094D Lemma 21.40.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$. The $\mathcal{O}$-module $j_{!} \mathcal{O}_{U}$ is a compact object of $D(\mathcal{O})$ if there exists an integer $d$ such that
(1) $H^{p}(U, \mathcal{F})=0$ for all $p>d$, and
(2) the functors $\mathcal{F} \mapsto H^{p}(U, \mathcal{F})$ commute with direct sums.

Proof. Assume (1) and (2). The first means that the functor $F=H^{0}(U,-)$ has finite cohomological dimension. Moreover, any direct sum of injective modules is acyclic for $F$ by (2). Since we may compute $R F$ by applying $F$ to any complex of acyclics (Derived Categories, Lemma 13.30.2). Thus, if $K_{i}$ be a family of objects of $D(\mathcal{O})$, then we can choose K-injective representatives $I_{i}^{\bullet}$ and we see that $\bigoplus K_{i}$ is represented by $\bigoplus I_{i}^{\bullet}$. Thus $H^{0}(U,-)$ commutes with direct sums.

094 E Lemma 21.40.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $U$ be an object of $\mathcal{C}$ which is quasi-compact and weakly contractible. Then $j_{!} \mathcal{O}_{U}$ is a compact object of $D(\mathcal{O})$.

Proof. Combine Lemmas 21.40 .4 and 21.39 .1 with Modules on Sites, Lemma 18.29.2.

### 21.41. Complexes with locally constant cohomology sheaves

094F Locally constant sheaves are introduced in Modules on Sites, Section 18.42. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a ring. We denote $D(\mathcal{C}, \Lambda)$ the derived category of the abelian category of $\underline{\Lambda}$-modules on $\mathcal{C}$.

094G Lemma 21.41.1. Let $\mathcal{C}$ be a site with final object $X$. Let $\Lambda$ be a Noetherian ring. Let $K \in D^{b}(\mathcal{C}, \Lambda)$ with $H^{i}(K)$ locally constant sheaves of $\Lambda$-modules of finite type. Then there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that each $\left.K\right|_{U_{i}}$ is represented by a complex of locally constant sheaves of $\Lambda$-modules of finite type.

Proof. Let $a \leq b$ be such that $H^{i}(K)=0$ for $i \notin[a, b]$. By induction on $b-a$ we will prove there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.K\right|_{U_{i}}$ can be represented by a complex $\underline{M}_{U_{i}}$ with $M^{p}$ a finite type $\Lambda$-module and $M^{p}=0$ for $p \notin[a, b]$. If $b=a$, then this is clear. In general, we may replace $X$ by the members of a covering and assume that $H^{b}(K)$ is constant, say $H^{b}(K)=\underline{M}$. By Modules on Sites, Lemma 18.41.5 the module $M$ is a finite $\Lambda$-module. Choose a surjection $\Lambda^{\oplus r} \rightarrow M$ given by generators $x_{1}, \ldots, x_{r}$ of $M$.

By a slight generalization of Lemma 21.8.3 (details omitted) there exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $x_{i} \in H^{0}\left(X, H^{b}(K)\right)$ lifts to an element of $H^{b}\left(U_{i}, K\right)$. Thus, after replacing $X$ by the $U_{i}$ we reach the situation where there is a map $\underline{\Lambda}^{\oplus r}[-b] \rightarrow$ $K$ inducing a surjection on cohomology sheaves in degree $b$. Choose a distinguished triangle

$$
\underline{\Lambda^{\oplus r}}[-b] \rightarrow K \rightarrow L \rightarrow \underline{\Lambda^{\oplus r}}[-b+1]
$$

Now the cohomology sheaves of $L$ are nonzero only in the interval $[a, b-1]$, agree with the cohomology sheaves of $K$ in the interval $[a, b-2]$ and there is a short exact sequence

$$
0 \rightarrow H^{b-1}(K) \rightarrow H^{b-1}(L) \rightarrow \underline{\operatorname{Ker}\left(\Lambda^{\oplus r} \rightarrow M\right)} \rightarrow 0
$$

in degree $b-1$. By Modules on Sites, Lemma 18.42 .5 we see that $H^{b-1}(L)$ is locally constant of finite type. By induction hypothesis we obtain an isomorphism $\underline{M^{\bullet}} \rightarrow L$ in $D(\mathcal{C}, \underline{\Lambda})$ with $M^{p}$ a finite $\Lambda$-module and $M^{p}=0$ for $p \notin[a, b-1]$. The map $L \rightarrow \Lambda^{\oplus r}[-b+1]$ gives a map $\underline{M^{b-1}} \rightarrow \underline{\Lambda^{\oplus r}}$ which locally is constant (Modules on Sites, Lemma 18.42 .3 . Thus we may assume it is given by a map $M^{b-1} \rightarrow \Lambda^{\oplus r}$. The distinguished triangle shows that the composition $M^{b-2} \rightarrow M^{b-1} \rightarrow \Lambda^{\oplus r}$ is zero and the axioms of triangulated categories produce an isomorphism

$$
M^{a} \rightarrow \ldots \rightarrow M^{b-1} \rightarrow \Lambda^{\oplus r} \longrightarrow K
$$

in $D(\mathcal{C}, \Lambda)$.
Let $\mathcal{C}$ be a site. Let $\Lambda$ be a ring. Using the morphism $\operatorname{Sh}(\mathcal{C}) \rightarrow \operatorname{Sh}(p t)$ we see that there is a functor $D(\Lambda) \rightarrow D(\mathcal{C}, \Lambda), K \mapsto \underline{K}$.

09BD Lemma 21.41.2. Let $\mathcal{C}$ be a site with final object $X$. Let $\Lambda$ be a ring. Let
(1) $K$ a perfect object of $D(\Lambda)$,
(2) a finite complex $K^{\bullet}$ of finite projective $\Lambda$-modules representing $K$,
(3) $\mathcal{L}^{\bullet}$ a complex of sheaves of $\Lambda$-modules, and
(4) $\varphi: \underline{K} \rightarrow \mathcal{L}^{\bullet}$ a map in $D(\mathcal{C}, \Lambda)$.

Then there exists a covering $\left\{U_{i} \rightarrow X\right\}$ and maps of complexes $\alpha_{i}:\left.\left.\underline{K}^{\bullet}\right|_{U_{i}} \rightarrow \mathcal{L}^{\bullet}\right|_{U_{i}}$ representing $\left.\varphi\right|_{U_{i}}$.

Proof. Follows immediately from Lemma 21.34 .8.
09BE Lemma 21.41.3. Let $\mathcal{C}$ be a site with final object $X$. Let $\Lambda$ be a ring. Let $K, L$ be objects of $D(\Lambda)$ with $K$ perfect. Let $\varphi: \underline{K} \rightarrow \underline{L}$ be map in $D(\mathcal{C}, \Lambda)$. There exists a covering $\left\{U_{i} \rightarrow X\right\}$ such that $\left.\varphi\right|_{U_{i}}$ is equal to $\underline{\alpha_{i}}$ for some map $\alpha_{i}: K \rightarrow L$ in $D(\Lambda)$.

Proof. Follows from Lemma 21.41.2 and Modules on Sites, Lemma 18.42.3.
094H Lemma 21.41.4. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a Noetherian ring. Let $K, L \in$ $D^{-}(\mathcal{C}, \Lambda)$. If the cohomology sheaves of $K$ and $L$ are locally constant sheaves of $\Lambda$ modules of finite type, then the cohomology sheaves of $K \otimes_{\Lambda}^{\mathbf{L}} L$ are locally constant sheaves of $\Lambda$-modules of finite type.

Proof. We'll prove this as an application of Lemma 21.41.1. Note that $H^{i}\left(K \otimes_{\Lambda}^{\mathbf{L}} L\right)$ is the same as $H^{i}\left(\tau_{\geq i-1} K \otimes_{\Lambda}^{\mathbf{L}} \tau_{\geq i-1} L\right)$. Thus we may assume $K$ and $L$ are bounded. By Lemma 21.41.1 we may assume that $K$ and $L$ are represented by complexes of locally constant sheaves of $\Lambda$-modules of finite type. Then we can replace these complexes by bounded above complexes of finite free $\Lambda$-modules. In this case the result is clear.

094 L Lemma 21.41.5. Let $\mathcal{C}$ be a site. Let $\Lambda$ be a Noetherian ring. Let $I \subset \Lambda$ be an ideal. Let $K \in D^{-}(\mathcal{C}, \Lambda)$. If the cohomology sheaves of $K \otimes_{\Lambda}^{\mathbf{L}} \Lambda / I$ are locally constant sheaves of $\Lambda / I$-modules of finite type, then the cohomology sheaves of $K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}}$ are locally constant sheaves of $\Lambda / I^{n}$-modules of finite type for all $n \geq 1$.
Proof. Recall that the locally constant sheaves of $\Lambda$-modules of finite type form a weak Serre subcategory of all $\underline{\Lambda}$-modules, see Modules on Sites, Lemma 18.42.5. Thus the subcategory of $D(\mathcal{C}, \Lambda)$ consisting of complexes whose cohomology sheaves
are locally constant sheaves of $\Lambda$-modules of finite type forms a strictly full, saturated triangulated subcategory of $D(\mathcal{C}, \Lambda)$, see Derived Categories, Lemma 13.13.1. Next, consider the distinguished triangles

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n+1}} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I^{n}} \rightarrow K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}[1]
$$

and the isomorphisms

$$
K \otimes_{\Lambda}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}=\left(K \otimes_{\Lambda}^{\mathbf{L}} \underline{\Lambda / I}\right) \otimes_{\Lambda / I}^{\mathbf{L}} \underline{I^{n} / I^{n+1}}
$$

Combined with Lemma 21.41.4 we obtain the result.

## CHAPTER 22

## Differential Graded Algebra

### 22.1. Introduction

09JE In this chapter we talk about differential graded algebras, modules, categories, etc. A basic reference is Kel94. A survey paper is Kel06.

Since we do not worry about length of exposition in the Stacks project we first develop the material in the setting of categories of differential graded modules. After that we redo the constructions in the setting of differential graded modules over differential graded categories.

### 22.2. Conventions

09JF In this chapter we hold on to the convention that ring means commutative ring with 1 . If $R$ is a ring, then an $R$-algebra $A$ will be an $R$-module $A$ endowed with an $R$-bilinear map $A \times A \rightarrow A$ (multiplication) such that multiplication is associative and has a unit. In other words, these are unital associative $R$-algebras such that the structure map $R \rightarrow A$ maps into the center of $A$.

### 22.3. Differential graded algebras

061 U Just the definitions.
061V Definition 22.3.1. Let $R$ be a commutative ring. A differential graded algebra over $R$ is either
(1) a chain complex $A$ • of $R$-modules endowed with $R$-bilinear maps $A_{n} \times$ $A_{m} \rightarrow A_{n+m},(a, b) \mapsto a b$ such that

$$
\mathrm{d}_{n+m}(a b)=\mathrm{d}_{n}(a) b+(-1)^{n} a \mathrm{~d}_{m}(b)
$$

and such that $\bigoplus A_{n}$ becomes an associative and unital $R$-algebra, or
(2) a cochain complex $A^{\bullet}$ of $R$-modules endowed with $R$-bilinear maps $A^{n} \times$ $A^{m} \rightarrow A^{n+m},(a, b) \mapsto a b$ such that

$$
\mathrm{d}^{n+m}(a b)=\mathrm{d}^{n}(a) b+(-1)^{n} a \mathrm{~d}^{m}(b)
$$

and such that $\bigoplus A^{n}$ becomes an associative and unital $R$-algebra.
We often just write $A=\bigoplus A_{n}$ or $A=\bigoplus A^{n}$ and think of this as an associative unital $R$-algebra endowed with a Z-grading and an $R$-linear operator d whose square is zero and which satisfies the Leibniz rule as explained above. In this case we often say "Let $(A, \mathrm{~d})$ be a differential graded algebra".

061X Definition 22.3.2. A homomorphism of differential graded algebras $f:(A, \mathrm{~d}) \rightarrow$ $(B, \mathrm{~d})$ is an algebra map $f: A \rightarrow B$ compatible with the gradings and d .

09JG Definition 22.3.3. Let $R$ be a ring. Let $(A, \mathrm{~d})$ be a differential graded algebra over $R$. The opposite differential graded algebra is the differential graded algebra $\left(A^{o p p}, \mathrm{~d}\right)$ over $R$ where $A^{o p p}=A$ as an $R$-module, $\mathrm{d}=\mathrm{d}$, and multiplication is given by

$$
a \cdot \text { opp } b=(-1)^{\operatorname{deg}(a) \operatorname{deg}(b)} b a
$$

for homogeneous elements $a, b \in A$.
This makes sense because

$$
\begin{aligned}
\mathrm{d}\left(a \cdot_{\text {opp }} b\right) & =(-1)^{\operatorname{deg}(a) \operatorname{deg}(b)} \mathrm{d}(b a) \\
& =(-1)^{\operatorname{deg}(a) \operatorname{deg}(b)} \mathrm{d}(b) a+(-1)^{\operatorname{deg}(a) \operatorname{deg}(b)+\operatorname{deg}(b)} b \mathrm{~d}(a) \\
& =(-1)^{\operatorname{deg}(a)} a \cdot \text { opp } \mathrm{d}(b)+\mathrm{d}(a) \cdot{ }_{\text {opp }} b
\end{aligned}
$$

as desired.
061W Definition 22.3.4. A differential graded algebra $(A, \mathrm{~d})$ is commutative if $a b=$ $(-1)^{n m} b a$ for $a$ in degree $n$ and $b$ in degree $m$. We say $A$ is strictly commutative if in addition $a^{2}=0$ for $\operatorname{deg}(a)$ odd.
The following definition makes sense in general but is perhaps "correct" only when tensoring commutative differential graded algebras.
065W Definition 22.3.5. Let $R$ be a ring. Let $(A, \mathrm{~d}),(B, \mathrm{~d})$ be differential graded algebras over $R$. The tensor product differential graded algebra of $A$ and $B$ is the algebra $A \otimes_{R} B$ with multiplication defined by

$$
(a \otimes b)\left(a^{\prime} \otimes b^{\prime}\right)=(-1)^{\operatorname{deg}\left(a^{\prime}\right) \operatorname{deg}(b)} a a^{\prime} \otimes b b^{\prime}
$$

endowed with differential d defined by the rule $\mathrm{d}(a \otimes b)=\mathrm{d}(a) \otimes b+(-1)^{m} a \otimes \mathrm{~d}(b)$ where $m=\operatorname{deg}(a)$.

065X Lemma 22.3.6. Let $R$ be a ring. Let $(A, d),(B, d)$ be differential graded algebras over $R$. Denote $A^{\bullet}, B^{\bullet}$ the underlying cochain complexes. As cochain complexes of $R$-modules we have

$$
\left(A \otimes_{R} B\right)^{\bullet}=\operatorname{Tot}\left(A^{\bullet} \otimes_{R} B^{\bullet}\right)
$$

Proof. Recall that the differential of the total complex is given by $\mathrm{d}_{1}^{p, q}+(-1)^{p} \mathrm{~d}_{2}^{p, q}$ on $A^{p} \otimes_{R} B^{q}$. And this is exactly the same as the rule for the differential on $A \otimes_{R} B$ in Definition 22.3.5.

### 22.4. Differential graded modules

09JH Just the definitions.
09JI Definition 22.4.1. Let $R$ be a ring. Let $(A, \mathrm{~d})$ be a differential graded algebra over $R$. A (right) differential graded module $M$ over $A$ is a right $A$-module $M$ which has a grading $M=\bigoplus M^{n}$ and a differential d such that $M^{n} A^{m} \subset M^{n+m}$, such that $\mathrm{d}\left(M^{n}\right) \subset M^{n+1}$, and such that

$$
\mathrm{d}(m a)=\mathrm{d}(m) a+(-1)^{n} m \mathrm{~d}(a)
$$

for $a \in A$ and $m \in M^{n}$. A homomorphism of differential graded modules $f: M \rightarrow N$ is an $A$-module map compatible with gradings and differentials. The category of (right) differential graded $A$-modules is denoted $\operatorname{Mod}_{(A, \mathrm{~d})}$.

Note that we can think of $M$ as a cochain complex $M^{\bullet}$ of (right) $R$-modules. Namely, for $r \in R$ we have $\mathrm{d}(r)=0$ and $r$ maps to a degree 0 element of $A$, hence $\mathrm{d}(m r)=\mathrm{d}(m) r$.
We can define left differential graded $A$-modules in exactly the same manner. If $M$ is a left $A$-module, then we can think of $M$ as a right $A^{o p p}$-module with mulitplication ${ }^{\circ}$ opp defined by the rule

$$
m \cdot{ }_{o p p} a=(-1)^{\operatorname{deg}(a) \operatorname{deg}(m)} a m
$$

for $a$ and $m$ homogeneous. The category of left differential graded $A$-modules is equivalent to the category of right differential graded $A^{o p p}$-modules. We prefer to work with right modules (essentially because of what happens in Example 22.19.8), but the reader is free to switch to left modules if (s)he so desires.
09JJ Lemma 22.4.2. Let $(A, d)$ be a differential graded algebra. The category $\operatorname{Mod}_{(A, d)}$ is abelian and has arbitrary limits and colimits.

Proof. Kernels and cokernels commute with taking underlying $A$-modules. Similarly for direct sums and colimits. In other words, these operations in $\operatorname{Mod}_{(A, \mathrm{~d})}$ commute with the forgetful functor to the category of $A$-modules. This is not the case for products and limits. Namely, if $N_{i}, i \in I$ is a family of differential graded $A$-modules, then the product $\Pi N_{i}$ in $\operatorname{Mod}_{(A, \mathrm{~d})}$ is given by setting $\left(\Pi N_{i}\right)^{n}=\Pi N_{i}^{n}$ and $\prod N_{i}=\bigoplus_{n}\left(\prod N_{i}\right)^{n}$. Thus we see that the product does commute with the forgetful functor to the category of graded $A$-modules. A category with products and equalizers has limits, see Categories, Lemma 4.14.10.
Thus, if $(A, \mathrm{~d})$ is a differential graded algebra over $R$, then there is an exact functor

$$
\operatorname{Mod}_{(A, \mathrm{~d})} \longrightarrow \operatorname{Comp}(R)
$$

of abelian categories. For a differential graded module $M$ the cohomology groups $H^{n}(M)$ are defined as the cohomology of the corresponding complex of $R$-modules. Therefore, a short exact sequence $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ of differential graded modules gives rise to a long exact sequence

$$
\begin{equation*}
H^{n}(K) \rightarrow H^{n}(L) \rightarrow H^{n}(M) \rightarrow H^{n+1}(K) \tag{22.4.2.1}
\end{equation*}
$$

of cohomology modules, see Homology, Lemma 12.12 .12 .
Moreover, from now on we borrow all the terminology used for complexes of modules. For example, we say that a differential graded $A$-module $M$ is acyclic if $H^{k}(M)=0$ for all $k \in \mathbf{Z}$. We say that a homomorphism $M \rightarrow N$ of differential graded $A$-modules is a quasi-isomorphism if it induces isomorphisms $H^{k}(M) \rightarrow$ $H^{k}(N)$ for all $k \in \mathbf{Z}$. And so on and so forth.

09JL Definition 22.4.3. Let $(A, \mathrm{~d})$ be a differential graded algebra. Let $M$ be a differential graded module. For any $k \in \mathbf{Z}$ we define the $k$-shifted module $M[k]$ as follows
(1) as $A$-module $M[k]=M$,
(2) $M[k]^{n}=M^{n+k}$,
(3) $\mathrm{d}_{M[k]}=(-1)^{k} \mathrm{~d}_{M}$.

For a morphism $f: M \rightarrow N$ of differential graded $A$-modules we let $f[k]: M[k] \rightarrow$ $N[k]$ be the map equal to $f$ on underlying $A$-modules. This defines a functor $[k]: \operatorname{Mod}_{(A, \mathrm{~d})} \rightarrow \operatorname{Mod}_{(A, \mathrm{~d})}$.

The remarks in Homology, Section 12.14 apply. In particular, we will identify the cohomology groups of all shifts $M[k]$ without the intervention of signs.

At this point we have enough structure to talk about triangles, see Derived Categories, Definition 13.3.1. In fact, our next goal is to develop enough theory to be able to state and prove that the homotopy category of differential graded modules is a triangulated category. First we define the homotopy category.

### 22.5. The homotopy category

09JM Our homotopies take into account the $A$-module structure and the grading, but not the differential (of course).

09JN Definition 22.5.1. Let $(A, \mathrm{~d})$ be a differential graded algebra. Let $f, g: M \rightarrow N$ be homomorphisms of differential graded $A$-modules. A homotopy between $f$ and $g$ is an $A$-module map $h: M \rightarrow N$ such that
(1) $h\left(M^{n}\right) \subset N^{n-1}$ for all $n$, and
(2) $f(x)-g(x)=\mathrm{d}_{N}(h(x))+h\left(\mathrm{~d}_{M}(x)\right)$ for all $x \in M$.

If a homotopy exists, then we say $f$ and $g$ are homotopic.
Thus $h$ is compatible with the $A$-module structure and the grading but not with the differential. If $f=g$ and $h$ is a homotopy as in the definition, then $h$ defines a morphism $h: M \rightarrow N[-1]$ in $\operatorname{Mod}_{(A, \mathrm{~d})}$.

09JP Lemma 22.5.2. Let $(A, d)$ be a differential graded algebra. Let $f, g: L \rightarrow M$ be homomorphisms of differential graded A-modules. Suppose given further homomorphisms $a: K \rightarrow L$, and $c: M \rightarrow N$. If $h: L \rightarrow M$ is an $A$-module map which defines a homotopy between $f$ and $g$, then $c \circ h \circ a$ defines a homotopy between $c \circ f \circ a$ and $c \circ g \circ a$.

Proof. Immediate from Homology, Lemma 12.12.7.

This lemma allows us to define the homotopy category as follows.
09JQ Definition 22.5.3. Let $(A, \mathrm{~d})$ be a differential graded algebra. The homotopy category, denoted $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$, is the category whose objects are the objects of $\operatorname{Mod}_{(A, \mathrm{~d})}$ and whose morphisms are homotopy classes of homomorphisms of differential graded $A$-modules.

The notation $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ is not standard but at least is consistent with the use of $K(-)$ in other places of the Stacks project.

09JR Lemma 22.5.4. Let $(A, d)$ be a differential graded algebra. The homotopy category $K\left(\operatorname{Mod}_{(A, d)}\right)$ has direct sums and products.

Proof. Omitted. Hint: Just use the direct sums and products as in Lemma 22.4.2. This works because we saw that these functors commute with the forgetful functor to the category of graded $A$-modules and because $\Pi$ is an exact functor on the category of families of abelian groups.

### 22.6. Cones

09K9 We introduce cones for the category of differential graded modules.
09KA Definition 22.6.1. Let $(A, \mathrm{~d})$ be a differential graded algebra. Let $f: K \rightarrow L$ be a homomorphism of differential graded $A$-modules. The cone of $f$ is the differential graded $A$-module $C(f)$ given by $C(f)=L \oplus K$ with grading $C(f)^{n}=L^{n} \oplus K^{n+1}$ and differential

$$
d_{C(f)}=\left(\begin{array}{cc}
\mathrm{d}_{L} & f \\
0 & -\mathrm{d}_{K}
\end{array}\right)
$$

It comes equipped with canonical morphisms of complexes $i: L \rightarrow C(f)$ and $p: C(f) \rightarrow K[1]$ induced by the obvious maps $L \rightarrow C(f)$ and $C(f) \rightarrow K$.

The formation of the cone triangle is functorial in the following sense.
09KD Lemma 22.6.2. Let $(A, d)$ be a differential graded algebra. Suppose that

is a diagram of homomorphisms of diferential graded $A$-modules which is commutative up to homotopy. Then there exists a morphism $c: C\left(f_{1}\right) \rightarrow C\left(f_{2}\right)$ which gives rise to a morphism of triangles

$$
(a, b, c):\left(K_{1}, L_{1}, C\left(f_{1}\right), f_{1}, i_{1}, p_{1}\right) \rightarrow\left(K_{1}, L_{1}, C\left(f_{1}\right), f_{2}, i_{2}, p_{2}\right)
$$

in $K\left(\operatorname{Mod}_{(A, d)}\right)$.
Proof. Let $h: K_{1} \rightarrow L_{2}$ be a homotopy between $f_{2} \circ a$ and $b \circ f_{1}$. Define $c$ by the matrix

$$
c=\left(\begin{array}{ll}
b & h \\
0 & a
\end{array}\right): L_{1} \oplus K_{1} \rightarrow L_{2} \oplus K_{2}
$$

A matrix computation show that $c$ is a morphism of differential graded modules. It is trivial that $c \circ i_{1}=i_{2} \circ b$, and it is trivial also to check that $p_{2} \circ c=a \circ p_{1}$.

### 22.7. Admissible short exact sequences

09JS An admissible short exact sequence is the analogue of termwise split exact sequences in the setting of differential graded modules.

09JT Definition 22.7.1. Let $(A, \mathrm{~d})$ be a differential graded algebra.
(1) A homomorphism $K \rightarrow L$ of differential graded $A$-modules is an admissible monomorphism if there exists a graded $A$-module map $L \rightarrow K$ which is left inverse to $K \rightarrow L$.
(2) A homomorphism $L \rightarrow M$ of differential graded $A$-modules is an admissible epimorphism if there exists a graded $A$-module map $M \rightarrow L$ which is right inverse to $L \rightarrow M$.
(3) A short exact sequence $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ of differential graded A-modules is an admissible short exact sequence if it is split as a sequence of graded $A$-modules.

Thus the splittings are compatible with all the data except for the differentials. Given an admissible short exact sequence we obtain a triangle; this is the reason that we require our splittings to be compatible with the $A$-module structure.

09JU Lemma 22.7.2. Let $(A, d)$ be a differential graded algebra. Let $0 \rightarrow K \rightarrow L \rightarrow$ $M \rightarrow 0$ be an admissible short exact sequence of differential graded $A$-modules. Let $s: M \rightarrow L$ and $\pi: L \rightarrow K$ be splittings such that $\operatorname{Ker}(\pi)=\operatorname{Im}(s)$. Then we obtain a morphism

$$
\delta=\pi \circ d_{L} \circ s: M \rightarrow K[1]
$$

of $\operatorname{Mod}_{(A, d)}$ which induces the boundary maps in the long exact sequence of cohomology (22.4.2.1).

Proof. The map $\pi \circ \mathrm{d}_{L} \circ s$ is compatible with the $A$-module structure and the gradings by construction. It is compatible with differentials by Homology, Lemmas 12.14.10. Let $R$ be the ring that $A$ is a differential graded algebra over. The equality of maps is a statement about $R$-modules. Hence this follows from Homology, Lemmas 12.14 .10 and 12.14.11

09JV Lemma 22.7.3. Let $(A, d)$ be a differential graded algebra. Let

be a diagram of homomorphisms of differential graded $A$-modules commuting up to homotopy.
(1) If $f$ is an admissible monomorphism, then $b$ is homotopic to a homomorphism which makes the diagram commute.
(2) If $g$ is an admissible epimorphism, then a is homotopic to a morphism which makes the diagram commute.

Proof. Let $h: K \rightarrow N$ be a homotopy between $b f$ and $g a$, i.e., $b f-g a=\mathrm{d} h+h \mathrm{~d}$. Suppose that $\pi: L \rightarrow K$ is a graded $A$-module map left inverse to $f$. Take $b^{\prime}=b-\mathrm{d} h \pi-h \pi \mathrm{~d}$. Suppose $s: N \rightarrow M$ is a graded $A$-module map right inverse to $g$. Take $a^{\prime}=a+\mathrm{d} s h+s h \mathrm{~d}$. Computations omitted.

09JW Lemma 22.7.4. Let $(A, d)$ be a differential graded algebra. Let $\alpha: K \rightarrow L$ be a homomorphism of differential graded $A$-modules. There exists a factorization

in $\operatorname{Mod}_{(A, d)}$ such that
(1) $\tilde{\alpha}$ is an admissible monomorphism (see Definition 22.7.1),
(2) there is a morphism $s: L \rightarrow \tilde{L}$ such that $\pi \circ s=i d_{L}$ and such that $s \circ \pi$ is homotopic to $i d_{\tilde{L}}$.
Proof. The proof is identical to the proof of Derived Categories, Lemma 13.9.6. Namely, we set $\tilde{L}=L \oplus C\left(1_{K}\right)$ and we use elementary properties of the cone construction.

09JX Lemma 22.7.5. Let $(A, d)$ be a differential graded algebra. Let $L_{1} \rightarrow L_{2} \rightarrow \ldots \rightarrow$ $L_{n}$ be a sequence of composable homomorphisms of differential graded A-modules. There exists a commutative diagram

in $\operatorname{Mod}_{(A, d)}$ such that each $M_{i} \rightarrow M_{i+1}$ is an admissible monomorphism and each $M_{i} \rightarrow L_{i}$ is a homotopy equivalence.

Proof. The case $n=1$ is without content. Lemma 22.7.4 is the case $n=2$. Suppose we have constructed the diagram except for $M_{n}$. Apply Lemma 22.7 .4 to the composition $M_{n-1} \rightarrow L_{n-1} \rightarrow L_{n}$. The result is a factorization $M_{n-1} \rightarrow$ $M_{n} \rightarrow L_{n}$ as desired.

09JY Lemma 22.7.6. Let $(A, d)$ be a differential graded algebra. Let $0 \rightarrow K_{i} \rightarrow L_{i} \rightarrow$ $M_{i} \rightarrow 0, i=1,2,3$ be admissible short exact sequence of differential graded $A$ modules. Let $b: L_{1} \rightarrow L_{2}$ and $b^{\prime}: L_{2} \rightarrow L_{3}$ be homomorphisms of differential graded modules such that

commute up to homotopy. Then $b^{\prime} \circ b$ is homotopic to 0 .
Proof. By Lemma 22.7 .3 we can replace $b$ and $b^{\prime}$ by homotopic maps such that the right square of the left diagram commutes and the left square of the right diagram commutes. In other words, we have $\operatorname{Im}(b) \subset \operatorname{Im}\left(K_{2} \rightarrow L_{2}\right)$ and $\operatorname{Ker}\left(\left(b^{\prime}\right)^{n}\right) \supset$ $\operatorname{Im}\left(K_{2} \rightarrow L_{2}\right)$. Then $b \circ b^{\prime}=0$ as a map of modules.

### 22.8. Distinguished triangles

09K5 The following lemma produces our distinguished triangles.
09K6 Lemma 22.8.1. Let $(A, d)$ be a differential graded algebra. Let $0 \rightarrow K \rightarrow L \rightarrow$ $M \rightarrow 0$ be an admissible short exact sequence of differential graded $A$-modules. The triangle

09K7

$$
\begin{equation*}
K \rightarrow L \rightarrow M \stackrel{\delta}{\rightarrow} K[1] \tag{22.8.1.1}
\end{equation*}
$$

with $\delta$ as in Lemma 22.7.2 is, up to canonical isomorphism in $K\left(\operatorname{Mod}_{(A, d)}\right)$, independent of the choices made in Lemma 22.7.2.
Proof. Namely, let $\left(s^{\prime}, \pi^{\prime}\right)$ be a second choice of splittings as in Lemma 22.7.2 Then we claim that $\delta$ and $\delta^{\prime}$ are homotopic. Namely, write $s^{\prime}=s+\alpha \circ h$ and $\pi^{\prime}=\pi+g \circ \beta$ for some unique homomorphisms of $A$-modules $h: M \rightarrow K$ and $g: M \rightarrow K$ of degree -1 . Then $g=-h$ and $g$ is a homotopy between $\delta$ and $\delta^{\prime}$. The computations are done in the proof of Homology, Lemma 12.14.12.

09K8 Definition 22.8.2. Let $(A, \mathrm{~d})$ be a differential graded algebra.
(1) If $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is an admissible short exact sequence of differential graded $A$-modules, then the triangle associated to $0 \rightarrow K \rightarrow$ $L \rightarrow M \rightarrow 0$ is the triangle 22.8.1.1) of $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$.
(2) A triangle of $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ is called a distinguished triangle if it is isomorphic to a triangle associated to an admissible short exact sequence of differential graded $A$-modules.

### 22.9. Cones and distinguished triangles

09P1 Let $(A, \mathrm{~d})$ be a differential graded algebra. Let $f: K \rightarrow L$ be a homomorphism of differential graded $A$-modules. Then $(K, L, C(f), f, i, p)$ forms a triangle:

$$
K \rightarrow L \rightarrow C(f) \rightarrow K[1]
$$

in $\operatorname{Mod}_{(A, \mathrm{~d})}$ and hence in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. Cones are not distinguished triangles in general, but the difference is a sign or a rotation (your choice). Here are two precise statements.

09KB Lemma 22.9.1. Let $(A, d)$ be a differential graded algebra. Let $f: K \rightarrow L$ be a homomorphism of differential graded modules. The triangle $(L, C(f), K[1], i, p, f[1])$ is the triangle associated to the admissible short exact sequence

$$
0 \rightarrow L \rightarrow C(f) \rightarrow K[1] \rightarrow 0
$$

coming from the definition of the cone of $f$.
Proof. Immediate from the definitions.
09KC Lemma 22.9.2. Let $(A, d)$ be a differential graded algebra. Let $\alpha: K \rightarrow L$ and $\beta: L \rightarrow M$ define an admissible short exact sequence

$$
0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0
$$

of differential graded $A$-modules. Let $(K, L, M, \alpha, \beta, \delta)$ be the associated triangle. Then the triangles

$$
(M[-1], K, L, \delta[-1], \alpha, \beta) \quad \text { and } \quad(M[-1], K, C(\delta[-1]), \delta[-1], i, p)
$$

are isomorphic.
Proof. Using a choice of splittings we write $L=K \oplus M$ and we identify $\alpha$ and $\beta$ with the natural inclusion and projection maps. By construction of $\delta$ we have

$$
d_{B}=\left(\begin{array}{cc}
d_{K} & \delta \\
0 & d_{M}
\end{array}\right)
$$

On the other hand the cone of $\delta[-1]: M[-1] \rightarrow K$ is given as $C(\delta[-1])=K \oplus M$ with differential identical with the matrix above! Whence the lemma.

09KE Lemma 22.9.3. Let $(A, d)$ be a differential graded algebra. Let $f_{1}: K_{1} \rightarrow L_{1}$ and $f_{2}: K_{2} \rightarrow L_{2}$ be homomorphisms of differential graded $A$-modules. Let

$$
(a, b, c):\left(K_{1}, L_{1}, C\left(f_{1}\right), f_{1}, i_{1}, p_{1}\right) \longrightarrow\left(K_{1}, L_{1}, C\left(f_{1}\right), f_{2}, i_{2}, p_{2}\right)
$$

be any morphism of triangles of $K\left(\operatorname{Mod}_{(A, d)}\right)$. If a and $b$ are homotopy equivalences then so is $c$.

Proof. Let $a^{-1}: K_{2} \rightarrow K_{1}$ be a homomorphism of differential graded $A$-modules which is inverse to $a$ in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. Let $b^{-1}: L_{2} \rightarrow L_{1}$ be a homomorphism of differential graded $A$-modules which is inverse to $b$ in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. Let $c^{\prime}$ : $C\left(f_{2}\right) \rightarrow C\left(f_{1}\right)$ be the morphism from Lemma 22.6 .2 applied to $f_{1} \circ a^{-1}=b^{-1} \circ$ $f_{2}$. If we can show that $c \circ c^{\prime}$ and $c^{\prime} \circ c$ are isomorphisms in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ then we win. Hence it suffices to prove the following: Given a morphism of triangles $(1,1, c):(K, L, C(f), f, i, p)$ in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ the morphism $c$ is an isomorphism in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. By assumption the two squares in the diagram

commute up to homotopy. By construction of $C(f)$ the rows form admissible short exact sequences. Thus we see that $(c-1)^{2}=0$ in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ by Lemma 22.7.6. Hence $c$ is an isomorphism in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ with inverse $2-c$.

The following lemma shows that the collection of triangles of the homotopy category given by cones and the distinguished triangles are the same up to isomorphisms, at least up to sign!
09KF Lemma 22.9.4. Let $(A, d)$ be a differential graded algebra.
(1) Given an admissible short exact sequence $0 \rightarrow K \xrightarrow{\alpha} L \rightarrow M \rightarrow 0$ of differential graded $A$-modules there exists a homotopy equivalence $C(\alpha) \rightarrow$ $M$ such that the diagram

defines an isomorphism of triangles in $K\left(\operatorname{Mod}_{(A, d)}\right)$.
(2) Given a morphism of complexes $f: K \rightarrow L$ there exists an isomorphism of triangles

where the upper triangle is the triangle associated to a admissible short exact sequence $K \rightarrow \tilde{L} \rightarrow M$.

Proof. Proof of (1). We have $C(\alpha)=L \oplus K$ and we simply define $C(\alpha) \rightarrow M$ via the projection onto $L$ followed by $\beta$. This defines a morphism of differential graded modules because the compositions $K^{n+1} \rightarrow L^{n+1} \rightarrow M^{n+1}$ are zero. Choose splittings $s: M \rightarrow L$ and $\pi: L \rightarrow K$ with $\operatorname{Ker}(\pi)=\operatorname{Im}(s)$ and set $\delta=\pi \circ \mathrm{d}_{L} \circ s$ as usual. To get a homotopy inverse we take $M \rightarrow C(\alpha)$ given by $(s,-\delta)$. This is compatible with differentials because $\delta^{n}$ can be characterized as the unique map $M^{n} \rightarrow K^{n+1}$ such that $\mathrm{d} \circ s^{n}-s^{n+1} \circ \mathrm{~d}=\alpha \circ \delta^{n}$, see proof of Homology, Lemma
12.14.10. The composition $M \rightarrow C(f) \rightarrow M$ is the identity. The composition $C(f) \rightarrow M \rightarrow C(f)$ is equal to the morphism

$$
\left(\begin{array}{cc}
s \circ \beta & 0 \\
-\delta \circ \beta & 0
\end{array}\right)
$$

To see that this is homotopic to the identity map use the homotopy $h: C(\alpha) \rightarrow$ $C(\alpha)$ given by the matrix

$$
\left(\begin{array}{ll}
0 & 0 \\
\pi & 0
\end{array}\right): C(\alpha)=L \oplus K \rightarrow L \oplus K=C(\alpha)
$$

It is trivial to verify that

$$
\left(\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right)-\binom{s}{-\delta}\left(\begin{array}{ll}
\beta & 0
\end{array}\right)=\left(\begin{array}{cc}
\mathrm{d} & \alpha \\
0 & -\mathrm{d}
\end{array}\right)\left(\begin{array}{cc}
0 & 0 \\
\pi & 0
\end{array}\right)+\left(\begin{array}{cc}
0 & 0 \\
\pi & 0
\end{array}\right)\left(\begin{array}{cc}
\mathrm{d} & \alpha \\
0 & -\mathrm{d}
\end{array}\right)
$$

To finish the proof of (1) we have to show that the morphisms $-p: C(\alpha) \rightarrow K[1]$ (see Definition 22.6.1) and $C(\alpha) \rightarrow M \rightarrow K[1]$ agree up to homotopy. This is clear from the above. Namely, we can use the homotopy inverse $(s,-\delta): M \rightarrow C(\alpha)$ and check instead that the two maps $M \rightarrow K[1]$ agree. And note that $p \circ(s,-\delta)=-\delta$ as desired.
Proof of (2). We let $\tilde{f}: K \rightarrow \tilde{L}, s: L \rightarrow \tilde{L}$ and $\pi: L \rightarrow L$ be as in Lemma 22.7.4. By Lemmas 22.6 .2 and 22.9 .3 the triangles $(K, L, C(f), i, p)$ and ( $K, \tilde{L}, C(\tilde{f}), \tilde{i}, \tilde{p})$ are isomorphic. Note that we can compose isomorphisms of triangles. Thus we may replace $L$ by $\tilde{L}$ and $f$ by $\tilde{f}$. In other words we may assume that $f$ is an admissible monomorphism. In this case the result follows from part (1).

### 22.10. The homotopy category is triangulated

09 KG We first prove that it is pre-triangulated.
09 KH Lemma 22.10.1. Let $(A, d)$ be a differential graded algebra. The homotopy category $K\left(\operatorname{Mod}_{(A, d)}\right)$ with its natural translation functors and distinguished triangles is a pre-triangulated category.

Proof. Proof of TR1. By definition every triangle isomorphic to a distinguished one is distinguished. Also, any triangle ( $K, K, 0,1,0,0$ ) is distinguished since $0 \rightarrow K \rightarrow K \rightarrow 0 \rightarrow 0$ is an admissible short exact sequence. Finally, given any homomorphism $f: K \rightarrow L$ of differential graded $A$-modules the triangle $(K, L, C(f), f, i,-p)$ is distinguished by Lemma 22.9.4.
Proof of TR2. Let $(X, Y, Z, f, g, h)$ be a triangle. Assume $(Y, Z, X[1], g, h,-f[1])$ is distinguished. Then there exists an admissible short exact sequence $0 \rightarrow K \rightarrow$ $L \rightarrow M \rightarrow 0$ such that the associated triangle $(K, L, M, \alpha, \beta, \delta)$ is isomorphic to $(Y, Z, X[1], g, h,-f[1])$. Rotating back we see that $(X, Y, Z, f, g, h)$ is isomorphic to $(M[-1], K, L,-\delta[-1], \alpha, \beta)$. It follows from Lemma 22.9 .2 that the triangle $(M[-1], K, L, \delta[-1], \alpha, \beta)$ is isomorphic to $(M[-1], K, C(\delta[-1]), \delta[-1], i, p)$. Precomposing the previous isomorphism of triangles with -1 on $Y$ it follows that $(X, Y, Z, f, g, h)$ is isomorphic to $(M[-1], K, C(\delta[-1]), \delta[-1], i,-p)$. Hence it is distinguished by Lemma 22.9.4. On the other hand, suppose that $(X, Y, Z, f, g, h)$ is distinguished. By Lemma 22.9.4 this means that it is isomorphic to a triangle of the form $(K, L, C(f), f, i,-p)$ for some morphism $f$ of $\operatorname{Mod}_{(A, \mathrm{~d})}$. Then the rotated triangle $(Y, Z, X[1], g, h,-f[1])$ is isomorphic to $(L, C(f), K[1], i,-p,-f[1])$ which is
isomorphic to the triangle $(L, C(f), K[1], i, p, f[1])$. By Lemma 22.9.1 this triangle is distinguished. Hence $(Y, Z, X[1], g, h,-f[1])$ is distinguished as desired.
Proof of TR3. Let $(X, Y, Z, f, g, h)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)$ be distinguished triangles of $K(\mathcal{A})$ and let $a: X \rightarrow X^{\prime}$ and $b: Y \rightarrow Y^{\prime}$ be morphisms such that $f^{\prime} \circ a=$ $b \circ f$. By Lemma 22.9.4 we may assume that $(X, Y, Z, f, g, h)=(X, Y, C(f), f, i,-p)$ and $\left(X^{\prime}, Y^{\prime}, Z^{\prime}, f^{\prime}, g^{\prime}, h^{\prime}\right)=\left(X^{\prime}, Y^{\prime}, C\left(f^{\prime}\right), f^{\prime}, i^{\prime},-p^{\prime}\right)$. At this point we simply apply Lemma 22.6 .2 to the commutative diagram given by $f, f^{\prime}, a, b$.

Before we prove TR4 in general we prove it in a special case.
09KI Lemma 22.10.2. Let $(A, d)$ be a differential graded algebra. Suppose that $\alpha: K \rightarrow$ $L$ and $\beta: L \rightarrow M$ are admissible monomorphisms of differential graded $A$-modules. Then there exist distinguished triangles $\left(K, L, Q_{1}, \alpha, p_{1}, d_{1}\right),\left(K, M, Q_{2}, \beta \circ \alpha, p_{2}, d_{2}\right)$ and $\left(L, M, Q_{3}, \beta, p_{3}, d_{3}\right)$ for which TR4 holds.

Proof. Say $\pi_{1}: L \rightarrow K$ and $\pi_{3}: M \rightarrow L$ are homomorphisms of graded $A$ modules which are left inverse to $\alpha$ and $\beta$. Then also $K \rightarrow M$ is an admissible monomorphism with left inverse $\pi_{2}=\pi_{1} \circ \pi_{3}$. Let us write $Q_{1}, Q_{2}$ and $Q_{3}$ for the cokernels of $K \rightarrow L, K \rightarrow M$, and $L \rightarrow M$. Then we obtain identifications (as graded $A$-modules) $Q_{1}=\operatorname{Ker}\left(\pi_{1}\right), Q_{3}=\operatorname{Ker}\left(\pi_{3}\right)$ and $Q_{2}=\operatorname{Ker}\left(\pi_{2}\right)$. Then $L=K \oplus Q_{1}$ and $M=L \oplus Q_{3}$ as graded $A$-modules. This implies $M=K \oplus Q_{1} \oplus Q_{3}$. Note that $\pi_{2}=\pi_{1} \circ \pi_{3}$ is zero on both $Q_{1}$ and $Q_{3}$. Hence $Q_{2}=Q_{1} \oplus Q_{3}$. Consider the commutative diagram

The rows of this diagram are admissible short exact sequences, and hence determine distinguished triangles by definition. Moreover downward arrows in the diagram above are compatible with the chosen splittings and hence define morphisms of triangles

$$
\left(K \rightarrow L \rightarrow Q_{1} \rightarrow K[1]\right) \longrightarrow\left(K \rightarrow M \rightarrow Q_{2} \rightarrow K[1]\right)
$$

and

$$
\left(K \rightarrow M \rightarrow Q_{2} \rightarrow K[1]\right) \longrightarrow\left(L \rightarrow M \rightarrow Q_{3} \rightarrow L[1]\right)
$$

Note that the splittings $Q_{3} \rightarrow M$ of the bottom sequence in the diagram provides a splitting for the split sequence $0 \rightarrow Q_{1} \rightarrow Q_{2} \rightarrow Q_{3} \rightarrow 0$ upon composing with $M \rightarrow Q_{2}$. It follows easily from this that the morphism $\delta: Q_{3} \rightarrow Q_{1}[1]$ in the corresponding distinguished triangle

$$
\left(Q_{1} \rightarrow Q_{2} \rightarrow Q_{3} \rightarrow Q_{1}[1]\right)
$$

is equal to the composition $Q_{3} \rightarrow L[1] \rightarrow Q_{1}[1]$. Hence we get a structure as in the conclusion of axiom TR4.

Here is the final result.
09KJ Proposition 22.10.3. Let $(A, d)$ be a differential graded algebra. The homotopy category $K\left(\operatorname{Mod}_{(A, d)}\right)$ of differential graded A-modules with its natural translation functors and distinguished triangles is a triangulated category.

Proof. We know that $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ is a pre-triangulated category. Hence it suffices to prove TR4 and to prove it we can use Derived Categories, Lemma 13.4.13 Let $K \rightarrow L$ and $L \rightarrow M$ be composable morphisms of $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. By Lemma 22.7.5 we may assume that $K \rightarrow L$ and $L \rightarrow M$ are admissible monomorphisms. In this case the result follows from Lemma 22.10.2.

### 22.11. Projective modules over algebras

09JZ In this section we discuss projective modules over algebras and over graded algebras. Thus it is the analogue of Algebra, Section 10.76 in the setting of this chapter.

Algebras and modules. Let $R$ be a ring and let $A$ be an $R$-algebra, see Section 22.2 for our conventions. It is clear that $A$ is a projective right $A$-module since $\operatorname{Hom}_{A}(A, M)=M$ for any right $A$-module $M$ (and thus $\operatorname{Hom}_{A}(A,-)$ is exact). Conversely, let $P$ be a projective right $A$-module. Then we can choose a surjection $\bigoplus_{i \in I} A \rightarrow M$ by choosing a set $\left\{m_{i}\right\}_{i \in I}$ of generators of $P$ over $A$. Since $P$ is projective there is a left inverse to the surjection, and we find that $P$ is isomorphic to a direct summand of a free module, exactly as in the commutative case (Algebra, Lemma 10.76.2.
Graded algebras and modules. Let $R$ be a ring. Let $A$ be a graded algebra over $R$. Let $\operatorname{Mod}_{A}$ denote the category of graded right $A$-modules. For an integer $k$ let $A[k]$ denote the shift of $A$. For an graded right $A$-module we have

$$
\operatorname{Hom}_{\operatorname{Mod}_{A}}(A[k], M)=M^{-k}
$$

As the functor $M \mapsto M^{-k}$ is exact on $\operatorname{Mod}_{A}$ we conclude that $A[k]$ is a projective object of $\operatorname{Mod}_{A}$. Conversely, suppose that $P$ is a projective object of $\operatorname{Mod}_{A}$. By choosing a set of homogeneous generators of $P$ as an $A$-module, we can find a surjection

$$
\bigoplus_{i \in I} A\left[k_{i}\right] \longrightarrow P
$$

Thus we conclude that a projective object of $\operatorname{Mod}_{A}$ is a direct summand of a direct sum of the shifts $A[k]$.

If $(A, \mathrm{~d})$ is a differential graded algebra and $P$ is an object of $\operatorname{Mod}_{(A, \mathrm{~d})}$ then we say $P$ is projective as a graded $A$-module or sometimes $P$ is graded projective to mean that $P$ is a projective object of the abelian category $\operatorname{Mod}_{A}$ of graded $A$-modules.

09K0 Lemma 22.11.1. Let $(A, d)$ be a differential graded algebra. Let $M \rightarrow P$ be a surjective homomorphism of differential graded $A$-modules. If $P$ is projective as a graded $A$-module, then $M \rightarrow P$ is an admissible epimorphism.

Proof. This is immediate from the definitions.
09K1 Lemma 22.11.2. Let $(A, d)$ be a differential graded algebra. Then we have

$$
\operatorname{Hom}_{\operatorname{Mod}_{(A, d)}}(A[k], M)=\operatorname{Ker}\left(d: M^{-k} \rightarrow M^{-k+1}\right)
$$

and

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}(A[k], M)=H^{-k}(M)
$$

for any differential graded $A$-module $M$.
Proof. This is clear from the discussion above.

### 22.12. Injective modules over algebras

04JD In this section we discuss injective modules over algebras and over graded algebras. Thus it is the analogue of More on Algebra, Section 15.46 in the setting of this chapter.
Algebras and modules. Let $R$ be a ring and let $A$ be an $R$-algebra, see Section 22.2 for our conventions. For a right $A$-module $M$ we set

$$
M^{\vee}=\operatorname{Hom}_{\mathbf{Z}}(M, \mathbf{Q} / \mathbf{Z})
$$

which we think of as a left $A$-module by the multiplication $(a f)(x)=f(x a)$. Namely, $((a b) f)(x)=f(x a b)=(b f)(x a)=(a(b f))(x)$. Conversely, if $M$ is a left $A$-module, then $M^{\vee}$ is a right $A$-module. Since $\mathbf{Q} / \mathbf{Z}$ is an injective abelian group (More on Algebra, Lemma 15.45.1), the functor $M \mapsto M^{\vee}$ is exact (More on Algebra, Lemma 15.46.6). Moreover, the evaluation map $M \rightarrow\left(M^{\vee}\right)^{\vee}$ is injective for all modules $M$ (More on Algebra, Lemma 15.46.7).
We claim that $A^{\vee}$ is an injective right $A$-module. Namely, given a right $A$-module $N$ we have

$$
\operatorname{Hom}_{A}\left(N, A^{\vee}\right)=\operatorname{Hom}_{A}\left(N, \operatorname{Hom}_{\mathbf{Z}}(A, \mathbf{Q} / \mathbf{Z})\right)=N^{\vee}
$$

and we conclude because the functor $N \mapsto N^{\vee}$ is exact. The second equality holds because

$$
\operatorname{Hom}_{\mathbf{Z}}\left(N, \operatorname{Hom}_{\mathbf{Z}}(A, \mathbf{Q} / \mathbf{Z})\right)=\operatorname{Hom}_{\mathbf{Z}}\left(N \otimes_{\mathbf{Z}} A, \mathbf{Q} / \mathbf{Z}\right)
$$

by Algebra, Lemma 10.11 .8 . Inside this module $A$-linearity exactly picks out the bilinear maps $\varphi: N \times A \rightarrow \mathbf{Q} / \mathbf{Z}$ which have the same value on $x \otimes a$ and $x a \otimes 1$, i.e., come from elements of $N^{\vee}$.

Finally, for every right $A$-module $M$ we can choose a surjection $\bigoplus_{i \in I} A \rightarrow M^{\vee}$ to get an injection $M \rightarrow\left(M^{\vee}\right)^{\vee} \rightarrow \prod_{i \in I} A^{\vee}$.
We conclude
(1) the category of $A$-modules has enough injectives,
(2) $A^{\vee}$ is an injective $A$-module, and
(3) every $A$-module injects into a product of copies of $A^{\vee}$.

Graded algebras and modules. Let $R$ be a ring. Let $A$ be a graded algebra over $R$. If $M$ is a graded $A$-module we set

$$
M^{\vee}=\bigoplus_{n \in \mathbf{Z}} \operatorname{Hom}_{\mathbf{Z}}\left(M^{-n}, \mathbf{Q} / \mathbf{Z}\right)=\bigoplus_{n \in \mathbf{Z}}\left(M^{-n}\right)^{\vee}
$$

as a graded $R$-module with the $A$-module structure defined as above (for homogeneous elements). This again switches left and right modules. On the category of graded $A$-modules the functor $M \mapsto M^{\vee}$ is exact (check on graded pieces). Moreover, the evaluation map $M \rightarrow\left(M^{\vee}\right)^{\vee}$ is injective as before (because we can check this on the graded pieces).
We claim that $A^{\vee}$ is an injective object of the category $\operatorname{Mod}_{A}$ of graded right $A$-modules. Namely, given a graded right $A$-module $N$ we have

$$
\operatorname{Hom}_{\operatorname{Mod}_{A}}\left(N, A^{\vee}\right)=\operatorname{Hom}_{\operatorname{Mod}_{A}}\left(N, \bigoplus \operatorname{Hom}_{\mathbf{Z}}\left(A^{-n}, \mathbf{Q} / \mathbf{Z}\right)\right)=\left(N^{0}\right)^{\vee}
$$

and we conclude because the functor $N \mapsto\left(N^{0}\right)^{\vee}=\left(N^{\vee}\right)^{0}$ is exact. To see that the second equality holds we use the equalities

$$
\operatorname{Hom}_{\mathbf{Z}}\left(N^{n}, \operatorname{Hom}_{\mathbf{Z}}\left(A^{-n}, \mathbf{Q} / \mathbf{Z}\right)\right)=\operatorname{Hom}_{\mathbf{Z}}\left(N^{n} \otimes_{\mathbf{Z}} A^{-n}, \mathbf{Q} / \mathbf{Z}\right)
$$

of Algebra, Lemma 10.11.8. Thus an element of $\operatorname{Hom}_{\operatorname{Mod}_{A}}\left(N, A^{\vee}\right)$ corresponds to a family of $\mathbf{Z}$-bilinear maps $\psi_{n}: N^{n} \times A^{-n} \rightarrow \mathbf{Q} / \mathbf{Z}$ such that $\psi_{n}(x, a)=\psi_{0}(x a, 1)$ for all $x \in N^{n}$ and $a \in A^{-n}$. Moreover, $\psi_{0}(x, a)=\psi_{0}(x a, 1)$ for all $x \in N^{0}, a \in A^{0}$. It follows that the maps $\psi_{n}$ are determined by $\psi_{0}$ and that $\psi_{0}(x, a)=\varphi(x a)$ for a unique element $\varphi \in\left(N^{0}\right)^{\vee}$.

Finally, for every graded right $A$-module $M$ we can choose a surjection (of graded left $A$-modules)

$$
\bigoplus_{i \in I} A\left[k_{i}\right] \rightarrow M^{\vee}
$$

where $A\left[k_{i}\right]$ denotes the shift of $A$ by $k_{i} \in \mathbf{Z}$. (We do this by choosing homogeneous generators for $M^{\vee}$.) In this way we get an injection

$$
M \rightarrow\left(M^{\vee}\right)^{\vee} \rightarrow \prod A\left[k_{i}\right]^{\vee}=\prod A^{\vee}\left[-k_{i}\right]
$$

Observe that the products in the formula above are products in the category of graded modules (in other words, take products in each degree and then take the direct sum of the pieces).

We conclude that
(1) the category of graded $A$-modules has enough injectives,
(2) for every $k \in \mathbf{Z}$ the module $A^{\vee}[k]$ is injective, and
(3) every $A$-module injects into a product in the category of graded modules of copies of shifts $A^{\vee}[k]$.
If $(A, \mathrm{~d})$ is a differential graded algebra and $I$ is an object of $\operatorname{Mod}_{(A, \mathrm{~d})}$ then we say $I$ is injective as a graded $A$-module to mean that $I$ is a injective object of the abelian category $\operatorname{Mod}_{A}$ of graded $A$-modules.

09K2 Lemma 22.12.1. Let $(A, d)$ be a differential graded algebra. Let $I \rightarrow M$ be an injective homomorphism of differential graded A-modules. If I is an injective object of the category of graded $A$-modules, then $I \rightarrow M$ is an admissible monomorphism.

Proof. This is immediate from the definitions.
Let $(A, \mathrm{~d})$ be a differential graded algebra. If $M$ is a left differential graded $A$ module, then we will endow $M^{\vee}$ (with its graded module structure as above) with a right differential graded module structure by setting

$$
\mathrm{d}_{M^{\vee}}(f)=-(-1)^{n} f \circ \mathrm{~d}_{M}^{-n-1} \quad \text { in }\left(M^{\vee}\right)^{n+1}
$$

for $f \in\left(M^{\vee}\right)^{n}=\operatorname{Hom}_{\mathbf{Z}}\left(M^{-n}, \mathbf{Q} / \mathbf{Z}\right)$ and $\mathrm{d}_{M}^{-n-1}: M^{-n-1} \rightarrow M^{-n}$ the differential of $M^{1}$. We will show by a computation that this works. Namely, if $a \in A^{m}$, $x \in M^{-n-m-1}$ and $f \in\left(M^{\vee}\right)^{n}$, then we have

$$
\begin{aligned}
\mathrm{d}_{M^{\vee}}(f a)(x) & =-(-1)^{n+m}(f a)\left(\mathrm{d}_{M}(x)\right) \\
& =-(-1)^{n+m} f\left(a \mathrm{~d}_{M}(x)\right) \\
& =-(-1)^{n} f\left(\mathrm{~d}_{M}(a x)-\mathrm{d}(a) x\right) \\
& =-(-1)^{n}\left[-(-1)^{n} \mathrm{~d}_{M^{\vee}}(f)(a x)-(f \mathrm{~d}(a))(x)\right] \\
& =\left(\mathrm{d}_{M^{\vee}}(f) a\right)(x)+(-1)^{n}(f \mathrm{~d}(a))(x)
\end{aligned}
$$

[^57]the third equality because $\mathrm{d}_{M}(a x)=\mathrm{d}(a) x+(-1)^{m} a \mathrm{~d}_{M}(x)$. In other words we have $\mathrm{d}_{M^{\vee}}(f a)=\mathrm{d}_{M^{\vee}}(f) a+(-1)^{n} f \mathrm{~d}(a)$ as desired.
If $M$ is a right differential graded module, then the sign rule above does not work. The problem seems to be that in defining the left $A$-module structure on $M^{\vee}$ our conventions for graded modules above defines $a f$ to be the element of $\left(M^{\vee}\right)^{n+m}$ such that $(a f)(x)=f(x a)$ for $f \in\left(M^{\vee}\right)^{n}, a \in A^{m}$ and $x \in M^{-n-m}$ which in some sense is the "wrong" thing to do if $m$ is odd. Anyway, instead of changing the sign rule for the module structure, we fix the problem by using
$$
\mathrm{d}_{M^{\vee}}(f)=(-1)^{n} f \circ \mathrm{~d}_{M}^{-n-1}
$$
when $M$ is a right differential graded $A$-module. The computation for $a \in A^{m}$, $x \in M^{-n-m-1}$ and $f \in\left(M^{\vee}\right)^{n}$ then becomes
\[

$$
\begin{aligned}
\mathrm{d}_{M^{\vee}}(a f)(x) & =(-1)^{n+m}(f a)\left(\mathrm{d}_{M}(x)\right) \\
& =(-1)^{n+m} f\left(\mathrm{~d}_{M}(x) a\right) \\
& =(-1)^{n+m} f\left(\mathrm{~d}_{M}(a x)-(-1)^{m+n+1} x \mathrm{~d}(a)\right) \\
& =(-1)^{m} \mathrm{~d}_{M^{\vee}}(f)(a x)+f(x \mathrm{~d}(a)) \\
& =(-1)^{m}\left(a \mathrm{~d}_{M^{\vee}}(f)\right)(x)+(\mathrm{d}(a) f)(x)
\end{aligned}
$$
\]

the third equality because $\mathrm{d}_{M}(x a)=\mathrm{d}_{M}(x) a+(-1)^{n+m+1} x \mathrm{~d}(a)$. In other words, we have $\mathrm{d}_{M^{\vee}}(a f)=\mathrm{d}(a) f+(-1)^{m} a \mathrm{~d}_{M^{\vee}}(f)$ as desired.
We leave it to the reader to show that with the conventions above there is a natural evaluation map $M \rightarrow\left(M^{\vee}\right)^{\vee}$ in the category of differential graded modules if $M$ is either a differential graded left module or a differential graded right module. This works because the sign choices above cancel out and the differentials of $\left(\left(M^{\vee}\right)^{\vee}\right.$ are the natural maps $\left(\left(M^{n}\right)^{\vee}\right)^{\vee} \rightarrow\left(\left(M^{n+1}\right)^{\vee}\right)^{\vee}$.

09K3 Lemma 22.12.2. Let $(A, d)$ be a differential graded algebra. If $M$ is a left differential graded $A$-module and $N$ is a right differential graded $A$-module, then

$$
\operatorname{Hom}_{\operatorname{Mod}_{(A, d)}}\left(N, M^{\vee}\right)
$$

is isomorphic to the set of sequences $\left(\psi_{n}\right)$ of $\mathbf{Z}$-bilinear pairings

$$
\psi_{n}: N^{n} \times M^{-n} \longrightarrow \mathbf{Q} / \mathbf{Z}
$$

such that $\psi_{n+m}(y, a x)=\psi_{n+m}(y a, x)$ for all $y \in N^{n}, x \in M^{-m}$, and $a \in A^{m-n}$ and such that $\psi_{n+1}(d(y), x)+(-1)^{n} \psi_{n}(y, d(x))=0$ for all $y \in N^{n}$ and $x \in M^{-n-1}$.
Proof. If $f \in \operatorname{Hom}_{\operatorname{Mod}_{(A, \mathrm{~d})}}\left(N, M^{\vee}\right)$, then we map this to the sequence of pairings defined by $\psi_{n}(y, x)=f(y)(x)$. It is a computation (omitted) to see that these pairings satisfy the conditions as in the lemma. For the converse, use Algebra, Lemma 10.11 .8 to turn a sequence of pairings into a map $f: N \rightarrow M^{\vee}$.
09K4 Lemma 22.12.3. Let $(A, d)$ be a differential graded algebra. Then we have

$$
\operatorname{Hom}_{\operatorname{Mod}_{(A, d)}}\left(M, A^{\vee}[k]\right)=\operatorname{Ker}\left(d:\left(M^{\vee}\right)^{k} \rightarrow\left(M^{\vee}\right)^{k+1}\right)
$$

and

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}\left(M, A^{\vee}[k]\right)=H^{k}\left(M^{\vee}\right)
$$

for any differential graded $A$-module $M$.
Proof. This is clear from the discussion above.

### 22.13. P-resolutions

09 KK This section is the analogue of Derived Categories, Section 13.28 .
Let $(A, \mathrm{~d})$ be a differential graded algebra. Let $P$ be a differential graded $A$-module. We say $P$ has property $(P)$ if it there exists a filtration

$$
0=F_{-1} P \subset F_{0} P \subset F_{1} P \subset \ldots \subset P
$$

by differential graded submodules such that
(1) $P=\bigcup F_{p} P$,
(2) the inclusions $F_{i} P \rightarrow F_{i+1} P$ are admissible monomorphisms,
(3) the quotients $F_{i+1} P / F_{i} P$ are isomorphic as differential graded $A$-modules to a direct sum of $A[k]$.
In fact, condition (2) is a consequence of condition (3), see Lemma 22.11.1 Moreover, the reader can verify that as a graded $A$-module $P$ will be isomorphic to a direct sum of shifts of $A$.

09KL Lemma 22.13.1. Let $(A, d)$ be a differential graded algebra. Let $P$ be a differential graded A-module. If $F_{\bullet}$ is a filtration as in property $(P)$, then we obtain an admissible short exact sequence

$$
0 \rightarrow \bigoplus F_{i} P \rightarrow \bigoplus F_{i} P \rightarrow P \rightarrow 0
$$

of differential graded $A$-modules.
Proof. The second map is the direct sum of the inclusion maps. The first map on the summand $F_{i} P$ of the source is the sum of the identity $F_{i} P \rightarrow F_{i} P$ and the negative of the inclusion map $F_{i} P \rightarrow P_{i+1} P$. Choose homomorphisms $s_{i}: F_{i+1} P \rightarrow$ $F_{i} P$ of graded $A$-modules which are left inverse to the inclusion maps. Composing gives maps $s_{j, i}: F_{j} P \rightarrow F_{i} P$ for all $j>i$. Then a left inverse of the first arrow maps $x \in F_{j} P$ to $\left(s_{j, 0}(x), s_{j, 1}(x), \ldots, s_{j, j-1}(x), 0, \ldots\right)$ in $\bigoplus F_{i} P$.

The following lemma shows that differential graded modules with property ( P ) are the dual notion to K-injective modules (i.e., they are K-projective in some sense). See Derived Categories, Definition 13.29.1.

09KM Lemma 22.13.2. Let $(A, d)$ be a differential graded algebra. Let $P$ be a differential graded $A$-module with property ( $P$ ). Then

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}(P, N)=0
$$

for all acyclic differential graded $A$-modules $N$.
Proof. We will use that $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ is a triangulated category (Proposition 22.10.3). Let $F_{\bullet}$ be a filtration on $P$ as in property (P). The short exact sequence of Lemma 22.13.1 produces a distinguished triangle. Hence by Derived Categories, Lemma 13.4.2 it suffices to show that

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}\left(F_{i} P, N\right)=0
$$

for all acyclic differential graded $A$-modules $N$ and all $i$. Each of the differential graded modules $F_{i} P$ has a finite filtration by admissible monomorphisms, whose graded pieces are direct sums of shifts $A[k]$. Thus it suffices to prove that

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}(A[k], N)=0
$$

for all acyclic differential graded $A$-modules $N$ and all $k$. This follows from Lemma 22.11.2.

09KN Lemma 22.13.3. Let $(A, d)$ be a differential graded algebra. Let $M$ be a differential graded $A$-module. There exists a homomorphism $P \rightarrow M$ of differential graded $A$ modules with the following properties
(1) $P \rightarrow M$ is surjective,
(2) $\operatorname{Ker}\left(d_{P}\right) \rightarrow \operatorname{Ker}\left(d_{M}\right)$ is surjective, and
(3) $P$ sits in an admissible short exact sequence $0 \rightarrow P^{\prime} \rightarrow P \rightarrow P^{\prime \prime} \rightarrow 0$ where $P^{\prime}, P^{\prime \prime}$ are direct sums of shifts of $A$.

Proof. Let $P_{k}$ be the free $A$-module with generators $x, y$ in degrees $k$ and $k+1$. Define the structure of a differential graded $A$-module on $P_{k}$ by setting $\mathrm{d}(x)=y$ and $\mathrm{d}(y)=0$. For every element $m \in M^{k}$ there is a homomorphism $P_{k} \rightarrow M$ sending $x$ to $m$ and $y$ to $\mathrm{d}(m)$. Thus we see that there is a surjection from a direct sum of copies of $P_{k}$ to $M$. This clearly produces $P \rightarrow M$ having properties (1) and (3). To obtain property (2) note that if $m \in \operatorname{Ker}\left(\mathrm{~d}_{M}\right)$ has degree $k$, then there is a map $A[k] \rightarrow M$ mapping 1 to $m$. Hence we can achieve (2) by adding a direct sum of copies of shifts of $A$.

09KP Lemma 22.13.4. Let $(A, d)$ be a differential graded algebra. Let $M$ be a differential graded A-module. There exists a homomorphism $P \rightarrow M$ of differential graded $A$ modules such that
(1) $P \rightarrow M$ is a quasi-isomorphism, and
(2) $P$ has property ( $P$ ).

Proof. Set $M=M_{0}$. We inductively choose short exact sequences

$$
0 \rightarrow M_{i+1} \rightarrow P_{i} \rightarrow M_{i} \rightarrow 0
$$

where the maps $P_{i} \rightarrow M_{i}$ are chosen as in Lemma 22.13.3. This gives a "resolution"

$$
\ldots \rightarrow P_{2} \xrightarrow{f_{2}} P_{1} \xrightarrow{f_{1}} P_{0} \rightarrow M \rightarrow 0
$$

Then we set

$$
P=\bigoplus_{i \geq 0} P_{i}
$$

as an $A$-module with grading given by $P^{n}=\bigoplus_{a+b=n} P_{-a}^{b}$ and differential (as in the construction of the total complex associated to a double complex) by

$$
\mathrm{d}_{P}(x)=f_{-a}(x)+(-1)^{a} \mathrm{~d}_{P_{-a}}(x)
$$

for $x \in P_{-a}^{b}$. With these conventions $P$ is indeed a differential graded $A$-module. Recalling that each $P_{i}$ has a two step filtration $0 \rightarrow P_{i}^{\prime} \rightarrow P_{i} \rightarrow P_{i}^{\prime \prime} \rightarrow 0$ we set

$$
F_{2 i} P=\bigoplus_{i \geq j \geq 0} P_{j} \subset \bigoplus_{i \geq 0} P_{i}=P
$$

and we add $P_{i+1}^{\prime}$ to $F_{2 i} P$ to get $F_{2 i+1}$. These are differential graded submodules and the successive quotients are direct sums of shifts of $A$. By Lemma 22.11.1 we see that the inclusions $F_{i} P \rightarrow F_{i+1} P$ are admissible monomorphisms. Finally, we have to show that the map $P \rightarrow M$ (given by the augmentation $P_{0} \rightarrow M$ ) is a quasi-isomorphism. This follows from Homology, Lemma 12.22.9.

### 22.14. I-resolutions

09 KQ This section is the dual of the section on P-resolutions.
Let $(A, \mathrm{~d})$ be a differential graded algebra. Let $I$ be a differential graded $A$-module.
We say $I$ has property ( $I$ ) if it there exists a filtration

$$
I=F_{0} I \supset F_{1} I \supset F_{2} I \supset \ldots \supset 0
$$

by differential graded submodules such that
(1) $I=\lim I / F_{p} I$,
(2) the maps $I / F_{i+1} I \rightarrow I / F_{i} I$ are admissible epimorphisms,
(3) the quotients $F_{i} I / F_{i+1} I$ are isomorphic as differential graded $A$-modules to products of $A^{\vee}[k]$.
In fact, condition (2) is a consequence of condition (3), see Lemma 22.12.1 The reader can verify that as a graded module $I$ will be isomorphic to a product of $A^{\vee}[k]$.
09 KR Lemma 22.14.1. Let $(A, d)$ be a differential graded algebra. Let $I$ be a differential graded $A$-module. If $F_{\bullet}$ is a filtration as in property (I), then we obtain an admissible short exact sequence

$$
0 \rightarrow I \rightarrow \prod I / F_{i} I \rightarrow \prod I / F_{i} I \rightarrow 0
$$

of differential graded $A$-modules.
Proof. Omitted. Hint: This is dual to Lemma 22.13.1.
The following lemma shows that differential graded modules with property (I) are the analogue of K-injective modules. See Derived Categories, Definition 13.29 .1
09KS Lemma 22.14.2. Let $(A, d)$ be a differential graded algebra. Let I be a differential graded $A$-module with property (I). Then

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}(N, I)=0
$$

for all acyclic differential graded $A$-modules $N$.
Proof. We will use that $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$ is a triangulated category (Proposition 22.10.3). Let $F_{\bullet}$ be a filtration on $I$ as in property (I). The short exact sequence of Lemma 22.14 .1 produces a distinguished triangle. Hence by Derived Categories, Lemma 13.4.2 it suffices to show that

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}\left(N, I / F_{i} I\right)=0
$$

for all acyclic differential graded $A$-modules $N$ and all $i$. Each of the differential graded modules $I / F_{i} I$ has a finite filtration by admissible monomorphisms, whose graded pieces are products of $A^{\vee}[k]$. Thus it suffices to prove that

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}\left(N, A^{\vee}[k]\right)=0
$$

for all acyclic differential graded $A$-modules $N$ and all $k$. This follows from Lemma 22.12 .3 and the fact that $(-)^{\vee}$ is an exact functor.

09 KT Lemma 22.14.3. Let $(A, d)$ be a differential graded algebra. Let $M$ be a differential graded $A$-module. There exists a homomorphism $M \rightarrow I$ of differential graded $A$ modules with the following properties
(1) $M \rightarrow I$ is injective,
(2) Coker $\left(d_{M}\right) \rightarrow \operatorname{Coker}\left(d_{I}\right)$ is injective, and
(3) I sits in an admissible short exact sequence $0 \rightarrow I^{\prime} \rightarrow I \rightarrow I^{\prime \prime} \rightarrow 0$ where $I^{\prime}, I^{\prime \prime}$ are products of shifts of $A^{\vee}$.

Proof. For every $k \in \mathbf{Z}$ let $Q_{k}$ be the free left $A$-module with generators $x, y$ in degrees $k$ and $k+1$. Define the structure of a left differential graded $A$-module on $Q_{k}$ by setting $\mathrm{d}(x)=y$ and $\mathrm{d}(y)=0$. Let $I_{k}=Q_{-k}^{\vee}$ be the "dual" right differential graded $A$-module, see Section 22.12. The next paragraph shows that we can embed $M$ into a product of copies of $I_{k}$ (for varying $k$ ). The dual statement (that any differential graded module is a quotient of a direct sum of of $P_{k}$ 's) is easy to prove (see proof of Lemma 22.13.3 and using double duals there should be a noncomputational way to deduce what we want. Thus we suggest skipping the next paragraph.
Given a Z-linear map $\lambda: M^{k} \rightarrow \mathbf{Q} / \mathbf{Z}$ we construct pairings

$$
\psi_{n}: M^{n} \times Q_{k}^{-n} \longrightarrow \mathbf{Q} / \mathbf{Z}
$$

by setting

$$
\psi_{n}(m, a x+b y)=\lambda\left(m a+(-1)^{k+1} \mathrm{~d}(m b)\right)
$$

for $m \in M^{n}, a \in A^{-n-k}$, and $b \in A^{-n-k-1}$. We compute

$$
\begin{aligned}
\psi_{n+1}(\mathrm{~d}(m), a x+b y) & =\lambda\left(\mathrm{d}(m) a+(-1)^{k+1} \mathrm{~d}(\mathrm{~d}(m) b)\right) \\
& =\lambda\left(\mathrm{d}(m) a+(-1)^{k+n} \mathrm{~d}(m) \mathrm{d}(b)\right)
\end{aligned}
$$

and because $\mathrm{d}(a x+b y)=\mathrm{d}(a) x+(-1)^{-n-k} a y+\mathrm{d}(b) y$ we have

$$
\begin{aligned}
\psi_{n}(m, \mathrm{~d}(a x+b y)) & =\lambda\left(m \mathrm{~d}(a)+(-1)^{k+1} \mathrm{~d}\left(m\left((-1)^{-n-k} a+\mathrm{d}(b)\right)\right)\right) \\
& \left.\left.=\lambda\left(m \mathrm{~d}(a)+(-1)^{-n+1} \mathrm{~d}(m a)+(-1)^{k+1} \mathrm{~d}(m) \mathrm{d}(b)\right)\right)\right)
\end{aligned}
$$

and we see that

$$
\psi_{n+1}(\mathrm{~d}(m), a x+b y)+(-1)^{n} \psi_{n}(m, \mathrm{~d}(a x+b y))=0
$$

Thus these pairings define a homomorphism $f_{\lambda}: M \rightarrow I_{k}$ by Lemma 22.12.2 such that the composition

$$
M^{k} \xrightarrow{f_{\lambda}^{k}} I_{k}^{k}=\left(Q_{k}^{k}\right)^{\vee} \xrightarrow{\text { evaluation at } x} \mathbf{Q} / \mathbf{Z}
$$

is the given map $\lambda$. It is clear that we can find an embedding into a product of copies of $I_{k}$ 's by using a map of the form $\prod f_{\lambda}$ for a suitable choice of the maps $\lambda$.

The result of the previous paragraph produces $M \rightarrow I$ having properties (1) and (3). To obtain property (2), suppose $\bar{m} \in \operatorname{Coker}\left(\mathrm{~d}_{M}\right)$ is a nonzero element of degree $k$. Pick a map $\lambda: M^{k} \rightarrow \mathbf{Q} / \mathbf{Z}$ which vanishes on $\operatorname{Im}\left(M^{k-1} \rightarrow M^{k}\right)$ but not on $m$. By Lemma 22.12 .3 this corresponds to a homomorphism $M \rightarrow A^{\vee}[k]$ of differential graded $A$-modules which does not vanish on $m$. Hence we can achieve (2) by adding a product of copies of shifts of $A^{\vee}$.

09KU Lemma 22.14.4. Let $(A, d)$ be a differential graded algebra. Let $M$ be a differential graded $A$-module. There exists a homomorphism $M \rightarrow I$ of differential graded $A$ modules such that
(1) $M \rightarrow I$ is a quasi-isomorphism, and
(2) I has property (I).

Proof. Set $M=M_{0}$. We inductively choose short exact sequences

$$
0 \rightarrow M_{i} \rightarrow I_{i} \rightarrow M_{i+1} \rightarrow 0
$$

where the maps $M_{i} \rightarrow I_{i}$ are chosen as in Lemma 22.14.3. This gives a "resolution"

$$
0 \rightarrow M \rightarrow I_{0} \xrightarrow{f_{0}} I_{1} \xrightarrow{f_{1}} I_{1} \rightarrow \ldots
$$

Then we set

$$
I=\prod_{i \geq 0} I_{i}
$$

where we take the product in the category of graded $A$-modules and differential defined by

$$
\mathrm{d}_{I}(x)=f_{a}(x)+(-1)^{a} \mathrm{~d}_{I_{a}}(x)
$$

for $x \in I_{a}^{b}$. With these conventions $I$ is indeed a differential graded $A$-module. Recalling that each $I_{i}$ has a two step filtration $0 \rightarrow I_{i}^{\prime} \rightarrow I_{i} \rightarrow I_{i}^{\prime \prime} \rightarrow 0$ we set

$$
F_{2 i} P=\prod_{j \geq i} I_{j} \subset \prod_{i \geq 0} I_{i}=I
$$

and we add a factor $I_{i+1}^{\prime}$ to $F_{2 i} I$ to get $F_{2 i+1} I$. These are differential graded submodules and the successive quotients are products of shifts of $A^{\vee}$. By Lemma 22.12 .1 we see that the inclusions $F_{i+1} I \rightarrow F_{i} I$ are admissible monomorphisms. Finally, we have to show that the map $M \rightarrow I$ (given by the augmentation $M \rightarrow I_{0}$ ) is a quasi-isomorphism. This follows from Homology, Lemma 12.22 .10 .

### 22.15. The derived category

09KV Recall that the notions of acyclic differential graded modules and quasi-isomorphism of differential graded modules make sense (see Section 22.4).

09KW Lemma 22.15.1. Let $(A, d)$ be a differential graded algebra. The full subcategory Ac of $K\left(\operatorname{Mod}_{(A, d)}\right)$ consisting of acyclic modules is a strictly full saturated triangulated subcategory of $K\left(\operatorname{Mod}_{(A, d)}\right)$. The corresponding saturated multiplicative system (see Derived Categories, Lemma 13.6.10) of $K\left(\operatorname{Mod}_{(A, d)}\right)$ is the class Qis of quasi-isomorphisms. In particular, the kernel of the localization functor

$$
Q: K\left(\operatorname{Mod}_{(A, d)}\right) \rightarrow \operatorname{Qis}^{-1} K\left(\operatorname{Mod}_{(A, d)}\right)
$$

is Ac. Moreover, the functor $H^{0}$ factors through $Q$.
Proof. We know that $H^{0}$ is a homological functor by the long exact sequence of homology 22.4.2.1). The kernel of $H^{0}$ is the subcategory of acyclic objects and the arrows with induce isomorphisms on all $H^{i}$ are the quasi-isomorphisms. Thus this lemma is a special case of Derived Categories, Lemma 13.6.11.

Set theoretical remark. The construction of the localization in Derived Categories, Proposition 13.5.5 assumes the given triangulated category is "small", i.e., that the underlying collection of objects forms a set. Let $V_{\alpha}$ be a partial universe (as in Sets, Section 3.5 containing ( $A, \mathrm{~d}$ ) and where the cofinality of $\alpha$ is bigger than $\aleph_{0}$ (see Sets, Proposition 3.7.2). Then we can consider the category $\operatorname{Mod}_{(A, \mathrm{~d}), \alpha}$ of differential graded $A$-modules contained in $V_{\alpha}$. A straightforward check shows that all the constructions used in the proof of Proposition 22.10 .3 work inside of $\operatorname{Mod}_{(A, \mathrm{~d}), \alpha}$ (because at worst we take finite direct sums of differential graded
modules). Thus we obtain a triangulated category $\operatorname{Qis}_{\alpha}^{-1} K\left(\operatorname{Mod}_{(A, \mathrm{~d}), \alpha}\right)$. We will see below that if $\beta>\alpha$, then the transition functors

$$
\operatorname{Qis}_{\alpha}^{-1} K\left(\operatorname{Mod}_{(A, \mathrm{~d}), \alpha}\right) \longrightarrow \operatorname{Qis}_{\beta}^{-1} K\left(\operatorname{Mod}_{(A, \mathrm{~d}), \beta}\right)
$$

are fully faithful as the morphism sets in the quotient categories are computed by maps in the homotopy categories from P-resolutions (the construction of a Presolution in the proof of Lemma 22.13 .4 takes countable direct sums as well as direct sums indexed over subsets of the given module). The reader should therefore think of the category of the lemma as the union of these subcategories.

Taking into account the set theoretical remark at the end of the proof of the preceding lemma we define the derived category as follows.

09KX Definition 22.15.2. Let $(A, d)$ be a differential graded algebra. Let Ac and Qis be as in Lemma 22.15.1. The derived category of $(A, d)$ is the triangulated category

$$
D(A, \mathrm{~d})=K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right) / \mathrm{Ac}=\mathrm{Qis}^{-1} K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)
$$

We denote $H^{0}: D(A, \mathrm{~d}) \rightarrow \operatorname{Mod}_{R}$ the unique functor whose composition with the quotient functor gives back the functor $H^{0}$ defined above.

Here is the promised lemma computing morphism sets in the derived category.
09KY Lemma 22.15.3. Let $(A, d)$ be a differential graded algebra. Let $M$ and $N$ be differential graded $A$-modules.
(1) Let $P \rightarrow M$ be a $P$-resolution as in Lemma 22.13.4. Then

$$
\operatorname{Hom}_{D(A, d)}(M, N)=\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}(P, N)
$$

(2) Let $N \rightarrow I$ be an I-resolution as in Lemma 22.14.4. Then

$$
\operatorname{Hom}_{D(A, d)}(M, N)=\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, d)}\right)}(M, I)
$$

Proof. Let $P \rightarrow M$ be as in (1). Since $P \rightarrow M$ is a quasi-isomorphism we see that

$$
\operatorname{Hom}_{D(A, \mathrm{~d})}(P, N)=\operatorname{Hom}_{D(A, \mathrm{~d})}(M, N)
$$

by definition of the derived category. A morphism $f: P \rightarrow N$ in $D(A, \mathrm{~d})$ is equal to $s^{-1} f^{\prime}$ where $f^{\prime}: P \rightarrow N^{\prime}$ is a morphism and $s: N \rightarrow N^{\prime}$ is a quasi-isomorphism. Choose a distringuished triangle

$$
N \rightarrow N^{\prime} \rightarrow Q \rightarrow N[1]
$$

As $s$ is a quasi-isomorphism, we see that $Q$ is acyclic. Thus $\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}(P, Q[k])=$ 0 for all $k$ by Lemma 22.13 .2 . Since $\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}(P,-)$ is cohomological, we conclude that we can lift $f^{\prime}: P \rightarrow N^{\prime}$ uniquely to a morphism $f: P \rightarrow N$. This finishes the proof.

The proof of (2) is dual to that of (1) using Lemma 22.14 .2 in stead of Lemma 22.13 .2

09QI Lemma 22.15.4. Let $(A, d)$ be a differential graded algebra. Then
(1) $D(A, d)$ has both direct sums and products,
(2) direct sums are obtained by taking direct sums of differential graded modules,
(3) products are obtained by taking products of differential graded modules.

Proof. We will use that $\operatorname{Mod}_{(A, \mathrm{~d})}$ is an abelian category with arbitrary direct sums and products, and that these give rise to direct sums and products in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. See Lemmas 22.4.2 and 22.5.4.
Let $M_{j}$ be a family of differential graded $A$-modules. Consider the graded direct sum $M=\bigoplus M_{j}$ which is a differential graded $A$-module with the obvious. For a differential graded $A$-module $N$ choose a quasi-isomorphism $N \rightarrow I$ where $I$ is a differential graded $A$-module with property (I). See Lemma 22.14.4. Using Lemma 22.15 .3 we have

$$
\begin{aligned}
\operatorname{Hom}_{D(A, \mathrm{~d})}(M, N) & =\operatorname{Hom}_{K(A, \mathrm{~d})}(M, I) \\
& =\prod \operatorname{Hom}_{K(A, \mathrm{~d})}\left(M_{j}, I\right) \\
& =\prod \operatorname{Hom}_{D(A, \mathrm{~d})}\left(M_{j}, N\right)
\end{aligned}
$$

whence the existence of direct sums in $D(A, \mathrm{~d})$ as given in part (2) of the lemma.
Let $M_{j}$ be a family of differential graded $A$-modules. Consider the product $M=$ $\prod M_{j}$ of differential graded $A$-modules. For a differential graded $A$-module $N$ choose a quasi-isomorphism $P \rightarrow N$ where $P$ is a differential graded $A$-module with property (P). See Lemma 22.13.4 Using Lemma 22.15.3 we have

$$
\begin{aligned}
\operatorname{Hom}_{D(A, \mathrm{~d})}(N, M) & =\operatorname{Hom}_{K(A, \mathrm{~d})}(P, M) \\
& =\prod \operatorname{Hom}_{K(A, \mathrm{~d})}\left(P, M_{j}\right) \\
& =\prod \operatorname{Hom}_{D(A, \mathrm{~d})}\left(N, M_{j}\right)
\end{aligned}
$$

whence the existence of direct sums in $D(A, \mathrm{~d})$ as given in part (3) of the lemma.

### 22.16. The canonical delta-functor

09 KZ Let $(A, \mathrm{~d})$ be a differential graded algebra. Consider the functor $\operatorname{Mod}(\mathcal{A}) \rightarrow$ $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. This functor is not a $\delta$-functor in general. However, it turns out that the functor $\operatorname{Mod}_{(A, \mathrm{~d})} \rightarrow D(A, \mathrm{~d})$ is a $\delta$-functor. In order to see this we have to define the morphisms $\delta$ associated to a short exact sequence

$$
0 \rightarrow K \xrightarrow{a} L \xrightarrow{b} M \rightarrow 0
$$

in the abelian category $\operatorname{Mod}_{(A, \mathrm{~d})}$. Consider the cone $C(a)$ of the morphism $a$. We have $C(a)=L \oplus K$ and we define $q: C(a) \rightarrow M$ via the projection to $L$ followed by $b$. Hence a homomorphism of differential graded $A$-modules

$$
q: C(a) \longrightarrow M
$$

It is clear that $q \circ i=b$ where $i$ is as in Definition 22.6.1. Note that, as $a$ is injective, the kernel of $q$ is identified with the cone of $\mathrm{id}_{K}$ which is acyclic. Hence we see that $q$ is a quasi-isomorphism. According to Lemma 22.9.4 the triangle

$$
(K, L, C(a), a, i,-p)
$$

is a distinguished triangle in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. As the localization functor $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right) \rightarrow$ $D(A, \mathrm{~d})$ is exact we see that $(K, L, C(a), a, i,-p)$ is a distinguished triangle in $D(A, \mathrm{~d})$. Since $q$ is a quasi-isomorphism we see that $q$ is an isomorphism in $D(A, \mathrm{~d})$. Hence we deduce that

$$
\left(K, L, M, a, b,-p \circ q^{-1}\right)
$$

is a distinguished triangle of $D(A, \mathrm{~d})$. This suggests the following lemma.

09L0 Lemma 22.16.1. Let $(A, d)$ be a differential graded algebra. The functor $\operatorname{Mod}_{(A, d)} \rightarrow$ $D(A, d)$ defined has the natural structure of a $\delta$-functor, with

$$
\delta_{K \rightarrow L \rightarrow M}=-p \circ q^{-1}
$$

with $p$ and $q$ as explained above.
Proof. We have already seen that this choice leads to a distinguished triangle whenever given a short exact sequence of complexes. We have to show functoriality of this construction, see Derived Categories, Definition 13.3.6. This follows from Lemma 22.6 .2 with a bit of work. Compare with Derived Categories, Lemma 13.12.1.

### 22.17. Linear categories

09MI Just the definitions.
09MJ Definition 22.17.1. Let $R$ be a ring. An $R$-linear category $\mathcal{A}$ is a category where every morphism set is given the structure of an $R$-module and where for $x, y, z \in \operatorname{Ob}(\mathcal{A})$ composition law

$$
\operatorname{Hom}_{\mathcal{A}}(y, z) \times \operatorname{Hom}_{\mathcal{A}}(x, y) \longrightarrow \operatorname{Hom}_{\mathcal{A}}(x, z)
$$

is $R$-bilinear.
Thus composition determines an $R$-linear map

$$
\operatorname{Hom}_{\mathcal{A}}(y, z) \otimes_{R} \operatorname{Hom}_{\mathcal{A}}(x, y) \longrightarrow \operatorname{Hom}_{\mathcal{A}}(x, z)
$$

of $R$-modules. Note that we do not assume $R$-linear categories to be additive.
09MK Definition 22.17.2. Let $R$ be a ring. A functor of $R$-linear categories, or an $R$-linear is a functor $F: \mathcal{A} \rightarrow \mathcal{B}$ where for all objects $x, y$ of $\mathcal{A}$ the map $F$ : $\operatorname{Hom}_{\mathcal{A}}(x, y) \rightarrow \operatorname{Hom}_{\mathcal{A}}(F(x), F(y))$ is a homomorphism of $R$-modules.

### 22.18. Graded categories

09L1 Just some definitions.
09L2 Definition 22.18.1. Let $R$ be a ring. A graded category $\mathcal{A}$ over $R$ is a category where every morphism set is given the structure of a graded $R$-module and where for $x, y, z \in \operatorname{Ob}(\mathcal{A})$ composition is $R$-bilinear and induces a homomorphism

$$
\operatorname{Hom}_{\mathcal{A}}(y, z) \otimes_{R} \operatorname{Hom}_{\mathcal{A}}(x, y) \longrightarrow \operatorname{Hom}_{\mathcal{A}}(x, z)
$$

of graded $R$-modules (i.e., preserving degrees).
In this situation we denote $\operatorname{Hom}_{\mathcal{A}}^{i}(x, y)$ the degree $i$ part of the graded object $\operatorname{Hom}_{\mathcal{A}}(x, y)$, so that

$$
\operatorname{Hom}_{\mathcal{A}}(x, y)=\bigoplus_{i \in \mathbf{Z}} \operatorname{Hom}_{\mathcal{A}}^{i}(x, y)
$$

is the direct sum decomposition into graded parts.
09L3 Definition 22.18.2. Let $R$ be a ring. A functor of graded categories over $R$, or a graded functor is a functor $F: \mathcal{A} \rightarrow \mathcal{B}$ where for all objects $x, y$ of $\mathcal{A}$ the map $F: \operatorname{Hom}_{\mathcal{A}}(x, y) \rightarrow \operatorname{Hom}_{\mathcal{A}}(F(x), F(y))$ is a homomorphism of graded $R$-modules.
Given a graded category we are often interested in the corresponding "usual" category of maps of degree 0 . Here is a formal definition.

09ML Definition 22.18.3. Let $R$ be a ring. Let $\mathcal{A}$ be a differential graded category over $R$. We let $\mathcal{A}^{0}$ be the category with the same objects as $\mathcal{A}$ and with

$$
\operatorname{Hom}_{\mathcal{A}^{0}}(x, y)=\operatorname{Hom}_{\mathcal{A}}^{0}(x, y)
$$

the degree 0 graded piece of the graded module of morphisms of $\mathcal{A}$.
09P2 Definition 22.18.4. Let $R$ be a ring. Let $\mathcal{A}$ be a graded category over $R$. A direct sum $(x, y, z, i, j, p, q)$ in $\mathcal{A}$ (notation as in Homology, Remark 12.3.6) is a graded direct sum if $i, j, p, q$ are homogeneous of degree 0 .

09MM Example 22.18.5 (Graded category of graded objects). Let $\mathcal{B}$ be an additive category. Recall that we have defined the category $\operatorname{Gr}(\mathcal{B})$ of graded objects of $\mathcal{B}$ in Homology, Definition 12.15.1. In this example, we will construct a graded category $\mathrm{Gr}^{g r}(\mathcal{B})$ over $R=\mathbf{Z}$ whose associated category $\mathrm{Gr}^{g r}(\mathcal{B})^{0}$ recovers $\mathrm{Gr}(\mathcal{B})$. As objects of $\operatorname{Comp}^{g r}(\mathcal{B})$ we take graded objects of $\mathcal{B}$. Then, given graded objects $A=\left(A^{i}\right)$ and $B=\left(B^{i}\right)$ of $\mathcal{B}$ we set

$$
\operatorname{Hom}_{\operatorname{Gr}^{g r}(\mathcal{B})}(A, B)=\bigoplus_{n \in \mathbf{Z}} \operatorname{Hom}^{n}(A, B)
$$

where the graded piece of degree $n$ is the abelian group of homogeneous maps of degree $n$ from $A$ to $B$ defined by the rule

$$
\operatorname{Hom}^{n}(A, B)=\operatorname{Hom}_{\operatorname{Gr}(\mathcal{A})}(A, B[n])=\operatorname{Hom}_{\operatorname{Gr}(\mathcal{A})}(A[-n], B)
$$

see Homology, Equation 12.15.4.1. Explicitly we have

$$
\operatorname{Hom}^{n}(A, B)=\prod_{p+q=n} \operatorname{Hom}_{\mathcal{B}}\left(A^{-q}, B^{p}\right)
$$

(observe reversal of indices and observe that we have a product here and not a direct sum). In other words, a degree $n$ morphism $f$ from $A$ to $B$ can be seen as a system $f=\left(f_{p, q}\right)$ where $p, q \in \mathbf{Z}, p+q=n$ with $f_{p, q}: A^{-q} \rightarrow B^{p}$ a morphism of $\mathcal{B}$. Given graded objects $A, B, C$ of $\mathcal{B}$ composition of morphisms in $\mathrm{Gr}^{g r}(\mathcal{B})$ is defined via the maps

$$
\operatorname{Hom}^{m}(B, C) \times \operatorname{Hom}^{n}(A, B) \longrightarrow \operatorname{Hom}^{n+m}(A, C)
$$

by simple composition $(g, f) \mapsto g \circ f$ of homogeneous maps of graded objects. In terms of components we have

$$
(g \circ f)_{p, r}=g_{p, q} \circ f_{-q, r}
$$

where $q$ is such that $p+q=m$ and $-q+r=n$.
09MN Example 22.18.6 (Graded category of graded modules). Let $A$ be a Z-graded algebra over a ring $R$. We will construct a graded category $\operatorname{Mod}_{A}^{g r}$ over $R$ whose associated category $\left(\operatorname{Mod}_{A}^{g r}\right)^{0}$ is the category of graded $A$-modules. As objects of $\operatorname{Mod}_{A}^{g r}$ we take right graded $A$-modules (see Section 22.11). Given graded $A$ modules $L$ and $M$ we set

$$
\operatorname{Hom}_{\operatorname{Mod}_{A}^{g r}}(L, M)=\bigoplus_{n \in \mathbf{Z}} \operatorname{Hom}^{n}(L, M)
$$

where $\operatorname{Hom}^{n}(L, M)$ is the set of right $A$-module maps $L \rightarrow M$ which are homogeneous of degree $n$, i.e., $f\left(L^{i}\right) \subset M^{i+n}$ for all $i \in \mathbf{Z}$. In terms of components, we have that

$$
\operatorname{Hom}^{n}(L, M) \subset \prod_{p+q=n} \operatorname{Hom}_{R}\left(L^{-q}, M^{p}\right)
$$

(observe reversal of indices) is the subset consisting of those $f=\left(f_{p, q}\right)$ such that

$$
f_{p, q}(m a)=f_{p-i, q+i}(m) a
$$

for $a \in A^{i}$ and $m \in L^{-q-i}$. For graded $A$-modules $K, L, M$ we define composition in $\operatorname{Mod}_{A}^{g r}$ via the maps

$$
\operatorname{Hom}^{m}(L, M) \times \operatorname{Hom}^{n}(K, L) \longrightarrow \operatorname{Hom}^{n+m}(K, M)
$$

by simple composition of right $A$-module maps: $(g, f) \mapsto g \circ f$.
09P3 Remark 22.18.7. Let $R$ be a ring. Let $\mathcal{D}$ be an $R$-linear category endowed with a collection of $R$-linear functors $[n]: \mathcal{D} \rightarrow \mathcal{D}, x \mapsto x[n]$ indexed by $n \in \mathbf{Z}$ such that $[n] \circ[m]=[n+m]$ and $[0]=\operatorname{id}_{\mathcal{D}}$ (equality as functors). This allows us to construct a graded category $\mathcal{D}^{g r}$ over $R$ with the same objects of $\mathcal{D}$ setting

$$
\operatorname{Hom}_{\mathcal{D}^{g r}}(x, y)=\bigoplus_{n \in \mathbf{Z}} \operatorname{Hom}_{\mathcal{D}}(x, y[n])
$$

for $x, y$ in $\mathcal{D}$. Observe that $\left(\mathcal{D}^{g r}\right)^{0}=\mathcal{D}$ (see Definition 22.18.3). Moreover, the graded category $\mathcal{D}^{g r}$ inherits $R$-linear graded functors [ $n$ ] satisfying $[n] \circ[m]=$ $[n+m]$ and $[0]=\operatorname{id}_{\mathcal{D}^{g r}}$ with the property that

$$
\operatorname{Hom}_{\mathcal{D}^{g r}}(x, y[n])=\operatorname{Hom}_{\mathcal{D}^{g r}}(x, y)[n]
$$

as graded $R$-modules compatible with composition of morphisms.
Conversely, suppose given a graded category $\mathcal{A}$ over $R$ endowed with a collection of $R$-linear graded functors $[n]$ satisfying $[n] \circ[m]=[n+m]$ and $[0]=\operatorname{id}_{\mathcal{A}}$ which are moreover equipped with isomorphisms

$$
\operatorname{Hom}_{\mathcal{A}}(x, y[n])=\operatorname{Hom}_{\mathcal{A}}(x, y)[n]
$$

as graded $R$-modules compatible with composition of morphisms. Then the reader easily shows that $\mathcal{A}=\left(\mathcal{A}^{0}\right)^{g r}$.
Here are two examples of the relationship $\mathcal{D} \leftrightarrow \mathcal{A}$ we established above:
(1) Let $\mathcal{B}$ be an additive category. If $\mathcal{D}=\operatorname{Gr}(\mathcal{B})$, then $\mathcal{A}=\mathrm{Gr}^{g r}(\mathcal{B})$ as in Example 22.18.5.
(2) If $A$ is a graded ring and $\mathcal{D}=\operatorname{Mod}_{A}$ is the category of graded right $A$-modules, then $\mathcal{A}=\operatorname{Mod}_{A}^{g r}$, see Example 22.18.6

### 22.19. Differential graded categories

09L4 Note that if $R$ is a ring, then $R$ is a differential graded algebra over itself (with $R=R^{0}$ of course). In this case a differential graded $R$-module is the same thing as a complex of $R$-modules. In particular, given two differential graded $R$-modules $M$ and $N$ we denote $M \otimes_{R} N$ the differential graded $R$-module corresponding to the total complex associated to the double complex obtained by the tensor product of the complexes of $R$-modules associated to $M$ and $N$.

09L5 Definition 22.19.1. Let $R$ be a ring. A differential graded category $\mathcal{A}$ over $R$ is a category where every morphism set is given the structure of a differential graded $R$-module and where for $x, y, z \in \operatorname{Ob}(\mathcal{A})$ composition is $R$-bilinear and induces a homomorphism

$$
\operatorname{Hom}_{\mathcal{A}}(y, z) \otimes_{R} \operatorname{Hom}_{\mathcal{A}}(x, y) \longrightarrow \operatorname{Hom}_{\mathcal{A}}(x, z)
$$

of differential graded $R$-modules.

The final condition of the definition signifies the following: if $f \in \operatorname{Hom}_{\mathcal{A}}^{n}(x, y)$ and $g \in \operatorname{Hom}_{\mathcal{A}}^{m}(y, z)$ are homogeneous of degrees $n$ and $m$, then

$$
\mathrm{d}(g \circ f)=\mathrm{d}(g) \circ f+(-1)^{m} g \circ \mathrm{~d}(f)
$$

in $\operatorname{Hom}_{\mathcal{A}}^{n+m+1}(x, z)$. This follows from the sign rule for the differential on the total complex of a double complex, see Homology, Definition 12.22 .3 ,
09L6 Definition 22.19.2. Let $R$ be a ring. A functor of differential graded categories over $R$ is a functor $F: \mathcal{A} \rightarrow \mathcal{B}$ where for all objects $x, y$ of $\mathcal{A}$ the map $F:$ $\operatorname{Hom}_{\mathcal{A}}(x, y) \rightarrow \operatorname{Hom}_{\mathcal{A}}(F(x), F(y))$ is a homomorphism of differential graded $R$ modules.

Given a diffferential graded category we are often interested in the corresponding categories of complexes and homotopy category. Here is a formal definition.
09L7 Definition 22.19.3. Let $R$ be a ring. Let $\mathcal{A}$ be a differential graded category over $R$. Then we let
(1) the category of complexes of $\mathcal{A}^{2}$ be the category $\operatorname{Comp}(\mathcal{A})$ whose objects are the same as the objects of $\mathcal{A}$ and with

$$
\operatorname{Hom}_{\operatorname{Comp}(\mathcal{A})}(x, y)=\operatorname{Ker}\left(d: \operatorname{Hom}_{\mathcal{A}}^{0}(x, y) \rightarrow \operatorname{Hom}_{\mathcal{A}}^{0}(x, y)\right)
$$

(2) the homotopy category of $\mathcal{A}$ be the category $K(\mathcal{A})$ whose objects are the same as the objects of $\mathcal{A}$ and with

$$
\operatorname{Hom}_{K(\mathcal{A})}(x, y)=H^{0}\left(\operatorname{Hom}_{\mathcal{A}}(x, y)\right)
$$

Our use of the symbol $K(\mathcal{A})$ is nonstandard, but at least is compatible with the use of $K(-)$ in other chapters of the Stacks project.
09P4 Definition 22.19.4. Let $R$ be a ring. Let $\mathcal{A}$ be a differential graded category over $R$. A direct sum $(x, y, z, i, j, p, q)$ in $\mathcal{A}$ (notation as in Homology, Remark 12.3.6) is a differential graded direct sum if $i, j, p, q$ are homogeneous of degree 0 and closed, i.e., $\mathrm{d}(i)=0$, etc.

09L8 Lemma 22.19.5. Let $R$ be a ring. A functor $F: \mathcal{A} \rightarrow \mathcal{B}$ of differential graded categories over $R$ induces functors $\operatorname{Comp}(\mathcal{A}) \rightarrow \operatorname{Comp}(\mathcal{B})$ and $K(\mathcal{A}) \rightarrow K(\mathcal{B})$.
Proof. Omitted.
09L9 Example 22.19.6 (Differential graded category of complexes). Let $\mathcal{B}$ be an additive category. We will construct a differential graded category Comp ${ }^{d g}(\mathcal{B})$ over $R=\mathbf{Z}$ whose associated category of complexes is $\operatorname{Comp}(\mathcal{B})$ and whose associated homotopy category is $K(\mathcal{B})$. As objects of $\operatorname{Comp}^{d g}(\mathcal{B})$ we take complexes of $\mathcal{B}$. Given complexes $A^{\bullet}$ and $B^{\bullet}$ of $\mathcal{B}$, we sometimes also denote $A^{\bullet}$ and $B^{\bullet}$ the corresponding graded objects of $\mathcal{B}$ (i.e., forget about the differential). Using this abuse of notation, we set

$$
\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{B})}\left(A^{\bullet}, B^{\bullet}\right)=\operatorname{Hom}_{\operatorname{Gr}^{g r}(\mathcal{B})}\left(A^{\bullet}, B^{\bullet}\right)
$$

as a graded $\mathbf{Z}$-module where the right hand side is defined in Example 22.18.5. In other words, the $n$th graded piece is the abelian group of homogeneous morphism of degree $n$ of graded objects

$$
\operatorname{Hom}^{n}\left(A^{\bullet}, B^{\bullet}\right)=\operatorname{Hom}_{\operatorname{Gr}(\mathcal{B})}\left(A^{\bullet}, B^{\bullet}[n]\right)=\prod_{p+q=n} \operatorname{Hom}_{\mathcal{B}}\left(A^{-q}, B^{p}\right)
$$

[^58](observe reversal of indices and observe we have a direct product and not a direct sum). For an element $f \in \operatorname{Hom}^{n}\left(A^{\bullet}, B^{\bullet}\right)$ of degree $n$ we set
$$
\mathrm{d}(f)=\mathrm{d}_{B} \circ f-(-1)^{n} f \circ \mathrm{~d}_{A}
$$

To make sense of this we think of $\mathrm{d}_{B}$ and $\mathrm{d}_{A}$ as maps of graded objects of $\mathcal{B}$ homogeneous of degree 1 and we use composition in the category $\mathrm{Gr}^{g r}(\mathcal{B})$ on the right hand side. In terms of components, if $f=\left(f_{p, q}\right)$ with $f_{p, q}: A^{-q} \rightarrow B^{p}$ we have
09LA

$$
\begin{equation*}
\mathrm{d}\left(f_{p, q}\right)=\mathrm{d}_{B} \circ f_{p, q}+(-1)^{p+q+1} f_{p, q} \circ \mathrm{~d}_{A} \tag{22.19.6.1}
\end{equation*}
$$

Note that the first term of this expression is in $\operatorname{Hom}_{\mathcal{B}}\left(A^{-q}, B^{p+1}\right)$ and the second term is in $\operatorname{Hom}_{\mathcal{B}}\left(A^{-q-1}, B^{p}\right)$. In other words, given $p+q=n+1$ we have

$$
\mathrm{d}(f)_{p, q}=\mathrm{d}_{B} \circ f_{p-1, q}-(-1)^{n} f_{p, q-1} \circ \mathrm{~d}_{A}
$$

with obvious notation. The reader check $3^{3}$ that
(1) d has square zero,
(2) an element $f$ in $\operatorname{Hom}^{n}\left(A^{\bullet}, B^{\bullet}\right)$ has $\mathrm{d}(f)=0$ if and only if the morphism $f: A^{\bullet} \rightarrow B^{\bullet}[n]$ of graded objects of $\mathcal{B}$ is actually a map of complexes,
(3) in particular, the category of complexes of $\operatorname{Comp}^{d g}(\mathcal{B})$ is equal to $\operatorname{Comp}(\mathcal{B})$,
(4) the morphism of complexes defined by $f$ as in (2) is homotopy equivalent to zero if and only if $f=\mathrm{d}(g)$ for some $g \in \operatorname{Hom}^{n-1}\left(A^{\bullet}, B^{\bullet}\right)$.
(5) in particular, we obtain a canonical isomorphism

$$
\operatorname{Hom}_{K(\mathcal{B})}\left(A^{\bullet}, B^{\bullet}\right) \longrightarrow H^{0}\left(\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{B})}\left(A^{\bullet}, B^{\bullet}\right)\right)
$$

and the homotopy category of $\operatorname{Comp}^{d g}(\mathcal{B})$ is equal to $K(\mathcal{B})$.
Given complexes $A^{\bullet}, B^{\bullet}, C^{\bullet}$ we define composition

$$
\operatorname{Hom}^{m}\left(B^{\bullet}, C^{\bullet}\right) \times \operatorname{Hom}^{n}\left(A^{\bullet}, B^{\bullet}\right) \longrightarrow \operatorname{Hom}^{n+m}\left(A^{\bullet}, C^{\bullet}\right)
$$

by composition $(g, f) \mapsto g \circ f$ in the graded category $\mathrm{Gr}^{g r}(\mathcal{B})$, see Example 22.18 .5 . This defines a map of differential graded modules as in Definition 22.19.1 because

$$
\begin{aligned}
\mathrm{d}(g \circ f) & =\mathrm{d}_{C} \circ g \circ f-(-1)^{n+m} g \circ f \circ \mathrm{~d}_{A} \\
& =\left(\mathrm{d}_{C} \circ g-(-1)^{m} g \circ \mathrm{~d}_{B}\right) \circ f+(-1)^{m} g \circ\left(\mathrm{~d}_{B} \circ f-(-1)^{n} f \circ \mathrm{~d}_{A}\right) \\
& =\mathrm{d}(g) \circ f+(-1)^{m} g \circ \mathrm{~d}(f)
\end{aligned}
$$

as desired.
09LB Lemma 22.19.7. Let $F: \mathcal{B} \rightarrow \mathcal{B}^{\prime}$ be an additive functor between additive categories. Then $F$ induces a functor of differential graded categories

$$
F: \operatorname{Comp}^{d g}(\mathcal{B}) \rightarrow \operatorname{Comp}^{d g}\left(\mathcal{B}^{\prime}\right)
$$

of Example 22.19.6 inducing the usual functors on the category of complexes and the homotopy categories.

Proof. Omitted.

[^59]Example 22.19.8 (Differential graded category of differential graded modules).
09LC Let $(A, \mathrm{~d})$ be a differential graded algebra over a ring $R$. We will construct a differential graded category $\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}$ over $R$ whose category of complexes is $\operatorname{Mod}_{(A, \mathrm{~d})}$ and whose homotopy category is $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$. As objects of $\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}$ we take the differential graded $A$-modules. Given differential graded $A$-modules $L$ and $M$ we set

$$
\operatorname{Hom}_{\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}}(L, M)=\operatorname{Hom}_{\operatorname{Mod}_{A}^{g r}}(L, M)=\bigoplus \operatorname{Hom}^{n}(L, M)
$$

as a graded $R$-module where the right hand side is defined as in Example 22.18.6. In other words, the $n$th graded piece $\operatorname{Hom}^{n}(L, M)$ is the $R$-module of right $A$-module maps homogeneous of degree $n$. For an element $f \in \operatorname{Hom}^{n}(L, M)$ we set

$$
\mathrm{d}(f)=\mathrm{d}_{M} \circ f-(-1)^{n} f \circ \mathrm{~d}_{L}
$$

To make sense of this we think of $\mathrm{d}_{M}$ and $\mathrm{d}_{L}$ as graded $R$-module maps and we use composition of graded $R$-module maps. It is clear that $\mathrm{d}(f)$ is homogeneous of degree $n+1$ as a graded $R$-module map, and it is linear because

$$
\begin{aligned}
\mathrm{d}(f)(x a) & =\mathrm{d}_{M}(f(x) a)-(-1)^{n} f\left(\mathrm{~d}_{L}(x a)\right) \\
& =\mathrm{d}_{M}(f(x)) a+(-1)^{\operatorname{deg}(x)+n} f(x) \mathrm{d}(a)-(-1)^{n} f\left(\mathrm{~d}_{L}(x)\right) a-(-1)^{n+\operatorname{deg}(x)} f(x) \mathrm{d}(a) \\
& =\mathrm{d}(f)(x) a
\end{aligned}
$$

as desired (observe that this calculation would not work without the sign in the definition of our differential on Hom). Similar formulae to those of Example 22.19.6 hold for the differential of $f$ in terms of components. The reader checks (in the same way as in Example 22.19.6 that
(1) d has square zero,
(2) an element $f$ in $\operatorname{Hom}^{n}(L, M)$ has $\mathrm{d}(f)=0$ if and only if $f: L \rightarrow M[n]$ is a homomorphism of differential graded $A$-modules,
(3) in particular, the category of complexes of $\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}$ is $\operatorname{Mod}_{(A, \mathrm{~d})}$,
(4) the homomorphism defined by $f$ as in (2) is homotopy equivalent to zero if and only if $f=\mathrm{d}(g)$ for some $g \in \operatorname{Hom}^{n-1}(L, M)$.
(5) in particular, we obtain a canonical isomorphism

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}(L, M) \longrightarrow H^{0}\left(\operatorname{Hom}_{\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}}(L, M)\right)
$$

and the homotopy category of $\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}$ is $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$.
Given differential graded $A$-modules $K, L, M$ we define composition

$$
\operatorname{Hom}^{m}(L, M) \times \operatorname{Hom}^{n}(K, L) \longrightarrow \operatorname{Hom}^{n+m}(K, M)
$$

by composition of homogeneous right $A$-module maps $(g, f) \mapsto g \circ f$. This defines a map of differential graded modules as in Definition 22.19.1 because

$$
\begin{aligned}
\mathrm{d}(g \circ f) & =\mathrm{d}_{M} \circ g \circ f-(-1)^{n+m} g \circ f \circ \mathrm{~d}_{K} \\
& =\left(\mathrm{d}_{M} \circ g-(-1)^{m} g \circ \mathrm{~d}_{L}\right) \circ f+(-1)^{m} g \circ\left(\mathrm{~d}_{L} \circ f-(-1)^{n} f \circ \mathrm{~d}_{K}\right) \\
& =\mathrm{d}(g) \circ f+(-1)^{m} g \circ \mathrm{~d}(f)
\end{aligned}
$$

as desired.

09LD Lemma 22.19.9. Let $\varphi:(A, d) \rightarrow(E, d)$ be a homomorphism of differential graded algebras. Then $\varphi$ induces a functor of differential graded categories

$$
F: \operatorname{Mod}_{(E, d)}^{d g} \longrightarrow \operatorname{Mod}_{(A, d)}^{d g}
$$

of Example 22.19.8 inducing obvious restriction functors on the categories of differential graded modules and homotopy categories.

Proof. Omitted.
09LE Lemma 22.19.10. Let $R$ be a ring. Let $\mathcal{A}$ be a differential graded category over $R$. Let $x$ be an object of $\mathcal{A}$. Let

$$
(E, d)=\operatorname{Hom}_{\mathcal{A}}(x, x)
$$

be the differential graded $R$-algebra of endomorphisms of $x$. We obtain a functor

$$
\mathcal{A} \longrightarrow \operatorname{Mod}_{(E, d)}^{d g}, \quad y \longmapsto \operatorname{Hom}_{\mathcal{A}}(x, y)
$$

of differential graded categories by letting $E$ act on $\operatorname{Hom}_{\mathcal{A}}(x, y)$ via composition in $\mathcal{A}$. This functor induces functors

$$
\operatorname{Comp}(\mathcal{A}) \rightarrow \operatorname{Mod}_{(A, d)} \quad \text { and } \quad K(\mathcal{A}) \rightarrow K\left(\operatorname{Mod}_{(A, d)}\right)
$$

by an application of Lemma 22.19.5.
Proof. This lemma proves itself.

### 22.20. Obtaining triangulated categories

09P5 In this section we discuss the most general setup to which the arguments proving Derived Categories, Proposition 13.10 .3 and Proposition 22.10 .3 apply.

Let $R$ be a ring. Let $\mathcal{A}$ be a differential graded category over $R$. To make our argument work, we impose some axioms on $\mathcal{A}$ :
(A) $\mathcal{A}$ has a zero object and differential graded direct sums of two objects (as in Definition 22.19.4.
(B) there are functors $[n]: \mathcal{A} \longrightarrow \mathcal{A}$ of differential graded categories such that $[0]=\operatorname{id}_{\mathcal{A}}$ and $[n+m]=[n] \circ[m]$ and given isomorphisms

$$
\operatorname{Hom}_{\mathcal{A}}(x, y[n])=\operatorname{Hom}_{\mathcal{A}}(x, y)[n]
$$

of differential graded $R$-modules compatible with composition.
Given our differential graded category $\mathcal{A}$ we say
(1) a sequence $x \rightarrow y \rightarrow z$ of morphisms of $\operatorname{Comp}(\mathcal{A})$ is an admissible short exact sequence if there exists an isomorphism $y \cong x \oplus z$ in the underlying graded category such that $x \rightarrow z$ and $y \rightarrow z$ are (co)projections.
(2) a morphism $x \rightarrow y$ of $\operatorname{Comp}(\mathcal{A})$ is an admissible monomorphism if it extends to an admissible short exact sequence $x \rightarrow y \rightarrow z$.
(3) a morphism $y \rightarrow z$ of $\operatorname{Comp}(\mathcal{A})$ is an admissible epimorphism if it extends to an admissible short exact sequence $x \rightarrow y \rightarrow z$.
The next lemma tells us an admissible short exact sequence gives a triangle, provided we have axioms (A) and (B).

09P6 Lemma 22.20.1. Let $\mathcal{A}$ be a differential graded category satisfying axioms (A) and (B). Given an admissible short exact sequence $x \rightarrow y \rightarrow z$ we obtain (see proof) a triangle

$$
x \rightarrow y \rightarrow z \rightarrow x[1]
$$

in $\operatorname{Comp}(\mathcal{A})$ with the property that any two compositions in $z[-1] \rightarrow x \rightarrow y \rightarrow z \rightarrow$ $x[1]$ are zero in $K(\mathcal{A})$.

Proof. Choose a diagram

giving the isomorphism of graded objects $y \cong x \oplus z$ as in the defintion of an admissible short exact sequence. Here are some equations that hold in this situation
(1) $1=\pi a$ and hence $\mathrm{d}(\pi) a=0$,
(2) $1=b s$ and hence $b \mathrm{~d}(s)=0$,
(3) $1=a \pi+s b$ and hence $a \mathrm{~d}(\pi)+\mathrm{d}(s) b=0$,
(4) $\pi s=0$ and hence $\mathrm{d}(\pi) s+\pi \mathrm{d}(s)=0$,
(5) $\mathrm{d}(s)=a \pi \mathrm{~d}(s)$ because $\mathrm{d}(s)=(a \pi+s b) \mathrm{d}(s)$ and $b \mathrm{~d}(s)=0$,
(6) $\mathrm{d}(\pi)=\mathrm{d}(\pi) s b$ because $\mathrm{d}(\pi)=\mathrm{d}(\pi)(a \pi+s b)$ and $\mathrm{d}(\pi) a=0$,
(7) $\mathrm{d}(\pi \mathrm{d}(s))=0$ because if we postcompose it with the monomorphism $a$ we get $\mathrm{d}(a \pi \mathrm{~d}(s))=\mathrm{d}(\mathrm{d}(s))=0$, and
(8) $\mathrm{d}(\mathrm{d}(\pi) s)=0$ as by (4) it is the negative of $\mathrm{d}(\pi \mathrm{d}(s))$ which is 0 by (7).

We've used repeatedly that $\mathrm{d}(a)=0, \mathrm{~d}(b)=0$, and that $\mathrm{d}(1)=0$. By (7) we see that

$$
\delta=\pi \mathrm{d}(s)=-\mathrm{d}(\pi) s: z \rightarrow x[1]
$$

is a morphism in $\operatorname{Comp}(\mathcal{A})$. By (5) we see that the composition $a \delta=a \pi \mathrm{~d}(s)=\mathrm{d}(s)$ is homotopic to zero. By (6) we see that the composition $\delta b=-\mathrm{d}(\pi) s b=\mathrm{d}(-\pi)$ is homotopic to zero.
Besides axioms (A) and (B) we need an axiom concerning the existence of cones. We formalize everything as follows.

09QJ Situation 22.20.2. Here $R$ is a ring and $\mathcal{A}$ is a differential graded category over $R$ having axioms (A), (B), and
(C) given an arrow $f: x \rightarrow y$ of degree 0 with $\mathrm{d}(f)=0$ there exists an admissible short exact sequence $y \rightarrow c(f) \rightarrow x[1]$ in $\operatorname{Comp}(\mathcal{A})$ such that the map $x[1] \rightarrow y[1]$ of Lemma 22.20.1 is equal to $f[1]$.

We will call $c(f)$ a cone of the morphism $f$. If (A), (B), and (C) hold, then cones are functorial in a weak sense.

09P7 Lemma 22.20.3. In Situation 22.20.2 suppose that

is a diagram of $\operatorname{Comp}(\mathcal{A})$ commutative up to homotopy. Then there exists a morphism $c: c\left(f_{1}\right) \rightarrow c\left(f_{2}\right)$ which gives rise to a morphism of triangles

$$
(a, b, c):\left(x_{1}, y_{1}, c\left(f_{1}\right)\right) \rightarrow\left(x_{1}, y_{1}, c\left(f_{1}\right)\right)
$$

in $K(\mathcal{A})$.
Proof. The assumption means there exists a morphism $h: x_{1} \rightarrow y_{2}$ of degree -1 such that $\mathrm{d}(h)=b f_{1}-f_{2} a$. Choose isomorphisms $c\left(f_{i}\right)=y_{i} \oplus x_{i}[1]$ of graded objects compatible with the morphisms $y_{i} \rightarrow c\left(f_{i}\right) \rightarrow x_{i}[1]$. Let's denote $a_{i}: y_{i} \rightarrow c\left(f_{i}\right)$, $b_{i}: c\left(f_{i}\right) \rightarrow x_{i}[1], s_{i}: x_{i}[1] \rightarrow c\left(f_{i}\right)$, and $\pi_{i}: c\left(f_{i}\right) \rightarrow y_{i}$ the given morphisms. Recall that $x_{i}[1] \rightarrow y_{i}[1]$ is given by $\pi_{i} \mathrm{~d}\left(s_{i}\right)$. By axiom (C) this means that

$$
f_{i}=\pi_{i} \mathrm{~d}\left(s_{i}\right)=-\mathrm{d}\left(\pi_{i}\right) s_{i}
$$

(we identify $\operatorname{Hom}\left(x_{i}, y_{i}\right)$ with $\operatorname{Hom}\left(x_{i}[1], y_{i}[1]\right)$ using the shift functor [1]). Set $c=a_{2} b \pi_{1}+s_{2} a b_{1}+a_{2} h b$. Then, using the equalities found in the proof of Lemma 22.20 .1 we obtain

$$
\begin{aligned}
\mathrm{d}(c) & =a_{2} b \mathrm{~d}\left(\pi_{1}\right)+\mathrm{d}\left(s_{2}\right) a b_{1}+a_{2} \mathrm{~d}(h) b_{1} \\
& =-a_{2} b f_{1} b_{1}+a_{2} f_{2} a b_{1}+a_{2}\left(b f_{1}-f_{2} a\right) b_{1} \\
& =0
\end{aligned}
$$

(where we have used in particular that $\mathrm{d}\left(\pi_{1}\right)=\mathrm{d}\left(\pi_{1}\right) s_{1} b_{1}=f_{1} b_{1}$ and $\mathrm{d}\left(s_{2}\right)=$ $\left.a_{2} \pi_{2} \mathrm{~d}\left(s_{2}\right)=a_{2} f_{2}\right)$. Thus $c$ is a degree 0 morphism $c: c\left(f_{1}\right) \rightarrow c\left(f_{2}\right)$ of $\mathcal{A}$ compatible with the given morphisms $y_{i} \rightarrow c\left(f_{i}\right) \rightarrow x_{i}[1]$.

In Situation 22.20 .2 we say that a triangle $(x, y, z, f, g, h)$ in $K(\mathcal{A})$ is a distinguished triangle if there exists an admissible short exact sequence $x^{\prime} \rightarrow y^{\prime} \rightarrow z^{\prime}$ such that $(x, y, z, f, g, h)$ is isomorphic as a triangle in $K(\mathcal{A})$ to the triangle $\left(x^{\prime}, y^{\prime}, z^{\prime}, x^{\prime} \rightarrow\right.$ $\left.y^{\prime}, y^{\prime} \rightarrow z^{\prime}, \delta\right)$ constructed in Lemma 22.20.1. We will show below that

$$
K(\mathcal{A}) \text { is a triangulated category }
$$

This result, although not as general as one might think, applies to a number of natural generalizations of the cases covered so far in the Stacks project. Here are some examples:
(1) Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $(A, d)$ be a sheaf of differential graded $\mathcal{O}_{X}$-algebras. Let $\mathcal{A}$ be the differential graded category of differential graded $A$-modules. Then $K(\mathcal{A})$ is a triangulated category.
(2) Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $(A, d)$ be a sheaf of differential graded $\mathcal{O}$ algebras. Let $\mathcal{A}$ be the differential graded category of differential graded $A$-modules. Then $K(\mathcal{A})$ is a triangulated category.
(3) Two examples with a different flavor may be found in Examples, Section 88.59

The following simple lemma is a key to the construction.
09QK Lemma 22.20.4. In Situation 22.20.2 given any object $x$ of $\mathcal{A}$, and the cone $C\left(1_{x}\right)$ of the identity morphism $1_{x}: x \rightarrow x$, the identity morphism on $C\left(1_{x}\right)$ is homotopic to zero.

Proof. Consider the admissible short exact sequence given by axiom (C).

$$
x \underset{\pi}{\stackrel{a}{\rightleftarrows}} C\left(1_{x}\right) \stackrel{b}{\rightleftarrows} \stackrel{s}{\rightleftarrows} x[1]
$$

Then by Lemma 22.20.1. identifying hom-sets under shifting, we have $1_{x}=\pi d(s)=$ $-d(\pi) s$ where $s$ is regarded as a morphism in $\operatorname{Hom}_{\mathcal{A}}^{-1}\left(x, C\left(1_{x}\right)\right)$. Therefore $a=$ $a \pi d(s)=d(s)$ using formula (5) of Lemma 22.20.1 and $b=-d(\pi) s b=-d(\pi)$ by formula (6) of Lemma 22.20.1. Hence

$$
1_{C\left(1_{x}\right)}=a \pi+s b=d(s) \pi-s d(\pi)=d(s \pi)
$$

since $s$ is of degree -1 .
A more general version of the above lemma will appear in Lemma 22.20.13. The following lemma is the analogue of Lemma 22.7.3.

09QL Lemma 22.20.5. In Situation 22.20.2 given a diagram

in $\operatorname{Comp}(\mathcal{A})$ commuting up to homotopy. Then
(1) If $f$ is an admissible monomorphism, then $b$ is homotopic to a morphism $b^{\prime}$ which makes the diagram commute.
(2) If $g$ is an admissible epimorphism, then a is homotopic to a morphism $a^{\prime}$ which makes the diagram commute.

Proof. To prove (1), observe that the hypothesis implies that there is some $h \in$ $\operatorname{Hom}_{\mathcal{A}}(x, w)$ of degree -1 such that $b f-g a=d(h)$. Since $f$ is an admissible monomorphism, there is a morphism $\pi: y \rightarrow x$ in the category $\mathcal{A}$ of degree 0 . Let $b^{\prime}=b-d(h \pi)$. Then

$$
\begin{aligned}
b^{\prime} f=b f-d(h \pi) f & =b f-d(h \pi f) \quad(\text { since } d(f)=0) \\
& =b f-d(h) \\
& =g a
\end{aligned}
$$

as desired. The proof for (2) is omitted.
The following lemma is the analogue of Lemma 22.7.4.
09QM Lemma 22.20.6. In Situation 22.20.2 let $\alpha: x \rightarrow y$ be a morphism in $\operatorname{Comp}(\mathcal{A})$. Then there exists a factorization in $\operatorname{Comp}(\mathcal{A})$ :

$$
x \xrightarrow{\tilde{\alpha}} \tilde{y} \underset{s}{\stackrel{\pi}{\longleftrightarrow}} y
$$

such that
(1) $\tilde{\alpha}$ is an admissible monomorphism, and $\pi \tilde{\alpha}=\alpha$.
(2) There exists a morphism $s: y \rightarrow \tilde{y}$ in $\operatorname{Comp}(\mathcal{A})$ such that $\pi s=1_{y}$ and $s \pi$ is homotopic to $1_{\tilde{y}}$.
Proof. By axiom (B), we may let $\tilde{y}$ be the differential graded direct sum of $y$ and $C\left(1_{x}\right)$, i.e., there exists a diagram

$$
y \underset{\pi}{\rightleftarrows} y \oplus C\left(1_{x}\right) \xrightarrow[t]{\rightleftarrows} \stackrel{p}{\rightleftarrows} C\left(1_{x}\right)
$$

where all morphisms are of degree zero, and in $\operatorname{Comp}(\mathcal{A})$. Let $\tilde{y}=y \oplus C\left(1_{x}\right)$. Then $1_{\tilde{y}}=s \pi+t p$. Consider now the diagram

$$
x \xrightarrow{\tilde{\alpha}} \tilde{\longrightarrow} \tilde{{ }_{s}} \underset{\underset{\sim}{\pi}}{\underset{~}{~}} y
$$

where $\tilde{\alpha}$ is induced by the morphism $x \xrightarrow{\alpha} y$ and the natural morphism $x \rightarrow C\left(1_{x}\right)$ fitting in the admissible short exact sequence

$$
x \rightleftarrows C\left(1_{x}\right) \rightleftarrows x[1]
$$

So the morphism $C\left(1_{x}\right) \rightarrow x$ of degree 0 in this diagram, together with the zero morphism $y \rightarrow x$, induces a degree- 0 morphism $\beta: \tilde{y} \rightarrow x$. Then $\tilde{\alpha}$ is an admissible monomorphism since it fits into the admissible short exact sequence

$$
x \xrightarrow{\tilde{\alpha}} \tilde{y} \longrightarrow x[1]
$$

Furthermore, $\pi \tilde{\alpha}=\alpha$ by the construction of $\tilde{\alpha}$, and $\pi s=1_{y}$ by the first diagram. It remains to show that $s \pi$ is homotopic to $1_{\tilde{y}}$. Write $1_{x}$ as $d(h)$ for some degree -1 map. Then, our last statement follows from

$$
\begin{aligned}
1_{\tilde{y}}-s \pi & =t p \\
& =t(d h) p \quad(\text { by Lemma } 22.20 .4) \\
& =d(t h p)
\end{aligned}
$$

since $d t=d p=0$, and $t$ is of degree zero.
The following lemma is the analogue of Lemma 22.7.5.
09QN Lemma 22.20.7. In Situation 22.20.2 let $x_{1} \rightarrow x_{2} \rightarrow \ldots \rightarrow x_{n}$ be a sequence of composable morphisms in $\operatorname{Comp}(\mathcal{A})$. Then there exists a commutative diagram in $\operatorname{Comp}(\mathcal{A}):$

such that each $y_{i} \rightarrow y_{i+1}$ is an admissible monomorphism and each $y_{i} \rightarrow x_{i}$ is a homotopy equivalence.

Proof. The case for $n=1$ is trivial: one simply takes $y_{1}=x_{1}$ and the identity morphism on $x_{1}$ is in particular a homotopy equivalence. The case $n=2$ is given by Lemma 22.20.6. Suppose we have constructed the diagram up to $x_{n-1}$. We apply Lemma 22.20 .6 to the composition $y_{n-1} \rightarrow x_{n-1} \rightarrow x_{n}$ to obtain $y_{n}$. Then $y_{n-1} \rightarrow$ $y_{n}$ will be an admissible monomorphism, and $y_{n} \rightarrow x_{n}$ a homotopy equivalence.

The following lemma is the analogue of Lemma 22.7.6.
09QP Lemma 22.20.8. In Situation 22.20.2 let $x_{i} \rightarrow y_{i} \rightarrow z_{i}$ be morphisms in $\mathcal{A}$ ( $i=1,2,3$ ) such that $x_{2} \rightarrow y_{2} \rightarrow z_{2}$ is an admissible short exact sequence. Let $b: y_{1} \rightarrow y_{2}$ and $b^{\prime}: y_{2} \rightarrow y_{3}$ be morphisms in $\operatorname{Comp}(\mathcal{A})$ such that

commute up to homotopy. Then $b^{\prime} \circ b$ is homotopic to 0 .
Proof. By Lemma 22.20.5, we can replace $b$ and $b^{\prime}$ by homotopic maps $\tilde{b}$ and $\tilde{b}^{\prime}$, such that the right square of the left diagram commutes and the left square of the right diagram commutes. Say $b=\tilde{b}+d(h)$ and $b^{\prime}=\tilde{b}^{\prime}+d\left(h^{\prime}\right)$ for degree -1 morphisms $h$ and $h^{\prime}$ in $\mathcal{A}$. Hence

$$
b^{\prime} b=\tilde{b}^{\prime} \tilde{b}+d\left(\tilde{b}^{\prime} h+h^{\prime} \tilde{b}+h^{\prime} d(h)\right)
$$

since $d(\tilde{b})=d\left(\tilde{b}^{\prime}\right)=0$, i.e. $b^{\prime} b$ is homotopic to $\tilde{b}^{\prime} \tilde{b}$. We now want to show that $\tilde{b}^{\prime} \tilde{b}=0$. Because $x_{2} \xrightarrow{f} y_{2} \xrightarrow{g} z_{2}$ is an admissible short exact sequence, there exist degree 0 morphisms $\pi: y_{2} \rightarrow x_{2}$ and $s: z_{2} \rightarrow y_{2}$ such that $\mathrm{id}_{y_{2}}=f \pi+s g$. Therefore

$$
\tilde{b}^{\prime} \tilde{b}=\tilde{b}^{\prime}(f \pi+s g) \tilde{b}=0
$$

since $g \tilde{b}=0$ and $\tilde{b}^{\prime} f=0$ as consequences of the two commuting squares.
The following lemma is the analogue of Lemma 22.8.1.
09QQ Lemma 22.20.9. In Situation 22.20.2 let $0 \rightarrow x \rightarrow y \rightarrow z \rightarrow 0$ be an admissible short exact sequence in $\operatorname{Comp}(\mathcal{A})$. The triangle

$$
x \longrightarrow y \longrightarrow z \xrightarrow{\delta} x[1]
$$

with $\delta: z \rightarrow x[1]$ as defined in Lemma 22.20.1 is up to canonical isomorphism in $K(\mathcal{A})$, independent of the choices made in Lemma 22.20.1.

Proof. Suppose $\delta$ is defined by the splitting

$$
x \underset{\pi}{<} \stackrel{a}{<} y \underset{s}{<} z
$$

and $\delta^{\prime}$ is defined by the splitting with $\pi^{\prime}, s^{\prime}$ in place of $\pi, s$. Then

$$
s^{\prime}-s=(a \pi+s b)\left(s^{\prime}-s\right)=a \pi s^{\prime}
$$

since $b s^{\prime}=b s=1_{z}$ and $\pi s=0$. Similarly,

$$
\pi^{\prime}-\pi=\left(\pi^{\prime}-\pi\right)(a \pi+s b)=\pi^{\prime} s b
$$

Since $\delta=\pi d(s)$ and $\delta^{\prime}=\pi^{\prime} d\left(s^{\prime}\right)$ as constructed in Lemma 22.20.1, we may compute

$$
\delta^{\prime}=\pi^{\prime} d\left(s^{\prime}\right)=\left(\pi+\pi^{\prime} s b\right) d\left(s+a \pi s^{\prime}\right)=\delta+d\left(\pi s^{\prime}\right)
$$

using $\pi a=1_{x}, b a=0$, and $\pi^{\prime} \operatorname{sbd}\left(s^{\prime}\right)=\pi^{\prime} s b a \pi d\left(s^{\prime}\right)=0$ by formula (5) in Lemma 22.20 .1 .

The following lemma is the analogue of Lemma 22.9.1.
09QR Lemma 22.20.10. In Situation 22.20.2 let $f: x \rightarrow y$ be a morphism in $\operatorname{Comp}(\mathcal{A})$. The triangle $(y, c(f), x[1], i, p, f[1])$ is the triangle associated to the admissible short exact sequence

$$
y \longrightarrow c(f) \longrightarrow x[1]
$$

where the cone $c(f)$ is defined as in Lemma 22.20.1.
Proof. This follows from axiom (C).
The following lemma is the analogue of Lemma 22.9.2.

09QS Lemma 22.20.11. In Situation 22.20.2 let $\alpha: x \rightarrow y$ and $\beta: y \rightarrow z$ define an admissible short exact sequence

$$
x \longrightarrow y \longrightarrow z
$$

in $\operatorname{Comp}(\mathcal{A})$. Let $(x, y, z, \alpha, \beta, \delta)$ be the associated triangle in $K(\mathcal{A})$. Then, the triangles

$$
(z[-1], x, y, \delta[-1], \alpha, \beta) \quad \text { and } \quad(z[-1], x, c(\delta[-1]), \delta[-1], i, p)
$$

are isomorphic.
Proof. We have a diagram of the form

with splittings to $\alpha, \beta, i$, and $p$ given by $\tilde{\alpha}, \tilde{\beta}, \tilde{i}$, and $\tilde{p}$ respectively. Define a mor$\operatorname{phism} y \rightarrow c(\delta[-1])$ by $i \tilde{\alpha}+\tilde{p} \beta$ and a morphism $c(\delta[-1]) \rightarrow y$ by $\alpha \tilde{i}+\tilde{\beta} p$. Let us first check that these define morphisms in $\operatorname{Comp}(\mathcal{A})$. We remark that by identities from Lemma 22.20.1, we have the relation $\delta[-1]=\tilde{\alpha} d(\tilde{\beta})=-d(\tilde{\alpha}) \tilde{\beta}$ and the relation $\delta[-1]=\tilde{i} d(\tilde{p})$. Then

$$
\begin{aligned}
d(\tilde{\alpha}) & =d(\tilde{\alpha}) \tilde{\beta} \beta \\
& =-\delta[-1] \beta
\end{aligned}
$$

where we have used equation (6) of Lemma 22.20 .1 for the first equality and the preceeding remark for the second. Similarly, we obtain $d(\tilde{p})=i \delta[-1]$. Hence

$$
\begin{aligned}
d(i \tilde{\alpha}+\tilde{p} \beta) & =d(i) \tilde{\alpha}+i d(\tilde{\alpha})+d(\tilde{p}) \beta+\tilde{p} d(\beta) \\
& =i d(\tilde{\alpha})+d(\tilde{p}) \beta \\
& =-i \delta[-1] \beta+i \delta[-1] \beta \\
& =0
\end{aligned}
$$

so $i \tilde{\alpha}+\tilde{p} \beta$ is indeed a morphism of $\operatorname{Comp}(\mathcal{A})$. By a similar calculation, $\alpha \tilde{i}+\tilde{\beta} p$ is also a morphism of $\operatorname{Comp}(\mathcal{A})$. It is immediate that these morphisms fit in the commutative diagram. We compute:

$$
\begin{aligned}
(i \tilde{\alpha}+\tilde{p} \beta)(\alpha \tilde{i}+\tilde{\beta} p) & =i \tilde{\alpha} \alpha \tilde{i}+i \tilde{\alpha} \tilde{\beta} p+\tilde{p} \beta \alpha \tilde{i}+\tilde{p} \beta \tilde{\beta} p \\
& =i \tilde{i}+\tilde{p} p \\
& =1_{c(\delta[-1])}
\end{aligned}
$$

where we have freely used the identities of Lemma 22.20.1. Similarly, we compute $(\alpha \tilde{i}+\tilde{\beta} p)(i \tilde{\alpha}+\tilde{p} \beta)=1_{y}$, so we conclude $y \cong c(\delta[-1])$. Hence, the two triangles in question are isomorphic.

The following lemma is the analogue of Lemma 22.9.3.
09QT Lemma 22.20.12. In Situation 22.20.2 let $f_{1}: x_{1} \rightarrow y_{1}$ and $f_{2}: x_{2} \rightarrow y_{2}$ be morphisms in $\operatorname{Comp}(\mathcal{A})$. Let

$$
(a, b, c):\left(x_{1}, y_{1}, c\left(f_{1}\right), f_{1}, i_{1}, p_{1}\right) \rightarrow\left(x_{2}, y_{2}, c\left(f_{2}\right), f_{2}, i_{1}, p_{1}\right)
$$

be any morphism of triangles in $K(\mathcal{A})$. If a and $b$ are homotopy equivalences, then so is $c$.

Proof. Since $a$ and $b$ are homotopy equivalences, they are invertible in $K(\mathcal{A})$ so let $a^{-1}$ and $b^{-1}$ denote their inverses in $K(\mathcal{A})$, giving us a commutative diagram

where the map $c^{\prime}$ is defined via Lemma 22.20 .3 applied to the left commutative box of the above diagram. Since the diagram commutes in $K(\mathcal{A})$, it suffices by Lemma 22.20 .8 to prove the following: given a morphism of triangle $(1,1, c)$ : $(x, y, c(f), f, i, p) \rightarrow(x, y, c(f), f, i, p)$ in $K(\mathcal{A})$, the map $c$ is an isomorphism in $K(\mathcal{A})$. We have the commutative diagrams in $K(\mathcal{A})$ :

Since the rows are admissible short exact sequences, we obtain the identity $(c-1)^{2}=$ 0 by Lemma 22.20 .8 , from which we conclude that $2-c$ is inverse to $c$ in $K(\mathcal{A})$ so that $c$ is an isomorphism.

The following lemma is the analogue of Lemma 22.9.4.
09QU Lemma 22.20.13. In Situation 22.20.2.
(1) Given an admissible short exact sequence $x \xrightarrow{\alpha} y \xrightarrow{\beta} z$. Then there exists a homotopy equivalence $e: C(\alpha) \rightarrow z$ such that the diagram

09QV

defines an isomorphism of triangles in $K(\mathcal{A})$. Here $y \xrightarrow{b} C(\alpha) \xrightarrow{c} x[1]$ is the admissible short exact sequence given as in axiom $(C)$.
(2) Given a morphism $\alpha: x \rightarrow y$ in $\operatorname{Comp}(\mathcal{A})$, let $x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow y$ be the factorization given as in Lemma 22.20.6, where the admissible monomorphism $x \xrightarrow{\tilde{\alpha}} y$ extends to the admissible short exact sequence

$$
x \xrightarrow{\tilde{\alpha}} \tilde{y} \longrightarrow z
$$

Then there exists an isomorphism of triangles

where the upper triangle is the triangle associated to the sequence $x \xrightarrow{\tilde{\alpha}}$ $\tilde{y} \rightarrow z$.

Proof. For (1), we consider the more complete diagram, without the sign change on $c$ :

where the admissible short exact sequence $x \xrightarrow{\alpha} y \xrightarrow{\beta} z$ is given the splitting $\pi, s$, and the admissible short exact sequence $y \xrightarrow{b} C(\alpha) \xrightarrow{c} x[1]$ is given the splitting $p$, $\sigma$. Note that (identifying hom-sets under shifting)

$$
\alpha=p d(\sigma)=-d(p) \sigma, \quad \delta=\pi d(s)=-d(\pi) s
$$

by the construction in Lemma 22.20.1.
We define $e=\beta p$ and $f=b s-\sigma \delta$. We first check that they are morphisms in $\operatorname{Comp}(\mathcal{A})$. To show that $d(e)=\beta d(p)$ vanishes, it suffices to show that $\beta d(p) b$ and $\beta d(p) \sigma$ both vanish, whereas

$$
\beta d(p) b=\beta d(p b)=\beta d\left(1_{y}\right)=0, \quad \beta d(p) \sigma=-\beta \alpha=0
$$

Similarly, to check that $d(f)=b d(s)-d(\sigma) \delta$ vanishes, it suffices to check the post-compositions by $p$ and $c$ both vanish, whereas

$$
\begin{aligned}
p b d(s)-p d(\sigma) \delta & =d(s)-\alpha \delta
\end{aligned}=d(s)-\alpha \pi d(s)=0 ~ 子 \begin{aligned}
& c b d(s)-c d(\sigma) \delta
\end{aligned}=-c d(\sigma) \delta=-d(c \sigma) \delta=0
$$

The commutativity of left two squares of the diagram 22.20 .13 .1 follows directly from definition. Before we prove the commutativity of the right square (up to homotopy), we first check that $e$ is a homotopy equivalence. Clearly,

$$
e f=\beta p(b s-\sigma \delta)=\beta s=1_{z}
$$

To check that $f e$ is homotopic to $1_{C(\alpha)}$, we first observe

$$
b \alpha=b p d(\alpha)=d(\sigma), \quad \alpha c=-d(p) \sigma c=-d(p), \quad d(\pi) p=d(\pi) s \beta p=-\delta \beta p
$$

Using these identities, we compute

$$
\begin{aligned}
1_{C(\alpha)} & =b p+\sigma c \quad(\text { from } y \xrightarrow{b} C(\alpha) \stackrel{c}{\rightarrow} x[1]) \\
& =b(\alpha \pi+s \beta) p+\sigma(\pi \alpha) c \quad(\text { from } x \xrightarrow{\alpha} y \xrightarrow{\beta} z) \\
& =d(\sigma) \pi p+b s \beta p-\sigma \pi d(p) \quad \text { (by the first two identities above) } \\
& =d(\sigma) \pi p+b s \beta p-\sigma \delta \beta p+\sigma \delta \beta p-\sigma \pi d(p) \\
& =(b s-\sigma \delta) \beta p+d(\sigma) \pi p-\sigma d(\pi) p-\sigma \pi d(p) \quad \text { (by the third identity above) } \\
& =f e+d(\sigma \pi p)
\end{aligned}
$$

since $\sigma \in \operatorname{Hom}^{-1}(x, C(\alpha))$ (cf. proof of Lemma 22.20.4. Hence $e$ and $f$ are homotopy inverses. Finally, to check that the right square of diagram 22.20.13.1 commutes up to homotopy, it suffices to check that $-c f=\delta$. This follows from

$$
-c f=-c(b s-\sigma \delta)=c \sigma \delta=\delta
$$

since $c b=0$.
For (2), consider the factorization $x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow y$ given as in Lemma 22.20.6, so the second morphism is a homotopy equivalence. By Lemmas 22.20 .3 and 22.20.12, there exists an isomorphism of triangles between

$$
x \xrightarrow{\alpha} y \rightarrow C(\alpha) \rightarrow x[1] \quad \text { and } \quad x \xrightarrow{\tilde{\alpha}} \tilde{y} \rightarrow C(\tilde{\alpha}) \rightarrow x[1]
$$

Since we can compose isomorphisms of triangles, by replacing $\alpha$ by $\tilde{\alpha}, y$ by $\tilde{y}$, and $C(\alpha)$ by $C(\tilde{\alpha})$, we may assume $\alpha$ is an admissible monomorphism. In this case, the result follows from (1).

The following lemma is the analogue of Lemma 22.10.1.
09QW Lemma 22.20.14. In Situation 22.20.2 the homotopy category $K(\mathcal{A})$ with its natural translation functors and distinguished triangles is a pre-triangulated category.
Proof. We will verify each of TR1, TR2, and TR3.
Proof of TR1. By definition every triangle isomorphic to a distinguished one is distinguished. Since

$$
x \xrightarrow{1_{x}}>x \longrightarrow 0
$$

is an admissible short exact sequence, $\left(x, x, 0,1_{x}, 0,0\right)$ is a distinguished triangle. Moreover, given a morphism $\alpha: x \rightarrow y \operatorname{in} \operatorname{Comp}(\mathcal{A})$, the triangle given by $(x, y, c(\alpha), \alpha, i,-p)$ is distinguished by Lemma 22.20.13.
Proof of TR2. Let $(x, y, z, \alpha, \beta, \gamma)$ be a triangle and suppose $(y, z, x[1], \beta, \gamma,-\alpha[1])$ is distinguished. Then there exists an admissible short exact sequence $0 \rightarrow x^{\prime} \rightarrow$ $y^{\prime} \rightarrow z^{\prime} \rightarrow 0$ such that the associated triangle ( $x^{\prime}, y^{\prime}, z^{\prime}, \alpha^{\prime}, \beta^{\prime}, \gamma^{\prime}$ ) is isomorphic to $(y, z, x[1], \beta, \gamma,-\alpha[1])$. After rotating, we conclude that $(x, y, z, \alpha, \beta, \gamma)$ is isomorphic to $\left(z^{\prime}[-1], x^{\prime}, y^{\prime}, \gamma^{\prime}[-1], \alpha^{\prime}, \beta^{\prime}\right)$. By Lemma 22.20.11, we deduce that $\left(z^{\prime}[-1], x^{\prime}, y^{\prime}, \gamma^{\prime}[-1], \alpha^{\prime}, \beta^{\prime}\right)$ is isomorphic to $\left(z^{\prime}[-1], x^{\prime}, c\left(\gamma^{\prime}[-1]\right), \gamma^{\prime}[-1], i, p\right)$. Composing the two isomorphisms with sign changes as indicated in the following diagram:

We conclude that $(x, y, z, \alpha, \beta, \gamma)$ is distinguished by Lemma 22.20.13 (2). Conversely, suppose that $(x, y, z, \alpha, \beta, \gamma)$ is distinguished, so that by Lemma 22.20 .13 (1), it is isomorphic to a triangle of the form $\left(x^{\prime}, y^{\prime}, c\left(\alpha^{\prime}\right), \alpha^{\prime}, i,-p\right)$ for some mor$\operatorname{phism} \alpha^{\prime}: x^{\prime} \rightarrow y^{\prime}$ in $\operatorname{Comp}(\mathcal{A})$. The rotated triangle ( $y, z, x[1], \beta, \gamma,-\alpha[1]$ ) is isomorphic to the triangle $\left(y^{\prime}, c\left(\alpha^{\prime}\right), x^{\prime}[1], i,-p,-\alpha[1]\right)$ which is isomorphic to $\left(y^{\prime}, c\left(\alpha^{\prime}\right), x^{\prime}[1], i, p, \alpha[1]\right)$. By Lemma 22.20 .10 , this triangle is distinguished, from which it follows that $(y, z, x[1], \beta, \gamma,-\alpha[1])$ is distinguished.
Proof of TR3: Suppose ( $x, y, z, \alpha, \beta, \gamma$ ) and ( $x^{\prime}, y^{\prime}, z^{\prime}, \alpha^{\prime}, \beta^{\prime}, \gamma^{\prime}$ ) are distinguished triangles of $\operatorname{Comp}(\mathcal{A})$ and let $f: x \rightarrow x^{\prime}$ and $g: y \rightarrow y^{\prime}$ be morphisms such that $\alpha^{\prime} \circ f=g \circ \alpha$. By Lemma 22.20.13, we may assume that $(x, y, z, \alpha, \beta, \gamma)=$
$(x, y, c(\alpha), \alpha, i,-p)$ and $\left(x^{\prime}, y^{\prime}, z^{\prime}, \alpha^{\prime}, \beta^{\prime}, \gamma^{\prime}\right)=\left(x^{\prime}, y^{\prime}, c\left(\alpha^{\prime}\right), \alpha^{\prime}, i^{\prime},-p^{\prime}\right)$. Now apply Lemma 22.20.3 and we are done.

The following lemma is the analogue of Lemma 22.10 .2
09QX Lemma 22.20.15. In Situation 22.20.2 given admissible monomorphisms $x \xrightarrow{\alpha} y$, $y \xrightarrow{\beta} z$ in $\mathcal{A}$, there exist distinguished triangles $\left(x, y, q_{1}, \alpha, p_{1}, \delta_{1}\right),\left(x, z, q_{2}, \beta \alpha, p_{2}, \delta_{2}\right)$ and $\left(y, z, q_{3}, \beta, p_{3}, \delta_{3}\right)$ for which TR4 holds.

Proof. Given admissible monomorphisms $x \xrightarrow{\alpha} y$ and $y \xrightarrow{\beta} z$, we can find distinguished triangles, via their extensions to admissible short exact sequences,

$$
\begin{aligned}
& x \underset{\pi_{1}}{\stackrel{\alpha}{\rightleftarrows}} y \underset{s_{1}}{\stackrel{p_{1}}{\rightleftarrows}} q_{1} \xrightarrow{\delta_{1}} x[1] \\
& x \underset{\pi_{1} \pi_{3}}{\stackrel{\beta \alpha}{\rightleftarrows}} z \stackrel{p_{2}}{\underset{s_{2}}{\rightleftarrows}} q_{2} \xrightarrow{\delta_{2}} x[1] \\
& y \underset{\pi_{3}}{\rightleftarrows} z \underset{s_{3}}{\stackrel{\beta}{\rightleftarrows}} q_{3} \xrightarrow{p_{3}} x[1]
\end{aligned}
$$

In these diagrams, the maps $\delta_{i}$ are defined as $\delta_{i}=\pi_{i} d\left(s_{i}\right)$ analagous to the maps defined in Lemma 22.20.1. They fit in the following solid commutative diagram

where we have defined the dashed arrows as indicated. Clearly, their composition $p_{3} s_{2} p_{2} \beta s_{1}=0$ since $s_{2} p_{2}=0$. We claim that they both are morphisms of $\operatorname{Comp}(\mathcal{A})$. We can check this using equations in Lemma 22.20.1

$$
d\left(p_{2} \beta s_{1}\right)=p_{2} \beta d\left(s_{1}\right)=p_{2} \beta \alpha \pi_{1} d\left(s_{1}\right)=0
$$

since $p_{2} \beta \alpha=0$, and

$$
d\left(p_{3} s_{2}\right)=p_{3} d\left(s_{2}\right)=p_{3} \beta \alpha \pi_{1} \pi_{3} d\left(s_{2}\right)=0
$$

since $p_{3} \beta=0$. To check that $q_{1} \rightarrow q_{2} \rightarrow q_{3}$ is an admissible short exact sequence, it remains to show that in the underlying graded category, $q_{2}=q_{1} \oplus q_{3}$ with the above two morphisms as coprojection and projection. To do this, observe that in the underlying graded category $\mathcal{C}$, there hold

$$
y=x \oplus q_{1}, \quad z=y \oplus q_{3}=x \oplus q_{1} \oplus q_{3}
$$

where $\pi_{1} \pi_{3}$ gives the projection morphism onto the first factor: $x \oplus q_{1} \oplus q_{3} \rightarrow z$. By axiom (A) on $\mathcal{A}, \mathcal{C}$ is an additive category, hence we may apply Homology, Lemma 12.3.10 and conclude that

$$
\operatorname{Ker}\left(\pi_{1} \pi_{3}\right)=q_{1} \oplus q_{3}
$$

in $\mathcal{C}$. Another application of Homology, Lemma 12.3 .10 to $z=x \oplus q_{2}$ gives $\operatorname{Ker}\left(\pi_{1} \pi_{3}\right)=q_{2}$. Hence $q_{2} \cong q_{1} \oplus q_{3}$ in $\mathcal{C}$. It is clear that the dashed morphisms defined above give coprojection and projection.

Finally, we have to check that the morphism $\delta: q_{3} \rightarrow q_{1}[1]$ induced by the admissible short exact sequence $q_{1} \rightarrow q_{2} \rightarrow q_{3}$ agrees with $p_{1} \delta_{3}$. By the construction in Lemma 22.20.1 the morphism $\delta$ is given by

$$
\begin{aligned}
p_{1} \pi_{3} s_{2} d\left(p_{2} s_{3}\right) & =p_{1} \pi_{3} s_{2} p_{2} d\left(s_{3}\right) \\
& =p_{1} \pi_{3}\left(1-\beta \alpha \pi_{1} \pi_{3}\right) d\left(s_{3}\right) \\
& =p_{1} \pi_{3} d\left(s_{3}\right) \quad\left(\text { since } \pi_{3} \beta=0\right) \\
& =p_{1} \delta_{3}
\end{aligned}
$$

as desired. The proof is complete.
Putting everything together we finally obtain the analogue of Proposition 22.10.3.
09QY Proposition 22.20.16. In Situation 22.20.2 the homotopy category $K(\mathcal{A})$ with its natural translation functors and distinguished triangles is a triangulated category.

Proof. By Lemma 22.20 .14 we know that $K(\mathcal{A})$ is pre-triangulated. Combining Lemmas 22.20.7 and 22.20.15 with Derived Categories, Lemma 13.4.13, we conclude that $K(\mathcal{A})$ is a triangulated category.

### 22.21. Derived Hom

09LF Let $R$ be a ring. Let $(B, \mathrm{~d})$ be a differential graded algebra over $R$. Denote $\mathcal{B}=\operatorname{Mod}_{(B, \mathrm{~d})}^{d g}$ the differential graded category of differential graded $B$-modules, see Example 22.19.8, Let $N$ be a differential graded $B$-module. Then the endomorphisms of $N$ in $\mathcal{B}$

$$
\operatorname{Hom}_{\mathcal{B}}(N, N)
$$

is differential graded algebra over $R$. Now let $N^{\prime}$ be a second differential graded $B$-module. Then

$$
\operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right)
$$

becomes a right differential graded $\operatorname{Hom}_{\mathcal{B}}(N, N)$-module by the composition

$$
\operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right) \times \operatorname{Hom}_{\mathcal{B}}(N, N) \longrightarrow \operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right)
$$

We need one more piece of data, in order to be able to formulate the results in the correct generality. Namely, let $(A, \mathrm{~d})$ be a differential graded $R$-algebra and let $A \rightarrow \operatorname{Hom}_{\mathcal{B}}(N, N)$ be a homomorphism of differential graded $R$-algebras ${ }^{4}$. Using this homomorphism we obtain a functor

09LG

$$
\begin{equation*}
\operatorname{Mod}_{(B, \mathrm{~d})} \longrightarrow \operatorname{Mod}_{(A, \mathrm{~d})}, \quad N^{\prime} \longmapsto \operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right) \tag{22.21.0.1}
\end{equation*}
$$

where $A$ acts on $\operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right)$ via the given homomorphism and the action of $\operatorname{Hom}_{\mathcal{B}}(N, N)$ given above.

[^60]09LH Lemma 22.21.1. The functor (22.21.0.1) defines an exact functor of triangulated categories $K\left(\operatorname{Mod}_{(B, d)}\right) \rightarrow K\left(\operatorname{Mod}_{(A, d)}\right)$.

Proof. Combining Lemmas 22.19.9, 22.19.10, and 22.19.5 we obtain the functor of the statement. We have to show that (22.21.0.1) transforms distinguished triangles into distinguished triangles. To see this suppose that $0 \rightarrow N_{1} \rightarrow N_{2} \rightarrow N_{3} \rightarrow 0$ is an admissible short exact sequence of differential graded $B$-modules. Let $s: N_{3} \rightarrow N_{2}$ be a graded $B$-module homomorphism which is left inverse to $N_{2} \rightarrow N_{3}$. Then $s$ defines a graded $A$-module homomorphism $\operatorname{Hom}_{\mathcal{B}}\left(N, N_{3}\right) \rightarrow \operatorname{Hom}_{\mathcal{B}}\left(N, N_{2}\right)$ which is left inverse to $\operatorname{Hom}_{\mathcal{B}}\left(N, N_{2}\right) \rightarrow \operatorname{Hom}_{\mathcal{B}}\left(N, N_{3}\right)$. This finishes the proof.

At this point we can consider the diagram

We would like to construct a dotted arrow as the right derived functor of the composition $F$. (Warning: the diagram will not commute.) Namely, in the general setting of Derived Categories, Section 13.15 we want to compute the right derived functor of $F$ with respect to the multplicative system of quasi-isomorphisms in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$.

09LI Lemma 22.21.2. In the situation above, the right derived functor of $F$ exists. We denote it $R \operatorname{Hom}(N,-): D(B, d) \rightarrow D(A, d)$.

Proof. We will use Derived Categories, Lemma 13.15 .15 to prove this. As our collection $\mathcal{I}$ of objects we will use the objects with property (I). Property (1) was shown in Lemma 22.14.4 Property (2) holds because if $s: I \rightarrow I^{\prime}$ is a quasiisomorphism of modules with property (I), then $s$ is a homotopy equivalence by Lemma 22.15.3.

### 22.22. Variant of derived Hom

09 LJ Let $\mathcal{A}$ be an abelian category. Consider the differential graded category $\operatorname{Comp}^{d g}(\mathcal{A})$ of complexes of $\mathcal{A}$, see Example 22.19.6. Let $K^{\bullet}$ be a complex of $\mathcal{A}$. Set

$$
(E, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{A})}\left(K^{\bullet}, K^{\bullet}\right)
$$

and consider the functor of differential graded categories

$$
\operatorname{Comp}^{d g}(\mathcal{A}) \longrightarrow \operatorname{Mod}_{(E, \mathrm{~d})}^{d g}, \quad X^{\bullet} \longmapsto \operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{A})}\left(K^{\bullet}, X^{\bullet}\right)
$$

of Lemma 22.19.10.
09LK Lemma 22.22.1. In the situation above. If the right derived functor $R \operatorname{Hom}\left(K^{\bullet},-\right)$ of $\operatorname{Hom}\left(K^{\bullet},-\right): K(\mathcal{A}) \rightarrow D(A b)$ is everywhere defined on $D(\mathcal{A})$, then we obtain a canonical exact functor

$$
R \operatorname{Hom}\left(K^{\bullet},-\right): D(\mathcal{A}) \longrightarrow D(E, d)
$$

of triangulated categories which reduces to the usual one on taking associated complexes of abelian groups.

Proof. Note that we have an associated functor $K(\mathcal{A}) \rightarrow K\left(\operatorname{Mod}_{(E, \mathrm{~d})}\right)$ by Lemma 22.19.10. We claim this functor is an exact functor of triangulated categories. Namely, let $f: A^{\bullet} \rightarrow B^{\bullet}$ be a map of complexes of $\mathcal{A}$. Then a computation shows that
$\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{A})}\left(K^{\bullet}, C(f)^{\bullet}\right)=C\left(\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{A})}\left(K^{\bullet}, A^{\bullet}\right) \rightarrow \operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{A})}\left(K^{\bullet}, B^{\bullet}\right)\right)$
where the right hand side is the cone in $\operatorname{Mod}_{(E, \mathrm{~d})}$ defined earlier in this chapter. This shows that our functor is compatible with cones, hence with distinguished triangles. Let $X^{\bullet}$ be an object of $K(\mathcal{A})$. Consider the category of quasi-isomorphisms $s: X^{\bullet} \rightarrow Y^{\bullet}$. We are given that the functor $\left(s: X^{\bullet} \rightarrow Y^{\bullet}\right) \mapsto \operatorname{Hom}_{\mathcal{A}}\left(K^{\bullet}, Y^{\bullet}\right)$ is essentially constant when viewed in $D(A b)$. But since the forgetful functor $D(E, \mathrm{~d}) \rightarrow D(A b)$ is compatible with taking cohomology, the same thing is true in $D(E, \mathrm{~d})$. This proves the lemma.

Warning: Although the lemma holds as stated and may be useful as stated, the differential algebra $E$ isn't the "correct" one unless $H^{n}(E)=\operatorname{Ext}_{D(\mathcal{A})}^{n}\left(K^{\bullet}, K^{\bullet}\right)$ for all $n \in \mathbf{Z}$.

### 22.23. Tensor product

09LL This section should be moved somewhere else. Let $R$ be a ring. Let $A$ be an $R$ algebra (see Section 22.2). Given a right $A$-module $M$ and a left $A$-module $N$ there is a tensor product

$$
M \otimes_{A} N
$$

This tensor product is a module over $R$. In fact, it is the receptacle of the universal $A$-bilinear map $M \times N \rightarrow M \otimes_{A} N,(m, n) \mapsto m \otimes n$.

We list some properties of the tensor product
(1) In each variable the tensor product is right exact, in fact commutes with direct sums and arbitrary colimits.
(2) If $A, M, N$ are graded and the module structures are compatible with gradings then $M \otimes_{A} N$ is graded as well. Then $n$th graded piece $\left(M \otimes_{A} N\right)^{n}$ of $M \otimes_{A} N$ is the quotient of $\bigoplus_{p+q=n} M^{p} \otimes_{A^{0}} N^{q}$ by the submodule generated by $m \otimes a n-m a \otimes n$ where $m \in M^{p}, n \in N^{q}$, and $a \in A^{n-p-q}$.
(3) If $(A, \mathrm{~d})$ is a differential graded algebra, and $M$ and $N$ are (left and right) differential graded $A$-modules, then $M \otimes_{A} N$ is a differential graded $R$ module with differential

$$
\mathrm{d}(m \otimes n)=\mathrm{d}(m) \otimes n+(-1)^{i} m \otimes \mathrm{~d}(n)
$$

for $m \in M^{i}$ and $n \in N$.
(4) If $N$ is a $(A, B)$-bimodule then $M \otimes_{A} N$ is a right $B$-module.
(5) If $A$ and $B$ are graded algebras, $M$ is a graded $A$-module, and $N$ is an ( $A, B$ )-bimodule which comes with a grading such that it is both a left graded $A$-module and a right graded $B$-module, then $M \otimes_{A} N$ is a graded $B$-module.
(6) If $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ are differential graded algebras, $M$ is a differential graded $A$-module, and $N$ is an $(A, B)$-bimodule which comes with a grading and a differential such that it is both a left differential graded $A$ module and a right differential graded $B$-module, then $M \otimes_{A} N$ is a differential graded $B$-module.

In the last item, the condition may be more succintly stated by saying that $N$ is a differential graded module over $A^{\text {opp }} \otimes_{R} B$. We state the following as a lemma.

09LM Lemma 22.23.1. Let $(A, d)$ and $(B, d)$ be differential graded algebras, and let $N$ be an $(A, B)$-bimodule which comes with a grading and a differential such that it is both a left differential graded $A$-module and a right differential graded B-module. Then $M \mapsto M \otimes_{A} N$ defines a functor

$$
-\otimes_{A} N: \operatorname{Mod}_{(A, d)}^{d g} \longrightarrow \operatorname{Mod}_{(B, d)}^{d g}
$$

of differential graded categories. This functor induces functors

$$
\operatorname{Mod}_{(A, d)} \rightarrow \operatorname{Mod}_{(B, d)} \quad \text { and } \quad K\left(\operatorname{Mod}_{(A, d)}\right) \rightarrow K\left(\operatorname{Mod}_{(B, d)}\right)
$$

by an application of Lemma 22.19.5.
Proof. This follows from the discussion above.
If $A$ is an algebra and $M, M^{\prime}$ are right $A$-modules, then we define

$$
\operatorname{Hom}_{A}\left(M, M^{\prime}\right)=\left\{f: M \rightarrow M^{\prime} \mid f \text { is } A \text {-linear }\right\}
$$

as usual. If $A$ is graded and $M$ and $M^{\prime}$ are graded $A$-modules, then we recall (Example 22.18.6) that

$$
\operatorname{Hom}_{\operatorname{Mod}_{A}^{g r}}\left(M, M^{\prime}\right)=\bigoplus_{n \in \mathbf{Z}} \operatorname{Hom}^{n}\left(M, M^{\prime}\right)
$$

where $\operatorname{Hom}^{n}\left(M, M^{\prime}\right)$ is the collection of all $A$-module maps $M \rightarrow M^{\prime}$ which are homogeneous of degree $n$.

09LN Lemma 22.23.2. Let $A$ and $B$ be algebras. Let $M$ be a right $A$-module, $N$ an $(A, B)$-bimodule, and $N^{\prime}$ a right $B$-module. Then we have

$$
\operatorname{Hom}_{B}\left(M \otimes_{A} N, N^{\prime}\right)=\operatorname{Hom}_{A}\left(M, \operatorname{Hom}_{B}\left(N, N^{\prime}\right)\right)
$$

If $A, B, M, N, N^{\prime}$ are compatibly graded, then we have

$$
\operatorname{Hom}_{\operatorname{Mod}_{B}^{g r}}^{g r}\left(M \otimes_{A} N, N^{\prime}\right)=\operatorname{Hom}_{M o d_{A}^{g r}}\left(M, \operatorname{Hom}_{\operatorname{Mod}_{B}^{g r}}\left(N, N^{\prime}\right)\right)
$$

for the graded versions.
Proof. This follows by interpreting both sides as $A$-bilinear maps $\psi: M \times N \rightarrow N^{\prime}$ which are $B$-linear on the right.

### 22.24. Derived tensor product

09LP This section is analogous to More on Algebra, Section 15.50 .
Let $R$ be a ring. Let $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ be differential graded algebras over $R$. Let $N$ be a $(A, B)$-bimodule equipped with a grading and differential such that $N$ is a left differential graded $A$-module and a right differential graded $B$-module. In other words, $N$ is a differential graded $A^{o p p} \otimes_{R} B$-module. Consider the functor

09LQ $\quad(22.24 .0 .1) \quad \operatorname{Mod}_{(A, \mathrm{~d})} \longrightarrow \operatorname{Mod}_{(B, \mathrm{~d})}, \quad M \longmapsto M \otimes_{A} N$
defined in Section 22.23.
09LR Lemma 22.24.1. The functor (22.24.0.1) defines an exact functor of triangulated categories $K\left(\operatorname{Mod}_{(A, d)}\right) \rightarrow K\left(\operatorname{Mod}_{(B, d)}\right)$.

Proof. The functor was constructed in Lemma 22.23.1. We have to show that $-\otimes_{A} N$ transforms distinguished triangles into distinguished triangles. Suppose that $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is an admissible short exact sequence of differential graded $A$-modules. Let $s: M \rightarrow L$ be a graded $A$-module homomorphism which is left inverse to $L \rightarrow M$. Then $s$ defines a graded $B$-module homomorphism $M \otimes_{A} N \rightarrow L \otimes_{A} N$ which is left inverse to $L \otimes_{A} N \rightarrow M \otimes_{A} N$.

At this point we can consider the diagram

The dotted arrow that we will construct below will be the left derived functor of the composition $F$. (Warning: the diagram will not commute.) Namely, in the general setting of Derived Categories, Section 13.15 we want to compute the left derived functor of $F$ with respect to the multplicative system of quasi-isomorphisms in $K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)$.

09LS Lemma 22.24.2. In the situation above, the left derived functor of $F$ exists. We denote it $-\otimes_{A}^{\mathbf{L}} N: D(A, d) \rightarrow D(B, d)$.

Proof. We will use Derived Categories, Lemma 13.15 .15 to prove this. As our collection $\mathcal{P}$ of objects we will use the objects with property ( P ). Property (1) was shown in Lemma 22.13.4. Property (2) holds because if $s: P \rightarrow P^{\prime}$ is a quasiisomorphism of modules with property $(\mathrm{P})$, then $s$ is a homotopy equivalence by Lemma 22.15.3.

09S3 Remark 22.24.3. Let $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ be differential graded algebras. Let $f: N \rightarrow N^{\prime}$ be a homomorphism of differential graded $A^{o p p} \otimes_{R} B$-modules. Then $f$ induces a morphism of functors

$$
1 \otimes f:-\otimes_{A}^{\mathbf{L}} N \longrightarrow-\otimes_{A}^{\mathbf{L}} N^{\prime}
$$

If $f$ is a quasi-isomorphism, then $1 \otimes f$ is an isomorphism of functors.
09LT Lemma 22.24.4. Let $(A, d)$ and $(B, d)$ be differential graded algebras. Let $N$ be an $(A, B)$-bimodule which comes with a grading and a differential such that it is a differential graded module for both $A$ and $B$. Then the functors

$$
-\otimes_{A}^{\mathbf{L}} N: D(A, d) \longrightarrow D(B, d)
$$

of Lemma 22.24.2 and

$$
R \operatorname{Hom}(N,-): D(B, d) \longrightarrow D(A, d)
$$

of Lemma 22.21.2 are adjoint.
Proof. The statement means that we have

$$
\operatorname{Hom}_{D(A, \mathrm{~d})}\left(M, R \operatorname{Hom}\left(N, N^{\prime}\right)\right)=\operatorname{Hom}_{D(B, \mathrm{~d})}\left(M \otimes_{A}^{\mathbf{L}} N, N^{\prime}\right)
$$

bifunctorially in $M$ and $N^{\prime}$. To see this we may assume that $M$ is a differential graded $A$-module with property $(\mathrm{P})$ and that $N^{\prime}$ is a differential graded $B$-module
with property (I). The computation of the derived functors given in the lemmas referenced in the statement combined with Lemma 22.15.3 translates the above into

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(A, \mathrm{~d})}\right)}\left(M, \operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right)\right)=\operatorname{Hom}_{K\left(\operatorname{Mod}_{(B, \mathrm{~d})}\right)}\left(M \otimes_{A} N, N^{\prime}\right)
$$

where $\mathcal{B}=\operatorname{Mod}_{(B, \mathrm{~d})}^{d g}$. Thus it is certainly sufficient to show that

$$
\operatorname{Hom}_{\mathcal{A}}\left(M, \operatorname{Hom}_{\mathcal{B}}\left(N, N^{\prime}\right)\right)=\operatorname{Hom}_{\mathcal{B}}\left(M \otimes_{A} N, N^{\prime}\right)
$$

as differential graded $\mathbf{Z}$-modules where $\mathcal{A}=\operatorname{Mod}_{(A, \mathrm{~d})}^{d g}$. This follows from the fact that the isomorphism (Lemma 22.23.2)

$$
\operatorname{Hom}_{A}\left(M, \operatorname{Hom}_{B}\left(N, N^{\prime}\right)\right)=\operatorname{Hom}_{B}\left(M \otimes_{A} N, N^{\prime}\right)
$$

of internal homs of graded modules respects the differentials.
09S4 Lemma 22.24.5. Let $R$ be a ring. Let $(A, d),(B, d)$, and $(C, d)$ be differential graded algebras over $R$. Let $N$ be a differential graded $A^{o p p} \otimes_{R} B$-module. Let $N^{\prime}$ be a differential graded $B^{o p p} \otimes_{R} C$-module. If $C$ is $K$-flat as a complex of $R$-modules, then the composition

$$
D(A, d) \xrightarrow{-\otimes_{A}^{\mathrm{L}} N} D(B, d) \xrightarrow{-\otimes_{B}^{\mathrm{L}} N^{\prime}} D(C, d)
$$

is isomorphic to $-\otimes_{A}^{\mathbf{L}} N^{\prime \prime}$ for some differential graded $A^{\text {opp }} \otimes_{R} C$-module $N^{\prime \prime}$.
Proof. We will use the construction of the functor $-\otimes^{\mathbf{L}}-$ of the proof of Lemma 22.24 .2 without further mention. By Remark 22.24 .3 we may replace $N^{\prime}$ by a quasi-isomorphic bimodule. Thus we assume that $N^{\prime}$ has property ( P ) as a differential graded $B^{o p p} \otimes_{R} C$-module, see Lemma 22.13.4. Let $F_{\bullet}$ be the corresponding filtration on $N^{\prime}$. We claim that $N^{\prime \prime}=N \otimes_{B} N^{\prime}$ works.

Let $M$ be an object of $D(A, \mathrm{~d})$. Using the lemma we may and do assume that $M$ has property $(\mathrm{P})$ as a differential graded $A$-module. Then $M \otimes_{A}^{\mathbf{L}} N=M \otimes_{A} N$. Next, we choose a quasi-isomorphism $P \rightarrow M \otimes_{A} N$ where $P$ is a differential graded $B$-module with property ( P ). Then

$$
\left(M \otimes_{A}^{\mathbf{L}} N\right) \otimes_{B}^{\mathbf{L}} N^{\prime}=P \otimes_{B} N^{\prime}
$$

The map $P \rightarrow M \otimes_{A} N$ induces a map

$$
P \otimes_{B} N^{\prime} \rightarrow\left(M \otimes_{A} N\right) \otimes_{B} N^{\prime}=M \otimes_{A} N^{\prime \prime}
$$

This construction is functorial in $M$ (details omitted) and hence it suffices to prove this map is a quasi-isomorphism.

Since $N^{\prime}=\operatorname{colim} F_{i} N^{\prime}$ it suffices to prove

$$
P \otimes_{B} F_{i} N^{\prime} \rightarrow M \otimes_{A} N \otimes_{B} F_{i} N^{\prime}
$$

is a quasi-isomorphism for all $i$. Using the short exact sequences $0 \rightarrow F_{i-1} N^{\prime} \rightarrow$ $F_{i} N^{\prime} \rightarrow F_{i} N^{\prime} / F_{i-1} N^{\prime} \rightarrow 0$ which are graded split, we see that it suffices to prove that the maps

$$
P \otimes_{B} F_{i} N^{\prime} / F_{i-1} N^{\prime} \rightarrow M \otimes_{A} N \otimes_{B} F_{i} N^{\prime} / F_{i-1} N^{\prime}
$$

are quasi-isomorphisms for all $i$. Since $F_{i} N^{\prime} / F_{i-1} N^{\prime}$ is a direct sum of shifts of $B^{o p p} \otimes_{R} C$ we finally reduce to showing that the map

$$
P \otimes_{B}\left(B^{o p p} \otimes_{R} C\right) \rightarrow M \otimes_{A} N \otimes_{B}\left(B^{o p p} \otimes_{R} C\right)
$$

is a quasi-isomorphism. In other words, we have to show that

$$
P \otimes_{R} C \rightarrow M \otimes_{A} N \otimes_{R} C
$$

is a quasi-isomorphism. Since $P \rightarrow M \otimes_{A} N$ is a quasi-isomorphism we conclude using More on Algebra, Lemma 15.49.4

09R9 Lemma 22.24.6. With notation and assumptions as in Lemma 22.24.4. Assume
(1) $N$ defines a compact object of $D(B, d)$, and
(2) the map $H^{k}(A) \rightarrow \operatorname{Hom}_{D(B, d)}(N, N[k])$ is an isomorphism for all $k \in \mathbf{Z}$.

Then the functor $-\otimes_{A}^{\mathbf{L}} N$ is fully faithful.
Proof. Because our functor has a left adjoint given by $R \operatorname{Hom}(N,-)$ by Lemma 22.24 .4 it suffices to show that for a differential graded $A$-module $M$ the map

$$
H^{0}(M) \longrightarrow \operatorname{Hom}_{D(B, \mathrm{~d})}\left(N, M \otimes_{A}^{\mathbf{L}} N\right)
$$

is an isomorphism. We may assume that $M=P$ is a differential graded $A$-module which has property (P). Since $N$ defines a compact object, we reduce using Lemma 22.13 .1 to the case where $P$ has a finite filtration whose graded pieces are direct sums of $A[k]$. Again using compactness we reduce to the case $P=A[k]$. Assumption (2) on $N$ is that the result holds for these.

### 22.25. Variant of derived tensor product

09 LU Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Then we have the functors

$$
\operatorname{Comp}(\mathcal{O}) \rightarrow K(\mathcal{O}) \rightarrow D(\mathcal{O})
$$

and as we've seen above we have differential graded enhancement $\operatorname{Comp}^{d g}(\mathcal{O})$. Namely, this is the differential graded category of Example 22.19.6 associated to the abelian category $\operatorname{Mod}(\mathcal{O})$. Let $K^{\bullet}$ be a complex of $\mathcal{O}$-modules in other words, an object of $\operatorname{Comp}^{d g}(\mathcal{O})$. Set

$$
(E, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{O})}\left(K^{\bullet}, K^{\bullet}\right)
$$

This is a differential graded $\mathbf{Z}$-algebra. We claim there is an analogue of the derived base change in this situation.

09LV Lemma 22.25.1. In the situation above there is a functor

$$
-\otimes_{E} K^{\bullet}: \operatorname{Mod}_{(E, d)}^{d g} \longrightarrow \operatorname{Comp}^{d g}(\mathcal{O})
$$

of differential graded categories. This functor sends $E$ to $K^{\bullet}$ and commutes with direct sums.

Proof. Let $M$ be a differential graded $E$-module. For every object $U$ of $\mathcal{C}$ the complex $K^{\bullet}(U)$ is a left differential graded $E$-module as well as a right $\mathcal{O}(U)$ module. The actions commute, so we have a bimodule. Thus, by the constructions in Section 22.23 we can form the tensor product

$$
M \otimes_{E} K^{\bullet}(U)
$$

which is a differential graded $\mathcal{O}(U)$-module, i.e., a complex of $\mathcal{O}(U)$-modules. This construction is functorial with respect to $U$, hence we can sheafify to get a complex of $\mathcal{O}$-modules which we denote

$$
M \otimes_{E} K^{\bullet}
$$

Moreover, for each $U$ the construction determines a functor $\operatorname{Mod}_{(E, \mathrm{~d})}^{d g} \rightarrow \operatorname{Comp}^{d g}(\mathcal{O}(U))$ of differential graded categories by Lemma 22.23.1. It is therefore clear that we obtain a functor as stated in the lemma.

09LW Lemma 22.25.2. The functor of Lemma 22.25.1 defines an exact functor of triangulated categories $K\left(\operatorname{Mod}_{(E d)}\right) \rightarrow K(\mathcal{O})$.
Proof. The functor induces a functor between homotopy categories by Lemma 22.19 .5 We have to show that $-\otimes_{E} K^{\bullet}$ transforms distinguished triangles into distinguished triangles. Suppose that $0 \rightarrow K \rightarrow L \rightarrow M \rightarrow 0$ is an admissible short exact sequence of differential graded $E$-modules. Let $s: M \rightarrow L$ be a graded $E$-module homomorphism which is left inverse to $L \rightarrow M$. Then $s$ defines a map $M \otimes_{E} K^{\bullet} \rightarrow L \otimes_{E} K^{\bullet}$ of graded $\mathcal{O}$-modules (i.e., respecting $\mathcal{O}$-module structure and grading, but not differentials) which is left inverse to $L \otimes_{E} K^{\bullet} \rightarrow M \otimes_{E} K^{\bullet}$. Thus we see that

$$
0 \rightarrow K \otimes_{E} K^{\bullet} \rightarrow L \otimes_{E} K^{\bullet} \rightarrow M \otimes_{E} K^{\bullet} \rightarrow 0
$$

is a termwise split short exact sequences of complexes, i.e., a defines a distinguished triangle in $K(\mathcal{O})$.

09LX Lemma 22.25.3. The functor $K\left(\operatorname{Mod}_{(E, d)}\right) \rightarrow K(\mathcal{O})$ of Lemma 22.25.2 has a left derived version defined on all of $D(E, d)$. We denote it $-\otimes_{E}^{\mathbf{L}} K^{\bullet}: \bar{D}(E, d) \rightarrow D(\mathcal{O})$.
Proof. We will use Derived Categories, Lemma 13.15 .15 to prove this. As our collection $\mathcal{P}$ of objects we will use the objects with property ( P ). Property (1) was shown in Lemma 22.13.4. Property (2) holds because if $s: P \rightarrow P^{\prime}$ is a quasiisomorphism of modules with property $(\mathrm{P})$, then $s$ is a homotopy equivalence by Lemma 22.15.3.
09LY Lemma 22.25.4. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K^{\bullet}$ be a complex of $\mathcal{O}$-modules. Then the functors

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, d) \longrightarrow D(\mathcal{O})
$$

of Lemma 22.25.3 and

$$
R \operatorname{Hom}\left(K^{\bullet},-\right): D(\mathcal{O}) \longrightarrow D(E, d)
$$

of Lemma 22.22.1 are adjoint.
Proof. The statement means that we have

$$
\operatorname{Hom}_{D(E, \mathrm{~d})}\left(M, R \operatorname{Hom}\left(K^{\bullet}, L^{\bullet}\right)\right)=\operatorname{Hom}_{D(\mathcal{O})}\left(M \otimes_{E}^{\mathbf{L}} K^{\bullet}, L^{\bullet}\right)
$$

bifunctorially in $M$ and $L^{\bullet}$. To see this we may replace $M$ by a differential graded $E$-module $P$ with property (P). We also may replace $L^{\bullet}$ by a K-injective complex of $\mathcal{O}$-modules $I^{\bullet}$. The computation of the derived functors given in the lemmas referenced in the statement combined with Lemma 22.15.3 translates the above into

$$
\operatorname{Hom}_{K\left(\operatorname{Mod}_{(E, \mathrm{~d})}\right)}\left(P, \operatorname{Hom}_{\mathcal{B}}\left(K^{\bullet}, I^{\bullet}\right)\right)=\operatorname{Hom}_{K(\mathcal{O})}\left(P \otimes_{E} K^{\bullet}, I^{\bullet}\right)
$$

where $\mathcal{B}=\operatorname{Comp}^{d g}(\mathcal{O})$. There is an evalution map from right to left functorial in $P$ and $I^{\bullet}$ (details omitted). Choose a filtration $F_{\bullet}$ on $P$ as in the definition of property (P). By Lemma 22.13 .1 and the fact that both sides of the equation are homological functors in $P$ on $K\left(\operatorname{Mod}_{(E, \mathrm{~d})}\right)$ we reduce to the case where $P$ is replaced by the differential graded $E$-module $\bigoplus F_{i} P$. Since both sides turn direct sums in the variable $P$ into direct products we reduce to the case where $P$ is one
of the differential graded $E$-modules $F_{i} P$. Since each $F_{i} P$ has a finite filtration (given by admissible monomorpisms) whose graded pieces are graded projective $E$-modules we reduce to the case where $P$ is a graded projective $E$-module. In this case we clearly have

$$
\operatorname{Hom}_{\operatorname{Mod}_{(E, \mathrm{~d})}^{d g}}\left(P, \operatorname{Hom}_{\mathcal{B}}\left(K^{\bullet}, I^{\bullet}\right)\right)=\operatorname{Hom}_{\operatorname{Comp}^{d g}(\mathcal{O})}\left(P \otimes_{E} K^{\bullet}, I^{\bullet}\right)
$$

as graded Z-modules (because this statement reduces to the case $P=E[k]$ where it is obvious). As the isomorphism is compatible with differentials we conclude.

09LZ Lemma 22.25.5. Let $(\mathcal{C}, \mathcal{O})$ be a ringed site. Let $K^{\bullet}$ be a complex of $\mathcal{O}$-modules. Assume
(1) $K^{\bullet}$ represents a compact object of $D(\mathcal{O})$, and
(2) $E=\operatorname{Hom}_{\text {Comp }}{ }^{d g}(\mathcal{O})\left(K^{\bullet}, K^{\bullet}\right)$ computes the ext groups of $K^{\bullet}$ in $D(\mathcal{O})$.

Then the functor

$$
-\otimes_{E}^{\mathbf{L}} K^{\bullet}: D(E, d) \longrightarrow D(\mathcal{O})
$$

of Lemma 22.25.3 is fully faithful.
Proof. Because our functor has a left adjoint given by $R \operatorname{Hom}\left(K^{\bullet},-\right)$ by Lemma 22.25 .4 it suffices to show for a differential graded $E$-module $M$ that the map

$$
H^{0}(M) \longrightarrow \operatorname{Hom}_{D(\mathcal{O})}\left(K^{\bullet}, M \otimes_{E}^{\mathbf{L}} K^{\bullet}\right)
$$

is an isomorphism. We may assume that $M=P$ is a differential graded $E$-module which has property $(\mathrm{P})$. Since $K^{\bullet}$ defines a compact object, we reduce using Lemma 22.13.1 to the case where $P$ has a finite filtration whose graded pieces are direct sums of $E[k]$. Again using compactness we reduce to the case $P=E[k]$. The assumption on $K^{\bullet}$ is that the result holds for these.

### 22.26. Characterizing compact objects

09QZ Compact objects of additive categories are defined in Derived Categories, Definition 13.34.1. In this section we characterize compact objects of the derived category of a differential graded algebra.

09R0 Remark 22.26.1. Let $(A, \mathrm{~d})$ be a differential graded algebra. Is there a characterization of those differential graded $A$-modules $P$ for which we have

$$
\operatorname{Hom}_{K(A, \mathrm{~d})}(P, M)=\operatorname{Hom}_{D(A, \mathrm{~d})}(P, M)
$$

for all differential graded $A$-modules $M$ ? Let $\mathcal{D} \subset K(A, \mathrm{~d})$ be the full subcategory whose objects are the objects $P$ satisfying the above. Then $\mathcal{D}$ is a strictly full saturated triangulated subcategory of $K(A, \mathrm{~d})$. If $P$ is projective as a graded $A$-module, then to see where $P$ is an object of $\mathcal{D}$ it is enough to check that $\operatorname{Hom}_{K(A, \mathrm{~d})}(P, M)=0$ whenever $M$ is acyclic. However, in general it is not enough to assume that $P$ is projective as a graded $A$-module. Example: take $A=R=k[\epsilon]$ where $k$ is a field and $k[\epsilon]=k[x] /\left(x^{2}\right)$ is the ring of dual numbers. Let $P$ be the object with $P^{n}=R$ for all $n \in \mathbf{Z}$ and differential given by multiplication by $\epsilon$. Then $\operatorname{id}_{P} \in \operatorname{Hom}_{K(A, \mathrm{~d})}(P, P)$ is a nonzero element but $P$ is acyclic.

09R1 Remark 22.26.2. Let $(A, \mathrm{~d})$ be a differential graded algebra. Let us say a differential graded $A$-module $M$ is finite if $M$ is generated, as a right $A$-module, by finitely many elements. If $P$ is a differential graded $A$-module which is finite graded
projective, then we can ask: Does $P$ give a compact object of $D(A, \mathrm{~d})$ ? Presumably, this is not true in general, but we do not know a counter example. However, if $P$ is also an object of the category $\mathcal{D}$ of Remark 22.26.1), then this is the case (this follows from the fact that direct sums in $D(A, \mathrm{~d})$ are given by direct sums of modules; details omitted).

09R2 Lemma 22.26.3. Let $(A, d)$ be a differential graded algebra. Let $E$ be a compact object of $D(A, d)$. Let $P$ be a differential graded $A$-module which has a finite filtration

$$
0=F_{-1} P \subset F_{0} P \subset F_{1} P \subset \ldots \subset F_{n} P=P
$$

by differential graded submodules such that

$$
F_{i+1} P / F_{i} P \cong \bigoplus_{j \in J_{i}} A\left[k_{i, j}\right]
$$

as differential graded $A$-modules for some sets $J_{i}$ and integers $k_{i, j}$. Let $E \rightarrow P$ be a morphism of $D(A, d)$. Then there exists a differential graded submodule $P^{\prime} \subset P$ such that $F_{i+1} P \cap P^{\prime} /\left(F_{i} P \cap P^{\prime}\right)$ is equal to $\bigoplus_{j \in J_{i}^{\prime}} A\left[k_{i, j}\right]$ for some finite subsets $J_{i}^{\prime} \subset J_{i}$ and such that $E \rightarrow P$ factors through $P^{\prime}$.

Proof. We will prove by induction on $-1 \leq m \leq n$ that there exists a differential graded submodule $P^{\prime} \subset P$ such that
(1) $F_{m} P \subset P^{\prime}$,
(2) for $i \geq m$ the quotient $F_{i+1} P \cap P^{\prime} /\left(F_{i} P \cap P^{\prime}\right)$ is isomorphic to $\bigoplus_{j \in J_{i}^{\prime}} A\left[k_{i, j}\right]$ for some finite subsets $J_{i}^{\prime} \subset J_{i}$, and
(3) $E \rightarrow P$ factors through $P^{\prime}$.

The base case is $m=n$ where we can take $P^{\prime}=P$.
Induction step. Assume $P^{\prime}$ works for $m$. For $i \geq m$ and $j \in J_{i}^{\prime}$ let $x_{i, j} \in F_{i+1} P \cap P^{\prime}$ be a homogeneous element of degree $k_{i, j}$ whose image in $F_{i+1} P \cap P^{\prime} /\left(F_{i} P \cap P^{\prime}\right)$ is the generator in the summand corresponding to $j \in J_{i}$. The $x_{i, j}$ generate $P^{\prime} / F_{m} P$ as an $A$-module. Write

$$
\mathrm{d}\left(x_{i, j}\right)=\sum x_{i^{\prime}, j^{\prime}} a_{i, j}^{i^{\prime}, j^{\prime}}+y_{i, j}
$$

with $y_{i, j} \in F_{m} P$ and $a_{i, j}^{i^{\prime}, j^{\prime}} \in A$. There exists a finite subset $J_{m-1}^{\prime} \subset J_{m-1}$ such that each $y_{i, j}$ maps to an element of the submodule $\bigoplus_{j \in J_{m-1}^{\prime}} A\left[k_{m-1, j}\right]$ of $F_{m} P / F_{m-1} P$. Let $P^{\prime \prime} \subset F_{m} P$ be the inverse image of $\bigoplus_{j \in J_{m-1}^{\prime}} A\left[k_{m-1, j}\right]$ under the map $F_{m} P \rightarrow$ $F_{m} P / F_{m-1} P$. Then we see that the $A$-submodule

$$
P^{\prime \prime}+\sum x_{i, j} A
$$

is a differential graded submodule of the type we are looking for. Moreover

$$
P^{\prime} /\left(P^{\prime \prime}+\sum x_{i, j} A\right)=\bigoplus_{j \in J_{m-1} \backslash J_{m-1}^{\prime}} A\left[k_{m-1, j}\right]
$$

Since $E$ is compact, the composition of the given map $E \rightarrow P^{\prime}$ with the quotient map, factors through a finite direct subsum of the module displayed above. Hence after enlarging $J_{m-1}^{\prime}$ we may assume $E \rightarrow P^{\prime}$ factors through $P^{\prime \prime}+\sum x_{i, j} A$ as desired.

It is not true that every compact object of $D(A, \mathrm{~d})$ comes from a finite graded projective differential graded $A$-module, see Examples, Section 88.58 .

09R3 Proposition 22.26.4. Let $(A, d)$ be a differential graded algebra. Let $E$ be an object of $D(A, d)$. Then the following are equivalent
(1) $E$ is a compact object,
(2) $E$ is a direct summand of an object of $D(A, d)$ which is represented by a differential graded module $P$ which has a finite filtration $F_{\bullet}$ by differential graded submodules such that $F_{i} P / F_{i-1} P$ are finite direct sums of shifts of A.

Proof. Assume $E$ is compact. By Lemma 22.13 .4 we may assume that $E$ is represented by a differential graded $A$-module $P$ with propery (P). Consider the distinguished triangle

$$
\bigoplus F_{i} P \rightarrow \bigoplus F_{i} P \rightarrow P \stackrel{\delta}{\rightarrow} \bigoplus F_{i} P[1]
$$

coming from the admissible short exact sequence of Lemma 22.13.1. Since $E$ is compact we have $\delta=\sum_{i=1, \ldots, n} \delta_{i}$ for some $\delta_{i}: P \rightarrow F_{i} P[1]$. Since the compostion of $\delta$ with the map $\bigoplus F_{i} P[1] \rightarrow \bigoplus F_{i} P[1]$ is zero (Derived Categories, Lemma 13.4.1) it follows that $\delta=0$ (follows as $\bigoplus F_{i} P \rightarrow \bigoplus F_{i} P$ maps the summand $F_{i} P$ via the difference of id and the inclusion map into $F_{i-1} P$ ). Thus we see that the identity on $E$ factors through $\bigoplus F_{i} P$ in $D(A, \mathrm{~d})$ (by Derived Categories, Lemma 13.4.10. Next, we use that $P$ is compact again to see that the map $E \rightarrow \bigoplus F_{i} P$ factors through $\bigoplus_{i=1, \ldots, n} F_{i} P$ for some $n$. In other words, the identity on $E$ factors through $\bigoplus_{i=1, \ldots, n} F_{i} P$. By Lemma 22.26 .3 we see that the identity of $E$ factors as $E \rightarrow P \rightarrow E$ where $P$ is as in part (2) of the statement of the lemma. In other words, we have proven that (1) implies (2).

Assume (2). By Derived Categories, Lemma 13.34 .2 it suffices to show that $P$ gives a compact object. Observe that $P$ has property (P), hence we have

$$
\operatorname{Hom}_{D(A, \mathrm{~d})}(P, M)=\operatorname{Hom}_{K(A, \mathrm{~d})}(P, M)
$$

for any differential graded module $M$ by Lemma 22.15.3. As direct sums in $D(A, \mathrm{~d})$ are given by direct sums of graded modules (Lemma 22.15.4) we reduce to showing that $\operatorname{Hom}_{K(A, \mathrm{~d})}(P, M)$ commutes with direct sums. Using that $K(A, \mathrm{~d})$ is a triangulated category, that Hom is a cohomological functor in the first variable, and the filtration on $P$, we reduce to the case that $P$ is a finite direct sum of shifts of $A$. Thus we reduce to the case $P=A[k]$ which is clear.

09RA Lemma 22.26.5. Let $(A, d)$ be a differential graded algebra. For every compact object $E$ of $D(A, d)$ there exist integers $a \leq b$ such that $\operatorname{Hom}_{D(A, d)}(E, M)=0$ if $H^{i}(M)=0$ for $i \in[a, b]$.

Proof. Observe that the collection of objects of $D(A, \mathrm{~d})$ for which such a pair of integers exists is a saturated, strictly full triangulated subcategory of $D(A, \mathrm{~d})$. Thus by Proposition 22.26 .4 it suffices to prove this when $E$ is represented by a differential graded module $P$ which has a finite filtration $F_{\bullet}$ by differential graded submodules such that $F_{i} P / F_{i-1} P$ are finite direct sums of shifts of $A$. Using the compatibility with triangles, we see that it suffices to prove it for $P=A$. In this case $\operatorname{Hom}_{D(A, \mathrm{~d})}(A, M)=H^{0}(M)$ and the result holds with $a=b=0$.

If ( $A, \mathrm{~d}$ ) is just a graded algebra or more generally lives in only a finite number of degrees, then we do obtain the more precise description of compact objects.

09RB Lemma 22.26.6. Let $(A, d)$ be a differential graded algebra. Assume that $A^{n}=0$ for $|n| \gg 0$. Let $E$ be an object of $D(A, d)$. The following are equivalent
(1) $E$ is a compact object, and
(2) $E$ can be represented by a differential graded $A$-module $P$ which is finite projective as a graded A-module and satisfies $\operatorname{Hom}_{K(A, d)}(P, M)=$ $\operatorname{Hom}_{D(A, d)}(P, M)$ for every differential graded $A$-module $M$.

Proof. Let $\mathcal{D} \subset K(A, \mathrm{~d})$ be the triangulated subcategory discussed in Remark 22.26.1. Let $P$ be an object of $\mathcal{D}$ which is finite projective as a graded $A$-module. Then $P$ represents a compact object of $D(A, \mathrm{~d})$ by Remark 22.26 .2 .

To prove the converse, let $E$ be a compact object of $D(A, \mathrm{~d})$. Fix $a \leq b$ as in Lemma 22.26.5. After decreasing $a$ and increasing $b$ if necessary, we may also assume that $H^{i}(E)=0$ for $i \notin[a, b]$ (this follows from Proposition 22.26.4 and our assumption on $A$ ). Moreover, fix an integer $c>0$ such that $A^{n}=0$ if $|n| \geq c$.

By Proposition 22.26 .4 we see that $E$ is a direct summand, in $D(A, \mathrm{~d})$, of a differential graded $A$-module $P$ which has a finite filtration $F_{\bullet}$ by differential graded submodules such that $F_{i} P / F_{i-1} P$ are finite direct sums of shifts of $A$. In particular, $P$ has property (P) and we have $\operatorname{Hom}_{D(A, \mathrm{~d})}(P, M)=\operatorname{Hom}_{K(A, \mathrm{~d})}(P, M)$ for any differential graded module $M$ by Lemma 22.15.3. In other words, $P$ is an object of the triangulated subcategory $\mathcal{D} \subset K(A, \mathrm{~d})$ discussed in Remark 22.26.1. Note that $P$ is finite free as a graded $A$-module.

Choose $n>0$ such that $b+4 c-n<a$. Represent the projector onto $E$ by an endomorphism $\varphi: P \rightarrow P$ of differential graded $A$-modules. Consider the distinguished triangle

$$
P \xrightarrow{1-\varphi} P \rightarrow C \rightarrow P[1]
$$

in $K(A, \mathrm{~d})$ where $C$ is the cone of the first arrow. Then $C$ is an object of $\mathcal{D}$, we have $C \cong E \oplus E[1]$ in $D(A, \mathrm{~d})$, and $C$ is a finite graded free $A$-module. Next, consider a distinguished triangle

$$
C[1] \rightarrow C \rightarrow C^{\prime} \rightarrow C[2]
$$

in $K(A, \mathrm{~d})$ where $C^{\prime}$ is the cone on a morphism $C[1] \rightarrow C$ representing the composition

$$
C[1] \cong E[1] \oplus E[2] \rightarrow E[1] \rightarrow E \oplus E[1] \cong C
$$

in $D(A, \mathrm{~d})$. Then we see that $C^{\prime}$ represents $E \oplus E[2]$. Continuing in this manner we see that we can find a differential graded $A$-module $P$ which is an object of $\mathcal{D}$, is a finite free as a graded $A$-module, and represents $E \oplus E[n]$.

Choose a basis $x_{i}, i \in I$ of homogeneous elements for $P$ as an $A$-module. Let $d_{i}=\operatorname{deg}\left(x_{i}\right)$. Let $P_{1}$ be the $A$-submodule of $P$ generated by $x_{i}$ and $\mathrm{d}\left(x_{i}\right)$ for $d_{i} \leq a-c-1$. Let $P_{2}$ be the $A$-submodule of $P$ generated by $x_{i}$ and $\mathrm{d}\left(x_{i}\right)$ for $d_{i} \geq b-n+c$. We observe
(1) $P_{1}$ and $P_{2}$ are differential graded submodules of $P$,
(2) $P_{1}^{t}=0$ for $t \geq a$,
(3) $P_{1}^{t}=P^{t}$ for $t \leq a-2 c$,
(4) $P_{2}^{t}=0$ for $t \leq b-n$,
(5) $P_{2}^{t}=P^{t}$ for $t \geq b-n+2 c$.

As $b-n+2 c \geq a-2 c$ by our choice of $n$ we obtain a short exact sequence of differential graded $A$-modules

$$
0 \rightarrow P_{1} \cap P_{2} \rightarrow P_{1} \oplus P_{2} \xrightarrow{\pi} P \rightarrow 0
$$

Since $P$ is projective as a graded $A$-module this is an admissible short exact sequence (Lemma 22.11.1). Hence we obtain a boundary map $\delta: P \rightarrow\left(P_{1} \cap P_{2}\right)[1]$ in $K(A, \mathrm{~d})$, see Lemma 22.7.2. Since $P=E \oplus E[n]$ and since $P_{1} \cap P_{2}$ lives in degrees $(b-n, a)$ we find that $\operatorname{Hom}_{D(A, \mathrm{~d})}\left(E \oplus E[n],\left(P_{1} \cap P_{2}\right)[1]\right)$ is zero. Therefore $\delta=0$ as a morphism in $K(A, \mathrm{~d})$ as $P$ is an object of $\mathcal{D}$. By Derived Categories, Lemma 13.4.10 we can find a map $s: P \rightarrow P_{1} \oplus P_{2}$ such that $\pi \circ s=\mathrm{id}_{P}+\mathrm{d} h+h \mathrm{~d}$ for some $h: P \rightarrow P$ of degree -1 . Since $P_{1} \oplus P_{2} \rightarrow P$ is surjective and since $P$ is projective as a graded $A$ module we can choose a homogeneous lift $\tilde{h}: P \rightarrow P_{1} \oplus P_{2}$ of $h$. Then we change $s$ into $s+\mathrm{d} \tilde{h}+\tilde{h} \mathrm{~d}$ to get $\pi \circ s=\operatorname{id}_{P}$. This means we obtain a direct sum decomposition $P=s^{-1}\left(P_{1}\right) \oplus s^{-1}\left(P_{2}\right)$. Since $s^{-1}\left(P_{2}\right)$ is equal to $P$ in degrees $\geq b-n+2 c$ we see that $s^{-1}\left(P_{2}\right) \rightarrow P \rightarrow E$ is a quasi-isomorphism, i.e., an isomorphism in $D(A, \mathrm{~d})$. This finishes the proof.

### 22.27. Equivalences of derived categories

09S5 Let $R$ be a ring. Let $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ be differential graded $R$-algebras. A natural question that arises in nature is what it means that $D(A, \mathrm{~d})$ is equivalent to $D(B, \mathrm{~d})$ as an $R$-linear triangulated category. This is a rather subtle question and it will turn out it isn't always the correct question to ask. Nonetheless, in this section we collection some conditions that guarantee this is the case.
We strongly urge the reader to take a look at the groundbreaking paper Ric89b on this topic.
09S6 Lemma 22.27.1. Let $R$ be a ring. Let $(A, d) \rightarrow(B, d)$ be a homomorphism of differential graded algebras over $R$, which induces an isomorphism on cohomology algebras. Then

$$
-\otimes_{A}^{\mathbf{L}} B: D(A, d) \rightarrow D(B, d)
$$

gives an R-linear equivalence of triangulated categories with quasi-inverse the restriction functor $N \mapsto N_{A}$.
Proof. By Lemma 22.24 .6 the functor $M \longmapsto M \otimes_{A}^{\mathbf{L}} B$ is fully faithful. By Lemma 22.24 .4 the functor $N \longmapsto R \operatorname{Hom}(B, N)=N_{A}$ is a right adjoint. It is clear that the kernel of $R \operatorname{Hom}(B,-)$ is zero. Hence the result follows from Derived Categories, Lemma 13.7.2.

When we analyze the proof above we see that we obtain the following generalization for free.

09S7 Lemma 22.27.2. Let $R$ be a ring. Let $(A, d)$ and $(B, d)$ be differential graded algebras over $R$. Let $N$ be an $(A, B)$-bimodule which comes with a grading and $a$ differential such that it is a differential graded module for both $A$ and $B$. Assume that
(1) $N$ defines a compact object of $D(B, d)$,
(2) if $N^{\prime} \in D(B, d)$ and $\operatorname{Hom}_{D(B, d)}\left(N, N^{\prime}[n]\right)=0$ for $n \in \mathbf{Z}$, then $N^{\prime}=0$, and
(3) the map $H^{k}(A) \rightarrow \operatorname{Hom}_{D(B, d)}(N, N[k])$ is an isomorphism for all $k \in \mathbf{Z}$.

Then

$$
-\otimes_{A}^{\mathbf{L}} N: D(A, d) \rightarrow D(B, d)
$$

gives an $R$-linear equivalence of triangulated categories.
Proof. By Lemma 22.24 .6 the functor $M \longmapsto M \otimes_{A}^{\mathbf{L}} N$ is fully faithful. By Lemma 22.24 .4 the functor $N^{\prime} \longmapsto R \operatorname{Hom}\left(N, N^{\prime}\right)$ is a right adjoint. By assumption (3) the kernel of $R \operatorname{Hom}(N,-)$ is zero. Hence the result follows from Derived Categories, Lemma 13.7.2.

09SS Remark 22.27.3. In Lemma 22.27 .2 we can replace condition (2) by the condition that $N$ is a classical generator for $D_{\text {compact }}(B, d)$, see Derived Categories, Proposition 13.34.6. Moreover, if we knew that $R \operatorname{Hom}(N, B)$ is a compact object of $D(A, \mathrm{~d})$, then it suffices to check that $N$ is a weak generator for $D_{\text {compact }}(B, \mathrm{~d})$. We omit the proof; we will add it here if we ever need it in the Stacks project.

Sometimes the $B$-module $P$ in the lemma below is called an " $(A, B)$-tilting complex".

09S8 Lemma 22.27.4. Let $R$ be a ring. Let $(A, d)$ and $(B, d)$ be differential graded $R$-algebras. Assume that $A=H^{0}(A)$. The following are equivalent
(1) $D(A, d)$ and $D(B, d)$ are equivalent as $R$-linear triangulated categories, and
(2) there exists an object $P$ of $D(B, d)$ such that
(a) $P$ is a compact object of $D(B, d)$,
(b) if $N \in D(B, d)$ with $\operatorname{Hom}_{D(B, d)}(P, N[i])=0$ for $i \in \mathbf{Z}$, then $N=0$,
(c) $\operatorname{Hom}_{D(B, d)}(P, P[i])=0$ for $i \neq 0$ and equal to $A$ for $i=0$.

Proof. Let $F: D(A, \mathrm{~d}) \rightarrow D(B, \mathrm{~d})$ be an equivalence. Then $F$ maps compact objects to compact objects. Hence $P=F(A)$ is compact, i.e., (2)(a) holds. Conditions (2)(b) and (2)(c) are immediate from the fact that $F$ is an equivalence.

Let $P$ be an object as in (2). Represent $P$ by a differential graded module with property (P). Set

$$
(E, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Mod}_{B}^{d_{g}}}(P, P)
$$

Then $H^{0}(E)=A$ and $H^{k}(E)=0$ for $k \neq 0$ by Lemma 22.15.3 and assumption (2)(c). Viewing $P$ as a ( $E, B$ )-bimodule and using Lemma 22.27 .2 and assumption $(2)(\mathrm{b})$ we obtain an equivalence

$$
D(E, \mathrm{~d}) \rightarrow D(B, \mathrm{~d})
$$

Let $E^{\prime} \subset E$ be the differential graded $R$-subalgebra with

$$
\left(E^{\prime}\right)^{i}=\left\{\begin{array}{cc}
E^{i} & \text { if } i<0 \\
\operatorname{Ker}\left(E^{0} \rightarrow E^{1}\right) & \text { if } i=0 \\
0 & \text { if } i>0
\end{array}\right.
$$

Then there are quasi-isomorphisms of differential graded algebras $(A, \mathrm{~d}) \leftarrow\left(E^{\prime}, \mathrm{d}\right) \rightarrow$ $(E, \mathrm{~d})$ Thus we obtain equivalences

$$
D(A, \mathrm{~d}) \leftarrow D\left(E^{\prime}, \mathrm{d}\right) \rightarrow D(E, \mathrm{~d}) \rightarrow D(B, \mathrm{~d})
$$

by Lemma 22.27.1.

09S9 Remark 22.27.5. Let $R$ be a ring. Let $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ be differential graded $R$-algebras. Suppose given an $R$-linear equivalence

$$
F: D(A, \mathrm{~d}) \longrightarrow D(B, \mathrm{~d})
$$

of triangulated categories. Set $N=F(A)$. Then $N$ is a differential graded $B$-module. Since $F$ is an equivalence and $A$ is a compact object of $D(A, \mathrm{~d})$, we conclude that $N$ is a compact object of $D(B, \mathrm{~d})$. Moreover, since $H^{k}(A)=$ $\operatorname{Hom}_{D(A, \mathrm{~d})}(A, A[k])$ and $F$ an equivalence we see that $F$ induces an isomorphism $H^{k}(A)=\operatorname{Hom}_{D(B, \mathrm{~d})}(N, N[k])$ for all $k$. In order to conclude that there is an equivalence $D(A, \mathrm{~d}) \longrightarrow D(B, \mathrm{~d})$ which arises from the construction in Lemma 22.27 .2 all we need is a right $A$-module structure on $N$ or on any differential graded $B$-module quasi-isomorphic to $B$. This module structure can be constructed in certain cases. For example, if we assume that $F$ can be lifted to a differential graded functor

$$
F^{d g}: \operatorname{Mod}_{(A, \mathrm{~d})}^{d g} \longrightarrow \operatorname{Mod}_{(B, \mathrm{~d})}^{d g}
$$

(for notation see Example 22.19.8) between the associated differential graded categories, then this holds. Another case is discussed in the proposition below.

09SA Proposition 22.27.6. Let $R$ be a ring. Let $(A, d)$ and $(B, d)$ be differential graded $R$-algebras. Let $F: D(A, d) \rightarrow D(B, d)$ be an $R$-linear equivalence of triangulated cateories. Assume that
(1) $A=H^{0}(A)$, and
(2) $B$ is $K$-flat as a complex of $R$-modules.

Then there exists an $(A, B)$-bimodule $N$ as in Lemma 22.27.2.
Proof. As in Remark 22.27 .5 above, we set $N=F(A)$ in $D(B, \mathrm{~d})$. We may assume that $N$ is a differential graded $B$-module with property (P). Set

$$
(E, \mathrm{~d})=\operatorname{Hom}_{\operatorname{Mod}_{(B, \mathrm{~d})}^{d g}}(N, N)
$$

Then $H^{0}(E)=A$ and $H^{k}(E)=0$ for $k \neq 0$ by Lemma 22.15.3. Moreover, by the discussion preceding the proposition and Lemma 22.27 .2 we see that $N$ as a $(E, B)$-bimodule induces an equivalence $-\otimes_{E}^{\mathbf{L}} N: D(E, \mathrm{~d}) \rightarrow D(B, \mathrm{~d})$. Let $E^{\prime} \subset E$ be the differential graded $R$-subalgebra with

$$
\left(E^{\prime}\right)^{i}=\left\{\begin{array}{cl}
E^{i} & \text { if } i<0 \\
\operatorname{Ker}\left(E^{0} \rightarrow E^{1}\right) & \text { if } i=0 \\
0 & \text { if } i>0
\end{array}\right.
$$

Then there are quasi-isomorphisms of differential graded algebras $(A, \mathrm{~d}) \leftarrow\left(E^{\prime}, \mathrm{d}\right) \rightarrow$ $(E, \mathrm{~d})$ Thus we obtain equivalences

$$
D(A, \mathrm{~d}) \leftarrow D\left(E^{\prime}, \mathrm{d}\right) \rightarrow D(E, \mathrm{~d}) \rightarrow D(B, \mathrm{~d})
$$

by Lemma 22.27.1. Note that the quasi-inverse $D(A, \mathrm{~d}) \rightarrow D\left(E^{\prime}, \mathrm{d}\right)$ of the left vertical arrow is given by $M \mapsto M \otimes_{A}^{\mathbf{L}} A$ where $A$ is viewed as a $A^{o p p} \otimes_{R} E^{\prime}$-module. On the other hand the functor $D\left(E^{\prime}, \mathrm{d}\right) \rightarrow D(B, \mathrm{~d})$ is given by $M \mapsto M \otimes_{E^{\prime}}^{\mathbf{L}} N$ where $N$ is as above. We conclude by Lemma 22.24 .5 .

09SB Remark 22.27.7. Let $A, B, F, N$ be as in Proposition 22.27.6. It is not clear that $F$ and the functor $G(-)=-\otimes_{A}^{\mathbf{L}} N$ are isomorphic. By construction there is an isomorphism $N=G(A) \rightarrow F(A)$ in $D(B, \mathrm{~d})$. It is straigthforward to extend this to a functorial isomorphism $G(M) \rightarrow F(M)$ for $M$ is a differential graded $A$-module
which is graded projective (e.g., a sum of shifts of $A$ ). Then one can conclude that $G(M) \cong F(M)$ when $M$ is a cone of a map between such modules. We don't know whether more is true in general.

09SC Lemma 22.27.8. Let $R$ be a ring. Let $A$ and $B$ be $R$-algebras. The following are equivalent
(1) there is an R-linear equivalence $D(A) \rightarrow D(B)$ of triangulated categories,
(2) there exists an object $P$ of $D(B)$ such that
(a) $P$ can be represented by a finite complex of finite projective $B$-modules,
(b) if $K \in D(B)$ with $E x t_{B}^{i}(P, K)=0$ for $i \in \mathbf{Z}$, then $K=0$, and
(c) $\operatorname{Ext}_{B}^{i}(P, P)=0$ for $i \neq 0$ and equal to $A$ for $i=0$.

Moreover, if $B$ is flat as an $R$-module, then this is also equivalent to
(3) there exists an $(A, B)$-bimodule $N$ such that $-\otimes_{A}^{\mathbf{L}} N: D(A) \rightarrow D(B)$ is an equivalence.

Proof. The equivalence of (1) and (2) is a special case of Lemma 22.27.4 combined with the result of Lemma 22.26 .6 characterizing compact objects of $D(B)$ (small detail omitted). The equivalence with (3) if $B$ is $R$-flat follows from Proposition 22.27 .6

09SD Remark 22.27.9. Let $R$ be a ring. Let $A$ and $B$ be $R$-algebras. If $D(A)$ and $D(B)$ are equivalent as $R$-linear triangulated categories, then the centers of $A$ and $B$ are isomorphic as $R$-algebras. In particular, if $A$ and $B$ are commutative, then $A \cong$ $B$. The rather tricky proof can be found in Ric89b, Proposition 9.2] or KZ98, Proposition 6.3.2]. Another approach might be to use Hochschild cohomology (see remark below).

09ST Remark 22.27.10. Let $R$ be a ring. Let $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ be differential graded $R$-algebras which are derived equivalent, i.e., such that there exists an $R$-linear equivalence $D(A, \mathrm{~d}) \rightarrow D(B, \mathrm{~d})$ of triangulated categories. We would like to show that certain invariants of $(A, \mathrm{~d})$ and $(B, \mathrm{~d})$ coincide. In many situations one has more control of the situation. For example, it may happen that there is an equivalence of the form

$$
-\otimes_{A} \Omega: D(A, \mathrm{~d}) \longrightarrow D(B, \mathrm{~d})
$$

for some differential graded $A^{o p p} \otimes_{R} B$-module $\Omega$ (this happens in the situation of Proposition 22.27 .6 and is often true if the equivalence comes from a geometric construction). If also the quasi-inverse of our functor is given as

$$
-\otimes_{A}^{\mathbf{L}} \Omega^{\prime}: D(B, \mathrm{~d}) \longrightarrow D(A, \mathrm{~d})
$$

for a differential graded $B^{o p p} \otimes_{R} A$-module $\Omega^{\prime}$ (and as before such a module $\Omega^{\prime}$ often exists in practice) then we can consider the functor

$$
D\left(A^{o p p} \otimes_{R} A, \mathrm{~d}\right) \longrightarrow D\left(B^{o p p} \otimes_{R} B, \mathrm{~d}\right), \quad M \longmapsto \Omega^{\prime} \otimes_{A}^{\mathbf{L}} M \otimes_{A}^{\mathbf{L}} \Omega
$$

Observe that this functor sends the $(A, A)$-bimodule $A$ to the $(B, B)$-bimodule $B$. Under suitable conditions (e.g., flatness of $A, B, \Omega$, etc) this functor will be an equivalence as well. If this is the case, then it follows that we have isomorphisms of Hochschild cohomology groups
$H H^{i}(A, \mathrm{~d})=\operatorname{Hom}_{D\left(A^{o p p} \otimes_{R} A, \mathrm{~d}\right)}(A, A[i]) \longrightarrow \operatorname{Hom}_{D\left(B^{o p p} \otimes_{R} B, \mathrm{~d}\right)}(B, B[i])=H H^{i}(B, \mathrm{~d})$.

For example, if $A=H^{0}(A)$, then $H H^{0}(A, \mathrm{~d})$ is equal to the center of $A$, and this gives a conceptual proof of the result mentioned in Remark 22.27.9. If we ever need this remark we will provide a precise statement with a detailed proof here.

## Divided Power Algebra

09PD

### 23.1. Introduction

09PE In this chapter we talk about divided power algebras and what you can do with them. A reference is the book [Ber74].

### 23.2. Divided powers

07GK In this section we collect some results on divided power rings. We will use the convention $0!=1$ (as empty products should give 1 ).

07GL Definition 23.2.1. Let $A$ be a ring. Let $I$ be an ideal of $A$. A collection of maps $\gamma_{n}: I \rightarrow I, n>0$ is called a divided power structure on $I$ if for all $n \geq 0, m>0$, $x, y \in I$, and $a \in A$ we have
(1) $\gamma_{1}(x)=x$, we also set $\gamma_{0}(x)=1$,
(2) $\gamma_{n}(x) \gamma_{m}(x)=\frac{(n+m)!}{n!m!} \gamma_{n+m}(x)$,
(3) $\gamma_{n}(a x)=a^{n} \gamma_{n}(x)$,
(4) $\gamma_{n}(x+y)=\sum_{i=0, \ldots, n} \gamma_{i}(x) \gamma_{n-i}(y)$,
(5) $\gamma_{n}\left(\gamma_{m}(x)\right)=\frac{(n m)!}{n!(m!)^{n}} \gamma_{n m}(x)$.

Note that the rational numbers $\frac{(n+m)!}{n!m!}$ and $\frac{(n m)!}{n!(m!)^{n}}$ occurring in the definition are in fact integers; the first is the number of ways to choose $n$ out of $n+m$ and the second counts the number of ways to divide a group of $n m$ objects into $n$ groups of $m$. We make some remarks about the definition which show that $\gamma_{n}(x)$ is a replacement for $x^{n} / n!$ in $I$.

07GM Lemma 23.2.2. Let $A$ be a ring. Let $I$ be an ideal of $A$.
(1) If $\gamma$ is a divided power structur $\bigoplus^{1}$ on $I$, then $n!\gamma_{n}(x)=x^{n}$ for $n \geq 1$, $x \in I$.
Assume $A$ is torsion free as a Z-module.
(2) A divided power structure on $I$, if it exists, is unique.
(3) If $\gamma_{n}: I \rightarrow I$ are maps then
$\gamma$ is a divided power structure $\Leftrightarrow n!\gamma_{n}(x)=x^{n} \forall x \in I, n \geq 1$.
(4) The ideal I has a divided power structure if and only if there exists a set of generators $x_{i}$ of $I$ as an ideal such that for all $n \geq 1$ we have $x_{i}^{n} \in(n!) I$.

[^61]Proof. Proof of (1). If $\gamma$ is a divided power structure, then condition (2) (applied to 1 and $n-1$ instead of $n$ and $m$ ) implies that $n \gamma_{n}(x)=\gamma_{1}(x) \gamma_{n-1}(x)$. Hence by induction and condition (1) we get $n!\gamma_{n}(x)=x^{n}$.
Assume $A$ is torsion free as a Z-module. Proof of (2). This is clear from (1).
Proof of (3). Assume that $n!\gamma_{n}(x)=x^{n}$ for all $x \in I$ and $n \geq 1$. Since $A \subset A \otimes_{\mathbf{Z}} \mathbf{Q}$ it suffices to prove the axioms (1) - (5) of Definition 23.2.1 in case $A$ is a $\mathbf{Q}$-algebra. In this case $\gamma_{n}(x)=x^{n} / n$ ! and it is straightforward to verify (1) - (5); for example, (4) corresponds to the binomial formula

$$
(x+y)^{n}=\sum_{i=0, \ldots, n} \frac{n!}{i!(n-i)!} x^{i} y^{n-i}
$$

We encourage the reader to do the verifications to make sure that we have the coefficients correct.

Proof of (4). Assume we have generators $x_{i}$ of $I$ as an ideal such that $x_{i}^{n} \in(n!) I$ for all $n \geq 1$. We claim that for all $x \in I$ we have $x^{n} \in(n!) I$. If the claim holds then we can set $\gamma_{n}(x)=x^{n} / n$ ! which is a divided power structure by (3). To prove the claim we note that it holds for $x=a x_{i}$. Hence we see that the claim holds for a set of generators of $I$ as an abelian group. By induction on the length of an expression in terms of these, it suffices to prove the claim for $x+y$ if it holds for $x$ and $y$. This follows immediately from the binomial theorem.

07GN Example 23.2.3. Let $p$ be a prime number. Let $A$ be a ring such that every integer $n$ not divisible by $p$ is invertible, i.e., $A$ is a $\mathbf{Z}_{(p)}$-algebra. Then $I=p A$ has a canonical divided power structure. Namely, given $x=p a \in I$ we set

$$
\gamma_{n}(x)=\frac{p^{n}}{n!} a^{n}
$$

The reader verifies immediately that $p^{n} / n!\in p \mathbf{Z}_{(p)}$ for $n \geq 1$ (for instance, this can be derived from the fact that the exponent of $p$ in the prime factorization of $n!$ is $\left.\lfloor p / n\rfloor+\left\lfloor p / n^{2}\right\rfloor+\left\lfloor p / n^{3}\right\rfloor+\ldots\right)$, so that the definition makes sense and gives us a sequence of maps $\gamma_{n}: I \rightarrow I$. It is a straightforward exercise to verify that conditions (1) - (5) of Definition 23.2.1 are satisfied. Alternatively, it is clear that the definition works for $A_{0}=\mathbf{Z}_{(p)}$ and then the result follows from Lemma 23.4.2.

We notice that $\gamma_{n}(0)=0$ for any ideal $I$ of $A$ and any divided power structure $\gamma$ on $I$. (This follows from axiom (3) in Definition 23.2.1, applied to $a=0$.)

07GP Lemma 23.2.4. Let $A$ be a ring. Let $I$ be an ideal of $A$. Let $\gamma_{n}: I \rightarrow I, n \geq 1$ be a sequence of maps. Assume
(a) (1), (3), and (4) of Definition 23.2.1 hold for all $x, y \in I$, and
(b) properties (2) and (5) hold for $x$ in some set of generators of $I$ as an ideal. Then $\gamma$ is a divided power structure on $I$.

Proof. The numbers (1), (2), (3), (4), (5) in this proof refer to the conditions listed in Definition 23.2.1. Applying (3) we see that if (2) and (5) hold for $x$ then (2) and (5) hold for $a x$ for all $a \in A$. Hence we see (b) implies (2) and (5) hold for a set of generators of $I$ as an abelian group. Hence, by induction of the length of an expression in terms of these it suffices to prove that, given $x, y \in I$ such that (2) and (5) hold for $x$ and $y$, then (2) and (5) hold for $x+y$.

Proof of (2) for $x+y$. By (4) we have

$$
\gamma_{n}(x+y) \gamma_{m}(x+y)=\sum_{i+j=n, k+l=m} \gamma_{i}(x) \gamma_{k}(x) \gamma_{j}(y) \gamma_{l}(y)
$$

Using (2) for $x$ and $y$ this equals

$$
\sum \frac{(i+k)!}{i!k!} \frac{(j+l)!}{j!!!} \gamma_{i+k}(x) \gamma_{j+l}(y)
$$

Comparing this with the expansion

$$
\gamma_{n+m}(x+y)=\sum \gamma_{a}(x) \gamma_{b}(y)
$$

we see that we have to prove that given $a+b=n+m$ we have

$$
\sum_{i+k=a, j+l=b, i+j=n, k+l=m} \frac{(i+k)!}{i!k!} \frac{(j+l)!}{j!l!}=\frac{(n+m)!}{n!m!}
$$

Instead of arguing this directly, we note that the result is true for the ideal $I=(x, y)$ in the polynomial ring $\mathbf{Q}[x, y]$ because $\gamma_{n}(f)=f^{n} / n!, f \in I$ defines a divided power structure on $I$. Hence the equality of rational numbers above is true.
Proof of (5) for $x+y$ given that (1) - (4) hold and that (5) holds for $x$ and $y$. We will again reduce the proof to an equality of rational numbers. Namely, using (4) we can write $\gamma_{n}\left(\gamma_{m}(x+y)\right)=\gamma_{n}\left(\sum \gamma_{i}(x) \gamma_{j}(y)\right)$. Using (4) we can write $\gamma_{n}\left(\gamma_{m}(x+y)\right)$ as a sum of terms which are products of factors of the form $\gamma_{k}\left(\gamma_{i}(x) \gamma_{j}(y)\right)$. If $i>0$ then

$$
\begin{aligned}
\gamma_{k}\left(\gamma_{i}(x) \gamma_{j}(y)\right) & =\gamma_{j}(y)^{k} \gamma_{k}\left(\gamma_{i}(x)\right) \\
& =\frac{(k i)!}{k!(i!)^{k}} \gamma_{j}(y)^{k} \gamma_{k i}(x) \\
& =\frac{(k i)!}{k!(i!)^{k}} \frac{(k j)!}{(j!)^{k}} \gamma_{k i}(x) \gamma_{k j}(y)
\end{aligned}
$$

using (3) in the first equality, (5) for $x$ in the second, and (2) exactly $k$ times in the third. Using (5) for $y$ we see the same equality holds when $i=0$. Continuing like this using all axioms but (5) we see that we can write

$$
\gamma_{n}\left(\gamma_{m}(x+y)\right)=\sum_{i+j=n m} c_{i j} \gamma_{i}(x) \gamma_{j}(y)
$$

for certain universal constants $c_{i j} \in \mathbf{Z}$. Again the fact that the equality is valid in the polynomial ring $\mathbf{Q}[x, y]$ implies that the coefficients $c_{i j}$ are all equal to $(n m)!/ n!(m!)^{n}$ as desired.

07GQ Lemma 23.2.5. Let $A$ be a ring with two ideals $I, J \subset A$. Let $\gamma$ be a divided power structure on $I$ and let $\delta$ be a divided power structure on $J$. Then
(1) $\gamma$ and $\delta$ agree on $I J$,
(2) if $\gamma$ and $\delta$ agree on $I \cap J$ then they are the restriction of a unique divided power structure $\epsilon$ on $I+J$.

Proof. Let $x \in I$ and $y \in J$. Then

$$
\gamma_{n}(x y)=y^{n} \gamma_{n}(x)=n!\delta_{n}(y) \gamma_{n}(x)=\delta_{n}(y) x^{n}=\delta_{n}(x y)
$$

Hence $\gamma$ and $\delta$ agree on a set of (additive) generators of $I J$. By property (4) of Definition 23.2.1 it follows that they agree on all of $I J$.

Assume $\gamma$ and $\delta$ agree on $I \cap J$. Let $z \in I+J$. Write $z=x+y$ with $x \in I$ and $y \in J$. Then we set

$$
\epsilon_{n}(z)=\sum \gamma_{i}(x) \delta_{n-i}(y)
$$

for all $n \geq 1$. To see that this is well defined, suppose that $z=x^{\prime}+y^{\prime}$ is another representation with $x^{\prime} \in I$ and $y^{\prime} \in J$. Then $w=x-x^{\prime}=y^{\prime}-y \in I \cap J$. Hence

$$
\begin{aligned}
\sum_{i+j=n} \gamma_{i}(x) \delta_{j}(y) & =\sum_{i+j=n} \gamma_{i}\left(x^{\prime}+w\right) \delta_{j}(y) \\
& =\sum_{i^{\prime}+l+j=n} \gamma_{i^{\prime}}\left(x^{\prime}\right) \gamma_{l}(w) \delta_{j}(y) \\
& =\sum_{i^{\prime}+l+j=n} \gamma_{i^{\prime}}\left(x^{\prime}\right) \delta_{l}(w) \delta_{j}(y) \\
& =\sum_{i^{\prime}+j^{\prime}=n} \gamma_{i^{\prime}}\left(x^{\prime}\right) \delta_{j^{\prime}}(y+w) \\
& =\sum_{i^{\prime}+j^{\prime}=n} \gamma_{i^{\prime}}\left(x^{\prime}\right) \delta_{j^{\prime}}\left(y^{\prime}\right)
\end{aligned}
$$

as desired. Hence, we have defined maps $\epsilon_{n}: I+J \rightarrow I+J$ for all $n \geq 1$; it is easy to see that $\left.\epsilon_{n}\right|_{I}=\gamma_{n}$ and $\left.\epsilon_{n}\right|_{J}=\delta_{n}$. Next, we prove conditions (1) - (5) of Definition 23.2.1 for the collection of maps $\epsilon_{n}$. Properties (1) and (3) are clear. To see (4), suppose that $z=x+y$ and $z^{\prime}=x^{\prime}+y^{\prime}$ with $x, x^{\prime} \in I$ and $y, y^{\prime} \in J$ and compute

$$
\begin{aligned}
\epsilon_{n}\left(z+z^{\prime}\right) & =\sum_{a+b=n} \gamma_{a}\left(x+x^{\prime}\right) \delta_{b}\left(y+y^{\prime}\right) \\
& =\sum_{i+i^{\prime}+j+j^{\prime}=n} \gamma_{i}(x) \gamma_{i^{\prime}}\left(x^{\prime}\right) \delta_{j}(y) \delta_{j^{\prime}}\left(y^{\prime}\right) \\
& =\sum_{k=0, \ldots, n} \sum_{i+j=k} \gamma_{i}(x) \delta_{j}(y) \sum_{i^{\prime}+j^{\prime}=n-k} \gamma_{i^{\prime}}\left(x^{\prime}\right) \delta_{j^{\prime}}\left(y^{\prime}\right) \\
& =\sum_{k=0, \ldots, n} \epsilon_{k}(z) \epsilon_{n-k}\left(z^{\prime}\right)
\end{aligned}
$$

as desired. Now we see that it suffices to prove (2) and (5) for elements of $I$ or $J$, see Lemma 23.2.4. This is clear because $\gamma$ and $\delta$ are divided power structures.

The existence of a divided power structure $\epsilon$ on $I+J$ whose restrictions to $I$ and $J$ are $\gamma$ and $\delta$ is thus proven; its uniqueness is rather clear.

07GR Lemma 23.2.6. Let $p$ be a prime number. Let $A$ be a ring, let $I \subset A$ be an ideal, and let $\gamma$ be a divided power structure on $I$. Assume $p$ is nilpotent in $A / I$. Then $I$ is locally nilpotent if and only if $p$ is nilpotent in $A$.

Proof. If $p^{N}=0$ in $A$, then for $x \in I$ we have $x^{p N}=(p N)!\gamma_{p N}(x)=0$ because $(p N)$ ! is divisible by $p^{N}$. Conversely, assume $I$ is locally nilpotent. We've also assumed that $p$ is nilpotent in $A / I$, hence $p^{r} \in I$ for some $r$, hence $p^{r}$ nilpotent, hence $p$ nilpotent.

### 23.3. Divided power rings

07GT There is a category of divided power rings. Here is the definition.
07GU Definition 23.3.1. A divided power ring is a triple $(A, I, \gamma)$ where $A$ is a ring, $I \subset$ $A$ is an ideal, and $\gamma=\left(\gamma_{n}\right)_{n \geq 1}$ is a divided power structure on $I$. A homomorphism of divided power rings $\varphi:(\bar{A}, I, \gamma) \rightarrow(B, J, \delta)$ is a ring homomorphism $\varphi: A \rightarrow B$ such that $\varphi(I) \subset J$ and such that $\delta_{n}(\varphi(x))=\varphi\left(\gamma_{n}(x)\right)$ for all $x \in I$ and $n \geq 1$.

We sometimes say "let $(B, J, \delta)$ be a divided power algebra over $(A, I, \gamma)$ " to indicate that $(B, J, \delta)$ is a divided power ring which comes equipped with a homomorphism of divided power rings $(A, I, \gamma) \rightarrow(B, J, \delta)$.
07GV Lemma 23.3.2. The category of divided power rings has all limits and they agree with limits in the category of rings.

Proof. The empty limit is the zero ring (that's weird but we need it). The product of a collection of divided power rings $\left(A_{t}, I_{t}, \gamma_{t}\right), t \in T$ is given by $\left(\prod A_{t}, \Pi I_{t}, \gamma\right)$ where $\gamma_{n}\left(\left(x_{t}\right)\right)=\left(\gamma_{t, n}\left(x_{t}\right)\right)$. The equalizer of $\alpha, \beta:(A, I, \gamma) \rightarrow(B, J, \delta)$ is just $C=\{a \in A \mid \alpha(a)=\beta(a)\}$ with ideal $C \cap I$ and induced divided powers. It follows that all limits exist, see Categories, Lemma 4.14.10.

The following lemma illustrates a very general category theoretic phenomenon in the case of divided power algebras.

07GW Lemma 23.3.3. Let $\mathcal{C}$ be the category of divided power rings. Let $F: \mathcal{C} \rightarrow$ Sets be a functor. Assume that
(1) there exists a cardinal $\kappa$ such that for every $f \in F(A, I, \gamma)$ there exists a morphism $\left(A^{\prime}, I^{\prime}, \gamma^{\prime}\right) \rightarrow(A, I, \gamma)$ of $\mathcal{C}$ such that $f$ is the image of $f^{\prime} \in$ $F\left(A^{\prime}, I^{\prime}, \gamma^{\prime}\right)$ and $\left|A^{\prime}\right| \leq \kappa$, and
(2) $F$ commutes with limits.

Then $F$ is representable, i.e., there exists an object $(B, J, \delta)$ of $\mathcal{C}$ such that

$$
F(A, I, \gamma)=\operatorname{Hom}_{\mathcal{C}}((B, J, \delta),(A, I, \gamma))
$$

functorially in $(A, I, \gamma)$.
Proof. This is a special case of Categories, Lemma 4.25.1.
07GX Lemma 23.3.4. The category of divided power rings has all colimits.
Proof. The empty colimit is $\mathbf{Z}$ with divided power ideal (0). Let's discuss general colimits. Let $\mathcal{C}$ be a category and let $c \mapsto\left(A_{c}, I_{c}, \gamma_{c}\right)$ be a diagram. Consider the functor

$$
F(B, J, \delta)=\lim _{c \in \mathcal{C}} \operatorname{Hom}\left(\left(A_{c}, I_{c}, \gamma_{c}\right),(B, J, \delta)\right)
$$

Note that any $f=\left(f_{c}\right)_{c \in C} \in F(B, J, \delta)$ has the property that all the images $f_{c}\left(A_{c}\right)$ generate a subring $B^{\prime}$ of $B$ of bounded cardinality $\kappa$ and that all the images $f_{c}\left(I_{c}\right)$ generate a divided power sub ideal $J^{\prime}$ of $B^{\prime}$. And we get a factorization of $f$ as a $f^{\prime}$ in $F\left(B^{\prime}\right)$ followed by the inclusion $B^{\prime} \rightarrow B$. Also, $F$ commutes with limits. Hence we may apply Lemma 23.3 .3 to see that $F$ is representable and we win.
07GY Remark 23.3.5. The forgetful functor $(A, I, \gamma) \mapsto A$ does not commute with colimits. For example, let

be a pushout in the category of divided power rings. Then in general the map $B \otimes_{A} B^{\prime} \rightarrow B^{\prime \prime}$ isn't an isomorphism. (It is always surjective.) An explicit example is given by $(A, I, \gamma)=(\mathbf{Z},(0), \emptyset),(B, J, \delta)=(\mathbf{Z} / 4 \mathbf{Z}, 2 \mathbf{Z} / 4 \mathbf{Z}, \delta)$, and $\left(B^{\prime}, J^{\prime}, \delta^{\prime}\right)=$ $\left(\mathbf{Z} / 4 \mathbf{Z}, 2 \mathbf{Z} / 4 \mathbf{Z}, \delta^{\prime}\right)$ where $\delta_{2}(2)=2$ and $\delta_{2}^{\prime}(2)=0$ and all higher divided powers
equal to zero. Then $\left(B^{\prime \prime}, J^{\prime \prime}, \delta^{\prime \prime}\right)=\left(\mathbf{F}_{2},(0), \emptyset\right)$ which doesn't agree with the tensor product. However, note that it is always true that

$$
B^{\prime \prime} / J^{\prime \prime}=B / J \otimes_{A / I} B^{\prime} / J^{\prime}
$$

as can be seen from the universal property of the pushout by considering maps into divided power algebras of the form $(C,(0), \emptyset)$.

### 23.4. Extending divided powers

07 GZ Here is the definition.
07H0 Definition 23.4.1. Given a divided power ring $(A, I, \gamma)$ and a ring map $A \rightarrow B$ we say $\gamma$ extends to $B$ if there exists a divided power structure $\bar{\gamma}$ on $I B$ such that $(A, I, \gamma) \rightarrow(B, I B, \bar{\gamma})$ is a homomorphism of divided power rings.

07H1 Lemma 23.4.2. Let $(A, I, \gamma)$ be a divided power ring. Let $A \rightarrow B$ be a ring map. If $\gamma$ extends to $B$ then it extends uniquely. Assume (at least) one of the following conditions holds
(1) $I B=0$,
(2) $I$ is principal, or
(3) $A \rightarrow B$ is flat.

Then $\gamma$ extends to $B$.
Proof. Any element of $I B$ can be written as a finite sum $\sum_{i=1}^{t} b_{i} x_{i}$ with $b_{i} \in B$ and $x_{i} \in I$. If $\gamma$ extends to $\bar{\gamma}$ on $I B$ then $\bar{\gamma}_{n}\left(x_{i}\right)=\gamma_{n}\left(x_{i}\right)$. Thus, conditions (3) and (4) in Definition 23.2.1 imply that

$$
\bar{\gamma}_{n}\left(\sum_{i=1}^{t} b_{i} x_{i}\right)=\sum_{n_{1}+\ldots+n_{t}=n} \prod_{i=1}^{t} b_{i}^{n_{i}} \gamma_{n_{i}}\left(x_{i}\right)
$$

Thus we see that $\bar{\gamma}$ is unique if it exists.
If $I B=0$ then setting $\bar{\gamma}_{n}(0)=0$ works. If $I=(x)$ then we define $\bar{\gamma}_{n}(b x)=b^{n} \gamma_{n}(x)$. This is well defined: if $b^{\prime} x=b x$, i.e., $\left(b-b^{\prime}\right) x=0$ then

$$
\begin{aligned}
b^{n} \gamma_{n}(x)-\left(b^{\prime}\right)^{n} \gamma_{n}(x) & =\left(b^{n}-\left(b^{\prime}\right)^{n}\right) \gamma_{n}(x) \\
& =\left(b^{n-1}+\ldots+\left(b^{\prime}\right)^{n-1}\right)\left(b-b^{\prime}\right) \gamma_{n}(x)=0
\end{aligned}
$$

because $\gamma_{n}(x)$ is divisible by $x$ (since $\left.\gamma_{n}(I) \subseteq I\right)$ and hence annihilated by $b-b^{\prime}$. Next, we prove conditions (1) - (5) of Definition 23.2.1. Parts (1), (2), (3), (5) are obvious from the construction. For (4) suppose that $y, z \in I B$, say $y=b x$ and $z=c x$. Then $y+z=(b+c) x$ hence

$$
\begin{aligned}
\bar{\gamma}_{n}(y+z) & =(b+c)^{n} \gamma_{n}(x) \\
& =\sum \frac{n!}{i!(n-i)!} b^{i} c^{n-i} \gamma_{n}(x) \\
& =\sum b^{i} c^{n-i} \gamma_{i}(x) \gamma_{n-i}(x) \\
& =\sum \bar{\gamma}_{i}(y) \bar{\gamma}_{n-i}(z)
\end{aligned}
$$

as desired.
Assume $A \rightarrow B$ is flat. Suppose that $b_{1}, \ldots, b_{r} \in B$ and $x_{1}, \ldots, x_{r} \in I$. Then

$$
\bar{\gamma}_{n}\left(\sum b_{i} x_{i}\right)=\sum b_{1}^{e_{1}} \ldots b_{r}^{e_{r}} \gamma_{e_{1}}\left(x_{1}\right) \ldots \gamma_{e_{r}}\left(x_{r}\right)
$$

where the sum is over $e_{1}+\ldots+e_{r}=n$ if $\bar{\gamma}_{n}$ exists. Next suppose that we have $c_{1}, \ldots, c_{s} \in B$ and $a_{i j} \in A$ such that $b_{i}=\sum a_{i j} c_{j}$. Setting $y_{j}=\sum a_{i j} x_{i}$ we claim that

$$
\sum b_{1}^{e_{1}} \ldots b_{r}^{e_{r}} \gamma_{e_{1}}\left(x_{1}\right) \ldots \gamma_{e_{r}}\left(x_{r}\right)=\sum c_{1}^{d_{1}} \ldots c_{s}^{d_{s}} \gamma_{d_{1}}\left(y_{1}\right) \ldots \gamma_{d_{s}}\left(y_{s}\right)
$$

in $B$ where on the right hand side we are summing over $d_{1}+\ldots+d_{s}=n$. Namely, using the axioms of a divided power structure we can expand both sides into a sum with coefficients in $\mathbf{Z}\left[a_{i j}\right]$ of terms of the form $c_{1}^{d_{1}} \ldots c_{s}^{d_{s}} \gamma_{e_{1}}\left(x_{1}\right) \ldots \gamma_{e_{r}}\left(x_{r}\right)$. To see that the coefficients agree we note that the result is true in $\mathbf{Q}\left[x_{1}, \ldots, x_{r}, c_{1}, \ldots, c_{s}, a_{i j}\right]$ with $\gamma$ the unique divided power structure on $\left(x_{1}, \ldots, x_{r}\right)$. By Lazard's theorem (Algebra, Theorem 10.80.4) we can write $B$ as a directed colimit of finite free $A$ modules. In particular, if $z \in I B$ is written as $z=\sum x_{i} b_{i}$ and $z=\sum x_{i^{\prime}}^{\prime} b_{i^{\prime}}^{\prime}$, then we can find $c_{1}, \ldots, c_{s} \in B$ and $a_{i j}, a_{i^{\prime} j}^{\prime} \in A$ such that $b_{i}=\sum a_{i j} c_{j}$ and $b_{i^{\prime}}^{\prime}=\sum a_{i^{\prime} j}^{\prime} c_{j}$ such that $y_{j}=\sum x_{i} a_{i j}=\sum x_{i^{\prime}}^{\prime} a_{i^{\prime} j}^{\prime}$ holds ${ }^{2}$. Hence the procedure above gives a well defined map $\bar{\gamma}_{n}$ on $I B$. By construction $\bar{\gamma}$ satisfies conditions (1), (3), and (4). Moreover, for $x \in I$ we have $\bar{\gamma}_{n}(x)=\gamma_{n}(x)$. Hence it follows from Lemma 23.2.4 that $\bar{\gamma}$ is a divided power structure on $I B$.

07H2 Lemma 23.4.3. Let $(A, I, \gamma)$ be a divided power ring.
(1) If $\varphi:(A, I, \gamma) \rightarrow(B, J, \delta)$ is a homomorphism of divided power rings, then $\operatorname{Ker}(\varphi) \cap I$ is preserved by $\gamma_{n}$ for all $n \geq 1$.
(2) Let $\mathfrak{a} \subset A$ be an ideal and set $I^{\prime}=I \cap \mathfrak{a}$. The following are equivalent
(a) $I^{\prime}$ is preserved by $\gamma_{n}$ for all $n>0$,
(b) $\gamma$ extends to $A / \mathfrak{a}$, and
(c) there exist a set of generators $x_{i}$ of $I^{\prime}$ as an ideal such that $\gamma_{n}\left(x_{i}\right) \in I^{\prime}$ for all $n>0$.

Proof. Proof of (1). This is clear. Assume (2)(a). Define $\bar{\gamma}_{n}\left(x \bmod I^{\prime}\right)=\gamma_{n}(x) \bmod$ $I^{\prime}$ for $x \in I$. This is well defined since $\gamma_{n}(x+y)=\gamma_{n}(x) \bmod I^{\prime}$ for $y \in I^{\prime}$ by Definition 23.2 .1 (4) and the fact that $\gamma_{j}(y) \in I^{\prime}$ by assumption. It is clear that $\bar{\gamma}$ is a divided power structure as $\gamma$ is one. Hence (2)(b) holds. Also, (2)(b) implies (2)(a) by part (1). It is clear that (2)(a) implies (2)(c). Assume (2)(c). Note that $\gamma_{n}(x)=a^{n} \gamma_{n}\left(x_{i}\right) \in I^{\prime}$ for $x=a x_{i}$. Hence we see that $\gamma_{n}(x) \in I^{\prime}$ for a set of generators of $I^{\prime}$ as an abelian group. By induction on the length of an expression in terms of these, it suffices to prove $\forall n: \gamma_{n}(x+y) \in I^{\prime}$ if $\forall n: \gamma_{n}(x), \gamma_{n}(y) \in I^{\prime}$. This follows immediately from the fourth axiom of a divided power structure.

07H3 Lemma 23.4.4. Let $(A, I, \gamma)$ be a divided power ring. Let $E \subset I$ be a subset. Then the smallest ideal $J \subset I$ preserved by $\gamma$ and containing all $f \in E$ is the ideal $J$ generated by $\gamma_{n}(f), n \geq 1, f \in E$.

Proof. Follows immediately from Lemma 23.4.3.
07KD Lemma 23.4.5. Let $(A, I, \gamma)$ be a divided power ring. Let $p$ be a prime. If $p$ is nilpotent in $A / I$, then
(1) the $p$-adic completion $A^{\wedge}=\lim _{e} A / p^{e} A$ surjects onto $A / I$,
(2) the kernel of this map is the p-adic completion $I^{\wedge}$ of $I$, and

[^62](3) each $\gamma_{n}$ is continuous for the p-adic topology and extends to $\gamma_{n}^{\wedge}: I^{\wedge} \rightarrow I^{\wedge}$ defining a divided power structure on $I^{\wedge}$.
If moreover $A$ is a $\mathbf{Z}_{(p)}$-algebra, then
(4) for $e$ large enough the ideal $p^{e} A \subset I$ is preserved by the divided power structure $\gamma$ and
$$
\left(A^{\wedge}, I^{\wedge}, \gamma^{\wedge}\right)=\lim _{e}\left(A / p^{e} A, I / p^{e} A, \bar{\gamma}\right)
$$
in the category of divided power rings.
Proof. Let $t \geq 1$ be an integer such that $p^{t} A / I=0$, i.e., $p^{t} A \subset I$. The map $A^{\wedge} \rightarrow A / I$ is the composition $A^{\wedge} \rightarrow A / p^{t} A \rightarrow A / I$ which is surjective (for example by Algebra, Lemma 10.95.1). As $p^{e} I \subset p^{e} A \cap I \subset p^{e-t} I$ for $e \geq t$ we see that the kernel of the composition $A^{\wedge} \rightarrow A / I$ is the $p$-adic completion of $I$. The map $\gamma_{n}$ is continuous because
$$
\gamma_{n}\left(x+p^{e} y\right)=\sum_{i+j=n} p^{j e} \gamma_{i}(x) \gamma_{j}(y)=\gamma_{n}(x) \bmod p^{e} I
$$
by the axioms of a divided power structure. It is clear that the axioms for divided power structures are inherited by the maps $\gamma_{n}^{\wedge}$ from the maps $\gamma_{n}$. Finally, to see the last statement say $e>t$. Then $p^{e} A \subset I$ and $\gamma_{1}\left(p^{e} A\right) \subset p^{e} A$ and for $n>1$ we have
$$
\gamma_{n}\left(p^{e} a\right)=p^{n} \gamma_{n}\left(p^{e-1} a\right)=\frac{p^{n}}{n!} p^{n(e-1)} a^{n} \in p^{e} A
$$
as $p^{n} / n!\in \mathbf{Z}_{(p)}$ and as $n \geq 2$ and $e \geq 2$ so $n(e-1) \geq e$. This proves that $\gamma$ extends to $A / p^{e} A$, see Lemma 23.4.3. The statement on limits is clear from the construction of limits in the proof of Lemma 23.3.2.

### 23.5. Divided power polynomial algebras

07 H 4 A very useful example is the divided power polynomial algebra. Let $A$ be a ring. Let $t \geq 1$. We will denote $A\left\langle x_{1}, \ldots, x_{t}\right\rangle$ the following $A$-algebra: As an $A$-module we set

$$
A\left\langle x_{1}, \ldots, x_{t}\right\rangle=\bigoplus_{n_{1}, \ldots, n_{t} \geq 0} A x_{1}^{\left[n_{1}\right]} \ldots x_{t}^{\left[n_{t}\right]}
$$

with multiplication given by

$$
x_{i}^{[n]} x_{i}^{[m]}=\frac{(n+m)!}{n!m!} x_{i}^{[n+m]}
$$

We also set $x_{i}=x_{i}^{[1]}$. Note that $1=x_{1}^{[0]} \ldots x_{t}^{[0]}$. There is a similar construction which gives the divided power polynomial algebra in infinitely many variables. There is an canonical $A$-algebra map $A\left\langle x_{1}, \ldots, x_{t}\right\rangle \rightarrow A$ sending $x_{i}^{[n]}$ to zero for $n>0$. The kernel of this map is denoted $A\left\langle x_{1}, \ldots, x_{t}\right\rangle_{+}$.
07H5 Lemma 23.5.1. Let $(A, I, \gamma)$ be a divided power ring. There exists a unique divided power structure $\delta$ on

$$
J=I A\left\langle x_{1}, \ldots, x_{t}\right\rangle+A\left\langle x_{1}, \ldots, x_{t}\right\rangle_{+}
$$

such that
(1) $\delta_{n}\left(x_{i}\right)=x_{i}^{[n]}$, and
(2) $(A, I, \gamma) \rightarrow\left(A\left\langle x_{1}, \ldots, x_{t}\right\rangle, J, \delta\right)$ is a homomorphism of divided power rings.

Moreover, $\left(A\left\langle x_{1}, \ldots, x_{t}\right\rangle, J, \delta\right)$ has the following universal property: A homomorphism of divided power rings $\varphi:(A\langle x\rangle, J, \delta) \rightarrow(C, K, \epsilon)$ is the same thing as a homomorphism of divided power rings $A \rightarrow C$ and elements $k_{1}, \ldots, k_{t} \in K$.

Proof. We will prove the lemma in case of a divided power polynomial algebra in one variable. The result for the general case can be argued in exactly the same way, or by noting that $A\left\langle x_{1}, \ldots, x_{t}\right\rangle$ is isomorphic to the ring obtained by adjoining the divided power variables $x_{1}, \ldots, x_{t}$ one by one.
Let $A\langle x\rangle_{+}$be the ideal generated by $x, x^{[2]}, x^{[3]}, \ldots$. Note that $J=I A\langle x\rangle+A\langle x\rangle_{+}$ and that

$$
I A\langle x\rangle \cap A\langle x\rangle_{+}=I A\langle x\rangle \cdot A\langle x\rangle_{+}
$$

Hence by Lemma 23.2 .5 it suffices to show that there exist divided power structures on the ideals $I A\langle x\rangle$ and $A\langle x\rangle_{+}$. The existence of the first follows from Lemma 23.4 .2 as $A \rightarrow A\langle x\rangle$ is flat. For the second, note that if $A$ is torsion free, then we can apply Lemma 23.2 .2 (4) to see that $\delta$ exists. Namely, choosing as generators the elements $x^{[m]}$ we see that $\left(x^{[m]}\right)^{n}=\frac{(n m)!}{(m!)^{n}} x^{[n m]}$ and $n!$ divides the integer $\frac{(n m)!}{(m!)^{n}}$. In general write $A=R / \mathfrak{a}$ for some torsion free ring $R$ (e.g., a polynomial ring over $\mathbf{Z}$ ). The kernel of $R\langle x\rangle \rightarrow A\langle x\rangle$ is $\bigoplus \mathfrak{a} x^{[m]}$. Applying criterion (2)(c) of Lemma 23.4.3 we see that the divided power structure on $R\langle x\rangle_{+}$extends to $A\langle x\rangle$ as desired.

Proof of the universal property. Given a homomorphism $\varphi: A \rightarrow C$ of divided power rings and $k_{1}, \ldots, k_{t} \in K$ we consider

$$
A\left\langle x_{1}, \ldots, x_{t}\right\rangle \rightarrow C, \quad x_{1}^{\left[n_{1}\right]} \ldots x_{t}^{\left[n_{t}\right]} \longmapsto \epsilon_{n_{1}}\left(k_{1}\right) \ldots \epsilon_{n_{t}}\left(k_{t}\right)
$$

using $\varphi$ on coefficients. The only thing to check is that this is an $A$-algebra homomorphism (details omitted). The inverse construction is clear.

07H6 Remark 23.5.2. Let $(A, I, \gamma)$ be a divided power ring. There is a variant of Lemma 23.5.1 for infinitely many variables. First note that if $s<t$ then there is a canonical map

$$
A\left\langle x_{1}, \ldots, x_{s}\right\rangle \rightarrow A\left\langle x_{1}, \ldots, x_{t}\right\rangle
$$

Hence if $W$ is any set, then we set

$$
A\left\langle x_{w}, w \in W\right\rangle=\operatorname{colim}_{E \subset W} A\left\langle x_{e}, e \in E\right\rangle
$$

(colimit over $E$ finite subset of $W$ ) with transition maps as above. By the definition of a colimit we see that the universal mapping property of $A\left\langle x_{w}, w \in W\right\rangle$ is completely analogous to the mapping property stated in Lemma 23.5.1.

The following lemma can be found in BO83.
07GS Lemma 23.5.3. Let $p$ be a prime number. Let $A$ be a ring such that every integer $n$ not divisible by $p$ is invertible, i.e., $A$ is a $\mathbf{Z}_{(p)}$-algebra. Let $I \subset A$ be an ideal. Two divided power structures $\gamma, \gamma^{\prime}$ on $I$ are equal if and only if $\gamma_{p}=\gamma_{p}^{\prime}$. Moreover, given a map $\delta: I \rightarrow I$ such that
(1) $p!\delta(x)=x^{p}$ for all $x \in I$,
(2) $\delta(a x)=a^{p} \delta(x)$ for all $a \in A, x \in I$, and
(3) $\delta(x+y)=\delta(x)+\sum_{i+j=p, i, j \geq 1} \frac{1}{i!j!} x^{i} y^{j}+\delta(y)$ for all $x, y \in I$,
then there exists a unique divided power structure $\gamma$ on I such that $\gamma_{p}=\delta$.

Proof. If $n$ is not divisible by $p$, then $\gamma_{n}(x)=c x \gamma_{n-1}(x)$ where $c$ is a unit in $\mathbf{Z}_{(p)}$. Moreover,

$$
\gamma_{p m}(x)=c \gamma_{m}\left(\gamma_{p}(x)\right)
$$

where $c$ is a unit in $\mathbf{Z}_{(p)}$. Thus the first assertion is clear. For the second assertion, we can, working backwards, use these equalities to define all $\gamma_{n}$. More precisely, if $n=a_{0}+a_{1} p+\ldots+a_{e} p^{e}$ with $a_{i} \in\{0, \ldots, p-1\}$ then we set

$$
\gamma_{n}(x)=c_{n} x^{a_{0}} \delta(x)^{a_{1}} \ldots \delta^{e}(x)^{a_{e}}
$$

for $c_{n} \in \mathbf{Z}_{(p)}$ defined by

$$
c_{n}=(p!)^{a_{1}+a_{2}(1+p)+\ldots+a_{e}\left(1+\ldots+p^{e-1}\right)} / n!
$$

Now we have to show the axioms (1) - (5) of a divided power structure, see Definition 23.2.1. We observe that (1) and (3) are immediate. Verification of (2) and (5) is by a direct calculation which we omit. Let $x, y \in I$. We claim there is a ring map

$$
\varphi: \mathbf{Z}_{(p)}\langle u, v\rangle \longrightarrow A
$$

which maps $u^{[n]}$ to $\gamma_{n}(x)$ and $v^{[n]}$ to $\gamma_{n}(y)$. By construction of $\mathbf{Z}_{(p)}\langle u, v\rangle$ this means we have to check that

$$
\gamma_{n}(x) \gamma_{m}(x)=\frac{(n+m)!}{n!m!} \gamma_{n+m}(x)
$$

in $A$ and similarly for $y$. This is true because (2) holds for $\gamma$. Let $\epsilon$ denote the divided power structure on the ideal $\mathbf{Z}_{(p)}\langle u, v\rangle_{+}$of $\mathbf{Z}_{(p)}\langle u, v\rangle$. Next, we claim that $\varphi\left(\epsilon_{n}(f)\right)=\gamma_{n}(\varphi(f))$ for $f \in \mathbf{Z}_{(p)}\langle u, v\rangle_{+}$and all $n$. This is clear for $n=$ $0,1, \ldots, p-1$. For $n=p$ it suffices to prove it for a set of generators of the ideal $\mathbf{Z}_{(p)}\langle u, v\rangle_{+}$because both $\epsilon_{p}$ and $\gamma_{p}=\delta$ satisfy properties (1) and (3) of the lemma. Hence it suffices to prove that $\gamma_{p}\left(\gamma_{n}(x)\right)=\frac{(p n)!}{p!(n!)^{p}} \gamma_{p n}(x)$ and similarly for $y$, which follows as (5) holds for $\gamma$. Now, if $n=a_{0}+a_{1} p+\ldots+a_{e} p^{e}$ is an arbitrary integer written in $p$-adic expansion as above, then

$$
\epsilon_{n}(f)=c_{n} f^{a_{0}} \gamma_{p}(f)^{a_{1}} \ldots \gamma_{p}^{e}(f)^{a_{e}}
$$

because $\epsilon$ is a divided power structure. Hence we see that $\varphi\left(\epsilon_{n}(f)\right)=\gamma_{n}(\varphi(f))$ holds for all $n$. Applying this for $f=u+v$ we see that axiom (4) for $\gamma$ follows from the fact that $\epsilon$ is a divided power structure.

### 23.6. Tate resolutions

09 PF In this section we briefly discuss the resolutions constructed in Tat57 which combine divided power structures with differential graded algebras. In this section we will use homological notation for differential graded algebras. Our differential graded algebras will sit in nonnegative homological degrees. Thus our differential graded algebras $(A, \mathrm{~d})$ will be given as chain complexes

$$
\ldots \rightarrow A_{2} \rightarrow A_{1} \rightarrow A_{0} \rightarrow 0 \rightarrow \ldots
$$

endowed with a multiplication.
Let $R$ be a ring. In this section we will often consider graded $R$-algebras $A=$ $\bigoplus_{d \geq 0} A_{d}$ whose components are zero in negative degrees. We will set $A_{+}=$ $\bigoplus_{d>0} A_{d}$. We will write $A_{\text {even }}=\bigoplus_{d \geq 0} A_{2 d}$ and $A_{o d d}=\bigoplus_{d \geq 0} A_{2 d+1}$. Recall that $A$ is graded commutative if $x y=(-1)^{\operatorname{deg}(x) \operatorname{deg}(y)} y x$ for homogeneous elements
$x, y$. Recall that $A$ is strictly graded commutative if in addition $x^{2}=0$ for homogeneous elements $x$ of odd degree. Finally, to understand the following definition, keep in mind that $\gamma_{n}(x)=x^{n} / n!$ if $A$ is a $\mathbf{Q}$-algebra.

09PG Definition 23.6.1. Let $R$ be a ring. Let $A=\bigoplus_{d \geq 0} A_{d}$ be a graded $R$-algebra which is strictly graded commutative. A collection of maps $\gamma_{n}: A_{\text {even },+} \rightarrow A_{\text {even },+}$ defined for all $n>0$ is called a divided power structure on $A$ if we have
(1) $\gamma_{n}(x) \in A_{2 n d}$ if $x \in A_{2 d}$,
(2) $\gamma_{1}(x)=x$ for any $x$, we also set $\gamma_{0}(x)=1$,
(3) $\gamma_{n}(x) \gamma_{m}(x)=\frac{(n+m)!}{n!m!} \gamma_{n+m}(x)$,
(4) $\gamma_{n}(x y)=x^{n} \gamma_{n}(y)$ for all $x \in A_{\text {even }}$ and $y \in A_{\text {even },+}$,
(5) $\gamma_{n}(x y)=0$ if $x, y \in A_{\text {odd }}$ homogeneous and $n>1$
(6) if $x, y \in A_{\text {even },+}$ then $\gamma_{n}(x+y)=\sum_{i=0, \ldots, n} \gamma_{i}(x) \gamma_{n-i}(y)$,
(7) $\gamma_{n}\left(\gamma_{m}(x)\right)=\frac{(n m)!}{n!(m!)^{n}} \gamma_{n m}(x)$ for $x \in A_{\text {even },+}$.

Observe that conditions $(2),(3),(4),(6)$, and (7) imply that $\gamma$ is a "usual" divided power structure on the ideal $A_{\text {even },+}$ of the (commutative) ring $A_{\text {even }}$, see Sections 23.2 23.3, 23.4, and 23.5. In particular, we have $\gamma_{n}(x)=n!x^{n}$ for all $x \in A_{\text {even },+}$. Condition (1) states that $\gamma$ is compatible with grading and condition (5) tells us $\gamma_{n}$ for $n>1$ vanishes on products of homogeneous elements of odd degree. But note that it may happen that

$$
\gamma_{2}\left(z_{1} z_{2}+z_{3} z_{4}\right)=z_{1} z_{2} z_{3} z_{4}
$$

is nonzero if $z_{1}, z_{2}, z_{3}, z_{4}$ are homogeneous elements of odd degree.
09PH Example 23.6.2 (Adjoining odd variable). Let $R$ be a ring. Let $(A, \gamma)$ be a strictly graded commutative graded $R$-algebra endowed with a divided power structure as in the definition above. Let $d>0$ be an odd integer. In this setting we can adjoin a variable $T$ of degree $d$ to $A$. Namely, set

$$
A\langle T\rangle=A \oplus A T
$$

with grading given by $A\langle T\rangle_{m}=A_{m} \oplus A_{m-d} T$. We claim there is a unique divided power structure on $A\langle T\rangle$ compatible with the given divided power structure on $A$. Namely, we set

$$
\gamma_{n}(x+y T)=\gamma_{n}(x)+\gamma_{n-1}(x) y T
$$

for $x \in A_{\text {even },+}$ and $y \in A_{\text {odd }}$.
09PI Example 23.6.3 (Adjoining even variable). Let $R$ be a ring. Let $(A, \gamma)$ be a strictly graded commutative graded $R$-algebra endowed with a divided power structure as in the definition above. Let $d>0$ be an even integer. In this setting we can adjoin a variable $T$ of degree $d$ to $A$. Namely, set

$$
A\langle T\rangle=A \oplus A T \oplus A T^{(2)} \oplus A T^{(3)} \oplus \ldots
$$

with multiplication given by

$$
T^{(n)} T^{(m)}=\frac{(n+m)!}{n!m!} T^{(n+m)}
$$

and with grading given by

$$
A\langle T\rangle_{m}=A_{m} \oplus A_{m-d} T \oplus A_{m-2 d} T^{(2)} \oplus \ldots
$$

We claim there is a unique divided power structure on $A\langle T\rangle$ compatible with the given divided power structure on $A$ such that $\gamma_{n}\left(T^{(i)}\right)=T^{(n i)}$. To define the divided power structure we first set

$$
\gamma_{n}\left(\sum_{i>0} x_{i} T^{(i)}\right)=\sum \prod_{n=\sum e_{i}} x_{i}^{e_{i}} T^{\left(i e_{i}\right)}
$$

if $x_{i}$ is in $A_{\text {even }}$. If $x_{0} \in A_{\text {even },+}$ then we take

$$
\gamma_{n}\left(\sum_{i \geq 0} x_{i} T^{(i)}\right)=\sum_{a+b=n} \gamma_{a}\left(x_{0}\right) \gamma_{b}\left(\sum_{i>0} x_{i} T^{(i)}\right)
$$

where $\gamma_{b}$ is as defined above.
At this point we tie in the definition of divided power structures with differentials. To understand the definition note that $\mathrm{d}\left(x^{n} / n!\right)=\mathrm{d}(x) x^{n-1} /(n-1)$ ! if $A$ is a Q-algebra and $x \in A_{\text {even },+}$.
09PJ Definition 23.6.4. Let $R$ be a ring. Let $A=\bigoplus_{d \geq 0} A_{d}$ be a differential graded $R$-algebra which is strictly graded commutative. A divided power structure $\gamma$ on $A$ is compatible with the differential graded structure if $\mathrm{d}\left(\gamma_{n}(x)\right)=\mathrm{d}(x) \gamma_{n-1}(x)$ for all $x \in A_{\text {even },+}$.
Warning: Let $(A, \mathrm{~d}, \gamma)$ be as in Definition 23.6.4. It may not be true that $\gamma_{n}(x)$ is a boundary, if $x$ is a boundary. Thus $\gamma$ in general does not induce a divided power structure on the homology algebra $H(A)$. In some papers the authors put an additional compatibility condition in order to insure this is the case, but we elect not to do so.
09PK Lemma 23.6.5. Let $(A, d, \gamma)$ and $(B, d, \gamma)$ be as in Definition 23.6.4. Let $f: A \rightarrow$ $B$ be a map of differential graded algebras compatible with divided power structures. Assume
(1) $H_{k}(A)=0$ for $k>0$, and
(2) $f$ is surjective.

Then $\gamma$ induces a divided power structure on the graded $R$-algebra $H(B)$.
Proof. Suppose that $x$ and $x^{\prime}$ are homogeneous of the same degree $2 d$ and define the same cohomology class in $H(B)$. Say $x^{\prime}-x=\mathrm{d}(w)$. Choose a lift $y \in A_{2 d}$ of $x$ and a lift $z \in A_{2 d+1}$ of $w$. Then $y^{\prime}=y+\mathrm{d}(z)$ is a lift of $x^{\prime}$. Hence

$$
\gamma_{n}\left(y^{\prime}\right)=\sum \gamma_{i}(y) \gamma_{n-i}(\mathrm{~d}(z))=\gamma_{n}(y)+\sum_{i<n} \gamma_{i}(y) \gamma_{n-i}(\mathrm{~d}(z))
$$

Since $A$ is acyclic in positive degrees and since $\mathrm{d}\left(\gamma_{j}(\mathrm{~d}(z))\right)=0$ for all $j$ we can write this as

$$
\gamma_{n}\left(y^{\prime}\right)=\gamma_{n}(y)+\sum_{i<n} \gamma_{i}(y) \mathrm{d}\left(z_{i}\right)
$$

for some $z_{i}$ in $A$. Moreover, for $0<i<n$ we have

$$
\mathrm{d}\left(\gamma_{i}(y) z_{i}\right)=\mathrm{d}\left(\gamma_{i}(y)\right) z_{i}+\gamma_{i}(y) \mathrm{d}\left(z_{i}\right)=\mathrm{d}(y) \gamma_{i-1}(y) z_{i}+\gamma_{i}(y) \mathrm{d}\left(z_{i}\right)
$$

and the first term maps to zero in $B$ as $\mathrm{d}(y)$ maps to zero in $B$. Hence $\gamma_{n}\left(x^{\prime}\right)$ and $\gamma_{n}(x)$ map to the same element of $H(B)$. Thus we obtain a well defined map $\gamma_{n}: H_{2 d}(B) \rightarrow H_{2 n d}(B)$ for all $d>0$ and $n>0$. We omit the verification that this defines a divided power structure on $H(B)$.
09PL Lemma 23.6.6. Let $(A, d, \gamma)$ be as in Definition 23.6.4. Let $R \rightarrow R^{\prime}$ be a ring map. Then $d$ and $\gamma$ induce similar structures on $A^{\prime}=A \otimes_{R} R^{\prime}$ such that $\left(A^{\prime}, d, \gamma\right)$ is as in Definition 23.6.4.

Proof. Observe that $A_{\text {even }}^{\prime}=A_{\text {even }} \otimes_{R} R^{\prime}$ and $A_{\text {even },+}^{\prime}=A_{\text {even },+} \otimes_{R} R^{\prime}$. Hence we are trying to show that the divided powers $\gamma$ extend to $A_{\text {even }}^{\prime}$ (terminology as in Definition 23.4.1. Once we have shown $\gamma$ extends it follows easily that this extension has all the desired properties.
Choose a polynomial $R$-algebra $P$ and a surjection of $R$-algebras $P \rightarrow R^{\prime}$. The ring map $A_{\text {even }} \rightarrow A_{\text {even }} \otimes_{R} P$ is flat, hence the divided powers $\gamma$ extend to $A_{\text {even }} \otimes_{R} P$ uniquely by Lemma 23.4.2. Let $J=\operatorname{Ker}\left(P \rightarrow R^{\prime}\right)$. To show that $\gamma$ extends to $A \otimes_{R} R^{\prime}$ it suffices to show that $I^{\prime}=\operatorname{Ker}\left(A_{\text {even },+} \otimes_{R} P \rightarrow A_{\text {even },+} \otimes_{R} R^{\prime}\right)$ is generated by elements $z$ such that $\gamma_{n}(z) \in I^{\prime}$ for all $n>0$. This is clear as $I^{\prime}$ is generated by elements of the form $x \otimes f$ with $x \in A_{\text {even },+}$ and $f \in \operatorname{Ker}\left(P \rightarrow R^{\prime}\right)$.

09PM Lemma 23.6.7. Let $(A, d, \gamma)$ be as in Definition 23.6.4. Let $d \geq 1$ be an integer. Let $A\langle T\rangle$ be the graded divided power polynomial algebra on $T$ with $\operatorname{deg}(T)=d$ constructed in Example 23.6.2 or 23.6.3. Let $f \in A_{d-1}$ be an element with $d(f)=0$. There exists a unique differential $d$ on $A\langle T\rangle$ such that $d(T)=f$ and such that $d$ is compatible with the divided power structure on $A\langle T\rangle$.

Proof. This is proved by a direct computation which is omitted.
Here is the construction of Tate.
09PN Lemma 23.6.8. Assume that $R$ is a Noetherian ring and $R \rightarrow S$ a ring map of finite type. There exists a factorization

$$
R \rightarrow A \rightarrow S
$$

with the following properties
(1) $(A, d, \gamma)$ is as in Definition 23.6.4.
(2) $A \rightarrow S$ is a quasi-isomorphism (if we endow $S$ with the zero differential),
(3) $A$ is a graded divided power polynomial algebra over $R$ with finitely many variables in each degree.
The last condition means that $A$ is constructed out of $R$ by successively adjoining variables $T$ as in Examples 23.6.2 and 23.6.3.

Proof. Start of the construction. Let $A(0)=R\left[x_{1}, \ldots, x_{n}\right]$ be a (usual) polynomial ring and let $A(0) \rightarrow S$ be a surjection. As grading we take $A(0)_{0}=A(0)$ and $A(0)_{d}=0$ for $d \neq 0$. Thus $\mathrm{d}=0$ and $\gamma_{n}, n>0$ is zero as well.
Choose generators $f_{1}, \ldots, f_{m} \in R\left[x_{1}, \ldots, x_{m}\right]$ for the kernel of the given map $A(0)=R\left[x_{1}, \ldots, x_{m}\right] \rightarrow S$. We apply Examples 23.6.2 $m$ times to get

$$
A(1)=A(0)\left\langle T_{1}, \ldots, T_{m}\right\rangle
$$

with $\operatorname{deg}\left(T_{i}\right)=1$ as a graded divided power polynomial algebra. We set $\mathrm{d}\left(T_{i}\right)=f_{i}$. Since $A(1)$ is a divided power polynomial algebra over $A(0)$ and since $\mathrm{d}\left(f_{i}\right)=0$ this extends uniquely to a differential on $A(1)$ by Lemma 23.6.7.
Induction hypothesis: Assume we are given factorizations

$$
R \rightarrow A(0) \rightarrow A(1) \rightarrow \ldots \rightarrow A(m) \rightarrow S
$$

where $A(0)$ and $A(1)$ are as above and each $R \rightarrow A\left(m^{\prime}\right) \rightarrow S$ for $2 \leq m^{\prime} \leq m$ satisfies properties (1) and (3) of the statement of the lemma and (2) replaced by the condition that $H_{i}\left(A\left(m^{\prime}\right)\right) \rightarrow H_{i}(S)$ is an isomorphism for $m^{\prime}>i \geq 0$. The base case is $m=1$.

Induction step. Assume we have $R \rightarrow A(m) \rightarrow S$ as in the induction hypothesis. Consider the group $H_{m}(A(m))$. This is a module over $H_{0}(A(m))=S$. In fact, it is a subquotient of $A(m)_{m}$ which is a finite type module over $A(m)_{0}=R\left[x_{1}, \ldots, x_{n}\right]$. Thus we can pick finitely many elements

$$
e_{1}, \ldots, e_{t} \in \operatorname{Ker}\left(\mathrm{~d}: A(m)_{m} \rightarrow A(m)_{m-1}\right)
$$

which map to generators of this module. Applying Example 23.6.3 or 23.6.2 $t$ times we get

$$
A(m+1)=A(m)\left\langle T_{1}, \ldots, T_{t}\right\rangle
$$

with $\operatorname{deg}\left(T_{i}\right)=m+1$ as a graded divided power algebra. We set $\mathrm{d}\left(T_{i}\right)=e_{i}$. Since $A(1)$ is a divided power polynomial algebra over $A(0)$ and since $\mathrm{d}\left(e_{i}\right)=0$ this extends uniquely to a differential on $A(m+1)$ compatible with the divided power structure. Since we've added only material in degree $m+1$ and higher we see that $H_{i}(A(m+1))=H_{i}(A(m))$ for $i<m$. Moreover, it is clear that $H_{m}(A(m+1))=0$ by construction.
To finish the proof we observe that we have shown there exists a sequence of maps

$$
R \rightarrow A(0) \rightarrow A(1) \rightarrow \ldots \rightarrow A(m) \rightarrow A(m+1) \rightarrow \ldots \rightarrow S
$$

and to finish the proof we set $A=\operatorname{colim} A(m)$.
09PP Lemma 23.6.9. Let $R$ be a ring. Suppose that $(A, d, \gamma)$ and $(B, d, \gamma)$ are as in Definition 23.6.4. Let $\bar{\varphi}: H_{0}(A) \rightarrow H_{0}(B)$ be an $R$-algebra map. Assume
(1) $A$ is a graded divided power polynomial algebra over $R$ with finitely many variables in each degree,
(2) $H_{k}(B)=0$ for $k>0$.

Then there exists a map $\varphi: A \rightarrow B$ of differential graded $R$-algebras compatible with divided powers lifting $\varphi$.

Proof. Since $A$ is obtained from $R$ by adjoining divided power variables, we obtain filtrations $R \subset A(0) \subset A(1) \subset \ldots$ such that $A(m+1)$ is obtained from $A(m)$ by adjoining finitely many divided power variables of degree $m+1$. Then $A(0) \rightarrow S$ is a surjection from a (usual) polynomial algebra over $R$ onto $S$. Thus we can lift $\bar{\varphi}$ to an $R$-algebra map $\varphi(0): A(0) \rightarrow B(0)$.
Write $A(1)=A(0)\left\langle T_{1}, \ldots, T_{m}\right\rangle$ for some divided power variables $T_{j}$ of degree 1 . Let $f_{j} \in B_{0}$ be $f_{j}=\varphi(0)\left(\mathrm{d}\left(T_{j}\right)\right)$. Observe that $f_{j}$ maps to zero in $H_{0}(B)$ as $\mathrm{d} T_{j}$ maps to zero in $H_{0}(A)$. Thus we can find $b_{j} \in B_{1}$ with $\mathrm{d}\left(b_{j}\right)=f_{j}$. By the universal property of divided power polynomial algebras we find a lift $\varphi(1): A(1) \rightarrow B$ of $\varphi(0)$ mapping $T_{j}$ to $f_{j}$.

Having constructed $\varphi(m)$ for some $m \geq 1$ we can construct $\varphi(m+1): A(m+1) \rightarrow B$ in exactly the same manner. We omit the details.

09PQ Lemma 23.6.10. Let $R$ be a Noetherian ring. Let $R \rightarrow S$ and $R \rightarrow T$ be finite type ring maps. There exists a canonical structure of a divided power graded $R$-algebra on

$$
\operatorname{Tor}_{*}^{R}(S, T)
$$

Proof. Choose a factorization $R \rightarrow A \rightarrow S$ as above. Since $A \rightarrow S$ is a quasiisomorphism and since $A_{d}$ is a free $R$-module, we see that the differential graded algebra $B=A \otimes_{R} T$ computes the tor groups displayed in the lemma. Choose
a surjection $R\left[y_{1}, \ldots, y_{k}\right] \rightarrow T$. Then we see that $B$ is a quotient of the differential graded algebra $A\left[y_{1}, \ldots, y_{k}\right]$ whose homology sits in degree 0 (it is equal to $\left.S\left[y_{1}, \ldots, y_{k}\right]\right)$. By Lemma 23.6 .6 the differential graded algebras $B$ and $A\left[y_{1}, \ldots, y_{k}\right]$ have divided power structures compatible with the differentials. Hence we obtain our divided power structure on $H(B)$ by Lemma 23.6.5.

The divided power algebra structure constructed in this way is independent of the choice of $A$. Namely, if $A^{\prime}$ is a second choice, then Lemma 23.6 .9 implies there is a map $A \rightarrow A^{\prime}$ preserving all structure and the augmentations towards $S$. Then the induced map $B=A \otimes_{R} T \rightarrow A^{\prime} \otimes_{R} T^{\prime}=B^{\prime}$ is likewise and is a quasiisomorphism. The induced isomorphism of Tor algebras is therefore compatible with all multiplication and divided powers.

### 23.7. Application to complete intersections

09 PR Let $R$ be a ring. Let $(A, \mathrm{~d}, \gamma)$ be as in Definition 23.6.4. A derivation of degree 2 is an $R$-linear map $\theta: A \rightarrow A$ with the following properties
(1) $\theta\left(A_{d}\right) \subset A_{d-2}$,
(2) $\theta(x y)=\theta(x) y+x \theta(y)$,
(3) $\theta$ commutes with d,
(4) $\theta\left(\gamma_{n}(x)\right)=\theta(x) \gamma_{n-1}(x)$ for all $x \in A_{2 d}$ all $d$.

In the following lemma we construct a derivation.
09PS Lemma 23.7.1. Let $R$ be a ring. Let $(A, d, \gamma)$ be as in Definition 23.6.4. Let $R^{\prime} \rightarrow R$ be a surjection of rings whose kernel has square zero and is generated by one element $f$. If $A$ is a graded divided power polynomial algebra over $R$ with finitely many variables in each degree, then we obtain a derivation $\theta: A / I A \rightarrow A / I A$ where $I$ is the annihilator of $f$ in $R$.

Proof. Since $A$ is a divided power polynomial algebra, we can find a divided power polynomial algebra $A^{\prime}$ over $R^{\prime}$ such that $A=A^{\prime} \otimes_{R} R^{\prime}$. Moreover, we can lift d to an $R$-linear operator d on $A^{\prime}$ such that
(1) $\mathrm{d}(x y)=\mathrm{d}(x) y+(-1)^{\operatorname{deg}(x)} x \mathrm{~d}(y)$ for $x, y \in A^{\prime}$ homogeneous, and
(2) $\mathrm{d}\left(\gamma_{n}(x)\right)=\mathrm{d}(x) \gamma_{n-1}(x)$ for $x \in A_{\text {even },+}^{\prime}$.

We omit the details (hint: proceed one variable at the time). However, it may not be the case that $\mathrm{d}^{2}$ is zero on $A^{\prime}$. It is clear that $\mathrm{d}^{2}$ maps $A^{\prime}$ into $f A^{\prime} \cong A / I A$. Hence $\mathrm{d}^{2}$ annihilates $f A^{\prime}$ and factors as a map $A \rightarrow A / I A$. Since $\mathrm{d}^{2}$ is $R$-linear we obtain our map $\theta: A / I A \rightarrow A / I A$. The verification of the properties of a derivation is immediate.

09PT Lemma 23.7.2. Assumption and notation as in Lemma 23.7.1. Suppose $S=$ $H_{0}(A)$ is isomorphic to $R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ for some $n$, $m$, and $f_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$. Moreover, suppose given a relation

$$
\sum r_{j} f_{j}=0
$$

with $r_{j} \in R\left[x_{1}, \ldots, x_{n}\right]$. Choose $r_{j}^{\prime}, f_{j}^{\prime} \in R^{\prime}\left[x_{1}, \ldots, x_{n}\right]$ lifting $r_{j}, f_{j}$. Write $\sum r_{j}^{\prime} f_{j}^{\prime}=$ $g f$ for some $g \in R / I\left[x_{1}, \ldots, x_{n}\right]$. If $H_{1}(A)=0$ and all the coefficients of each $r_{j}$ are in $I$, then there exists an element $\xi \in H_{2}(A / I A)$ such that $\theta(\xi)=g$ in $S / I S$.

Proof. Let $A(0) \subset A(1) \subset A(2) \subset \ldots$ be the filtration of $A$ such that $A(m)$ is gotten from $A(m-1)$ by adjoining divided power variables of degree $m$. Then $A(0)$ is a polynomial algebra over $R$ equipped with an $R$-algebra surjection $A(0) \rightarrow S$. Thus we can choose a map

$$
\varphi: R\left[x_{1}, \ldots, x_{n}\right] \rightarrow A(0)
$$

lifting the augmentations to $S$. Next, $A(1)=A(0)\left\langle T_{1}, \ldots, T_{t}\right\rangle$ for some divided power variables $T_{i}$ of degree 1 . Since $H_{0}(A)=S$ we can pick $\xi_{j} \in \sum A(0) T_{i}$ with $\mathrm{d}\left(\xi_{j}\right)=\varphi\left(f_{j}\right)$. Then

$$
\mathrm{d}\left(\sum \varphi\left(r_{j}\right) \xi_{j}\right)=\sum \varphi\left(r_{j}\right) \varphi\left(f_{j}\right)=\sum \varphi\left(r_{j} f_{j}\right)=0
$$

Since $H_{1}(A)=0$ we can pick $\xi \in A_{2}$ with $\mathrm{d}(\xi)=\sum \varphi\left(r_{j}\right) \xi_{j}$. If the coefficients of $r_{j}$ are in $I$, then the same is true for $\varphi\left(r_{j}\right)$. In this case $\mathrm{d}(\xi)$ dies in $A_{1} / I A_{1}$ and hence $\xi$ defines a class in $H_{2}(A / I A)$.

The construction of $\theta$ in the proof of Lemma 23.7.1 proceeds by successively lifting $A(i)$ to $A^{\prime}(i)$ and lifting the differential d. We lift $\varphi$ to $\varphi^{\prime}: R^{\prime}\left[x_{1}, \ldots, x_{n}\right] \rightarrow A^{\prime}(0)$. Next, we have $A^{\prime}(1)=A^{\prime}(0)\left\langle T_{1}, \ldots, T_{t}\right\rangle$. Moreover, we can lift $\xi_{j}$ to $\xi_{j}^{\prime} \in \sum A^{\prime}(0) T_{i}$. Then $\mathrm{d}\left(\xi_{j}^{\prime}\right)=\varphi^{\prime}\left(f_{j}^{\prime}\right)+f a_{j}$ for some $a_{j} \in A^{\prime}(0)$. Consider a lift $\xi^{\prime} \in A_{2}^{\prime}$ of $\xi$. Then we know that

$$
\mathrm{d}\left(\xi^{\prime}\right)=\sum \varphi^{\prime}\left(r_{j}^{\prime}\right) \xi_{j}^{\prime}+\sum f b_{i} T_{i}
$$

for some $b_{i} \in A(0)$. Applying d again we find

$$
\theta(\xi)=\sum \varphi^{\prime}\left(r_{j}^{\prime}\right) \varphi^{\prime}\left(f_{j}^{\prime}\right)+\sum f \varphi^{\prime}\left(r_{j}^{\prime}\right) a_{j}+\sum f b_{i} \mathrm{~d}\left(T_{i}\right)
$$

The first term gives us what we want. The second term is zero because the coefficients of $r_{j}$ are in $I$ and hence are annihilated by $f$. The third term maps to zero in $H_{0}$ because $\mathrm{d}\left(T_{i}\right)$ maps to zero.

The method of proof of the following lemma is apparantly due to Gulliksen.
09PU Lemma 23.7.3. Let $R^{\prime} \rightarrow R$ be a surjection of Noetherian rings whose kernel has square zero and is generated by one element $f$. Let $S=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$. Let $\sum r_{j} f_{j}=0$ be a relation in $R\left[x_{1}, \ldots, x_{m}\right]$. Assume that
(1) each $r_{j}$ has coeffients in the annihilator $I$ of $f$ in $R$,
(2) for some lifts $r_{j}^{\prime}, f_{j}^{\prime} \in R^{\prime}\left[x_{1}, \ldots, x_{n}\right]$ we have $\sum r_{j}^{\prime} f_{j}^{\prime}=g f$ where $g$ is not nilpotent in $S$.
Then $S$ does not have finite tor dimension over $R$ (i.e., $S$ is not a perfect $R$-algebra).
Proof. Choose a Tate resolution $R \rightarrow A \rightarrow S$ as in Lemma 23.6.8. Let $\xi \in$ $H_{2}(A / I A)$ and $\theta: A / I A \rightarrow A / I A$ be the element and derivation found in Lemmas 23.7 .1 and 23.7.2 Observe that

$$
\theta^{n}\left(\gamma_{n}(\xi)\right)=g^{n}
$$

Hence if $g$ is not nilpotent, then $\xi^{n}$ is nonzero in $H_{2 n}(A / I A)$ for all $n>0$. Since $H_{2 n}(A / I A)=\operatorname{Tor}_{2 n}^{R}(S, R / I)$ we conclude.

The following result can be found in Rod88.
09PV Lemma 23.7.4. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Let $I \subset J \subset A$ be proper ideals. If $A / J$ has finite tor dimension over $A / I$, then $I / \mathfrak{m} I \rightarrow J / \mathfrak{m} J$ is injective.

Proof. Let $f \in I$ be an element mapping to a nonzero element of $I / \mathfrak{m} I$ which is mapped to zero in $J / \mathfrak{m} J$. We can choose an ideal $I^{\prime}$ with $\mathfrak{m} I \subset I^{\prime} \subset I$ such that $I / I^{\prime}$ is generated by the image of $f$. Set $R=A / I$ and $R^{\prime}=A / I^{\prime}$. Let $J=\left(a_{1}, \ldots, a_{m}\right)$ for some $a_{j} \in A$. Then $f=\sum b_{j} a_{j}$ for some $b_{j} \in \mathfrak{m}$. Let $r_{j}, f_{j} \in R$ resp. $r_{j}^{\prime}, f_{j}^{\prime} \in R^{\prime}$ be the image of $b_{j}, a_{j}$. Then we see we are in the situation of Lemma 23.7.3 (with the ideal $I$ of that lemma equal to $\mathfrak{m}_{R}$ ) and the lemma is proved.

09PW Lemma 23.7.5. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Let $I \subset J \subset A$ be proper ideals. Assume
(1) $A / J$ has finite tor dimension over $A / I$, and
(2) $J$ is generated by a regular sequence.

Then I is generated by a regular sequence and $J / I$ is generated by a regular sequence.
Proof. By Lemma 23.7.4 we see that $I / \mathfrak{m} I \rightarrow J / \mathfrak{m} J$ is injective. Thus we can find $s \leq r$ and a minimal system of generators $f_{1}, \ldots, f_{r}$ of $J$ such that $f_{1}, \ldots, f_{s}$ are in $I$ and form a minimal system of generators of $I$. The lemma follows as any minimal system of generators of $J$ is a regular sequence by More on Algebra, Lemmas 15.23 .14 and 15.23 .6 .

09PX Lemma 23.7.6. Let $R \rightarrow S$ be a local ring map of Noetherian local rings. Let $I \subset R$ and $J \subset S$ be ideals with $I S \subset J$. If $R \rightarrow S$ is flat and $S / \mathfrak{m}_{R} S$ is regular, then the following are equivalent
(1) $J$ is generated by a regular sequence and $S / J$ has finite tor dimension as a module over $R / I$,
(2) $J$ is generated by a regular sequence and $\operatorname{Tor}_{p}^{R / I}\left(S / J, R / \mathfrak{m}_{R}\right)$ is nonzero for only finitely many $p$,
(3) $I$ is generated by a regular sequence and $J / I S$ is generated by a regular sequence in $S / I S$.

Proof. If (3) holds, then $J$ is generated by a regular sequence, see for example More on Algebra, Lemmas 15.23.12 and 15.23.6. Moreover, if (3) holds, then $S / J=$ $(S / I) /(J / I)$ has finite projective dimension over $S / I S$ because the Koszul complex will be a finite free resolution of $S / J$ over $S / I S$. Since $R / I \rightarrow S / I S$ is flat, it then follows that $S / J$ has finite tor dimension over $R / I$ by More on Algebra, Lemma 15.55.10. Thus (3) implies (1).

The implication $(1) \Rightarrow(2)$ is trivial. Assume (2). By More on Algebra, Lemma 15.63 .8 we find that $S / J$ has finite tor dimension over $S / I S$. Thus we can apply Lemma 23.7 .5 to conclude that $I S$ and $J / I S$ are generated by regular sequences. Let $f_{1}, \ldots, f_{r} \in I$ be a minimal system of generators of $I$. Since $R \rightarrow S$ is flat, we see that $f_{1}, \ldots, f_{r}$ form a minimal system of generators for $I S$ in $S$. Thus $f_{1}, \ldots, f_{r} \in R$ is a sequence of elements whose images in $S$ form a regular sequence by More on Algebra, Lemmas 15.23 .14 and 15.23 .6 . Thus $f_{1}, \ldots, f_{r}$ is a regular sequence in $R$ by Algebra, Lemma 10.67.5.

### 23.8. Local complete intersection rings

09PY Let $(A, \mathfrak{m})$ be a Noetherian complete local ring. By the Cohen structure theorem (see Algebra, Theorem 10.152.8) we can write $A$ as the quotient of a regular Noetherian complete local ring $R$. Let us say that $A$ is a complete intersection if there exists some surjection $R \rightarrow A$ with $R$ a regular local ring such that the
kernel is generated by a regular sequence. The following lemma shows this notion is independent of the choice of the surjection.

09PZ Lemma 23.8.1. Let $(A, \mathfrak{m})$ be a Noetherian complete local ring. The following are equivalent
(1) for every surjection of local rings $R \rightarrow A$ with $R$ a regular local ring, the kernel of $R \rightarrow A$ is generated by a regular sequence, and
(2) for some surjection of local rings $R \rightarrow A$ with $R$ a regular local ring, the kernel of $R \rightarrow A$ is generated by a regular sequence.

Proof. Let $k$ be the residue field of $A$. If the characteristic of $k$ is $p>0$, then we denote $\Lambda$ a Cohen ring (Algebra, Definition 10.152.5) with residue field $k$ (Algebra, Lemma 10.152.6). If the characteristic of $k$ is 0 we set $\Lambda=k$. Recall that $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right]$ for any $n$ is formally smooth over $\mathbf{Z}$, resp. $\mathbf{Q}$ in the $\mathfrak{m}$-adic topology, see More on Algebra, Lemma 15.30.1. Fix a surjection $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow A$ as in the Cohen structure theorem (Algebra, Theorem 10.152.8).

Let $R \rightarrow A$ be a surjection from a regular local ring $R$. Let $f_{1}, \ldots, f_{r}$ be a minimal sequence of generators of $\operatorname{Ker}(R \rightarrow A)$. We will use without further mention that an ideal in a Noetherian local ring is generated by a regular sequence if and only if any minimal set of generators is a regular sequence. Observe that $f_{1}, \ldots, f_{r}$ is a regular sequence in $R$ if and only if $f_{1}, \ldots, f_{r}$ is a regular sequence in the completion $R^{\wedge}$ by Algebra, Lemmas 10.67 .5 and 10.96.2. Moreover, we have

$$
R^{\wedge} /\left(f_{1}, \ldots, f_{r}\right) R^{\wedge}=\left(R /\left(f_{1}, \ldots, f_{n}\right)\right)^{\wedge}=A^{\wedge}=A
$$

because $A$ is $\mathfrak{m}_{A^{-}}$-adically complete (first equality by Algebra, Lemma 10.96.1). Finally, the ring $R^{\wedge}$ is regular since $R$ is regular (More on Algebra, Lemma 15.34.4). Hence we may assume $R$ is complete.

If $R$ is complete we can choose a map $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow R$ lifting the given map $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow A$, see More on Algebra, Lemma 15.29.5. By adding some more variables $y_{1}, \ldots, y_{m}$ mapping to generators of the kernel of $R \rightarrow A$ we may assume that $\Lambda\left[\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{m}\right]\right] \rightarrow R$ is surjective (some details omitted). Then we can consider the commutative diagram

By Algebra, Lemma 10.133 .6 we see that the condition for $R \rightarrow A$ is equivalent to the condition for the fixed chosen map $\Lambda\left[\left[x_{1}, \ldots, x_{n}\right]\right] \rightarrow A$. This finishes the proof of the lemma.

The following two lemmas are sanity checks on the definition given above.
09Q0 Lemma 23.8.2. Let $R$ be a regular ring. Let $\mathfrak{p} \subset R$ be a prime. Let $f_{1}, \ldots, f_{r} \in \mathfrak{p}$ be a regular sequence. Then the completion of

$$
A=\left(R /\left(f_{1}, \ldots, f_{r}\right)\right)_{\mathfrak{p}}=R_{\mathfrak{p}} /\left(f_{1}, \ldots, f_{r}\right) R_{\mathfrak{p}}
$$

is a complete intersection in the sense defined above.

Proof. The completion of $A$ is equal to $A^{\wedge}=R_{\mathfrak{p}}^{\wedge} /\left(f_{1}, \ldots, f_{r}\right) R_{\mathfrak{p}}^{\wedge}$ because completion for finite modules over the Noetherian ring $R_{\mathfrak{p}}$ is exact (Algebra, Lemma 10.96.1). The image of the sequence $f_{1}, \ldots, f_{r}$ in $R_{\mathfrak{p}}$ is a regular sequence by Algebra, Lemmas 10.96 .2 and 10.67 .5 . Moreover, $R_{\mathfrak{p}}^{\wedge}$ is a regular local ring by More on Algebra, Lemma 15.34.4. Hence the result holds by our definition of complete intersection for complete local rings.

The following lemma is the analogue of Algebra, Lemma 10.133.4.
09Q1 Lemma 23.8.3. Let $R$ be a regular ring. Let $\mathfrak{p} \subset R$ be a prime. Let $I \subset \mathfrak{p}$ be an ideal. Set $A=(R / I)_{\mathfrak{p}}=R_{\mathfrak{p}} / I_{\mathfrak{p}}$. The following are equivalent
(1) the completion of $A$ is a complete intersection in the sense above,
(2) $I_{\mathfrak{p}} \subset R_{\mathfrak{p}}$ is generated by a regular sequence,
(3) the module $\left(I / I^{2}\right)_{\mathfrak{p}}$ can be generated by $\operatorname{dim}\left(R_{\mathfrak{p}}\right)-\operatorname{dim}(A)$ elements,
(4) add more here.

Proof. We may and do replace $R$ by its localization at $\mathfrak{p}$. Then $\mathfrak{p}=\mathfrak{m}$ is the maximal ideal of $R$ and $A=R / I$. Let $f_{1}, \ldots, f_{r} \in I$ be a minimal sequence of generators. The completion of $A$ is equal to $A^{\wedge}=R^{\wedge} /\left(f_{1}, \ldots, f_{r}\right) R^{\wedge}$ because completion for finite modules over the Noetherian ring $R_{\mathfrak{p}}$ is exact (Algebra, Lemma 10.96.1.

If (1) holds, then the image of the sequence $f_{1}, \ldots, f_{r}$ in $R^{\wedge}$ is a regular sequence by assumption. Hence it is a regular sequence in $R$ by Algebra, Lemmas 10.96.2 and 10.67.5. Thus (1) implies (2).

Assume (3) holds. Set $c=\operatorname{dim}(R)-\operatorname{dim}(A)$ and let $f_{1}, \ldots, f_{c} \in I$ map to generators of $I / I^{2}$. by Nakayama's lemme (Algebra, Lemma 10.19.1) we see that $I=\left(f_{1}, \ldots, f_{c}\right)$. Since $R$ is regular and hence Cohen-Macaulay (Algebra, Proposition 10.102 .5 we see that $f_{1}, \ldots, f_{c}$ is a regular sequence by Algebra, Proposition 10.102.5. Thus (3) implies (2). Finally, (2) implies (1) by Lemma 23.8.2.

The following result is due to Avramov, see Avr75.
09Q2 Proposition 23.8.4. Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings. Then the following are equivalent
(1) $B^{\wedge}$ is a complete intersection,
(2) $A^{\wedge}$ and $\left(B / \mathfrak{m}_{A} B\right)^{\wedge}$ are complete intersections.

Proof. Consider the diagram

Since the horizontal maps are faithfully flat (Algebra, Lemma 10.96.3) we conclude that the right vertical arrow is flat (for example by Algebra, Lemma 10.98.15). Moreover, we have $\left(B / \mathfrak{m}_{A} B\right)^{\wedge}=B^{\wedge} / \mathfrak{m}_{A \wedge} B^{\wedge}$ by Algebra, Lemma 10.96.1. Thus we may assume $A$ and $B$ are complete local Noetherian rings.

Assume $A$ and $B$ are complete local Noetherian rings. Choose a diagram

as in More on Algebra, Lemma 15.30.3 Let $I=\operatorname{Ker}(R \rightarrow A)$ and $J=\operatorname{Ker}(S \rightarrow B)$. Note that since $R / I=A \rightarrow B=S / J$ is flat the map $J / I \otimes_{R} R / \mathfrak{m}_{R} \rightarrow J / J \cap \mathfrak{m}_{R} S$ is an isomorphism. Hence a minimal system of generators of $J / I$ maps to a minimal system of generators of $\operatorname{Ker}\left(S / \mathfrak{m}_{R} S \rightarrow B / \mathfrak{m}_{A} B\right)$. Finally, $S / \mathfrak{m}_{R} S$ is a regular local ring.
Assume (1) holds, i.e., $J$ is generated by a regular sequence. Since $A=R / I \rightarrow$ $B=S / J$ is flat we see Lemma 23.7.6 applies and we deduce that $I$ and $J / I$ are generated by regular sequences. We have $\operatorname{dim}(B)=\operatorname{dim}(A)+\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)$ and $\operatorname{dim}(S / I S)=\operatorname{dim}(A)+\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)$ (Algebra, Lemma 10.111.7). Thus $J / I$ is generated by

$$
\operatorname{dim}(S / J)-\operatorname{dim}(S / I S)=\operatorname{dim}\left(S / \mathfrak{m}_{R} S\right)-\operatorname{dim}\left(B / \mathfrak{m}_{A} B\right)
$$

elements (Algebra, Lemma 10.59 .12 ). It follows that $\operatorname{Ker}\left(S / \mathfrak{m}_{R} S \rightarrow B / \mathfrak{m}_{A} B\right)$ is generated by the same number of elements (see above). Hence $\operatorname{Ker}\left(S / \mathfrak{m}_{R} S \rightarrow\right.$ $B / \mathfrak{m}_{A} B$ ) is generated by a regular sequence, see for example Lemma 23.8.3 In this way we see that (2) holds.
If (2) holds, then $I$ and $J / J \cap \mathfrak{m}_{R} S$ are generated by regular sequences. Lifting these generators (see above), using flatness of $R / I \rightarrow S / I S$, and using Grothendieck's lemma (Algebra, Lemma 10.98.3) we find that $J / I$ is generated by a regular sequence in $S / I S$. Thus Lemma 23.7 .6 tells us that $J$ is generated by a regular sequence, whence (1) holds.

09Q3 Definition 23.8.5. Let $A$ be a Noetherian ring.
(1) If $A$ is local, then we say $A$ is a complete intersection if its completion is a complete intersection in the sense above.
(2) In general we say $A$ is a local complete intersection if all of its local rings are complete intersections.
We will check below that this does not conflict with the terminology introduced in Algebra, Definitions 10.133 .1 and 10.133 .5 But first, we show this "makes sense" by showing that if $A$ is a Noetherian local complete intersection, then $A$ is a local complete intersection, i.e., all of its local rings are complete intersections.

09Q4 Lemma 23.8.6. Let $(A, \mathfrak{m})$ be a Noetherian local ring. Let $\mathfrak{p} \subset A$ be a prime ideal. If $A$ is a complete intersection, then $A_{\mathfrak{p}}$ is a complete intersection too.

Proof. Choose a prime $\mathfrak{q}$ of $A^{\wedge}$ lying over $\mathfrak{p}$ (this is possible as $A \rightarrow A^{\wedge}$ is faithfully flat by Algebra, Lemma 10.96.3). Then $A_{\mathfrak{p}} \rightarrow\left(A^{\wedge}\right)_{\mathfrak{q}}$ is a flat local ring homomorphism. Thus by Proposition 23.8 .4 we see that $A_{\mathfrak{p}}$ is a complete intersection if and only if $\left(A^{\wedge}\right)_{\mathfrak{q}}$ is a complete intersection. Thus it suffices to prove the lemma in case $A$ is complete (this is the key step of the proof).
Assume $A$ is complete. By definition we may write $A=R /\left(f_{1}, \ldots, f_{r}\right)$ for some regular sequence $f_{1}, \ldots, f_{r}$ in a regular local ring $R$. Let $\mathfrak{q} \subset R$ be the prime
corresponding to $\mathfrak{p}$. Observe that $f_{1}, \ldots, f_{r} \in \mathfrak{q}$ and that $A_{\mathfrak{p}}=R_{\mathfrak{q}} /\left(f_{1}, \ldots, f_{r}\right) R_{\mathfrak{q}}$. Hence $A_{\mathfrak{p}}$ is a complete intersection by Lemma 23.8.2.

09Q5 Lemma 23.8.7. Let $A$ be a Noetherian ring. Then $A$ is a local complete intersection if and only if $A_{\mathfrak{m}}$ is a complete intersection for every maximal ideal $\mathfrak{m}$ of A.

Proof. This follows immediately from Lemma 23.8.6 and the definitions.
09Q6 Lemma 23.8.8. Let $S$ be a finite type algebra over a field $k$.
(1) for a prime $\mathfrak{q} \subset S$ the local ring $S_{\mathfrak{q}}$ is a complete intersection in the sense of Algebra, Definition 10.133 .5 if and only if $S_{\mathfrak{q}}$ is a complete intersection in the sense of Definition 23.8.5, and
(2) $S$ is a local complete intersection in the sense of Algebra, Definition 10.133.1 if and only if $S$ is a local complete intersection in the sense of Definition 23.8.5.

Proof. Proof of (1). Let $k\left[x_{1}, \ldots, x_{n}\right] \rightarrow S$ be a surjection. Let $\mathfrak{p} \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the prime ideal corresponding to $\mathfrak{q}$. Let $I \subset k\left[x_{1}, \ldots, x_{n}\right]$ be the kernel of our surjection. Note that $k\left[x_{1}, \ldots, x_{n}\right]_{\mathfrak{p}} \rightarrow S_{\mathfrak{q}}$ is surjective with kernel $I_{\mathfrak{p}}$. Observe that $k\left[x_{1}, \ldots, x_{n}\right]$ is a regular ring by Algebra, Proposition 10.113.2. Hence the equivalence of the two notions in (1) follows by combining Lemma 23.8.3 with Algebra, Lemma 10.133.7.
Having proved (1) the equivalence in (2) follows from the definition and Algebra, Lemma 10.133 .9

09Q7 Lemma 23.8.9. Let $A \rightarrow B$ be a flat local homomorphism of Noetherian local rings. Then the following are equivalent
(1) $B$ is a complete intersection,
(2) $A$ and $B / \mathfrak{m}_{A} B$ are complete intersections.

Proof. Now that the definition makes sense this is a trivial reformulation of the (nontrivial) Proposition 23.8.4.

### 23.9. Local complete intersection maps

09Q9 Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. A consequence of the Cohen structure theorem is that we can find a commutative diagram

of Noetherian complete local rings with $S \rightarrow B$ surjective, $A \rightarrow S$ flat, and $S / \mathfrak{m}_{A} S$ a regular local ring. This follows from More on Algebra, Lemma 15.30.3. Let us (temporarily) say $A \rightarrow S \rightarrow B$ is a good factorization of $A \rightarrow B$ if $S$ is a Noetherian local ring, $A \rightarrow S \rightarrow B$ are local ring maps, $S \rightarrow B$ surjective, $A \rightarrow S$ flat, and $S / \mathfrak{m}_{A} S$ regular. Let us say that $A \rightarrow B$ is a complete intersection homomorphism if there exists some good factorization $A \rightarrow S \rightarrow B$ such that the kernel of $S \rightarrow B$ is generated by a regular sequence. The following lemma shows this notion is independent of the choice of the diagram.

09QA Lemma 23.9.1. Let $A \rightarrow B$ be a local homomorphism of Noetherian complete local rings. The following are equivalent
(1) for some good factorization $A \rightarrow S \rightarrow B$ the kernel of $S \rightarrow B$ is generated by a regular sequence, and
(2) for every good factorization $A \rightarrow S \rightarrow B$ the kernel of $S \rightarrow B$ is generated by a regular sequence.

Proof. Let $A \rightarrow S \rightarrow B$ be a good factorization. As $B$ is complete we obtain a factorization $A \rightarrow S^{\wedge} \rightarrow B$ where $S^{\wedge}$ is the completion of $S$. Note that this is also a good factorization: The ring map $S \rightarrow S^{\wedge}$ is flat (Algebra, Lemma 10.96.2), hence $A \rightarrow S^{\wedge}$ is flat. The ring $S^{\wedge} / \mathfrak{m}_{A} S^{\wedge}=\left(S / \mathfrak{m}_{A} S\right)^{\wedge}$ is regular since $S / \mathfrak{m}_{A} S$ is regular (More on Algebra, Lemma 15.34.4). Let $f_{1}, \ldots, f_{r}$ be a minimal sequence of generators of $\operatorname{Ker}(S \rightarrow B)$. We will use without further mention that an ideal in a Noetherian local ring is generated by a regular sequence if and only if any minimal set of generators is a regular sequence. Observe that $f_{1}, \ldots, f_{r}$ is a regular sequence in $S$ if and only if $f_{1}, \ldots, f_{r}$ is a regular sequence in the completion $S^{\wedge}$ by Algebra, Lemma 10.67.5. Moreover, we have

$$
S^{\wedge} /\left(f_{1}, \ldots, f_{r}\right) R^{\wedge}=\left(S /\left(f_{1}, \ldots, f_{n}\right)\right)^{\wedge}=B^{\wedge}=B
$$

because $B$ is $\mathfrak{m}_{B}$-adically complete (first equality by Algebra, Lemma 10.96.1). Thus the kernel of $S \rightarrow B$ is generated by a regular sequence if and only if the kernel of $S^{\wedge} \rightarrow B$ is generated by a regular sequence. Hence it suffices to consider good factorizations where $S$ is complete.
Assume we have two factorizations $A \rightarrow S \rightarrow B$ and $A \rightarrow S^{\prime} \rightarrow B$ with $S$ and $S^{\prime}$ complete. By More on Algebra, Lemma 15.30 .4 the ring $S \times_{B} S^{\prime}$ is a Noetherian complete local ring. Hence, using More on Algebra, Lemma 15.30 .3 we can choose a good factorization $A \rightarrow S^{\prime \prime} \rightarrow S \times_{B} S^{\prime}$ with $S^{\prime \prime}$ complete. Thus it suffices to show: If $A \rightarrow S^{\prime} \rightarrow S \rightarrow B$ are comparable good factorizations, then $\operatorname{Ker}(S \rightarrow B)$ is generated by a regular sequence if and only if $\operatorname{Ker}\left(S^{\prime} \rightarrow B\right)$ is generated by a regular sequence.

Let $A \rightarrow S^{\prime} \rightarrow S \rightarrow B$ be comparable good factorizations. First, since $S^{\prime} / \mathfrak{m}_{R} S^{\prime} \rightarrow$ $S / \mathfrak{m}_{R} S$ is a surjection of regular local rings, the kernel is generated by a regular sequence $\bar{x}_{1}, \ldots, \bar{x}_{c} \in \mathfrak{m}_{S^{\prime}} / \mathfrak{m}_{R} S^{\prime}$ which can be extended to a regular system of parameters for the regular local ring $S^{\prime} / \mathfrak{m}_{R} S^{\prime}$, see (Algebra, Lemma 10.105.4). Set $I=\operatorname{Ker}\left(S^{\prime} \rightarrow S\right)$. By flatness of $S$ over $R$ we have

$$
I / \mathfrak{m}_{R} I=\operatorname{Ker}\left(S^{\prime} / \mathfrak{m}_{R} S^{\prime} \rightarrow S / \mathfrak{m}_{R} S\right)=\left(\bar{x}_{1}, \ldots, \bar{x}_{c}\right)
$$

Choose lifts $x_{1}, \ldots, x_{c} \in I$. These lifts form a regular sequence generating $I$ as $S^{\prime}$ is flat over $R$, see Algebra, Lemma 10.98 .3 .

We conclude that if also $\operatorname{Ker}(S \rightarrow B)$ is generated by a regular sequence, then so is $\operatorname{Ker}\left(S^{\prime} \rightarrow B\right)$, see More on Algebra, Lemmas 15.23 .12 and 15.23 .6 .

Conversely, assume that $J=\operatorname{Ker}\left(S^{\prime} \rightarrow B\right)$ is generated by a regular sequence. Because the generators $x_{1}, \ldots, x_{c}$ of $I$ map to linearly independent elements of $\mathfrak{m}_{S^{\prime}} / \mathfrak{m}_{S^{\prime}}^{2}$ we see that $I / \mathfrak{m}_{S^{\prime}} I \rightarrow J / \mathfrak{m}_{S^{\prime}} J$ is injective. Hence there exists a minimal system of generators $x_{1}, \ldots, x_{c}, y_{1}, \ldots, y_{d}$ for $J$. Then $x_{1}, \ldots, x_{c}, y_{1}, \ldots, y_{d}$ is a regular sequence and it follows that the images of $y_{1}, \ldots, y_{d}$ in $S$ form a regular sequence generating $\operatorname{Ker}(S \rightarrow B)$. This finishes the proof of the lemma.

In the following proposition observe that the condition on vanishing of Tor's applies in particular if $B$ has finite tor dimension over $A$ and thus in particular if $B$ is flat over $A$.

09QB Proposition 23.9.2. Let $A \rightarrow B$ be a local homomorphism of Noetherian local rings. Then the following are equivalent
(1) $B$ is a complete intersection and $\operatorname{Tor}_{p}^{A}\left(B, A / \mathfrak{m}_{A}\right)$ is nonzero for only finitely many $p$,
(2) $A$ is a complete intersection and $A^{\wedge} \rightarrow B^{\wedge}$ is a complete intersection homomorphism in the sense defined above.

Proof. Let $F_{\bullet} \rightarrow A / \mathfrak{m}_{A}$ be a resolution by finite free $A$-modules. Observe that $\operatorname{Tor}_{p}^{A}\left(B, A / \mathfrak{m}_{A}\right)$ is the $p$ th homology of the complex $F_{\bullet} \otimes_{A} B$. Let $F_{\bullet}^{\wedge}=F_{\bullet} \otimes_{A} A^{\wedge}$ be the completion. Then $F_{\bullet}^{\wedge}$ is a resolution of $A^{\wedge} / \mathfrak{m}_{A^{\wedge}}$ by finite free $A^{\wedge}$-modules (as $A \rightarrow A^{\wedge}$ is flat and completion on finite modules is exact, see Algebra, Lemmas 10.96 .1 and 10.96 .2 . It follows that

$$
F_{\bullet}^{\wedge} \otimes_{A^{\wedge}} B^{\wedge}=F_{\bullet} \otimes_{A} B \otimes_{B} B^{\wedge}
$$

By flatness of $B \rightarrow B^{\wedge}$ we conclude that

$$
\operatorname{Tor}_{p}^{A^{\wedge}}\left(B^{\wedge}, A^{\wedge} / \mathfrak{m}_{A^{\wedge}}\right)=\operatorname{Tor}_{p}^{A}\left(B, A / \mathfrak{m}_{A}\right) \otimes_{B} B^{\wedge}
$$

In this way we see that the condition in (1) on the local ring map $A \rightarrow B$ is equivalent to the same condition for the local ring map $A^{\wedge} \rightarrow B^{\wedge}$. Thus we may assume $A$ and $B$ are complete local Noetherian rings (since the other conditions are formulated in terms of the completions in any case).

Assume $A$ and $B$ are complete local Noetherian rings. Choose a diagram

as in More on Algebra, Lemma 15.30 .3 . Let $I=\operatorname{Ker}(R \rightarrow A)$ and $J=\operatorname{Ker}(S \rightarrow B)$. The proposition now follows from Lemma 23.7.6.

09QC Remark 23.9.3. It appears difficult to define an good notion of "local complete intersection homomorphisms" for maps between general Noetherian rings. The reason is that, for a local Noetherian ring $A$, the fibres of $A \rightarrow A^{\wedge}$ are not local complete intersection rings. Thus, if $A \rightarrow B$ is a local homomorphism of local Noetherian rings, and the map of completions $A^{\wedge} \rightarrow B^{\wedge}$ is a complete intersection homomorphism in the sense defined above, then $\left(A_{\mathfrak{p}}\right)^{\wedge} \rightarrow\left(B_{\mathfrak{q}}\right)^{\wedge}$ is in general not a complete intersection homomorphism in the sense defined above. A solution can be had by working exclusively with excellent Noetherian rings. More generally, one could work with those Noetherian rings whose formal fibres are complete intersections, see Rod87. We will develop this theory in Dualizing Complexes, Section 45.39

To finish of this section we compare the notion defined above with the notion introduced in More on Algebra, Section 23.8.

09QD Lemma 23.9.4. Consider a commutative diagram

of Noetherian local rings with $S \rightarrow B$ surjective, $A \rightarrow S$ flat, and $S / \mathfrak{m}_{A} S$ a regular local ring. The following are equivalent
(1) $\operatorname{Ker}(S \rightarrow B)$ is generated by a regular sequence, and
(2) $A^{\wedge} \rightarrow B^{\wedge}$ is a complete intersection homomorphism as defined above.

Proof. Omitted. Hint: the proof is indentical to the argument given in the first paragraph of the proof of Lemma 23.9.1.

09QE Lemma 23.9.5. Let $A$ be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map. The following are equivalent
(1) $A \rightarrow B$ is a local complete intersection in the sense of More on Algebra, Definition 15.25.2.
(2) for every prime $\mathfrak{q} \subset B$ and with $\mathfrak{p}=A \cap \mathfrak{q}$ the ring map $\left(A_{\mathfrak{p}}\right)^{\wedge} \rightarrow\left(B_{\mathfrak{q}}\right)^{\wedge}$ is a complete intersection homomorphism in the sense defined above.
Proof. Choose a surjection $R=A\left[x_{1}, \ldots, x_{n}\right] \rightarrow B$. Observe that $A \rightarrow R$ is flat with regular fibres. Let $I$ be the kernel of $R \rightarrow B$. Assume (2). Then we see that $I$ is locally generated by a regular sequence by Lemma 23.9.4 and Algebra, Lemma 10.67.6. In other words, (1) holds. Conversely, assume (1). Then after localizing on $R$ and $B$ we can assume that $I$ is generated by a Koszul regular sequence. By More on Algebra, Lemma 15.23 .6 we find that $I$ is locally generated by a regular sequence. Hence (2) hold by Lemma 23.9.4. Some details omitted.

09QF Lemma 23.9.6. Let $A$ be a Noetherian ring. Let $A \rightarrow B$ be a finite type ring map such that the image of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ contains all closed points of $\operatorname{Spec}(A)$. Then the following are equivalent
(1) $B$ is a complete intersection and $A \rightarrow B$ has finite tor dimension,
(2) $A$ is a complete intersection and $A \rightarrow B$ is a complete intersection in the sense of More on Algebra, Definition 15.25.2.

Proof. This is a reformulation of Proposition 23.9.2 via Lemma 23.9.5. We omit the details.

## CHAPTER 24

## Hypercoverings

01FX

### 24.1. Introduction

$01 F Y$ Let $\mathcal{C}$ be a site, see Sites, Definition 7.6.2. Let $X$ be an object of $\mathcal{C}$. Given an abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ we would like to compute its cohomology groups

$$
H^{i}(X, \mathcal{F})
$$

According to our general definitions (Cohomology on Sites, Section 21.3) this cohomology group is computed by choosing an injective resolution $0 \rightarrow \mathcal{F} \rightarrow \mathcal{I}^{0} \rightarrow$ $\mathcal{I}^{1} \rightarrow \ldots$ and setting

$$
H^{i}(X, \mathcal{F})=H^{i}\left(\Gamma\left(X, \mathcal{I}^{0}\right) \rightarrow \Gamma\left(X, \mathcal{I}^{1}\right) \rightarrow \Gamma\left(X, \mathcal{I}^{2}\right) \rightarrow \ldots\right)
$$

The goal of this chapter is to show that we may also compute these cohomology groups without choosing an injective resolution (in the case that $\mathcal{C}$ has fibre products). To do this we will use hypercoverings.

A hypercovering in a site is a generalization of a covering, see AGV71, Exposé V, Sec. 7]. Given a hypercovering $K$ of an object $X$, there is a Cech to cohomology spectral sequence expressing the cohomology of an abelian sheaf $\mathcal{F}$ over $X$ in terms of the cohomology of the sheaf over the components $K_{n}$ of $K$. It turns out that there are always enough hypercoverings, so that taking the colimit over all hypercoverings, the spectral sequence degenerates and the cohomology of $\mathcal{F}$ over $X$ is computed by the colimit of the Čech cohomology groups.

A more general gadget one can consider is a simplicial augmentation where one has cohomological descent, see AGV71, Exposé Vbis]. A nice manuscript on cohomological descent is the text by Brian Conrad, see http://math.stanford.edu/ ~conrad/papers/hypercover.pdf. We will come back to these issue in the chapter on simplicial spaces where we will show, for example, that proper hypercoverings of "locally compact" topological spaces are of cohomological descent (Simplicial Spaces, Section 69.6. Our method of attack will be to reduce this statement to the Čech to cohomology spectral sequence constructed in this chapter.

### 24.2. Hypercoverings

01FZ In order to start we make the following definition. The letters "SR" stand for Semi-Representable.

01G0 Definition 24.2.1. Let $\mathcal{C}$ be a site. We denote $\operatorname{SR}(\mathcal{C})$ the category of semirepresentable objects defined as follows
(1) objects are families of objects $\left\{U_{i}\right\}_{i \in I}$, and
(2) morphisms $\left\{U_{i}\right\}_{i \in I} \rightarrow\left\{V_{j}\right\}_{j \in J}$ are given by a map $\alpha: I \rightarrow J$ and for each $i \in I$ a morphism $f_{i}: U_{i} \rightarrow V_{\alpha(i)}$ of $\mathcal{C}$.
Let $X \in \operatorname{Ob}(\mathcal{C})$ be an object of $\mathcal{C}$. The category of semi-representable objects over $X$ is the category $\operatorname{SR}(\mathcal{C}, X)=\operatorname{SR}(\mathcal{C} / X)$.

This definition differs from the one in AGV71, Exposé V, Sec. 7], but it seems flexible enough to do all the required arguments. Note that this is a "big" category. We will later "bound" the size of the index sets $I$ that we need for hypercoverings of $X$. We can then redefine $\operatorname{SR}(\mathcal{C}, X)$ to become a category. Let's spell out the objects and morphisms $\operatorname{SR}(\mathcal{C}, X)$ :
(1) objects are families of morphisms $\left\{U_{i} \rightarrow X\right\}_{i \in I}$, and
(2) morphisms $\left\{U_{i} \rightarrow X\right\}_{i \in I} \rightarrow\left\{V_{j} \rightarrow X\right\}_{j \in J}$ are given by a map $\alpha: I \rightarrow J$ and for each $i \in I$ a morphism $f_{i}: U_{i} \rightarrow V_{\alpha(i)}$ over $X$.
There is a forgetful functor $\operatorname{SR}(\mathcal{C}, X) \rightarrow \operatorname{SR}(\mathcal{C})$.
01G1 Definition 24.2.2. Let $\mathcal{C}$ be a site with fibre products. We denote $F$ the functor which associates a presheaf to a semi-representable object. In a formula

$$
\begin{array}{rll}
F: \mathrm{SR}(\mathcal{C}) & \longrightarrow & \operatorname{PSh}(\mathcal{C}) \\
\left\{U_{i}\right\}_{i \in I} & \longmapsto & \amalg_{i \in I} h_{U_{i}}
\end{array}
$$

where $h_{U}$ denotes the representable presheaf associated to the object $U$.
Given a morphism $U \rightarrow X$ we obtain a morphism $h_{U} \rightarrow h_{X}$ of representable presheaves. Thus we often think of $F$ on $\operatorname{SR}(\mathcal{C}, X)$ as a functor into the category of presheaves of sets over $h_{X}$, namely $\operatorname{PSh}(\mathcal{C}) / h_{X}$. Here is a picture:

Next we discuss the existence of limits in the category of semi-representable objects.
01G2 Lemma 24.2.3. Let $\mathcal{C}$ be a site.
(1) the category $S R(\mathcal{C})$ has coproducts and $F$ commutes with them,
(2) the functor $F: S R(\mathcal{C}) \rightarrow P S h(\mathcal{C})$ commutes with limits,
(3) if $\mathcal{C}$ has fibre products, then $S R(\mathcal{C})$ has fibre products,
(4) if $\mathcal{C}$ has products of pairs, then $S R(\mathcal{C})$ has products of pairs,
(5) if $\mathcal{C}$ has equalizers, so does $S R(\mathcal{C})$, and
(6) if $\mathcal{C}$ has a final object, so does $S R(\mathcal{C})$.

Let $X \in \mathrm{Ob}(\mathcal{C})$.
(1) the category $S R(\mathcal{C}, X)$ has coproducts and $F$ commutes with them,
(2) if $\mathcal{C}$ has fibre products, then $S R(\mathcal{C}, X)$ has finite limits and $F: S R(\mathcal{C}, X) \rightarrow$ $\operatorname{PSh}(\mathcal{C}) / h_{X}$ commutes with them.

Proof. Proof of the results on $\operatorname{SR}(\mathcal{C})$. Proof of (1). The coproduct of $\left\{U_{i}\right\}_{i \in I}$ and $\left\{V_{j}\right\}_{j \in J}$ is $\left\{U_{i}\right\}_{i \in I} \amalg\left\{V_{j}\right\}_{j \in J}$, in other words, the family of objects whose index set is $I \amalg J$ and for an element $k \in I \amalg J$ gives $U_{i}$ if $k=i \in I$ and gives $V_{j}$ if $k=j \in J$. Similarly for coproducts of families of objects. It is clear that $F$ commutes with these.

Proof of (2). For $U$ in $\operatorname{Ob}(\mathcal{C})$ consider the object $\{U\}$ of $\operatorname{SR}(\mathcal{C})$. It is clear that $\left.\operatorname{Mor}_{\operatorname{SR}(\mathcal{C})}(\{U\}, K)\right)=F(K)(U)$ for $K \in \operatorname{Ob}(\operatorname{SR}(\mathcal{C}))$. Since limits of presheaves are computed at the level of sections (Sites, Section 7.4 ) we conclude that $F$ commutes with limits.

Proof of (3). Suppose given a morphism $\left(\alpha, f_{i}\right):\left\{U_{i}\right\}_{i \in I} \rightarrow\left\{V_{j}\right\}_{j \in J}$ and a mor$\operatorname{phism}\left(\beta, g_{k}\right):\left\{W_{k}\right\}_{k \in K} \rightarrow\left\{V_{j}\right\}_{j \in J}$. The fibred product of these morphisms is given by

$$
\left\{U_{i} \times{ }_{f_{i}, V_{j}, g_{k}} W_{k}\right\}_{(i, j, k) \in I \times J \times K \text { such that } j=\alpha(i)=\beta(k)}
$$

The fibre products exist if $\mathcal{C}$ has fibre products.
Proof of (4). The product of $\left\{U_{i}\right\}_{i \in I}$ and $\left\{V_{j}\right\}_{j \in J}$ is $\left\{U_{i} \times V_{j}\right\}_{i \in I, j \in J}$. The products exist if $\mathcal{C}$ has products.

Proof of (5). The equalizer of two maps $\left(\alpha, f_{i}\right),\left(\alpha^{\prime}, f_{i}^{\prime}\right):\left\{U_{i}\right\}_{i \in I} \rightarrow\left\{V_{j}\right\}_{j \in J}$ is

$$
\left\{\operatorname{Eq}\left(f_{i}, f_{i}^{\prime}: U_{i} \rightarrow V_{\alpha(i)}\right)\right\}_{i \in I, \alpha(i)=\alpha^{\prime}(i)}
$$

The equalizers exist if $\mathcal{C}$ has equalizers.
Proof of (6). If $X$ is a final object of $\mathcal{C}$, then $\{X\}$ is a final object of $\operatorname{SR}(\mathcal{C})$.
Proof of the statements about $\operatorname{SR}(\mathcal{C}, X)$. These follow from the results above applied to the category $\mathcal{C} / X$ using that $\operatorname{SR}(\mathcal{C} / X)=\operatorname{SR}(\mathcal{C}, X)$ and that $\operatorname{PSh}(\mathcal{C} / X)=$ $\operatorname{PSh}(\mathcal{C}) / h_{X}$ (Sites, Lemma 7.24.4 applied to $\mathcal{C}$ endowed with the chaotic topology). However we also argue directly as follows. It is clear that the coproduct of $\left\{U_{i} \rightarrow X\right\}_{i \in I}$ and $\left\{V_{j} \rightarrow X\right\}_{j \in J}$ is $\left\{U_{i} \rightarrow X\right\}_{i \in I} \amalg\left\{V_{j} \rightarrow X\right\}_{j \in J}$ and similarly for coproducts of families of families of morphisms with target $X$. The object $\{X \rightarrow X\}$ is a final object of $\operatorname{SR}(\mathcal{C}, X)$. Suppose given a morphism $\left(\alpha, f_{i}\right):\left\{U_{i} \rightarrow\right.$ $X\}_{i \in I} \rightarrow\left\{V_{j} \rightarrow X\right\}_{j \in J}$ and a morphism $\left(\beta, g_{k}\right):\left\{W_{k} \rightarrow X\right\}_{k \in K} \rightarrow\left\{V_{j} \rightarrow X\right\}_{j \in J}$. The fibred product of these morphisms is given by

$$
\left\{U_{i} \times_{f_{i}, V_{j}, g_{k}} W_{k} \rightarrow X\right\}_{(i, j, k) \in I \times J \times K \text { such that } j=\alpha(i)=\beta(k)}
$$

The fibre products exist by the assumption that $\mathcal{C}$ has fibre products. Thus $\operatorname{SR}(\mathcal{C}, X)$ has finite limits, see Categories, Lemma 4.18.4. We omit verifying the statements on the functor $F$ in this case.

01G3 Definition 24.2.4. Let $\mathcal{C}$ be a site. Let $f=\left(\alpha, f_{i}\right):\left\{U_{i}\right\}_{i \in I} \rightarrow\left\{V_{j}\right\}_{j \in J}$ be a morphism in the category $\operatorname{SR}(\mathcal{C})$. We say that $f$ is a covering if for every $j \in J$ the family of morphisms $\left\{U_{i} \rightarrow V_{j}\right\}_{i \in I, \alpha(i)=j}$ is a covering for the site $\mathcal{C}$. Let $X$ be an object of $\mathcal{C}$. A morphism $K \rightarrow L$ in $\operatorname{SR}(\mathcal{C}, X)$ is a covering if its image in $\operatorname{SR}(\mathcal{C})$ is a covering.

01G4 Lemma 24.2.5. Let $\mathcal{C}$ be a site.
(1) A composition of coverings in $S R(\mathcal{C})$ is a covering.
(2) If $K \rightarrow L$ is a covering in $S R(\mathcal{C})$ and $L^{\prime} \rightarrow L$ is a morphism, then $L^{\prime} \times{ }_{L} K$ exists and $L^{\prime} \times_{L} K \rightarrow L^{\prime}$ is a covering.
(3) If $\mathcal{C}$ has products of pairs, and $A \rightarrow B$ and $K \rightarrow L$ are coverings in $S R(\mathcal{C})$, then $A \times K \rightarrow B \times L$ is a covering.
Let $X \in \operatorname{Ob}(\mathcal{C})$. Then (1) and (2) holds for $S R(\mathcal{C}, X)$ and (3) holds if $\mathcal{C}$ has fibre products.

Proof. Part (1) is immediate from the axioms of a site. Part (2) follows by the construction of fibre products in $\operatorname{SR}(\mathcal{C})$ in the proof of Lemma 24.2.3 and the requirement that the morphisms in a covering of $\mathcal{C}$ are representable. Part (3) follows by thinking of $A \times K \rightarrow B \times L$ as the composition $A \times K \rightarrow B \times K \rightarrow B \times L$ and hence a composition of basechanges of coverings. The final statement follows because $\operatorname{SR}(\mathcal{C}, X)=\operatorname{SR}(\mathcal{C} / X)$.

By Lemma 24.2 .3 and Simplicial, Lemma 14.19 .2 the coskeleton of a truncated simplicial object of $\operatorname{SR}(\mathcal{C}, X)$ exists if $\mathcal{C}$ has fibre products. Hence the following definition makes sense.

01G5 Definition 24.2.6. Let $\mathcal{C}$ be a site. Assume $\mathcal{C}$ has fibre products. Let $X \in \operatorname{Ob}(\mathcal{C})$ be an object of $\mathcal{C}$. A hypercovering of $X$ is a simplicial object $K$ of $\operatorname{SR}(\mathcal{C}, X)$ such that
(1) The object $K_{0}$ is a covering of $X$ for the site $\mathcal{C}$.
(2) For every $n \geq 0$ the canonical morphism

$$
K_{n+1} \longrightarrow\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} K\right)_{n+1}
$$

is a covering in the sense defined above.
Condition (1) makes sense since each object of $\operatorname{SR}(\mathcal{C}, X)$ is after all a family of morphisms with target $X$. It could also be formulated as saying that the morphism of $K_{0}$ to the final object of $\operatorname{SR}(\mathcal{C}, X)$ is a covering.
01G6 Example 24.2.7. Let $\left\{U_{i} \rightarrow X\right\}_{i \in I}$ be a covering of the site $\mathcal{C}$. Set $K_{0}=\left\{U_{i} \rightarrow\right.$ $X\}_{i \in I}$. Then $K_{0}$ is a 0 -truncated simplicial object of $\operatorname{SR}(\mathcal{C}, X)$. Hence we may form

$$
K=\operatorname{cosk}_{0} K_{0} .
$$

Clearly $K$ passes condition (1) of Definition 24.2.6. Since all the morphisms $K_{n+1} \rightarrow\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} K\right)_{n+1}$ are isomorphisms by Simplicial, Lemma 14.19 .10 it also passes condition (2). Note that the terms $K_{n}$ are the usual

$$
K_{n}=\left\{U_{i_{0}} \times_{X} U_{i_{1}} \times_{X} \ldots \times_{X} U_{i_{n}} \rightarrow X\right\}_{\left(i_{0}, i_{1}, \ldots, i_{n}\right) \in I^{n+1}}
$$

01 G 7 Lemma 24.2.8. Let $\mathcal{C}$ be a site with fibre products. Let $X \in \mathrm{Ob}(\mathcal{C})$ be an object of $\mathcal{C}$. The collection of all hypercoverings of $X$ forms a set.

Proof. Since $\mathcal{C}$ is a site, the set of all coverings of $X$ forms a set. Thus we see that the collection of possible $K_{0}$ forms a set. Suppose we have shown that the collection of all possible $K_{0}, \ldots, K_{n}$ form a set. Then it is enough to show that given $K_{0}, \ldots, K_{n}$ the collection of all possible $K_{n+1}$ forms a set. And this is clearly true since we have to choose $K_{n+1}$ among all possible coverings of $\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} K\right)_{n+1}$.

01G8 Remark 24.2.9. The lemma does not just say that there is a cofinal system of choices of hypercoverings that is a set, but that really the hypercoverings form a set.

The category of presheaves on $\mathcal{C}$ has finite (co)limits. Hence the functors $\operatorname{cosk}_{n}$ exists for presheaves of sets.

01G9 Lemma 24.2.10. Let $\mathcal{C}$ be a site with fibre products. Let $X \in \operatorname{Ob}(\mathcal{C})$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Consider the simplicial object $F(K)$ of $\operatorname{PSh}(\mathcal{C})$, endowed with its augmentation to the constant simplicial presheaf $h_{X}$.
(1) The morphism of presheaves $F(K)_{0} \rightarrow h_{X}$ becomes a surjection after sheafification.
(2) The morphism

$$
\left(d_{0}^{1}, d_{1}^{1}\right): F(K)_{1} \longrightarrow F(K)_{0} \times_{h_{X}} F(K)_{0}
$$

becomes a surjection after sheafification.
(3) For every $n \geq 1$ the morphism

$$
F(K)_{n+1} \longrightarrow\left(\operatorname{cosk}_{n} s k_{n} F(K)\right)_{n+1}
$$

turns into a surjection after sheafification.
Proof. We will use the fact that if $\left\{U_{i} \rightarrow U\right\}_{i \in I}$ is a covering of the site $\mathcal{C}$, then the morphism

$$
\amalg_{i \in I} h_{U_{i}} \rightarrow h_{U}
$$

becomes surjective after sheafification, see Sites, Lemma 7.13.4. Thus the first assertion follows immediately.

For the second assertion, note that according to Simplicial, Example 14.19 .1 the simplicial object cosk sk $_{0} K$ has terms $K_{0} \times \ldots \times K_{0}$. Thus according to the definition of a hypercovering we see that $\left(d_{0}^{1}, d_{1}^{1}\right): K_{1} \rightarrow K_{0} \times K_{0}$ is a covering. Hence (2) follows from the claim above and the fact that $F$ transforms products into fibred products over $h_{X}$.
For the third, we claim that $\operatorname{cosk}_{n} \mathrm{sk}_{n} F(K)=F\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} K\right)$ for $n \geq 1$. To prove this, denote temporarily $F^{\prime}$ the functor $\operatorname{SR}(\mathcal{C}, X) \rightarrow P S h(\mathcal{C}) / h_{X}$. By Lemma 24.2.3 the functor $F^{\prime}$ commutes with finite limits. By our description of the cosk ${ }_{n}$ functor in Simplicial, Section 14.12 we see that $\operatorname{cosk}_{n} \operatorname{sk}_{n} F^{\prime}(K)=F^{\prime}\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} K\right)$. Recall that the category used in the description of $\left(\operatorname{cosk}_{n} U\right)_{m}$ in Simplicial, Lemma 14.19.2 is the category $(\Delta /[m])_{\leq n}^{o p p}$. It is an amusing exercise to show that $(\Delta /[m])_{\leq n}$ is a connected category (see Categories, Definition 4.16.1) as soon as $n \geq 1$. Hence, Categories, Lemma 4.16 .2 shows that $\operatorname{cosk}_{n} \mathrm{sk}_{n} F^{\prime}(K)=\operatorname{cosk}_{n} \mathrm{sk}_{n} F(K)$. Whence the claim. Property (2) follows from this, because now we see that the morphism in (2) is the result of applying the functor $F$ to a covering as in Definition 24.2.4. and the result follows from the first fact mentioned in this proof.

### 24.3. Acyclicity

01 GA Let $\mathcal{C}$ be a site. For a presheaf of sets $\mathcal{F}$ we denote $\mathbf{Z}_{\mathcal{F}}$ the presheaf of abelian groups defined by the rule

$$
\mathbf{Z}_{\mathcal{F}}(U)=\text { free abelian group on } \mathcal{F}(U)
$$

We will sometimes call this the free abelian presheaf on $\mathcal{F}$. Of course the construction $\mathcal{F} \mapsto \mathbf{Z}_{\mathcal{F}}$ is a functor and it is left adjoint to the forgetful functor $\operatorname{PAb}(\mathcal{C}) \rightarrow \operatorname{PSh}(\mathcal{C})$. Of course the sheafification $\mathbf{Z}_{\mathcal{F}}^{\#}$ is a sheaf of abelian groups, and the functor $\mathcal{F} \mapsto \mathbf{Z}_{\mathcal{F}}^{\#}$ is a left adjoint as well. We sometimes call $\mathbf{Z}_{\mathcal{F}}^{\#}$ the free abelian sheaf on $\mathcal{F}$.
For an object $X$ of the site $\mathcal{C}$ we denote $\mathbf{Z}_{X}$ the free abelian presheaf on $h_{X}$, and we denote $\mathbf{Z}_{X}^{\#}$ its sheafification.

01GB Definition 24.3.1. Let $\mathcal{C}$ be a site. Let $K$ be a simplicial object of $\operatorname{PSh}(\mathcal{C})$. By the above we get a simplicial object $\mathbf{Z}_{K}^{\#}$ of $A b(\mathcal{C})$. We can take its associated complex of abelian presheaves $s\left(\mathbf{Z}_{K}^{\#}\right)$, see Simplicial, Section 14.23 . The homology of $K$ is the homology of the complex of abelian sheaves $s\left(\mathbf{Z}_{K}^{\#}\right)$.

In other words, the ith homology $H_{i}(K)$ of $K$ is the sheaf of abelian groups $H_{i}(K)=H_{i}\left(s\left(\mathbf{Z}_{K}^{\#}\right)\right)$. In this section we worry about the homology in case $K$ is a hypercovering of an object $X$ of $\mathcal{C}$.

01GC Lemma 24.3.2. Let $\mathcal{C}$ be a site. Let $\mathcal{F} \rightarrow \mathcal{G}$ be a morphism of presheaves of sets. Denote $K$ the simplicial object of $\operatorname{PSh}(\mathcal{C})$ whose nth term is the $(n+1)$ st fibre product of $\mathcal{F}$ over $\mathcal{G}$, see Simplicial, Example 14.3.5. Then, if $\mathcal{F} \rightarrow \mathcal{G}$ is surjective after sheafification, we have

$$
H_{i}(K)=\left\{\begin{array}{ccc}
0 & \text { if } & i>0 \\
\mathbf{Z}_{\mathcal{G}}^{\#} & \text { if } & i=0
\end{array}\right.
$$

The isomorphism in degree 0 is given by the morphism $H_{0}(K) \rightarrow \mathbf{Z}_{\mathcal{G}}^{\#}$ coming from the $\operatorname{map}\left(\mathbf{Z}_{K}^{\#}\right)_{0}=\mathbf{Z}_{\mathcal{F}}^{\#} \rightarrow \mathbf{Z}_{\mathcal{G}}^{\#}$.

Proof. Let $\mathcal{G}^{\prime} \subset \mathcal{G}$ be the image of the morphism $\mathcal{F} \rightarrow \mathcal{G}$. Let $U \in \operatorname{Ob}(\mathcal{C})$. Set $A=\mathcal{F}(U)$ and $B=\mathcal{G}^{\prime}(U)$. Then the simplicial set $K(U)$ is equal to the simplicial set with $n$-simplices given by

$$
A \times_{B} A \times_{B} \ldots \times_{B} A(n+1 \text { factors })
$$

By Simplicial, Lemma 14.32 .3 the morphism $K(U) \rightarrow B$ is a trivial Kan fibration. Thus it is a homotopy equivalence (Simplicial, Lemma 14.32.3). Hence applying the functor "free abelian group on" to this we deduce that

$$
\mathbf{Z}_{K}(U) \longrightarrow \mathbf{Z}_{B}
$$

is a homotopy equivalence. Note that $s\left(\mathbf{Z}_{B}\right)$ is the complex

$$
\ldots \rightarrow \bigoplus_{b \in B} \mathbf{Z} \xrightarrow{0} \bigoplus_{b \in B} \mathbf{Z} \xrightarrow{1} \bigoplus_{b \in B} \mathbf{Z} \xrightarrow{0} \bigoplus_{b \in B} \mathbf{Z} \rightarrow 0
$$

see Simplicial, Lemma 14.23 .3 . Thus we see that $H_{i}\left(s\left(\mathbf{Z}_{K}(U)\right)\right)=0$ for $i>0$, and $H_{0}\left(s\left(\mathbf{Z}_{K}(U)\right)\right)=\bigoplus_{b \in B} \mathbf{Z}=\bigoplus_{s \in \mathcal{G}^{\prime}(U)} \mathbf{Z}$. These identifications are compatible with restriction maps.

We conclude that $H_{i}\left(s\left(\mathbf{Z}_{K}\right)\right)=0$ for $i>0$ and $H_{0}\left(s\left(\mathbf{Z}_{K}\right)\right)=\mathbf{Z}_{\mathcal{G}^{\prime}}$, where here we compute homology groups in $\operatorname{PAb}(\mathcal{C})$. Since sheafification is an exact functor we deduce the result of the lemma. Namely, the exactness implies that $H_{0}\left(s\left(\mathbf{Z}_{K}\right)\right)^{\#}=$ $H_{0}\left(s\left(\mathbf{Z}_{K}^{\#}\right)\right)$, and similarly for other indices.

01GD Lemma 24.3.3. Let $\mathcal{C}$ be a site. Let $f: L \rightarrow K$ be a morphism of simplicial objects of $\operatorname{PSh}(\mathcal{C})$. Let $n \geq 0$ be an integer. Assume that
(1) For $i<n$ the morphism $L_{i} \rightarrow K_{i}$ is an isomorphism.
(2) The morphism $L_{n} \rightarrow K_{n}$ is surjective after sheafification.
(3) The canonical map $L \rightarrow \operatorname{cosk}_{n} s k_{n} L$ is an isomorphism.
(4) The canonical map $K \rightarrow \operatorname{cosk}_{n} s k_{n} K$ is an isomorphism.

Then $H_{i}(f): H_{i}(L) \rightarrow H_{i}(K)$ is an isomorphism.

Proof. This proof is exactly the same as the proof of Lemma 24.3.2 above. Namely, we first let $K_{n}^{\prime} \subset K_{n}$ be the sub presheaf which is the image of the map $L_{n} \rightarrow K_{n}$. Assumption (2) means that the sheafification of $K_{n}^{\prime}$ is equal to the sheafification of $K_{n}$. Moreover, since $L_{i}=K_{i}$ for all $i<n$ we see that get an $n$-truncated simplicial presheaf $U$ by taking $U_{0}=L_{0}=K_{0}, \ldots, U_{n-1}=L_{n-1}=K_{n-1}, U_{n}=$ $K_{n}^{\prime}$. Denote $K^{\prime}=\operatorname{cosk}_{n} U$, a simplicial presheaf. Because we can construct $K_{m}^{\prime}$ as a finite limit, and since sheafification is exact, we see that $\left(K_{m}^{\prime}\right)^{\#}=K_{m}$. In other words, $\left(K^{\prime}\right)^{\#}=K^{\#}$. We conclude, by exactness of sheafification once more, that $H_{i}(K)=H_{i}\left(K^{\prime}\right)$. Thus it suffices to prove the lemma for the morphism $L \rightarrow K^{\prime}$, in other words, we may assume that $L_{n} \rightarrow K_{n}$ is a surjective morphism of presheaves!
In this case, for any object $U$ of $\mathcal{C}$ we see that the morphism of simplicial sets

$$
L(U) \longrightarrow K(U)
$$

satisfies all the assumptions of Simplicial, Lemma 14.32.1. Hence it is a trivial Kan fibration. In particular it is a homotopy equivalence (Simplicial, Lemma 14.30.8). Thus

$$
\mathbf{Z}_{L}(U) \longrightarrow \mathbf{Z}_{K}(U)
$$

is a homotopy equivalence too. This for all $U$. The result follows.
01GE Lemma 24.3.4. Let $\mathcal{C}$ be a site. Let $K$ be a simplicial presheaf. Let $\mathcal{G}$ be $a$ presheaf. Let $K \rightarrow \mathcal{G}$ be an augmentation of $K$ towards $\mathcal{G}$. Assume that
(1) The morphism of presheaves $K_{0} \rightarrow \mathcal{G}$ becomes a surjection after sheafification.
(2) The morphism

$$
\left(d_{0}^{1}, d_{1}^{1}\right): K_{1} \longrightarrow K_{0} \times_{\mathcal{G}} K_{0}
$$

becomes a surjection after sheafification.
(3) For every $n \geq 1$ the morphism

$$
K_{n+1} \longrightarrow\left(\operatorname{cosk}_{n} s k_{n} K\right)_{n+1}
$$

turns into a surjection after sheafification.
Then $H_{i}(K)=0$ for $i>0$ and $H_{0}(K)=\mathbf{Z}_{\mathcal{G}}^{\#}$.
Proof. Denote $K^{n}=\operatorname{cosk}_{n} \mathrm{sk}_{n} K$ for $n \geq 1$. Define $K^{0}$ as the simplicial object with terms $\left(K^{0}\right)_{n}$ equal to the $(n+1)$-fold fibred product $K_{0} \times_{\mathcal{G}} \ldots \times_{\mathcal{G}} K_{0}$, see Simplicial, Example 14.3.5. We have morphisms

$$
K \longrightarrow \ldots \rightarrow K^{n} \rightarrow K^{n-1} \rightarrow \ldots \rightarrow K^{1} \rightarrow K^{0}
$$

The morphisms $K \rightarrow K^{i}, K^{j} \rightarrow K^{i}$ for $j \geq i \geq 1$ come from the universal properties of the $\operatorname{cosk}_{n}$ functors. The morphism $K^{1} \rightarrow K^{0}$ is the canonical morphism from Simplicial, Remark 14.20.4. We also recall that $K^{0} \rightarrow \operatorname{cosk}_{1} \operatorname{sk}_{1} K^{0}$ is an isomorphism, see Simplicial, Lemma 14.20 .3 .
By Lemma 24.3.2 we see that $H_{i}\left(K^{0}\right)=0$ for $i>0$ and $H_{0}\left(K^{0}\right)=\mathbf{Z}_{\mathcal{G}}^{\#}$.
Pick $n \geq 1$. Consider the morphism $K^{n} \rightarrow K^{n-1}$. It is an isomorphism on terms of degree $<n$. Note that $K^{n} \rightarrow \operatorname{cosk}_{n} \mathrm{sk}_{n} K^{n}$ and $K^{n-1} \rightarrow \operatorname{cosk}_{n} \mathrm{sk}_{n} K^{n-1}$ are isomorphisms. Note that $\left(K^{n}\right)_{n}=K_{n}$ and that $\left(K^{n-1}\right)_{n}=\left(\operatorname{cosk}_{n-1} \operatorname{sk}_{n-1} K\right)_{n}$. Hence by assumption, we have that $\left(K^{n}\right)_{n} \rightarrow\left(K^{n-1}\right)_{n}$ is a morphism of presheaves which becomes surjective after sheafification. By Lemma 24.3.3 we conclude that $H_{i}\left(K^{n}\right)=H_{i}\left(K^{n-1}\right)$. Combined with the above this proves the lemma.

01GF Lemma 24.3.5. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. The homology of the simplicial presheaf $F(K)$ is 0 in degrees $>0$ and equal to $\mathbf{Z}_{X}^{\#}$ in degree 0 .

Proof. Combine Lemmas 24.3.4 and 24.2.10.

### 24.4. Cech cohomology and hypercoverings

01 GU Let $\mathcal{C}$ be a site. Consider a presheaf of abelian groups $\mathcal{F}$ on the site $\mathcal{C}$. It defines a functor

$$
\begin{aligned}
\mathcal{F}: \mathrm{SR}(\mathcal{C})^{o p p} & \longrightarrow A b \\
\left\{U_{i}\right\}_{i \in I} & \longmapsto \prod_{i \in I} \mathcal{F}\left(U_{i}\right)
\end{aligned}
$$

Thus a simplicial object $K$ of $\operatorname{SR}(\mathcal{C})$ is turned into a cosimplicial object $\mathcal{F}(K)$ of $A b$. The cochain complex $s(\mathcal{F})(K)$ ) associated to $\mathcal{F}(K)$ (Simplicial, Section 14.25) is called the Čech complex of $\mathcal{F}$ with respect to the simplicial object $K$. We set

$$
\check{H}^{i}(K, \mathcal{F})=H^{i}(s(\mathcal{F}(K)))
$$

and we call it the $i$ th Čech cohomology group of $\mathcal{F}$ with respect to $K$. In this section we prove analogues of some of the results for Cech cohomology of open coverings proved in Cohomology, Sections 20.10, 20.11 and 20.12 .

01GV Lemma 24.4.1. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $\mathcal{F}$ be a sheaf of abelian groups on $\mathcal{C}$. Then $\check{H}^{0}(K, \mathcal{F})=\mathcal{F}(X)$.

Proof. We have

$$
\check{H}^{0}(K, \mathcal{F})=\operatorname{Ker}\left(\mathcal{F}\left(K_{0}\right) \longrightarrow \mathcal{F}\left(K_{1}\right)\right)
$$

Write $K_{0}=\left\{U_{i} \rightarrow X\right\}$. It is a covering in the site $\mathcal{C}$. As well, we have that $K_{1} \rightarrow$ $K_{0} \times K_{0}$ is a covering in $\operatorname{SR}(\mathcal{C}, X)$. Hence we may write $K_{1}=\amalg_{i_{0}, i_{1} \in I}\left\{V_{i_{0} i_{1} j} \rightarrow X\right\}$ so that the morphism $K_{1} \rightarrow K_{0} \times K_{0}$ is given by coverings $\left\{V_{i_{0} i_{1} j} \rightarrow U_{i_{0}} \times{ }_{X} U_{i_{1}}\right\}$ of the site $\mathcal{C}$. Thus we can further identify

$$
\check{H}^{0}(K, \mathcal{F})=\operatorname{Ker}\left(\prod_{i} \mathcal{F}\left(U_{i}\right) \longrightarrow \prod_{i_{0} i_{1} j} \mathcal{F}\left(V_{i_{0} i_{1} j}\right)\right)
$$

with obvious map. The sheaf property of $\mathcal{F}$ implies that $\check{H}^{0}(K, \mathcal{F})=H^{0}(X, \mathcal{F})$.
In fact this property characterizes the abelian sheaves among all abelian presheaves on $\mathcal{C}$ of course. The analogue of Cohomology, Lemma 24.4.2 in this case is the following.

01GW Lemma 24.4.2. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $\mathcal{I}$ be an injective sheaf of abelian groups on $\mathcal{C}$. Then

$$
\check{H}^{p}(K, \mathcal{I})=\left\{\begin{array}{cll}
\mathcal{I}(X) & \text { if } & p=0 \\
0 & \text { if } & p>0
\end{array}\right.
$$

Proof. Observe that for any object $Z=\left\{U_{i} \rightarrow X\right\}$ of $\mathrm{SR}(\mathcal{C}, X)$ and any abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ we have

$$
\begin{aligned}
\mathcal{F}(Z) & =\prod \mathcal{F}\left(U_{i}\right) \\
& =\prod \operatorname{Mor}_{P S h(\mathcal{C})}\left(h_{U_{i}}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{P S h(\mathcal{C})}(F(Z), \mathcal{F}) \\
& =\operatorname{Mor}_{P A b(\mathcal{C})}\left(\mathbf{Z}_{F(Z)}, \mathcal{F}\right) \\
& =\operatorname{Mor}_{A b(\mathcal{C})}\left(\mathbf{Z}_{F(Z)}^{\#}, \mathcal{F}\right)
\end{aligned}
$$

Thus we see, for any simplicial object $K$ of $\operatorname{SR}(\mathcal{C}, X)$ that we have
01GX

$$
\begin{equation*}
s(\mathcal{F}(K))=\operatorname{Hom}_{A b(\mathcal{C})}\left(s\left(\mathbf{Z}_{F(K)}^{\#}\right), \mathcal{F}\right) \tag{24.4.2.1}
\end{equation*}
$$

see Definition 24.3.1 for notation. The complex of sheaves $s\left(\mathbf{Z}_{F(K)}^{\#}\right)$ is quasiisomorphic to $\mathbf{Z}_{X}^{\#}$ if $K$ is a hypercovering, see Lemma 24.3.5. We conclude that if $\mathcal{I}$ is an injective abelian sheaf, and $K$ a hypercovering, then the complex $s(\mathcal{I}(K))$ is acyclic except possibly in degree 0 . In other words, we have

$$
\check{H}^{i}(K, \mathcal{I})=0
$$

for $i>0$. Combined with Lemma 24.4.1 the lemma is proved.
Next we come to the analogue of Cohomology on Sites, Lemma 21.11.6. Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf of abelian groups on $\mathcal{C}$. Recall that $\underline{H}^{i}(\mathcal{F})$ indicates the presheaf of abelian groups on $\mathcal{C}$ which is defined by the rule $\underline{H}^{i}(\mathcal{F}): U \longmapsto$ $H^{i}(U, \mathcal{F})$. We extend this to $\mathrm{SR}(\mathcal{C})$ as in the introduction to this section.

01GY Lemma 24.4.3. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $\mathcal{F}$ be a sheaf of abelian groups on $\mathcal{C}$. There is $a$ map

$$
s(\mathcal{F}(K)) \longrightarrow R \Gamma(X, \mathcal{F})
$$

in $D^{+}(A b)$ functorial in $\mathcal{F}$, which induces natural transformations

$$
\check{H}^{i}(K,-) \longrightarrow H^{i}(X,-)
$$

as functors $A b(\mathcal{C}) \rightarrow A b$. Moreover, there is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{2}^{p, q}=\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to $H^{p+q}(X, \mathcal{F})$. This spectral sequence is functorial in $\mathcal{F}$ and in the hypercovering $K$.

Proof. We could prove this by the same method as employed in the corresponding lemma in the chapter on cohomology. Instead let us prove this by a double complex argument.
Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I}^{\bullet}$ in the category of abelian sheaves on $\mathcal{C}$. Consider the double complex $A^{\bullet \bullet \bullet}$ with terms

$$
A^{p, q}=\mathcal{I}^{q}\left(K_{p}\right)
$$

where the differential $d_{1}^{p, q}: A^{p, q} \rightarrow A^{p+1, q}$ is the one coming from the differential $\mathcal{I}^{p} \rightarrow \mathcal{I}^{p+1}$ and the differential $d_{2}^{p, q}: A^{p, q} \rightarrow A^{p, q+1}$ is the one coming from the differential on the complex $s\left(\mathcal{I}^{p}(K)\right)$ associated to the cosimplicial abelian group $\mathcal{I}^{p}(K)$ as explained above. As usual we denote $s A^{\bullet}$ the simple complex associated
to the double complex $A^{\bullet \bullet \bullet}$. We will use the two spectral sequences $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)$ and ( ${ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}$ ) associated to this double complex, see Homology, Section 12.22 .
By Lemma 24.4.2 the complexes $s\left(\mathcal{I}^{p}(K)\right)$ are acyclic in positive degrees and have $H^{0}$ equal to $\mathcal{I}^{p}(X)$. Hence by Homology, Lemma 12.22 .7 and its proof the spectral sequence $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)$ degenerates, and the natural map

$$
\mathcal{I}^{\bullet}(X) \longrightarrow s A^{\bullet}
$$

is a quasi-isomorphism of complexes of abelian groups. In particular we conclude that $H^{n}\left(s A^{\bullet}\right)=H^{n}(X, \mathcal{F})$.

The map $s(\mathcal{F}(K)) \longrightarrow R \Gamma(X, \mathcal{F})$ of the lemma is the composition of the natural $\operatorname{map} s(\mathcal{F}(K)) \rightarrow s A^{\bullet}$ followed by the inverse of the displayed quasi-isomorphism above. This works because $\mathcal{I}^{\bullet}(X)$ is a representative of $R \Gamma(X, \mathcal{F})$.
Consider the spectral sequence $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$. By Homology, Lemma 12.22 .4 we see that

$$
{ }^{\prime \prime} E_{2}^{p, q}=H_{I I}^{p}\left(H_{I}^{q}\left(A^{\bullet, \bullet}\right)\right)
$$

In other words, we first take cohomology with respect to $d_{1}$ which gives the groups ${ }^{\prime \prime} E_{1}^{p, q}=\underline{H}^{p}(\mathcal{F})\left(K_{q}\right)$. Hence it is indeed the case (by the description of the differential " $d_{1}$ ) that " $E_{2}^{p, q}=\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)$. And by the other spectral sequence above we see that this one converges to $H^{n}(X, \mathcal{F})$ as desired.
We omit the proof of the statements regarding the functoriality of the above constructions in the abelian sheaf $\mathcal{F}$ and the hypercovering $K$.

### 24.5. Hypercoverings a la Verdier

09VT The astute reader will have noticed that all we need in order to get the Čech to cohomology spectral sequence for a hypercovering of an object $X$, is the conclusion of Lemma 24.2.10. Therefore the following definition makes sense.
09VU Definition 24.5.1. Let $\mathcal{C}$ be a site. Assume $\mathcal{C}$ has equalizers and fibre products. Let $\mathcal{G}$ be a presheaf of sets. A hypercovering of $\mathcal{G}$ is a simplicial object $K$ of $\operatorname{SR}(\mathcal{C})$ endowed with an augmentation $F(K) \rightarrow \mathcal{G}$ such that
(1) $F\left(K_{0}\right) \rightarrow \mathcal{G}$ becomes surjective after sheafification,
(2) $F\left(K_{1}\right) \rightarrow F\left(K_{0}\right) \times_{\mathcal{G}} F\left(K_{0}\right)$ becomes surjective after sheafification, and
(3) $F\left(K_{n+1}\right) \longrightarrow F\left(\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} K\right)_{n+1}\right)$ for $n \geq 1$ becomes surjective after sheafification.
We say that a simplicial object $K$ of $\operatorname{SR}(\mathcal{C})$ is a hypercovering if $K$ is a hypercovering of the final object $*$ of $\operatorname{PSh}(\mathcal{C})$.

The assumption that $\mathcal{C}$ has fibre products and equalizers guarantees that $\mathrm{SR}(\mathcal{C})$ has fibre products and equalizers and $F$ commutes with these (Lemma 24.2.3) which suffices to define the coskeleton functors used (see Simplicial, Remark 14.19.11 and Categories, Lemma 4.18.2). If $\mathcal{C}$ is general, we can replace the condition (3) by the condition that $F\left(K_{n+1}\right) \longrightarrow\left(\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} F(K)\right)_{n+1}\right)$ for $n \geq 1$ becomes surjective after sheafification and the results of this section remain valid.
Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$. In the previous section, we defined the Čech complex of $\mathcal{F}$ with respect to a simplicial object $K$ of $\operatorname{SR}(\mathcal{C})$. Next, given a presheaf $\mathcal{G}$ we set

$$
H^{0}(\mathcal{G}, \mathcal{F})=\operatorname{Mor}_{P S h(\mathcal{C})}(\mathcal{G}, \mathcal{F})=\operatorname{Mor}_{S h(\mathcal{C})}\left(\mathcal{G}^{\#}, \mathcal{F}\right)=H^{0}\left(\mathcal{G}^{\#}, \mathcal{F}\right)
$$

with notation as in Cohomology on Sites, Section 21.13). This is a left exact functor and its higher derived functors (briefly studied in Cohomology on Sites, Section 21.13 will be denoted $H^{i}(\mathcal{G}, \mathcal{F})$. We will show that given a hypercovering $K$ of $\mathcal{G}$, there is a Čech to cohomology spectral sequence converging to the cohomology $H^{i}(\mathcal{G}, \mathcal{F})$. Note that if $\mathcal{G}=*$, then $H^{i}(*, \mathcal{F})=H^{i}(\mathcal{F})$ recovers the global cohomology of $\mathcal{F}$.
09VV Lemma 24.5.2. Let $\mathcal{C}$ be a site with equalizers and fibre products. Let $\mathcal{G}$ be a presheaf on $\mathcal{C}$. Let $K$ be a hypercovering of $\mathcal{G}$. Let $\mathcal{F}$ be a sheaf of abelian groups on $\mathcal{C}$. Then $\check{H}^{0}(K, \mathcal{F})=H^{0}(\mathcal{G}, \mathcal{F})$.
Proof. This follows from the definition of $H^{0}(\mathcal{G}, \mathcal{F})$ and the fact that

$$
F\left(K_{1}\right) \longrightarrow F\left(K_{0}\right) \longrightarrow \mathcal{G}
$$

becomes an coequalizer diagram after sheafification.
09VW Lemma 24.5.3. Let $\mathcal{C}$ be a site with equalizers and fibre products. Let $\mathcal{G}$ be a presheaf on $\mathcal{C}$. Let $K$ be a hypercovering of $\mathcal{G}$. Let $\mathcal{I}$ be an injective sheaf of abelian groups on $\mathcal{C}$. Then

$$
\check{H}^{p}(K, \mathcal{I})=\left\{\begin{array}{cl}
H^{0}(\mathcal{G}, \mathcal{I}) & \text { if } \quad p=0 \\
0 & \text { if } p>0
\end{array}\right.
$$

Proof. By 24.4.2.1 we have

$$
s(\mathcal{F}(K))=\operatorname{Hom}_{A b(\mathcal{C})}\left(s\left(\mathbf{Z}_{F(K)}^{\#}\right), \mathcal{F}\right)
$$

The complex $s\left(\mathbf{Z}_{F(K)}^{\#}\right)$ is quasi-isomorphic to $\mathbf{Z}_{\mathcal{G}}^{\#}$, see Lemma 24.3.4. We conclude that if $\mathcal{I}$ is an injective abelian sheaf, then the complex $s(\mathcal{I}(K))$ is acyclic except possibly in degree 0 . In other words, we have $\breve{H}^{i}(K, \mathcal{I})=0$ for $i>0$. Combined with Lemma 24.5.2 the lemma is proved.

09VX Lemma 24.5.4. Let $\mathcal{C}$ be a site with equalizers and fibre products. Let $\mathcal{G}$ be a presheaf on $\mathcal{C}$. Let $K$ be a hypercovering of $\mathcal{G}$. Let $\mathcal{F}$ be a sheaf of abelian groups on $\mathcal{C}$. There is a map

$$
s(\mathcal{F}(K)) \longrightarrow R \Gamma(\mathcal{G}, \mathcal{F})
$$

in $D^{+}(A b)$ functorial in $\mathcal{F}$, which induces a natural transformation

$$
\check{H}^{i}(K,-) \longrightarrow H^{i}(\mathcal{G},-)
$$

of functors $A b(\mathcal{C}) \rightarrow A b$. Moreover, there is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{2}^{p, q}=\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to $H^{p+q}(\mathcal{G}, \mathcal{F})$. This spectral sequence is functorial in $\mathcal{F}$ and in the hypercovering $K$.
Proof. Choose an injective resolution $\mathcal{F} \rightarrow \mathcal{I} \bullet$ in the category of abelian sheaves on $\mathcal{C}$. Consider the double complex $A^{\bullet \bullet \bullet}$ with terms

$$
A^{p, q}=\mathcal{I}^{q}\left(K_{p}\right)
$$

where the differential $d_{1}^{p, q}: A^{p, q} \rightarrow A^{p+1, q}$ is the one coming from the differential $\mathcal{I}^{p} \rightarrow \mathcal{I}^{p+1}$ and the differential $d_{2}^{p, q}: A^{p, q} \rightarrow A^{p, q+1}$ is the one coming from the differential on the complex $s\left(\mathcal{I}^{p}(K)\right)$ associated to the cosimplicial abelian group $\mathcal{I}^{p}(K)$ as explained above. We will use the two spectral sequences $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)$ and ( ${ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}$ ) associated to this double complex, see Homology, Section 12.22 .

By Lemma 24.5.3 the complexes $s\left(\mathcal{I}^{p}(K)\right)$ are acyclic in positive degrees and have $H^{0}$ equal to $H^{0}\left(\mathcal{G}, \mathcal{I}^{p}\right)$. Hence by Homology, Lemma 12.22 .7 and its proof the spectral sequence $\left({ }^{\prime} E_{r},{ }^{\prime} d_{r}\right)$ degenerates, and the natural map

$$
H^{0}\left(\mathcal{G}, \mathcal{I}^{\bullet}\right) \longrightarrow \operatorname{Tot}\left(A^{\bullet, \bullet}\right)
$$

is a quasi-isomorphism of complexes of abelian groups. The map $s(\mathcal{F}(K)) \longrightarrow$ $R \Gamma(\mathcal{G}, \mathcal{F})$ of the lemma is the composition of the natural map $s(\mathcal{F}(K)) \rightarrow \operatorname{Tot}\left(A^{\bullet \bullet \bullet}\right)$ followed by the inverse of the displayed quasi-isomorphism above. This works because $H^{0}\left(\mathcal{G}, \mathcal{I}^{\bullet}\right)$ is a representative of $R \Gamma(\mathcal{G}, \mathcal{F})$.

Consider the spectral sequence $\left({ }^{\prime \prime} E_{r},{ }^{\prime \prime} d_{r}\right)_{r \geq 0}$. By Homology, Lemma 12.22 .4 we see that

$$
{ }^{\prime \prime} E_{2}^{p, q}=H_{I I}^{p}\left(H_{I}^{q}\left(A^{\bullet \bullet \bullet}\right)\right)
$$

In other words, we first take cohomology with respect to $d_{1}$ which gives the groups ${ }^{\prime \prime} E_{1}^{p, q}=\underline{H^{p}}(\mathcal{F})\left(K_{q}\right)$. Hence it is indeed the case (by the description of the differential " $d_{1}$ ) that ${ }^{\prime \prime} E_{2}^{p, q}=\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)$. Since this spectral sequence converges to the cohomology of $\operatorname{Tot}\left(A^{\bullet \bullet \bullet}\right)$ the proof is finished.

09VY Lemma 24.5.5. Let $\mathcal{C}$ be a site with equalizers and fibre products. Let $K$ be a hypercovering. Let $\mathcal{F}$ be an abelian sheaf. There is a spectral sequence $\left(E_{r}, d_{r}\right)_{r \geq 0}$ with

$$
E_{2}^{p, q}=\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to the global cohomology groups $H^{p+q}(\mathcal{F})$.
Proof. This is a special case of Lemma 24.5.4

### 24.6. Covering hypercoverings

01 GG Here are some ways to construct hypercoverings. We note that since the category $\operatorname{SR}(\mathcal{C}, X)$ has fibre products the category of simplicial objects of $\operatorname{SR}(\mathcal{C}, X)$ has fibre products as well, see Simplicial, Lemma 14.7.2.

01GH Lemma 24.6.1. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K, L, M$ be simplicial objects of $S R(\mathcal{C}, X)$. Let $a: K \rightarrow L, b: M \rightarrow L$ be morphisms. Assume
(1) $K$ is a hypercovering of $X$,
(2) the morphism $M_{0} \rightarrow L_{0}$ is a covering, and
(3) for all $n \geq 0$ in the diagram

the arrow $\gamma$ is a covering.
Then the fibre product $K \times{ }_{L} M$ is a hypercovering of $X$.

Proof. The morphism $\left(K \times_{L} M\right)_{0}=K_{0} \times_{L_{0}} M_{0} \rightarrow K_{0}$ is a base change of a covering by (2), hence a covering, see Lemma 24.2.5. And $K_{0} \rightarrow\{X \rightarrow X\}$ is a covering by (1). Thus $\left(K \times{ }_{L} M\right)_{0} \rightarrow\{X \rightarrow X\}$ is a covering by Lemma 24.2.5. Hence $K \times{ }_{L} M$ satisfies the first condition of Definition 24.2.6.
We still have to check that

$$
K_{n+1} \times_{L_{n+1}} M_{n+1}=\left(K \times_{L} M\right)_{n+1} \longrightarrow\left(\operatorname{cosk}_{n} \operatorname{sk}_{n}\left(K \times_{L} M\right)\right)_{n+1}
$$

is a covering for all $n \geq 0$. We abbreviate as follows: $A=\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} K\right)_{n+1}$, $B=\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} L\right)_{n+1}$, and $C=\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} M\right)_{n+1}$. The functor $\operatorname{cosk}_{n} \operatorname{sk}_{n}$ commutes with fibre products, see Simplicial, Lemma 14.19.13 Thus the right hand side above is equal to $A \times{ }_{B} C$. Consider the following commutative diagram

This diagram shows that

$$
K_{n+1} \times_{L_{n+1}} M_{n+1}=\left(K_{n+1} \times{ }_{B} C\right) \times\left(L_{n+1} \times_{B} C\right), \gamma, M_{n+1}
$$

Now, $K_{n+1} \times_{B} C \rightarrow A \times_{B} C$ is a base change of the covering $K_{n+1} \rightarrow A$ via the morphism $A \times{ }_{B} C \rightarrow A$, hence is a covering. By assumption (3) the morphism $\gamma$ is a covering. Hence the morphism

$$
\left(K_{n+1} \times_{B} C\right) \times \times_{\left(L_{n+1} \times{ }_{B} C\right), \gamma} M_{n+1} \longrightarrow K_{n+1} \times_{B} C
$$

is a covering as a base change of a covering. The lemma follows as a composition of coverings is a covering.

01GI Lemma 24.6.2. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. If $K, L$ are hypercoverings of $X$, then $K \times L$ is a hypercovering of $X$.

Proof. You can either verify this directly, or use Lemma 24.6.1 above and check that $L \rightarrow\{X \rightarrow X\}$ has property (3).

Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Since the category $\mathrm{SR}(\mathcal{C}, X)$ has coproducts and finite limits, it is permissible to speak about the objects $U \times K$ and $\operatorname{Hom}(U, K)$ for certain simplicial sets $U$ (for example those with finitely many nondegenerate simplices) and any simplicial object $K$ of $\operatorname{SR}(\mathcal{C}, X)$. See Simplicial, Sections 14.13 and 14.17 .

01GJ Lemma 24.6.3. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $k \geq 0$ be an integer. Let $u: Z \rightarrow K_{k}$ be a covering in in $S R(\mathcal{C}, X)$. Then there exists a morphism of hypercoverings $f: L \rightarrow K$ such that $L_{k} \rightarrow K_{k}$ factors through $u$.
Proof. Denote $Y=K_{k}$. Let $C[k]$ be the cosimplicial set defined in Simplicial, Example 14.5.6. We will use the description of $\operatorname{Hom}(C[k], Y)$ and $\operatorname{Hom}(C[k], Z)$ given in Simplicial, Lemma 14.15.2. There is a canonical morphism $K \rightarrow \operatorname{Hom}(C[k], Y)$
corresponding to id : $K_{k}=Y \rightarrow Y$. Consider the morphism Hom $(C[k], Z) \rightarrow$ $\operatorname{Hom}(C[k], Y)$ which on degree $n$ terms is the morphism

$$
\prod_{\alpha:[k] \rightarrow[n]} Z \longrightarrow \prod_{\alpha:[k] \rightarrow[n]} Y
$$

using the given morphism $Z \rightarrow Y$ on each factor. Set

$$
L=K \times_{\operatorname{Hom}(C[k], Y)} \operatorname{Hom}(C[k], Z)
$$

The morphism $L_{k} \rightarrow K_{k}$ sits in to a commutative diagram

Since the composition of the two bottom arrows is the identity we conclude that we have the desired factorization.
We still have to show that $L$ is a hypercovering of $X$. To see this we will use Lemma 24.6.1. Condition (1) is satisfied by assumption. For (2), the morphism

$$
\operatorname{Hom}(C[k], Z)_{0} \rightarrow \operatorname{Hom}(C[k], Y)_{0}
$$

is a covering because it is isomorphic to $Z \rightarrow Y$ as there is only one morphism $[k] \rightarrow[0]$.
Let us consider condition (3) for $n=0$. Then, since $\left(\operatorname{cosk}_{0} T\right)_{1}=T \times T$ (Simplicial, Example 14.19.1 and since $\operatorname{Hom}(C[k], Z)_{1}=\prod_{\alpha:[k] \rightarrow[1]} Z$ we obtain the diagram

with horizontal arrows corresponding to the projection onto the factors corresponding to the two nonsurjective $\alpha$. Thus the arrow $\gamma$ is the morphism

$$
\prod_{\alpha:[k] \rightarrow[1]} Z \longrightarrow \prod_{\alpha:[k] \rightarrow[1] \text { not onto }} Z \times \prod_{\alpha:[k] \rightarrow[1] \text { onto }} Y
$$

which is a product of coverings and hence a covering by Lemma 24.2.5.
Let us consider condition (3) for $n>0$. We claim there is an injective map $\tau$ : $S^{\prime} \rightarrow S$ of finite sets, such that for any object $T$ of $\mathrm{SR}(\mathcal{C}, X)$ the morphism

$$
\begin{equation*}
\operatorname{Hom}(C[k], T)_{n+1} \rightarrow\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} \operatorname{Hom}(C[k], T)\right)_{n+1} \tag{24.6.3.1}
\end{equation*}
$$

is isomorphic to the projection $\prod_{s \in S} T \rightarrow \prod_{s^{\prime} \in S^{\prime}} T$ functorially in $T$. If this is true, then we see, arguing as in the previous paragraph, that the arrow $\gamma$ is the morphism

$$
\Pi_{e s S^{Z}} \rightarrow \Pi_{\varepsilon \in S} Z \times \Pi_{s e q(s)} Y
$$

which is a product of coverings and hence a covering by Lemma 24.2.5. By construction, we have $\operatorname{Hom}(C[k], T)_{n+1}=\prod_{\alpha:[k] \rightarrow[n+1]} T$ (see Simplicial, Lemma 14.15.2). Correspondingly we take $S=\operatorname{Map}([k],[n+1])$. On the other hand, Simplicial, Lemma 14.19.5 provides a description of points of $\left(\operatorname{cosk}_{n} \operatorname{sk}_{n} \operatorname{Hom}(C[k], T)\right)_{n+1}$
as sequences $\left(f_{0}, \ldots, f_{n+1}\right)$ of points of $\operatorname{Hom}(C[k], T)_{n}$ satisfying $d_{j-1}^{n} f_{i}=d_{i}^{n} f_{j}$ for $0 \leq i<j \leq n+1$. We can write $f_{i}=\left(f_{i, \alpha}\right)$ with $f_{i, \alpha}$ a point of $T$ and $\alpha \in \operatorname{Map}([k],[n])$. The conditions translate into

$$
f_{i, \delta_{j-1}^{n}} \circ \beta=f_{j, \delta_{i}^{n} \circ \beta}
$$

for any $0 \leq i<j \leq n+1$ and $\beta:[k] \rightarrow[n-1]$. Thus we see that

$$
S^{\prime}=\{0, \ldots, n+1\} \times \operatorname{Map}([k],[n]) / \sim
$$

where the equivalence relation is generated by the equivalences

$$
\left(i, \delta_{j-1}^{n} \circ \beta\right) \sim\left(j, \delta_{i}^{n} \circ \beta\right)
$$

for $0 \leq i<j \leq n+1$ and $\beta:[k] \rightarrow[n-1]$. A computation (omitted) shows that the morphism 24.6.3.1 corresponds to the map $S^{\prime} \rightarrow S$ which sends $(i, \alpha)$ to $\delta_{i}^{n+1} \circ \alpha \in S$. (It may be a comfort to the reader to see that this map is well defined by part (1) of Simplicial, Lemma 14.2.3) To finish the proof it suffices to show that if $\alpha, \alpha^{\prime}:[k] \rightarrow[n]$ and $0 \leq i<j \leq n+1$ are such that

$$
\delta_{i}^{n+1} \circ \alpha=\delta_{j}^{n+1} \circ \alpha^{\prime}
$$

then we have $\alpha=\delta_{j-1}^{n} \circ \beta$ and $\alpha^{\prime}=\delta_{i}^{n} \circ \beta$ for some $\beta:[k] \rightarrow[n-1]$. This is easy to see and omitted.

01GK Lemma 24.6.4. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $n \geq 0$ be an integer. Let $u: \mathcal{F} \rightarrow F\left(K_{n}\right)$ be a morphism of presheaves which becomes surjective on sheafification. Then there exists a morphism of hypercoverings $f: L \rightarrow K$ such that $F\left(f_{n}\right): F\left(L_{n}\right) \rightarrow F\left(K_{n}\right)$ factors through $u$.

Proof. Write $K_{n}=\left\{U_{i} \rightarrow X\right\}_{i \in I}$. Thus the map $u$ is a morphism of presheaves of sets $u: \mathcal{F} \rightarrow \amalg h_{u_{i}}$. The assumption on $u$ means that for every $i \in I$ there exists a covering $\left\{U_{i j} \rightarrow U_{i}\right\}_{j \in I_{i}}$ of the site $\mathcal{C}$ and a morphism of presheaves $t_{i j}: h_{U_{i j}} \rightarrow \mathcal{F}$ such that $u \circ t_{i j}$ is the map $h_{U_{i j}} \rightarrow h_{U_{i}}$ coming from the morphism $U_{i j} \rightarrow U_{i}$. Set $J=\amalg_{i \in I} I_{i}$, and let $\alpha: J \rightarrow I$ be the obvious map. For $j \in J$ denote $V_{j}=U_{\alpha(j) j}$. Set $Z=\left\{V_{j} \rightarrow X\right\}_{j \in J}$. Finally, consider the morphism $u^{\prime}: Z \rightarrow K_{n}$ given by $\alpha: J \rightarrow I$ and the morphisms $V_{j}=U_{\alpha(j) j} \rightarrow U_{\alpha(j)}$ above. Clearly, this is a covering in the category $\operatorname{SR}(\mathcal{C}, X)$, and by construction $F\left(u^{\prime}\right): F(Z) \rightarrow F\left(K_{n}\right)$ factors through $u$. Thus the result follows from Lemma 24.6.3 above.

### 24.7. Adding simplices

01GL In this section we prove some technical lemmas which we will need later. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. As we pointed out in Section 24.6 above, the objects $U \times K$ and $\operatorname{Hom}(U, K)$ for certain simplicial sets $U$ and any simplicial object $K$ of $\operatorname{SR}(\mathcal{C}, X)$ are defined. See Simplicial, Sections 14.13 and 14.17

01 GM Lemma 24.7.1. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $U \subset V$ be simplicial sets, with $U_{n}, V_{n}$ finite nonempty for all $n$. Assume that $U$ has finitely many nondegenerate simplices. Suppose $n \geq 0$ and $x \in V_{n}, x \notin U_{n}$ are such that
(1) $V_{i}=U_{i}$ for $i<n$,
(2) $V_{n}=U_{n} \cup\{x\}$,
(3) any $z \in V_{j}, z \notin U_{j}$ for $j>n$ is degenerate.

Then the morphism

$$
\operatorname{Hom}(V, K)_{0} \longrightarrow \operatorname{Hom}(U, K)_{0}
$$

of $\operatorname{SR}(\mathcal{C}, X)$ is a covering.
Proof. If $n=0$, then it follows easily that $V=U \amalg \Delta[0]$ (see below). In this case $\operatorname{Hom}(V, K)_{0}=\operatorname{Hom}(U, K)_{0} \times K_{0}$. The result, in this case, then follows from Lemma 24.2.5.

Let $a: \Delta[n] \rightarrow V$ be the morphism associated to $x$ as in Simplicial, Lemma 14.11.3 Let us write $\partial \Delta[n]=i_{(n-1)!} \mathrm{sk}_{n-1} \Delta[n]$ for the $(n-1)$-skeleton of $\Delta[n]$. Let $b$ : $\partial \Delta[n] \rightarrow U$ be the restriction of $a$ to the $(n-1)$ skeleton of $\Delta[n]$. By Simplicial, Lemma 14.21 .7 we have $V=U \amalg_{\partial \Delta[n]} \Delta[n]$. By Simplicial, Lemma 14.17 .5 we get that

is a fibre product square. Thus it suffices to show that the bottom horizontal arrow is a covering. By Simplicial, Lemma 14.21.11 this arrow is identified with

$$
K_{n} \rightarrow\left(\operatorname{cosk}_{n-1} \mathrm{sk}_{n-1} K\right)_{n}
$$

and hence is a covering by definition of a hypercovering.
01GN Lemma 24.7.2. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K$ be a hypercovering of $X$. Let $U \subset V$ be simplicial sets, with $U_{n}, V_{n}$ finite nonempty for all $n$. Assume that $U$ and $V$ have finitely many nondegenerate simplices. Then the morphism

$$
\operatorname{Hom}(V, K)_{0} \longrightarrow \operatorname{Hom}(U, K)_{0}
$$

of $\operatorname{SR}(\mathcal{C}, X)$ is a covering.
Proof. By Lemma 24.7.1 above, it suffices to prove a simple lemma about inclusions of simplicial sets $U \subset V$ as in the lemma. And this is exactly the result of Simplicial, Lemma 14.21.8.

### 24.8. Homotopies

01 GO Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $L$ be a simplicial object of $\operatorname{SR}(\mathcal{C}, X)$. According to Simplicial, Lemma 14.17.4 there exists an object $\operatorname{Hom}(\Delta[1], L)$ in the category $\operatorname{Simp}(\operatorname{SR}(\mathcal{C}, X))$ which represents the functor

$$
T \longmapsto \operatorname{Mor}_{\operatorname{Simp}(\operatorname{SR}(\mathcal{C}, X))}(\Delta[1] \times T, L)
$$

There is a canonical morphism

$$
\operatorname{Hom}(\Delta[1], L) \rightarrow L \times L
$$

coming from $e_{i}: \Delta[0] \rightarrow \Delta[1]$ and the identification $\operatorname{Hom}(\Delta[0], L)=L$.

01GP Lemma 24.8.1. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $L$ be a simplicial object of $S R(\mathcal{C}, X)$. Let $n \geq 0$. Consider the commutative diagram

01GQ

coming from the morphism defined above. We can identify the terms in this diagram as follows, where $\partial \Delta[n+1]=i_{n!}$ sk $k_{n} \Delta[n+1]$ is the $n$-skeleton of the $(n+1)$-simplex:

$$
\begin{aligned}
\operatorname{Hom}(\Delta[1], L)_{n+1} & =\operatorname{Hom}(\Delta[1] \times \Delta[n+1], L)_{0} \\
\left(\operatorname{cosk}_{n} s k_{n} \operatorname{Hom}(\Delta[1], L)\right)_{n+1} & =\operatorname{Hom}(\Delta[1] \times \partial \Delta[n+1], L)_{0} \\
(L \times L)_{n+1} & =\operatorname{Hom}\left((\Delta[n+1] \amalg \Delta[n+1], L)_{0}\right. \\
\left(\operatorname{cosk}_{n} s k_{n}(L \times L)\right)_{n+1} & =\operatorname{Hom}(\partial \Delta[n+1] \amalg \partial \Delta[n+1], L)_{0}
\end{aligned}
$$

and the morphism between these objects of $S R(\mathcal{C}, X)$ come from the commutative diagram of simplicial sets

01GR

Moreover the fibre product of the bottom arrow and the right arrow in 24.8.1.1) is equal to

$$
\operatorname{Hom}(U, L)_{0}
$$

where $U \subset \Delta[1] \times \Delta[n+1]$ is the smallest simplicial subset such that both $\Delta[n+$ 1] $\amalg \Delta[n+1]$ and $\Delta[1] \times \partial \Delta[n+1]$ map into it.

Proof. The first and third equalities are Simplicial, Lemma 14.17.4. The second and fourth follow from the cited lemma combined with Simplicial, Lemma 14.21.11. The last assertion follows from the fact that $U$ is the push-out of the bottom and right arrow of the diagram (24.8.1.2), via Simplicial, Lemma 14.17.5. To see that $U$ is equal to this push-out it suffices to see that the intersection of $\Delta[n+1] \amalg \Delta[n+1]$ and $\Delta[1] \times \partial \Delta[n+1]$ in $\Delta[1] \times \Delta[n+1]$ is equal to $\partial \Delta[n+1] \amalg \partial \Delta[n+1]$. This we leave to the reader.

01GS Lemma 24.8.2. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $K, L$ be hypercoverings of $X$. Let $a, b: K \rightarrow L$ be morphisms of hypercoverings. There exists a morphism of hypercoverings $c: K^{\prime} \rightarrow K$ such that $a \circ c$ is homotopic to $b \circ c$.

Proof. Consider the following commutative diagram

By the functorial property of $\operatorname{Hom}(\Delta[1], L)$ the composition of the horizontal morphisms corresponds to a morphism $K^{\prime} \times \Delta[1] \rightarrow L$ which defines a homotopy
between $c \circ a$ and $c \circ b$. Thus if we can show that $K^{\prime}$ is a hypercovering of $X$, then we obtain the lemma. To see this we will apply Lemma 24.6.1 to the pair of morphisms $K \rightarrow L \times L$ and $\operatorname{Hom}(\Delta[1], L) \rightarrow L \times L$. Condition (1) of Lemma 24.6.1 is satisfied. Condition (2) of Lemma 24.6.1 is true because $\operatorname{Hom}(\Delta[1], L)_{0}=L_{1}$, and the morphism $\left(d_{0}^{1}, d_{1}^{1}\right): L_{1} \rightarrow L_{0} \times L_{0}$ is a covering of $\mathrm{SR}(\mathcal{C}, X)$ by our assumption that $L$ is a hypercovering. To prove condition (3) of Lemma 24.6.1 we use Lemma 24.8.1 above. According to this lemma the morphism $\gamma$ of condition (3) of Lemma 24.6.1 is the morphism

$$
\operatorname{Hom}(\Delta[1] \times \Delta[n+1], L)_{0} \longrightarrow \operatorname{Hom}(U, L)_{0}
$$

where $U \subset \Delta[1] \times \Delta[n+1]$. According to Lemma 24.7 .2 this is a covering and hence the claim has been proven.

01GT Remark 24.8.3. Note that the crux of the proof is to use Lemma 24.7.2. This lemma is completely general and does not care about the exact shape of the simplicial sets (as long as they have only finitely many nondegenerate simplices). It seems altogether reasonable to expect a result of the following kind: Given any morphism $a: K \times \partial \Delta[k] \rightarrow L$, with $K$ and $L$ hypercoverings, there exists a morphism of hypercoverings $c: K^{\prime} \rightarrow K$ and a morphism $g: K^{\prime} \times \Delta[k] \rightarrow L$ such that $\left.g\right|_{K^{\prime} \times \partial \Delta[k]}=a \circ\left(c \times \operatorname{id}_{\partial \Delta[k]}\right)$. In other words, the category of hypercoverings is in a suitable sense contractible.

### 24.9. Cohomology and hypercoverings

01 GZ Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $\mathcal{F}$ be a sheaf of abelian groups on $\mathcal{C}$. Let $K, L$ be hypercoverings of $X$. If $a, b: K \rightarrow L$ are homotopic maps, then $\mathcal{F}(a), \mathcal{F}(b): \mathcal{F}(K) \rightarrow \mathcal{F}(L)$ are homotopic maps, see Simplicial, Lemma 14.28 .3 . Hence have the same effect on cohomology groups of the associated cochain complexes, see Simplicial, Lemma 14.28.5. We are going to use this to define the colimit over all hypercoverings.

Let us temporarily denote $\operatorname{HC}(\mathcal{C}, X)$ the category of hypercoverings of $X$. We have seen that this is a category and not a "big" category, see Lemma 24.2.8. This will be the index category for our diagram, see Categories, Section 4.14 for notation. Consider the diagram

$$
\check{H}^{i}(-, \mathcal{F}): \mathrm{HC}(\mathcal{C}, X) \longrightarrow A b .
$$

By Lemma 24.6.2 and Lemma 24.8.2, and the remark on homotopies above, this diagram is directed, see Categories, Definition 4.19.1. Thus the colimit

$$
\check{H}_{\mathrm{HC}}^{i}(X, \mathcal{F})=\operatorname{colim}_{K \in \mathrm{HC}(\mathcal{C}, X)} \check{H}^{i}(K, \mathcal{F})
$$

has a particularly simple description (see location cited).
01H0 Theorem 24.9.1. Let $\mathcal{C}$ be a site with fibre products. Let $X$ be an object of $\mathcal{C}$. Let $i \geq 0$. The functors

$$
\begin{aligned}
A b(\mathcal{C}) & \longrightarrow A b \\
\mathcal{F} & \longmapsto H^{i}(X, \mathcal{F}) \\
\mathcal{F} & \longmapsto \check{H}_{H C}^{i}(X, \mathcal{F})
\end{aligned}
$$

are canonically isomorphic.

Proof using spectral sequences. Suppose that $\xi \in H^{p}(X, \mathcal{F})$ for some $p \geq 0$. Let us show that $\xi$ is in the image of the map $\check{H}^{p}(X, \mathcal{F}) \rightarrow H^{p}(X, \mathcal{F})$ of Lemma 24.4.3 for some hypercovering $K$ of $X$.

This is true if $p=0$ by Lemma 24.4.1. If $p=1$, choose a Cech hypercovering $K$ of $X$ as in Example 24.2.7 starting with a covering $K_{0}=\left\{U_{i} \rightarrow X\right\}$ in the site $\mathcal{C}$ such that $\left.\xi\right|_{U_{i}}=0$, see Cohomology on Sites, Lemma 21.8.3. It follows immediately from the spectral sequence in Lemma 24.4 .3 that $\xi$ comes from an element of $\check{H}^{1}(K, \mathcal{F})$ in this case. In general, choose any hypercovering $K$ of $X$ such that $\xi$ maps to zero in $\underline{H}^{p}(\mathcal{F})\left(K_{0}\right)$ (using Example 24.2 .7 and Cohomology on Sites, Lemma 21.8.3 again). By the spectral sequence of Lemma 24.4.3 the obstruction for $\xi$ to come from an element of $H^{p}(K, \mathcal{F})$ is a sequence of elements $\xi_{1}, \ldots, \xi_{p-1}$ with $\xi_{q} \in \check{H}^{p-q}\left(K, \underline{H}^{q}(\mathcal{F})\right)$ (more precisely the images of the $\xi_{q}$ in certain subquotients of these groups).
We can inductively replace the hypercovering $K$ by refinements such that the obstructions $\xi_{1}, \ldots, \xi_{p-1}$ restrict to zero (and not just the images in the subquotients - so no subtlety here). Indeed, suppose we have already managed to reach the situation where $\xi_{q+1}, \ldots, \xi_{p-1}$ are zero. Note that $\xi_{q} \in \check{H}^{p-q}\left(K, \underline{H}^{q}(\mathcal{F})\right)$ is the class of some element

$$
\tilde{\xi}_{q} \in \underline{H}^{q}(\mathcal{F})\left(K_{p-q}\right)=\prod H^{q}\left(U_{i}, \mathcal{F}\right)
$$

if $K_{p-q}=\left\{U_{i} \rightarrow X\right\}_{i \in I}$. Let $\xi_{q, i}$ be the component of $\tilde{\xi}_{q}$ in $H^{q}\left(U_{i}, \mathcal{F}\right)$. As $q \geq 1$ we can use Cohomology on Sites, Lemma 21.8.3 yet again to choose coverings $\left\{U_{i, j} \rightarrow U_{i}\right\}$ of the site such that each restriction $\left.\xi_{q, i}\right|_{U_{i, j}}=0$. Consider the object $Z=\left\{U_{i, j} \rightarrow X\right\}$ of the category $\mathrm{SR}(\mathcal{C}, X)$ and its obvious morphism $u: Z \rightarrow K_{p-q}$. It is clear that $u$ is a covering, see Definition 24.2.4. By Lemma 24.6 .3 there exists a morphism $L \rightarrow K$ of hypercoverings of $X$ such that $L_{p-q} \rightarrow K_{p-q}$ factors through $u$. Then clearly the image of $\xi_{q}$ in $\underline{H}^{q}(\mathcal{F})\left(L_{p-q}\right)$. is zero. Since the spectral sequence of Lemma 24.4 .3 is functorial this means that after replacing $K$ by $L$ we reach the situation where $\xi_{q}, \ldots, \xi_{p-1}$ are all zero. Continuing like this we end up with a hypercovering where they are all zero and hence $\xi$ is in the image of the map $\check{H}^{p}(X, \mathcal{F}) \rightarrow H^{p}(X, \mathcal{F})$.

Suppose that $K$ is a hypercovering of $X$, that $\xi \in \check{H}^{p}(K, \mathcal{F})$ and that the image of $\xi$ under the map $\check{H}^{p}(X, \mathcal{F}) \rightarrow H^{p}(X, \mathcal{F})$ of Lemma 24.4.3 is zero. To finish the proof of the theorem we have to show that there exists a morphism of hypercoverings $L \rightarrow K$ such that $\xi$ restricts to zero in $\check{H}^{p}(L, \mathcal{F})$. By the spectral sequence of Lemma 24.4.3 the vanishing of the image of $\xi$ in $H^{p}(X, \mathcal{F})$ means that there exist elements $\xi_{1}, \ldots, \xi_{p-2}$ with $\xi_{q} \in \check{H}^{p-1-q}\left(K, \underline{H}^{q}(\mathcal{F})\right)$ (more precisely the images of these in certain subquotients) such that the images $d_{q+1}^{p-1-q, q} \xi_{q}$ (in the spectral sequence) add up to $\xi$. Hence by exactly the same mechanism as above we can find a morphism of hypercoverings $L \rightarrow K$ such that the restrictions of the elements $\xi_{q}, q=1, \ldots, p-2$ in $\check{H}^{p-1-q}\left(L, \underline{H}^{q}(\mathcal{F})\right)$ are zero. Then it follows that $\xi$ is zero since the morphism $L \rightarrow K$ induces a morphism of spectral sequences according to Lemma 24.4.3

Proof without using spectral sequences. We have seen the result for $i=0$, see Lemma 24.4.1. We know that the functors $H^{i}(X,-)$ form a universal $\delta$-functor, see Derived Categories, Lemma 13.20 .4 . In order to prove the theorem it suffices to show that the sequence of functors $\breve{H}_{H C}^{i}(X,-)$ forms a $\delta$-functor. Namely we
know that Cech cohomology is zero on injective sheaves (Lemma 24.4.2) and then we can apply Homology, Lemma 12.11.4.
Let

$$
0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0
$$

be a short exact sequence of abelian sheaves on $\mathcal{C}$. Let $\xi \in \check{H}_{H C}^{p}(X, \mathcal{H})$. Choose a hypercovering $K$ of $X$ and an element $\sigma \in \mathcal{H}\left(K_{p}\right)$ representing $\xi$ in cohomology. There is a corresponding exact sequence of complexes

$$
0 \rightarrow s(\mathcal{F}(K)) \rightarrow s(\mathcal{G}(K)) \rightarrow s(\mathcal{H}(K))
$$

but we are not assured that there is a zero on the right also and this is the only thing that prevents us from defining $\delta(\xi)$ by a simple application of the snake lemma. Recall that

$$
\mathcal{H}\left(K_{p}\right)=\prod \mathcal{H}\left(U_{i}\right)
$$

if $K_{p}=\left\{U_{i} \rightarrow X\right\}$. Let $\sigma=\prod \sigma_{i}$ with $\sigma_{i} \in \mathcal{H}\left(U_{i}\right)$. Since $\mathcal{G} \rightarrow \mathcal{H}$ is a surjection of sheaves we see that there exist coverings $\left\{U_{i, j} \rightarrow U_{i}\right\}$ such that $\left.\sigma_{i}\right|_{U_{i, j}}$ is the image of some element $\tau_{i, j} \in \mathcal{G}\left(U_{i, j}\right)$. Consider the object $Z=\left\{U_{i, j} \rightarrow X\right\}$ of the category $\operatorname{SR}(\mathcal{C}, X)$ and its obvious morphism $u: Z \rightarrow K_{p}$. It is clear that $u$ is a covering, see Definition 24.2.4. By Lemma 24.6.3 there exists a morphism $L \rightarrow K$ of hypercoverings of $X$ such that $L_{p} \rightarrow K_{p}$ factors through $u$. After replacing $K$ by $L$ we may therefore assume that $\sigma$ is the image of an element $\tau \in \mathcal{G}\left(K_{p}\right)$. Note that $d(\sigma)=0$, but not necessarily $d(\tau)=0$. Thus $d(\tau) \in \mathcal{F}\left(K_{p+1}\right)$ is a cocycle. In this situation we define $\delta(\xi)$ as the class of the cocycle $d(\tau)$ in $\check{H}_{H C}^{p+1}(X, \mathcal{F})$.

At this point there are several things to verify: (a) $\delta(\xi)$ does not depend on the choice of $\tau$, (b) $\delta(\xi)$ does not depend on the choice of the hypercovering $L \rightarrow K$ such that $\sigma$ lifts, and (c) $\delta(\xi)$ does not depend on the initial hypercovering and $\sigma$ chosen to represent $\xi$. We omit the verification of (a), (b), and (c); the independence of the choices of the hypercoverings really comes down to Lemmas 24.6.2 and 24.8.2. We also omit the verification that $\delta$ is functorial with respect to morphisms of short exact sequences of abelian sheaves on $\mathcal{C}$.

Finally, we have to verify that with this definition of $\delta$ our short exact sequence of abelian sheaves above leads to a long exact sequence of Cech cohomology groups. First we show that if $\delta(\xi)=0$ (with $\xi$ as above) then $\xi$ is the image of some element $\xi^{\prime} \in \check{H}_{H C}^{p}(X, \mathcal{G})$. Namely, if $\delta(\xi)=0$, then, with notation as above, we see that the class of $d(\tau)$ is zero in $\check{H}_{H C}^{p+1}(X, \mathcal{F})$. Hence there exists a morphism of hypercoverings $L \rightarrow K$ such that the restriction of $d(\tau)$ to an element of $\mathcal{F}\left(L_{p+1}\right)$ is equal to $d(v)$ for some $v \in \mathcal{F}\left(L_{p}\right)$. This implies that $\left.\tau\right|_{L_{p}}+v$ form a cocycle, and determine a class $\xi^{\prime} \in \check{H}^{p}(L, \mathcal{G})$ which maps to $\xi$ as desired.
We omit the proof that if $\xi^{\prime} \in \check{H}_{H C}^{p+1}(X, \mathcal{F})$ maps to zero in $\check{H}_{H C}^{p+1}(X, \mathcal{G})$, then it is equal to $\delta(\xi)$ for some $\xi \in \check{H}_{H C}^{p}(X, \mathcal{H})$.

Next, we deduce Verdier's case of Theorem 24.9.1 by a sleight of hand.
09VZ Proposition 24.9.2. Let $\mathcal{C}$ be a site with fibre products and products of pairs. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$. Let $i \geq 0$. Then
(1) for every $\xi \in H^{i}(\mathcal{F})$ there exists a hypercovering $K$ such that $\xi$ is in the image of the canonical map $\check{H}^{i}(K, \mathcal{F}) \rightarrow H^{i}(\mathcal{F})$, and
(2) if $K, L$ are hypercoverings and $\xi_{K} \in \check{H}^{i}(K, \mathcal{F}), \xi_{L} \in \check{H}^{i}(L, \mathcal{F})$ are elements mapping to the same element of $H^{i}(\mathcal{F})$, then there exists a hypercovering $M$ and morphisms $M \rightarrow K$ and $M \rightarrow L$ such that $\xi_{K}$ and $\xi_{L}$ map to the same element of $\check{H}^{i}(M, \mathcal{F})$.
In other words, modulo set theoretical issues, the cohomology groups of $\mathcal{F}$ on $\mathcal{C}$ are the colimit of the Čech cohomology groups of $\mathcal{F}$ over all hypercoverings.

Proof. This result is a trivial consequence of Theorem 24.9.1. Namely, we can articially replace $\mathcal{C}$ with a slightly bigger site $\mathcal{C}^{\prime}$ such that (I) $\mathcal{C}^{\prime}$ has a final object $X$ and (II) hypercoverings in $\mathcal{C}$ are more or less the same thing as hypercoverings of $X$ in $\mathcal{C}^{\prime}$. But due to the nature of things, there is quite a bit of bookkeeping to do.

Let us call a family of morphisms $\left\{U_{i} \rightarrow U\right\}$ in $\mathcal{C}$ with fixed target a weak covering if the sheafification of the map $\prod_{i \in I} h_{U_{i}} \rightarrow h_{U}$ becomes surjective. We construct a new site $\mathcal{C}^{\prime}$ as follows
(1) as a category set $\operatorname{Ob}\left(\mathcal{C}^{\prime}\right)=\operatorname{Ob}(\mathcal{C}) \amalg\{X\}$ and add a unique morphism to $X$ from every object of $\mathcal{C}^{\prime}$,
(2) $\mathcal{C}^{\prime}$ has fibre products as fibre products and products of pairs exist in $\mathcal{C}$,
(3) coverings of $\mathcal{C}^{\prime}$ are weak coverings of $\mathcal{C}$ together with those $\left\{U_{i} \rightarrow X\right\}_{i \in I}$ such that either $U_{i}=X$ for some $i$, or $U_{i} \neq X$ for all $i$ and the map $\prod h_{U_{i}} \rightarrow *$ of presheaves on $\mathcal{C}$ becomes surjective after sheafification on $\mathcal{C}$,
(4) we apply Sets, Lemma 3.11.1 to restrict the coverings to obtain our site $\mathcal{C}^{\prime}$.
Then $S h\left(\mathcal{C}^{\prime}\right)=S h(\mathcal{C})$ because the inclusion functor $\mathcal{C} \rightarrow \mathcal{C}^{\prime}$ is a special cocontinuous functor (see Sites, Definition 7.28.2). We omit the straightforward verifications.
Choose a covering $\left\{U_{i} \rightarrow X\right\}$ of $\mathcal{C}^{\prime}$ such that $U_{i}$ is an object of $\mathcal{C}$ for all $i$ (possible because $\mathcal{C} \rightarrow \mathcal{C}^{\prime}$ is special cocontinuous). Then $K_{0}=\left\{U_{i} \rightarrow X\right\}$ is a covering in the site $\mathcal{C}^{\prime}$ constructed above. We view $K_{0}$ as an object of $\operatorname{SR}\left(\mathcal{C}^{\prime}, X\right)$ and we set $K_{\text {init }}=\operatorname{cosk}_{0}\left(K_{0}\right)$. Then $K_{\text {init }}$ is a hypercovering of $X$, see Example 24.2.7. Note that every $K_{\text {init,n }}$ has the shape $\left\{W_{j} \rightarrow X\right\}$ with $W_{j} \in \operatorname{Ob}(\mathcal{C})$.

Proof of (1). Choose $\xi \in H^{i}(\mathcal{F})=H^{i}\left(X, \mathcal{F}^{\prime}\right)$ where $\mathcal{F}^{\prime}$ is the abelian sheaf on $\mathcal{C}^{\prime}$ corresponding to $\mathcal{F}$ on $\mathcal{C}$. By Theorem 24.9.1 there exists a morphism of hypercoverings $K^{\prime} \rightarrow K_{\text {init }}$ of $X$ in $\mathcal{C}^{\prime}$ such that $\xi$ comes from an element of $\check{H}^{i}\left(K^{\prime}, \mathcal{F}\right)$. Write $K_{n}^{\prime}=\left\{U_{n, j} \rightarrow X\right\}$. Now since $K_{n}^{\prime}$ maps to $K_{i n i t, n}$ we see that $U_{n, j}$ is an object of $\mathcal{C}$. Hence we can define a simplicial object $K$ of $\mathrm{SR}(\mathcal{C})$ by setting $K_{n}=\left\{U_{n, j}\right\}$. Since coverings in $\mathcal{C}^{\prime}$ consisting of families of morphisms of $\mathcal{C}$ are weak coverings, we see that $K$ is a hypercovering in the sense of Definition 24.5.1. Finally, since $\mathcal{F}^{\prime}$ is the unique sheaf on $\mathcal{C}^{\prime}$ whose restriction to $\mathcal{C}$ is equal to $\mathcal{F}$ we see that the Cech complexes $s(\mathcal{F}(K))$ and $s\left(\mathcal{F}^{\prime}\left(K^{\prime}\right)\right)$ are identical and (1) follows. (Compatibility with map into cohomology groups omitted.)

Proof of (2). Let $K$ and $L$ be hypercoverings in $\mathcal{C}$. Let $K^{\prime}$ and $L^{\prime}$ be the simplicial objects of $\operatorname{SR}\left(\mathcal{C}^{\prime}, X\right)$ gotten from $K$ and $L$ by the functor $\operatorname{SR}(\mathcal{C}) \rightarrow \operatorname{SR}\left(\mathcal{C}^{\prime}, X\right)$, $\left\{U_{i}\right\} \mapsto\left\{U_{i} \rightarrow X\right\}$. As before we have equality of Čech complexes and hence we obtain $\xi_{K^{\prime}}$ and $\xi_{L^{\prime}}$ mapping to the same cohomology class of $\mathcal{F}^{\prime}$ over $\mathcal{C}^{\prime}$. After possibly enlarging our choice of coverings in $\mathcal{C}^{\prime}$ (due to a set theoretical issue) we may assume that $K^{\prime}$ and $L^{\prime}$ are hypercoverings of $X$ in $\mathcal{C}^{\prime}$; this is true by our
definition of hypercoverings in Definition 24.5.1 and the fact that weak coverings in $\mathcal{C}$ give coverings in $\mathcal{C}^{\prime}$. By Theorem 24.9.1 there exists a hypercovering $M^{\prime}$ of $X$ in $\mathcal{C}^{\prime}$ and morphisms $M^{\prime} \rightarrow K^{\prime}, M^{\prime} \rightarrow L^{\prime}$, and $M^{\prime} \rightarrow K_{\text {init }}$ such that $\xi_{K^{\prime}}$ and $\xi_{L^{\prime}}$ restrict to the same element of $\check{H}^{i}\left(M^{\prime}, \mathcal{F}\right)$. Unwinding this statement as above we find that (2) is true.

### 24.10. Hypercoverings of spaces

01H1 The theory above is mildly interesting even in the case of topological spaces. In this case we can work out what a hypercovering is and see what the result actually says.
Let $X$ be a topological space. Consider the site $X_{Z a r}$ of Sites, Example 7.6.4, Recall that an object of $X_{Z a r}$ is simply an open of $X$ and that morphisms of $X_{Z a r}$ correspond simply to inclusions. So what is a hypercovering of $X$ for the site $X_{Z a r}$ ?

Let us first unwind Definition 24.2.1. An object of $\operatorname{SR}\left(X_{Z a r}, X\right)$ is simply given by a set $I$ and for each $i \in I$ an open $U_{i} \subset X$. Let us denote this by $\left\{U_{i}\right\}_{i \in I}$ since there can be no confusion about the morphism $U_{i} \rightarrow X$. A morphism $\left\{U_{i}\right\}_{i \in I} \rightarrow\left\{V_{j}\right\}_{j \in J}$ between two such objects is given by a map of sets $\alpha: I \rightarrow J$ such that $U_{i} \subset V_{\alpha(i)}$ for all $i \in I$. When is such a morphism a covering? This is the case if and only if for every $j \in J$ we have $V_{j}=\bigcup_{i \in I, \alpha(i)=j} U_{i}$ (and is a covering in the site $X_{Z a r}$ ).
Using the above we get the following description of a hypercovering in the site $X_{Z a r}$. A hypercovering of $X$ in $X_{Z a r}$ is given by the following data
(1) a simplicial set $I$ (see Simplicial, Section 14.11, and
(2) for each $n \geq 0$ and every $i \in I_{n}$ an open set $U_{i} \subset X$.

We will denote such a collection of data by the notation $\left(I,\left\{U_{i}\right\}\right)$. In order for this to be a hypercovering of $X$ we require the following properties

- for $i \in I_{n}$ and $0 \leq a \leq n$ we have $U_{i} \subset U_{d_{a}^{n}(i)}$,
- for $i \in I_{n}$ and $0 \leq a \leq n$ we have $U_{i}=U_{s_{a}^{n}(i)}$,
- we have

01H2

$$
\begin{equation*}
X=\bigcup_{i \in I_{0}} U_{i} \tag{24.10.0.1}
\end{equation*}
$$

- for every $i_{0}, i_{1} \in I_{0}$, we have

$$
\begin{equation*}
U_{i_{0}} \cap U_{i_{1}}=\bigcup_{i \in I_{1}, d_{0}^{1}(i)=i_{0}, d_{1}^{1}(i)=i_{1}} U_{i} \tag{24.10.0.2}
\end{equation*}
$$

- for every $n \geq 1$ and every $\left(i_{0}, \ldots, i_{n+1}\right) \in\left(I_{n}\right)^{n+2}$ such that $d_{b-1}^{n}\left(i_{a}\right)=$ $d_{a}^{n}\left(i_{b}\right)$ for all $0 \leq a<b \leq n+1$ we have

01H4 (24.10.0.3)

$$
U_{i_{0}} \cap \ldots \cap U_{i_{n+1}}=\bigcup_{i \in I_{n+1}, d_{a}^{n+1}(i)=i_{a}, a=0, \ldots, n+1} U_{i}
$$

- each of the open coverings 24.10.0.1, 24.10.0.2, and 24.10.0.3 is an element of $\operatorname{Cov}\left(X_{Z a r}\right)$ (this is a set theoretic condition, bounding the size of the index sets of the coverings).
Conditions 24.10.0.1 and 24.10.0.2 should be familiar from the chapter on sheaves on spaces for example, and condition 24.10 .0 .3 is the natural generalization.

01H5 Remark 24.10.1. One feature of this description is that if one of the multiple intersections $U_{i_{0}} \cap \ldots \cap U_{i_{n+1}}$ is empty then the covering on the right hand side may be the empty covering. Thus it is not automatically the case that the maps
$I_{n+1} \rightarrow\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} I\right)_{n+1}$ are surjective. This means that the geometric realization of $I$ may be an interesting (non-contractible) space.

In fact, let $I_{n}^{\prime} \subset I_{n}$ be the subset consisting of those simplices $i \in I_{n}$ such that $U_{i} \neq \emptyset$. It is easy to see that $I^{\prime} \subset I$ is a subsimplicial set, and that $\left(I^{\prime},\left\{U_{i}\right\}\right)$ is a hypercovering. Hence we can always refine a hypercovering to a hypercovering where none of the opens $U_{i}$ is empty.
02N9 Remark 24.10.2. Let us repackage this information in yet another way. Namely, suppose that $\left(I,\left\{U_{i}\right\}\right)$ is a hypercovering of the topological space $X$. Given this data we can construct a simplicial topological space $U_{\bullet}$ by setting

$$
U_{n}=\coprod_{i \in I_{n}} U_{i}
$$

and where for given $\varphi:[n] \rightarrow[m]$ we let morphisms $U(\varphi): U_{n} \rightarrow U_{m}$ be the morphism coming from the inclusions $U_{i} \subset U_{\varphi(i)}$ for $i \in I_{n}$. This simplicial topological space comes with an augmentation $\epsilon: U_{\bullet} \rightarrow X$. With this morphism the simplicial space $U_{\bullet}$ becomes a hypercovering of $X$ along which one has cohomological descent in the sense of AGV71, Exposé Vbis]. In other words, $H^{n}\left(U_{\bullet}, \epsilon^{*} \mathcal{F}\right)=H^{n}(X, \mathcal{F})$. (Insert future reference here to cohomology over simplicial spaces and cohomological descent formulated in those terms.) Suppose that $\mathcal{F}$ is an abelian sheaf on $X$. In this case the spectral sequence of Lemma 24.4.3 becomes the spectral sequence with $E_{1}$-term

$$
E_{1}^{p, q}=H^{q}\left(U_{p}, \epsilon_{q}^{*} \mathcal{F}\right) \Rightarrow H^{p+q}\left(U_{\bullet}, \epsilon^{*} \mathcal{F}\right)=H^{p+q}(X, \mathcal{F})
$$

comparing the total cohomology of $\epsilon^{*} \mathcal{F}$ to the cohomology groups of $\mathcal{F}$ over the pieces of $U_{\bullet}$. (Insert future reference to this spectral sequence here.)

In topology we often want to find hypercoverings of $X$ which have the property that all the $U_{i}$ come from a given basis for the topology of $X$ and that all the coverings 24.10 .0 .2 and 24.10 .0 .3 are from a given cofinal collection of coverings. Here are two example lemmas.

01H6 Lemma 24.10.3. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology of $X$. There exists a hypercovering $\left(I,\left\{U_{i}\right\}\right)$ of $X$ such that each $U_{i}$ is an element of $\mathcal{B}$.

Proof. Let $n \geq 0$. Let us say that an $n$-truncated hypercovering of $X$ is given by an $n$-truncated simplicial set $I$ and for each $i \in I_{a}, 0 \leq a \leq n$ an open $U_{i}$ of $X$ such that the conditions defining a hypercovering hold whenever they make sense. In other words we require the inclusion relations and covering conditions only when all simplices that occur in them are $a$-simplices with $a \leq n$. The lemma follows if we can prove that given a $n$-truncated hypercovering ( $I,\left\{U_{i}\right\}$ ) with all $U_{i} \in \mathcal{B}$ we can extend it to an ( $n+1$ )-truncated hypercovering without adding any $a$-simplices for $a \leq n$. This we do as follows. First we consider the $(n+1)$-truncated simplicial set $I^{\prime}$ defined by $I^{\prime}=\operatorname{sk}_{n+1}\left(\operatorname{cosk}_{n} I\right)$. Recall that

$$
I_{n+1}^{\prime}=\left\{\begin{array}{c}
\left(i_{0}, \ldots, i_{n+1}\right) \in\left(I_{n}\right)^{n+2} \text { such that } \\
d_{b-1}^{n}\left(i_{a}\right)=d_{a}^{n}\left(i_{b}\right) \text { for all } 0 \leq a<b \leq n+1
\end{array}\right\}
$$

If $i^{\prime} \in I_{n+1}^{\prime}$ is degenerate, say $i^{\prime}=s_{a}^{n}(i)$ then we set $U_{i^{\prime}}=U_{i}$ (this is forced on us anyway by the second condition). We also set $J_{i^{\prime}}=\left\{i^{\prime}\right\}$ in this case. If $i^{\prime} \in I_{n+1}^{\prime}$
is nondegenerate, say $i^{\prime}=\left(i_{0}, \ldots, i_{n+1}\right)$, then we choose a set $J_{i^{\prime}}$ and an open covering

071K

$$
\begin{equation*}
U_{i_{0}} \cap \ldots \cap U_{i_{n+1}}=\bigcup_{i \in J_{i^{\prime}}} U_{i} \tag{24.10.3.1}
\end{equation*}
$$

with $U_{i} \in \mathcal{B}$ for $i \in J_{i^{\prime}}$. Set

$$
I_{n+1}=\coprod_{i^{\prime} \in I_{n+1}^{\prime}} J_{i^{\prime}}
$$

There is a canonical map $\pi: I_{n+1} \rightarrow I_{n+1}^{\prime}$ which is a bijection over the set of degenerate simplices in $I_{n+1}^{\prime}$ by construction. For $i \in I_{n+1}$ we define $d_{a}^{n+1}(i)=$ $d_{a}^{n+1}(\pi(i))$. For $i \in I_{n}$ we define $s_{a}^{n}(i) \in I_{n+1}$ as the unique simplex lying over the degenerate simplex $s_{a}^{n}(i) \in I_{n+1}^{\prime}$. We omit the verification that this defines an $(n+1)$-truncated hypercovering of $X$.
01H7 Lemma 24.10.4. Let $X$ be a topological space. Let $\mathcal{B}$ be a basis for the topology of X. Assume that
(1) $X$ is quasi-compact,
(2) each $U \in \mathcal{B}$ is quasi-compact open, and
(3) the intersection of any two quasi-compact opens in $X$ is quasi-compact.

Then there exists a hypercovering $\left(I,\left\{U_{i}\right\}\right)$ of $X$ with the following properties
(1) each $U_{i}$ is an element of the basis $\mathcal{B}$,
(2) each of the $I_{n}$ is a finite set, and in particular
(3) each of the coverings 24.10.0.1, 24.10.0.2 , and 24.10.0.3 is finite.

Proof. This follows directly from the construction in the proof of Lemma 24.10.3 if we choose finite coverings by elements of $\mathcal{B}$ in 24.10.3.1. Details omitted.

### 24.11. Hypercoverings and weakly contractible objects

094J In this section we construct hypercoverings in the presence of enough weakly contractible objects (Sites, Definition 7.39.2). With our conventions this is particularly straightforward if every object has a covering by a single weakly contractible object.
094K Lemma 24.11.1. Let $\mathcal{C}$ be a site. Let $\mathcal{B} \subset \mathrm{Ob}(\mathcal{C})$ be a subset. Assume
(1) $\mathcal{C}$ has fibre products,
(2) for all $X \in \mathrm{Ob}(\mathcal{C})$ there exists a covering $\{U \rightarrow X\}$ with $U \in \mathcal{B}$,
(3) every element of $\mathcal{B}$ is weakly contractible,
(4) the topology is subcanonical.

Then for every $X$ there exists a hypercovering $K$ of $X$ such that each $K_{n}=\left\{U_{n} \rightarrow\right.$ $X\}$ with $U_{n} \in \mathcal{B}$.

Proof. We will construct $K$ by induction. As a first approximation choose a covering $\left\{U_{0} \rightarrow X\right\}$ with $U_{0} \in \mathcal{B}$ and set $K_{0}=\left\{U_{0} \rightarrow X\right\}$ and $K=\operatorname{cosk}_{0} K_{0}$, see Example 24.2.7. (This object will be denoted $K^{0}$ in the final paragraph of the proof.)
Suppose for some $n \geq 0$ we have constructed a hypercovering $K$ such that $K_{k}$ consists of a single object of $\mathcal{B}$ mapping to $X$ for $0 \leq k \leq n$ and such that $K=\operatorname{cosk}_{n} \mathrm{sk}_{n} K$. In particular $K_{n+1}=\left(\operatorname{cosk}_{n} \mathrm{sk}_{n} K\right)_{n+1}$ is a finite limit of $K_{k}$ for $k \leq n$, see Simplicial, Section 14.12 (especially Lemmas 14.19 .2 and 14.19.5). By the description of finite limits in $\operatorname{SR}(\mathcal{C}, X)$ (see proof of Lemma 24.2.3) we see that $K_{n+1}=\left\{X_{n+1} \rightarrow X\right\}$ for some object $X_{n+1}$ of $\mathcal{C}$. Choose a covering
$\left\{U_{n+1} \rightarrow X_{n+1}\right\}$ with $U_{n+1} \in \mathcal{B}$. Since $U_{n}$ is weakly contractible, the topology is subcanonical, and $\left\{U_{n+1} \rightarrow X_{n+1}\right\}$ is a covering, the morphisms $s_{i}: U_{n} \rightarrow X_{n+1}$ lift to morphisms $s_{i}^{\prime}: U_{n} \rightarrow U_{n+1}$. Set $d_{j}^{\prime}: U_{n+1} \rightarrow U_{n}$ equal to the composition of $U_{n+1} \rightarrow X_{n+1}$ and $d_{j}: X_{n+1} \rightarrow U_{n}$. We obtain a truncated simplicial object $K^{\prime}$ of $\operatorname{SR}(\mathcal{C}, X)$ by setting $K_{k}^{\prime}=K_{k}$ for $k \leq n$ and $K_{n+1}^{\prime}=U_{n+1}$ and morphisms $d_{i}^{\prime}=d_{i}$ and $s_{i}^{\prime}=s_{i}$ in degrees $k \leq n-1$ and using the morphisms $d_{j}^{\prime}$ and $s_{i}^{\prime}$ in degree $n$. Extend this to a full simplicial object $K^{\prime}$ of $\operatorname{SR}(\mathcal{C}, X)$ using $\operatorname{cosk}_{n+1}$. By functoriality of the coskeleton functors there is a morphism $K^{\prime} \rightarrow K$ of simplicial objects extending the given morphism of $(n+1)$-truncated simplicial objects.

It is immediately clear from the construction that the simplicial object $K^{\prime}$ so constructed is a hypercovering of $X$. Moreover, note that $K^{\prime} \rightarrow K$ is the identity morphism in degrees $\leq n$.
To finish the proof we take the inverse limit $K=\lim K^{n}$ of the sequence of simplicial objects

$$
\ldots \rightarrow K^{2} \rightarrow K^{1} \rightarrow K^{0}
$$

constructed above. Since we have stabilization in each degree it is clear that $K$ agrees with $K^{n}$ in degrees $\leq n$ and therefore is a hypercovering of $X$.

## CHAPTER 25

## Schemes

### 25.1. Introduction

01H9 In this document we define schemes. A basic reference is DG67.

### 25.2. Locally ringed spaces

01HA Recall that we defined ringed spaces in Sheaves, Section 6.25. Briefly, a ringed space is a pair $\left(X, \mathcal{O}_{X}\right)$ consisting of a topological space $X$ and a sheaf of rings $\mathcal{O}_{X}$. A morphism of ringed spaces $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ is given by a continuous map $f: X \rightarrow Y$ and an $f$-map of sheaves of rings $f^{\sharp}: \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$. You can think of $f^{\sharp}$ as a map $\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$, see Sheaves, Definition 6.21.7 and Lemma 6.21.8
A good geometric example of this to keep in mind is $\mathcal{C}^{\infty}$-manifolds and morphisms of $\mathcal{C}^{\infty}$-manifolds. Namely, if $M$ is a $\mathcal{C}^{\infty}$-manifold, then the sheaf $\mathcal{C}_{M}^{\infty}$ of smooth functions is a sheaf of rings on $M$. And any map $f: M \rightarrow N$ of manifolds is smooth if and only if for every local section $h$ of $\mathcal{C}_{N}^{\infty}$ the composition $h \circ f$ is a local section of $\mathcal{C}_{M}^{\infty}$. Thus a smooth map $f$ gives rise in a natural way to a morphism of ringed spaces

$$
f:\left(M, \mathcal{C}_{M}^{\infty}\right) \longrightarrow\left(N, \mathcal{C}_{N}^{\infty}\right)
$$

see Sheaves, Example 6.25.2. It is instructive to consider what happens to stalks. Namely, let $m \in M$ with image $f(m)=n \in N$. Recall that the stalk $\mathcal{C}_{M, m}^{\infty}$ is the ring of germs of smooth functions at $m$, see Sheaves, Example 6.11.4. The algebra of germs of functions on $(M, m)$ is a local ring with maximal ideal the functions which vanish at $m$. Similarly for $\mathcal{C}_{N, n}^{\infty}$. The map on stalks $f^{\sharp}: \mathcal{C}_{N, n}^{\infty} \rightarrow \mathcal{C}_{M, m}^{\infty}$ maps the maximal ideal into the maximal ideal, simply because $f(m)=n$.
In algebraic geometry we study schemes. On a scheme the sheaf of rings is not determined by an intrinsic property of the space. The spectrum of a ring $R$ (see Algebra, Section 10.16) endowed with a sheaf of rings constructed out of $R$ (see below), will be our basic building block. It will turn out that the stalks of $\mathcal{O}$ on $\operatorname{Spec}(R)$ are the local rings of $R$ at its primes. There are two reasons to introduce locally ringed spaces in this setting: (1) There is in general no mechanism that assigns to a continuous map of spectra a map of the corresponding rings. This is why we add as an extra datum the map $f^{\sharp}$. (2) If we consider morphisms of these spectra in the category of ringed spaces, then the maps on stalks may not be local homomorphisms. Since our geometric intuition says it should we introduce locally ringed spaces as follows.

01HB Definition 25.2.1. Locally ringed spaces.
(1) A locally ringed space $\left(X, \mathcal{O}_{X}\right)$ is a pair consisting of a topological space $X$ and a sheaf of rings $\mathcal{O}_{X}$ all of whose stalks are local rings.
(2) Given a locally ringed space $\left(X, \mathcal{O}_{X}\right)$ we say that $\mathcal{O}_{X, x}$ is the local ring of $X$ at $x$. We denote $\mathfrak{m}_{X, x}$ or simply $\mathfrak{m}_{x}$ the maximal ideal of $\mathcal{O}_{X, x}$. Moreover, the residue field of $X$ at $x$ is the residue field $\kappa(x)=\mathcal{O}_{X, x} / \mathfrak{m}_{x}$.
(3) A morphism of locally ringed spaces $\left(f, f^{\sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ is a morphism of ringed spaces such that for all $x \in X$ the induced ring map $\mathcal{O}_{Y, f(x)} \rightarrow \mathcal{O}_{X, x}$ is a local ring map.

We will usually suppress the sheaf of rings $\mathcal{O}_{X}$ in the notation when discussing locally ringed spaces. We will simply refer to "the locally ringed space $X$ ". We will by abuse of notation think of $X$ also as the underlying topological space. Finally we will denote the corresponding sheaf of rings $\mathcal{O}_{X}$ as the structure sheaf of $X$. In addition, it is customary to denote the maximal ideal of the local ring $\mathcal{O}_{X, x}$ by $\mathfrak{m}_{X, x}$ or simply $\mathfrak{m}_{x}$. We will say "let $f: X \rightarrow Y$ be a morphism of locally ringed spaces" thereby suppressing the structure sheaves even further. In this case, we will by abuse of notation think of $f: X \rightarrow Y$ also as the underlying continuous map of topological spaces. The $f$-map corresponding to $f$ will customarily be denoted $f^{\sharp}$. The condition that $f$ is a morphism of locally ringed spaces can then be expressed by saying that for every $x \in X$ the map on stalks

$$
f_{x}^{\sharp}: \mathcal{O}_{Y, f(x)} \longrightarrow \mathcal{O}_{X, x}
$$

maps the maximal ideal $\mathfrak{m}_{Y, f(x)}$ into $\mathfrak{m}_{X, x}$.
Let us use these notational conventions to show that the collection of locally ringed spaces and morphisms of locally ringed spaces forms a category. In order to see this we have to show that the composition of morphisms of locally ringed spaces is a morphism of locally ringed spaces. OK, so let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphism of locally ringed spaces. The composition of $f$ and $g$ is defined in Sheaves, Definition 6.25.3. Let $x \in X$. By Sheaves, Lemma 6.21.10 the composition

$$
\mathcal{O}_{Z, g(f(x))} \xrightarrow{g^{\sharp}} \mathcal{O}_{Y, f(x)} \xrightarrow{f^{\sharp}} \mathcal{O}_{X, x}
$$

is the associated map on stalks for the morphism $g \circ f$. The result follows since a composition of local ring homomorphisms is a local ring homomorphism.
A pleasing feature of the definition is the fact that the functor

$$
\text { Locally ringed spaces } \longrightarrow \text { Ringed spaces }
$$

reflects isomorphisms (plus more). Here is a less abstract statement.
01HC Lemma 25.2.2. Let $X, Y$ be locally ringed spaces. If $f: X \rightarrow Y$ is an isomorphism of ringed spaces, then $f$ is an isomorphism of locally ringed spaces.

Proof. This follows trivially from the corresponding fact in algebra: Suppose $A, B$ are local rings. Any isomorphism of rings $A \rightarrow B$ is a local ring homomorphism.

### 25.3. Open immersions of locally ringed spaces

01HD
01HE Definition 25.3.1. Let $f: X \rightarrow Y$ be a morphism of locally ringed spaces. We say that $f$ is an open immersion if $f$ is a homeomorphism of $X$ onto an open subset of $Y$, and the map $f^{-1} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{X}$ is an isomorphism.

The following construction is parallel to Sheaves, Definition 6.31.2 (3).
01HF Example 25.3.2. Let $X$ be a locally ringed space. Let $U \subset X$ be an open subset. Let $\mathcal{O}_{U}=\left.\mathcal{O}_{X}\right|_{U}$ be the restriction of $\mathcal{O}_{X}$ to $U$. For $u \in U$ the stalk $\mathcal{O}_{U, u}$ is equal to the stalk $\mathcal{O}_{X, u}$, and hence is a local ring. Thus $\left(U, \mathcal{O}_{U}\right)$ is a locally ringed space and the morphism $j:\left(U, \mathcal{O}_{U}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ is an open immersion.

01HG Definition 25.3.3. Let $X$ be a locally ringed space. Let $U \subset X$ be an open subset. The locally ringed space $\left(U, \mathcal{O}_{U}\right)$ of Example 25.3 .2 above is the open subspace of $X$ associated to $U$.

01HH Lemma 25.3.4. Let $f: X \rightarrow Y$ be an open immersion of locally ringed spaces. Let $j: V=f(X) \rightarrow Y$ be the open subspace of $Y$ associated to the image of $f$. There is a unique isomorphism $f^{\prime}: X \cong V$ of locally ringed spaces such that $f=j \circ f^{\prime}$.

Proof. Let $f^{\prime}$ be the homeomorphism between $X$ and $V$ induced by $f$. Then $f=j \circ f^{\prime}$ as maps of topological spaces. Since there is an isomorphism of sheaves $f^{\sharp}: f^{-1}\left(\mathcal{O}_{Y}\right) \rightarrow \mathcal{O}_{X}$, there is an isomorphism of rings $f^{\sharp}: \Gamma\left(U, f^{-1}\left(\mathcal{O}_{Y}\right)\right) \rightarrow$ $\Gamma\left(U, \mathcal{O}_{X}\right)$ for each open subset $U \subset X$. Since $\mathcal{O}_{V}=j^{-1} \mathcal{O}_{Y}$ and $f^{-1}=f^{\prime-1} j^{-1}$ (Sheaves, Lemma 6.21.6 we see that $f^{-1} \mathcal{O}_{Y}=f^{\prime-1} \mathcal{O}_{V}$, hence $\Gamma\left(U, f^{\prime-1}\left(\mathcal{O}_{V}\right)\right) \rightarrow$ $\Gamma\left(U, f^{-1}\left(\mathcal{O}_{Y}\right)\right)$ for every $U \subset X$ open. By composing these we get an isomorphism of rings

$$
\Gamma\left(U, f^{\prime-1}\left(\mathcal{O}_{V}\right)\right) \rightarrow \Gamma\left(U, \mathcal{O}_{X}\right)
$$

for each open subset $U \subset X$, and therefore an isomorphism of sheaves $f^{-1}\left(\mathcal{O}_{V}\right) \rightarrow$ $\mathcal{O}_{X}$. In other words, we have an isomorphism $f^{\prime \sharp}: f^{\prime-1}\left(\mathcal{O}_{V}\right) \rightarrow \mathcal{O}_{X}$ and therefore an isomorphism of locally ringed spaces $\left(f^{\prime}, f^{\prime \sharp}\right):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(V, \mathcal{O}_{V}\right)$ (use Lemma 25.2 .2 . Note that $f=j \circ f^{\prime}$ as morphisms of locally ringed spaces by construction.

Suppose we have another morphism $f^{\prime \prime}:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(V, \mathcal{O}_{Y}\right)$ such that $f=j \circ f^{\prime \prime}$. At any point $x \in X$, we have $j\left(f^{\prime}(x)\right)=j\left(f^{\prime \prime}(x)\right)$ from which it follows that $f^{\prime}(x)=f^{\prime \prime}(x)$ since $j$ is the inclusion map; therefore $f^{\prime}$ and $f^{\prime \prime}$ are the same as morphisms of topological spaces. On structure sheaves, for each open subset $U \subset X$ we have a commutative diagram

from which we see that $f^{\prime \sharp}$ and $f^{\prime \prime \sharp}$ define the same morphism of sheaves.
From now on we do not distinguish between open subsets and their associated subspaces.

01HI Lemma 25.3.5. Let $f: X \rightarrow Y$ be a morphism of locally ringed spaces. Let $U \subset X$, and $V \subset Y$ be open subsets. Suppose that $f(U) \subset V$. There exists a unique morphism of locally ringed spaces $\left.f\right|_{U}: U \rightarrow V$ such that the following
diagram is a commutative square of locally ringed spaces

Proof. Omitted.
In the following we will use without further mention the following fact which follows from the lemma above. Given any morphism $f: Y \rightarrow X$ of locally ringed spaces, and any open subset $U \subset X$ such that $f(Y) \subset U$, then there exists a unique morphism of locally ringed spaces $Y \rightarrow U$ such that the composition $Y \rightarrow U \rightarrow X$ is equal to $f$. In fact, we will even by abuse of notation write $f: Y \rightarrow U$ since this rarely gives rise to confusion.

### 25.4. Closed immersions of locally ringed spaces

01HJ We follow our conventions introduced in Modules, Definition 17.13.1.
01HK Definition 25.4.1. Let $i: Z \rightarrow X$ be a morphism of locally ringed spaces. We say that $i$ is an closed immersion if:
(1) The map $i$ is a homeomorphism of $Z$ onto a closed subset of $X$.
(2) The map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective; let $\mathcal{I}$ denote the kernel.
(3) The $\mathcal{O}_{X}$-module $\mathcal{I}$ is locally generated by sections.

01HL Lemma 25.4.2. Let $f: Z \rightarrow X$ be a morphism of locally ringed spaces. In order for $f$ to be a closed immersion it suffices if there exists an open covering $X=\bigcup U_{i}$ such that each $f: f^{-1} U_{i} \rightarrow U_{i}$ is a closed immersion.

Proof. Omitted.
01HM Example 25.4.3. Let $X$ be a locally ringed space. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a sheaf of ideals which is locally generated by sections as a sheaf of $\mathcal{O}_{X}$-modules. Let $Z$ be the support of the sheaf of rings $\mathcal{O}_{X} / \mathcal{I}$. This is a closed subset of $X$, by Modules, Lemma 17.5.3. Denote $i: Z \rightarrow X$ the inclusion map. By Modules, Lemma 17.6.1 there is a unique sheaf of rings $\mathcal{O}_{Z}$ on $Z$ with $i_{*} \mathcal{O}_{Z}=\mathcal{O}_{X} / \mathcal{I}$. For any $z \in Z$ the local ring $\mathcal{O}_{Z, z}$ is equal to the quotient ring $\mathcal{O}_{X, i(z)} / \mathcal{I}_{i(z)}$ and nonzero, hence a local ring. Thus $i:\left(Z, \mathcal{O}_{Z}\right) \rightarrow\left(X, \mathcal{O}_{X}\right)$ is a closed immersion of locally ringed spaces.
01HN Definition 25.4.4. Let $X$ be a locally ringed space. Let $\mathcal{I}$ be a sheaf of ideals on $X$ which is locally generated by sections. The locally ringed space $\left(Z, \mathcal{O}_{Z}\right)$ of Example 25.4.3 above is the closed subspace of $X$ associated to the sheaf of ideals $\mathcal{I}$.

01HO Lemma 25.4.5. Let $f: X \rightarrow Y$ be a closed immersion of locally ringed spaces. Let $\mathcal{I}$ be the kernel of the map $\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$. Let $i: Z \rightarrow Y$ be the closed subspace of $Y$ associated to $\mathcal{I}$. There is a unique isomorphism $f^{\prime}: X \cong Z$ of locally ringed spaces such that $f=i \circ f^{\prime}$.

Proof. Omitted.
01HP Lemma 25.4.6. Let $X, Y$ be a locally ringed spaces. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a sheaf of ideals locally generated by sections. Let $i: Z \rightarrow X$ be the associated closed subspace. A morphism $f: Y \rightarrow X$ factors through $Z$ if and only if the map
$f^{*} \mathcal{I} \rightarrow f^{*} \mathcal{O}_{X}=\mathcal{O}_{Y}$ is zero. If this is the case the morphism $g: Y \rightarrow Z$ such that $f=i \circ g$ is unique.

Proof. Clearly if $f$ factors as $Y \rightarrow Z \rightarrow X$ then the map $f^{*} \mathcal{I} \rightarrow \mathcal{O}_{Y}$ is zero. Conversely suppose that $f^{*} \mathcal{I} \rightarrow \mathcal{O}_{Y}$ is zero. Pick any $y \in Y$, and consider the ring map $f_{y}^{\sharp}: \mathcal{O}_{X, f(y)} \rightarrow \mathcal{O}_{Y, y}$. Since the composition $\mathcal{I}_{f(y)} \rightarrow \mathcal{O}_{X, f(y)} \rightarrow \mathcal{O}_{Y, y}$ is zero by assumption and since $f_{y}^{\sharp}(1)=1$ we see that $1 \notin \mathcal{I}_{f(y)}$, i.e., $\mathcal{I}_{f(y)} \neq \mathcal{O}_{X, f(y)}$. We conclude that $f(Y) \subset Z=\operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{I}\right)$. Hence $f=i \circ g$ where $g: Y \rightarrow Z$ is continuous. Consider the map $f^{\sharp}: \mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{Y}$. The assumption $f^{*} \mathcal{I} \rightarrow \mathcal{O}_{Y}$ is zero implies that the composition $\mathcal{I} \rightarrow \mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{Y}$ is zero by adjointness of $f_{*}$ and $f^{*}$. In other words, we obtain a morphism of sheaves of rings $f^{\sharp}: \mathcal{O}_{X} / \mathcal{I} \rightarrow f_{*} \mathcal{O}_{Y}$. Note that $f_{*} \mathcal{O}_{Y}=i_{*} g_{*} \mathcal{O}_{Y}$ and that $\mathcal{O}_{X} / \mathcal{I}=i_{*} \mathcal{O}_{Z}$. By Sheaves, Lemma 6.32.4 we obtain a unique morphism of sheaves of rings $g^{\sharp}: \mathcal{O}_{Z} \rightarrow g_{*} \mathcal{O}_{Y}$ whose pushforward under $i$ is $\overline{f^{\sharp}}$. We omit the verification that $\left(g, g^{\sharp}\right)$ defines a morphism of locally ringed spaces and that $f=i \circ g$ as a morphism of locally ringed spaces. The uniqueness of $\left(g, g^{\sharp}\right)$ was pointed out above.

01HQ Lemma 25.4.7. Let $f: X \rightarrow Y$ be a morphism of locally ringed spaces. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be a sheaf of ideals which is locally generated by sections. Let $i: Z \rightarrow Y$ be the closed subspace associated to the sheaf of ideals $\mathcal{I}$. Let $\mathcal{J}$ be the image of the map $f^{*} \mathcal{I} \rightarrow f^{*} \mathcal{O}_{Y}=\mathcal{O}_{X}$. Then this ideal is locally generated by sections. Moreover, let $i^{\prime}: Z^{\prime} \rightarrow X$ be the associated closed subspace of $X$. There exists a unique morphism of locally ringed spaces $f^{\prime}: Z^{\prime} \rightarrow Z$ such that the following diagram is a commutative square of locally ringed spaces

Moreover, this diagram is a fibre square in the category of locally ringed spaces.
Proof. The ideal $\mathcal{J}$ is locally generated by sections by Modules, Lemma 17.8.2. The rest of the lemma follows from the characterization, in Lemma 25.4.6 above, of what it means for a morphism to factor through a closed subspace.

### 25.5. Affine schemes

01 HR Let $R$ be a ring. Consider the topological space $\operatorname{Spec}(R)$ associated to $R$, see Algebra, Section 10.16 . We will endow this space with a sheaf of rings $\mathcal{O}_{\operatorname{Spec}(R)}$ and the resulting pair $\left(\operatorname{Spec}(R), \mathcal{O}_{\mathrm{Spec}(R)}\right)$ will be an affine scheme.
Recall that $\operatorname{Spec}(R)$ has a basis of open sets $D(f), f \in R$ which we call standard opens, see Algebra, Definition 10.16.3. In addition, the intersection of two standard opens is another: $D(f) \cap D(g)=D(f g), f, g \in R$.

01HS Lemma 25.5.1. Let $R$ be a ring. Let $f \in R$.
(1) If $g \in R$ and $D(g) \subset D(f)$, then
(a) $f$ is invertible in $R_{g}$,
(b) $g^{e}=a f$ for some $e \geq 1$ and $a \in R$,
(c) there is a canonical ring map $R_{f} \rightarrow R_{g}$, and
(d) there is a canonical $R_{f}$-module map $M_{f} \rightarrow M_{g}$ for any $R$-module $M$.
(2) Any open covering of $D(f)$ can be refined to a finite open covering of the form $D(f)=\bigcup_{i=1}^{n} D\left(g_{i}\right)$.
(3) If $g_{1}, \ldots, g_{n} \in R$, then $D(f) \subset \bigcup D\left(g_{i}\right)$ if and only if $g_{1}, \ldots, g_{n}$ generate the unit ideal in $R_{f}$.

Proof. Recall that $D(g)=\operatorname{Spec}\left(R_{g}\right)$ (see Algebra, Lemma 10.16.6. Thus (a) holds because $f$ maps to an element of $R_{g}$ which is not contained in any prime ideal, and hence invertible, see Algebra, Lemma 10.16 .2 . Write the inverse of $f$ in $R_{g}$ as $a / g^{d}$. This means $g^{d}-a f$ is annihilated by a power of $g$, whence (b). For (c), the map $R_{f} \rightarrow R_{g}$ exists by (a) from the universal property of localization, or we can define it by mapping $b / f^{n}$ to $a^{n} b / g^{n e}$. The equality $M_{f}=M \otimes_{R} R_{f}$ can be used to obtain the map on modules, or we can define $M_{f} \rightarrow M_{g}$ by mapping $x / f^{n}$ to $a^{n} x / g^{n e}$.

Recall that $D(f)$ is quasi-compact, see Algebra, Lemma 10.28.1. Hence the second statement follows directly from the fact that the standard opens form a basis for the topology.

The third statement follows directly from Algebra, Lemma 10.16.2.
In Sheaves, Section 6.30 we defined the notion of a sheaf on a basis, and we showed that it is essentially equivalent to the notion of a sheaf on the space, see Sheaves, Lemmas 6.30.6 and 6.30.9. Moreover, we showed in Sheaves, Lemma 6.30.4 that it is sufficient to check the sheaf condition on a cofinal system of open coverings for each standard open. By the lemma above it suffices to check on the finite coverings by standard opens.

01HT Definition 25.5.2. Let $R$ be a ring.
(1) A standard open covering of $\operatorname{Spec}(R)$ is a covering $\operatorname{Spec}(R)=\bigcup_{i=1}^{n} D\left(f_{i}\right)$, where $f_{1}, \ldots, f_{n} \in R$.
(2) Suppose that $D(f) \subset \operatorname{Spec}(R)$ is a standard open. A standard open covering of $D(f)$ is a covering $D(f)=\bigcup_{i=1}^{n} D\left(g_{i}\right)$, where $g_{1}, \ldots, g_{n} \in R$.

Let $R$ be a ring. Let $M$ be an $R$-module. We will define a presheaf $\widetilde{M}$ on the basis of standard opens. Suppose that $U \subset \operatorname{Spec}(R)$ is a standard open. If $f, g \in R$ are such that $D(f)=D(g)$, then by Lemma 25.5.1 above there are canonical maps $M_{f} \rightarrow M_{g}$ and $M_{g} \rightarrow M_{f}$ which are mutually inverse. Hence we may choose any $f$ such that $U=D(f)$ and define

$$
\widetilde{M}(U)=M_{f}
$$

Note that if $D(g) \subset D(f)$, then by Lemma 25.5.1 above we have a canonical map

$$
\widetilde{M}(D(f))=M_{f} \longrightarrow M_{g}=\widetilde{M}(D(g))
$$

Clearly, this defines a presheaf of abelian groups on the basis of standard opens. If $M=R$, then $\widetilde{R}$ is a presheaf of rings on the basis of standard opens.

Let us compute the stalk of $\widetilde{M}$ at a point $x \in \operatorname{Spec}(R)$. Suppose that $x$ corresponds to the prime $\mathfrak{p} \subset R$. By definition of the stalk we see that

$$
\widetilde{M}_{x}=\operatorname{colim}_{f \in R, f \notin \mathfrak{p}} M_{f}
$$

Here the set $\{f \in R, f \notin \mathfrak{p}\}$ is partially ordered by the rule $f \geq f^{\prime} \Leftrightarrow D(f) \subset D\left(f^{\prime}\right)$. If $f_{1}, f_{2} \in R \backslash \mathfrak{p}$, then we have $f_{1} f_{2} \geq f_{1}$ in this ordering. Hence by Algebra, Lemma 10.9 .9 we conclude that

$$
\widetilde{M}_{x}=M_{\mathfrak{p}} .
$$

Next, we check the sheaf condition for the standard open coverings. If $D(f)=$ $\bigcup_{i=1}^{n} D\left(g_{i}\right)$, then the sheaf condition for this covering is equivalent with the exactness of the sequence

$$
0 \rightarrow M_{f} \rightarrow \bigoplus M_{g_{i}} \rightarrow \bigoplus M_{g_{i} g_{j}}
$$

Note that $D\left(g_{i}\right)=D\left(f g_{i}\right)$, and hence we can rewrite this sequence as the sequence

$$
0 \rightarrow M_{f} \rightarrow \bigoplus M_{f g_{i}} \rightarrow \bigoplus M_{f g_{i} g_{j}}
$$

In addition, by Lemma 25.5 .1 above we see that $g_{1}, \ldots, g_{n}$ generate the unit ideal in $R_{f}$. Thus we may apply Algebra, Lemma 10.22 .2 to the module $M_{f}$ over $R_{f}$ and the elements $g_{1}, \ldots, g_{n}$. We conclude that the sequence is exact. By the remarks made above, we see that $\widetilde{M}$ is a sheaf on the basis of standard opens.
Thus we conclude from the material in Sheaves, Section 6.30 that there exists a unique sheaf of rings $\mathcal{O}_{\operatorname{Spec}(R)}$ which agrees with $\widetilde{R}$ on the standard opens. Note that by our computation of stalks above, the stalks of this sheaf of rings are all local rings.
Similarly, for any $R$-module $M$ there exists a unique sheaf of $\mathcal{O}_{\operatorname{Spec}(R) \text {-modules } \mathcal{F}}$ which agrees with $\widetilde{M}$ on the standard opens, see Sheaves, Lemma 6.30.12.
01HU Definition 25.5.3. Let $R$ be a ring.
(1) The structure sheaf $\mathcal{O}_{\operatorname{Spec}(R)}$ of the spectrum of $R$ is the unique sheaf of rings $\mathcal{O}_{\text {Spec }(R)}$ which agrees with $\widetilde{R}$ on the basis of standard opens.
(2) The locally ringed space $\left(\operatorname{Spec}(R), \mathcal{O}_{\mathrm{Spec}(R)}\right)$ is called the spectrum of $R$ and denoted $\operatorname{Spec}(R)$.
(3) The sheaf of $\mathcal{O}_{\operatorname{Spec}(R)}$-modules extending $\widetilde{M}$ to all opens of $\operatorname{Spec}(R)$ is called the sheaf of $\mathcal{O}_{\mathrm{Spec}(R)}$-modules associated to $M$. This sheaf is denoted $\widetilde{M}$ as well.

We summarize the results obtained so far.
01HV Lemma 25.5.4. Let $R$ be a ring. Let $M$ be an $R$-module. Let $\widetilde{M}$ be the sheaf of $\mathcal{O}_{\mathrm{Spec}(R)}$-modules associated to M.
(1) We have $\Gamma\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)=R$.
(2) We have $\Gamma(\operatorname{Spec}(R), \widetilde{M})=M$ as an $R$-module.
(3) For every $f \in R$ we have $\Gamma\left(D(f), \mathcal{O}_{\operatorname{Spec}(R)}\right)=R_{f}$.
(4) For every $f \in R$ we have $\Gamma(D(f), \widetilde{M})=M_{f}$ as an $R_{f}$-module.
(5) Whenever $D(g) \subset D(f)$ the restriction mappings on $\mathcal{O}_{\operatorname{Spec}(R)}$ and $\widetilde{M}$ are the maps $R_{f} \rightarrow R_{g}$ and $M_{f} \rightarrow M_{g}$ from Lemma 25.5.1.
(6) Let $\mathfrak{p}$ be a prime of $R$, and let $x \in \operatorname{Spec}(R)$ be the corresponding point. We have $\mathcal{O}_{\operatorname{Spec}(R), x}=R_{\mathfrak{p}}$.
(7) Let $\mathfrak{p}$ be a prime of $R$, and let $x \in \operatorname{Spec}(R)$ be the corresponding point. We have $\mathcal{F}_{x}=M_{\mathfrak{p}}$ as an $R_{\mathfrak{p}}$-module.

Moreover, all these identifications are functorial in the $R$ module M. In particular, the functor $M \mapsto \widetilde{M}$ is an exact functor from the category of $R$-modules to the category of $\mathcal{O}_{\mathrm{Spec}(R)}$-modules.

Proof. Assertions (1) - (7) are clear from the discussion above. The exactness of the functor $M \mapsto \widetilde{M}$ follows from the fact that the functor $M \mapsto M_{\mathfrak{p}}$ is exact and the fact that exactness of short exact sequences may be checked on stalks, see Modules, Lemma 17.3.1.

01HW Definition 25.5.5. An affine scheme is a locally ringed space isomorphic as a locally ringed space to $\operatorname{Spec}(R)$ for some ring $R$. A morphism of affine schemes is a morphism in the category of locally ringed spaces.

It turns out that affine schemes play a special role among all locally ringed spaces, which is what the next section is about.

### 25.6. The category of affine schemes

01HX Note that if $Y$ is an affine scheme, then its points are in canonical $1-1$ bijection with prime ideals in $\Gamma\left(Y, \mathcal{O}_{Y}\right)$.

01HY Lemma 25.6.1. Let $X$ be a locally ringed space. Let $Y$ be an affine scheme. Let $f \in \operatorname{Mor}(X, Y)$ be a morphism of locally ringed spaces. Given a point $x \in X$ consider the ring maps

$$
\Gamma\left(Y, \mathcal{O}_{Y}\right) \xrightarrow{f^{\sharp}} \Gamma\left(X, \mathcal{O}_{X}\right) \rightarrow \mathcal{O}_{X, x}
$$

Let $\mathfrak{p} \subset \Gamma\left(Y, \mathcal{O}_{Y}\right)$ denote the inverse image of $\mathfrak{m}_{x}$. Let $y \in Y$ be the corresponding point. Then $f(x)=y$.

Proof. Consider the commutative diagram

(see the discussion of $f$-maps below Sheaves, Definition 6.21.7). Since the right vertical arrow is local we see that $\mathfrak{m}_{f(x)}$ is the inverse image of $\mathfrak{m}_{x}$. The result follows.

01HZ Lemma 25.6.2. Let $X$ be a locally ringed space. Let $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$. The set

$$
D(f)=\left\{x \in X \mid \text { image } f \notin \mathfrak{m}_{x}\right\}
$$

is open. Moreover $\left.f\right|_{D(f)}$ has an inverse.
Proof. This is a special case of Modules, Lemma 17.21 .10 , but we also give a direct proof. Suppose that $U \subset X$ and $V \subset X$ are two open subsets such that $\left.f\right|_{U}$ has an inverse $g$ and $\left.f\right|_{V}$ has an inverse $h$. Then clearly $\left.g\right|_{U \cap V}=\left.h\right|_{U \cap V}$. Thus it suffices to show that $f$ is invertible in an open neighbourhood of any $x \in D(f)$. This is clear because $f \notin \mathfrak{m}_{x}$ implies that $f \in \mathcal{O}_{X, x}$ has an inverse $g \in \mathcal{O}_{X, x}$ which means there is some open neighbourhood $x \in U \subset X$ so that $g \in \mathcal{O}_{X}(U)$ and $\left.g \cdot f\right|_{U}=1$.

0110 Lemma 25.6.3. In Lemma 25.6.2 above, if $X$ is an affine scheme, then the open $D(f)$ agrees with the standard open $D(f)$ defined previously (in Algebra, Definition 10.16.1).

Proof. Omitted.
01 L Lemma 25.6.4. Let $X$ be a locally ringed space. Let $Y$ be an affine scheme. The map

$$
\operatorname{Mor}(X, Y) \longrightarrow \operatorname{Hom}\left(\Gamma\left(Y, \mathcal{O}_{Y}\right), \Gamma\left(X, \mathcal{O}_{X}\right)\right)
$$

which maps $f$ to $f^{\sharp}$ (on global sections) is bijective.
Proof. Since $Y$ is affine we have $\left(Y, \mathcal{O}_{Y}\right) \cong\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ for some ring $R$. During the proof we will use facts about $Y$ and its structure sheaf which are direct consequences of things we know about the spectrum of a ring, see e.g. Lemma 25.5.4.

Motivated by the lemmas above we construct the inverse map. Let $\psi_{Y}: \Gamma\left(Y, \mathcal{O}_{Y}\right) \rightarrow$ $\Gamma\left(X, \mathcal{O}_{X}\right)$ be a ring map. First, we define the corresponding map of spaces

$$
\Psi: X \longrightarrow Y
$$

by the rule of Lemma 25.6.1. In other words, given $x \in X$ we define $\Psi(x)$ to be the point of $Y$ corresponding to the prime in $\Gamma\left(Y, \mathcal{O}_{Y}\right)$ which is the inverse image of $\mathfrak{m}_{x}$ under the composition $\Gamma\left(Y, \mathcal{O}_{Y}\right) \xrightarrow{\psi_{Y}} \Gamma\left(X, \mathcal{O}_{X}\right) \rightarrow \mathcal{O}_{X, x}$.

We claim that the map $\Psi: X \rightarrow Y$ is continuous. The standard opens $D(g)$, for $g \in \Gamma\left(Y, \mathcal{O}_{Y}\right)$ are a basis for the topology of $Y$. Thus it suffices to prove that $\Psi^{-1}(D(g))$ is open. By construction of $\Psi$ the inverse image $\Psi^{-1}(D(g))$ is exactly the set $D\left(\psi_{Y}(g)\right) \subset X$ which is open by Lemma 25.6.2. Hence $\Psi$ is continuous.
Next we construct a $\Psi$-map of sheaves from $\mathcal{O}_{Y}$ to $\mathcal{O}_{X}$. By Sheaves, Lemma 6.30.14 it suffices to define ring maps $\psi_{D(g)}: \Gamma\left(D(g), \mathcal{O}_{Y}\right) \rightarrow \Gamma\left(\Psi^{-1}(D(g)), \mathcal{O}_{X}\right)$ compatible with restriction maps. We have a canonical isomorphism $\Gamma\left(D(g), \mathcal{O}_{Y}\right)=\Gamma\left(Y, \mathcal{O}_{Y}\right)_{g}$, because $Y$ is an affine scheme. Because $\psi_{Y}(g)$ is invertible on $D\left(\psi_{Y}(g)\right)$ we see that there is a canonical map

$$
\Gamma\left(Y, \mathcal{O}_{Y}\right)_{g} \longrightarrow \Gamma\left(\Psi^{-1}(D(g)), \mathcal{O}_{X}\right)=\Gamma\left(D\left(\psi_{Y}(g)\right), \mathcal{O}_{X}\right)
$$

extending the map $\psi_{Y}$ by the universal property of localization. Note that there is no choice but to take the canonical map here! And we take this, combined with the canonical identification $\Gamma\left(D(g), \mathcal{O}_{Y}\right)=\Gamma\left(Y, \mathcal{O}_{Y}\right)_{g}$, to be $\psi_{D(g)}$. This is compatible with localization since the restriction mapping on the affine schemes are defined in terms of the universal properties of localization also, see Lemmas 25.5.4 and 25.5.1.
Thus we have defined a morphism of ringed spaces $(\Psi, \psi):\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ recovering $\psi_{Y}$ on global sections. To see that it is a morphism of locally ringed spaces we have to show that the induced maps on local rings

$$
\psi_{x}: \mathcal{O}_{Y, \Psi(x)} \longrightarrow \mathcal{O}_{X, x}
$$

are local. This follows immediately from the commutative diagram of the proof of Lemma 25.6.1 and the definition of $\Psi$.
Finally, we have to show that the constructions $(\Psi, \psi) \mapsto \psi_{Y}$ and the construction $\psi_{Y} \mapsto(\Psi, \psi)$ are inverse to each other. Clearly, $\psi_{Y} \mapsto(\Psi, \psi) \mapsto \psi_{Y}$. Hence the only thing to prove is that given $\psi_{Y}$ there is at most one pair $(\Psi, \psi)$ giving rise to it. The uniqueness of $\Psi$ was shown in Lemma 25.6.1 and given the uniqueness
of $\Psi$ the uniqueness of the map $\psi$ was pointed out during the course of the proof above.

01I2 Lemma 25.6.5. The category of affine schemes is equivalent to the opposite of the category of rings. The equivalence is given by the functor that associates to an affine scheme the global sections of its structure sheaf.

Proof. This is now clear from Definition 25.5.5 and Lemma 25.6.4.
01I3 Lemma 25.6.6. Let $Y$ be an affine scheme. Let $f \in \Gamma\left(Y, \mathcal{O}_{Y}\right)$. The open subspace $D(f)$ is an affine scheme.

Proof. We may assume that $Y=\operatorname{Spec}(R)$ and $f \in R$. Consider the morphism of affine schemes $\phi: U=\operatorname{Spec}\left(R_{f}\right) \rightarrow \operatorname{Spec}(R)=Y$ induced by the ring map $R \rightarrow R_{f}$. By Algebra, Lemma 10.16 .6 we know that it is a homeomorphism onto $D(f)$. On the other hand, the map $\phi^{-1} \mathcal{O}_{Y} \rightarrow \mathcal{O}_{U}$ is an isomorphism on stalks, hence an isomorphism. Thus we see that $\phi$ is an open immersion. We conclude that $D(f)$ is isomorphic to $U$ by Lemma 25.3.4.

01 Lemma 25.6.7. The category of affine schemes has finite products, and fibre products. In other words, it has finite limits. Moreover, the products and fibre products in the category of affine schemes are the same as in the category of locally ringed spaces. In a formula, we have (in the category of locally ringed spaces)

$$
\operatorname{Spec}(R) \times \operatorname{Spec}(S)=\operatorname{Spec}\left(R \otimes_{\mathbf{Z}} S\right)
$$

and given ring maps $R \rightarrow A, R \rightarrow B$ we have

$$
\operatorname{Spec}(A) \times_{\operatorname{Spec}(R)} \operatorname{Spec}(B)=\operatorname{Spec}\left(A \otimes_{R} B\right)
$$

Proof. This is just an application of Lemma 25.6.4. First of all, by that lemma, the affine scheme $\operatorname{Spec}(\mathbf{Z})$ is the final object in the category of locally ringed spaces. Thus the first displayed formula follows from the second. To prove the second note that for any locally ringed space $X$ we have

$$
\begin{aligned}
\operatorname{Mor}\left(X, \operatorname{Spec}\left(A \otimes_{R} B\right)\right) & =\operatorname{Hom}\left(A \otimes_{R} B, \mathcal{O}_{X}(X)\right) \\
& =\operatorname{Hom}\left(A, \mathcal{O}_{X}(X)\right) \times_{\operatorname{Hom}\left(R, \mathcal{O}_{X}(X)\right)} \operatorname{Hom}\left(B, \mathcal{O}_{X}(X)\right) \\
& =\operatorname{Mor}(X, \operatorname{Spec}(A)) \times_{\operatorname{Mor}(X, \operatorname{Spec}(R))} \operatorname{Mor}(X, \operatorname{Spec}(B))
\end{aligned}
$$

which proves the formula. See Categories, Section 4.6 for the relevant definitions.

01I5 Lemma 25.6.8. Let $X$ be a locally ringed space. Assume $X=U \amalg V$ with $U$ and $V$ open and such that $U, V$ are affine schemes. Then $X$ is an affine scheme.
Proof. Set $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Note that $R=\mathcal{O}_{X}(U) \times \mathcal{O}_{X}(V)$ by the sheaf property. By Lemma 25.6 .4 there is a canonical morphism of locally ringed spaces $X \rightarrow \operatorname{Spec}(R)$. By Algebra, Lemma 10.20 .2 we see that as a topological space $\operatorname{Spec}\left(\mathcal{O}_{X}(U)\right) \amalg \operatorname{Spec}\left(\mathcal{O}_{X}(V)\right)=\operatorname{Spec}(R)$ with the maps coming from the ring homomorphisms $R \rightarrow \mathcal{O}_{X}(U)$ and $R \rightarrow \mathcal{O}_{X}(V)$. This of course means that $\operatorname{Spec}(R)$ is the coproduct in the category of locally ringed spaces as well. By assumption the morphism $X \rightarrow \operatorname{Spec}(R)$ induces an isomorphism of $\operatorname{Spec}\left(\mathcal{O}_{X}(U)\right)$ with $U$ and similarly for $V$. Hence $X \rightarrow \operatorname{Spec}(R)$ is an isomorphism.

### 25.7. Quasi-coherent sheaves on affines

01I6 Recall that we have defined the abstract notion of a quasi-coherent sheaf in Modules, Definition 17.10.1. In this section we show that any quasi-coherent sheaf on an affine scheme $\operatorname{Spec}(R)$ corresponds to the sheaf $\widetilde{M}$ associated to an $R$-module $M$.

0117 Lemma 25.7.1. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be an affine scheme. Let $M$ be an $R$-module. There exists a canonical isomorphism between the sheaf $\widetilde{M}$ associated to the $R$-module $M$ (Definition 25.5.3) and the sheaf $\mathcal{F}_{M}$ associated to the $R$-module $M$ (Modules, Definition 17.10.6). This isomorphism is functorial in $M$. In particular, the sheaves $\widetilde{M}$ are quasi-coherent. Moreover, they are characterized by the following mapping property

$$
\operatorname{Hom}_{\mathcal{O}_{X}}(\widetilde{M}, \mathcal{F})=\operatorname{Hom}_{R}(M, \Gamma(X, \mathcal{F}))
$$

for any sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$. Here a map $\alpha: \widetilde{M} \rightarrow \mathcal{F}$ corresponds to its effect on global sections.

Proof. By Modules, Lemma 17.10.5 we have a morphism $\mathcal{F}_{M} \rightarrow \widetilde{M}$ corresponding to the map $M \rightarrow \Gamma(X, \widetilde{M})=M$. Let $x \in X$ correspond to the prime $\mathfrak{p} \subset R$. The induced map on stalks are the maps $\mathcal{O}_{X, x} \otimes_{R} M \rightarrow M_{\mathfrak{p}}$ which are isomorphisms because $R_{\mathfrak{p}} \otimes_{R} M=M_{\mathfrak{p}}$. Hence the map $\mathcal{F}_{M} \rightarrow \widetilde{M}$ is an isomorphism. The mapping property follows from the mapping property of the sheaves $\mathcal{F}_{M}$.

01 Lemma 25.7.2. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be an affine scheme. There are canonical isomorphisms
(1) $\widetilde{M \otimes_{R}} N \cong \widetilde{M} \otimes_{\mathcal{O}_{X}} \widetilde{N}$, see Modules, Section 17.15 .
(2) $\widehat{T^{n}(M)} \cong T^{n}(\widetilde{M}), \widehat{\operatorname{Sym}^{n}(M)} \cong \operatorname{Sym}^{n}(\widetilde{M})$, and $\widetilde{\wedge^{n}(M)} \cong \wedge^{n}(\widetilde{M})$, see Modules, Section 17.18 .
(3) if $M$ is a finitely presented $R$-module, then $\left.\mathcal{H o m}_{\mathcal{O}_{X}}(\widetilde{M}, \widetilde{N}) \cong \widetilde{\operatorname{Hom}_{R}(M}, N\right)$, see Modules, Section 17.19 .

Proof. To give a map $\widetilde{M \otimes_{R}} N$ into $\widetilde{M} \otimes_{\mathcal{O}_{X}} \widetilde{N}$ we have to give a map on global sections $M \otimes_{R} N \rightarrow \Gamma\left(X, \widetilde{M} \otimes_{\mathcal{O}_{X}} \widetilde{N}\right)$ which exists by definition of the tensor product of sheaves of modules. To see that this map is an isomorphism it suffices to check that it is an isomorphism on stalks. And this follows from the description of the stalks of $\widetilde{M}$ (as a functor) and Modules, Lemma 17.15.1.

The proof of (2) is similar, using Modules, Lemma 17.18.2
For (3) note that if $M$ is finitely presented as an $R$-module then $\widetilde{M}$ has a global finite presentation as an $\mathcal{O}_{X}$-module. Hence Modules, Lemma 17.19 .3 applies.

01I9 Lemma 25.7.3. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(S), \mathcal{O}_{\operatorname{Spec}(S)}\right),\left(Y, \mathcal{O}_{Y}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be affine schemes. Let $\psi:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of affine schemes, corresponding to the ring map $\psi^{\sharp}: R \rightarrow S$ (see Lemma 25.6.5).
(1) We have $\psi^{*} \widetilde{M}=\widetilde{S \otimes_{R} M}$ functorially in the $R$-module $M$.
(2) We have $\psi_{*} \widetilde{N}=\widetilde{N_{R}}$ functorially in the $S$-module $N$.

Proof. The first assertion follows from the identification in Lemma 25.7.1 and the result of Modules, Lemma 17.10.7. The second assertion follows from the fact that $\psi^{-1}(D(f))=D\left(\psi^{\sharp}(f)\right)$ and hence

$$
\psi_{*} \widetilde{N}(D(f))=\widetilde{N}\left(D\left(\psi^{\sharp}(f)\right)\right)=N_{\psi^{\sharp}(f)}=\left(N_{R}\right)_{f}=\widetilde{N_{R}}(D(f))
$$

as desired.
Lemma 25.7.3 above says in particular that if you restrict the sheaf $\widetilde{M}$ to a standard affine open subspace $D(f)$, then you get $\widetilde{M_{f}}$. We will use this from now on without further mention.

01IA Lemma 25.7.4. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be an affine scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then $\mathcal{F}$ is isomorphic to the sheaf associated to the $R$-module $\Gamma(X, \mathcal{F})$.

Proof. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Since every standard open $D(f)$ is quasi-compact we see that $X$ is a locally quasi-compact, i.e., every point has a fundamental system of quasi-compact neighbourhoods, see Topology, Definition 5.12.1. Hence by Modules, Lemma 17.10 .8 for every prime $\mathfrak{p} \subset R$ corresponding to $x \in X$ there exists an open neighbourhood $x \in U \subset X$ such that $\left.\mathcal{F}\right|_{U}$ is isomorphic to the quasi-coherent sheaf associated to some $\mathcal{O}_{X}(U)$-module $M$. In other words, we get an open covering by $U$ 's with this property. By Lemma 25.5.1 for example we can refine this covering to a standard open covering. Thus we get a covering $\operatorname{Spec}(R)=\bigcup D\left(f_{i}\right)$ and $R_{f_{i}}$-modules $M_{i}$ and isomorphisms $\varphi_{i}:\left.\mathcal{F}\right|_{D\left(f_{i}\right)} \rightarrow \mathcal{F}_{M_{i}}$ for some $R_{f_{i}}$-module $M_{i}$. On the overlaps we get isomorphisms

$$
\left.\left.\left.\mathcal{F}_{M_{i}}\right|_{D\left(f_{i} f_{j}\right)} \xrightarrow{\left.\varphi_{i}^{-1}\right|_{D\left(f_{i} f_{j}\right)}} \mathcal{F}\right|_{D\left(f_{i} f_{j}\right)} \xrightarrow{\left.\varphi_{j}\right|_{D\left(f_{i} f_{j}\right)}} \mathcal{F}_{M_{j}}\right|_{D\left(f_{i} f_{j}\right)} .
$$

Let us denote these $\psi_{i j}$. It is clear that we have the cocycle condition

$$
\left.\left.\psi_{j k}\right|_{D\left(f_{i} f_{j} f_{k}\right)} \circ \psi_{i j}\right|_{D\left(f_{i} f_{j} f_{k}\right)}=\left.\psi_{i k}\right|_{D\left(f_{i} f_{j} f_{k}\right)}
$$

on triple overlaps.
Recall that each of the open subspaces $D\left(f_{i}\right), D\left(f_{i} f_{j}\right), D\left(f_{i} f_{j} f_{k}\right)$ is an affine scheme. Hence the sheaves $\mathcal{F}_{M_{i}}$ are isomorphic to the sheaves $\widetilde{M}_{i}$ by Lemma 25.7.1 above. In particular we see that $\mathcal{F}_{M_{i}}\left(D\left(f_{i} f_{j}\right)\right)=\left(M_{i}\right)_{f_{j}}$, etc. Also by Lemma 25.7.1 above we see that $\psi_{i j}$ corresponds to a unique $R_{f_{i} f_{j}}$-module isomorphism

$$
\psi_{i j}:\left(M_{i}\right)_{f_{j}} \longrightarrow\left(M_{j}\right)_{f_{i}}
$$

namely, the effect of $\psi_{i j}$ on sections over $D\left(f_{i} f_{j}\right)$. Moreover these then satisfy the cocycle condition that

commutes (for any triple $i, j, k$ ).
Now Algebra, Lemma 10.23 .4 shows that there exist an $R$-module $M$ such that $M_{i}=M_{f_{i}}$ compatible with the morphisms $\psi_{i j}$. Consider $\mathcal{F}_{M}=\widetilde{M}$. At this point it is a formality to show that $\widetilde{M}$ is isomorphic to the quasi-coherent sheaf $\mathcal{F}$ we
started out with. Namely, the sheaves $\mathcal{F}$ and $\widetilde{M}$ give rise to isomorphic sets of glueing data of sheaves of $\mathcal{O}_{X}$-modules with respect to the covering $X=\bigcup D\left(f_{i}\right)$, see Sheaves, Section 6.33 and in particular Lemma 6.33.4. Explicitly, in the current situation, this boils down to the following argument: Let us construct an $R$-module map

$$
M \longrightarrow \Gamma(X, \mathcal{F})
$$

Namely, given $m \in M$ we get $m_{i}=m / 1 \in M_{f_{i}}=M_{i}$ by construction of $M$. By construction of $M_{i}$ this corresponds to a section $s_{i} \in \mathcal{F}\left(U_{i}\right)$. (Namely, $\varphi_{i}^{-1}\left(m_{i}\right)$.) We claim that $\left.s_{i}\right|_{D\left(f_{i} f_{j}\right)}=\left.s_{j}\right|_{D\left(f_{i} f_{j}\right)}$. This is true because, by construction of $M$, we have $\psi_{i j}\left(m_{i}\right)=m_{j}$, and by the construction of the $\psi_{i j}$. By the sheaf condition of $\mathcal{F}$ this collection of sections gives rise to a unique section $s$ of $\mathcal{F}$ over $X$. We leave it to the reader to show that $m \mapsto s$ is a $R$-module map. By Lemma 25.7.1 we obtain an associated $\mathcal{O}_{X}$-module map

$$
\widetilde{M} \longrightarrow \mathcal{F}
$$

By construction this map reduces to the isomorphisms $\varphi_{i}^{-1}$ on each $D\left(f_{i}\right)$ and hence is an isomorphism.

01IB Lemma 25.7.5. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be an affine scheme. The functors $M \mapsto \widetilde{M}$ and $\mathcal{F} \mapsto \Gamma(X, \mathcal{F})$ define quasi-inverse equivalences of categories
$Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \longleftrightarrow$ Mod-R
between the category of quasi-coherent $\mathcal{O}_{X}$-modules and the category of $R$-modules.
Proof. See Lemmas 25.7.1 and 25.7.4 above.
From now on we will not distinguish between quasi-coherent sheaves on affine schemes and sheaves of the form $\widetilde{M}$.

01IC Lemma 25.7.6. Let $X=\operatorname{Spec}(R)$ be an affine scheme. Kernels and cokernels of maps of quasi-coherent $\mathcal{O}_{X}$-modules are quasi-coherent.

Proof. This follows from the exactness of the functor ${ }^{\sim}$ since by Lemma 25.7.1 we know that any map $\psi: \widetilde{M} \rightarrow \widetilde{N}$ comes from an $R$-module map $\varphi: M \rightarrow N$. (So we have $\operatorname{Ker}(\psi)=\widetilde{\operatorname{Ker}(\varphi)}$ and $\operatorname{Coker}(\psi)=\widetilde{\operatorname{Coker}(\varphi)}$.)

01ID Lemma 25.7.7. Let $X=\operatorname{Spec}(R)$ be an affine scheme. The direct sum of an arbitrary collection of quasi-coherent sheaves on $X$ is quasi-coherent. The same holds for colimits.

Proof. Suppose $\mathcal{F}_{i}, i \in I$ is a collection of quasi-coherent sheaves on $X$. By Lemma 25.7 .5 above we can write $\mathcal{F}_{i}=\widetilde{M}_{i}$ for some $R$-module $M_{i}$. Set $M=\bigoplus M_{i}$. Consider the sheaf $\widetilde{M}$. For each standard open $D(f)$ we have

$$
\widetilde{M}(D(f))=M_{f}=\left(\bigoplus M_{i}\right)_{f}=\bigoplus M_{i, f}
$$

Hence we see that the quasi-coherent $\mathcal{O}_{X}$-module $\widetilde{M}$ is the direct sum of the sheaves $\mathcal{F}_{i}$. A similar argument works for general colimits.

01IE Lemma 25.7.8. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be an affine scheme. Suppose that

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

is a short exact sequence of sheaves $\mathcal{O}_{X}$-modules. If two out of three are quasicoherent then so is the third.

Proof. This is clear in case both $\mathcal{F}_{1}$ and $\mathcal{F}_{2}$ are quasi-coherent because the functor $M \mapsto \widetilde{M}$ is exact, see Lemma 25.5.4 Similarly in case both $\mathcal{F}_{2}$ and $\mathcal{F}_{3}$ are quasicoherent. Now, suppose that $\mathcal{F}_{1}=\widetilde{M}_{1}$ and $\mathcal{F}_{3}=\widetilde{M}_{3}$ are quasi-coherent. Set $M_{2}=\Gamma\left(X, \mathcal{F}_{2}\right)$. We claim it suffices to show that the sequence

$$
0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow 0
$$

is exact. Namely, if this is the case, then (by using the mapping property of Lemma 25.7.1 we get a commutative diagram

and we win by the snake lemma.
The "correct" argument here would be to show first that $H^{1}(X, \mathcal{F})=0$ for any quasi-coherent sheaf $\mathcal{F}$. This is actually not all that hard, but it is perhaps better to postpone this till later. Instead we use a small trick.

Pick $m \in M_{3}=\Gamma\left(X, \mathcal{F}_{3}\right)$. Consider the following set

$$
I=\left\{f \in R \mid \text { the element } f m \text { comes from } M_{2}\right\}
$$

Clearly this is an ideal. It suffices to show $1 \in I$. Hence it suffices to show that for any prime $\mathfrak{p}$ there exists an $f \in I, f \notin \mathfrak{p}$. Let $x \in X$ be the point corresponding to $\mathfrak{p}$. Because surjectivity can be checked on stalks there exists an open neighbourhood $U$ of $x$ such that $\left.m\right|_{U}$ comes from a local section $s \in \mathcal{F}_{2}(U)$. In fact we may assume that $U=D(f)$ is a standard open, i.e., $f \in R, f \notin \mathfrak{p}$. We will show that for some $N \gg 0$ we have $f^{N} \in I$, which will finish the proof.
Take any point $z \in V(f)$, say corresponding to the prime $\mathfrak{q} \subset R$. We can also find a $g \in R, g \notin \mathfrak{q}$ such that $\left.m\right|_{D(g)}$ lifts to some $s^{\prime} \in \mathcal{F}_{2}(D(g))$. Consider the difference $\left.s\right|_{D(f g)}-\left.s^{\prime}\right|_{D(f g)}$. This is an element $m^{\prime}$ of $\mathcal{F}_{1}(D(f g))=\left(M_{1}\right)_{f g}$. For some integer $n=n(z)$ the element $f^{n} m^{\prime}$ comes from some $m_{1}^{\prime} \in\left(M_{1}\right)_{g}$. We see that $f^{n} s$ extends to a section $\sigma$ of $\mathcal{F}_{2}$ on $D(f) \cup D(g)$ because it agrees with the restriction of $f^{n} s^{\prime}+m_{1}^{\prime}$ on $D(f) \cap D(g)=D(f g)$. Moreover, $\sigma$ maps to the restriction of $f^{n} m$ to $D(f) \cup D(g)$.
Since $V(f)$ is quasi-compact, there exists a finite list of elements $g_{1}, \ldots, g_{m} \in R$ such that $V(f) \subset \bigcup D\left(g_{j}\right)$, an integer $n>0$ and sections $\sigma_{j} \in \mathcal{F}_{2}\left(D(f) \cup D\left(g_{j}\right)\right)$ such that $\left.\sigma_{j}\right|_{D(f)}=f^{n} s$ and $\sigma_{j}$ maps to the section $\left.f^{n} m\right|_{D(f) \cup D\left(g_{j}\right)}$ of $\mathcal{F}_{3}$. Consider the differences

$$
\left.\sigma_{j}\right|_{D(f) \cup D\left(g_{j} g_{k}\right)}-\left.\sigma_{k}\right|_{D(f) \cup D\left(g_{j} g_{k}\right)}
$$

These correspond to sections of $\mathcal{F}_{1}$ over $D(f) \cup D\left(g_{j} g_{k}\right)$ which are zero on $D(f)$. In particular their images in $\mathcal{F}_{1}\left(D\left(g_{j} g_{k}\right)\right)=\left(M_{1}\right)_{g_{j} g_{k}}$ are zero in $\left(M_{1}\right)_{g_{j} g_{k} f}$. Thus some high power of $f$ kills each and every one of these. In other words, the elements
$f^{N} \sigma_{j}$, for some $N \gg 0$ satisfy the glueing condition of the sheaf property and give rise to a section $\sigma$ of $\mathcal{F}_{2}$ over $\bigcup\left(D(f) \cup D\left(g_{j}\right)\right)=X$ as desired.

### 25.8. Closed subspaces of affine schemes

## 01IF

01IG Example 25.8.1. Let $R$ be a ring. Let $I \subset R$ be an ideal. Consider the morphism of affine schemes $i: Z=\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)=X$. By Algebra, Lemma 10.16.7 this is a homeomorphism of $Z$ onto a closed subset of $X$. Moreover, if $I \subset \mathfrak{p} \subset R$ is a prime corresponding to a point $x=i(z), x \in X, z \in Z$, then on stalks we get the map

$$
\mathcal{O}_{X, x}=R_{\mathfrak{p}} \longrightarrow R_{\mathfrak{p}} / I R_{\mathfrak{p}}=\mathcal{O}_{Z, z}
$$

Thus we see that $i$ is a closed immersion of locally ringed spaces, see Definition 25.4.1. Clearly, this is (isomorphic) to the closed subspace associated to the quasicoherent sheaf of ideals $\widetilde{I}$, as in Example 25.4.3.

01IH Lemma 25.8.2. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ be an affine scheme. Let $i: Z \rightarrow X$ be any closed immersion of locally ringed spaces. Then there exists $a$ unique ideal $I \subset R$ such that the morphism $i: Z \rightarrow X$ can be identified with the closed immersion $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$ constructed in Example 25.8.1 above.
Proof. This is kind of silly! Namely, by Lemma 25.4.5 we can identify $Z \rightarrow X$ with the closed subspace associated to a sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ as in Definition 25.4.4 and Example 25.4.3. By our conventions this sheaf of ideals is locally generated by sections as a sheaf of $\mathcal{O}_{X}$-modules. Hence the quotient sheaf $\mathcal{O}_{X} / \mathcal{I}$ is locally on $X$ the cokernel of a map $\bigoplus_{j \in J} \mathcal{O}_{U} \rightarrow \mathcal{O}_{U}$. Thus by definition, $\mathcal{O}_{X} / \mathcal{I}$ is quasicoherent. By our results in Section 25.7 it is of the form $\widetilde{S}$ for some $R$-module $S$. Moreover, since $\mathcal{O}_{X}=\widetilde{R} \rightarrow \widetilde{S}$ is surjective we see by Lemma 25.7.8 that also $\mathcal{I}$ is quasi-coherent, say $\mathcal{I}=\widetilde{I}$. Of course $I \subset R$ and $S=R / I$ and everything is clear.

### 25.9. Schemes

01II
01IJ Definition 25.9.1. A scheme is a locally ringed space with the property that every point has an open neighbourhood which is an affine scheme. A morphism of schemes is a morphism of locally ringed spaces. The category of schemes will be denoted Sch.

Let $X$ be a scheme. We will use the following (very slight) abuse of language. We will say $U \subset X$ is an affine open, or an open affine if the open subspace $U$ is an affine scheme. We will often write $U=\operatorname{Spec}(R)$ to indicate that $U$ is isomorphic to $\operatorname{Spec}(R)$ and moreover that we will identify (temporarily) $U$ and $\operatorname{Spec}(R)$.

01IK Lemma 25.9.2. Let $X$ be a scheme. Let $j: U \rightarrow X$ be an open immersion of locally ringed spaces. Then $U$ is a scheme. In particular, any open subspace of $X$ is a scheme.

Proof. Let $U \subset X$. Let $u \in U$. Pick an affine open neighbourhood $u \in V \subset X$. Because standard opens of $V$ form a basis of the topology on $V$ we see that there exists a $f \in \mathcal{O}_{V}(V)$ such that $u \in D(f) \subset U$. And $D(f)$ is an affine scheme by

Lemma 25.6.6. This proves that every point of $U$ has an open neighbourhood which is affine.

Clearly the lemma (or its proof) shows that any scheme $X$ has a basis (see Topology, Section 5.4) for the topology consisting of affine opens.
01IL Example 25.9.3. Let $k$ be a field. An example of a scheme which is not affine is given by the open subspace $U=\operatorname{Spec}(k[x, y]) \backslash\{(x, y)\}$ of the affine scheme $X=\operatorname{Spec}(k[x, y])$. It is covered by two affines, namely $D(x)=\operatorname{Spec}(k[x, y, 1 / x])$ and $D(y)=\operatorname{Spec}(k[x, y, 1 / y])$ whose intersection is $D(x y)=\operatorname{Spec}(k[x, y, 1 / x y])$. By the sheaf property for $\mathcal{O}_{U}$ there is an exact sequence

$$
0 \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right) \rightarrow k[x, y, 1 / x] \times k[x, y, 1 / y] \rightarrow k[x, y, 1 / x y]
$$

We conclude that the map $k[x, y] \rightarrow \Gamma\left(U, \mathcal{O}_{U}\right)$ (coming from the morphism $U \rightarrow X$ ) is an isomorphism. Therefore $U$ cannot be affine since if it was then by Lemma 25.6 .5 we would have $U \cong X$.

### 25.10. Immersions of schemes

01IM In Lemma 25.9.2 we saw that any open subspace of a scheme is a scheme. Below we will prove that the same holds for a closed subspace of a scheme.

Note that the notion of a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules is defined for any ringed space $X$ in particular when $X$ is a scheme. By our efforts in Section 25.7 we know that such a sheaf is on any affine open $U \subset X$ of the form $\widetilde{M}$ for some $\mathcal{O}_{X}(U)$-module $M$.

01IN Lemma 25.10.1. Let $X$ be a scheme. Let $i: Z \rightarrow X$ be a closed immersion of locally ringed spaces.
(1) The locally ringed space $Z$ is a scheme,
(2) the kernel $\mathcal{I}$ of the map $\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is a quasi-coherent sheaf of ideals,
(3) for any affine open $U=\operatorname{Spec}(R)$ of $X$ the morphism $i^{-1}(U) \rightarrow U$ can be identified with $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$ for some ideal $I \subset R$, and
(4) we have $\left.\mathcal{I}\right|_{U}=\widetilde{I}$.

In particular, any sheaf of ideals locally generated by sections is a quasi-coherent sheaf of ideals (and vice versa), and any closed subspace of $X$ is a scheme.

Proof. Let $i: Z \rightarrow X$ be a closed immersion. Let $z \in Z$ be a point. Choose any affine open neighbourhood $i(z) \in U \subset X$. Say $U=\operatorname{Spec}(R)$. By Lemma 25.8.2 we know that $i^{-1}(U) \rightarrow U$ can be identified with the morphism of affine schemes $\operatorname{Spec}(R / I) \rightarrow \operatorname{Spec}(R)$. First of all this implies that $z \in i^{-1}(U) \subset Z$ is an affine neighbourhood of $z$. Thus $Z$ is a scheme. Second this implies that $\left.\mathcal{I}\right|_{U}$ is $\widetilde{I}$. In other words for every point $x \in i(Z)$ there exists an open neighbourhood such that $\mathcal{I}$ is quasi-coherent in that neighbourhood. Note that $\left.\mathcal{I}\right|_{X \backslash i(Z)} \cong \mathcal{O}_{X \backslash i(Z)}$. Thus the restriction of the sheaf of ideals is quasi-coherent on $X \backslash i(Z)$ also. We conclude that $\mathcal{I}$ is quasi-coherent.

01 IO Definition 25.10.2. Let $X$ be a scheme.
(1) A morphism of schemes is called an open immersion if it is an open immersion of locally ringed spaces (see Definition 25.3.1).
(2) An open subscheme of $X$ is an open subspace of $X$ which is a scheme by Lemma 25.9.2 above.
(3) A morphism of schemes is called a closed immersion if it is a closed immersion of locally ringed spaces (see Definition 25.4.1).
(4) A closed subscheme of $X$ is a closed subspace of $X$ which is a scheme by Lemma 25.10.1 above.
(5) A morphism of schemes $f: X \rightarrow Y$ is called an immersion, or a locally closed immersion if it can be factored as $j \circ i$ where $i$ is a closed immersion and $j$ is an open immersion.

It follows from the lemmas in Sections 25.3 and 25.4 that any open (resp. closed) immersion of schemes is isomorphic to the inclusion of an open (resp. closed) subscheme of the target. We will define locally closed subschemes below.

01IP Remark 25.10.3. If $f: X \rightarrow Y$ is an immersion of schemes, then it is in general not possible to factor $f$ as an open immersion followed by a closed immersion. See Morphisms, Example 28.3.4.
01IQ Lemma 25.10.4. Let $f: Y \rightarrow X$ be an immersion of schemes. Then $f$ is a closed immersion if and only if $f(Y) \subset X$ is a closed subset.

Proof. If $f$ is a closed immersion then $f(Y)$ is closed by definition. Conversely, suppose that $f(Y)$ is closed. By definition there exists an open subscheme $U \subset X$ such that $f$ is the composition of a closed immersion $i: Y \rightarrow U$ and the open immersion $j: U \rightarrow X$. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the quasi-coherent sheaf of ideals associated to the closed immersion $i$. Note that $\left.\mathcal{I}\right|_{U \backslash i(Y)}=\mathcal{O}_{U \backslash i(Y)}=\left.\mathcal{O}_{X \backslash i(Y)}\right|_{U \backslash i(Y)}$. Thus we may glue (see Sheaves, Section 6.33) $\mathcal{I}$ and $\mathcal{O}_{X \backslash i(Y)}$ to a sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X}$. Since every point of $X$ has a neighbourhood where $\mathcal{J}$ is quasi-coherent, we see that $\mathcal{J}$ is quasi-coherent (in particular locally generated by sections). By construction $\mathcal{O}_{X} / \mathcal{J}$ is supported on $U$ and equal to $\mathcal{O}_{U} / \mathcal{I}$. Thus we see that the closed subspaces associated to $\mathcal{I}$ and $\mathcal{J}$ are canonically isomorphic, see Example 25.4.3. In particular the closed subspace of $U$ associated to $\mathcal{I}$ is isomorphic to a closed subspace of $X$. Since $Y \rightarrow U$ is identified with the closed subspace associated to $\mathcal{I}$, see Lemma 25.4.5, we conclude that $Y \rightarrow U \rightarrow X$ is a closed immersion.

Let $f: Y \rightarrow X$ be an immersion. Let $Z=\overline{f(Y)} \backslash f(Y)$ which is a closed subset of $X$. Let $U=X \backslash Z$. The lemma implies that $U$ is the biggest open subspace of $X$ such that $f: Y \rightarrow X$ factors through a closed immersion into $U$. If we define a locally closed subscheme of $X$ as a pair $(Z, U)$ consisting of a closed subscheme $Z$ of an open subscheme $U$ of $X$ such that in addition $\bar{Z} \cup U=X$. We usually just say "let $Z$ be a locally closed subscheme of $X$ " since we may recover $U$ from the morphism $Z \rightarrow X$. The above then shows that any immersion $f: Y \rightarrow X$ factors uniquely as $Y \rightarrow Z \rightarrow X$ where $Z$ is a locally closed subspace of $X$ and $Y \rightarrow Z$ is an isomorphism.

The interest of this is that the collection of locally closed subschemes of $X$ forms a set. We may define a partial ordering on this set, which we call inclusion for obvious reasons. To be explicit, if $Z \rightarrow X$ and $Z^{\prime} \rightarrow X$ are two locally closed subschemes of $X$, then we say that $Z$ is contained in $Z^{\prime}$ simply if the morphism $Z \rightarrow X$ factors through $Z^{\prime}$. If it does, then of course $Z$ is identified with a unique locally closed subscheme of $Z^{\prime}$, and so on.

### 25.11. Zariski topology of schemes

01IR

See Topology, Section5.1for some basic material in topology adapted to the Zariski topology of schemes.

01IS Lemma 25.11.1. Let $X$ be a scheme. Any irreducible closed subset of $X$ has a unique generic point. In other words, $X$ is a sober topological space, see Topology, Definition 5.7.4.
Proof. Let $Z \subset X$ be an irreducible closed subset. For every affine open $U \subset X$, $U=\operatorname{Spec}(R)$ we know that $Z \cap U=V(I)$ for a unique radical ideal $I \subset R$. Note that $Z \cap U$ is either empty or irreducible. In the second case (which occurs for at least one $U$ ) we see that $I=\mathfrak{p}$ is a prime ideal, which is a generic point $\xi$ of $Z \cap U$. It follows that $Z=\overline{\{\xi\}}$, in other words $\xi$ is a generic point of $Z$. If $\xi^{\prime}$ was a second generic point, then $\xi^{\prime} \in Z \cap U$ and it follows immediately that $\xi^{\prime}=\xi$.

01IT Lemma 25.11.2. Let $X$ be a scheme. The collection of affine opens of $X$ forms a basis for the topology on $X$.

Proof. This follows from the discussion on open subschemes in Section 25.9
01IU Remark 25.11.3. In general the intersection of two affine opens in $X$ is not affine open. See Example 25.14.3.
01IV Lemma 25.11.4. The underlying topological space of any scheme is locally quasicompact, see Topology, Definition 5.12.1.

Proof. This follows from Lemma 25.11 .2 above and the fact that the spectrum of ring is quasi-compact, see Algebra, Lemma 10.16.10.

01IW Lemma 25.11.5. Let $X$ be a scheme. Let $U, V$ be affine opens of $X$, and let $x \in U \cap V$. There exists an affine open neighbourhood $W$ of $x$ such that $W$ is a standard open of both $U$ and $V$.

Proof. Write $U=\operatorname{Spec}(A)$ and $V=\operatorname{Spec}(B)$. Say $x$ corresponds to the prime $\mathfrak{p} \subset A$ and the prime $\mathfrak{q} \subset B$. We may choose a $f \in A, f \notin \mathfrak{p}$ such that $D(f) \subset U \cap V$. Note that any standard open of $D(f)$ is a standard open of $\operatorname{Spec}(A)=U$. Hence we may assume that $U \subset V$. In other words, now we may think of $U$ as an affine open of $V$. Next we choose a $g \in B, g \notin \mathfrak{q}$ such that $D(g) \subset U$. In this case we see that $D(g)=D\left(g_{A}\right)$ where $g_{A} \in A$ denotes the image of $g \in A$. Thus the lemma is proved.

01IX Lemma 25.11.6. Let $X$ be a scheme. Let $X=\bigcup_{i} U_{i}$ be an affine open covering. Let $V \subset X$ be an affine open. There exists a standard open covering $V=\bigcup_{j=1, \ldots, m} V_{j}$ (see Definition 25.5.2) such that each $V_{j}$ is a standard open in one of the $U_{i}$.
Proof. Pick $v \in V$. Then $v \in U_{i}$ for some $i$. By Lemma 25.11.5 above there exists an open $v \in W_{v} \subset V \cap U_{i}$ such that $W_{v}$ is a standard open in both $V$ and $U_{i}$. Since $V$ is quasi-compact the lemma follows.
02 O 0 Lemma 25.11.7. Let $X$ be a scheme whose underlying topological space is a finite discrete set. Then $X$ is affine.
Proof. Say $X=\left\{x_{1}, \ldots, x_{n}\right\}$. Then $U_{i}=\left\{x_{i}\right\}$ is an open neighbourhood of $x_{i}$. By Lemma 25.11 .2 it is affine. Hence $X$ is a finite disjoint union of affine schemes, and hence is affine by Lemma 25.6.8.

01IY Example 25.11.8. There exists a scheme without closed points. Namely, let $R$ be a local domain whose spectrum looks like $(0)=\mathfrak{p}_{0} \subset \mathfrak{p}_{1} \subset \mathfrak{p}_{2} \subset \ldots \subset \mathfrak{m}$. Then the open subscheme $\operatorname{Spec}(R) \backslash\{\mathfrak{m}\}$ does not have a closed point. To see that such a ring $R$ exists, we use that given any totally ordered group $(\Gamma, \geq)$ there exists a valuation ring $A$ with valuation group $(\Gamma, \geq)$, see $\mathbf{K r u 3 2}$. See Algebra, Section 10.49 for notation. We take $\Gamma=\mathbf{Z} x_{1} \oplus \mathbf{Z} x_{2} \oplus \mathbf{Z} x_{3} \oplus \ldots$ and we define $\sum_{i} a_{i} x_{i} \geq 0$ if and only if the first nonzero $a_{i}$ is $>0$, or all $a_{i}=0$. So $x_{1} \geq x_{2} \geq x_{3} \geq \ldots \geq 0$. The subsets $x_{i}+\Gamma_{\geq 0}$ are prime ideals of $(\Gamma, \geq)$, see Algebra, notation above Lemma 10.49.17. These together with $\emptyset$ and $\Gamma_{\geq 0}$ are the only prime ideals. Hence $A$ is an example of a ring with the given structure of its spectrum, by Algebra, Lemma 10.49 .17

### 25.12. Reduced schemes

01IZ
01J0 Definition 25.12.1. Let $X$ be a scheme. We say $X$ is reduced if every local ring $\mathcal{O}_{X, x}$ is reduced.

01J1 Lemma 25.12.2. A scheme $X$ is reduced if and only if $\mathcal{O}_{X}(U)$ is a reduced ring for all $U \subset X$ open.
Proof. Assume that $X$ is reduced. Let $f \in \mathcal{O}_{X}(U)$ be a section such that $f^{n}=0$. Then the image of $f$ in $\mathcal{O}_{U, u}$ is zero for all $u \in U$. Hence $f$ is zero, see Sheaves, Lemma 6.11.1 Conversely, assume that $\mathcal{O}_{X}(U)$ is reduced for all opens $U$. Pick any nonzero element $f \in \mathcal{O}_{X, x}$. Any representative $(U, f \in \mathcal{O}(U))$ of $f$ is nonzero and hence not nilpotent. Hence $f$ is not nilpotent in $\mathcal{O}_{X, x}$.

01J2 Lemma 25.12.3. An affine scheme $\operatorname{Spec}(R)$ is reduced if and only if $R$ is reduced.
Proof. The direct implication follows immediately from Lemma 25.12 .2 above. In the other direction it follows since any localization of a reduced ring is reduced, and in particular the local rings of a reduced ring are reduced.
01J3 Lemma 25.12.4. Let $X$ be a scheme. Let $T \subset X$ be a closed subset. There exists a unique closed subscheme $Z \subset X$ with the following properties: (a) the underlying topological space of $Z$ is equal to $T$, and (b) $Z$ is reduced.

Proof. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the sub presheaf defined by the rule

$$
\mathcal{I}(U)=\left\{f \in \mathcal{O}_{X}(U) \mid f(t)=0 \text { for all } t \in T \cap U\right\}
$$

Here we use $f(t)$ to indicate the image of $f$ in the residue field $\kappa(t)$ of $X$ at $t$. Because of the local nature of the condition it is clear that $\mathcal{I}$ is a sheaf of ideals. Moreover, let $U=\operatorname{Spec}(R)$ be an affine open. We may write $T \cap U=V(I)$ for a unique radical ideal $I \subset R$. Given a prime $\mathfrak{p} \in V(I)$ corresponding to $t \in T \cap U$ and an element $f \in R$ we have $f(t)=0 \Leftrightarrow f \in \mathfrak{p}$. Hence $\mathcal{I}(U)=\cap_{\mathfrak{p} \in V(I)} \mathfrak{p}=I$ by Algebra, Lemma 10.16.2. Moreover, for any standard open $D(g) \subset \operatorname{Spec}(R)=U$ we have $\mathcal{I}(D(g))=I_{g}$ by the same reasoning. Thus $\widetilde{I}$ and $\left.\mathcal{I}\right|_{U}$ agree (as ideals) on a basis of opens and hence are equal. Therefore $\mathcal{I}$ is a quasi-coherent sheaf of ideals.
At this point we may define $Z$ as the closed subspace associated to the sheaf of ideals $\mathcal{I}$. For every affine open $U=\operatorname{Spec}(R)$ of $X$ we see that $Z \cap U=\operatorname{Spec}(R / I)$ where $I$ is a radical ideal and hence $Z$ is reduced (by Lemma 25.12.3 above). By
construction the underlying closed subset of $Z$ is $T$. Hence we have found a closed subscheme with properties (a) and (b).
Let $Z^{\prime} \subset X$ be a second closed subscheme with properties (a) and (b). For every affine open $U=\operatorname{Spec}(R)$ of $X$ we see that $Z^{\prime} \cap U=\operatorname{Spec}\left(R / I^{\prime}\right)$ for some ideal $I^{\prime} \subset R$. By Lemma 25.12 .3 the ring $R / I^{\prime}$ is reduced and hence $I^{\prime}$ is radical. Since $V\left(I^{\prime}\right)=T \cap U=V(I)$ we deduced that $I=I^{\prime}$ by Algebra, Lemma 10.16.2. Hence $Z^{\prime}$ and $Z$ are defined by the same sheaf of ideals and hence are equal.

01J4 Definition 25.12.5. Let $X$ be a scheme. Let $i: Z \rightarrow X$ be the inclusion of a closed subset. A scheme structure on $Z$ is given by a closed subscheme $Z^{\prime}$ of $X$ whose underlying closed is equal to $Z$. We often say "let $\left(Z, \mathcal{O}_{Z}\right)$ be a scheme structure on $Z$ " to indicate this. The reduced induced scheme structure on $Z$ is the one constructed in Lemma 25.12.4. The reduction $X_{\text {red }}$ of $X$ is the reduced induced scheme structure on $X$ itself.

Often when we say "let $Z \subset X$ be an irreducible component of $X$ " we think of $Z$ as a reduced closed subscheme of $X$ using the reduced induced scheme structure.

0356 Lemma 25.12.6. Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme. Let $Y$ be a reduced scheme. A morphism $f: Y \rightarrow X$ factors through $Z$ if and only if $f(Y) \subset Z$ (set theoretically). In particular, any morphism $Y \rightarrow X$ factors as $Y \rightarrow X_{\text {red }} \rightarrow X$.
Proof. Assume $f(Y) \subset Z$ (set theoretically). Let $I \subset \mathcal{O}_{X}$ be the ideal sheaf of $Z$. For any affine opens $U \subset X, \operatorname{Spec}(B)=V \subset Y$ with $f(V) \subset U$ and any $g \in \mathcal{I}(U)$ the pullback $b=f^{\sharp}(g) \in \Gamma\left(V, \mathcal{O}_{Y}\right)=B$ maps to zero in the residue field of any $y \in V$. In other words $b \in \bigcap_{\mathfrak{p} \subset B} \mathfrak{p}$. This implies $b=0$ as $B$ is reduced (Lemma 25.12.2, and Algebra, Lemma 10.16.2). Hence $f$ factors through $Z$ by Lemma 25.4.6.

### 25.13. Points of schemes

01J5 Given a scheme $X$ we can define a functor

$$
h_{X}: S c h^{o p p} \longrightarrow \text { Sets, } \quad T \longmapsto \operatorname{Mor}(T, X) .
$$

See Categories, Example 4.3.4. This is called the functor of points of $X$. A fun part of scheme theory is to find descriptions of the internal geometry of $X$ in terms of this functor $h_{X}$. In this section we find a simple way to describe points of $X$.
Let $X$ be a scheme. Let $R$ be a local ring with maximal ideal $\mathfrak{m} \subset R$. Suppose that $f: \operatorname{Spec}(R) \rightarrow X$ is a morphism of schemes. Let $x \in X$ be the image of the closed point $\mathfrak{m} \in \operatorname{Spec}(R)$. Then we obtain a local homomorphism of local rings

$$
f^{\sharp}: \mathcal{O}_{X, x} \longrightarrow \mathcal{O}_{\operatorname{Spec}(R), \mathfrak{m}}=R .
$$

01J6 Lemma 25.13.1. Let $X$ be a scheme. Let $R$ be a local ring. The construction above gives a bijective correspondence between morphisms $\operatorname{Spec}(R) \rightarrow X$ and pairs $(x, \varphi)$ consisting of a point $x \in X$ and a local homomorphism of local rings $\varphi$ : $\mathcal{O}_{X, x} \rightarrow R$.

Proof. Let $A$ be a ring. For any ring homomorphism $\psi: A \rightarrow R$ there exists a unique prime ideal $\mathfrak{p} \subset A$ and a factorization $A \rightarrow A_{\mathfrak{p}} \rightarrow R$ where the last map is a local homomorphism of local rings. Namely, $\mathfrak{p}=\psi^{-1}(\mathfrak{m})$. Via Lemma 25.6.4 this proves that the lemma holds if $X$ is an affine scheme.

Let $X$ be a general scheme. Any $x \in X$ is contained in an open affine $U \subset X$. By the affine case we conclude that every pair $(x, \varphi)$ occurs as the end product of the construction above the lemma.

To finish the proof it suffices to show that any morphism $f: \operatorname{Spec}(R) \rightarrow X$ has image contained in any affine open containing the image $x$ of the closed point of $\operatorname{Spec}(R)$. In fact, let $x \in V \subset X$ be any open neighbourhood containing $x$. Then $f^{-1}(V) \subset \operatorname{Spec}(R)$ is an open containing the unique closed point and hence equal to $\operatorname{Spec}(R)$.

As a special case of the lemma above we obtain for every point $x$ of a scheme $X$ a canonical morphism

02NA

$$
\begin{equation*}
\operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \longrightarrow X \tag{25.13.1.1}
\end{equation*}
$$

corresponding to the identity map on the local ring of $X$ at $x$. We may reformulate the lemma above as saying that for any morphism $f: \operatorname{Spec}(R) \rightarrow X$ there exists a unique point $x \in X$ such that $f$ factors as $\operatorname{Spec}(R) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \rightarrow X$ where the first map comes from a local homomorphism $\mathcal{O}_{X, x} \rightarrow R$.

In case we have a morphism of schemes $f: X \rightarrow S$, and a point $x$ mapping to a point $s \in S$ we obtain a commutative diagram

where the left vertical map corresponds to the local ring map $f_{x}^{\sharp}: \mathcal{O}_{X, x} \rightarrow \mathcal{O}_{S, s}$.
01J7 Lemma 25.13.2. Let $X$ be a scheme. Let $x, x^{\prime} \in X$ be points of $X$. Then $x^{\prime} \in X$ is a generalization of $x$ if and only if $x^{\prime}$ is in the image of the canonical morphism $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \rightarrow X$.

Proof. A continuous map preserves the relation of specialization/generalization. Since every point of $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ is a generalization of the closed point we see every point in the image of $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \rightarrow X$ is a generalization of $x$. Conversely, suppose that $x^{\prime}$ is a generalization of $x$. Choose an affine open neighbourhood $U=\operatorname{Spec}(R)$ of $x$. Then $x^{\prime} \in U$. Say $\mathfrak{p} \subset R$ and $\mathfrak{p}^{\prime} \subset R$ are the primes corresponding to $x$ and $x^{\prime}$. Since $x^{\prime}$ is a generalization of $x$ we see that $\mathfrak{p}^{\prime} \subset \mathfrak{p}$. This means that $\mathfrak{p}^{\prime}$ is in the image of the morphism $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)=\operatorname{Spec}\left(R_{\mathfrak{p}}\right) \rightarrow \operatorname{Spec}(R)=U \subset X$ as desired.

Now, let us discuss morphisms from spectra of fields. Let $(R, \mathfrak{m}, \kappa)$ be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa$. Let $K$ be a field. A local homomorphism $R \rightarrow K$ by definition factors as $R \rightarrow \kappa \rightarrow K$, i.e., is the same thing as a morphism $\kappa \rightarrow K$. Thus we see that morphisms

$$
\operatorname{Spec}(K) \longrightarrow X
$$

correspond to pairs $(x, \kappa(x) \rightarrow K)$. We may define a partial ordering on morphisms of spectra of fields to $X$ by saying that $\operatorname{Spec}(K) \rightarrow X$ dominates $\operatorname{Spec}(L) \rightarrow X$ if $\operatorname{Spec}(K) \rightarrow X$ factors through $\operatorname{Spec}(L) \rightarrow X$. This suggests the following notion:

Let us temporarily say that two morphisms $p: \operatorname{Spec}(K) \rightarrow X$ and $q: \operatorname{Spec}(L) \rightarrow X$ are equivalent if there exists a third field $\Omega$ and a commutative diagram

Of course this immediately implies that the unique points of all three of the schemes $\operatorname{Spec}(K), \operatorname{Spec}(L)$, and $\operatorname{Spec}(\Omega)$ map to the same $x \in X$. Thus a diagram (by the remarks above) corresponds to a point $x \in X$ and a commutative diagram

of fields. This defines an equivalence relation, because given any set of extensions $\kappa \subset K_{i}$ there exists some field extension $\kappa \subset \Omega$ such that all the field extensions $K_{i}$ are contained in the extension $\Omega$.

01J9 Lemma 25.13.3. Let $X$ be a scheme. Points of $X$ correspond bijectively to equivalence classes of morphisms from spectra of fields into $X$. Moreover, each equivalence class contains a (unique up to unique isomorphism) smallest element $\operatorname{Spec}(\kappa(x)) \rightarrow X$.

Proof. Follows from the discussion above.
Of course the morphisms $\operatorname{Spec}(\kappa(x)) \rightarrow X$ factor through the canonical morphisms $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \rightarrow X$. And the content of Lemma 25.13 .2 is in this setting that the morphism $\operatorname{Spec}\left(\kappa\left(x^{\prime}\right)\right) \rightarrow X$ factors as $\operatorname{Spec}\left(\kappa\left(x^{\prime}\right)\right) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \rightarrow X$ whenever $x^{\prime}$ is a generalization of $x$. In case we have a morphism of schemes $f: X \rightarrow S$, and a point $x$ mapping to a point $s \in S$ we obtain a commutative diagram

### 25.14. Glueing schemes

01 JA Let $I$ be a set. For each $i \in I$ let $\left(X_{i}, \mathcal{O}_{i}\right)$ be a locally ringed space. (Actually the construction that follows works equally well for ringed spaces.) For each pair $i, j \in I$ let $U_{i j} \subset X_{i}$ be an open subspace. For each pair $i, j \in I$, let

$$
\varphi_{i j}: U_{i j} \rightarrow U_{j i}
$$

be an isomorphism of locally ringed spaces. For convenience we assume that $U_{i i}=$ $X_{i}$ and $\varphi_{i i}=\operatorname{id}_{X_{i}}$. For each triple $i, j, k \in I$ assume that
(1) we have $\varphi_{i j}^{-1}\left(U_{j i} \cap U_{j k}\right)=U_{i j} \cap U_{i k}$, and
(2) the diagram

is commutative.
Let us call a collection $\left(I,\left(X_{i}\right)_{i \in I},\left(U_{i j}\right)_{i, j \in I},\left(\varphi_{i j}\right)_{i, j \in I}\right)$ satisfying the conditions above a glueing data.
01JB Lemma 25.14.1. Given any glueing data of locally ringed spaces there exists a locally ringed space $X$ and open subspaces $U_{i} \subset X$ together with isomorphisms $\varphi_{i}: X_{i} \rightarrow U_{i}$ of locally ringed spaces such that
(1) $\varphi_{i}\left(U_{i j}\right)=U_{i} \cap U_{j}$, and
(2) $\varphi_{i j}=\left.\left.\varphi_{j}^{-1}\right|_{U_{i} \cap U_{j}} \circ \varphi_{i}\right|_{U_{i j}}$.

The locally ringed space $X$ is characterized by the following mapping properties: Given a locally ringed space $Y$ we have

$$
\begin{aligned}
\operatorname{Mor}(X, Y) & =\left\{\left(f_{i}\right)_{i \in I}\left|f_{i}: X_{i} \rightarrow Y, f_{j} \circ \varphi_{i j}=f_{i}\right|_{U_{i j}}\right\} \\
f & \mapsto\left(\left.f\right|_{U_{i}} \circ \varphi_{i}\right)_{i \in I} \\
\operatorname{Mor}(Y, X) & =\left\{\begin{array}{c}
\text { open covering } Y=\bigcup_{i \in I} V_{i} \text { and }\left(g_{i}: V_{i} \rightarrow X_{i}\right)_{i \in I} \text { such that } \\
g_{i}^{-1}\left(U_{i j}\right)=V_{i} \cap V_{j} \text { and }\left.g_{j}\right|_{V_{i} \cap V_{j}}=\left.\varphi_{i j} \circ g_{i}\right|_{V_{i} \cap V_{j}}
\end{array}\right\} \\
g & \mapsto V_{i}=g^{-1}\left(U_{i}\right), g_{i}=\left.g\right|_{V_{i}}
\end{aligned}
$$

Proof. We construct $X$ in stages. As a set we take

$$
X=\left(\coprod X_{i}\right) / \sim
$$

Here given $x \in X_{i}$ and $x^{\prime} \in X_{j}$ we say $x \sim x^{\prime}$ if and only if $x \in U_{i j}, x^{\prime} \in U_{j i}$ and $\varphi_{i j}(x)=x^{\prime}$. This is an equivalence relation since if $x \in X_{i}, x^{\prime} \in X_{j}, x^{\prime \prime} \in X_{k}$, and $x \sim x^{\prime}$ and $x^{\prime} \sim x^{\prime \prime}$, then $x^{\prime} \in U_{j i} \cap U_{j k}$, hence by condition (1) of a glueing data also $x \in U_{i j} \cap U_{i k}$ and $x^{\prime \prime} \in U_{k i} \cap U_{k j}$ and by condition (2) we see that $\varphi_{i k}(x)=x^{\prime \prime}$. (Reflexivity and symmetry follows from our assumptions that $U_{i i}=X_{i}$ and $\varphi_{i i}=$ $\operatorname{id}_{X_{i}}$. .) Denote $\varphi_{i}: X_{i} \rightarrow X$ the natural maps. Denote $U_{i}=\varphi_{i}\left(X_{i}\right) \subset X$. Note that $\varphi_{i}: X_{i} \rightarrow U_{i}$ is a bijection.
The topology on $X$ is defined by the rule that $U \subset X$ is open if and only if $\varphi_{i}^{-1}(U)$ is open for all $i$. We leave it to the reader to verify that this does indeed define a topology. Note that in particular $U_{i}$ is open since $\varphi_{j}^{-1}\left(U_{i}\right)=U_{j i}$ which is open in $X_{j}$ for all $j$. Moreover, for any open set $W \subset X_{i}$ the image $\varphi_{i}(W) \subset U_{i}$ is open because $\varphi_{j}^{-1}\left(\varphi_{i}(W)\right)=\varphi_{j i}^{-1}\left(W \cap U_{i j}\right)$. Therefore $\varphi_{i}: X_{i} \rightarrow U_{i}$ is a homeomorphism.
To obtain a locally ringed space we have to construct the sheaf of rings $\mathcal{O}_{X}$. We do this by glueing the sheaves of rings $\mathcal{O}_{U_{i}}:=\varphi_{i, *} \mathcal{O}_{i}$. Namely, in the commutative diagram

the arrow on top is an isomorphism of ringed spaces, and hence we get unique isomorphisms of sheaves of rings

$$
\left.\left.\mathcal{O}_{U_{i}}\right|_{U_{i} \cap U_{j}} \longrightarrow \mathcal{O}_{U_{j}}\right|_{U_{i} \cap U_{j}} .
$$

These satisfy a cocycle condition as in Sheaves, Section 6.33. By the results of that section we obtain a sheaf of rings $\mathcal{O}_{X}$ on $X$ such that $\left.\mathcal{O}_{X}\right|_{U_{i}}$ is isomorphic to $\mathcal{O}_{U_{i}}$ compatibly with the glueing maps displayed above. In particular $\left(X, \mathcal{O}_{X}\right)$ is a locally ringed space since the stalks of $\mathcal{O}_{X}$ are equal to the stalks of $\mathcal{O}_{i}$ at corresponding points.
The proof of the mapping properties is omitted.
01JC Lemma 25.14.2. In Lemma 25.14.1 above, assume that all $X_{i}$ are schemes. Then the resulting locally ringed space $X$ is a scheme.

Proof. This is clear since each of the $U_{i}$ is a scheme and hence every $x \in X$ has an affine neighbourhood.

It is customary to think of $X_{i}$ as an open subspace of $X$ via the isomorphisms $\varphi_{i}$. We will do this in the next two examples.

01JD Example 25.14.3 (Affine space with zero doubled). Let $k$ be a field. Let $n \geq 1$. Let $X_{1}=\operatorname{Spec}\left(k\left[x_{1}, \ldots, x_{n}\right]\right)$, let $X_{2}=\operatorname{Spec}\left(k\left[y_{1}, \ldots, y_{n}\right]\right)$. Let $0_{1} \in X_{1}$ be the point corresponding to the maximal ideal $\left(x_{1}, \ldots, x_{n}\right) \subset k\left[x_{1}, \ldots, x_{n}\right]$. Let $0_{2} \in X_{2}$ be the point corresponding to the maximal ideal $\left(y_{1}, \ldots, y_{n}\right) \subset k\left[y_{1}, \ldots, y_{n}\right]$. Let $U_{12}=X_{1} \backslash\left\{0_{1}\right\}$ and let $U_{21}=X_{2} \backslash\left\{0_{2}\right\}$. Let $\varphi_{12}: U_{12} \rightarrow U_{21}$ be the isomorphism coming from the isomorphism of $k$-algebras $k\left[y_{1}, \ldots, y_{n}\right] \rightarrow k\left[x_{1}, \ldots, x_{n}\right]$ mapping $y_{i}$ to $x_{i}$ (which induces $X_{1} \cong X_{2}$ mapping $0_{1}$ to $0_{2}$ ). Let $X$ be the scheme obtained from the glueing data $\left(X_{1}, X_{2}, U_{12}, U_{21}, \varphi_{12}, \varphi_{21}=\varphi_{12}^{-1}\right)$. Via the slight abuse of notation introduced above the example we think of $X_{i} \subset X$ as open subschemes. There is a morphism $f: X \rightarrow \operatorname{Spec}\left(k\left[t_{1}, \ldots, t_{n}\right]\right)$ which on $X_{i}$ corresponds to $k$ algebra map $k\left[t_{1}, \ldots, t_{n}\right] \rightarrow k\left[x_{1}, \ldots, x_{n}\right]\left(\right.$ resp. $\left.k\left[t_{1}, \ldots, t_{n}\right] \rightarrow k\left[y_{1}, \ldots, y_{n}\right]\right)$ mapping $t_{i}$ to $x_{i}$ (resp. $t_{i}$ to $y_{i}$ ). It is easy to see that this morphism identifies $k\left[t_{1}, \ldots, t_{n}\right]$ with $\Gamma\left(X, \mathcal{O}_{X}\right)$. Since $f\left(0_{1}\right)=f\left(0_{2}\right)$ we see that $X$ is not affine.
Note that $X_{1}$ and $X_{2}$ are affine opens of $X$. But, if $n=2$, then $X_{1} \cap X_{2}$ is the scheme described in Example 25.9.3 and hence not affine. Thus in general the intersection of affine opens of a scheme is not affine. (This fact holds more generally for any $n>1$.)
Another curious feature of this example is the following. If $n>1$ there are many irreducible closed subsets $T \subset X$ (take the closure of any non closed point in $X_{1}$ for example). But unless $T=\left\{0_{1}\right\}$, or $T=\left\{0_{2}\right\}$ we have $0_{1} \in T \Leftrightarrow 0_{2} \in T$. Proof omitted.

01JE Example 25.14.4 (Projective line). Let $k$ be a field. Let $X_{1}=\operatorname{Spec}(k[x])$, let $X_{2}=\operatorname{Spec}(k[y])$. Let $0 \in X_{1}$ be the point corresponding to the maximal ideal $(x) \subset k[x]$. Let $\infty \in X_{2}$ be the point corresponding to the maximal ideal $(y) \subset k[y]$. Let $U_{12}=X_{1} \backslash\{0\}=D(x)=\operatorname{Spec}(k[x, 1 / x])$ and let $U_{21}=X_{2} \backslash\{\infty\}=$ $D(y)=\operatorname{Spec}(k[y, 1 / y])$. Let $\varphi_{12}: U_{12} \rightarrow U_{21}$ be the isomorphism coming from the isomorphism of $k$-algebras $k[y, 1 / y] \rightarrow k[x, 1 / x]$ mapping $y$ to $1 / x$. Let $\mathbf{P}_{k}^{1}$ be the scheme obtained from the glueing data $\left(X_{1}, X_{2}, U_{12}, U_{21}, \varphi_{12}, \varphi_{21}=\varphi_{12}^{-1}\right)$. Via the slight abuse of notation introduced above the example we think of $X_{i} \subset \mathbf{P}_{k}^{1}$ as open
subschemes. In this case we see that $\Gamma\left(\mathbf{P}_{k}^{1}, \mathcal{O}\right)=k$ because the only polynomials $g(x)$ in $x$ such that $g(1 / y)$ is also a polynomial in $y$ are constant polynomials. Since $\mathbf{P}_{k}^{1}$ is infinite we see that $\mathbf{P}_{k}^{1}$ is not affine.
We claim that there exists an affine open $U \subset \mathbf{P}_{k}^{1}$ which contains both 0 and $\infty$. Namely, let $U=\mathbf{P}_{k}^{1} \backslash\{1\}$, where 1 is the point of $X_{1}$ corresponding to the maximal ideal $(x-1)$ and also the point of $X_{2}$ corresponding to the maximal ideal $(y-1)$. Then it is easy to see that $s=1 /(x-1)=y /(1-y) \in \Gamma\left(U, \mathcal{O}_{U}\right)$. In fact you can show that $\Gamma\left(U, \mathcal{O}_{U}\right)$ is equal to the polynomial ring $k[s]$ and that the corresponding morphism $U \rightarrow \operatorname{Spec}(k[s])$ is an isomorphism of schemes. Details omitted.

### 25.15. A representability criterion

01 JF In this section we reformulate the glueing lemma of Section 25.14 in terms of functors. We recall some of the material from Categories, Section 4.3 Recall that given a scheme $X$ we can define a functor

$$
h_{X}: S c h^{o p p} \longrightarrow S e t s, \quad T \longmapsto \operatorname{Mor}(T, X)
$$

This is called the functor of points of $X$.
Let $F$ be a contravariant functor from the category of schemes to the category of sets. In a formula

$$
F: S c h^{o p p} \longrightarrow \text { Sets. }
$$

We will use the same terminology as in Sites, Section 7.2. Namely, given a scheme $T$, an element $\xi \in F(T)$, and a morphism $f: T^{\prime} \rightarrow T$ we will denote $f^{*} \xi$ the element $F(f)(\xi)$, and sometimes we will even use the notation $\left.\xi\right|_{T^{\prime}}$
01JG Definition 25.15.1. (See Categories, Definition 4.3.6.) Let $F$ be a contravariant functor from the category of schemes to the category of sets (as above). We say that $F$ is representable by a scheme or representable if there exists a scheme $X$ such that $h_{X} \cong F$.

Suppose that $F$ is representable by the scheme $X$ and that $s: h_{X} \rightarrow F$ is an isomorphism. By Categories, Yoneda Lemma 4.3.5 the pair $\left(X, s: h_{X} \rightarrow F\right)$ is unique up to unique isomorphism if it exists. Moreover, the Yoneda lemma says that given any contravariant functor $F$ as above and any scheme $Y$, we have a bijection

$$
\operatorname{Mor}_{\text {Fun }\left(S c h^{o p p}, S e t s\right)}\left(h_{Y}, F\right) \longrightarrow F(Y), \quad s \longmapsto s\left(\operatorname{id}_{Y}\right)
$$

Here is the reverse construction. Given any $\xi \in F(Y)$ the transformation of functors $s_{\xi}: h_{Y} \rightarrow F$ associates to any morphism $f: T \rightarrow Y$ the element $f^{*} \xi \in F(T)$.

In particular, in the case that $F$ is representable, there exists a scheme $X$ and an element $\xi \in F(X)$ such that the corresponding morphism $h_{X} \rightarrow F$ is an isomorphism. In this case we also say the pair $(X, \xi)$ represents $F$. The element $\xi \in F(X)$ is often called the "universal family" for reasons that will become more clear when we talk about algebraic stacks (insert future reference here). For the moment we simply observe that the fact that if the pair $(X, \xi)$ represents $F$, then every element $\xi^{\prime} \in F(T)$ for any $T$ is of the form $\xi^{\prime}=f^{*} \xi$ for a unique morphism $f: T \rightarrow X$.
01JH Example 25.15.2. Consider the rule which associates to every scheme $T$ the set $F(T)=\Gamma\left(T, \mathcal{O}_{T}\right)$. We can turn this into a contravariant functor by using for a morphism $f: T^{\prime} \rightarrow T$ the pullback map $f^{\sharp}: \Gamma\left(T, \mathcal{O}_{T}\right) \rightarrow \Gamma\left(T^{\prime}, \mathcal{O}_{T^{\prime}}\right)$. Given a ring
$R$ and an element $t \in R$ there exists a unique ring homomorphism $\mathbf{Z}[x] \rightarrow R$ which maps $x$ to $t$. Thus, using Lemma 25.6.4, we see that

$$
\operatorname{Mor}(T, \operatorname{Spec}(\mathbf{Z}[x]))=\operatorname{Hom}\left(\mathbf{Z}[x], \Gamma\left(T, \mathcal{O}_{T}\right)\right)=\Gamma\left(T, \mathcal{O}_{T}\right)
$$

This does indeed give an isomorphism $h_{\operatorname{Spec}(\mathbf{Z}[x])} \rightarrow F$. What is the "universal family" $\xi$ ? To get it we have to apply the identifications above to $\operatorname{id}_{\operatorname{Spec}(\mathbf{Z}[x])}$. Clearly under the identifications above this gives that $\xi=x \in \Gamma\left(\operatorname{Spec}(\mathbf{Z}[x]), \mathcal{O}_{\operatorname{Spec}(\mathbf{Z}[x])}\right)=$ $\mathbf{Z}[x]$ as expected.

01JI Definition 25.15.3. Let $F$ be a contravariant functor on the category of schemes with values in sets.
(1) We say that $F$ satisfies the sheaf property for the Zariski topology if for every scheme $T$ and every open covering $T=\bigcup_{i \in I} U_{i}$, and for any collection of elements $\xi_{i} \in F\left(U_{i}\right)$ such that $\left.\xi_{i}\right|_{U_{i} \cap U_{j}}=\left.\xi_{j}\right|_{U_{i} \cap U_{j}}$ there exists a unique element $\xi \in F(T)$ such that $\xi_{i}=\left.\xi\right|_{U_{i}}$ in $F\left(U_{i}\right)$.
(2) A subfunctor $H \subset F$ is a rule that associates to every scheme $T$ a subset $H(T) \subset F(T)$ such that the maps $F(f): F(T) \rightarrow F\left(T^{\prime}\right)$ maps $H(T)$ into $H\left(T^{\prime}\right)$ for all morphisms of schemes $f: T^{\prime} \rightarrow T$.
(3) Let $H \subset F$ be a subfunctor. We say that $H \subset F$ is representable by open immersions if for all pairs $(T, \xi)$, where $T$ is a scheme and $\xi \in F(T)$ there exists an open subscheme $U_{\xi} \subset T$ with the following property:
(*) A morphism $f: T^{\prime} \rightarrow T$ factors through $U_{\xi}$ if and only if $f^{*} \xi \in$ $H\left(T^{\prime}\right)$.
(4) Let $I$ be a set. For each $i \in I$ let $H_{i} \subset F$ be a subfunctor. We say that the collection $\left(H_{i}\right)_{i \in I}$ covers $F$ if and only if for every $\xi \in F(T)$ there exists an open covering $T=\bigcup U_{i}$ such that $\left.\xi\right|_{U_{i}} \in H_{i}\left(U_{i}\right)$.

In condition (4), if $H_{i} \subset F$ is representable by open immersions for all $i$, then to check $\left(H_{i}\right)_{i \in I}$ covers $F$, it suffices to check $F(T)=\bigcup H_{i}(T)$ whenever $T$ is the spectrum of a field.
01JJ Lemma 25.15.4. Let $F$ be a contravariant functor on the category of schemes with values in the category of sets. Suppose that
(1) $F$ satisfies the sheaf property for the Zariski topology,
(2) there exists a set $I$ and a collection of subfunctors $F_{i} \subset F$ such that
(a) each $F_{i}$ is representable,
(b) each $F_{i} \subset F$ is representable by open immersions, and
(c) the collection $\left(F_{i}\right)_{i \in I}$ covers $F$.

Then $F$ is representable.
Proof. Let $X_{i}$ be a scheme representing $F_{i}$ and let $\xi_{i} \in F_{i}\left(X_{i}\right) \subset F\left(X_{i}\right)$ be the "universal family". Because $F_{j} \subset F$ is representable by open immersions, there exists an open $U_{i j} \subset X_{i}$ such that $T \rightarrow X_{i}$ factors through $U_{i j}$ if and only if $\left.\xi_{i}\right|_{T} \in F_{j}(T)$. In particular $\left.\xi_{i}\right|_{U_{i j}} \in F_{j}\left(U_{i j}\right)$ and therefore we obtain a canonical morphism $\varphi_{i j}: U_{i j} \rightarrow X_{j}$ such that $\varphi_{i j}^{*} \xi_{j}=\left.\xi_{i}\right|_{U_{i j}}$. By definition of $U_{j i}$ this implies that $\varphi_{i j}$ factors through $U_{j i}$. Since $\left(\varphi_{i j} \circ \varphi_{j i}\right)^{*} \xi_{j}=\varphi_{j i}^{*}\left(\varphi_{i j}^{*} \xi_{j}\right)=\varphi_{j i}^{*} \xi_{i}=\xi_{j}$ we conclude that $\varphi_{i j} \circ \varphi_{j i}=\operatorname{id}_{U_{j i}}$ because the pair $\left(X_{j}, \xi_{j}\right)$ represents $F_{j}$. In particular the maps $\varphi_{i j}: U_{i j} \rightarrow U_{j i}$ are isomorphisms of schemes. Next we have to show that $\varphi_{i j}^{-1}\left(U_{j i} \cap U_{j k}\right)=U_{i j} \cap U_{i k}$. This is true because (a) $U_{j i} \cap U_{j k}$ is the largest open of $U_{j i}$ such that $\xi_{j}$ restricts to an element of $F_{k}$, (b) $U_{i j} \cap U_{i k}$ is the largest open
of $U_{i j}$ such that $\xi_{i}$ restricts to an element of $F_{k}$, and (c) $\varphi_{i j}^{*} \xi_{j}=\xi_{i}$. Moreover, the cocycle condition in Section 25.14 follows because both $\left.\left.\varphi_{j k}\right|_{U_{j i} \cap U_{j k}} \circ \varphi_{i j}\right|_{U_{i j} \cap U_{i k}}$ and $\left.\varphi_{i k}\right|_{U_{i j} \cap U_{i k}}$ pullback $\xi_{k}$ to the element $\xi_{i}$. Thus we may apply Lemma 25.14 .2 to obtain a scheme $X$ with an open covering $X=\bigcup U_{i}$ and isomorphisms $\varphi_{i}: X_{i} \rightarrow U_{i}$ with properties as in Lemma 25.14.1. Let $\xi_{i}^{\prime}=\left(\varphi_{i}^{-1}\right)^{*} \xi_{i}$. The conditions of Lemma 25.14.1 imply that $\left.\xi_{i}^{\prime}\right|_{U_{i} \cap U_{j}}=\left.\xi_{j}^{\prime}\right|_{U_{i} \cap U_{j}}$. Therefore, by the condition that $F$ satisfies the sheaf condition in the Zariski topology we see that there exists an element $\xi^{\prime} \in F(X)$ such that $\xi_{i}=\left.\varphi_{i}^{*} \xi^{\prime}\right|_{U_{i}}$ for all $i$. Since $\varphi_{i}$ is an isomorphism we also get that $\left(U_{i},\left.\xi^{\prime}\right|_{U_{i}}\right)$ represents the functor $F_{i}$.

We claim that the pair $\left(X, \xi^{\prime}\right)$ represents the functor $F$. To show this, let $T$ be a scheme and let $\xi \in F(T)$. We will construct a unique morphism $g: T \rightarrow X$ such that $g^{*} \xi^{\prime}=\xi$. Namely, by the condition that the subfunctors $F_{i}$ cover $T$ there exists an open covering $T=\bigcup V_{i}$ such that for each $i$ the restriction $\left.\xi\right|_{V_{i}} \in F_{i}\left(V_{i}\right)$. Moreover, since each of the inclusions $F_{i} \subset F$ are representable by open immersions we may assume that each $V_{i} \subset T$ is maximal open with this property. Because, $\left(U_{i}, \xi_{U_{i}}^{\prime}\right)$ represents the functor $F_{i}$ we get a unique morphism $g_{i}: V_{i} \rightarrow U_{i}$ such that $\left.g_{i}^{*} \xi^{\prime}\right|_{U_{i}}=\left.\xi\right|_{V_{i}}$. On the overlaps $V_{i} \cap V_{j}$ the morphisms $g_{i}$ and $g_{j}$ agree, for example because they both pull back $\left.\xi^{\prime}\right|_{U_{i} \cap U_{j}} \in F_{i}\left(U_{i} \cap U_{j}\right)$ to the same element. Thus the morphisms $g_{i}$ glue to a unique morphism from $T \rightarrow X$ as desired.

01JK Remark 25.15.5. Suppose the functor $F$ is defined on all locally ringed spaces, and if conditions of Lemma 25.15.4 are replaced by the following:
(1) $F$ satisfies the sheaf property on the category of locally ringed spaces,
(2) there exists a set $I$ and a collection of subfunctors $F_{i} \subset F$ such that
(a) each $F_{i}$ is representable by a scheme,
(b) each $F_{i} \subset F$ is representable by open immersions on the category of locally ringed spaces, and
(c) the collection $\left(F_{i}\right)_{i \in I}$ covers $F$ as a functor on the category of locally ringed spaces.
We leave it to the reader to spell this out further. Then the end result is that the functor $F$ is representable in the category of locally ringed spaces and that the representing object is a scheme.

### 25.16. Existence of fibre products of schemes

01JL A very basic question is whether or not products and fibre products exist on the category of schemes. We first prove abstractly that products and fibre products exist, and in the next section we show how we may think in a reasonable way about fibre products of schemes.

01JM Lemma 25.16.1. The category of schemes has a final object, products and fibre products. In other words, the category of schemes has finite limits, see Categories, Lemma 4.18.4.

Proof. Please skip this proof. It is more important to learn how to work with the fibre product which is explained in the next section.

By Lemma 25.6 .4 the $\operatorname{scheme} \operatorname{Spec}(\mathbf{Z})$ is a final object in the category of locally ringed spaces. Thus it suffices to prove that fibred products exist.

Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes. We have to show that the functor

$$
\begin{aligned}
F: S^{\text {sh }} h^{o p p} & \longrightarrow \text { Sets } \\
T & \longmapsto \operatorname{Mor}(T, X) \times_{\operatorname{Mor}(T, S)} \operatorname{Mor}(T, Y)
\end{aligned}
$$

is representable. We claim that Lemma 25.15 .4 applies to the functor $F$. If we prove this then the lemma is proved.

First we show that $F$ satisfies the sheaf property in the Zariski topology. Namely, suppose that $T$ is a scheme, $T=\bigcup_{i \in I} U_{i}$ is an open covering, and $\xi_{i} \in F\left(U_{i}\right)$ such that $\left.\xi_{i}\right|_{U_{i} \cap U_{j}}=\left.\xi_{j}\right|_{U_{i} \cap U_{j}}$ for all pairs $i, j$. By definition $\xi_{i}$ corresponds to a pair ( $a_{i}, b_{i}$ ) where $a_{i}: U_{i} \rightarrow X$ and $b_{i}: U_{i} \rightarrow Y$ are morphisms of schemes such that $f \circ a_{i}=g \circ b_{i}$. The glueing condition says that $\left.a_{i}\right|_{U_{i} \cap U_{j}}=\left.a_{j}\right|_{U_{i} \cap U_{j}}$ and $\left.b_{i}\right|_{U_{i} \cap U_{j}}=\left.b_{j}\right|_{U_{i} \cap U_{j}}$. Thus by glueing the morphisms $a_{i}$ we obtain a morphism of locally ringed spaces (i.e., a morphism of schemes) $a: T \rightarrow X$ and similarly $b: T \rightarrow Y$ (see for example the mapping property of Lemma 25.14.1). Moreover, on the members of an open covering the compositions $f \circ a$ and $g \circ b$ agree. Therefore $f \circ a=g \circ b$ and the pair $(a, b)$ defines an element of $F(T)$ which restricts to the pairs $\left(a_{i}, b_{i}\right)$ on each $U_{i}$. The sheaf condition is verified.

Next, we construct the family of subfunctors. Choose an open covering by open affines $S=\bigcup_{i \in I} U_{i}$. For every $i \in I$ choose open coverings by open affines $f^{-1}\left(U_{i}\right)=\bigcup_{j \in J_{i}} V_{j}$ and $g^{-1}\left(U_{i}\right)=\bigcup_{k \in K_{i}} W_{k}$. Note that $X=\bigcup_{i \in I} \bigcup_{j \in J_{i}} V_{j}$ is an open covering and similarly for $Y$. For any $i \in I$ and each pair $(j, k) \in J_{i} \times K_{i}$ we have a commutative diagram

where all the skew arrows are open immersions. For such a triple we get a functor

$$
\begin{aligned}
F_{i, j, k}: \text { Sch }^{o p p} & \longrightarrow \text { Sets } \\
T & \longmapsto \operatorname{Mor}\left(T, V_{j}\right) \times_{\operatorname{Mor}\left(T, U_{i}\right)} \operatorname{Mor}\left(T, W_{j}\right) .
\end{aligned}
$$

There is an obvious transformation of functors $F_{i, j, k} \rightarrow F$ (coming from the huge commutative diagram above) which is injective, so we may think of $F_{i, j, k}$ as a subfunctor of $F$.
We check condition (2)(a) of Lemma 25.15.4. This follows directly from Lemma 25.6.7. (Note that we use here that the fibre products in the category of affine schemes are also fibre products in the whole category of locally ringed spaces.)

We check condition (2)(b) of Lemma 25.15.4 Let $T$ be a scheme and let $\xi \in F(T)$. In other words, $\xi=(a, b)$ where $a: T \rightarrow X$ and $b: T \rightarrow Y$ are morphisms of schemes such that $f \circ a=g \circ b$. Set $V_{i, j, k}=a^{-1}\left(V_{j}\right) \cap b^{-1}\left(W_{k}\right)$. For any further morphism $h: T^{\prime} \rightarrow T$ we have $h^{*} \xi=(a \circ h, b \circ h)$. Hence we see that $h^{*} \xi \in F_{i, j, k}\left(T^{\prime}\right)$ if and only if $a\left(h\left(T^{\prime}\right)\right) \subset V_{j}$ and $b\left(h\left(T^{\prime}\right)\right) \subset W_{k}$. In other words, if and only if $h\left(T^{\prime}\right) \subset V_{i, j, k}$. This proves condition (2)(b).

We check condition (2)(c) of Lemma 25.15.4. Let $T$ be a scheme and let $\xi=$ $(a, b) \in F(T)$ as above. Set $V_{i, j, k}=a^{-1}\left(V_{j}\right) \cap b^{-1}\left(W_{k}\right)$ as above. Condition (2)(c) just means that $T=\bigcup V_{i, j, k}$ which is evident. Thus the lemma is proved and fibre products exist.
01JN Remark 25.16.2. Using Remark 25.15 .5 you can show that the fibre product of morphisms of schemes exists in the category of locally ringed spaces and is a scheme.

### 25.17. Fibre products of schemes

01JO Here is a review of the general definition, even though we have already shown that fibre products of schemes exist.

01JP Definition 25.17.1. Given morphisms of schemes $f: X \rightarrow S$ and $g: Y \rightarrow S$ the fibre product is a scheme $X \times{ }_{S} Y$ together with projection morphisms $p: X \times{ }_{S} Y \rightarrow$ $X$ and $q: X \times_{S} Y \rightarrow Y$ sitting into the following commutative diagram

which is universal among all diagrams of this sort, see Categories, Definition 4.6.1. In other words, given any solid commutative diagram of morphisms of schemes

there exists a unique dotted arrow making the diagram commute. We will prove some lemmas which will tell us how to think about fibre products.
01JQ Lemma 25.17.2. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes with the same target. If $X, Y, S$ are all affine then $X \times_{S} Y$ is affine.

Proof. Suppose that $X=\operatorname{Spec}(A), Y=\operatorname{Spec}(B)$ and $S=\operatorname{Spec}(R)$. By Lemma 25.6 .7 the affine scheme $\operatorname{Spec}\left(A \otimes_{R} B\right)$ is the fibre product $X \times_{S} Y$ in the category of locally ringed spaces. Hence it is a fortiori the fibre product in the category of schemes.

01JR Lemma 25.17.3. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes with the same target. Let $X \times_{S} Y, p, q$ be the fibre product. Suppose that $U \subset S$, $V \subset X, W \subset Y$ are open subschemes such that $f(V) \subset U$ and $g(W) \subset U$. Then the canonical morphism $V \times_{U} W \rightarrow X \times_{S} Y$ is an open immersion which identifies $V \times_{U} W$ with $p^{-1}(V) \cap q^{-1}(W)$.
Proof. Let $T$ be a scheme Suppose $a: T \rightarrow V$ and $b: T \rightarrow W$ are morphisms such that $f \circ a=g \circ b$ as morphisms into $U$. Then they agree as morphisms into $S$. By the universal property of the fibre product we get a unique morphism $T \rightarrow X \times{ }_{S} Y$.

Of course this morphism has image contained in the open $p^{-1}(V) \cap q^{-1}(W)$. Thus $p^{-1}(V) \cap q^{-1}(W)$ is a fibre product of $V$ and $W$ over $U$. The result follows from the uniqueness of fibre products, see Categories, Section 4.6.

In particular this shows that $V \times_{U} W=V \times_{S} W$ in the situation of the lemma. Moreover, if $U, V, W$ are all affine, then we know that $V \times_{U} W$ is affine. And of course we may cover $X \times_{S} Y$ by such affine opens $V \times_{U} W$. We formulate this as a lemma.

01JS Lemma 25.17.4. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes with the same target. Let $S=\bigcup U_{i}$ be any affine open covering of $S$. For each $i \in I$, let $f^{-1}\left(U_{i}\right)=\bigcup_{j \in J_{i}} V_{j}$ be an affine open covering of $f^{-1}\left(U_{i}\right)$ and let $g^{-1}\left(U_{i}\right)=$ $\bigcup_{k \in K_{i}} W_{k}$ be an affine open covering of $g^{-1}\left(U_{i}\right)$. Then

$$
X \times_{S} Y=\bigcup_{i \in I} \bigcup_{j \in J_{i}, k \in K_{i}} V_{j} \times_{U_{i}} W_{k}
$$

is an affine open covering of $X \times_{S} Y$.

Proof. See discussion above the lemma.

In other words, we might have used the previous lemma as a way of construction the fibre product directly by glueing the affine schemes. (Which is of course exactly what we did in the proof of Lemma 25.16.1 anyway.) Here is a way to describe the set of points of a fibre product of schemes.

01JT Lemma 25.17.5. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes with the same target. Points $z$ of $X \times_{S} Y$ are in bijective correspondence to quadruples

$$
(x, y, s, \mathfrak{p})
$$

where $x \in X, y \in Y, s \in S$ are points with $f(x)=s, g(y)=s$ and $\mathfrak{p}$ is a prime ideal of the ring $\kappa(x) \otimes_{\kappa(s)} \kappa(y)$. The residue field of $z$ corresponds to the residue field of the prime $\mathfrak{p}$.

Proof. Let $z$ be a point of $X \times{ }_{S} Y$ and let us construct a triple as above. Recall that we may think of $z$ as a morphism $\operatorname{Spec}(\kappa(z)) \rightarrow X \times_{S} Y$, see Lemma 25.13.3. This morphism corresponds to morphisms $a: \operatorname{Spec}(\kappa(z)) \rightarrow X$ and $b: \operatorname{Spec}(\kappa(z)) \rightarrow Y$ such that $f \circ a=g \circ b$. By the same lemma again we get points $x \in X, y \in Y$ lying over the same point $s \in S$ as well as field maps $\kappa(x) \rightarrow \kappa(z), \kappa(y) \rightarrow \kappa(z)$ such that the compositions $\kappa(s) \rightarrow \kappa(x) \rightarrow \kappa(z)$ and $\kappa(s) \rightarrow \kappa(y) \rightarrow \kappa(z)$ are the same. In other words we get a ring map $\kappa(x) \otimes_{\kappa(s)} \kappa(y) \rightarrow \kappa(z)$. We let $\mathfrak{p}$ be the kernel of this map.

Conversely, given a quadruple $(x, y, s, \mathfrak{p})$ we get a commutative solid diagram

see the discussion in Section 25.13 . Thus we get the dotted arrow. The corresponding point $z$ of $X \times_{S} Y$ is the image of the generic point of $\operatorname{Spec}\left(\kappa(x) \otimes_{\kappa(s)} \kappa(y) / \mathfrak{p}\right)$. We omit the verification that the two constructions are inverse to each other.

01JU Lemma 25.17.6. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes with the same target.
(1) If $f: X \rightarrow S$ is a closed immersion, then $X \times_{S} Y \rightarrow Y$ is a closed immersion. Moreover, if $X \rightarrow S$ corresponds to the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{S}$, then $X \times_{S} Y \rightarrow Y$ corresponds to the sheaf of ideals $\operatorname{Im}\left(g^{*} \mathcal{I} \rightarrow \mathcal{O}_{Y}\right)$.
(2) If $f: X \rightarrow S$ is an open immersion, then $X \times_{S} Y \rightarrow Y$ is an open immersion.
(3) If $f: X \rightarrow S$ is an immersion, then $X \times_{S} Y \rightarrow Y$ is an immersion.

Proof. Assume that $X \rightarrow S$ is a closed immersion corresponding to the quasicoherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{S}$. By Lemma 25.4.7 the closed subspace $Z \subset Y$ defined by the sheaf of ideals $\operatorname{Im}\left(g^{*} \mathcal{I} \rightarrow \mathcal{O}_{Y}\right)$ is the fibre product in the category of locally ringed spaces. By Lemma $25.10 .1 Z$ is a scheme. Hence $Z=X \times{ }_{S} Y$ and the first statement follows. The second follows from Lemma 25.17 .3 for example. The third is a combination of the first two.

01JV Definition 25.17.7. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $Z \subset Y$ be a closed subscheme of $Y$. The inverse image $f^{-1}(Z)$ of the closed subscheme $Z$ is the closed subscheme $Z \times_{Y} X$ of $X$. See Lemma 25.17.6 above.

We may occasionally also use this terminology with locally closed and open subschemes.

### 25.18. Base change in algebraic geometry

01JW One motivation for the introduction of the language of schemes is that it gives a very precise notion of what it means to define a variety over a particular field. For example a variety $X$ over $\mathbf{Q}$ is synonymous (insert future reference here) with $X \rightarrow \operatorname{Spec}(\mathbf{Q})$ which is of finite type, separated, irreducible and reduced ${ }^{1}$ In any case, the idea is more generally to work with schemes over a given base scheme, often denoted $S$. We use the language: "let $X$ be a scheme over $S$ " to mean simply

[^63]that $X$ comes equipped with a morphism $X \rightarrow S$. In diagrams we will try to picture the structure morphism $X \rightarrow S$ as a downward arrow from $X$ to $S$. We are often more interested in the properties of $X$ relative to $S$ rather than the internal geometry of $X$. For example, we would like to know things about the fibres of $X \rightarrow S$, what happens to $X$ after base change, and so on.
We introduce some of the language that is customarily used. Of course this language is just a special case of thinking about the category of objects over a given object in a category, see Categories, Example 4.2.13.

01JX Definition 25.18.1. Let $S$ be a scheme.
(1) We say $X$ is a scheme over $S$ to mean that $X$ comes equipped with a morphism of schemes $X \rightarrow S$. The morphism $X \rightarrow S$ is sometimes called the structure morphism.
(2) If $R$ is a ring we say $X$ is a scheme over $R$ instead of $X$ is a scheme over $\operatorname{Spec}(R)$.
(3) A morphism $f: X \rightarrow Y$ of schemes over $S$ is a morphism of schemes such that the composition $X \rightarrow Y \rightarrow S$ of $f$ with the structure morphism of $Y$ is equal to the structure morphism of $X$.
(4) We denote $\operatorname{Mor}_{S}(X, Y)$ the set of all morphisms from $X$ to $Y$ over $S$.
(5) Let $X$ be a scheme over $S$. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. The base change of $X$ is the scheme $X_{S^{\prime}}=S^{\prime} \times_{S} X$ over $S^{\prime}$.
(6) Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. The base change of $f$ is the induced morphism $f^{\prime}: X_{S^{\prime}} \rightarrow Y_{S^{\prime}}\left(\right.$ namely the morphism $\left.\operatorname{id}_{S^{\prime}} \times_{\mathrm{id}_{S}} f\right)$.
(7) Let $R$ be a ring. Let $X$ be a scheme over $R$. Let $R \rightarrow R^{\prime}$ be a ring map. The base change $X_{R^{\prime}}$ is the scheme $\operatorname{Spec}\left(R^{\prime}\right) \times_{\operatorname{Spec}(R)} X$ over $R^{\prime}$.
Here is a typical result.
01JY Lemma 25.18.2. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be an immersion (resp. closed immersion, resp. open immersion) of schemes over $S$. Then any base change of $f$ is an immersion (resp. closed immersion, resp. open immersion).
Proof. We can think of the base change of $f$ via the morphism $S^{\prime} \rightarrow S$ as the top left vertical arrow in the following commutative diagram:

The diagram implies $X_{S^{\prime}} \cong Y_{S^{\prime}} \times_{Y} X$, and the lemma follows from Lemma 25.17.6.

In fact this type of result is so typical that there is a piece of language to express it. Here it is.

01JZ Definition 25.18.3. Properties and base change.
(1) Let $\mathcal{P}$ be a property of schemes over a base. We say that $\mathcal{P}$ is preserved under arbitrary base change, or simply that preserved under base change if whenever $X / S$ has $\mathcal{P}$, any base change $X_{S^{\prime}} / S^{\prime}$ has $\mathcal{P}$.
(2) Let $\mathcal{P}$ be a property of morphisms of schemes over a base. We say that $\mathcal{P}$ is preserved under arbitrary base change, or simply that preserved under base change if whenever $f: X \rightarrow Y$ over $S$ has $\mathcal{P}$, any base change $f^{\prime}: X_{S^{\prime}} \rightarrow Y_{S^{\prime}}$ over $S^{\prime}$ has $\mathcal{P}$.

At this point we can say that "being a closed immersion" is preserved under arbitrary base change.

01K0 Definition 25.18.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$ be a point. The scheme theoretic fibre $X_{s}$ of $f$ over $s$, or simply the fibre of $f$ over $s$ is the scheme fitting in the following fibre product diagram

We think of the fibre $X_{s}$ always as a scheme over $\kappa(s)$.
01K1 Lemma 25.18.5. Let $f: X \rightarrow S$ be a morphism of schemes. Consider the diagrams

In both cases the top horizontal arrow is a homeomorphism onto its image.
Proof. Choose an open affine $U \subset S$ that contains $s$. The bottom horizontal morphisms factor through $U$, see Lemma 25.13.1for example. Thus we may assume that $S$ is affine. If $X$ is also affine, then the result follows from Algebra, Remark 10.16 .8 . In the general case the result follows by covering $X$ by open affines.

### 25.19. Quasi-compact morphisms

01 K 2 A scheme is quasi-compact if its underlying topological space is quasi-compact. There is a relative notion which is defined as follows.

01K3 Definition 25.19.1. A morphism of schemes is called quasi-compact if the underlying map of topological spaces is quasi-compact, see Topology, Definition 5.11.1.

01K4 Lemma 25.19.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $f: X \rightarrow S$ is quasi-compact,
(2) the inverse image of every affine open is quasi-compact, and
(3) there exists some affine open covering $S=\bigcup_{i \in I} U_{i}$ such that $f^{-1}\left(U_{i}\right)$ is quasi-compact for all $i$.
Proof. Suppose we are given a covering $S=\bigcup_{i \in I} U_{i}$ as in (3). First, let $U \subset S$ be any affine open. For any $u \in U$ we can find an index $i(u) \in I$ such that $u \in U_{i(u)}$. As standard opens form a basis for the topology on $U_{i(u)}$ we can find $W_{u} \subset U \cap U_{i(u)}$
which is standard open in $U_{i(u)}$. By compactness we can find finitely many points $u_{1}, \ldots, u_{n} \in U$ such that $U=\bigcup_{j=1}^{n} W_{u_{j}}$. For each $j$ write $f^{-1} U_{i\left(u_{j}\right)}=\bigcup_{k \in K_{j}} V_{j k}$ as a finite union of affine opens. Since $W_{u_{j}} \subset U_{i(u)}$ is a standard open we see that $f^{-1}\left(W_{u_{j}}\right) \cap V_{j k}$ is a standard open of $V_{j k}$, see Algebra, Lemma 10.16.4. Hence $f^{-1}\left(W_{u_{j}}\right) \cap V_{j k}$ is affine, and so $f^{-1}\left(W_{u_{j}}\right)$ is a finite union of affines. This proves that the inverse image of any affine open is a finite union of affine opens.
Next, assume that the inverse image of every affine open is a finite union of affine opens. Let $K \subset S$ be any quasi-compact open. Since $S$ has a basis of the topology consisting of affine opens we see that $K$ is a finite union of affine opens. Hence the inverse image of $K$ is a finite union of affine opens. Hence $f$ is quasi-compact.

Finally, assume that $f$ is quasi-compact. In this case the argument of the previous paragraph shows that the inverse image of any affine is a finite union of affine opens.
01K5 Lemma 25.19.3. Being quasi-compact is a property of morphisms of schemes over a base which is preserved under arbitrary base change.

Proof. Omitted.
01K6 Lemma 25.19.4. The composition of quasi-compact morphisms is quasi-compact.
Proof. This follows from the definitions and Topology, Lemma 5.11.2,
01K7 Lemma 25.19.5. A closed immersion is quasi-compact.
Proof. Follows from the definitions and Topology, Lemma 5.11.3.
01K8 Example 25.19.6. An open immersion is in general not quasi-compact. The standard example of this is the open subspace $U \subset X$, where $X=\operatorname{Spec}\left(k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\right)$, where $U$ is $X \backslash\{0\}$, and where 0 is the point of $X$ corresponding to the maximal ideal $\left(x_{1}, x_{2}, x_{3}, \ldots\right)$.
05JL Lemma 25.19.7. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. The following are equivalent
(1) $f(X) \subset S$ is closed, and
(2) $f(X) \subset S$ is stable under specialization.

Proof. We have (1) $\Rightarrow$ (2) by Topology, Lemma 5.18.2. Assume (2). Let $U \subset S$ be an affine open. It suffices to prove that $f(X) \cap U$ is closed. Since $U \cap f(X)$ is stable under specializations, we have reduced to the case where $S$ is affine. Because $f$ is quasi-compact we deduce that $X=f^{-1}(S)$ is quasi-compact as $S$ is affine. Thus we may write $X=\bigcup_{i=1}^{n} U_{i}$ with $U_{i} \subset X$ open affine. Say $S=\operatorname{Spec}(R)$ and $U_{i}=\operatorname{Spec}\left(A_{i}\right)$ for some $R$-algebra $A_{i}$. Then $f(X)=\operatorname{Im}\left(\operatorname{Spec}\left(A_{1} \times \ldots \times A_{n}\right) \rightarrow\right.$ $\operatorname{Spec}(R))$. Thus the lemma follows from Algebra, Lemma 10.40 .5

01K9 Lemma 25.19.8. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. Then $f$ is closed if and only if specializations lift along $f$, see Topology, Definition 5.18.3.

Proof. According to Topology, Lemma 5.18.6 if $f$ is closed then specializations lift along $f$. Conversely, suppose that specializations lift along $f$. Let $Z \subset X$ be a closed subset. We may think of $Z$ as a scheme with the reduced induced scheme structure, see Definition 25.12.5. Since $Z \subset X$ is closed the restriction of $f$ to $Z$ is still quasi-compact. Moreover specializations lift along $Z \rightarrow S$ as well, see Topology,

Lemma 5.18.4 Hence it suffices to prove $f(X)$ is closed if specializations lift along $f$. In particular $f(X)$ is stable under specializations, see Topology, Lemma 5.18.5. Thus $f(X)$ is closed by Lemma 25.19.7.

### 25.20. Valuative criterion for universal closedness

01KA In Topology, Section 5.16 there is a discussion of proper maps as closed maps of topological spaces all of whose fibres are quasi-compact, or as maps such that all base changes are closed maps. Here is the corresponding notion in algebraic geometry.

01KB Definition 25.20.1. A morphism of schemes $f: X \rightarrow S$ is said to be universally closed if every base change $f^{\prime}: X_{S^{\prime}} \rightarrow S^{\prime}$ is closed.

In fact the adjective "universally" is often used in this way. In other words, given a property $\mathcal{P}$ of morphisms the we say that " $X \rightarrow S$ is universally $\mathcal{P}$ " if and only if every base change $X_{S^{\prime}} \rightarrow S^{\prime}$ has $\mathcal{P}$.
Please take a look at Morphisms, Section 28.41 for a more detailed discussion of the properties of universally closed morphisms. In this section we restrict the discussion to the relationship between universal closed morphisms and morphisms satisfying the existence part of the valuative criterion.

01KC Lemma 25.20.2. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) If $f$ is universally closed then specializations lift along any base change of $f$, see Topology, Definition 5.18.3.
(2) If $f$ is quasi-compact and specializations lift along any base change of $f$, then $f$ is universally closed.

Proof. Part (1) is a direct consequence of Topology, Lemma 5.18.6. Part (2) follows from Lemmas 25.19 .8 and 25.19.3.

01KD Definition 25.20.3. Let $f: X \rightarrow S$ be a morphism of schemes. We say $f$ satisfies the existence part of the valuative criterion if given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, the dotted arrow exists. We say $f$ satisfies the uniqueness part of the valuative criterion if there is at most one dotted arrow given any diagram as above (without requiring existence of course).

A valuation ring is a local domain maximal among the relation of domination in its fraction field, see Algebra, Definition 10.49.1. Hence the spectrum of a valuation ring has a unique generic point $\eta$ and a unique closed point 0 , and of course we have the specialization $\eta \rightsquigarrow 0$. The significance of valuation rings is that any specialization of points in any scheme is the image of $\eta \rightsquigarrow 0$ under some morphism from the spectrum of some valuation ring. Here is the precise result.

01J8 Lemma 25.20.4. Let $S$ be a scheme. Let $s^{\prime} \rightsquigarrow s$ be a specialization of points of S. Then
(1) there exists a valuation ring $A$ and a morphism $\operatorname{Spec}(A) \rightarrow S$ such that the generic point $\eta$ of $\operatorname{Spec}(A)$ maps to $s^{\prime}$ and the special point maps to s, and
(2) given a field extension $\kappa\left(s^{\prime}\right) \subset K$ we may arrange it so that the extension $\kappa\left(s^{\prime}\right) \subset \kappa(\eta)$ induced by $f$ is isomorphic to the given extension.

Proof. Let $s^{\prime} \rightsquigarrow s$ be a specialization in $S$, and let $\kappa\left(s^{\prime}\right) \subset K$ be an extension of fields. By Lemma 25.13.2 and the discussion following Lemma 25.13 .3 this leads to ring maps $\mathcal{O}_{S, s} \rightarrow \kappa\left(s^{\prime}\right) \rightarrow K$. Let $A \subset K$ be any valuation ring whose field of fractions is $K$ and which dominates the image of $\mathcal{O}_{S, s} \rightarrow K$, see Algebra, Lemma 10.49 .2 . The ring map $\mathcal{O}_{S, s} \rightarrow A$ induces the morphism $f: \operatorname{Spec}(A) \rightarrow S$, see Lemma 25.13.1. This morphism has all the desired properties by construction.

01KE Lemma 25.20.5. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) Specializations lift along any base change of $f$
(2) The morphism $f$ satisfies the existence part of the valuative criterion.

Proof. Assume (1) holds. Let a solid diagram as in Definition 25.20 .3 be given. In order to find the dotted arrow we may replace $X \rightarrow S$ by $X_{\mathrm{Spec}(A)} \rightarrow \operatorname{Spec}(A)$ since after all the assumption is stable under base change. Thus we may assume $S=\operatorname{Spec}(A)$. Let $x^{\prime} \in X$ be the image of $\operatorname{Spec}(K) \rightarrow X$, so that we have $\kappa\left(x^{\prime}\right) \subset K$, see Lemma 25.13.3. By assumption there exists a specialization $x^{\prime} \rightsquigarrow x$ in $X$ such that $x$ maps to the closed point of $S=\operatorname{Spec}(A)$. We get a local ring map $A \rightarrow \mathcal{O}_{X, x}$ and a ring map $\mathcal{O}_{X, x} \rightarrow \kappa\left(x^{\prime}\right)$, see Lemma 25.13 .2 and the discussion following Lemma 25.13.3 The composition $A \rightarrow \mathcal{O}_{X, x} \rightarrow \kappa\left(x^{\prime}\right) \rightarrow K$ is the given injection $A \rightarrow K$. Since $A \rightarrow \mathcal{O}_{X, x}$ is local, the image of $\mathcal{O}_{X, x} \rightarrow K$ dominates $A$ and hence is equal to $A$, by Algebra, Definition 10.49.1. Thus we obtain a ring map $\mathcal{O}_{X, x} \rightarrow A$ and hence a morphism $\operatorname{Spec}(A) \rightarrow X$ (see Lemma 25.13.1 and discussion following it). This proves (2).

Conversely, assume (2) holds. It is immediate that the existence part of the valuative criterion holds for any base change $X_{S^{\prime}} \rightarrow S^{\prime}$ of $f$ by considering the following commutative diagram

Namely, the more horizontal dotted arrow will lead to the other one by definition of the fibre product. OK, so it clearly suffices to show that specializations lift along $f$. Let $s^{\prime} \rightsquigarrow s$ be a specialization in $S$, and let $x^{\prime} \in X$ be a point lying over $s^{\prime}$. Apply Lemma 25.20 .4 to $s^{\prime} \rightsquigarrow s$ and the extension of fields $\kappa\left(s^{\prime}\right) \subset \kappa\left(x^{\prime}\right)=K$. We get a commutative diagram

and by condition (2) we get the dotted arrow. The image $x$ of the closed point of $\operatorname{Spec}(A)$ in $X$ will be a solution to our problem, i.e., $x$ is a specialization of $x^{\prime}$ and maps to $s$.

01KF Proposition 25.20.6 (Valuative criterion of universal closedness). Let $f$ be $a$ quasi-compact morphism of schemes. Then $f$ is universally closed if and only if $f$ satisfies the existence part of the valuative criterion.
Proof. This is a formal consequence of Lemmas 25.20 .2 and 25.20 .5 above.
01KG Example 25.20.7. Let $k$ be a field. Consider the structure morphism $p: \mathbf{P}_{k}^{1} \rightarrow$ $\operatorname{Spec}(k)$ of the projective line over $k$, see Example 25.14.4. Let us use the valuative criterion above to prove that $p$ is universally closed. By construction $\mathbf{P}_{k}^{1}$ is covered by two affine opens and hence $p$ is quasi-compact. Let a commutative diagram

be given, where $A$ is a valuation ring and $K$ is its field of fractions. Recall that $\mathbf{P}_{k}^{1}$ is gotten by glueing $\operatorname{Spec}(k[x])$ to $\operatorname{Spec}(k[y])$ by glueing $D(x)$ to $D(y)$ via $x=y^{-1}$ (or more symmetrically $x y=1$ ). To show there is a morphism $\operatorname{Spec}(A) \rightarrow \mathbf{P}_{k}^{1}$ fitting diagonally into the diagram above we may assume that $\xi$ maps into the open $\operatorname{Spec}(k[x])$ (by symmetry). This gives the following commutative diagram of rings

By Algebra, Lemma 10.49 .3 we see that either $\xi^{\sharp}(x) \in A$ or $\xi^{\sharp}(x)^{-1} \in A$. In the first case we get a ring map

$$
k[x] \rightarrow A, \lambda \mapsto \varphi^{\sharp}(\lambda), x \mapsto \xi^{\sharp}(x)
$$

fitting into the diagram of rings above, and we win. In the second case we see that we get a ring map

$$
k[y] \rightarrow A, \lambda \mapsto \varphi^{\sharp}(\lambda), y \mapsto \xi^{\sharp}(x)^{-1} .
$$

This gives a morphism $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(k[y]) \rightarrow \mathbf{P}_{k}^{1}$ which fits diagonally into the initial commutative diagram of this example (check omitted).

### 25.21. Separation axioms

$01 \mathrm{KH} \quad$ A topological space $X$ is Hausdorff if and only if the diagonal $\Delta \subset X \times X$ is a closed subset. The analogue in algebraic geometry is, given a scheme $X$ over a base scheme $S$, to consider the diagonal morphism

$$
\Delta_{X / S}: X \longrightarrow X \times_{S} X
$$

This is the unique morphism of schemes such that $\mathrm{pr}_{1} \circ \Delta_{X / S}=\mathrm{id} \mathrm{X}_{X}$ and $\mathrm{pr}_{2} \circ$ $\Delta_{X / S}=\mathrm{id}_{X}$ (it exists in any category with fibre products).

01KI Lemma 25.21.1. The diagonal morphism of a morphism between affines is closed.

Proof. The diagonal morphism associated to the morphism $\operatorname{Spec}(S) \rightarrow \operatorname{Spec}(R)$ is the morphism on spectra corresponding to the ring map $S \otimes_{R} S \rightarrow S, a \otimes b \mapsto a b$. This map is clearly surjective, so $S \cong S \otimes_{R} S / J$ for some ideal $J \subset S \otimes_{R} S$. Hence $\Delta$ is a closed immersion according to Example 25.8.1
01KJ Lemma 25.21.2. Let $X$ be a scheme over $S$. The diagonal morphism $\Delta_{X / S}$ is an immersion.

Proof. Recall that if $V \subset X$ is affine open and maps into $U \subset S$ affine open, then $V \times_{U} V$ is affine open in $X \times_{S} X$, see Lemmas 25.17.2 and 25.17.3. Consider the open subscheme $W$ of $X \times_{S} X$ which is the union of these affine opens $V \times_{U} V$. By Lemma 25.4.2 it is enough to show that each morphism $\Delta_{X / S}^{-1}\left(V \times_{U} V\right) \rightarrow V \times_{U} V$ is a closed immersion. Since $V=\Delta_{X / S}^{-1}\left(V \times_{U} V\right)$ we are just checking that $\Delta_{V / U}$ is a closed immersion, which is Lemma 25.21.1.

01KK Definition 25.21.3. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say $f$ is separated if the diagonal morphism $\Delta_{X / S}$ is a closed immersion.
(2) We say $f$ is quasi-separated if the diagonal morphism $\Delta_{X / S}$ is a quasicompact morphism.
(3) We say a scheme $Y$ is separated if the morphism $Y \rightarrow \operatorname{Spec}(\mathbf{Z})$ is separated.
(4) We say a scheme $Y$ is quasi-separated if the morphism $Y \rightarrow \operatorname{Spec}(\mathbf{Z})$ is quasi-separated.

By Lemmas 25.21 .2 and 25.10 .4 we see that $\Delta_{X / S}$ is a closed immersion if an only if $\Delta_{X / S}(X) \subset X \times_{S} X$ is a closed subset. Moreover, by Lemma 25.19.5 we see that a separated morphism is quasi-separated. The reason for introducing quasi-separated morphisms is that nonseparated morphisms come up naturally in studying algebraic varieties (especially when doing moduli, algebraic stacks, etc). But most often they are still quasi-separated.
01KL Example 25.21.4. Here is an example of a non-quasi-separated morphism. Suppose $X=X_{1} \cup X_{2} \rightarrow S=\operatorname{Spec}(k)$ with $X_{1}=X_{2}=\operatorname{Spec}\left(k\left[t_{1}, t_{2}, t_{3}, \ldots\right]\right)$ glued along the complement of $\{0\}=\left\{\left(t_{1}, t_{2}, t_{3}, \ldots\right)\right\}$ (glued as in Example 25.14.3). In this case the inverse image of the affine scheme $X_{1} \times_{S} X_{2}$ under $\Delta_{X / S}$ is the scheme $\operatorname{Spec}\left(k\left[t_{1}, t_{2}, t_{3}, \ldots\right]\right) \backslash\{0\}$ which is not quasi-compact.
01KM Lemma 25.21.5. Let $X, Y$ be schemes over $S$. Let $a, b: X \rightarrow Y$ be morphisms of schemes over $S$. There exists a largest locally closed subscheme $Z \subset X$ such that $\left.a\right|_{Z}=\left.b\right|_{Z}$. In fact $Z$ is the equalizer of $(a, b)$. Moreover, if $Y$ is separated over $S$, then $Z$ is a closed subscheme.

Proof. The equalizer of $(a, b)$ is for categorical reasons the fibre product $Z$ in the following diagram

Thus the lemma follows from Lemmas 25.18.2, 25.21.2 and Definition 25.21.3.
01KN Lemma 25.21.6. An affine scheme is separated. A morphism of affine schemes is separated.

Proof. See Lemma 25.21.1
01KO Lemma 25.21.7. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is quasi-separated.
(2) For every pair of affine opens $U, V \subset X$ which map into a common affine open of $S$ the intersection $U \cap V$ is a finite union of affine opens of $X$.
(3) There exists an affine open covering $S=\bigcup_{i \in I} U_{i}$ and for each $i$ an affine open covering $f^{-1} U_{i}=\bigcup_{j \in I_{i}} V_{j}$ such that for each $i$ and each pair $j, j^{\prime} \in I_{i}$ the intersection $V_{j} \cap V_{j^{\prime}}$ is a finite union of affine opens of $X$.
Proof. Let us prove that (3) implies (1). By Lemma 25.17.4 the covering $X \times{ }_{S} X=$ $\bigcup_{i} \bigcup_{j, j^{\prime}} V_{j} \times_{U_{i}} V_{j^{\prime}}$ is an affine open covering of $X \times_{S} X$. Moreover, $\Delta_{X / S}^{-1}\left(V_{j} \times_{U_{i}}\right.$ $\left.V_{j^{\prime}}\right)=V_{j} \cap V_{j^{\prime}}$. Hence the implication follows from Lemma 25.19.2
The implication $(1) \Rightarrow(2)$ follows from the fact that under the hypotheses of (2) the fibre product $U \times_{S} V$ is an affine open of $X \times_{S} X$. The implication (2) $\Rightarrow$ (3) is trivial.

01KP Lemma 25.21.8. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) If $f$ is separated then for every pair of affine opens $(U, V)$ of $X$ which map into a common affine open of $S$ we have
(a) the intersection $U \cap V$ is affine.
(b) the ring map $\mathcal{O}_{X}(U) \otimes_{\mathbf{z}} \mathcal{O}_{X}(V) \rightarrow \mathcal{O}_{X}(U \cap V)$ is surjective.
(2) If any pair of points $x_{1}, x_{2} \in X$ lying over a common point $s \in S$ are contained in affine opens $x_{1} \in U, x_{2} \in V$ which map into a common affine open of $S$ such that (a), (b) hold, then $f$ is separated.

Proof. Assume $f$ separated. Suppose $(U, V)$ is a pair as in (1). Let $W=\operatorname{Spec}(R)$ be an affine open of $S$ containing both $f(U)$ and $g(V)$. Write $U=\operatorname{Spec}(A)$ and $V=\operatorname{Spec}(B)$ for $R$-algebras $A$ and $B$. By Lemma 25.17 .3 we see that $U \times_{S} V=$ $U \times_{W} V=\operatorname{Spec}\left(A \otimes_{R} B\right)$ is an affine open of $X \times_{S} X$. Hence, by Lemma 25.10.1 we see that $\Delta^{-1}\left(U \times_{S} V\right) \rightarrow U \times_{S} V$ can be identified with $\operatorname{Spec}\left(A \otimes_{R} B / J\right)$ for some ideal $J \subset A \otimes_{R} B$. Thus $U \cap V=\Delta^{-1}\left(U \times_{S} V\right)$ is affine. Assertion (1)(b) holds because $A \otimes_{\mathbf{Z}} B \rightarrow\left(A \otimes_{R} B\right) / J$ is surjective.

Assume the hypothesis formulated in (2) holds. Clearly the collection of affine opens $U \times_{S} V$ for pairs ( $U, V$ ) as in (2) form an affine open covering of $X \times_{S} X$ (see e.g. Lemma 25.17.4). Hence it suffices to show that each morphism $U \cap V=$ $\Delta_{X / S}^{-1}\left(U \times_{S} V\right) \rightarrow U \times_{S} V$ is a closed immersion, see Lemma 25.4.2, By assumption (a) we have $U \cap V=\operatorname{Spec}(C)$ for some ring $C$. After choosing an affine open $W=\operatorname{Spec}(R)$ of $S$ into which both $U$ and $V$ map and writing $U=\operatorname{Spec}(A)$, $V=\operatorname{Spec}(B)$ we see that the assumption (b) means that the composition

$$
A \otimes_{\mathbf{Z}} B \rightarrow A \otimes_{R} B \rightarrow C
$$

is surjective. Hence $A \otimes_{R} B \rightarrow C$ is surjective and we conclude that $\operatorname{Spec}(C) \rightarrow$ $\operatorname{Spec}\left(A \otimes_{R} B\right)$ is a closed immersion.
01KQ Example 25.21.9. Let $k$ be a field. Consider the structure morphism $p: \mathbf{P}_{k}^{1} \rightarrow$ $\operatorname{Spec}(k)$ of the projective line over $k$, see Example 25.14.4. Let us use the lemma above to prove that $p$ is separated. By construction $\mathbf{P}_{k}^{1}$ is covered by two affine opens $U=\operatorname{Spec}(k[x])$ and $V=\operatorname{Spec}(k[y])$ with intersection $U \cap V=\operatorname{Spec}(k[x, y] /(x y-1))$
(using obvious notation). Thus it suffices to check that conditions (2)(a) and (2)(b) of Lemma 25.21 .8 hold for the pairs of affine opens $(U, U),(U, V),(V, U)$ and $(V, V)$. For the pairs $(U, U)$ and $(V, V)$ this is trivial. For the pair $(U, V)$ this amounts to proving that $U \cap V$ is affine, which is true, and that the ring map

$$
k[x] \otimes_{\mathbf{Z}} k[y] \longrightarrow k[x, y] /(x y-1)
$$

is surjective. This is clear because any element in the right hand side can be written as a sum of a polynomial in $x$ and a polynomial in $y$.
01KR Lemma 25.21.10. Let $f: X \rightarrow T$ and $g: Y \rightarrow T$ be morphisms of schemes with the same target. Let $h: T \rightarrow S$ be a morphism of schemes. Then the induced morphism $i: X \times_{T} Y \rightarrow X \times_{S} Y$ is an immersion. If $T \rightarrow S$ is separated, then $i$ is a closed immersion. If $T \rightarrow S$ is quasi-separated, then $i$ is a quasi-compact morphism.

Proof. By general category theory the following diagram

is a fibre product diagram. The lemma follows from Lemmas 25.21.2, 25.17.6 and 25.19 .3

01KS Lemma 25.21.11. Let $g: X \rightarrow Y$ be a morphism of schemes over $S$. The morphism $i: X \rightarrow X \times_{S} Y$ is an immersion. If $Y$ is separated over $S$ it is a closed immersion. If $Y$ is quasi-separated over $S$ it is quasi-compact.

Proof. This is a special case of Lemma 25.21 .10 applied to the morphism $X=$ $X \times_{Y} Y \rightarrow X \times_{S} Y$.

01KT Lemma 25.21.12. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s: S \rightarrow X$ be $a$ section of $f$ (in a formula $f \circ s=i d_{S}$ ). Then $s$ is an immersion. If $f$ is separated then $s$ is a closed immersion. If $f$ is quasi-separated, then $s$ is quasi-compact.

Proof. This is a special case of Lemma 25.21.11 applied to $g=s$ so the morphism $i=s: S \rightarrow S \times{ }_{S} X$.

01KU Lemma 25.21.13. Permanence properties.
(1) A composition of separated morphisms is separated.
(2) A composition of quasi-separated morphisms is quasi-separated.
(3) The base change of a separated morphism is separated.
(4) The base change of a quasi-separated morphism is quasi-separated.
(5) A (fibre) product of separated morphisms is separated.
(6) A (fibre) product of quasi-separated morphisms is quasi-separated.

Proof. Let $X \rightarrow Y \rightarrow Z$ be morphisms. Assume that $X \rightarrow Y$ and $Y \rightarrow Z$ are separated. The composition

$$
X \rightarrow X \times_{Y} X \rightarrow X \times_{Z} X
$$

is closed because the first one is by assumption and the second one by Lemma 25.21.10. The same argument works for "quasi-separated" (with the same references).

Let $f: X \rightarrow Y$ be a morphism of schemes over a base $S$. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. Let $f^{\prime}: X_{S^{\prime}} \rightarrow Y_{S^{\prime}}$ be the base change of $f$. Then the diagonal morphism of $f^{\prime}$ is a morphism

$$
\Delta_{f^{\prime}}: X_{S^{\prime}}=S^{\prime} \times_{S} X \longrightarrow X_{S^{\prime}} \times_{Y_{S^{\prime}}} X_{S^{\prime}}=S^{\prime} \times_{S}\left(X \times_{Y} X\right)
$$

which is easily seen to be the base change of $\Delta_{f}$. Thus (3) and (4) follow from the fact that closed immersions and quasi-compact morphisms are preserved under arbitrary base change (Lemmas 25.17.6 and 25.19.3).

If $f: X \rightarrow Y$ and $g: U \rightarrow V$ are morphisms of schemes over a base $S$, then $f \times g$ is the composition of $X \times_{S} U \rightarrow X \times_{S} V$ (a base change of $g$ ) and $X \times_{S} V \rightarrow Y \times_{S} V$ (a base change of $f$ ). Hence (5) and (6) follow from (1) - (4).

01KV Lemma 25.21.14. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of schemes. If $g \circ f$ is separated then so is $f$. If $g \circ f$ is quasi-separated then so is $f$.

Proof. Assume that $g \circ f$ is separated. Consider the factorization $X \rightarrow X \times_{Y} X \rightarrow$ $X \times{ }_{Z} X$ of the diagonal morphism of $g \circ f$. By Lemma 25.21.10 the last morphism is an immersion. By assumption the image of $X$ in $X \times{ }_{Z} X$ is closed. Hence it is also closed in $X \times_{Y} X$. Thus we see that $X \rightarrow X \times_{Y} X$ is a closed immersion by Lemma 25.10.4.

Assume that $g \circ f$ is quasi-separated. Let $V \subset Y$ be an affine open which maps into an affine open of $Z$. Let $U_{1}, U_{2} \subset X$ be affine opens which map into $V$. Then $U_{1} \cap U_{2}$ is a finite union of affine opens because $U_{1}, U_{2}$ map into a common affine open of $Z$. Since we may cover $Y$ by affine opens like $V$ we deduce the lemma from Lemma 25.21.7

03GI Lemma 25.21.15. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms of schemes. If $g \circ f$ is quasi-compact and $g$ is quasi-separated then $f$ is quasi-compact.

Proof. This is true because $f$ equals the composition (1, $f): X \rightarrow X \times{ }_{Z} Y \rightarrow$ $Y$. The first map is quasi-compact by Lemma 25.21 .12 because it is a section of the quasi-separated morphism $X \times_{Z} Y \rightarrow X$ (a base change of $g$, see Lemma 25.21.13). The second map is quasi-compact as it is the base change of $f$, see Lemma 25.19.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 25.19.4.

You may have been wondering whether the condition of only considering pairs of affine opens whose image is contained in an affine open is really necessary to be able to conclude that their intersection is affine. Often it isn't!

01KW Lemma 25.21.16. Let $f: X \rightarrow S$ be a morphism. Assume $f$ is separated and $S$ is a separated scheme. Suppose $U \subset X$ and $V \subset X$ are affine. Then $U \cap V$ is affine (and a closed subscheme of $U \times V$ ).

Proof. In this case $X$ is separated by Lemma 25.21.13. Hence $U \cap V$ is affine by applying Lemma 25.21 .8 to the morphism $X \rightarrow \operatorname{Spec}(\mathbf{Z})$.

On the other hand, the following example shows that we cannot expect the image of an affine to be contained in an affine.

01KX Example 25.21.17. Consider the nonaffine scheme $U=\operatorname{Spec}(k[x, y]) \backslash\{(x, y)\}$ of Example 25.9.3. On the other hand, consider the scheme

$$
\mathbf{G} \mathbf{L}_{2, k}=\operatorname{Spec}(k[a, b, c, d, 1 / a d-b c]) .
$$

There is a morphism $\mathbf{G} \mathbf{L}_{2, k} \rightarrow U$ corresponding to the ring map $x \mapsto a, y \mapsto b$. It is easy to see that this is a surjective morphism, and hence the image is not contained in any affine open of $U$. In fact, the affine scheme $\mathbf{G} \mathbf{L}_{2, k}$ also surjects onto $\mathbf{P}_{k}^{1}$, and $\mathbf{P}_{k}^{1}$ does not even have an immersion into any affine scheme.

0816 Remark 25.21.18. The category of quasi-compact and quasi-separated schemes $\mathcal{C}$ has the following properties. If $X, Y \in \operatorname{Ob}(\mathcal{C})$, then any morphism of schemes $f: X \rightarrow Y$ is quasi-compact and quasi-separated by Lemmas 25.21.15 and 25.21.14 with $Z=\operatorname{Spec}(\mathbf{Z})$. Moreover, if $X \rightarrow Y$ and $Z \rightarrow Y$ are morphisms $\mathcal{C}$, then $X \times_{Y} Z$ is an object of $\mathcal{C}$ too. Namely, the projection $X \times_{Y} Z \rightarrow Z$ is quasi-compact and quasi-separated as a base change of the morphism $Z \rightarrow Y$, see Lemmas 25.21.13 and 25.19.3. Hence the composition $X \times_{Y} Z \rightarrow Z \rightarrow \operatorname{Spec}(\mathbf{Z})$ is quasi-compact and quasi-separated, see Lemmas 25.21.13 and 25.19.4

### 25.22. Valuative criterion of separatedness

01KY
01KZ Lemma 25.22.1. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is separated, then $f$ satisfies the uniqueness part of the valuative criterion.

Proof. Let a diagram as in Definition 25.20 .3 be given. Suppose there are two morphisms $a, b: \operatorname{Spec}(A) \rightarrow X$ fitting into the diagram. Let $Z \subset \operatorname{Spec}(A)$ be the equalizer of $a$ and $b$. By Lemma 25.21 .5 this is a closed subscheme of $\operatorname{Spec}(A)$. By assumption it contains the generic point of $\operatorname{Spec}(A)$. Since $A$ is a domain this implies $Z=\operatorname{Spec}(A)$. Hence $a=b$ as desired.

01L0 Lemma 25.22.2 (Valuative criterion separatedness). Let $f: X \rightarrow S$ be a morphism. Assume
(1) the morphism $f$ is quasi-separated, and
(2) the morphism $f$ satisfies the uniqueness part of the valuative criterion.

Then $f$ is separated.
Proof. By assumption (1) and Proposition 25.20.6 we see that it suffices to prove the morphism $\Delta_{X / S}: X \rightarrow X \times_{S} X$ satisfies the existence part of the valuative criterion. Let a solid commutative diagram

be given. The lower right arrow corresponds to a pair of morphisms $a, b: \operatorname{Spec}(A) \rightarrow$ $X$ over $S$. By (2) we see that $a=b$. Hence using $a$ as the dotted arrow works.

### 25.23. Monomorphisms

## 01L1

01L2 Definition 25.23.1. A morphism of schemes is called a monomorphism if it is a monomorphism in the category of schemes, see Categories, Definition 4.13.1.
01L3 Lemma 25.23.2. Let $j: X \rightarrow Y$ be a morphism of schemes. Then $j$ is $a$ monomorphism if and only if the diagonal morphism $\Delta_{X / Y}: X \rightarrow X \times_{Y} X$ is an isomorphism.

Proof. This is true in any category with fibre products.
01L4 Lemma 25.23.3. A monomorphism of schemes is separated.
Proof. This is true because an isomorphism is a closed immersion, and Lemma 25.23 .2 above.

01L5 Lemma 25.23.4. A composition of monomorphisms is a monomorphism.
Proof. True in any category.
02YC Lemma 25.23.5. The base change of a monomorphism is a monomorphism.
Proof. True in any category with fibre products.
01L6 Lemma 25.23.6. Let $j: X \rightarrow Y$ be a morphism of schemes. If
(1) $j$ is injective on points, and
(2) for any $x \in X$ the ring map $j_{x}^{\sharp}: \mathcal{O}_{Y, j(x)} \rightarrow \mathcal{O}_{X, x}$ is surjective, then $j$ is a monomorphism.

Proof. Let $a, b: Z \rightarrow X$ be two morphisms of schemes such that $j \circ a=j \circ b$. Then (1) implies $a=b$ as underlying maps of topological spaces. For any $z \in Z$ we have $a_{z}^{\sharp} \circ j_{a(z)}^{\sharp}=b_{z}^{\sharp} \circ j_{b(z)}^{\sharp}$ as maps $\mathcal{O}_{Y, j(a(z))} \rightarrow \mathcal{O}_{Z, z}$. The surjectivity of the maps $j_{x}^{\sharp}$ forces $a_{z}^{\sharp}=b_{z}^{\sharp}, \forall z \in Z$. This implies that $a^{\sharp}=b^{\sharp}$. Hence we conclude $a=b$ as morphisms of schemes as desired.
01L7 Lemma 25.23.7. An immersion of schemes is a monomorphism. In particular, any immersion is separated.

Proof. We can see this by checking that the criterion of Lemma 25.23 .6 applies. More elegantly perhaps, we can use that Lemmas 25.3.5 and 25.4.6 imply that open and closed immersions are monomorphisms and hence any immersion (which is a composition of such) is a monomorphism.
01L8 Lemma 25.23.8. Let $f: X \rightarrow S$ be a separated morphism. Any locally closed subscheme $Z \subset X$ is separated over $S$.

Proof. Follows from Lemma 25.23 .7 and the fact that a composition of separated morphisms is separated (Lemma 25.21.13).
01L9 Example 25.23.9. The morphism $\operatorname{Spec}(\mathbf{Q}) \rightarrow \operatorname{Spec}(\mathbf{Z})$ is a monomorphism. This is true because $\mathbf{Q} \otimes_{\mathbf{z}} \mathbf{Q}=\mathbf{Q}$. More generally, for any scheme $S$ and any point $s \in S$ the canonical morphism

$$
\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \longrightarrow S
$$

is a monomorphism.

03DP Lemma 25.23.10. Let $k_{1}, \ldots, k_{n}$ be fields. For any monomorphism of schemes $X \rightarrow \operatorname{Spec}\left(k_{1} \times \ldots \times k_{n}\right)$ there exists a subset $I \subset\{1, \ldots, n\}$ such that $X \cong$ $\operatorname{Spec}\left(\prod_{i \in I} k_{i}\right)$ as schemes over $\operatorname{Spec}\left(k_{1} \times \ldots \times k_{n}\right)$. More generally, if $X=\coprod_{i \in I} \operatorname{Spec}\left(k_{i}\right)$ is a disjoint union of spectra of fields and $Y \rightarrow X$ is a monomorphism, then there exists a subset $J \subset I$ such that $Y=\coprod_{i \in J} \operatorname{Spec}\left(k_{i}\right)$.
Proof. First reduce to the case $n=1$ (or $\# I=1$ ) by taking the inverse images of the open and closed subschemes $\operatorname{Spec}\left(k_{i}\right)$. In this case $X$ has only one point hence is affine. The corresponding algebra problem is this: If $k \rightarrow R$ is an algebra map with $R \otimes_{k} R \cong R$, then $R \cong k$. This holds for dimension reasons. See also Algebra, Lemma 10.106.8

### 25.24. Functoriality for quasi-coherent modules

01LA Let $X$ be a scheme. We denote $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ the category of quasi-coherent $\mathcal{O}_{X^{-}}$ modules as defined in Modules, Definition 17.10.1. We have seen in Section 25.7 that the category $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ has a lot of good properties when $X$ is affine. Since the property of being quasi-coherent is local on $X$, these properties are inherited by the category of quasi-coherent sheaves on any scheme $X$. We enumerate them here.
(1) A sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ is quasi-coherent if and only if the restriction of $\mathcal{F}$ to each affine open $U=\operatorname{Spec}(R)$ is of the form $\widetilde{M}$ for some $R$-module $M$.
(2) A sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ is quasi-coherent if and only if the restriction of $\mathcal{F}$ to each of the members of an affine open covering is quasi-coherent.
(3) Any direct sum of quasi-coherent sheaves is quasi-coherent.
(4) Any colimit of quasi-coherent sheaves is quasi-coherent.

01LB (5) The kernel and cokernel of a morphism of quasi-coherent sheaves is quasicoherent.
(6) Given a short exact sequence of $\mathcal{O}_{X}$-modules $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ if two out of three are quasi-coherent so is the third.
(7) Given a morphism of schemes $f: Y \rightarrow X$ the pullback of a quasi-coherent $\mathcal{O}_{X}$-module is a quasi-coherent $\mathcal{O}_{Y}$-module. See Modules, Lemma 17.10.4.
(8) Given two quasi-coherent $\mathcal{O}_{X}$-modules the tensor product is quasi-coherent, see Modules, Lemma 17.15.5.
(9) Given a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the tensor, symmetric and exterior algebras on $\mathcal{F}$ are quasi-coherent, see Modules, Lemma 17.18.6.
(10) Given two quasi-coherent $\mathcal{O}_{X}$-modules $\mathcal{F}, \mathcal{G}$ such that $\mathcal{F}$ is of finite presentation, then the internal hom $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is quasi-coherent, see Modules, Lemma 17.19.4 and (5) above.
On the other hand, it is in general not the case that the pushforward of a quasicoherent module is quasi-coherent. Here is a case where it this does hold.
01LC Lemma 25.24.1. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is quasicompact and quasi-separated then $f_{*}$ transforms quasi-coherent $\mathcal{O}_{X}$-modules into quasi-coherent $\mathcal{O}_{S}$-modules.

Proof. The question is local on $S$ and hence we may assume that $S$ is affine. Because $X$ is quasi-compact we may write $X=\bigcup_{i=1}^{n} U_{i}$ with each $U_{i}$ open affine. Because $f$ is quasi-separated we may write $U_{i} \cap U_{j}=\bigcup_{k=1}^{n_{i j}} U_{i j k}$ for some affine open
$U_{i j k}$, see Lemma 25.21.7. Denote $f_{i}: U_{i} \rightarrow S$ and $f_{i j k}: U_{i j k} \rightarrow S$ the restrictions of $f$. For any open $V$ of $S$ and any sheaf $\mathcal{F}$ on $X$ we have

$$
\begin{aligned}
f_{*} \mathcal{F}(V) & =\mathcal{F}\left(f^{-1} V\right) \\
& =\operatorname{Ker}\left(\bigoplus_{i} \mathcal{F}\left(f^{-1} V \cap U_{i}\right) \rightarrow \bigoplus_{i, j, k} \mathcal{F}\left(f^{-1} V \cap U_{i j k}\right)\right) \\
& =\operatorname{Ker}\left(\bigoplus_{i} f_{i, *}\left(\left.\mathcal{F}\right|_{U_{i}}\right)(V) \rightarrow \bigoplus_{i, j, k} f_{i j k, *}\left(\left.\mathcal{F}\right|_{U_{i j k}}\right)\right)(V) \\
& =\operatorname{Ker}\left(\bigoplus_{i} f_{i, *}\left(\left.\mathcal{F}\right|_{U_{i}}\right) \rightarrow \bigoplus_{i, j, k} f_{i j k, *}\left(\left.\mathcal{F}\right|_{U_{i j k}}\right)\right)(V)
\end{aligned}
$$

In other words there is an exact sequence of sheaves

$$
0 \rightarrow f_{*} \mathcal{F} \rightarrow \bigoplus f_{i, *} \mathcal{F}_{i} \rightarrow \bigoplus f_{i j k, *} \mathcal{F}_{i j k}
$$

where $\mathcal{F}_{i}, \mathcal{F}_{i j k}$ denotes the restriction of $\mathcal{F}$ to the corresponding open. If $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_{X}$-modules then $\mathcal{F}_{i}, \mathcal{F}_{i j k}$ is a quasi-coherent $\mathcal{O}_{U_{i}}, \mathcal{O}_{U_{i j k}}$-module. Hence by Lemma 25.7 .3 we see that the second and third term of the exact sequence are quasi-coherent $\mathcal{O}_{S^{-}}$modules. Thus we conclude that $f_{*} \mathcal{F}$ is a quasi-coherent $\mathcal{O}_{S^{-}}$ module.

Using this we can characterize (closed) immersions of schemes as follows.
01LD Lemma 25.24.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Suppose that
(1) $f$ induces a homeomorphism of $X$ with a closed subset of $Y$, and
(2) $f^{\sharp}: \mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$ is surjective.

Then $f$ is a closed immersion of schemes.
Proof. Assume (1) and (2). By (1) the morphism $f$ is quasi-compact (see Topology, Lemma 5.11.3). Conditions (1) and (2) imply conditions (1) and (2) of Lemma 25.23.6. Hence $f: X \rightarrow Y$ is a monomorphism. In particular, $f$ is separated, see Lemma 25.23.3. Hence Lemma 25.24.1 above applies and we conclude that $f_{*} \mathcal{O}_{X}$ is a quasi-coherent $\mathcal{O}_{Y}$-module. Therefore the kernel of $\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}$ is quasi-coherent by Lemma 25.7.8. Since a quasi-coherent sheaf is locally generated by sections (see Modules, Definition 17.10.1) this implies that $f$ is a closed immersion, see Definition 25.4.1.

We can use this lemma to prove the following lemma.
02V0 Lemma 25.24.3. A composition of immersions of schemes is an immersion, a composition of closed immersions of schemes is a closed immersion, and a composition of open immersions of schemes is an open immersion.

Proof. This is clear for the case of open immersions since an open subspace of an open subspace is also an open subspace.

Suppose $a: Z \rightarrow Y$ and $b: Y \rightarrow X$ are closed immersions of schemes. We will verify that $c=b \circ a$ is also a closed immersion. The assumption implies that $a$ and $b$ are homeomorphisms onto closed subsets, and hence also $c=b \circ a$ is a homeomorphism onto a closed subset. Moreover, the map $\mathcal{O}_{X} \rightarrow c_{*} \mathcal{O}_{Z}$ is surjective since it factors as the composition of the surjective maps $\mathcal{O}_{X} \rightarrow b_{*} \mathcal{O}_{Y}$ and $b_{*} \mathcal{O}_{Y} \rightarrow b_{*} a_{*} \mathcal{O}_{Z}$ (surjective as $b_{*}$ is exact, see Modules, Lemma 17.6.1. Hence by Lemma 25.24.2 above $c$ is a closed immersion.

Finally, we come to the case of immersions. Suppose $a: Z \rightarrow Y$ and $b: Y \rightarrow X$ are immersions of schemes. This means there exist open subschemes $V \subset Y$ and $U \subset X$ such that $a(Z) \subset V, b(Y) \subset U$ and $a: Z \rightarrow V$ and $b: Y \rightarrow U$ are closed immersions. Since the topology on $Y$ is induced from the topology on $U$ we can find an open $U^{\prime} \subset U$ such that $V=b^{-1}\left(U^{\prime}\right)$. Then we see that $Z \rightarrow V=b^{-1}\left(U^{\prime}\right) \rightarrow U^{\prime}$ is a composition of closed immersions and hence a closed immersion. This proves that $Z \rightarrow X$ is an immersion and we win.

## Constructions of Schemes

01LE

### 26.1. Introduction

01 LF In this chapter we introduce ways of constructing schemes out of others. A basic reference is DG67.

### 26.2. Relative glueing

01LG The following lemma is relevant in case we are trying to construct a scheme $X$ over $S$, and we already know how to construct the restriction of $X$ to the affine opens of $S$. The actual result is completely general and works in the setting of (locally) ringed spaces, although our proof is written in the language of schemes.

01LH Lemma 26.2.1. Let $S$ be a scheme. Let $\mathcal{B}$ be a basis for the topology of $S$. Suppose given the following data:
(1) For every $U \in \mathcal{B}$ a scheme $f_{U}: X_{U} \rightarrow U$ over $U$.
(2) For every pair $U, V \in \mathcal{B}$ such that $V \subset U$ a morphism $\rho_{V}^{U}: X_{V} \rightarrow X_{U}$. Assume that
(a) each $\rho_{V}^{U}$ induces an isomorphism $X_{V} \rightarrow f_{U}^{-1}(V)$ of schemes over $V$,
(b) whenever $W, V, U \in \mathcal{B}$, with $W \subset V \subset U$ we have $\rho_{W}^{U}=\rho_{V}^{U} \circ \rho_{W}^{V}$.

Then there exists a unique scheme $f: X \rightarrow S$ over $S$ and isomorphisms $i_{U}:$ $f^{-1}(U) \rightarrow X_{U}$ over $U$ such that for $V \subset U \subset S$ affine open the composition

$$
X_{V} \xrightarrow{i_{V}^{-1}} f^{-1}(V) \xrightarrow{\text { inclusion }} f^{-1}(U) \xrightarrow{i_{U}} X_{U}
$$

is the morphism $\rho_{V}^{U}$.
Proof. To prove this we will use Schemes, Lemma 25.15.4. First we define a contravariant functor $F$ from the category of schemes to the category of sets. Namely, for a scheme $T$ we set

$$
F(T)=\left\{\begin{array}{c}
\left(g,\left\{h_{U}\right\}_{U \in \mathcal{B}}\right), g: T \rightarrow S, h_{U}: g^{-1}(U) \rightarrow X_{U} \\
f_{U} \circ h_{U}=\left.g\right|_{g^{-1}(U)},\left.h_{U}\right|_{g^{-1}(V)}=\rho_{V}^{U} \circ h_{V} \forall V, U \in \mathcal{B}, V \subset U
\end{array}\right\} .
$$

The restriction mapping $F(T) \rightarrow F\left(T^{\prime}\right)$ given a morphism $T^{\prime} \rightarrow T$ is just gotten by composition. For any $W \in \mathcal{B}$ we consider the subfunctor $F_{W} \subset F$ consisting of those systems $\left(g,\left\{h_{U}\right\}\right)$ such that $g(T) \subset W$.

First we show $F$ satisfies the sheaf property for the Zariski topology. Suppose that $T$ is a scheme, $T=\bigcup V_{i}$ is an open covering, and $\xi_{i} \in F\left(V_{i}\right)$ is an element such that $\left.\xi_{i}\right|_{V_{i} \cap V_{j}}=\left.\xi_{j}\right|_{V_{i} \cap V_{j}}$. Say $\xi_{i}=\left(g_{i},\left\{h_{i, U}\right\}\right)$. Then we immediately see that the morphisms $g_{i}$ glue to a unique global morphism $g: T \rightarrow S$. Moreover, it is clear
that $g^{-1}(U)=\bigcup g_{i}^{-1}(U)$. Hence the morphisms $h_{i, U}: g_{i}^{-1}(U) \rightarrow X_{U}$ glue to a unique morphism $h_{U}: U \rightarrow X_{U}$. It is easy to verify that the system $\left(g,\left\{f_{U}\right\}\right)$ is an element of $F(T)$. Hence $F$ satisfies the sheaf property for the Zariski topology.

Next we verify that each $F_{W}, W \in \mathcal{B}$ is representable. Namely, we claim that the transformation of functors

$$
F_{W} \longrightarrow \operatorname{Mor}\left(-, X_{W}\right),\left(g,\left\{h_{U}\right\}\right) \longmapsto h_{W}
$$

is an isomorphism. To see this suppose that $T$ is a scheme and $\alpha: T \rightarrow X_{W}$ is a morphism. Set $g=f_{W} \circ \alpha$. For any $U \in \mathcal{B}$ such that $U \subset W$ we can define $h_{U}: g^{-1}(U) \rightarrow X_{U}$ be the composition $\left.\left(\rho_{U}^{W}\right)^{-1} \circ \alpha\right|_{g^{-1}(U)}$. This works because the image $\alpha\left(g^{-1}(U)\right)$ is contained in $f_{W}^{-1}(U)$ and condition (a) of the lemma. It is clear that $f_{U} \circ h_{U}=\left.g\right|_{g^{-1}(U)}$ for such a $U$. Moreover, if also $V \in \mathcal{B}$ and $V \subset U \subset W$, then $\rho_{V}^{U} \circ h_{V}=\left.h_{U}\right|_{g^{-1}(V)}$ by property (b) of the lemma. We still have to define $h_{U}$ for an arbitrary element $U \in \mathcal{B}$. Since $\mathcal{B}$ is a basis for the topology on $S$ we can find an open covering $U \cap W=\bigcup U_{i}$ with $U_{i} \in \mathcal{B}$. Since $g$ maps into $W$ we have $g^{-1}(U)=g^{-1}(U \cap W)=\bigcup g^{-1}\left(U_{i}\right)$. Consider the morphisms $h_{i}=\rho_{U_{i}}^{U} \circ h_{U_{i}}: g^{-1}\left(U_{i}\right) \rightarrow X_{U}$. It is a simple matter to use condition (b) of the lemma to prove that $\left.h_{i}\right|_{g^{-1}\left(U_{i}\right) \cap g^{-1}\left(U_{j}\right)}=\left.h_{j}\right|_{g^{-1}\left(U_{i}\right) \cap g^{-1}\left(U_{j}\right)}$. Hence these morphisms glue to give the desired morphism $h_{U}: g^{-1}(U) \rightarrow X_{U}$. We omit the (easy) verification that the system $\left(g,\left\{h_{U}\right\}\right)$ is an element of $F_{W}(T)$ which maps to $\alpha$ under the displayed arrow above.

Next, we verify each $F_{W} \subset F$ is representable by open immersions. This is clear from the definitions.

Finally we have to verify the collection $\left(F_{W}\right)_{W \in \mathcal{B}}$ covers $F$. This is clear by construction and the fact that $\mathcal{B}$ is a basis for the topology of $S$.

Let $X$ be a scheme representing the functor $F$. Let $\left(f,\left\{i_{U}\right\}\right) \in F(X)$ be a "universal family". Since each $F_{W}$ is representable by $X_{W}$ (via the morphism of functors displayed above) we see that $i_{W}: f^{-1}(W) \rightarrow X_{W}$ is an isomorphism as desired. The lemma is proved.

01LI Lemma 26.2.2. Let $S$ be a scheme. Let $\mathcal{B}$ be a basis for the topology of $S$. Suppose given the following data:
(1) For every $U \in \mathcal{B}$ a scheme $f_{U}: X_{U} \rightarrow U$ over $U$.
(2) For every $U \in \mathcal{B}$ a quasi-coherent sheaf $\mathcal{F}_{U}$ over $X_{U}$.
(3) For every pair $U, V \in \mathcal{B}$ such that $V \subset U$ a morphism $\rho_{V}^{U}: X_{V} \rightarrow X_{U}$.
(4) For every pair $U, V \in \mathcal{B}$ such that $V \subset U$ a morphism $\theta_{V}^{U}:\left(\rho_{V}^{U}\right)^{*} \mathcal{F}_{U} \rightarrow$ $\mathcal{F}_{V}$.
Assume that
(a) each $\rho_{V}^{U}$ induces an isomorphism $X_{V} \rightarrow f_{U}^{-1}(V)$ of schemes over $V$,
(b) each $\theta_{V}^{U}$ is an isomorphism,
(c) whenever $W, V, U \in \mathcal{B}$, with $W \subset V \subset U$ we have $\rho_{W}^{U}=\rho_{V}^{U} \circ \rho_{W}^{V}$,
(d) whenever $W, V, U \in \mathcal{B}$, with $W \subset V \subset U$ we have $\theta_{W}^{U}=\theta_{W}^{V} \circ\left(\rho_{W}^{V}\right)^{*} \theta_{V}^{U}$.

Then there exists a unique scheme $f: X \rightarrow S$ over $S$ together with a unique quasicoherent sheaf $\mathcal{F}$ on $X$ and isomorphisms $i_{U}: f^{-1}(U) \rightarrow X_{U}$ and $\theta_{U}: i_{U}^{*} \mathcal{F}_{U} \rightarrow$
$\left.\mathcal{F}\right|_{f^{-1}(U)}$ over $U$ such that for $V \subset U \subset S$ affine open the composition

$$
X_{V} \xrightarrow{i_{V}^{-1}} f^{-1}(V) \xrightarrow{\text { inclusion }} f^{-1}(U) \xrightarrow{i_{U}} X_{U}
$$

is the morphism $\rho_{V}^{U}$, and the composition
01LJ
(26.2.2.1) $\left(\rho_{V}^{U}\right)^{*} \mathcal{F}_{U}=\left(i_{V}^{-1}\right)^{*}\left(\left.\left(i_{U}^{*} \mathcal{F}_{U}\right)\right|_{f^{-1}(V)}\right) \xrightarrow{\left.\theta_{U}\right|_{f^{-1}(V)}}\left(i_{V}^{-1}\right)^{*}\left(\left.\mathcal{F}\right|_{f^{-1}(V)}\right) \xrightarrow{\theta_{V}^{-1}} \mathcal{F}_{V}$
is equal to $\theta_{V}^{U}$.
Proof. By Lemma 26.2.1 we get the scheme $X$ over $S$ and the isomorphisms $i_{U}$. Set $\mathcal{F}_{U}^{\prime}=i_{U}^{*} \mathcal{F}_{U}$ for $U \in \mathcal{B}$. This is a quasi-coherent $\mathcal{O}_{f^{-1}(U)}$-module. The maps

$$
\left.\mathcal{F}_{U}^{\prime}\right|_{f^{-1}(V)}=\left.i_{U}^{*} \mathcal{F}_{U}\right|_{f^{-1}(V)}=i_{V}^{*}\left(\rho_{V}^{U}\right)^{*} \mathcal{F}_{U} \xrightarrow{i_{V}^{*} \theta_{V}^{U}} i_{V}^{*} \mathcal{F}_{V}=\mathcal{F}_{V}^{\prime}
$$

define isomorphisms $\left(\theta^{\prime}\right)_{V}^{U}:\left.\mathcal{F}_{U}^{\prime}\right|_{f^{-1}(V)} \rightarrow \mathcal{F}_{V}^{\prime}$ whenever $V \subset U$ are elements of $\mathcal{B}$. Condition (d) says exactly that this is compatible in case we have a triple of elements $W \subset V \subset U$ of $\mathcal{B}$. This allows us to get well defined isomorphisms

$$
\varphi_{12}:\left.\left.\mathcal{F}_{U_{1}}^{\prime}\right|_{f-1}\left(U_{1} \cap U_{2}\right) \longrightarrow \mathcal{F}_{U_{2}}^{\prime}\right|_{f-1\left(U_{1} \cap U_{2}\right)}
$$

whenever $U_{1}, U_{2} \in \mathcal{B}$ by covering the intersection $U_{1} \cap U_{2}=\bigcup V_{j}$ by elements $V_{j}$ of $\mathcal{B}$ and taking

$$
\left.\varphi_{12}\right|_{V_{j}}=\left(\left(\theta^{\prime}\right)_{V_{j}}^{U_{2}}\right)^{-1} \circ\left(\theta^{\prime}\right)_{V_{j}}^{U_{1}} .
$$

We omit the verification that these maps do indeed glue to a $\varphi_{12}$ and we omit the verification of the cocycle condition of a glueing datum for sheaves (as in Sheaves, Section 6.33). By Sheaves, Lemma 6.33.2 we get our $\mathcal{F}$ on $X$. We omit the verification of 26.2.2.1).

01LK Remark 26.2.3. There is a functoriality property for the constructions explained in Lemmas 26.2 .1 and 26.2.2 Namely, suppose given two collections of data ( $f_{U}$ : $\left.X_{U} \rightarrow U, \rho_{V}^{U}\right)$ and $\left(g_{U}: Y_{U} \rightarrow U, \sigma_{V}^{U}\right)$ as in Lemma 26.2.1. Suppose for every $U \in \mathcal{B}$ given a morphism $h_{U}: X_{U} \rightarrow Y_{U}$ over $U$ compatible with the restrictions $\rho_{V}^{U}$ and $\sigma_{V}^{U}$. Functoriality means that this gives rise to a morphism of schemes $h: X \rightarrow Y$ over $S$ restricting back to the morphisms $h_{U}$, where $f: X \rightarrow S$ is obtained from the datum $\left(f_{U}: X_{U} \rightarrow U, \rho_{V}^{U}\right)$ and $g: Y \rightarrow S$ is obtained from the datum $\left(g_{U}: Y_{U} \rightarrow U, \sigma_{V}^{U}\right)$.

Similarly, suppose given two collections of data $\left(f_{U}: X_{U} \rightarrow U, \mathcal{F}_{U}, \rho_{V}^{U}, \theta_{V}^{U}\right)$ and $\left(g_{U}: Y_{U} \rightarrow U, \mathcal{G}_{U}, \sigma_{V}^{U}, \eta_{V}^{U}\right)$ as in Lemma 26.2.2. Suppose for every $U \in \mathcal{B}$ given a morphism $h_{U}: X_{U} \rightarrow Y_{U}$ over $U$ compatible with the restrictions $\rho_{V}^{U}$ and $\sigma_{V}^{U}$, and a morphism $\tau_{U}: h_{U}^{*} \mathcal{G}_{U} \rightarrow \mathcal{F}_{U}$ compatible with the maps $\theta_{V}^{U}$ and $\eta_{V}^{U}$. Functoriality means that these give rise to a morphism of schemes $h: X \rightarrow Y$ over $S$ restricting back to the morphisms $h_{U}$, and a morphism $h^{*} \mathcal{G} \rightarrow \mathcal{F}$ restricting back to the maps $h_{U}$ where $(f: X \rightarrow S, \mathcal{F})$ is obtained from the datum $\left(f_{U}: X_{U} \rightarrow U, \mathcal{F}_{U}, \rho_{V}^{U}, \theta_{V}^{U}\right)$ and where $(g: Y \rightarrow S, \mathcal{G})$ is obtained from the datum $\left(g_{U}: Y_{U} \rightarrow U, \mathcal{G}_{U}, \sigma_{V}^{U}, \eta_{V}^{U}\right)$.

We omit the verifications and we omit a suitable formulation of "equivalence of categories" between relative glueing data and relative objects.

### 26.3. Relative spectrum via glueing

01LL
01LM Situation 26.3.1. Here $S$ is a scheme, and $\mathcal{A}$ is a quasi-coherent $\mathcal{O}_{S}$-algebra. This means that $\mathcal{A}$ is a sheaf of $\mathcal{O}_{S}$-algebras which is quasi-coherent as an $\mathcal{O}_{S}$-module.

In this section we outline how to construct a morphism of schemes

$$
\underline{\operatorname{Spec}}_{S}(\mathcal{A}) \longrightarrow S
$$

by glueing the spectra $\operatorname{Spec}(\Gamma(U, \mathcal{A}))$ where $U$ ranges over the affine opens of $S$. We first show that the spectra of the values of $\mathcal{A}$ over affines form a suitable collection of schemes, as in Lemma 26.2.1.

01LN Lemma 26.3.2. In Situation 26.3.1. Suppose $U \subset U^{\prime} \subset S$ are affine opens. Let $A=\mathcal{A}(U)$ and $A^{\prime}=\mathcal{A}\left(U^{\prime}\right)$. The map of rings $A^{\prime} \rightarrow A$ induces a morphism $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$, and the diagram

is cartesian.
Proof. Let $R=\mathcal{O}_{S}(U)$ and $R^{\prime}=\mathcal{O}_{S}\left(U^{\prime}\right)$. Note that the map $R \otimes_{R^{\prime}} A^{\prime} \rightarrow A$ is an isomorphism as $\mathcal{A}$ is quasi-coherent (see Schemes, Lemma 25.7 .3 for example). The result follows from the description of the fibre product of affine schemes in Schemes, Lemma 25.6.7.

In particular the morphism $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$ of the lemma is an open immersion.
01 LO Lemma 26.3.3. In Situation 26.3.1. Suppose $U \subset U^{\prime} \subset U^{\prime \prime} \subset S$ are affine opens. Let $A=\mathcal{A}(U), A^{\prime}=\mathcal{A}\left(U^{\prime}\right)$ and $A^{\prime \prime}=\mathcal{A}\left(U^{\prime \prime}\right)$. The composition of the morphisms $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)$, and $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}\left(A^{\prime \prime}\right)$ of Lemma 26.3.2 gives the morphism $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(A^{\prime \prime}\right)$ of Lemma 26.3.2.

Proof. This follows as the map $A^{\prime \prime} \rightarrow A$ is the composition of $A^{\prime \prime} \rightarrow A^{\prime}$ and $A^{\prime} \rightarrow A$ (because $\mathcal{A}$ is a sheaf).

01LP Lemma 26.3.4. In Situation 26.3.1. There exists a morphism of schemes

$$
\pi: \underline{\operatorname{Spec}}_{S}(\mathcal{A}) \longrightarrow S
$$

with the following properties:
(1) for every affine open $U \subset S$ there exists an isomorphism $i_{U}: \pi^{-1}(U) \rightarrow$ $\operatorname{Spec}(\mathcal{A}(U))$, and
(2) for $U \subset U^{\prime} \subset S$ affine open the composition

$$
\operatorname{Spec}(\mathcal{A}(U)) \xrightarrow{i_{U}^{-1}} \pi^{-1}(U) \xrightarrow{\text { inclusion }} \pi^{-1}\left(U^{\prime}\right) \xrightarrow{i_{U^{\prime}}} \operatorname{Spec}\left(\mathcal{A}\left(U^{\prime}\right)\right)
$$

is the open immersion of Lemma 26.3.2 above.
Proof. Follows immediately from Lemmas 26.2.1, 26.3.2, and 26.3.3.

### 26.4. Relative spectrum as a functor

01 LQ We place ourselves in Situation 26.3.1, i.e., $S$ is a scheme and $\mathcal{A}$ is a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras.
For any $f: T \rightarrow S$ the pullback $f^{*} \mathcal{A}$ is a quasi-coherent sheaf of $\mathcal{O}_{T}$-algebras. We are going to consider pairs $(f: T \rightarrow S, \varphi)$ where $f$ is a morphism of schemes and $\varphi: f^{*} \mathcal{A} \rightarrow \mathcal{O}_{T}$ is a morphism of $\mathcal{O}_{T}$-algebras. Note that this is the same as giving a $f^{-1} \mathcal{O}_{S^{-}}$-algebra homomorphism $\varphi: f^{-1} \mathcal{A} \rightarrow \mathcal{O}_{T}$, see Sheaves, Lemma 6.20.2. This is also the same as giving a $\mathcal{O}_{S}$-algebra map $\varphi: \mathcal{A} \rightarrow f_{*} \mathcal{O}_{T}$, see Sheaves, Lemma 6.24.7. We will use all three ways of thinking about $\varphi$, without further mention.

Given such a pair $(f: T \rightarrow S, \varphi)$ and a morphism $a: T^{\prime} \rightarrow T$ we get a second pair $\left(f^{\prime}=f \circ a, \varphi^{\prime}=a^{*} \varphi\right)$ which we call the pullback of $(f, \varphi)$. One way to describe $\varphi^{\prime}=a^{*} \varphi$ is as the composition $\mathcal{A} \rightarrow f_{*} \mathcal{O}_{T} \rightarrow f_{*}^{\prime} \mathcal{O}_{T^{\prime}}$ where the second map is $f_{*} a^{\sharp}$ with $a^{\sharp}: \mathcal{O}_{T} \rightarrow a_{*} \mathcal{O}_{T^{\prime}}$. In this way we have defined a functor
01LR (26.4.0.1) $\quad F: S^{\text {S }} h^{\text {opp }} \longrightarrow$ Sets

$$
T \longmapsto F(T)=\{\text { pairs }(f, \varphi) \text { as above }\}
$$

01LS Lemma 26.4.1. In Situation 26.3.1. Let $F$ be the functor associated to $(S, \mathcal{A})$ above. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Set $\mathcal{A}^{\prime}=g^{*} \mathcal{A}$. Let $F^{\prime}$ be the functor associated to $\left(S^{\prime}, \mathcal{A}^{\prime}\right)$ above. Then there is a canonical isomorphism

$$
F^{\prime} \cong h_{S^{\prime}} \times_{h_{S}} F
$$

of functors.
Proof. A pair $\left(f^{\prime}: T \rightarrow S^{\prime}, \varphi^{\prime}:\left(f^{\prime}\right)^{*} \mathcal{A}^{\prime} \rightarrow \mathcal{O}_{T}\right)$ is the same as a pair $\left(f, \varphi: f^{*} \mathcal{A} \rightarrow\right.$ $\mathcal{O}_{T}$ ) together with a factorization of $f$ as $f=g \circ f^{\prime}$. Namely with this notation we have $\left(f^{\prime}\right)^{*} \mathcal{A}^{\prime}=\left(f^{\prime}\right)^{*} g^{*} \mathcal{A}=f^{*} \mathcal{A}$. Hence the lemma.

01LT Lemma 26.4.2. In Situation 26.3.1. Let $F$ be the functor associated to $(S, \mathcal{A})$ above. If $S$ is affine, then $F$ is representable by the affine scheme $\operatorname{Spec}(\Gamma(S, \mathcal{A}))$.
Proof. Write $S=\operatorname{Spec}(R)$ and $A=\Gamma(S, \mathcal{A})$. Then $A$ is an $R$-algebra and $\mathcal{A}=\widetilde{A}$. The ring map $R \rightarrow A$ gives rise to a canonical map

$$
f_{u n i v}: \operatorname{Spec}(A) \longrightarrow S=\operatorname{Spec}(R)
$$

We have $f_{\text {univ }}^{*} \mathcal{A}=\widetilde{A \otimes_{R} A}$ by Schemes, Lemma 25.7.3. Hence there is a canonical map

$$
\varphi_{\text {univ }}: f_{\text {univ }}^{*} \mathcal{A}=\widetilde{A \otimes_{R}} A \longrightarrow \widetilde{A}=\mathcal{O}_{\operatorname{Spec}(A)}
$$

coming from the $A$-module map $A \otimes_{R} A \rightarrow A, a \otimes a^{\prime} \mapsto a a^{\prime}$. We claim that the pair $\left(f_{\text {univ }}, \varphi_{\text {univ }}\right)$ represents $F$ in this case. In other words we claim that for any scheme $T$ the map

$$
\operatorname{Mor}(T, \operatorname{Spec}(A)) \longrightarrow\{\operatorname{pairs}(f, \varphi)\}, \quad a \longmapsto\left(a^{*} f_{\text {univ }}, a^{*} \varphi\right)
$$

is bijective.
Let us construct the inverse map. For any pair $(f: T \rightarrow S, \varphi)$ we get the induced ring map

$$
A=\Gamma(S, \mathcal{A}) \xrightarrow{f^{*}} \Gamma\left(T, f^{*} \mathcal{A}\right) \xrightarrow{\varphi} \Gamma\left(T, \mathcal{O}_{T}\right)
$$

This induces a morphism of schemes $T \rightarrow \operatorname{Spec}(A)$ by Schemes, Lemma 25.6.4
The verification that this map is inverse to the map displayed above is omitted.

01LU Lemma 26.4.3. In Situation 26.3.1. The functor $F$ is representable by a scheme.
Proof. We are going to use Schemes, Lemma 25.15.4.
First we check that $F$ satisfies the sheaf property for the Zariski topology. Namely, suppose that $T$ is a scheme, that $T=\bigcup_{i \in I} U_{i}$ is an open covering, and that $\left(f_{i}, \varphi_{i}\right) \in$ $F\left(U_{i}\right)$ such that $\left.\left(f_{i}, \varphi_{i}\right)\right|_{U_{i} \cap U_{j}}=\left.\left(f_{j}, \varphi_{j}\right)\right|_{U_{i} \cap U_{j}}$. This implies that the morphisms $f_{i}: U_{i} \rightarrow S$ glue to a morphism of schemes $f: T \rightarrow S$ such that $\left.f\right|_{I_{i}}=f_{i}$, see Schemes, Section 25.14. Thus $f_{i}^{*} \mathcal{A}=\left.f^{*} \mathcal{A}\right|_{U_{i}}$ and by assumption the morphisms $\varphi_{i}$ agree on $U_{i} \cap U_{j}$. Hence by Sheaves, Section 6.33 these glue to a morphism of $\mathcal{O}_{T}$-algebras $f^{*} \mathcal{A} \rightarrow \mathcal{O}_{T}$. This proves that $F$ satisfies the sheaf condition with respect to the Zariski topology.

Let $S=\bigcup_{i \in I} U_{i}$ be an affine open covering. Let $F_{i} \subset F$ be the subfunctor consisting of those pairs $(f: T \rightarrow S, \varphi)$ such that $f(T) \subset U_{i}$.

We have to show each $F_{i}$ is representable. This is the case because $F_{i}$ is identified with the functor associated to $U_{i}$ equipped with the quasi-coherent $\mathcal{O}_{U_{i}}$-algebra $\left.\mathcal{A}\right|_{U_{i}}$, by Lemma 26.4.1. Thus the result follows from Lemma 26.4.2.
Next we show that $F_{i} \subset F$ is representable by open immersions. Let $(f: T \rightarrow$ $S, \varphi) \in F(T)$. Consider $V_{i}=f^{-1}\left(U_{i}\right)$. It follows from the definition of $F_{i}$ that given $a: T^{\prime} \rightarrow T$ we gave $a^{*}(f, \varphi) \in F_{i}\left(T^{\prime}\right)$ if and only if $a\left(T^{\prime}\right) \subset V_{i}$. This is what we were required to show.

Finally, we have to show that the collection $\left(F_{i}\right)_{i \in I}$ covers $F$. Let $(f: T \rightarrow S, \varphi) \in$ $F(T)$. Consider $V_{i}=f^{-1}\left(U_{i}\right)$. Since $S=\bigcup_{i \in I} U_{i}$ is an open covering of $S$ we see that $T=\bigcup_{i \in I} V_{i}$ is an open covering of $T$. Moreover $\left.(f, \varphi)\right|_{V_{i}} \in F_{i}\left(V_{i}\right)$. This finishes the proof of the lemma.

01LV Lemma 26.4.4. In Situation 26.3.1. The scheme $\pi:{\underline{\operatorname{Spec}_{S}}(\mathcal{A}) \rightarrow S \text { constructed }}$ in Lemma 26.3.4 and the scheme representing the functor $F$ are canonically isomorphic as schemes over $S$.

Proof. Let $X \rightarrow S$ be the scheme representing the functor $F$. Consider the sheaf of $\mathcal{O}_{S}$-algebras $\mathcal{R}=\pi_{*} \mathcal{O}_{\text {Spec }_{S}(\mathcal{A})}$. By construction of $\underline{\operatorname{Spec}}_{S}(\mathcal{A})$ we have isomorphisms $\mathcal{A}(U) \rightarrow \mathcal{R}(U)$ for every affine open $U \subset S$; this follows from Lemma 26.3.4 part (1). For $U \subset U^{\prime} \subset S$ open these isomorphisms are compatible with the restriction mappings; this follows from Lemma 26.3 .4 part (2). Hence by Sheaves, Lemma 6.30 .13 these isomorphisms result from an isomorphism of $\mathcal{O}_{S}$-algebras $\varphi: \mathcal{A} \rightarrow \mathcal{R}$. Hence this gives an element $\left(\underline{\operatorname{Spec}}_{S}(\mathcal{A}), \varphi\right) \in F\left(\underline{\operatorname{Spec}}_{S}(\mathcal{A})\right)$. Since $X$ represents the functor $F$ we get a corresponding morphism of schemes can : $\underline{\operatorname{Spec}}_{S}(\mathcal{A}) \rightarrow X$ over $S$.
Let $U \subset S$ be any affine open. Let $F_{U} \subset F$ be the subfunctor of $F$ corresponding to pairs $(f, \varphi)$ over schemes $T$ with $f(T) \subset U$. Clearly the base change $X_{U}$ represents $F_{U}$. Moreover, $F_{U}$ is represented by $\operatorname{Spec}(\mathcal{A}(U))=\pi^{-1}(U)$ according to Lemma 26.4.2 In other words $X_{U} \cong \pi^{-1}(U)$. We omit the verification that this identification is brought about by the base change of the morphism can to $U$.

01LW Definition 26.4.5. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{S^{-}}$ algebras. The relative spectrum of $\mathcal{A}$ over $S$, or simply the spectrum of $\mathcal{A}$ over $S$ is the scheme constructed in Lemma 26.3.4 which represents the functor $F$ 26.4.0.1,
see Lemma 26.4.4 We denote it $\pi: \underline{\operatorname{Spec}}_{S}(\mathcal{A}) \rightarrow S$. The "universal family" is a morphism of $\mathcal{O}_{S}$-algebras

$$
\mathcal{A} \longrightarrow \pi_{*} \mathcal{O}_{{\underline{\mathrm{Spec}_{S}}}_{S}(\mathcal{A})}
$$

The following lemma says among other things that forming the relative spectrum commutes with base change.

01LX Lemma 26.4.6. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{S^{-}}$ algebras. Let $\pi: \underline{\operatorname{Spec}}_{S}(\mathcal{A}) \rightarrow S$ be the relative spectrum of $\mathcal{A}$ over $S$.
(1) For every affine open $U \subset S$ the inverse image $\pi^{-1}(U)$ is affine.
(2) For every morphism $g: S^{\prime} \rightarrow S$ we have $S^{\prime} \times{ }_{S} \underline{\operatorname{Spec}}_{S}(\mathcal{A})=\underline{\operatorname{Spec}}_{S^{\prime}}\left(g^{*} \mathcal{A}\right)$.
(3) The universal map

$$
\mathcal{A} \longrightarrow \pi_{*} \mathcal{O}_{{\underline{\mathrm{Spec}_{S}}}(\mathcal{A})}
$$

is an isomorphism of $\mathcal{O}_{S}$-algebras.
Proof. Part (1) comes from the description of the relative spectrum by glueing, see Lemma 26.3.4. Part (2) follows immediately from Lemma 26.4.1. Part (3) follows because it is local on $S$ and it is clear in case $S$ is affine by Lemma 26.4.2 for example.

01LY Lemma 26.4.7. Let $f: X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. By Schemes, Lemma 25.24.1 the sheaf $f_{*} \mathcal{O}_{X}$ is a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras. There is a canonical morphism

$$
\operatorname{can}: X \longrightarrow \underline{\operatorname{Spec}}_{S}\left(f_{*} \mathcal{O}_{X}\right)
$$

of schemes over $S$. For any affine open $U \subset S$ the restriction can $\left.\right|_{f^{-1}(U)}$ is identified with the canonical morphism

$$
f^{-1}(U) \longrightarrow \operatorname{Spec}\left(\Gamma\left(f^{-1}(U), \mathcal{O}_{X}\right)\right)
$$

coming from Schemes, Lemma 25.6.4.
Proof. The morphism comes, via the definition of Spec as the scheme representing the functor $F$, from the canonical map $\varphi: f^{*} f_{*} \mathcal{O}_{X} \rightarrow \mathcal{O}_{X}$ (which by adjointness of push and pull corresponds to id : $\left.f_{*} \mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{X}\right)$. The statement on the restriction to $f^{-1}(U)$ follows from the description of the relative spectrum over affines, see Lemma 26.4.2.

### 26.5. Affine n-space

01 LZ As an application of the relative spectrum we define affine $n$-space over a base scheme $S$ as follows. For any integer $n \geq 0$ we can consider the quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras $\mathcal{O}_{S}\left[T_{1}, \ldots, T_{n}\right]$. It is quasi-coherent because as a sheaf of $\mathcal{O}_{S}$-modules it is just the direct sum of copies of $\mathcal{O}_{S}$ indexed by multi-indices.

01M0 Definition 26.5.1. Let $S$ be a scheme and $n \geq 0$. The scheme

$$
\mathbf{A}_{S}^{n}=\underline{\operatorname{Spec}}_{S}\left(\mathcal{O}_{S}\left[T_{1}, \ldots, T_{n}\right]\right)
$$

over $S$ is called affine $n$-space over $S$. If $S=\operatorname{Spec}(R)$ is affine then we also call this affine $n$-space over $R$ and we denote it $\mathbf{A}_{R}^{n}$.

Note that $\mathbf{A}_{R}^{n}=\operatorname{Spec}\left(R\left[T_{1}, \ldots, T_{n}\right]\right)$. For any morphism $g: S^{\prime} \rightarrow S$ of schemes we have $g^{*} \mathcal{O}_{S}\left[T_{1}, \ldots, T_{n}\right]=\mathcal{O}_{S^{\prime}}\left[T_{1}, \ldots, T_{n}\right]$ and hence $\mathbf{A}_{S^{\prime}}^{n}=S^{\prime} \times_{S} \mathbf{A}_{S}^{n}$ is the base change. Therefore an alternative definition of affine $n$-space is the formula

$$
\mathbf{A}_{S}^{n}=S \times_{\operatorname{Spec}(\mathbf{Z})} \mathbf{A}_{\mathbf{Z}}^{n}
$$

Also, a morphism from an $S$-scheme $f: X \rightarrow S$ to $\mathbf{A}_{S}^{n}$ is given by a homomorphism of $\mathcal{O}_{S}$-algebras $\mathcal{O}_{S}\left[T_{1}, \ldots, T_{n}\right] \rightarrow f_{*} \mathcal{O}_{X}$. This is clearly the same thing as giving the images of the $T_{i}$. In other words, a morphism from $X$ to $\mathbf{A}_{S}^{n}$ over $S$ is the same as giving $n$ elements $h_{1}, \ldots, h_{n} \in \Gamma\left(X, \mathcal{O}_{X}\right)$.

### 26.6. Vector bundles

01 M 1 Let $S$ be a scheme. Let $\mathcal{E}$ be a quasi-coherent sheaf of $\mathcal{O}_{S}$-modules. By Modules, Lemma 17.18 .6 the symmetric algebra $\operatorname{Sym}(\mathcal{E})$ of $\mathcal{E}$ over $\mathcal{O}_{S}$ is a quasi-coherent sheaf of $\overline{\mathcal{O}_{S}}$-algebras. Hence it makes sense to apply the construction of the previous section to it.

01M2 Definition 26.6.1. Let $S$ be a scheme. Let $\mathcal{E}$ be a quasi-coherent $\mathcal{O}_{S}$-modul ${ }^{1}$ The vector bundle associated to $\mathcal{E}$ is

$$
\mathbf{V}(\mathcal{E})=\underline{\operatorname{Spec}}_{S}(\operatorname{Sym}(\mathcal{E}))
$$

The vector bundle associated to $\mathcal{E}$ comes with a bit of extra structure. Namely, we have a grading

$$
\pi_{*} \mathcal{O}_{\mathbf{V}(\mathcal{E})}=\bigoplus_{n \geq 0} \operatorname{Sym}^{n}(\mathcal{E})
$$

which turns $\pi_{*} \mathcal{O}_{\mathbf{V}(\mathcal{E})}$ into a graded $\mathcal{O}_{S^{-}}$-algebra. Conversely, we can recover $\mathcal{E}$ from the degree 1 part of this. Thus we define an abstract vector bundle as follows.

062M Definition 26.6.2. Let $S$ be a scheme. A vector bundle $\pi: V \rightarrow S$ over $S$ is an affine morphism of schemes such that $\pi_{*} \mathcal{O}_{V}$ is endowed with the structure of a graded $\mathcal{O}_{S}$-algebra $\pi_{*} \mathcal{O}_{V}=\bigoplus_{n \geq 0} \mathcal{E}_{n}$ such that $\mathcal{E}_{0}=\mathcal{O}_{S}$ and such that the maps

$$
\operatorname{Sym}^{n}\left(\mathcal{E}_{1}\right) \longrightarrow \mathcal{E}_{n}
$$

are isomorphisms for all $n \geq 0$. A morphism of vector bundles over $S$ is a morphism $f: V \rightarrow V^{\prime}$ such that the induced map

$$
f^{*}: \pi_{*}^{\prime} \mathcal{O}_{V^{\prime}} \longrightarrow \pi_{*} \mathcal{O}_{V}
$$

is compatible with the given gradings.
An example of a vector bundle over $S$ is affine $n$-space $\mathbf{A}_{S}^{n}$ over $S$, see Definition 26.5.1. This is true because $\mathcal{O}_{S}\left[T_{1}, \ldots, T_{n}\right]=\operatorname{Sym}\left(\mathcal{O}_{S}^{\oplus n}\right)$.

062N Lemma 26.6.3. The category of vector bundles over a scheme $S$ is anti-equivalent to the category of quasi-coherent $\mathcal{O}_{S}$-modules.

Proof. Omitted. Hint: In one direction one uses the functor $\underline{S p e c}_{S}(-)$ and in the other the functor $(\pi: V \rightarrow S) \rightsquigarrow\left(\pi_{*} \mathcal{O}_{V}\right)_{1}$ (degree 1 part).

[^64]
### 26.7. Cones

062 P In algebraic geometry cones correspond to graded algebras. By our conventions a graded ring or algebra $A$ comes with a grading $A=\bigoplus_{d \geq 0} A_{d}$ by the nonnegative integers, see Algebra, Section 10.55 .
062Q Definition 26.7.1. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S^{-}}$ algebra. Assume that $\mathcal{O}_{S} \rightarrow \mathcal{A}_{0}$ is an isomorphism ${ }^{2}$. The cone associated to $\mathcal{A}$ or the affine cone associated to $\mathcal{A}$ is

$$
C(\mathcal{A})=\underline{\operatorname{spec}}_{S}(\mathcal{A})
$$

The cone associated to a graded sheaf of $\mathcal{O}_{S}$-algebras comes with a bit of extra structure. Namely, we obtain a grading

$$
\pi_{*} \mathcal{O}_{C(\mathcal{A})}=\bigoplus_{n \geq 0} \mathcal{A}_{n}
$$

Thus we can define an abstract cone as follows.
062R Definition 26.7.2. Let $S$ be a scheme. A cone $\pi: C \rightarrow S$ over $S$ is an affine morphism of schemes such that $\pi_{*} \mathcal{O}_{C}$ is endowed with the structure of a graded $\mathcal{O}_{S}$-algebra $\pi_{*} \mathcal{O}_{C}=\bigoplus_{n \geq 0} \mathcal{A}_{n}$ such that $\mathcal{A}_{0}=\mathcal{O}_{S}$. A morphism of cones from $\pi: C \rightarrow S$ to $\pi^{\prime}: C^{\prime} \rightarrow S$ is a morphism $f: C \rightarrow C^{\prime}$ such that the induced map

$$
f^{*}: \pi_{*}^{\prime} \mathcal{O}_{C^{\prime}} \longrightarrow \pi_{*} \mathcal{O}_{C}
$$

is compatible with the given gradings.
Any vector bundle is an example of a cone. In fact the category of vector bundles over $S$ is a full subcategory of the category of cones over $S$.

### 26.8. Proj of a graded ring

01M3 Let $S$ be a graded ring. Consider the topological space $\operatorname{Proj}(S)$ associated to $S$, see Algebra, Section 10.56. We will endow this space with a sheaf of rings $\mathcal{O}_{\operatorname{Proj}(S)}$ such that the resulting pair $\left(\operatorname{Proj}(S), \mathcal{O}_{\operatorname{Proj}(S)}\right)$ will be a scheme.

Recall that $\operatorname{Proj}(S)$ has a basis of open sets $D_{+}(f), f \in S_{d}, d \geq 1$ which we call standard opens, see Algebra, Section 10.56 . This terminology will always imply that $f$ is homogeneous of positive degree even if we forget to mention it. In addition, the intersection of two standard opens is another: $D_{+}(f) \cap D_{+}(g)=D_{+}(f g)$, for $f, g \in S$ homogeneous of positive degree.
01M4 Lemma 26.8.1. Let $S$ be a graded ring. Let $f \in S$ homogeneous of positive degree.
(1) If $g \in S$ homogeneous of positive degree and $D_{+}(g) \subset D_{+}(f)$, then
(a) $f$ is invertible in $S_{g}$, and $f^{\operatorname{deg}(g)} / g^{\operatorname{deg}(f)}$ is invertible in $S_{(g)}$,
(b) $g^{e}=a f$ for some $e \geq 1$ and $a \in S$ homogeneous,
(c) there is a canonical $S$-algebra map $S_{f} \rightarrow S_{g}$,
(d) there is a canonical $S_{0}$-algebra map $S_{(f)} \rightarrow S_{(g)}$ compatible with the $\operatorname{map} S_{f} \rightarrow S_{g}$,
(e) the map $S_{(f)} \rightarrow S_{(g)}$ induces an isomorphism

$$
\left(S_{(f)}\right)_{g^{\operatorname{deg}(f)} / f^{\operatorname{deg}(g)}} \cong S_{(g)}
$$

[^65](f) these maps induce a commutative diagram of topological spaces

where the horizontal maps are homeomorphisms and the vertical maps are open immersions,
(g) there are compatible canonical $S_{f}$ and $S_{(f)}$-module maps $M_{f} \rightarrow M_{g}$ and $M_{(f)} \rightarrow M_{(g)}$ for any graded $S$-module $M$, and
(h) the map $M_{(f)} \rightarrow M_{(g)}$ induces an isomorphism
$$
\left(M_{(f)}\right)_{g^{\operatorname{deg}(f)} / f^{\operatorname{deg}(g)}} \cong M_{(g)}
$$
(2) Any open covering of $D_{+}(f)$ can be refined to a finite open covering of the form $D_{+}(f)=\bigcup_{i=1}^{n} D_{+}\left(g_{i}\right)$.
(3) Let $g_{1}, \ldots, g_{n} \in S$ be homogeneous of positive degree. Then $D_{+}(f) \subset$ $\cup D_{+}\left(g_{i}\right)$ if and only if $g_{1}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(g_{1}\right)}, \ldots, g_{n}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(g_{n}\right)}$ generate the unit ideal in $S_{(f)}$.

Proof. Recall that $D_{+}(g)=\operatorname{Spec}\left(S_{(g)}\right)$ with identification given by the ring maps $S \rightarrow S_{g} \leftarrow S_{(g)}$, see Algebra, Lemma 10.56.3. Thus $f^{\operatorname{deg}(g)} / g^{\operatorname{deg}(f)}$ is an element of $S_{(g)}$ which is not contained in any prime ideal, and hence invertible, see Algebra, Lemma 10.16.2. We conclude that (a) holds. Write the inverse of $f$ in $S_{g}$ as $a / g^{d}$. We may replace $a$ by its homogeneous part of degree $d \operatorname{deg}(g)-\operatorname{deg}(f)$. This means $g^{d}-a f$ is annihilated by a power of $g$, whence $g^{e}=a f$ for some $a \in S$ homogeneous of degree $e \operatorname{deg}(g)-\operatorname{deg}(f)$. This proves (b). For (c), the map $S_{f} \rightarrow S_{g}$ exists by (a) from the universal property of localization, or we can define it by mapping $b / f^{n}$ to $a^{n} b / g^{n e}$. This clearly induces a map of the subrings $S_{(f)} \rightarrow S_{(g)}$ of degree zero elements as well. We can similarly define $M_{f} \rightarrow M_{g}$ and $M_{(f)} \rightarrow M_{(g)}$ by mapping $x / f^{n}$ to $a^{n} x / g^{n e}$. The statements writing $S_{(g)}$ resp. $M_{(g)}$ as principal localizations of $S_{(f)}$ resp. $M_{(f)}$ are clear from the formulas above. The maps in the commutative diagram of topological spaces correspond to the ring maps given above. The horizontal arrows are homeomorphisms by Algebra, Lemma 10.56.3. The vertical arrows are open immersions since the left one is the inclusion of an open subset.

The open $D_{+}(f)$ is quasi-compact because it is homeomorphic to $\operatorname{Spec}\left(S_{(f)}\right)$, see Algebra, Lemma 10.16.10. Hence the second statement follows directly from the fact that the standard opens form a basis for the topology.

The third statement follows directly from Algebra, Lemma 10.16 .2 .
In Sheaves, Section 6.30 we defined the notion of a sheaf on a basis, and we showed that it is essentially equivalent to the notion of a sheaf on the space, see Sheaves, Lemmas 6.30.6 and 6.30.9. Moreover, we showed in Sheaves, Lemma 6.30.4 that it is sufficient to check the sheaf condition on a cofinal system of open coverings for each standard open. By the lemma above it suffices to check on the finite coverings by standard opens.

01M5 Definition 26.8.2. Let $S$ be a graded ring. Suppose that $D_{+}(f) \subset \operatorname{Proj}(S)$ is a standard open. A standard open covering of $D_{+}(f)$ is a covering $D_{+}(f)=$ $\bigcup_{i=1}^{n} D_{+}\left(g_{i}\right)$, where $g_{1}, \ldots, g_{n} \in S$ are homogeneous of positive degree.
Let $S$ be a graded ring. Let $M$ be a graded $S$-module. We will define a presheaf $\widetilde{M}$ on the basis of standard opens. Suppose that $U \subset \operatorname{Proj}(S)$ is a standard open. If $f, g \in S$ are homogeneous of positive degree such that $D_{+}(f)=D_{+}(g)$, then by Lemma 26.8.1 above there are canonical maps $M_{(f)} \rightarrow M_{(g)}$ and $M_{(g)} \rightarrow M_{(f)}$ which are mutually inverse. Hence we may choose any $f$ such that $U=D_{+}(f)$ and define

$$
\widetilde{M}(U)=M_{(f)}
$$

Note that if $D_{+}(g) \subset D_{+}(f)$, then by Lemma 26.8.1 above we have a canonical map

$$
\widetilde{M}\left(D_{+}(f)\right)=M_{(f)} \longrightarrow M_{(g)}=\widetilde{M}\left(D_{+}(g)\right)
$$

Clearly, this defines a presheaf of abelian groups on the basis of standard opens. If $M=S$, then $\widetilde{S}$ is a presheaf of rings on the basis of standard opens. And for general $M$ we see that $\widetilde{M}$ is a presheaf of $\widetilde{S}$-modules on the basis of standard opens.
Let us compute the stalk of $\widetilde{M}$ at a point $x \in \operatorname{Proj}(S)$. Suppose that $x$ corresponds to the homogeneous prime ideal $\mathfrak{p} \subset S$. By definition of the stalk we see that

$$
\widetilde{M}_{x}=\operatorname{colim}_{f \in S_{d}, d>0, f \notin \mathfrak{p}} M_{(f)}
$$

Here the set $\left\{f \in S_{d}, d>0, f \notin \mathfrak{p}\right\}$ is partially ordered by the rule $f \geq f^{\prime} \Leftrightarrow$ $D_{+}(f) \subset D_{+}\left(f^{\prime}\right)$. If $f_{1}, f_{2} \in S \backslash \mathfrak{p}$ are homogeneous of positive degree, then we have $f_{1} f_{2} \geq f_{1}$ in this ordering. In Algebra, Section 10.56 we defined $M_{(\mathfrak{p})}$ as the ring whose elements are fractions $x / f$ with $x, f$ homogeneous, $\operatorname{deg}(x)=\operatorname{deg}(f)$, $f \notin \mathfrak{p}$. Since $\mathfrak{p} \in \operatorname{Proj}(S)$ there exists at least one $f_{0} \in S$ homogeneous of positive degree with $f_{0} \notin \mathfrak{p}$. Hence $x / f=f_{0} x / f f_{0}$ and we see that we may always assume the denominator of an element in $M_{(\mathfrak{p})}$ has positive degree. From these remarks it follows easily that

$$
\widetilde{M}_{x}=M_{(\mathfrak{p})}
$$

Next, we check the sheaf condition for the standard open coverings. If $D_{+}(f)=$ $\bigcup_{i=1}^{n} D_{+}\left(g_{i}\right)$, then the sheaf condition for this covering is equivalent with the exactness of the sequence

$$
0 \rightarrow M_{(f)} \rightarrow \bigoplus M_{\left(g_{i}\right)} \rightarrow \bigoplus M_{\left(g_{i} g_{j}\right)}
$$

Note that $D_{+}\left(g_{i}\right)=D_{+}\left(f g_{i}\right)$, and hence we can rewrite this sequence as the sequence

$$
0 \rightarrow M_{(f)} \rightarrow \bigoplus M_{\left(f g_{i}\right)} \rightarrow \bigoplus M_{\left(f g_{i} g_{j}\right)}
$$

By Lemma 26.8.1 we see that $g_{1}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(g_{1}\right)}, \ldots, g_{n}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(g_{n}\right)}$ generate the unit ideal in $S_{(f)}$, and that the modules $M_{\left(f g_{i}\right)}, M_{\left(f g_{i} g_{j}\right)}$ are the principal localizations of the $S_{(f)}$-module $M_{(f)}$ at these elements and their products. Thus we may apply Algebra, Lemma 10.22 .2 to the module $M_{(f)}$ over $S_{(f)}$ and the elements $g_{1}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(g_{1}\right)}, \ldots, g_{n}^{\operatorname{deg}(f)} / f^{\operatorname{deg}\left(g_{n}\right)}$. We conclude that the sequence is exact. By the remarks made above, we see that $\widetilde{M}$ is a sheaf on the basis of standard opens.
Thus we conclude from the material in Sheaves, Section 6.30 that there exists a unique sheaf of rings $\mathcal{O}_{\operatorname{Proj}(S)}$ which agrees with $\widetilde{S}$ on the standard opens. Note
that by our computation of stalks above and Algebra, Lemma 10.56 .5 the stalks of this sheaf of rings are all local rings.
Similarly, for any graded $S$-module $M$ there exists a unique sheaf of $\mathcal{O}_{\operatorname{Proj}(S)^{-}}$ modules $\mathcal{F}$ which agrees with $\widetilde{M}$ on the standard opens, see Sheaves, Lemma 6.30 .12

01M6 Definition 26.8.3. Let $S$ be a graded ring.
(1) The structure sheaf $\mathcal{O}_{\operatorname{Proj}(S)}$ of the homogeneous spectrum of $S$ is the unique sheaf of rings $\mathcal{O}_{\operatorname{Proj}(S)}$ which agrees with $\widetilde{S}$ on the basis of standard opens.
(2) The locally ringed space $\left(\operatorname{Proj}(S), \mathcal{O}_{\operatorname{Proj}(S)}\right)$ is called the homogeneous spectrum of $S$ and denoted $\operatorname{Proj}(S)$.
(3) The sheaf of $\mathcal{O}_{\operatorname{Proj}(S)}$-modules extending $\widetilde{M}$ to all opens of $\operatorname{Proj}(S)$ is called the sheaf of $\mathcal{O}_{\operatorname{Proj}(S)}$-modules associated to $M$. This sheaf is denoted $\widetilde{M}$ as well.
We summarize the results obtained so far.
01M7 Lemma 26.8.4. Let $S$ be a graded ring. Let $M$ be a graded $S$-module. Let $\widetilde{M}$ be the sheaf of $\mathcal{O}_{\operatorname{Proj}(S)}$-modules associated to $M$.
(1) For every $f \in S$ homogeneous of positive degree we have

$$
\Gamma\left(D_{+}(f), \mathcal{O}_{\operatorname{Proj}(S)}\right)=S_{(f)}
$$

(2) For every $f \in S$ homogeneous of positive degree we have $\Gamma\left(D_{+}(f), \widetilde{M}\right)=$ $M_{(f)}$ as an $S_{(f)}$-module.
(3) Whenever $D_{+}(g) \subset D_{+}(f)$ the restriction mappings on $\mathcal{O}_{\operatorname{Proj}(S)}$ and $\widetilde{M}$ are the maps $S_{(f)} \rightarrow S_{(g)}$ and $M_{(f)} \rightarrow M_{(g)}$ from Lemma 26.8.1.
(4) Let $\mathfrak{p}$ be a homogeneous prime of $S$ not containing $S_{+}$, and let $x \in \operatorname{Proj}(S)$ be the corresponding point. We have $\mathcal{O}_{\operatorname{Proj}(S), x}=S_{(\mathfrak{p})}$.
(5) Let $\mathfrak{p}$ be a homogeneous prime of $S$ not containing $S_{+}$, and let $x \in \operatorname{Proj}(S)$ be the corresponding point. We have $\mathcal{F}_{x}=M_{(\mathfrak{p})}$ as an $S_{(\mathfrak{p})}$-module.
01M8
(6) There is a canonical ring map $S_{0} \longrightarrow \Gamma(\operatorname{Proj}(S), \widetilde{S})$ and a canonical $S_{0-}$ module map $M_{0} \longrightarrow \Gamma(\operatorname{Proj}(S), \widetilde{M})$ compatible with the descriptions of sections over standard opens and stalks above.
Moreover, all these identifications are functorial in the graded $S$-module $M$. In particular, the functor $M \mapsto \widetilde{M}$ is an exact functor from the category of graded $S$-modules to the category of $\mathcal{O}_{\operatorname{Proj}(S)}$-modules.
Proof. Assertions (1) - (5) are clear from the discussion above. We see (6) since there are canonical maps $M_{0} \rightarrow M_{(f)}, x \mapsto x / 1$ compatible with the restriction maps described in (3). The exactness of the functor $M \mapsto \widetilde{M}$ follows from the fact that the functor $M \mapsto M_{(\mathfrak{p})}$ is exact (see Algebra, Lemma 10.56.5) and the fact that exactness of short exact sequences may be checked on stalks, see Modules, Lemma 17.3.1.

01M9 Remark 26.8.5. The map from $M_{0}$ to the global sections of $\widetilde{M}$ is generally far from being an isomorphism. A trivial example is to take $S=k[x, y, z]$ with $1=\operatorname{deg}(x)=\operatorname{deg}(y)=\operatorname{deg}(z)$ (or any number of variables) and to take $M=$ $S /\left(x^{100}, y^{100}, z^{100}\right)$. It is easy to see that $\widetilde{M}=0$, but $M_{0}=k$.

01MA Lemma 26.8.6. Let $S$ be a graded ring. Let $f \in S$ be homogeneous of positive degree. Suppose that $D(g) \subset \operatorname{Spec}\left(S_{(f)}\right)$ is a standard open. Then there exists a $h \in$ $S$ homogeneous of positive degree such that $D(g)$ corresponds to $D_{+}(h) \subset D_{+}(f)$ via the homeomorphism of Algebra, Lemma 10.56.3. In fact we can take $h$ such that $g=h / f^{n}$ for some $n$.

Proof. Write $g=h / f^{n}$ for some $h$ homogeneous of positive degree and some $n \geq 1$. If $D_{+}(h)$ is not contained in $D_{+}(f)$ then we replace $h$ by $h f$ and $n$ by $n+1$. Then $h$ has the required shape and $D_{+}(h) \subset D_{+}(f)$ corresponds to $D(g) \subset \operatorname{Spec}\left(S_{(f)}\right)$.

01MB Lemma 26.8.7. Let $S$ be a graded ring. The locally ringed space Proj $(S)$ is a scheme. The standard opens $D_{+}(f)$ are affine opens. For any graded $S$-module $M$ the sheaf $\widetilde{M}$ is a quasi-coherent sheaf of $\mathcal{O}_{\operatorname{Proj}(S)}$-modules.

Proof. Consider a standard open $D_{+}(f) \subset \operatorname{Proj}(S)$. By Lemmas 26.8.1 and 26.8.4 we have $\Gamma\left(D_{+}(f), \mathcal{O}_{\operatorname{Proj}(S)}\right)=S_{(f)}$, and we have a homeomorphism $\varphi: D_{+}(f) \rightarrow$ $\operatorname{Spec}\left(S_{(f)}\right)$. For any standard open $D(g) \subset \operatorname{Spec}\left(S_{(f)}\right)$ we may pick a $h \in S_{+}$as in Lemma 26.8.6. Then $\varphi^{-1}(D(g))=D_{+}(h)$, and by Lemmas 26.8.4 and 26.8.1 we see

$$
\Gamma\left(D_{+}(h), \mathcal{O}_{\operatorname{Proj}(S)}\right)=S_{(h)}=\left(S_{(f)}\right)_{h^{\operatorname{deg}(f)} / f^{\operatorname{deg}(h)}}=\left(S_{(f)}\right)_{g}=\Gamma\left(D(g), \mathcal{O}_{\operatorname{Spec}\left(S_{(f)}\right)}\right)
$$

Thus the restriction of $\mathcal{O}_{\operatorname{Proj}(S)}$ to $D_{+}(f)$ corresponds via the homeomorphism $\varphi$ exactly to the sheaf $\mathcal{O}_{\operatorname{Spec}\left(S_{(f)}\right)}$ as defined in Schemes, Section 25.5. We conclude that $D_{+}(f)$ is an affine scheme isomorphic to $\operatorname{Spec}\left(S_{(f)}\right)$ via $\varphi$ and hence that $\operatorname{Proj}(S)$ is a scheme.

In exactly the same way we show that $\widetilde{M}$ is a quasi-coherent sheaf of $\mathcal{O}_{\operatorname{Proj}(S)^{-}}$ modules. Namely, the argument above will show that

$$
\left.\widetilde{M}\right|_{D_{+}(f)} \cong \varphi^{*}\left(\widetilde{M_{(f)}}\right)
$$

which shows that $\widetilde{M}$ is quasi-coherent.
01MC Lemma 26.8.8. Let $S$ be a graded ring. The scheme $\operatorname{Proj}(S)$ is separated.
Proof. We have to show that the canonical morphism $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}(\mathbf{Z})$ is separated. We will use Schemes, Lemma 25.21.8. Thus it suffices to show given any pair of standard opens $D_{+}(f)$ and $D_{+}(g)$ that $D_{+}(f) \cap D_{+}(g)=D_{+}(f g)$ is affine (clear) and that the ring map

$$
S_{(f)} \otimes_{\mathbf{Z}} S_{(g)} \longrightarrow S_{(f g)}
$$

is surjective. Any element $s$ in $S_{(f g)}$ is of the form $s=h /\left(f^{n} g^{m}\right)$ with $h \in S$ homogeneous of degree $n \operatorname{deg}(f)+m \operatorname{deg}(g)$. We may multiply $h$ by a suitable monomial $f^{i} g^{j}$ and assume that $n=n^{\prime} \operatorname{deg}(g)$, and $m=m^{\prime} \operatorname{deg}(f)$. Then we can rewrite $s$ as $s=h / f^{\left(n^{\prime}+m^{\prime}\right) \operatorname{deg}(g)} \cdot f^{m^{\prime} \operatorname{deg}(g)} / g^{m^{\prime} \operatorname{deg}(f)}$. So $s$ is indeed in the image of the displayed arrow.

01MD Lemma 26.8.9. Let $S$ be a graded ring. The scheme Proj( $S$ ) is quasi-compact if and only if there exist finitely many homogeneous elements $f_{1}, \ldots, f_{n} \in S_{+}$such that $S_{+} \subset \sqrt{\left(f_{1}, \ldots, f_{n}\right)}$. In this case $\operatorname{Proj}(S)=D_{+}\left(f_{1}\right) \cup \ldots \cup D_{+}\left(f_{n}\right)$.

Proof. Given such a collection of elements the standard affine opens $D_{+}\left(f_{i}\right)$ cover $\operatorname{Proj}(S)$ by Algebra, Lemma 10.56.3. Conversely, if $\operatorname{Proj}(S)$ is quasi-compact, then we may cover it by finitely many standard opens $D_{+}\left(f_{i}\right), i=1, \ldots, n$ and we see that $S_{+} \subset \sqrt{\left(f_{1}, \ldots, f_{n}\right)}$ by the lemma referenced above.

01 ME Lemma 26.8.10. Let $S$ be a graded ring. The scheme Proj(S) has a canonical morphism towards the affine scheme $\operatorname{Spec}\left(S_{0}\right)$, agreeing with the map on topological spaces coming from Algebra, Definition 10.56.1.

Proof. We saw above that our construction of $\widetilde{S}$, resp. $\widetilde{M}$ gives a sheaf of $S_{0^{-}}$ algebras, resp. $S_{0}$-modules. Hence we get a morphism by Schemes, Lemma 25.6.4. This morphism, when restricted to $D_{+}(f)$ comes from the canonical ring map $S_{0} \rightarrow$ $S_{(f)}$. The maps $S \rightarrow S_{f}, S_{(f)} \rightarrow S_{f}$ are $S_{0}$-algebra maps, see Lemma 26.8.1 Hence if the homogeneous prime $\mathfrak{p} \subset S$ corresponds to the $\mathbf{Z}$-graded prime $\mathfrak{p}^{\prime} \subset S_{f}$ and the (usual) prime $\mathfrak{p}^{\prime \prime} \subset S_{(f)}$, then each of these has the same inverse image in $S_{0}$.

01MF Lemma 26.8.11. Let $S$ be a graded ring. If $S$ is finitely generated as an algebra over $S_{0}$, then the morphism $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}\left(S_{0}\right)$ satisfies the existence and uniqueness parts of the valuative criterion, see Schemes, Definition 25.20.3.

Proof. The uniqueness part follows from the fact that $\operatorname{Proj}(S)$ is separated (Lemma 26.8 .8 and Schemes, Lemma 25.22.1. Choose $x_{i} \in S_{+}$homogeneous, $i=1, \ldots, n$ which generate $S$ over $S_{0}$. Let $d_{i}=\operatorname{deg}\left(x_{i}\right)$ and set $d=\operatorname{lcm}\left\{d_{i}\right\}$. Suppose we are given a diagram

as in Schemes, Definition 25.20.3. Denote $v: K^{*} \rightarrow \Gamma$ the valuation of $A$, see Algebra, Definition 10.49 .13 . We may choose an $f \in S_{+}$homogeneous such that $\operatorname{Spec}(K)$ maps into $D_{+}(f)$. Then we get a commutative diagram of ring maps

After renumbering we may assume that $\varphi\left(x_{i}^{\operatorname{deg}(f)} / f^{d_{i}}\right)$ is nonzero for $i=1, \ldots, r$ and zero for $i=r+1, \ldots, n$. Since the open sets $D_{+}\left(x_{i}\right)$ cover $\operatorname{Proj}(S)$ we see that $r \geq 1$. Let $i_{0} \in\{1, \ldots, r\}$ be an index minimizing $\gamma_{i}=\left(d / d_{i}\right) v\left(\varphi\left(x_{i}^{\operatorname{deg}(f)} / f^{d_{i}}\right)\right)$ in $\Gamma$. For convenience set $x_{0}=x_{i_{0}}$ and $d_{0}=d_{i_{0}}$. The ring map $\varphi$ factors though a $\operatorname{map} \varphi^{\prime}: S_{\left(f x_{0}\right)} \rightarrow K$ which gives a ring map $S_{\left(x_{0}\right)} \rightarrow S_{\left(f x_{0}\right)} \rightarrow K$. The algebra $S_{\left(x_{0}\right)}$ is generated over $S_{0}$ by the elements $x_{1}^{e_{1}} \ldots x_{n}^{e_{n}} / x_{0}^{e_{0}}$, where $\sum e_{i} d_{i}=e_{0} d_{0}$. If $e_{i}>0$ for some $i>r$, then $\varphi^{\prime}\left(x_{1}^{e_{1}} \ldots x_{n}^{e_{n}} / x_{0}^{e_{0}}\right)=0$. If $e_{i}=0$ for $i>r$, then we
have

$$
\begin{aligned}
\operatorname{deg}(f) v\left(\varphi^{\prime}\left(x_{1}^{e_{1}} \ldots x_{r}^{e_{r}} / x_{0}^{e_{0}}\right)\right) & =v\left(\varphi^{\prime}\left(x_{1}^{e_{1} \operatorname{deg}(f)} \ldots x_{r}^{e_{r} \operatorname{deg}(f)} / x_{0}^{e_{0} \operatorname{deg}(f)}\right)\right) \\
& =\sum e_{i} v\left(\varphi^{\prime}\left(x_{i}^{\operatorname{deg}(f)} / f^{d_{i}}\right)\right)-e_{0} v\left(\varphi^{\prime}\left(x_{0}^{\operatorname{deg}(f)} / f^{d_{0}}\right)\right) \\
& =\sum e_{i} d_{i} \gamma_{i}-e_{0} d_{0} \gamma_{0} \\
& \geq \sum e_{i} d_{i} \gamma_{0}-e_{0} d_{0} \gamma_{0}=0
\end{aligned}
$$

because $\gamma_{0}$ is minimal among the $\gamma_{i}$. This implies that $S_{\left(x_{0}\right)}$ maps into $A$ via $\varphi^{\prime}$. The corresponding morphism of schemes $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}\left(S_{\left(x_{0}\right)}\right)=D_{+}\left(x_{0}\right) \subset \operatorname{Proj}(S)$ provides the morphism fitting into the first commutative diagram of this proof.

We saw in the proof of Lemma 26.8.11 that, under the hypotheses of that lemma, the morphism $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}\left(S_{0}\right)$ is quasi-compact as well. Hence (by Schemes, Proposition 25.20 .6 ) we see that $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}\left(S_{0}\right)$ is universally closed in the situation of the lemma. We give two examples showing these results do not hold without some assumption on the graded ring $S$.

01 MG Example 26.8.12. Let $\mathbf{C}\left[X_{1}, X_{2}, X_{3}, \ldots\right]$ be the graded $\mathbf{C}$-algebra with each $X_{i}$ in degree 0 . Consider the ring map

$$
\mathbf{C}\left[X_{1}, X_{2}, X_{3}, \ldots\right] \longrightarrow \mathbf{C}\left[t^{\alpha} ; \alpha \in \mathbf{Q}_{\geq 0}\right]
$$

which maps $X_{i}$ to $t^{1 / i}$. The right hand side becomes a valuation ring $A$ upon localization at the ideal $\mathfrak{m}=\left(t^{\alpha} ; \alpha>0\right)$. This gives a morphism from $\operatorname{Spec}(f . f .(A))$ to $\operatorname{Proj}\left(\mathbf{C}\left[X_{1}, X_{2}, X_{3}, \ldots\right]\right)$ which does not extend to a morphism defined on all of $\operatorname{Spec}(A)$. The reason is that the image of $\operatorname{Spec}(A)$ would be contained in one of the $D_{+}\left(X_{i}\right)$ but then $X_{i+1} / X_{i}$ would map to an element of $A$ which it doesn't since it maps to $t^{1 /(i+1)-1 / i}$.

01 MH Example 26.8.13. Let $R=\mathbf{C}[t]$ and

$$
S=R\left[X_{1}, X_{2}, X_{3}, \ldots\right] /\left(X_{i}^{2}-t X_{i+1}\right)
$$

The grading is such that $R=S_{0}$ and $\operatorname{deg}\left(X_{i}\right)=2^{i-1}$. Note that if $\mathfrak{p} \in \operatorname{Proj}(S)$ then $t \notin \mathfrak{p}$ (otherwise $\mathfrak{p}$ has to contain all of the $X_{i}$ which is not allowed for an element of the homogeneous spectrum). Thus we see that $D_{+}\left(X_{i}\right)=D_{+}\left(X_{i+1}\right)$ for all $i$. Hence $\operatorname{Proj}(S)$ is quasi-compact; in fact it is affine since it is equal to $D_{+}\left(X_{1}\right)$. It is easy to see that the image of $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}(R)$ is $D(t)$. Hence the morphism $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}(R)$ is not closed. Thus the valuative criterion cannot apply because it would imply that the morphism is closed (see Schemes, Proposition 25.20.6).

01MI Example 26.8.14. Let $A$ be a ring. Let $S=A[T]$ as a graded $A$ algebra with $T$ in degree 1. Then the canonical morphism $\operatorname{Proj}(S) \rightarrow \operatorname{Spec}(A)$ (see Lemma 26.8.10) is an isomorphism.

### 26.9. Quasi-coherent sheaves on Proj

01 MJ Let $S$ be a graded ring. Let $M$ be a graded $S$-module. We saw in Lemma 26.8.4 how to construct a quasi-coherent sheaf of modules $\widetilde{M}$ on $\operatorname{Proj}(S)$ and a map

0AG1

$$
\begin{equation*}
M_{0} \longrightarrow \Gamma(\operatorname{Proj}(S), \widetilde{M}) \tag{26.9.0.1}
\end{equation*}
$$

of the degree 0 part of $M$ to the global sections of $\widetilde{M}$. The degree 0 part of the $n$th twist $M(n)$ of the graded module $M$ (see Algebra, Section 10.55 is equal to $M_{n}$. Hence we can get maps

0AG2

$$
\begin{equation*}
M_{n} \longrightarrow \Gamma(\operatorname{Proj}(S), \widetilde{M(n)}) \tag{26.9.0.2}
\end{equation*}
$$

We would like to be able to perform this operation for any quasi-coherent sheaf $\mathcal{F}$ on $\operatorname{Proj}(S)$. We will do this by tensoring with the $n$th twist of the structure sheaf, see Definition 26.10.1. In order to relate the two notions we will use the following lemma.

01MK Lemma 26.9.1. Let $S$ be a graded ring. Let $\left(X, \mathcal{O}_{X}\right)=\left(\operatorname{Proj}(S), \mathcal{O}_{\operatorname{Proj}(S)}\right)$ be the scheme of Lemma 26.8.7. Let $f \in S_{+}$be homogeneous. Let $x \in X$ be a point corresponding to the homogeneous prime $\mathfrak{p} \subset S$. Let $M, N$ be graded $S$-modules. There is a canonical map of $\mathcal{O}_{\operatorname{Proj}(S)}$-modules

$$
\widetilde{M} \otimes_{\mathcal{O}_{X}} \tilde{N} \longrightarrow \widetilde{M \otimes_{S} N}
$$

which induces the canonical map $M_{(f)} \otimes_{S_{(f)}} N_{(f)} \rightarrow\left(M \otimes_{S} N\right)_{(f)}$ on sections over $D_{+}(f)$ and the canonical map $M_{(\mathfrak{p})} \otimes_{S_{(\mathfrak{p})}} N_{(\mathfrak{p})} \rightarrow\left(M \otimes_{S} N\right)_{(\mathfrak{p})}$ on stalks at $x$. Moreover, the following diagram

is commutative where the vertical maps are given by 26.9.0.1.
Proof. To construct a morphism as displayed is the same as constructing a $\mathcal{O}_{X^{-}}$ bilinear map

$$
\widetilde{M} \times \widetilde{N} \longrightarrow \widetilde{M \otimes_{R} N}
$$

see Modules, Section 17.15 It suffices to define this on sections over the opens $D_{+}(f)$ compatible with restriction mappings. On $D_{+}(f)$ we use the $S_{(f)}$-bilinear $\operatorname{map} M_{(f)} \times N_{(f)} \rightarrow\left(M \otimes_{S} N\right)_{(f)},\left(x / f^{n}, y / f^{m}\right) \mapsto(x \otimes y) / f^{n+m}$. Details omitted.

01ML Remark 26.9.2. In general the map constructed in Lemma 26.9.1 above is not an isomorphism. Here is an example. Let $k$ be a field. Let $S=k[x, y, z]$ with $k$ in degree 0 and $\operatorname{deg}(x)=1, \operatorname{deg}(y)=2, \operatorname{deg}(z)=3$. Let $M=S(1)$ and $N=S(2)$, see Algebra, Section 10.55 for notation. Then $M \otimes_{S} N=S(3)$. Note that

$$
\begin{aligned}
S_{z} & =k[x, y, z, 1 / z] \\
S_{(z)} & =k\left[x^{3} / z, x y / z, y^{3} / z^{2}\right] \cong k[u, v, w] /\left(u w-v^{3}\right) \\
M_{(z)} & =S_{(z)} \cdot x+S_{(z)} \cdot y^{2} / z \subset S_{z} \\
N_{(z)} & =S_{(z)} \cdot y+S_{(z)} \cdot x^{2} \subset S_{z} \\
S(3)_{(z)} & =S_{(z)} \cdot z \subset S_{z}
\end{aligned}
$$

Consider the maximal ideal $\mathfrak{m}=(u, v, w) \subset S_{(z)}$. It is not hard to see that both $M_{(z)} / \mathfrak{m} M_{(z)}$ and $N_{(z)} / \mathfrak{m} N_{(z)}$ have dimension 2 over $\kappa(\mathfrak{m})$. But $S(3)_{(z)} / \mathfrak{m} S(3)_{(z)}$ has dimension 1. Thus the map $M_{(z)} \otimes N_{(z)} \rightarrow S(3)_{(z)}$ is not an isomorphism.

### 26.10. Invertible sheaves on Proj

01 MM Recall from Algebra, Section 10.55 the construction of the twisted module $M(n)$ associated to a graded module over a graded ring.

01MN Definition 26.10.1. Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$.
(1) We define $\mathcal{O}_{X}(n)=\widetilde{S(n)}$. This is called the $n$th twist of the structure sheaf of $\operatorname{Proj}(S)$.
(2) For any sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ we set $\mathcal{F}(n)=\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(n)$.

We are going to use Lemma 26.9.1 to construct some canonical maps. Since $S(n) \otimes_{S}$ $S(m)=S(n+m)$ we see that there are canonical maps

01 MO

$$
\begin{equation*}
\mathcal{O}_{X}(n) \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(m) \longrightarrow \mathcal{O}_{X}(n+m) \tag{26.10.1.1}
\end{equation*}
$$

These maps are not isomorphisms in general, see the example in Remark 26.9.2
The same example shows that $\mathcal{O}_{X}(n)$ is not an invertible sheaf on $X$ in general. Tensoring with an arbitrary $\mathcal{O}_{X}$-module $\mathcal{F}$ we get maps
03GJ
(26.10.1.2)

$$
\mathcal{O}_{X}(n) \otimes_{\mathcal{O}_{X}} \mathcal{F}(m) \longrightarrow \mathcal{F}(n+m) .
$$

The maps 26.10.1.1 on global sections give a map of graded rings
01MP

$$
\begin{equation*}
S \longrightarrow \bigoplus_{n \geq 0} \Gamma\left(X, \mathcal{O}_{X}(n)\right) \tag{26.10.1.3}
\end{equation*}
$$

And for an arbitrary $\mathcal{O}_{X}$-module $\mathcal{F}$ the maps 26.10.1.2 give a graded module structure

03GK
(26.10.1.4)

$$
\bigoplus_{n \geq 0} \Gamma\left(X, \mathcal{O}_{X}(n)\right) \times \bigoplus_{m \in \mathbf{Z}} \Gamma(X, \mathcal{F}(m)) \longrightarrow \bigoplus_{m \in \mathbf{Z}} \Gamma(X, \mathcal{F}(m))
$$

and via 26.10 .1 .3 also a $S$-module structure. More generally, given any graded $S$-module $M$ we have $M(n)=M \otimes_{S} S(n)$. Hence we get maps

01MQ

$$
\begin{equation*}
\widetilde{M}(n)=\widetilde{M} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(n) \longrightarrow \widetilde{M(n)} \tag{26.10.1.5}
\end{equation*}
$$

On global sections $\sqrt[26.9 .0 .2]{ }$ defines a map of graded $S$-modules
01MR

$$
\begin{equation*}
M \longrightarrow \bigoplus_{n \in \mathbf{Z}} \Gamma(X, \widetilde{M(n)}) \tag{26.10.1.6}
\end{equation*}
$$

Here is an important fact which follows basically immediately from the definitions.
01MS Lemma 26.10.2. Let $S$ be a graded ring. Set $X=\operatorname{Proj}(S)$. Let $f \in S$ be homogeneous of degree $d>0$. The sheaves $\left.\mathcal{O}_{X}(n d)\right|_{D_{+}(f)}$ are invertible, and in fact trivial for all $n \in \mathbf{Z}$ (see Modules, Definition 17.21.1). The maps 26.10.1.1) restricted to $D_{+}(f)$

$$
\left.\left.\left.\mathcal{O}_{X}(n d)\right|_{D_{+}(f)} \otimes_{\mathcal{O}_{D_{+}(f)}} \mathcal{O}_{X}(m)\right|_{D_{+}(f)} \longrightarrow \mathcal{O}_{X}(n d+m)\right|_{D_{+}(f)}
$$

the maps 26.10.1.2 restricted to $D_{+}(f)$

$$
\left.\left.\left.\mathcal{O}_{X}(n d)\right|_{D_{+}(f)} \otimes_{\mathcal{O}_{D_{+}(f)}} \mathcal{F}(m)\right|_{D_{+}(f)} \longrightarrow \mathcal{F}(n d+m)\right|_{D_{+}(f)}
$$

and the maps 26.10.1.5) restricted to $D_{+}(f)$

$$
\left.\widetilde{M}(n d)\right|_{D_{+}(f)}=\left.\left.\left.\widetilde{M}\right|_{D_{+}(f)} \otimes_{\mathcal{O}_{D_{+}(f)}} \mathcal{O}_{X}(n d)\right|_{D_{+}(f)} \longrightarrow \widetilde{M(n d)}\right|_{D_{+}(f)}
$$

are isomorphisms for all $n, m \in \mathbf{Z}$.

Proof. The (not graded) $S$-module maps $S \rightarrow S(n d)$, and $M \rightarrow M(n d)$, given by $x \mapsto f^{n} x$ become isomorphisms after inverting $f$. The first shows that $S_{(f)} \cong$ $S(n d)_{(f)}$ which gives an isomorphism $\left.\mathcal{O}_{D_{+}(f)} \cong \mathcal{O}_{X}(n d)\right|_{D_{+}(f)}$. The second shows that the map $S(n d)_{(f)} \otimes_{S_{(f)}} M_{(f)} \rightarrow M(n d)_{(f)}$ is an isomorphism. The case of the map 26.10.1.2 is a consequence of the case of the map 26.10.1.1.

01MT Lemma 26.10.3. Let $S$ be a graded ring. Let $M$ be a graded $S$-module. Set $X=\operatorname{Proj}(S)$. Assume $X$ is covered by the standard opens $D_{+}(f)$ with $f \in S_{1}$, e.g., if $S$ is generated by $S_{1}$ over $S_{0}$. Then the sheaves $\mathcal{O}_{X}(n)$ are invertible and the maps (26.10.1.1), 26.10.1.2), and 26.10.1.5) are isomorphisms. In particular, these maps induce isomorphisms

$$
\mathcal{O}_{X}(1)^{\otimes n} \cong \mathcal{O}_{X}(n) \quad \text { and } \quad \widetilde{M} \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}(n)=\widetilde{M}(n) \cong \widetilde{M}(n)
$$

Thus (26.9.0.2) becomes a map
0AG3

$$
\begin{equation*}
M_{n} \longrightarrow \Gamma(X, \widetilde{M}(n)) \tag{26.10.3.1}
\end{equation*}
$$

and 26.10.1.6 becomes a map
0AG4

$$
\begin{equation*}
M \longrightarrow \bigoplus_{n \in \mathbf{Z}} \Gamma(X, \widetilde{M}(n)) \tag{26.10.3.2}
\end{equation*}
$$

Proof. Under the assumptions of the lemma $X$ is covered by the open subsets $D_{+}(f)$ with $f \in S_{1}$ and the lemma is a consequence of Lemma 26.10.2 above.

01 MU Lemma 26.10.4. Let $S$ be a graded ring. Set $X=\operatorname{Proj}(S)$. Fix $d \geq 1$ an integer. The following open subsets of $X$ are equal:
(1) The largest open subset $W=W_{d} \subset X$ such that each $\left.\mathcal{O}_{X}(d n)\right|_{W}$ is invertible and all the multiplication maps $\left.\left.\mathcal{O}_{X}(n d)\right|_{W} \otimes_{\mathcal{O}_{W}} \mathcal{O}_{X}(m d)\right|_{W} \rightarrow$ $\left.\mathcal{O}_{X}(n d+m d)\right|_{W}($ see 26.10.1.1) are isomorphisms.
(2) The union of the open subsets $D_{+}(f g)$ with $f, g \in S$ homogeneous and $\operatorname{deg}(f)=\operatorname{deg}(g)+d$.
Moreover, all the maps $\left.\widetilde{M}(n d)\right|_{W}=\left.\left.\left.\widetilde{M}\right|_{W} \otimes_{\mathcal{O}_{W}} \mathcal{O}_{X}(n d)\right|_{W} \rightarrow \widetilde{M(n d)}\right|_{W}($ see 26.10.1.5) are isomorphisms.

Proof. If $x \in D_{+}(f g)$ with $\operatorname{deg}(f)=\operatorname{deg}(g)+d$ then on $D_{+}(f g)$ the sheaves $\mathcal{O}_{X}(d n)$ are generated by the element $(f / g)^{n}=f^{2 n} /(f g)^{n}$. This implies $x$ is in the open subset $W$ defined in (1) by arguing as in the proof of Lemma 26.10.2.

Conversely, suppose that $\mathcal{O}_{X}(d)$ is free of rank 1 in an open neighbourhood $V$ of $x \in X$ and all the multiplication maps $\left.\left.\left.\mathcal{O}_{X}(n d)\right|_{V} \otimes_{\mathcal{O}_{V}} \mathcal{O}_{X}(m d)\right|_{V} \rightarrow \mathcal{O}_{X}(n d+m d)\right|_{V}$ are isomorphisms. We may choose $h \in S_{+}$homogeneous such that $D_{+}(h) \subset V$. By the definition of the twists of the structure sheaf we conclude there exists an element $s$ of $\left(S_{h}\right)_{d}$ such that $s^{n}$ is a basis of $\left(S_{h}\right)_{n d}$ as a module over $S_{(h)}$ for all $n \in \mathbf{Z}$. We may write $s=f / h^{m}$ for some $m \geq 1$ and $f \in S_{d+m \operatorname{deg}(h)}$. Set $g=h^{m}$ so $s=f / g$. Note that $x \in D(g)$ by construction. Note that $g^{d} \in\left(S_{h}\right)_{-d \operatorname{deg}(g)}$. By assumption we can write this as a multiple of $s^{\operatorname{deg}(g)}=f^{\operatorname{deg}(g)} / g^{\operatorname{deg}(g)}$, say $g^{d}=a / g^{e} \cdot f^{\operatorname{deg}(g)} / g^{\operatorname{deg}(g)}$. Then we conclude that $g^{d+e+\operatorname{deg}(g)}=a f^{\operatorname{deg}(g)}$ and hence also $x \in D_{+}(f)$. So $x$ is an element of the set defined in (2).

The existence of the generating section $s=f / g$ over the affine open $D_{+}(f g)$ whose powers freely generate the sheaves of modules $\mathcal{O}_{X}(n d)$ easily implies that the multiplication maps $\left.\widetilde{M}(n d)\right|_{W}=\left.\left.\left.\widetilde{M}\right|_{W} \otimes_{\mathcal{O}_{W}} \mathcal{O}_{X}(n d)\right|_{W} \rightarrow \widetilde{M(n d)}\right|_{W}$ (see 26.10.1.5 are isomorphisms. Compare with the proof of Lemma 26.10.2.

Recall from Modules, Lemma 17.21 .10 that given an invertible sheaf $\mathcal{L}$ on a locally ringed space $X$, and given a global section $s$ of $\mathcal{L}$ the set $X_{s}=\left\{x \in X \mid s \notin \mathfrak{m}_{x} \mathcal{L}_{x}\right\}$ is open.

01MV Lemma 26.10.5. Let $S$ be a graded ring. Set $X=\operatorname{Proj}(S)$. Fix $d \geq 1$ an integer. Let $W=W_{d} \subset X$ be the open subscheme defined in Lemma 26.10.4. Let $n \geq 1$ and $f \in S_{n d}$. Denote $s \in \Gamma\left(W, \mathcal{O}_{W}(n d)\right)$ the section which is the image of $f$ via (26.10.1.3) restricted to $W$. Then

$$
W_{s}=D_{+}(f) \cap W
$$

Proof. Let $D_{+}(a b) \subset W$ be a standard affine open with $a, b \in S$ homogeneous and $\operatorname{deg}(a)=\operatorname{deg}(b)+d$. Note that $D_{+}(a b) \cap D_{+}(f)=D_{+}(a b f)$. On the other hand the restriction of $s$ to $D_{+}(a b)$ corresponds to the element $f / 1=b^{n} f / a^{n}(a / b)^{n} \in$ $\left(S_{a b}\right)_{n d}$. We have seen in the proof of Lemma 26.10 .4 that $(a / b)^{n}$ is a generator for $\mathcal{O}_{W}(n d)$ over $D_{+}(a b)$. We conclude that $W_{s} \cap D_{+}(a b)$ is the principal open associated to $b^{n} f / a^{n} \in \mathcal{O}_{X}\left(D_{+}(a b)\right)$. Thus the result of the lemma is clear.

The following lemma states the properties that we will later use to characterize schemes with an ample invertible sheaf.

01MW Lemma 26.10.6. Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$. Let $Y \subset X$ be a quasi-compact open subscheme. Denote $\mathcal{O}_{Y}(n)$ the restriction of $\mathcal{O}_{X}(n)$ to $Y$. There exists an integer $d \geq 1$ such that
(1) the subscheme $Y$ is contained in the open $W_{d}$ defined in Lemma 26.10.4,
(2) the sheaf $\mathcal{O}_{Y}(d n)$ is invertible for all $n \in \mathbf{Z}$,
(3) all the maps $\mathcal{O}_{Y}(n d) \otimes_{\mathcal{O}_{Y}} \mathcal{O}_{Y}(m) \longrightarrow \mathcal{O}_{Y}(n d+m)$ of Equation 26.10.1.1) are isomorphisms,
(4) all the maps $\left.\widetilde{M}(n d)\right|_{Y}=\left.\left.\left.\widetilde{M}\right|_{Y} \otimes_{\mathcal{O}_{Y}} \mathcal{O}_{X}(n d)\right|_{Y} \rightarrow \widetilde{M(n d)}\right|_{Y}$ (see 26.10.1.5) are isomorphisms,
(5) given $f \in S_{n d}$ denote $s \in \Gamma\left(Y, \mathcal{O}_{Y}(n d)\right.$ ) the image of $f$ via 26.10.1.3) restricted to $Y$, then $D_{+}(f) \cap Y=Y_{s}$,
(6) a basis for the topology on $Y$ is given by the collection of opens $Y_{s}$, where $s \in \Gamma\left(Y, \mathcal{O}_{Y}(n d)\right), n \geq 1$, and
(7) a basis for the topology of $Y$ is given by those opens $Y_{s} \subset Y$, for $s \in$ $\Gamma\left(Y, \mathcal{O}_{Y}(n d)\right), n \geq 1$ which are affine.

Proof. Since $Y$ is quasi-compact there exist finitely many homogeneous $f_{i} \in S_{+}$, $i=1, \ldots, n$ such that the standard opens $D_{+}\left(f_{i}\right)$ give an open covering of $Y$. Let $d_{i}=\operatorname{deg}\left(f_{i}\right)$ and set $d=d_{1} \ldots d_{n}$. Note that $D_{+}\left(f_{i}\right)=D_{+}\left(f_{i}^{d / d_{i}}\right)$ and hence we see immediately that $Y \subset W_{d}$, by characterization (2) in Lemma 26.10.4 or by (1) using Lemma 26.10.2. Note that (1) implies (2), (3) and (4) by Lemma 26.10.4. (Note that (3) is a special case of (4).) Assertion (5) follows from Lemma 26.10.5. Assertions (6) and (7) follow because the open subsets $D_{+}(f)$ form a basis for the topology of $X$ and are affine.

0B5I Lemma 26.10.7. Let $S$ be a graded ring. Set $X=\operatorname{Proj}(S)$. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Set $M=\bigoplus_{n \in \mathbf{Z}} \Gamma(X, \mathcal{F}(n))$ as a graded $S$-module, using (26.10.1.4) and (26.10.1.3). Then there is a canonical $\mathcal{O}_{X}$-module map

$$
\widetilde{M} \longrightarrow \mathcal{F}
$$

functorial in $\mathcal{F}$ such that the induced map $M_{0} \rightarrow \Gamma(X, \mathcal{F})$ is the identity.
Proof. Let $f \in S$ be homogeneous of degree $d>0$. Recall that $\left.\widetilde{M}\right|_{D_{+}(f)}$ corresponds to the $S_{(f)}$-module $M_{(f)}$ by Lemma 26.8.4. Thus we can define a canonical map

$$
M_{(f)} \longrightarrow \Gamma\left(D_{+}(f), \mathcal{F}\right), \quad m /\left.\left.f^{n} \longmapsto m\right|_{D_{+}(f)} \otimes f\right|_{D_{+}(f)} ^{-n}
$$

which makes sense because $\left.f\right|_{D_{+}(f)}$ is a trivializing section of the invertible sheaf $\left.\mathcal{O}_{X}(d)\right|_{D_{+}(f)}$, see Lemma 26.10 .2 and its proof. Since $\widetilde{M}$ is quasi-coherent, this leads to a canonical map

$$
\left.\left.\widetilde{M}\right|_{D_{+}(f)} \longrightarrow \mathcal{F}\right|_{D_{+}(f)}
$$

via Schemes, Lemma 25.7.1. We obtain a global map if we prove that the displayed maps glue on overlaps. Proof of this is omitted. We also omit the proof of the final statement.

### 26.11. Functoriality of Proj

01MX A graded ring map $\psi: A \rightarrow B$ does not always give rise to a morphism of associated projective homogeneous spectra. The reason is that the inverse image $\psi^{-1}(\mathfrak{q})$ of a homogeneous prime $\mathfrak{q} \subset B$ may contain the irrelevant prime $A_{+}$even if $\mathfrak{q}$ does not contain $B_{+}$. The correct result is stated as follows.

01MY Lemma 26.11.1. Let $A, B$ be two graded rings. Set $X=\operatorname{Proj}(A)$ and $Y=$ $\operatorname{Proj}(B)$. Let $\psi: A \rightarrow B$ be a graded ring map. Set

$$
U(\psi)=\bigcup_{f \in A_{+} \text {homogeneous }} D_{+}(\psi(f)) \subset Y
$$

Then there is a canonical morphism of schemes

$$
r_{\psi}: U(\psi) \longrightarrow X
$$

and a map of $\mathbf{Z}$-graded $\mathcal{O}_{U(\psi)}$-algebras

$$
\theta=\theta_{\psi}: r_{\psi}^{*}\left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{X}(d)\right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d)
$$

The triple $\left(U(\psi), r_{\psi}, \theta\right)$ is characterized by the following properties:
(1) For every $d \geq 0$ the diagram

is commutative.
(2) For any $f \in A_{+}$homogeneous we have $r_{\psi}^{-1}\left(D_{+}(f)\right)=D_{+}(\psi(f))$ and the restriction of $r_{\psi}$ to $D_{+}(\psi(f))$ corresponds to the ring map $A_{(f)} \rightarrow B_{(\psi(f))}$ induced by $\psi$.

Proof. Clearly condition (2) uniquely determines the morphism of schemes and the open subset $U(\psi)$. Pick $f \in A_{d}$ with $d \geq 1$. Note that $\left.\mathcal{O}_{X}(n)\right|_{D_{+}(f)}$ corresponds to the $A_{(f) \text {-module }}\left(A_{f}\right)_{n}$ and that $\left.\mathcal{O}_{Y}(n)\right|_{D_{+}(\psi(f))}$ corresponds to the $B_{(\psi(f))}$-module $\left(B_{\psi(f)}\right)_{n}$. In other words $\theta$ when restricted to $D_{+}(\psi(f))$ corresponds to a map of Z-graded $B_{(\psi(f))}$-algebras

$$
A_{f} \otimes_{A_{(f)}} B_{(\psi(f))} \longrightarrow B_{\psi(f)}
$$

Condition (1) determines the images of all elements of $A$. Since $f$ is an invertible element which is mapped to $\psi(f)$ we see that $1 / f^{m}$ is mapped to $1 / \psi(f)^{m}$. It easily follows from this that $\theta$ is uniquely determined, namely it is given by the rule

$$
a / f^{m} \otimes b / \psi(f)^{e} \longmapsto \psi(a) b / \psi(f)^{m+e} .
$$

To show existence we remark that the proof of uniqueness above gave a well defined prescription for the morphism $r$ and the map $\theta$ when restricted to every standard open of the form $D_{+}(\psi(f)) \subset U(\psi)$ into $D_{+}(f)$. Call these $r_{f}$ and $\theta_{f}$. Hence we only need to verify that if $D_{+}(f) \subset D_{+}(g)$ for some $f, g \in A_{+}$homogeneous, then the restriction of $r_{g}$ to $D_{+}(\psi(f))$ matches $r_{f}$. This is clear from the formulas given for $r$ and $\theta$ above.

01MZ Lemma 26.11.2. Let $A, B$, and $C$ be graded rings. Set $X=\operatorname{Proj}(A), Y=$ $\operatorname{Proj}(B)$ and $Z=\operatorname{Proj}(C)$. Let $\varphi: A \rightarrow B, \psi: B \rightarrow C$ be graded ring maps. Then we have

$$
U(\psi \circ \varphi)=r_{\varphi}^{-1}(U(\psi)) \quad \text { and } \quad r_{\psi \circ \varphi}=\left.r_{\varphi} \circ r_{\psi}\right|_{U(\psi \circ \varphi)}
$$

In addition we have

$$
\theta_{\psi} \circ r_{\psi}^{*} \theta_{\varphi}=\theta_{\psi \circ \varphi}
$$

with obvious notation.
Proof. Omitted.
01N0 Lemma 26.11.3. With hypotheses and notation as in Lemma 26.11.1 above. Assume $A_{d} \rightarrow B_{d}$ is surjective for all $d \gg 0$. Then
(1) $U(\psi)=Y$,
(2) $r_{\psi}: Y \rightarrow X$ is a closed immersion, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are surjective but not isomorphisms in general (even if $A \rightarrow B$ is surjective).

Proof. Part (1) follows from the definition of $U(\psi)$ and the fact that $D_{+}(f)=$ $D_{+}\left(f^{n}\right)$ for any $n>0$. For $f \in A_{+}$homogeneous we see that $A_{(f)} \rightarrow B_{(\psi(f))}$ is surjective because any element of $B_{(\psi(f))}$ can be represented by a fraction $b / \psi(f)^{n}$ with $n$ arbitrarily large (which forces the degree of $b \in B$ to be large). This proves (2). The same argument shows the map

$$
A_{f} \rightarrow B_{\psi(f)}
$$

is surjective which proves the surjectivity of $\theta$. For an example where this map is not an isomorphism consider the graded ring $A=k[x, y]$ where $k$ is a field and $\operatorname{deg}(x)=1, \operatorname{deg}(y)=2$. Set $I=(x)$, so that $B=k[y]$. Note that $\mathcal{O}_{Y}(1)=0$ in this case. But it is easy to see that $r_{\psi}^{*} \mathcal{O}_{Y}(1)$ is not zero. (There are less silly examples.)

07ZE Lemma 26.11.4. With hypotheses and notation as in Lemma 26.11.1 above. Assume $A_{d} \rightarrow B_{d}$ is an isomorphism for all $d \gg 0$. Then
(1) $U(\psi)=Y$,
(2) $r_{\psi}: Y \rightarrow X$ is an isomorphism, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are isomorphisms.

Proof. We have (1) by Lemma 26.11.3. Let $f \in A_{+}$be homogeneous. The assumption on $\psi$ implies that $A_{f} \rightarrow B_{f}$ is an isomorphism (details omitted). Thus it is clear that $r_{\psi}$ and $\theta$ restrict to isomorphisms over $D_{+}(f)$. The lemma follows.

01N1 Lemma 26.11.5. With hypotheses and notation as in Lemma 26.11.1 above. Assume $A_{d} \rightarrow B_{d}$ is surjective for $d \gg 0$ and that $A$ is generated by $A_{1}$ over $A_{0}$. Then
(1) $U(\psi)=Y$,
(2) $r_{\psi}: Y \rightarrow X$ is a closed immersion, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are isomorphisms.

Proof. By Lemmas 26.11.4 and 26.11 .2 we may replace $B$ by the image of $A \rightarrow B$ without changing $X$ or the sheaves $\mathcal{O}_{X}(n)$. Thus we may assume that $A \rightarrow B$ is surjective. By Lemma 26.11.3 we get (1) and (2) and surjectivity in (3). By Lemma 26.10.3 we see that both $\mathcal{O}_{X}(n)$ and $\mathcal{O}_{Y}(n)$ are invertible. Hence $\theta$ is an isomorphism.

01N2 Lemma 26.11.6. With hypotheses and notation as in Lemma 26.11.1 above. Assume there exists a ring map $R \rightarrow A_{0}$ and a ring map $R \rightarrow R^{\prime}$ such that $B=$ $R^{\prime} \otimes_{R} A$. Then
(1) $U(\psi)=Y$,
(2) the diagram

is a fibre product square, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are isomorphisms.

Proof. This follows immediately by looking at what happens over the standard opens $D_{+}(f)$ for $f \in A_{+}$.

01N3 Lemma 26.11.7. With hypotheses and notation as in Lemma 26.11.1 above. Assume there exists a $g \in A_{0}$ such that $\psi$ induces an isomorphism $\bar{A}_{g} \rightarrow B$. Then $U(\psi)=Y, r_{\psi}: Y \rightarrow X$ is an open immersion which induces an isomorphism of $Y$ with the inverse image of $D(g) \subset \operatorname{Spec}\left(A_{0}\right)$. Moreover the map $\theta$ is an isomorphism.

Proof. This is a special case of Lemma 26.11.6 above.
0B5J Lemma 26.11.8. Let $S$ be a graded ring. Let $d \geq 1$. Set $S^{\prime}=S^{(d)}$ with notation as in Algebra, Section 10.55. Set $X=\operatorname{Proj}(S)$ and $X^{\prime}=\operatorname{Proj}\left(S^{\prime}\right)$. There is a canonical isomorphism $i: X \rightarrow X^{\prime}$ of schemes such that
(1) for any graded $S$-module $M$ setting $M^{\prime}=M^{(d)}$, we have a canonical isomorphism $\widetilde{M} \rightarrow i^{*} \widetilde{M^{\prime}}$,
(2) we have canonical isomorphisms $\mathcal{O}_{X}(n d) \rightarrow i^{*} \mathcal{O}_{X^{\prime}}(n)$
and these isomorphisms are compatible with the multiplication maps of Lemma 26.9.1 and hence with the maps 26.10.1.1, (26.10.1.2, 26.10.1.3, 26.10.1.4, (26.10.1.5), and 26.10.1.6) (see proof for precise statements.

Proof. The injective ring map $S^{\prime} \rightarrow S$ (which is not a homomorphism of graded rings due to our conventions), induces a map $j: \operatorname{Spec}(S) \rightarrow \operatorname{Spec}\left(S^{\prime}\right)$. Given a graded prime ideal $\mathfrak{p} \subset S$ we see that $\mathfrak{p}^{\prime}=j(\mathfrak{p})=S^{\prime} \cap \mathfrak{p}$ is a graded prime ideal of $S^{\prime}$. Moreover, if $f \in S_{+}$is homogeneous and $f \notin \mathfrak{p}$, then $f^{d} \in S_{+}^{\prime}$ and $f^{d} \notin \mathfrak{p}^{\prime}$. Conversely, if $\mathfrak{p}^{\prime} \subset S^{\prime}$ is a graded prime ideal not containing some homogeneous element $f \in S_{+}^{\prime}$, then $\mathfrak{p}=\left\{g \in S \mid g^{d} \in \mathfrak{p}^{\prime}\right\}$ is a graded prime ideal of $S$ not containing $f$ whose image under $j$ is $\mathfrak{p}^{\prime}$. To see that $\mathfrak{p}$ is an ideal, note that if $g, h \in \mathfrak{p}$, then $(g+h)^{2 d} \in \mathfrak{p}^{\prime}$ by the binomial formula and hence $g+h \in \mathfrak{p}^{\prime}$ as $\mathfrak{p}^{\prime}$ is a prime. In this way we see that $j$ induces a homeomorphism $i: X \rightarrow X^{\prime}$. Moreover, given $f \in S_{+}$homogeneous, then we have $S_{(f)} \cong S_{\left(f^{d}\right)}^{\prime}$. Since these isomorphisms are compatible with the restrictions mappings of Lemma 26.8.1, we see that there exists an isomorphism $i^{\sharp}: i^{-1} \mathcal{O}_{X^{\prime}} \rightarrow \mathcal{O}_{X}$ of structure sheaves on $X$ and $X^{\prime}$, hence $i$ is an isomorphism of schemes.

Let $M$ be a graded $S$-module. Given $f \in S_{+}$homogeneous, we have $M_{(f)} \cong M_{\left(f^{d}\right)}^{\prime}$, hence in exactly the same manner as above we obtain the isomorphism in (1). The isomorphisms in (2) are a special case of (1) for $M=S(n d)$ which gives $M^{\prime}=S^{\prime}(n)$. Let $M$ and $N$ be graded $S$-modules. Then we have

$$
M^{\prime} \otimes_{S^{\prime}} N^{\prime}=\left(M \otimes_{S} N\right)^{(d)}=\left(M \otimes_{S} N\right)^{\prime}
$$

as can be verified directly from the definitions. Having said this the compatibility with the multiplication maps of Lemma 26.9.1 is the commutativity of the diagram

This can be seen by looking at the construction of the maps over the open $D_{+}(f)=$ $D_{+}\left(f^{d}\right)$ where the top horizontal arrow is given by the map $M_{(f)} \times N_{(f)} \rightarrow\left(M \otimes_{S}\right.$ $N)_{(f)}$ and the lower horizontal arrow by the map $M_{\left(f^{d}\right)}^{\prime} \times N_{\left(f^{d}\right)}^{\prime} \rightarrow\left(M^{\prime} \otimes_{S^{\prime}} N^{\prime}\right)_{\left(f^{d}\right)}$. Since these maps agree via the identifications $M_{(f)}=M_{\left(f^{d}\right)}^{\prime}$, etc, we get the desired compatibility. We omit the proof of the other compatibilities.

### 26.12. Morphisms into Proj

01N4 Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$ be the homogeneous spectrum of $S$. Let $d \geq 1$ be an integer. Consider the open subscheme

01N5

$$
\begin{equation*}
U_{d}=\bigcup_{f \in S_{d}} D_{+}(f) \quad \subset \quad X=\operatorname{Proj}(S) \tag{26.12.0.1}
\end{equation*}
$$

Note that $d \mid d^{\prime} \Rightarrow U_{d} \subset U_{d^{\prime}}$ and $X=\bigcup_{d} U_{d}$. Neither $X$ nor $U_{d}$ need be quasicompact, see Algebra, Lemma 10.56.3 Let us write $\mathcal{O}_{U_{d}}(n)=\left.\mathcal{O}_{X}(n)\right|_{U_{d}}$. By Lemma 26.10 .2 we know that $\mathcal{O}_{U_{d}}(n d), n \in \mathbf{Z}$ is an invertible $\mathcal{O}_{U_{d}}$-module and that all the multiplication maps $\mathcal{O}_{U_{d}}(n d) \otimes \mathcal{O}_{U_{d}} \mathcal{O}_{X}(m) \rightarrow \mathcal{O}_{U_{d}}(n d+m)$ of 26.10.1.1 are isomorphisms. In particular we have $\mathcal{O}_{U_{d}}(n d) \cong \mathcal{O}_{U_{d}}(d)^{\otimes n}$. The graded ring map
26.10.1.3 on global sections combined with restriction to $U_{d}$ give a homomorphism of graded rings
01N6

$$
\begin{equation*}
\psi^{d}: S^{(d)} \longrightarrow \Gamma_{*}\left(U_{d}, \mathcal{O}_{U_{d}}(d)\right) \tag{26.12.0.2}
\end{equation*}
$$

For the notation $S^{(d)}$, see Algebra, Section 10.55 . For the notation $\Gamma_{*}$ see Modules, Definition 17.21.7. Moreover, since $U_{d}$ is covered by the opens $D_{+}(f), f \in S_{d}$ we see that $\mathcal{O}_{U_{d}}(d)$ is globally generated by the sections in the image of $\psi_{1}^{d}: S_{1}^{(d)}=$ $S_{d} \rightarrow \Gamma\left(U_{d}, \mathcal{O}_{U_{d}}(d)\right)$, see Modules, Definition 17.4.1.
Let $Y$ be a scheme, and let $\varphi: Y \rightarrow X$ be a morphism of schemes. Assume the image $\varphi(Y)$ is contained in the open subscheme $U_{d}$ of $X$. By the discussion following Modules, Definition 17.21 .7 we obtain a homomorphism of graded rings

$$
\Gamma_{*}\left(U_{d}, \mathcal{O}_{U_{d}}(d)\right) \longrightarrow \Gamma_{*}\left(Y, \varphi^{*} \mathcal{O}_{X}(d)\right)
$$

The composition of this and $\psi^{d}$ gives a graded ring homomorphism
01N7

$$
\begin{equation*}
\psi_{\varphi}^{d}: S^{(d)} \longrightarrow \Gamma_{*}\left(Y, \varphi^{*} \mathcal{O}_{X}(d)\right) \tag{26.12.0.3}
\end{equation*}
$$

which has the property that the invertible sheaf $\varphi^{*} \mathcal{O}_{X}(d)$ is globally generated by the sections in the image of $\left(S^{(d)}\right)_{1}=S_{d} \rightarrow \Gamma\left(Y, \varphi^{*} \mathcal{O}_{X}(d)\right)$.

01N8 Lemma 26.12.1. Let $S$ be a graded ring, and $X=\operatorname{Proj}(S)$. Let $d \geq 1$ and $U_{d} \subset X$ as above. Let $Y$ be a scheme. Let $\mathcal{L}$ be an invertible sheaf on $Y$. Let $\psi: S^{(d)} \rightarrow \Gamma_{*}(Y, \mathcal{L})$ be a graded ring homomorphism such that $\mathcal{L}$ is generated by the sections in the image of $\left.\psi\right|_{S_{d}}: S_{d} \rightarrow \Gamma(Y, \mathcal{L})$. Then there exists a morphism $\varphi: Y \rightarrow X$ such that $\varphi(Y) \subset U_{d}$ and an isomorphism $\alpha: \varphi^{*} \mathcal{O}_{U_{d}}(d) \rightarrow \mathcal{L}$ such that $\psi_{\varphi}^{d}$ agrees with $\psi$ via $\alpha$ :

commutes. Moreover, the pair $(\varphi, \alpha)$ is unique.
Proof. Pick $f \in S_{d}$. Denote $s=\psi(f) \in \Gamma(Y, \mathcal{L})$. On the open set $Y_{s}$ where $s$ does not vanish multiplication by $s$ induces an isomorphism $\left.\mathcal{O}_{Y_{s}} \rightarrow \mathcal{L}\right|_{Y_{s}}$, see Modules, Lemma 17.21.10. We will denote the inverse of this map $x \mapsto x / s$, and similarly for powers of $\mathcal{L}$. Using this we define a ring map $\psi_{(f)}: S_{(f)} \rightarrow \Gamma\left(Y_{s}, \mathcal{O}\right)$ by mapping the fraction $a / f^{n}$ to $\psi(a) / s^{n}$. By Schemes, Lemma 25.6 .4 this corresponds to a $\operatorname{morphism} \varphi_{f}: Y_{s} \rightarrow \operatorname{Spec}\left(S_{(f)}\right)=D_{+}(f)$. We also introduce the isomorphism $\alpha_{f}:\left.\varphi_{f}^{*} \mathcal{O}_{D_{+}(f)}(d) \rightarrow \mathcal{L}\right|_{Y_{s}}$ which maps the pullback of the trivializing section $f$ over $D_{+}(f)$ to the trivializing section $s$ over $Y_{s}$. With this choice the commutativity of the diagram in the lemma holds with $Y$ replace by $Y_{s}, \varphi$ replaced by $\varphi_{f}$, and $\alpha$ replaced by $\alpha_{f}$; verification omitted.
Suppose that $f^{\prime} \in S_{d}$ is a second element, and denote $s^{\prime}=\psi\left(f^{\prime}\right) \in \Gamma(Y, \mathcal{L})$. Then $Y_{s} \cap Y_{s^{\prime}}=Y_{s s^{\prime}}$ and similarly $D_{+}(f) \cap D_{+}\left(f^{\prime}\right)=D_{+}\left(f f^{\prime}\right)$. In Lemma 26.10.6 we saw that $D_{+}\left(f^{\prime}\right) \cap D_{+}(f)$ is the same as the set of points of $D_{+}(f)$ where the section of $\mathcal{O}_{X}(d)$ defined by $f^{\prime}$ does not vanish. Hence $\varphi_{f}^{-1}\left(D_{+}\left(f^{\prime}\right) \cap D_{+}(f)\right)=Y_{s} \cap Y_{s^{\prime}}=$ $\varphi_{f^{\prime}}^{-1}\left(D_{+}\left(f^{\prime}\right) \cap D_{+}(f)\right)$. On $D_{+}(f) \cap D_{+}\left(f^{\prime}\right)$ the fraction $f / f^{\prime}$ is an invertible section of the structure sheaf with inverse $f^{\prime} / f$. Note that $\psi_{\left(f^{\prime}\right)}\left(f / f^{\prime}\right)=\psi(f) / s^{\prime}=s / s^{\prime}$
and $\psi_{(f)}\left(f^{\prime} / f\right)=\psi\left(f^{\prime}\right) / s=s^{\prime} / s$. We claim there is a unique ring map $S_{\left(f f^{\prime}\right)} \rightarrow$ $\Gamma\left(Y_{s s^{\prime}}, \mathcal{O}\right)$ making the following diagram commute

It exists because we may use the rule $x /\left(f f^{\prime}\right)^{n} \mapsto \psi(x) /\left(s s^{\prime}\right)^{n}$, which "works" by the formulas above. Uniqueness follows as $\operatorname{Proj}(S)$ is separated, see Lemma 26.8.8 and its proof. This shows that the morphisms $\varphi_{f}$ and $\varphi_{f^{\prime}}$ agree over $Y_{s} \cap Y_{s^{\prime}}$. The restrictions of $\alpha_{f}$ and $\alpha_{f^{\prime}}$ agree over $Y_{s} \cap Y_{s^{\prime}}$ because the regular functions $s / s^{\prime}$ and $\psi_{\left(f^{\prime}\right)}(f)$ agree. This proves that the morphisms $\psi_{f}$ glue to a global morphism from $Y$ into $U_{d} \subset X$, and that the maps $\alpha_{f}$ glue to an isomorphism satisfying the conditions of the lemma.
We still have to show the pair $(\varphi, \alpha)$ is unique. Suppose $\left(\varphi^{\prime}, \alpha^{\prime}\right)$ is a second such pair. Let $f \in S_{d}$. By the commutativity of the diagrams in the lemma we have that the inverse images of $D_{+}(f)$ under both $\varphi$ and $\varphi^{\prime}$ are equal to $Y_{\psi(f)}$. Since the opens $D_{+}(f)$ are a basis for the topology on $X$, and since $X$ is a sober topological space (see Schemes, Lemma 25.11.1) this means the maps $\varphi$ and $\varphi^{\prime}$ are the same on underlying topological spaces. Let us use $s=\psi(f)$ to trivialize the invertible sheaf $\mathcal{L}$ over $Y_{\psi(f)}$. By the commutativity of the diagrams we have that $\alpha^{\otimes n}\left(\psi_{\varphi}^{d}(x)\right)=$ $\psi(x)=\left(\alpha^{\prime}\right)^{\otimes n}\left(\psi_{\varphi^{\prime}}^{d}(x)\right)$ for all $x \in S_{n d}$. By construction of $\psi_{\varphi}^{d}$ and $\psi_{\varphi^{\prime}}^{d}$ we have $\psi_{\varphi}^{d}(x)=\varphi^{\sharp}\left(x / f^{n}\right) \psi_{\varphi}^{d}\left(f^{n}\right)$ over $Y_{\psi(f)}$, and similarly for $\psi_{\varphi^{\prime}}^{d}$. by the commutativity of the diagrams of the lemma we deduce that $\varphi^{\sharp}\left(x / f^{n}\right)=\left(\varphi^{\prime}\right)^{\sharp}\left(x / f^{n}\right)$. This proves that $\varphi$ and $\varphi^{\prime}$ induce the same morphism from $Y_{\psi(f)}$ into the affine scheme $D_{+}(f)=$ $\operatorname{Spec}\left(S_{(f)}\right)$. Hence $\varphi$ and $\varphi^{\prime}$ are the same as morphisms. Finally, it remains to show that the commutativity of the diagram of the lemma singles out, given $\varphi$, a unique $\alpha$. We omit the verification.

We continue the discussion from above the lemma. Let $S$ be a graded ring. Let $Y$ be a scheme. We will consider triples $(d, \mathcal{L}, \psi)$ where
(1) $d \geq 1$ is an integer,
(2) $\mathcal{L}$ is an invertible $\mathcal{O}_{Y}$-module, and
(3) $\psi: S^{(d)} \rightarrow \Gamma_{*}(Y, \mathcal{L})$ is a graded ring homomorphism such that $\mathcal{L}$ is generated by the global sections $\psi(f)$, with $f \in S_{d}$.
Given a morphism $h: Y^{\prime} \rightarrow Y$ and a triple $(d, \mathcal{L}, \psi)$ over $Y$ we can pull it back to the triple $\left(d, h^{*} \mathcal{L}, h^{*} \circ \psi\right)$. Given two triples $(d, \mathcal{L}, \psi)$ and $\left(d, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ with the same integer $d$ we say they are strictly equivalent if there exists an isomorphism $\beta: \mathcal{L} \rightarrow \mathcal{L}^{\prime}$ such that $\beta \circ \psi=\psi^{\prime}$ as graded ring maps $S^{(d)} \rightarrow \Gamma_{*}\left(Y, \mathcal{L}^{\prime}\right)$.
For each integer $d \geq 1$ we define

$$
\begin{aligned}
F_{d}: \text { Sch }^{\text {opp }} & \longrightarrow \text { Sets }, \\
Y & \longmapsto \text { \{strict equivalence classes of triples }(d, \mathcal{L}, \psi) \text { as above }\}
\end{aligned}
$$

with pullbacks as defined above.
01N9 Lemma 26.12.2. Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$. The open subscheme $U_{d} \subset X$ 26.12.0.1 represents the functor $F_{d}$ and the triple $\left(d, \mathcal{O}_{U_{d}}(d), \psi^{d}\right)$ defined above is the universal family (see Schemes, Section 25.15).

Proof. This is a reformulation of Lemma 26.12.1
01NA Lemma 26.12.3. Let $S$ be a graded ring generated as an $S_{0}$-algebra by the elements of $S_{1}$. In this case the scheme $X=\operatorname{Proj}(S)$ represents the functor which associates to a scheme $Y$ the set of pairs $(\mathcal{L}, \psi)$, where
(1) $\mathcal{L}$ is an invertible $\mathcal{O}_{Y}$-module, and
(2) $\psi: S \rightarrow \Gamma_{*}(Y, \mathcal{L})$ is a graded ring homomorphism such that $\mathcal{L}$ is generated by the global sections $\psi(f)$, with $f \in S_{1}$
up to strict equivalence as above.
Proof. Under the assumptions of the lemma we have $X=U_{1}$ and the lemma is a reformulation of Lemma 26.12 .2 above.

We end this section with a discussion of a functor corresponding to $\operatorname{Proj}(S)$ for a general graded ring $S$. We advise the reader to skip the rest of this section.
Fix an arbitrary graded ring $S$. Let $T$ be a scheme. We will say two triples $(d, \mathcal{L}, \psi)$ and $\left(d^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ over $T$ with possibly different integers $d, d^{\prime}$ are equivalent if there exists an isomorphism $\beta: \mathcal{L}^{\otimes d^{\prime}} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes d}$ of invertible sheaves over $T$ such that $\left.\beta \circ \psi\right|_{S^{\left(d d^{\prime}\right)}}$ and $\left.\psi^{\prime}\right|_{S^{\left(d d^{\prime}\right)}}$ agree as graded ring maps $S^{\left(d d^{\prime}\right)} \rightarrow \Gamma_{*}\left(Y,\left(\mathcal{L}^{\prime}\right)^{\otimes d d^{\prime}}\right)$.
01NB Lemma 26.12.4. Let $S$ be a graded ring. Set $X=\operatorname{Proj}(S)$. Let $T$ be a scheme. Let $(d, \mathcal{L}, \psi)$ and $\left(d^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ be two triples over $T$. The following are equivalent:
(1) Let $n=\operatorname{lcm}\left(d, d^{\prime}\right)$. Write $n=a d=a^{\prime} d^{\prime}$. There exists an isomorphism $\beta: \mathcal{L}^{\otimes a} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a^{\prime}}$ with the property that $\left.\beta \circ \psi\right|_{S^{(n)}}$ and $\left.\psi^{\prime}\right|_{S^{(n)}}$ agree as graded ring maps $S^{(n)} \rightarrow \Gamma_{*}\left(Y,\left(\mathcal{L}^{\prime}\right)^{\otimes n}\right)$.
(2) The triples $(d, \mathcal{L}, \psi)$ and $\left(d^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ are equivalent.
(3) For some positive integer $n=a d=a^{\prime} d^{\prime}$ there exists an isomorphism $\beta: \mathcal{L}^{\otimes a} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a^{\prime}}$ with the property that $\left.\beta \circ \psi\right|_{S^{(n)}}$ and $\left.\psi^{\prime}\right|_{S^{(n)}}$ agree as graded ring maps $S^{(n)} \rightarrow \Gamma_{*}\left(Y,\left(\mathcal{L}^{\prime}\right)^{\otimes n}\right)$.
(4) The morphisms $\varphi: T \rightarrow X$ and $\varphi^{\prime}: T \rightarrow X$ associated to $(d, \mathcal{L}, \psi)$ and ( $d^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}$ ) are equal.

Proof. Clearly (1) implies (2) and (2) implies (3) by restricting to more divisible degrees and powers of invertible sheaves. Also (3) implies (4) by the uniqueness statement in Lemma 26.12.1. Thus we have to prove that (4) implies (1). Assume (4), in other words $\varphi=\varphi^{\prime}$. Note that this implies that we may write $\mathcal{L}=\varphi^{*} \mathcal{O}_{X}(d)$ and $\mathcal{L}^{\prime}=\varphi^{*} \mathcal{O}_{X}\left(d^{\prime}\right)$. Moreover, via these identifications we have that the graded ring maps $\psi$ and $\psi^{\prime}$ correspond to the restriction of the canonical graded ring map

$$
S \longrightarrow \bigoplus_{n \geq 0} \Gamma\left(X, \mathcal{O}_{X}(n)\right)
$$

to $S^{(d)}$ and $S^{\left(d^{\prime}\right)}$ composed with pullback by $\varphi$ (by Lemma 26.12.1 again). Hence taking $\beta$ to be the isomorphism

$$
\left(\varphi^{*} \mathcal{O}_{X}(d)\right)^{\otimes a}=\varphi^{*} \mathcal{O}_{X}(n)=\left(\varphi^{*} \mathcal{O}_{X}\left(d^{\prime}\right)\right)^{\otimes a^{\prime}}
$$

works.
Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$. Over the open subscheme scheme $U_{d} \subset X=\operatorname{Proj}(S) 26.12 .0 .1$ we have the triple $\left(d, \mathcal{O}_{U_{d}}(d), \psi^{d}\right)$. Clearly, if $d \mid d^{\prime}$ the triples $\left(d, \mathcal{O}_{U_{d}}(d), \psi^{d}\right)$ and $\left(d^{\prime}, \mathcal{O}_{U_{d^{\prime}}}\left(d^{\prime}\right), \psi^{d^{\prime}}\right)$ are equivalent when restricted to the open $U_{d}$ (which is a subset of $U_{d^{\prime}}$ ). This, combined with Lemma 26.12.1 shows
that morphisms $Y \rightarrow X$ correspond roughly to equivalence classes of triples over $Y$. This is not quite true since if $Y$ is not quasi-compact, then there may not be a single triple which works. Thus we have to be slightly careful in defining the corresponding functor.

Here is one possible way to do this. Suppose $d^{\prime}=a d$. Consider the transformation of functors $F_{d} \rightarrow F_{d^{\prime}}$ which assigns to the triple $(d, \mathcal{L}, \psi)$ over $T$ the triple $\left(d^{\prime}, \mathcal{L}^{\otimes a},\left.\psi\right|_{S^{\left(d^{\prime}\right)}}\right)$. One of the implications of Lemma 26.12 .4 is that the transformation $F_{d} \rightarrow F_{d^{\prime}}$ is injective! For a quasi-compact scheme $T$ we define

$$
F(T)=\bigcup_{d \in \mathbf{N}} F_{d}(T)
$$

with transition maps as explained above. This clearly defines a contravariant functor on the category of quasi-compact schemes with values in sets. For a general scheme $T$ we define

$$
F(T)=\lim _{V \subset T \text { quasi-compact open }} F(V)
$$

In other words, an element $\xi$ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_{V} \in F(V)$ where $V$ ranges over the quasi-compact opens of $T$. We omit the definition of the pullback map $F(T) \rightarrow F\left(T^{\prime}\right)$ for a morphism $T^{\prime} \rightarrow T$ of schemes. Thus we have defined our functor

$$
F: S c h^{o p p} \quad \longrightarrow \quad \text { Sets }
$$

01NC Lemma 26.12.5. Let $S$ be a graded ring. Let $X=\operatorname{Proj}(S)$. The functor $F$ defined above is representable by the scheme $X$.

Proof. We have seen above that the functor $F_{d}$ corresponds to the open subscheme $U_{d} \subset X$. Moreover the transformation of functors $F_{d} \rightarrow F_{d^{\prime}}$ (if $d \mid d^{\prime}$ ) defined above corresponds to the inclusion morphism $U_{d} \rightarrow U_{d^{\prime}}$ (see discussion above). Hence to show that $F$ is represented by $X$ it suffices to show that $T \rightarrow X$ for a quasi-compact scheme $T$ ends up in some $U_{d}$, and that for a general scheme $T$ we have

$$
\operatorname{Mor}(T, X)=\lim _{V \subset T \text { quasi-compact open }} \operatorname{Mor}(V, X)
$$

These verifications are omitted.

### 26.13. Projective space

01 ND Projective space is one of the fundamental objects studied in algebraic geometry. In this section we just give its construction as Proj of a polynomial ring. Later we will discover many of its beautiful properties.

01NE Lemma 26.13.1. Let $S=\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right]$ with $\operatorname{deg}\left(T_{i}\right)=1$. The scheme

$$
\mathbf{P}_{\mathbf{Z}}^{n}=\operatorname{Proj}(S)
$$

represents the functor which associates to a scheme $Y$ the pairs $\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)$ where
(1) $\mathcal{L}$ is an invertible $\mathcal{O}_{Y}$-module, and
(2) $s_{0}, \ldots, s_{n}$ are global sections of $\mathcal{L}$ which generate $\mathcal{L}$
up to the following equivalence: $\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right) \sim\left(\mathcal{N},\left(t_{0}, \ldots, t_{n}\right)\right) \Leftrightarrow$ there exists an isomorphism $\beta: \mathcal{L} \rightarrow \mathcal{N}$ with $\beta\left(s_{i}\right)=t_{i}$ for $i=0, \ldots, n$.

Proof. This is a special case of Lemma 26.12 .3 above. Namely, for any graded ring $A$ we have

$$
\begin{aligned}
\operatorname{Mor}_{\text {gradedrings }}\left(\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right], A\right) & =A_{1} \times \ldots \times A_{1} \\
\psi & \mapsto\left(\psi\left(T_{0}\right), \ldots, \psi\left(T_{n}\right)\right)
\end{aligned}
$$

and the degree 1 part of $\Gamma_{*}(Y, \mathcal{L})$ is just $\Gamma(Y, \mathcal{L})$.
01NF Definition 26.13.2. The scheme $\mathbf{P}_{\mathbf{Z}}^{n}=\operatorname{Proj}\left(\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right]\right)$ is called projective $n$-space over $\mathbf{Z}$. Its base change $\mathbf{P}_{S}^{n}$ to a scheme $S$ is called projective $n$-space over $S$. If $R$ is a ring the base change to $\operatorname{Spec}(R)$ is denoted $\mathbf{P}_{R}^{n}$ and called projective $n$-space over $R$.

Given a scheme $Y$ over $S$ and a pair $\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)$ as in Lemma 26.13.1 the induced morphism to $\mathbf{P}_{S}^{n}$ is denoted

$$
\varphi_{\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)}: Y \longrightarrow \mathbf{P}_{S}^{n}
$$

This makes sense since the pair defines a morphism into $\mathbf{P}_{\mathrm{Z}}^{n}$ and we already have the structure morphism into $S$ so combined we get a morphism into $\mathbf{P}_{S}^{n}=\mathbf{P}_{\mathbf{Z}}^{n} \times S$. Note that this is the $S$-morphism characterized by

$$
\mathcal{L}=\varphi_{\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)}^{*} \mathcal{O}_{\mathbf{P}_{R}^{n}}(1) \quad \text { and } \quad s_{i}=\varphi_{\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)}^{*} T_{i}
$$

where we think of $T_{i}$ as a global section of $\mathcal{O}_{\mathbf{P}_{S}^{n}}(1)$ via 26.10.1.3.
01NG Lemma 26.13.3. Projective $n$-space over $\mathbf{Z}$ is covered by $n+1$ standard opens

$$
\mathbf{P}_{\mathbf{Z}}^{n}=\bigcup_{i=0, \ldots, n} D_{+}\left(T_{i}\right)
$$

where each $D_{+}\left(T_{i}\right)$ is isomorphic to $\mathbf{A}_{\mathbf{Z}}^{n}$ affine $n$-space over $\mathbf{Z}$.
Proof. This is true because $\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right]_{+}=\left(T_{0}, \ldots, T_{n}\right)$ and since

$$
\operatorname{Spec}\left(\mathbf{Z}\left[\frac{T_{0}}{T_{i}}, \ldots, \frac{T_{n}}{T_{i}}\right]\right) \cong \mathbf{A}_{\mathbf{Z}}^{n}
$$

in an obvious way.
01 NH Lemma 26.13.4. Let $S$ be a scheme. The structure morphism $\mathbf{P}_{S}^{n} \rightarrow S$ is
(1) separated,
(2) quasi-compact,
(3) satisfies the existence and uniqueness parts of the valuative criterion, and
(4) universally closed.

Proof. All these properties are stable under base change (this is clear for the last two and for the other two see Schemes, Lemmas 25.21.13 and 25.19.3. Hence it suffices to prove them for the morphism $\mathbf{P}_{\mathbf{Z}}^{n} \rightarrow \operatorname{Spec}(\mathbf{Z})$. Separatedness is Lemma 26.8.8. Quasi-compactness follows from Lemma 26.13.3. Existence and uniqueness of the valuative criterion follow from Lemma 26.8.11. Universally closed follows from the above and Schemes, Proposition 25.20 .6 .
01NI Remark 26.13.5. What's missing in the list of properties above? Well to be sure the property of being of finite type. The reason we do not list this here is that we have not yet defined the notion of finite type at this point. (Another property which is missing is "smoothness". And I'm sure there are many more you can think of.)

We finish this section with two simple lemmas. These lemmas are special cases of more general results later, but perhaps it makes sense to prove these directly here now.

03GL Lemma 26.13.6. Let $R$ be a ring. Let $Z \subset \mathbf{P}_{R}^{n}$ be a closed subscheme. Let

$$
I_{d}=\operatorname{Ker}\left(R\left[T_{0}, \ldots, T_{n}\right]_{d} \longrightarrow \Gamma\left(Z,\left.\mathcal{O}_{\mathbf{P}_{R}^{n}}(d)\right|_{Z}\right)\right)
$$

Then $I=\bigoplus I_{d} \subset R\left[T_{0}, \ldots, T_{n}\right]$ is a graded ideal and $Z=\operatorname{Proj}\left(R\left[T_{0}, \ldots, T_{n}\right] / I\right)$.
Proof. It is clear that $I$ is a graded ideal. Set $Z^{\prime}=\operatorname{Proj}\left(R\left[T_{0}, \ldots, T_{n}\right] / I\right)$. By Lemma 26.11.5 we see that $Z^{\prime}$ is a closed subscheme of $\mathbf{P}_{R}^{n}$. To see the equality $Z=Z^{\prime}$ it suffices to check on an standard affine open $D_{+}\left(T_{i}\right)$. By renumbering the homogeneous coordinates we may assume $i=0$. Say $Z \cap D_{+}\left(T_{0}\right)$, resp. $Z^{\prime} \cap D_{+}\left(T_{0}\right)$ is cut out by the ideal $J$, resp. $J^{\prime}$ of $R\left[T_{1} / T_{0}, \ldots, T_{n} / T_{0}\right]$. Then $J^{\prime}$ is the ideal generated by the elements $F / T_{0}^{\operatorname{deg}(F)}$ where $F \in I$ is homogeneous. Suppose the degree of $F \in I$ is $d$. Since $F$ vanishes as a section of $\mathcal{O}_{\mathbf{P}_{R}^{n}}(d)$ restricted to $Z$ we see that $F / T_{0}^{d}$ is an element of $J$. Thus $J^{\prime} \subset J$.
Conversely, suppose that $f \in J$. If $f$ has total degree $d$ in $T_{1} / T_{0}, \ldots, T_{n} / T_{0}$, then we can write $f=F / T_{0}^{d}$ for some $F \in R\left[T_{0}, \ldots, T_{n}\right]_{d}$. Pick $i \in\{1, \ldots, n\}$. Then $Z \cap D_{+}\left(T_{i}\right)$ is cut out by some ideal $J_{i} \subset R\left[T_{0} / T_{i}, \ldots, T_{n} / T_{i}\right]$. Moreover,

$$
J \cdot R\left[\frac{T_{1}}{T_{0}}, \ldots, \frac{T_{n}}{T_{0}}, \frac{T_{0}}{T_{i}}, \ldots, \frac{T_{n}}{T_{i}}\right]=J_{i} \cdot R\left[\frac{T_{1}}{T_{0}}, \ldots, \frac{T_{n}}{T_{0}}, \frac{T_{0}}{T_{i}}, \ldots, \frac{T_{n}}{T_{i}}\right]
$$

The left hand side is the localization of $J$ with respect to the element $T_{i} / T_{0}$ and the right hand side is the localization of $J_{i}$ with respect to the element $T_{0} / T_{i}$. It follows that $T_{0}^{d_{i}} F / T_{i}^{d+d_{i}}$ is an element of $J_{i}$ for some $d_{i}$ sufficiently large. This proves that $T_{0}^{\max \left(d_{i}\right)} F$ is an element of $I$, because its restriction to each standard affine open $D_{+}\left(T_{i}\right)$ vanishes on the closed subscheme $Z \cap D_{+}\left(T_{i}\right)$. Hence $f \in J^{\prime}$ and we conclude $J \subset J^{\prime}$ as desired.

The following lemma is a special case of the more general Properties, Lemmas 27.28 .3 or 27.28 .5 .

03GM Lemma 26.13.7. Let $R$ be a ring. Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathbf{P}_{R}^{n}$. For $d \geq 0$ set

$$
M_{d}=\Gamma\left(\mathbf{P}_{R}^{n}, \mathcal{F} \otimes_{\mathcal{O}_{\mathbf{P}_{R}^{n}}} \mathcal{O}_{\mathbf{P}_{R}^{n}}(d)\right)=\Gamma\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right)
$$

Then $M=\bigoplus_{d \geq 0} M_{d}$ is a graded $R\left[T_{0}, \ldots, R_{n}\right]$-module and there is a canonical isomorphism $\mathcal{F}=\widetilde{M}$.

Proof. The multiplication maps

$$
R\left[T_{0}, \ldots, R_{n}\right]_{e} \times M_{d} \longrightarrow M_{d+e}
$$

come from the natural isomorphisms

$$
\mathcal{O}_{\mathbf{P}_{R}^{n}}(e) \otimes_{\mathcal{O}_{\mathbf{P}_{R}^{n}}} \mathcal{F}(d) \longrightarrow \mathcal{F}(e+d)
$$

see Equation 26.10.1.4. Let us construct the map $c: \widetilde{M} \rightarrow \mathcal{F}$. On each of the standard affines $U_{i}=D_{+}\left(T_{i}\right)$ we see that $\Gamma\left(U_{i}, \widetilde{M}\right)=\left(M\left[1 / T_{i}\right]\right)_{0}$ where the subscript ${ }_{0}$ means degree 0 part. An element of this can be written as $m / T_{i}^{d}$ with $m \in M_{d}$. Since $T_{i}$ is a generator of $\mathcal{O}(1)$ over $U_{i}$ we can always write $\left.m\right|_{U_{i}}=m_{i} \otimes T_{i}^{d}$ where $m_{i} \in \Gamma\left(U_{i}, \mathcal{F}\right)$ is a unique section. Thus a natural guess is $c\left(m / T_{i}^{d}\right)=m_{i}$.

A small argument, which is omitted here, shows that this gives a well defined map $c: \widetilde{M} \rightarrow \mathcal{F}$ if we can show that

$$
\left.\left(T_{i} / T_{j}\right)^{d} m_{i}\right|_{U_{i} \cap U_{j}}=\left.m_{j}\right|_{U_{i} \cap U_{j}}
$$

in $M\left[1 / T_{i} T_{j}\right]$. But this is clear since on the overlap the generators $T_{i}$ and $T_{j}$ of $\mathcal{O}(1)$ differ by the invertible function $T_{i} / T_{j}$.
Injectivity of $c$. We may check for injectivity over the affine opens $U_{i}$. Let $i \in$ $\{0, \ldots, n\}$ and let $s$ be an element $s=m / T_{i}^{d} \in \Gamma\left(U_{i}, \widetilde{M}\right)$ such that $c\left(m / T_{i}^{d}\right)=0$. By the description of $c$ above this means that $m_{i}=0$, hence $\left.m\right|_{U_{i}}=0$. Hence $T_{i}^{e} m=0$ in $M$ for some $e$. Hence $s=m / T_{i}^{d}=T_{i}^{e} / T_{i}^{e+d}=0$ as desired.
Surjectivity of $c$. We may check for surjectivity over the affine opens $U_{i}$. By renumbering it suffices to check it over $U_{0}$. Let $s \in \mathcal{F}\left(U_{0}\right)$. Let us write $\left.\mathcal{F}\right|_{U_{i}}=$ $\widetilde{N}_{i}$ for some $R\left[T_{0} / T_{i}, \ldots, T_{0} / T_{i}\right]$-module $N_{i}$, which is possible because $\mathcal{F}$ is quasicoherent. So $s$ corresponds to an element $x \in N_{0}$. Then we have that

$$
\left(N_{i}\right)_{T_{j} / T_{i}} \cong\left(N_{j}\right)_{T_{i} / T_{j}}
$$

(where the subscripts mean "principal localization at") as modules over the ring

$$
R\left[\frac{T_{0}}{T_{i}}, \ldots, \frac{T_{n}}{T_{i}}, \frac{T_{0}}{T_{j}}, \ldots, \frac{T_{n}}{T_{j}}\right]
$$

This means that for some large integer $d$ there exist elements $s_{i} \in N_{i}, i=1, \ldots, n$ such that

$$
s=\left(T_{i} / T_{0}\right)^{d} s_{i}
$$

on $U_{0} \cap U_{i}$. Next, we look at the difference

$$
t_{i j}=s_{i}-\left(T_{j} / T_{i}\right)^{d} s_{j}
$$

on $U_{i} \cap U_{j}, 0<i<j$. By our choice of $s_{i}$ we know that $\left.t_{i j}\right|_{U_{0} \cap U_{i} \cap U_{j}}=0$. Hence there exists a large integer $e$ such that $\left(T_{0} / T_{i}\right)^{e} t_{i j}=0$. Set $s_{i}^{\prime}=\left(T_{0} / T_{i}\right)^{e} s_{i}$, and $s_{0}^{\prime}=s$. Then we will have

$$
s_{a}^{\prime}=\left(T_{b} / T_{a}\right)^{e+d} s_{b}^{\prime}
$$

on $U_{a} \cap U_{b}$ for all $a, b$. This is exactly the condition that the elements $s_{a}^{\prime}$ glue to a global section $m \in \Gamma\left(\mathbf{P}_{R}^{n}, \mathcal{F}(e+d)\right)$. And moreover $c\left(m / T_{0}^{e+d}\right)=s$ by construction. Hence $c$ is surjective and we win.

0B3B Lemma 26.13.8. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible sheaf and let $s_{0}, \ldots, s_{n}$ be global sections of $\mathcal{L}$ which generate it. Let $\mathcal{F}$ be the kernel of the induced map $\mathcal{O}_{X}^{\oplus}{ }^{\oplus+1} \rightarrow \mathcal{L}$. Then $\mathcal{F} \otimes \mathcal{L}$ is globally generated
Proof. In fact the result is true if $X$ is any locally ringed space. The sheaf $\mathcal{F}$ is a finite locally free $\mathcal{O}_{X}$-module of rank $n$. The elements

$$
s_{i j}=\left(0, \ldots, 0, s_{j}, 0, \ldots, 0, s_{i}, 0, \ldots, 0\right) \in \Gamma\left(X, \mathcal{L}^{\oplus n+1}\right)
$$

with $s_{j}$ in the $i$ th spot and $s_{i}$ in the $j$ th spot map to zero in $\mathcal{L}^{\otimes 2}$. Hence $s_{i j} \in$ $\Gamma\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right)$. A local computation shows that these sections generate $\mathcal{F} \otimes \mathcal{L}$.
Alternative proof. Consider the morphism $\varphi: X \rightarrow \mathbf{P}_{\mathbf{Z}}^{n}$ associated to the pair $\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)$. Since the pullback of $\mathcal{O}(1)$ is $\mathcal{L}$ and since the pullback of $T_{i}$ is $s_{i}$, it suffices to prove the lemma in the case of $\mathbf{P}_{\mathbf{Z}}^{n}$. In this case the sheaf $\mathcal{F}$ corresponds to the graded $S=\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right]$ module $M$ which fits into the short exact sequence

$$
0 \rightarrow M \rightarrow S^{\oplus n+1} \rightarrow S(1) \rightarrow 0
$$

where the second map is given by $T_{0}, \ldots, T_{n}$. In this case the statement above translates into the statment that the elements

$$
T_{i j}=\left(0, \ldots, 0, T_{j}, 0, \ldots, 0, T_{i}, 0, \ldots, 0\right) \in M(1)_{0}
$$

generate the graded module $M(1)$ over $S$. We omit the details.

### 26.14. Invertible sheaves and morphisms into Proj

01 NJ Let $T$ be a scheme and let $\mathcal{L}$ be an invertible sheaf on $T$. For a section $s \in \Gamma(T, \mathcal{L})$ we denote $T_{s}$ the open subset of points where $s$ does not vanish. See Modules, Lemma 17.21 .10 . We can view the following lemma as a slight generalization of Lemma 26.12.3. It also is a generalization of Lemma 26.11.1.

01NK Lemma 26.14.1. Let $A$ be a graded ring. Set $X=\operatorname{Proj}(A)$. Let $T$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{T}$-module. Let $\psi: A \rightarrow \Gamma_{*}(T, \mathcal{L})$ be a homomorphism of graded rings. Set

$$
U(\psi)=\bigcup_{f \in A_{+} \text {homogeneous }} T_{\psi(f)}
$$

The morphism $\psi$ induces a canonical morphism of schemes

$$
r_{\mathcal{L}, \psi}: U(\psi) \longrightarrow X
$$

together with a map of $\mathbf{Z}$-graded $\mathcal{O}_{T}$-algebras

$$
\theta:\left.r_{\mathcal{L}, \psi}^{*}\left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{X}(d)\right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{L}^{\otimes d}\right|_{U(\psi)}
$$

The triple $\left(U(\psi), r_{\mathcal{L}, \psi}, \theta\right)$ is characterized by the following properties:
(1) For $f \in A_{+}$homogeneous we have $r_{\mathcal{L}, \psi}^{-1}\left(D_{+}(f)\right)=T_{\psi(f)}$.
(2) For every $d \geq 0$ the diagram

is commutative.
Moreover, for any $d \geq 1$ and any open subscheme $V \subset T$ such that the sections in $\psi\left(A_{d}\right)$ generate $\left.\mathcal{L}^{\otimes d}\right|_{V}$ the morphism $\left.r_{\mathcal{L}, \psi}\right|_{V}$ agrees with the morphism $\varphi: V \rightarrow$ $\operatorname{Proj}(A)$ and the map $\left.\theta\right|_{V}$ agrees with the map $\alpha:\left.\varphi^{*} \mathcal{O}_{X}(d) \rightarrow \mathcal{L}^{\otimes d}\right|_{V}$ where $(\varphi, \alpha)$ is the pair of Lemma 26.12.1 associated to $\left.\psi\right|_{A^{(d)}}: A^{(d)} \rightarrow \Gamma_{*}\left(V, \mathcal{L}^{\otimes d}\right)$.

Proof. Suppose that we have two triples $(U, r: U \rightarrow X, \theta)$ and $\left(U^{\prime}, r^{\prime}: U^{\prime} \rightarrow X, \theta^{\prime}\right)$ satisfying (1) and (2). Property (1) implies that $U=U^{\prime}=U(\psi)$ and that $r=r^{\prime}$ as maps of underlying topological spaces, since the opens $D_{+}(f)$ form a basis for the topology on $X$, and since $X$ is a sober topological space (see Algebra, Section 10.56 and Schemes, Lemma 25.11.1. Let $f \in A_{+}$be homogeneous. Note that $\bar{\Gamma}\left(D_{+}(f), \bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{X}(n)\right)=A_{f}$ as a $\mathbf{Z}$-graded algebra. Consider the two $\mathbf{Z}$-graded ring maps

$$
\theta, \theta^{\prime}: A_{f} \longrightarrow \Gamma\left(T_{\psi(f)}, \bigoplus \mathcal{L}^{\otimes n}\right)
$$

We know that multiplication by $f$ (resp. $\psi(f)$ ) is an isomorphism on the left (resp. right) hand side. We also know that $\theta(x / 1)=\theta^{\prime}(x / 1)=\left.\psi(x)\right|_{T_{\psi(f)}}$ by (2) for all $x \in A$. Hence we deduce easily that $\theta=\theta^{\prime}$ as desired. Considering the degree 0
parts we deduce that $r^{\sharp}=\left(r^{\prime}\right)^{\sharp}$, i.e., that $r=r^{\prime}$ as morphisms of schemes. This proves the uniqueness.
Now we come to existence. By the uniqueness just proved, it is enough to construct the pair $(r, \theta)$ locally on $T$. Hence we may assume that $T=\operatorname{Spec}(R)$ is affine, that $\mathcal{L}=\mathcal{O}_{T}$ and that for some $f \in A_{+}$homogeneous we have $\psi(f)$ generates $\mathcal{O}_{T}=\mathcal{O}_{T}^{\otimes \operatorname{deg}(f)}$. In other words, $\psi(f)=u \in R^{*}$ is a unit. In this case the map $\psi$ is a graded ring map

$$
A \longrightarrow R[x]=\Gamma_{*}\left(T, \mathcal{O}_{T}\right)
$$

which maps $f$ to $u x^{\operatorname{deg}(f)}$. Clearly this extends (uniquely) to a Z-graded ring map $\theta: A_{f} \rightarrow R\left[x, x^{-1}\right]$ by mapping $1 / f$ to $u^{-1} x^{-\operatorname{deg}(f)}$. This map in degree zero gives the ring map $A_{(f)} \rightarrow R$ which gives the morphism $r: T=\operatorname{Spec}(R) \rightarrow \operatorname{Spec}\left(A_{(f)}\right)=$ $D_{+}(f) \subset X$. Hence we have constructed $(r, \theta)$ in this special case.
Let us show the last statement of the lemma. According to Lemma 26.12.1 the morphism constructed there is the unique one such that the displayed diagram in its statement commutes. The commutativity of the diagram in the lemma implies the commutativity when restricted to $V$ and $A^{(d)}$. Whence the result.
01NL Remark 26.14.2. Assumptions as in Lemma 26.14.1 above. The image of the morphism $r_{\mathcal{L}, \psi}$ need not be contained in the locus where the sheaf $\mathcal{O}_{X}(1)$ is invertible. Here is an example. Let $k$ be a field. Let $S=k[A, B, C] \operatorname{graded}$ by $\operatorname{deg}(A)=1$, $\operatorname{deg}(B)=2, \operatorname{deg}(C)=3$. Set $X=\operatorname{Proj}(S)$. Let $T=\mathbf{P}_{k}^{2}=\operatorname{Proj}\left(k\left[X_{0}, X_{1}, X_{2}\right]\right)$. Recall that $\mathcal{L}=\mathcal{O}_{T}(1)$ is invertible and that $\mathcal{O}_{T}(n)=\mathcal{L}^{\otimes n}$. Consider the composition $\psi$ of the maps

$$
S \rightarrow k\left[X_{0}, X_{1}, X_{2}\right] \rightarrow \Gamma_{*}(T, \mathcal{L})
$$

Here the first map is $A \mapsto X_{0}^{6}, B \mapsto X_{1}^{3}, C \mapsto X_{2}^{3}$ and the second map is 26.10.1.3). By the lemma this corresponds to a morphism $r_{\mathcal{L}, \psi}: T \rightarrow X=\operatorname{Proj}(S)$ which is easily seen to be surjective. On the other hand, in Remark 26.9 .2 we showed that the sheaf $\mathcal{O}_{X}(1)$ is not invertible at all points of $X$.

### 26.15. Relative Proj via glueing

01NM
01 NN Situation 26.15.1. Here $S$ is a scheme, and $\mathcal{A}$ is a quasi-coherent graded $\mathcal{O}_{S^{-}}$ algebra.

In this section we outline how to construct a morphism of schemes

$$
\underline{\operatorname{Proj}}_{S}(\mathcal{A}) \longrightarrow S
$$

by glueing the homogeneous spectra $\operatorname{Proj}(\Gamma(U, \mathcal{A}))$ where $U$ ranges over the affine opens of $S$. We first show that the homogeneous spectra of the values of $\mathcal{A}$ over affines form a suitable collection of schemes, as in Lemma 26.2.1.
01NO Lemma 26.15.2. In Situation 26.15.1. Suppose $U \subset U^{\prime} \subset S$ are affine opens. Let $A=\mathcal{A}(U)$ and $A^{\prime}=\mathcal{A}\left(U^{\prime}\right)$. The map of graded rings $A^{\prime} \rightarrow A$ induces a morphism $r: \operatorname{Proj}(A) \rightarrow \operatorname{Proj}\left(A^{\prime}\right)$, and the diagram

is cartesian. Moreover there are canonical isomorphisms $\theta: r^{*} \mathcal{O}_{\operatorname{Proj}\left(A^{\prime}\right)}(n) \rightarrow$ $\mathcal{O}_{\operatorname{Proj}(A)}(n)$ compatible with multiplication maps.

Proof. Let $R=\mathcal{O}_{S}(U)$ and $R^{\prime}=\mathcal{O}_{S}\left(U^{\prime}\right)$. Note that the map $R \otimes_{R^{\prime}} A^{\prime} \rightarrow A$ is an isomorphism as $\mathcal{A}$ is quasi-coherent (see Schemes, Lemma 25.7.3 for example). Hence the lemma follows from Lemma 26.11.6.

In particular the morphism $\operatorname{Proj}(A) \rightarrow \operatorname{Proj}\left(A^{\prime}\right)$ of the lemma is an open immersion.
01NP Lemma 26.15.3. In Situation 26.15.1. Suppose $U \subset U^{\prime} \subset U^{\prime \prime} \subset S$ are affine opens. Let $A=\mathcal{A}(U), A^{\prime}=\mathcal{A}\left(U^{\prime}\right)$ and $A^{\prime \prime}=\mathcal{A}\left(U^{\prime \prime}\right)$. The composition of the morphisms $r: \operatorname{Proj}(A) \rightarrow \operatorname{Proj}\left(A^{\prime}\right)$, and $r^{\prime}: \operatorname{Proj}\left(A^{\prime}\right) \rightarrow \operatorname{Proj}\left(A^{\prime \prime}\right)$ of Lemma 26.15.2 gives the morphism $r^{\prime \prime}: \operatorname{Proj}(A) \rightarrow \operatorname{Proj}\left(A^{\prime \prime}\right)$ of Lemma 26.15.2. A similar statement holds for the isomorphisms $\theta$.

Proof. This follows from Lemma 26.11 .2 since the map $A^{\prime \prime} \rightarrow A$ is the composition of $A^{\prime \prime} \rightarrow A^{\prime}$ and $A^{\prime} \rightarrow A$.

01NQ Lemma 26.15.4. In Situation 26.15.1. There exists a morphism of schemes

$$
\pi: \underline{\operatorname{Proj}}_{S}(\mathcal{A}) \longrightarrow S
$$

with the following properties:
(1) for every affine open $U \subset S$ there exists an isomorphism $i_{U}: \pi^{-1}(U) \rightarrow$ $\operatorname{Proj}(A)$ with $A=\mathcal{A}(U)$, and
(2) for $U \subset U^{\prime} \subset S$ affine open the composition

$$
\operatorname{Proj}(A) \xrightarrow{i_{U}^{-1}} \pi^{-1}(U) \xrightarrow{\text { inclusion }} \pi^{-1}\left(U^{\prime}\right) \xrightarrow{i_{U^{\prime}}} \operatorname{Proj}\left(A^{\prime}\right)
$$

with $A=\mathcal{A}(U), A^{\prime}=\mathcal{A}\left(U^{\prime}\right)$ is the open immersion of Lemma 26.15.2 above.

Proof. Follows immediately from Lemmas 26.2.1, 26.15.2, and 26.15.3.
01NR Lemma 26.15.5. In Situation 26.15.1. The morphism $\pi: \underline{\operatorname{Proj}}_{S}(\mathcal{A}) \rightarrow S$ of Lemma 26.15 .4 comes with the following additional structure. There exists a quasicoherent $\mathbf{Z}$-graded sheaf of $\mathcal{O}_{\text {Proj}_{S}(\mathcal{A})}$-algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\text { Proj }}_{S}(\mathcal{A})}(n)$, and a morphism of graded $\mathcal{O}_{S^{-}}$-algebras

$$
\psi: \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \pi_{*}\left(\mathcal{O}_{\underline{\operatorname{Proj}}_{S}(\mathcal{A})}(n)\right)
$$

uniquely determined by the following property: For every affine open $U \subset S$ with $A=\mathcal{A}(U)$ there is an isomorphism

$$
\theta_{U}:\left.i_{U}^{*}\left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\operatorname{Proj}(A)}(n)\right) \longrightarrow\left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\operatorname{Proj}}_{S}(\mathcal{A})}(n)\right)\right|_{\pi^{-1}(U)}
$$

of $\mathbf{Z}$-graded $\mathcal{O}_{\pi^{-1}(U)}$-algebras such that

is commutative.

Proof. We are going to use Lemma 26.2 .2 to glue the sheaves of $\mathbf{Z}$-graded algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\operatorname{Proj}(A)}(n)$ for $A=\mathcal{A}(U), U \subset S$ affine open over the scheme $\operatorname{Proj}_{S}(\mathcal{A})$. We have constructed the data necessary for this in Lemma 26.15 .2 and we have checked condition (d) of Lemma 26.2.2 in Lemma 26.15.3. Hence we get the sheaf of $\mathbf{Z}$ graded $\mathcal{O}_{\operatorname{Proj}_{S}(\mathcal{A})}$-algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\operatorname{Proj}_{S}(\mathcal{A})}(n)$ together with the isomorphisms $\theta_{U}$ for all $U \subset S$ affine open and all $n \in \mathbf{Z}$. For every affine open $U \subset S$ with $A=\mathcal{A}(U)$ we have a map $A \rightarrow \Gamma\left(\operatorname{Proj}(A), \bigoplus_{n \geq 0} \mathcal{O}_{\operatorname{Proj}(A)}(n)\right)$. Hence the map $\psi$ exists by functoriality of relative glueing, see $\overline{\mathrm{R}}$ emark 26.2 .3 . The diagram of the lemma commutes by construction. This characterizes the sheaf of Z-graded $\mathcal{O}_{\underline{\text { Proj }}}^{S}(\mathcal{A})$-algebras $\bigoplus \mathcal{O}_{\underline{\operatorname{Proj}}_{S}(\mathcal{A})}(n)$ because the proof of Lemma 26.11.1 shows that having these diagrams commute uniquely determines the maps $\theta_{U}$. Some details omitted.

### 26.16. Relative Proj as a functor

01 NS We place ourselves in Situation 26.15.1. So $S$ is a scheme and $\mathcal{A}=\bigoplus_{d \geq 0} \mathcal{A}_{d}$ is a quasi-coherent graded $\mathcal{O}_{S}$-algebra. In this section we relativize the construction of Proj by constructing a functor which the relative homogeneous spectrum will represent. As a result we will construct a morphism of schemes

$$
\underline{\operatorname{Proj}}_{S}(\mathcal{A}) \longrightarrow S
$$

which above affine opens of $S$ will look like the homogeneous spectrum of a graded ring. The discussion will be modeled after our discussion of the relative spectrum in Section 26.4. The easier method using glueing schemes of the form $\operatorname{Proj}(A)$, $A=\Gamma(U, \mathcal{A}), U \subset S$ affine open, is explained in Section 26.15, and the result in this section will be shown to be isomorphic to that one.

Fix for the moment an integer $d \geq 1$. We denote $\mathcal{A}^{(d)}=\bigoplus_{n \geq 0} \mathcal{A}_{n d}$ similarly to the notation in Algebra, Section 10.55. Let $T$ be a scheme. Let us consider quadruples $(d, f: T \rightarrow S, \mathcal{L}, \psi)$ over $T$ where
(1) $d$ is the integer we fixed above,
(2) $f: T \rightarrow S$ is a morphism of schemes,
(3) $\mathcal{L}$ is an invertible $\mathcal{O}_{T}$-module, and
(4) $\psi: f^{*} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a homomorphism of graded $\mathcal{O}_{T}$-algebras such that $f^{*} \mathcal{A}_{d} \rightarrow \mathcal{L}$ is surjective.
Given a morphism $h: T^{\prime} \rightarrow T$ and a quadruple $(d, f, \mathcal{L}, \psi)$ over $T$ we can pull it back to the quadruple $\left(d, f \circ h, h^{*} \mathcal{L}, h^{*} \psi\right)$ over $T^{\prime}$. Given two quadruples $(d, f, \mathcal{L}, \psi)$ and $\left(d, f^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ over $T$ with the same integer $d$ we say they are strictly equivalent if $f=f^{\prime}$ and there exists an isomorphism $\beta: \mathcal{L} \rightarrow \mathcal{L}^{\prime}$ such that $\beta \circ \psi=\psi^{\prime}$ as graded $\mathcal{O}_{T}$-algebra maps $f^{*} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0}\left(\mathcal{L}^{\prime}\right)^{\otimes n}$.

For each integer $d \geq 1$ we define

$$
\begin{aligned}
F_{d}: S c h^{o p p} & \longrightarrow \text { Sets, } \\
T & \longmapsto\{\text { strict equivalence classes of }(d, f: T \rightarrow S, \mathcal{L}, \psi) \text { as above }\}
\end{aligned}
$$

with pullbacks as defined above.
01NT Lemma 26.16.1. In Situation 26.15.1. Let $d \geq 1$. Let $F_{d}$ be the functor associated to $(S, \mathcal{A})$ above. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Set $\mathcal{A}^{\prime}=g^{*} \mathcal{A}$. Let $F_{d}^{\prime}$
be the functor associated to $\left(S^{\prime}, \mathcal{A}^{\prime}\right)$ above. Then there is a canonical isomorphism

$$
F_{d}^{\prime} \cong h_{S^{\prime}} \times_{h_{S}} F_{d}
$$

of functors.
Proof. A quadruple $\left(d, f^{\prime}: T \rightarrow S^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}:\left(f^{\prime}\right)^{*}\left(\mathcal{A}^{\prime}\right)^{(d)} \rightarrow \bigoplus_{n \geq 0}\left(\mathcal{L}^{\prime}\right)^{\otimes n}\right)$ is the same as a quadruple $\left(d, f, \mathcal{L}, \psi: f^{*} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}\right)$ together with a factorization of $f$ as $f=g \circ f^{\prime}$. Namely, the correspondence is $f=g \circ f^{\prime}, \mathcal{L}=\mathcal{L}^{\prime}$ and $\psi=\psi^{\prime}$ via the identifications $\left(f^{\prime}\right)^{*}\left(\mathcal{A}^{\prime}\right)^{(d)}=\left(f^{\prime}\right)^{*} g^{*}\left(\mathcal{A}^{(d)}\right)=f^{*} \mathcal{A}^{(d)}$. Hence the lemma.

01NU Lemma 26.16.2. In Situation 26.15.1. Let $F_{d}$ be the functor associated to $(d, S, \mathcal{A})$ above. If $S$ is affine, then $F_{d}$ is representable by the open subscheme $U_{d}$ 26.12.0.1) of the scheme $\operatorname{Proj}(\Gamma(S, \mathcal{A}))$.
Proof. Write $S=\operatorname{Spec}(R)$ and $A=\Gamma(S, \mathcal{A})$. Then $A$ is a graded $R$-algebra and $\mathcal{A}=\widetilde{A}$. To prove the lemma we have to identify the functor $F_{d}$ with the functor $F_{d}^{\text {triples }}$ of triples defined in Section 26.12 .
Let $(d, f: T \rightarrow S, \mathcal{L}, \psi)$ be a quadruple. We may think of $\psi$ as a $\mathcal{O}_{S}$-module $\operatorname{map} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} f_{*} \mathcal{L}^{\otimes n}$. Since $\mathcal{A}^{(d)}$ is quasi-coherent this is the same thing as an $R$-linear homomorphism of graded rings $A^{(d)} \rightarrow \Gamma\left(S, \bigoplus_{n \geq 0} f_{*} \mathcal{L}^{\otimes n}\right)$. Clearly, $\Gamma\left(S, \bigoplus_{n \geq 0} f_{*} \mathcal{L}^{\otimes n}\right)=\Gamma_{*}(T, \mathcal{L})$. Thus we may associate to the quadruple the triple $(d, \mathcal{L}, \psi)$.
Conversely, let $(d, \mathcal{L}, \psi)$ be a triple. The composition $R \rightarrow A_{0} \rightarrow \Gamma\left(T, \mathcal{O}_{T}\right)$ determines a morphism $f: T \rightarrow S=\operatorname{Spec}(R)$, see Schemes, Lemma 25.6.4. With this choice of $f$ the map $A^{(d)} \rightarrow \Gamma\left(S, \bigoplus_{n \geq 0} f_{*} \mathcal{L}^{\otimes n}\right)$ is $R$-linear, and hence corresponds to a $\psi$ which we can use for a quadruple $(d, f: T \rightarrow S, \mathcal{L}, \psi)$. We omit the verification that this establishes an isomorphism of functors $F_{d}=F_{d}^{\text {triples }}$.
01NV Lemma 26.16.3. In Situation 26.15.1. The functor $F_{d}$ is representable by a scheme.

Proof. We are going to use Schemes, Lemma 25.15.4.
First we check that $F_{d}$ satisfies the sheaf property for the Zariski topology. Namely, suppose that $T$ is a scheme, that $T=\bigcup_{i \in I} U_{i}$ is an open covering, and that $\left(d, f_{i}, \mathcal{L}_{i}, \psi_{i}\right) \in F_{d}\left(U_{i}\right)$ such that $\left.\left(d, f_{i}, \mathcal{L}_{i}, \psi_{i}\right)\right|_{U_{i} \cap U_{j}}$ and $\left.\left(d, f_{j}, \mathcal{L}_{j}, \psi_{j}\right)\right|_{U_{i} \cap U_{j}}$ are strictly equivalent. This implies that the morphisms $f_{i}: U_{i} \rightarrow S$ glue to a morphism of schemes $f: T \rightarrow S$ such that $\left.f\right|_{I_{i}}=f_{i}$, see Schemes, Section 25.14. Thus $f_{i}^{*} \mathcal{A}^{(d)}=\left.f^{*} \mathcal{A}^{(d)}\right|_{U_{i}}$. It also implies there exist isomorphisms $\beta_{i j}:\left.\mathcal{L}_{i}\right|_{U_{i} \cap U_{j}} \rightarrow$ $\left.\mathcal{L}_{j}\right|_{U_{i} \cap U_{j}}$ such that $\beta_{i j} \circ \psi_{i}=\psi_{j}$ on $U_{i} \cap U_{j}$. Note that the isomorphisms $\beta_{i j}$ are uniquely determined by this requirement because the maps $f_{i}^{*} \mathcal{A}_{d} \rightarrow \mathcal{L}_{i}$ are surjective. In particular we see that $\beta_{j k} \circ \beta_{i j}=\beta_{i k}$ on $U_{i} \cap U_{j} \cap U_{k}$. Hence by Sheaves, Section 6.33 the invertible sheaves $\mathcal{L}_{i}$ glue to an invertible $\mathcal{O}_{T}$-module $\mathcal{L}$ and the morphisms $\psi_{i}$ glue to morphism of $\mathcal{O}_{T \text {-algebras } \psi: f^{*} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n} \text {. This } \mathrm{C}}$ proves that $F_{d}$ satisfies the sheaf condition with respect to the Zariski topology.
Let $S=\bigcup_{i \in I} U_{i}$ be an affine open covering. Let $F_{d, i} \subset F_{d}$ be the subfunctor consisting of those pairs $(f: T \rightarrow S, \varphi)$ such that $f(T) \subset U_{i}$.
We have to show each $F_{d, i}$ is representable. This is the case because $F_{d, i}$ is identified with the functor associated to $U_{i}$ equipped with the quasi-coherent graded $\mathcal{O}_{U_{i}}-$ algebra $\left.\left.\mathcal{A}\right|_{U_{i}}\right)$ by Lemma 26.16.1. Thus the result follows from Lemma 26.16.2.

Next we show that $F_{d, i} \subset F_{d}$ is representable by open immersions. Let ( $f: T \rightarrow$ $S, \varphi) \in F_{d}(T)$. Consider $V_{i}=f^{-1}\left(U_{i}\right)$. It follows from the definition of $F_{d, i}$ that given $a: T^{\prime} \rightarrow T$ we gave $a^{*}(f, \varphi) \in F_{d, i}\left(T^{\prime}\right)$ if and only if $a\left(T^{\prime}\right) \subset V_{i}$. This is what we were required to show.
Finally, we have to show that the collection $\left(F_{d, i}\right)_{i \in I}$ covers $F_{d}$. Let $(f: T \rightarrow$ $S, \varphi) \in F_{d}(T)$. Consider $V_{i}=f^{-1}\left(U_{i}\right)$. Since $S=\bigcup_{i \in I} U_{i}$ is an open covering of $S$ we see that $T=\bigcup_{i \in I} V_{i}$ is an open covering of $T$. Moreover $\left.(f, \varphi)\right|_{V_{i}} \in F_{d, i}\left(V_{i}\right)$. This finishes the proof of the lemma.

At this point we can redo the material at the end of Section 26.12 in the current relative setting and define a functor which is representable by $\operatorname{Proj}_{S}(\mathcal{A})$. To do this we introduce the notion of equivalence between two quadruples $(d, f: T \rightarrow S, \mathcal{L}, \psi)$ and $\left(d^{\prime}, f^{\prime}: T \rightarrow S, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ with possibly different values of the integers $d, d^{\prime}$. Namely, we say these are equivalent if $f=f^{\prime}$, and there exists an isomorphism $\beta: \mathcal{L}^{\otimes d^{\prime}} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes d}$ such that $\left.\beta \circ \psi\right|_{f^{*} \mathcal{A}^{\left(d d^{\prime}\right)}}=\left.\psi^{\prime}\right|_{f^{*} \mathcal{A}^{\left(d d^{\prime}\right)}}$. The following lemma implies that this defines an equivalence relation. (This is not a complete triviality.)

01NW Lemma 26.16.4. In Situation 26.15.1. Let $T$ be a scheme. Let $(d, f, \mathcal{L}, \psi)$, $\left(d^{\prime}, f^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ be two quadruples over $T$. The following are equivalent:
(1) Let $m=\operatorname{lcm}\left(d, d^{\prime}\right)$. Write $m=a d=a^{\prime} d^{\prime}$. We have $f=f^{\prime}$ and there exists an isomorphism $\beta: \mathcal{L}^{\otimes a} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a^{\prime}}$ with the property that $\left.\beta \circ \psi\right|_{f^{*} \mathcal{A}^{(m)}}$ and $\left.\psi^{\prime}\right|_{f^{*} \mathcal{A}(m)}$ agree as graded ring maps $f^{*} \mathcal{A}^{(m)} \rightarrow \bigoplus_{n \geq 0}\left(\mathcal{L}^{\prime}\right)^{\otimes m n}$.
(2) The quadruples $(d, f, \mathcal{L}, \psi)$ and $\left(d^{\prime}, f^{\prime}, \mathcal{L}^{\prime}, \psi^{\prime}\right)$ are equivalent.
(3) We have $f=f^{\prime}$ and for some positive integer $m=a d=a^{\prime} d^{\prime}$ there exists an isomorphism $\beta: \mathcal{L}^{\otimes a} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a^{\prime}}$ with the property that $\left.\beta \circ \psi\right|_{f^{*} \mathcal{A}^{(m)}}$ and $\left.\psi^{\prime}\right|_{f^{*} \mathcal{A}^{(m)}}$ agree as graded ring maps $f^{*} \mathcal{A}^{(m)} \rightarrow \bigoplus_{n \geq 0}\left(\mathcal{L}^{\prime}\right)^{\otimes m n}$.

Proof. Clearly (1) implies (2) and (2) implies (3) by restricting to more divisible degrees and powers of invertible sheaves. Assume (3) for some integer $m=a d=$ $a^{\prime} d^{\prime}$. Let $m_{0}=\operatorname{lcm}\left(d, d^{\prime}\right)$ and write it as $m_{0}=a_{0} d=a_{0}^{\prime} d^{\prime}$. We are given an isomorphism $\beta: \mathcal{L}^{\otimes a} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a^{\prime}}$ with the property described in (3). We want to find an isomorphism $\beta_{0}: \mathcal{L}^{\otimes a_{0}} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a_{0}^{\prime}}$ having that property as well. Since by assumption the maps $\psi: f^{*} \mathcal{A}_{d} \rightarrow \mathcal{L}$ and $\psi^{\prime}:\left(f^{\prime}\right)^{*} \mathcal{A}_{d^{\prime}} \rightarrow \mathcal{L}^{\prime}$ are surjective the same is true for the maps $\psi: f^{*} \mathcal{A}_{m_{0}} \rightarrow \mathcal{L}^{\otimes a_{0}}$ and $\psi^{\prime}:\left(f^{\prime}\right)^{*} \mathcal{A}_{m_{0}} \rightarrow\left(\mathcal{L}^{\prime}\right)^{\otimes a_{0}}$. Hence if $\beta_{0}$ exists it is uniquely determined by the condition that $\beta_{0} \circ \psi=\psi^{\prime}$. This means that we may work locally on $T$. Hence we may assume that $f=f^{\prime}: T \rightarrow S$ maps into an affine open, in other words we may assume that $S$ is affine. In this case the result follows from the corresponding result for triples (see Lemma 26.12.4) and the fact that triples and quadruples correspond in the affine base case (see proof of Lemma 26.16.2.

Suppose $d^{\prime}=a d$. Consider the transformation of functors $F_{d} \rightarrow F_{d^{\prime}}$ which assigns to the quadruple $(d, f, \mathcal{L}, \psi)$ over $T$ the quadruple $\left(d^{\prime}, f, \mathcal{L}^{\otimes a},\left.\psi\right|_{f^{*} \mathcal{A}^{\left(d^{\prime}\right)}}\right)$. One of the implications of Lemma 26.16 .4 is that the transformation $F_{d} \rightarrow F_{d^{\prime}}$ is injective! For a quasi-compact scheme $T$ we define

$$
F(T)=\bigcup_{d \in \mathbf{N}} F_{d}(T)
$$

with transition maps as explained above. This clearly defines a contravariant functor on the category of quasi-compact schemes with values in sets. For a general
scheme $T$ we define

$$
F(T)=\lim _{V \subset T \text { quasi-compact open }} F(V)
$$

In other words, an element $\xi$ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_{V} \in F(V)$ where $V$ ranges over the quasi-compact opens of $T$. We omit the definition of the pullback map $F(T) \rightarrow F\left(T^{\prime}\right)$ for a morphism $T^{\prime} \rightarrow T$ of schemes. Thus we have defined our functor
01NX (26.16.4.1)

$$
F: S^{o p h} \longrightarrow \text { Sets }
$$

01NY Lemma 26.16.5. In Situation 26.15.1. The functor $F$ above is representable by a scheme.

Proof. Let $U_{d} \rightarrow S$ be the scheme representing the functor $F_{d}$ defined above. Let $\mathcal{L}_{d}, \psi^{d}: \pi_{d}^{*} \mathcal{A}^{(d)} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}_{d}^{\otimes n}$ be the universal object. If $d \mid d^{\prime}$, then we may consider the quadruple $\left(d^{\prime}, \pi_{d}, \mathcal{L}_{d}^{\otimes d^{\prime} / d},\left.\psi^{d}\right|_{\mathcal{A}^{\left(d^{\prime}\right)}}\right)$ which determines a canonical morphism $U_{d} \rightarrow U_{d^{\prime}}$ over $S$. By construction this morphism corresponds to the transformation of functors $F_{d} \rightarrow F_{d^{\prime}}$ defined above.
For every affine open $\operatorname{Spec}(R)=V \subset S$ setting $A=\Gamma(V, \mathcal{A})$ we have a canonical identification of the base change $U_{d, V}$ with the corresponding open subscheme of $\operatorname{Proj}(A)$, see Lemma 26.16 .2 . Moreover, the morphisms $U_{d, V} \rightarrow U_{d^{\prime}, V}$ constructed above correspond to the inclusions of opens in $\operatorname{Proj}(A)$. Thus we conclude that $U_{d} \rightarrow U_{d^{\prime}}$ is an open immersion.

This allows us to construct $X$ by glueing the schemes $U_{d}$ along the open immersions $U_{d} \rightarrow U_{d^{\prime}}$. Technically, it is convenient to choose a sequence $d_{1}\left|d_{2}\right| d_{3} \mid \ldots$ such that every positive integer divides one of the $d_{i}$ and to simply take $X=\bigcup U_{d_{i}}$ using the open immersions above. It is then a simple matter to prove that $X$ represents the functor $F$.

01 NZ Lemma 26.16.6. In Situation 26.15.1. The scheme $\pi:$ Proj $_{S}(\mathcal{A}) \rightarrow S$ constructed in Lemma 26.15.4 and the scheme representing the functor $F$ are canonically isomorphic as schemes over $S$.

Proof. Let $X$ be the scheme representing the functor $F$. Note that $X$ is a scheme over $S$ since the functor $F$ comes equipped with a natural transformation $F \rightarrow h_{S}$. Write $Y=\underline{\operatorname{Proj}}_{S}(\mathcal{A})$. We have to show that $X \cong Y$ as $S$-schemes. We give two arguments.
The first argument uses the construction of $X$ as the union of the schemes $U_{d}$ representing $F_{d}$ in the proof of Lemma 26.16.5. Over each affine open of $S$ we can identify $X$ with the homogeneous spectrum of the sections of $\mathcal{A}$ over that open, since this was true for the opens $U_{d}$. Moreover, these identifications are compatible with further restrictions to smaller affine opens. On the other hand, $Y$ was constructed by glueing these homogeneous spectra. Hence we can glue these isomorphisms to an isomorphism between $X$ and $\underline{\operatorname{Proj}}_{S}(\mathcal{A})$ as desired. Details omitted.
Here is the second argument. Lemma 26.15 .5 shows that there exists a morphism of graded algebras

$$
\psi: \pi^{*} \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_{Y}(n)
$$

over $Y$ which on sections over affine opens of $S$ agrees with 26.10.1.3. Hence for every $y \in Y$ there exists an open neighbourhood $V \subset Y$ of $y$ and an integer
$d \geq 1$ such that for $d \mid n$ the sheaf $\left.\mathcal{O}_{Y}(n)\right|_{V}$ is invertible and the multiplication maps $\left.\left.\left.\mathcal{O}_{Y}(n)\right|_{V} \otimes_{\mathcal{O}_{V}} \mathcal{O}_{Y}(m)\right|_{V} \rightarrow \mathcal{O}_{Y}(n+m)\right|_{V}$ are isomorphisms. Thus $\psi$ restricted to the sheaf $\left.\pi^{*} \mathcal{A}^{(d)}\right|_{V}$ gives an element of $F_{d}(V)$. Since the opens $V$ cover $Y$ we see " $\psi$ " gives rise to an element of $F(Y)$. Hence a canonical morphism $Y \rightarrow X$ over $S$. Because this construction is completely canonical to see that it is an isomorphism we may work locally on $S$. Hence we reduce to the case $S$ affine where the result is clear.

0100 Definition 26.16.7. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{S}$-algebras. The relative homogeneous spectrum of $\mathcal{A}$ over $S$, or the homogeneous spectrum of $\mathcal{A}$ over $S$, or the relative $\operatorname{Proj}$ of $\mathcal{A}$ over $S$ is the scheme constructed in Lemma 26.15.4 which represents the functor $F$ 26.16.4.1, see Lemma 26.16.6. We denote it $\pi: \underline{\operatorname{Proj}}_{S}(\mathcal{A}) \rightarrow S$.

The relative Proj comes equipped with a quasi-coherent sheaf of $\mathbf{Z}$-graded algebras $\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\operatorname{Proj}_{S}(\mathcal{A})}(n)$ (the twists of the structure sheaf) and a "universal" homomorphism of graded algebras

$$
\psi_{u n i v}: \mathcal{A} \longrightarrow \pi_{*}\left(\bigoplus_{n \geq 0} \mathcal{O}_{\underline{\operatorname{Proj}}_{S}(\mathcal{A})}(n)\right)
$$

see Lemma 26.15.5. We may also think of this as a homomorphism

$$
\psi_{\text {univ }}: \pi^{*} \mathcal{A} \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_{\operatorname{Proj}_{S}(\mathcal{A})}(n)
$$

if we like. The following lemma is a formulation of the universality of this object.
0101 Lemma 26.16.8. In Situation 26.15.1. Let $(f: T \rightarrow S, d, \mathcal{L}, \psi)$ be a quadruple. Let $r_{d, \mathcal{L}, \psi}: T \rightarrow \operatorname{Proj}_{S}(\mathcal{A})$ be the associated $S$-morphism. There exists an isomorphism of $\mathbf{Z}$-grade $\overline{\mathcal{O}}_{T}$-algebras

$$
\theta: r_{d, \mathcal{L}, \psi}^{*}\left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\underline{\operatorname{Proj}}_{S}(\mathcal{A})}(n d)\right) \longrightarrow \bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n}
$$

such that the following diagram commutes

The commutativity of this diagram uniquely determines $\theta$.
Proof. Note that the quadruple $(f: T \rightarrow S, d, \mathcal{L}, \psi)$ defines an element of $F_{d}(T)$. Let $U_{d} \subset \operatorname{Proj}_{S}(\mathcal{A})$ be the locus where the sheaf $\mathcal{O}_{\operatorname{Proj}_{S}(\mathcal{A})}(d)$ is invertible and generated by the image of $\psi_{\text {univ }}: \pi^{*} \mathcal{A}_{d} \rightarrow \mathcal{O}_{\text {Proj }_{S}}(\mathcal{A})\left(\overline{d) .}\right.$ Recall that $U_{d}$ represents the functor $F_{d}$, see the proof of Lemma 26.16.5. Hence the result will follow if we can show the quadruple $\left(U_{d} \rightarrow S, d, \mathcal{O}_{U_{d}}(d),\left.\psi_{u n i v}\right|_{\mathcal{A}^{(d)}}\right)$ is the universal family, i.e., the representing object in $F_{d}\left(U_{d}\right)$. We may do this after restricting to an affine open of $S$ because (a) the formation of the functors $F_{d}$ commutes with base change (see Lemma 26.16.1), and (b) the pair $\left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{\text {Proj }_{S}(\mathcal{A})}(n), \psi_{\text {univ }}\right)$ is constructed by glueing over affine opens in $S$ (see Lemma 26.15.5). Hence we may assume that $S$ is affine. In this case the functor of quadruples $F_{d}$ and the functor of triples $F_{d}$ agree (see proof of Lemma 26.16 .2 and moreover Lemma 26.12 .2 shows that
$\left(d, \mathcal{O}_{U_{d}}(d), \psi^{d}\right)$ is the universal triple over $U_{d}$. Going backwards through the identifications in the proof of Lemma 26.16 .2 shows that $\left(U_{d} \rightarrow S, d, \mathcal{O}_{U_{d}}(d),\left.\psi_{u n i v}\right|_{\mathcal{A}^{(d)}}\right)$ is the universal quadruple as desired.

01 O 2 Lemma 26.16.9. Let $S$ be a scheme and $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{S}$-algebras. The morphism $\pi: \underline{\operatorname{Proj}}_{S}(\mathcal{A}) \rightarrow S$ is separated.

Proof. To prove a morphism is separated we may work locally on the base, see Schemes, Section 25.21. By construction $\operatorname{Proj}_{S}(\mathcal{A})$ is over any affine $U \subset S$ isomorphic to $\operatorname{Proj}(A)$ with $A=\mathcal{A}(U)$. By Lemma 26.8 .8 we see that $\operatorname{Proj}(A)$ is separated. Hence $\operatorname{Proj}(A) \rightarrow U$ is separated (see Schemes, Lemma 25.21.14) as desired.

0103 Lemma 26.16.10. Let $S$ be a scheme and $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{S}$-algebras. Let $g: S^{\prime} \rightarrow S$ be any morphism of schemes. Then there is a canonical isomorphism

$$
r: \underline{\operatorname{Proj}}_{S^{\prime}}\left(g^{*} \mathcal{A}\right) \longrightarrow S^{\prime} \times_{S}{\operatorname{Proj}_{S}}^{(\mathcal{A})}
$$

as well as a corresponding isomorphism

$$
\theta: r^{*} p r_{2}^{*}\left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{P r o j}_{S}(\mathcal{A})}(d)\right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{\underline{\text { Proj}}_{S^{\prime}}\left(g^{*} \mathcal{A}\right)}(d)
$$

of $\mathbf{Z}$-graded $\mathcal{O}_{\text {Proj }_{S^{\prime}}\left(g^{*} \mathcal{A}\right) \text {-algebras. }}$
Proof. This follows from Lemma 26.16 .1 and the construction of $\operatorname{Proj}_{S}(\mathcal{A})$ in Lemma 26.16 .5 as the union of the schemes $U_{d}$ representing the functors $F_{d}$. In terms of the construction of relative Proj via glueing this isomorphism is given by the isomorphisms constructed in Lemma 26.11 .6 which provides us with the isomorphism $\theta$. Some details omitted.

01O4 Lemma 26.16.11. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{S}$-modules generated as an $\mathcal{A}_{0}$-algebra by $\mathcal{A}_{1}$. In this case the scheme $X=\operatorname{Proj}_{S}(\mathcal{A})$ represents the functor $F_{1}$ which associates to a scheme $f: T \rightarrow S$ over $\bar{S}$ the set of pairs $(\mathcal{L}, \psi)$, where
(1) $\mathcal{L}$ is an invertible $\mathcal{O}_{T}$-module, and
(2) $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{n>0} \mathcal{L}^{\otimes n}$ is a graded $\mathcal{O}_{T}$-algebra homomorphism such that $f^{*} \mathcal{A}_{1} \rightarrow \mathcal{L}$ is surjective
up to strict equivalence as above. Moreover, in this case all the quasi-coherent sheaves $\mathcal{O}_{\operatorname{Proj}(\mathcal{A})}(n)$ are invertible $\mathcal{O}_{\operatorname{Proj}(\mathcal{A})}$-modules and the multiplication maps induce isomorphisms $\mathcal{O}_{\underline{\operatorname{Proj}(\mathcal{A})}}(n) \otimes_{\underline{\mathcal{O}_{\underline{\text { Proj }}(\mathcal{A})}}} \mathcal{O}_{\underline{\text { Proj }}(\mathcal{A})}(m)=\mathcal{O}_{\underline{\text { Proj }}(\mathcal{A})}(n+m)$.
Proof. Under the assumptions of the lemma the sheaves $\mathcal{O}_{\operatorname{Proj}(\mathcal{A})}(n)$ are invertible and the multiplication maps isomorphisms by Lemma 26.16.5 and Lemma 26.12.3 over affine opens of $S$. Thus $X$ actually represents the functor $F_{1}$, see proof of Lemma 26.16.5.

### 26.17. Quasi-coherent sheaves on relative Proj

0105 We briefly discuss how to deal with graded modules in the relative setting.
We place ourselves in Situation 26.15.1. So $S$ is a scheme, and $\mathcal{A}$ is a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $\mathcal{M}=\bigoplus_{n \in \mathbf{Z}} \mathcal{M}_{n}$ be a graded $\mathcal{A}$-module, quasi-coherent as an $\mathcal{O}_{S}$-module. We are going to describe the associated quasi-coherent sheaf of
modules on $\operatorname{Proj}_{S}(\mathcal{A})$. We first describe the value of this sheaf schemes $T$ mapping into the relative Proj.

Let $T$ be a scheme. Let $(d, f: T \rightarrow S, \mathcal{L}, \psi)$ be a quadruple over $T$, as in Section 26.16 We define a quasi-coherent sheaf $\widetilde{\mathcal{M}}_{T}$ of $\mathcal{O}_{T}$-modules as follows

0106

$$
\begin{equation*}
\widetilde{\mathcal{M}}_{T}=\left(f^{*} \mathcal{M}^{(d)} \otimes_{f^{*} \mathcal{A}^{(d)}}\left(\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n}\right)\right)_{0} \tag{26.17.0.1}
\end{equation*}
$$

So $\widetilde{\mathcal{M}}_{T}$ is the degree 0 part of the tensor product of the graded $f^{*} \mathcal{A}^{(d)}$-modules $\mathcal{M}^{(d)}$ and $\bigoplus_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n}$. Note that the sheaf $\widetilde{\mathcal{M}}_{T}$ depends on the quadruple even though we suppressed this in the notation. This construction has the pleasing property that given any morphism $g: T^{\prime} \rightarrow T$ we have $\widetilde{\mathcal{M}}_{T^{\prime}}=g^{*} \widetilde{\mathcal{M}}_{T}$ where $\widetilde{\mathcal{M}}_{T^{\prime}}$ denotes the quasi-coherent sheaf associated to the pullback quadruple $\left(d, f \circ g, g^{*} \mathcal{L}, g^{*} \psi\right)$.

Since all sheaves in 26.17 .0 .1 are quasi-coherent we can spell out the construction over an affine open $\operatorname{Spec}(C)=V \subset T$ which maps into an affine open $\operatorname{Spec}(R)=$ $U \subset S$. Namely, suppose that $\left.\mathcal{A}\right|_{U}$ corresponds to the graded $R$-algebra $A$, that $\left.\mathcal{M}\right|_{U}$ corresponds to the graded $A$-module $M$, and that $\left.\mathcal{L}\right|_{V}$ corresponds to the invertible $C$-module $L$. The map $\psi$ gives rise to a graded $R$-algebra map $\gamma: A^{(d)} \rightarrow$ $\bigoplus_{n \geq 0} L^{\otimes n}$. (Tensor powers of $L$ over $C$.) Then $\left.\left(\widetilde{\mathcal{M}}_{T}\right)\right|_{V}$ is the quasi-coherent sheaf associated to the $C$-module

$$
N_{R, C, A, M, \gamma}=\left(M^{(d)} \otimes_{A^{(d)}, \gamma}\left(\bigoplus_{n \in \mathbf{Z}} L^{\otimes n}\right)\right)_{0}
$$

By assumption we may even cover $T$ by affine opens $V$ such that there exists some $a \in A_{d}$ such that $\gamma(a) \in L$ is a $C$-basis for the module $L$. In that case any element of $N_{R, C, A, M, \gamma}$ is a sum of pure tensors $\sum m_{i} \otimes \gamma(a)^{-n_{i}}$ with $m \in M_{n_{i} d}$. In fact we may multiply each $m_{i}$ with a suitable positive power of $a$ and collect terms to see that each element of $N_{R, C, A, M, \gamma}$ can be written as $m \otimes \gamma(a)^{-n}$ with $m \in M_{n d}$ and $n \gg 0$. In other words we see that in this case

$$
N_{R, C, A, M, \gamma}=M_{(a)} \otimes_{A_{(a)}} C
$$

where the map $A_{(a)} \rightarrow C$ is the map $x / a^{n} \mapsto \gamma(x) / \gamma(a)^{n}$. In other words, this is the value of $\widetilde{M}$ on $D_{+}(a) \subset \operatorname{Proj}(A)$ pulled back to $\operatorname{Spec}(C)$ via the morphism $\operatorname{Spec}(C) \rightarrow D_{+}(a)$ coming from $\gamma$.

0107 Lemma 26.17.1. In Situation 26.15.1. For any quasi-coherent sheaf of graded $\mathcal{A}$-modules $\mathcal{M}$ on $S$, there exists a canonical associated sheaf of $\mathcal{O}_{\underline{\text { Proj }}_{S}(\mathcal{A})}$-modules $\widetilde{\mathcal{M}}$ with the following properties:
(1) Given a scheme $T$ and a quadruple $(T \rightarrow S, d, \mathcal{L}, \psi)$ over $T$ corresponding to a morphism $h: T \rightarrow \underline{\operatorname{Proj}}_{S}(\mathcal{A})$ there is a canonical isomorphism $\widetilde{\mathcal{M}}_{T}=$ $h^{*} \widetilde{\mathcal{M}}$ where $\widetilde{\mathcal{M}}_{T}$ is defined by 26.17.0.1).
(2) The isomorphisms of (1) are compatible with pullbacks.
(3) There is a canonical map

$$
\pi^{*} \mathcal{M}_{0} \longrightarrow \widetilde{\mathcal{M}}
$$

(4) The construction $\mathcal{M} \mapsto \widetilde{\mathcal{M}}$ is functorial in $\mathcal{M}$.
(5) The construction $\mathcal{M} \mapsto \widetilde{\mathcal{M}}$ is exact.
(6) There are canonical maps

$$
\widetilde{\mathcal{M}} \otimes_{{\mathcal{\text { Proj } _ { S }}(\mathcal{A})}} \tilde{\mathcal{N}} \longrightarrow \widetilde{\mathcal{M} \otimes_{\mathcal{A}} \mathcal{N}}
$$

as in Lemma 26.9.1
(7) There exist canonical maps

$$
\pi^{*} \mathcal{M} \longrightarrow \bigoplus_{n \in \mathbf{Z}} \widetilde{\mathcal{M}(n)}
$$

generalizing 26.10.1.6.
(8) The formation of $\hat{\mathcal{M}}$ commutes with base change.

Proof. Omitted. We should split this lemma into parts and prove the parts separately.

### 26.18. Functoriality of relative Proj

07ZF This section is the analogue of Section 26.11 for the relative Proj. Let $S$ be a scheme. A graded $\mathcal{O}_{S}$-algebra map $\psi: \mathcal{A} \rightarrow \mathcal{B}$ does not always give rise to a morphism of associated relative Proj. The correct result is stated as follows.

07ZG Lemma 26.18.1. Let $S$ be a scheme. Let $\mathcal{A}, \mathcal{B}$ be two graded quasi-coherent $\mathcal{O}_{S^{-}}$ algebras. Set $p: X=\underline{\operatorname{Proj}}_{S}(\mathcal{A}) \rightarrow S$ and $q: Y=\underline{\operatorname{Proj}}_{S}(\mathcal{B}) \rightarrow S$. Let $\psi: \mathcal{A} \rightarrow \mathcal{B}$ be a homomorphism of graded $\mathcal{O}_{S}$-algebras. There is a canonical open $U(\psi) \subset Y$ and a canonical morphism of schemes

$$
r_{\psi}: U(\psi) \longrightarrow X
$$

over $S$ and a map of $\mathbf{Z}$-graded $\mathcal{O}_{U(\psi)}$-algebras

$$
\theta=\theta_{\psi}: r_{\psi}^{*}\left(\bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{X}(d)\right) \longrightarrow \bigoplus_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d)
$$

The triple $\left(U(\psi), r_{\psi}, \theta\right)$ is characterized by the property that for any affine open $W \subset S$ the triple

$$
\left(U(\psi) \cap p^{-1} W,\left.\quad r_{\psi}\right|_{U(\psi) \cap p^{-1} W}: U(\psi) \cap p^{-1} W \rightarrow q^{-1} W,\left.\quad \theta\right|_{U(\psi) \cap p^{-1} W}\right)
$$

is equal to the triple associated to $\psi: \mathcal{A}(W) \rightarrow \mathcal{B}(W)$ in Lemma 26.11.1 via the identifications $p^{-1} W=\operatorname{Proj}(\mathcal{A}(W))$ and $q^{-1} W=\operatorname{Proj}(\mathcal{B}(W))$ of Section 26.15.

Proof. This lemma proves itself by glueing the local triples.
07ZH Lemma 26.18.2. Let $S$ be a scheme. Let $\mathcal{A}, \mathcal{B}$, and $\mathcal{C}$ be quasi-coherent graded $\mathcal{O}_{S}$-algebras. Set $X=\underline{\operatorname{Proj}}_{S}(\mathcal{A}), Y=\underline{\operatorname{Proj}}_{S}(\mathcal{B})$ and $Z=\underline{\operatorname{Proj}_{S}}(\mathcal{C})$. Let $\varphi: \mathcal{A} \rightarrow \mathcal{B}$, $\psi: \mathcal{B} \rightarrow \mathcal{C}$ be graded $\mathcal{O}_{S}$-algebra maps. Then we have

$$
U(\psi \circ \varphi)=r_{\varphi}^{-1}(U(\psi)) \quad \text { and } \quad r_{\psi \circ \varphi}=\left.r_{\varphi} \circ r_{\psi}\right|_{U(\psi \circ \varphi)}
$$

In addition we have

$$
\theta_{\psi} \circ r_{\psi}^{*} \theta_{\varphi}=\theta_{\psi \circ \varphi}
$$

with obvious notation.
Proof. Omitted.
07ZI Lemma 26.18.3. With hypotheses and notation as in Lemma 26.18.1 above. Assume $\mathcal{A}_{d} \rightarrow \mathcal{B}_{d}$ is surjective for $d \gg 0$. Then
(1) $U(\psi)=Y$,
(2) $r_{\psi}: Y \rightarrow X$ is a closed immersion, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are surjective but not isomorphisms in general (even if $\mathcal{A} \rightarrow \mathcal{B}$ is surjective).

Proof. Follows on combining Lemma 26.18.1 with Lemma 26.11.3.
07ZJ Lemma 26.18.4. With hypotheses and notation as in Lemma 26.18.1 above. Assume $\mathcal{A}_{d} \rightarrow \mathcal{B}_{d}$ is an isomorphism for all $d \gg 0$. Then
(1) $U(\psi)=Y$,
(2) $r_{\psi}: Y \rightarrow X$ is an isomorphism, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are isomorphisms.

Proof. Follows on combining Lemma 26.18.1 with Lemma 26.11.4
07ZK Lemma 26.18.5. With hypotheses and notation as in Lemma 26.18.1 above. Assume $\mathcal{A}_{d} \rightarrow \mathcal{B}_{d}$ is surjective for $d \gg 0$ and that $\mathcal{A}$ is generated by $\mathcal{A}_{1}$ over $\mathcal{A}_{0}$. Then
(1) $U(\psi)=Y$,
(2) $r_{\psi}: Y \rightarrow X$ is a closed immersion, and
(3) the maps $\theta: r_{\psi}^{*} \mathcal{O}_{X}(n) \rightarrow \mathcal{O}_{Y}(n)$ are isomorphisms.

Proof. Follows on combining Lemma 26.18.1 with Lemma 26.11.5.

### 26.19. Invertible sheaves and morphisms into relative Proj

0108 It seems that we may need the following lemma somewhere. The situation is the following:
(1) Let $S$ be a scheme.
(2) Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra.
(3) Denote $\pi: \operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ the relative homogeneous spectrum over $S$.
(4) Let $f: X \rightarrow S$ be a morphism of schemes.
(5) Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module.
(6) Let $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ be a homomorphism of graded $\mathcal{O}_{X}$-algebras.

Given this data set

$$
U(\psi)=\bigcup_{(U, V, a)} U_{\psi(a)}
$$

where $(U, V, a)$ satisfies:
(1) $V \subset S$ affine open,
(2) $U=f^{-1}(V)$, and
(3) $a \in \mathcal{A}(V)_{+}$is homogeneous.

Namely, then $\psi(a) \in \Gamma\left(U, \mathcal{L}^{\otimes \operatorname{deg}(a)}\right)$ and $U_{\psi(a)}$ is the corresponding open (see Modules, Lemma 17.21.10.

0109 Lemma 26.19.1. With assumptions and notation as above. The morphism $\psi$ induces a canonical morphism of schemes over $S$

$$
r_{\mathcal{L}, \psi}: U(\psi) \longrightarrow \underline{\operatorname{Proj}}_{S}(\mathcal{A})
$$

together with a map of graded $\mathcal{O}_{U(\psi)}$-algebras

$$
\theta:\left.r_{\mathcal{L}, \psi}^{*}\left(\bigoplus_{d \geq 0} \mathcal{O}_{\underline{\operatorname{Proj}}_{S}(\mathcal{A})}(d)\right) \longrightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}\right|_{U(\psi)}
$$

characterized by the following properties:
(1) For every open $V \subset S$ and every $d \geq 0$ the diagram

is commutative.
(2) For any $d \geq 1$ and any open subscheme $W \subset X$ such that $\left.\psi\right|_{W}:\left.f^{*} \mathcal{A}_{d}\right|_{W} \rightarrow$ $\left.\mathcal{L}^{\otimes d}\right|_{W}$ is surjective the restriction of the morphism $r_{\mathcal{L}, \psi}$ agrees with the morphism $W \rightarrow \operatorname{Proj}_{S}(\mathcal{A})$ which exists by the construction of the relative homogeneous spectrum, see Definition 26.16.7.
(3) For any affine open $V \subset S$, the restriction

$$
\left(U(\psi) \cap f^{-1}(V),\left.r_{\mathcal{L}, \psi}\right|_{U(\psi) \cap f^{-1}(V)},\left.\theta\right|_{U(\psi) \cap f^{-1}(V)}\right)
$$

agrees via $i_{V}$ (see Lemma 26.15.4) with the triple $\left(U\left(\psi^{\prime}\right), r_{\mathcal{L}, \psi^{\prime}}, \theta^{\prime}\right)$ of Lemma 26.14.1 associated to the map $\psi^{\prime}: A=\mathcal{A}(V) \rightarrow \Gamma_{*}\left(f^{-1}(V),\left.\mathcal{L}\right|_{f^{-1}(V)}\right)$ induced by $\psi$.

Proof. Use characterization (3) to construct the morphism $r_{\mathcal{L}, \psi}$ and $\theta$ locally over $S$. Use the uniqueness of Lemma 26.14.1 to show that the construction glues. Details omitted.

### 26.20. Twisting by invertible sheaves and relative Proj

$02 \mathrm{NB} \quad$ Let $S$ be a scheme. Let $\mathcal{A}=\bigoplus_{d \geq 0} \mathcal{A}_{d}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $\mathcal{L}$ be an invertible sheaf on $S$. In this situation we obtain another quasi-coherent graded $\mathcal{O}_{S}$-algebra, namely

$$
\mathcal{B}=\bigoplus_{d \geq 0} \mathcal{A}_{d} \otimes_{\mathcal{O}_{S}} \mathcal{L}^{\otimes d}
$$

It turns out that $\mathcal{A}$ and $\mathcal{B}$ have isomorphic relative homogeneous spectra.
02NC Lemma 26.20.1. With notation $S, \mathcal{A}, \mathcal{L}$ and $\mathcal{B}$ as above. There is a canonical isomorphism

with the following properties
(1) There are isomorphisms $\theta_{n}: g^{*} \mathcal{O}_{P^{\prime}}(n) \rightarrow \mathcal{O}_{P}(n) \otimes \pi^{*} \mathcal{L}^{\otimes n}$ which fit together to give an isomorphism of $\mathbf{Z}$-graded algebras

$$
\theta: g^{*}\left(\bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{P^{\prime}}(n)\right) \longrightarrow \bigoplus_{n \in \mathbf{Z}} \mathcal{O}_{P}(n) \otimes \pi^{*} \mathcal{L}^{\otimes n}
$$

(2) For every open $V \subset S$ the diagrams

are commutative.
(3) Add more here as necessary.

Proof. This is the identity map when $\mathcal{L} \cong \mathcal{O}_{S}$. In general choose an open covering of $S$ such that $\mathcal{L}$ is trivialized over the pieces and glue the corresponding maps. Details omitted.

### 26.21. Projective bundles

01OA Let $S$ be a scheme. Let $\mathcal{E}$ be a quasi-coherent sheaf of $\mathcal{O}_{S}$-modules. By Modules, Lemma 17.18 .6 the symmetric algebra $\operatorname{Sym}(\mathcal{E})$ of $\mathcal{E}$ over $\mathcal{O}_{S}$ is a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras. Note that it is generated in degree 1 over $\mathcal{O}_{S}$. Hence it makes sense to apply the construction of the previous section to it, specifically Lemmas 26.16.5 and 26.16.11

01OB Definition 26.21.1. Let $S$ be a scheme. Let $\mathcal{E}$ be a quasi-coherent $\mathcal{O}_{S}$-modul $ॄ^{3}$ We denote

$$
\pi: \mathbf{P}(\mathcal{E})=\underline{\operatorname{Proj}}_{S}(\operatorname{Sym}(\mathcal{E})) \longrightarrow S
$$

and we call it the projective bundle associated to $\mathcal{E}$. The symbol $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n)$ indicates the invertible $\mathcal{O}_{\mathbf{P}(\mathcal{E})}$-modules introduced in Lemma 26.16 .5 and is called the $n$th twist of the structure sheaf.

Note that according to Lemma 26.16 .5 there are canonical $\mathcal{O}_{S}$-module homomorphisms

$$
\operatorname{Sym}^{n}(\mathcal{E}) \longrightarrow \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n)\right)
$$

for all $n \geq 0$. This, combined with the fact that $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ is the canonical relatively ample invertible sheaf on $\mathbf{P}(\mathcal{E})$, is a good way to remember how we have normalized our construction of $\mathbf{P}(\mathcal{E})$. Namely, in some references the space $\mathbf{P}(\mathcal{E})$ is only defined for $\mathcal{E}$ finite locally free on $S$, and sometimes $\mathbf{P}(\mathcal{E})$ is actually defined as our $\mathbf{P}\left(\mathcal{E}^{\wedge}\right)$ where $\mathcal{E}^{\wedge}$ is the dual of the sheaf $\mathcal{E}$.

01OC Example 26.21.2. The map $\operatorname{Sym}^{n}(\mathcal{E}) \rightarrow \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n)\right)$ is an isomorphism if $\mathcal{E}$ is locally free, but in general need not be an isomorphism. In fact we will give an example where this map is not injective for $n=1$. Set $S=\operatorname{Spec}(A)$ with

$$
A=k\left[u, v, s_{1}, s_{2}, t_{1}, t_{2}\right] / I
$$

where $k$ is a field and

$$
I=\left(-u s_{1}+v t_{1}+u t_{2}, v s_{1}+u s_{2}-v t_{2}, v s_{2}, u t_{1}\right) .
$$

[^66]Denote $\bar{u}$ the class of $u$ in $A$ and similarly for the other variables. Let $M=$ $(A x \oplus A y) / A(\bar{u} x+\bar{v} y)$ so that

$$
\operatorname{Sym}(M)=A[x, y] /(\bar{u} x+\bar{v} y)=k\left[x, y, u, v, s_{1}, s_{2}, t_{1}, t_{2}\right] / J
$$

where

$$
J=\left(-u s_{1}+v t_{1}+u t_{2}, v s_{1}+u s_{2}-v t_{2}, v s_{2}, u t_{1}, u x+v y\right)
$$

In this case the projective bundle associated to the quasi-coherent sheaf $\mathcal{E}=\widetilde{M}$ on $S=\operatorname{Spec}(A)$ is the scheme

$$
P=\operatorname{Proj}(\operatorname{Sym}(M))
$$

Note that this scheme as an affine open covering $P=D_{+}(x) \cup D_{+}(y)$. Consider the element $m \in M$ which is the image of the element $u s_{1} x+v t_{2} y$. Note that

$$
x\left(u s_{1} x+v t_{2} y\right)=\left(s_{1} x+s_{2} y\right)(u x+v y) \bmod I
$$

and

$$
y\left(u s_{1} x+v t_{2} y\right)=\left(t_{1} x+t_{2} y\right)(u x+v y) \bmod I .
$$

The first equation implies that $m$ maps to zero as a section of $\mathcal{O}_{P}(1)$ on $D_{+}(x)$ and the second that it maps to zero as a section of $\mathcal{O}_{P}(1)$ on $D_{+}(y)$. This shows that $m$ maps to zero in $\Gamma\left(P, \mathcal{O}_{P}(1)\right)$. On the other hand we claim that $m \neq 0$, so that $m$ gives an example of a nonzero global section of $\mathcal{E}$ mapping to zero in $\Gamma\left(P, \mathcal{O}_{P}(1)\right)$. Assume $m=0$ to get a contradiction. In this case there exists an element $f \in k\left[u, v, s_{1}, s_{2}, t_{1}, t_{2}\right]$ such that

$$
u s_{1} x+v t_{2} y=f(u x+v y) \bmod I
$$

Since $I$ is generated by homogeneous polynomials of degree 2 we may decompose $f$ into its homogeneous components and take the degree 1 component. In other words we may assume that

$$
f=a u+b v+\alpha_{1} s_{1}+\alpha_{2} s_{2}+\beta_{1} t_{1}+\beta_{2} t_{2}
$$

for some $a, b, \alpha_{1}, \alpha_{2}, \beta_{1}, \beta_{2} \in k$. The resulting conditions are that

$$
\begin{aligned}
& u s_{1}-u\left(a u+b v+\alpha_{1} s_{1}+\alpha_{2} s_{2}+\beta_{1} t_{1}+\beta_{2} t_{2}\right) \in I \\
& v t_{2}-v\left(a u+b v+\alpha_{1} s_{1}+\alpha_{2} s_{2}+\beta_{1} t_{1}+\beta_{2} t_{2}\right) \in I
\end{aligned}
$$

There are no terms $u^{2}, u v, v^{2}$ in the generators of $I$ and hence we see $a=b=0$. Thus we get the relations

$$
\begin{aligned}
u s_{1}-u\left(\alpha_{1} s_{1}+\alpha_{2} s_{2}+\beta_{1} t_{1}+\beta_{2} t_{2}\right) & \in I \\
v t_{2}-v\left(\alpha_{1} s_{1}+\alpha_{2} s_{2}+\beta_{1} t_{1}+\beta_{2} t_{2}\right) & \in I
\end{aligned}
$$

We may use the first generator of $I$ to replace any occurrence of $u s_{1}$ by $v t_{1}+u t_{2}$, the second generator of $I$ to replace any occurrence of $v s_{1}$ by $-u s_{2}+v t_{2}$, the third generator to remove occurrences of $v s_{2}$ and the third to remove occurences of $u t_{1}$. Then we get the relations

$$
\begin{gathered}
\left(1-\alpha_{1}\right) v t_{1}+\left(1-\alpha_{1}\right) u t_{2}-\alpha_{2} u s_{2}-\beta_{2} u t_{2}=0 \\
\left(1-\alpha_{1}\right) v t_{2}+\alpha_{1} u s_{2}-\beta_{1} v t_{1}-\beta_{2} v t_{2}=0
\end{gathered}
$$

This implies that $\alpha_{1}$ should be both 0 and 1 which is a contradiction as desired.
01OD Lemma 26.21.3. Let $S$ be a scheme. The structure morphism $\mathbf{P}(\mathcal{E}) \rightarrow S$ of a projective bundle over $S$ is separated.

Proof. Immediate from Lemma 26.16.9,

01OE Lemma 26.21.4. Let $S$ be a scheme. Let $n \geq 0$. Then $\mathbf{P}_{S}^{n}$ is a projective bundle over $S$.

Proof. Note that

$$
\mathbf{P}_{\mathbf{Z}}^{n}=\operatorname{Proj}\left(\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right]\right)=\underline{\operatorname{Proj}}_{\operatorname{Spec}(\mathbf{Z})}\left(\widetilde{\left.\mathbf{Z}\left[\widetilde{T_{0}, \ldots,} T_{n}\right]\right)}\right.
$$

where the grading on the ring $\mathbf{Z}\left[T_{0}, \ldots, T_{n}\right]$ is given by $\operatorname{deg}\left(T_{i}\right)=1$ and the elements of $\mathbf{Z}$ are in degree 0. Recall that $\mathbf{P}_{S}^{n}$ is defined as $\mathbf{P}_{\mathbf{Z}}^{n} \times{ }_{\operatorname{Spec}(\mathbf{Z})} S$. Moreover, forming the relative homogeneous spectrum commutes with base change, see Lemma 26.16 .10 . For any scheme $g: S \rightarrow \operatorname{Spec}(\mathbf{Z})$ we have $g^{*} \mathcal{O}_{\operatorname{Spec}(\mathbf{Z})}\left[T_{0}, \ldots, T_{n}\right]=$ $\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]$. Combining the above we see that

$$
\mathbf{P}_{S}^{n}=\underline{\operatorname{Proj}_{S}}\left(\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]\right)
$$

Finally, note that $\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]=\operatorname{Sym}\left(\mathcal{O}_{S}^{\oplus n+1}\right)$. Hence we see that $\mathbf{P}_{S}^{n}$ is a projective bundle over $S$.

### 26.22. Grassmannians

089R In this section we introduce the standard Grassmannian functors and we show that they are represented by schemes. Pick integers $k, n$ with $0<k<n$. We will construct a functor

089S
(26.22.0.1)

$$
G(k, n): S c h \longrightarrow \text { Sets }
$$

which will loosely speaking parametrize $k$-dimensional subspaces of $n$-space. However, for technical reasons it is more convenient to parametrize $(n-k)$-dimensional quotients and this is what we will do.

More precisely, $G(k, n)$ associates to a scheme $S$ the set $G(k, n)(S)$ of isomorphism classes of surjections

$$
q: \mathcal{O}_{S}^{\oplus n} \longrightarrow \mathcal{Q}
$$

where $\mathcal{Q}$ is a finite locally free $\mathcal{O}_{S}$-module of rank $n-k$. Note that this is indeed a set, for example by Modules, Lemma 17.9 .8 or by the observation that the isomorphism class of the surjection $q$ is determined by the kernel of $q$ (and given a sheaf there is a set of subsheaves). Given a morphism of schemes $f: T \rightarrow S$ we let $G(k, n)(f): G(k, n)(S) \rightarrow G(k, n)(T)$ which sends the isomorphism class of $q: \mathcal{O}_{S}^{\oplus n} \longrightarrow \mathcal{Q}$ to the isomorphism class of $f^{*} q: \mathcal{O}_{T}^{\oplus n} \longrightarrow f^{*} \mathcal{Q}$. This makes sense since (1) $f^{*} \mathcal{O}_{S}=\mathcal{O}_{T}$, (2) $f^{*}$ is additive, (3) $f^{*}$ preserves locally free modules (Modules, Lemma 17.14.3), and (4) $f^{*}$ is right exact (Modules, Lemma 17.3.3).
089T Lemma 26.22.1. Let $0<k<n$. The functor $G(k, n)$ of 26.22.0.1) is representable by a scheme.

Proof. Set $F=G(k, n)$. To prove the lemma we will use the criterion of Schemes, Lemma 25.15.4. The reason $F$ satisfies the sheaf property for the Zariski topology is that we can glue sheaves, see Sheaves, Section 6.33 (some details omitted).
The family of subfunctors $F_{i}$. Let $I$ be the set of subsets of $\{1, \ldots, n\}$ of cardinality $n-k$. Given a scheme $S$ and $j \in\{1, \ldots, n\}$ we denote $e_{j}$ the global section

$$
e_{j}=(0, \ldots, 0,1,0, \ldots, 0) \quad(1 \text { in } j \text { th spot })
$$

of $\mathcal{O}_{S}^{\oplus n}$. Of course these sections freely generate $\mathcal{O}_{S}^{\oplus n}$. Similarly, for $j \in\{1, \ldots, k\}$ we denote $f_{j}$ the global section of $\mathcal{O}_{S}^{\oplus k}$ which is zero in all summands except the $j$ th where we put a 1 . For $i \in I$ we let

$$
s_{i}: \mathcal{O}_{S}^{\oplus n-k} \longrightarrow \mathcal{O}_{S}^{\oplus n}
$$

which is the direct sum of the coprojections $\mathcal{O}_{S} \rightarrow \mathcal{O}_{S}^{\oplus n}$ corresponding to elements of $i$. More precisely, if $i=\left\{i_{1}, \ldots, i_{n-k}\right\}$ with $i_{1}<i_{2}<\ldots<i_{n-k}$ then $s_{i}$ maps $f_{j}$ to $e_{i_{j}}$ for $j \in\{1, \ldots, n-k\}$. With this notation we can set

$$
F_{i}(S)=\left\{q: \mathcal{O}_{S}^{\oplus n} \rightarrow \mathcal{Q} \in F(S) \mid q \circ s_{i} \text { is surjective }\right\} \subset F(S)
$$

Given a morphism $f: T \rightarrow S$ of schemes the pullback $f^{*} s_{i}$ is the corresponding map over $T$. Since $f^{*}$ is right exact (Modules, Lemma 17.3.3) we conclude that $F_{i}$ is a subfunctor of $F$.

Representability of $F_{i}$. To prove this we may assume (after renumbering) that $i=\{1, \ldots, n-k\}$. This means $s_{i}$ is the inclusion of the first $n-k$ summands. Observe that if $q \circ s_{i}$ is surjective, then $q \circ s_{i}$ is an isomorphism as a surjective map between finite locally free modules of the same rank (Modules, Lemma 17.14.5). Thus if $q: \mathcal{O}_{S}^{\oplus n} \rightarrow \mathcal{Q}$ is an element of $F_{i}(S)$, then we can use $q \circ s_{i}$ to identify $\mathcal{Q}$ with $\mathcal{O}_{S}^{\oplus n-k}$. After doing so we obtain

$$
q: \mathcal{O}_{S}^{\oplus n} \longrightarrow \mathcal{O}_{S}^{\oplus n-k}
$$

mapping $e_{j}$ to $f_{j}$ (notation as above) for $j=1, \ldots, n-k$. To determine $q$ completely we have to fix the images $q\left(e_{n-k+1}\right), \ldots, q\left(e_{n}\right)$ in $\Gamma\left(S, \mathcal{O}_{S}^{\oplus n-k}\right)$. It follows that $F_{i}$ is isomorphic to the functor

$$
S \longmapsto \prod_{j=n-k+1, \ldots, n} \Gamma\left(S, \mathcal{O}_{S}^{\oplus n-k}\right)
$$

This functor is isomorphic to the $k(n-k)$-fold self product of the functor $S \mapsto$ $\Gamma\left(S, \mathcal{O}_{S}\right)$. By Schemes, Example 25.15 .2 the latter is representable by $\mathbf{A}_{\mathbf{Z}}^{1}$. It follows $F_{i}$ is representable by $\mathbf{A}_{\mathbf{Z}}^{k(n-k)}$ since fibred product over $\operatorname{Spec}(\mathbf{Z})$ is the product in the category of schemes.

The inclusion $F_{i} \subset F$ is representable by open immersions. Let $S$ be a scheme and let $q: \mathcal{O}_{S}^{\oplus n} \rightarrow \mathcal{Q}$ be an element of $F(S)$. By Modules, Lemma 17.9.4 the set $U_{i}=\left\{s \in S \mid\left(q \circ s_{i}\right)_{s}\right.$ surjective $\}$ is open in $S$. Since $\mathcal{O}_{S, s}$ is a local ring and $\mathcal{Q}_{s}$ a finite $\mathcal{O}_{S, s}$-module by Nakayama's lemma (Algebra, Lemma 10.19.1) we have

$$
s \in U_{i} \Leftrightarrow\left(\text { the map } \kappa(s)^{\oplus n-k} \rightarrow \mathcal{Q}_{s} / \mathfrak{m}_{s} \mathcal{Q}_{s} \text { induced by }\left(q \circ s_{i}\right)_{s} \text { is surjective }\right)
$$

Let $f: T \rightarrow S$ be a morphism of schemes and let $t \in T$ be a point mapping to $s \in S$. We have $\left(f^{*} \mathcal{Q}\right)_{t}=\mathcal{Q}_{s} \otimes_{\mathcal{O}_{S, s}} \mathcal{O}_{T, t}$ (Sheaves, Lemma 6.26.4) and so on. Thus the map

$$
\kappa(t)^{\oplus n-k} \rightarrow\left(f^{*} \mathcal{Q}\right)_{t} / \mathfrak{m}_{t}\left(f^{*} \mathcal{Q}\right)_{t}
$$

induced by $\left(f^{*} q \circ f^{*} s_{i}\right)_{t}$ is the base change of the map $\kappa(s)^{\oplus n-k} \rightarrow \mathcal{Q}_{s} / \mathfrak{m}_{s} \mathcal{Q}_{s}$ above by the field extension $\kappa(s) \subset \kappa(t)$. It follows that $s \in U_{i}$ if and only if $t$ is in the corresponding open for $f^{*} q$. In particular $T \rightarrow S$ factors through $U_{i}$ if and only if $f^{*} q \in F_{i}(T)$ as desired.
The collection $F_{i}, i \in I$ covers $F$. Let $q: \mathcal{O}_{S}^{\oplus n} \rightarrow \mathcal{Q}$ be an element of $F(S)$. We have to show that for every point $s$ of $S$ there exists an $i \in I$ such that $s_{i}$ is surjective
in a neighbourhood of $s$. Thus we have to show that one of the compositions

$$
\kappa(s)^{\oplus n-k} \xrightarrow{s_{i}} \kappa(s)^{\oplus n} \rightarrow \mathcal{Q}_{s} / \mathfrak{m}_{s} \mathcal{Q}_{s}
$$

is surjective (see previous paragraph). As $\mathcal{Q}_{s} / \mathfrak{m}_{s} \mathcal{Q}_{s}$ is a vector space of dimension $n-k$ this follows from the theory of vector spaces.

089U Definition 26.22.2. Let $0<k<n$. The scheme $\mathbf{G}(k, n)$ representing the functor $G(k, n)$ is called Grassmannian over $\mathbf{Z}$. Its base change $\mathbf{G}(k, n)_{S}$ to a scheme $S$ is called Grassmannian over $S$. If $R$ is a ring the base change to $\operatorname{Spec}(R)$ is denoted $\mathbf{G}(k, n)_{R}$ and called Grassmannian over $R$.
The definition makes sense as we've shown in Lemma 26.22.1 that these functors are indeed representable.
089V Lemma 26.22.3. Let $n \geq 1$. There is a canonical isomorphism $\mathbf{G}(n, n+1)=\mathbf{P}_{\mathbf{Z}}^{n}$.
Proof. According to Lemma 26.13 .1 the scheme $\mathbf{P}_{\mathbf{Z}}^{n}$ represents the functor which assigns to a scheme $S$ the set of isomorphisms classes of pairs $\left(\mathcal{L},\left(s_{0}, \ldots, s_{n}\right)\right)$ consisting of an invertible module $\mathcal{L}$ and an $(n+1)$-tuple of global sections generating $\mathcal{L}$. Given such a pair we obtain a quotient

$$
\mathcal{O}_{S}^{\oplus n+1} \longrightarrow \mathcal{L}, \quad\left(h_{0}, \ldots, h_{n}\right) \longmapsto \sum h_{i} s_{i}
$$

Conversely, given an element $q: \mathcal{O}_{S}^{\oplus n+1} \rightarrow \mathcal{Q}$ of $G(n, n+1)(S)$ we obtain such a pair, namely $\left(\mathcal{Q},\left(q\left(e_{1}\right), \ldots, q\left(e_{n+1}\right)\right)\right)$. Here $e_{i}, i=1, \ldots, n+1$ are the standard generating sections of the free module $\mathcal{O}_{S}^{\oplus n+1}$. We omit the verification that these constructions define mutually inverse transformations of functors.

## CHAPTER 27

## Properties of Schemes

01 OH

### 27.1. Introduction

01 OI In this chapter we introduce some absolute properties of schemes. A foundational reference is DG67.

### 27.2. Constructible sets

054B Constructible and locally constructible sets are introduced in Topology, Section 5.14. We may characterize locally constructible subsets of schemes as follows.

054C Lemma 27.2.1. Let $X$ be a scheme. A subset $E$ of $X$ is locally constructible in $X$ if and only if $E \cap U$ is constructible in $U$ for every affine open $U$ of $X$.

Proof. Assume $E$ is locally constructible. Then there exists an open covering $X=\bigcup U_{i}$ such that $E \cap U_{i}$ is constructible in $U_{i}$ for each $i$. Let $V \subset X$ be any affine open. We can find a finite open affine covering $V=V_{1} \cup \ldots \cup V_{m}$ such that for each $j$ we have $V_{j} \subset U_{i}$ for some $i=i(j)$. By Topology, Lemma 5.14.4 we see that each $E \cap V_{j}$ is constructible in $V_{j}$. Since the inclusions $V_{j} \rightarrow V$ are quasi-compact (see Schemes, Lemma 25.19.2) we conclude that $E \cap V$ is constructible in $V$ by Topology, Lemma 5.14.6. The converse implication is immediate.

0AAW Lemma 27.2.2. Let $X$ be a scheme and let $E \subset X$ be a constructible subset. Let $\xi \in X$ be a generic point of an irreducible component of $X$.
(1) If $\xi \in E$, then an open neighbourhood of $\xi$ is contained in $E$.
(2) If $\xi \notin E$, then an open neighbourhood of $\xi$ is disjoint from $E$.

Proof. As the complement of a locally constructible subset is locally constructible it suffices to show (2). We may assume $X$ is affine and hence $E$ constructible (Lemma 27.2.1). In this case $X$ is a spectral space (Algebra, Lemma 10.25.2). Then $\xi \notin E$ implies $\xi \notin \bar{E}$ by Topology, Lemma 5.22.5 and the fact that there are no points of $X$ different from $\xi$ which specialize to $\xi$.

054D Lemma 27.2.3. Let $X$ be a quasi-separated scheme. The intersection of any two quasi-compact opens of $X$ is a quasi-compact open of $X$. Every quasi-compact open of $X$ is retrocompact in $X$.

Proof. If $U$ and $V$ are quasi-compact open then $U \cap V=\Delta^{-1}(U \times V)$, where $\Delta: X \rightarrow X \times X$ is the diagonal. As $X$ is quasi-separated we see that $\Delta$ is quasicompact. Hence we see that $U \cap V$ is quasi-compact as $U \times V$ is quasi-compact (details omitted; use Schemes, Lemma 25.17 .4 to see $U \times V$ is a finite union of affines). The other assertions follow from the first and Topology, Lemma 5.26.1.

094L Lemma 27.2.4. Let $X$ be a quasi-compact and quasi-separated scheme. Then the underlying topological space of $X$ is a spectral space.
Proof. By Topology, Definition 5.22.1 we have to check that $X$ is sober, quasicompact, has a basis of quasi-compact opens, and the intersection of any two quasicompact opens is quasi-compact. This follows from Schemes, Lemma 25.11.1 and 25.11.2 and Lemma 27.2.3 above.

054E Lemma 27.2.5. Let $X$ be a quasi-compact and quasi-separated scheme. Any locally constructible subset of $X$ is constructible.

Proof. As $X$ is quasi-compact we can choose a finite affine open covering $X=$ $V_{1} \cup \ldots \cup V_{m}$. As $X$ is quasi-separated each $V_{i}$ is retrocompact in $X$ by Lemma 27.2.3. Hence by Topology, Lemma 5.14.6 we see that $E \subset X$ is constructible in $X$ if and only if $E \cap V_{j}$ is constructible in $V_{j}$. Thus we win by Lemma 27.2.1.

07ZL Lemma 27.2.6. Let $X$ be a scheme. A subset $Z$ of $X$ is retrocompact in $X$ if and only if $E \cap U$ is quasi-compact for every affine open $U$ of $X$.

Proof. Immediate from the fact that every quasi-compact open of $X$ is a finite union of affine opens.

### 27.3. Integral, irreducible, and reduced schemes

01OJ
01OK Definition 27.3.1. Let $X$ be a scheme. We say $X$ is integral if it is nonempty and for every nonempty affine open $\operatorname{Spec}(R)=U \subset X$ the ring $R$ is an integral domain.

01OL Lemma 27.3.2. Let $X$ be a scheme. The following are equivalent.
(1) The scheme $X$ is reduced, see Schemes, Definition 25.12.1.
(2) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\Gamma\left(U_{i}, \mathcal{O}_{X}\right)$ is reduced.
(3) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is reduced.
(4) For every open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is reduced.

Proof. See Schemes, Lemmas 25.12.2 and 25.12.3.
01OM Lemma 27.3.3. Let $X$ be a scheme. The following are equivalent.
(1) The scheme $X$ is irreducible.
(2) There exists an affine open covering $X=\bigcup_{i \in I} U_{i}$ such that $I$ is not empty, $U_{i}$ is irreducible for all $i \in I$, and $U_{i} \cap U_{j} \neq \emptyset$ for all $i, j \in I$.
(3) The scheme $X$ is nonempty and every nonempty affine open $U \subset X$ is irreducible.

Proof. Assume (1). By Schemes, Lemma 25.11.1 we see that $X$ has a unique generic point $\eta$. Then $X=\overline{\{\eta\}}$. Hence $\eta$ is an element of every nonempty affine open $U \subset X$. This implies that $U=\overline{\{\eta\}}$ and that any two nonempty affines meet. Thus (1) implies both (2) and (3).
Assume (2). Suppose $X=Z_{1} \cup Z_{2}$ is a union of two closed subsets. For every $i$ we see that either $U_{i} \subset Z_{1}$ or $U_{i} \subset Z_{2}$. Pick some $i \in I$ and assume $U_{i} \subset Z_{1}$ (possibly after renumbering $Z_{1}, Z_{2}$ ). For any $j \in I$ the open subset $U_{i} \cap U_{j}$ is dense in $U_{j}$
and contained in the closed subset $Z_{1} \cap U_{j}$. We conclude that also $U_{j} \subset Z_{1}$. Thus $X=Z_{1}$ as desired.

Assume (3). Choose an affine open covering $X=\bigcup_{i \in I} U_{i}$. We may assume that each $U_{i}$ is nonempty. Since $X$ is nonempty we see that $I$ is not empty. By assumption each $U_{i}$ is irreducible. Suppose $U_{i} \cap U_{j}=\emptyset$ for some pair $i, j \in I$. Then the open $U_{i} \amalg U_{j}=U_{i} \cup U_{j}$ is affine, see Schemes, Lemma 25.6.8. Hence it is irreducible by assumption which is absurd. We conclude that (3) implies (2). The lemma is proved.

01ON Lemma 27.3.4. A scheme $X$ is integral if and only if it is reduced and irreducible.
Proof. If $X$ is irreducible, then every affine open $\operatorname{Spec}(R)=U \subset X$ is irreducible. If $X$ is reduced, then $R$ is reduced, by Lemma 27.3 .2 above. Hence $R$ is reduced and (0) is a prime ideal, i.e., $R$ is an integral domain.

If $X$ is integral, then for every nonempty affine open $\operatorname{Spec}(R)=U \subset X$ the ring $R$ is reduced and hence $X$ is reduced by Lemma 27.3.2. Moreover, every nonempty affine open is irreducible. Hence $X$ is irreducible, see Lemma 27.3.3.

In Examples, Section 88.5 we construct a connected affine scheme all of whose local rings are domains, but which is not integral.

### 27.4. Types of schemes defined by properties of rings

0100 In this section we study what properties of rings allow one to define local properties of schemes.

01OP Definition 27.4.1. Let $P$ be a property of rings. We say that $P$ is local if the following hold:
(1) For any ring $R$, and any $f \in R$ we have $P(R) \Rightarrow P\left(R_{f}\right)$.
(2) For any ring $R$, and $f_{i} \in R$ such that $\left(f_{1}, \ldots, f_{n}\right)=R$ then $\forall i, P\left(R_{f_{i}}\right) \Rightarrow$ $P(R)$.
01OQ Definition 27.4.2. Let $P$ be a property of rings. Let $X$ be a scheme. We say $X$ is locally $P$ if for any $x \in X$ there exists an affine open neighbourhood $U$ of $x$ in $X$ such that $\mathcal{O}_{X}(U)$ has property $P$.

This is only a good notion if the property is local. Even if $P$ is a local property we will not automatically use this definition to say that a scheme is "locally $P$ " unless we also explicitly state the definition elsewhere.

01OR Lemma 27.4.3. Let $X$ be a scheme. Let $P$ be a local property of rings. The following are equivalent:
(1) The scheme $X$ is locally $P$.
(2) For every affine open $U \subset X$ the property $P\left(\mathcal{O}_{X}(U)\right)$ holds.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ satisfies $P$.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is locally $P$.
Moreover, if $X$ is locally $P$ then every open subscheme is locally $P$.

Proof. Of course (1) $\Leftrightarrow(3)$ and $(2) \Rightarrow(1)$. If $(3) \Rightarrow(2)$, then the final statement of the lemma holds and it follows easily that (4) is also equivalent to (1). Thus we show $(3) \Rightarrow(2)$.
Let $X=\bigcup U_{i}$ be an affine open covering, say $U_{i}=\operatorname{Spec}\left(R_{i}\right)$. Assume $P\left(R_{i}\right)$. Let $\operatorname{Spec}(R)=U \subset X$ be an arbitrary affine open. By Schemes, Lemma 25.11 .6 there exists a standard covering of $U=\operatorname{Spec}(R)$ by standard opens $D\left(f_{j}\right)$ such that each ring $R_{f_{j}}$ is a principal localization of one of the rings $R_{i}$. By Definition 27.4.1 (1) we get $P\left(R_{f_{j}}\right)$. Whereupon $P(R)$ by Definition 27.4.1 (2).

Here is a sample application.
01OS Lemma 27.4.4. Let $X$ be a scheme. Then $X$ is reduced if and only if $X$ is "locally reduced" in the sense of Definition 27.4.2.

Proof. This is clear from Lemma 27.3.2.
01OT Lemma 27.4.5. The following properties of a ring $R$ are local.
(1) (Cohen-Macaulay.) The ring $R$ is Noetherian and CM, see Algebra, Definition 10.103.6.
(2) (Regular.) The ring $R$ is Noetherian and regular, see Algebra, Definition 10.109.7.
(3) (Absolutely Noetherian.) The ring $R$ is of finite type over $Z$.
(4) Add more here as needed ${ }^{1}$

Proof. Omitted.

### 27.5. Noetherian schemes

01 OU Recall that a ring $R$ is Noetherian if it satisfies the ascending chain condition of ideals. Equivalently every ideal of $R$ is finitely generated.

01OV Definition 27.5.1. Let $X$ be a scheme.
(1) We say $X$ is locally Noetherian if every $x \in X$ has an affine open neighbourhood $\operatorname{Spec}(R)=U \subset X$ such that the ring $R$ is Noetherian.
(2) We say $X$ is Noetherian if $X$ is locally Noetherian and quasi-compact.

Here is the standard result characterizing locally Noetherian schemes.
01OW Lemma 27.5.2. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is locally Noetherian.
(2) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is Noetherian.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is Noetherian.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is locally Noetherian.
Moreover, if $X$ is locally Noetherian then every open subscheme is locally Noetherian.

[^67]Proof. To show this it suffices to show that being Noetherian is a local property of rings, see Lemma 27.4.3. Any localization of a Noetherian ring is Noetherian, see Algebra, Lemma 10.30.1. By Algebra, Lemma 10.23 .2 we see the second property to Definition 27.4.1

01OX Lemma 27.5.3. Any immersion $Z \rightarrow X$ with $X$ locally Noetherian is quasicompact.

Proof. A closed immersion is clearly quasi-compact. A composition of quasicompact morphisms is quasi-compact, see Topology, Lemma 5.11.2. Hence it suffices to show that an open immersion into a locally Noetherian scheme is quasicompact. Using Schemes, Lemma 25.19.2 we reduce to the case where $X$ is affine. Any open subset of the spectrum of a Noetherian ring is quasi-compact (for example combine Algebra, Lemma 10.30.5 and Topology, Lemmas 5.8.2 and 5.11.13.

01OY Lemma 27.5.4. A locally Noetherian scheme is quasi-separated.
Proof. By Schemes, Lemma 25.21 .7 we have to show that the intersection $U \cap V$ of two affine opens of $X$ is quasi-compact. This follows from Lemma 27.5 .3 above on considering the open immersion $U \cap V \rightarrow U$ for example. (But really it is just because any open of the spectrum of a Noetherian ring is quasi-compact.)

01OZ Lemma 27.5.5. A (locally) Noetherian scheme has a (locally) Noetherian underlying topological space, see Topology, Definition 5.8.1.

Proof. This is because a Noetherian scheme is a finite union of spectra of Noetherian rings and Algebra, Lemma 10.30 .5 and Topology, Lemma 5.8.4.

02IK Lemma 27.5.6. Any locally closed subscheme of a (locally) Noetherian scheme is (locally) Noetherian.

Proof. Omitted. Hint: Any quotient, and any localization of a Noetherian ring is Noetherian. For the Noetherian case use again that any subset of a Noetherian space is a Noetherian space (with induced topology).

0BA8 Lemma 27.5.7. A Noetherian scheme has a finite number of irreducible components.

Proof. The underlying topological space of a Noetherian scheme is Noetherian (Lemma 27.5.5) and we conclude because a Noetherian topological space has only finitely many irreducible components (Topology, Lemma 5.8.2.

01P0 Lemma 27.5.8. Any morphism of schemes $f: X \rightarrow Y$ with $X$ Noetherian is quasi-compact.

Proof. Use Lemma 27.5 .5 and use that any subset of a Noetherian topological space is quasi-compact (see Topology, Lemmas Lemmas 5.8.2 and 5.11.13).

Here is a fun lemma. It says that every locally Noetherian scheme has plenty of closed points (at least one in every closed subset).

02IL Lemma 27.5.9. Any nonempty locally Noetherian scheme has a closed point. Any nonempty closed subset of a locally Noetherian scheme has a closed point. Equivalently, any point of a locally Noetherian scheme specializes to a closed point.

Proof. The second assertion follows from the first (using Schemes, Lemma 25.12 .4 and Lemma 27.5.6. Consider any nonempty affine open $U \subset X$. Let $x \in U$ be a closed point. If $x$ is a closed point of $X$ then we are done. If not, let $X_{0} \subset X$ be the reduced induced closed subscheme structure on $\overline{\{x\}}$. Then $U_{0}=U \cap X_{0}$ is an affine open of $X_{0}$ by Schemes, Lemma 25.10.1 and $U_{0}=\{x\}$. Let $y \in X_{0}, y \neq x$ be a specialization of $x$. Consider the local ring $R=\mathcal{O}_{X_{0}, y}$. This is a Noetherian local ring as $X_{0}$ is Noetherian by Lemma 27.5.6. Denote $V \subset \operatorname{Spec}(R)$ the inverse image of $U_{0}$ in $\operatorname{Spec}(R)$ by the canonical morphism $\operatorname{Spec}(R) \rightarrow X_{0}$ (see Schemes, Section 25.13 ) By construction $V$ is a singleton with unique point corresponding to $x$ (use Schemes, Lemma 25.13.2). By Algebra, Lemma 10.60.1 we see that $\operatorname{dim}(R)=1$. In other words, we see that $y$ is an immediate specialization of $x$ (see Topology, Definition 5.19.1. In other words, any point $y \neq x$ such that $x \rightsquigarrow y$ is an immediate specialization of $x$. Clearly each of these points is a closed point as desired.

054F Lemma 27.5.10. Let $X$ be a locally Noetherian scheme. Let $x^{\prime} \rightsquigarrow x$ be a specialization of points of $X$. Then
(1) there exists a discrete valuation ring $R$ and a morphism $f: \operatorname{Spec}(R) \rightarrow X$ such that the generic point $\eta$ of $\operatorname{Spec}(R)$ maps to $x^{\prime}$ and the special point maps to $x$, and
(2) given a finitely generated field extension $\kappa\left(x^{\prime}\right) \subset K$ we may arrange it so that the extension $\kappa\left(x^{\prime}\right) \subset \kappa(\eta)$ induced by $f$ is isomorphic to the given one.

Proof. Let $x^{\prime} \rightsquigarrow x$ be a specialization in $X$, and let $\kappa\left(x^{\prime}\right) \subset K$ be a finitely generated extension of fields. By Schemes, Lemma 25.13 .2 and the discussion following Schemes, Lemma 25.13 .3 this leads to ring maps $\mathcal{O}_{X, x} \rightarrow \kappa\left(x^{\prime}\right) \rightarrow K$. Let $R \subset K$ be any discrete valuation ring whose field of fractions is $K$ and which dominates the image of $\mathcal{O}_{X, x} \rightarrow K$, see Algebra, Lemma 10.118 .13 . The ring map $\mathcal{O}_{X, x} \rightarrow R$ induces the morphism $f: \operatorname{Spec}(R) \rightarrow X$, see Schemes, Lemma 25.13.1. This morphism has all the desired properties by construction.

### 27.6. Jacobson schemes

01P1 Recall that a space is said to be Jacobson if the closed points are dense in every closed subset, see Topology, Section 5.17.

01P2 Definition 27.6.1. A scheme $S$ is said to be Jacobson if its underlying topological space is Jacobson.

Recall that a ring $R$ is Jacobson if every radical ideal of $R$ is the intersection of maximal ideals, see Algebra, Definition 10.34.1.

01P3 Lemma 27.6.2. An affine scheme $\operatorname{Spec}(R)$ is Jacobson if and only if the ring $R$ is Jacobson.

Proof. This is Algebra, Lemma 10.34.4.
Here is the standard result characterizing Jacobson schemes. Intuitively it claims that Jacobson $\Leftrightarrow$ locally Jacobson.

01P4 Lemma 27.6.3. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is Jacobson.
(2) The scheme $X$ is "locally Jacobson" in the sense of Definition 27.4.2.
(3) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is Jacobson.
(4) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is Jacobson.
(5) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is Jacobson.
Moreover, if $X$ is Jacobson then every open subscheme is Jacobson.
Proof. The final assertion of the lemma holds by Topology, Lemma 5.17.5. The equivalence of (5) and (1) is Topology, Lemma 5.17.4. Hence, using Lemma 27.6.2, we see that $(1) \Leftrightarrow(2)$. To finish proving the lemma it suffices to show that "Jacobson" is a local property of rings, see Lemma 27.4.3. Any localization of a Jacobson ring at an element is Jacobson, see Algebra, Lemma 10.34.14. Suppose $R$ is a ring, $f_{1}, \ldots, f_{n} \in R$ generate the unit ideal and each $R_{f_{i}}$ is Jacobson. Then we see that $\operatorname{Spec}(R)=\bigcup D\left(f_{i}\right)$ is a union of open subsets which are all Jacobson, and hence $\operatorname{Spec}(R)$ is Jacobson by Topology, Lemma 5.17.4 again. This proves the second property of Definition 27.4.1.

Many schemes used commonly in algebraic geometry are Jacobson, see Morphisms, Lemma 28.16.10. We mention here the following interesting case.
02IM Lemma 27.6.4. Let $R$ be a Noetherian local ring with maximal ideal $\mathfrak{m}$. In this case the scheme $S=\operatorname{Spec}(R) \backslash\{\mathfrak{m}\}$ is Jacobson.

Proof. Since $\operatorname{Spec}(R)$ is a Noetherian scheme, hence $S$ is a Noetherian scheme (Lemma 27.5.6). Hence $S$ is a sober, Noetherian topological space (use Schemes, Lemma 25.11.1). Assume $S$ is not Jacobson to get a contradiction. By Topology, Lemma 5.17.3 there exists some non-closed point $\xi \in S$ such that $\{\xi\}$ is locally closed. This corresponds to a prime $\mathfrak{p} \subset R$ such that (1) there exists a prime $\mathfrak{q}$, $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}$ with both inclusions strict, and (2) $\{\mathfrak{p}\}$ is open in $\operatorname{Spec}(R / \mathfrak{p})$. This is impossible by Algebra, Lemma 10.60.1.

### 27.7. Normal schemes

033 H Recall that a ring $R$ is said to be normal if all its local rings are normal domains, see Algebra, Definition 10.36.11. A normal domain is a domain which is integrally closed in its field of fractions, see Algebra, Definition 10.36.1. Thus it makes sense to define a normal scheme as follows.

033I Definition 27.7.1. A scheme $X$ is normal if and only if for all $x \in X$ the local ring $\mathcal{O}_{X, x}$ is a normal domain.

This seems to be the definition used in EGA, see DG67, 0, 4.1.4]. Suppose $X=$ $\operatorname{Spec}(A)$, and $A$ is reduced. Then saying that $X$ is normal is not equivalent to saying that $A$ is integrally closed in its total ring of fractions. However, if $A$ is Noetherian then this is the case (see Algebra, Lemma 10.36.15).
033J Lemma 27.7.2. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is normal.
(2) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is normal.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is normal.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is normal.

Moreover, if $X$ is normal then every open subscheme is normal.
Proof. This is clear from the definitions.
033K Lemma 27.7.3. A normal scheme is reduced.
Proof. Immediate from the definitions.
033L Lemma 27.7.4. Let $X$ be an integral scheme. Then $X$ is normal if and only if for every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is a normal domain.

Proof. This follows from Algebra, Lemma 10.36.10.
0357 Lemma 27.7.5. Let $X$ be a scheme with a finite number of irreducible components. The following are equivalent:
(1) $X$ is normal, and
(2) $X$ is a finite disjoint union of normal integral schemes.

Proof. It is immediate from the definitions that (2) implies (1). Let $X$ be a normal scheme with a finite number of irreducible components. If $X$ is affine then $X$ satisfies (2) by Algebra, Lemma 10.36.15. For a general $X$, let $X=\bigcup X_{i}$ be an affine open covering. Note that also each $X_{i}$ has but a finite number of irreducible components, and the lemma holds for each $X_{i}$. Let $T \subset X$ be an irreducible component. By the affine case each intersection $T \cap X_{i}$ is open in $X_{i}$ and an integral normal scheme. Hence $T \subset X$ is open, and an integral normal scheme. This proves that $X$ is the disjoint union of its irreducible components, which are integral normal schemes. There are only finitely many by assumption.

033M Lemma 27.7.6. Let $X$ be a Noetherian scheme. The following are equivalent:
(1) $X$ is normal, and
(2) $X$ is a finite disjoint union of normal integral schemes.

Proof. This is a special case of Lemma 27.7 .5 because a Noetherian scheme has a Noetherian underlying topological space (Lemma 27.5.5 and Topology, Lemma 5.8.2.

033N Lemma 27.7.7. Let $X$ be a locally Noetherian scheme. The following are equivalent:
(1) $X$ is normal, and
(2) $X$ is a disjoint union of integral normal schemes.

Proof. Omitted. Hint: This is purely topological from Lemma 27.7.6.
033 O Remark 27.7.8. Let $X$ be a normal scheme. If $X$ is locally Noetherian then we see that $X$ is integral if and only if $X$ is connected, see Lemma 27.7.7. But there exists a connected affine scheme $X$ such that $\mathcal{O}_{X, x}$ is a domain for all $x \in X$, but $X$ is not irreducible, see Examples, Section 88.5. This example is even a normal scheme (proof omitted), so beware!

0358 Lemma 27.7.9. Let $X$ be an integral normal scheme. Then $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a normal domain.

Proof. Set $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. It is clear that $R$ is a domain. Suppose $f=a / b$ is an element of its fraction field which is integral over $R$. Say we have $f^{d}+$ $\sum_{i=1, \ldots, d} a_{i} f^{i}=0$ with $a_{i} \in R$. Let $U \subset X$ be affine open. Since $b \in R$ is not zero and since $X$ is integral we see that also $\left.b\right|_{U} \in \mathcal{O}_{X}(U)$ is not zero. Hence $a / b$ is an element of the fraction field of $\mathcal{O}_{X}(U)$ which is integral over $\mathcal{O}_{X}(U)$ (because we can use the same polynomial $f^{d}+\left.\sum_{i=1, \ldots, d} a_{i}\right|_{U} f^{i}=0$ on $\left.U\right)$. Since $\mathcal{O}_{X}(U)$ is a normal domain (Lemma 27.7.2), we see that $f_{U}=\left(\left.a\right|_{U}\right) /\left(\left.b\right|_{U}\right) \in \mathcal{O}_{X}(U)$. It is easy to see that $\left.f_{U}\right|_{V}=f_{V}$ whenever $V \subset U \subset X$ are affine open. Hence the local sections $f_{U}$ glue to a global section $f$ as desired.

### 27.8. Cohen-Macaulay schemes

02IN Recall, see Algebra, Definition 10.103.1, that a local Noetherian ring $(R, \mathfrak{m})$ is said to be Cohen-Macaulay if $\operatorname{depth}_{\mathfrak{m}}(R)=\operatorname{dim}(R)$. Recall that a Noetherian ring $R$ is said to be Cohen-Macaulay if every local ring $R_{\mathfrak{p}}$ of $R$ is Cohen-Macaulay, see Algebra, Definition 10.103.6.

02IO Definition 27.8.1. Let $X$ be a scheme. We say $X$ is Cohen-Macaulay if for every $x \in X$ there exists an affine open neighbourhood $U \subset X$ of $x$ such that the ring $\mathcal{O}_{X}(U)$ is Noetherian and Cohen-Macaulay.

02IP Lemma 27.8.2. Let $X$ be a scheme. The following are equivalent:
(1) $X$ is Cohen-Macaulay,
(2) $X$ is locally Noetherian and all of its local rings are Cohen-Macaulay, and
(3) $X$ is locally Noetherian and for any closed point $x \in X$ the local ring $\mathcal{O}_{X, x}$ is Cohen-Macaulay.
Proof. Algebra, Lemma 10.103 .5 says that the localization of a Cohen-Macaulay local ring is Cohen-Macaulay. The lemma follows by combining this with Lemma 27.5 .2 , with the existence of closed points on locally Noetherian schemes (Lemma 27.5.9, and the definitions.

02IQ Lemma 27.8.3. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is Cohen-Macaulay.
(2) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is Noetherian and CohenMacaulay.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is Noetherian and Cohen-Macaulay.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is Cohen-Macaulay.
Moreover, if $X$ is Cohen-Macaulay then every open subscheme is Cohen-Macaulay.
Proof. Combine Lemmas 27.5.2 and 27.8.2.
More information on Cohen-Macaulay schemes and depth can be found in Cohomology of Schemes, Section 29.11.

### 27.9. Regular schemes

02IR Recall, see Algebra, Definition 10.59.9, that a local Noetherian ring $(R, \mathfrak{m})$ is said to be regular if $\mathfrak{m}$ can be generated by $\operatorname{dim}(R)$ elements. Recall that a Noetherian ring $R$ is said to be regular if every local ring $R_{\mathfrak{p}}$ of $R$ is regular, see Algebra, Definition 10.109.7.

02IS Definition 27.9.1. Let $X$ be a scheme. We say $X$ is regular, or nonsingular if for every $x \in X$ there exists an affine open neighbourhood $U \subset X$ of $x$ such that the ring $\mathcal{O}_{X}(U)$ is Noetherian and regular.

02IT Lemma 27.9.2. Let $X$ be a scheme. The following are equivalent:
(1) $X$ is regular,
(2) $X$ is locally Noetherian and all of its local rings are regular, and
(3) $X$ is locally Noetherian and for any closed point $x \in X$ the local ring $\mathcal{O}_{X, x}$ is regular.

Proof. By the discussion in Algebra preceding Algebra, Definition 10.109 .7 we know that the localization of a regular local ring is regular. The lemma follows by combining this with Lemma 27.5.2 with the existence of closed points on locally Noetherian schemes (Lemma 27.5.9), and the definitions.

02IU Lemma 27.9.3. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is regular.
(2) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is Noetherian and regular.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is Noetherian and regular.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is regular.
Moreover, if $X$ is regular then every open subscheme is regular.
Proof. Combine Lemmas 27.5.2 and 27.9.2
0569 Lemma 27.9.4. A regular scheme is normal.
Proof. See Algebra, Lemma 10.149.5.

### 27.10. Dimension

04MS The dimension of a scheme is just the dimension of its underlying topological space.
04MT Definition 27.10.1. Let $X$ be a scheme.
(1) The dimension of $X$ is just the dimension of $X$ as a topological spaces, see Topology, Definition 5.9.1
(2) For $x \in X$ we denote $\operatorname{dim}_{x}(X)$ the dimension of the underlying topological space of $X$ at $x$ as in Topology, Definition 5.9.1. We say $\operatorname{dim}_{x}(X)$ is the dimension of $X$ at $x$.

As a scheme has a sober underlying topological space (Schemes, Lemma 25.11.1) we may compute the dimension of $X$ as the supremum of the lengths $n$ of chains

$$
T_{0} \subset T_{1} \subset \ldots \subset T_{n}
$$

of irreducible closed subsets of $X$, or as the supremum of the lengths $n$ of chains of specializations

$$
\xi_{n} \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_{0}
$$

of points of $X$.
04MU Lemma 27.10.2. Let $X$ be a scheme. The following are equal
(1) The dimension of $X$.
(2) The supremum of the dimensions of the local rings of $X$.
(3) The supremum of $\operatorname{dim}_{x}(X)$ for $x \in X$.

Proof. Note that given a chain of specializations

$$
\xi_{n} \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_{0}
$$

of points of $X$ all of the points $\xi_{i}$ correspond to prime ideals of the local ring of $X$ at $\xi_{0}$ by Schemes, Lemma 25.13.2. Hence we see that the dimension of $X$ is the supremum of the dimensions of its local rings. In particular $\operatorname{dim}_{x}(X) \geq \operatorname{dim}\left(\mathcal{O}_{X, x}\right)$ as $\operatorname{dim}_{x}(X)$ is the minimum of the dimensions of open neighbourhoods of $x$. Thus $\sup _{x \in X} \operatorname{dim}_{x}(X) \geq \operatorname{dim}(X)$. On the other hand, it is clear that $\sup _{x \in X} \operatorname{dim}_{x}(X) \leq$ $\operatorname{dim}(X)$ as $\operatorname{dim}(U) \leq \operatorname{dim}(X)$ for any open subset of $X$.

02IZ Lemma 27.10.3. Let $X$ be a scheme. Let $Y \subset X$ be an irreducible closed subset. Let $\xi \in Y$ be the generic point. Then

$$
\operatorname{codim}(Y, X)=\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)
$$

where the codimension is as defined in Topology, Definition 5.10.1.
Proof. By Topology, Lemma 5.10.2 we may replace $X$ by an affine open neighbourhood of $\xi$. In this case the result follows easily from Algebra, Lemma 10.25.3.

0BA9 Lemma 27.10.4. Let $X$ be a scheme. Let $x \in X$. Then $x$ is a generic point of an irreducible component of $X$ if and only if $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=0$.

Proof. This follows from Lemma 27.10 .3 for example.
0AAX Lemma 27.10.5. A locally Noetherian scheme of dimension 0 is a disjoint union of spectra of Artinian local rings.

Proof. A Noetherian ring of dimension 0 is a finite product of Artinian local rings, see Algebra, Proposition 10.59.6. Hence an affine open of a locally Noetherian scheme $X$ of dimension 0 has discrete underlying topological space. This implies that the topology on $X$ is discrete. The lemma follows easily from these remarks.

### 27.11. Catenary schemes

02IV Recall that a topological space $X$ is called catenary if for every pair of irreducible closed subsets $T \subset T^{\prime}$ there exist a maximal chain of irreducible closed subsets

$$
T=T_{0} \subset T_{1} \subset \ldots \subset T_{e}=T^{\prime}
$$

and every such chain has the same length. See Topology, Definition 5.10.4
02IW Definition 27.11.1. Let $S$ be a scheme. We say $S$ is catenary if the underlying topological space of $S$ is catenary.
Recall that a ring $A$ is called catenary if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$ there exists a maximal chain of primes

$$
\mathfrak{p}=\mathfrak{p}_{0} \subset \ldots \subset \mathfrak{p}_{e}=\mathfrak{q}
$$

and all of these have the same length. See Algebra, Definition 10.104.1.
02IX Lemma 27.11.2. Let $S$ be a scheme. The following are equivalent
(1) $S$ is catenary,
(2) there exists an open covering of $S$ all of whose members are catenary schemes,
(3) for every affine open $\operatorname{Spec}(R)=U \subset S$ the ring $R$ is catenary, and
(4) there exists an affine open covering $S=\bigcup U_{i}$ such that each $U_{i}$ is the spectrum of a catenary ring.
Moreover, in this case any locally closed subscheme of $S$ is catenary as well.
Proof. Combine Topology, Lemma 5.10.5 and Algebra, Lemma 10.104.2.
02IY Lemma 27.11.3. Let $S$ be a locally Noetherian scheme. The following are equivalent:
(1) $S$ is catenary, and
(2) locally in the Zariski topology there exists a dimension function on $S$ (see Topology, Definition 5.19.1).

Proof. This follows from Topology, Lemmas 5.10.5, 5.19.2, and 5.19.4. Schemes, Lemma 25.11.1 and finally Lemma 27.5.5

It turns out that a scheme is catenary if and only if its local rings are catenary.
02J0 Lemma 27.11.4. Let $X$ be a scheme. The following are equivalent
(1) $X$ is catenary, and
(2) for any $x \in X$ the local ring $\mathcal{O}_{X, x}$ is catenary.

Proof. Assume $X$ is catenary. Let $x \in X$. By Lemma 27.11 .2 we may replace $X$ by an affine open neighbourhood of $x$, and then $\Gamma\left(X, \mathcal{O}_{X}\right)$ is a catenary ring. By Algebra, Lemma 10.104 .4 any localization of a catenary ring is catenary. Whence $\mathcal{O}_{X, x}$ is catenary.
Conversely assume all local rings of $X$ are catenary. Let $Y \subset Y^{\prime}$ be an inclusion of irreducible closed subsets of $X$. Let $\xi \in Y$ be the generic point. Let $\mathfrak{p} \subset \mathcal{O}_{X, \xi}$ be the prime corresponding to the generic point of $Y^{\prime}$, see Schemes, Lemma 25.13.2, By that same lemma the irreducible closed subsets of $X$ in between $Y$ and $Y^{\prime}$ correspond to primes $\mathfrak{q} \subset \mathcal{O}_{X, \xi}$ with $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}_{\xi}$. Hence we see all maximal chains of these are finite and have the same length as $\mathcal{O}_{X, \xi}$ is a catenary ring.

### 27.12. Serre's conditions

033 P Here are two technical notions that are often useful. See also Cohomology of Schemes, Section 29.11.

033Q Definition 27.12.1. Let $X$ be a locally Noetherian scheme. Let $k \geq 0$.
(1) We say $X$ is regular in codimension $k$, or we say $X$ has property $\left(R_{k}\right)$ if for every $x \in X$ we have

$$
\operatorname{dim}\left(\mathcal{O}_{X, x}\right) \leq k \Rightarrow \mathcal{O}_{X, x} \text { is regular }
$$

(2) We say $X$ has property $\left(S_{k}\right)$ if for every $x \in X$ we have $\operatorname{depth}\left(\mathcal{O}_{X, x}\right) \geq$ $\min \left(k, \operatorname{dim}\left(\mathcal{O}_{X, x}\right)\right)$.

The phrase "regular in codimension $k$ " makes sense since we have seen in Section 27.11 that if $Y \subset X$ is irreducible closed with generic point $x$, then $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=$ $\operatorname{codim}(Y, X)$. For example condition $\left(R_{0}\right)$ means that for every generic point $\eta \in X$ of an irreducible component of $X$ the local ring $\mathcal{O}_{X, \eta}$ is a field. But for general

Noetherian schemes it can happen that the regular locus of $X$ is badly behaved, so care has to be taken.

0B3C Lemma 27.12.2. Let $X$ be a locally Noetherian scheme. Then $X$ is regular if and only if $X$ has $\left(R_{k}\right)$ for all $k \geq 0$.

Proof. Follows from Lemma 27.9.2 and the definitions.
0342 Lemma 27.12.3. Let $X$ be a locally Noetherian scheme. Then $X$ is CohenMacaulay if and only if $X$ has $\left(S_{k}\right)$ for all $k \geq 0$.

Proof. By Lemma 27.8 .2 we reduce to looking at local rings. Hence the lemma is true because a Noetherian local ring is Cohen-Macaulay if and only if it has depth equal to its dimension.

0344 Lemma 27.12.4. Let $X$ be a locally Noetherian scheme. Then $X$ is reduced if and only if $X$ has properties $\left(S_{1}\right)$ and $\left(R_{0}\right)$.
Proof. This is Algebra, Lemma 10.149.3
0345 Lemma 27.12.5. Let $X$ be a locally Noetherian scheme. Then $X$ is normal if and only if $X$ has properties $\left(S_{2}\right)$ and $\left(R_{1}\right)$.

Proof. This is Algebra, Lemma 10.149 .4
0B3D Lemma 27.12.6. Let $X$ be a locally Noetherian scheme which is normal and has dimension $\leq 2$. Then $X$ is Cohen-Macaulay.

Proof. This follows from Lemma 27.12.5 and the definitions.

### 27.13. Japanese and Nagata schemes

033R The notions considered in this section are not prominently defined in EGA. A "universally Japanese scheme" is mentioned and defined in DG67, IV Corollary 5.11.4]. A "Japanese scheme" is mentioned in [DG67, IV Remark 10.4.14 (ii)] but no definition is given. A Nagata scheme (as given below) occurs in a few places in the literature (see for example [Liu02, Definition 8.2.30] and [Gre76, Page 142]).

We briefly recall that a domain $R$ is called Japanese if the integral closure of $R$ in any finite extension of its fraction field is finite over $R$. A ring $R$ is called universally Japanese if for any finite type ring map $R \rightarrow S$ with $S$ a domain $S$ is Japanese. A $\operatorname{ring} R$ is called Nagata if it is Noetherian and $R / \mathfrak{p}$ is Japanese for every prime $\mathfrak{p}$ of $R$.

033S Definition 27.13.1. Let $X$ be a scheme.
(1) Assume $X$ integral. We say $X$ is Japanese if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_{X}(U)$ is Japanese (see Algebra, Definition 10.153.1.
(2) We say $X$ is universally Japanese if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the $\operatorname{ring} \mathcal{O}_{X}(U)$ is universally Japanese (see Algebra, Definition 10.154.1).
(3) We say $X$ is Nagata if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_{X}(U)$ is Nagata (see Algebra, Definition 10.154.1.

Being Nagata is the same thing as being locally Noetherian and universally Japanese, see Lemma 27.13.8.

033T Remark 27.13.2. In Hoo72] a (locally Noetherian) scheme $X$ is called Japanese if for every $x \in X$ and every associated prime $\mathfrak{p}$ of $\mathcal{O}_{X, x}$ the ring $\mathcal{O}_{X, x} / \mathfrak{p}$ is Japanese. We do not use this definition since there exists a one dimensional noetherian domain with excellent (in particular Japanese) local rings whose normalization is not finite. See Hoc73, Example 1] or HL07] or [ILO14, Exposé XIX]. On the other hand, we could circumvent this problem by calling a scheme $X$ Japanese if for every affine open $\operatorname{Spec}(A) \subset X$ the ring $A / \mathfrak{p}$ is Japanese for every associated prime $\mathfrak{p}$ of $A$.

033U Lemma 27.13.3. A Nagata scheme is locally Noetherian.
Proof. This is true because a Nagata ring is Noetherian by definition.
033V Lemma 27.13.4. Let $X$ be an integral scheme. The following are equivalent:
(1) The scheme $X$ is Japanese.
(2) For every affine open $U \subset X$ the domain $\mathcal{O}_{X}(U)$ is Japanese.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is Japanese.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is Japanese.
Moreover, if $X$ is Japanese then every open subscheme is Japanese.
Proof. This follows from Lemma 27.4 .3 and Algebra, Lemmas 10.153 .3 and 10.153 .4 ,

033W Lemma 27.13.5. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is universally Japanese.
(2) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is universally Japanese.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is universally Japanese.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is universally Japanese.
Moreover, if $X$ is universally Japanese then every open subscheme is universally Japanese.

Proof. This follows from Lemma 27.4.3 and Algebra, Lemmas 10.154.4 and 10.154.7

033X Lemma 27.13.6. Let $X$ be a scheme. The following are equivalent:
(1) The scheme $X$ is Nagata.
(2) For every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is Nagata.
(3) There exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is Nagata.
(4) There exists an open covering $X=\bigcup X_{j}$ such that each open subscheme $X_{j}$ is Nagata.
Moreover, if $X$ is Nagata then every open subscheme is Nagata.
Proof. This follows from Lemma 27.4.3 and Algebra, Lemmas 10.154.6 and 10.154.7.

033Y Lemma 27.13.7. Let $X$ be a locally Noetherian scheme. Then $X$ is Nagata if and only if every integral closed subscheme $Z \subset X$ is Japanese.

Proof. Assume $X$ is Nagata. Let $Z \subset X$ be an integral closed subscheme. Let $z \in Z$. Let $\operatorname{Spec}(A)=U \subset X$ be an affine open containing $z$ such that $A$ is Nagata. Then $Z \cap U \cong \operatorname{Spec}(A / \mathfrak{p})$ for some prime $\mathfrak{p}$, see Schemes, Lemma 25.10.1 (and Definition 27.3.1. By Algebra, Definition 10.154.1 we see that $A / \mathfrak{p}$ is Japanese. Hence $Z$ is Japanese by definition.

Assume every integral closed subscheme of $X$ is Japanese. Let $\operatorname{Spec}(A)=U \subset X$ be any affine open. As $X$ is locally Noetherian we see that $A$ is Noetherian (Lemma 27.5.2). Let $\mathfrak{p} \subset A$ be a prime ideal. We have to show that $A / \mathfrak{p}$ is Japanese. Let $T \subset U$ be the closed subset $V(\mathfrak{p}) \subset \operatorname{Spec}(A)$. Let $\bar{T} \subset X$ be the closure. Then $\bar{T}$ is irreducible as the closure of an irreducible subset. Hence the reduced closed subscheme defined by $\bar{T}$ is an integral closed subscheme (called $\bar{T}$ again), see Schemes, Lemma 25.12.4. In other words, $\operatorname{Spec}(A / \mathfrak{p})$ is an affine open of an integral closed subscheme of $X$. This subscheme is Japanese by assumption and by Lemma 27.13.4 we see that $A / \mathfrak{p}$ is Japanese.

033Z Lemma 27.13.8. Let $X$ be a scheme. The following are equivalent:
(1) $X$ is Nagata, and
(2) $X$ is locally Noetherian and universally Japanese.

Proof. This is Algebra, Proposition 10.154 .15 .
This discussion will be continued in Morphisms, Section 28.18.

### 27.14. The singular locus

07R0 Here is the definition.
07R1 Definition 27.14.1. Let $X$ be a locally Noetherian scheme. The regular locus $\operatorname{Reg}(X)$ of $X$ is the set of $x \in X$ such that $\mathcal{O}_{X, x}$ is a regular local ring. The singular locus $\operatorname{Sing}(X)$ is the complement $X \backslash \operatorname{Reg}(X)$, i.e., the set of points $x \in X$ such that $\mathcal{O}_{X, x}$ is not a regular local ring.

The regular locus of a locally Noetherian scheme is stable under generalizations, see the discussion preceding Algebra, Definition 10.109.7. However, for general locally Noetherian schemes the regular locus need not be open. In More on Algebra, Section 15.38 the reader can find some criteria for when this is the case. We will discuss this further in Morphisms, Section 28.19 .

### 27.15. Local irreducibility

0BQ1 Recall that in More on Algebra, Section 15.79 we introduced the notion of a (geometrically) unibranch local ring.

0BQ2 Definition 27.15.1. Let $X$ be a scheme. Let $x \in X$. We say $X$ is unibranch at $x$ if the local ring $\mathcal{O}_{X, x}$ is unibranch. We say $X$ is geometrically unibranch at $x$ if the local ring $\mathcal{O}_{X, x}$ is geometrically unibranch. We say $X$ is unibranch if $X$ is unibranch at all of its points. We say $X$ is geometrically unibranch if $X$ is geometrically unibranch at all of its points.

GD67, Chapter IV (6.15.1)]

To be sure, it can happen that a local ring $A$ is geometrically unibranch (in the sense of More on Algebra, Definition 15.79.1) but the $\operatorname{scheme} \operatorname{Spec}(A)$ is not geometrically unibranch in the sense of Definition 27.15.1. For example this happens if $A$ is the local ring at the vertex of the cone over an irreducible plane curve which has ordinary double point singularity (a node).
0BQ3 Lemma 27.15.2. A normal scheme is geometrically unibranch.
Proof. This follows from the definitions. Namely, a scheme is normal if the local rings are normal domains. It is immediate from the More on Algebra, Definition 15.79 .1 that a local normal domain is geometrically unibranch.

0BQ4 Lemma 27.15.3. Let $X$ be a Noetherian scheme. The following are equivalent
(1) $X$ is geometrically unibranch (Definition 27.15.1),
(2) for every point $x \in X$ which is not the generic point of an irreducible

Compare with
Art66, Proposition 2.3]

Proof. More on Algebra, Lemma 15.79 .3 shows that (1) implies that the punctured spectra in (2) are irreducible and in particular connected.
Assume (2). Let $x \in X$. We have to show that $\mathcal{O}_{X, x}$ is geometrically unibranch. By induction on $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)$ we may assume that the result holds for every nontrivial generalization of $x$. We may replace $X$ by $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$. In other words, we may assume that $X=\operatorname{Spec}(A)$ with $A$ local and that $A_{\mathfrak{p}}$ is geometrically unibranch for each nonmaximal prime $\mathfrak{p} \subset A$.

Let $A^{\text {sh }}$ be the strict henselization of $A$. If $\mathfrak{q} \subset A^{\text {sh }}$ is a prime lying over $\mathfrak{p} \subset A$, then $A_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}^{s h}$ is a filtered colimit of étale algebras. Hence the strict henselizations of $A_{\mathfrak{p}}$ and $A_{\mathfrak{q}}^{s h}$ are isomorphic. Thus by More on Algebra, Lemma 15.79.3 we conclude that $A_{\mathfrak{q}}^{s h}$ has a unique minimal prime ideal for every nonmaximal prime $\mathfrak{q}$ of $A^{s h}$.
Let $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{r}$ be the minimal primes of $A^{s h}$. We have to show that $r=1$. By the above we see that $V\left(\mathfrak{q}_{1}\right) \cap V\left(\mathfrak{q}_{j}\right)=\left\{\mathfrak{m}^{s h}\right\}$ for $j=2, \ldots, r$. Hence $V\left(\mathfrak{q}_{1}\right) \backslash\left\{\mathfrak{m}^{s h}\right\}$ is an open and closed subset of the punctured spectrum of $A^{s h}$ which is a contradiction with the assumption that this punctured spectrum is connected unless $r=1$.

### 27.16. Characterizing modules of finite type and finite presentation

01PA Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The following lemma implies that $\mathcal{F}$ is of finite type (see Modules, Definition 17.9.1) if and only if $\mathcal{F}$ is on each open affine $\operatorname{Spec}(A)=U \subset X$ of the form $\widetilde{M}$ for some finite type $A$-module M. Similarly, $\mathcal{F}$ is of finite presentation (see Modules, Definition 17.11.1) if and only if $\mathcal{F}$ is on each open affine $\operatorname{Spec}(A)=U \subset X$ of the form $\widetilde{M}$ for some finitely presented $A$-module $M$.

01PB Lemma 27.16.1. Let $X=\operatorname{Spec}(R)$ be an affine scheme. The quasi-coherent sheaf of $\mathcal{O}_{X}$-modules $\widetilde{M}$ is a finite type $\mathcal{O}_{X}$-module if and only if $M$ is a finite $R$-module.

Proof. Assume $\widetilde{M}$ is a finite type $\mathcal{O}_{X}$-module. This means there exists an open covering of $X$ such that $\widetilde{M}$ restricted to the members of this covering is globally generated by finitely many sections. Thus there also exists a standard open covering $X=\bigcup_{i=1, \ldots, n} D\left(f_{i}\right)$ such that $\left.\widetilde{M}\right|_{D\left(f_{i}\right)}$ is generated by finitely many sections.

Thus $M_{f_{i}}$ is finitely generated for each $i$. Hence we conclude by Algebra, Lemma 10.23 .2

01PC Lemma 27.16.2. Let $X=\operatorname{Spec}(R)$ be an affine scheme. The quasi-coherent sheaf of $\mathcal{O}_{X}$-modules $\widetilde{M}$ is an $\mathcal{O}_{X}$-module of finite presentation if and only if $M$ is an $R$-module of finite presentation.

Proof. Assume $\widetilde{M}$ is an $\mathcal{O}_{X}$-module of finite presentation. By Lemma 27.16.1 we see that $M$ is a finite $R$-module. Choose a surjection $R^{n} \rightarrow M$ with kernel $K$. By Schemes, Lemma 25.5.4 there is a short exact sequence

$$
0 \rightarrow \widetilde{K} \rightarrow \bigoplus \mathcal{O}_{X}^{\oplus n} \rightarrow \widetilde{M} \rightarrow 0
$$

By Modules, Lemma 17.11 .3 we see that $\widetilde{K}$ is a finite type $\mathcal{O}_{X}$-module. Hence by Lemma 27.16.1 again we see that $K$ is a finite $R$-module. Hence $M$ is an $R$-module of finite presentation.

### 27.17. Sections over principal opens

0B5K Here is a typical result of this kind. We will use a more naive but more direct method of proof in later lemmas.

01P7 Lemma 27.17.1. Let $X$ be a scheme. Let $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$. Denote $X_{f} \subset X$ the open where $f$ is invertible, see Schemes, Lemma 25.6.2. If $X$ is quasi-compact and quasi-separated, the canonical map

$$
\Gamma\left(X, \mathcal{O}_{X}\right)_{f} \longrightarrow \Gamma\left(X_{f}, \mathcal{O}_{X}\right)
$$

is an isomorphism. Moreover, if $\mathcal{F}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules the map

$$
\Gamma(X, \mathcal{F})_{f} \longrightarrow \Gamma\left(X_{f}, \mathcal{F}\right)
$$

is an isomorphism.
Proof. Write $R=\Gamma\left(X, \mathcal{O}_{X}\right)$. Consider the canonical morphism

$$
\varphi: X \longrightarrow \operatorname{Spec}(R)
$$

of schemes, see Schemes, Lemma 25.6.4 Then the inverse image of the standard open $D(f)$ on the right hand side is $X_{f}$ on the left hand side. Moreover, since $X$ is assumed quasi-compact and quasi-separated the morphism $\varphi$ is quasi-compact and quasi-separated, see Schemes, Lemma 25.19 .2 and 25.21.14. Hence by Schemes, Lemma 25.24.1 we see that $\varphi_{*} \mathcal{F}$ is quasi-coherent. Hence we see that $\varphi_{*} \mathcal{F}=\widetilde{M}$ with $M=\Gamma(X, \mathcal{F})$ as an $R$-module. Thus we see that

$$
\Gamma\left(X_{f}, \mathcal{F}\right)=\Gamma\left(D(f), \varphi_{*} \mathcal{F}\right)=\Gamma(D(f), \widetilde{M})=M_{f}
$$

which is exactly the content of the lemma. The first displayed isomorphism of the lemma follows by taking $\mathcal{F}=\mathcal{O}_{X}$.

Recall that given a scheme $X$, an invertible sheaf $\mathcal{L}$ on $X$, and a sheaf of $\mathcal{O}_{X^{-}}$ modules $\mathcal{F}$ we get a graded ring $\Gamma_{*}(X, \mathcal{L})=\bigoplus_{n \geq 0} \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ and a graded $\Gamma_{*}(X, \mathcal{L})$ module $\Gamma_{*}(X, \mathcal{L}, \mathcal{F})=\bigoplus_{n \in \mathbf{Z}} \Gamma\left(X, \mathcal{F} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n}\right)$ see Modules, Definition 17.21.7. If we have moreover a section $s \in \Gamma(X, \mathcal{L})$, then we obtain a map
0B5L

$$
\begin{equation*}
\Gamma_{*}(X, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow \Gamma\left(X_{s},\left.\mathcal{F}\right|_{X_{s}}\right) \tag{27.17.1.1}
\end{equation*}
$$

which sends $t / s^{n}$ where $t \in \Gamma\left(X, \mathcal{F} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n}\right)$ to $\left.\left.t\right|_{X_{s}} \otimes s\right|_{X_{s}} ^{-n}$. This makes sense because $X_{s} \subset X$ is by definition the open over which $s$ has an inverse, see Modules, Lemma 17.21 .10

01PW Lemma 27.17.2. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible sheaf on $X$. Let $s \in \Gamma(X, \mathcal{L})$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module.
(1) If $X$ is quasi-compact, then 27.17.1.1 is injective, and
(2) if $X$ is quasi-compact and quasi-separated, then 27.17.1.1) is an isomorphism.
In particular, the canonical map

$$
\Gamma_{*}(X, \mathcal{L})_{(s)} \longrightarrow \Gamma\left(X_{s}, \mathcal{O}\right), \quad a / s^{n} \longmapsto a \otimes s^{-n}
$$

is an isomorphism if $X$ is quasi-compact and quasi-separated.
Proof. Assume $X$ is quasi-compact. Choose a finite affine open covering $X=$ $U_{1} \cup \ldots \cup U_{m}$ with $U_{j}$ affine and $\left.\mathcal{L}\right|_{U_{j}} \cong \mathcal{O}_{U_{j}}$. Via this isomorphism, the image $\left.s\right|_{U_{j}}$ corresponds to some $f_{j} \in \Gamma\left(U_{j}, \mathcal{O}_{U_{j}}\right)$. Then $X_{s} \cap U_{j}=D\left(f_{j}\right)$.
Proof of (1). Let $t / s^{n}$ be an element in the kernel of 27.17.1.1). Then $\left.t\right|_{X_{s}}=0$. Hence $\left.\left(\left.t\right|_{U_{j}}\right)\right|_{D\left(f_{j}\right)}=0$. By Lemma 27.17.1 we conclude that $\left.f_{j}^{\text {en }_{j}} t\right|_{U_{j}}=0$ for some $e_{j} \geq 0$. Let $e=\max \left(e_{j}\right)$. Then we see that $t \otimes s^{e}$ restricts to zero on $U_{j}$ for all $j$, hence is zero. Since $t / s^{n}$ is equal to $t \otimes s^{e} / s^{n+e}$ in $\Gamma_{*}(X, \mathcal{L}, \mathcal{F})_{(s)}$ we conclude that $t / s^{n}=0$ as desired.

Proof of (2). Assume $X$ is quasi-compact and quasi-separated. Then $U_{j} \cap U_{j^{\prime}}$ is quasi-compact for all pairs $j, j^{\prime}$, see Schemes, Lemma 25.21.7. By part (1) we know 27.17.1.1 is injective. Let $t^{\prime} \in \Gamma\left(X_{s},\left.\mathcal{F}\right|_{X_{s}}\right)$. For every $j$, there exist an integer $n_{j} \geq 0$ and $t_{j}^{\prime} \in \Gamma\left(U_{j},\left.\mathcal{F}\right|_{U_{j}}\right)$ such that $\left.t^{\prime}\right|_{D\left(f_{j}\right)}$ corresponds to $t_{j}^{\prime} / f_{j}^{e_{j}}$ via the isomorphism of Lemma 27.17.1. Set $e=\max \left(e_{j}\right)$ and

$$
t_{j}=\left.t_{j}^{\prime} \otimes s\right|_{U_{j}} ^{e} \in \Gamma\left(U_{j},\left.\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes e}\right)\right|_{U_{j}}\right)
$$

Then we see that $\left.t_{j}\right|_{U_{j} \cap U_{j^{\prime}}}$ and $\left.t_{j^{\prime}}\right|_{U_{j} \cap U_{j^{\prime}}}$ map to the same section of $\mathcal{F}$ over $U_{j} \cap$ $U_{j^{\prime}} \cap X_{s}$. By quasi-compactness of $U_{j} \cap U_{j^{\prime}}$ and part (1) there exists an integer $e^{\prime} \geq 0$ such that

$$
\left.\left.t_{j}\right|_{U_{j} \cap U_{j^{\prime}}} \otimes s^{e^{\prime}}\right|_{U_{j} \cap U_{j^{\prime}}}=\left.\left.t_{j^{\prime}}\right|_{U_{j} \cap U_{j^{\prime}}} \otimes s^{e^{\prime}}\right|_{U_{j} \cap U_{j^{\prime}}}
$$

as sections of $\mathcal{F} \otimes \mathcal{L}^{\otimes e+e^{\prime}}$ over $U_{j} \cap U_{j^{\prime}}$. We may choose the same $e^{\prime}$ to work for all pairs $j, j^{\prime}$. Then the sheaf conditions implies there is a section $t \in \Gamma\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes e+e^{\prime}}\right)$ whose restriction to $U_{j}$ is $\left.t_{j} \otimes s^{e^{\prime}}\right|_{U_{j}}$. A simple computation shows that $t / s^{e+e^{\prime}}$ maps to $t^{\prime}$ as desired.

Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $\mathcal{F}$ and $\mathcal{G}$ be quasicoherent $\mathcal{O}_{X}$-modules. Consider the graded $\Gamma_{*}(X, \mathcal{L})$-module

$$
M=\bigoplus_{n \in \mathbf{Z}} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)
$$

Next, let $s \in \Gamma(X, \mathcal{L})$ be a section. Then there is a canonical map
0B5M (27.17.2.1)

$$
M_{(s)} \longrightarrow \operatorname{Hom}_{\mathcal{O}_{X_{s}}}\left(\left.\mathcal{F}\right|_{X_{s}},\left.\mathcal{G}\right|_{X_{s}}\right)
$$

which sends $\alpha / s^{n}$ to the map $\left.\left.\alpha\right|_{X_{s}} \otimes s\right|_{X_{s}} ^{-n}$. The following lemma, combined with Lemma 27.22.4, says roughly that, if $X$ is quasi-compact and quasi-separated, the
category of finitely presented $\mathcal{O}_{X_{s}}$-modules is the category of finitely presented $\mathcal{O}_{X}$-modules with the multiplicative systm of maps $s^{n}: \mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}$ inverted.
01XQ Lemma 27.17.3. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent $\mathcal{O}_{X}$-modules.
(1) If $X$ is quasi-compact and $\mathcal{F}$ is of finite type, then 27.17.2.1) is injective, and
(2) if $X$ is quasi-compact and quasi-separated and $\mathcal{F}$ is of finite presentation, then 27.17.2.1) is bijective.

Proof. We first prove the lemma in case $X=\operatorname{Spec}(A)$ is affine and $\mathcal{L}=\mathcal{O}_{X}$. In this case $s$ corresponds to an element $f \in A$. Say $\mathcal{F}=\widetilde{M}$ and $\mathcal{G}=\widetilde{N}$ for some $A$-modules $M$ and $N$. Then the lemma translates (via Lemmas 27.16.1 and 27.16.2) into the following algebra statements
(1) If $M$ is a finite $A$-module and $\varphi: M \rightarrow N$ is an $A$-module map such that the induced map $M_{f} \rightarrow N_{f}$ is zero, then $f^{n} \varphi=0$ for some $n$.
(2) If $M$ is a finitely presented $A$-module, then $\operatorname{Hom}_{A}(M, N)_{f}=\operatorname{Hom}_{A_{f}}\left(M_{f}, N_{f}\right)$.

The second statement is Algebra, Lemma 10.10 .2 and we omit the proof of the first statement.
Next, we prove (1) for general $X$. Assume $X$ is quasi-compact and hoose a finite affine open covering $X=U_{1} \cup \ldots \cup U_{m}$ with $U_{j}$ affine and $\left.\mathcal{L}\right|_{U_{j}} \cong \mathcal{O}_{U_{j}}$. Via this isomorphism, the image $\left.s\right|_{U_{j}}$ corresponds to some $f_{j} \in \Gamma\left(U_{j}, \mathcal{O}_{U_{j}}\right)$. Then $X_{s} \cap U_{j}=D\left(f_{j}\right)$. Let $\alpha / s^{n}$ be an element in the kernel of 27.17.2.1). Then $\left.\alpha\right|_{X_{s}}=0$. Hence $\left.\left(\left.\alpha\right|_{U_{j}}\right)\right|_{D\left(f_{j}\right)}=0$. By the affine case treated above we conclude that $\left.f_{j}^{e_{j}} \alpha\right|_{U_{j}}=0$ for some $e_{j} \geq 0$. Let $e=\max \left(e_{j}\right)$. Then we see that $\alpha \otimes s^{e}$ restricts to zero on $U_{j}$ for all $j$, hence is zero. Since $\alpha / s^{n}$ is equal to $\alpha \otimes s^{e} / s^{n+e}$ in $M_{(s)}$ we conclude that $\alpha / s^{n}=0$ as desired.
Proof of (2). Since $\mathcal{F}$ is of finite presentation, the sheaf $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is quasicoherent, see Schemes, Section 25.24. Moreover, it is clear that

$$
\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)=\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G}) \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}
$$

for all $n$. Hence in this case the statement follows from Lemma 27.17.2 applied to $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$.

### 27.18. Quasi-affine schemes

01P5
01P6 Definition 27.18.1. A scheme $X$ is called quasi-affine if it is quasi-compact and isomorphic to an open subscheme of an affine scheme.

01P8 Lemma 27.18.2. Let $X$ be a scheme. Let $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$. Assume $X$ is quasicompact and quasi-separated and assume that $X_{f}$ is affine. Then the canonical morphism

$$
j: X \longrightarrow \operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)
$$

from Schemes, Lemma 25.6.4 induces an isomorphism of $X_{f}=j^{-1}(D(f))$ onto the standard affine open $D(f) \subset \operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)$.

Proof. This is clear as $j$ induces an isomorphism of rings $\Gamma\left(X, \mathcal{O}_{X}\right)_{f} \rightarrow \mathcal{O}_{X}\left(X_{f}\right)$ by Lemma 27.17.1 above.

01P9 Lemma 27.18.3. Let $X$ be a scheme. Then $X$ is quasi-affine if and only if the canonical morphism

$$
X \longrightarrow \operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)
$$

from Schemes, Lemma 25.6.4 is a quasi-compact open immersion.
Proof. If the displayed morphism is a quasi-compact open immersion then $X$ is isomorphic to a quasi-compact open subscheme of $\operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)$ and clearly $X$ is quasi-affine.
Assume $X$ is quasi-affine, say $X \subset \operatorname{Spec}(R)$ is quasi-compact open. This in particular implies that $X$ is separated, see Schemes, Lemma 25.23.8. Let $A=\Gamma\left(X, \mathcal{O}_{X}\right)$. Consider the ring map $R \rightarrow A$ coming from $R=\Gamma\left(\operatorname{Spec}(R), \mathcal{O}_{\operatorname{Spec}(R)}\right)$ and the restriction mapping of the sheaf $\mathcal{O}_{\operatorname{Spec}(R)}$. By Schemes, Lemma 25.6.4 we obtain a factorization:

$$
X \longrightarrow \operatorname{Spec}(A) \longrightarrow \operatorname{Spec}(R)
$$

of the inclusion morphism. Let $x \in X$. Choose $r \in R$ such that $x \in D(r)$ and $D(r) \subset X$. Denote $f \in A$ the image of $r$ in $A$. The open $X_{f}$ of Lemma 27.17.1 above is equal to $D(r) \subset X$ and hence $A_{f} \cong R_{r}$ by the conclusion of that lemma. Hence $D(r) \rightarrow \operatorname{Spec}(A)$ is an isomorphism onto the standard affine open $D(f)$ of $\operatorname{Spec}(A)$. Since $X$ can be covered by such affine opens $D(f)$ we win.

0ARY Lemma 27.18.4. Let $U \rightarrow V$ be an open immersion of quasi-affine schemes. Then

is cartesian.
Proof. The diagram is commutative by Schemes, Lemma 25.6.4 Write $A=$ $\Gamma\left(U, \mathcal{O}_{U}\right)$ and $B=\Gamma\left(V, \mathcal{O}_{V}\right)$. Let $g \in B$ be such that $V_{g}$ is affine and contained in $U$. This means that if $f$ is the image of $g$ in $A$, then $U_{f}=V_{g}$. By Lemma 27.18.2 we see that $j^{\prime}$ induces an isomorphism of $V_{g}$ with the standard open $D(g)$ of $\operatorname{Spec}(B)$. Thus $V_{g} \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A) \rightarrow \operatorname{Spec}(A)$ is an isomorphism onto $D(f) \subset \operatorname{Spec}(A)$. By Lemma 27.18 .2 again $j$ maps $U_{f}$ isomorphically to $D(f)$. Thus we see that $U_{f}=U_{f} \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A)$. Since by Lemma 27.18.3 we can cover $U$ by $V_{g}=U_{f}$ as above, we see that $U \rightarrow U \times_{\operatorname{Spec}(B)} \operatorname{Spec}(A)$ is an isomorphism.

### 27.19. Flat modules

05 NZ On any ringed space $\left(X, \mathcal{O}_{X}\right)$ we know what it means for an $\mathcal{O}_{X}$-module to be flat (at a point), see Modules, Definition 17.16.1 (Definition 17.16.3). On an affine scheme this matches the notion defined in the algebra chapter.

05P0 Lemma 27.19.1. Let $X=\operatorname{Spec}(R)$ be an affine scheme. Let $\mathcal{F}=\widetilde{M}$ for some $R$-module $M$. The quasi-coherent sheaf $\mathcal{F}$ is a flat $\mathcal{O}_{X}$-module of if and only if $M$ is a flat $R$-module.

Proof. Flatness of $\mathcal{F}$ may be checked on the stalks, see Modules, Lemma 17.16.2, The same is true in the case of modules over a ring, see Algebra, Lemma 10.38.19, And since $\mathcal{F}_{x}=M_{\mathfrak{p}}$ if $x$ corresponds to $\mathfrak{p}$ the lemma is true.

### 27.20. Locally free modules

05P1 On any ringed space we know what it means for an $\mathcal{O}_{X}$-module to be (finite) locally free. On an affine scheme this matches the notion defined in the algebra chapter.
05JM Lemma 27.20.1. Let $X=\operatorname{Spec}(R)$ be an affine scheme. Let $\mathcal{F}=\widetilde{M}$ for some $R$-module $M$. The quasi-coherent sheaf $\mathcal{F}$ is a (finite) locally free $\mathcal{O}_{X}$-module of if and only if $M$ is a (finite) locally free $R$-module.

Proof. Follows from the definitions, see Modules, Definition 17.14.1 and Algebra, Definition 10.77.1

We can characterize finite locally free modules in many different ways.
05P2 Lemma 27.20.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The following are equivalent:
(1) $\mathcal{F}$ is a flat $\mathcal{O}_{X}$-module of finite presentation,
(2) $\mathcal{F}$ is $\mathcal{O}_{X}$-module of finite presentation and for all $x \in X$ the stalk $\mathcal{F}_{x}$ is a free $\mathcal{O}_{X, x}$-module,
(3) $\mathcal{F}$ is a locally free, finite type $\mathcal{O}_{X}$-module,
(4) $\mathcal{F}$ is a finite locally free $\mathcal{O}_{X}$-module, and
(5) $\mathcal{F}$ is an $\mathcal{O}_{X}$-module of finite type, for every $x \in X$ the stalk $\mathcal{F}_{x}$ is a free $\mathcal{O}_{X, x}$-module, and the function

$$
\rho_{\mathcal{F}}: X \rightarrow \mathbf{Z}, \quad x \longmapsto \operatorname{dim}_{\kappa(x)} \mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

is locally constant in the Zariski topology on $X$.
Proof. This lemma immediately reduces to the affine case. In this case the lemma is a reformulation of Algebra, Lemma 10.77.2. The translation uses Lemmas 27.16.1, 27.16 .2 27.19.1 and 27.20.1.

### 27.21. Locally projective modules

05 JN A consequence of the work done in the algebra chapter is that it makes sense to define a locally projective module as follows.
05JP Definition 27.21.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. We say $\mathcal{F}$ is locally projective if for every affine open $U \subset X$ the $\mathcal{O}_{X}(U)$-module $\mathcal{F}(U)$ is projective.
05JQ Lemma 27.21.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is locally projective, and
(2) there exists an affine open covering $X=\bigcup U_{i}$ such that the $\mathcal{O}_{X}\left(U_{i}\right)$ module $\mathcal{F}\left(U_{i}\right)$ is projective for every $i$.
In particular, if $X=\operatorname{Spec}(A)$ and $\mathcal{F}=\widetilde{M}$ then $\mathcal{F}$ is locally projective if and only if $M$ is a projective $A$-module.

Proof. First, note that if $M$ is a projective $A$-module and $A \rightarrow B$ is a ring map, then $M \otimes_{A} B$ is a projective $B$-module, see Algebra, Lemma 10.93.1. Hence if $U$ is an affine open such that $\mathcal{F}(U)$ is a projective $\mathcal{O}_{X}(U)$-module, then the standard open $D(f)$ is an affine open such that $\mathcal{F}(D(f))$ is a projective $\mathcal{O}_{X}(D(f))$-module for all $f \in \mathcal{O}_{X}(U)$. Assume (2) holds. Let $U \subset X$ be an arbitrary affine open. We
can find an open covering $U=\bigcup_{j=1, \ldots, m} D\left(f_{j}\right)$ by finitely many standard opens $D\left(f_{j}\right)$ such that for each $j$ the open $D\left(f_{j}\right)$ is a standard open of some $U_{i}$, see Schemes, Lemma 25.11.5. Hence, if we set $A=\mathcal{O}_{X}(U)$ and if $M$ is an $A$-module such that $\left.\mathcal{F}\right|_{U}$ corresponds to $M$, then we see that $M_{f_{j}}$ is a projective $A_{f_{j}}$-module. It follows that $A \rightarrow B=\prod A_{f_{j}}$ is a faithfully flat ring map such that $M \times{ }_{A} B$ is a projective $B$-module. Hence $M$ is projective by Algebra, Theorem 10.94.5.

060M Lemma 27.21.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{G}$ be a quasicoherent $\mathcal{O}_{Y}$-module. If $\mathcal{G}$ is locally projective on $Y$, then $f^{*} \mathcal{G}$ is locally projective on $X$.

Proof. See Algebra, Lemma 10.93.1.

### 27.22. Extending quasi-coherent sheaves

01 PD It is sometimes useful to be able to show that a given quasi-coherent sheaf on an open subscheme extends to the whole scheme.

01PE Lemma 27.22.1. Let $j: U \rightarrow X$ be a quasi-compact open immersion of schemes.
(1) Any quasi-coherent sheaf on $U$ extends to a quasi-coherent sheaf on $X$.
(2) Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $\left.\mathcal{G} \subset \mathcal{F}\right|_{U}$ be a quasi-coherent subsheaf. There exists a quasi-coherent subsheaf $\mathcal{H}$ of $\mathcal{F}$ such that $\left.\mathcal{H}\right|_{U}=\mathcal{G}$ as subsheaves of $\left.\mathcal{F}\right|_{U}$.
(3) Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $\mathcal{G}$ be a quasi-coherent sheaf on $U$. Let $\varphi:\left.\mathcal{G} \rightarrow \mathcal{F}\right|_{U}$ be a morphism of $\mathcal{O}_{U}$-modules. There exists a quasi-coherent sheaf $\mathcal{H}$ of $\mathcal{O}_{X}$-modules and a map $\psi: \mathcal{H} \rightarrow \mathcal{F}$ such that $\left.\mathcal{H}\right|_{U}=\mathcal{G}$ and that $\left.\psi\right|_{U}=\varphi$.

Proof. An immersion is separated (see Schemes, Lemma 25.23.7) and $j$ is quasicompact by assumption. Hence for any quasi-coherent sheaf $\mathcal{G}$ on $U$ the sheaf $j_{*} \mathcal{G}$ is an extension to $X$. See Schemes, Lemma 25.24.1 and Sheaves, Section 6.31.

Assume $\mathcal{F}, \mathcal{G}$ are as in (2). Then $j_{*} \mathcal{G}$ is a quasi-coherent sheaf on $X$ (see above). It is a subsheaf of $j_{*} j^{*} \mathcal{F}$. Hence the kernel

$$
\mathcal{H}=\operatorname{Ker}\left(\mathcal{F} \oplus j_{*} \mathcal{G} \longrightarrow j_{*} j^{*} \mathcal{F}\right)
$$

is quasi-coherent as well, see Schemes, Section 25.24 . It is formal to check that $\mathcal{H} \subset \mathcal{F}$ and that $\left.\mathcal{H}\right|_{U}=\mathcal{G}$ (using the material in Sheaves, Section 6.31 again).

The same proof as above works. Just take $\mathcal{H}=\operatorname{Ker}\left(\mathcal{F} \oplus j_{*} \mathcal{G} \rightarrow j_{*} j^{*} \mathcal{F}\right)$ with its obvious map to $\mathcal{F}$ and its obvious identification with $\mathcal{G}$ over $U$.

01PF Lemma 27.22.2. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\left.\mathcal{G} \subset \mathcal{F}\right|_{U}$ be a quasi-coherent $\mathcal{O}_{U}$-submodule which is of finite type. Then there exists a quasi-coherent submodule $\mathcal{G}^{\prime} \subset \mathcal{F}$ which is of finite type such that $\left.\mathcal{G}^{\prime}\right|_{U}=\mathcal{G}$.

Proof. Let $n$ be the minimal number of affine opens $U_{i} \subset X, i=1, \ldots, n$ such that $X=U \cup \bigcup U_{i}$. (Here we use that $X$ is quasi-compact.) Suppose we can prove the lemma for the case $n=1$. Then we can successively extend $\mathcal{G}$ to a $\mathcal{G}_{1}$ over $U \cup U_{1}$ to a $\mathcal{G}_{2}$ over $U \cup U_{1} \cup U_{2}$ to a $\mathcal{G}_{3}$ over $U \cup U_{1} \cup U_{2} \cup U_{3}$, and so on. Thus we reduce to the case $n=1$.

Thus we may assume that $X=U \cup V$ with $V$ affine. Since $X$ is quasi-separated and $U, V$ are quasi-compact open, we see that $U \cap V$ is a quasi-compact open. It suffices to prove the lemma for the system $\left(V, U \cap V,\left.\mathcal{F}\right|_{V},\left.\mathcal{G}\right|_{U \cap V}\right)$ since we can glue the resulting sheaf $\mathcal{G}^{\prime}$ over $V$ to the given sheaf $\mathcal{G}$ over $U$ along the common value over $U \cap V$. Thus we reduce to the case where $X$ is affine.
Assume $X=\operatorname{Spec}(R)$. Write $\mathcal{F}=\widetilde{M}$ for some $R$-module $M$. By Lemma 27.22.1 above we may find a quasi-coherent subsheaf $\mathcal{H} \subset \mathcal{F}$ which restricts to $\mathcal{G}$ over $U$. Write $\mathcal{H}=\widetilde{N}$ for some $R$-module $N$. For every $u \in U$ there exists an $f \in R$ such that $u \in D(f) \subset U$ and such that $N_{f}$ is finitely generated, see Lemma 27.16.1. Since $U$ is quasi-compact we can cover it by finitely many $D\left(f_{i}\right)$ such that $N_{f_{i}}$ is generated by finitely many elements, say $x_{i, 1} / f_{i}^{N}, \ldots, x_{i, r_{i}} / f_{i}^{N}$. Let $N^{\prime} \subset N$ be the submodule generated by the elements $x_{i, j}$. Then the subsheaf $\mathcal{G}:=\widetilde{N^{\prime}} \subset \mathcal{H} \subset \mathcal{F}$ works.

01PG Lemma 27.22.3. Let $X$ be a quasi-compact and quasi-separated scheme. Any quasi-coherent sheaf of $\mathcal{O}_{X}$-modules is the directed colimit of its quasi-coherent $\mathcal{O}_{X}$ submodules which are of finite type.

Proof. The colimit is directed because if $\mathcal{G}_{1}, \mathcal{G}_{2}$ are quasi-coherent subsheaves of finite type, then $\mathcal{G}_{1}+\mathcal{G}_{2} \subset \mathcal{F}$ is a quasi-coherent subsheaf of finite type. Let $U \subset X$ be any affine open, and let $s \in \Gamma(U, \mathcal{F})$ be any section. Let $\left.\mathcal{G} \subset \mathcal{F}\right|_{U}$ be the subsheaf generated by $s$. Then clearly $\mathcal{G}$ is quasi-coherent and has finite type as an $\mathcal{O}_{U}$-module. By Lemma 27.22 .2 we see that $\mathcal{G}$ is the restriction of a quasi-coherent subsheaf $\mathcal{G}^{\prime} \subset \mathcal{F}$ which has finite type. Since $X$ has a basis for the topology consisting of affine opens we conclude that every local section of $\mathcal{F}$ is locally contained in a quasi-coherent submodule of finite type. Thus we win.

01PI Lemma 27.22.4. (Variant of Lemma 27.22.2 dealing with modules of finite presentation.) Let $X$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{F}$ be $a$ quasi-coherent $\mathcal{O}_{X}$-module. Let $U \subset X$ be a quasi-compact open. Let $\mathcal{G}$ be an $\mathcal{O}_{U}$-module which of finite presentation. Let $\varphi:\left.\mathcal{G} \rightarrow \mathcal{F}\right|_{U}$ be a morphism of $\mathcal{O}_{U}-$ modules. Then there exists an $\mathcal{O}_{X}$-module $\mathcal{G}^{\prime}$ of finite presentation, and a morphism of $\mathcal{O}_{X}$-modules $\varphi^{\prime}: \mathcal{G}^{\prime} \rightarrow \mathcal{F}$ such that $\left.\mathcal{G}^{\prime}\right|_{U}=\mathcal{G}$ and such that $\left.\varphi^{\prime}\right|_{U}=\varphi$.
Proof. The beginning of the proof is a repeat of the beginning of the proof of Lemma 27.22.2. We write it out carefuly anyway.
Let $n$ be the minimal number of affine opens $U_{i} \subset X, i=1, \ldots, n$ such that $X=U \cup \bigcup U_{i}$. (Here we use that $X$ is quasi-compact.) Suppose we can prove the lemma for the case $n=1$. Then we can successively extend the pair $(\mathcal{G}, \varphi)$ to a pair $\left(\mathcal{G}_{1}, \varphi_{1}\right)$ over $U \cup U_{1}$ to a pair $\left(\mathcal{G}_{2}, \varphi_{2}\right)$ over $U \cup U_{1} \cup U_{2}$ to a pair $\left(\mathcal{G}_{3}, \varphi_{3}\right)$ over $U \cup U_{1} \cup U_{2} \cup U_{3}$, and so on. Thus we reduce to the case $n=1$.
Thus we may assume that $X=U \cup V$ with $V$ affine. Since $X$ is quasi-separated and $U$ quasi-compact, we see that $U \cap V \subset V$ is quasi-compact. Suppose we prove the lemma for the system $\left(V, U \cap V,\left.\mathcal{F}\right|_{V},\left.\mathcal{G}\right|_{U \cap V},\left.\varphi\right|_{U \cap V}\right)$ thereby producing $\left(\mathcal{G}^{\prime}, \varphi^{\prime}\right)$ over $V$. Then we can glue $\mathcal{G}^{\prime}$ over $V$ to the given sheaf $\mathcal{G}$ over $U$ along the common value over $U \cap V$, and similarly we can glue the $\operatorname{map} \varphi^{\prime}$ to the map $\varphi$ along the common value over $U \cap V$. Thus we reduce to the case where $X$ is affine.
Assume $X=\operatorname{Spec}(R)$. By Lemma 27.22.1 above we may find a quasi-coherent sheaf $\mathcal{H}$ with a map $\psi: \mathcal{H} \rightarrow \mathcal{F}$ over $X$ which restricts to $\mathcal{G}$ and $\varphi$ over $U$. By

Lemma 27.22 .2 we can find a finite type quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{H}^{\prime} \subset \mathcal{H}$ such that $\left.\mathcal{H}^{\prime}\right|_{U}=\mathcal{G}$. Thus after replacing $\mathcal{H}$ by $\mathcal{H}^{\prime}$ and $\psi$ by the restriction of $\psi$ to $\mathcal{H}^{\prime}$ we may assume that $\mathcal{H}$ is of finite type. By Lemma 27.16 .2 we conclude that $\mathcal{H}=\widetilde{N}$ with $N$ a finitely generated $R$-module. Hence there exists a surjection as in the following short exact sequence of quasi-coherent $\mathcal{O}_{X}$-modules

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{O}_{X}^{\oplus n} \rightarrow \mathcal{H} \rightarrow 0
$$

where $\mathcal{K}$ is defined as the kernel. Since $\mathcal{G}$ is of finite presentation and $\left.\mathcal{H}\right|_{U}=\mathcal{G}$ by Modules, Lemma 17.11 .3 the restriction $\left.\mathcal{K}\right|_{U}$ is an $\mathcal{O}_{U}$-module of finite type. Hence by Lemma 27.22.2 again we see that there exists a finite type quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{K}^{\prime} \subset \mathcal{K}$ such that $\left.\mathcal{K}^{\prime}\right|_{U}=\left.\mathcal{K}\right|_{U}$. The solution to the problem posed in the lemma is to set

$$
\mathcal{G}^{\prime}=\mathcal{O}_{X}^{\oplus n} / \mathcal{K}^{\prime}
$$

which is clearly of finite presentation and restricts to give $\mathcal{G}$ on $U$ with $\varphi^{\prime}$ equal to the composition

$$
\mathcal{G}^{\prime}=\mathcal{O}_{X}^{\oplus n} / \mathcal{K}^{\prime} \rightarrow \mathcal{O}_{X}^{\oplus n} / \mathcal{K}=\mathcal{H} \xrightarrow{\psi} \mathcal{F}
$$

This finishes the proof of the lemma.
The following lemma says that every quasi-coherent sheaf on a quasi-compact and quasi-separated scheme is a filtered colimit of $\mathcal{O}$-modules of finite presentation. Actually, we reformulate this in (perhaps more familiar) terms of directed colimits over posets in the next lemma.

01PJ Lemma 27.22.5. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. There exist
(1) a filtered index category $\mathcal{I}$ (see Categories, Definition 4.19.1),
(2) a diagram $\mathcal{I} \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ (see Categories, Section 4.14), $i \mapsto \mathcal{F}_{i}$,
(3) morphisms of $\mathcal{O}_{X}$-modules $\varphi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{F}$
such that each $\mathcal{F}_{i}$ is of finite presentation and such that the morphisms $\varphi_{i}$ induce an isomorphism

$$
\operatorname{colim}_{i} \mathcal{F}_{i}=\mathcal{F}
$$

Proof. Choose a set $I$ and for each $i \in I$ an $\mathcal{O}_{X}$-module of finite presentation and a homomorphism of $\mathcal{O}_{X}$-modules $\varphi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{F}$ with the following property: For any $\psi: \mathcal{G} \rightarrow \mathcal{F}$ with $\mathcal{G}$ of finite presentation there is an $i \in I$ such that there exists an isomorphism $\alpha: \mathcal{F}_{i} \rightarrow \mathcal{G}$ with $\varphi_{i}=\psi \circ \alpha$. It is clear from Modules, Lemma 17.9 .8 that such a set exists (see also its proof). We denote $\mathcal{I}$ the category with $\mathrm{Ob}(\mathcal{I})=I$ and given $i, i^{\prime} \in I$ we set

$$
\operatorname{Mor}_{\mathcal{I}}\left(i, i^{\prime}\right)=\left\{\alpha: \mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}} \mid \alpha \circ \varphi_{i^{\prime}}=\varphi_{i}\right\} .
$$

We claim that $\mathcal{I}$ is a filtered category and that $\mathcal{F}=\operatorname{colim}_{i} \mathcal{F}_{i}$.
Let $i, i^{\prime} \in I$. Then we can consider the morphism

$$
\mathcal{F}_{i} \oplus \mathcal{F}_{i^{\prime}} \longrightarrow \mathcal{F}
$$

which is the direct sum of $\varphi_{i}$ and $\varphi_{i^{\prime}}$. Since a direct sum of finitely presented $\mathcal{O}_{X}$-modules is finitely presented we see that there exists some $i^{\prime \prime} \in I$ such that
$\varphi_{i^{\prime \prime}}: \mathcal{F}_{i^{\prime \prime}} \rightarrow \mathcal{F}$ is isomorphic to the displayed arrow towards $\mathcal{F}$ above. Since there are commutative diagrams

we see that there are morphisms $i \rightarrow i^{\prime \prime}$ and $i^{\prime} \rightarrow i^{\prime \prime}$ in $\mathcal{I}$. Next, suppose that we have $i, i^{\prime} \in I$ and morphisms $\alpha, \beta: i \rightarrow i^{\prime}$ (corresponding to $\mathcal{O}_{X}$-module maps $\left.\alpha, \beta: \mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}\right)$. In this case consider the coequalizer

$$
\mathcal{G}=\operatorname{Coker}\left(\mathcal{F}_{i} \xrightarrow{\alpha-\beta} \mathcal{F}_{i^{\prime}}\right)
$$

Note that $\mathcal{G}$ is an $\mathcal{O}_{X}$-module of finite presentation. Since by definition of morphisms in the category $\mathcal{I}$ we have $\varphi_{i^{\prime}} \circ \alpha=\varphi_{i^{\prime}} \circ \beta$ we see that we get an induced $\operatorname{map} \psi: \mathcal{G} \rightarrow \mathcal{F}$. Hence again the pair $(\mathcal{G}, \psi)$ is isomorphic to the pair $\left(\mathcal{F}_{i^{\prime \prime}}, \varphi_{i^{\prime \prime}}\right)$ for some $i^{\prime \prime}$. Hence we see that there exists a morphism $i^{\prime} \rightarrow i^{\prime \prime}$ in $\mathcal{I}$ which equalizes $\alpha$ and $\beta$. Thus we have shown that the category $\mathcal{I}$ is filtered.
We still have to show that the colimit of the diagram is $\mathcal{F}$. By definition of the colimit, and by our definition of the category $\mathcal{I}$ there is a canonical map

$$
\varphi: \operatorname{colim}_{i} \mathcal{F}_{i} \longrightarrow \mathcal{F} .
$$

Pick $x \in X$. Let us show that $\varphi_{x}$ is an isomorphism. Recall that

$$
\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)_{x}=\operatorname{colim}_{i} \mathcal{F}_{i, x}
$$

see Sheaves, Section 6.29 First we show that the map $\varphi_{x}$ is injective. Suppose that $s \in \mathcal{F}_{i, x}$ is an element such that $s$ maps to zero in $\mathcal{F}_{x}$. Then there exists a quasi-compact open $U$ such that $s$ comes from $s \in \mathcal{F}_{i}(U)$ and such that $\varphi_{i}(s)=0$ in $\mathcal{F}(U)$. By Lemma 27.22 .2 we can find a finite type quasi-coherent subsheaf $\mathcal{K} \subset \operatorname{Ker}\left(\varphi_{i}\right)$ which restricts to the quasi-coherent $\mathcal{O}_{U}$-submodule of $\mathcal{F}_{i}$ generated by $s:\left.\mathcal{K}\right|_{U}=\left.\mathcal{O}_{U} \cdot s \subset \mathcal{F}_{i}\right|_{U}$. Clearly, $\mathcal{F}_{i} / \mathcal{K}$ is of finite presentation and the map $\varphi_{i}$ factors through the quotient map $\mathcal{F}_{i} \rightarrow \mathcal{F}_{i} / \mathcal{K}$. Hence we can find an $i^{\prime} \in I$ and a morphism $\alpha: \mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ in $\mathcal{I}$ which can be identified with the quotient map $\mathcal{F}_{i} \rightarrow \mathcal{F}_{i} / \mathcal{K}$. Then it follows that the section $s$ maps to zero in $\mathcal{F}_{i^{\prime}}(U)$ and in particular in $\left(\operatorname{colim}_{i} \mathcal{F}_{i}\right)_{x}=\operatorname{colim}_{i} \mathcal{F}_{i, x}$. The injectivity follows. Finally, we show that the map $\varphi_{x}$ is surjective. Pick $s \in \mathcal{F}_{x}$. Choose a quasi-compact open neighbourhood $U \subset X$ of $x$ such that $s$ corresponds to a section $s \in \mathcal{F}(U)$. Consider the map $s: \mathcal{O}_{U} \rightarrow \mathcal{F}$ (multiplication by $s$ ). By Lemma 27.22 .4 there exists an $\mathcal{O}_{X}$-module $\mathcal{G}$ of finite presentation and an $\mathcal{O}_{X}$-module map $\mathcal{G} \rightarrow \mathcal{F}$ such that $\left.\left.\mathcal{G}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ is identified with $s: \mathcal{O}_{U} \rightarrow \mathcal{F}$. Again by definition of $\mathcal{I}$ there exists an $i \in I$ such that $\mathcal{G} \rightarrow \mathcal{F}$ is isomorphic to $\varphi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{F}$. Clearly there exists a section $s^{\prime} \in \mathcal{F}_{i}(U)$ mapping to $s \in \mathcal{F}(U)$. This proves surjectivity and the proof of the lemma is complete.

01PK Lemma 27.22.6. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. There exist
(1) a directed partially ordered set I (see Categories, Definition 4.21.2),
(2) a system $\left(\mathcal{F}_{i}, \varphi_{i i^{\prime}}\right)$ over I in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ (see Categories, Definition 4.21.1)
(3) morphisms of $\mathcal{O}_{X}$-modules $\varphi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{F}$
such that each $\mathcal{F}_{i}$ is of finite presentation and such that the morphisms $\varphi_{i}$ induce an isomorphism

$$
\operatorname{colim}_{i} \mathcal{F}_{i}=\mathcal{F}
$$

Proof. This is a direct consequence of Lemma 27.22 .5 and Categories, Lemma 4.21 .3 (combined with the fact that colimits exist in the category of sheaves of $\mathcal{O}_{X}$-modules, see Sheaves, Section 6.29.

05JR Lemma 27.22.7. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then $\mathcal{F}$ is the directed colimit of its finite type quasi-coherent submodules.

Proof. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are finite type quasi-coherent $\mathcal{O}_{X}$-submodules then the image of $\mathcal{G} \oplus \mathcal{H} \rightarrow \mathcal{F}$ is another finite type quasi-coherent $\mathcal{O}_{X}$-submodule which contains both of them. In this way we see that the system is directed. To show that $\mathcal{F}$ is the colimit of this system, write $\mathcal{F}=\operatorname{colim}_{i} \mathcal{F}_{i}$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 27.22.6. Then the images $\mathcal{G}_{i}=\operatorname{Im}\left(\mathcal{F}_{i} \rightarrow \mathcal{F}\right)$ are finite type quasi-coherent subsheaves of $\mathcal{F}$. Since $\mathcal{F}$ is the colimit of these the result follows.

086M Lemma 27.22.8. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Then we can write $\mathcal{F}=$ $\lim \mathcal{F}_{i}$ with $\mathcal{F}_{i}$ of finite presentation and all transition maps $\mathcal{F}_{i} \rightarrow \mathcal{F}_{i^{\prime}}$ surjective.

Proof. Write $\mathcal{F}=\operatorname{colim} \mathcal{G}_{i}$ as a filtered colimit of finitely presented $\mathcal{O}_{X}$-modules (Lemma 27.22.6). We claim that $\mathcal{G}_{i} \rightarrow \mathcal{F}$ is surjective for some $i$. Namely, choose a finite affine open covering $X=U_{1} \cup \ldots \cup U_{m}$. Choose sections $s_{j l} \in \mathcal{F}\left(U_{j}\right)$ generating $\left.\mathcal{F}\right|_{U_{j}}$, see Lemma 27.16.1. By Sheaves, Lemma 6.29.1 we see that $s_{j l}$ is in the image of $\mathcal{G}_{i} \rightarrow \mathcal{F}$ for $i$ large enough. Hence $\mathcal{G}_{i} \rightarrow \mathcal{F}$ is surjective for $i$ large enough. Choose such an $i$ and let $\mathcal{K} \subset \mathcal{G}_{i}$ be the kernel of the map $\mathcal{G}_{i} \rightarrow \mathcal{F}$. Write $\mathcal{K}=\operatorname{colim} \mathcal{K}_{a}$ as the filtered colimit of its finite type quasi-coherent submodules (Lemma 27.22.7). Then $\mathcal{F}=\operatorname{colim} \mathcal{G}_{i} / \mathcal{K}_{a}$ is a solution to the problem posed by the lemma.

080V Lemma 27.22.9. Let $X$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module. Let $U \subset X$ be a quasi-compact open such that $\left.\mathcal{F}\right|_{U}$ is of finite presentation. Then there exists a map of $\mathcal{O}_{X}$-modules $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ with (a) $\mathcal{G}$ of finite presentation, (b) $\varphi$ is surjective, and (c) $\left.\varphi\right|_{U}$ is an isomorphism.

Proof. Write $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ as a directed colimit with each $\mathcal{F}_{i}$ of finite presentation, see Lemma 27.22.6 Choose a finite affine open covering $X=\bigcup V_{j}$ and choose finitely many sections $s_{j l} \in \mathcal{F}\left(V_{j}\right)$ generating $\left.\mathcal{F}\right|_{V_{j}}$, see Lemma 27.16.1. By Sheaves, Lemma 6.29.1 we see that $s_{j l}$ is in the image of $\mathcal{F}_{i} \rightarrow \mathcal{F}$ for $i$ large enough. Hence $\mathcal{F}_{i} \rightarrow \mathcal{F}$ is surjective for $i$ large enough. Choose such an $i$ and let $\mathcal{K} \subset \mathcal{F}_{i}$ be the kernel of the map $\mathcal{F}_{i} \rightarrow \mathcal{F}$. Since $\mathcal{F}_{U}$ is of finite presentation, we see that $\left.\mathcal{K}\right|_{U}$ is of finite type, see Modules, Lemma 17.11.3. Hence we can find a finite type quasi-coherent submodule $\mathcal{K}^{\prime} \subset \mathcal{K}$ with $\left.\mathcal{K}^{\prime}\right|_{U}=\left.\mathcal{K}\right|_{U}$, see Lemma 27.22.2. Then $\mathcal{G}=\mathcal{F}_{i} / \mathcal{K}^{\prime}$ with the given map $\mathcal{G} \rightarrow \mathcal{F}$ is a solution.

Let $X$ be a scheme. In the following lemma we use the notion of a quasi-coherent $\mathcal{O}_{X}$-algebra $\mathcal{A}$ of finite presentation. This means that for every affine open $\operatorname{Spec}(R) \subset$
$X$ we have $\mathcal{A}=\widetilde{A}$ where $A$ is a (commutative) $R$-algebra which is of finite presentation as an $R$-algebra.

05JS Lemma 27.22.10. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{A}$ be a quasi-coherent $\mathcal{O}_{X}$-algebra. There exist
(1) a directed partially ordered set I (see Categories, Definition 4.21.2),
(2) a system $\left(\mathcal{A}_{i}, \varphi_{i i^{\prime}}\right)$ over $I$ in the category of $\mathcal{O}_{X}$-algebras,
(3) morphisms of $\mathcal{O}_{X}$-algebras $\varphi_{i}: \mathcal{A}_{i} \rightarrow \mathcal{A}$
such that each $\mathcal{A}_{i}$ is a quasi-coherent $\mathcal{O}_{X}$-algebra of finite presentation and such that the morphisms $\varphi_{i}$ induce an isomorphism

$$
\operatorname{colim}_{i} \mathcal{A}_{i}=\mathcal{A}
$$

Proof. First we write $\mathcal{A}=\operatorname{colim}_{i} \mathcal{F}_{i}$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 27.22.6. For each $i$ let $\mathcal{B}_{i}=\operatorname{Sym}\left(\mathcal{F}_{i}\right)$ be the symmetric algebra on $\mathcal{F}_{i}$ over $\mathcal{O}_{X}$. Write $\mathcal{I}_{i}=\operatorname{Ker}\left(\mathcal{B}_{i} \rightarrow \mathcal{A}\right)$. Write $\mathcal{I}_{i}=\operatorname{colim}_{j} \mathcal{F}_{i, j}$ where $\mathcal{F}_{i, j}$ is a finite type quasi-coherent submodule of $\mathcal{I}_{i}$, see Lemma 27.22.7. Set $\mathcal{I}_{i, j} \subset \mathcal{I}_{i}$ equal to the $\mathcal{B}_{i}$-ideal generated by $\mathcal{F}_{i, j}$. Set $\mathcal{A}_{i, j}=\mathcal{B}_{i} / \mathcal{I}_{i, j}$. Then $\mathcal{A}_{i, j}$ is a quasi-coherent finitely presented $\mathcal{O}_{X}$-algebra. Define $(i, j) \leq\left(i^{\prime}, j^{\prime}\right)$ if $i \leq i^{\prime}$ and the map $\mathcal{B}_{i} \rightarrow \mathcal{B}_{i^{\prime}}$ maps the ideal $\mathcal{I}_{i, j}$ into the ideal $\mathcal{I}_{i^{\prime}, j^{\prime}}$. Then it is clear that $\mathcal{A}=\operatorname{colim}_{i, j} \mathcal{A}_{i, j}$.

Let $X$ be a scheme. In the following lemma we use the notion of a quasi-coherent $\mathcal{O}_{X}$-algebra $\mathcal{A}$ of finite type. This means that for every affine open $\operatorname{Spec}(R) \subset X$ we have $\mathcal{A}=\widetilde{A}$ where $A$ is a (commutative) $R$-algebra which is of finite type as an $R$-algebra.

05JT Lemma 27.22.11. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{A}$ be a quasi-coherent $\mathcal{O}_{X}$-algebra. Then $\mathcal{A}$ is the directed colimit of its finite type quasi-coherent $\mathcal{O}_{X}$-subalgebras.
Proof. Omitted. Hint: Compare with the proof of Lemma 27.22.7
Let $X$ be a scheme. In the following lemma we use the notion of a finite (resp. integral) quasi-coherent $\mathcal{O}_{X}$-algebra $\mathcal{A}$. This means that for every affine open $\operatorname{Spec}(R) \subset X$ we have $\mathcal{A}=\widetilde{A}$ where $A$ is a (commutative) $R$-algebra which is finite (resp. integral) as an $R$-algebra.

086N Lemma 27.22.12. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{A}$ be a finite quasi-coherent $\mathcal{O}_{X}$-algebra. Then $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ is a directed colimit of finite and finitely presented quasi-coherent $\mathcal{O}_{X}$-algebras such that all transition maps $\mathcal{A}_{i^{\prime}} \rightarrow \mathcal{A}_{i}$ are surjective.

Proof. By Lemma 27.22 .8 there exists a finitely presented $\mathcal{O}_{X}$-module $\mathcal{F}$ and a surjection $\mathcal{F} \rightarrow \mathcal{A}$. Using the algebra structure we obtain a surjection

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{F}) \longrightarrow \mathcal{A}
$$

Denote $\mathcal{J}$ the kernel. Write $\mathcal{J}=\operatorname{colim} \mathcal{E}_{i}$ as a filtered colimit of finite type $\mathcal{O}_{X^{-}}$ submodules $\mathcal{E}_{i}$ (Lemma 27.22.7). Set

$$
\mathcal{A}_{i}=\operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{F}) /\left(\mathcal{E}_{i}\right)
$$

where $\left(\mathcal{E}_{i}\right)$ indicates the ideal sheaf generated by the image of $\mathcal{E}_{i} \rightarrow \operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{F})$. Then each $\mathcal{A}_{i}$ is a finitely presented $\mathcal{O}_{X}$-algebra, the transition maps are surjections,
and $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$. To finish the proof we still have to show that $\mathcal{A}_{i}$ is a finite $\mathcal{O}_{X}$-algebra for $i$ sufficiently large. To do this we choose an affine open covering $X=U_{1} \cup \ldots \cup U_{m}$. Take generators $f_{j, 1}, \ldots, f_{j, N_{j}} \in \Gamma\left(U_{i}, \mathcal{F}\right)$. As $\mathcal{A}\left(U_{j}\right)$ is a finite $\mathcal{O}_{X}\left(U_{j}\right)$-algebra we see that for each $k$ there exists a monic polynomial $P_{j, k} \in \mathcal{O}\left(U_{j}\right)[T]$ such that $P_{j, k}\left(f_{j, k}\right)$ is zero in $\mathcal{A}\left(U_{j}\right)$. Since $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ by construction, we have $P_{j, k}\left(f_{j, k}\right)=0$ in $\mathcal{A}_{i}\left(U_{j}\right)$ for all sufficiently large $i$. For such $i$ the algebras $\mathcal{A}_{i}$ are finite.

0817 Lemma 27.22.13. Let $X$ be a scheme. Assume $X$ is quasi-compact and quasiseparated. Let $\mathcal{A}$ be an integral quasi-coherent $\mathcal{O}_{X}$-algebra. Then
(1) $\mathcal{A}$ is the directed colimit of its finite quasi-coherent $\mathcal{O}_{X}$-subalgebras, and
(2) $\mathcal{A}$ is a direct colimit of finite and finitely presented quasi-cohernet $\mathcal{O}_{X}$ algebras.

Proof. By Lemma 27.22.11 we have $\mathcal{A}=\operatorname{colim} \mathcal{A}_{i}$ where $\mathcal{A}_{i} \subset \mathcal{A}$ runs through the quasi-coherent $\mathcal{O}_{X^{-}}$-algebras of finite type. Any finite type quasi-coherent $\mathcal{O}_{X^{-}}$ subalgebra of $\mathcal{A}$ is finite (apply Algebra, Lemma 10.35 .5 to $\mathcal{A}_{i}(U) \subset \mathcal{A}(U)$ for affine opens $U$ in $X$ ). This proves (1).
To prove (2), write $\mathcal{A}=\operatorname{colim} \mathcal{F}_{i}$ as a colimit of finitely presented $\mathcal{O}_{X}$-modules using Lemma 27.22.6. For each $i$, let $\mathcal{J}_{i}$ be the kernel of the map

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) \longrightarrow \mathcal{A}
$$

For $i^{\prime} \geq i$ there is an induced map $\mathcal{J}_{i} \rightarrow \mathcal{J}_{i^{\prime}}$ and we have $\mathcal{A}=\operatorname{colim} \operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) / \mathcal{J}_{i}$. Moreover, the quasi-coherent $\mathcal{O}_{X}$-algebras $\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) / \mathcal{J}_{i}$ are finite (see above). Write $\mathcal{J}_{i}=\operatorname{colim} \mathcal{E}_{i k}$ as a colimit of finitely presented $\mathcal{O}_{X}$-modules. Given $i^{\prime} \geq i$ and $k$ there exists a $k^{\prime}$ such that we have a map $\mathcal{E}_{i k} \rightarrow \mathcal{E}_{i^{\prime} k^{\prime}}$ making

commute. This follows from Modules, Lemma 17.11.6. This induces a map

$$
\mathcal{A}_{i k}=\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i}\right) /\left(\mathcal{E}_{i k}\right) \longrightarrow \operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{F}_{i^{\prime}}\right) /\left(\mathcal{E}_{i^{\prime} k^{\prime}}\right)=\mathcal{A}_{i^{\prime} k^{\prime}}
$$

where $\left(\mathcal{E}_{i k}\right)$ denotes the ideal generated by $\mathcal{E}_{i k}$. The quasi-coherent $\mathcal{O}_{X}$-algebras $\mathcal{A}_{k i}$ are of finite presentation and finite for $k$ large enough (see proof of Lemma 27.22 .12 . Finally, we have

$$
\operatorname{colim} \mathcal{A}_{i k}=\operatorname{colim} \mathcal{A}_{i}=\mathcal{A}
$$

Namely, the first equality was shown in the proof of Lemma 27.22.12 and the second equality because $\mathcal{A}$ is the colimit of the modules $\mathcal{F}_{i}$.

### 27.23. Gabber's result

077 K In this section we prove a result of Gabber which guarantees that on every scheme there exists a cardinal $\kappa$ such that every quasi-coherent module $\mathcal{F}$ is the union of its quasi-coherent $\kappa$-generated subsheaves. It follows that the category of quasicoherent sheaves on a scheme is a Grothendieck abelian category having limits and enough injectives ${ }^{2}$

[^68]077L Definition 27.23.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\kappa$ be an infinite cardinal. We say a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ is $\kappa$-generated if there exists an open covering $X=\bigcup U_{i}$ such that $\left.\mathcal{F}\right|_{U_{i}}$ is generated by a subset $R_{i} \subset \mathcal{F}\left(U_{i}\right)$ whose cardinality is at most $\kappa$.

Note that a direct sum of at most $\kappa \kappa$-generated modules is again $\kappa$-generated because $\kappa \otimes \kappa=\kappa$, see Sets, Section 3.6. In particular this holds for the direct sum of two $\kappa$-generated modules. Moreover, a quotient of a $\kappa$-generated sheaf is $\kappa$-generated. (But the same needn't be true for submodules.)

077 M Lemma 27.23.2. Let $\left(X, \mathcal{O}_{X}\right)$ be a ringed space. Let $\kappa$ be a cardinal. There exists a set $T$ and a family $\left(\mathcal{F}_{t}\right)_{t \in T}$ of $\kappa$-generated $\mathcal{O}_{X}$-modules such that every $\kappa$-generated $\mathcal{O}_{X}$-module is isomorphic to one of the $\mathcal{F}_{t}$.

Proof. There is a set of coverings of $X$ (provided we disallow repeats). Suppose $X=\bigcup U_{i}$ is a covering and suppose $\mathcal{F}_{i}$ is an $\mathcal{O}_{U_{i}}$-module. Then there is a set of isomorphism classes of $\mathcal{O}_{X}$-modules $\mathcal{F}$ with the property that $\left.\mathcal{F}\right|_{U_{i}} \cong \mathcal{F}_{i}$ since there is a set of glueing maps. This reduces us to proving there is a set of (isomorphism classes of) quotients $\oplus_{k \in \kappa} \mathcal{O}_{X} \rightarrow \mathcal{F}$ for any ringed space $X$. This is clear.

Here is the result the title of this section refers to.
077 N Lemma 27.23.3. Let $X$ be a scheme. There exists a cardinal $\kappa$ such that every quasi-coherent module $\mathcal{F}$ is the directed colimit of its quasi-coherent $\kappa$-generated quasi-coherent subsheaves.

Proof. Choose an affine open covering $X=\bigcup_{i \in I} U_{i}$. For each pair $i, j$ choose an affine open covering $U_{i} \cap U_{j}=\bigcup_{k \in I_{i j}} U_{i j k}$. Write $U_{i}=\operatorname{Spec}\left(A_{i}\right)$ and $U_{i j k}=$ $\operatorname{Spec}\left(A_{i j k}\right)$. Let $\kappa$ be any infinite cardinal $\geq$ than the cardinality of any of the sets $I, I_{i j}$.

Let $\mathcal{F}$ be a quasi-coherent sheaf. Set $M_{i}=\mathcal{F}\left(U_{i}\right)$ and $M_{i j k}=\mathcal{F}\left(U_{i j k}\right)$. Note that

$$
M_{i} \otimes_{A_{i}} A_{i j k}=M_{i j k}=M_{j} \otimes_{A_{j}} A_{i j k}
$$

see Schemes, Lemma 25.7.3. Using the axiom of choice we choose a map

$$
(i, j, k, m) \mapsto S(i, j, k, m)
$$

which associates to every $i, j \in I, k \in I_{i j}$ and $m \in M_{i}$ a finite subset $S(i, j, k, m) \subset$ $M_{j}$ such that we have

$$
m \otimes 1=\sum_{m^{\prime} \in S(i, j, k, m)} m^{\prime} \otimes a_{m^{\prime}}
$$

in $M_{i j k}$ for some $a_{m^{\prime}} \in A_{i j k}$. Moreover, let's agree that $S(i, i, k, m)=\{m\}$ for all $i, j=i, k, m$ as above. Fix such a map.

Given a family $\mathcal{S}=\left(S_{i}\right)_{i \in I}$ of subsets $S_{i} \subset M_{i}$ of cardinality at most $\kappa$ we set $\mathcal{S}^{\prime}=\left(S_{i}^{\prime}\right)$ where

$$
S_{j}^{\prime}=\bigcup_{(i, j, k, m) \text { such that } m \in S_{i}} S(i, j, k, m)
$$

Note that $S_{i} \subset S_{i}^{\prime}$. Note that $S_{i}^{\prime}$ has cardinality at most $\kappa$ because it is a union over a set of cardinality at most $\kappa$ of finite sets. Set $\mathcal{S}^{(0)}=\mathcal{S}, \mathcal{S}^{(1)}=\mathcal{S}^{\prime}$ and by induction $\mathcal{S}^{(n+1)}=\left(\mathcal{S}^{(n)}\right)^{\prime}$. Then set $\mathcal{S}^{(\infty)}=\bigcup_{n \geq 0} \mathcal{S}^{(n)}$. Writing $\mathcal{S}^{(\infty)}=\left(S_{i}^{(\infty)}\right)$
we see that for any element $m \in S_{i}^{(\infty)}$ the image of $m$ in $M_{i j k}$ can be written as a finite sum $\sum m^{\prime} \otimes a_{m^{\prime}}$ with $m^{\prime} \in S_{j}^{(\infty)}$. In this way we see that setting

$$
N_{i}=A_{i} \text {-submodule of } M_{i} \text { generated by } S_{i}^{(\infty)}
$$

we have

$$
N_{i} \otimes_{A_{i}} A_{i j k}=N_{j} \otimes_{A_{j}} A_{i j k}
$$

as submodules of $M_{i j k}$. Thus there exists a quasi-coherent subsheaf $\mathcal{G} \subset \mathcal{F}$ with $\mathcal{G}\left(U_{i}\right)=N_{i}$. Moreover, by construction the sheaf $\mathcal{G}$ is $\kappa$-generated.

Let $\left\{\mathcal{G}_{t}\right\}_{t \in T}$ be the set of $\kappa$-generated quasi-coherent subsheaves. If $t, t^{\prime} \in T$ then $\mathcal{G}_{t}+\mathcal{G}_{t^{\prime}}$ is also a $\kappa$-generated quasi-coherent subsheaf as it is the image of the map $\mathcal{G}_{t} \oplus \mathcal{G}_{t^{\prime}} \rightarrow \mathcal{F}$. Hence the system (ordered by inclusion) is directed. The arguments above show that every section of $\mathcal{F}$ over $U_{i}$ is in one of the $\mathcal{G}_{t}$ (because we can start with $\mathcal{S}$ such that the given section is an element of $S_{i}$ ). Hence colim $_{t} \mathcal{G}_{t} \rightarrow \mathcal{F}$ is both injective and surjective as desired.

## 077P Proposition 27.23.4. Let $X$ be a scheme.

(1) The category $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a Grothendieck abelian category. Consequently, $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ has enough injectives and all limits.
(2) The inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ has a right adjoin $\dagger^{3}$

$$
Q: \operatorname{Mod}\left(\mathcal{O}_{X}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)
$$

such that for every quasi-coherent sheaf $\mathcal{F}$ the adjunction mapping $Q(\mathcal{F}) \rightarrow$ $\mathcal{F}$ is an isomorphism.

Proof. Part (1) means $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ (a) has all colimits, (b) filtered colimits are exact, and (c) has a generator, see Injectives, Section 19.10. By Schemes, Section 25.24 colimits in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ exist and agree with colimits in $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$. By Modules, Lemma 17.3 .2 filtered colimits are exact. Hence (a) and (b) hold. To construct a generator $U$, pick a cardinal $\kappa$ as in Lemma 27.23.3. Pick a collection $\left(\mathcal{F}_{t}\right)_{t \in T}$ of $\kappa$-generated quasi-coherent sheaves as in Lemma 27.23.2. Set $U=\bigoplus_{t \in T} \mathcal{F}_{t}$. Since every object of $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is a filtered colimit of $\kappa$-generated quasi-coherent modules, i.e., of objects isomorphic to $\mathcal{F}_{t}$, it is clear that $U$ is a generator. The assertions on limits and injectives hold in any Grothendieck abelian category, see Injectives, Theorem 19.11 .6 and Lemma 19.13 .2 .

Proof of (2). To construct $Q$ we use the following general procedure. Given an object $\mathcal{F}$ of $\operatorname{Mod}\left(\mathcal{O}_{X}\right)$ we consider the functor

$$
Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)^{o p p} \longrightarrow \text { Sets, } \quad \mathcal{G} \longmapsto \operatorname{Hom}_{X}(\mathcal{G}, \mathcal{F})
$$

This functor transforms colimits into limits, hence is representable, see Injectives, Lemma 19.13.1. Thus there exists a quasi-coherent sheaf $Q(\mathcal{F})$ and a functorial isomorphism $\operatorname{Hom}_{X}(\mathcal{G}, \mathcal{F})=\operatorname{Hom}_{X}(\mathcal{G}, Q(\mathcal{F}))$ for $\mathcal{G}$ in $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$. By the Yoneda lemma (Categories, Lemma 4.3.5 the construction $\mathcal{F} \rightsquigarrow Q(\mathcal{F})$ is functorial in $\mathcal{F}$. By construction $Q$ is a right adjoint to the inclusion functor. The fact that $Q(\mathcal{F}) \rightarrow \mathcal{F}$ is an isomorphism when $\mathcal{F}$ is quasi-coherent is a formal consequence of the fact that the inclusion functor $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow \operatorname{Mod}\left(\mathcal{O}_{X}\right)$ is fully faithful.

[^69]
### 27.24. Sections with support in a closed subset

07ZM Given any topological space $X$, a closed subset $Z \subset X$, and an abelian sheaf $\mathcal{F}$ you can take the subsheaf of sections whose support is contained in $Z$. If $X$ is a scheme, $Z$ a closed subscheme, and $\mathcal{F}$ a quasi-coherent module there is a variant where you take sections which are scheme theoretically supported on $Z$. However, in the scheme setting you have to be careful because the resulting $\mathcal{O}_{X}$-module may not be quasi-coherent.

01PH Lemma 27.24.1. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be an open subscheme. The following are equivalent:
(1) $U$ is retrocompact in $X$,
(2) $U$ is quasi-compact,
(3) $U$ is a finite union of affine opens, and
(4) there exists a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ such that $X \backslash U=V(\mathcal{I})$ (set theoretically).

Proof. The equivalence of (1), (2), and (3) follows from Lemma 27.2.3. Assume (1), (2), (3). Let $T=X \backslash U$. By Schemes, Lemma 25.12 .4 there exists a unique quasi-coherent sheaf of ideals $\mathcal{J}$ cutting out the reduced induced closed subscheme structure on $T$. Note that $\left.\mathcal{J}\right|_{U}=\mathcal{O}_{U}$ which is an $\mathcal{O}_{U}$-modules of finite type. By Lemma 27.22 .2 there exists a quasi-coherent subsheaf $\mathcal{I} \subset \mathcal{J}$ which is of finite type and has the property that $\left.\mathcal{I}\right|_{U}=\left.\mathcal{J}\right|_{U}$. Then $X \backslash U=V(\mathcal{I})$ and we obtain (4). Conversely, if $\mathcal{I}$ is as in (4) and $W=\operatorname{Spec}(R) \subset X$ is an affine open, then $\left.\mathcal{I}\right|_{W}=\widetilde{I}$ for some finitely generated ideal $I \subset R$, see Lemma 27.16.1. It follows that $U \cap W=\operatorname{Spec}(R) \backslash V(I)$ is quasi-compact, see Algebra, Lemma 10.28.1. Hence $U \subset X$ is retrocompact by Lemma 27.2 .6

01PO Lemma 27.24.2. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Consider the sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}^{\prime}$ which associates to every open $U \subset X$

$$
\mathcal{F}^{\prime}(U)=\{s \in \mathcal{F}(U) \mid \mathcal{I} s=0\}
$$

Assume $\mathcal{I}$ is of finite type. Then
(1) $\mathcal{F}^{\prime}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules,
(2) on any affine open $U \subset X$ we have $\mathcal{F}^{\prime}(U)=\{s \in \mathcal{F}(U) \mid \mathcal{I}(U) s=0\}$, and
(3) $\mathcal{F}_{x}^{\prime}=\left\{s \in \mathcal{F}_{x} \mid \mathcal{I}_{x} s=0\right\}$.

Proof. It is clear that the rule defining $\mathcal{F}^{\prime}$ gives a subsheaf of $\mathcal{F}$ (the sheaf condition is easy to verify). Hence we may work locally on $X$ to verify the other statements. In other words we may assume that $X=\operatorname{Spec}(A), \mathcal{F}=\widetilde{M}$ and $\mathcal{I}=\widetilde{I}$. It is clear that in this case $\mathcal{F}^{\prime}(U)=\{x \in M \mid I x=0\}=: M^{\prime}$ because $\widetilde{I}$ is generated by its global sections $I$ which proves (2). To show $\mathcal{F}^{\prime}$ is quasi-coherent it suffices to show that for every $f \in A$ we have $\left\{x \in M_{f} \mid I_{f} x=0\right\}=\left(M^{\prime}\right)_{f}$. Write $I=\left(g_{1}, \ldots, g_{t}\right)$, which is possible because $\mathcal{I}$ is of finite type, see Lemma 27.16.1. If $x=y / f^{n}$ and $I_{f} x=0$, then that means that for every $i$ there exists an $m \geq 0$ such that $f^{m} g_{i} x=0$. We may choose one $m$ which works for all $i$ (and this is where we use that $I$ is finitely generated). Then we see that $f^{m} x \in M^{\prime}$ and $x / f^{n}=f^{m} x / f^{n+m}$ in $\left(M^{\prime}\right)_{f}$ as desired. The proof of (3) is similar and omitted.

01PP Definition 27.24.3. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The subsheaf $\mathcal{F}^{\prime} \subset \mathcal{F}$ defined in Lemma 27.24 .2 above is called the subsheaf of sections annihilated by $\mathcal{I}$.

07ZN Lemma 27.24.4. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be a quasi-coherent sheaf of ideals of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the subsheaf of sections annihilated by $f^{-1} \mathcal{I} \mathcal{O}_{X}$. Then $f_{*} \mathcal{F}^{\prime} \subset f_{*} \mathcal{F}$ is the subsheaf of sections annihilated by $\mathcal{I}$.

Proof. Omitted. (Hint: The assumption that $f$ is quasi-compact and quasiseparated implies that $f_{*} \mathcal{F}$ is quasi-coherent so that Lemma 27.24 .2 applies to $\mathcal{I}$ and $f_{*} \mathcal{F}$.)

For an abelian sheaf on a topological space we have discussed the subsheaf of sections with support in a closed subset in Modules, Lemma 17.6.2. For quasicoherent modules this submodule isn't always a quasi-coherent module, but if the closed subset has a retrocompact complement, then it is.

07ZP Lemma 27.24.5. Let $X$ be a scheme. Let $Z \subset X$ be a closed subset. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Consider the sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}^{\prime}$ which associates to every open $U \subset X$

$$
\mathcal{F}^{\prime}(U)=\{s \in \mathcal{F}(U) \mid \text { the support of } s \text { is contained in } Z \cap U\}
$$

If $X \backslash Z$ is a retrocompact open in $X$, then
(1) for an affine open $U \subset X$ there exist a finitely generated ideal $I \subset \mathcal{O}_{X}(U)$ such that $Z \cap U=V(I)$,
(2) for $U$ and $I$ as in (1) we have $\mathcal{F}^{\prime}(U)=\left\{x \in \mathcal{F}(U) \mid I^{n} x=0\right.$ for some $\left.n\right\}$,
(3) $\mathcal{F}^{\prime}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules.

Proof. Part (1) is Algebra, Lemma 10.28.1. Let $U=\operatorname{Spec}(A)$ and $I$ be as in (1). Then $\left.\mathcal{F}\right|_{U}$ is the quasi-coherent sheaf associated to some $A$-module $M$. We have

$$
\mathcal{F}^{\prime}(U)=\left\{x \in M \mid x=0 \text { in } M_{\mathfrak{p}} \text { for all } \mathfrak{p} \notin Z\right\} .
$$

by Modules, Definition 17.5.1. Thus $x \in \mathcal{F}^{\prime}(U)$ if and only if $V(\operatorname{Ann}(x)) \subset V(I)$, see Algebra, Lemma 10.39.6 Since $I$ is finitely generated this is equivalent to $I^{n} x=0$ for some $n$. This proves (2).

The rule for $\mathcal{F}^{\prime}$ indeed defines a submodule of $\mathcal{F}$. Hence we may work locally on $X$ to verify (3). Let $U, I$ and $M$ be as above. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals corresponding to $I$. Part (2) implies sections of $\mathcal{F}^{\prime}$ over any affine open of $U$ are the sections of $\mathcal{F}$ which are annihilated by some power of $\mathcal{I}$. Hence we see that $\left.\mathcal{F}^{\prime}\right|_{U}=\operatorname{colim} \mathcal{F}_{n}$, where $\left.\mathcal{F}_{n} \subset \mathcal{F}\right|_{U}$ is the subsheaf of sections annihilated by $\mathcal{I}^{n}$, see Definition 27.24.3. Thus (3) follows from Lemma 27.24 .2 and that colimits of quasi-coherent modules are quasi-coherent, see Schemes, Section 25.24 .

084L Definition 27.24.6. Let $X$ be a scheme. Let $T \subset X$ be a closed subset whose complement is retrocompact in $X$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The quasi-coherent subsheaf $\mathcal{F}^{\prime} \subset \mathcal{F}$ defined in Lemma 27.24 .5 is called the subsheaf of sections supported on $T$.

07ZQ Lemma 27.24.7. Let $f: X \rightarrow Y$ be a quasi-compact and quasi-separated morphism of schemes. Let $Z \subset Y$ be a closed subset such that $Y \backslash Z$ is retrocompact in $Y$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the subsheaf of sections supported in $f^{-1} Z$. Then $f_{*} \mathcal{F}^{\prime} \subset f_{*} \mathcal{F}$ is the subsheaf of sections supported in $Z$.
Proof. Omitted. (Hint: First show that $X \backslash f^{-1} Z$ is retrocompact in $X$ as $Y \backslash Z$ is retrocompact in $Y$. Hence Lemma 27.24 .5 applies to $f^{-1} Z$ and $\mathcal{F}$. As $f$ is quasicompact and quasi-separated we see that $f_{*} \mathcal{F}$ is quasi-coherent. Hence Lemma 27.24 .5 applies to $Z$ and $f_{*} \mathcal{F}$. Finally, match the sheaves directly.)

### 27.25. Sections of quasi-coherent sheaves

01PL Here is a computation of sections of a quasi-coherent sheaf on a quasi-compact open of an affine spectrum.

01PM Lemma 27.25.1. Let $A$ be a ring. Let $I \subset A$ be a finitely generated ideal. Let $M$ be an $A$-module. Then there is a canonical map

$$
\operatorname{colim}_{n} \operatorname{Hom}_{A}\left(I^{n}, M\right) \longrightarrow \Gamma(\operatorname{Spec}(A) \backslash V(I), \widetilde{M})
$$

This map is always injective. If for all $x \in M$ we have $I x=0 \Rightarrow x=0$ then this map is an isomorphism. In general, set $M_{n}=\left\{x \in M \mid I^{n} x=0\right\}$, then there is an isomorphism

$$
\operatorname{colim}_{n} \operatorname{Hom}_{A}\left(I^{n}, M / M_{n}\right) \longrightarrow \Gamma(\operatorname{Spec}(A) \backslash V(I), \widetilde{M})
$$

Proof. Since $I^{n} \subset I^{n+1}$ and $M_{n} \subset M_{n+1}$ we can use composition via these maps to get canonical maps of $A$-modules

$$
\operatorname{Hom}_{A}\left(I^{n}, M\right) \longrightarrow \operatorname{Hom}_{A}\left(I^{n+1}, M\right)
$$

and

$$
\operatorname{Hom}_{A}\left(I^{n}, M / M_{n}\right) \longrightarrow \operatorname{Hom}_{A}\left(I^{n+1}, M / M_{n+1}\right)
$$

which we will use as the transition maps in the systems. Given an $A$-module map $\varphi: I^{n} \rightarrow M$, then we get a map of sheaves $\widetilde{\varphi}: \widetilde{I^{n}} \rightarrow \widetilde{M}$ which we can restrict to the open $\operatorname{Spec}(A) \backslash V(I)$. Since $\widetilde{I^{n}}$ restricted to this open gives the structure sheaf we get an element of $\Gamma(\operatorname{Spec}(A) \backslash V(I), \widetilde{M})$. We omit the verification that this is compatible with the transition maps in the system $\operatorname{Hom}_{A}\left(I^{n}, M\right)$. This gives the first arrow. To get the second arrow we note that $\widetilde{M}$ and $\widetilde{M / M_{n}}$ agree over the open $\operatorname{Spec}(A) \backslash V(I)$ since the sheaf $\widetilde{M_{n}}$ is clearly supported on $V(I)$. Hence we can use the same mechanism as before.

Next, we work out how to define this arrow in terms of algebra. Say $I=\left(f_{1}, \ldots, f_{t}\right)$. Then $\operatorname{Spec}(A) \backslash V(I)=\bigcup_{i=1, \ldots, t} D\left(f_{i}\right)$. Hence

$$
0 \rightarrow \Gamma(\operatorname{Spec}(A) \backslash V(I), \widetilde{M}) \rightarrow \bigoplus_{i} M_{f_{i}} \rightarrow \bigoplus_{i, j} M_{f_{i} f_{j}}
$$

is exact. Suppose that $\varphi: I^{n} \rightarrow M$ is an $A$-module map. Consider the vector of elements $\varphi\left(f_{i}^{n}\right) / f_{i}^{n} \in M_{f_{i}}$. It is easy to see that this vector maps to zero in the second direct sum of the exact sequence above. Whence an element of $\Gamma(\operatorname{Spec}(A) \backslash V(I), \widetilde{M})$. We omit the verification that this description agrees with the one given above.
Let us show that the first arrow is injective using this description. Namely, if $\varphi$ maps to zero, then for each $i$ the element $\varphi\left(f_{i}^{n}\right) / f_{i}^{n}$ is zero in $M_{f_{i}}$. In other words
we see that for each $i$ we have $f_{i}^{m} \varphi\left(f_{i}^{n}\right)=0$ for some $m \geq 0$. We may choose a single $m$ which works for all $i$. Then we see that $\varphi\left(f_{i}^{n+m}\right)=0$ for all $i$. It is easy to see that this means that $\left.\varphi\right|_{I^{t(n+m-1)+1}}=0$ in other words that $\varphi$ maps to zero in the $t(n+m-1)+1$ st term of the colimit. Hence injectivity follows.
Note that each $M_{n}=0$ in case we have $I x=0 \Rightarrow x=0$ for $x \in M$. Thus to finish the proof of the lemma it suffices to show that the second arrow is an isomorphism.

Let us attempt to construct an inverse of the second map of the lemma. Let $s \in \Gamma(\operatorname{Spec}(A) \backslash V(I), \widetilde{M})$. This corresponds to a vector $x_{i} / f_{i}^{n}$ with $x_{i} \in M$ of the first direct sum of the exact sequence above. Hence for each $i, j$ there exists $m \geq 0$ such that $f_{i}^{m} f_{j}^{m}\left(f_{j}^{n} x_{i}-f_{i}^{n} x_{j}\right)=0$ in $M$. We may choose a single $m$ which works for all pairs $i, j$. After replacing $x_{i}$ by $f_{i}^{m} x_{i}$ and $n$ by $n+m$ we see that we get $f_{j}^{n} x_{i}=f_{i}^{n} x_{j}$ in $M$ for all $i, j$. Let us introduce

$$
K_{n}=\left\{x \in M \mid f_{1}^{n} x=\ldots=f_{t}^{n} x=0\right\}
$$

We claim there is an $A$-module map

$$
\varphi: I^{t(n-1)+1} \longrightarrow M / K_{n}
$$

which maps the monomial $f_{1}^{e_{1}} \ldots f_{t}^{e_{t}}$ with $\sum e_{i}=t(n-1)+1$ to the class modulo $K_{n}$ of the expression $f_{1}^{e_{1}} \ldots f_{i}^{e_{i}-n} \ldots f_{t}^{e_{t}} x_{i}$ where $i$ is chosen such that $e_{i} \geq n$ (note that there is at least one such $i$ ). To see that this is indeed the case suppose that

$$
\sum_{E=\left(e_{1}, \ldots, e_{t}\right),|E|=t(n-1)+1} a_{E} f_{1}^{e_{1}} \ldots f_{t}^{e_{t}}=0
$$

is a relation between the monomials with coefficients $a_{E}$ in $A$. Then we would map this to

$$
z=\sum_{E=\left(e_{1}, \ldots, e_{t}\right),|E|=t(n-1)+1} a_{E} f_{1}^{e_{1}} \ldots f_{i(E)}^{e_{i(E)}-n} \ldots f_{t}^{e_{t}} x_{i(E)}
$$

where for each multiindex $E$ we have chosen a particular $i(E)$ such that $e_{i(E)} \geq n$. Note that if we multiply this by $f_{j}^{n}$ for any $j$, then we get zero, since by the relations $f_{j}^{n} x_{i}=f_{i}^{n} x_{j}$ above we get

$$
\begin{aligned}
f_{j}^{n} z & =\sum_{E=\left(e_{1}, \ldots, e_{t}\right),|E|=t(n-1)+1} a_{E} f_{1}^{e_{1}} \ldots f_{j}^{e_{j}+n} \ldots f_{i(E)}^{e_{i(E)}-n} \ldots f_{t}^{e_{t}} x_{i(E)} \\
& =\sum_{E=\left(e_{1}, \ldots, e_{t}\right),|E|=t(n-1)+1} a_{E} f_{1}^{e_{1}} \ldots f_{t}^{e_{t}} x_{j}=0
\end{aligned}
$$

Hence $z \in K_{n}$ and we see that every relation gets mapped to zero in $M / K_{n}$. This proves the claim.
Note that $K_{n} \subset M_{t(n-1)+1}$. Hence the map $\varphi$ in particular gives rise to a $A$-module map $I^{t(n-1)+1} \rightarrow M / M_{t(n-1)+1}$. This proves the second arrow of the lemma is surjective. We omit the proof of injectivity.

01PN Example 27.25.2. We will give two examples showing that the first displayed map of Lemma 27.25.1 is not an isomorphism.
Let $k$ be a field. Consider the ring

$$
A=k\left[x, y, z_{1}, z_{2}, \ldots\right] /\left(x^{n} z_{n}\right)
$$

Set $I=(x)$ and let $M=A$. Then the element $y / x$ defines a section of the structure sheaf of $\operatorname{Spec}(A)$ over $D(x)=\operatorname{Spec}(A) \backslash V(I)$. We claim that $y / x$ is not in the image of the canonical map colim $\operatorname{Hom}_{A}\left(I^{n}, A\right) \rightarrow A_{x}=\mathcal{O}(D(x))$. Namely, if so it would come from a homomorphism $\varphi: I^{n} \rightarrow A$ for some $n$. Set $a=\varphi\left(x^{n}\right)$. Then we would
have $x^{m}\left(x a-x^{n} y\right)=0$ for some $m>0$. This would mean that $x^{m+1} a=x^{m+n} y$. This would mean that $\varphi\left(x^{n+m+1}\right)=x^{m+n} y$. This leads to a contradiction because it would imply that

$$
0=\varphi(0)=\varphi\left(z_{n+m+1} x^{n+m+1}\right)=x^{m+n} y z_{n+m+1}
$$

which is not true in the ring $A$.
Let $k$ be a field. Consider the ring

$$
A=k\left[f, g, x, y,\left\{a_{n}, b_{n}\right\}_{n \geq 1}\right] /\left(f y-g x,\left\{a_{n} f^{n}+b_{n} g^{n}\right\}_{n \geq 1}\right)
$$

Set $I=(f, g)$ and let $M=A$. Then $x / f \in A_{f}$ and $y / g \in A_{g}$ map to the same element of $A_{f g}$. Hence these define a section $s$ of the structure sheaf of $\operatorname{Spec}(A)$ over $D(f) \cup D(g)=\operatorname{Spec}(A) \backslash V(I)$. However, there is no $n \geq 0$ such that $s$ comes from an $A$-module map $\varphi: I^{n} \rightarrow A$ as in the source of the first displayed arrow of Lemma 27.25.1. Namely, given such a module map set $x_{n}=\varphi\left(f^{n}\right)$ and $y_{n}=\varphi\left(g^{n}\right)$. Then $f^{m} x_{n}=f^{n+m-1} x$ and $g^{m} y_{n}=g^{n+m-1} y$ for some $m \geq 0$ (see proof of the lemma). But then we would have $0=\varphi(0)=\varphi\left(a_{n+m} f^{n+m}+b_{n+m} g^{n+m}\right)=$ $a_{n+m} f^{n+m-1} x+b_{n+m} g^{n+m-1} y$ which is not the case in the ring $A$.

We will improve on the following lemma in the Noetherian case, see Cohomology of Schemes, Lemma 29.10.4.

01PQ Lemma 27.25.3. Let $X$ be a quasi-compact scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals of finite type. Let $Z \subset X$ be the closed subscheme defined by $\mathcal{I}$ and set $U=X \backslash Z$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The canonical map

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{I}^{n}, \mathcal{F}\right) \longrightarrow \Gamma(U, \mathcal{F})
$$

is injective. Assume further that $X$ is quasi-separated. Let $\mathcal{F}_{n} \subset \mathcal{F}$ be subsheaf of sections annihilated by $\mathcal{I}^{n}$. The canonical map

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{I}^{n}, \mathcal{F} / \mathcal{F}_{n}\right) \longrightarrow \Gamma(U, \mathcal{F})
$$

is an isomorphism.
Proof. Let $\operatorname{Spec}(A)=W \subset X$ be an affine open. Write $\left.\mathcal{F}\right|_{W}=\widetilde{M}$ for some $A$-module $M$ and $\left.\mathcal{I}\right|_{W}=\widetilde{I}$ for some finite type ideal $I \subset A$. Restricting the first displayed map of the lemma to $W$ we obtain the first displayed map of Lemma 27.25.1. Since we can cover $X$ by a finite number of affine opens this proves the first displayed map of the lemma is injective.

We have $\left.\mathcal{F}_{n}\right|_{W}=\widetilde{M_{n}}$ where $M_{n} \subset M$ is defined as in Lemma 27.25.1 (details omitted). The lemma guarantees that we have a bijection

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{W}}\left(\left.\mathcal{I}^{n}\right|_{W},\left.\left(\mathcal{F} / \mathcal{F}_{n}\right)\right|_{W}\right) \longrightarrow \Gamma(U \cap W, \mathcal{F})
$$

for any such affine open $W$.
To see the second displayed arrow of the lemma is bijective, we choose a finite affine open covering $X=\bigcup_{j=1, \ldots, m} W_{j}$. The injectivity follows immediately from the above and the finiteness of the covering. If $X$ is quasi-separated, then for each pair $j, j^{\prime}$ we choose a finite affine open covering

$$
W_{j} \cap W_{j^{\prime}}=\bigcup_{k=1, \ldots, m_{j j^{\prime}}} W_{j j^{\prime} k}
$$

Let $s \in \Gamma(U, \mathcal{F})$. As seen above for each $j$ there exists an $n_{j}$ and a map $\varphi_{j}$ : $\left.\left.\mathcal{I}^{n_{j}}\right|_{W_{j}} \rightarrow\left(\mathcal{F} / \mathcal{F}_{n_{j}}\right)\right|_{W_{j}}$ which corresponds to $\left.s\right|_{W_{j}}$. By the same token for each triple $\left(j, j^{\prime}, k\right)$ there exists an integer $n_{j j^{\prime} k}$ such that the restriction of $\varphi_{j}$ and $\varphi_{j^{\prime}}$ as maps $\mathcal{I}^{n_{j j^{\prime} k}} \rightarrow \mathcal{F} / \mathcal{F}_{n_{j j^{\prime} k}}$ agree over $W_{j j^{\prime} l}$. Let $n=\max \left\{n_{j}, n_{j j^{\prime} k}\right\}$ and we see that the $\varphi_{j}$ glue as maps $\mathcal{I}^{n} \rightarrow \mathcal{F} / \mathcal{F}_{n}$ over $X$. This proves surjectivity of the map.

### 27.26. Ample invertible sheaves

01PR Recall from Modules, Lemma 17.21 .10 that given an invertible sheaf $\mathcal{L}$ on a locally ringed space $X$, and given a global section $s$ of $\mathcal{L}$ the set $X_{s}=\left\{x \in X \mid s \notin \mathfrak{m}_{x} \mathcal{L}_{x}\right\}$ is open. A general remark is that $X_{s} \cap X_{s^{\prime}}=X_{s s^{\prime}}$, where $s s^{\prime}$ denote the section $s \otimes s^{\prime} \in \Gamma\left(X, \mathcal{L} \otimes \mathcal{L}^{\prime}\right)$.
01PS Definition 27.26.1. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. We say $\mathcal{L}$ is ample if
(1) $X$ is quasi-compact, and
(2) for every $x \in X$ there exists an $n \geq 1$ and $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $x \in X_{s}$ and $X_{s}$ is affine.
01PT Lemma 27.26.2. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $n \geq 1$. Then $\mathcal{L}$ is ample if and only if $\mathcal{L}^{\otimes n}$ is ample.
Proof. This follows from the fact that $X_{s^{n}}=X_{s}$.
01PU Lemma 27.26.3. Let $X$ be a scheme. Let $\mathcal{L}$ be an ample invertible $\mathcal{O}_{X}$-module. For any closed subscheme $Z \subset X$ the restriction of $\mathcal{L}$ to $Z$ is ample.

Proof. This is clear since a closed subset of a quasi-compact space is quasi-compact and a closed subscheme of an affine scheme is affine (see Schemes, Lemma 25.8.2).

01PV Lemma 27.26.4. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$. For any affine $U \subset X$ the intersection $U \cap X_{s}$ is affine.

Proof. This translates into the following algebra problem. Let $R$ be a ring. Let $N$ be an invertible $R$-module (i.e., locally free of rank 1 ). Let $s \in N$ be an element. Then $U=\{\mathfrak{p} \mid s \notin \mathfrak{p} N\}$ is an affine open subset of $\operatorname{Spec}(R)$. This you can see as follows. Think of $s$ as an $R$-module map $R \rightarrow N$. This gives rise to $R$-module maps $N^{\otimes k} \rightarrow N^{\otimes k+1}$. Consider

$$
R^{\prime}=\operatorname{colim}_{n} N^{\otimes n}
$$

with transition maps as above. Define an $R$-algebra structure on $R^{\prime}$ by the rule $x \cdot y=x \otimes y \in N^{\otimes n+m}$ if $x \in N^{\otimes n}$ and $y \in N^{\otimes m}$. We claim that $\operatorname{Spec}\left(R^{\prime}\right) \rightarrow$ $\operatorname{Spec}(R)$ is an open immersion with image $U$.
To prove this is a local question on $\operatorname{Spec}(R)$. Let $\mathfrak{p} \in \operatorname{Spec}(R)$. Pick $f \in R$, $f \notin \mathfrak{p}$ such that $N_{f} \cong R_{f}$ as a module. Replacing $R$ by $R_{f}, N$ by $N_{f}$ and $R^{\prime}$ by $R_{f}^{\prime}=\operatorname{colim} N_{f}^{\otimes n}$ we may assume that $N \cong R$. Say $N=R$. In this case $s$ is an element of $R$ and it is easy to see that $R^{\prime} \cong R_{s}$. Thus the lemma follows.

0890 Lemma 27.26.5. Let $X$ be a scheme. Let $\mathcal{L}$ and $\mathcal{M}$ be invertible $\mathcal{O}_{X}$-modules. If
(1) $\mathcal{L}$ is ample, and
(2) the open sets $X_{t}$ where $t \in \Gamma\left(X, \mathcal{M}^{\otimes m}\right)$ for $m>0$ cover $X$,
then $\mathcal{L} \otimes \mathcal{M}$ is ample.
Proof. We check the conditions of Definition 27.26.1. As $\mathcal{L}$ is ample we see that $X$ is quasi-compact. Let $x \in X$. Choose $n \geq 1, m \geq 1, s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$, and $t \in \Gamma\left(X, \mathcal{M}^{\otimes m}\right)$ such that $x \in X_{s}, x \in X_{t}$ and $X_{s}$ is affine. Then $s^{m} t^{n} \in \Gamma(X,(\mathcal{L} \otimes$ $\left.\mathcal{M})^{\otimes n m}\right), x \in X_{s^{m} t^{n}}$, and $X_{s^{m} t^{n}}$ is affine by Lemma 27.26.4

01PX Lemma 27.26.6. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume the open sets $X_{s}$, where $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ and $n \geq 1$, form a basis for the topology on $X$. Then among those opens, the open sets $X_{s}$ which are affine form a basis for the topology on $X$.

Proof. Let $x \in X$. Choose an affine open neighbourhood $\operatorname{Spec}(R)=U \subset X$ of $x$. By assumption, there exists a $n \geq 1$ and a $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $X_{s} \subset U$. By Lemma 27.26.4 above the intersection $X_{s}=U \cap X_{s}$ is affine. Since $U$ can be chosen arbitrarily small we win.

01PY Lemma 27.26.7. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume for every point $x$ of $X$ there exists $n \geq 1$ and $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $x \in X_{s}$ and $X_{s}$ is affine. Then $X$ is separated.

Proof. By assumption we can find a covering of $X$ by affine opens of the form $X_{s}$. To show that $X$ is quasi-separated, by Schemes, Lemma 25.21.7 it suffices to show that $X_{s} \cap X_{s^{\prime}}$ is quasi-compact whenever $X_{s}$ is affine. This is true by Lemma 27.26.4. Finally, to show that $X$ is separated, we can use the valuative criterion, see Schemes, Lemma 25.22.2.

Thus, let $A$ be a valuation ring with fraction field $K$ and consider two morphisms $f, g: \operatorname{Spec}(A) \rightarrow X$ such that the two compositions $\operatorname{Spec}(K) \rightarrow \operatorname{Spec}(A) \rightarrow X$ agree. Then $f^{*} \mathcal{L}$ corresponds to an $A$-module $M$ and $g^{*} \mathcal{L}$ corresponds to an $A$-module $N$ by our classification of quasi-coherent modules over affine schemes (Schemes, Lemma 25.7.4). The $A$-modules $M$ and $N$ are locally free of rank 1 (Lemma 27.20.1) and as $A$ is local they are free of rank 1 . We are given an isomorphism $N \otimes_{A} K \cong M \otimes_{A} K$ because $\left.f\right|_{\operatorname{Spec}(K)}=\left.g\right|_{\operatorname{Spec}(K)}$. We fix an isomorphism $M \otimes_{A} K \cong K \cong N \otimes_{A} K$ compatible with the given isomorphism above, so that we may think of $M$ and $N$ as $A$-submodules of $K$ (free of rank 1 over $A$ ). Next, choose $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $\operatorname{Im}(f) \subset X_{s}$ and such that $X_{s}$ is affine. This is possible by assumption and the fact that $A$ is local, so it suffices to look at the image of the closed point of $\operatorname{Spec}(A)$. Then $s$ corresponds to an element $x \in M^{\otimes n}$ and $y \in N^{\otimes n}$ mapping to the same element of $K^{\otimes n}$ and moreover $x \notin \mathfrak{m}_{A} M^{\otimes n}$ because $f(\operatorname{Spec}(A)) \subset X_{s}$. We conclude that $N^{\otimes n}=A x=A y \subset M^{\otimes n}$ inside of $K^{\otimes n}$. Thus $N \subset M$. By symmetry we get $M=N$. This in turn implies that $g(\operatorname{Spec}(A)) \subset X_{s}$. Then $f=g$ because $X_{s}$ is affine and hence separated, thereby finishing the proof.

09MP Lemma 27.26.8. Let $X$ be a scheme. If there exists an ample invertible sheaf on $X$ then $X$ is separated.

Proof. Follows immediately from Lemma 27.26.7 and Definition 27.26.1.
01PZ Lemma 27.26.9. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Set $S=\Gamma_{*}(X, \mathcal{L})$ as a graded ring. If every point of $X$ is contained in one of the open
subschemes $X_{s}$, for some $s \in S_{+}$homogeneous, then there is a canonical morphism of schemes

$$
f: X \longrightarrow Y=\operatorname{Proj}(S)
$$

to the homogeneous spectrum of $S$ (see Constructions, Section 26.8). This morphism has the following properties
(1) $f^{-1}\left(D_{+}(s)\right)=X_{s}$ for any $s \in S_{+}$homogeneous,
(2) there are $\mathcal{O}_{Y}$-module maps $f^{*} \mathcal{O}_{Y}(n) \rightarrow \mathcal{L}^{\otimes n}$ compatible with multiplication maps, see Constructions, Equation (26.10.1.1),
(3) the compositions $S_{n} \rightarrow \Gamma\left(Y, \mathcal{O}_{Y}(n)\right) \rightarrow \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ are equal to the identity maps, and
(4) for every $x \in X$ there is an integer $d \geq 1$ and an open neighbourhood $U \subset X$ of $x$ such that $\left.\left.f^{*} \mathcal{O}_{Y}(d n)\right|_{U} \rightarrow \mathcal{L}^{\otimes d n}\right|_{U}$ is an isomorphism for all $n \in \mathbf{Z}$.

Proof. Denote $\psi: S \rightarrow \Gamma_{*}(X, \mathcal{L})$ the identity map. We are going to use the triple $\left(U(\psi), r_{\mathcal{L}, \psi}, \theta\right)$ of Constructions, Lemma 26.14.1. By assumption the open subscheme $U(\psi)$ of equals $X$. Hence $r_{\mathcal{L}, \psi}: U(\psi) \rightarrow Y$ is defined on all of $X$. We set $f=r_{\mathcal{L}, \psi}$. The maps in part (2) are the components of $\theta$. Part (3) follows from condition (2) in the lemma cited above. Part (1) follows from (3) combined with condition (1) in the lemma cited above. Part (4) follows from the last statement in Constructions, Lemma 26.14.1 since the map $\alpha$ mentioned there is an isomorphism.

01Q0 Lemma 27.26.10. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Set $S=\Gamma_{*}(X, \mathcal{L})$. Assume (a) every point of $X$ is contained in one of the open subschemes $X_{s}$, for some $s \in S_{+}$homogeneous, and (b) $X$ is quasi-compact. Then the canonical morphism of schemes $f: X \longrightarrow \operatorname{Proj}(S)$ of Lemma 27.26.9 above is quasi-compact.
Proof. It suffices to show that $f^{-1}\left(D_{+}(s)\right)$ is quasi-compact for any $s \in S_{+}$homogeneous. Write $X=\bigcup_{i=1, \ldots, n} X_{i}$ as a finite union of affine opens. By Lemma 27.26 .4 each intersection $X_{s} \cap X_{i}$ is affine. Hence $X_{s}=\bigcup_{i=1, \ldots, n} X_{s} \cap X_{i}$ is quasicompact.

01Q1 Lemma 27.26.11. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Set $S=\Gamma_{*}(X, \mathcal{L})$. Assume $\mathcal{L}$ is ample. Then the canonical morphism of schemes $f: X \longrightarrow \operatorname{Proj}(S)$ of Lemma 27.26.9 is an open immersion.
Proof. By Lemma 27.26 .7 we see that $X$ is quasi-separated. Choose finitely many $s_{1}, \ldots, s_{n} \in S_{+}$homogeneous such that $X_{s_{i}}$ are affine, and $X=\bigcup X_{s_{i}}$. Say $s_{i}$ has degree $d_{i}$. The inverse image of $D_{+}\left(s_{i}\right)$ under $f$ is $X_{s_{i}}$, see Lemma 27.26.9. By Lemma 27.17.2 the ring map

$$
\left(S^{\left(d_{i}\right)}\right)_{\left(s_{i}\right)}=\Gamma\left(D_{+}\left(s_{i}\right), \mathcal{O}_{\operatorname{Proj}(S)}\right) \longrightarrow \Gamma\left(X_{s_{i}}, \mathcal{O}_{X}\right)
$$

is an isomorphism. Hence $f$ induces an isomorphism $X_{s_{i}} \rightarrow D_{+}\left(s_{i}\right)$. Thus $f$ is an isomorphism of $X$ onto the open subscheme $\bigcup_{i=1, \ldots, n} D_{+}\left(s_{i}\right)$ of $\operatorname{Proj}(S)$.

01Q2 Lemma 27.26.12. Let $X$ be a scheme. Let $S$ be a graded ring. Assume $X$ is quasi-compact, and assume there exists an open immersion

$$
j: X \longrightarrow Y=\operatorname{Proj}(S)
$$

Then $j^{*} \mathcal{O}_{Y}(d)$ is an invertible ample sheaf for some $d>0$.

Proof. This is Constructions, Lemma 26.10.6
01Q3 Proposition 27.26.13. Let $X$ be a quasi-compact scheme. Let $\mathcal{L}$ be an invertible sheaf on $X$. Set $S=\Gamma_{*}(X, \mathcal{L})$. The following are equivalent:
(1) $\mathcal{L}$ is ample,
(2) the open sets $X_{s}$, with $s \in S_{+}$homogeneous, cover $X$ and the associated morphism $X \rightarrow \operatorname{Proj}(S)$ is an open immersion,
(3) the open sets $X_{s}$, with $s \in S_{+}$homogeneous, form a basis for the topology of $X$,
(4) the open sets $X_{s}$, with $s \in S_{+}$homogeneous, which are affine form a basis for the topology of $X$,
(5) for every quasi-coherent sheaf $\mathcal{F}$ on $X$ the sum of the images of the canonical maps

$$
\Gamma\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right) \otimes_{\mathbf{Z}} \mathcal{L}^{\otimes-n} \longrightarrow \mathcal{F}
$$

with $n \geq 1$ equals $\mathcal{F}$,
(6) same property as (5) with $\mathcal{F}$ ranging over all quasi-coherent sheaves of ideals,
(7) $X$ is quasi-separated and for every quasi-coherent sheaf $\mathcal{F}$ of finite type on $X$ there exists an integer $n_{0}$ such that $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_{0}$,
(8) $X$ is quasi-separated and for every quasi-coherent sheaf $\mathcal{F}$ of finite type on $X$ there exist integers $n>0, k \geq 0$ such that $\mathcal{F}$ is a quotient of a direct sum of $k$ copies of $\mathcal{L}^{\otimes-n}$, and
(9) same as in (8) with $\mathcal{F}$ ranging over all sheaves of ideals of finite type on $X$.

Proof. Lemma 27.26 .11 is (1) $\Rightarrow$ (2). Lemmas 27.26 .2 and 27.26 .12 provide the implication (1) $\Leftarrow(22)$. The implications $(2) \Rightarrow(4) \Rightarrow(3)$ are clear from Constructions, Section 26.8. Lemma 27.26.6 is (3) $\Rightarrow$ (11). Thus we see that the first 4 conditions are all equivalent.
Assume the equivalent conditions (1) - (4). Note that in particular $X$ is separated (as an open subscheme of the separated scheme $\operatorname{Proj}(S)$ ). Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Choose $s \in S_{+}$homogeneous such that $X_{s}$ is affine. We claim that any section $m \in \Gamma\left(X_{s}, \mathcal{F}\right)$ is in the image of one of the maps displayed in (5) above. This will imply (5) since these affines $X_{s}$ cover $X$. Namely, by Lemma 27.17 .2 we may write $m$ as the image of $m^{\prime} \otimes s^{-n}$ for some $n \geq 1$, some $m^{\prime} \in \Gamma\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}\right)$. This proves the claim.
Clearly (5) $\Rightarrow$ (6). Let us assume (6) and prove $\mathcal{L}$ is ample. Pick $x \in X$. Let $U \subset X$ be an affine open which contains $x$. Set $Z=X \backslash U$. We may think of $Z$ as a reduced closed subscheme, see Schemes, Section 25.12, Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals corresponding to the closed subscheme $Z$. By assumption (6), there exists an $n \geq 1$ and a section $s \in \Gamma\left(X, \mathcal{I} \otimes \mathcal{L}^{\otimes n}\right)$ such that $s$ does not vanish at $x$ (more precisely such that $s \notin \mathfrak{m}_{x} \mathcal{I}_{x} \otimes \mathcal{L}_{x}^{\otimes n}$ ). We may think of $s$ as a section of $\mathcal{L}^{\otimes n}$. Since it clearly vanishes along $Z$ we see that $X_{s} \subset U$. Hence $X_{s}$ is affine, see Lemma 27.26.4 This proves that $\mathcal{L}$ is ample. At this point we have proved that (1) - (6) are equivalent.

Assume the equivalent conditions (1) - (6). In the following we will use the fact that the tensor product of two sheaves of modules which are globally generated
is globally generated without further mention (see Modules, Lemma 17.4.3). By (1) we can find elements $s_{i} \in S_{d_{i}}$ with $d_{i} \geq 1$ such that $X=\bigcup_{i=1, \ldots, n} X_{s_{i}}$. Set $d=d_{1} \ldots d_{n}$. It follows that $\mathcal{L}^{\otimes d}$ is globally generated by

$$
s_{1}^{d / d_{1}}, \ldots, s_{n}^{d / d_{n}}
$$

This means that if $\mathcal{L}^{\otimes j}$ is globally generated then so is $\mathcal{L}^{\otimes j+d n}$ for all $n \geq 0$. Fix a $j \in\{0, \ldots, d-1\}$. For any point $x \in X$ there exists an $n \geq 1$ and a global section $s$ of $\mathcal{L}^{j+d n}$ which does not vanish at $x$, as follows from (5) applied to $\mathcal{F}=\mathcal{L}^{\otimes j}$ and ample invertible sheaf $\mathcal{L}^{\otimes d}$. Since $X$ is quasi-compact there we may find a finite list of integers $n_{i}$ and global sections $s_{i}$ of $\mathcal{L}^{\otimes j+d n_{i}}$ which do not vanish at any point of $X$. Since $\mathcal{L}^{\otimes d}$ is globally generated this means that $\mathcal{L}^{\otimes j+d n}$ is globally generated where $n=\max \left\{n_{i}\right\}$. Since we proved this for every congruence class mod $d$ we conclude that there exists an $n_{0}=n_{0}(\mathcal{L})$ such that $\mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_{0}$. At this point we see that if $\mathcal{F}$ is globally generated then so is $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$ for all $n \geq n_{0}$.
We continue to assume the equivalent conditions (1) - (6). Let $\mathcal{F}$ be a quasicoherent sheaf of $\mathcal{O}_{X}$-modules of finite type. Denote $\mathcal{F}_{n} \subset \mathcal{F}$ the image of the canonical map of (5). By construction $\mathcal{F}_{n} \otimes \mathcal{L}^{\otimes n}$ is globally generated. By (5) we see $\mathcal{F}$ is the sum of the subsheaves $\mathcal{F}_{n}, n \geq 1$. By Modules, Lemma 17.9.7 we see that $\mathcal{F}=\sum_{n=1, \ldots, N} \mathcal{F}_{n}$ for some $N \geq 1$. It follows that $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$ is globally generated whenever $n \geq N+n_{0}(\mathcal{L})$ with $n_{0}(\mathcal{L})$ as above. We conclude that (1) (6) implies (7).

Assume (7). Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules of finite type. By (7) there exists an integer $n \geq 1$ such that the canonical map

$$
\Gamma\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right) \otimes_{\mathbf{Z}} \mathcal{L}^{\otimes-n} \longrightarrow \mathcal{F}
$$

is surjective. Let $I$ be the set of finite subsets of $\Gamma\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)$ partially ordered by inclusion. Then $I$ is a directed partially ordered set. For $i=\left\{s_{1}, \ldots, s_{r(i)}\right\}$ let $\mathcal{F}_{i} \subset \mathcal{F}$ be the image of the map

$$
\bigoplus_{j=1, \ldots, r(i)} \mathcal{L}^{\otimes-n} \longrightarrow \mathcal{F}
$$

which is multiplication by $s_{j}$ on the $j$ th factor. The surjectivity above implies that $\mathcal{F}=\operatorname{colim}_{i \in I} \mathcal{F}_{i}$. Hence Modules, Lemma 17.9 .7 applies and we conclude that $\mathcal{F}=\mathcal{F}_{i}$ for some $i$. Hence we have proved (8). In other words, $77 \Rightarrow 8$.
The implication $(8) \Rightarrow(9)$ is trivial.
Finally, assume (9). Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. By Lemma 27.22 .3 (this is where we use the condition that $X$ be quasi-separated) we see that $\overline{\mathcal{I}}=\operatorname{colim}_{\alpha} I_{\alpha}$ with each $I_{\alpha}$ quasi-coherent of finite type. Since by assumption each of the $I_{\alpha}$ is a quotient of negative tensor powers of $\mathcal{L}$ we conclude the same for $\mathcal{I}$ (but of course without the finiteness or boundedness of the powers). Hence we conclude that (9) implies (6). This ends the proof of the proposition.

0B3E Lemma 27.26.14. Let $X$ be a scheme. Let $\mathcal{L}$ be an ample invertible $\mathcal{O}_{X}$-module. For any quasi-compact immersion $i: X^{\prime} \rightarrow X$ the pullback $i^{*} \mathcal{L}$ is ample on $X^{\prime}$.
Proof. For $s \in \Gamma\left(X, \mathcal{L}^{\otimes d}\right)$ denote $s^{\prime}=i^{*} s$ the restriction to $X^{\prime}$. By Proposition 27.26 .13 the opens $X_{s}$, for $s \in \Gamma\left(X, \mathcal{L}^{\otimes d}\right)$, form a basis for the topology on $X$. Since $X_{s^{\prime}}^{\prime}=X^{\prime} \cap X_{s}$ and since $i\left(X^{\prime}\right) \subset X$ is locally closed, we conclude the same
thing is true for the opens $X_{s^{\prime}}^{\prime}$. Hence the lemma is a consequence of Proposition 27.26 .13

### 27.27. Affine and quasi-affine schemes

01QD
01QE Lemma 27.27.1. Let $X$ be a scheme. Then $X$ is quasi-affine if and only if $\mathcal{O}_{X}$ is ample.
Proof. Suppose that $X$ is quasi-affine. Consider the open immersion

$$
j: X \longrightarrow \operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)
$$

from Lemma 27.18.3. Note that $\operatorname{Spec}(A)=\operatorname{Proj}(A[T])$, see Constructions, Example 26.8.14 Hence we can apply Lemma 27.26 .12 to deduce that $\mathcal{O}_{X}$ is ample.

Suppose that $\mathcal{O}_{X}$ is ample. Note that $\Gamma_{*}\left(X, \mathcal{O}_{X}\right) \cong \Gamma\left(X, \mathcal{O}_{X}\right)[T]$ as graded rings. Hence the result follows from Lemmas 27.26 .11 and 27.18 .3 taking into account that $\operatorname{Spec}(A)=\operatorname{Proj}(A[T])$ for any ring $A$ as seen above.

0BCK Lemma 27.27.2. Let $X$ be a quasi-affine scheme. For any quasi-compact immersion $i: X^{\prime} \rightarrow X$ the scheme $X^{\prime}$ is quasi-affine.
Proof. This can be proved directly without making use of the material on ample invertible sheaves; we urge the reader to do this on a napkin. Since $X$ is quasiaffine, we have that $\mathcal{O}_{X}$ is ample by Lemma 27.27.1. Then $\mathcal{O}_{X^{\prime}}$ is ample by Lemma 27.26.14. Then $X^{\prime}$ is quasi-affine by Lemma 27.27.1

01QF Lemma 27.27.3. Let $X$ be a scheme. Suppose that there exist finitely many elements $f_{1}, \ldots, f_{n} \in \Gamma\left(X, \mathcal{O}_{X}\right)$ such that
(1) each $X_{f_{i}}$ is an affine open of $X$, and
(2) the ideal generated by $f_{1}, \ldots, f_{n}$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is equal to the unit ideal.

Then $X$ is affine.
Proof. Assume we have $f_{1}, \ldots, f_{n}$ as in the lemma. We may write $1=\sum g_{i} f_{i}$ for some $g_{j} \in \Gamma\left(X, \mathcal{O}_{X}\right)$ and hence it is clear that $X=\bigcup X_{f_{i}}$. (The $f_{i}$ 's cannot all vanish at a point.) Since each $X_{f_{i}}$ is quasi-compact (being affine) it follows that $X$ is quasi-compact. Hence we see that $X$ is quasi-affine by Lemma 27.27.1 above. Consider the open immersion

$$
j: X \rightarrow \operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)
$$

see Lemma 27.18.3. The inverse image of the standard open $D\left(f_{i}\right)$ on the right hand side is equal to $X_{f_{i}}$ on the left hand side and the morphism $j$ induces an isomorphism $X_{f_{i}} \cong D\left(f_{i}\right)$, see Lemma 27.18.2. Since the $f_{i}$ generate the unit ideal we see that $\operatorname{Spec}\left(\Gamma\left(X, \mathcal{O}_{X}\right)\right)=\bigcup_{i=1, \ldots, n} D\left(f_{i}\right)$. Thus $j$ is an isomorphism.

### 27.28. Quasi-coherent sheaves and ample invertible sheaves

01QG Theme of this section: in the presence of an ample invertible sheaf every quasicoherent sheaf comes from a graded module.

01QH Situation 27.28.1. Let $X$ be a scheme. Let $\mathcal{L}$ be an ample invertible sheaf on $X$. Set $S=\Gamma_{*}(X, \mathcal{L})$ as a graded ring. Set $Y=\operatorname{Proj}(S)$. Let $f: X \rightarrow Y$ be the canonical morphism of Lemma 27.26.9. It comes equipped with a Z-graded $\mathcal{O}_{X}$-algebra map $\bigoplus f^{*} \mathcal{O}_{Y}(n) \rightarrow \bigoplus \mathcal{L}^{\otimes n}$.

The following lemma is really a special case of the next lemma but it seems like a good idea to point out its validity first.

01QI Lemma 27.28.2. In Situation 27.28.1. The canonical morphism $f: X \rightarrow Y$ maps $X$ into the open subscheme $W=W_{1} \subset Y$ where $\mathcal{O}_{Y}(1)$ is invertible and where all multiplication maps $\mathcal{O}_{Y}(n) \otimes_{\mathcal{O}_{Y}} \mathcal{O}_{Y}(m) \rightarrow \mathcal{O}_{Y}(n+m)$ are isomorphisms (see Constructions, Lemma 26.10.4). Moreover, the maps $f^{*} \mathcal{O}_{Y}(n) \rightarrow \mathcal{L}^{\otimes n}$ are all isomorphisms.

Proof. By Proposition 27.26 .13 there exists an integer $n_{0}$ such that $\mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_{0}$. Let $x \in X$ be a point. By the above we can find $a \in S_{n_{0}}$ and $b \in S_{n_{0}+1}$ such that $a$ and $b$ do not vanish at $x$. Hence $f(x) \in D_{+}(a) \cap D_{+}(b)=$ $D_{+}(a b)$. By Constructions, Lemma 26.10.4 we see that $f(x) \in W_{1}$ as desired. By Constructions, Lemma 26.14.1 which was used in the construction of the map $f$ the maps $f^{*} \mathcal{O}_{Y}\left(n_{0}\right) \rightarrow \mathcal{L}^{\otimes n_{0}}$ and $f^{*} \mathcal{O}_{Y}\left(n_{0}+1\right) \rightarrow \mathcal{L}^{\otimes n_{0}+1}$ are isomorphisms in a neighbourhood of $x$. By compatibility with the algebra structure and the fact that $f$ maps into $W$ we conclude all the maps $f^{*} \mathcal{O}_{Y}(n) \rightarrow \mathcal{L}^{\otimes n}$ are isomorphisms in a neighbourhood of $x$. Hence we win.

Recall from Modules, Definition 17.21 .7 that given a locally ringed space $X$, an invertible sheaf $\mathcal{L}$, and a $\mathcal{O}_{X}$-module $\mathcal{F}$ we have the graded $\Gamma_{*}(X, \mathcal{L})$-module

$$
\Gamma_{*}(X, \mathcal{L}, \mathcal{F})=\bigoplus_{n \in \mathbf{Z}} \Gamma\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)
$$

The following lemma says that, in Situation 27.28.1 we can recover a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ from this graded module. Take a look also at Constructions, Lemma 26.13 .7 where we prove this lemma in the special case $X=\mathbf{P}_{R}^{n}$.

01QJ Lemma 27.28.3. In Situation 27.28.1. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Set $M=\Gamma_{*}(X, \mathcal{L}, \mathcal{F})$ as a graded $S$-module. There are isomorphisms

$$
f^{*} \widetilde{M} \longrightarrow \mathcal{F}
$$

functorial in $\mathcal{F}$ such that $M_{0} \rightarrow \Gamma(\operatorname{Proj}(S), \widetilde{M}) \rightarrow \Gamma(X, \mathcal{F})$ is the identity map.
Proof. Let $s \in S_{+}$be homogeneous such that $X_{s}$ is affine open in $X$. Recall that $\left.\widetilde{M}\right|_{D_{+}(s)}$ corresponds to the $S_{(s) \text {-module }} M_{(s)}$, see Constructions, Lemma 26.8.4. Recall that $f^{-1}\left(D_{+}(s)\right)=X_{s}$. As $X$ carries an ample invertible sheaf it is quasi-compact and quasi-separated, see Section 27.26. By Lemma 27.17.2 there is a canonical isomorphism $M_{(s)}=\Gamma_{*}(X, \mathcal{L}, \mathcal{F})_{(s)} \rightarrow \Gamma\left(X_{s}, \mathcal{F}\right)$. Since $\mathcal{F}$ is quasi-coherent this leads to a canonical isomorphism

$$
\left.\left.f^{*} \widetilde{M}\right|_{X_{s}} \rightarrow \mathcal{F}\right|_{X_{s}}
$$

Since $\mathcal{L}$ is ample on $X$ we know that $X$ is covered by the affine opens of the form $X_{s}$. Hence it suffices to prove that the displayed maps glue on overlaps. Proof of this is omitted.

01QK Remark 27.28.4. With assumptions and notation of Lemma 27.28.3. Denote the displayed map of the lemma by $\theta_{\mathcal{F}}$. Note that the isomorphism $f^{*} \mathcal{O}_{Y}(n) \rightarrow \mathcal{L}^{\otimes n}$ of Lemma 27.28 .2 is just $\theta_{\mathcal{L}{ }^{\otimes n}}$. Consider the multiplication maps

$$
\widetilde{M} \otimes_{\mathcal{O}_{Y}} \mathcal{O}_{Y}(n) \longrightarrow \widetilde{M(n)}
$$

see Constructions, Equation 26.10.1.5. Pull this back to $X$ and consider

Here we have used the obvious identification $M(n)=\Gamma_{*}\left(X, \mathcal{L}, \mathcal{F} \otimes \mathcal{L}^{\otimes n}\right)$. This diagram commutes. Proof omitted.

It should be possible to deduce the following lemma from Lemma 27.28 .3 (or conversely) but it seems simpler to just repeat the proof.

0AG5 Lemma 27.28.5. Let $S$ be a graded ring such that $X=\operatorname{Proj}(S)$ is quasi-compact. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Set $M=\bigoplus_{n \in \mathbf{Z}} \Gamma(X, \mathcal{F}(n))$ as a graded $S$-module, see Constructions, Section 26.10. The map

$$
\widetilde{M} \longrightarrow \mathcal{F}
$$

of Constructions, Lemma 26.10.7 is an isomorphism. If $X$ is covered by standard opens $D_{+}(f)$ where $f$ has degree 1 , then the induced maps $M_{n} \rightarrow \Gamma(X, \mathcal{F}(n))$ are the identity maps.

Proof. Since $X$ is quasi-compact we can find homogeneous elements $f_{1}, \ldots, f_{n} \in S$ of positive degrees such that $X=D_{+}\left(f_{1}\right) \cup \ldots \cup D_{+}\left(f_{n}\right)$. Let $d$ be the least common multiple of the degrees of $f_{1}, \ldots, f_{n}$. After replacing $f_{i}$ by a power we may assume that each $f_{i}$ has degree $d$. Then we see that $\mathcal{L}=\mathcal{O}_{X}(d)$ is invertible, the multiplication maps $\mathcal{O}_{X}(a d) \otimes \mathcal{O}_{X}(b d) \rightarrow \mathcal{O}_{X}((a+b) d)$ are isomorphisms, and each $f_{i}$ determines a global section $s_{i}$ of $\mathcal{L}$ such that $X_{s_{i}}=D_{+}\left(f_{i}\right)$, see Constructions, Lemmas 26.10.4 and 26.10.5. Thus $\Gamma(X, \mathcal{F}(a d))=\Gamma\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes a}\right)$. Recall that $\left.\widetilde{M}\right|_{D_{+}\left(f_{i}\right)}$ corresponds to the $S_{\left(f_{i}\right)}$-module $M_{\left(f_{i}\right)}$, see Constructions, Lemma 26.8.4 Since the degree of $f_{i}$ is $d$, the isomorphism class of $M_{\left(f_{i}\right)}$ depends only on the homogeneous summands of $M$ of degree divisible by $d$. More precisely, the isomorphism class of $M_{\left(f_{i}\right)}$ depends only on the graded $\Gamma_{*}(X, \mathcal{L})$-module $\Gamma_{*}(X, \mathcal{L}, \mathcal{F})$ and the image $s_{i}$ of $f_{i}$ in $\Gamma_{*}(X, \mathcal{L})$. The scheme $X$ is quasi-compact by assumption and separated by Constructions, Lemma 26.8.8. By Lemma 27.17.2 there is a canonical isomorphism

$$
M_{\left(f_{i}\right)}=\Gamma_{*}(X, \mathcal{L}, \mathcal{F})_{\left(s_{i}\right)} \rightarrow \Gamma\left(X_{s_{i}}, \mathcal{F}\right)
$$

The construction of the map in Constructions, Lemma 26.10.7 then shows that it is an isomorphism over $D_{+}\left(f_{i}\right)$ hence an isomorphism as $X$ is covered by these opens. We omit the proof of the final statement.

### 27.29. Finding suitable affine opens

$01 Z \mathrm{U}$ In this section we collect some results on the existence of affine opens in more and less general situations.

01ZV Lemma 27.29.1. Let $X$ be a quasi-separated scheme. Let $Z_{1}, \ldots, Z_{n}$ be pairwise distinct irreducible components of $X$, see Topology, Section55.7. Let $\eta_{i} \in Z_{i}$ be their generic points, see Schemes, Lemma 25.11.1. There exist affine open neighbourhoods $\eta_{i} \in U_{i}$ such that $U_{i} \cap U_{j}=\emptyset$ for all $i \neq j$. In particular, $U=U_{1} \cup \ldots \cup U_{n}$ is an affine open containing all of the points $\eta_{1}, \ldots, \eta_{n}$.

Proof. Let $V_{i}$ be any affine open containing $\eta_{i}$ and disjoint from the closed set $Z_{1} \cup$ $\ldots \hat{Z}_{i} \ldots \cup Z_{n}$. Since $X$ is quasi-separated for each $i$ the union $W_{i}=\bigcup_{j, j \neq i} V_{i} \cap V_{j}$ is a quasi-compact open of $V_{i}$ not containing $\eta_{i}$. We can find open neighbourhoods $U_{i} \subset V_{i}$ containing $\eta_{i}$ and disjoint from $W_{i}$ by Algebra, Lemma 10.25.4. Finally, $U$ is affine since it is the spectrum of the ring $R_{1} \times \ldots \times R_{n}$ where $R_{i}=\mathcal{O}_{X}\left(U_{i}\right)$, see Schemes, Lemma 25.6.8.

01ZW Remark 27.29.2. Lemma 27.29.1 above is false if $X$ is not quasi-separated. Here is an example. Take $R=\mathbf{Q}\left[x, y_{1}, y_{2}, \ldots\right] /\left((x-i) y_{i}\right)$. Consider the minimal prime ideal $\mathfrak{p}=\left(y_{1}, y_{2}, \ldots\right)$ of $R$. Glue two copies of $\operatorname{Spec}(R)$ along the (not quasicompact) open $\operatorname{Spec}(R) \backslash V(\mathfrak{p})$ to get a scheme $X$ (glueing as in Schemes, Example 25.14.3). Then the two maximal points of $X$ corresponding to $\mathfrak{p}$ are not contained in a common affine open. The reason is that any open of $\operatorname{Spec}(R)$ containing $\mathfrak{p}$ contains infinitely many of the "lines" $x=i, y_{j}=0, j \neq i$ with parameter $y_{i}$. Details omitted.

Notwithstanding the example above, for "most" finite sets of irreducible closed subsets one can apply Lemma 27.29.1 above, at least if $X$ is quasi-compact. This is true because $X$ contains a dense open which is separated.

03J1 Lemma 27.29.3. Let $X$ be a quasi-compact scheme. There exists a dense open $V \subset X$ which is separated.

Proof. Say $X=\bigcup_{i=1, \ldots, n} U_{i}$ is a union of $n$ affine open subschemes. We will prove the lemma by induction on $n$. It is trivial for $n=1$. Let $V^{\prime} \subset \bigcup_{i=1, \ldots, n-1} U_{i}$ be a separated dense open subscheme, which exists by induction hypothesis. Consider

$$
V=V^{\prime} \amalg\left(U_{n} \backslash \overline{V^{\prime}}\right) .
$$

It is clear that $V$ is separated and a dense open subscheme of $X$.
It turns out that, even if $X$ is quasi-separated as well as quasi-compact, there does not exist a separated, quasi-compact dense open, see Examples, Lemma 88.20.2, Here is a slight refinement of Lemma 27.29.1 above.

01ZX Lemma 27.29.4. Let $X$ be a quasi-separated scheme. Let $Z_{1}, \ldots, Z_{n}$ be pairwise distinct irreducible components of $X$. Let $\eta_{i} \in Z_{i}$ be their generic points. Let $x \in X$ be arbitrary. There exists an affine open $U \subset X$ containing $x$ and all the $\eta_{i}$.

Proof. Suppose that $x \in Z_{1} \cap \ldots \cap Z_{r}$ and $x \notin Z_{r+1}, \ldots, Z_{n}$. Then we may choose an affine open $W \subset X$ such that $x \in W$ and $W \cap Z_{i}=\emptyset$ for $i=r+1, \ldots, n$. Note that clearly $\eta_{i} \in W$ for $i=1, \ldots, r$. By Lemma 27.29.1 we may choose affine opens $U_{i} \subset X$ which are pairwise disjoint such that $\eta_{i} \in U_{i}$ for $i=r+1, \ldots, n$. Since $X$ is quasi-separated the opens $W \cap U_{i}$ are quasi-compact and do not contain $\eta_{i}$ for $i=r+1, \ldots, n$. Hence by Algebra, Lemma 10.25 .4 we may shrink $U_{i}$ such that $W \cap U_{i}=\emptyset$ for $i=r+1, \ldots, n$. Then the union $U=W \cup \bigcup_{i=r+1, \ldots, n} U_{i}$ is disjoint and hence (by Schemes, Lemma 25.6.8) a suitable affine open.

01ZY Lemma 27.29.5. Let $X$ be a scheme. Assume either
(1) The scheme $X$ is quasi-affine.
(2) The scheme $X$ is isomorphic to a locally closed subscheme of an affine scheme.
(3) There exists an ample invertible sheaf on $X$.
(4) The scheme $X$ is isomorphic to a locally closed subscheme of $\operatorname{Proj}(S)$ for some graded ring $S$.
Then for any finite subset $E \subset X$ there exists an affine open $U \subset X$ with $E \subset U$.
Proof. By Properties, Definition 27.18.1 a quasi-affine scheme is a quasi-compact open subscheme of an affine scheme. Any affine $\operatorname{scheme} \operatorname{Spec}(R)$ is isomorphic to $\operatorname{Proj}(R[X])$ where $R[X]$ is graded by setting $\operatorname{deg}(X)=1$. By Proposition 27.26.13 if $X$ has an ample invertible sheaf then $X$ is isomorphic to an open subscheme of $\operatorname{Proj}(S)$ for some graded ring $S$. Hence, it suffices to prove the lemma in case (4). (We urge the reader to prove case (2) directly for themselves.)
Thus assume $X \subset \operatorname{Proj}(S)$ is a locally closed subscheme where $S$ is some graded ring. Let $T=\bar{X} \backslash X$. Recall that the standard opens $D_{+}(f)$ form a basis of the topology on $\operatorname{Proj}(S)$. Since $E$ is finite we may choose finitely many homogeneous elements $f_{i} \in S_{+}$such that

$$
E \subset D_{+}\left(f_{1}\right) \cup \ldots \cup D_{+}\left(f_{n}\right) \subset \operatorname{Proj}(S) \backslash T
$$

Suppose that $E=\left\{\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{m}\right\}$ as a subset of $\operatorname{Proj}(S)$. Consider the ideal $I=$ $\left(f_{1}, \ldots, f_{n}\right) \subset S$. Since $I \not \subset \mathfrak{p}_{j}$ for all $j=1, \ldots, m$ we see from Algebra, Lemma 10.56 .6 that there exists a homogeneous element $f \in I, f \notin \mathfrak{p}_{j}$ for all $j=1, \ldots, m$. Then $E \subset D_{+}(f) \subset D_{+}\left(f_{1}\right) \cup \ldots \cup D_{+}\left(f_{n}\right)$. Since $D_{+}(f)$ does not meet $T$ we see that $X \cap D_{+}(f)$ is a closed subscheme of the affine scheme $D_{+}(f)$, hence is an affine open of $X$ as desired.
09NV Lemma 27.29.6. Let $X$ be a scheme. Let $\mathcal{L}$ be an ample invertible sheaf on $X$. Let

$$
E \subset W \subset X
$$

with $E$ finite and $W$ open in $X$. Then there exists an $n>0$ and a section $s \in$ $\Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $X_{s}$ is affine and $E \subset X_{s} \subset W$.

Proof. The reader can modify the proof of Lemma 27.29 .5 to prove this lemma; we will instead deduce the lemma from it. By Lemma 27.29 .5 we can choose an affine open $U \subset W$ such that $E \subset U$. Consider the graded ring $S=\Gamma_{*}(X, \mathcal{L})=$ $\bigoplus_{n \geq 0} \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$. For each $x \in E$ let $\mathfrak{p}_{x} \subset S$ be the graded ideal of sections vanishing at $x$. It is clear that $\mathfrak{p}_{x}$ is a prime ideal and since some power of $\mathcal{L}$ is globally generated, it is clear that $S_{+} \not \subset \mathfrak{p}_{x}$. Let $I \subset S$ be the graded ideal of sections vanishing on all points of $X \backslash U$. Since the sets $X_{s}$ form a basis for the topology we see that $I \not \subset \mathfrak{p}_{x}$ for all $x \in E$. By (graded) prime avoidance (Algebra, Lemma 10.56.6 we can find $s \in I$ homogeneous with $s \notin \mathfrak{p}_{x}$ for all $x \in E$. Then $E \subset X_{s} \subset U$ and $X_{s}$ is affine by Lemma 27.26.4

## CHAPTER 28

## Morphisms of Schemes

01QL

### 28.1. Introduction

01QM In this chapter we introduce some types of morphisms of schemes. A basic reference is DG67.

### 28.2. Closed immersions

01QN In this section we elucidate some of the results obtained previously on closed immersions of schemes. Recall that a morphism of schemes $i: Z \rightarrow X$ is defined to be a closed immersion if (a) $i$ induces a homeomorphism onto a closed subset of $X$, (b) $i^{\sharp}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective, and (c) the kernel of $i^{\sharp}$ is locally generated by sections, see Schemes, Definitions 25.10 .2 and 25.4.1. It turns out that, given that $Z$ and $X$ are schemes, there are many different ways of characterizing a closed immersion.

01QO Lemma 28.2.1. Let $i: Z \rightarrow X$ be a morphism of schemes. The following are equivalent:
(1) The morphism $i$ is a closed immersion.
(2) For every affine open $\operatorname{Spec}(R)=U \subset X$, there exists an ideal $I \subset R$ such that $i^{-1}(U)=\operatorname{Spec}(R / I)$ as schemes over $U=\operatorname{Spec}(R)$.
(3) There exists an affine open covering $X=\bigcup_{j \in J} U_{j}, U_{j}=\operatorname{Spec}\left(R_{j}\right)$ and for every $j \in J$ there exists an ideal $I_{j} \subset R_{j}$ such that $i^{-1}\left(U_{j}\right)=\operatorname{Spec}\left(R_{j} / I_{j}\right)$ as schemes over $U_{j}=\operatorname{Spec}\left(R_{j}\right)$.
(4) The morphism $i$ induces a homeomorphism of $Z$ with a closed subset of $X$ and $i^{\sharp}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective.
(5) The morphism $i$ induces a homeomorphism of $Z$ with a closed subset of $X$, the map $i^{\sharp}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective, and the kernel $\operatorname{Ker}\left(i^{\sharp}\right) \subset \mathcal{O}_{X}$ is a quasi-coherent sheaf of ideals.
(6) The morphism $i$ induces a homeomorphism of $Z$ with a closed subset of $X$, the map $i^{\#}: \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}$ is surjective, and the kernel $\operatorname{Ker}\left(i^{\sharp}\right) \subset \mathcal{O}_{X}$ is a sheaf of ideals which is locally generated by sections.

Proof. Condition (6) is our definition of a closed immersion, see Schemes, Definitions 25.4.1 and 25.10.2 So $(6) \Leftrightarrow(1)$. We have $(1) \Rightarrow(2)$ by Schemes, Lemma | 25.10 .1 | Trivially $(2) \Rightarrow(3)$. |
| :---: | :---: |

Assume (3). Each of the morphisms $\operatorname{Spec}\left(R_{j} / I_{j}\right) \rightarrow \operatorname{Spec}\left(R_{j}\right)$ is a closed immersion, see Schemes, Example 25.8.1. Hence $i^{-1}\left(U_{j}\right) \rightarrow U_{j}$ is a homeomorphism onto its image and $\left.i^{\sharp}\right|_{U_{j}}$ is surjective. Hence $i$ is a homeomorphism onto its image and $i^{\sharp}$ is surjective since this may be checked locally. We conclude that $(3) \Rightarrow(4)$.

The implication $(4) \Rightarrow(1)$ is Schemes, Lemma 25.24.2. The implication (5) $\Rightarrow$ (6) is trivial. And the implication $(6) \Rightarrow(5)$ follows from Schemes, Lemma 25.10.1.

01QP Lemma 28.2.2. Let $X$ be a scheme. Suppose $i: Z \rightarrow X$ and $i^{\prime}: Z^{\prime} \rightarrow X$ are closed immersions corresponding to the quasi-coherent ideal sheaves $\mathcal{I}=\operatorname{Ker}\left(i^{\sharp}\right)$ and $\mathcal{I}^{\prime}=\operatorname{Ker}\left(\left(i^{\prime}\right)^{\sharp}\right)$ of $\mathcal{O}_{X}$.
(1) The morphism $i: Z \rightarrow X$ factors as $Z \rightarrow Z^{\prime} \rightarrow X$ for some $a: Z \rightarrow Z^{\prime}$ if and only if $\mathcal{I}^{\prime} \subset \mathcal{I}$. If this happens, then $a$ is a closed immersion.
(2) We have $Z \cong Z^{\prime}$ as schemes over $X$ if and only if $\mathcal{I}=\mathcal{I}^{\prime}$.

Proof. This follows from our discussion of closed subspaces in Schemes, Section 25.4 especially Schemes, Lemma 25.4.6. It also follows in a straightforward way from characterization (3) in Lemma 28.2.1 above.

01QQ Lemma 28.2.3. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a sheaf of ideals. The following are equivalent:
(1) The sheaf of ideals $\mathcal{I}$ is locally generated by sections as a sheaf of $\mathcal{O}_{X}$ modules.
(2) The sheaf of ideals $\mathcal{I}$ is quasi-coherent as a sheaf of $\mathcal{O}_{X}$-modules.
(3) There exists a closed immersion $i: Z \rightarrow X$ whose corresponding sheaf of ideals $\operatorname{Ker}\left(i^{\sharp}\right)$ is equal to $\mathcal{I}$.

Proof. In Schemes, Section 25.4 we constructed the closed subspace associated to a sheaf of ideals locally generated by sections. This closed subspace is a scheme by Schemes, Lemma 25.10.1. Hence we see that $(1) \Rightarrow(3)$ by our definition of a closed immersion of schemes. By Lemma 28.2.1 above we see that (3) $\Rightarrow$ (2). And of course (2) $\Rightarrow(1)$.

01QR Lemma 28.2.4. The base change of a closed immersion is a closed immersion.
Proof. See Schemes, Lemma 25.18.2.
01QS Lemma 28.2.5. A composition of closed immersions is a closed immersion.
Proof. We have seen this in Schemes, Lemma 25.24 .3 but here is another proof. Namely, it follows from the characterization (3) of closed immersions in Lemma 28.2.1. Since if $I \subset R$ is an ideal, and $\bar{J} \subset R / I$ is an ideal, then $\bar{J}=J / I$ for some ideal $J \subset R$ which contains $I$ and $(R / I) / \bar{J}=R / J$.

01QT Lemma 28.2.6. A closed immersion is quasi-compact.
Proof. This lemma is a duplicate of Schemes, Lemma 25.19.5.
01QU Lemma 28.2.7. A closed immersion is separated.
Proof. This lemma is a special case of Schemes, Lemma 25.23 .7

### 28.3. Immersions

07RJ In this section we collect some facts on immersions.
07RK Lemma 28.3.1. Let $Z \rightarrow Y \rightarrow X$ be morphisms of schemes.
(1) If $Z \rightarrow X$ is an immersion, then $Z \rightarrow Y$ is an immersion.
(2) If $Z \rightarrow X$ is a quasi-compact immersion and $Z \rightarrow Y$ is quasi-separated, then $Z \rightarrow Y$ is a quasi-compact immersion.
(3) If $Z \rightarrow X$ is a closed immersion and $Y \rightarrow X$ is separated, then $Z \rightarrow Y$ is a closed immersion.

Proof. In each case the proof is to contemplate the commutative diagram

where the composition of the top horizontal arrows is the identity. Let us prove (1). The first horizontal arrow is a section of $Y \times_{X} Z \rightarrow Z$, whence an immersion by Schemes, Lemma 25.21.12. The arrow $Y \times_{X} Z \rightarrow Y$ is a base change of $Z \rightarrow X$ hence an immersion (Schemes, Lemma 25.18.2). Finally, a composition of immersions is an immersion (Schemes, Lemma 25.24.3). This proves (1). The other two results are proved in exactly the same manner.

01QV Lemma 28.3.2. Let $h: Z \rightarrow X$ be an immersion. If $h$ is quasi-compact, then we can factor $h=i \circ j$ with $j: Z \rightarrow \bar{Z}$ an open immersion and $i: \bar{Z} \rightarrow X$ a closed immersion.

Proof. Note that $h$ is quasi-compact and quasi-separated (see Schemes, Lemma 25.23.7). Hence $h_{*} \mathcal{O}_{Z}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules by Schemes, Lemma 25.24.1. This implies that $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow h_{*} \mathcal{O}_{Z}\right)$ is a quasi-coherent sheaf of ideals, see Schemes, Section 25.24. Let $\bar{Z} \subset X$ be the closed subscheme corresponding to $\mathcal{I}$, see Lemma 28.2.3. By Schemes, Lemma 25.4.6 the morphism $h$ factors as $h=i \circ j$ where $i: \bar{Z} \rightarrow X$ is the inclusion morphism. To see that $j$ is an open immersion, choose an open subscheme $U \subset X$ such that $h$ induces a closed immersion of $Z$ into $U$. Then it is clear that $\left.\mathcal{I}\right|_{U}$ is the sheaf of ideals corresponding to the closed immersion $Z \rightarrow U$. Hence we see that $Z=\bar{Z} \cap U$.

03DQ Lemma 28.3.3. Let $h: Z \rightarrow X$ be an immersion. If $Z$ is reduced, then we can factor $h=i \circ j$ with $j: Z \rightarrow \bar{Z}$ an open immersion and $i: \bar{Z} \rightarrow X$ a closed immersion.

Proof. Let $\bar{Z} \subset X$ be the closure of $h(Z)$ with the reduced induced closed subscheme structure, see Schemes, Definition 25.12.5. By Schemes, Lemma 25.12.6 the morphism $h$ factors as $h=i \circ j$ with $i: \bar{Z} \rightarrow X$ the inclusion morphism and $j: Z \rightarrow \bar{Z}$. From the definition of an immersion we see there exists an open subscheme $U \subset X$ such that $h$ factors through a closed immersion into $U$. Hence $\bar{Z} \cap U$ and $h(Z)$ are reduced closed subschemes of $U$ with the same underlying closed set. Hence by the uniqueness in Schemes, Lemma 25.12.4 we see that $h(Z) \cong \bar{Z} \cap U$. So $j$ induces an isomorphism of $Z$ with $\bar{Z} \cap U$. In other words $j$ is an open immersion.

01QW Example 28.3.4. Here is an example of an immersion which is not a composition of an open immersion followed by a closed immersion. Let $k$ be a field. Let $X=$ $\operatorname{Spec}\left(k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\right)$. Let $U=\bigcup_{n=1}^{\infty} D\left(x_{n}\right)$. Then $U \rightarrow X$ is an open immersion. Consider the ideals

$$
I_{n}=\left(x_{1}^{n}, x_{2}^{n}, \ldots, x_{n-1}^{n}, x_{n}-1, x_{n+1}, x_{n+2}, \ldots\right) \subset k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\left[1 / x_{n}\right]
$$

Note that $I_{n} k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\left[1 / x_{n} x_{m}\right]=(1)$ for any $m \neq n$. Hence the quasicoherent ideals $\widetilde{I}_{n}$ on $D\left(x_{n}\right)$ agree on $D\left(x_{n} x_{m}\right)$, namely $\left.\widetilde{I}_{n}\right|_{D\left(x_{n} x_{m}\right)}=\mathcal{O}_{D\left(x_{n} x_{m}\right)}$ if
$n \neq m$. Hence these ideals glue to a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{U}$. Let $Z \subset U$ be the closed subscheme corresponding to $\mathcal{I}$. Thus $Z \rightarrow X$ is an immersion.
We claim that we cannot factor $Z \rightarrow X$ as $Z \rightarrow \bar{Z} \rightarrow X$, where $\bar{Z} \rightarrow X$ is closed and $Z \rightarrow \bar{Z}$ is open. Namely, $\bar{Z}$ would have to be defined by an ideal $I \subset k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ such that $I_{n}=I k\left[x_{1}, x_{2}, x_{3}, \ldots\right]\left[1 / x_{n}\right]$. But the only element $f \in k\left[x_{1}, x_{2}, x_{3}, \ldots\right]$ which ends up in all $I_{n}$ is 0 ! Hence $I$ does not exist.

### 28.4. Closed immersions and quasi-coherent sheaves

01QX The following lemma finally does for quasi-coherent sheaves on schemes what Modules, Lemma 17.6.1 does for abelian sheaves. See also the discussion in Modules, Section 17.13

01QY Lemma 28.4.1. Let $i: Z \rightarrow X$ be a closed immersion of schemes. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals cutting out $Z$. The functor

$$
i_{*}: Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right) \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)
$$

is exact, fully faithful, with essential image those quasi-coherent $\mathcal{O}_{X}$-modules $\mathcal{G}$ such that $\mathcal{I G}=0$.

Proof. A closed immersion is quasi-compact and separated, see Lemmas 28.2.6 and 28.2.7. Hence Schemes, Lemma 25.24.1 applies and the pushforward of a quasicoherent sheaf on $Z$ is indeed a quasi-coherent sheaf on $X$.

By Modules, Lemma 17.13 .4 the functor $i_{*}$ is fully faithful.
Now we turn to the description of the essential image of the functor $i_{*}$. It is clear that $\mathcal{I}\left(i_{*} \mathcal{F}\right)=0$ for any quasi-coherent $\mathcal{O}_{Z}$-module, for example by our local description above. Next, suppose that $\mathcal{G}$ is any quasi-coherent $\mathcal{O}_{X}$-module such that $\mathcal{I G}=0$. It suffices to show that the canonical map

$$
\mathcal{G} \longrightarrow i_{*} i^{*} \mathcal{G}
$$

is an isomorphism. By exactly the same arguments as above we see that it suffices to prove the following algebraic statement: Given a ring $R$, an ideal $I$ and an $R$-module $N$ such that $I N=0$ the canonical map

$$
N \longrightarrow N \otimes_{R} R / I, \quad n \longmapsto n \otimes 1
$$

is an isomorphism of $R$-modules. Proof of this easy algebra fact is omitted.
Let $i: Z \rightarrow X$ be a closed immersion. Because of the lemma above we often, by abuse of notation, denote $\mathcal{F}$ the sheaf $i_{*} \mathcal{F}$ on $X$.

01QZ Lemma 28.4.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{G} \subset \mathcal{F}$ be a $\mathcal{O}_{X}$-submodule. There exists a unique quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{G}^{\prime} \subset \mathcal{G}$ with the following property: For every quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{H}$ the map

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{H}, \mathcal{G}^{\prime}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{X}}(\mathcal{H}, \mathcal{G})
$$

is bijective. In particular $\mathcal{G}^{\prime}$ is the largest quasi-coherent $\mathcal{O}_{X}$-submodule of $\mathcal{F}$ contained in $\mathcal{G}$.

Proof. Let $\mathcal{G}_{a}, a \in A$ be the set of quasi-coherent $\mathcal{O}_{X}$-submodules contained in $\mathcal{G}$. Then the image $\mathcal{G}^{\prime}$ of

$$
\bigoplus_{a \in A} \mathcal{G}_{a} \longrightarrow \mathcal{F}
$$

is quasi-coherent as the image of a map of quasi-coherent sheaves on $X$ is quasicoherent and since a direct sum of quasi-coherent sheaves is quasi-coherent, see Schemes, Section 25.24 . The module $\mathcal{G}^{\prime}$ is contained in $\mathcal{G}$. Hence this is the largest quasi-coherent $\mathcal{O}_{X}$-module contained in $\mathcal{G}$.
To prove the formula, let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{X}$-module and let $\alpha: \mathcal{H} \rightarrow \mathcal{G}$ be an $\mathcal{O}_{X}$-module map. The image of the composition $\mathcal{H} \rightarrow \mathcal{G} \rightarrow \mathcal{F}$ is quasi-coherent as the image of a map of quasi-coherent sheaves. Hence it is contained in $\mathcal{G}^{\prime}$. Hence $\alpha$ factors through $\mathcal{G}^{\prime}$ as desired.

01R0 Lemma 28.4.3. Let $i: Z \rightarrow X$ be a closed immersion of schemes. There is a functo $i^{!}: Q \operatorname{Coh}\left(\mathcal{O}_{X}\right) \rightarrow Q \operatorname{Coh}\left(\mathcal{O}_{Z}\right)$ which is a right adjoint to $i_{*}$. (Compare Modules, Lemma 17.6.3.)

Proof. Given quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{G}$ we consider the subsheaf $\mathcal{H}_{Z}(\mathcal{G})$ of $\mathcal{G}$ of local sections annihilated by $\mathcal{I}$. By Lemma 28.4 .2 there is a canonical largest quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{H}_{Z}(\mathcal{G})^{\prime}$. By construction we have

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{F}, \mathcal{H}_{Z}(\mathcal{G})^{\prime}\right)=\operatorname{Hom}_{\mathcal{O}_{X}}\left(i_{*} \mathcal{F}, \mathcal{G}\right)
$$

for any quasi-coherent $\mathcal{O}_{Z}$-module $\mathcal{F}$. Hence we can set $i^{!} \mathcal{G}=i^{*}\left(\mathcal{H}_{Z}(\mathcal{G})^{\prime}\right)$. Details omitted.

### 28.5. Supports of modules

056 H In this section we collect some elementary results on supports of quasi-coherent modules on schemes. Recall that the support of a sheaf of modules has been defined in Modules, Section 17.5. On the other hand, the support of a module was defined in Algebra, Section 10.61 These match.

056I Lemma 28.5.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $\operatorname{Spec}(A)=U \subset X$ be an affine open, and $\operatorname{set} M=\Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime. The following are equivalent
(1) $\mathfrak{p}$ is in the support of $M$, and
(2) $x$ is in the support of $\mathcal{F}$.

Proof. This follows from the equality $\mathcal{F}_{x}=M_{\mathfrak{p}}$, see Schemes, Lemma 25.5.4 and the definitions.

05AC Lemma 28.5.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. The support of $\mathcal{F}$ is closed under specialization.

Proof. If $x^{\prime} \rightsquigarrow x$ is a specialization and $\mathcal{F}_{x}=0$ then $\mathcal{F}_{x^{\prime}}$ is zero, as $\mathcal{F}_{x^{\prime}}$ is a localization of the module $\mathcal{F}_{x}$. Hence the complement of $\operatorname{Supp}(\mathcal{F})$ is closed under generalization.

For finite type quasi-coherent modules the support is closed, can be checked on fibres, and commutes with base change.

[^70]056J Lemma 28.5.3. Let $\mathcal{F}$ be a finite type quasi-coherent module on a scheme $X$. Then
(1) The support of $\mathcal{F}$ is closed.
(2) For $x \in X$ we have

$$
x \in \operatorname{Supp}(\mathcal{F}) \Leftrightarrow \mathcal{F}_{x} \neq 0 \Leftrightarrow \mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \kappa(x) \neq 0
$$

(3) For any morphism of schemes $f: Y \rightarrow X$ the pullback $f^{*} \mathcal{F}$ is of finite type as well and we have $\operatorname{Supp}\left(f^{*} \mathcal{F}\right)=f^{-1}(\operatorname{Supp}(\mathcal{F}))$.

Proof. Part (1) is a reformulation of Modules, Lemma 17.9.6. You can also combine Lemma 28.5.1, Properties, Lemma 27.16.1, and Algebra, Lemma 10.39 .5 to see this. The first equivalence in (2) is the definition of support, and the second equivalence follows from Nakayama's lemma, see Algebra, Lemma 10.19.1 Let $f: Y \rightarrow X$ be a morphism of schemes. Note that $f^{*} \mathcal{F}$ is of finite type by Modules, Lemma 17.9.2. For the final assertion, let $y \in Y$ with image $x \in X$. Recall that

$$
\left(f^{*} \mathcal{F}\right)_{y}=\mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{O}_{Y, y}
$$

see Sheaves, Lemma 6.26.4. Hence $\left(f^{*} \mathcal{F}\right)_{y} \otimes \kappa(y)$ is nonzero if and only if $\mathcal{F}_{x} \otimes \kappa(x)$ is nonzero. By (2) this implies $x \in \operatorname{Supp}(\mathcal{F})$ if and only if $y \in \operatorname{Supp}\left(f^{*} \mathcal{F}\right)$, which is the content of assertion (3).

05JU Lemma 28.5.4. Let $\mathcal{F}$ be a finite type quasi-coherent module on a scheme $X$. There exists a smallest closed subscheme $i: Z \rightarrow X$ such that there exists a quasicoherent $\mathcal{O}_{Z}$-module $\mathcal{G}$ with $i_{*} \mathcal{G} \cong \mathcal{F}$. Moreover:
(1) If $\operatorname{Spec}(A) \subset X$ is any affine open, and $\left.\mathcal{F}\right|_{\operatorname{Spec}(A)}=\widetilde{M}$ then $Z \cap \operatorname{Spec}(A)=$ $\operatorname{Spec}(A / I)$ where $I=A n n_{A}(M)$.
(2) The quasi-coherent sheaf $\mathcal{G}$ is unique up to unique isomorphism.
(3) The quasi-coherent sheaf $\mathcal{G}$ is of finite type.
(4) The support of $\mathcal{G}$ and of $\mathcal{F}$ is $Z$.

Proof. Suppose that $i^{\prime}: Z^{\prime} \rightarrow X$ is a closed subscheme which satisfies the description on open affines from the lemma. Then by Lemma 28.4.1 we see that $\mathcal{F} \cong i_{*}^{\prime} \mathcal{G}^{\prime}$ for some unique quasi-coherent sheaf $\mathcal{G}^{\prime}$ on $Z^{\prime}$. Furthermore, it is clear that $Z^{\prime}$ is the smallest closed subscheme with this property (by the same lemma). Finally, using Properties, Lemma 27.16.1 and Algebra, Lemma 10.5.5 it follows that $\mathcal{G}^{\prime}$ is of finite type. We have $\operatorname{Supp}\left(\mathcal{G}^{\prime}\right)=Z$ by Algebra, Lemma 10.39.5. Hence, in order to prove the lemma it suffices to show that the characterization in (1) actually does define a closed subscheme. And, in order to do this it suffices to prove that the given rule produces a quasi-coherent sheaf of ideals, see Lemma 28.2.3. This comes down to the following algebra fact: If $A$ is a ring, $f \in A$, and $M$ is a finite $A$-module, then $\operatorname{Ann}_{A}(M)_{f}=\operatorname{Ann}_{A_{f}}\left(M_{f}\right)$. We omit the proof.

05JV Definition 28.5.5. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module of finite type. The scheme theoretic support of $\mathcal{F}$ is the closed subscheme $Z \subset X$ constructed in Lemma 28.5.4.

In this situation we often think of $\mathcal{F}$ as a quasi-coherent sheaf of finite type on $Z$ (via the equivalence of categories of Lemma 28.4.1).

### 28.6. Scheme theoretic image

01R5 Caution: Some of the material in this section is ultra-general and behaves differently from what you might expect.

01R6 Lemma 28.6.1. Let $f: X \rightarrow Y$ be a morphism of schemes. There exists a closed subscheme $Z \subset Y$ such that $f$ factors through $Z$ and such that for any other closed subscheme $Z^{\prime} \subset Y$ such that $f$ factors through $Z^{\prime}$ we have $Z \subset Z^{\prime}$.

Proof. Let $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}\right)$. If $\mathcal{I}$ is quasi-coherent then we just take $Z$ to be the closed subscheme determined by $\mathcal{I}$, see Lemma 28.2.3. This works by Schemes, Lemma 25.4.6. In general the same lemma requires us to show that there exists a largest quasi-coherent sheaf of ideals $\mathcal{I}^{\prime}$ contained in $\mathcal{I}$. This follows from Lemma 28.4.2.

01R7 Definition 28.6.2. Let $f: X \rightarrow Y$ be a morphism of schemes. The scheme theoretic image of $f$ is the smallest closed subscheme $Z \subset Y$ through which $f$ factors, see Lemma 28.6.1 above.

We often just denote $f: X \rightarrow Z$ the factorization of $f$. If the morphism $f$ is not quasi-compact, then (in general) the construction of the scheme theoretic image does not commute with restriction to open subschemes to $Y$. Namely, if $f$ is the immersion $Z \rightarrow X$ of Example 28.3.4 above then the scheme theoretic image of $Z \rightarrow X$ is $X$. But clearly the scheme theoretic image of $Z=Z \cap U \rightarrow U$ is just $Z$.

01R8 Lemma 28.6.3. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $Z \subset Y$ be the scheme theoretic image of $f$. If $f$ is quasi-compact then
(1) the sheaf of ideals $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow f_{*} \mathcal{O}_{X}\right)$ is quasi-coherent,
(2) the scheme theoretic image $Z$ is the closed subscheme determined by $\mathcal{I}$,
(3) for any open $U \subset Y$ the scheme theoretic image of $\left.f\right|_{f^{-1}(U)}: f^{-1}(U) \rightarrow U$ is equal to $Z \cap U$, and
(4) the image $f(X) \subset Z$ is a dense subset of $Z$, in other words the morphism $X \rightarrow Z$ is dominant (see Definition 28.8.1).

Proof. Part (4) follows from part (3). To show (3) it suffices to prove (1) since the formation of $\mathcal{I}$ commutes with restriction to open subschemes of $Y$. And if (1) holds then in the proof of Lemma 28.6.1 we showed (2). Thus it suffices to prove that $\mathcal{I}$ is quasi-coherent. Since the property of being quasi-coherent is local we may assume $Y$ is affine. As $f$ is quasi-compact, we can find a finite affine open covering $X=\bigcup_{i=1, \ldots, n} U_{i}$. Denote $f^{\prime}$ the composition

$$
X^{\prime}=\coprod U_{i} \longrightarrow X \longrightarrow Y
$$

Then $f_{*} \mathcal{O}_{X}$ is a subsheaf of $f_{*}^{\prime} \mathcal{O}_{X^{\prime}}$, and hence $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow \mathcal{O}_{X^{\prime}}\right)$. By Schemes, Lemma 25.24.1 the sheaf $f_{*}^{\prime} \mathcal{O}_{X^{\prime}}$ is quasi-coherent on $Y$. Hence we win.

056A Example 28.6.4. If $A \rightarrow B$ is a ring map with kernel $I$, then the scheme theoretic image of $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is the closed subscheme $\operatorname{Spec}(A / I)$ of $\operatorname{Spec}(A)$. This follows from Lemma 28.6.3.

If the morphism is quasi-compact, then the scheme theoretic image only adds points which are specializations of points in the image.

02JQ Lemma 28.6.5. Let $f: X \rightarrow Y$ be a quasi-compact morphism. Let $Z$ be the scheme theoretic image of $f$. Let $z \in Z$. There exists a valuation ring $A$ with fraction field $K$ and a commutative diagram

such that the closed point of $\operatorname{Spec}(A)$ maps to $z$. In particular any point of $Z$ is the specialization of a point of $f(X)$.

Proof. Let $z \in \operatorname{Spec}(R)=V \subset Y$ be an affine open neighbourhood of $z$. By Lemma 28.6.3 we have $Z \cap V$ is the scheme theoretic closure of $f^{-1}(V) \rightarrow V$, and hence we may replace $Y$ by $V$ and assume $Y=\operatorname{Spec}(R)$ is affine. In this case $X$ is quasi-compact as $f$ is quasi-compact. Say $X=U_{1} \cup \ldots \cup U_{n}$ is a finite affine open covering. Write $U_{i}=\operatorname{Spec}\left(A_{i}\right)$. Let $I=\operatorname{Ker}\left(R \rightarrow A_{1} \times \ldots \times A_{n}\right)$. By Lemma 28.6.3 again we see that $Z$ corresponds to the closed subscheme $\operatorname{Spec}(R / I)$ of $Y$. If $\mathfrak{p} \subset R$ is the prime corresponding to $z$, then we see that $I_{\mathfrak{p}} \subset R_{\mathfrak{p}}$ is not an equality. Hence (as localization is exact, see Algebra, Proposition 10.9.12 we see that $R_{\mathfrak{p}} \rightarrow\left(A_{1}\right)_{\mathfrak{p}} \times \ldots \times\left(A_{1}\right)_{\mathfrak{p}}$ is not zero. Hence one of the rings $\left(A_{i}\right)_{\mathfrak{p}}$ is not zero. Hence there exists an $i$ and a prime $\mathfrak{q}_{i} \subset A_{i}$ lying over a prime $\mathfrak{p}_{i} \subset \mathfrak{p}$. By Algebra, Lemma 10.49 .2 we can choose a valuation ring $A \subset K=f . f .\left(A_{i} / \mathfrak{q}_{i}\right)$ dominating the local ring $R_{\mathfrak{p}} / \mathfrak{p}_{1} R_{\mathfrak{p}} \subset f . f .\left(A_{i} / \mathfrak{q}_{i}\right)$. This gives the desired diagram. Some details omitted.

01R9 Lemma 28.6.6. Let $f_{1}: X \rightarrow Y_{1}$ and $Y_{1} \rightarrow Y_{2}$ be morphisms of schemes. Let $f_{2}: X \rightarrow Y_{2}$ be the composition. Let $Z_{i} \subset Y_{i}, i=1,2$ be the scheme theoretic image of $f_{i}$. Then the morphism $Y_{1} \rightarrow Y_{2}$ induces a morphism $Z_{1} \rightarrow Z_{2}$ and $a$ commutative diagram

Proof. See Schemes, Lemma 25.4.6
056B Lemma 28.6.7. Let $f: X \rightarrow Y$ be a morphism of schemes. If $X$ is reduced, then the scheme theoretic image of $f$ is the reduced induced scheme structure on $\overline{f(X)}$.

Proof. This is true because the reduced induced scheme structure on $\overline{f(X)}$ is clearly the smallest closed subscheme of $Y$ through which $f$ factors, see Schemes, Lemma 25.12.6.

### 28.7. Scheme theoretic closure and density

01RA We take the following definition from [DG67, IV, Definition 11.10.2].
01RB Definition 28.7.1. Let $X$ be a scheme. Let $U \subset X$ be an open subscheme.
(1) The scheme theoretic image of the morphism $U \rightarrow X$ is called the scheme theoretic closure of $U$ in $X$.
(2) We say $U$ is scheme theoretically dense in $X$ if for every open $V \subset X$ the scheme theoretic closure of $U \cap V$ in $V$ is equal to $V$.
With this definition it is not the case that $U$ is scheme theoretically dense in $X$ if and only if the scheme theoretic closure of $U$ is $X$, see Example 28.7.2. This is somewhat inelegant; but see Lemmas 28.7 .3 and 28.7 .8 below. On the other hand, with this definition $U$ is scheme theoretically dense in $X$ if and only if for every $V \subset X$ open the ring map $\mathcal{O}_{X}(V) \rightarrow \mathcal{O}_{X}(U \cap V)$ is injective, see Lemma 28.7.5 below. In particular we see that scheme theoretically dense implies dense which is pleasing.

01RC Example 28.7.2. Here is an example where scheme theoretic closure being $X$ does not imply dense for the underlying topological spaces. Let $k$ be a field. Set $A=k\left[x, z_{1}, z_{2}, \ldots\right] /\left(x^{n} z_{n}\right)$ Set $I=\left(z_{1}, z_{2}, \ldots\right) \subset A$. Consider the affine scheme $X=\operatorname{Spec}(A)$ and the open subscheme $U=X \backslash V(I)$. Since $A \rightarrow \prod_{n} A_{z_{n}}$ is injective we see that the scheme theoretic closure of $U$ is $X$. Consider the morphism $X \rightarrow \operatorname{Spec}(k[x])$. This morphism is surjective (set all $z_{n}=0$ to see this). But the restriction of this morphism to $U$ is not surjective because it maps to the point $x=0$. Hence $U$ cannot be topologically dense in $X$.

01RD Lemma 28.7.3. Let $X$ be a scheme. Let $U \subset X$ be an open subscheme. If the inclusion morphism $U \rightarrow X$ is quasi-compact, then $U$ is scheme theoretically dense in $X$ if and only if the scheme theoretic closure of $U$ in $X$ is $X$.
Proof. Follows from Lemma 28.6.3 part (3).
056C Example 28.7.4. Let $A$ be a ring and $X=\operatorname{Spec}(A)$. Let $f_{1}, \ldots, f_{n} \in A$ and let $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$. Let $I=\operatorname{Ker}\left(A \rightarrow \prod A_{f_{i}}\right)$. Then the scheme theoretic closure of $U$ in $X$ is the closed subscheme $\operatorname{Spec}(A / I)$ of $X$. Note that $U \rightarrow X$ is quasi-compact. Hence by Lemma 28.7 .3 we see $U$ is scheme theoretically dense in $X$ if and only if $I=0$.

01RE Lemma 28.7.5. Let $j: U \rightarrow X$ be an open immersion of schemes. Then $U$ is scheme theoretically dense in $X$ if and only if $\mathcal{O}_{X} \rightarrow j_{*} \mathcal{O}_{U}$ is injective.

Proof. If $\mathcal{O}_{X} \rightarrow j_{*} \mathcal{O}_{U}$ is injective, then the same is true when restricted to any open $V$ of $X$. Hence the scheme theoretic closure of $U \cap V$ in $V$ is equal to $V$, see proof of Lemma 28.6.1. Conversely, suppose that the scheme theoretic closure of $U \cap V$ is equal to $V$ for all opens $V$. Suppose that $\mathcal{O}_{X} \rightarrow j_{*} \mathcal{O}_{U}$ is not injective. Then we can find an affine open, say $\operatorname{Spec}(A)=V \subset X$ and a nonzero element $f \in A$ such that $f$ maps to zero in $\Gamma\left(V \cap U, \mathcal{O}_{X}\right)$. In this case the scheme theoretic closure of $V \cap U$ in $V$ is clearly contained in $\operatorname{Spec}(A /(f))$ a contradiction.

01RF Lemma 28.7.6. Let $X$ be a scheme. If $U, V$ are scheme theoretically dense open subschemes of $X$, then so is $U \cap V$.

Proof. Let $W \subset X$ be any open. Consider the map $\mathcal{O}_{X}(W) \rightarrow \mathcal{O}_{X}(W \cap V) \rightarrow$ $\mathcal{O}_{X}(W \cap V \cap U)$. By Lemma 28.7 .5 both maps are injective. Hence the composite is injective. Hence by Lemma 28.7.5 $U \cap V$ is scheme theoretically dense in $X$.
01RG Lemma 28.7.7. Let $h: Z \rightarrow X$ be an immersion. Assume either $h$ is quasicompact or $Z$ is reduced. Let $\bar{Z} \subset X$ be the scheme theoretic image of $h$. Then the morphism $Z \rightarrow \bar{Z}$ is an open immersion which identifies $Z$ with a scheme theoretically dense open subscheme of $\bar{Z}$. Moreover, $Z$ is topologically dense in $\bar{Z}$.

Proof. By Lemma 28.3 .2 or Lemma 28.3 .3 we can factor $Z \rightarrow X$ as $Z \rightarrow \bar{Z}_{1} \rightarrow X$ with $Z \rightarrow \bar{Z}_{1}$ open and $\bar{Z}_{1} \rightarrow X$ closed. On the other hand, let $Z \rightarrow \bar{Z} \subset X$ be the scheme theoretic closure of $Z \rightarrow X$. We conclude that $\bar{Z} \subset \bar{Z}_{1}$. Since $Z$ is an open subscheme of $\bar{Z}_{1}$ it follows that $Z$ is an open subscheme of $\bar{Z}$ as well. In the case that $Z$ is reduced we know that $Z \subset \bar{Z}_{1}$ is topologically dense by the construction of $\bar{Z}_{1}$ in the proof of Lemma 28.3.3. Hence $\bar{Z}_{1}$ and $\bar{Z}$ have the same underlying topological spaces. Thus $\bar{Z} \subset \bar{Z}_{1}$ is a closed immersion into a reduced scheme which induces a bijection on underlying topological spaces, and hence it is an isomorphism. In the case that $Z \rightarrow X$ is quasi-compact we argue as follows: The assertion that $Z$ is scheme theoretically dense in $\bar{Z}$ follows from Lemma 28.6.3 part (3). The last assertion follows from Lemma 28.6.3 part (4).

056D Lemma 28.7.8. Let $X$ be a reduced scheme and let $U \subset X$ be an open subscheme. Then the following are equivalent
(1) $U$ is topologically dense in $X$,
(2) the scheme theoretic closure of $U$ in $X$ is $X$, and
(3) $U$ is scheme theoretically dense in $X$.

Proof. This follows from Lemma 28.7.7 and the fact that a closed subscheme $Z$ of $X$ whose underlying topological space equals $X$ must be equal to $X$ as a scheme.

056E Lemma 28.7.9. Let $X$ be a scheme and let $U \subset X$ be a reduced open subscheme. Then the following are equivalent
(1) the scheme theoretic closure of $U$ in $X$ is $X$, and
(2) $U$ is scheme theoretically dense in $X$. If this holds then $X$ is a reduced scheme.
Proof. This follows from Lemma 28.7 .7 and the fact that the scheme theoretic closure of $U$ in $X$ is reduced by Lemma 28.6.7.

01RH Lemma 28.7.10. Let $S$ be a scheme. Let $X, Y$ be schemes over $S$. Let $f, g$ : $X \rightarrow Y$ be morphisms of schemes over $S$. Let $U \subset X$ be an open subscheme such that $\left.f\right|_{U}=\left.g\right|_{U}$. If the scheme theoretic closure of $U$ in $X$ is $X$ and $Y \rightarrow S$ is separated, then $f=g$.
Proof. Follows from the definitions and Schemes, Lemma 25.21.5.

### 28.8. Dominant morphisms

01RI The definition of a morphism of schemes being dominant is a little different from what you might expect if you are used to the notion of a dominant morphism of varieties.

01RJ Definition 28.8.1. A morphism $f: X \rightarrow S$ of schemes is called dominant if the image of $f$ is a dense subset of $S$.

So for example, if $k$ is an infinite field and $\lambda_{1}, \lambda_{2}, \ldots$ is a countable collection of elements of $k$, then the morphism

$$
\coprod_{i=1,2, \ldots} \operatorname{Spec}(k) \longrightarrow \operatorname{Spec}(k[x])
$$

with $i$ th factor mapping to the point $x=\lambda_{i}$ is dominant.
01RK Lemma 28.8.2. Let $f: X \rightarrow S$ be a morphism of schemes. If every generic point of every irreducible component of $S$ is in the image of $f$, then $f$ is dominant.

Proof. This is a topological fact which follows directly from the fact that the topological space underlying a scheme is sober, see Schemes, Lemma 25.11.1, and that every point of $S$ is contained in an irreducible component of $S$, see Topology, Lemma 5.7.3.

The expectation that morphisms are dominant only if generic points of the target are in the image does hold if the morphism is quasi-compact.

01RL Lemma 28.8.3. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. Then $f$ is dominant (if and) only if for every irreducible component $Z \subset S$ the generic point of $Z$ is in the image of $f$.

Proof. Let $V \subset S$ be an affine open. Because $f$ is quasi-compact we may choose finitely many affine opens $U_{i} \subset f^{-1}(V), i=1, \ldots, n$ covering $f^{-1}(V)$. Consider the morphism of affines

$$
f^{\prime}: \coprod_{i=1, \ldots, n} U_{i} \longrightarrow V
$$

A disjoint union of affines is affine, see Schemes, Lemma 25.6.8. Generic points of irreducible components of $V$ are exactly the generic points of the irreducible components of $S$ that meet $V$. Also, $f$ is dominant if and only $f^{\prime}$ is dominant no matter what choices of $V, n, U_{i}$ we make above. Thus we have reduced the lemma to the case of a morphism of affine schemes. The affine case is Algebra, Lemma 10.29 .6

Here is a slightly more useful variant of the lemma above.
02NE Lemma 28.8.4. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. Let $\eta \in S$ be a generic point of an irreducible component of $S$. If $\eta \notin f(X)$ then there exists an open neighbourhood $V \subset S$ of $\eta$ such that $f^{-1}(V)=\emptyset$.

Proof. Let $Z \subset S$ be the scheme theoretic image of $f$. We have to show that $\eta \notin Z$. This follows from Lemma 28.6.5 but can also be seen as follows. By Lemma 28.6 .3 the morphism $X \rightarrow Z$ is dominant, which by Lemma 28.8.3 means all the generic points of all irreducible components of $Z$ are in the image of $X \rightarrow Z$. By assumption we see that $\eta \notin Z$ since $\eta$ would be the generic point of some irreducible component of $Z$ if it were in $Z$.

There is another case where dominant is the same as having all generic points of irreducible components in the image.

01RM Lemma 28.8.5. Let $f: X \rightarrow S$ be a morphism of schemes. Suppose that $X$ has finitely many irreducible components. Then $f$ is dominant (if and) only if for every irreducible component $Z \subset S$ the generic point of $Z$ is in the image of $f$. If so, then $S$ has finitely many irreducible components as well.

Proof. Assume $f$ is dominant. Say $X=Z_{1} \cup Z_{2} \cup \ldots \cup Z_{n}$ is the decomposition of $X$ into irreducible components. Let $\xi_{i} \in Z_{i}$ be its generic point, so $Z_{i}=\overline{\left\{\xi_{i}\right\}}$. Note that $f\left(Z_{i}\right)$ is an irreducible subset of $S$. Hence

$$
S=\overline{f(X)}=\bigcup \overline{f\left(Z_{i}\right)}=\bigcup \overline{\left\{f\left(\xi_{i}\right)\right\}}
$$

is a finite union of irreducible subsets whose generic points are in the image of $f$. The lemma follows.

### 28.9. Rational maps

$01 R \mathrm{R}$ Let $X$ be a scheme. Note that if $U, V$ are dense open in $X$, then so is $U \cap V$.
01RS Definition 28.9.1. Let $X, Y$ be schemes.
(1) Let $f: U \rightarrow Y, g: V \rightarrow Y$ be morphisms of schemes defined on dense open subsets $U, V$ of $X$. We say that $f$ is equivalent to $g$ if $\left.f\right|_{W}=\left.g\right|_{W}$ for some $W \subset U \cap V$ dense open in $X$.
(2) A rational map from $X$ to $Y$ is an equivalence class for the equivalence relation defined in (1).
(3) If $X, Y$ are schemes over a base scheme $S$ we say that a rational map from $X$ to $Y$ is an $S$-rational map from $X$ to $Y$ if there exists a representative $f: U \rightarrow Y$ of the equivalence class which is an $S$-morphism.

We say that two morphisms $f, g$ as in (1) of the definition define the same rational map instead of saying that they are equivalent.

01RT Definition 28.9.2. Let $X$ be a scheme. A rational function on $X$ is a rational map from $X$ to $\mathbf{A}_{\mathbf{Z}}^{1}$.
See Constructions, Definition 26.5.1 for the definition of the affine line $\mathbf{A}^{1}$. Let $X$ be a scheme over $S$. For any open $U \subset X$ a morphism $U \rightarrow \mathbf{A}_{\mathbf{Z}}^{1}$ is the same as a morphism $U \rightarrow \mathbf{A}_{S}^{1}$ over $S$. Hence a rational function is also the same as a $S$-rational map from $X$ into $\mathbf{A}_{S}^{1}$.

Recall that we have the canonical identification $\operatorname{Mor}\left(T, \mathbf{A}_{\mathbf{Z}}^{1}\right)=\Gamma\left(T, \mathcal{O}_{T}\right)$ for any scheme $T$, see Schemes, Example 25.15.2. Hence $\mathbf{A}_{\mathbf{Z}}^{1}$ is a ring-object in the category of schemes. More precisely, the morphisms

$$
\begin{aligned}
& +: \mathbf{A}_{\mathbf{Z}}^{1} \times \mathbf{A}_{\mathbf{Z}}^{1} \longrightarrow \mathbf{A}_{\mathbf{Z}}^{1} \\
& (f, g) \longmapsto f+g \\
& *: \mathbf{A}_{\mathbf{Z}}^{1} \times \mathbf{A}_{\mathbf{Z}}^{1} \longrightarrow \mathbf{A}_{\mathbf{Z}}^{1} \\
& (f, g) \longmapsto f g
\end{aligned}
$$

satisfy all the axioms of the addition and multiplication in a ring (commutative with 1 as always). Hence also the set of rational maps into $\mathbf{A}_{\mathbf{Z}}^{1}$ has a natural ring structure.

01RU Definition 28.9.3. Let $X$ be a scheme. The ring of rational functions on $X$ is the ring $R(X)$ whose elements are rational functions with addition and multiplication as just described.
01RV Lemma 28.9.4. Let $X$ be an irreducible scheme. Let $\eta \in X$ be the generic point of $X$. There is a canonical identification $R(X)=\mathcal{O}_{X, \eta}$. If $X$ is integral then $R(X)=\kappa(\eta)=\mathcal{O}_{X, \eta}$ is a field.
Proof. The identification $R(X)=\mathcal{O}_{X, \eta}$ comes from the string of equalities

$$
R(X)=\operatorname{colim}_{\emptyset \neq U \subset X \text { open }} \operatorname{Mor}\left(U, \mathbf{A}_{\mathbf{Z}}^{1}\right)=\operatorname{colim}_{\eta \in U \subset X \text { open }} \Gamma\left(U, \mathcal{O}_{X}\right)=\mathcal{O}_{X, \eta}
$$

The second statement follows from Algebra, Lemma 10.24.1.
01RW Definition 28.9.5. Let $X$ be an integral scheme. The function field, or the field of rational functions of $X$ is the field $R(X)$.

We may occasionally indicate this field $k(X)$ instead of $R(X)$. We can use the notion of the function field to elucidate the separation condition on an integral scheme. Note that by Lemma 28.9 .4 on an integral scheme every local ring $\mathcal{O}_{X, x}$ may be viewed as a local subring of $R(X)$.
02NF Lemma 28.9.6. Let $X$ be an integral separated scheme. Let $Z_{1}, Z_{2}$ be distinct irreducible closed subsets of $X$. Let $\eta_{i}$ be the generic point of $Z_{i}$. If $Z_{1} \not \subset Z_{2}$, then $\mathcal{O}_{X, \eta_{1}} \not \subset \mathcal{O}_{X, \eta_{2}}$ as subrings of $R(X)$. In particular, if $Z_{1}=\{x\}$ consists of one closed point $x$, there exists a function regular in a neighborhood of $x$ which is not in $\mathcal{O}_{X, \eta_{2}}$.

Proof. First observe that under the assumption of $X$ being separated, there is a unique map of $\operatorname{schemes} \operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right) \rightarrow X$ over $X$ such that the composition

$$
\operatorname{Spec}(R(X)) \longrightarrow \operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right) \longrightarrow X
$$

is the canonical map $\operatorname{Spec}(R(X)) \rightarrow X$. Namely, there is the canonical map can : $\operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right) \rightarrow X$, see Schemes, Equation 25.13.1.1). Given a second morphism $a$ to $X$, we have that $a$ agrees with can on the generic point of $\operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right)$ by assumption. Now being $X$ being separated guarantees that the subset in $\operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right)$ where these two maps agree is closed, see Schemes, Lemma 25.21.5. Hence $a=$ can on all of $\operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right)$.
Assume $Z_{1} \not \subset Z_{2}$ and assume on the contrary that $\mathcal{O}_{X, \eta_{1}} \subset \mathcal{O}_{X, \eta_{2}}$ as subrings of $R(X)$. Then we would obtain a second morphism

$$
\operatorname{Spec}\left(\mathcal{O}_{X, \eta_{2}}\right) \longrightarrow \operatorname{Spec}\left(\mathcal{O}_{X, \eta_{1}}\right) \longrightarrow X .
$$

By the above this composition would have to be equal to can. This implies that $\eta_{2}$ specializes to $\eta_{1}$ (see Schemes, Lemma 25.13.2). But this contradicts our assumption $Z_{1} \not \subset Z_{2}$.

0A1X Definition 28.9.7. Let $\varphi$ be a rational map between two schemes $X$ and $Y$. We say $\varphi$ is defined in a point $x \in X$ if there exists a representative $(U, f)$ of $\varphi$ with $x \in U$. The domain of definition of $\varphi$ is the set of all points where $\varphi$ is defined.

With this definition it isn't true in general that $\varphi$ has a representative which is defined on all of the domain of definition.

0A1Y Lemma 28.9.8. Let $X$ and $Y$ be schemes. Assume $X$ reduced and $Y$ separated. Let $\varphi$ be a rational map from $X$ to $Y$ with domain of definition $U \subset X$. Then there exists a unique morphism $f: U \rightarrow Y$ representing $\varphi$. If $X$ and $Y$ are schemes over a separated scheme $S$ and if $\varphi$ is an $S$-rational map, then $f$ is a morphism over $S$.

Proof. Let $(V, g)$ and $\left(V^{\prime}, g^{\prime}\right)$ be representatives of $\varphi$. Then $g, g^{\prime}$ agree on a dense open subscheme $W \subset V \cap V^{\prime}$. On the other hand, the equalizer $E$ of $\left.g\right|_{V \cap V^{\prime}}$ and $\left.g^{\prime}\right|_{V \cap V^{\prime}}$ is a closed subscheme of $V \cap V^{\prime}$ (Schemes, Lemma 25.21.5). Now $W \subset E$ implies that $E=V \cap V^{\prime}$ set theoretically. As $V \cap V^{\prime}$ is reduced we conclude $E=V \cap V^{\prime}$ scheme theoretically, i.e., $\left.g\right|_{V \cap V^{\prime}}=\left.g^{\prime}\right|_{V \cap V^{\prime}}$. It follows that we can glue the representatives $g: V \rightarrow Y$ of $\varphi$ to a morphism $f: U \rightarrow Y$, see Schemes, Lemma 25.14.1. We omit the proof of the final statement.

In general it does not make sense to compose rational maps. The reason is that the image of a representative of the first rational map may have empty intersection with the domain of definition of the second. However, if we assume that our schemes are
irreducible and we look at dominant rational maps, then we can compose rational maps.
0A1Z Definition 28.9.9. Let $X$ and $Y$ be irreducible schemes. A rational map from $X$ to $Y$ is called dominant if any representative $f: U \rightarrow Y$ is a dominant morphism of schemes.
By Lemma 28.8 .5 it is equivalent to require that the generic point $\eta \in X$ maps to the generic point $\xi$ of $Y$, i.e., $f(\eta)=\xi$ for any representative $f: U \rightarrow Y$. We can compose a dominant rational map $\varphi$ between irreducible schemes $X$ and $Y$ with an arbitrary rational map $\psi$ from $Y$ to $Z$. Namely, choose representatives $f: U \rightarrow Y$ with $U \subset X$ open dense and $g: V \rightarrow Z$ with $V \subset Y$ open dense. Then $W=f^{-1}(V) \subset X$ is open nonempty (because it contains the generic point of $X$ ) and we let $\psi \circ \varphi$ be the equivalence class of $\left.g \circ f\right|_{W}: W \rightarrow Z$. We omit the verification that this is well defined.
In this way we obtain a category whose objects are irreducible schemes and whose morphisms are dominant rational maps. Given a base scheme $S$ we can similarly define a category whose objects are irreducible schemes over $S$ and whose morphisms are dominant $S$-rational maps.

0A20 Definition 28.9.10. Let $X$ and $Y$ be irreducible schemes.
(1) We say $X$ and $Y$ are birational if $X$ and $Y$ are isomorphic in the category of irreducible schemes and dominant rational maps.
(2) Assume $X$ and $Y$ are schemes over a base scheme $S$. We say $X$ and $Y$ are $S$-birational if $X$ and $Y$ are isomorphic in the category of irreducible schemes over $S$ and dominant $S$-rational maps.

If $X$ and $Y$ are birational irreducible schemes, then the set of rational maps from $X$ to $Z$ is bijective with the set of rational map from $Y$ to $Z$ for all schemes $Z$ (functorially in $Z$ ). For "general" irreducible schemes this is just one possible definition. Another would be to require $X$ and $Y$ have isomorphic rings of rational functions. For varieties these conditions are equivalent, see Lemma 28.46.6.
0BAA Lemma 28.9.11. Let $X$ and $Y$ be irreducible schemes.
(1) The schemes $X$ and $Y$ are birational if and only if they have isomorphic nonempty opens.
(2) Assume $X$ and $Y$ are schemes over a base scheme $S$. Then $X$ and $Y$ are $S$-birational if and only if there are nonempty opens $U \subset X$ and $V \subset Y$ which are $S$-isomorphic.
Proof. Assume $X$ and $Y$ are birational. Let $f: U \rightarrow Y$ and $g: V \rightarrow X$ define inverse dominant rational maps from $X$ to $Y$ and from $Y$ to $X$. We may assume $V$ affine. We may replace $U$ by an affine open of $f^{-1}(V)$. As $g \circ f$ is the identity as a dominant rational map, we see that the composition $U \rightarrow V \rightarrow X$ is the identity on a dense open of $U$. Thus after replacing $U$ by a smaller affine open we may assume that $U \rightarrow V \rightarrow X$ is the inclusion of $U$ into $X$. It follows that $U \rightarrow V$ is an immersion (apply Schemes, Lemma 25.21 .12 to $U \rightarrow g^{-1}(U) \rightarrow U$ ). However, switching the roles of $U$ and $V$ and redoing the argument above, we see that there exists a nonempty affine open $V^{\prime} \subset V$ such that the inclusion factors as $V^{\prime} \rightarrow U \rightarrow V$. Then $V^{\prime} \rightarrow U$ is necessarily an open immersion. Namely, $V^{\prime} \rightarrow f^{-1}\left(V^{\prime}\right) \rightarrow V^{\prime}$ are monomorphisms (Schemes, Lemma 25.23.7) composing to
the identity, hence isomorphisms. Thus $V^{\prime}$ is isomorphic to an open of both $X$ and $Y$. In the $S$-rational maps case, the exact same argument works.
01RX Remark 28.9.12. There is a variant of Definition 28.9.1 where we consider only those morphism $U \rightarrow Y$ defined on scheme theoretically dense open subschemes $U \subset X$. We use Lemma 28.7.6 to see that we obtain an equivalence relation. An equivalence class of these is called a pseudo-morphism from $X$ to $Y$. If $X$ is reduced the two notions coincide.

### 28.10. Surjective morphisms

01RY
01RZ Definition 28.10.1. A morphism of schemes is said to be surjective if it is surjective on underlying topological spaces.

01S0 Lemma 28.10.2. The composition of surjective morphisms is surjective.
Proof. Omitted.
0495 Lemma 28.10.3. Let $X$ and $Y$ be schemes over a base scheme $S$. Given points $x \in X$ and $y \in Y$, there is a point of $X \times_{S} Y$ mapping to $x$ and $y$ under the projections if and only if $x$ and $y$ lie above the same point of $S$.

Proof. The condition is obviously necessary, and the converse follows from the proof of Schemes, Lemma 25.17.5.

01S1 Lemma 28.10.4. The base change of a surjective morphism is surjective.
Proof. Let $f: X \rightarrow Y$ be a morphism of schemes over a base scheme $S$. If $S^{\prime} \rightarrow S$ is a morphism of schemes, let $p: X_{S^{\prime}} \rightarrow X$ and $q: Y_{S^{\prime}} \rightarrow Y$ be the canonical projections. The commutative square

identifies $X_{S^{\prime}}$ as a fibre product of $X \rightarrow Y$ and $Y_{S^{\prime}} \rightarrow Y$. Let $Z$ be a subset of the underlying topological space of $X$. Then $q^{-1}(f(Z))=f_{S^{\prime}}\left(p^{-1}(Z)\right)$, because $y^{\prime} \in q^{-1}(f(Z))$ if and only if $q\left(y^{\prime}\right)=f(x)$ for some $x \in Z$, if and only if, by Lemma 28.10.3. there exists $x^{\prime} \in X_{S^{\prime}}$ such that $f_{S^{\prime}}\left(x^{\prime}\right)=y^{\prime}$ and $p\left(x^{\prime}\right)=x$. In particular taking $Z=X$ we see that if $f$ is surjective so is the base change $f_{S^{\prime}}: X_{S^{\prime}} \rightarrow Y_{S^{\prime}}$.

0496 Example 28.10.5. Bijectivity is not stable under base change, and so neither is injectivity. For example consider the bijection $\operatorname{Spec}(\mathbf{C}) \rightarrow \operatorname{Spec}(\mathbf{R})$. The base change $\operatorname{Spec}\left(\mathbf{C} \otimes_{\mathbf{R}} \mathbf{C}\right) \rightarrow \operatorname{Spec}(\mathbf{C})$ is not injective, since there is an isomorphism $\mathbf{C} \otimes_{\mathbf{R}} \mathbf{C} \cong \mathbf{C} \times \mathbf{C}$ (the decomposition comes from the idempotent $\frac{1 \otimes 1+i \otimes i}{2}$ ) and hence $\operatorname{Spec}\left(\mathbf{C} \otimes_{\mathbf{R}} \mathbf{C}\right)$ has two points.
04ZD Lemma 28.10.6. Let

be a commutative diagram of morphisms of schemes. If $f$ is surjective and $p$ is quasi-compact, then $q$ is quasi-compact.
Proof. Let $W \subset Z$ be a quasi-compact open. By assumption $p^{-1}(W)$ is quasicompact. Hence by Topology, Lemma5.11.7 the inverse image $q^{-1}(W)=f\left(p^{-1}(W)\right)$ is quasi-compact too. This proves the lemma.

### 28.11. Radicial and universally injective morphisms

01S2 In this section we define what it means for a morphism of schemes to be radicial and what it means for a morphism of schemes to be universally injective. We then show that these notions agree. The reason for introducing both is that in the case of algebraic spaces there are corresponding notions which may not always agree.

01S3 Definition 28.11.1. Let $f: X \rightarrow S$ be a morphism.
(1) We say that $f$ is universally injective if and only if for any morphism of schemes $S^{\prime} \rightarrow S$ the base change $f^{\prime}: X_{S^{\prime}} \rightarrow S^{\prime}$ is injective (on underlying topological spaces).
(2) We say $f$ is radicial if $f$ is injective as a map of topological spaces, and for every $x \in X$ the field extension $\kappa(x) \supset \kappa(f(x))$ is purely inseparable.

01S4 Lemma 28.11.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) For every field $K$ the induced map $\operatorname{Mor}(\operatorname{Spec}(K), X) \rightarrow \operatorname{Mor}(\operatorname{Spec}(K), S)$ is injective.
(2) The morphism $f$ is universally injective.
(3) The morphism $f$ is radicial.
(4) The diagonal morphism $\Delta_{X / S}: X \longrightarrow X \times_{S} X$ is surjective.

Proof. Let $K$ be a field, and let $s: \operatorname{Spec}(K) \rightarrow S$ be a morphism. Giving a morphism $x: \operatorname{Spec}(K) \rightarrow X$ such that $f \circ x=s$ is the same as giving a section of the projection $X_{K}=\operatorname{Spec}(K) \times_{S} X \rightarrow \operatorname{Spec}(K)$, which in turn is the same as giving a point $x \in X_{K}$ whose residue field is $K$. Hence we see that (2) implies (1).
Conversely, suppose that (1) holds. Assume that $x, x^{\prime} \in X_{S^{\prime}}$ map to the same point $s^{\prime} \in S^{\prime}$. Choose a commutative diagram

of fields. By Schemes, Lemma 25.13 .3 we get two morphisms $a, a^{\prime}: \operatorname{Spec}(K) \rightarrow$ $X_{S^{\prime}}$. One corresponding to the point $x$ and the embedding $\kappa(x) \subset K$ and the other corresponding to the point $x^{\prime}$ and the embedding $\kappa\left(x^{\prime}\right) \subset K$. Also we have $f^{\prime} \circ a=f^{\prime} \circ a^{\prime}$. Condition (1) now implies that the compositions of $a$ and $a^{\prime}$ with $X_{S^{\prime}} \rightarrow X$ are equal. Since $X_{S^{\prime}}$ is the fibre product of $S^{\prime}$ and $X$ over $S$ we see that $a=a^{\prime}$. Hence $x=x^{\prime}$. Thus (1) implies (2).
If there are two different points $x, x^{\prime} \in X$ mapping to the same point of $s$ then (2) is violated. If for some $s=f(x), x \in X$ the field extension $\kappa(s) \subset \kappa(x)$ is not purely inseparable, then we may find a field extension $\kappa(s) \subset K$ such that $\kappa(x)$ has two $\kappa(s)$-homomorphisms into $K$. By Schemes, Lemma 25.13 .3 this implies that
the map $\operatorname{Mor}(\operatorname{Spec}(K), X) \rightarrow \operatorname{Mor}(\operatorname{Spec}(K), S)$ is not injective, and hence (1) is violated. Thus we see that the equivalent conditions (1) and (2) imply $f$ is radicial, i.e., they imply (3).

Assume (3). By Schemes, Lemma 25.13.3 a morphism $\operatorname{Spec}(K) \rightarrow X$ is given by a pair $(x, \kappa(x) \rightarrow K)$. Property (3) says exactly that associating to the pair $(x, \kappa(x) \rightarrow K)$ the pair $(s, \kappa(s) \rightarrow \kappa(x) \rightarrow K)$ is injective. In other words (1) holds. At this point we know that (1), (2) and (3) are all equivalent.
Finally, we prove the equivalence of (4) with (1), (2) and (3). A point of $X \times_{S} X$ is given by a quadruple $\left(x_{1}, x_{2}, s, \mathfrak{p}\right)$, where $x_{1}, x_{2} \in X, f\left(x_{1}\right)=f\left(x_{2}\right)=s$ and $\mathfrak{p} \subset$ $\kappa\left(x_{1}\right) \otimes_{\kappa(s)} \kappa\left(x_{2}\right)$ is a prime ideal, see Schemes, Lemma 25.17.5. If $f$ is universally injective, then by taking $S^{\prime}=X$ in the definition of universally injective, $\Delta_{X / S}$ must be surjective since it is a section of the injective morphism $X \times_{S} X \longrightarrow X$. Conversely, if $\Delta_{X / S}$ is surjective, then always $x_{1}=x_{2}=x$ and there is exactly one such prime ideal $\mathfrak{p}$, which means that $\kappa(s) \subset \kappa(x)$ is purely inseparable. Hence $f$ is radicial. Alternatively, if $\Delta_{X / S}$ is surjective, then for any $S^{\prime} \rightarrow S$ the base change $\Delta_{X_{S^{\prime}} / S^{\prime}}$ is surjective which implies that $f$ is universally injective. This finishes the proof of the lemma.
05VE Lemma 28.11.3. A universally injective morphism is separated.
Proof. Combine Lemma 28.11.2 with the remark that $X \rightarrow S$ is separated if and only if the image of $\Delta_{X / S}$ is closed in $X \times_{S} X$, see Schemes, Definition 25.21 .3 and the discussion following it.

0472 Lemma 28.11.4. A base change of a universally injective morphism is universally injective.

Proof. This is formal.
02V1 Lemma 28.11.5. A composition of radicial morphisms is radicial, and so the same holds for the equivalent condition of being universally injective.
Proof. Omitted.

### 28.12. Affine morphisms

01S5
01S6 Definition 28.12.1. A morphism of schemes $f: X \rightarrow S$ is called affine if the inverse image of every affine open of $S$ is an affine open of $X$.
01S7 Lemma 28.12.2. An affine morphism is separated and quasi-compact.
Proof. Let $f: X \rightarrow S$ be affine. Quasi-compactness is immediate from Schemes, Lemma 25.19.2. We will show $f$ is separated using Schemes, Lemma 25.21.8. Let $x_{1}, x_{2} \in X$ be points of $X$ which map to the same point $s \in S$. Choose any affine open $W \subset S$ containing $s$. By assumption $f^{-1}(W)$ is affine. Apply the lemma cited with $U=V=f^{-1}(W)$.
01S8 Lemma 28.12.3. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is affine.
(2) There exists an affine open covering $S=\bigcup W_{j}$ such that each $f^{-1}\left(W_{j}\right)$ is affine.
(3) There exists a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras $\mathcal{A}$ and an isomorphism $X \cong \operatorname{Spec}_{S}(\mathcal{A})$ of schemes over $S$. See Constructions, Section 26.4 for notation.
Moreover, in this case $X=\operatorname{Spec}_{S}\left(f_{*} \mathcal{O}_{X}\right)$.
Proof. It is obvious that (1) implies (2).
Assume $S=\bigcup_{j \in J} W_{j}$ is an affine open covering such that each $f^{-1}\left(W_{j}\right)$ is affine. By Schemes, Lemma 25.19.2 we see that $f$ is quasi-compact. By Schemes, Lemma 25.21 .7 we see the morphism $f$ is quasi-separated. Hence by Schemes, Lemma 25.24.1 the sheaf $\mathcal{A}=f_{*} \mathcal{O}_{X}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. Thus we have the scheme $g: Y=\underline{\operatorname{Spec}}_{S}(\mathcal{A}) \rightarrow S$ over $S$. The identity map id: $\mathcal{A}=f_{*} \mathcal{O}_{X} \rightarrow$ $f_{*} \mathcal{O}_{X}$ provides, via the definition of the relative spectrum, a morphism can : X $\rightarrow Y$ over $S$, see Constructions, Lemma 26.4.7. By assumption and the lemma just cited the restriction $\left.\operatorname{can}\right|_{f^{-1}\left(W_{j}\right)}: f^{-1}\left(W_{j}\right) \rightarrow g^{-1}\left(W_{j}\right)$ is an isomorphism. Thus can is an isomorphism. We have shown that (2) implies (3).
Assume (3). By Constructions, Lemma 26.4.6 we see that the inverse image of every affine open is affine, and hence the morphism is affine by definition.
01S9 Remark 28.12.4. We can also argue directly that (2) implies (1) in Lemma 28.12 .3 above as follows. Assume $S=\bigcup W_{j}$ is an affine open covering such that each $f^{-1}\left(W_{j}\right)$ is affine. First argue that $\mathcal{A}=f_{*} \mathcal{O}_{X}$ is quasi-coherent as in the proof above. Let $\operatorname{Spec}(R)=V \subset S$ be affine open. We have to show that $f^{-1}(V)$ is affine. Set $A=\mathcal{A}(V)=f_{*} \mathcal{O}_{X}(V)=\mathcal{O}_{X}\left(f^{-1}(V)\right)$. By Schemes, Lemma 25.6.4 there is a canonical morphism $\psi: f^{-1}(V) \rightarrow \operatorname{Spec}(A)$ over $\operatorname{Spec}(R)=V$. By Schemes, Lemma 25.11.6 there exists an integer $n \geq 0$, a standard open covering $V=\bigcup_{i=1, \ldots, n} D\left(h_{i}\right), h_{i} \in R$, and a map $a:\{1, \ldots, n\} \rightarrow J$ such that each $D\left(h_{i}\right)$ is also a standard open of the affine scheme $W_{a(i)}$. The inverse image of a standard open under a morphism of affine schemes is standard open, see Algebra, Lemma 10.16.4. Hence we see that $f^{-1}\left(D\left(h_{i}\right)\right)$ is a standard open of $f^{-1}\left(W_{a(i)}\right)$, in particular that $f^{-1}\left(D\left(h_{i}\right)\right)$ is affine. Because $\mathcal{A}$ is quasi-coherent we have $A_{h_{i}}=$ $\mathcal{A}\left(D\left(h_{i}\right)\right)=\mathcal{O}_{X}\left(f^{-1}\left(D\left(h_{i}\right)\right)\right)$, so $f^{-1}\left(D\left(h_{i}\right)\right)$ is the spectrum of $A_{h_{i}}$. It follows that the morphism $\psi$ induces an isomorphism of the open $f^{-1}\left(D\left(h_{i}\right)\right)$ with the open $\operatorname{Spec}\left(A_{h_{i}}\right)$ of $\operatorname{Spec}(A)$. Since $f^{-1}(V)=\bigcup f^{-1}\left(D\left(h_{i}\right)\right)$ and $\operatorname{Spec}(A)=\bigcup \operatorname{Spec}\left(A_{h_{i}}\right)$ we win.

01SA Lemma 28.12.5. Let $S$ be a scheme. There is an anti-equivalence of categories

$$
\begin{gathered}
\text { Schemes affine } \\
\text { over } S
\end{gathered} \longleftrightarrow \begin{gathered}
\text { quasi-coherent sheaves } \\
\text { of } \mathcal{O}_{S} \text {-algebras }
\end{gathered}
$$

which associates to $f: X \rightarrow S$ the sheaf $f_{*} \mathcal{O}_{X}$. Moreover, this equivalence if compatible with arbitrary base change.

Proof. The functor from right to left is given by $\mathrm{Spec}_{S}$. The two functors are mutually inverse by Lemma 28.12.3 and Constructions, Lemma 26.4.6 part (3). The final statement is Constructions, Lemma 26.4.6 part (2).

01SB Lemma 28.12.6. Let $f: X \rightarrow S$ be an affine morphism of schemes. Let $\mathcal{A}=$ $f_{*} \mathcal{O}_{X}$. The functor $\mathcal{F} \mapsto f_{*} \mathcal{F}$ induces an equivalence of categories

$$
\left\{\begin{array}{c}
\text { category of quasi-coherent } \\
\mathcal{O}_{X} \text {-modules }
\end{array}\right\} \longrightarrow\left\{\begin{array}{c}
\text { category of quasi-coherent } \\
\mathcal{A} \text {-modules }
\end{array}\right\}
$$

Moreover, an $\mathcal{A}$-module is quasi-coherent as an $\mathcal{O}_{S}$-module if and only if it is quasicoherent as an $\mathcal{A}$-module.

Proof. Omitted.
01SC Lemma 28.12.7. The composition of affine morphisms is affine.
Proof. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be affine morphisms. Let $U \subset Z$ be affine open. Then $g^{-1}(U)$ is affine by assumption on $g$. Whereupon $f^{-1}\left(g^{-1}(U)\right)$ is affine by assumption on $f$. Hence $(g \circ f)^{-1}(U)$ is affine.

01SD Lemma 28.12.8. The base change of an affine morphism is affine.
Proof. Let $f: X \rightarrow S$ be an affine morphism. Let $S^{\prime} \rightarrow S$ be any morphism. Denote $f^{\prime}: X_{S^{\prime}}=S^{\prime} \times_{S} X \rightarrow S^{\prime}$ the base change of $f$. For every $s^{\prime} \in S^{\prime}$ there exists an open affine neighbourhood $s^{\prime} \in V \subset S^{\prime}$ which maps into some open affine $U \subset S$. By assumption $f^{-1}(U)$ is affine. By the material in Schemes, Section 25.17 we see that $f^{-1}(U)_{V}=V \times_{U} f^{-1}(U)$ is affine and equal to $\left(f^{\prime}\right)^{-1}(V)$. This proves that $S^{\prime}$ has an open covering by affines whose inverse image under $f^{\prime}$ is affine. We conclude by Lemma 28.12.3 above.

01SE Lemma 28.12.9. A closed immersion is affine.
Proof. The first indication of this is Schemes, Lemma 25.8.2. See Schemes, Lemma 25.10 .1 for a complete statement.

01SF Lemma 28.12.10. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$. The inclusion morphism $j: X_{s} \rightarrow X$ is affine.

Proof. This follows from Properties, Lemma 27.26.4 and the definition.
01SG Lemma 28.12.11. Suppose $g: X \rightarrow Y$ is a morphism of schemes over $S$.
(1) If $X$ is affine over $S$ and $\Delta: Y \rightarrow Y \times{ }_{S} Y$ is affine, then $g$ is affine.
(2) If $X$ is affine over $S$ and $Y$ is separated over $S$, then $g$ is affine.
(3) A morphism from an affine scheme to a scheme with affine diagonal is affine.
(4) A morphism from an affine scheme to a separated scheme is affine.

Proof. Proof of (1). The base change $X \times_{S} Y \rightarrow Y$ is affine by Lemma 28.12.8. The morphism $(1, g): X \rightarrow X \times{ }_{S} Y$ is the base change of $Y \rightarrow Y \times_{S} Y$ by the morphism $X \times_{S} Y \rightarrow Y \times_{S} Y$. Hence it is affine by Lemma 28.12.8. The composition of affine morphisms is affine (see Lemma 28.12.7) and (1) follows. Part (2) follows from (1) as a closed immersion is affine (see Lemma 28.12 .9 ) and $Y / S$ separated means $\Delta$ is a closed immersion. Parts (3) and (4) are special cases of (1) and (2).

01SH Lemma 28.12.12. A morphism between affine schemes is affine.
Proof. Immediate from Lemma 28.12 .11 with $S=\operatorname{Spec}(\mathbf{Z})$. It also follows directly from the equivalence of (1) and (2) in Lemma 28.12.3.

01SI Lemma 28.12.13. Let $S$ be a scheme. Let $A$ be an Artinian ring. Any morphism $\operatorname{Spec}(A) \rightarrow S$ is affine.

Proof. Omitted.

### 28.13. Quasi-affine morphisms

01SJ Recall that a scheme $X$ is called quasi-affine if it is quasi-compact and isomorphic to an open subscheme of an affine scheme, see Properties, Definition 27.18.1.
01SK Definition 28.13.1. A morphism of schemes $f: X \rightarrow S$ is called quasi-affine if the inverse image of every affine open of $S$ is a quasi-affine scheme.
01SL Lemma 28.13.2. A quasi-affine morphism is separated and quasi-compact.
Proof. Let $f: X \rightarrow S$ be quasi-affine. Quasi-compactness is immediate from Schemes, Lemma 25.19.2. We will show $f$ is separated using Schemes, Lemma 25.21.8. Let $x_{1}, x_{2} \in X$ be points of $X$ which map to the same point $s \in S$. Choose any affine open $W \subset S$ containing $s$. By assumption $f^{-1}(W)$ is isomorphic to an open subscheme of an affine scheme, say $f^{-1}(W) \rightarrow Y$ is such an open immersion. Choose affine open neighbourhoods $x_{1} \in U \subset f^{-1}(W)$ and $x_{2} \in V \subset f^{-1}(W)$. We may think of $U$ and $V$ as open subschemes of $Y$ and hence we see that $U \cap V$ is affine and that $\mathcal{O}(U) \otimes_{\mathbf{z}} \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$ is surjective (by the lemma cited above applied to $U, V$ in $Y$ ). Hence by the lemma cited we conclude that $f$ is separated.

01SM Lemma 28.13.3. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is quasi-affine.
(2) There exists an affine open covering $S=\bigcup W_{j}$ such that each $f^{-1}\left(W_{j}\right)$ is quasi-affine.
(3) There exists a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras $\mathcal{A}$ and a quasi-compact open immersion

over $S$.
(4) Same as in (3) but with $\mathcal{A}=f_{*} \mathcal{O}_{X}$ and the horizontal arrow the canonical morphism of Constructions, Lemma 26.4.7.

Proof. It is obvious that (1) implies (2) and that (4) implies (3).
Assume $S=\bigcup_{j \in J} W_{j}$ is an affine open covering such that each $f^{-1}\left(W_{j}\right)$ is quasiaffine. By Schemes, Lemma 25.19 .2 we see that $f$ is quasi-compact. By Schemes, Lemma 25.21.7 we see the morphism $f$ is quasi-separated. Hence by Schemes, Lemma 25.24 .1 the sheaf $\mathcal{A}=f_{*} \mathcal{O}_{X}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. Thus we have the scheme $g: Y=\underline{\operatorname{Spec}}_{S}(\mathcal{A}) \rightarrow S$ over $S$. The identity map id : $\mathcal{A}=f_{*} \mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{X}$ provides, via the definition of the relative spectrum, a morphism can : $X \rightarrow Y$ over $S$, see Constructions, Lemma 26.4.7. By assumption, the lemma just cited, and Properties, Lemma 27.18 .3 the restriction $\left.\operatorname{can}\right|_{f^{-1}\left(W_{j}\right)}$ : $f^{-1}\left(W_{j}\right) \rightarrow g^{-1}\left(W_{j}\right)$ is a quasi-compact open immersion. Thus can is a quasicompact open immersion. We have shown that (2) implies (4).
Assume (3). Choose any affine open $U \subset S$. By Constructions, Lemma 26.4.6 we see that the inverse image of $U$ in the relative spectrum is affine. Hence we conclude
that $f^{-1}(U)$ is quasi-affine (note that quasi-compactness is encoded in (3) as well). Thus (3) implies (1).
01SN Lemma 28.13.4. The composition of quasi-affine morphisms is quasi-affine.
Proof. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be quasi-affine morphisms. Let $U \subset Z$ be affine open. Then $g^{-1}(U)$ is quasi-affine by assumption on $g$. Let $j: g^{-1}(U) \rightarrow V$ be a quasi-compact open immersion into an affine scheme $V$. By Lemma 28.13 .3 above we see that $f^{-1}\left(g^{-1}(U)\right)$ is a quasi-compact open subscheme of the relative spectrum $\underline{\operatorname{Spec}}_{g^{-1}(U)}(\mathcal{A})$ for some quasi-coherent sheaf of $\mathcal{O}_{g^{-1}(U)}$-algebras $\mathcal{A}$. By Schemes, Lemma 25.24 .1 the sheaf $\mathcal{A}^{\prime}=j_{*} \mathcal{A}$ is a quasi-coherent sheaf of $\mathcal{O}_{V^{-}}$ algebras with the property that $j^{*} \mathcal{A}^{\prime}=\mathcal{A}$. Hence we get a commutative diagram

with the square being a fibre square, see Constructions, Lemma 26.4.6. Note that the upper right corner is an affine scheme. Hence $(g \circ f)^{-1}(U)$ is quasi-affine.
01SO Lemma 28.13.5. The base change of a quasi-affine morphism is quasi-affine.
Proof. Let $f: X \rightarrow S$ be a quasi-affine morphism. By Lemma 28.13.3 above we can find a quasi-coherent sheaf of $\mathcal{O}_{S}$-algebras $\mathcal{A}$ and a quasi-compact open immersion $X \rightarrow \operatorname{Spec}_{S}(\mathcal{A})$ over $S$. Let $g: S^{\prime} \rightarrow S$ be any morphism. Denote $f^{\prime}: X_{S^{\prime}}=S^{\prime} \times{ }_{S} X \rightarrow S^{\prime}$ the base change of $f$. Since the base change of a quasi-compact open immersion is a quasi-compact open immersion we see that $X_{S^{\prime}} \rightarrow \operatorname{Spec}_{S^{\prime}}\left(g^{*} \mathcal{A}\right)$ is a quasi-compact open immersion (we have used Schemes, Lemmas 25.19 .3 and 25.18 .2 and Constructions, Lemma 26.4.6. By Lemma 28.13 .3 again we conclude that $X_{S^{\prime}} \rightarrow S^{\prime}$ is quasi-affine.

02JR Lemma 28.13.6. A quasi-compact immersion is quasi-affine.
Proof. Let $X \rightarrow S$ be a quasi-compact immersion. We have to show the inverse image of every affine open is quasi-affine. Hence, assuming $S$ is an affine scheme, we have to show $X$ is quasi-affine. By Lemma 28.7.7 the morphism $X \rightarrow S$ factors as $X \rightarrow Z \rightarrow S$ where $Z$ is a closed subscheme of $S$ and $X \subset Z$ is a quasi-compact open. Since $S$ is affine Lemma 28.2.1 implies $Z$ is affine. Hence we win.

01SP Lemma 28.13.7. Let $S$ be a scheme. Let $X$ be an affine scheme. A morphism $f: X \rightarrow S$ is quasi-affine if and only if it is quasi-compact. In particular any morphism from an affine scheme to a quasi-separated scheme is quasi-affine.
Proof. Let $V \subset S$ be an affine open. Then $f^{-1}(V)$ is an open subscheme of the affine scheme $X$, hence quasi-affine if and only if it is quasi-compact. This proves the first assertion. The quasi-compactness of any $f: X \rightarrow S$ where $X$ is affine and $S$ quasi-separated follows from Schemes, Lemma 25.21 .15 applied to $X \rightarrow S \rightarrow \operatorname{Spec}(\mathbf{Z})$.
054G Lemma 28.13.8. Suppose $g: X \rightarrow Y$ is a morphism of schemes over $S$. If $X$ is quasi-affine over $S$ and $Y$ is quasi-separated over $S$, then $g$ is quasi-affine. In particular, any morphism from a quasi-affine scheme to a quasi-separated scheme is quasi-affine.

Proof. The base change $X \times{ }_{S} Y \rightarrow Y$ is quasi-affine by Lemma 28.13.5. The morphism $X \rightarrow X \times_{S} Y$ is a quasi-compact immersion as $Y \rightarrow S$ is quasi-separated, see Schemes, Lemma 25.21.12, A quasi-compact immersion is quasi-affine by Lemma 28.13 .6 and the composition of quasi-affine morphisms is quasi-affine (see Lemma 28.13.4. Thus we win.

### 28.14. Types of morphisms defined by properties of ring maps

01SQ In this section we study what properties of ring maps allow one to define local properties of morphisms of schemes.

01SR Definition 28.14.1. Let $P$ be a property of ring maps.
(1) We say that $P$ is local if the following hold:
(a) For any ring map $R \rightarrow A$, and any $f \in R$ we have $P(R \rightarrow A) \Rightarrow$ $P\left(R_{f} \rightarrow A_{f}\right)$.
(b) For any rings $R, A$, any $f \in R, a \in A$, and any ring map $R_{f} \rightarrow A$ we have $P\left(R_{f} \rightarrow A\right) \Rightarrow P\left(R \rightarrow A_{a}\right)$.
(c) For any ring map $R \rightarrow A$, and $a_{i} \in A$ such that $\left(a_{1}, \ldots, a_{n}\right)=A$ then $\forall i, P\left(R \rightarrow A_{a_{i}}\right) \Rightarrow P(R \rightarrow A)$.
(2) We say that $P$ is stable under base change if for any ring maps $R \rightarrow A$, $R \rightarrow R^{\prime}$ we have $P(R \rightarrow A) \Rightarrow P\left(R^{\prime} \rightarrow R^{\prime} \otimes_{R} A\right)$.
(3) We say that $P$ is stable under composition if for any ring maps $A \rightarrow B$, $B \rightarrow C$ we have $P(A \rightarrow B) \wedge P(B \rightarrow C) \Rightarrow P(A \rightarrow C)$.
01SS Definition 28.14.2. Let $P$ be a property of ring maps. Let $f: X \rightarrow S$ be a morphisms of schemes. We say $f$ is locally of type $P$ if for any $x \in X$ there exists an affine open neighbourhood $U$ of $x$ in $X$ which maps into an affine open $V \subset S$ such that the induced ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ has property $P$.
This is not a "good" definition unless the property $P$ is a local property. Even if $P$ is a local property we will not automatically use this definition to say that a morphism is "locally of type $P$ " unless we also explicitly state the definition elsewhere.

01ST Lemma 28.14.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $P$ be a property of ring maps. Let $U$ be an affine open of $X$, and $V$ an affine open of $S$ such that $f(U) \subset V$. If $f$ is locally of type $P$ and $P$ is local, then $P\left(\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)\right)$ holds.
Proof. As $f$ is locally of type $P$ for every $u \in U$ there exists an affine open $U_{u} \subset X$ mapping into an affine open $V_{u} \subset S$ such that $P\left(\mathcal{O}_{S}\left(V_{u}\right) \rightarrow \mathcal{O}_{X}\left(U_{u}\right)\right)$ holds. Choose an open neighbourhood $U_{u}^{\prime} \subset U \cap U_{u}$ of $u$ which is standard affine open in both $U$ and $U_{u}$, see Schemes, Lemma 25.11.5. By Definition 28.14.1 (1)(b) we see that $P\left(\mathcal{O}_{S}\left(V_{u}\right) \rightarrow \mathcal{O}_{X}\left(U_{u}^{\prime}\right)\right)$ holds. Hence we may assume that $U_{u} \subset U$ is a standard affine open. Choose an open neighbourhood $V_{u}^{\prime} \subset V \cap V_{u}$ of $f(u)$ which is standard affine open in both $V$ and $V_{u}$, see Schemes, Lemma 25.11.5. Then $U_{u}^{\prime}=f^{-1}\left(V_{u}^{\prime}\right) \cap U_{u}$ is a standard affine open of $U_{u}$ (hence of $U$ ) and we have $P\left(\mathcal{O}_{S}\left(V_{u}^{\prime}\right) \rightarrow \mathcal{O}_{X}\left(U_{u}^{\prime}\right)\right)$ by Definition 28.14.1 (1)(a). Hence we may assume both $U_{u} \subset U$ and $V_{u} \subset V$ are standard affine open. Applying Definition 28.14.1 $(1)(\mathrm{b})$ one more time we conclude that $P\left(\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}\left(U_{u}\right)\right)$ holds. Because $U$ is quasi-compact we may choose a finite number of points $u_{1}, \ldots, u_{n} \in U$ such that

$$
U=U_{u_{1}} \cup \ldots \cup U_{u_{n}}
$$

By Definition 28.14.1 (1)(c) we conclude that $P\left(\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)\right)$ holds.

01SU Lemma 28.14.4. Let $P$ be a local property of ring maps. Let $f: X \rightarrow S$ be $a$ morphism of schemes. The following are equivalent
(1) The morphism $f$ is locally of type $P$.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ we have $P\left(\mathcal{O}_{S}(V) \rightarrow\right.$ $\left.\mathcal{O}_{X}(U)\right)$.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is locally of type $P$.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that $P\left(\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)\right)$ holds, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is locally of type $P$ then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is locally of type $P$.

Proof. This follows from Lemma 28.14 .3 above.
01SV Lemma 28.14.5. Let $P$ be a property of ring maps. Assume $P$ is local and stable under composition. The composition of morphisms locally of type $P$ is locally of type $P$.

Proof. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms locally of type $P$. Let $x \in X$. Choose an affine open neighbourhood $W \subset Z$ of $g(f(x))$. Choose an affine open neighbourhood $V \subset g^{-1}(W)$ of $f(x)$. Choose an affine open neighbourhood $U \subset f^{-1}(V)$ of $x$. By Lemma 28.14.4 the ring maps $\mathcal{O}_{Z}(W) \rightarrow \mathcal{O}_{Y}(V)$ and $\mathcal{O}_{Y}(V) \rightarrow \mathcal{O}_{X}(U)$ satisfy $P$. Hence $\mathcal{O}_{Z}(W) \rightarrow \mathcal{O}_{X}(U)$ satisfies $P$ as $P$ is assumed stable under composition.

01SW Lemma 28.14.6. Let $P$ be a property of ring maps. Assume $P$ is local and stable under base change. The base change of a morphism locally of type $P$ is locally of type $P$.

Proof. Let $f: X \rightarrow S$ be a morphism locally of type $P$. Let $S^{\prime} \rightarrow S$ be any morphism. Denote $f^{\prime}: X_{S^{\prime}}=S^{\prime} \times_{S} X \rightarrow S^{\prime}$ the base change of $f$. For every $s^{\prime} \in S^{\prime}$ there exists an open affine neighbourhood $s^{\prime} \in V^{\prime} \subset S^{\prime}$ which maps into some open affine $V \subset S$. By Lemma 28.14.4 the open $f^{-1}(V)$ is a union of affines $U_{i}$ such that the ring maps $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ all satisfy $P$. By the material in Schemes, Section 25.17 we see that $f^{-1}(U)_{V^{\prime}}=V^{\prime} \times_{V} f^{-1}(V)$ is the union of the affine opens $V^{\prime} \times_{V} U_{i}$. Since $\mathcal{O}_{X_{S^{\prime}}}\left(V^{\prime} \times_{V} U_{i}\right)=\mathcal{O}_{S^{\prime}}\left(V^{\prime}\right) \otimes_{\mathcal{O}_{S}(V)} \mathcal{O}_{X}\left(U_{i}\right)$ we see that the ring maps $\mathcal{O}_{S^{\prime}}\left(V^{\prime}\right) \rightarrow \mathcal{O}_{X_{S^{\prime}}}\left(V^{\prime} \times_{V} U_{i}\right)$ satisfy $P$ as $P$ is assumed stable under base change.

01SX Lemma 28.14.7. The following properties of a ring map $R \rightarrow A$ are local.
(1) (Isomorphism on local rings.) For every prime $\mathfrak{q}$ of $A$ lying over $\mathfrak{p} \subset R$ the ring map $R \rightarrow A$ induces an isomorphism $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}$.
(2) (Open immersion.) For every prime $\mathfrak{q}$ of $A$ there exists an $f \in R, \varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi: R \rightarrow A$ induces an isomorphism $R_{f} \rightarrow A_{f}$.
(3) (Reduced fibres.) For every prime $\mathfrak{p}$ of $R$ the fibre $\operatorname{ring} A \otimes_{R} \kappa(\mathfrak{p})$ is reduced.
(4) (Fibres of dimension at most n.) For every prime $\mathfrak{p}$ of $R$ the fibre ring $A \otimes_{R} \kappa(\mathfrak{p})$ has Krull dimension at most $n$.
(5) (Locally Noetherian on the target.) The ring map $R \rightarrow A$ has the property that $A$ is Noetherian.
(6) Add more here as needed ${ }^{2}$.

Proof. Omitted.
01SY Lemma 28.14.8. The following properties of ring maps are stable under base change.
(1) (Isomorphism on local rings.) For every prime $\mathfrak{q}$ of $A$ lying over $\mathfrak{p} \subset R$ the ring map $R \rightarrow A$ induces an isomorphism $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}$.
(2) (Open immersion.) For every prime $\mathfrak{q}$ of $A$ there exists an $f \in R, \varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi: R \rightarrow A$ induces an isomorphism $R_{f} \rightarrow A_{f}$.
(3) (Reduced fibres.) For every prime $\mathfrak{p}$ of $R$ the fibre ring $A \otimes_{R} \kappa(\mathfrak{p})$ is reduced.
(4) (Fibres of dimension at most n.) For every prime $\mathfrak{p}$ of $R$ the fibre ring $A \otimes_{R} \kappa(\mathfrak{p})$ has Krull dimension at most $n$.
(5) Add more here as needed ${ }^{3}$.

Proof. Omitted.
01SZ Lemma 28.14.9. The following properties of ring maps are stable under composition.
(1) (Isomorphism on local rings.) For every prime $\mathfrak{q}$ of $A$ lying over $\mathfrak{p} \subset R$ the ring map $R \rightarrow A$ induces an isomorphism $R_{\mathfrak{p}} \rightarrow A_{\mathfrak{q}}$.
(2) (Open immersion.) For every prime $\mathfrak{q}$ of $A$ there exists an $f \in R, \varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi: R \rightarrow A$ induces an isomorphism $R_{f} \rightarrow A_{f}$.
(3) (Locally Noetherian on the target.) The ring map $R \rightarrow A$ has the property that $A$ is Noetherian.
(4) Add more here as needed ${ }^{4}$.

Proof. Omitted.

### 28.15. Morphisms of finite type

01 T 0 Recall that a ring map $R \rightarrow A$ is said to be of finite type if $A$ is isomorphic to a quotient of $R\left[x_{1}, \ldots, x_{n}\right]$ as an $R$-algebra, see Algebra, Definition 10.6.1.

01T1 Definition 28.15.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is of finite type at $x \in X$ if there exists an affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and an affine open $\operatorname{Spec}(R)=V \subset$ $S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is of finite type.
(2) We say that $f$ is locally of finite type if it is of finite type at every point of $X$.
(3) We say that $f$ is of finite type if it is locally of finite type and quasicompact.
01T2 Lemma 28.15.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is locally of finite type.

[^71](2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is of finite type.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is locally of finite type.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is of finite type, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is locally of finite type then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is locally of finite type.

Proof. This follows from Lemma 28.14 .3 if we show that the property " $R \rightarrow A$ is of finite type" is local. We check conditions (a), (b) and (c) of Definition 28.14.1. By Algebra, Lemma 10.13 .2 being of finite type is stable under base change and hence we conclude (a) holds. By the same lemma being of finite type is stable under composition and trivially for any ring $R$ the ring map $R \rightarrow R_{f}$ is of finite type. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.23 .3

01T3 Lemma 28.15.3. The composition of two morphisms which are locally of finite type is locally of finite type. The same is true for morphisms of finite type.

Proof. In the proof of Lemma 28.15 .2 we saw that being of finite type is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being of finite type is a property of ring maps that is stable under composition, see Algebra, Lemma 10.6.2. By the above and the fact that compositions of quasi-compact morphisms are quasi-compact, see Schemes, Lemma 25.19.4 we see that the composition of morphisms of finite type is of finite type.

01T4 Lemma 28.15.4. The base change of a morphism which is locally of finite type is locally of finite type. The same is true for morphisms of finite type.

Proof. In the proof of Lemma 28.15 .2 we saw that being of finite type is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14.5 combined with the fact that being of finite type is a property of ring maps that is stable under base change, see Algebra, Lemma 10.13.2. By the above and the fact that a base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 25.19 .3 we see that the base change of a morphism of finite type is a morphism of finite type.

01 T Lemma 28.15.5. A closed immersion is of finite type. An immersion is locally of finite type.

Proof. This is true because an open immersion is a local isomorphism, and a closed immersion is obviously of finite type.

01T6 Lemma 28.15.6. Let $f: X \rightarrow S$ be a morphism. If $S$ is (locally) Noetherian and $f$ (locally) of finite type then $X$ is (locally) Noetherian.

Proof. This follows immediately from the fact that a ring of finite type over a Noetherian ring is Noetherian, see Algebra, Lemma 10.30.1. (Also: use the fact
that the source of a quasi-compact morphism with quasi-compact target is quasicompact.)

01T7 Lemma 28.15.7. Let $f: X \rightarrow S$ be locally of finite type with $S$ locally Noetherian. Then $f$ is quasi-separated.

Proof. In fact, it is true that $X$ is quasi-separated, see Properties, Lemma 27.5 .4 and Lemma 28.15 .6 above. Then apply Schemes, Lemma 25.21 .14 to conclude that $f$ is quasi-separated.

01T8 Lemma 28.15.8. Let $X \rightarrow Y$ be a morphism of schemes over a base scheme $S$. If $X$ is locally of finite type over $S$, then $X \rightarrow Y$ is locally of finite type.

Proof. Via Lemma 28.15 .2 this translates into the following algebra fact: Given ring maps $A \rightarrow B \rightarrow C$ such that $A \rightarrow C$ is of finite type, then $B \rightarrow C$ is of finite type. (See Algebra, Lemma 10.6.2.

### 28.16. Points of finite type and Jacobson schemes

01 T9 Let $S$ be a scheme. A finite type point $s$ of $S$ is a point such that the morphism $\operatorname{Spec}(\kappa(s)) \rightarrow S$ is of finite type. The reason for studying this is that finite type points can replace closed points in a certain sense and in certain situations. There are always enough of them for example. Moreover, a scheme is Jacobson if and only if all finite type points are closed points.

01TA Lemma 28.16.1. Let $S$ be a scheme. Let $k$ be a field. Let $f: \operatorname{Spec}(k) \rightarrow S$ be a morphism. The following are equivalent:
(1) The morphism $f$ is of finite type.
(2) The morphism $f$ is locally of finite type.
(3) There exists an affine open $U=\operatorname{Spec}(R)$ of $S$ such that $f$ corresponds to a finite ring map $R \rightarrow k$.
(4) There exists an affine open $U=\operatorname{Spec}(R)$ of $S$ such that the image of $f$ consists of a closed point $u$ in $U$ and the field extension $\kappa(u) \subset k$ is finite.

Proof. The equivalence of (1) and (2) is obvious as $\operatorname{Spec}(k)$ is a singleton and hence any morphism from it is quasi-compact.

Suppose $f$ is locally of finite type. Choose any affine open $\operatorname{Spec}(R)=U \subset S$ such that the image of $f$ is contained in $U$, and the ring map $R \rightarrow k$ is of finite type. Let $\mathfrak{p} \subset R$ be the kernel. Then $R / \mathfrak{p} \subset k$ is of finite type. By Algebra, Lemma 10.33 .2 there exist a $\bar{f} \in R / \mathfrak{p}$ such that $(R / \mathfrak{p})_{\bar{f}}$ is a field and $(R / \mathfrak{p})_{\bar{f}} \rightarrow k$ is a finite field extension. If $f \in R$ is a lift of $\bar{f}$, then we see that $k$ is a finite $R_{f}$-module. Thus $(2) \Rightarrow(3)$.

Suppose that $\operatorname{Spec}(R)=U \subset S$ is an affine open such that $f$ corresponds to a finite ring map $R \rightarrow k$. Then $f$ is locally of finite type by Lemma 28.15.2. Thus $(3) \Rightarrow$ (2).

Suppose $R \rightarrow k$ is finite. The image of $R \rightarrow k$ is a field over which $k$ is finite by Algebra, Lemma 10.35.16. Hence the kernel of $R \rightarrow k$ is a maximal ideal. Thus (3) $\Rightarrow$ (4).

The implication $(4) \Rightarrow(3)$ is immediate.

02HV Lemma 28.16.2. Let $S$ be a scheme. Let $A$ be an Artinian local ring with residue field $\kappa$. Let $f: \operatorname{Spec}(A) \rightarrow S$ be a morphism of schemes. Then $f$ is of finite type if and only if the composition $\operatorname{Spec}(\kappa) \rightarrow \operatorname{Spec}(A) \rightarrow S$ is of finite type.

Proof. Since the morphism $\operatorname{Spec}(\kappa) \rightarrow \operatorname{Spec}(A)$ is of finite type it is clear that if $f$ is of finite type so is the composition $\operatorname{Spec}(\kappa) \rightarrow S$ (see Lemma 28.15.3). For the converse, note that $\operatorname{Spec}(A) \rightarrow S$ maps into some affine open $U=\operatorname{Spec}(B)$ of $S$ as $\operatorname{Spec}(A)$ has only one point. To finish apply Algebra, Lemma 10.53 .4 to $B \rightarrow A$.

Recall that given a point $s$ of a scheme $S$ there is a canonical morphism $\operatorname{Spec}(\kappa(s)) \rightarrow$ $S$, see Schemes, Section 25.13 .

02J1 Definition 28.16.3. Let $S$ be a scheme. Let us say that a point $s$ of $S$ is a finite type point if the canonical morphism $\operatorname{Spec}(\kappa(s)) \rightarrow S$ is of finite type. We denote $S_{\mathrm{ft}-\mathrm{pts}}$ the set of finite type points of $S$.

We can describe the set of finite type points as follows.
02J2 Lemma 28.16.4. Let $S$ be a scheme. We have

$$
S_{f t-p t s}=\bigcup_{U \subset S \text { open }} U_{0}
$$

where $U_{0}$ is the set of closed points of $U$. Here we may let $U$ range over all opens or over all affine opens of $S$.

Proof. Immediate from Lemma 28.16.1.
02J3 Lemma 28.16.5. Let $f: T \rightarrow S$ be a morphism of schemes. If $f$ is locally of finite type, then $f\left(T_{f t-p t s}\right) \subset S_{f t-p t s}$.

Proof. If $T$ is the spectrum of a field this is Lemma 28.16.1. In general it follows since the composition of morphisms locally of finite type is locally of finite type (Lemma 28.15.3).

06EB Lemma 28.16.6. Let $f: T \rightarrow S$ be a morphism of schemes. If $f$ is locally of finite type and surjective, then $f\left(T_{f t-p t s}\right)=S_{f t-p t s}$.

Proof. We have $f\left(T_{\mathrm{ft}-\mathrm{pts}}\right) \subset S_{\mathrm{ft}-\mathrm{pts}}$ by Lemma 28.16.5. Let $s \in S$ be a finite type point. As $f$ is surjective the scheme $T_{s}=\operatorname{Spec}(\kappa(s)) \times{ }_{S} T$ is nonempty, therefore has a finite type point $t \in T_{s}$ by Lemma 28.16.4. Now $T_{s} \rightarrow T$ is a morphism of finite type as a base change of $s \rightarrow S$ (Lemma 28.15.4. Hence the image of $t$ in $T$ is a finite type point by Lemma 28.16.5 which maps to $s$ by construction.

02J4 Lemma 28.16.7. Let $S$ be a scheme. For any locally closed subset $T \subset S$ we have

$$
T \neq \emptyset \Rightarrow T \cap S_{f t-p t s} \neq \emptyset
$$

In particular, for any closed subset $T \subset S$ we see that $T \cap S_{f t-p t s}$ is dense in $T$.
Proof. Note that $T$ carries a scheme structure (see Schemes, Lemma 25.12.4) such that $T \rightarrow S$ is a locally closed immersion. Any locally closed immersion is locally of finite type, see Lemma 28.15.5. Hence by Lemma 28.16 .5 we see $T_{\mathrm{ft} \text {-pts }} \subset S_{\mathrm{ft}-\mathrm{pts}}$. Finally, any nonempty affine open of $T$ has at least one closed point which is a finite type point of $T$ by Lemma 28.16.4.

It follows that most of the material from Topology, Section 5.17 goes through with the set of closed points replaced by the set of points of finite type. In fact, if $S$ is Jacobson then we recover the closed points as the finite type points.

01TB Lemma 28.16.8. Let $S$ be a scheme. The following are equivalent:
(1) the scheme $S$ is Jacobson,
(2) $S_{f t-p t s}$ is the set of closed points of $S$,
(3) for all $T \rightarrow S$ locally of finite type closed points map to closed points, and
(4) for all $T \rightarrow S$ locally of finite type closed points $t \in T$ map to closed points $s \in S$ with $\kappa(s) \subset \kappa(t)$ finite.

Proof. We have trivially $(4) \Rightarrow(3) \Rightarrow(2)$. Lemma 28.16 .7 shows that (2) implies (1). Hence it suffices to show that (1) implies (4). Suppose that $T \rightarrow S$ is locally of finite type. Choose $t \in T$ closed and let $s \in S$ be the image. Choose affine open neighbourhoods $\operatorname{Spec}(R)=U \subset S$ of $s$ and $\operatorname{Spec}(A)=V \subset T$ of $t$ with $V$ mapping into $U$. The induced ring map $R \rightarrow A$ is of finite type (see Lemma 28.15.2) and $R$ is Jacobson by Properties, Lemma 27.6.3. Thus the result follows from Algebra, Proposition 10.34.18.

02J5 Lemma 28.16.9. Let $S$ be a Jacobson scheme. Any scheme locally of finite type over $S$ is Jacobson.

Proof. This is clear from Algebra, Proposition 10.34 .18 (and Properties, Lemma 27.6 .3 and Lemma 28.15.2.

02J6 Lemma 28.16.10. The following types of schemes are Jacobson.
(1) Any scheme locally of finite type over a field.
(2) Any scheme locally of finite type over $\mathbf{Z}$.
(3) Any scheme locally of finite type over a 1-dimensional Noetherian domain with infinitely many primes.
(4) A scheme of the form $\operatorname{Spec}(R) \backslash\{\mathfrak{m}\}$ where $(R, \mathfrak{m})$ is a Noetherian local ring. Also any scheme locally of finite type over it.

Proof. We will use Lemma 28.16 .9 without mention. The spectrum of a field is clearly Jacobson. The spectrum of $\mathbf{Z}$ is Jacobson, see Algebra, Lemma 10.34.6. For (3) see Algebra, Lemma 10.60.4. For (4) see Properties, Lemma 27.6.4

### 28.17. Universally catenary schemes

02J7 Recall that a topological space $X$ is called catenary if for every pair of irreducible closed subsets $T \subset T^{\prime}$ there exist a maximal chain of irreducible closed subsets

$$
T=T_{0} \subset T_{1} \subset \ldots \subset T_{e}=T^{\prime}
$$

and every such chain has the same length. See Topology, Definition 5.10.4. Recall that a scheme is catenary if its underlying topological space is catenary. See Properties, Definition 27.11.1.

02J8 Definition 28.17.1. Let $S$ be a scheme. Assume $S$ is locally Noetherian. We say $S$ is universally catenary if for every morphism $X \rightarrow S$ locally of finite type the scheme $X$ is catenary.

This is a "better" notion than catenary as there exist Noetherian schemes which are catenary but not universally catenary. See Examples, Section 88.16. Many schemes are universally catenary, see Lemma 28.17 .4 below.
Recall that a ring $A$ is called catenary if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$ there exists a maximal chain of primes

$$
\mathfrak{p}=\mathfrak{p}_{0} \subset \ldots \subset \mathfrak{p}_{e}=\mathfrak{q}
$$

and all of these have the same length. See Algebra, Definition 10.104.1. We have seen the relationship between catenary schemes and catenary rings in Properties, Section 27.11. Recall that a ring $A$ is called universally catenary if $A$ is Noetherian and for every finite type ring map $A \rightarrow B$ the ring $B$ is catenary. See Algebra, Definition 10.104.3. Many interesting rings which come up in algebraic geometry satisfy this property.

02J9 Lemma 28.17.2. Let $S$ be a locally Noetherian scheme. The following are equivalent
(1) $S$ is universally catenary,
(2) there exists an open covering of $S$ all of whose members are universally catenary schemes,
(3) for every affine open $\operatorname{Spec}(R)=U \subset S$ the ring $R$ is universally catenary, and
(4) there exists an affine open covering $S=\bigcup U_{i}$ such that each $U_{i}$ is the spectrum of a universally catenary ring.
Moreover, in this case any scheme locally of finite type over $S$ is universally catenary as well.

Proof. By Lemma 28.15 .5 an open immersion is locally of finite type. A composition of morphisms locally of finite type is locally of finite type (Lemma 28.15.3). Thus it is clear that if $S$ is universally catenary then any open and any scheme locally of finite type over $S$ is universally catenary as well. This proves the final statement of the lemma and that (1) implies (2).
If $\operatorname{Spec}(R)$ is a universally catenary scheme, then every $\operatorname{scheme} \operatorname{Spec}(A)$ with $A$ a finite type $R$-algebra is catenary. Hence all these rings $A$ are catenary by Algebra, Lemma 10.104 .2 . Thus $R$ is universally catenary. Combined with the remarks above we conclude that (1) implies (3), and (2) implies (4). Of course (3) implies (4) trivially.

To finish the proof we show that (4) implies (1). Assume (4) and let $X \rightarrow S$ be a morphism locally of finite type. We can find an affine open covering $X=\bigcup V_{j}$ such that each $V_{j} \rightarrow S$ maps into one of the $U_{i}$. By Lemma 28.15 .2 the induced ring map $\mathcal{O}\left(U_{i}\right) \rightarrow \mathcal{O}\left(V_{j}\right)$ is of finite type. Hence $\mathcal{O}\left(V_{j}\right)$ is catenary. Hence $X$ is catenary by Properties, Lemma 27.11.2.

02JA Lemma 28.17.3. Let $S$ be a locally Noetherian scheme. The following are equivalent:
(1) $S$ is universally catenary, and
(2) all local rings $\mathcal{O}_{S, s}$ of $S$ are universally catenary.

Proof. Assume that all local rings of $S$ are universally catenary. Let $f: X \rightarrow S$ be locally of finite type. We know that $X$ is catenary if and only if $\mathcal{O}_{X, x}$ is catenary
for all $x \in X$. If $f(x)=s$, then $\mathcal{O}_{X, x}$ is essentially of finite type over $\mathcal{O}_{S, s}$. Hence $\mathcal{O}_{X, x}$ is catenary by the assumption that $\mathcal{O}_{S, s}$ is universally catenary.
Conversely, assume that $S$ is universally catenary. Let $s \in S$. We may replace $S$ by an affine open neighbourhood of $s$ by Lemma 28.17.2. Say $S=\operatorname{Spec}(R)$ and $s$ corresponds to the prime ideal $\mathfrak{p}$. Any finite type $R_{\mathfrak{p}}$-algebra $A^{\prime}$ is of the form $A_{\mathfrak{p}}$ for some finite type $R$-algebra $A$. By assumption (and Lemma 28.17 .2 if you like) the ring $A$ is catenary, and hence $A^{\prime}$ (a localization of $A$ ) is catenary. Thus $R_{\mathfrak{p}}$ is universally catenary.

02JB Lemma 28.17.4. The following types of schemes are universally catenary.
(1) Any scheme locally of finite type over a field.
(2) Any scheme locally of finite type over a Cohen-Macaulay scheme.
(3) Any scheme locally of finite type over $\mathbf{Z}$.
(4) Any scheme locally of finite type over a 1-dimensional Noetherian domain.
(5) And so on.

Proof. All of these follow from the fact that a Cohen-Macaulay ring is universally catenary, see Algebra, Lemma 10.104.8. Also, use the last assertion of Lemma 28.17.2 Some details omitted.

### 28.18. Nagata schemes, reprise

0359 See Properties, Section 27.13 for the definitions and basic properties of Nagata and universally Japanese schemes.

035A Lemma 28.18.1. Let $f: X \rightarrow S$ be a morphism. If $S$ is Nagata and $f$ locally of finite type then $X$ is Nagata. If $S$ is universally Japanese and $f$ locally of finite type then $X$ is universally Japanese.

Proof. For "universally Japanese" this follows from Algebra, Lemma 10.154.4 For "Nagata" this follows from Algebra, Proposition 10.154.15.
035B Lemma 28.18.2. The following types of schemes are Nagata.
(1) Any scheme locally of finite type over a field.
(2) Any scheme locally of finite type over a Noetherian complete local ring.
(3) Any scheme locally of finite type over $\mathbf{Z}$.
(4) Any scheme locally of finite type over a Dedekind ring of characteristic zero.
(5) And so on.

Proof. By Lemma 28.18.1 we only need to show that the rings mentioned above are Nagata rings. For this see Algebra, Proposition 10.154.16.

### 28.19. The singular locus, reprise

07R2 We look for a criterion that implies openness of the regular locus for any scheme locally of finite type over the base. Here is the definition.

07R3 Definition 28.19.1. Let $X$ be a locally Noetherian scheme. We say $X$ is $J$-2 if for every morphism $Y \rightarrow X$ which is locally of finite type the regular locus $\operatorname{Reg}(Y)$ is open in $Y$.
This is the analogue of the corresponding notion for Noetherian rings, see More on Algebra, Definition 15.38.1.

07R4 Lemma 28.19.2. Let $X$ be a locally Noetherian scheme. The following are equivalent
(1) $X$ is J-2,
(2) there exists an open covering of $X$ all of whose members are J-2 schemes,
(3) for every affine open $\operatorname{Spec}(R)=U \subset X$ the ring $R$ is $J$-2, and
(4) there exists an affine open covering $S=\bigcup U_{i}$ such that each $\mathcal{O}\left(U_{i}\right)$ is J-2 for all $i$.
Moreover, in this case any scheme locally of finite type over $X$ is J-2 as well.
Proof. By Lemma 28.15 .5 an open immersion is locally of finite type. A composition of morphisms locally of finite type is locally of finite type (Lemma 28.15.3). Thus it is clear that if $X$ is J-2 then any open and any scheme locally of finite type over $X$ is $\mathrm{J}-2$ as well. This proves the final statement of the lemma.
If $\operatorname{Spec}(R)$ is J-2, then for every finite type $R$-algebra $A$ the regular locus of the scheme $\operatorname{Spec}(A)$ is open. Hence $R$ is J-2, by definition (see More on Algebra, Definition 15.38.1. Combined with the remarks above we conclude that (1) implies (3), and (2) implies (4). Of course $(1) \Rightarrow(2)$ and $(3) \Rightarrow(4)$ trivially.

To finish the proof we show that (4) implies (1). Assume (4) and let $Y \rightarrow X$ be a morphism locally of finite type. We can find an affine open covering $Y=\bigcup V_{j}$ such that each $V_{j} \rightarrow X$ maps into one of the $U_{i}$. By Lemma 28.15 .2 the induced ring map $\mathcal{O}\left(U_{i}\right) \rightarrow \mathcal{O}\left(V_{j}\right)$ is of finite type. Hence the regular locus of $V_{j}=\operatorname{Spec}\left(\mathcal{O}\left(V_{j}\right)\right)$ is open. Since $\operatorname{Reg}(Y) \cap V_{j}=\operatorname{Reg}\left(V_{j}\right)$ we conclude that $\operatorname{Reg}(Y)$ is open as desired.

07R5 Lemma 28.19.3. The following types of schemes are J-2.
(1) Any scheme locally of finite type over a field.
(2) Any scheme locally of finite type over a Noetherian complete local ring.
(3) Any scheme locally of finite type over $\mathbf{Z}$.
(4) Any scheme locally of finite type over a Dedekind ring of characteristic zero.
(5) And so on.

Proof. By Lemma 28.19 .2 we only need to show that the rings mentioned above are J-2. For this see More on Algebra, Proposition 15.39 .6

### 28.20. Quasi-finite morphisms

01 TC A solid treatment of quasi-finite morphisms is the basis of many developments further down the road. It will lead to various versions of Zariski's Main Theorem, behaviour of dimensions of fibres, descent for étale morphisms, etc, etc. Before reading this section it may be a good idea to take a look at the algebra results in Algebra, Section 10.121
Recall that a finite type ring map $R \rightarrow A$ is quasi-finite at a prime $\mathfrak{q}$ if $\mathfrak{q}$ defines an isolated point of its fibre, see Algebra, Definition 10.121.3.
01TD Definition 28.20.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is quasi-finite at a point $x \in X$ if there exist an affine neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and an affine open $\operatorname{Spec}(R)=V \subset$ $S$ such that $f(U) \subset V$, the ring map $R \rightarrow A$ is of finite type, and $R \rightarrow A$ is quasi-finite at the prime of $A$ corresponding to $x$ (see above).
(2) We say $f$ is locally quasi-finite if $f$ is quasi-finite at every point $x$ of $X$.
(3) We say that $f$ is quasi-finite if $f$ is of finite type and every point $x$ is an isolated point of its fibre.
Trivially, a locally quasi-finite morphism is locally of finite type. We will see below that a morphism $f$ which is locally of finite type is quasi-finite at $x$ if and only if $x$ is isolated in its fibre. Moreover, the set of points at which a morphism is quasi-finite is open; we will see this in Section 28.50 on Zariski's Main Theorem.

01TE Lemma 28.20.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point. Set $s=f(x)$. If $\kappa(s) \supset \kappa(x)$ is an algebraic field extension, then
(1) $x$ is a closed point of its fibre, and
(2) if in addition $s$ is a closed point of $S$, then $x$ is a closed point of $X$.

Proof. The second statement follows from the first by elementary topology. According to Schemes, Lemma 25.18.5 to prove the first statement we may replace $X$ by $X_{s}$ and $S$ by $\operatorname{Spec}(\kappa(s))$. Thus we may assume that $S=\operatorname{Spec}(k)$ is the spectrum of a field. In this case, let $\operatorname{Spec}(A)=U \subset X$ be any affine open containing $x$. The point $x$ corresponds to a prime ideal $\mathfrak{q} \subset A$ such that $k \subset \kappa(\mathfrak{q})$ is an algebraic field extension. By Algebra, Lemma 10.34 .9 we see that $\mathfrak{q}$ is a maximal ideal, i.e., $x \in U$ is a closed point. Since the affine opens form a basis of the topology of $X$ we conclude that $\{x\}$ is closed.

The following lemma is a version of the Hilbert Nullstellensatz.
01TF Lemma 28.20.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point. Set $s=f(x)$. Assume $f$ is locally of finite type. Then $x$ is a closed point of its fibre if and only if $\kappa(s) \subset \kappa(x)$ is a finite field extension.

Proof. If the extension is finite, then $x$ is a closed point of the fibre by Lemma 28.20 .2 above. For the converse, assume that $x$ is a closed point of its fibre. Choose affine opens $\operatorname{Spec}(A)=U \subset X$ and $\operatorname{Spec}(R)=V \subset S$ such that $f(U) \subset V$. By Lemma 28.15.2 the ring map $R \rightarrow A$ is of finite type. Let $\mathfrak{q} \subset A$, resp. $\mathfrak{p} \subset R$ be the prime ideal corresponding to $x$, resp. $s$. Consider the fibre ring $\bar{A}=A \otimes_{R} \kappa(\mathfrak{p})$. Let $\overline{\mathfrak{q}}$ be the prime of $\bar{A}$ corresponding to $\mathfrak{q}$. The assumption that $x$ is a closed point of its fibre implies that $\overline{\mathfrak{q}}$ is a maximal ideal of $\bar{A}$. Since $\bar{A}$ is an algebra of finite type over the field $\kappa(\mathfrak{p})$ we see by the Hilbert Nullstellensatz, see Algebra, Theorem 10.33.1, that $\kappa(\overline{\mathfrak{q}})$ is a finite extension of $\kappa(\mathfrak{p})$. Since $\kappa(s)=\kappa(\mathfrak{p})$ and $\kappa(x)=\kappa(\mathfrak{q})=\kappa(\overline{\mathfrak{q}})$ we win.

053M Lemma 28.20.4. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $g: S^{\prime} \rightarrow S$ be any morphism. Denote $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ the base change. If $x^{\prime} \in X^{\prime}$ maps to a point $x \in X$ which is closed in $X_{f(x)}$ then $x^{\prime}$ is closed in $X_{f^{\prime}\left(x^{\prime}\right)}^{\prime}$.
Proof. The residue field $\kappa\left(x^{\prime}\right)$ is a quotient of $\kappa\left(f^{\prime}\left(x^{\prime}\right)\right) \otimes_{\kappa(f(x))} \kappa(x)$, see Schemes, Lemma 25.17.5. Hence it is a finite extension of $\kappa\left(f^{\prime}\left(x^{\prime}\right)\right)$ as $\kappa(x)$ is a finite extension of $\kappa(f(x))$ by Lemma 28.20.3. Thus we see that $x^{\prime}$ is closed in its fibre by applying that lemma one more time.

01TG Lemma 28.20.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s=f(x)$. If $f$ is quasi-finite at $x$, then the residue field extension $\kappa(s) \subset \kappa(x)$ is finite.

Proof. This is clear from Algebra, Definition 10.121.3.
01TH Lemma 28.20.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s=f(x)$. Let $X_{s}$ be the fibre of $f$ at $s$. Assume $f$ is locally of finite type. The following are equivalent:
(1) The morphism $f$ is quasi-finite at $x$.
(2) The point $x$ is isolated in $X_{s}$.
(3) The point $x$ is closed in $X_{s}$ and there is no point $x^{\prime} \in X_{s}, x^{\prime} \neq x$ which specializes to $x$.
(4) For any pair of affine opens $\operatorname{Spec}(A)=U \subset X, \operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ and $x \in U$ corresponding to $\mathfrak{q} \subset A$ the ring map $R \rightarrow A$ is quasi-finite at $\mathfrak{q}$.

Proof. Assume $f$ is quasi-finite at $x$. By assumption there exist opens $U \subset X$, $V \subset S$ such that $f(U) \subset V, x \in U$ and $x$ an isolated point of $U_{s}$. Hence $\{x\} \subset U_{s}$ is an open subset. Since $U_{s}=U \cap X_{s} \subset X_{s}$ is also open we conclude that $\{x\} \subset X_{s}$ is an open subset also. Thus we conclude that $x$ is an isolated point of $X_{s}$.

Note that $X_{s}$ is a Jacobson scheme by Lemma 28.16.10 (and Lemma 28.15.4). If $x$ is isolated in $X_{s}$, i.e., $\{x\} \subset X_{s}$ is open, then $\{x\}$ contains a closed point (by the Jacobson property), hence $x$ is closed in $X_{s}$. It is clear that there is no point $x^{\prime} \in X_{s}$, distinct from $x$, specializing to $x$.
Assume that $x$ is closed in $X_{s}$ and that there is no point $x^{\prime} \in X_{s}$, distinct from $x$, specializing to $x$. Consider a pair of affine opens $\operatorname{Spec}(A)=U \subset X, \operatorname{Spec}(R)=$ $V \subset S$ with $f(U) \subset V$ and $x \in U$. Let $\mathfrak{q} \subset A$ correspond to $x$ and $\mathfrak{p} \subset R$ correspond to $s$. By Lemma 28.15 .2 the ring map $R \rightarrow A$ is of finite type. Consider the fibre ring $\bar{A}=A \otimes_{R} \kappa(\mathfrak{p})$. Let $\overline{\mathfrak{q}}$ be the prime of $\bar{A}$ corresponding to $\mathfrak{q}$. Since $\operatorname{Spec}(\bar{A})$ is an open subscheme of the fibre $X_{s}$ we see that $\bar{q}$ is a maximal ideal of $\bar{A}$ and that there is no point of $\operatorname{Spec}(\bar{A})$ specializing to $\overline{\mathfrak{q}}$. This implies that $\operatorname{dim}\left(\bar{A}_{\bar{q}}\right)=0$. Hence by Algebra, Definition 10.121 .3 we see that $R \rightarrow A$ is quasi-finite at $\mathfrak{q}$, i.e., $X \rightarrow S$ is quasi-finite at $x$ by definition.
At this point we have shown conditions (1) - (3) are all equivalent. It is clear that (4) implies (1). And it is also clear that (2) implies (4) since if $x$ is an isolated point of $X_{s}$ then it is also an isolated point of $U_{s}$ for any open $U$ which contains it.

02NG Lemma 28.20.7. Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume that
(1) $f$ is locally of finite type, and
(2) $f^{-1}(\{s\})$ is a finite set.

Then $X_{s}$ is a finite discrete topological space, and $f$ is quasi-finite at each point of $X$ lying over $s$.

Proof. Suppose $T$ is a scheme which (a) is locally of finite type over a field $k$, and (b) has finitely many points. Then Lemma 28.16 .10 shows $T$ is a Jacobson scheme. A finite Jacobson space is discrete, see Topology, Lemma 5.17.6. Apply this remark to the fibre $X_{s}$ which is locally of finite type over $\operatorname{Spec}(\kappa(s))$ to see the first statement. Finally, apply Lemma 28.20 .6 to see the second.

06RT Lemma 28.20.8. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is locally of finite type. Then the following are equivalent
(1) $f$ is locally quasi-finite,
(2) for every $s \in S$ the fibre $X_{s}$ is a discrete topological space, and
(3) for every morphism $\operatorname{Spec}(k) \rightarrow S$ where $k$ is a field the base change $X_{k}$ has an underlying discrete topological space.
Proof. It is immediate that (3) implies (2). Lemma 28.20 .6 shows that (2) is equivalent to (1). Assume (2) and let $\operatorname{Spec}(k) \rightarrow S$ be as in (3). Denote $s \in S$ the image of $\operatorname{Spec}(k) \rightarrow S$. Then $X_{k}$ is the base change of $X_{s}$ via $\operatorname{Spec}(k) \rightarrow \operatorname{Spec}(\kappa(s))$. Hence every point of $X_{k}$ is closed by Lemma 28.20.4. As $X_{k} \rightarrow \operatorname{Spec}(k)$ is locally of finite type (by Lemma 28.15.4), we may apply Lemma 28.20 .6 to conclude that every point of $X_{k}$ is isolated, i.e., $X_{k}$ has a discrete underlying topological space.

01TJ Lemma 28.20.9. Let $f: X \rightarrow S$ be a morphism of schemes. Then $f$ is quasi-finite if and only if $f$ is locally quasi-finite and quasi-compact.
Proof. Assume $f$ is quasi-finite. It is quasi-compact by Definition 28.15.1 Let $x \in X$. We see that $f$ is quasi-finite at $x$ by Lemma 28.20.6. Hence $f$ is quasicompact and locally quasi-finite.
Assume $f$ is quasi-compact and locally quasi-finite. Then $f$ is of finite type. Let $x \in X$ be a point. By Lemma 28.20 .6 we see that $x$ is an isolated point of its fibre. The lemma is proved.
02NH Lemma 28.20.10. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) $f$ is quasi-finite, and
(2) $f$ is locally of finite type, quasi-compact, and has finite fibres.

Proof. Assume $f$ is quasi-finite. In particular $f$ is locally of finite type and quasicompact (since it is of finite type). Let $s \in S$. Since every $x \in X_{s}$ is isolated in $X_{s}$ we see that $X_{s}=\bigcup_{x \in X_{s}}\{x\}$ is an open covering. As $f$ is quasi-compact, the fibre $X_{s}$ is quasi-compact. Hence we see that $X_{s}$ is finite.

Conversely, assume $f$ is locally of finite type, quasi-compact and has finite fibres. Then it is locally quasi-finite by Lemma 28.20.7. Hence it is quasi-finite by Lemma 28.20 .9 ,

Recall that a ring map $R \rightarrow A$ is quasi-finite if it is of finite type and quasi-finite at all primes of $A$, see Algebra, Definition 10.121.3.

01TK Lemma 28.20.11. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is locally quasi-finite.
(2) For every pair of affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is quasi-finite.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is locally quasi-finite.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is quasi-finite, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is locally quasi-finite then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is locally quasi-finite.

Proof. For a ring map $R \rightarrow A$ let us define $P(R \rightarrow A)$ to mean " $R \rightarrow A$ is quasifinite" (see remark above lemma). We claim that $P$ is a local property of ring maps. We check conditions (a), (b) and (c) of Definition 28.14.1. In the proof of Lemma 28.15 .2 we have seen that (a), (b) and (c) hold for the property of being "of finite type". Note that, for a finite type ring map $R \rightarrow A$, the property $R \rightarrow A$ is quasifinite at $\mathfrak{q}$ depends only on the local ring $A_{\mathfrak{q}}$ as an algebra over $R_{\mathfrak{p}}$ where $\mathfrak{p}=R \cap \mathfrak{q}$ (usual abuse of notation). Using these remarks (a), (b) and (c) of Definition 28.14.1 follow immediately. For example, suppose $R \rightarrow A$ is a ring map such that all of the ring maps $R \rightarrow A_{a_{i}}$ are quasi-finite for $a_{1}, \ldots, a_{n} \in A$ generating the unit ideal. We conclude that $R \rightarrow A$ is of finite type. Also, for any prime $\mathfrak{q} \subset A$ the local $\operatorname{ring} A_{\mathfrak{q}}$ is isomorphic as an $R$-algebra to the local ring $\left(A_{a_{i}}\right)_{\mathfrak{q}_{i}}$ for some $i$ and some $\mathfrak{q}_{i} \subset A_{a_{i}}$. Hence we conclude that $R \rightarrow A$ is quasi-finite at $\mathfrak{q}$.

We conclude that Lemma 28.14.3 applies with $P$ as in the previous paragraph. Hence it suffices to prove that $f$ is locally quasi-finite is equivalent to $f$ is locally of type $P$. Since $P(R \rightarrow A)$ is " $R \rightarrow A$ is quasi-finite" which means $R \rightarrow A$ is quasi-finite at every prime of $A$, this follows from Lemma 28.20.6.

01TL Lemma 28.20.12. The composition of two morphisms which are locally quasifinite is locally quasi-finite. The same is true for quasi-finite morphisms.

Proof. In the proof of Lemma 28.20 .11 we saw that $P=$ "quasi-finite" is a local property of ring maps, and that a morphism of schemes is locally quasi-finite if and only if it is locally of type $P$ as in Definition 28.14.2 Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being quasifinite is a property of ring maps that is stable under composition, see Algebra, Lemma 10.121.7. By the above, Lemma 28.20 .9 and the fact that compositions of quasi-compact morphisms are quasi-compact, see Schemes, Lemma 25.19.4 we see that the composition of quasi-finite morphisms is quasi-finite.

We will see later (Lemma 28.50.2) that the set $U$ of the following lemma is open.
01TM Lemma 28.20.13. Let $f: X \rightarrow S$ be a morphism of schemes. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Denote $f^{\prime}: X_{S^{\prime}} \rightarrow S^{\prime}$ the base change of $f$ by $g$ and denote $g^{\prime}: X_{S^{\prime}} \rightarrow X$ the projection. Assume $X$ is locally of finite type over $S$.
(1) Let $U \subset X$ (resp. $U^{\prime} \subset X^{\prime}$ ) be the set of points where $f$ (resp. $f^{\prime}$ ) is quasi-finite. Then $U^{\prime}=U_{S^{\prime}}=\left(g^{\prime}\right)^{-1}(U)$.
(2) The base change of a locally quasi-finite morphism is locally quasi-finite.
(3) The base change of a quasi-finite morphism is quasi-finite.

Proof. The first and second assertion follow from the corresponding algebra result, see Algebra, Lemma 10.121 .8 (combined with the fact that $f^{\prime}$ is also locally of finite type by Lemma 28.15.4. By the above, Lemma 28.20 .9 and the fact that a base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 25.19.3 we see that the base change of a quasi-finite morphism is quasi-finite.

0AAY Lemma 28.20.14. Let $f: X \rightarrow S$ be a morphism of schemes of finite type. Let $s \in S$. There are at most finitely many points of $X$ lying over $s$ at which $f$ is quasi-finite.
Proof. The fibre $X_{s}$ is a scheme of finite type over a field, hence Noetherian (Lemma 28.15.6). Hence the topology on $X_{s}$ is Noetherian (Properties, Lemma
27.5.5) and can have at most a finite number of isolated points (by elementary topology). Thus our lemma follows from Lemma 28.20.6.
01TN Lemma 28.20.15. Any immersion is locally quasi-finite.
Proof. This is true because an open immersion is a local isomorphism and a closed immersion is clearly quasi-finite.

03WR Lemma 28.20.16. Let $X \rightarrow Y$ be a morphism of schemes over a base scheme $S$. Let $x \in X$. If $X \rightarrow S$ is quasi-finite at $x$, then $X \rightarrow Y$ is quasi-finite at $x$. If $X$ is locally quasi-finite over $S$, then $X \rightarrow Y$ is locally quasi-finite.

Proof. Via Lemma 28.20 .11 this translates into the following algebra fact: Given ring maps $A \rightarrow B \rightarrow C$ such that $A \rightarrow C$ is quasi-finite, then $B \rightarrow C$ is quasifinite. This follows from Algebra, Lemma 10.121 .6 with $R=A, S=S^{\prime}=C$ and $R^{\prime}=B$.

### 28.21. Morphisms of finite presentation

01 TO Recall that a ring map $R \rightarrow A$ is of finite presentation if $A$ is isomorphic to $R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{m}\right)$ as an $R$-algebra for some $n, m$ and some polynomials $f_{j}$, see Algebra, Definition 10.6.1.
01TP Definition 28.21.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is of finite presentation at $x \in X$ if there exists a affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and affine open $\operatorname{Spec}(R)=$ $V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is of finite presentation.
(2) We say that $f$ is locally of finite presentation if it is of finite presentation at every point of $X$.
(3) We say that $f$ is of finite presentation if it is locally of finite presentation, quasi-compact and quasi-separated.
Note that a morphism of finite presentation is not just a quasi-compact morphism which is locally of finite presentation. Later we will characterize morphisms which are locally of finite presentation as those morphisms such that

$$
\operatorname{colim}_{\operatorname{Mor}_{S}}\left(T_{i}, X\right)=\operatorname{Mor}_{S}\left(\lim T_{i}, X\right)
$$

for any directed system of affine schemes $T_{i}$ over $S$. See Limits, Proposition 31.5.1. In Limits, Section 31.9 we show that, if $S=\lim _{i} S_{i}$ is a limit of affine schemes, any scheme $X$ of finite presentation over $S$ descends to a scheme $X_{i}$ over $S_{i}$ for some $i$.
01TQ Lemma 28.21.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is locally of finite presentation.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is of finite presentation.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is locally of finite presentation.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is of finite presentation, for all $j \in J, i \in I_{j}$.

Moreover, if $f$ is locally of finite presentation then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is locally of finite presentation.

Proof. This follows from Lemma 28.14 .3 if we show that the property " $R \rightarrow A$ is of finite presentation" is local. We check conditions (a), (b) and (c) of Definition 28.14.1. By Algebra, Lemma 10.13.2 being of finite presentation is stable under base change and hence we conclude (a) holds. By the same lemma being of finite presentation is stable under composition and trivially for any ring $R$ the ring map $R \rightarrow R_{f}$ is of finite presentation. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.23 .3 .

01TR Lemma 28.21.3. The composition of two morphisms which locally of finite presentation is locally of finite presentation. The same is true for morphisms of finite presentation.

Proof. In the proof of Lemma 28.21 .2 we saw that being of finite presentation is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being of finite presentation is a property of ring maps that is stable under composition, see Algebra, Lemma 10.6.2. By the above and the fact that compositions of quasi-compact, quasi-separated morphisms are quasi-compact and quasi-separated, see Schemes, Lemmas 25.19.4 and 25.21 .13 we see that the composition of morphisms of finite presentation is of finite presentation.

01TS Lemma 28.21.4. The base change of a morphism which is locally of finite presentation is locally of finite presentation. The same is true for morphisms of finite presentation.

Proof. In the proof of Lemma 28.21 .2 we saw that being of finite presentation is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being of finite presentation is a property of ring maps that is stable under base change, see Algebra, Lemma 10.13.2. By the above and the fact that a base change of a quasi-compact, quasi-separated morphism is quasi-compact and quasi-separated, see Schemes, Lemmas 25.19.3 and 25.21 .13 we see that the base change of a morphism of finite presentation is a morphism of finite presentation.

01TT Lemma 28.21.5. Any open immersion is locally of finite presentation.
Proof. This is true because an open immersion is a local isomorphism.
01TU Lemma 28.21.6. Any open immersion is of finite presentation if and only if it is quasi-compact.

Proof. We have seen (Lemma 28.21.5) that an open immersion is locally of finite presentation. We have see (Schemes, Lemma 25.23.7) that an immersion is separated and hence quasi-separated. From this and Definition 28.21.1 the lemma follows.

01TV Lemma 28.21.7. A closed immersion $i: Z \rightarrow X$ is of finite presentation if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}\right)$ is of finite type (as an $\mathcal{O}_{X}$-module).

Proof. On any affine open $\operatorname{Spec}(R) \subset X$ we have $i^{-1}(\operatorname{Spec}(R))=\operatorname{Spec}(R / I)$ and $\mathcal{I}=\widetilde{I}$. Moreover, $\mathcal{I}$ is of finite type if and only if $I$ is a finite $R$-module for every such affine open (see Properties, Lemma 27.16.1). And $R / I$ is of finite presentation over $R$ if and only if $I$ is a finite $R$-module. Hence we win.

01TW Lemma 28.21.8. A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.

Proof. Omitted.

01TX Lemma 28.21.9. Let $f: X \rightarrow S$ be a morphism.
(1) If $S$ is locally Noetherian and $f$ locally of finite type then $f$ is locally of finite presentation.
(2) If $S$ is locally Noetherian and $f$ of finite type then $f$ is of finite presentation.

Proof. The first statement follows from the fact that a ring of finite type over a Noetherian ring is of finite presentation, see Algebra, Lemma 10.30.4. Suppose that $f$ is of finite type and $S$ is locally Noetherian. Then $f$ is quasi-compact and locally of finite presentation by (1). Hence it suffices to prove that $f$ is quasi-separated. This follows from Lemma 28.15.7 (and Lemma 28.21.8.

01TY Lemma 28.21.10. Let $S$ be a scheme which is quasi-compact and quasi-separated. If $X$ is of finite presentation over $S$, then $X$ is quasi-compact and quasi-separated.

Proof. Omitted.
02FV Lemma 28.21.11. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$.
(1) If $X$ is locally of finite presentation over $S$ and $Y$ is locally of finite type over $S$, then $f$ is locally of finite presentation.
(2) If $X$ is of finite presentation over $S$ and $Y$ is quasi-separated and locally of finite type over $S$, then $f$ is of finite presentation.

Proof. Proof of (1). Via Lemma 28.21 .2 this translates into the following algebra fact: Given ring maps $A \rightarrow B \rightarrow C$ such that $A \rightarrow C$ is of finite presentation and $A \rightarrow B$ is of finite type, then $B \rightarrow C$ is of finite type. See Algebra, Lemma 10.6.2,

Part (2) follows from (1) and Schemes, Lemmas 25.21.14 and 25.21.15
0818 Lemma 28.21.12. Let $f: X \rightarrow Y$ be a morphism of schemes with diagonal $\Delta: X \rightarrow X \times_{Y} X$. If $f$ is locally of finite type then $\Delta$ is locally of finite presentation. If $f$ is quasi-separated and locally of finite type, then $\Delta$ is of finite presentation.

Proof. Note that $\Delta$ is a morphism of schemes over $X$ (via the second projection $\left.X \times_{Y} X \rightarrow X\right)$. Assume $f$ is locally of finite type. Note that $X$ is of finite presentation over $X$ and $X \times_{Y} X$ is locally of finite type over $X$ (by Lemma 28.15.4). Thus the first statement holds by Lemma 28.21.11. The second statement follows from the first, the definitions, and the fact that a diagonal morphism is a monomorphism, hence separated (Schemes, Lemma 25.23.3).

### 28.22. Constructible sets

054 H Constructible and locally constructible sets of schemes have been discussed in Properties, Section 27.2. In this section we prove some results concerning images and inverse images of (locally) constructible sets. The main result is Chevalley's theorem which states that the image of a locally constructible set under a morphism of finite presentation is locally constructible.

054 Lemma 28.22.1. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $E \subset Y$ be a subset. If $E$ is (locally) constructible in $Y$, then $f^{-1}(E)$ is (locally) constructible in $X$.

Proof. To show that the inverse image of every constructible subset is constructible it suffices to show that the inverse image of every retrocompact open $V$ of $Y$ is retrocompact in $X$, see Topology, Lemma 5.14.3. The significance of $V$ being retrocompact in $Y$ is just that the open immersion $V \rightarrow Y$ is quasi-compact. Hence the base change $f^{-1}(V)=X \times_{Y} V \rightarrow X$ is quasi-compact too, see Schemes, Lemma 25.19.3. Hence we see $f^{-1}(V)$ is retrocompact in $X$. Suppose $E$ is locally constructible in $Y$. Choose $x \in X$. Choose an affine neighbourhood $V$ of $f(x)$ and an affine neighbourhood $U \subset X$ of $x$ such that $f(U) \subset V$. Thus we think of $\left.f\right|_{U}: U \rightarrow V$ as a morphism into $V$. By Properties, Lemma 27.2.1 we see that $E \cap V$ is constructible in $V$. By the constructible case we see that $\left(\left.f\right|_{U}\right)^{-1}(E \cap V)$ is constructible in $U$. Since $\left(\left.f\right|_{U}\right)^{-1}(E \cap V)=f^{-1}(E) \cap U$ we win.

054J Lemma 28.22.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume
(1) $f$ is quasi-compact and locally of finite presentation, and
(2) $Y$ is quasi-compact and quasi-separated.

Then the image of every constructible subset of $X$ is constructible in $Y$.
Proof. By Properties, Lemma 27.2 .5 it suffices to prove this lemma in case $Y$ is affine. In this case $X$ is quasi-compact. Hence we can write $X=U_{1} \cup \ldots \cup U_{n}$ with each $U_{i}$ affine open in $X$. If $E \subset X$ is constructible, then each $E \cap U_{i}$ is constructible too, see Topology, Lemma 5.14.4. Hence, since $f(E)=\bigcup f\left(E \cap U_{i}\right)$ and since finite unions of constructible sets are constructible, this reduces us to the case where $X$ is affine. In this case the result is Algebra, Theorem 10.28.9.

054K Theorem 28.22.3 (Chevalley's Theorem). Let $f: X \rightarrow Y$ be a morphism of schemes. Assume $f$ is quasi-compact and locally of finite presentation. Then the image of every locally constructible subset is locally constructible.

Proof. Let $E \subset X$ be locally constructible. We have to show that $f(E)$ is locally constructible too. We will show that $f(E) \cap V$ is constructible for any affine open $V \subset Y$. Thus we reduce to the case where $Y$ is affine. In this case $X$ is quasicompact. Hence we can write $X=U_{1} \cup \ldots \cup U_{n}$ with each $U_{i}$ affine open in $X$. If $E \subset$ $X$ is locally constructible, then each $E \cap U_{i}$ is constructible, see Properties, Lemma 27.2.1. Hence, since $f(E)=\bigcup f\left(E \cap U_{i}\right)$ and since finite unions of constructible sets are constructible, this reduces us to the case where $X$ is affine. In this case the result is Algebra, Theorem 10.28.9.

05LW Lemma 28.22.4. Let $X$ be a scheme. Let $x \in X$. Let $E \subset X$ be a locally constructible subset. If $\left\{x^{\prime} \mid x^{\prime} \rightsquigarrow x\right\} \subset E$, then $E$ contains an open neighbourhood of $x$.

Proof. Assume $\left\{x^{\prime} \mid x^{\prime} \rightsquigarrow x\right\} \subset E$. We may assume $X$ is affine. In this case $E$ is constructible, see Properties, Lemma 27.2.1. In particular, also the complement $E^{c}$ is constructible. By Algebra, Lemma 10.28 .3 we can find a morphism of affine schemes $f: Y \rightarrow X$ such that $E^{c}=f(Y)$. Let $Z \subset X$ be the scheme theoretic image of $f$. By Lemma 28.6 .5 and the assumption $\left\{x^{\prime} \mid x^{\prime} \rightsquigarrow x\right\} \subset E$ we see that $x \notin Z$. Hence $X \backslash Z \subset E$ is an open neighbourhood of $x$ contained in $E$.

### 28.23. Open morphisms

01TZ
01U0 Definition 28.23.1. Let $f: X \rightarrow S$ be a morphism.
(1) We say $f$ is open if the map on underlying topological spaces is open.
(2) We say $f$ is universally open if for any morphism of schemes $S^{\prime} \rightarrow S$ the base change $f^{\prime}: X_{S^{\prime}} \rightarrow S^{\prime}$ is open.

According to Topology, Lemma 5.18 .6 generalizations lift along certain types of open maps of topological spaces. In fact generalizations lift along any open morphism of schemes (see Lemma 28.23.5). Also, we will see that generalizations lift along flat morphisms of schemes (Lemma 28.25.8). This sometimes in turn implies that the morphism is open.

01U1 Lemma 28.23.2. Let $f: X \rightarrow S$ be a morphism.
(1) If $f$ is locally of finite presentation and generalizations lift along $f$, then $f$ is open.
(2) If $f$ is locally of finite presentation and generalizations lift along every base change of $f$, then $f$ is universally open.
Proof. It suffices to prove the first assertion. This reduces to the case where both $X$ and $S$ are affine. In this case the result follows from Algebra, Lemma 10.40.3 and Proposition 10.40.8.

See also Lemma 28.25 .9 for the case of a morphism flat of finite presentation.
02V2 Lemma 28.23.3. A composition of (universally) open morphisms is (universally) open.

Proof. Omitted.
0383 Lemma 28.23.4. Let $k$ be a field. Let $X$ be a scheme over $k$. The structure morphism $X \rightarrow \operatorname{Spec}(k)$ is universally open.
Proof. Let $S \rightarrow \operatorname{Spec}(k)$ be a morphism. We have to show that the base change $X_{S} \rightarrow S$ is open. The question is local on $S$ and $X$, hence we may assume that $S$ and $X$ are affine. In this case the result is Algebra, Lemma 10.40.10,

040F Lemma 28.23.5. Let $\varphi: X \rightarrow Y$ be a morphism of schemes. If $\varphi$ is open, then $\varphi$ is generizing (i.e., generalizations lift along $\varphi$ ). If $\varphi$ is universally open, then $\varphi$ is universally generizing.

Proof. Assume $\varphi$ is open. Let $y^{\prime} \rightsquigarrow y$ be a specialization of points of $Y$. Let $x \in X$ with $\varphi(x)=y$. Choose affine opens $U \subset X$ and $V \subset Y$ such that $\varphi(U) \subset V$ and $x \in U$. Then also $y^{\prime} \in V$. Hence we may replace $X$ by $U$ and $Y$ by $V$ and assume $X, Y$ affine. The affine case is Algebra, Lemma 10.40 .2 (combined with Algebra, Lemma 10.40.3.

04ZE Lemma 28.23.6. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $g: Y^{\prime} \rightarrow Y$ be open and surjective such that the base change $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is quasi-compact. Then $f$ is quasi-compact.
Proof. Let $V \subset Y$ be a quasi-compact open. As $g$ is open and surjective we can find a quasi-compact open $W^{\prime} \subset W$ such that $g\left(W^{\prime}\right)=V$. By assumption $\left(f^{\prime}\right)^{-1}\left(W^{\prime}\right)$ is quasi-compact. The image of $\left(f^{\prime}\right)^{-1}\left(W^{\prime}\right)$ in $X$ is equal to $f^{-1}(V)$, see Lemma 28.10.3. Hence $f^{-1}(V)$ is quasi-compact as the image of a quasi-compact space, see Topology, Lemma 5.11.7. Thus $f$ is quasi-compact.

### 28.24. Submersive morphisms

040G
040H Definition 28.24.1. Let $f: X \rightarrow Y$ be a morphism of schemes.
(1) We say $f$ is submersiv $6^{5}$ if the continuous map of underlying topological spaces is submersive, see Topology, Definition 5.5.3.
(2) We say $f$ is universally submersive if for every morphism of schemes $Y^{\prime} \rightarrow$ $Y$ the base change $Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is submersive.

We note that a submersive morphism is in particular surjective.

### 28.25. Flat morphisms

01U2 Flatness is one of the most important technical tools in algebraic geometry. In this section we introduce this notion. We intentionally limit the discussion to straightforward observations, apart from Lemma 28.25.9. A very important class of results, namely criteria for flatness will be discussed (insert future reference here).
Recall that a module $M$ over a ring $R$ is flat if the functor $-\otimes_{R} M: \operatorname{Mod}_{R} \rightarrow \operatorname{Mod}_{R}$ is exact. A ring map $R \rightarrow A$ is said to be flat if $A$ is flat as an $R$-module. See Algebra, Definition 10.38.1.

01U3 Definition 28.25.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules.
(1) We say $f$ is flat at a point $x \in X$ if the local ring $\mathcal{O}_{X, x}$ is flat over the local ring $\mathcal{O}_{S, f(x)}$.
(2) We say that $\mathcal{F}$ is flat over $S$ at a point $x \in X$ if the stalk $\mathcal{F}_{x}$ is a flat $\mathcal{O}_{S, f(x)}$-module.
(3) We say $f$ is flat if $f$ is flat at every point of $X$.
(4) We say that $\mathcal{F}$ is flat over $S$ if $\mathcal{F}$ is flat over $S$ at every point $x$ of $X$.

Thus we see that $f$ is flat if and only if the structure sheaf $\mathcal{O}_{X}$ is flat over $S$.
01U4 Lemma 28.25.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf of $\mathcal{O}_{X}$-modules. The following are equivalent
(1) The sheaf $\mathcal{F}$ is flat over $S$.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the $\mathcal{O}_{S}(V)$-module $\mathcal{F}(U)$ is flat.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the modules $\left.\mathcal{F}\right|_{U_{i}}$ is flat over $V_{j}$, for all $j \in$ $J, i \in I_{j}$.

[^72](4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that $\mathcal{F}\left(U_{i}\right)$ is a flat $\mathcal{O}_{S}\left(V_{j}\right)$-module, for all $j \in J, i \in I_{j}$.
Moreover, if $\mathcal{F}$ is flat over $S$ then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.\mathcal{F}\right|_{U}$ is flat over $V$.

Proof. Let $R \rightarrow A$ be a ring map. Let $M$ be an $A$-module. If $M$ is $R$-flat, then for all primes $\mathfrak{q}$ the module $M_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ with $\mathfrak{p}$ the prime of $R$ lying under $\mathfrak{q}$. Conversely, if $M_{\mathfrak{q}}$ is flat over $R_{\mathfrak{p}}$ for all primes $\mathfrak{q}$ of $A$, then $M$ is flat over $R$. See Algebra, Lemma 10.38 .19 . This equivalence easily implies the statements of the lemma.

01U5 Lemma 28.25.3. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is flat.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is flat.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is flat.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is flat, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is flat then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is flat.

Proof. This is a special case of Lemma 28.25 .2 above.
01U6 Lemma 28.25.4. Let $X \rightarrow Y \rightarrow Z$ be morphisms of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $x \in X$ with image $y$ in $Y$. If $\mathcal{F}$ is flat over $Y$ at $x$, and $Y$ is flat over $Z$ at $y$, then $\mathcal{F}$ is flat over $Z$ at $x$.

Proof. See Algebra, Lemma 10.38.4.
01U7 Lemma 28.25.5. The composition of flat morphisms is flat.
Proof. This is a special case of Lemma 28.25.4.
01U8 Lemma 28.25.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf of $\mathcal{O}_{X}$-modules. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Denote $g^{\prime}: X^{\prime}=X_{S^{\prime}} \rightarrow X$ the projection. Let $x^{\prime} \in X^{\prime}$ be a point with image $x=g\left(x^{\prime}\right) \in X$. If $\mathcal{F}$ is flat over $S$ at $x$, then $\left(g^{\prime}\right)^{* \mathcal{F}}$ is flat over $S^{\prime}$ at $x^{\prime}$. In particular, if $\mathcal{F}$ is flat over $S$, then $\left(g^{\prime}\right)^{*} \mathcal{F}$ is flat over $S^{\prime}$.

Proof. See Algebra, Lemma 10.38.7.
01U9 Lemma 28.25.7. The base change of a flat morphism is flat.
Proof. This is a special case of Lemma 28.25.6.
03HV Lemma 28.25.8. Let $f: X \rightarrow S$ be a flat morphism of schemes. Then generalizations lift along $f$, see Topology, Definition 5.18.3.

Proof. See Algebra, Section 10.40 .

01UA Lemma 28.25.9. A flat morphism locally of finite presentation is universally open.

Proof. This follows from Lemmas 28.25 .8 and Lemma 28.23 .2 above. We can also argue directly as follows.

Let $f: X \rightarrow S$ be flat locally of finite presentation. To show $f$ is open it suffices to show that we may cover $X$ by open affines $X=\bigcup U_{i}$ such that $U_{i} \rightarrow S$ is open. By definition we may cover $X$ by affine opens $U_{i} \subset X$ such that each $U_{i}$ maps into an affine open $V_{i} \subset S$ and such that the induced ring map $\mathcal{O}_{S}\left(V_{i}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is of finite presentation. Thus $U_{i} \rightarrow V_{i}$ is open by Algebra, Proposition 10.40.8. The lemma follows.

02JY Lemma 28.25.10. Let $f: X \rightarrow Y$ be a quasi-compact, surjective, flat morphism. A subset $T \subset Y$ is open (resp. closed) if and only $f^{-1}(T)$ is open (resp. closed). In other words, $f$ is a submersive morphism.

Proof. The question is local on $Y$, hence we may assume that $Y$ is affine. In this case $X$ is quasi-compact as $f$ is quasi-compact. Write $X=X_{1} \cup \ldots \cup X_{n}$ as a finite union of affine opens. Then $f^{\prime}: X^{\prime}=X_{1} \amalg \ldots \amalg X_{n} \rightarrow Y$ is a surjective flat morphism of affine schemes. Note that for $T \subset Y$ we have $\left(f^{\prime}\right)^{-1}(T)=f^{-1}(T) \cap$ $X_{1} \amalg \ldots \amalg f^{-1}(T) \cap X_{n}$. Hence, $f^{-1}(T)$ is open if and only if $\left(f^{\prime}\right)^{-1}(T)$ is open. Thus we may assume both $X$ and $Y$ are affine.

Let $f: \operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ be a surjective morphism of affine schemes corresponding to a flat ring map $A \rightarrow B$. Suppose that $f^{-1}(T)$ is closed, say $f^{-1}(T)=V(I)$ for $I \subset A$ an ideal. Then $T=f\left(f^{-1}(T)\right)=f(V(I))$ is the image of $\operatorname{Spec}(A / I) \rightarrow$ $\operatorname{Spec}(B)$ (here we use that $f$ is surjective). On the other hand, generalizations lift along $f$ (Lemma 28.25.8). Hence by Topology, Lemma 5.18 .5 we see that $Y \backslash T=f\left(X \backslash f^{-1}(T)\right)$ is stable under generalization. Hence $T$ is stable under specialization (Topology, Lemma 5.18.2). Thus $T$ is closed by Algebra, Lemma 10.40 .5

02JZ Lemma 28.25.11. Let $h: X \rightarrow Y$ be a morphism of schemes over $S$. Let $\mathcal{G}$ be a quasi-coherent sheaf on $Y$. Let $x \in X$ with $y=h(x) \in Y$. If $h$ is flat at $x$, then

$$
\mathcal{G} \text { flat over } S \text { at } y \Leftrightarrow h^{*} \mathcal{G} \text { flat over } S \text { at } x .
$$

In particular: If $h$ is surjective and flat, then $\mathcal{G}$ is flat over $S$, if and only if $h^{*} \mathcal{G}$ is flat over $S$. If $h$ is surjective and flat, and $X$ is flat over $S$, then $Y$ is flat over $S$.

Proof. You can prove this by applying Algebra, Lemma 10.38.9. Here is a direct proof. Let $s \in S$ be the image of $y$. Consider the local ring maps $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{Y, y} \rightarrow$ $\mathcal{O}_{X, x}$. By assumption the ring map $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x}$ is faithfully flat, see Algebra, Lemma 10.38.17. Let $N=\mathcal{G}_{y}$. Note that $h^{*} \mathcal{G}_{x}=N \otimes_{\mathcal{O}_{Y, y}} \mathcal{O}_{X, x}$, see Sheaves, Lemma 6.26.4 Let $M^{\prime} \rightarrow M$ be an injection of $\mathcal{O}_{S, s}$-modules. By the faithful flatness mentioned above we have

$$
\begin{aligned}
\operatorname{Ker}\left(M^{\prime} \otimes_{\mathcal{O}_{S, s}} N\right. & \left.\rightarrow M \otimes_{\mathcal{O}_{S, s}} N\right) \otimes_{\mathcal{O}_{Y, y}} \mathcal{O}_{X, x} \\
=\operatorname{Ker}\left(M^{\prime} \otimes_{\mathcal{O}_{S, s}} N \otimes_{\mathcal{O}_{Y, y}} \mathcal{O}_{X, x}\right. & \left.\rightarrow M \otimes_{\mathcal{O}_{S, s}} N \otimes_{\mathcal{O}_{Y, y}} \mathcal{O}_{X, x}\right)
\end{aligned}
$$

Hence the equivalence of the lemma follows from the second characterization of flatness in Algebra, Lemma 10.38.5.

07 T 9 Lemma 28.25.12. Let $f: Y \rightarrow X$ be a morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_{X}$-module with scheme theoretic support $Z \subset X$. If $f$ is flat, then $f^{-1}(Z)$ is the scheme theoretic support of $f^{*} \mathcal{F}$.

Proof. Using the characterization of scheme theoretic support on affines as given in Lemma 28.5.4 we reduce to Algebra, Lemma 10.39.4.

081H Lemma 28.25.13. Let $f: X \rightarrow Y$ be a flat morphism of schemes. Let $V \subset Y$ be a retrocompact open which is scheme theoretically dense. Then $f^{-1} V$ is scheme theoretically dense in $X$.

Proof. We will use the characterization of Lemma 28.7.5. We have to show that for any open $U \subset X$ the map $\mathcal{O}_{X}(U) \rightarrow \mathcal{O}_{X}\left(U \cap f^{-1} V\right)$ is injective. It suffices to prove this when $U$ is an affine open which maps into an affine open $W \subset Y$. Say $W=\operatorname{Spec}(A)$ and $U=\operatorname{Spec}(B)$. Then $V \cap W=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ for some $f_{i} \in A$, see Algebra, Lemma 10.28.1. Thus we have to show that $B \rightarrow B_{f_{1}} \times \ldots \times B_{f_{n}}$ is injective. We are given that $A \rightarrow A_{f_{1}} \times \ldots \times A_{f_{n}}$ is injective and that $A \rightarrow B$ is flat. Since $B_{f_{i}}=A_{f_{i}} \otimes_{A} B$ we win.

081 I Lemma 28.25.14. Let $f: X \rightarrow Y$ be a flat morphism of schemes. Let $g: V \rightarrow Y$ be a quasi-compact morphism of schemes. Let $Z \subset Y$ be the scheme theoretic image of $g$ and let $Z^{\prime} \subset X$ be the scheme theoretic image of the base change $V \times_{Y} X \rightarrow X$. Then $Z^{\prime}=f^{-1} Z$.

Proof. Recall that $Z$ is cut out by $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{Y} \rightarrow g_{*} \mathcal{O}_{V}\right)$ and $Z^{\prime}$ is cut out by $\mathcal{I}^{\prime}=\operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow\left(V \times_{Y} X \rightarrow X\right)_{*} \mathcal{O}_{V \times_{Y} X}\right)$, see Lemma 28.6.3. Hence the question is local on $X$ and $Y$ and we may assume $X$ and $Y$ affine. Note that we may replace $V$ by $\coprod V_{i}$ where $V=V_{1} \cup \ldots \cup V_{n}$ is a finite affine open covering. Hence we may assume $g$ is affine. In this case $\left(V \times_{Y} X \rightarrow X\right)_{*} \mathcal{O}_{V \times_{Y} X}$ is the pullback of $g_{*} \mathcal{O}_{V}$ by $f$. Since $f$ is flat we conclude that $f^{*} \mathcal{I}=\mathcal{I}^{\prime}$ and the lemma holds.

### 28.26. Flat closed immersions

04 PV Connected components of schemes are not always open. But they do always have a canonical scheme structure. We explain this in this section.

04PW Lemma 28.26.1. Let $X$ be a scheme. The rule which associates to a closed subscheme of $X$ its underlying closed subset defines a bijection

$$
\left\{\begin{array}{c}
\text { closed subschemes } Z \subset X \\
\text { such that } Z \rightarrow X \text { is flat }
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { closed subsets } Z \subset X \\
\text { closed under generalizations }
\end{array}\right\}
$$

Proof. The affine case is Algebra, Lemma 10.107.4. In general the lemma follows by covering $X$ by affines and glueing. Details omitted.

0819 Lemma 28.26.2. A flat closed immersion of finite presentation is the open immersion of an open and closed subscheme.

Proof. The affine case is Algebra, Lemma 10.107.5. In general the lemma follows by covering $X$ by affines. Details omitted.

Note that a connected component $T$ of a scheme $X$ is a closed subset stable under generalization. Hence the following definition makes sense.

04PX Definition 28.26.3. Let $X$ be a scheme. Let $T \subset X$ be a connected component. The canonical scheme structure on $T$ is the unique scheme structure on $T$ such that the closed immersion $T \rightarrow X$ is flat, see Lemma 28.26.1.

It turns out that we can determine when every finite flat $\mathcal{O}_{X}$-module is finite locally free using the previous lemma.

053N Lemma 28.26.4. Let $X$ be a scheme. The following are equivalent
(1) every finite flat quasi-coherent $\mathcal{O}_{X}$-module is finite locally free, and
(2) every closed subset $Z \subset X$ which is closed under generalizations is open.

Proof. In the affine case this is Algebra, Lemma 10.107.6. The scheme case does not follow directly from the affine case, so we simply repeat the arguments.
Assume (1). Consider a closed immersion $i: Z \rightarrow X$ such that $i$ is flat. Then $i_{*} \mathcal{O}_{Z}$ is quasi-coherent and flat, hence finite locally free by (1). Thus $Z=\operatorname{Supp}\left(i_{*} \mathcal{O}_{Z}\right)$ is also open and we see that (2) holds. Hence the implication $(1) \Rightarrow(2)$ follows from the characterization of flat closed immersions in Lemma 28.26.1.
For the converse assume that $X$ satisfies (2). Let $\mathcal{F}$ be a finite flat quasi-coherent $\mathcal{O}_{X}$-module. The support $Z=\operatorname{Supp}(\mathcal{F})$ of $\mathcal{F}$ is closed, see Modules, Lemma 17.9.6 On the other hand, if $x \rightsquigarrow x^{\prime}$ is a specialization, then by Algebra, Lemma 10.77.4 the module $\mathcal{F}_{x^{\prime}}$ is free over $\mathcal{O}_{X, x^{\prime}}$, and

$$
\mathcal{F}_{x}=\mathcal{F}_{x^{\prime}} \otimes_{\mathcal{O}_{X, x^{\prime}}} \mathcal{O}_{X, x}
$$

Hence $x^{\prime} \in \operatorname{Supp}(\mathcal{F}) \Rightarrow x \in \operatorname{Supp}(\mathcal{F})$, in other words, the support is closed under generalization. As $X$ satisfies (2) we see that the support of $\mathcal{F}$ is open and closed. The modules $\wedge^{i}(\mathcal{F}), i=1,2,3, \ldots$ are finite flat quasi-coherent $\mathcal{O}_{X}$-modules also, see Modules, Section 17.18. Note that $\operatorname{Supp}\left(\wedge^{i+1}(\mathcal{F})\right) \subset \operatorname{Supp}\left(\wedge^{i}(\mathcal{F})\right)$. Thus we see that there exists a decomposition

$$
X=U_{0} \amalg U_{1} \amalg U_{2} \amalg \ldots
$$

by open and closed subsets such that the support of $\wedge^{i}(\mathcal{F})$ is $U_{i} \cup U_{i+1} \cup \ldots$ for all $i$. Let $x$ be a point of $X$, and say $x \in U_{r}$. Note that $\wedge^{i}(\mathcal{F})_{x} \otimes \kappa(x)=\wedge^{i}\left(\mathcal{F}_{x} \otimes\right.$ $\kappa(x))$. Hence, $x \in U_{r}$ implies that $\mathcal{F}_{x} \otimes \kappa(x)$ is a vector space of dimension $r$. By Nakayama's lemma, see Algebra, Lemma 10.19.1 we can choose an affine open neighbourhood $U \subset U_{r} \subset X$ of $x$ and sections $s_{1}, \ldots, s_{r} \in \mathcal{F}(U)$ such that the induced map

$$
\left.\mathcal{O}_{U}^{\oplus r} \longrightarrow \mathcal{F}\right|_{U}, \quad\left(f_{1}, \ldots, f_{r}\right) \longmapsto \sum f_{i} s_{i}
$$

is surjective. This means that $\wedge^{r}\left(\left.\mathcal{F}\right|_{U}\right)$ is a finite flat quasi-coherent $\mathcal{O}_{U}$-module whose support is all of $U$. By the above it is generated by a single element, namely $s_{1} \wedge \ldots \wedge s_{r}$. Hence $\wedge^{r}\left(\left.\mathcal{F}\right|_{U}\right) \cong \mathcal{O}_{U} / \mathcal{I}$ for some quasi-coherent sheaf of ideals $\mathcal{I}$ such that $\mathcal{O}_{U} / \mathcal{I}$ is flat over $\mathcal{O}_{U}$ and such that $V(\mathcal{I})=U$. It follows that $\mathcal{I}=0$ by applying Lemma 28.26.1. Thus $s_{1} \wedge \ldots \wedge s_{r}$ is a basis for $\wedge^{r}\left(\left.\mathcal{F}\right|_{U}\right)$ and it follows that the displayed map is injective as well as surjective. This proves that $\mathcal{F}$ is finite locally free as desired.

### 28.27. Generic flatness

0529 A scheme of finite type over an integral base is flat over a dense open of the base. In Algebra, Section 10.117 we proved a Noetherian version, a version for morphisms of finite presentation, and a general version. We only state and prove the general
version here. However, it turns out that this will be superseded by Proposition 28.27 .2 which shows the result holds if we only assume the base is reduced.

052A Proposition 28.27.1 (Generic flatness). Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules. Assume
(1) $S$ is integral,
(2) $f$ is of finite type, and
(3) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module.

Then there exists an open dense subscheme $U \subset S$ such that $X_{U} \rightarrow U$ is flat and of finite presentation and such that $\left.\mathcal{F}\right|_{X_{U}}$ is flat over $U$ and of finite presentation over $\mathcal{O}_{X_{U}}$.

Proof. As $S$ is integral it is irreducible (see Properties, Lemma 27.3.4 and any nonempty open is dense. Hence we may replace $S$ by an affine open of $S$ and assume that $S=\operatorname{Spec}(A)$ is affine. As $S$ is integral we see that $A$ is a domain. As $f$ is of finite type, it is quasi-compact, so $X$ is quasi-compact. Hence we can find a finite affine open cover $X=\bigcup_{i=1, \ldots, n} X_{i}$. Write $X_{i}=\operatorname{Spec}\left(B_{i}\right)$. Then $B_{i}$ is a finite type $A$-algebra, see Lemma 28.15 .2 . Moreover there are finite type $B_{i}$-modules $M_{i}$ such that $\left.\mathcal{F}\right|_{X_{i}}$ is the quasi-coherent sheaf associated to the $B_{i}$-module $M_{i}$, see Properties, Lemma 27.16.1. Next, for each pair of indices $i, j$ choose an ideal $I_{i j} \subset B_{i}$ such that $X_{i} \backslash X_{i} \cap X_{j}=V\left(I_{i j}\right)$ inside $X_{i}=\operatorname{Spec}\left(B_{i}\right)$. Set $M_{i j}=B_{i} / I_{i j}$ and think of it as a $B_{i}$-module. Then $V\left(I_{i j}\right)=\operatorname{Supp}\left(M_{i j}\right)$ and $M_{i j}$ is a finite $B_{i}$-module.
At this point we apply Algebra, Lemma 10.117 .3 the pairs $\left(A \rightarrow B_{i}, M_{i j}\right)$ and to the pairs $\left(A \rightarrow B_{i}, M_{i}\right)$. Thus we obtain nonzero $f_{i j}, f_{i} \in A$ such that (a) $A_{f_{i j}} \rightarrow B_{i, f_{i j}}$ is flat and of finite presentation and $M_{i j, f_{i j}}$ is flat over $A_{f_{i j}}$ and of finite presentation over $B_{i, f_{i j}}$, and (b) $B_{i, f_{i}}$ is flat and of finite presentation over $A_{f}$ and $M_{i, f_{i}}$ is flat and of finite presentation over $B_{i, f_{i}}$. Set $f=\left(\prod f_{i}\right)\left(\prod f_{i j}\right)$. We claim that taking $U=D(f)$ works.

To prove our claim we may replace $A$ by $A_{f}$, i.e., perform the base change by $U=\operatorname{Spec}\left(A_{f}\right) \rightarrow S$. After this base change we see that each of $A \rightarrow B_{i}$ is flat and of finite presentation and that $M_{i}, M_{i j}$ are flat over $A$ and of finite presentation over $B_{i}$. This already proves that $X \rightarrow S$ is quasi-compact, locally of finite presentation, flat, and that $\mathcal{F}$ is flat over $S$ and of finite presentation over $\mathcal{O}_{X}$, see Lemma 28.21.2 and Properties, Lemma 27.16.2. Since $M_{i j}$ is of finite presentation over $B_{i}$ we see that $X_{i} \cap X_{j}=X_{i} \backslash \operatorname{Supp}\left(M_{i j}\right)$ is a quasi-compact open of $X_{i}$, see Algebra, Lemma 10.39.7. Hence we see that $X \rightarrow S$ is quasi-separated by Schemes, Lemma 25.21.7. This proves the proposition.

It actually turns out that there is also a version of generic flatness over an arbitrary reduced base. Here it is.
052B Proposition 28.27.2 (Generic flatness, reduced case). Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-modules. Assume
(1) $S$ is reduced,
(2) $f$ is of finite type, and
(3) $\mathcal{F}$ is a finite type $\mathcal{O}_{X}$-module.

Then there exists an open dense subscheme $U \subset S$ such that $X_{U} \rightarrow U$ is flat and of finite presentation and such that $\left.\mathcal{F}\right|_{X_{U}}$ is flat over $U$ and of finite presentation over $\mathcal{O}_{X_{U}}$.

Proof. For the impatient reader: This proof is a repeat of the proof of Proposition 28.27.1 using Algebra, Lemma 10.117.7 instead of Algebra, Lemma 10.117.3.

Since being flat and being of finite presentation is local on the base, see Lemmas 28.25 .2 and 28.21 .2 , we may work affine locally on $S$. Thus we may assume that $S=\operatorname{Spec}(A)$, where $A$ is a reduced ring (see Properties, Lemma 27.3.2. As $f$ is of finite type, it is quasi-compact, so $X$ is quasi-compact. Hence we can find a finite affine open cover $X=\bigcup_{i=1, \ldots, n} X_{i}$. Write $X_{i}=\operatorname{Spec}\left(B_{i}\right)$. Then $B_{i}$ is a finite type $A$-algebra, see Lemma $\sqrt{28.15 .2}$. Moreover there are finite type $B_{i}$-modules $M_{i}$ such that $\left.\mathcal{F}\right|_{X_{i}}$ is the quasi-coherent sheaf associated to the $B_{i}$-module $M_{i}$, see Properties, Lemma 27.16.1. Next, for each pair of indices $i, j$ choose an ideal $I_{i j} \subset B_{i}$ such that $X_{i} \backslash X_{i} \cap X_{j}=V\left(I_{i j}\right)$ inside $X_{i}=\operatorname{Spec}\left(B_{i}\right)$. Set $M_{i j}=B_{i} / I_{i j}$ and think of it as a $B_{i}$-module. Then $V\left(I_{i j}\right)=\operatorname{Supp}\left(M_{i j}\right)$ and $M_{i j}$ is a finite $B_{i}$-module.

At this point we apply Algebra, Lemma 10.117 .7 the pairs $\left(A \rightarrow B_{i}, M_{i j}\right)$ and to the pairs $\left(A \rightarrow B_{i}, M_{i}\right)$. Thus we obtain dense opens $U\left(A \rightarrow B_{i}, M_{i j}\right) \subset S$ and dense opens $U\left(A \rightarrow B_{i}, M_{i}\right) \subset S$ with notation as in Algebra, Equation 10.117.3.2. Since a finite intersection of dense opens is dense open, we see that

$$
U=\bigcap_{i, j} U\left(A \rightarrow B_{i}, M_{i j}\right) \quad \cap \bigcap_{i} U\left(A \rightarrow B_{i}, M_{i}\right)
$$

is open and dense in $S$. We claim that $U$ is the desired open.
Pick $u \in U$. By definition of the loci $U\left(A \rightarrow B_{i}, M_{i j}\right)$ and $U\left(A \rightarrow B, M_{i}\right)$ there exist $f_{i j}, f_{i} \in A$ such that (a) $u \in D\left(f_{i}\right)$ and $u \in D\left(f_{i j}\right)$, (b) $A_{f_{i j}} \rightarrow B_{i, f_{i j}}$ is flat and of finite presentation and $M_{i j, f_{i j}}$ is flat over $A_{f_{i j}}$ and of finite presentation over $B_{i, f_{i j}}$, and (c) $B_{i, f_{i}}$ is flat and of finite presentation over $A_{f}$ and $M_{i, f_{i}}$ is flat and of finite presentation over $B_{i, f_{i}}$. Set $f=\left(\prod f_{i}\right)\left(\prod f_{i j}\right)$. Now it suffices to prove that $X \rightarrow S$ is flat and of finite presentation over $D(f)$ and that $\mathcal{F}$ restricted to $X_{D(f)}$ is flat over $D(f)$ and of finite presentation over the structure sheaf of $X_{D(f)}$.

Hence we may replace $A$ by $A_{f}$, i.e., perform the base change by $\operatorname{Spec}\left(A_{f}\right) \rightarrow S$. After this base change we see that each of $A \rightarrow B_{i}$ is flat and of finite presentation and that $M_{i}, M_{i j}$ are flat over $A$ and of finite presentation over $B_{i}$. This already proves that $X \rightarrow S$ is quasi-compact, locally of finite presentation, flat, and that $\mathcal{F}$ is flat over $S$ and of finite presentation over $\mathcal{O}_{X}$, see Lemma 28.21 .2 and Properties, Lemma 27.16 .2 Since $M_{i j}$ is of finite presentation over $B_{i}$ we see that $X_{i} \cap X_{j}=$ $X_{i} \backslash \operatorname{Supp}\left(M_{i j}\right)$ is a quasi-compact open of $X_{i}$, see Algebra, Lemma 10.39.7. Hence we see that $X \rightarrow S$ is quasi-separated by Schemes, Lemma 25.21.7. This proves the proposition.

052C Remark 28.27.3. The results above are a first step towards more refined flattening techniques for morphisms of schemes. The article GR71 by Raynaud and Gruson contains many wonderful results in this direction.

### 28.28. Morphisms and dimensions of fibres

02FW Let $X$ be a topological space, and $x \in X$. Recall that we have defined $\operatorname{dim}_{x}(X)$ as the minimum of the dimensions of the open neighbourhoods of $x$ in $X$. See Topology, Definition 5.9.1.

02FX Lemma 28.28.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ and set $s=f(x)$. Assume $f$ is locally of finite type. Then

$$
\operatorname{dim}_{x}\left(X_{s}\right)=\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)+\operatorname{trdeg}_{\kappa(s)}(\kappa(x))
$$

Proof. This immediately reduces to the case $S=s$, and $X$ affine. In this case the result follows from Algebra, Lemma 10.115.3.

02JS Lemma 28.28.2. Let $f: X \rightarrow Y$ and $g: Y \rightarrow S$ be morphisms of schemes. Let $x \in X$ and set $y=f(x), s=g(y)$. Assume $f$ and $g$ locally of finite type. Then

$$
\operatorname{dim}_{x}\left(X_{s}\right) \leq \operatorname{dim}_{x}\left(X_{y}\right)+\operatorname{dim}_{y}\left(Y_{s}\right)
$$

Moreover, equality holds if $\mathcal{O}_{X_{s}, x}$ is flat over $\mathcal{O}_{Y_{s}, y}$, which holds for example if $\mathcal{O}_{X, x}$ is flat over $\mathcal{O}_{Y, y}$.
Proof. Note that $\operatorname{trdeg}_{\kappa(s)}(\kappa(x))=\operatorname{trdeg}_{\kappa(y)}(\kappa(x))+\operatorname{trdeg}_{\kappa(s)}(\kappa(y))$. Thus by Lemma 28.28.1 the statement is equivalent to

$$
\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right) \leq \operatorname{dim}\left(\mathcal{O}_{X_{y}, x}\right)+\operatorname{dim}\left(\mathcal{O}_{Y_{s}, y}\right)
$$

For this see Algebra, Lemma 10.111.6. For the flat case see Algebra, Lemma 10.111.7.

02FY Lemma 28.28.3. Let

be a fibre product diagram of schemes. Assume $f$ locally of finite type. Suppose that $x^{\prime} \in X^{\prime}, x=g^{\prime}\left(x^{\prime}\right), s^{\prime}=f^{\prime}\left(x^{\prime}\right)$ and $s=g\left(s^{\prime}\right)=f(x)$. Then $\operatorname{dim}_{x}\left(X_{s}\right)=$ $\operatorname{dim}_{x^{\prime}}\left(X_{s^{\prime}}^{\prime}\right)$.
Proof. Follows immediately from Algebra, Lemma 10.115.6.
The following lemma follows from a nontrivial algebraic result. Namely, the algebraic version of Zariski's main theorem.
02FZ Lemma 28.28.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $n \geq 0$. Assume $f$ is locally of finite type. The set

$$
U_{n}=\left\{x \in X \mid \operatorname{dim}_{x} X_{f(x)} \leq n\right\}
$$

is open in $X$.
Proof. This is immediate from Algebra, Lemma 10.124 .6
02G0 Lemma 28.28.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $n \geq 0$. Assume $f$ is locally of finite presentation. The open

$$
U_{n}=\left\{x \in X \mid \operatorname{dim}_{x} X_{f(x)} \leq n\right\}
$$

of Lemma 28.28.4 is retrocompact in $X$. (See Topology, Definition 5.11.1.)
Proof. The topological space $X$ has a basis for its topology consisting of affine opens $U \subset X$ such that the induced morphism $\left.f\right|_{U}: U \rightarrow S$ factors through an affine open $V \subset S$. Hence it is enough to show that $U \cap U_{n}$ is quasi-compact for such a $U$. Note that $U_{n} \cap U$ is the same as the open $\left\{x \in U \mid \operatorname{dim}_{x} U_{f(x)} \leq n\right\}$. This reduces us to the case where $X$ and $S$ are affine. In this case the lemma follows from Algebra, Lemma 10.124.8 (and Lemma 28.21.2).

06RU Lemma 28.28.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \rightsquigarrow x^{\prime}$ be a nontrivial specialization of points in $X$ lying over the same point $s \in S$. Assume $f$ is locally of finite type. Then
(1) $\operatorname{dim}_{x}\left(X_{s}\right) \leq \operatorname{dim}_{x^{\prime}}\left(X_{s}\right)$,
(2) $\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)<\operatorname{dim}\left(\mathcal{O}_{X_{s}, x^{\prime}}\right)$, and
(3) $\operatorname{trdeg}_{\kappa(s)}(\kappa(x))>\operatorname{trdeg}_{\kappa(s)}\left(\kappa\left(x^{\prime}\right)\right)$.

Proof. Part (1) follows from the fact that any open of $X_{s}$ containing $x^{\prime}$ also contains $x$. Part (2) follows since $\mathcal{O}_{X_{s}, x}$ is a localization of $\mathcal{O}_{X_{s}, x^{\prime}}$ at a prime ideal, hence any chain of prime ideals in $\mathcal{O}_{X_{s}, x}$ is part of a strictly longer chain of primes in $\mathcal{O}_{X_{s}, x^{\prime}}$. The last inequality follows from Algebra, Lemma 10.115.2.

### 28.29. Morphisms of given relative dimension

02 NI In order to be able to speak comfortably about morphisms of a given relative dimension we introduce the following notion.

02NJ Definition 28.29.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is locally of finite type.
(1) We say $f$ is of relative dimension $\leq d$ at $x$ if $\operatorname{dim}_{x}\left(X_{f(x)}\right) \leq d$.
(2) We say $f$ is of relative dimension $\leq d$ if $\operatorname{dim}_{x}\left(X_{f(x)}\right) \leq d$ for all $x \in X$.
(3) We say $f$ is of relative dimension $d$ if all nonempty fibres $X_{s}$ are equidimensional of dimension $d$.

This is not a particularly well behaved notion, but it works well in a number of situations.

02NK Lemma 28.29.2. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. If $f$ has relative dimension $d$, then so does any base change of $f$. Same for relative dimension $\leq d$.

Proof. This is immediate from Lemma 28.28 .3
02NL Lemma 28.29.3. Let $f: X \rightarrow Y, g: Y \rightarrow Z$ be locally of finite type. If $f$ has relative dimension $\leq d$ and $g$ has relative dimension $\leq e$ then $g \circ f$ has relative dimension $\leq d+e$. If
(1) $f$ has relative dimension $d$,
(2) $g$ has relative dimension $e$, and
(3) $f$ is flat,
then $g \circ f$ has relative dimension $d+e$.
Proof. This is immediate from Lemma 28.28.2
In general it is not possible to decompose a morphism into its pieces where the relative dimension is a given one. However, it is possible if the morphism has Cohen-Macaulay fibres and is flat of finite presentation.

02NM Lemma 28.29.4. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that
(1) $f$ is flat,
(2) $f$ is locally of finite presentation, and
(3) for all $s \in S$ the fibre $X_{s}$ is Cohen-Macaulay (Properties, Definition 27.8.1)

Then there exist open and closed subschemes $X_{d} \subset X$ such that $X=\coprod_{d \geq 0} X_{d}$ and $\left.f\right|_{X_{d}}: X_{d} \rightarrow S$ has relative dimension $d$.

Proof. This is immediate from Algebra, Lemma 10.129.8.
0397 Lemma 28.29.5. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is locally of finite type. Let $x \in X$ with $s=f(x)$. Then $f$ is quasi-finite at $x$ if and only if $\operatorname{dim}_{x}\left(X_{s}\right)=0$. In particular, $f$ is locally quasi-finite if and only if $f$ has relative dimension 0 .

Proof. If $f$ is quasi-finite at $x$ then $\kappa(x)$ is a finite extension of $\kappa(s)$ (by Lemma 28.20 .5 and $x$ is isolated in $X_{s}$ (by Lemma 28.20.6), hence $\operatorname{dim}_{x}\left(X_{s}\right)=0$ by Lemma 28.28.1. Conversely, if $\operatorname{dim}_{x}\left(X_{s}\right)=0$ then by Lemma 28.28.1 we see $\kappa(s) \subset \kappa(x)$ is algebraic and there are no other points of $X_{s}$ specializing to $x$. Hence $x$ is closed in its fibre by Lemma 28.20 .2 and by Lemma 28.20 .6 (3) we conclude that $f$ is quasi-finite at $x$.

0AFE Lemma 28.29.6. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian schemes which is flat, locally of finite type and of relative dimension $d$. For every point $x$ in $X$ with image $y$ in $Y$ we have $\operatorname{dim}_{x}(X)=\operatorname{dim}_{y}(Y)+d$.

Proof. After shrinking $X$ and $Y$ to open neighborhoods of $x$ and $y$, we can assume that $\operatorname{dim}(X)=\operatorname{dim}_{x}(X)$ and $\operatorname{dim}(Y)=\operatorname{dim}_{y}(Y)$, by definition of the dimension of a scheme at a point (Properties, Definition 27.10.1). The morphism $f$ is open by Lemmas 28.21.9 and 28.25.9. Hence we can shrink $Y$ to arrange that $f$ is surjective. It remains to show that $\operatorname{dim}(X)=\operatorname{dim}(Y)+d$.

Let $a$ be a point in $X$ with image $b$ in $Y$. By Algebra, Lemma 10.111.7,

$$
\operatorname{dim}\left(\mathcal{O}_{X, a}\right)=\operatorname{dim}\left(\mathcal{O}_{Y, b}\right)+\operatorname{dim}\left(\mathcal{O}_{X_{b}}, a\right)
$$

Taking the supremum over all points $a$ in $X$, it follows that $\operatorname{dim}(X)=\operatorname{dim}(Y)+d$, as we want, see Properties, Lemma 27.10.2.

### 28.30. The dimension formula

02JT For morphisms between Noetherian schemes we can say a little more about dimensions of local rings. Here is an important (and not so hard to prove) result. Recall that $R(X)$ denotes the function field of an integral scheme $X$.

02JU Lemma 28.30.1. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$, and set $s=f(x)$. Assume
(1) $S$ is locally Noetherian,
(2) $f$ is locally of finite type,
(3) $X$ and $S$ integral, and
(4) $f$ dominant.

We have
02JV (28.30.1.1)

$$
\operatorname{dim}\left(\mathcal{O}_{X, x}\right) \leq \operatorname{dim}\left(\mathcal{O}_{S, s}\right)+\operatorname{trdeg}_{R(S)} R(X)-\operatorname{trdeg}_{\kappa(s)} \kappa(x)
$$

Moreover, equality holds if $S$ is universally catenary.
Proof. The corresponding algebra statement is Algebra, Lemma 10.112.1.

0BAE Lemma 28.30.2. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$, and set $s=f(x)$. Assume $S$ is locally Noetherian and $f$ is locally of finite type, We have
0BAF

$$
\begin{equation*}
\operatorname{dim}\left(\mathcal{O}_{X, x}\right) \leq \operatorname{dim}\left(\mathcal{O}_{S, s}\right)+E-\operatorname{trdeg}_{\kappa(s)} \kappa(x) \tag{28.30.2.1}
\end{equation*}
$$

where $E$ is the maximum of $\operatorname{trdeg}_{\kappa(f(\xi))}(\kappa(\xi))$ where $\xi$ runs over the generic points of irreducible components of $X$ containing $x$.

Proof. Let $X_{1}, \ldots, X_{n}$ be the irreducible components of $X$ containing $x$ endowed with their reduced induced scheme structure. These correspond to the minimal primes $\mathfrak{q}_{i}$ of $\mathcal{O}_{X, x}$ and hence there are finitely many of them (Schemes, Lemma 25.13 .2 and Algebra, Lemma 10.30.6). Then $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=\max \operatorname{dim}\left(\mathcal{O}_{X, x} / \mathfrak{q}_{i}\right)=$ $\max \operatorname{dim}\left(\mathcal{O}_{X_{i}, x}\right)$. The $\xi$ 's occuring in the definition of $E$ are exactly the generic points $\xi_{i} \in X_{i}$. Let $Z_{i}=\overline{\left\{f\left(\xi_{i}\right)\right\}} \subset S$ endowed with the reduced induced scheme structure. The composition $X_{i} \rightarrow X \rightarrow S$ factors through $Z_{i}$ (Schemes, Lemma 25.12.6. Thus we may apply the dimension formula (Lemma 28.30.1) to see that $\operatorname{dim}\left(\mathcal{O}_{X_{i}, x}\right) \leq \operatorname{dim}\left(\mathcal{O}_{Z_{i}, x}\right)+\operatorname{trdeg}_{\kappa(f(\xi))}(\kappa(\xi))-\operatorname{trdeg}_{\kappa(s)} \kappa(x)$. Putting everything together we obtain the lemma.

An application is the construction of a dimension function on any scheme of finite type over a universally catenary scheme endowed with a dimension function. For the definition of dimension functions, see Topology, Definition 5.19.1.
02JW Lemma 28.30.3. Let $S$ be a universally catenary scheme. Let $\delta: S \rightarrow \mathbf{Z}$ be a dimension function. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ locally of finite type. Then the map

$$
\begin{aligned}
\delta=\delta_{X / S}: X & \longrightarrow \mathbf{Z} \\
x & \longmapsto \delta(f(x))+\operatorname{trdeg}_{\kappa(f(x))} \kappa(x)
\end{aligned}
$$

is a dimension function on $X$.
Proof. Let $f: X \rightarrow S$ be locally of finite type. Let $x \rightsquigarrow y, x \neq y$ be a specialization in $X$. We have to show that $\delta_{X / S}(x)>\delta_{X / S}(y)$ and that $\delta_{X / S}(x)=\delta_{X / S}(y)+1$ if $y$ is an immediate specialization of $x$.

Choose an affine open $V \subset S$ containing the image of $y$ and choose an affine open $U \subset X$ mapping into $V$ and containing $y$. We may clearly replace $X$ by $U$ and $S$ by $V$. Thus we may assume that $X=\operatorname{Spec}(A)$ and $S=\operatorname{Spec}(R)$ and that $f$ is given by a ring map $R \rightarrow A$. The ring $R$ is universally catenary (Lemma 28.17.2) and the map $R \rightarrow A$ is of finite type (Lemma 28.15.2.
Let $\mathfrak{q} \subset A$ be the prime ideal corresponding to the point $x$ and let $\mathfrak{p} \subset R$ be the prime ideal corresponding to $f(x)$. The restriction $\delta^{\prime}$ of $\delta$ to $S^{\prime}=\operatorname{Spec}(R / \mathfrak{p}) \subset S$ is a dimension function. The ring $R / \mathfrak{p}$ is universally catenary. The restriction of $\delta_{X / S}$ to $X^{\prime}=\operatorname{Spec}(A / \mathfrak{q})$ is clearly equal to the function $\delta_{X^{\prime} / S^{\prime}}$ constructed using the dimension function $\delta^{\prime}$. Hence we may assume in addition to the above that $R \subset A$ are domains, in other words that $X$ and $S$ are integral schemes, and that $x$ is the generic point of $X$ and $f(x)$ is the generic point of $S$.
Note that $\mathcal{O}_{X, x}=R(X)$ and that since $x \rightsquigarrow y, x \neq y$, the spectrum of $\mathcal{O}_{X, y}$ has at least two points (Schemes, Lemma 25.13.2) hence $\operatorname{dim}\left(\mathcal{O}_{X, y}\right)>0$. If $y$ is an immediate specialization of $x$, then $\operatorname{Spec}\left(\mathcal{O}_{X, y}\right)=\{x, y\}$ and $\operatorname{dim}\left(\mathcal{O}_{X, y}\right)=1$.

Write $s=f(x)$ and $t=f(y)$. We compute

$$
\begin{aligned}
\delta_{X / S}(x)-\delta_{X / S}(y) & =\delta(s)+\operatorname{trdeg}_{\kappa(s)} \kappa(x)-\delta(t)-\operatorname{trdeg}_{\kappa(t)} \kappa(y) \\
& =\delta(s)-\delta(t)+\operatorname{trdeg} \\
& =\delta(s)-\delta(t)+\operatorname{dim}\left(\mathcal{O}_{X, y}\right)-\operatorname{dim}\left(\mathcal{O}_{S, t}\right)
\end{aligned}
$$

where we use equality in 28.30 .1 .1 in the last step. Since $\delta$ is a dimension function on the scheme $S$ and $s \in S$ is the generic point, the difference $\delta(s)-\delta(t)$ is equal to $\operatorname{codim}(\overline{\{t\}}, S)$ by Topology, Lemma 5.19.2. This is equal to $\operatorname{dim}\left(\mathcal{O}_{S, t}\right)$ by Properties, Lemma 27.10.3. Hence we conclude that

$$
\delta_{X / S}(x)-\delta_{X / S}(y)=\operatorname{dim}\left(\mathcal{O}_{X, y}\right)
$$

and the lemma follows from what we said above about $\operatorname{dim}\left(\mathcal{O}_{X, y}\right)$.
Another application of the dimension formula is that the dimension does not change under "alterations" (to be defined later).

02JX Lemma 28.30.4. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that
(1) $Y$ is locally Noetherian,
(2) $X$ and $Y$ are integral schemes,
(3) $f$ is dominant, and
(4) $f$ is locally of finite type.

Then we have

$$
\operatorname{dim}(X) \leq \operatorname{dim}(Y)+\operatorname{trdeg}_{R(Y)} R(X)
$$

If $f$ is closed then equality holds.
Proof. Let $f: X \rightarrow Y$ be as in the lemma. Let $\xi_{0} \rightsquigarrow \xi_{1} \rightsquigarrow \ldots \rightsquigarrow \xi_{e}$ be a sequence of specializations in $X$. We may assume that $x=\xi_{e}$ is a closed point of $X$, see Properties, Lemma 27.5.9. In particular, setting $y=f(x)$, we see $x$ is a closed point of its fibre $X_{y}$. By the Hilbert Nullstellensatz we see that $\kappa(x)$ is a finite extension of $\kappa(y)$, see Lemma 28.20.3. By the dimension formula, Lemma 28.30.1. we see that

$$
\operatorname{dim}\left(\mathcal{O}_{X, x}\right) \leq \operatorname{dim}\left(\mathcal{O}_{Y, y}\right)+\operatorname{trdeg}_{R(Y)} R(X)
$$

Hence we conclude that $e \leq \operatorname{dim}(Y)+\operatorname{trdeg}_{R(Y)} R(X)$ as desired.
Next, assume $f$ is also closed. Say $\bar{\xi}_{0} \rightsquigarrow \bar{\xi}_{1} \rightsquigarrow \ldots \rightsquigarrow \bar{\xi}_{d}$ is a sequence of specializations in $Y$. We want to show that $\operatorname{dim}(X) \geq d+r$. We may assume that $\bar{\xi}_{0}=\eta$ is the generic point of $Y$. The generic fibre $X_{\eta}$ is a scheme locally of finite type over $\kappa(\eta)=R(Y)$. It is nonempty as $f$ is dominant. Hence by Lemma 28.16.10 it is a Jacobson scheme. Thus by Lemma 28.16 .8 we can find a closed point $\xi_{0} \in X_{\eta}$ and the extension $\kappa(\eta) \subset \kappa\left(\xi_{0}\right)$ is a finite extension. Note that $\mathcal{O}_{X, \xi_{0}}=\mathcal{O}_{X_{\eta}, \xi_{0}}$ because $\eta$ is the generic point of $Y$. Hence we see that $\operatorname{dim}\left(\mathcal{O}_{X, \xi_{0}}\right)=r$ by Lemma 28.30.1applied to the scheme $X_{\eta}$ over the universally catenary scheme $\operatorname{Spec}(\kappa(\eta))$ see Lemma 28.17 .4 and the point $\xi_{0}$. This means that we can find $\xi_{-r} \rightsquigarrow \ldots \rightsquigarrow \xi_{-1} \rightsquigarrow \xi_{0}$ in $X$. On the other hand, as $f$ is closed specializations lift along $f$, see Topology, Lemma 5.18.6. Thus, as $\xi_{0}$ lies over $\eta=\bar{\xi}_{0}$ we can find specializations $\xi_{0} \rightsquigarrow \xi_{1} \rightsquigarrow \ldots \rightsquigarrow \xi_{d}$ lying over $\bar{\xi}_{0} \rightsquigarrow \bar{\xi}_{1} \rightsquigarrow \ldots \rightsquigarrow \bar{\xi}_{d}$. In other words we have

$$
\xi_{-r} \rightsquigarrow \ldots \rightsquigarrow \xi_{-1} \rightsquigarrow \xi_{0} \rightsquigarrow \xi_{1} \rightsquigarrow \ldots \rightsquigarrow \xi_{d}
$$

[^73]which means that $\operatorname{dim}(X) \geq d+r$ as desired.
0BAG Lemma 28.30.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that $Y$ is locally Noetherian and $f$ is locally of finite type. Then
$$
\operatorname{dim}(X) \leq \operatorname{dim}(Y)+E
$$
where $E$ is the supremum of $\operatorname{trdeg}_{\kappa(f(\xi))}(\kappa(\xi))$ where $\xi$ runs through the generic points of the irreducible components of $X$.

Proof. Immediate consequence of Lemma 28.30 .2 and Properties, Lemma 27.10.2.

### 28.31. Syntomic morphisms

01UB An algebra $A$ over a field $k$ is called a global complete intersection over $k$ if $A \cong$ $k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ and $\operatorname{dim}(A)=n-c$. An algebra $A$ over a field $k$ is called a local complete intersection if $\operatorname{Spec}(A)$ can be covered by standard opens each of which are global complete intersections over $k$. See Algebra, Section 10.133. Recall that a ring map $R \rightarrow A$ is syntomic if it is of finite presentation, flat with local complete intersection rings as fibres, see Algebra, Definition 10.134.1.

01UC Definition 28.31.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is syntomic at $x \in X$ if there exists a affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and affine open $\operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is syntomic.
(2) We say that $f$ is syntomic if it is syntomic at every point of $X$.
(3) If $S=\operatorname{Spec}(k)$ and $f$ is syntomic, then we say that $X$ is a local complete intersection over $k$.
(4) A morphism of affine schemes $f: X \rightarrow S$ is called standard syntomic if there exists a global relative complete intersection $R \rightarrow R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ (see Algebra, Definition 10.134.5) such that $X \rightarrow S$ is isomorphic to

$$
\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)\right) \rightarrow \operatorname{Spec}(R)
$$

In the literature a syntomic morphism is sometimes referred to as a flat local complete intersection morphism. It turns out this is a convenient class of morphisms. For example one can define a syntomic topology using these, which is finer than the smooth and étale topologies, but has many of the same formal properties.

A global relative complete intersection (which we used to define standard syntomic ring maps) is in particular flat. In More on Morphisms, Section 36.44 we will consider morphisms $X \rightarrow S$ which locally are of the form

$$
\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)\right) \rightarrow \operatorname{Spec}(R)
$$

for some Koszul-regular sequence $f_{1}, \ldots, f_{r}$ in $R\left[x_{1}, \ldots, x_{n}\right]$. Such a morphism will be called a local complete intersection morphism. One we have this definition in place it will be the case that a morphism is syntomic if and only if it is a flat, local complete intersection morphism.
Note that there is no separation or quasi-compactness hypotheses in the definition of a syntomic morphism. Hence the question of being syntomic is local in nature on the source. Here is the precise result.

01UD Lemma 28.31.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is syntomic.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is syntomic.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is syntomic.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is syntomic, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is syntomic then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is syntomic.
Proof. This follows from Lemma 28.14 .3 if we show that the property " $R \rightarrow A$ is syntomic" is local. We check conditions (a), (b) and (c) of Definition 28.14.1. By Algebra, Lemma 10.134 .3 being syntomic is stable under base change and hence we conclude (a) holds. By Algebra, Lemma 10.134 .17 being syntomic is stable under composition and trivially for any ring $R$ the ring map $R \rightarrow R_{f}$ is syntomic. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.134 .4 .

01UH Lemma 28.31.3. The composition of two morphisms which are syntomic is syntomic.

Proof. In the proof of Lemma 28.31 .2 we saw that being syntomic is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being syntomic is a property of ring maps that is stable under composition, see Algebra, Lemma 10.134.17.

01UI Lemma 28.31.4. The base change of a morphism which is syntomic is syntomic.
Proof. In the proof of Lemma 28.31 .2 we saw that being syntomic is a local property of ring maps. Hence the lemma follows from Lemma 28.14 .5 combined with the fact that being syntomic is a property of ring maps that is stable under base change, see Algebra, Lemma 10.134.3

01UJ Lemma 28.31.5. Any open immersion is syntomic.
Proof. This is true because an open immersion is a local isomorphism.
01UK Lemma 28.31.6. A syntomic morphism is locally of finite presentation.
Proof. True because a syntomic ring map is of finite presentation by definition.
01UL Lemma 28.31.7. A syntomic morphism is flat.
Proof. True because a syntomic ring map is flat by definition.
056F Lemma 28.31.8. A syntomic morphism is universally open.
Proof. Combine Lemmas 28.31.6, 28.31.7, and 28.25.9

Let $k$ be a field. Let $A$ be a local $k$-algebra essentially of finite type over $k$. Recall that $A$ is called a complete intersection over $k$ if we can write $A \cong R /\left(f_{1}, \ldots, f_{c}\right)$ where $R$ is a regular local ring essentially of finite type over $k$, and $f_{1}, \ldots, f_{c}$ is a regular sequence in $R$, see Algebra, Definition 10.133.5.
01UG Lemma 28.31.9. Let $k$ be a field. Let $X$ be a scheme locally of finite type over $k$. The following are equivalent:
(1) $X$ is a local complete intersection over $k$,
(2) for every $x \in X$ there exists an affine open $U=\operatorname{Spec}(R) \subset X$ neighbourhood of $x$ such that $R \cong k\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ is a global complete intersection over $k$, and
(3) for every $x \in X$ the local ring $\mathcal{O}_{X, x}$ is a complete intersection over $k$.

Proof. The corresponding algebra results can be found in Algebra, Lemmas 10.133.8 and 10.133 .9 .

The following lemma says locally any syntomic morphism is standard syntomic. Hence we can use standard syntomic morphisms as a local model for a syntomic morphism. Moreover, it says that a flat morphism of finite presentation is syntomic if and only if the fibres are local complete intersection schemes.

01UE Lemma 28.31.10. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ locally of finite presentation. Let $x \in X$ be a point. Set $s=f(x)$. The following are equivalent
(1) The morphism $f$ is syntomic at $x$.
(2) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U, f(U) \subset V$ and the induced morphism $\left.f\right|_{U}: U \rightarrow V$ is standard syntomic.
(3) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and $\mathcal{O}_{X, x} / \mathfrak{m}_{s} \mathcal{O}_{X, x}$ is a complete intersection over $\kappa(s)$ (see Algebra, Definition 10.133.5).
Proof. Follows from the definitions and Algebra, Lemma 10.134.15,
01UF Lemma 28.31.11. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is flat, locally of finite presentation, and all fibres $X_{s}$ are local complete intersections, then $f$ is syntomic.

Proof. Clear from Lemmas 28.31 .9 and 28.31 .10 and the isomorphisms of local rings $\mathcal{O}_{X, x} / \mathfrak{m}_{s} \mathcal{O}_{X, x} \cong \mathcal{O}_{X_{s}, x}$.
02V3 Lemma 28.31.12. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ locally of finite type. Formation of the set

$$
T=\left\{x \in X \mid \mathcal{O}_{X_{f(x)}, x} \text { is a complete intersection over } \kappa(f(x))\right\}
$$

commutes with arbitrary base change: For any morphism $g: S^{\prime} \rightarrow S$, consider the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ of $f$ and the projection $g^{\prime}: X^{\prime} \rightarrow X$. Then the corresponding set $T^{\prime}$ for the morphism $f^{\prime}$ is equal to $T^{\prime}=\left(g^{\prime}\right)^{-1}(T)$. In particular, if $f$ is assumed flat, and locally of finite presentation then the same holds for the open set of points where $f$ is syntomic.
Proof. Let $s^{\prime} \in S^{\prime}$ be a point, and let $s=g\left(s^{\prime}\right)$. Then we have

$$
X_{s^{\prime}}^{\prime}=\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right) \times_{\operatorname{Spec}(\kappa(s))} X_{s}
$$

In other words the fibres of the base change are the base changes of the fibres. Hence the first part is equivalent to Algebra, Lemma 10.133.10. The second part
follows from the first because in that case $T$ is the set of points where $f$ is syntomic according to Lemma 28.31.10.

02 K 0 Lemma 28.31.13. Let $R$ be a ring. Let $R \rightarrow A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ be a relative global complete intersection. Set $S=\operatorname{Spec}(R)$ and $X=\operatorname{Spec}(A)$. Consider the morphism $f: X \rightarrow S$ associated to the ring map $R \rightarrow A$. The function $x \mapsto \operatorname{dim}_{x}\left(X_{f(x)}\right)$ is constant with value $n-c$.
Proof. By Algebra, Definition $10.134 .5 R \rightarrow A$ being a relative global complete intersection means all nonzero fibre rings have dimension $n-c$. Thus for a prime $\mathfrak{p}$ of $R$ the fibre ring $\kappa(\mathfrak{p})\left[x_{1}, \ldots, x_{n}\right] /\left(\bar{f}_{1}, \ldots, \bar{f}_{c}\right)$ is either zero or a global complete intersection ring of dimension $n-c$. By the discussion following Algebra, Definition 10.133 .1 this implies it is equidimensional of dimension $n-c$. Whence the lemma.

02K1 Lemma 28.31.14. Let $f: X \rightarrow S$ be a syntomic morphism. The function $x \mapsto$ $\operatorname{dim}_{x}\left(X_{f(x)}\right)$ is locally constant on $X$.
Proof. By Lemma 28.31 .10 the morphism $f$ locally looks like a standard syntomic morphism of affines. Hence the result follows from Lemma 28.31.13.

Lemma 28.31 .14 says that the following definition makes sense.
02K2 Definition 28.31.15. Let $d \geq 0$ be an integer. We say a morphism of schemes $f: X \rightarrow S$ is syntomic of relative dimension $d$ if $f$ is syntomic and the function $\operatorname{dim}_{x}\left(X_{f(x)}\right)=d$ for all $x \in X$.
In other words, $f$ is syntomic and the nonempty fibres are equidimensional of dimension $d$.

02K3 Lemma 28.31.16. Let

be a commutative diagram of morphisms of schemes. Assume that
(1) $f$ is surjective and syntomic,
(2) $p$ is syntomic, and
(3) $q$ is locally of finite presentation ${ }^{7}$.

Then $q$ is syntomic.
Proof. By Lemma 28.25 .11 we see that $q$ is flat. Hence it suffices to show that the fibres of $Y \rightarrow S$ are local complete intersections, see Lemma 28.31.11. Let $s \in S$. Consider the morphism $X_{s} \rightarrow Y_{s}$. This is a base change of the morphism $X \rightarrow Y$ and hence surjective, and syntomic (Lemma 28.31.4). For the same reason $X_{s}$ is syntomic over $\kappa(s)$. Moreover, $Y_{s}$ is locally of finite type over $\kappa(s)$ (Lemma 28.15.4. In this way we reduce to the case where $S$ is the spectrum of a field.

Assume $S=\operatorname{Spec}(k)$. Let $y \in Y$. Choose an affine open $\operatorname{Spec}(A) \subset Y$ neighbourhood of $y$. Let $\operatorname{Spec}(B) \subset X$ be an affine open such that $f(\operatorname{Spec}(B)) \subset \operatorname{Spec}(A)$, containing a point $x \in X$ such that $f(x)=y$. Choose a surjection $k\left[x_{1}, \ldots, x_{n}\right] \rightarrow A$

[^74]with kernel $I$. Choose a surjection $A\left[y_{1}, \ldots, y_{m}\right] \rightarrow B$, which gives rise in turn to a surjection $k\left[x_{i}, y_{j}\right] \rightarrow B$ with kernel $J$. Let $\mathfrak{q} \subset k\left[x_{i}, y_{j}\right]$ be the prime corresponding to $y \in \operatorname{Spec}(B)$ and let $\mathfrak{p} \subset k\left[x_{i}\right]$ the prime corresponding to $x \in \operatorname{Spec}(A)$. Since $x$ maps to $y$ we have $\mathfrak{p}=\mathfrak{q} \cap k\left[x_{i}\right]$. Consider the following commutative diagram of local rings:

We claim that the hypotheses of Algebra, Lemma 10.133 .12 are satisfied. Conditions (1) and (2) are trivial. Condition (4) follows as $X \rightarrow Y$ is flat. Condition (3) follows as the rings $\mathcal{O}_{Y, y}$ and $\mathcal{O}_{X_{y}, x}=\mathcal{O}_{X, x} / \mathfrak{m}_{y} \mathcal{O}_{X, x}$ are complete intersection rings by our assumptions that $f$ and $p$ are syntomic, see Lemma 28.31.10. The output of Algebra, Lemma 10.133 .12 is exactly that $\mathcal{O}_{Y, y}$ is a complete intersection ring! Hence by Lemma 28.31 .10 again we see that $Y$ is syntomic over $k$ at $y$ as desired.

### 28.32. Conormal sheaf of an immersion

01R1 Let $i: Z \rightarrow X$ be a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the corresponding quasicoherent sheaf of ideals. Consider the short exact sequence

$$
0 \rightarrow \mathcal{I}^{2} \rightarrow \mathcal{I} \rightarrow \mathcal{I} / \mathcal{I}^{2} \rightarrow 0
$$

of quasi-coherent sheaves on $X$. Since the sheaf $\mathcal{I} / \mathcal{I}^{2}$ is annihilated by $\mathcal{I}$ it corresponds to a sheaf on $Z$ by Lemma 28.4.1. This quasi-coherent $\mathcal{O}_{Z}$-module is called the conormal sheaf of $Z$ in $X$ and is often simply denoted $\mathcal{I} / \mathcal{I}^{2}$ by the abuse of notation mentioned in Section 28.4.

In case $i: Z \rightarrow X$ is a (locally closed) immersion we define the conormal sheaf of $i$ as the conormal sheaf of the closed immersion $i: Z \rightarrow X \backslash \partial Z$, where $\partial Z=\bar{Z} \backslash Z$. It is often denoted $\mathcal{I} / \mathcal{I}^{2}$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i: Z \rightarrow$ $X \backslash \partial Z$.

01R2 Definition 28.32.1. Let $i: Z \rightarrow X$ be an immersion. The conormal sheaf $\mathcal{C}_{Z / X}$ of $Z$ in $X$ or the conormal sheaf of $i$ is the quasi-coherent $\mathcal{O}_{Z}$-module $\mathcal{I} / \mathcal{I}^{2}$ described above.

In DG67, IV Definition 16.1.2] this sheaf is denoted $\mathcal{N}_{Z / X}$. We will not follow this convention since we would like to reserve the notation $\mathcal{N}_{Z / X}$ for the normal sheaf of the immersion. It is defined as

$$
\mathcal{N}_{Z / X}=\mathcal{H o m}_{\mathcal{O}_{Z}}\left(\mathcal{C}_{Z / X}, \mathcal{O}_{Z}\right)=\mathcal{H o m}_{\mathcal{O}_{Z}}\left(\mathcal{I} / \mathcal{I}^{2}, \mathcal{O}_{Z}\right)
$$

provided the conormal sheaf is of finite presentation (otherwise the normal sheaf may not even be quasi-coherent). We will come back to the normal sheaf later (insert future reference here).

01R3 Lemma 28.32.2. Let $i: Z \rightarrow X$ be an immersion. The conormal sheaf of $i$ has the following properties:
(1) Let $U \subset X$ be any open such that $i(Z)$ is a closed subset of $U$. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the sheaf of ideals corresponding to the closed subscheme $i(Z) \subset U$. Then

$$
\mathcal{C}_{Z / X}=i^{*} \mathcal{I}=i^{-1}\left(\mathcal{I} / \mathcal{I}^{2}\right)
$$

(2) For any affine open $\operatorname{Spec}(R)=U \subset X$ such that $Z \cap U=\operatorname{Spec}(R / I)$ there is a canonical isomorphism $\Gamma\left(Z \cap U, \mathcal{C}_{Z / X}\right)=I / I^{2}$.

Proof. Mostly clear from the definitions. Note that given a ring $R$ and an ideal $I$ of $R$ we have $I / I^{2}=I \otimes_{R} R / I$. Details omitted.

## 01R4 Lemma 28.32.3. Let

be a commutative diagram in the category of schemes. Assume $i, i^{\prime}$ immersions. There is a canonical map of $\mathcal{O}_{Z}$-modules

$$
f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}} \longrightarrow \mathcal{C}_{Z / X}
$$

characterized by the following property: For every pair of affine opens $(\operatorname{Spec}(R)=$ $\left.U \subset X, \operatorname{Spec}\left(R^{\prime}\right)=U^{\prime} \subset X^{\prime}\right)$ with $f(U) \subset U^{\prime}$ such that $Z \cap U=\operatorname{Spec}(R / I)$ and $Z^{\prime} \cap U^{\prime}=\operatorname{Spec}\left(R^{\prime} / I^{\prime}\right)$ the induced map

$$
\Gamma\left(Z^{\prime} \cap U^{\prime}, \mathcal{C}_{Z^{\prime} / X^{\prime}}\right)=I^{\prime} / I^{\prime 2} \longrightarrow I / I^{2}=\Gamma\left(Z \cap U, \mathcal{C}_{Z / X}\right)
$$

is the one induced by the ring map $f^{\sharp}: R^{\prime} \rightarrow R$ which has the property $f^{\sharp}\left(I^{\prime}\right) \subset I$.
Proof. Let $\partial Z^{\prime}=\overline{Z^{\prime}} \backslash Z^{\prime}$ and $\partial Z=\bar{Z} \backslash Z$. These are closed subsets of $X^{\prime}$ and of $X$. Replacing $X^{\prime}$ by $X^{\prime} \backslash \partial Z^{\prime}$ and $X$ by $X \backslash\left(g^{-1}\left(\partial Z^{\prime}\right) \cup \partial Z\right)$ we see that we may assume that $i$ and $i^{\prime}$ are closed immersions.

The fact that $g \circ i$ factors through $i^{\prime}$ implies that $g^{*} \mathcal{I}^{\prime}$ maps into $\mathcal{I}$ under the canonical map $g^{*} \mathcal{I}^{\prime} \rightarrow \mathcal{O}_{X}$, see Schemes, Lemmas 25.4.6 and 25.4.7. Hence we get an induced map of quasi-coherent sheaves $g^{*}\left(\mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}\right) \rightarrow \mathcal{I} / \mathcal{I}^{2}$. Pulling back by $i$ gives $i^{*} g^{*}\left(\mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}\right) \rightarrow i^{*}\left(\mathcal{I} / \mathcal{I}^{2}\right)$. Note that $i^{*}\left(\mathcal{I} / \mathcal{I}^{2}\right)=\mathcal{C}_{Z / X}$. On the other hand, $i^{*} g^{*}\left(\mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}\right)=f^{*}\left(i^{\prime}\right)^{*}\left(\mathcal{I}^{\prime} /\left(\mathcal{I}^{\prime}\right)^{2}\right)=f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}}$. This gives the desired map.
Checking that the map is locally described as the given map $I^{\prime} /\left(I^{\prime}\right)^{2} \rightarrow I / I^{2}$ is a matter of unwinding the definitions and is omitted. Another observation is that given any $x \in i(Z)$ there do exist affine open neighbourhoods $U, U^{\prime}$ with $f(U) \subset U^{\prime}$ and $Z \cap U$ as well as $U^{\prime} \cap Z^{\prime}$ closed such that $x \in U$. Proof omitted. Hence the requirement of the lemma indeed characterizes the map (and could have been used to define it).

0473 Lemma 28.32.4. Let

be a fibre product diagram in the category of schemes with $i$, $i^{\prime}$ immersions. Then the canonical map $f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}} \rightarrow \mathcal{C}_{Z / X}$ of Lemma 28.32.3 is surjective. If $g$ is flat, then it is an isomorphism.

Proof. Let $R^{\prime} \rightarrow R$ be a ring map, and $I^{\prime} \subset R^{\prime}$ an ideal. Set $I=I^{\prime} R$. Then $I^{\prime} /\left(I^{\prime}\right)^{2} \otimes_{R^{\prime}} R \rightarrow I / I^{2}$ is surjective. If $R^{\prime} \rightarrow R$ is flat, then $I=I^{\prime} \otimes_{R^{\prime}} R$ and $I^{2}=\left(I^{\prime}\right)^{2} \otimes_{R^{\prime}} R$ and we see the map is an isomorphism.

062S Lemma 28.32.5. Let $Z \rightarrow Y \rightarrow X$ be immersions of schemes. Then there is a canonical exact sequence

$$
i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

where the maps come from Lemma 28.32.3 and $i: Z \rightarrow Y$ is the first morphism.
Proof. Via Lemma 28.32 .3 this translates into the following algebra fact. Suppose that $C \rightarrow B \rightarrow A$ are surjective ring maps. Let $I=\operatorname{Ker}(B \rightarrow A), J=\operatorname{Ker}(C \rightarrow A)$ and $K=\operatorname{Ker}(C \rightarrow B)$. Then there is an exact sequence

$$
K / K^{2} \otimes_{B} A \rightarrow J / J^{2} \rightarrow I / I^{2} \rightarrow 0
$$

This follows immediately from the observation that $I=J / K$.

### 28.33. Sheaf of differentials of a morphism

01UM We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 10.130 ) and the corresponding section in the chapter on sheaves of modules (Modules, Section 17.24).

01UQ Definition 28.33.1. Let $f: X \rightarrow S$ be a morphism of schemes. The sheaf of differentials $\Omega_{X / S}$ of $X$ over $S$ is the sheaf of differentials of $f$ viewed as a morphism of ringed spaces (Modules, Definition 17.24.10) equipped with its universal $S$-derivation

$$
\mathrm{d}_{X / S}: \mathcal{O}_{X} \longrightarrow \Omega_{X / S}
$$

It turns out that $\Omega_{X / S}$ is a quasi-coherent $\mathcal{O}_{X}$-module for example as it is isomorphic to the conormal sheaf of the diagonal morphism $\Delta: X \rightarrow X \times{ }_{S} X$ (Lemma 28.33 .5 . We have defined the module of differentials of $X$ over $S$ using a universal property, namely as the receptacle of the universal derivation. If you have any other construction of the sheaf of relative differentials which satisfies this universal property then, by the Yoneda lemma, it will be canonically isomorphic to the one defined above. For convenience we restate the universal property here.

01UR Lemma 28.33.2. Let $f: X \rightarrow S$ be a morphism of schemes. The map

$$
\operatorname{Hom}_{\mathcal{O}_{X}}\left(\Omega_{X / S}, \mathcal{F}\right) \longrightarrow \operatorname{Der}_{S}\left(\mathcal{O}_{X}, \mathcal{F}\right), \quad \alpha \longmapsto \alpha \circ d_{X / S}
$$

is an isomorphism of functors $\operatorname{Mod}\left(\mathcal{O}_{X}\right) \rightarrow$ Sets.
Proof. This is just a restatement of the definition.
01US Lemma 28.33.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $U \subset X, V \subset S$ be open subschemes such that $f(U) \subset V$. Then there is a unique isomorphism $\left.\Omega_{X / S}\right|_{U}=\Omega_{U / V}$ of $\mathcal{O}_{U}$-modules such that $\left.d_{X / S}\right|_{U}=d_{U / V}$.
Proof. This is a special case of Modules, Lemma 17.24 .5 if we use the canonical identification $\left.f^{-1} \mathcal{O}_{S}\right|_{U}=\left(\left.f\right|_{U}\right)^{-1} \mathcal{O}_{V}$.

From now on we will use these canonical identifications and simply write $\Omega_{U / S}$ or $\Omega_{U / V}$ for the restriction of $\Omega_{X / S}$ to $U$.

01UO Lemma 28.33.4. Let $R \rightarrow A$ be a ring map. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules on $X=\operatorname{Spec}(A)$. Set $S=\operatorname{Spec}(R)$. The rule which associates to an $S$-derivation on $\mathcal{F}$ its action on global sections defines a bijection between the set of $S$-derivations of $\mathcal{F}$ and the set of $R$-derivations on $M=\Gamma(X, \mathcal{F})$.
Proof. Let $D: A \rightarrow M$ be an $R$-derivation. We have to show there exists a unique $S$-derivation on $\mathcal{F}$ which gives rise to $D$ on global sections. Let $U=D(f) \subset X$ be a standard affine open. Any element of $\Gamma\left(U, \mathcal{O}_{X}\right)$ is of the form $a / f^{n}$ for some $a \in A$ and $n \geq 0$. By the Leibniz rule we have

$$
\left.D(a)\right|_{U}=a /\left.f^{n} D\left(f^{n}\right)\right|_{U}+f^{n} D\left(a / f^{n}\right)
$$

in $\Gamma(U, \mathcal{F})$. Since $f$ acts invertibly on $\Gamma(U, \mathcal{F})$ this completely determines the value of $D\left(a / f^{n}\right) \in \Gamma(U, \mathcal{F})$. This proves uniqueness. Existence follows by simply defining

$$
D\left(a / f^{n}\right):=\left.\left(1 / f^{n}\right) D(a)\right|_{U}-a /\left.f^{2 n} D\left(f^{n}\right)\right|_{U}
$$

and proving this has all the desired properties (on the basis of standard opens of $X)$. Details omitted.
01UT Lemma 28.33.5. Let $f: X \rightarrow S$ be a morphism of schemes. For any pair of affine opens $\operatorname{Spec}(A)=U \subset X, \operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ there is a unique isomorphism

$$
\Gamma\left(U, \Omega_{X / S}\right)=\Omega_{A / R}
$$

compatible with $d_{X / S}$ and $d: A \rightarrow \Omega_{A / R}$.
Proof. We claim that the $A$-module $M=\Gamma\left(U, \Omega_{X / S}\right)=\Gamma\left(U, \Omega_{U / V}\right)$ together with $\mathrm{d}_{X / S}=\mathrm{d}_{U / V}: A \rightarrow M$ is a universal $R$-derivation of $A$. This follows by combining Lemmas 28.33 .4 and 28.33 .2 above. The universal property of $\mathrm{d}: A \rightarrow \Omega_{A / R}$ (see Algebra, Lemma 10.130 .3 ) and the Yoneda lemma (Categories, Lemma 4.3.5) imply there is a unique isomorphism of $A$-modules $M \cong \Omega_{A / R}$ compatible with derivations.

01UU Remark 28.33.6. The lemma above gives a second way of constructing the module of differentials. Namely, let $f: X \rightarrow S$ be a morphism of schemes. Consider the collection of all affine opens $U \subset X$ which map into an affine open of $S$. These form a basis for the topology on $X$. Thus it suffices to define $\Gamma\left(U, \Omega_{X / S}\right)$ for such $U$. We simply set $\Gamma\left(U, \Omega_{X / S}\right)=\Omega_{A / R}$ if $A, R$ are as in Lemma 28.33.5 above. This works, but it takes somewhat more algebraic preliminaries to construct the restriction mappings and to verify the sheaf condition with this ansatz.

The following lemma gives yet another way to define the sheaf of differentials and it in particular shows that $\Omega_{X / S}$ is quasi-coherent if $X$ and $S$ are schemes.

08S2 Lemma 28.33.7. Let $f: X \rightarrow S$ be a morphism of schemes. There is a canonical isomorphism between $\Omega_{X / S}$ and the conormal sheaf of the diagonal morphism $\Delta_{X / S}: X \longrightarrow X \times_{S} X$.

Proof. We first establish the existence of a couple of "global" sheaves and global maps of sheaves, and further down we describe the constructions over some affine opens.
Recall that $\Delta=\Delta_{X / S}: X \rightarrow X \times_{S} X$ is an immersion, see Schemes, Lemma 25.21 .2 Let $\mathcal{J}$ be the ideal sheaf of the immersion which lives over some open subscheme $W$ of $X \times_{S} X$ such that $\Delta(X) \subset W$ is closed. Let us take the one
that was found in the proof of Schemes, Lemma 25.21.2 Note that the sheaf of rings $\mathcal{O}_{W} / \mathcal{J}^{2}$ is supported on $\Delta(X)$. Moreover it sits in a short exact sequence of sheaves

$$
0 \rightarrow \mathcal{J} / \mathcal{J}^{2} \rightarrow \mathcal{O}_{W} / \mathcal{J}^{2} \rightarrow \Delta_{*} \mathcal{O}_{X} \rightarrow 0
$$

Using $\Delta^{-1}$ we can think of this as a surjection of sheaves of $f^{-1} \mathcal{O}_{S}$-algebras with kernel the conormal sheaf of $\Delta$ (see Definition 28.32.1 and Lemma 28.32.2).

$$
0 \rightarrow \mathcal{C}_{X / X \times{ }_{S} X} \rightarrow \Delta^{-1}\left(\mathcal{O}_{W} / \mathcal{J}^{2}\right) \rightarrow \mathcal{O}_{X} \rightarrow 0
$$

This places us in the situation of Modules, Lemma 17.24.11. The projection morphisms $p_{i}: X \times_{S} X \rightarrow X, i=1,2$ induce maps of sheaves of rings $\left(p_{i}\right)^{\sharp}$ : $\left(p_{i}\right)^{-1} \mathcal{O}_{X} \rightarrow \mathcal{O}_{X \times_{S} X}$. We may restrict to $W$ and quotient by $\mathcal{J}^{2}$ to get $\left(p_{i}\right)^{-1} \mathcal{O}_{X} \rightarrow$ $\mathcal{O}_{W} / \mathcal{J}^{2}$. Since $\Delta^{-1} p_{i}^{-1} \mathcal{O}_{X}=\mathcal{O}_{X}$ we get maps

$$
s_{i}: \mathcal{O}_{X} \rightarrow \Delta^{-1}\left(\mathcal{O}_{W} / \mathcal{J}^{2}\right)
$$

Both $s_{1}$ and $s_{2}$ are sections to the map $\Delta^{-1}\left(\mathcal{O}_{W} / \mathcal{J}^{2}\right) \rightarrow \mathcal{O}_{X}$, as in Modules, Lemma 17.24.11. Thus we get an $S$-derivation $\mathrm{d}=s_{2}-s_{1}: \mathcal{O}_{X} \rightarrow \mathcal{C}_{X / X \times{ }_{S} X}$. By the universal property of the module of differentials we find a unique $\mathcal{O}_{X}$-linear map

$$
\Omega_{X / S} \longrightarrow \mathcal{C}_{X / X \times_{S} X}, \quad f \mathrm{~d} g \longmapsto f s_{2}(g)-f s_{1}(g)
$$

To see the map is an isomorphism, let us work this out over suitable affine opens. We can cover $X$ by affine opens $\operatorname{Spec}(A)=U \subset X$ whose image is contained in an affine open $\operatorname{Spec}(R)=V \subset S$. According to the proof of Schemes, Lemma $25.21 .2 U \times_{V} U \subset X \times_{S} X$ is an affine open contained in the open $W$ mentioned above. Also $U \times_{V} U=\operatorname{Spec}\left(A \otimes_{R} A\right)$. The sheaf $\mathcal{J}$ corresponds to the ideal $J=\operatorname{Ker}\left(A \otimes_{R} A \rightarrow A\right)$. The short exact sequence to the short exact sequence of $A \otimes_{R} A$-modules

$$
0 \rightarrow J / J^{2} \rightarrow\left(A \otimes_{R} A\right) / J^{2} \rightarrow A \rightarrow 0
$$

The sections $s_{i}$ correspond to the ring maps

$$
A \longrightarrow\left(A \otimes_{R} A\right) / J^{2}, \quad s_{1}: a \mapsto a \otimes 1, \quad s_{2}: a \mapsto 1 \otimes a
$$

By Lemma 28.32 .2 we have $\Gamma\left(U, \mathcal{C}_{X / X \times{ }_{S} X}\right)=J / J^{2}$ and by Lemma 28.33 .5 we have $\Gamma\left(U, \Omega_{X / S}\right)=\Omega_{A / R}$. The map above is the map $a \mathrm{~d} b \mapsto a \otimes b-a b \otimes 1$ which is shown to be an isomorphism in Algebra, Lemma 10.130.13.

01UV Lemma 28.33.8. Let

be a commutative diagram of schemes. The canonical map $\mathcal{O}_{X} \rightarrow f_{*} \mathcal{O}_{X^{\prime}}$ composed with the map $f_{*} d_{X^{\prime} / S^{\prime}}: f_{*} \mathcal{O}_{X^{\prime}} \rightarrow f_{*} \Omega_{X^{\prime} / S^{\prime}}$ is a $S$-derivation. Hence we obtain a canonical map of $\mathcal{O}_{X}$-modules $\Omega_{X / S} \rightarrow f_{*} \Omega_{X^{\prime} / S^{\prime}}$, and by adjointness of $f_{*}$ and $f^{*}$ a canonical $\mathcal{O}_{X^{\prime}-\text { module }}$ homomorphism

$$
c_{f}: f^{*} \Omega_{X / S} \longrightarrow \Omega_{X^{\prime} / S^{\prime}}
$$

It is uniquely characterized by the property that $f^{*} d_{X / S}(h)$ maps to $d_{X^{\prime} / S^{\prime}}\left(f^{*} h\right)$ for any local section $h$ of $\mathcal{O}_{X}$.

Proof. This is a special case of Modules, Lemma 17.24.12. In the case of schemes we can also use the functoriality of the conormal sheaves (see Lemma 28.32.3) and Lemma 28.33 .7 to define $c_{f}$. Or we can use the characterization in the last line of the lemma to glue maps defined on affine patches (see Algebra, Equation (10.130.5.1)).

01UX Lemma 28.33.9. Let $f: X \rightarrow Y, g: Y \rightarrow S$ be morphisms of schemes. Then there is a canonical exact sequence

$$
f^{*} \Omega_{Y / S} \rightarrow \Omega_{X / S} \rightarrow \Omega_{X / Y} \rightarrow 0
$$

where the maps come from applications of Lemma 28.33.8.
Proof. This is the sheafified version of Algebra, Lemma 10.130.7.
01V0 Lemma 28.33.10. Let $X \rightarrow S$ be a morphism of schemes. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Let $X^{\prime}=X_{S^{\prime}}$ be the base change of $X$. Denote $g^{\prime}: X^{\prime} \rightarrow X$ the projection. Then the map

$$
\left(g^{\prime}\right)^{*} \Omega_{X / S} \rightarrow \Omega_{X^{\prime} / S^{\prime}}
$$

of Lemma 28.33.8 is an isomorphism.
Proof. This is the sheafified version of Algebra, Lemma 10.130.12.
01V1 Lemma 28.33.11. Let $f: X \rightarrow S$ and $g: Y \rightarrow S$ be morphisms of schemes with the same target. Let $p: X \times_{S} Y \rightarrow X$ and $q: X \times_{S} Y \rightarrow Y$ be the projection morphisms. The maps from Lemma 28.33.8

$$
p^{*} \Omega_{X / S} \oplus q^{*} \Omega_{Y / S} \longrightarrow \Omega_{X \times_{S} Y / S}
$$

give an isomorphism.
Proof. By Lemma 28.33 .10 the composition $p^{*} \Omega_{X / S} \rightarrow \Omega_{X \times{ }_{S} Y / S} \rightarrow \Omega_{X \times{ }_{S} Y / Y}$ is an isomorphism, and similarly for $q$. Moreover, the cokernel of $p^{*} \Omega_{X / S} \rightarrow \Omega_{X \times S} Y / S$ is $\Omega_{X \times{ }_{S} Y / X}$ by Lemma 28.33 .9 . The result follows.

01V2 Lemma 28.33.12. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is locally of finite type, then $\Omega_{X / S}$ is a finite type $\mathcal{O}_{X}$-module.

Proof. Immediate from Algebra, Lemma 10.130.16. Lemma 28.33.5. Lemma 28.15.2, and Properties, Lemma 27.16.1.

01V3 Lemma 28.33.13. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is locally of finite type, then $\Omega_{X / S}$ is an $\mathcal{O}_{X}$-module of finite presentation.

Proof. Immediate from Algebra, Lemma 10.130.15, Lemma 28.33.5. Lemma 28.21.2, and Properties, Lemma 27.16.2.

01UY Lemma 28.33.14. If $X \rightarrow S$ is an immersion, or more generally a monomorphism, then $\Omega_{X / S}$ is zero.

Proof. This is true because $\Delta_{X / S}$ is an isomorphism in this case and hence has trivial conormal sheaf. Hence $\Omega_{X / S}=0$ by Lemma 28.33.7. The algebraic version is Algebra, Lemma 10.130.5.

01UZ Lemma 28.33.15. Let $i: Z \rightarrow X$ be an immersion of schemes over $S$. There is a canonical exact sequence

$$
\mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / S} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

where the first arrow is induced by $d_{X / S}$ and the second arrow comes from Lemma 28.33.8.

Proof. This is the sheafified version of Algebra, Lemma 10.130.9. However we should make sure we can define the first arrow globally. Hence we explain the meaning of "induced by $\mathrm{d}_{X / S}$ " here. Namely, we may assume that $i$ is a closed immersion by shrinking $X$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the sheaf of ideals corresponding to $Z \subset X$. Then $\mathrm{d}_{X / S}: \mathcal{I} \rightarrow \Omega_{X / S}$ maps the subsheaf $\mathcal{I}^{2} \subset \mathcal{I}$ to $\mathcal{I} \Omega_{X / S}$. Hence it induces a map $\mathcal{I} / \mathcal{I}^{2} \rightarrow \Omega_{X / S} / \mathcal{I} \Omega_{X / S}$ which is $\mathcal{O}_{X} / \mathcal{I}$-linear. By Lemma 28.4 .1 this corresponds to a map $\mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / S}$ as desired.

0474 Lemma 28.33.16. Let $i: Z \rightarrow X$ be an immersion of schemes over $S$, and assume $i$ (locally) has a left inverse. Then the canonical sequence

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / S} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

of Lemma 28.33.15 is (locally) split exact. In particular, if $s: S \rightarrow X$ is a section of the structure morphism $X \rightarrow S$ then the map $\mathcal{C}_{S / X} \rightarrow s^{*} \Omega_{X / S}$ induced by $d_{X / S}$ is an isomorphism.

Proof. Follows from Algebra, Lemma 10.130.10. Clarification: if $g: X \rightarrow Z$ is a left inverse of $i$, then $i^{*} c_{g}$ is a right inverse of the map $i^{*} \Omega_{X / S} \rightarrow \Omega_{Z / S}$. Also, if $s$ is a section, then it is an immersion $s: Z=S \rightarrow X$ over $S$ (see Schemes, Lemma 25.21 .12 and in that case $\Omega_{Z / S}=0$.

060N Remark 28.33.17. Let $X \rightarrow S$ be a morphism of schemes. According to Lemma 28.33.11 we have

$$
\Omega_{X \times S X / S}=\operatorname{pr}_{1}^{*} \Omega_{X / S} \oplus \operatorname{pr}_{2}^{*} \Omega_{X / S}
$$

On the other hand, the diagonal morphism $\Delta: X \rightarrow X \times_{S} X$ is an immersion, which locally has a left inverse. Hence by Lemma 28.33 .16 we obtain a canonical short exact sequence

$$
0 \rightarrow \mathcal{C}_{X / X \times_{S} X} \rightarrow \Omega_{X / S} \oplus \Omega_{X / S} \rightarrow \Omega_{X / S} \rightarrow 0
$$

Note that the right arrow is $(1,1)$ which is indeed a split surjection. On the other hand, by Lemma 28.33 .7 we have an identification $\Omega_{X / S}=\mathcal{C}_{X / X \times_{S} X}$. Because we chose $\mathrm{d}_{X / S}(f)=s_{2}(f)-s_{1}(f)$ in this identification it turns out that the left arrow is the map $(-1,1)^{8}$.

067L Lemma 28.33.18. Let

[^75]be a commutative diagram of schemes where $i$ and $j$ are immersions. Then there is a canonical exact sequence
$$
\mathcal{C}_{Z / Y} \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / Y} \rightarrow 0
$$
where the first arrow comes from Lemma 28.32 .3 and the second from Lemma 28.33.15.

Proof. The algebraic version of this is Algebra, Lemma 10.132.7.

### 28.34. Smooth morphisms

01V4 Let $f: X \rightarrow Y$ be a map of topological spaces. Consider the following condition:
(*) For every $x \in X$ there exist open neighbourhoods $x \in U \subset X$ and $f(x) \in$ $V \subset Y$, and an integer $d$ such that $f(U)=V$ and such that there is an isomorphism

where $B_{d}(0,1) \subset \mathbf{R}^{d}$ is a ball of radius 1 around 0 .
Smooth morphisms are the analogue of such morphisms in the category of schemes. See Lemma 28.34.11 and Lemma 28.36.20,

Contrary to expectations (perhaps) the notion of a smooth ring map is not defined solely in terms of the module of differentials. Namely, recall that $R \rightarrow A$ is a smooth ring map if $A$ is of finite presentation over $R$ and if the naive cotangent complex of $A$ over $R$ is quasi-isomorphic to a projective module placed in degree 0 , see Algebra, Definition 10.135 .1 .

01V5 Definition 28.34.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is smooth at $x \in X$ if there exists a affine open neighbour$\operatorname{hood} \operatorname{Spec}(A)=U \subset X$ of $x$ and affine open $\operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is smooth.
(2) We say that $f$ is smooth if it is smooth at every point of $X$.
(3) A morphism of affine schemes $f: X \rightarrow S$ is called standard smooth if there exists a standard smooth ring map $R \rightarrow R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)$ (see Algebra, Definition 10.135.6) such that $X \rightarrow S$ is isomorphic to

$$
\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)\right) \rightarrow \operatorname{Spec}(R)
$$

A pleasing feature of this definition is that the set of points where a morphism is smooth is automatically open.

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being smooth is local in nature on the source. Here is the precise result.
01V6 Lemma 28.34.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is smooth.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is smooth.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is smooth.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is smooth, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is smooth then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is smooth.

Proof. This follows from Lemma 28.14 .3 if we show that the property " $R \rightarrow A$ is smooth" is local. We check conditions (a), (b) and (c) of Definition 28.14.1. By Algebra, Lemma 10.135 .4 being smooth is stable under base change and hence we conclude (a) holds. By Algebra, Lemma 10.135 .14 being smooth is stable under composition and for any ring $R$ the ring map $R \rightarrow R_{f}$ is (standard) smooth. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 10.135 .13 .

The following lemma characterizes a smooth morphism as a flat, finitely presented morphism with smooth fibres. Note that schemes smooth over a field are discussed in more detail in Varieties, Section 32.20 .
01V8 Lemma 28.34.3. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is flat, locally of finite presentation, and all fibres $X_{s}$ are smooth, then $f$ is smooth.
Proof. Follows from Algebra, Lemma 10.135.16
01VA Lemma 28.34.4. The composition of two morphisms which are smooth is smooth.
Proof. In the proof of Lemma 28.34 .2 we saw that being smooth is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being smooth is a property of ring maps that is stable under composition, see Algebra, Lemma 10.135.14.

01VB Lemma 28.34.5. The base change of a morphism which is smooth is smooth.
Proof. In the proof of Lemma 28.34 .2 we saw that being smooth is a local property of ring maps. Hence the lemma follows from Lemma 28.14 .5 combined with the fact that being smooth is a property of ring maps that is stable under base change, see Algebra, Lemma 10.135.4.

01VC Lemma 28.34.6. Any open immersion is smooth.
Proof. This is true because an open immersion is a local isomorphism.
01VD Lemma 28.34.7. A smooth morphism is syntomic.
Proof. See Algebra, Lemma 10.135 .10
01VE Lemma 28.34.8. A smooth morphism is locally of finite presentation.
Proof. True because a smooth ring map is of finite presentation by definition.
01VF Lemma 28.34.9. A smooth morphism is flat.
Proof. Combine Lemmas 28.31.7 and 28.34.7,
056G Lemma 28.34.10. A smooth morphism is universally open.

Proof. Combine Lemmas 28.34.9, 28.34.8, and 28.25.9. Or alternatively, combine Lemmas 28.34.7, 28.31.8.

The following lemma says locally any smooth morphism is standard smooth. Hence we can use standard smooth morphisms as a local model for a smooth morphism.
01V7 Lemma 28.34.11. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be $a$ point. Set $s=f(x)$. The following are equivalent
(1) The morphism $f$ is smooth at $x$.
(2) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U, f(U) \subset V$ and the induced morphism $\left.f\right|_{U}: U \rightarrow V$ is standard smooth.
Proof. Follows from the definitions and Algebra, Lemmas 10.135.7 and 10.135.10.

02G1 Lemma 28.34.12. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is smooth. Then the module of differentials $\Omega_{X / S}$ of $X$ over $S$ is finite locally free and

$$
\operatorname{rank}_{x}\left(\Omega_{X / S}\right)=\operatorname{dim}_{x}\left(X_{f(x)}\right)
$$

for every $x \in X$.
Proof. The statement is local on $X$ and $S$. By Lemma 28.34.11 above we may assume that $f$ is a standard smooth morphism of affines. In this case the result follows from Algebra, Lemma 10.135.7 (and the definition of a relative global complete intersection, see Algebra, Definition 10.134.5.

Lemma 28.34 .12 says that the following definition makes sense.
02G2 Definition 28.34.13. Let $d \geq 0$ be an integer. We say a morphism of schemes $f: X \rightarrow S$ is smooth of relative dimension $d$ if $f$ is smooth and $\Omega_{X / S}$ is finite locally free of constant rank $d$.
In other words, $f$ is smooth and the nonempty fibres are equidimensional of dimension $d$. By Lemma 28.34 .14 below this is also the same as requiring: (a) $f$ is locally of finite presentation, (b) $f$ is flat, (c) all nonempty fibres equidimensional of dimension $d$, and (d) $\Omega_{X / S}$ finite locally free of rank $d$. It is not enough to simply assume that $f$ is flat, of finite presentation, and $\Omega_{X / S}$ is finite locally free of rank $d$. A counter example is given by $\operatorname{Spec}\left(\mathbf{F}_{p}[t]\right) \rightarrow \operatorname{Spec}\left(\mathbf{F}_{p}\left[t^{p}\right]\right)$.
Here is a differential criterion of smoothness at a point. There are many variants of this result all of which may be useful at some point. We will just add them here as needed.
01V9 Lemma 28.34.14. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s=f(x)$. Assume $f$ is locally of finite presentation. The following are equivalent:
(1) The morphism $f$ is smooth at $x$.
(2) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and $X_{s} \rightarrow \operatorname{Spec}(\kappa(s))$ is smooth at $x$.
(3) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and the $\mathcal{O}_{X, x}$-module $\Omega_{X / S, x}$ can be generated by at most $\operatorname{dim}_{x}\left(X_{f(x)}\right)$ elements.
(4) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and the $\kappa(x)$-vector space

$$
\Omega_{X_{s} / s, x} \otimes_{\mathcal{O}_{X_{s}, x}} \kappa(x)=\Omega_{X / S, x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

can be generated by at most $\operatorname{dim}_{x}\left(X_{f(x)}\right)$ elements.
(5) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U, f(U) \subset V$ and the induced morphism $\left.f\right|_{U}: U \rightarrow V$ is standard smooth.
(6) There exist affine opens $\operatorname{Spec}(A)=U \subset X$ and $\operatorname{Spec}(R)=V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation

$$
A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

with

$$
g=\operatorname{det}\left(\begin{array}{cccc}
\partial f_{1} / \partial x_{1} & \partial f_{2} / \partial x_{1} & \ldots & \partial f_{c} / \partial x_{1} \\
\partial f_{1} / \partial x_{2} & \partial f_{2} / \partial x_{2} & \ldots & \partial f_{c} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{c} & \partial f_{2} / \partial x_{c} & \ldots & \partial f_{c} / \partial x_{c}
\end{array}\right)
$$

mapping to an element of $A$ not in $\mathfrak{q}$.
Proof. Note that if $f$ is smooth at $x$, then we see from Lemma 28.34.11 that (5) holds, and (6) is a slightly weakened version of (5). Moreover, $f$ smooth implies that the ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat (see Lemma 28.34.9) and that $\Omega_{X / S}$ is finite locally free of rank equal to $\operatorname{dim}_{x}\left(X_{s}\right)$ (see Lemma 28.34.12). Thus (1) implies (3) and (4). By Lemma 28.34.5 we also see that (1) implies (2).
By Lemma 28.33 .10 the module of differentials $\Omega_{X_{s} / s}$ of the fibre $X_{s}$ over $\kappa(s)$ is the pullback of the module of differentials $\Omega_{X / S}$ of $X$ over $S$. Hence the displayed equality in part (4) of the lemma. By Lemma 28.33 .12 these modules are of finite type. Hence the minimal number of generators of the modules $\Omega_{X / S, x}$ and $\Omega_{X_{s} / s, x}$ is the same and equal to the dimension of this $\kappa(x)$-vector space by Nakayama's Lemma (Algebra, Lemma 10.19.1). This in particular shows that (3) and (4) are equivalent.
Algebra, Lemma 10.135 .16 shows that (2) implies (1). Algebra, Lemma 10.138 .3 shows that (3) and (4) imply (2). Finally, (6) implies (5) see for example Algebra, Example 10.135 .8 and (5) implies (1) by Algebra, Lemma 10.135.7.

## Lemma 28.34.15. Let

be a cartesian diagram of schemes. Let $W \subset X$, resp. $W^{\prime} \subset X^{\prime}$ be the open subscheme of points where $f$, resp. $f^{\prime}$ is smooth. Then $W^{\prime}=\left(g^{\prime}\right)^{-1}(W)$ if
(1) $f$ is flat and locally of finite presentation, or
(2) $f$ is locally of finite presentation and $g$ is flat.

Proof. Assume first that $f$ locally of finite type. Consider the set

$$
T=\left\{x \in X \mid X_{f(x)} \text { is smooth over } \kappa(f(x)) \text { at } x\right\}
$$

and the corresponding set $T^{\prime} \subset X^{\prime}$ for $f^{\prime}$. Then we claim $T^{\prime}=\left(g^{\prime}\right)^{-1}(T)$. Namely, let $s^{\prime} \in S^{\prime}$ be a point, and let $s=g\left(s^{\prime}\right)$. Then we have

$$
X_{s^{\prime}}^{\prime}=\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right) \times_{\operatorname{Spec}(\kappa(s))} X_{s}
$$

In other words the fibres of the base change are the base changes of the fibres. Hence the claim is equivalent to Algebra, Lemma 10.135.18.

Thus case (1) follows because in case (1) $T$ is the (open) set of points where $f$ is smooth by Lemma 28.34.14.
In case (2) let $x^{\prime} \in W^{\prime}$. Then $g^{\prime}$ is flat at $x^{\prime}$ (Lemma 28.25.6) and $g \circ f$ is flat at $x^{\prime}$ (Lemma 28.25.4). It follows that $f$ is flat at $x=g^{\prime}\left(x^{\prime}\right)$ by Lemma 28.25.11. On the other hand, since $x^{\prime} \in T^{\prime}$ (Lemma 28.34.5) we see that $x \in T$. Hence $f$ is smooth at $x$ by Lemma 28.34.14.

Here is a lemma that actually uses the vanishing of $H^{-1}$ of the naive cotangent complex for a smooth ring map.
02K4 Lemma 28.34.16. Let $f: X \rightarrow Y, g: Y \rightarrow S$ be morphisms of schemes. Assume $f$ is smooth. Then

$$
0 \rightarrow f^{*} \Omega_{Y / S} \rightarrow \Omega_{X / S} \rightarrow \Omega_{X / Y} \rightarrow 0
$$

(see Lemma 28.33.9) is short exact.
Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $B \rightarrow C$ smooth, then the sequence

$$
0 \rightarrow C \otimes_{B} \Omega_{B / A} \rightarrow \Omega_{C / A} \rightarrow \Omega_{C / B} \rightarrow 0
$$

of Algebra, Lemma 10.130.7 is exact. This is Algebra, Lemma 10.137.1.
06AA Lemma 28.34.17. Let $i: Z \rightarrow X$ be an immersion of schemes over $S$. Assume that $Z$ is smooth over $S$. Then the canonical exact sequence

$$
0 \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / S} \rightarrow \Omega_{Z / S} \rightarrow 0
$$

of Lemma 28.33.15 is short exact.
Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $A \rightarrow C$ smooth and $B \rightarrow C$ surjective with kernel $J$, then the sequence

$$
0 \rightarrow J / J^{2} \rightarrow C \otimes_{B} \Omega_{B / A} \rightarrow \Omega_{C / A} \rightarrow 0
$$

of Algebra, Lemma 10.130 .9 is exact. This is Algebra, Lemma 10.137.2.
06AB Lemma 28.34.18. Let

be a commutative diagram of schemes where $i$ and $j$ are immersions and $X \rightarrow Y$ is smooth. Then the canonical exact sequence

$$
0 \rightarrow \mathcal{C}_{Z / Y} \rightarrow \mathcal{C}_{Z / X} \rightarrow i^{*} \Omega_{X / Y} \rightarrow 0
$$

of Lemma 28.33.18 is exact.
Proof. The algebraic version of this lemma is the following: Given ring maps $A \rightarrow B \rightarrow C$ with $A \rightarrow C$ surjective and $A \rightarrow B$ smooth, then the sequence

$$
0 \rightarrow I / I^{2} \rightarrow J / J^{2} \rightarrow C \otimes_{B} \Omega_{B / A} \rightarrow 0
$$

of Algebra, Lemma 10.132.7 is exact. This is Algebra, Lemma 10.137.3.

02K5 Lemma 28.34.19. Let

be a commutative diagram of morphisms of schemes. Assume that
(1) $f$ is surjective, and smooth,
(2) $p$ is smooth, and
(3) $q$ is locally of finite presentatior ${ }^{9}$

Then $q$ is smooth.
Proof. By Lemma 28.25.11 we see that $q$ is flat. Pick a point $y \in Y$. Pick a point $x \in X$ mapping to $y$. Suppose $f$ has relative dimension $a$ at $x$ and $p$ has relative dimension $b$ at $x$. By Lemma 28.34 .12 this means that $\Omega_{X / S, x}$ is free of rank $b$ and $\Omega_{X / Y, x}$ is free of rank $a$. By the short exact sequence of Lemma 28.34.16 this means that $\left(f^{*} \Omega_{Y / S}\right)_{x}$ is free of rank $b-a$. By Nakayama's Lemma this implies that $\Omega_{Y / S, y}$ can be generated by $b-a$ elements. Also, by Lemma 28.28 .2 we see that $\operatorname{dim}_{y}\left(Y_{s}\right)=b-a$. Hence we conclude that $Y \rightarrow S$ is smooth at $y$ by Lemma 28.34 .14 part (2).

In the situation of the following lemma the image of $\sigma$ is locally on $X$ cut out by a regular sequence, see Divisors, Lemma 30.19.7.
05D9 Lemma 28.34.20. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\sigma: S \rightarrow X$ be $a$ section of $f$. Let $s \in S$ be a point such that $f$ is smooth at $x=\sigma(s)$. Then there exist affine open neighbourhoods $\operatorname{Spec}(A)=U \subset S$ of $s$ and $\operatorname{Spec}(B)=V \subset X$ of $x$ such that
(1) $f(V) \subset U$ and $\sigma(U) \subset V$,
(2) with $I=\operatorname{Ker}\left(\sigma^{\#}: B \rightarrow A\right)$ the module $I / I^{2}$ is a free $A$-module, and
(3) $B^{\wedge} \cong A\left[\left[x_{1}, \ldots, x_{d}\right]\right]$ as $A$-algebras where $B^{\wedge}$ denotes the completion of $B$ with respect to $I$.

Proof. Pick an affine open $U \subset S$ containing $s$ Pick an affine open $V \subset f^{-1}(U)$ containing $x$. Pick an affine open $U^{\prime} \subset \sigma^{-1}(V)$ containing $s$. Note that $V^{\prime}=$ $f^{-1}\left(U^{\prime}\right) \cap V$ is affine as it is equal to the fibre product $V^{\prime}=U^{\prime} \times_{U} V$. Then $U^{\prime}$ and $V^{\prime}$ satisfy (1). Write $U^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ and $V^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$. By Algebra, Lemma 10.137 .4 the module $I^{\prime} /\left(I^{\prime}\right)^{2}$ is finite locally free as a $A^{\prime}$-module. Hence after replacing $U^{\prime}$ by a smaller affine open $U^{\prime \prime} \subset U^{\prime}$ and $V^{\prime}$ by $V^{\prime \prime}=V^{\prime} \cap f^{-1}\left(U^{\prime \prime}\right)$ we obtain the situation where $I^{\prime \prime} /\left(I^{\prime \prime}\right)^{2}$ is free, i.e., (2) holds. In this case (3) holds also by Algebra, Lemma 10.137.4.

The dimension of a scheme $X$ at a point $x$ (Properties, Definition 27.10.1) is just the dimension of $X$ at $x$ as a topological space, see Topology, Definition 5.9.1. This is not the dimension of the local ring $\mathcal{O}_{X, x}$, in general.

0AFF Lemma 28.34.21. Let $f: X \rightarrow Y$ be a smooth morphism of locally Noetherian schemes. For every point $x$ in $X$ with image $y$ in $Y$,

$$
\operatorname{dim}_{x}(X)=\operatorname{dim}_{y}(Y)+\operatorname{dim}_{x}\left(X_{y}\right)
$$

[^76]where $X_{y}$ denotes the fiber over $y$.
Proof. After replacing $X$ by an open neighborhood of $x$, there is a natural number $d$ such that all fibers of $X \rightarrow Y$ have dimension $d$ at every point, see Lemma 28.34.12. Then $f$ is flat (Lemma 28.34.9), locally of finite type (Lemma 28.34.8), and of relative dimension $d$. Hence the result follows from Lemma 28.29.6.

### 28.35. Unramified morphisms

02G3 We briefly discuss unramified morphisms before the (perhaps) more interesting class of étale morphisms. Recall that a ring map $R \rightarrow A$ is unramified if it is of finite type and $\Omega_{A / R}=0$ (this is the definition of Ray70). A ring map $R \rightarrow A$ is called $G$-unramified if it is of finite presentation and $\Omega_{A / R}=0$ (this is the definition of DG67). See Algebra, Definition 10.147.1.
02G4 Definition 28.35.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is unramified at $x \in X$ if there exists a affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and affine open $\operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is unramified.
(2) We say that $f$ is $G$-unramified at $x \in X$ if there exists a affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and affine open $\operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is G-unramified.
(3) We say that $f$ is unramified if it is unramified at every point of $X$.
(4) We say that $f$ is $G$-unramified if it is G-unramified at every point of $X$.

Note that a G-unramified morphism is unramified. Hence any result for unramified morphisms implies the corresponding result for G-unramified morphisms. Moreover, if $S$ is locally Noetherian then there is no difference between G-unramified and unramified morphisms, see Lemma 28.35.6. A pleasing feature of this definition is that the set of points where a morphism is unramified (resp. G-unramified) is automatically open.
02G5 Lemma 28.35.2. Let $f: X \rightarrow S$ be a morphism of schemes. Then
(1) $f$ is unramified if and only if $f$ is locally of finite type and $\Omega_{X / S}=0$, and
(2) $f$ is G-unramified if and only if $f$ is locally of finite presentation and $\Omega_{X / S}=0$.
Proof. By definition a ring map $R \rightarrow A$ is unramified (resp. G-unramified) if and only if it is of finite type (resp. finite presentation) and $\Omega_{A / R}=0$. Hence the lemma follows directly from the definitions and Lemma 28.33 .5 .

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being unramified is local in nature on the source. Here is the precise result.
02G6 Lemma 28.35.3. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is unramified (resp. G-unramified).
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is unramified (resp. G-unramified).
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is unramified (resp. G-unramified).
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is unramified (resp. G-unramified), for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is unramified (resp. G-unramified) then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is unramified (resp. $G$-unramified).

Proof. This follows from Lemma 28.14 .3 if we show that the property " $R \rightarrow A$ is unramified" is local. We check conditions (a), (b) and (c) of Definition 28.14.1. These properties are proved in Algebra, Lemma 10.147.3.

02G9 Lemma 28.35.4. The composition of two morphisms which are unramified is unramified. The same holds for G-unramified morphisms.

Proof. The proof of Lemma 28.35 .3 shows that being unramified (resp. G-unramified) is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14.5 combined with the fact that being unramified (resp. G-unramified) is a property of ring maps that is stable under composition, see Algebra, Lemma 10.147.3.

02GA Lemma 28.35.5. The base change of a morphism which is unramified is unramified. The same holds for G-unramified morphisms.

Proof. The proof of Lemma 28.35 .3 shows that being unramified (resp. G-unramified) is a local property of ring maps. Hence the lemma follows from Lemma 28.14.5combined with the fact that being unramified (resp. G-unramified) is a property of ring maps that is stable under base change, see Algebra, Lemma 10.147.3.

04EV Lemma 28.35.6. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $S$ is locally Noetherian. Then $f$ is unramified if and only if $f$ is G-unramified.

Proof. Follows from the definitions and Lemma 28.21.9,
02GB Lemma 28.35.7. Any open immersion is $G$-unramified.
Proof. This is true because an open immersion is a local isomorphism.
02GC Lemma 28.35.8. A closed immersion $i: Z \rightarrow X$ is unramified. It is $G$-unramified if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z}\right)$ is of finite type (as an $\mathcal{O}_{X}$-module).

Proof. Follows from Lemma 28.21.7 and Algebra, Lemma 10.147.3.
02GD Lemma 28.35.9. An unramified morphism is locally of finite type. A G-unramified morphism is locally of finite presentation.

Proof. An unramified ring map is of finite type by definition. A G-unramified ring map is of finite presentation by definition.

02V5 Lemma 28.35.10. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is unramified at $x$ then $f$ is quasi-finite at $x$. In particular, an unramified morphism is locally quasi-finite.
Proof. See Algebra, Lemma 10.147.6.
02G7 Lemma 28.35.11. Fibres of unramified morphisms.
(1) Let $X$ be a scheme over a field $k$. The structure morphism $X \rightarrow \operatorname{Spec}(k)$ is unramified if and only if $X$ is a disjoint union of spectra of finite separable field extensions of $k$.
(2) If $f: X \rightarrow S$ is an unramified morphism then for every $s \in S$ the fibre $X_{s}$ is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$.

Proof. Part (2) follows from part (1) and Lemma 28.35.5. Let us prove part (1). We first use Algebra, Lemma 10.147.7. This lemma implies that if $X$ is a disjoint union of spectra of finite separable field extensions of $k$ then $X \rightarrow \operatorname{Spec}(k)$ is unramified. Conversely, suppose that $X \rightarrow \operatorname{Spec}(k)$ is unramified. By Algebra, Lemma 10.147 .5 for every $x \in X$ the residue field extension $k \subset \kappa(x)$ is finite separable. Hence all points of $X$ are closed points (see Lemma 28.20 .2 for example). Thus $X$ is a discrete space, in particular the disjoint union of the spectra of its local rings. By Algebra, Lemma 10.147 .5 again these local rings are fields, and we win.

The following lemma characterizes an unramified morphisms as morphisms locally of finite type with unramified fibres.

02G8 Lemma 28.35.12. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) If $f$ is unramified then for any $x \in X$ the field extension $\kappa(f(x)) \subset \kappa(x)$ is finite separable.
(2) If $f$ is locally of finite type, and for every $s \in S$ the fibre $X_{s}$ is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$ then $f$ is unramified.
(3) If $f$ is locally of finite presentation, and for every $s \in S$ the fibre $X_{s}$ is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$ then $f$ is G-unramified.

Proof. Follows from Algebra, Lemmas 10.147.5 and 10.147.7.
Here is a characterization of unramified morphisms in terms of the diagonal morphism.

02GE Lemma 28.35.13. Let $f: X \rightarrow S$ be a morphism.
(1) If $f$ is unramified, then the diagonal morphism $\Delta: X \rightarrow X \times_{S} X$ is an open immersion.
(2) If $f$ is locally of finite type and $\Delta$ is an open immersion, then $f$ is unramified.
(3) If $f$ is locally of finite presentation and $\Delta$ is an open immersion, then $f$ is G-unramified.

Proof. The first statement follows from Algebra, Lemma 10.147.4. The second statement from the fact that $\Omega_{X / S}$ is the conormal sheaf of the diagonal morphism (Lemma 28.33.7) and hence clearly zero if $\Delta$ is an open immersion.
02GF Lemma 28.35.14. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s=f(x)$. Assume $f$ is locally of finite type (resp. locally of finite presentation). The following are equivalent:
(1) The morphism $f$ is unramified (resp. G-unramified) at $x$.
(2) The fibre $X_{s}$ is unramified over $\kappa(s)$ at $x$.
(3) The $\mathcal{O}_{X, x}$-module $\Omega_{X / S, x}$ is zero.
(4) The $\mathcal{O}_{X_{s}, x}$-module $\Omega_{X_{s} / s, x}$ is zero.
(5) The $\kappa(x)$-vector space

$$
\Omega_{X_{s} / s, x} \otimes_{\mathcal{O}_{X_{s}, x}} \kappa(x)=\Omega_{X / S, x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

is zero.
(6) We have $\mathfrak{m}_{s} \mathcal{O}_{X, x}=\mathfrak{m}_{x}$ and the field extension $\kappa(s) \subset \kappa(x)$ is finite separable.

Proof. Note that if $f$ is unramified at $x$, then we see that $\Omega_{X / S}=0$ in a neighbourhood of $x$ by the definitions and the results on modules of differentials in Section 28.33 Hence (1) implies (3) and the vanishing of the right hand vector space in (5). It also implies (2) because by Lemma 28.33 .10 the module of differentials $\Omega_{X_{s} / s}$ of the fibre $X_{s}$ over $\kappa(s)$ is the pullback of the module of differentials $\Omega_{X / S}$ of $X$ over $S$. This fact on modules of differentials also implies the displayed equality of vector spaces in part (4). By Lemma 28.33 .12 the modules $\Omega_{X / S, x}$ and $\Omega_{X_{s} / s, x}$ are of finite type. Hence he modules $\Omega_{X / S, x}$ and $\Omega_{X_{s} / s, x}$ are zero if and only if the corresponding $\kappa(x)$-vector space in (4) is zero by Nakayama's Lemma (Algebra, Lemma 10.19.1). This in particular shows that (3), (4) and (5) are equivalent. The support of $\Omega_{X / S}$ is closed in $X$, see Modules, Lemma 17.9.6. Assumption (3) implies that $x$ is not in the support. Hence $\Omega_{X / S}$ is zero in a neighbourhood of $x$, which implies (1). The equivalence of (1) and (3) applied to $X_{s} \rightarrow s$ implies the equivalence of (2) and (4). At this point we have seen that (1) - (5) are equivalent.

Alternatively you can use Algebra, Lemma 10.147 .3 to see the equivalence of (1) (5) more directly.

The equivalence of (1) and (6) follows from Lemma 28.35 .12 . It also follows more directly from Algebra, Lemmas 10.147 .5 and 10.147.7.
0475 Lemma 28.35.15. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ locally of finite type. Formation of the open set

$$
\begin{aligned}
T & =\left\{x \in X \mid X_{f(x)} \text { is unramified over } \kappa(f(x)) \text { at } x\right\} \\
& =\{x \in X \mid X \text { is unramified over } S \text { at } x\}
\end{aligned}
$$

commutes with arbitrary base change: For any morphism $g: S^{\prime} \rightarrow S$, consider the base change $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ of $f$ and the projection $g^{\prime}: X^{\prime} \rightarrow X$. Then the corresponding set $T^{\prime}$ for the morphism $f^{\prime}$ is equal to $T^{\prime}=\left(g^{\prime}\right)^{-1}(T)$. If $f$ is assumed locally of finite presentation then the same holds for the open set of points where $f$ is $G$-unramified.
Proof. Let $s^{\prime} \in S^{\prime}$ be a point, and let $s=g\left(s^{\prime}\right)$. Then we have

$$
X_{s^{\prime}}^{\prime}=\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right) \times_{\operatorname{Spec}(\kappa(s))} X_{s}
$$

In other words the fibres of the base change are the base changes of the fibres. In particular

$$
\Omega_{X_{s} / s, x} \otimes_{\mathcal{O}_{X_{s}, x}} \kappa\left(x^{\prime}\right)=\Omega_{X_{s^{\prime}}^{\prime} / s^{\prime}, x^{\prime}} \otimes_{\mathcal{O}_{X_{s^{\prime}}^{\prime}, x^{\prime}}} \kappa\left(x^{\prime}\right)
$$

see Lemma 28.33.10. Whence $x^{\prime} \in T^{\prime}$ if and only if $x \in T$ by Lemma 28.35.14. The second part follows from the first because in that case $T$ is the (open) set of points where $f$ is G-unramified according to Lemma 28.35.14.

02GG Lemma 28.35.16. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$.
(1) If $X$ is unramified over $S$, then $f$ is unramified.
(2) If $X$ is $G$-unramified over $S$ and $Y$ of finite type over $S$, then $f$ is $G$ unramified.

Proof. Assume that $X$ is unramified over $S$. By Lemma 28.15 .8 we see that $f$ is locally of finite type. By assumption we have $\Omega_{X / S}=0$. Hence $\Omega_{X / Y}=0$ by Lemma 28.33.9. Thus $f$ is unramified. If $X$ is G-unramified over $S$ and $Y$ of finite type over $S$, then by Lemma 28.21.11 we see that $f$ is locally of finite presentation and we conclude that $f$ is G-unramified.

04HB Lemma 28.35.17. Let $S$ be a scheme. Let $X, Y$ be schemes over $S$. Let $f, g$ : $X \rightarrow Y$ be morphisms over $S$. Let $x \in X$. Assume that
(1) the structure morphism $Y \rightarrow S$ is unramified,
(2) $f(x)=g(x)$ in $Y$, say $y=f(x)=g(x)$, and
(3) the induced maps $f^{\sharp}, g^{\sharp}: \kappa(y) \rightarrow \kappa(x)$ are equal.

Then there exists an open neighbourhood of $x$ in $X$ on which $f$ and $g$ are equal.
Proof. Consider the morphism $(f, g): X \rightarrow Y \times_{S} Y$. By assumption (1) and Lemma 28.35 .13 the inverse image of $\Delta_{Y / S}(Y)$ is open in $X$. And assumptions (2) and (3) imply that $x$ is in this open subset.

### 28.36. Étale morphisms

02GH The Zariski topology of a scheme is a very coarse topology. This is particularly clear when looking at varieties over $\mathbf{C}$. It turns out that declaring an étale morphism to be the analogue of a local isomorphism in topology introduces a much finer topology. On varieties over $\mathbf{C}$ this topology gives rise to the "correct" Betti numbers when computing cohomology with finite coefficients. Another observable is that if $f: X \rightarrow Y$ is an étale morphism of varieties over $\mathbf{C}$, and if $x$ is a closed point of $X$, then $f$ induces an isomorphism $\mathcal{O}_{Y, f(x)}^{\wedge} \rightarrow \mathcal{O}_{X, x}^{\wedge}$ of complete local rings.

In this section we start our study of these matters. In fact we deliberately restrict our discussion to a minimum since we will discuss more interesting results elsewhere. Recall that a ring map $R \rightarrow A$ is said to be étale if it is smooth and $\Omega_{A / R}=0$, see Algebra, Definition 10.141.1.

02GI Definition 28.36.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is étale at $x \in X$ if there exists a affine open neighbourhood $\operatorname{Spec}(A)=U \subset X$ of $x$ and affine open $\operatorname{Spec}(R)=V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \rightarrow A$ is étale.
(2) We say that $f$ is étale if it is étale at every point of $X$.
(3) A morphism of affine schemes $f: X \rightarrow S$ is called standard étale if $X \rightarrow S$ is isomorphic to

$$
\operatorname{Spec}\left(R[x]_{g} /(f)\right) \rightarrow \operatorname{Spec}(R)
$$

where $R \rightarrow R[x]_{g} /(f)$ is a standard étale ring map, see Algebra, Definition 10.141.14, i.e., $f$ is monic and $f^{\prime}$ invertible in $R[x]_{g} /(f)$.

A morphism is étale if and only if it is smooth of relative dimension 0 (see Definition 28.34 .13 ). A pleasing feature of the definition is that the set of points where a morphism is étale is automatically open.

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being étale is local in nature on the source. Here is the precise result.

02GJ Lemma 28.36.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) The morphism $f$ is étale.
(2) For every affine opens $U \subset X, V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is étale.
(3) There exists an open covering $S=\bigcup_{j \in J} V_{j}$ and open coverings $f^{-1}\left(V_{j}\right)=$ $\bigcup_{i \in I_{j}} U_{i}$ such that each of the morphisms $U_{i} \rightarrow V_{j}, j \in J, i \in I_{j}$ is étale.
(4) There exists an affine open covering $S=\bigcup_{j \in J} V_{j}$ and affine open coverings $f^{-1}\left(V_{j}\right)=\bigcup_{i \in I_{j}} U_{i}$ such that the ring map $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{i}\right)$ is étale, for all $j \in J, i \in I_{j}$.
Moreover, if $f$ is étale then for any open subschemes $U \subset X, V \subset S$ with $f(U) \subset V$ the restriction $\left.f\right|_{U}: U \rightarrow V$ is étale.
Proof. This follows from Lemma 28.14 .3 if we show that the property " $R \rightarrow A$ is étale" is local. We check conditions (a), (b) and (c) of Definition 28.14.1. These all follow from Algebra, Lemma 10.141.3.

02GN Lemma 28.36.3. The composition of two morphisms which are étale is étale.
Proof. In the proof of Lemma 28.36 .2 we saw that being étale is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 28.14 .5 combined with the fact that being étale is a property of ring maps that is stable under composition, see Algebra, Lemma 10.141.3.

02GO Lemma 28.36.4. The base change of a morphism which is étale is étale.
Proof. In the proof of Lemma 28.36 .2 we saw that being étale is a local property of ring maps. Hence the lemma follows from Lemma 28.14 .5 combined with the fact that being étale is a property of ring maps that is stable under base change, see Algebra, Lemma 10.141.3.

02GK Lemma 28.36.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Then $f$ is étale at $x$ if and only if $f$ is smooth and unramified at $x$.

Proof. This follows immediately from the definitions.
03WS Lemma 28.36.6. An étale morphism is locally quasi-finite.
Proof. By Lemma 28.36.5 an étale morphism is unramified. By Lemma 28.35.10 an unramified morphism is locally quasi-finite.

02GL Lemma 28.36.7. Fibres of étale morphisms.
(1) Let $X$ be a scheme over a field $k$. The structure morphism $X \rightarrow \operatorname{Spec}(k)$ is étale if and only if $X$ is a disjoint union of spectra of finite separable field extensions of $k$.
(2) If $f: X \rightarrow S$ is an étale morphism, then for every $s \in S$ the fibre $X_{s}$ is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$.

Proof. You can deduce this from Lemma 28.35.11 via Lemma 28.36.5 above. Here is a direct proof.
We will use Algebra, Lemma 10.141.4. Hence it is clear that if $X$ is a disjoint union of spectra of finite separable field extensions of $k$ then $X \rightarrow \operatorname{Spec}(k)$ is étale. Conversely, suppose that $X \rightarrow \operatorname{Spec}(k)$ is étale. Then for any affine open $U \subset X$ we see that $U$ is a finite disjoint union of spectra of finite separable field extensions of $k$. Hence all points of $X$ are closed points (see Lemma 28.20 .2 for example). Thus $X$ is a discrete space and we win.

The following lemma characterizes an étale morphism as a flat, finitely presented morphism with "étale fibres".

02GM Lemma 28.36.8. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is flat, locally of finite presentation, and for every $s \in S$ the fibre $X_{s}$ is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$, then $f$ is étale.
Proof. You can deduce this from Algebra, Lemma 10.141.7. Here is another proof.
By Lemma 28.36.7a fibre $X_{s}$ is étale and hence smooth over $s$. By Lemma 28.34.3 we see that $X \rightarrow S$ is smooth. By Lemma 28.35 .12 we see that $f$ is unramified. We conclude by Lemma 28.36.5.

02GP Lemma 28.36.9. Any open immersion is étale.
Proof. This is true because an open immersion is a local isomorphism.
02GQ Lemma 28.36.10. An étale morphism is syntomic.
Proof. See Algebra, Lemma 10.135 .10 and use that an étale morphism is the same as a smooth morphism of relative dimension 0 .

02GR Lemma 28.36.11. An étale morphism is locally of finite presentation.
Proof. True because an étale ring map is of finite presentation by definition.
02GS Lemma 28.36.12. An étale morphism is flat.
Proof. Combine Lemmas 28.31.7 and 28.36.10.
03WT Lemma 28.36.13. An étale morphism is open.
Proof. Combine Lemmas 28.36.12, 28.36.11, and 28.25.9.
The following lemma says locally any étale morphism is standard étale. This is actually kind of a tricky result to prove in complete generality. The tricky parts are hidden in the chapter on commutative algebra. Hence a standard étale morphism is a local model for a general étale morphism.

02GT Lemma 28.36.14. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s=f(x)$. The following are equivalent
(1) The morphism $f$ is étale at $x$.
(2) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U, f(U) \subset V$ and the induced morphism $\left.f\right|_{U}: U \rightarrow V$ is standard étale (see Definition 28.36.1).

Proof. Follows from the definitions and Algebra, Proposition 10.141.17

Here is a differential criterion of étaleness at a point. There are many variants of this result all of which may be useful at some point. We will just add them here as needed.

02GU Lemma 28.36.15. Let $f: X \rightarrow S$ be a morphism of schemes. Let $x \in X$. Set $s=f(x)$. Assume $f$ is locally of finite presentation. The following are equivalent:
(1) The morphism $f$ is étale at $x$.
(2) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and $X_{s} \rightarrow \operatorname{Spec}(\kappa(s))$ is étale at $x$.
(3) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and $X_{s} \rightarrow \operatorname{Spec}(\kappa(s))$ is unramified at $x$.
(4) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and the $\mathcal{O}_{X, x}$-module $\Omega_{X / S, x}$ is zero.
(5) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat and the $\kappa(x)$-vector space

$$
\Omega_{X_{s} / s, x} \otimes_{\mathcal{O}_{X_{s}, x}} \kappa(x)=\Omega_{X / S, x} \otimes_{\mathcal{O}_{X, x}} \kappa(x)
$$

is zero.
(6) The local ring map $\mathcal{O}_{S, s} \rightarrow \mathcal{O}_{X, x}$ is flat, we have $\mathfrak{m}_{s} \mathcal{O}_{X, x}=\mathfrak{m}_{x}$ and the field extension $\kappa(s) \subset \kappa(x)$ is finite separable.
(7) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U, f(U) \subset V$ and the induced morphism $\left.f\right|_{U}: U \rightarrow V$ is standard smooth of relative dimension 0.
(8) There exist affine opens $\operatorname{Spec}(A)=U \subset X$ and $\operatorname{Spec}(R)=V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation

$$
A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{n}\right)
$$

with

$$
g=\operatorname{det}\left(\begin{array}{cccc}
\partial f_{1} / \partial x_{1} & \partial f_{2} / \partial x_{1} & \ldots & \partial f_{n} / \partial x_{1} \\
\partial f_{1} / \partial x_{2} & \partial f_{2} / \partial x_{2} & \ldots & \partial f_{n} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{n} & \partial f_{2} / \partial x_{n} & \ldots & \partial f_{n} / \partial x_{n}
\end{array}\right)
$$

mapping to an element of $A$ not in $\mathfrak{q}$.
(9) There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U, f(U) \subset V$ and the induced morphism $\left.f\right|_{U}: U \rightarrow V$ is standard étale.
(10) There exist affine opens $\operatorname{Spec}(A)=U \subset X$ and $\operatorname{Spec}(R)=V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists $a$ presentation

$$
A=R[x]_{Q} /(P)=R[x, 1 / Q] /(P)
$$

with $P, Q \in R[x], P$ monic and $P^{\prime}=d P / d x$ mapping to an element of $A$ not in $\mathfrak{q}$.

Proof. Use Lemma 28.36 .14 and the definitions to see that (1) implies all of the other conditions. For each of the conditions (2) - (10) combine Lemmas 28.34.14 and 28.35 .14 to see that (1) holds by showing $f$ is both smooth and unramified at $x$ and applying Lemma 28.36.5. Some details omitted.

02GV Lemma 28.36.16. A morphism is étale at a point if and only if it is flat and $G$-unramified at that point. A morphism is étale if and only if it is flat and $G$ unramified.

Proof. This is clear from Lemmas 28.36.15 and 28.35.14.
0476 Lemma 28.36.17. Let

be a cartesian diagram of schemes. Let $W \subset X$, resp. $W^{\prime} \subset X^{\prime}$ be the open subscheme of points where $f$, resp. $f^{\prime}$ is étale. Then $W^{\prime}=\left(g^{\prime}\right)^{-1}(W)$ if
(1) $f$ is flat and locally of finite presentation, or
(2) $f$ is locally of finite presentation and $g$ is flat.

Proof. Assume first that $f$ locally of finite type. Consider the set

$$
T=\{x \in X \mid f \text { is unramified at } x\}
$$

and the corresponding set $T^{\prime} \subset X^{\prime}$ for $f^{\prime}$. Then $T^{\prime}=\left(g^{\prime}\right)^{-1}(T)$ by Lemma 28.35.15.
Thus case (1) follows because in case (1) $T$ is the (open) set of points where $f$ is étale by Lemma 28.36.16.
In case (2) let $x^{\prime} \in W^{\prime}$. Then $g^{\prime}$ is flat at $x^{\prime}$ (Lemma 28.25.6) and $g \circ f$ is flat at $x^{\prime}$ (Lemma 28.25.4). It follows that $f$ is flat at $x=g^{\prime}\left(x^{\prime}\right)$ by Lemma 28.25.11. On the other hand, since $x^{\prime} \in T^{\prime}$ (Lemma 28.34.5) we see that $x \in T$. Hence $f$ is étale at $x$ by Lemma 28.36.15.

Our proof of the following lemma is somewhat complicated. It uses the "Critère de platitude par fibres" to see that a morphism $X \rightarrow Y$ over $S$ between schemes étale over $S$ is automatically flat. The details are in the chapter on commutative algebra.
02GW Lemma 28.36.18. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. If $X$ and $Y$ are étale over $S$, then $f$ is étale.
Proof. See Algebra, Lemma 10.141.9.
02K6 Lemma 28.36.19. Let

be a commutative diagram of morphisms of schemes. Assume that
(1) $f$ is surjective, and étale,
(2) $p$ is étale, and
(3) $q$ is locally of finite presentatior ${ }^{10}$.

Then $q$ is étale.

[^77]Proof. By Lemma 28.34 .19 we see that $q$ is smooth. Thus we only need to see that $q$ has relative dimension 0 . This follows from Lemma 28.28 .2 and the fact that $f$ and $p$ have relative dimension 0 .
A final characterization of smooth morphisms is that a smooth morphism $f: X \rightarrow S$ is locally the composition of an étale morphism by a projection $\mathbf{A}_{S}^{d} \rightarrow S$.
054L Lemma 28.36.20. Let $\varphi: X \rightarrow Y$ be a morphism of schemes. Let $x \in X$. If $\varphi$ is smooth at $x$, then there exists an integer $d \geq 0$ and affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and $\varphi(U) \subset V$ such that there exists a commutative diagram

where $\pi$ is étale.
Proof. By Lemma 28.34.11 we can find affine opens $U$ and $V$ as in the lemma such that $\left.\varphi\right|_{U}: U \rightarrow V$ is standard smooth. Write $U=\operatorname{Spec}(A)$ and $V=\operatorname{Spec}(R)$ so that we can write

$$
A=R\left[x_{1}, \ldots, x_{n}\right] /\left(f_{1}, \ldots, f_{c}\right)
$$

with

$$
g=\operatorname{det}\left(\begin{array}{cccc}
\partial f_{1} / \partial x_{1} & \partial f_{2} / \partial x_{1} & \ldots & \partial f_{c} / \partial x_{1} \\
\partial f_{1} / \partial x_{2} & \partial f_{2} / \partial x_{2} & \ldots & \partial f_{c} / \partial x_{2} \\
\ldots & \ldots & \ldots & \ldots \\
\partial f_{1} / \partial x_{c} & \partial f_{2} / \partial x_{c} & \ldots & \partial f_{c} / \partial x_{c}
\end{array}\right)
$$

mapping to an invertible element of $A$. Then it is clear that $R\left[x_{c+1}, \ldots, x_{n}\right] \rightarrow A$ is standard smooth of relative dimension 0 . Hence it is smooth of relative dimension 0 . In other words the ring map $R\left[x_{c+1}, \ldots, x_{n}\right] \rightarrow A$ is étale. As $\mathbf{A}_{V}^{n-c}=$ $\operatorname{Spec}\left(R\left[x_{c+1}, \ldots, x_{n}\right]\right)$ the lemma with $d=n-c$.

### 28.37. Relatively ample sheaves

01 VG Let $X$ be a scheme and $\mathcal{L}$ an invertible sheaf on $X$. Then $\mathcal{L}$ is ample on $X$ if $X$ is quasi-compact and every point of $X$ is contained in an affine open of the form $X_{s}$, where $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ and $n \geq 1$, see Properties, Definition 27.26.1. We turn this into a relative notion as follows.

01VH Definition 28.37.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. We say $\mathcal{L}$ is relatively ample, or $f$-relatively ample, or ample on $X / S$, or $f$-ample if $f: X \rightarrow S$ is quasi-compact, and if for every affine open $V \subset S$ the restriction of $\mathcal{L}$ to the open subscheme $f^{-1}(V)$ of $X$ is ample.
We note that the existence of a relatively ample sheaf on $X$ does not force the morphism $X \rightarrow S$ to be of finite type.

02NN Lemma 28.37.2. Let $X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $n \geq 1$. Then $\mathcal{L}$ is $f$-ample if and only if $\mathcal{L}^{\otimes n}$ is $f$-ample.
Proof. This follows from Properties, Lemma 27.26.2,
01VI Lemma 28.37.3. Let $f: X \rightarrow S$ be a morphism of schemes. If there exists an $f$-ample invertible sheaf, then $f$ is separated.

Proof. Being separated is local on the base (see Schemes, Lemma 25.21 .8 for example; it also follows easily from the definition). Hence we may assume $S$ is affine and $X$ has an ample invertible sheaf. In this case the result follows from Properties, Lemma 27.26.8.

There are many ways to characterize relatively ample invertible sheaves, analogous to the equivalent conditions in Properties, Proposition 27.26.13. We will add these here as needed.

01VJ Lemma 28.37.4. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. The following are equivalent:
(1) The invertible sheaf $\mathcal{L}$ is $f$-ample.
(2) There exists an open covering $S=\bigcup V_{i}$ such that each $\left.\mathcal{L}\right|_{f^{-1}\left(V_{i}\right)}$ is ample relative to $f^{-1}\left(V_{i}\right) \rightarrow V_{i}$.
(3) There exists an affine open covering $S=\bigcup V_{i}$ such that each $\left.\mathcal{L}\right|_{f^{-1}\left(V_{i}\right)}$ is ample.
(4) There exists a quasi-coherent graded $\mathcal{O}_{S}$-algebra $\mathcal{A}$ and a map of graded $\mathcal{O}_{X}$-algebras $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ such that $U(\psi)=X$ and

$$
r_{\mathcal{L}, \psi}: X \longrightarrow \underline{\operatorname{Proj}}_{S}(\mathcal{A})
$$

is an open immersion (see Constructions, Lemma 26.19.1 for notation).
(5) The morphism $f$ is quasi-separated and part (4) above holds with $\mathcal{A}=$ $f_{*}\left(\bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}\right)$ and $\psi$ the adjunction mapping.
(6) Same as (4) but just requiring $r_{\mathcal{L}, \psi}$ to be an immersion.

Proof. It is immediate from the definition that (1) implies (2) and (2) implies (3). It is clear that (5) implies (4).
Assume (3) holds for the affine open covering $S=\bigcup V_{i}$. We are going to show (5) holds. Since each $f^{-1}\left(V_{i}\right)$ has an ample invertible sheaf we see that $f^{-1}\left(V_{i}\right)$ is separated (Properties, Lemma 27.26.8). Hence $f$ is separated. By Schemes, Lemma 25.24.1 we see that $\mathcal{A}=f_{*}\left(\bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}\right)$ is a quasi-coherent graded $\mathcal{O}_{S^{-}}$ algebra. Denote $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ the adjunction mapping. The description of the open $U(\psi)$ in Constructions, Section 26.19 and the definition of ampleness of $\left.\mathcal{L}\right|_{f^{-1}\left(V_{i}\right)}$ show that $U(\psi)=X$. Moreover, Constructions, Lemma 26.19.1 part (3) shows that the restriction of $r_{\mathcal{L}, \psi}$ to $f^{-1}\left(V_{i}\right)$ is the same as the morphism from Properties, Lemma 27.26.9 which is an open immersion according to Properties, Lemma 27.26.11 Hence (5) holds.

Let us show that (4) implies (1). Assume (4). Denote $\pi: \operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ the structure morphism. Choose $V \subset S$ affine open. By Constructions, Definition 26.16.7 we see that $\pi^{-1}(V) \subset \underline{\operatorname{Proj}}_{S}(\mathcal{A})$ is equal to $\operatorname{Proj}(A)$ where $A=\mathcal{A}(V)$ as a graded ring. Hence $r_{\mathcal{L}, \psi}$ maps $f^{-1}(V)$ isomorphically onto a quasi-compact open of $\operatorname{Proj}(A)$. Moreover, $\mathcal{L}^{\otimes d}$ is isomorphic to the pullback of $\mathcal{O}_{\operatorname{Proj}(A)}(d)$ for some $d \geq 1$. (See part (3) of Constructions, Lemma 26.19.1 and the final statement of Constructions, Lemma 26.14.1) This implies that $\left.\mathcal{L}\right|_{f^{-1}(V)}$ is ample by Properties, Lemmas 27.26.12 and 27.26.2

Assume (6). By the equivalence of (1) - (5) above we see that the property of being relatively ample on $X / S$ is local on $S$. Hence we may assume that $S$ is affine, and we have to show that $\mathcal{L}$ is ample on $X$. In this case the morphism $r_{\mathcal{L}, \psi}$ is
identified with the morphism, also denoted $r_{\mathcal{L}, \psi}: X \rightarrow \operatorname{Proj}(A)$ associated to the $\operatorname{map} \psi: A=\mathcal{A}(V) \rightarrow \Gamma_{*}(X, \mathcal{L})$. (See references above.) As above we also see that $\mathcal{L}^{\otimes d}$ is the pullback of the sheaf $\mathcal{O}_{\operatorname{Proj}(A)}(d)$ for some $d \geq 1$. Moreover, since $X$ is quasi-compact we see that $X$ gets identified with a closed subscheme of a quasi-compact open subscheme $Y \subset \operatorname{Proj}(A)$. By Constructions, Lemma 26.10.6 (see also Properties, Lemma 27.26.12) we see that $\mathcal{O}_{Y}\left(d^{\prime}\right)$ is an ample invertible sheaf on $Y$ for some $d^{\prime} \geq 1$. Since the restriction of an ample sheaf to a closed subscheme is ample, see Properties, Lemma 27.26 .3 we conclude that the pullback of $\mathcal{O}_{Y}\left(d^{\prime}\right)$ is ample. Combining these results with Properties, Lemma 27.26 .2 we conclude that $\mathcal{L}$ is ample as desired.

01VK Lemma 28.37.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume $S$ affine. Then $\mathcal{L}$ is $f$-relatively ample if and only if $\mathcal{L}$ is ample on $X$.

Proof. Immediate from Lemma 28.37 .4 and the definitions.
0891 Lemma 28.37.6. Let $f: X \rightarrow S$ be a morphism of schemes. Then $f$ is quasiaffine if and only if $\mathcal{O}_{X}$ is $f$-relatively ample.

Proof. Follows from Properties, Lemma 27.27.1 and the definitions.
0892 Lemma 28.37.7. Let $f: X \rightarrow Y$ be a morphism of schemes, $\mathcal{M}$ an invertible $\mathcal{O}_{Y}$-module, and $\mathcal{L}$ an invertible $\mathcal{O}_{X}$-module.
(1) If $\mathcal{L}$ is $f$-ample and $\mathcal{M}$ is ample, then $\mathcal{L} \otimes f^{*} \mathcal{M}^{\otimes a}$ is ample for $a \gg 0$.
(2) If $\mathcal{M}$ is ample and $f$ quasi-affine, then $f^{*} \mathcal{M}$ is ample.

Proof. Assume $\mathcal{L}$ is $f$-ample and $\mathcal{M}$ ample. By assumption $Y$ and $f$ are quasicompact (see Definition 28.37.1 and Properties, Definition 27.26.1). Hence $X$ is quasi-compact. Pick $x \in X$. We can choose $m \geq 1$ and $t \in \Gamma\left(Y, \mathcal{M}^{\otimes m}\right)$ such that $Y_{t}$ is affine and $f(x) \in Y_{t}$. Since $\mathcal{L}$ restricts to an ample invertible sheaf on $f^{-1}\left(Y_{t}\right)=X_{f^{*} t}$ we can choose $n \geq 1$ and $s \in \Gamma\left(X_{f^{*} t}, \mathcal{L}^{\otimes n}\right)$ with $x \in\left(X_{f^{*} t}\right)_{s}$ with $\left(X_{f * t}\right)_{s}$ affine. By Properties, Lemma 27.17.2 there exists an integer $e \geq 1$ and a section $s^{\prime} \in \Gamma\left(X, \mathcal{L}^{\otimes n} \otimes f^{*} \mathcal{M}^{\otimes e m}\right)$ which restricts to $s\left(f^{*} t\right)^{e}$ on $X_{f^{*} t}$. For any $b>0$ consider the section $s^{\prime \prime}=s^{\prime}\left(f^{*} t\right)^{b}$ of $\mathcal{L}^{\otimes n} \otimes f^{*} \mathcal{M}^{\otimes(e+b) m}$. Then $X_{s^{\prime \prime}}=\left(X_{f^{*} t}\right)_{s}$ is an affine open of $X$ containing $x$. Picking $b$ such that $n$ divides $e+b$ we see $\mathcal{L}^{\otimes n} \otimes f^{*} \mathcal{M}^{\otimes(e+b) m}$ is the $n$th power of $\mathcal{L} \otimes f^{*} \mathcal{M}^{\otimes a}$ for some $a$ and we can get any $a$ divisible by $m$ and big enough. Since $X$ is quasi-compact a finite number of these affine opens cover $X$. We conclude that for some $a$ sufficiently divisible and large enough the invertible sheaf $\mathcal{L} \otimes f^{*} \mathcal{M}^{\otimes a}$ is ample on $X$. On the other hand, we know that $\mathcal{M}^{\otimes c}$ (and hence its pullback to $X$ ) is globally generated for all $c \gg 0$ by Properties, Proposition 27.26.13. Thus $\mathcal{L} \otimes f^{*} \mathcal{M}^{\otimes a+c}$ is ample (Properties, Lemma 27.26 .5 for $c \gg 0$ and (1) is proved.

Part (2) follows from Lemma 28.37.6. Properties, Lemma 27.26.2, and part (1).
0893 Lemma 28.37.8. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. Let $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ be the base change of $f$ and denote $\mathcal{L}^{\prime}$ the pullback of $\mathcal{L}$ to $X^{\prime}$. If $\mathcal{L}$ is $f$-ample, then $\mathcal{L}^{\prime}$ is $f^{\prime}$-ample.

Proof. By Lemma 28.37 .4 it suffices to find an affine open covering $S^{\prime}=\bigcup U_{i}^{\prime}$ such that $\mathcal{L}^{\prime}$ restricts to an ample invertible sheaf on $\left(f^{\prime}\right)^{-1}\left(U_{i}^{\prime}\right)$ for all $i$. We
may choose $U_{i}^{\prime}$ mapping into an affine open $U_{i} \subset S$. In this case the morphism $\left(f^{\prime}\right)^{-1}\left(U_{i}^{\prime}\right) \rightarrow f^{-1}\left(U_{i}\right)$ is affine as a base change of the affine morphism $U_{i}^{\prime} \rightarrow U_{i}$ (Lemma 28.12.8. Thus $\left.\mathcal{L}^{\prime}\right|_{\left(f^{\prime}\right)^{-1}\left(U_{i}^{\prime}\right)}$ is ample by Lemma 28.37.7.

### 28.38. Very ample sheaves

01VL Recall that given a quasi-coherent sheaf $\mathcal{E}$ on a scheme $S$ the projective bundle associated to $\mathcal{E}$ is the morphism $\mathbf{P}(\mathcal{E}) \rightarrow S$, where $\mathbf{P}(\mathcal{E})=\underline{\operatorname{Proj}}_{S}(\operatorname{Sym}(\mathcal{E}))$, see Constructions, Definition 26.21.1.

01VM Definition 28.38.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. We say $\mathcal{L}$ is relatively very ample or more precisely $f$-relatively very ample, or very ample on $X / S$, or $f$-very ample if there exist a quasi-coherent $\mathcal{O}_{S}$-module $\mathcal{E}$ and an immersion $i: X \rightarrow \mathbf{P}(\mathcal{E})$ over $S$ such that $\mathcal{L} \cong i^{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$.

Since there is no assumption of quasi-compactness in this definition it is not true in general that a relatively very ample invertible sheaf is a relatively ample invertible sheaf.

01VN Lemma 28.38.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. If $f$ is quasi-compact and $\mathcal{L}$ is a relatively very ample invertible sheaf, then $\mathcal{L}$ is a relatively ample invertible sheaf.

Proof. By definition there exists quasi-coherent $\mathcal{O}_{S}$-module $\mathcal{E}$ and an immersion $i: X \rightarrow \mathbf{P}(\mathcal{E})$ over $S$ such that $\mathcal{L} \cong i^{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. Set $\mathcal{A}=\operatorname{Sym}(\mathcal{E})$, so $\mathbf{P}(\mathcal{E})=$ $\underline{\operatorname{Proj}}_{S}(\mathcal{A})$ by definition. The graded $\mathcal{O}_{S}$-algebra $\mathcal{A}$ comes equipped with a map

$$
\psi: \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(n) \rightarrow \bigoplus_{n \geq 0} f_{*} \mathcal{L}^{\otimes n}
$$

where the second arrow uses the identification $\mathcal{L} \cong i^{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. By adjointness of $f_{*}$ and $f^{*}$ we get a morphism $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$. We omit the verification that the morphism $r_{\mathcal{L}, \psi}$ associated to this map is exactly the immersion $i$. Hence the result follows from part (6) of Lemma 28.37.4.

To arrive at the correct converse of this lemma we ask whether given a relatively ample invertible sheaf $\mathcal{L}$ there exists an integer $n \geq 1$ such that $\mathcal{L}^{\otimes n}$ is relatively very ample? In general this is false. There are several things that prevent this from being true:
(1) Even if $S$ is affine, it can happen that no finite integer $n$ works because $X \rightarrow S$ is not of finite type, see Example 28.38.4
(2) The base not being quasi-compact means the result can be prevented from being true even with $f$ finite type. Namely, given a field $k$ there exists a scheme $X_{d}$ of finite type over $k$ with an ample invertible sheaf $\mathcal{O}_{X_{d}}(1)$ so that the smallest tensor power of $\mathcal{O}_{X_{d}}(1)$ which is very ample is the $d$ th power. See Example 28.38.5. Taking $f$ to be the disjoint union of the schemes $X_{d}$ mapping to the disjoint union of copies of $\operatorname{Spec}(k)$ gives an example.
To see our version of the converse take a look at Lemma 28.39.5 below. We will do some preliminary work before proving it.

07ZR Example 28.38.3. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S^{-}}$ algebra generated by $\mathcal{A}_{1}$ over $\mathcal{A}_{0}$. Set $X=\underline{\operatorname{Proj}}_{S}(\mathcal{A})$. In this case $\mathcal{O}_{X}(1)$ is a very ample invertible sheaf on $X$. Namely, the morphism associated to the graded $\mathcal{O}_{S}$-algebra map

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{A}_{1}\right) \longrightarrow \mathcal{A}
$$

is a closed immersion $X \rightarrow \mathbf{P}\left(\mathcal{A}_{1}\right)$ which pulls back $\mathcal{O}_{\mathbf{P}\left(\mathcal{A}_{1}\right)}(1)$ to $\mathcal{O}_{X}(1)$, see Constructions, Lemma 26.18.5.

01 VO Example 28.38.4. Let $k$ be a field. Consider the graded $k$-algebra

$$
A=k\left[U, V, Z_{1}, Z_{2}, Z_{3}, \ldots\right] / I \quad \text { with } \quad I=\left(U^{2}-Z_{1}^{2}, U^{4}-Z_{2}^{2}, U^{6}-Z_{3}^{2}, \ldots\right)
$$

with grading given by $\operatorname{deg}(U)=\operatorname{deg}(V)=\operatorname{deg}\left(Z_{1}\right)=1$ and $\operatorname{deg}\left(Z_{d}\right)=d$. Note that $X=\operatorname{Proj}(A)$ is covered by $D_{+}(U)$ and $D_{+}(V)$. Hence the sheaves $\mathcal{O}_{X}(n)$ are all invertible and isomorphic to $\mathcal{O}_{X}(1)^{\otimes n}$. In particular $\mathcal{O}_{X}(1)$ is ample and $f$-ample for the morphism $f: X \rightarrow \operatorname{Spec}(k)$. We claim that no power of $\mathcal{O}_{X}(1)$ is $f$-relatively very ample. Namely, it is easy to see that $\Gamma\left(X, \mathcal{O}_{X}(n)\right)$ is the degree $n$ summand of the algebra $A$. Hence if $\mathcal{O}_{X}(n)$ were very ample, then $X$ would be a closed subscheme of a projective space over $k$ and hence of finite type over $k$. On the other hand $D_{+}(V)$ is the spectrum of $k\left[t, t_{1}, t_{2}, \ldots\right] /\left(t^{2}-t_{1}^{2}, t^{4}-t_{2}^{2}, t^{6}-t_{3}^{2}, \ldots\right)$ which is not of finite type over $k$.
01VP Example 28.38.5. Let $k$ be an infinite field. Let $\lambda_{1}, \lambda_{2}, \lambda_{3}, \ldots$ be pairwise distinct elements of $k^{*}$. (This is not strictly necessary, and in fact the example works perfectly well even if all $\lambda_{i}$ are equal to 1.) Consider the graded $k$-algebra

$$
A_{d}=k[U, V, Z] / I_{d} \quad \text { with } \quad I_{d}=\left(Z^{2}-\prod_{i=1}^{2 d}\left(U-\lambda_{i} V\right)\right)
$$

with grading given by $\operatorname{deg}(U)=\operatorname{deg}(V)=1$ and $\operatorname{deg}(Z)=d$. Then $X_{d}=\operatorname{Proj}\left(A_{d}\right)$ has ample invertible sheaf $\mathcal{O}_{X_{d}}(1)$. We claim that if $\mathcal{O}_{X_{d}}(n)$ is very ample, then $n \geq d$. The reason for this is that $Z$ has degree $d$, and hence $\Gamma\left(X_{d}, \mathcal{O}_{X_{d}}(n)\right)=$ $k[U, V]_{n}$ for $n<d$. Details omitted.
01VQ Lemma 28.38.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. If $\mathcal{L}$ is relatively very ample on $X / S$ then $f$ is separated.

Proof. Being separated is local on the base (see Schemes, Section 25.21). An immersion is separated (see Schemes, Lemma 25.23.7). Hence the lemma follows since locally $X$ has an immersion into the homogeneous spectrum of a graded ring which is separated, see Constructions, Lemma 26.8.8.

01VR Lemma 28.38.7. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. Assume $f$ is quasi-compact. The following are equivalent
(1) $\mathcal{L}$ is relatively very ample on $X / S$,
(2) there exists an open covering $S=\bigcup V_{j}$ such that $\left.\mathcal{L}\right|_{f^{-1}\left(V_{j}\right)}$ is relatively very ample on $f^{-1}\left(V_{j}\right) / V_{j}$ for all $j$,
(3) there exists a quasi-coherent sheaf of graded $\mathcal{O}_{S}$-algebras $\mathcal{A}$ generated in degree 1 over $\mathcal{O}_{S}$ and a map of graded $\mathcal{O}_{X}$-algebras $\psi: f^{*} \mathcal{A} \rightarrow \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ such that $f^{*} \mathcal{A}_{1} \rightarrow \mathcal{L}$ is surjective and the associated morphism $r_{\mathcal{L}, \psi} \geq X \rightarrow$ $\underline{\operatorname{Proj}}_{S}(\mathcal{A})$ is an immersion, and
(4) $\bar{f}$ is quasi-separated, the canonical map $\psi: f^{*} f_{*} \mathcal{L} \rightarrow \mathcal{L}$ is surjective, and the associated map $r_{\mathcal{L}, \psi}: X \rightarrow \mathbf{P}\left(f_{*} \mathcal{L}\right)$ is an immersion.

Proof. It is clear that (1) implies (2). It is also clear that (4) implies (1); the hypothesis of quasi-separation in (4) is used to guarantee that $f_{*} \mathcal{L}$ is quasi-coherent via Schemes, Lemma 25.24.1.
Assume (2). We will prove (4). Let $S=\bigcup V_{j}$ be an open covering as in (2). Set $X_{j}=f^{-1}\left(V_{j}\right)$ and $f_{j}: X_{j} \rightarrow V_{j}$ the restriction of $f$. We see that $f$ is separated by Lemma 28.38 .6 (as being separated is local on the base). Consider the map $\psi: f^{*} f_{*} \mathcal{L} \rightarrow \overline{\mathcal{L}}$. On each $V_{j}$ there exists a quasi-coherent sheaf $\mathcal{E}_{j}$ and an embedding $i: X_{j} \rightarrow \mathbf{P}\left(\mathcal{E}_{j}\right)$ with $\mathcal{L}_{X_{j}} \cong i^{*} \mathcal{O}_{\mathbf{P}\left(\mathcal{E}_{j}\right)}(1)$. In other words there is a map $\left.\mathcal{E}_{j} \rightarrow\left(f_{*} \mathcal{L}\right)\right|_{X_{j}}$ such that the composition

$$
\left.\left.f_{j}^{*} \mathcal{E}_{j} \rightarrow\left(f^{*} f_{*} \mathcal{L}\right)\right|_{X_{j}} \rightarrow \mathcal{L}\right|_{X_{j}}
$$

is surjective. Hence we conclude that $\psi$ is surjective. Let $r_{\mathcal{L}, \psi}: X \rightarrow \mathbf{P}\left(f_{*} \mathcal{L}\right)$ be the associated morphism. Using the maps $\left.\mathcal{E}_{j} \rightarrow\left(f_{*} \mathcal{L}\right)\right|_{X_{j}}$ we see that there is a factorization

$$
\left.X_{j} \xrightarrow{r_{\mathcal{L}, \psi}} \mathbf{P}\left(f_{*} \mathcal{L}\right)\right|_{V_{j}} \longrightarrow \mathbf{P}\left(\mathcal{E}_{j}\right)
$$

which shows that $r_{\mathcal{L}, \psi}$ is an immersion.
At this point we see that (1), (2) and (4) are equivalent. Clearly (4) implies (3). Assume (3). We will prove (1). Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_{S^{-}}$ algebras generated in degree 1 over $\mathcal{O}_{S}$. Consider the map of graded $\mathcal{O}_{S}$-algebras $\operatorname{Sym}\left(\mathcal{A}_{1}\right) \rightarrow \mathcal{A}$. This is surjective by hypothesis and hence induces a closed immersion

$$
\underline{\operatorname{Proj}}_{S}(\mathcal{A}) \longrightarrow \mathbf{P}\left(\mathcal{A}_{1}\right)
$$

which pulls back $\mathcal{O}(1)$ to $\mathcal{O}(1)$, see Constructions, Lemma 26.18.5. Hence it is clear that (3) implies (1).

0B3F Lemma 28.38.8. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. Let $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ be the base change of $f$ and denote $\mathcal{L}^{\prime}$ the pullback of $\mathcal{L}$ to $X^{\prime}$. If $\mathcal{L}$ is $f$-very ample, then $\mathcal{L}^{\prime}$ is $f^{\prime}$-very ample.

Proof. By Definition 28.38 .1 there exists there exist a quasi-coherent $\mathcal{O}_{S}$-module $\mathcal{E}$ and an immersion $i: X \rightarrow \mathbf{P}(\mathcal{E})$ over $S$ such that $\mathcal{L} \cong i^{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. The base change of $\mathbf{P}(\mathcal{E})$ to $S^{\prime}$ is the projective bundle associated to the pullback $\mathcal{E}^{\prime}$ of $\mathcal{E}$ and the pullback of $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ is $\mathcal{O}_{\mathbf{P}\left(\mathcal{E}^{\prime}\right)}(1)$, see Constructions, Lemma 26.16.10 Finally, the base change of an immersion is an immersion (Schemes, Lemma 25.18.2).
28.39. Ample and very ample sheaves relative to finite type morphisms

02 NO In fact most of the material in this section is about the notion of a (quasi-)projective morphism which we have not defined yet.

02NP Lemma 28.39.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. Assume that
(1) the invertible sheaf $\mathcal{L}$ is very ample on $X / S$,
(2) the morphism $X \rightarrow S$ is of finite type, and
(3) $S$ is affine.

Then there exists an $n \geq 0$ and an immersion $i: X \rightarrow \mathbf{P}_{S}^{n}$ over $S$ such that $\mathcal{L} \cong i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1)$.

Proof. Assume (1), (2) and (3). Condition (3) means $S=\operatorname{Spec}(R)$ for some ring $R$. Condition (1) means by definition there exists a quasi-coherent $\mathcal{O}_{S}$-module $\mathcal{E}$ and an immersion $\alpha: X \rightarrow \mathbf{P}(\mathcal{E})$ such that $\mathcal{L}=\alpha^{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. Write $\mathcal{E}=\widetilde{M}$ for some $R$-module $M$. Thus we have

$$
\mathbf{P}(\mathcal{E})=\operatorname{Proj}\left(\operatorname{Sym}_{R}(M)\right)
$$

Since $\alpha$ is an immersion, and since the topology of $\operatorname{Proj}\left(\operatorname{Sym}_{R}(M)\right)$ is generated by the standard opens $D_{+}(f), f \in \operatorname{Sym}_{R}^{d}(M), d \geq 1$, we can find for each $x \in X$ an $f \in \operatorname{Sym}_{R}^{d}(M), d \geq 1$, with $\alpha(x) \in D_{+}(f)$ such that

$$
\left.\alpha\right|_{\alpha^{-1}\left(D_{+}(f)\right)}: \alpha^{-1}\left(D_{+}(f)\right) \rightarrow D_{+}(f)
$$

is a closed immersion. Condition (2) implies $X$ is quasi-compact. Hence we can find a finite collection of elements $f_{j} \in \operatorname{Sym}_{R}^{d_{j}}(M), d_{j} \geq 1$ such that for each $f=f_{j}$ the displayed map above is a closed immersion and such that $\alpha(X) \subset \bigcup D_{+}\left(f_{j}\right)$. Write $U_{j}=\alpha^{-1}\left(D_{+}\left(f_{j}\right)\right)$. Note that $U_{j}$ is affine as a closed subscheme of the affine scheme $D_{+}\left(f_{j}\right)$. Write $U_{j}=\operatorname{Spec}\left(A_{j}\right)$. Condition (2) also implies that $A_{j}$ is of finite type over $R$, see Lemma 28.15.2. Choose finitely many $x_{j, k} \in A_{j}$ which generate $A_{j}$ as a $R$-algebra. Since $\left.\alpha\right|_{U_{j}}$ is a closed immersion we see that $x_{j, k}$ is the image of an element

$$
f_{j, k} / f_{j}^{e_{j, k}} \in \operatorname{Sym}_{R}(M)_{\left(f_{j}\right)}=\Gamma\left(D_{+}\left(f_{j}\right), \mathcal{O}_{\operatorname{Proj}\left(\operatorname{Sym}_{R}(M)\right)}\right)
$$

Finally, choose $n \geq 1$ and elements $y_{0}, \ldots, y_{n} \in M$ such that each of the polynomials $f_{j}, f_{j, k} \in \operatorname{Sym}_{R}(M)$ is a polynomial in the elements $y_{t}$ with coefficients in $R$. Consider the graded ring map

$$
\psi: R\left[Y_{0}, \ldots, Y_{n}\right] \longrightarrow \operatorname{Sym}_{R}(M), \quad Y_{i} \longmapsto y_{i}
$$

Denote $F_{j}, F_{j, k}$ the elements of $R\left[Y_{0}, \ldots, Y_{n}\right]$ such that $\psi\left(F_{j}\right)=f_{j}$ and $\psi\left(F_{j, k}\right)=$ $f_{j, k}$. By Constructions, Lemma 26.11.1 we obtain an open subscheme

$$
U(\psi) \subset \operatorname{Proj}\left(\operatorname{Sym}_{R}(M)\right)
$$

and a morphism $r_{\psi}: U(\psi) \rightarrow \mathbf{P}_{R}^{n}$. This morphism satisfies $r_{\psi}^{-1}\left(D_{+}\left(F_{j}\right)\right)=D_{+}\left(f_{j}\right)$, and hence we see that $\alpha(X) \subset U(\psi)$. Moreover, it is clear that

$$
i=r_{\psi} \circ \alpha: X \longrightarrow \mathbf{P}_{R}^{n}
$$

is still an immersion since $i^{\sharp}\left(F_{j, k} / F_{j}^{e_{j, k}}\right)=x_{j, k} \in A_{j}=\Gamma\left(U_{j}, \mathcal{O}_{X}\right)$ by construction. Moreover, the morphism $r_{\psi}$ comes equipped with a map $\theta: r_{\psi}^{*} \mathcal{O}_{\mathbf{P}_{R}^{n}}(1) \rightarrow$ $\left.\mathcal{O}_{\operatorname{Proj}\left(\operatorname{Sym}_{R}(M)\right)}(1)\right|_{U(\psi)}$ which is an isomorphism in this case (for construction $\theta$ see lemma cited above; some details omitted). Since the original map $\alpha$ was assumed to have the property that $\mathcal{L}=\alpha^{*} \mathcal{O}_{\operatorname{Proj}\left(\operatorname{Sym}_{R}(M)\right)}(1)$ we win.

04II Lemma 28.39.2. Let $\pi: X \rightarrow S$ be a morphism of schemes. Assume that $X$ is quasi-affine and that $\pi$ is locally of finite type. Then there exist $n \geq 0$ and an immersion $i: X \rightarrow \mathbf{A}_{S}^{n}$ over $S$.

Proof. Let $A=\Gamma\left(X, \mathcal{O}_{X}\right)$. By assumption $X$ is quasi-compact and is identified with an open subscheme of $\operatorname{Spec}(A)$, see Properties, Lemma 27.18.3. Moreover, the set of opens $X_{f}$, for those $f \in A$ such that $X_{f}$ is affine, forms a basis for the topology of $X$, see the proof of Properties, Lemma 27.18.3. Hence we can find a finite number of $f_{j} \in A, j=1, \ldots, m$ such that $X=\bigcup X_{f_{j}}$, and such that $\pi\left(X_{f_{j}}\right) \subset V_{j}$ for some affine open $V_{j} \subset S$. By Lemma 28.15.2 the ring maps
$\mathcal{O}\left(V_{j}\right) \rightarrow \mathcal{O}\left(X_{f_{j}}\right)=A_{f_{j}}$ are of finite type. Thus we may choose $a_{1}, \ldots, a_{N} \in A$ such that the elements $a_{1}, \ldots, a_{N}, f_{1}, \ldots, f_{m}, 1 / f_{j}$ generate $A_{f_{j}}$ over $\mathcal{O}\left(V_{j}\right)$ for each $j$. Take $n=N+m$ and let

$$
i: X \longrightarrow \mathbf{A}_{S}^{n}
$$

be the morphism given by the global sections $a_{1}, \ldots, a_{n}, f_{1}, \ldots, f_{n}$ of the structure sheaf of $X$. Let $D\left(x_{j}\right) \subset \mathbf{A}_{S}^{n}$ be the open subscheme where the $j$ th coordinate function is nonzero. Then it is clear that $i^{-1}\left(D\left(x_{j}\right)\right)$ is $X_{f_{j}}$ and that the induced morphism $X_{f_{j}} \rightarrow D\left(x_{j}\right)$ factors through the affine open $\operatorname{Spec}\left(\mathcal{O}\left(V_{j}\right)\left[x_{1}, \ldots, x_{n}, 1 / x_{j}\right]\right)$ of $D\left(x_{j}\right)$. Since the ring map $\mathcal{O}\left(V_{j}\right)\left[x_{1}, \ldots, x_{n}, 1 / x_{j}\right] \rightarrow A_{f_{j}}$ is surjective by construction we conclude that the restriction of $i$ to $X_{f_{j}}$ is an immersion as desired.

01VS Lemma 28.39.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. Assume that
(1) the invertible sheaf $\mathcal{L}$ is ample on $X$, and
(2) the morphism $X \rightarrow S$ is locally of finite type.

Then there exists a $d_{0} \geq 1$ such that for every $d \geq d_{0}$ there exists an $n \geq 0$ and an immersion $i: X \rightarrow \mathbf{P}_{S}^{n}$ over $S$ such that $\mathcal{L}^{\otimes d} \cong i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1)$.

Proof. Let $A=\Gamma_{*}(X, \mathcal{L})=\bigoplus_{d \geq 0} \Gamma\left(X, \mathcal{L}^{\otimes d}\right)$. By Properties, Proposition 27.26 .13 the set of affine opens $X_{a}$ with $a \in A_{+}$homogeneous forms a basis for the topology of $X$. Hence we can find finitely many such elements $a_{0}, \ldots, a_{n} \in A_{+}$such that
(1) we have $X=\bigcup_{i=0, \ldots, n} X_{a_{i}}$,
(2) each $X_{a_{i}}$ is affine, and
(3) each $X_{a_{i}}$ maps into an affine open $V_{i} \subset S$.

By Lemma 28.15 .2 we see that the ring maps $\mathcal{O}_{S}\left(V_{i}\right) \rightarrow \mathcal{O}_{X}\left(X_{a_{i}}\right)$ are of finite type. Hence we can find finitely many elements $f_{i j} \in \mathcal{O}_{X}\left(X_{a_{i}}\right), j=1, \ldots, n_{i}$ which generate $\mathcal{O}_{X}\left(X_{a_{i}}\right)$ as an $\mathcal{O}_{S}\left(V_{i}\right)$-algebra. By Properties, Lemma 27.17.2 we may write each $f_{i j}$ as $a_{i j} / a_{i}^{e_{i j}}$ for some $a_{i j} \in A_{+}$homogeneous. Let $N$ be a positive integer which is a common multiple of all the degrees of the elements $a_{i}$, $a_{i j}$. Consider the elements

$$
a_{i}^{N / \operatorname{deg}\left(a_{i}\right)}, a_{i j} a_{i}^{\left(N / \operatorname{deg}\left(a_{i}\right)\right)-e_{i j}} \in A_{N} .
$$

By construction these generate the invertible sheaf $\mathcal{L}^{\otimes N}$ over $X$. Hence they give rise to a morphism

$$
j: X \longrightarrow \mathbf{P}_{S}^{m} \quad \text { with } m=n+\sum n_{i}
$$

over $S$, see Constructions, Lemma 26.13.1 and Definition 26.13.2. Moreover, $j^{*} \mathcal{O}_{\mathbf{P}_{S}}(1)=$ $\mathcal{L}^{\otimes N}$. We name the homogeneous coordinates $T_{0}, \ldots, T_{n}, T_{i j}$ instead of $T_{0}, \ldots, T_{m}$. For $i=0, \ldots, n$ we have $i^{-1}\left(D_{+}\left(T_{i}\right)\right)=X_{a_{i}}$. Moreover, pulling back the element $T_{i j} / T_{i}$ via $j^{\sharp}$ we get the element $f_{i j} \in \mathcal{O}_{X}\left(X_{a_{i}}\right)$. Hence the morphism $j$ restricted to $X_{a_{i}}$ gives a closed immersion of $X_{a_{i}}$ into the affine open $D_{+}\left(T_{i}\right) \cap \mathbf{P}_{V_{i}}^{m}$ of $\mathbf{P}_{S}^{N}$. Hence we conclude that the morphism $j$ is an immersion. This implies the lemma holds for some $d$ and $n$ which is enough in virtually all applications.

This proves that for one $d_{2} \geq 1$ (namely $d_{2}=N$ above), some $m \geq 0$ there exists some immersion $j: X \rightarrow \mathbf{P}_{S}^{m}$ given by global sections $s_{0}^{\prime}, \ldots, s_{m}^{\prime} \in \Gamma\left(X, \mathcal{L}^{\otimes d_{2}}\right)$. By Properties, Proposition 27.26 .13 we know there exists an integer $d_{1}$ such that $\mathcal{L}^{\otimes d}$ is globally generated for all $d \geq d_{1}$. Set $d_{0}=d_{1}+d_{2}$. We claim that the lemma holds with this value of $d_{0}$. Namely, given an integer $d \geq d_{0}$ we may choose
$s_{1}^{\prime \prime}, \ldots, s_{t}^{\prime \prime} \in \Gamma\left(X, \mathcal{L}^{\otimes d-d_{2}}\right)$ which generate $\mathcal{L}^{\otimes d-d_{2}}$ over $X$. Set $n=(m+1) t$ and denote $s_{0}, \ldots, s_{n}$ the collection of sections $s_{\alpha}^{\prime} s_{\beta}^{\prime \prime}, \alpha=0, \ldots, m, \beta=1, \ldots, t$. These generate $\mathcal{L}^{\otimes d}$ over $X$ and therefore define a morphism

$$
i: X \longrightarrow \mathbf{P}_{S}^{n}
$$

such that $i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1) \cong \mathcal{L}^{\otimes d}$. We omit the verification that since $j$ was an immersion also the morphism $i$ so obtained is an immersion also. (Hint: Segre embedding.)

01VT Lemma 28.39.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume $S$ affine and $f$ of finite type. The following are equivalent
(1) $\mathcal{L}$ is ample on $X$,
(2) $\mathcal{L}$ is $f$-ample,
(3) $\mathcal{L}^{\otimes d}$ is $f$-very ample for some $d \geq 1$,
(4) $\mathcal{L}^{\otimes d}$ is $f$-very ample for all $d \gg 1$,
(5) for some $d \geq 1$ there exist $n \geq 1$ and an immersion $i: X \rightarrow \mathbf{P}_{S}^{n}$ such that $\mathcal{L}^{\otimes d} \cong i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1)$, and
(6) for all $d \gg 1$ there exist $n \geq 1$ and an immersion $i: X \rightarrow \mathbf{P}_{S}^{n}$ such that $\mathcal{L}^{\otimes d} \cong i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1)$.
Proof. The equivalence of (1) and (2) is Lemma 28.37.5. The implication (2) $\Rightarrow$ (6) is Lemma 28.39.3. Trivially (6) implies (5). As $\mathbf{P}_{S}^{n}$ is a projective bundle over $S$ (see Constructions, Lemma 26.21.4 we see that (5) implies (3) and (6) implies (4) from the definition of a relatively very ample sheaf. Trivially (4) implies (3). To finish we have to show that (3) implies (2) which follows from Lemma 28.38.2 and Lemma 28.37.2.

01VU Lemma 28.39.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume $S$ quasi-compact and $f$ of finite type. The following are equivalent
(1) $\mathcal{L}$ is $f$-ample,
(2) $\mathcal{L}^{\otimes d}$ is $f$-very ample for some $d \geq 1$,
(3) $\mathcal{L}^{\otimes d}$ is $f$-very ample for all $d \gg 1$.

Proof. Trivially (3) implies (2). Lemma 28.38 .2 guarantees that (2) implies (1) since a morphism of finite type is quasi-compact by definition. Assume that $\mathcal{L}$ is $f$ ample. Choose a finite affine open covering $S=V_{1} \cup \ldots \cup V_{m}$. Write $X_{i}=f^{-1}\left(V_{i}\right)$. By Lemma 28.39 .4 above we see there exists a $d_{0}$ such that $\mathcal{L}^{\otimes d}$ is relatively very ample on $X_{i} / V_{i}$ for all $d \geq d_{0}$. Hence we conclude (1) implies (3) by Lemma 28.38 .7

The following two lemmas provide the most used and most useful characterizations of relatively very ample and relatively ample invertible sheaves when the morphism is of finite type.

02NQ Lemma 28.39.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. Assume $f$ is of finite type. The following are equivalent:
(1) $\mathcal{L}$ is $f$-relatively very ample, and
(2) there exist an open covering $S=\bigcup V_{j}$, for each $j$ an integer $n_{j}$, and immersions

$$
i_{j}: X_{j}=f^{-1}\left(V_{j}\right)=V_{j} \times_{S} X \longrightarrow \mathbf{P}_{V_{j}}^{n_{j}}
$$

over $V_{j}$ such that $\left.\mathcal{L}\right|_{X_{j}} \cong i_{j}^{*} \mathcal{O}_{\mathbf{P}_{V_{j}}^{n_{j}}}(1)$.
Proof. We see that (1) implies (2) by taking an affine open covering of $S$ and applying Lemma 28.39.1 to each of the restrictions of $f$ and $\mathcal{L}$. We see that (2) implies (1) by Lemma 28.38.7.

02NR Lemma 28.39.7. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on $X$. Assume $f$ is of finite type. The following are equivalent:
(1) $\mathcal{L}$ is $f$-relatively ample, and
(2) there exist an open covering $S=\bigcup V_{j}$, for each $j$ an integers $d_{j} \geq 1$, $n_{j} \geq 0$, and immersions

$$
i_{j}: X_{j}=f^{-1}\left(V_{j}\right)=V_{j} \times_{S} X \longrightarrow \mathbf{P}_{V_{j}}^{n_{j}}
$$

over $V_{j}$ such that $\left.\mathcal{L}^{\otimes d_{j}}\right|_{X_{j}} \cong i_{j}^{*} \mathcal{O}_{\mathbf{P}_{V_{j}}^{n_{j}}}(1)$.
Proof. We see that (1) implies (2) by taking an affine open covering of $S$ and applying Lemma 28.39 .4 to each of the restrictions of $f$ and $\mathcal{L}$. We see that (2) implies (1) by Lemma 28.37.4.

### 28.40. Quasi-projective morphisms

01VV The discussion in the previous section suggests the following definitions. We take our definition of quasi-projective from DG67. The version with the letter "H" is the definition in Har77.

01VW Definition 28.40.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say $f$ is quasi-projective if $f$ is of finite type and there exists an $f$ relatively ample invertible $\mathcal{O}_{X}$-module.
(2) We say $f$ is $H$-quasi-projective if there exists a quasi-compact immersion $X \rightarrow \mathbf{P}_{S}^{n}$ over $S$ for some $n{ }^{11}$
(3) We say $f$ is locally quasi-projective if there exists an open covering $S=$ $\bigcup V_{j}$ such that each $f^{-1}\left(V_{j}\right) \rightarrow V_{j}$ is quasi-projective.

As this definition suggests the property of being quasi-projective is not local on $S$. At a later stage we will be able to say more about the category of quasi-projective schemes, see More on Morphisms, Section 36.35 .
0B3G Lemma 28.40.2. A base change of a quasi-projective morphism is quasi-projective.
Proof. This follows from Lemmas 28.15.4 and 28.37.8.
01VX Lemma 28.40.3. Let $f: X \rightarrow S$ be a morphism of schemes. If $f$ is quasiprojective, or H-quasi-projective or locally quasi-projective, then $f$ is separated of finite type.

Proof. Omitted.
01VY Lemma 28.40.4. A H-quasi-projective morphism is quasi-projective.
Proof. Omitted.

[^78]01VZ Lemma 28.40.5. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is locally quasi-projective.
(2) There exists an open covering $S=\bigcup V_{j}$ such that each $f^{-1}\left(V_{j}\right) \rightarrow V_{j}$ is H-quasi-projective.

Proof. By Lemma 28.40 .4 we see that (2) implies (1). Assume (1). The question is local on $S$ and hence we may assume $S$ is affine, $X$ of finite type over $S$ and $\mathcal{L}$ is a relatively ample invertible sheaf on $X / S$. By Lemma 28.39.4 we may assume $\mathcal{L}$ is ample on $X$. By Lemma 28.39 .3 we see that there exists an immersion of $X$ into a projective space over $S$, i.e., $X$ is H-quasi-projective over $S$ as desired.

0B3H Lemma 28.40.6. A quasi-affine morphism of finite type is quasi-projective.
Proof. This follows from Lemma 28.37 .6

### 28.41. Proper morphisms

01W0 The notion of a proper morphism plays an important role in algebraic geometry. An important example of a proper morphism will be the structure morphism $\mathbf{P}_{S}^{n} \rightarrow S$ of projective $n$-space, and this is in fact the motivating example leading to the definition.

01W1 Definition 28.41.1. Let $f: X \rightarrow S$ be a morphism of schemes. We say $f$ is proper if $f$ is separated, finite type, and universally closed.

The morphism from the affine line with zero doubled to the affine line is of finite type and universally closed, so the separation condition is necessary in the definition above. In the rest of this section we prove some of the basic properties of proper morphisms and of universally closed morphisms.

02K7 Lemma 28.41.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is universally closed.
(2) There exists an open covering $S=\bigcup V_{j}$ such that $f^{-1}\left(V_{j}\right) \rightarrow V_{j}$ is universally closed for all indices $j$.

Proof. This is clear from the definition.
01W2 Lemma 28.41.3. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is proper.
(2) There exists an open covering $S=\bigcup V_{j}$ such that $f^{-1}\left(V_{j}\right) \rightarrow V_{j}$ is proper for all indices $j$.

Proof. Omitted.
01W3 Lemma 28.41.4. The composition of proper morphisms is proper. The same is true for universally closed morphisms.

Proof. A composition of closed morphisms is closed. If $X \rightarrow Y \rightarrow Z$ are universally closed morphisms and $Z^{\prime} \rightarrow Z$ is any morphism, then we see that $Z^{\prime} \times{ }_{Z} X=$ $\left(Z^{\prime} \times{ }_{Z} Y\right) \times{ }_{Y} X \rightarrow Z^{\prime} \times{ }_{Z} Y$ is closed and $Z^{\prime} \times{ }_{Z} Y \rightarrow Z^{\prime}$ is closed. Hence the result for universally closed morphisms. We have seen that "separated" and "finite type"
are preserved under compositions (Schemes, Lemma 25.21.13 and Lemma 28.15.3). Hence the result for proper morphisms.

01W4 Lemma 28.41.5. The base change of a proper morphism is proper. The same is true for universally closed morphisms.

Proof. This is true by definition for universally closed morphisms. It is true for separated morphisms (Schemes, Lemma 25.21.13). It is true for morphisms of finite type (Lemma 28.15.4). Hence it is true for proper morphisms.

01W5 Lemma 28.41.6. A closed immersion is proper, hence a fortiori universally closed.

Proof. The base change of a closed immersion is a closed immersion (Schemes, Lemma 25.18.2. Hence it is universally closed. A closed immersion is separated (Schemes, Lemma 25.23.7). A closed immersion is of finite type (Lemma 28.15.5). Hence a closed immersion is proper.

01W6 Lemma 28.41.7. Suppose given a commutative diagram of schemes

with $Y$ separated over $S$.
(1) If $X \rightarrow S$ is universally closed, then the morphism $X \rightarrow Y$ is universally closed.
(2) If $X$ proper over $S$, then the morphism $X \rightarrow Y$ is proper.

In particular, in both cases the image of $X$ in $Y$ is closed.
Proof. Assume that $X \rightarrow S$ is universally closed (resp. proper). We factor the morphism as $X \rightarrow X \times_{S} Y \rightarrow Y$. The first morphism is a closed immersion, see Schemes, Lemma 25.21.11. Hence the first morphism is proper (Lemma 28.41.6). The projection $X \times{ }_{S} Y \rightarrow Y$ is the base change of a universally closed (resp. proper) morphism and hence universally closed (resp. proper), see Lemma 28.41.5. Thus $X \rightarrow Y$ is universally closed (resp. proper) as the composition of universally closed (resp. proper) morphisms (Lemma 28.41.4).

The following lemma says that the image of a proper scheme (in a separated scheme of finite type over the base) is proper.

03GN Lemma 28.41.8. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a morphism of schemes over $S$. If $X$ is universally closed over $S$ and $f$ is surjective then $Y$ is universally closed over $S$. In particular, if also $Y$ is separated and of finite type over $S$, then $Y$ is proper over $S$.

Proof. Assume $X$ is universally closed and $f$ surjective. Denote $p: X \rightarrow S$, $q: Y \rightarrow S$ the structure morphisms. Let $S^{\prime} \rightarrow S$ be a morphism of schemes. The base change $f^{\prime}: X_{S^{\prime}} \rightarrow Y_{S^{\prime}}$ is surjective (Lemma 28.10.4), and the base change $p^{\prime}: X_{S^{\prime}} \rightarrow S^{\prime}$ is closed. If $T \subset Y_{S^{\prime}}$ is closed, then $\left(f^{\prime}\right)^{-1}(T) \subset X_{S^{\prime}}$ is closed, hence $p^{\prime}\left(\left(f^{\prime}\right)^{-1}(T)\right)=q^{\prime}(T)$ is closed. So $q^{\prime}$ is closed.

0AH6 Lemma 28.41.9. Suppose given a commutative diagram of schemes

Assume
(1) $X \rightarrow S$ is a proper morphism, and
(2) $Y \rightarrow S$ is separated and locally of finite type.

Then the scheme theoretic image $Z \subset Y$ of $h$ is proper over $S$ and $X \rightarrow Z$ is surjective.

Proof. The scheme theoretic image of $h$ is constructed in Section 28.6. Observe that $h$ is quasi-compact (Schemes, Lemma 25.21.15 hence $h(X) \subset Z$ is dense (Lemma 28.6.3). On the other hand $h(X)$ is closed in $Y$ (Lemma 28.41.7) hence $X \rightarrow Z$ is surjective. Thus $Z \rightarrow S$ is a proper (Lemma 28.41.8).

The proof of the following lemma is due to Bjorn Poonen, see this location.
04XU Lemma 28.41.10. A universally closed morphism of schemes is quasi-compact.
Proof. Let $f: X \rightarrow S$ be a morphism. Assume that $f$ is not quasi-compact. Our goal is to show that $f$ is not universally closed. By Schemes, Lemma 25.19 .2 there exists an affine open $V \subset S$ such that $f^{-1}(V)$ is not quasi-compact. To achieve our goal it suffices to show that $f^{-1}(V) \rightarrow V$ is not universally closed, hence we may assume that $S=\operatorname{Spec}(A)$ for some ring $A$.
Write $X=\bigcup_{i \in I} X_{i}$ where the $X_{i}$ are affine open subschemes of $X$. Let $T=$ $\operatorname{Spec}\left(A\left[y_{i} ; i \in I\right]\right)$. Let $T_{i}=D\left(y_{i}\right) \subset T$. Let $Z$ be the closed set $\left(X \times_{S} T\right)-$ $\bigcup_{i \in I}\left(X_{i} \times{ }_{S} T_{i}\right)$. It suffices to prove that the image $f_{T}(Z)$ of $Z$ under $f_{T}: X \times{ }_{S} T \rightarrow$ $T$ is not closed.

There exists a point $s \in S$ such that there is no neighborhood $U$ of $s$ in $S$ such that $X_{U}$ is quasi-compact. Otherwise we could cover $S$ with finitely many such $U$ and Schemes, Lemma 25.19.2 would imply $f$ quasi-compact. Fix such an $s \in S$.
First we check that $f_{T}\left(Z_{s}\right) \neq T_{s}$. Let $t \in T$ be the point lying over $s$ with $\kappa(t)=$ $\kappa(s)$ such that $y_{i}=1$ in $\kappa(t)$ for all $i$. Then $t \in T_{i}$ for all $i$, and the fiber of $Z_{s} \rightarrow T_{s}$ above $t$ is isomorphic to $\left(X-\bigcup_{i \in I} X_{i}\right)_{s}$, which is empty. Thus $t \in T_{s}-f_{T}\left(Z_{s}\right)$.
Assume $f_{T}(Z)$ is closed in $T$. Then there exists an element $g \in A\left[y_{i} ; i \in I\right]$ with $f_{T}(Z) \subset V(g)$ but $t \notin V(g)$. Hence the image of $g$ in $\kappa(t)$ is nonzero. In particular some coefficient of $g$ has nonzero image in $\kappa(s)$. Hence this coefficient is invertible on some neighborhood $U$ of $s$. Let $J$ be the finite set of $j \in I$ such that $y_{j}$ appears in $g$. Since $X_{U}$ is not quasi-compact, we may choose a point $x \in X-\bigcup_{j \in J} X_{j}$ lying above some $u \in U$. Since $g$ has a coefficient that is invertible on $U$, we can find a point $t^{\prime} \in T$ lying above $u$ such that $t^{\prime} \notin V(g)$ and $t^{\prime} \in V\left(y_{i}\right)$ for all $i \notin J$. This is true because $V\left(y_{i} ; i \in I, i \notin J\right)=\operatorname{Spec}\left(A\left[t_{j} ; j \in J\right]\right)$ and the set of points of this scheme lying over $u$ is bijective with $\operatorname{Spec}\left(\kappa(u)\left[t_{j} ; j \in J\right]\right)$. In other words $t^{\prime} \notin T_{i}$ for each $i \notin J$. By Schemes, Lemma 25.17.5 we can find a point $z$ of $X \times_{S} T$ mapping to $x \in X$ and to $t^{\prime} \in T$. Since $x \notin X_{j}$ for $j \in J$ and $t^{\prime} \notin T_{i}$ for $i \in I \backslash J$ we see that $z \in Z$. On the other hand $f_{T}(z)=t^{\prime} \notin V(g)$ which contradicts $f_{T}(Z) \subset V(g)$.

Thus the assumption " $f_{T}(Z)$ closed" is wrong and we conclude indeed that $f_{T}$ is not closed, as desired.

The target of a separated scheme under a surjective universally closed morphism is separated.

09MQ Lemma 28.41.11. Let $S$ be a scheme. Let $f: X \rightarrow Y$ be a surjective universally closed morphism of schemes over $S$.
(1) If $X$ is quasi-separated, then $Y$ is quasi-separated.
(2) If $X$ is separated, then $Y$ is separated.
(3) If $X$ is quasi-separated over $S$, then $Y$ is quasi-separated over $S$.
(4) If $X$ is separated over $S$, then $Y$ is separated over $S$.

Proof. Parts (1) and (2) are a consequence of (3) and (4) for $S=\operatorname{Spec}(\mathbf{Z})$ (see Schemes, Definition 25.21.3). Consider the commutative diagram

The left vertical arrow is surjective (i.e., universally surjective). The right vertical arrow is universally closed as a composition of the universally closed morphisms $X \times_{S} X \rightarrow X \times_{S} Y \rightarrow Y \times_{S} Y$. Hence it is also quasi-compact, see Lemma 28.41.10.

Assume $X$ is quasi-separated over $S$, i.e., $\Delta_{X / S}$ is quasi-compact. If $V \subset Y \times_{S} Y$ is a quasi-compact open, then $V \times_{Y \times{ }_{S} Y} X \rightarrow \Delta_{Y / S}^{-1}(V)$ is surjective and $V \times_{Y \times{ }_{S} Y} X$ is quasi-compact by our remarks above. We conclude that $\Delta_{Y / S}$ is quasi-compact, i.e., $Y$ is quasi-separated over $S$.

Assume $X$ is separated over $S$, i.e., $\Delta_{X / S}$ is a closed immersion. Then $X \rightarrow Y \times_{S} Y$ is closed as a composition of closed morphisms. Since $X \rightarrow Y$ is surjective, it follows that $\Delta_{Y / S}(Y)$ is closed in $Y \times_{S} Y$. Hence $Y$ is separated over $S$ by the discussion following Schemes, Definition 25.21 .3 .

0894 Lemma 28.41.12. Let $f: X \rightarrow S$ and $h: U \rightarrow X$ be morphisms of schemes. Assume that $f$ and $h$ are quasi-compact and that $h(U)$ is dense in $X$. If given any commutative solid diagram

where $A$ is a valuation ring with field of fractions $K$, there exists a unique dotted arrow making the diagram commute, then $f$ is universally closed.

Proof. We will verify the existence part of the valuative criterion for $f$ which will imply $f$ is universally closed by Schemes, Proposition 25.20.6. To do this, consider
a commutative diagram

where $A$ is a valuation ring and $K$ is the fraction field of $A$. Note that since valuation rings and fields are reduced, we may replace $U, X$, and $S$ by their respective reductions by Schemes, Lemma 25.12 .6 . In this case the assumption that $h(U)$ is dense means that the scheme theoretic image of $h: U \rightarrow X$ is $X$, see Lemma 28.6.7. We may also replace $S$ by an affine open through which the morphism $\operatorname{Spec}(A) \rightarrow S$ factors. Thus we may assume that $S=\operatorname{Spec}(R)$.

Let $\operatorname{Spec}(B) \subset X$ be an affine open through which the morphism $\operatorname{Spec}(K) \rightarrow X$ factors. Choose a polynomial algebra $P$ over $B$ and a $B$-algebra surjection $P \rightarrow K$. Then $\operatorname{Spec}(P) \rightarrow X$ is flat. Hence the scheme theoretic image of the morphism $U \times_{X} \operatorname{Spec}(P) \rightarrow \operatorname{Spec}(P)$ is $\operatorname{Spec}(P)$ by Lemma 28.25.14. By Lemma 28.6.5 we can find a commutative diagram

where $A^{\prime}$ is a valuation ring and $K^{\prime}$ is the fraction field of $A^{\prime}$ such that the closed point of $\operatorname{Spec}\left(A^{\prime}\right)$ maps to $\operatorname{Spec}(K) \subset \operatorname{Spec}(P)$. In other words, there is a $B$-algebra map $\varphi: K \rightarrow A^{\prime} / \mathfrak{m}_{A^{\prime}}$. Choose a valuation ring $A^{\prime \prime} \subset A^{\prime} / \mathfrak{m}_{A^{\prime}}$ dominating $\varphi(A)$ with field of fractions $K^{\prime \prime}=A^{\prime} / \mathfrak{m}_{A^{\prime}}$ (Algebra, Lemma 10.49.2). We set

$$
C=\left\{\lambda \in A^{\prime} \mid \lambda \bmod \mathfrak{m}_{A^{\prime}} \in A^{\prime \prime}\right\}
$$

which is a valuation ring by Algebra, Lemma 10.49 .9 . As $C$ is an $R$-algebra with fraction field $K^{\prime}$, we obtain a commutative diagram

as in the statement of the lemma. Thus a dotted arrow fitting into the diagram as indicated. By the uniqueness assumption of the lemma the composition $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow$ $\operatorname{Spec}(C) \rightarrow X$ agrees with the given morphism $\operatorname{Spec}\left(A^{\prime}\right) \rightarrow \operatorname{Spec}(P) \rightarrow \operatorname{Spec}(B) \subset$ $X$. Hence the restriction of the morphism to the spectrum of $C / \mathfrak{m}_{A^{\prime}}=A^{\prime \prime}$ induces the given morphism $\operatorname{Spec}\left(K^{\prime \prime}\right)=\operatorname{Spec}\left(A^{\prime} / \mathfrak{m}_{A^{\prime}}\right) \rightarrow \operatorname{Spec}(K) \rightarrow X$. Let $x \in X$ be the image of the closed point of $\operatorname{Spec}\left(A^{\prime \prime}\right) \rightarrow X$. The image of the induced ring map $\mathcal{O}_{X, x} \rightarrow A^{\prime \prime}$ is a local subring which is contained in $K \subset K^{\prime \prime}$. Since $A$ is maximal for the relation of domination in $K$ and since $A \subset A^{\prime \prime}$, we have $A=K \cap A^{\prime \prime}$. We conclude that $\mathcal{O}_{X, x} \rightarrow A^{\prime \prime}$ factors through $A \subset A^{\prime \prime}$. In this way we obtain our desired arrow $\operatorname{Spec}(A) \rightarrow X$.

0895 Remark 28.41.13. The assumption on uniqueness of the dotted arrows in Lemma 28.41 .12 is necessary (details omitted). The uniqueness is guaranteed if $f$ is separated (Schemes, Lemma 25.22.1. Conversely, if $h$ and $f$ satisfy the assumptions of the lemma and $f$ is quasi-separated, then $f$ is separated as well as universally closed (details omitted; apply the lemma to the diagonal morphism as in the proof of Schemes, Lemma 25.22.2.

### 28.42. Projective morphisms

01W7 We will use the definition of a projective morphism from DG67. The version of the definition with the "H" is the one from Har77. The resulting definitions are different. Both are useful.

01W8 Definition 28.42.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say $f$ is projective if $X$ is isomorphic as an $S$-scheme to a closed subscheme of a projective bundle $\mathbf{P}(\mathcal{E})$ for some quasi-coherent, finite type $\mathcal{O}_{S}$-module $\mathcal{E}$.
(2) We say $f$ is $H$-projective if there exists and integer $n$ and a closed immersion $X \rightarrow \mathbf{P}_{S}^{n}$ over $S$.
(3) We say $f$ is locally projective if there exists an open covering $S=\bigcup U_{i}$ such that each $f^{-1}\left(U_{i}\right) \rightarrow U_{i}$ is projective.

As expected, a projective morphism is quasi-projective, see Lemma 28.42.11. Conversely, quasi-projective morphisms are often compositions of open immersions and projective morphisms, see Lemma 28.42.13. For an overview of properties of projective morphisms over a quasi-projective base, see More on Morphisms, Section 36.36

07ZS Example 28.42.2. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S^{-}}$ algebra generated by $\mathcal{A}_{1}$ over $\mathcal{A}_{0}$. Assume furthermore that $\mathcal{A}_{1}$ is of finite type over $\mathcal{O}_{S}$. Set $X=\underline{\operatorname{Proj}}_{S}(\mathcal{A})$. In this case $X \rightarrow S$ is projective. Namely, the morphism associated to the graded $\mathcal{O}_{S}$-algebra map

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{A}_{1}\right) \longrightarrow \mathcal{A}
$$

is a closed immersion, see Constructions, Lemma 26.18.5.
01W9 Lemma 28.42.3. An $H$-projective morphism is $H$-quasi-projective. An $H$-projective morphism is projective.

Proof. The first statement is immediate from the definitions. The second holds as $\mathbf{P}_{S}^{n}$ is a projective bundle over $S$, see Constructions, Lemma 26.21.4.

01WB Lemma 28.42.4. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is locally projective.
(2) There exists an open covering $S=\bigcup U_{i}$ such that each $f^{-1}\left(U_{i}\right) \rightarrow U_{i}$ is $H$-projective.
Proof. By Lemma 28.42.3 we see that (2) implies (1). Assume (1). For every point $s \in S$ we can find $\operatorname{Spec}(R)=U \subset S$ an affine open neighbourhood of $s$ such that $X_{U}$ is isomorphic to a closed subscheme of $\mathbf{P}(\mathcal{E})$ for some finite type, quasicoherent sheaf of $\mathcal{O}_{U}$-modules $\mathcal{E}$. Write $\mathcal{E}=\widetilde{M}$ for some finite type $R$-module $M$
(see Properties, Lemma 27.16.1). Choose generators $x_{0}, \ldots, x_{n} \in M$ of $M$ as an $R$-module. Consider the surjective graded $R$-algebra map

$$
R\left[X_{0}, \ldots, X_{n}\right] \longrightarrow \operatorname{Sym}_{R}(M)
$$

According to Constructions, Lemma 26.11.3 the corresponding morphism

$$
\mathbf{P}(\mathcal{E}) \rightarrow \mathbf{P}_{R}^{n}
$$

is a closed immersion. Hence we conclude that $f^{-1}(U)$ is isomorphic to a closed subscheme of $\mathbf{P}_{U}^{n}$ (as a scheme over $U$ ). In other words: (2) holds.

01WC Lemma 28.42.5. A locally projective morphism is proper.
Proof. Let $f: X \rightarrow S$ be locally projective. In order to show that $f$ is proper we may work locally on the base, see Lemma 28.41.3. Hence, by Lemma 28.42.4 above we may assume there exists a closed immersion $X \rightarrow \mathbf{P}_{S}^{n}$. By Lemmas 28.41.4 and 28.41.6 it suffices to prove that $\mathbf{P}_{S}^{n} \rightarrow S$ is proper. Since $\mathbf{P}_{S}^{n} \rightarrow S$ is the base change of $\mathbf{P}_{\mathbf{Z}}^{n} \rightarrow \operatorname{Spec}(\mathbf{Z})$ it suffices to show that $\mathbf{P}_{\mathbf{Z}}^{n} \rightarrow \operatorname{Spec}(\mathbf{Z})$ is proper, see Lemma 28.41.5. By Constructions, Lemma 26.8 .8 the scheme $\mathbf{P}_{\mathbf{Z}}^{n}$ is separated. By Constructions, Lemma 26.8 .9 the scheme $\mathbf{P}_{\mathbf{Z}}^{n}$ is quasi-compact. It is clear that $\mathbf{P}_{\mathbf{Z}}^{n} \rightarrow \operatorname{Spec}(\mathbf{Z})$ is locally of finite type since $\mathbf{P}_{\mathbf{Z}}^{n}$ is covered by the affine opens $D_{+}\left(X_{i}\right)$ each of which is the spectrum of the finite type $\mathbf{Z}$-algebra

$$
\mathbf{Z}\left[X_{0} / X_{i}, \ldots, X_{n} / X_{i}\right]
$$

Finally, we have to show that $\mathbf{P}_{\mathbf{Z}}^{n} \rightarrow \operatorname{Spec}(\mathbf{Z})$ is universally closed. This follows from Constructions, Lemma 26.8.11 and the valuative criterion (see Schemes, Proposition 25.20.6).

0B5N Lemma 28.42.6. Let $f: X \rightarrow S$ be a proper morphism of schemes. If there exists an $f$-ample invertible sheaf on $X$, then $f$ is locally projective.

Proof. If there exists an $f$-ample inverible sheavf, then we can locally on $S$ find an immersion $i: X \rightarrow \mathbf{P}_{S}^{n}$. Since $X \rightarrow S$ is proper the morphism $i$ is a closed immersion, see Lemma 28.41.7.
01WD Lemma 28.42.7. Let $S$ be a scheme. There exists a closed immersion

$$
\mathbf{P}_{S}^{n} \times_{S} \mathbf{P}_{S}^{m} \longrightarrow \mathbf{P}_{S}^{n m+n+m}
$$

called the Segre embedding.
Proof. It suffices to prove this when $S=\operatorname{Spec}(\mathbf{Z})$. Hence we will drop the index $S$ and work in the absolute setting. Write $\mathbf{P}^{n}=\operatorname{Proj}\left(\mathbf{Z}\left[X_{0}, \ldots, X_{n}\right]\right), \mathbf{P}^{m}=$ $\operatorname{Proj}\left(\mathbf{Z}\left[Y_{0}, \ldots, Y_{m}\right]\right)$, and $\mathbf{P}^{n m+n+m}=\operatorname{Proj}\left(\mathbf{Z}\left[Z_{0}, \ldots, Z_{n m+n+m}\right]\right)$. In order to map into $\mathbf{P}^{n m+n+m}$ we have to write down an invertible sheaf $\mathcal{L}$ on the left hand side and $(n+1)(m+1)$ sections $s_{i}$ which generate it. See Constructions, Lemma 26.13.1. The invertible sheaf we take is

$$
\mathcal{L}=\operatorname{pr}_{1}^{*} \mathcal{O}_{\mathbf{P}^{n}}(1) \otimes \operatorname{pr}_{2}^{*} \mathcal{O}_{\mathbf{P}^{m}}(1)
$$

The sections we take are

$$
s_{0}=X_{0} Y_{0}, s_{1}=X_{1} Y_{0}, \ldots, s_{n}=X_{n} Y_{0}, s_{n+1}=X_{0} Y_{1}, \ldots, s_{n m+n+m}=X_{n} Y_{m}
$$

These generate $\mathcal{L}$ since the sections $X_{i}$ generate $\mathcal{O}_{\mathbf{P}^{n}}(1)$ and the sections $Y_{j}$ generate $\mathcal{O}_{\mathbf{P}^{m}}(1)$. The induced morphism $\varphi$ has the property that

$$
\varphi^{-1}\left(D_{+}\left(Z_{i+(n+1) j}\right)\right)=D_{+}\left(X_{i}\right) \times D_{+}\left(Y_{j}\right)
$$

Hence it is an affine morphism. The corresponding ring map in case $(i, j)=(0,0)$ is the map

$$
\mathbf{Z}\left[Z_{1} / Z_{0}, \ldots, Z_{n m+n+m} / Z_{0}\right] \longrightarrow \mathbf{Z}\left[X_{1} / X_{0}, \ldots, X_{n} / X_{0}, Y_{1} / Y_{0}, \ldots, Y_{n} / Y_{0}\right]
$$

which maps $Z_{i} / Z_{0}$ to the element $X_{i} / X_{0}$ for $i \leq n$ and the element $Z_{(n+1) j} / Z_{0}$ to the element $Y_{j} / Y_{0}$. Hence it is surjective. A similar argument works for the other affine open subsets. Hence the morphism $\varphi$ is a closed immersion.
01WE Lemma 28.42.8. A composition of H-projective morphisms is H-projective.
Proof. Suppose $X \rightarrow Y$ and $Y \rightarrow Z$ are H-projective. Then there exist closed immersions $X \rightarrow \mathbf{P}_{Y}^{n}$ over $Y$, and $Y \rightarrow \mathbf{P}_{Z}^{m}$ over $Z$. Consider the following diagram

Here the rightmost top horizontal arrow is the Segre embedding, see Lemma 28.42.7. The diagram identifies $X$ as a closed subscheme of $\mathbf{P}_{Z}^{n m+n+m}$ as desired.
01WF Lemma 28.42.9. A base change of a H-projective morphism is H-projective.
Proof. This is true because the base change of projective space over a scheme is projective space, and the fact that the base change of a closed immersion is a closed immersion, see Schemes, Lemma 25.18.2.

02V6 Lemma 28.42.10. A base change of a (locally) projective morphism is (locally) projective.
Proof. This is true because the base change of a projective bundle over a scheme is a projective bundle, the pullback of a finite type $\mathcal{O}$-module is of finite type (Modules, Lemma 17.9.2) and the fact that the base change of a closed immersion is a closed immersion, see Schemes, Lemma 25.18.2. Some details omitted.

07RL Lemma 28.42.11. A projective morphism is quasi-projective.
Proof. Let $f: X \rightarrow S$ be a projective morphism. Choose a closed immersion $i: X \rightarrow \mathbf{P}(\mathcal{E})$ where $\mathcal{E}$ is a quasi-coherent, finite type $\mathcal{O}_{S}$-module. Then $\mathcal{L}=$ $i^{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ is $f$-very ample. Since $f$ is proper (Lemma 28.42.5) it is quasi-compact. Hence Lemma 28.38 .2 implies that $\mathcal{L}$ is $f$-ample. Since $f$ is proper it is of finite type. Thus we've checked all the defining properties of quasi-projective holds and we win.

01WA Lemma 28.42.12. Let $f: X \rightarrow S$ be a H-quasi-projective morphism. Then $f$ factors as $X \rightarrow X^{\prime} \rightarrow S$ where $X \rightarrow X^{\prime}$ is an open immersion and $X^{\prime} \rightarrow S$ is $H$-projective.

Proof. By definition we can factor $f$ as a quasi-compact immersion $i: X \rightarrow$ $\mathbf{P}_{S}^{n}$ followed by the projection $\mathbf{P}_{S}^{n} \rightarrow S$. By Lemma 28.7 .7 there exists a closed subscheme $X^{\prime} \subset \mathbf{P}_{S}^{n}$ such that $i$ factors through an open immersion $X \rightarrow X^{\prime}$. The lemma follows.

07RM Lemma 28.42.13. Let $f: X \rightarrow S$ be a quasi-projective morphism with $S$ quasicompact and quasi-separated. Then $f$ factors as $X \rightarrow X^{\prime} \rightarrow S$ where $X \rightarrow X^{\prime}$ is an open immersion and $X^{\prime} \rightarrow S$ is projective.
Proof. Let $\mathcal{L}$ be $f$-ample. Since $f$ is of finite type and $S$ is quasi-compact $\mathcal{L}^{\otimes n}$ is $f$-very ample for some $n>0$, see Lemma 28.39.5. Replace $\mathcal{L}$ by $\mathcal{L}^{\otimes n}$. Write $\mathcal{F}=f_{*} \mathcal{L}$. This is a quasi-coherent $\mathcal{O}_{S}$-module by Schemes, Lemma 25.24.1 (quasiprojective morphisms are quasi-compact and separated, see Lemma 28.40.3). By Properties, Lemma 27.22 .6 we can find a directed partially ordered set $I$ and a system of finite type quasi-coherent $\mathcal{O}_{S}$-modules $\mathcal{E}_{i}$ over $I$ such that $\mathcal{F}=\operatorname{colim} \mathcal{E}_{i}$. Consider the compositions $\psi_{i}: f^{*} \mathcal{E}_{i} \rightarrow f^{*} \mathcal{F} \rightarrow \mathcal{L}$. Choose a finite affine open covering $S=\bigcup_{j=1, \ldots, m} V_{j}$. For each $j$ we can choose sections

$$
s_{j, 0}, \ldots, s_{j, n_{j}} \in \Gamma\left(f^{-1}\left(V_{j}\right), \mathcal{L}\right)=f_{*} \mathcal{L}\left(V_{j}\right)=\mathcal{F}\left(V_{j}\right)
$$

which generate $\mathcal{L}$ over $f^{-1} V_{j}$ and define an immersion

$$
f^{-1} V_{j} \longrightarrow \mathbf{P}_{V_{j}}^{n_{j}}
$$

see Lemma 28.39.1. Choose $i$ such that there exist sections $e_{j, t} \in \mathcal{E}_{i}\left(V_{j}\right)$ mapping to $s_{j, t}$ in $\mathcal{F}$ for all $j=1, \ldots, m$ and $t=1, \ldots, n_{j}$. Then the map $\psi_{i}$ is surjective as the sections $f^{*} e_{j, t}$ have the same image as the sections $s_{j, t}$ which generate $\left.\mathcal{L}\right|_{f^{-1} V_{j}}$. Whence we obtain a morphism

$$
r_{\mathcal{L}, \psi_{i}}: X \longrightarrow \mathbf{P}\left(\mathcal{E}_{i}\right)
$$

over $S$ such that over $V_{j}$ we have a factorization

$$
\left.f^{-1} V_{j} \rightarrow \mathbf{P}\left(\mathcal{E}_{i}\right)\right|_{V_{j}} \rightarrow \mathbf{P}_{V_{j}}^{n_{j}}
$$

of the immersion given above. It follows that $\left.r_{\mathcal{L}, \psi_{i}}\right|_{V_{j}}$ is an immersion, see Lemma 28.3.1. Since $S=\bigcup V_{j}$ we conclude that $r_{\mathcal{L}, \psi_{i}}$ is an immersion. Note that $r_{\mathcal{L}, \psi_{i}}$ is quasi-compact as $X \rightarrow S$ is quasi-compact and $\mathbf{P}\left(\mathcal{E}_{i}\right) \rightarrow S$ is separated (see Schemes, Lemma 25.21.15). By Lemma 28.7.7 there exists a closed subscheme $X^{\prime} \subset \mathbf{P}\left(\mathcal{E}_{i}\right)$ such that $i$ factors through an open immersion $X \rightarrow X^{\prime}$. Then $X^{\prime} \rightarrow S$ is projective by definition and we win.

0BCL Lemma 28.42.14. Let $S$ be a quasi-compact and quasi-separated scheme. Let $f: X \rightarrow S$ be a morphism of schemes. Then
(1) $f$ is projective if and only if $f$ is quasi-projective and proper, and
(2) $f$ is $H$-projective if and only if $f$ is $H$-quasi-projective and proper.

Proof. If $f$ is projective, then $f$ is quasi-projective by Lemma 28.42.11 and proper by Lemma 28.42.5. Conversely, if $X \rightarrow S$ is quasi-projective and proper, then we can choose an open immersion $X \rightarrow X^{\prime}$ with $X^{\prime} \rightarrow S$ projective by Lemma 28.42.13. Since $X \rightarrow S$ is proper, we see that $X$ is closed in $X^{\prime}$ (Lemma 28.41.7), i.e., $X \rightarrow X^{\prime}$ is a (open and) closed immersion. Since $X^{\prime}$ is isomorphic to a closed subscheme of a projective bundle over $S$ (Definition 28.42.1) we see that the same thing is true for $X$, i.e., $X \rightarrow S$ is a projective morphism. This proves (1). The proof of (2) is the same, except it uses Lemmas 28.42.3 and 28.42.12.
087S Lemma 28.42.15. Let $S$ be a scheme which admits an ample invertible sheaf. Then
(1) any projective morphism $X \rightarrow S$ is $H$-projective, and
(2) any quasi-projective morphism $X \rightarrow S$ is $H$-quasi-projective.

Proof. The assumptions on $S$ imply that $S$ is quasi-compact and separated, see Properties, Definition 27.26.1 and Lemma 27.26.11 and Constructions, Lemma 26.8 .8 . Hence Lemma 28.42 .13 applies and we see that (1) implies (2). Let $\mathcal{E}$ be a finite type quasi-coherent $\mathcal{O}_{S}$-module. By our definition of projective morphisms it suffices to show that $\mathbf{P}(\mathcal{E}) \rightarrow S$ is H-projective. If $\mathcal{E}$ is generated by finitely many global sections, then the corresponding surjection $\mathcal{O}_{S}^{\oplus n} \rightarrow \mathcal{E}$ induces a closed immersion

$$
\mathbf{P}(\mathcal{E}) \longrightarrow \mathbf{P}\left(\mathcal{O}_{S}^{\oplus n}\right)=\mathbf{P}_{S}^{n}
$$

as desired. In general, let $\mathcal{L}$ be an invertible sheaf on $S$. By Properties, Proposition 27.26 .13 there exists an integer $n$ such that $\mathcal{E} \otimes_{\mathcal{O}_{S}} \mathcal{L}^{\otimes n}$ is globally generated by finitely many sections. Since $\mathbf{P}(\mathcal{E})=\mathbf{P}\left(\mathcal{E} \otimes_{\mathcal{O}_{S}} \mathcal{L}^{\otimes n}\right)$ by Constructions, Lemma 26.20 .1 this finishes the proof.

### 28.43. Integral and finite morphisms

01 WG Recall that a ring map $R \rightarrow A$ is said to be integral if every element of $A$ satisfies a monic equation with coefficients in $R$. Recall that a ring map $R \rightarrow A$ is said to be finite if $A$ is finite as an $R$-module. See Algebra, Definition 10.35.1.

01WH Definition 28.43.1. Let $f: X \rightarrow S$ be a morphism of schemes.
(1) We say that $f$ is integral if $f$ is affine and if for every affine open $\operatorname{Spec}(R)=$ $V \subset S$ with inverse image $\operatorname{Spec}(A)=f^{-1}(V) \subset X$ the associated ring $\operatorname{map} R \rightarrow A$ is integral.
(2) We say that $f$ is finite if $f$ is affine and if for every affine open $\operatorname{Spec}(R)=$ $V \subset S$ with inverse image $\operatorname{Spec}(A)=f^{-1}(V) \subset X$ the associated ring $\operatorname{map} R \rightarrow A$ is finite.

It is clear that integral/finite morphisms are separated and quasi-compact. It is also clear that a finite morphism is a morphism of finite type. Most of the lemmas in this section are completely standard. But note the fun Lemma 28.43.7 at the end of the section.

02K8 Lemma 28.43.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is integral.
(2) There exists an affine open covering $S=\bigcup U_{i}$ such that each $f^{-1}\left(U_{i}\right)$ is affine and $\mathcal{O}_{S}\left(U_{i}\right) \rightarrow \mathcal{O}_{X}\left(f^{-1}\left(U_{i}\right)\right)$ is integral.
(3) There exists an open covering $S=\bigcup U_{i}$ such that each $f^{-1}\left(U_{i}\right) \rightarrow U_{i}$ is integral.
Moreover, if $f$ is integral then for every open subscheme $U \subset S$ the morphism $f: f^{-1}(U) \rightarrow U$ is integral.
Proof. See Algebra, Lemma 10.35.12. Some details omitted.
01WI Lemma 28.43.3. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is finite.
(2) There exists an affine open covering $S=\bigcup U_{i}$ such that each $f^{-1}\left(U_{i}\right)$ is affine and $\mathcal{O}_{S}\left(U_{i}\right) \rightarrow \mathcal{O}_{X}\left(f^{-1}\left(U_{i}\right)\right)$ is finite.
(3) There exists an open covering $S=\bigcup U_{i}$ such that each $f^{-1}\left(U_{i}\right) \rightarrow U_{i}$ is finite.

Moreover, if $f$ is finite then for every open subscheme $U \subset S$ the morphism $f$ : $f^{-1}(U) \rightarrow U$ is finite.
Proof. See Algebra, Lemma 10.35.12. Some details omitted.
01WJ Lemma 28.43.4. A finite morphism is integral. An integral morphism which is locally of finite type is finite.
Proof. See Algebra, Lemma 10.35 .3 and Lemma 10.35 .5
01WK Lemma 28.43.5. A composition of finite morphisms is finite. Same is true for integral morphisms.
Proof. See Algebra, Lemmas 10.7 .3 and 10.35 .6
01WL Lemma 28.43.6. A base change of a finite morphism is finite. Same is true for integral morphisms.
Proof. See Algebra, Lemma 10.35 .11 .
01WM Lemma 28.43.7. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $f$ is integral, and
(2) $f$ is affine and universally closed.

Proof. Assume (1). An integral morphism is affine by definition. A base change of an integral morphism is integral so in order to prove (2) it suffices to show that an integral morphism is closed. This follows from Algebra, Lemmas 10.35 .20 and 10.40 .6

Assume (2). We may assume $f$ is the morphism $f: \operatorname{Spec}(A) \rightarrow \operatorname{Spec}(R)$ coming from a ring map $R \rightarrow A$. Let $a$ be an element of $A$. We have to show that $a$ is integral over $R$, i.e. that in the kernel $I$ of the map $R[x] \rightarrow A$ sending $x$ to $a$ there is a monic polynomial. Consider the ring $B=A[x] /(a x-1)$ and let $J$ be the kernel of the composition $R[x] \rightarrow A[x] \rightarrow B$. If $f \in J$ there exists $q \in A[x]$ such that $f=(a x-1) q$ in $A[x]$ so if $f=\sum_{i} f_{i} x^{i}$ and $q=\sum_{i} q_{i} x^{i}$, for all $i \geq 0$ we have $f_{i}=a q_{i-1}-q_{i}$. For $n \geq \operatorname{deg} q+1$ the polynomial

$$
\sum_{i \geq 0} f_{i} x^{n-i}=\sum_{i \geq 0}\left(a q_{i-1}-q_{i}\right) x^{n-i}=(a-x) \sum_{i \geq 0} q_{i} x^{n-i-1}
$$

is clearly in $I$; if $f_{0}=1$ this polynomial is also monic, so we are reduced to prove that $J$ contains a polynomial with constant term 1 . We do it by proving $\operatorname{Spec}(R[x] /(J+(x))$ is empty.
Since $f$ is universally closed the base change $\operatorname{Spec}(A[x]) \rightarrow \operatorname{Spec}(R[x])$ is closed. Hence the image of the closed subset $\operatorname{Spec}(B) \subset \operatorname{Spec}(A[x])$ is the closed subset $\operatorname{Spec}(R[x] / J) \subset \operatorname{Spec}(R[x])$, see Example 28.6.4 and Lemma 28.6.3. In particular $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(R[x] / J)$ is surjective. Consider the following diagram where every square is a pullback:

The bottom left corner is empty because it is the spectrum of $R \otimes_{R[x]} B$ where the map $R[x] \rightarrow B$ sends $x$ to an invertible element and $R[x] \rightarrow R$ sends $x$ to 0 . Since $g$ is surjective this implies $\operatorname{Spec}(R[x] /(J+(x)))$ is empty, as we wanted to show.
02NT Lemma 28.43.8. Let $f: X \rightarrow S$ be an integral morphism. Then every point of $X$ is closed in its fibre.

Proof. See Algebra, Lemma 10.35 .18 .
02NU Lemma 28.43.9. A finite morphism is quasi-finite.
Proof. This is implied by Algebra, Lemma 10.121.4 and Lemma 28.20.9. Alternatively, all points in fibres are closed points by Lemma 28.43 .8 (and the fact that a finite morphism is integral) and use Lemma 28.20 .6 (3) to see that $f$ is quasi-finite at $x$ for all $x \in X$.

01WN Lemma 28.43.10. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent
(1) $f$ is finite, and
(2) $f$ is affine and proper.

Proof. This follows formally from Lemma 28.43.7, the fact that a finite morphism is integral and separated, the fact that a proper morphism is the same thing as a finite type, separated, universally closed morphism, and the fact that an integral morphism of finite type is finite (Lemma 28.43.4).

035C Lemma 28.43.11. A closed immersion is finite (and a fortiori integral).
Proof. True because a closed immersion is affine (Lemma 28.12.9) and a surjective ring map is finite and integral.

035D Lemma 28.43.12. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be morphisms.
(1) If $g \circ f$ is finite and $g$ separated then $f$ is finite.
(2) If $g \circ f$ is integral and $g$ separated then $f$ is integral.

Proof. Assume $g \circ f$ is finite (resp. integral) and $g$ separated. The base change $X \times_{Z} Y \rightarrow Y$ is finite (resp. integral) by Lemma 28.43.6. The morphism $X \rightarrow$ $X \times{ }_{Z} Y$ is a closed immersion as $Y \rightarrow Z$ is separated, see Schemes, Lemma 25.21.12, A closed immersion is finite (resp. integral), see Lemma 28.43.11. The composition of finite (resp. integral) morphisms is finite (resp. integral), see Lemma 28.43.5. Thus we win.

03BB Lemma 28.43.13. Let $f: X \rightarrow Y$ be a morphism of schemes. If $f$ is finite and a monomorphism, then $f$ is a closed immersion.

Proof. This reduces to Algebra, Lemma 10.106.6.
0B3I Lemma 28.43.14. A finite morphism is projective.
Proof. Let $f: X \rightarrow S$ be a finite morphism. Then $f_{*} \mathcal{O}_{X}$ is a quasi-coherent $\mathcal{O}_{S}$-module (Lemma 28.12.5) of finite type (by our definition of finite morphisms and Properties, Lemma 27.16.1]. We claim there is a closed immersion $\sigma: X \rightarrow$ $\mathbf{P}\left(f_{*} \mathcal{O}_{X}\right)$ over $S$, which finishes the proof. Namely, we let $\sigma$ be the morphism which corresponds (via Constructions, Lemma 26.16.11) to the surjection

$$
f^{*} f_{*} \mathcal{O}_{X} \longrightarrow \mathcal{O}_{X}
$$

coming from the adjunction map $f^{*} f_{*} \rightarrow$ id. Then $\sigma$ is a closed immersion by Schemes, Lemma 25.21.11 and Constructions, Lemma 26.21.3.

### 28.44. Universal homeomorphisms

04DC The following definition is really superfluous since a universal homeomorphism is really just an integral, universally injective and surjective morphism, see Lemma 28.44 .3

04DD Definition 28.44.1. A morphisms $f: X \rightarrow Y$ of schemes is called a universal homeomorphism if the base change $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime}$ is a homeomorphism for every morphism $Y^{\prime} \rightarrow Y$.

04DE Lemma 28.44.2. Let $f: X \rightarrow Y$ be a morphism of schemes. If $f$ is a homeomorphism onto a closed subset of $Y$ then $f$ is affine.

Proof. Let $y \in Y$ be a point. If $y \notin f(X)$, then there exists an affine neighbourhood of $y$ which is disjoint from $f(X)$. If $y \in f(X)$, let $x \in X$ be the unique point of $X$ mapping to $y$. Let $y \in V$ be an affine open neighbourhood. Let $U \subset X$ be an affine open neighbourhood of $x$ which maps into $V$. Since $f(U) \subset V \cap f(X)$ is open in the induced topology by our assumption on $f$ we may choose a $h \in \Gamma\left(V, \mathcal{O}_{Y}\right)$ such that $y \in D(h)$ and $D(h) \cap f(X) \subset f(U)$. Denote $h^{\prime} \in \Gamma\left(U, \mathcal{O}_{X}\right)$ the restriction of $f^{\sharp}(h)$ to $U$. Then we see that $D\left(h^{\prime}\right) \subset U$ is equal to $f^{-1}(D(h))$. In other words, every point of $Y$ has an open neighbourhood whose inverse image is affine. Thus $f$ is affine, see Lemma 28.12.3.

04DF Lemma 28.44.3. Let $f: X \rightarrow Y$ be a morphism of schemes. The following are equivalent:
(1) $f$ is a universal homeomorphism, and
(2) $f$ is integral, universally injective and surjective.

Proof. Assume $f$ is a universal homeomorphism. By Lemma 28.44.2 we see that $f$ is affine. Since $f$ is clearly universally closed we see that $f$ is integral by Lemma 28.43.7. It is also clear that $f$ is universally injective and surjective.

Assume $f$ is integral, universally injective and surjective. By Lemma 28.43.7 $f$ is universally closed. Since it is also universally bijective (see Lemma 28.10.4) we see that it is a universal homeomorphism.

054M Lemma 28.44.4. Let $X$ be a scheme. The canonical closed immersion $X_{\text {red }} \rightarrow X$ (see Schemes, Definition 25.12.5) is a universal homeomorphism.
Proof. Omitted.
0896 Lemma 28.44.5. Let $f: X \rightarrow S$ and $S^{\prime} \rightarrow S$ be morphisms of schemes. Assume
(1) $S^{\prime} \rightarrow S$ is a closed immersion,
(2) $S^{\prime} \rightarrow S$ is bijective on points,
(3) $X \times_{S} S^{\prime} \rightarrow S^{\prime}$ is a closed immersion, and
(4) $X \rightarrow S$ is of finite type or $S^{\prime} \rightarrow S$ is of finite presentation.

Then $f: X \rightarrow S$ is a closed immersion.
Proof. Assumptions (1) and (2) imply that $S^{\prime} \rightarrow S$ is a universal homeomorphism (for example because $S_{r e d}=S_{r e d}^{\prime}$ and using Lemma 28.44.4). Hence (3) implies that $X \rightarrow S$ is homeomorphism onto a closed subset of $S$. Then $X \rightarrow S$ is affine
by Lemma 28.44.2. Let $U \subset S$ be an affine open, say $U=\operatorname{Spec}(A)$. Then $S^{\prime}=$ $\operatorname{Spec}(A / I)$ by (1) for a locally nilpotent ideal $I$ by (2). As $f$ is affine we see that $f^{-1}(U)=\operatorname{Spec}(B)$. Assumption (4) tells us $B$ is a finite type $A$-algebra (Lemma 28.15 .2 ) or that $I$ is finitely generated (Lemma 28.21.7). Assumption (3) is that $A / I \rightarrow B / I B$ is surjective. From Algebra, Lemma 10.125 .8 if $A \rightarrow B$ is of finite type or Algebra, Lemma 10.19 .1 if $I$ is finitely generated and hence nilpotent we deduce that $A \rightarrow B$ is surjective. This means that $f$ is a closed immersion, see Lemma 28.2.1.

### 28.45. Finite locally free morphisms

02K9 In many papers the authors use finite flat morphisms when they really mean finite locally free morphisms. The reason is that if the base is locally Noetherian then this is the same thing. But in general it is not, see Exercises, Exercise 89.4.3.
02KA Definition 28.45.1. Let $f: X \rightarrow S$ be a morphism of schemes. We say $f$ is finite locally free if $f$ is affine and $f_{*} \mathcal{O}_{X}$ is a finite locally free $\mathcal{O}_{S}$-module. In this case we say $f$ is has rank or degree $d$ if the sheaf $f_{*} \mathcal{O}_{X}$ is finite locally free of degree $d$.

Note that if $f: X \rightarrow S$ is finite locally free then $S$ is the disjoint union of open and closed subschemes $S_{d}$ such that $f^{-1}\left(S_{d}\right) \rightarrow S_{d}$ is finite locally free of degree $d$.

02KB Lemma 28.45.2. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) $f$ is finite locally free,
(2) $f$ is finite, flat, and locally of finite presentation. If $S$ is locally Noetherian these are also equivalent to
(3) $f$ is finite and flat.

Proof. Assume $f$ is finite and locally of finite presentation. Let $\operatorname{Spec}(R) \subset S$ be affine open and $f^{-1}(\operatorname{Spec}(R))=\operatorname{Spec}(A)$. Then $R \rightarrow A$ is finite and of finite presentation. By Algebra, Lemma 10.35 .21 we see that $A$ is finitely presented as an $R$-module. Thus the equivalence of (1) and (2) follows from Algebra, Lemma 10.77.2. The Noetherian case follows as a finite module over a Noetherian ring is a finitely presented module, see Algebra, Lemma 10.30 .4

02KC Lemma 28.45.3. A composition of finite locally free morphisms is finite locally free.
Proof. Omitted.
02KD Lemma 28.45.4. A base change of a finite locally free morphism is finite locally free.
Proof. Omitted.
04MH Lemma 28.45.5. Let $f: X \rightarrow S$ be a finite locally free morphism of schemes. There exists a disjoint union decomposition $S=\coprod_{d \geq 0} S_{d}$ by open and closed subschemes such that setting $X_{d}=f^{-1}\left(S_{d}\right)$ the restrictions $\left.f\right|_{X_{d}}$ are finite locally free morphisms $X_{d} \rightarrow S_{d}$ of degree d.
Proof. This is true because a finite locally free sheaf locally has a well defined rank. Details omitted.

03HW Lemma 28.45.6. Let $f: Y \rightarrow X$ be a finite morphism with $X$ affine. There exists a diagram

where
(1) $Y^{\prime} \rightarrow Y$ and $X^{\prime} \rightarrow X$ are surjective finite locally free,
(2) $Y^{\prime}=X^{\prime} \times_{X} Y$,
(3) $i: Y^{\prime} \rightarrow Z^{\prime}$ is a closed immersion,
(4) $Z^{\prime} \rightarrow X^{\prime}$ is finite locally free, and
(5) $Z^{\prime}=\bigcup_{j=1, \ldots, m} Z_{j}^{\prime}$ is a (set theoretic) finite union of closed subschemes, each of which maps isomorphically to $X^{\prime}$.
Proof. Write $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$. See also More on Algebra, Section 15.15. Let $x_{1}, \ldots, x_{n} \in B$ be generators of $B$ over $A$. For each $i$ we can choose a monic polynomial $P_{i}(T) \in A[T]$ such that $P\left(x_{i}\right)=0$ in $B$. By Algebra, Lemma 10.134 .9 (applied $n$ times) there exists a finite locally free ring extension $A \subset A^{\prime}$ such that each $P_{i}$ splits completely:

$$
P_{i}(T)=\prod_{k=1, \ldots, d_{i}}\left(T-\alpha_{i k}\right)
$$

for certain $\alpha_{i k} \in A^{\prime}$. Set

$$
C=A^{\prime}\left[T_{1}, \ldots, T_{n}\right] /\left(P_{1}\left(T_{1}\right), \ldots, P_{n}\left(T_{n}\right)\right)
$$

and $B^{\prime}=A^{\prime} \otimes_{A} B$. The map $C \rightarrow B^{\prime}, T_{i} \mapsto 1 \otimes x_{i}$ is an $A^{\prime}$-algebra surjection. Setting $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right), Y^{\prime}=\operatorname{Spec}\left(B^{\prime}\right)$ and $Z^{\prime}=\operatorname{Spec}(C)$ we see that (1) - (4) hold. Part (5) holds because set theoretically $\operatorname{Spec}(C)$ is the union of the closed subschemes cut out by the ideals

$$
\left(T_{1}-\alpha_{1 k_{1}}, T_{2}-\alpha_{2 k_{2}}, \ldots, T_{n}-\alpha_{n k_{n}}\right)
$$

for any $1 \leq k_{i} \leq d_{i}$.
The following lemma is stated in the correct generality in Lemma 28.50.4 below.
03HX Lemma 28.45.7. Let $f: Y \rightarrow X$ be a finite morphism of schemes. Let $T \subset Y$ be a closed nowhere dense subset of $Y$. Then $f(T) \subset X$ is a closed nowhere dense subset of $X$.

Proof. By Lemma 28.43 .10 we know that $f(T) \subset X$ is closed. Let $X=\bigcup X_{i}$ be an affine covering. Since $T$ is nowhere dense in $Y$, we see that also $T \cap f^{-1}\left(X_{i}\right)$ is nowhere dense in $f^{-1}\left(X_{i}\right)$. Hence if we can prove the theorem in the affine case, then we see that $f(T) \cap X_{i}$ is nowhere dense. This then implies that $T$ is nowhere dense in $X$ by Topology, Lemma 5.20.4.
Assume $X$ is affine. Choose a diagram

as in Lemma 28.45.6. The morphisms $a, b$ are open since they are finite locally free (Lemmas 28.45.2 and 28.25.9. Hence $T^{\prime}=a^{-1}(T)$ is nowhere dense, see Topology, Lemma 5.20.6. The morphism $b$ is surjective and open. Hence, if we can prove $f^{\prime}\left(T^{\prime}\right)=b^{-1}(f(T))$ is nowhere dense, then $f(T)$ is nowhere dense, see Topology, Lemma 5.20.6. As $i$ is a closed immersion, by Topology, Lemma 5.20.5 we see that $i\left(T^{\prime}\right) \subset Z^{\prime}$ is closed and nowhere dense. Thus we have reduced the problem to the case discussed in the following paragraph.

Assume that $Y=\bigcup_{i=1, \ldots, n} Y_{i}$ is a finite union of closed subsets, each mapping isomorphically to $X$. Consider $T_{i}=Y_{i} \cap T$. If each of the $T_{i}$ is nowhere dense in $Y_{i}$, then each $f\left(T_{i}\right)$ is nowhere dense in $X$ as $Y_{i} \rightarrow X$ is an isomorphism. Hence $f(T)=f\left(T_{i}\right)$ is a finite union of nowhere dense closed subsets of $X$ and we win, see Topology, Lemma 5.20.2 Suppose not, say $T_{1}$ contains a nonempty open $V \subset Y_{1}$. We are going to show this leads to a contradiction. Consider $Y_{2} \cap V \subset V$. This is either a proper closed subset, or equal to $V$. In the first case we replace $V$ by $V \backslash V \cap Y_{2}$, so $V \subset T_{1}$ is open in $Y_{1}$ and does not meet $Y_{2}$. In the second case we have $V \subset Y_{1} \cap Y_{2}$ is open in both $Y_{1}$ and $Y_{2}$. Repeat sequentially with $i=3, \ldots, n$. The result is a disjoint union decomposition

$$
\{1, \ldots, n\}=I_{1} \amalg I_{2}, \quad 1 \in I_{1}
$$

and an open $V$ of $Y_{1}$ contained in $T_{1}$ such that $V \subset Y_{i}$ for $i \in I_{1}$ and $V \cap Y_{i}=\emptyset$ for $i \in I_{2}$. Set $U=f(V)$. This is an open of $X$ since $\left.f\right|_{Y_{1}}: Y_{1} \rightarrow X$ is an isomorphism. Then

$$
f^{-1}(U)=V \amalg \bigcup_{i \in I_{2}}\left(Y_{i} \cap f^{-1}(U)\right)
$$

As $\bigcup_{i \in I_{2}} Y_{i}$ is closed, this implies that $V \subset f^{-1}(U)$ is open, hence $V \subset Y$ is open. This contradicts the assumption that $T$ is nowhere dense in $Y$, as desired.

### 28.46. Birational morphisms

01RN You may be used to the notion of a birational map of varieties having the property that it is an isomorphism over an open subset of the target. However, in general a birational morphism may not be an isomorphism over any nonempty open, see Example 28.46.4. Here is the formal definition.
01RO Definition 28.46.1. Let $X, Y$ be schemes. Assume $X$ and $Y$ have finitely many irreducible components. We say a morphism $f: X \rightarrow Y$ is birational if
(1) $f$ induces a bijection between the set of generic points of irreducible components of $X$ and the set of generic points of the irreducible components of $Y$, and
(2) for every generic point $\eta \in X$ of an irreducible component of $X$ the local ring map $\mathcal{O}_{Y, f(\eta)} \rightarrow \mathcal{O}_{X, \eta}$ is an isomorphism.
We will see below that the fibres of a birational morphism over generic points are singletons. Moreover, we will see that in most cases one encounters in practice the existence a birational morphism between irreducible schemes $X$ and $Y$ implies $X$ and $Y$ are birational schemes.

01RP Lemma 28.46.2. Let $f: X \rightarrow Y$ be a morphism of schemes having finitely many irreducible components. If $f$ is birational then $f$ is dominant.

Proof. Follows immediately from the definitions.

0BAB Lemma 28.46.3. Let $f: X \rightarrow Y$ be a birational morphism of schemes having finitely many irreducible components. If $y \in Y$ is the generic point of an irreducible component, then the base change $X \times_{Y} \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ is an isomorphism.

Proof. We may assume $Y=\operatorname{Spec}(B)$ is affine and irreducible. Then $X$ is irreducible too. If we prove the result for any nonempty affine open $U \subset X$, then the result holds for $X$ (small argument omitted). Hence we may assume $X$ is affine too, say $X=\operatorname{Spec}(A)$. Let $y \in Y$ correspond to the minimal prime $\mathfrak{q} \subset B$. By assumption $A$ has a unique minimal prime $\mathfrak{p}$ lying over $\mathfrak{q}$ and $B_{\mathfrak{q}} \rightarrow A_{\mathfrak{p}}$ is an isomorphism. It follows that $A_{\mathfrak{q}} \rightarrow \kappa(\mathfrak{p})$ is surjective, hence $\mathfrak{p} A_{\mathfrak{q}}$ is a maximal ideal. On the other hand $\mathfrak{p} A_{\mathfrak{q}}$ is the unique minimal prime of $A_{\mathfrak{q}}$. We conclude that $\mathfrak{p} A_{\mathfrak{q}}$ is the unique prime of $A_{\mathfrak{q}}$ and that $A_{\mathfrak{q}}=A_{\mathfrak{p}}$. Since $A_{\mathfrak{q}}=A \otimes_{B} B_{\mathfrak{q}}$ the lemma follows.

01RQ Example 28.46.4. Here are two examples of birational morphisms which are not isomorphisms over any open of the target.

First example. Let $k$ be an infinite field. Let $A=k[x]$. Let $B=k\left[x,\left\{y_{\alpha}\right\}_{\alpha \in k}\right] /((x-$ $\left.\alpha) y_{\alpha}, y_{\alpha} y_{\beta}\right)$. There is an inclusion $A \subset B$ and a retraction $B \rightarrow A$ setting all $y_{\alpha}$ equal to zero. Both the morphism $\operatorname{Spec}(A) \rightarrow \operatorname{Spec}(B)$ and the morphism $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ are birational but not an isomorphism over any open.
Second example. Let $A$ be a domain. Let $S \subset A$ be a multiplicative subset not containing 0 . With $B=S^{-1} A$ the morphism $f: \operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ is birational. If there exists an open $U$ of $\operatorname{Spec}(A)$ such that $f^{-1}(U) \rightarrow U$ is an isomorphism, then there exists an $a \in A$ such that each every element of $S$ becomes invertible in the principal localization $A_{a}$. Taking $A=\mathbf{Z}$ and $S$ the set of odd integers give a counter example.

0BAC Lemma 28.46.5. Let $f: X \rightarrow Y$ be a birational morphism of schemes having finitely may irreducible components over a base scheme $S$. Assume one of the following conditions is satisfied
(1) $f$ is locally of finite type and $Y$ reduced,
(2) $f$ is locally of finite presentation.

Then there exist dense opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $\left.f\right|_{U}$ : $U \rightarrow V$ is an isomorphism. In particular if $X$ and $Y$ are irreducible, then $X$ and $Y$ are $S$-birational.

Proof. There is an immediate reduction to the case where $X$ and $Y$ are irreducible which we omit. Moreover, after shrinking further and we may assume $X$ and $Y$ are affine, say $X=\operatorname{Spec}(A)$ and $Y=\operatorname{Spec}(B)$. By assumption $A$, resp. $B$ has a unique minimal prime $\mathfrak{p}$, resp. $\mathfrak{q}$, the prime $\mathfrak{p}$ lies over $\mathfrak{q}$, and $B_{\mathfrak{q}}=A_{\mathfrak{p}}$. By Lemma 28.46 .3 we have $B_{\mathfrak{q}}=A_{\mathfrak{q}}=A_{\mathfrak{p}}$.

Suppose $B \rightarrow A$ is of finite type, say $A=B\left[x_{1}, \ldots, x_{n}\right]$. There exist a $b_{i} \in B$ and $g_{i} \in B \backslash \mathfrak{q}$ such that $b_{i} / g_{i}$ maps to the image of $x_{i}$ in $A_{\mathfrak{q}}$. Hence $b_{i}-g_{i} x_{i}$ maps to zero in $A_{g_{i}^{\prime}}$ for some $g_{i}^{\prime} \in B \backslash \mathfrak{q}$. Setting $g=\prod g_{i} g_{i}^{\prime}$ we see that $B_{g} \rightarrow A_{g}$ is surjective. If moreover $Y$ is reduced, then the map $B_{g} \rightarrow B_{\mathfrak{q}}$ is injective and hence $B_{g} \rightarrow A_{g}$ is injective as well. This proves case (1).
Proof of (2). By the argument given in the previous paragraph we may assume that $B \rightarrow A$ is surjective. As $f$ is locally of finite presentation the kernel $J \subset B$ is a
finitely generated ideal. Say $J=\left(b_{1}, \ldots, b_{r}\right)$. Since $B_{\mathfrak{q}}=A_{\mathfrak{q}}$ there exist $g_{i} \in B \backslash \mathfrak{q}$ such that $g_{i} b_{i}=0$. Setting $g=\prod g_{i}$ we see that $B_{g} \rightarrow A_{g}$ is an isomorphism.
0BAD Lemma 28.46.6. Let $S$ be a scheme. Let $X$ and $Y$ be irreducible schemes locally of finite presentation over $S$. Let $x \in X$ and $y \in Y$ be the generic points. The following are equivalent
(1) $X$ and $Y$ are $S$-birational,
(2) there exist nonempty opens of $X$ and $Y$ which are $S$-isomorphic, and
(3) $x$ and $y$ map to the same point $s$ of $S$ and $\mathcal{O}_{X, x}$ and $\mathcal{O}_{Y, y}$ are isomorphic as $\mathcal{O}_{S, s}$-algebras.

Proof. We have seen the equivalence of (1) and (2) in Lemma 28.9.11. It is immediate that (2) implies (3). To finish we assume (3) holds and we prove (1). To do this we may replace $X, Y$, and $S$ by suitable affine opens. Say $X=\operatorname{Spec}(A)$, $Y=\operatorname{Spec}(B)$, and $S=\operatorname{Spec}(R)$. Let $\mathfrak{p} \subset A$ and $\mathfrak{q} \subset B$ be the unique minimal prime ideals. Let $\varphi: A_{\mathfrak{p}} \rightarrow B_{\mathfrak{q}}$ be the isomorphism we are given. Since $R \rightarrow A$ is a ring map of finite presentation there exists a $g \in B \backslash \mathfrak{q}$ and an $R$-algebra map $A \rightarrow B_{g}$ such that

commutes, see Algebra, Lemmas 10.126 .2 and 10.9 .9 The induced morphism $\operatorname{Spec}\left(B_{g}\right) \rightarrow \operatorname{Spec}(A)$ is birational by construction and hence an isomorphism on nonempty opens by Lemma 28.46.5. This finishes the proof.

### 28.47. Generically finite morphisms

02 NV In this section we characterize maps between schemes which are locally of finite type and which are "generically finite" in some sense.
02NW Lemma 28.47.1. Let $X, Y$ be schemes. Let $f: X \rightarrow Y$ be locally of finite type. Let $\eta \in Y$ be a generic point of an irreducible component of $Y$. The following are equivalent:
(1) the set $f^{-1}(\{\eta\})$ is finite,
(2) there exist affine opens $U_{i} \subset X, i=1, \ldots, n$ and $V \subset Y$ with $f\left(U_{i}\right) \subset V$, $\eta \in V$ and $f^{-1}(\{\eta\}) \subset \bigcup U_{i}$ such that each $\left.f\right|_{U_{i}}: U_{i} \rightarrow V$ is finite.
If $f$ is quasi-separated, then these are also equivalent to
(3) there exist affine opens $V \subset Y$, and $U \subset X$ with $f(U) \subset V, \eta \in V$ and $f^{-1}(\{\eta\}) \subset U$ such that $\left.f\right|_{U}: U \rightarrow V$ is finite.
If $f$ is quasi-compact and quasi-separated, then these are also equivalent to
(4) there exists an affine open $V \subset Y, \eta \in V$ such that $f^{-1}(V) \rightarrow V$ is finite.

Proof. The question is local on the base. Hence we may replace $Y$ by an affine neighbourhood of $\eta$, and we may and do assume throughout the proof below that $Y$ is affine, say $Y=\operatorname{Spec}(R)$.
It is clear that (2) implies (1). Assume that $f^{-1}(\{\eta\})=\left\{\xi_{1}, \ldots, \xi_{n}\right\}$ is finite. Choose affine opens $U_{i} \subset X$ with $\xi_{i} \in U_{i}$. By Algebra, Lemma 10.121.9 we see that after replacing $Y$ by a standard open in $Y$ each of the morphisms $U_{i} \rightarrow Y$ is finite. In other words (2) holds.

It is clear that (3) implies (1). Assume $f^{-1}(\{\eta\})=\left\{\xi_{1}, \ldots, \xi_{n}\right\}$ and assume that $f$ is quasi-separated. Since $Y$ is affine this implies that $X$ is quasi-separated. Since each $\xi_{i}$ maps to a generic point of an irreducible component of $Y$, we see that each $\xi_{i}$ is a generic point of an irreducible component of $X$. By Properties, Lemma 27.29.1 we can find an affine open $U \subset X$ containing each $\xi_{i}$. By Algebra, Lemma 10.121 .9 we see that after replacing $Y$ by a standard open in $Y$ the morphisms $U \rightarrow Y$ is finite. In other words (3) holds.

It is clear that (4) implies all of $(1)-(3)$ with no further assumptions on $f$. Suppose that $f$ is quasi-compact and quasi-separated. We have to show that the equivalent conditions (1) - (3) imply (4). Let $U, V$ be as in (3). Replace $Y$ by $V$. Since $f$ is quasi-compact and $Y$ is quasi-compact (being affine) we see that $X$ is quasicompact. Hence $Z=X \backslash U$ is quasi-compact, hence the morphism $\left.f\right|_{Z}: Z \rightarrow Y$ is quasi-compact. By construction of $Z$ we see that $\eta \notin f(Z)$. Hence by Lemma 28.8.4 we see that there exists an affine open neighbourhood $V^{\prime}$ of $\eta$ in $Y$ such that $f^{-1}\left(V^{\prime}\right) \cap Z=\emptyset$. Then we have $f^{-1}\left(V^{\prime}\right) \subset U$ and this means that $f^{-1}\left(V^{\prime}\right) \rightarrow V^{\prime}$ is finite.

03HY Example 28.47.2. Let $A=\prod_{n \in \mathbf{N}} \mathbf{F}_{2}$. Every element of $A$ is an idempotent. Hence every prime ideal is maximal with residue field $\mathbf{F}_{2}$. Thus the topology on $X=\operatorname{Spec}(A)$ is totally disconnected and quasi-compact. The projection maps $A \rightarrow \mathbf{F}_{2}$ define open points of $\operatorname{Spec}(A)$. It cannot be the case that all the points of $X$ are open since $X$ is quasi-compact. Let $x \in X$ be a closed point which is not open. Then we can form a scheme $Y$ which is two copies of $X$ glued along $X \backslash\{x\}$. In other words, this is $X$ with $x$ doubled, compare Schemes, Example 25.14.3. The morphism $f: Y \rightarrow X$ is quasi-compact, finite type and has finite fibres but is not quasi-separated. The point $x \in X$ is a generic point of an irreducible component of $X$ (since $X$ is totally disconnected). But properties (3) and (4) of Lemma 28.47.1 do not hold. The reason is that for any open neighbourhood $x \in U \subset X$ the inverse image $f^{-1}(U)$ is not affine because functions on $f^{-1}(U)$ cannot separate the two points lying over $x$ (proof omitted; this is a nice exercise). Hence the condition that $f$ is quasi-separated is necessary in parts (3) and (4) of the lemma.

03HZ Remark 28.47.3. An alternative to Lemma 28.47.1 is the statement that a quasifinite morphism is finite over a dense open of the target. This will be shown in More on Morphisms, Section 36.31.

0BAH Lemma 28.47.4. Let $X, Y$ be schemes. Let $f: X \rightarrow Y$ be locally of finite type. Let $X^{0}$, resp. $Y^{0}$ denote the set of generic points of irreducible components of $X$, resp. Y. Let $\eta \in Y^{0}$. The following are equivalent
(1) $f^{-1}(\{\eta\}) \subset X^{0}$,
(2) $f$ is quasi-finite at all points lying over $\eta$,
(3) $f$ is quasi-finite at all $\xi \in X^{0}$ lying over $\eta$.

Proof. Condition (1) implies there are no specializations among the points of the fibre $X_{\eta}$. Hence (2) holds by Lemma 28.20.6. The implication $(2) \Rightarrow(3)$ is immediate. Since $\eta$ is a generic point of $Y$, the generic points of $X_{\eta}$ are generic points of $X$. Hence (3) and Lemma 28.20.6 imply the generic points of $X_{\eta}$ are also closed. Thus all points of $X_{\eta}$ are generic and we see that (1) holds.

0BAI Lemma 28.47.5. Let $X, Y$ be schemes. Let $f: X \rightarrow Y$ be locally of finite type. Let $X^{0}$, resp. $Y^{0}$ denote the set of generic points of irreducible components of $X$, resp. Y. Assume
(1) $X^{0}$ and $Y^{0}$ are finite and $f^{-1}\left(Y^{0}\right)=X^{0}$,
(2) either $f$ is quasi-compact or $f$ is separated.

Then there exists a dense open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite.
Proof. Since $Y$ has finitely many irreducible components, we can find a dense open which is a disjoint union of its irreducible components. Thus we may assume $Y$ is irreducible affine with generic point $\eta$. Then the fibre over $\eta$ is finite as $X^{0}$ is finite.

Assume $f$ is separated and $Y$ irreducible affine. Choose $V \subset Y$ and $U \subset X$ as in Lemma 28.47.1 part (3). Since $\left.f\right|_{U}: U \rightarrow V$ is finite, we see that $U \subset f^{-1}(V)$ is closed as well as open (Lemmas 28.41.7 and 28.43.10). Thus $f^{-1}(V)=U \amalg W$ for some open subscheme $W$ of $X$. However, since $U$ contains all the generic points of $X$ we conclude that $W=\emptyset$ as desired.
Assume $f$ is quasi-compact and $Y$ irreducible affine. Then $X$ is quasi-compact, hence there exists a dense open subscheme $U \subset X$ which is separated (Properties, Lemma 27.29.3. Since the set of generic points $X^{0}$ is finite, we see that $X^{0} \subset U$. Thus $\eta \notin f(X \backslash U)$. Since $X \backslash U \rightarrow Y$ is quasi-compact, we conclude that there is a nonempty open $V \subset Y$ such that $f^{-1}(V) \subset U$, see Lemma 28.8.3. After replacing $X$ by $f^{-1}(V)$ and $Y$ by $V$ we reduce to the separated case which we dealt with in the preceding paragraph.

0BAJ Lemma 28.47.6. Let $X, Y$ be schemes. Let $f: X \rightarrow Y$ be a birational morphism between schemes which have finitely many irreducible components. Assume
(1) either $f$ is quasi-compact or $f$ is separated, and
(2) either $f$ is locally of finite type and $Y$ is reduced or $f$ is locally of finite presentation.
Then there exists a dense open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is an isomorphism.
Proof. By Lemma 28.47 .5 we may assume that $f$ is finite. Since $Y$ has finitely many irreducible components, we can find a dense open which is a disjoint union of its irreducible components. Thus we may assume $Y$ is irreducible. By Lemma 28.46.5 we find a nonempty open $U \subset X$ such that $\left.f\right|_{U}: U \rightarrow Y$ is an open immersion. After removing the closed (as $f$ finite) subset $f(X \backslash U)$ from $Y$ we see that $f$ is an isomorphism.

02NX Lemma 28.47.7. Let $X, Y$ be integral schemes. Let $f: X \rightarrow Y$ be locally of finite type. Assume $f$ is dominant. The following are equivalent:
(1) the extension $R(Y) \subset R(X)$ has transcendence degree 0 ,
(2) the extension $R(Y) \subset R(X)$ is finite,
(3) there exist nonempty affine opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $\left.f\right|_{U}: U \rightarrow V$ is finite, and
(4) the generic point of $X$ is the only point of $X$ mapping to the generic point of $Y$.
If $f$ is separated or if $f$ is quasi-compact, then these are also equivalent to
(5) there exists a nonempty affine open $V \subset Y$ such that $f^{-1}(V) \rightarrow V$ is finite.

Proof. Choose any affine opens $\operatorname{Spec}(A)=U \subset X$ and $\operatorname{Spec}(R)=V \subset Y$ such that $f(U) \subset V$. Then $R$ and $A$ are domains by definition. The ring map $R \rightarrow A$ is of finite type (Lemma 28.15.2. By Lemma 28.8.5 the generic point of $X$ maps to the generic point of $Y$ hence $R \rightarrow A$ is injective. Let $K=f . f .(R)=R(Y)$ and $L=f . f .(A)=R(X)$. Then $K \subset L$ is a finitely generated field extension. Hence we see that (1) is equivalent to (2).
Suppose (2) holds. Let $x_{1}, \ldots, x_{n} \in A$ be generators of $A$ over $R$. By assumption there exist nonzero polynomials $P_{i}(X) \in R[X]$ such that $P_{i}\left(x_{i}\right)=0$. Let $f_{i} \in R$ be the leading coefficient of $P_{i}$. Then we conclude that $R_{f_{1} \ldots f_{n}} \rightarrow A_{f_{1} \ldots f_{n}}$ is finite, i.e., (3) holds. Note that (3) implies (2). So now we see that (1), (2) and (3) are all equivalent.
Let $\eta$ be the generic point of $X$, and let $\eta^{\prime} \in Y$ be the generic point of $Y$. Assume (4). Then $\operatorname{dim}_{\eta}\left(X_{\eta^{\prime}}\right)=0$ and we see that $R(X)=\kappa(\eta)$ has transcendence degree 0 over $R(Y)=\kappa\left(\eta^{\prime}\right)$ by Lemma 28.28.1. In other words (1) holds. Assume the equivalent conditions (1), (2) and (3). Suppose that $x \in X$ is a point mapping to $\eta^{\prime}$. As $x$ is a specialization of $\eta$, this gives inclusions $R(Y) \subset \mathcal{O}_{X, x} \subset R(X)$, which implies $\mathcal{O}_{X, x}$ is a field, see Algebra, Lemma 10.35.17. Hence $x=\eta$. Thus we see that $(1)-(4)$ are all equivalent.
It is clear that (5) implies (3) with no additional assumptions on $f$. What remains is to prove that if $f$ is either separated or quasi-compact, then the equivalent conditions (1) - (4) imply (5). This follows from Lemma 28.47.5.

02NY Definition 28.47.8. Let $X$ and $Y$ be integral schemes. Let $f: X \rightarrow Y$ be locally of finite type and dominant. Assume $[R(X): R(Y)]<\infty$, or any other of the equivalent conditions (1) - (4) of Lemma 28.47.7. Then the positive integer

$$
\operatorname{deg}(X / Y)=[R(X): R(Y)]
$$

is called the degree of $X$ over $Y$.
It is possible to extend this notion to a morphism $f: X \rightarrow Y$ if (a) $Y$ is integral with generic point $\eta$, (b) $f$ is locally of finite type, and (c) $f^{-1}(\{\eta\})$ is finite. In this case we can define

$$
\operatorname{deg}(X / Y)=\sum_{\xi \in X, f(\xi)=\eta} \operatorname{dim}_{R(Y)}\left(\mathcal{O}_{X, \xi}\right)
$$

Namely, given that $R(Y)=\kappa(\eta)=\mathcal{O}_{Y, \eta}$ (Lemma 28.9.4) the dimensions above are finite by Lemma 28.47.1 above. However, for most applications the definition given above is the right one.
02NZ Lemma 28.47.9. Let $X, Y, Z$ be integral schemes. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ be dominant morphisms locally of finite type. Assume that $[R(X): R(Y)]<\infty$ and $[R(Y): R(Z)]<\infty$. Then

$$
\operatorname{deg}(X / Z)=\operatorname{deg}(X / Y) \operatorname{deg}(Y / Z)
$$

Proof. This comes from the multiplicativity of degrees in towers of finite extensions of fields, see Fields, Lemma 9.7.6.

073A Remark 28.47.10. Let $f: X \rightarrow Y$ be a morphism of schemes which is locally of finite type. There are (at least) two properties that we could use to define generically finite morphisms. These correspond to whether you want the property to be local on the source or local on the target:
(1) (Local on the target; suggested by Ravi Vakil.) Assume every quasicompact open of $Y$ has finitely many irreducible components (for example if $Y$ is locally Noetherian). The requirement is that the inverse image of each generic point is finite, see Lemma 28.47.1.
(2) (Local on the source.) The requirement is that there exists a dense open $U \subset X$ such that $U \rightarrow Y$ is locally quasi-finite.
In case (1) the requirement can be formulated without the auxiliary condition on $Y$, but probably doesn't give the right notion for general schemes. Property (2) as formulated doesn't imply that the fibres over generic points are finite; however, if $f$ is quasi-compact and $Y$ is as in (1) then it does.
0AAZ Definition 28.47.11. Let $X$ be an integral scheme. A modification of $X$ is a birational proper morphism $f: X^{\prime} \rightarrow X$ with $X^{\prime}$ integral.

Let $f: X^{\prime} \rightarrow X$ be a modification as in the definition. By Lemma 28.47 .7 there exists a nonempty $U \subset X$ such that $f^{-1}(U) \rightarrow U$ is finite. By generic flatness (Proposition 28.27.1) we may assume $f^{-1}(U) \rightarrow U$ is flat and of finite presentation. So $f^{-1}(U) \rightarrow U$ is finite locally free (Lemma 28.45.2. Since $f$ is birational, the degree of $X^{\prime}$ over $X$ is 1 . Hence $f^{-1}(U) \rightarrow U$ is finite locally free of degree 1 , in other words it is an isomorphism. Thus we can redefine a modification to be a proper morphism $f: X^{\prime} \rightarrow X$ of integral schemes such that $f^{-1}(U) \rightarrow U$ is an isomorphism for some nonempty open $U \subset X$.
0AB0 Definition 28.47.12. Let $X$ be an integral scheme. An alteration of $X$ is a proper dominant morphism $f: Y \rightarrow X$ with $Y$ integral such that $f^{-1}(U) \rightarrow U$ is finite for
dJ96, Definition 2.20] some nonempty open $U \subset X$.
This is the definition as given in dJ96, except that here we do not require $X$ and $Y$ to be Noetherian. Arguing as above we see that an alteration is a proper dominant morphism $f: Y \rightarrow X$ of integral schemes which induces a finite extension of function fields, i.e., such that the equivalent conditions of Lemma 28.47.7 hold.

### 28.48. Relative normalization

0BAK In this section we construct the normalization of one scheme in another.
035F Lemma 28.48.1. Let $X$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X^{-}}$ algebras. The subsheaf $\mathcal{A}^{\prime} \subset \mathcal{A}$ defined by the rule

$$
U \longmapsto\left\{f \in \mathcal{A}(U) \mid f_{x} \in \mathcal{A}_{x} \text { integral over } \mathcal{O}_{X, x} \text { for all } x \in U\right\}
$$

is a quasi-coherent $\mathcal{O}_{X}$-algebra, the stalk $\mathcal{A}_{x}^{\prime}$ is the integral closure of $\mathcal{O}_{X, x}$ in $\mathcal{A}_{x}$, and for any affine open $U \subset X$ the ring $\mathcal{A}^{\prime}(U) \subset \mathcal{A}(U)$ is the integral closure of $\mathcal{O}_{X}(U)$ in $\mathcal{A}(U)$.

Proof. This is a subsheaf by the local nature of the conditions. It is an $\mathcal{O}_{X}$-algebra by Algebra, Lemma 10.35.7. Let $U \subset X$ be an affine open. Say $U=\operatorname{Spec}(R)$ and say $\mathcal{A}$ is the quasi-coherent sheaf associated to the $R$-algebra $A$. Then according to Algebra, Lemma 10.35 .10 the value of $\mathcal{A}^{\prime}$ over $U$ is given by the integral closure $A^{\prime}$ of $R$ in $A$. This proves the last assertion of the lemma. To prove that $\mathcal{A}^{\prime}$ is quasi-coherent, it suffices to show that $\mathcal{A}^{\prime}(D(f))=A_{f}^{\prime}$. This follows from the fact that integral closure and localization commute, see Algebra, Lemma 10.35.9. The same fact shows that the stalks are as advertised.

035G Definition 28.48.2. Let $X$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras. The integral closure of $\mathcal{O}_{X}$ in $\mathcal{A}$ is the quasi-coherent $\mathcal{O}_{X}$-subalgebra $\mathcal{A}^{\prime} \subset \mathcal{A}$ constructed in Lemma 28.48.1 above.

In the setting of the definition above we can consider the morphism of relative spectra

see Lemma 28.12.5. The scheme $X^{\prime} \rightarrow X$ will be the normalization of $X$ in the scheme $Y$. Here is a slightly more general setting. Suppose we have a quasi-compact and quasi-separated morphism $f: Y \rightarrow X$ of schemes. In this case the sheaf of $\mathcal{O}_{X^{-}}$ algebras $f_{*} \mathcal{O}_{Y}$ is quasi-coherent, see Schemes, Lemma 25.24.1. Taking the integral closure $\mathcal{O}^{\prime} \subset f_{*} \mathcal{O}_{Y}$ we obtain a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras whose relative spectrum is the normalization of $X$ in $Y$. Here is the formal definition.

035H Definition 28.48.3. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{O}^{\prime}$ be the integral closure of $\mathcal{O}_{X}$ in $f_{*} \mathcal{O}_{Y}$. The normalization of $X$ in $Y$ is the scheme

$$
\nu: X^{\prime}=\underline{\operatorname{Spec}}_{X}\left(\mathcal{O}^{\prime}\right) \rightarrow X
$$

over $X$. It comes equipped with a natural factorization

$$
Y \xrightarrow{f^{\prime}} X^{\prime} \xrightarrow{\nu} X
$$

of the initial morphism $f$.
The factorization is the composition of the canonical morphism $Y \rightarrow \operatorname{Spec}\left(f_{*} \mathcal{O}_{Y}\right)$ (see Constructions, Lemma 26.4.7) and the morphism of relative spectra coming from the inclusion map $\mathcal{O}^{\prime} \rightarrow f_{*} \mathcal{O}_{Y}$. We can characterize the normalization as follows.

035I Lemma 28.48.4. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. The factorization $f=\nu \circ f^{\prime}$, where $\nu: X^{\prime} \rightarrow X$ is the normalization of $X$ in $Y$ is characterized by the following two properties:
(1) the morphism $\nu$ is integral, and
(2) for any factorization $f=\pi \circ g$, with $\pi: Z \rightarrow X$ integral, there exists a commutative diagram

for some unique morphism $h: X^{\prime} \rightarrow Z$.
Moreover, in (2) the morphism $h: X^{\prime} \rightarrow Z$ is the normalization of $Z$ in $Y$.

[^79]Proof. Let $\mathcal{O}^{\prime} \subset f_{*} \mathcal{O}_{Y}$ be the integral closure of $\mathcal{O}_{X}$ as in Definition 28.48.3. The morphism $\nu$ is integral by construction, which proves (1). Assume given a factorization $f=\pi \circ g$ with $\pi: Z \rightarrow X$ integral as in (2). By Definition 28.43.1 $\pi$ is affine, and hence $Z$ is the relative spectrum of a quasi-coherent sheaf of $\mathcal{O}_{X^{-}}$ algebras $\mathcal{B}$. The morphism $g: X \rightarrow Z$ corresponds to a map of $\mathcal{O}_{X}$-algebras $\chi: \mathcal{B} \rightarrow f_{*} \mathcal{O}_{Y}$. Since $\mathcal{B}(U)$ is integral over $\mathcal{O}_{X}(U)$ for every affine open $U \subset X$ (by Definition 28.43.1 we see from Lemma 28.48.1 that $\chi(\mathcal{B}) \subset \mathcal{O}^{\prime}$. By the functoriality of the relative spectrum Lemma 28.12 .5 this provides us with a unique morphism $h: X^{\prime} \rightarrow Z$. We omit the verification that the diagram commutes.

It is clear that (1) and (2) characterize the factorization $f=\nu \circ f^{\prime}$ since it characterizes it as an initial object in a category. The morphism $h$ in (2) is integral by Lemma 28.43.12. Given a factorization $g=\pi^{\prime} \circ g^{\prime}$ with $\pi^{\prime}: Z^{\prime} \rightarrow Z$ integral, we get a factorization $f=\left(\pi \circ \pi^{\prime}\right) \circ g^{\prime}$ and we get a morphism $h^{\prime}: X^{\prime} \rightarrow Z^{\prime}$. Uniqueness implies that $\pi^{\prime} \circ h^{\prime}=h$. Hence the characterization (1), (2) applies to the morphism $h: X^{\prime} \rightarrow Z$ which gives the last statement of the lemma.

035J Lemma 28.48.5. Let

be a commutative diagram of morphisms of schemes. Assume $f_{1}, f_{2}$ quasi-compact and quasi-separated. Let $f_{i}=\nu_{i} \circ f_{i}^{\prime}, i=1,2$ be the canonical factorizations, where $\nu_{i}: X_{i}^{\prime} \rightarrow X_{i}$ is the normalization of $X_{i}$ in $Y_{i}$. Then there exists a canonical commutative diagram

Proof. By Lemmas 28.48 .4 (1) and 28.43 .6 the base change $X_{2} \times_{X_{1}} X_{1}^{\prime} \rightarrow X_{2}$ is integral. Note that $f_{2}$ factors through this morphism. Hence we get a canonical morphism $X_{2}^{\prime} \rightarrow X_{2} \times_{X_{1}} X_{1}^{\prime}$ from Lemma 28.48.4 (2). This gives the middle horizontal arrow in the last diagram.

035K Lemma 28.48.6. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let $U \subset X$ be an open subscheme and set $V=f^{-1}(U)$. Then the normalization of $U$ in $V$ is the inverse image of $U$ in the normalization of $X$ in $Y$.

Proof. Clear from the construction.
0AXN Lemma 28.48.7. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let $X^{\prime} \rightarrow X$ be the normalization of $X$ in $Y$. If $Y$ is reduced, so is $X^{\prime}$.

Proof. This follows from the fact that a subring of a reduced ring is reduced. Some details omitted.

0AXP Lemma 28.48.8. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Let $X^{\prime} \rightarrow X$ be the normalization of $X$ in $Y$. Every generic point of an irreducible component of $X^{\prime}$ is the image of a generic point of an irreducible component of $Y$.

Proof. By Lemma 28.48 .6 we may assume $X=\operatorname{Spec}(A)$ is affine. Choose a finite affine open covering $Y=\bigcup \operatorname{Spec}\left(B_{i}\right)$. Then $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$ and the morphisms $\operatorname{Spec}\left(B_{i}\right) \rightarrow Y \rightarrow X^{\prime}$ jointly define an injective $A$-algebra map $A^{\prime} \rightarrow \prod B_{i}$. Thus the lemma follows from Algebra, Lemma 10.29.5.

03GO Lemma 28.48.9. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Suppose that $Y=Y_{1} \amalg Y_{2}$ is a disjoint union of two schemes. Write $f_{i}=\left.f\right|_{Y_{i}}$. Let $X_{i}^{\prime}$ be the normalization of $X$ in $Y_{i}$. Then $X_{1}^{\prime} \amalg X_{2}^{\prime}$ is the normalization of $X$ in $Y$.

Proof. In terms of integral closures this corresponds to the following fact: Let $A \rightarrow B$ be a ring map. Suppose that $B=B_{1} \times B_{2}$. Let $A_{i}^{\prime}$ be the integral closure of $A$ in $B_{i}$. Then $A_{1}^{\prime} \times A_{2}^{\prime}$ is the integral closure of $A$ in $B$. The reason this works is that the elements $(1,0)$ and $(0,1)$ of $B$ are idempotents and hence integral over $A$. Thus the integral closure $A^{\prime}$ of $A$ in $B$ is a product and it is not hard to see that the factors are the integral closures $A_{i}^{\prime}$ as described above (some details omitted).
03GQ Lemma 28.48.10. Let $f: X \rightarrow S$ be a quasi-compact, quasi-separated and universally closed morphisms of schemes. Then $f_{*} \mathcal{O}_{X}$ is integral over $\mathcal{O}_{S}$. In other words, the normalization of $S$ in $X$ is equal to the factorization

$$
X \longrightarrow \underline{\operatorname{Spec}}_{S}\left(f_{*} \mathcal{O}_{X}\right) \longrightarrow S
$$

of Constructions, Lemma 26.4.7.
Proof. The question is local on $S$, hence we may assume $S=\operatorname{Spec}(R)$ is affine. Let $h \in \Gamma\left(X, \mathcal{O}_{X}\right)$. We have to show that $h$ satisfies a monic equation over $R$. Think of $h$ as a morphism as in the following commutative diagram

Let $Z \subset \mathbf{A}_{S}^{1}$ be the scheme theoretic image of $h$, see Definition 28.6.2. The morphism $h$ is quasi-compact as $f$ is quasi-compact and $\mathbf{A}_{S}^{1} \rightarrow S$ is separated, see Schemes, Lemma 25.21.15. By Lemma 28.6 .3 the morphism $X \rightarrow Z$ is dominant. By Lemma 28.41.7 the morphism $X \rightarrow Z$ is closed. Hence $h(X)=Z$ (set theoretically). Thus we can use Lemma 28.41 .8 to conclude that $Z \rightarrow S$ is universally closed (and even proper). Since $Z \subset \mathbf{A}_{S}^{1}$, we see that $Z \rightarrow S$ is affine and proper, hence integral by Lemma 28.43 .7 . Writing $\mathbf{A}_{S}^{1}=\operatorname{Spec}(R[T])$ we conclude that the ideal $I \subset R[T]$ of $Z$ contains a monic polynomial $P(T) \in R[T]$. Hence $P(h)=0$ and we win.

03GP Lemma 28.48.11. Let $f: Y \rightarrow X$ be an integral morphism. Then the normalization of $X$ in $Y$ is equal to $Y$.

Proof. By Lemma 28.43.7 this is a special case of Lemma 28.48.10.
035L Lemma 28.48.12. Let $f: Y \rightarrow X$ be a quasi-compact and quasi-separated morphism of schemes. Assume
(1) $Y$ is a normal scheme,
(2) quasi-compact opens of $Y$ have finitely many irreducible components.

Then the normalization $X^{\prime}$ of $X$ in $Y$ is a normal scheme. Moreover, the morphism $Y \rightarrow X^{\prime}$ is dominant and induces a bijection of irreducible components.

Proof. We first prove that $X^{\prime}$ is normal. Let $U \subset X$ be an affine open. It suffices to prove that the inverse image of $U$ in $X^{\prime}$ is normal (see Properties, Lemma 27.7 .2 . By Lemma 28.48 .6 we may replace $X$ by $U$, and hence we may assume $X=\operatorname{Spec}(A)$ affine. In this case $Y$ is quasi-compact, and hence has a finite number of irreducible components by assumption. Hence $Y=\coprod_{i=1, \ldots n} Y_{i}$ is a finite disjoint union of normal integral schemes by Properties, Lemma 27.7.5. By Lemma 28.48.9 we see that $X^{\prime}=\coprod_{i=1, \ldots, n} X_{i}^{\prime}$, where $X_{i}^{\prime}$ is the normalization of $X$ in $Y_{i}$. By Properties, Lemma 27.7 .9 we see that $B_{i}=\Gamma\left(Y_{i}, \mathcal{O}_{Y_{i}}\right)$ is a normal domain. Note that $X_{i}^{\prime}=\operatorname{Spec}\left(A_{i}^{\prime}\right)$, where $A_{i}^{\prime} \subset B_{i}$ is the integral closure of $A$ in $B_{i}$, see Lemma 28.48.1. By Algebra, Lemma 10.36 .2 we see that $A_{i}^{\prime} \subset B_{i}$ is a normal domain. Hence $X^{\prime}=\coprod X_{i}^{\prime}$ is a finite union of normal schemes and hence is normal.
It is clear from the description of $X^{\prime}$ above that $Y \rightarrow X^{\prime}$ is dominant and induces a bijection on irreducible components if $X$ is affine. The result in general follows from this by a topological argument (omitted).
0AVK Lemma 28.48.13. Let $f: X \rightarrow S$ be a morphism. Assume that
(1) $S$ is a Nagata scheme,
(2) $f$ is quasi-compact and quasi-separated,
(3) quasi-compact opens of $X$ have finitely many irreducible components,
(4) if $x \in X$ is a generic point of an irreducible component, then the field extension $\kappa(f(x)) \subset \kappa(x)$ is finitely generated, and
(5) $X$ is reduced.

Then the normalization $\nu: S^{\prime} \rightarrow S$ of $S$ in $X$ is finite.
Proof. There is an immediate reduction to the case $S=\operatorname{Spec}(R)$ where $R$ is a Nagata ring by assumption (1). We have to show that the integral closure $A$ of $R$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is finite over $R$. Since $f$ is quasi-compact by assumption (2) we can write $X=\bigcup_{i=1, \ldots, n} U_{i}$ with each $U_{i}$ affine. Say $U_{i}=\operatorname{Spec}\left(B_{i}\right)$. Each $B_{i}$ is reduced by assumption (5) and has finitely many minial primes $\mathfrak{q}_{i 1}, \ldots, \mathfrak{q}_{i m_{i}}$ by assumption (3) and Algebra, Lemma 10.25.1 We have

$$
\Gamma\left(X, \mathcal{O}_{X}\right) \subset B_{1} \times \ldots \times B_{n} \subset \prod_{i=1, \ldots, n} \prod_{j=1, \ldots, m_{i}}\left(B_{i}\right)_{\mathfrak{q}_{i j}}
$$

the second inclusion by Algebra, Lemma 10.24.2. We have $\kappa\left(\mathfrak{q}_{i j}\right)=\left(B_{i}\right)_{\mathfrak{q}_{i j}}$ by Algebra, Lemma 10.24.1. Hence the integral closure $A$ of $R$ in $\Gamma\left(X, \mathcal{O}_{X}\right)$ is contained in the product of the integral closures $A_{i j}$ of $R$ in $\kappa\left(\mathfrak{q}_{i j}\right)$. Since $R$ is Noetherian it suffices to show that $A_{i j}$ is a finite $R$-module for each $i, j$. Let $\mathfrak{p}_{i j} \subset R$ be the image of $\mathfrak{q}_{i j}$. As $\kappa\left(\mathfrak{p}_{i j}\right) \subset \kappa\left(\mathfrak{q}_{i j}\right)$ is a finitely generated field extension by assumption (4), we see that $R \rightarrow \kappa\left(\mathfrak{q}_{i j}\right)$ is essentially of finite type. Thus $R \rightarrow A_{i j}$ is finite by Algebra, Lemma 10.154.2.
03GR Lemma 28.48.14. Let $f: X \rightarrow S$ be a morphism. Assume that
(1) $S$ is a Nagata scheme,
(2) $f$ is of finite type,
(3) $X$ is reduced.

Then the normalization $\nu: S^{\prime} \rightarrow S$ of $S$ in $X$ is finite.
Proof. This is a special case of Lemma 28.48.13. Namely, (2) holds as the finite type morphism $f$ is quasi-compact by definition and quasi-separated by Lemma 28.15.7. Condition (3) holds because $X$ is locally Noetherian by Lemma 28.15.6. Finally, condition (4) holds because a finite type morphism induces finitely generated residue field extensions.

### 28.49. Normalization

035 E Next, we come to the normalization of a scheme $X$. We only define/construct it when $X$ has locally finitely many irreducible components. Let $X$ be a scheme such that every quasi-compact open has finitely many irreducible components. Let $X^{(0)} \subset X$ be the set of generic points of irreducible components of $X$. Let

035M

$$
\begin{equation*}
f: Y=\coprod_{\eta \in X^{(0)}} \operatorname{Spec}(\kappa(\eta)) \longrightarrow X \tag{28.49.0.1}
\end{equation*}
$$

be the inclusion of the generic points into $X$ using the canonical maps of Schemes, Section 25.13. Note that this morphism is quasi-compact by assumption and quasiseparated as $Y$ is separated (see Schemes, Section 25.21).
035N Definition 28.49.1. Let $X$ be a scheme such that every quasi-compact open has finitely many irreducible components. We define the normalization of $X$ as the morphism

$$
\nu: X^{\nu} \longrightarrow X
$$

which is the normalization of $X$ in the morphism $f: Y \rightarrow X$ 28.49.0.1 constructed above.
Any locally Noetherian scheme has a locally finite set of irreducible components and the definition applies to it. Usually the normalization is defined only for reduced schemes. With the definition above the normalization of $X$ is the same as the normalization of the reduction $X_{\text {red }}$ of $X$.
035 O Lemma 28.49.2. Let $X$ be a scheme such that every quasi-compact open has finitely many irreducible components. The normalization morphism $\nu$ factors through the reduction $X_{\text {red }}$ and $X^{\nu} \rightarrow X_{\text {red }}$ is the normalization of $X_{\text {red }}$.
Proof. Let $f: Y \rightarrow X$ be the morphism 28.49.0.1). We get a factorization $Y \rightarrow X_{\text {red }} \rightarrow X$ of $f$ from Schemes, Lemma 25.12.6. By Lemma 28.48.4 we obtain a canonical morphism $X^{\nu} \rightarrow X_{\text {red }}$ and that $X^{\nu}$ is the normalization of $X_{\text {red }}$ in $Y$. The lemma follows as $Y \rightarrow X_{\text {red }}$ is identical to the morphism 28.49.0.1) constructed for $X_{\text {red }}$.

If $X$ is reduced, then the normalization of $X$ is the same as the relative spectrum of the integral closure of $\mathcal{O}_{X}$ in the sheaf of meromorphic functions $\mathcal{K}_{X}$ (see Divisors, Section 30.20. Namely, $\mathcal{K}_{X}=f_{*} \mathcal{O}_{Y}$ in this case, see Divisors, Lemma 30.20.8 and its proof. We describe this here explicitly.
035P Lemma 28.49.3. Let $X$ be a reduced scheme such that every quasi-compact open has finitely many irreducible components. Let $\operatorname{Spec}(A)=U \subset X$ be an affine open. Then
(1) A has finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$,
(2) the total ring of fractions $Q(A)$ of $A$ is $Q\left(A / \mathfrak{q}_{1}\right) \times \ldots \times Q\left(A / \mathfrak{q}_{t}\right)$,
(3) the integral closure $A^{\prime}$ of $A$ in $Q(A)$ is the product of the integral closures of the domains $A / \mathfrak{q}_{i}$ in the fields $Q\left(A / \mathfrak{q}_{i}\right)$, and
(4) $\nu^{-1}(U)$ is identified with the spectrum of $A^{\prime}$.

Proof. Minimal primes correspond to irreducible components (Algebra, Lemma 10.25.1), hence we have (1) by assumption. Then ( 0 ) $=\mathfrak{q}_{1} \cap \ldots \cap \mathfrak{q}_{t}$ because $A$ is reduced (Algebra, Lemma 10.16.2). Then we have $Q(A)=\prod A_{\mathfrak{q}_{i}}=\prod \kappa\left(\mathfrak{q}_{i}\right)$ by Algebra, Lemmas 10.24 .4 and 10.24 .1 . This proves (2). Part (3) follows from Algebra, Lemma 10.36.15, or Lemma 28.48.9. Part (4) holds because it is clear that $f^{-1}(U) \rightarrow U$ is the morphism

$$
\operatorname{Spec}\left(\prod \kappa\left(\mathfrak{q}_{i}\right)\right) \longrightarrow \operatorname{Spec}(A)
$$

where $f: Y \rightarrow X$ is the morphism 28.49.0.1.
035Q Lemma 28.49.4. Let $X$ be a scheme such that every quasi-compact open has finitely many irreducible components.
(1) The normalization $X^{\nu}$ is a normal scheme.
(2) The morphism $\nu: X^{\nu} \rightarrow X$ is integral, surjective, and induces a bijection on irreducible components.
(3) For any integral, birationa ${ }^{13}$ morphism $X^{\prime} \rightarrow X$ there exists a factorization $X^{\nu} \rightarrow X^{\prime} \rightarrow X$ and $X^{\nu} \rightarrow X^{\prime}$ is the normalization of $X^{\prime}$.
(4) For any morphism $Z \rightarrow X$ with $Z$ a normal scheme such that each irreducible component of $Z$ dominates an irreducible component of $X$ there exists a unique factorization $Z \rightarrow X^{\nu} \rightarrow X$.
Proof. Let $f: Y \rightarrow X$ be as in 28.49.0.1). Part (1) follows from Lemma 28.48.12 and the fact that $Y$ is normal. It also follows from the description of the affine opens in Lemma 28.49.3.
The morphism $\nu$ is integral by Lemma 28.48.4. By Lemma 28.48 .12 the morphism $Y \rightarrow X^{\nu}$ induces a bijection on irreducible components, and by construction of $Y$ this implies that $X^{\nu} \rightarrow X$ induces a bijection on irreducible components. By construction $f: Y \rightarrow X$ is dominant, hence also $\nu$ is dominant. Since an integral morphism is closed (Lemma 28.43.7) this implies that $\nu$ is surjective. This proves (2).

Suppose that $\alpha: X^{\prime} \rightarrow X$ is integral and birational. Any quasi-compact open $U^{\prime}$ of $X^{\prime}$ maps to a quasi-compact open of $X$, hence we see that $U^{\prime}$ has only finitely many irreducible components. Let $f^{\prime}: Y^{\prime} \rightarrow X^{\prime}$ be the morphism (28.49.0.1) constructed starting with $X^{\prime}$. As $\alpha$ is birational it is clear that $Y^{\prime}=Y$ and $f=\alpha \circ f^{\prime}$. Hence the factorization $X^{\nu} \rightarrow X^{\prime} \rightarrow X$ exists and $X^{\nu} \rightarrow X^{\prime}$ is the normalization of $X^{\prime}$ by Lemma 28.48.4. This proves (3).
Let $g: Z \rightarrow X$ be a morphism whose domain is a normal scheme and such that every irreducible component dominates an irreducible component of $X$. By Lemma 28.49 .2 we have $X^{\nu}=X_{r e d}^{\nu}$ and by Schemes, Lemma $25.12 .6 Z \rightarrow X$ factors through $X_{\text {red }}$. Hence we may replace $X$ by $X_{\text {red }}$ and assume $X$ is reduced. Moreover, as the factorization is unique it suffices to construct it locally on $Z$. Let $W \subset Z$ and

[^80]$U \subset X$ be affine opens such that $g(W) \subset U$. Write $U=\operatorname{Spec}(A)$ and $W=\operatorname{Spec}(B)$, with $\left.g\right|_{W}$ given by $\varphi: A \rightarrow B$. We will use the results of Lemma 28.49 .3 freely. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{t}$ be the minimal primes of $A$. As $Z$ is normal, we see that $B$ is a normal ring, in particular reduced. Moreover, by assumption any minimal prime $\mathfrak{q} \subset B$ we have that $\varphi^{-1}(\mathfrak{q})$ is a minimal prime of $A$. Hence if $x \in A$ is a nonzerodivisor, i.e., $x \notin \bigcup \mathfrak{p}_{i}$, then $\varphi(x)$ is a nonzerodivisor in $B$. Thus we obtain a canonical ring $\operatorname{map} Q(A) \rightarrow Q(B)$. As $B$ is normal it is equal to its integral closure in $Q(B)$ (see Algebra, Lemma 10.36.12. Hence we see that the integral closure $A^{\prime} \subset Q(A)$ of $A$ maps into $B$ via the canonical map $Q(A) \rightarrow Q(B)$. Since $\nu^{-1}(U)=\operatorname{Spec}\left(A^{\prime}\right)$ this gives the canonical factorization $W \rightarrow \nu^{-1}(U) \rightarrow U$ of $\left.\nu\right|_{W}$. We omit the verification that it is unique.

0AB1 Lemma 28.49.5. A finite (or even integral) birational morphism $f: X \rightarrow Y$ of integral schemes with $Y$ normal is an isomorphism.

Proof. Let $V \subset Y$ be an affine open with inverse image $U \subset X$ which is an affine open too. Since $f$ is a birational morphism of integral schemes, the homomorphism $\mathcal{O}_{Y}(V) \rightarrow \mathcal{O}_{X}(U)$ is an injective map of domains which induces an isomorphism of fraction fields. As $Y$ is normal, the ring $\mathcal{O}_{Y}(V)$ is integrally closed in the fraction field. Since $f$ is finite (or integral) every element of $\mathcal{O}_{X}(U)$ is integral over $\mathcal{O}_{Y}(V)$. We conclude that $\mathcal{O}_{Y}(V)=\mathcal{O}_{X}(U)$. This proves that $f$ is an isomorphism as desired.

035R Lemma 28.49.6. Let $X$ be an integral, Japanese scheme. The normalization $\nu: X^{\nu} \rightarrow X$ is a finite morphism.

Proof. Follows from the definition (Properties, Definition 27.13.1) and Lemma 28.49.3. Namely, in this case the lemma says that $\nu^{-1}(\operatorname{Spec}(A))$ is the spectrum of the integral closure of $A$ in its field of fractions.

035S Lemma 28.49.7. Let $X$ be a Nagata scheme. The normalization $\nu: X^{\nu} \rightarrow X$ is a finite morphism.

Proof. Note that a Nagata scheme is locally Noetherian, thus Definition 28.49.1 does apply. The lemma is now a special case of Lemma 28.48 .13 but we can also prove it directly as follows. Write $X^{\nu} \rightarrow X$ as the composition $X^{\nu} \rightarrow X_{\text {red }} \rightarrow X$. As $X_{\text {red }} \rightarrow X$ is a closed immersion it is finite. Hence it suffices to prove the lemma for a reduced Nagata scheme (by Lemma 28.43.5). Let $\operatorname{Spec}(A)=U \subset X$ be an affine open. By Lemma 28.49 .3 we have $\nu^{-1}(U)=\operatorname{Spec}\left(\prod A_{i}^{\prime}\right)$ where $A_{i}^{\prime}$ is the integral closure of $A / \mathfrak{q}_{i}$ in its fraction field. As $A$ is a Nagata ring (see Properties, Lemma 27.13.6) each of the ring extensions $A / \mathfrak{q}_{i} \subset A_{i}^{\prime}$ are finite. Hence $A \rightarrow \prod A_{i}^{\prime}$ is a finite ring map and we win.

### 28.50. Zariski's Main Theorem (algebraic version)

03GS This is the version you can prove using purely algebraic methods. Before we can prove more powerful versions (for non-affine morphisms) we need to develop more tools. See Cohomology of Schemes, Section 29.20 and More on Morphisms, Section 36.31

03GT Theorem 28.50.1 (Algebraic version of Zariski's Main Theorem). Let $f: Y \rightarrow X$ be an affine morphism of schemes. Assume $f$ is of finite type. Let $X^{\prime}$ be the
normalization of $X$ in $Y$. Picture:

Then there exists an open subscheme $U^{\prime} \subset X^{\prime}$ such that
(1) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \rightarrow U^{\prime}$ is an isomorphism, and
(2) $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right) \subset Y$ is the set of points at which $f$ is quasi-finite.

Proof. There is an immediate reduction to the case where $X$ and hence $Y$ are affine. Say $X=\operatorname{Spec}(R)$ and $Y=\operatorname{Spec}(A)$. Then $X^{\prime}=\operatorname{Spec}\left(A^{\prime}\right)$, where $A^{\prime}$ is the integral closure of $R$ in $A$, see Definitions 28.48 .2 and 28.48.3. By Algebra, Theorem 10.122 .13 for every $y \in Y$ at which $f$ is quasi-finite, there exists an open $U_{y}^{\prime} \subset X^{\prime}$ such that $\left(f^{\prime}\right)^{-1}\left(U_{y}^{\prime}\right) \rightarrow U_{y}^{\prime}$ is an isomorphism. Set $U^{\prime}=\bigcup U_{y}^{\prime}$ where $y \in Y$ ranges over all points where $f$ is quasi-finite. It remains to show that $f$ is quasi-finite at all points of $\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right)$. If $y \in\left(f^{\prime}\right)^{-1}\left(U^{\prime}\right)$ with image $x \in X$, then we see that $Y_{x} \rightarrow X_{x}^{\prime}$ is an isomorphism in a neighbourhood of $y$. Hence there is no point of $Y_{x}$ which specializes to $y$, since this is true for $f^{\prime}(y)$ in $X_{x}^{\prime}$, see Lemma 28.43.8. By Lemma 28.20.6 part (3) this implies $f$ is quasi-finite at $y$.

We can use the algebraic version of Zariski's Main Theorem to show that the set of points where a morphism is quasi-finite is open.

01TI Lemma 28.50.2. Let $f: X \rightarrow S$ be a morphism of schemes. The set of points of $X$ where $f$ is quasi-finite is an open $U \subset X$. The induced morphism $U \rightarrow S$ is locally quasi-finite.

Proof. Suppose $f$ is quasi-finite at $x$. Let $x \in U=\operatorname{Spec}(R) \subset X, V=\operatorname{Spec}(A) \subset$ $S$ be affine opens as in Definition 28.20.1. By either Theorem 28.50.1 above or Algebra, Lemma 10.122 .14 , the set of primes $\mathfrak{q}$ at which $R \rightarrow A$ is quasi-finite is open in $\operatorname{Spec}(A)$. Since these all correspond to points of $X$ where $f$ is quasi-finite we get the first statement. The second statement is obvious.

We will improve the following lemma to general quasi-finite separated morphisms later, see More on Morphisms, Lemma 36.31.3.

03GU Lemma 28.50.3. Let $f: Y \rightarrow X$ be a morphism of schemes. Assume
(1) $X$ and $Y$ are affine, and
(2) $f$ is quasi-finite.

Then there exists a diagram

with $Z$ affine, $\pi$ finite and $j$ an open immersion.
Proof. This is Algebra, Lemma 10.122 .15 reformulated in the language of schemes.

03J2 Lemma 28.50.4. Let $f: Y \rightarrow X$ be a quasi-finite morphism of schemes. Let $T \subset Y$ be a closed nowhere dense subset of $Y$. Then $f(T) \subset X$ is a nowhere dense subset of $X$.
Proof. As in the proof of Lemma 28.45 .7 this reduces immediately to the case where the base $X$ is affine. In this case $Y=\bigcup_{i=1, \ldots, n} Y_{i}$ is a finite union of affine opens (as $f$ is quasi-compact). Since each $T \cap Y_{i}$ is nowhere dense, and since a finite union of nowhere dense sets is nowhere dense (see Topology, Lemma 5.20.2, it suffices to prove that the image $f\left(T \cap Y_{i}\right)$ is nowhere dense in $X$. This reduces us to the case where both $X$ and $Y$ are affine. At this point we apply Lemma 28.50.3 above to get a diagram

with $Z$ affine, $\pi$ finite and $j$ an open immersion. Set $\bar{T}=\overline{j(T)} \subset Z$. By Topology, Lemma 5.20 .3 we see $\bar{T}$ is nowhere dense in $Z$. Since $f(T) \subset \pi(\bar{T})$ the lemma follows from the corresponding result in the finite case, see Lemma 28.45.7.

### 28.51. Universally bounded fibres

03J3 Let $X$ be a scheme over a field $k$. If $X$ is finite over $k$, then $X=\operatorname{Spec}(A)$ where $A$ is a finite $k$-algebra. Another way to say this is that $X$ is finite locally free over $\operatorname{Spec}(k)$, see Definition 28.45.1. Hence $X \rightarrow \operatorname{Spec}(k)$ has a degree which is an integer $d \geq 0$, namely $d=\operatorname{dim}_{k}(A)$. We sometime call this the degree of the (finite) scheme $X$ over $k$.

03J4 Definition 28.51.1. Let $f: X \rightarrow Y$ be a morphism of schemes.
(1) We say the integer $n$ bounds the degrees of the fibres of $f$ if for all $y \in Y$ the fibre $X_{y}$ is a finite scheme over $\kappa(y)$ whose degree over $\kappa(y)$ is $\leq n$.
(2) We say the fibres of $f$ are universally bounded ${ }^{14}$ if there exists an integer $n$ which bounds the degrees of the fibres of $f$.

Note that in particular the number of points in a fibre is bounded by $n$ as well. (The converse does not hold, even if all fibres are finite reduced schemes.)
03J5 Lemma 28.51.2. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $n \geq 0$. The following are equivalent:
(1) the integer $n$ bounds the degrees of the fibres of $f$, and
(2) for every morphism $\operatorname{Spec}(k) \rightarrow Y$, where $k$ is a field, the fibre product $X_{k}=\operatorname{Spec}(k) \times_{Y} X$ is finite over $k$ of degree $\leq n$.
In this case $f$ is universally bounded and the schemes $X_{k}$ have at most $n$ points.
Proof. The implication $(2) \Rightarrow(1)$ is trivial. The other implication holds because if the image of $\operatorname{Spec}(k) \rightarrow Y$ is $y$, then $X_{k}=\operatorname{Spec}(k) \times_{\operatorname{Spec}(\kappa(y))} X_{y}$.
03J6 Lemma 28.51.3. A composition of morphisms with universally bounded fibres is a morphism with universally bounded fibres. More precisely, assume that $n$ bounds the degrees of the fibres of $f: X \rightarrow Y$ and $m$ bounds the degrees of $g: Y \rightarrow Z$. Then nm bounds the degrees of the fibres of $g \circ f: X \rightarrow Z$.

[^81]Proof. Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$ have universally bounded fibres. Say that $\operatorname{deg}\left(X_{y} / \kappa(y)\right) \leq n$ for all $y \in Y$, and that $\operatorname{deg}\left(Y_{z} / \kappa(z)\right) \leq m$ for all $z \in Z$. Let $z \in Z$ be a point. By assumption the scheme $Y_{z}$ is finite over $\operatorname{Spec}(\kappa(z))$. In particular, the underlying topological space of $Y_{z}$ is a finite discrete set. The fibres of the morphism $f_{z}: X_{z} \rightarrow Y_{z}$ are the fibres of $f$ at the corresponding points of $Y$, which are finite discrete sets by the reasoning above. Hence we conclude that the underlying topological space of $X_{z}$ is a finite discrete set as well. Thus $X_{z}$ is an affine scheme (this is a nice exercise; it also follows for example from Properties, Lemma 27.29 .1 applied to the set of all points of $\left.X_{z}\right)$. Write $X_{z}=\operatorname{Spec}(A), Y_{z}=\operatorname{Spec}(B)$, and $k=\kappa(z)$. Then $k \rightarrow B \rightarrow A$ and we know that (a) $\operatorname{dim}_{k}(B) \leq m$, and (b) for every maximal ideal $\mathfrak{m} \subset B$ we have $\operatorname{dim}_{\kappa(\mathfrak{m})}(A / \mathfrak{m} A) \leq n$. We claim this implies that $\operatorname{dim}_{k}(A) \leq n m$. Note that $B$ is the product of its localizations $B_{\mathfrak{m}}$, for example because $Y_{z}$ is a disjoint union of 1-point schemes, or by Algebra, Lemmas 10.52 .2 and 10.52.6. So we see that $\operatorname{dim}_{k}(B)=\sum_{\mathfrak{m}}\left(B_{\mathfrak{m}}\right)$ and $\operatorname{dim}_{k}(A)=\sum_{\mathfrak{m}}\left(A_{\mathfrak{m}}\right)$ where in both cases $\mathfrak{m}$ runs over the maximal ideals of $B$ (not of $A$ ). By the above, and Nakayama's Lemma (Algebra, Lemma 10.19.1) we see that each $A_{\mathfrak{m}}$ is a quotient of $B_{\mathfrak{m}}^{\oplus n}$ as a $B_{\mathfrak{m}}$-module. Hence $\operatorname{dim}_{k}\left(A_{\mathfrak{m}}\right) \leq n \operatorname{dim}_{k}\left(B_{\mathfrak{m}}\right)$. Putting everything together we see that

$$
\operatorname{dim}_{k}(A)=\sum_{\mathfrak{m}}\left(A_{\mathfrak{m}}\right) \leq \sum_{\mathfrak{m}} n \operatorname{dim}_{k}\left(B_{\mathfrak{m}}\right)=n \operatorname{dim}_{k}(B) \leq n m
$$

as desired.
03J7 Lemma 28.51.4. A base change of a morphism with universally bounded fibres is a morphism with universally bounded fibres. More precisely, if $n$ bounds the degrees of the fibres of $f: X \rightarrow Y$ and $Y^{\prime} \rightarrow Y$ is any morphism, then the degrees of the fibres of the base change $f^{\prime}: Y^{\prime} \times_{Y} X \rightarrow Y^{\prime} \rightarrow Y^{\prime}$ is also bounded by $n$.

Proof. This is clear from the result of Lemma 28.51.2,
03J8 Lemma 28.51.5. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $Y^{\prime} \rightarrow Y$ be a morphism of schemes, and let $f^{\prime}: X^{\prime}=X_{Y^{\prime}} \rightarrow Y^{\prime}$ be the base change of $f$. If $Y^{\prime} \rightarrow Y$ is surjective and $f^{\prime}$ has universally bounded fibres, then $f$ has universally bounded fibres. More precisely, if $n$ bounds the degree of the fibres of $f^{\prime}$, then also $n$ bounds the degrees of the fibres of $f$.
Proof. Let $n \geq 0$ be an integer bounding the degrees of the fibres of $f^{\prime}$. We claim that $n$ works for $f$ also. Namely, if $y \in Y$ is a point, then choose a point $y^{\prime} \in Y^{\prime}$ lying over $y$ and observe that

$$
X_{y^{\prime}}^{\prime}=\operatorname{Spec}\left(\kappa\left(y^{\prime}\right)\right) \times_{\operatorname{Spec}(\kappa(y))} X_{y}
$$

Since $X_{y^{\prime}}^{\prime}$ is assumed finite of degree $\leq n$ over $\kappa\left(y^{\prime}\right)$ it follows that also $X_{y}$ is finite of degree $\leq n$ over $\kappa(y)$. (Some details omitted.)

03J9 Lemma 28.51.6. An immersion has universally bounded fibres.
Proof. The integer $n=1$ works in the definition.
03WU Lemma 28.51.7. Let $f: X \rightarrow Y$ be an étale morphism of schemes. Let $n \geq 0$. The following are equivalent
(1) the integer $n$ bounds the degrees of the fibres,
(2) for every field $k$ and morphism $\operatorname{Spec}(k) \rightarrow Y$ the base change $X_{k}=$ $\operatorname{Spec}(k) \times_{Y} X$ has at most $n$ points, and
(3) for every $y \in Y$ and every separable algebraic closure $\kappa(y) \subset \kappa(y)^{\text {sep }}$ the scheme $X_{\kappa(y) \text { sep }}$ has at most $n$ points.
Proof. This follows from Lemma 28.51 .2 and the fact that the fibres $X_{y}$ are disjoint unions of spectra of finite separable field extensions of $\kappa(y)$, see Lemma 28.36.7.

Having universally bounded fibres is an absolute notion and not a relative notion. This is why the condition in the following lemma is that $X$ is quasi-compact, and not that $f$ is quasi-compact.
03JA Lemma 28.51.8. Let $f: X \rightarrow Y$ be a morphism of schemes. Assume that
(1) $f$ is locally quasi-finite, and
(2) $X$ is quasi-compact.

Then $f$ has universally bounded fibres.
Proof. Since $X$ is quasi-compact, there exists a finite affine open covering $X=$ $\bigcup_{i=1, \ldots, n} U_{i}$ and affine opens $V_{i} \subset Y, i=1, \ldots, n$ such that $f\left(U_{i}\right) \subset V_{i}$. Because of the local nature of "local quasi-finiteness" (see Lemma 28.20.6 part (4)) we see that the morphisms $\left.f\right|_{U_{i}}: U_{i} \rightarrow V_{i}$ are locally quasi-finite morphisms of affines, hence quasi-finite, see Lemma 28.20.9. For $y \in Y$ it is clear that $X_{y}=\bigcup_{y \in V_{i}}\left(U_{i}\right)_{y}$ is an open covering. Hence it suffices to prove the lemma for a quasi-finite morphism of affines (namely, if $n_{i}$ works for the morphism $\left.f\right|_{U_{i}}: U_{i} \rightarrow V_{i}$, then $\sum n_{i}$ works for f).

Assume $f: X \rightarrow Y$ is a quasi-finite morphism of affines. By Lemma 28.50.3 we can find a diagram

with $Z$ affine, $\pi$ finite and $j$ an open immersion. Since $j$ has universally bounded fibres (Lemma 28.51 .6 this reduces us to showing that $\pi$ has universally bounded fibres (Lemma 28.51.3).

This reduces us to a morphism of the form $\operatorname{Spec}(B) \rightarrow \operatorname{Spec}(A)$ where $A \rightarrow B$ is finite. Say $B$ is generated by $x_{1}, \ldots, x_{n}$ over $A$ and say $P_{i}(T) \in A[T]$ is a monic polynomial of degree $d_{i}$ such that $P_{i}\left(x_{i}\right)=0$ in $B$ (a finite ring extension is integral, see Algebra, Lemma 10.35.3). With these notations it is clear that

$$
\bigoplus_{0 \leq e_{i}<d_{i}, i=1, \ldots n} A \longrightarrow B, \quad\left(a_{\left(e_{1}, \ldots, e_{n}\right)}\right) \longmapsto \sum a_{\left(e_{1}, \ldots, e_{n}\right)} x_{1}^{e_{1}} \ldots x_{n}^{e_{n}}
$$

is a surjective $A$-module map. Thus for any prime $\mathfrak{p} \subset A$ this induces a surjective map $\kappa(\mathfrak{p})$-vector spaces

$$
\kappa(\mathfrak{p})^{\oplus d_{1} \ldots d_{n}} \longrightarrow B \otimes_{A} \kappa(\mathfrak{p})
$$

In other words, the integer $d_{1} \ldots d_{n}$ works in the definition of a morphism with universally bounded fibres.

03JB Lemma 28.51.9. Consider a commutative diagram of morphisms of schemes

If $g$ has universally bounded fibres, and $f$ is surjective and flat, then also $h$ has universally bounded fibres. More precisely, if $n$ bounds the degree of the fibres of $g$, then also $n$ bounds the degree of the fibres of $h$.
Proof. Assume $g$ has universally bounded fibres, and $f$ is surjective and flat. Say the degree of the fibres of $g$ is bounded by $n \in \mathbf{N}$. We claim $n$ also works for $h$. Let $z \in Z$. Consider the morphism of schemes $X_{z} \rightarrow Y_{z}$. It is flat and surjective. By assumption $X_{z}$ is a finite scheme over $\kappa(z)$, in particular it is the spectrum of an Artinian ring (by Algebra, Lemma 10.52.2). By Lemma 28.12 .13 the morphism $X_{z} \rightarrow Y_{z}$ is affine in particular quasi-compact. It follows from Lemma 28.25.10 that $Y_{z}$ is a finite discrete as this holds for $X_{z}$. Hence $Y_{z}$ is an affine scheme (this is a nice exercise; it also follows for example from Properties, Lemma 27.29.1 applied to the set of all points of $Y_{z}$ ). Write $Y_{z}=\operatorname{Spec}(B)$ and $X_{z}=\operatorname{Spec}(A)$. Then $A$ is faithfully flat over $B$, so $B \subset A$. Hence $\operatorname{dim}_{k}(B) \leq \operatorname{dim}_{k}(A) \leq n$ as desired.

## Cohomology of Schemes

### 29.1. Introduction

01X7 In this chapter we first prove a number of results on the cohomology of quasicoherent sheaves. A fundamental reference is DG67. Having done this we will elaborate on cohomology of coherent sheaves in the Noetherian setting. See Ser55b.

### 29.2. Cech cohomology of quasi-coherent sheaves

01 X 8 Let $X$ be a scheme. Let $U \subset X$ be an affine open. Recall that a standard open covering of $U$ is a covering of the form $\mathcal{U}: U=\bigcup_{i=1}^{n} D\left(f_{i}\right)$ where $f_{1}, \ldots, f_{n} \in$ $\Gamma\left(U, \mathcal{O}_{X}\right)$ generate the unit ideal, see Schemes, Definition 25.5.2

01X9 Lemma 29.2.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $\mathcal{U}: U=\bigcup_{i=1}^{n} D\left(f_{i}\right)$ be a standard open covering of an affine open of $X$. Then $\check{H}^{p}(\mathcal{U}, \mathcal{F})=0$ for all $p>0$.

Proof. Write $U=\operatorname{Spec}(A)$ for some ring $A$. In other words, $f_{1}, \ldots, f_{n}$ are elements of $A$ which generate the unit ideal of $A$. Write $\left.\mathcal{F}\right|_{U}=\widetilde{M}$ for some $A$-module $M$. Clearly the Cech complex $\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F})$ is identified with the complex

$$
\prod_{i_{0}} M_{f_{i_{0}}} \rightarrow \prod_{i_{0} i_{1}} M_{f_{i_{0}} f_{i_{1}}} \rightarrow \prod_{i_{0} i_{1} i_{2}} M_{f_{i_{0}} f_{i_{1}} f_{i_{2}}} \rightarrow \ldots
$$

We are asked to show that the extended complex
01XA

$$
\begin{equation*}
0 \rightarrow M \rightarrow \prod_{i_{0}} M_{f_{i_{0}}} \rightarrow \prod_{i_{0} i_{1}} M_{f_{i_{0}} f_{i_{1}}} \rightarrow \prod_{i_{0} i_{1} i_{2}} M_{f_{i_{0}} f_{i_{1} f_{i}}} \rightarrow \ldots \tag{29.2.1.1}
\end{equation*}
$$

(whose truncation we have studied in Algebra, Lemma 10.22.2) is exact. It suffices to show that 29.2 .1 .1 is exact after localizing at a prime $\mathfrak{p}$, see Algebra, Lemma 10.23.1. In fact we will show that the extended complex localized at $\mathfrak{p}$ is homotopic to zero.

There exists an index $i$ such that $f_{i} \notin \mathfrak{p}$. Choose and fix such an element $i_{\text {fix }}$. Note that $M_{f_{i_{\text {fix }}, \mathfrak{p}}}=M_{\mathfrak{p}}$. Similarly for a localization at a product $f_{i_{0}} \ldots f_{i_{p}}$ and $\mathfrak{p}$ we can drop any $f_{i_{j}}$ for which $i_{j}=i_{\text {fix }}$. Let us define a homotopy

$$
h: \prod_{i_{0} \ldots i_{p+1}} M_{f_{i_{0} \ldots f_{i_{p+1}}, \mathfrak{p}}} \longrightarrow \prod_{i_{0} \ldots i_{p}} M_{f_{i_{0} \ldots f_{i_{p}}, \mathfrak{p}}}
$$

by the rule

$$
h(s)_{i_{0} \ldots i_{p}}=s_{i_{\mathrm{fix}} i_{0} \ldots i_{p}}
$$

(This is "dual" to the homotopy in the proof of Cohomology, Lemma 20.11.4.) In other words, $h: \prod_{i_{0}} M_{f_{i_{0}}, \mathfrak{p}} \rightarrow M$ is projection onto the factor $M_{f_{i_{\text {fix }}}, \mathfrak{p}}=M_{\mathfrak{p}}$
and in general the map $h$ equal projection onto the factors $M_{f_{i_{\text {fix }}} f_{i_{1} \ldots f_{i_{p+1}}, \mathfrak{p}}}=$ $M_{f_{i_{1}} \ldots f_{i_{p+1}}, \mathfrak{p}}$. We compute

$$
\begin{aligned}
(d h+h d)(s)_{i_{0} \ldots i_{p}} & =\sum_{j=0}^{p}(-1)^{j} h(s)_{i_{0} \ldots \hat{i}_{j} \ldots i_{p}}+d(s)_{i_{\mathrm{fix}} i_{0} \ldots i_{p}} \\
& =\sum_{j=0}^{p}(-1)^{j} s_{i_{\mathrm{fix}} i_{0} \ldots \hat{i}_{j} \ldots i_{p}}+s_{i_{0} \ldots i_{p}}+\sum_{j=0}^{p}(-1)^{j+1} s_{i_{\mathrm{fix}} i_{0} \ldots \hat{i}_{j} \ldots i_{p}} \\
& =s_{i_{0} \ldots i_{p}}
\end{aligned}
$$

This proves the identity map is homotopic to zero as desired.
The following lemma says in particular that for any affine scheme $X$ and any quasicoherent sheaf $\mathcal{F}$ on $X$ we have

$$
H^{p}(X, \mathcal{F})=0
$$

for all $p>0$.
01XB Lemma 29.2.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. For any affine open $U \subset X$ we have $H^{p}(U, \mathcal{F})=0$ for all $p>0$.

Proof. We are going to apply Cohomology, Lemma 20.12.9. As our basis $\mathcal{B}$ for the topology of $X$ we are going to use the affine opens of $X$. As our set Cov of open coverings we are going to use the standard open coverings of affine opens of $X$. Next we check that conditions (1), (2) and (3) of Cohomology, Lemma 20.12 .9 hold. Note that the intersection of standard opens in an affine is another standard open. Hence property (1) holds. The coverings form a cofinal system of open coverings of any element of $\mathcal{B}$, see Schemes, Lemma 25.5.1. Hence (2) holds. Finally, condition (3) of the lemma follows from Lemma 29.2.1.

Here is a relative version of the vanishing of cohomology of quasi-coherent sheaves on affines.

01XC Lemma 29.2.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. If $f$ is affine then $R^{i} f_{*} \mathcal{F}=0$ for all $i>0$.

Proof. According to Cohomology, Lemma 20.8.3 the sheaf $R^{i} f_{*} \mathcal{F}$ is the sheaf associated to the presheaf $V \mapsto H^{i}\left(f^{-1}(V),\left.\mathcal{F}\right|_{f^{-1}(V)}\right)$. By assumption, whenever $V$ is affine we have that $f^{-1}(V)$ is affine, see Morphisms, Definition 28.12.1. By Lemma 29.2.2 we conclude that $H^{i}\left(f^{-1}(V),\left.\mathcal{F}\right|_{f^{-1}(V)}\right)=0$ whenever $V$ is affine. Since $S$ has a basis consisting of affine opens we win.

089W Lemma 29.2.4. Let $f: X \rightarrow S$ be an affine morphism of schemes. Let $\mathcal{F}$ be $a$ quasi-coherent $\mathcal{O}_{X}$-module. Then $H^{i}(X, \mathcal{F})=H^{i}\left(S, f_{*} \mathcal{F}\right)$ for all $i \geq 0$.

Proof. Follows from Lemma 29.2 .3 and the Leray spectral sequence. See Cohomology, Lemma 20.14.6.

The following two lemmas explain when Čech cohomology can be used to compute cohomology of quasi-coherent modules.
0BDX Lemma 29.2.5. Let $X$ be a scheme. The following are equivalent
(1) $X$ has affine diagonal $\Delta: X \rightarrow X \times X$,
(2) for $U, V \subset X$ affine open, the intersection $U \cap V$ is affine, and
(3) there exists an open covering $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ such that $U_{i_{0} \ldots i_{p}}$ is affine open for all $p \geq 0$ and all $i_{0}, \ldots, i_{p} \in I$.

In particular this holds if $X$ is separated.
Proof. Assume $X$ has affine diagonal. Let $U, V \subset X$ be affine opens. Then $U \cap V=\Delta^{-1}(U \times V)$ is affine. Thus (2) holds. It is immediate that (2) implies (3). Conversely, if there is a covering of $X$ as in (3), then $X \times X=\bigcup U_{i} \times U_{i^{\prime}}$ is an affine open covering, and we see that $\Delta^{-1}\left(U_{i} \times U_{i^{\prime}}\right)=U_{i} \cap U_{i^{\prime}}$ is affine. Then $\Delta$ is an affine morphism by Morphisms, Lemma 28.12.3. The final assertion follows from Schemes, Lemma 25.21.8.

01XD Lemma 29.2.6. Let $X$ be a scheme. Let $\mathcal{U}: X=\bigcup_{i \in I} U_{i}$ be an open covering such that $U_{i_{0} \ldots i_{p}}$ is affine open for all $p \geq 0$ and all $i_{0}, \ldots, i_{p} \in I$. In this case for any quasi-coherent sheaf $\mathcal{F}$ we have

$$
\check{H}^{p}(\mathcal{U}, \mathcal{F})=H^{p}(X, \mathcal{F})
$$

as $\Gamma\left(X, \mathcal{O}_{X}\right)$-modules for all $p$.
Proof. In view of Lemma 29.2.2 this is a special case of Cohomology, Lemma 20.12.6.

### 29.3. Vanishing of cohomology

01XE We have seen that on an affine scheme the higher cohomology groups of any quasicoherent sheaf vanish (Lemma 29.2.2). It turns out that this also characterizes affine schemes. We give two versions.
01XF Lemma 29.3.1. Let $X$ be a scheme. Assume that
(1) $X$ is quasi-compact,
(2) for every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ we have $H^{1}(X, \mathcal{I})=0$.

Then $X$ is affine.
Proof. Let $x \in X$ be a closed point. Let $U \subset X$ be an affine open neighbourhood of $x$. Write $U=\operatorname{Spec}(A)$ and let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to $x$. Set $Z=X \backslash U$ and $Z^{\prime}=Z \cup\{x\}$. By Schemes, Lemma 25.12 .4 there are quasicoherent sheaves of ideals $\mathcal{I}$, resp. $\mathcal{I}^{\prime}$ cutting out the reduced closed subschemes $Z$, resp. $Z^{\prime}$. Consider the short exact sequence

$$
0 \rightarrow \mathcal{I}^{\prime} \rightarrow \mathcal{I} \rightarrow \mathcal{I} / \mathcal{I}^{\prime} \rightarrow 0
$$

Since $x$ is a closed point of $X$ and $x \notin Z$ we see that $\mathcal{I} / \mathcal{I}^{\prime}$ is supported at $x$. In fact, the restriction of $\mathcal{I} / \mathcal{I}^{\prime}$ to $U$ corresponds to the $A$-module $A / \mathfrak{m}$. Hence we see that $\Gamma\left(X, \mathcal{I} / \mathcal{I}^{\prime}\right)=A / \mathfrak{m}$. Since by assumption $H^{1}\left(X, \mathcal{I}^{\prime}\right)=0$ we see there exists a global section $f \in \Gamma(X, \mathcal{I})$ which maps to the element $1 \in A / \mathfrak{m}$ as a section of $\mathcal{I} / \mathcal{I}^{\prime}$. Clearly we have $x \in X_{f} \subset U$. This implies that $X_{f}=D\left(f_{A}\right)$ where $f_{A}$ is the image of $f$ in $A=\Gamma\left(U, \mathcal{O}_{X}\right)$. In particular $X_{f}$ is affine.
Consider the union $W=\bigcup X_{f}$ over all $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$ such that $X_{f}$ is affine. Obviously $W$ is open in $X$. By the arguments above every closed point of $X$ is contained in $W$. The closed subset $X \backslash W$ of $X$ is also quasi-compact (see Topology, Lemma 5.11.3. Hence it has a closed point if it is nonempty (see Topology, Lemma 5.11 .8 . This would contradict the fact that all closed points are in $W$. Hence we conclude $X=W$.
Choose finitely many $f_{1}, \ldots, f_{n} \in \Gamma\left(X, \mathcal{O}_{X}\right)$ such that $X=X_{f_{1}} \cup \ldots \cup X_{f_{n}}$ and such that each $X_{f_{i}}$ is affine. This is possible as we've seen above. By Properties,

Lemma 27.27 .3 to finish the proof it suffices to show that $f_{1}, \ldots, f_{n}$ generate the unit ideal in $\Gamma\left(X, \mathcal{O}_{X}\right)$. Consider the short exact sequence

$$
0 \longrightarrow \mathcal{F} \longrightarrow \mathcal{O}_{X}^{\oplus n} \xrightarrow{f_{1}, \ldots, f_{n}} \mathcal{O}_{X} \longrightarrow 0
$$

The arrow defined by $f_{1}, \ldots, f_{n}$ is surjective since the opens $X_{f_{i}}$ cover $X$. We let $\mathcal{F}$ be the kernel of this surjective map. Observe that $\mathcal{F}$ has a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{n}=\mathcal{F}
$$

so that each subquotient $\mathcal{F}_{i} / \mathcal{F}_{i-1}$ is isomorphic to a quasi-coherent sheaf of ideals. Namely we can take $\mathcal{F}_{i}$ to be the intersection of $\mathcal{F}$ with the first $i$ direct summands of $\mathcal{O}_{X}^{\oplus n}$. The assumption of the lemma implies that $H^{1}\left(X, \mathcal{F}_{i} / \mathcal{F}_{i-1}\right)=0$ for all $i$. This implies that $H^{1}\left(X, \mathcal{F}_{2}\right)=0$ because it is sandwiched between $H^{1}\left(X, \mathcal{F}_{1}\right)$ and $H^{1}\left(X, \mathcal{F}_{2} / \mathcal{F}_{1}\right)$. Continuing like this we deduce that $H^{1}(X, \mathcal{F})=0$. Therefore we conclude that the map

$$
\bigoplus_{i=1, \ldots, n} \Gamma\left(X, \mathcal{O}_{X}\right) \xrightarrow{f_{1}, \ldots, f_{n}} \Gamma\left(X, \mathcal{O}_{X}\right)
$$

is surjective as desired.
Note that if $X$ is a Noetherian scheme then every quasi-coherent sheaf of ideals is automatically a coherent sheaf of ideals and a finite type quasi-coherent sheaf of ideals. Hence the preceding lemma and the next lemma both apply in this case.

01XG Lemma 29.3.2. Let $X$ be a scheme. Assume that
(1) $X$ is quasi-compact,
(2) $X$ is quasi-separated, and
(3) $H^{1}(X, \mathcal{I})=0$ for every quasi-coherent sheaf of ideals $\mathcal{I}$ of finite type.

Then $X$ is affine.
Proof. By Properties, Lemma 27.22.3 every quasi-coherent sheaf of ideals is a directed colimit of quasi-coherent sheaves of ideals of finite type. By Cohomology, Lemma 20.20.1 taking cohomology on $X$ commutes with directed colimits. Hence we see that $H^{1}(X, \mathcal{I})=0$ for every quasi-coherent sheaf of ideals on $X$. In other words we see that Lemma 29.3 .1 applies.

We can use the arguments given above to find a sufficient criterion to see when an invertible sheaf is ample. However, we warn the reader that this criterion is not necessary.

0B5P Lemma 29.3.3. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume that
(1) $X$ is quasi-compact,
(2) for every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ there exists an $n \geq 1$ such that $H^{1}\left(X, \mathcal{I} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n}\right)=0$.
Then $\mathcal{L}$ is ample.
Proof. This is proved in exactly the same way as Lemma 29.3.1. Let $x \in X$ be a closed point. Let $U \subset X$ be an affine open neighbourhood of $x$ such that $\left.\mathcal{L}\right|_{U} \cong \mathcal{O}_{U}$. Write $U=\operatorname{Spec}(A)$ and let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to $x$. Set $Z=X \backslash U$ and $Z^{\prime}=Z \cup\{x\}$. By Schemes, Lemma 25.12.4 there are quasi-coherent
sheaves of ideals $\mathcal{I}$, resp. $\mathcal{I}^{\prime}$ cutting out the reduced closed subschemes $Z$, resp. $Z^{\prime}$. Consider the short exact sequence

$$
0 \rightarrow \mathcal{I}^{\prime} \rightarrow \mathcal{I} \rightarrow \mathcal{I} / \mathcal{I}^{\prime} \rightarrow 0
$$

For every $n \geq 1$ we obtain a short exact sequence

$$
0 \rightarrow \mathcal{I}^{\prime} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n} \rightarrow \mathcal{I} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n} \rightarrow \mathcal{I} / \mathcal{I}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n} \rightarrow 0
$$

By our assumption we may pick $n$ such that $H^{1}\left(X, \mathcal{I}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)=0$. Since $x$ is a closed point of $X$ and $x \notin Z$ we see that $\mathcal{I} / \mathcal{I}^{\prime}$ is supported at $x$. In fact, the restriction of $\mathcal{I} / \mathcal{I}^{\prime}$ to $U$ corresponds to the $A$-module $A / \mathfrak{m}$. Since $\mathcal{L}$ is trivial on $U$ we see that the restriction of $\mathcal{I} / \mathcal{I}^{\prime} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n}$ to $U$ also corresponds to the $A$-module $A / \mathfrak{m}$. Hence we see that $\Gamma\left(X, \mathcal{I} / \mathcal{I}^{\prime} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)=A / \mathfrak{m}$. By our choice of $n$ we see there exists a global section $s \in \Gamma\left(X, \mathcal{I} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n}\right)$ which maps to the element $1 \in A / \mathfrak{m}$. Clearly we have $x \in X_{s} \subset U$ because $s$ vanishes at points of $Z$. This implies that $X_{s}=D(f)$ where $f \in A$ is the image of $s$ in $A \cong \Gamma\left(U, \mathcal{L}^{\otimes n}\right)$. In particular $X_{s}$ is affine.
Consider the union $W=\bigcup X_{s}$ over all $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ for $n \geq 1$ such that $X_{s}$ is affine. Obviously $W$ is open in $X$. By the arguments above every closed point of $X$ is contained in $W$. The closed subset $X \backslash W$ of $X$ is also quasi-compact (see Topology, Lemma 5.11.3). Hence it has a closed point if it is nonempty (see Topology, Lemma 5.11.8). This would contradict the fact that all closed points are in $W$. Hence we conclude $X=W$. This means that $\mathcal{L}$ is ample by Properties, Definition 27.26.1

There is a variant of Lemma 29.3 .3 with finite type ideal sheaves which we will formulate and prove here if we ever need it.

### 29.4. Quasi-coherence of higher direct images

01XH We have seen that the higher cohomology groups of a quasi-coherent module on an affine is zero. For (quasi-)separated quasi-compact schemes $X$ this implies vanishing of cohomology groups of quasi-coherent sheaves beyond a certain degree. However, it may not be the case that $X$ has finite cohomological dimension, because that is defined in terms of vanishing of cohomology of all $\mathcal{O}_{X}$-modules.
08DR Lemma 29.4.1. Let $X$ be a quasi-compact and quasi-separated scheme. Let $P$ be a property of the quasi-compact opens of $X$. Assume that
(1) $P$ holds for every affine open of $X$,
(2) if $U$ is quasi-compact open, $V$ affine open, $P$ holds for $U$, $V$, and $U \cap V$, then $P$ holds for $U \cup V$.
Then $P$ holds for every quasi-compact open of $X$ and in particular for $X$.
Proof. First we argue by induction that $P$ holds for separated quasi-compact opens $W \subset X$. Namely, such an open can be written as $W=U_{1} \cup \ldots \cup U_{n}$ and we can do induction on $n$ using property (2) with $U=U_{1} \cup \ldots \cup U_{n-1}$ and $V=U_{n}$. This is allowed because $U \cap V=\left(U_{1} \cap U_{n}\right) \cup \ldots \cup\left(U_{n-1} \cap U_{n}\right)$ is also a union of $n-1$ affine open subschemes by Schemes, Lemma 25.21 .8 applied to the affine opens $U_{i}$ and $U_{n}$ of $W$. Having said this, for any quasi-compact open $W \subset X$ we can do induction on the number of affine opens needed to cover $W$ using the same trick as before and using that the quasi-compact open $U_{i} \cap U_{n}$ is separated as an open subscheme of the affine scheme $U_{n}$.
29.4. QUASI-COHERENCE OF HIGHER DIRECT IMAGES

01XI Lemma 29.4.2. Let $X$ be a quasi-compact scheme with affine diagonal (for example if $X$ is separated). Let $t=t(X)$ be the minimal number of affine opens needed to cover $X$. Then $H^{n}(X, \mathcal{F})=0$ for all $n \geq t$ and all quasi-coherent sheaves $\mathcal{F}$.

Proof. First proof. By induction on $t$. If $t=1$ the result follows from Lemma 29.2.2. If $t>1$ write $X=U \cup V$ with $V$ affine open and $U=U_{1} \cup \ldots \cup U_{t-1}$ a union of $t-1$ open affines. Note that in this case $U \cap V=\left(U_{1} \cap V\right) \cup \ldots\left(U_{t-1} \cap V\right)$ is also a union of $t-1$ affine open subschemes. Namely, since the diagonal is affine, the intersection of two affine opens is affine, see Lemma 29.2.5. We apply the Mayer-Vietoris long exact sequence

$$
0 \rightarrow H^{0}(X, \mathcal{F}) \rightarrow H^{0}(U, \mathcal{F}) \oplus H^{0}(V, \mathcal{F}) \rightarrow H^{0}(U \cap V, \mathcal{F}) \rightarrow H^{1}(X, \mathcal{F}) \rightarrow \ldots
$$

see Cohomology, Lemma 20.9.2. By induction we see that the groups $H^{i}(U, \mathcal{F})$, $H^{i}(V, \mathcal{F}), H^{i}(U \cap V, \mathcal{F})$ are zero for $i \geq t-1$. It follows immediately that $H^{i}(X, \mathcal{F})$ is zero for $i \geq t$.

Second proof. Let $\mathcal{U}: X=\bigcup_{i=1}^{t} U_{i}$ be a finite affine open covering. Since $X$ is has affine diagonal the multiple intersections $U_{i_{0} \ldots i_{p}}$ are all affine, see Lemma 29.2.5. By Lemma 29.2.6 the Cech cohomology groups $\check{H}^{p}(\mathcal{U}, \mathcal{F})$ agree with the cohomology groups. By Cohomology, Lemma 20.24.6 the Cech cohomology groups may be computed using the alternating Cech complex $\check{\mathcal{C}}_{\text {©lt }}(\mathcal{U}, \mathcal{F})$. As the covering consists of $t$ elements we see immediately that $\check{\mathcal{C}}_{\text {alt }}^{p}(\mathcal{U}, \mathcal{F})=0$ for all $p \geq t$. Hence the result follows.

0BDY Lemma 29.4.3. Let $X$ be a quasi-compact scheme with affine diaganal (for example if $X$ is separated). Then
(1) given a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ there exists an embedding $\mathcal{F} \rightarrow \mathcal{F}^{\prime}$ of quasi-coherent $\mathcal{O}_{X}$-modules such that $H^{p}\left(X, \mathcal{F}^{\prime}\right)=0$ for all $p \geq 1$, and
(2) $\left\{H^{n}(X,-)\right\}_{n \geq 0}$ is a universal $\delta$-functor from $Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ to $A b$.

Proof. Let $X=\bigcup U_{i}$ be an affine open covering. Set $U=\coprod U_{i}$ and denote $f: U \rightarrow X$ the morphism inducing the given open immersions $U_{i} \rightarrow X$. For every $\mathcal{O}_{X}$-module $\mathcal{F}$ there is a canonical map $\mathcal{F} \rightarrow j_{*} j^{*} \mathcal{F}$. This map is injective as can be seen by checking on stalks: if $x \in U_{i}$, then we have a factorization

$$
\mathcal{F}_{x} \rightarrow\left(j_{*} j^{*} \mathcal{F}\right)_{x} \rightarrow\left(j^{*} \mathcal{F}\right)_{x^{\prime}}=\mathcal{F}_{x}
$$

where $x^{\prime} \in U$ is the point $x$ viewed as a point of $U_{i} \subset U$. Now if $\mathcal{F}$ is quasicoherent, then $j^{*} \mathcal{F}$ is quasi-coherent on the affine scheme $U$ hence has vanishing higher cohomology. Then $H^{p}\left(X, j_{*} j^{*} \mathcal{F}\right)=0$ for $p>0$ by Lemma 29.2.4 as $j$ is affine by Morphisms, Lemma 28.12.11. This proves (1). Then $H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, j_{*} j^{*} \mathcal{F}\right)$ is zero and part (2) follows from Homology, Lemma 12.11.4.

071L Lemma 29.4.4. Let $X$ be a quasi-compact quasi-separated scheme. Let $X=$ $U_{1} \cup \ldots \cup U_{t}$ be an affine open covering. Set

$$
d=\max _{I \subset\{1, \ldots, t\}}\left(|I|+t\left(\bigcap_{i \in I} U_{i}\right)\right)
$$

where $t(U)$ is the minimal number of affines needed to cover the scheme $U$. Then $H^{n}(X, \mathcal{F})=0$ for all $n \geq d$ and all quasi-coherent sheaves $\mathcal{F}$.

Proof. Note that since $X$ is quasi-separated the numbers $t\left(\bigcap_{i \in I} U_{i}\right)$ are finite. Let $\mathcal{U}: X=\bigcup_{i=1}^{t} U_{i}$. By Cohomology, Lemma 20.12.5 there is a spectral sequence

$$
E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to $H^{p+q}(U, \mathcal{F})$. By Cohomology, Lemma 20.24.6 we have

$$
E_{2}^{p, q}=H^{p}\left(\check{\mathcal{C}}_{\text {alt }}^{\bullet}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)\right.
$$

The alternating Čech complex with values in the presheaf $\underline{H}^{q}(\mathcal{F})$ vanishes in high degrees by Lemma 29.4.2 more precisely $E_{2}^{p, q}=0$ for $p+q \geq d$. Hence the result follows.

01XJ Lemma 29.4.5. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that $f$ is quasi-separated and quasi-compact.
(1) For any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the higher direct images $R^{p} f_{*} \mathcal{F}$ are quasi-coherent on $S$.
(2) If $S$ is quasi-compact, there exists an integer $n=n(X, S, f)$ such that $R^{p} f_{*} \mathcal{F}=0$ for all $p \geq n$ and any quasi-coherent sheaf $\mathcal{F}$ on $X$.
(3) In fact, if $S$ is quasi-compact we can find $n=n(X, S, f)$ such that for every morphism of schemes $S^{\prime} \rightarrow S$ we have $R^{p}\left(f^{\prime}\right)_{*} \mathcal{F}^{\prime}=0$ for $p \geq n$ and any quasi-coherent sheaf $\mathcal{F}^{\prime}$ on $X^{\prime}$. Here $f^{\prime}: X^{\prime}=S^{\prime} \times_{S} X \rightarrow S^{\prime}$ is the base change of $f$.

Proof. We first prove (1). Note that under the hypotheses of the lemma the sheaf $R^{0} f_{*} \mathcal{F}=f_{*} \mathcal{F}$ is quasi-coherent by Schemes, Lemma 25.24.1. Using Cohomology, Lemma 20.8.4 we see that forming higher direct images commutes with restriction to open subschemes. Since being quasi-coherent is local on $S$ we may assume $S$ is affine.

Assume $S$ is affine and $f$ quasi-compact and separated. Let $t \geq 1$ be the minimal number of affine opens needed to cover $X$. We will prove this case of (1) by induction on $t$. If $t=1$ then the morphism $f$ is affine by Morphisms, Lemma 28.12.12 and (1) follows from Lemma 29.2.3. If $t>1$ write $X=U \cup V$ with $V$ affine open and $U=U_{1} \cup \ldots \cup U_{t-1}$ a union of $t-1$ open affines. Note that in this case $U \cap V=\left(U_{1} \cap V\right) \cup \ldots\left(U_{t-1} \cap V\right)$ is also a union of $t-1$ affine open subschemes, see Schemes, Lemma 25.21.8. We will apply the relative Mayer-Vietoris sequence

$$
0 \rightarrow f_{*} \mathcal{F} \rightarrow a_{*}\left(\left.\mathcal{F}\right|_{U}\right) \oplus b_{*}\left(\left.\mathcal{F}\right|_{V}\right) \rightarrow c_{*}\left(\left.\mathcal{F}\right|_{U \cap V}\right) \rightarrow R^{1} f_{*} \mathcal{F} \rightarrow \ldots
$$

see Cohomology, Lemma 20.9.3. By induction we see that $R^{p} a_{*} \mathcal{F}, R^{p} b_{*} \mathcal{F}$ and $R^{p} c_{*} \mathcal{F}$ are all quasi-coherent. This implies that each of the sheaves $R^{p} f_{*} \mathcal{F}$ is quasi-coherent since it sits in the middle of a short exact sequence with a cokernel of a map between quasi-coherent sheaves on the left and a kernel of a map between quasi-coherent sheaves on the right. Using the results on quasi-coherent sheaves in Schemes, Section 25.24 we see conclude $R^{p} f_{*} \mathcal{F}$ is quasi-coherent.

Assume $S$ is affine and $f$ quasi-compact and quasi-separated. Let $t \geq 1$ be the minimal number of affine opens needed to cover $X$. We will prove (1) by induction on $t$. In case $t=1$ the morphism $f$ is separated and we are back in the previous case (see previous paragraph). If $t>1$ write $X=U \cup V$ with $V$ affine open and $U$ a union of $t-1$ open affines. Note that in this case $U \cap V$ is an open subscheme
of an affine scheme and hence separated (see Schemes, Lemma 25.21.6). We will apply the relative Mayer-Vietoris sequence

$$
0 \rightarrow f_{*} \mathcal{F} \rightarrow a_{*}\left(\left.\mathcal{F}\right|_{U}\right) \oplus b_{*}\left(\left.\mathcal{F}\right|_{V}\right) \rightarrow c_{*}\left(\left.\mathcal{F}\right|_{U \cap V}\right) \rightarrow R^{1} f_{*} \mathcal{F} \rightarrow \ldots
$$

see Cohomology, Lemma 20.9.3. By induction and the result of the previous paragraph we see that $R^{p} a_{*} \mathcal{F}, R^{p} b_{*} \mathcal{F}$ and $R^{p} c_{*} \mathcal{F}$ are quasi-coherent. As in the previous paragraph this implies each of sheaves $R^{p} f_{*} \mathcal{F}$ is quasi-coherent.

Next, we prove (3) and a fortiori (2). Choose a finite affine open covering $S=$ $\bigcup_{j=1, \ldots m} S_{j}$. For each $i$ choose a finite affine open covering $f^{-1}\left(S_{j}\right)=\bigcup_{i=1, \ldots t_{j}} U_{j i}$. Let

$$
d_{j}=\max _{I \subset\left\{1, \ldots, t_{j}\right\}}\left(|I|+t\left(\bigcap_{i \in I} U_{j i}\right)\right)
$$

be the integer found in Lemma 29.4.4. We claim that $n(X, S, f)=\max d_{j}$ works.
Namely, let $S^{\prime} \rightarrow S$ be a morphism of schemes and let $\mathcal{F}^{\prime}$ be a quasi-coherent sheaf on $X^{\prime}=S^{\prime} \times_{S} X$. We want to show that $R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}=0$ for $p \geq n(X, S, f)$. Since this question is local on $S^{\prime}$ we may assume that $S^{\prime}$ is affine and maps into $S_{j}$ for some $j$. Then $X^{\prime}=S^{\prime} \times S_{j} f^{-1}\left(S_{j}\right)$ is covered by the open affines $S^{\prime} \times{ }_{S_{j}} U_{j i}, i=1, \ldots t_{j}$ and the intersections

$$
\bigcap_{i \in I} S^{\prime} \times_{S_{j}} U_{j i}=S^{\prime} \times_{S_{j}} \bigcap_{i \in I} U_{j i}
$$

are covered by the same number of affines as before the base change. Applying Lemma 29.4.4 we get $H^{p}\left(X^{\prime}, \mathcal{F}^{\prime}\right)=0$. By the first part of the proof we already know that each $R^{q} f_{*}^{\prime} \mathcal{F}^{\prime}$ is quasi-coherent hence has vanishing higher cohomology groups on our affine scheme $S^{\prime}$, thus we see that $H^{0}\left(S^{\prime}, R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}\right)=H^{p}\left(X^{\prime}, \mathcal{F}^{\prime}\right)=0$ by Cohomology, Lemma 20.14.6. Since $R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}$ is quasi-coherent we conclude that $R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}=0$.

01XK Lemma 29.4.6. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that $f$ is quasi-separated and quasi-compact. Assume $S$ is affine. For any quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have

$$
H^{q}(X, \mathcal{F})=H^{0}\left(S, R^{q} f_{*} \mathcal{F}\right)
$$

for all $q \in \mathbf{Z}$.
Proof. Consider the Leray spectral sequence $E_{2}^{p, q}=H^{p}\left(S, R^{q} f_{*} \mathcal{F}\right)$ converging to $H^{p+q}(X, \mathcal{F})$, see Cohomology, Lemma 20.14.4. By Lemma 29.4.5 we see that the sheaves $R^{q} f_{*} \mathcal{F}$ are quasi-coherent. By Lemma 29.2 .2 we see that $E_{2}^{p, q}=0$ when $p>0$. Hence the spectral sequence degenerates at $E_{2}$ and we win. See also Cohomology, Lemma 20.14.6 (2) for the general principle.

### 29.5. Cohomology and base change, I

02KE Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Suppose further that $g: S^{\prime} \rightarrow S$ is any morphism of schemes. Denote $X^{\prime}=X_{S^{\prime}}=S^{\prime} \times_{S} X$ the base change of $X$ and denote $f^{\prime}: X^{\prime} \rightarrow S^{\prime}$ the base change of $f$. Also write $g^{\prime}: X^{\prime} \rightarrow X$ the projection, and set $\mathcal{F}^{\prime}=\left(g^{\prime}\right)^{*} \mathcal{F}$. Here is
a diagram representing the situation:

02KF (29.5.0.1)

Here is the simplest case of the base change property we have in mind.
02KG Lemma 29.5.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Assume $f$ is affine. In this case $f_{*} \mathcal{F} \cong R f_{*} \mathcal{F}$ is a quasicoherent sheaf, and for every base change diagram (29.5.0.1) we have

$$
g^{*} f_{*} \mathcal{F}=f_{*}^{\prime}\left(g^{\prime}\right)^{*} \mathcal{F}
$$

Proof. The vanishing of higher direct images is Lemma 29.2.3. The statement is local on $S$ and $S^{\prime}$. Hence we may assume $X=\operatorname{Spec}(A), S=\operatorname{Spec}(R), S^{\prime}=$ $\operatorname{Spec}\left(R^{\prime}\right)$ and $\mathcal{F}=\widetilde{M}$ for some $A$-module $M$. We use Schemes, Lemma 25.7.3 to describe pullbacks and pushforwards of $\mathcal{F}$. Namely, $X^{\prime}=\operatorname{Spec}\left(R^{\prime} \otimes_{R} A\right)$ and $\mathcal{F}^{\prime}$ is the quasi-coherent sheaf associated to $\left(R^{\prime} \otimes_{R} A\right) \otimes_{A} M$. Thus we see that the lemma boils down to the equality

$$
\left(R^{\prime} \otimes_{R} A\right) \otimes_{A} M=R^{\prime} \otimes_{R} M
$$

as $R^{\prime}$-modules.
In many situations it is sufficient to know about the following special case of cohomology and base change. It follows immediately from the stronger results in Section 29.7. but since it is so important it deserves its own proof.

02KH Lemma 29.5.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Assume that $g$ is flat and that $f$ is quasi-compact and quasi-separated. Then for any $i \geq 0$ we have

$$
R^{i} f_{*}^{\prime} \mathcal{F}^{\prime}=g^{*} R^{i} f_{*} \mathcal{F}
$$

with notation as in 29.5.0.1). Moreover, the induced isomorphism is the map given by the base change map of Cohomology, Lemma 20.18.1.

Proof. The statement is local on $S^{\prime}$ and hence we may assume $S$ and $S^{\prime}$ are affine. Say $S=\operatorname{Spec}(A)$ and $S^{\prime}=\operatorname{Spec}(B)$. In this case we are really trying to show that the map

$$
H^{i}(X, \mathcal{F}) \otimes_{A} B \longrightarrow H^{i}\left(X_{B}, \mathcal{F}_{B}\right)
$$

(given by the reference in the statement of the lemma) is an isomorphism where $X_{B}=\operatorname{Spec}(B) \times_{\operatorname{Spec}(A)} X$ and $\mathcal{F}_{B}$ is the pullback of $\mathcal{F}$ to $X_{B}$.
In case $X$ is separated, choose an affine open covering $\mathcal{U}: X=U_{1} \cup \ldots \cup U_{t}$ and recall that

$$
\check{H}^{p}(\mathcal{U}, \mathcal{F})=H^{p}(X, \mathcal{F})
$$

see Lemma 29.2.6. If $\mathcal{U}_{B}: X_{B}=\left(U_{1}\right)_{B} \cup \ldots \cup\left(U_{t}\right)_{B}$ we obtain by base change, then it is still the case that each $\left(U_{i}\right)_{B}$ is affine and that $X_{B}$ is separated. Thus we obtain

$$
\check{H}^{p}\left(\mathcal{U}_{B}, \mathcal{F}_{B}\right)=H^{p}\left(X_{B}, \mathcal{F}_{B}\right)
$$

We have the following relation between the Čech complexes

$$
\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}_{B}, \mathcal{F}_{B}\right)=\check{\mathcal{C}} \bullet(\mathcal{U}, \mathcal{F}) \otimes_{A} B
$$

as follows from Lemma 29.5.1. Since $A \rightarrow B$ is flat, the same thing remains true on taking cohomology.

In case $X$ is quasi-separated, choose an affine open covering $\mathcal{U}: X=U_{1} \cup \ldots \cup$ $U_{t}$. We will use the Čech-to-cohomology spectral sequence Cohomology, Lemma 20.12.5. The reader who wishes to avoid this spectral sequence can use MajerVietoris and induction on $t$ as in the proof of Lemma 29.4.5. The spectral sequence has $E_{2}$-page $E_{2}^{p, q}=\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right)$ and converges to $H^{p+q}(X, \mathcal{F})$. Similarly, we have a spectral sequence with $E_{2}$-page $E_{2}^{p, q}=\breve{H}^{p}\left(\mathcal{U}_{B}, \underline{H}^{q}\left(\mathcal{F}_{B}\right)\right)$ which converges to $H^{p+q}\left(X_{B}, \mathcal{F}_{B}\right)$. Since the intersections $U_{i_{0} \ldots i_{p}}$ are quasi-compact and separated, the result of the second paragraph of the proof gives $\breve{H}^{p}\left(\mathcal{U}_{B}, \underline{H}^{q}\left(\mathcal{F}_{B}\right)\right)=$ $\check{H}^{p}\left(\mathcal{U}, \underline{H}^{q}(\mathcal{F})\right) \otimes_{A} B$. Using that $A \rightarrow B$ is flat we conclude that $H^{i}(X, \mathcal{F}) \otimes_{A} B \rightarrow$ $H^{i}\left(X_{B}, \mathcal{F}_{B}\right)$ is an isomorphism for all $i$ and we win.

### 29.6. Colimits and higher direct images

07TA General results of this nature can be found in Cohomology, Section 20.20. Sheaves, Lemma 6.29.1, and Modules, Lemma 17.11.6

07TB Lemma 29.6.1. Let $f: X \rightarrow S$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{F}=\operatorname{colim} \mathcal{F}_{i}$ be a filtered colimit of quasi-coherent sheaves on $X$. Then for any $p \geq 0$ we have

$$
R^{p} f_{*} \mathcal{F}=\operatorname{colim} R^{p} f_{*} \mathcal{F}_{i}
$$

Proof. Recall that $R^{p} f_{*} \mathcal{F}$ is the sheaf associated to $U \mapsto H^{p}\left(f^{-1} U, \mathcal{F}\right)$, see Cohomology, Lemma 20.8.3. Recall that the colimit is the sheaf associated to the presheaf colimit (taking colimits over opens). Hence we can apply Cohomology, Lemma 20.20.1 to $H^{p}\left(f^{-1} U,-\right)$ where $U$ is affine to conclude. (Because the basis of affine opens in $f^{-1} U$ satisfies the assumptions of that lemma.)

### 29.7. Cohomology and base change, II

071 M Let $f: X \rightarrow S$ be a morphism of schemes and let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$ module. If $f$ is quasi-compact and quasi-separated we would like to represent $R f_{*} \mathcal{F}$ by a complex of quasi-coherent sheaves on $S$. This follows from the fact that the sheaves $R^{i} f_{*} \mathcal{F}$ are quasi-coherent if $S$ is quasi-compact and has affine diagonal, using that $D_{Q C o h}(S)$ is equivalent to $D\left(Q \operatorname{Coh}\left(\mathcal{O}_{S}\right)\right)$, see Derived Categories of Schemes, Proposition 35.7.5.

In this section we will use a different approach which produces an explicit complex having a good base change property. The construction is particularly easy if $f$ and $S$ are separated, or more generally have affine diagonal. Since this is the case which by far the most often used we treat it separately.

01XL Lemma 29.7.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Assume $X$ is quasi-compact and $X$ and $S$ have affine diagonal (e.g., if $X$ and $S$ are separated). In this case we can compute $R f_{*} \mathcal{F}$ as follows:
(1) Choose a finite affine open covering $\mathcal{U}: X=\bigcup_{i=1, \ldots, n} U_{i}$.
(2) For $i_{0}, \ldots, i_{p} \in\{1, \ldots, n\}$ denote $f_{i_{0} \ldots i_{p}}: U_{i_{0} \ldots i_{p}} \rightarrow S$ the restriction of $f$ to the intersection $U_{i_{0} \ldots i_{p}}=U_{i_{0}} \cap \ldots \cap U_{i_{p}}$.
(3) Set $\mathcal{F}_{i_{0} \ldots i_{p}}$ equal to the restriction of $\mathcal{F}$ to $U_{i_{0} \ldots i_{p}}$.
(4) Set

$$
\check{\mathcal{C}}^{p}(\mathcal{U}, f, \mathcal{F})=\bigoplus_{i_{0} \ldots i_{p}} f_{i_{0} \ldots i_{p} *} \mathcal{F}_{i_{0} \ldots i_{p}}
$$

and define differentials $d: \check{\mathcal{C}}^{p}(\mathcal{U}, f, \mathcal{F}) \rightarrow \breve{\mathcal{C}}^{p+1}(\mathcal{U}, f, \mathcal{F})$ as in Cohomology, Equation 20.10.0.1.
Then the complex $\check{\mathcal{C}} \bullet(\mathcal{U}, f, \mathcal{F})$ is a complex of quasi-coherent sheaves on $S$ which comes equipped with an isomorphism

$$
\check{\mathcal{C}}^{\bullet}(\mathcal{U}, f, \mathcal{F}) \longrightarrow R f_{*} \mathcal{F}
$$

in $D^{+}(S)$. This isomorphism is functorial in the quasi-coherent sheaf $\mathcal{F}$.
Proof. Consider the resolution $\mathcal{F} \rightarrow \mathfrak{C}(\mathcal{U}, \mathcal{F})$ of Cohomology, Lemma 20.25.1. We have an equality of complexes $\mathcal{C}^{\bullet}(\mathcal{U}, f, \mathcal{F})=f_{*} \mathfrak{C}^{\bullet}(\mathcal{U}, \mathcal{F})$ of quasi-coherent $\mathcal{O}_{S}$-modules. The morphisms $j_{i_{0} \ldots i_{p}}: U_{i_{0} \ldots i_{p}} \rightarrow X$ and the morphisms $f_{i_{0} \ldots i_{p}}$ : $U_{i_{0} \ldots i_{p}} \rightarrow S$ are affine by Morphisms, Lemma 28.12.11 and Lemma 29.2.5. Hence $R^{q} j_{i_{0} \ldots i_{p} *} \mathcal{F}_{i_{0} \ldots i_{p}}$ as well as $R^{q} f_{i_{0} \ldots i_{p} *} \mathcal{F}_{i_{0} \ldots i_{p}}$ are zero for $q>0$ (Lemma 29.2.3). Using $f \circ j_{i_{0} \ldots i_{p}}=f_{i_{0} \ldots i_{p}}$ and the spectral sequence of Cohomology, Lemma 20.14.8 we conclude that $R^{q} f_{*}\left(j_{i_{0} \ldots i_{p} *} \mathcal{F}_{i_{0} \ldots i_{p}}\right)=0$ for $q>0$. Since the terms of the complex $\mathfrak{C}^{\bullet}(\mathcal{U}, \mathcal{F})$ are finite direct sums of the sheaves $j_{i_{0} \ldots i_{p} *} \mathcal{F}_{i_{0} \ldots i_{p}}$ we conclude using Leray's acyclicity lemma (Derived Categories, Lemma 13.17.7) that

$$
R f_{*} \mathcal{F}=f_{*} \mathbb{C}^{\bullet}(\mathcal{U}, \mathcal{F})=\mathcal{C}^{\bullet}(\mathcal{U}, f, \mathcal{F})
$$

as desired.
Next, we are going to consider what happens if we do a base change.
01XM Lemma 29.7.2. With notation as in diagram (29.5.0.1). Assume $f: X \rightarrow S$ and $\mathcal{F}$ satisfy the hypotheses of Lemma 29.7.1. Choose a finite affine open covering $\mathcal{U}: X=\bigcup U_{i}$ of $X$. There is a canonical isomorphism

$$
g^{*} \check{\mathcal{C}}^{\bullet}(\mathcal{U}, f, \mathcal{F}) \longrightarrow R f_{*}^{\prime} \mathcal{F}^{\prime}
$$

in $D^{+}\left(S^{\prime}\right)$. Moreover, if $S^{\prime} \rightarrow S$ is affine, then in fact

$$
g^{*} \check{\mathcal{C}} \bullet(\mathcal{U}, f, \mathcal{F})=\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}^{\prime}, f^{\prime}, \mathcal{F}^{\prime}\right)
$$

with $\mathcal{U}^{\prime}: X^{\prime}=\bigcup U_{i}^{\prime}$ where $U_{i}^{\prime}=\left(g^{\prime}\right)^{-1}\left(U_{i}\right)=U_{i, S^{\prime}}$ is also affine.
Proof. In fact we may define $U_{i}^{\prime}=\left(g^{\prime}\right)^{-1}\left(U_{i}\right)=U_{i, S^{\prime}}$ no matter whether $S^{\prime}$ is affine over $S$ or not. Let $\mathcal{U}^{\prime}: X^{\prime}=\bigcup U_{i}^{\prime}$ be the induced covering of $X^{\prime}$. In this case we claim that

$$
g^{*} \check{\mathcal{C}}^{\bullet}(\mathcal{U}, f, \mathcal{F})=\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}^{\prime}, f^{\prime}, \mathcal{F}^{\prime}\right)
$$

with $\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}^{\prime}, f^{\prime}, \mathcal{F}^{\prime}\right)$ defined in exactly the same manner as in Lemma 29.7.1. This is clear from the case of affine morphisms (Lemma 29.5.1) by working locally on $S^{\prime}$. Moreover, exactly as in the proof of Lemma 29.7.1 one sees that there is an isomorphism

$$
\check{\mathcal{C}}^{\bullet}\left(\mathcal{U}^{\prime}, f^{\prime}, \mathcal{F}^{\prime}\right) \longrightarrow R f_{*}^{\prime} \mathcal{F}^{\prime}
$$

in $D^{+}\left(S^{\prime}\right)$ since the morphisms $U_{i}^{\prime} \rightarrow X^{\prime}$ and $U_{i}^{\prime} \rightarrow S^{\prime}$ are still affine (being base changes of affine morphisms). Details omitted.

The lemma above says that the complex

$$
\mathcal{K}^{\bullet}=\check{\mathcal{C}}^{\bullet}(\mathcal{U}, f, \mathcal{F})
$$

is a bounded below complex of quasi-coherent sheaves on $S$ which universally computes the higher direct images of $f: X \rightarrow S$. This is something about this particular complex and it is not preserved by replacing $\mathcal{C} \bullet(\mathcal{U}, f, \mathcal{F})$ by a quasi-isomorphic complex in general! In other words, this is not a statement that makes sense in the derived category. The reason is that the pullback $g^{*} \mathcal{K}^{\bullet}$ is not equal to the derived pullback $L g^{*} \mathcal{K}^{\bullet}$ of $\mathcal{K}^{\bullet}$ in general!
Here is a more general case where we can prove this statement. We remark that the condition of $S$ being separated is harmless in most applications, since this is usually used to prove some local property of the total derived image. The proof is significantly more involved and uses hypercoverings; it is a nice example of how you can use them sometimes.
01XN Lemma 29.7.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$. Assume that $f$ is quasi-compact and quasi-separated and that $S$ is quasi-compact and separated. There exists a bounded below complex $\mathcal{K}^{\bullet}$ of quasi-coherent $\mathcal{O}_{S}$-modules with the following property: For every morphism $g: S^{\prime} \rightarrow S$ the complex $g^{*} \mathcal{K}^{\bullet}$ is a representative for $R f_{*}^{\prime} \mathcal{F}^{\prime}$ with notation as in diagram 29.5.0.1).

Proof. (If $f$ is separated as well, please see Lemma 29.7.2, The assumptions imply in particular that $X$ is quasi-compact and quasi-separated as a scheme. Let $\mathcal{B}$ be the set of affine opens of $X$. By Hypercoverings, Lemma 24.10.4 we can find a hypercovering $K=\left(I,\left\{U_{i}\right\}\right)$ such that each $I_{n}$ is finite and each $U_{i}$ is an affine open of $X$. By Hypercoverings, Lemma 24.4 .3 there is a spectral sequence with $E_{2}$-page

$$
E_{2}^{p, q}=\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)
$$

converging to $H^{p+q}(X, \mathcal{F})$. Note that $\check{H}^{p}\left(K, \underline{H}^{q}(\mathcal{F})\right)$ is the $p$ th cohomology group of the complex

$$
\prod_{i \in I_{0}} H^{q}\left(U_{i}, \mathcal{F}\right) \rightarrow \prod_{i \in I_{1}} H^{q}\left(U_{i}, \mathcal{F}\right) \rightarrow \prod_{i \in I_{2}} H^{q}\left(U_{i}, \mathcal{F}\right) \rightarrow \ldots
$$

Since each $U_{i}$ is affine we see that this is zero unless $q=0$ in which case we obtain

$$
\prod_{i \in I_{0}} \mathcal{F}\left(U_{i}\right) \rightarrow \prod_{i \in I_{1}} \mathcal{F}\left(U_{i}\right) \rightarrow \prod_{i \in I_{2}} \mathcal{F}\left(U_{i}\right) \rightarrow \ldots
$$

Thus we conclude that $R \Gamma(X, \mathcal{F})$ is computed by this complex.
For any $n$ and $i \in I_{n}$ denote $f_{i}: U_{i} \rightarrow S$ the restriction of $f$ to $U_{i}$. As $S$ is separated and $U_{i}$ is affine this morphism is affine. Consider the complex of quasi-coherent sheaves

$$
\mathcal{K}^{\bullet}=\left(\left.\left.\left.\prod_{i \in I_{0}} f_{i, *} \mathcal{F}\right|_{U_{i}} \rightarrow \prod_{i \in I_{1}} f_{i, *} \mathcal{F}\right|_{U_{i}} \rightarrow \prod_{i \in I_{2}} f_{i, *} \mathcal{F}\right|_{U_{i}} \rightarrow \ldots\right)
$$

on $S$. As in Hypercoverings, Lemma 24.4.3 we obtain a map $\mathcal{K}^{\bullet} \rightarrow R f_{*} \mathcal{F}$ in $D\left(\mathcal{O}_{S}\right)$ by choosing an injective resolution of $\mathcal{F}$ (details omitted). Consider any affine scheme $V$ and a morphism $g: V \rightarrow S$. Then the base change $X_{V}$ has a hypercovering $K_{V}=\left(I,\left\{U_{i, V}\right\}\right)$ obtained by base change. Moreover, $g^{*} f_{i, *} \mathcal{F}=$ $\left.f_{i, V, *}\left(g^{\prime}\right)^{*} \mathcal{F}\right|_{U_{i, V}}$. Thus the arguments above prove that $\Gamma\left(V, g^{*} \mathcal{K}^{\bullet}\right)$ computes $R \Gamma\left(X_{V},\left(g^{\prime}\right)^{*} \mathcal{F}\right)$. This finishes the proof of the lemma as it suffices to prove the equality of complexes Zariski locally on $S^{\prime}$.

### 29.8. Cohomology of projective space

01XS In this section we compute the cohomology of the twists of the structure sheaf on $\mathbf{P}_{S}^{n}$ over a scheme $S$. Recall that $\mathbf{P}_{S}^{n}$ was defined as the fibre product $\mathbf{P}_{S}^{n}=$ $S \times_{\operatorname{Spec}(\mathbf{Z})} \mathbf{P}_{\mathbf{Z}}^{n}$ in Constructions, Definition 26.13.2. It was shown to be equal to

$$
\mathbf{P}_{S}^{n}=\underline{\operatorname{Proj}}_{S}\left(\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]\right)
$$

in Constructions, Lemma 26.21.4 In particular, projective space is a particular case of a projective bundle. If $S=\operatorname{Spec}(R)$ is affine then we have

$$
\mathbf{P}_{S}^{n}=\mathbf{P}_{R}^{n}=\operatorname{Proj}\left(R\left[T_{0}, \ldots, T_{n}\right]\right)
$$

All these identifications are compatible and compatible with the constructions of the twisted structure sheaves $\mathcal{O}_{\mathbf{P}_{S}^{n}}(d)$.
Before we state the result we need some notation. Let $R$ be a ring. Recall that $R\left[T_{0}, \ldots, T_{n}\right]$ is a graded $R$-algebra where each $T_{i}$ is homogeneous of degree 1 . Denote $\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{d}$ the degree $d$ summand. It is a finite free $R$-module of rank $\binom{n+d}{d}$ when $d \geq 0$ and zero else. It has a basis consisting of monomials $T_{0}^{e_{0}} \ldots T_{n}^{e_{n}}$ with $\sum e_{i}=\bar{d}$. We will also use the following notation: $R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right]$ denotes the $\mathbf{Z}$-graded ring with $\frac{1}{T_{i}}$ in degree -1 . In particular the $\mathbf{Z}$-graded $R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right]$ module

$$
\frac{1}{T_{0} \ldots T_{n}} R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right]
$$

which shows up in the statement below is zero in degrees $\geq-n$, is free on the generator $\frac{1}{T_{0} \ldots T_{n}}$ in degree $-n-1$ and is free of $\operatorname{rank}(-1)^{n}\binom{n+d}{d}$ for $d \leq-n-1$.
01XT Lemma 29.8.1. Let $R$ be a ring. Let $n \geq 0$ be an integer. We have

$$
H^{q}\left(\mathbf{P}^{n}, \mathcal{O}_{\mathbf{P}_{R}^{n}}(d)\right)=\left\{\begin{array}{cl}
\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{d} & \text { if } \quad q=0 \\
0 & \text { if } q \neq 0, n \\
\left(\frac{1}{T_{0} \ldots T_{n}} R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right]\right)_{d} & \text { if } \quad q=n
\end{array}\right.
$$

as $R$-modules.
Proof. We will use the standard affine open covering

$$
\mathcal{U}: \mathbf{P}_{R}^{n}=\bigcup_{i=0}^{n} D_{+}\left(T_{i}\right)
$$

to compute the cohomology using the Cech complex. This is permissible by Lemma 29.2.6 since any intersection of finitely many affine $D_{+}\left(T_{i}\right)$ is also a standard affine open (see Constructions, Section 26.8). In fact, we can use the alternating or ordered Cech complex according to Cohomology, Lemmas 20.24.3 and 20.24.6.
The ordering we will use on $\{0, \ldots, n\}$ is the usual one. Hence the complex we are looking at has terms

$$
\check{\mathcal{C}}_{o r d}^{p}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d)\right)=\bigoplus_{i_{0}<\ldots<i_{p}}\left(R\left[T_{0}, \ldots, T_{n}, \frac{1}{T_{i_{0}} \ldots T_{i_{p}}}\right]\right)_{d}
$$

Moreover, the maps are given by the usual formula

$$
d(s)_{i_{0} \ldots i_{p+1}}=\sum_{j=0}^{p+1}(-1)^{j} s_{i_{0} \ldots \hat{i}_{j} \ldots i_{p+1}}
$$

see Cohomology, Section 20.24. Note that each term of this complex has a natural $\mathbf{Z}^{n+1}$-grading. Namely, we get this by declaring a monomial $T_{0}^{e_{0}} \ldots T_{n}^{e_{n}}$ to be
homogeneous with weight $\left(e_{0}, \ldots, e_{n}\right) \in \mathbf{Z}^{n+1}$. It is clear that the differential given above respects the grading. In a formula we have

$$
\check{\mathcal{C}}_{\text {ord }}^{\bullet}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d)\right)=\bigoplus_{\vec{e} \in \mathbf{Z}^{n+1}} \check{\mathcal{C}}^{\bullet}(\vec{e})
$$

where not all summands on the right hand side occur (see below). Hence in order to compute the cohomology modules of the complex it suffices to compute the cohomology of the graded pieces and take the direct sum at the end.
Fix $\vec{e}=\left(e_{0}, \ldots, e_{n}\right) \in \mathbf{Z}^{n+1}$. In order for this weight to occur in the complex above we need to assume $e_{0}+\ldots+e_{n}=d$ (if not then it occurs for a different twist of the structure sheaf of course). Assuming this, set

$$
N E G(\vec{e})=\left\{i \in\{0, \ldots, n\} \mid e_{i}<0\right\}
$$

With this notation the weight $\vec{e}$ summand $\check{\mathcal{C}} \bullet(\vec{e})$ of the Cech complex above has the following terms

$$
\check{\mathcal{C}}^{p}(\vec{e})=\bigoplus_{i_{0}<\ldots<i_{p}, N E G(\vec{e}) \subset\left\{i_{0}, \ldots, i_{p}\right\}} R \cdot T_{0}^{e_{0}} \ldots T_{n}^{e_{n}}
$$

In other words, the terms corresponding to $i_{0}<\ldots<i_{p}$ such that $N E G(\vec{e})$ is not contained in $\left\{i_{0} \ldots i_{p}\right\}$ are zero. The differential of the complex $\check{\mathcal{C}}^{\bullet}(\vec{e})$ is still given by the exact same formula as above.

Suppose that $\operatorname{NEG}(\vec{e})=\{0, \ldots, n\}$, i.e., that all exponents $e_{i}$ are negative. In this case the complex $\check{\mathcal{C}} \bullet(\vec{e})$ has only one term, namely $\check{\mathcal{C}}^{n}(\vec{e})=R \cdot \frac{1}{T^{-e_{0}} \ldots T^{-e_{n}}}$. Hence in this case

$$
H^{q}\left(\check{\mathcal{C}}^{\bullet}(\vec{e})\right)=\left\{\begin{array}{cl}
R \cdot \frac{1}{T^{-e_{0}} \ldots T^{-e_{n}}} & \text { if } q=n \\
0 & \text { if else }
\end{array}\right.
$$

The direct sum of all of these terms clearly gives the value

$$
\left(\frac{1}{T_{0} \ldots T_{n}} R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right]\right)_{d}
$$

in degree $n$ as stated in the lemma. Moreover these terms do not contribute to cohomology in other degrees (also in accordance with the statement of the lemma).

Assume $\operatorname{NEG}(\vec{e})=\emptyset$. In this case the complex $\check{\mathcal{C}} \bullet(\vec{e})$ has a summand $R$ corresponding to all $i_{0}<\ldots<i_{p}$. Let us compare the complex $\check{\mathcal{C}} \bullet(\vec{e})$ to another complex. Namely, consider the affine open open covering

$$
\mathcal{V}: \operatorname{Spec}(R)=\bigcup_{i \in\{0, \ldots, n\}} V_{i}
$$

where $V_{i}=\operatorname{Spec}(R)$ for all $i$. Consider the alternating Cech complex

$$
\check{\mathcal{C}}_{\circ r d}^{\bullet}\left(\mathcal{V}, \mathcal{O}_{\operatorname{Spec}(R)}\right)
$$

By the same reasoning as above this computes the cohomology of the structure sheaf on $\operatorname{Spec}(R)$. Hence we see that $H^{p}\left(\mathcal{C}_{\text {ord }}^{\bullet}\left(\mathcal{V}, \mathcal{O}_{\operatorname{Spec}(R)}\right)\right)=R$ if $p=0$ and is 0 whenever $p>0$. For these facts, see Lemma 29.2 .1 and its proof. Note that also $\check{\mathcal{C}}_{\text {ord }}^{\bullet}\left(\mathcal{V}, \mathcal{O}_{\text {Spec }(R)}\right)$ has a summand $R$ for every $i_{0}<\ldots<i_{p}$ and has exactly the same differential as $\check{\mathcal{C}} \bullet(\vec{e})$. In other words these complexes are isomorphic complexes and hence have the same cohomology. We conclude that

$$
H^{q}\left(\check{\mathcal{C}}^{\bullet}(\vec{e})\right)=\left\{\begin{array}{ccc}
R \cdot T^{e_{0}} \ldots T^{e_{n}} & \text { if } q=0 \\
0 & \text { if } & \text { else }
\end{array}\right.
$$

in the case that $N E G(\vec{e})=\emptyset$. The direct sum of all of these terms clearly gives the value

$$
\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{d}
$$

in degree 0 as stated in the lemma. Moreover these terms do not contribute to cohomology in other degrees (also in accordance with the statement of the lemma).
To finish the proof of the lemma we have to show that the complexes $\check{\mathcal{C}}^{\bullet}(\vec{e})$ are acyclic when $\operatorname{NEG}(\vec{e})$ is neither empty nor equal to $\{0, \ldots, n\}$. Pick an index $i_{\text {fix }} \notin N E G(\vec{e})$ (such an index exists). Consider the map

$$
h: \check{\mathcal{C}}^{p+1}(\vec{e}) \rightarrow \check{\mathcal{C}}^{p}(\vec{e})
$$

given by the rule

$$
h(s)_{i_{0} \ldots i_{p}}=s_{i_{\mathrm{fix}} i_{0} \ldots i_{p}}
$$

(compare with the proof of Lemma 29.2.1). It is clear that this is well defined since

$$
N E G(\vec{e}) \subset\left\{i_{0}, \ldots, i_{p}\right\} \Leftrightarrow N E G(\vec{e}) \subset\left\{i_{\mathrm{fix}}, i_{0}, \ldots, i_{p}\right\}
$$

Also $\check{\mathcal{C}}^{0}(\vec{e})=0$ so that this formula does work for all $p$ including $p=-1$. The exact same (combinatorial) computation as in the proof of Lemma 29.2.1 shows that

$$
(h d+d h)(s)_{i_{0} \ldots i_{p}}=s_{i_{0} \ldots i_{p}}
$$

Hence we see that the identity map of the complex $\check{\mathcal{C}} \bullet(\vec{e})$ is homotopic to zero which implies that it is acyclic.

In the following lemma we are going to use the pairing of free $R$-modules

$$
R\left[T_{0}, \ldots, T_{n}\right] \times \frac{1}{T_{0} \ldots T_{n}} R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right] \longrightarrow R
$$

which is defined by the rule

$$
(f, g) \longmapsto \text { coefficient of } \frac{1}{T_{0} \ldots T_{n}} \text { in } f g
$$

In other words, the basis element $T_{0}^{e_{0}} \ldots T_{n}^{e_{n}}$ pairs with the basis element $T_{0}^{d_{0}} \ldots T_{n}^{d_{n}}$ to give 1 if and only if $e_{i}+d_{i}=-1$ for all $i$, and pairs to zero in all other cases. Using this pairing we get an identification

$$
\left(\frac{1}{T_{0} \ldots T_{n}} R\left[\frac{1}{T_{0}}, \ldots, \frac{1}{T_{n}}\right]\right)_{d}=\operatorname{Hom}_{R}\left(\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-d}, R\right)
$$

Thus we can reformulate the result of Lemma 29.8.1 as saying that

$$
H^{q}\left(\mathbf{P}^{n}, \mathcal{O}_{\mathbf{P}_{R}^{n}}(d)\right)=\left\{\begin{array}{ccc}
\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{d} & \text { if } \quad q=0  \tag{29.8.1.1}\\
0 & \text { if } q \neq 0, n \\
\operatorname{Hom}_{R}\left(\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-d}, R\right) & \text { if } \quad q=n
\end{array}\right.
$$

01XV Lemma 29.8.2. The identifications of Equation 29.8.1.1) are compatible with base change w.r.t. ring maps $R \rightarrow R^{\prime}$. Moreover, for any $f \in R\left[T_{0}, \ldots, T_{n}\right]$ homogeneous of degree $m$ the map multiplication by $f$

$$
\mathcal{O}_{\mathbf{P}_{R}^{n}}(d) \longrightarrow \mathcal{O}_{\mathbf{P}_{R}^{n}}(d+m)
$$

induces the map on the cohomology group via the identifications of Equation 29.8.1.1) which is multiplication by for $H^{0}$ and the contragredient of multiplication by $f$

$$
\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-(d+m)} \longrightarrow\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-d}
$$

on $H^{n}$.

Proof. Suppose that $R \rightarrow R^{\prime}$ is a ring map. Let $\mathcal{U}$ be the standard affine open covering of $\mathbf{P}_{R}^{n}$, and let $\mathcal{U}^{\prime}$ be the standard affine open covering of $\mathbf{P}_{R^{\prime}}^{n}$. Note that $\mathcal{U}^{\prime}$ is the pullback of the covering $\mathcal{U}$ under the canonical morphism $\mathbf{P}_{R^{\prime}}^{n} \rightarrow \mathbf{P}_{R}^{n}$. Hence there is a map of Cech complexes

$$
\gamma: \check{\mathcal{C}}_{o r d}^{\bullet}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d)\right) \longrightarrow \check{\mathcal{C}}_{o r d}^{\bullet}\left(\mathcal{U}^{\prime}, \mathcal{O}_{\mathbf{P}_{R^{\prime}}}(d)\right)
$$

which is compatible with the map on cohomology by Cohomology, Lemma 20.16.1. It is clear from the computations in the proof of Lemma 29.8.1 that this map of Cech complexes is compatible with the identifications of the cohomology groups in question. (Namely the basis elements for the Cech complex over $R$ simply map to the corresponding basis elements for the Cech complex over $R^{\prime}$.) Whence the first statement of the lemma.

Now fix the ring $R$ and consider two homogeneous polynomials $f, g \in R\left[T_{0}, \ldots, T_{n}\right]$ both of the same degree $m$. Since cohomology is an additive functor, it is clear that the map induced by multiplication by $f+g$ is the same as the sum of the maps induced by multiplication by $f$ and the map induced by multiplication by $g$. Moreover, since cohomology is a functor, a similar result holds for multiplication by a product $f g$ where $f, g$ are both homogeneous (but not necessarily of the same degree). Hence to verify the second statement of the lemma it suffices to prove this when $f=x \in R$ or when $f=T_{i}$. In the case of multiplication by an element $x \in R$ the result follows since every cohomology groups or complex in sight has the structure of an $R$-module or complex of $R$-modules. Finally, we consider the case of multiplication by $T_{i}$ as a $\mathcal{O}_{\mathbf{P}_{R}^{n}}$-linear map

$$
\mathcal{O}_{\mathbf{P}_{R}^{n}}(d) \longrightarrow \mathcal{O}_{\mathbf{P}_{R}^{n}}(d+1)
$$

The statement on $H^{0}$ is clear. For the statement on $H^{n}$ consider multiplication by $T_{i}$ as a map on Cech complexes

$$
\check{\mathcal{C}}_{\text {ord }}^{\bullet}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d)\right) \longrightarrow \check{\mathcal{C}}_{\text {ord }}^{\bullet}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d+1)\right)
$$

We are going to use the notation introduced in the proof of Lemma 29.8.1. We consider the effect of multiplication by $T_{i}$ in terms of the decompositions

$$
\check{\mathcal{C}}_{\circ r d}^{\bullet}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d)\right)=\bigoplus_{\vec{e} \in \mathbf{Z}^{n+1}, \sum e_{i}=d} \check{\mathcal{C}} \stackrel{(\vec{e})}{ }
$$

and

$$
\check{\mathcal{C}}_{o r d}^{\bullet}\left(\mathcal{U}, \mathcal{O}_{\mathbf{P}_{R}}(d+1)\right)=\bigoplus_{\vec{e} \in \mathbf{Z}^{n+1}, \sum e_{i}=d+1} \check{\mathcal{C}}^{\bullet}(\vec{e})
$$

It is clear that it maps the subcomplex $\check{\mathcal{C}} \bullet(\vec{e})$ to the subcomplex $\check{\mathcal{C}} \bullet\left(\vec{e}+\vec{b}_{i}\right)$ where $\vec{b}_{i}=$ $(0, \ldots, 0,1,0, \ldots, 0))$ the $i$ th basis vector. In other words, it maps the summand of $H^{n}$ corresponding to $\vec{e}$ with $e_{i}<0$ and $\sum e_{i}=d$ to the summand of $H^{n}$ corresponding to $\vec{e}+\vec{b}_{i}$ (which is zero if $e_{i}+b_{i} \geq 0$ ). It is easy to see that this corresponds exactly to the action of the contragredient of multiplication by $T_{i}$ as a map

$$
\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-(d+1)} \longrightarrow\left(R\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-d}
$$

This proves the lemma.
Before we state the relative version we need some notation. Namely, recall that $\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]$ is a graded $\mathcal{O}_{S}$-module where each $T_{i}$ is homogeneous of degree 1 . Denote $\left(\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]\right)_{d}$ the degree $d$ summand. It is a finite locally free sheaf of $\operatorname{rank}\binom{n+d}{d}$ on $S$.

01XW Lemma 29.8.3. Let $S$ be a scheme. Let $n \geq 0$ be an integer. Consider the structure morphism

$$
f: \mathbf{P}_{S}^{n} \longrightarrow S
$$

We have

$$
R^{q} f_{*}\left(\mathcal{O}_{\mathbf{P}_{S}^{n}}(d)\right)=\left\{\begin{array}{cl}
\left(\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]\right)_{d} & \text { if } q=0 \\
0 & \text { if } q \neq 0, n \\
\mathcal{H o m}_{\mathcal{O}_{S}}\left(\left(\mathcal{O}_{S}\left[T_{0}, \ldots, T_{n}\right]\right)_{-n-1-d}, \mathcal{O}_{S}\right) & \text { if } q=n
\end{array}\right.
$$

Proof. Omitted. Hint: This follows since the identifications in 29.8.1.1 are compatible with affine base change by Lemma 29.8.2.

Next we state the version for projective bundles associated to finite locally free sheaves. Let $S$ be a scheme. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{S}$-module of constant rank $n+1$, see Modules, Section 17.14 . In this case we think of $\operatorname{Sym}(\mathcal{E})$ as a graded $\mathcal{O}_{S}$-module where $\mathcal{E}$ is the graded part of degree 1. And $\operatorname{Sym}^{d}(\mathcal{E})$ is the degree $d$ summand. It is a finite locally free sheaf of $\operatorname{rank}\binom{n+d}{d}$ on $S$. Recall that our normalization is that

$$
\pi: \mathbf{P}(\mathcal{E})=\underline{\operatorname{Proj}}_{S}(\operatorname{Sym}(\mathcal{E})) \longrightarrow S
$$

and that there are natural maps $\operatorname{Sym}^{d}(\mathcal{E}) \rightarrow \pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$.
01XX Lemma 29.8.4. Let $S$ be a scheme. Let $n \geq 1$. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{S}$-module of constant rank $n+1$. Consider the structure morphism

$$
\pi: \mathbf{P}(\mathcal{E}) \longrightarrow S
$$

We have

$$
R^{q} \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)\right)=\left\{\begin{array}{cl}
\operatorname{Sym}^{d}(\mathcal{E}) & \text { if } q=0 \\
0 & \text { if } q \neq 0, n \\
\mathcal{H o m}_{\mathcal{O}_{S}}\left(\operatorname{Sym}^{-n-1-d}(\mathcal{E}) \otimes_{\mathcal{O}_{S}} \wedge^{n+1} \mathcal{E}, \mathcal{O}_{S}\right) & \text { if } q=n
\end{array}\right.
$$

These identifications are compatible with base change and isomorphism between locally free sheaves.

Proof. Consider the canonical map

$$
\pi^{*} \mathcal{E} \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)
$$

and twist down by 1 to get

$$
\pi^{*}(\mathcal{E})(-1) \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}
$$

This is a surjective map from a locally free rank $n+1$ sheaf onto the structure sheaf. Hence the corresponding Koszul complex is exact (More on Algebra, Lemma 15.22 .5 . In other words there is an exact complex

$$
0 \rightarrow \pi^{*}\left(\wedge^{n+1} \mathcal{E}\right)(-n-1) \rightarrow \ldots \rightarrow \pi^{*}\left(\wedge^{i} \mathcal{E}\right)(-i) \rightarrow \ldots \rightarrow \pi^{*} \mathcal{E}(-1) \rightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})} \rightarrow 0
$$

We will think of the term $\pi^{*}\left(\wedge^{i} \mathcal{E}\right)(-i)$ as being in degree $-i$. We are going to compute the higher direct images of this acyclic complex using the first spectral sequence of Derived Categories, Lemma 13.21.3. Namely, we see that there is a spectral sequence with terms

$$
E_{1}^{p, q}=R^{q} \pi_{*}\left(\pi^{*}\left(\wedge^{-p} \mathcal{E}\right)(p)\right)
$$

converging to zero! By the projection formula (Cohomology, Lemma 20.43.2 we have

$$
E_{1}^{p, q}=\wedge^{-p} \mathcal{E} \otimes_{\mathcal{O}_{S}} R^{q} \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(p)\right)
$$

Note that locally on $S$ the sheaf $\mathcal{E}$ is trivial, i.e., isomorphic to $\mathcal{O}_{S}^{\oplus n+1}$, hence locally on $S$ the morphism $\mathbf{P}(\mathcal{E}) \rightarrow S$ can be identified with $\mathbf{P}_{S}^{n} \rightarrow S$. Hence locally on $S$ we can use the result of Lemmas 29.8.1, 29.8.2, or 29.8.3. It follows that $E_{1}^{p, q}=0$ unless $(p, q)$ is $(0,0)$ or $(-n-1, n)$. The nonzero terms are

$$
\begin{aligned}
E_{1}^{0,0} & =\pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}=\mathcal{O}_{S} \\
E_{1}^{-n-1, n} & =R^{n} \pi_{*}\left(\pi^{*}\left(\wedge^{n+1} \mathcal{E}\right)(-n-1)\right)=\wedge^{n+1} \mathcal{E} \otimes_{\mathcal{O}_{S}} R^{n} \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)\right)
\end{aligned}
$$

Hence there can only be one nonzero differential in the spectral sequence namely the map $d_{n+1}^{-n-1, n}: E_{n+1}^{-n-1, n} \rightarrow E_{n+1}^{0,0}$ which has to be an isomorphism (because the spectral sequence converges to the 0 sheaf). Thus $E_{1}^{p, q}=E_{n+1}^{p, q}$ and we obtain a canonical isomorphism

$$
\wedge^{n+1} \mathcal{E} \otimes_{\mathcal{O}_{S}} R^{n} \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)\right)=R^{n} \pi_{*}\left(\pi^{*}\left(\wedge^{n+1} \mathcal{E}\right)(-n-1)\right) \xrightarrow{d_{n+1}^{-n-1, n}} \mathcal{O}_{S}
$$

Since $\wedge^{n+1} \mathcal{E}$ is an invertible sheaf, this implies that $R^{n} \pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)$ is invertible as well and canonically isomorphic to the inverse of $\wedge^{n+1} \mathcal{E}$. In other words we have proved the case $d=-n-1$ of the lemma.
Working locally on $S$ we see immediately from the computation of cohomology in Lemmas 29.8.1, 29.8.2, or 29.8 .3 the statements on vanishing of the lemma. Moreover the result on $R^{0} \pi_{*}$ is clear as well, since there are canonical maps $\operatorname{Sym}^{d}(\mathcal{E}) \rightarrow$ $\pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$ for all $d$. It remains to show that the description of $R^{n} \pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$ is correct for $d<-n-1$. In order to do this we consider the map

$$
\pi^{*}\left(\operatorname{Sym}^{-d-n-1}(\mathcal{E})\right) \otimes_{\mathcal{O}_{\mathbf{P}(\mathcal{E})}} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d) \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)
$$

Applying $R^{n} \pi_{*}$ and the projection formula (see above) we get a map

$$
\operatorname{Sym}^{-d-n-1}(\mathcal{E}) \otimes_{\mathcal{O}_{S}} R^{n} \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)\right) \longrightarrow R^{n} \pi_{*} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)=\left(\wedge^{n+1} \mathcal{E}\right)^{\otimes-1}
$$

(the last equality we have shown above). Again by the local calculations of Lemmas $29.8 .1,29.8 .2$, or 29.8 .3 it follows that this map induces a perfect pairing between $R^{n} \pi_{*}\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)\right)$ and $\operatorname{Sym}^{-d-n-1}(\mathcal{E}) \otimes \wedge^{n+1}(\mathcal{E})$ as desired.

### 29.9. Coherent sheaves on locally Noetherian schemes

01XY We have defined the notion of a coherent module on any ringed space in Modules, Section 17.12 . Although it is possible to consider coherent sheaves on nonNoetherian schemes we will always assume the base scheme is locally Noetherian when we consider coherent sheaves. Here is a characterization of coherent sheaves on locally Noetherian schemes.

01XZ Lemma 29.9.1. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be an $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is coherent,
(2) $\mathcal{F}$ is a quasi-coherent, finite type $\mathcal{O}_{X}$-module,
(3) $\mathcal{F}$ is a finitely presented $\mathcal{O}_{X}$-module,
(4) for any affine open $\operatorname{Spec}(A)=U \subset X$ we have $\left.\mathcal{F}\right|_{U}=\widetilde{M}$ with $M$ a finite A-module, and
(5) there exists an affine open covering $X=\bigcup U_{i}, U_{i}=\operatorname{Spec}\left(A_{i}\right)$ such that each $\left.\mathcal{F}\right|_{U_{i}}=\widetilde{M}_{i}$ with $M_{i}$ a finite $A_{i}$-module.
In particular $\mathcal{O}_{X}$ is coherent, any invertible $\mathcal{O}_{X}$-module is coherent, and more generally any finite locally free $\mathcal{O}_{X}$-module is coherent.

Proof. The implications $(1) \Rightarrow(2)$ and $(1) \Rightarrow(3)$ hold in general, see Modules, Lemma 17.12 .2 . If $\mathcal{F}$ is finitely presented then $\mathcal{F}$ is quasi-coherent, see Modules, Lemma 17.11.2. Hence also (3) $\Rightarrow$ (2).
Assume $\mathcal{F}$ is a quasi-coherent, finite type $\mathcal{O}_{X}$-module. By Properties, Lemma 27.16.1 we see that on any affine open $\operatorname{Spec}(A)=U \subset X$ we have $\left.\mathcal{F}\right|_{U}=\widetilde{M}$ with $M$ a finite $A$-module. Since $A$ is Noetherian we see that $M$ has a finite resolution

$$
A^{\oplus m} \rightarrow A^{\oplus n} \rightarrow M \rightarrow 0
$$

Hence $\mathcal{F}$ is of finite presentation by Properties, Lemma 27.16.2. In other words (2) $\Rightarrow(3)$.
By Modules, Lemma 17.12 .5 it suffices to show that $\mathcal{O}_{X}$ is coherent in order to show that (3) implies (1). Thus we have to show: given any open $U \subset X$ and any finite collection of sections $f_{i} \in \mathcal{O}_{X}(U), i=1, \ldots, n$ the kernel of the map $\bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{O}_{U}$ is of finite type. Since being of finite type is a local property it suffices to check this in a neighbourhood of any $x \in U$. Thus we may assume $U=\operatorname{Spec}(A)$ is affine. In this case $f_{1}, \ldots, f_{n} \in A$ are elements of $A$. Since $A$ is Noetherian, see Properties, Lemma 27.5 .2 the kernel $K$ of the map $\bigoplus_{i=1, \ldots, n} A \rightarrow A$ is a finite $A$-module. See for example Algebra, Lemma 10.50.1. As the functor ${ }^{\sim}$ is exact, see Schemes, Lemma 25.5.4 we get an exact sequence

$$
\widetilde{K} \rightarrow \bigoplus_{i=1, \ldots, n} \mathcal{O}_{U} \rightarrow \mathcal{O}_{U}
$$

and by Properties, Lemma 27.16.1 again we see that $\widetilde{K}$ is of finite type. We conclude that (1), (2) and (3) are all equivalent.
It follows from Properties, Lemma 27.16.1 that (2) implies (4). It is trivial that (4) implies (5). The discussion in Schemes, Section 25.24 show that (5) implies that $\mathcal{F}$ is quasi-coherent and it is clear that (5) implies that $\mathcal{F}$ is of finite type. Hence (5) implies (2) and we win.

01Y0 Lemma 29.9.2. Let $X$ be a locally Noetherian scheme. The category of coherent $\mathcal{O}_{X}$-modules is abelian. More precisely, the kernel and cokernel of a map of coherent $\mathcal{O}_{X}$-modules are coherent. Any extension of coherent sheaves is coherent.

Proof. This is a restatement of Modules, Lemma 17.12 .4 in a particular case.
The following lemma does not always hold for the category of coherent $\mathcal{O}_{X}$-modules on a general ringed space $X$.

01Y1 Lemma 29.9.3. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Any quasi-coherent submodule of $\mathcal{F}$ is coherent. Any quasi-coherent quotient module of $\mathcal{F}$ is coherent.
Proof. We may assume that $X$ is affine, say $X=\operatorname{Spec}(A)$. Properties, Lemma 27.5 .2 implies that $A$ is Noetherian. Lemma 29.9.1 turns this into algebra. The algebraic counter part of the lemma is that a quotient, or a submodule of a finite $A$-module is a finite $A$-module, see for example Algebra, Lemma 10.50 .1 .

01 Y 2 Lemma 29.9.4. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. The $\mathcal{O}_{X}$-modules $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{G}$ and $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ are coherent.
Proof. It is shown in Modules, Lemma 17.19 .4 that $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is coherent. The result for tensor products is Modules, Lemma 17.15 .5
01 Y 3 Lemma 29.9.5. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Let $\varphi: \mathcal{G} \rightarrow \mathcal{F}$ be a homomorphism of $\mathcal{O}_{X}$-modules. Let $x \in X$.
(1) If $\mathcal{F}_{x}=0$ then there exists an open neighbourhood $U \subset X$ of $x$ such that $\left.\mathcal{F}\right|_{U}=0$.
(2) If $\varphi_{x}: \mathcal{G}_{x} \rightarrow \mathcal{F}_{x}$ is injective, then there exists an open neighbourhood $U \subset X$ of $x$ such that $\left.\varphi\right|_{U}$ is injective.
(3) If $\varphi_{x}: \mathcal{G}_{x} \rightarrow \mathcal{F}_{x}$ is surjective, then there exists an open neighbourhood $U \subset X$ of $x$ such that $\left.\varphi\right|_{U}$ is surjective.
(4) If $\varphi_{x}: \mathcal{G}_{x} \rightarrow \mathcal{F}_{x}$ is bijective, then there exists an open neighbourhood $U \subset X$ of $x$ such that $\left.\varphi\right|_{U}$ is an isomorphism.

Proof. See Modules, Lemmas 17.9.4, 17.9.5, and 17.12.6.
01Y4 Lemma 29.9.6. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Let $x \in X$. Suppose $\psi: \mathcal{G}_{x} \rightarrow \mathcal{F}_{x}$ is a map of $\mathcal{O}_{X, x}$-modules. Then there exists an open neighbourhood $U \subset X$ of $x$ and a map $\varphi:\left.\left.\mathcal{G}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ such that $\varphi_{x}=\psi$.
Proof. In view of Lemma 29.9.1 this is a reformulation of Modules, Lemma 17.19.3.

01 Y 5 Lemma 29.9.7. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X^{-}}$ module. Then $\operatorname{Supp}(\mathcal{F})$ is closed, and $\mathcal{F}$ comes from a coherent sheaf on the scheme theoretic support of $\mathcal{F}$, see Morphisms, Definition 28.5.5.
Proof. Let $i: Z \rightarrow X$ be the scheme theoretic support of $\mathcal{F}$ and let $\mathcal{G}$ be the finite type quasi-coherent sheaf on $Z$ such that $i_{*} \mathcal{G} \cong \mathcal{F}$. Since $Z=\operatorname{Supp}(\mathcal{F})$ we see that the support is closed. The scheme $Z$ is locally Noetherian by Morphisms, Lemmas 28.15.5 and 28.15.6. Finally, $\mathcal{G}$ is a coherent $\mathcal{O}_{Z}$-module by Lemma 29.9.1

087T Lemma 29.9.8. Let $i: Z \rightarrow X$ be a closed immersion of locally Noetherian schemes. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals cutting out $Z$. The functor $i_{*}$ induces an equivalence between the category of coherent $\mathcal{O}_{X}$-modules annihilated by $\mathcal{I}$ and the category of coherent $\mathcal{O}_{Z}$-modules.
Proof. The functor is fully faithful by Morphisms, Lemma 28.4.1. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module annihilated by $\mathcal{I}$. By Morphisms, Lemma 28.4.1 we can write $\mathcal{F}=i_{*} \mathcal{G}$ for some quasi-coherent sheaf $\mathcal{G}$ on $Z$. By Modules, Lemma 17.13.3 we see that $\mathcal{G}$ is of finite type. Hence $\mathcal{G}$ is coherent by Lemma 29.9.1. Thus the functor is also essentially surjective as desired.

01Y6 Lemma 29.9.9. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Assume $f$ is finite and $Y$ locally Noetherian. Then $R^{p} f_{*} \mathcal{F}=$ 0 for $p>0$ and $f_{*} \mathcal{F}$ is coherent if $\mathcal{F}$ is coherent.

Proof. The higher direct images vanish by Lemma 29.2 .3 and because a finite morphism is affine (by definition). Note that the assumptions imply that also $X$ is locally Noetherian (see Morphisms, Lemma 28.15.6) and hence the statement makes
sense. Let $\operatorname{Spec}(A)=V \subset Y$ be an affine open subset. By Morphisms, Definition 28.43.1 we see that $f^{-1}(V)=\operatorname{Spec}(B)$ with $A \rightarrow B$ finite. Lemma 29.9.1 turns the statement of the lemma into the following algebra fact: If $M$ is a finite $B$-module, then $M$ is also finite viewed as a $A$-module, see Algebra, Lemma 10.7.2.

In the situation of the lemma also the higher direct images are coherent since they vanish. We will show that this is always the case for a proper morphism between locally Noetherian schemes (insert future reference here).

0B3J Lemma 29.9.10. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf with $\operatorname{dim}(\operatorname{Supp}(\mathcal{F})) \leq 0$. Then $\mathcal{F}$ is generated by global sections and $H^{i}(X, \mathcal{F})=0$ for $i>0$.

Proof. By Lemma 29.9.7 we see that $\mathcal{F}=i_{*} \mathcal{G}$ where $i: Z \rightarrow X$ is the inclusion of the scheme theoretic support of $\mathcal{F}$ and where $\mathcal{G}$ is a coherent $\mathcal{O}_{Z}$-module. Since the dimension of $Z$ is 0 , we see $Z$ is a disjoint union of affines (Properties, Lemma 27.10 .5 . Hence $\mathcal{G}$ is globally generated and the higher cohomology groups of $\mathcal{G}$ are zero (Lemma 29.2.2). Hence $\mathcal{F}=i_{*} \mathcal{G}$ is globally generated. Since the cohomologies of $\mathcal{F}$ and $\mathcal{G}$ agree (Lemma 29.2.4 applies as a closed immersion is affine) we conclude that the higher cohomology groups of $\mathcal{F}$ are zero.

### 29.10. Coherent sheaves on Noetherian schemes

01 Y 7 In this section we mention some properties of coherent sheaves on Noetherian schemes.

01 Y 8 Lemma 29.10.1. Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The ascending chain condition holds for quasi-coherent submodules of $\mathcal{F}$. In other words, given any sequence

$$
\mathcal{F}_{1} \subset \mathcal{F}_{2} \subset \ldots \subset \mathcal{F}
$$

of quasi-coherent submodules, then $\mathcal{F}_{n}=\mathcal{F}_{n+1}=\ldots$ for some $n \geq 0$.
Proof. Choose a finite affine open covering. On each member of the covering we get stabilization by Algebra, Lemma 10.50.1. Hence the lemma follows.

01 Y9 Lemma 29.10.2. Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals corresponding to a closed subscheme $Z \subset X$. Then there is some $n \geq 0$ such that $\mathcal{I}^{n} \mathcal{F}=0$ if and only if $\operatorname{Supp}(\mathcal{F}) \subset Z$ (set theoretically).

Proof. This follows immediately from Algebra, Lemma 10.61 .4 because $X$ has a finite covering by spectra of Noetherian rings.

01YA Lemma 29.10.3 (Artin-Rees). Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. Let $\mathcal{G} \subset \mathcal{F}$ be a quasi-coherent subsheaf. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals. Then there exists a $c \geq 0$ such that for all $n \geq c$ we have

$$
\mathcal{I}^{n-c}\left(\mathcal{I}^{c} \mathcal{F} \cap \mathcal{G}\right)=\mathcal{I}^{n} \mathcal{F} \cap \mathcal{G}
$$

Proof. This follows immediately from Algebra, Lemma 10.50 .2 because $X$ has a finite covering by spectra of Noetherian rings.

01YB Lemma 29.10.4. Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$ module. Let $\mathcal{G}$ be coherent $\mathcal{O}_{X}$-module. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Denote $Z \subset X$ the corresponding closed subscheme and set $U=X \backslash Z$. There is a canonical isomorphism

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{I}^{n} \mathcal{G}, \mathcal{F}\right) \longrightarrow \operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{G}\right|_{U},\left.\mathcal{F}\right|_{U}\right)
$$

In particular we have an isomorphism

$$
\operatorname{colim}_{n} \operatorname{Hom}_{\mathcal{O}_{X}}\left(\mathcal{I}^{n}, \mathcal{F}\right) \longrightarrow \Gamma(U, \mathcal{F})
$$

Proof. We first prove the second map is an isomorphism. It is injective by Properties, Lemma 27.25.3. Since $\mathcal{F}$ is the union of its coherent submodules, see Properties, Lemma 27.22 .3 (and Lemma 29.9.1) we may and do assume that $\mathcal{F}$ is coherent to prove surjectivity. Let $\mathcal{F}_{n}$ denote the quasi-coherent subsheaf of $\mathcal{F}$ consisting of sections annihilated by $\mathcal{I}^{n}$, see Properties, Lemma 27.25.3. Since $\mathcal{F}_{1} \subset \mathcal{F}_{2} \subset \ldots$ we see that $\mathcal{F}_{n}=\mathcal{F}_{n+1}=\ldots$ for some $n \geq 0$ by Lemma 29.10.1. Set $\mathcal{H}=\mathcal{F}_{n}$ for this $n$. By Artin-Rees (Lemma 29.10.3) there exists an $c \geq 0$ such that $\mathcal{I}^{m} \mathcal{F} \cap \mathcal{H} \subset \mathcal{I}^{m-c} \mathcal{H}$. Picking $m=n+c$ we get $\mathcal{I}^{m} \mathcal{F} \cap \mathcal{H} \subset \mathcal{I}^{n} \mathcal{H}=0$. Thus if we set $\mathcal{F}^{\prime}=\mathcal{I}^{m} \mathcal{F}$ then we see that $\mathcal{F}^{\prime} \cap \mathcal{F}_{n}=0$ and $\left.\mathcal{F}^{\prime}\right|_{U}=\left.\mathcal{F}\right|_{U}$. Note in particular that the subsheaf $\left(\mathcal{F}^{\prime}\right)_{N}$ of sections annihilated by $\mathcal{I}^{N}$ is zero for all $N \geq 0$. Hence by Properties, Lemma 27.25 .3 we deduce that the top horizontal arrow in the following commutative diagram is a bijection:

Since also the right vertical arrow is a bijection we conclude that the bottom horizontal arrow is surjective as desired.

Next, we prove the first arrow of the lemma is a bijection. By Lemma 29.9.1 the sheaf $\mathcal{G}$ is of finite presentation and hence the sheaf $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{G}, \mathcal{F})$ is quasicoherent, see Schemes, Section 25.24. By definition we have

$$
\mathcal{H}(U)=\operatorname{Hom}_{\mathcal{O}_{U}}\left(\left.\mathcal{G}\right|_{U},\left.\mathcal{F}\right|_{U}\right)
$$

Pick a $\psi$ in the right hand side of the first arrow of the lemma, i.e., $\psi \in \mathcal{H}(U)$. The result just proved applies to $\mathcal{H}$ and hence there exists an $n \geq 0$ and an $\varphi: \mathcal{I}^{n} \rightarrow \mathcal{H}$ which recovers $\psi$ on restriction to $U$. By Modules, Lemma 17.19.1 $\varphi$ corresponds to a map

$$
\varphi: \mathcal{I}^{\otimes n} \otimes_{\mathcal{O}_{X}} \mathcal{G} \longrightarrow \mathcal{F}
$$

This is almost what we want except that the source of the arrow is the tensor product of $\mathcal{I}^{n}$ and $\mathcal{G}$ and not the product. We will show that, at the cost of increasing $n$, the difference is irrelevant. Consider the short exact sequence

$$
0 \rightarrow \mathcal{K} \rightarrow \mathcal{I}^{n} \otimes_{\mathcal{O}_{X}} \mathcal{G} \rightarrow \mathcal{I}^{n} \mathcal{G} \rightarrow 0
$$

where $\mathcal{K}$ is defined as the kernel. Note that $\mathcal{I}^{n} \mathcal{K}=0$ (proof omitted). By ArtinRees again we see that

$$
\mathcal{K} \cap \mathcal{I}^{m}\left(\mathcal{I}^{n} \otimes_{\mathcal{O}_{X}} \mathcal{G}\right)=0
$$

for some $m$ large enough. In other words we see that

$$
\mathcal{I}^{m}\left(\mathcal{I}^{n} \otimes_{\mathcal{O}_{X}} \mathcal{G}\right) \longrightarrow \mathcal{I}^{n+m} \mathcal{G}
$$

is an isomorphism. Let $\varphi^{\prime}$ be the restriction of $\varphi$ to this submodule thought of as a map $\mathcal{I}^{m+n} \mathcal{G} \rightarrow \mathcal{F}$. Then $\varphi^{\prime}$ gives an element of the left hand side of the first arrow of the lemma which maps to $\psi$ via the arrow. In other words we have proved surjectivity of the arrow. We omit the proof of injectivity.

### 29.11. Depth

0340 In this section we talk a little bit about depth and property $\left(S_{k}\right)$ for coherent modules on locally Noetherian schemes. Note that we have already discussed this notion for locally Noetherian schemes in Properties, Section 27.12 .
0341 Definition 29.11.1. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Let $k \geq 0$ be an integer.
(1) We say $\mathcal{F}$ has depth $k$ at a point $x$ of $X$ if $\operatorname{depth}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}\right)=k$.
(2) We say $X$ has depth $k$ at a point $x$ of $X$ if $\operatorname{depth}\left(\mathcal{O}_{X, x}\right)=k$.
(3) We say $\mathcal{F}$ has property $\left(S_{k}\right)$ if

$$
\operatorname{depth}_{\mathcal{O}_{X, x}}\left(\mathcal{F}_{x}\right) \geq \min \left(k, \operatorname{dim}\left(\operatorname{Supp}\left(\mathcal{F}_{x}\right)\right)\right)
$$

for all $x \in X$.
(4) We say $X$ has property $\left(S_{k}\right)$ if $\mathcal{O}_{X}$ has property $\left(S_{k}\right)$.

Any coherent sheaf satisfies condition $\left(S_{0}\right)$. Condition $\left(S_{1}\right)$ is equivalent to having no embedded associated points, see Divisors, Lemma 30.4.3.
We have seen in Properties, Lemma 27.12.3 that a locally Noetherian scheme is Cohen-Macaulay if and only if $\left(S_{k}\right)$ holds for all $k$. Thus it makes sense to introduce the following definition, which is equivalent to the condition that all stalks are Cohen-Macaulay modules.

0343 Definition 29.11.2. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. We say $\mathcal{F}$ is Cohen-Macaulay if and only if $\left(S_{k}\right)$ holds for all $k \geq 0$.

0AXQ Lemma 29.11.3. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules.
(1) If $\mathcal{G}$ has property $\left(S_{1}\right)$, then $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ has property $\left(S_{1}\right)$.
(2) If $\mathcal{G}$ has property $\left(S_{2}\right)$, then $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ has property $\left(S_{2}\right)$.

Proof. Observe that $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is a coherent $\mathcal{O}_{X}$-module by Lemma 29.9.4. Coherent modules are of finite presentation (Lemma 29.9.1) hence taking stalks commutes with taking $\mathcal{H o m}$ and Hom, see Modules, Lemma 17.19.3. Thus we reduce to the case of finite modules over local rings which is More on Algebra, Lemma 15.17.8.

0B3K Lemma 29.11.4. Let $X$ be a regular scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is Cohen-Macaulay and $\operatorname{Supp}(\mathcal{F})=X$,
(2) $\mathcal{F}$ is finite locally free of rank $>0$.

Proof. Let $x \in X$. If (2) holds, then $\mathcal{F}_{x}$ is a free $\mathcal{O}_{X, x}$-module of rank $>0$. Hence $\operatorname{depth}\left(\mathcal{F}_{x}\right)=\operatorname{dim}\left(\mathcal{O}_{X, x}\right)$ because a regular local ring is Cohen-Macaulay (Algebra, Lemma 10.105.3. Conversely, if (1) holds, then $\mathcal{F}_{x}$ is a maximal Cohen-Macaulay module over $\mathcal{O}_{X, x}$ (Algebra, Definition 10.102.6). Hence $\mathcal{F}_{x}$ is free by Algebra, Lemma 10.105.6.

### 29.12. Devissage of coherent sheaves

$01 Y C$ Let $X$ be a Noetherian scheme. Consider an integral closed subscheme $i: Z \rightarrow X$. It is often convenient to consider coherent sheaves of the form $i_{*} \mathcal{G}$ where $\mathcal{G}$ is a coherent sheaf on $Z$. In particular we are interested in these sheaves when $\mathcal{G}$ is a torsion free rank 1 sheaf. For example $\mathcal{G}$ could be a nonzero sheaf of ideals on $Z$, or even more specifically $\mathcal{G}=\mathcal{O}_{Z}$.
Throughout this section we will use that a coherent sheaf is the same thing as a finite type quasi-coherent sheaf and that a quasi-coherent subquotient of a coherent sheaf is coherent, see Section 29.9. The support of a coherent sheaf is closed, see Modules, Lemma 17.9.6.

01YD Lemma 29.12.1. Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. Suppose that $\operatorname{Supp}(\mathcal{F})=Z \cup Z^{\prime}$ with $Z, Z^{\prime}$ closed. Then there exists a short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{G}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow 0
$$

with $\operatorname{Supp}\left(\mathcal{G}^{\prime}\right) \subset Z^{\prime}$ and $\operatorname{Supp}(\mathcal{G}) \subset Z$.
Proof. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the sheaf of ideals defining the reduced induced closed subscheme structure on $Z$, see Schemes, Lemma 25.12.4. Consider the subsheaves $\mathcal{G}_{n}^{\prime}=\mathcal{I}^{n} \mathcal{F}$ and the quotients $\mathcal{G}_{n}=\mathcal{F} / \mathcal{I}^{n} \mathcal{F}$. For each $n$ we have a short exact sequence

$$
0 \rightarrow \mathcal{G}_{n}^{\prime} \rightarrow \mathcal{F} \rightarrow \mathcal{G}_{n} \rightarrow 0
$$

For every point $x$ of $Z^{\prime} \backslash Z$ we have $\mathcal{I}_{x}=\mathcal{O}_{X, x}$ and hence $\mathcal{G}_{n, x}=0$. Thus we see that $\operatorname{Supp}\left(\mathcal{G}_{n}\right) \subset Z$. Note that $X \backslash Z^{\prime}$ is a Noetherian scheme. Hence by Lemma 29.10 .2 there exists an $n$ such that $\left.\mathcal{G}_{n}^{\prime}\right|_{X \backslash Z^{\prime}}=\left.\mathcal{I}^{n} \mathcal{F}\right|_{X \backslash Z^{\prime}}=0$. For such an $n$ we see that $\operatorname{Supp}\left(\mathcal{G}_{n}^{\prime}\right) \subset Z^{\prime}$. Thus setting $\mathcal{G}^{\prime}=\mathcal{G}_{n}^{\prime}$ and $\mathcal{G}=\mathcal{G}_{n}$ works.
01YE Lemma 29.12.2. Let $X$ be a Noetherian scheme. Let $i: Z \rightarrow X$ be an integral closed subscheme. Let $\xi \in Z$ be the generic point. Let $\mathcal{F}$ be a coherent sheaf on $X$. Assume that $\mathcal{F}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$. Then there exists an integer $r \geq 0$ and $a$ sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ and an injective map of coherent sheaves

$$
i_{*}\left(\mathcal{I}^{\oplus r}\right) \rightarrow \mathcal{F}
$$

which is an isomorphism in a neighbourhood of $\xi$.
Proof. Let $\mathcal{J} \subset \mathcal{O}_{X}$ be the ideal sheaf of $Z$. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the subsheaf of local sections of $\mathcal{F}$ which are annihilated by $\mathcal{J}$. It is a quasi-coherent sheaf by Properties, Lemma 27.24.2. Moreover, $\mathcal{F}_{\xi}^{\prime}=\mathcal{F}_{\xi}$ because $\mathcal{J}_{\xi}=\mathfrak{m}_{\xi}$ and part (3) of Properties, Lemma 27.24.2 By Lemma 29.9.5 we see that $\mathcal{F}^{\prime} \rightarrow \mathcal{F}$ induces an isomorphism in a neighbourhood of $\xi$. Hence we may replace $\mathcal{F}$ by $\mathcal{F}^{\prime}$ and assume that $\mathcal{F}$ is annihilated by $\mathcal{J}$.

Assume $\mathcal{J} \mathcal{F}=0$. By Lemma 29.9.8 we can write $\mathcal{F}=i_{*} \mathcal{G}$ for some coherent sheaf $\mathcal{G}$ on $Z$. Suppose we can find a morphism $\mathcal{I}^{\oplus r} \rightarrow \mathcal{G}$ which is an isomorphism in a neighbourhood of the generic point $\xi$ of $Z$. Then applying $i_{*}$ (which is left exact) we get the result of the lemma. Hence we have reduced to the case $X=Z$.
Suppose $Z=X$ is an integral Noetherian scheme with generic point $\xi$. Note that $\mathcal{O}_{X, \xi}=\kappa(\xi)$ is the function field of $X$ in this case. Since $\mathcal{F}_{\xi}$ is a finite $\mathcal{O}_{\xi}$-module we see that $r=\operatorname{dim}_{\kappa(\xi)} \mathcal{F}_{\xi}$ is finite. Hence the sheaves $\mathcal{O}_{X}^{\oplus r}$ and $\mathcal{F}$ have isomorphic
stalks at $\xi$. By Lemma 29.9.6 there exists a nonempty open $U \subset X$ and a morphism $\psi:\left.\left.\mathcal{O}_{X}^{\oplus r}\right|_{U} \rightarrow \mathcal{F}\right|_{U}$ which is an isomorphism at $\xi$, and hence an isomorphism in a neighbourhood of $\xi$ by Lemma 29.9.5. By Schemes, Lemma 25.12 .4 there exists a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ whose associated closed subscheme $Z \subset X$ is the complement of $U$. By Lemma 29.10.4 there exists an $n \geq 0$ and a morphism $\mathcal{I}^{n}\left(\mathcal{O}_{X}^{\oplus r}\right) \rightarrow \mathcal{F}$ which recovers our $\psi$ over $U$. Since $\mathcal{I}^{n}\left(\mathcal{O}_{X}^{\oplus r}\right)=\left(\mathcal{I}^{n}\right)^{\oplus r}$ we get a map as in the lemma. It is injective because $X$ is integral and it is injective at the generic point of $X$ (easy proof omitted).

01YF Lemma 29.12.3. Let $X$ be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. There exists a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that for each $j=1, \ldots, m$ there exists an integral closed subscheme $Z_{j} \subset X$ and a sheaf of ideals $\mathcal{I}_{j} \subset \mathcal{O}_{Z_{j}}$ such that

$$
\mathcal{F}_{j} / \mathcal{F}_{j-1} \cong\left(Z_{j} \rightarrow X\right)_{*} \mathcal{I}_{j}
$$

Proof. Consider the collection

$$
\mathcal{T}=\left\{\begin{array}{c}
Z \subset X \text { closed such that there exists a coherent sheaf } \mathcal{F} \\
\text { with } \operatorname{Supp}(\mathcal{F})=Z \text { for which the lemma is wrong }
\end{array}\right\}
$$

We are trying to show that $\mathcal{T}$ is empty. If not, then because $X$ is Noetherian we can choose a minimal element $Z \in \mathcal{T}$. This means that there exists a coherent sheaf $\mathcal{F}$ on $X$ whose support is $Z$ and for which the lemma does not hold. Clearly $Z \neq \emptyset$ since the only sheaf whose support is empty is the zero sheaf for which the lemma does hold (with $m=0$ ).
If $Z$ is not irreducible, then we can write $Z=Z_{1} \cup Z_{2}$ with $Z_{1}, Z_{2}$ closed and strictly smaller than $Z$. Then we can apply Lemma 29.12.1 to get a short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{G}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{G}_{2} \rightarrow 0
$$

with $\operatorname{Supp}\left(\mathcal{G}_{i}\right) \subset Z_{i}$. By minimality of $Z$ each of $\mathcal{G}_{i}$ has a filtration as in the statement of the lemma. By considering the induced filtration on $\mathcal{F}$ we arrive at a contradiction. Hence we conclude that $Z$ is irreducible.

Suppose $Z$ is irreducible. Let $\mathcal{J}$ be the sheaf of ideals cutting out the reduced induced closed subscheme structure of $Z$, see Schemes, Lemma 25.12.4. By Lemma 29.10 .2 we see there exists an $n \geq 0$ such that $\mathcal{J}^{n} \mathcal{F}=0$. Hence we obtain a filtration

$$
0=\mathcal{J}^{n} \mathcal{F} \subset \mathcal{J}^{n-1} \mathcal{F} \subset \ldots \subset \mathcal{J F} \subset \mathcal{F}
$$

each of whose successive subquotients is annihilated by $\mathcal{J}$. Hence if each of these subquotients has a filtration as in the statement of the lemma then also $\mathcal{F}$ does. In other words we may assume that $\mathcal{J}$ does annihilate $\mathcal{F}$.
In the case where $Z$ is irreducible and $\mathcal{J F}=0$ we can apply Lemma 29.12.2. This gives a short exact sequence

$$
0 \rightarrow i_{*}\left(\mathcal{I}^{\oplus r}\right) \rightarrow \mathcal{F} \rightarrow \mathcal{Q} \rightarrow 0
$$

where $\mathcal{Q}$ is defined as the quotient. Since $\mathcal{Q}$ is zero in a neighbourhood of $\xi$ by the lemma just cited we see that the support of $\mathcal{Q}$ is strictly smaller than $Z$. Hence we see that $\mathcal{Q}$ has a filtration of the desired type by minimality of $Z$. But then clearly $\mathcal{F}$ does too, which is our final contradiction.

01YG Lemma 29.12.4. Let $X$ be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on $X$. Assume
(1) For any short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

if $\mathcal{F}_{i}, i=1,2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
(2) For every integral closed subscheme $Z \subset X$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ we have $\mathcal{P}$ for $i_{*} \mathcal{I}$.
Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. First note that if $\mathcal{F}$ is a coherent sheaf with a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that each of $\mathcal{F}_{i} / \mathcal{F}_{i-1}$ has property $\mathcal{P}$, then so does $\mathcal{F}$. This follows from the property (1) for $\mathcal{P}$. On the other hand, by Lemma 29.12 .3 we can filter any $\mathcal{F}$ with successive subquotients as in (2). Hence the lemma follows.

01YH Lemma 29.12.5. Let $X$ be a Noetherian scheme. Let $Z_{0} \subset X$ be an irreducible closed subset with generic point $\xi$. Let $\mathcal{P}$ be a property of coherent sheaves on $X$ with support contained in $Z_{0}$ such that
(1) For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.
(2) For every integral closed subscheme $Z \subset Z_{0} \subset X, Z \neq Z_{0}$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ we have $\mathcal{P}$ for $(Z \rightarrow X)_{*} \mathcal{I}$.
(3) There exists some coherent sheaf $\mathcal{G}$ on $X$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z_{0}$,
(b) $\mathcal{G}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$,
(c) $\operatorname{dim}_{\kappa(\xi)} \mathcal{G}_{\xi}=1$, and
(d) property $\mathcal{P}$ holds for $\mathcal{G}$.

Then property $\mathcal{P}$ holds for every coherent sheaf $\mathcal{F}$ on $X$ whose support is contained in $Z_{0}$.

Proof. First note that if $\mathcal{F}$ is a coherent sheaf with support contained in $Z_{0}$ with a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that each of $\mathcal{F}_{i} / \mathcal{F}_{i-1}$ has property $\mathcal{P}$, then so does $\mathcal{F}$. Or, if $\mathcal{F}$ has property $\mathcal{P}$ and all but one of the $\mathcal{F}_{i} / \mathcal{F}_{i-1}$ has property $\mathcal{P}$ then so does the last one. This follows from assumption (1).

As a first application we conclude that any coherent sheaf whose support is strictly contained in $Z_{0}$ has property $\mathcal{P}$. Namely, such a sheaf has a filtration (see Lemma 29.12.3 whose subquotients have property $\mathcal{P}$ according to (2).

Let $\mathcal{G}$ be as in (3). By Lemma 29.12 .2 there exist a sheaf of ideals $\mathcal{I}$ on $Z_{0}$, an integer $r \geq 1$, and a short exact sequence

$$
0 \rightarrow\left(\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}\right)^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0
$$

where the support of $\mathcal{Q}$ is strictly contained in $Z_{0}$. By $(3)(\mathrm{c})$ we see that $r=1$. Since $\mathcal{Q}$ has property $\mathcal{P}$ too we conclude that $\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}$ has property $\mathcal{P}$.

Next, suppose that $\mathcal{I}^{\prime} \neq 0$ is another quasi-coherent sheaf of ideals on $Z_{0}$. Then we can consider the intersection $\mathcal{I}^{\prime \prime}=\mathcal{I}^{\prime} \cap \mathcal{I}$ and we get two short exact sequences

$$
0 \rightarrow\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}^{\prime \prime} \rightarrow\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I} \rightarrow \mathcal{Q} \rightarrow 0
$$

and

$$
0 \rightarrow\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}^{\prime \prime} \rightarrow\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}^{\prime} \rightarrow \mathcal{Q}^{\prime} \rightarrow 0
$$

Note that the support of the coherent sheaves $\mathcal{Q}$ and $\mathcal{Q}^{\prime}$ are strictly contained in $Z_{0}$. Hence $\mathcal{Q}$ and $\mathcal{Q}^{\prime}$ have property $\mathcal{P}$ (see above). Hence we conclude using (1) that $\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}^{\prime \prime}$ and $\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}^{\prime}$ both have $\mathcal{P}$ as well.

The final step of the proof is to note that any coherent sheaf $\mathcal{F}$ on $X$ whose support is contained in $Z_{0}$ has a filtration (see Lemma 29.12 .3 again) whose subquotients all have property $\mathcal{P}$ by what we just said.

01YI Lemma 29.12.6. Let $X$ be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on $X$ such that
(1) For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.
(2) For every integral closed subscheme $Z \subset X$ with generic point $\xi$ there exists some coherent sheaf $\mathcal{G}$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z$,
(b) $\mathcal{G}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$,
(c) $\operatorname{dim}_{\kappa(\xi)} \mathcal{G}_{\xi}=1$, and
(d) property $\mathcal{P}$ holds for $\mathcal{G}$.

Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. According to Lemma 29.12.4 it suffices to show that for all integral closed subschemes $Z \subset X$ and all quasi-coherent ideal sheaves $\mathcal{I} \subset \mathcal{O}_{Z}$ we have $\mathcal{P}$ for $(Z \rightarrow X)_{*} \mathcal{I}$. If this fails, then since $X$ is Noetherian there is a minimal integral closed subscheme $Z_{0} \subset X$ such that $\mathcal{P}$ fails for $\left(Z_{0} \rightarrow X\right)_{*} \mathcal{I}_{0}$ for some quasicoherent sheaf of ideals $\mathcal{I}_{0} \subset \mathcal{O}_{Z_{0}}$, but $\mathcal{P}$ does hold for $(Z \rightarrow X)_{*} \mathcal{I}$ for all integral closed subschemes $Z \subset Z_{0}, Z \neq Z_{0}$ and quasi-coherent ideal sheaves $\mathcal{I} \subset \mathcal{O}_{Z}$. Since we have the existence of $\mathcal{G}$ for $Z_{0}$ by part (2), according to Lemma 29.12.5 this cannot happen.

01YL Lemma 29.12.7. Let $X$ be a Noetherian scheme. Let $Z_{0} \subset X$ be an irreducible closed subset with generic point $\xi$. Let $\mathcal{P}$ be a property of coherent sheaves on $X$ such that
(1) For any short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

if $\mathcal{F}_{i}, i=1,2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
(2) If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.
(3) For every integral closed subscheme $Z \subset Z_{0} \subset X, Z \neq Z_{0}$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z}$ we have $\mathcal{P}$ for $(Z \rightarrow X)_{*} \mathcal{I}$.
(4) There exists some coherent sheaf $\mathcal{G}$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z_{0}$,
(b) $\mathcal{G}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$, and
(c) for every quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X}$ such that $\mathcal{J}_{\xi}=\mathcal{O}_{X, \xi}$ there exists a quasi-coherent subsheaf $\mathcal{G}^{\prime} \subset \mathcal{J G}$ with $\mathcal{G}_{\xi}^{\prime}=\mathcal{G}_{\xi}$ and such that $\mathcal{P}$ holds for $\mathcal{G}^{\prime}$.
Then property $\mathcal{P}$ holds for every coherent sheaf $\mathcal{F}$ on $X$ whose support is contained in $Z_{0}$.

Proof. Note that if $\mathcal{F}$ is a coherent sheaf with a filtration

$$
0=\mathcal{F}_{0} \subset \mathcal{F}_{1} \subset \ldots \subset \mathcal{F}_{m}=\mathcal{F}
$$

by coherent subsheaves such that each of $\mathcal{F}_{i} / \mathcal{F}_{i-1}$ has property $\mathcal{P}$, then so does $\mathcal{F}$. This follows from assumption (1).

As a first application we conclude that any coherent sheaf whose support is strictly contained in $Z_{0}$ has property $\mathcal{P}$. Namely, such a sheaf has a filtration (see Lemma 29.12.3 whose subquotients have property $\mathcal{P}$ according to (3).

Let us denote $i: Z_{0} \rightarrow X$ the closed immersion. Consider a coherent sheaf $\mathcal{G}$ as in (4). By Lemma 29.12 .2 there exists a sheaf of ideals $\mathcal{I}$ on $Z_{0}$ and a short exact sequence

$$
0 \rightarrow i_{*} \mathcal{I}^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q} \rightarrow 0
$$

where the support of $\mathcal{Q}$ is strictly contained in $Z_{0}$. In particular $r>0$ and $\mathcal{I}$ is nonzero because the support of $\mathcal{G}$ is equal to $Z_{0}$. Let $\mathcal{I}^{\prime} \subset \mathcal{I}$ be any nonzero quasi-coherent sheaf of ideals on $Z_{0}$ contained in $\mathcal{I}$. Then we also get a short exact sequence

$$
0 \rightarrow i_{*}\left(\mathcal{I}^{\prime}\right)^{\oplus r} \rightarrow \mathcal{G} \rightarrow \mathcal{Q}^{\prime} \rightarrow 0
$$

where $\mathcal{Q}^{\prime}$ has support properly contained in $Z_{0}$. Let $\mathcal{J} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals cutting out the support of $\mathcal{Q}^{\prime}$ (for example the ideal corresponding to the reduced induced closed subscheme structure on the support of $\left.\mathcal{Q}^{\prime}\right)$. Then $\mathcal{J}_{\xi}=\mathcal{O}_{X, \xi}$. By Lemma 29.10 .2 we see that $\mathcal{J}^{n} \mathcal{Q}^{\prime}=0$ for some $n$. Hence $\mathcal{J}^{n} \mathcal{G} \subset$ $i_{*}\left(\mathcal{I}^{\prime}\right)^{\oplus r}$. By assumption (4)(c) of the lemma we see there exists a quasi-coherent subsheaf $\mathcal{G}^{\prime} \subset \mathcal{J}^{n} \mathcal{G}$ with $\mathcal{G}_{\xi}^{\prime}=\mathcal{G}_{\xi}$ for which property $\mathcal{P}$ holds. Hence we get a short exact sequence

$$
0 \rightarrow \mathcal{G}^{\prime} \rightarrow i_{*}\left(\mathcal{I}^{\prime}\right)^{\oplus r} \rightarrow \mathcal{Q}^{\prime \prime} \rightarrow 0
$$

where $\mathcal{Q}^{\prime \prime}$ has support properly contained in $Z_{0}$. Thus by our initial remarks and property (1) of the lemma we conclude that $i_{*}\left(\mathcal{I}^{\prime}\right)^{\oplus r}$ satisfies $\mathcal{P}$. Hence we see that $i_{*} \mathcal{I}^{\prime}$ satisfies $\mathcal{P}$ by (2). Finally, for an arbitrary quasi-coherent sheaf of ideals $\mathcal{I}^{\prime \prime} \subset \mathcal{O}_{Z_{0}}$ we can set $\mathcal{I}^{\prime}=\mathcal{I}^{\prime \prime} \cap \mathcal{I}$ and we get a short exact sequence

$$
0 \rightarrow i_{*}\left(\mathcal{I}^{\prime}\right) \rightarrow i_{*}\left(\mathcal{I}^{\prime \prime}\right) \rightarrow \mathcal{Q}^{\prime \prime \prime} \rightarrow 0
$$

where $\mathcal{Q}^{\prime \prime \prime}$ has support properly contained in $Z_{0}$. Hence we conclude that property $\mathcal{P}$ holds for $i_{*} \mathcal{I}^{\prime \prime}$ as well.

The final step of the proof is to note that any coherent sheaf $\mathcal{F}$ on $X$ whose support is contained in $Z_{0}$ has a filtration (see Lemma 29.12 .3 again) whose subquotients all have property $\mathcal{P}$ by what we just said.

01YM Lemma 29.12.8. Let $X$ be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on $X$ such that
(1) For any short exact sequence of coherent sheaves

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{2} \rightarrow 0
$$

if $\mathcal{F}_{i}, i=1,2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
(2) If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.
(3) For every integral closed subscheme $Z \subset X$ with generic point $\xi$ there exists some coherent sheaf $\mathcal{G}$ such that
(a) $\operatorname{Supp}(\mathcal{G})=Z$,
(b) $\mathcal{G}_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$, and
(c) for every quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X}$ such that $\mathcal{J}_{\xi}=\mathcal{O}_{X, \xi}$ there exists a quasi-coherent subsheaf $\mathcal{G}^{\prime} \subset \mathcal{J G}$ with $\mathcal{G}_{\xi}^{\prime}=\mathcal{G}_{\xi}$ and such that $\mathcal{P}$ holds for $\mathcal{G}^{\prime}$.
Then property $\mathcal{P}$ holds for every coherent sheaf on $X$.
Proof. Follows from Lemma 29.12.7 in exactly the same way that Lemma 29.12 .6 follows from Lemma 29.12.5

### 29.13. Finite morphisms and affines

01 YN In this section we use the results of the preceding sections to show that the image of a Noetherian affine scheme under a finite morphism is affine. We will see later that this result holds more generally (see Limits, Lemma 31.10.1).

01YO Lemma 29.13.1. Let $f: Y \rightarrow X$ be a morphism of schemes. Assume $f$ is finite, surjective and $X$ locally Noetherian. Let $Z \subset X$ be an integral closed subscheme with generic point $\xi$. Then there exists a coherent sheaf $\mathcal{F}$ on $Y$ such that the support of $f_{*} \mathcal{F}$ is equal to $Z$ and $\left(f_{*} \mathcal{F}\right)_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$.

Proof. Note that $Y$ is locally Noetherian by Morphisms, Lemma 28.15.6. Because $f$ is surjective the fibre $Y_{\xi}$ is not empty. Pick $\xi^{\prime} \in Y$ mapping to $\bar{\xi}$. Let $Z^{\prime}=\overline{\left\{\xi^{\prime}\right\}}$. We may think of $Z^{\prime} \subset Y$ as a reduced closed subscheme, see Schemes, Lemma 25.12.4 Hence the sheaf $\mathcal{F}=\left(Z^{\prime} \rightarrow Y\right)_{*} \mathcal{O}_{Z^{\prime}}$ is a coherent sheaf on $Y$ (see Lemma 29.9.9. Look at the commutative diagram

We see that $f_{*} \mathcal{F}=i_{*} f_{*}^{\prime} \mathcal{O}_{Z^{\prime}}$. Hence the stalk of $f_{*} \mathcal{F}$ at $\xi$ is the stalk of $f_{*}^{\prime} \mathcal{O}_{Z^{\prime}}$ at $\xi$. Note that since $Z^{\prime}$ is integral with generic point $\xi^{\prime}$ we have that $\xi^{\prime}$ is the only point of $Z^{\prime}$ lying over $\xi$, see Algebra, Lemmas 10.35 .3 and 10.35 .18 . Hence the stalk of $f_{*}^{\prime} \mathcal{O}_{Z^{\prime}}$ at $\xi$ equal $\mathcal{O}_{Z^{\prime}, \xi^{\prime}}=\kappa\left(\xi^{\prime}\right)$. In particular the stalk of $f_{*} \mathcal{F}$ at $\xi$ is not zero. This combined with the fact that $f_{*} \mathcal{F}$ is of the form $i_{*} f_{*}^{\prime}$ (something) implies the lemma.

01YP Lemma 29.13.2. Let $f: Y \rightarrow X$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $Y$. Let $\mathcal{I}$ be a quasi-coherent sheaf of ideals on $X$. If the morphism $f$ is affine then $\mathcal{I} f_{*} \mathcal{F}=f_{*}\left(f^{-1} \mathcal{I} \mathcal{F}\right)$.
Proof. The notation means the following. Since $f^{-1}$ is an exact functor we see that $f^{-1} \mathcal{I}$ is a sheaf of ideals of $f^{-1} \mathcal{O}_{X}$. Via the map $f^{\sharp}: f^{-1} \mathcal{O}_{X} \rightarrow \mathcal{O}_{Y}$ this acts on $\mathcal{F}$. Then $f^{-1} \mathcal{I F}$ is the subsheaf generated by sums of local sections of the
form $a s$ where $a$ is a local section of $f^{-1} \mathcal{I}$ and $s$ is a local section of $\mathcal{F}$. It is a quasi-coherent $\mathcal{O}_{Y}$-submodule of $\mathcal{F}$ because it is also the image of a natural map $f^{*} \mathcal{I} \otimes_{\mathcal{O}_{Y}} \mathcal{F} \rightarrow \mathcal{F}$.
Having said this the proof is straightforward. Namely, the question is local and hence we may assume $X$ is affine. Since $f$ is affine we see that $Y$ is affine too. Thus we may write $Y=\operatorname{Spec}(B), X=\operatorname{Spec}(A), \mathcal{F}=\widetilde{M}$, and $\mathcal{I}=\widetilde{I}$. The assertion of the lemma in this case boils down to the statement that

$$
I\left(M_{A}\right)=((I B) M)_{A}
$$

where $M_{A}$ indicates the $A$-module associated to the $B$-module $M$.
01YQ Lemma 29.13.3. Let $f: Y \rightarrow X$ be a morphism of schemes. Assume
(1) $f$ finite,
(2) $f$ surjective,
(3) $Y$ affine, and
(4) $X$ Noetherian.

Then $X$ is affine.
Proof. We will prove that under the assumptions of the lemma for any coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ we have $H^{1}(X, \mathcal{F})=0$. This will in particular imply that $H^{1}(X, \mathcal{I})=0$ for every quasi-coherent sheaf of ideals of $\mathcal{O}_{X}$. Then it follows that $X$ is affine from either Lemma 29.3.1 or Lemma 29.3.2

Let $\mathcal{P}$ be the property of coherent sheaves $\mathcal{F}$ on $X$ defined by the rule

$$
\mathcal{P}(\mathcal{F}) \Leftrightarrow H^{1}(X, \mathcal{F})=0
$$

We are going to apply Lemma 29.12 .8 . Thus we have to verify (1), (2) and (3) of that lemma for $\mathcal{P}$. Property (1) follows from the long exact cohomology sequence associated to a short exact sequence of sheaves. Property (2) follows since $H^{1}(X,-)$ is an additive functor. To see (3) let $Z \subset X$ be an integral closed subscheme with generic point $\xi$. Let $\mathcal{F}$ be a coherent sheaf on $Y$ such that the support of $f_{*} \mathcal{F}$ is equal to $Z$ and $\left(f_{*} \mathcal{F}\right)_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$, see Lemma 29.13.1. We claim that taking $\mathcal{G}=f_{*} \mathcal{F}$ works. We only have to verify part (3)(c) of Lemma 29.12.8. Hence assume that $\mathcal{J} \subset \mathcal{O}_{X}$ is a quasi-coherent sheaf of ideals such that $\mathcal{J}_{\xi}=\mathcal{O}_{X, \xi}$. A finite morphism is affine hence by Lemma 29.13.2 we see that $\mathcal{J G}=f_{*}\left(f^{-1} \mathcal{J} \mathcal{F}\right)$. Also, as pointed out in the proof of Lemma 29.13.2 the sheaf $f^{-1} \mathcal{J F}$ is a quasicoherent $\mathcal{O}_{Y}$-module. Since $Y$ is affine we see that $H^{1}\left(Y, f^{-1} \mathcal{J} \mathcal{F}\right)=0$, see Lemma 29.2.2. Since $f$ is finite, hence affine, we see that

$$
H^{1}(X, \mathcal{J G})=H^{1}\left(X, f_{*}\left(f^{-1} \mathcal{J} \mathcal{F}\right)\right)=H^{1}\left(Y, f^{-1} \mathcal{J F}\right)=0
$$

by Lemma 29.2.4 Hence the quasi-coherent subsheaf $\mathcal{G}^{\prime}=\mathcal{J G}$ satisfies $\mathcal{P}$. This verifies property (3)(c) of Lemma 29.12 .8 as desired.

### 29.14. Coherent sheaves on Proj

01 YR It seems illuminating to formulate an all-in-one result for projective space over a Noetherian ring.

01YS Lemma 29.14.1. Let $R$ be a Noetherian ring. Let $n \geq 0$ be an integer. For every coherent sheaf $\mathcal{F}$ on $\mathbf{P}_{R}^{n}$ we have the following:
(1) There exists an $r \geq 0$ and $d_{1}, \ldots, d_{r} \in \mathbf{Z}$ and a surjection

$$
\bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}\right) \longrightarrow \mathcal{F}
$$

(2) We have $H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}\right)=0$ unless $0 \leq i \leq n$.
(3) For any $i$ the cohomology group $H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}\right)$ is a finite $R$-module.
(4) If $i>0$, then $H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right)=0$ for all d large enough.
(5) For any $k \in \mathbf{Z}$ the graded $R\left[T_{0}, \ldots, T_{n}\right]$-module

$$
\bigoplus_{d \geq k} H^{0}\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right)
$$

is a finite $R\left[T_{0}, \ldots, T_{n}\right]$-module.
Proof. We will use that $\mathcal{O}_{\mathbf{P}_{R}^{n}}(1)$ is an ample invertible sheaf on the scheme $\mathbf{P}_{R}^{n}$. This follows directly from the definition since $\mathbf{P}_{R}^{n}$ covered by the standard affine opens $D_{+}\left(T_{i}\right)$. Hence by Properties, Proposition 27.26 .13 every finite type quasicoherent $\mathcal{O}_{\mathbf{P}_{R}^{n}}$-module is a quotient of a finite direct sum of tensor powers of $\mathcal{O}_{\mathbf{P}_{R}^{n}}(1)$. On the other hand coherent sheaves and finite type quasi-coherent sheaves are the same thing on projective space over $R$ by Lemma 29.9.1. Thus we see (1).
Projective $n$-space $\mathbf{P}_{R}^{n}$ is covered by $n+1$ affines, namely the standard opens $D_{+}\left(T_{i}\right), i=0, \ldots, n$, see Constructions, Lemma 26.13.3. Hence we see that for any quasi-coherent sheaf $\mathcal{F}$ on $\mathbf{P}_{R}^{n}$ we have $H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}\right)=0$ for $i \geq n+1$, see Lemma 29.4.2. Hence (2) holds.

Let us prove (3) and (4) simultaneously for all coherent sheaves on $\mathbf{P}_{R}^{n}$ by descending induction on $i$. Clearly the result holds for $i \geq n+1$ by (2). Suppose we know the result for $i+1$ and we want to show the result for $i$. (If $i=0$, then part (4) is vacuous.) Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}_{R}^{n}$. Choose a surjection as in (1) and denote $\mathcal{G}$ the kernel so that we have a short exact sequence

$$
0 \rightarrow \mathcal{G} \rightarrow \bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}\right) \rightarrow \mathcal{F} \rightarrow 0
$$

By Lemma 29.9.2 we see that $\mathcal{G}$ is coherent. The long exact cohomology sequence gives an exact sequence

$$
H^{i}\left(\mathbf{P}_{R}^{n}, \bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}\right)\right) \rightarrow H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}\right) \rightarrow H^{i+1}\left(\mathbf{P}_{R}^{n}, \mathcal{G}\right)
$$

By induction assumption the right $R$-module is finite and by Lemma 29.8.1 the left $R$-module is finite. Since $R$ is Noetherian it follows immediately that $H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}\right)$ is a finite $R$-module. This proves the induction step for assertion (3). Since $\mathcal{O}_{\mathbf{P}_{R}^{n}}(d)$ is invertible we see that twisting on $\mathbf{P}_{R}^{n}$ is an exact functor (since you get it by tensoring with an invertible sheaf, see Constructions, Definition 26.10.1). This means that for all $d \in \mathbf{Z}$ the sequence

$$
0 \rightarrow \mathcal{G}(d) \rightarrow \bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}+d\right) \rightarrow \mathcal{F}(d) \rightarrow 0
$$

is short exact. The resulting cohomology sequence is

$$
H^{i}\left(\mathbf{P}_{R}^{n}, \bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}+d\right)\right) \rightarrow H^{i}\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right) \rightarrow H^{i+1}\left(\mathbf{P}_{R}^{n}, \mathcal{G}(d)\right)
$$

By induction assumption we see the module on the right is zero for $d \gg 0$ and by the computation in Lemma 29.8.1 the module on the left is zero as soon as $d \geq-\min \left\{d_{j}\right\}$ and $i \geq 1$. Hence the induction step for assertion (4). This concludes the proof of (3) and (4).

In order to prove (5) note that for all sufficiently large $d$ the map

$$
H^{0}\left(\mathbf{P}_{R}^{n}, \bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}+d\right)\right) \rightarrow H^{0}\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right)
$$

is surjective by the vanishing of $H^{1}\left(\mathbf{P}_{R}^{n}, \mathcal{G}(d)\right)$ we just proved. In other words, the module

$$
M_{k}=\bigoplus_{d \geq k} H^{0}\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right)
$$

is for $k$ large enough a quotient of the corresponding module

$$
N_{k}=\bigoplus_{d \geq k} H^{0}\left(\mathbf{P}_{R}^{n}, \bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{R}^{n}}\left(d_{j}+d\right)\right)
$$

When $k$ is sufficiently small (e.g. $k<-d_{j}$ for all $j$ ) then

$$
N_{k}=\bigoplus_{j=1, \ldots, r} R\left[T_{0}, \ldots, T_{n}\right]\left(d_{j}\right)
$$

by our computations in Section 29.8. In particular it is finitely generated. Suppose $k \in \mathbf{Z}$ is arbitrary. Choose $k_{-} \ll k \ll k_{+}$. Consider the diagram

where the vertical arrow is the surjective map above and the horizontal arrows are the obvious inclusion maps. By what was said above we see that $N_{k_{-}}$is a finitely generated $R\left[T_{0}, \ldots, T_{n}\right]$-module. Hence $N_{k_{+}}$is a finitely generated $R\left[T_{0}, \ldots, T_{n}\right]$ module because it is a submodule of a finitely generated module and the ring $R\left[T_{0}, \ldots, T_{n}\right]$ is Noetherian. Since the vertical arrow is surjective we conclude that $M_{k_{+}}$is a finitely generated $R\left[T_{0}, \ldots, T_{n}\right]$-module. The quotient $M_{k} / M_{k_{+}}$is finite as an $R$-module since it is a finite direct sum of the finite $R$-modules $H^{0}\left(\mathbf{P}_{R}^{n}, \mathcal{F}(d)\right)$ for $k \leq d<k_{+}$. Note that we use part (3) for $i=0$ here. Hence $M_{k} / M_{k_{+}}$is a fortiori a finite $R\left[T_{0}, \ldots, T_{n}\right]$-module. In other words, we have sandwiched $M_{k}$ between two finite $R\left[T_{0}, \ldots, T_{n}\right]$-modules and we win.

0AG6 Lemma 29.14.2. Let $A$ be a graded ring such that $A_{0}$ is Noetherian and $A$ is generated by finitely many elements of $A_{1}$ over $A_{0}$. Set $X=\operatorname{Proj}(A)$. Then $X$ is a Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module.
(1) There exists an $r \geq 0$ and $d_{1}, \ldots, d_{r} \in \mathbf{Z}$ and a surjection

$$
\bigoplus_{j=1, \ldots, r} \mathcal{O}_{X}\left(d_{j}\right) \longrightarrow \mathcal{F}
$$

(2) For any $p$ the cohomology group $H^{p}(X, \mathcal{F})$ is a finite $A_{0}$-module.
(3) If $p>0$, then $H^{p}(X, \mathcal{F}(d))=0$ for all d large enough.
(4) For any $k \in \mathbf{Z}$ the graded $A$-module

$$
\bigoplus_{d \geq k} H^{0}(X, \mathcal{F}(d))
$$

is a finite $A$-module.
Proof. By assumption there exists a surjection of graded $A_{0}$-algebras

$$
A_{0}\left[T_{0}, \ldots, T_{n}\right] \longrightarrow A
$$

where $\operatorname{deg}\left(T_{j}\right)=1$ for $j=0, \ldots, n$. By Constructions, Lemma 26.11.5 this defines a closed immersion $i: X \rightarrow \mathbf{P}_{A_{0}}^{n}$ such that $i^{*} \mathcal{O}_{\mathbf{P}_{A_{0}}^{n}}(1)=\mathcal{O}_{X}(1)$. In particular, $X$
is Noetherian as a closed subscheme of the Noetherian scheme $\mathbf{P}_{A_{0}}^{n}$. We claim that the results of the lemma for $\mathcal{F}$ follow from the corresponding results of Lemma 29.14.1 for the coherent sheaf $i_{*} \mathcal{F}$ (Lemma 29.9.8) on $\mathbf{P}_{A_{0}}^{n}$. For example, by this lemma there exists a surjection

$$
\bigoplus_{j=1, \ldots, r} \mathcal{O}_{\mathbf{P}_{A_{0}}^{n}}\left(d_{j}\right) \longrightarrow i_{*} \mathcal{F}
$$

By adjunction this corresponds to a map $\bigoplus_{j=1, \ldots, r} \mathcal{O}_{X}\left(d_{j}\right) \longrightarrow \mathcal{F}$ which is surjective as well. The statements on cohomology follow from the fact that $H^{p}(X, \mathcal{F}(d))=$ $H^{p}\left(\mathbf{P}_{A_{0}}^{n}, i_{*} \mathcal{F}(d)\right)$ by Lemma 29.2 .4

0B5Q Lemma 29.14.3. Let $A$ be a Noetherian graded ring. Set $X=\operatorname{Proj}(A)$. Then $X$ is a Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module.
(1) There exists an $r \geq 0$ and $d_{1}, \ldots, d_{r} \in \mathbf{Z}$ and a surjection

$$
\bigoplus_{j=1, \ldots, r} \mathcal{O}_{X}\left(d_{j}\right) \longrightarrow \mathcal{F}
$$

(2) For any $p$ the cohomology group $H^{p}(X, \mathcal{F})$ is a finite $A_{0}$-module.
(3) If $p>0$, then $H^{p}(X, \mathcal{F}(d))=0$ for all d large enough.
(4) For any $k \in \mathbf{Z}$ the graded $A$-module

$$
\bigoplus_{d \geq k} H^{0}(X, \mathcal{F}(d))
$$

is a finite $A$-module.
Proof. We will prove this by reducing the statement to Lemma 29.14.2. By Algebra, Lemmas 10.57 .2 and 10.57 .1 the ring $A_{0}$ is Noetherian and $A$ is generated over $A_{0}$ by finitely many elements $f_{1}, \ldots, f_{r}$ homogeneous of positive degree. Let $d=\operatorname{lcm}\left(\operatorname{deg}\left(f_{i}\right)\right)$. Set $A^{\prime}=A^{(d)}$ with notation as in Algebra, Section 10.55 Observe that $A^{\prime}$ is generated over $A_{0}$ by the monomials $f_{1}^{e_{1}} \ldots f_{r}^{e_{r}} \in A_{1}^{\prime}=A_{d}$ with $\sum e_{i}=d$. Thus Lemma 29.14 .2 applies to $X^{\prime}=\operatorname{Proj}\left(A^{\prime}\right)$.

By Constructions, Lemma 26.11.8 there exist an isomorphism of schemes $i: X \rightarrow$ $X^{\prime}$ and isomorphisms $\mathcal{O}_{X}(n d) \rightarrow i^{*} \mathcal{O}_{X^{\prime}}(n)$ compatible with the map $A^{\prime} \rightarrow A$ and the maps $A_{n} \rightarrow H^{0}\left(X, \mathcal{O}_{X}(n)\right.$ and $A_{n}^{\prime} \rightarrow H^{0}\left(X^{\prime}, \mathcal{O}_{X^{\prime}}(n)\right)$. Thus Lemma 29.14.2 implies $X$ is Noetherian and that (1) and (2) hold. To see (3) and (4) we can use that for any fixed $k, p$, and $q$ we have

$$
\bigoplus_{d n+q \geq k} H^{p}(X, \mathcal{F}(d n+q))=\bigoplus_{d n+q \geq k} H^{p}\left(X^{\prime},\left(i_{*} \mathcal{F}(q)\right)(n)\right.
$$

by the compatibilities above. If $p>0$, we have the vanishing of the right hand side for $k$ depending on $q$ large enough by Lemma 29.14.2. Since there are only a finite number of congruence classes of integers modulo $d$, we see that (3) holds for $\mathcal{F}$ on $X$. If $p=0$, then we have that the right hand side is a finite $A^{\prime}$-module by Lemma 29.14.2. Using the finiteness of congruence classes once more, we find that $\bigoplus_{n \geq k} H^{0}(X, \mathcal{F}(n))$ is a finite $A^{\prime}$-module too. Since the $A^{\prime}$-module structure comes from the $A$-module structure (by the compatibilities mentioned above), we conclude it is finite as an $A$-module as well.

0AG7 Lemma 29.14.4. Let $A$ be a graded ring such that $A_{0}$ is Noetherian and $A$ is generated by finitely many elements of $A_{1}$ over $A_{0}$. Let $M$ be a finite graded $A$-module.

Set $X=\operatorname{Proj}(A)$ and let $\widetilde{M}$ be the quasi-coherent $\mathcal{O}_{X}$-module on $X$ associated to M. The maps

$$
M_{n} \longrightarrow \Gamma(X, \widetilde{M}(n))
$$

from Constructions, Lemma 26.10.3 are isomorphisms for all sufficiently large $n$.
Proof. Because $M$ is a finite $A$-module we see that $\widetilde{M}$ is a finite type $\mathcal{O}_{X}$-module, i.e., a coherent $\mathcal{O}_{X}$-module. Set $N=\bigoplus_{n \geq 0} \Gamma(X, \widetilde{M}(n))$. We have to show that the map $M \rightarrow N$ of graded $A$-modules is an isomorphism in all sufficiently large degrees. By Properties, Lemma 27.28 .5 we have a canonical isomorphism $\widetilde{N} \rightarrow \widetilde{M}$ such that $M_{n} \rightarrow N_{n}=\Gamma(X, \widetilde{M}(n))$ is the canonical map. Let $K=\operatorname{Ker}(M \rightarrow N)$ and $Q=\operatorname{Coker}(M \rightarrow N)$. Recall that the functor $M \mapsto \widetilde{M}$ is exact, see Constructions, Lemma 26.8.4. Hence we see that $\widetilde{K}=0$ and $\widetilde{Q}=0$. On the other hand, $A$ is a Noetherian ring and $M$ and $N$ are finitely generated $A$-modules (for $N$ this follows from the last part of Lemma 29.14.2. Hence $K$ and $Q$ are finite $A$-modules. Thus it suffices to show that a finite $A$-module $K$ with $\widetilde{K}=0$ has only finitely many nonzero homogeneous parts $K_{d}$. To do this, let $x_{1}, \ldots, x_{r} \in K$ be homogeneous generators say sitting in degrees $d_{1}, \ldots, d_{r}$. Let $f_{1}, \ldots, f_{n} \in A_{1}$ be elements generating $A$ over $A_{0}$. For each $i$ and $j$ there exists an $n_{i j} \geq 0$ such that $f_{i}^{n_{i j}} x_{j}=0$ in $K_{d_{j}+n_{i j}}$ : if not then $x_{i} / f_{i}^{d_{i}} \in K_{\left(f_{i}\right)}$ would not be zero, i.e., $\widetilde{K}$ would not be zero. Then we see that $K_{d}$ is zero for $d>\max _{j}\left(d_{j}+\sum_{i} n_{i j}\right)$ as every element of $K_{d}$ is a sum of terms where each term is a monomials in the $f_{i}$ times one of the $x_{j}$ of total degree $d$.
0B5R Lemma 29.14.5. Let $A$ be a Noetherian graded ring. Let $M$ be a finite graded A-module. Set $X=\operatorname{Proj}(A)$ and let $\widetilde{M}$ be the quasi-coherent $\mathcal{O}_{X}$-module on $X$ associated to $M$. Let $k \in \mathbf{Z}$.
(1) $N^{\prime}=\bigoplus_{n \geq k} H^{0}(X, \widetilde{M(n)})$ is a finite A-module,
(2) $N=\bigoplus_{n \geq k} H^{0}(X, \widetilde{M}(n))$ is a finite $A$-module,
(3) there is a canonical map $N \rightarrow N^{\prime}$,
(4) if $k$ is small enough there is a canonical map $M \rightarrow N^{\prime}$,
(5) the map $M_{n} \rightarrow N_{n}^{\prime}$ is an isomorphism for $n \gg 0$,
(6) there exists an integer $d$ such that $N_{n} \rightarrow N_{n}^{\prime}$ is an isomorphism for $d \mid n$.

Proof. The map $N \rightarrow N^{\prime}$ in (3) comes from Constructions, Equation 26.10.1.5 by taking global sections.

By Constructions, Equation 26.10.1.6 there is a map of graded $A$-modules $M \rightarrow$ $\bigoplus_{n \in \mathbf{Z}} H^{0}(X, \widetilde{M(n)})$. If the generators of $M$ sit in degrees $\geq k$, then the image is contained in the submodule $N^{\prime} \subset \bigoplus_{n \in \mathbf{Z}} H^{0}(X, \widetilde{M(n)})$ and we get the map in (4).
By Algebra, Lemmas 10.57 .2 and 10.57 .1 the ring $A_{0}$ is Noetherian and $A$ is generated over $A_{0}$ by finitely many elements $f_{1}, \ldots, f_{r}$ homogeneous of positive degree. Let $d=\operatorname{lcm}\left(\operatorname{deg}\left(f_{i}\right)\right)$. Then we see that (6) holds for example by Constructions, Lemma 26.10.4.
Because $M$ is a finite $A$-module we see that $\widetilde{M}$ is a finite type $\mathcal{O}_{X}$-module, i.e., a coherent $\mathcal{O}_{X}$-module. Thus part (2) follows from Lemma 29.14.3.
We will deduce (1) from (2) using a trick. For $q \in\{0, \ldots, d-1\}$ write

$$
{ }^{q} N=\bigoplus_{n+q \geq k} H^{0}(X, \widetilde{M(q)}(n))
$$

By part (2) these are finite $A$-modules. The Noetherian ring $A$ is finite over $A^{(d)}=$ $\bigoplus_{n \geq 0} A_{d n}$, because it is generated by $f_{i}$ over $A^{(d)}$ and $f_{i}^{d} \in A^{(d)}$. Hence ${ }^{q} N$ is a finite $A^{(d)}$-module. Moreover, $A^{(d)}$ is Noetherian (follows from Algebra, Lemma 10.56.9). It follows that the $A^{(d)}$-submodule ${ }^{q} N^{(d)}=\bigoplus_{n \in \mathbf{Z}}{ }^{q} N_{d n}$ is a finite module over $A^{(d)}$. Using the isomorphisms $\widetilde{M(d n+q)}=\widetilde{M(q)}(d n)$ we can write

$$
N^{\prime}=\bigoplus_{q \in\{0, \ldots, d-1\}} \bigoplus_{d n+q \geq k} H^{0}(X, \widetilde{M(q)}(d n))=\bigoplus_{q \in\{0, \ldots, d-1\}}{ }^{q} N^{(d)}
$$

Thus $N^{\prime}$ is finite over $A^{(d)}$ and a fortiori finite over $A$. Thus (1) is true.
Let $K$ be a finite $A$-module such that $\widetilde{K}=0$. We claim that $K_{n}=0$ for $d \mid n$ and $n \gg 0$. Arguing as above we see that $K^{(d)}$ is a finite $A^{(d)}$-module. Let $x_{1}, \ldots, x_{m} \in K$ be homogeneous generators of $K^{(d)}$ over $A^{(d)}$, say sitting in degrees $d_{1}, \ldots, d_{m}$ with $d \mid d_{j}$. For each $i$ and $j$ there exists an $n_{i j} \geq 0$ such that $f_{i}^{n_{i j}} x_{j}=0$ in $K_{d_{j}+n_{i j}}$ : if not then $x_{j} / f_{i}^{d_{i} / \operatorname{deg}\left(f_{i}\right)} \in K_{\left(f_{i}\right)}$ would not be zero, i.e., $\widetilde{K}$ would not be zero. Here we use that $\operatorname{deg}\left(f_{i}\right)|d| d_{j}$ for all $i, j$. We conclude that $K_{n}$ is zero for $n$ with $d \mid n$ and $n>\max _{j}\left(d_{j}+\sum_{i} n_{i j} \operatorname{deg}\left(f_{i}\right)\right)$ as every element of $K_{n}$ is a sum of terms where each term is a monomials in the $f_{i}$ times one of the $x_{j}$ of total degree $n$.

To finish the proof, we have to show that $M \rightarrow N^{\prime}$ is an isomorphism in all sufficiently large degrees. The map $N \rightarrow N^{\prime}$ induces an isomorphism $\widetilde{N} \rightarrow \widetilde{N^{\prime}}$ because on the affine opens $D_{+}\left(f_{i}\right)=D_{+}\left(f_{i}^{d}\right)$ the corresponding modules are isomorphic: $N_{\left(f_{i}\right)} \cong N_{\left(f_{i}^{d}\right)} \cong N_{\left(f_{i}^{d}\right)}^{\prime} \cong N_{\left(f_{i}\right)}^{\prime}$ by property (6). By Properties, Lemma 27.28.5 we have a canonical isomorphism $\widetilde{N} \rightarrow \widetilde{M}$. The composition $\widetilde{N} \rightarrow \widetilde{M} \rightarrow \widetilde{N^{\prime}}$ is the isomorphism above (proof omitted; hint: look on standard affine opens to check this). Thus the map $M \rightarrow N^{\prime}$ induces an isomorphism $\widetilde{M} \rightarrow \widetilde{N^{\prime}}$. Let $K=\operatorname{Ker}\left(M \rightarrow N^{\prime}\right)$ and $Q=\operatorname{Coker}\left(M \rightarrow N^{\prime}\right)$. Recall that the functor $M \mapsto \widetilde{M}$ is exact, see Constructions, Lemma 26.8.4. Hence we see that $\widetilde{K}=0$ and $\widetilde{Q}=0$. By the result of the previous paragraph we see that $K_{n}=0$ and $Q_{n}=0$ for $d \mid n$ and $n \gg 0$. At this point we finally see the advantage of using $N^{\prime}$ over $N$ : the functor $M \rightsquigarrow N^{\prime}$ is compatible with shifts (immediate from the construction). Thus, repeating the whole argument with $M$ replaced by $M(q)$ we find that $K_{n}=0$ and $Q_{n}=0$ for $n \equiv q \bmod d$ and $n \gg 0$. Since there are only finitely many congruence classes modulo $n$ the proof is finished.

### 29.15. Higher direct images along projective morphisms

0B5S We first state and prove a result for when the base is affine and then we deduce some results for projective morphisms.

0B5T Lemma 29.15.1. Let $R$ be a Noetherian ring. Let $X \rightarrow \operatorname{Spec}(R)$ be a proper morphism. Let $\mathcal{L}$ be an ample invertible sheaf on $X$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X^{-}}$ module.
(1) The graded ring $A=\bigoplus_{d \geq 0} H^{0}\left(X, \mathcal{L}^{\otimes d}\right)$ is a finitely generated $R$-algebra.
(2) There exists an $r \geq 0$ and $d_{1}, \ldots, d_{r} \in \mathbf{Z}$ and a surjection

$$
\bigoplus_{j=1, \ldots, r} \mathcal{L}^{\otimes d_{j}} \longrightarrow \mathcal{F} .
$$

(3) For any $p$ the cohomology group $H^{p}(X, \mathcal{F})$ is a finite $R$-module.
(4) If $p>0$, then $H^{p}\left(X, \mathcal{F} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes d}\right)=0$ for all d large enough.
(5) For any $k \in \mathbf{Z}$ the graded $A$-module

$$
\bigoplus_{d \geq k} H^{0}\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes d}\right)
$$

is a finite $A$-module.
Proof. By Morphisms, Lemma 28.39.4 there exists a $d>0$ and an immersion $i: X \rightarrow \mathbf{P}_{R}^{n}$ such that $\mathcal{L}^{\otimes d} \cong i^{*} \mathcal{O}_{\mathbf{P}_{R}^{n}}(1)$. Since $X$ is proper over $R$ the morphism $i$ is a closed immersion (Morphisms, Lemma 28.41.7). Thus we have $H^{i}(X, \mathcal{G})=$ $H^{i}\left(\mathbf{P}_{R}^{n}, i_{*} \mathcal{G}\right)$ for any quasi-coherent sheaf $\mathcal{G}$ on $X$ (by Lemma 29.2.4 and the fact that closed immersions are affine, see Morphisms, Lemma 28.12.9). Moreover, if $\mathcal{G}$ is coherent, then $i_{*} \mathcal{G}$ is coherent as well (Lemma 29.9.8). We will use these facts without further mention.
Proof of (1). Set $S=R\left[T_{0}, \ldots, T_{n}\right]$ so that $\mathbf{P}_{R}^{n}=\operatorname{Proj}(S)$. Observe that $A$ is an $S$-algebra (but the ring map $S \rightarrow A$ is not a homomorphism of graded rings because $S_{n}$ maps into $A_{d n}$ ). By the projection formula (Cohomology, Lemma 20.43.2 we have

$$
i_{*}\left(\mathcal{L}^{\otimes n d+q}\right)=i_{*}\left(\mathcal{L}^{\otimes q}\right) \otimes_{\mathcal{O}_{\mathbf{P}_{R}^{n}}} \mathcal{O}_{\mathbf{P}_{R}^{n}}(n)
$$

for all $n \in \mathbf{Z}$. We conclude that $\bigoplus_{n>0} A_{n d+q}$ is a finite graded $S$-module by Lemma 29.14.1 Since $A=\bigoplus_{q \in\{0, \ldots, d-1} \bigoplus_{n \geq 0} A_{n d+q}$ we see that $A$ is finite as an $S$-algebra, hence (1) is true.
Proof of (2). This follows from Properties, Proposition 27.26.13
Proof of (3). Apply Lemma 29.14.1 and use $H^{p}(X, \mathcal{F})=H^{p}\left(\mathbf{P}_{R}^{n}, i_{*} \mathcal{F}\right)$.
Proof of (4). Fix $p>0$. By the projection formula we have

$$
i_{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n d+q}\right)=i_{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes q}\right) \otimes_{\mathcal{O}_{\mathbf{P}_{R}^{n}}} \mathcal{O}_{\mathbf{P}_{R}^{n}}(n)
$$

for all $n \in \mathbf{Z}$. By Lemma 29.14.1 we conclude that $H^{p}\left(X, \mathcal{F} \otimes \mathcal{L}^{n d+q}\right)=0$ for $n \gg 0$. Since there are only finitely many congruence classes of integers modulo $d$ this proves (4).
Proof of (5). Fix an integer $k$. Set $M=\bigoplus_{n \geq k} H^{0}\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}\right)$. Arguing as above we conclude that $\bigoplus_{n d+q \geq k} A_{n d+q}$ is a finite graded $S$-module. Since $M=$ $\bigoplus_{q \in\{0, \ldots, d-1\}} \bigoplus_{n d+q \geq k} M_{n d+q}$ we see that $M$ is finite as an $S$-module. Since the $S$-module structure factors through the ring map $S \rightarrow A$, we conclude that $M$ is finite as an $A$-module.

02O1 Lemma 29.15.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $\mathcal{L}$ be an invertible sheaf on $X$. Assume that
(1) $S$ is Noetherian,
(2) $f$ is proper,
(3) $\mathcal{F}$ is coherent, and
(4) $\mathcal{L}$ is relatively ample on $X / S$.

Then there exists an $n_{0}$ such that for all $n \geq n_{0}$ we have

$$
R^{p} f_{*}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)=0
$$

for all $p>0$.

Proof. Choose a finite affine open covering $S=\bigcup V_{j}$ and set $X_{j}=f^{-1}\left(V_{j}\right)$. Clearly, if we solve the question for each of the finitely many systems $\left(X_{j} \rightarrow\right.$ $\left.V_{j},\left.\mathcal{L}\right|_{X_{j}},\left.\mathcal{F}\right|_{V_{j}}\right)$ then the result follows. Thus we may assume $S$ is affine. In this case the vanishing of $R^{p} f_{*}\left(\mathcal{F} \otimes \mathcal{L}^{\otimes n}\right)$ is equivalent to the vanishing of $H^{p}\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}\right)$, see Lemma 29.4.6. Thus the required vanishing follows from Lemma 29.15.1 (which applies because $\mathcal{L}$ is ample on $X$ by Morphisms, Lemma 28.39.4.

02O4 Lemma 29.15.3. Let $S$ be a locally Noetherian scheme. Let $f: X \rightarrow S$ be a locally projective morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then $R^{i} f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{S}$-module for all $i \geq 0$.
Proof. We first remark that a locally projective morphism is proper (Morphisms, Lemma 28.42.5 and hence of finite type. In particular $X$ is locally Noetherian (Morphisms, Lemma 28.15.6) and hence the statement makes sense. Moreover, by Lemma 29.4.5 the sheaves $R^{p} f_{*} \mathcal{F}$ are quasi-coherent.

Having said this the statement is local on $S$ (for example by Cohomology, Lemma 20.8.4. Hence we may assume $S=\operatorname{Spec}(R)$ is the spectrum of a Noetherian ring, and $X$ is a closed subscheme of $\mathbf{P}_{R}^{n}$ for some $n$, see Morphisms, Lemma 28.42.4. In this case, the sheaves $R^{p} f_{*} \mathcal{F}$ are the quasi-coherent sheaves associated to the $R$-modules $H^{p}(X, \mathcal{F})$, see Lemma 29.4.6 Hence it suffices to show that $R$-modules $H^{p}(X, \mathcal{F})$ are finite $R$-modules (Lemma 29.9.1). This follows from Lemma 29.15.1 (because the restriction of $\mathcal{O}_{\mathbf{P}_{R}^{n}}(1)$ to $X$ is ample on $X$ ).

### 29.16. Ample invertible sheaves and cohomology

01 XO Here is a criterion for ampleness on proper schemes over affine bases in terms of vanshing of cohomology after twisting.
0B5U Lemma 29.16.1. Let $R$ be a Noetherian ring. Let $f: X \rightarrow \operatorname{Spec}(R)$ be a proper morphism. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{L}$ is ample on $X$ (this is equivalent to many other things, see Properties, Proposition 27.26.13 and Morphisms, Lemma 28.39.4,
(2) for every coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ there exists an $n_{0} \geq 0$ such that $H^{p}(X, \mathcal{F} \otimes$ $\left.\mathcal{L}^{\otimes n}\right)=0$ for all $n \geq n_{0}$ and $p>0$, and
(3) for every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$, there exists an $n \geq 1$ such that $H^{1}\left(X, \mathcal{I} \otimes \mathcal{L}^{\otimes n}\right)=0$.
Proof. The implication $(1) \Rightarrow(2)$ follows from Lemma 29.15.1. The implication $(2) \Rightarrow(3)$ is trivial. The implication $(3) \Rightarrow(1)$ is Lemma 29.3.3
0B5V Lemma 29.16.2. Let $R$ be a Noetherian ring. Let $f: Y \rightarrow X$ be a morphism of schemes proper over $R$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume $f$ is finite and surjective. Then $\mathcal{L}$ is ample if and only if $f^{*} \mathcal{L}$ is ample.

Proof. The pullback of an ample invertible sheaf by a quasi-affine morphism is ample, see Morphisms, Lemma 28.37.7. This proves one of the implications as a finite morphism is affine by definition. To prove the other we will use the criterion of Lemma 29.16.1

Assume that $f^{*} \mathcal{L}$ is ample. Let $P$ be the following property on coherent $\mathcal{O}_{X^{-}}$ modules $\mathcal{F}$ : there exists an $n_{0}$ such that $H^{p}\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}\right)=0$ for all $n \geq n_{0}$ and $p>0$. We will prove that $P$ holds for any coherent $\mathcal{O}_{X}$-module $\mathcal{F}$, which suffices
to prove that $\mathcal{L}$ is ample. We are going to apply Lemma 29.12.8. Thus we have to verify (1), (2) and (3) of that lemma for $P$. Property (1) follows from the long exact cohomology sequence associated to a short exact sequence of sheaves and the fact that tensoring with an invertible sheaf is an exact functor. Property (2) follows since $H^{p}(X,-)$ is an additive functor. To see (3) let $Z \subset X$ be an integral closed subscheme with generic point $\xi$. Let $\mathcal{F}$ be a coherent sheaf on $Y$ such that the support of $f_{*} \mathcal{F}$ is equal to $Z$ and $\left(f_{*} \mathcal{F}\right)_{\xi}$ is annihilated by $\mathfrak{m}_{\xi}$, see Lemma 29.13.1. We claim that taking $\mathcal{G}=f_{*} \mathcal{F}$ works. We only have to verify part (3)(c) of Lemma 29.12.8. Hence assume that $\mathcal{J} \subset \mathcal{O}_{X}$ is a quasi-coherent sheaf of ideals such that $\mathcal{J}_{\xi}=\mathcal{O}_{X, \xi}$. A finite morphism is affine hence by Lemma 29.13.2 we see that $\mathcal{J G}=f_{*}\left(f^{-1} \mathcal{J} \mathcal{F}\right)$. Also, as pointed out in the proof of Lemma 29.13.2 the sheaf $f^{-1} \mathcal{J F}$ is a coherent $\mathcal{O}_{Y}$-module. By assumption we see that there exists an $n_{0}$ such that

$$
H^{p}\left(Y, f^{-1} \mathcal{J} \mathcal{F} \otimes_{\mathcal{O}_{Y}} f^{*} \mathcal{L}^{\otimes n}\right)=0
$$

for $n \geq n_{0}$ and $p>0$. Since $f$ is finite, hence affine, we see that

$$
\begin{aligned}
H^{p}\left(X, \mathcal{J G} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right) & =H^{p}\left(X, f_{*}\left(f^{-1} \mathcal{J F}\right) \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right) \\
& \left.=H^{p}\left(X, f_{*}\left(f^{-1} \mathcal{J F}\right) \otimes_{\mathcal{O}_{Y}} f^{*} \mathcal{L}^{\otimes n}\right)\right) \\
& =H^{p}\left(Y, f^{-1} \mathcal{J \mathcal { F }} \otimes_{\mathcal{O}_{Y}} f^{*} \mathcal{L}^{\otimes n}\right)=0
\end{aligned}
$$

by references cited earlier in this proof. Hence the quasi-coherent subsheaf $\mathcal{G}^{\prime}=\mathcal{J G}$ satisfies $P$. This verifies property (3)(c) of Lemma 29.12.8 as desired.

Cohomology is functorial. In particular, given a ringed space $X$, an invertible $\mathcal{O}_{X}$-module $\mathcal{L}$, a section $s \in \Gamma(X, \mathcal{L})$ we get maps

$$
H^{p}(X, \mathcal{F}) \longrightarrow H^{p}\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}\right), \quad \xi \longmapsto s \xi
$$

induced by the map $\mathcal{F} \rightarrow \mathcal{F} \otimes \mathcal{O}_{X} \mathcal{L}$ which is multiplication by $s$. We set $\Gamma_{*}(X, \mathcal{L})=$ $\bigoplus_{n>0} \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ as a graded ring, see Modules, Definition 17.21.7. Given a sheaf of $\mathcal{O}_{X}$-modules $\mathcal{F}$ and an integer $p \geq 0$ we set

$$
H_{*}^{p}(X, \mathcal{L}, \mathcal{F})=\bigoplus_{n \in \mathbf{Z}} H^{p}\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)
$$

This is a graded $\Gamma_{*}(X, \mathcal{L})$-module by the multiplication defined above. Warning: the notation $H_{*}^{p}(X, \mathcal{L}, \mathcal{F})$ is nonstandard.

09MR Lemma 29.16.3. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible sheaf on $X$. Let $s \in \Gamma(X, \mathcal{L})$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $X$ is quasi-compact and quasi-separated, the canonical map

$$
H_{*}^{p}(X, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow H^{p}\left(X_{s}, \mathcal{F}\right)
$$

which maps $\xi / s^{n}$ to $s^{-n} \xi$ is an isomorphism.
Proof. Note that for $p=0$ this is Properties, Lemma 27.17.2. We will prove the statement using the induction principle (Lemma 29.4.1) where for $U \subset X$ quasicompact open we let $P(U)$ be the property: for all $p \geq 0$ the map

$$
H_{*}^{p}(U, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow H^{p}\left(U_{s}, \mathcal{F}\right)
$$

is an isomorphism.
If $U$ is affine, then both sides of the arrow displayed above are zero for $p>0$ by Lemma 29.2.2 and Properties, Lemma 27.26.4 and the statement is true. If $P$ is true
for $U, V$, and $U \cap V$, then we can use the Mayer-Vietoris sequences (Cohomology, Lemma 20.9.2 to obtain a map of long exact sequences

(only a snippet shown). Observe that $U_{s} \cap V_{s}=(U \cap V)_{s}$ and that $U_{s} \cup V_{s}=(U \cup V)_{s}$. Thus the left and right vertical maps are isomorphisms (as well as one more to the right and one more to the left which are not shown in the diagram). We conclude that $P(U \cup V)$ holds by the 5 -lemma (Homology, Lemma 12.5.20). This finishes the proof.

01XR Lemma 29.16.4. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Assume that
(1) $X$ is quasi-compact and quasi-separated, and
(2) $X_{s}$ is affine.

Then for every quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ and every $p>0$ and all $\xi \in H^{p}(X, \mathcal{F})$ there exists an $n \geq 0$ such that $s^{n} \xi=0$ in $H^{p}\left(X, \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)$.

Proof. Recall that $H^{p}\left(X_{s}, \mathcal{G}\right)$ is zero for every quasi-coherent module $\mathcal{G}$ by Lemma 29.2.2. Hence the lemma follows from Lemma 29.16.3.

For a more general version of the following lemma see Limits, Lemma 31.10.4
09MS Lemma 29.16.5. Let $i: Z \rightarrow X$ be a closed immersion of Noetherian schemes inducing a homeomorphism of underlying topological spaces. Let $\mathcal{L}$ be an invertible sheaf on $X$. Then $i^{*} \mathcal{L}$ is ample on $Z$, if and only if $\mathcal{L}$ is ample on $X$.

Proof. If $\mathcal{L}$ is ample, then $i^{*} \mathcal{L}$ is ample for example by Morphisms, Lemma 28.37.7. Assume $i^{*} \mathcal{L}$ is ample. We have to show that $\mathcal{L}$ is ample on $X$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the coherent sheaf of ideals cutting out the closed subscheme $Z$. Since $i(Z)=X$ set theoretically we see that $\mathcal{I}^{n}=0$ for some $n$ by Lemma 29.10.2 Consider the sequence

$$
X=Z_{n} \supset Z_{n-1} \supset Z_{n-2} \supset \ldots \supset Z_{1}=Z
$$

of closed subschemes cut out by $0=\mathcal{I}^{n} \subset \mathcal{I}^{n-1} \subset \ldots \subset \mathcal{I}$. Then each of the closed immersions $Z_{i} \rightarrow Z_{i-1}$ is defined by a coherent sheaf of ideals of square zero. In this way we reduce to the case that $\mathcal{I}^{2}=0$.
Consider the short exact sequence

$$
0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X} \rightarrow i_{*} \mathcal{O}_{Z} \rightarrow 0
$$

of quasi-coherent $\mathcal{O}_{X}$-modules. Tensoring with $\mathcal{L}^{\otimes n}$ we obtain short exact sequences
0B8T

$$
\begin{equation*}
0 \rightarrow \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n} \rightarrow \mathcal{L}^{\otimes n} \rightarrow i_{*} i^{*} \mathcal{L}^{\otimes n} \rightarrow 0 \tag{29.16.5.1}
\end{equation*}
$$

As $\mathcal{I}^{2}=0$, we can use Morphisms, Lemma 28.4.1 to think of $\mathcal{I}$ as a quasi-coherent $\mathcal{O}_{Z}$-module and then $\mathcal{I} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes n}=\mathcal{I} \otimes \mathcal{O}_{Z} i^{*} \mathcal{L}^{\otimes n}$ with obvious abuse of notation. Moreover, the cohomology of this sheaf over $Z$ is canonically the same as the cohomology of this sheaf over $X$ (as $i$ is a homeomorphism).

Let $x \in X$ be a point and denote $z \in Z$ the corresponding point. Because $i^{*} \mathcal{L}$ is ample there exists an $n$ and a section $s \in \Gamma\left(Z, i^{*} \mathcal{L}^{\otimes n}\right)$ with $z \in Z_{s}$ and with $Z_{s}$ affine. The obstruction to lifting $s$ to a section of $\mathcal{L}^{\otimes n}$ over $X$ is the boundary

$$
\xi=\partial s \in H^{1}\left(X, \mathcal{I} \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes n}\right)=H^{1}\left(Z, \mathcal{I} \otimes_{\mathcal{O}_{Z}} i^{*} \mathcal{L}^{\otimes n}\right)
$$

coming from the short exact sequence of sheaves 29.16.5.1. If we replace $s$ by $s^{e+1}$ then $\xi$ is replaced by $\partial\left(s^{e+1}\right)=(e+1) s^{e} \xi$ in $H^{1}\left(Z, \mathcal{I} \otimes_{\mathcal{O}_{Z}} i^{*} \mathcal{L}^{\otimes(e+1) n}\right)$ because the boundary map for

$$
0 \rightarrow \bigoplus_{m \geq 0} \mathcal{I} \otimes \mathcal{O}_{X} \mathcal{L}^{\otimes m} \rightarrow \bigoplus_{m \geq 0} \mathcal{L}^{\otimes m} \rightarrow \bigoplus_{m \geq 0} i_{*} i^{*} \mathcal{L}^{\otimes m} \rightarrow 0
$$

is a derivation by Cohomology, Lemma 20.26.3. By Lemma 29.16.4 we see that $s^{e} \xi$ is zero for $e$ large enough. Hence, after replacing $s$ by a power, we can assume $s$ is the image of a section $s^{\prime} \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$. Then $X_{s^{\prime}}$ is an open subscheme and $Z_{s} \rightarrow X_{s^{\prime}}$ is a surjective closed immersion of Noetherian schemes with $Z_{s}$ affine. Hence $X_{s}$ is affine by Lemma 29.13.3 and we conclude that $\mathcal{L}$ is ample.

For a more general version of the following lemma see Limits, Lemma 31.10.5
0B7K Lemma 29.16.6. Let $i: Z \rightarrow X$ be a closed immersion of Noetherian schemes inducing a homeomorphism of underlying topological spaces. Then $X$ is quasi-affine if and only if $Z$ is quasi-affine.

Proof. Recall that a scheme is quasi-affine if and only if the structure sheaf is ample, see Properties, Lemma 27.27.1. Hence if $Z$ is quasi-affine, then $\mathcal{O}_{Z}$ is ample, hence $\mathcal{O}_{X}$ is ample by Lemma 29.16.5, hence $X$ is quasi-affine. A proof of the converse, which can also be seen in an elementary way, is gotten by reading the argument just given backwards.

### 29.17. Chow's Lemma

02 O 2 In this section we prove Chow's lemma in the Noetherian case (Lemma 29.17.1). In Limits, Section 31.11 we prove some variants for the non-Noetherian case.

0200 Lemma 29.17.1. Let $S$ be a Noetherian scheme. Let $f: X \rightarrow S$ be a separated morphism of finite type. Then there exists an $n \geq 0$ and a diagram

where $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is an immersion, and $\pi: X^{\prime} \rightarrow X$ is proper and surjective. Moreover, we may arrange it such that there exists a dense open subscheme $U \subset X$ such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism.
Proof. All of the schemes we will encounter during the rest of the proof are going to be of finite type over the Noetherian scheme $S$ and hence Noetherian (see Morphisms, Lemma 28.15.6). All morphisms between them will automatically be quasi-compact, locally of finite type and quasi-separated, see Morphisms, Lemma 28.15 .8 and Properties, Lemmas 27.5.4 and 27.5.8.

The scheme $X$ has only finitely many irreducible components (Properties, Lemma 27.5.7). Say $X=X_{1} \cup \ldots \cup X_{r}$ is the decomposition of $X$ into irreducible components. Let $\eta_{i} \in X_{i}$ be the generic point. For every point $x \in X$ there exists an affine
open $U_{x} \subset X$ which contains $x$ and each of the generic points $\eta_{i}$. See Properties, Lemma 27.29.4. Since $X$ is quasi-compact, we can find a finite affine open covering $X=U_{1} \cup \ldots \cup U_{m}$ such that each $U_{i}$ contains $\eta_{1}, \ldots, \eta_{r}$. In particular we conclude that the open $U=U_{1} \cap \ldots \cap U_{m} \subset X$ is a dense open. This and the fact that the $U_{i}$ are affine opens covering $X$ is all that we will use below.

Let $X^{*} \subset X$ be the scheme theoretic closure of $U \rightarrow X$, see Morphisms, Definition 28.6.2. Let $U_{i}^{*}=X^{*} \cap U_{i}$. Note that $U_{i}^{*}$ is a closed subscheme of $U_{i}$. Hence $U_{i}^{*}$ is affine. Since $U$ is dense in $X$ the morphism $X^{*} \rightarrow X$ is a surjective closed immersion. It is an isomorphism over $U$. Hence we may replace $X$ by $X^{*}$ and $U_{i}$ by $U_{i}^{*}$ and assume that $U$ is scheme theoretically dense in $X$, see Morphisms, Definition 28.7.1.

By Morphisms, Lemma 28.39.3 we can find an immersion $j_{i}: U_{i} \rightarrow \mathbf{P}_{S}^{n_{i}}$ for each $i$. By Morphisms, Lemma 28.7.7 we can find closed subschemes $Z_{i} \subset \mathbf{P}_{S}^{n_{i}}$ such that $j_{i}: U_{i} \rightarrow Z_{i}$ is a scheme theoretically dense open immersion. Note that $Z_{i} \rightarrow S$ is proper, see Morphisms, Lemma 28.42.5. Consider the morphism

$$
j=\left(\left.j_{1}\right|_{U}, \ldots,\left.j_{n}\right|_{U}\right): U \longrightarrow \mathbf{P}_{S}^{n_{1}} \times_{S} \ldots \times_{S} \mathbf{P}_{S}^{n_{n}} .
$$

By the lemma cited above we can find a closed subscheme $Z$ of $\mathbf{P}_{S}^{n_{1}} \times \times_{S} \ldots \times_{S} \mathbf{P}_{S}^{n_{n}}$ such that $j: U \rightarrow Z$ is an open immersion and such that $U$ is scheme theoretically dense in $Z$. The morphism $Z \rightarrow S$ is proper. Consider the $i$ th projection

$$
\left.\operatorname{pr}_{i}\right|_{Z}: Z \longrightarrow \mathbf{P}_{S}^{n_{i}}
$$

This morphism factors through $Z_{i}$ (see Morphisms, Lemma 28.6.6). Denote $p_{i}$ : $Z \rightarrow Z_{i}$ the induced morphism. This is a proper morphism, see Morphisms, Lemma 28.41.7 for example. At this point we have that $U \subset U_{i} \subset Z_{i}$ are scheme theoretically dense open immersions. Moreover, we can think of $Z$ as the scheme theoretic image of the "diagonal" morphism $U \rightarrow Z_{1} \times_{S} \ldots \times_{S} Z_{n}$.
Set $V_{i}=p_{i}^{-1}\left(U_{i}\right)$. Note that $\left.p_{i}\right|_{V_{i}}: V_{i} \rightarrow U_{i}$ is proper. Set $X^{\prime}=V_{1} \cup \ldots \cup V_{n}$. By construction $X^{\prime}$ has an immersion into the scheme $\mathbf{P}_{S}^{n_{1}} \times{ }_{S} \ldots \times_{S} \mathbf{P}_{S}^{n_{n}}$. Thus by the Segre embedding (see Morphisms, Lemma 28.42.7) we see that $X^{\prime}$ has an immersion into a projective space over $S$.

We claim that the morphisms $\left.p_{i}\right|_{V_{i}}: V_{i} \rightarrow U_{i}$ glue to a morphism $X^{\prime} \rightarrow X$. Namely, it is clear that $\left.p_{i}\right|_{U}$ is the identity map from $U$ to $U$. Since $U \subset X^{\prime}$ is scheme theoretically dense by construction, it is also scheme theoretically dense in the open subscheme $V_{i} \cap V_{j}$. Thus we see that $\left.p_{i}\right|_{V_{i} \cap V_{j}}=p_{j} \mid V_{i} \cap V_{j}$ as morphisms into the separated $S$-scheme $X$, see Morphisms, Lemma 28.7.10 We denote the resulting morphism $\pi: X^{\prime} \rightarrow X$.
We claim that $\pi^{-1}\left(U_{i}\right)=V_{i}$. Since $\left.\pi\right|_{V_{i}}=\left.p_{i}\right|_{V_{i}}$ it follows that $V_{i} \subset \pi^{-1}\left(U_{i}\right)$. Consider the diagram

Since $V_{i} \rightarrow U_{i}$ is proper we see that the image of the horizontal arrow is closed, see Morphisms, Lemma 28.41.7. Since $V_{i} \subset \pi^{-1}\left(U_{i}\right)$ is scheme theoretically dense (as it contains $U$ ) we conclude that $V_{i}=\pi^{-1}\left(U_{i}\right)$ as claimed.

This shows that $\pi^{-1}\left(U_{i}\right) \rightarrow U_{i}$ is identified with the proper morphism $\left.p_{i}\right|_{V_{i}}: V_{i} \rightarrow$ $U_{i}$. Hence we see that $X$ has a finite affine covering $X=\bigcup U_{i}$ such that the restriction of $\pi$ is proper on each member of the covering. Thus by Morphisms, Lemma 28.41.3 we see that $\pi$ is proper.
Finally we have to show that $\pi^{-1}(U)=U$. To see this we argue in the same way as above using the diagram

and using that $\mathrm{id}_{U}: U \rightarrow U$ is proper and that $U$ is scheme theoretically dense in $\pi^{-1}(U)$.

Remark 29.17.2. In the situation of Chow's Lemma 29.17.1
(1) The morphism $\pi$ is actually H-projective (hence projective, see Morphisms, Lemma 28.42.3 since the morphism $X^{\prime} \rightarrow \mathbf{P}_{S}^{n} \times{ }_{S} X=\mathbf{P}_{X}^{n}$ is a closed immersion (use the fact that $\pi$ is proper, see Morphisms, Lemma 28.41.7).
(2) We may assume that $\pi^{-1}(U)$ is scheme theoretically dense in $X^{\prime}$. Namely, we can simply replace $X^{\prime}$ by the scheme theoretic closure of $\pi^{-1}(U)$. In this case we can think of $U$ as a scheme theoretically dense open subscheme of $X^{\prime}$. See Morphisms, Section 28.6.
(3) If $X$ is reduced then we may choose $X^{\prime}$ reduced. This is clear from (2).

### 29.18. Higher direct images of coherent sheaves

02O3 In this section we prove the fundamental fact that the higher direct images of a coherent sheaf under a proper morphism are coherent.
02 O 5 Proposition 29.18.1. Let $S$ be a locally Noetherian scheme. Let $f: X \rightarrow S$ be a proper morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then $R^{i} f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{S}$-module for all $i \geq 0$.

Proof. Since the problem is local on $S$ we may assume that $S$ is a Noetherian scheme. Since a proper morphism is of finite type we see that in this case $X$ is a Noetherian scheme also. Consider the property $\mathcal{P}$ of coherent sheaves on $X$ defined by the rule

$$
\mathcal{P}(\mathcal{F}) \Leftrightarrow R^{p} f_{*} \mathcal{F} \text { is coherent for all } p \geq 0
$$

We are going to use the result of Lemma 29.12 .6 to prove that $\mathcal{P}$ holds for every coherent sheaf on $X$.
Let

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

be a short exact sequence of coherent sheaves on $X$. Consider the long exact sequence of higher direct images

$$
R^{p-1} f_{*} \mathcal{F}_{3} \rightarrow R^{p} f_{*} \mathcal{F}_{1} \rightarrow R^{p} f_{*} \mathcal{F}_{2} \rightarrow R^{p} f_{*} \mathcal{F}_{3} \rightarrow R^{p+1} f_{*} \mathcal{F}_{1}
$$

Then it is clear that if 2 -out-of- 3 of the sheaves $\mathcal{F}_{i}$ have property $\mathcal{P}$, then the higher direct images of the third are sandwiched in this exact complex between two
coherent sheaves. Hence these higher direct images are also coherent by Lemma 29.9 .2 and 29.9.3. Hence property $\mathcal{P}$ holds for the third as well.

Let $Z \subset X$ be an integral closed subscheme. We have to find a coherent sheaf $\mathcal{F}$ on $X$ whose support is contained in $Z$, whose stalk at the generic point $\xi$ of $Z$ is a 1 -dimensional vector space over $\kappa(\xi)$ such that $\mathcal{P}$ holds for $\mathcal{F}$. Denote $g=\left.f\right|_{Z}: Z \rightarrow S$ the restriction of $f$. Suppose we can find a coherent sheaf $\mathcal{G}$ on $Z$ such that (a) $\mathcal{G}_{\xi}$ is a 1-dimensional vector space over $\kappa(\xi)$, (b) $R^{p} g_{*} \mathcal{G}=0$ for $p>0$, and (c) $g_{*} \mathcal{G}$ is coherent. Then we can consider $\mathcal{F}=(Z \rightarrow X)_{*} \mathcal{G}$. As $Z \rightarrow X$ is a closed immersion we see that $(Z \rightarrow X)_{*} \mathcal{G}$ is coherent on $X$ and $R^{p}(Z \rightarrow X)_{*} \mathcal{G}=0$ for $p>0$ (Lemma 29.9.9). Hence by the relative Leray spectral sequence (Cohomology, Lemma 20.14.8) we will have $R^{p} f_{*} \mathcal{F}=R^{p} g_{*} \mathcal{G}=0$ for $p>0$ and $f_{*} \mathcal{F}=g_{*} \mathcal{G}$ is coherent. Finally $\mathcal{F}_{\xi}=\left((Z \rightarrow X)_{*} \mathcal{G}\right)_{\xi}=\mathcal{G}_{\xi}$ which verifies the condition on the stalk at $\xi$. Hence everything depends on finding a coherent sheaf $\mathcal{G}$ on $Z$ which has properties (a), (b), and (c).

We can apply Chow's Lemma 29.17.1 to the morphism $Z \rightarrow S$. Thus we get a diagram

as in the statement of Chow's lemma. Also, let $U \subset Z$ be the dense open subscheme such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism. By the discussion in Remark 29.17.2 we see that $i^{\prime}=(i, \pi): Z^{\prime} \rightarrow \mathbf{P}_{Z}^{n}$ is a closed immersion. Hence

$$
\mathcal{L}=i^{*} \mathcal{O}_{\mathbf{P}_{S}^{n}}(1) \cong\left(i^{\prime}\right)^{*} \mathcal{O}_{\mathbf{P}_{Z}^{n}}(1)
$$

is $g^{\prime}$-relatively ample and $\pi$-relatively ample (for example by Morphisms, Lemma 28.39.7). Hence by Lemma 29.15 .2 there exists an $n \geq 0$ such that both $R^{p} \pi_{*} \mathcal{L}^{\otimes n}=$ 0 for all $p>0$ and $R^{p}\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes n}=0$ for all $p>0$. Set $\mathcal{G}=\pi_{*} \mathcal{L}^{\otimes n}$. Property (a) holds because $\left.\pi_{*} \mathcal{L}^{\otimes}\right|_{U}$ is an invertible sheaf (as $\pi^{-1}(U) \rightarrow U$ is an isomorphism). Properties (b) and (c) hold because by the relative Leray spectral sequence (Cohomology, Lemma 20.14.8 we have

$$
E_{2}^{p, q}=R^{p} g_{*} R^{q} \pi_{*} \mathcal{L}^{\otimes n} \Rightarrow R^{p+q}\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes n}
$$

and by choice of $n$ the only nonzero terms in $E_{2}^{p, q}$ are those with $q=0$ and the only nonzero terms of $R^{p+q}\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes n}$ are those with $p=q=0$. This implies that $R^{p} g_{*} \mathcal{G}=0$ for $p>0$ and that $g_{*} \mathcal{G}=\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes n}$. Finally, applying the previous Lemma 29.15.3 we see that $g_{*} \mathcal{G}=\left(g^{\prime}\right)_{*} \mathcal{L}^{\otimes n}$ is coherent as desired.

08DS Remark 29.18.2. Let $S$ be a locally Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Then $X$ is locally Noetherian (Morphisms, Lemma 28.15.6). Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Assume the scheme theoretic support $Z$ of $\mathcal{F}$ is proper over $S$. we claim $R^{p} f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{S}$-module for all $p \geq 0$. Namely, Let $i: Z \rightarrow X$ be the closed immersion and write $\mathcal{F}=i_{*} \mathcal{G}$ for some coherent module $\mathcal{G}$ on $Z$ (Lemma 29.9.7). Denoting $g: Z \rightarrow S$ the composition $f \circ i$ we see that $R^{p} g_{*} \mathcal{G}$ is coherent on $S$ by Proposition 29.18.1. On the other hand, $R^{q} i_{*} \mathcal{G}=0$ for $q>0$ (Lemma 29.9.9). By Cohomology, Lemma 20.14.8 we get $R^{p} f_{*} \mathcal{F}=R^{p} g_{*} \mathcal{G}$ and the claim.

02 O 6 Lemma 29.18.3. Let $S=\operatorname{Spec}(A)$ with $A$ a Noetherian ring. Let $f: X \rightarrow S$ be a proper morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then $H^{i}(X, \mathcal{F})$ is finite $A$-module for all $i \geq 0$.

Proof. This is just the affine case of Proposition 29.18.1. Namely, by Lemmas 29.4 .5 and 29.4 .6 we know that $R^{i} f_{*} \mathcal{F}$ is the quasi-coherent sheaf associated to the $A$-module $H^{i}(X, \mathcal{F})$ and by Lemma 29.9 .1 this is a coherent sheaf if and only if $H^{i}(X, \mathcal{F})$ is an $A$-module of finite type.

0897 Lemma 29.18.4. Let $A$ be a Noetherian ring. Let $B$ be a finitely generated graded $A$-algebra. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Set $\mathcal{B}=f^{*} \widetilde{B}$. Let $\mathcal{F}$ be a quasi-coherent graded $\mathcal{B}$-module of finite type.
(1) For every $p \geq 0$ the graded $B$-module $H^{p}(X, \mathcal{F})$ is a finite $B$-module.
(2) If $\mathcal{L}$ is an ample invertible $\mathcal{O}_{X}$-module, then there exists an integer $d_{0}$ such that $H^{p}\left(X, \mathcal{F} \otimes \mathcal{L}^{\otimes d}\right)=0$ for all $p>0$ and $d \geq d_{0}$.
Proof. To prove this we consider the fibre product diagram

Note that $f^{\prime}$ is a proper morphism, see Morphisms, Lemma 28.41.5. Also, $B$ is a finitely generated $A$-algebra, and hence Noetherian (Algebra, Lemma 10.30.1). This implies that $X^{\prime}$ is a Noetherian scheme (Morphisms, Lemma 28.15.6). Note that $X^{\prime}$ is the relative spectrum of the quasi-coherent $\mathcal{O}_{X}$-algebra $\mathcal{B}$ by Constructions, Lemma 26.4.6. Since $\mathcal{F}$ is a quasi-coherent $\mathcal{B}$-module we see that there is a unique quasi-coherent $\mathcal{O}_{X^{\prime}}$-module $\mathcal{F}^{\prime}$ such that $\pi_{*} \mathcal{F}^{\prime}=\mathcal{F}$, see Morphisms, Lemma 28.12.6 Since $\mathcal{F}$ is finite type as a $\mathcal{B}$-module we conclude that $\mathcal{F}^{\prime}$ is a finite type $\mathcal{O}_{X^{\prime}}$-module (details omitted). In other words, $\mathcal{F}^{\prime}$ is a coherent $\mathcal{O}_{X^{\prime}}$-module (Lemma 29.9.1). Since the morphism $\pi: X^{\prime} \rightarrow X$ is affine we have

$$
H^{p}(X, \mathcal{F})=H^{p}\left(X^{\prime}, \mathcal{F}^{\prime}\right)
$$

by Lemma 29.2.4. Thus (1) follows from Lemma 29.18.3. Given $\mathcal{L}$ as in (2) we set $\mathcal{L}^{\prime}=\pi^{*} \mathcal{L}$. Note that $\mathcal{L}^{\prime}$ is ample on $X^{\prime}$ by Morphisms, Lemma 28.37.7. By the projection formula (Cohomology, Lemma 20.43.2) we have $\pi_{*}\left(\mathcal{F}^{\prime} \otimes \mathcal{L}^{\prime}\right)=\mathcal{F} \otimes \mathcal{L}$. Thus part (2) follows by the same reasoning as above from Lemma 29.15.2.

### 29.19. The theorem on formal functions

02 O 7 In this section we study the behaviour of cohomology of sequences of sheaves either of the form $\left\{I^{n} \mathcal{F}\right\}_{n \geq 0}$ or of the form $\left\{\mathcal{F} / I^{n} \mathcal{F}\right\}_{n \geq 0}$ as $n$ varies.

Here and below we use the following notation. Given a morphism of schemes $f: X \rightarrow Y$, a quasi-coherent sheaf $\mathcal{F}$ on $X$, and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Y}$ we denote $\mathcal{I}^{n} \mathcal{F}$ the quasi-coherent subsheaf generated by products of local sections of $f^{-1}\left(\mathcal{I}^{n}\right)$ and $\mathcal{F}$. In a formula

$$
\mathcal{I}^{n} \mathcal{F}=\operatorname{Im}\left(f^{*}\left(\mathcal{I}^{n}\right) \otimes_{\mathcal{O}_{X}} \mathcal{F} \longrightarrow \mathcal{F}\right)
$$

Note that there are natural maps

$$
f^{-1}\left(\mathcal{I}^{n}\right) \otimes_{f^{-1} \mathcal{O}_{Y}} \mathcal{I}^{m} \mathcal{F} \longrightarrow f^{*}\left(\mathcal{I}^{n}\right) \otimes_{\mathcal{O}_{X}} \mathcal{I}^{m} \mathcal{F} \longrightarrow \mathcal{I}^{n+m} \mathcal{F}
$$

Hence a section of $\mathcal{I}^{n}$ will give rise to a map $R^{p} f_{*}\left(\mathcal{I}^{m} \mathcal{F}\right) \rightarrow R^{p} f_{*}\left(\mathcal{I}^{n+m} \mathcal{F}\right)$ by functoriality of higher direct images. Localizing and then sheafifying we see that there are $\mathcal{O}_{Y}$-module maps

$$
\mathcal{I}^{n} \otimes_{\mathcal{O}_{Y}} R^{p} f_{*}\left(\mathcal{I}^{m} \mathcal{F}\right) \longrightarrow R^{p} f_{*}\left(\mathcal{I}^{n+m} \mathcal{F}\right) .
$$

In other words we see that $\bigoplus_{n \geq 0} R^{p} f_{*}\left(\mathcal{I}^{n} \mathcal{F}\right)$ is a graded $\bigoplus_{n \geq 0} \mathcal{I}^{n}$-module.
If $Y=\operatorname{Spec}(A)$ and $\mathcal{I}=\widetilde{I}$ we denote $\mathcal{I}^{n} \mathcal{F}$ simply $I^{n} \mathcal{F}$. The maps introduced above give $M=\bigoplus H^{p}\left(X, I^{n} \mathcal{F}\right)$ the structure of a graded $S=\bigoplus I^{n}$-module. If $f$ is proper, $A$ is Noetherian and $\mathcal{F}$ is coherent, then this turns out to be a module of finite type.

02 O 8 Lemma 29.19.1. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Set $B=\bigoplus_{n>0} I^{n}$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on $X$. Then for every $p \geq 0$ the graded $B$-module $\bigoplus_{n \geq 0} H^{p}\left(X, I^{n} \mathcal{F}\right)$ is a finite $B$-module.

Proof. Let $\mathcal{B}=\bigoplus I^{n} \mathcal{O}_{X}=f^{*} \widetilde{B}$. Then $\bigoplus I^{n} \mathcal{F}$ is a finite type graded $\mathcal{B}$-module. Hence the result follows from Lemma 29.18.4 part (1).

02O9 Lemma 29.19.2. Given a morphism of schemes $f: X \rightarrow Y$, a quasi-coherent sheaf $\mathcal{F}$ on $X$, and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Y}$. Assume $Y$ locally Noetherian, $f$ proper, and $\mathcal{F}$ coherent. Then

$$
\mathcal{M}=\bigoplus_{n \geq 0} R^{p} f_{*}\left(\mathcal{I}^{n} \mathcal{F}\right)
$$

is a graded $\mathcal{A}=\bigoplus_{n \geq 0} \mathcal{I}^{n}$-module which is quasi-coherent and of finite type.
Proof. The statement is local on $Y$, hence this reduces to the case where $Y$ is affine. In the affine case the result follows from Lemma 29.19.1. Details omitted.

02OA Lemma 29.19.3. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on $X$. Then for every $p \geq 0$ there exists an integer $c \geq 0$ such that
(1) the multiplication map $I^{n-c} \otimes H^{p}\left(X, I^{c} \mathcal{F}\right) \rightarrow H^{p}\left(X, I^{n} \mathcal{F}\right)$ is surjective for all $n \geq c$, and
(2) the image of $H^{p}\left(X, I^{n+m} \mathcal{F}\right) \rightarrow H^{p}\left(X, I^{n} \mathcal{F}\right)$ is contained in the submodule $I^{m-c} H^{p}\left(X, I^{n} \mathcal{F}\right)$ for all $n \geq 0, m \geq c$.

Proof. By Lemma 29.19.1 we can find $d_{1}, \ldots, d_{t} \geq 0$, and $x_{i} \in H^{p}\left(X, I^{d_{i}} \mathcal{F}\right)$ such that $\bigoplus_{n \geq 0} H^{p}\left(X, I^{n} \mathcal{F}\right)$ is generated by $x_{1}, \ldots, x_{t}$ over $S=\bigoplus_{n \geq 0} I^{n}$. Take $c=\max \left\{d_{i}\right\}$. It is clear that (1) holds. For (2) let $b=\max (0, n-c)$. Consider the commutative diagram of $A$-modules

By part (1) of the lemma the composition of the horizontal arrows is surjective if $n+m \geq c$. On the other hand, it is clear that $n+m-c-b \geq m-c$. Hence part (2).

In the situation of Lemmas 29.19.1 and 29.19.3 consider the inverse system

$$
\mathcal{F} / I \mathcal{F} \leftarrow \mathcal{F} / I^{2} \mathcal{F} \leftarrow \mathcal{F} / I^{3} \mathcal{F} \leftarrow \ldots
$$

We would like to know what happens to the cohomology groups. Here is a first result.

02OB Lemma 29.19.4. Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on $X$. Fix $p \geq 0$.
(1) There exists a $c_{1} \geq 0$ such that for all $n \geq c_{1}$ we have

$$
\operatorname{Ker}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right) \subset I^{n-c_{1}} H^{p}(X, \mathcal{F})
$$

(2) The inverse system

$$
\left(H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)_{n \in \mathbf{N}}
$$

satisfies the Mittag-Leffler condition (see Homology, Definition 12.27.2).
(3) In fact for any $p$ and $n$ there exists a $c_{2}(n) \geq n$ such that

$$
\begin{aligned}
& \operatorname{Im}\left(H^{p}\left(X, \mathcal{F} / I^{k} \mathcal{F}\right) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)=\operatorname{Im}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right) \\
& \quad \text { for all } k \geq c_{2}(n)
\end{aligned}
$$

Proof. Let $c_{1}=\max \left\{c_{p}, c_{p+1}\right\}$, where $c_{p}, c_{p+1}$ are the integers found in Lemma 29.19 .3 for $H^{p}$ and $H^{p+1}$. We will use this constant in the proofs of (1), (2) and (3).

Let us prove part (1). Consider the short exact sequence

$$
0 \rightarrow I^{n} \mathcal{F} \rightarrow \mathcal{F} \rightarrow \mathcal{F} / I^{n} \mathcal{F} \rightarrow 0
$$

From the long exact cohomology sequence we see that

$$
\operatorname{Ker}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)=\operatorname{Im}\left(H^{p}\left(X, I^{n} \mathcal{F}\right) \rightarrow H^{p}(X, \mathcal{F})\right)
$$

Hence by our choice of $c_{1}$ we see that this is contained in $I^{n-c_{1}} H^{p}(X, \mathcal{F})$ for $n \geq c_{1}$.
Note that part (3) implies part (2) by definition of the Mittag-Leffler condition.
Let us prove part (3). Fix an $n$ throughout the rest of the proof. Consider the commutative diagram

This gives rise to the following commutative diagram

If $m \geq c_{1}$ we see that the image of $a$ is contained in $I^{m-c_{1}} H^{p+1}\left(X, I^{n} \mathcal{F}\right)$. By the Artin-Rees lemma (see Algebra, Lemma 10.50.3) there exists an integer $c_{3}(n)$ such that

$$
I^{N} H^{p+1}\left(X, I^{n} \mathcal{F}\right) \cap \operatorname{Im}(\delta) \subset \delta\left(I^{N-c_{3}(n)} H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)
$$

for all $N \geq c_{3}(n)$. As $H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)$ is annihilated by $I^{n}$, we see that if $m \geq$ $c_{3}(n)+c_{1}+n$, then

$$
\operatorname{Im}\left(H^{p}\left(X, \mathcal{F} / I^{n+m} \mathcal{F}\right) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)=\operatorname{Im}\left(H^{p}(X, \mathcal{F}) \rightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)\right)
$$

In other words, part (3) holds with $c_{2}(n)=c_{3}(n)+c_{1}+n$.
02OC Theorem 29.19.5 (Theorem on formal functions). Let $A$ be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Let $\mathcal{F}$ be $a$ coherent sheaf on $X$. Fix $p \geq 0$. The system of maps

$$
H^{p}(X, \mathcal{F}) / I^{n} H^{p}(X, \mathcal{F}) \longrightarrow H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

define an isomorphism of limits

$$
H^{p}(X, \mathcal{F})^{\wedge} \longrightarrow \lim _{n} H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

where the left hand side is the completion of the $A$-module $H^{p}(X, \mathcal{F})$ with respect to the ideal I, see Algebra, Section 10.95. Moreover, this is in fact a homeomorphism for the limit topologies.
Proof. In fact, this follows immediately from Lemma 29.19.4. We spell out the details. Set $M=H^{p}(X, \mathcal{F})$ and $M_{n}=H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)$. Denote $N_{n}=\operatorname{Im}(M \rightarrow$ $M_{n}$ ). By the description of the limit in Homology, Section 12.27 we have

$$
\lim _{n} M_{n}=\left\{\left(x_{n}\right) \in \prod M_{n} \mid \varphi_{i}\left(x_{n}\right)=x_{n-1}, n=2,3, \ldots\right\}
$$

Pick an element $x=\left(x_{n}\right) \in \lim _{n} M_{n}$. By Lemma 29.19.4 part (3) we have $x_{n} \in N_{n}$ for all $n$ since by definition $x_{n}$ is the image of some $x_{n+m} \in M_{n+m}$ for all $m$. By Lemma 29.19.4 part (1) we see that there exists a factorization

$$
M \rightarrow N_{n} \rightarrow M / I^{n-c_{1}} M
$$

of the reduction map. Denote $y_{n} \in M / I^{n-c_{1}} M$ the image of $x_{n}$ for $n \geq c_{1}$. Since for $n^{\prime} \geq n$ the composition $M \rightarrow M_{n^{\prime}} \rightarrow M_{n}$ is the given map $M \rightarrow M_{n}$ we see that $y_{n^{\prime}}$ maps to $y_{n}$ under the canonical map $M / I^{n^{\prime}-c_{1}} M \rightarrow M / I^{n-c_{1}} M$. Hence $y=\left(y_{n+c_{1}}\right)$ defines an element of $\lim _{n} M / I^{n} M$. We omit the verification that $y$ maps to $x$ under the map

$$
M^{\wedge}=\lim _{n} M / I^{n} M \longrightarrow \lim _{n} M_{n}
$$

of the lemma. We also omit the verification on topologies.
087U Lemma 29.19.6. Let $A$ be a ring. Let $I \subset A$ be an ideal. Assume $A$ is Noetherian and complete with respect to $I$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on $X$. Then

$$
H^{p}(X, \mathcal{F})=\lim _{n} H^{p}\left(X, \mathcal{F} / I^{n} \mathcal{F}\right)
$$

for all $p \geq 0$.
Proof. This is a reformulation of the theorem on formal functions (Theorem 29.19.5) in the case of a complete Noetherian base ring. Namely, in this case the $A$-module $H^{p}(X, \mathcal{F})$ is finite (Lemma 29.18.3) hence $I$-adically complete (Algebra, Lemma 10.96.1 and we see that completion on the left hand side is not necessary.

02OD Lemma 29.19.7. Given a morphism of schemes $f: X \rightarrow Y$ and a quasi-coherent sheaf $\mathcal{F}$ on $X$. Assume
(1) Y locally Noetherian,
(2) $f$ proper, and
(3) $\mathcal{F}$ coherent.

Let $y \in Y$ be a point. Consider the infinitesimal neighbourhoods

of the fibre $X_{1}=X_{y}$ and set $\mathcal{F}_{n}=i_{n}^{*} \mathcal{F}$. Then we have

$$
\left(R^{p} f_{*} \mathcal{F}\right)_{y}^{\wedge} \cong \lim _{n} H^{p}\left(X_{n}, \mathcal{F}_{n}\right)
$$

as $\mathcal{O}_{Y, y}$-modules.
Proof. This is just a reformulation of a special case of the theorem on formal functions, Theorem 29.19.5. Let us spell it out. Note that $\mathcal{O}_{Y, y}$ is a Noetherian local ring. Consider the canonical morphism $c: \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right) \rightarrow Y$, see Schemes, Equation 25.13.1.1). This is a flat morphism as it identifies local rings. Denote momentarily $f^{\prime}: X^{\prime} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$ the base change of $f$ to this local ring. We see that $c^{*} R^{p} f_{*} \mathcal{F}=R^{p} f_{*}^{\prime} \mathcal{F}^{\prime}$ by Lemma 29.5.2. Moreover, the infinitesimal neighbourhoods of the fibre $X_{y}$ and $X_{y}^{\prime}$ are identified (verification omitted; hint: the morphisms $c_{n}$ factor through $c$ ).
Hence we may assume that $Y=\operatorname{Spec}(A)$ is the spectrum of a Noetherian local ring $A$ with maximal ideal $\mathfrak{m}$ and that $y \in Y$ corresponds to the closed point (i.e., to $\mathfrak{m})$. In particular it follows that

$$
\left(R^{p} f_{*} \mathcal{F}\right)_{y}=\Gamma\left(Y, R^{p} f_{*} \mathcal{F}\right)=H^{p}(X, \mathcal{F})
$$

In this case also, the morphisms $c_{n}$ are each closed immersions. Hence their base changes $i_{n}$ are closed immersions as well. Note that $i_{n, *} \mathcal{F}_{n}=i_{n, *} i_{n}^{*} \mathcal{F}=\mathcal{F} / \mathfrak{m}^{n} \mathcal{F}$. By the Leray spectral sequence for $i_{n}$, and Lemma 29.9.9 we see that

$$
H^{p}\left(X_{n}, \mathcal{F}_{n}\right)=H^{p}\left(X, i_{n, *} \mathcal{F}\right)=H^{p}\left(X, \mathcal{F} / \mathfrak{m}^{n} \mathcal{F}\right)
$$

Hence we may indeed apply the theorem on formal functions to compute the limit in the statement of the lemma and we win.

Here is a lemma which we will generalize later to fibres of dimension $>0$, namely the next lemma.

02OE Lemma 29.19.8. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $y \in Y$. Assume
(1) Y locally Noetherian,
(2) $f$ is proper, and
(3) $f^{-1}(\{y\})$ is finite.

Then for any coherent sheaf $\mathcal{F}$ on $X$ we have $\left(R^{p} f_{*} \mathcal{F}\right)_{y}=0$ for all $p>0$.
Proof. The fibre $X_{y}$ is finite, and by Morphisms, Lemma 28.20 .7 it is a finite discrete space. Moreover, the underlying topological space of each infinitesimal neighbourhood $X_{n}$ is the same. Hence each of the schemes $X_{n}$ is affine according to Schemes, Lemma 25.11.7. Hence it follows that $H^{p}\left(X_{n}, \mathcal{F}_{n}\right)=0$ for all $p>0$. Hence we see that $\left(R^{p} f_{*} \mathcal{F}\right)_{y}^{\wedge}=0$ by Lemma 29.19.7. Note that $R^{p} f_{*} \mathcal{F}$ is coherent by Proposition 29.18 .1 and hence $R^{p} f_{*} \mathcal{F}_{y}$ is a finite $\mathcal{O}_{Y, y}$-module. By Algebra, Lemma 10.96.1 this implies that $\left(R^{p} f_{*} \mathcal{F}\right)_{y}=0$.

02V7 Lemma 29.19.9. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $y \in Y$. Assume
(1) Y locally Noetherian,
(2) $f$ is proper, and
(3) $\operatorname{dim}\left(X_{y}\right)=d$.

Then for any coherent sheaf $\mathcal{F}$ on $X$ we have $\left(R^{p} f_{*} \mathcal{F}\right)_{y}=0$ for all $p>d$.
Proof. The fibre $X_{y}$ is of finite type over $\operatorname{Spec}(\kappa(y))$. Hence $X_{y}$ is a Noetherian scheme by Morphisms, Lemma 28.15.6. Hence the underlying topological space of $X_{y}$ is Noetherian, see Properties, Lemma 27.5.5. Moreover, the underlying topological space of each infinitesimal neighbourhood $X_{n}$ is the same as that of $X_{y}$. Hence $H^{p}\left(X_{n}, \mathcal{F}_{n}\right)=0$ for all $p>d$ by Cohomology, Proposition 20.21.6. Hence we see that $\left(R^{p} f_{*} \mathcal{F}\right)_{y}^{\wedge}=0$ by Lemma 29.19 .7 for $p>d$. Note that $R^{p} f_{*} \mathcal{F}$ is coherent by Proposition 29.18.1 and hence $R^{p} f_{*} \mathcal{F}_{y}$ is a finite $\mathcal{O}_{Y, y}$-module. By Algebra, Lemma 10.96.1 this implies that $\left(R^{p} f_{*} \mathcal{F}\right)_{y}=0$.

### 29.20. Applications of the theorem on formal functions

02OF We will add more here as needed. For the moment we need the following characterization of finite morphisms (in the Noetherian case - for a more general version see the chapter More on Morphisms, Section 36.31.

02OG Lemma 29.20.1. (For a more general version see More on Morphisms, Lemma 36.31.4). Let $f: X \rightarrow S$ be a morphism of schemes. Assume $S$ is locally Noetherian. The following are equivalent
(1) $f$ is finite, and
(2) $f$ is proper with finite fibres.

Proof. A finite morphism is proper according to Morphisms, Lemma 28.43.10. A finite morphism is quasi-finite according to Morphisms, Lemma 28.43.9. A quasifinite morphism has finite fibres, see Morphisms, Lemma 28.20.10. Hence a finite morphism is proper and has finite fibres.
Assume $f$ is proper with finite fibres. We want to show $f$ is finite. In fact it suffices to prove $f$ is affine. Namely, if $f$ is affine, then it follows that $f$ is integral by Morphisms, Lemma 28.43.7 whereupon it follows from Morphisms, Lemma 28.43.4 that $f$ is finite.

To show that $f$ is affine we may assume that $S$ is affine, and our goal is to show that $X$ is affine too. Since $f$ is proper we see that $X$ is separated and quasi-compact. Hence we may use the criterion of Lemma 29.3 .2 to prove that $X$ is affine. To see this let $\mathcal{I} \subset \mathcal{O}_{X}$ be a finite type ideal sheaf. In particular $\mathcal{I}$ is a coherent sheaf on $X$. By Lemma 29.19 .8 we conclude that $R^{1} f_{*} \mathcal{I}_{s}=0$ for all $s \in S$. In other words, $R^{1} f_{*} \mathcal{I}=0$. Hence we see from the Leray Spectral Sequence for $f$ that $H^{1}(X, \mathcal{I})=H^{1}\left(S, f_{*} \mathcal{I}\right)$. Since $S$ is affine, and $f_{*} \mathcal{I}$ is quasi-coherent (Schemes, Lemma 25.24.1 we conclude $H^{1}\left(S, f_{*} \mathcal{I}\right)=0$ from Lemma 29.2.2 as desired. Hence $H^{1}(X, \mathcal{I})=0$ as desired.

As a consequence we have the following useful result.
02OH Lemma 29.20.2. (For a more general version see More on Morphisms, Lemma 36.31.5). Let $f: X \rightarrow S$ be a morphism of schemes. Let $s \in S$. Assume
(1) $S$ is locally Noetherian,
(2) $f$ is proper, and
(3) $f^{-1}(\{s\})$ is a finite set.

Then there exists an open neighbourhood $V \subset S$ of $s$ such that $\left.f\right|_{f^{-1}(V)}: f^{-1}(V) \rightarrow$ $V$ is finite.

Proof. The morphism $f$ is quasi-finite at all the points of $f^{-1}(\{s\})$ by Morphisms, Lemma 28.20.7. By Morphisms, Lemma 28.50.2 the set of points at which $f$ is quasi-finite is an open $U \subset X$. Let $Z=X \backslash U$. Then $s \notin f(Z)$. Since $f$ is proper the set $f(Z) \subset S$ is closed. Choose any open neighbourhood $V \subset S$ of $s$ with $Z \cap V=\emptyset$. Then $f^{-1}(V) \rightarrow V$ is locally quasi-finite and proper. Hence it is quasi-finite (Morphisms, Lemma 28.20.9), hence has finite fibres (Morphisms, Lemma 28.20.10, hence is finite by Lemma 29.20.1.

### 29.21. Cohomology and base change, III

07 VJ In this section we prove the simplest case of a very general phenomenon that will be discussed in Derived Categories of Schemes, Section 35.18. Please see Remark 29.21 .2 for a translation of the following lemma into algebra.

07 VK Lemma 29.21.1. Let $A$ be a Noetherian ring and set $S=\operatorname{Spec}(A)$. Let $f: X \rightarrow S$ be a proper morphism of schemes. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module flat over $S$. Then
(1) $R \Gamma(X, \mathcal{F})$ is a perfect object of $D(A)$, and
(2) for any ring map $A \rightarrow A^{\prime}$ the base change map

$$
R \Gamma(X, \mathcal{F}) \otimes_{A}^{\mathbf{L}} A^{\prime} \longrightarrow R \Gamma\left(X_{A^{\prime}}, \mathcal{F}_{A^{\prime}}\right)
$$

is an isomorphism.
Proof. Choose a finite affine open covering $X=\bigcup_{i=1, \ldots, n} U_{i}$. By Lemmas 29.7.1 and 29.7.2 the Čech complex $K^{\bullet}=\check{C} \bullet(\mathcal{U}, \mathcal{F})$ satisfies

$$
K^{\bullet} \otimes_{A} A^{\prime}=R \Gamma\left(X_{A^{\prime}}, \mathcal{F}_{A^{\prime}}\right)
$$

for all ring maps $A \rightarrow A^{\prime}$. Let $K_{\text {alt }}^{\bullet}=\check{C}_{a l t}^{\bullet}(\mathcal{U}, \mathcal{F})$ be the alternating Čech complex. By Cohomology, Lemma 20.24 .6 there is a homotopy equivalence $K_{a l t}^{\bullet} \rightarrow K^{\bullet}$ of $A$-modules. In particular, we have

$$
K_{a l t}^{\bullet} \otimes_{A} A^{\prime}=R \Gamma\left(X_{A^{\prime}}, \mathcal{F}_{A^{\prime}}\right)
$$

as well. Since $\mathcal{F}$ is flat over $A$ we see that each $K_{\text {alt }}^{n}$ is flat over $A$ (see Morphisms, Lemma 28.25.2. . Since moreover $K_{\text {alt }}^{\bullet}$ is bounded above (this is why we switched to the alternating Cech complex) $K_{\text {alt }}^{\bullet} \otimes_{A} A^{\prime}=K_{\text {alt }}^{\bullet} \otimes_{A}^{\mathbf{L}} A^{\prime}$ by the definition of derived tensor products (see More on Algebra, Section 15.49). By Lemma 29.18.3 the cohomology groups $H^{i}\left(K_{\text {alt }}^{\bullet}\right)$ are finite $A$-modules. As $K_{\text {alt }}^{\bullet}$ is bounded, we conclude that $K_{\text {alt }}^{\bullet}$ is pseudo-coherent, see More on Algebra, Lemma 15.54.16. Given any $A$-module $M$ set $A^{\prime}=A \oplus M$ where $M$ is a square zero ideal, i.e., $(a, m) \cdot\left(a^{\prime}, m^{\prime}\right)=$ $\left(a a^{\prime}, a m^{\prime}+a^{\prime} m\right)$. By the above we see that $K_{a l t}^{\bullet} \otimes_{A}^{\mathbf{L}} A^{\prime}$ has cohomology in degrees $0, \ldots, n$. Hence $K_{a l t}^{\bullet} \otimes_{A}^{\mathbf{L}} M$ has cohomology in degrees $0, \ldots, n$. Hence $K_{\text {alt }}^{\bullet}$ has finite Tor dimension, see More on Algebra, Definition 15.55.1. We win by More on Algebra, Lemma 15.61.2.

07VL Remark 29.21.2. A consequence of Lemma 29.21 .1 is that there exists a finite complex of finite projective $A$-modules $M^{\bullet}$ such that we have

$$
H^{i}\left(X_{A^{\prime}}, \mathcal{F}_{A^{\prime}}\right)=H^{i}\left(M^{\bullet} \otimes_{A} A^{\prime}\right)
$$

functorially in $A^{\prime}$. The condition that $\mathcal{F}$ is flat over $A$ is essential, see Har98.

### 29.22. Grothendieck's existence theorem, I

087 V In this section we discuss Grothendieck's existence theorem for the projective case. As we do not yet have the theory of formal schemes to our disposal, we temporarily develop a bit of language that replaces the notion of a "coherent module on a Noetherian adic formal scheme". The reader who is familiar with formal schemes is encouraged to read the statement and proof of the theorem in DG67.
Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Below we will consider inverse systems $\left(\mathcal{F}_{n}\right)$ of coherent $\mathcal{O}_{X}$-modules such that
(1) $\mathcal{F}_{n}$ is annihilated by $\mathcal{I}^{n}$, and
(2) the transition maps induce isomorphisms $\mathcal{F}_{n+1} / \mathcal{I}^{n} \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$.

A morphism of such inverse systems is defined as usual. Let us denote the category of these inverse systems with $\operatorname{Coh}(X, \mathcal{I})$. We are going to proceed by proving a bunch of lemmas about objects in this category. In fact, most of the lemmas that follow are straightforward consequences of the following description of the category in the affine case.

087W Lemma 29.22.1. If $X=\operatorname{Spec}(A)$ is the spectrum of a Noetherian ring and $\mathcal{I}$ is the quasi-coherent sheaf of ideals associated to the ideal $I \subset A$, then $\operatorname{Coh}(X, \mathcal{I})$ is equivalent to the category of finite $A^{\wedge}$-modules where $A^{\wedge}$ is the completion of $A$ with respect to $I$.
Proof. Let $\operatorname{Mod}_{A, I}^{f g}$ be the category of inverse systems $\left(M_{n}\right)$ of finite $A$-modules satisfying: (1) $M_{n}$ is annihilated by $I^{n}$ and (2) $M_{n+1} / I^{n} M_{n+1}=M_{n}$. By the correspondence between coherent sheaves on $X$ and finite $A$-modules (Lemma 29.9.1) it suffices to show $\operatorname{Mod}_{A, I}^{f g}$ is equivalent to the category of finite $A^{\wedge}$-modules. To see this it suffices to prove that given an object $\left(M_{n}\right)$ of $\operatorname{Mod}_{A, I}^{f g}$ the module

$$
M=\lim M_{n}
$$

is a finite $A^{\wedge}$-module and that $M / I^{n} M=M_{n}$. As the transition maps are surjective, we see that $M \rightarrow M_{1}$ is surjective. Pick $x_{1}, \ldots, x_{t} \in M$ which map to generators of $M_{1}$. This induces a map of systems $\left(A / I^{n}\right)^{\oplus t} \rightarrow M_{n}$. By Nakayama's lemma (Algebra, Lemma 10.19.1) these maps are surjective. Let $K_{n} \subset\left(A / I^{n}\right)^{\oplus t}$ be the kernel. Property (2) implies that $K_{n+1} \rightarrow K_{n}$ is surjective, in particular the system $\left(K_{n}\right)$ satisfies the Mittag-Leffler condition. By Homology, Lemma 12.27.3 we obtain an exact sequence $0 \rightarrow K \rightarrow\left(A^{\wedge}\right)^{\oplus t} \rightarrow M \rightarrow 0$ with $K=\lim K_{n}$. Hence $M$ is a finite $A^{\wedge}$-module. As $K \rightarrow K_{n}$ is surjective it follows that

$$
M / I^{n} M=\operatorname{Coker}\left(K \rightarrow\left(A / I^{n}\right)^{\oplus t}\right)=\left(A / I^{n}\right)^{\oplus t} / K_{n}=M_{n}
$$

as desired.
087X Lemma 29.22.2. Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals.
(1) The category $\operatorname{Coh}(X, \mathcal{I})$ is abelian.
(2) For $U \subset X$ open the restriction functor $\operatorname{Coh}(X, \mathcal{I}) \rightarrow \operatorname{Coh}\left(U,\left.\mathcal{I}\right|_{U}\right)$ is exact.
(3) Exactness in $\operatorname{Coh}(X, \mathcal{I})$ may be checked by restricting to the members of an open covering of $X$.

Proof. Let $\alpha=\left(\alpha_{n}\right):\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ be a morphism of $\operatorname{Coh}(X, \mathcal{I})$. The cokernel of $\alpha$ is the inverse system $\left(\operatorname{Coker}\left(\alpha_{n}\right)\right)$ (details omitted). To describe the kernel let

$$
\mathcal{K}_{l, m}^{\prime}=\operatorname{Im}\left(\operatorname{Ker}\left(\alpha_{l}\right) \rightarrow \mathcal{F}_{m}\right)
$$

for $l \geq m$. We claim:
(a) the inverse system $\left(\mathcal{K}_{l, m}^{\prime}\right)_{l \geq m}$ is eventually constant, say with value $\mathcal{K}_{m}^{\prime}$,
(b) the system $\left(\mathcal{K}_{m}^{\prime} / \mathcal{I}^{n} \mathcal{K}_{m}^{\prime}\right)_{m \geq n}$ is eventually constant, say with value $\mathcal{K}_{n}$,
(c) the system $\left(\mathcal{K}_{n}\right)$ forms an object of $\operatorname{Coh}(X, \mathcal{I})$, and
(d) this object is the kernel of $\alpha$.

To see (a), (b), and (c) we may work affine locally, say $X=\operatorname{Spec}(A)$ and $\mathcal{I}$ corresponds to the ideal $I \subset A$. By Lemma 29.22.1 $\alpha$ corresponds to a map $f: M \rightarrow N$ of finite $A^{\wedge}$-modules. Denote $K=\operatorname{Ker}(f)$. Note that $A^{\wedge}$ is a Noetherian ring (Algebra, Lemma 10.96.6). Choose an integer $c \geq 0$ such that $K \cap I^{n} M \subset I^{n-c} K$ for $n \geq c$ (Algebra, Lemma 10.50 .2 ) and which satisfies Algebra, Lemma 10.50.3

$$
K_{l, m}^{\prime}=\frac{a^{-1}\left(I^{l} N\right)+I^{m} M}{I^{m} M}=\frac{K+I^{l-c} f^{-1}\left(I^{c} N\right)+I^{m} M}{I^{m} M}=\frac{K+I^{m} M}{I^{m} M}
$$

where the last equality holds if $l \geq m+c$. So $\mathcal{K}_{m}^{\prime}$ corresponds to the $A$-module $K / K \cap I^{m} M$ and $\mathcal{K}_{m}^{\prime} / \mathcal{I}^{n} \mathcal{K}_{m}^{\prime}$ corresponds to

$$
\frac{K}{K \cap I^{m} M+I^{n} K}=\frac{K}{I^{n} K}
$$

for $m \geq n+c$ by our choice of $c$ above. Hence $\mathcal{K}_{n}$ corresponds to $K / I^{n} K$.
We prove (d). It is clear from the description on affines above that the composition $\left(\mathcal{K}_{n}\right) \rightarrow\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ is zero. Let $\beta:\left(\mathcal{H}_{n}\right) \rightarrow\left(\mathcal{F}_{n}\right)$ be a morphism such that $\alpha \circ \beta=$ 0 . Then $\mathcal{H}_{l} \rightarrow \mathcal{F}_{l}$ maps into $\operatorname{Ker}\left(\alpha_{l}\right)$. Since $\mathcal{H}_{m}=\mathcal{H}_{l} / \mathcal{I}^{m} \mathcal{H}_{l}$ for $l \geq m$ we obtain a system of maps $\mathcal{H}_{m} \rightarrow \mathcal{K}_{l, m}^{\prime}$. Thus a map $\mathcal{H}_{m} \rightarrow \mathcal{K}_{m}^{\prime}$. Since $\mathcal{H}_{n}=\mathcal{H}_{m} / \mathcal{I}^{n} \mathcal{H}_{m}$ we obtain a system of maps $\mathcal{H}_{n} \rightarrow \mathcal{K}_{m}^{\prime} / \mathcal{I}^{n} \mathcal{K}_{m}^{\prime}$ and hence a map $\mathcal{H}_{n} \rightarrow \mathcal{K}_{n}$ as desired.
To finish the proof of (1) we still have to show that $\operatorname{Coim}=\operatorname{Im}$ in $\operatorname{Coh}(X, \mathcal{I})$. We have seen above that taking kernels and cokernels commutes, over affines, with the description of $\operatorname{Coh}(X, \mathcal{I})$ as a category of modules. Since $\operatorname{Im}=$ Coim holds in the category of modules this gives $\operatorname{Coim}=\operatorname{Im}$ in $\operatorname{Coh}(X, \mathcal{I})$. Parts (2) and (3) of the lemma are immediate from our construction of kernels and cokernels.

087Y Lemma 29.22.3. Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals. $A \operatorname{map}\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ is surjective in $\operatorname{Coh}(X, \mathcal{I})$ if and only if $\mathcal{F}_{1} \rightarrow \mathcal{G}_{1}$ is surjective.

Proof. Omitted. Hint: Look on affine opens, use Lemma 29.22.1, and use Algebra, Lemma 10.19.1.

087Z Lemma 29.22.4. Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals. If $\left(\mathcal{F}_{n}\right)$ is an object of $\operatorname{Coh}(X, \mathcal{I})$ then $\bigoplus \operatorname{Ker}\left(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}\right)$ is a finite type, graded, quasi-coherent $\bigoplus \mathcal{I}^{n} / \mathcal{I}^{n+1}$-module.

Proof. The question is local on $X$ hence we may assume $X$ is affine, i.e., we have a situation as in Lemma 29.22.1. In this case, if $\left(\mathcal{F}_{n}\right)$ corresponds to the finite $A^{\wedge}$ module $M$, then $\bigoplus \operatorname{Ker}\left(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}\right)$ corresponds to $\bigoplus I^{n} M / I^{n+1} M$ which is clearly a finite module over $\bigoplus I^{n} / I^{n+1}$.

Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. There is a functor
0880 (29.22.4.1)

$$
\operatorname{Coh}\left(\mathcal{O}_{X}\right) \longrightarrow \operatorname{Coh}(X, \mathcal{I}), \quad \mathcal{F} \longmapsto \mathcal{F}^{\wedge}
$$

which associates to the coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the object $\mathcal{F}^{\wedge}=\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right)$ of $\operatorname{Coh}(X, \mathcal{I})$.

0881 Lemma 29.22.5. The functor (29.22.4.1) is exact.
Proof. It suffices to check this locally on $X$. Hence we may assume $X$ is affine, i.e., we have a situation as in Lemma 29.22.1. The functor is the functor $\operatorname{Mod}_{A}^{f g} \rightarrow$ $\operatorname{Mod}_{A \wedge}^{f g}$ which associates to a finite $A$-module $M$ the completion $M^{\wedge}$. Thus the result follows from Algebra, Lemma 10.96.2.

0882 Lemma 29.22.6. Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Set $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{G}, \mathcal{F})$. Then

$$
\lim H^{0}\left(X, \mathcal{H} / \mathcal{I}^{n} \mathcal{H}\right)=\operatorname{Mor}_{\operatorname{Coh}(X, \mathcal{I})}\left(\mathcal{G}^{\wedge}, \mathcal{F}^{\wedge}\right)
$$

Proof. To prove this we may work affine locally on $X$. Hence we may assume $X=\operatorname{Spec}(A)$ and $\mathcal{F}, \mathcal{G}$ given by finite $A$-module $M$ and $N$. Then $\mathcal{H}$ corresponds to the finite $A$-module $H=\operatorname{Hom}_{A}(M, N)$. The statement of the lemma becomes the statement

$$
H^{\wedge}=\operatorname{Hom}_{A^{\wedge}}\left(M^{\wedge}, N^{\wedge}\right)
$$

via the equivalence of Lemma 29.22.1. By Algebra, Lemma 10.96 .2 (used 3 times) we have

$$
H^{\wedge}=\operatorname{Hom}_{A}(M, N) \otimes_{A} A^{\wedge}=\operatorname{Hom}_{A^{\wedge}}\left(M \otimes_{A} A^{\wedge}, N \otimes_{A} A^{\wedge}\right)=\operatorname{Hom}_{A^{\wedge}}\left(M^{\wedge}, N^{\wedge}\right)
$$

where the second equality uses that $A^{\wedge}$ is flat over $A$ (see More on Algebra, Remark 15.54.18). The lemma follows.

0883 Lemma 29.22.7. Let $A$ be Noetherian ring complete with respect to an ideal $I$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism. Let $\mathcal{I}=I \mathcal{O}_{X}$. Then the functor 29.22.4.1) is fully faithful.

Proof. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Then $\mathcal{H}=\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{G}, \mathcal{F})$ is a coherent $\mathcal{O}_{X}$-module, see Modules, Lemma 17.19.4. By Lemma 29.22.6 the map

$$
\lim _{n} H^{0}\left(X, \mathcal{H} / \mathcal{I}^{n} \mathcal{H}\right) \rightarrow \operatorname{Mor}_{\operatorname{Coh}(X, \mathcal{I})}\left(\mathcal{G}^{\wedge}, \mathcal{F}^{\wedge}\right)
$$

is bijective. Hence fully faithfulness of 29.22.4.1 follows from the theorem on formal functions (Lemma 29.19.6) for the coherent sheaf $\mathcal{H}$.
0884 Lemma 29.22.8. Let $A$ be Noetherian ring and $I \subset A$ and ideal. Let $f: X \rightarrow$ $\operatorname{Spec}(A)$ be a proper morphism and let $\mathcal{L}$ be an $f$-ample invertible sheaf. Let $\mathcal{I}=$ $I \mathcal{O}_{X}$. Let $\left(\mathcal{F}_{n}\right)$ be an object of $\operatorname{Coh}(X, \mathcal{I})$. Then there exists an integer $d_{0}$ such that

$$
H^{1}\left(X, \operatorname{Ker}\left(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}\right) \otimes \mathcal{L}^{\otimes d}\right)=0
$$

for all $n \geq 0$ and all $d \geq d_{0}$.
Proof. Set $B=\bigoplus I^{n} / I^{n+1}$ and $\mathcal{B}=\bigoplus \mathcal{I}^{n} / \mathcal{I}^{n+1}=f^{*} \widetilde{B}$. By Lemma 29.22.4 the graded quasi-coherent $\mathcal{B}$-module $\mathcal{G}=\bigoplus \operatorname{Ker}\left(\mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}\right)$ is of finite type. Hence the lemma follows from Lemma 29.18.4 part (2).

0885 Lemma 29.22.9. Let $A$ be Noetherian ring complete with respect to an ideal $I$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a projective morphism. Let $\mathcal{I}=I \mathcal{O}_{X}$. Then the functor 29.22.4.1) is an equivalence.

Proof. We have already seen that 29.22 .4 .1 is fully faithful in Lemma 29.22.7 Thus it suffices to show that the functor is essentially surjective.
We first show that every object $\left(\mathcal{F}_{n}\right)$ of $\operatorname{Coh}(X, \mathcal{I})$ is the quotient of an object in the image of 29.22 .4 .1 . Let $\mathcal{L}$ be an $f$-ample invertible sheaf on $X$. Choose $d_{0}$ as in Lemma 29.22.8. Choose a $d \geq d_{0}$ such that $\mathcal{F}_{1} \otimes \mathcal{L}^{\otimes d}$ is globally generated by some sections $s_{1,1}, \ldots, s_{t, 1}$. Since the transition maps of the system

$$
H^{0}\left(X, \mathcal{F}_{n+1} \otimes \mathcal{L}^{\otimes d}\right) \longrightarrow H^{0}\left(X, \mathcal{F}_{n} \otimes \mathcal{L}^{\otimes d}\right)
$$

are surjective by the vanishing of $H^{1}$ we can lift $s_{1,1}, \ldots, s_{t, 1}$ to a compatible system of global sections $s_{1, n}, \ldots, s_{t, n}$ of $\mathcal{F}_{n} \otimes \mathcal{L}^{\otimes d}$. These determine a compatible system of maps

$$
\left(s_{1, n}, \ldots, s_{t, n}\right):\left(\mathcal{L}^{\otimes-d}\right)^{\oplus t} \longrightarrow \mathcal{F}_{n}
$$

Using Lemma 29.22.3 we deduce that we have a surjective map

$$
\left(\left(\mathcal{L}^{\otimes-d}\right)^{\oplus t}\right)^{\wedge} \longrightarrow\left(\mathcal{F}_{n}\right)
$$

as desired.
The result of the previous paragraph and the fact that $\operatorname{Coh}(X, \mathcal{I})$ is abelian (Lemma 29.22 .2 implies that every object of $\operatorname{Coh}(X, \mathcal{I})$ is a cokernel of a map between objects coming from $\operatorname{Coh}\left(\mathcal{O}_{X}\right)$. As 29.22.4.1 is fully faithful and exact by Lemmas 29.22 .7 and 29.22.5 we conclude.

### 29.23. Grothendieck's existence theorem, II

In this section we discuss Grothendieck's existence theorem. Before we give the statement and proof, we need to develop a bit more theory regarding the categories $\operatorname{Coh}(X, \mathcal{I})$ introduced in Section 29.22 .

0887 Lemma 29.23.1. Let $f: X \rightarrow Y$ be a morphism of Noetherian schemes. Let $\mathcal{J} \subset \mathcal{O}_{Y}$ be a quasi-coherent sheaf of ideals and set $\mathcal{I}=f^{-1} \mathcal{J} \mathcal{O}_{X}$. Then there is a right exact functor

$$
f^{*}: \operatorname{Coh}(Y, \mathcal{J}) \longrightarrow \operatorname{Coh}(X, \mathcal{I})
$$

which sends $\left(\mathcal{G}_{n}\right)$ to $\left(f^{*} \mathcal{G}_{n}\right)$. If $f$ is flat, then $f^{*}$ is an exact functor.
Proof. Since $f^{*}: \operatorname{Coh}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is right exact we have

$$
f^{*} \mathcal{G}_{n}=f^{*}\left(\mathcal{G}_{n+1} / \mathcal{I}^{n} \mathcal{G}_{n+1}\right)=f^{*} \mathcal{G}_{n+1} / f^{-1} \mathcal{I}^{n} f^{*} \mathcal{G}_{n+1}=f^{*} \mathcal{G}_{n+1} / \mathcal{J}^{n} f^{*} \mathcal{G}_{n+1}
$$

hence the pullback of a system is a system. The construction of cokernels in the proof of Lemma 29.22 .2 shows that $f^{*}: \operatorname{Coh}(Y, \mathcal{J}) \rightarrow \operatorname{Coh}(X, \mathcal{I})$ is always right exact. If $f$ is flat, then $f^{*}: \operatorname{Coh}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ is an exact functor. It follows from the construction of kernels in the proof of Lemma 29.22 .2 that in this case $f^{*}: \operatorname{Coh}(Y, \mathcal{J}) \rightarrow \operatorname{Coh}(X, \mathcal{I})$ also transforms kernels into kernels.

0888 Remark 29.23.2. Let $X$ be a Noetherian scheme and let $\mathcal{I}, \mathcal{K} \subset \mathcal{O}_{X}$ be quasicoherent sheaves of ideals. Let $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow\left(\mathcal{G}_{n}\right)$ be a morphism of $\operatorname{Coh}(X, \mathcal{I})$. Given an affine open $\operatorname{Spec}(A)=U \subset X$ with $\left.\mathcal{I}\right|_{U},\left.\mathcal{K}\right|_{U}$ corresponding to ideals $I, K \subset A$ denote $\alpha_{U}: M \rightarrow N$ of finite $A^{\wedge}$-modules which corresponds to $\left.\alpha\right|_{U}$ via Lemma 29.22.1. We claim the following are equivalent
(1) there exists an integer $t \geq 1$ such that $\operatorname{Ker}\left(\alpha_{n}\right)$ and $\operatorname{Coker}\left(\alpha_{n}\right)$ are annihilated by $\mathcal{K}^{t}$ for all $n \geq 1$,
(2) for any affine open $\operatorname{Spec}(A)=U \subset X$ as above the modules $\operatorname{Ker}\left(\alpha_{U}\right)$ and $\operatorname{Coker}\left(\alpha_{U}\right)$ are annihilated by $K^{t}$ for some integer $t \geq 1$, and
(3) there exists a finite affine open covering $X=\bigcup U_{i}$ such that the conclusion of (2) holds for $\alpha_{U_{i}}$.
If these equivalent conditions hold we will say that $\alpha$ is a map whose kernel and cokernel are annihilated by a power of $\mathcal{K}$. To see the equivalence we use the following commutative algebra fact: suppose given an exact sequence

$$
0 \rightarrow T \rightarrow M \rightarrow N \rightarrow Q \rightarrow 0
$$

of $A$-modules with $T$ and $Q$ annihilated by $K^{t}$ for some ideal $K \subset A$. Then for every $f, g \in K^{t}$ there exists a canonical map " $f g$ " $: N \rightarrow M$ such that $M \rightarrow N \rightarrow M$ is equal to multiplication by $f g$. Namely, for $y \in N$ we can pick $x \in M$ mapping to $f y$ in $N$ and then we can set " $f g "(y)=g x$. Thus it is clear that $\operatorname{Ker}(M / J M \rightarrow N / J N)$ and $\operatorname{Coker}(M / J M \rightarrow N / J N)$ are annihilated by $K^{2 t}$ for any ideal $J \subset A$.

Applying the commutative algebra fact to $\alpha_{U_{i}}$ and $J=I^{n}$ we see that (3) implies (1). Conversely, suppose (1) holds and $M \rightarrow N$ is equal to $\alpha_{U}$. Then there is a $t \geq 1$ such that $\operatorname{Ker}\left(M / I^{n} M \rightarrow N / I^{n} N\right)$ and $\operatorname{Coker}\left(M / I^{n} M \rightarrow N / I^{n} N\right)$ are annihilated by $K^{t}$ for all $n$. We obtain maps " $f g$ ": $N / I^{n} N \rightarrow M / I^{n} M$ which in the limit induce a map $N \rightarrow M$ as $N$ and $M$ are $I$-adically complete. Since the composition with $N \rightarrow M \rightarrow N$ is multiplication by $f g$ we conclude that $f g$ annihilates $T$ and $Q$. In other words $T$ and $Q$ are annihilated by $K^{2 t}$ as desired.

0889 Lemma 29.23.3. Let $X$ be a Noetherian scheme and let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals. Let $\mathcal{G}$ be a coherent $\mathcal{O}_{X}$-module, $\left(\mathcal{F}_{n}\right)$ an object of $\operatorname{Coh}(X, \mathcal{I})$, and $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{G}^{\wedge}$ a map whose kernel and cokernel are annihilated by a power of $\mathcal{I}$. Then there exists a unique (up to unique isomorphism) triple $(\mathcal{F}, a, \beta)$ where
(1) $\mathcal{F}$ is a coherent $\mathcal{O}_{X}$-module,
(2) $a: \mathcal{F} \rightarrow \mathcal{G}$ is an $\mathcal{O}_{X}$-module map whose kernel and cokernel are annihilated by a power of $\mathcal{I}$,
(3) $\beta:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{F}^{\wedge}$ is an isomorphism, and
(4) $\alpha=a^{\wedge} \circ \beta$.

Proof. The uniqueness implies it suffices to construct $(\mathcal{F}, a, \beta)$ Zariski locally on $X$. Thus we may assume $X=\operatorname{Spec}(A)$ and $\mathcal{I}$ corresponds to the ideal $I \subset A$. In this situation Lemma 29.22 .1 applies. Let $M^{\prime}$ be the finite $A^{\wedge}$-module corresponding to $\left(\mathcal{F}_{n}\right)$. Let $N$ be the finite $A$-module corresponding to $\mathcal{G}$. Then $\alpha$ corresponds to a map

$$
\varphi: M^{\prime} \longrightarrow N^{\wedge}
$$

whose kernel and cokernel are annihilated by $I^{t}$ for some $t$. Recall that $N^{\wedge}=$ $N \otimes_{A} A^{\wedge}$ (Algebra, Lemma 10.96.1). By More on Algebra, Lemma 15.70 .16 there is an $A$-module map $\psi: M \rightarrow N$ whose kernel and cokernel are $I$-power torsion and an isomorphism $M \otimes_{A} A^{\wedge}=M^{\prime}$ compatible with $\varphi$. As $N$ and $M^{\prime}$ are finite modules, we conclude that $M$ is a finite $A$-module, see More on Algebra, Remark 15.70.19. Hence $M \otimes_{A} A^{\wedge}=M^{\wedge}$. We omit the verification that the triple ( $M, N \rightarrow$ $M, M^{\wedge} \rightarrow M^{\prime}$ ) so obtained is unique up to unique isomorphism.

088A Lemma 29.23.4. Let $X$ be a Noetherian scheme. Let $\mathcal{I}, \mathcal{K} \subset \mathcal{O}_{X}$ be quasicoherent sheaves of ideals. Let $X_{e} \subset X$ be the closed subscheme cut out by $\mathcal{K}^{e}$. Let $\mathcal{I}_{e}=\mathcal{I} \mathcal{O}_{X_{e}}$. Let $\left(\mathcal{F}_{n}\right)$ be an object of $\operatorname{Coh}(X, \mathcal{I})$. Assume
(1) the functor $\operatorname{Coh}\left(\mathcal{O}_{X_{e}}\right) \rightarrow \operatorname{Coh}\left(X_{e}, \mathcal{I}_{e}\right)$ is an equivalence for all $e \geq 1$, and
(2) there exists a coherent sheaf $\mathcal{H}$ on $X$ and a map $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{H}^{\wedge}$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$.
Then $\left(\mathcal{F}_{n}\right)$ is in the essential image of 29.22.4.1).
Proof. During this proof we will use without further mention that for a closed immersion $i: Z \rightarrow X$ the functor $i_{*}$ gives an equivalence between the category of coherent modules on $Z$ and coherent modules on $X$ annihilated by the ideal sheaf of $Z$, see Lemma 29.9.8. In particular we may identify $\operatorname{Coh}\left(\mathcal{O}_{X_{e}}\right)$ with the category of coherent $\mathcal{O}_{X}$-modules annihilated by $\mathcal{K}^{e}$ and $\operatorname{Coh}\left(X_{e}, \mathcal{I}_{e}\right)$ as the full subcategory of $\operatorname{Coh}(X, \mathcal{I})$ of objects annihilated by $\mathcal{K}^{e}$. Moreover (1) tells us these two categories are equivalent under the completion functor 29.22.4.1.

Applying this equivalence we get a coherent $\mathcal{O}_{X}$-module $\mathcal{G}_{e}$ annihilated by $\mathcal{K}^{e}$ corresponding to the system $\left(\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n}\right)$ of $\operatorname{Coh}(X, \mathcal{I})$. The maps $\mathcal{F}_{n} / \mathcal{K}^{e+1} \mathcal{F}_{n} \rightarrow$ $\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n}$ correspond to canonical maps $\mathcal{G}_{e+1} \rightarrow \mathcal{G}_{e}$ which induce isomorphisms $\mathcal{G}_{e+1} / \mathcal{K}^{e} \mathcal{G}_{e+1} \rightarrow \mathcal{G}_{e}$. Hence $\left(\mathcal{G}_{e}\right)$ is an object of $\operatorname{Coh}(X, \mathcal{K})$. The map $\alpha$ induces a system of maps

$$
\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n} \longrightarrow \mathcal{H} /\left(\mathcal{I}^{n}+\mathcal{K}^{e}\right) \mathcal{H}
$$

whence maps $\mathcal{G}_{e} \rightarrow \mathcal{H} / \mathcal{K}^{e} \mathcal{H}$ (by the equivalence of categories again). Let $t \geq 1$ be an integer, which exists by assumption (2), such that $\mathcal{K}^{t}$ annihilates the kernel and cokernel of all the maps $\mathcal{F}_{n} \rightarrow \mathcal{H} / \mathcal{I}^{n} \mathcal{H}$. Then $\mathcal{K}^{2 t}$ annihilates the kernel and cokernel of the maps $\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n} \rightarrow \mathcal{H} /\left(\mathcal{I}^{n}+\mathcal{K}^{e}\right) \mathcal{H}$, see Remark 29.23.2. Whereupon we conclude that $\mathcal{K}^{4 t}$ annihilates the kernel and the cokernel of the maps

$$
\mathcal{G}_{e} \longrightarrow \mathcal{H} / \mathcal{K}^{e} \mathcal{H}
$$

see Remark 29.23.2. We apply Lemma 29.23 .3 to obtain a coherent $\mathcal{O}_{X}$-module $\mathcal{F}$, a $\operatorname{map} a: \mathcal{F} \rightarrow \mathcal{H}$ and an isomorphism $\beta:\left(\mathcal{G}_{e}\right) \rightarrow\left(\mathcal{F} / \mathcal{K}^{e} \mathcal{F}\right)$ in $\operatorname{Coh}(X, \mathcal{K})$. Working backwards, for a given $n$ the triple $\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}, a \bmod \mathcal{I}^{n}, \beta \bmod \mathcal{I}^{n}\right)$ is a triple as in the lemma for the morphism $\alpha_{n} \bmod \mathcal{K}^{e}:\left(\mathcal{F}_{n} / \mathcal{K}^{e} \mathcal{F}_{n}\right) \rightarrow\left(\mathcal{H} /\left(\mathcal{I}^{n}+\mathcal{K}^{e}\right) \mathcal{H}\right)$ of $\operatorname{Coh}(X, \mathcal{K})$. Thus the uniqueness in Lemma 29.23 .3 gives a canonical isomorphism $\mathcal{F} / \mathcal{I}^{n} \mathcal{F} \rightarrow \mathcal{F}_{n}$ compatible with all the morphisms in sight. This finishes the proof of the lemma.

Lemma 29.23.5. Let $Y$ be a Noetherian scheme. Let $\mathcal{J}, \mathcal{K} \subset \mathcal{O}_{Y}$ be quasi-coherent sheaves of ideals. Let $f: X \rightarrow Y$ be a proper morphism which is an isomorphism over $V=Y \backslash V(\mathcal{K})$. Set $\mathcal{I}=f^{-1} \mathcal{J} \mathcal{O}_{X}$. Let $\left(\mathcal{G}_{n}\right)$ be an object of $\operatorname{Coh}(Y, \mathcal{J})$, let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module, and let $\beta:\left(f^{*} \mathcal{G}_{n}\right) \rightarrow \mathcal{F}^{\wedge}$ be an isomorphism in $\operatorname{Coh}(X, \mathcal{I})$. Then there exists a map

$$
\alpha:\left(\mathcal{G}_{n}\right) \longrightarrow\left(f_{*} \mathcal{F}\right)^{\wedge}
$$

in $\operatorname{Coh}(Y, \mathcal{J})$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$.
Proof. Since $f$ is a proper morphism we see that $f_{*} \mathcal{F}$ is a coherent $\mathcal{O}_{Y}$-module (Proposition 29.18.1). Thus the statement of the lemma makes sense. Consider the compositions

$$
\gamma_{n}: \mathcal{G}_{n} \rightarrow f_{*} f^{*} \mathcal{G}_{n} \rightarrow f_{*}\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right)
$$

Here the first map is the adjunction map and the second is $f_{*} \beta_{n}$. We claim that there exists a unique $\alpha$ as in the lemma such that the compositions

$$
\mathcal{G}_{n} \xrightarrow{\alpha_{n}} f_{*} \mathcal{F} / \mathcal{J}^{n} f_{*} \mathcal{F} \rightarrow f_{*}\left(\mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right)
$$

equal $\gamma_{n}$ for all $n$. Because of the uniqueness we may assume that $Y=\operatorname{Spec}(B)$ is affine. Let $J \subset B$ corresponds to the ideal $\mathcal{J}$. Set

$$
M_{n}=H^{0}\left(X, \mathcal{F} / \mathcal{I}^{n} \mathcal{F}\right) \quad \text { and } \quad M=H^{0}(X, \mathcal{F})
$$

By Lemma 29.19 .4 and Theorem 29.19 .5 the inverse limit of the modules $M_{n}$ equals the completion $M^{\wedge}=\lim M / J^{n} M$. Set $N_{n}=H^{0}\left(Y, \mathcal{G}_{n}\right)$ and $N=\lim N_{n}$. Via the equivalence of categories of Lemma 29.22.1 the finite $B^{\wedge}$ modules $N$ and $M^{\wedge}$ correspond to $\left(\mathcal{G}_{n}\right)$ and $f_{*} \mathcal{F}^{\wedge}$. It follows from this that $\alpha$ has to be the morphism of $\operatorname{Coh}(Y, \mathcal{J})$ corresponding to the homomorphism

$$
\lim \gamma_{n}: N=\lim _{n} N_{n} \longrightarrow \lim M_{n}=M^{\wedge}
$$

of finite $B^{\wedge}$-modules.
We still have to show that the kernel and cokernel of $\alpha$ are annihilated by a power of $\mathcal{K}$. Set $Y^{\prime}=\operatorname{Spec}\left(B^{\wedge}\right)$ and $X^{\prime}=Y^{\prime} \times_{Y} X$. Let $\mathcal{K}^{\prime}, \mathcal{J}^{\prime}, \mathcal{G}_{n}^{\prime}$ and $\mathcal{I}^{\prime}$, $\mathcal{F}^{\prime}$ be the pullback of $\mathcal{K}, \mathcal{J}, \mathcal{G}_{n}$ and $\mathcal{I}, \mathcal{F}$, to $Y^{\prime}$ and $X^{\prime}$. The projection morphism $f^{\prime}: X^{\prime} \rightarrow Y^{\prime}$ is the base change of $f$ by $Y^{\prime} \rightarrow Y$. Note that $Y^{\prime} \rightarrow Y$ is a flat morphism of schemes as $B \rightarrow B^{\wedge}$ is flat by Algebra, Lemma 10.96.2 Hence $f_{*}^{\prime} \mathcal{F}^{\prime}$, resp. $f_{*}^{\prime}\left(f^{\prime}\right)^{*} \mathcal{G}_{n}^{\prime}$ is the pullback of $f_{*} \mathcal{F}$, resp. $f_{*} f^{*} \mathcal{G}_{n}$ to $Y^{\prime}$ by Lemma 29.5.2. The uniqueness of our construction shows the pullback of $\alpha$ to $Y^{\prime}$ is the corresponding map $\alpha^{\prime}$ constructed for the situation on $Y^{\prime}$. Moreover, to check that the kernel and cokernel of $\alpha$ are annihilated by $\mathcal{K}^{t}$ it suffices to check that the kernel and cokernel of $\alpha^{\prime}$ are annihilated by $\left(\mathcal{K}^{\prime}\right)^{t}$. Namely, to see this we need to check this for kernels and cokernels of the maps $\alpha_{n}$ and $\alpha_{n}^{\prime}$ (see Remark 29.23.2) and the ring $\operatorname{map} B \rightarrow B^{\wedge}$ induces an equivalence of categories between modules annihilated by $J^{n}$ and $\left(J^{\prime}\right)^{n}$, see More on Algebra, Lemma 15.70.3. Thus we may assume $B$ is complete with respect to $J$.
Assume $Y=\operatorname{Spec}(B)$ is affine, $\mathcal{J}$ corresponds to the ideal $J \subset B$, and $B$ is complete with respect to $J$. In this case $\left(\mathcal{G}_{n}\right)$ is in the essential image of the functor $\operatorname{Coh}\left(\mathcal{O}_{Y}\right) \rightarrow \operatorname{Coh}(Y, \mathcal{J})$. Say $\mathcal{G}$ is a coherent $\mathcal{O}_{Y}$-module such that $\left(\mathcal{G}_{n}\right)=\mathcal{G}^{\wedge}$. Note that $f^{*}\left(\mathcal{G}^{\wedge}\right)=\left(f^{*} \mathcal{G}\right)^{\wedge}$. Hence Lemma 29.22.7 tells us that $\beta$ comes from an isomorphism $b: f^{*} \mathcal{G} \rightarrow \mathcal{F}$ and $\alpha$ is the completion functor applied to

$$
\mathcal{G} \rightarrow f_{*} f^{*} \mathcal{G} \cong f_{*} \mathcal{F}
$$

Hence we are trying to verify that the kernel and cokernel of the adjunction map $c: \mathcal{G} \rightarrow f_{*} f^{*} \mathcal{G}$ are annihilated by a power of $\mathcal{K}$. However, since the restriction $\left.f\right|_{f^{-1}(V)}: f^{-1}(V) \rightarrow V$ is an isomorphism we see that $\left.c\right|_{V}$ is an isomorphism. Thus the coherent sheaves $\operatorname{Ker}(c)$ and $\operatorname{Coker}(c)$ are supported on $V(\mathcal{K})$ hence are annihilated by a power of $\mathcal{K}$ (Lemma 29.10.2) as desired.

The following proposition is the form of Grothendieck's existence theorem which is most often used in practice.

088C Proposition 29.23.6. Let $A$ be a Noetherian ring complete with respect to an ideal I. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a proper morphism of schemes. Set $\mathcal{I}=I \mathcal{O}_{X}$. Then the functor 29.22.4.1) is an equivalence.

Proof. We have already seen that 29.22 .4 .1 is fully faithful in Lemma 29.22.7. Thus it suffices to show that the functor is essentially surjective.
Consider the collection $\Xi$ of quasi-coherent sheaves of ideals $\mathcal{K} \subset \mathcal{O}_{X}$ such that every object $\left(\mathcal{F}_{n}\right)$ annihilated by $\mathcal{K}$ is in the essential image. We want to show (0) is in $\Xi$. If not, then since $X$ is Noetherian there exists a maximal quasi-coherent sheaf of ideals $\mathcal{K}$ not in $\Xi$, see Lemma 29.10.1 After replacing $X$ by the closed subscheme of $X$ corresponding to $\mathcal{K}$ we may assume that every nonzero $\mathcal{K}$ is in $\Xi$. (This uses the correspondence by coherent modules annihilated by $\mathcal{K}$ and coherent modules on the closed subscheme corresponding to $\mathcal{K}$, see Lemma 29.9.8.) Let $\left(\mathcal{F}_{n}\right)$ be an object of $\operatorname{Coh}(X, \mathcal{I})$. We will show that this object is in the essential image of the functor 29.22.4.1), thereby completion the proof of the proposition.

Apply Chow's lemma (Lemma 29.17.1) to find a proper surjective morphism $f$ : $X^{\prime} \rightarrow X$ which is an isomorphism over a dense open $U \subset X$ such that $X^{\prime}$ is projective over $A$. Let $\mathcal{K}$ be the quasi-coherent sheaf of ideals cutting out the reduced complement $X \backslash U$. By the projective case of Grothendieck's existence theorem (Lemma 29.22 .9 there exists a coherent module $\mathcal{F}^{\prime}$ on $X^{\prime}$ such that $\left(\mathcal{F}^{\prime}\right)^{\wedge} \cong\left(f^{*} \mathcal{F}_{n}\right)$. By Proposition 29.18.1 the $\mathcal{O}_{X}$-module $\mathcal{H}=f_{*} \mathcal{F}^{\prime}$ is coherent and by Lemma 29.23 .5 there exists a morphism $\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{H}^{\wedge}$ of $\operatorname{Coh}(X, \mathcal{I})$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$. The powers $\mathcal{K}^{e}$ are all in $\Xi$ so that 29.22.4.1 is an equivalence for the closed subschemes $X_{e}=V\left(\mathcal{K}^{e}\right)$. We conclude by Lemma 29.23 .4

To state the general version of Grothendieck's existence theorem we introduce a bit more notation. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Let $f: X \rightarrow \operatorname{Spec}(A)$ be a separated finite type morphism of schemes. Set $\mathcal{I}=I \mathcal{O}_{X}$. In this situation we let

$$
C o h_{\text {support proper over } A}\left(\mathcal{O}_{X}\right)
$$

be the full subcategory of $\operatorname{Coh}\left(\mathcal{O}_{X}\right)$ consisting of those coherent $\mathcal{O}_{X}$-modules whose scheme theoretic support is proper over $\operatorname{Spec}(A)$. Similarly, we let

$$
\operatorname{Coh}_{\text {support proper over } A}(X, \mathcal{I})
$$

be the full subcategory of $\operatorname{Coh}(X, \mathcal{I})$ consisting of those objects $\left(\mathcal{F}_{n}\right)$ such that the scheme theoretic support of $\mathcal{F}_{1}$ is proper over $\operatorname{Spec}(A)$. Since the support of a quotient module is contained in the support of the module, it follows that 29.22.4.1) induces a functor

088D (29.23.6.1) $C o h_{\text {support proper over } A}\left(\mathcal{O}_{X}\right) \longrightarrow C o h_{\text {support proper over } A}(X, \mathcal{I})$
We are now ready to state the main theorem of this section.
088E Theorem 29.23.7 (Grothendieck's existence theorem). In the situation described above the functor 29.23.6.1) is an equivalence.

Proof. We will use the equivalence of categories of Lemma 29.9 .8 without further mention in the proof of the theorem. Let $Z \subset X$ be a closed subscheme proper over $A$. By Proposition 29.23 .6 we know that the result is true for the functor between coherent modules and systems of coherent modules supported on $Z$. Hence it suffices to show that every object of $\operatorname{Coh}_{\text {support proper over } A}\left(\mathcal{O}_{X}\right)$ and every object of $C o h_{\text {support proper over } A}(X, \mathcal{I})$ is supported on such a closed subscheme $Z \subset X$ proper over $A$. This holds by definition for objects of $C o h_{\text {support }}$ proper over $A\left(\mathcal{O}_{X}\right)$.

We will prove this statement for objects of $\operatorname{Coh}_{\text {support proper over } A}(X, \mathcal{I})$ using the method of proof of Proposition 29.23.6. We urge the reader to read that proof first.

Consider the collection $\Xi$ of quasi-coherent sheaves of ideals $\mathcal{K} \subset \mathcal{O}_{X}$ such that the statement holds for every object $\left(\mathcal{F}_{n}\right)$ of $\operatorname{Coh}_{\text {support proper over } A}(X, \mathcal{I})$ annihilated by $\mathcal{K}$. We want to show (0) is in $\Xi$. If not, then since $X$ is Noetherian there exists a maximal quasi-coherent sheaf of ideals $\mathcal{K}$ not in $\Xi$, see Lemma 29.10.1. After replacing $X$ by the closed subscheme of $X$ corresponding to $\mathcal{K}$ we may assume that every nonzero $\mathcal{K}$ is in $\Xi$. Let $\left(\mathcal{F}_{n}\right)$ be an object of $C o h_{\text {support proper over } A}(X, \mathcal{I})$. We will show that this object is supported on a closed subscheme $Z \subset X$ proper over $A$, thereby completing the proof of the theorem.

Apply Chow's lemma (Lemma 29.17.1) to find a proper surjective morphism $f$ : $Y \rightarrow X$ which is an isomorphism over a dense open $U \subset X$ such that $Y$ is H -quasi-projective over $A$. Choose an open immersion $j: Y \rightarrow Y^{\prime}$ with $Y^{\prime}$ projective over $A$, see Morphisms, Lemma 28.42.12. Let $T_{n}$ be the scheme theoretic support of $\mathcal{F}_{n}$. Note that $T_{n}=T_{1}$ set-theoretically, hence $T_{n}$ is proper over $A$ for all $n$ (Morphisms, Lemma 28.41.8). Then $f^{*} \mathcal{F}_{n}$ is supported on the closed subscheme $f^{-1} T_{n}$ which is proper over $A$ (by Morphisms, Lemma 28.41 .4 and properness of $f$ ). In particular, the composition $f^{-1} T_{n} \rightarrow Y \rightarrow Y^{\prime}$ is closed (Morphisms, Lemma 28.41.7). Let $T_{n}^{\prime} \subset Y^{\prime}$ be the corresponding closed subscheme; it is contained in the open subscheme $Y$ and equal to $f^{-1} T_{n}$ as a closed subscheme of $Y$. Let $\mathcal{F}_{n}^{\prime}$ be the coherent $\mathcal{O}_{Y^{\prime}}$-module corresponding to $f^{*} \mathcal{F}_{n}$ viewed as a coherent module on $Y^{\prime}$ via the closed immersion $f^{-1} T_{n}=T_{n}^{\prime} \subset Y^{\prime}$. Then $\left(\mathcal{F}_{n}^{\prime}\right)$ is an object of $\operatorname{Coh}\left(Y^{\prime}, I \mathcal{O}_{Y^{\prime}}\right)$. By the projective case of Grothendieck's existence theorem (Lemma 29.22 .9 there exists a coherent $\mathcal{O}_{Y^{\prime}}$-module $\mathcal{F}^{\prime}$ and an isomorphism $\left(\mathcal{F}^{\prime}\right)^{\wedge} \cong\left(\mathcal{F}_{n}^{\prime}\right)$ in $\operatorname{Coh}\left(Y^{\prime}, I \mathcal{O}_{Y^{\prime}}\right)$. Let $Z^{\prime} \subset Y^{\prime}$ be the scheme theoretic support of $\mathcal{F}^{\prime}$. Since $\mathcal{F}^{\prime} / I \mathcal{F}^{\prime}=\mathcal{F}_{1}^{\prime}$ we see that $Z^{\prime} \cap V\left(I \mathcal{O}_{Y^{\prime}}\right)=T_{1}^{\prime}$ set-theoretically. The structure morphism $p^{\prime}: Y^{\prime} \rightarrow \operatorname{Spec}(A)$ is proper, hence $p^{\prime}\left(Z^{\prime} \cap\left(Y^{\prime} \backslash Y\right)\right)$ is closed in $\operatorname{Spec}(A)$. If nonempty, then it would contain a point of $V(I)$ as $I$ is contained in the radical of $A$ (Algebra, Lemma 10.95.6). But we've seen above that $Z^{\prime} \cap\left(p^{\prime}\right)^{-1} V(I)=T_{1}^{\prime} \subset Y$ hence we conclude that $Z^{\prime} \subset Y$. Thus $\left.\mathcal{F}^{\prime}\right|_{Y}$ is supported on a closed subscheme of $Y$ proper over $A$.

Let $\mathcal{K}$ be the quasi-coherent sheaf of ideals cutting out the reduced complement $X \backslash U$. By Proposition 29.18 .1 the $\mathcal{O}_{X}$-module $\mathcal{H}=f_{*} \mathcal{F}^{\prime}$ is coherent and by Lemma 29.23 .5 there exists a morphism $\alpha:\left(\mathcal{F}_{n}\right) \rightarrow \mathcal{H}^{\wedge}$ of $\operatorname{Coh}(X, \mathcal{I})$ whose kernel and cokernel are annihilated by a power of $\mathcal{K}$. Let $Z_{0} \subset X$ be the scheme theoretic support of $\mathcal{H}$. It is clear that $Z_{0} \subset f\left(Z^{\prime}\right)$ set-theoretically. Hence $Z_{0} \rightarrow \operatorname{Spec}(A)$ is proper (Morphisms, Lemma 28.41.7). The kernel of $\alpha$ is an object of $\operatorname{Coh}_{\text {support proper over } A}(X, \mathcal{I})$ annihilated by a power of $\mathcal{K}^{t}$ which is in $\Xi$. Hence the kernel of $\alpha$ are supported on closed subschemes $Z_{1} \subset X$ proper over $A$. Let $\mathcal{K}_{i} \subset \mathcal{O}_{X}$ be the quasi-coherent sheaf of ideals cutting out $Z_{i}$ for $i=0,1$. Set $\mathcal{K}=\mathcal{K}_{0} \mathcal{K}_{1}$ and let $Z=V(\mathcal{K}) \subset X$. Then $\left(\mathcal{F}_{n}\right)$ is supported on $Z$ (details omitted). Finally, $Z_{0} \amalg Z_{1} \rightarrow Z$ is surjective, whence $Z$ is proper over $A$ by Morphisms, Lemma 28.41.7. This finishes the proof of the theorem.

088F Remark 29.23.8 (Unwinding Grothendieck's existence theorem). Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X \rightarrow S$ be a separated morphism of finite type. For $n \geq 1$
we set $X_{n}=X \times_{S} S_{n}$. Picture:

In this situation we consider systems $\left(\mathcal{F}_{n}, \varphi_{n}\right)$ where
(1) $\mathcal{F}_{n}$ is a coherent $\mathcal{O}_{X_{n}}$-module,
(2) $\varphi_{n}: i_{n}^{*} \mathcal{F}_{n+1} \rightarrow \mathcal{F}_{n}$ is an isomorphism, and
(3) $\operatorname{Supp}\left(\mathcal{F}_{1}\right)$ is proper over $S_{1}$.

Theorem 29.23.7 says that the completion functor

is an equivalence of categories. In the special case that $X$ is proper over $A$ we can omit the conditions on the supports.

### 29.24. Grothendieck's algebraization theorem

0898 Our first result is a translation of Grothendieck's existence theorem in terms of closed subschemes and finite morphisms.

0899 Lemma 29.24.1. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X \rightarrow S$ be a separated morphism of finite type. For $n \geq 1$ we set $X_{n}=X \times{ }_{S} S_{n}$. Suppose given a commutative diagram

of schemes with cartesian squares. Assume that
(1) $Z_{1} \rightarrow X_{1}$ is a closed immersion, and
(2) $Z_{1} \rightarrow S_{1}$ is proper.

Then there exists a closed immersion of schemes $Z \rightarrow X$ such that $Z_{n}=Z \times_{S} S_{n}$. Moreover, $Z$ is proper over $S$.

Proof. Let's write $j_{n}: Z_{n} \rightarrow X_{n}$ for the vertical morphisms. As the squares in the statement are cartesian we see that the base change of $j_{n}$ to $X_{1}$ is $j_{1}$. Thus Morphisms, Lemma 28.44 .5 shows that $j_{n}$ is a closed immersion. Set $\mathcal{F}_{n}=j_{n, *} \mathcal{O}_{Z_{n}}$, so that $j_{n}^{\sharp}$ is a surjection $\mathcal{O}_{X_{n}} \rightarrow \mathcal{F}_{n}$. Again using that the squares are cartesian we see that the pullback of $\mathcal{F}_{n+1}$ to $X_{n}$ is $\mathcal{F}_{n}$. Hence Grothendieck's existence theorem, as reformulated in Remark 29.23 .8 , tells us there exists a map $\mathcal{O}_{X} \rightarrow \mathcal{F}$ of coherent $\mathcal{O}_{X}$-modules whose restriction to $X_{n}$ recovers $\mathcal{O}_{X_{n}} \rightarrow \mathcal{F}_{n}$. Moreover, the support of $\mathcal{F}$ is proper over $S$. As the completion functor is exact (Lemma 29.22.5) we see that $\mathcal{O}_{X} \rightarrow \mathcal{F}$ is surjective. Thus $\mathcal{F}=\mathcal{O}_{X} / \mathcal{J}$ for some quasi-coherent sheaf of ideals $\mathcal{J}$. Setting $Z=V(\mathcal{J})$ finishes the proof.

In the following lemma it is actually enough to assume that $Y_{1} \rightarrow X_{1}$ is finite as it will imply that $Y_{n} \rightarrow X_{n}$ is finite too (see More on Morphisms, Lemma 36.2.8).

09ZT Lemma 29.24.2. Let $A$ be a Noetherian ring complete with respect to an ideal $I$. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X \rightarrow S$ be a separated morphism of finite type. For $n \geq 1$ we set $X_{n}=X \times_{S} S_{n}$. Suppose given a commutative diagram

of schemes with cartesian squares. Assume that
(1) $Y_{n} \rightarrow X_{n}$ is a finite morphism, and
(2) $Y_{1} \rightarrow S_{1}$ is proper.

Then there exists a finite morphism of schemes $Y \rightarrow X$ such that $Y_{n}=Y \times_{S} S_{n}$. Moreover, $Y$ is proper over $S$.

Proof. Let's write $f_{n}: Y_{n} \rightarrow X_{n}$ for the vertical morphisms. Set $\mathcal{F}_{n}=f_{n, *} \mathcal{O}_{Y_{n}}$. This is a coherent $\mathcal{O}_{X_{n}}$-module as $f_{n}$ is finite (Lemma 29.9.9). Using that the squares are cartesian we see that the pullback of $\mathcal{F}_{n+1}$ to $X_{n}$ is $\mathcal{F}_{n}$. Hence Grothendieck's existence theorem, as reformulated in Remark 29.23 .8 , tells us there exists a coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ whose restriction to $X_{n}$ recovers $\mathcal{F}_{n}$. Moreover, the support of $\mathcal{F}$ is proper over $S$. As the completion functor is fuly faithful (Theorem 29.23.7 we see that the multiplication maps $\mathcal{F}_{n} \otimes_{\mathcal{O}_{X_{n}}} \mathcal{F}_{n} \rightarrow \mathcal{F}_{n}$ fit together to give an algebra structure on $\mathcal{F}$. Setting $Y=\underline{\operatorname{Spec}}_{X}(\mathcal{F})$ finishes the proof.

0A42 Lemma 29.24.3. Let $A$ be a Noetherian ring complete with respect to an ideal I. Write $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Let $X, Y$ be schemes over $S$. For $n \geq 1$ we set $X_{n}=X \times_{S} S_{n}$ and $Y_{n}=Y \times_{S} S_{n}$. Suppose given a compatible system of commutative diagrams

Assume that
(1) $X \rightarrow S$ is proper, and
(2) $Y \rightarrow S$ is separated of finite type.

Then there exists a unique morphism of schemes $g: X \rightarrow Y$ over $S$ such that $g_{n}$ is the base change of $g$ to $S_{n}$.

Proof. The morphisms $\left(1, g_{n}\right): X_{n} \rightarrow X_{n} \times_{S} Y_{n}$ are closed immersions because $Y_{n} \rightarrow S_{n}$ is separated (Schemes, Lemma 25.21.12). Thus by Lemma 29.24.1 there exists a closed subscheme $Z \subset X \times{ }_{S} Y$ proper over $S$ whose base change to $S_{n}$ recovers $X_{n} \subset X_{n} \times_{S} Y_{n}$. The first projection $p: Z \rightarrow X$ is a proper morphism (as $Z$ is proper over $S$, see Morphisms, Lemma 28.41.7) whose base change to $S_{n}$ is an isomorphism for all $n$. In particular, $p: Z \rightarrow X$ is finite over an open neighbourhood of $X_{0}$ by Lemma 29.20.2. As $X$ is proper over $S$ this open neighbourhood is all of $X$ and we conclude $p: Z \rightarrow X$ is finite. Applying the equivalence of Proposition
29.23 .6 we see that $p_{*} \mathcal{O}_{Z}=\mathcal{O}_{X}$ as this is true modulo $I^{n}$ for all $n$. Hence $p$ is an isomorphism and we obtain the morphism $g$ as the composition $X \cong Z \rightarrow Y$. We omit the proof of uniqueness.

In order to prove an "abstract" algebraization theorem we need to assume we have an ample invertible sheaf, as the result is false without such an assumption.

089A Theorem 29.24.4 (Grothendieck's algebraization theorem). Let A be a Noetherian ring complete with respect to an ideal $I$. Set $S=\operatorname{Spec}(A)$ and $S_{n}=\operatorname{Spec}\left(A / I^{n}\right)$. Consider a commutative diagram

of schemes with cartesian squares. Suppose given $\left(\mathcal{L}_{n}, \varphi_{n}\right)$ where each $\mathcal{L}_{n}$ is an invertible sheaf on $X_{n}$ and $\varphi_{n}: i_{n}^{*} \mathcal{L}_{n+1} \rightarrow \mathcal{L}_{n}$ is an isomorphism. If
(1) $X_{1} \rightarrow S_{1}$ is proper, and
(2) $\mathcal{L}_{1}$ is ample on $X_{1}$
then there exists a proper morphism of schemes $X \rightarrow S$ and an ample invertible $\mathcal{O}_{X}$-module $\mathcal{L}$ and isomorphisms $X_{n} \cong X \times_{S} S_{n}$ and $\left.\mathcal{L}_{n} \cong \mathcal{L}\right|_{X_{n}}$ compatible with the morphisms $i_{n}$ and $\varphi_{n}$.

Proof. Since the squares in the diagram are cartesian and since the morphisms $S_{n} \rightarrow S_{n+1}$ are closed immersions, we see that the morphisms $i_{n}$ are closed immersions too. In particular we may think of $X_{m}$ as a closed subscheme of $X_{n}$ for $m<n$. In fact $X_{m}$ is the closed subscheme cut out by the quasi-coherent sheaf of ideals $I^{m} \mathcal{O}_{X_{n}}$. Moreover, the underlying topological spaces of the schemes $X_{1}, X_{2}, X_{3}, \ldots$ are all identified, hence we may (and do) think of sheaves $\mathcal{O}_{X_{n}}$ as living on the same underlying topological space; similarly for coherent $\mathcal{O}_{X_{n}}$-modules. Set

$$
\mathcal{F}_{n}=\operatorname{Ker}\left(\mathcal{O}_{X_{n+1}} \rightarrow \mathcal{O}_{X_{n}}\right)
$$

so that we obtain short exact sequences

$$
0 \rightarrow \mathcal{F}_{n} \rightarrow \mathcal{O}_{X_{n+1}} \rightarrow \mathcal{O}_{X_{n}} \rightarrow 0
$$

By the above we have $\mathcal{F}_{n}=I^{n} \mathcal{O}_{X_{n+1}}$. It follows $\mathcal{F}_{n}$ is a coherent sheaf on $X_{n+1}$ annihilated by $I$, hence we may (and do) think of it as a coherent module $\mathcal{O}_{X_{1}}$ module. Observe that for $m>n$ the sheaf

$$
I^{n} \mathcal{O}_{X_{m}} / I^{n+1} \mathcal{O}_{X_{m}}
$$

maps isomorphically to $\mathcal{F}_{n}$ under the map $\mathcal{O}_{X_{m}} \rightarrow \mathcal{O}_{X_{n+1}}$. Hence given $n_{1}, n_{2} \geq 0$ we can pick an $m>n_{1}+n_{2}$ and consider the multiplication map

$$
I^{n_{1}} \mathcal{O}_{X_{m}} \times I^{n_{2}} \mathcal{O}_{X_{m}} \longrightarrow I^{n_{1}+n_{2}} \mathcal{O}_{X_{m}} \rightarrow \mathcal{F}_{n_{1}+n_{2}}
$$

This induces an $\mathcal{O}_{X_{1}}$-bilinear map

$$
\mathcal{F}_{n_{1}} \times \mathcal{F}_{n_{2}} \longrightarrow \mathcal{F}_{n_{1}+n_{2}}
$$

which in turn defines the structure of a graded $\mathcal{O}_{X_{1}}$-algebra on $\mathcal{F}=\bigoplus_{n \geq 0} \mathcal{F}_{n}$.

Set $B=\bigoplus_{\widetilde{B}} I^{n} / I^{n+1}$; this is a finitely generated graded $A / I$-algebra. Set $\mathcal{B}=$ $\left(X_{1} \rightarrow S_{1}\right)^{*} \widetilde{B}$. The discussion above provides us with a canonical surjection

$$
\mathcal{B} \longrightarrow \mathcal{F}
$$

of graded $\mathcal{O}_{X_{1}}$-algebras. In particular we see that $\mathcal{F}$ is a finite type quasi-coherent graded $\mathcal{B}$-module. By Lemma 29.18 .4 we can find an integer $d_{0}$ such that $H^{1}\left(X_{1}, \mathcal{F} \otimes\right.$ $\left.\mathcal{L}^{\otimes d}\right)=0$ for all $d \geq d_{0}$. Pick a $d \geq d_{0}$ such that there exist sections $s_{0,1}, \ldots, s_{N, 1} \in$ $\Gamma\left(X_{1}, \mathcal{L}_{1}^{\otimes d}\right)$ which induce an immersion

$$
\psi_{1}: X_{1} \rightarrow \mathbf{P}_{S_{1}}^{N}
$$

over $S_{1}$, see Morphisms, Lemma 28.39.4 As $X_{1}$ is proper over $S_{1}$ we see that $\psi_{1}$ is a closed immersion, see Morphisms, Lemma 28.41.7 and Schemes, Lemma 25.10.4. We are going to "lift" $\psi_{1}$ to a compatible system of closed immersions of $X_{n}$ into $\mathbf{P}^{N}$.

Upon tensoring the short exact sequences of the first paragraph of the proof by $\mathcal{L}_{n+1}^{\otimes d}$ we obtain short exact sequences

$$
0 \rightarrow \mathcal{F}_{n} \otimes \mathcal{L}_{n+1}^{\otimes d} \rightarrow \mathcal{L}_{n+1}^{\otimes d} \rightarrow \mathcal{L}_{n+1}^{\otimes d} \rightarrow 0
$$

Using the isomorphisms $\varphi_{n}$ we obtain isomorphisms $\mathcal{L}_{n+1} \otimes \mathcal{O}_{X_{l}}=\mathcal{L}_{l}$ for $l \leq n$. Whence the sequence above becomes

$$
0 \rightarrow \mathcal{F}_{n} \otimes \mathcal{L}_{1}^{\otimes d} \rightarrow \mathcal{L}_{n+1}^{\otimes d} \rightarrow \mathcal{L}_{n}^{\otimes d} \rightarrow 0
$$

The vanishing of $H^{1}\left(X, \mathcal{F}_{n} \otimes \mathcal{L}_{1}^{\otimes d}\right)$ implies we can inductively lift $s_{0,1}, \ldots, s_{N, 1} \in$ $\Gamma\left(X_{1}, \mathcal{L}_{1}^{\otimes d}\right)$ to sections $s_{0, n}, \ldots, s_{N, n} \in \Gamma\left(X_{n}, \mathcal{L}_{n}^{\otimes d}\right)$. Thus we obtain a commutative diagram

where $\psi_{n}=\varphi_{\left(\mathcal{L}_{n},\left(s_{0, n}, \ldots, s_{N, n}\right)\right)}$ in the notation of Constructions, Section 26.13. As the squares in the statement of the theorem are cartesian we see that the squares in the above diagram are cartesian. We win by applying Lemma 29.24.1

01WO

### 30.1. Introduction

01WP In this chapter we study some very basic questions related to defining divisors, etc. A basic reference is DG67.

### 30.2. Associated points

02 OI Let $R$ be a ring and let $M$ be an $R$-module. Recall that a prime $\mathfrak{p} \subset R$ is associated to $M$ if there exists an element of $M$ whose annihilator is $\mathfrak{p}$. See Algebra, Definition 10.62.1. Here is the definition of associated points for quasi-coherent sheaves on schemes as given in DG67, IV Definition 3.1.1].

02OJ Definition 30.2.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$.
(1) We say $x \in X$ is associated to $\mathcal{F}$ if the maximal ideal $\mathfrak{m}_{x}$ is associated to the $\mathcal{O}_{X, x}$-module $\mathcal{F}_{x}$.
(2) We denote $\operatorname{Ass}(\mathcal{F})$ or $\operatorname{Ass}_{X}(\mathcal{F})$ the set of associated points of $\mathcal{F}$.
(3) The associated points of $X$ are the associated points of $\mathcal{O}_{X}$.

These definitions are most useful when $X$ is locally Noetherian and $\mathcal{F}$ of finite type. For example it may happen that a generic point of an irreducible component of $X$ is not associated to $X$, see Example 30.2.7. In the non-Noetherian case it may be more convenient to use weakly associated points, see Section 30.5. Let us link the scheme theoretic notion with the algebraic notion on affine opens; note that this correspondence works perfectly only for locally Noetherian schemes.

02OK Lemma 30.2.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $\operatorname{Spec}(A)=U \subset X$ be an affine open, and set $M=\Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime.
(1) If $\mathfrak{p}$ is associated to $M$, then $x$ is associated to $\mathcal{F}$.
(2) If $\mathfrak{p}$ is finitely generated, then the converse holds as well.

In particular, if $X$ is locally Noetherian, then the equivalence

$$
\mathfrak{p} \in \operatorname{Ass}(M) \Leftrightarrow x \in \operatorname{Ass}(\mathcal{F})
$$

holds for all pairs ( $\mathfrak{p}, x$ ) as above.
Proof. This follows from Algebra, Lemma 10.62.15. But we can also argue directly as follows. Suppose $\mathfrak{p}$ is associated to $M$. Then there exists an $m \in M$ whose annihilator is $\mathfrak{p}$. Since localization is exact we see that $\mathfrak{p} A_{\mathfrak{p}}$ is the annihilator of $m / 1 \in M_{\mathfrak{p}}$. Since $M_{\mathfrak{p}}=\mathcal{F}_{x}$ (Schemes, Lemma 25.5.4) we conclude that $x$ is associated to $\mathcal{F}$.

Conversely, assume that $x$ is associated to $\mathcal{F}$, and $\mathfrak{p}$ is finitely generated. As $x$ is associated to $\mathcal{F}$ there exists an element $m^{\prime} \in M_{\mathfrak{p}}$ whose annihilator is $\mathfrak{p} A_{\mathfrak{p}}$. Write $m^{\prime}=m / f$ for some $f \in A, f \notin \mathfrak{p}$. The annihilator $I$ of $m$ is an ideal of $A$ such that $I A_{\mathfrak{p}}=\mathfrak{p} A_{\mathfrak{p}}$. Hence $I \subset \mathfrak{p}$, and $(\mathfrak{p} / I)_{\mathfrak{p}}=0$. Since $\mathfrak{p}$ is finitely generated, there exists a $g \in A, g \notin \mathfrak{p}$ such that $g(\mathfrak{p} / I)=0$. Hence the annihilator of $g m$ is $\mathfrak{p}$ and we win.

If $X$ is locally Noetherian, then $A$ is Noetherian (Properties, Lemma 27.5.2) and $\mathfrak{p}$ is always finitely generated.

05AD Lemma 30.2.3. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then $A s s(\mathcal{F}) \subset \operatorname{Supp}(\mathcal{F})$.

Proof. This is immediate from the definitions.
05AE Lemma 30.2.4. Let $X$ be a scheme. Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ be a short exact sequence of quasi-coherent sheaves on $X$. Then $\operatorname{Ass}\left(\mathcal{F}_{2}\right) \subset \operatorname{Ass}\left(\mathcal{F}_{1}\right) \cup \operatorname{Ass}\left(\mathcal{F}_{3}\right)$ and $\operatorname{Ass}\left(\mathcal{F}_{1}\right) \subset \operatorname{Ass}\left(\mathcal{F}_{2}\right)$.

Proof. For every point $x \in X$ the sequence of stalks $0 \rightarrow \mathcal{F}_{1, x} \rightarrow \mathcal{F}_{2, x} \rightarrow \mathcal{F}_{3, x} \rightarrow 0$ is a short exact sequence of $\mathcal{O}_{X, x}$-modules. Hence the lemma follows from Algebra, Lemma 10.62 .3 .

05AF Lemma 30.2.5. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then $\operatorname{Ass}(\mathcal{F}) \cap U$ is finite for every quasi-compact open $U \subset X$.

Proof. This is true because the set of associated primes of a finite module over a Noetherian ring is finite, see Algebra, Lemma 10.62.5. To translate from schemes to algebra use that $U$ is a finite union of affine opens, each of these opens is the spectrum of a Noetherian ring (Properties, Lemma 27.5.2), $\mathcal{F}$ corresponds to a finite module over this ring (Cohomology of Schemes, Lemma 29.9.1), and finally use Lemma 30.2.2

05AG Lemma 30.2.6. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then

$$
\mathcal{F}=0 \Leftrightarrow \operatorname{Ass}(\mathcal{F})=\emptyset
$$

Proof. If $\mathcal{F}=0$, then $\operatorname{Ass}(\mathcal{F})=\emptyset$ by definition. Conversely, if $\operatorname{Ass}(\mathcal{F})=\emptyset$, then $\mathcal{F}=0$ by Algebra, Lemma 10.62.7. To translate from schemes to algebra, restrict to any affine and use Lemma 30.2.2.

05AI Example 30.2.7. Let $k$ be a field. The ring $R=k\left[x_{1}, x_{2}, x_{3}, \ldots\right] /\left(x_{i}^{2}\right)$ is local with locally nilpotent maximal ideal $\mathfrak{m}$. There exists no element of $R$ which has annihilator $\mathfrak{m}$. Hence $\operatorname{Ass}(R)=\emptyset$, and $X=\operatorname{Spec}(R)$ is an example of a scheme which has no associated points.

0B3L Lemma 30.2.8. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $\operatorname{Ass}(\mathcal{F}) \subset U \subset X$ is open, then $\Gamma(X, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{F})$ is injective.

Proof. Let $s \in \Gamma(X, \mathcal{F})$ be a section which restricts to zero on $U$. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the image of the map $\mathcal{O}_{X} \rightarrow \mathcal{F}$ defined by $s$. Then $\operatorname{Supp}\left(\mathcal{F}^{\prime}\right) \cap U=\emptyset$. On the other hand, $\operatorname{Ass}\left(\mathcal{F}^{\prime}\right) \subset \operatorname{Ass}(\mathcal{F})$ by Lemma 30.2.4. Since also $\operatorname{Ass}\left(\mathcal{F}^{\prime}\right) \subset \operatorname{Supp}\left(\mathcal{F}^{\prime}\right)$ (Lemma 30.2.3) we conclude $\operatorname{Ass}\left(\mathcal{F}^{\prime}\right)=\emptyset$. Hence $\mathcal{F}^{\prime}=0$ by Lemma 30.2.6.

05AH Lemma 30.2.9. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in \operatorname{Supp}(\mathcal{F})$ be a point in the support of $\mathcal{F}$ which is not a specialization of another point of $\operatorname{Supp}(\mathcal{F})$. Then $x \in \operatorname{Ass}(\mathcal{F})$. In particular, any generic point of an irreducible component of $X$ is an associated point of $X$.

Proof. Since $x \in \operatorname{Supp}(\mathcal{F})$ the module $\mathcal{F}_{x}$ is not zero. Hence $\operatorname{Ass}\left(\mathcal{F}_{x}\right) \subset \operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ is nonempty by Algebra, Lemma 10.62.7. On the other hand, by assumption $\operatorname{Supp}\left(\mathcal{F}_{x}\right)=\left\{\mathfrak{m}_{x}\right\}$. Since $\operatorname{Ass}\left(\mathcal{F}_{x}\right) \subset \operatorname{Supp}\left(\mathcal{F}_{x}\right)$ (Algebra, Lemma 10.62.2 we see that $\mathfrak{m}_{x}$ is associated to $\mathcal{F}_{x}$ and we win.

The following lemma is the analogue of More on Algebra, Lemma 15.17.10.
0AVL Lemma 30.2.10. Let $X$ be a locally Noetherian scheme. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of quasi-coherent $\mathcal{O}_{X}$-modules. Assume that for every $x \in X$ at least one of the following happens
(1) $\mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is injective, or
(2) $x \notin \operatorname{Ass}(\mathcal{F})$.

Then $\varphi$ is injective.
Proof. The assumptions imply that $\operatorname{WeakAss}(\operatorname{Ker}(\varphi))=\emptyset$ and hence $\operatorname{Ker}(\varphi)=0$ by Lemma 30.2.6.

0AVM Lemma 30.2.11. Let $X$ be a locally Noetherian scheme. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of quasi-coherent $\mathcal{O}_{X}$-modules. Assume $\mathcal{F}$ is coherent and that for every $x \in X$ one of the following happens
(1) $\mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is an isomorphism, or
(2) $\operatorname{depth}\left(\mathcal{F}_{x}\right) \geq 2$ and $x \notin \operatorname{Ass}(\mathcal{G})$.

Then $\varphi$ is an isomorphism.
Proof. This is a translation of More on Algebra, Lemma 15.17.11 into the language of schemes.

### 30.3. Morphisms and associated points

05DA
05DB Lemma 30.3.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent sheaf on $X$ which is flat over $S$. Let $\mathcal{G}$ be a quasi-coherent sheaf on $S$. Then we have

$$
A s s_{X}\left(\mathcal{F} \otimes \mathcal{O}_{X} f^{*} \mathcal{G}\right) \supset \bigcup_{s \in A s s_{S}(\mathcal{G})} A s s_{X_{s}}\left(\mathcal{F}_{s}\right)
$$

and equality holds if $S$ is locally Noetherian.
Proof. Let $x \in X$ and let $s=f(x) \in S$. Set $B=\mathcal{O}_{X, x}, A=\mathcal{O}_{S, s}, N=\mathcal{F}_{x}$, and $M=\mathcal{G}_{s}$. Note that the stalk of $\mathcal{F} \otimes \mathcal{O}_{X} f^{*} \mathcal{G}$ at $x$ is equal to the $B$-module $M \otimes_{A} N$. Hence $x \in \operatorname{Ass}_{X}\left(\mathcal{F} \otimes_{\mathcal{O}_{X}} f^{*} \mathcal{G}\right)$ if and only if $\mathfrak{m}_{B}$ is in $\operatorname{Ass}_{B}\left(M \otimes_{A}\right.$ $N)$. Similarly $s \in \operatorname{Ass}_{S}(\mathcal{G})$ and $x \in \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)$ if and only if $\mathfrak{m}_{A} \in \operatorname{Ass}_{A}(M)$ and $\mathfrak{m}_{B} / \mathfrak{m}_{A} B \in \operatorname{Ass}_{B \otimes \kappa\left(\mathfrak{m}_{A}\right)}\left(N \otimes \kappa\left(\mathfrak{m}_{A}\right)\right)$. Thus the lemma follows from Algebra, Lemma 10.64.5.

### 30.4. Embedded points

05AJ Let $R$ be a ring and let $M$ be an $R$-module. Recall that a prime $\mathfrak{p} \subset R$ is an embedded associated prime of $M$ if it is an associated prime of $M$ which is not minimal among the associated primes of $M$. See Algebra, Definition 10.66.1. Here is the definition of embedded associated points for quasi-coherent sheaves on schemes as given in DG67, IV Definition 3.1.1].

05AK Definition 30.4.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$.
(1) An embedded associated point of $\mathcal{F}$ is an associated point which is not maximal among the associated points of $\mathcal{F}$, i.e., it is the specialization of another associated point of $\mathcal{F}$.
(2) A point $x$ of $X$ is called an embedded point if $x$ is an embedded associated point of $\mathcal{O}_{X}$.
(3) An embedded component of $X$ is an irreducible closed subset $Z=\overline{\{x\}}$ where $x$ is an embedded point of $X$.

In the Noetherian case when $\mathcal{F}$ is coherent we have the following.
05AL Lemma 30.4.2. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. Then
(1) the generic points of irreducible components of $\operatorname{Supp}(\mathcal{F})$ are associated points of $\mathcal{F}$, and
(2) an associated point of $\mathcal{F}$ is embedded if and only if it is not a generic point of an irreducible component of $\operatorname{Supp}(\mathcal{F})$.
In particular an embedded point of $X$ is an associated point of $X$ which is not $a$ generic point of an irreducible component of $X$.

Proof. Recall that in this case $Z=\operatorname{Supp}(\mathcal{F})$ is closed, see Morphisms, Lemma 28.5 .3 and that the generic points of irreducible components of $Z$ are associated points of $\mathcal{F}$, see Lemma 30.2 .9 . Finally, we have $\operatorname{Ass}(\mathcal{F}) \subset Z$, by Lemma 30.2.3. These results, combined with the fact that $Z$ is a sober topological space and hence every point of $Z$ is a specialization of a generic point of $Z$, imply (1) and (2).

0346 Lemma 30.4.3. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. Then the following are equivalent:
(1) $\mathcal{F}$ has no embedded associated points, and
(2) $\mathcal{F}$ has property $\left(S_{1}\right)$.

Proof. This is Algebra, Lemma 10.149 .2 , combined with Lemma 30.2.2 above.
083P Lemma 30.4.4. Let $X$ be a locally Noetherian scheme. Let $U \subset X$ be an open subscheme. The following are equivalent
(1) $U$ is scheme theoretically dense in $X$ (Morphisms, Definition 28.7.1),
(2) $U$ is dense in $X$ and $U$ contains all embedded points of $X$.

Proof. The question is local on $X$, hence we may assume that $X=\operatorname{Spec}(A)$ where $A$ is a Noetherian ring. Then $U$ is quasi-compact (Properties, Lemma 27.5.3) hence $U=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ (Algebra, Lemma 10.28.1). In this situation $U$ is scheme theoretically dense in $X$ if and only if $A \rightarrow A_{f_{1}} \times \ldots \times A_{f_{n}}$ is injective, see Morphisms, Example 28.7.4. Condition (2) translated into algebra means that for every associated prime $\mathfrak{p}$ of $A$ there exists an $i$ with $f_{i} \notin \mathfrak{p}$.

Assume (1), i.e., $A \rightarrow A_{f_{1}} \times \ldots \times A_{f_{n}}$ is injective. If $x \in A$ has annihilator a prime $\mathfrak{p}$, then $x$ maps to a nonzero element of $A_{f_{i}}$ for some $i$ and hence $f_{i} \notin \mathfrak{p}$. Thus (2) holds. Assume (2), i.e., every associated prime $\mathfrak{p}$ of $A$ corresponds to a prime of $A_{f_{i}}$ for some $i$. Then $A \rightarrow A_{f_{1}} \times \ldots \times A_{f_{n}}$ is injective because $A \rightarrow \prod_{\mathfrak{p} \in \operatorname{Ass}(A)} A_{\mathfrak{p}}$ is injective by Algebra, Lemma 10.62 .19 .

02OL Lemma 30.4.5. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on $X$. The set of coherent subsheaves

$$
\{\mathcal{K} \subset \mathcal{F} \mid \operatorname{Supp}(\mathcal{K}) \text { is nowhere dense in } \operatorname{Supp}(\mathcal{F})\}
$$

has a maximal element $\mathcal{K}$. Setting $\mathcal{F}^{\prime}=\mathcal{F} / \mathcal{K}$ we have the following
(1) $\operatorname{Supp}\left(\mathcal{F}^{\prime}\right)=\operatorname{Supp}(\mathcal{F})$,
(2) $\mathcal{F}^{\prime}$ has no embedded associated points, and
(3) there exists a dense open $U \subset X$ such that $U \cap \operatorname{Supp}(\mathcal{F})$ is dense in $\operatorname{Supp}(\mathcal{F})$ and $\left.\left.\mathcal{F}^{\prime}\right|_{U} \cong \mathcal{F}\right|_{U}$.
Proof. This follows from Algebra, Lemmas 10.66 .2 and 10.66 .3 . Note that $U$ can be taken as the complement of the closure of the set of embedded associated points of $\mathcal{F}$.

02OM Lemma 30.4.6. Let $X$ be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module without embedded associated points. Set

$$
\mathcal{I}=\operatorname{Ker}\left(\mathcal{O}_{X} \longrightarrow \mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{F})\right)
$$

This is a coherent sheaf of ideals which defines a closed subscheme $Z \subset X$ without embedded points. Moreover there exists a coherent sheaf $\mathcal{G}$ on $Z$ such that (a) $\mathcal{F}=(Z \rightarrow X)_{*} \mathcal{G}$, (b) $\mathcal{G}$ has no associated embedded points, and (c) $\operatorname{Supp}(\mathcal{G})=Z$ (as sets).

Proof. Some of the statements we have seen in the proof of Cohomology of Schemes, Lemma 29.9.7. The others follow from Algebra, Lemma 10.66.4.

### 30.5. Weakly associated points

056 K Let $R$ be a ring and let $M$ be an $R$-module. Recall that a prime $\mathfrak{p} \subset R$ is weakly associated to $M$ if there exists an element $m$ of $M$ such that $\mathfrak{p}$ is minimal among the primes containing the annihilator of $m$. See Algebra, Definition 10.65.1. If $R$ is a local ring with maximal ideal $\mathfrak{m}$, then $\mathfrak{m}$ is associated to $M$ if and only if there exists an element $m \in M$ whose annihilator has radical $\mathfrak{m}$, see Algebra, Lemma 10.65 .2

056L Definition 30.5.1. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$.
(1) We say $x \in X$ is weakly associated to $\mathcal{F}$ if the maximal ideal $\mathfrak{m}_{x}$ is weakly associated to the $\mathcal{O}_{X, x}$-module $\mathcal{F}_{x}$.
(2) We denote WeakAss $(\mathcal{F})$ the set of weakly associated points of $\mathcal{F}$.
(3) The weakly associated points of $X$ are the weakly associated points of $\mathcal{O}_{X}$.

In this case, on any affine open, this corresponds exactly to the weakly associated primes as defined above. Here is the precise statement.
056M Lemma 30.5.2. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $\operatorname{Spec}(A)=U \subset X$ be an affine open, and set $M=\Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime. The following are equivalent
(1) $\mathfrak{p}$ is weakly associated to $M$, and
(2) $x$ is weakly associated to $\mathcal{F}$.

Proof. This follows from Algebra, Lemma 10.65 .2 .
05AM Lemma 30.5.3. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then

$$
\operatorname{Ass}(\mathcal{F}) \subset W e a k A s s(\mathcal{F}) \subset \operatorname{Supp}(\mathcal{F})
$$

Proof. This is immediate from the definitions.
05AN Lemma 30.5.4. Let $X$ be a scheme. Let $0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0$ be a short exact sequence of quasi-coherent sheaves on $X$. Then WeakAss $\left(\mathcal{F}_{2}\right) \subset \operatorname{WeakAss}\left(\mathcal{F}_{1}\right) \cup$ $\operatorname{WeakAss}\left(\mathcal{F}_{3}\right)$ and $\operatorname{WeakAss}\left(\mathcal{F}_{1}\right) \subset \operatorname{WeakAss}\left(\mathcal{F}_{2}\right)$.

Proof. For every point $x \in X$ the sequence of stalks $0 \rightarrow \mathcal{F}_{1, x} \rightarrow \mathcal{F}_{2, x} \rightarrow \mathcal{F}_{3, x} \rightarrow 0$ is a short exact sequence of $\mathcal{O}_{X, x}$-modules. Hence the lemma follows from Algebra, Lemma 10.65.3.

05AP Lemma 30.5.5. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then

$$
\mathcal{F}=(0) \Leftrightarrow W e a k A s s(\mathcal{F})=\emptyset
$$

Proof. Follows from Lemma 30.5 .2 and Algebra, Lemma 10.65 .4
0B3M Lemma 30.5.6. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If WeakAss $(\mathcal{F}) \subset U \subset X$ is open, then $\Gamma(X, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{F})$ is injective.

Proof. Let $s \in \Gamma(X, \mathcal{F})$ be a section which restricts to zero on $U$. Let $\mathcal{F}^{\prime} \subset \mathcal{F}$ be the image of the map $\mathcal{O}_{X} \rightarrow \mathcal{F}$ defined by $s$. Then $\operatorname{Supp}\left(\mathcal{F}^{\prime}\right) \cap U=\emptyset$. On the other hand, WeakAss $\left(\mathcal{F}^{\prime}\right) \subset \operatorname{WeakAss}(\mathcal{F})$ by Lemma 30.5.4. Since also $\operatorname{Ass}\left(\mathcal{F}^{\prime}\right) \subset$ $\operatorname{Supp}\left(\mathcal{F}^{\prime}\right)$ (Lemma 30.5 .3 ) we conclude $\operatorname{Ass}\left(\mathcal{F}^{\prime}\right)=\emptyset$. Hence $\mathcal{F}^{\prime}=0$ by Lemma 30.5.5.

05 AQ Lemma 30.5.7. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $x \in \operatorname{Supp}(\mathcal{F})$ be a point in the support of $\mathcal{F}$ which is not a specialization of another point of $\operatorname{Supp}(\mathcal{F})$. Then $x \in$ WeakAss $(\mathcal{F})$. In particular, any generic point of an irreducible component of $X$ is weakly associated to $\mathcal{O}_{X}$.

Proof. Since $x \in \operatorname{Supp}(\mathcal{F})$ the module $\mathcal{F}_{x}$ is not zero. Hence WeakAss $\left(\mathcal{F}_{x}\right) \subset$ $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right)$ is nonempty by Algebra, Lemma 10.65.4. On the other hand, by assumption $\operatorname{Supp}\left(\mathcal{F}_{x}\right)=\left\{\mathfrak{m}_{x}\right\}$. Since WeakAss $\left(\mathcal{F}_{x}\right) \subset \operatorname{Supp}\left(\mathcal{F}_{x}\right)$ (Algebra, Lemma 10.65.5 we see that $\mathfrak{m}_{x}$ is weakly associated to $\mathcal{F}_{x}$ and we win.

05AR Lemma 30.5.8. Let $X$ be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $\mathfrak{m}_{x}$ is a finitely generated ideal of $\mathcal{O}_{X, x}$, then

$$
x \in \operatorname{Ass}(\mathcal{F}) \Leftrightarrow x \in W e a k A s s(\mathcal{F}) .
$$

In particular, if $X$ is locally Noetherian, then $\operatorname{Ass}(\mathcal{F})=W e a k A s s(\mathcal{F})$.
Proof. See Algebra, Lemma 10.65 .8 .
0AVN Lemma 30.5.9. Let $X$ be a scheme. Let $j: U \rightarrow X$ be the inclusion of an open subscheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{U}$-module. Assume $j$ is quasi-compact, i.e., $U$ is retro-compact in $X$. Let $x \in X, x \notin U$. Then $x$ is not weakly associated to $j_{*} \mathcal{F}$.

Proof. The question is local so we may assume $X=\operatorname{Spec}(A)$. Say $U=D\left(f_{1}\right) \cup$ $\ldots \cup D\left(f_{r}\right)$ and $x$ corresponds to $\mathfrak{p} \subset A$. By Schemes, Lemma 25.24.1 the sheaf $j_{*} \mathcal{F}$ is quasi-coherent, say corresponding to the $A$-module $M$. Then

$$
M \rightarrow M_{f_{1}} \oplus \ldots \oplus M_{f_{r}}
$$

is injective. Hence for any nonzero element $m$ of the stalk $M_{\mathfrak{p}}$ there exists an $i$ such that $f_{i}^{n} m$ is nonzero for all $n \geq 0$. Thus $\mathfrak{p} A_{\mathfrak{p}}$ is not weakly associated to $M_{\mathfrak{p}}$.

0AVP Lemma 30.5.10. Let $X$ be a scheme. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of quasi-coherent $\mathcal{O}_{X}$-modules. Assume that for every $x \in X$ at least one of the following happens
(1) $\mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is injective, or
(2) $x \notin$ WeakAss $(\mathcal{F})$.

Then $\varphi$ is injective.
Proof. The assumptions imply that $\operatorname{WeakAss}(\operatorname{Ker}(\varphi))=\emptyset$ and hence $\operatorname{Ker}(\varphi)=0$ by Lemma 30.5.5.

### 30.6. Morphisms and weakly associated points

05EX Lemma 30.6.1. Let $f: X \rightarrow S$ be an affine morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then we have

$$
W^{2} a k A s s_{S}\left(f_{*} \mathcal{F}\right) \subset f\left(\text { WeakAss }_{X}(\mathcal{F})\right)
$$

Proof. We may assume $X$ and $S$ affine, so $X \rightarrow S$ comes from a ring map $A \rightarrow B$. Then $\mathcal{F}=\widetilde{M}$ for some $B$-module $M$. By Lemma 30.5.2 the weakly associated points of $\mathcal{F}$ correspond exactly to the weakly associated primes of $M$. Similarly, the weakly associated points of $f_{*} \mathcal{F}$ correspond exactly to the weakly associated primes of $M$ as an $A$-module. Hence the lemma follows from Algebra, Lemma 10.65.10.

05EY Lemma 30.6.2. Let $f: X \rightarrow S$ be an affine morphism of schemes. Let $\mathcal{F}$ be $a$ quasi-coherent $\mathcal{O}_{X}$-module. If $X$ is locally Noetherian, then we have

$$
f\left(A s s_{X}(\mathcal{F})\right)=A s s_{S}\left(f_{*} \mathcal{F}\right)=W e a k A s s_{S}\left(f_{*} \mathcal{F}\right)=f\left(\operatorname{WeakAss}_{X}(\mathcal{F})\right)
$$

Proof. We may assume $X$ and $S$ affine, so $X \rightarrow S$ comes from a ring map $A \rightarrow B$. As $X$ is locally Noetherian the ring $B$ is Noetherian, see Properties, Lemma 27.5.2. Write $\mathcal{F}=\widetilde{M}$ for some $B$-module $M$. By Lemma 30.2 .2 the associated points of $\mathcal{F}$ correspond exactly to the associated primes of $M$, and any associated prime of $M$ as an $A$-module is an associated points of $f_{*} \mathcal{F}$. Hence the inclusion

$$
f\left(\operatorname{Ass}_{X}(\mathcal{F})\right) \subset \operatorname{Ass}_{S}\left(f_{*} \mathcal{F}\right)
$$

follows from Algebra, Lemma 10.62.13. We have the inclusion

$$
\operatorname{Ass}_{S}\left(f_{*} \mathcal{F}\right) \subset \operatorname{WeakAss}_{S}\left(f_{*} \mathcal{F}\right)
$$

by Lemma 30.5.3. We have the inclusion

$$
\operatorname{WeakAss}_{S}\left(f_{*} \mathcal{F}\right) \subset f\left(\operatorname{WeakAss}_{X}(\mathcal{F})\right)
$$

by Lemma 30.6.1. The outer sets are equal by Lemma 30.5 .8 hence we have equality everywhere.

05EZ Lemma 30.6.3. Let $f: X \rightarrow S$ be a finite morphism of schemes. Let $\mathcal{F}$ be $a$ quasi-coherent $\mathcal{O}_{X}$-module. Then $\operatorname{WeakAss}\left(f_{*} \mathcal{F}\right)=f(\operatorname{WeakAss}(\mathcal{F}))$.
Proof. We may assume $X$ and $S$ affine, so $X \rightarrow S$ comes from a finite ring map $A \rightarrow B$. Write $\mathcal{F}=\widetilde{M}$ for some $B$-module $M$. By Lemma 30.5.2 the weakly associated points of $\mathcal{F}$ correspond exactly to the weakly associated primes of $M$. Similarly, the weakly associated points of $f_{*} \mathcal{F}$ correspond exactly to the weakly associated primes of $M$ as an $A$-module. Hence the lemma follows from Algebra, Lemma 10.65 .12

05F0 Lemma 30.6.4. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{G}$ be a quasicoherent $\mathcal{O}_{S}$-module. Let $x \in X$ with $s=f(x)$. If $f$ is flat at $x$, the point $x$ is a generic point of the fibre $X_{s}$, and $s \in W e a k A s s_{S}(\mathcal{G})$, then $x \in W e a k A s s\left(f^{*} \mathcal{G}\right)$.

Proof. Let $A=\mathcal{O}_{S, s}, B=\mathcal{O}_{X, x}$, and $M=\mathcal{G}_{s}$. Let $m \in M$ be an element whose annihilator $I=\{a \in A \mid a m=0\}$ has radical $\mathfrak{m}_{A}$. Then $m \otimes 1$ has annihilator $I B$ as $A \rightarrow B$ is faithfully flat. Thus it suffices to see that $\sqrt{I B}=\mathfrak{m}_{B}$. This follows from the fact that the maximal ideal of $B / \mathfrak{m}_{A} B$ is locally nilpotent (see Algebra, Lemma 10.24.1 and the assumption that $\sqrt{I}=\mathfrak{m}_{A}$. Some details omitted.

### 30.7. Relative assassin

05AS
05AT
Definition 30.7.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The relative assassin of $\mathcal{F}$ in $X$ over $S$ is the set

$$
\operatorname{Ass}_{X / S}(\mathcal{F})=\bigcup_{s \in S} \operatorname{Ass}_{X_{s}}\left(\mathcal{F}_{s}\right)
$$

where $\mathcal{F}_{s}=\left(X_{s} \rightarrow X\right)^{*} \mathcal{F}$ is the restriction of $\mathcal{F}$ to the fibre of $f$ at $s$.
Again there is a caveat that this is best used when the fibres of $f$ are locally Noetherian and $\mathcal{F}$ is of finite type. In the general case we should probably use the relative weak assassin (defined in the next section).
05DC Lemma 30.7.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasicoherent $\mathcal{O}_{X}$-module. Let $g: S^{\prime} \rightarrow S$ be a morphism of schemes. Consider the base change diagram

and set $\mathcal{F}^{\prime}=\left(g^{\prime}\right)^{*} \mathcal{F}$. Let $x^{\prime} \in X^{\prime}$ be a point with images $x \in X, s^{\prime} \in S^{\prime}$ and $s \in S$. Assume $f$ locally of finite type. Then $x^{\prime} \in A s s_{X^{\prime} / S^{\prime}}\left(\mathcal{F}^{\prime}\right)$ if and only if $x \in A s s_{X / S}(\mathcal{F})$ and $x^{\prime}$ corresponds to a generic point of an irreducible component of $\operatorname{Spec}\left(\kappa\left(s^{\prime}\right) \otimes_{\kappa(s)} \kappa(x)\right)$.
Proof. Consider the morphism $X_{s^{\prime}}^{\prime} \rightarrow X_{s}$ of fibres. As $X_{s^{\prime}}=X_{s} \times_{\operatorname{Spec}(\kappa(s))}$ $\operatorname{Spec}\left(\kappa\left(s^{\prime}\right)\right)$ this is a flat morphism. Moreover $\mathcal{F}_{s^{\prime}}^{\prime}$ is the pullback of $\mathcal{F}_{s}$ via this morphism. As $X_{s}$ is locally of finite type over the Noetherian scheme $\operatorname{Spec}(\kappa(s))$ we have that $X_{s}$ is locally Noetherian, see Morphisms, Lemma 28.15.6. Thus we may apply Lemma 30.3.1 and we see that

$$
\operatorname{Ass}_{X_{s^{\prime}}^{\prime}}\left(\mathcal{F}_{s^{\prime}}^{\prime}\right)=\bigcup_{x \in \operatorname{Ass}\left(\mathcal{F}_{s}\right)} \operatorname{Ass}\left(\left(X_{s^{\prime}}^{\prime}\right)_{x}\right)
$$

Thus to prove the lemma it suffices to show that the associated points of the fibre $\left(X_{s^{\prime}}^{\prime}\right)_{x}$ of the morphism $X_{s^{\prime}}^{\prime} \rightarrow X_{s}$ over $x$ are its generic points. Note that $\left(X_{s^{\prime}}^{\prime}\right)_{x}=\operatorname{Spec}\left(\kappa\left(s^{\prime}\right) \otimes_{\kappa(s)} \kappa(x)\right)$ as schemes. By Algebra, Lemma 10.159.1 the ring $\kappa\left(s^{\prime}\right) \otimes_{\kappa(s)} \kappa(x)$ is a Noetherian Cohen-Macaulay ring. Hence its associated primes are its minimal primes, see Algebra, Proposition 10.62 .6 (minimal primes are associated) and Algebra, Lemma 10.149 .2 (no embedded primes).

05KL Remark 30.7.3. With notation and assumptions as in Lemma 30.7.2 we see that it is always the case that $\left(g^{\prime}\right)^{-1}\left(\operatorname{Ass}_{X / S}(\mathcal{F})\right) \supset \operatorname{Ass}_{X^{\prime} / S^{\prime}}\left(\mathcal{F}^{\prime}\right)$. If the morphism $S^{\prime} \rightarrow S$ is locally quasi-finite, then we actually have

$$
\left(g^{\prime}\right)^{-1}\left(\operatorname{Ass}_{X / S}(\mathcal{F})\right)=\operatorname{Ass}_{X^{\prime} / S^{\prime}}\left(\mathcal{F}^{\prime}\right)
$$

because in this case the field extensions $\kappa(s) \subset \kappa\left(s^{\prime}\right)$ are always finite. In fact, this holds more generally for any morphism $g: S^{\prime} \rightarrow S$ such that all the field extensions $\kappa(s) \subset \kappa\left(s^{\prime}\right)$ are algebraic, because in this case all prime ideals of $\kappa\left(s^{\prime}\right) \otimes_{\kappa(s)} \kappa(x)$ are maximal (and minimal) primes, see Algebra, Lemma 10.35.17.

### 30.8. Relative weak assassin

05AU
05AV Definition 30.8.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. The relative weak assassin of $\mathcal{F}$ in $X$ over $S$ is the set

$$
\operatorname{WeakAss}_{X / S}(\mathcal{F})=\bigcup_{s \in S} \operatorname{WeakAss}\left(\mathcal{F}_{s}\right)
$$

where $\mathcal{F}_{s}=\left(X_{s} \rightarrow X\right)^{*} \mathcal{F}$ is the restriction of $\mathcal{F}$ to the fibre of $f$ at $s$.
05F2 Lemma 30.8.2. Let $f: X \rightarrow S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Then WeakAss ${ }_{X / S}(\mathcal{F})=A s s_{X / S}(\mathcal{F})$.
Proof. This is true bacause the fibres of $f$ are locally Noetherian schemes, and associated and weakly associated points agree on locally Noetherian schemes, see Lemma 30.5.8.

### 30.9. Torsion free modules

$0 A V Q$ This section is the analogue of More on Algebra, Section 15.16 for quasi-coherent modules.

0AXR Lemma 30.9.1. Let $X$ be an integral scheme with generic point $\eta$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. Let $U \subset X$ be nonempty open and $s \in \mathcal{F}(U)$. The following are equivalent
(1) for some $x \in U$ the image of $s$ in $\mathcal{F}_{x}$ is torsion,
(2) for all $x \in U$ the image of $s$ in $\mathcal{F}_{x}$ is torsion,
(3) the image of $s$ in $\mathcal{F}_{\eta}$ is zero,
(4) the image of $s$ in $j_{*} \mathcal{F}_{\eta}$ is zero, where $j: \eta \rightarrow X$ is the inclusion morphism.

Proof. Omitted.
0AVR Definition 30.9.2. Let $X$ be an integral scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module.
(1) We say a local section of $\mathcal{F}$ is torsion if it satisfies the equivalent conditions of Lemma 30.9.1.
(2) We say $\mathcal{F}$ is torsion free if every torsion section of $\mathcal{F}$ is 0 .

Here is the obligatory lemma comparing this to the usual algebraic notion.
0AXS Lemma 30.9.3. Let $X$ be an integral scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$ module. The following are equivalent
(1) $\mathcal{F}$ is torsion free,
(2) for $U \subset X$ affine open $\mathcal{F}(U)$ is a torsion free $\mathcal{O}(U)$-module.

Proof. Omitted.
0AXT Lemma 30.9.4. Let $X$ be an integral scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$ module. The torsion sections of $\mathcal{F}$ form a quasi-coherent $\mathcal{O}_{X}$-submodule $\mathcal{F}_{\text {tors }} \subset \mathcal{F}$. The quotient module $\mathcal{F} / \mathcal{F}_{\text {tors }}$ is torsion free.
Proof. Omitted. See More on Algebra, Lemma 15.16 .2 for the algebraic analogue.

0AXU Lemma 30.9.5. Let $X$ be an integral scheme. Any flat quasi-coherent $\mathcal{O}_{X}$-module is torsion free.

Proof. Omitted. See More on Algebra, Lemma 15.16 .9 ,
0AXV Lemma 30.9.6. Let $f: X \rightarrow Y$ be a flat morphism of integral schemes. Let $\mathcal{G}$ be a torsion free quasi-coherent $\mathcal{O}_{Y}$-module. Then $f^{*} \mathcal{G}$ is a torsion free $\mathcal{O}_{X}$-module.
Proof. Omitted. See More on Algebra, Lemma 15.16 .4 for the algebraic analogue.

0BCM Lemma 30.9.7. Let $f: X \rightarrow Y$ be a flat morphism of schemes. If $Y$ is integral and the generic fibre of $f$ is integral, then $X$ is integral.

Proof. The algebraic analogue is this: let $A$ be a domain with fraction field $K$ and let $B$ be a flat $A$-algebra such that $B \otimes_{A} K$ is a domain. Then $B$ is a domain. This is true because $B$ is torsion free by More on Algebra, Lemma 15.16 .9 and hence $B \subset B \otimes_{A} K$.

0AXW Lemma 30.9.8. Let $X$ be an integral scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X^{-}}$ module. Then $\mathcal{F}$ is torsion free if and only if $\mathcal{F}_{x}$ is a torsion free $\mathcal{O}_{X, x}$-module for all $x \in X$.

Proof. Omitted. See More on Algebra, Lemma 15.16.6.
0AXX Lemma 30.9.9. Let $X$ be an integral scheme. Let $0 \rightarrow \mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime \prime} \rightarrow 0$ be $a$ short exact sequence of quasi-coherent $\mathcal{O}_{X}$-modules. If $\mathcal{F}$ and $\mathcal{F}^{\prime \prime}$ are torsion free, then $\mathcal{F}^{\prime}$ is torsion free.
Proof. Omitted. See More on Algebra, Lemma 15.16 .5 for the algebraic analogue.

0AXY Lemma 30.9.10. Let $X$ be a locally Noetherian integral scheme with generic point $\eta$. Let $\mathcal{F}$ be a nonzero coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is torsion free,
(2) $\eta$ is the only associated prime of $\mathcal{F}$,
(3) $\eta$ is in the support of $\mathcal{F}$ and $\mathcal{F}$ has property $\left(S_{1}\right)$, and
(4) $\eta$ is in the support of $\mathcal{F}$ and $\mathcal{F}$ has no embedded associated prime.

Proof. This is a translation of More on Algebra, Lemma 15.16 .8 into the language of schemes. We omit the translation.

0 AXZ Lemma 30.9.11. Let $X$ be an integral scheme. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent $\mathcal{O}_{X^{-}}$ modules. If $\mathcal{G}$ is torsion free and $\mathcal{F}$ is of finite presentation, then $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is torsion free.
Proof. The statement makes sense because $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is quasi-coherent by Schemes, Section 25.24. To see the statement is true, see More on Algebra, Lemma 15.16.12, Some details omitted.

0AVS Lemma 30.9.12. Let $X$ be an integral locally Noetherian scheme. Let $\varphi: \mathcal{F} \rightarrow \mathcal{G}$ be a map of quasi-coherent $\mathcal{O}_{X}$-modules. Assume $\mathcal{F}$ is coherent, $\mathcal{G}$ is torsion free, and that for every $x \in X$ one of the following happens
(1) $\mathcal{F}_{x} \rightarrow \mathcal{G}_{x}$ is an isomorphism, or
(2) $\operatorname{depth}\left(\mathcal{F}_{x}\right) \geq 2$.

Then $\varphi$ is an isomorphism.
Proof. This is a translation of More on Algebra, Lemma 15.17.12 into the language of schemes.

### 30.10. Reflexive modules

0AVT This section is the analogue of More on Algebra, Section 15.17 for coherent modules on locally Noetherian schemes. The reason for working with coherent modules is that $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is coherent for every pair of coherent $\mathcal{O}_{X}$-modules $\mathcal{F}, \mathcal{G}$, see Modules, Lemma 17.19.4
0AVU Definition 30.10.1. Let $X$ be an integral locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The reflexive hull of $\mathcal{F}$ is the $\mathcal{O}_{X}$-module

$$
\mathcal{F}^{* *}=\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{H o m}_{\mathcal{O}_{X}}\left(\mathcal{F}, \mathcal{O}_{X}\right), \mathcal{O}_{X}\right)
$$

We say $\mathcal{F}$ is reflexive if the natural map $j: \mathcal{F} \longrightarrow \mathcal{F}^{* *}$ is an isomorphism.
It follows from Lemma 30.10 .6 that the reflexive hull is a reflexive $\mathcal{O}_{X}$-module. You can use the same definition to define reflexive modules in more general situations, but this does not seem to be very useful. Here is the obligatory lemma comparing this to the usual algebraic notion.
0AY0 Lemma 30.10.2. Let $X$ be an integral locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is reflexive,
(2) for $U \subset X$ affine open $\mathcal{F}(U)$ is a reflexive $\mathcal{O}(U)$-module.

Proof. Omitted.
0AY1 Remark 30.10.3. If $X$ is a scheme of finite type over a field, then sometimes a different notion of reflexive modules is used (see for example HL97, bottom of page 5 and Definition 1.1.9]). This other notion uses $R \mathcal{H}$ Hom into a dualizing complex $\omega_{X}^{\bullet}$ instead of into $\mathcal{O}_{X}$ and should probably have a different name because it can be different when $X$ is not Gorenstein. For example, if $X=\operatorname{Spec}\left(k\left[t^{3}, t^{4}, t^{5}\right]\right)$, then a computation shows the dualizing sheaf $\omega_{X}$ is not reflexive in our sense, but it is reflexive in the other sense as $\omega_{X} \rightarrow \mathcal{H} \operatorname{Hom}\left(\mathcal{H o m}\left(\omega_{X}, \omega_{X}\right), \omega_{X}\right)$ is an isomorphism.

0AY2 Lemma 30.10.4. Let $X$ be an integral locally Noetherian scheme. Let $\mathcal{F}$ be $a$ coherent $\mathcal{O}_{X}$-module.
(1) If $\mathcal{F}$ is reflexive, then $\mathcal{F}$ is torsion free.
(2) The map $j: \mathcal{F} \longrightarrow \mathcal{F}^{* *}$ is injective if and only if $\mathcal{F}$ is torsion free

Proof. Omitted. See More on Algebra, Lemma 15.17.2.
0AY3 Lemma 30.10.5. Let $X$ be an integral locally Noetherian scheme. Let $\mathcal{F}$ be $a$ coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is reflexive,
(2) $\mathcal{F}_{x}$ is a reflexive $\mathcal{O}_{X, x}$-module for all $x \in X$,
(3) $\mathcal{F}_{x}$ is a reflexive $\mathcal{O}_{X, x}$-module for all closed points $x \in X$.

Proof. By Modules, Lemma 17.19 .3 we see that (1) and (2) are equivalent. Since every point of $X$ specializes to a closed point (Properties, Lemma 27.5.9) we see that (2) and (3) are equivalent.

0AY4 Lemma 30.10.6. Let $X$ be an integral locally Noetherian scheme. Let $\mathcal{F}, \mathcal{G}$ be quasi-coherent $\mathcal{O}_{X}$-modules. If $\mathcal{G}$ is reflexive and $\mathcal{F}$ is coherent, then $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is reflexive.

Proof. The statement makes sense because $\mathcal{H o m}_{\mathcal{O}_{X}}(\mathcal{F}, \mathcal{G})$ is coherent by Cohomology of Schemes, Lemma 29.9.4. To see the statement is true, see More on Algebra, Lemma 15.17.6. Some details omitted.

0AY5 Lemma 30.10.7. Let $X$ be an integral locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is reflexive,
(2) for each $x \in X$ one of the following happens
(a) $\mathcal{F}_{x}$ is a reflexive $\mathcal{O}_{X, x}$-module, or
(b) $\operatorname{depth}\left(\mathcal{O}_{X, x}\right) \geq 2$ and $\operatorname{depth}\left(\mathcal{F}_{x}\right) \geq 2$.

Proof. Omitted. See More on Algebra, Lemma 15.17.13.
If the scheme is normal, then reflexive is the same thing as torsion free and $\left(S_{2}\right)$.
0AY6 Lemma 30.10.8. Let $X$ be an integral locally Noetherian normal scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is reflexive, and
(2) $\mathcal{F}$ is torsion free and has property $\left(S_{2}\right)$.

Proof. This is the scheme theoretic analogue of More on Algebra, Lemma 15.17.14, To translate into algebra use Lemma 30.10.2.

0AY7 Lemma 30.10.9. Let $X$ be an integral locally Noetherian normal scheme with generic point $\eta$. Let $\mathcal{F}, \mathcal{G}$ be coherent $\mathcal{O}_{X}$-modules. Let $T: \mathcal{G}_{\eta} \rightarrow \mathcal{F}_{\eta}$ be a linear map. Then $T$ extends to a map $\mathcal{G} \rightarrow \mathcal{F}^{* *}$ of $\mathcal{O}_{X}$-modules if and only if
(*) for every $x \in X$ with $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=1$ we have

$$
T\left(\operatorname{Im}\left(\mathcal{G}_{x} \rightarrow \mathcal{G}_{\eta}\right)\right) \subset \operatorname{Im}\left(\mathcal{F}_{x} \rightarrow \mathcal{F}_{\eta}\right)
$$

Proof. Because $\mathcal{F}^{* *}$ is torsion free and $\mathcal{F}_{\eta}=\mathcal{F}_{\eta}^{* *}$ an extension, if it exists, is unique. Thus it suffices to prove the lemma over the members of an open covering of $X$, i.e., we may assume $X$ is affine. In this case we are asking the following algebra question: Let $R$ be a Noetherian normal domain with fraction field $K$, let $M, N$ be finite $R$-modules, let $T: M \otimes_{R} K \rightarrow N \otimes_{R} K$ be a $K$-linear map. When does $T$ extend to a map $N \rightarrow M^{* *}$ ? By More on Algebra, Lemma 15.17 .15 this happens if and only if $N_{\mathfrak{p}}$ maps into $\left(M / M_{\text {tors }}\right)_{\mathfrak{p}}$ for every height 1 prime $\mathfrak{p}$ of $R$. This is exactly condition $(*)$ of the lemma.

0B3N Lemma 30.10.10. Let $X$ be a regular scheme of dimension $\leq 2$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_{X}$-module. The following are equivalent
(1) $\mathcal{F}$ is reflexive,
(2) $\mathcal{F}$ is finite locally free of rank $>0$.

Proof. It is clear that a finite locally free module is reflexive. For the converse, we will show that if $\mathcal{F}$ is reflexive, then $\mathcal{F}_{x}$ is a free $\mathcal{O}_{X, x}$-module for all $x \in X$. If $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=0$, then $\mathcal{O}_{X, x}$ is a field and the statement is clear. If $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=1$, then $\mathcal{O}_{X, x}$ is a discrete valuation ring (Algebra, Lemma 10.118.7) and $\mathcal{F}_{x}$ is torsion free. Hence $\mathcal{F}_{x}$ is free by More on Algebra, Lemma 15.16 .11 . If $\operatorname{dim}\left(\mathcal{O}_{X, x}\right)=2$, then $\mathcal{O}_{X, x}$ is a regular local ring of dimension 2. By More on Algebra, Lemma 15.17.14 we see that $\mathcal{F}_{x}$ has depth $\geq 2$. Hence $\mathcal{F}$ is free by Algebra, Lemma 10.105.6.

### 30.11. Effective Cartier divisors

01WQ We define the notion of an effective Cartier divisor before any other type of divisor.
01WR Definition 30.11.1. Let $S$ be a scheme.
(1) A locally principal closed subscheme of $S$ is a closed subscheme whose sheaf of ideals is locally generated by a single element.
(2) An effective Cartier divisor on $S$ is a closed subscheme $D \subset S$ such that the ideal sheaf $\mathcal{I}_{D} \subset \mathcal{O}_{X}$ is an invertible $\mathcal{O}_{X}$-module.

Thus an effective Cartier divisor is a locally principal closed subscheme, but the converse is not always true. Effective Cartier divisors are closed subschemes of pure codimension 1 in the strongest possible sense. Namely they are locally cut out by a single element which is not a zerodivisor. In particular they are nowhere dense.

01WS Lemma 30.11.2. Let $S$ be a scheme. Let $D \subset S$ be a closed subscheme. The following are equivalent:
(1) The subscheme $D$ is an effective Cartier divisor on $S$.
(2) For every $x \in D$ there exists an affine open neighbourhood $\operatorname{Spec}(A)=U \subset$ $S$ of $x$ such that $U \cap D=\operatorname{Spec}(A /(f))$ with $f \in A$ not a zerodivisor.

Proof. Assume (1). For every $x \in D$ there exists an affine open neighbourhood $\operatorname{Spec}(A)=U \subset S$ of $x$ such that $\left.\mathcal{I}_{D}\right|_{U} \cong \mathcal{O}_{U}$. In other words, there exists a section $f \in \Gamma\left(U, \mathcal{I}_{D}\right)$ which freely generates the restriction $\left.\mathcal{I}_{D}\right|_{U}$. Hence $f \in A$, and the multiplication map $f: A \rightarrow A$ is injective. Also, since $\mathcal{I}_{D}$ is quasi-coherent we see that $D \cap U=\operatorname{Spec}(A /(f))$.
Assume (2). Let $x \in D$. By assumption there exists an affine open neighbourhood $\operatorname{Spec}(A)=U \subset S$ of $x$ such that $U \cap D=\operatorname{Spec}(A /(f))$ with $f \in A$ not a zerodivisor. Then $\left.\mathcal{I}_{D}\right|_{U} \cong \mathcal{O}_{U}$ since it is equal to $\widetilde{(f)} \cong \widetilde{A} \cong \mathcal{O}_{U}$. Of course $\mathcal{I}_{D}$ restricted to
the open subscheme $S \backslash D$ is isomorphic to $\mathcal{O}_{S \backslash D}$. Hence $\mathcal{I}_{D}$ is an invertible $\mathcal{O}_{S^{-}}$ module.

07ZT Lemma 30.11.3. Let $S$ be a scheme. Let $Z \subset S$ be a locally principal closed subscheme. Let $U=S \backslash Z$. Then $U \rightarrow S$ is an affine morphism.

Proof. The question is local on $S$, see Morphisms, Lemmas 28.12.3. Thus we may assume $S=\operatorname{Spec}(A)$ and $Z=V(f)$ for some $f \in A$. In this case $U=D(f)=$ $\operatorname{Spec}\left(A_{f}\right)$ is affine hence $U \rightarrow S$ is affine.

07ZU Lemma 30.11.4. Let $S$ be a scheme. Let $D \subset S$ be an effective Cartier divisor. Let $U=S \backslash D$. Then $U \rightarrow S$ is an affine morphism and $U$ is scheme theoretically dense in $S$.

Proof. Affineness is Lemma 30.11.3. The density question is local on $S$, see Morphisms, Lemma 28.7.5. Thus we may assume $S=\operatorname{Spec}(A)$ and $D$ corresponding to the nonzerodivisor $f \in A$, see Lemma 30.11.2. Thus $A \subset A_{f}$ which implies that $U \subset S$ is scheme theoretically dense, see Morphisms, Example 28.7.4.

056N Lemma 30.11.5. Let $S$ be a scheme. Let $D \subset S$ be an effective Cartier divisor. Let $s \in D$. If $\operatorname{dim}_{s}(S)<\infty$, then $\operatorname{dim}_{s}(D)<\operatorname{dim}_{s}(S)$.

Proof. Assume $\operatorname{dim}_{s}(S)<\infty$. Let $U=\operatorname{Spec}(A) \subset S$ be an affine open neighbourhood of $s$ such that $\operatorname{dim}(U)=\operatorname{dim}_{s}(S)$ and such that $D=V(f)$ for some nonzerodivisor $f \in A$ (see Lemma 30.11 .2 ). Recall that $\operatorname{dim}(U)$ is the Krull dimension of the ring $A$ and that $\operatorname{dim}(U \cap D)$ is the Krull dimension of the ring $A /(f)$. Then $f$ is not contained in any minimal prime of $A$. Hence any maximal chain of primes in $A /(f)$, viewed as a chain of primes in $A$, can be extended by adding a minimal prime.

01WT Definition 30.11.6. Let $S$ be a scheme. Given effective Cartier divisors $D_{1}, D_{2}$ on $S$ we set $D=D_{1}+D_{2}$ equal to the closed subscheme of $S$ corresponding to the quasi-coherent sheaf of ideals $\mathcal{I}_{D_{1}} \mathcal{I}_{D_{2}} \subset \mathcal{O}_{S}$. We call this the sum of the effective Cartier divisors $D_{1}$ and $D_{2}$.

It is clear that we may define the sum $\sum n_{i} D_{i}$ given finitely many effective Cartier divisors $D_{i}$ on $X$ and nonnegative integers $n_{i}$.

01WU Lemma 30.11.7. The sum of two effective Cartier divisors is an effective Cartier divisor.

Proof. Omitted. Locally $f_{1}, f_{2} \in A$ are nonzerodivisors, then also $f_{1} f_{2} \in A$ is a nonzerodivisor.

02ON Lemma 30.11.8. Let $X$ be a scheme. Let $D, D^{\prime}$ be two effective Cartier divisors on $X$. If $D \subset D^{\prime}$ (as closed subschemes of $X$ ), then there exists an effective Cartier divisor $D^{\prime \prime}$ such that $D^{\prime}=D+D^{\prime \prime}$.

Proof. Omitted.
07ZV Lemma 30.11.9. Let $X$ be a scheme. Let $Z, Y$ be two closed subschemes of $X$ with ideal sheaves $\mathcal{I}$ and $\mathcal{J}$. If $\mathcal{I} \mathcal{J}$ defines an effective Cartier divisor $D \subset X$, then $Z$ and $Y$ are effective Cartier divisors and $D=Z+Y$.

Proof. Applying Lemma 30.11 .2 we obtain the following algebra situation: $A$ is a ring, $I, J \subset A$ ideals and $f \in A$ a nonzerodivisor such that $I J=(f)$. Thus the result follows from Algebra, Lemma 10.119.14.

Recall that we have defined the inverse image of a closed subscheme under any morphism of schemes in Schemes, Definition 25.17.7.
053P Lemma 30.11.10. Let $f: S^{\prime} \rightarrow S$ be a morphism of schemes. Let $Z \subset S$ be a locally principal closed subscheme. Then the inverse image $f^{-1}(Z)$ is a locally principal closed subscheme of $S^{\prime}$.
Proof. Omitted.
01WV Definition 30.11.11. Let $f: S^{\prime} \rightarrow S$ be a morphism of schemes. Let $D \subset S$ be an effective Cartier divisor. We say the pullback of $D$ by $f$ is defined if the closed subscheme $f^{-1}(D) \subset S^{\prime}$ is an effective Cartier divisor. In this case we denote it either $f^{*} D$ or $f^{-1}(D)$ and we call it the pullback of the effective Cartier divisor.
The condition that $f^{-1}(D)$ is an effective Cartier divisor is often satisfied in practice. Here is an example lemma.

02 OO Lemma 30.11.12. Let $f: X \rightarrow Y$ be a morphism of schemes. Let $D \subset Y$ be an effective Cartier divisor. The pullback of $D$ by $f$ is defined in each of the following cases:
(1) $X, Y$ integral and $f$ dominant,
(2) $X$ reduced, and for any generic point $\xi$ of any irreducible component of $X$ we have $f(\xi) \notin D$,
(3) $X$ is locally Noetherian and for any associated point $x$ of $X$ we have $f(x) \notin D$,
(4) $X$ is locally Noetherian, has no embedded points, and for any generic point $\xi$ of any irreducible component of $X$ we have $f(\xi) \notin D$,
(5) $f$ is flat, and
(6) add more here as needed.

Proof. The question is local on $X$, and hence we reduce to the case where $X=$ $\operatorname{Spec}(A), Y=\operatorname{Spec}(R), f$ is given by $\varphi: R \rightarrow A$ and $D=\operatorname{Spec}(R /(t))$ where $t \in R$ is not a zerodivisor. The goal in each case is to show that $\varphi(t) \in A$ is not a zerodivisor.

In case (2) this follows as the intersection of all minimal primes of a ring is the nilradical of the ring, see Algebra, Lemma 10.16.2.
Let us prove (3). By Lemma 30.2.2 the associated points of $X$ correspond to the primes $\mathfrak{p} \in \operatorname{Ass}(A)$. By Algebra, Lemma 10.62 .9 we have $\bigcup_{\mathfrak{p} \in \operatorname{Ass}(A)} \mathfrak{p}$ is the set of zerodivisors of $A$. The hypothesis of (3) is that $\varphi(t) \notin \mathfrak{p}$ for all $\mathfrak{p} \in \operatorname{Ass}(A)$. Hence $\varphi(t)$ is a nonzerodivisor as desired.
Part (4) follows from (3) and the definitions.
01WW Lemma 30.11.13. Let $f: S^{\prime} \rightarrow S$ be a morphism of schemes. Let $D_{1}, D_{2}$ be effective Cartier divisors on $S$. If the pullbacks of $D_{1}$ and $D_{2}$ are defined then the pullback of $D=D_{1}+D_{2}$ is defined and $f^{*} D=f^{*} D_{1}+f^{*} D_{2}$.
Proof. Omitted.

01WX Definition 30.11.14. Let $S$ be a scheme and let $D$ be an effective Cartier divisor. The invertible sheaf $\mathcal{O}_{S}(D)$ associated to $D$ is given by

$$
\mathcal{O}_{S}(D):=\mathcal{H o m}_{\mathcal{O}_{S}}\left(\mathcal{I}_{D}, \mathcal{O}_{S}\right)=\mathcal{I}_{D}^{\otimes-1}
$$

The canonical section, usually denoted 1 or $1_{D}$, is the global section of $\mathcal{O}_{S}(D)$ corresponding to the inclusion mapping $\mathcal{I}_{D} \rightarrow \mathcal{O}_{S}$.
0B3P Lemma 30.11.15. Let $S$ be a scheme and let $D \subset S$ be an effective Cartier divisor. Then for the conormal sheaf we have $\mathcal{C}_{D / S}=\mathcal{I}_{D}\left|D=\mathcal{O}_{S}(D)^{\otimes-1}\right|_{D}$.

Proof. Omitted.
02OP Lemma 30.11.16. Let $S$ be a scheme. Let $D_{1}, D_{2}$ be effective Cartier divisors on $S$. Let $D=D_{1}+D_{2}$. Then there is a unique isomorphism

$$
\mathcal{O}_{S}\left(D_{1}\right) \otimes_{\mathcal{O}_{S}} \mathcal{O}_{S}\left(D_{2}\right) \longrightarrow \mathcal{O}_{S}(D)
$$

which maps $1_{D_{1}} \otimes 1_{D_{2}}$ to $1_{D}$.
Proof. Omitted.
01WY Definition 30.11.17. Let $\left(X, \mathcal{O}_{X}\right)$ be a locally ringed space. Let $\mathcal{L}$ be an invertible sheaf on $X$. A global section $s \in \Gamma(X, \mathcal{L})$ is called a regular section if the map $\mathcal{O}_{X} \rightarrow \mathcal{L}, f \mapsto f s$ is injective.

01WZ Lemma 30.11.18. Let $X$ be a locally ringed space. Let $f \in \Gamma\left(X, \mathcal{O}_{X}\right)$. The following are equivalent:
(1) $f$ is a regular section, and
(2) for any $x \in X$ the image $f \in \mathcal{O}_{X, x}$ is not a zerodivisor.

If $X$ is a scheme these are also equivalent to
(3) for any affine open $\operatorname{Spec}(A)=U \subset X$ the image $f \in A$ is not a zerodivisor, and
(4) there exists an affine open covering $X=\bigcup \operatorname{Spec}\left(A_{i}\right)$ such that the image of $f$ in $A_{i}$ is not a zerodivisor for all $i$.

Proof. Omitted.
Note that a global section $s$ of an invertible $\mathcal{O}_{X^{-}}$-module $\mathcal{L}$ may be seen as an $\mathcal{O}_{X^{-}}$ module $\operatorname{map} s: \mathcal{O}_{X} \rightarrow \mathcal{L}$. Its dual is therefore a map $s: \mathcal{L}^{\otimes-1} \rightarrow \mathcal{O}_{X}$. (See Modules, Definition 17.21 .6 for the definition of the dual invertible sheaf.)
02OQ Definition 30.11.19. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$ be a global section. The zero scheme of $s$ is the closed subscheme $Z(s) \subset X$ defined by the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$ which is the image of the map $s: \mathcal{L}^{\otimes-1} \rightarrow \mathcal{O}_{X}$.
02OR Lemma 30.11.20. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible sheaf. Let $s \in$ $\Gamma(X, \mathcal{L})$.
(1) Consider closed immersions $i: Z \rightarrow X$ such that $\left.i^{*} s \in \Gamma\left(Z, i^{*} \mathcal{L}\right)\right)$ is zero ordered by inclusion. The zero scheme $Z(s)$ is the maximal element of this ordered set.
(2) For any morphism of schemes $f: Y \rightarrow X$ we have $f^{*} s=0$ in $\Gamma\left(Y, f^{*} \mathcal{L}\right)$ if and only if $f$ factors through $Z(s)$.
(3) The zero scheme $Z(s)$ is a locally principal closed subscheme.
(4) The zero scheme $Z(s)$ is an effective Cartier divisor if and only if $s$ is a regular section of $\mathcal{L}$.
Proof. Omitted.
01X0 Lemma 30.11.21. Let $X$ be a scheme.
(1) If $D \subset X$ is an effective Cartier divisor, then the canonical section $1_{D}$ of $\mathcal{O}_{X}(D)$ is regular.
(2) Conversely, if $s$ is a regular section of the invertible sheaf $\mathcal{L}$, then there exists a unique effective Cartier divisor $D=Z(s) \subset X$ and a unique isomorphism $\mathcal{O}_{X}(D) \rightarrow \mathcal{L}$ which maps $1_{D}$ to $s$.
The constructions $D \mapsto\left(\mathcal{O}_{X}(D), 1_{D}\right)$ and $(\mathcal{L}, s) \mapsto Z(s)$ give mutually inverse maps $\{$ effective Cartier divisors on $X\} \leftrightarrow\left\{\begin{array}{c}\text { pairs }(\mathcal{L}, s) \text { consisting of an invertible } \\ \mathcal{O}_{X} \text {-module and a regular global section }\end{array}\right\}$
Proof. Omitted.

### 30.12. Effective Cartier divisors on Noetherian schemes

0B3Q In the locally Noetherian setting most of the discussion of effective Cartier divisors and regular sections simplifies somewhat.

0AYL Lemma 30.12.1. Let $X$ be a locally Noetherian scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma(X, \mathcal{L})$. Then $s$ is a regular section if and only if $s$ does not vanish in the associated points of $X$.

Proof. Omitted. Hint: reduce to the affine case and $\mathcal{L}$ trivial and then use Lemma 30.11.18 and Algebra, Lemma 10.62.9.

0AG8 Lemma 30.12.2. Let $X$ be a locally Noetherian scheme. Let $D \subset X$ be a closed subscheme corresponding to the quasi-coherent ideal sheaf $\mathcal{I} \subset \mathcal{O}_{X}$.
(1) If for every $x \in D$ the ideal $\mathcal{I}_{x} \subset \mathcal{O}_{X, x}$ can be generated by one element, then $D$ is locally principal.
(2) If for every $x \in D$ the ideal $\mathcal{I}_{x} \subset \mathcal{O}_{X, x}$ can be generated by a single nonzerodivisor, then $D$ is an effective Cartier divisor.

Proof. Let $\operatorname{Spec}(A)$ be an affine neighbourhood of a point $x \in D$. Let $\mathfrak{p} \subset A$ be the prime corresponding to $x$. Let $I \subset A$ be the ideal defining the trace of $D$ on $\operatorname{Spec}(A)$. Since $A$ is Noetherian (as $X$ is Noetherian) the ideal $I$ is generated by finitely many elements, say $I=\left(f_{1}, \ldots, f_{r}\right)$. Under the assumption of (1) we have $I_{\mathfrak{p}}=(f)$ for some $f \in A_{\mathfrak{p}}$. Then $f_{i}=g_{i} f$ for some $g_{i} \in A_{\mathfrak{p}}$. Write $g_{i}=a_{i} / h_{i}$ and $f=f^{\prime} / h$ for some $h_{i}, h \in A, h_{i}, h \notin \mathfrak{p}$. Then $I_{h_{1} \ldots h_{r} h} \subset A_{h_{1} \ldots h_{r} h}$ is principal, because it is generated by $f^{\prime}$. This proves (1). For (2) we may assume $I=(f)$. The assumption implies that the image of $f$ in $A_{\mathfrak{p}}$ is a nonzerodivisor. Then $f$ is a nonzerodivisor on a neighbourhood of $x$ by Algebra, Lemma 10.67.6. This proves (2).

0BCN Lemma 30.12.3. Let $X$ be a locally Noetherian scheme.
(1) Let $D \subset X$ be a locally principal closed subscheme. Let $\xi \in D$ be a generic point of an irreducible component of $D$. Then $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right) \leq 1$.
(2) Let $D \subset X$ be an effective Cartier divisor. Let $\xi \in D$ be a generic point of an irreducible component of $D$. Then $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)=1$.

Proof. Proof of (1). By assumption we may assume $X=\operatorname{Spec}(A)$ and $D=$ $\operatorname{Spec}(A /(f))$ where $A$ is a Noetherian ring and $f \in A$. Let $\xi$ correspond to the prime ideal $\mathfrak{p} \subset A$. The assumption that $\xi$ is a generic point of an irreducible componet of $D$ signifies $\mathfrak{p}$ is minimal over $(f)$. Thus $\operatorname{dim}\left(A_{\mathfrak{p}}\right) \leq 1$ by Algebra, Lemma 10.59 .10
Proof of (2). By part (1) we see that $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right) \leq 1$. On the other hand, the local equation $f$ is a nonzerodivisor in $A_{\mathfrak{p}}$ by Lemma 30.11 .2 which implies the dimension is at least 1 (because there must be a prime in $A_{\mathfrak{p}}$ not containing $f$ by the elementary Algebra, Lemma 10.16.2.
0AG9 Lemma 30.12.4. Let $X$ be a Noetherian scheme. Let $D \subset X$ be an integral closed subscheme which is also an effective Cartier divisor. Then the local ring of $X$ at the generic point of $D$ is a discrete valuation ring.

Proof. By Lemma 30.11 .2 we may assume $X=\operatorname{Spec}(A)$ and $D=\operatorname{Spec}(A /(f))$ where $A$ is a Noetherian ring and $f \in A$ is a nonzerodivisor. The assumption that $D$ is integral signifies that $(f)$ is prime. Hence the local ring of $X$ at the generic point is $A_{(f)}$ which is a Noetherian local ring whose maximal ideal is generated by a nonzerodivisor. Thus it is a discrete valuation ring by Algebra, Lemma 10.118.7

0B3R Lemma 30.12.5. Let $X$ be a locally Noetherian scheme. Let $D \subset X$ be an effective Cartier divisor. If $X$ is $\left(S_{k}\right)$, then $D$ is $\left(S_{k-1}\right)$.

Proof. Let $x \in D$. Then $\mathcal{O}_{D, x}=\mathcal{O}_{X, x} /(f)$ where $f \in \mathcal{O}_{X, x}$ is a nonzerodivisor. By assumption we have $\operatorname{depth}\left(\mathcal{O}_{X, x}\right) \geq \min \left(\operatorname{dim}\left(\mathcal{O}_{X, x}\right), k\right)$. By Algebra, Lemma 10.71.7 we have $\operatorname{depth}\left(\mathcal{O}_{D, x}\right)=\operatorname{depth}\left(\mathcal{O}_{X, x}\right)-1$ and by Algebra, Lemma 10.59 .12 $\operatorname{dim}\left(\mathcal{O}_{D, x}\right)=\operatorname{dim}\left(\mathcal{O}_{X, x}\right)-1$. It follows that $\operatorname{depth}\left(\mathcal{O}_{D, x}\right) \geq \min \left(\operatorname{dim}\left(\mathcal{O}_{D, x}\right), k-1\right)$ as desired.

0B3S Lemma 30.12.6. Let $X$ be a locally Noetherian normal scheme. Let $D \subset X$ be an effective Cartier divisor. Then $D$ is $\left(S_{1}\right)$.

Proof. By Properties, Lemma 27.12 .5 we see that $X$ is $\left(S_{2}\right)$. Thus we conclude by Lemma 30.12.5

0AGA Lemma 30.12.7. Let $X$ be a Noetherian scheme. Let $D \subset X$ be a integral closed subscheme. Assume that
(1) $D$ has codimension 1 in $X$, and
(2) $\mathcal{O}_{X, x}$ is a UFD for all $x \in D$.

Then $D$ is an effective Cartier divisor.
Proof. Let $x \in D$ and set $A=\mathcal{O}_{X, x}$. Let $\mathfrak{p} \subset A$ correspond to the generic point of $D$. Then $A_{\mathfrak{p}}$ has dimension 1 by assumption (1). Thus $\mathfrak{p}$ is a prime ideal of height 1. Since $A$ is a UFD this implies that $\mathfrak{p}=(f)$ for some $f \in A$. Of course $f$ is a nonzerodivisor and we conclude by Lemma 30.12.2
0AGB Lemma 30.12.8. Let $X$ be a Noetherian scheme. Let $Z \subset X$ be a closed subscheme. Assume there exist integral effective Cartier divisors $D_{i} \subset X$ and a closed subset $Z^{\prime} \subset X$ of codimension $\geq 2$ such that $Z \subset Z^{\prime} \cup \bigcup D_{i}$ set-theoretically. Then there exists an effective Cartier divisor of the form

$$
D=\sum a_{i} D_{i} \subset Z
$$

such that $D \rightarrow Z$ is an isomorphism away from codimension 2 in $X$. The existence of the $D_{i}$ is guaranteed if $\mathcal{O}_{X, x}$ is a UFD for all $x \in Z$ or if $X$ is regular.

Proof. Let $\xi_{i} \in D_{i}$ be the generic point and let $\mathcal{O}_{i}=\mathcal{O}_{X, \xi_{i}}$ be the local ring which is a discrete valuation ring by Lemma 30.12.4. Let $a_{i} \geq 0$ be the minimal valuation of an element of $\mathcal{I}_{Z, \xi_{i}} \subset \mathcal{O}_{i}$. We claim that the effective Cartier divisor $D=\sum a_{i} D_{i}$ works.
Namely, suppose that $x \in X$. Let $A=\mathcal{O}_{X, x}$. Let $f_{i} \in A$ be a local equation for $D_{i}$; we only consider those $i$ such that $x \in D_{i}$. Then $f_{i}$ is a prime element of $A$ and $\mathcal{O}_{i}=A_{\left(f_{i}\right)}$. Let $I=\mathcal{I}_{Z, x} \subset A$. By our choice of $a_{i}$ we have $I A_{\left(f_{i}\right)}=f_{i}^{a_{i}} A_{\left(f_{i}\right)}$. It follows that $I \subset\left(\prod f_{i}^{a_{i}}\right)$ because the $f_{i}$ are prime elements of $A$. This proves that $\mathcal{I}_{Z} \subset \mathcal{I}_{D}$, i.e., that $D \subset Z$. Moreover, we also see that $D$ and $Z$ agree at the $\xi_{i}$, which proves the final assertion.
To see the final statements we argue as follows. A regular local ring is a UFD (More on Algebra, Lemma 15.83.7 hence it suffices to argue in the UFD case. In that case, let $D_{i}$ be the irreducible components of $Z$ which have codimension 1 in $X$. By Lemma 30.12.7 each $D_{i}$ is an effective Cartier divisor.

0BCP Lemma 30.12.9. Let $X$ be a Noetherian scheme. Let $D \subset X$ be an effective Cartier divisor. Assume that there exist integral effective Cartier divisors $D_{i} \subset X$ such that $D \subset \bigcup D_{i}$ set theoretically. Then $D=\sum a_{i} D_{i}$ for some $a_{i} \geq 0$. The existence of the $D_{i}$ is guaranteed if $\mathcal{O}_{X, x}$ is a UFD for all $x \in D$ or if $X$ is regular.
Proof. Choose $a_{i}$ as in Lemma 30.12 .8 and set $D^{\prime}=\sum a_{i} D_{i}$. Then $D^{\prime} \rightarrow D$ is an inclusion of effective Cartier divisors which is an isomorphism away from codimension 2 on $X$. Pick $x \in X$. Set $A=\mathcal{O}_{X, x}$ and let $f, f^{\prime} \in A$ be the nonzerodivisor generating the ideal of $D, D^{\prime}$ in $A$. Then $f=g f^{\prime}$ for some $g \in A$. Moreover, for every prime $\mathfrak{p}$ of height $\leq 1$ of $A$ we see that $g$ maps to a unit of $A_{\mathfrak{p}}$. This implies that $g$ is a unit because the minimal primes over $(g)$ have height 1 (Algebra, Lemma 10.59.10).
0AYM Lemma 30.12.10. Let $X$ be a Noetherian scheme which has an ample invertible sheaf. Then every invertible $\mathcal{O}_{X}$-module is isomorphic to

$$
\mathcal{O}_{X}(D) \otimes_{\mathcal{O}_{X}} \mathcal{O}_{X}\left(D^{\prime}\right)^{\otimes-1}
$$

for some effective Cartier divisors $D, D^{\prime}$ in $X$.
Proof. Let $x_{1}, \ldots, x_{n}$ be the associated points of $X$ (Lemma 30.2.5). Let $\mathcal{L}$ be an ample invertible sheaf. There exists an $n>0$ and a section $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that $X_{s}=\operatorname{Spec}(A)$ is affine and such that $x_{i} \in X_{s}$ for $i=1, \ldots, n$ (Properties, Lemma 27.29.6). Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{n} \subset A$ be the prime ideals corresponding to $x_{1}, \ldots, x_{n}$.

Then $\left.\mathcal{N}\right|_{X_{s}}$ corresponds to an invertible $A$-module $N$. Choose an element $t \in N$, $t \notin \mathfrak{p}_{i} N$ for all $i$. Such an element exists. This is clear if $n=1$. If $n>1$ first rearrange the primes such that $\mathfrak{p}_{i} \not \subset \mathfrak{p}_{n}$ for all $i<n$. Then using induction choose an element $t \in N$ with $t \notin \mathfrak{p}_{i} N$ for $i<n$. Then we are done if $t \notin \mathfrak{p}_{n} N$. Otherwise, pick an $t^{\prime} \in N, t^{\prime} \notin \mathfrak{p}_{n} N$ and $f_{i} \in \mathfrak{p}_{i}, f_{i} \notin \mathfrak{p}_{n}$. The element $t+f_{1} f_{2} \ldots f_{n-1} t^{\prime}$ will be as desired.
By Properties, Lemma 27.17 .2 we see that for some $e \geq 0$ the section $\left.s^{e}\right|_{U} t$ extends to a global section $\tau$ of $\mathcal{L}^{\otimes e} \otimes \mathcal{N}$. Thus both $\mathcal{L}^{\otimes e} \otimes \mathcal{N}$ and $\mathcal{L}^{\otimes e}$ are invertible sheaves which have global sections which generate the stalks at the associated points of $X$.

Thus these are regular sections by Lemma 30.12.1. Hence $\mathcal{L}^{\otimes e} \otimes \mathcal{N} \cong \mathcal{O}_{X}(D)$ and $\mathcal{L}^{\otimes e} \cong \mathcal{O}_{X}\left(D^{\prime}\right)$ for some effective Cartier divisors, see Lemma 30.11.21.

0B3T Lemma 30.12.11. Let $X$ be an integral regular scheme of dimension 2. Let $i: D \rightarrow X$ be the immersion of an effective Cartier divisor. Let $\mathcal{F} \rightarrow \mathcal{F}^{\prime} \rightarrow i_{*} \mathcal{G} \rightarrow 0$ be an exact sequence of coherent $\mathcal{O}_{X}$-modules. Assume
(1) $\mathcal{F}, \mathcal{F}^{\prime}$ are locally free of rank $r$ on a nonempty open of $X$,
(2) $D$ is an integral scheme,
(3) $\mathcal{G}$ is a finite locally free $\mathcal{O}_{D}$-module of rank $s$.

Then $\mathcal{L}=\left(\wedge^{r} \mathcal{F}\right)^{* *}$ and $\mathcal{L}^{\prime}=\left(\wedge^{r} \mathcal{F}^{\prime}\right)^{* *}$ are invertible $\mathcal{O}_{X}$-modules and $\mathcal{L}^{\prime} \cong \mathcal{L}(k D)$ for some $k \in\{0, \ldots, \min (s, r)\}$.
Proof. The first statement follows from Lemma 30.10 .10 as assumption (1) implies that $\mathcal{L}$ and $\mathcal{L}^{\prime}$ have rank 1. Taking $\wedge^{r}$ and double duals are functors, hence we obtain a canonical map $\sigma: \mathcal{L} \rightarrow \mathcal{L}^{\prime}$ which is an isomorphism over the nonempty open of (1), hence nonzero. To finish the proof, it suffices to see that $\sigma$ viewed as a global section of $\mathcal{L}^{\prime} \otimes \mathcal{L}^{\otimes-1}$ does not vanish at any codimension point of $X$, except at the generic point of $D$ and there with vanishing order at most $\min (s, r)$.
Translated into algebra, we arrive at the following problem: Let $(A, \mathfrak{m}, \kappa)$ be a discrete valuation ring with fraction field $K$. Let $M \rightarrow M^{\prime} \rightarrow N \rightarrow 0$ be an exact sequence of finite $A$-modules with $\operatorname{dim}_{K}(M \otimes K)=\operatorname{dim}_{K}\left(M^{\prime} \otimes K\right)=r$ and with $N \cong \kappa^{\oplus s}$. Show that the induced map $L=\wedge^{r}(M)^{* *} \rightarrow L^{\prime}=\wedge^{r}\left(M^{\prime}\right)^{* *}$ vanishes to order at most $\min (s, r)$. We will use the structure theorem for modules over $A$, see More on Algebra, Lemma 15.85.3 or 15.85.9. Dividing out a finite $A$-module by a torsion submodule does not change the double dual. Thus we may replace $M$ by $M / M_{\text {tors }}$ and $M^{\prime}$ by $M^{\prime} / \operatorname{Im}\left(M_{\text {tors }} \rightarrow M^{\prime}\right)$ and assume that $M$ is torsion free. Then $M \rightarrow M^{\prime}$ is injective and $M_{\text {tors }}^{\prime} \rightarrow N$ is injective. Hence we may replace $M^{\prime}$ by $M^{\prime} / M_{\text {tors }}^{\prime}$ and $N$ by $N / M_{\text {tors }}^{\prime}$. Thus we reduce to the case where $M$ and $M^{\prime}$ are free of rank $r$ and $N \cong \kappa^{\oplus s}$. In this case $\sigma$ is the determinant of $M \rightarrow M^{\prime}$ and vanishes to order $s$ for example by Algebra, Lemma 10.120.7.

### 30.13. Complements of affine opens

$0 B C Q$ In this section we discuss the result that the complement of an affine open in a variety has pure codimension 1.
0BCR Lemma 30.13.1. Let $(A, \mathfrak{m})$ be a Noetherian local ring. The puctured spectrum $U=\operatorname{Spec}(A) \backslash\{\mathfrak{m}\}$ of $A$ is affine if and only if $\operatorname{dim}(A) \leq 1$.

Proof. If $\operatorname{dim}(A)=0$, then $U$ is empty hence affine (equal to the spectrum of the 0 ring). If $\operatorname{dim}(A)=1$, then we can choose an element $f \in \mathfrak{m}$ not contained in any of the finite number of minimal primes of $A$ (Algebra, Lemmas 10.30.6 and 10.14.2). Then $U=\operatorname{Spec}\left(A_{f}\right)$ is affine.

The converse is more interesting. We will give a somewhat nonstandard proof and discuss the standard argument in a remark below. Assume $U=\operatorname{Spec}(B)$ is affine. Since affineness and dimension are not affecting by going to the reduction we may replace $A$ by the quotient by its ideal of nilpotent elements and assume $A$ is reduced. Set $Q=B / A$ viewed as an $A$-module. The support of $Q$ is $\{\mathfrak{m}\}$ as $A_{\mathfrak{p}}=B_{\mathfrak{p}}$ for all nonmaximal primes $\mathfrak{p}$ of $A$. We may assume $\operatorname{dim}(A) \geq 1$, hence as above we can pick $f \in \mathfrak{m}$ not contained in any of the minimal ideals of $A$. Since $A$ is reduced
this implies that $f$ is a nonzerodivisor. In particular $\operatorname{dim}(A / f A)=\operatorname{dim}(A)-1$, see Algebra, Lemma 10.59.12. Applying the snake lemma to multiplication by $f$ on the short exact sequence $0 \rightarrow A \rightarrow B \rightarrow Q \rightarrow 0$ we obtain

$$
0 \rightarrow Q[f] \rightarrow A / f A \rightarrow B / f B \rightarrow Q / f Q \rightarrow 0
$$

where $Q[f]=\operatorname{Ker}(f: Q \rightarrow Q)$. This implies that $Q[f]$ is a finite $A$-module. Since the support of $Q[f]$ is $\{\mathfrak{m}\}$ we see $l=\operatorname{length}_{A}(Q[f])<\infty$ (Algebra, Lemma 10.61.3). Set $l_{n}=\operatorname{length}_{A}\left(Q\left[f^{n}\right]\right)$. The exact sequence

$$
0 \rightarrow Q\left[f^{n}\right] \rightarrow Q\left[f^{n+1}\right] \xrightarrow{f^{n}} Q[f]
$$

shows inductively that $l_{n}<\infty$ and that $l_{n} \leq l_{n+1}$. Considering the exact sequence

$$
0 \rightarrow Q[f] \rightarrow Q\left[f^{n+1}\right] \stackrel{f}{\rightarrow} Q\left[f^{n}\right] \rightarrow Q / f Q
$$

and we see that the image of $Q\left[f^{n}\right]$ in $Q / f Q$ has length $l_{n}-l_{n+1}+l \leq l$. Since $Q=\bigcup Q\left[f^{n}\right]$ we find that the length of $Q / f Q$ is at most $l$, i.e., bounded. Thus $Q / f Q$ is a finite $A$-module. Hence $A / f A \rightarrow B / f B$ is a finite ring map, in particular induces a closed map on spectra (Algebra, Lemmas 10.35 .20 and 10.40.6). On the other hand $\operatorname{Spec}(B / f B)$ is the puctured spectrum of $\operatorname{Spec}(A / f A)$. This is a contradiction unless $\operatorname{Spec}(B / f B)=\emptyset$ which means that $\operatorname{dim}(A / f A)=0$ as desired.

0BCS Remark 30.13.2. If $(A, \mathfrak{m})$ is a Noetherian local normal domain of dimension $\geq 2$ and $U$ is the punctured spectrum of $A$, then $\Gamma\left(U, \mathcal{O}_{U}\right)=A$. This algebraic version of Hartog's theorem follows from the fact that $A=\bigcap_{\text {height }(\mathfrak{p})=1} A_{\mathfrak{p}}$ we've seen in Algebra, Lemma 10.149.6. Thus in this case $U$ cannot be affine (since it would force $\mathfrak{m}$ to be a point of $U$ ). This is often used as the starting point of the proof of Lemma 30.13.1. To reduce the case of a general Noetherian local ring to this case, we first complete (to get a Nagata local ring), then replace $A$ by $A / \mathfrak{q}$ for a suitable minimal prime, and then normalize. Each of these steps does not change the dimension and we obtain a contradiction. You can skip the completion step, but then the normalization in general is not a Noetherian domain. However, it is still a Krull domain of the same dimension (this is proved using Krull-Akizuki) and one can apply the same argument.
0BCT Remark 30.13.3. It is not clear how to characterize the non-Noetherian local rings $(A, \mathfrak{m})$ whose punctured spectrum is affine. Such a ring has a finitely generated ideal $I$ with $\mathfrak{m}=\sqrt{I}$. Of course if we can take $I$ generated by 1 element, then $A$ has an affine puncture spectrum; this gives lots of non-Noetherian examples. Conversely, it follows from the argument in the proof of Lemma 30.13.1 that such a ring cannot possess a nonzerodivisor $f \in \mathfrak{m}$ with $H_{I}^{0}(A / f A)=0$ (so $A$ cannot have a regular sequence of length 2 ). Moreover, the same holds for any ring $A^{\prime}$ which is the target of a local homomorphism of local rings $A \rightarrow A^{\prime}$ such that $\mathfrak{m}_{A^{\prime}}=\sqrt{\mathfrak{m} A^{\prime}}$.

0BCU Lemma 30.13.4. Let $X$ be a locally Noetherian scheme. Let $U \subset X$ be an open subscheme such that the inclusion morphism $U \rightarrow X$ is affine. For every generic point $\xi$ of an irreducible component of $X \backslash U$ the local ring $\mathcal{O}_{X, \xi}$ has dimension $\leq 1$. If $U$ is dense or if $\xi$ is in the closure of $U$, then $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)=1$.

Proof. Since $\xi$ is a generic point of $X \backslash U$, we see that

$$
U_{\xi}=U \times_{X} \operatorname{Spec}\left(\mathcal{O}_{X, \xi}\right) \subset \operatorname{Spec}\left(\mathcal{O}_{X, \xi}\right)
$$

is the punctured spectrum of $\mathcal{O}_{X, \xi}$ (hint: use Schemes, Lemma 25.13.2. As $U \rightarrow X$ is affine, we see that $U_{\xi} \rightarrow \operatorname{Spec}\left(\mathcal{O}_{X, \xi}\right)$ is affine (Morphisms, Lemma 28.12.8) and we conclude that $U_{\xi}$ is affine. Hence $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right) \leq 1$ by Lemma 30.13.1. If $\xi \in \bar{U}$, then there is a specialization $\eta \rightarrow \xi$ where $\eta \in U$ (just take $\eta$ a generic point of an irreducible component of $\bar{U}$ which contains $\xi$; since $\bar{U}$ is locally Noetherian, hence locally has finitely many irreducible components, we see that $\eta \in U)$. Then $\eta \in \operatorname{Spec}\left(\mathcal{O}_{X, \xi}\right)$ and we see that the dimension cannot be 0 .

0BCV Lemma 30.13.5. Let $X$ be a separated locally Noetherian scheme. Let $U \subset X$ be an affine open. For every generic point $\xi$ of an irreducible component of $X \backslash U$ the local ring $\mathcal{O}_{X, \xi}$ has dimension $\leq 1$. If $U$ is dense or if $\xi$ is in the closure of $U$, then $\operatorname{dim}\left(\mathcal{O}_{X, \xi}\right)=1$.

Proof. This follows from Lemma 30.13 .4 because the morphism $U \rightarrow X$ is affine by Morphisms, Lemma 28.12.11.

The following lemma can sometimes be used to produce effective Cartier divisors.
0BCW Lemma 30.13.6. Let $X$ be a Noetherian separated scheme. Let $U \subset X$ be $a$ dense affine open. If $\mathcal{O}_{X, x}$ is a UFD for all $x \in X \backslash U$, then there exists an effective Cartier divisor $D \subset X$ with $U=X \backslash D$.

Proof. Since $X$ is Noetherian, the complement $X \backslash U$ has finitely many irreducible components $D_{1}, \ldots, D_{r}$ (Properties, Lemma 27.5.7 applied to the reduced induced subscheme structure on $X \backslash U$ ). Each $D_{i} \subset X$ has codimension 1 by Lemma 30.13.5 (and Properties, Lemma 27.10.3). Thus $D_{i}$ is an effective Cartier divisor by Lemma 30.12.7. Hence we can take $D=D_{1}+\ldots+D_{r}$.

### 30.14. Norms

0BCX Let $\pi: X \rightarrow Y$ be a finite morphism of schemes and let $d \geq 1$ be an integer. Let us say there exists a norm of degree $d$ for $\pi]^{1}$ if there exists a multiplicative map

$$
\operatorname{Norm}_{\pi}: \pi_{*} \mathcal{O}_{X} \rightarrow \mathcal{O}_{Y}
$$

of sheaves such that
(1) the composition $\mathcal{O}_{Y} \xrightarrow{\pi^{\sharp}} \pi_{*} \mathcal{O}_{X} \xrightarrow{\text { Norm }_{\pi}} \mathcal{O}_{Y}$ equals $g \mapsto g^{d}$, and
(2) if $f \in \mathcal{O}_{X}\left(\pi^{-1} V\right)$ is zero at $x \in \pi^{-1}(V)$, then $\operatorname{Norm}_{\pi}(f)$ is zero at $\pi(x)$.

We observe that condition (1) forces $\pi$ to be surjective. Since Norm $_{\pi}$ is multiplicative it sends units to units hence, given $y \in Y$, if $f$ is a regular function on $X$ defined at but nonvanishing at any $x \in X$ with $\pi(x)=y$, then $\operatorname{Norm}_{\pi}(f)$ is defined and does not vanish at $y$. This holds without requiring (2); in fact, the constructions in this section will only require condition (1) and only certain vanishing properties (which are used in particular in the proof of Lemma 30.14.3) will require property (2).

0BCY Lemma 30.14.1. Let $\pi: X \rightarrow Y$ be a finite morphism of schemes. If there exists a norm of degree $d$ for $\pi$, then there exists a homomorphism of abelian groups

$$
\operatorname{Norm}_{\pi}: \operatorname{Pic}(X) \rightarrow \operatorname{Pic}(Y)
$$

such that $\operatorname{Norm}_{\pi}\left(\pi^{*} \mathcal{N}\right) \cong \mathcal{N}^{\otimes d}$ for all invertible $\mathcal{O}_{Y}$-modules $\mathcal{N}$.

[^82]Proof. We will use the correspondence between isomorphism classes of invertible $\mathcal{O}_{X}$-modules and elements of $H^{1}\left(X, \mathcal{O}_{X}^{*}\right)$ given in Cohomology, Lemma 20.7.1 without further mention. We explain how to take the norm of an invertible $\mathcal{O}_{X}$-module $\mathcal{L}$. Namely, we will see below that there exists an open covering $Y=\bigcup V_{j}$ such that $\left.\mathcal{L}\right|_{\pi^{-1} V_{j}}$ is trivial. Choose a generating section $s_{j} \in \mathcal{L}\left(\pi^{-1} V_{j}\right)$ for each $j$. On the overlaps $\pi^{-1} V_{j} \cap \pi^{-1} V_{j^{\prime}}$ we can write

$$
s_{j}=u_{j j^{\prime}} s_{j^{\prime}}
$$

for a unique $u_{j j^{\prime}} \in \mathcal{O}_{X}^{*}\left(\pi^{-1} V_{j} \cap \pi^{-1} V_{j^{\prime}}\right)$. Thus we can consider the elements

$$
v_{j j^{\prime}}=\operatorname{Norm}_{\pi}\left(u_{j j^{\prime}}\right) \in \mathcal{O}_{Y}^{*}\left(V_{j} \cap V_{j^{\prime}}\right)
$$

These elements satisfy the cocycle condition (because the $u_{j j^{\prime}}$ do and Norm ${ }_{\pi}$ is multiplicative) and therefore define an invertible $\mathcal{O}_{Y}$-module. We omit the verification that: this is well defined, additive on Picard groups, and satisfies the property $\operatorname{Norm}_{\pi}\left(\pi^{*} \mathcal{N}\right) \cong \mathcal{N}^{\otimes d}$ for all invertible $\mathcal{O}_{Y}$-modules $\mathcal{N}$.
Pick $y \in Y$. We have to show there exists an affine open neighbourhood $V \subset Y$ of $y$ such that $\left.\mathcal{L}\right|_{\pi^{-1}(V)}$ is trivial. Clearly we may assume $Y$ and hence $X$ affine. Since $\pi$ is finite the fibre $\pi^{-1}(\{y\})$ over $y$ is finite. Since $X$ is affine, we can pick $s \in \Gamma(X, \mathcal{L})$ not vanishing in any point of $\pi^{-1}(\{y\})$. Namely, we can pick a finite set $E \subset X$ of closed points such that every $x \in \pi^{-1}(\{y\})$ specializes to some point of $E$. For $x \in E$ denote $i_{x}: x \rightarrow X$ the closed immersion. Then $\mathcal{L} \rightarrow \bigoplus_{x \in E} i_{x, *} i_{x}^{*} \mathcal{L}$ is a surjective map of quasi-coherent $\mathcal{O}_{X}$-modules, and hence the map

$$
\Gamma(X, \mathcal{L}) \rightarrow \bigoplus_{x \in E} \mathcal{L}_{x} / \mathfrak{m}_{x} \mathcal{L}_{x}
$$

is surjective (as taking global sections is an exact functor on the category of quasicoherent $\mathcal{O}_{X}$-modules, see Schemes, Lemma 25.7.5). Thus we can find an $s \in$ $\Gamma(X, \mathcal{L})$ not vanishing at any point specializing to a point of $E$. Then $X_{s} \subset X$ is an open neighbourhood of $\pi^{-1}(\{y\})$. Since $\pi$ is finite, hence closed, we conclude that there is an open neighbourhood $V \subset Y$ of $y$ whose inverse image is contained in $X_{s}$ as desired.

0BCZ Lemma 30.14.2. Let $\pi: X \rightarrow Y$ be a finite morphism of schemes. Assume there exists a norm of degree $d$ for $\pi$. For any $\mathcal{O}_{X}$-linear map $\varphi: \mathcal{L} \rightarrow \mathcal{L}^{\prime}$ of invertible $\mathcal{O}_{X}$-modules there is an $\mathcal{O}_{Y}$-linear map

$$
\operatorname{Norm}_{\pi}(\varphi): \operatorname{Norm}_{\pi}(\mathcal{L}) \longrightarrow \operatorname{Norm}_{\pi}\left(\mathcal{L}^{\prime}\right)
$$

with $\operatorname{Norm}_{\pi}(\mathcal{L}), \operatorname{Norm}_{\pi}\left(\mathcal{L}^{\prime}\right)$ as in Lemma 30.14.1. Moreover, for $y \in Y$ the following are equivalent
(1) $\varphi$ is zero at a point of $x \in X$ with $\pi(x)=y$, and
(2) $\operatorname{Norm}_{\pi}(\varphi)$ is zero at $y$.

Proof. We choose an open covering $Y=\bigcup V_{j}$ such that $\mathcal{L}$ and $\mathcal{L}^{\prime}$ are trivial over the opens $\pi^{-1} V_{j}$. This is possible by the claim in the proof of Lemma 30.14.1. Choose generating sections $s_{j}$ and $s_{j}^{\prime}$ of $\mathcal{L}$ and $\mathcal{L}^{\prime}$ over the opens $\pi^{-1} V_{j}$. Then $\varphi\left(s_{j}\right)=f_{j} s_{j}^{\prime}$ for some $f_{j} \in \mathcal{O}_{X}\left(\pi^{-1} V_{j}\right)$. Define $\operatorname{Norm}_{\pi}(\varphi)$ to be multiplication by $\operatorname{Norm}_{\pi}\left(f_{j}\right)$ on $V_{j}$. An simple calculation involving the cocycles used to construct $\operatorname{Norm}_{\pi}(\mathcal{L}), \operatorname{Norm}_{\pi}\left(\mathcal{L}^{\prime}\right)$ in the proof of Lemma 30.14.1 shows that this defines a map as stated in the lemma. The final statement follows from condition (2) in the definition of a norm map of degree $d$. Some details omitted.

0BD0 Lemma 30.14.3. Let $\pi: X \rightarrow Y$ be a finite morphism of schemes. Assume $X$ has an ample invertible sheaf and there exists a norm of degree d for $\pi$. Then $Y$ has an ample invertible sheaf.

Proof. Let $\mathcal{L}$ be the ample invertible sheaf on $X$ given to us by assumption. We will prove that $\mathcal{N}=\operatorname{Norm}_{\pi}(\mathcal{L})$ is ample on $Y$.
Since $X$ is quasi-compact (Properties, Definition 27.26.1) and $X \rightarrow Y$ surjective (by the existence of $\operatorname{Norm}_{\pi}$ ) we see that $Y$ is quasi-compact. Let $y \in Y$ be a point. To finish the proof we will show that there exists a section $t$ of some positive tensor power of $\mathcal{N}$ which does not vanish at $y$ such that $Y_{t}$ is affine. To do this, choose an affine open neighbourhood $V \subset Y$ of $y$. Choose $n \gg 0$ and a section $s \in \Gamma\left(X, \mathcal{L}^{\otimes n}\right)$ such that

$$
\pi^{-1}(\{y\}) \subset X_{s} \subset \pi^{-1} V
$$

by Properties, Lemma 27.29.6. Then $t=\operatorname{Norm}_{\pi}(s)$ is a section of $\mathcal{N} \otimes n$ which does not vanish at $x$ and with $Y_{t} \subset V$, see Lemma 30.14.2. Then $Y_{t}$ is affine by Properties, Lemma 27.26.4.

0BD1 Lemma 30.14.4. Let $\pi: X \rightarrow Y$ be a finite morphism of schemes. Assume $X$ is quasi-affine and there exists a norm of degree d for $\pi$. Then $Y$ is quasi-affine.
Proof. By Properties, Lemma 27.27 .1 we see that $\mathcal{O}_{X}$ is an ample invertible sheaf on $X$. The proof of Lemma 30.14 .3 shows that $\operatorname{Norm}_{\pi}\left(\mathcal{O}_{X}\right)=\mathcal{O}_{Y}$ is an ample invertible $\mathcal{O}_{Y}$-module. Hence Properties, Lemma 27.27.1 shows that $Y$ is quasiaffine.

0BD2 Lemma 30.14.5. Let $\pi: X \rightarrow Y$ be a finite locally free morphism of degree $d \geq 1$. Then there exists a canonical norm of degree $d$ whose formation commutes with arbitrary base change.

Proof. Let $V \subset Y$ be an affine open such that $\left.\left(\pi_{*} \mathcal{O}_{X}\right)\right|_{V}$ is finite free of rank $d$. Choosing a basis we obtain an isomorphism

$$
\left.\mathcal{O}_{V}^{\oplus d} \cong\left(\pi_{*} \mathcal{O}_{X}\right)\right|_{V}
$$

For every $f \in \pi_{*} \mathcal{O}_{X}(V)=\mathcal{O}_{X}\left(\pi^{-1}(V)\right)$ multipliciation by $f$ defines a $\mathcal{O}_{V}$-linear endomorphism $m_{f}$ of the displayed free vector bundle. Thus we get a $d \times d$ matrix $M_{f} \in \operatorname{Mat}\left(d \times d, \mathcal{O}_{Y}(V)\right)$ and we can set

$$
\operatorname{Norm}_{\pi}(f)=\operatorname{det}\left(M_{f}\right)
$$

Since the determinant of a matrix is independent of the choice of the basis chosen we see that this is well defined which also means that this construction will glue to a global map as desired. Compatibility with base change is straightforward from the construction.

Property (1) follows from the fact that the determinant of a $d \times d$ diagonal matrix with entries $g, g, \ldots, g$ is $g^{d}$. To see property (2) we may base change and assume that $Y$ is the spectrum of a field $k$. Then $X=\operatorname{Spec}(A)$ with $A$ a $k$-algebra with $\operatorname{dim}_{k}(A)=d$. If there exists an $x \in X$ such that $f \in A$ vanishes at $x$, then there exists a map $A \rightarrow \kappa$ into a field such that $f$ maps to zero in $\kappa$. Then $f: A \rightarrow A$ cannot be surjective, hence $\operatorname{det}(f: A \rightarrow A)=0$ as desired.

0BD3 Lemma 30.14.6. Let $\pi: X \rightarrow Y$ be a finite surjective morphism with $X$ and $Y$ integral and $Y$ normal. Then there exists a norm of degree $[R(X): R(Y)]$ for $\pi$.

Proof. Let $\operatorname{Spec}(B) \subset Y$ be an affine open subset and let $\operatorname{Spec}(A) \subset X$ be its inverse image. Then $A$ and $B$ are domains. Let $K$ be the fraction field of $A$ and $L$ the fraction field of $B$. Picture:

Since $K / L$ is a finite extension, there is a norm map $\operatorname{Norm}_{K / L}: K^{*} \rightarrow L^{*}$ of degree $d=[K: L]$; this is given by mapping $f \in K$ to $\operatorname{det}_{L}(f: K \rightarrow K)$ as in the proof of Lemma 30.14.5. Observe that the characteristic polynomial of $f: K \rightarrow K$ is a power of the minimal polynomial of $f$ over $L$; in particular $\operatorname{Norm}_{K / L}(f)$ is a power of the constant coefficient of the minimal polynomial of $f$ over $L$. Hence by Algebra, Lemma $10.37 .6 \operatorname{Norm}_{K / L}$ maps $A$ into $B$. This determines a compatible system of maps on sections over affines and hence a global norm map $\mathrm{Norm}_{\pi}$ of degree $d$.

Property (1) is immediate from the construction. To see property (2) let $f \in A$ be contained in the prime ideal $\mathfrak{p} \subset A$. Let $f^{m}+b_{1} f^{m-1}+\ldots+b_{m}$ be the minimal polynomial of $f$ over $L$. By Algebra, Lemma 10.37 .6 we have $b_{i} \in B$. Hence $b_{0} \in B \cap \mathfrak{p}$. Since $\operatorname{Norm}_{K / L}(f)=b_{0}^{d / m}$ (see above) we conclude that the norm vanishes in the image point of $\mathfrak{p}$.

0BDZ Lemma 30.14.7. Let $X$ be a Noetherian scheme. Let $p$ be a prime number such that $p \mathcal{O}_{X}=0$. Then for some $e>0$ there exists a norm of degree $p^{e}$ for $X_{r e d} \rightarrow X$ where $X_{\text {red }}$ is the reduction of $X$.

Proof. Let $A$ be a Noetherian ring with $p A=0$. Let $I \subset A$ be the ideal of nilpotent elements. Then $I^{n}=0$ for some $n$ (Algebra, Lemma 10.31.4). Pick $e$ such that $p^{e} \geq n$. Then

$$
A / I \longrightarrow A, \quad f \bmod I \longmapsto f^{p^{e}}
$$

is well defined. This produces a norm of degree $p^{e}$ for $\operatorname{Spec}(A / I) \rightarrow \operatorname{Spec}(A)$. Now if $X$ is obtained by glueing some affine schemes $\operatorname{Spec}\left(A_{i}\right)$ then for some $e \gg 0$ these maps glue to a norm map for $X_{\text {red }} \rightarrow X$. Details omitted.

0BD4 Proposition 30.14.8. Let $f: X \rightarrow Y$ be a finite surjective morphism of schemes. Assume that $X$ has an ample invertible $\mathcal{O}_{X}$-module. If
(1) $\pi$ is finite locally free, or
(2) $Y$ is an integral normal scheme, or
(3) $Y$ is Noetherian, $p \mathcal{O}_{Y}=0$, and $X=Y_{\text {red }}$,
then $Y$ has an ample invertible $\mathcal{O}_{Y}$-module.
Proof. Case (1) follows from a combination of Lemmas 30.14.5 and 30.14.3. Case (3) follows from a combination of Lemmas 30.14 .7 and 30.14.3. In case (2) we first replace $X$ by an irreducible component of $X$ which dominates $Y$ (viewed as a reduced closed subscheme of $X$ ). Then we can apply Lemma 30.14.6.

0BD5 Lemma 30.14.9. Let $f: X \rightarrow Y$ be a finite surjective morphism of schemes. Assume that $X$ is quasi-affine. If either
(1) $\pi$ is finite locally free, or
(2) $Y$ is an integral normal scheme
then $Y$ is quasi-affine.
Proof. Case (1) follows from a combination of Lemmas 30.14.5 and 30.14.4. In case (2) we first replace $X$ by an irreducible component of $X$ which dominates $Y$ (viewed as a reduced closed subscheme of $X$ ). Then we can apply Lemma 30.14.6

### 30.15. Relative effective Cartier divisors

056P The following lemma shows that an effective Cartier divisor which is flat over the base is really a "family of effective Cartier divisors" over the base. For example the restriction to any fibre is an effective Cartier divisor.

056Q Lemma 30.15.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be $a$ closed subscheme. Assume
(1) $D$ is an effective Cartier divisor, and
(2) $D \rightarrow S$ is a flat morphism.

Then for every morphism of schemes $g: S^{\prime} \rightarrow S$ the pullback $\left(g^{\prime}\right)^{-1} D$ is an effective Cartier divisor on $X^{\prime}=S^{\prime} \times_{S} X$ where $g^{\prime}: X^{\prime} \rightarrow X$ is the projection.
Proof. Using Lemma 30.11 .2 we translate this as follows into algebra. Let $A \rightarrow B$ be a ring map and $h \in B$. Assume $h$ is a nonzerodivisor and that $B / h B$ is flat over A. Then

$$
0 \rightarrow B \xrightarrow{h} B \rightarrow B / h B \rightarrow 0
$$

is a short exact sequence of $A$-modules with $B / h B$ flat over $A$. By Algebra, Lemma 10.38 .12 this sequence remains exact on tensoring over $A$ with any module, in particular with any $A$-algebra $A^{\prime}$.

This lemma is the motivation for the following definition.
062T Definition 30.15.2. Let $f: X \rightarrow S$ be a morphism of schemes. A relative effective Cartier divisor on $X / S$ is an effective Cartier divisor $D \subset X$ such that $D \rightarrow S$ is a flat morphism of schemes.

We warn the reader that this may be nonstandard notation. In particular, in DG67, IV, Section 21.15] the notion of a relative divisor is discussed only when $X \rightarrow S$ is flat and locally of finite presentation. Our definition is a bit more general. However, it turns out that if $x \in D$ then $X \rightarrow S$ is flat at $x$ in many cases (but not always).

0B8U Lemma 30.15.3. Let $f: X \rightarrow S$ be a morphism of schemes. If $D_{1}, D_{2} \subset X$ are relative effective Cartier divisor on $X / S$ then so is $D_{1}+D_{2}$ (Definition 30.11.6).

Proof. This translates into the following algebra fact: Let $A \rightarrow B$ be a ring map and $h_{1}, h_{2} \in B$. Assume the $h_{i}$ are nonzerodivisors and that $B / h_{i} B$ is flat over $A$. Then $h_{1} h_{2}$ is a nonzerodivisor and $B / h_{1} h_{2} B$ is flat over $A$. The reason is that we have a short exact sequence

$$
0 \rightarrow B / h_{1} B \rightarrow B / h_{1} h_{2} B \rightarrow B / h_{2} B \rightarrow 0
$$

where the first arrow is given by multiplication by $h_{2}$. Since the outer two are flat modules over $A$, so is the middle one, see Algebra, Lemma 10.38.13.

0B8V Lemma 30.15.4. Let $f: X \rightarrow S$ be a morphism of schemes. If $D_{1}, D_{2} \subset X$ are relative effective Cartier divisor on $X / S$ and $D_{1} \subset D_{2}$ as closed subschemes, then the effective Cartier divisor $D$ such that $D_{2}=D_{1}+D$ (Lemma 30.11.8) is a relative effective Cartier divisor on $X / S$.
Proof. This translates into the following algebra fact: Let $A \rightarrow B$ be a ring map and $h_{1}, h_{2} \in B$. Assume the $h_{i}$ are nonzerodivisors, that $B / h_{i} B$ is flat over $A$, and that $\left(h_{2}\right) \subset\left(h_{1}\right)$. Then we can write $h_{2}=h h_{1}$ where $h \in B$ is a nonzerodivisor. We get a short exact sequence

$$
0 \rightarrow B / h B \rightarrow B / h_{2} B \rightarrow B / h_{1} B \rightarrow 0
$$

where the first arrow is given by multiplication by $h_{1}$. Since the right two are flat modules over $A$, so is the middle one, see Algebra, Lemma 10.38 .13 .
062U Lemma 30.15.5. Let $f: X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be $a$ relative effective Cartier divisor on $X / S$. If $x \in D$ and $\mathcal{O}_{X, x}$ is Noetherian, then $f$ is flat at $x$.

Proof. Set $A=\mathcal{O}_{S, f(x)}$ and $B=\mathcal{O}_{X, x}$. Let $h \in B$ be an element which generates the ideal of $D$. Then $h$ is a nonzerodivisor in $B$ such that $B / h B$ is a flat local $A$-algebra. Let $I \subset A$ be a finitely generated ideal. Consider the commutative diagram

The lower sequence is short exact as $B / h B$ is flat over $A$, see Algebra, Lemma 10.38.12. The right vertical arrow is injective as $B / h B$ is flat over $A$, see Algebra, Lemma 10.38.5. Hence multiplication by $h$ is surjective on the kernel $K$ of the middle vertical arrow. By Nakayama's lemma, see Algebra, Lemma 10.19.1 we conclude that $K=0$. Hence $B$ is flat over $A$, see Algebra, Lemma 10.38.5.

The following lemma relies on the algebraic version of openness of the flat locus. The scheme theoretic version can be found in More on Morphisms, Section 36.12.

062V Lemma 30.15.6. Let $f: X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor. If $f$ is locally of finite presentation, then there exists an open subscheme $U \subset X$ such that $D \subset U$ and such that $\left.f\right|_{U}: U \rightarrow S$ is flat.
Proof. Pick $x \in D$. It suffices to find an open neighbourhood $U \subset X$ of $x$ such that $\left.f\right|_{U}$ is flat. Hence the lemma reduces to the case that $X=\operatorname{Spec}(B)$ and $S=\operatorname{Spec}(A)$ are affine and that $D$ is given by a nonzerodivisor $h \in B$. By assumption $B$ is a finitely presented $A$-algebra and $B / h B$ is a flat $A$-algebra. We are going to use absolute Noetherian approximation.
Write $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. Assume $h$ is the image of $h^{\prime} \in A\left[x_{1}, \ldots, x_{n}\right]$. Choose a finite type $\mathbf{Z}$-subalgebra $A_{0} \subset A$ such that all the coefficients of the polynomials $h^{\prime}, g_{1}, \ldots, g_{m}$ are in $A_{0}$. Then we can set $B_{0}=A_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$ and $h_{0}$ the image of $h^{\prime}$ in $B_{0}$. Then $B=B_{0} \otimes_{A_{0}} A$ and $B / h B=B_{0} / h_{0} B_{0} \otimes_{A_{0}} A$. By Algebra, Lemma 10.160.1 we may, after enlarging $A_{0}$, assume that $B_{0} / h_{0} B_{0}$ is
flat over $A_{0}$. Let $K_{0}=\operatorname{Ker}\left(h_{0}: B_{0} \rightarrow B_{0}\right)$. As $B_{0}$ is of finite type over $\mathbf{Z}$ we see that $K_{0}$ is a finitely generated ideal. Let $A_{1} \subset A$ be a finite type Z-subalgebra containing $A_{0}$ and denote $B_{1}, h_{1}, K_{1}$ the corresponding objects over $A_{1}$. By More on Algebra, Lemma 15.23 .15 the map $K_{0} \otimes_{A_{0}} A_{1} \rightarrow K_{1}$ is surjective. On the other hand, the kernel of $h: B \rightarrow B$ is zero by assumption. Hence every element of $K_{0}$ maps to zero in $K_{1}$ for sufficiently large subrings $A_{1} \subset A$. Since $K_{0}$ is finitely generated, we conclude that $K_{1}=0$ for a suitable choice of $A_{1}$.

Set $f_{1}: X_{1} \rightarrow S_{1}$ equal to Spec of the ring map $A_{1} \rightarrow B_{1}$. Set $D_{1}=\operatorname{Spec}\left(B_{1} / h_{1} B_{1}\right)$. Since $B=B_{1} \otimes_{A_{1}} A$, i.e., $X=X_{1} \times_{S_{1}} S$, it now suffices to prove the lemma for $X_{1} \rightarrow S_{1}$ and the relative effective Cartier divisor $D_{1}$, see Morphisms, Lemma 28.25 .6 . Hence we have reduced to the case where $A$ is a Noetherian ring. In this case we know that the ring map $A \rightarrow B$ is flat at every prime $\mathfrak{q}$ of $V(h)$ by Lemma 30.15.5. Combined with the fact that the flat locus is open in this case, see Algebra, Theorem 10.128 .4 we win.

There is also the following lemma (whose idea is apparently due to Michael Artin, see Nob77]) which needs no finiteness assumptions at all.

062W Lemma 30.15.7. Let $f: X \rightarrow S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor on $X / S$. If $f$ is flat at all points of $X \backslash D$, then $f$ is flat.

Proof. This translates into the following algebra fact: Let $A \rightarrow B$ be a ring map and $h \in B$. Assume $h$ is a nonzerodivisor, that $B / h B$ is flat over $A$, and that the localization $B_{h}$ is flat over $A$. Then $B$ is flat over $A$. The reason is that we have a short exact sequence

$$
0 \rightarrow B \rightarrow B_{h} \rightarrow \operatorname{colim}_{n}\left(1 / h^{n}\right) B / B \rightarrow 0
$$

and that the second and third terms are flat over $A$, which implies that $B$ is flat over $A$ (see Algebra, Lemma 10.38.13). Note that a filtered colimit of flat modules is flat (see Algebra, Lemma 10.38.3) and that by induction on $n$ each $\left(1 / h^{n}\right) B / B \cong B / h^{n} B$ is flat over $A$ since it fits into the short exact sequence

$$
0 \rightarrow B / h^{n-1} B \xrightarrow{h} B / h^{n} B \rightarrow B / h B \rightarrow 0
$$

Some details omitted.
062X Example 30.15.8. Here is an example of a relative effective Cartier divisor $D$ where the ambient scheme is not flat in a neighbourhood of $D$. Namely, let $A=k[t]$ and

$$
B=k\left[t, x, y, x^{-1} y, x^{-2} y, \ldots\right] /\left(t y, t x^{-1} y, t x^{-2} y, \ldots\right)
$$

Then $B$ is not flat over $A$ but $B / x B \cong A$ is flat over $A$. Moreover $x$ is a nonzerodivisor and hence defines a relative effective Cartier divisor in $\operatorname{Spec}(B)$ over $\operatorname{Spec}(A)$.

If the ambient scheme is flat and locally of finite presentation over the base, then we can characterize a relative effective Cartier divisor in terms of its fibres. See also More on Morphisms, Lemma 36.18.1 for a slightly different take on this lemma.

062Y Lemma 30.15.9. Let $\varphi: X \rightarrow S$ be a flat morphism which is locally of finite presentation. Let $Z \subset X$ be a closed subscheme. Let $x \in Z$ with image $s \in S$.
(1) If $Z_{s} \subset X_{s}$ is a Cartier divisor in a neighbourhood of $x$, then there exists an open $U \subset X$ and a relative effective Cartier divisor $D \subset U$ such that $Z \cap U \subset D$ and $Z_{s} \cap U=D_{s}$.
(2) If $Z_{s} \subset X_{s}$ is a Cartier divisor in a neighbourhood of $x$, the morphism $Z \rightarrow X$ is of finite presentation, and $Z \rightarrow S$ is flat at $x$, then we can choose $U$ and $D$ such that $Z \cap U=D$.
(3) If $Z_{s} \subset X_{s}$ is a Cartier divisor in a neighbourhood of $x$ and $Z$ is a locally principal closed subscheme of $X$ in a neighbourhood of $x$, then we can choose $U$ and $D$ such that $Z \cap U=D$.
In particular, if $Z \rightarrow S$ is locally of finite presentation and flat and all fibres $Z_{s} \subset X_{s}$ are effective Cartier divisors, then $Z$ is a relative effective Cartier divisor. Similarly, if $Z$ is a locally principal closed subscheme of $X$ such that all fibres $Z_{s} \subset X_{s}$ are effective Cartier divisors, then $Z$ is a relative effective Cartier divisor.

Proof. Choose affine open neighbourhoods $\operatorname{Spec}(A)$ of $s$ and $\operatorname{Spec}(B)$ of $x$ such that $\varphi(\operatorname{Spec}(B)) \subset \operatorname{Spec}(A)$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to $s$. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to $x$. Let $I \subset B$ be the ideal corresponding to $Z$. By the initial assumption of the lemma we know that $A \rightarrow B$ is flat and of finite presentation. The assumption in (1) means that, after shrinking $\operatorname{Spec}(B)$, we may assume $I\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$ is generated by a single element which is a nonzerodivisor in $B \otimes_{A} \kappa(\mathfrak{p})$. Say $f \in I$ maps to this generator. We claim that after inverting an element $g \in B, g \notin \mathfrak{q}$ the closed subscheme $D=V(f) \subset \operatorname{Spec}\left(B_{g}\right)$ is a relative effective Cartier divisor.

By Algebra, Lemma 10.160 .1 we can find a flat finite type ring map $A_{0} \rightarrow B_{0}$ of Noetherian rings, an element $f_{0} \in B_{0}$, a ring map $A_{0} \rightarrow A$ and an isomorphism $A \otimes_{A_{0}} B_{0} \cong B$. If $\mathfrak{p}_{0}=A_{0} \cap \mathfrak{p}$ then we see that

$$
B \otimes_{A} \kappa(\mathfrak{p})=\left(B_{0} \otimes_{A_{0}} \kappa\left(\mathfrak{p}_{0}\right)\right) \otimes_{\left.\kappa\left(\mathfrak{p}_{0}\right)\right)} \kappa(\mathfrak{p})
$$

hence $f_{0}$ is a nonzerodivisor in $B_{0} \otimes_{A_{0}} \kappa\left(\mathfrak{p}_{0}\right)$. By Algebra, Lemma 10.98 .2 we see that $f_{0}$ is a nonzerodivisor in $\left(B_{0}\right)_{\mathfrak{q}_{0}}$ where $\mathfrak{q}_{0}=B_{0} \cap \mathfrak{q}$ and that $\left(B_{0} / f_{0} B_{0}\right)_{\mathfrak{q}_{0}}$ is flat over $A_{0}$. Hence by Algebra, Lemma 10.67 .6 and Algebra, Theorem 10.128.4 there exists a $g_{0} \in B_{0}, g_{0} \notin \mathfrak{q}_{0}$ such that $f_{0}$ is a nonzerodivisor in $\left(B_{0}\right)_{g_{0}}$ and such that $\left(B_{0} / f_{0} B_{0}\right)_{g_{0}}$ is flat over $A_{0}$. Hence we see that $D_{0}=V\left(f_{0}\right) \subset \operatorname{Spec}\left(\left(B_{0}\right)_{g_{0}}\right)$ is a relative effective Cartier divisor. Since we know that this property is preserved under base change, see Lemma 30.15 .1 we obtain the claim mentioned above with $g$ equal to the image of $g_{0}$ in $B$.

At this point we have proved (1). To see (2) consider the closed immersion $Z \rightarrow D$. The surjective ring map $u: \mathcal{O}_{D, x} \rightarrow \mathcal{O}_{Z, x}$ is a map of flat local $\mathcal{O}_{S, s^{-}}$-algebras which are essentially of finite presentation, and which becomes an isomorphisms after dividing by $\mathfrak{m}_{s}$. Hence it is an isomorphism, see Algebra, Lemma 10.127.4 It follows that $Z \rightarrow D$ is an isomorphism in a neighbourhood of $x$, see Algebra, Lemma 10.125 .6 . To see (3), after possibly shrinking $U$ we may assume that the ideal of $D$ is generated by a single nonzerodivisor $f$ and the ideal of $Z$ is generated by an element $g$. Then $f=g h$. But $\left.g\right|_{U_{s}}$ and $\left.f\right|_{U_{s}}$ cut out the same effective Cartier divisor in a neighbourhood of $x$. Hence $\left.h\right|_{X_{s}}$ is a unit in $\mathcal{O}_{X_{s}, x}$, hence $h$ is a unit in $\mathcal{O}_{X, x}$ hence $h$ is a unit in an open neighbourhood of $x$. I.e., $Z \cap U=D$ after shrinking $U$.

The final statements of the lemma follow immediately from parts (2) and (3), combined with the fact that $Z \rightarrow S$ is locally of finite presentation if and only if $Z \rightarrow X$ is of finite presentation, see Morphisms, Lemmas 28.21.3 and 28.21.11.

### 30.16. The normal cone of an immersion

062 Z Let $i: Z \rightarrow X$ be a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the corresponding quasicoherent sheaf of ideals. Consider the quasi-coherent sheaf of graded $\mathcal{O}_{X}$-algebras $\bigoplus_{n>0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$. Since the sheaves $\mathcal{I}^{n} / \mathcal{I}^{n+1}$ are each annihilated by $\mathcal{I}$ this graded alge $\bar{b} r a$ corresponds to a quasi-coherent sheaf of graded $\mathcal{O}_{Z}$-algebras by Morphisms, Lemma 28.4.1. This quasi-coherent graded $\mathcal{O}_{Z}$-algebra is called the conormal algebra of $Z$ in $X$ and is often simply denoted $\bigoplus_{n \geq 0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$ by the abuse of notation mentioned in Morphisms, Section 28.4 .

Let $f: Z \rightarrow X$ be an immersion. We define the conormal algebra of $f$ as the conormal sheaf of the closed immersion $i: Z \rightarrow X \backslash \partial Z$, where $\partial Z=\bar{Z} \backslash Z$. It is often denoted $\bigoplus_{n \geq 0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i: Z \rightarrow X \backslash \partial Z$.

0630 Definition 30.16.1. Let $f: Z \rightarrow X$ be an immersion. The conormal algebra $\mathcal{C}_{Z / X, *}$ of $Z$ in $X$ or the conormal algebra of $f$ is the quasi-coherent sheaf of graded $\mathcal{O}_{Z}$-algebras $\bigoplus_{n \geq 0} \mathcal{I}^{n} / \mathcal{I}^{n+1}$ described above.
Thus $\mathcal{C}_{Z / X, 1}=\mathcal{C}_{Z / X}$ is the conormal sheaf of the immersion. Also $\mathcal{C}_{Z / X, 0}=\mathcal{O}_{Z}$ and $\mathcal{C}_{Z / X, n}$ is a quasi-coherent $\mathcal{O}_{Z \text {-module characterized by the property }}$
0631

$$
\begin{equation*}
i_{*} \mathcal{C}_{Z / X, n}=\mathcal{I}^{n} / \mathcal{I}^{n+1} \tag{30.16.1.1}
\end{equation*}
$$

where $i: Z \rightarrow X \backslash \partial Z$ and $\mathcal{I}$ is the ideal sheaf of $i$ as above. Finally, note that there is a canonical surjective map

0632

$$
\begin{equation*}
\operatorname{Sym}^{*}\left(\mathcal{C}_{Z / X}\right) \longrightarrow \mathcal{C}_{Z / X, *} \tag{30.16.1.2}
\end{equation*}
$$

of quasi-coherent graded $\mathcal{O}_{Z}$-algebras which is an isomorphism in degrees 0 and 1 .
0633 Lemma 30.16.2. Let $i: Z \rightarrow X$ be an immersion. The conormal algebra of $i$ has the following properties:
(1) Let $U \subset X$ be any open such that $i(Z)$ is a closed subset of $U$. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the sheaf of ideals corresponding to the closed subscheme $i(Z) \subset U$. Then

$$
\mathcal{C}_{Z / X, *}=i^{*}\left(\bigoplus_{n \geq 0} \mathcal{I}^{n}\right)=i^{-1}\left(\bigoplus_{n \geq 0} \mathcal{I}^{n} / \mathcal{I}^{n+1}\right)
$$

(2) For any affine open $\operatorname{Spec}(R)=U \subset X$ such that $Z \cap U=\operatorname{Spec}(R / I)$ there is a canonical isomorphism $\Gamma\left(Z \cap U, \mathcal{C}_{Z / X, *}\right)=\bigoplus_{n \geq 0} I^{n} / I^{n+1}$.

Proof. Mostly clear from the definitions. Note that given a ring $R$ and an ideal $I$ of $R$ we have $I^{n} / I^{n+1}=I^{n} \otimes_{R} R / I$. Details omitted.

0634 Lemma 30.16.3. Let

be a commutative diagram in the category of schemes. Assume $i, i^{\prime}$ immersions. There is a canonical map of graded $\mathcal{O}_{Z}$-algebras

$$
f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}, *} \longrightarrow \mathcal{C}_{Z / X, *}
$$

characterized by the following property: For every pair of affine opens $(\operatorname{Spec}(R)=$ $\left.U \subset X, \operatorname{Spec}\left(R^{\prime}\right)=U^{\prime} \subset X^{\prime}\right)$ with $f(U) \subset U^{\prime}$ such that $Z \cap U=\operatorname{Spec}(R / I)$ and $Z^{\prime} \cap U^{\prime}=\operatorname{Spec}\left(R^{\prime} / I^{\prime}\right)$ the induced map

$$
\Gamma\left(Z^{\prime} \cap U^{\prime}, \mathcal{C}_{Z^{\prime} / X^{\prime}, *}\right)=\bigoplus\left(I^{\prime}\right)^{n} /\left(I^{\prime}\right)^{n+1} \longrightarrow \bigoplus_{n \geq 0} I^{n} / I^{n+1}=\Gamma\left(Z \cap U, \mathcal{C}_{Z / X, *}\right)
$$

is the one induced by the ring map $f^{\sharp}: R^{\prime} \rightarrow R$ which has the property $f^{\sharp}\left(I^{\prime}\right) \subset I$.
Proof. Let $\partial Z^{\prime}=\overline{Z^{\prime}} \backslash Z^{\prime}$ and $\partial Z=\bar{Z} \backslash Z$. These are closed subsets of $X^{\prime}$ and of $X$. Replacing $X^{\prime}$ by $X^{\prime} \backslash \partial Z^{\prime}$ and $X$ by $X \backslash\left(g^{-1}\left(\partial Z^{\prime}\right) \cup \partial Z\right)$ we see that we may assume that $i$ and $i^{\prime}$ are closed immersions.

The fact that $g \circ i$ factors through $i^{\prime}$ implies that $g^{*} \mathcal{I}^{\prime}$ maps into $\mathcal{I}$ under the canonical map $g^{*} \mathcal{I}^{\prime} \rightarrow \mathcal{O}_{X}$, see Schemes, Lemmas 25.4.6 and 25.4.7. Hence we get an induced map of quasi-coherent sheaves $g^{*}\left(\left(\mathcal{I}^{\prime}\right)^{n} /\left(\mathcal{I}^{\prime}\right)^{n+1}\right) \rightarrow \mathcal{I}^{n} / \mathcal{I}^{n+1}$. Pulling back by $i$ gives $i^{*} g^{*}\left(\left(\mathcal{I}^{\prime}\right)^{n} /\left(\mathcal{I}^{\prime}\right)^{n+1}\right) \rightarrow i^{*}\left(\mathcal{I}^{n} / \mathcal{I}^{n+1}\right)$. Note that $i^{*}\left(\mathcal{I}^{n} / \mathcal{I}^{n+1}\right)=\mathcal{C}_{Z / X, n}$. On the other hand, $i^{*} g^{*}\left(\left(\mathcal{I}^{\prime}\right)^{n} /\left(\mathcal{I}^{\prime}\right)^{n+1}\right)=f^{*}\left(i^{\prime}\right)^{*}\left(\left(\mathcal{I}^{\prime}\right)^{n} /\left(\mathcal{I}^{\prime}\right)^{n+1}\right)=f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}, n}$. This gives the desired map.
Checking that the map is locally described as the given map $\left(I^{\prime}\right)^{n} /\left(I^{\prime}\right)^{n+1} \rightarrow$ $I^{n} / I^{n+1}$ is a matter of unwinding the definitions and is omitted. Another observation is that given any $x \in i(Z)$ there do exist affine open neighbourhoods $U$, $U^{\prime}$ with $f(U) \subset U^{\prime}$ and $Z \cap U$ as well as $U^{\prime} \cap Z^{\prime}$ closed such that $x \in U$. Proof omitted. Hence the requirement of the lemma indeed characterizes the map (and could have been used to define it).

Lemma 30.16.4. Let

be a fibre product diagram in the category of schemes with $i$, $i^{\prime}$ immersions. Then the canonical map $f^{*} \mathcal{C}_{Z^{\prime} / X^{\prime}, *} \rightarrow \mathcal{C}_{Z / X, *}$ of Lemma 30.16 .3 is surjective. If $g$ is flat, then it is an isomorphism.

Proof. Let $R^{\prime} \rightarrow R$ be a ring map, and $I^{\prime} \subset R^{\prime}$ an ideal. Set $I=I^{\prime} R$. Then $\left(I^{\prime}\right)^{n} /\left(I^{\prime}\right)^{n+1} \otimes_{R^{\prime}} R \rightarrow I^{n} / I^{n+1}$ is surjective. If $R^{\prime} \rightarrow R$ is flat, then $I^{n}=\left(I^{\prime}\right)^{n} \otimes_{R^{\prime}} R$ and we see the map is an isomorphism.

0636 Definition 30.16.5. Let $i: Z \rightarrow X$ be an immersion of schemes. The normal cone $C_{Z} X$ of $Z$ in $X$ is

$$
C_{Z} X=\underline{\operatorname{Spec}_{Z}}\left(\mathcal{C}_{Z / X, *}\right)
$$

see Constructions, Definitions 26.7.1 and 26.7.2. The normal bundle of $Z$ in $X$ is the vector bundle

$$
N_{Z} X=\underline{\operatorname{Spec}}_{Z}\left(\operatorname{Sym}\left(\mathcal{C}_{Z / X}\right)\right)
$$

see Constructions, Definitions 26.6.1 and 26.6.2.

Thus $C_{Z} X \rightarrow Z$ is a cone over $Z$ and $N_{Z} X \rightarrow Z$ is a vector bundle over $Z$ (recall that in our terminology this does not imply that the conormal sheaf is a finite locally free sheaf). Moreover, the canonical surjection 30.16.1.2 of graded algebras defines a canonical closed immersion

$$
\begin{equation*}
C_{Z} X \longrightarrow N_{Z} X \tag{30.16.5.1}
\end{equation*}
$$

of cones over $Z$.

### 30.17. Regular ideal sheaves

067 M In this section we generalize the notion of an effective Cartier divisor to higher codimension. Recall that a sequence of elements $f_{1}, \ldots, f_{r}$ of a ring $R$ is a regular sequence if for each $i=1, \ldots, r$ the element $f_{i}$ is a nonzerodivisor on $R /\left(f_{1}, \ldots, f_{i-1}\right)$ and $R /\left(f_{1}, \ldots, f_{r}\right) \neq 0$, see Algebra, Definition 10.67.1. There are three closely related weaker conditions that we can impose. The first is to assume that $f_{1}, \ldots, f_{r}$ is a Koszul-regular sequence, i.e., that $H_{i}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)\right)=0$ for $i>0$, see More on Algebra, Definition 15.23.1. The sequence is called an $H_{1}$-regular sequence if $H_{1}\left(K_{\bullet}\left(f_{1}, \ldots, f_{r}\right)\right)=0$. Another condition we can impose is that with $J=\left(f_{1}, \ldots, f_{r}\right)$, the map

$$
R / J\left[T_{1}, \ldots, T_{r}\right] \longrightarrow \bigoplus_{n \geq 0} J^{n} / J^{n+1}
$$

which maps $T_{i}$ to $f_{i} \bmod J^{2}$ is an isomorphism. In this case we say that $f_{1}, \ldots, f_{r}$ is a quasi-regular sequence, see Algebra, Definition 10.68.1. Given an $R$-module $M$ there is also a notion of $M$-regular and $M$-quasi-regular sequence.
We can generalize this to the case of ringed spaces as follows. Let $X$ be a ringed space and let $f_{1}, \ldots, f_{r} \in \Gamma\left(X, \mathcal{O}_{X}\right)$. We say that $f_{1}, \ldots, f_{r}$ is a regular sequence if for each $i=1, \ldots, r$ the map

$$
\begin{equation*}
f_{i}: \mathcal{O}_{X} /\left(f_{1}, \ldots, f_{i-1}\right) \longrightarrow \mathcal{O}_{X} /\left(f_{1}, \ldots, f_{i-1}\right) \tag{30.17.0.2}
\end{equation*}
$$

is an injective map of sheaves. We say that $f_{1}, \ldots, f_{r}$ is a Koszul-regular sequence if the Koszul complex

$$
K_{\bullet}\left(\mathcal{O}_{X}, f_{\bullet}\right),
$$

see Modules, Definition 17.20.2, is acyclic in degrees $>0$. We say that $f_{1}, \ldots, f_{r}$ is a $H_{1}$-regular sequence if the Koszul complex $K_{\bullet}\left(\mathcal{O}_{X}, f_{\bullet}\right)$ is exact in degree 1 . Finally, we say that $f_{1}, \ldots, f_{r}$ is a quasi-regular sequence if the map

$$
\begin{equation*}
\mathcal{O}_{X} / \mathcal{J}\left[T_{1}, \ldots, T_{r}\right] \longrightarrow \bigoplus_{d \geq 0} \mathcal{J}^{d} / \mathcal{J}^{d+1} \tag{30.17.0.4}
\end{equation*}
$$

is an isomorphism of sheaves where $\mathcal{J} \subset \mathcal{O}_{X}$ is the sheaf of ideals generated by $f_{1}, \ldots, f_{r}$. (There is also a notion of $\mathcal{F}$-regular and $\mathcal{F}$-quasi-regular sequence for a given $\mathcal{O}_{X}$-module $\mathcal{F}$ which we will introduce here if we ever need it.)

063C Lemma 30.17.1. Let $X$ be a ringed space. Let $f_{1}, \ldots, f_{r} \in \Gamma\left(X, \mathcal{O}_{X}\right)$. We have the following implications $f_{1}, \ldots, f_{r}$ is a regular sequence $\Rightarrow f_{1}, \ldots, f_{r}$ is a Koszul-regular sequence $\Rightarrow f_{1}, \ldots, f_{r}$ is an $H_{1}$-regular sequence $\Rightarrow f_{1}, \ldots, f_{r}$ is a quasi-regular sequence.

Proof. Since we may check exactness at stalks, a sequence $f_{1}, \ldots, f_{r}$ is a regular sequence if and only if the maps

$$
f_{i}: \mathcal{O}_{X, x} /\left(f_{1}, \ldots, f_{i-1}\right) \longrightarrow \mathcal{O}_{X, x} /\left(f_{1}, \ldots, f_{i-1}\right)
$$

are injective for all $x \in X$. In other words, the image of the sequence $f_{1}, \ldots, f_{r}$ in the ring $\mathcal{O}_{X, x}$ is a regular sequence for all $x \in X$. The other types of regularity can be checked stalkwise as well (details omitted). Hence the implications follow from More on Algebra, Lemmas 15.23 .2 and 15.23 .5 .
063D Definition 30.17.2. Let $X$ be a ringed space. Let $\mathcal{J} \subset \mathcal{O}_{X}$ be a sheaf of ideals.
(1) We say $\mathcal{J}$ is regular if for every $x \in \operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{J}\right)$ there exists an open neighbourhood $x \in U \subset X$ and a regular sequence $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ such that $\left.\mathcal{J}\right|_{U}$ is generated by $f_{1}, \ldots, f_{r}$.
(2) We say $\mathcal{J}$ is Koszul-regular if for every $x \in \operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{J}\right)$ there exists an open neighbourhood $x \in U \subset X$ and a Koszul-regular sequence $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ such that $\left.\mathcal{J}\right|_{U}$ is generated by $f_{1}, \ldots, f_{r}$.
(3) We say $\mathcal{J}$ is $H_{1}$-regular if for every $x \in \operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{J}\right)$ there exists an open neighbourhood $x \in U \subset X$ and a $H_{1}$-regular sequence $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ such that $\left.\mathcal{J}\right|_{U}$ is generated by $f_{1}, \ldots, f_{r}$.
(4) We say $\mathcal{J}$ is quasi-regular if for every $x \in \operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{J}\right)$ there exists an open neighbourhood $x \in U \subset X$ and a quasi-regular sequence $f_{1}, \ldots, f_{r} \in$ $\mathcal{O}_{X}(U)$ such that $\left.\mathcal{J}\right|_{U}$ is generated by $f_{1}, \ldots, f_{r}$.
Many properties of this notion immediately follow from the corresponding notions for regular and quasi-regular sequences in rings.
063E Lemma 30.17.3. Let $X$ be a ringed space. Let $\mathcal{J}$ be a sheaf of ideals. We have the following implications: $\mathcal{J}$ is regular $\Rightarrow \mathcal{J}$ is Koszul-regular $\Rightarrow \mathcal{J}$ is $H_{1}$-regular $\Rightarrow \mathcal{J}$ is quasi-regular.
Proof. The lemma immediately reduces to Lemma 30.17.1.
063H Lemma 30.17.4. Let $X$ be a locally ringed space. Let $\mathcal{J} \subset \mathcal{O}_{X}$ be a sheaf of ideals. Then $\mathcal{J}$ is quasi-regular if and only if the following conditions are satisfied:
(1) $\mathcal{J}$ is an $\mathcal{O}_{X}$-module of finite type,
(2) $\mathcal{J} / \mathcal{J}^{2}$ is a finite locally free $\mathcal{O}_{X} / \mathcal{J}$-module, and
(3) the canonical maps

$$
\operatorname{Sym}_{\mathcal{O}_{X} / \mathcal{J}}^{n}\left(\mathcal{J} / \mathcal{J}^{2}\right) \longrightarrow \mathcal{J}^{n} / \mathcal{J}^{n+1}
$$

are isomorphisms for all $n \geq 0$.
Proof. It is clear that if $U \subset X$ is an open such that $\left.\mathcal{J}\right|_{U}$ is generated by a quasi-regular sequence $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ then $\left.\mathcal{J}\right|_{U}$ is of finite type, $\left.\mathcal{J}\right|_{U} /\left.\mathcal{J}^{2}\right|_{U}$ is free with basis $f_{1}, \ldots, f_{r}$, and the maps in (3) are isomorphisms because they are coordinate free formulation of the degree $n$ part of 30.17.0.4. Hence it is clear that being quasi-regular implies conditions (1), (2), and (3).
Conversely, suppose that (1), (2), and (3) hold. Pick a point $x \in \operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{J}\right)$. Then there exists a neighbourhood $U \subset X$ of $x$ such that $\left.\mathcal{J}\right|_{U} /\left.\mathcal{J}^{2}\right|_{U}$ is free of rank $r$ over $\mathcal{O}_{U} /\left.\mathcal{J}\right|_{U}$. After possibly shrinking $U$ we may assume there exist $f_{1}, \ldots, f_{r} \in$ $\mathcal{J}(U)$ which map to a basis of $\left.\mathcal{J}\right|_{U} /\left.\mathcal{J}^{2}\right|_{U}$ as an $\mathcal{O}_{U} /\left.\mathcal{J}\right|_{U}$-module. In particular we see that the images of $f_{1}, \ldots, f_{r}$ in $\mathcal{J}_{x} / \mathcal{J}_{x}^{2}$ generate. Hence by Nakayama's lemma (Algebra, Lemma 10.19.1 we see that $f_{1}, \ldots, f_{r}$ generate the stalk $\mathcal{J}_{x}$. Hence, since $\mathcal{J}$ is of finite type, by Modules, Lemma 17.9 .4 after shrinking $U$ we may assume that $f_{1}, \ldots, f_{r}$ generate $\mathcal{J}$. Finally, from (3) and the isomorphism $\left.\mathcal{J}\right|_{U} /\left.\mathcal{J}^{2}\right|_{U}=\bigoplus \mathcal{O}_{U} /\left.\mathcal{J}\right|_{U} f_{i}$ it is clear that $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ is a quasi-regular sequence.

067 N Lemma 30.17.5. Let $\left(X, \mathcal{O}_{X}\right)$ be a locally ringed space. Let $\mathcal{J} \subset \mathcal{O}_{X}$ be a sheaf of ideals. Let $x \in X$ and $f_{1}, \ldots, f_{r} \in \mathcal{J}_{x}$ whose images give a basis for the $\kappa(x)$-vector space $\mathcal{J}_{x} / \mathfrak{m}_{x} \mathcal{J}_{x}$.
(1) If $\mathcal{J}$ is quasi-regular, then there exists an open neighbourhood such that $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ form a quasi-regular sequence generating $\left.\mathcal{J}\right|_{U}$.
(2) If $\mathcal{J}$ is $H_{1}$-regular, then there exists an open neighbourhood such that $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ form an $H_{1}$-regular sequence generating $\left.\mathcal{J}\right|_{U}$.
(3) If $\mathcal{J}$ is Koszul-regular, then there exists an open neighbourhood such that $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$ form an Koszul-regular sequence generating $\left.\mathcal{J}\right|_{U}$.
Proof. First assume that $\mathcal{J}$ is quasi-regular. We may choose an open neighbourhood $U \subset X$ of $x$ and a quasi-regular sequence $g_{1}, \ldots, g_{s} \in \mathcal{O}_{X}(U)$ which generates $\left.\mathcal{J}\right|_{U}$. Note that this implies that $\mathcal{J} / \mathcal{J}^{2}$ is free of rank $s$ over $\mathcal{O}_{U} /\left.\mathcal{J}\right|_{U}$ (see Lemma 30.17 .4 and its proof) and hence $r=s$. We may shrink $U$ and assume $f_{1}, \ldots, f_{r} \in \mathcal{J}(U)$. Thus we may write

$$
f_{i}=\sum a_{i j} g_{j}
$$

for some $a_{i j} \in \mathcal{O}_{X}(U)$. By assumption the matrix $A=\left(a_{i j}\right)$ maps to an invertible matrix over $\kappa(x)$. Hence, after shrinking $U$ once more, we may assume that $\left(a_{i j}\right)$ is invertible. Thus we see that $f_{1}, \ldots, f_{r}$ give a basis for $\left.\left(\mathcal{J} / \mathcal{J}^{2}\right)\right|_{U}$ which proves that $f_{1}, \ldots, f_{r}$ is a quasi-regular sequence over $U$.

Note that in order to prove (2) and (3) we may, because the assumptions of (2) and (3) are stronger than the assumption in (1), already assume that $f_{1}, \ldots, f_{r} \in \mathcal{J}(U)$ and $f_{i}=\sum a_{i j} g_{j}$ with $\left(a_{i j}\right)$ invertible as above, where now $g_{1}, \ldots, g_{r}$ is a $H_{1}$-regular or Koszul-regular sequence. Since the Koszul complex on $f_{1}, \ldots, f_{r}$ is isomorphic to the Koszul complex on $g_{1}, \ldots, g_{r}$ via the matrix $\left(a_{i j}\right)$ (see More on Algebra, Lemma 15.22.4 we conclude that $f_{1}, \ldots, f_{r}$ is $H_{1}$-regular or Koszul-regular as desired.

063F Lemma 30.17.6. Any regular, Koszul-regular, $H_{1}$-regular, or quasi-regular sheaf of ideals on a scheme is a finite type quasi-coherent sheaf of ideals.

Proof. This follows as such a sheaf of ideals is locally generated by finitely many sections. And any sheaf of ideals locally generated by sections on a scheme is quasi-coherent, see Schemes, Lemma 25.10.1.

063G Lemma 30.17.7. Let $X$ be a scheme. Let $\mathcal{J}$ be a sheaf of ideals. Then $\mathcal{J}$ is regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) if and only if for every $x \in$ $\operatorname{Supp}\left(\mathcal{O}_{X} / \mathcal{J}\right)$ there exists an affine open neighbourhood $x \in U \subset X, U=\operatorname{Spec}(A)$ such that $\left.\mathcal{J}\right|_{U}=\widetilde{I}$ and such that $I$ is generated by a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) sequence $f_{1}, \ldots, f_{r} \in A$.

Proof. By assumption we can find an open neighbourhood $U$ of $x$ over which $\mathcal{J}$ is generated by a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) sequence $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X}(U)$. After shrinking $U$ we may assume that $U$ is affine, say $U=$ $\operatorname{Spec}(A)$. Since $\mathcal{J}$ is quasi-coherent by Lemma 30.17 .6 we see that $\left.\mathcal{J}\right|_{U}=\widetilde{I}$ for some ideal $I \subset A$. Now we can use the fact that

$$
\sim: \operatorname{Mod}_{A} \longrightarrow Q \operatorname{Coh}\left(\mathcal{O}_{U}\right)
$$

is an equivalence of categories which preserves exactness. For example the fact that the functions $f_{i}$ generate $\mathcal{J}$ means that the $f_{i}$, seen as elements of $A$ generate $I$.

The fact that $\sqrt{30.17 .0 .2}$ ) is injective (resp. 30.17 .0 .3 ) is exact, 30.17 .0 .3 is exact in degree 1, 30.17.0.4 is an isomorphism) implies the corresponding property of the $\operatorname{map} A /\left(f_{1}, \ldots, f_{i-1}\right) \rightarrow A /\left(f_{1}, \ldots, f_{i-1}\right)$ (resp. the complex $K_{\bullet}\left(A, f_{1}, \ldots, f_{r}\right)$, the map $A / I\left[T_{1}, \ldots, T_{r}\right] \rightarrow \bigoplus I^{n} / I^{n+1}$ ). Thus $f_{1}, \ldots, f_{r} \in A$ is a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) sequence of the ring $A$.

063I Lemma 30.17.8. Let $X$ be a locally Noetherian scheme. Let $\mathcal{J} \subset \mathcal{O}_{X}$ be a quasicoherent sheaf of ideals. Let $x$ be a point of the support of $\mathcal{O}_{X} / \mathcal{J}$. The following are equivalent
(1) $\mathcal{J}_{x}$ is generated by a regular sequence in $\mathcal{O}_{X, x}$,
(2) $\mathcal{J}_{x}$ is generated by a Koszul-regular sequence in $\mathcal{O}_{X, x}$,
(3) $\mathcal{J}_{x}$ is generated by an $H_{1}$-regular sequence in $\mathcal{O}_{X, x}$,
(4) $\mathcal{J}_{x}$ is generated by a quasi-regular sequence in $\mathcal{O}_{X, x}$,
(5) there exists an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$ such that $\left.\mathcal{J}\right|_{U}=\widetilde{I}$ and $I$ is generated by a regular sequence in $A$, and
(6) there exists an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$ such that $\left.\mathcal{J}\right|_{U}=\widetilde{I}$ and $I$ is generated by a Koszul-regular sequence in $A$, and
(7) there exists an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$ such that $\left.\mathcal{J}\right|_{U}=\widetilde{I}$ and $I$ is generated by an $H_{1}$-regular sequence in $A$, and
(8) there exists an affine neighbourhood $U=\operatorname{Spec}(A)$ of $x$ such that $\left.\mathcal{J}\right|_{U}=\widetilde{I}$ and $I$ is generated by a quasi-regular sequence in $A$,
(9) there exists a neighbourhood $U$ of $x$ such that $\left.\mathcal{J}\right|_{U}$ is regular, and
(10) there exists a neighbourhood $U$ of $x$ such that $\left.\mathcal{J}\right|_{U}$ is Koszul-regular, and
(11) there exists a neighbourhood $U$ of $x$ such that $\left.\mathcal{J}\right|_{U}$ is $H_{1}$-regular, and
(12) there exists a neighbourhood $U$ of $x$ such that $\left.\mathcal{J}\right|_{U}$ is quasi-regular.

In particular, on a locally Noetherian scheme the notions of regular, Koszul-regular, $H_{1}$-regular, or quasi-regular ideal sheaf all agree.

Proof. It follows from Lemma 30.17 .7 that $(5) \Leftrightarrow(9),(6) \Leftrightarrow(10),(7) \Leftrightarrow(11)$, and $(8) \Leftrightarrow(12)$. It is clear that $(5) \Rightarrow(1),(6) \Rightarrow(2),(7) \Rightarrow(3)$, and $(8) \Rightarrow(4)$. We have $(1) \Rightarrow(5)$ by Algebra, Lemma 10.67.6. We have $(9) \Rightarrow(10) \Rightarrow(11) \Rightarrow$ (12) by Lemma 30.17.3. Finally, $(4) \Rightarrow(1)$ by Algebra, Lemma 10.68 .6 . Now all 12 statements are equivalent.

### 30.18. Regular immersions

0638 Let $i: Z \rightarrow X$ be an immersion of schemes. By definition this means there exists an open subscheme $U \subset X$ such that $Z$ is identified with a closed subscheme of $U$. Let $\mathcal{I} \subset \mathcal{O}_{U}$ be the corresponding quasi-coherent sheaf of ideals. Suppose $U^{\prime} \subset X$ is a second such open subscheme, and denote $\mathcal{I}^{\prime} \subset \mathcal{O}_{U^{\prime}}$ the corresponding quasicoherent sheaf of ideals. Then $\left.\mathcal{I}\right|_{U \cap U^{\prime}}=\left.\mathcal{I}^{\prime}\right|_{U \cap U^{\prime}}$. Moreover, the support of $\mathcal{O}_{U} / \mathcal{I}$ is $Z$ which is contained in $U \cap U^{\prime}$ and is also the support of $\mathcal{O}_{U^{\prime}} / \mathcal{I}^{\prime}$. Hence it follows from Definition 30.17 .2 that $\mathcal{I}$ is a regular ideal if and only if $\mathcal{I}^{\prime}$ is a regular ideal. Similarly for being Koszul-regular, $H_{1}$-regular, or quasi-regular.

063J Definition 30.18.1. Let $i: Z \rightarrow X$ be an immersion of schemes. Choose an open subscheme $U \subset X$ such that $i$ identifies $Z$ with a closed subscheme of $U$ and denote $\mathcal{I} \subset \mathcal{O}_{U}$ the corresponding quasi-coherent sheaf of ideals.
(1) We say $i$ is a regular immersion if $\mathcal{I}$ is regular.
(2) We say $i$ is a Koszul-regular immersion if $\mathcal{I}$ is Koszul-regular.
(3) We say $i$ is a $H_{1}$-regular immersion if $\mathcal{I}$ is $H_{1}$-regular.
(4) We say $i$ is a quasi-regular immersion if $\mathcal{I}$ is quasi-regular.

The discussion above shows that this is independent of the choice of $U$. The conditions are listed in decreasing order of strength, see Lemma 30.18.2. A Koszul-regular closed immersion is smooth locally a regular immersion, see Lemma 30.18.11. In the locally Noetherian case all four notions agree, see Lemma 30.17.8,

063K Lemma 30.18.2. Let $i: Z \rightarrow X$ be an immersion of schemes. We have the following implications: $i$ is regular $\Rightarrow i$ is Koszul-regular $\Rightarrow i$ is $H_{1}$-regular $\Rightarrow i$ is quasi-regular.
Proof. The lemma immediately reduces to Lemma 30.17.3.
063L Lemma 30.18.3. Let $i: Z \rightarrow X$ be an immersion of schemes. Assume $X$ is locally Noetherian. Then $i$ is regular $\Leftrightarrow i$ is Koszul-regular $\Leftrightarrow i$ is $H_{1}$-regular $\Leftrightarrow i$ is quasi-regular.

Proof. Follows immediately from Lemma 30.18 .2 and Lemma 30.17.8
067P Lemma 30.18.4. Let $i: Z \rightarrow X$ be a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) immersion. Let $X^{\prime} \rightarrow X$ be a flat morphism. Then the base change $i^{\prime}: Z \times_{X} X^{\prime} \rightarrow X^{\prime}$ is a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) immersion.

Proof. Via Lemma 30.17 .7 this translates into the algebraic statements in Algebra, Lemmas 10.67 .5 and 10.68 .3 and More on Algebra, Lemma 15.23.4.

063M Lemma 30.18.5. Let $i: Z \rightarrow X$ be an immersion of schemes. Then $i$ is $a$ quasi-regular immersion if and only if the following conditions are satisfied
(1) $i$ is locally of finite presentation,
(2) the conormal sheaf $\mathcal{C}_{Z / X}$ is finite locally free, and
(3) the map 30.16.1.2) is an isomorphism.

Proof. An open immersion is locally of finite presentation. Hence we may replace $X$ by an open subscheme $U \subset X$ such that $i$ identifies $Z$ with a closed subscheme of $U$, i.e., we may assume that $i$ is a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the corresponding quasi-coherent sheaf of ideals. Recall, see Morphisms, Lemma 28.21.7 that $\mathcal{I}$ is of finite type if and only if $i$ is locally of finite presentation. Hence the equivalence follows from Lemma 30.17.4 and unwinding the definitions.

063N Lemma 30.18.6. Let $Z \rightarrow Y \rightarrow X$ be immersions of schemes. Assume that $Z \rightarrow Y$ is $H_{1}$-regular. Then the canonical sequence of Morphisms, Lemma 28.32.5

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

is exact and locally split.
Proof. Since $\mathcal{C}_{Z / Y}$ is finite locally free (see Lemma 30.18.5 and Lemma 30.17.3) it suffices to prove that the sequence is exact. By what was proven in Morphisms, Lemma 28.32.5 it suffices to show that the first map is injective. Working affine locally this reduces to the following question: Suppose that we have a ring $A$ and ideals $I \subset J \subset A$. Assume that $J / I \subset A / I$ is generated by an $H_{1}$-regular sequence. Does this imply that $I / I^{2} \otimes_{A} A / J \rightarrow J / J^{2}$ is injective? Note that $I / I^{2} \otimes_{A} A / J=I / I J$. Hence we are trying to prove that $I \cap J^{2}=I J$. This is the result of More on Algebra, Lemma 15.23.8.

A composition of quasi-regular immersions may not be quasi-regular, see Algebra, Remark 10.68 .8 . The other types of regular immersions are preserved under composition.
067Q Lemma 30.18.7. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of schemes.
(1) If $i$ and $j$ are regular immersions, so is $j \circ i$.
(2) If $i$ and $j$ are Koszul-regular immersions, so is $j \circ i$.
(3) If $i$ and $j$ are $H_{1}$-regular immersions, so is $j \circ i$.
(4) If $i$ is an $H_{1}$-regular immersion and $j$ is a quasi-regular immersion, then $j \circ i$ is a quasi-regular immersion.

Proof. The algebraic version of (1) is Algebra, Lemma 10.67.7. The algebraic version of (2) is More on Algebra, Lemma 15.23.12. The algebraic version of (3) is More on Algebra, Lemma 15.23 .10 . The algebraic version of (4) is More on Algebra, Lemma 15.23 .9 .

068Z Lemma 30.18.8. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of schemes. Assume that the sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

of Morphisms, Lemma 28.32.5 is exact and locally split.
(1) If $j \circ i$ is a quasi-regular immersion, so is $i$.
(2) If $j \circ i$ is a $H_{1}$-regular immersion, so is $i$.
(3) If both $j$ and $j \circ i$ are Koszul-regular immersions, so is $i$.

Proof. After shrinking $Y$ and $X$ we may assume that $i$ and $j$ are closed immersions. Denote $\mathcal{I} \subset \mathcal{O}_{X}$ the ideal sheaf of $Y$ and $\mathcal{J} \subset \mathcal{O}_{X}$ the ideal sheaf of $Z$. The conormal sequence is $0 \rightarrow \mathcal{I} / \mathcal{I} \mathcal{J} \rightarrow \mathcal{J} / \mathcal{J}^{2} \rightarrow \mathcal{J} /\left(\mathcal{I}+\mathcal{J}^{2}\right) \rightarrow 0$. Let $z \in Z$ and set $y=i(z)$, $x=j(y)=j(i(z))$. Choose $f_{1}, \ldots, f_{n} \in \mathcal{I}_{x}$ which map to a basis of $\mathcal{I}_{x} / \mathfrak{m}_{z} \mathcal{I}_{x}$. Extend this to $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m} \in \mathcal{J}_{x}$ which map to a basis of $\mathcal{J}_{x} / \mathfrak{m}_{z} \mathcal{J}_{x}$. This is possible as we have assumed that the sequence of conormal sheaves is split in a neighbourhood of $z$, hence $\mathcal{I}_{x} / \mathfrak{m}_{x} \mathcal{I}_{x} \rightarrow \mathcal{J}_{x} / \mathfrak{m}_{x} \mathcal{J}_{x}$ is injective.
Proof of (1). By Lemma 30.17.5 we can find an affine open neighbourhood $U$ of $x$ such that $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ forms a quasi-regular sequence generating $\mathcal{J}$. Hence by Algebra, Lemma 10.68 .5 we see that $g_{1}, \ldots, g_{m}$ induces a quasi-regular sequence on $Y \cap U$ cutting out $Z$.
Proof of (2). Exactly the same as the proof of (1) except using More on Algebra, Lemma 15.23.11.

Proof of (3). By Lemma 30.17.5 (applied twice) we can find an affine open neighbourhood $U$ of $x$ such that $f_{1}, \ldots, f_{n}$ forms a Koszul-regular sequence generating $\mathcal{I}$ and $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ forms a Koszul-regular sequence generating $\mathcal{J}$. Hence by More on Algebra, Lemma 15.23 .13 we see that $g_{1}, \ldots, g_{m}$ induces a Koszul-regular sequence on $Y \cap U$ cutting out $Z$.

0690 Lemma 30.18.9. Let $i: Z \rightarrow Y$ and $j: Y \rightarrow X$ be immersions of schemes. Pick $z \in Z$ and denote $y \in Y, x \in X$ the corresponding points. Assume $X$ is locally Noetherian. The following are equivalent
(1) $i$ is a regular immersion in a neighbourhood of $z$ and $j$ is a regular immersion in a neighbourhood of $y$,
(2) $i$ and $j \circ i$ are regular immersions in a neighbourhood of $z$,
(3) $j \circ i$ is a regular immersion in a neighbourhood of $z$ and the conormal sequence

$$
0 \rightarrow i^{*} \mathcal{C}_{Y / X} \rightarrow \mathcal{C}_{Z / X} \rightarrow \mathcal{C}_{Z / Y} \rightarrow 0
$$

is split exact in a neighbourhood of $z$.
Proof. Since $X$ (and hence $Y$ ) is locally Noetherian all 4 types of regular immersions agree, and moreover we may check whether a morphism is a regular immersion on the level of local rings, see Lemma 30.17.8. The implication (1) $\Rightarrow(2)$ is Lemma 30.18.7. The implication $(2) \Rightarrow(3)$ is Lemma 30.18.6. Thus it suffices to prove that (3) implies (1).

Assume (3). Set $A=\mathcal{O}_{X, x}$. Denote $I \subset A$ the kernel of the surjective map $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{Y, y}$ and denote $J \subset A$ the kernel of the surjective map $\mathcal{O}_{X, x} \rightarrow \mathcal{O}_{Z, z}$. Note that any minimal sequence of elements generating $J$ in $A$ is a quasi-regular hence regular sequence, see Lemma 30.17.5. By assumption the conormal sequence

$$
0 \rightarrow I / I J \rightarrow J / J^{2} \rightarrow J /\left(I+J^{2}\right) \rightarrow 0
$$

is split exact as a sequence of $A / J$-modules. Hence we can pick a minimal system of generators $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ of $J$ with $f_{1}, \ldots, f_{n} \in I$ a minimal system of generators of $I$. As pointed out above $f_{1}, \ldots, f_{n}, g_{1}, \ldots, g_{m}$ is a regular sequence in $A$. It follows directly from the definition of a regular sequence that $f_{1}, \ldots, f_{n}$ is a regular sequence in $A$ and $\bar{g}_{1}, \ldots, \bar{g}_{m}$ is a regular sequence in $A / I$. Thus $j$ is a regular immersion at $y$ and $i$ is a regular immersion at $z$.

0691 Remark 30.18.10. In the situation of Lemma 30.18 .9 parts (1), (2), (3) are not equivalent to " $j \circ i$ and $j$ are regular immersions at $z$ and $y$ ". An example is $X=\mathbf{A}_{k}^{1}=\operatorname{Spec}(k[x]), Y=\operatorname{Spec}\left(k[x] /\left(x^{2}\right)\right)$ and $Z=\operatorname{Spec}(k[x] /(x))$.

0692 Lemma 30.18.11. Let $i: Z \rightarrow X$ be a Koszul regular closed immersion. Then there exists a surjective smooth morphism $X^{\prime} \rightarrow X$ such that the base change $i^{\prime}:$ $Z \times_{X} X^{\prime} \rightarrow X^{\prime}$ of $i$ is a regular immersion.

Proof. We may assume that $X$ is affine and the ideal of $Z$ generated by a Koszulregular sequence by replacing $X$ by the members of a suitable affine open covering (affine opens as in Lemma 30.17.7). The affine case is More on Algebra, Lemma 15.23 .17

### 30.19. Relative regular immersions

063 P In this section we consider the base change property for regular immersions. The following lemma does not hold for regular immersions or for Koszul immersions, see Examples, Lemma 88.13.2.

063R Lemma 30.19.1. Let $f: X \rightarrow S$ be a morphism of schemes. Let $i: Z \subset X$ be an immersion. Assume
(1) $i$ is an $H_{1}$-regular (resp. quasi-regular) immersion, and
(2) $Z \rightarrow S$ is a flat morphism.

Then for every morphism of schemes $g: S^{\prime} \rightarrow S$ the base change $Z^{\prime}=S^{\prime} \times{ }_{S} Z \rightarrow$ $X^{\prime}=S^{\prime} \times_{S} X$ is an $H_{1}$-regular (resp. quasi-regular) immersion.

Proof. Unwinding the definitions and using Lemma 30.17.7 we translate this into algebra as follows. Let $A \rightarrow B$ be a ring map and $f_{1}, \ldots, f_{r} \in B$. Assume $B /\left(f_{1}, \ldots, f_{r}\right) B$ is flat over $A$. Consider a ring map $A \rightarrow A^{\prime}$. Set $B^{\prime}=B \otimes_{A} A^{\prime}$ and $J^{\prime}=J B^{\prime}$.

Case I: $f_{1}, \ldots, f_{r}$ is quasi-regular. Set $J=\left(f_{1}, \ldots, f_{r}\right)$. By assumption $J^{n} / J^{n+1}$ is isomorphic to a direct sum of copies of $B / J$ hence flat over $A$. By induction and Algebra, Lemma 10.38 .13 we conclude that $B / J^{n}$ is flat over $A$. The ideal $\left(J^{\prime}\right)^{n}$ is equal to $J^{n} \otimes_{A} A^{\prime}$, see Algebra, Lemma 10.38 .12 . Hence $\left(J^{\prime}\right)^{n} /\left(J^{\prime}\right)^{n+1}=$ $J^{n} / J^{n+1} \otimes_{A} A^{\prime}$ which clearly implies that $f_{1}, \ldots, f_{r}$ is a quasi-regular sequence in $B^{\prime}$.

Case II: $f_{1}, \ldots, f_{r}$ is $H_{1}$-regular. By More on Algebra, Lemma 15.23 .15 the vanishing of the Koszul homology group $H_{1}\left(K_{\bullet}\left(B, f_{1}, \ldots, f_{r}\right)\right)$ implies the vanishing of $H_{1}\left(K_{\bullet}\left(B^{\prime}, f_{1}^{\prime}, \ldots, f_{r}^{\prime}\right)\right)$ and we win.

This lemma is the motivation for the following definition.
063 S Definition 30.19.2. Let $f: X \rightarrow S$ be a morphism of schemes. Let $i: Z \rightarrow X$ be an immersion.
(1) We say $i$ is a relative quasi-regular immersion if $Z \rightarrow S$ is flat and $i$ is a quasi-regular immersion.
(2) We say $i$ is a relative $H_{1}$-regular immersion if $Z \rightarrow S$ is flat and $i$ is an $H_{1}$-regular immersion.

We warn the reader that this may be nonstandard notation. Lemma 30.19.1 guarantees that relative quasi-regular (resp. $H_{1}$-regular) immersions are preserved under any base change. A relative $H_{1}$-regular immersion is a relative quasi-regular immersion, see Lemma 30.18.2. Please take a look at Lemma 30.19.5 (or Lemma 30.19.4) which shows that if $Z \rightarrow X$ is a relative $H_{1}$-regular (or quasi-regular) immersion and the ambient scheme is (flat and) locally of finite presentation over $S$, then $Z \rightarrow X$ is actually a regular immersion and the same remains true after any base change.

063T Lemma 30.19.3. Let $f: X \rightarrow S$ be a morphism of schemes. Let $Z \rightarrow X$ be $a$ relative quasi-regular immersion. If $x \in Z$ and $\mathcal{O}_{X, x}$ is Noetherian, then $f$ is flat at $x$.

Proof. Let $f_{1}, \ldots, f_{r} \in \mathcal{O}_{X, x}$ be a quasi-regular sequence cutting out the ideal of $Z$ at $x$. By Algebra, Lemma 10.68 .6 we know that $f_{1}, \ldots, f_{r}$ is a regular sequence. Hence $f_{r}$ is a nonzerodivisor on $\mathcal{O}_{X, x} /\left(f_{1}, \ldots, f_{r-1}\right)$ such that the quotient is a flat $\mathcal{O}_{S, f(x)}$-module. By Lemma 30.15 .5 we conclude that $\mathcal{O}_{X, x} /\left(f_{1}, \ldots, f_{r-1}\right)$ is a flat $\mathcal{O}_{S, f(x)}$-module. Continuing by induction we find that $\mathcal{O}_{X, x}$ is a flat $\mathcal{O}_{S, s^{-}}$ module.

063U Lemma 30.19.4. Let $X \rightarrow S$ be a morphism of schemes. Let $Z \rightarrow X$ be an immersion. Assume
(1) $X \rightarrow S$ is flat and locally of finite presentation,
(2) $Z \rightarrow X$ is a relative quasi-regular immersion.

Then $Z \rightarrow X$ is a regular immersion and the same remains true after any base change.

Proof. Pick $x \in Z$ with image $s \in S$. To prove this it suffices to find an affine neighbourhood of $x$ contained in $U$ such that the result holds on that affine open. Hence we may assume that $X$ is affine and there exist a quasi-regular sequence $f_{1}, \ldots, f_{r} \in \Gamma\left(X, \mathcal{O}_{X}\right)$ such that $Z=V\left(f_{1}, \ldots, f_{r}\right)$. By Lemma 30.19.1 and its proof the sequence $\left.f_{1}\right|_{X_{s}}, \ldots,\left.f_{r}\right|_{X_{s}}$ is a quasi-regular sequence in $\Gamma\left(\bar{X}_{s}, \mathcal{O}_{X_{s}}\right)$. Since $X_{s}$ is Noetherian, this implies, possibly after shrinking $X$ a bit, that $\left.f_{1}\right|_{X_{s}}, \ldots,\left.f_{r}\right|_{X_{s}}$ is a regular sequence, see Algebra, Lemmas 10.68.6 and 10.67.6. By Lemma 30.15.9 it follows that $Z_{1}=V\left(f_{1}\right) \subset X$ is a relative effective Cartier divisor, again after possibly shrinking $X$ a bit. Applying the same lemma again, but now to $Z_{2}=$ $V\left(f_{1}, f_{2}\right) \subset Z_{1}$ we see that $Z_{2} \subset Z_{1}$ is a relative effective Cartier divisor. And so on until on reaches $Z=Z_{n}=V\left(f_{1}, \ldots, f_{n}\right)$. Since being a relative effective Cartier divisor is preserved under arbitrary base change, see Lemma 30.15.1, we also see that the final statement of the lemma holds.

063V Lemma 30.19.5. Let $X \rightarrow S$ be a morphism of schemes. Let $Z \rightarrow X$ be a relative $H_{1}$-regular immersion. Assume $X \rightarrow S$ is locally of finite presentation. Then
(1) there exists an open subscheme $U \subset X$ such that $Z \subset U$ and such that $U \rightarrow S$ is flat, and
(2) $Z \rightarrow X$ is a regular immersion and the same remains true after any base change.

Proof. Pick $x \in Z$. To prove (1) suffices to find an open neighbourhood $U \subset X$ of $x$ such that $U \rightarrow S$ is flat. Hence the lemma reduces to the case that $X=\operatorname{Spec}(B)$ and $S=\operatorname{Spec}(A)$ are affine and that $Z$ is given by an $H_{1}$-regular sequence $f_{1}, \ldots, f_{r} \in$ $B$. By assumption $B$ is a finitely presented $A$-algebra and $B /\left(f_{1}, \ldots, f_{r}\right) B$ is a flat $A$-algebra. We are going to use absolute Noetherian approximation.
Write $B=A\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$. Assume $f_{i}$ is the image of $f_{i}^{\prime} \in A\left[x_{1}, \ldots, x_{n}\right]$. Choose a finite type Z-subalgebra $A_{0} \subset A$ such that all the coefficients of the polynomials $f_{1}^{\prime}, \ldots, f_{r}^{\prime}, g_{1}, \ldots, g_{m}$ are in $A_{0}$. We set $B_{0}=A_{0}\left[x_{1}, \ldots, x_{n}\right] /\left(g_{1}, \ldots, g_{m}\right)$ and we denote $f_{i, 0}$ the image of $f_{i}^{\prime}$ in $B_{0}$. Then $B=B_{0} \otimes_{A_{0}} A$ and

$$
B /\left(f_{1}, \ldots, f_{r}\right)=B_{0} /\left(f_{0,1}, \ldots, f_{0, r}\right) \otimes_{A_{0}} A
$$

By Algebra, Lemma 10.160 .1 we may, after enlarging $A_{0}$, assume that $B_{0} /\left(f_{0,1}, \ldots, f_{0, r}\right)$ is flat over $A_{0}$. It may not be the case at this point that the Koszul cohomology group $H_{1}\left(K_{\bullet}\left(B_{0}, f_{0,1}, \ldots, f_{0, r}\right)\right)$ is zero. On the other hand, as $B_{0}$ is Noetherian, it is a finitely generated $B_{0}$-module. Let $\xi_{1}, \ldots, \xi_{n} \in H_{1}\left(K_{\bullet}\left(B_{0}, f_{0,1}, \ldots, f_{0, r}\right)\right)$ be generators. Let $A_{0} \subset A_{1} \subset A$ be a larger finite type $\mathbf{Z}$-subalgebra of $A$. Denote $f_{1, i}$ the image of $f_{0, i}$ in $B_{1}=B_{0} \otimes_{A_{0}} A_{1}$. By More on Algebra, Lemma 15.23 .15 the map

$$
H_{1}\left(K_{\bullet}\left(B_{0}, f_{0,1}, \ldots, f_{0, r}\right)\right) \otimes_{A_{0}} A_{1} \longrightarrow H_{1}\left(K_{\bullet}\left(B_{1}, f_{1,1}, \ldots, f_{1, r}\right)\right)
$$

is surjective. Furthermore, it is clear that the colimit (over all choices of $A_{1}$ as above) of the complexes $K_{\bullet}\left(B_{1}, f_{1,1}, \ldots, f_{1, r}\right)$ is the complex $K_{\bullet}\left(B, f_{1}, \ldots, f_{r}\right)$ which is acyclic in degree 1 . Hence

$$
\operatorname{colim}_{A_{0} \subset A_{1} \subset A} H_{1}\left(K_{\bullet}\left(B_{1}, f_{1,1}, \ldots, f_{1, r}\right)\right)=0
$$

by Algebra, Lemma 10.8.9. Thus we can find a choice of $A_{1}$ such that $\xi_{1}, \ldots, \xi_{n}$ all map to zero in $H_{1}\left(K_{\bullet}\left(B_{1}, f_{1,1}, \ldots, f_{1, r}\right)\right)$. In other words, the Koszul cohomology group $H_{1}\left(K_{\bullet}\left(B_{1}, f_{1,1}, \ldots, f_{1, r}\right)\right)$ is zero.

Consider the morphism of affine schemes $X_{1} \rightarrow S_{1}$ equal to Spec of the ring map $A_{1} \rightarrow B_{1}$ and $Z_{1}=\operatorname{Spec}\left(B_{1} /\left(f_{1,1}, \ldots, f_{1, r}\right)\right)$. Since $B=B_{1} \otimes_{A_{1}} A$, i.e., $X=$ $X_{1} \times{ }_{S_{1}} S$, and similarly $Z=Z_{1} \times{ }_{S} S_{1}$, it now suffices to prove (1) for $X_{1} \rightarrow S_{1}$ and the relative $H_{1}$-regular immersion $Z_{1} \rightarrow X_{1}$, see Morphisms, Lemma 28.25.6. Hence we have reduced to the case where $X \rightarrow S$ is a finite type morphism of Noetherian schemes. In this case we know that $X \rightarrow S$ is flat at every point of $Z$ by Lemma 30.19.3. Combined with the fact that the flat locus is open in this case, see Algebra, Theorem 10.128 .4 we see that (1) holds. Part (2) then follows from an application of Lemma 30.19.4.

If the ambient scheme is flat and locally of finite presentation over the base, then we can characterize a relative quasi-regular immersion in terms of its fibres.

063W Lemma 30.19.6. Let $\varphi: X \rightarrow S$ be a flat morphism which is locally of finite presentation. Let $T \subset X$ be a closed subscheme. Let $x \in T$ with image $s \in S$.
(1) If $T_{s} \subset X_{s}$ is a quasi-regular immersion in a neighbourhood of $x$, then there exists an open $U \subset X$ and a relative quasi-regular immersion $Z \subset U$ such that $Z_{s}=T_{s} \cap U_{s}$ and $T \cap U \subset Z$.
(2) If $T_{s} \subset X_{s}$ is a quasi-regular immersion in a neighbourhood of $x$, the morphism $T \rightarrow X$ is of finite presentation, and $T \rightarrow S$ is flat at $x$, then we can choose $U$ and $Z$ as in (1) such that $T \cap U=Z$.
(3) If $T_{s} \subset X_{s}$ is a quasi-regular immersion in a neighbourhood of $x$, and $T$ is cut out by $c$ equations in a neighbourhood of $x$, where $c=\operatorname{dim}_{x}\left(X_{s}\right)-$ $\operatorname{dim}_{x}\left(T_{s}\right)$, then we can choose $U$ and $Z$ as in (1) such that $T \cap U=Z$.
In each case $Z \rightarrow U$ is a regular immersion by Lemma 30.19.4. In particular, if $T \rightarrow S$ is locally of finite presentation and flat and all fibres $T_{s} \subset X_{s}$ are quasiregular immersions, then $T \rightarrow X$ is a relative quasi-regular immersion.

Proof. Choose affine open neighbourhoods $\operatorname{Spec}(A)$ of $s$ and $\operatorname{Spec}(B)$ of $x$ such that $\varphi(\operatorname{Spec}(B)) \subset \operatorname{Spec}(A)$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to $s$. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to $x$. Let $I \subset B$ be the ideal corresponding to $T$. By the initial assumption of the lemma we know that $A \rightarrow B$ is flat and of finite presentation. The assumption in (1) means that, after shrinking $\operatorname{Spec}(B)$, we may assume $I\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$ is generated by a quasi-regular sequence of elements. After possibly localizing $B$ at some $g \in B, g \notin \mathfrak{q}$ we may assume there exist $f_{1}, \ldots, f_{r} \in I$ which map to a quasi-regular sequence in $B \otimes_{A} \kappa(\mathfrak{p})$ which generates $I\left(B \otimes_{A} \kappa(\mathfrak{p})\right)$. By Algebra, Lemmas 10.68 .6 and 10.67 .6 we may assume after another localization that $f_{1}, \ldots, f_{r} \in I$ form a regular sequence in $B \otimes_{A} \kappa(\mathfrak{p})$. By Lemma 30.15 .9 it follows that $Z_{1}=V\left(f_{1}\right) \subset \operatorname{Spec}(B)$ is a relative effective Cartier divisor, again after possibly localizing $B$. Applying the same lemma again, but now to $Z_{2}=V\left(f_{1}, f_{2}\right) \subset Z_{1}$ we see that $Z_{2} \subset Z_{1}$ is a relative effective Cartier divisor. And so on until one reaches $Z=Z_{n}=V\left(f_{1}, \ldots, f_{n}\right)$. Then $Z \rightarrow \operatorname{Spec}(B)$ is a regular immersion and $Z$ is flat over $S$, in particular $Z \rightarrow \operatorname{Spec}(B)$ is a relative quasi-regular immersion over $\operatorname{Spec}(A)$. This proves (1).
To see (2) consider the closed immersion $Z \rightarrow D$. The surjective ring map $u$ : $\mathcal{O}_{D, x} \rightarrow \mathcal{O}_{Z, x}$ is a map of flat local $\mathcal{O}_{S, s}$-algebras which are essentially of finite presentation, and which becomes an isomorphisms after dividing by $\mathfrak{m}_{s}$. Hence it is an isomorphism, see Algebra, Lemma 10.127.4. It follows that $Z \rightarrow D$ is an isomorphism in a neighbourhood of $x$, see Algebra, Lemma 10.125.6.

To see (3), after possibly shrinking $U$ we may assume that the ideal of $Z$ is generated by a regular sequence $f_{1}, \ldots, f_{r}$ (see our construction of $Z$ above) and the ideal of $T$ is generated by $g_{1}, \ldots, g_{c}$. We claim that $c=r$. Namely,

$$
\begin{aligned}
\operatorname{dim}_{x}\left(X_{s}\right) & =\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right)+\operatorname{trdeg}_{\kappa(s)}(\kappa(x)) \\
\operatorname{dim}_{x}\left(T_{s}\right) & =\operatorname{dim}\left(\mathcal{O}_{T_{s}, x}\right)+\operatorname{trdeg}_{\kappa(s)}(\kappa(x)) \\
\operatorname{dim}\left(\mathcal{O}_{X_{s}, x}\right) & =\operatorname{dim}\left(\mathcal{O}_{T_{s}, x}\right)+r
\end{aligned}
$$

the first two equalities by Algebra, Lemma 10.115 .3 and the second by $r$ times applying Algebra, Lemma 10.59 .12 . As $T \subset Z$ we see that $f_{i}=\sum b_{i j} g_{j}$. But the ideals of $Z$ and $T$ cut out the same quasi-regular closed subscheme of $X_{s}$ in a neighbourhood of $x$. Hence the matrix $\left(b_{i j}\right) \bmod \mathfrak{m}_{x}$ is invertible (some details omitted). Hence $\left(b_{i j}\right)$ is invertible in an open neighbourhood of $x$. In other words, $T \cap U=Z$ after shrinking $U$.
The final statements of the lemma follow immediately from part (2), combined with the fact that $Z \rightarrow S$ is locally of finite presentation if and only if $Z \rightarrow X$ is of finite presentation, see Morphisms, Lemmas 28.21.3 and 28.21.11.

The following lemma is an enhancement of Morphisms, Lemma 28.34.20.
067R Lemma 30.19.7. Let $f: X \rightarrow S$ be a smooth morphism of schemes. Let $\sigma: S \rightarrow$ $X$ be a section of $f$. Then $\sigma$ is a regular immersion.

Proof. By Schemes, Lemma 25.21.11 the morphism $\sigma$ is an immersion. After replacing $X$ by an open neighbourhood of $\sigma(S)$ we may assume that $\sigma$ is a closed immersion. Let $T=\sigma(S)$ be the corresponding closed subscheme of $X$. Since $T \rightarrow S$ is an isomorphism it is flat and of finite presentation. Also a smooth morphism is flat and locally of finite presentation, see Morphisms, Lemmas 28.34.9 and 28.34.8. Thus, according to Lemma 30.19.6, it suffices to show that $T_{s} \subset X_{s}$ is a quasi-regular closed subscheme. This follows immediately from Morphisms, Lemma 28.34 .20 but we can also see it directly as follows. Let $k$ be a field and let $A$ be a smooth $k$-algebra. Let $\mathfrak{m} \subset A$ be a maximal ideal whose residue field is $k$. Then $\mathfrak{m}$ is generated by a quasi-regular sequence, possibly after replacing $A$ by $A_{g}$ for some $g \in A, g \notin \mathfrak{m}$. In Algebra, Lemma 10.138 .3 we proved that $A_{\mathfrak{m}}$ is a regular local ring, hence $\mathfrak{m} A_{\mathfrak{m}}$ is generated by a regular sequence. This does indeed imply that $\mathfrak{m}$ is generated by a regular sequence (after replacing $A$ by $A_{g}$ for some $g \in A$, $g \notin \mathfrak{m})$, see Algebra, Lemma 10.67 .6
The following lemma has a kind of converse, see Lemma 30.19.11.
067S
Lemma 30.19.8. Let

be a commutative diagram of morphisms of schemes. Assume $X \rightarrow S$ smooth, and $i, j$ immersions. If $j$ is a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) immersion, then so is $i$.

Proof. We can write $i$ as the composition

$$
Y \rightarrow Y \times_{S} X \rightarrow X
$$

By Lemma 30.19 .7 the first arrow is a regular immersion. The second arrow is a flat base change of $Y \rightarrow S$, hence is a regular (resp. Koszul-regular, $H_{1}$-regular, quasi-regular) immersion, see Lemma 30.18.4. We conclude by an application of Lemma 30.18.7.

be a commutative diagram of morphisms of schemes. Assume that $Y \rightarrow S$ is syntomic, $X \rightarrow S$ smooth, and $i$ an immersion. Then $i$ is a regular immersion.

Proof. After replacing $X$ by an open neighbourhood of $i(Y)$ we may assume that $i$ is a closed immersion. Let $T=i(Y)$ be the corresponding closed subscheme of $X$. Since $T \cong Y$ the morphism $T \rightarrow S$ is flat and of finite presentation (Morphisms, Lemmas 28.31 .6 and 28.31.7). Also a smooth morphism is flat and locally of finite presentation (Morphisms, Lemmas 28.34.9 and 28.34.8). Thus, according to Lemma 30.19.6, it suffices to show that $T_{s} \subset X_{s}$ is a quasi-regular closed subscheme. As $X_{s}$ is locally of finite type over a field, it is Noetherian (Morphisms, Lemma 28.15.6). Thus we can check that $T_{s} \subset X_{s}$ is a quasi-regular immersion at points, see Lemma 30.17.8. Take $t \in T_{s}$. By Morphisms, Lemma 28.31.9 the local ring $\mathcal{O}_{T_{s}, t}$ is a local complete intersection over $\kappa(s)$. The local ring $\mathcal{O}_{X_{s}, t}$ is regular, see Algebra, Lemma 10.138.3. By Algebra, Lemma 10.133.7 we see that the kernel of the surjection $\mathcal{O}_{X_{s}, t} \rightarrow \mathcal{O}_{T_{s}, t}$ is generated by a regular sequence, which is what we had to show.

Lemma 30.19.10. Let

be a commutative diagram of morphisms of schemes. Assume that $Y \rightarrow S$ is smooth, $X \rightarrow S$ smooth, and $i$ an immersion. Then $i$ is a regular immersion.

Proof. This is a special case of Lemma 30.19 .9 because a smooth morphism is syntomic, see Morphisms, Lemma 28.34.7.

0693 Lemma 30.19.11. Let

be a commutative diagram of morphisms of schemes. Assume $X \rightarrow S$ smooth, and $i$, $j$ immersions. If $i$ is a Koszul-regular (resp. $H_{1}$-regular, quasi-regular) immersion, then so is $j$.

Proof. Let $y \in Y$ be any point. Set $x=i(y)$ and set $s=j(y)$. It suffices to prove the result after replacing $X, S$ by open neighbourhoods $U, V$ of $x, s$ and $Y$ by an open neighbourhood of $y$ in $i^{-1}(U) \cap j^{-1}(V)$. Hence we may assume that $Y, X$ and $S$ are affine. In this case we can choose a closed immersion $h: X \rightarrow \mathbf{A}_{S}^{n}$ over $S$
for some $n$. Note that $h$ is a regular immersion by Lemma 30.19.10. Hence $h \circ i$ is a Koszul-regular (resp. $H_{1}$-regular, quasi-regular) immersion, see Lemmas 30.18.7 and 30.18.2. In this way we reduce to the case $X=\mathbf{A}_{S}^{n}$ and $S$ affine.
After replacing $S$ by an affine open $V$ and replacing $Y$ by $j^{-1}(V)$ we may assume that $i$ is a closed immersion and $S$ affine. Write $S=\operatorname{Spec}(A)$. Then $j: Y \rightarrow S$ defines an isomorphism of $Y$ to the closed subscheme $\operatorname{Spec}(A / I)$ for some ideal $I \subset A$. The map $i: Y=\operatorname{Spec}(A / I) \rightarrow \mathbf{A}_{S}^{n}=\operatorname{Spec}\left(A\left[x_{1}, \ldots, x_{n}\right]\right)$ corresponds to an $A$-algebra homomorphism $i^{\sharp}: A\left[x_{1}, \ldots, x_{n}\right] \rightarrow A / I$. Choose $a_{i} \in A$ which map to $i^{\sharp}\left(x_{i}\right)$ in $A / I$. Observe that the ideal of the closed immersion $i$ is

$$
J=\left(x_{1}-a_{1}, \ldots, x_{n}-a_{n}\right)+I A\left[x_{1}, \ldots, x_{n}\right]
$$

Set $K=\left(x_{1}-a_{1}, \ldots, x_{n}-a_{n}\right)$. We claim the sequence

$$
0 \rightarrow K / K J \rightarrow J / J^{2} \rightarrow J /\left(K+J^{2}\right) \rightarrow 0
$$

is split exact. To see this note that $K / K^{2}$ is free with basis $x_{i}-a_{i}$ over the ring $A\left[x_{1}, \ldots, x_{n}\right] / K \cong A$. Hence $K / K J$ is free with the same basis over the ring $A\left[x_{1}, \ldots, x_{n}\right] / J \cong A / I$. On the other hand, taking derivatives gives a map

$$
\mathrm{d}_{A\left[x_{1}, \ldots, x_{n}\right] / A}: J / J^{2} \longrightarrow \Omega_{A\left[x_{1}, \ldots, x_{n}\right] / A} \otimes_{A\left[x_{1}, \ldots, x_{n}\right]} A\left[x_{1}, \ldots, x_{n}\right] / J
$$

which maps the generators $x_{i}-a_{i}$ to the basis elements $\mathrm{d} x_{i}$ of the free module on the right. The claim follows. Moreover, note that $x_{1}-a_{1}, \ldots, x_{n}-a_{n}$ is a regular sequence in $A\left[x_{1}, \ldots, x_{n}\right]$ with quotient ring $A\left[x_{1}, \ldots, x_{n}\right] /\left(x_{1}-a_{1}, \ldots, x_{n}-a_{n}\right) \cong$ $A$. Thus we have a factorization

$$
Y \rightarrow V\left(x_{1}-a_{1}, \ldots, x_{n}-a_{n}\right) \rightarrow \mathbf{A}_{S}^{n}
$$

of our closed immersion $i$ where the composition is Koszul-regular (resp. $H_{1}$-regular, quasi-regular), the second arrow is a regular immersion, and the associated conormal sequence is split. Now the result follows from Lemma 30.18.8.

### 30.20. Meromorphic functions and sections

01X1 See Kle79] for some possible pitfalls ${ }^{2}$.
Let $\left(X, \mathcal{O}_{X}\right)$ be a locally ringed space. For any open $U \subset X$ we have defined the set $\mathcal{S}(U) \subset \mathcal{O}_{X}(U)$ of regular sections of $\mathcal{O}_{X}$ over $U$, see Definition 30.11.17. The restriction of a regular section to a smaller open is regular. Hence $\mathcal{\mathcal { S }}: U \mapsto \mathcal{S}(U)$ is a subsheaf (of sets) of $\mathcal{O}_{X}$. We sometimes denote $\mathcal{S}=\mathcal{S}_{X}$ if we want to indicate the dependence on $X$. Moreover, $\mathcal{S}(U)$ is a multiplicative subset of the ring $\mathcal{O}_{X}(U)$ for each $U$. Hence we may consider the presheaf of rings

$$
U \longmapsto \mathcal{S}(U)^{-1} \mathcal{O}_{X}(U)
$$

see Modules, Lemma 17.23.1.
01X2 Definition 30.20.1. Let $\left(X, \mathcal{O}_{X}\right)$ be a locally ringed space. The sheaf of meromorphic functions on $X$ is the sheaf $\mathcal{K}_{X}$ associated to the presheaf displayed above. A meromorphic function on $X$ is a global section of $\mathcal{K}_{X}$.

Since each element of each $\mathcal{S}(U)$ is a nonzerodivisor on $\mathcal{O}_{X}(U)$ we see that the natural map of sheaves of rings $\mathcal{O}_{X} \rightarrow \mathcal{K}_{X}$ is injective.

[^83]01X3 Example 30.20.2. Let $A=\mathbf{C}\left[x,\left\{y_{\alpha}\right\}_{\alpha \in \mathbf{C}}\right] /\left((x-\alpha) y_{\alpha}, y_{\alpha} y_{\beta}\right)$. Any element of $A$ can be written uniquely as $f(x)+\sum \lambda_{\alpha} y_{\alpha}$ with $f(x) \in \mathbf{C}[x]$ and $\lambda_{\alpha} \in \mathbf{C}$. Let $X=\operatorname{Spec}(A)$. In this case $\mathcal{O}_{X}=\mathcal{K}_{X}$, since on any affine open $D(f)$ the ring $A_{f}$ any nonzerodivisor is a unit (proof omitted).
02OT Definition 30.20.3. Let $f:\left(X, \mathcal{O}_{X}\right) \rightarrow\left(Y, \mathcal{O}_{Y}\right)$ be a morphism of locally ringed spaces. We say that pullbacks of meromorphic functions are defined for $f$ if for every pair of open $U \subset X, V \subset Y$ such that $f(U) \subset V$, and any section $s \in \Gamma\left(V, \mathcal{S}_{Y}\right)$ the pullback $f^{\sharp}(s) \in \Gamma\left(U, \mathcal{O}_{X}\right)$ is an element of $\Gamma\left(U, \mathcal{S}_{X}\right)$.
In this case there is an induced map $f^{\sharp}: f^{-1} \mathcal{K}_{Y} \rightarrow \mathcal{K}_{X}$, in other words we obtain a commutative diagram of morphisms of ringed spaces

We sometimes denote $f^{*}(s)=f^{\sharp}(s)$ for a section $s \in \Gamma\left(Y, \mathcal{K}_{Y}\right)$.
02OU Lemma 30.20.4. Let $f: X \rightarrow Y$ be a morphism of schemes. In each of the following cases pullbacks of meromorphic sections are defined.
(1) $X, Y$ are integral and $f$ is dominant,
(2) $X$ is integral and the generic point of $X$ maps to a generic point of an irreducible component of $Y$,
(3) $X$ is reduced and every generic point of every irreducible component of $X$ maps to the generic point of an irreducible component of $Y$,
(4) $X$ is locally Noetherian, and any associated point of $X$ maps to a generic point of an irreducible component of $Y$, and
(5) $X$ is locally Noetherian, has no embedded points and any generic point of an irreducible component of $X$ maps to the generic point of an irreducible component of $Y$.

Proof. Omitted. Hint: Similar to the proof of Lemma 30.11.12, using the following fact (on $Y$ ): if an element $x \in R$ maps to a nonzerodivisor in $R_{p}$ for a minimal prime $\mathfrak{p}$ of $R$, then $x \notin \mathfrak{p}$. See Algebra, Lemma 10.24.1.

Let $\left(X, \mathcal{O}_{X}\right)$ be a locally ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X}$-modules. Consider the presheaf $U \mapsto \mathcal{S}(U)^{-1} \mathcal{F}(U)$. Its sheafification is the sheaf $\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{K}_{X}$, see Modules, Lemma 17.23.2.

01X4 Definition 30.20.5. Let $X$ be a locally ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X^{-}}$ modules.
(1) We denote $\mathcal{K}_{X}(\mathcal{F})$ the sheaf of $\mathcal{K}_{X}$-modules which is the sheafification of the presheaf $U \mapsto \mathcal{S}(U)^{-1} \mathcal{F}(U)$. Equivalently $\mathcal{K}_{X}(\mathcal{F})=\mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{K}_{X}$ (see above).
(2) A meromorphic section of $\mathcal{F}$ is a global section of $\mathcal{K}_{X}(\mathcal{F})$.

In particular we have

$$
\mathcal{K}_{X}(\mathcal{F})_{x}=\mathcal{F}_{x} \otimes_{\mathcal{O}_{X, x}} \mathcal{K}_{X, x}=\mathcal{S}_{x}^{-1} \mathcal{F}_{x}
$$

for any point $x \in X$. However, one has to be careful since it may not be the case that $\mathcal{S}_{x}$ is the set of nonzerodivisors in the local ring $\mathcal{O}_{X, x}$. Namely, there is always an injective map

$$
\mathcal{K}_{X, x} \longrightarrow Q\left(\mathcal{O}_{X, x}\right)
$$

to the total quotient ring. It is also surjective if and only if $\mathcal{S}_{x}$ is the set of nonzerodivisors in $\mathcal{O}_{X, x}$. The sheaves of meromorphic sections aren't quasi-coherent modules in general, but they do have some properties in common with quasi-coherent modules.

0817 Lemma 30.20.6. Let $X$ be a quasi-compact scheme. Let $h \in \Gamma\left(X, \mathcal{O}_{X}\right)$ and $f \in \Gamma\left(X, \mathcal{K}_{X}\right)$ such that $f$ restricts to zero on $X_{h}$. Then $h^{n} f=0$ for some $n \gg 0$.

Proof. We can find a covering of $X$ by affine opens $U$ such that $\left.f\right|_{U}=s^{-1} a$ with $a \in \mathcal{O}_{X}(U)$ and $s \in \mathcal{S}(U)$. Since $X$ is quasi-compact we can cover it by finitely many affine opens of this form. Thus it suffices to prove the lemma when $X=\operatorname{Spec}(A)$ and $f=s^{-1} a$. Note that $s \in A$ is a nonzerodivisor hence it suffices to prove the result when $f=a$. The condition $\left.f\right|_{X_{h}}=0$ implies that $a$ maps to zero in $A_{h}=\mathcal{O}_{X}\left(X_{h}\right)$ as $\mathcal{O}_{X} \subset \mathcal{K}_{X}$. Thus $h^{n} a=0$ for some $n>0$ as desired.

02OV Lemma 30.20.7. Let $X$ be a locally Noetherian scheme.
(1) For any $x \in X$ we have $\mathcal{S}_{x} \subset \mathcal{O}_{X, x}$ is the set of nonzerodivisors, and hence $\mathcal{K}_{X, x}$ is the total quotient ring of $\mathcal{O}_{X, x}$.
(2) For any affine open $U \subset X$ the ring $\mathcal{K}_{X}(U)$ equals the total quotient ring of $\mathcal{O}_{X}(U)$.

Proof. To prove this lemma we may assume $X$ is the spectrum of a Noetherian ring $A$. Say $x \in X$ corresponds to $\mathfrak{p} \subset A$.
Proof of (1). It is clear that $\mathcal{S}_{x}$ is contained in the set of nonzerodivisors of $\mathcal{O}_{X, x}=$ $A_{\mathfrak{p}}$. For the converse, let $f, g \in A, g \notin \mathfrak{p}$ and assume $f / g$ is a nonzerodivisor in $A_{\mathfrak{p}}$. Let $I=\{a \in A \mid a f=0\}$. Then we see that $I_{\mathfrak{p}}=0$ by exactness of localization. Since $A$ is Noetherian we see that $I$ is finitely generated and hence that $g^{\prime} I=0$ for some $g^{\prime} \in A, g^{\prime} \notin \mathfrak{p}$. Hence $f$ is a nonzerodivisor in $A_{g^{\prime}}$, i.e., in a Zariski open neighbourhood of $\mathfrak{p}$. Thus $f / g$ is an element of $\mathcal{S}_{x}$.
Proof of (2). Let $f \in \Gamma\left(X, \mathcal{K}_{X}\right)$ be a meromorphic function. Set $I=\{a \in A \mid a f \in$ $A\}$. Fix a prime $\mathfrak{p} \subset A$ corresponding to the point $x \in X$. By (1) we can write the image of $f$ in the stalk at $\mathfrak{p}$ as $a / b, a, b \in A_{\mathfrak{p}}$ with $b \in A_{\mathfrak{p}}$ not a zerodivisor. Write $b=c / d$ with $c, d \in A, d \notin \mathfrak{p}$. Then $a d-c f$ is a section of $\mathcal{K}_{X}$ which vanishes in an open neighbourhood of $x$. Say it vanishes on $D(e)$ with $e \in A, e \notin \mathfrak{p}$. Then $e^{n}(a d-c f)=0$ for some $n \gg 0$ by Lemma 30.20.6. Thus $e^{n} c \in I$ and $e^{n} c$ maps to a nonzerodivisor in $A_{\mathfrak{p}}$. Let $\operatorname{Ass}(A)=\left\{\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}\right\}$ be the associated primes of $A$. By looking at $I A_{\mathfrak{q}_{i}}$ and using Algebra, Lemma 10.62 .15 the above says that $I \not \subset \mathfrak{q}_{i}$ for each $i$. By Algebra, Lemma 10.14 .2 there exists an element $x \in I, x \notin \bigcup \mathfrak{q}_{i}$. By Algebra, Lemma 10.62 .9 we see that $x$ is not a zerodivisor on $A$. Hence $f=(x f) / x$ is an element of the total ring of fractions of $A$. This proves (2).

02OW Lemma 30.20.8. Let $X$ be a scheme. Assume $X$ is reduced and any quasi-compact open $U \subset X$ has a finite number of irreducible components.
(1) The sheaf $\mathcal{K}_{X}$ is a quasi-coherent sheaf of $\mathcal{O}_{X}$-algebras.
(2) For any $x \in X$ we have $\mathcal{S}_{x} \subset \mathcal{O}_{X, x}$ is the set of nonzerodivisors. In particular $\mathcal{K}_{X, x}$ is the total quotient ring of $\mathcal{O}_{X, x}$.
(3) For any affine open $\operatorname{Spec}(A)=U \subset X$ we have that $\mathcal{K}_{X}(U)$ equals the total quotient ring of $A$.

Proof. Let $X$ be as in the lemma. Let $X^{(0)} \subset X$ be the set of generic points of irreducible components of $X$. Let

$$
f: Y=\coprod_{\eta \in X^{(0)}} \operatorname{Spec}(\kappa(\eta)) \longrightarrow X
$$

be the inclusion of the generic points into $X$ using the canonical maps of Schemes, Section 25.13. (This morphism was used in Morphisms, Definition 28.49.1 to define the normalization of $X$.) We claim that $\mathcal{K}_{X}=f_{*} \mathcal{O}_{Y}$. First note that $\mathcal{K}_{Y}=\mathcal{O}_{Y}$ as $Y$ is a disjoint union of spectra of field. Next, note that pullbacks of meromorphic functions are defined for $f$, by Lemma 30.20.4. This gives a map

$$
\mathcal{K}_{X} \longrightarrow f_{*} \mathcal{O}_{Y}
$$

Let $\operatorname{Spec}(A)=U \subset X$ be an affine open. Then $A$ is a reduced ring with finitely many minimal primes $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$. Then we have $Q(A)=\prod A_{\mathfrak{q}_{i}}=\prod \kappa\left(\mathfrak{q}_{i}\right)$ by Algebra, Lemmas 10.24 .4 and 10.24.1. In other words, already the value of the presheaf $U \mapsto \mathcal{S}(U)^{-1} \mathcal{O}_{X}(U)$ agrees with $f_{*} \mathcal{O}_{Y}(U)$ on our affine open $U$. Hence the displayed map is an isomorphism.

Now we are ready to prove (1), (2) and (3). The morphism $f$ is quasi-compact by our assumption that the set of irreducible components of $X$ is locally finite. Hence $f$ is quasi-compact and quasi-separated (as $Y$ is separated). By Schemes, Lemma 25.24.1 $f_{*} \mathcal{O}_{Y}$ is quasi-coherent. This proves (1). Let $x \in X$. Then

$$
\left(f_{*} \mathcal{O}_{Y}\right)_{x}=\prod_{\eta \in X^{(0)}, x \in \overline{\{\eta\}}} \kappa(\eta)
$$

On the other hand, $\mathcal{O}_{X, x}$ is reduced and has finitely minimal primes $\mathfrak{q}_{i}$ corresponding exactly to those $\eta \in X^{(0)}$ such that $x \in \overline{\{\eta\}} \kappa(\eta)$. Hence by Algebra, Lemmas 10.24.4 and 10.24.1 again we see that $Q\left(\mathcal{O}_{X, x}\right)=\prod \kappa\left(\mathfrak{q}_{i}\right)$ is the same as $\left(f_{*} \mathcal{O}_{Y}\right)_{x}$. This proves (2). Part (3) we saw during the course of the proof that $\mathcal{K}_{X}=f_{*} \mathcal{O}_{Y}$.

035T Lemma 30.20.9. Let $X$ be a scheme. Assume $X$ is reduced and any quasi-compact open $U \subset X$ has a finite number of irreducible components. Then the normalization morphism $\nu: X^{\nu} \rightarrow X$ is the morphism

$$
\underline{\operatorname{Spec}}_{X}\left(\mathcal{O}^{\prime}\right) \longrightarrow X
$$

where $\mathcal{O}^{\prime} \subset \mathcal{K}_{X}$ is the integral closure of $\mathcal{O}_{X}$ in the sheaf of meromorphic functions.
Proof. Compare the definition of the normalization morphism $\nu: X^{\nu} \rightarrow X$ (see Morphisms, Definition 28.49.1 with the result $\mathcal{K}_{X}=f_{*} \mathcal{O}_{Y}$ obtained in the proof of Lemma 30.20.8 above.

01X5 Lemma 30.20.10. Let $X$ be an integral scheme with generic point $\eta$. We have
(1) the sheaf of meromorphic functions is isomorphic to the constant sheaf with value the function field (see Morphisms, Definition 28.9.5) of $X$.
(2) for any quasi-coherent sheaf $\mathcal{F}$ on $X$ the sheaf $\mathcal{K}_{X}(\mathcal{F})$ is isomorphic to the constant sheaf with value $\mathcal{F}_{\eta}$.

Proof. Omitted.

02OX Definition 30.20.11. Let $X$ be a locally ringed space. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. A meromorphic section $s$ of $\mathcal{L}$ is said to be regular if the induced map $\mathcal{K}_{X} \rightarrow \mathcal{K}_{X}(\mathcal{L})$ is injective. (In other words, this means that $s$ is a regular section of the invertible $\mathcal{K}_{X}$-module $\mathcal{K}_{X}(\mathcal{L})$. See Definition 30.11.17.)
First we spell out when (regular) meromorphic sections can be pulled back. After that we discuss the existence of regular meromorphic sections and consequences.

02OY Lemma 30.20.12. Let $f: X \rightarrow Y$ be a morphism of locally ringed spaces. Assume that pullbacks of meromorphic functions are defined for $f$ (see Definition 30.20.3).
(1) Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{Y}$-modules. There is a canonical pullback map $f^{*}$ : $\Gamma\left(Y, \mathcal{K}_{Y}(\mathcal{F})\right) \rightarrow \Gamma\left(X, \mathcal{K}_{X}\left(f^{*} \mathcal{F}\right)\right)$ for meromorphic sections of $\mathcal{F}$.
(2) Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. A regular meromorphic section $s$ of $\mathcal{L}$ pulls back to a regular meromorphic section $f^{*} s$ of $f^{*} \mathcal{L}$.
Proof. Omitted.
In some cases we can show regular meromorphic sections exist.
02OZ Lemma 30.20.13. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. In each of the following cases $\mathcal{L}$ has a regular meromorphic section:
(1) $X$ is integral,
(2) $X$ is reduced and any quasi-compact open has a finite number of irreducible components, and
(3) $X$ is locally Noetherian and has no embedded points.

Proof. In case (1) we have seen in Lemma 30.20 .10 that $\mathcal{K}_{X}(\mathcal{L})$ is a constant sheaf with value $\mathcal{L}_{\eta}$, and hence the result is clear.
Suppose $X$ is a scheme. Let $G \subset X$ be the set of generic points of irreducible components of $X$. For each $\eta \in G$ denote $j_{\eta}: \eta \rightarrow X$ the canonical morphism of $\eta=\operatorname{Spec}(\kappa(\eta))$ into $X$ (see Schemes, Lemma 25.13.3). Consider the sheaf

$$
\mathcal{G}_{X}(\mathcal{L})=\prod_{\eta \in G} j_{\eta, *}\left(\mathcal{L}_{\eta}\right)
$$

There is a canonical map

$$
\varphi: \mathcal{K}_{X}(\mathcal{L}) \longrightarrow \mathcal{G}_{X}(\mathcal{L})
$$

coming from the maps $\mathcal{K}_{X}(\mathcal{L})_{\eta} \rightarrow \mathcal{L}_{\eta}$ and adjunction (see Sheaves, Lemma 6.27.3).
We claim that in cases (2) and (3) the map $\varphi$ is an isomorphism for any invertible sheaf $\mathcal{L}$. Before proving this let us show that cases (2) and (3) follow from this. Namely, we can choose $s_{\eta} \in \mathcal{L}_{\eta}$ which generate $\mathcal{L}_{\eta}$, i.e., such that $\mathcal{L}_{\eta}=\mathcal{O}_{X, \eta} s_{\eta}$. Since the claim applied to $\mathcal{O}_{X}$ gives $\mathcal{K}_{X}=\mathcal{G}_{X}\left(\mathcal{O}_{X}\right)$ it is clear that the global section $s=\prod_{\eta \in G} s_{\eta}$ is regular as desired.

To prove that $\varphi$ is an isomorphism we may work locally on $X$. For example it suffices to show that sections of $\mathcal{K}_{X}(\mathcal{L})$ and $\mathcal{G}_{X}(\mathcal{L})$ agree over small affine opens $U$. Say $U=\operatorname{Spec}(A)$ and $\left.\mathcal{L}\right|_{U} \cong \mathcal{O}_{U}$. By Lemmas 30.20 .7 and 30.20 .8 we see that $\Gamma\left(U, \mathcal{K}_{X}\right)=Q(A)$ is the total ring of fractions of $A$. On the other hand, $\Gamma\left(U, \mathcal{G}_{X}\left(\mathcal{O}_{X}\right)\right)=\prod_{\mathfrak{q} \subset A \text { minimal }} A_{\mathfrak{q}}$. In both cases we see that the set of minimal primes of $A$ is finite, say $\mathfrak{q}_{1}, \ldots, \mathfrak{q}_{t}$, and that the set of zerodivisors of $A$ is equal to $\mathfrak{q}_{1} \cup \ldots \cup \mathfrak{q}_{t}$ (see Algebra, Lemma 10.62.9). Hence the result follows from Algebra, Lemma 10.24 .4 .

02P0 Lemma 30.20.14. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s$ be a regular meromorphic section of $\mathcal{L}$. Let us denote $\mathcal{I} \subset \mathcal{O}_{X}$ the sheaf of ideals defined by the rule

$$
\mathcal{I}(V)=\left\{f \in \mathcal{O}_{X}(V) \mid f s \in \mathcal{L}(V)\right\}
$$

The formula makes sense since $\mathcal{L}(V) \subset \mathcal{K}_{X}(\mathcal{L})(V)$. Then $\mathcal{I}$ is a quasi-coherent sheaf of ideals and we have injective maps

$$
1: \mathcal{I} \longrightarrow \mathcal{O}_{X}, \quad s: \mathcal{I} \longrightarrow \mathcal{L}
$$

whose cokernels are supported on closed nowhere dense subsets of $X$.
Proof. The question is local on $X$. Hence we may assume that $X=\operatorname{Spec}(A)$, and $\mathcal{L}=\mathcal{O}_{X}$. After shrinking further we may assume that $s=x / y$ with $a, b \in A$ both nonzerodivisors in $A$. Set $I=\{x \in A \mid x(a / b) \in A\}$.
To show that $\mathcal{I}$ is quasi-coherent we have to show that $I_{f}=\left\{x \in A_{f} \mid x(a / b) \in A_{f}\right\}$ for every $f \in A$. If $c / f^{n} \in A_{f},\left(c / f^{n}\right)(a / b) \in A_{f}$, then we see that $f^{m} c(a / b) \in A$ for some $m$, hence $c / f^{n} \in I_{f}$. Conversely it is easy to see that $I_{f}$ is contained in $\left\{x \in A_{f} \mid x(a / b) \in A_{f}\right\}$. This proves quasi-coherence.

Let us prove the final statement. It is clear that $(b) \subset I$. Hence $V(I) \subset V(b)$ is a nowhere dense subset as $b$ is a nonzerodivisor. Thus the cokernel of 1 is supported in a nowhere dense closed set. The same argument works for the cokernel of $s$ since $s(b)=(a) \subset s I \subset A$.

02P1 Definition 30.20.15. Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s$ be a regular meromorphic section of $\mathcal{L}$. The sheaf of ideals $\mathcal{I}$ constructed in Lemma 30.20 .14 is called the ideal sheaf of denominators of $s$.
Here is a lemma which will be used later.
02P2 Lemma 30.20.16. Suppose given
(1) $X$ a locally Noetherian scheme,
(2) $\mathcal{L}$ an invertible $\mathcal{O}_{X}$-module,
(3) $s$ a regular meromorphic section of $\mathcal{L}$, and
(4) $\mathcal{F}$ coherent on $X$ without embedded associated points and $\operatorname{Supp}(\mathcal{F})=X$.

Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal of denominators of $s$. Let $T \subset X$ be the union of the supports of $\mathcal{O}_{X} / \mathcal{I}$ and $\mathcal{L} / s(\mathcal{I})$ which is a nowhere dense closed subset $T \subset X$ according to Lemma 30.20.14. Then there are canonical injective maps

$$
1: \mathcal{I F} \rightarrow \mathcal{F}, \quad s: \mathcal{I F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X}} \mathcal{L}
$$

whose cokernels are supported on $T$.
Proof. Reduce to the affine case with $\mathcal{L} \cong \mathcal{O}_{X}$, and $s=a / b$ with $a, b \in A$ both nonzerodivisors. Proof of reduction step omitted. Write $\mathcal{F}=\widetilde{M}$. Let $I=\{x \in$ $A \mid x(a / b) \in A\}$ so that $\mathcal{I}=\widetilde{I}$ (see proof of Lemma 30.20.14). Note that $T=$ $V(I) \cup V((a / b) I)$. For any $A$-module $M$ consider the map 1: $I M \rightarrow M$; this is the map that gives rise to the map 1 of the lemma. Consider on the other hand the map $\sigma: I M \rightarrow M_{b}, x \mapsto a x / b$. Since $b$ is not a zerodivisor in $A$, and since $M$ has support $\operatorname{Spec}(A)$ and no embedded primes we see that $b$ is a nonzerodivisor on $M$ also. Hence $M \subset M_{b}$. By definition of $I$ we have $\sigma(I M) \subset M$ as submodules of $M_{b}$. Hence we get an $A$-module map $s: I M \rightarrow M$ (namely the unique map such that $s(z) / 1=\sigma(z)$ in $M_{b}$ for all $\left.z \in I M\right)$. It is injective because $a$ is a
nonzerodivisor also (on both $A$ and $M$ ). It is clear that $M / I M$ is annihilated by $I$ and that $M / s(I M)$ is annihilated by $(a / b) I$. Thus the lemma follows.

### 30.21. Weil divisors

0BE0 We will introduce Weil divisors and rational equivalence of Weil divisors for locally Noetherian integral schemes. Since we are not assuming our schemes are quasicompact we have to be a little careful when defining Weil divisors. We have to allow infinite sums of prime divisors because a rational function may have infinitely many poles for example. For quasi-compact schemes our Weil divisors are finite sums as usual. Here is a basic lemma we will often use to prove collections of closed subschemes are locally finite.

0BE1 Lemma 30.21.1. Let $X$ be a locally Noetherian scheme. Let $Z \subset X$ be a closed subscheme. The collection of irreducible components of $Z$ is locally finite in $X$.

Proof. Let $U \subset X$ be a quasi-compact open subscheme. Then $U$ is a Noetherian scheme, and hence has a Noetherian underlying topological space (Properties, Lemma 27.5.5. Hence every subspace is Noetherian and has finitely many irreducible components (see Topology, Lemma 5.8.2).

Recall that if $Z$ is an irreducible closed subset of a scheme $X$, then the codimension of $Z$ in $X$ is equal to the dimension of the local ring $\mathcal{O}_{X, \xi}$, where $\xi \in Z$ is the generic point. See Properties, Lemma 27.10.3.

0BE2 Definition 30.21.2. Let $X$ be a locally Noetherian integral scheme.
(1) A prime divisor is an integral closed subscheme $Z \subset X$ of codimension 1.
(2) A Weil divisor is a formal sum $D=\sum n_{Z} Z$ where the sum is over prime divisors of $X$ and the collection $\left\{Z \mid n_{Z} \neq 0\right\}$ is locally finite (Topology, Definition 5.27.4.
The group of all Weil divisors on $X$ is denoted $\operatorname{Div}(X)$.
Our next task is to define the Weil divisor associated to a rational function. In order to do this we use the order of vanishing of a rational function along a prime divisor which is defined as follows.

02RJ Definition 30.21.3. Let $X$ be a locally Noetherian integral scheme. Let $f \in$ $R(X)^{*}$. For every prime divisor $Z \subset X$ we define the order of vanishing of $f$ along $Z$ as the integer

$$
\operatorname{ord}_{Z}(f)=\operatorname{ord}_{\mathcal{O}_{X, \xi}}(f)
$$

where the right hand side is the notion of Algebra, Definition 10.120 .2 and $\xi$ is the generic point of $Z$.

Note that for $f, g \in R(X)^{*}$ we have

$$
\operatorname{ord}_{Z}(f g)=\operatorname{ord}_{Z}(f)+\operatorname{ord}_{Z}(g) .
$$

Of course it can happen that $\operatorname{ord}_{Z}(f)<0$. In this case we say that $f$ has a pole along $Z$ and that $-\operatorname{ord}_{Z}(f)>0$ is the order of pole of $f$ along $Z$. It is important to note that the condition $\operatorname{ord}_{Z}(f) \geq 0$ is not equivalent to the condition $f \in \mathcal{O}_{X, \xi}$ unless the local ring $\mathcal{O}_{X, \xi}$ is a discrete valuation ring.

02RL Lemma 30.21.4. Let $X$ be a locally Noetherian integral scheme. Let $f \in R(X)^{*}$. Then the collections

$$
\left\{Z \subset X \mid Z \text { a prime divisor with generic point } \xi \text { and } f \text { not in } \mathcal{O}_{X, \xi}\right\}
$$

and

$$
\left\{Z \subset X \mid Z \text { a prime divisor and } \operatorname{ord}_{Z}(f) \neq 0\right\}
$$

are locally finite in $X$.
Proof. There exists a nonempty open subscheme $U \subset X$ such that $f$ corresponds to a section of $\Gamma\left(U, \mathcal{O}_{X}^{*}\right)$. Hence the prime divisors which can occur in the sets of the lemma are all irreducible components of $X \backslash U$. Hence Lemma 30.21.1 gives the desired result.

This lemma allows us to make the following definition.
0BE3 Definition 30.21.5. Let $X$ be a locally Noetherian integral scheme. Let $f \in$ $R(X)^{*}$. The principal Weil divisor associated to $f$ is the Weil divisor

$$
\operatorname{div}(f)=\operatorname{div}_{X}(f)=\sum \operatorname{ord}_{Z}(f)[Z]
$$

where the sum is over prime divisors and $\operatorname{ord}_{Z}(f)$ is as in Definition 30.21.3. This makes sense by Lemma 30.21.4.

02RP Lemma 30.21.6. Let $X$ be a locally Noetherian integral scheme. Let $f, g \in R(X)^{*}$. Then

$$
\operatorname{div}_{X}(f g)=\operatorname{div}_{X}(f)+\operatorname{div}_{X}(g)
$$

as Weil divisors on $X$.
Proof. This is clear from the additivity of the ord functions.
We see from the lemma above that the collection of principal Weil divisors form a subgroup of the group of all Weil divisors. This leads to the following definition.

0BE4 Definition 30.21.7. Let $X$ be a locally Noetherian integral scheme. The Weil divisor class group of $X$ is the quotient of the group of Weil divisors by the subgroup of principal Weil divisors. Notation: $\mathrm{Cl}(X)$.
By construction we obtain an exact complex
0BE5 (30.21.7.1)

$$
R(X)^{*} \xrightarrow{\text { div }} \operatorname{Div}(X) \rightarrow \mathrm{Cl}(X) \rightarrow 0
$$

which we can think of as a presentation of $\mathrm{Cl}(X)$. Our next task is to relate the Weil divisor class group to the Picard group.

### 30.22. The Weil divisor class associated to an invertible module

02 SE In this section we go through exactly the same progression as in Section 30.21 to define a canonical map $\operatorname{Pic}(X) \rightarrow \mathrm{Cl}(X)$ on a locally Noetherian integral scheme.

Let $X$ be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $\xi \in X$ be a point. If $s_{\xi}, s_{\xi}^{\prime} \in \mathcal{L}_{\xi}$ generate $\mathcal{L}_{\xi}$ as $\mathcal{O}_{X, \xi}$-module, then there exists a unit $u \in \mathcal{O}_{X, \xi}^{*}$ such that $s_{\xi}=u s_{\xi}^{\prime}$. The stalk of the sheaf of meromorphic sections $\mathcal{K}_{X}(\mathcal{L})$ of $\mathcal{L}$ at $x$ is equal to $\mathcal{K}_{X, x} \otimes_{\mathcal{O}_{X, x}} \mathcal{L}_{x}$. Thus the image of any meromorphic section $s$ of $\mathcal{L}$ in the stalk at $x$ can be written as $s=f s \xi$ with $f \in \mathcal{K}_{X, x}$. Below we will abbreviate this by saying $f=s / s_{\xi}$. Also, if $X$ is integral we have $\mathcal{K}_{X, x}=R(X)$ is equal to the function field of $X$, so $s / s_{\xi} \in R(X)$. If $s$ is a regular meromorphic section,
then actually $s / s_{\xi} \in R(X)^{*}$. On an integral scheme a regular meromorphic section is the same thing as a nonzero meromorphic section. Finally, we see that $s / s_{\xi}$ is independent of the choice of $s_{\xi}$ up to multiplication by a unit of the local ring $\mathcal{O}_{X, x}$. Putting everything together we see the following definition makes sense.

02SF Definition 30.22.1. Let $X$ be a locally Noetherian integral scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \Gamma\left(X, \mathcal{K}_{X}(\mathcal{L})\right)$ be a regular meromorphic section of $\mathcal{L}$. For every prime divisor $Z \subset X$ we define the order of vanishing of $s$ along $Z$ as the integer

$$
\operatorname{ord}_{Z, \mathcal{L}}(s)=\operatorname{ord}_{\mathcal{O}_{X, \xi}}\left(s / s_{\xi}\right)
$$

where the right hand side is the notion of Algebra, Definition 10.120.2, $\xi \in Z$ is the generic point, and $s_{\xi} \in \mathcal{L}_{\xi}$ is a generator.

As in the case of principal divisors we have the following lemma.
02SG Lemma 30.22.2. Let $X$ be a locally Noetherian integral scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s \in \mathcal{K}_{X}(\mathcal{L})$ be a regular (i.e., nonzero) meromorphic section of $\mathcal{L}$. Then the sets

$$
\left\{Z \subset X \mid Z \text { a prime divisor with generic point } \xi \text { and } s \text { not in } \mathcal{L}_{\xi}\right\}
$$

and

$$
\left\{Z \subset X \mid Z \text { is a prime divisor and } \operatorname{ord}_{Z, \mathcal{L}}(s) \neq 0\right\}
$$

are locally finite in $X$.
Proof. There exists a nonempty open subscheme $U \subset X$ such that $s$ corresponds to a section of $\Gamma(U, \mathcal{L})$ which generates $\mathcal{L}$ over $U$. Hence the prime divisors which can occur in the sets of the lemma are all irreducible components of $X \backslash U$. Hence Lemma 30.21.1. gives the desired result.

02SH Lemma 30.22.3. Let $X$ be a locally Noetherian integral scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Let $s, s^{\prime} \in \mathcal{K}_{X}(\mathcal{L})$ be nonzero meromorphic sections of $\mathcal{L}$. Then $f=s / s^{\prime}$ is an element of $R(X)^{*}$ and we have

$$
\sum \operatorname{ord}_{Z, \mathcal{L}}(s)[Z]=\sum \operatorname{ord}_{Z, \mathcal{L}}\left(s^{\prime}\right)[Z]+\operatorname{div}(f)
$$

as Weil divisors.
Proof. This is clear from the definitions. Note that Lemma 30.22.2 guarantees that the sums are indeed Weil divisors.

0BE6 Definition 30.22.4. Let $X$ be a locally Noetherian integral scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module.
(1) For any nonzero meromorphic section $s$ of $\mathcal{L}$ we define the Weil divisor associated to $s$ as

$$
\operatorname{div}_{\mathcal{L}}(s)=\sum \operatorname{ord}_{Z, \mathcal{L}}(s)[Z] \in \operatorname{Div}(X)
$$

where the sum is over prime divisors.
(2) We define Weil divisor class associated to $\mathcal{L}$ as the image of $\operatorname{div}_{\mathcal{L}}(s)$ in $\mathrm{Cl}(X)$ where $s$ is any nonzero meromorphic section of $\mathcal{L}$ over $X$. This is well defined by Lemma 30.22 .3 .

As expected this construction is additive in the invertible module.

02SL Lemma 30.22.5. Let $X$ be a locally Noetherian integral scheme. Let $\mathcal{L}, \mathcal{N}$ be invertible $\mathcal{O}_{X}$-modules. Let s, resp. $t$ be a nonzero meromorphic section of $\mathcal{L}$, resp. $\mathcal{N}$. Then st is a nonzero meromorphic section of $\mathcal{L} \otimes \mathcal{N}$, and

$$
\operatorname{div}_{\mathcal{L} \otimes \mathcal{N}}(s t)=\operatorname{div}_{\mathcal{L}}(s)+\operatorname{div}_{\mathcal{N}}(t)
$$

in Div $(X)$. In particular, the Weil divisor class of $\mathcal{L} \otimes \mathcal{O}_{X} \mathcal{N}$ is the sum of the Weil divisor classes of $\mathcal{L}$ and $\mathcal{N}$.

Proof. Let $s$, resp. $t$ be a nonzero meromorphic section of $\mathcal{L}$, resp. $\mathcal{N}$. Then st is a nonzero meromorphic section of $\mathcal{L} \otimes \mathcal{N}$. Let $Z \subset X$ be a prime divisor. Let $\xi \in Z$ be its generic point. Choose generators $s_{\xi} \in \mathcal{L}_{\xi}$, and $t_{\xi} \in \mathcal{N}_{\xi}$. Then $s_{\xi} t_{\xi}$ is a generator for $(\mathcal{L} \otimes \mathcal{N})_{\xi}$. So $s t /\left(s_{\xi} t_{\xi}\right)=\left(s / s_{\xi}\right)\left(t / t_{\xi}\right)$. Hence we see that

$$
\operatorname{div}_{\mathcal{L} \otimes \mathcal{N}, Z}(s t)=\operatorname{div}_{\mathcal{L}, Z}(s)+\operatorname{div}_{\mathcal{N}, Z}(t)
$$

by the additivity of the $\operatorname{ord}_{Z}$ function.
In this way we obtain a homomorphism of abelian groups
0BE7

$$
\begin{equation*}
\operatorname{Pic}(X) \longrightarrow \mathrm{Cl}(X) \tag{30.22.5.1}
\end{equation*}
$$

which assigns to an invertible module its Weil divisor class.
0BE8 Lemma 30.22.6. Let $X$ be a locally Noetherian integral scheme. If $X$ is normal, then the map 30.22.5.1) $\operatorname{Pic}(X) \rightarrow C l(X)$ is injective.

Proof. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module whose associated Weil divisor class is trivial. Let $s$ be a regular meromorphic section of $\mathcal{L}$. The assuption means that $\operatorname{div}_{\mathcal{L}}(s)=\operatorname{div}(f)$ for some $f \in R(X)^{*}$. Then we see that $t=f^{-1} s$ is a regular meromorphic section of $\mathcal{L}$ with $\operatorname{div}_{\mathcal{L}}(t)=0$, see Lemma 30.22.3. We will show that $t$ defines a trivialization of $\mathcal{L}$ which finishes the proof of the lemma. In order to prove this we may work locall on $X$. Hence we may assume that $X=\operatorname{Spec}(A)$ is affine and that $\mathcal{L}$ is trivial. Then $A$ is a Noetherian normal domain and $t$ is an element of its fraction field such that $\operatorname{ord}_{A_{\mathfrak{p}}}(t)=0$ for all height 1 primes $\mathfrak{p}$ of $A$. Our goal is to show that $t$ is a unit of $A$. Since $A_{\mathfrak{p}}$ is a discrete valuation ring for height one primes of $A$ (Algebra, Lemma 10.149 .4 , the condition signifies that $t \in A_{\mathfrak{p}}^{*}$ for all primes $\mathfrak{p}$ of height 1 . This implies $t \in A$ and $t^{-1} \in A$ by Algebra, Lemma 10.149 .6 and the proof is complete.

0BE9 Lemma 30.22.7. Let $X$ be a locally Noetherian integral scheme. Consider the map 30.22.5.1) $\operatorname{Pic}(X) \rightarrow C l(X)$. The following are equivalent
(1) the local rings of $X$ are $U F D$ s, and
(2) $X$ is normal and $\operatorname{Pic}(X) \rightarrow C l(X)$ is surjective.

In this case $\operatorname{Pic}(X) \rightarrow C l(X)$ is an isomorphism.
Proof. If (1) holds, then $X$ is normal by Algebra, Lemma 10.119.9. Hence the map (30.22.5.1) is injective by Lemma 30.22 .6 Moreover, every prime divisor $D \subset X$ is an effective Cartier divisor by Lemma 30.12.7. In this case the canonical section $1_{D}$ of $\mathcal{O}_{X}(D)$ (Definition 30.11.14) vanishes exactly along $D$ and we see that the class of $D$ is the image of $\mathcal{O}_{X}(D)$ under the map (30.22.5.1). Thus the map is surjective as well.
Assume (2) holds. Pick a prime divisor $D \subset X$. Since 30.22 .5 .1 is surjective there exists an invertible sheaf $\mathcal{L}$, a regular meromorphic sectio $s$, and $f \in R(X)^{*}$ such that $\operatorname{div}_{\mathcal{L}}(s)+\operatorname{div}(f)=[D]$. In other words, $\operatorname{div}_{\mathcal{L}}(f s)=[D]$. Let $x \in X$
and let $A=\mathcal{O}_{X, x}$. Thus $A$ is a Noetherian local normal domain with fraction field $K=R(X)$. Every height 1 prime of $A$ corresponds to a prime divisor on $X$ and every invertible $\mathcal{O}_{X}$-module restricts to the trivial invertible module on $\operatorname{Spec}(A)$. It follows that for every height 1 prime $\mathfrak{p} \subset A$ there exists an element $f \in K$ such that $\operatorname{ord}_{A_{\mathfrak{p}}}(f)=1$ and $\operatorname{ord}_{A_{\mathfrak{p}^{\prime}}}(f)=0$ for every other height one prime $\mathfrak{p}^{\prime}$. Then $f \in A$ by Algebra, Lemma 10.149 .6 . Arguing in the same fashion we see that every element $g \in \mathfrak{p}$ is of the form $g=a f$ for some $a \in A$. Thus we see that every height one prime ideal of $A$ is principal and $A$ is a UFD by Algebra, Lemma 10.119.6.

### 30.23. More on invertible modules

0BD6 In this section we discuss some properties of invertible modules.
0BD7 Lemma 30.23.1. Let $\varphi: X \rightarrow Y$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{X}$-module. Assume that
(1) $X$ is locally Noetherian,
(2) $Y$ is locally Noetherian, integral, and normal,
(3) $\varphi$ is flat with integral (hence nonempty) fibres,
(4) $\varphi$ is either quasi-compact or locally of finite type,
(5) $\mathcal{L}$ is trivial when restricted to the generic fibre of $\varphi$.

Then $\mathcal{L} \cong \varphi^{*} \mathcal{N}$ for some invertible $\mathcal{O}_{Y}$-module $\mathcal{N}$.
Proof. Let $\xi \in Y$ be the generic point. Let $X_{\xi}$ be the scheme theoretic fibre of $\varphi$ over $\xi$. Denote $\mathcal{L}_{\xi}$ the pullback of $\mathcal{L}$ to $X_{\xi}$. Assumption (5) means that $\mathcal{L}_{\xi}$ is trivial. Choose a trivializing section $s \in \Gamma\left(X_{\xi}, \mathcal{L}_{\xi}\right)$. Observe that $X$ is integral by Lemma 30.9.7. Hence we can think of $s$ as a regular meromorphic section of $\mathcal{L}$. Pullbacks of meromorphic functions are defined for $\varphi$ by Lemma 30.20.4 Let $\mathcal{N} \subset \mathcal{K}_{Y}$ be the $\mathcal{O}_{Y}$-module whose sections over an open $V \subset Y$ are those meromorphic functions $g \in \mathcal{K}_{Y}(V)$ such that $\varphi^{*}(g) s \in \mathcal{L}\left(\varphi^{-1} V\right)$. A priori $\varphi^{*}(g) s$ is a section of $\mathcal{K}_{X}(\mathcal{L})$ over $\varphi^{-1} V$. We claim that $\mathcal{N}$ is an invertible $\mathcal{O}_{Y}$-module and that the map

$$
\varphi^{*} \mathcal{N} \longrightarrow \mathcal{L}, \quad g \longmapsto g s
$$

is an isomorphism.
We first prove the claim in the following situation: $X$ and $Y$ are affine and $\mathcal{L}$ trivial. Say $Y=\operatorname{Spec}(R), X=\operatorname{Spec}(A)$ and $s$ given by the element $s \in A \otimes_{R} K$ where $K$ is the fraction field of $R$. We can write $s=a / r$ for some nonzero $r \in R$ and $a \in A$. Since $s$ generates $\mathcal{L}$ on the generic fibre we see that there exists an $s^{\prime} \in A \otimes_{R} K$ such that $s s^{\prime}=1$. Thus we see that $s=r^{\prime} / a^{\prime}$ for some nonzero $r^{\prime} \in R$ and $a^{\prime} \in A$. Let $\mathfrak{p}_{1}, \ldots, \mathfrak{p}_{n} \subset R$ be the mininal primes over $r r^{\prime}$. Each $R_{\mathfrak{p}_{i}}$ is a discrete valuation ring (Algebra, Lemmas 10.59.10 and 10.149.4). By assumption $\mathfrak{q}_{i}=\mathfrak{p}_{i} A$ is a prime. Hence $\mathfrak{q}_{i} A_{\mathfrak{q}_{i}}$ is generated by a single element and we find that $A_{\mathfrak{q}_{i}}$ is a discrete valuation ring as well (Algebra, Lemma 10.118.7). Of course $R_{\mathfrak{p}_{i}} \rightarrow A_{\mathfrak{q}_{i}}$ has ramification index 1 . Let $e_{i}, e_{i}^{\prime} \geq 0$ be the valuation of $a, a^{\prime}$ in $A_{\mathfrak{q}_{i}}$. Then $e_{i}+e_{i}^{\prime}$ is the valuation of $r r^{\prime}$ in $R_{\mathfrak{p}_{i}}$. Note that

$$
\mathfrak{p}_{1}^{\left(e_{1}+e_{1}^{\prime}\right)} \cap \ldots \cap \mathfrak{p}_{i}^{\left(e_{n}+e_{n}^{\prime}\right)}=\left(r r^{\prime}\right)
$$

in $R$ by Algebra, Lemma 10.149.6. Set

$$
I=\mathfrak{p}_{1}^{\left(e_{1}\right)} \cap \ldots \cap \mathfrak{p}_{i}^{\left(e_{n}\right)} \quad \text { and } \quad I^{\prime}=\mathfrak{p}_{1}^{\left(e_{1}^{\prime}\right)} \cap \ldots \cap \mathfrak{p}_{i}^{\left(e_{n}^{\prime}\right)}
$$

so that $I I^{\prime} \subset\left(r r^{\prime}\right)$. Observe that

$$
I A=\left(\mathfrak{p}_{1}^{\left(e_{1}\right)} \cap \ldots \cap \mathfrak{p}_{i}^{\left(e_{n}\right)}\right) A=\left(\mathfrak{p}_{1} A\right)^{\left(e_{1}\right)} \cap \ldots \cap\left(\mathfrak{p}_{i} A\right)^{\left(e_{n}\right)}
$$

by Algebra, Lemmas 10.63 .3 and 10.38 .2 . Similarly for $I^{\prime} A$. Hence $a \in I A$ and $a^{\prime} \in I^{\prime} A$. We conclude that $I A \otimes_{A} I^{\prime} A \rightarrow r r^{\prime} A$ is surjective. By faithfull flatness of $R \rightarrow A$ we find that $I \otimes_{R} I^{\prime} \rightarrow\left(r r^{\prime}\right)$ is surjective as well. It follows that $I I^{\prime}=\left(r r^{\prime}\right)$ and $I$ and $I^{\prime}$ are finite locally free of rank 1, see Algebra, Lemma 10.119.14. Thus Zariski locally on $R$ we can write $I=(g)$ and $I^{\prime}=\left(g^{\prime}\right)$ with $g g^{\prime}=r r^{\prime}$. Then $a=u g$ and $a^{\prime}=u^{\prime} g^{\prime}$ for some $u, u^{\prime} \in A$. We conclude that $u, u^{\prime}$ are units. Thus Zariski locally on $R$ we have $s=u g / r$ and the claim follows in this case.
Let $y \in Y$ be a point. Pick $x \in X$ mapping to $y$. We may apply the result of the previous paragraph to $\operatorname{Spec}\left(\mathcal{O}_{X, x}\right) \rightarrow \operatorname{Spec}\left(\mathcal{O}_{Y, y}\right)$. We conclude there exists an element $g \in R(Y)^{*}$ well defined up to multiplication by an element of $\mathcal{O}_{Y, y}^{*}$ such that $\varphi^{*}(g) s$ generates $\mathcal{L}_{x}$. Hence $\varphi^{*}(g) s$ generates $\mathcal{L}$ in a neighbourhood $U$ of $x$. Suppose $x^{\prime}$ is a second point lying over $y$ and $g^{\prime} \in R(Y)^{*}$ is such that $\varphi^{*}\left(g^{\prime}\right) s$ generates $\mathcal{L}$ in an open neighbourhood $U^{\prime}$ of $x^{\prime}$. Then we can choose a point $x^{\prime \prime}$ in $U \cap U^{\prime} \cap \varphi^{-1}(\{y\})$ because the fibre is irreducible. By the uniqueness for the ring map $\mathcal{O}_{Y, y} \rightarrow \mathcal{O}_{X, x^{\prime \prime}}$ we find that $g$ and $g^{\prime}$ differ (multiplicatively) by an element in $\mathcal{O}_{Y, y}^{*}$. Hence we see that $\varphi^{*}(g) s$ is a generator for $\mathcal{L}$ on an open neighbourhood of $\varphi^{-1}(y)$. Let $Z \subset X$ be the set of points $z \in X$ such that $\varphi^{*}(g) s$ does not generate $\mathcal{L}_{z}$. The arguments above show that $Z$ is closed and that $Z=\varphi^{-1}(T)$ for some subset $T \subset Y$ with $y \notin T$. If we can show that $T$ is closed, then $g$ will be a generator for $\mathcal{N}$ as an $\mathcal{O}_{Y}$-module in the open neighbourhood $Y \backslash T$ of $y$ thereby finishing the proof (some details omitted).
If $\varphi$ is quasi-compact, then $T$ is closed by Morphisms, Lemma 28.25.10. If $\varphi$ is locally of finite type, then $\varphi$ is open by Morphisms, Lemma 28.25.9. Then $Y \backslash T$ is open as the image of the open $X \backslash Z$.
0BD8 Lemma 30.23.2. Let $X$ be a locally Noetherian scheme. Let $U \subset X$ be an open and let $D \subset U$ be an effective Cartier divisor. If $\mathcal{O}_{X, x}$ is a UFD for all $x \in X \backslash U$, then there exists an effective Cartier divisor $D^{\prime} \subset X$ with $D=U \cap D^{\prime}$.

Proof. Let $D^{\prime} \subset X$ be the scheme theoretic image of the morphism $D \rightarrow X$. Since $X$ is locally Noetherian the morphism $D \rightarrow X$ is quasi-compact, see Properties, Lemma 27.5.3. Hence the formation of $D^{\prime}$ commutes with passing to opens in $X$ by Morphisms, Lemma 28.6.3. Thus we may assume $X=\operatorname{Spec}(A)$ is affine. Let $I \subset A$ be the ideal corresponding to $D^{\prime}$. Let $\mathfrak{p} \subset A$ be a prime ideal corresponding to a point of $X \backslash U$. To finish the proof it is enough to show that $I_{\mathfrak{p}}$ is generated by one element, see Lemma 30.12.2. Thus we may replace $X$ by $\operatorname{Spec}\left(A_{\mathfrak{p}}\right)$, see Morphisms, Lemma 28.25.14. In other words, we may assume that $X$ is the spectrum of a local UFD $A$. Then all local rings of $A$ are UFD's. It follows that $D=\sum a_{i} D_{i}$ with $D_{i} \subset U$ an integral effective Cartier divisor, see Lemma 30.12.9. The generic points $\xi_{i}$ of $D_{i}$ correspond to prime ideals $\mathfrak{p}_{i} \subset A$ of height 1 , see Lemma 30.12.3. Then $\mathfrak{p}_{i}=\left(f_{i}\right)$ for some prime element $f_{i} \in A$ and we conclude that $D^{\prime}$ is cut out by $\prod f_{i}^{a_{i}}$ as desired.

0BD9 Lemma 30.23.3. Let $X$ be a locally Noetherian scheme. Let $U \subset X$ be an open and let $\mathcal{L}$ be an invertible $\mathcal{O}_{U}$-module. If $\mathcal{O}_{X, x}$ is a UFD for all $x \in X \backslash U$, then there exists an invertible $\mathcal{O}_{X}$-module $\mathcal{L}^{\prime}$ with $\left.\mathcal{L} \cong \mathcal{L}^{\prime}\right|_{U}$.

Proof. Choose $x \in X, x \notin U$. We will show there exists an affine open neighbourhood $W \subset X$, such that $\left.\mathcal{L}\right|_{W \cap U}$ extends to an invertible sheaf on $W$. This implies by glueing of sheaves (Sheaves, Section 6.33) that we can extend $\mathcal{L}$ to the strictly bigger open $U \cup W$. Let $W=\operatorname{Spec}(A)$ be an affine open neighbourhood. Since $U \cap W$ is quasi-affine, we see that we can can write $\left.\mathcal{L}\right|_{W \cap U}$ as $\mathcal{O}\left(D_{1}\right) \otimes \mathcal{O}\left(D_{2}\right)^{\otimes-1}$ for some effective Cartier divisors $D_{1}, D_{2} \subset W \cap U$, see Lemma 30.12.10. Then $D_{1}$ and $D_{2}$ extend to effective Cartier divisors of $W$ by Lemma 30.23 .2 which gives us the extension of the invertible sheaf.
If $X$ is Noetherian (which is the case most used in practice), the above combined with Noetherian induction finishes the proof. In the general case we argue as follows. First, because every local ring of a point outside of $U$ is a domain and $X$ is locally Noetherian, we see that the closure of $U$ in $X$ is open. Thus we may assume that $U \subset X$ is dense and schematically dense. Now we consider the set $T$ of triples $\left(U^{\prime}, \mathcal{L}^{\prime}, \alpha\right)$ where $U \subset U^{\prime} \subset X$ is an open subscheme, $\mathcal{L}^{\prime}$ is an invertible $\mathcal{O}_{U^{\prime}}$-module, and $\alpha:\left.\mathcal{L}^{\prime}\right|_{U} \rightarrow \mathcal{L}$ is an isomorphism. We endow $T$ with a partial ordering $\leq$ defined by the rule $\left(U^{\prime}, \mathcal{L}^{\prime}, \alpha\right) \leq\left(U^{\prime \prime}, \mathcal{L}^{\prime \prime}, \alpha^{\prime}\right)$ if and only if $U^{\prime} \subset U^{\prime \prime}$ and there exists an isomorphism $\beta:\left.\mathcal{L}^{\prime \prime}\right|_{U^{\prime}} \rightarrow \mathcal{L}^{\prime}$ compatible with $\alpha$ and $\alpha^{\prime}$. Observe that $\beta$ is unique (if it exists) because $U \subset X$ is dense. The first part of the proof shows that for any element $t=\left(U^{\prime}, \mathcal{L}^{\prime}, \alpha\right)$ of $T$ with $U^{\prime} \neq X$ there exists a $t^{\prime} \in T$ with $t^{\prime}>t$. Hence to finish the proof it suffices to show that Zorn's lemma applies. Thus consider a totally ordered subset $I \subset T$. If $i \in I$ corresponds to the triple ( $U_{i}, \mathcal{L}_{i}, \alpha_{i}$ ), then we can construct an invertible module $\mathcal{L}^{\prime}$ on $U^{\prime}=\bigcup U_{i}$ as follows. For $W \subset U^{\prime}$ open and quasi-compact we see that $W \subset U_{i}$ for some $i$ and we set

$$
\mathcal{L}^{\prime}(W)=\mathcal{L}_{i}(W)
$$

For the transition maps we use the $\beta$ 's (which are unique and hence compose correctly). This defines an invertible $\mathcal{O}$-module $\mathcal{L}^{\prime}$ on the basis of quasi-compact opens of $U^{\prime}$ which is sufficent to define an invertible module (Sheaves, Section 6.30). We omit the details.
OBDA Lemma 30.23.4. Let $R$ be a UFD. The Picard groups of the following are trivial.
(1) $\operatorname{Spec}(R)$ and any open subscheme of it.
(2) $\mathbf{A}_{R}^{n}=\operatorname{Spec}\left(R\left[x_{1}, \ldots, x_{n}\right]\right)$ and any open subscheme of it.

In particular, the Picard group of any open subscheme of affine $n$-space $\mathbf{A}_{k}^{n}$ over a field $k$ is trivial.

Proof. Since $R$ is a UFD so is any localization of it and any polynomial ring over it (Algebra, Lemma 10.119.8). Thus if $U \subset \mathbf{A}_{R}^{n}$ is open, then the map $\operatorname{Pic}\left(\mathbf{A}_{R}^{n}\right) \rightarrow$ $\operatorname{Pic}(U)$ is surjective by Lemma 30.23 .3 . The vanishing of $\operatorname{Pic}\left(\mathbf{A}_{R}^{n}\right)$ is equivalent to the vanishing of the picard group of the UFD $R\left[x_{1}, \ldots, x_{n}\right]$ which is proved in More on Algebra, Lemma 15.83 .3

### 30.24. Relative Proj

07ZW Some results on relative Proj. First some very basic results. Recall that a relative Proj is always separated over the base, see Constructions, Lemma 26.16.9.

07ZX Lemma 30.24.1. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. If one of the following holds
(1) $\mathcal{A}$ is of finite type as a sheaf of $\mathcal{A}_{0}$-algebras,
(2) $\mathcal{A}$ is generated by $\mathcal{A}_{1}$ as an $\mathcal{A}_{0}$-algebra and $\mathcal{A}_{1}$ is a finite type $\mathcal{A}_{0}$-module,
(3) there exists a finite type quasi-coherent $\mathcal{A}_{0}$-submodule $\mathcal{F} \subset \mathcal{A}_{+}$such that $\mathcal{A}_{+} / \mathcal{F} \mathcal{A}$ is a locally nilpotent sheaf of ideals of $\mathcal{A} / \mathcal{F} \mathcal{A}$,
then $p$ is quasi-compact.
Proof. The question is local on the base, see Schemes, Lemma 25.19.2. Thus we may assume $S$ is affine. Say $S=\operatorname{Spec}(R)$ and $\mathcal{A}$ corresponds to the graded $R$ algebra $A$. Then $X=\operatorname{Proj}(A)$, see Constructions, Section 26.15. In case (1) we may after possibly localizing more assume that $A$ is generated by homogeneous elements $f_{1}, \ldots, f_{n} \in A_{+}$over $A_{0}$. Then $A_{+}=\left(f_{1}, \ldots, f_{n}\right)$ by Algebra, Lemma 10.57.1. In case (3) we see that $\mathcal{F}=\widetilde{M}$ for some finite type $A_{0}$-module $M \subset A_{+}$. Say $M=\sum A_{0} f_{i}$. Say $f_{i}=\sum f_{i, j}$ is the decomposition into homogeneous pieces. The condition in (3) signifies that $A_{+} \subset \sqrt{\left(f_{i, j}\right)}$. Thus in both cases we conclude that $\operatorname{Proj}(A)$ is quasi-compact by Constructions, Lemma 26.8.9. Finally, (2) follows from (1).

07ZY Lemma 30.24.2. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. If $\mathcal{A}$ is of finite type as a sheaf of $\mathcal{O}_{S}$-algebras, then $p$ is of finite type.

Proof. The assumption implies that $p$ is quasi-compact, see Lemma 30.24.1. Hence it suffices to show that $p$ is locally of finite type. Thus the question is local on the base and target, see Morphisms, Lemma 28.15.2. Say $S=\operatorname{Spec}(R)$ and $\mathcal{A}$ corresponds to the graded $R$-algebra $A$. After further localizing on $S$ we may assume that $A$ is a finite type $R$-algebra. The scheme $X$ is constructed out of glueing the spectra of the rings $A_{(f)}$ for $f \in A_{+}$homogeneous. Each of these is of finite type over $R$ by Algebra, Lemma 10.56.9. Thus $\operatorname{Proj}(A)$ is of finite type over $R$.

07ZZ Lemma 30.24.3. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. If $\mathcal{O}_{S} \rightarrow \mathcal{A}_{0}$ is an integral algebra mar ${ }^{3}$ and $\mathcal{A}$ is of finite type as an $\mathcal{A}_{0}$-algebra, then $p$ is universally closed.

Proof. The question is local on the base. Thus we may assume that $X=\operatorname{Spec}(R)$ is affine. Let $\mathcal{A}$ be the quasi-coherent $\mathcal{O}_{X}$-algebra associated to the graded $R$ algebra $A$. The assumption is that $R \rightarrow A_{0}$ is integral and $A$ is of finite type over $A_{0}$. Write $X \rightarrow \operatorname{Spec}(R)$ as the composition $X \rightarrow \operatorname{Spec}\left(A_{0}\right) \rightarrow \operatorname{Spec}(R)$. Since $R \rightarrow A_{0}$ is an integral ring map, we see that $\operatorname{Spec}\left(A_{0}\right) \rightarrow \operatorname{Spec}(R)$ is universally closed, see Morphisms, Lemma 28.43.7. The quasi-compact (see Constructions, Lemma 26.8.9 morphism

$$
X=\operatorname{Proj}(A) \rightarrow \operatorname{Spec}\left(A_{0}\right)
$$

satisfies the existence part of the valuative criterion by Constructions, Lemma 26.8 .11 and hence it is universally closed by Schemes, Proposition 25.20.6. Thus $X \rightarrow \operatorname{Spec}(R)$ is universally closed as a composition of universally closed morphisms.

[^84]0800 Lemma 30.24.4. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S^{-}}$-algebra. Let $p: X=\underline{\operatorname{Proj}}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. The following conditions are equivalent
(1) $\mathcal{A}_{0}$ is a finite type $\mathcal{O}_{S}$-module and $\mathcal{A}$ is of finite type as an $\mathcal{A}_{0}$-algebra,
(2) $\mathcal{A}_{0}$ is a finite type $\mathcal{O}_{S}$-module and $\mathcal{A}$ is of finite type as an $\mathcal{O}_{S}$-algebra If these conditions hold, then $p$ is locally projective and in particular proper.

Proof. Assume that $\mathcal{A}_{0}$ is a finite type $\mathcal{O}_{S}$-module. Choose an affine open $U=$ $\operatorname{Spec}(R) \subset X$ such that $\mathcal{A}$ corresponds to a graded $R$-algebra $A$ with $A_{0}$ a finite $R$-module. Condition (1) means that (after possibly localizing further on $S$ ) that $A$ is a finite type $A_{0}$-algebra and condition (2) means that (after possibly localizing further on $S$ ) that $A$ is a finite type $R$-algebra. Thus these conditions imply each other by Algebra, Lemma 10.6.2.
A locally projective morphism is proper, see Morphisms, Lemma 28.42.5. Thus we may now assume that $S=\operatorname{Spec}(R)$ and $X=\operatorname{Proj}(A)$ and that $A_{0}$ is finite over $R$ and $A$ of finite type over $R$. We will show that $X=\operatorname{Proj}(A) \rightarrow \operatorname{Spec}(R)$ is projective. We urge the reader to prove this for themselves, by directly constructing a closed immersion of $X$ into a projective space over $R$, instead of reading the argument we give below.
By Lemma 30.24 .2 we see that $X$ is of finite type over $\operatorname{Spec}(R)$. Constructions, Lemma 26.10.6 tells us that $\mathcal{O}_{X}(d)$ is ample on $X$ for some $d \geq 1$ (see Properties, Section 27.26). Hence $X \rightarrow \operatorname{Spec}(R)$ is quasi-projective (by Morphisms, Definition 28.40 .1 . By Morphisms, Lemma 28.42 .13 we conclude that $X$ is isomorphic to an open subscheme of a scheme projective over $\operatorname{Spec}(R)$. Therefore, to finish the proof, it suffices to show that $X \rightarrow \operatorname{Spec}(R)$ is universally closed (use Morphisms, Lemma 28.41.7. This follows from Lemma 30.24.3.

0B3U Lemma 30.24.5. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. If $\mathcal{A}$ is generated by $\mathcal{A}_{1}$ over $\mathcal{A}_{0}$ and $\mathcal{A}_{1}$ is a finite type $\mathcal{O}_{S}$-module, then $p$ is projective.
Proof. Namely, the morphism associated to the graded $\mathcal{O}_{S}$-algebra map

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}\left(\mathcal{A}_{1}\right) \longrightarrow \mathcal{A}
$$

is a closed immersion $X \rightarrow \mathbf{P}\left(\mathcal{A}_{1}\right)$, see Constructions, Lemma 26.18.5.

### 30.25. Closed subschemes of relative proj

084M Some auxiliary lemmas about closed subschemes of relative proj.
0801 Lemma 30.25.1. Let $S$ be a scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. Let $i: Z \rightarrow X$ be a closed subscheme. Denote $\mathcal{I} \subset \mathcal{A}$ the kernel of the canonical map

$$
\mathcal{A} \longrightarrow \bigoplus_{d \geq 0} p_{*}\left(\left(i_{*} \mathcal{O}_{Z}\right)(d)\right)
$$

If $p$ is quasi-compact, then there is an isomorphism $Z=\underline{\operatorname{Proj}}_{S}(\mathcal{A} / \mathcal{I})$.
Proof. The morphism $p$ is separated by Constructions, Lemma 26.16.9. As $p$ is quasi-compact, $p_{*}$ transforms quasi-coherent modules into quasi-coherent modules, see Schemes, Lemma 25.24.1. Hence $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{S}$-module. In particular, $\mathcal{B}=\mathcal{A} / \mathcal{I}$ is a quasi-coherent graded $\mathcal{O}_{S}$-algebra. The functoriality morphism
$Z^{\prime}=\underline{\operatorname{Proj}}_{S}(\mathcal{B}) \rightarrow \operatorname{Proj}_{S}(\mathcal{A})$ is everywhere defined and a closed immersion, see Constructions, Lemma 26.18.3. Hence it suffices to prove $Z=Z^{\prime}$ as closed subschemes of $X$.
Having said this, the question is local on the base and we may assume that $S=$ $\operatorname{Spec}(R)$ and that $X=\operatorname{Proj}(A)$ for some graded $R$-algebra $A$. Assume $\mathcal{I}=\widetilde{I}$ for $I \subset A$ a graded ideal. By Constructions, Lemma 26.8 .9 there exist $f_{0}, \ldots, f_{n} \in A_{+}$ such that $A_{+} \subset \sqrt{\left(f_{0}, \ldots, f_{n}\right)}$ in other words $X=\bigcup D_{+}\left(f_{i}\right)$. Therefore, it suffices to check that $Z \cap D_{+}\left(f_{i}\right)=Z^{\prime} \cap D_{+}\left(f_{i}\right)$ for each $i$. By renumbering we may assume $i=0$. Say $Z \cap D_{+}\left(f_{0}\right)$, resp. $Z^{\prime} \cap D_{+}\left(f_{0}\right)$ is cut out by the ideal $J$, resp. $J^{\prime}$ of $A_{\left(f_{0}\right)}$.
The inclusion $J^{\prime} \subset J$. Let $d$ be the least common multiple of $\operatorname{deg}\left(f_{0}\right), \ldots, \operatorname{deg}\left(f_{n}\right)$. Note that each of the twists $\mathcal{O}_{X}(n d)$ is invertible, trivialized by $f_{i}^{n d / \operatorname{deg}\left(f_{i}\right)}$ over $D_{+}\left(f_{i}\right)$, and that for any quasi-coherent module $\mathcal{F}$ on $X$ the multiplication maps $\mathcal{O}_{X}(n d) \otimes_{\mathcal{O}_{X}} \mathcal{F}(m) \rightarrow \mathcal{F}(n d+m)$ are isomorphisms, see Constructions, Lemma 26.10.2. Observe that $J^{\prime}$ is the ideal generated by the elements $g / f_{0}^{e}$ where $g \in I$ is homogeneous of degree $e \operatorname{deg}\left(f_{0}\right)$ (see proof of Constructions, Lemma 26.11.3). Of course, by replacing $g$ by $f_{0}^{l} g$ for suitable $l$ we may always assume that $d \mid e$. Then, since $g$ vanishes as a section of $\mathcal{O}_{X}\left(e \operatorname{deg}\left(f_{0}\right)\right)$ restricted to $Z$ we see that $g / f_{0}^{d}$ is an element of $J$. Thus $J^{\prime} \subset J$.
Conversely, suppose that $g / f_{0}^{e} \in J$. Again we may assume $d \mid e$. Pick $i \in\{1, \ldots, n\}$. Then $Z \cap D_{+}\left(f_{i}\right)$ is cut out by some ideal $J_{i} \subset A_{\left(f_{i}\right)}$. Moreover,

$$
J \cdot A_{\left(f_{0} f_{i}\right)}=J_{i} \cdot A_{\left(f_{0} f_{i}\right)}
$$

The right hand side is the localization of $J_{i}$ with respect to $f_{0}^{\operatorname{deg}\left(f_{i}\right)} / f_{i}^{\operatorname{deg}\left(f_{0}\right)}$. It follows that

$$
f_{0}^{e_{i}} g / f_{i}^{\left(e_{i}+e\right) \operatorname{deg}\left(f_{0}\right) / \operatorname{deg}\left(f_{i}\right)} \in J_{i}
$$

for some $e_{i} \gg 0$ sufficiently divisible. This proves that $f_{0}^{\max \left(e_{i}\right)} g$ is an element of $I$, because its restriction to each affine open $D_{+}\left(f_{i}\right)$ vanishes on the closed subscheme $Z \cap D_{+}\left(f_{i}\right)$. Hence $g \in J^{\prime}$ and we conclude $J \subset J^{\prime}$ as desired.

In case the closed subscheme is locally cut out by finitely many equations we can define it by a finite type ideal sheaf of $\mathcal{A}$.

0802 Lemma 30.25.2. Let $S$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. Let $i: Z \rightarrow X$ be a closed subscheme. If $p$ is quasi-compact and $i$ of finite presentation, then there exists $a d>0$ and a quasi-coherent finite type $\mathcal{O}_{S}$-submodule $\mathcal{F} \subset \mathcal{A}_{d}$ such that $Z=\underline{\operatorname{Proj}}_{S}(\mathcal{A} / \mathcal{F} \mathcal{A})$.

Proof. By Lemma 30.25 .1 we know there exists a quasi-coherent graded sheaf of ideals $\mathcal{I} \subset \mathcal{A}$ such that $Z=\underline{\operatorname{Proj}}(\mathcal{A} / \mathcal{I})$. Since $S$ is quasi-compact we can choose a finite affine open covering $\overline{S=} U_{1} \cup \ldots \cup U_{n}$. Say $U_{i}=\operatorname{Spec}\left(R_{i}\right)$. Let $\left.\mathcal{A}\right|_{U_{i}}$ correspond to the graded $R_{i}$-algebra $A_{i}$ and $\left.\mathcal{I}\right|_{U_{i}}$ to the graded ideal $I_{i} \subset A_{i}$. Note that $p^{-1}\left(U_{i}\right)=\operatorname{Proj}\left(A_{i}\right)$ as schemes over $R_{i}$. Since $p$ is quasi-compact we can choose finitely many homogeneous elements $f_{i, j} \in A_{i,+}$ such that $p^{-1}\left(U_{i}\right)=D_{+}\left(f_{i, j}\right)$. The condition on $Z \rightarrow X$ means that the ideal sheaf of $Z$ in $\mathcal{O}_{X}$ is of finite type, see Morphisms, Lemma 28.21.7. Hence we can find finitely many homogeneous elements $h_{i, j, k} \in I_{i} \cap A_{i,+}$ such that the ideal of $Z \cap D_{+}\left(f_{i, j}\right)$ is generated by the elements $h_{i, j, k} / f_{i, j}^{e_{i, j, k}}$. Choose $d>0$ to be a common multiple of all the integers $\operatorname{deg}\left(f_{i, j}\right)$
and $\operatorname{deg}\left(h_{i, j, k}\right)$. By Properties, Lemma 27.22.7 there exists a finite type $\mathcal{F} \subset \mathcal{I}_{d}$ such that all the local sections

$$
h_{i, j, k} f_{i, j}^{\left(d-\operatorname{deg}\left(h_{i, j, k}\right)\right) / \operatorname{deg}\left(f_{i, j}\right)}
$$

are sections of $\mathcal{F}$. By construction $\mathcal{F}$ is a solution.
The following version of Lemma 30.25 .2 will be used in the proof of Lemma 30.28.2.
0803 Lemma 30.25.3. Let $S$ be a quasi-compact and quasi-separated scheme. Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_{S}$-algebra. Let $p: X=\operatorname{Proj}_{S}(\mathcal{A}) \rightarrow S$ be the relative Proj of $\mathcal{A}$. Let $i: Z \rightarrow X$ be a closed subscheme. Let $\bar{U} \subset X$ be an open. Assume that
(1) $p$ is quasi-compact,
(2) $i$ of finite presentation,
(3) $U \cap p(i(Z))=\emptyset$,
(4) $U$ is quasi-compact,
(5) $\mathcal{A}_{n}$ is a finite type $\mathcal{O}_{S}$-module for all $n$.

Then there exists a $d>0$ and a quasi-coherent finite type $\mathcal{O}_{S}$-submodule $\mathcal{F} \subset \mathcal{A}_{d}$ with (a) $Z=\underline{\operatorname{Proj}}_{S}(\mathcal{A} / \mathcal{F} \mathcal{A})$ and (b) the support of $\mathcal{A}_{d} / \mathcal{F}$ is disjoint from $U$.
Proof. Let $\mathcal{I} \subset \mathcal{A}$ be the sheaf of quasi-coherent graded ideals constructed in Lemma 30.25.1. Let $U_{i}, R_{i}, A_{i}, I_{i}, f_{i, j}, h_{i, j, k}$, and $d$ be as constructed in the proof of Lemma 30.25 .2 . Since $U \cap p(i(Z))=\emptyset$ we see that $\left.\mathcal{I}_{d}\right|_{U}=\left.\mathcal{A}_{d}\right|_{U}$ (by our construction of $\mathcal{I}$ as a kernel). Since $U$ is quasi-compact we can choose a finite affine open covering $U=W_{1} \cup \ldots \cup W_{m}$. Since $\mathcal{A}_{d}$ is of finite type we can find finitely many sections $g_{t, s} \in \mathcal{A}_{d}\left(W_{t}\right)$ which generate $\left.\mathcal{A}_{d}\right|_{W_{t}}=\left.\mathcal{I}_{d}\right|_{W_{t}}$ as an $\mathcal{O}_{W_{t}}$-module. To finish the proof, note that by Properties, Lemma 27.22 .7 there exists a finite type $\mathcal{F} \subset \mathcal{I}_{d}$ such that all the local sections

$$
h_{i, j, k} f_{i, j}^{\left(d-\operatorname{deg}\left(h_{i, j, k}\right)\right) / \operatorname{deg}\left(f_{i, j}\right)} \quad \text { and } \quad g_{t, s}
$$

are sections of $\mathcal{F}$. By construction $\mathcal{F}$ is a solution.
0B3V Lemma 30.25.4. Let $X$ be a scheme. Let $\mathcal{E}$ be a quasi-coherent $\mathcal{O}_{X}$-module. There is a bijection

$$
\left\{\begin{array}{c}
\text { sections } \sigma \text { of the } \\
\text { morphism } \mathbf{P}(\mathcal{E}) \rightarrow X
\end{array}\right\} \leftrightarrow\left\{\begin{array}{c}
\text { surjections } \mathcal{E} \rightarrow \mathcal{L} \text { where } \\
\mathcal{L} \text { is an invertible } \mathcal{O}_{X} \text {-module }
\end{array}\right\}
$$

In this case $\sigma$ is a closed immersion and there is a canonical isomorphism

$$
\operatorname{Ker}(\mathcal{E} \rightarrow \mathcal{L}) \otimes_{\mathcal{O}_{X}} \mathcal{L}^{\otimes-1} \longrightarrow \mathcal{C}_{\sigma(X) / \mathbf{P}(\mathcal{E})}
$$

Both the bijection and isomorphism are compatible with base change.
Proof. Recall that $\pi: \mathbf{P}(\mathcal{E}) \rightarrow X$ is the relative proj of the symmetric algebra on $\mathcal{E}$, see Constructions, Definition 26.21.1. Hence the descriptions of sections $\sigma$ follows immediately from the description of the functor of points of $\mathbf{P}(\mathcal{E})$ in Constructions, Lemma 26.16.11. Since $\pi$ is separated, any section is a closed immersion (Constructions, Lemma 26.16.9 and Schemes, Lemma 25.21.12). Let $U \subset X$ be an affine open and $k \in \mathcal{E}(U)$ and $s \in \mathcal{E}(U)$ be local sections such that $k$ maps to zero in $\mathcal{L}$ and $s$ maps to a generator $\bar{s}$ of $\mathcal{L}$. Then $f=k / s$ is a section of $\mathcal{O}_{\mathbf{P}(\mathcal{E})}$ defined in an open neighbourhood $D_{+}(s)$ of $s(U)$ in $\pi^{-1}(U)$. Moreover, since $k$ maps to zero in $\mathcal{L}$ we see that $f$ is a section of the ideal sheaf of $s(U)$ in $\pi^{-1}(U)$. Thus we can take the image $\bar{f}$ of $f$ in $\mathcal{C}_{\sigma(X) / \mathbf{P}(\mathcal{E})}(U)$. We claim (1) that the image $\bar{f}$
depends only on the sections $k$ and $\bar{s}$ and not on the choice of $s$ and (2) that we get an isomorphism over $U$ in this manner (see below). However, once (1) and (2) are esthablished, we see that the construction is compatible with base change by $U^{\prime} \rightarrow U$ where $U^{\prime}$ is affine, which proves that these local maps glue and are compatible with arbitrary base change.
To prove (1) and (2) we make explicit what is going on. Namely, say $U=\operatorname{Spec}(A)$ and say $\mathcal{E} \rightarrow \mathcal{L}$ corresponds to the map of $A$-modules $M \rightarrow N$. Then $k \in K=$ $\operatorname{Ker}(M \rightarrow N)$ and $s \in M$ maps to a generator $\bar{s}$ of $N$. Hence $M=K \oplus A s$. Thus

$$
\operatorname{Sym}(M)=\operatorname{Sym}(K)[s]
$$

Consider the identification $\operatorname{Sym}(K) \rightarrow \operatorname{Sym}(M)_{(s)}$ via the rule $g \mapsto g / s^{n}$ for $g \in \operatorname{Sym}^{n}(K)$. This gives an isomorphism $D_{+}(s)=\operatorname{Spec}(\operatorname{Sym}(K))$ such that $\sigma$ corresponds to the ring map $\operatorname{Sym}(K) \rightarrow A$ mapping $K$ to zero. Via this isomorphism we see that the quasi-coherent module corresponding to $K$ is identified with $\mathcal{C}_{\sigma(U) / D_{+}(s)}$ proving (2). Finally, suppose that $s^{\prime}=k^{\prime}+s$ for some $k^{\prime} \in K$. Then

$$
k / s^{\prime}=(k / s)\left(s / s^{\prime}\right)=(k / s)\left(s^{\prime} / s\right)^{-1}=(k / s)\left(1+k^{\prime} / s\right)^{-1}
$$

in an open neighbourhood of $\sigma(U)$ in $D_{+}(s)$. Thus we see that $s^{\prime} / s$ restricts to 1 on $\sigma(U)$ and we see that $k / s^{\prime}$ maps to the same element of the conormal sheaf as does $k / s$ thereby proving (1).

### 30.26. Blowing up

01OF Blowing up is an important tool in algebraic geometry.
01OG Definition 30.26.1. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals, and let $Z \subset X$ be the closed subscheme corresponding to $\mathcal{I}$, see Schemes, Definition 25.10.2. The blowing up of $X$ along $Z$, or the blowing up of $X$ in the ideal sheaf $\mathcal{I}$ is the morphism

$$
b: \underline{\operatorname{Proj}}_{X}\left(\bigoplus_{n \geq 0} \mathcal{I}^{n}\right) \longrightarrow X
$$

The exceptional divisor of the blow up is the inverse image $b^{-1}(Z)$. Sometimes $Z$ is called the center of the blowup.

We will see later that the exceptional divisor is an effective Cartier divisor. Moreover, the blowing up is characterized as the "smallest" scheme over $X$ such that the inverse image of $Z$ is an effective Cartier divisor.
If $b: X^{\prime} \rightarrow X$ is the blow up of $X$ in $Z$, then we often denote $\mathcal{O}_{X^{\prime}}(n)$ the twists of the structure sheaf. Note that these are invertible $\mathcal{O}_{X^{\prime}}$-modules and that $\mathcal{O}_{X^{\prime}}(n)=$ $\mathcal{O}_{X^{\prime}}(1)^{\otimes n}$ because $X^{\prime}$ is the relative Proj of a quasi-coherent graded $\mathcal{O}_{X}$-algebra which is generated in degree 1 , see Constructions, Lemma 26.16.11. Note that $\mathcal{O}_{X^{\prime}}(1)$ is $b$-relatively very ample, even though $b$ need not be of finite type or even quasi-compact, because $X^{\prime}$ comes equipped with a closed immersion into $\mathbf{P}(\mathcal{I})$, see Morphisms, Example 28.38.3.

0804 Lemma 30.26.2. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $U=\operatorname{Spec}(A)$ be an affine open subscheme of $X$ and let $I \subset A$ be the ideal corresponding to $\left.\mathcal{I}\right|_{U}$. If $b: X^{\prime} \rightarrow X$ is the blow up of $X$ in $\mathcal{I}$, then there is a canonical isomorphism

$$
b^{-1}(U)=\operatorname{Proj}\left(\bigoplus_{d \geq 0} I^{d}\right)
$$

of $b^{-1}(U)$ with the homogeneous spectrum of the Rees algebra of $I$ in $A$. Moreover, $b^{-1}(U)$ has an affine open covering by spectra of the affine blowup algebras $A\left[\frac{I}{a}\right]$.
Proof. The first statement is clear from the construction of the relative Proj via glueing, see Constructions, Section 26.15. For $a \in I$ denote $a^{(1)}$ the element $a$ seen as an element of degree 1 in the Rees algebra $\bigoplus_{n \geq 0} I^{n}$. Since these elements generate the Rees algebra over $A$ we see that $\operatorname{Proj}\left(\bigoplus_{d \geq 0} I^{d}\right)$ is covered by the affine opens $D_{+}\left(a^{(1)}\right)$. The affine scheme $D_{+}\left(a^{(1)}\right)$ is the spectrum of the affine blowup algebra $A^{\prime}=A\left[\frac{I}{a}\right]$, see Algebra, Definition 10.69.1. This finishes the proof.

0805 Lemma 30.26.3. Let $X_{1} \rightarrow X_{2}$ be a flat morphism of schemes. Let $Z_{2} \subset X_{2}$ be a closed subscheme. Let $Z_{1}$ be the inverse image of $Z_{2}$ in $X_{1}$. Let $X_{i}^{\prime}$ be the blow up of $Z_{i}$ in $X_{i}$. Then there exists a cartesian diagram

of schemes.
Proof. Let $\mathcal{I}_{2}$ be the ideal sheaf of $Z_{2}$ in $X_{2}$. Denote $g: X_{1} \rightarrow X_{2}$ the given morphism. Then the ideal sheaf $\mathcal{I}_{1}$ of $Z_{1}$ is the image of $g^{*} \mathcal{I}_{2} \rightarrow \mathcal{O}_{X_{1}}$ (by definition of the inverse image, see Schemes, Definition 25.17.7). By Constructions, Lemma 26.16.10 we see that $X_{1} \times_{X_{2}} X_{2}^{\prime}$ is the relative Proj of $\bigoplus_{n \geq 0} g^{*} \mathcal{I}_{2}^{n}$. Because $g$ is flat the map $g^{*} \mathcal{I}_{2}^{n} \rightarrow \mathcal{O}_{X_{1}}$ is injective with image $\mathcal{I}_{1}^{n}$. Thus we see that $X_{1} \times X_{2} X_{2}^{\prime}=$ $X_{1}^{\prime}$.

02OS Lemma 30.26.4. Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme. The blowing up $b: X^{\prime} \rightarrow X$ of $Z$ in $X$ has the following properties:
(1) $\left.b\right|_{b^{-1}(X \backslash Z)}: b^{-1}(X \backslash Z) \rightarrow X \backslash Z$ is an isomorphism,
(2) the exceptional divisor $E=b^{-1}(Z)$ is an effective Cartier divisor on $X^{\prime}$,
(3) there is a canonical isomorphism $\mathcal{O}_{X^{\prime}}(-1)=\mathcal{O}_{X^{\prime}}(E)$

Proof. As blowing up commutes with restrictions to open subschemes (Lemma 30.26 .3 the first statement just means that $X^{\prime}=X$ if $Z=\emptyset$. In this case we are blowing up in the ideal sheaf $\mathcal{I}=\mathcal{O}_{X}$ and the result follows from Constructions, Example 26.8.14.

The second statement is local on $X$, hence we may assume $X$ affine. Say $X=$ $\operatorname{Spec}(A)$ and $Z=\operatorname{Spec}(A / I)$. By Lemma 30.26 .2 we see that $X^{\prime}$ is covered by the spectra of the affine blowup algebras $A^{\prime}=A\left[\frac{1}{a}\right]$. Then $I A^{\prime}=a A^{\prime}$ and $a$ maps to a nonzerodivisor in $A^{\prime}$ according to Algebra, Lemma 10.69.2. This proves the lemma as the inverse image of $Z$ in $\operatorname{Spec}\left(A^{\prime}\right)$ corresponds to $\operatorname{Spec}\left(A^{\prime} / I A^{\prime}\right) \subset \operatorname{Spec}\left(A^{\prime}\right)$.
Consider the canonical map $\psi_{u n i v, 1}: b^{*} \mathcal{I} \rightarrow \mathcal{O}_{X^{\prime}}(1)$, see discussion following Constructions, Definition 26.16.7. We claim that this factors through an isomorphism $\mathcal{I}_{E} \rightarrow \mathcal{O}_{X^{\prime}}(1)$ (which proves the final assertion). Namely, on the affine open corresponding to the blowup algebra $A^{\prime}=A\left[\frac{I}{a}\right]$ mentioned above $\psi_{u n i v, 1}$ corresponds to the $A^{\prime}$-module map

$$
I \otimes_{A} A^{\prime} \longrightarrow\left(\left(\bigoplus_{d \geq 0} I^{d}\right)_{a^{(1)}}\right)_{1}
$$

where $a^{(1)}$ is as in Algebra, Definition 10.69.1. We omit the verification that this is the map $I \otimes_{A} A^{\prime} \rightarrow I A^{\prime}=a A^{\prime}$.

0806 Lemma 30.26.5 (Universal property blowing up). Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme. Let $\mathcal{C}$ be the full subcategory of $(S c h / X)$ consisting of $Y \rightarrow X$ such that the inverse image of $Z$ is an effective Cartier divisor on $Y$. Then the blowing up $b: X^{\prime} \rightarrow X$ of $Z$ in $X$ is a final object of $\mathcal{C}$.

Proof. We see that $b: X^{\prime} \rightarrow X$ is an object of $\mathcal{C}$ according to Lemma 30.26.4. Let $f: Y \rightarrow X$ be an object of $\mathcal{C}$. We have to show there exists a unique morphism $Y \rightarrow X^{\prime}$ over $X$. Let $D=f^{-1}(Z)$. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be the ideal sheaf of $Z$ and let $\mathcal{I}_{D}$ be the ideal sheaf of $D$. Then $f^{*} \mathcal{I} \rightarrow \mathcal{I}_{D}$ is a surjection to an invertible $\mathcal{O}_{Y}$-module. This extends to a map $\psi: \bigoplus f^{*} \mathcal{I}^{d} \rightarrow \bigoplus \mathcal{I}_{D}^{d}$ of graded $\mathcal{O}_{Y}$-algebras. (We observe that $\mathcal{I}_{D}^{d}=\mathcal{I}_{D}^{\otimes d}$ as $D$ is an effective Cartier divisor.) By the material in Constructions, Section 26.16 the triple $(1, f: Y \rightarrow X, \psi)$ defines a morphism $Y \rightarrow X^{\prime}$ over $X$. The restriction

$$
Y \backslash D \longrightarrow X^{\prime} \backslash b^{-1}(Z)=X \backslash Z
$$

is unique. The open $Y \backslash D$ is scheme theoretically dense in $Y$ according to Lemma 30.11.4. Thus the morphism $Y \rightarrow X^{\prime}$ is unique by Morphisms, Lemma 28.7.10 (also $b$ is separated by Constructions, Lemma 26.16.9.

0BFL Lemma 30.26.6. Let $b: X^{\prime} \rightarrow X$ be the blowing up of the scheme $X$ along $a$ closed subscheme $Z$. Let $U=\operatorname{Spec}(A)$ be an affine open of $X$ and let $I \subset A$ be the ideal corresponding to $Z \cap U$. Let $a \in I$ and let $x^{\prime} \in X^{\prime}$ be a point mapping to $a$ point of $U$. Then $x^{\prime}$ is a point of the affine open $U^{\prime}=\operatorname{Spec}\left(A\left[\frac{I}{a}\right]\right)$ if and only if the image of $a$ in $\mathcal{O}_{X^{\prime}, x^{\prime}}$ cuts out the exceptional divisor.

Proof. Since the exceptional divisor over $U^{\prime}$ is cut out by the image of $a$ in $A^{\prime}=$ $A\left[\frac{I}{a}\right]$ one direct is clear. Conversely, assume that the image of $a$ in $\mathcal{O}_{X^{\prime}, x^{\prime}}$ cuts out $E$. Since every element of $I$ maps to an element of the ideal defining $E$ over $b^{-1}(U)$ we see that elements of $I$ become divisible by $a$ in $\mathcal{O}_{X^{\prime}, x^{\prime}}$. Thus for $f \in I^{n}$ we can write $f=\psi(f) a^{n}$ for some $\psi(f) \in \mathcal{O}_{X^{\prime}, x^{\prime}}$. Observe that since $a$ maps to a nonzerodivisor of $\mathcal{O}_{X^{\prime}, x^{\prime}}$ the element $\psi(f)$ is uniquely characterized by this. Then we define

$$
A^{\prime} \longrightarrow \mathcal{O}_{X^{\prime}, x^{\prime}}, \quad f / a^{n} \longmapsto \psi(f)
$$

Here we use the description of blowup algebras given following Algebra, Definition 30.26.1. The uniqueness mentioned above shows that this is an $A$-algebra homomorphism. This gives a morphism $\operatorname{Spec}\left(\mathcal{O}_{X^{\prime}, x "}\right) \rightarrow \operatorname{Spec}\left(A^{\prime}\right)=U^{\prime}$. By the universal property of blowing up (Lemma 30.26.5) this is a morphism over $X^{\prime}$, which of course implies that $x^{\prime} \in U^{\prime}$.

0807 Lemma 30.26.7. Let $X$ be a scheme. Let $Z \subset X$ be an effective Cartier divisor. The blowup of $X$ in $Z$ is the identity morphism of $X$.

Proof. Immediate from the universal property of blowups (Lemma 30.26.5).
0808 Lemma 30.26.8. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. If $X$ is reduced, then the blow up $X^{\prime}$ of $X$ in $\mathcal{I}$ is reduced.

Proof. Combine Lemma 30.26 .2 with Algebra, Lemma 10.69 .6 .

02ND Lemma 30.26.9. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. If $X$ is integral, then the blow up $X^{\prime}$ of $X$ in $\mathcal{I}$ is integral.
Proof. Combine Lemma 30.26 .2 with Algebra, Lemma 10.69 .7 .
0BFM Lemma 30.26.10. Let $X$ be a scheme. Let $Z \subset X$ be a closed subscheme. Let $b: X^{\prime} \rightarrow X$ be the blowing up of $X$ along $Z$. Then $b$ induces an bijective map from the set of generic points of irreducible components of $X^{\prime}$ to the set of generic points of irreducible components of $X$ which are not in $Z$.

Proof. The exceptional divisor $E \subset X^{\prime}$ is an effective Cartier divisor (Lemma 30.26.4 hence is nowhere dense in $X^{\prime}$ (Lemma 30.11.4). On the other hand, $X^{\prime} \backslash$ $E \rightarrow X \backslash Z$ is an isomorphism. The lemma follows.

0809 Lemma 30.26.11. Let $X$ be a scheme. Let $b: X^{\prime} \rightarrow X$ be a blow up of $X$ in a closed subscheme. For any effective Cartier divisor $D$ on $X$ the pullback $b^{-1} D$ is defined (see Definition 30.11.11).

Proof. By Lemmas 30.26 .2 and 30.11 .2 this reduces to the following algebra fact: Let $A$ be a ring, $I \subset A$ an ideal, $a \in I$, and $x \in A$ a nonzerodivisor. Then the image of $x$ in $A\left[\frac{I}{a}\right]$ is a nonzerodivisor. Namely, suppose that $x\left(y / a^{n}\right)=0$ in $A\left[\frac{I}{a}\right]$. Then $a^{m} x y=0$ in $A$ for some $m$. Hence $a^{m} y=0$ as $x$ is a nonzerodivisor. Whence $y / a^{n}$ is zero in $A\left[\frac{I}{a}\right]$ as desired.
080A Lemma 30.26.12. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ and $\mathcal{J}$ be quasi-coherent sheaves of ideals. Let $b: X^{\prime} \rightarrow X$ be the blowing up of $X$ in $\mathcal{I}$. Let $b^{\prime}: X^{\prime \prime} \rightarrow X^{\prime}$ be the blowing up of $X^{\prime}$ in $b^{-1} \mathcal{J O}_{X^{\prime}}$. Then $X^{\prime \prime} \rightarrow X$ is canonically isomorphic to the blowing up of $X$ in $\mathcal{I} \mathcal{J}$.

Proof. Let $E \subset X^{\prime}$ be the exceptional divisor of $b$ which is an effective Cartier divisor by Lemma 30.26 .4 Then $\left(b^{\prime}\right)^{-1} E$ is an effective Cartier divisor on $X^{\prime \prime}$ by Lemma 30.26.11. Let $E^{\prime} \subset X^{\prime \prime}$ be the exceptional divisor of $b^{\prime}$ (also an effective Cartier divisor). Consider the effective Cartier divisor $E^{\prime \prime}=E^{\prime}+\left(b^{\prime}\right)^{-1} E$. By construction the ideal of $E^{\prime \prime}$ is $\left(b \circ b^{\prime}\right)^{-1} \mathcal{I}\left(b \circ b^{\prime}\right)^{-1} \mathcal{J} \mathcal{O}_{X^{\prime \prime}}$. Hence according to Lemma 30.26 .5 there is a canonical morphism from $X^{\prime \prime}$ to the blowup $c: Y \rightarrow X$ of $X$ in $\mathcal{I} \mathcal{J}$. Conversely, as $\mathcal{I} \mathcal{J}$ pulls back to an invertible ideal we see that $c^{-1} \mathcal{I} \mathcal{O}_{Y}$ defines an effective Cartier divisor, see Lemma 30.11.9. Thus a morphism $c^{\prime}: Y \rightarrow X^{\prime}$ over $X$ by Lemma 30.26.5. Then $\left(c^{\prime}\right)^{-1} b^{-1} \mathcal{J O}_{Y}=c^{-1} \mathcal{J} \mathcal{O}_{Y}$ which also defines an effective Cartier divisor. Thus a morphism $c^{\prime \prime}: Y \rightarrow X^{\prime \prime}$ over $X^{\prime}$. We omit the verification that this morphism is inverse to the morphism $X^{\prime \prime} \rightarrow Y$ constructed earlier.

02NS Lemma 30.26.13. Let $X$ be a scheme. Let $\mathcal{I} \subset \mathcal{O}_{X}$ be a quasi-coherent sheaf of ideals. Let $b: X^{\prime} \rightarrow X$ be the blowing up of $X$ in the ideal sheaf $\mathcal{I}$. If $\mathcal{I}$ is of finite type, then
(1) $b: X^{\prime} \rightarrow X$ is a projective morphism, and
(2) $\mathcal{O}_{X^{\prime}}(1)$ is a b-relatively ample invertible sheaf.

Proof. The surjection of graded $\mathcal{O}_{X}$-algebras

$$
\operatorname{Sym}_{\mathcal{O}_{X}}^{*}(\mathcal{I}) \longrightarrow \bigoplus_{d \geq 0} \mathcal{I}^{d}
$$

defines via Constructions, Lemma 26.18.5 a closed immersion

$$
X^{\prime}=\underline{\operatorname{Proj}}_{X}\left(\bigoplus_{d \geq 0} \mathcal{I}^{d}\right) \longrightarrow \mathbf{P}(\mathcal{I})
$$

Hence $b$ is projective, see Morphisms, Definition 28.42.1. The second statement follows for example from the characterization of relatively ample invertible sheaves in Morphisms, Lemma 28.37.4. Some details omitted.

080B Lemma 30.26.14. Let $X$ be a quasi-compact and quasi-separated scheme. Let $Z \subset X$ be a closed subscheme of finite presentation. Let $b: X^{\prime} \rightarrow X$ be the blowing up with center $Z$. Let $Z^{\prime} \subset X^{\prime}$ be a closed subscheme of finite presentation. Let $X^{\prime \prime} \rightarrow X^{\prime}$ be the blowing up with center $Z^{\prime}$. There exists a closed subscheme $Y \subset X$ of finite presentation, such that
(1) $Y=Z \cup b\left(Z^{\prime}\right)$ set theoretically, and
(2) the composition $X^{\prime \prime} \rightarrow X$ is isomorphic to the blowing up of $X$ in $Y$.

Proof. The condition that $Z \rightarrow X$ is of finite presentation means that $Z$ is cut out by a finite type quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X}$, see Morphisms, Lemma 28.21.7. Write $\mathcal{A}=\bigoplus_{n \geq 0} \mathcal{I}^{n}$ so that $X^{\prime}=\operatorname{Proj}(\mathcal{A})$. Note that $X \backslash Z$ is a quasicompact open of $X$ by Properties, Lemma 27.24.1. Since $b^{-1}(X \backslash Z) \rightarrow X \backslash Z$ is an isomorphism (Lemma 30.26.4) the same result shows that $b^{-1}(X \backslash Z) \backslash Z^{\prime}$ is quasi-compact open in $X^{\prime}$. Hence $U=X \backslash\left(Z \cup b\left(Z^{\prime}\right)\right)$ is quasi-compact open in $X$. By Lemma 30.25 .3 there exist a $d>0$ and a finite type $\mathcal{O}_{X}$-submodule $\mathcal{F} \subset \mathcal{I}^{d}$ such that $Z^{\prime}=\operatorname{Proj}(\mathcal{A} / \mathcal{F} \mathcal{A})$ and such that the support of $\mathcal{I}^{d} / \mathcal{F}$ is contained in $X \backslash U$.
Since $\mathcal{F} \subset \mathcal{I}^{d}$ is an $\mathcal{O}_{X}$-submodule we may think of $\mathcal{F} \subset \mathcal{I}^{d} \subset \mathcal{O}_{X}$ as a finite type quasi-coherent sheaf of ideals on $X$. Let's denote this $\mathcal{J} \subset \mathcal{O}_{X}$ to prevent confusion. Since $\mathcal{I}^{d} / \mathcal{J}$ and $\mathcal{O} / \mathcal{I}^{d}$ are supported on $X \backslash U$ we see that $V(\mathcal{J})$ is contained in $X \backslash U$. Conversely, as $\mathcal{J} \subset \mathcal{I}^{d}$ we see that $Z \subset V(\mathcal{J})$. Over $X \backslash Z \cong X^{\prime} \backslash b^{-1}(Z)$ the sheaf of ideals $\mathcal{J}$ cuts out $Z^{\prime}$ (see displayed formula below). Hence $V(\mathcal{J})$ equals $Z \cup b\left(Z^{\prime}\right)$. It follows that also $V(\mathcal{I} \mathcal{J})=Z \cup b\left(Z^{\prime}\right)$ set theoretically. Moreover, $\mathcal{I} \mathcal{J}$ is an ideal of finite type as a product of two such. We claim that $X^{\prime \prime} \rightarrow X$ is isomorphic to the blowing up of $X$ in $\mathcal{I} \mathcal{J}$ which finishes the proof of the lemma by setting $Y=V(\mathcal{I} \mathcal{J})$.
First, recall that the blow up of $X$ in $\mathcal{I} \mathcal{J}$ is the same as the blow up of $X^{\prime}$ in $b^{-1} \mathcal{J} \mathcal{O}_{X^{\prime}}$, see Lemma 30.26 .12 . Hence it suffices to show that the blow up of $X^{\prime}$ in $b^{-1} \mathcal{J} \mathcal{O}_{X^{\prime}}$ agrees with the blow up of $X^{\prime}$ in $Z^{\prime}$. We will show that

$$
b^{-1} \mathcal{J O}_{X^{\prime}}=\mathcal{I}_{E}^{d} \mathcal{I}_{Z^{\prime}}
$$

as ideal sheaves on $X^{\prime \prime}$. This will prove what we want as $\mathcal{I}_{E}^{d}$ cuts out the effective Cartier divisor $d E$ and we can use Lemmas 30.26.7 and 30.26.12.
To see the displayed equality of the ideals we may work locally. With notation $A, I$, $a \in I$ as in Lemma 30.26 .2 we see that $\mathcal{F}$ corresponds to an $R$-submodule $M \subset I^{d}$ mapping isomorphically to an ideal $J \subset R$. The condition $Z^{\prime}=\operatorname{Proj}(\mathcal{A} / \mathcal{F} \mathcal{A})$ means that $Z^{\prime} \cap \operatorname{Spec}\left(A\left[\frac{I}{a}\right]\right)$ is cut out by the ideal generated by the elements $m / a^{d}$, $m \in M$. Say the element $m \in M$ corresponds to the function $f \in J$. Then in the affine blowup algebra $A^{\prime}=A\left[\frac{I}{a}\right]$ we see that $f=\left(a^{d} m\right) / a^{d}=a^{d}\left(m / a^{d}\right)$. Thus the equality holds.

### 30.27. Strict transform

080C In this section we briefly discuss strict transform under blowing up. Let $S$ be a scheme and let $Z \subset S$ be a closed subscheme. Let $b: S^{\prime} \rightarrow S$ be the blowing up of
$S$ in $Z$ and denote $E \subset S^{\prime}$ the exceptional divisor $E=b^{-1} Z$. In the following we will often consider a scheme $X$ over $S$ and form the cartesian diagram

Since $E$ is an effective Cartier divisor (Lemma 30.26.4) we see that $\operatorname{pr}_{S^{\prime}}^{-1} E \subset X \times{ }_{S} S^{\prime}$ is locally principal (Lemma 30.11.10). Thus the complement of $\operatorname{pr}_{S^{\prime}}^{-1} E$ in $X \times{ }_{S} S^{\prime}$ is retrocompact (Lemma 30.11 .3 ). Consequently, for a quasi-coherent $\mathcal{O}_{X \times S_{S}}$-module $\mathcal{G}$ the subsheaf of sections supported on $\operatorname{pr}_{S^{\prime}}^{-1} E$ is a quasi-coherent submodule, see Properties, Lemma 27.24.5. If $\mathcal{G}$ is a quasi-coherent sheaf of algebras, e.g., $\mathcal{G}=\mathcal{O}_{X \times{ }_{S} S^{\prime}}$, then this subsheaf is an ideal of $\mathcal{G}$.
080D Definition 30.27.1. With $Z \subset S$ and $f: X \rightarrow S$ as above.
(1) Given a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the strict transform of $\mathcal{F}$ with respect to the blowup of $S$ in $Z$ is the quotient $\mathcal{F}^{\prime}$ of $\operatorname{pr}_{X}^{*} \mathcal{F}$ by the submodule of sections supported on $\operatorname{pr}_{S^{\prime}}^{-1} E$.
(2) The strict transform of $X$ is the closed subscheme $X^{\prime} \subset X \times{ }_{S} S^{\prime}$ cut out by the quasi-coherent ideal of sections of $\mathcal{O}_{X \times S} S^{\prime}$ supported on $\mathrm{pr}_{S^{\prime}}^{-1} E$.
Note that taking the strict transform along a blowup depends on the closed subscheme used for the blowup (and not just on the morphism $S^{\prime} \rightarrow S$ ). This notion is often used for closed subschemes of $S$. It turns out that the strict transform of $X$ is a blowup of $X$.
080E Lemma 30.27.2. In the situation of Definition 30.27.1.
(1) The strict transform $X^{\prime}$ of $X$ is the blowup of $X$ in the closed subscheme $f^{-1} Z$ of $X$.
(2) For a quasi-coherent $\mathcal{O}_{X}$-module $\mathcal{F}$ the strict transform $\mathcal{F}^{\prime}$ is canonically isomorphic to the pushforward along $X^{\prime} \rightarrow X \times{ }_{S} S^{\prime}$ of the strict transform of $\mathcal{F}$ relative to the blowing up $X^{\prime} \rightarrow X$.
Proof. Let $X^{\prime \prime} \rightarrow X$ be the blowup of $X$ in $f^{-1} Z$. By the universal property of blowing up (Lemma 30.26.5) there exists a commutative diagram

whence a morphism $X^{\prime \prime} \rightarrow X \times_{S} S^{\prime}$. Thus the first assertion is that this morphism is a closed immersion with image $X^{\prime}$. The question is local on $X$. Thus we may assume $X$ and $S$ are affine. Say that $S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$, and $Z$ is cut out by the ideal $I \subset A$. Set $J=I B$. The map $B \otimes_{A} \bigoplus_{n>0} I^{n} \rightarrow \bigoplus_{n>0} J^{n}$ defines a closed immersion $X^{\prime \prime} \rightarrow X \times_{S} S^{\prime}$, see Constructions, Lemmas 26.11.6 and 26.11.5. We omit the verification that this morphism is the same as the one constructed above from the universal property. Pick $a \in I$ corresponding to the affine open $\operatorname{Spec}\left(A\left[\frac{I}{a}\right]\right) \subset S^{\prime}$, see Lemma 30.26.2 The inverse image of $\operatorname{Spec}\left(A\left[\frac{I}{a}\right]\right)$ in the strict transform $X^{\prime}$ of $X$ is the spectrum of

$$
B^{\prime}=\left(B \otimes_{A} A\left[\frac{I}{a}\right]\right) / a \text {-power-torsion }
$$

see Properties, Lemma 27.24.5. On the other hand, letting $b \in J$ be the image of $a$ we see that $\operatorname{Spec}\left(B\left[\frac{\left.\left.\frac{J}{b}\right]\right)}{}\right.\right.$ is the inverse image of $\operatorname{Spec}\left(A\left[\frac{I}{a}\right]\right)$ in $X^{\prime \prime}$. By Algebra, Lemma 10.69 .3 the open $\operatorname{Spec}\left(B\left[\frac{J}{b}\right]\right)$ maps isomorphically to the open subscheme $\operatorname{pr}_{S^{\prime}}^{-1}\left(\operatorname{Spec}\left(A\left[\frac{1}{a}\right]\right)\right)$ of $X^{\prime}$. Thus $X^{\prime \prime} \rightarrow X^{\prime}$ is an isomorphism.
In the notation above, let $\mathcal{F}$ correspond to the $B$-module $N$. The strict transform of $\mathcal{F}$ corresponds to the $B \otimes_{A} A\left[\frac{I}{a}\right]$-module

$$
N^{\prime}=\left(N \otimes_{A} A\left[\frac{I}{a}\right]\right) / a \text {-power-torsion }
$$

see Properties, Lemma 27.24.5. The strict transform of $\mathcal{F}$ relative to the blowup of $X$ in $f^{-1} Z$ corresponds to the $B\left[\frac{J}{b}\right]$-module $N \otimes_{B} B\left[\frac{J}{b}\right] / b$-power-torsion. In exactly the same way as above one proves that these two modules are isomorphic. Details omitted.
080F Lemma 30.27.3. In the situation of Definition 30.27.1.
(1) If $X$ is flat over $S$ at all points lying over $Z$, then the strict transform of $X$ is equal to the base change $X \times_{S} S^{\prime}$.
(2) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $\mathcal{F}$ is flat over $S$ at all points lying over $Z$, then the strict transform $\mathcal{F}^{\prime}$ of $\mathcal{F}$ is equal to the pullback $p r_{X}^{*} \mathcal{F}$.

Proof. We will prove part (2) as it implies part (1) by the definition of the strict transform of a scheme over $S$. The question is local on $X$. Thus we may assume that $S=\operatorname{Spec}(A), X=\operatorname{Spec}(B)$, and that $\mathcal{F}$ corresponds to the $B$-module $N$. Then $\mathcal{F}^{\prime}$ over the open $\operatorname{Spec}\left(B \otimes_{A} A\left[\frac{I}{a}\right]\right)$ of $X \times_{S} S^{\prime}$ corresponds to the module

$$
N^{\prime}=\left(N \otimes_{A} A\left[\frac{I}{a}\right]\right) / a \text {-power-torsion }
$$

see Properties, Lemma 27.24.5. Thus we have to show that the $a$-power-torsion of $N \otimes_{A} A\left[\frac{I}{a}\right]$ is zero. Let $y \in N \otimes_{A} A\left[\frac{I}{a}\right]$ with $a^{n} y=0$. If $\mathfrak{q} \subset B$ is a prime and $a \notin \mathfrak{q}$, then $y$ maps to zero in $\left(N \otimes_{A} A\left[\frac{I}{a}\right]\right)_{\mathfrak{q}}$. on the other hand, if $a \in \mathfrak{q}$, then $N_{\mathfrak{q}}$ is a flat $A$-module and we see that $N_{\mathfrak{q}} \otimes_{A} A\left[\frac{I}{a}\right]=\left(N \otimes_{A} A\left[\frac{I}{a}\right]\right)_{\mathfrak{q}}$ has no $a$-power torsion (as $A\left[\frac{I}{a}\right]$ doesn't). Hence $y$ maps to zero in this localization as well. We conclude that $y$ is zero by Algebra, Lemma 10.23.1.
080G Lemma 30.27.4. Let $S$ be a scheme. Let $Z \subset S$ be a closed subscheme. Let $b: S^{\prime} \rightarrow S$ be the blowing up of $Z$ in $S$. Let $g: X \rightarrow Y$ be an affine morphism of schemes over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $g^{\prime}: X \times_{S} S^{\prime} \rightarrow Y \times{ }_{S} S^{\prime}$ be the base change of $g$. Let $\mathcal{F}^{\prime}$ be the strict transform of $\mathcal{F}$ relative to $b$. Then $g_{*}^{\prime} \mathcal{F}^{\prime}$ is the strict transform of $g_{*} \mathcal{F}$.

Proof. Observe that $g_{*}^{\prime} \operatorname{pr}_{X}^{*} \mathcal{F}=\operatorname{pr}_{Y}^{*} g_{*} \mathcal{F}$ by Cohomology of Schemes, Lemma 29.5.1. Let $\mathcal{K} \subset \operatorname{pr}_{X}^{*} \mathcal{F}$ be the subsheaf of sections supported in the inverse image of $Z$ in $X \times{ }_{S} S^{\prime}$. By Properties, Lemma 27.24 .7 the pushforward $g_{*}^{\prime} \mathcal{K}$ is the subsheaf of sections of $\operatorname{pr}_{Y}^{*} g_{*} \mathcal{F}$ supported in the inverse image of $Z$ in $Y \times{ }_{S} S^{\prime}$. As $g^{\prime}$ is affine (Morphisms, Lemma 28.12.8) we see that $g_{*}^{\prime}$ is exact, hence we conclude.

080H Lemma 30.27.5. Let $S$ be a scheme. Let $Z \subset S$ be a closed subscheme. Let $D \subset S$ be an effective Cartier divisor. Let $Z^{\prime} \subset S$ be the closed subscheme cut out by the product of the ideal sheaves of $Z$ and $D$. Let $S^{\prime} \rightarrow S$ be the blowup of $S$ in $Z$.
(1) The blowup of $S$ in $Z^{\prime}$ is isomorphic to $S^{\prime} \rightarrow S$.
(2) Let $f: X \rightarrow S$ be a morphism of schemes and let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_{X}$-module. If $\mathcal{F}$ has no nonzero local sections supported in $f^{-1} D$, then the strict transform of $\mathcal{F}$ relative to the blowing up in $Z$ agrees with the strict transform of $\mathcal{F}$ relative to the blowing up of $S$ in $Z^{\prime}$.
Proof. The first statement follows on combining Lemmas 30.26 .12 and 30.26.7. Using Lemma 30.26 .2 the second statement translates into the following algebra problem. Let $A$ be a ring, $I \subset A$ an ideal, $x \in A$ a nonzerodivisor, and $a \in I$. Let $M$ be an $A$-module whose $x$-torsion is zero. To show: the $a$-power torsion in $M \otimes_{A} A\left[\frac{I}{a}\right]$ is equal to the $x a$-power torsion. The reason for this is that the kernel and cokernel of the map $A \rightarrow A\left[\frac{I}{a}\right]$ is $a$-power torsion, so this map becomes an isomorphism after inverting $a$. Hence the kernel and cokernel of $M \rightarrow M \otimes_{A} A\left[\frac{I}{a}\right]$ are $a$-power torsion too. This implies the result.

080I Lemma 30.27.6. Let $S$ be a scheme. Let $Z \subset S$ be a closed subscheme. Let $b: S^{\prime} \rightarrow S$ be the blowing up with center $Z$. Let $Z^{\prime} \subset S^{\prime}$ be a closed subscheme. Let $S^{\prime \prime} \rightarrow S^{\prime}$ be the blowing up with center $Z^{\prime}$. Let $Y \subset S$ be a closed subscheme such that $Y=Z \cup b\left(Z^{\prime}\right)$ set theoretically and the composition $S^{\prime \prime} \rightarrow S$ is isomorphic to the blowing up of $S$ in $Y$. In this situation, given any scheme $X$ over $S$ and $\mathcal{F} \in Q \operatorname{Coh}\left(\mathcal{O}_{X}\right)$ we have
(1) the strict transform of $\mathcal{F}$ with respect to the blowing up of $S$ in $Y$ is equal to the strict transform with respect to the blowup $S^{\prime \prime} \rightarrow S^{\prime}$ in $Z^{\prime}$ of the strict transform of $\mathcal{F}$ with respect to the blowup $S^{\prime} \rightarrow S$ of $S$ in $Z$, and
(2) the strict transform of $X$ with respect to the blowing up of $S$ in $Y$ is equal to the strict transform with respect to the blowup $S^{\prime \prime} \rightarrow S^{\prime}$ in $Z^{\prime}$ of the strict transform of $X$ with respect to the blowup $S^{\prime} \rightarrow S$ of $S$ in $Z$.
Proof. Let $\mathcal{F}^{\prime}$ be the strict transform of $\mathcal{F}$ with respect to the blowup $S^{\prime} \rightarrow S$ of $S$ in $Z$. Let $\mathcal{F}^{\prime \prime}$ be the strict transform of $\mathcal{F}^{\prime}$ with respect to the blowup $S^{\prime \prime} \rightarrow S^{\prime}$ of $S^{\prime}$ in $Z^{\prime}$. Let $\mathcal{G}$ be the strict transform of $\mathcal{F}$ with respect to the blowup $S^{\prime \prime} \rightarrow S$ of $S$ in $Y$. We also label the morphisms

By definition there is a surjection $p^{*} \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ and a surjection $q^{*} \mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime \prime}$ which combine by right exactness of $q^{*}$ to a surjection $(p \circ q)^{*} \mathcal{F} \rightarrow \mathcal{F}^{\prime \prime}$. Also we have the surjection $(p \circ q)^{*} \mathcal{F} \rightarrow \mathcal{G}$. Thus it suffices to prove that these two surjections have the same kernel.

The kernel of the surjection $p^{*} \mathcal{F} \rightarrow \mathcal{F}^{\prime}$ is supported on $(f \circ p)^{-1} Z$, so this map is an isomorphism at points in the complement. Hence the kernel of $q^{*} p^{*} \mathcal{F} \rightarrow$ $q^{*} \mathcal{F}^{\prime}$ is supported on $(f \circ p \circ q)^{-1} Z$. The kernel of $q^{*} \mathcal{F}^{\prime} \rightarrow \mathcal{F}^{\prime \prime}$ is supported on $\left(f^{\prime} \circ q\right)^{-1} Z^{\prime}$. Combined we see that the kernel of $(p \circ q)^{*} \mathcal{F} \rightarrow \mathcal{F}^{\prime \prime}$ is supported on $(f \circ p \circ q)^{-1} Z \cup\left(f^{\prime} \circ q\right)^{-1} Z^{\prime}=(f \circ p \circ q)^{-1} Y$. By construction of $\mathcal{G}$ we see that we obtain a factorization $(p \circ q)^{*} \mathcal{F} \rightarrow \mathcal{F}^{\prime \prime} \rightarrow \mathcal{G}$. To finish the proof it suffices to show that $\mathcal{F}^{\prime \prime}$ has no nonzero (local) sections supported on $(f \circ p \circ q)^{-1}(Y)=$ $(f \circ p \circ q)^{-1} Z \cup\left(f^{\prime} \circ q\right)^{-1} Z^{\prime}$. This follows from Lemma 30.27 .5 applied to $\mathcal{F}^{\prime}$ on $X \times{ }_{S} S^{\prime}$ over $S^{\prime}$, the closed subscheme $Z^{\prime}$ and the effective Cartier divisor $b^{-1} Z$.

080W Lemma 30.27.7. In the situation of Definition 30.27.1. Suppose that

$$
0 \rightarrow \mathcal{F}_{1} \rightarrow \mathcal{F}_{2} \rightarrow \mathcal{F}_{3} \rightarrow 0
$$

is an exact sequence of quasi-coherent sheaves on $X$ which remains exact after any base change $T \rightarrow S$. Then the strict transforms of $\mathcal{F}_{i}^{\prime}$ relative to any blowup $S^{\prime} \rightarrow S$ form a short exact sequence $0 \rightarrow \mathcal{F}_{1}^{\prime} \rightarrow \mathcal{F}_{2}^{\prime} \rightarrow \mathcal{F}_{3}^{\prime} \rightarrow 0$ too.

Proof. We may localize on $S$ and $X$ and assume both are affine. Then we may push $\mathcal{F}_{i}$ to $S$, see Lemma 30.27.4. We may assume that our blowup is the morphism $1: S \rightarrow S$ associated to an effective Cartier divisor $D \subset S$. Then the translation into algebra is the following: Suppose that $A$ is a ring and $0 \rightarrow M_{1} \rightarrow M_{2} \rightarrow M_{3} \rightarrow$ 0 is a universally exact sequence of $A$-modules. Let $a \in A$. Then the sequence

$$
0 \rightarrow M_{1} / a \text {-power torsion } \rightarrow M_{2} / a \text {-power torsion } \rightarrow M_{3} / a \text {-power torsion } \rightarrow 0
$$

is exact too. Namely, surjectivity of the last map and injectivity of the first map are immediate. The problem is exactness in the middle. Suppose that $x \in M_{2}$ maps to zero in $M_{3} / a$-power torsion. Then $y=a^{n} x \in M_{1}$ for some $n$. Then $y$ maps to zero in $M_{2} / a^{n} M_{2}$. Since $M_{1} \rightarrow M_{2}$ is universally injective we see that $y$ maps to zero in $M_{1} / a^{n} M_{1}$. Thus $y=a^{n} z$ for some $z \in M_{1}$. Thus $a^{n}(x-y)=0$. Hence $y$ maps to the class of $x$ in $M_{2} / a$-power torsion as desired.

### 30.28. Admissible blowups

080J To have a bit more control over our blowups we introduce the following standard terminology.

080K Definition 30.28.1. Let $X$ be a scheme. Let $U \subset X$ be an open subscheme. A morphism $X^{\prime} \rightarrow X$ is called a $U$-admissible blowup if there exists a closed immersion $Z \rightarrow X$ of finite presentation with $Z$ disjoint from $U$ such that $X^{\prime}$ is isomorphic to the blow up of $X$ in $Z$.

We recall that $Z \rightarrow X$ is of finite presentation if and only if the ideal sheaf $\mathcal{I}_{Z} \subset \mathcal{O}_{X}$ is of finite type, see Morphisms, Lemma 28.21.7. In particular, a $U$-admissible blowup is a projective morphism, see Lemma 30.26.13. Note that there can be multiple centers which give rise to the same morphism. Hence the requirement is just the existence of some center disjoint from $U$ which produces $X^{\prime}$. Finally, as the morphism $b: X^{\prime} \rightarrow X$ is an isomorphism over $U$ (see Lemma 30.26.4) we will often abuse notation and think of $U$ as an open subscheme of $X^{\prime}$ as well.

080L Lemma 30.28.2. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open subscheme. Let $b: X^{\prime} \rightarrow X$ be a $U$-admissible blowup. Let $X^{\prime \prime} \rightarrow X^{\prime}$ be a $U$-admissible blowup. Then the composition $X^{\prime \prime} \rightarrow X$ is a $U$-admissible blowup.

Proof. Immediate from the more precise Lemma 30.26.14.
080M Lemma 30.28.3. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U, V \subset X$ be quasi-compact open subschemes. Let $b: V^{\prime} \rightarrow V$ be a $U \cap V$-admissible blowup. Then there exists a $U$-admissible blowup $X^{\prime} \rightarrow X$ whose restriction to $V$ is $V^{\prime}$.

Proof. Let $\mathcal{I} \subset \mathcal{O}_{V}$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I})$ is disjoint from $U \cap V$ and such that $V^{\prime}$ is isomorphic to the blow up of $V$
in $\mathcal{I}$. Let $\mathcal{I}^{\prime} \subset \mathcal{O}_{U \cup V}$ be the quasi-coherent sheaf of ideals whose restriction to $U$ is $\mathcal{O}_{U}$ and whose restriction to $V$ is $\mathcal{I}$ (see Sheaves, Section 6.33). By Properties, Lemma 27.22 .2 there exists a finite type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_{X}$ whose restriction to $U \cup V$ is $\mathcal{I}^{\prime}$. The lemma follows.
080N Lemma 30.28.4. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open subscheme. Let $b_{i}: X_{i} \rightarrow X, i=1, \ldots, n$ be $U$-admissible blowups. There exists a $U$-admissible blowup $b: X^{\prime} \rightarrow X$ such that (a) b factors as $X^{\prime} \rightarrow X_{i} \rightarrow X$ for $i=1, \ldots, n$ and (b) each of the morphisms $X^{\prime} \rightarrow X_{i}$ is a $U$-admissible blowup.

Proof. Let $\mathcal{I}_{i} \subset \mathcal{O}_{X}$ be the finite type quasi-coherent sheaf of ideals such that $V\left(\mathcal{I}_{i}\right)$ is disjoint from $U$ and such that $X_{i}$ is isomorphic to the blow up of $X$ in $\mathcal{I}_{i}$. Set $\mathcal{I}=\mathcal{I}_{1} \cdot \ldots \cdot \mathcal{I}_{n}$ and let $X^{\prime}$ be the blowup of $X$ in $\mathcal{I}$. Then $X^{\prime} \rightarrow X$ factors through $b_{i}$ by Lemma 30.26.12.

080P Lemma 30.28.5. Let $X$ be a quasi-compact and quasi-separated scheme. Let $U, V$ be quasi-compact disjoint open subschemes of $X$. Then there exist a $U \cup V$ admissible blowup $b: X^{\prime} \rightarrow X$ such that $X^{\prime}$ is a disjoint union of open subschemes $X^{\prime}=X_{1}^{\prime} \amalg X_{2}^{\prime}$ with $b^{-1}(U) \subset X_{1}^{\prime}$ and $b^{-1}(V) \subset X_{2}^{\prime}$.
Proof. Choose a finite type quasi-coherent sheaf of ideals $\mathcal{I}$, resp. $\mathcal{J}$ such that $X \backslash U=V(\mathcal{I})$, resp. $X \backslash V=V(\mathcal{J})$, see Properties, Lemma 27.24.1. Then $V(\mathcal{I} \mathcal{J})=$ $X$ set theoretically, hence $\mathcal{I} \mathcal{J}$ is a locally nilpotent sheaf of ideals. Since $\mathcal{I}$ and $\mathcal{J}$ are of finite type and $X$ is quasi-compact there exists an $n>0$ such that $\mathcal{I}^{n} \mathcal{J}^{n}=0$. We may and do replace $\mathcal{I}$ by $\mathcal{I}^{n}$ and $\mathcal{J}$ by $\mathcal{J}^{n}$. Whence $\mathcal{I} \mathcal{J}=0$. Let $b: X^{\prime} \rightarrow X$ be the blowing up in $\mathcal{I}+\mathcal{J}$. This is $U \cup V$-admissible as $V(\mathcal{I}+\mathcal{J})=X \backslash U \cup V$. We will show that $X^{\prime}$ is a disjoint union of open subschemes $X^{\prime}=X_{1}^{\prime} \amalg X_{2}^{\prime}$ such that $\left.b^{-1} \mathcal{I}\right|_{X_{2}^{\prime}}=0$ and $\left.b^{-1} \mathcal{J}\right|_{X_{1}^{\prime}}=0$ which will prove the lemma.
We will use the description of the blowing up in Lemma 30.26.2. Suppose that $U=\operatorname{Spec}(A) \subset X$ is an affine open such that $\left.\mathcal{I}\right|_{U}$, resp. $\left.\mathcal{J}\right|_{U}$ corresponds to the finitely generated ideal $I \subset A$, resp. $J \subset A$. Then

$$
b^{-1}(U)=\operatorname{Proj}\left(A \oplus(I+J) \oplus(I+J)^{2} \oplus \ldots\right)
$$

This is covered by the affine open subsets $A\left[\frac{I+J}{x}\right]$ and $A\left[\frac{I+J}{y}\right]$ with $x \in I$ and $y \in J$. Since $x \in I$ is a nonzerodivisor in $A\left[\frac{I+J}{x}\right]$ and $I J=0$ we see that $J A\left[\frac{I+J}{x}\right]=0$. Since $y \in J$ is a nonzerodivisor in $A\left[\frac{I+J}{y}\right]$ and $I J=0$ we see that $I A\left[\frac{I+J}{y}\right]=0$. Moreover,

$$
\operatorname{Spec}\left(A\left[\frac{I+J}{x}\right]\right) \cap \operatorname{Spec}\left(A\left[\frac{I+J}{y}\right]\right)=\operatorname{Spec}\left(A\left[\frac{I+J}{x y}\right]\right)=\emptyset
$$

because $x y$ is both a nonzerodivisor and zero. Thus $b^{-1}(U)$ is the disjoint union of the open subscheme $U_{1}$ defined as the union of the standard opens $\operatorname{Spec}\left(A\left[\frac{I+J}{x}\right]\right)$ for $x \in I$ and the open subscheme $U_{2}$ which is the union of the affine opens $\operatorname{Spec}\left(A\left[\frac{I+J}{y}\right]\right)$ for $y \in J$. We have seen that $b^{-1} \mathcal{I} \mathcal{O}_{X^{\prime}}$ restricts to zero on $U_{2}$ and $b^{-1} \mathcal{I} \mathcal{O}_{X^{\prime}}$ restricts to zero on $U_{1}$. We omit the verification that these open subschemes glue to global open subschemes $X_{1}^{\prime}$ and $X_{2}^{\prime}$.

### 30.29. Modifications

OAYN In this section we will collect results of the type: after a modification such and such are true. We will later see that a modification can be dominated by a blow up (More on Flatness, Lemma 37.29.4).

0AYP Lemma 30.29.1. Let $X$ be an integral scheme. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_{X}$ module. There exists a modification $f: X^{\prime} \rightarrow X$ such that $f^{*} \mathcal{E}$ has a filtration whose successive quotients are invertible $\mathcal{O}_{X^{\prime}}$-modules.

Proof. We prove this by induction on the rank $r$ of $\mathcal{E}$. If $r=1$ or $r=0$ the lemma is obvious. Assume $r>1$. Let $P=\mathbf{P}(\mathcal{E})$ with structure morphism $\pi: P \rightarrow X$, see Constructions, Section 26.21. Then $\pi$ is proper (Lemma 30.24.4). There is a canonical surjection

$$
\pi^{*} \mathcal{E} \rightarrow \mathcal{O}_{P}(1)
$$

whose kernel is finite locally free of rank $r-1$. Choose a nonempty open subscheme $U \subset X$ such that $\left.\mathcal{E}\right|_{U} \cong \mathcal{O}_{U}^{\oplus r}$. Then $P_{U}=\pi^{-1}(U)$ is isomorphic to $\mathbf{P}_{U}^{r-1}$. In particular, there exists a section $s: U \rightarrow P_{U}$ of $\pi$. Let $X^{\prime} \subset P$ be the scheme theoretic image of the morphism $U \rightarrow P_{U} \rightarrow P$. Then $X^{\prime}$ is integral (Morphisms, Lemma 28.6.7), the morphism $f=\left.\pi\right|_{X^{\prime}}: X^{\prime} \rightarrow X$ is proper (Morphisms, Lemmas 28.41.6 and 28.41.4 , and $f^{-1}(U) \rightarrow U$ is an isomorphism. Hence $f$ is a modification (Morphisms, Definition 28.47.11). By construction the pullback $f^{*} \mathcal{E}$ has a two step filtration whose quotient is invertible because it is equal to $\left.\mathcal{O}_{P}(1)\right|_{X^{\prime}}$ and whose sub $\mathcal{E}^{\prime}$ is locally free of rank $r-1$. By induction we can find a modification $g: X^{\prime \prime} \rightarrow X^{\prime}$ such that $g^{*} \mathcal{E}^{\prime}$ has a filtration as in the statement of the lemma. Thus $f \circ g: X^{\prime \prime} \rightarrow X$ is the required modification.

## CHAPTER 31

## Limits of Schemes

01YT

### 31.1. Introduction

01 YU In this chapter we put material related to limits of schemes. We mostly study limits of inverse systems over directed partially ordered sets with affine transition maps. We discuss absolute Noetherian approximation. We characterize schemes locally of finite presentation over a base as those whose associated functor of points is limit preserving. As an application of absolute Noetherian approximation we prove that the image of an affine under an integral morphism is affine. Moreover, we prove some very general variants of Chow's lemma. A basic reference is DG67].

### 31.2. Directed limits of schemes with affine transition maps

01 YV In this section we construct the limit.
01YW Lemma 31.2.1. Let I be a directed partially ordered set. Let $\left(S_{i}, f_{i i^{\prime}}\right)$ be an inverse system of schemes over $I$. If all the schemes $S_{i}$ are affine, then the limit $S=\lim _{i} S_{i}$ exists in the category of schemes. In fact $S$ is affine and $S=\operatorname{Spec}\left(\operatorname{colim}_{i} R_{i}\right)$ with $R_{i}=\Gamma\left(S_{i}, \mathcal{O}\right)$.

Proof. Just define $S=\operatorname{Spec}\left(\operatorname{colim}_{i} R_{i}\right)$. It follows from Schemes, Lemma 25.6.4 that $S$ is the limit even in the category of locally ringed spaces.

01YX
Lemma 31.2.2. Let $I$ be a directed partially ordered set. Let ( $S_{i}, f_{i i^{\prime}}$ ) be an inverse system of schemes over $I$. If all the morphisms $f_{i i^{\prime}}: S_{i} \rightarrow S_{i^{\prime}}$ are affine, then the limit $S=\lim _{i} S_{i}$ exists in the category of schemes. Moreover,
(1) each of the morphisms $f_{i}: S \rightarrow S_{i}$ is affine,
(2) for an element $0 \in I$ and any open subscheme $U_{0} \subset S_{0}$ we have

$$
f_{0}^{-1}\left(U_{0}\right)=\lim _{i \geq 0} f_{i 0}^{-1}\left(U_{0}\right)
$$

in the category of schemes.
Proof. Choose an element $0 \in I$. Note that $I$ is nonempty as the limit is directed. For every $i \geq 0$ consider the quasi-coherent sheaf of $\mathcal{O}_{S_{0}}$-algebras $\mathcal{A}_{i}=f_{i 0, *} \mathcal{O}_{S_{i}}$. Recall that $S_{i}=\underline{\operatorname{Spec}}_{S_{0}}\left(\mathcal{A}_{i}\right)$, see Morphisms, Lemma 28.12 .3 . Set $\mathcal{A}=\operatorname{colim}_{i \geq 0} \mathcal{A}_{i}$. This is a quasi-coherent sheaf of $\mathcal{O}_{S_{0}}$-algebras, see Schemes, Section 25.24 . Set $S=\operatorname{Spec}_{S_{0}}(\mathcal{A})$. By Morphisms, Lemma 28.12.5 we get for $i \geq 0$ morphisms $f_{i}: S \rightarrow S_{i}$ compatible with the transition morphisms. Note that the morphisms $f_{i}$ are affine by Morphisms, Lemma 28.12.11 for example. By Lemma 31.2.1 above we see that for any affine open $U_{0} \subset S_{0}$ the inverse image $U=f_{0}^{-1}\left(U_{0}\right) \subset S$ is the limit of the system of opens $U_{i}=f_{i 0}^{-1}\left(U_{0}\right), i \geq 0$ in the category of schemes.

Let $T$ be a scheme. Let $g_{i}: T \rightarrow S_{i}$ be a compatible system of morphisms. To show that $S=\lim _{i} S_{i}$ we have to prove there is a unique morphism $g: T \rightarrow S$ with $g_{i}=f_{i} \circ g$ for all $i \in I$. For every $t \in T$ there exists an affine open $U_{0} \subset S_{0}$ containing $g_{0}(t)$. Let $V \subset g_{0}^{-1}\left(U_{0}\right)$ be an affine open neighbourhood containing $t$. By the remarks above we obtain a unique morphism $g_{V}: V \rightarrow U=f_{0}^{-1}\left(U_{0}\right)$ such that $f_{i} \circ g_{V}=\left.g_{i}\right|_{U_{i}}$ for all $i$. The open sets $V \subset T$ so constructed form a basis for the topology of $T$. The morphisms $g_{V}$ glue to a morphism $g: T \rightarrow S$ because of the uniqueness property. This gives the desired morphism $g: T \rightarrow S$.

The final statement is clear from the construction of the limit above.
01YZ Lemma 31.2.3. Let $I$ be a directed partially ordered set. Let $\left(S_{i}, f_{i i^{\prime}}\right)$ be an inverse system of schemes over $I$. Assume all the morphisms $f_{i i^{\prime}}: S_{i} \rightarrow S_{i^{\prime}}$ are affine, Let $S=\lim _{i} S_{i}$. Let $0 \in I$. Suppose that $T$ is a scheme over $S_{0}$. Then

$$
T \times_{S_{0}} S=\lim _{i \geq 0} T \times_{S_{0}} S_{i}
$$

Proof. The right hand side is a scheme by Lemma 31.2.2. The equality is formal, see Categories, Lemma 4.14.9.

### 31.3. Descending properties

081A In this section we work in the following situation.
086P Situation 31.3.1. Let $S=\lim _{i \in I} S_{i}$ be the limit of a directed system of schemes with affine transition morphisms $f_{i^{\prime} i}: S_{i^{\prime}} \rightarrow S_{i}$ (Lemma 31.2.2). We assume that $S_{i}$ is quasi-compact and quasi-separated for all $i \in I$. We denote $f_{i}: S \rightarrow S_{i}$ the projection. We also choose an element $0 \in I$.

The type of result we are looking for is the following: If we have an object over $S$, then for some $i$ there is a similar object over $S_{i}$.

01YY Lemma 31.3.2. In Situation 31.3.1.
(1) We have $S_{\text {set }}=\lim _{i} S_{i, \text { set }}$ where $S_{\text {set }}$ indicates the underlying set of the scheme $S$.
(2) We have $S_{\text {top }}=\lim _{i} S_{i, \text { top }}$ where $S_{\text {top }}$ indicates the underlying topological space of the scheme $S$.
(3) If $s, s^{\prime} \in S$ and $s^{\prime}$ is not a specialization of $s$ then for some $i \in I$ the image $s_{i}^{\prime} \in S_{i}$ of $s^{\prime}$ is not a specialization of the image $s_{i} \in S_{i}$ of $s$.
(4) Add more easy facts on topology of $S$ here. (Requirement: whatever is added should be easy in the affine case.)
Proof. Proof of (1). Pick $i \in I$. Take $U_{i} \subset S_{i}$ an affine open. Denote $U_{i^{\prime}}=f_{i^{\prime} i}^{-1}\left(U_{i}\right)$ and $U=f_{i}^{-1}\left(U_{i}\right)$. Suppose we can show that $U_{\text {set }}=\lim _{i^{\prime} \geq i} U_{i^{\prime}, \text { set }}$. Then assertion (1) follows by a simple argument using an affine covering of $S_{i}$. Hence we may assume all $S_{i}$ and $S$ affine. This reduces us to the following algebra question: Suppose given a system of rings $\left(A_{i}, \varphi_{i i^{\prime}}\right)$ over $I$. Set $A=\operatorname{colim}_{i} A_{i}$ with canonical maps $\varphi_{i}: A_{i} \rightarrow A$. Then

$$
\operatorname{Spec}(A)=\lim _{i} \operatorname{Spec}\left(A_{i}\right)
$$

Namely, suppose that we are given primes $\mathfrak{p}_{i} \subset A_{i}$ such that $\mathfrak{p}_{i}=\varphi_{i i^{\prime}}^{-1}\left(\mathfrak{p}_{i^{\prime}}\right)$ for all $i^{\prime} \geq i$. Then we simply set

$$
\mathfrak{p}=\left\{x \in A \mid \exists i, x_{i} \in \mathfrak{p}_{i} \text { with } \varphi_{i}\left(x_{i}\right)=x\right\}
$$

It is clear that this is an ideal and has the property that $\varphi_{i}^{-1}(\mathfrak{p})=\mathfrak{p}_{i}$. Then it follows easily that it is a prime ideal as well. This proves (1).
Proof of (2). Choose an $i$ and a finite affine open covering $S_{i}=U_{1, i} \cup \ldots \cup U_{n, i}$. If we can show the topology on $f_{i}^{-1}\left(U_{k, i}\right)=\lim _{i^{\prime} \geq i} f_{i^{\prime} i}^{-1}\left(U_{k, i}\right)$ is the limit topology, then the same is true for $S$. Hence we may assume that $S$ and $S_{i}$ are affine. Say $S_{i}=\operatorname{Spec}\left(A_{i}\right)$ and $S=\operatorname{Spec}(A)$ with $A=\operatorname{colim} A_{i}$. A basis for the topology of $\operatorname{Spec}(A)$ is given by the standard opens $D(g), g \in A$. Since each $g \in A$ is the image of some $g_{i} \in A_{i}$ for some $i$ we see that $D(g)$ is the inverse image of $D\left(g_{i}\right)$ by $f_{i}$. The desired result now follows from the criterion of Topology, Lemma 5.13.3.

Proof of (3). Pick $i \in I$. Pick an affine open $U_{i} \subset S_{i}$ containing $f_{i}\left(s^{\prime}\right)$. If $f_{i}(s) \notin S_{i}$ then we are done. Hence reduce to the affine case by considering the inverse images of $U_{i}$ as above. This reduces us to the following algebra question: Suppose given a system of rings $\left(A_{i}, \varphi_{i i^{\prime}}\right)$ over $I$. Set $A=\operatorname{colim}_{i} A_{i}$ with canonical maps $\varphi_{i}: A_{i} \rightarrow$ $A$. Suppose given primes $\mathfrak{p}, \mathfrak{p}^{\prime}$ of $A$. Suppose that $\mathfrak{p} \not \subset \mathfrak{p}^{\prime}$. Then for some $i$ we have $\varphi_{i}^{-1}(\mathfrak{p}) \not \subset \varphi_{i}^{-1}\left(\mathfrak{p}^{\prime}\right)$. This is clear.

01 Z 0 Lemma 31.3.3. In Situation 31.3.1. Suppose that $\mathcal{F}_{0}$ is a quasi-coherent sheaf on $S_{0}$. Set $\mathcal{F}_{i}=f_{i 0}^{*} \mathcal{F}_{0}$ for $i \geq 0$ and set $\mathcal{F}=f_{0}^{*} \mathcal{F}_{0}$. Then

$$
\Gamma(S, \mathcal{F})=\operatorname{colim}_{i \geq 0} \Gamma\left(S_{i}, \mathcal{F}_{i}\right)
$$

Proof. Write $\mathcal{A}_{j}=f_{i 0, *} \mathcal{O}_{S_{i}}$. This is a quasi-coherent sheaf of $\mathcal{O}_{S_{0}}$-algebras (see Morphisms, Lemma 28.12.5) and $S_{i}$ is the relative spectrum of $\mathcal{A}_{i}$ over $S_{0}$. In the proof of Lemma 31.2 .2 we constructed $S$ as the relative spectrum of $\mathcal{A}=\operatorname{colim}_{i \geq 0} \mathcal{A}_{i}$ over $S_{0}$. Set

$$
\mathcal{M}_{i}=\mathcal{F}_{0} \otimes \mathcal{O}_{S_{0}} \mathcal{A}_{i}
$$

and

$$
\mathcal{M}=\mathcal{F}_{0} \otimes_{\mathcal{O}_{S_{0}}} \mathcal{A}
$$

Then we have $f_{i 0, *} \mathcal{F}_{i}=\mathcal{M}_{i}$ and $f_{0, *} \mathcal{F}=\mathcal{M}$. Since $\mathcal{A}$ is the colimit of the sheaves $\mathcal{A}_{i}$ and since tensor product commutes with directed colimits, we conclude that $\mathcal{M}=\operatorname{colim}_{i \geq 0} \mathcal{M}_{i}$. Since $S_{0}$ is quasi-compact and quasi-separated we see that

$$
\begin{aligned}
& \Gamma(S, \mathcal{F})=\Gamma\left(S_{0}, \mathcal{M}\right) \\
&=\Gamma\left(S_{0}, \operatorname{colim}\right. \\
& i \geq 0 \\
&\left.=\mathcal{M}_{i}\right) \\
&=\operatorname{colim}_{i \geq 0} \Gamma\left(S_{0}, \mathcal{M}_{i}\right) \\
& \operatorname{colim}_{i \geq 0} \Gamma\left(S_{i}, \mathcal{F}_{i}\right)
\end{aligned}
$$

see Sheaves, Lemma 6.29.1 and Topology, Lemma 5.26 .1 for the middle equality.
01 Z 2 Lemma 31.3.4. In Situation 31.3.1. If all the schemes $S_{i}$ are nonempty, then the limit $S=\lim _{i} S_{i}$ is nonempty.

Proof. Choose $i_{0} \in I$. Note that $I$ is nonempty as the limit is directed. For convenience write $S_{0}=S_{i_{0}}$ and $i_{0}=0$. Choose an affine open covering $S_{0}=$ $\bigcup_{j=1, \ldots, m} U_{j}$. Since $I$ is directed there exists a $j \in\{1, \ldots, m\}$ such that $f_{i 0}^{-1}\left(U_{j}\right) \neq \emptyset$ for all $i \geq 0$. Hence $\lim _{i \geq 0} f_{i 0}^{-1}\left(U_{j}\right)$ is not empty since a directed colimit of nonzero rings is nonzero (because $1 \neq 0$ ). As $\lim _{i \geq 0} f_{i 0}^{-1}\left(U_{j}\right)$ is an open subscheme of the limit we win.

01 Z 3 Lemma 31.3.5. In Situation 31.3.1. Suppose for each $i$ we are given a nonempty closed subset $Z_{i} \subset S_{i}$ with $f_{i i^{\prime}}\left(Z_{i}\right) \subset Z_{i^{\prime}}$. Then there exists a point $s \in S$ with $f_{i}(s) \in Z_{i}$ for all $i$.

Proof. Let $Z_{i} \subset S_{i}$ also denote the reduced closed subscheme associated to $Z_{i}$, see Schemes, Definition 25.12.5. A closed immersion is affine, and a composition of affine morphisms is affine (see Morphisms, Lemmas 28.12.9 and 28.12.7), and hence $Z_{i} \rightarrow S_{i^{\prime}}$ is affine when $i \geq i^{\prime}$. We conclude that the morphism $f_{i i^{\prime}}: Z_{i} \rightarrow Z_{i^{\prime}}$ is affine by Morphisms, Lemma 28.12.11. Each of the schemes $Z_{i}$ is quasi-compact as a closed subscheme of a quasi-compact scheme. Hence we may apply Lemma 31.3.4 to see that $Z=\lim _{i} Z_{i}$ is nonempty. Since there is a canonical morphism $Z \rightarrow S$ we win.

05F3 Lemma 31.3.6. In Situation 31.3.1. Suppose we are given an $i$ and a morphism $T \rightarrow S_{i}$ such that
(1) $T \times{ }_{S_{i}} S=\emptyset$, and
(2) $T$ is quasi-compact.

Then $T \times{ }_{S_{i}} S_{i^{\prime}}=\emptyset$ for all sufficiently large $i^{\prime}$.
Proof. By Lemma 31.2 .3 we see that $T \times{ }_{S_{i}} S=\lim _{i^{\prime} \geq i} T \times{ }_{S_{i}} S_{i^{\prime}}$. Hence the result follows from Lemma 31.3.4.
05F4 Lemma 31.3.7. In Situation 31.3.1. Suppose we are given an $i$ and a locally constructible subset $E \subset S_{i}$ such that $f_{i}(S) \subset E$. Then $f_{i i^{\prime}}\left(S_{i^{\prime}}\right) \subset E$ for all sufficiently large $i^{\prime}$.

Proof. Writing $S_{i}$ as a finite union of open affine subschemes reduces the question to the case that $S_{i}$ is affine and $E$ is constructible, see Lemma 31.2 .2 and Properties, Lemma 27.2.1. In this case the complement $S_{i} \backslash E$ is constructible too. Hence there exists an affine scheme $T$ and a morphism $T \rightarrow S_{i}$ whose image is $S_{i} \backslash E$, see Algebra, Lemma 10.28 .3 . By Lemma 31.3 .6 we see that $T \times{ }_{S_{i}} S_{i^{\prime}}$ is empty for all sufficiently large $i^{\prime}$, and hence $f_{i i^{\prime}}\left(S_{i^{\prime}}\right) \subset E$ for all sufficiently large $i^{\prime}$.

01 Z 4 Lemma 31.3.8. In Situation 31.3.1 we have the following:
(1) Given any quasi-compact open $V \subset S=\lim _{i} S_{i}$ there exists an $i \in I$ and a quasi-compact open $V_{i} \subset S_{i}$ such that $f_{i}^{-1}\left(V_{i}\right)=V$.
(2) Given $V_{i} \subset S_{i}$ and $V_{i^{\prime}} \subset S_{i^{\prime}}$ quasi-compact opens such that $f_{i}^{-1}\left(V_{i}\right)=$ $f_{i^{\prime}}^{-1}\left(V_{i^{\prime}}\right)$ there exists an index $i^{\prime \prime} \geq i, i^{\prime}$ such that $f_{i^{\prime \prime} i}^{-1}\left(V_{i}\right)=f_{i^{\prime \prime} i^{\prime}}^{-1}\left(V_{i^{\prime}}\right)$.
(3) If $V_{1, i}, \ldots, V_{n, i} \subset S_{i}$ are quasi-compact opens and $S=f_{i}^{-1}\left(V_{1, i}\right) \cup \ldots \cup$ $f_{i}^{-1}\left(V_{n, i}\right)$ then $S_{i^{\prime}}=f_{i^{\prime} i}^{-1}\left(V_{1, i}\right) \cup \ldots \cup f_{i^{\prime} i}^{-1}\left(V_{n, i}\right)$ for some $i^{\prime} \geq i$.
Proof. Choose $i_{0} \in I$. Note that $I$ is nonempty as the limit is directed. For convenience we write $S_{0}=S_{i_{0}}$ and $i_{0}=0$. Choose an affine open covering $S_{0}=$ $U_{1,0} \cup \ldots \cup U_{m, 0}$. Denote $U_{j, i} \subset S_{i}$ the inverse image of $U_{j, 0}$ under the transition morphism for $i \geq 0$. Denote $U_{j}$ the inverse image of $U_{j, 0}$ in $S$. Note that $U_{j}=$ $\lim _{i} U_{j, i}$ is a limit of affine schemes.
We first prove the uniqueness statement: Let $V_{i} \subset S_{i}$ and $V_{i^{\prime}} \subset S_{i^{\prime}}$ quasi-compact opens such that $f_{i}^{-1}\left(V_{i}\right)=f_{i^{\prime}}^{-1}\left(V_{i^{\prime}}\right)$. It suffices to show that $f_{i^{\prime \prime} i}^{-1}\left(V_{i} \cap U_{j, i^{\prime \prime}}\right)$ and $f_{i^{\prime \prime} i^{\prime}}^{-1}\left(V_{i^{\prime}} \cap U_{j, i^{\prime \prime}}\right)$ become equal for $i^{\prime \prime}$ large enough. Hence we reduce to the case of a limit of affine schemes. In this case write $S=\operatorname{Spec}(R)$ and $S_{i}=\operatorname{Spec}\left(R_{i}\right)$ for all $i \in I$. We may write $V_{i}=S_{i} \backslash V\left(h_{1}, \ldots, h_{m}\right)$ and $V_{i^{\prime}}=S_{i^{\prime}} \backslash V\left(g_{1}, \ldots, g_{n}\right)$.

The assumption means that the ideals $\sum g_{j} R$ and $\sum h_{j} R$ have the same radical in $R$. This means that $g_{j}^{N}=\sum a_{j j^{\prime}} h_{j^{\prime}}$ and $h_{j}^{N}=\sum b_{j j^{\prime}} g_{j^{\prime}}$ for some $N \gg 0$ and $a_{j j^{\prime}}$ and $b_{j j^{\prime}}$ in $R$. Since $R=\operatorname{colim}_{i} R_{i}$ we can chose an index $i^{\prime \prime} \geq i$ such that the equations $g_{j}^{N}=\sum a_{j j^{\prime}} h_{j^{\prime}}$ and $h_{j}^{N}=\sum b_{j j^{\prime}} g_{j^{\prime}}$ hold in $R_{i^{\prime \prime}}$ for some $a_{j j^{\prime}}$ and $b_{j j^{\prime}}$ in $R_{i^{\prime \prime}}$. This implies that the ideals $\sum g_{j} R_{i^{\prime \prime}}$ and $\sum h_{j} R_{i^{\prime \prime}}$ have the same radical in $R_{i^{\prime \prime}}$ as desired.

We prove existence. We may apply the uniqueness statement to the limit of schemes $U_{j_{1}} \cap U_{j_{2}}=\lim _{i} U_{j_{1}, i} \cap U_{j_{2}, i}$ since these are still quasi-compact due to the fact that the $S_{i}$ were assumed quasi-separated. Hence it is enough to prove existence in the affine case. In this case write $S=\operatorname{Spec}(R)$ and $S_{i}=\operatorname{Spec}\left(R_{i}\right)$ for all $i \in I$. Then $V=S \backslash V\left(g_{1}, \ldots, g_{n}\right)$ for some $g_{1}, \ldots, g_{n} \in R$. Choose any $i$ large enough so that each of the $g_{j}$ comes from an element $g_{j, i} \in R_{i}$ and take $V_{i}=S_{i} \backslash V\left(g_{1, i}, \ldots, g_{n, i}\right)$.

The statement on coverings follows from the uniqueness statement for the opens $V_{1, i} \cup \ldots \cup V_{n, i}$ and $S_{i}$ of $S_{i}$.
$01 Z 5$ Lemma 31.3.9. In Situation 31.3.1 if $S$ is quasi-affine, then for some $i_{0} \in I$ the schemes $S_{i}$ for $i \geq i_{0}$ are quasi-affine.

Proof. Choose $i_{0} \in I$. Note that $I$ is nonempty as the limit is directed. For convenience we write $S_{0}=S_{i_{0}}$ and $i_{0}=0$. Let $s \in S$. We may choose an affine open $U_{0} \subset S_{0}$ containing $f_{0}(s)$. Since $S$ is quasi-affine we may choose an element $a \in \Gamma\left(S, \mathcal{O}_{S}\right)$ such that $s \in D(a) \subset f_{0}^{-1}\left(U_{0}\right)$, and such that $D(a)$ is affine. By Lemma 31.3.3 there exists an $i \geq 0$ such that $a$ comes from an element $a_{i} \in$ $\Gamma\left(S_{i}, \mathcal{O}_{S_{i}}\right)$. For any index $j \geq i$ we denote $a_{j}$ the image of $a_{i}$ in the global sections of the structure sheaf of $S_{j}$. Consider the opens $D\left(a_{j}\right) \subset S_{j}$ and $U_{j}=f_{j 0}^{-1}\left(U_{0}\right)$. Note that $U_{j}$ is affine and $D\left(a_{j}\right)$ is a quasi-compact open of $S_{j}$, see Properties, Lemma 27.26 .4 for example. Hence we may apply Lemma 31.3 .8 to the opens $U_{j}$ and $U_{j} \cup D\left(a_{j}\right)$ to conclude that $D\left(a_{j}\right) \subset U_{j}$ for some $j \geq i$. For such an index $j$ we see that $D\left(a_{j}\right) \subset S_{j}$ is an affine open (because $D\left(a_{j}\right)$ is a standard affine open of the affine open $\left.U_{j}\right)$ containing the image $f_{j}(s)$.
We conclude that for every $s \in S$ there exist an index $i \in I$, and a global section $a \in \Gamma\left(S_{i}, \mathcal{O}_{S_{i}}\right)$ such that $D(a) \subset S_{i}$ is an affine open containing $f_{i}(s)$. Because $S$ is quasi-compact we may choose a single index $i \in I$ and global sections $a_{1}, \ldots, a_{m} \in$ $\Gamma\left(S_{i}, \mathcal{O}_{S_{i}}\right)$ such that each $D\left(a_{j}\right) \subset S_{i}$ is affine open and such that $f_{i}: S \rightarrow S_{i}$ has image contained in the union $W_{i}=\bigcup_{j=1, \ldots, m} D\left(a_{j}\right)$. For $i^{\prime} \geq i$ set $W_{i^{\prime}}=f_{i^{\prime} i}^{-1}\left(W_{i}\right)$. Since $f_{i}^{-1}\left(W_{i}\right)$ is all of $S$ we see (by Lemma 31.3 .8 again) that for a suitable $i^{\prime} \geq i$ we have $S_{i^{\prime}}=W_{i^{\prime}}$. Thus we may replace $i$ by $i^{\prime}$ and assume that $S_{i}=\bigcup_{j=1, \ldots, m} D\left(a_{j}\right)$. This implies that $\mathcal{O}_{S_{i}}$ is an ample invertible sheaf on $S_{i}$ (see Properties, Definition 27.26.1) and hence that $S_{i}$ is quasi-affine, see Properties, Lemma 27.27.1. Hence we win.

01 Z 6 Lemma 31.3.10. In Situation 31.3.1 if $S$ is affine, then for some $i_{0} \in I$ the schemes $S_{i}$ for $i \geq i_{0}$ are affine.

Proof. By Lemma 31.3 .9 we may assume that $S_{0}$ is quasi-affine for some $0 \in I$. Set $R_{0}=\Gamma\left(S_{0}, \mathcal{O}_{S_{0}}\right)$. Then $S_{0}$ is a quasi-compact open of $T_{0}=\operatorname{Spec}\left(R_{0}\right)$. Denote $j_{0}: S_{0} \rightarrow T_{0}$ the corresponding quasi-compact open immersion. For $i \geq 0$ set $\mathcal{A}_{i}=$ $f_{0 i, *} \mathcal{O}_{S_{i}}$. Since $f_{0 i}$ is affine we see that $S_{i}=\underline{\operatorname{Spec}}_{S_{0}}\left(\mathcal{A}_{i}\right)$. Set $T_{i}=\underline{\operatorname{Spec}}_{T_{0}}\left(j_{0, *} \mathcal{A}_{i}\right)$.

Then $T_{i} \rightarrow T_{0}$ is affine, hence $T_{i}$ is affine. Thus $T_{i}$ is the spectrum of

$$
R_{i}=\Gamma\left(T_{0}, j_{0, *} \mathcal{A}_{i}\right)=\Gamma\left(S_{0}, \mathcal{A}_{i}\right)=\Gamma\left(S_{i}, \mathcal{O}_{S_{i}}\right)
$$

Write $S=\operatorname{Spec}(R)$. We have $R=\operatorname{colim}_{i} R_{i}$ by Lemma 31.3.3. Hence also $S=$ $\lim _{i} T_{i}$. As formation of the relative spectrum commutes with base change, the inverse image of the open $S_{0} \subset T_{0}$ in $T_{i}$ is $S_{i}$. Let $Z_{0}=T_{0} \backslash S_{0}$ and let $Z_{i} \subset T_{i}$ be the inverse image of $Z_{0}$. As $S_{i}=T_{i} \backslash Z_{i}$, it suffices to show that $Z_{i}$ is empty for some $i$. Assume $Z_{i}$ is nonempty for all $i$ to get a contradiction. By Lemma 31.3.5 there exists a point $s$ of $S=\lim T_{i}$ which maps to a point of $Z_{i}$ for every $i$. But $S=\lim _{i} S_{i}$, and hence we arrive at a contradiction by Lemma 31.3.2.

086Q Lemma 31.3.11. In Situation 31.3.1 if $S$ is separated, then for some $i_{0} \in I$ the schemes $S_{i}$ for $i \geq i_{0}$ are separated.

Proof. Choose a finite affine open covering $S_{0}=U_{0,1} \cup \ldots \cup U_{0, m}$. Set $U_{i, j} \subset S_{i}$ and $U_{j} \subset S$ equal to the inverse image of $U_{0, j}$. Note that $U_{i, j}$ and $U_{j}$ are affine. As $S$ is separated the intersections $U_{j_{1}} \cap U_{j_{2}}$ are affine. Since $U_{j_{1}} \cap U_{j_{2}}=\lim _{i \geq 0} U_{i, j_{1}} \cap U_{i, j_{2}}$ we see that $U_{i, j_{1}} \cap U_{i, j_{2}}$ is affine for large $i$ by Lemma 31.3.10. To show that $S_{i}$ is separated for large $i$ it now suffices to show that

$$
\mathcal{O}_{S_{i}}\left(V_{i, j_{1}}\right) \otimes_{\mathcal{O}_{S}(S)} \mathcal{O}_{S_{i}}\left(V_{i, j_{2}}\right) \longrightarrow \mathcal{O}_{S_{i}}\left(V_{i, j_{1}} \cap V_{i, j_{2}}\right)
$$

is surjective for large $i$ (Schemes, Lemma 25.21.8).
To get rid of the annoying indices, assume we have affine opens $U, V \subset S_{0}$ such that $U \cap V$ is affine too. Let $U_{i}, V_{i} \subset S_{i}$, resp. $U, V \subset S$ be the inverse images. We have to show that $\mathcal{O}\left(U_{i}\right) \otimes \mathcal{O}\left(V_{i}\right) \rightarrow \mathcal{O}\left(U_{i} \cap V_{i}\right)$ is surjective for $i$ large enough and we know that $\mathcal{O}(U) \otimes \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$ is surjective. Note that $\mathcal{O}\left(U_{0}\right) \otimes \mathcal{O}\left(V_{0}\right) \rightarrow$ $\mathcal{O}\left(U_{0} \cap V_{0}\right)$ is of finite type, as the diagonal morphism $S_{i} \rightarrow S_{i} \times S_{i}$ is an immersion (Schemes, Lemma 25.21.2) hence locally of finite type (Morphisms, Lemmas 28.15.2 and 28.15.5. Thus we can choose elements $f_{0,1}, \ldots, f_{0, n} \in \mathcal{O}\left(U_{0} \cap V_{0}\right)$ which generate $\mathcal{O}\left(U_{0} \cap V_{0}\right)$ over $\mathcal{O}\left(U_{0}\right) \otimes \mathcal{O}\left(V_{0}\right)$. Observe that for $i \geq 0$ the diagram of schemes

is cartesian. Thus we see that the images $f_{i, 1}, \ldots, f_{i, n} \in \mathcal{O}\left(U_{i} \cap V_{i}\right)$ generate $\mathcal{O}\left(U_{i} \cap V_{i}\right)$ over $\mathcal{O}\left(U_{i}\right) \otimes \mathcal{O}\left(V_{0}\right)$ and a fortiori over $\mathcal{O}\left(U_{i}\right) \otimes \mathcal{O}\left(V_{i}\right)$. By assumption the images $f_{1}, \ldots, f_{n} \in \mathcal{O}(U \otimes V)$ are in the image of the map $\mathcal{O}(U) \otimes \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$. Since $\mathcal{O}(U) \otimes \mathcal{O}(V)=\operatorname{colim} \mathcal{O}\left(U_{i}\right) \otimes \mathcal{O}\left(V_{i}\right)$ we see that they are in the image of the map at some finite level and the lemma is proved.

09MT Lemma 31.3.12. In Situation 31.3.1 let $\mathcal{L}_{0}$ be an invertible sheaf of modules on $S_{0}$. If the pullback $\mathcal{L}$ to $S$ is ample, then for some $i \in I$ the pullback $\mathcal{L}_{i}$ to $S_{i}$ is ample.

Proof. The assumption means there are finitely many sections $s_{1}, \ldots, s_{m} \in \Gamma(S, \mathcal{L})$ such that $S_{s_{j}}$ is affine and such that $S=\bigcup S_{s_{j}}$, see Properties, Definition 27.26.1. By Lemma 31.3.3 we can find an $i \in I$ and sections $s_{i, j} \in \Gamma\left(S_{i}, \mathcal{L}_{i}\right)$ mapping to $s_{j}$. By Lemma 31.3.10 we may, after increasing $i$, assume that $\left(S_{i}\right)_{s_{i, j}}$ is affine for
$j=1, \ldots, m$. By Lemma 31.3.8 we may, after increasing $i$ a last time, assume that $S_{i}=\bigcup\left(S_{i}\right)_{s_{i, j}}$. Then $\mathcal{L}_{i}$ is ample by definition.

081B Lemma 31.3.13. Let $S$ be a scheme. Let $X=\lim X_{i}$ be a directed limit of schemes over $S$ with affine transition morphisms. Let $Y \rightarrow X$ be a morphism of schemes over $S$.
(1) If $Y \rightarrow X$ is a closed immersion, $X_{i}$ quasi-compact, and $Y$ locally of finite type over $S$, then $Y \rightarrow X_{i}$ is a closed immersion for $i$ large enough.
(2) If $Y \rightarrow X$ is an immersion, $X_{i}$ quasi-separated, $Y \rightarrow S$ locally of finite type, and $Y$ quasi-compact, then $Y \rightarrow X_{i}$ is an immersion for $i$ large enough.

Proof. Proof of (1). Choose $0 \in I$ and a finite affine open covering $X_{0}=U_{0,1} \cup$ $\ldots \cup U_{0, m}$ with the property that $U_{0, j}$ maps into an affine open $W_{j} \subset S$. Let $V_{j} \subset Y$, resp. $U_{i, j} \subset X_{i}, i \geq 0$, resp. $U_{j} \subset X$ be the inverse image of $U_{0, j}$. It suffices to prove that $V_{j} \rightarrow U_{i, j}$ is a closed immersion for $i$ sufficiently large and we know that $V_{j} \rightarrow U_{j}$ is a closed immersion. Thus we reduce to the following algebra fact: If $A=\operatorname{colim} A_{i}$ is a directed colimit of $R$-algebras, $A \rightarrow B$ is a surjection of $R$-algebras, and $B$ is a finitely generated $R$-algebra, then $A_{i} \rightarrow B$ is surjective for $i$ sufficiently large.
Proof of (2). Choose $0 \in I$. Choose a quasi-compact open $X_{0}^{\prime} \subset X_{0}$ such that $Y \rightarrow X_{0}$ factors through $X_{0}^{\prime}$. After replacing $X_{i}$ by the inverse image of $X_{0}^{\prime}$ for $i \geq 0$ we may assume all $X_{i}^{\prime}$ are quasi-compact and quasi-separated. Let $U \subset X$ be a quasi-compact open such that $Y \rightarrow X$ factors through a closed immersion $Y \rightarrow U$ ( $U$ exists as $Y$ is quasi-compact). By Lemma 31.3.8 we may assume that $U=\lim U_{i}$ with $U_{i} \subset X_{i}$ quasi-compact open. By part (1) we see that $Y \rightarrow U_{i}$ is a closed immersion for some $i$. Thus (2) holds.
01ZH Lemma 31.3.14. Let $S$ be a scheme. Let $X=\lim X_{i}$ be a directed limit of schemes over $S$ with affine transition morphisms. Assume
(1) $S$ quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) $X \rightarrow S$ separated.

Then $X_{i} \rightarrow S$ is separated for all $i$ large enough.
Proof. Let $0 \in I$. Note that $I$ is nonempty as the limit is directed. As $X_{0}$ is quasi-compact we can find finitely many affine opens $U_{1}, \ldots, U_{n} \subset S$ such that $X_{0} \rightarrow S$ maps into $U_{1} \cup \ldots \cup U_{n}$. Denote $h_{i}: X_{i} \rightarrow S$ the structure morphism. It suffices to check that for some $i \geq 0$ the morphisms $h_{i}^{-1}\left(U_{j}\right) \rightarrow U_{j}$ are separated for $j=1, \ldots, n$. Since $S$ is quasi-separated the morphisms $U_{j} \rightarrow S$ are quasi-compact. Hence $h_{i}^{-1}\left(U_{j}\right)$ is quasi-compact and quasi-separated. In this way we reduce to the case $S$ affine. In this case we have to show that $X_{i}$ is separated and we know that $X$ is separated. Thus the lemma follows from Lemma 31.3.11.

09ZM Lemma 31.3.15. Let $S$ be a scheme. Let $X=\lim X_{i}$ be a directed limit of schemes over $S$ with affine transition morphisms. Assume
(1) $S$ quasi-compact and quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) $X \rightarrow S$ affine.

Then $X_{i} \rightarrow S$ is affine for $i$ large enough.

Proof. Choose a finite affine open covering $S=\bigcup_{j=1, \ldots, n} V_{j}$. Denote $f: X \rightarrow S$ and $f_{i}: X_{i} \rightarrow S$ the structure morphisms. For each $j$ the scheme $f^{-1}\left(V_{j}\right)=$ $\lim _{i} f_{i}^{-1}\left(V_{j}\right)$ is affine (as a finite morphism is affine by definition). Hence by Lemma 31.3 .10 there exists an $i \in I$ such that each $f_{i}^{-1}\left(V_{j}\right)$ is affine. In other words, $f_{i}: X_{i} \rightarrow S$ is affine for $i$ large enough, see Morphisms, Lemma 28.12.3.

09ZN Lemma 31.3.16. Let $S$ be a scheme. Let $X=\lim X_{i}$ be a directed limit of schemes over $S$ with affine transition morphisms. Assume
(1) $S$ quasi-compact and quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are finite,
(4) $X_{i} \rightarrow S$ locally of finite type
(5) $X \rightarrow S$ integral.

Then $X_{i} \rightarrow S$ is finite for $i$ large enough.
Proof. By Lemma 31.3 .15 we may assume $X_{i} \rightarrow S$ is affine for all $i$. Choose a finite affine open covering $S=\bigcup_{j=1, \ldots, n} V_{j}$. Denote $f: X \rightarrow S$ and $f_{i}: X_{i} \rightarrow S$ the structure morphisms. It suffices to show that there exists an $i$ such that $f_{i}^{-1}\left(V_{j}\right)$ is finite over $V_{j}$ for $j=1, \ldots, m$ (Morphisms, Lemma 28.43.3). Namely, for $i^{\prime} \geq i$ the composition $X_{i^{\prime}} \rightarrow X_{i} \rightarrow S$ will be finite as a composition of finite morphisms (Morphisms, Lemma 28.43.5). This reduces us to the affine case: Let $R$ be a ring and $A=\operatorname{colim} A_{i}$ with $R \rightarrow A$ integral and $A_{i} \rightarrow A_{i^{\prime}}$ finite for all $i \leq i^{\prime}$. Moreover $R \rightarrow A_{i}$ is of finite type for all $i$. Goal: Show that $A_{i}$ is finite over $R$ for some $i$. To prove this choose an $i \in I$ and pick generators $x_{1}, \ldots, x_{m} \in A_{i}$ of $A_{i}$ as an $R$-algebra. Since $A$ is integral over $R$ we can find monic polynomials $P_{j} \in R[T]$ such that $P_{j}\left(x_{j}\right)=0$ in $A$. Thus there exists an $i^{\prime} \geq i$ such that $P_{j}\left(x_{j}\right)=0$ in $A_{i^{\prime}}$ for $j=1, \ldots, m$. Then the image $A_{i}^{\prime}$ of $A_{i}$ in $A_{i^{\prime}}$ is finite over $R$ by Algebra, Lemma 10.35.5. Since $A_{i}^{\prime} \subset A_{i^{\prime}}$ is finite too we conclude that $A_{i^{\prime}}$ is finite over $R$ by Algebra, Lemma 10.7.3.

0A0N Lemma 31.3.17. Let $S$ be a scheme. Let $X=\lim X_{i}$ be a directed limit of schemes over $S$ with affine transition morphisms. Assume
(1) $S$ quasi-compact and quasi-separated,
(2) $X_{i}$ quasi-compact and quasi-separated,
(3) the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are closed immersions,
(4) $X_{i} \rightarrow S$ locally of finite type
(5) $X \rightarrow S$ a closed immersion.

Then $X_{i} \rightarrow S$ is a closed immersion for $i$ large enough.
Proof. By Lemma 31.3 .15 we may assume $X_{i} \rightarrow S$ is affine for all $i$. Choose a finite affine open covering $S=\bigcup_{j=1, \ldots, n} V_{j}$. Denote $f: X \rightarrow S$ and $f_{i}: X_{i} \rightarrow S$ the structure morphisms. It suffices to show that there exists an $i$ such that $f_{i}^{-1}\left(V_{j}\right)$ is a closed subscheme of $V_{j}$ for $j=1, \ldots, m$ (Morphisms, Lemma 28.2.1). This reduces us to the affine case: Let $R$ be a ring and $A=\operatorname{colim} A_{i}$ with $R \rightarrow A$ surjective and $A_{i} \rightarrow A_{i^{\prime}}$ surjective for all $i \leq i^{\prime}$. Moreover $R \rightarrow A_{i}$ is of finite type for all $i$. Goal: Show that $R \rightarrow A_{i}$ is surjective for some $i$. To prove this choose an $i \in I$ and pick generators $x_{1}, \ldots, x_{m} \in A_{i}$ of $A_{i}$ as an $R$-algebra. Since $R \rightarrow A$ is surjective we can find $r_{j} \in R$ such that $r_{j}$ maps to $x_{j}$ in $A$. Thus there exists an
$i^{\prime} \geq i$ such that $r_{j}$ maps to the image of $x_{j}$ in $A_{i^{\prime}}$ for $j=1, \ldots, m$. Since $A_{i} \rightarrow A_{i^{\prime}}$ is surjective this implies that $R \rightarrow A_{i^{\prime}}$ is surjective.

### 31.4. Absolute Noetherian Approximation

01 Z 1 A nice reference for this section is Appendix C of the article by Thomason and Trobaugh TT90. See Categories, Section 4.21 for our conventions regarding directed systems. We will use the existence result and properties of the limit from Section 31.2 without further mention.

01 Z 7 Lemma 31.4.1. Let $W$ be a quasi-affine scheme of finite type over Z. Suppose $W \rightarrow \operatorname{Spec}(R)$ is an open immersion into an affine scheme. There exists a finite type Z-algebra $A \subset R$ which induces an open immersion $W \rightarrow \operatorname{Spec}(A)$. Moreover, $R$ is the directed colimit of such subalgebras.

Proof. Choose an affine open covering $W=\bigcup_{i=1, \ldots, n} W_{i}$ such that each $W_{i}$ is a standard affine open in $\operatorname{Spec}(R)$. In other words, if we write $W_{i}=\operatorname{Spec}\left(R_{i}\right)$ then $R_{i}=R_{f_{i}}$ for some $f_{i} \in R$. Choose finitely many $x_{i j} \in R_{i}$ which generate $R_{i}$ over $\mathbf{Z}$. Pick an $N \gg 0$ such that each $f_{i}^{N} x_{i j}$ comes from an element of $R$, say $y_{i j} \in R$. Set $A$ equal to the $\mathbf{Z}$-algebra generated by the $f_{i}$ and the $y_{i j}$ and (optionally) finitely many additional elements of $R$. Then $A$ works. Details omitted.

01Z9 Lemma 31.4.2. Suppose given a cartesian diagram of rings

Let $W^{\prime} \subset \operatorname{Spec}\left(R^{\prime}\right)$ be an open of the form $W^{\prime}=D\left(f_{1}\right) \cup \ldots \cup D\left(f_{n}\right)$ such that $t\left(f_{i}\right)=s\left(g_{i}\right)$ for some $g_{i} \in B$ and $B_{g_{i}} \cong R_{s\left(g_{i}\right)}$. Then $B^{\prime} \rightarrow R^{\prime}$ induces an open immersion of $W^{\prime}$ into $\operatorname{Spec}\left(B^{\prime}\right)$.

Proof. Set $h_{i}=\left(g_{i}, f_{i}\right) \in B^{\prime}$. More on Algebra, Lemma 15.5.3 shows that $\left(B^{\prime}\right)_{h_{i}} \cong$ $\left(R^{\prime}\right)_{f_{i}}$ as desired.

The following lemma is a precise statement of Noetherian approximation.
07RN Lemma 31.4.3. Let $S$ be a quasi-compact and quasi-separated scheme. Let $V \subset S$ be a quasi-compact open. Let I be a directed partially ordered set and let $\left(V_{i}, f_{i i^{\prime}}\right)$ be an inverse system of schemes over I with affine transition maps, with each $V_{i}$ of finite type over $\mathbf{Z}$, and with $V=\lim V_{i}$. Then there exist
(1) a directed partially ordered set $J$,
(2) an inverse system of schemes $\left(S_{j}, g_{j j^{\prime}}\right)$ over $J$,
(3) an order preserving map $\alpha: J \rightarrow I$,
(4) open subschemes $V_{j}^{\prime} \subset S_{j}$, and
(5) isomorphisms $V_{j}^{\prime} \rightarrow V_{\alpha(j)}$
such that
(1) the transition morphisms $g_{j j^{\prime}}: S_{j} \rightarrow S_{j^{\prime}}$ are affine,
(2) each $S_{j}$ is of finite type over $\mathbf{Z}$,
(3) $g_{j j^{\prime}}^{-1}\left(V_{j^{\prime}}\right)=V_{j}$,
(4) $S=\lim S_{j}$ and $V=\lim V_{j}$, and
(5) the diagrams

are commutative.
Proof. Set $Z=S \backslash V$. Choose affine opens $U_{1}, \ldots, U_{m} \subset S$ such that $Z \subset$ $\bigcup_{l=1, \ldots, m} U_{l}$. Consider the opens

$$
V \subset V \cup U_{1} \subset V \cup U_{1} \cup U_{2} \subset \ldots \subset V \cup \bigcup_{l=1, \ldots, m} U_{l}=S
$$

If we can prove the lemma successively for each of the cases

$$
V \cup U_{1} \cup \ldots \cup U_{l} \subset V \cup U_{1} \cup \ldots \cup U_{l+1}
$$

then the lemma will follow for $V \subset S$. In each case we are adding one affine open. Thus we may assume
(1) $S=U \cup V$,
(2) $U$ affine open in $S$,
(3) $V$ quasi-compact open in $S$, and
(4) $V=\lim _{i} V_{i}$ with $\left(V_{i}, f_{i i^{\prime}}\right)$ an inverse system over a directed set $I$, each $f_{i i^{\prime}}$ affine and each $V_{i}$ of finite type over $\mathbf{Z}$.
Set $W=U \cap V$. As $S$ is quasi-separated, this is a quasi-compact open of $V$. By Lemma 31.3 .8 (and after shrinking $I$ ) we may assume that there exist opens $W_{i} \subset V_{i}$ such that $f_{i j}^{-1}\left(W_{j}\right)=W_{i}$ and such that $f_{i}^{-1}\left(W_{i}\right)=W$. Since $W$ is a quasi-compact open of $U$ it is quasi-affine. Hence we may assume (after shrinking $I$ again) that $W_{i}$ is quasi-affine for all $i$, see Lemma 31.3.9.

Write $U=\operatorname{Spec}(B)$. Set $R=\Gamma\left(W, \mathcal{O}_{W}\right)$, and $R_{i}=\Gamma\left(W_{i}, \mathcal{O}_{W_{i}}\right)$. By Lemma 31.3.3 we have $R=\operatorname{colim}_{i} R_{i}$. Now we have the maps of rings

We set $B_{i}=\left\{(b, r) \in B \times R_{i} \mid s(b)=t_{i}(t)\right\}$ so that we have a cartesian diagram

for each $i$. The transition maps $R_{i} \rightarrow R_{i^{\prime}}$ induce maps $B_{i} \rightarrow B_{i^{\prime}}$. It is clear that $B=\operatorname{colim}_{i} B_{i}$. In the next paragraph we show that for all sufficiently large $i$ the composition $W_{i} \rightarrow \operatorname{Spec}\left(R_{i}\right) \rightarrow \operatorname{Spec}\left(B_{i}\right)$ is an open immersion.

As $W$ is a quasi-compact open of $U=\operatorname{Spec}(B)$ we can find a finitely many elements $g_{l} \in B, l=1, \ldots, m$ such that $D\left(g_{l}\right) \subset W$ and such that $W=\bigcup_{l=1, \ldots, m} D\left(g_{l}\right)$.

Note that this implies $D\left(g_{l}\right)=W_{s\left(g_{l}\right)}$ as open subsets of $U$, where $W_{s\left(g_{l}\right)}$ denotes the largest open subset of $W$ on which $s\left(g_{l}\right)$ is invertible. Hence

$$
B_{g_{l}}=\Gamma\left(D\left(g_{l}\right), \mathcal{O}_{U}\right)=\Gamma\left(W_{s\left(g_{l}\right)}, \mathcal{O}_{W}\right)=R_{s\left(g_{l}\right)}
$$

where the last equality is Properties, Lemma 27.17.1. Since $W_{s\left(g_{l}\right)}$ is affine this also implies that $D\left(s\left(g_{l}\right)\right)=W_{s\left(g_{l}\right)}$ as open subsets of $\operatorname{Spec}(R)$. Since $R=\operatorname{colim}_{i} R_{i}$ we can (after shrinking $I$ ) assume there exist $g_{l, i} \in R_{i}$ for all $i \in I$ such that $s\left(g_{l}\right)=$ $t_{i}\left(g_{l, i}\right)$. Of course we choose the $g_{l, i}$ such that $g_{l, i}$ maps to $g_{l, i^{\prime}}$ under the transition maps $R_{i} \rightarrow R_{i^{\prime}}$. Then, by Lemma 31.3 .8 we can (after shrinking $I$ again) assume the corresponding opens $D\left(g_{l, i}\right) \subset \operatorname{Spec}\left(R_{i}\right)$ are contained in $W_{i}, j=1, \ldots, m$ and cover $W_{i}$. We conclude that the morphism $W_{i} \rightarrow \operatorname{Spec}\left(R_{i}\right) \rightarrow \operatorname{Spec}\left(B_{i}\right)$ is an open immersion, see Lemma 31.4.2
By Lemma 31.4.1 we can write $B_{i}$ as a directed colimit of subalgebras $A_{i, p} \subset B_{i}, p \in$ $P_{i}$ each of finite type over $\mathbf{Z}$ and such that $W_{i}$ is identified with an open subscheme of $\operatorname{Spec}\left(A_{i, p}\right)$. Let $S_{i, p}$ be the scheme obtained by glueing $V_{i}$ and $\operatorname{Spec}\left(A_{i, p}\right)$ along the open $W_{i}$, see Schemes, Section 25.14 . Here is the resulting commutative diagram of schemes:

The morphism $S \rightarrow S_{i, p}$ arises because the upper right square is a pushout in the category of schemes. Note that $S_{i, p}$ is of finite type over $\mathbf{Z}$ since it has a finite affine open covering whose members are spectra of finite type $\mathbf{Z}$-algebras. We define a partial ordering on $J=\coprod_{i \in I} P_{i}$ by the rule $\left(i^{\prime}, p^{\prime}\right) \geq(i, p)$ if and only if $i^{\prime} \geq i$ and the map $B_{i} \rightarrow B_{i^{\prime}}$ maps $A_{i, p}$ into $A_{i^{\prime}, p^{\prime}}$. This is exactly the condition needed to define a morphism $S_{i^{\prime}, p^{\prime}} \rightarrow S_{i, p}$ : namely make a commutative diagram as above using the transition morphisms $V_{i^{\prime}} \rightarrow V_{i}$ and $W_{i^{\prime}} \rightarrow W_{i}$ and the morphism $\operatorname{Spec}\left(A_{i^{\prime}, p^{\prime}}\right) \rightarrow \operatorname{Spec}\left(A_{i, p}\right)$ induced by the ring map $A_{i, p} \rightarrow A_{i^{\prime}, p^{\prime}}$. The relevant commutativities have been built into the constructions. We claim that $S$ is the directed limit of the schemes $S_{i, p}$. Since by construction the schemes $V_{i}$ have limit $V$ this boils down to the fact that $B$ is the limit of the rings $A_{i, p}$ which is true by construction. The map $\alpha: J \rightarrow I$ is given by the rule $j=(i, p) \mapsto i$. The open subscheme $V_{j}^{\prime}$ is just the image of $V_{i} \rightarrow S_{i, p}$ above. The commutativity of the diagrams in (5) is clear from the construction. This finishes the proof of the lemma.

01ZA Proposition 31.4.4. Let $S$ be a quasi-compact and quasi-separated scheme. There exist a directed partially ordered set $I$ and an inverse system of schemes ( $S_{i}, f_{i i^{\prime}}$ ) over I such that
(1) the transition morphisms $f_{i i^{\prime}}$ are affine
(2) each $S_{i}$ is of finite type over $\mathbf{Z}$, and
(3) $S=\lim _{i} S_{i}$.

Proof. This is a special case of Lemma 31.4.3 with $V=\emptyset$.

### 31.5. Limits and morphisms of finite presentation

01ZB The following is a generalization of Algebra, Lemma 10.126.2.
01ZC Proposition 31.5.1. Let $f: X \rightarrow S$ be a morphism of schemes. The following are equivalent:
(1) The morphism $f$ is locally of finite presentation.
(2) For any directed partially ordered set $I$, and any inverse system $\left(T_{i}, f_{i i^{\prime}}\right)$ of $S$-schemes over I with each $T_{i}$ affine, we have

$$
\operatorname{Mor}_{S}\left(\lim _{i} T_{i}, X\right)=\operatorname{colim}_{i} \operatorname{Mor}_{S}\left(T_{i}, X\right)
$$

(3) For any directed partially ordered set $I$, and any inverse system $\left(T_{i}, f_{i i^{\prime}}\right)$ of $S$-schemes over $I$ with each $f_{i i^{\prime}}$ affine and every $T_{i}$ quasi-compact and quasi-separated as a scheme, we have

$$
\operatorname{Mor}_{S}\left(\lim _{i} T_{i}, X\right)=\operatorname{colim}_{i} \operatorname{Mor}_{S}\left(T_{i}, X\right)
$$

Proof. It is clear that (3) implies (2).
Let us prove that (2) implies (1). Assume (2). Choose any affine opens $U \subset X$ and $V \subset S$ such that $f(U) \subset V$. We have to show that $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is of finite presentation. Let $\left(A_{i}, \varphi_{i i^{\prime}}\right)$ be a directed system of $\mathcal{O}_{S}(V)$-algebras. Set $A=\operatorname{colim}_{i} A_{i}$. According to Algebra, Lemma 10.126 .2 we have to show that

$$
\operatorname{Hom}_{\mathcal{O}_{S}(V)}\left(\mathcal{O}_{X}(U), A\right)=\operatorname{colim}_{i} \operatorname{Hom}_{\mathcal{O}_{S}(V)}\left(\mathcal{O}_{X}(U), A_{i}\right)
$$

Consider the schemes $T_{i}=\operatorname{Spec}\left(A_{i}\right)$. They form an inverse system of $V$-schemes over $I$ with transition morphisms $f_{i i^{\prime}}: T_{i} \rightarrow T_{i^{\prime}}$ induced by the $\mathcal{O}_{S}(V)$-algebra maps $\varphi_{i^{\prime} i}$. Set $T:=\operatorname{Spec}(A)=\lim _{i} T_{i}$. The formula above becomes in terms of morphism sets of schemes

$$
\operatorname{Mor}_{V}\left(\lim _{i} T_{i}, U\right)=\operatorname{colim}_{i} \operatorname{Mor}_{V}\left(T_{i}, U\right)
$$

We first observe that $\operatorname{Mor}_{V}\left(T_{i}, U\right)=\operatorname{Mor}_{S}\left(T_{i}, U\right)$ and $\operatorname{Mor}_{V}(T, U)=\operatorname{Mor}_{S}(T, U)$. Hence we have to show that

$$
\operatorname{Mor}_{S}\left(\lim _{i} T_{i}, U\right)=\operatorname{colim}_{i} \operatorname{Mor}_{S}\left(T_{i}, U\right)
$$

and we are given that

$$
\operatorname{Mor}_{S}\left(\lim _{i} T_{i}, X\right)=\operatorname{colim}_{i} \operatorname{Mor}_{S}\left(T_{i}, X\right)
$$

Hence it suffices to prove that given a morphism $g_{i}: T_{i} \rightarrow X$ over $S$ such that the composition $T \rightarrow T_{i} \rightarrow X$ ends up in $U$ there exists some $i^{\prime} \geq i$ such that the composition $g_{i^{\prime}}: T_{i^{\prime}} \rightarrow T_{i} \rightarrow X$ ends up in $U$. Denote $Z_{i^{\prime}}=g_{i^{\prime}}^{-1}(X \backslash U)$. Assume each $Z_{i^{\prime}}$ is nonempty to get a contradiction. By Lemma 31.3.5 there exists a point $t$ of $T$ which is mapped into $Z_{i^{\prime}}$ for all $i^{\prime} \geq i$. Such a point is not mapped into $U$. A contradiction.
Finally, let us prove that (1) implies (3). Assume (1). Let an inverse directed system $\left(T_{i}, f_{i i^{\prime}}\right)$ of $S$-schemes be given. Assume the morphisms $f_{i i^{\prime}}$ are affine and each $T_{i}$ is quasi-compact and quasi-separated as a scheme. Let $T=\lim _{i} T_{i}$. Denote $f_{i}: T \rightarrow T_{i}$ the projection morphisms. We have to show:
(a) Given morphisms $g_{i}, g_{i}^{\prime}: T_{i} \rightarrow X$ over $S$ such that $g_{i} \circ f_{i}=g_{i}^{\prime} \circ f_{i}$, then there exists an $i^{\prime} \geq i$ such that $g_{i} \circ f_{i^{\prime} i}=g_{i}^{\prime} \circ f_{i^{\prime} i}$.
(b) Given any morphism $g: T \rightarrow X$ over $S$ there exists an $i \in I$ and a morphism $g_{i}: T_{i} \rightarrow X$ such that $g=f_{i} \circ g_{i}$.

First let us prove the uniqueness part (a). Let $g_{i}, g_{i}^{\prime}: T_{i} \rightarrow X$ be morphisms such that $g_{i} \circ f_{i}=g_{i}^{\prime} \circ f_{i}$. For any $i^{\prime} \geq i$ we set $g_{i^{\prime}}=g_{i} \circ f_{i^{\prime} i}$ and $g_{i^{\prime}}^{\prime}=g_{i}^{\prime} \circ f_{i^{\prime} i}$. We also set $g=g_{i} \circ f_{i}=g_{i}^{\prime} \circ f_{i}$. Consider the morphism $\left(g_{i}, g_{i}^{\prime}\right): T_{i} \rightarrow X \times_{S} X$. Set

$$
W=\bigcup_{U \subset X \text { affine open }, V \subset S \text { affine open, } f(U) \subset V} U \times_{V} U .
$$

This is an open in $X \times_{S} X$, with the property that the morphism $\Delta_{X / S}$ factors through a closed immersion into $W$, see the proof of Schemes, Lemma 25.21.2. Note that the composition $\left(g_{i}, g_{i}^{\prime}\right) \circ f_{i}: T \rightarrow X \times_{S} X$ is a morphism into $W$ because it factors through the diagonal by assumption. Set $Z_{i^{\prime}}=\left(g_{i^{\prime}}, g_{i^{\prime}}^{\prime}\right)^{-1}\left(X \times_{S} X \backslash W\right)$. If each $Z_{i^{\prime}}$ is nonempty, then by Lemma 31.3 .5 there exists a point $t \in T$ which maps to $Z_{i^{\prime}}$ for all $i^{\prime} \geq i$. This is a contradiction with the fact that $T$ maps into $W$. Hence we may increase $i$ and assume that $\left(g_{i}, g_{i}^{\prime}\right): T_{i} \rightarrow X \times{ }_{S} X$ is a morphism into $W$. By construction of $W$, and since $T_{i}$ is quasi-compact we can find a finite affine open covering $T_{i}=T_{1, i} \cup \ldots \cup T_{n, i}$ such that $\left.\left(g_{i}, g_{i}^{\prime}\right)\right|_{T_{j, i}}$ is a morphism into $U \times_{V} U$ for some pair $(U, V)$ as in the definition of $W$ above. Since it suffices to prove that $g_{i^{\prime}}$ and $g_{i^{\prime}}^{\prime}$ agree on each of the $f_{i^{\prime} i}^{-1}\left(T_{j, i}\right)$ this reduces us to the affine case. The affine case follows from Algebra, Lemma 10.126 .2 and the fact that the ring map $\mathcal{O}_{S}(V) \rightarrow \mathcal{O}_{X}(U)$ is of finite presentation (see Morphisms, Lemma 28.21.2).

Finally, we prove the existence part (b). Let $g: T \rightarrow X$ be a morphism of schemes over $S$. We can find a finite affine open covering $T=W_{1} \cup \ldots \cup W_{n}$ such that for each $j \in\{1, \ldots, n\}$ there exist affine opens $U_{j} \subset X$ and $V_{j} \subset S$ with $f\left(U_{j}\right) \subset V_{j}$ and $g\left(W_{j}\right) \subset U_{j}$. By Lemmas 31.3 .8 and 31.3 .10 (after possibly shrinking $I$ ) we may assume that there exist affine open coverings $T_{i}=W_{1, i} \cup \ldots \cup W_{n, i}$ compatible with transition maps such that $W_{j}=\lim _{i} W_{j, i}$. We apply Algebra, Lemma 10.126 .2 to the rings corresponding to the affine schemes $U_{j}, V_{j}, W_{j, i}$ and $W_{j}$ using that $\mathcal{O}_{S}\left(V_{j}\right) \rightarrow \mathcal{O}_{X}\left(U_{j}\right)$ is of finite presentation (see Morphisms, Lemma 28.21.2. Thus we can find for each $j$ an index $i_{j} \in I$ and a morphism $g_{j, i_{j}}: W_{j, i_{j}} \rightarrow X$ such that $\left.g_{j, i_{j}} \circ f_{i}\right|_{W_{j}}: W_{j} \rightarrow W_{j, i} \rightarrow X$ equals $\left.g\right|_{W_{j}}$. By part (a) proved above, using the quasi-compactness of $W_{j_{1}, i} \cap W_{j_{2}, i}$ which follows as $T_{i}$ is quasi-separated, we can find an index $i^{\prime} \in I$ larger than all $i_{j}$ such that

$$
g_{j_{1}, i_{j_{1}}} \circ f_{i^{\prime} i_{j_{1}}}\left|W_{j_{1}, i^{\prime}} \cap W_{j_{2}, i^{\prime}}=g_{j_{2}, i_{j_{2}}} \circ f_{i^{\prime} i_{j_{2}}}\right| W_{j_{1}, i^{\prime}} \cap W_{j_{2}, i^{\prime}}
$$

for all $j_{1}, j_{2} \in\{1, \ldots, n\}$. Hence the morphisms $g_{j, i_{j}} \circ f_{i^{\prime} i_{j}} \mid W_{j, i^{\prime}}$ glue to given the desired morphism $T_{i^{\prime}} \rightarrow X$.

05LX Remark 31.5.2. Let $S$ be a scheme. Let us say that a functor $F:(S c h / S)^{o p p} \rightarrow$ Sets is limit preserving if for every directed inverse system $\left\{T_{i}\right\}_{i \in I}$ of affine schemes with limit $T$ we have $F(T)=\operatorname{colim}_{i} F\left(T_{i}\right)$. Let $X$ be a scheme over $S$, and let $h_{X}:(S c h / S)^{o p p} \rightarrow$ Sets be its functor of points, see Schemes, Section 25.15. In this terminology Proposition 31.5 .1 says that a scheme $X$ is locally of finite presentation over $S$ if and only if $h_{X}$ is limit preserving.

### 31.6. Relative approximation

09 MU The title of this section refers to results of the following type.
09MV Lemma 31.6.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that
(1) $X$ is quasi-compact and quasi-separated, and
(2) $S$ is quasi-separated.

Then $X=\lim X_{i}$ is a limit of a directed system of schemes $X_{i}$ of finite presentation over $S$ with affine transition morphisms over $S$.

Proof. Since $f(X)$ is quasi-compact we may replace $S$ by a quasi-compact open containing $f(X)$. Hence we may assume $S$ is quasi-compact as well. Write $X=$ $\lim X_{a}$ and $S=\lim S_{b}$ as in Proposition 31.4.4, i.e., with $X_{a}$ and $S_{b}$ of finite type over $\mathbf{Z}$ and with affine transition morphisms. By Proposition 31.5.1 we find that for each $b$ there exists an $a$ and a morphism $f_{a, b}: X_{a} \rightarrow S_{b}$ making the diagram

commute. Moreover the same proposition implies that, given a second triple $\left(a^{\prime}, b^{\prime}, f_{a^{\prime}, b^{\prime}}\right)$, there exists an $a^{\prime \prime} \geq a^{\prime}$ such that the compositions $X_{a^{\prime \prime}} \rightarrow X_{a} \rightarrow X_{b}$ and $X_{a^{\prime \prime}} \rightarrow X_{a^{\prime}} \rightarrow X_{b^{\prime}} \rightarrow X_{b}$ are equal. Consider the set of triples $\left(a, b, f_{a, b}\right)$ endowed with the partial ordering

$$
\left(a, b, f_{a, b}\right) \geq\left(a^{\prime}, b^{\prime}, f_{a^{\prime}, b^{\prime}}\right) \Leftrightarrow a \geq a^{\prime}, b^{\prime} \geq b, \text { and } f_{a^{\prime}, b^{\prime}} \circ h_{a, a^{\prime}}=g_{b^{\prime}, b} \circ f_{a, b}
$$

where $h_{a, a^{\prime}}: X_{a} \rightarrow X_{a^{\prime}}$ and $g_{b^{\prime}, b}: S_{b^{\prime}} \rightarrow S_{b}$ are the transition morphisms. The remarks above show that this system is directed. It follows formally from the equalities $X=\lim X_{a}$ and $S=\lim S_{b}$ that

$$
X=\lim _{\left(a, b, f_{a, b}\right)} X_{a} \times_{f_{a, b}, S_{b}} S
$$

where the limit is over our directed system above. The transition morphisms $X_{a} \times S_{b}$ $S \rightarrow X_{a^{\prime}} \times_{S_{b^{\prime}}} S$ are affine as the composition

$$
X_{a} \times_{S_{b}} S \rightarrow X_{a} \times_{S_{b^{\prime}}} S \rightarrow X_{a^{\prime}} \times_{S_{b^{\prime}}} S
$$

where the first morphism is a closed immersion (by Schemes, Lemma 25.21.10) and the second is a base change of an affine morphism (Morphisms, Lemma 28.12.8) and the composition of affine morphisms is affine (Morphisms, Lemma 28.12.7). The morphisms $f_{a, b}$ are of finite presentation (Morphisms, Lemmas 28.21.9 and 28.21.11) and hence the base changes $X_{a} \times{ }_{f_{a, b}, S_{b}} S \rightarrow S$ are of finite presentation (Morphisms, Lemma 28.21.4).

09YZ Lemma 31.6.2. Let $X \rightarrow S$ be an integral morphism with $S$ quasi-compact and quasi-separated. Then $X=\lim X_{i}$ with $X_{i} \rightarrow S$ finite and of finite presentation.

Proof. Consider the sheaf $\mathcal{A}=f_{*} \mathcal{O}_{X}$. This is a quasi-coherent sheaf of $\mathcal{O}_{S^{-}}$ algebras, see Schemes, Lemma 25.24.1. Combining Properties, Lemma 27.22.13 we can write $\mathcal{A}=\operatorname{colim}_{i} \mathcal{A}_{i}$ as a filtered colimit of finite and finitely presented $\mathcal{O}_{S}$-algebras. Then

$$
X_{i}=\underline{\operatorname{Spec}}_{S}\left(\mathcal{A}_{i}\right) \longrightarrow S
$$

is a finite and finitely presented morphism of schemes. By construction $X=\lim _{i} X_{i}$ which proves the lemma.

### 31.7. Descending properties of morphisms

081C This section is the analogue of Section 31.3 for properties of morphisms over $S$. We will work in the following situation.
081D Situation 31.7.1. Let $S=\lim S_{i}$ be a limit of a directed system of schemes with affine transition morphisms (Lemma 31.2.2). Let $0 \in I$ and let $f_{0}: X_{0} \rightarrow Y_{0}$ be a morphism of schemes over $S_{0}$. Assume $S_{0}, X_{0}, Y_{0}$ are quasi-compact and quasiseparated. Let $f_{i}: X_{i} \rightarrow Y_{i}$ be the base change of $f_{0}$ to $S_{i}$ and let $f: X \rightarrow Y$ be the base change of $f_{0}$ to $S$.

01ZN Lemma 31.7.2. Notation and assumptions as in Situation 31.7.1. If $f$ is affine, then there exists an index $i \geq 0$ such that $f_{i}$ is affine.

Proof. Let $Y_{0}=\bigcup_{j=1, \ldots, m} V_{j, 0}$ be a finite affine open covering. Set $U_{j, 0}=$ $f_{0}^{-1}\left(V_{j, 0}\right)$. For $i \geq 0$ we denote $V_{j, i}$ the inverse image of $V_{j, 0}$ in $Y_{i}$ and $U_{j, i}=$ $f_{i}^{-1}\left(V_{j, i}\right)$. Similarly we have $U_{j}=f^{-1}\left(V_{j}\right)$. Then $U_{j}=\lim _{i \geq 0} U_{j, i}$ (see Lemma 31.2.2). Since $U_{j}$ is affine by assumption we see that each $U_{j, i}$ is affine for $i$ large enough, see Lemma 31.3.10. As there are finitely many $j$ we can pick an $i$ which works for all $j$. Thus $f_{i}$ is affine for $i$ large enough, see Morphisms, Lemma 28.12 .3

01ZO Lemma 31.7.3. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is a finite morphism, and
(2) $f_{0}$ is locally of finite type,
then there exists an $i \geq 0$ such that $f_{i}$ is finite.
Proof. A finite morphism is affine, see Morphisms, Definition 28.43.1. Hence by Lemma 31.7.2 above after increasing 0 we may assume that $f_{0}$ is affine. By writing $Y_{0}$ as a finite union of affines we reduce to proving the result when $X_{0}$ and $Y_{0}$ are affine and map into a common affine $W \subset S_{0}$. The corresponding algebra statement follows from Algebra, Lemma 10.160.3.
01ZP Lemma 31.7.4. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is a closed immersion, and
(2) $f_{0}$ is locally of finite type,
then there exists an $i \geq 0$ such that $f_{i}$ is a closed immersion.
Proof. A closed immersion is affine, see Morphisms, Lemma 28.12.9. Hence by Lemma 31.7.2 above after increasing 0 we may assume that $f_{0}$ is affine. By writing $Y_{0}$ as a finite union of affines we reduce to proving the result when $X_{0}$ and $Y_{0}$ are affine and map into a common affine $W \subset S_{0}$. The corresponding algebra statement is a consequence of Algebra, Lemma 10.160.4.

01ZQ Lemma 31.7.5. Notation and assumptions as in Situation 31.7.1. If $f$ is separated, then $f_{i}$ is separated for some $i \geq 0$.

Proof. Apply Lemma 31.7 .4 to the diagonal morphism $\Delta_{X_{0} / S_{0}}: X_{0} \rightarrow X_{0} \times{ }_{S_{0}} X_{0}$. (This is permissible as diagonal morphisms are locally of finite type and the fibre product $X_{0} \times{ }_{S_{0}} X_{0}$ is quasi-compact and quasi-separated, see Schemes, Lemma 25.21.2. Morphisms, Lemma 28.15.5, and Schemes, Remark 25.21.18.

04AI Lemma 31.7.6. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is flat,
(2) $f_{0}$ is locally of finite presentation,
then $f_{i}$ is flat for some $i \geq 0$.
Proof. Choose a finite affine open covering $Y_{0}=\bigcup_{j=1, \ldots, m} Y_{j, 0}$ such that each $Y_{j, 0}$ maps into an affine open $S_{j, 0} \subset S_{0}$. For each $j$ let $f_{0}^{-1} Y_{j, 0}=\bigcup_{k=1, \ldots, n_{j}} X_{k, 0}$ be a finite affine open covering. Since the property of being flat is local we see that it suffices to prove the lemma for the morphisms of affines $X_{k, i} \rightarrow Y_{j, i} \rightarrow S_{j, i}$ which are the base changes of $X_{k, 0} \rightarrow Y_{j, 0} \rightarrow S_{j, 0}$ to $S_{i}$. Thus we reduce to the case that $X_{0}, Y_{0}, S_{0}$ are affine

In the affine case we reduce to the following algebra result. Suppose that $R=$ $\operatorname{colim}_{i \in I} R_{i}$. For some $0 \in I$ suppose given an $R_{0}$-algebra map $A_{i} \rightarrow B_{i}$ of finite presentation. If $R \otimes_{R_{0}} A_{0} \rightarrow R \otimes_{R_{0}} B_{0}$ is flat, then for some $i \geq 0$ the map $R_{i} \otimes_{R_{0}} A_{0} \rightarrow R_{i} \otimes_{R_{0}} B_{0}$ is flat. This follows from Algebra, Lemma 10.160.1 part (3).

06AC Lemma 31.7.7. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is finite locally free (of degree d),
(2) $f_{0}$ is locally of finite presentation, then $f_{i}$ is finite locally free (of degree d) for some $i \geq 0$.

Proof. By Lemmas 31.7 .6 and 31.7 .3 we find an $i$ such that $f_{i}$ is flat and finite. On the other hand, $f_{i}$ is locally of finite presentation. Hence $f_{i}$ is finite locally free by Morphisms, Lemma 28.45.2. If moreover $f$ is finite locally free of degree $d$, then the image of $Y \rightarrow Y_{i}$ is contained in the open and closed locus $W_{d} \subset Y_{i}$ over which $f_{i}$ has degree $d$. By Lemma 31.3.7 we see that for some $i^{\prime} \geq i$ the image of $Y_{i^{\prime}} \rightarrow Y_{i}$ is contained in $W_{d}$. Then $f_{i^{\prime}}$ will be finite locally free of degree $d$.

07RP Lemma 31.7.8. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is étale,
(2) $f_{0}$ is locally of finite presentation,
then $f_{i}$ is étale for some $i \geq 0$.
Proof. Being étale is local on the source and the target (Morphisms, Lemma 28.36.2) hence we may assume $S_{0}, X_{0}, Y_{0}$ affine (details omitted). The corresponding algebra fact is Algebra, Lemma 10.160 .5
081E Lemma 31.7.9. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is an isomorphism, and
(2) $f_{0}$ is locally of finite presentation, then $f_{i}$ is an isomorphism for some $i \geq 0$.
Proof. By Lemmas 31.7.8 and 31.7.4 we can find an $i$ such that $f_{i}$ is flat and a closed immersion. Then $f_{i}$ identifies $X_{i}$ with an open and closed subscheme of $Y_{i}$, see Morphisms, Lemma 28.26.2, By assumption the image of $Y \rightarrow Y_{i}$ maps into $f_{i}\left(X_{i}\right)$. Thus by Lemma 31.3.7 we find that $Y_{i^{\prime}}$ maps into $f_{i}\left(X_{i}\right)$ for some $i^{\prime} \geq i$. It follows that $X_{i^{\prime}} \rightarrow Y_{i^{\prime}}$ is surjective and we win.
07 RQ Lemma 31.7.10. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is a monomorphism, and
(2) $f_{0}$ is locally of finite type,
then $f_{i}$ is a monomorphism for some $i \geq 0$.
Proof. Recall that a morphism of schemes $V \rightarrow W$ is a monomorphism if and only if the diagonal $V \rightarrow V \times_{W} V$ is an isomorphism (Schemes, Lemma 25.23.2). The morphism $X_{0} \rightarrow X_{0} \times_{Y_{0}} X_{0}$ is locally of finite presentation by Morphisms, Lemma 28.21.12, Since $X_{0} \times{ }_{Y_{0}} X_{0}$ is quasi-compact and quasi-separated (Schemes, Remark 25.21.18 we conclude from Lemma 31.7.9 that $\Delta_{i}: X_{i} \rightarrow X_{i} \times_{Y_{i}} X_{i}$ is an isomorphism for some $i \geq 0$. For this $i$ the morphism $f_{i}$ is a monomorphism.

07RR Lemma 31.7.11. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is surjective, and
(2) $f_{0}$ is locally of finite presentation,
then there exists an $i \geq 0$ such that $f_{i}$ is surjective.
Proof. The morphism $f_{0}$ is of finite presentation. Hence $E=f_{0}\left(X_{0}\right)$ is a constructible subset of $Y_{0}$, see Morphisms, Lemma 28.22.2. Since $f_{i}$ is the base change of $f_{0}$ by $Y_{i} \rightarrow Y_{0}$ we see that the image of $f_{i}$ is the inverse image of $E$ in $Y_{i}$. Moreover, we know that $Y \rightarrow Y_{0}$ maps into $E$. Hence we win by Lemma 31.3.7.

### 31.8. Finite type closed in finite presentation

01ZD A result of this type is [Kie72, Satz 2.10]. Another reference is Con07b.
01ZE Lemma 31.8.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume:
(1) The morphism $f$ is locally of finite type.
(2) The scheme $X$ is quasi-compact and quasi-separated.

Then there exists a morphism of finite presentation $f^{\prime}: X^{\prime} \rightarrow S$ and an immersion $X \rightarrow X^{\prime}$ of schemes over $S$.

Proof. By Proposition 31.4.4 we can write $X=\lim _{i} X_{i}$ with each $X_{i}$ of finite type over $\mathbf{Z}$ and with transition morphisms $f_{i i^{\prime}}: X_{i} \rightarrow X_{i^{\prime}}$ affine. Consider the commutative diagram

Note that $X_{i}$ is of finite presentation over $\operatorname{Spec}(\mathbf{Z})$, see Morphisms, Lemma 28.21.9. Hence the base change $X_{i, S} \rightarrow S$ is of finite presentation by Morphisms, Lemma 28.21.4 Thus it suffices to show that the arrow $X \rightarrow X_{i, S}$ is an immersion for $i$ sufficiently large.
To do this we choose a finite affine open covering $X=V_{1} \cup \ldots \cup V_{n}$ such that $f$ maps each $V_{j}$ into an affine open $U_{j} \subset S$. Let $h_{j, a} \in \mathcal{O}_{X}\left(V_{j}\right)$ be a finite set of elements which generate $\mathcal{O}_{X}\left(V_{j}\right)$ as an $\mathcal{O}_{S}\left(U_{j}\right)$-algebra, see Morphisms, Lemma 28.15.2. By Lemmas 31.3 .8 and 31.3 .10 (after possibly shrinking $I$ ) we may assume that there exist affine open coverings $X_{i}=V_{1, i} \cup \ldots \cup V_{n, i}$ compatible with transition maps such that $V_{j}=\lim _{i} V_{j, i}$. By Lemma 31.3 .3 we can choose $i$ so large that each $h_{j, a}$ comes from an element $h_{j, a, i} \in \mathcal{O}_{X_{i}}\left(\overline{V_{j, i}}\right)$. Thus the arrow in

$$
V_{j} \longrightarrow U_{j} \times_{\operatorname{Spec}(\mathbf{Z})} V_{j, i}=\left(V_{j, i}\right)_{U_{j}} \subset\left(V_{j, i}\right)_{S} \subset X_{i, S}
$$

is a closed immersion. Since $\bigcup\left(V_{j, i}\right)_{U_{j}}$ forms an open of $X_{i, S}$ and since the inverse image of $\left(V_{j, i}\right)_{U_{j}}$ in $X$ is $V_{j}$ it follows that $X \rightarrow X_{i, S}$ is an immersion.

01ZF Remark 31.8.2. We cannot do better than this if we do not assume more on $S$ and the morphism $f: X \rightarrow S$. For example, in general it will not be possible to find a closed immersion $X \rightarrow X^{\prime}$ as in the lemma. The reason is that this would imply that $f$ is quasi-compact which may not be the case. An example is to take $S$ to be infinite dimensional affine space with 0 doubled and $X$ to be one of the two infinite dimensional affine spaces.

01ZG Lemma 31.8.3. Let $f: X \rightarrow S$ be a morphism of schemes. Assume:
(1) The morphism $f$ is of locally of finite type.
(2) The scheme $X$ is quasi-compact and quasi-separated, and
(3) The scheme $S$ is quasi-separated.

Then there exists a morphism of finite presentation $f^{\prime}: X^{\prime} \rightarrow S$ and a closed immersion $X \rightarrow X^{\prime}$ of schemes over $S$.
Proof. By Lemma 31.8.1 above there exists a morphism $Y \rightarrow S$ of finite presentation and an immersion $i: X \rightarrow Y$ of schemes over $S$. For every point $x \in X$, there exists an affine open $V_{x} \subset Y$ such that $i^{-1}\left(V_{x}\right) \rightarrow V_{x}$ is a closed immersion. Since $X$ is quasi-compact we can find finitely may affine opens $V_{1}, \ldots, V_{n} \subset Y$ such that $i(X) \subset V_{1} \cup \ldots \cup V_{n}$ and $i^{-1}\left(V_{j}\right) \rightarrow V_{j}$ is a closed immersion. In other words such that $i: X \rightarrow X^{\prime}=V_{1} \cup \ldots \cup V_{n}$ is a closed immersion of schemes over $S$. Since $S$ is quasi-separated and $Y$ is quasi-separated over $S$ we deduce that $Y$ is quasi-separated, see Schemes, Lemma 25.21.13. Hence the open immersion $X^{\prime}=V_{1} \cup \ldots \cup V_{n} \rightarrow Y$ is quasi-compact. This implies that $X^{\prime} \rightarrow Y$ is of finite presentation, see Morphisms, Lemma 28.21.6. We conclude since then $X^{\prime} \rightarrow Y \rightarrow S$ is a composition of morphisms of finite presentation, and hence of finite presentation (see Morphisms, Lemma 28.21.3).
09ZP Lemma 31.8.4. Let $X \rightarrow Y$ be a closed immersion of schemes. Assume $Y$ quasicompact and quasi-separated. Then $X$ can be written as a directed limit $X=\lim X_{i}$ of schemes over $Y$ where $X_{i} \rightarrow Y$ is a closed immersion of finite presentation.

Proof. Let $\mathcal{I} \subset \mathcal{O}_{Y}$ be the quasi-coherent sheaf of ideals defining $X$ as a closed subscheme of $Y$. By Properties, Lemma 27.22.3 we can write $\mathcal{I}$ as a directed colimit $\mathcal{I}=\operatorname{colim}_{i \in I} \mathcal{I}_{i}$ of its quasi-coherent sheaves of ideals of finite type. Let $X_{i} \subset Y$ be the closed subscheme defined by $\mathcal{I}_{i}$. These form an inverse system of schemes indexed by $I$. The transition morphisms $X_{i} \rightarrow X_{i^{\prime}}$ are affine because they are closed immersions. Each $X_{i}$ is quasi-compact and quasi-separated since it is a closed subscheme of $Y$ and $Y$ is quasi-compact and quasi-separated by our assumptions. We have $X=\lim _{i} X_{i}$ as follows directly from the fact that $\mathcal{I}=\operatorname{colim}_{i \in I} \mathcal{I}_{a}$. Each of the morphisms $X_{i} \rightarrow Y$ is of finite presentation, see Morphisms, Lemma 28.21.7.

09ZQ Lemma 31.8.5. Let $f: X \rightarrow S$ be a morphism of schemes. Assume
(1) The morphism $f$ is of locally of finite type.
(2) The scheme $X$ is quasi-compact and quasi-separated, and
(3) The scheme $S$ is quasi-separated.

Then $X=\lim X_{i}$ where the $X_{i} \rightarrow S$ are of finite presentation, the $X_{i}$ are quasicompact and quasi-separated, and the transition morphisms $X_{i^{\prime}} \rightarrow X_{i}$ are closed immersions (which implies that $X \rightarrow X_{i}$ are closed immersions for all $i$ ).

Proof. By Lemma 31.8 .3 there is a closed immersion $X \rightarrow Y$ with $Y \rightarrow S$ of finite presentation. Then $Y$ is quasi-separated by Schemes, Lemma 25.21.13. Since $X$ is quasi-compact, we may assume $Y$ is quasi-compact by replacing $Y$ with a quasi-compact open containing $X$. We see that $X=\lim X_{i}$ with $X_{i} \rightarrow Y$ a closed immersion of finite presentation by Lemma 31.8.4. The morphisms $X_{i} \rightarrow S$ are of finite presentation by Morphisms, Lemma 28.21.3

01ZJ Proposition 31.8.6. Let $f: X \rightarrow S$ be a morphism of schemes. Assume
(1) $f$ is of finite type and separated, and
(2) $S$ is quasi-compact and quasi-separated.

Then there exists a separated morphism of finite presentation $f^{\prime}: X^{\prime} \rightarrow S$ and $a$ closed immersion $X \rightarrow X^{\prime}$ of schemes over $S$.

Proof. Apply Lemma 31.8 .5 and note that $X_{i} \rightarrow S$ is separated for large $i$ by Lemma 31.3.14 as we have assumed that $X \rightarrow S$ is separated.

01ZK Lemma 31.8.7. Let $f: X \rightarrow S$ be a morphism of schemes. Assume
(1) $f$ is finite, and
(2) $S$ is quasi-compact and quasi-separated.

Then there exists a morphism which is finite and of finite presentation $f^{\prime}: X^{\prime} \rightarrow S$ and a closed immersion $X \rightarrow X^{\prime}$ of schemes over $S$.

Proof. We may write $X=\lim X_{i}$ as in Lemma 31.8.5. Applying Lemma 31.3.16 we see that $X_{i} \rightarrow S$ is finite for large enough $i$.

09YY Lemma 31.8.8. Let $f: X \rightarrow S$ be a morphism of schemes. Assume
(1) $f$ is finite, and
(2) $S$ quasi-compact and quasi-separated.

Then $X$ is a directed limit $X=\lim X_{i}$ where the transition maps are closed immersions and the objects $X_{i}$ are finite and of finite presentation over $S$.

Proof. We may write $X=\lim X_{i}$ as in Lemma 31.8.5. Applying Lemma 31.3.16 we see that $X_{i} \rightarrow S$ is finite for large enough $i$.

### 31.9. Descending relative objects

01ZL The following lemma is typical of the type of results in this section. We write out the "standard" proof completely. It may be faster to convince yourself that the result is true than to read this proof.

01ZM Lemma 31.9.1. Let $I$ be a directed partially ordered set. Let $\left(S_{i}, f_{i i^{\prime}}\right)$ be an inverse system of schemes over I. Assume
(1) the morphisms $f_{i i^{\prime}}: S_{i} \rightarrow S_{i^{\prime}}$ are affine,
(2) the schemes $S_{i}$ are quasi-compact and quasi-separated.

Let $S=\lim _{i} S_{i}$. Then we have the following:
(1) For any morphism of finite presentation $X \rightarrow S$ there exists an index $i \in I$ and a morphism of finite presentation $X_{i} \rightarrow S_{i}$ such that $X \cong X_{i, S}$ as schemes over $S$.
(2) Given an index $i \in I$, schemes $X_{i}, Y_{i}$ of finite presentation over $S_{i}$, and a morphism $\varphi: X_{i, S} \rightarrow Y_{i, S}$ over $S$, there exists an index $i^{\prime} \geq i$ and $a$ morphism $\varphi_{i^{\prime}}: X_{i, S_{i^{\prime}}} \rightarrow Y_{i, S_{i^{\prime}}}$ whose base change to $S$ is $\varphi$.
(3) Given an index $i \in I$, schemes $X_{i}, Y_{i}$ of finite presentation over $S_{i}$ and a pair of morphisms $\varphi_{i}, \psi_{i}: X_{i} \rightarrow Y_{i}$ whose base changes $\varphi_{i, S}=\psi_{i, S}$ are equal, there exists an index $i^{\prime} \geq i$ such that $\varphi_{i, S_{i^{\prime}}}=\psi_{i, S_{i^{\prime}}}$.
In other words, the category of schemes of finite presentation over $S$ is the colimit over I of the categories of schemes of finite presentation over $S_{i}$.

Proof. In case each of the schemes $S_{i}$ is affine, and we consider only affine schemes of finite presentation over $S_{i}$, resp. $S$ this lemma is equivalent to Algebra, Lemma 10.126.6. We claim that the affine case implies the lemma in general.

Let us prove (3). Suppose given an index $i \in I$, schemes $X_{i}, Y_{i}$ of finite presentation over $S_{i}$ and a pair of morphisms $\varphi_{i}, \psi_{i}: X_{i} \rightarrow Y_{i}$. Assume that the base changes are equal: $\varphi_{i, S}=\psi_{i, S}$. We will use the notation $X_{i^{\prime}}=X_{i, S_{i^{\prime}}}$ and $Y_{i^{\prime}}=Y_{i, S_{i^{\prime}}}$ for $i^{\prime} \geq i$. We also set $X=X_{i, S}$ and $Y=Y_{i, S}$. Note that according to Lemma 31.2 .3 we have $X=\lim _{i^{\prime} \geq i} X_{i^{\prime}}$ and similarly for $Y$. Additionally we denote $\varphi_{i^{\prime}}$ and $\psi_{i^{\prime}}\left(\right.$ resp. $\varphi$ and $\psi$ ) the base change of $\varphi_{i}$ and $\psi_{i}$ to $S_{i^{\prime}}$ (resp. $S$ ). So our assumption means that $\varphi=\psi$. Since $Y_{i}$ and $X_{i}$ are of finite presentation over $S_{i}$, and since $S_{i}$ is quasi-compact and quasi-separated, also $X_{i}$ and $Y_{i}$ are quasicompact and quasi-separated (see Morphisms, Lemma 28.21.10). Hence we may choose a finite affine open covering $Y_{i}=\bigcup V_{j, i}$ such that each $V_{j, i}$ maps into an affine open of $S$. As above, denote $V_{j, i^{\prime}}$ the inverse image of $V_{j, i}$ in $Y_{i^{\prime}}$ and $V_{j}$ the inverse image in $Y$. The immersions $V_{j, i^{\prime}} \rightarrow Y_{i^{\prime}}$ are quasi-compact, and the inverse images $U_{j, i^{\prime}}=\varphi_{i}^{-1}\left(V_{j, i^{\prime}}\right)$ and $U_{j, i^{\prime}}^{\prime}=\psi_{i}^{-1}\left(V_{j, i^{\prime}}\right)$ are quasi-compact opens of $X_{i^{\prime}}$. By assumption the inverse images of $V_{j}$ under $\varphi$ and $\psi$ in $X$ are equal. Hence by Lemma 31.3 .8 there exists an index $i^{\prime} \geq i$ such that of $U_{j, i^{\prime}}=U_{j, i^{\prime}}^{\prime}$ in $X_{i^{\prime}}$. Choose an finite affine open covering $U_{j, i^{\prime}}=U_{j, i^{\prime}}^{\prime}=\bigcup W_{j, k, i^{\prime}}$ which induce coverings $U_{j, i^{\prime \prime}}=U_{j, i^{\prime \prime}}^{\prime}=\bigcup W_{j, k, i^{\prime \prime}}$ for all $i^{\prime \prime} \geq i^{\prime}$. By the affine case there exists an index $i^{\prime \prime}$ such that $\left.\varphi_{i^{\prime \prime}}\right|_{W_{j, k, i^{\prime \prime}}}=\left.\psi_{i^{\prime \prime}}\right|_{W_{j, k, i^{\prime \prime}}}$ for all $j, k$. Then $i^{\prime \prime}$ is an index such that $\varphi_{i^{\prime \prime}}=\psi_{i^{\prime \prime}}$ and (3) is proved.
Let us prove (2). Suppose given an index $i \in I$, schemes $X_{i}, Y_{i}$ of finite presentation over $S_{i}$ and a morphism $\varphi: X_{i, S} \rightarrow Y_{i, S}$. We will use the notation $X_{i^{\prime}}=X_{i, S_{i^{\prime}}}$ and $Y_{i^{\prime}}=Y_{i, S_{i^{\prime}}}$ for $i^{\prime} \geq i$. We also set $X=X_{i, S}$ and $Y=Y_{i, S}$. Note that according to Lemma 31.2 .3 we have $X=\lim _{i^{\prime} \geq i} X_{i^{\prime}}$ and similarly for $Y$. Since $Y_{i}$ and $X_{i}$ are of finite presentation over $S_{i}$, and since $S_{i}$ is quasi-compact and quasiseparated, also $X_{i}$ and $Y_{i}$ are quasi-compact and quasi-separated (see Morphisms, Lemma 28.21.10. Hence we may choose a finite affine open covering $Y_{i}=\bigcup V_{j, i}$ such that each $V_{j, i}$ maps into an affine open of $S$. As above, denote $V_{j, i^{\prime}}$ the inverse image of $V_{j, i}$ in $Y_{i^{\prime}}$ and $V_{j}$ the inverse image in $Y$. The immersions $V_{j} \rightarrow Y$ are quasi-compact, and the inverse images $U_{j}=\varphi^{-1}\left(V_{j}\right)$ are quasi-compact opens of $X$. Hence by Lemma 31.3 .8 there exists an index $i^{\prime} \geq i$ and quasi-compact opens $U_{j, i^{\prime}}$ of $X_{i^{\prime}}$ whose inverse image in $X$ is $U_{j}$. Choose an finite affine open covering $U_{j, i^{\prime}}=\bigcup W_{j, k, i^{\prime}}$ which induce affine open coverings $U_{j, i^{\prime \prime}}=\bigcup W_{j, k, i^{\prime \prime}}$ for all $i^{\prime \prime} \geq i^{\prime}$ and an affine open covering $U_{j}=\bigcup W_{j, k}$. By the affine case there exists an index $i^{\prime \prime}$ and morphisms $\varphi_{j, k, i^{\prime \prime}}: W_{j, k, i^{\prime \prime}} \rightarrow V_{j, i^{\prime \prime}}$ such that $\left.\varphi\right|_{W_{j, k}}=\varphi_{j, k, i^{\prime \prime}, S}$ for all $j, k$. By part (3) proved above, there is a further index $i^{\prime \prime \prime} \geq i^{\prime \prime}$ such that

$$
\left.\varphi_{j_{1}, k_{1}, i^{\prime \prime}, S_{i^{\prime \prime \prime}}}\right|_{W_{j_{1}, k_{1}, i^{\prime \prime \prime}} \cap W_{j_{2}, k_{2}, i^{\prime \prime \prime}}}=\left.\varphi_{j_{2}, k_{2}, i^{\prime \prime}, S_{i^{\prime \prime \prime}}}\right|_{W_{j_{1}, k_{1}, i^{\prime \prime \prime}} \cap W_{j_{2}, k_{2}, i^{\prime \prime \prime}}}
$$

for all $j_{1}, j_{2}, k_{1}, k_{2}$. Then $i^{\prime \prime \prime}$ is an index such that there exists a morphism $\varphi_{i^{\prime \prime \prime}}$ : $X_{i^{\prime \prime \prime}} \rightarrow Y_{i^{\prime \prime \prime}}$ whose base change to $S$ gives $\varphi$. Hence (2) holds.

Let us prove (1). Suppose given a scheme $X$ of finite presentation over $S$. Since $X$ is of finite presentation over $S$, and since $S$ is quasi-compact and quasi-separated, also $X$ is quasi-compact and quasi-separated (see Morphisms, Lemma 28.21.10). Choose a finite affine open covering $X=\bigcup U_{j}$ such that each $U_{j}$ maps into an affine open $V_{j} \subset S$. Denote $U_{j_{1} j_{2}}=U_{j_{1}} \cap U_{j_{2}}$ and $U_{j_{1} j_{2} j_{3}}=U_{j_{1}} \cap U_{j_{2}} \cap U_{j_{3}}$. By Lemmas 31.3 .8 and 31.3 .10 we can find an index $i_{1}$ and affine opens $V_{j, i_{1}} \subset S_{i_{1}}$ such that each $V_{j}$ is the inverse of this in $S$. Let $V_{j, i}$ be the inverse image of $V_{j, i_{1}}$ in $S_{i}$ for $i \geq i_{1}$. By the affine case we may find an index $i_{2} \geq i_{1}$ and affine schemes $U_{j, i_{2}} \rightarrow V_{j, i_{2}}$ such that $U_{j}=S \times{ }_{S_{i_{2}}} U_{j, i_{2}}$ is the base change. Denote $U_{j, i}=S_{i} \times{ }_{S_{i_{2}}} U_{j, i_{2}}$ for $i \geq i_{2}$. By Lemma 31.3 .8 there exists an index $i_{3} \geq i_{2}$ and open subschemes $W_{j_{1}, j_{2}, i_{3}} \subset U_{j_{1}, i_{3}}$ whose base change to $S$ is equal to $U_{j_{1} j_{2}}$. Denote $W_{j_{1}, j_{2}, i}=S_{i} \times S_{i_{3}} W_{j_{1}, j_{2}, i_{3}}$ for $i \geq i_{3}$. By part (2) shown above there exists an index $i_{4} \geq i_{3}$ and morphisms $\varphi_{j_{1}, j_{2}, i_{4}}: W_{j_{1}, j_{2}, i_{4}} \rightarrow W_{j_{2}, j_{1}, i_{4}}$ whose base change to $S$ gives the identity morphism $U_{j_{1} j_{2}}=U_{j_{2} j_{1}}$ for all $j_{1}, j_{2}$. For all $i \geq i_{4}$ denote $\varphi_{j_{1}, j_{2}, i}=\operatorname{id}_{S} \times \varphi_{j_{1}, j_{2}, i_{4}}$ the base change. We claim that for some $i_{5} \geq$ $i_{4}$ the system $\left(\left(U_{j, i_{5}}\right)_{j},\left(W_{j_{1}, j_{2}, i_{5}}\right)_{j_{1}, j_{2}},\left(\varphi_{j_{1}, j_{2}, i_{5}}\right)_{j_{1}, j_{2}}\right)$ forms a glueing datum as in Schemes, Section 25.14. In order to see this we have to verify that for $i$ large enough we have

$$
\varphi_{j_{1}, j_{2}, i}^{-1}\left(W_{j_{1}, j_{2}, i} \cap W_{j_{1}, j_{3}, i}\right)=W_{j_{1}, j_{2}, i} \cap W_{j_{1}, j_{3}, i}
$$

and that for large enough $i$ the cocycle condition holds. The first condition follows from Lemma 31.3 .8 and the fact that $U_{j_{2} j_{1} j_{3}}=U_{j_{1} j_{2} j_{3}}$. The second from part (1) of the lemma proved above and the fact that the cocycle condition holds for the maps id : $U_{j_{1} j_{2}} \rightarrow U_{j_{2} j_{1}}$. Ok, so now we can use Schemes, Lemma 25.14 .2 to glue the system $\left(\left(U_{j, i_{5}}\right)_{j},\left(W_{j_{1}, j_{2}, i_{5}}\right)_{j_{1}, j_{2}},\left(\varphi_{j_{1}, j_{2}, i_{5}}\right)_{j_{1}, j_{2}}\right)$ to get a scheme $X_{i_{5}} \rightarrow S_{i_{5}}$. By construction the base change of $X_{i_{5}}$ to $S$ is formed by glueing the open affines $U_{j}$ along the opens $U_{j_{1}} \leftarrow U_{j_{1} j_{2}} \rightarrow U_{j_{2}}$. Hence $S \times_{S_{i_{5}}} X_{i_{5}} \cong X$ as desired.

01ZR Lemma 31.9.2. Let $I$ be a directed partially ordered set. Let $\left(S_{i}, f_{i i^{\prime}}\right)$ be an inverse system of schemes over I. Assume
(1) all the morphisms $f_{i i^{\prime}}: S_{i} \rightarrow S_{i^{\prime}}$ are affine,
(2) all the schemes $S_{i}$ are quasi-compact and quasi-separated.

Let $S=\lim _{i} S_{i}$. Then we have the following:
(1) For any sheaf of $\mathcal{O}_{S}$-modules $\mathcal{F}$ of finite presentation there exists an index $i \in I$ and a sheaf of $\mathcal{O}_{S_{i}}$-modules of finite presentation $\mathcal{F}_{i}$ such that $\mathcal{F} \cong$ $f_{i}^{*} \mathcal{I}_{i}$.
(2) Suppose given an index $i \in I$, sheaves of $\mathcal{O}_{S_{i}}$-modules $\mathcal{F}_{i}, \mathcal{G}_{i}$ of finite presentation and a morphism $\varphi: f_{i}^{*} \mathcal{F}_{i} \rightarrow f_{i}^{*} \mathcal{G}_{i}$ over $S$. Then there exists an index $i^{\prime} \geq i$ and a morphism $\varphi_{i^{\prime}}: f_{i^{\prime} i}^{*} \mathcal{F}_{i} \rightarrow f_{i^{\prime} i}^{*} \mathcal{G}_{i}$ whose base change to $S$ is $\varphi$.
(3) Suppose given an index $i \in I$, sheaves of $\mathcal{O}_{S_{i}}$-modules $\mathcal{F}_{i}, \mathcal{G}_{i}$ of finite presentation and a pair of morphisms $\varphi_{i}, \psi_{i}: \mathcal{F}_{i} \rightarrow \mathcal{G}_{i}$. Assume that the base changes are equal: $f_{i}^{*} \varphi_{i}=f_{i}^{*} \psi_{i}$. Then there exists an index $i^{\prime} \geq i$ such that $f_{i^{\prime} i}^{*} \varphi_{i}=f_{i^{\prime} i}^{*} \psi_{i}$.
In other words, the category of modules of finite presentation over $S$ is the colimit over I of the categories modules of finite presentation over $S_{i}$.
Proof. Omitted. Since we have written out completely the proof of Lemma 31.9.1 above it seems wise to use this here and not completely write this proof out also. For example we can use:
(1) there is an equivalence of categories between quasi-coherent $\mathcal{O}_{S}$-modules and vector bundles over $S$, see Constructions, Section 26.6 .
(2) a vector bundle $\mathbf{V}(\mathcal{F}) \rightarrow S$ is of finite presentation over $S$ if and only if $\mathcal{F}$ is an $\mathcal{O}_{S}$-module of finite presentation.
Then you can descend morphisms in terms of morphisms of the associated vectorbundles. Similarly for objects.

0B8W Lemma 31.9.3. Let $S=\lim S_{i}$ be the limit of a directed system of quasi-compact and quasi-separated schemes $S_{i}$ with affine transition morphisms. Then any invertible $\mathcal{O}_{S}$-module is the pullback of an invertible $\mathcal{O}_{S_{i}}$-module for some $i$.

Proof. Let $\mathcal{L}$ be an invertible $\mathcal{O}_{S}$-module. Since invertible modules are of finite presentation we can find an $i$ and modules $\mathcal{L}_{i}$ and $\mathcal{N}_{i}$ of finite presentation over $S_{i}$ such that $f_{i}^{*} \mathcal{L}_{i} \cong \mathcal{L}$ and $f_{i}^{*} \mathcal{N}_{i} \cong \mathcal{L}^{\otimes-1}$, see Lemma 31.9.2. Since pullback commutes with tensor product we see that $f_{i}^{*}\left(\mathcal{L}_{i} \otimes_{\mathcal{O}_{S_{i}}} \mathcal{N}_{i}\right)$ is isomorphic to $\mathcal{O}_{S}$. Since the tensor product of finitely presented modules is finitely presented, the same lemma implies that $f_{i^{\prime} i}^{*} \mathcal{L}_{i} \otimes_{\mathcal{O}_{S^{\prime}}} f_{i^{\prime} i}^{*} \mathcal{N}_{i}$ is isomorphic to $\mathcal{O}_{S_{i^{\prime}}}$ for some $i^{\prime} \geq i$. It follows that $f_{i^{\prime} i}^{*} \mathcal{L}_{i}$ is invertible (Modules, Lemma 17.21.2) and the proof is complete.

05LY Lemma 31.9.4. With notation and assumptions as in Lemma 31.9.1. Let $i \in I$. Suppose that $\varphi_{i}: X_{i} \rightarrow Y_{i}$ is a morphism of schemes of finite presentation over $S_{i}$ and that $\mathcal{F}_{i}$ is a quasi-coherent $\mathcal{O}_{X_{i}}$-module of finite presentation. If the pullback of $\mathcal{F}_{i}$ to $X_{i} \times{ }_{S_{i}} S$ is flat over $Y_{i} \times{ }_{S_{i}} S$, then there exists an index $i^{\prime} \geq i$ such that the pullback of $\mathcal{F}_{i}$ to $X_{i} \times S_{i} S_{i^{\prime}}$ is flat over $Y_{i} \times{ }_{S_{i}} S_{i^{\prime}}$.

Proof. (This lemma is the analogue of Lemma 31.7.6 for modules.) For $i^{\prime} \geq i$ denote $X_{i^{\prime}}=S_{i^{\prime}} \times{ }_{S_{i}} X_{i}, \mathcal{F}_{i^{\prime}}=\left(X_{i^{\prime}} \rightarrow X_{i}\right)^{*} \mathcal{F}_{i}$ and similarly for $Y_{i^{\prime}}$. Denote $\varphi_{i^{\prime}}$ the base change of $\varphi_{i}$ to $S_{i^{\prime}}$. Also set $X=S \times_{S_{i}} X_{i}, Y=S \times_{S_{i}} X_{i}, \mathcal{F}=\left(X \rightarrow X_{i}\right)^{*} \mathcal{F}_{i}$ and $\varphi$ the base change of $\varphi_{i}$ to $S$. Let $Y_{i}=\bigcup_{j=1, \ldots, m} V_{j, i}$ be a finite affine open covering such that each $V_{j, i}$ maps into some affine open of $S_{i}$. For each $j=1, \ldots m$ let $\varphi_{i}^{-1}\left(V_{j, i}\right)=\bigcup_{k=1, \ldots, m(j)} U_{k, j, i}$ be a finite affine open covering. For $i^{\prime} \geq i$ we denote $V_{j, i^{\prime}}$ the inverse image of $V_{j, i}$ in $Y_{i^{\prime}}$ and $U_{k, j, i^{\prime}}$ the inverse image of $U_{k, j, i}$ in $X_{i^{\prime}}$. Similarly we have $U_{k, j} \subset X$ and $V_{j} \subset Y$. Then $U_{k, j}=\lim _{i^{\prime} \geq i} U_{k, j, i^{\prime}}$ and $V_{j}=\lim _{i^{\prime} \geq i} V_{j}$ (see Lemma 31.2.2). Since $X_{i^{\prime}}=\bigcup_{k, j} U_{k, j, i^{\prime}}$ is a finite open covering it suffices to prove the lemma for each of the morphisms $U_{k, j, i} \rightarrow V_{j, i}$ and the sheaf $\left.\mathcal{F}_{i}\right|_{U_{k, j, i}}$. Hence we see that the lemma reduces to the case that $X_{i}$ and $Y_{i}$ are affine and map into an affine open of $S_{i}$, i.e., we may also assume that $S$ is affine.

In the affine case we reduce to the following algebra result. Suppose that $R=$ $\operatorname{colim}_{i \in I} R_{i}$. For some $i \in I$ suppose given a map $A_{i} \rightarrow B_{i}$ of finitely presented $R_{i}$-algebras. Let $N_{i}$ be a finitely presented $B_{i}$-module. Then, if $R \otimes_{R_{i}} N_{i}$ is flat over $R \otimes_{R_{i}} A_{i}$, then for some $i^{\prime} \geq i$ the module $R_{i^{\prime}} \otimes_{R_{i}} N_{i}$ is flat over $R_{i^{\prime}} \otimes_{R_{i}} A$. This is exactly the result proved in Algebra, Lemma 10.160.1 part (3).

### 31.10. Characterizing affine schemes

$01 Z S$ If $f: X \rightarrow S$ is a surjective integral morphism of schemes such that $X$ is an affine scheme then $S$ is affine too. See Con07b, A.2]. Our proof relies on the Noetherian case which we stated and proved in Cohomology of Schemes, Lemma 29.13.3. See also [DG67, II 6.7.1].

01ZT Lemma 31.10.1. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that $f$ is surjective and finite, and assume that $X$ is affine. Then $S$ is affine.

Proof. Since $f$ is surjective and $X$ is quasi-compact we see that $S$ is quasi-compact. Since $X$ is separated and $f$ is surjective and universally closed (Morphisms, Lemma 28.43.7), we see that $S$ is separated (Morphisms, Lemma 28.41.11.

By Lemma 31.8 .8 we can write $X=\lim _{a} X_{a}$ with $X_{a} \rightarrow S$ finite and of finite presentation. By Lemma 31.3.10 we see that $X_{a}$ is affine for some $a \in A$. Replacing $X$ by $X_{a}$ we may assume that $X \rightarrow S$ is surjective, finite, of finite presentation and that $X$ is affine.
By Proposition 31.4.4 we may write $S=\lim _{i \in I} S_{i}$ as a directed limits as schemes of finite type over $\mathbf{Z}$. By Lemma 31.9.1 we can after shrinking $I$ assume there exist schemes $X_{i} \rightarrow S_{i}$ of finite presentation such that $X_{i^{\prime}}=X_{i} \times_{S} S_{i^{\prime}}$ for $i^{\prime} \geq i$ and such that $X=\lim _{i} X_{i}$. By Lemma 31.7 .3 we may assume that $X_{i} \rightarrow S_{i}$ is finite for all $i \in I$ as well. By Lemma 31.3 .10 once again we may assume that $X_{i}$ is affine for all $i \in I$. Hence the result follows from the Noetherian case, see Cohomology of Schemes, Lemma 29.13.3.

05YU Proposition 31.10.2. Let $f: X \rightarrow S$ be a morphism of schemes. Assume that $f$ is surjective and integral, and assume that $X$ is affine. Then $S$ is affine.

Proof. Since $f$ is surjective and $X$ is quasi-compact we see that $S$ is quasi-compact. Since $X$ is separated and $f$ is surjective and universally closed (Morphisms, Lemma 28.43.7), we see that $S$ is separated (Morphisms, Lemma 28.41.11).

By Lemma 31.6.2 we can write $X=\lim _{i} X_{i}$ with $X_{i} \rightarrow S$ finite. By Lemma 31.3.10 we see that for $i$ sufficiently large the scheme $X_{i}$ is affine. Moreover, since $X \rightarrow S$ factors through each $X_{i}$ we see that $X_{i} \rightarrow S$ is surjective. Hence we conclude that $S$ is affine by Lemma 31.10.1.

09NL Lemma 31.10.3. Let $X$ be a scheme which is set theoretically the union of finitely many affine closed subschemes. Then $X$ is affine.

Proof. Let $Z_{i} \subset X, i=1, \ldots, n$ be affine closed subschemes such that $X=\bigcup Z_{i}$ set theoretically. Then $\coprod Z_{i} \rightarrow X$ is surjective and integral with affine source. Hence $X$ is affine by Proposition 31.10.2.

09MW Lemma 31.10.4. Let $i: Z \rightarrow X$ be a closed immersion of schemes inducing $a$ homeomorphism of underlying topological spaces. Let $\mathcal{L}$ be an invertible sheaf on $X$. Then $i^{*} \mathcal{L}$ is ample on $Z$, if and only if $\mathcal{L}$ is ample on $X$.
Proof. If $\mathcal{L}$ is ample, then $i^{*} \mathcal{L}$ is ample for example by Morphisms, Lemma 28.37.7. Assume $i^{*} \mathcal{L}$ is ample. Then $Z$ is quasi-compact (Properties, Definition 27.26.1) and separated (Properties, Lemma 27.26.8). Since $i$ is surjective, we see that $X$ is quasicompact. Since $i$ is universally closed and surjective, we see that $X$ is separated (Morphisms, Lemma 28.41.11).

By Proposition 31.4.4 we can write $X=\lim X_{i}$ as a directed limit of finite type schemes over $\mathbf{Z}$ with affine transition morphisms. We can find an $i$ and an invertible sheaf $\mathcal{L}_{i}$ on $X_{i}$ whose pullback to $X$ is isomorphic to $\mathcal{L}$, see Lemma 31.9.2.
For each $i$ let $Z_{i} \subset X_{i}$ be the scheme theoretic image of the morphism $Z \rightarrow X$. If $\operatorname{Spec}\left(A_{i}\right) \subset X_{i}$ is an affine open subscheme with inverse image of $\operatorname{Spec}(A)$ in $X$ and
if $Z \cap \operatorname{Spec}(A)$ is defined by the ideal $I \subset A$, then $Z_{i} \cap \operatorname{Spec}\left(A_{i}\right)$ is defined by the ideal $I_{i} \subset A_{i}$ which is the inverse image of $I$ in $A_{i}$ under the ring map $A_{i} \rightarrow A$, see Morphisms, Example 28.6.4. Since colim $A_{i} / I_{i}=A / I$ it follows that $\lim Z_{i}=Z$. By Lemma 31.3 .12 we see that $\left.\mathcal{L}_{i}\right|_{Z_{i}}$ is ample for some $i$. Since $Z$ and hence $X$ maps into $Z_{i}$ set theoretically, we see that $X_{i^{\prime}} \rightarrow X_{i}$ maps into $Z_{i}$ set theoretically for some $i^{\prime} \geq i$, see Lemma 31.3.7. (Observe that since $X_{i}$ is Noetherian, every closed subset of $X_{i}$ is constructible.) Let $T \subset X_{i^{\prime}}$ be the scheme theoretic inverse image of $Z_{i}$ in $X_{i^{\prime}}$. Observe that $\left.\mathcal{L}_{i^{\prime}}\right|_{T}$ is the pullback of $\left.\mathcal{L}_{i}\right|_{Z_{i}}$ and hence ample by Morphisms, Lemma 28.37 .7 and the fact that $T \rightarrow Z_{i}$ is an affine morphism. Thus we see that $\mathcal{L}_{i^{\prime}}$ is ample on $X_{i^{\prime}}$ by Cohomology of Schemes, Lemma 29.16.5. Pulling back to $X$ (using the same lemma as above) we find that $\mathcal{L}$ is ample.

0B7L Lemma 31.10.5. Let $i: Z \rightarrow X$ be a closed immersion of schemes inducing a homeomorphism of underlying topological spaces. Then $X$ is quasi-affine if and only if $Z$ is quasi-affine.

Proof. Recall that a scheme is quasi-affine if and only if the structure sheaf is ample, see Properties, Lemma 27.27.1. Hence if $Z$ is quasi-affine, then $\mathcal{O}_{Z}$ is ample, hence $\mathcal{O}_{X}$ is ample by Lemma 31.10.4, hence $X$ is quasi-affine. A proof of the converse, which can also be seen in an elementary way, is gotten by reading the argument just given backwards.

### 31.11. Variants of Chow's Lemma

$01 Z Z$ In this section we prove a number of variants of Chow's lemma. The most interesting version is probably just the Noetherian case, which we stated and proved in Cohomology of Schemes, Section 29.17.

0202 Lemma 31.11.1. Let $S$ be a quasi-compact and quasi-separated scheme. Let $f: X \rightarrow S$ be a separated morphism of finite type. Then there exists an $n \geq 0$ and a diagram

where $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is an immersion, and $\pi: X^{\prime} \rightarrow X$ is proper and surjective.
Proof. By Proposition 31.8 .6 we can find a closed immersion $X \rightarrow Y$ where $Y$ is separated and of finite presentation over $S$. Clearly, if we prove the assertion for $Y$, then the result follows for $X$. Hence we may assume that $X$ is of finite presentation over $S$.

Write $S=\lim _{i} S_{i}$ as a directed limit of Noetherian schemes, see Proposition 31.4.4. By Lemma 31.9.1 we can find an index $i \in I$ and a scheme $X_{i} \rightarrow S_{i}$ of finite presentation so that $X=S \times{ }_{S_{i}} X_{i}$. By Lemma 31.7.5 we may assume that $X_{i} \rightarrow S_{i}$ is separated. Clearly, if we prove the assertion for $X_{i}$ over $S_{i}$, then the assertion holds for $X$. The case $X_{i} \rightarrow S_{i}$ is treated by Cohomology of Schemes, Lemma 29.17 .1 .

Here is a variant of Chow's lemma where we assume the scheme on top has finitely many irreducible components.

0203 Lemma 31.11.2. Let $S$ be a quasi-compact and quasi-separated scheme. Let $f: X \rightarrow S$ be a separated morphism of finite type. Assume that $X$ has finitely many irreducible components. Then there exists an $n \geq 0$ and a diagram

where $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is an immersion, and $\pi: X^{\prime} \rightarrow X$ is proper and surjective. Moreover, there exists an open dense subscheme $U \subset X$ such that $\pi^{-1}(U) \rightarrow U$ is an isomorphism of schemes.

Proof. Let $X=Z_{1} \cup \ldots \cup Z_{n}$ be the decomposition of $X$ into irreducible components. Let $\eta_{j} \in Z_{j}$ be the generic point.
There are (at least) two ways to proceed with the proof. The first is to redo the proof of Cohomology of Schemes, Lemma 29.17.1 using the general Properties, Lemma 27.29.4 to find suitable affine opens in $X$. (This is the "standard" proof.) The second is to use absolute Noetherian approximation as in the proof of Lemma 31.11.1 above. This is what we will do here.

By Proposition 31.8.6 we can find a closed immersion $X \rightarrow Y$ where $Y$ is separated and of finite presentation over $S$. Write $S=\lim _{i} S_{i}$ as a directed limit of Noetherian schemes, see Proposition 31.4.4. By Lemma 31.9.1 we can find an index $i \in I$ and a scheme $Y_{i} \rightarrow S_{i}$ of finite presentation so that $Y=S \times{ }_{S_{i}} Y_{i}$. By Lemma 31.7.5we may assume that $Y_{i} \rightarrow S_{i}$ is separated. We have the following diagram

Denote $h: X \rightarrow Y_{i}$ the composition.
For $i^{\prime} \geq i$ write $Y_{i^{\prime}}=S_{i^{\prime}} \times_{S_{i}} Y_{i}$. Then $Y=\lim _{i^{\prime} \geq i} Y_{i^{\prime}}$, see Lemma 31.2.3. Choose $j, j^{\prime} \in\{1, \ldots, n\}, j \neq j^{\prime}$. Note that $\eta_{j}$ is not a specialization of $\eta_{j^{\prime}}$. By Lemma 31.3 .2 we can replace $i$ by a bigger index and assume that $h\left(\eta_{j}\right)$ is not a specialization of $h\left(\eta_{j^{\prime}}\right)$ for all pairs $\left(j, j^{\prime}\right)$ as above. For such an index, let $Y^{\prime} \subset Y_{i}$ be the scheme theoretic image of $h: X \rightarrow Y_{i}$, see Morphisms, Definition 28.6.2. The morphism $h$ is quasi-compact as the composition of the quasi-compact morphisms $X \rightarrow Y$ and $Y \rightarrow Y_{i}$ (which is affine). Hence by Morphisms, Lemma 28.6.3 the morphism $X \rightarrow Y^{\prime}$ is dominant. Thus the generic points of $Y^{\prime}$ are all contained in the set $\left\{h\left(\eta_{1}\right), \ldots, h\left(\eta_{n}\right)\right\}$, see Morphisms, Lemma 28.8.3. Since none of the $h\left(\eta_{j}\right)$ is the specialization of another we see that the points $h\left(\eta_{1}\right), \ldots, h\left(\eta_{n}\right)$ are pairwise distinct and are each a generic point of $Y^{\prime}$.

We apply Cohomology of Schemes, Lemma 29.17.1 above to the morphism $Y^{\prime} \rightarrow S_{i}$. This gives a diagram

such that $\pi$ is proper and surjective and an isomorphism over a dense open subscheme $V \subset Y^{\prime}$. By our choice of $i$ above we know that $h\left(\eta_{1}\right), \ldots, h\left(\eta_{n}\right) \in V$. Consider the commutative diagram

Note that $X^{\prime} \rightarrow X$ is an isomorphism over the open subscheme $U=h^{-1}(V)$ which contains each of the $\eta_{j}$ and hence is dense in $X$. We conclude $X \leftarrow X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is a solution to the problem posed in the lemma.

### 31.12. Applications of Chow's lemma

0204 We can use Chow's lemma to investigate the notions of proper and separated morphisms. As a first application we have the following.

0205 Lemma 31.12.1. Let $S$ be a scheme. Let $f: X \rightarrow S$ be a separated morphism of finite type. The following are equivalent:
(1) The morphism $f$ is proper.
(2) For any morphism $S^{\prime} \rightarrow S$ which is locally of finite type the base change $X_{S^{\prime}} \rightarrow S^{\prime}$ is closed.
(3) For every $n \geq 0$ the morphism $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ is closed.

Proof. Clearly (1) implies (2), and (2) implies (3), so we just need to show (3) implies (1). First we reduce to the case when $S$ is affine. Assume that (3) implies (1) when the base is affine. Now let $f: X \rightarrow S$ be a separated morphism of finite type. Being proper is local on the base (see Morphisms, Lemma 28.41.3), so if $S=\bigcup_{\alpha} S_{\alpha}$ is an open affine cover, and if we denote $X_{\alpha}:=f^{-1}\left(S_{\alpha}\right)$, then it is enough to show that $\left.f\right|_{X_{\alpha}}: X_{\alpha} \rightarrow S_{\alpha}$ is proper for all $\alpha$. Since $S_{\alpha}$ is affine, if the map $\left.f\right|_{X_{\alpha}}$ satisfies (3), then it will satisfy (1) by assumption, and will be proper. To finish the reduction to the case $S$ is affine, we must show that if $f: X \rightarrow S$ is separated of finite type satisfying (3), then $\left.f\right|_{X_{\alpha}}: X_{\alpha} \rightarrow S_{\alpha}$ is separated of finite type satisfying (3). Separatedness and finite type are clear. To see (3), notice that $\mathbf{A}^{n} \times X_{\alpha}$ is the open preimage of $\mathbf{A}^{n} \times S_{\alpha}$ under the map $1 \times f$. Fix a closed set $Z \subset \mathbf{A}^{n} \times X_{\alpha}$. Let $\bar{Z}$ denote the closure of $Z$ in $\mathbf{A}^{n} \times X$. Then for topological reasons,

$$
1 \times f(\bar{Z}) \cap \mathbf{A}^{n} \times S_{\alpha}=1 \times f(Z)
$$

Hence $1 \times f(Z)$ is closed, and we have reduced the proof of $(3) \Rightarrow(1)$ to the affine case.

Assume $S$ affine, and $f: X \rightarrow S$ separated of finite type. We can apply Chow's Lemma 31.11.1 to get $\pi: X^{\prime} \rightarrow X$ proper surjective and $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ an immersion. If $X$ is proper over $S$, then $X^{\prime} \rightarrow S$ is proper (Morphisms, Lemma 28.41.4). Since $\mathbf{P}_{S}^{n} \rightarrow S$ is separated, we conclude that $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is proper (Morphisms, Lemma
28.41.7) and hence a closed immersion (Schemes, Lemma 25.10.4. Conversely, assume $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is a closed immersion. Consider the diagram:

05LZ (31.12.1.1)

All maps are a priori proper except for $X \rightarrow S$. Hence we conclude that $X \rightarrow S$ is proper by Morphisms, Lemma 28.41.8. Therefore, we have shown that $X \rightarrow S$ is proper if and only if $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is a closed immersion.

Assume $S$ is affine and (3) holds, and let $n, X^{\prime}, \pi$ be as above. Since being a closed morphism is local on the base, the map $X \times \mathbf{P}^{n} \rightarrow S \times \mathbf{P}^{n}$ is closed since by (3) $X \times \mathbf{A}^{n} \rightarrow S \times \mathbf{A}^{n}$ is closed and since projective space is covered by copies of affine $n$-space, see Constructions, Lemma 26.13.3. By Morphisms, Lemma 28.41 .5 the morphism

$$
X^{\prime} \times_{S} \mathbf{P}_{S}^{n} \rightarrow X \times_{S} \mathbf{P}_{S}^{n}=X \times \mathbf{P}^{n}
$$

is proper. Since $\mathbf{P}^{n}$ is separated, the projection

$$
X^{\prime} \times{ }_{S} \mathbf{P}_{S}^{n}=\mathbf{P}_{X^{\prime}}^{n} \rightarrow X^{\prime}
$$

will be separated as it is just a base change of a separated morphism. Therefore, the map $X^{\prime} \rightarrow X^{\prime} \times_{S} \mathbf{P}_{S}^{n}$ is proper, since it is a section to a separated map (see Schemes, Lemma 25.21.12). Composing all these proper morphisms

$$
X^{\prime} \rightarrow X^{\prime} \times{ }_{S} \mathbf{P}_{S}^{n} \rightarrow X \times{ }_{S} \mathbf{P}_{S}^{n}=X \times \mathbf{P}^{n} \rightarrow S \times \mathbf{P}^{n}=\mathbf{P}_{S}^{n}
$$

we see that the map $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is proper, and hence a closed immersion.
If the base is Noetherian we can show that the valuative criterion holds using only discrete valuation rings. First we state the result concerning separation. We will often use solid commutative diagrams of morphisms of schemes having the following shape

0206 (31.12.1.2)

with $A$ a valuation ring and $K$ its field of fractions.
0207 Lemma 31.12.2. Let $S$ be a locally Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of schemes. Assume $f$ is locally of finite type. The following are equivalent:
(1) The morphism $f$ is separated.
(2) For any diagram (31.12.1.2) there is at most one dotted arrow.
(3) For all diagrams (31.12.1.2) with $A$ a discrete valuation ring there is at most one dotted arrow.
(4) For any irreducible component $X_{0}$ of $X$ with generic point $\eta \in X_{0}$, for any discrete valuation ring $A \subset K=\kappa(\eta)$ with fraction field $K$ and any diagram (31.12.1.2) such that the morphism $\operatorname{Spec}(K) \rightarrow X$ is the canonical one (see Schemes, Section 25.13) there is at most one dotted arrow.

Proof. Clearly (1) implies (2), (2) implies (3), and (3) implies (4). It remains to show (4) implies (1). Assume (4). We begin by reducing to $S$ affine. Being separated is a local on the base (see Schemes, Lemma 25.21.8). Hence, as in the proof of Lemma 31.12.1 if we can show that whenever $X \rightarrow S$ has (4) that the restriction $X_{\alpha} \rightarrow S_{\alpha}$ has (4) where $S_{\alpha} \subset S$ is an (affine) open subset and $X_{\alpha}:=f^{-1}\left(S_{\alpha}\right)$, then we will be done. The generic points of the irreducible components of $X_{\alpha}$ will be the generic points of irreducible components of $X$, since $X_{\alpha}$ is open in $X$. Therefore, any two distinct dotted arrows in the diagram

would then give two distinct arrows in diagram $\sqrt{31.12 .1 .2}$ via the maps $X_{\alpha} \rightarrow X$ and $S_{\alpha} \rightarrow S$, which is a contradiction. Thus we have reduced to the case $S$ is affine. We remark that in the course of this reduction, we prove that if $X \rightarrow S$ has (4) then the restriction $U \rightarrow V$ has (4) for opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$.

We next wish to reduce to the case $X \rightarrow S$ is finite type. Assume that we know (4) implies (1) when $X$ is finite type. Since $S$ is Noetherian and $X$ is locally of finite type over $S$ we see $X$ is locally Noetherian as well (see Morphisms, Lemma 28.15.6). Thus, $X \rightarrow S$ is quasi-separated (see Properties, Lemma 27.5.4), and therefore we may apply the valuative criterion to check whether $X$ is separated (see Schemes, Lemma 25.22.2. Let $X=\bigcup_{\alpha} X_{\alpha}$ be an affine open cover of $X$. Given any two dotted arrows, in a diagram (31.12.1.2), the image of the closed points of Spec $A$ will fall in two sets $X_{\alpha}$ and $X_{\beta}$. Since $X_{\alpha} \cup X_{\beta}$ is open, for topological reasons it must contain the image of $\operatorname{Spec}(A)$ under both maps. Therefore, the two dotted arrows factor through $X_{\alpha} \cup X_{\beta} \rightarrow X$, which is a scheme of finite type over $S$. Since $X_{\alpha} \cup X_{\beta}$ is an open subset of $X$, by our previous remark, $X_{\alpha} \cup X_{\beta}$ satisfies (4), so by assumption, is separated. This implies the two given dotted arrows are the same. Therefore, we have reduced to $X \rightarrow S$ is finite type.

Assume $X \rightarrow S$ of finite type and assume (4). Since $X \rightarrow S$ is finite type, and $S$ is an affine Noetherian scheme, $X$ is also Noetherian (see Morphisms, Lemma 28.15.6). Therefore, $X \rightarrow X \times{ }_{S} X$ will be a quasi-compact immersion of Noetherian schemes. We proceed by contradiction. Assume that $X \rightarrow X \times{ }_{S} X$ is not closed. Then, there is some $y \in X \times_{S} X$ in the closure of the image that is not in the image. As $X$ is Noetherian it has finitely many irreducible components. Therefore, $y$ is in the closure of the image of one of the irreducible components $X_{0} \subset X$. Give $X_{0}$ the reduced induced structure. The composition $X_{0} \rightarrow X \rightarrow X \times_{S} X$ factors through the closed subscheme $X_{0} \times_{S} X_{0} \subset X \times_{S} X$. Denote the closure of $\Delta\left(X_{0}\right)$ in $X_{0} \times{ }_{S} X_{0}$ by $\bar{X}_{0}$ (again as a reduced closed subscheme). Thus $y \in \bar{X}_{0}$. Since $X_{0} \rightarrow X_{0} \times_{S} X_{0}$ is an immersion, the image of $X_{0}$ will be open in $\bar{X}_{0}$. Hence $X_{0}$ and $\bar{X}_{0}$ are birational. Since $\bar{X}_{0}$ is a closed subscheme of a Noetherian scheme, it is Noetherian. Thus, the local ring $\mathcal{O}_{\bar{X}_{0}, y}$ is a local Noetherian domain with fraction field $K$ equal to the function field of $X_{0}$. By the Krull-Akizuki theorem (see Algebra, Lemma 10.118.13), there exists a discrete valuation ring $A$ dominating
$\mathcal{O}_{\bar{X}_{0}, y}$ with fraction field $K$. This allows to to construct a diagram:
05M1
(31.12.2.2)

which sends Spec K to the generic point of $\Delta\left(X_{0}\right)$ and the closed point of $A$ to $y \in X_{0} \times_{S} X_{0}$ (use the material in Schemes, Section 25.13 to construct the arrows). There cannot even exist a set theoretic dotted arrow, since $y$ is not in the image of $\Delta$ by our choice of $y$. By categorical means, the existence of the dotted arrow in the above diagram is equivalent to the uniqueness of the dotted arrow in the following diagram:

05M2

Therefore, we have non-uniqueness in this latter diagram by the nonexistence in the first. Therefore, $X_{0}$ does not satisfy uniqueness for discrete valuation rings, and since $X_{0}$ is an irreducible component of $X$, we have that $X \rightarrow S$ does not satisfy (4). Therefore, we have shown (4) implies (1).

0208 Lemma 31.12.3. Let $S$ be a locally Noetherian scheme. Let $f: X \rightarrow S$ be a morphism of finite type. The following are equivalent:
(1) The morphism $f$ is proper.
(2) For any diagram (31.12.1.2) there exists exactly one dotted arrow.
(3) For all diagrams (31.12.1.2) with $A$ a discrete valuation ring there exists exactly one dotted arrow.
(4) For any irreducible component $X_{0}$ of $X$ with generic point $\eta \in X_{0}$, for any discrete valuation ring $A \subset K=\kappa(\eta)$ with fraction field $K$ and any diagram (31.12.1.2) such that the morphism $\operatorname{Spec}(K) \rightarrow X$ is the canonical one (see Schemes, Section 25.13) there exists exactly one dotted arrow.

Proof. (1) implies (2) implies (3) implies (4). We will now show (4) implies (1). As in the proof of Lemma 31.12.2, we can reduce to the case $S$ is affine, since properness is local on the base, and if $X \rightarrow S$ satisfies (4), then $X_{\alpha} \rightarrow S_{\alpha}$ does as well for open $S_{\alpha} \subset S$ and $X_{\alpha}=f^{-1}\left(S_{\alpha}\right)$.
Now $S$ is a Noetherian scheme, and so $X$ is as well, since $X \rightarrow S$ is of finite type. Now we may use Chow's lemma (Cohomology of Schemes, Lemma 29.17.1) to get a surjective, proper, birational $X^{\prime} \rightarrow X$ and an immersion $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$. We wish to show $X \rightarrow S$ is universally closed. As in the proof of Lemma 31.12.1, it is enough to check that $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is a closed immersion. For the sake of contradiction, assume that $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is not a closed immersion. Then there is some $y \in \mathbf{P}_{S}^{n}$ that is in the closure of the image of $X^{\prime}$, but is not in the image. So $y$ is in the closure of the image of an irreducible component $X_{0}^{\prime}$ of $X^{\prime}$, but not in the image. Let $\bar{X}_{0}^{\prime} \subset \mathbf{P}_{S}^{n}$ be the closure of the image of $X_{0}^{\prime}$. As $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is an immersion of Noetherian schemes, the morphism $X_{0}^{\prime} \rightarrow \bar{X}_{0}^{\prime}$ is open and dense. By Algebra, Lemma 10.118.13 or Properties, Lemma 27.5.10 we can find a discrete valuation ring $A$ dominating
$\mathcal{O}_{\bar{X}_{0}^{\prime}, y}$ and with identical field of fractions $K$. It is clear that $K$ is the residue field at the generic point of $X_{0}^{\prime}$. Thus the solid commutative diagram

Note that the closed point of $A$ maps to $y \in \mathbf{P}_{S}^{n}$. By construction, there does not exist a set theoretic lift to $X^{\prime}$. As $X^{\prime} \rightarrow X$ is birational, the image of $X_{0}^{\prime}$ in $X$ is an irreducible component $X_{0}$ of $X$ and $K$ is also identified with the function field of $X_{0}$. Hence, as $X \rightarrow S$ is assumed to satisfy (4), the dotted arrow $\operatorname{Spec}(A) \rightarrow$ $X$ exists. Since $X^{\prime} \rightarrow X$ is proper, the dotted arrow lifts to the dotted arrow $\operatorname{Spec}(A) \rightarrow X^{\prime}$ (use Schemes, Proposition 25.20.6). We can compose this with the immersion $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ to obtain another morphism (not depicted in the diagram) from $\operatorname{Spec}(A) \rightarrow \mathbf{P}_{S}^{n}$. Since $\mathbf{P}_{S}^{n}$ is proper over $S$, it satisfies (2), and so these two morphisms agree. This is a contradiction, for we have constructed the forbidden lift of our original map $\operatorname{Spec}(A) \rightarrow \mathbf{P}_{S}^{n}$ to $X^{\prime}$.

Here is an application of Chow's lemma which goes in a slightly different direction.
081F Lemma 31.12.4. Assumptions and notation as in Situation 31.7.1. If
(1) $f$ is proper, and
(2) $f_{0}$ is locally of finite type,
then there exists an $i$ such that $f_{i}$ is proper.
Proof. By Lemma 31.7.5 we see that $f_{i}$ is separated for some $i \geq 0$. Replacing 0 by $i$ we may assume that $f_{0}$ is separated. Observe that $f_{0}$ is quasi-compact, see Schemes, Lemma 25.21.15. By Lemma 31.11.1 we can choose a diagram

where $X_{0}^{\prime} \rightarrow \mathbf{P}_{Y_{0}}^{n}$ is an immersion, and $\pi: X_{0}^{\prime} \rightarrow X_{0}$ is proper and surjective. Introduce $X^{\prime}=X_{0}^{\prime} \times_{Y_{0}} Y$ and $X_{i}^{\prime}=X_{0}^{\prime} \times_{Y_{0}} Y_{i}$. By Morphisms, Lemmas 28.41.4 and 28.41 .5 we see that $X^{\prime} \rightarrow Y$ is proper. Hence $X^{\prime} \rightarrow \mathbf{P}_{Y}^{n}$ is a closed immersion (Morphisms, Lemma 28.41.7). By Morphisms, Lemma 28.41.8 it suffices to prove that $X_{i}^{\prime} \rightarrow Y_{i}$ is proper for some $i$. By Lemma 31.7.4 we find that $X_{i}^{\prime} \rightarrow \mathbf{P}_{Y_{i}}^{n}$ is a closed immersion for $i$ large enough. Then $X_{i}^{\prime} \rightarrow Y_{i}$ is proper and we win.
09ZR Lemma 31.12.5. Let $f: X \rightarrow S$ be a proper morphism with $S$ quasi-compact and quasi-separated. Then $X=\lim X_{i}$ with $X_{i} \rightarrow S$ proper and of finite presentation.
Proof. By Proposition 31.8 .6 we can find a closed immersion $X \rightarrow Y$ with $Y$ separated and of finite presentation over $S$. By Lemma 31.11.1 we can find a diagram

where $Y^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is an immersion, and $\pi: Y^{\prime} \rightarrow Y$ is proper and surjective. By Lemma 31.8.4 we can write $X=\lim X_{i}$ with $X_{i} \rightarrow Y$ a closed immersion of finite presentation. Denote $X_{i}^{\prime} \subset Y^{\prime}$, resp. $X^{\prime} \subset Y^{\prime}$ the scheme theoretic inverse image of $X_{i} \subset Y$, resp. $X \subset Y$. Then $\lim X_{i}^{\prime}=X^{\prime}$. Since $X^{\prime} \rightarrow S$ is proper (Morphisms, Lemmas 28.41.4, we see that $X^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is a closed immersion (Morphisms, Lemma 28.41.7). Hence for $i$ large enough we find that $X_{i}^{\prime} \rightarrow \mathbf{P}_{S}^{n}$ is a closed immersion by Lemma 31.3.17. Thus $X_{i}^{\prime}$ is proper over $S$. For such $i$ the morphism $X_{i} \rightarrow S$ is proper by Morphisms, Lemma 28.41.8.

0A0P Lemma 31.12.6. Let $f: X \rightarrow S$ be a proper morphism with $S$ quasi-compact and quasi-separated. Then $(X \rightarrow S)=\lim \left(X_{i} \rightarrow S_{i}\right)$ with $S_{i}$ of finite type over $\mathbf{Z}$ and $X_{i} \rightarrow S_{i}$ proper and of finite presentation.

Proof. By Lemma 31.12 .5 we can write $X=\lim _{k \in K} X_{k}$ with $X_{k} \rightarrow S$ proper and of finite presentation. Next, by absolute Noetherian approximation (Proposition 31.4.4 we can write $S=\lim _{j \in J} S_{j}$ with $S_{j}$ of finite type over $\mathbf{Z}$. For each $k$ there exists a $j$ and a morphism $X_{k, j} \rightarrow S_{j}$ of finite presentation with $X_{k} \cong S \times{ }_{S_{j}} X_{k, j}$ as schemes over $S$, see Lemma 31.9.1. After increasing $j$ we may assume $X_{k, j} \rightarrow S_{j}$ is proper, see Lemma 31.12.4. The set $I$ will be consist of these pairs $(k, j)$ and the corresponding morphism is $X_{k, j} \rightarrow S_{j}$. For every $k^{\prime} \geq k$ we can find a $j^{\prime} \geq j$ and a morphism $X_{j^{\prime}, k^{\prime}} \rightarrow X_{j, k}$ over $S_{j^{\prime}} \rightarrow S_{j}$ whose base change to $S$ gives the morphism $X_{k^{\prime}} \rightarrow X_{k}$ (follows again from Lemma 31.9.1). These morphisms form the transition morphisms of the system. Some details omitted.

Recall the scheme theoretic support of a finite type quasi-coherent module, see Morphisms, Definition 28.5.5.
081G Lemma 31.12.7. Assumptions and notation as in Situation 31.7.1. Let $\mathcal{F}_{0}$ be a quasi-coherent $\mathcal{O}_{X_{0}}$-module. Denote $\mathcal{F}$ and $\mathcal{F}_{i}$ the pullbacks of $\mathcal{F}_{0}$ to $X$ and $X_{i}$. Assume
(1) $f_{0}$ is locally of finite type,
(2) $\mathcal{F}_{0}$ is of finite type,
(3) the scheme theoretic support of $\mathcal{F}$ is proper over $Y$.

Then the scheme theoretic support of $\mathcal{F}_{i}$ is proper over $Y_{i}$ for some $i$.
Proof. We may replace $X_{0}$ by the scheme theoretic support of $\mathcal{F}_{0}$. By Morphisms, Lemma 28.5.3 this guarantees that $X_{i}$ is the support of $\mathcal{F}_{i}$ and $X$ is the support of $\mathcal{F}$. Then, if $Z \subset X$ denotes the scheme theoretic support of $\mathcal{F}$, we see that $Z \rightarrow X$ is a universal homeomorphism. We conclude that $X \rightarrow Y$ is proper as this is true for $Z \rightarrow Y$ by assumption, see Morphisms, Lemma 28.41.8. By Lemma 31.12 .4 we see that $X_{i} \rightarrow Y$ is proper for some $i$. Then it follows that the scheme theoretic support $Z_{i}$ of $\mathcal{F}_{i}$ is proper over $Y$ by Morphisms, Lemmas 28.41.6 and 28.41.4.

### 31.13. Universally closed morphisms

05JW In this section we discuss when a quasi-compact but not necessarily separated morphism is universally closed. We first prove a lemma which will allow us to check universal closedness after a base change which is locally of finite presentation.

05BD Lemma 31.13.1. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. Let $g: T \rightarrow S$ be a morphism of schemes. Let $t \in T$ be a point and $Z \subset X_{T}$ be a closed
subscheme such that $Z \cap X_{t}=\emptyset$. Then there exists an open neighbourhood $V \subset T$ of $t$, a commutative diagram

and a closed subscheme $Z^{\prime} \subset X_{T^{\prime}}$ such that
(1) the morphism $b: T^{\prime} \rightarrow S$ is locally of finite presentation,
(2) with $t^{\prime}=a(t)$ we have $Z^{\prime} \cap X_{t^{\prime}}=\emptyset$, and
(3) $Z \cap X_{V}$ maps into $Z^{\prime}$ via the morphism $X_{V} \rightarrow X_{T^{\prime}}$.

Proof. Let $s=g(t)$. During the proof we may always replace $T$ by an open neighbourhood of $t$. Hence we may also replace $S$ by an open neighbourhood of $s$. Thus we may and do assume that $T$ and $S$ are affine. Say $S=\operatorname{Spec}(A)$, $T=\operatorname{Spec}(B), g$ is given by the ring map $A \rightarrow B$, and $t$ correspond to the prime ideal $\mathfrak{q} \subset B$.
As $X \rightarrow S$ is quasi-compact and $S$ is affine we may write $X=\bigcup_{i=1, \ldots, n} U_{i}$ as a finite union of affine opens. Write $U_{i}=\operatorname{Spec}\left(C_{i}\right)$. In particular we have $X_{T}=\bigcup_{i=1, \ldots, n} U_{i, T}=\bigcup_{i=1, \ldots n} \operatorname{Spec}\left(C_{i} \otimes_{A} B\right)$. Let $I_{i} \subset C_{i} \otimes_{A} B$ be the ideal corresponding to the closed subscheme $Z \cap U_{i, T}$. The condition that $Z \cap X_{t}=\emptyset$ signifies that $I_{i}$ generates the unit ideal in the ring

$$
C_{i} \otimes_{A} \kappa(\mathfrak{q})=(B \backslash \mathfrak{q})^{-1}\left(C_{i} \otimes_{A} B / \mathfrak{q} C_{i} \otimes_{A} B\right)
$$

Since $I_{i}(B \backslash \mathfrak{q})^{-1}\left(C_{i} \otimes_{A} B\right)=(B \backslash \mathfrak{q})^{-1} I_{i}$ this means that $1=x_{i} / g_{i}$ for some $x_{i} \in I_{i}$ and $g_{i} \in B, g_{i} \notin \mathfrak{q}$. Thus, clearing denominators we can find a relation of the form

$$
x_{i}+\sum_{j} f_{i, j} c_{i, j}=g_{i}
$$

with $x_{i} \in I_{i}, f_{i, j} \in \mathfrak{q}, c_{i, j} \in C_{i} \otimes_{A} B$, and $g_{i} \in B, g_{i} \notin \mathfrak{q}$. After replacing $B$ by $B_{g_{1} \ldots g_{n}}$, i.e., after replacing $T$ by a smaller affine neighbourhood of $t$, we may assume the equations read

$$
x_{i}+\sum_{j} f_{i, j} c_{i, j}=1
$$

with $x_{i} \in I_{i}, f_{i, j} \in \mathfrak{q}, c_{i, j} \in C_{i} \otimes_{A} B$.
To finish the argument write $B$ as a colimit of finitely presented $A$-algebras $B_{\lambda}$ over a directed partially ordered set $\Lambda$. For each $\lambda$ set $\mathfrak{q}_{\lambda}=\left(B_{\lambda} \rightarrow B\right)^{-1}(\mathfrak{q})$. For sufficiently large $\lambda \in \Lambda$ we can find
(1) an element $x_{i, \lambda} \in C_{i} \otimes_{A} B_{\lambda}$ which maps to $x_{i}$,
(2) elements $f_{i, j, \lambda} \in \mathfrak{q}_{i, \lambda}$ mapping to $f_{i, j}$, and
(3) elements $c_{i, j, \lambda} \in C_{i} \otimes_{A} B_{\lambda}$ mapping to $c_{i, j}$.

After increasing $\lambda$ a bit more the equation

$$
x_{i, \lambda}+\sum_{j} f_{i, j, \lambda} c_{i, j, \lambda}=1
$$

will hold. Fix such a $\lambda$ and set $T^{\prime}=\operatorname{Spec}\left(B_{\lambda}\right)$. Then $t^{\prime} \in T^{\prime}$ is the point corresponding to the prime $\mathfrak{q}_{\lambda}$. Finally, let $Z^{\prime} \subset X_{T^{\prime}}$ be the scheme theoretic closure of $Z \rightarrow X_{T} \rightarrow X_{T^{\prime}}$. As $X_{T} \rightarrow X_{T^{\prime}}$ is affine, we can compute $Z^{\prime}$ on the affine open pieces $U_{i, T^{\prime}}$ as the closed subscheme associated to $\operatorname{Ker}\left(C_{i} \otimes_{A} B_{\lambda} \rightarrow C_{i} \otimes_{A} B / I_{i}\right)$, see Morphisms, Example 28.6.4. Hence $x_{i, \lambda}$ is in the ideal defining $Z^{\prime}$. Thus the last displayed equation shows that $Z^{\prime} \cap X_{t^{\prime}}$ is empty.

05JX Lemma 31.13.2. Let $f: X \rightarrow S$ be a quasi-compact morphism of schemes. The following are equivalent
(1) $f$ is universally closed,
(2) for every morphism $S^{\prime} \rightarrow S$ which is locally of finite presentation the base change $X_{S^{\prime}} \rightarrow S^{\prime}$ is closed, and
(3) for every $n$ the morphism $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ is closed.

Proof. It is clear that (1) implies (2). Let us prove that (2) implies (1). Suppose that the base change $X_{T} \rightarrow T$ is not closed for some scheme $T$ over $S$. By Schemes, Lemma 25.19 .8 this means that there exists some specialization $t_{1} \rightsquigarrow t$ in $T$ and a point $\xi \in X_{T}$ mapping to $t_{1}$ such that $\xi$ does not specialize to a point in the fibre over $t$. Set $Z=\overline{\{\xi\}} \subset X_{T}$. Then $Z \cap X_{t}=\emptyset$. Apply Lemma 31.13.1. We find an open neighbourhood $V \subset T$ of $t$, a commutative diagram

and a closed subscheme $Z^{\prime} \subset X_{T^{\prime}}$ such that
(1) the morphism $b: T^{\prime} \rightarrow S$ is locally of finite presentation,
(2) with $t^{\prime}=a(t)$ we have $Z^{\prime} \cap X_{t^{\prime}}=\emptyset$, and
(3) $Z \cap X_{V}$ maps into $Z^{\prime}$ via the morphism $X_{V} \rightarrow X_{T^{\prime}}$.

Clearly this means that $X_{T^{\prime}} \rightarrow T^{\prime}$ maps the closed subset $Z^{\prime}$ to a subset of $T^{\prime}$ which contains $a\left(t_{1}\right)$ but not $t^{\prime}=a(t)$. Since $a\left(t_{1}\right) \rightsquigarrow a(t)=t^{\prime}$ we conclude that $X_{T^{\prime}} \rightarrow T^{\prime}$ is not closed. Hence we have shown that $X \rightarrow S$ not universally closed implies that $X_{T^{\prime}} \rightarrow T^{\prime}$ is not closed for some $T^{\prime} \rightarrow S$ which is locally of finite presentation. In order words (2) implies (1).

Assume that $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ is closed for every integer $n$. We want to prove that $X_{T} \rightarrow T$ is closed for every scheme $T$ which is locally of finite presentation over $S$. We may of course assume that $T$ is affine and maps into an affine open $V$ of $S$ (since $X_{T} \rightarrow T$ being a closed is local on $T$ ). In this case there exists a closed immersion $T \rightarrow \mathbf{A}^{n} \times V$ because $\mathcal{O}_{T}(T)$ is a finitely presented $\mathcal{O}_{S}(V)$-algebra, see Morphisms, Lemma 28.21.2. Then $T \rightarrow \mathbf{A}^{n} \times S$ is a locally closed immersion. Hence we get a cartesian diagram

of schemes where the horizontal arrows are locally closed immersions. Hence any closed subset $Z \subset X_{T}$ can be written as $X_{T} \cap Z^{\prime}$ for some closed subset $Z^{\prime} \subset \mathbf{A}^{n} \times X$. Then $f_{T}(Z)=T \cap f_{n}\left(Z^{\prime}\right)$ and we see that if $f_{n}$ is closed, then also $f_{T}$ is closed.

05JY Lemma 31.13.3. Let $f: X \rightarrow S$ be a finite type morphism of schemes. Assume $S$ is locally Noetherian. Then the following are equivalent
(1) $f$ is universally closed,
(2) for every $n$ the morphism $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ is closed,
(3) for any diagram (31.12.1.2) there exists some dotted arrow,
(4) for all diagrams (31.12.1.2) with $A$ a discrete valuation ring there exists some dotted arrow.

Proof. The equivalence of (1) and (2) is a special case of Lemma 31.13.2. The equivalence of (1) and (3) is a special case of Schemes, Proposition 25.20.6. Trivially (3) implies (4). Thus all we have to do is prove that (4) implies (2). We will prove that $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ is closed by the criterion of Schemes, Lemma 25.19.8. Pick $n$ and a specialization $z \rightsquigarrow z^{\prime}$ of points in $\mathbf{A}^{n} \times S$ and a point $y \in \mathbf{A}^{n} \times X$ lying over $z$. Note that $\kappa(y)$ is a finitely generated field extension of $\kappa(z)$ as $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ is of finite type. Hence by Properties, Lemma 27.5.10 or Algebra, Lemma 10.118.13 implies that there exists a discrete valuation ring $A \subset \kappa(y)$ with fraction field $\kappa(z)$ dominating the image of $\mathcal{O}_{\mathbf{A}^{n} \times S, z^{\prime}}$ in $\kappa(z)$. This gives a commutative diagram

Now property (4) implies that there exists a morphism $\operatorname{Spec}(A) \rightarrow X$ which fits into this diagram. Since we already have the morphism $\operatorname{Spec}(A) \rightarrow \mathbf{A}^{n}$ from the left lower horizontal arrow we also get a morphism $\operatorname{Spec}(A) \rightarrow \mathbf{A}^{n} \times X$ fitting into the left square. Thus the image $y^{\prime} \in \mathbf{A}^{n} \times X$ of the closed point is a specialization of $y$ lying over $z^{\prime}$. This proves that specializations lift along $\mathbf{A}^{n} \times X \rightarrow \mathbf{A}^{n} \times S$ and we win.

### 31.14. Limits and dimensions of fibres

05M4 The following lemma is most often used in the situation of Lemma 31.9.1 to assure that if the fibres of the limit have dimension $\leq d$, then the fibres at some finite stage have dimension $\leq d$.

05M5 Lemma 31.14.1. Let $I$ be a directed partially ordered set. Let $\left(f_{i}: X_{i} \rightarrow S_{i}\right)$ be an inverse system of morphisms of schemes over I. Assume
(1) all the morphisms $S_{i^{\prime}} \rightarrow S_{i}$ are affine,
(2) all the schemes $S_{i}$ are quasi-compact and quasi-separated,
(3) the morphisms $f_{i}$ are of finite type, and
(4) the morphisms $X_{i^{\prime}} \rightarrow X_{i} \times{ }_{S_{i}} S_{i^{\prime}}$ are closed immersions.

Let $f: X=\lim _{i} X_{i} \rightarrow S=\lim _{i} S_{i}$ be the limit. Let $d \geq 0$. If every fibre of $f$ has dimension $\leq d$, then for some $i$ every fibre of $f_{i}$ has dimension $\leq d$.
Proof. For each $i$ let $U_{i}=\left\{x \in X_{i} \mid \operatorname{dim}_{x}\left(\left(X_{i}\right)_{f_{i}(x)}\right) \leq d\right\}$. This is an open subset of $X_{i}$, see Morphisms, Lemma 28.28.4 Set $Z_{i}=X_{i} \backslash U_{i}$ (with reduced induced scheme structure). We have to show that $Z_{i}=\emptyset$ for some $i$. If not, then $Z=\lim Z_{i} \neq \emptyset$, see Lemma 31.3.4. Say $z \in Z$ is a point. Note that $Z \subset X$ is a closed subscheme. Set $s=f(z)$. For each $i$ let $s_{i} \in S_{i}$ be the image of $s$. We remark that $Z_{s}$ is the limit of the schemes $\left(Z_{i}\right)_{s_{i}}$ and $Z_{s}$ is also the limit of the schemes $\left(Z_{i}\right)_{s_{i}}$ base changed to $\kappa(s)$. Moreover, all the morphisms

$$
Z_{s} \longrightarrow\left(Z_{i^{\prime}}\right)_{s_{i^{\prime}}} \times \operatorname{Spec}\left(\kappa\left(s_{i^{\prime}}\right)\right) \operatorname{Spec}(\kappa(s)) \longrightarrow\left(Z_{i}\right)_{s_{i}} \times \times_{\operatorname{Spec}\left(\kappa\left(s_{i}\right)\right)} \operatorname{Spec}(\kappa(s)) \longrightarrow X_{s}
$$

are closed immersions by assumption (4). Hence $Z_{s}$ is the scheme theoretic intersection of the closed subschemes $\left(Z_{i}\right)_{s_{i}} \times_{\operatorname{Spec}\left(\kappa\left(s_{i}\right)\right)} \operatorname{Spec}(\kappa(s))$ in $X_{s}$. Since all the
irreducible components of the schemes $\left(Z_{i}\right)_{s_{i}} \times{ }_{\operatorname{Spec}\left(\kappa\left(s_{i}\right)\right)} \operatorname{Spec}(\kappa(s))$ have dimension $>d$ and contain $z$ we conclude that $Z_{s}$ contains an irreducible component of dimension $>d$ passing through $z$ which contradicts the fact that $Z_{s} \subset X_{s}$ and $\operatorname{dim}\left(X_{s}\right) \leq d$.

094M Lemma 31.14.2. Notation and assumptions as in Situation 31.7.1. If
(1) $f$ is a quasi-finite morphism, and
(2) $f_{0}$ is locally of finite type,
then there exists an $i \geq 0$ such that $f_{i}$ is quasi-finite.
Proof. Follows immediately from Lemma 31.14.1.
05M6 Lemma 31.14.3. Let $S$ be a quasi-compact and quasi-separated scheme. Let $f: X \rightarrow S$ be a morphism of finite presentation. Let $d \geq 0$ be an integer. If $Z \subset X$ be a closed subscheme such that $\operatorname{dim}\left(Z_{s}\right) \leq d$ for all $s \in S$, then there exists a closed subscheme $Z^{\prime} \subset X$ such that
(1) $Z \subset Z^{\prime}$,
(2) $Z^{\prime} \rightarrow X$ is of finite presentation, and
(3) $\operatorname{dim}\left(Z_{s}^{\prime}\right) \leq d$ for all $s \in S$.

Proof. By Proposition 31.4.4 we can write $S=\lim S_{i}$ as the limit of a directed inverse system of Noetherian schemes with affine transition maps. By Lemma 31.9.1 we may assume that there exist a system of morphisms $f_{i}: X_{i} \rightarrow S_{i}$ of finite presentation such that $X_{i^{\prime}}=X_{i} \times_{S_{i}} S_{i^{\prime}}$ for all $i^{\prime} \geq i$ and such that $X=X_{i} \times{ }_{S_{i}} S$. Let $Z_{i} \subset X_{i}$ be the scheme theoretic image of $Z \rightarrow X \rightarrow X_{i}$. Then for $i^{\prime} \geq i$ the morphism $X_{i^{\prime}} \rightarrow X_{i}$ maps $Z_{i^{\prime}}$ into $Z_{i}$ and the induced morphism $Z_{i^{\prime}} \rightarrow Z_{i} \times{ }_{S_{i}} S_{i^{\prime}}$ is a closed immersion. By Lemma 31.14.1 we see that the dimension of the fibres of $Z_{i} \rightarrow S_{i}$ all have dimension $\leq d$ for a suitable $i \in I$. Fix such an $i$ and set $Z^{\prime}=Z_{i} \times_{S_{i}} S \subset X$. Since $S_{i}$ is Noetherian, we see that $X_{i}$ is Noetherian, and hence the morphism $Z_{i} \rightarrow X_{i}$ is of finite presentation. Therefore also the base change $Z^{\prime} \rightarrow X$ is of finite presentation. Moreover, the fibres of $Z^{\prime} \rightarrow S$ are base changes of the fibres of $Z_{i} \rightarrow S_{i}$ and hence have dimension $\leq d$.

### 31.15. Application to modifications

0B3W Applying our theory above to the spectrum of a local ring we obtain the following pleasing glueing result for relative schemes.

0BPA Lemma 31.15.1. Let $S$ be a scheme. Let $s \in S$ be a closed point such that $U=S \backslash\{s\} \rightarrow S$ is quasi-compact. With $V=\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \backslash\{s\}$ there is an equivalence of categories

$$
\{X \rightarrow S \text { of finite presentation }\} \longrightarrow\left\{\begin{array}{cc}
X^{\prime} \longleftarrow Y^{\prime} \longrightarrow Y \\
\mid & \downarrow \\
U \longleftarrow V \longrightarrow \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)
\end{array}\right\}
$$

where on the right hand side we consider commutative diagrams whose squares are cartesian and whose vertical arrows are of finite presentation.

Proof. Let $W \subset S$ be an open neighbourhood of $s$. By glueing of relative schemes, see Constructions, Section 26.2, the functor

$$
\{X \rightarrow S \text { of finite presentation }\} \longrightarrow\left\{\begin{array}{ll}
X^{\prime} \longleftarrow & Y^{\prime} \longrightarrow Y \\
\downarrow & \downarrow \\
U \longleftarrow W \backslash\{s\} \longrightarrow W
\end{array}\right\}
$$

is an equivalence of categories. We have $\mathcal{O}_{S, s}=\operatorname{colim} \mathcal{O}_{W}(W)$ where $W$ runs over the affine open neighbourhoods of $s$. Hence $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)=\lim W$ where $W$ runs over the affine open neighbourhoods of $s$. Thus the category of schemes of finite presentation over $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ is the limit of the category of schemes of finite presentation over $W$ where $W$ runs over the affine open neighbourhoods of $s$, see Lemma 31.9.1. For every affine open $s \in W$ we see that $U \cap W$ is quasi-compact as $U \rightarrow S$ is quasi-compact. Hence $V=\lim W \cap U=\lim W \backslash\{s\}$ is a limit of quasicompact and quasi-separated schemes (see Lemma 31.2.2). Thus also the category of schemes of finite presentation over $V$ is the limit of the categories of schemes of finite presentation over $W \cap U$ where $W$ runs over the affine open neighbourhoods of $s$. The lemma follows formally from a combination of these results.

0BQ5 Lemma 31.15.2. Let $S$ be a scheme. Let $U \subset S$ be a retrocompact open. Let $s \in S$ be a point in the complement of $U$. With $V=\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \cap U$ there is an equivalence of categories

where on the left hand side the vertical arrow is of finite presentation and on the right hand side we consider commutative diagrams whose squares are cartesian and whose vertical arrows are of finite presentation.
Proof. Let $W \subset S$ be an open neighbourhood of $s$. By glueing of relative schemes, see Constructions, Section 26.2 the functor
is an equivalence of categories. We have $\mathcal{O}_{S, s}=\operatorname{colim} \mathcal{O}_{W}(W)$ where $W$ runs over the affine open neighbourhoods of $s$. Hence $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)=\lim W$ where $W$ runs over the affine open neighbourhoods of $s$. Thus the category of schemes of finite presentation over $\operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ is the limit of the category of schemes of finite presentation over $W$ where $W$ runs over the affine open neighbourhoods of $s$, see Lemma 31.9.1. For every affine open $s \in W$ we see that $U \cap W$ is quasi-compact as $U \rightarrow S$ is quasi-compact. Hence $V=\lim W \cap U$ is a limit of quasi-compact and quasiseparated schemes (see Lemma 31.2.2). Thus also the category of schemes of finite presentation over $V$ is the limit of the categories of schemes of finite presentation over $W \cap U$ where $W$ runs over the affine open neighbourhoods of $s$. The lemma follows formally from a combination of these results.

Using the above we can describe the category of modifications of a scheme over a closed point in terms of the local ring.
0B3X Lemma 31.15.3. Let $S$ be a scheme. Let $s \in S$ be a closed point such that $U=S \backslash\{s\} \rightarrow S$ is quasi-compact. With $V=\operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \backslash\{s\}$ the base change functor
$\left\{\begin{array}{l}f: X \rightarrow S \text { of finite presentation } \\ f^{-1}(U) \rightarrow U \text { is an isomorphism }\end{array}\right\} \rightarrow\left\{\begin{array}{c}g: Y \rightarrow \operatorname{Spec}\left(\mathcal{O}_{S, s}\right) \text { of finite presentation } \\ g^{-1}(V) \rightarrow V \text { is an isomorphism }\end{array}\right\}$
is an equivalence of categories.
Proof. This is a special case of Lemma 31.15.1
0BFN Lemma 31.15.4. Notation and assumptions as in Lemma 31.15.3. Let $f: X \rightarrow S$ correspond to $g: Y \rightarrow \operatorname{Spec}\left(\mathcal{O}_{S, s}\right)$ via the equivalence. Then $f$ is separated, proper, finite, and add more here if and only if $g$ is so.

Proof. The property of being separated, proper, integral, finite, etc is stable under base change. See Schemes, Lemma 25.21 .13 and Morphisms, Lemmas 28.41 .5 and 28.43.6. Hence if $f$ has the propery, then so does $g$. Conversely, if $g$ does, then $f$ does in a neighbourhood of $s$ by Lemmas 31.7.5, 31.12.4, and 31.7.3. Since $f$ clearly has the given property over $S \backslash\{s\}$ we conclude as one can check the property locally on the base.

0B3Y Remark 31.15.5. The lemma above can be generalized as follows. Let $S$ be a scheme and let $T \subset S$ be a closed subset. Assume there exists a cofinal system of open neighbourhoods $T \subset W_{i}$ such that (1) $W_{i} \backslash T$ is quasi-compact and (2) $W_{i} \subset W_{j}$ is an affine morphism. Then $W=\lim W_{i}$ is a scheme which contains $T$ as a closed subscheme. Set $U=X \backslash T$ and $V=W \backslash T$. Then the base change functor

$$
\left\{\begin{array}{l}
f: X \rightarrow S \text { of finite presentation } \\
f^{-1}(U) \rightarrow U \text { is an isomorphism }
\end{array}\right\} \longrightarrow\left\{\begin{array}{c}
g: Y \rightarrow W \text { of finite presentation } \\
g^{-1}(V) \rightarrow V \text { is an isomorphism }
\end{array}\right\}
$$

is an equivalence of categories. If we ever need this we will change this remark into a lemma and provide a detailed proof.

## CHAPTER 32

## Varieties

### 32.1. Introduction

020A In this chapter we start studying varieties and more generally schemes over a field. A fundamental reference is DG67.

### 32.2. Notation

020B Throughout this chapter we use the letter $k$ to denote the ground field.

### 32.3. Varieties

020 C In the stacks project we will use the following as our definition of a variety.
020D Definition 32.3.1. Let $k$ be a field. A variety is a scheme $X$ over $k$ such that $X$ is integral and the structure morphism $X \rightarrow \operatorname{Spec}(k)$ is separated and of finite type.
This definition has the following drawback. Suppose that $k \subset k^{\prime}$ is an extension of fields. Suppose that $X$ is a variety over $k$. Then the base change $X_{k^{\prime}}=$ $X \times_{\operatorname{Spec}(k)} \operatorname{Spec}\left(k^{\prime}\right)$ is not necessarily a variety over $k^{\prime}$. This phenomenon (in greater generality) will be discussed in detail in the following sections. The product of two varieties need not be a variety (this is really the same phenomenon). Here is an example.

020G Example 32.3.2. Let $k=\mathbf{Q}$. Let $X=\operatorname{Spec}(\mathbf{Q}(i))$ and $Y=\operatorname{Spec}(\mathbf{Q}(i))$. Then the product $X \times_{\operatorname{Spec}(k)} Y$ of the varieties $X$ and $Y$ is not a variety, since it is reducible. (It is isomorphic to the disjoint union of two copies of $X$.)
If the ground field is algebraically closed however, then the product of varieties is a variety. This follows from the results in the algebra chapter, but there we treat much more general situations. There is also a simple direct proof of it which we present here.

05P3 Lemma 32.3.3. Let $k$ be an algebraically closed field. Let $X, Y$ be varieties over $k$. Then $X \times_{\operatorname{Spec}(k)} Y$ is a variety over $k$.

Proof. The morphism $X \times_{\operatorname{Spec}(k)} Y \rightarrow \operatorname{Spec}(k)$ is of finite type and separated because it is the composition of the morphisms $X \times_{\operatorname{Spec}(k)} Y \rightarrow Y \rightarrow \operatorname{Spec}(k)$ which are separated and of finite type, see Morphisms, Lemmas 28.15 .4 and 28.15 .3 and Schemes, Lemma 25.21 .13 . To finish the proof it suffices to show that $X \times{ }_{\operatorname{Spec}(k)} Y$ is integral. Let $X=\bigcup_{i=1, \ldots, n} U_{i}, Y=\bigcup_{j=1, \ldots, m} V_{j}$ be finite affine open coverings. If we can show that each $U_{i} \times \operatorname{Spec}(k) V_{j}$ is integral, then we are done by Properties, Lemmas 27.3.2, 27.3.3, and 27.3.4. This reduces us to the affine case.

The affine case translates into the following algebra statement: Suppose that $A, B$ are integral domains and finitely generated $k$-algebras. Then $A \otimes_{k} B$ is an integral domain. To get a contradiction suppose that

$$
\left(\sum_{i=1, \ldots, n} a_{i} \otimes b_{i}\right)\left(\sum_{j=1, \ldots, m} c_{j} \otimes d_{j}\right)=0
$$

in $A \otimes_{k} B$ with both factors nonzero in $A \otimes_{k} B$. We may assume that $b_{1}, \ldots, b_{n}$ are $k$-linearly independent in $B$, and that $d_{1}, \ldots, d_{m}$ are $k$-linearly independent in $B$. Of course we may also assume that $a_{1}$ and $c_{1}$ are nonzero in $A$. Hence $D\left(a_{1} c_{1}\right) \subset \operatorname{Spec}(A)$ is nonempty. By the Hilbert Nullstellensatz (Algebra, Theorem 10.33.1) we can find a maximal ideal $\mathfrak{m} \subset A$ contained in $D\left(a_{1} c_{1}\right)$ and $A / \mathfrak{m}=k$ as $k$ is algebraically closed. Denote $\bar{a}_{i}, \bar{c}_{j}$ the residue classes of $a_{i}, c_{j}$ in $A / \mathfrak{m}=k$. Then equation above becomes

$$
\left(\sum_{i=1, \ldots, n} \bar{a}_{i} b_{i}\right)\left(\sum_{j=1, \ldots, m} \bar{c}_{j} d_{j}\right)=0
$$

which is a contradiction with $\mathfrak{m} \in D\left(a_{1} c_{1}\right)$, the linear independence of $b_{1}, \ldots, b_{n}$ and $d_{1}, \ldots, d_{m}$, and the fact that $B$ is a domain.

### 32.4. Geometrically reduced schemes

035 U If $X$ is a reduced scheme over a field, then it can happen that $X$ becomes nonreduced after extending the ground field. This does not happen for geometrically reduced schemes.

035V Definition 32.4.1. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $x \in X$ be a point.
(1) Let $x \in X$ be a point. We say $X$ is geometrically reduced at $x$ if for any field extension $k \subset k^{\prime}$ and any point $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ the local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is reduced.
(2) We say $X$ is geometrically reduced over $k$ if $X$ is geometrically reduced at every point of $X$.

This may seem a little mysterious at first, but it is really the same thing as the notion discussed in the algebra chapter. Here are some basic results explaining the connection.

035W Lemma 32.4.2. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $x \in X$. The following are equivalent
(1) $X$ is geometrically reduced at $x$, and
(2) the ring $\mathcal{O}_{X, x}$ is geometrically reduced over $k$ (see Algebra, Definition 10.42.1).

Proof. Assume (1). This in particular implies that $\mathcal{O}_{X, x}$ is reduced. Let $k \subset k^{\prime}$ be a finite purely inseparable field extension. Consider the ring $\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. By Algebra, Lemma 10.45 .6 its spectrum is the same as the spectrum of $\mathcal{O}_{X, x}$. Hence it is a local ring also (Algebra, Lemma 10.17 .2 ). Therefore there is a unique point $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ and $\mathcal{O}_{X_{k^{\prime}, x^{\prime}}} \cong \mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. By assumption this is a reduced ring. Hence we deduce (2) by Algebra, Lemma 10.43.3.
Assume (2). Let $k \subset k^{\prime}$ be a field extension. Since $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$ is surjective, also $X_{k^{\prime}} \rightarrow X$ is surjective (Morphisms, Lemma 28.10.4). Let $x^{\prime} \in X_{k^{\prime}}$ be any point lying over $x$. The local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is a localization of the ring $\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. Hence it is reduced by assumption and (1) is proved.

The notion isn't interesting in characteristic zero.
020I Lemma 32.4.3. Let $X$ be a scheme over a perfect field $k$ (e.g. $k$ has characteristic zero). Let $x \in X$. If $\mathcal{O}_{X, x}$ is reduced, then $X$ is geometrically reduced at $x$. If $X$ is reduced, then $X$ is geometrically reduced over $k$.

Proof. The first statement follows from Lemma 32.4 .2 and Algebra, Lemma 10.42 .6 and the definition of a perfect field (Algebra, Definition 10.44.1). The second statement follows from the first.

035X Lemma 32.4.4. Let $k$ be a field of characteristic $p>0$. Let $X$ be a scheme over $k$. The following are equivalent
(1) $X$ is geometrically reduced,
(2) $X_{k^{\prime}}$ is reduced for every field extension $k \subset k^{\prime}$,
(3) $X_{k^{\prime}}$ is reduced for every finite purely inseparable field extension $k \subset k^{\prime}$,
(4) $X_{k^{1 / p}}$ is reduced,
(5) $X_{k^{p e r f}}$ is reduced,
(6) $X_{\bar{k}}$ is reduced,
(7) for every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is geometrically reduced (see Algebra, Definition 10.42.1).
Proof. Assume (1). Then for every field extension $k \subset k^{\prime}$ and every point $x^{\prime} \in X_{k^{\prime}}$ the local ring of $X_{k^{\prime}}$ at $x^{\prime}$ is reduced. In other words $X_{k^{\prime}}$ is reduced. Hence (2).
Assume (2). Let $U \subset X$ be an affine open. Then for every field extension $k \subset k^{\prime}$ the scheme $X_{k^{\prime}}$ is reduced, hence $U_{k^{\prime}}=\operatorname{Spec}\left(\mathcal{O}(U) \otimes_{k} k^{\prime}\right)$ is reduced, hence $\mathcal{O}(U) \otimes_{k} k^{\prime}$ is reduced (see Properties, Section 27.3). In other words $\mathcal{O}(U)$ is geometrically reduced, so (7) holds.

Assume (7). For any field extension $k \subset k^{\prime}$ the base change $X_{k^{\prime}}$ is gotten by gluing the spectra of the rings $\mathcal{O}_{X}(U) \otimes_{k} k^{\prime}$ where $U$ is affine open in $X$ (see Schemes, Section 25.17). Hence $X_{k^{\prime}}$ is reduced. So (1) holds.
This proves that (1), (2), and (7) are equivalent. These are equivalent to (3), (4), (5), and (6) because we can apply Algebra, Lemma 10.43 .3 to $\mathcal{O}_{X}(U)$ for $U \subset X$ affine open.

035Y Lemma 32.4.5. Let $k$ be a field of characteristic $p>0$. Let $X$ be a scheme over $k$. Let $x \in X$. The following are equivalent
(1) $X$ is geometrically reduced at $x$,
(2) $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is reduced for every finite purely inseparable field extension $k^{\prime}$ of $k$ and $x^{\prime} \in X_{k^{\prime}}$ the unique point lying over $x$,
(3) $\mathcal{O}_{X_{k^{1 / p}}, x^{\prime}}$ is reduced for $x^{\prime} \in X_{k^{\prime}}$ the unique point lying over $x$, and
(4) $\mathcal{O}_{X_{k p e r f}, x^{\prime}}$ is reduced for $x^{\prime} \in X_{k^{p e r f}}$ the unique point lying over $x$.

Proof. Note that if $k \subset k^{\prime}$ is purely inseparable, then $X_{k^{\prime}} \rightarrow X$ induces a homeomorphism on underlying topological spaces, see Algebra, Lemma 10.45.6. Whence the uniqueness of $x^{\prime}$ lying over $x$ mentioned in the statement. Moreover, in this case $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}=\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. Hence the lemma follows from Lemma 32.4.2 above and Algebra, Lemma 10.43.3.
0384 Lemma 32.4.6. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $k^{\prime} / k$ be a field extension. Let $x \in X$ be a point, and let $x^{\prime} \in X_{k^{\prime}}$ be a point lying over $x$. The following are equivalent
(1) $X$ is geometrically reduced at $x$,
(2) $X_{k^{\prime}}$ is geometrically reduced at $x^{\prime}$.

In particular, $X$ is geometrically reduced over $k$ if and only if $X_{k^{\prime}}$ is geometrically reduced over $k^{\prime}$.

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k^{\prime \prime}$ be a finite purely inseparable field extension and let $x^{\prime \prime} \in X_{k^{\prime \prime}}$ be a point lying over $x$ (actually it is unique). We can find a common field extension $k \subset k^{\prime \prime \prime}$ (i.e. with both $k^{\prime} \subset k^{\prime \prime \prime}$ and $\left.k^{\prime \prime} \subset k^{\prime \prime \prime}\right)$ and a point $x^{\prime \prime \prime} \in X_{k^{\prime \prime \prime}}$ lying over both $x^{\prime}$ and $x^{\prime \prime}$. Consider the map of local rings

$$
\mathcal{O}_{X_{k^{\prime \prime}}, x^{\prime \prime}} \longrightarrow \mathcal{O}_{X_{k^{\prime \prime \prime}}, x^{\prime \prime \prime \prime}}
$$

This is a flat local ring homomorphism and hence faithfully flat. By (2) we see that the local ring on the right is reduced. Thus by Algebra, Lemma 10.156 .2 we conclude that $\mathcal{O}_{X_{k^{\prime \prime}}, x^{\prime \prime}}$ is reduced. Thus by Lemma 32.4.5 we conclude that $X$ is geometrically reduced at $x$.

035Z Lemma 32.4.7. Let $k$ be a field. Let $X, Y$ be schemes over $k$.
(1) If $X$ is geometrically reduced at $x$, and $Y$ reduced, then $X \times_{k} Y$ is reduced at every point lying over $x$.
(2) If $X$ geometrically reduced over $k$ and $Y$ reduced. Then $X \times{ }_{k} Y$ is reduced.

Proof. Combine, Lemmas 32.4 .2 and 32.4 .4 and Algebra, Lemma 10.42.5.
04KS Lemma 32.4.8. Let $k$ be a field. Let $X$ be a scheme over $k$.
(1) If $x^{\prime} \rightsquigarrow x$ is a specialization and $X$ is geometrically reduced at $x$, then $X$ is geometrically reduced at $x^{\prime}$.
(2) If $x \in X$ such that (a) $\mathcal{O}_{X, x}$ is reduced, and (b) for each specialization $x^{\prime} \rightsquigarrow x$ where $x^{\prime}$ is a generic point of an irreducible component of $X$ the scheme $X$ is geometrically reduced at $x^{\prime}$, then $X$ is geometrically reduced at $x$.
(3) If $X$ is reduced and geometrically reduced at all generic points of irreducible components of $X$, then $X$ is geometrically reduced.

Proof. Part (1) follows from Lemma 32.4 .2 and the fact that if $A$ is a geometrically reduced $k$-algebra, then $S^{-1} A$ is a geometrically reduced $k$-algebra for any multiplicative subset $S$ of $A$, see Algebra, Lemma 10.42.3.

Let $A=\mathcal{O}_{X, x}$. The assumptions (a) and (b) of (2) imply that $A$ is reduced, and that $A_{\mathfrak{q}}$ is geometrically reduced over $k$ for every minimal prime $\mathfrak{q}$ of $A$. Hence $A$ is geometrically reduced over $k$, see Algebra, Lemma 10.42.7. Thus $X$ is geometrically reduced at $x$, see Lemma 32.4.2

Part (3) follows trivially from part (2).
0360 Lemma 32.4.9. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $x \in X$. Assume $X$ locally Noetherian and geometrically reduced at $x$. Then there exists an open neighbourhood $U \subset X$ of $x$ which is geometrically reduced over $k$.
Proof. Let $R$ be a Noetherian $k$-algebra. Let $\mathfrak{p} \subset R$ be a prime. Let $I=\operatorname{Ker}(R \rightarrow$ $R_{\mathfrak{p}}$. Since $I R_{\mathfrak{p}}=0$ and $I$ is finitely generated there exists an $f \in R, f \notin \mathfrak{p}$ such that $f I=0$. Hence $R_{f} \subset R_{\mathfrak{p}}$.

Assume $X$ locally Noetherian and geometrically reduced at $x$. If we apply the above to $R=\mathcal{O}_{X}(U)$ for some affine open neighbourhood of $x$, and $\mathfrak{p} \subset R$ the prime corresponding to $x$, then we see that after shrinking $U$ we may assume $R \subset R_{\mathfrak{p}}$. By Lemma 32.4 .2 the assumption means that $R_{\mathfrak{p}}$ is geometrically reduced over $k$. By Algebra, Lemma 10.42 .2 this implies that $R$ is geometrically reduced over $k$, which in turn implies that $U$ is geometrically reduced.
020F Example 32.4.10. Let $k=\mathbf{F}_{p}(s, t)$, i.e., a purely transcendental extension of the prime field. Consider the variety $X=\operatorname{Spec}\left(k[x, y] /\left(1+s x^{p}+t y^{p}\right)\right)$. Let $k \subset k^{\prime}$ be any extension such that both $s$ and $t$ have a $p$ th root in $k^{\prime}$. Then the base change $X_{k^{\prime}}$ is not reduced. Namely, the ring $k^{\prime}[x, y] /\left(1+s x^{p}+t y^{p}\right)$ contains the element $1+s^{1 / p} x+t^{1 / p} y$ whose $p$ th power is zero but which is not zero (since the ideal $\left(1+s x^{p}+t y^{p}\right)$ certainly does not contain any nonzero element of degree $\left.<p\right)$.
04KT Lemma 32.4.11. Let $k$ be a field. Let $X \rightarrow \operatorname{Spec}(k)$ be locally of finite type. Assume $X$ has finitely many irreducible components. Then there exists a finite purely inseparable extension $k \subset k^{\prime}$ such that $\left(X_{k^{\prime}}\right)_{\text {red }}$ is geometrically reduced over $k^{\prime}$.

Proof. To prove this lemma we may replace $X$ by its reduction $X_{r e d}$. Hence we may assume that $X$ is reduced and locally of finite type over $k$. Let $x_{1}, \ldots, x_{n} \in X$ be the generic points of the irreducible components of $X$. Note that for every purely inseparable algebraic extension $k \subset k^{\prime}$ the morphism $\left(X_{k^{\prime}}\right)_{\text {red }} \rightarrow X$ is a homeomorphism, see Algebra, Lemma 10.45.6. Hence the points $x_{1}^{\prime}, \ldots, x_{n}^{\prime}$ lying over $x_{1}, \ldots, x_{n}$ are the generic points of the irreducible components of $\left(X_{k^{\prime}}\right)_{\text {red }}$. As $X$ is reduced the local rings $K_{i}=\mathcal{O}_{X, x_{i}}$ are fields, see Algebra, Lemma 10.24.1. As $X$ is locally of finite type over $k$ the field extensions $k \subset K_{i}$ are finitely generated field extensions. Finally, the local rings $\mathcal{O}_{\left(X_{k^{\prime}}\right)_{r e d}, x_{i}^{\prime}}$ are the fields $\left(K_{i} \otimes_{k} k^{\prime}\right)_{\text {red }}$. By Algebra, Lemma 10.44 .3 we can find a finite purely inseparable extension $k \subset k^{\prime}$ such that $\left(K_{i} \otimes_{k} k^{\prime}\right)_{\text {red }}$ are separable field extensions of $k^{\prime}$. In particular each $\left(K_{i} \otimes_{k} k^{\prime}\right)_{\text {red }}$ is geometrically reduced over $k^{\prime}$ by Algebra, Lemma 10.43.1. At this point Lemma 32.4.8 part (3) implies that $\left(X_{k^{\prime}}\right)_{\text {red }}$ is geometrically reduced.

### 32.5. Geometrically connected schemes

0361 If $X$ is a connected scheme over a field, then it can happen that $X$ becomes disconnected after extending the ground field. This does not happen for geometrically connected schemes.
0362 Definition 32.5.1. Let $X$ be a scheme over the field $k$. We say $X$ is geometrically connected over $k$ if the scheme $X_{k^{\prime}}$ is connected for every field extension $k^{\prime}$ of $k$.

By convention a connected topological space is nonempty; hence a fortiori geometrically connected schemes are nonempty. Here is an example of a variety which is not geometrically connected.
020E Example 32.5.2. Let $k=\mathbf{Q}$. The scheme $X=\operatorname{Spec}(\mathbf{Q}(i))$ is a variety over $\operatorname{Spec}(\mathbf{Q})$. But the base change $X_{\mathbf{C}}$ is the spectrum of $\mathbf{C} \otimes_{\mathbf{Q}} \mathbf{Q}(i) \cong \mathbf{C} \times \mathbf{C}$ which is the disjoint union of two copies of $\operatorname{Spec}(\mathbf{C})$. So in fact, this is an example of a non-geometrically connected variety.
054N Lemma 32.5.3. Let $X$ be a scheme over the field $k$. Let $k \subset k^{\prime}$ be a field extension. Then $X$ is geometrically connected over $k$ if and only if $X_{k^{\prime}}$ is geometrically connected over $k^{\prime}$.

Proof. If $X$ is geometrically connected over $k$, then it is clear that $X_{k^{\prime}}$ is geometrically connected over $k^{\prime}$. For the converse, note that for any field extension $k \subset k^{\prime \prime}$ there exists a common field extension $k^{\prime} \subset k^{\prime \prime \prime}$ and $k^{\prime \prime} \subset k^{\prime \prime \prime}$. As the morphism $X_{k^{\prime \prime \prime}} \rightarrow X_{k^{\prime \prime}}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the connectedness of $X_{k^{\prime \prime \prime}}$ implies the connectedness of $X_{k^{\prime \prime}}$. Thus if $X_{k^{\prime}}$ is geometrically connected over $k^{\prime}$ then $X$ is geometrically connected over $k$.

0385 Lemma 32.5.4. Let $k$ be a field. Let $X, Y$ be schemes over $k$. Assume $X$ is geometrically connected over $k$. Then the projection morphism

$$
p: X \times_{k} Y \longrightarrow Y
$$

induces a bijection between connected components.
Proof. The scheme theoretic fibres of $p$ are connected, since they are base changes of the geometrically connected scheme $X$ by field extensions. Moreover the scheme theoretic fibres are homeomorphic to the set theoretic fibres, see Schemes, Lemma 25.18.5. By Morphisms, Lemma 28.23.4 the map $p$ is open. Thus we may apply Topology, Lemma 5.6.5 to conclude.
0386 Lemma 32.5.5. Let $k$ be a field. Let $A$ be a $k$-algebra. Then $X=\operatorname{Spec}(A)$ is geometrically connected over $k$ if and only if $A$ is geometrically connected over $k$ (see Algebra, Definition 10.47.3).

Proof. Immediate from the definitions.
0363 Lemma 32.5.6. Let $k \subset k^{\prime}$ be an extension of fields. Let $X$ be a scheme over $k$. Assume $k$ separably algebraically closed. Then the morphism $X_{k^{\prime}} \rightarrow X$ induces $a$ bijection of connected components. In particular, $X$ is geometrically connected over $k$ if and only if $X$ is connected.

Proof. Since $k$ is separably algebraically closed we see that $k^{\prime}$ is geometrically connected over $k$, see Algebra, Lemma 10.47.4. Hence $Z=\operatorname{Spec}\left(k^{\prime}\right)$ is geometrically connected over $k$ by Lemma 32.5 .5 above. Since $X_{k^{\prime}}=Z \times{ }_{k} X$ the result is a special case of Lemma 32.5.4
0387 Lemma 32.5.7. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $\bar{k}$ be a separable algebraic closure of $k$. Then $X$ is geometrically connected if and only if the base change $X_{\bar{k}}$ is connected.

Proof. Assume $X_{\bar{k}}$ is connected. Let $k \subset k^{\prime}$ be a field extension. There exists a field extension $\bar{k} \subset \bar{k}^{\prime}$ such that $k^{\prime}$ embeds into $\bar{k}^{\prime}$ as an extension of $k$. By Lemma 32.5 .6 we see that $X_{\bar{k}^{\prime}}$ is connected. Since $X_{\bar{k}^{\prime}} \rightarrow X_{k^{\prime}}$ is surjective we conclude that $X_{k^{\prime}}$ is connected as desired.

0388 Lemma 32.5.8. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $A$ be a $k$-algebra. Let $V \subset X_{A}$ be a quasi-compact open. Then there exists a finitely generated $k$ subalgebra $A^{\prime} \subset A$ and a quasi-compact open $V^{\prime} \subset X_{A^{\prime}}$ such that $V=V_{A}^{\prime}$.
Proof. We remark that if $X$ is also quasi-separated this follows from Limits, Lemma 31.3.8 Let $U_{1}, \ldots, U_{n}$ be finitely many affine opens of $X$ such that $V \subset$ $\bigcup U_{i, A}$. Say $U_{i}=\operatorname{Spec}\left(R_{i}\right)$. Since $V$ is quasi-compact we can find finitely many $f_{i j} \in R_{i} \otimes_{k} A, j=1, \ldots, n_{i}$ such that $V=\bigcup_{i} \bigcup_{j=1, \ldots, n_{i}} D\left(f_{i j}\right)$ where $D\left(f_{i j}\right) \subset U_{i, A}$ is the corresponding standard open. (We do not claim that $V \cap U_{i, A}$ is the union
of the $D\left(f_{i j}\right), j=1, \ldots, n_{i}$.) It is clear that we can find a finitely generated $k$-subalgebra $A^{\prime} \subset A$ such that $f_{i j}$ is the image of some $f_{i j}^{\prime} \in R_{i} \otimes_{k} A^{\prime}$. Set $V^{\prime}=\bigcup D\left(f_{i j}^{\prime}\right)$ which is a quasi-compact open of $X_{A^{\prime}}$. Denote $\pi: X_{A} \rightarrow X_{A^{\prime}}$ the canonical morphism. We have $\pi(V) \subset V^{\prime}$ as $\pi\left(D\left(f_{i j}\right)\right) \subset D\left(f_{i j}^{\prime}\right)$. If $x \in X_{A}$ with $\pi(x) \in V^{\prime}$, then $\pi(x) \in D\left(f_{i j}^{\prime}\right)$ for some $i, j$ and we see that $x \in D\left(f_{i j}\right)$ as $f_{i j}^{\prime}$ maps to $f_{i j}$. Thus we see that $V=\pi^{-1}\left(V^{\prime}\right)$ as desired.

Let $k$ be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. For example $\bar{k}$ could be the separable algebraic closure of $k$. For any $\sigma \in \operatorname{Gal}(\bar{k} / k)$ we get a corresponding automorphism $\operatorname{Spec}(\sigma): \operatorname{Spec}(\bar{k}) \longrightarrow \operatorname{Spec}(\bar{k})$. Note that $\operatorname{Spec}(\sigma) \circ$ $\operatorname{Spec}(\tau)=\operatorname{Spec}(\tau \circ \sigma)$. Hence we get an action

$$
\operatorname{Gal}(\bar{k} / k)^{o p p} \times \operatorname{Spec}(\bar{k}) \longrightarrow \operatorname{Spec}(\bar{k})
$$

of the opposite group on the scheme $\operatorname{Spec}(\bar{k})$. Let $X$ be a scheme over $k$. Since $X_{\bar{k}}=\operatorname{Spec}(\bar{k}) \times_{\operatorname{Spec}(k)} X$ by definition we see that the action above induces a canonical action

$$
\operatorname{Gal}(\bar{k} / k)^{o p p} \times X_{\bar{k}} \longrightarrow X_{\bar{k}} .
$$

04KU Lemma 32.5.9. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $\bar{k}$ be a (possibly infinite) Galois extension of $k$. Let $V \subset X_{\bar{k}}$ be a quasi-compact open. Then
(1) there exists a finite subextension $k \subset k^{\prime} \subset \bar{k}$ and a quasi-compact open $V^{\prime} \subset X_{k^{\prime}}$ such that $V=\left(V^{\prime}\right)_{\bar{k}}$,
(2) there exists an open subgroup $H \subset G a l(\bar{k} / k)$ such that $\sigma(V)=V$ for all $\sigma \in H$.

Proof. By Lemma 32.5 .8 there exists a finite subextension $k \subset k^{\prime} \subset \bar{k}$ and an open $V^{\prime} \subset X_{k^{\prime}}$ which pulls back to $V$. This proves (1). Since $\operatorname{Gal}\left(\bar{k} / k^{\prime}\right)$ is open in $\operatorname{Gal}(\bar{k} / k)$ part (2) is clear as well.

038B Lemma 32.5.10. Let $k$ be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. Let $X$ be a scheme over $k$. Let $\bar{T} \subset X_{\bar{k}}$ have the following properties
(1) $\bar{T}$ is a closed subset of $X_{\bar{k}}$,
(2) for every $\sigma \in \operatorname{Gal}(\bar{k} / k)$ we have $\sigma(\bar{T})=\bar{T}$.

Then there exists a closed subset $T \subset X$ whose inverse image in $X_{\bar{k}}$ is $\bar{T}$.
Proof. This lemma immediately reduces to the case where $X=\operatorname{Spec}(A)$ is affine. In this case, let $\bar{I} \subset A \otimes_{k} \bar{k}$ be the radical ideal corresponding to $\bar{T}$. Assumption (2) implies that $\sigma(\bar{I})=\bar{I}$ for all $\sigma \in \operatorname{Gal}(\bar{k} / k)$. Pick $x \in \bar{I}$. There exists a finite Galois extension $k \subset k^{\prime}$ contained in $\bar{k}$ such that $x \in A \otimes_{k} k^{\prime}$. Set $G=\operatorname{Gal}\left(k^{\prime} / k\right)$. Set

$$
P(T)=\prod_{\sigma \in G}(T-\sigma(x)) \in\left(A \otimes_{k} k^{\prime}\right)[T]
$$

It is clear that $P(T)$ is monic and is actually an element of $\left(A \otimes_{k} k^{\prime}\right)^{G}[T]=A[T]$ (by basic Galois theory). Moreover, if we write $P(T)=T^{d}+a_{1} T^{d-1}+\ldots+a_{0}$ the we see that $a_{i} \in I:=A \cap \bar{I}$. By Algebra, Lemma 10.37 .5 we see that $x$ is contained in the radical of $I\left(A \otimes_{k} \bar{k}\right)$. Hence $\bar{I}$ is the radical of $I\left(A \otimes_{k} \bar{k}\right)$ and setting $T=V(I)$ is a solution.

0389 Lemma 32.5.11. Let $k$ be a field. Let $X$ be a scheme over $k$. The following are equivalent
(1) $X$ is geometrically connected,
(2) for every finite separable field extension $k \subset k^{\prime}$ the scheme $X_{k^{\prime}}$ is connected.

Proof. It follows immediately from the definition that (1) implies (2). Assume that $X$ is not geometrically connected. Let $k \subset \bar{k}$ be a separable algebraic closure of $k$. By Lemma 32.5 .7 it follows that $X_{\bar{k}}$ is disconnected. Say $X_{\bar{k}}=\bar{U} \amalg \bar{V}$ with $\bar{U}$ and $\bar{V}$ open, closed, and nonempty.
Suppose that $W \subset X$ is any quasi-compact open. Then $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are open and closed in $W_{\bar{k}}$. In particular $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are quasi-compact, and by Lemma 32.5 .9 both $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are defined over a finite subextension and invariant under an open subgroup of $\operatorname{Gal}(\bar{k} / k)$. We will use this without further mention in the following.
Pick $W_{0} \subset X$ quasi-compact open such that both $W_{0, \bar{k}} \cap \bar{U}$ and $W_{0, \bar{k}} \cap \bar{V}$ are nonempty. Choose a finite subextension $k \subset k^{\prime} \subset \bar{k}$ and a decomposition $W_{0, k^{\prime}}=$ $U_{0}^{\prime} \amalg V_{0}^{\prime}$ into open and closed subsets such that $W_{0, \bar{k}} \cap \bar{U}=\left(U_{0}^{\prime}\right)_{\bar{k}}$ and $W_{0, \bar{k}} \cap \bar{V}=$ $\left(V_{0}^{\prime}\right)_{\bar{k}}$. Let $H=\operatorname{Gal}\left(\bar{k} / k^{\prime}\right) \subset \operatorname{Gal}(\bar{k} / k)$. In particular $\sigma\left(W_{0, \bar{k}} \cap \bar{U}\right)=W_{0, \bar{k}} \cap \bar{U}$ and similarly for $\bar{V}$.

Having chosen $W_{0}, k^{\prime}$ as above, for every quasi-compact open $W \subset X$ we set

$$
U_{W}=\bigcap_{\sigma \in H} \sigma\left(W_{\bar{k}} \cap \bar{U}\right), \quad V_{W}=\bigcup_{\sigma \in H} \sigma\left(W_{\bar{k}} \cap \bar{V}\right)
$$

Now, since $W_{\bar{k}} \cap \bar{U}$ and $W_{\bar{k}} \cap \bar{V}$ are fixed by an open subgroup of $\operatorname{Gal}(\bar{k} / k)$ we see that the union and intersection above are finite. Hence $U_{W}$ and $V_{W}$ are both open and closed. Also, by construction $W_{\bar{k}}=U_{W} \amalg V_{W}$.
We claim that if $W \subset W^{\prime} \subset X$ are quasi-compact open, then $W_{\bar{k}} \cap U_{W^{\prime}}=U_{W}$ and $W_{\bar{k}} \cap V_{W^{\prime}}=V_{W}$. Verification omitted. Hence we see that upon defining $U=\bigcup_{W \subset X} U_{W}$ and $V=\bigcup_{W \subset X} V_{W}$ we obtain $X_{\bar{k}}=U \amalg V$ is a disjoint union of open and closed subsets. It is clear that $V$ is nonempty as it is constructed by taking unions (locally). On the other hand, $U$ is nonempty since it contains $W_{0} \cap \bar{U}$ by construction. Finally, $U, V \subset X_{\bar{k}}$ are closed and $H$-invariant by construction. Hence by Lemma 32.5 .10 we have $U=\left(U^{\prime}\right)_{\bar{k}}$, and $V=\left(V^{\prime}\right)_{\bar{k}}$ for some closed $U^{\prime}, V^{\prime} \subset X_{k^{\prime}}$. Clearly $X_{k^{\prime}}=U^{\prime} \amalg V^{\prime}$ and we see that $X_{k^{\prime}}$ is disconnected as desired.

038C Lemma 32.5.12. Let $k$ be a field. Let $k \subset \bar{k}$ be a (possibly infinite) Galois extension. Let $f: T \rightarrow X$ be a morphism of schemes over $k$. Assume $T_{\bar{k}}$ connected and $X_{\bar{k}}$ disconnected. Then $X$ is disconnected.

Proof. Write $X_{\bar{k}}=\bar{U} \amalg \bar{V}$ with $\bar{U}$ and $\bar{V}$ open and closed. Denote $\bar{f}: T_{\bar{k}} \rightarrow X_{\bar{k}}$ the base change of $f$. Since $T_{\bar{k}}$ is connected we see that $T_{\bar{k}}$ is contained in either $\bar{f}^{-1}(\bar{U})$ or $\bar{f}^{-1}(\bar{V})$. Say $T_{\bar{k}} \subset \bar{f}^{-1}(\bar{U})$.
Fix a quasi-compact open $W \subset X$. There exists a finite Galois subextension $k \subset$ $k^{\prime} \subset \bar{k}$ such that $\bar{U} \cap W_{\bar{k}}$ and $\bar{V} \cap W_{\bar{k}}$ come from quasi-compact opens $U^{\prime}, V^{\prime} \subset W_{k^{\prime}}$. Then also $W_{k^{\prime}}=U^{\prime} \amalg V^{\prime}$. Consider

$$
U^{\prime \prime}=\bigcap_{\sigma \in \operatorname{Gal}\left(k^{\prime} / k\right)} \sigma\left(U^{\prime}\right), \quad V^{\prime \prime}=\bigcup_{\sigma \in \operatorname{Gal}\left(k^{\prime} / k\right)} \sigma\left(V^{\prime}\right)
$$

These are Galois invariant, open and closed, and $W_{k^{\prime}}=U^{\prime \prime} \amalg V^{\prime \prime}$. By Lemma 32.5 .10 we get open and closed subsets $U_{W}, V_{W} \subset W$ such that $U^{\prime \prime}=\left(U_{W}\right)_{k^{\prime}}$, $V^{\prime \prime}=\left(V_{W}\right)_{k^{\prime}}$ and $W=U_{W} \amalg V_{W}$.
We claim that if $W \subset W^{\prime} \subset X$ are quasi-compact open, then $W \cap U_{W^{\prime}}=U_{W}$ and $W \cap V_{W^{\prime}}=V_{W}$. Verification omitted. Hence we see that upon defining $U=\bigcup_{W \subset X} U_{W}$ and $V=\bigcup_{W \subset X} V_{W}$ we obtain $X=U \amalg V$. It is clear that $V$ is nonempty as it is constructed by taking unions (locally). On the other hand, $U$ is nonempty since it contains $f(T)$ by construction.

056R Lemma 32.5.13. Let $k$ be a field. Let $T \rightarrow X$ be a morphism of schemes over $k$. Assume $T$ is geometrically connected and $X$ connected. Then $X$ is geometrically connected.

Proof. This is a reformulation of Lemma 32.5.12.
04KV Lemma 32.5.14. Let $k$ be a field. Let $X$ be a scheme over $k$. Assume $X$ is connected and has a point $x$ such that $k$ is algebraically closed in $\kappa(x)$. Then $X$ is geometrically connected. In particular, if $X$ has a $k$-rational point and $X$ is connected, then $X$ is geometrically connected.

Proof. Set $T=\operatorname{Spec}(\kappa(x))$. Let $k \subset \bar{k}$ be a separable algebraic closure of $k$. The assumption on $k \subset \kappa(x)$ implies that $T_{\bar{k}}$ is irreducible, see Algebra, Lemma 10.46.8. Hence by Lemma 32.5 .13 we see that $X_{\bar{k}}$ is connected. By Lemma 32.5.7 we conclude that $X$ is geometrically connected.

04PY Lemma 32.5.15. Let $k \subset K$ be an extension of fields. Let $X$ be a scheme over $k$. For every connected component $T$ of $X$ the inverse image $T_{K} \subset X_{K}$ is a union of connected components of $X_{K}$.

Proof. This is a purely topological statement. Denote $p: X_{K} \rightarrow X$ the projection morphism. Let $T \subset X$ be a connected component of $X$. Let $t \in T_{K}=p^{-1}(T)$. Let $C \subset X_{K}$ be a connected component containing $t$. Then $p(C)$ is a connected subset of $X$ which meets $T$, hence $p(C) \subset T$. Hence $C \subset T_{K}$.

07VM Lemma 32.5.16. Let $k \subset K$ be a finite extension of fields and let $X$ be a scheme over $k$. Denote by $p: X_{K} \rightarrow X$ the projection morphism. For every connected component $T$ of $X_{K}$ the image $p(T)$ is a connected component of $X$.

Proof. The image $p(T)$ is contained in some connected component $X^{\prime}$ of $X$. Consider $X^{\prime}$ as a closed subscheme of $X$ in any way. Then $T$ is also a connected component of $X_{K}^{\prime}=p^{-1}\left(X^{\prime}\right)$ and we may therefore assume that $X$ is connected. The morphism $p$ is open (Morphisms, Lemma 28.23.4), closed (Morphisms, Lemma 28.43.7) and the fibers of $p$ are finite sets (Morphisms, Lemma 28.43.9). Thus we may apply Topology, Lemma 5.6.6 to conclude.

04PZ Remark 32.5.17. Let $k \subset K$ be an extension of fields. Let $X$ be a scheme over $k$. Denote $p: X_{K} \rightarrow X$ the projection morphism. Let $\bar{T} \subset X_{K}$ be a connected component. Is it true that $p(\bar{T})$ is a connected component of $X$ ? When $k \subset K$ is finite Lemma 32.5 .16 tells us the answer is "yes". In general we do not know the answer. If you do, or if you have a reference, please email stacks.project@gmail.com.

Let $X$ be a scheme. We denote $\pi_{0}(X)$ the set of connected components of $X$.

038D Lemma 32.5.18. Let $k$ be a field, with separable algebraic closure $\bar{k}$. Let $X$ be $a$ scheme over $k$. There is an action

$$
\operatorname{Gal}(\bar{k} / k)^{o p p} \times \pi_{0}\left(X_{\bar{k}}\right) \longrightarrow \pi_{0}\left(X_{\bar{k}}\right)
$$

with the following properties:
(1) An element $\bar{T} \in \pi_{0}\left(X_{\bar{k}}\right)$ is fixed by the action if and only if there exists a connected component $T \subset X$, which is geometrically connected over $k$, such that $T_{\bar{k}}=\bar{T}$.
(2) For any field extension $k \subset k^{\prime}$ with separable algebraic closure $\bar{k}^{\prime}$ the diagram

is commutative (where the right vertical arrow is a bijection according to Lemma 32.5.6.

Proof. The action 32.5 .8 .1 of $\operatorname{Gal}(\bar{k} / k)$ on $X_{\bar{k}}$ induces an action on its connected components. Connected components are always closed (Topology, Lemma 5.6.3). Hence if $\bar{T}$ is as in (1), then by Lemma 32.5 .10 there exists a closed subset $T \subset X$ such that $\bar{T}=T_{\bar{k}}$. Note that $T$ is geometrically connected over $k$, see Lemma 32.5.7. To see that $T$ is a connected component of $X$, suppose that $T \subset T^{\prime}, T \neq T^{\prime}$ where $T^{\prime}$ is a connected component of $X$. In this case $T_{k^{\prime}}^{\prime}$ strictly contains $\bar{T}$ and hence is disconnected. By Lemma 32.5 .12 this means that $T^{\prime}$ is disconnected! Contradiction.

We omit the proof of the functoriality in (2).
038E Lemma 32.5.19. Let $k$ be a field, with separable algebraic closure $\bar{k}$. Let $X$ be a scheme over $k$. Assume
(1) $X$ is quasi-compact, and
(2) the connected components of $X_{\bar{k}}$ are open.

Then
(a) $\pi_{0}\left(X_{\bar{k}}\right)$ is finite, and
(b) the action of $G a l(\bar{k} / k)$ on $\pi_{0}\left(X_{\bar{k}}\right)$ is continuous.

Moreover, assumptions (1) and (2) are satisfied when $X$ is of finite type over $k$.
Proof. Since the connected components are open, cover $X_{\bar{k}}$ (Topology, Lemma 5.6.3 and $X_{\bar{k}}$ is quasi-compact, we conclude that there are only finitely many of them. Thus (a) holds. By Lemma 32.5 .8 these connected components are each defined over a finite subextension of $k \subset \bar{k}$ and we get (b). If $X$ is of finite type over $k$, then $X_{\bar{k}}$ is of finite type over $\bar{k}$ (Morphisms, Lemma 28.15.4. Hence $X_{\bar{k}}$ is a Noetherian scheme (Morphisms, Lemma 28.15.6). Thus $\bar{X}_{\bar{k}}$ has finitely many irreducible components (Properties, Lemma 27.5.7) and a fortiori finitely many connected components (which are therefore open).

### 32.6. Geometrically irreducible schemes

0364 If $X$ is an irreducible scheme over a field, then it can happen that $X$ becomes reducible after extending the ground field. This does not happen for geometrically irreducible schemes.

0365 Definition 32.6.1. Let $X$ be a scheme over the field $k$. We say $X$ is geometrically irreducible over $k$ if the scheme $X_{k^{\prime}}$ is irreducibl $1^{1}$ for any field extension $k^{\prime}$ of $k$.
054P Lemma 32.6.2. Let $X$ be a scheme over the field $k$. Let $k \subset k^{\prime}$ be a field extension. Then $X$ is geometrically irreducible over $k$ if and only if $X_{k^{\prime}}$ is geometrically irreducible over $k^{\prime}$.

Proof. If $X$ is geometrically irreducible over $k$, then it is clear that $X_{k^{\prime}}$ is geometrically irreducible over $k^{\prime}$. For the converse, note that for any field extension $k \subset k^{\prime \prime}$ there exists a common field extension $k^{\prime} \subset k^{\prime \prime \prime}$ and $k^{\prime \prime} \subset k^{\prime \prime \prime}$. As the morphism $X_{k^{\prime \prime \prime}} \rightarrow X_{k^{\prime \prime}}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the irreducibility of $X_{k^{\prime \prime \prime}}$ implies the irreducibility of $X_{k^{\prime \prime}}$. Thus if $X_{k^{\prime}}$ is geometrically irreducible over $k^{\prime}$ then $X$ is geometrically irreducible over $k$.

020J Lemma 32.6.3. Let $X$ be a scheme over a separably closed field $k$. If $X$ is irreducible, then $X_{K}$ is irreducible for any field extension $k \subset K$. I.e., $X$ is geometrically irreducible over $k$.
Proof. Use Properties, Lemma 27.3 .3 and Algebra, Lemma 10.46.2,
038F Lemma 32.6.4. Let $k$ be a field. Let $X, Y$ be schemes over $k$. Assume $X$ is geometrically irreducible over $k$. Then the projection morphism

$$
p: X \times_{k} Y \longrightarrow Y
$$

induces a bijection between irreducible components.
Proof. First, note that the scheme theoretic fibres of $p$ are irreducible, since they are base changes of the geometrically irreducible scheme $X$ by field extensions. Moreover the scheme theoretic fibres are homeomorphic to the set theoretic fibres, see Schemes, Lemma 25.18.5. By Morphisms, Lemma 28.23.4 the map $p$ is open. Thus we may apply Topology, Lemma 5.7.13 to conclude.

038G Lemma 32.6.5. Let $k$ be a field. Let $X$ be a scheme over $k$. The following are equivalent
(1) $X$ is geometrically irreducible over $k$,
(2) for every nonempty affine open $U$ the $k$-algebra $\mathcal{O}_{X}(U)$ is geometrically irreducible over $k$ (see Algebra, Definition 10.46.4),
(3) $X$ is irreducible and there exists an affine open covering $X=\bigcup U_{i}$ such that each $k$-algebra $\mathcal{O}_{X}\left(U_{i}\right)$ is geometrically irreducible, and
(4) there exists an open covering $X=\bigcup_{i \in I} X_{i}$ with $I \neq \emptyset$ such that $X_{i}$ is geometrically irreducible for each $i$ and such that $X_{i} \cap X_{j} \neq \emptyset$ for all $i, j \in I$.
Moreover, if $X$ is geometrically irreducible so is every nonempty open subscheme of $X$.

[^85]Proof. An affine scheme $\operatorname{Spec}(A)$ over $k$ is geometrically irreducible if and only if $A$ is geometrically irreducible over $k$; this is immediate from the definitions. Recall that if a scheme is irreducible so is every nonempty open subscheme of $X$, any two nonempty open subsets have a nonempty intersection. Also, if every affine open is irreducible then the scheme is irreducible, see Properties, Lemma 27.3.3. Hence the final statement of the lemma is clear, as well as the implications $(1) \Rightarrow(2),(2)$ $\Rightarrow(3)$, and $(3) \Rightarrow(4)$. If (4) holds, then for any field extension $k^{\prime} / k$ the scheme $X_{k^{\prime}}$ has a covering by irreducible opens which pairwise intersect. Hence $X_{k^{\prime}}$ is irreducible. Hence (4) implies (1).

054Q Lemma 32.6.6. Let $X$ be a geometrically irreducible scheme over the field $k$. Let $\xi \in X$ be its generic point. Then $\kappa(\xi)$ is a geometrically irreducible over $k$.

Proof. Combining Lemma 32.6 .5 and Algebra, Lemma 10.46 .6 we see that $\mathcal{O}_{X, \xi}$ is geometrically irreducible over $k$. Since $\mathcal{O}_{X, \xi} \rightarrow \kappa(\xi)$ is a surjection with locally nilpotent kernel (see Algebra, Lemma 10.24.1) it follows that $\kappa(\xi)$ is geometrically irreducible, see Algebra, Lemma 10.45.6.

038H Lemma 32.6.7. Let $k \subset k^{\prime}$ be an extension of fields. Let $X$ be a scheme over $k$. Set $X^{\prime}=X_{k^{\prime}}$. Assume $k$ separably algebraically closed. Then the morphism $X^{\prime} \rightarrow X$ induces a bijection of irreducible components.

Proof. Since $k$ is separably algebraically closed we see that $k^{\prime}$ is geometrically irreducible over $k$, see Algebra, Lemma 10.46.5. Hence $Z=\operatorname{Spec}\left(k^{\prime}\right)$ is geometrically irreducible over $k$. by Lemma 32.6 .5 above. Since $X^{\prime}=Z \times_{k} X$ the result is a special case of Lemma 32.6.4.

038I Lemma 32.6.8. Let $k$ be a field. Let $X$ be a scheme over $k$. The following are equivalent:
(1) $X$ is geometrically irreducible over $k$,
(2) for every finite separable field extension $k \subset k^{\prime}$ the scheme $X_{k^{\prime}}$ is irreducible, and
(3) $X_{\bar{k}}$ is irreducible, where $k \subset \bar{k}$ is a separable algebraic closure of $k$.

Proof. Assume $X_{\bar{k}}$ is irreducible, i.e., assume (3). Let $k \subset k^{\prime}$ be a field extension. There exists a field extension $\bar{k} \subset \bar{k}^{\prime}$ such that $k^{\prime}$ embeds into $\bar{k}^{\prime}$ as an extension of $k$. By Lemma 32.6 .7 we see that $X_{\bar{k}^{\prime}}$ is irreducible. Since $X_{\bar{k}^{\prime}} \rightarrow X_{k^{\prime}}$ is surjective we conclude that $X_{k^{\prime}}$ is irreducible. Hence (1) holds.

Let $k \subset \bar{k}$ be a separable algebraic closure of $k$. Assume not (3), i.e., assume $X_{\bar{k}}$ is reducible. Our goal is to show that also $X_{k^{\prime}}$ is reducible for some finite subextension $k \subset k^{\prime} \subset \bar{k}$. Let $X=\bigcup_{i \in I} U_{i}$ be an affine open covering with $U_{i}$ not empty. If for some $i$ the scheme $U_{i}$ is reducible, or if for some pair $i \neq j$ the intersection $U_{i} \cap U_{j}$ is empty, then $X$ is reducible (Properties, Lemma 27.3.3) and we are done. In particular we may assume that $U_{i, \bar{k}} \cap U_{j, \bar{k}}$ for all $i, j \in I$ is nonempty and we conclude that $U_{i, \bar{k}}$ has to be reducible for some $i$. According to Algebra, Lemma 10.46 .3 this means that $U_{i, k^{\prime}}$ is reducible for some finite separable field extension $k \subset k^{\prime}$. Hence also $X_{k^{\prime}}$ is reducible. Thus we see that (2) implies (3).

The implication $(1) \Rightarrow(2)$ is immediate. This proves the lemma.

04KW Lemma 32.6.9. Let $k \subset K$ be an extension of fields. Let $X$ be a scheme over $k$. For every irreducible component $T$ of $X$ the inverse image $T_{K} \subset X_{K}$ is a union of irreducible components of $X_{K}$.
Proof. Let $T \subset X$ be an irreducible component of $X$. The morphism $T_{K} \rightarrow T$ is flat, so generalizations lift along $T_{K} \rightarrow T$. Hence every $\xi \in T_{K}$ which is a generic point of an irreducible component of $T_{K}$ maps to the generic point $\eta$ of $T$. If $\xi^{\prime} \rightsquigarrow \xi$ is a specialization in $X_{K}$ then $\xi^{\prime}$ maps to $\eta$ since there are no points specializing to $\eta$ in $X$. Hence $\xi^{\prime} \in T_{K}$ and we conclude that $\xi=\xi^{\prime}$. In other words $\xi$ is the generic point of an irreducible component of $X_{K}$. This means that the irreducible components of $T_{K}$ are all irreducible components of $X_{K}$.

For a scheme $X$ we denote $\operatorname{IrredComp}(X)$ the set of irreducible components of $X$.
04KX Lemma 32.6.10. Let $k \subset K$ be an extension of fields. Let $X$ be a scheme over $k$. For every irreducible component $\bar{T} \subset X_{K}$ the image of $\bar{T}$ in $X$ is an irreducible component in $X$. This defines a canonical map

$$
\operatorname{Irred} \operatorname{Comp}\left(X_{K}\right) \longrightarrow \operatorname{IrredComp}(X)
$$

which is surjective.
Proof. Consider the diagram

where $\bar{K}$ is the separable algebraic closure of $K$, and where $\bar{k}$ is the separable algebraic closure of $k$. By Lemma 32.6 .7 the morphism $X_{\bar{K}} \rightarrow X_{\bar{k}}$ induces a bijection between irreducible components. Hence it suffices to show the lemma for the morphisms $X_{\bar{k}} \rightarrow X$ and $X_{\bar{K}} \rightarrow X_{K}$. In other words we may assume that $K=\bar{k}$.

The morphism $p: X_{\bar{k}} \rightarrow X$ is integral, flat and surjective. Flatness implies that generalizations lift along $p$, see Morphisms, Lemma 28.25.8. Hence generic points of irreducible components of $X_{\bar{k}}$ map to generic points of irreducible components of $X$. Integrality implies that $p$ is universally closed, see Morphisms, Lemma 28.43.7. Hence we conclude that the image $p(\bar{T})$ of an irreducible component is a closed irreducible subset which contains a generic point of an irreducible component of $X$, hence $p(\bar{T})$ is an irreducible component of $X$. This proves the first assertion. If $T \subset X$ is an irreducible component, then $p^{-1}(T)=T_{K}$ is a nonempty union of irreducible components, see Lemma 32.6.9. Each of these necessarily maps onto $T$ by the first part. Hence the map is surjective.

038J Lemma 32.6.11. Let $k$ be a field, with separable algebraic closure $\bar{k}$. Let $X$ be $a$ scheme over $k$. There is an action

$$
G a l(\bar{k} / k)^{o p p} \times \operatorname{Irred} \operatorname{Comp}\left(X_{\bar{k}}\right) \longrightarrow \operatorname{Irred} \operatorname{Comp}\left(X_{\bar{k}}\right)
$$

with the following properties:
(1) An element $\bar{T} \in \operatorname{Irred} \operatorname{Comp}\left(X_{\bar{k}}\right)$ is fixed by the action if and only if there exists an irreducible component $T \subset X$, which is geometrically irreducible over $k$, such that $T_{\bar{k}}=\bar{T}$.
(2) For any field extension $k \subset k^{\prime}$ with separable algebraic closure $\bar{k}^{\prime}$ the diagram

is commutative (where the right vertical arrow is a bijection according to Lemma 32.6.7).

Proof. The action (32.5.8.1) of $\operatorname{Gal}(\bar{k} / k)$ on $X_{\bar{k}}$ induces an action on its irreducible components. Irreducible components are always closed (Topology, Lemma 5.6.3). Hence if $\bar{T}$ is as in (1), then by Lemma 32.5 .10 there exists a closed subset $\bar{T} \subset X$ such that $\bar{T}=T_{\bar{k}}$. Note that $T$ is geometrically irreducible over $k$, see Lemma 32.6.8. To see that $T$ is an irreducible component of $X$, suppose that $T \subset T^{\prime}$, $T \neq T^{\prime}$ where $T^{\prime}$ is an irreducible component of $X$. Let $\bar{\eta}$ be the generic point of $\bar{T}$. It maps to the generic point $\eta$ of $T$. Then the generic point $\xi \in T^{\prime}$ specializes to $\eta$. As $X_{\bar{k}} \rightarrow X$ is flat there exists a point $\bar{\xi} \in X_{\bar{k}}$ which maps to $\xi$ and specializes to $\bar{\eta}$. It follows that the closure of the singleton $\{\bar{\xi}\}$ is an irreducible closed subset of $X_{\bar{\xi}}$ which strictly contains $\bar{T}$. This is the desired contradiction.
We omit the proof of the functoriality in (2).
04KY Lemma 32.6.12. Let $k$ be a field, with separable algebraic closure $\bar{k}$. Let $X$ be a scheme over $k$. The fibres of the map

$$
\operatorname{Irred} \operatorname{Comp}\left(X_{\bar{k}}\right) \longrightarrow \operatorname{Irred} \operatorname{Comp}(X)
$$

of Lemma 32.6.10 are exactly the orbits of $\operatorname{Gal}(\bar{k} / k)$ under the action of Lemma 32.6.11.

Proof. Let $T \subset X$ be an irreducible component of $X$. Let $\eta \in T$ be its generic point. By Lemmas 32.6 .9 and 32.6 .10 the generic points of irreducible components of $\bar{T}$ which map into $T$ map to $\eta$. By Algebra, Lemma 10.46 .10 the Galois group acts transitively on all of the points of $X_{\bar{k}}$ mapping to $\eta$. Hence the lemma follows.

04KZ Lemma 32.6.13. Let $k$ be a field. Assume $X \rightarrow \operatorname{Spec}(k)$ locally of finite type. In this case
(1) the action

$$
\operatorname{Gal}(\bar{k} / k)^{o p p} \times \operatorname{Irred} \operatorname{Comp}\left(X_{\bar{k}}\right) \longrightarrow \operatorname{Irred} \operatorname{Comp}\left(X_{\bar{k}}\right)
$$

is continuous if we give Irred $\operatorname{Comp}\left(X_{\bar{k}}\right)$ the discrete topology,
(2) every irreducible component of $X_{\bar{k}}$ can be defined over a finite extension of $k$, and
(3) given any irreducible component $T \subset X$ the scheme $T_{\bar{k}}$ is a finite union of irreducible components of $X_{\bar{k}}$ which are all in the same $G a l(\bar{k} / k)$-orbit.

Proof. Let $\bar{T}$ be an irreducible component of $X_{\bar{k}}$. We may choose an affine open $U \subset X$ such that $\bar{T} \cap U_{\bar{k}}$ is not empty. Write $U=\operatorname{Spec}(A)$, so $A$ is a finite type $k$-algebra, see Morphisms, Lemma 28.15.2. Hence $A_{\bar{k}}$ is a finite type $\bar{k}$-algebra, and in particular Noetherian. Let $\mathfrak{p}=\left(f_{1}, \ldots, f_{n}\right)$ be the prime ideal corresponding to
$\bar{T} \cap U_{\bar{k}}$. Since $A_{\bar{k}}=A \otimes_{k} \bar{k}$ we see that there exists a finite subextension $k \subset k^{\prime} \subset \bar{k}$ such that each $f_{i} \in A_{k^{\prime}}$. It is clear that $\operatorname{Gal}\left(\bar{k} / k^{\prime}\right)$ fixes $\bar{T}$, which proves (1).
Part (2) follows by applying Lemma 32.6 .11 (1) to the situation over $k^{\prime}$ which implies the irreducible component $\bar{T}$ is of the form $T_{\bar{k}}^{\prime}$ for some irreducible $T^{\prime} \subset X_{k^{\prime}}$.
To prove (3), let $T \subset X$ be an irreducible component. Choose an irreducible component $\bar{T} \subset X_{\bar{k}}$ which maps to $T$, see Lemma 32.6.10. By the above the orbit of $\bar{T}$ is finite, say it is $\bar{T}_{1}, \ldots, \bar{T}_{n}$. Then $\bar{T}_{1} \cup \ldots \cup \bar{T}_{n}$ is a $\operatorname{Gal}(\bar{k} / k)$-invariant closed subset of $X_{\bar{k}}$ hence of the form $W_{\bar{k}}$ for some $W \subset X$ closed by Lemma 32.5.10, Clearly $W=T$ and we win.

054R Lemma 32.6.14. Let $k$ be a field. Let $X \rightarrow \operatorname{Spec}(k)$ be locally of finite type. Assume $X$ has finitely many irreducible components. Then there exists a finite separable extension $k \subset k^{\prime}$ such that every irreducible component of $X_{k^{\prime}}$ is geometrically irreducible over $k^{\prime}$.
Proof. Let $\bar{k}$ be a separable algebraic closure of $k$. The assumption that $X$ has finitely many irreducible components combined with Lemma 32.6 .13 (3) shows that $X_{\bar{k}}$ has finitely many irreducible components $\bar{T}_{1}, \ldots, \bar{T}_{n}$. By Lemma 32.6.13 (2) there exists a finite extension $k \subset k^{\prime} \subset \bar{k}$ and irreducible components $T_{i} \subset X_{k^{\prime}}$ such that $\bar{T}_{i}=T_{i, \bar{k}}$ and we win.

054S Lemma 32.6.15. Let $X$ be a scheme over the field $k$. Assume $X$ has finitely many irreducible components which are all geometrically irreducible. Then $X$ has finitely many connected components each of which is geometrically connected.
Proof. This is clear because a connected component is a union of irreducible components. Details omitted.

### 32.7. Geometrically integral schemes

0366 If $X$ is an irreducible scheme over a field, then it can happen that $X$ becomes reducible after extending the ground field. This does not happen for geometrically irreducible schemes.

020H Definition 32.7.1. Let $X$ be a scheme over the field $k$.
(1) Let $x \in X$. We say $X$ is geometrically pointwise integral at $x$ if for every field extension $k \subset k^{\prime}$ and every $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ the local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is integral.
(2) We say $X$ is geometrically pointwise integral if $X$ is geometrically pointwise integral at every point.
(3) We say $X$ is geometrically integral over $k$ if the scheme $X_{k^{\prime}}$ is integral for every field extension $k^{\prime}$ of $k$.

The distinction between notions (2) and (3) is necessary. For example if $k=\mathbf{R}$ and $X=\operatorname{Spec}(\mathbf{C}[x])$, then $X$ is geometrically pointwise integral over $\mathbf{R}$ but of course not geometrically integral.

038K Lemma 32.7.2. Let $k$ be a field. Let $X$ be a scheme over $k$. Then $X$ is geometrically integral over $k$ if and only if $X$ is both geometrically reduced and geometrically irreducible over $k$.

Proof. See Properties, Lemma 27.3.4.

### 32.8. Geometrically normal schemes

038L In Properties, Definition 27.7.1 we have defined the notion of a normal scheme. This notion is defined even for non-Noetherian schemes. Hence, contrary to our discussion of "geometrically regular" schemes we consider all field extensions of the ground field.

038M Definition 32.8.1. Let $X$ be a scheme over the field $k$.
(1) Let $x \in X$. We say $X$ is geometrically normal at $x$ if for every field extension $k \subset k^{\prime}$ and every $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ the local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is normal.
(2) We say $X$ is geometrically normal over $k$ if $X$ is geometrically normal at every $x \in X$.
038N Lemma 32.8.2. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $x \in X$. The following are equivalent
(1) $X$ is geometrically normal at $x$,
(2) for every finite purely inseparable field extension $k^{\prime}$ of $k$ and $x^{\prime} \in X_{k^{\prime}}$ lying over over $x$ the local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is normal, and
(3) the ring $\mathcal{O}_{X, x}$ is geometrically normal over $k$ (see Algebra, Definition 10.157.2).

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k^{\prime}$ be a finite purely inseparable field extension (for example $k=k^{\prime}$ ). Consider the ring $\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. By Algebra, Lemma 10.45 .6 its spectrum is the same as the spectrum of $\mathcal{O}_{X, x}$. Hence it is a local ring also (Algebra, Lemma 10.17.2). Therefore there is a unique point $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ and $\mathcal{O}_{X_{k^{\prime}, x^{\prime}}} \cong \mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. By assumption this is a normal ring. Hence we deduce (3) by Algebra, Lemma 10.157.1.

Assume (3). Let $k \subset k^{\prime}$ be a field extension. Since $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$ is surjective, also $X_{k^{\prime}} \rightarrow X$ is surjective (Morphisms, Lemma 28.10.4. Let $x^{\prime} \in X_{k^{\prime}}$ be any point lying over $x$. The local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is a localization of the ring $\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. Hence it is normal by assumption and (1) is proved.

038 O Lemma 32.8.3. Let $k$ be a field. Let $X$ be a scheme over $k$. The following are equivalent
(1) $X$ is geometrically normal,
(2) $X_{k^{\prime}}$ is a normal scheme for every field extension $k \subset k^{\prime}$,
(3) $X_{k^{\prime}}$ is a normal scheme for every finitely generated field extension $k \subset k^{\prime}$,
(4) $X_{k^{\prime}}$ is a normal scheme for every finite purely inseparable field extension $k \subset k^{\prime}$, and
(5) for every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is geometrically normal (see Algebra, Definition 10.157.2).

Proof. Assume (1). Then for every field extension $k \subset k^{\prime}$ and every point $x^{\prime} \in X_{k^{\prime}}$ the local ring of $X_{k^{\prime}}$ at $x^{\prime}$ is normal. By definition this means that $X_{k^{\prime}}$ is normal. Hence (2).
It is clear that (2) implies (3) implies (4).
Assume (4) and let $U \subset X$ be an affine open subscheme. Then $U_{k^{\prime}}$ is a normal scheme for any finite purely inseparable extension $k \subset k^{\prime}$ (including $k=k^{\prime}$ ). This
means that $k^{\prime} \otimes_{k} \mathcal{O}(U)$ is a normal ring for all finite purely inseparable extensions $k \subset k^{\prime}$. Hence $\mathcal{O}(U)$ is a geometrically normal $k$-algebra by definition.

Assume (5). For any field extension $k \subset k^{\prime}$ the base change $X_{k^{\prime}}$ is gotten by gluing the spectra of the rings $\mathcal{O}_{X}(U) \otimes_{k} k^{\prime}$ where $U$ is affine open in $X$ (see Schemes, Section 25.17). Hence $X_{k^{\prime}}$ is normal. So (1) holds.

038P Lemma 32.8.4. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $k^{\prime} / k$ be a field extension. Let $x \in X$ be a point, and let $x^{\prime} \in X_{k^{\prime}}$ be a point lying over $x$. The following are equivalent
(1) $X$ is geometrically normal at $x$,
(2) $X_{k^{\prime}}$ is geometrically normal at $x^{\prime}$.

In particular, $X$ is geometrically normal over $k$ if and only if $X_{k^{\prime}}$ is geometrically normal over $k^{\prime}$.

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k^{\prime \prime}$ be a finite purely inseparable field extension and let $x^{\prime \prime} \in X_{k^{\prime \prime}}$ be a point lying over $x$ (actually it is unique). We can find a common field extension $k \subset k^{\prime \prime \prime}$ (i.e. with both $k^{\prime} \subset k^{\prime \prime \prime}$ and $\left.k^{\prime \prime} \subset k^{\prime \prime \prime}\right)$ and a point $x^{\prime \prime \prime} \in X_{k^{\prime \prime \prime}}$ lying over both $x^{\prime}$ and $x^{\prime \prime}$. Consider the map of local rings

$$
\mathcal{O}_{X_{k^{\prime \prime}}, x^{\prime \prime}} \longrightarrow \mathcal{O}_{X_{k^{\prime \prime \prime}}, x^{\prime \prime \prime \prime}}
$$

This is a flat local ring homomorphism and hence faithfully flat. By (2) we see that the local ring on the right is normal. Thus by Algebra, Lemma 10.156 .3 we conclude that $\mathcal{O}_{X_{k^{\prime \prime}}, x^{\prime \prime}}$ is normal. By Lemma 32.8 .2 we see that $X$ is geometrically normal at $x$.

06DG Lemma 32.8.5. Let $k$ be a field. Let $X$ be a geometrically normal scheme over $k$ and let $Y$ be a normal scheme over $k$. Then $X \times_{k} Y$ is a normal scheme.

Proof. This reduces to Algebra, Lemma 10.157 .4 by Lemma 32.8.3.

### 32.9. Change of fields and locally Noetherian schemes

038 Q Let $X$ a locally Noetherian scheme over a field $k$. It is not always that case that $X_{k^{\prime}}$ is locally Noetherian too. For example if $X=\operatorname{Spec}(\overline{\mathbf{Q}})$ and $k=\mathbf{Q}$, then $X_{\overline{\mathbf{Q}}}$ is the spectrum of $\overline{\mathbf{Q}} \otimes_{\mathbf{Q}} \overline{\mathbf{Q}}$ which is not Noetherian. (Hint: It has too many idempotents). But if we only base change using finitely generated field extensions then the Noetherian property is preserved. (Or if $X$ is locally of finite type over $k$, since this property is preserved under base change.)

038R Lemma 32.9.1. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $k \subset k^{\prime}$ be a finitely generated field extension. Then $X$ is locally Noetherian if and only if $X_{k^{\prime}}$ is locally Noetherian.

Proof. Using Properties, Lemma 27.5 .2 we reduce to the case where $X$ is affine, say $X=\operatorname{Spec}(A)$. In this case we have to prove that $A$ is Noetherian if and only if $A_{k^{\prime}}$ is Noetherian. Since $A \rightarrow A_{k^{\prime}}=k^{\prime} \otimes_{k} A$ is faithfully flat, we see that if $A_{k^{\prime}}$ is Noetherian, then so is $A$, by Algebra, Lemma 10.156.1. Conversely, if $A$ is Noetherian then $A_{k^{\prime}}$ is Noetherian by Algebra, Lemma 10.30.7.

### 32.10. Geometrically regular schemes

038 S A geometrically regular scheme over a field $k$ is a locally Noetherian scheme over $k$ which remains regular upon suitable changes of base field. A finite type scheme over $k$ is geometrically regular if and only if it is smooth over $k$ (see Lemma32.10.6). The notion of geometric regularity is most interesting in situations where smoothness cannot be used such as formal fibres (insert future reference here).
In the following definition we restrict ourselves to locally Noetherian schemes, since the property of being a regular local ring is only defined for Noetherian local rings. By Lemma 32.8.3 above, if we restrict ourselves to finitely generated field extensions then this property is preserved under change of base field. This comment will be used without further reference in this section. In particular the following definition makes sense.

038T Definition 32.10.1. Let $k$ be a field. Let $X$ be a locally Noetherian scheme over k.
(1) Let $x \in X$. We say $X$ is geometrically regular at $x$ over $k$ if for every finitely generated field extension $k \subset k^{\prime}$ and any $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ the local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is regular.
(2) We say $X$ is geometrically regular over $k$ if $X$ is geometrically regular at all of its points.

A similar definition works to define geometrically Cohen-Macaulay, $\left(R_{k}\right)$, and $\left(S_{k}\right)$ schemes over a field. We will add a section for these separately as needed.
038U Lemma 32.10.2. Let $k$ be a field. Let $X$ be a locally Noetherian scheme over $k$. Let $x \in X$. The following are equivalent
(1) $X$ is geometrically regular at $x$,
(2) for every finite purely inseparable field extension $k^{\prime}$ of $k$ and $x^{\prime} \in X_{k^{\prime}}$ lying over over $x$ the local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is regular, and
(3) the ring $\mathcal{O}_{X, x}$ is geometrically regular over $k$ (see Algebra, Definition 10.158.2).

Proof. It is clear that (1) implies (2). Assume (2). This in particular implies that $\mathcal{O}_{X, x}$ is a regular local ring. Let $k \subset k^{\prime}$ be a finite purely inseparable field extension. Consider the ring $\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. By Algebra, Lemma 10.45 .6 its spectrum is the same as the spectrum of $\mathcal{O}_{X, x}$. Hence it is a local ring also (Algebra, Lemma 10.17.2). Therefore there is a unique point $x^{\prime} \in X_{k^{\prime}}$ lying over $x$ and $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}} \cong \mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. By assumption this is a regular ring. Hence we deduce (3) from the definition of a geometrically regular ring.
Assume (3). Let $k \subset k^{\prime}$ be a field extension. Since $\operatorname{Spec}\left(k^{\prime}\right) \rightarrow \operatorname{Spec}(k)$ is surjective, also $X_{k^{\prime}} \rightarrow X$ is surjective (Morphisms, Lemma 28.10.4. Let $x^{\prime} \in X_{k^{\prime}}$ be any point lying over $x$. The local ring $\mathcal{O}_{X_{k^{\prime}}, x^{\prime}}$ is a localization of the ring $\mathcal{O}_{X, x} \otimes_{k} k^{\prime}$. Hence it is regular by assumption and (1) is proved.
038V Lemma 32.10.3. Let $k$ be a field. Let $X$ be a locally Noetherian scheme over $k$. The following are equivalent
(1) $X$ is geometrically regular,
(2) $X_{k^{\prime}}$ is a regular scheme for every finitely generated field extension $k \subset k^{\prime}$,
(3) $X_{k^{\prime}}$ is a regular scheme for every finite purely inseparable field extension $k \subset k^{\prime}$,
(4) for every affine open $U \subset X$ the ring $\mathcal{O}_{X}(U)$ is geometrically regular (see Algebra, Definition 10.158.2), and
(5) there exists an affine open covering $X=\bigcup U_{i}$ such that each $\mathcal{O}_{X}\left(U_{i}\right)$ is geometrically regular over $k$.

Proof. Assume (1). Then for every finitely generated field extension $k \subset k^{\prime}$ and every point $x^{\prime} \in X_{k^{\prime}}$ the local ring of $X_{k^{\prime}}$ at $x^{\prime}$ is regular. By Properties, Lemma 27.9.2 this means that $X_{k^{\prime}}$ is regular. Hence (2).

It is clear that (2) implies (3).
Assume (3) and let $U \subset X$ be an affine open subscheme. Then $U_{k^{\prime}}$ is a regular scheme for any finite purely inseparable extension $k \subset k^{\prime}$ (including $k=k^{\prime}$ ). This means that $k^{\prime} \otimes_{k} \mathcal{O}(U)$ is a regular ring for all finite purely inseparable extensions $k \subset k^{\prime}$. Hence $\mathcal{O}(U)$ is a geometrically regular $k$-algebra and we see that (4) holds.

It is clear that (4) implies (5). Let $X=\bigcup U_{i}$ be an affine open covering as in (5). For any field extension $k \subset k^{\prime}$ the base change $X_{k^{\prime}}$ is gotten by gluing the spectra of the rings $\mathcal{O}_{X}\left(U_{i}\right) \otimes_{k} k^{\prime}$ (see Schemes, Section 25.17). Hence $X_{k^{\prime}}$ is regular. So (1) holds.

038W Lemma 32.10.4. Let $k$ be a field. Let $X$ be a scheme over $k$. Let $k^{\prime} / k$ be a finitely generated field extension. Let $x \in X$ be a point, and let $x^{\prime} \in X_{k^{\prime}}$ be a point lying over $x$. The following are equivalent
(1) $X$ is geometrically regular at $x$,
(2) $X_{k^{\prime}}$ is geometrically regular at $x^{\prime}$.

In particular, $X$ is geometrically regular over $k$ if and only if $X_{k^{\prime}}$ is geometrically regular over $k^{\prime}$.

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k^{\prime \prime}$ be a finite purely inseparable field extension and let $x^{\prime \prime} \in X_{k^{\prime \prime}}$ be a point lying over $x$ (actually it is unique). We can find a common, finitely generated, field extension $k \subset k^{\prime \prime \prime}$ (i.e. with both $k^{\prime} \subset k^{\prime \prime \prime}$ and $\left.k^{\prime \prime} \subset k^{\prime \prime \prime}\right)$ and a point $x^{\prime \prime \prime} \in X_{k^{\prime \prime \prime}}$ lying over both $x^{\prime}$ and $x^{\prime \prime}$. Consider the map of local rings

$$
\mathcal{O}_{X_{k^{\prime \prime}}, x^{\prime \prime}} \longrightarrow \mathcal{O}_{X_{k^{\prime \prime \prime}}, x^{\prime \prime \prime \prime}}
$$

This is a flat local ring homomorphism of Noetherian local rings and hence faithfully flat. By (2) we see that the local ring on the right is regular. Thus by Algebra, Lemma 10.109 .9 we conclude that $\mathcal{O}_{X_{k^{\prime \prime}}, x^{\prime \prime}}$ is regular. By Lemma 32.10.2 we see that $X$ is geometrically regular at $x$.

The following lemma is a geometric variant of Algebra, Lemma 10.158.3.
05AW Lemma 32.10.5. Let $k$ be a field. Let $f: X \rightarrow Y$ be a morphism of locally Noetherian schemes over $k$. Let $x \in X$ be a point and set $y=f(x)$. If $X$ is geometrically regular at $x$ and $f$ is flat at $x$ then $Y$ is geometrically regular at $y$. In particular, if $X$ is geometrically regular over $k$ and $f$ is flat and surjective, then $Y$ is geometrically regular over $k$.

Proof. Let $k^{\prime}$ be finite purely inseparable extension of $k$. Let $f^{\prime}: X_{k^{\prime}} \rightarrow Y_{k^{\prime}}$ be the base change of $f$. Let $x^{\prime} \in X_{k^{\prime}}$ be the unique point lying over $x$. If we show that $Y_{k^{\prime}}$ is regular at $y^{\prime}=f^{\prime}\left(x^{\prime}\right)$, then $Y$ is geometrically regular over $k$ at $y^{\prime}$, see

Lemma 32.10.3 By Morphisms, Lemma 28.25 .6 the morphism $X_{k^{\prime}} \rightarrow Y_{k^{\prime}}$ is flat at $x^{\prime}$. Hence the ring map

$$
\mathcal{O}_{Y_{k^{\prime}}, y^{\prime}} \longrightarrow \mathcal{O}_{X_{k^{\prime}}, x^{\prime}}
$$

is a flat local homomorphism of local Noetherian rings with right hand side regular by assumption. Hence the left hand side is a regular local ring by Algebra, Lemma 10.109.9.

038X Lemma 32.10.6. Let $k$ be a field. Let $X$ be a scheme of finite type over $k$. Let $x \in X$. Then $X$ is geometrically regular at $x$ if and only if $X \rightarrow \operatorname{Spec}(k)$ is smooth at $x$ (Morphisms, Definition 28.34.1).

Proof. The question is local around $x$, hence we may assume that $X=\operatorname{Spec}(A)$ for some finite type $k$-algebra. Let $x$ correspond to the prime $\mathfrak{p}$.

If $A$ is smooth over $k$ at $\mathfrak{p}$, then we may localize $A$ and assume that $A$ is smooth over $k$. In this case $k^{\prime} \otimes_{k} A$ is smooth over $k^{\prime}$ for all extension fields $k^{\prime} / k$, and each of these Noetherian rings is regular by Algebra, Lemma 10.138.3.

Assume $X$ is geometrically regular at $x$. Consider the residue field $K:=\kappa(x)=\kappa(\mathfrak{p})$ of $x$. It is a finitely generated extension of $k$. By Algebra, Lemma 10.44 .3 there exists a finite purely inseparable extension $k \subset k^{\prime}$ such that the compositum $k^{\prime} K$ is a separable field extension of $k^{\prime}$. Let $\mathfrak{p}^{\prime} \subset A^{\prime}=k^{\prime} \otimes_{k} A$ be a prime ideal lying over $\mathfrak{p}$. It is the unique prime lying over $\mathfrak{p}$, see Algebra, Lemma 10.45.6. Hence the residue field $K^{\prime}:=\kappa\left(\mathfrak{p}^{\prime}\right)$ is the compositum $k^{\prime} K$. By assumption the local ring $\left(A^{\prime}\right)_{\mathfrak{p}^{\prime}}$ is regular. Hence by Algebra, Lemma 10.138 .5 we see that $k^{\prime} \rightarrow A^{\prime}$ is smooth at $\mathfrak{p}^{\prime}$. This in turn implies that $k \rightarrow A$ is smooth at $\mathfrak{p}$ by Algebra, Lemma 10.135.18. The lemma is proved.
