $k$. Then we see that also $R \otimes_{k} S$ is of finite type over $k$. Note that in this case all the rings are Noetherian and hence their spectra have finitely many connected components (since they have finitely many irreducible components, see Lemma 10.30.6). In particular, all connected components in question are open! Hence via Lemma 10.22 .3 we see that the first statement of the lemma in this case is equivalent to the second. Let's prove this. As the algebra $S$ is geometrically connected and nonzero we see that all fibres of $X=\operatorname{Spec}\left(R \otimes_{k} S\right) \rightarrow \operatorname{Spec}(R)=Y$ are connected and nonempty. Also, as $R \rightarrow R \otimes_{k} S$ is flat of finite presentation the map $X \rightarrow Y$ is open (Proposition 10.40.8. Topology, Lemma 5.6.5 shows that $X \rightarrow Y$ induces bijection on connected components.

### 10.48. Geometrically integral algebras

05DW
05DX Definition 10.48.1. Let $k$ be a field. Let $S$ be a $k$-algebra. We say $S$ is geometrically integral over $k$ if for every field extension $k \subset k^{\prime}$ the ring of $S \otimes_{k} k^{\prime}$ is a domain.

Any question about geometrically integral algebras can be translated in a question about geometrically reduced and irreducible algebras.

05DY Lemma 10.48.2. Let $k$ be a field. Let $S$ be a $k$-algebra. In this case $S$ is geometrically integral over $k$ if and only if $S$ is geometrically irreducible as well as geometrically reduced over $k$.

Proof. Omitted.
09P9 Lemma 10.48.3. Let $k$ be a field. Let $S$ be a geometrically integral $k$-algebra. Let $R$ be ak-algebra and an integral domain. Then $R \otimes_{k} S$ is an integral domain.

Proof. By Lemma 10.42 .5 the ring $R \otimes_{k} S$ is reduced and by Lemma 10.46 .7 the ring $R \otimes_{k} S$ is irreducible (the spectrum has just one irreducible component), so $R \otimes_{k} S$ is an integral domain.

### 10.49. Valuation rings

00 I 8 Here are some definitions.
00 I 9 Definition 10.49.1. Valuation rings.
(1) Let $K$ be a field. Let $A, B$ be local rings contained in $K$. We say that $B$ dominates $A$ if $A \subset B$ and $\mathfrak{m}_{A}=A \cap \mathfrak{m}_{B}$.
(2) Let $A$ be a ring. We say $A$ is a valuation ring if $A$ is a local domain and if $A$ is maximal for the relation of domination among local rings contained in the fraction field of $A$.
(3) Let $A$ be a valuation ring with fraction field $K$. If $R \subset K$ is a subring of $K$, then we say $A$ is centered on $R$ if $R \subset A$.

With this definition a field is a valuation ring.
00IA Lemma 10.49.2. Let $K$ be a field. Let $A \subset K$ be a local subring. Then there exists a valuation ring with fraction field $K$ dominating $A$.

Proof. We consider the collection of local subrings of $K$ as a partially ordered set using the relation of domination. Suppose that $\left\{A_{i}\right\}_{i \in I}$ is a totally ordered collection of local subrings of $K$. Then $B=\bigcup A_{i}$ is a local subring which dominates all of the $A_{i}$. Hence by Zorn's Lemma, it suffices to show that if $A \subset K$ is a local ring whose fraction field is not $K$, then there exists a local ring $B \subset K, B \neq A$ dominating $A$.
Pick $t \in K$ which is not in the fraction field of $A$. If $t$ is transcendental over $A$, then $A[t] \subset K$ and hence $A[t]_{(t, \mathfrak{m})} \subset K$ is a local ring distinct from $A$ dominating $A$. Suppose $t$ is algebraic over $A$. Then for some $a \in A$ the element at is integral over $A$. In this case the subring $A^{\prime} \subset K$ generated by $A$ and $t a$ is finite over $A$. By Lemma 10.35 .15 there exists a prime ideal $\mathfrak{m}^{\prime} \subset A^{\prime}$ lying over $\mathfrak{m}$. Then $A_{\mathfrak{m}^{\prime}}^{\prime}$ dominates $A$. If $A=A_{\mathfrak{m}^{\prime}}^{\prime}$, then $t$ is in the fraction field of $A$ which we assumed not to be the case. Thus $A \neq A_{\mathfrak{m}^{\prime}}^{\prime}$ as desired.
00IB Lemma 10.49.3. Let $A$ be a valuation ring with maximal ideal $\mathfrak{m}$ and fraction field $K$. Let $x \in K$. Then either $x \in A$ or $x^{-1} \in A$ or both.
Proof. Assume that $x$ is not in $A$. Let $A^{\prime}$ denote the subring of $K$ generated by $A$ and $x$. Since $A$ is a valuation ring we see that there is no prime of $A^{\prime}$ lying over $\mathfrak{m}$. Hence we can write $1=\sum_{i=0}^{d} t_{i} x^{i}$ with $t_{i} \in \mathfrak{m}$. This implies that $\left(1-t_{0}\right)\left(x^{-1}\right)^{d}-\sum t_{i}\left(x^{-1}\right)^{d-i}=0$. In particular we see that $x^{-1}$ is integral over $A$. Thus the subring $A^{\prime \prime}$ of $K$ generated by $A$ and $x^{-1}$ is finite over $A$ and we see there exists a prime ideal $\mathfrak{m}^{\prime \prime} \subset A^{\prime \prime}$ lying over $\mathfrak{m}$ by Lemma 10.35.15. Since $A$ is a valuation ring we conclude that $A=\left(A^{\prime \prime}\right)_{\mathfrak{m}^{\prime \prime}}$ and hence $x^{-1} \in A$.

052K Lemma 10.49.4. Let $A \subset K$ be a subring of a field $K$ such that for all $x \in K$ either $x \in A$ or $x^{-1} \in A$ or both. Then $A$ is a valuation ring with fraction field $K$.

Proof. If $A$ is not $K$, then $A$ is not a field and there is a nonzero maximal ideal $\mathfrak{m}$. If $\mathfrak{m}^{\prime}$ is a second maximal ideal, then choose $x, y \in A$ with $x \in \mathfrak{m}, y \notin \mathfrak{m}, x \notin \mathfrak{m}^{\prime}$, and $y \in \mathfrak{m}^{\prime}$ (see Lemma 10.14.2). Then neither $x / y \in A$ nor $y / x \in A$ contradicting the assumption of the lemma. Thus we see that $A$ is a local ring. Suppose that $A^{\prime}$ is a local ring contained in $K$ which dominates $A$. Let $x \in A^{\prime}$. We have to show that $x \in A$. If not, then $x^{-1} \in A$, and of course $x^{-1} \in \mathfrak{m}_{A}$. But then $x^{-1} \in \mathfrak{m}_{A^{\prime}}$ which contradicts $x \in A^{\prime}$.

0AS4 Lemma 10.49.5. Let I be a directed partially ordered set. Let $\left(A_{i}, \varphi_{i j}\right)$ be a system of valuation rings over I whose transition maps $\varphi_{i j}$ are local. Then $A=\operatorname{colim} A_{i}$ is a valuation ring.

Proof. It is clear that $A$ is a domain. Let $a, b \in A$. Lemma 10.49 .4 tells us we have to show that either $a \mid b$ or $b \mid a$ in $A$. Choose $i$ so large that there exist $a_{i}, b_{i} \in A_{i}$ mapping to $a, b$. Then Lemma 10.49 .3 applied to $a_{i}, b_{i}$ in $A_{i}$ implies the result for $a, b$ in $A$.

052L Lemma 10.49.6. Let $K \subset L$ be an extension of fields. If $B \subset L$ is a valuation ring, then $A=K \cap B$ is a valuation ring.

Proof. We can replace $L$ by $f . f .(B)$ and $K$ by $K \cap f . f .(B)$. Then the lemma follows from a combination of Lemmas 10.49 .3 and 10.49.4.

0AAV Lemma 10.49.7. Let $K \subset L$ be an algebraic extension of fields. If $B \subset L$ is a valuation ring with fraction field $L$ and not a field, then $A=K \cap B$ is a valuation ring and not a field.

Proof. By Lemma 10.49 .6 the ring $A$ is a valuation ring. If $A$ is a field, then $A=K$. Then $A=K \subset B$ is an integral extension, hence there are no proper inclusions among the primes of $B$ (Lemma 10.35.18). This contradicts the assumption that $B$ is a local domain and not a field.

088Y Lemma 10.49.8. Let $A$ be a valuation ring. For any prime ideal $\mathfrak{p} \subset A$ the quotient $A / \mathfrak{p}$ is a valuation ring. The same is true for the localization $A_{\mathfrak{p}}$ and in fact any localization of $A$.

Proof. Use the characterization of valuation rings given in Lemma 10.49.4
088 Z Lemma 10.49.9. Let $A^{\prime}$ be a valuation ring with residue field $K$. Let $A$ be a valuation ring with fraction field $K$. Then $C=\left\{\lambda \in A^{\prime} \mid \lambda \bmod \mathfrak{m}_{A^{\prime}} \in A\right\}$ is a valuation ring.

Proof. Note that $\mathfrak{m}_{A^{\prime}} \subset C$ and $C / \mathfrak{m}_{A^{\prime}}=A$. In particular, the fraction field of $C$ is equal to the fraction field of $A^{\prime}$. We will use the criterion of Lemma 10.49 .4 to prove the lemma. Let $x$ be an element of the fraction field of $C$. By the lemma we may assume $x \in A^{\prime}$. If $x \in \mathfrak{m}_{A^{\prime}}$, then we see $x \in C$. If not, then $x$ is a unit of $A^{\prime}$ and we also have $x^{-1} \in A^{\prime}$. Hence either $x$ or $x^{-1}$ maps to an element of $A$ by the lemma again.

00IC Lemma 10.49.10. Let $A$ be a valuation ring. Then $A$ is a normal domain.
Proof. Suppose $x$ is in the field of fractions of $A$ and integral over $A$, say $x^{d}+$ $\sum_{i<d} a_{i} x^{i}=0$. By Lemma 10.49 .4 either $x \in A$ (and we're done) or $x^{-1} \in A$. In the second case we see that $x=-\sum a_{i} x^{i-d} \in A$ as well.

090P Lemma 10.49.11. Let $A$ be a normal domain with fraction field $K$. For every $x \in K, x \notin A$ there exists a valuation ring $A \subset V \subset K$ with fraction field $K$ such that $x \notin V$. In other words, $A$ is the intersection of all valuation rings in $K$ containing $A$.

Proof. Suppose $x \in K, x \notin A$. Consider $B=A\left[x^{-1}\right]$. Then $x \notin B$. Namely, if $x=a_{0}+a_{1} x^{-1}+\ldots+a_{d} x^{-d}$ then $x^{d+1}-a_{0} x^{d}-\ldots-a_{d}=0$ and $x$ is integral over $A$ in contradiction with the fact that $A$ is normal. Thus $x^{-1}$ is not a unit in $B$. Thus $V\left(x^{-1}\right) \subset \operatorname{Spec}(B)$ is not empty (Lemma 10.16.2), and we can choose a prime $\mathfrak{p} \subset B$ with $x^{-1} \in \mathfrak{p}$. Choose a valuation ring $V \subset K$ dominating $B_{\mathfrak{p}}$ (Lemma 10.49.2. Then $x \notin V$ as $x^{-1} \in \mathfrak{m}_{V}$.

An totally ordered abelian group is a pair $(\Gamma, \geq)$ consisting of an abelian group $\Gamma$ endowed with a total ordering $\geq$ such that $\gamma \geq \gamma^{\prime} \Rightarrow \gamma+\gamma^{\prime \prime} \geq \gamma^{\prime}+\gamma^{\prime \prime}$ for all $\gamma, \gamma^{\prime}, \gamma^{\prime \prime} \in \Gamma$.
00ID Lemma 10.49.12. Let $A$ be a valuation ring with field of fractions $K$. Set $\Gamma=$ $K^{*} / A^{*}$ (with group law written additively). For $\gamma, \gamma^{\prime} \in \Gamma$ define $\gamma \geq \gamma^{\prime}$ if and only if $\gamma-\gamma^{\prime}$ is in the image of $A-\{0\} \rightarrow \Gamma$. Then $(\Gamma, \geq)$ is a totally ordered abelian group.

Proof. Omitted, but follows easily from Lemma 10.49.3. Note that in case $A=K$ we obtain the zero group $\Gamma=\{0\}$ endowed with its unique total ordering.

00IE Definition 10.49.13. Let $A$ be a valuation ring.
(1) The totally ordered abelian group $(\Gamma, \geq)$ of Lemma 10.49 .12 is called the value group of the valuation ring $A$.
(2) The map $v: A-\{0\} \rightarrow \Gamma$ and also $v: K^{*} \rightarrow \Gamma$ is called the valuation associated to $A$.
(3) The valuation ring $A$ is called a discrete valuation ring if $\Gamma \cong \mathbf{Z}$.

Note that if $\Gamma \cong \mathbf{Z}$ then there is a unique such isomorphism such that $1 \geq 0$. If the isomorphism is chosen in this way, then the ordering becomes the usual ordering of the integers.

00IF Lemma 10.49.14. Let $A$ be a valuation ring. The valuation $v: A-\{0\} \rightarrow \Gamma_{\geq 0}$ has the following properties:
(1) $v(a)=0 \Leftrightarrow a \in A^{*}$,
(2) $v(a b)=v(a)+v(b)$,
(3) $v(a+b) \geq \min (v(a), v(b))$.

Proof. Omitted.
090Q Lemma 10.49.15. Let $A$ be a ring. The following are equivalent
(1) $A$ is a valuation ring,
(2) $A$ is a local domain and every finitely generated ideal of $A$ is principal.

Proof. Assume $A$ is a valuation ring and let $f_{1}, \ldots, f_{n} \in A$. Choose $i$ such that $v\left(f_{i}\right)$ is minimal among $v\left(f_{j}\right)$. Then $\left(f_{i}\right)=\left(f_{1}, \ldots, f_{n}\right)$. Conversely, assume $A$ is a local domain and every finitely generated ideal of $A$ is principal. Pick $f, g \in A$ and write $(f, g)=(h)$. Then $f=a h$ and $g=b h$ and $h=c f+d g$ for some $a, b, c, d \in A$. Thus $a c+b d=1$ and we see that either $a$ or $b$ is a unit, i.e., either $g / f$ or $f / g$ is an element of $A$. This shows $A$ is a valuation ring by Lemma 10.49.4,
00IG Lemma 10.49.16. Let $(\Gamma, \geq)$ be a totally ordered abelian group. Let $K$ be $a$ field. Let $v: K^{*} \rightarrow \Gamma$ be a homomorphism of abelian groups such that $v(a+b) \geq$ $\min (v(a), v(b))$ for $a, b \in K$ with $a, b, a+b$ not zero. Then

$$
A=\{x \in K \mid x=0 \text { or } v(x) \geq 0\}
$$

is a valuation ring with value group $\operatorname{Im}(v) \subset \Gamma$, with maximal ideal

$$
\mathfrak{m}=\{x \in K \mid x=0 \text { or } v(x)>0\}
$$

and with group of units

$$
A^{*}=\left\{x \in K^{*} \mid v(x)=0\right\}
$$

Proof. Omitted.

Let $(\Gamma, \geq)$ be a totally ordered abelian group. An ideal of $\Gamma$ is a subset $I \subset \Gamma$ such that all elements of $I$ are $\geq 0$ and $\gamma \in I, \gamma^{\prime} \geq \gamma$ implies $\gamma^{\prime} \in I$. We say that such an ideal is prime if $\gamma+\gamma^{\prime} \in I, \gamma, \gamma^{\prime} \geq 0 \Rightarrow \gamma \in I$ or $\gamma^{\prime} \in I$.
00IH Lemma 10.49.17. Let $A$ be a valuation ring. Ideals in $A$ correspond $1-1$ with ideals of $\Gamma$. This bijection is inclusion preserving, and maps prime ideals to prime ideals.

Proof. Omitted.
00II Lemma 10.49.18. A valuation ring is Noetherian if and only if it is a discrete valuation ring or a field.

Proof. Suppose $A$ is a discrete valuation ring with valuation $v: A \backslash\{0\} \rightarrow \mathbf{Z}$ normalized so that $\operatorname{Im}(v) \subset \mathbf{Z}_{\geq 0}$. By Lemma 10.49 .17 the ideals of $A$ are the subsets $I_{n}=\{0\} \cup v^{-1}\left(\mathbf{Z}_{\geq n}\right)$. It is clear that any element $x \in A$ with $v(x)=n$ generates $I_{n}$. Hence $A$ is a PID so certainly Noetherian.

Suppose $A$ is a Noetherian valuation ring with value group $\Gamma$. By Lemma 10.49.17 we see the ascending chain condition holds for ideals in $\Gamma$. We may assume $A$ is not a field, i.e., there is a $\gamma \in \Gamma$ with $\gamma>0$. Applying the ascending chain condition to the subsets $\gamma+\Gamma_{\geq 0}$ with $\gamma>0$ we see there exists a smallest element $\gamma_{0}$ which is bigger than 0 . Let $\gamma \in \Gamma$ be an element $\gamma>0$. Consider the sequence of elements $\gamma, \gamma-\gamma_{0}, \gamma-2 \gamma_{0}$, etc. By the ascending chain condition these cannot all be $>0$. Let $\gamma-n \gamma_{0}$ be the last one $\geq 0$. By minimality of $\gamma_{0}$ we see that $0=\gamma-n \gamma_{0}$. Hence $\Gamma$ is a cyclic group as desired.

### 10.50. More Noetherian rings

00IJ
00IK Lemma 10.50.1. Let $R$ be a Noetherian ring. Any finite $R$-module is of finite presentation. Any submodule of a finite $R$-module is finite. The ascending chain condition holds for $R$-submodules of a finite $R$-module.

Proof. We first show that any submodule $N$ of a finite $R$-module $M$ is finite. We do this by induction on the number of generators of $M$. If this number is 1 , then $N=J / I \subset M=R / I$ for some ideals $I \subset J \subset R$. Thus the definition of Noetherian implies the result. If the number of generators of $M$ is greater than 1 , then we can find a short exact sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ where $M^{\prime}$ and $M^{\prime \prime}$ have fewer generators. Note that setting $N^{\prime}=M^{\prime} \cap N$ and $N^{\prime \prime}=\operatorname{Im}\left(N \rightarrow M^{\prime \prime}\right)$ gives a similar short exact sequence for $N$. Hence the result follows from the induction hypothesis since the number of generators of $N$ is at most the number of generators of $N^{\prime}$ plus the number of generators of $N^{\prime \prime}$.
To show that $M$ is finitely presented just apply the previous result to the kernel of a presentation $R^{n} \rightarrow M$.
It is well known and easy to prove that the ascending chain condition for $R$ submodules of $M$ is equivalent to the condition that every submodule of $M$ is a finite $R$-module. We omit the proof.

00IN Lemma 10.50.2 (Artin-Rees). Suppose that $R$ is Noetherian, $I \subset R$ an ideal. Let $N \subset M$ be finite $R$-modules. There exists a constant $c>0$ such that $I^{n} M \cap N=$ $I^{n-c}\left(I^{c} M \cap N\right)$ for all $n \geq c$.

Proof. Consider the ring $S=R \oplus I \oplus I^{2} \oplus \ldots=\bigoplus_{n \geq 0} I^{n}$. Convention: $I^{0}=$ $R$. Multiplication maps $I^{n} \times I^{m}$ into $I^{n+m}$ by multiplication in $R$. Note that if $I=\left(f_{1}, \ldots, f_{t}\right)$ then $S$ is a quotient of the Noetherian ring $R\left[X_{1}, \ldots, X_{t}\right]$. The map just sends the monomial $X_{1}^{e_{1}} \ldots X_{t}^{e_{t}}$ to $f_{1}^{e_{1}} \ldots f_{t}^{e_{t}}$. Thus $S$ is Noetherian. Similarly, consider the module $M \oplus I M \oplus I^{2} M \oplus \ldots=\bigoplus_{n \geq 0} I^{n} M$. This is a finitely generated $S$-module. Namely, if $x_{1}, \ldots, x_{r}$ generate $M$ over $R$, then they also generate $\bigoplus_{n \geq 0} I^{n} M$ over $S$. Next, consider the submodule $\bigoplus_{n \geq 0} I^{n} M \cap N$. This is an $S$-submodule, as is easily verified. By Lemma 10.50 .1 it is finitely generated as an $S$-module, say by $\xi_{j} \in \bigoplus_{n \geq 0} I^{n} M \cap N, j=1, \ldots, s$. We may assume by decomposing each $\xi_{j}$ into its homogeneous pieces that each $\xi_{j} \in I^{d_{j}} M \cap N$ for some $d_{j}$. Set $c=\max \left\{d_{j}\right\}$. Then for all $n \geq c$ every element in $I^{n} M \cap N$ is of the form $\sum h_{j} \xi_{j}$ with $h_{j} \in I^{n-d_{j}}$. The lemma now follows from this and the trivial observation that $I^{n-d_{j}}\left(I^{d_{j}} M \cap N\right) \subset I^{n-c}\left(I^{c} M \cap N\right)$.
00IO Lemma 10.50.3. Suppose that $0 \rightarrow K \rightarrow M \xrightarrow{f} N$ is an exact sequence of finitely generated modules over a Noetherian ring $R$. Let $I \subset R$ be an ideal. Then there exists a $c$ such that

$$
f^{-1}\left(I^{n} N\right)=K+I^{n-c} f^{-1}\left(I^{c} N\right) \quad \text { and } \quad f(M) \cap I^{n} N \subset f\left(I^{n-c} M\right)
$$

for all $n \geq c$.
Proof. Apply Lemma 10.50 .2 to $\operatorname{Im}(f) \subset N$ and note that $f: I^{n-c} M \rightarrow I^{n-c} f(M)$ is surjective.
00IP Lemma 10.50.4 (Krull's intersection theorem). Let $R$ be a Noetherian local ring. Let $I \subset R$ be a proper ideal. Let $M$ be a finite $R$-module. Then $\bigcap_{n \geq 0} I^{n} M=0$.
Proof. Let $N=\bigcap_{n \geq 0} I^{n} M$. Then $N=I^{n} M \cap N$ for all $n \geq 0$. By the Artin-Rees Lemma 10.50 .2 we see that $N=I^{n} M \cap N \subset I N$ for some suitably large $n$. By Nakayama's Lemma 10.19.1 we see that $N=0$.

00IQ Lemma 10.50.5. Let $R$ be a Noetherian ring. Let $I \subset R$ be an ideal. Let $M$ be a finite $R$-module. Let $N=\bigcap_{n} I^{n} M$.
(1) For every prime $\mathfrak{p}, I \subset \mathfrak{p}$ there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $N_{f}=0$.
(2) If $I \subset \operatorname{rad}(R)$ is contained in the Jacobson radical of $R$, then $N=0$.

Proof. Proof of (1). Let $x_{1}, \ldots, x_{n}$ be generators for the module $N$, see Lemma 10.50.1. For every prime $\mathfrak{p}, I \subset \mathfrak{p}$ we see that the image of $N$ in the localization $M_{\mathfrak{p}}$ is zero, by Lemma 10.50 .4 . Hence we can find $g_{i} \in R, g_{i} \notin \mathfrak{p}$ such that $x_{i}$ maps to zero in $N_{g_{i}}$. Thus $N_{g_{1} g_{2} \ldots g_{n}}=0$.
Part (2) follows from (1) and Lemma 10.23.1.
00IR Remark 10.50.6. Lemma 10.50 .4 in particular implies that $\bigcap_{n} I^{n}=(0)$ when $I \subset R$ is a non-unit ideal in a Noetherian local ring $R$. More generally, let $R$ be a Noetherian ring and $I \subset R$ an ideal. Suppose that $f \in \bigcap_{n \in \mathbf{N}} I^{n}$. Then Lemma 10.50 .5 says that for every prime ideal $I \subset \mathfrak{p}$ there exists a $g \in R, g \notin \mathfrak{p}$ such that $f$ maps to zero in $R_{g}$. In algebraic geometry we express this by saying that " $f$ is zero in an open neighbourhood of the closed set $V(I)$ of $\operatorname{Spec}(R)$ ".

00IS Lemma 10.50.7 (Artin-Tate). Let $R$ be a Noetherian ring. Let $S$ be a finitely generated $R$-algebra. If $T \subset S$ is an $R$-subalgebra such that $S$ is finitely generated as a $T$-module, then $T$ is a finite type over $R$.

Proof. Choose elements $x_{1}, \ldots, x_{n} \in S$ which generate $S$ as an $R$-algebra. Choose $y_{1}, \ldots, y_{m}$ in $S$ which generate $S$ as a $T$-module. Thus there exist $a_{i j} \in T$ such that $x_{i}=\sum a_{i j} y_{j}$. There also exist $b_{i j k} \in T$ such that $y_{i} y_{j}=\sum b_{i j k} y_{k}$. Let $T^{\prime} \subset T$ be the sub $R$-algebra generated by $a_{i j}$ and $b_{i j k}$. This is a finitely generated $R$-algebra, hence Noetherian. Consider the algebra

$$
S^{\prime}=T^{\prime}\left[Y_{1}, \ldots, Y_{m}\right] /\left(Y_{i} Y_{j}-\sum b_{i j k} Y_{k}\right)
$$

Note that $S^{\prime}$ is finite over $T^{\prime}$, namely as a $T^{\prime}$-module it is generated by the classes of $1, Y_{1}, \ldots, Y_{m}$. Consider the $T^{\prime}$-algebra homomorphism $S^{\prime} \rightarrow S$ which maps $Y_{i}$ to $y_{i}$. Because $a_{i j} \in T^{\prime}$ we see that $x_{j}$ is in the image of this map. Thus $S^{\prime} \rightarrow S$ is surjective. Therefore $S$ is finite over $T^{\prime}$ as well. Since $T^{\prime}$ is Noetherian and we conclude that $T \subset S$ is finite over $T^{\prime}$ and we win.

### 10.51. Length

00IU
02LY Definition 10.51.1. Let $R$ be a ring. For any $R$-module $M$ we define the length of $M$ over $R$ by the formula

$$
\operatorname{length}_{R}(M)=\sup \left\{n \mid \exists 0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M, M_{i} \neq M_{i+1}\right\}
$$

In other words it is the supremum of the lengths of chains of submodules. There is an obvious notion of when a chain of submodules is a refinement of another. This gives a partial ordering on the collection of all chains of submodules, with the smallest chain having the shape $0=M_{0} \subset M_{1}=M$ if $M$ is not zero. We note the obvious fact that if the length of $M$ is finite, then every chain can be refined to a maximal chain. But it is not as obvious that all maximal chains have the same length (as we will see later).

02LZ Lemma 10.51.2. Let $R$ be a ring. Let $M$ be an $R$-module. If length $h_{R}(M)<\infty$ then $M$ is a finite $R$-module.

Proof. Omitted.
00IV Lemma 10.51.3. If $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ is a short exact sequence of modules over $R$ then the length of $M$ is the sum of the lengths of $M^{\prime}$ and $M^{\prime \prime}$.

Proof. Given filtrations of $M^{\prime}$ and $M^{\prime \prime}$ of lengths $n^{\prime}, n^{\prime \prime}$ it is easy to make a corresponding filtration of $M$ of length $n^{\prime}+n^{\prime \prime}$. Thus we see that length $R_{R} \geq$ length $_{R} M^{\prime}+$ length $_{R} M^{\prime \prime}$. Conversely, given a filtration $M_{0} \subset M_{1} \subset \ldots \subset M_{n}$ of $M$ consider the induced filtrations $M_{i}^{\prime}=M_{i} \cap M^{\prime}$ and $M_{i}^{\prime \prime}=\operatorname{Im}\left(M_{i} \rightarrow M^{\prime \prime}\right)$. Let $n^{\prime}$ (resp. $n^{\prime \prime}$ ) be the number of steps in the filtration $\left\{M_{i}^{\prime}\right\}$ (resp. $\left\{M_{i}^{\prime \prime}\right\}$ ). If $M_{i}^{\prime}=M_{i+1}^{\prime}$ and $M_{i}^{\prime \prime}=M_{i+1}^{\prime \prime}$ then $M_{i}=M_{i+1}$. Hence we conclude that $n^{\prime}+n^{\prime \prime} \geq n$. Combined with the earlier result we win.

00IW Lemma 10.51.4. Let $R$ be a local ring with maximal ideal $\mathfrak{m}$. Let $M$ be an $R$-module.
(1) If $M$ is a finite module and $\mathfrak{m}^{n} M \neq 0$ for all $n \geq 0$, then length ${ }_{R}(M)=\infty$.
(2) If $M$ has finite length then $\mathfrak{m}^{n} M=0$ for some $n$.

Proof. Assume $\mathfrak{m}^{n} M \neq 0$ for all $n \geq 0$. Choose $x \in M$ and $f_{1}, \ldots, f_{n} \in \mathfrak{m}$ such that $f_{1} f_{2} \ldots f_{n} x \neq 0$. By Nakayama's Lemma 10.19.1 the first $n$ steps in the filtration

$$
0 \subset R f_{1} \ldots f_{n} x \subset R f_{1} \ldots f_{n-1} x \subset \ldots \subset R x \subset M
$$

are distinct. This can also be seen directly. For example, if $R f_{1} x=R f_{1} f_{2} x$, then $f_{1} x=g f_{1} f_{2} x$ for some $g$, hence $\left(1-g f_{2}\right) f_{1} x=0$ hence $f_{1} x=0$ as $1-g f_{2}$ is a unit which is a contradiction with the choice of $x$ and $f_{1}, \ldots, f_{n}$. Hence the length is infinite, i.e., (1) holds. Combine (1) and Lemma 10.51 .2 to see (2).
00IX Lemma 10.51.5. Let $R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. We always have length $h_{R}(M) \geq$ length $_{S}(M)$. If $R \rightarrow S$ is surjective then equality holds.

Proof. A filtration of $M$ by $S$-submodules gives rise a filtration of $M$ by $R$ submodules. This proves the inequality. And if $R \rightarrow S$ is surjective, then any $R$-submodule of $M$ is automatically a $S$-submodule. Hence equality in this case.
00IY Lemma 10.51.6. Let $R$ be a ring with maximal ideal $\mathfrak{m}$. Suppose that $M$ is an $R$-module with $\mathfrak{m} M=0$. Then the length of $M$ as an $R$-module agrees with the dimension of $M$ as a $R / \mathfrak{m}$ vector space. The length is finite if and only if $M$ is a finite $R$-module.
Proof. The first part is a special case of Lemma 10.51.5. Thus the length is finite if and only if $M$ has a finite basis as a $R / \mathfrak{m}$-vector space if and only if $M$ has a finite set of generators as an $R$-module.
00IZ Lemma 10.51.7. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S \subset R$ be $a$ multiplicative subset. Then length $R_{R}(M) \geq$ length $_{S^{-1} R}\left(S^{-1} M\right)$.
Proof. Any submodule $N^{\prime} \subset S^{-1} M$ is of the form $S^{-1} N$ for some $R$-submodule $N \subset M$, by Lemma 10.9.15. The lemma follows.

00J0 Lemma 10.51.8. Let $R$ be a ring with finitely generated maximal ideal $\mathfrak{m}$. (For example $R$ Noetherian.) Suppose that $M$ is a finite $R$-module with $\mathfrak{m}^{n} M=0$ for some $n$. Then length ${ }_{R}(M)<\infty$.
Proof. Consider the filtration $0=\mathfrak{m}^{n} M \subset \mathfrak{m}^{n-1} M \subset \ldots \subset \mathfrak{m} M \subset M$. All of the subquotients are finitely generated $R$-modules to which Lemma 10.51 .6 applies. We conclude by additivity, see Lemma 10.51 .3 .

00J1 Definition 10.51.9. Let $R$ be a ring. Let $M$ be an $R$-module. We say $M$ is simple if $M \neq 0$ and every submodule of $M$ is either equal to $M$ or to 0 .

00J2 Lemma 10.51.10. Let $R$ be a ring. Let $M$ be an $R$-module. The following are equivalent:
(1) $M$ is simple,
(2) length $_{R}(M)=1$, and
(3) $M \cong R / \mathfrak{m}$ for some maximal ideal $\mathfrak{m} \subset R$.

Proof. Let $\mathfrak{m}$ be a maximal ideal of $R$. By Lemma 10.51 .6 the module $R / \mathfrak{m}$ has length 1. The equivalence of the first two assertions is tautological. Suppose that $M$ is simple. Choose $x \in M, x \neq 0$. As $M$ is simple we have $M=R \cdot x$. Let $I \subset R$ be the annihilator of $x$, i.e., $I=\{f \in R \mid f x=0\}$. The map $R / I \rightarrow M$, $f \bmod I \mapsto f x$ is an isomorphism, hence $R / I$ is a simple $R$-module. Since $R / I \neq 0$ we see $I \neq R$. Let $I \subset \mathfrak{m}$ be a maximal ideal containing $I$. If $I \neq \mathfrak{m}$, then
$\mathfrak{m} / I \subset R / I$ is a nontrivial submodule contradicting the simplicity of $R / I$. Hence we see $I=\mathfrak{m}$ as desired.

00J3 Lemma 10.51.11. Let $R$ be a ring. Let $M$ be a finite length $R$-module. Let $\ell=$ length $_{R}(M)$. Choose any maximal chain of submodules

$$
0=M_{0} \subset M_{1} \subset M_{2} \subset \ldots \subset M_{n}=M
$$

with $M_{i} \neq M_{i-1}, i=1, \ldots, n$. Then
(1) $n=\ell$,
(2) each $M_{i} / M_{i-1}$ is simple,
(3) each $M_{i} / M_{i-1}$ is of the form $R / \mathfrak{m}_{i}$ for some maximal ideal $\mathfrak{m}_{i}$,
(4) given a maximal ideal $\mathfrak{m} \subset R$ we have

$$
\#\left\{i \mid \mathfrak{m}_{i}=\mathfrak{m}\right\}=\text { length }_{R_{\mathfrak{m}}}\left(M_{\mathfrak{m}}\right)
$$

Proof. If $M_{i} / M_{i-1}$ is not simple then we can refine the filtration and the filtration is not maximal. Thus we see that $M_{i} / M_{i-1}$ is simple. By Lemma 10.51 .10 the modules $M_{i} / M_{i-1}$ have length 1 and are of the form $R / \mathfrak{m}_{i}$ for some maximal ideals $\mathfrak{m}_{i}$. By additivity of length, Lemma 10.51 .3 , we see $n=\ell$. Since localization is exact, we see that

$$
0=\left(M_{0}\right)_{\mathfrak{m}} \subset\left(M_{1}\right)_{\mathfrak{m}} \subset\left(M_{2}\right)_{\mathfrak{m}} \subset \ldots \subset\left(M_{n}\right)_{\mathfrak{m}}=M_{\mathfrak{m}}
$$

is a filtration of $M_{\mathfrak{m}}$ with successive quotients $\left(M_{i} / M_{i-1}\right)_{\mathfrak{m}}$. Thus the last statement follows directly from the fact that given maximal ideals $\mathfrak{m}, \mathfrak{m}^{\prime}$ of $R$ we have

$$
\left(R / \mathfrak{m}^{\prime}\right)_{\mathfrak{m}} \cong\left\{\begin{array}{cc}
0 & \text { if } \mathfrak{m} \neq \mathfrak{m}^{\prime} \\
R_{\mathfrak{m}} / \mathfrak{m} R_{\mathfrak{m}} & \text { if } \mathfrak{m}=\mathfrak{m}^{\prime}
\end{array}\right.
$$

This we leave to the reader.
02M0 Lemma 10.51.12. Let $A$ be a local ring with maximal ideal $\mathfrak{m}$. Let $B$ be a semi-local ring with maximal ideals $\mathfrak{m}_{i}, i=1, \ldots, n$. Suppose that $A \rightarrow B$ is a homomorphism such that each $\mathfrak{m}_{i}$ lies over $\mathfrak{m}$ and such that

$$
\left[\kappa\left(\mathfrak{m}_{i}\right): \kappa(\mathfrak{m})\right]<\infty .
$$

Let $M$ be a $B$-module of finite length. Then

$$
\text { length }_{A}(M)=\sum_{i=1, \ldots, n}\left[\kappa\left(\mathfrak{m}_{i}\right): \kappa(\mathfrak{m})\right] \text { length }_{B_{\mathfrak{m}_{i}}}\left(M_{\mathfrak{m}_{i}}\right)
$$

in particular length $A_{A}(M)<\infty$.
Proof. Choose a maximal chain

$$
0=M_{0} \subset M_{1} \subset M_{2} \subset \ldots \subset M_{n}=M
$$

by $B$-submodules as in Lemma 10.51 .11 . Then each quotient $M_{i} / M_{i-1}$ is isomorphic to $\kappa\left(\mathfrak{m}_{j(i)}\right)$ for some $j(i) \in\{1, \ldots, n\}$. Moreover length ${ }_{A}\left(\kappa\left(\mathfrak{m}_{i}\right)\right)=\left[\kappa\left(\mathfrak{m}_{i}\right)\right.$ : $\kappa(\mathfrak{m})$ ] by Lemma 10.51 .6 . The lemma follows by additivity of lengths (Lemma 10.51.3).

02M1 Lemma 10.51.13. Let $A \rightarrow B$ be a flat local homomorphism of local rings. Then for any $A$-module $M$ we have

$$
\text { length }_{A}(M) \text { length }_{B}\left(B / \mathfrak{m}_{A} B\right)=\text { length }_{B}\left(M \otimes_{A} B\right)
$$

In particular, if length ${ }_{B}\left(B / \mathfrak{m}_{A} B\right)<\infty$ then $M$ has finite length if and only if $M \otimes_{A} B$ has finite length.

Proof. The ring map $A \rightarrow B$ is faithfully flat by Lemma 10.38.17. Hence if $0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M$ is a chain of length $n$ in $M$, then the corresponding chain $0=M_{0} \otimes_{A} B \subset M_{1} \otimes_{A} B \subset \ldots \subset M_{n} \otimes_{A} B=M \otimes_{A} B$ has length $n$ also. This proves length $A_{A}(M)=\infty \Rightarrow \operatorname{length}_{B}\left(M \otimes_{A} B\right)=\infty$. Next, assume length $A_{A}(M)<$ $\infty$. In this case we see that $M$ has a filtration of length $\ell=\operatorname{length}_{A}(M)$ whose quotients are $A / \mathfrak{m}_{A}$. Arguing as above we see that $M \otimes_{A} B$ has a filtration of length $\ell$ whose quotients are isomorphic to $B \otimes_{A} A / \mathfrak{m}_{A}=B / \mathfrak{m}_{A} B$. Thus the lemma follows.

02M2 Lemma 10.51.14. Let $A \rightarrow B \rightarrow C$ be flat local homomorphisms of local rings. Then

$$
\text { length }_{B}\left(B / \mathfrak{m}_{A} B\right) \text { length }_{C}\left(C / \mathfrak{m}_{B} C\right)=\text { length }_{C}\left(C / \mathfrak{m}_{A} C\right)
$$

Proof. Follows from Lemma 10.51 .13 applied to the ring map $B \rightarrow C$ and the $B$-module $M=B / \mathfrak{m}_{A} B$

### 10.52. Artinian rings

00J4 Artinian rings, and especially local Artinian rings, play an important role in algebraic geometry, for example in deformation theory.
00J5 Definition 10.52.1. A ring $R$ is Artinian if it satisfies the descending chain condition for ideals.

00J6 Lemma 10.52.2. Suppose $R$ is a finite dimensional algebra over a field. Then $R$ is Artinian.

Proof. The descending chain condition for ideals obviously holds.
00J7 Lemma 10.52.3. If $R$ is Artinian then $R$ has only finitely many maximal ideals.
Proof. Suppose that $\mathfrak{m}_{i}, i=1,2,3, \ldots$ are maximal ideals. Then $\mathfrak{m}_{1} \supset \mathfrak{m}_{1} \cap \mathfrak{m}_{2} \supset$ $\mathfrak{m}_{1} \cap \mathfrak{m}_{2} \cap \mathfrak{m}_{3} \supset \ldots$ is an infinite descending sequence (because by the Chinese remainder theorem all the maps $R \rightarrow \oplus_{i=1}^{n} R / \mathfrak{m}_{i}$ are surjective).
00J8 Lemma 10.52.4. Let $R$ be Artinian. The radical $\operatorname{rad}(R)$ of $R$ is a nilpotent ideal.
Proof. Denote the radical $I$. Note that $I \supset I^{2} \supset I^{3} \supset \ldots$ is a descending sequence. Thus $I^{n}=I^{n+1}$ for some $n$. Set $J=\left\{x \in R \mid x I^{n}=0\right\}$. We have to show $J=R$. If not, choose an ideal $J^{\prime} \neq J, J \subset J^{\prime}$ minimal (possible by the Artinian property). Then $J^{\prime}=J+R x$ for some $x \in R$. By NAK, Lemma 10.19.1, we have $I J^{\prime} \subset J$. Hence $x I^{n+1} \subset x I \cdot I^{n} \subset J \cdot I^{n}=0$. Since $I^{n+1}=I^{n}$ we conclude $x \in J$. Contradiction.

00JA Lemma 10.52.5. Any ring with finitely many maximal ideals and locally nilpotent radical is the product of its localizations at its maximal ideals. Also, all primes are maximal.

Proof. Let $R$ be a ring with finitely many maximal ideals $\mathfrak{m}_{1}, \ldots, \mathfrak{m}_{n}$. Let $I=$ $\bigcap_{i=1}^{n} \mathfrak{m}_{i}$ be the radical of $R$. Assume $I$ is locally nilpotent. Let $\mathfrak{p}$ be a prime ideal of $R$. Since every prime contains every nilpotent element of $R$ we see $\mathfrak{p} \supset \mathfrak{m}_{1} \cap \ldots \cap \mathfrak{m}_{n}$. Since $\mathfrak{m}_{1} \cap \ldots \cap \mathfrak{m}_{n} \supset \mathfrak{m}_{1} \ldots \mathfrak{m}_{n}$ we conclude $\mathfrak{p} \supset \mathfrak{m}_{1} \ldots \mathfrak{m}_{n}$. Hence $\mathfrak{p} \supset \mathfrak{m}_{i}$ for some $i$, and so $\mathfrak{p}=\mathfrak{m}_{i}$. By the Chinese remainder theorem (Lemma 10.14.3) we have $R / I \cong \bigoplus R / \mathfrak{m}_{i}$ which is a product of fields. Hence by Lemma 10.31 .5 there are idempotents $e_{i}, i=1, \ldots, n$ with $e_{i} \bmod \mathfrak{m}_{j}=\delta_{i j}$. Hence $R=\prod R e_{i}$, and each $R e_{i}$ is a ring with exactly one maximal ideal.

00JB Lemma 10.52.6. $A$ ring $R$ is Artinian if and only if it has finite length as a module over itself. Any such ring $R$ is both Artinian and Noetherian, any prime ideal of $R$ is a maximal ideal, and $R$ is equal to the (finite) product of its localizations at its maximal ideals.

Proof. If $R$ has finite length over itself then it satisfies both the ascending chain condition and the descending chain condition for ideals. Hence it is both Noetherian and Artinian. Any Artinian ring is equal to product of its localizations at maximal ideals by Lemmas 10.52.3, 10.52.4, and 10.52.5.

Suppose that $R$ is Artinian. We will show $R$ has finite length over itself. It suffices to exhibit a chain of submodules whose successive quotients have finite length. By what we said above we may assume that $R$ is local, with maximal ideal $\mathfrak{m}$. By Lemma 10.52 .4 we have $\mathfrak{m}^{n}=0$ for some $n$. Consider the sequence $0=\mathfrak{m}^{n} \subset$ $\mathfrak{m}^{n-1} \subset \ldots \subset \mathfrak{m} \subset R$. By Lemma 10.51 .6 the length of each subquotient $\mathfrak{m}^{j} / \mathfrak{m}^{j+1}$ is the dimension of this as a vector space over $\kappa(\mathfrak{m})$. This has to be finite since otherwise we would have an infinite descending chain of sub vector spaces which would correspond to an infinite descending chain of ideals in $R$.

### 10.53. Homomorphisms essentially of finite type

07DR Some simple remarks on localizations of finite type ring maps.
00QM Definition 10.53.1. Let $R \rightarrow S$ be a ring map.
(1) We say that $R \rightarrow S$ is essentially of finite type if $S$ is the localization of an $R$-algebra of finite type.
(2) We say that $R \rightarrow S$ is essentially of finite presentation if $S$ is the localization of an $R$-algebra of finite presentation.

07DS Lemma 10.53.2. The class of ring maps which are essentially of finite type is preserved under composition. Similarly for essentially of finite presentation.
Proof. Omitted.
0AUF Lemma 10.53.3. The class of ring maps which are essentially of finite type is preserved by base change. Similarly for essentially of finite presentation.
Proof. Omitted.
07DT Lemma 10.53.4. Let $R \rightarrow S$ be a ring map. Assume $S$ is an Artinian local ring with maximal ideal $\mathfrak{m}$. Then
(1) $R \rightarrow S$ is finite if and only if $R \rightarrow S / \mathfrak{m}$ is finite,
(2) $R \rightarrow S$ is of finite type if and only if $R \rightarrow S / \mathfrak{m}$ is of finite type.
(3) $R \rightarrow S$ is essentially of finite type if and only if the composition $R \rightarrow S / \mathfrak{m}$ is essentially of finite type.

Proof. If $R \rightarrow S$ is finite, then $R \rightarrow S / \mathfrak{m}$ is finite by Lemma 10.7.3. Conversely, assume $R \rightarrow S / \mathfrak{m}$ is finite. As $S$ has finite length over itself (Lemma 10.52.6) we can choose a filtration

$$
0 \subset I_{1} \subset \ldots \subset I_{n}=S
$$

by ideals such that $I_{i} / I_{i-1} \cong S / \mathfrak{m}$ as $S$-modules. Thus $S$ has a filtration by $R$ submodules $I_{i}$ such that each successive quotient is a finite $R$-module. Thus $S$ is a finite $R$-module by Lemma 10.5.3.

If $R \rightarrow S$ is of finite type, then $R \rightarrow S / \mathfrak{m}$ is of finite type by Lemma 10.6.2, Conversely, assume that $R \rightarrow S / \mathfrak{m}$ is of finite type. Choose $f_{1}, \ldots, f_{n} \in S$ which map to generators of $S / \mathfrak{m}$. Then $A=R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S, x_{i} \mapsto f_{i}$ is a ring map such that $A \rightarrow S / \mathfrak{m}$ is surjective (in particular finite). Hence $A \rightarrow S$ is finite by part (1) and we see that $R \rightarrow S$ is of finite type by Lemma 10.6.2.

If $R \rightarrow S$ is essentially of finite type, then $R \rightarrow S / \mathfrak{m}$ is essentially of finite type by Lemma 10.53 .2 . Conversely, assume that $R \rightarrow S / \mathfrak{m}$ is essentially of finite type. Suppose $S / \mathfrak{m}$ is the localization of $R\left[x_{1}, \ldots, x_{n}\right] / I$. Choose $f_{1}, \ldots, f_{n} \in S$ whose congruence classes modulo $\mathfrak{m}$ correspond to the congruence classes of $x_{1}, \ldots, x_{n}$ modulo $I$. Consider the map $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow S, x_{i} \mapsto f_{i}$ with kernel J. Set $A=R\left[x_{1}, \ldots, x_{n}\right] / J \subset S$ and $\mathfrak{p}=A \cap \mathfrak{m}$. Note that $A / \mathfrak{p} \subset S / \mathfrak{m}$ is equal to the image of $R\left[x_{1}, \ldots, x_{n}\right] / I$ in $S / \mathfrak{m}$. Hence $\kappa(\mathfrak{p})=S / \mathfrak{m}$. Thus $A_{\mathfrak{p}} \rightarrow S$ is finite by part (1). We conclude that $S$ is essentially of finite type by Lemma 10.53.2.

The following lemma can be proven using properness of projective space instead of the algebraic argument we give here.

0AUG Lemma 10.53.5. Let $\varphi: R \rightarrow S$ be essentially of finite type with $R$ and $S$ local (but not necessarily $\varphi$ local). Then there exists an $n$ and a maximal ideal $\mathfrak{m} \subset R\left[x_{1}, \ldots, x_{n}\right]$ lying over $\mathfrak{m}_{R}$ such that $S$ is a localization of a quotient of $R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{m}}$.

Proof. We can write $S$ as a localization of a quotient of $R\left[x_{1}, \ldots, x_{n}\right]$. Hence it suffices to prove the lemma in case $S=R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}$ for some prime $\mathfrak{q} \subset$ $R\left[x_{1}, \ldots, x_{n}\right]$. If $\mathfrak{q}+\mathfrak{m}_{R} R\left[x_{1}, \ldots, x_{n}\right] \neq R\left[x_{1}, \ldots, x_{n}\right]$ then we can find a maximal ideal $\mathfrak{m}$ as in the statement of the lemma with $\mathfrak{q} \subset \mathfrak{m}$ and the result is clear.
Choose a valuation ring $A \subset \kappa(\mathfrak{q})$ which dominates the image of $R \rightarrow \kappa(\mathfrak{q})$ (Lemma 10.49.2. If the image $\lambda_{i} \in \kappa(\mathfrak{q})$ of $x_{i}$ is contained in $A$, then $\mathfrak{q}$ is contained in the inverse image of $\mathfrak{m}_{A}$ via $R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$ which means we are back in the preceding case. Hence there exists an $i$ such that $\lambda_{i}^{-1} \in A$ and such that $\lambda_{j} / \lambda_{i} \in A$ for all $j=1, \ldots, n$ (because the value group of $A$ is totally ordered, see Lemma 10.49 .12 . Then we consider the map

$$
R\left[y_{0}, y_{1}, \ldots y_{n}\right] \rightarrow R\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{q}}, \quad y_{0} \mapsto 1 / x_{i}, \quad y_{j} \mapsto x_{j} / x_{i}
$$

Let $\mathfrak{q}^{\prime} \subset R\left[y_{0}, \ldots, y_{n}\right]$ be the inverse image of $\mathfrak{q}$. Since $y_{0} \notin \mathfrak{q}^{\prime}$ it is easy to see that the displayed arrow defines an isomorphism on localizations. On the other hand, the result of the first paragraph applies to $R\left[y_{0}, \ldots, y_{n}\right]$ because $y_{j}$ maps to an element of $A$. This finishes the proof.

### 10.54. K-groups

00JC Let $R$ be a ring. We will introduce two abelian groups associated to $R$. The first of the two is denoted $K_{0}^{\prime}(R)$ and has the following properties:
(1) For every finite $R$-module $M$ there is given an element [ $M$ ] in $K_{0}^{\prime}(R)$,
(2) for every short exact sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ we have the relation $[M]=\left[M^{\prime}\right]+\left[M^{\prime \prime}\right]$,
(3) the group $K_{0}^{\prime}(R)$ is generated by the elements $[M]$, and
(4) all relations in $K_{0}^{\prime}(R)$ are Z-linear combinations of the relations coming from exact sequences as above.

The actual construction is a bit more annoying since one has to take care that the collection of all finitely generated $R$-modules is a proper class. However, this problem can be overcome by taking as set of generators of the group $K_{0}^{\prime}(R)$ the elements $\left[R^{n} / K\right]$ where $n$ ranges over all integers and $K$ ranges over all submodules $K \subset R^{n}$. The generators for the subgroup of relations imposed on these elements will be the relations coming from short exact sequences whose terms are of the form $R^{n} / K$. The element $[M]$ is defined by choosing $n$ and $K$ such that $M \cong R^{n} / K$ and putting $[M]=\left[R^{n} / K\right]$. Details left to the reader.
00JD Lemma 10.54.1. If $R$ is an Artinian local ring then the length function defines a natural abelian group homomorphism length ${ }_{R}: K_{0}^{\prime}(R) \rightarrow \mathbf{Z}$.

Proof. The length of any finite $R$-module is finite, because it is the quotient of $R^{n}$ which has finite length by Lemma 10.52.6. And the length function is additive, see Lemma 10.51.3.

The second of the two is denoted $K_{0}(R)$ and has the following properties:
(1) For every finite projective $R$-module $M$ there is given an element [ $M$ ] in $K_{0}(R)$,
(2) for every short exact sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ of finite projective $R$-modules we have the relation $[M]=\left[M^{\prime}\right]+\left[M^{\prime \prime}\right]$,
(3) the group $K_{0}(R)$ is generated by the elements [ $M$ ], and
(4) all relations in $K_{0}(R)$ are Z-linear combinations of the relations coming from exact sequences as above.
The construction of this group is done as above.
We note that there is an obvious map $K_{0}(R) \rightarrow K_{0}^{\prime}(R)$ which is not an isomorphism in general.
00JE Example 10.54.2. Note that if $R=k$ is a field then we clearly have $K_{0}(k)=$ $K_{0}^{\prime}(k) \cong \mathbf{Z}$ with the isomorphism given by the dimension function (which is also the length function).

00JF Example 10.54.3. Let $k$ be a field. Then $K_{0}(k[x])=K_{0}^{\prime}(k[x])=\mathbf{Z}$.
Since $R=k[x]$ is a principal ideal domain, any finite projective $R$-module is free. In a short exact sequence of modules

$$
0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0
$$

we have $\operatorname{rank}(M)=\operatorname{rank}\left(M^{\prime}\right)+\operatorname{rank}\left(M^{\prime \prime}\right)$, which gives $K_{0}(k[x])=\mathbf{Z}$.
As for $K_{0}^{\prime}$, the structure theorem for modules of a PID says that any finitely generated $R$-module is of the form $M=R^{r} \times R /\left(d_{1}\right) \times \ldots \times R /\left(d_{k}\right)$. Consider the short exact sequence

$$
0 \rightarrow\left(d_{i}\right) \rightarrow R \rightarrow R /\left(d_{i}\right) \rightarrow 0
$$

Since the ideal $\left(d_{i}\right)$ is isomorphic to $R$ as a module (it is free with generator $d_{i}$ ), in $K_{0}^{\prime}(R)$ we have $\left[\left(d_{i}\right)\right]=[R]$. Then $\left[R /\left(d_{i}\right)\right]=\left[\left(d_{i}\right)\right]-[R]=0$. From this it follows that any torsion part "disappears" in $K_{0}^{\prime}$. Again the rank of the free part determines that $K_{0}^{\prime}(k[x])=\mathbf{Z}$, and the canonical homomorphism from $K_{0}$ to $K_{0}^{\prime}$ is an isomorphism.

00JG Example 10.54.4. Let $k$ be a field. Let $R=\{f \in k[x] \mid f(0)=f(1)\}$, compare Example 10.26.4. In this case $K_{0}(R) \cong k^{*} \oplus \mathbf{Z}$, but $K_{0}^{\prime}(R)=\mathbf{Z}$.

00JH Lemma 10.54.5. Let $R=R_{1} \times R_{2}$. Then $K_{0}(R)=K_{0}\left(R_{1}\right) \times K_{0}\left(R_{2}\right)$ and $K_{0}^{\prime}(R)=K_{0}^{\prime}\left(R_{1}\right) \times K_{0}^{\prime}\left(R_{2}\right)$

Proof. Omitted.
00JI Lemma 10.54.6. Let $R$ be an Artinian local ring. The map length ${ }_{R}: K_{0}^{\prime}(R) \rightarrow \mathbf{Z}$ of Lemma 10.54.1 is an isomorphism.

Proof. Omitted.
00JJ Lemma 10.54.7. Let $R$ be a local ring. Every finite projective $R$-module is finite free. The map $\operatorname{rank}_{R}: K_{0}(R) \rightarrow \mathbf{Z}$ defined by $[M] \rightarrow \operatorname{rank}_{R}(M)$ is well defined and an isomorphism.

Proof. Let $P$ be a finite projective $R$-module. The $n$ generators of $P$ give a surjection $R^{n} \rightarrow P$, and since $P$ is projective it follows that $R^{n} \cong P \oplus Q$ for some projective module $Q$.

If $\mathfrak{m} \subset R$ is the maximal ideal, then $P / \mathfrak{m}$ and $Q / \mathfrak{m}$ are $R / \mathfrak{m}$-vector spaces, with $P / \mathfrak{m} \oplus Q / \mathfrak{m} \cong(R / \mathfrak{m})^{n}$. Say that $\operatorname{dim} P=p, \operatorname{dim} Q=q$, so $p+q=n$.

Choose elements $a_{1}, \ldots, a_{p}$ in $P$ and $b_{1}, \ldots, b_{q}$ in $Q$ lying above bases for $P / \mathfrak{m}$ and $Q / \mathfrak{m}$. The homomorphism $R^{n} \rightarrow P \oplus Q \cong R^{n}$ given by $\left(r_{1}, \ldots, r_{n}\right) \mapsto r_{1} a_{1}+\ldots+$ $r_{p} a_{p}+r_{p+1} b_{1}+\ldots+r_{n} b_{q}$ is a matrix $A$ which is invertible over $R / \mathfrak{m}$. Let $B$ be a matrix over $R$ lying over the inverse of $A$ in $R / \mathfrak{m} . A B=I+M$, where $M$ is a matrix whose entries all lie in $\mathfrak{m}$. Thus $\operatorname{det} A B=1+x$, for $x \in \mathfrak{m}$, so $A B$ is invertible, so $A$ is invertible.

The homomorphism $R^{p} \rightarrow P$ given by $\left(r_{1}, \ldots, r_{p}\right) \mapsto r_{1} a_{1}+\ldots+r_{p} a_{p}$ inherits injectivity and surjectivity from A. Hence, $P \cong R^{p}$.

Next we show that the rank of a finite projective module over $R$ is well defined: if $P \cong R^{\alpha} \cong R^{\beta}$, then $\alpha=\beta$. This is immediate in the vector space case, and so it is true in the general module case as well, by dividing out the maximal ideal on both sides. If $0 \rightarrow R^{\alpha} \rightarrow R^{\beta} \rightarrow R^{\gamma} \rightarrow 0$ is exact, the sequence splits, so $R^{\beta} \cong R^{\alpha} \oplus R^{\gamma}$, so $\beta=\alpha+\gamma$.

So far we have seen that the map $\operatorname{rank}_{R}: K_{0}(R) \rightarrow \mathbf{Z}$ is a well-defined homomorphism. It is surjective because $\operatorname{rank}_{R}[R]=1$. It is injective because the element of $K_{0}(R)$ with rank $\pm \alpha$ is uniquely $\pm\left[R^{\alpha}\right]$.

00JK Lemma 10.54.8. Let $R$ be a local Artinian ring. There is a commutative diagram

where the vertical maps are isomorphisms by Lemmas 10.54.6 and 10.54.7.
Proof. By induction on the rank of $M$. Suppose $[M] \in K_{0}(R)$. Then $M$ is a finite projective $R$-module over a local ring, so M is free; $M \cong R^{n}$ for some $n$. The claim is that $\operatorname{rank}(M) \operatorname{length}_{R}(R)=\operatorname{length}_{R}(M)$, or equivalently that $n$ length ${ }_{R}(R)=\operatorname{length}_{R}\left(R^{n}\right)$ for all $n \geq 1$. When $n=1$, this is clearly true.

Suppose that $(n-1)$ length $_{R}(R)=$ length $_{R}\left(R^{n-1}\right)$. Then since there is a split short exact sequence

$$
0 \rightarrow R \rightarrow R^{n} \rightarrow R^{n-1} \rightarrow 0
$$

by Lemma 10.51 .3 we have

$$
\begin{aligned}
\operatorname{length}_{R}\left(R^{n}\right) & =\operatorname{length}_{R}(R)+\operatorname{length}_{R}\left(R^{n-1}\right) \\
& =\operatorname{length}_{R}(R)+(n-1) \operatorname{length}_{R}(R) \\
& =n \operatorname{length}_{R}(R)
\end{aligned}
$$

as desired.

### 10.55. Graded rings

00JL A graded ring will be for us a ring $S$ endowed with a direct sum decomposition $S=\bigoplus_{d \geq 0} S_{d}$ such that $S_{d} \cdot S_{e} \subset S_{d+e}$. Note that we do not allow nonzero elements in negative degrees. The irrelevant ideal is the ideal $S_{+}=\bigoplus_{d>0} S_{d}$. A graded module will be an $S$-module $M$ endowed with a direct sum decomposition $M=\bigoplus_{n \in \mathbf{Z}} M_{n}$ such that $S_{d} \cdot M_{e} \subset M_{d+e}$. Note that for modules we do allow nonzero elements in negative degrees. We think of $S$ as a graded $S$-module by setting $S_{-k}=(0)$ for $k>0$. An element $x$ (resp. $f$ ) of $M$ (resp. $S$ ) is called homogeneous if $x \in M_{d}$ (resp. $f \in S_{d}$ ) for some $d$. A map of graded $S$-modules is a map of $S$-modules $\varphi: M \rightarrow M^{\prime}$ such that $\varphi\left(M_{d}\right) \subset M_{d}^{\prime}$. We do not allow maps to shift degrees. Let us denote $\operatorname{GrHom}_{0}(M, N)$ the $S_{0}$-module of homomorphisms of graded modules from $M$ to $N$.

At this point there are the notions of graded ideal, graded quotient ring, graded submodule, graded quotient module, graded tensor product, etc. We leave it to the reader to find the relevant definitions, and lemmas. For example: A short exact sequence of graded modules is short exact in every degree.
Given a graded ring $S$, a graded $S$-module $M$ and $n \in \mathbf{Z}$ we denote $M(n)$ the graded $S$-module with $M(n)_{d}=M_{n+d}$. This is called the twist of $M$ by $n$. In particular we get modules $S(n), n \in \mathbf{Z}$ which will play an important role in the study of projective schemes. There are some obvious functorial isomorphisms such as $(M \oplus N)(n)=M(n) \oplus N(n),\left(M \otimes_{S} N\right)(n)=M \otimes_{S} N(n)=M(n) \otimes_{S} N$. In addition we can define a graded $S$-module structure on the $S_{0}$-module
$\operatorname{GrHom}(M, N)=\bigoplus_{n \in \mathbf{Z}} \operatorname{GrHom}_{n}(M, N), \quad \operatorname{GrHom}_{n}(M, N)=\operatorname{GrHom}_{0}(M, N(n))$.
We omit the definition of the multiplication.
Let $S$ be a graded ring. Let $d \geq 1$ be an integer. We set $S^{(d)}=\bigoplus_{n \geq 0} S_{n d}$. We think of $S^{(d)}$ as a graded ring with degree $n$ summand $\left(S^{(d)}\right)_{n}=S_{n d}$. Given a graded $S$-module $M$ we can similarly consider $M^{(d)}=\bigoplus_{n \in \mathbf{Z}} M_{n d}$ which is a graded $S^{(d)}$-module.
077G Lemma 10.55.1. Let $R \rightarrow S$ be a homomorphism of graded rings. Let $S^{\prime} \subset S$ be the integral closure of $R$ in $S$. Then

$$
S^{\prime}=\bigoplus_{d \geq 0} S^{\prime} \cap S_{d}
$$

i.e., $S^{\prime}$ is a graded $R$-subalgebra of $S$.

Proof. We have to show the following: If $s=s_{n}+s_{n+1}+\ldots+s_{m} \in S^{\prime}$, then each homogeneous part $s_{j} \in S^{\prime}$. We will prove this by induction on $m-n$ over all homomorphisms $R \rightarrow S$ of graded rings. First note that it is immediate that $s_{0}$ is integral over $R_{0}$ (hence over $R$ ) as there is a ring map $S \rightarrow S_{0}$ compatible with the ring map $R \rightarrow R_{0}$. Thus, after replacing $s$ by $s-s_{0}$, we may assume $n>0$. Consider the extension of graded rings $R\left[t, t^{-1}\right] \rightarrow S\left[t, t^{-1}\right]$ where $t$ has degree 0 . There is a commutative diagram

where the horizontal maps are ring automorphisms. Hence the integral closure $C$ of $S\left[t, t^{-1}\right]$ over $R\left[t, t^{-1}\right]$ maps into itself. Thus we see that

$$
t^{m}\left(s_{n}+s_{n+1}+\ldots+s_{m}\right)-\left(t^{n} s_{n}+t^{n+1} s_{n+1}+\ldots+t^{m} s_{m}\right) \in C
$$

which implies by induction hypothesis that each $\left(t^{m}-t^{i}\right) s_{i} \in C$ for $i=n, \ldots, m-1$. Note that for any ring $A$ and $m>i \geq n>0$ we have $A\left[t, t^{-1}\right] /\left(t^{m}-t^{i}-1\right) \cong$ $A[t] /\left(t^{m}-t^{i}-1\right) \supset A$ because $t\left(t^{m-1}-t^{i-1}\right)=1$ in $A[t] /\left(t^{m}-t^{i}-1\right)$. Since $t^{m}-t^{i}$ maps to 1 we see the image of $s_{i}$ in the ring $S[t] /\left(t^{m}-t^{i}-1\right)$ is integral over $R[t] /\left(t^{m}-t^{i}-1\right)$ for $i=n, \ldots, m-1$. Since $R \rightarrow R[t] /\left(t^{m}-t^{i}-1\right)$ is finite we see that $s_{i}$ is integral over $R$ by transitivity, see Lemma 10.35.6. Finally, we also conclude that $s_{m}=s-\sum_{i=n, \ldots, m-1} s_{i}$ is integral over $R$.

### 10.56. Proj of a graded ring

$00 J M \quad$ Let $S$ be a graded ring. A homogeneous ideal is simply an ideal $I \subset S$ which is also a graded submodule of $S$. Equivalently, it is an ideal generated by homogeneous elements. Equivalently, if $f \in I$ and

$$
f=f_{0}+f_{1}+\ldots+f_{n}
$$

is the decomposition of $f$ into homogeneous parts in $S$ then $f_{i} \in I$ for each $i$. To check that a homogeneous ideal $\mathfrak{p}$ is prime it suffices to check that if $a b \in \mathfrak{p}$ with $a, b$ homogeneous then either $a \in \mathfrak{p}$ or $b \in \mathfrak{p}$.

00JN Definition 10.56.1. Let $S$ be a graded ring. We define $\operatorname{Proj}(S)$ to be the set of homogeneous, prime ideals $\mathfrak{p}$ of $S$ such that $S_{+} \not \subset \mathfrak{p}$. As $\operatorname{Proj}(S)$ is a subset of $\operatorname{Spec}(S)$ and we endow it with the induced topology. The topological space $\operatorname{Proj}(S)$ is called the homogeneous spectrum of the graded ring $S$.

Note that by construction there is a continuous map

$$
\operatorname{Proj}(S) \longrightarrow \operatorname{Spec}\left(S_{0}\right)
$$

Let $S=\oplus_{d \geq 0} S_{d}$ be a graded ring. Let $f \in S_{d}$ and assume that $d \geq 1$. We define $S_{(f)}$ to be the subring of $S_{f}$ consisting of elements of the form $r / f^{n}$ with $r$ homogeneous and $\operatorname{deg}(r)=n d$. If $M$ is a graded $S$-module, then we define the $S_{(f)}$-module $M_{(f)}$ as the sub module of $M_{f}$ consisting of elements of the form $x / f^{n}$ with $x$ homogeneous of degree $n d$.

00 JO Lemma 10.56.2. Let $S$ be a Z-graded ring containing a homogeneous invertible element of positive degree. Then the set $G \subset \operatorname{Spec}(S)$ of $\mathbf{Z}$-graded primes of $S$ (with induced topology) maps homeomorphically to $\operatorname{Spec}\left(S_{0}\right)$.

Proof. First we show that the map is a bijection by constructing an inverse. Let $f \in S_{d}, d>0$ be invertible in $S$. If $\mathfrak{p}_{0}$ is a prime of $S_{0}$, then $\mathfrak{p}_{0} S$ is a Z-graded ideal of $S$ such that $\mathfrak{p}_{0} S \cap S_{0}=\mathfrak{p}_{0}$. And if $a b \in \mathfrak{p}_{0} S$ with $a, b$ homogeneous, then $a^{d} b^{d} / f^{\operatorname{deg}(a)+\operatorname{deg}(b)} \in \mathfrak{p}_{0}$. Thus either $a^{d} / f^{\operatorname{deg}(a)} \in \mathfrak{p}_{0}$ or $b^{d} / f^{\operatorname{deg}(b)} \in \mathfrak{p}_{0}$, in other words either $a^{d} \in \mathfrak{p}_{0} S$ or $b^{d} \in \mathfrak{p}_{0} S$. It follows that $\sqrt{\mathfrak{p}_{0} S}$ is a Z-graded prime ideal of $S$ whose intersection with $S_{0}$ is $\mathfrak{p}_{0}$.

To show that the map is a homeomorphism we show that the image of $G \cap D(g)$ is open. If $g=\sum g_{i}$ with $g_{i} \in S_{i}$, then by the above $G \cap D(g)$ maps onto the set $\bigcup D\left(g_{i}^{d} / f^{i}\right)$ which is open.

For $f \in S$ homogeneous of degree $>0$ we define

$$
D_{+}(f)=\{\mathfrak{p} \in \operatorname{Proj}(S) \mid f \notin \mathfrak{p}\} .
$$

Finally, for a homogeneous ideal $I \subset S$ we define

$$
V_{+}(I)=\{\mathfrak{p} \in \operatorname{Proj}(S) \mid I \subset \mathfrak{p}\}
$$

We will use more generally the notation $V_{+}(E)$ for any set $E$ of homogeneous elements $E \subset S$.

00JP Lemma 10.56.3 (Topology on Proj). Let $S=\oplus_{d \geq 0} S_{d}$ be a graded ring.
(1) The sets $D_{+}(f)$ are open in $\operatorname{Proj}(S)$.
(2) We have $D_{+}\left(f f^{\prime}\right)=D_{+}(f) \cap D_{+}\left(f^{\prime}\right)$.
(3) Let $g=g_{0}+\ldots+g_{m}$ be an element of $S$ with $g_{i} \in S_{i}$. Then

$$
D(g) \cap \operatorname{Proj}(S)=\left(D\left(g_{0}\right) \cap \operatorname{Proj}(S)\right) \cup \bigcup_{i \geq 1} D_{+}\left(g_{i}\right)
$$

(4) Let $g_{0} \in S_{0}$ be a homogeneous element of degree 0 . Then

$$
D\left(g_{0}\right) \cap \operatorname{Proj}(S)=\bigcup_{f \in S_{d}, d \geq 1} D_{+}\left(g_{0} f\right)
$$

(5) The open sets $D_{+}(f)$ form a basis for the topology of $\operatorname{Proj}(S)$.
(6) Let $f \in S$ be homogeneous of positive degree. The ring $S_{f}$ has a natural Z-grading. The ring maps $S \rightarrow S_{f} \leftarrow S_{(f)}$ induce homeomorphisms

$$
D_{+}(f) \leftarrow\left\{\mathbf{Z} \text {-graded primes of } S_{f}\right\} \rightarrow \operatorname{Spec}\left(S_{(f)}\right)
$$

(7) There exists an $S$ such that $\operatorname{Proj}(S)$ is not quasi-compact.
(8) The sets $V_{+}(I)$ are closed.
(9) Any closed subset $T \subset \operatorname{Proj}(S)$ is of the form $V_{+}(I)$ for some homogeneous ideal $I \subset S$.
(10) For any graded ideal $I \subset S$ we have $V_{+}(I)=\emptyset$ if and only if $S_{+} \subset \sqrt{I}$.

Proof. Since $D_{+}(f)=\operatorname{Proj}(S) \cap D(f)$, these sets are open. Similarly the sets $V_{+}(I)=\operatorname{Proj}(S) \cap V(E)$ are closed.
Suppose that $T \subset \operatorname{Proj}(S)$ is closed. Then we can write $T=\operatorname{Proj}(S) \cap V(J)$ for some ideal $J \subset S$. By definition of a homogeneous ideal if $g \in J, g=g_{0}+\ldots+g_{m}$ with $g_{d} \in S_{d}$ then $g_{d} \in \mathfrak{p}$ for all $\mathfrak{p} \in T$. Thus, letting $I \subset S$ be the ideal generated by the homogeneous parts of the elements of $J$ we have $T=V_{+}(I)$.

The formula for $\operatorname{Proj}(S) \cap D(g)$, with $g \in S$ is direct from the definitions. Consider the formula for $\operatorname{Proj}(S) \cap D\left(g_{0}\right)$. The inclusion of the right hand side in the left hand side is obvious. For the other inclusion, suppose $g_{0} \notin \mathfrak{p}$ with $\mathfrak{p} \in \operatorname{Proj}(S)$. If all $g_{0} f \in \mathfrak{p}$ for all homogeneous $f$ of positive degree, then we see that $S_{+} \subset \mathfrak{p}$ which is a contradiction. This gives the other inclusion.

The collection of opens $D(g) \cap \operatorname{Proj}(S)$ forms a basis for the topology since the standard opens $D(g) \subset \operatorname{Spec}(S)$ form a basis for the topology on $\operatorname{Spec}(S)$. By the formulas above we can express $D(g) \cap \operatorname{proj}(S)$ as a union of opens $D_{+}(f)$. Hence the collection of opens $D_{+}(f)$ forms a basis for the topology also.

First we note that $D_{+}(f)$ may be identified with a subset (with induced topology) of $D(f)=\operatorname{Spec}\left(S_{f}\right)$ via Lemma 10.16.6. Note that the ring $S_{f}$ has a Z-grading. The homogeneous elements are of the form $r / f^{n}$ with $r \in S$ homogeneous and have degree $\operatorname{deg}\left(r / f^{n}\right)=\operatorname{deg}(r)-n \operatorname{deg}(f)$. The subset $D_{+}(f)$ corresponds exactly to those prime ideals $\mathfrak{p} \subset S_{f}$ which are $\mathbf{Z}$-graded ideals (i.e., generated by homogeneous elements). Hence we have to show that the set of $\mathbf{Z}$-graded prime ideals of $S_{f}$ maps homeomorphically to $\operatorname{Spec}\left(S_{(f)}\right)$. This follows from Lemma 10.56.2.
Let $S=\mathbf{Z}\left[X_{1}, X_{2}, X_{3}, \ldots\right]$ with grading such that each $X_{i}$ has degree 1. Then it is easy to see that

$$
\operatorname{Proj}(S)=\bigcup_{i=1}^{\infty} D_{+}\left(X_{i}\right)
$$

does not have a finite refinement.
Let $I \subset S$ be a graded ideal. If $\sqrt{I} \supset S_{+}$then $V_{+}(I)=\emptyset$ since every prime $\mathfrak{p} \in \operatorname{Proj}(S)$ does not contain $S_{+}$by definition. Conversely, suppose that $S_{+} \not \subset \sqrt{I}$. Then we can find an element $f \in S_{+}$such that $f$ is not nilpotent modulo $I$. Clearly this means that one of the homogeneous parts of $f$ is not nilpotent modulo $I$, in other words we may (and do) assume that $f$ is homogeneous. This implies that $I S_{f} \neq 0$, in other words that $(S / I)_{f}$ is not zero. Hence $(S / I)_{(f)} \neq 0$ since it is a ring which maps into $(S / I)_{f}$. Pick a prime $\mathfrak{q} \subset(S / I)_{(f)}$. This corresponds to a graded prime of $S / I$, not containing the irrelevant ideal $(S / I)_{+}$. And this in turn corresponds to a graded prime ideal $\mathfrak{p}$ of $S$, containing $I$ but not containing $S_{+}$as desired.

00JQ Example 10.56.4. Let $R$ be a ring. If $S=R[X]$ with $\operatorname{deg}(X)=1$, then the natural map $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}(R)$ is a bijection and in fact a homeomorphism. Namely, suppose $\mathfrak{p} \in \operatorname{Proj}(S)$. Since $S_{+} \not \subset \mathfrak{p}$ we see that $X \notin \mathfrak{p}$. Thus if $a X^{n} \in \mathfrak{p}$ with $a \in R$ and $n>0$, then $a \in \mathfrak{p}$. It follows that $\mathfrak{p}=\mathfrak{p}_{0} S$ with $\mathfrak{p}_{0}=\mathfrak{p} \cap R$.

If $\mathfrak{p} \in \operatorname{Proj}(S)$, then we define $S_{(\mathfrak{p})}$ to be the ring whose elements are fractions $r / f$ where $r, f \in S$ are homogeneous elements of the same degree such that $f \notin \mathfrak{p}$. As usual we say $r / f=r^{\prime} / f^{\prime}$ if and only if there exists some $f^{\prime \prime} \in S$ homogeneous, $f^{\prime \prime} \notin \mathfrak{p}$ such that $f^{\prime \prime}\left(r f^{\prime}-r^{\prime} f\right)=0$. Given a graded $S$-module $M$ we let $M_{(\mathfrak{p})}$ be the $S_{(\mathfrak{p})}$-module whose elements are fractions $x / f$ with $x \in M$ and $f \in S$ homogeneous of the same degree such that $f \notin \mathfrak{p}$. We say $x / f=x^{\prime} / f^{\prime}$ if and only if there exists some $f^{\prime \prime} \in S$ homogeneous, $f^{\prime \prime} \notin \mathfrak{p}$ such that $f^{\prime \prime}\left(x f^{\prime}-x^{\prime} f\right)=0$.

00JR Lemma 10.56.5. Let $S$ be a graded ring. Let $M$ be a graded $S$-module. Let $\mathfrak{p}$ be an element of $\operatorname{Proj}(S)$. Let $f \in S$ be a homogeneous element of positive degree such that $f \notin \mathfrak{p}$, i.e., $\mathfrak{p} \in D_{+}(f)$. Let $\mathfrak{p}^{\prime} \subset S_{(f)}$ be the element of $\operatorname{Spec}\left(S_{(f)}\right)$
corresponding to $\mathfrak{p}$ as in Lemma 10.56.3. Then $S_{(\mathfrak{p})}=\left(S_{(f)}\right)_{\mathfrak{p}^{\prime}}$ and compatibly $M_{(\mathfrak{p})}=\left(M_{(f)}\right)_{\mathfrak{p}^{\prime}}$.
Proof. We define a map $\psi: M_{(\mathfrak{p})} \rightarrow\left(M_{(f)}\right)_{\mathfrak{p}^{\prime}}$. Let $x / g \in M_{(\mathfrak{p})}$. We set

$$
\psi(x / g)=\left(x g^{\operatorname{deg}(f)-1} / f^{\operatorname{deg}(x)}\right) /\left(g^{\operatorname{deg}(f)} / f^{\operatorname{deg}(g)}\right)
$$

This makes sense since $\operatorname{deg}(x)=\operatorname{deg}(g)$ and since $g^{\operatorname{deg}(f)} / f^{\operatorname{deg}(g)} \notin \mathfrak{p}^{\prime}$. We omit the verification that $\psi$ is well defined, a module map and an isomorphism. Hint: the inverse sends $\left(x / f^{n}\right) /\left(g / f^{m}\right)$ to $\left(x f^{m}\right) /\left(g f^{n}\right)$.

Here is a graded variant of Lemma 10.14.2.
00JS Lemma 10.56.6. Suppose $S$ is a graded ring, $\mathfrak{p}_{i}, i=1, \ldots, r$ homogeneous prime ideals and $I \subset S_{+}$a graded ideal. Assume $I \not \subset \mathfrak{p}_{i}$ for all $i$. Then there exists $a$ homogeneous element $x \in I$ of positive degree such that $x \notin \mathfrak{p}_{i}$ for all $i$.
Proof. We may assume there are no inclusions among the $\mathfrak{p}_{i}$. The result is true for $r=1$. Suppose the result holds for $r-1$. Pick $x \in I$ homogeneous of positive degree such that $x \notin \mathfrak{p}_{i}$ for all $i=1, \ldots, r-1$. If $x \notin \mathfrak{p}_{r}$ we are done. So assume $x \in \mathfrak{p}_{r}$. If $I \mathfrak{p}_{1} \ldots \mathfrak{p}_{r-1} \subset \mathfrak{p}_{r}$ then $I \subset \mathfrak{p}_{r}$ a contradiction. Pick $y \in I \mathfrak{p}_{1} \ldots \mathfrak{p}_{r-1}$ homogeneous and $y \notin \mathfrak{p}_{r}$. Then $x^{\operatorname{deg}(y)}+y^{\operatorname{deg}(x)}$ works.
00JT Lemma 10.56.7. Let $S$ be a graded ring. Let $\mathfrak{p} \subset S$ be a prime. Let $\mathfrak{q}$ be the homogeneous ideal of $S$ generated by the homogeneous elements of $\mathfrak{p}$. Then $\mathfrak{q}$ is a prime ideal of $S$.
Proof. Suppose $f, g \in S$ are such that $f g \in \mathfrak{q}$. Let $f_{d}$ (resp. $g_{e}$ ) be the homogeneous part of $f$ (resp. $g$ ) of degree $d$ (resp. $e$ ). Assume $d, e$ are maxima such that $f_{d} \neq 0$ and $g_{e} \neq 0$. By assumption we can write $f g=\sum a_{i} f_{i}$ with $f_{i} \in \mathfrak{p}$ homogeneous. Say $\operatorname{deg}\left(f_{i}\right)=d_{i}$. Then $f_{d} g_{e}=\sum a_{i}^{\prime} f_{i}$ with $a_{i}^{\prime}$ to homogeneous par of degree $d+e-d_{i}$ of $a_{i}$ (or 0 if $d+e-d_{i}<0$ ). Hence $f_{d} \in \mathfrak{p}$ or $g_{e} \in \mathfrak{p}$. Hence $f_{d} \in \mathfrak{q}$ or $g_{e} \in \mathfrak{q}$. In the first case replace $f$ by $f-f_{d}$, in the second case replace $g$ by $g-g_{e}$. Then still $f g \in \mathfrak{q}$ but the discrete invariant $d+e$ has been decreased. Thus we may continue in this fashion until either $f$ or $g$ is zero. This clearly shows that $f g \in \mathfrak{q}$ implies either $f \in \mathfrak{q}$ or $g \in \mathfrak{q}$ as desired.
00JU Lemma 10.56.8. Let $S$ be a graded ring.
(1) Any minimal prime of $S$ is a homogeneous ideal of $S$.
(2) Given a homogeneous ideal $I \subset S$ any minimal prime over I is homogeneous.

Proof. The first assertion holds because the prime $\mathfrak{q}$ constructed in Lemma 10.56.7 satisfies $\mathfrak{q} \subset \mathfrak{p}$. The second because we may consider $S / I$ and apply the first part.
07Z2 Lemma 10.56.9. Let $R$ be a ring. Let $S$ be a graded $R$-algebra. Assume that $S$ is of finite type over $R$. Then for every homogeneous $f \in S_{+}$the ring $S_{(f)}$ is of finite type over $R$.

Proof. Choose $f_{1}, \ldots, f_{n} \in S$ which generate $S$ as an $R$-algebra. We may assume that each $f_{i}$ is homogeneous (by decomposing each $f_{i}$ into its homogeneous components). An element of $S_{(f)}$ is a sum of the form

$$
\sum_{e \operatorname{deg}(f)=\sum e_{i} \operatorname{deg}\left(f_{i}\right)} \lambda_{e_{1} \ldots e_{n}} f_{1}^{e_{1}} \ldots f_{n}^{e_{n}} / f^{e}
$$

with $\lambda_{e_{1} \ldots e_{n}} \in R$. Thus $S_{(f)}$ is generated as an $R$-algebra by the $f_{1}^{e_{1}} \ldots f_{n}^{e_{n}} / f^{e}$ with the property that $e \operatorname{deg}(f)=\sum e_{i} \operatorname{deg}\left(f_{i}\right)$. If $e_{i} \geq \operatorname{deg}(f)$ then we can write this as

$$
f_{1}^{e_{1}} \ldots f_{n}^{e_{n}} / f^{e}=f_{i}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(f_{i}\right)} \cdot f_{1}^{e_{1}} \ldots f_{i}^{e_{i}-\operatorname{deg}(f)} \ldots f_{n}^{e_{n}} / f^{e-\operatorname{deg}\left(f_{i}\right)}
$$

Thus we only need the elements $f_{i}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(f_{i}\right)}$ as well as the elements $f_{1}^{e_{1}} \ldots f_{n}^{e_{n}} / f^{e}$ with $e \operatorname{deg}(f)=\sum e_{i} \operatorname{deg}\left(f_{i}\right)$ and $e_{i} \leq \operatorname{deg}(f)$. This is a finite list and we win.
052N Lemma 10.56.10. Let $R$ be a ring. Let $R^{\prime}$ be a finite type $R$-algebra, and let $M$ be a finite $R^{\prime}$-module. There exists a graded $R$-algebra $S$, a graded $S$-module $N$ and an element $f \in S$ homogeneous of degree 1 such that
(1) $R^{\prime} \cong S_{(f)}$ and $M \cong N_{(f)}$ (as modules),
(2) $S_{0}=R$ and $S$ is generated by finitely many elements of degree 1 over $R$, and
(3) $N$ is a finite $S$-module.

Proof. We may write $R^{\prime}=R\left[x_{1}, \ldots, x_{n}\right] / I$ for some ideal $I$. For an element $g \in R\left[x_{1}, \ldots, x_{n}\right]$ denote $\tilde{g} \in R\left[x_{0}, \ldots, x_{n}\right]$ the element homogeneous of minimal degree such that $g=\tilde{g}\left(1, x_{1}, \ldots, x_{n}\right)$. Let $\tilde{I} \subset R\left[X_{0}, \ldots, X_{n}\right]$ generated by all elements $\tilde{g}, g \in I$. Set $S=R\left[X_{0}, \ldots, X_{n}\right] / \tilde{I}$ and denote $f$ the image of $X_{0}$ in $S$. By construction we have an isomorphism

$$
S_{(f)} \longrightarrow R^{\prime}, \quad X_{i} / X_{0} \longmapsto x_{i} .
$$

To do the same thing with the module $M$ we choose a presentation

$$
M=\left(R^{\prime}\right)^{\oplus r} / \sum_{j \in J} R^{\prime} k_{j}
$$

with $k_{j}=\left(k_{1 j}, \ldots, k_{r j}\right)$. Let $d_{i j}=\operatorname{deg}\left(\tilde{k}_{i j}\right)$. Set $d_{j}=\max \left\{d_{i j}\right\}$. Set $K_{i j}=$ $X_{0}^{d_{j}-d_{i j}} \tilde{k}_{i j}$ which is homogeneous of degree $d_{j}$. With this notation we set

$$
N=\operatorname{Coker}\left(\bigoplus_{j \in J} S\left(-d_{j}\right) \xrightarrow{\left(K_{i j}\right)} S^{\oplus r}\right)
$$

which works. Some details omitted.

### 10.57. Noetherian graded rings

00JV A bit of theory on Noetherian graded rings including some material on Hilbert polynomials.

07Z4 Lemma 10.57.1. Let $S$ be a graded ring. A set of homogeneous elements $f_{i} \in S_{+}$ generates $S$ as an algebra over $S_{0}$ if and only if they generate $S_{+}$as an ideal of $S$.

Proof. If the $f_{i}$ generate $S$ as an algebra over $S_{0}$ then every element in $S_{+}$is a polynomial without constant term in the $f_{i}$ and hence $S_{+}$is generated by the $f_{i}$ as an ideal. Conversely, suppose that $S_{+}=\sum S f_{i}$. We will prove that any element $f$ of $S$ can be written as a polynomial in the $f_{i}$ with coefficients in $S_{0}$. It suffices to do this for homogeneous elements. Say $f$ has degree $d$. Then we may perform induction on $d$. The case $d=0$ is immediate. If $d>0$ then $f \in S_{+}$hence we can write $f=\sum g_{i} f_{i}$ for some $g_{i} \in S$. As $S$ is graded we can replace $g_{i}$ by its homogeneous component of degree $d-\operatorname{deg}\left(f_{i}\right)$. By induction we see that each $g_{i}$ is a polynomial in the $f_{i}$ and we win.

00JW Lemma 10.57.2. A graded ring $S$ is Noetherian if and only if $S_{0}$ is Noetherian and $S_{+}$is finitely generated as an ideal of $S$.

Proof. It is clear that if $S$ is Noetherian then $S_{0}=S / S_{+}$is Noetherian and $S_{+}$is finitely generated. Conversely, assume $S_{0}$ is Noetherian and $S_{+}$finitely generated as an ideal of $S$. Pick generators $S_{+}=\left(f_{1}, \ldots, f_{n}\right)$. By decomposing the $f_{i}$ into homogeneous pieces we may assume each $f_{i}$ is homogeneous. By Lemma 10.57.1 we see that $S_{0}\left[X_{1}, \ldots X_{n}\right] \rightarrow S$ sending $X_{i}$ to $f_{i}$ is surjective. Thus $S$ is Noetherian by Lemma 10.30 .1 .
00JX Definition 10.57.3. Let $A$ be an abelian group. We say that a function $f: n \mapsto$ $f(n) \in A$ defined for all sufficient large integers $n$ is a numerical polynomial if there exists $r \geq 0$, elements $a_{0}, \ldots, a_{r} \in A$ such that

$$
f(n)=\sum_{i=0}^{r}\binom{n}{i} a_{i}
$$

for all $n \gg 0$.
The reason for using the binomial coefficients is the elementary fact that any polynomial $P \in \mathbf{Q}[T]$ all of whose values at integer points are integers, is equal to a sum $P(T)=\sum a_{i}\binom{T}{i}$ with $a_{i} \in \mathbf{Z}$. Note that in particular the expressions $\binom{T+1}{i+1}$ are of this form.

00JY Lemma 10.57.4. If $A \rightarrow A^{\prime}$ is a homomorphism of abelian groups and if $f: n \mapsto$ $f(n) \in A$ is a numerical polynomial, then so is the composition.

Proof. This is immediate from the definitions.
00JZ Lemma 10.57.5. Suppose that $f: n \mapsto f(n) \in A$ is defined for all $n$ sufficiently large and suppose that $n \mapsto f(n)-f(n-1)$ is a numerical polynomial. Then $f$ is a numerical polynomial.

Proof. Let $f(n)-f(n-1)=\sum_{i=0}^{r}\binom{n}{i} a_{i}$ for all $n \gg 0$. Set $g(n)=f(n)-$ $\sum_{i=0}^{r}\binom{n+1}{i+1} a_{i}$. Then $g(n)-g(n-1)=0$ for all $n \gg 0$. Hence $g$ is eventually constant, say equal to $a_{-1}$. We leave it to the reader to show that $a_{-1}+\sum_{i=0}^{r}\binom{n+1}{i+1} a_{i}$ has the required shape (see remark above the lemma).

00K0 Lemma 10.57.6. If $M$ is a finitely generated graded $S$-module, and if $S$ is finitely generated over $S_{0}$, then each $M_{n}$ is a finite $S_{0}$-module.

Proof. Suppose the generators of $M$ are $m_{i}$ and the generators of $S$ are $f_{i}$. By taking homogeneous components we may assume that the $m_{i}$ and the $f_{i}$ are homogeneous and we may assume $f_{i} \in S_{+}$. In this case it is clear that each $M_{n}$ is generated over $S_{0}$ by the "monomials" $\prod f_{i}^{e_{i}} m_{j}$ whose degree is $n$.

00K1 Proposition 10.57.7. Suppose that $S$ is a Noetherian graded ring and $M$ a finite graded $S$-module. Consider the function

$$
\mathbf{Z} \longrightarrow K_{0}^{\prime}\left(S_{0}\right), \quad n \longmapsto\left[M_{n}\right]
$$

see Lemma 10.57.6. If $S_{+}$is generated by elements of degree 1, then this function is a numerical polynomial.

Proof. We prove this by induction on the minimal number of generators of $S_{1}$. If this number is 0 , then $M_{n}=0$ for all $n \gg 0$ and the result holds. To prove the induction step, let $x \in S_{1}$ be one of a minimal set of generators, such that the induction hypothesis applies to the graded ring $S /(x)$.

First we show the result holds if $x$ is nilpotent on $M$. This we do by induction on the minimal integer $r$ such that $x^{r} M=0$. If $r=1$, then $M$ is a module over $S / x S$ and the result holds (by the other induction hypothesis). If $r>1$, then we can find a short exact sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ such that the integers $r^{\prime}, r^{\prime \prime}$ are strictly smaller than $r$. Thus we know the result for $M^{\prime \prime}$ and $M^{\prime}$. Hence we get the result for $M$ because of the relation $\left[M_{d}\right]=\left[M_{d}^{\prime}\right]+\left[M_{d}^{\prime \prime}\right]$ in $K_{0}^{\prime}\left(S_{0}\right)$.
If $x$ is not nilpotent on $M$, let $M^{\prime} \subset M$ be the largest submodule on which $x$ is nilpotent. Consider the exact sequence $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M / M^{\prime} \rightarrow 0$ we see again it suffices to prove the result for $M / M^{\prime}$. In other words we may assume that multiplication by $x$ is injective.
Let $\bar{M}=M / x M$. Note that the map $x: M \rightarrow M$ is not a map of graded $S$-modules, since it does not map $M_{d}$ into $M_{d}$. Namely, for each $d$ we have the following short exact sequence

$$
0 \rightarrow M_{d} \xrightarrow{x} M_{d+1} \rightarrow \bar{M}_{d+1} \rightarrow 0
$$

This proves that $\left[M_{d+1}\right]-\left[M_{d}\right]=\left[\bar{M}_{d+1}\right]$. Hence we win by Lemma 10.57.5.
02CD Remark 10.57.8. If $S$ is still Noetherian but $S$ is not generated in degree 1, then the function associated to a graded $S$-module is a periodic polynomial (i.e., it is a numerical polynomial on the congruence classes of integers modulo $n$ for some $n$ ).

00K2 Example 10.57.9. Suppose that $S=k\left[X_{1}, \ldots, X_{d}\right]$. By Example 10.54 .2 we may identify $K_{0}(k)=K_{0}^{\prime}(k)=\mathbf{Z}$. Hence any finitely generated graded $k\left[X_{1}, \ldots, X_{d}\right]$ module gives rise to a numerical polynomial $n \mapsto \operatorname{dim}_{k}\left(M_{n}\right)$.

00K3 Lemma 10.57.10. Let $k$ be a field. Suppose that $I \subset k\left[X_{1}, \ldots, X_{d}\right]$ is a nonzero graded ideal. Let $M=k\left[X_{1}, \ldots, X_{d}\right] / I$. Then the numerical polynomial $n \mapsto$ $\operatorname{dim}_{k}\left(M_{n}\right)$ (see Example 10.57.9) has degree $<d-1$ (or is zero if $d=1$ ).
Proof. The numerical polynomial associated to the graded module $k\left[X_{1}, \ldots, X_{n}\right]$ is $n \mapsto\binom{n-1+d}{d-1}$. For any nonzero homogeneous $f \in I$ of degree $e$ and any degree $n \gg e$ we have $I_{n} \supset f \cdot k\left[X_{1}, \ldots, X_{d}\right]_{n-e}$ and hence $\operatorname{dim}_{k}\left(I_{n}\right) \geq\binom{ n-e-1+d}{d-1}$. Hence $\operatorname{dim}_{k}\left(M_{n}\right) \leq\binom{ n-1+d}{d-1}-\binom{n-e-1+d}{d-1}$. We win because the last expression has degree $<d-1$ (or is zero if $d=1$ ).

### 10.58. Noetherian local rings

00 K 4 In all of this section $(R, \mathfrak{m}, \kappa)$ is a Noetherian local ring. We develop some theory on Hilbert functions of modules in this section. Let $M$ be a finite $R$-module. We define the Hilbert function of $M$ to be the function

$$
\varphi_{M}: n \longmapsto \operatorname{length}_{R}\left(\mathfrak{m}^{n} M / \mathfrak{m}^{n+1} M\right)
$$

defined for all integers $n \geq 0$. Another important invariant is the function

$$
\chi_{M}: n \longmapsto \operatorname{length}_{R}\left(M / \mathfrak{m}^{n+1} M\right)
$$

defined for all integers $n \geq 0$. Note that we have by Lemma 10.51 .3 that

$$
\chi_{M}(n)=\sum_{i=0}^{n} \varphi_{M}(i)
$$

There is a variant of this construction which uses an ideal of definition.
07DU Definition 10.58.1. Let $(R, \mathfrak{m})$ be a local Noetherian ring. An ideal $I \subset R$ such that $\sqrt{I}=\mathfrak{m}$ is called an ideal of definition of $R$.

Let $I \subset R$ be an ideal of definition. Because $R$ is Noetherian this means that $\mathfrak{m}^{r} \subset I$ for some $r$, see Lemma 10.31.4 Hence any finite $R$-module annihilated by a power of $I$ has a finite length, see Lemma 10.51.8. Thus it makes sense to define

$$
\varphi_{I, M}(n)=\operatorname{length}_{R}\left(I^{n} M / I^{n+1} M\right) \quad \text { and } \quad \chi_{I, M}(n)=\operatorname{length}_{R}\left(M / I^{n+1} M\right)
$$

for all $n \geq 0$. Again we have that

$$
\chi_{I, M}(n)=\sum_{i=0}^{n} \varphi_{I, M}(i)
$$

00K5 Lemma 10.58.2. Suppose that $M^{\prime} \subset M$ are finite $R$-modules with finite length quotient. Then there exists a constants $c_{1}, c_{2}$ such that for all $n \geq c_{2}$ we have

$$
c_{1}+\chi_{I, M^{\prime}}\left(n-c_{2}\right) \leq \chi_{I, M}(n) \leq c_{1}+\chi_{I, M^{\prime}}(n)
$$

Proof. Since $M / M^{\prime}$ has finite length there is a $c_{2} \geq 0$ such that $I^{c_{2}} M \subset M^{\prime}$. Let $c_{1}=\operatorname{length}_{R}\left(M / M^{\prime}\right)$. For $n \geq c_{2}$ we have

$$
\begin{aligned}
\chi_{I, M}(n) & =\operatorname{length}_{R}\left(M / I^{n+1} M\right) \\
& =c_{1}+\operatorname{length}_{R}\left(M^{\prime} / I^{n+1} M\right) \\
& \leq c_{1}+\operatorname{length}_{R}\left(M^{\prime} / I^{n+1} M^{\prime}\right) \\
& =c_{1}+\chi_{I, M^{\prime}}(n)
\end{aligned}
$$

On the other hand, since $I^{c_{2}} M \subset M^{\prime}$, we have $I^{n} M \subset I^{n-c_{2}} M^{\prime}$ for $n \geq c_{2}$. Thus for $n \geq c_{2}$ we get

$$
\begin{aligned}
\chi_{I, M}(n) & =\operatorname{length}_{R}\left(M / I^{n+1} M\right) \\
& =c_{1}+\operatorname{length}_{R}\left(M^{\prime} / I^{n+1} M\right) \\
& \geq c_{1}+\operatorname{length}_{R}\left(M^{\prime} / I^{n+1-c_{2}} M^{\prime}\right) \\
& =c_{1}+\chi_{I, M^{\prime}}\left(n-c_{2}\right)
\end{aligned}
$$

which finishes the proof.
00K6 Lemma 10.58.3. Suppose that $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ is a short exact sequence of finite $R$-modules. Then there exists a submodule $N \subset M^{\prime}$ with finite colength $l$ and $c \geq 0$ such that

$$
\chi_{I, M}(n)=\chi_{I, M^{\prime \prime}}(n)+\chi_{I, N}(n-c)+l
$$

and

$$
\varphi_{I, M}(n)=\varphi_{I, M^{\prime \prime}}(n)+\varphi_{I, N}(n-c)
$$

for all $n \geq c$.
Proof. Note that $M / I^{n} M \rightarrow M^{\prime \prime} / I^{n} M^{\prime \prime}$ is surjective with kernel $M^{\prime} / M^{\prime} \cap I^{n} M$. By the Artin-Rees Lemma 10.50 .2 there exists a constant $c$ such that $M^{\prime} \cap I^{n} M=$ $I^{n-c}\left(M^{\prime} \cap I^{c} M\right)$. Denote $N=M^{\prime} \cap I^{c} M$. Note that $I^{c} M^{\prime} \subset N \subset M^{\prime}$. Hence $\operatorname{length}_{R}\left(M^{\prime} / M^{\prime} \cap I^{n} M\right)=\operatorname{length}_{R}\left(M^{\prime} / N\right)+\operatorname{length}_{R}\left(N / I^{n-c} N\right)$ for $n \geq c$. From the short exact sequence

$$
0 \rightarrow M^{\prime} / M^{\prime} \cap I^{n} M \rightarrow M / I^{n} M \rightarrow M^{\prime \prime} / I^{n} M^{\prime \prime} \rightarrow 0
$$

and additivity of lengths (Lemma 10.51.3) we obtain the equality

$$
\chi_{I, M}(n-1)=\chi_{I, M^{\prime \prime}}(n-1)+\chi_{I, N}(n-c-1)+\operatorname{length}_{R}\left(M^{\prime} / N\right)
$$

for $n \geq c$. We have $\varphi_{I, M}(n)=\chi_{I, M}(n)-\chi_{I, M}(n-1)$ and similarly for the modules $M^{\prime \prime}$ and $N$. Hence we get $\varphi_{I, M}(n)=\varphi_{I, M^{\prime \prime}}(n)+\varphi_{I, N}(n-c)$ for $n \geq c$.

00K7 Lemma 10.58.4. Suppose that $I, I^{\prime}$ are two ideals of definition for the Noetherian local ring $R$. Let $M$ be a finite $R$-module. There exists a constant a such that $\chi_{I, M}(n) \leq \chi_{I^{\prime}, M}($ an $)$ for $n \geq 1$.
Proof. There exists an integer $c$ such that $\left(I^{\prime}\right)^{c} \subset I$. Hence we get a surjection $M /\left(I^{\prime}\right)^{c(n+1)} M \rightarrow M / I^{n+1} M$. Whence the result with $a=c+1$.
00K8 Proposition 10.58.5. Let $R$ be a Noetherian local ring. Let $M$ be a finite $R$ module. Let $I \subset R$ be an ideal of definition. The Hilbert function $\varphi_{I, M}$ and the function $\chi_{I, M}$ are numerical polynomials.

Proof. Consider the graded ring $S=R / I \oplus I / I^{2} \oplus I^{2} / I^{3} \oplus \ldots=\bigoplus_{d \geq 0} I^{d} / I^{d+1}$. Consider the graded $S$-module $N=M / I M \oplus I M / I^{2} M \oplus \ldots=\bigoplus_{d \geq 0} I^{d} M / I^{d+1} M$. This pair $(S, N)$ satisfies the hypotheses of Proposition 10.57.7. Hence the result for $\varphi_{I, M}$ follows from that proposition and Lemma 10.54.1. The result for $\chi_{I, M}$ follows from this and Lemma 10.57.5.

09CA Definition 10.58.6. Let $R$ be a Noetherian local ring. Let $M$ be a finite $R$ module. The Hilbert polynomial of $M$ over $R$ is the element $P(t) \in \mathbf{Q}[t]$ such that $P(n)=\varphi_{M}(n)$ for $n \gg 0$.
By Proposition 10.58 .5 we see that the Hilbert polynomial exists.
00K9 Lemma 10.58.7. Let $R$ be a Noetherian local ring. Let $M$ be a finite $R$-module.
(1) The degree of the numerical polynomial $\varphi_{I, M}$ is independent of the ideal of definition $I$.
(2) The degree of the numerical polynomial $\chi_{I, M}$ is independent of the ideal of definition $I$.
Proof. Part (2) follows immediately from Lemma 10.58.4 Part (1) follows from (2) because $\varphi_{I, M}(n)=\chi_{I, M}(n)-\chi_{I, M}(n-1)$ for $n \geq 1$.

00KA Definition 10.58.8. Let $R$ be a local Noetherian ring and $M$ a finite $R$-module. We denote $d(M)$ the element of $\{-\infty, 0,1,2, \ldots\}$ defined as follows:
(1) If $M=0$ we set $d(M)=-\infty$,
(2) if $M \neq 0$ then $d(M)$ is the degree of the numerical polynomial $\chi_{M}$.

If $\mathfrak{m}^{n} M \neq 0$ for all $n$, then we see that $d(M)$ is the degree +1 of the Hilbert polynomial of $M$.
00KB Lemma 10.58.9. Let $R$ be a Noetherian local ring. Let $I \subset R$ be an ideal of definition. Let $M$ be a finite $R$-module which does not have finite length. If $M^{\prime} \subset M$ is a submodule with finite colength, then $\chi_{I, M}-\chi_{I, M^{\prime}}$ is a polynomial of degree $<$ degree of either polynomial.

Proof. Follows from Lemma 10.58 .2 by elementary calculus.
00KC Lemma 10.58.10. Let $R$ be a Noetherian local ring. Let $I \subset R$ be an ideal of definition. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of finite $R$-modules. Then
(1) if $M^{\prime}$ does not have finite length, then $\chi_{I, M}-\chi_{I, M^{\prime \prime}}-\chi_{I, M^{\prime}}$ is a numerical polynomial of degree $<$ the degree of $\chi_{I, M^{\prime}}$,
(2) $\max \left\{\operatorname{deg}\left(\chi_{I, M^{\prime}}\right), \operatorname{deg}\left(\chi_{I, M^{\prime \prime}}\right)\right\}=\operatorname{deg}\left(\chi_{I, M}\right)$, and
(3) $\max \left\{d\left(M^{\prime}\right), d\left(M^{\prime \prime}\right)\right\}=d(M)$,

Proof. We first prove (1). Let $N \subset M^{\prime}$ be as in Lemma 10.58.3. By Lemma 10.58 .9 the numerical polynomial $\chi_{I, M^{\prime}}-\chi_{I, N}$ has degree $<$ the common degree of $\chi_{I, M^{\prime}}$ and $\chi_{I, N}$. By Lemma 10.58.3 the difference

$$
\chi_{I, M}(n)-\chi_{I, M^{\prime \prime}}(n)-\chi_{I, N}(n-c)
$$

is constant for $n \gg 0$. By elementary calculus the difference $\chi_{I, N}(n)-\chi_{I, N}(n-c)$ has degree $<$ the degree of $\chi_{I, N}$ which is bigger than zero (see above). Putting everything together we obtain (1).
Note that the leading coefficients of $\chi_{I, M^{\prime}}$ and $\chi_{I, M^{\prime \prime}}$ are nonnegative. Thus the degree of $\chi_{I, M^{\prime}}+\chi_{I, M^{\prime \prime}}$ is equal to the maximum of the degrees. Thus if $M^{\prime}$ does not have finite length, then (2) follows from (1). If $M^{\prime}$ does have finite length, then $I^{n} M \rightarrow I^{n} M^{\prime \prime}$ is an isomorphism for all $n \gg 0$ by Artin-Rees (Lemma 10.50.2). Thus $M / I^{n} M \rightarrow M^{\prime \prime} / I^{n} M^{\prime \prime}$ is a surjection with kernel $M^{\prime}$ for $n \gg 0$ and we see that $\chi_{I, M}(n)-\chi_{I, M^{\prime \prime}}(n)=$ length $\left(M^{\prime}\right)$ for all $n \gg 0$. Thus (2) holds in this case also.
Proof of (3). This follows from (2) except if one of $M, M^{\prime}$, or $M^{\prime \prime}$ is zero. We omit the proof in these special cases.

### 10.59. Dimension

00KD
00KE Definition 10.59.1. The Krull dimension of the ring $R$ is the Krull dimension of the topological space $\operatorname{Spec}(R)$, see Topology, Definition 5.9.1. In other words it is the supremum of the integers $n \geq 0$ such that there exists a chain of prime ideals of length $n$ :

$$
\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \ldots \subset \mathfrak{p}_{n}, \quad \mathfrak{p}_{i} \neq \mathfrak{p}_{i+1}
$$

00KF Definition 10.59.2. The height of a prime ideal $\mathfrak{p}$ of a ring $R$ is the dimension of the local ring $R_{p}$.
00KG Lemma 10.59.3. The Krull dimension of $R$ is the supremum of the heights of its (maximal) primes.

Proof. This is so because we can always add a maximal ideal at the end of a chain of prime ideals.
00KH Lemma 10.59.4. A Noetherian ring of dimension 0 is Artinian. Conversely, any Artinian ring is Noetherian of dimension zero.

Proof. By Lemma 10.30 .5 the space $\operatorname{Spec}(R)$ is Noetherian. By Topology, Lemma 5.8 .2 we see that $\operatorname{Spec}(R)$ has finitely many irreducible components, $\operatorname{say} \operatorname{Spec}(R)=$ $Z_{1} \cup \ldots Z_{r}$. According to Lemma 10.25.1, each $Z_{i}=V\left(\mathfrak{p}_{i}\right)$ with $\mathfrak{p}_{i}$ a minimal ideal. Since the dimension is 0 these $\mathfrak{p}_{i}$ are also maximal. Thus $\operatorname{Spec}(R)$ is the discrete topological space with elements $\mathfrak{p}_{i}$. All elements $f$ of the radical $I=\cap \mathfrak{p}_{i}$ are nilpotent since otherwise $R_{f}$ would not be the zero ring and we would have another prime. Since $I$ is finitely generated we conclude that $I$ is nilpotent, Lemma 10.31.4. By Lemma $10.52 .5 ~ R$ is the product of its local rings. By Lemma 10.51 .8 each of these has finite length over $R$. Hence we conclude that $R$ is Artinian by Lemma 10.52 .6

If $R$ is Artinian then by Lemma 10.52 .6 it is Noetherian. All of its primes are maximal by a combination of Lemmas 10.52.3, 10.52.4 and 10.52 .5 .

In the following we will use the invariant $d(-)$ defined in Definition 10.58.8. Here is a warm up lemma.

00KI Lemma 10.59.5. Let $R$ be a Noetherian local ring. Then $\operatorname{dim}(R)=0 \Leftrightarrow d(R)=0$.
Proof. This is because $d(R)=0$ if and only if $R$ has finite length as an $R$-module. See Lemma 10.52 .6

00KJ Proposition 10.59.6. Let $R$ be a ring. The following are equivalent:
(1) $R$ is Artinian,
(2) $R$ is Noetherian and $\operatorname{dim}(R)=0$,
(3) $R$ has finite length as a module over itself,
(4) $R$ is a finite product of Artinian local rings,
(5) $R$ is Noetherian and $\operatorname{Spec}(R)$ is a finite discrete topological space,
(6) $R$ is a finite product of Noetherian local rings of dimension 0,
(7) $R$ is a finite product of Noetherian local rings $R_{i}$ with $d\left(R_{i}\right)=0$,
(8) $R$ is a finite product of Noetherian local rings $R_{i}$ whose maximal ideals are nilpotent,
(9) $R$ is Noetherian, has finitely many maximal ideals and its radical ideal is nilpotent, and
(10) $R$ is Noetherian and there are no strict inclusions among its primes.

Proof. This is a combination of Lemmas 10.52.5, 10.52.6, 10.59.4, and 10.59.5.
00KK Lemma 10.59.7. Let $R$ be a local Noetherian ring. The following are equivalent:

00KL
(1) $\operatorname{dim}(R)=1$,

00 KM
(2) $d(R)=1$,

00KN
00KO
00KP
(3) there exists an $x \in \mathfrak{m}, x$ not nilpotent such that $V(x)=\{\mathfrak{m}\}$,
(4) there exists an $x \in \mathfrak{m}, x$ not nilpotent such that $\mathfrak{m}=\sqrt{(x)}$, and
(5) there exists an ideal of definition generated by 1 element, and no ideal of definition is generated by 0 elements.

Proof. First, assume that $\operatorname{dim}(R)=1$. Let $\mathfrak{p}_{i}$ be the minimal primes of $R$. Because the dimension is 1 the only other prime of $R$ is $\mathfrak{m}$. According to Lemma 10.30.6 there are finitely many. Hence we can find $x \in \mathfrak{m}, x \notin \mathfrak{p}_{i}$, see Lemma 10.14.2. Thus the only prime containing $x$ is $\mathfrak{m}$ and hence (3).

If 3 then $\mathfrak{m}=\sqrt{(x)}$ by Lemma 10.16 .2 and hence 4 . The converse is clear as well. The equivalence of (4) and (5) follows from directly the definitions.
Assume (5). Let $I=(x)$ be an ideal of definition. Note that $I^{n} / I^{n+1}$ is a quotient of $R / I$ via multiplication by $x^{n}$ and hence length ${ }_{R}\left(I^{n} / I^{n+1}\right)$ is bounded. Thus $d(R)=0$ or $d(R)=1$, but $d(R)=0$ is excluded by the assumption that 0 is not an ideal of definition.

Assume (22. To get a contradiction, assume there exist primes $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}$, with both inclusions strict. Pick some ideal of definition $I \subset R$. We will repeatedly use Lemma 10.58.10. First of all it implies, via the exact sequence $0 \rightarrow \mathfrak{p} \rightarrow R \rightarrow R / \mathfrak{p} \rightarrow 0$, that $d(R / \mathfrak{p}) \leq 1$. But it clearly cannot be zero. Pick $x \in \mathfrak{q}, x \notin \mathfrak{p}$. Consider the short exact sequence

$$
0 \rightarrow R / \mathfrak{p} \rightarrow R / \mathfrak{p} \rightarrow R /(x R+\mathfrak{p}) \rightarrow 0
$$

This implies that $\chi_{I, R / \mathfrak{p}}-\chi_{I, R / \mathfrak{p}}-\chi_{I, R /(x R+\mathfrak{p})}=-\chi_{I, R /(x R+\mathfrak{p})}$ has degree $<1$. In other words, $d(R /(x R+\mathfrak{p})=0$, and hence $\operatorname{dim}(R /(x R+\mathfrak{p}))=0$, by Lemma 10.59.5. But $R /(x R+\mathfrak{p})$ has the distinct primes $\mathfrak{q} /(x R+\mathfrak{p})$ and $\mathfrak{m} /(x R+\mathfrak{p})$ which gives the desired contradiction.

00KQ Proposition 10.59.8. Let $R$ be a local Noetherian ring. Let $d \geq 0$ be an integer. The following are equivalent:
00KR (1) $\operatorname{dim}(R)=d$,
(2) $d(R)=d$,

00KT
(3) there exists an ideal of definition generated by d elements, and no ideal of definition is generated by fewer than d elements.

Proof. This proof is really just the same as the proof of Lemma 10.59.7. We will prove the proposition by induction on $d$. By Lemmas 10.59 .5 and 10.59 .7 we may assume that $d>1$. Denote the minimal number of generators for an ideal of definition of $R$ by $d^{\prime}(R)$. We will prove that the inequalities $\operatorname{dim}(R) \geq d^{\prime}(R) \geq$ $d(R) \geq \operatorname{dim}(R)$, and hence they are all equal.

First, assume that $\operatorname{dim}(R)=d$. Let $\mathfrak{p}_{i}$ be the minimal primes of $R$. According to Lemma 10.30 .6 there are finitely many. Hence we can find $x \in \mathfrak{m}, x \notin \mathfrak{p}_{i}$, see Lemma 10.14.2. Note that every maximal chain of primes starts with some $\mathfrak{p}_{i}$, hence the dimension of $R / x R$ is at most $d-1$. By induction there are $x_{2}, \ldots, x_{d}$ which generate an ideal of definition in $R / x R$. Hence $R$ has an ideal of definition generated by (at most) $d$ elements.

Assume $d^{\prime}(R)=d$. Let $I=\left(x_{1}, \ldots, x_{d}\right)$ be an ideal of definition. Note that $I^{n} / I^{n+1}$ is a quotient of a direct sum of $\binom{d+n-1}{d-1}$ copies $R / I$ via multiplication by all degree $n$ monomials in $x_{1}, \ldots, x_{n}$. Hence length ${ }_{R}\left(I^{n} / I^{n+1}\right)$ is bounded by a polynomial of degree $d-1$. Thus $d(R) \leq d$.

Assume $d(R)=d$. Consider a chain of primes $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{q}_{2} \subset \ldots \subset \mathfrak{p}_{e}=\mathfrak{m}$, with all inclusions strict, and $e \geq 2$. Pick some ideal of definition $I \subset R$. We will repeatedly use Lemma 10.58 .10 First of all it implies, via the exact sequence $0 \rightarrow \mathfrak{p} \rightarrow R \rightarrow R / \mathfrak{p} \rightarrow 0$, that $d(R / \mathfrak{p}) \leq d$. But it clearly cannot be zero. Pick $x \in \mathfrak{q}, x \notin \mathfrak{p}$. Consider the short exact sequence

$$
0 \rightarrow R / \mathfrak{p} \rightarrow R / \mathfrak{p} \rightarrow R /(x R+\mathfrak{p}) \rightarrow 0
$$

This implies that $\chi_{I, R / \mathfrak{p}}-\chi_{I, R / \mathfrak{p}}-\chi_{I, R /(x R+\mathfrak{p})}=-\chi_{I, R /(x R+\mathfrak{p})}$ has degree $<d$. In other words, $d(R /(x R+\mathfrak{p})) \leq d-1$, and hence $\operatorname{dim}(R /(x R+\mathfrak{p})) \leq d-1$, by induction. Now $R /(x R+\mathfrak{p})$ has the chain of prime ideals $\mathfrak{q} /(x R+\mathfrak{p}) \subset \mathfrak{q}_{2} /(x R+\mathfrak{p}) \subset$ $\ldots \subset \mathfrak{q}_{e} /(x R+\mathfrak{p})$ which gives $e-1 \leq d-1$. Since we started with an arbitrary chain of primes this proves that $\operatorname{dim}(R) \leq d(R)$.
Reading back the reader will see we proved the circular inequalities as desired.
Let $(R, \mathfrak{m})$ be a Noetherian local ring. From the above it is clear that $\mathfrak{m}$ cannot be generated by fewer than $\operatorname{dim}(R)$ variables. By Nakayama's Lemma 10.19.1 the minimal number of generators of $\mathfrak{m}$ equals $\operatorname{dim}_{\kappa(\mathfrak{m})} \mathfrak{m} / \mathfrak{m}^{2}$. Hence we have the following fundamental inequality

$$
\operatorname{dim}(R) \leq \operatorname{dim}_{\kappa(\mathfrak{m})} \mathfrak{m} / \mathfrak{m}^{2}
$$

It turns out that the rings where equality holds have a lot of good properties. They are called regular local rings.

00 KU Definition 10.59.9. Let $(R, \mathfrak{m})$ be a Noetherian local ring of dimension $d$.
(1) A system of parameters of $R$ is a sequence of elements $x_{1}, \ldots, x_{d} \in \mathfrak{m}$ which generates an ideal of definition of $R$,
(2) if there exist $x_{1}, \ldots, x_{d} \in \mathfrak{m}$ such that $\mathfrak{m}=\left(x_{1}, \ldots, x_{d}\right)$ then we call $R$ a regular local ring and $x_{1}, \ldots, x_{d}$ a regular system of parameters.

The following lemmas are clear from the proofs of the lemmas and proposition above, but we spell them out so we have convenient references.
00KV Lemma 10.59.10. Let $R$ be a Noetherian ring. Let $x \in R$.
(1) If $\mathfrak{p}$ is minimal over $(x)$ then the height of $\mathfrak{p}$ is 0 or 1 .
(2) If $\mathfrak{p}, \mathfrak{q} \in \operatorname{Spec}(R)$ and $\mathfrak{q}$ is minimal over $(\mathfrak{p}, x)$, then there is no prime strictly between $\mathfrak{p}$ and $\mathfrak{q}$.

Proof. Proof of (1). If $\mathfrak{p}$ is minimal over $x$, then the only prime ideal of $R_{\mathfrak{p}}$ containing $x$ is the maximal ideal $\mathfrak{p} R_{\mathfrak{p}}$. This is true because the primes of $R_{\mathfrak{p}}$ correspond 1-to- 1 with the primes of $R$ contained in $\mathfrak{p}$, see Lemma 10.16.5. Hence Lemma 10.59 .7 shows $\operatorname{dim}\left(R_{\mathfrak{p}}\right)=1$ if $x$ is not nilpotent in $R_{\mathfrak{p}}$. Of course, if $x$ is nilpotent in $R_{\mathfrak{p}}$ the argument gives that $\mathfrak{p} R_{\mathfrak{p}}$ is the only prime ideal and we see that the height is 0 .

Proof of (2). By part (1) we see that $\mathfrak{p} / \mathfrak{q}$ is a prime of height 1 or 0 in $R / \mathfrak{q}$. This immediately implies there cannot be a prime strictly between $\mathfrak{p}$ and $\mathfrak{q}$.
0BBZ Lemma 10.59.11. Let $R$ be a Noetherian ring. Let $f_{1}, \ldots, f_{r} \in R$.
(1) If $\mathfrak{p}$ is minimal over $\left(f_{1}, \ldots, f_{r}\right)$ then the height of $\mathfrak{p}$ is $\leq r$.
(2) If $\mathfrak{p}, \mathfrak{q} \in \operatorname{Spec}(R)$ and $\mathfrak{q}$ is minimal over $\left(\mathfrak{p}, f_{1}, \ldots, f_{r}\right)$, then every chain of primes between $\mathfrak{p}$ and $\mathfrak{q}$ has length at most $r$.
Proof. Proof of (1). If $\mathfrak{p}$ is minimal over $f_{1}, \ldots, f_{r}$, then the only prime ideal of $R_{\mathfrak{p}}$ containing $f_{1}, \ldots, f_{r}$ is the maximal ideal $\mathfrak{p} R_{\mathfrak{p}}$. This is true because the primes of $R_{\mathfrak{p}}$ correspond 1-to-1 with the primes of $R$ contained in $\mathfrak{p}$, see Lemma 10.16.5. Hence Proposition 10.59 .8 shows $\operatorname{dim}\left(R_{\mathfrak{p}}\right) \leq r$.
Proof of (2). By part (1) we see that $\mathfrak{p} / \mathfrak{q}$ is a prime of height $\leq r$. This immediately implies the statement about chains of primes between $\mathfrak{p}$ and $\mathfrak{q}$.
00KW Lemma 10.59.12. Suppose that $R$ is a Noetherian local ring and $x \in \mathfrak{m}$ an element of its maximal ideal. Then $\operatorname{dim} R \leq \operatorname{dim} R / x R+1$. If $x$ is not contained in any of the minimal primes of $R$ then equality holds. (For example if $x$ is $a$ nonzerodivisor.)

Proof. If $x_{1}, \ldots, x_{\operatorname{dim} R / x R} \in R$ map to elements of $R / x R$ which generate an ideal of definition for $R / x R$, then $x, x_{1}, \ldots, x_{\operatorname{dim} R / x R}$ generate an ideal of definition for $R$. Hence the inequality by Proposition 10.59.8. On the other hand, if $x$ is not contained in any minimal prime of $R$, then the chains of primes in $R / x R$ all give rise to chains in $R$ which are at least one step away from being maximal.

02IE Lemma 10.59.13. Let $(R, \mathfrak{m})$ be a Noetherian local ring. Suppose $x_{1}, \ldots, x_{d} \in \mathfrak{m}$ generate an ideal of definition and $d=\operatorname{dim}(R)$. Then $\operatorname{dim}\left(R /\left(x_{1}, \ldots, x_{i}\right)\right)=d-i$ for all $i=1, \ldots, d$.
Proof. Follows either from the proof of Proposition 10.59 .8 , or by using induction on $d$ and Lemma 10.59.12.

### 10.60. Applications of dimension theory

02IF We can use the results on dimension to prove certain rings have infinite spectra and to produce more Jacobson rings.

02IG Lemma 10.60.1. Let $R$ be a Noetherian local domain of dimension $\geq 2$. $A$ nonempty open subset $U \subset \operatorname{Spec}(R)$ is infinite.
Proof. To get a contradiction, assume that $U \subset \operatorname{Spec}(R)$ is finite. In this case $(0) \in U$ and $\{(0)\}$ is an open subset of $U$ (because the complement of $\{(0)\}$ is the union of the closures of the other points). Thus we may assume $U=\{(0)\}$. Let $\mathfrak{m} \subset R$ be the maximal ideal. We can find an $x \in \mathfrak{m}, x \neq 0$ such that $V(x) \cup U=\operatorname{Spec}(R)$. In other words we see that $D(x)=\{(0)\}$. In particular we see that $\operatorname{dim}(R / x R)=\operatorname{dim}(R)-1 \geq 1$, see Lemma 10.59.12, Let $\bar{y}_{2}, \ldots, \bar{y}_{\operatorname{dim}(R)} \in$ $R / x R$ generate an ideal of definition of $R / x R$, see Proposition 10.59.8. Choose lifts $y_{2}, \ldots, y_{\operatorname{dim}(R)} \in R$, so that $x, y_{2}, \ldots, y_{\operatorname{dim}(R)}$ generate an ideal of definition in $R$. This implies that $\operatorname{dim}\left(R /\left(y_{2}\right)\right)=\operatorname{dim}(R)-1$ and $\operatorname{dim}\left(R /\left(y_{2}, x\right)\right)=\operatorname{dim}(R)-2$, see Lemma 10.59.13. Hence there exists a prime $\mathfrak{p}$ containing $y_{2}$ but not $x$. This contradicts the fact that $D(x)=\{(0)\}$.
The rings $k[[t]]$ where $k$ is a field, or the ring of $p$-adic numbers are Noetherian rings of dimension 1 with finitely many primes. This is the maximum dimension for which this can happen.
0ALV Lemma 10.60.2. A Noetherian ring with finitely many primes has dimension $\leq 1$.

Proof. Let $R$ be a Noetherian ring with finitely many primes. If $R$ is a local domain, then the lemma follows from Lemma 10.60.1. If $R$ is a domain, then $R_{\mathfrak{m}}$ has dimension $\leq 1$ for all maximal ideals $\mathfrak{m}$ by the local case. Hence $\operatorname{dim}(R) \leq 1$ by Lemma 10.59.3. If $R$ is general, then $\operatorname{dim}(R / \mathfrak{q}) \leq 1$ for every minimal prime $\mathfrak{q}$ of $R$. Since every prime contains a minimal prime (Lemma 10.16.2), this implies $\operatorname{dim}(R) \leq 1$.
0ALW Lemma 10.60.3. Let $S$ be a nonzero finite type algebra over a field $k$. Then $\operatorname{dim}(S)=0$ if and only if $S$ has finitely many primes.

Proof. Recall that $\operatorname{Spec}(S)$ is sober, Noetherian, and Jacobson, see Lemmas 10.25 .2 , 10.30 .510 .34 .2 and 10.34 .4 . If it has dimension 0 , then every point defines an irreducible component and there are only a finite number of irreducible components (Topology, Lemma 5.8.2). Conversely, if $\operatorname{Spec}(S)$ is finite, then it is discrete by Topology, Lemma 5.17.6 and hence the dimension is 0 .

00KX Lemma 10.60.4. Noetherian Jacobson rings.
(1) Any Noetherian domain $R$ of dimension 1 with infinitely many primes is Jacobson.
(2) Any Noetherian ring such that every prime $\mathfrak{p}$ is either maximal or contained in infinitely many prime ideals is Jacobson.

Proof. Part (1) is a reformulation of Lemma 10.34.6.
Let $R$ be a Noetherian ring such that every non-maximal prime $\mathfrak{p}$ is contained in infinitely many prime ideals. Assume $\operatorname{Spec}(R)$ is not Jacobson to get a contradiction. By Lemmas 10.25 .1 and 10.30 .5 we see that $\operatorname{Spec}(R)$ is a sober, Noetherian
topological space. By Topology, Lemma 5.17 .3 we see that there exists a nonmaximal ideal $\mathfrak{p} \subset R$ such that $\{\mathfrak{p}\}$ is a locally closed subset of $\operatorname{Spec}(R)$. In other words, $\mathfrak{p}$ is not maximal and $\{\mathfrak{p}\}$ is an open subset of $V(\mathfrak{p})$. Consider a prime $\mathfrak{q} \subset R$ with $\mathfrak{p} \subset \mathfrak{q}$. Recall that the topology on the spectrum of $(R / \mathfrak{p})_{\mathfrak{q}}=R_{\mathfrak{q}} / \mathfrak{p} R_{\mathfrak{q}}$ is induced from that of $\operatorname{Spec}(R)$, see Lemmas 10.16 .5 and 10.16 .7 . Hence we see that $\{(0)\}$ is a locally closed subset of $\operatorname{Spec}\left((R / \mathfrak{p})_{\mathfrak{q}}\right)$. By Lemma 10.60.1 we conclude that $\operatorname{dim}\left((R / \mathfrak{p})_{\mathfrak{q}}\right)=1$. Since this holds for every $\mathfrak{q} \supset \mathfrak{p}$ we conclude that $\operatorname{dim}(R / \mathfrak{p})=1$. At this point we use the assumption that $\mathfrak{p}$ is contained in infinitely many primes to see that $\operatorname{Spec}(R / \mathfrak{p})$ is infinite. Hence by part (1) of the lemma we see that $V(\mathfrak{p}) \cong \operatorname{Spec}(R / \mathfrak{p})$ is the closure of its closed points. This is the desired contradiction since it means that $\{\mathfrak{p}\} \subset V(\mathfrak{p})$ cannot be open.

### 10.61. Support and dimension of modules

00KY
00L0 Lemma 10.61.1. Let $R$ be a Noetherian ring, and let $M$ be a finite $R$-module. There exists a filtration by $R$-submodules

$$
0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M
$$

such that each quotient $M_{i} / M_{i-1}$ is isomorphic to $R / \mathfrak{p}_{i}$ for some prime ideal $\mathfrak{p}_{i}$ of $R$.

Proof. By Lemma 10.5 .4 it suffices to do the case $M=R / I$ for some ideal $I$. Consider the set $S$ of ideals $J$ such that the lemma does not hold for the module $R / J$, and order it by inclusion. To arrive at a contradiction, assume that $S$ is not empty. Because $R$ is Noetherian, $S$ has a maximal element $J$. By definition of $S$, the ideal $J$ cannot be prime. Pick $a, b \in R$ such that $a b \in J$, but neither $a \in J$ nor $b \in J$. Consider the filtration $0 \subset a R /(J \cap a R) \subset R / J$. Note that $a R /(J \cap a R)$ is a quotient of $R /(J+b R)$ and the second quotient equals $R /(a R+J)$. Hence by maximality of $J$, each of these has a filtration as above and hence so does $R / J$. Contradiction.

00L4 Lemma 10.61.2. Let $R, M, M_{i}, \mathfrak{p}_{i}$ as in Lemma 10.61.1. Then $\operatorname{Supp}(M)=$ $\bigcup V\left(\mathfrak{p}_{i}\right)$ and in particular $\mathfrak{p}_{i} \in \operatorname{Supp}(M)$.

Proof. This follows from Lemmas 10.39 .5 and 10.39 .8 .
00L5 Lemma 10.61.3. Suppose that $R$ is a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $M$ be a nonzero finite $R$-module. Then $\operatorname{Supp}(M)=\{\mathfrak{m}\}$ if and only if $M$ has finite length over $R$.

Proof. Assume that $\operatorname{Supp}(M)=\{\mathfrak{m}\}$. It suffices to show that all the primes $\mathfrak{p}_{i}$ in the filtration of Lemma 10.61.1 are the maximal ideal. This is clear by Lemma 10.61 .2

Suppose that $M$ has finite length over $R$. Then $\mathfrak{m}^{n} M=0$ by Lemma 10.51 .4 . Since some element of $\mathfrak{m}$ maps to a unit in $R_{\mathfrak{p}}$ for any prime $\mathfrak{p} \neq \mathfrak{m}$ in $R$ we see $M_{\mathfrak{p}}=0$.

00L6 Lemma 10.61.4. Let $R$ be a Noetherian ring. Let $I \subset R$ be an ideal. Let $M$ be a finite $R$-module. Then $I^{n} M=0$ for some $n \geq 0$ if and only if Supp $(M) \subset V(I)$.

Proof. It is clear that $I^{n} M=0$ for some $n \geq 0$ implies $\operatorname{Supp}(M) \subset V(I)$. Suppose that $\operatorname{Supp}(M) \subset V(I)$. Choose a filtration $0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M$ as in Lemma 10.61.1. Each of the primes $\mathfrak{p}_{i}$ is contained in $V(I)$ by Lemma 10.61.2. Hence $I \subset \mathfrak{p}_{i}$ and $I$ annihilates $M_{i} / M_{i-1}$. Hence $I^{n}$ annihilates $M$.
00L7 Lemma 10.61.5. Let $R, M, M_{i}, \mathfrak{p}_{i}$ as in Lemma 10.61.1. The minimal elements of the set $\left\{\mathfrak{p}_{i}\right\}$ are the minimal elements of $\operatorname{Supp}(M)$. The number of times a minimal prime $\mathfrak{p}$ occurs is

$$
\#\left\{i \mid \mathfrak{p}_{i}=\mathfrak{p}\right\}=\text { length }_{R_{\mathfrak{p}}} M_{\mathfrak{p}} .
$$

Proof. The first statement follows because $\operatorname{Supp}(M)=\bigcup V\left(\mathfrak{p}_{i}\right)$, see Lemma 10.61.2. Let $\mathfrak{p} \in \operatorname{Supp}(M)$ be minimal. The support of $M_{\mathfrak{p}}$ is the set consisting of the maximal ideal $\mathfrak{p} R_{\mathfrak{p}}$. Hence by Lemma 10.61 .3 the length of $M_{\mathfrak{p}}$ is finite and $>0$. Next we note that $M_{\mathfrak{p}}$ has a filtration with subquotients $\left(R / \mathfrak{p}_{i}\right)_{\mathfrak{p}}=R_{\mathfrak{p}} / \mathfrak{p}_{i} R_{\mathfrak{p}}$ These are zero if $\mathfrak{p}_{i} \not \subset \mathfrak{p}$ and equal to $\kappa(\mathfrak{p})$ if $\mathfrak{p}_{i} \subset \mathfrak{p}$ because by minimality of $\mathfrak{p}$ we have $\mathfrak{p}_{i}=\mathfrak{p}$ in this case. The result follows since $\kappa(\mathfrak{p})$ has length 1 .

00L8 Lemma 10.61.6. Let $R$ be a Noetherian local ring. Let $M$ be a finite $R$-module. Then $d(M)=\operatorname{dim}(S u p p(M))$.

Proof. Let $M_{i}, \mathfrak{p}_{i}$ be as in Lemma 10.61.1. By Lemma 10.58 .10 we obtain the equality $d(M)=\max \left\{d\left(R / \mathfrak{p}_{i}\right)\right\}$. By Proposition 10.59 .8 we have $d\left(R / \mathfrak{p}_{i}\right)=$ $\operatorname{dim}\left(R / \mathfrak{p}_{i}\right)$. Trivially $\operatorname{dim}\left(R / \mathfrak{p}_{i}\right)=\operatorname{dim} V\left(\mathfrak{p}_{i}\right)$. Since all minimal primes of $\operatorname{Supp}(M)$ occur among the $\mathfrak{p}_{i}$ (Lemma 10.61.5) we win.

0B51 Lemma 10.61.7. Let $R$ be a Noetherian ring. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of finite $R$-modules. Then $\max \left\{\operatorname{dim}\left(\operatorname{Supp}\left(M^{\prime}\right)\right), \operatorname{dim}\left(\operatorname{Supp}\left(M^{\prime \prime}\right)\right)\right\}=$ $\operatorname{dim}(\operatorname{Supp}(M))$.

Proof. If $R$ is local, this follows immediately from Lemmas 10.61 .6 and 10.58 .10 . A more elementary argument, which works also if $R$ is not local, is to use that $\operatorname{Supp}\left(M^{\prime}\right), \operatorname{Supp}\left(M^{\prime \prime}\right)$, and $\operatorname{Supp}(M)$ are closed (Lemma 10.39.5) and that $\operatorname{Supp}(M)=$ $\operatorname{Supp}\left(M^{\prime}\right) \cup \operatorname{Supp}\left(M^{\prime \prime}\right)($ Lemma 10.39.8.

### 10.62. Associated primes

00L9 Here is the standard definition. For non-Noetherian rings and non-finite modules it may be more appropriate to use the definition in Section 10.65 .

00LA Definition 10.62.1. Let $R$ be a ring. Let $M$ be an $R$-module. A prime $\mathfrak{p}$ of $R$ is associated to $M$ if there exists an element $m \in M$ whose annihilator is $\mathfrak{p}$. The set of all such primes is denoted $\operatorname{Ass}_{R}(M)$ or $\operatorname{Ass}(M)$.

0586 Lemma 10.62.2. Let $R$ be a ring. Let $M$ be an $R$-module. Then Ass $(M) \subset$ Supp $(M)$.

Proof. If $m \in M$ has annihilator $\mathfrak{p}$, then in particular no element of $R \backslash \mathfrak{p}$ annihilates $m$. Hence $m$ is a nonzero element of $M_{\mathfrak{p}}$, i.e., $\mathfrak{p} \in \operatorname{Supp}(M)$.

02M3 Lemma 10.62.3. Let $R$ be a ring. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of $R$-modules. Then $\operatorname{Ass}\left(M^{\prime}\right) \subset \operatorname{Ass}(M)$ and $\operatorname{Ass}(M) \subset \operatorname{Ass}\left(M^{\prime}\right) \cup$ $\operatorname{Ass}\left(M^{\prime \prime}\right)$.

Proof. Omitted.

00LB Lemma 10.62.4. Let $R$ be a ring, and $M$ an $R$-module. Suppose there exists a filtration by $R$-submodules

$$
0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M
$$

such that each quotient $M_{i} / M_{i-1}$ is isomorphic to $R / \mathfrak{p}_{i}$ for some prime ideal $\mathfrak{p}_{i}$ of R. Then $\operatorname{Ass}(M) \subset\left\{\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{n}\right\}$.

Proof. By induction on the length $n$ of the filtration $\left\{M_{i}\right\}$. Pick $m \in M$ whose annihilator is a prime $\mathfrak{p}$. If $m \in M_{n-1}$ we are done by induction. If not, then $m$ maps to a nonzero element of $M / M_{n-1} \cong R / \mathfrak{p}_{n}$. Hence we have $\mathfrak{p} \subset \mathfrak{p}_{n}$. If equality does not hold, then we can find $f \in \mathfrak{p}_{n}, f \notin \mathfrak{p}$. In this case the annihilator of $f m$ is still $\mathfrak{p}$ and $f m \in M_{n-1}$. Thus we win by induction.

00LC Lemma 10.62.5. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. Then Ass $(M)$ is finite.

Proof. Immediate from Lemma 10.62 .4 and Lemma 10.61 .1 .
02CE Proposition 10.62.6. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. The following sets of primes are the same:
(1) The minimal primes in the support of $M$.
(2) The minimal primes in $\operatorname{Ass}(M)$.
(3) For any filtration $0=M_{0} \subset M_{1} \subset \ldots \subset M_{n-1} \subset M_{n}=M$ with $M_{i} / M_{i-1} \cong R / \mathfrak{p}_{i}$ the minimal primes of the set $\left\{\mathfrak{p}_{i}\right\}$.

Proof. Choose a filtration as in (3). In Lemma 10.61 .5 we have seen that the sets in (1) and (3) are equal.

Let $\mathfrak{p}$ be a minimal element of the set $\left\{\mathfrak{p}_{i}\right\}$. Let $i$ be minimal such that $\mathfrak{p}=\mathfrak{p}_{i}$. Pick $m \in M_{i}, m \notin M_{i-1}$. The annihilator of $m$ is contained in $\mathfrak{p}_{i}=\mathfrak{p}$ and contains $\mathfrak{p}_{1} \mathfrak{p}_{2} \ldots \mathfrak{p}_{i}$. By our choice of $i$ and $\mathfrak{p}$ we have $\mathfrak{p}_{j} \not \subset \mathfrak{p}$ for $j<i$ and hence we have $\mathfrak{p}_{1} \mathfrak{p}_{2} \ldots \mathfrak{p}_{i-1} \not \subset \mathfrak{p}_{i}$. Pick $f \in \mathfrak{p}_{1} \mathfrak{p}_{2} \ldots \mathfrak{p}_{i-1}, f \notin \mathfrak{p}$. Then $f m$ has annihilator $\mathfrak{p}$. In this way we see that $\mathfrak{p}$ is an associated prime of $M$. By Lemma 10.62 .2 we have $\operatorname{Ass}(M) \subset \operatorname{Supp}(M)$ and hence $\mathfrak{p}$ is minimal in $\operatorname{Ass}(M)$. Thus the set of primes in (1) is contained in the set of primes of (2).

Let $\mathfrak{p}$ be a minimal element of $\operatorname{Ass}(M)$. Since $\operatorname{Ass}(M) \subset \operatorname{Supp}(M)$ there is a minimal element $\mathfrak{q}$ of $\operatorname{Supp}(M)$ with $\mathfrak{q} \subset \mathfrak{p}$. We have just shown that $\mathfrak{q} \in \operatorname{Ass}(M)$. Hence $\mathfrak{q}=\mathfrak{p}$ by minimality of $\mathfrak{p}$. Thus the set of primes in (2) is contained in the set of primes of (1).

0587 Lemma 10.62.7. Let $R$ be a Noetherian ring. Let $M$ be an $R$-module. Then

$$
M=(0) \Leftrightarrow \operatorname{Ass}(M)=\emptyset
$$

Proof. If $M=(0)$, then $\operatorname{Ass}(M)=\emptyset$ by definition. If $M \neq 0$, pick any nonzero finitely generated submodule $M^{\prime} \subset M$, for example a submodule generated by a single nonzero element. By Lemma 10.39 .2 we see that $\operatorname{Supp}\left(M^{\prime}\right)$ is nonempty. By Proposition 10.62 .6 this implies that $\operatorname{Ass}\left(M^{\prime}\right)$ is nonempty. By Lemma 10.62 .3 this implies $\operatorname{Ass}(M) \neq \emptyset$.

05BV Lemma 10.62.8. Let $R$ be a Noetherian ring. Let $M$ be an $R$-module. Any $\mathfrak{p} \in \operatorname{Supp}(M)$ which is minimal among the elements of $\operatorname{Supp}(M)$ is an element of Ass( $M$ ).

Proof. If $M$ is a finite $R$-module, then this is a consequence of Proposition 10.62 .6 , In general write $M=\bigcup M_{\lambda}$ as the union of its finite submodules, and use that $\operatorname{Supp}(M)=\bigcup \operatorname{Supp}\left(M_{\lambda}\right)$ and $\operatorname{Ass}(M)=\bigcup \operatorname{Ass}\left(M_{\lambda}\right)$.

00LD Lemma 10.62.9. Let $R$ be a Noetherian ring. Let $M$ be an $R$-module. The union $\bigcup_{\mathfrak{q} \in A s s(M)} \mathfrak{q}$ is the set of elements of $R$ which are zerodivisors on $M$.

Proof. Any element in any associated prime clearly is a zerodivisor on $M$. Conversely, suppose $x \in R$ is a zerodivisor on $M$. Consider the submodule $N=\{m \in$ $M \mid x m=0\}$. Since $N$ is not zero it has an associated prime $\mathfrak{q}$ by Lemma 10.62 .7 . Then $x \in \mathfrak{q}$ and $\mathfrak{q}$ is an associated prime of $M$ by Lemma 10.62 .3

0B52 Lemma 10.62.10. Let $R$ is a Noetherian local ring, $M$ a finite $R$-module, and $f \in \mathfrak{m}$ an element of the maximal ideal of $R$. Then

$$
\operatorname{dim}(S u p p(M / f M)) \leq \operatorname{dim}(\operatorname{Supp}(M)) \leq \operatorname{dim}(\operatorname{Supp}(M / f M))+1
$$

If $f$ is not in any of the minimal primes of the support of $M$ (for example if $f$ is a nonzerodivisor on $M$ ), then equality holds for the right inequality.

Proof. (The parenthetical statement follows from Lemma 10.62.9) The first inequality follows from $\operatorname{Supp}(M / f M) \subset \operatorname{Supp}(M)$, see Lemma 10.39 .8 . For the second inequality, note that $\operatorname{Supp}(M / f M)=\operatorname{Supp}(M) \cap V(f)$, see Lemma 10.39 .8 . It follows, for example by Lemma 10.61 .2 and elementary properties of dimension, that it suffices to show $\operatorname{dim} V(\mathfrak{p}) \leq \operatorname{dim}(V(\mathfrak{p}) \cap V(f))+1$ for primes $\mathfrak{p}$ of $R$. This is a consequence of Lemma 10.59 .12 Finally, if $f$ is not contained in any minimal prime of the support of $M$, then the chains of primes in $\operatorname{Supp}(M / f M)$ all give rise to chains in $\operatorname{Supp}(M)$ which are at least one step away from being maximal.

05BW Lemma 10.62.11. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Then $\operatorname{Spec}(\varphi)\left(A s s_{S}(M)\right) \subset A s s_{R}(M)$.

Proof. If $\mathfrak{q} \in \operatorname{Ass}_{S}(M)$, then there exists an $m$ in $M$ such that the annihilator of $m$ in $S$ is $\mathfrak{q}$. Then the annihilator of $m$ in $R$ is $\mathfrak{q} \cap R$.

05BX Remark 10.62.12. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Then it is not always the case that $\operatorname{Spec}(\varphi)\left(\operatorname{Ass}_{S}(M)\right) \supset \operatorname{Ass}_{R}(M)$. For example, consider the ring map $R=k \rightarrow S=k\left[x_{1}, x_{2}, x_{3}, \ldots\right] /\left(x_{i}^{2}\right)$ and $M=S$. Then $\operatorname{Ass}_{R}(M)$ is not empty, but $\operatorname{Ass}_{S}(S)$ is empty.

05DZ Lemma 10.62.13. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. If $S$ is Noetherian, then $\operatorname{Spec}(\varphi)\left(A s s_{S}(M)\right)=A s s_{R}(M)$.

Proof. We have already seen in Lemma 10.62 .11 that $\operatorname{Spec}(\varphi)\left(\operatorname{Ass}_{S}(M)\right) \subset \operatorname{Ass}_{R}(M)$. For the converse, choose a prime $\mathfrak{p} \in \operatorname{Ass}_{R}(M)$. Let $m \in M$ be an element such that the annihilator of $m$ in $R$ is $\mathfrak{p}$. Let $I=\{g \in S \mid g m=0\}$ be the annihilator of $m$ in $S$. Then $R / \mathfrak{p} \subset S / I$ is injective, hence there exists a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$, see Lemma 10.29 .5 . By Proposition 10.62 .6 we see that $\mathfrak{q}$ is an associated prime of $S / I$, hence an associated prime of $M$ by Lemma 10.62 .3 and we win.

05BY Lemma 10.62.14. Let $R$ be a ring. Let $I$ be an ideal. Let $M$ be an $R / I$-module. Via the canonical injection $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$ we have $A s s_{R / I}(M)=A s s_{R}(M)$.

Proof. Omitted.

0310 Lemma 10.62.15. Let $R$ be a ring. Let $M$ be an $R$-module. Let $\mathfrak{p} \subset R$ be $a$ prime.
(1) If $\mathfrak{p} \in \operatorname{Ass}(M)$ then $\mathfrak{p} R_{\mathfrak{p}} \in \operatorname{Ass}\left(M_{\mathfrak{p}}\right)$.
(2) If $\mathfrak{p}$ is finitely generated then the converse holds as well.

Proof. If $\mathfrak{p} \in \operatorname{Ass}(M)$ there exists an element $m \in M$ whose annihilator is $\mathfrak{p}$. As localization is exact (Proposition 10.9.12) we see that the annihilator of $m / 1$ in $M_{\mathfrak{p}}$ is $\mathfrak{p} R_{\mathfrak{p}}$ hence (1) holds. Assume $\mathfrak{p} R_{\mathfrak{p}} \in \operatorname{Ass}\left(M_{\mathfrak{p}}\right)$ and $\mathfrak{p}=\left(f_{1}, \ldots, f_{n}\right)$. Let $m / g$ be an element of $M_{\mathfrak{p}}$ whose annihilator is $\mathfrak{p} R_{\mathfrak{p}}$. This implies that the annihilator of $m$ is contained in $\mathfrak{p}$. As $f_{i} m / g=0$ in $M_{\mathfrak{p}}$ we see there exists a $g_{i} \in R, g_{i} \notin \mathfrak{p}$ such that $g_{i} f_{i} m=0$ in $M$. Combined we see the annihilator of $g_{1} \ldots g_{n} m$ is $\mathfrak{p}$. Hence $\mathfrak{p} \in \operatorname{Ass}(M)$.

05BZ Lemma 10.62.16. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S \subset R$ be a multiplicative subset. Via the canonical injection $\operatorname{Spec}\left(S^{-1} R\right) \rightarrow \operatorname{Spec}(R)$ we have
(1) $A s s_{R}\left(S^{-1} M\right)=A s s_{S^{-1} R}\left(S^{-1} M\right)$,
(2) $A s s_{R}(M) \cap \operatorname{Spec}\left(S^{-1} R\right) \subset A s s_{R}\left(S^{-1} M\right)$, and
(3) if $R$ is Noetherian this inclusion is an equality.

Proof. The first equality follows, since if $m \in S^{-1} M$, then the annihilator of $m$ in $R$ is the intersection of the annihilator of $m$ in $S^{-1} R$ with $R$. The displayed inclusion and equality in the Noetherian case follows from Lemma 10.62 .15 since for $\mathfrak{p} \in R, S \cap \mathfrak{p}=\emptyset$ we have $M_{\mathfrak{p}}=\left(S^{-1} M\right)_{S^{-1} \mathfrak{p}}$.

05C0 Lemma 10.62.17. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S \subset R$ be a multiplicative subset. Assume that every $s \in S$ is a nonzerodivisor on $M$. Then

$$
A s s_{R}(M)=A s s_{R}\left(S^{-1} M\right)
$$

Proof. As $M \subset S^{-1} M$ by assumption we get the inclusion $\operatorname{Ass}(M)=\operatorname{Ass}\left(S^{-1} M\right)$ from Lemma 10.62.3. Conversely, suppose that $n / s \in S^{-1} M$ is an element whose annihilator is a prime ideal $\mathfrak{p}$. Then the annihilator of $n \in M$ is also $\mathfrak{p}$.

00LL Lemma 10.62.18. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $I \subset \mathfrak{m}$ be an ideal. Let $M$ be a finite $R$-module. The following are equivalent:
(1) There exists an $x \in I$ which is not a zerodivisor on $M$.
(2) We have $I \not \subset \mathfrak{q}$ for all $\mathfrak{q} \in \operatorname{Ass}(M)$.

Proof. If there exists a nonzerodivisor $x$ in $I$, then $x$ clearly cannot be in any associated prime of $M$. Conversely, suppose $I \not \subset \mathfrak{q}$ for all $\mathfrak{q} \in \operatorname{Ass}(M)$. In this case we can choose $x \in I, x \notin \mathfrak{q}$ for all $\mathfrak{q} \in \operatorname{Ass}(M)$ by Lemmas 10.62.5 and 10.14.2. By Lemma 10.62 .9 the element $x$ is not a zerodivisor on $M$.

0311 Lemma 10.62.19. Let $R$ be a ring. Let $M$ be an $R$-module. If $R$ is Noetherian the map

$$
M \longrightarrow \prod_{\mathfrak{p} \in A s s(M)} M_{\mathfrak{p}}
$$

is injective.
Proof. Let $x \in M$ be an element of the kernel of the map. Then if $\mathfrak{p}$ is an associated prime of $R x \subset M$ we see on the one hand that $\mathfrak{p} \in \operatorname{Ass}(M)$ (Lemma 10.62.3) and on the other hand that $(R x)_{\mathfrak{p}} \subset M_{\mathfrak{p}}$ is not zero. This contradiction shows that $\operatorname{Ass}(R x)=\emptyset$. Hence $R x=0$ by Lemma 10.62.7.

### 10.63. Symbolic powers

05G9 Here is the definition.
0313 Definition 10.63.1. Let $R$ be a ring. Let $\mathfrak{p}$ be a prime ideal. For $n \geq 0$ the $n$th symbolic power of $\mathfrak{p}$ is the ideal $\mathfrak{p}^{(n)}=\operatorname{Ker}\left(R \rightarrow R_{\mathfrak{p}} / \mathfrak{p}^{n} R_{\mathfrak{p}}\right)$.

Note that $\mathfrak{p}^{n} \subset \mathfrak{p}^{(n)}$ but equality does not always hold.
0314 Lemma 10.63.2. Let $R$ be a Noetherian ring. Let $\mathfrak{p}$ be a prime ideal. Let $n>0$. Then $\operatorname{Ass}\left(R / \mathfrak{p}^{(n)}\right)=\{\mathfrak{p}\}$.
Proof. If $\mathfrak{q}$ is an associated prime of $R / \mathfrak{p}^{(n)}$ then clearly $\mathfrak{p} \subset \mathfrak{q}$. On the other hand, any element $x \in R, x \notin \mathfrak{p}$ is a nonzerodivisor on $R / \mathfrak{p}^{(n)}$. Namely, if $y \in R$ and $x y \in \mathfrak{p}^{(n)}=R \cap \mathfrak{p}^{n} R_{\mathfrak{p}}$ then $y \in \mathfrak{p}^{n} R_{\mathfrak{p}}$, hence $y \in \mathfrak{p}^{(n)}$. Hence the lemma follows.

0BC0 Lemma 10.63.3. Let $R \rightarrow S$ be flat ring map. Let $\mathfrak{p} \subset R$ be a prime such that $\mathfrak{q}=\mathfrak{p} S$ is a prime of $S$. Then $\mathfrak{p}^{(n)} S=\mathfrak{q}^{(n)}$.
Proof. Since $\mathfrak{p}^{(n)}=\operatorname{Ker}\left(R \rightarrow R_{\mathfrak{p}} / \mathfrak{p}^{n} R_{\mathfrak{p}}\right)$ we see using flatness that $\mathfrak{p}^{(n)} S$ is the kernel of the map $S \rightarrow S_{\mathfrak{p}} / \mathfrak{p}^{n} S_{\mathfrak{p}}$. On the other hand $\mathfrak{q}^{(n)}$ is the kernel of the map $S \rightarrow S_{\mathfrak{q}} / \mathfrak{q}^{n} S_{\mathfrak{q}}=S_{\mathfrak{q}} / \mathfrak{p}^{n} S_{\mathfrak{q}}$. Hence it suffices to show that

$$
S_{\mathfrak{p}} / \mathfrak{p}^{n} S_{\mathfrak{p}} \longrightarrow S_{\mathfrak{q}} / \mathfrak{p}^{n} S_{\mathfrak{q}}
$$

is injective. Observe that the right hand module is the localization of the left hand module by elements $f \in S, f \notin \mathfrak{q}$. Thus it suffices to show these elements are nonzerodivisors on $S_{\mathfrak{p}} / \mathfrak{p}^{n} S_{\mathfrak{p}}$. By flatness, the module $S_{\mathfrak{p}} / \mathfrak{p}^{n} S_{\mathfrak{p}}$ has a finite filtration whose subquotients are

$$
\mathfrak{p}^{i} S_{\mathfrak{p}} / \mathfrak{p}^{i+1} S_{\mathfrak{p}} \cong \mathfrak{p}^{i} R_{\mathfrak{p}} / \mathfrak{p}^{i+1} R_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{p}} \cong V \otimes_{\kappa(\mathfrak{p})}(S / \mathfrak{q})_{\mathfrak{p}}
$$

where $V$ is a $\kappa(\mathfrak{p})$ vector space. Thus $f$ acts invertibly as desired.

### 10.64. Relative assassin

05GA Discussion of relative assassins. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. In this situation we can introduce the following sets of primes $\mathfrak{q}$ of $S$ :
$A$ with $\mathfrak{p}=R \cap \mathfrak{q}$ we have that $\mathfrak{q} \in \operatorname{Ass}_{S}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)$,
$A^{\prime}$ with $\mathfrak{p}=R \cap \mathfrak{q}$ we have that $\mathfrak{q}$ is in the image of $\operatorname{Ass}_{S \otimes \kappa(\mathfrak{p})}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)$ under the canonical map $\operatorname{Spec}\left(S \otimes_{R} \kappa(\mathfrak{p})\right) \rightarrow \operatorname{Spec}(S)$,
$A_{\text {fin }}$ with $\mathfrak{p}=R \cap \mathfrak{q}$ we have that $\mathfrak{q} \in \operatorname{Ass}_{S}(N / \mathfrak{p} N)$,
$A_{\text {fin }}^{\prime}$ for some prime $\mathfrak{p}^{\prime} \subset R$ we have $\mathfrak{q} \in \operatorname{Ass}_{S}\left(N / \mathfrak{p}^{\prime} N\right)$,
$B$ for some $R$-module $M$ we have $\mathfrak{q} \in \operatorname{Ass}_{S}\left(N \otimes_{R} M\right)$, and
$B_{f \text { in }}$ for some finite $R$-module $M$ we have $\mathfrak{q} \in \operatorname{Ass}_{S}\left(N \otimes_{R} M\right)$.
Let us determine some of the relations between theses sets.
05GB Lemma 10.64.1. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Let $A, A^{\prime}$, $A_{\text {fin }}, B$, and $B_{\text {fin }}$ be the subsets of $\operatorname{Spec}(S)$ introduced above.
(1) We always have $A=A^{\prime}$.
(2) We always have $A_{f i n} \subset A, B_{f i n} \subset B, A_{\text {fin }} \subset A_{f i n}^{\prime} \subset B_{f i n}$ and $A \subset B$.
(3) If $S$ is Noetherian, then $A=A_{\text {fin }}$ and $B=B_{\text {fin }}$.
(4) If $N$ is flat over $R$, then $A=A_{\text {fin }}=A_{\text {fin }}^{\prime}$ and $B=B_{\text {fin }}$.
(5) If $R$ is Noetherian and $N$ is flat over $R$, then all of the sets are equal, i.e., $A=A^{\prime}=A_{f i n}=A_{f i n}^{\prime}=B=B_{f i n}$.

Proof. Some of the arguments in the proof will be repeated in the proofs of later lemmas which are more precise than this one (because they deal with a given module $M$ or a given prime $\mathfrak{p}$ and not with the collection of all of them).
Proof of (1). Let $\mathfrak{p}$ be a prime of $R$. Then we have

$$
\operatorname{Ass}_{S}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)=\operatorname{Ass}_{S / \mathfrak{p} S}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)=\operatorname{Ass}_{S \otimes_{R} \kappa(\mathfrak{p})}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)
$$

the first equality by Lemma 10.62 .14 and the second by Lemma 10.62 .16 part (1). This prove that $A=A^{\prime}$. The inclusion $A_{\text {fin }} \subset A_{\text {fin }}^{\prime}$ is clear.

Proof of (2). Each of the inclusions is immediate from the definitions except perhaps $A_{\text {fin }} \subset A$ which follows from Lemma 10.62 .16 and the fact that we require $\mathfrak{p}=R \cap \mathfrak{q}$ in the formulation of $A_{\text {fin }}$.
Proof of (3). The equality $A=A_{\text {fin }}$ follows from Lemma 10.62 .16 part (3) if $S$ is Noetherian. Let $\mathfrak{q}=\left(g_{1}, \ldots, g_{m}\right)$ be a finitely generated prime ideal of $S$. Say $z \in N \otimes_{R} M$ is an element whose annihilator is $\mathfrak{q}$. We may pick a finite submodule $M^{\prime} \subset M$ such that $z$ is the image of $z^{\prime} \in N \otimes_{R} M^{\prime}$. Then $\operatorname{Ann}_{S}\left(z^{\prime}\right) \subset \mathfrak{q}=\operatorname{Ann}_{S}(z)$. Since $N \otimes_{R}$ - commutes with colimits and since $M$ is the directed colimit of finite $R$-modules we can find $M^{\prime} \subset M^{\prime \prime} \subset M$ such that the image $z^{\prime \prime} \in N \otimes_{R} M^{\prime \prime}$ is annihilated by $g_{1}, \ldots, g_{m}$. Hence $\operatorname{Ann}_{S}\left(z^{\prime \prime}\right)=\mathfrak{q}$. This proves that $B=B_{\text {fin }}$ if $S$ is Noetherian.

Proof of (4). If $N$ is flat, then the functor $N \otimes_{R}$ is exact. In particular, if $M^{\prime} \subset M$, then $N \otimes_{R} M^{\prime} \subset N \otimes_{R} M$. Hence if $z \in N \otimes_{R} M$ is an element whose annihilator $\mathfrak{q}=\operatorname{Ann}_{S}(z)$ is a prime, then we can pick any finite $R$-submodule $M^{\prime} \subset M$ such that $z \in N \otimes_{R} M^{\prime}$ and we see that the annihilator of $z$ as an element of $N \otimes_{R} M^{\prime}$ is equal to $\mathfrak{q}$. Hence $B=B_{\text {fin }}$. Let $\mathfrak{p}^{\prime}$ be a prime of $R$ and let $\mathfrak{q}$ be a prime of $S$ which is an associated prime of $N / \mathfrak{p}^{\prime} N$. This implies that $\mathfrak{p}^{\prime} S \subset \mathfrak{q}$. As $N$ is flat over $R$ we see that $N / \mathfrak{p}^{\prime} N$ is flat over the integral domain $R / \mathfrak{p}^{\prime}$. Hence every nonzero element of $R / \mathfrak{p}^{\prime}$ is a nonzerodivisor on $N / \mathfrak{p}^{\prime}$. Hence none of these elements can map to an element of $\mathfrak{q}$ and we conclude that $\mathfrak{p}^{\prime}=R \cap \mathfrak{q}$. Hence $A_{\text {fin }}=A_{\text {fin }}^{\prime}$. Finally, by Lemma 10.62 .17 we see that $\operatorname{Ass}_{S}\left(N / \mathfrak{p}^{\prime} N\right)=\operatorname{Ass}_{S}\left(N \otimes_{R} \kappa\left(\mathfrak{p}^{\prime}\right)\right)$, i.e., $A_{\text {fin }}^{\prime}=A$.
Proof of (5). We only need to prove $A_{f i n}^{\prime}=B_{f i n}$ as the other equalities have been proved in (4). To see this let $M$ be a finite $R$-module. By Lemma 10.61.1 there exists a filtration by $R$-submodules

$$
0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M
$$

such that each quotient $M_{i} / M_{i-1}$ is isomorphic to $R / \mathfrak{p}_{i}$ for some prime ideal $\mathfrak{p}_{i}$ of $R$. Since $N$ is flat we obtain a filtration by $S$-submodules

$$
0=N \otimes_{R} M_{0} \subset N \otimes_{R} M_{1} \subset \ldots \subset N \otimes_{R} M_{n}=N \otimes_{R} M
$$

such that each subquotient is isomorphic to $N / \mathfrak{p}_{i} N$. By Lemma 10.62.3 we conclude that $\operatorname{Ass}_{S}\left(N \otimes_{R} M\right) \subset \bigcup \operatorname{Ass}_{S}\left(N / \mathfrak{p}_{i} N\right)$. Hence we see that $B_{f i n} \subset A_{f i n}^{\prime}$. Since the other inclusion is part of (2) we win.

We define the relative assassin of $N$ over $S / R$ to be the set $A=A^{\prime}$ above. As a motivation we point out that it depends only on the fibre modules $N \otimes_{R} \kappa(\mathfrak{p})$ over the fibre rings. As in the case of the assassin of a module we warn the reader that this notion makes most sense when the fibre rings $S \otimes_{R} \kappa(\mathfrak{p})$ are Noetherian, for example if $R \rightarrow S$ is of finite type.

05GC Definition 10.64.2. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. The relative assassin of $N$ over $S / R$ is the set

$$
\operatorname{Ass}_{S / R}(N)=\left\{\mathfrak{q} \subset S \mid \mathfrak{q} \in \operatorname{Ass}_{S}\left(N \otimes_{R} \kappa(\mathfrak{p})\right) \text { with } \mathfrak{p}=R \cap \mathfrak{q}\right\}
$$

This is the set named $A$ in Lemma 10.64 .1 .
The spirit of the next few results is that they are about the relative assassin, even though this may not be apparent.
0312 Lemma 10.64.3. Let $R \rightarrow S$ be a ring map. Let $M$ be an $R$-module, and let $N$ be an $S$-module. If $N$ is flat as $R$-module, then

$$
A s s_{S}\left(M \otimes_{R} N\right) \supset \bigcup_{\mathfrak{p} \in A s s_{R}(M)} A s s_{S}(N / \mathfrak{p} N)
$$

and if $R$ is Noetherian then we have equality.
Proof. If $\mathfrak{p} \in \operatorname{Ass}_{R}(M)$ then there exists an injection $R / \mathfrak{p} \rightarrow M$. As $N$ is flat over $R$ we obtain an injection $R / \mathfrak{p} \otimes_{R} N \rightarrow M \otimes_{R} N$. Since $R / \mathfrak{p} \otimes_{R} N=N / \mathfrak{p} N$ we conclude that $\operatorname{Ass}_{S}(N / \mathfrak{p} N) \subset \operatorname{Ass}_{S}\left(M \otimes_{R} N\right)$, see Lemma 10.62.3. Hence the right hand side is contained in the left hand side.
Write $M=\bigcup M_{\lambda}$ as the union of its finitely generated $R$-submodules. Then also $N \otimes_{R} M=\bigcup N \otimes_{R} M_{\lambda}$ (as $N$ is $R$-flat). By definition of associated primes we see that $\operatorname{Ass}_{S}\left(N \otimes_{R} M\right)=\bigcup \operatorname{Ass}_{S}\left(N \otimes_{R} M_{\lambda}\right)$ and $\operatorname{Ass}_{R}(M)=\bigcup \operatorname{Ass}\left(M_{\lambda}\right)$. Hence we may assume $M$ is finitely generated.

Let $\mathfrak{q} \in \operatorname{Ass}_{S}\left(M \otimes_{R} N\right)$, and assume $R$ is Noetherian and $M$ is a finite $R$-module. To finish the proof we have to show that $\mathfrak{q}$ is an element of the right hand side. First we observe that $\mathfrak{q} S_{\mathfrak{q}} \in \operatorname{Ass}_{S_{\mathfrak{q}}}\left(\left(M \otimes_{R} N\right)_{\mathfrak{q}}\right)$, see Lemma 10.62.15. Let $\mathfrak{p}$ be the corresponding prime of $R$. Note that

$$
\left(M \otimes_{R} N\right)_{\mathfrak{q}}=M \otimes_{R} N_{\mathfrak{q}}=M_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} N_{\mathfrak{q}}
$$

If $\mathfrak{p} R_{\mathfrak{p}} \notin \operatorname{Ass}_{R_{\mathfrak{p}}}\left(M_{\mathfrak{p}}\right)$ then there exists an element $x \in \mathfrak{p} R_{\mathfrak{p}}$ which is a nonzerodivisor in $M_{\mathfrak{p}}$ (see Lemma 10.62.18). Since $N_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ we see that the image of $x$ in $\mathfrak{q} S_{\mathfrak{q}}$ is a nonzerodivisor on $\left(M \otimes_{R} N\right)_{\mathfrak{q}}$. This is a contradiction with the assumption that $\mathfrak{q} S_{\mathfrak{q}} \in \operatorname{Ass}_{S}\left(\left(M \otimes_{R} N\right)_{\mathfrak{q}}\right)$. Hence we conclude that $\mathfrak{p}$ is one of the associated primes of $M$.
Continuing the argument we choose a filtration

$$
0=M_{0} \subset M_{1} \subset \ldots \subset M_{n}=M
$$

such that each quotient $M_{i} / M_{i-1}$ is isomorphic to $R / \mathfrak{p}_{i}$ for some prime ideal $\mathfrak{p}_{i}$ of $R$, see Lemma 10.61.1. (By Lemma 10.62 .4 we have $\mathfrak{p}_{i}=\mathfrak{p}$ for at least one $i$.) This gives a filtration

$$
0=M_{0} \otimes_{R} N \subset M_{1} \otimes_{R} N \subset \ldots \subset M_{n} \otimes_{R} N=M \otimes_{R} N
$$

with subquotients isomorphic to $N / \mathfrak{p}_{i} N$. If $\mathfrak{p}_{i} \neq \mathfrak{p}$ then $\mathfrak{q}$ cannot be associated to the module $N / \mathfrak{p}_{i} N$ by the result of the preceding paragraph (as $\left.\operatorname{Ass}_{R}\left(R / \mathfrak{p}_{i}\right)=\left\{\mathfrak{p}_{i}\right\}\right)$. Hence we conclude that $\mathfrak{q}$ is associated to $N / \mathfrak{p} N$ as desired.

05C1 Lemma 10.64.4. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Assume $N$ is flat as an $R$-module and $R$ is a domain with fraction field $K$. Then

$$
A s s_{S}(N)=A s s_{S}\left(N \otimes_{R} K\right)=A s s_{S \otimes_{R} K}\left(N \otimes_{R} K\right)
$$

via the canonical inclusion $\operatorname{Spec}\left(S \otimes_{R} K\right) \subset \operatorname{Spec}(S)$.

Proof. Note that $S \otimes_{R} K=(R \backslash\{0\})^{-1} S$ and $N \otimes_{R} K=(R \backslash\{0\})^{-1} N$. For any nonzero $x \in R$ multiplication by $x$ on $N$ is injective as $N$ is flat over $R$. Hence the lemma follows from Lemma 10.62 .17 combined with Lemma 10.62.16 part (1).
05C2 Lemma 10.64.5. Let $R \rightarrow S$ be a ring map. Let $M$ be an $R$-module, and let $N$ be an $S$-module. Assume $N$ is flat as $R$-module. Then

$$
A s s_{S}\left(M \otimes_{R} N\right) \supset \bigcup_{\mathfrak{p} \in A s s_{R}(M)} A s s_{S \otimes_{R} \kappa(\mathfrak{p})}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)
$$

where we use Remark 10.16 .8 to think of the spectra of fibre rings as subsets of $\operatorname{Spec}(S)$. If $R$ is Noetherian then this inclusion is an equality.

Proof. This is equivalent to Lemma 10.64 .3 by Lemmas $10.62 .14,10.38 .7$, and 10.64 .4.

05E0 Remark 10.64.6. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Let $\mathfrak{p}$ be a prime of $R$. Then

$$
\operatorname{Ass}_{S}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)=\operatorname{Ass}_{S / \mathfrak{p} S}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)=\operatorname{Ass}_{S \otimes_{R} \kappa(\mathfrak{p})}\left(N \otimes_{R} \kappa(\mathfrak{p})\right)
$$

The first equality by Lemma 10.62 .14 and the second by Lemma 10.62 .16 part (1).

### 10.65. Weakly associated primes

0546 This is a variant on the notion of an associated prime that is useful for nonNoetherian ring and non-finite modules.
0547 Definition 10.65.1. Let $R$ be a ring. Let $M$ be an $R$-module. A prime $\mathfrak{p}$ of $R$ is weakly associated to $M$ if there exists an element $m \in M$ such that $\mathfrak{p}$ is minimal among the prime ideals containing the annihilator $\operatorname{Ann}(m)=\{f \in R \mid f m=0\}$. The set of all such primes is denoted WeakAss ${ }_{R}(M)$ or WeakAss $(M)$.
Thus an associated prime is a weakly associated prime. Here is a characterization in terms of the localization at the prime.

0566 Lemma 10.65.2. Let $R$ be a ring. Let $M$ be an $R$-module. Let $\mathfrak{p}$ be a prime of $R$. The following are equivalent:
(1) $\mathfrak{p}$ is weakly associated to $M$,
(2) $\mathfrak{p} R_{\mathfrak{p}}$ is weakly associated to $M_{\mathfrak{p}}$, and
(3) $M_{\mathfrak{p}}$ contains an element whose annihilator has radical equal to $\mathfrak{p} R_{\mathfrak{p}}$.

Proof. Assume (1). Then there exists an element $m \in M$ such that $\mathfrak{p}$ is minimal among the primes containing the annihilator $I=\{x \in R \mid x m=0\}$ of $m$. As localization is exact, the annihilator of $m$ in $M_{\mathfrak{p}}$ is $I_{\mathfrak{p}}$. Hence $\mathfrak{p} R_{\mathfrak{p}}$ is a minimal prime of $R_{\mathfrak{p}}$ containing the annihilator $I_{\mathfrak{p}}$ of $m$ in $M_{\mathfrak{p}}$. This implies (2) holds, and also (3) as it implies that $\sqrt{I_{\mathfrak{p}}}=\mathfrak{p} R_{\mathfrak{p}}$.
Applying the implication $(1) \Rightarrow(3)$ to $M_{\mathfrak{p}}$ over $R_{\mathfrak{p}}$ we see that $(2) \Rightarrow(3)$.
Finally, assume (3). This means there exists an element $m / f \in M_{\mathfrak{p}}$ whose annihilator has radical equal to $\mathfrak{p} R_{\mathfrak{p}}$. Then the annihilator $I=\{x \in R \mid x m=0\}$ of $m$ in $M$ is such that $\sqrt{I_{\mathfrak{p}}}=\mathfrak{p} R_{\mathfrak{p}}$. Clearly this means that $\mathfrak{p}$ contains $I$ and is minimal among the primes containing $I$, i.e., (1) holds.
0548 Lemma 10.65.3. Let $R$ be a ring. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow M^{\prime \prime} \rightarrow 0$ be a short exact sequence of $R$-modules. Then WeakAss $\left(M^{\prime}\right) \subset W e a k A s s(M)$ and WeakAss $(M) \subset$ WeakAss $\left(M^{\prime}\right) \cup W e a k A s s\left(M^{\prime \prime}\right)$.

Proof. We will use the characterization of weakly associated primes of Lemma 10.65.2. Let $\mathfrak{p}$ be a prime of $R$. As localization is exact we obtain the short exact sequence $0 \rightarrow M_{\mathfrak{p}}^{\prime} \rightarrow M_{\mathfrak{p}} \rightarrow M_{\mathfrak{p}}^{\prime \prime} \rightarrow 0$. Suppose that $m \in M_{\mathfrak{p}}$ is an element whose annihilator has radical $\mathfrak{p} R_{\mathfrak{p}}$. Then either the image $\bar{m}$ of $m$ in $M_{\mathfrak{p}}^{\prime \prime}$ is zero and $m \in M_{\mathfrak{p}}^{\prime}$, or the annihilator of $\bar{m}$ is $\mathfrak{p} R_{\mathfrak{p}}$. This proves that $\operatorname{WeakAss}(M) \subset$ WeakAss $\left(M^{\prime}\right) \cup \operatorname{WeakAss}\left(M^{\prime \prime}\right)$. The inclusion WeakAss $\left(M^{\prime}\right) \subset \operatorname{WeakAss}(M)$ is immediate from the definitions.

0588 Lemma 10.65.4. Let $R$ be a ring. Let $M$ be an $R$-module. Then

$$
M=(0) \Leftrightarrow W e a k A s s(M)=\emptyset
$$

Proof. If $M=(0)$ then WeakAss $(M)=\emptyset$ by definition. Conversely, suppose that $M \neq 0$. Pick a nonzero element $m \in M$. Write $I=\{x \in R \mid x m=0\}$ the annihilator of $m$. Then $R / I \subset M$. Hence WeakAss $(R / I) \subset \operatorname{WeakAss}(M)$ by Lemma 10.65.3. But as $I \neq R$ we have $V(I)=\operatorname{Spec}(R / I)$ contains a minimal prime, see Lemmas 10.16 .2 and 10.16.7, and we win.
0589 Lemma 10.65.5. Let $R$ be a ring. Let $M$ be an $R$-module. Then

$$
\operatorname{Ass}(M) \subset W e a k A s s(M) \subset \operatorname{Supp}(M)
$$

Proof. The first inclusion is immediate from the definitions. If $\mathfrak{p} \in \operatorname{WeakAss}(M)$, then by Lemma 10.65 .2 we have $M_{\mathfrak{p}} \neq 0$, hence $\mathfrak{p} \in \operatorname{Supp}(M)$.

05C3 Lemma 10.65.6. Let $R$ be a ring. Let $M$ be an $R$-module. The union $\bigcup_{\mathfrak{q} \in \operatorname{WeakAss(M)}} \mathfrak{q}$ is the set elements of $R$ which are zerodivisors on $M$.

Proof. Suppose $f \in \mathfrak{q} \in \operatorname{WeakAss}(M)$. Then there exists an element $m \in M$ such that $\mathfrak{q}$ is minimal over $I=\{x \in R \mid x m=0\}$. Hence there exists a $g \in R$, $g \notin \mathfrak{q}$ and $n>0$ such that $f^{n} g m=0$. Note that $g m \neq 0$ as $g \notin I$. If we take $n$ minimal as above, then $f\left(f^{n-1} g m\right)=0$ and $f^{n-1} g m \neq 0$, so $f$ is a zerodivisor on $M$. Conversely, suppose $f \in R$ is a zerodivisor on $M$. Consider the submodule $N=\{m \in M \mid f m=0\}$. Since $N$ is not zero it has a weakly associated prime $\mathfrak{q}$ by Lemma 10.65 .4 . Clearly $f \in \mathfrak{q}$ and by Lemma $10.65 .3 \mathfrak{q}$ is a weakly associated prime of $M$.

05C4 Lemma 10.65.7. Let $R$ be a ring. Let $M$ be an $R$-module. Any $\mathfrak{p} \in \operatorname{Supp}(M)$ which is minimal among the elements of Supp $(M)$ is an element of WeakAss(M).

Proof. Note that $\operatorname{Supp}\left(M_{\mathfrak{p}}\right)=\left\{\mathfrak{p} R_{\mathfrak{p}}\right\}$ in $\operatorname{Spec}\left(R_{\mathfrak{p}}\right)$. In particular $M_{\mathfrak{p}}$ is nonzero, and hence $\operatorname{WeakAss}\left(M_{\mathfrak{p}}\right) \neq \emptyset$ by Lemma 10.65.4. Since WeakAss $\left(M_{\mathfrak{p}}\right) \subset \operatorname{Supp}\left(M_{\mathfrak{p}}\right)$ by Lemma 10.65 .5 we conclude that $\operatorname{WeakAss}\left(M_{\mathfrak{p}}\right)=\left\{\mathfrak{p} R_{\mathfrak{p}}\right\}$, whence $\mathfrak{p} \in \operatorname{WeakAss}(M)$ by Lemma 10.65.2.
058A Lemma 10.65.8. Let $R$ be a ring. Let $M$ be an $R$-module. Let $\mathfrak{p}$ be a prime ideal of $R$ which is finitely generated. Then

$$
\mathfrak{p} \in \operatorname{Ass}(M) \Leftrightarrow \mathfrak{p} \in W e a k A s s(M)
$$

In particular, if $R$ is Noetherian, then $\operatorname{Ass}(M)=\operatorname{WeakAss}(M)$.
Proof. Write $\mathfrak{p}=\left(g_{1}, \ldots, g_{n}\right)$ for some $g_{i} \in R$. It is enough the prove the implication " $\Leftarrow$ " as the other implication holds in general, see Lemma 10.65.5. Assume $\mathfrak{p} \in \operatorname{WeakAss}(M)$. By Lemma 10.65 .2 there exists an element $m \in M_{\mathfrak{p}}$ such that $I=\left\{x \in R_{\mathfrak{p}} \mid x m=0\right\}$ has radical $\mathfrak{p} R_{\mathfrak{p}}$. Hence for each $i$ there exists a smallest
$e_{i}>0$ such that $g_{i}^{e_{i}} m=0$ in $M_{\mathfrak{p}}$. If $e_{i}>1$ for some $i$, then we can replace $m$ by $g_{i}^{e_{i}-1} m \neq 0$ and decrease $\sum e_{i}$. Hence we may assume that the annihilator of $m \in M_{\mathfrak{p}}$ is $\left(g_{1}, \ldots, g_{n}\right) R_{\mathfrak{p}}=\mathfrak{p} R_{\mathfrak{p}}$. By Lemma 10.62 .15 we see that $\mathfrak{p} \in \operatorname{Ass}(M)$.

05C5 Remark 10.65.9. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Then it is not always the case that $\operatorname{Spec}(\varphi)\left(\operatorname{WeakAss}_{S}(M)\right) \subset \operatorname{WeakAss}_{R}(M)$ contrary to the case of associated primes (see Lemma 10.62.11). An example is to consider the ring map

$$
R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right] \rightarrow S=k\left[x_{1}, x_{2}, x_{3}, \ldots, y_{1}, y_{2}, y_{3}, \ldots\right] /\left(x_{1} y_{1}, x_{2} y_{2}, x_{3} y_{3}, \ldots\right)
$$

and $M=S$. In this case $\mathfrak{q}=\sum x_{i} S$ is a minimal prime of $S$, hence a weakly associated prime of $M=S$ (see Lemma 10.65.7). But on the other hand, for any nonzero element of $S$ the annihilator in $R$ is finitely generated, and hence does not have radical equal to $R \cap \mathfrak{q}=\left(x_{1}, x_{2}, x_{3}, \ldots\right)$ (details omitted).

05C6 Lemma 10.65.10. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Then we have $\operatorname{Spec}(\varphi)\left(W_{e a k A s s}^{S}(M)\right) \supset W e a k A s s_{R}(M)$.

Proof. Let $\mathfrak{p}$ be an element of $\operatorname{WeakAss}_{R}(M)$. Then there exists an $m \in M_{\mathfrak{p}}$ whose annihilator $I=\left\{x \in R_{\mathfrak{p}} \mid x m=0\right\}$ has radical $\mathfrak{p} R_{\mathfrak{p}}$. Consider the radical $J=\left\{x \in S_{\mathfrak{p}} \mid x m=0\right\}$ of $m$ in $S_{\mathfrak{p}}$. As $I S_{\mathfrak{p}} \subset J$ we see that any minimal prime $\mathfrak{q} \subset S_{\mathfrak{p}}$ over $J$ lies over $\mathfrak{p}$. Moreover such a $\mathfrak{q}$ corresponds to a weakly associated prime of $M$ for example by Lemma 10.65.2.
05C7 Remark 10.65.11. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Denote $f: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ the associated map on spectra. Then we have

$$
f\left(\operatorname{Ass}_{S}(M)\right) \subset \operatorname{Ass}_{R}(M) \subset \operatorname{WeakAss}_{R}(M) \subset f\left(\operatorname{WeakAss}_{S}(M)\right)
$$

see Lemmas $10.62 .11,10.65 .10$, and 10.65 .5 . In general all of the inclusions may be strict, see Remarks 10.62 .12 and 10.65 .9 If $S$ is Noetherian, then all the inclusions are equalities as the outer two are equal by Lemma 10.65.8.
05E1 Lemma 10.65.12. Let $\varphi: R \rightarrow S$ be a ring map. Let $M$ be an $S$-module. Denote $f: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ the associated map on spectra. If $\varphi$ is a finite ring map, then

$$
W e a k A s s_{R}(M)=f\left(\text { WeakAss }_{S}(M)\right)
$$

Proof. One of the inclusions has already been proved, see Remark 10.65.11. To prove the other assume $\mathfrak{q} \in \mathrm{WeakAss}_{S}(M)$ and let $\mathfrak{p}$ be the corresponding prime of $R$. Let $m \in M$ be an element such that $\mathfrak{q}$ is a minimal prime over $J=\{g \in$ $S \mid g m=0\}$. Thus the radical of $J S_{\mathfrak{q}}$ is $\mathfrak{q} S_{\mathfrak{q}}$. As $R \rightarrow S$ is finite there are finitely many primes $\mathfrak{q}=\mathfrak{q}_{1}, \mathfrak{q}_{2}, \ldots, \mathfrak{q}_{l}$ over $\mathfrak{p}$, see Lemma 10.35.19. Pick $x \in \mathfrak{q}$ with $x \notin \mathfrak{q}_{i}$ for $i>1$, see Lemma 10.14.2. By the above there exists an element $y \in S, y \notin \mathfrak{q}$ and an integer $t>0$ such that $y x^{t} m=0$. Thus the element $y m \in M$ is annihilated by $x^{t}$, hence $y m$ maps to zero in $M_{\mathfrak{q}_{i}}, i=2, \ldots, l$. To be sure, $y m$ does not map to zero in $S_{\mathfrak{q}}$.
The ring $S_{\mathfrak{p}}$ is semi-local with maximal ideals $\mathfrak{q}_{i} S_{\mathfrak{p}}$ by going up for finite ring maps, see Lemma 10.35 .20 . If $f \in \mathfrak{p} R_{\mathfrak{p}}$ then some power of $f$ ends up in $J S_{\mathfrak{q}}$ hence for some $n>0$ we see that $f^{t} y m$ maps to zero in $M_{\mathfrak{q}}$. As $y m$ vanishes at the other maximal ideals of $S_{\mathfrak{p}}$ we conclude that $f^{t} y m$ is zero in $M_{\mathfrak{p}}$, see Lemma 10.23.1. In this way we see that $\mathfrak{p}$ is a minimal prime over the annihilator of $y m$ in $R$ and we win.

05C8 Lemma 10.65.13. Let $R$ be a ring. Let $I$ be an ideal. Let $M$ be an $R / I$-module. Via the canonical injection $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$ we have $W^{\left(R a k A s s_{R / I}\right.}(M)=$ $W_{e a k A s s}^{R}(M)$.

Proof. Omitted.

05C9 Lemma 10.65.14. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S \subset R$ be a multiplicative subset. Via the canonical injection $\operatorname{Spec}\left(S^{-1} R\right) \rightarrow \operatorname{Spec}(R)$ we have WeakAss ${ }_{R}\left(S^{-1} M\right)=W e a k A s s_{S^{-1} R}\left(S^{-1} M\right)$ and

$$
W e a k A s s(M) \cap \operatorname{Spec}\left(S^{-1} R\right)=W e a k A s s\left(S^{-1} M\right)
$$

Proof. Suppose that $m \in S^{-1} M$. Let $I=\{x \in R \mid x m=0\}$ and $I^{\prime}=\left\{x^{\prime} \in\right.$ $\left.S^{-1} R \mid x^{\prime} m=0\right\}$. Then $I^{\prime}=S^{-1} I$ and $I \cap S=\emptyset$ unless $I=R$ (verifications omitted). Thus primes in $S^{-1} R$ minimal over $I^{\prime}$ correspond bijectively to primes in $R$ minimal over $I$ and avoiding $S$. This proves the equality $\operatorname{WeakAss}_{R}\left(S^{-1} M\right)=$ WeakAss ${ }_{S^{-1} R}\left(S^{-1} M\right)$. The second equality follows from Lemma 10.62.15 since for $\mathfrak{p} \in R, S \cap \mathfrak{p}=\emptyset$ we have $M_{\mathfrak{p}}=\left(S^{-1} M\right)_{S^{-1} \mathfrak{p}}$.

05CA
Lemma 10.65.15. Let $R$ be a ring. Let $M$ be an $R$-module. Let $S \subset R$ be $a$ multiplicative subset. Assume that every $s \in S$ is a nonzerodivisor on $M$. Then

$$
W e a k A s s(M)=W e a k A s s\left(S^{-1} M\right)
$$

Proof. As $M \subset S^{-1} M$ by assumption we obtain WeakAss $(M) \subset \operatorname{WeakAss}\left(S^{-1} M\right)$ from Lemma 10.65.3. Conversely, suppose that $n / s \in S^{-1} M$ is an element with annihilator $I$ and $\mathfrak{p}$ a prime which is minimal over $I$. Then the annihilator of $n \in M$ is $I$ and $\mathfrak{p}$ is a prime minimal over $I$.

05CB Lemma 10.65.16. Let $R$ be a ring. Let $M$ be an $R$-module. The map

$$
M \longrightarrow \prod_{\mathfrak{p} \in \text { WeakAss }(M)} M_{\mathfrak{p}}
$$

is injective.
Proof. Let $x \in M$ be an element of the kernel of the map. Set $N=R x \subset$ $M$. If $\mathfrak{p}$ is a weakly associated prime of $N$ we see on the one hand that $\mathfrak{p} \in$ WeakAss $(M)$ (Lemma 10.65.3) and on the other hand that $N_{\mathfrak{p}} \subset M_{\mathfrak{p}}$ is not zero. This contradiction shows that $\operatorname{WeakAss}(N)=\emptyset$. Hence $N=0$, i.e., $x=0$ by Lemma 10.65.4.

05CC Lemma 10.65.17. Let $R \rightarrow S$ be a ring map. Let $N$ be an $S$-module. Assume $N$ is flat as an $R$-module and $R$ is a domain with fraction field $K$. Then

$$
W e a k A s s_{S}(N)=W e a k A s s_{S \otimes_{R} K}\left(N \otimes_{R} K\right)
$$

via the canonical inclusion $\operatorname{Spec}\left(S \otimes_{R} K\right) \subset \operatorname{Spec}(S)$.
Proof. Note that $S \otimes_{R} K=(R \backslash\{0\})^{-1} S$ and $N \otimes_{R} K=(R \backslash\{0\})^{-1} N$. For any nonzero $x \in R$ multiplication by $x$ on $N$ is injective as $N$ is flat over $R$. Hence the lemma follows from Lemma 10.65.15.

### 10.66. Embedded primes

02M4 Here is the definition.
02M5 Definition 10.66.1. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) The associated primes of $M$ which are not minimal among the associated primes of $M$ are called the embedded associated primes of $M$.
(2) The embedded primes of $R$ are the embedded associated primes of $R$ as an $R$-module.

Here is a way to get rid of these.
02M6 Lemma 10.66.2. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. Consider the set of $R$-submodules

$$
\{K \subset M \mid \operatorname{Supp}(K) \text { nowhere dense in } \operatorname{Supp}(M)\} .
$$

This set has a maximal element $K$ and the quotient $M^{\prime}=M / K$ has the following properties
(1) $\operatorname{Supp}(M)=\operatorname{Supp}\left(M^{\prime}\right)$,
(2) $M^{\prime}$ has no embedded associated primes,
(3) for any $f \in R$ which is contained in all embedded associated primes of $M$ we have $M_{f} \cong M_{f}^{\prime}$.
Proof. Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$ denote the minimal primes in the support of $M$. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{s}$ denote the embedded associated primes of $M$. Then $\operatorname{Ass}(M)=\left\{\mathfrak{q}_{j}, \mathfrak{p}_{i}\right\}$. There are finitely many of these, see Lemma 10.62 .5 . Set $I=\prod_{i=1, \ldots, s} \mathfrak{p}_{i}$. Then $I \not \subset \mathfrak{q}_{j}$ for any $j$. Hence by Lemma 10.14 .2 we can find an $f \in I$ such that $f \notin \mathfrak{q}_{j}$ for all $j=1, \ldots, t$. Set $M^{\prime}=\operatorname{Im}\left(M \rightarrow M_{f}\right)$. This implies that $M_{f} \cong M_{f}^{\prime}$. Since $M^{\prime} \subset M_{f}$ we see that $\operatorname{Ass}\left(M^{\prime}\right) \subset \operatorname{Ass}\left(M_{f}\right)=\left\{\mathfrak{q}_{j}\right\}$. Thus $M^{\prime}$ has no embedded associated primes.
Moreover, the support of $K=\operatorname{Ker}\left(M \rightarrow M^{\prime}\right)$ is contained in $V\left(\mathfrak{p}_{1}\right) \cup \ldots \cup V\left(\mathfrak{p}_{s}\right)$, because $\operatorname{Ass}(K) \subset \operatorname{Ass}(M)$ (see Lemma 10.62.3) and $\operatorname{Ass}(K)$ contains none of the $\mathfrak{q}_{i}$ by construction. Clearly, $K$ is in fact the largest submodule of $M$ whose support is contained in $V\left(\mathfrak{p}_{1}\right) \cup \ldots \cup V\left(\mathfrak{p}_{t}\right)$. This implies that $K$ is the maximal element of the set displayed in the lemma.
02M7 Lemma 10.66.3. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. For any $f \in R$ we have $\left(M^{\prime}\right)_{f}=\left(M_{f}\right)^{\prime}$ where $M \rightarrow M^{\prime}$ and $M_{f} \rightarrow\left(M_{f}\right)^{\prime}$ are the quotients constructed in Lemma 10.66.2.
Proof. Omitted.
02M8 Lemma 10.66.4. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module without embedded associated primes. Let $I=\{x \in R \mid x M=0\}$. Then the ring $R / I$ has no embedded primes.
Proof. We may replace $R$ by $R / I$. Hence we may assume every nonzero element of $R$ acts nontrivially on $M$. By Lemma 10.39 .5 this implies that $\operatorname{Spec}(R)$ equals the support of $M$. Suppose that $\mathfrak{p}$ is an embedded prime of $R$. Let $x \in R$ be an element whose annihilator is $\mathfrak{p}$. Consider the nonzero module $N=x M \subset M$. It is annihilated by $\mathfrak{p}$. Hence any associated prime $\mathfrak{q}$ of $N$ contains $\mathfrak{p}$ and is also an associated prime of $M$. Then $\mathfrak{q}$ would be an embedded associated prime of $M$ which contradicts the assumption of the lemma.

### 10.67. Regular sequences

0AUH In this section we develop some basic properties of regular sequences.
00LF Definition 10.67.1. Let $R$ be a ring. Let $M$ be an $R$-module. A sequence of elements $f_{1}, \ldots, f_{r}$ of $R$ is called an $M$-regular sequence if the following conditions hold:
(1) $f_{i}$ is a nonzerodivisor on $M /\left(f_{1}, \ldots, f_{i-1}\right) M$ for each $i=1, \ldots, r$, and
(2) the module $M /\left(f_{1}, \ldots, f_{r}\right) M$ is not zero.

If $I$ is an ideal of $R$ and $f_{1}, \ldots, f_{r} \in I$ then we call $f_{1}, \ldots, f_{r}$ a $M$-regular sequence in $I$. If $M=R$, we call $f_{1}, \ldots, f_{r}$ simply a regular sequence (in $I$ ).

Please pay attention to the fact that the definition depends on the order of the elements $f_{1}, \ldots, f_{r}$ (see examples below). Some papers/books drop the requirement that the module $M /\left(f_{1}, \ldots, f_{r}\right) M$ is nonzero. This has the advantage that being a regular sequence is preserved under localization. However, we will use this definition mainly to define the depth of a module in case $R$ is local; in that case the $f_{i}$ are required to be in the maximal ideal - a condition which is not preserved under going from $R$ to a localization $R_{\mathfrak{p}}$.

00LG Example 10.67.2. Let $k$ be a field. In the ring $k[x, y, z]$ the sequence $x, y(1-$ $x), z(1-x)$ is regular but the sequence $y(1-x), z(1-x), x$ is not.

00LH Example 10.67.3. Let $k$ be a field. Consider the ring $k\left[x, y, w_{0}, w_{1}, w_{2}, \ldots\right] / I$ where $I$ is generated by $y w_{i}, i=0,1,2, \ldots$ and $w_{i}-x w_{i+1}, i=0,1,2, \ldots$ The sequence $x, y$ is regular, but $y$ is a zerodivisor. Moreover you can localize at the maximal ideal $\left(x, y, w_{i}\right)$ and still get an example.
00LJ Lemma 10.67.4. Let $R$ be a local Noetherian ring. Let $M$ be a finite $R$-module. Let $x_{1}, \ldots, x_{c}$ be an $M$-regular sequence. Then any permutation of the $x_{i}$ is $a$ regular sequence as well.

Proof. First we do the case $c=2$. Consider $K \subset M$ the kernel of $x_{2}: M \rightarrow M$. For any $z \in K$ we know that $z=x_{1} z^{\prime}$ for some $z^{\prime} \in M$ because $x_{2}$ is a nonzerodivisor on $M / x_{1} M$. Because $x_{1}$ is a nonzerodivisor on $M$ we see that $x_{2} z^{\prime}=0$ as well. Hence $x_{1}: K \rightarrow K$ is surjective. Thus $K=0$ by Nakayama's Lemma 10.19.1, Next, consider multiplication by $x_{1}$ on $M / x_{2} M$. If $z \in M$ maps to an element $\bar{z} \in M / x_{2} M$ in the kernel of this map, then $x_{1} z=x_{2} y$ for some $y \in M$. But then since $x_{1}, x_{2}$ is a regular sequence we see that $y=x_{1} y^{\prime}$ for some $y^{\prime} \in M$. Hence $x_{1}\left(z-x_{2} y^{\prime}\right)=0$ and hence $z=x_{2} y^{\prime}$ and hence $\bar{z}=0$ as desired.
For the general case, observe that any permutation is a composition of transpositions of adjacent indices. Hence it suffices to prove that

$$
x_{1}, \ldots, x_{i-2}, x_{i}, x_{i-1}, x_{i+1}, \ldots, x_{c}
$$

is an $M$-regular sequence. This follows from the case we just did applied to the module $M /\left(x_{1}, \ldots, x_{i-2}\right)$ and the length 2 regular sequence $x_{i-1}, x_{i}$.

00LM Lemma 10.67.5. Let $R, S$ be local rings. Let $R \rightarrow S$ be a flat local ring homomorphism. Let $x_{1}, \ldots, x_{r}$ be a sequence in $R$. Let $M$ be an $R$-module. The following are equivalent
(1) $x_{1}, \ldots, x_{r}$ is an $M$-regular sequence in $R$, and
(2) the images of $x_{1}, \ldots, x_{r}$ in $S$ form a $M \otimes_{R} S$-regular sequence.

Proof. This is so because $R \rightarrow S$ is faithfully flat by Lemma 10.38.17,
061L Lemma 10.67.6. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. Let $\mathfrak{p}$ be a prime. Let $x_{1}, \ldots, x_{r}$ be a sequence in $R$ whose image in $R_{\mathfrak{p}}$ forms an $M_{\mathfrak{p}}$ regular sequence. Then there exists a $g \in R, g \notin \mathfrak{p}$ such that the image of $x_{1}, \ldots, x_{r}$ in $R_{g}$ forms an $M_{g}$-regular sequence.

Proof. Set

$$
K_{i}=\operatorname{Ker}\left(x_{i}: M /\left(x_{1}, \ldots, x_{i-1}\right) M \rightarrow M /\left(x_{1}, \ldots, x_{i-1}\right) M\right) .
$$

This is a finite $R$-module whose localization at $\mathfrak{p}$ is zero by assumption. Hence there exists a $g \in R, g \notin \mathfrak{p}$ such that $\left(K_{i}\right)_{g}=0$ for all $i=1, \ldots, r$. This $g$ works.

065K Lemma 10.67.7. Let $A$ be a ring. Let I be an ideal generated by a regular sequence $f_{1}, \ldots, f_{n}$ in $A$. Let $g_{1}, \ldots, g_{m} \in A$ be elements whose images $\bar{g}_{1}, \ldots, \bar{g}_{m}$ form a regular sequence in $A / I$. Then $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ is a regular sequence in $A$.
Proof. This follows immediately from the definitions.
07DV Lemma 10.67.8. Let $R$ be a ring. Let $M$ be an $R$-module. Let $f_{1}, \ldots, f_{r} \in R$ be $M$-regular. Then for $e_{1}, \ldots, e_{r}>0$ the sequence $f_{1}^{e_{1}}, \ldots, f_{r}^{e_{r}}$ is $M$-regular too.

Proof. We will prove this by induction on $r$. If $r=1$ this follows from the fact that a power of an $M$-regular element is an $M$-regular element. If $r>1$, then by induction applied to $M / f_{1} M$ we have that $f_{1}, f_{2}^{e_{2}}, \ldots, f_{r}^{e_{r}}$ is an $M$-regular sequence. Thus it suffices to show that $f_{1}^{e}, f_{2}, \ldots, f_{r}$ is an $M$-regular sequence if $f_{1}, \ldots, f_{r}$ is an $M$-regular sequence. We will prove this by induction on $e$. The case $e=1$ is trivial. Since $f_{1}$ is a nonzerodivisor we have a short exact sequence

$$
0 \rightarrow M / f_{1} M \xrightarrow{f_{1}^{e-1}} M / f_{1}^{e} M \rightarrow M / f_{1}^{e-1} M \rightarrow 0
$$

By induction the elements $f_{2}, \ldots, f_{r}$ are $M / f_{1} M$ and $M / f_{1}^{e-1} M$-regular sequences. It follows from the snake lemma that they are also $M / f_{1}^{e} M$-regular sequences.

07DW Lemma 10.67.9. Let $R$ be a ring. Let $f_{1}, \ldots, f_{r} \in R$ which do not generate the unit ideal. The following are equivalent:
(1) any permutation of $f_{1}, \ldots, f_{r}$ is a regular sequence,
(2) any subsequence of $f_{1}, \ldots, f_{r}$ (in the given order) is a regular sequence, and
(3) $f_{1} x_{1}, \ldots, f_{r} x_{r}$ is a regular sequence in the polynomial ring $R\left[x_{1}, \ldots, x_{r}\right]$.

Proof. It is clear that (1) implies (2). We prove (2) implies (1) by induction on $r$. The case $r=1$ is trivial. The case $r=2$ says that if $a, b \in R$ are a regular sequence and $b$ is a nonzerodivisor, then $b, a$ is a regular sequence. This is clear because the kernel of $a: R /(b) \rightarrow R /(b)$ is isomorphic to the kernel of $b: R /(a) \rightarrow R /(a)$ if both $a$ and $b$ are nonzerodivisors. The case $r>2$. Assume (2) holds and say we want to prove $f_{\sigma(1)}, \ldots, f_{\sigma(r)}$ is a regular sequence for some permutation $\sigma$. We already know that $f_{\sigma(1)}, \ldots, f_{\sigma(r-1)}$ is a regular sequence by induction. Hence it suffices to show that $f_{s}$ where $s=\sigma(r)$ is a nonzerodivisor modulo $f_{1}, \ldots, \hat{f}_{s}, \ldots, f_{r}$. If $s=r$ we are done. If $s<r$, then note that $f_{s}$ and $f_{r}$ are both nonzerodivisors in the ring $R /\left(f_{1}, \ldots, \hat{f}_{s}, \ldots, f_{r-1}\right)$ (by induction hypothesis again). Since we know $f_{s}, f_{r}$ is a regular sequence in that ring we conclude by the case of sequence of length 2 that $f_{r}, f_{s}$ is too.

Note that $R\left[x_{1}, \ldots, x_{r}\right] /\left(f_{1} x_{1}, \ldots, f_{i} x_{i}\right)$ as an $R$-module is a direct sum of the modules

$$
R / I_{E} \cdot x_{1}^{e_{1}} \ldots x_{r}^{e_{r}}
$$

indexed by multi-indices $E=\left(e_{1}, \ldots, e_{r}\right)$ where $I_{E}$ is the ideal generated by $f_{j}$ for $1 \leq j \leq i$ with $e_{j}>0$. Hence $f_{i+1} x_{i}$ is a nonzerodivisor on this if and only if $f_{i+1}$ is a nonzerodivisor on $R / I_{E}$ for all $E$. Taking $E$ with all positive entries, we see that $f_{i+1}$ is a nonzerodivisor on $R /\left(f_{1}, \ldots, f_{i}\right)$. Thus (3) implies (2). Conversely, if (2) holds, then any subsequence of $f_{1}, \ldots, f_{i}, f_{i+1}$ is a regular sequence by Lemma 10.67 .8 , i.e., hence $f_{i+1}$ is a nonzerodivisor on all $R / I_{E}$. In this way we see that (2) implies (3).

### 10.68. Quasi-regular sequences

061 M There is a notion of regular sequence which is slightly weaker than that of a regular sequence and easier to use. Let $R$ be a ring and let $f_{1}, \ldots, f_{c} \in R$. Set $J=$ $\left(f_{1}, \ldots, f_{c}\right)$. Let $M$ be an $R$-module. Then there is a canonical map
$061 \mathrm{~N} \quad(10.68 .0 .1)$

$$
M / J M \otimes_{R / J} R / J\left[X_{1}, \ldots, X_{c}\right] \longrightarrow \bigoplus_{n \geq 0} J^{n} M / J^{n+1} M
$$

of graded $R / J\left[X_{1}, \ldots, X_{c}\right]$-modules defined by the rule

$$
\bar{m} \otimes X_{1}^{e_{1}} \ldots X_{c}^{e_{c}} \longmapsto f_{1}^{e_{1}} \ldots f_{c}^{e_{c}} m \bmod J^{e_{1}+\ldots+e_{c}+1} M
$$

Note that 10.68.0.1 is always surjective.
061P Definition 10.68.1. Let $R$ be a ring. Let $M$ be an $R$-module. A sequence of elements $f_{1}, \ldots, f_{c}$ of $R$ is called $M$-quasi-regular if 10.68 .0 .1 is an isomorphism. If $M=R$, we call $f_{1}, \ldots, f_{c}$ simply a quasi-regular sequence.
So if $f_{1}, \ldots, f_{c}$ is a quasi-regular sequence, then

$$
R / J\left[X_{1}, \ldots, X_{c}\right]=\bigoplus_{n \geq 0} J^{n} / J^{n+1}
$$

where $J=\left(f_{1}, \ldots, f_{c}\right)$. It is clear that being a quasi-regular sequence is independent of the order of $f_{1}, \ldots, f_{c}$.
00LN Lemma 10.68.2. Let $R$ be a ring.
(1) A regular sequence $f_{1}, \ldots, f_{c}$ of $R$ is a quasi-regular sequence.
(2) Suppose that $M$ is an $R$-module and that $f_{1}, \ldots, f_{c}$ is an $M$-regular sequence. Then $f_{1}, \ldots, f_{c}$ is an $M$-quasi-regular sequence.
Proof. Set $J=\left(f_{1}, \ldots, f_{c}\right)$. We prove the first assertion by induction on $c$. We have to show that given any relation $\sum_{|I|=n} a_{I} f^{I} \in J^{n+1}$ with $a_{I} \in R$ we actually have $a_{I} \in J$ for all multi-indices $I$. Since any element of $J^{n+1}$ is of the form $\sum_{|I|=n} b_{I} f^{I}$ with $b_{I} \in J$ we may assume, after replacing $a_{I}$ by $a_{I}-b_{I}$, the relation reads $\sum_{|I|=n} a_{I} f^{I}=0$. We can rewrite this as

$$
\sum_{e=0}^{n}\left(\sum_{\left|I^{\prime}\right|=n-e} a_{I^{\prime}, e} f^{I^{\prime}}\right) f_{c}^{e}=0
$$

Here and below the "primed" multi-indices $I^{\prime}$ are required to be of the form $I^{\prime}=$ $\left(i_{1}, \ldots, i_{d-1}, 0\right)$. We will show by descending induction on $l \in\{0, \ldots, n\}$ that if we have a relation

$$
\sum_{e=0}^{l}\left(\sum_{\left|I^{\prime}\right|=n-e} a_{I^{\prime}, e} f^{I^{\prime}}\right) f_{c}^{e}=0
$$

then $a_{I^{\prime}, e} \in J$ for all $I^{\prime}, e$. Namely, set $J^{\prime}=\left(f_{1}, \ldots, f_{c-1}\right)$. Observe that $\sum_{\left|I^{\prime}\right|=n-l} a_{I^{\prime}, l} f^{I^{\prime}}$ is mapped into $\left(J^{\prime}\right)^{n-l+1}$ by $f_{c}^{l}$. By induction hypothesis (for the induction on $c$ ) we see that $f_{c}^{l} a_{I^{\prime}, l} \in J^{\prime}$. Because $f_{c}$ is not a zerodivisor on $R / J^{\prime}$ (as $f_{1}, \ldots, f_{c}$ is a regular sequence) we conclude that $a_{I^{\prime}, l} \in J^{\prime}$. This allows us to rewrite the term $\left(\sum_{\left|I^{\prime}\right|=n-l} a_{I^{\prime}, l} f^{I^{\prime}}\right) f_{c}^{l}$ in the form $\left(\sum_{\left|I^{\prime}\right|=n-l+1} f_{c} b_{I^{\prime}, l-1} f^{I^{\prime}}\right) f_{c}^{l-1}$. This gives a new relation of the form

$$
\left.\sum_{\left|I^{\prime}\right|=n-l+1}\left(a_{I^{\prime}, l-1}+f_{c} b_{I^{\prime}, l-1}\right) f^{I^{\prime}}\right) f_{c}^{l-1}+\sum_{e=0}^{l-2}\left(\sum_{\left|I^{\prime}\right|=n-e} a_{I^{\prime}, e} f^{I^{\prime}}\right) f_{c}^{e}=0
$$

Now by the induction hypothesis (on $l$ this time) we see that all $a_{I^{\prime}, l-1}+f_{c} b_{I^{\prime}, l-1} \in$ $J$ and all $a_{I^{\prime}, e} \in J$ for $e \leq l-2$. This, combined with $a_{I^{\prime}, l} \in J^{\prime} \subset J$ seen above, finishes the proof of the induction step.
The second assertion means that given any formal expression $F=\sum_{|I|=n} m_{I} X^{I}$, $m_{I} \in M$ with $\sum m_{I} f^{I} \in J^{n+1} M$, then all the coefficients $m_{I}$ are in $J$. This is proved in exactly the same way as we prove the corresponding result for the first assertion above.

065L Lemma 10.68.3. Let $R \rightarrow R^{\prime}$ be a flat ring map. Let $M$ be an $R$-module. Suppose that $f_{1}, \ldots, f_{r} \in R$ form an $M$-quasi-regular sequence. Then the images of $f_{1}, \ldots, f_{r}$ in $R^{\prime}$ form a $M \otimes_{R} R^{\prime}$-quasi-regular sequence.
Proof. Set $J=\left(f_{1}, \ldots, f_{r}\right), J^{\prime}=J R^{\prime}$ and $M^{\prime}=M \otimes_{R} R^{\prime}$. We have to show the canonical map $\mu: R^{\prime} / J^{\prime}\left[X_{1}, \ldots X_{n}\right] \otimes_{R^{\prime} / J^{\prime}} M^{\prime} / J^{\prime} M^{\prime} \rightarrow \bigoplus\left(J^{\prime}\right)^{n} M^{\prime} /\left(J^{\prime}\right)^{n+1} M^{\prime}$ is an isomorphism. Because $R \rightarrow R^{\prime}$ is flat the sequences $0 \rightarrow J^{n} M \rightarrow M$ and $0 \rightarrow J^{n+1} M \rightarrow J^{n} M \rightarrow J^{n} M / J^{n+1} M \rightarrow 0$ remain exact on tensoring with $R^{\prime}$. This first implies that $J^{n} M \otimes_{R} R^{\prime}=\left(J^{\prime}\right)^{n} M^{\prime}$ and then that $\left(J^{\prime}\right)^{n} M^{\prime} /\left(J^{\prime}\right)^{n+1} M^{\prime}=$ $J^{n} M / J^{n+1} M \otimes_{R} R^{\prime}$. Thus $\mu$ is the tensor product of 10.68.0.1), which is an isomorphism by assumption, with $\operatorname{id}_{R^{\prime}}$ and we conclude.

061Q Lemma 10.68.4. Let $R$ be a Noetherian ring. Let $M$ be a finite $R$-module. Let $\mathfrak{p}$ be a prime. Let $x_{1}, \ldots, x_{c}$ be a sequence in $R$ whose image in $R_{\mathfrak{p}}$ forms an $M_{\mathfrak{p}}$ -quasi-regular sequence. Then there exists a $g \in R, g \notin \mathfrak{p}$ such that the image of $x_{1}, \ldots, x_{c}$ in $R_{g}$ forms an $M_{g}$-quasi-regular sequence.

Proof. Consider the kernel $K$ of the map 10.68.0.1). As $M / J M \otimes_{R / J} R / J\left[X_{1}, \ldots, X_{c}\right]$ is a finite $R / J\left[X_{1}, \ldots, X_{c}\right]$-module and as $R / J\left[X_{1}, \ldots, X_{c}\right]$ is Noetherian, we see that $K$ is also a finite $R / J\left[X_{1}, \ldots, X_{c}\right]$-module. Pick homogeneous generators $k_{1}, \ldots, k_{t} \in K$. By assumption for each $i=1, \ldots, t$ there exists a $g_{i} \in R, g_{i} \notin \mathfrak{p}$ such that $g_{i} k_{i}=0$. Hence $g=g_{1} \ldots g_{t}$ works.

061R Lemma 10.68.5. Let $R$ be a ring. Let $M$ be an $R$-module. Let $f_{1}, \ldots, f_{c} \in$ $R$ be an $M$-quasi-regular sequence. For any $i$ the sequence $\bar{f}_{i+1}, \ldots, \bar{f}_{c}$ of $\bar{R}=$ $R /\left(f_{1}, \ldots, f_{i}\right)$ is an $\bar{M}=M /\left(f_{1}, \ldots, f_{i}\right) M$-quasi-regular sequence.
Proof. It suffices to prove this for $i=1$. Set $\bar{J}=\left(\bar{f}_{2}, \ldots, \bar{f}_{c}\right) \subset \bar{R}$. Then

$$
\begin{aligned}
\bar{J}^{n} \bar{M} / \bar{J}^{n+1} \bar{M} & =\left(J^{n} M+f_{1} M\right) /\left(J^{n+1} M+f_{1} M\right) \\
& =J^{n} M /\left(J^{n+1} M+J^{n} M \cap f_{1} M\right)
\end{aligned}
$$

Thus, in order to prove the lemma it suffices to show that $J^{n+1} M+J^{n} M \cap f_{1} M=$ $J^{n+1} M+f_{1} J^{n-1} M$ because that will show that $\bigoplus_{n \geq 0} \bar{J}^{n} \bar{M} / \bar{J}^{n+1} \bar{M}$ is the quotient
of $\bigoplus_{n \geq 0} J^{n} M / J^{n+1} \cong M / J M\left[X_{1}, \ldots, X_{c}\right]$ by $X_{1}$. Actually, we have $J^{n} M \cap f_{1} M=$ $f_{1} J^{n-1} M$. Namely, if $m \notin J^{n-1} M$, then $f_{1} m \notin J^{n} M$ because $\bigoplus J^{n} M / J^{n+1} M$ is the polynomial algebra $M / J\left[X_{1}, \ldots, X_{c}\right]$ by assumption.

061S Lemma 10.68.6. Let $(R, \mathfrak{m})$ be a local Noetherian ring. Let $M$ be a nonzero finite $R$-module. Let $f_{1}, \ldots, f_{c} \in \mathfrak{m}$ be an $M$-quasi-regular sequence. Then $f_{1}, \ldots, f_{c}$ is an $M$-regular sequence.

Proof. Set $J=\left(f_{1}, \ldots, f_{c}\right)$. Let us show that $f_{1}$ is a nonzerodivisor on $M$. Suppose $x \in M$ is not zero. By the Artin-Rees lemma there exists an integer $r$ such that $x \in$ $J^{r} M$ but $x \notin J^{r+1} M$, see Lemma 10.50.4. Then $f_{1} x \in J^{r+1} M$ is an element whose class in $J^{r+1} M / J^{r+2} M$ is nonzero by the assumed structure of $\bigoplus J^{n} M / J^{n+1} M$. Whence $f_{1} x \neq 0$.

Now we can finish the proof by induction on $c$ using Lemma 10.68 .5
061T Remark 10.68.7 (Koszul regular sequences). In the paper Kab71 the author introduces two more regularity conditions for sequences $x_{1}, \ldots, x_{r}$ of elements of a ring $R$. Namely, we say the sequence is Koszul-regular if $H_{i}\left(K_{\bullet}\left(R, x_{\bullet}\right)\right)=0$ for $i \geq 1$ where $K_{\bullet}\left(R, x_{\bullet}\right)$ is the Koszul complex. The sequence is called $H_{1}$-regular if $H_{1}\left(K_{\bullet}\left(R, x_{\bullet}\right)\right)=0$. If $R$ is a local ring (possibly nonnoetherian) and the sequence consists of elements of the maximal ideal, then one has the implications regular $\Rightarrow$ Koszul-regular $\Rightarrow H_{1}$-regular $\Rightarrow$ quasi-regular. By examples the author shows that these implications cannot be reversed in general. We introduce these notions in more detail in More on Algebra, Section 15.23 .

065M Remark 10.68.8. Let $k$ be a field. Consider the ring

$$
A=k\left[x, y, w, z_{0}, z_{1}, z_{2}, \ldots\right] /\left(y^{2} z_{0}-w x, z_{0}-y z_{1}, z_{1}-y z_{2}, \ldots\right)
$$

In this ring $x$ is a nonzerodivisor and the image of $y$ in $A / x A$ gives a quasi-regular sequence. But it is not true that $x, y$ is a quasi-regular sequence in $A$ because $(x, y) /(x, y)^{2}$ isn't free of rank two over $A /(x, y)$ due to the fact that $w x=0$ in $(x, y) /(x, y)^{2}$ but $w$ isn't zero in $A /(x, y)$. Hence the analogue of Lemma 10.67.7 does not hold for quasi-regular sequences.

065N Lemma 10.68.9. Let $R$ be a ring. Let $J=\left(f_{1}, \ldots, f_{r}\right)$ be an ideal of $R$. Let $M$ be an $R$-module. Set $\bar{R}=R / \bigcap_{n \geq 0} J^{n}, \bar{M}=M / \bigcap_{n \geq 0} J^{n} M$, and denote $\bar{f}_{i}$ the image of $f_{i}$ in $\bar{R}$. Then $f_{1}, \ldots, f_{r}$ is M-quasi-regular if and only if $\bar{f}_{1}, \ldots, \bar{f}_{r}$ is $\bar{M}$-quasi-regular.

Proof. This is true because $J^{n} M / J^{n+1} M \cong \bar{J}^{n} \bar{M} / \bar{J}^{n+1} \bar{M}$.

### 10.69. Blow up algebras

052P In this section we make some elementary observations about blowing up.
052Q Definition 10.69.1. Let $R$ be a ring. Let $I \subset R$ be an ideal.
(1) The blowup algebra, or the Rees algebra, associated to the pair $(R, I)$ is the graded $R$-algebra

$$
\mathrm{Bl}_{I}(R)=\bigoplus_{n \geq 0} I^{n}=R \oplus I \oplus I^{2} \oplus \ldots
$$

where the summand $I^{n}$ is placed in degree $n$.
(2) Let $a \in I$ be an element. Denote $a^{(1)}$ the element $a$ seen as an element of degree 1 in the Rees algebra. Then the affine blowup algebra $R\left[\frac{I}{a}\right]$ is the algebra $\left(\mathrm{Bl}_{I}(R)\right)_{\left(a^{(1)}\right)}$ constructed in Section 10.56
In other words, an element of $R\left[\frac{I}{a}\right]$ is represented by an expression of the form $x / a^{n}$ with $x \in I^{n}$. Two representatives $x / a^{n}$ and $y / a^{m}$ define the same element if and only if $a^{k}\left(a^{m} x-a^{n} y\right)=0$ for some $k \geq 0$.
07Z3 Lemma 10.69.2. Let $R$ be a ring, $I \subset R$ an ideal, and $a \in I$. The image of $a$ in the blowup algebra $R^{\prime}=R\left[\frac{I}{a}\right]$ is a nonzerodivisor and $I R^{\prime}=a R^{\prime}$.
Proof. Immediate from the description of $R\left[\frac{I}{a}\right]$ above.
0BIP Lemma 10.69.3. Let $R \rightarrow S$ be a ring map. Let $I \subset R$ be an ideal and $a \in I$. Set $J=I S$ and let $b \in J$ be the image of $a$. Then $S\left[\frac{J}{b}\right]$ is the quotient of $S \otimes_{R} R\left[\frac{I}{a}\right]$ by the ideal of elements annihilated by some power of $b$.
Proof. Let $S^{\prime}$ be the quotient of $S \otimes_{R} R\left[\frac{I}{a}\right]$ by its $b$-power torsion elements. The ring map

$$
S \otimes_{R} R\left[\frac{I}{a}\right] \longrightarrow S\left[\frac{J}{b}\right]
$$

is surjective and annihilates $a$-power torsion as $b$ is a nonzerodivisor in $S\left[\frac{J}{b}\right]$. Hence we obtain a surjective map $S^{\prime} \rightarrow S\left[\frac{J}{b}\right]$. To see that the kernel is trivial, we construct an inverse map. Namely, let $z=y / b^{n}$ be an element of $S\left[\frac{J}{b}\right]$, i.e., $y \in J^{n}$. Write $y=\sum x_{i} s_{i}$ with $x_{i} \in I^{n}$ and $s_{i} \in S$. We map $z$ to the class of $\sum s_{i} \otimes x_{i} / a^{n}$ in $S^{\prime}$. This is well defined because an element of the kernel of the map $S \otimes_{R} I^{n} \rightarrow J^{n}$ is annihilated by $a^{n}$, hence maps to zero in $S^{\prime}$.
080U Lemma 10.69.4. Let $R$ be a ring, $I \subset R$ an ideal, and $a \in I$. Set $R^{\prime}=R\left[\frac{I}{a}\right]$. If $f \in R$ is such that $V(f)=V(I)$, then $f$ maps to a nonzerodivisor in $R^{\prime}$ and $R_{f}^{\prime}=R_{a}^{\prime}=R_{f}$.
Proof. We will use the results of Lemma 10.69 .2 without further mention. The assumption $V(f)=V(I)$ implies $V\left(f R^{\prime}\right)=V\left(I R^{\prime}\right)=V\left(a R^{\prime}\right)$. Hence $a^{n}=f b$ and $f^{m}=a c$ for some $b, c \in R^{\prime}$. The lemma follows.

0BBI Lemma 10.69.5. Let $R$ be a ring, $I \subset R$ an ideal, $a \in I$, and $f \in R$. Set $R^{\prime}=R\left[\frac{I}{a}\right]$ and $R^{\prime \prime}=R\left[\frac{f I}{f a}\right]$. Then there is a surjective $R$-algebra map $R^{\prime} \rightarrow R^{\prime \prime}$ whose kernel is the set of $f$-power torsion elements of $R^{\prime}$.

Proof. The map is given by sending $x / a^{n}$ for $x \in I^{n}$ to $f^{n} x /(f a)^{n}$. It is straightforward to check this map is well defined and surjective. Since $a f$ is a nonzero divisor in $R^{\prime \prime}$ (Lemma 10.69.2) we see that the set of $f$-power torsion elements are mapped to zero. Conversely, if $x \in R^{\prime}$ and $f^{n} x \neq 0$ for all $n>0$, then $(a f)^{n} x \neq 0$ for all $n$ as $a$ is a nonzero divisor in $R^{\prime}$. It follows that the image of $x$ in $R^{\prime \prime}$ is not zero by the description of $R^{\prime \prime}$ following Definition 10.69.1.

052S Lemma 10.69.6. If $R$ is reduced then every (affine) blowup algebra of $R$ is reduced.
Proof. Let $I \subset R$ be an ideal and $a \in I$. Suppose $x / a^{n}$ with $x \in I^{n}$ is a nilpotent element of $R\left[\frac{I}{a}\right]$. Then $\left(x / a^{n}\right)^{m}=0$. Hence $a^{N} x^{m}=0$ in $R$ for some $N \geq 0$. After increasing $N$ if necessary we may assume $N=m e$ for some $e \geq 0$. Then $\left(a^{e} x\right)^{m}=0$ and since $A$ is reduced we find $a^{e} x=0$. This means that $x / a^{n}=0$ in $R\left[\frac{I}{a}\right]$.

052R Lemma 10.69.7. If $R$ is a domain then every (affine) blowup algebra of $R$ is a domain.

Proof. Let $I \subset R$ be an ideal and $a \in I$ nonzero. Suppose $x / a^{n}, y / a^{m}$ with $x \in I^{n}$, $y \in I^{m}$ are elements of $R\left[\frac{I}{a}\right]$ whose product is zero. Then $a^{N} x y=0$ in $R$. Since $R$ is a domain we conclude that either $x=0$ or $y=0$.

052 Lemma 10.69.8. Let $R$ be a ring. Let $I \subset R$ be an ideal. Let $a \in I$. If $a$ is not contained in any minimal prime of $R$, then $\operatorname{Spec}\left(R\left[\frac{I}{a}\right]\right) \rightarrow \operatorname{Spec}(R)$ has dense image.

Proof. If $a^{k} x=0$ for $x \in R$, then $x$ is contained in all the minimal primes of $R$ and hence nilpotent, see Lemma 10.16.2. Thus the kernel of $R \rightarrow R\left[\frac{I}{a}\right]$ consists of nilpotent elements. Hence the result follows from Lemma 10.29.6.

0BIQ Lemma 10.69.9. Let $R$ be a Noetherian ring. Let $a, a_{2}, \ldots, a_{r}$ be a regular sequence in $R$. With $I=\left(a, a_{2}, \ldots, a_{r}\right)$ the blowup algebra $R^{\prime}=R\left[\frac{I}{a}\right]$ is isomorphic to $R^{\prime \prime}=R\left[y_{2}, \ldots, y_{r}\right] /\left(a y_{i}-a_{i}\right)$.

Proof. There is a canonical map $A^{\prime \prime} \rightarrow A^{\prime}$ sending $y_{i}$ to the class of $a_{i} / a$. Since every element $x$ of $I$ can be written as $r a+\sum r_{i} a_{i}$ we see that $x / a=r+\sum r_{i} a_{i} / a$ is in the image of the map. Hence our map is surjective. Suppose that $z=\sum r_{E} y^{E} \in A^{\prime \prime}$ maps to zero in $A^{\prime}$. Here we use the multi-index notation $E=\left(e_{2}, \ldots, e_{r}\right)$ and $y^{E}=y_{2}^{e_{2}} \ldots y_{r}^{e_{r}}$. Let $d$ be the maximum of the degrees $|E|=\sum e_{i}$ of the multiindices which occur with a nonzero coefficient $r_{E}$ in $z$. Then we see that

$$
a^{d} z=\sum r_{E} a^{d-|E|} a_{2}^{e_{2}} \ldots a_{r}^{e_{r}}
$$

is zero in $R$; here we use that $a$ is a nonzerodivisor on $R$. Since a regular sequence is quasi-regular by Lemma 10.68 .2 we conclude that $r_{E} \in I$ for all $E$. This means that $z$ is divisible by $a$ in $A^{\prime \prime}$. Say $z=a z^{\prime}$. Then $z^{\prime}$ is in the kernel of $A^{\prime \prime} \rightarrow A^{\prime}$ and we see that $z^{\prime}$ is divisible by $a$ and so on. In other words, $z$ is an element of $\bigcap a^{n} R^{\prime \prime}$. Since $R^{\prime \prime}$ is Noetherian by Krull's intersection theorem $z$ maps to zero in $R_{\mathfrak{p}}^{\prime \prime}$ for every prime ideal $\mathfrak{p}$ containing $a R^{\prime \prime}$, see Remark 10.50.6 On the other hand, if $\mathfrak{p} \subset R^{\prime \prime}$ does not contain $a$, then $R_{a}^{\prime \prime} \cong R_{a} \cong R_{a}^{\prime}$ and we find that $z$ maps to zero in $R_{\mathfrak{p}}^{\prime \prime}$ as well. We conclude that $z$ is zero by Lemma 10.23.1.

052M Lemma 10.69.10. Let $(R, \mathfrak{m})$ be a local domain with fraction field $K$. Let $R \subset$ $A \subset K$ be a valuation ring which dominates $R$. Then

$$
A=\operatorname{colim} R\left[\frac{I}{a}\right]
$$

is a directed colimit of affine blowups $R \rightarrow R\left[\frac{I}{a}\right]$ with the following properties
(1) $a \in I \subset \mathfrak{m}$,
(2) I is finitely generated, and
(3) the fibre ring of $R \rightarrow R\left[\frac{I}{a}\right]$ at $\mathfrak{m}$ is not zero.

Proof. Consider a finite subset $E \subset A$. Say $E=\left\{e_{1}, \ldots, e_{n}\right\}$. Choose a nonzero $a \in R$ such that we can write $e_{i}=f_{i} / a$ for all $i=1, \ldots, n$. Set $I=\left(f_{1}, \ldots, f_{n}, a\right)$. We claim that $R\left[\frac{I}{a}\right] \subset A$. This is clear as an element of $R\left[\frac{I}{a}\right]$ can be represented as a polynomial in the elements $e_{i}$. The lemma follows immediately from this observation.

### 10.70. Ext groups

00 LO In this section we do a tiny bit of homological algebra, in order to establish some fundamental properties of depth over Noetherian local rings.

00LP Lemma 10.70.1. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) There exists an exact complex

$$
\ldots \rightarrow F_{2} \rightarrow F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

with $F_{i}$ free $R$-modules.
(2) If $R$ is Noetherian and $M$ finite over $R$, then we can choose the complex such that $F_{i}$ is finite free. In other words, we can find an exact complex

$$
\ldots \rightarrow R^{\oplus n_{2}} \rightarrow R^{\oplus n_{1}} \rightarrow R^{\oplus n_{0}} \rightarrow M \rightarrow 0
$$

Proof. Let us explain only the Noetherian case. As a first step choose a surjection $R^{n_{0}} \rightarrow M$. Then having constructed an exact complex of length $e$ we simply choose a surjection $R^{n_{e+1}} \rightarrow \operatorname{Ker}\left(R^{n_{e}} \rightarrow R^{n_{e-1}}\right)$ which is possible because $R$ is Noetherian.

00LQ Definition 10.70.2. Let $R$ be a ring. Let $M$ be an $R$-module.
(1) A (left) resolution $F_{\bullet} \rightarrow M$ of $M$ is an exact complex

$$
\ldots \rightarrow F_{2} \rightarrow F_{1} \rightarrow F_{0} \rightarrow M \rightarrow 0
$$

of $R$-modules.
(2) A resolution of $M$ by free $R$-modules is a resolution $F \bullet \rightarrow M$ where each $F_{i}$ is a free $R$-module.
(3) A resolution of $M$ by finite free $R$-modules is a resolution $F_{\bullet} \rightarrow M$ where each $F_{i}$ is a finite free $R$-module.

We often use the notation $F_{\bullet}$ to denote a complex of $R$-modules

$$
\ldots \rightarrow F_{i} \rightarrow F_{i-1} \rightarrow \ldots
$$

In this case we often use $d_{i}$ or $d_{F, i}$ to denote the map $F_{i} \rightarrow F_{i-1}$. In this section we are always going to assume that $F_{0}$ is the last nonzero term in the complex. The $i$ th homology group of the complex $F_{\bullet}$ is the group $H_{i}=\operatorname{Ker}\left(d_{F, i}\right) / \operatorname{Im}\left(d_{F, i+1}\right)$. A map of complexes $\alpha: F_{\bullet} \rightarrow G_{\bullet}$ is given by maps $\alpha_{i}: F_{i} \rightarrow G_{i}$ such that $\alpha_{i-1} \circ d_{F, i}=$ $d_{G, i-1} \circ \alpha_{i}$. Such a map induces a map on homology $H_{i}(\alpha): H_{i}\left(F_{\bullet}\right) \rightarrow H_{i}\left(G_{\bullet}\right)$. If $\alpha, \beta: F_{\bullet} \rightarrow G_{\bullet}$ are maps of complexes, then a homotopy between $\alpha$ and $\beta$ is given by a collection of maps $h_{i}: F_{i} \rightarrow G_{i+1}$ such that $\alpha_{i}-\beta_{i}=d_{G, i+1} \circ h_{i}+h_{i-1} \circ d_{F, i}$.

We will use a very similar notation regarding complexes of the form $F^{\bullet}$ which look like

$$
\ldots \rightarrow F^{i} \xrightarrow{d^{i}} F^{i+1} \rightarrow \ldots
$$

There are maps of complexes, homotopies, etc. In this case we set $H^{i}\left(F^{\bullet}\right)=$ $\operatorname{Ker}\left(d^{i}\right) / \operatorname{Im}\left(d^{i-1}\right)$ and we call it the $i$ th cohomology group.

00LR Lemma 10.70.3. Any two homotopic maps of complexes induce the same maps on (co)homology groups.

Proof. Omitted.

00LS Lemma 10.70.4. Let $R$ be a ring. Let $M \rightarrow N$ be a map of $R$-modules. Let $F_{\bullet} \rightarrow$ $M$ be a resolution by free $R$-modules and let $N_{\bullet} \rightarrow N$ be an arbitrary resolution. Then
(1) there exists a map of complexes $F_{\bullet} \rightarrow N_{\bullet}$ inducing the given map

$$
M=\operatorname{Coker}\left(F_{1} \rightarrow F_{0}\right) \rightarrow \operatorname{Coker}\left(N_{1} \rightarrow N_{0}\right)=N
$$

(2) two maps $\alpha, \beta: F_{\bullet} \rightarrow N_{\bullet}$ inducing the same map $M \rightarrow N$ are homotopic.

Proof. Proof of (1). Because $F_{0}$ is free we can find a map $F_{0} \rightarrow N_{0}$ lifting the map $F_{0} \rightarrow M \rightarrow N$. We obtain an induced map $F_{1} \rightarrow F_{0} \rightarrow N_{0}$ which ends up in the image of $N_{1} \rightarrow N_{0}$. Since $F_{1}$ is free we may lift this to a map $F_{1} \rightarrow N_{1}$. This in turn induces a map $F_{2} \rightarrow F_{1} \rightarrow N_{1}$ which maps to zero into $N_{0}$. Since $N_{\bullet}$ is exact we see that the image of this map is contained in the image of $N_{2} \rightarrow N_{1}$. Hence we may lift to get a map $F_{2} \rightarrow N_{2}$. Repeat.

Proof of (2). To show that $\alpha, \beta$ are homotopic it suffices to show the difference $\gamma=\alpha-\beta$ is homotopic to zero. Note that the image of $\gamma_{0}: F_{0} \rightarrow N_{0}$ is contained in the image of $N_{1} \rightarrow N_{0}$. Hence we may lift $\gamma_{0}$ to a map $h_{0}: F_{0} \rightarrow N_{1}$. Consider the map $\gamma_{1}^{\prime}=\gamma_{1}-h_{0} \circ d_{F, 1}$. By our choice of $h_{0}$ we see that the image of $\gamma_{1}^{\prime}$ is contained in the kernel of $N_{1} \rightarrow N_{0}$. Since $N_{\bullet}$ is exact we may lift $\gamma_{1}^{\prime}$ to a map $h_{1}: F_{1} \rightarrow N_{2}$. At this point we have $\gamma_{1}=h_{0} \circ d_{F, 1}+d_{N, 2} \circ h_{1}$. Repeat.

At this point we are ready to define the groups $\operatorname{Ext}_{R}^{i}(M, N)$. Namely, choose a resolution $F_{\bullet}$ of $M$ by free $R$-modules, see Lemma 10.70 .1 . Consider the (cohomological) complex

$$
\operatorname{Hom}_{R}\left(F_{\bullet}, N\right): \operatorname{Hom}_{R}\left(F_{0}, N\right) \rightarrow \operatorname{Hom}_{R}\left(F_{1}, N\right) \rightarrow \operatorname{Hom}_{R}\left(F_{2}, N\right) \rightarrow \ldots
$$

We define $\operatorname{Ext}_{R}^{i}(M, N)$ to be the $i$ th cohomology group of this complex $5^{5}$ The following lemma explains in what sense this is well defined.

00LT Lemma 10.70.5. Let $R$ be a ring. Let $M_{1}, M_{2}, N$ be $R$-modules. Suppose that $F_{\bullet}$ is a free resolution of the module $M_{1}$, and $G_{\bullet}$ is a free resolution of the module $M_{2}$. Let $\varphi: M_{1} \rightarrow M_{2}$ be a module map. Let $\alpha: F_{\bullet} \rightarrow G_{\bullet}$ be a map of complexes inducing $\varphi$ on $M_{1}=\operatorname{Coker}\left(d_{F, 1}\right) \rightarrow M_{2}=\operatorname{Coker}\left(d_{G, 1}\right)$, see Lemma 10.70.4. Then the induced maps

$$
H^{i}(\alpha): H^{i}\left(\operatorname{Hom}_{R}\left(F_{\bullet}, N\right)\right) \longrightarrow H^{i}\left(\operatorname{Hom}_{R}\left(G_{\bullet}, N\right)\right)
$$

are independent of the choice of $\alpha$. If $\varphi$ is an isomorphism, so are all the maps $H^{i}(\alpha)$. If $M_{1}=M_{2}, F_{\bullet}=G_{\bullet}$, and $\varphi$ is the identity, so are all the maps $H_{i}(\alpha)$.

Proof. Another map $\beta: F_{\bullet} \rightarrow G_{\bullet}$ inducing $\varphi$ is homotopic to $\alpha$ by Lemma 10.70.4. Hence the maps $\operatorname{Hom}_{R}\left(F_{\bullet}, N\right) \rightarrow \operatorname{Hom}_{R}\left(G_{\bullet}, N\right)$ are homotopic. Hence the independence result follows from Lemma 10.70 .3 .
Suppose that $\varphi$ is an isomorphism. Let $\psi: M_{2} \rightarrow M_{1}$ be an inverse. Choose $\beta: G_{\bullet} \rightarrow F_{\bullet}$ be a map inducing $\psi: M_{2}=\operatorname{Coker}\left(d_{G, 1}\right) \rightarrow M_{1}=\operatorname{Coker}\left(d_{F, 1}\right)$, see Lemma 10.70.4. OK, and now consider the map $H^{i}(\alpha) \circ H^{i}(\beta)=H^{i}(\alpha \circ \beta)$. By the above the map $H^{i}(\alpha \circ \beta)$ is the same as the map $H^{i}\left(\operatorname{id}_{G_{\bullet}}\right)=$ id. Similarly for the composition $H^{i}(\beta) \circ H^{i}(\alpha)$. Hence $H^{i}(\alpha)$ and $H^{i}(\beta)$ are inverses of each other.

[^21]00LU Lemma 10.70.6. Let $R$ be a ring. Let $M$ be an $R$-module. Let $0 \rightarrow N^{\prime} \rightarrow N \rightarrow$ $N^{\prime \prime} \rightarrow 0$ be a short exact sequence. Then we get a long exact sequence

$$
\begin{aligned}
0 & \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime}\right) \rightarrow \operatorname{Hom}_{R}(M, N) \rightarrow \operatorname{Hom}_{R}\left(M, N^{\prime \prime}\right) \\
& \rightarrow \operatorname{Ext}_{R}^{1}\left(M, N^{\prime}\right) \rightarrow \operatorname{Ext}_{R}^{1}(M, N) \rightarrow \operatorname{Ext}_{R}^{1}\left(M, N^{\prime \prime}\right) \rightarrow \ldots
\end{aligned}
$$

Proof. Pick a free resolution $F_{\bullet} \rightarrow M$. Since each of the $F_{i}$ are free we see that we get a short exact sequence of complexes

$$
0 \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}, N^{\prime}\right) \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}, N\right) \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}, N^{\prime \prime}\right) \rightarrow 0
$$

Thus we get the long exact sequence from the snake lemma applied to this.
065P Lemma 10.70.7. Let $R$ be a ring. Let $N$ be an $R$-module. Let $0 \rightarrow M^{\prime} \rightarrow M \rightarrow$ $M^{\prime \prime} \rightarrow 0$ be a short exact sequence. Then we get a long exact sequence

$$
\begin{aligned}
& 0 \rightarrow \operatorname{Hom}_{R}\left(M^{\prime \prime}, N\right) \rightarrow \operatorname{Hom}_{R}(M, N) \rightarrow \operatorname{Hom}_{R}\left(M^{\prime}, N\right) \\
& \quad \rightarrow \operatorname{Ext}_{R}^{1}\left(M^{\prime \prime}, N\right) \rightarrow \operatorname{Ext}_{R}^{1}(M, N) \rightarrow \operatorname{Ext}_{R}^{1}\left(M^{\prime}, N\right) \rightarrow \ldots
\end{aligned}
$$

Proof. Pick sets of generators $\left\{m_{i^{\prime}}^{\prime}\right\}_{i^{\prime} \in I^{\prime}}$ and $\left\{m_{i^{\prime \prime}}^{\prime \prime}\right\}_{i^{\prime \prime} \in I^{\prime \prime}}$ of $M^{\prime}$ and $M^{\prime \prime}$. For each $i^{\prime \prime} \in I^{\prime \prime}$ choose a lift $\tilde{m}_{i^{\prime \prime}}^{\prime \prime} \in M$ of the element $m_{i^{\prime \prime}}^{\prime \prime} \in M^{\prime \prime}$. Set $F^{\prime}=\bigoplus_{i^{\prime} \in I^{\prime}} R$, $F^{\prime \prime}=\bigoplus_{i^{\prime \prime} \in I^{\prime \prime}} R$ and $F=F^{\prime} \oplus F^{\prime \prime}$. Mapping the generators of these free modules to the corresponding chosen generators gives surjective $R$-module maps $F^{\prime} \rightarrow M^{\prime}$, $F^{\prime \prime} \rightarrow M^{\prime \prime}$, and $F \rightarrow M$. We obtain a map of short exact sequences

$$
\begin{array}{ccccccccc}
0 & \rightarrow & M^{\prime} & \rightarrow & M & \rightarrow & M^{\prime \prime} & \rightarrow & 0 \\
& & \uparrow & & \uparrow & & \uparrow & & \\
0 & \rightarrow & F^{\prime} & \rightarrow & F & \rightarrow & F^{\prime \prime} & \rightarrow & 0
\end{array}
$$

By the snake lemma we see that the sequence of kernels $0 \rightarrow K^{\prime} \rightarrow K \rightarrow K^{\prime \prime} \rightarrow 0$ is short exact sequence of $R$-modules. Hence we can continue this process indefinitely. In other words we obtain a short exact sequence of resolutions fitting into the diagram

$$
\begin{array}{lllllllll}
0 & \rightarrow & M^{\prime} & \rightarrow & M & \rightarrow & M^{\prime \prime} & \rightarrow & 0 \\
& & \uparrow & & \uparrow & & \uparrow & & \\
0 & \rightarrow & F_{\bullet}^{\prime} & \rightarrow & F_{\bullet} & \rightarrow & F_{\bullet}^{\prime \prime} & \rightarrow & 0
\end{array}
$$

Because each of the sequences $0 \rightarrow F_{n}^{\prime} \rightarrow F_{n} \rightarrow F_{n}^{\prime \prime} \rightarrow 0$ is split exact (by construction) we obtain a short exact sequence of complexes

$$
0 \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}^{\prime \prime}, N\right) \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}, N\right) \rightarrow \operatorname{Hom}_{R}\left(F_{\bullet}^{\prime}, N\right) \rightarrow 0
$$
